16th ESTRO Teaching Course on

BRACHYTHERAPY FOR PROSTATE CANCER

Introduction

Welcome to the beautiful city of Brussels for the 16th ESTRO Prostate Brachytherapy Course.

Over the last few years more and more younger men have been diagnosed with localised potentially curable prostate cancer. While radical prostatectomy remains the gold standard for treatment in many countries, there is an increasing interest in the role of brachytherapy which proves a much simpler alternative and achieves similar outcomes with less risk of severe side effects. Several thousand patients now have the treatment each year in Europe.

Prostate brachytherapy is not something that can be taken up by a solitary enthusiast. It requires a significant amount of team work and there needs to be careful attention to patient selection, techniques of implantation and quality assurance to ensure that optimum outcomes can be achieved. A very experienced teaching staff in all aspects of both HDR and LDR Brachytherapy will be present at the meeting and will be happy for you to ask questions both during or after the lectures. Please make use of their expertise.

We hope that the teaching course will provide a foundation to begin the steep learning curve towards the achievement of consistent high quality implants and that more patients will have the option to choose this form of treatment.

On behalf of the teaching staff,

Peter Hoskin,
Course Director

NOTE TO THE PARTICIPANTS OF THE ESTRO TEACHING COURSE ON

BRACHYTHERAPY FOR PROSTATE CANCER

The present texts and slides are provided to you as a basis for taking notes during the course. In as many instances as practically possible, we have tried to indicate from which author these slides have been borrowed to illustrate this course.

It should be realised that the present text can only be considered as notes for a teaching course and should not in any way be copied or circulated. They are only for personal use. Please be very strict in this as it is the only condition under which such services can be provided to the participants of the course.

A NEW AND IMPROVED MEMBERSHIP PROGRAMME
Bringing you more benefits & online services

BECOME AN ESTRO MEMBER
TODAY AND JOIN THE RADIATION
ONCOLOGY COMMUNITY

ESTRO members

ESTRO has renewed its membership categories for 2013 in order to bring you more benefits that are better suited to your needs. ESTRO's mission is to guide your day-to-day professional development and to disseminate all the latest findings and knowledge that are crucial to our rapidly evolving field.
Join ESTRO, become an integral part of the Radiation Oncology Community.

The European SocieTy for Radiotherapy & Oncology (ESTRO), with its active community of over 5000 members, has supported the role of Radiation Oncology within the multidisciplinary treatment of cancer for more than 30 years.

ESTRO is the ideal platform for the sharing of cutting-edge knowledge and ground-breaking know-how within the radiation oncology community. ESTRO provides numerous high-level educational opportunities through teaching courses, organises conferences and congresses that are at the forefront of our specialisation, and is responsible for several top-notch publications.

The Society has the mission to represent all the Radiotherapy professionals: Radiation Oncologists, Medical Physicists in the field of Radiotherapy, Radiobiologists and RTT (Radiotherapy Technologists). Membership is also open to other oncology specialists such as Medical Oncologists, Surgeons, Nuclear Medicine Physicians...

By joining ESTRO, you will receive numerous benefits that have been carefully designed to support and advance your career. We invite you to peruse the many Membership categories on offer and to sign-up for the one that is best tailored to meet your professional requirements.

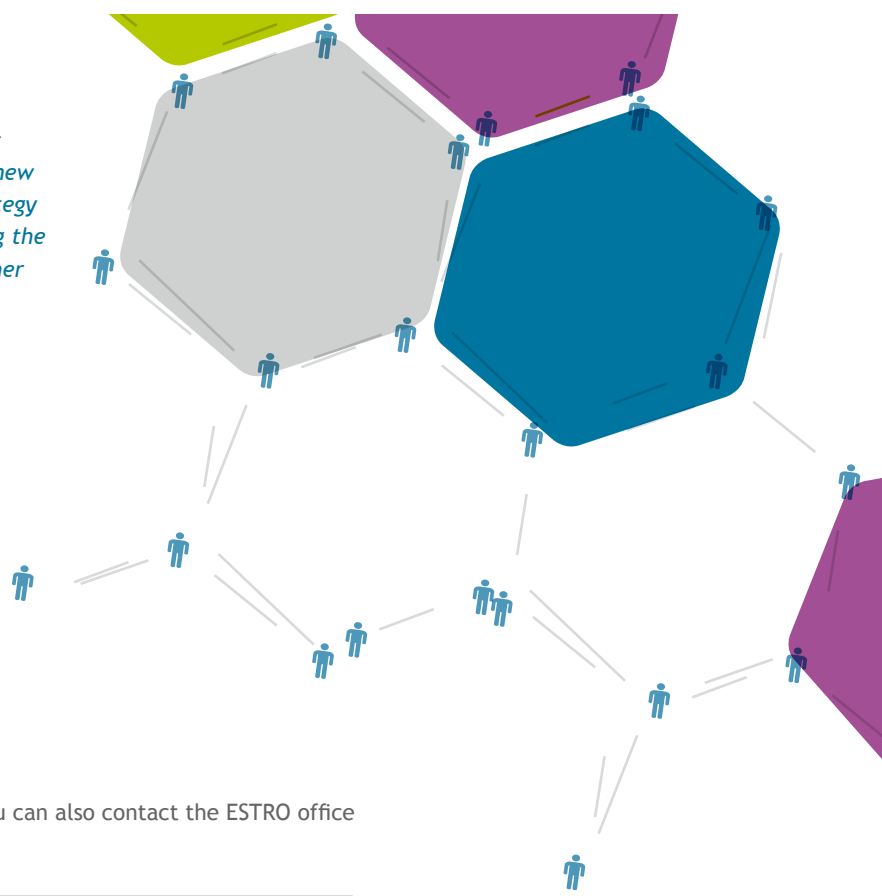
NEW FOR 2013!

ESTRO is developing additional new online services which will be functional as of January 2013: through our new search engine you will be able to access a comprehensive e-library containing documents such as the Green Journal and conference abstracts, webcasts, posters, free access to FALCON (our delineation tool), our newsletter, etc.

Don't forget that you can register for the 2013 ESTRO conferences and teaching courses at a discounted rate as soon as you have signed up for your 2013 membership!

"The new communication tools and on-line services create a personalised platform to help ESTRO members connect and network. Moreover, ESTRO members will find an environment that will stimulate education and development. As such the new membership categories will be an important part of the strategy of realising the central vision statement of ESTRO by offering the necessary tools for the individual member to develop his or her professional skills in the interests of our patients."

Dirk Verellen, ESTRO Membership Officer



How can you become an ESTRO member?

Please apply online via the ESTRO website www.estro.org. You can also contact the ESTRO office by email or by phone for any assistance you may require.

ESTRO
EUROPEAN SOCIETY FOR
RADIOTHERAPY & ONCOLOGY

INDIVIDUAL MEMBERSHIP | FULL

Full Membership is open to all healthcare providers who are active in the field of cancer care and/or cancer research, as well as related areas in a non-commercial setting.

ACTIVE MEMBER

Active Membership is open to all Radiation Oncology professionals. This category entitles you to the most complete range of benefits that the Society has on offer.

SUPPORTING AMBASSADOR MEMBERSHIP

This category is reserved for individuals who are strongly committed to the Society and who want to take an extra step to help ESTRO develop further by paying a higher membership fee. The additional income generated by these big-hearted members will be used to create a solidarity fund. The fund will be available to sponsor the membership fee of less fortunate individuals, finance support grants for ESTRO events, and help to ensure that Radiation Oncology professionals from economically challenged countries are also able to participate in our scientific arena.

INDIVIDUAL MEMBERSHIP | ASSOCIATE

IN TRAINING MEMBER

This category is open to all European healthcare providers who are active in the field of Radiation Oncology, as well as related areas in a non-commercial setting. In training members must be under the age of **35**, have relevant professional experience or a university diploma granted less than 5 years ago, and currently be in training.

AFFILIATE MEMBER

This category is available for Radiation Oncology professionals and/or individuals interested in the field of Radiation Oncology who do not require full involvement in the society but who still wish to enjoy some of the more basic benefits on offer.

CORPORATE REPRESENTATIVE

This category is reserved for individual members working for a company.

ESTRO membership runs from the 1st of January to the 31st of December.
N.B.: Please note these important changes: RTTs will now belong to all membership categories without distinction of disciplines. When registering for courses or conferences, whatever the membership category they belong to, RTTs will benefit from the 'In Training' rate.

PACKAGES OF BENEFITS FOR INDIVIDUAL MEMBERS

FULL MEMBERSHIP

SUPPORTING AMBASSADOR | 250€	will benefit from A + B + C + D + E
ACTIVE MEMBER | 95€	will benefit from A + B + C + D

ASSOCIATE MEMBERSHIP

IN TRAINING MEMBER | 75€	will benefit from A + B + C
AFFILIATE MEMBER | 55€	will benefit from A + B
CORPORATE REPRESENTATIVE | 55€	will benefit from A

A

- Subscription to the Green Journal
- Discounted price for ESTRO Publications and Handbooks
- Online access to ESTRO Handbooks
- Subscription to the ESTRO Newsletter
- Access to Conference Abstract Books
- Access to ESTRO Guidelines
- Access to the ESTRO Annual Reports

A

All the benefits listed above + Reduced registration fee for one ESTRO Conference or teaching course of choice per year (incl. joint conferences and courses)

B

- Eligibility for Awards
- Access to the "Members area" on the ESTRO website (read only)
- Access to Job advertisements
- Access to the ESTRO Annual Reports
- Reduced subscription rate to the European Journal of Cancer

B

All the benefits listed above + the possibility to get either a reduced registration fee for one ESTRO Conference or teaching course of choice (incl. joint conferences and courses) or a Grant once per year

C

- Reduced fee for attending ESTRO and Joint Conferences
- Reduced fee for attending ESTRO and Joint Courses
- Eligibility for Grants and Awards
- Eligibility to participate in ESTRO's Governance Activities
- Access to FALCON Cases (basic)
- Access to the Webcast library (after 6 months)

C

All the benefits listed above + Access to Membership Directory (young corner)

D

- Eligibility for Grants, Awards and Fellowships
- Eligibility for Working Groups, Task Force Groups, and Faculties
- Eligibility to hold formal positions such as President, being on the Board of Directors, Councils, Standing Committees, and participation in ESTRO's Governance Activities
- Access to the Membership Directory
- Access to the "Members area" on the ESTRO website enabling you to read and/or upload your presentations and research, etc.
- Voting rights in the General Assembly

E

- Online access to educational materials
- Contribution to the ESTRO Ambassador Solidarity fund (acknowledgement in the ESTRO webpage)
- Access to FALCON Cases (basic and endorsed cases)
- Access to the Webcast library (immediate access)

OTHER CATEGORIES

ESTRO can choose to bestow the following membership categories upon specially selected individuals. Neither of these memberships can be signed-up for.

HONORARY MEMBERSHIP

Honorary Members are professionals who have made a noteworthy contribution towards ESTRO's mission. They are selected by the Nominating Council of ESTRO.

DUAL MEMBERSHIP

This category can be granted to individual members who benefit from a JOINT membership agreement. The agreements are signed on a case-by-case basis between ESTRO and a National Society; the membership fee is covered by the annual fee paid by the partnering Society. The member is entitled to the same benefits as an Affiliate Member (with the exception that the discounted rate for attending courses and conferences is not limited to just one a year).

INSTITUTIONAL MEMBERSHIP

Institutional Membership is available for institutes who are willing to purchase several individual memberships in batch for their members. Your institute can buy several individual memberships (all benefits included) and enjoy additional benefits such as registration packages for online workshops, a dedicated corner in the Newsletter, the opportunity to disseminate standards/guidelines within the organisation and much more. Read the full details of all package deals available for institutes and the related list of benefits on www.estro.org or contact the ESTRO office by e-mail: institutional-membership@estro.org.

IMPROVE YOUR DELINEATION SKILLS WITH FALCON

FALCON
Fellowship in Anatomic deLineation & CONtouring

FALCON* is ESTRO's contouring platform that offers you the opportunity to practise your delineation skills online and to compare them with those made by experts and with the ESTRO/international guidelines.

3 FALCON cases for ESTRO members

Direclty accessible on DOVE, ESTRO's platform:

- Head and neck cancer
- Lymphoma
- Gynaecological cancer

* Fellowship in Anatomic delineation and CONtouring

ESTRO School

NEXT FALCON WORKSHOP

Lymphoma

- 14 June 2016
- 21 June 2016
- 5 July 2016

Each workshop includes 3 sessions

ESTRO School

E-LEARNING

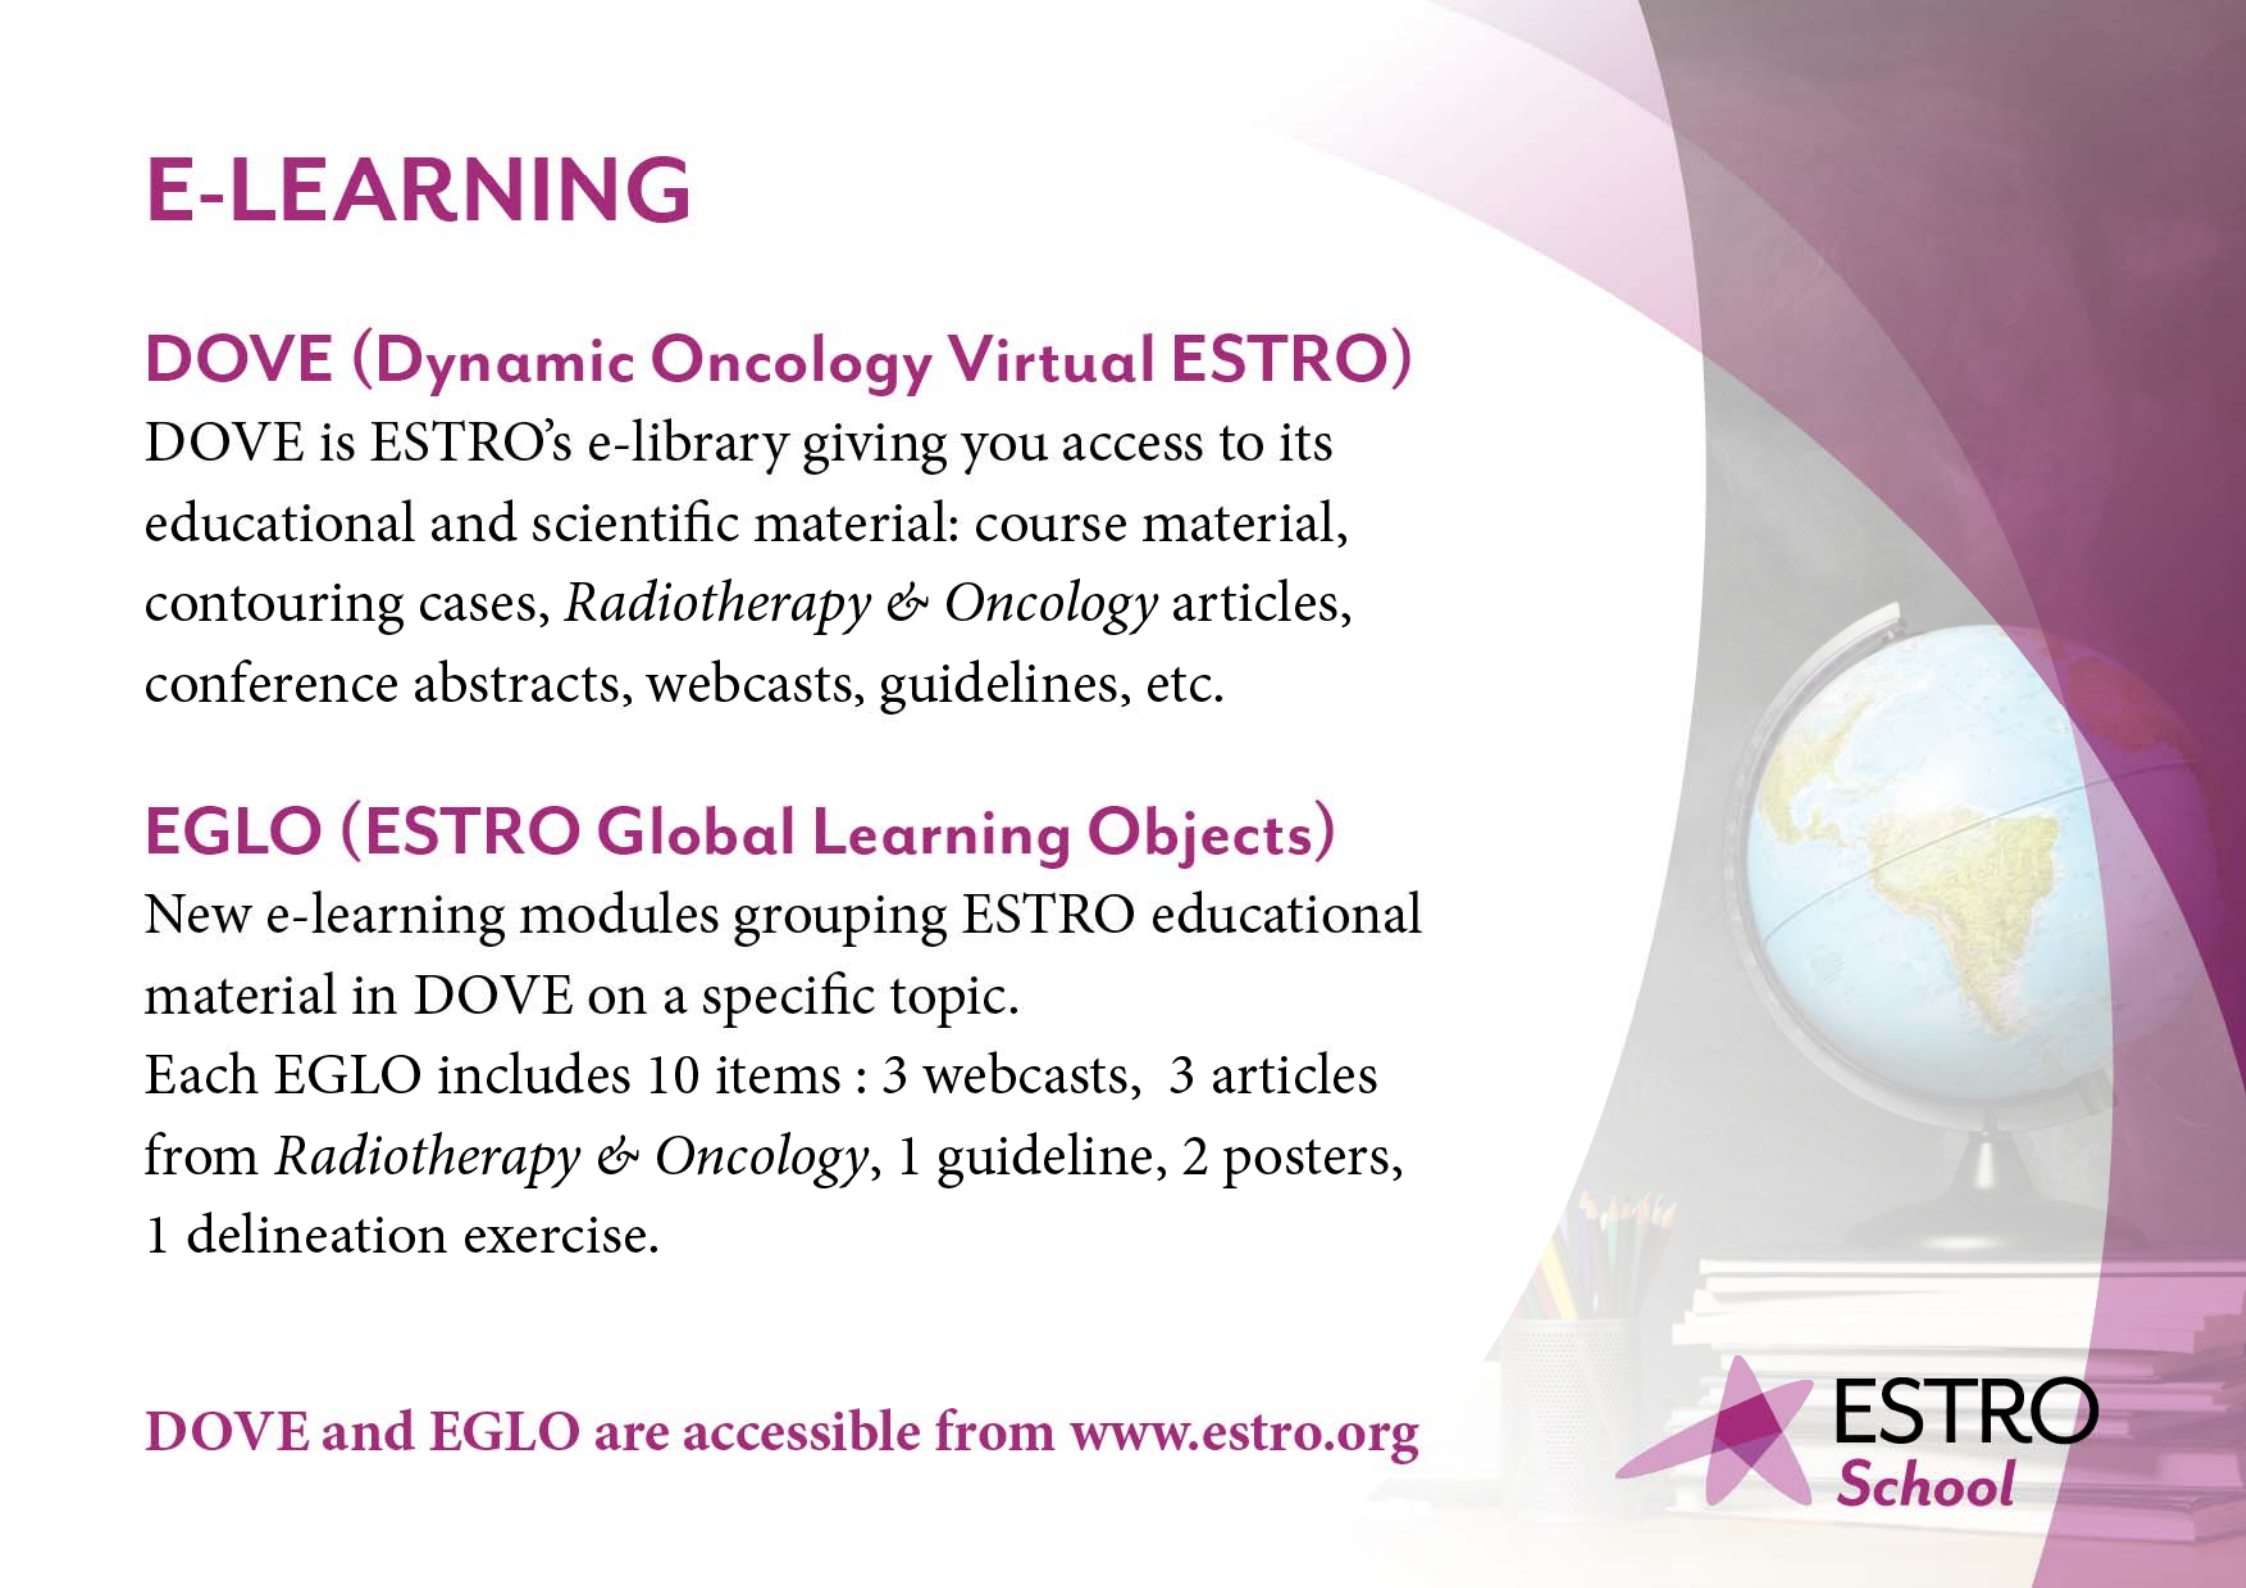
DOVE (Dynamic Oncology Virtual ESTRO)

DOVE is ESTRO's e-library giving you access to its educational and scientific material: course material, contouring cases, *Radiotherapy & Oncology* articles, conference abstracts, webcasts, guidelines, etc.

EGLO (ESTRO Global Learning Objects)

New e-learning modules grouping ESTRO educational material in DOVE on a specific topic.
Each EGLO includes 10 items : 3 webcasts, 3 articles from *Radiotherapy & Oncology*, 1 guideline, 2 posters, 1 delineation exercise.

DOVE and EGLO are accessible from www.estro.org



ESTRO School

ESTRO FELLOW

The ESTRO Fellow is a mark of distinction for competencies in radiation oncology.

The ESTRO Fellow process includes 3 steps and requires that candidates:

1. Meet the criteria

- Be an ESTRO member
- Be a board certified specialist in radiation or clinical oncology
- Have completed at least two years of working experience
- Have at least 50 ESTRO credits (attendance at ESTRO conferences and courses, online workshops, and publications in the *Green Journal*).

2. Send the application form

Deadline to submit the application form is on 5 April 2017.

3. Take the exam

The multiple choice exam will take place on 5 May 2017 in Vienna during ESTRO 36.

More information and application form are available on the ESTRO website on:
www.estro.org/careers-grants/estro-fellow/index

ESTRO School

ESTRO MOBILITY GRANTS (TTG)

Visit another institute

In order to learn about or gain experience with a technique, equipment or its application that is not easily available in your institute and which would be useful to you and your department, you can visit another institute for one to three weeks, in Europe or outside.

Just apply for an ESTRO Mobility Grant, the so-called "Technology Transfer Grants" (TTG).

Next deadline: 31 October 2016

Check the selection criteria on www.estro.org

REDUCED FEES FOR 2016 COURSES

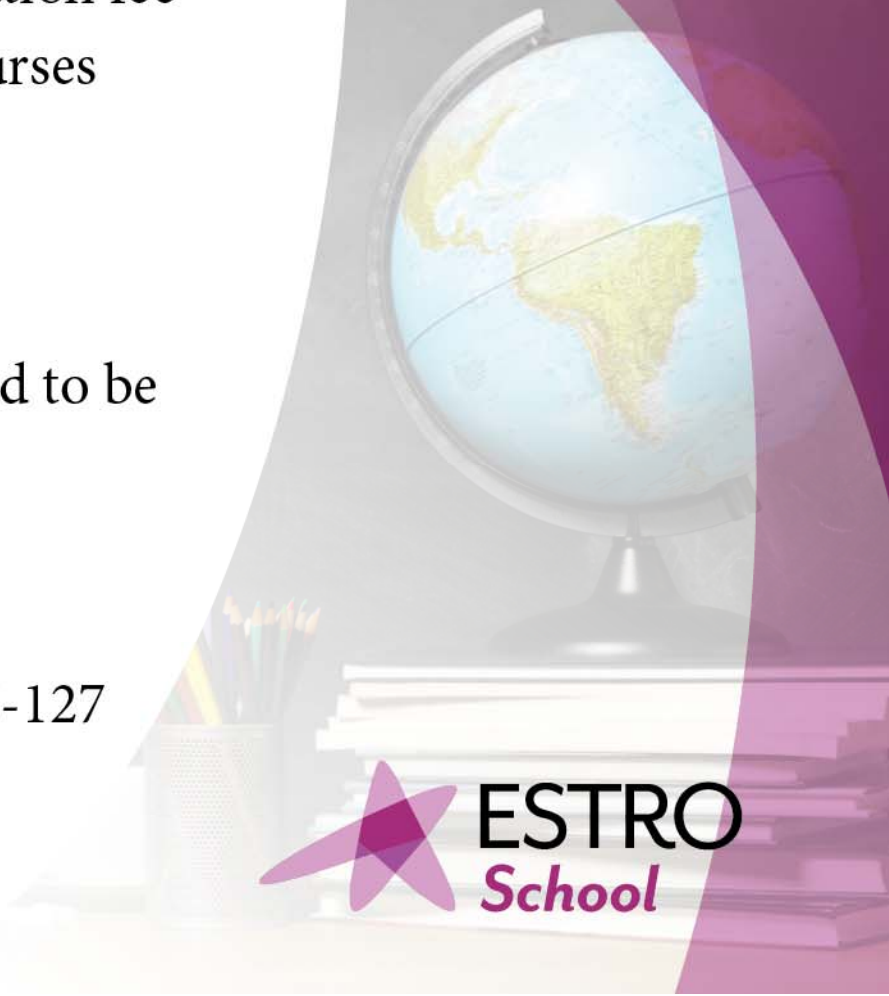
ESTRO members working in countries with a less competitive economic background can obtain a reduced registration fee and only pay 350€ to participate in live teaching courses organised in Europe.

How to apply

Applications forms and CV for the reduced fees need to be submitted to education@estro.org.

Eligible countries

Check the list of eligible countries and courses p126-127 of the 2016 ESTRO Guide or on www.estro.org



ESTRO School

ESTRO 36

5 - 9 May 2017

Vienna, Austria

WWW.ESTRO.ORG

ESTRO 36

5 - 9 May 2017 | Vienna, Austria

ESTRO 36 will draw attention on the multidisciplinarity and interdisciplinary components of radiation oncology, with emphasis on the new opportunities that they represent for all professionals of oncology, not only in research but also in the daily care of patients.

ESTRO 36

5 - 9 May 2017 | Vienna, Austria

Deadlines

- Abstract submission: 24 October 2016
- Early registration: 18 January 2017
- Late registration: 4 April 2017
- Desk registration as of 5 April 2017

6TH ICHNO

International Conference
on innovative approaches in

HEAD & NECK ONCOLOGY

16-18 March 2017
Barcelona, Spain

WWW.ESTRO.ORG

6TH ICHNO

16 - 18 March 2017 | Barcelona, Spain

Deadlines

- Early registration deadline: 26 October 2016
- Late registration deadline: 15 February 2017
- Desk registration as of 16 February 2017

4 GEC ESTRO workshop

FOURTH GEC-ESTRO WORKSHOP

"Techniques, Trials and Technologies for Brachytherapy Patients"

2-3 November 2016 | Poznan, Poland

ESTRO PUBLICATIONS

- ***Radiotherapy & Oncology***

- Publishes original research articles and review articles on all aspects of radiation oncology
- Is the leading publication in radiation oncology with an impact factor of 4.363
- Is a monthly publication available online and in hard-copy format to ESTRO members.

ESTRO NEWS APP

Keep pace with the activities of the Society and with the latest developments in radiation oncology

- The ESTRO newsletter is delivered in electronic format under the 'ESTRO News' app.
- The 'ESTRO News' app is available for:
  - tablets (Ipads and androids)
  - smartphones (android only)

The newsletter published every two months and covers a wide range of topics, and highlights – typically per discipline – latest advances, interviews with key opinion leaders, conference findings, research information, editor's picks, "Read it before your patients" columns, etc.

Each issue is also available on the ESTRO website.

ESTRO School

The prostate surrounds the urethra and is situated below the bladder.

The prostate produces fluid that is needed by sperms to move.

ESTRO School

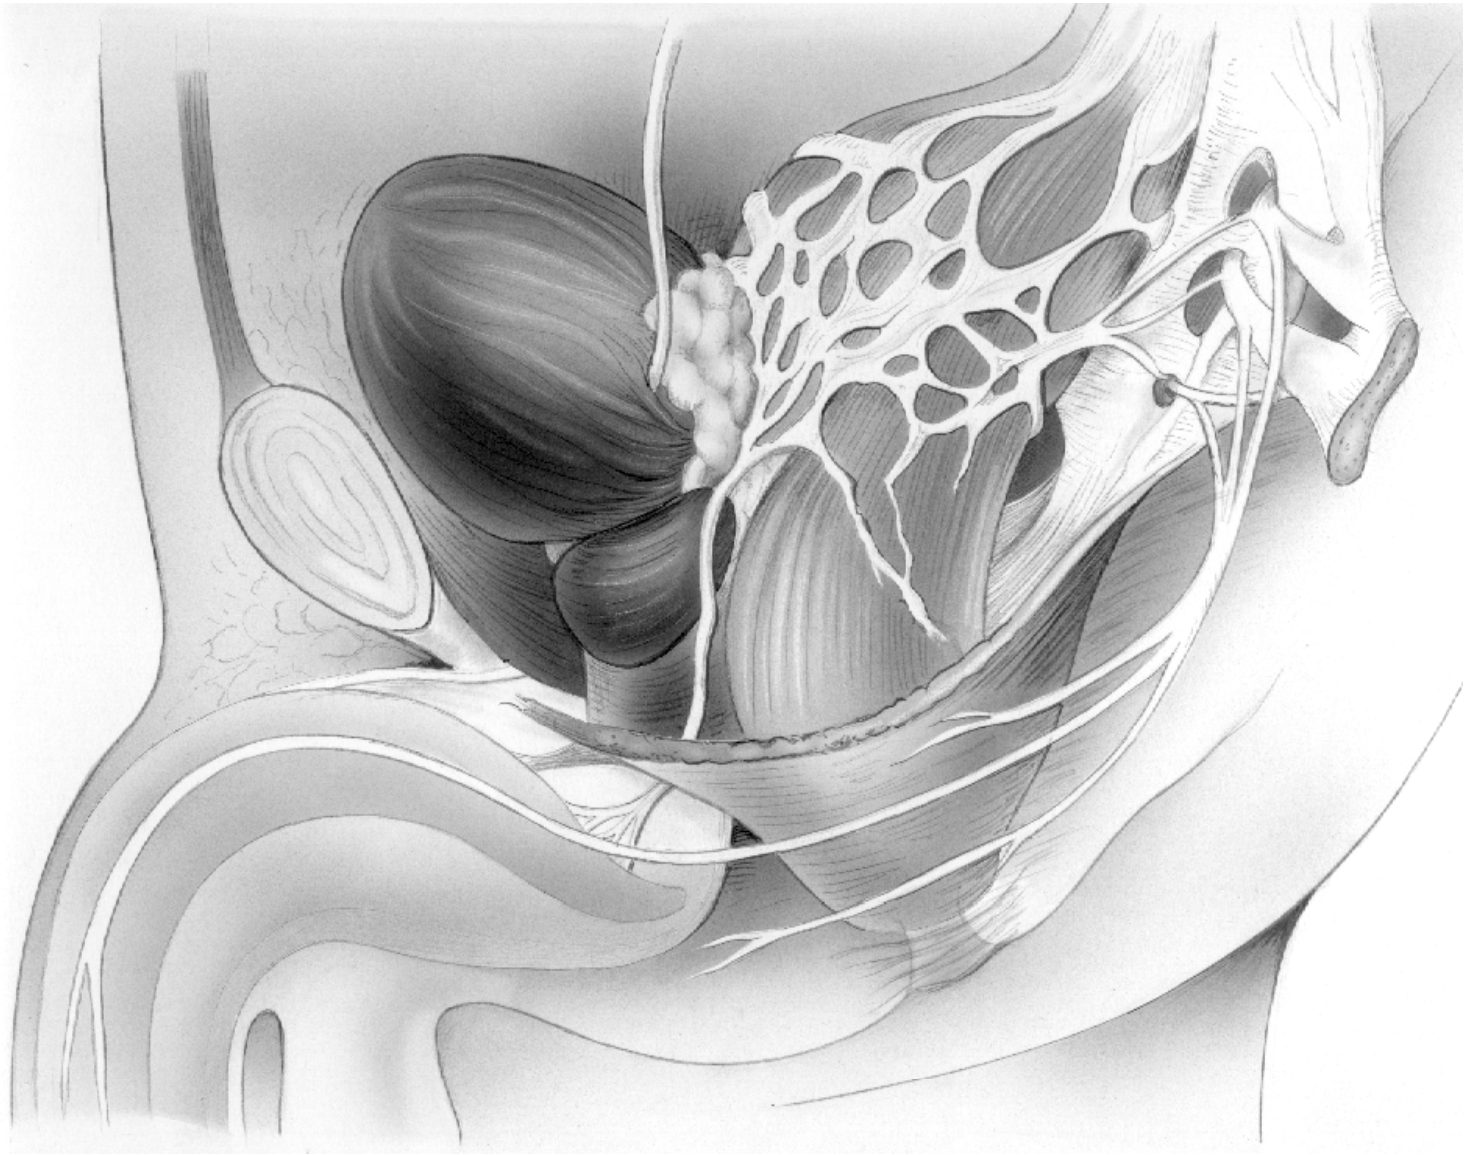
Parasympathic nerves



Course of neurovascular bundle

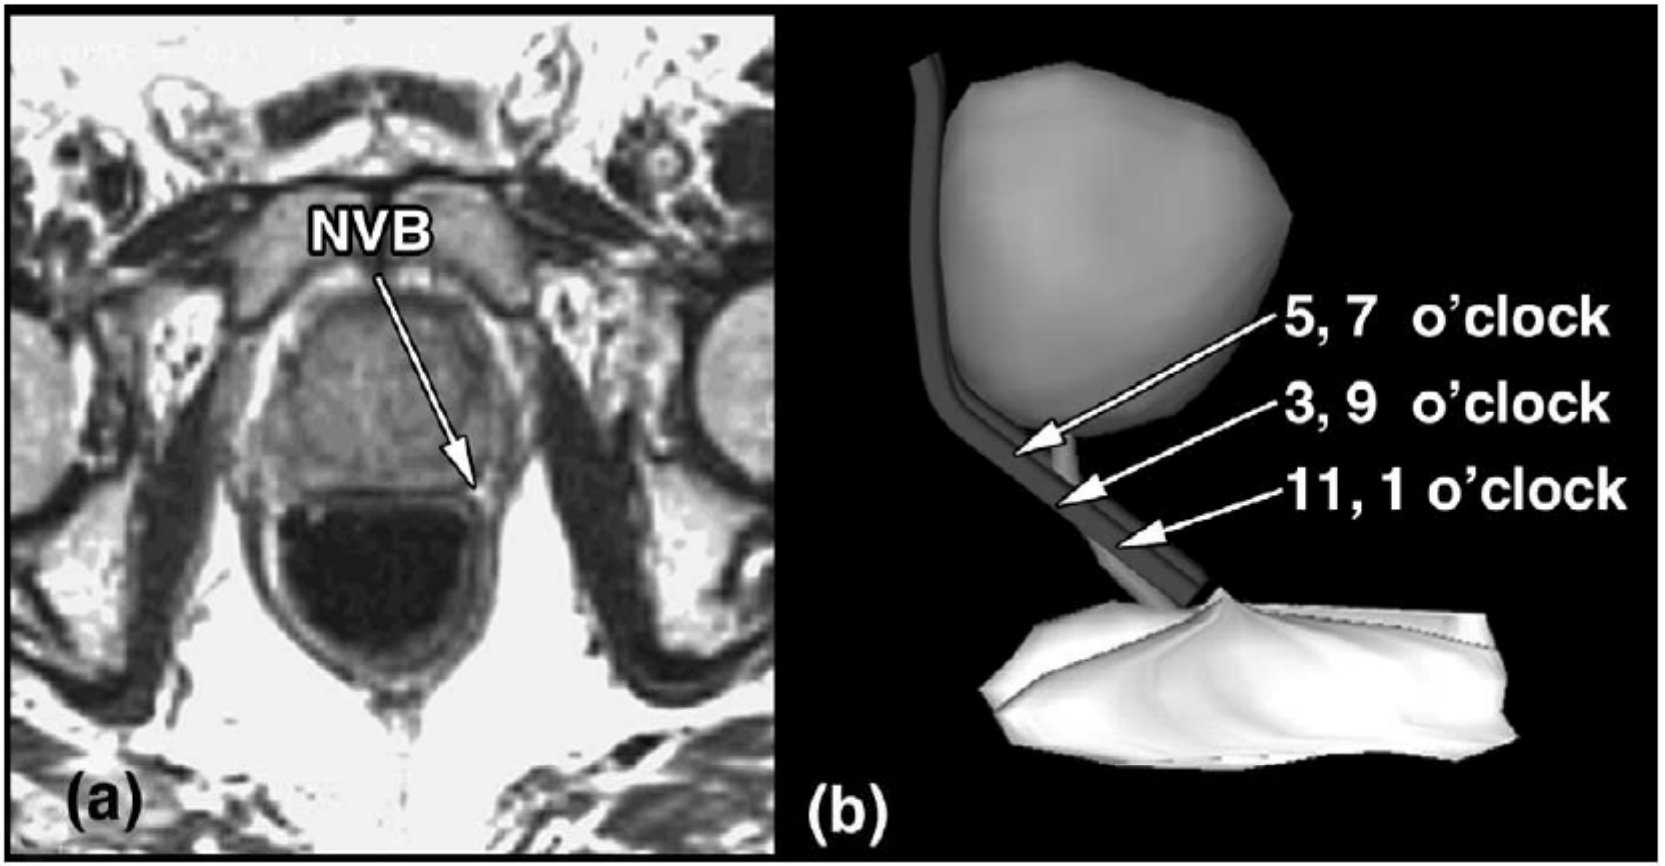


Fig. 7. Neurovascular bundle (NVB) and terminal branches. (a) Axial magnetic resonance imaging. (b) Three-dimensional reconstruction with cavernosal nerve defined by relationship to membranous urethra.

Nerve and vascular pathways

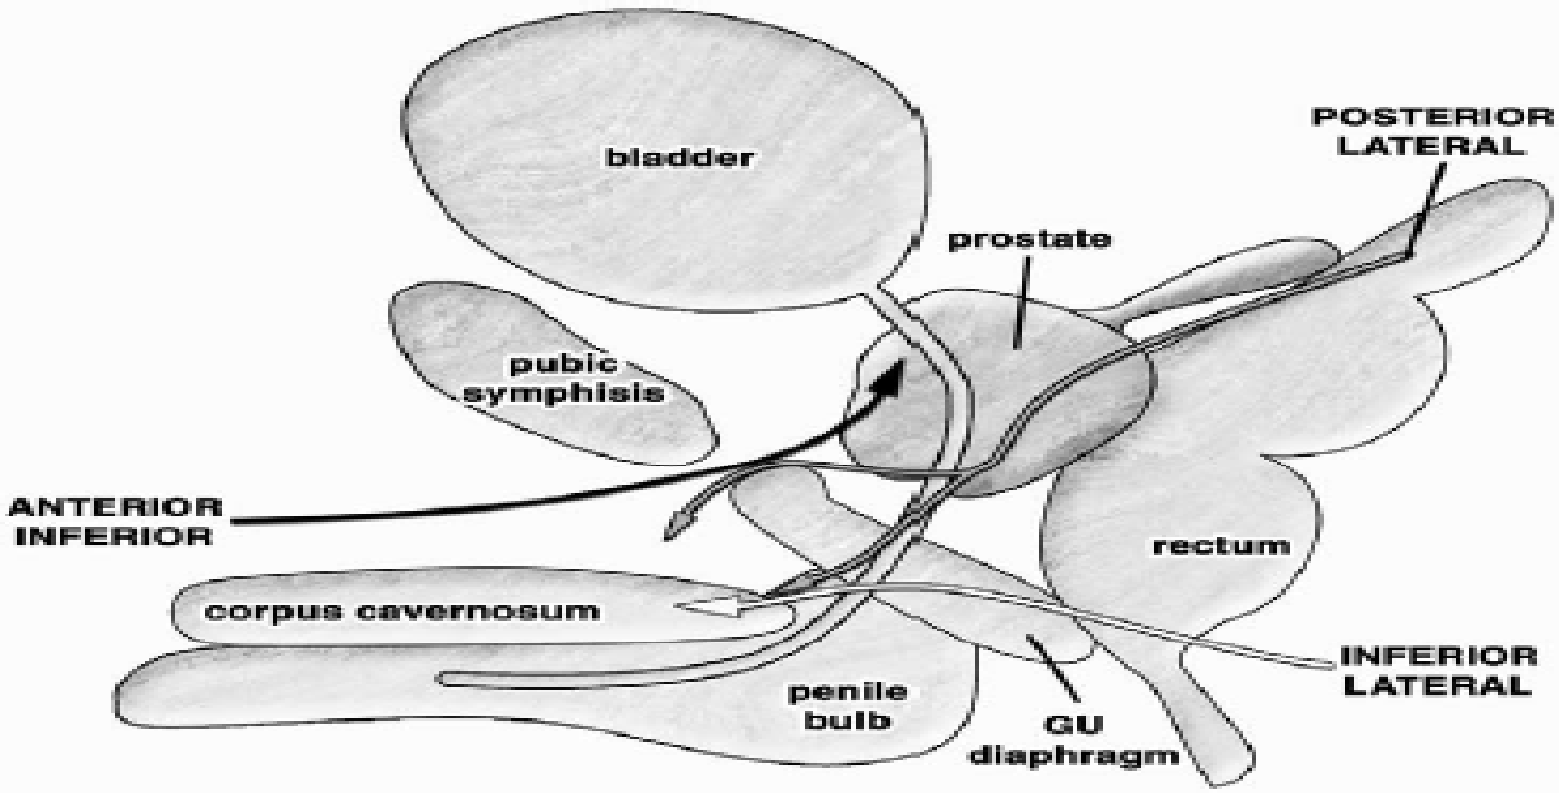

Fig. 3. Nerve and vascular pathways. The posterolateral (PL) pathway proceeds from superior (seminal vesicle) and along the posterior lateral prostate and pierces the genitourinary diaphragm (GUD) lateral to the urethra. The inferior lateral (IL) proceeds from posterior through the GUD and includes the internal pudendal artery and nerve. The anterior inferior (AI) proceeds under the pubic symphysis and over the anterior prostate surface and includes the dorsal venous complex.

Selection of patients for prostate cancer permanent implant brachytherapy

Jean-Marc Cosset, Institut Curie, Paris, France

ESTRO School

- **A brief history;**
- **The initial ABS recommendations (1999)**
- **The ESTRO recommendations (2000)**
- **The progressive evolution**
- **The 2012 ABS recommendations**

ESTRO School

- Int. J. Radiation Oncology Biol. Phys., Vol. 44, No. 4, pp. 789–799, 1999

- **AMERICAN BRACHYTHERAPY SOCIETY (ABS) RECOMMENDATIONS FOR TRANSPERINEAL PERMANENT BRACHYTHERAPY OF PROSTATE CANCER**

- *SUBIR NAG, M.D.,*† DAVID BEYER, M.D.,*‡ JAY FRIEDLAND, M.D.,* § PETER GRIMM, D.O.,*\ AND RAVINDER NATH, PH.D.*¶*

1999 AMERICAN BRACHYTHERAPY SOCIETY (ABS) RECOMMENDATIONS FOR TRANSPERINEAL PERMANENT BRACHYTHERAPY OF PROSTATE CANCER

- **Brachytherapy as Monotherapy:**
- Stage T1 to T2a and
- Grade Gleason sum 2–6 and
- PSA < 10 ng/ml
- *(i.e , Low-risk patients)*

ESTRO School

1999 AMERICAN BRACHYTHERAPY SOCIETY (ABS) RECOMMENDATIONS FOR TRANSPERINEAL PERMANENT BRACHYTHERAPY OF PROSTATE CANCER

- **Clinical Exclusion Criteria:**
- Life expectancy < 5 years
- Large or poorly healed TURP defect
- Unacceptable operative risks
- Distant metastases

- **Relative Contraindications for Brachytherapy (1) :**
- *These patients are not ideal candidates for brachytherapy, but have nevertheless been successfully implanted. Beginners should not implant these patients.*
- Patients at increased risk of developing complications
- Large median lobes
- Previous pelvic irradiation
- High AUA score
- History of multiple pelvic surgeries
- Severe diabetes with healing problems

ESTRO School

- **Relative Contraindications for Brachytherapy (2) :**
- *Technical difficulties which may result in inadequate dose coverage*
- Previous *(large ?)* transurethral resection of prostate (TURP)
- Gland size > 60 cc at time of implantation
- Prominent median lobe
- Positive seminal vesicles

ESTRO School

- **Brachytherapy as a Boost to EBRT:**
- Stage Clinical T2b, T2c *or*
- Grade: Gleason sum 8–10 *or*
- PSA > 20 ng/ml
- **Other possible indications for Brachytherapy as a Boost to EBRT:**
- Perineural invasion
- Multiple positive biopsies
- Bilateral positive biopsies
- MRI positive for capsular penetration

- Table 2. ABS prescription dose guidelines*

- Brachytherapy dose for monotherapy (Gy)
- 125I (pre TG-43) 160
- **125I (TG-43) 144**
- 103Pd 115–120
- **It should be recognized that the prescription dose is different from the dose actually delivered to the entire prostate.*

ESTRO School

- **Brachytherapy (including Boosting EBRT) in Conjunction with Androgen Deprivation:**

- Patients with initially large prostate (> 60 cc) that have downsized sufficiently

The ESTRO recommendations

- **The 2000 Dan Ash paper :**
- Radiother Oncol. 2000 Dec;57(3):315-21.
- **ESTRO/EAU/EORTC recommendations on permanent seed implantation for localized prostate cancer.**
- *Ash D, Flynn A, Battermann J, de Reijke T, Lavagnini P, Blank L; ESTRO/EAU Urological Brachytherapy Group; EORTC Radiotherapy Group.*

ESTRO School

- **Actually only minor differences with the ABS paper …**

Clinical exclusion criteria :

- **Life expectancy < 5 years**
- **Large or poorly healed TURP defect**
- **Unacceptable operative risks**
- **Bleeding disorder or anticoagulation that cannot be stopped**
- **Distant metastases**
- **Prostate volume greater than 50 cc (60 ?) at the time of implantation**

ESTRO School

Relative contra-indications :

- **Large median lobes**
- **Previous pelvic irradiation**
- **High AUA score (IPSS > 15)**
- **History of multiple pelvic surgery**

1999-2016 ; the evolution !

- **Ideas progressively changed …**
- **Risk groups ; should brachytherapy as monotherapy be reserved to low-risk patients ?**
- **What about age ?**
- **What about the biopsies ?(Percentage of involved samples, microfoci, bilaterality …)**
- **What about median lobes and obstructive syndroms ?**
- **Which role for MRI ?**

ESTRO School

- **Risk groups ; should brachytherapy as monotherapy be reserved to low-risk patients ?**

- Problems with the risk groups :
- Several definitions !

ESTRO School

Risk Group Definitions

	Author	T stage	PSA	Gleason	Indicator Rules
Low	ALL	T1c-T2a or T2	≤10	≤ 6	All required
Interm.	D'Amico	T2b	>10-20	7	One or more
	Blasko	T1T2	>10	7-10	One PSA or Gleason
	Zelefsky	T3	≥ 10	7-10	One
	Kuban	T1-T2a or T2bc	>10-20 or ≤20	≤7	All three
	Stock	T2b	>10	7	One
	Demanes	T2bc	>10-20	7	One or more
High	D'Amico	T2c	>20	8-10	One or more
	Blasko	T1T2	>10	7-10	Two or more PSA or Gleason
	Zelefsky	T3	≥ 10	7-10	Two or more
	Kuban	T3	>20	8-10	One
	Stock	T2c or T3	>20	8-10	One (or 2 Intermediate)
	Demanes	T3	>20	8-10	One or more

The main question :

- **<u>The intermediate risk group</u> :**
- **suitable for brachytherapy as monotherapy ?**

ESTRO School

- Brachytherapy. 2007 Jan-Mar;6(1):2-8.
  - Interstitial implant alone or in combination with external beam radiation therapy for intermediate-risk prostate cancer: a survey of practice patterns in the United States.

  Frank SJ, Grimm PD, Sylvester JE, Merrick GS, et al .

  PURPOSE: This study is aimed at understanding and defining the current patterns of care with respect to prostate brachytherapy for patients **with intermediate-risk localized disease** in the combined academic and community setting.

- RESULTS: *In the absence of PNI, all of those surveyed would perform monotherapy for intermediate-risk patients, GS 7 (3+4) or PSA 10-20, with cT1c and <30% cores +…*

- CONCLUSIONS: This Patterns of Care (POC) study reveals that certain subsets of intermediate-risk localized prostate cancer patients are considered appropriate candidates for an interstitial implant.

Favorable vs Unfavorable Intermediate-Risk Prostate Cancer: A Review of the New Classification System and Its Impact on Treatment Recommendations.

Serrano NA, Fastro MS.

Table 1. Proposed Intermediate-Risk Reclassification Schemes

Memorial Sloan Kettering Reclassification[26]		
Clinical Characteristics	**Favorable Intermediate-Risk[a]**	**Unfavorable Intermediate-Risk[b]**
	1 intermediate-risk factor[c]	> 1 intermediate-risk factor
	GS 3+4=7 or less	GS 4+3=7
	< 50% positive biopsy cores	≥ 50% positive biopsy cores

MD Anderson Reclassification[41]			
Clinical Characteristics	**Favorable[a]**	**Marginal[a]**	**Unfavorable[b]**
	GS 3+3=6	GS 3+4=7	GS 4+3=7
	≤ T2b	T2a/b	T2c

[a]*All* criteria must be met. [b]*Any* of these criteria can be met. [c]Based on the NCCN classification scheme.[5]
GS = Gleason score; NCCN = National Comprehensive Cancer Network.

ESTRO School

• What about age ?

- In the early years, most groups were reluctant to propose brachytherapy alone to « young » (< 60 years ?) patients,
- Mostly because of the lack of long follow-up …

ESTRO School

- **However, since that time …**

ESTRO School

- Cancer J. 2006 Jul-Aug;12(4):305-8.
- **The effect of age on prostate implantation results.**
- Peschel RE, Khan A, Colberg J, Wilson LD.

- **CONCLUSIONS:**
- Patients who are 60 years of age or younger who are treated with ultrasound-guided transperineal prostate implantation can expect 5-year biochemical disease-free survival rates similar to those of older patients treated with ultrasound-guided transperineal prostate implantation therapy.

ESTRO School

- Am J Clin Oncol. 2008 Dec;31(6):539-44.
- **Biochemical and functional outcomes following brachytherapy with or without supplemental therapies in men < or = 50 years of age with clinically organ-confined prostate cancer.**
- Merrick GS, Wallner KE, Galbreath RW, Butler WM, Brammer SG, Allen ZA, Lief JH, Adamovich E.

- **CONCLUSIONS:**
- Men < or =50 years of age have favorable biochemical and functional outcomes following brachytherapy. Depending on risk group assignment, brachytherapy with or without supplemental therapies should be considered a viable option for all healthy men regardless of age.

ESTRO School

- Int J Radiat Oncol Biol Phys. 2010 Aug 1;77(5):1315-21.
- **Young men have equivalent biochemical outcomes compared with older men after treatment with brachytherapy for prostate cancer.**
- Burri RJ, Ho AY, Forsythe K, Cesaretti JA, Stone NN, Stock RG.
- Department of Radiation Oncology, Mount Sinai School of Medicine, New York, New York, USA.
- **CONCLUSION:**
- Young men achieve excellent 5- and 8-year biochemical control rates that are comparable to those of older men after prostate brachytherapy.

ESTRO School

- **In CONCLUSION (Burri 2010):**
- **“Young age should not be a deterrent when considering brachytherapy as a primary treatment option for clinically localized prostate cancer”.**

- **What about the biopsies ?(Percentage of involved samples, microfoci, bilaterality …)**

- What about the impact of the percentage of positive biopsies ?
- Nil for some authors ;
- **Pe et al., Urology 2009**
- **No impact of the percentage of positive biopsies on Freedom From Biochemical Failure …**

ESTRO School

Int J Radiat Oncol Biol Phys. 2002 Mar 1;52(3):664-73.

Relationship between percent positive biopsies and biochemical outcome after permanent interstitial brachytherapy for clinically organ-confined carcinoma of the prostate gland.

Merrick GS[1], Butler WM, Galbreath RW, Lief JH, Adamovich E.

- ***CONCLUSION:***
- …. **Our results suggest that the percentage of positive biopsies is not statistically significant in predicting the 5-year biochemical disease-free outcome for patients with low, intermediate, and high-risk disease undergoing permanent prostate brachytherapy.**

ESTRO School

- **But to be taken into account for others :**
- Heidenreich A et al. EAU guidelines on prostate cancer. April 2010:
- **Criteria :**
- Stage cT1b-T2a, N0, M0
- Gleason score ≤6 7 (?) = “grey area”
- Initial PSA (ng/mL)<10
- **Amount of biopsy cores involved with cancer (%) ≤50**
- Prostate volume <50 cm^3
- IPSS ≤12

ESTRO School

What about microfoci ?

- **The « index lesion » concept !**
- **Treat the index (main) lesion and ignore the microfoci ?**
- **See presentation on focal brachytherapy …**

ESTRO School

- **Already quoted ;**
- Brachytherapy. 2007 Jan-Mar;6(1):2-8.
  - Interstitial implant alone or in combination with external beam radiation therapy for intermediate-risk prostate cancer: a survey of practice patterns in the United States.

« In the absence of PNI, all of those surveyed would perform monotherapy for intermediate-risk patients, GS 7 (3+4) or PSA 10-20, with cT1c ***and <30% cores +...*** *»*

ESTRO School

What about bilaterality ?

- **Depends …**
- **Massive bilateral involvement ,**
- ***or***
- **Unilateral « index » lesion and controlateral microfoci ?**
- **Different impact on decision !**

ESTRO School

- **What about median lobes and obstructive syndroms ?**

ESTRO School

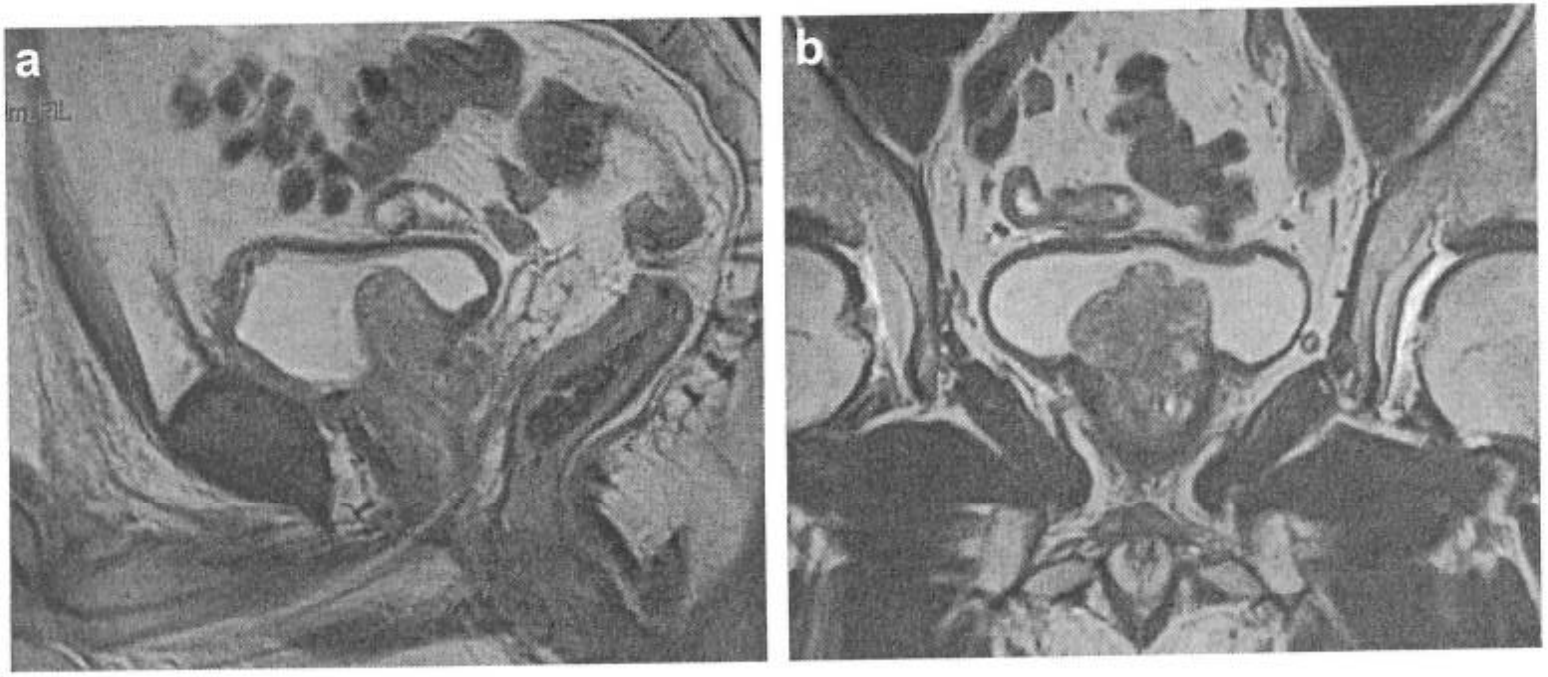

Fig. 1. (a and b) Example of a "very prominent" (+++) median lobe (Case $N = 19$).

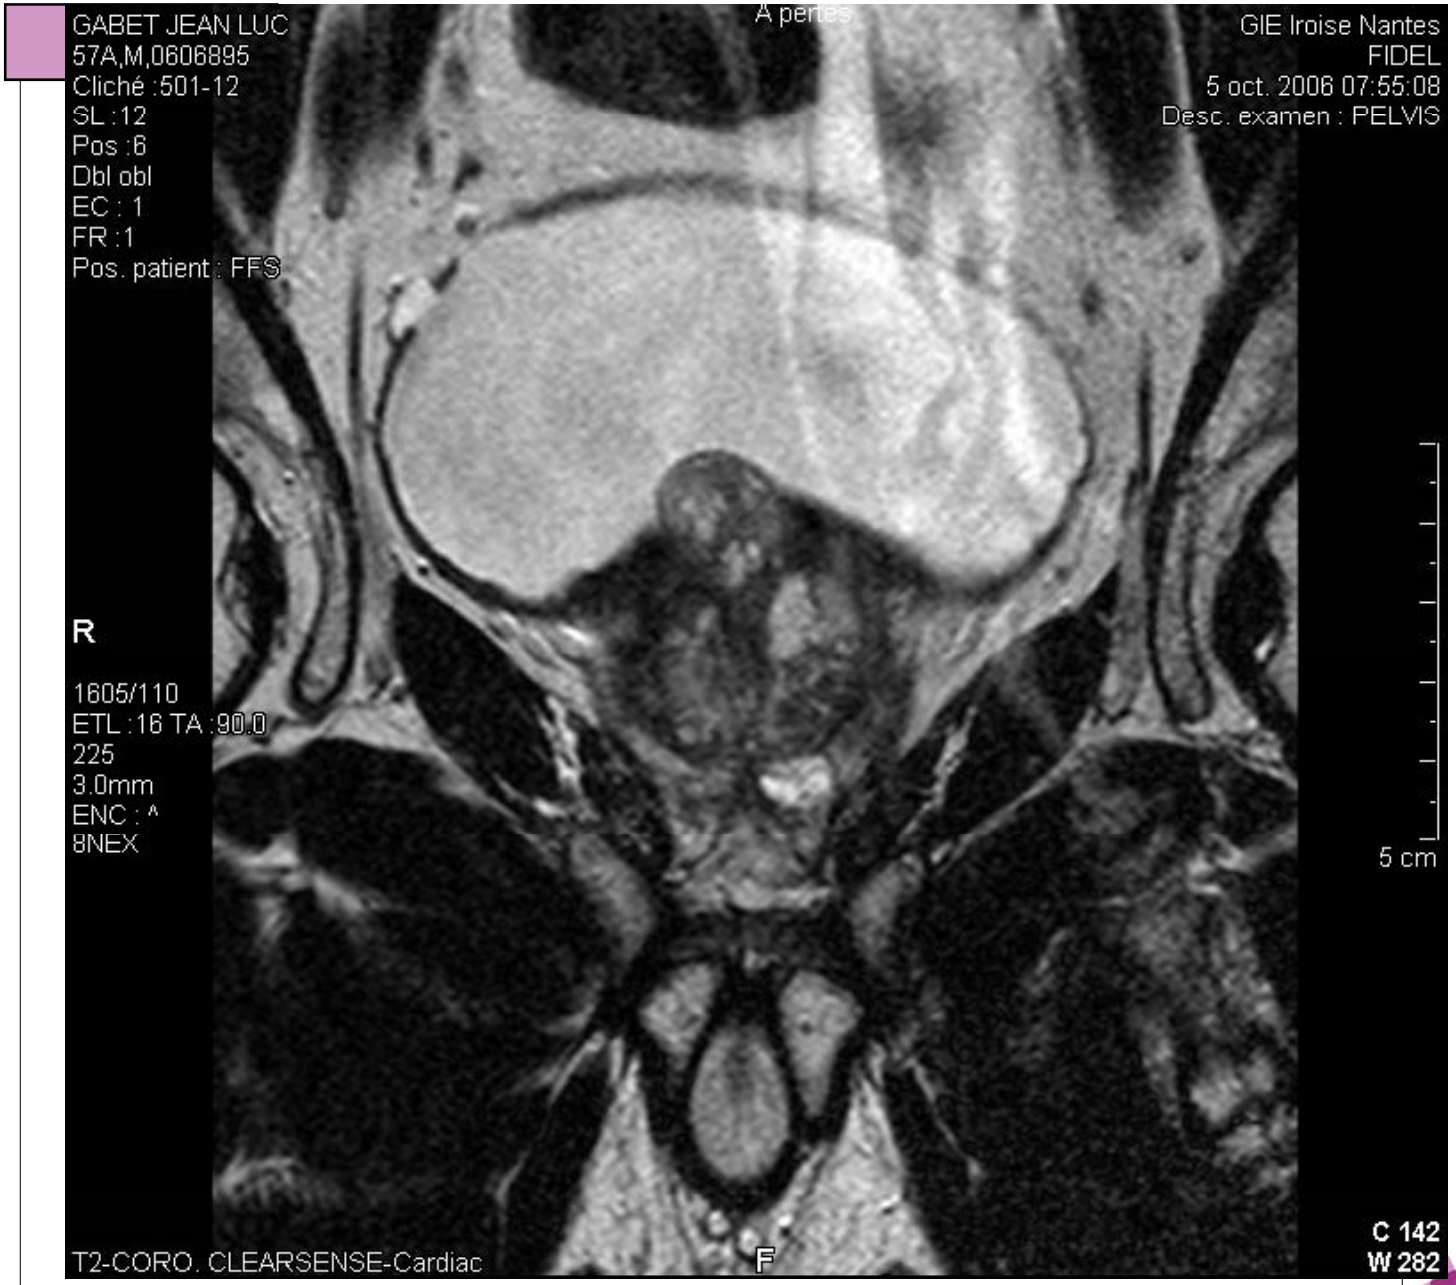

ESTRO School

- Brachytherapy. 2011 Jan-Feb;10(1):29-34.

- **One-step customized transurethral resection of the prostate and permanent implant brachytherapy for selected prostate cancer patients: technically feasible but too toxic.**

- Cosset JM, Barret E, Castro-Pena P, Cathelineau X, Galiano M, Rozet F, Pierrat N, Timbert M, Vallancien G
- Department of Radiotherapy, Institut Curie, 26 rue d'Ulm, Paris, France.

ESTRO School

Patients with prominent median lobe hyperplasia and/or high International Prostate Symptom Score (IPSS) are often contraindicated for prostate brachytherapy, mainly because of the risk of post-implant urinary retention.

We evaluated an approach combining **in the same operative step** a limited transurethral resection (TURP) of the median lobe, immediately followed by permanent implant-free seed brachytherapy.

ESTRO School

- METHODS AND MATERIALS:

- From January 2007 to November 2008, 22 patients underwent a customized limited TURP of their median lobe immediately before brachytherapy.

- **CONCLUSION:**

- Although technically feasible, with relatively few migrating seeds and satisfactory post-implant dosimetric parameters, one-step TURP and brachytherapy was found to be poorly tolerated, with higher than usual urinary retention and urinary toxicity rates.

- Considering those results, our group is presently evaluating **a two-step procedure**, with a customized TURP followed after 4-6 months by brachytherapy.

- ***(Encouraging preliminary results ...)***

ESTRO School

Two-step TURP and brachytherapy

- **Now almost a standard ;**
- **See :**
- **Abstracts PO37 and PO38 , ABS 2011**
- **PO37 ; bladder neck resection 6 weeks before implant**
- **PO38 ; vaporization of obstructive prostate tissue by 100W holmium laser**

ESTRO School

Which role for MRI ?

- With better and better MRIs in 2015:
- 3 Tesla, multiparametric, endorectal probe …
- **A prominent role for MRI ;**
- Most authors now take (more and more) the MRI images into account :
- Large MRI tumors, with extensive bilateral involvement and/or large « contact » with the capsule …
- … might be poor candidates for brachytherapy as monotherapy …

ESTRO School

This being said ….

- **The 2012 ABS recommendations**

ESTRO School

ESTRO School

Risk groups

[redacted]. The ABS recommends the use of the National Comprehensive Cancer Network guidelines (2):

Low risk: Gleason score ≤6, and PSA <10 ng/mL, and clinical tumor classification, T1, T2a.

Intermediate risk: Gleason score 7, or, PSA >10 ng/mL < 20 ng/mL, or clinical tumor classification of T2b, T2c.

High risk: Gleason score 8–10, or, PSA >20 ng/mL, or clinical tumor classification of T3a.

Patients with seminal vesicle invasion (SVI), clinical tumor classification T3b, are considered to be high risk in terms of treatment and evaluation. Consideration may be given to performing seminal vesicle biopsies when evaluating intermediate- and high-risk patients (70).

Table 1
Elements of patient history for permanent prostate brachytherapy

1. Urologic history including:
   a. Prior transurethral or open resection of the prostate or other surgery on the urethra
   b. Prior procedure for benign prostatic hyperplasia such as transurethral needle ablation (30) or microwave therapy
   c. Medications for treatment of urinary obstructive symptoms
   d. Erectile function
2. Prior diagnosis of cancer, especially bladder or rectal
3. Prior pelvic radiotherapy, surgery, or fracture
4. Inflammatory bowel disease
5. Connective tissue disorders
6. Documentation of International Prostate Symptom Score
7. Documentation of erectile function, International Index of Erectile function score preferred

Table 2

Minimum required elements of workup for permanent prostate brachytherapy

1. Prostate biopsy indicating adenocarcinoma within the preceding 12 months of planned permanent prostate brachytherapy. Additional synoptic information is required and includes the Gleason grading and percent cancer in the biopsy specimen.
2. Pretherapy serum prostate-specific antigen
3. Digital rectal exam with clinical tumor classification, "T stage"
4. Prostate volume determination, transrectal ultrasound preferred
5. Determination of a patient's ability to tolerate an extended dorsal lithotomy position
6. Determination of suitability for general or spinal anesthesia

Table 3a

Absolute contraindications to TRUS-guided PPB

Limited life expectancy
Unacceptable operative risks
Distant metastases
Absence of rectum such that TRUS guidance is precluded
Large TURP defects, which preclude seed placement and acceptable radiation dosimetry
Ataxia telangiectasia

TRUS = transrectal ultrasound; PPB = permanent prostate brachytherapy; TURP = transurethral resection of the prostate.

Table 3b
Relative contraindications for TRUS-guided PPB

The items listed below are considered as essential elements of the history in determining eligibility, but the criteria by themselves do not necessarily preclude therapy. They should, however, be considered closely in electing to proceed with PPB. Published experience demonstrates that patients with such conditions may undergo PPB if appropriately evaluated by an experienced team.
High IPSS (typically defined as >20)
History of prior pelvic radiotherapy
Transurethral resection defects
Large median lobes
Gland size >60 cm^3 at time of implantation
Inflammatory bowel disease

TRUS = transrectal ultrasound; PPB = permanent prostate brachytherapy; IPSS = International Prostate Symptom Score.

Table 4
Suggested treatment schema for low-, intermediate-, and high-risk disease for PPB

Risk group per NCCN	Brachytherapy alone?	Combined with EBRT?	Combined with androgen deprivation?
Low	Yes	Not favored	Not favored
Intermediate	Optional	Optional	Optional
High	No	Yes	Favored

NCCN = National Comprehensive Cancer Network; EBRT = external beam radiation therapy; PPB = permanent prostate brachytherapy.

- **“Patients with high probability of organ-confined disease or limited extraprostatic extension are considered appropriate candidates for PPB monotherapy.**
- **Low-risk patients may be treated with PPB alone without the need for supplemental external beam radiotherapy.**
- **High-risk patients should receive supplemental external beam radiotherapy if PPB is used.”**

ESTRO School

- **Intermediate-risk patients** should be considered on **an individual case basis**.
- **Intermediate-risk patients with favorable features may appropriately be treated with PPB monotherapy but results from confirmatory clinical trials are pending.**

ESTRO School

Table 5
Prescription doses to the planning target volume

^{125}I	
Monotherapy	140–160 Gy
Combination	
EBRT	41.4–50.4 Gy (1.8 Gy/d[a])
PPB dose	108–110 Gy
^{103}Pd	
Monotherapy	110–125 Gy
Combination	
EBRT	41.4–50.4 Gy (1.8 Gy/d[a])
PPB dose	90–100 Gy

PPB = permanent prostate brachytherapy; EBRT = external beam radiation therapy.

[a] 2 Gy/d also acceptable.

Table 6
Radionuclides for permanent prostate brachytherapy

Radionuclide	Half-life (d)	Average energy (keV)	Year introduced	Typical monotherapy seed strength (mCi)	(U)
^{125}I	59.4	28.4	1965	0.3–0.6	0.4–0.8
^{103}Pd	17.0	20.7	1986	1.1–2.2	1.4–2.8
^{131}Cs	9.7	30.4	2004	2.5–3.9	1.6–2.5

The ABS recommends the following postoperative dosimetric parameters be determined:

Prostate: D_{90} (in Gy and percent)

V_{100} and V_{150} (in percent)

Urethra: UV_{150} (in volume)

UV_5, UV_{30} (percent)

Rectum: RV_{100} (in volume)

In 2016, the indications of permanent implant prostate cancer brachytherapy are expanding :

- **Towards …**

- **At least selected patients in the intermediate risk group**
- **Younger patients**
- **Bilateral lesions if only controlateral microfoci**
- **Larger prostates (after volumetric reduction or not)**
- **Obstructive prostate (after customized RTUP)**
- **Moreover …**

ESTRO School

New indications ;

- **Brachytherapy « boost » after EBRT**
- **Salvage brachytherapy after failure of EBRT (or even brachytherapy)**
- **Focal brachytherapy**
- **(see ad hoc presentations)**

ESTRO School

- With a recent additional competitor ;
- Active surveillance ….

Med Care. 2014 Jul;52(7):579-85..

Perceptions of Active Surveillance and Treatment Recommendations for Low-risk Prostate Cancer: Results from a National Survey of Radiation Oncologists and Urologists.

Kim SP[1], Gross CP, Nguyen PL, Smaldone MC, Shah ND, Karnes RJ, Thompson RH, Han LC, Yu JB, Trinh QD, Ziegenfuss JY, Sun M, Tilburt JC.

- ***CONCLUSIONS***
- Most prostate cancer specialists in the United States believe Active Surveillance effective and underused for low-risk prostate cancer …

… yet continue to recommend the primary treatments their specialties deliver (!)

ESTRO School

- **Considering the pending and unsolved questions about Active Surveillance, they could be right (?) …**

High dose rate brachytherapy for prostate cancer: PATIENT SELECTION

Peter Hoskin
Mount Vernon Cancer Centre
Northwood
UK

ESTRO School

HDR prostate brachytherapy

- Practical
  - Existing source, afterloading

- Physical
  - Greater implant volume
  - including seminal vesicles

- Biological
  - Low α/β tumour; greater biological dose with high dose per fraction

ESTRO School

Advantages of temporary HDR prostate brachytherapy

Radioprotection

- no free live sources
- no risk of source loss
- no radioprotection issues after discharge

Cheap: utilises existing HDR source and equipment

Day case procedure

Disadvantages of temporary HDR prostate brachytherapy

High dose rate radiation requires fractionation

- no longer!?

- logistics:
  - Quality assurance

ESTRO School

Selection for HDR prostate brachytherapy

- Boost with external beam
- Monotherapy

Pre treatment investigations

- General medical assessment
- Prostate biopsy
- PSA
- IPSS
- IEFS
- Flow rate
- Pelvic MRI
- Staging investigations
  - PSA
  - Bone scan
  - (Whole body MRI)
  - (Choline PET)
  - (PSMA PET)

GEC/ESTRO recommendations on high dose rate afterloading brachytherapy for localised prostate cancer: An update

HDR monotherapy: what the guidelines say……

GEC ESTRO

Long term outcome data are not yet available from these cohorts and it is recommended that this treatment is not undertaken outside a formal study.

ABS

HDR monotherapy has been reported by several institutions (see Table 1), largely for low-risk, but also for intermediate-risk patients. The reported outcomes for disease control and toxicity are favorable. Monotherapy demands a higher degree of technical and planning expertise than boost HDR therapy. Institutions should take the requirements of HDR monotherapy into consideration before embarking on a monotherapy program. Monotherapy for high-risk patients should be considered investigational.

ESTRO School

HDR for salvage?
GEC ESTRO guidelines 2013

HDR in recurrence

There is limited experience of HDR brachytherapy for locally recurrent prostate cancer after previous irradiation and this is not recommended outside a formal prospective study. OAR constraints are critical in this setting. Published schedules (planning aim) include the following:

36 Gy in 6 fractions [44].
21 Gy in 3 fractions [45].
30 Gy in 2 fractions to peripheral zone after 30–40 Gy external beam [46].

- Rectum: D2 cc $\leqslant$ 75 Gy EQD_2
- Urethra:
  - D0.1 cc = $\leqslant$120 Gy EQD_2
  - D10 $\leqslant$ 120 Gy EQD_2
  - D30 $\leqslant$ 105 Gy EQD_2

ESTRO School

HDR for salvage?
ABS guidelines 2013

There is a promising data describing the use of HDR monotherapy as salvage for localized recurrence after prior external beam radiation or permanent seed brachytherapy. The ABS recommends that the use of HDR as salvage therapy be limited to Institutional Review Board-approved protocols or specialty centers with appropriate expertise.

Seed Calibration-Well chamber

- Calibration every two years. Med. Phys. 18, 1991.
- Consistency check.

  Cs-137, Co-60

Guidelines

"The activity of all sources should be measured, and *compared* with the calibration certificate supplied by the supplier, before being administered to a patient"…..Medical and Dental Guidance Notes, IPEM

Seed Calibration

•Sterile sources located in MICK magazine

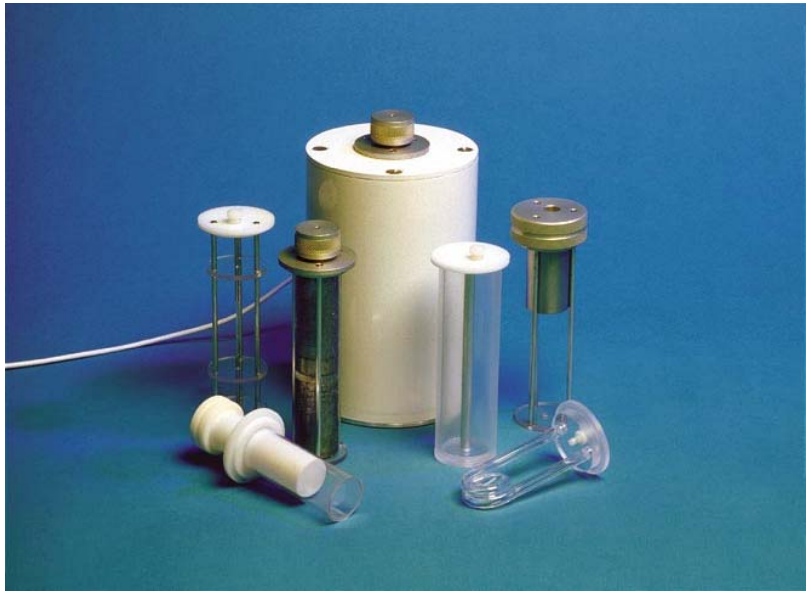
- a minimum of 10% of the total or two magazine cartridges of 15 seeds, whichever is greater.

• Sterile stranded sources.

- a minimum of 10% of the total or two strands of 10 seeds, whichever is greater.

• Loose seeds

- a minimum of 10% of the total or 20 seeds, whichever is greater.



Action level if seeds are out of tolerance

- If the mean source strength of the measured sources agrees within 3% of the manufacturer's stated source strength and the absolute difference of all the individual source/strand measurements are within the quoted calibration uncertainty on the manufacturer's certificate, the sources can be used clinically.
- If the mean difference is greater than 3%, the first step of investigation of the discrepancy should be to increase the sample size.
- After increasing the sample size, if the mean difference is still greater than 3%, further action must be taken to resolve the differences.
- If the mean difference is greater than a 5% action limit, the manufacturer should be consulted, if possible, to assist in resolving the differences. For measurements performed in the OR with the patient anaesthetised, discussions between the radiation oncologist and the MPE should take place regarding the consequences of proceeding with the implant using the measured source strength.

Clinical Oncology
The Royal College of Radiologists

Needles Check

- Verification of loaded brachytherapy needles.
- Place a film on top of the needles. The radiation from the loaded needles exposes an image in the film.
- The film will verify correct loading of seeds and spacers within each needle, or indicate any discrepancies or missing seeds.

TREATMENT PLANNING FOR PERMANENT SEED IMPLANTATION

Bashar Al-Qaisieh

The Leeds Teaching Hospitals NHS
NHS Trust

Prostate Brachytherapy

The procedure involves implanting radioactive seeds directly into the prostate gland where they continuously give off low level radiation. Since only a small area is irradiated by each seed, relatively little radiation reaches the adjacent normal organs.

The evolution of Prostate Brachytherapy
ABS convention (2002)

- Pre –Plan: 2 step procedure (delayed execution of a pre-plan)
- Intra-operative: Pre-plan (immediate execution of a pre-plan)
- Interactive planning: incremental refinement of a plan based on needle tracking
- Dynamic dose calculation: incremental refinement of a plan based on seed deposition

Intra-operative planning: Terminology

Planning modality	Description
Intra-operative planning	Creation of a plan on the OR just before the implant procedure, with immediate execution of the plan
Interactive planning	Stepwise refinement of the treatment plan using computerised dose calculations derived from image-based needle position feedback
Dynamic dose distribution	Constant updating of calculations of dose distribution, using continuous deposited seed position feedback

From Polo et al. Review of intraoperative imaging and planning techniques in permanent seed prostate brachytherapy. RO 94(2010) 12-23.

Seed Type

I-125	Pd-103	Cs-131
• 4.6mm long and 0.8mm diameter • I-125 adsorbed on silver rod, encased in titanium • Half-life of 59.4 days • Energy 27.4 & 31.4keV x-rays (electron capture) Also 35.5keV gamma photons	• 4.6mm long and 0.8mm diameter • Pd plated graphite pellets 0.9mm x 0.6mm • Titanium end cap • Half-life 17 days • Energy 20.8 KeV	• Short half-life (9.7 days) may provide radiobiological advantage for some prostate cancers • γ-ray emitter with highest peaks from 29 to 34 keV • Clinical protocol developed in Texas Cancer Center by Prestidge et al.

TG 43 and TG 43-U1

Report of American Association of Physicists in Medicine
Radiation Therapy Committee Task Group 43

Medical Physics, 22(2), 209-235, Feb 1995

Update of AAPM Task Group No. 43 Report: A revised AAPM protocol for brachytherapy dose calculations

Medical Physics, 31 (3), 633-674 Mar 2004

Clinical dose calculations

- Assumptions and possible errors in TG43
  - Dose to liquid water
    - Tissue variation/air/bone/calcification
  - Superposition of independent sources
    - Applicators/seeds attenuation
  - Fixed phantom dimensions
    - Patient boundaries

What difference does it make?

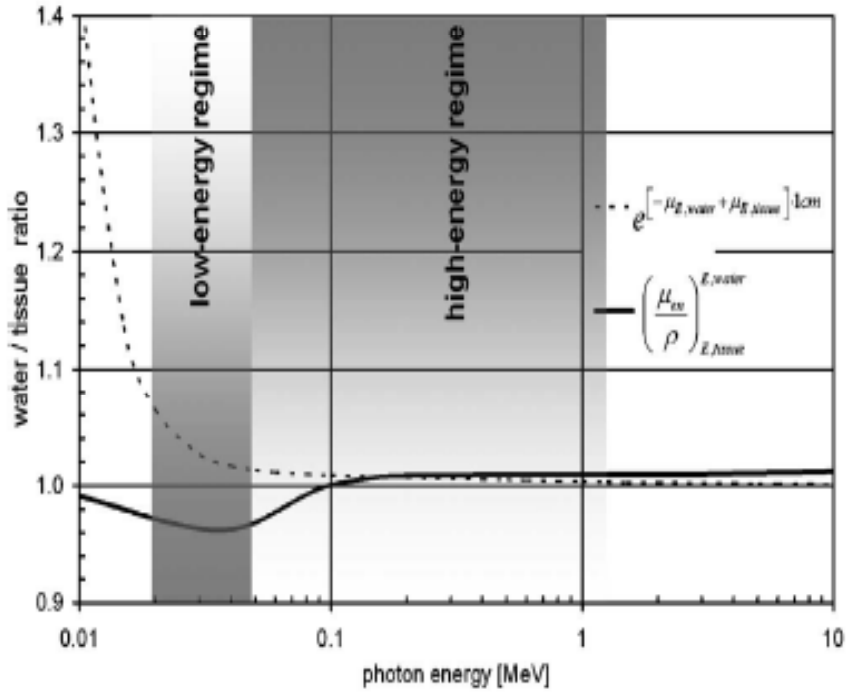

FIG. 3. Effect of phantom medium on absorbed dose and attenuation at $r=1$ cm as a function of photon energy.

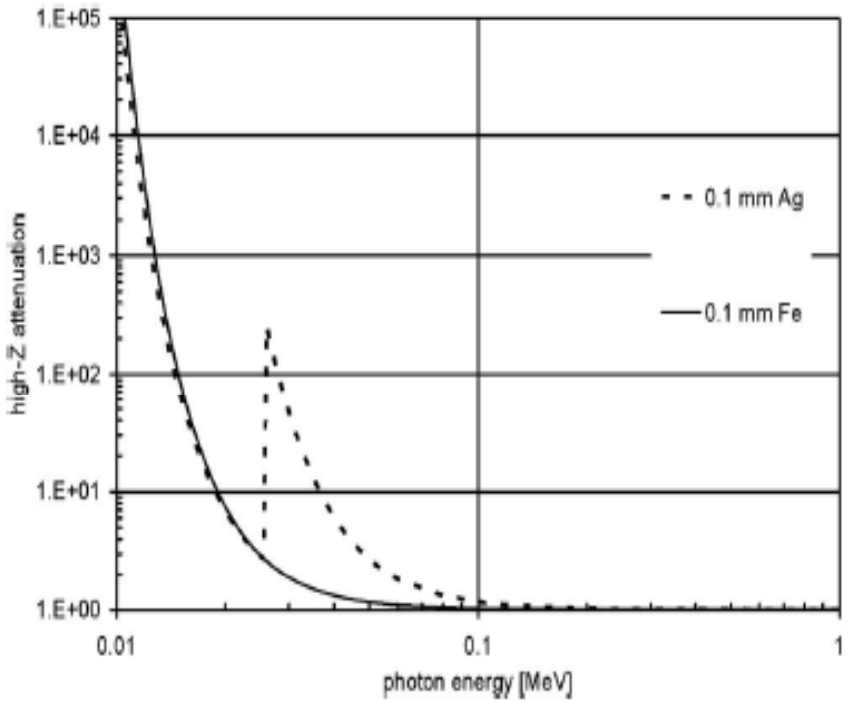

FIG. 4. Photon transmission ratios through water or high-Z attenuators as a function of photon energy. The Ag K edge (0.02 551 MeV) is indicated in the dashed curve.

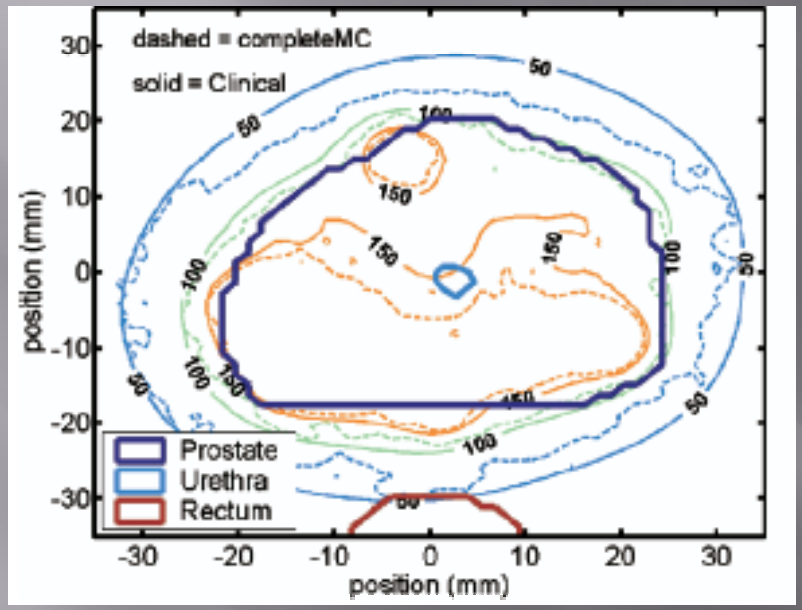
(From: The evolution of brachytherapy treatment planning, Rivard et al., Med.Phys. 36 (6), 2009: 2136-2153.)

Prostate I-125 studies in literature

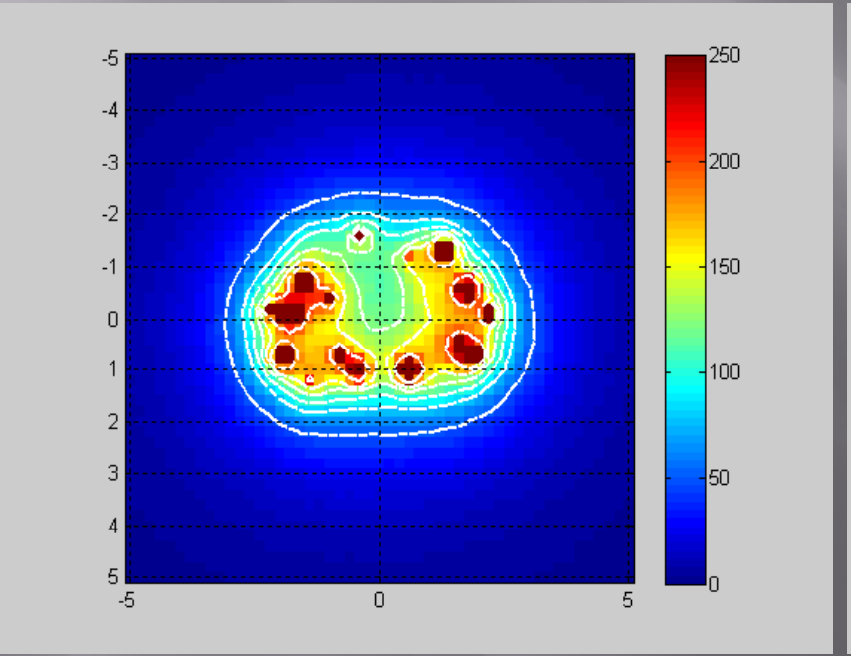


(From: Carrier, J.F., et al., Postimplant dosimetry using a Monte Carlo dose calculation engine: A new clinical standard. International Journal of Radiation Oncology* Biology* Physics, 2007. 68(4): p. 1190-1198.)

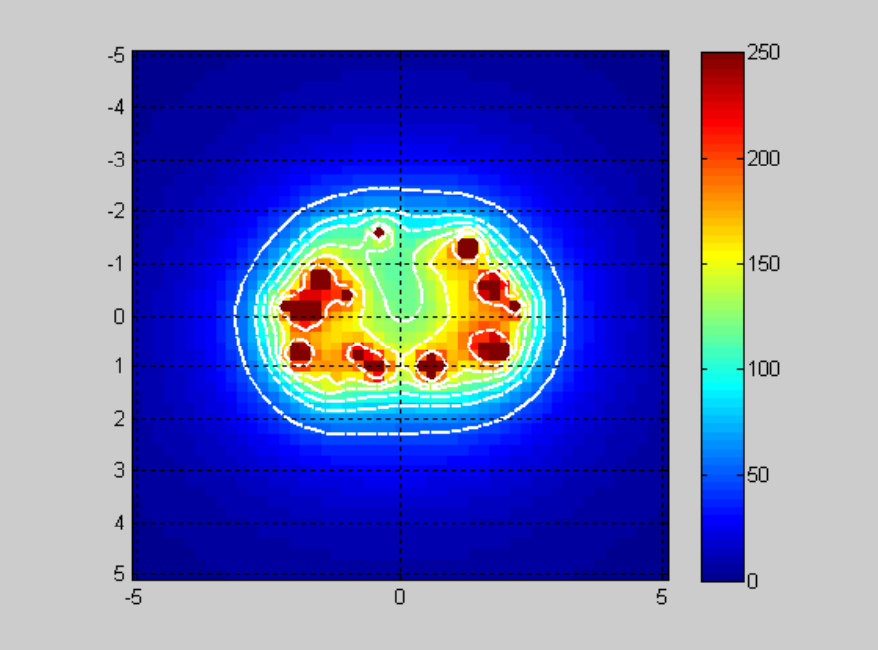
- Interseed attenuation reduces D90 by 4-6 %
  - *reduces urethral dose by few %*
  - *size of effect depends on seed activity*
- Water/prostate tissue difference reduces D90 by 3-5%

Initial results

MC Simulation



Superposition



Treatment planning

- aim to deliver a minimum of 145Gy to periphery of prostate (TG43 calculation)
- to deliver an even dose where possible, minimising the dose to the urethra and rectum
- minimising dose to normal tissue eg. neurovascular bundles
- TP manual/forward or inverse

PTV= CTV = Prostate Gland + "0-3mm" margin *(GEC/ESTRO Recommendations, Salembier et al 2007)*

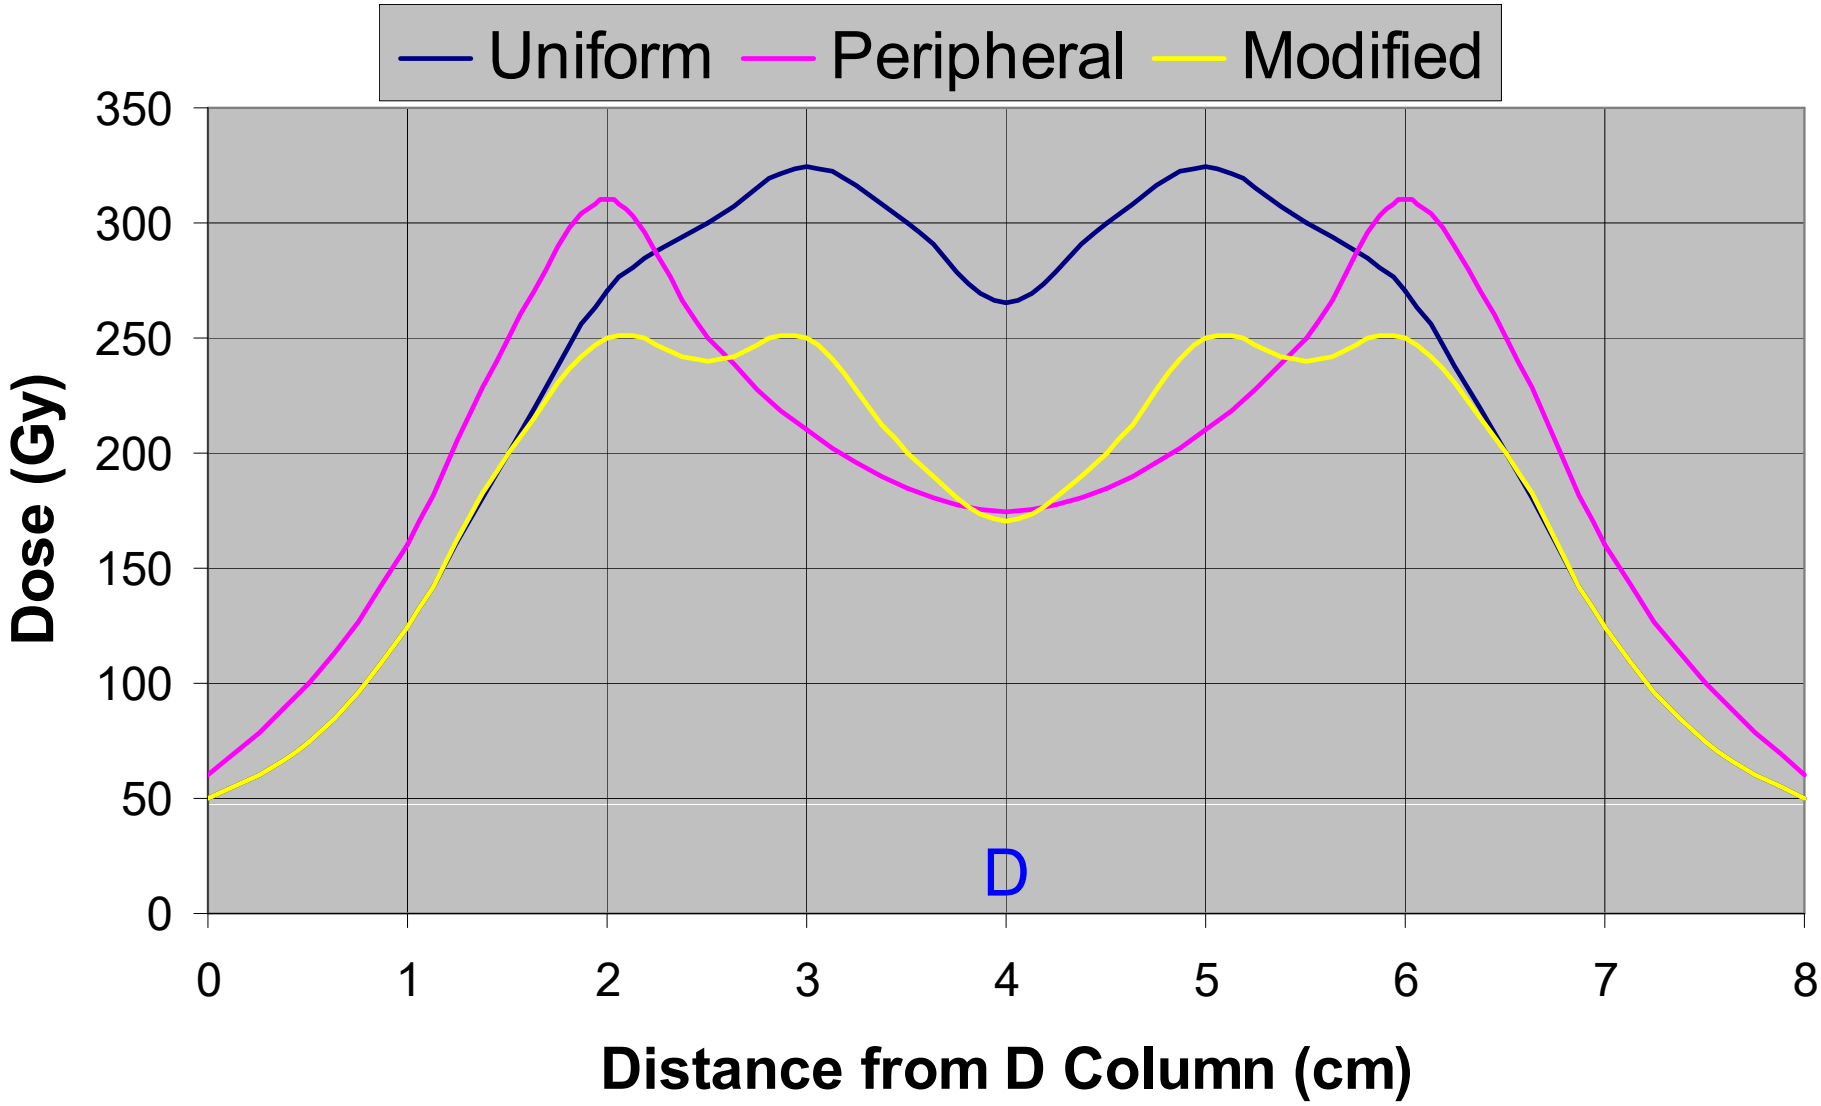
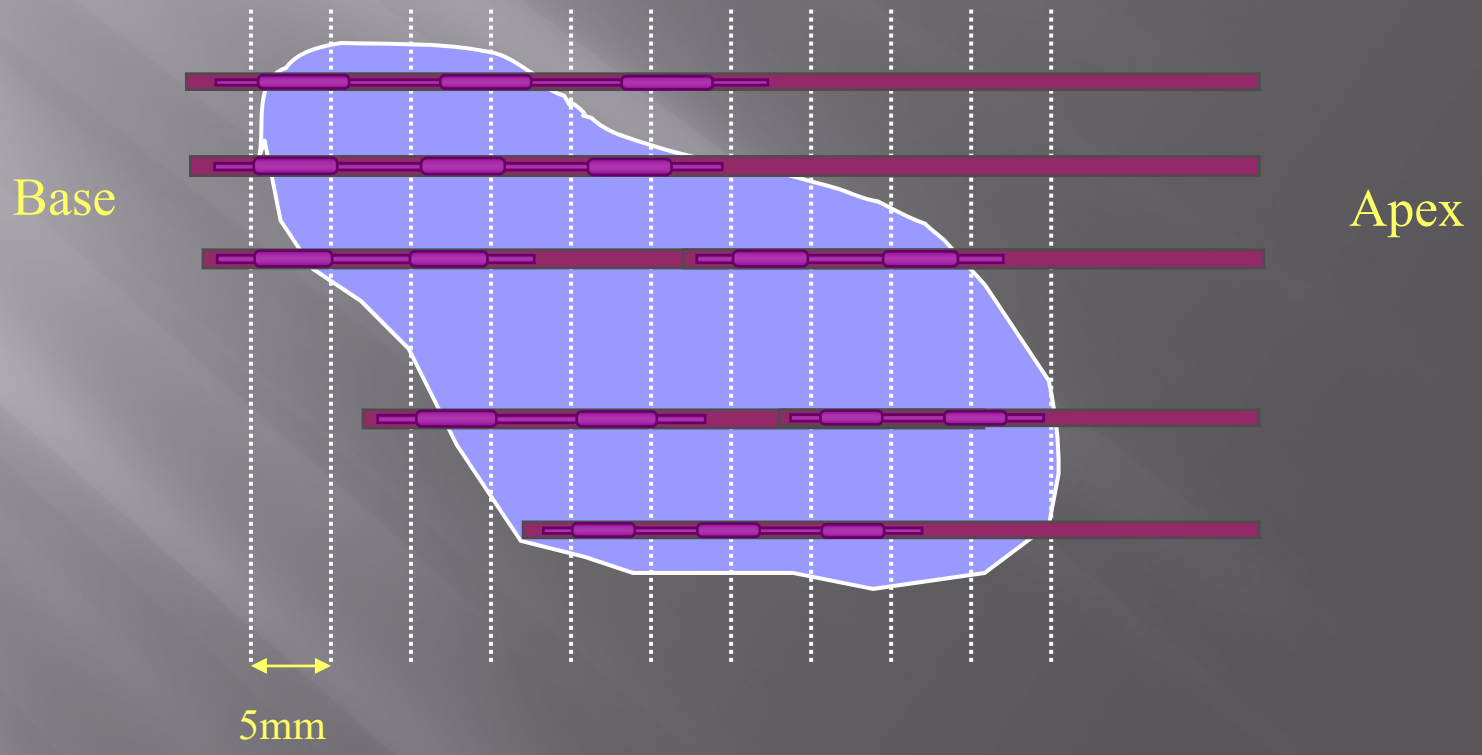
Dose Profile Through Urethra and Row 3 for Different Loading Techniques



Planning the Seed Locations



DVH Constrains

(GEC/ESTRO Recommendations, Salembier et al 2007)

Prostate:

- The V100 (the percentage of the CTV that receives the prescribed dose) must be at least 95% (V100 ≥ 95% of CTV).
- The D90 (the dose that covers 90% volume of the CTV) will be larger than the prescription dose D90 > 100% of prescription dose).
- The V150 (the percentage of the CTV that receives 150% of the prescription dose), should be equal to or less than 50% (V150 ≤ 50% of CTV).

Rectum:

- Primary parameter: D_{2cc} ≤ reference prescription dose of 145 Gy.
- Secondary parameter: $D_{0.1cc}$ (~Dmax) < 200 Gy.

Urethra:

- Primary parameter: D_{10} < 150% of the prescription dose.
- Secondary parameter: D_{30} < 130% of the prescription dose.

NHS Trust

Evaluating the plan

- Viewing the isodoses
- Looking at individual points
- Looking at DVHs of prostate, urethra etc.

Planning errors

- Systematic/random
  - template grid not calibrated correctly
  - planning grid not aligned with template grid correctly
  - wrong activity seed used (beware boosts!)
  - wrong dosimetry data in computer
  - incorrect manual transfer of information

Factors may affect accurate seeds positioning

- Patient set-up:

  - Prostate mis-match (day of volume study/day of implant).

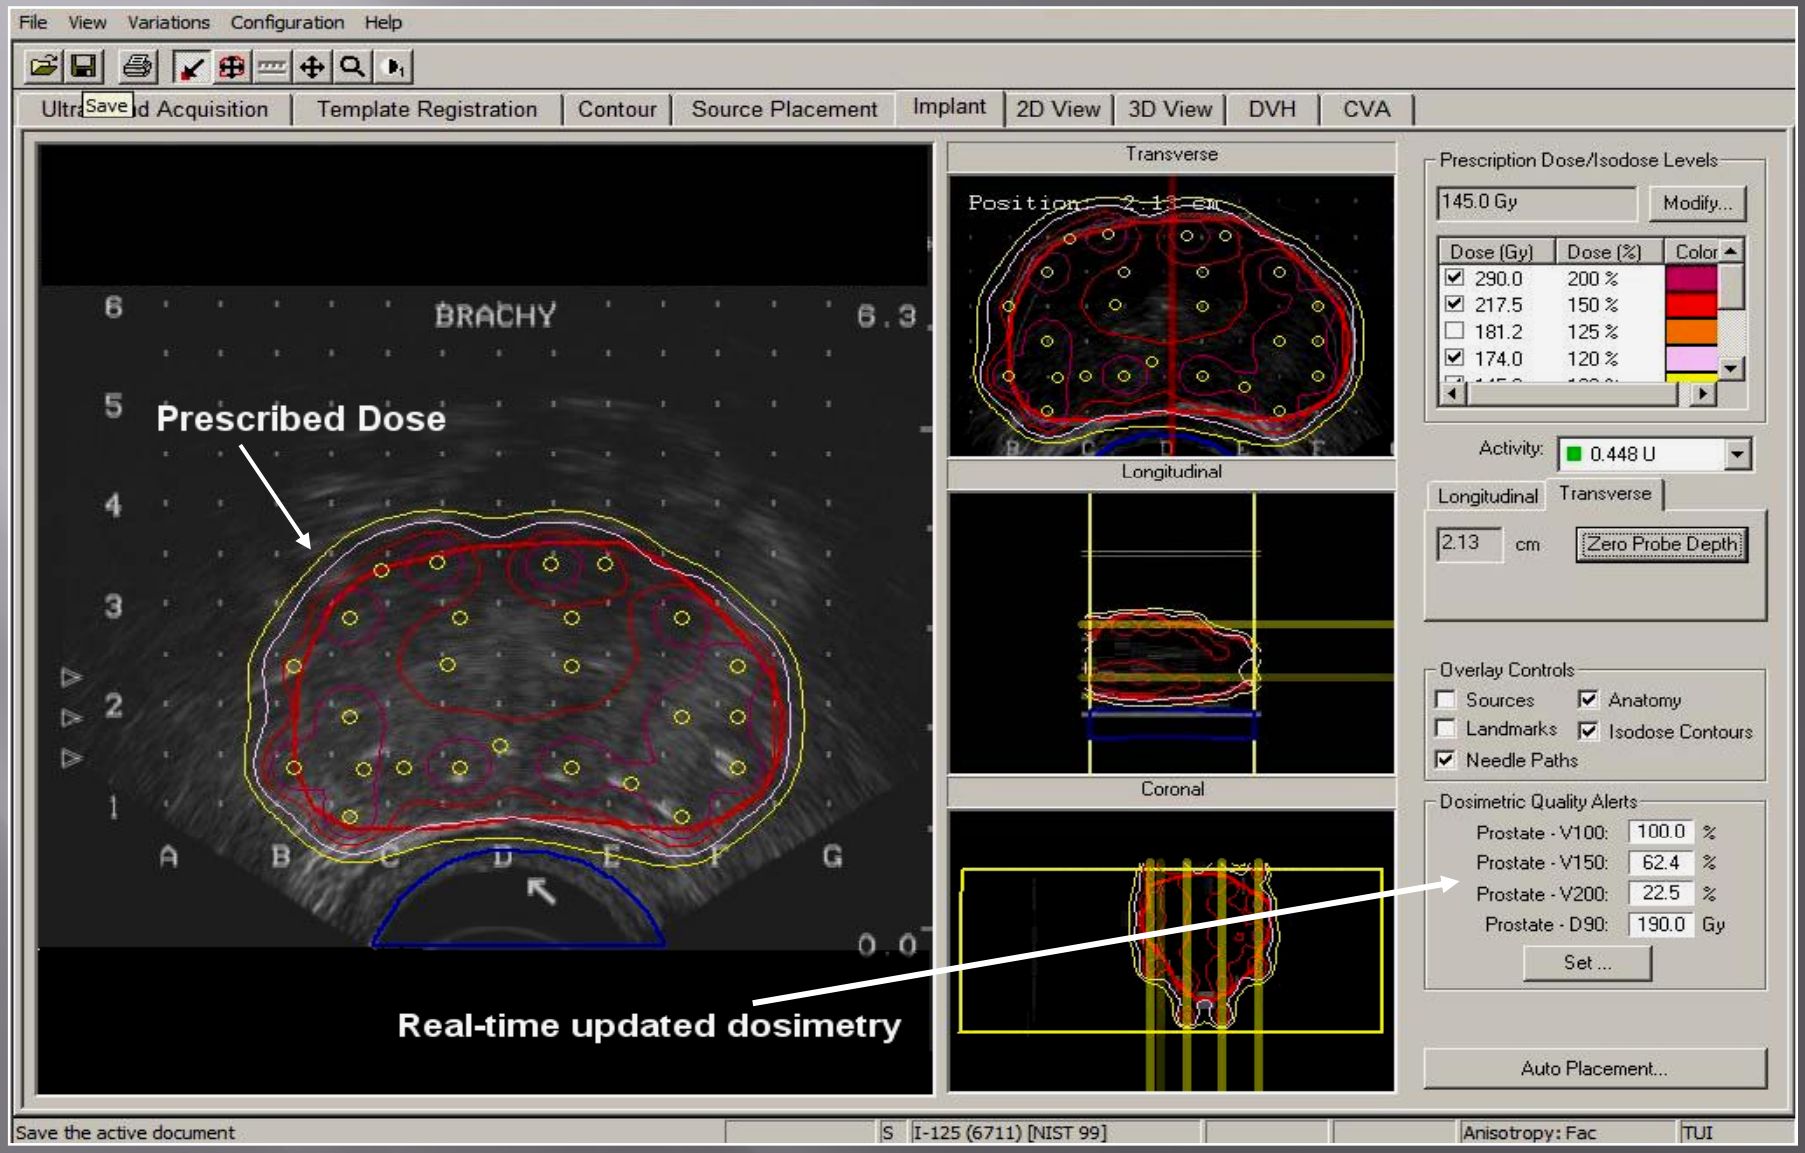
- Implant progression:

  - Pubic-arch interference.
  - Prostate movement (linear and rotational).
  - Bleeding affect seeds and needles visualisation on U/S.
  - Seeds jamming and operator error.

- Prostate oedema:

  - Change in prostate size during and after the implant (seeds migration).

Theatre Dosimetry Planning



Planning and implant techniques

	Pre-plan	Intra-operative	Interactive planning
Pros	-Less complex -Requires less technology, equipment and physics input -No seed wastage -No significant difference in clinical outcome -Long term outcome	-Reduces risk of introducing systematic error between pre-plan and implant -More convenient for patient -Overall time in OR less	Interactive may result in improved dosimetry but ? Clinical impact -In multi-operator teams interactive may produce more consistent dosimetry
Cons	-Patient setup -Long overall time in OR -Less convenient for patient	-Risk of seed wastage/over-ordering -Risk of being unable to implant if gland larger than expected -Plans need to be produced quickly -Resources: multiple physics staff need to be available	-Interactive planning based on needle position may not replicate actual seed position -Changes in prostate volume are not accounted for by TPS -Loose seeds may move and strands may retract after deposition and over time -For new operators there is still a learning curve

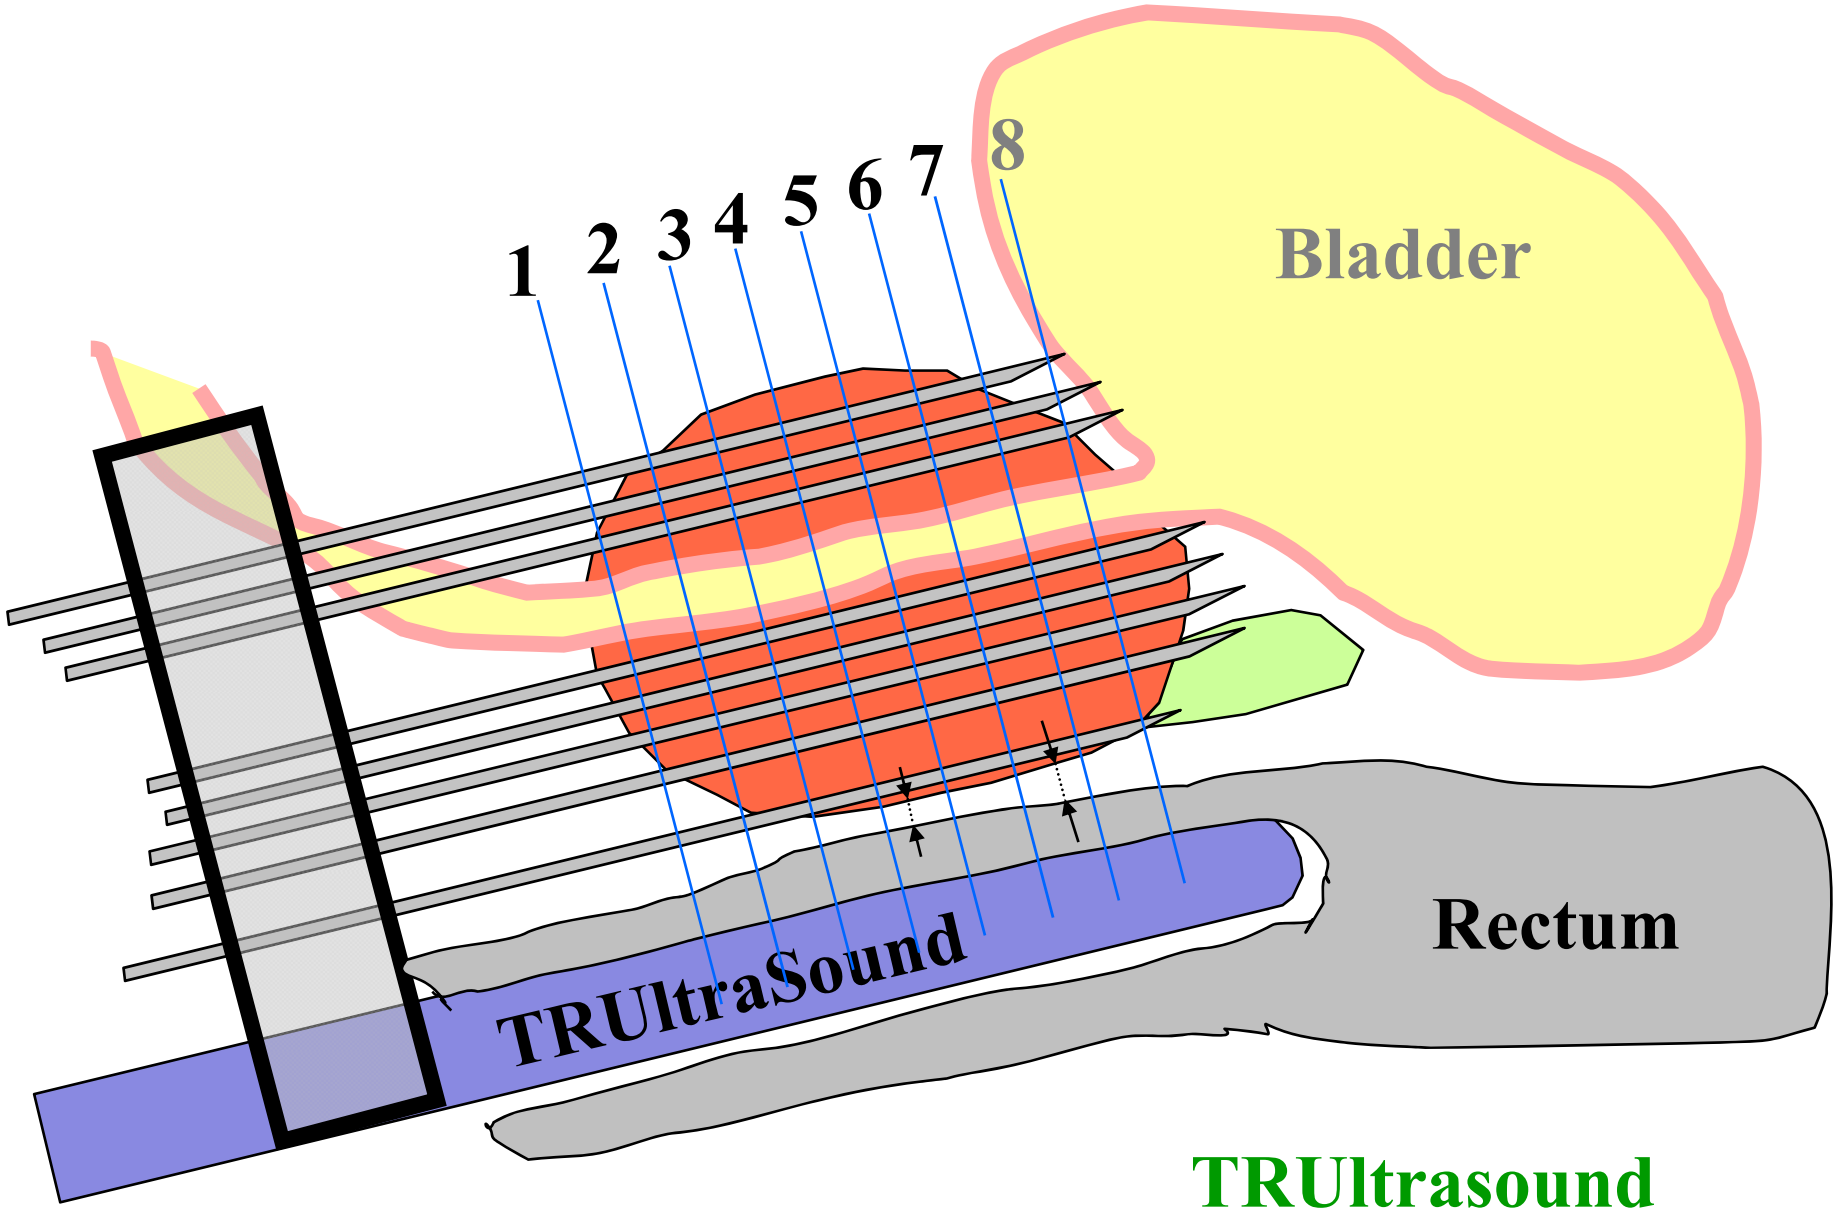
High dose rate brachytherapy for prostate cancer
TIPS and TRICKS

Peter Hoskin

Mount Vernon Cancer Centre

Northwood

UK

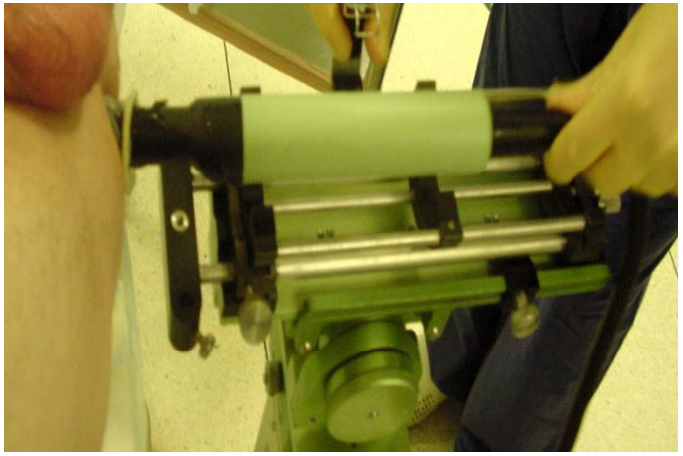


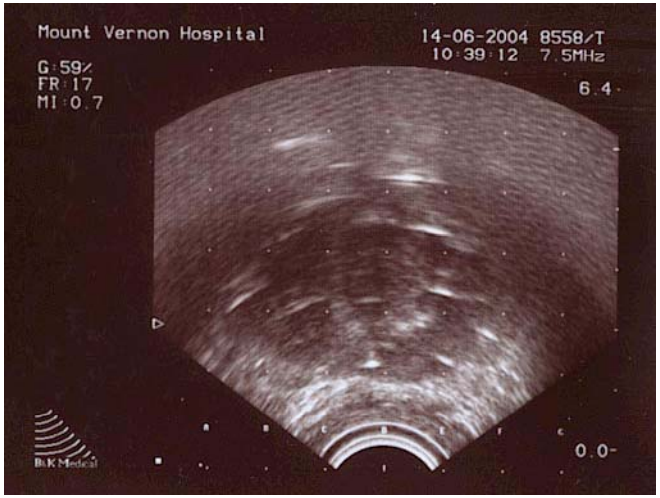
TRUltrasound
5 mm planes

Steps in HDR prostate brachytherapy

- Implantation
- Volume definition
- Dosimetry planning
- QA
- Treatment delivery

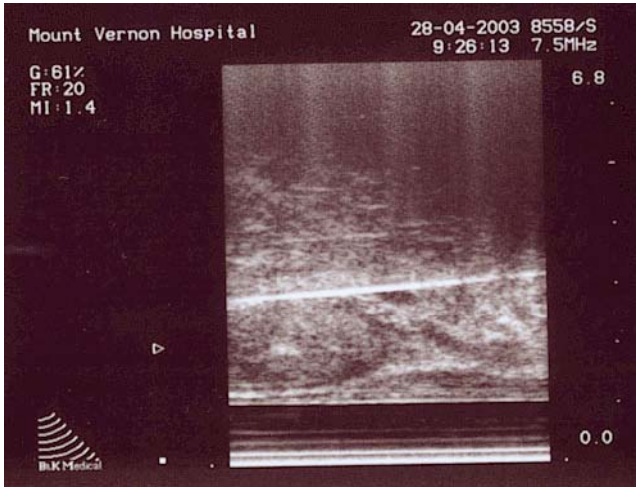
Implant technique





- TRUS guided
  - Transaxial and sagittal

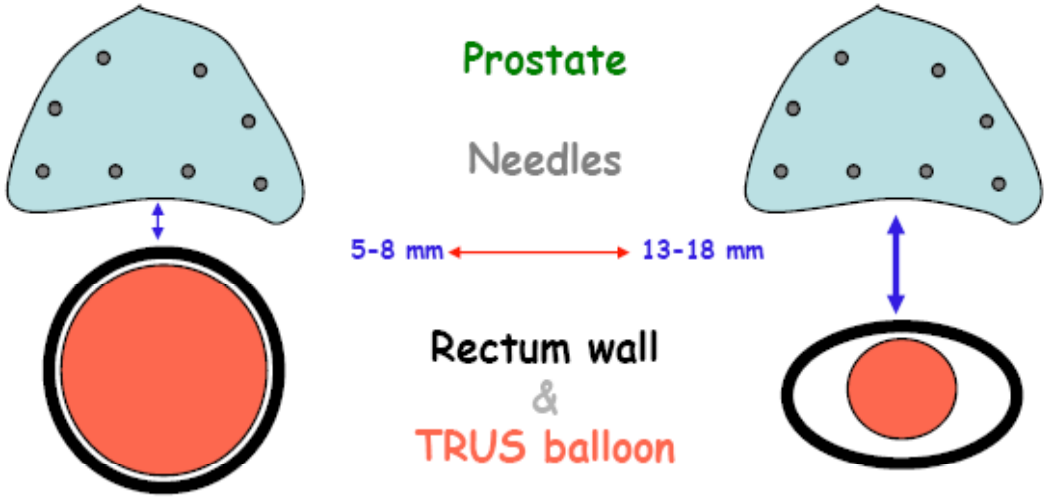
- SET UP:
  - Baseline to include posterior capsule and seminal vesicles
  - Urethra along Row D
  - Minimise probe pressure



-

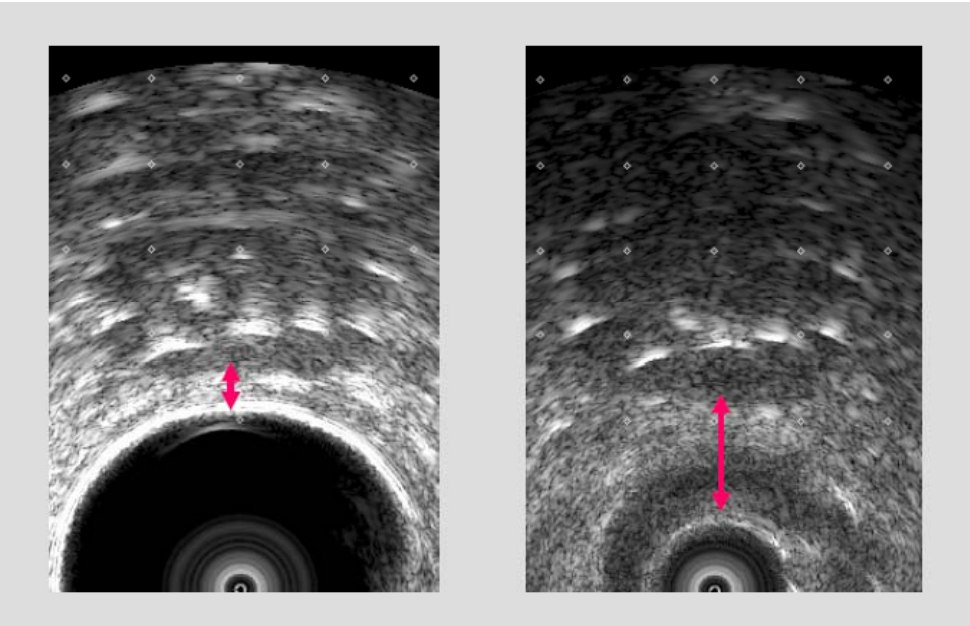
Tips for a good implant

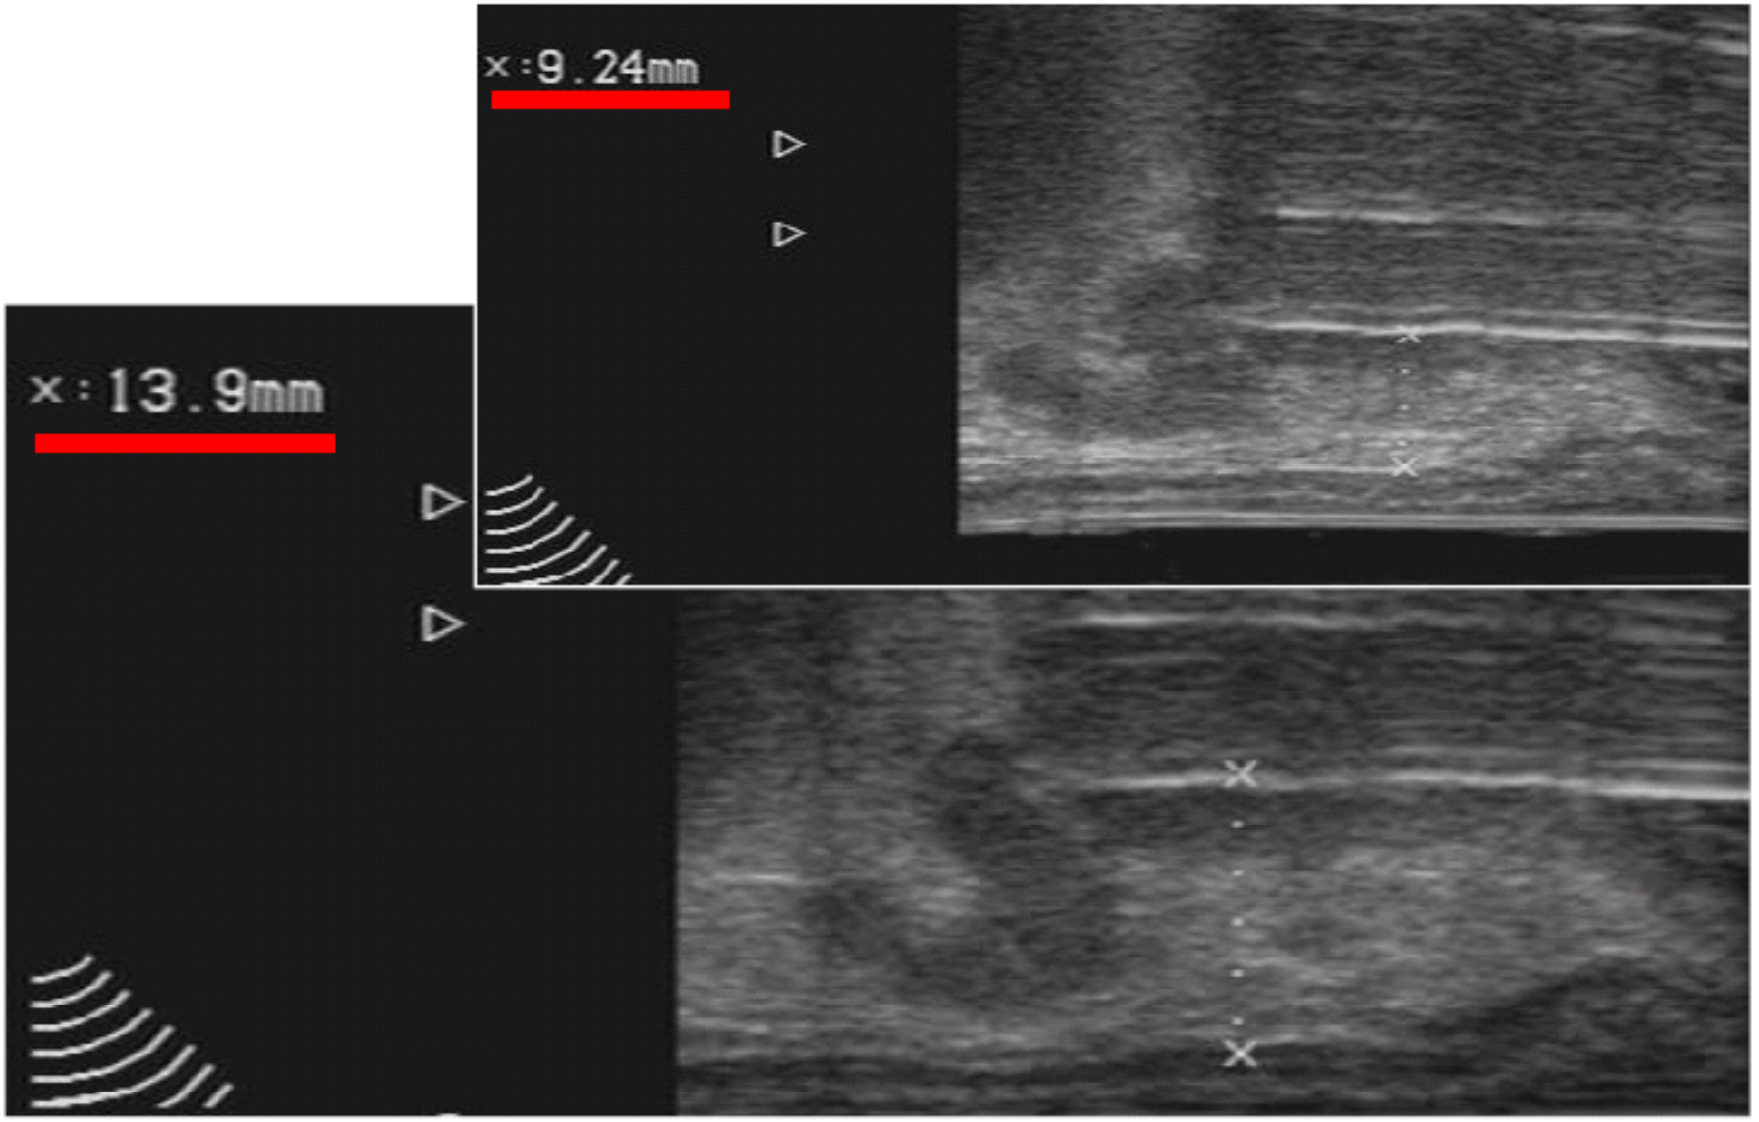
- Good peripheral coverage is essential
- Pay particular attention to superior catheters and baseline
- Monitor both transaxial and sagittal images; scroll through prostate length regularly



Positioning of posterior template row is crucial

Adjustment through probe position and build up cap





x:9.24mm
x:13.9mm

Steps in HDR prostate brachytherapy

- Implantation
- Volume definition
- Dosimetry planning
- QA
- Treatment delivery

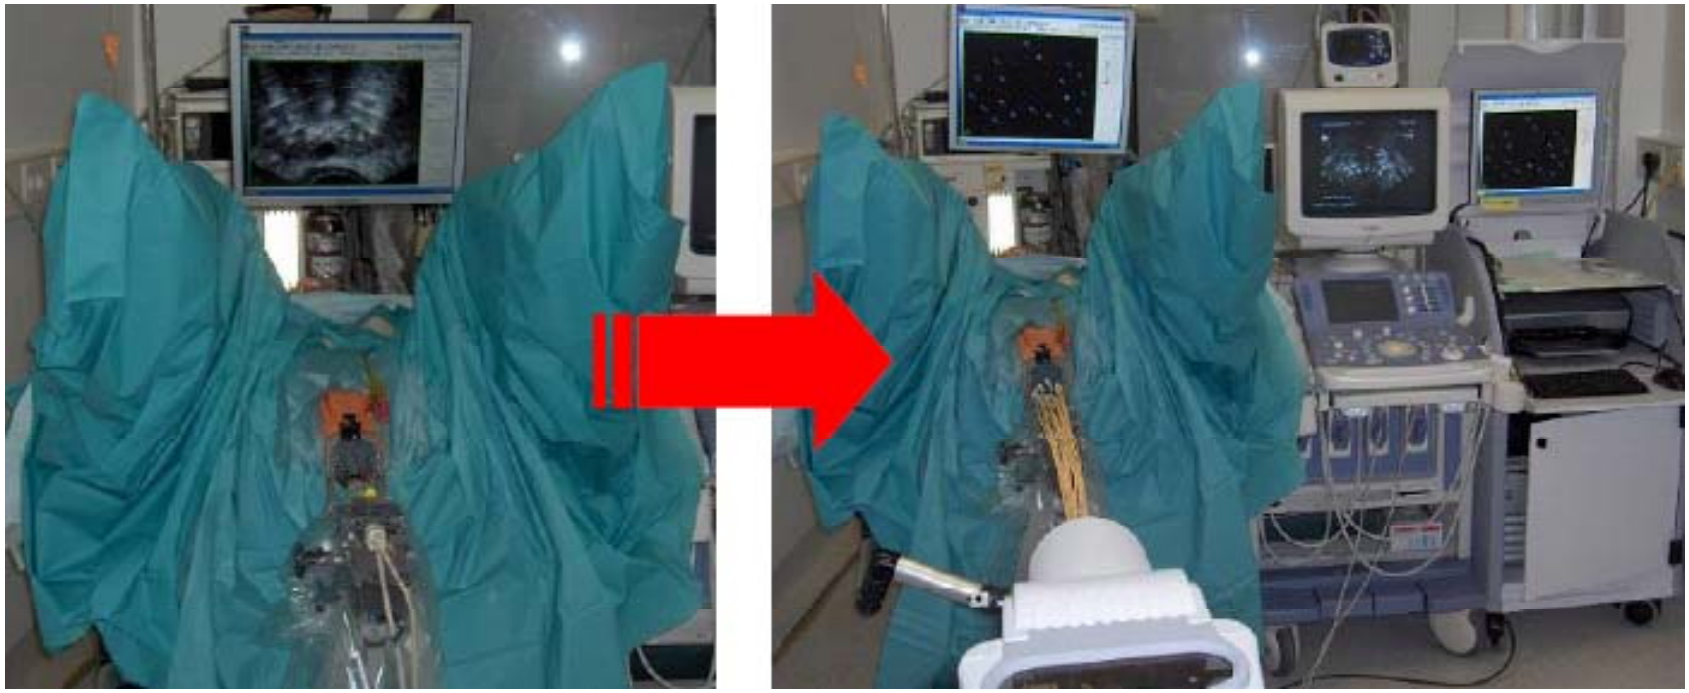
CTV definition

- Ultrasound
- CT
- MR

Ultrasound

- Intraoperative HDR planning
- Eliminates the CT scanner step
- Plan is created with patient remaining in lithotomy position in operating room

Offenbach

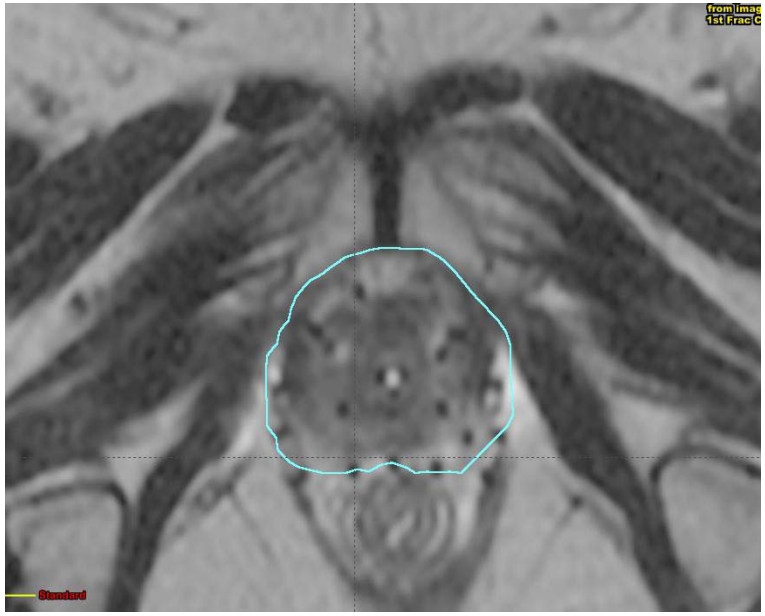


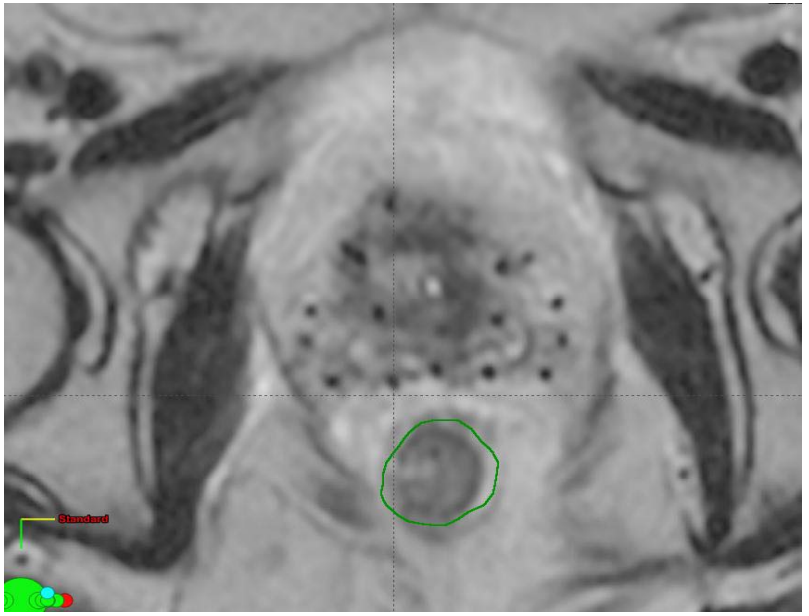
CT / MR based planning

- After recovery from implant
- Requires movement of patient
- Prolongs overall time
- May give additional information over US

MR vs CT outlining

- CT: better needle tracking
- MR: better soft tissue definition
- Image registration:
  - NB potential matching errors





CTV criteria
GEC ESTRO guidelines
2013

- Clinical target volume (CTV) is defined by:
  - the prostate capsule
  - plus any macroscopic extracapsular disease or seminal vesicle involvement identified on diagnostic images expanded by 3 mm to encompass potential microscopic disease. This is usually constrained posteriorly to the anterior rectal wall and superiorly to the bladder base.

OAR criteria
GEC ESTRO guidelines
2013

- Organs at risk (OAR) which should include as a minimum:
  - Rectum: outlining of the outer wall alone is considered adequate for brachytherapy dosimetry as defined for LDR seed techniques.
  - Urethra using the urethral catheter as the landmark on imaging for the urethral contour which should extend from bladder base to 5–10 mm below the prostatic apex. Contrast such as aerated gel within the catheter will aid visualisation on ultrasound.

- Other OARs of interest may include
  - Penile bulb.
  - Bladder neck.
  - Neurovascular bundle.

HDR brachytherapy: dose prescription

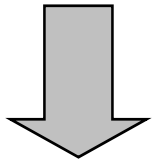
- Planning aim
  - Dose prescribed prior to planning
- Prescription dose
  - Finally accepted dose after planning to account for any compromise between PTV and OAR doses
- Reported dose
  - Dose as delivered using recommended reporting parameters

HDR brachytherapy boost: Planning aim

after

External beam

- 45 Gy in 25 fractions over 5 weeks.
- 46 Gy in 23 fractions over 4.5 weeks.
- 35.7 Gy in 13 fractions over 2.5 weeks.
- 37.5.Gy in 15 fractions over 3 weeks.



- 15 Gy in 3 fractions.
- 11–22 Gy in 2 fractions.
- 12–15 Gy in 1 fraction.

HDR brachytherapy monotherapy: Planning aim

34 Gy in 4 fractions.
36–38 Gy in 4 fractions.
31.5 Gy in 3 fractions.
26 Gy in 2 fractions.

Planning : the delineation and definition of GTV, CTV and PTV

-Delineation of the prostate gland

-Delineation of the urethra prostatica

-Delineation of the anterior rectal wall

-Definition of Gross Tumour Volume - GTV

-Definition of Clinical Target Volume - CTV

-Definition of Planning Target Volume - PTV

ICRU

Gross tumour volume

GTV

The gross palpable,visible or clinically demonstrable location and extent of the malignant growth.

Prostate brachytherapy:

Delineation of the GTV is possible in T2a or T2b (or higher stage)

Eventually important for location for boost dose

Clinical Target Volume

CTV

Is a tissue volume that contains the GTV and/or subclinical malignant disease at a certain probability level.

The CTV is a clinical-anatomical concept. Delineation of the CTV is based on the probability of presence of subclinical malignant cells outside the GTV and thus requires the interpretation of data and some judgment of the radiation oncologist.

Planning Target Volume

PTV

The PTV surrounds the CTV with a margin to compensate for the different types of variations and uncertainties of treatment delivery to the CTV.

The PTV is a geometrical concept, introduced for treatment planning.

A margin must be added to the CTV

- ***to compensate for expected physiological movements and variations in size, shape and position of the CTV during therapy (internal margin)***
- ***for uncertainties (inaccuracies and lack of reproducibility) in patient irradiation.***

Questionnaire (49 European brachytherapy centers – 2007):

Prostate brachytherapy

CTV =

Prostate contour: 100 %

PTV = CTV + margin

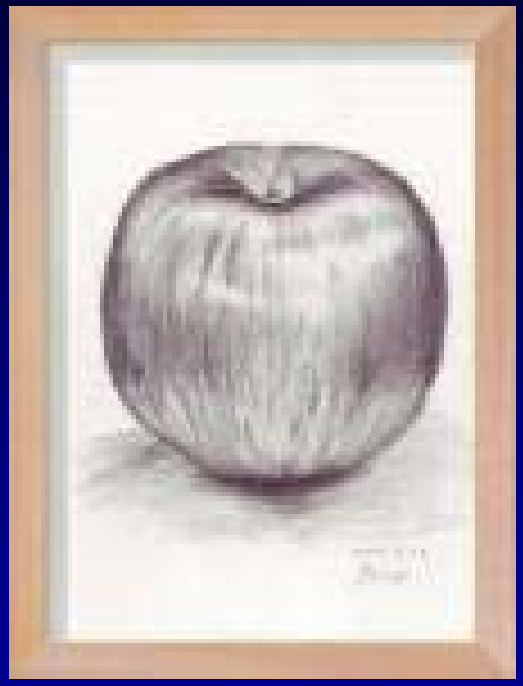
Prostate + 0 mm = 18/49

Prostate + margin = 31/49

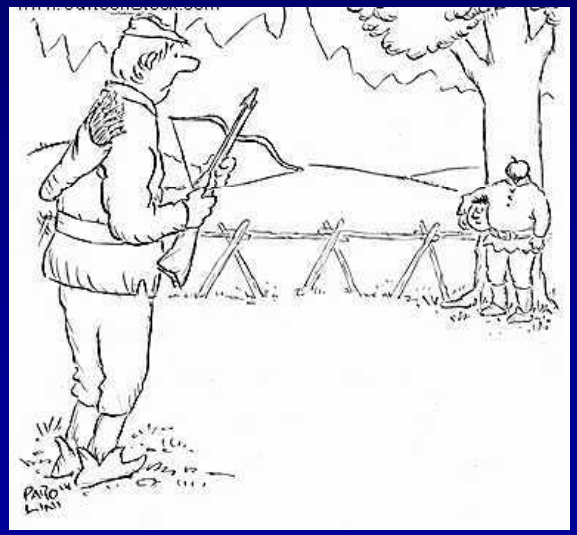
base :	**0 mm = 13**
	3 – 5 mm = 25
	> 5mm = 5
midgland:	**0 mm= 13**
	3 – 5 mm = 28
	> 5 mm = 0
apex :	**0 mm = 13**
	3 – 5 mm = 27
	> 5 mm = 1

peri-prostatic extension ?

CTV = ?



subclinical disease ?

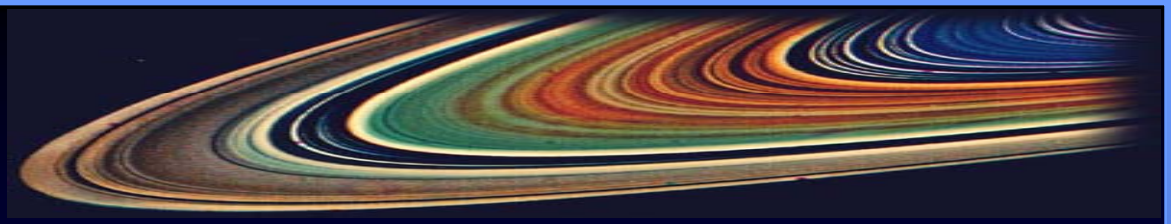


uncertainties in placement ?

PTV = ?

change of position ?

Margins ? ! ?



As shown, most centers consider a margin around the drawn prostatic contour for treatment planning.

But margins for ……

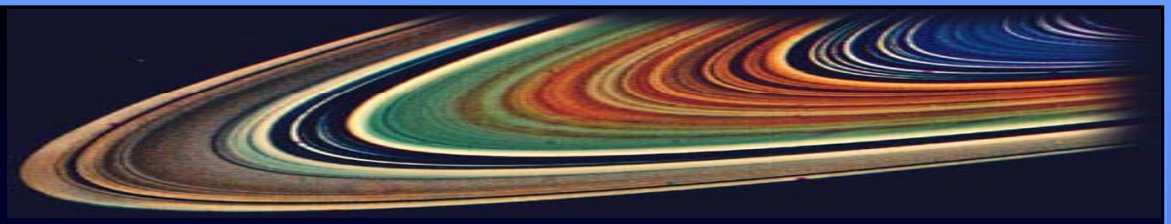
- ***microscopic spread ?***
- ***peri-prostatic extension ?***
- ***subclinical disease ?***

Δ CTV definition

- ***uncertainties in seed placement ?***
- ***change of volume ?***
- ***change of position ?***

Δ PTV definition

Margins ? ! ?

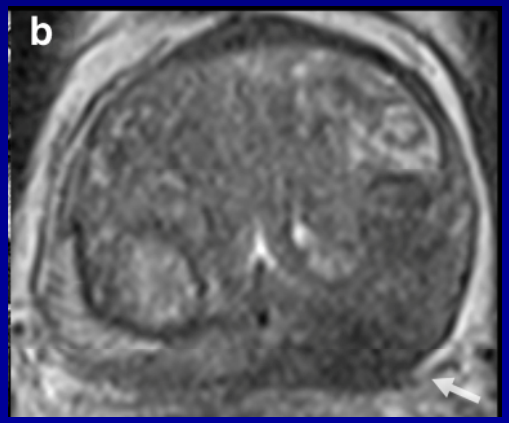


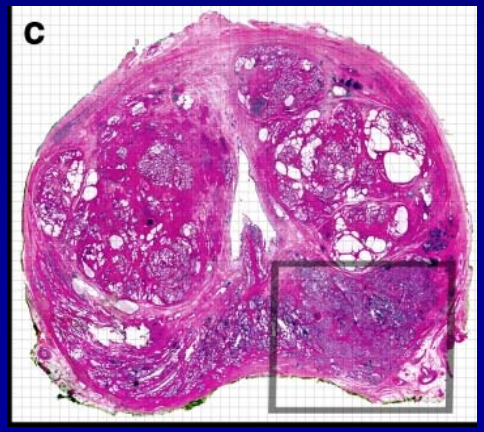
As shown, most centers consider a margin around the drawn prostatic contour for treatment planning.

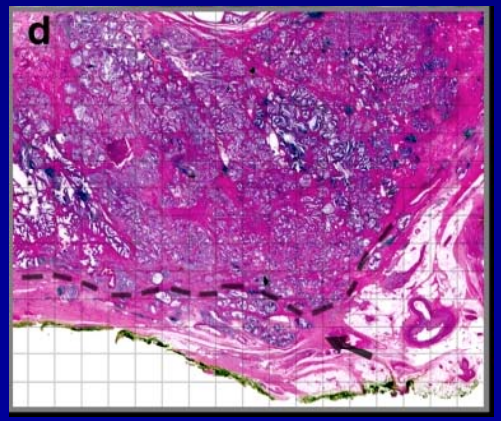
But margins for ……

- *microscopic spread ?*
- *peri-prostatic extension ?*
- *subclinical disease ?*

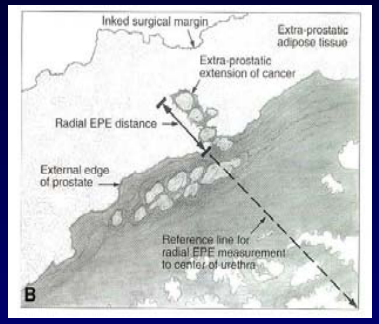
Δ CTV definition





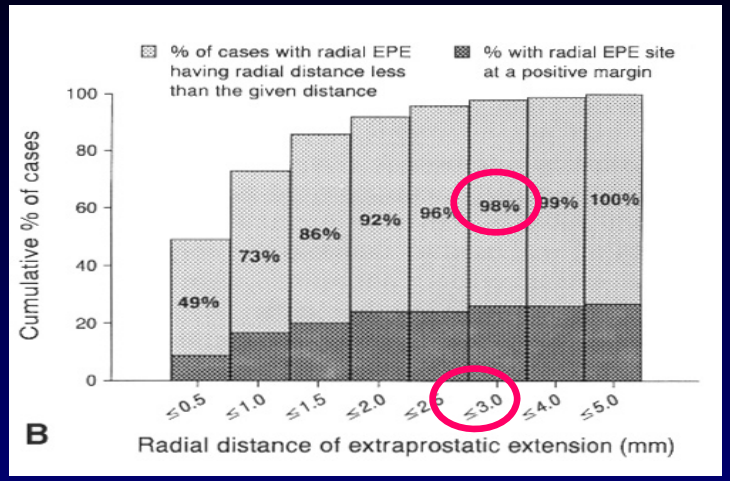


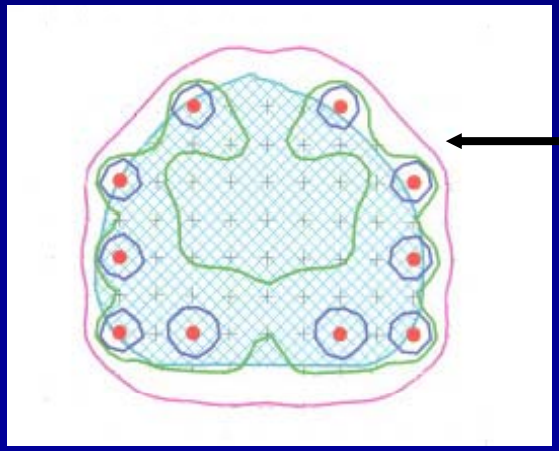
Extra-prostatic disease:



-105 prostatectomies
-Gleason 6.3 (range 3-9)
-PSA 8.6 (range 0.3-98)

Davis et al. Cancer 85(12) 1999



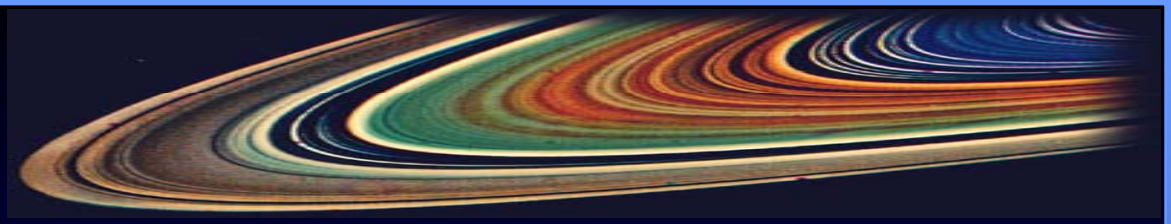


Extraprostatic disease

3 mm margins :

critical to success

Margins ? ! ?



So margins for ……

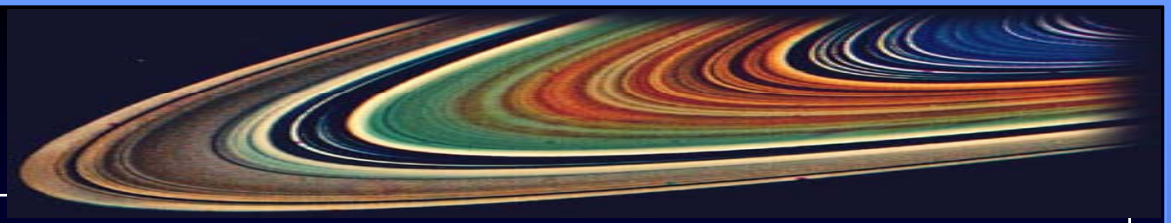
- *microscopic spread ?*
- *peri-prostatic extension ?*
- *subclinical disease ?*

Δ CTV definition

<u>ONE DEFINITION:</u>

For prostate brachytherapy the **CTV corresponds to the visible contour of the prostate expanded with a three-dimensional volume expansion of 3 mm**.
This three-dimensional expansion can be constrained to the anterior rectal wall (posterior direction) and the bladder neck (cranial direction).
In case of >T2 disease, the macroscopic extracapsular extension in taken into account when contouring the prostate volume.

Margins ? ! ?



But margins for ……..

- *uncertainties in seed placement ?*
  - *- x/y direction – no problems*
  - *- z direction – corrections during implantation*
- *change of volume ?*
  - *- only temporary problem*
  - *- edema resolves within the first ½ life of seeds*
- *change of position ?*
  - **- eventual use of stabilization needles**
  - **- continuous on-line verification of position**

So: *forget about margins for PTV definition ⟶ PTV = CTV*

Verbeeten Institute, Tilburg, The Netherlands,* [g]*Mount Vernon Cancer Centre, Northwood, UK*

The aim of this paper is to supplement the GEC/ESTRO/EAU recommendations for permanent seed implantations in prostate cancer to develop consistency in target and volume definition for permanent seed prostate brachytherapy.

Recommendations on target and organ at risk (OAR) definitions and dosimetry parameters to be reported on post implant planning are given.

Tumour and target volumes in permanent prostate brachytherapy: A supplement to the ESTRO/EAU/EORTC recommendations on prostate brachytherapy

Carl Salembier[a], Pablo Lavagnini[b], Philippe Nickers[c], Paola Mangili[d], Alex Rijnders[a], Alfredo Polo[e], Jack Venselaar[f], Peter Hoskin[g,*], on behalf of the PROBATE group of GEC ESTRO

In addition:

Description of :

- Organs at risk contouring
- Recommended prescription doses
- Dosimetric parameters related to ICRU definitions for dose prescription
- Physical parameters for dose reporting
- Post-planning – definitions and parameters
- Target definition in relation to the post-plan dosimetry
- Dose parameters in the post-implant setting

The aim of this paper is to supplement the GEC/ESTRO/EAU recommendations for permanent seed implantations in prostate cancer to develop consistency in target and volume definition for permanent seed prostate brachytherapy.

Recommendations on target and organ at risk (OAR) definitions and dosimetry parameters to be reported on post implant planning are given.

AAPM recommendations on dose prescription and reporting methods for permanent interstitial brachytherapy for prostate cancer: Report of Task Group 137

sist in understanding differences in outcomes and morbidity as well as differences in postoperative dosimetry. Users are encouraged to use the following definitions and procedures for planning and postimplant evaluations, which were proposed by the PROBATE group of GEC ESTRO.[19] A brief summary of these PROBATE recommendations is presented below, and the reader is referred to the original document by Salembier *et al.* for details.[19] We acknowledge that parts of the following recommendations in this section were based on this protocol.

The aim of this paper is to supplement the GEC/ESTRO/EAU recommendations for permanent seed implantations in prostate cancer to develop consistency in target and volume definition for permanent seed prostate brachytherapy.

Recommendations on target and organ at risk (OAR) definitions and dosimetry parameters to be reported on post implant planning are given.

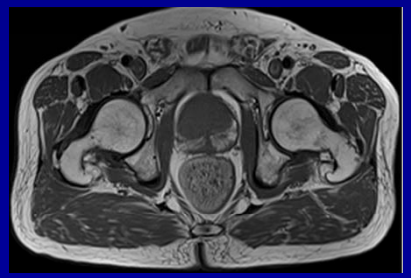
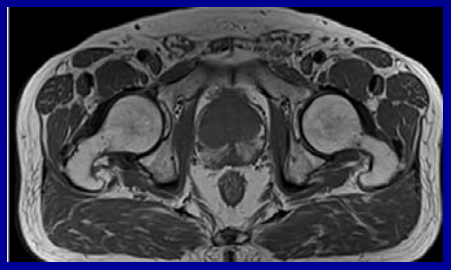
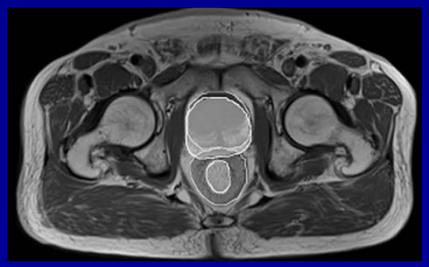
Matching between MRI and CT/US

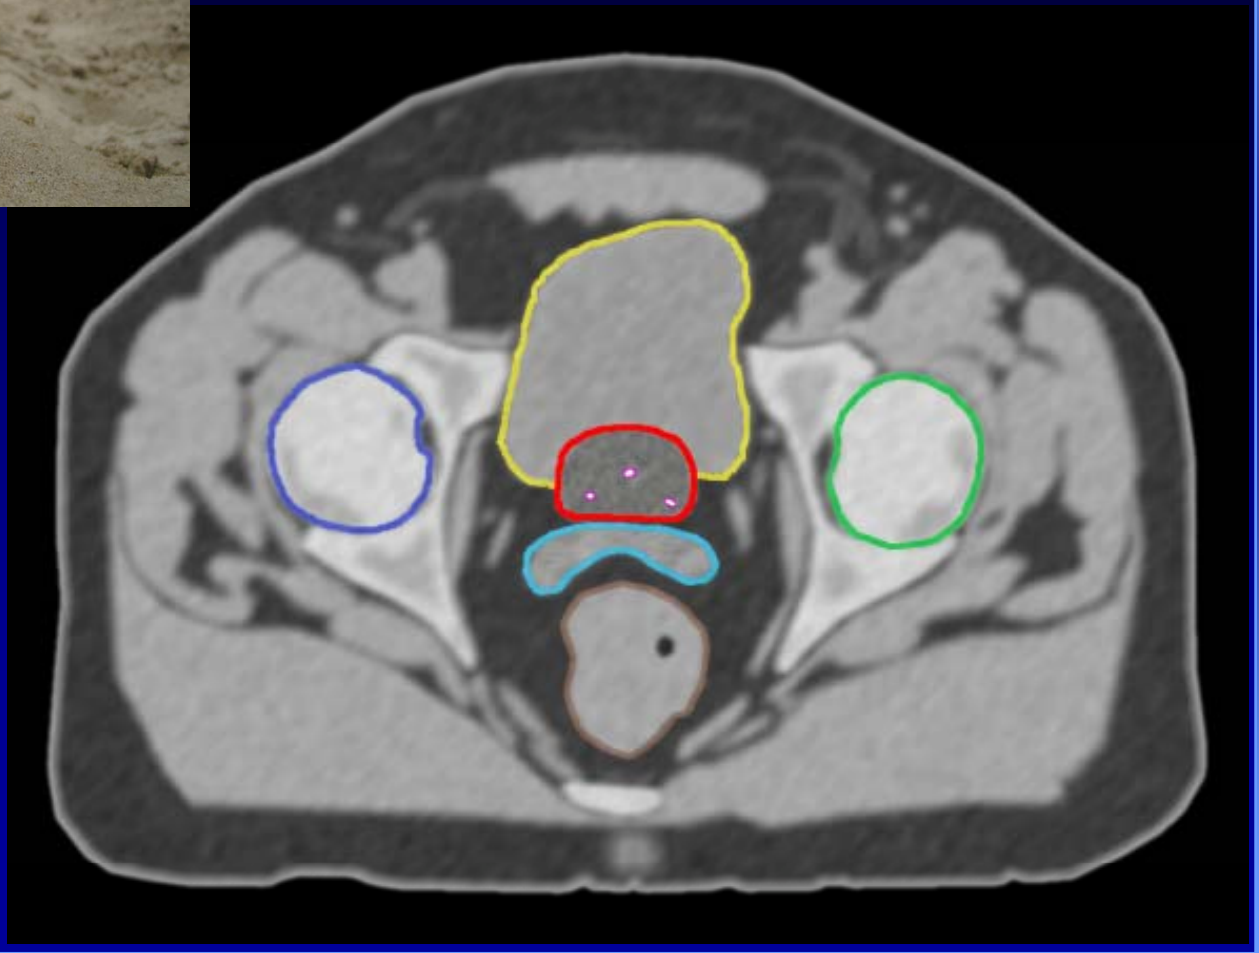
Be aware of possible drawbacks:

-Matching difficulties
-Flat table couch (also on MRI) – patient positioning
-Rectal distension (bowel prep?)
-Variation in bladder volume (bladder prep?)
-P-VS shape and volume differences









During delineation:

- Apply continuously ‘look ahead and back approach’

- Verify definitive results on delineation inconsistencies

- Check your delineation on sagittal and coronal views

One step back doesn't mean you're defeated, it only means you're going to take the same step forward again, but this time, WISER...

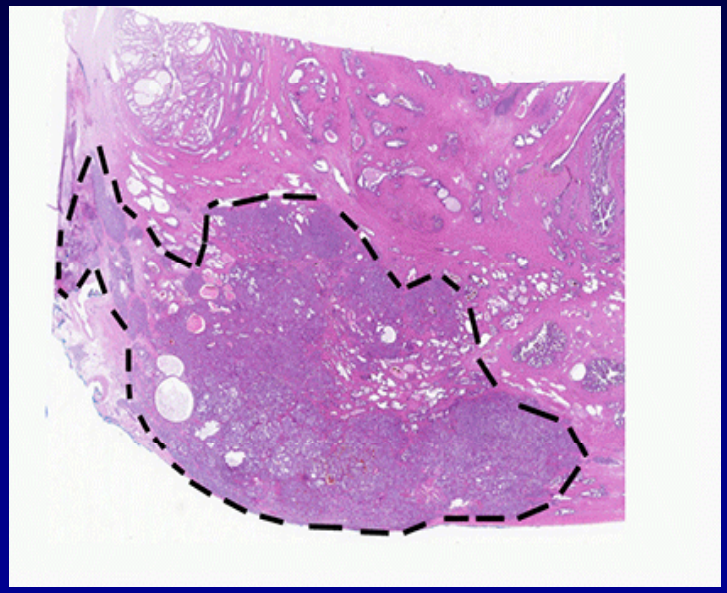
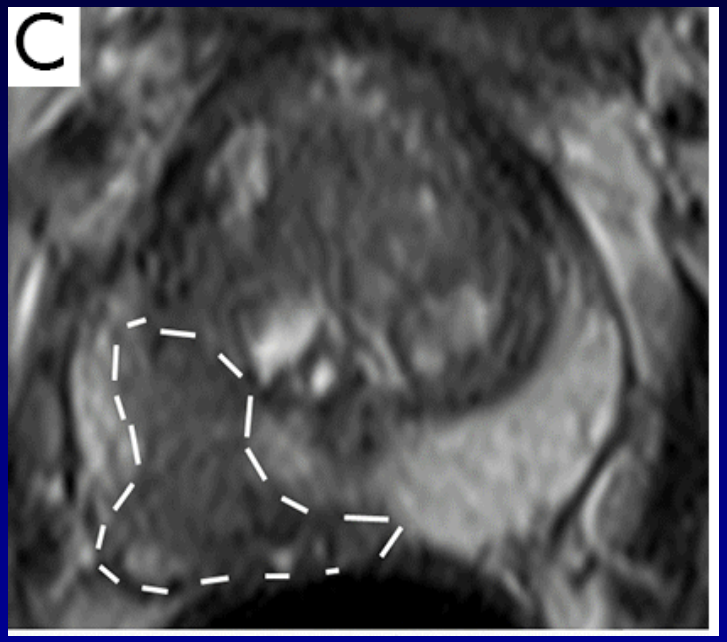
I see and I remember
I do and I understand

ADDENDUM: SEQUENCES IN MRI

Prostate: the anatomy…and the radiology..
THE BRIDGE

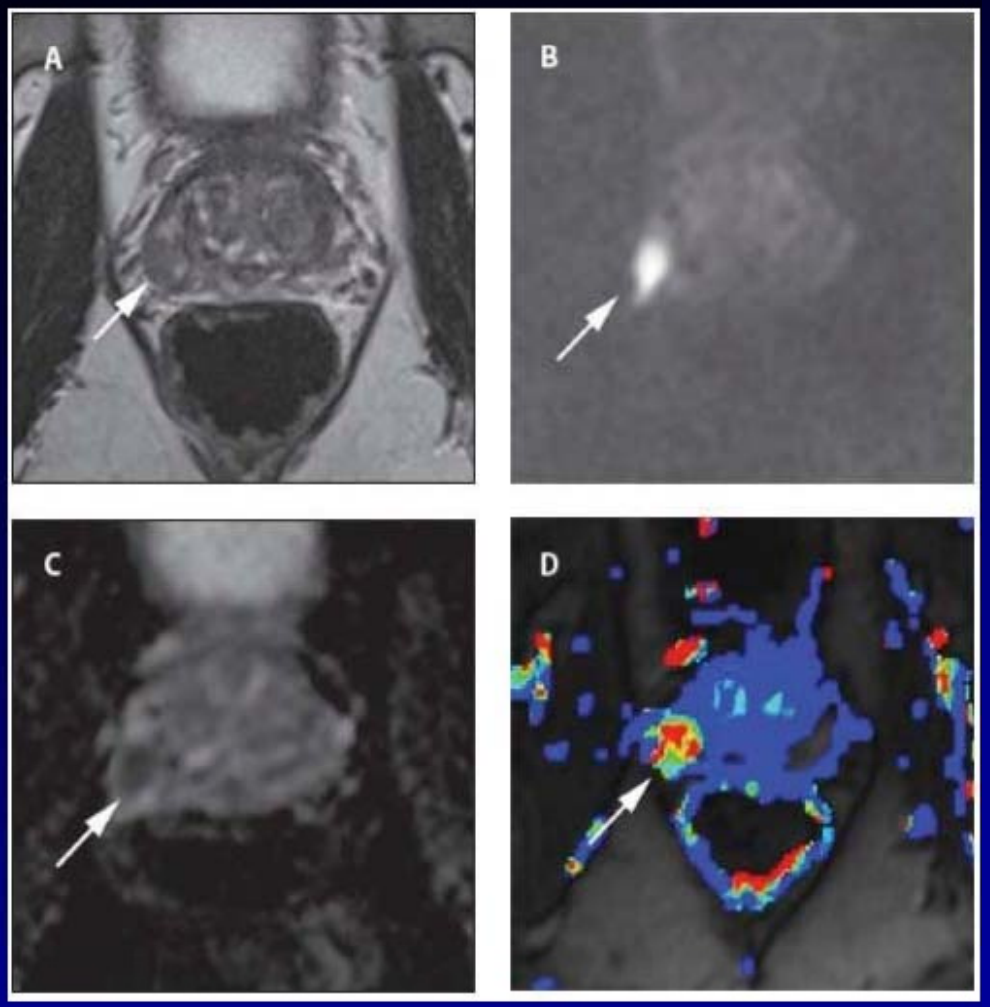




Radtke et al., Transl Androl and Urol. 2015

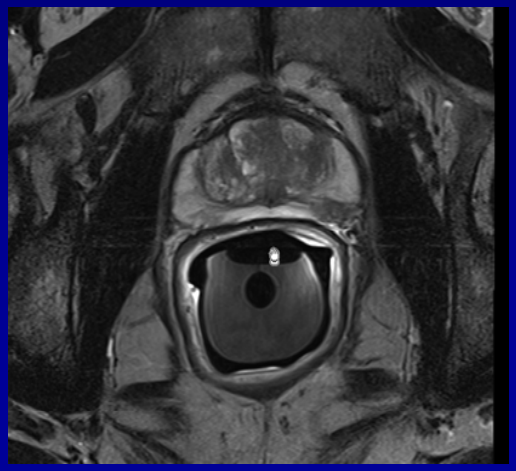
Prostate: the radiological anatomy and MRI which is the best sequence??

Prostate: the radiological anatomy and MRI which is the best sequence??



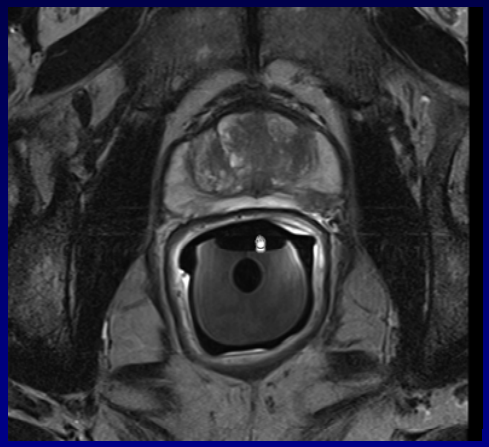
Prostate MRI: some practical points on T2W

- T2-weighted MR imaging is optimal to characterize the prostate
- On T2-wi, the peripheral zone has high signal intensity (quite white), in contrast to the low signal (grey and black) intensity of the central and transitional zones.
- BPH appears as a well-defined and inhomogeneous area with intermediate signal intensity on T2-wi.
- The anterior fibromuscular stroma also appears as an area with low signal intensity on T2-wi.



Prostate MRI: some practical points on T2W

- T2W images are useful to detect prostate cancer in the peripheral zones, as an area of low signal intensity (black).



- Noteworthy, low signal could be:
  - chronic prostatitis,
  - atrophy,
  - scars,
  - post-radiation therapy fibrosis
  - changes after ADT

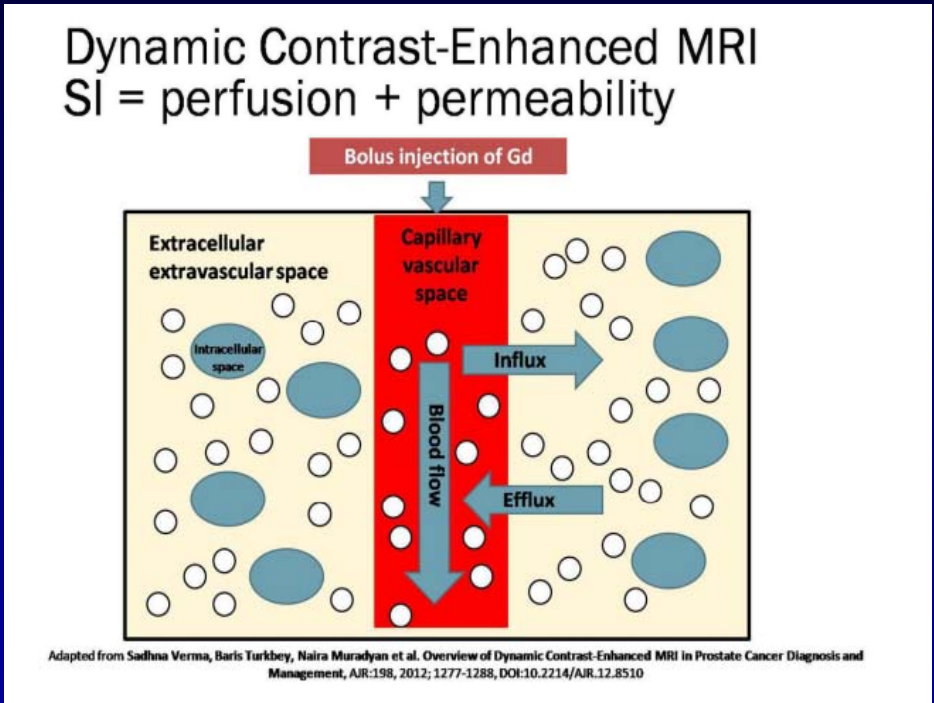
- Difficulties in identify a tumor in the transitional zone….because there is a lot of low signal….

PLEASE, COMMUNICATE WITH YOUR RADIOLOGIST!!

Prostate MRI: some practical points on DWI

- DWI/ADC provide functional information about the behavior of water molecules in tissue.
- Reduced diffusion of water = increased cellularity of malignant lesions that restricts water motion in a reduced extracellular space
- Reduced diffusion of water = prostate cancer
- Low signal intensity on the apparent diffusion coefficient (ADC) maps (dark grey/black)

Prostate MRI: some practical points on DCE

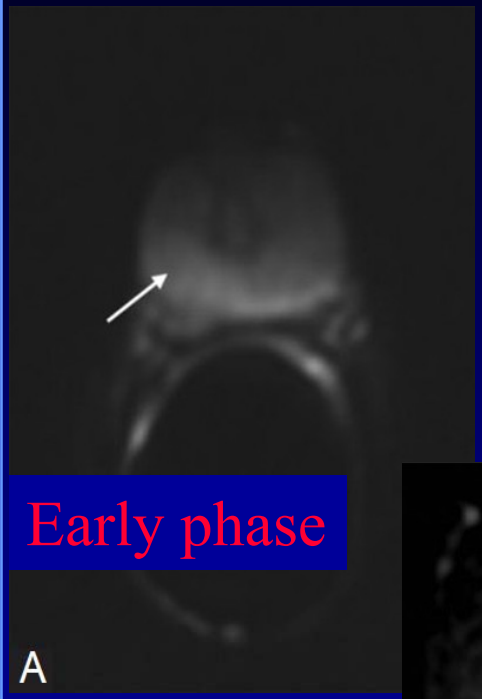


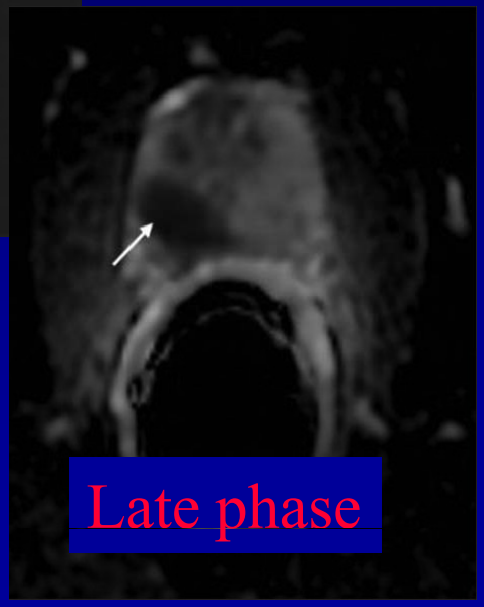
Dynamic Contrast Enhanced MRI =

Based on tumor angiogenesis

Tumor vessels = higher permeability than do normal vessels because of weak integrity of the vessel wall

Prostate MRI: some practical points on DCE

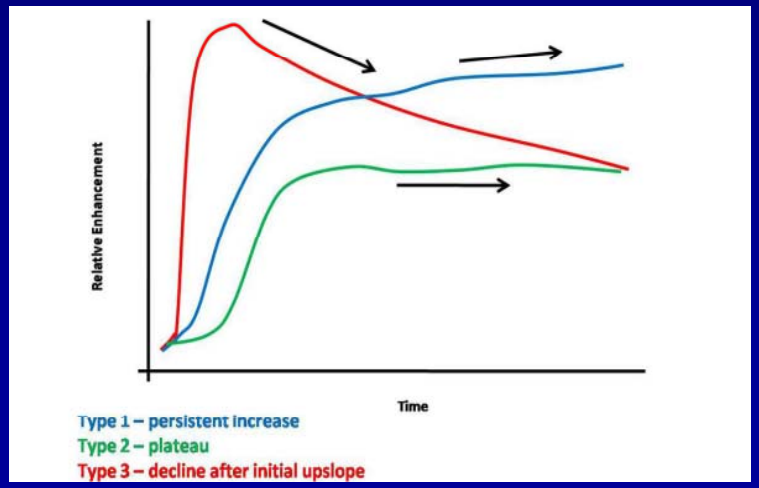




This characteristic tumor environment explains the enhancement pattern of cancerous tissues compared with normal tissues

1. Earlier and faster enhancement

2. Earlier contrast agent washout



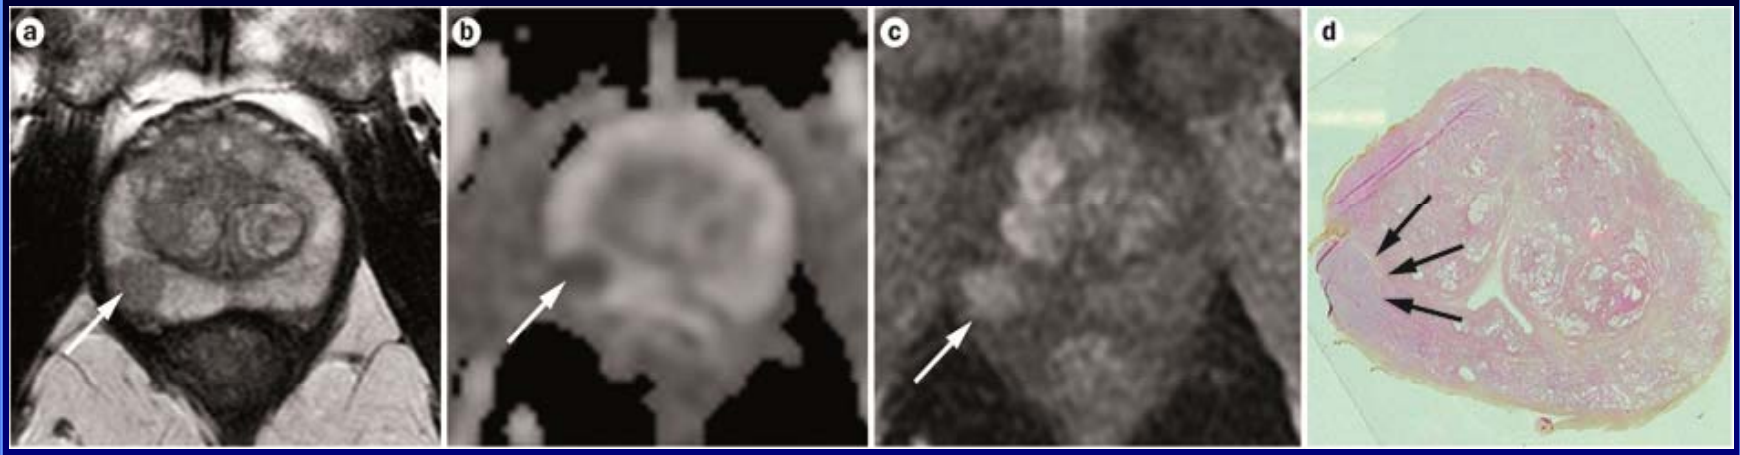
Prostate: the radiological anatomy at MRI which is the best sequence??

The T2W sequence for the Anatomy

The DWI sequence for the Biology

The DCI sequence for the Vascularity

Prostate MRI: some practical points



We look for something DARKER in T2W and in DWI….

….and for something BRIGHTER in late DCE!

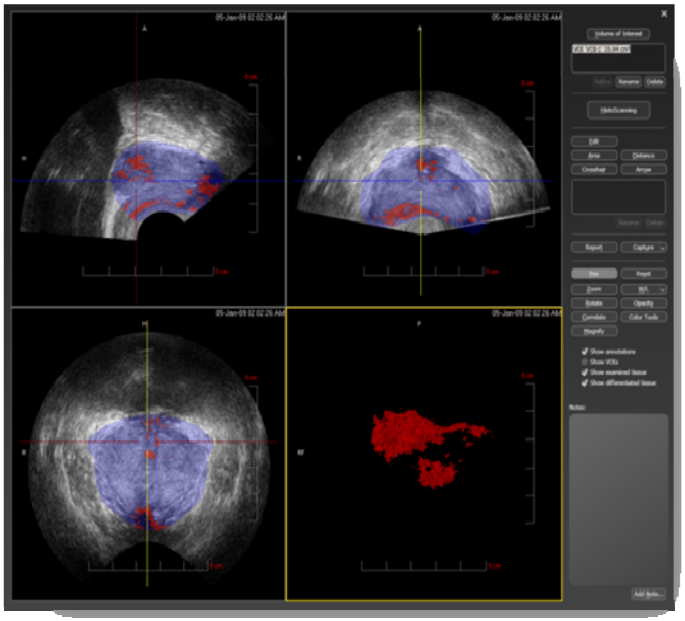
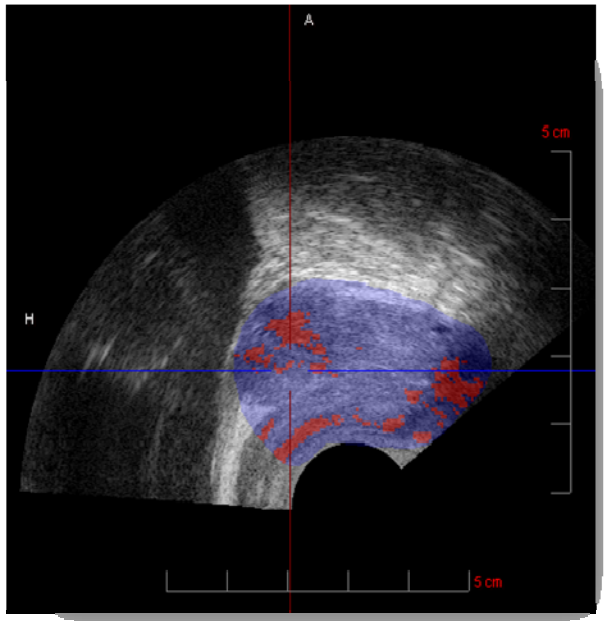
Prostate HistoScanning™

Tissue Differentiation and Visualization

- Computer-based information of 3D data.
- Visualization based on different acustic signals.
- HistoScanning™ signals appear as red pixels.





ESTRO School

Multicenter clinical study

Results[1] (Govindaraju et al. EAU 2009)

- HistoScanning detected 23 out of the 24 lesions found on histology
- The index lesion was identified in all cases
- The lesion “missed” was estimated by histology to have a volume of 0.2cc but only 0.12cc by HistoScanning (below the reporting threshold)
- There is strong correlation between the histological estimation and prediction of volumes by HistoScanning™ (r = 0.8, p< 0.001)

EDITORIAL COMMENT

J. Stephen Jones, M.D., Department of Regional Urology, Glickman Urological and Kidney Institute, Cleveland Clinic Foundation, Cleveland, Ohio

tissues. Unfortunately, the data still reveal minimal value from most of these technologies, and those reported in this article are similarly disappointing. HistoScanning demonstrated interesting color images, but coupled with a transperineal-targeted biopsy found exactly one more case of prostate cancer than did the current standard of care—the 14-core extended transrectal biopsy. This "difference" is actually statistically identical ($P > .99$). Exactly the same number of patients ($n = 4$) was found exclusively by both transperineal HistoScan-targeted biopsy as with standard transrectal biopsy, and when targeted using the transrectal approach, the technology actually missed almost half of the cancers that were identified overall.

Furthermore, these data do not support the suggestion that 9 cores are less morbid or traumatic than 14 cores, and the literature is replete with reports demonstrating this is simply not true. This is especially misleading when those 9 cores come at the cost, morbidity, time, and complexity of an operation such as this performed under general anesthesia.

Does Prostate HistoScanning™ accurately identify prostate cancer, measure tumour volume and assess pathological stage prior to radical prostatectomy?

Saqib Javed[1], Eliot Chadwick[1], Sabeena Beveridge[2], Simon Bott[3], Christopher Eden[1] and Stephen Langley[1]

Abstract

Objective: The objective of this paper is to assess the ability of Prostate HistoScanning™ (PHS) to accurately identify tumour volume, index lesion characteristics and pathological stage. PHS is a novel technology employing transrectal ultrasound scanning and software analysis of radiofrequency data to produce signatures for benign and cancerous tissues. Recent reports have suggested PHS is capable of characterising the index cancer lesion and disease multifocality and detecting extraprostatic extension (EPE).

Materials and methods: The index test was preoperative PHS on patients undergoing radical prostatectomy (RP). The reference test was the whole-mount pathological analysis of the RP specimen. PHS analysis estimated total tumour volumes, tumour volumes by prostate sextant, the locations and volumes of index lesions, and the presence and location of EPE.

Results: There was no correlation between PHS and histology total tumour volume estimates (Pearson coefficient –0.099), despite accounting for specimen fixation shrinkage (Pearson coefficient –0.070), nor among 144 prostate sextants in 24 patients (Pearson coefficient 0.14). Sensitivity and specificity of PHS in detecting foci > 0.2 ml were 63% and 53%, respectively; and 37% and 71%, respectively, for foci > 0.5 ml. Pearson correlation coefficient for index lesion volumes identified at pathology vs PHS was 0.065. PHS failed to locate accurately index lesion and pathological EPE.

Conclusions: PHS fails to identify total tumour volumes, tumour volumes prostate sextant, index lesion volumes and locations, and presence and location of EPE compared to RP pathology. PHS appears unsuitable for routine diagnostic clinical use in prostate cancer.

Keywords

Conclusions: PHS fails to identify total tumour volumes, tumour volumes prostate sextant, index lesion volumes and locations, and presence and location of EPE compared to RP pathology. PHS appears unsuitable for routine diagnostic clinical use in prostate cancer.

Conclusions: mpMRI is able to detect significant PCa in biopsy-naïve males and men with prior negative biopsies. The negative predictive value of mpMRI is important to the clinician because mpMRI could be used to rule out significant disease. This may result in fewer or no systematic or targeted biopsies in patients with PSA suspicious for prostate cancer.

Abstract # 548
Van Leeuwen PJ, Emmett L, Hruby G, Kneebone A, Stricker P
Amsterdam

Conclusions

- **Ultrasound**
  - **initial assessment of patients with increased PSA and/or abnormal DRE, but low diagnostic yield**
  - **excellent for biopsy guidance**
  - **no screening**
  - **no staging**

Conclusions

- **CT**
  - **no value for local tumor detection**
  - **lymph node staging**
  - **targeted imaging after bone scan**
  - **(detection of visceral metastases)**

Conclusions

- **MRI**
  - **optimally depicts prostatic anatomy**
  - **primarily detects peripheral zone carcinoma**

Conclusions

- **Tumour detection**

  - **T2-weighted imaging**
    - **baseline examination!**

  - **MR-spectroscopy**
    - **primarily detects higher grade tumours**

  - **dynamic contrast enhanced MRI**
    - **imaging of tumor neovascularisation**

  - **diffusion weighted imaging**

    Minimal requirement in MRI imaging

ESTRO School

Conclusions

- **MRI**
  - **Still not recommended before primary biopsy**
  - **Recommendation before secondary biopsy**
  - **Rising importance in follow-up under active surveillance**

Conclusions

- **PET**
  - **Indication in primary tumour detection unclear.**
  - **Unclear indication during staging.**
  - **No indication in case of recurrence with PSA<1ng/ml**
  - **Unclear indication and evidence in case of recurrence with PSA>1ng/ml**

BRACHYTHERAPY

Ultrasound–CT fusion compared with MR–CT fusion for postimplant dosimetry in permanent prostate brachytherapy

David Bowes[1], Juanita M. Crook[2,*], Cynthia Araujo[3], Deidre Batchelar[3]

[1]*Department of Radiation Oncology, Nova Scotia Cancer Center, Halifax, Nova Scotia, Canada*
[2]*Department of Radiation Oncology, British Columbia Cancer Agency, Center for the Southern Interior, Kelowna, BC, Canada*
[3]*Department of Radiation Physics, British Columbia Cancer Agency, Center for the Southern Interior, Kelowna, BC, Canada*

20 patients (I-125):

pre-implant TRUS
CT (1 month)
MRI (1 month)

→ Urethral position (catheter)
→ Seed positions

→ **Campus Kiel, Clinic of Radiotherapy**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

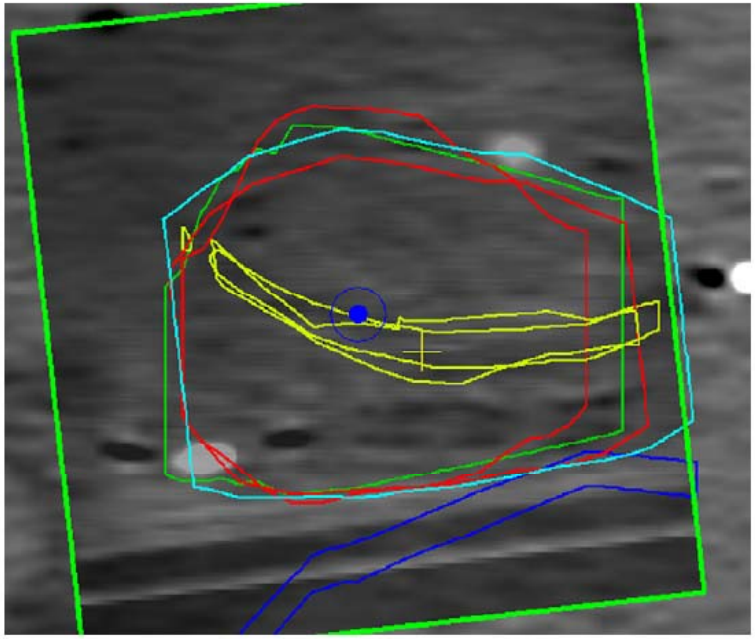

Fig. 1. Overlaying the sagittal images in the plane of the urethra superimposes the urethral curvature and brings the base and apex into alignment.

TRUS-CT fusion

Table 1
Median volume and dosimetric parameters as calculated using CT–TRUS fusion and CT–MRI fusion

Median value (IQ range)	CT–TRUS	CT–MRI
Volume (cc)	32.8 (25.8–42.6)	31.1 (25.8–37.6)
D_{90} (%)	120.0 (117.4–132.2)	122.8 (115.0–132.4)
V_{100} (%)	97.8 (95.4–98.9)	97.8 (94.9–98.8)
V_{150} (%)	71.5 (64.7–75.6)	72.6 (62.7–77.5)
V_{200} (%)	37.2 (28.9–41.2)	36.0 (26.6–42.4)

TRUS = transrectal ultrasound; IQ = interquartile.

CT and TRUS may be a reasonable alternative to MR-based dosimetry in patients where MRI is not available.

Prostate brachytherapy

Prostate post-implant dosimetry: Interobserver variability in seed localisation, contouring and fusion

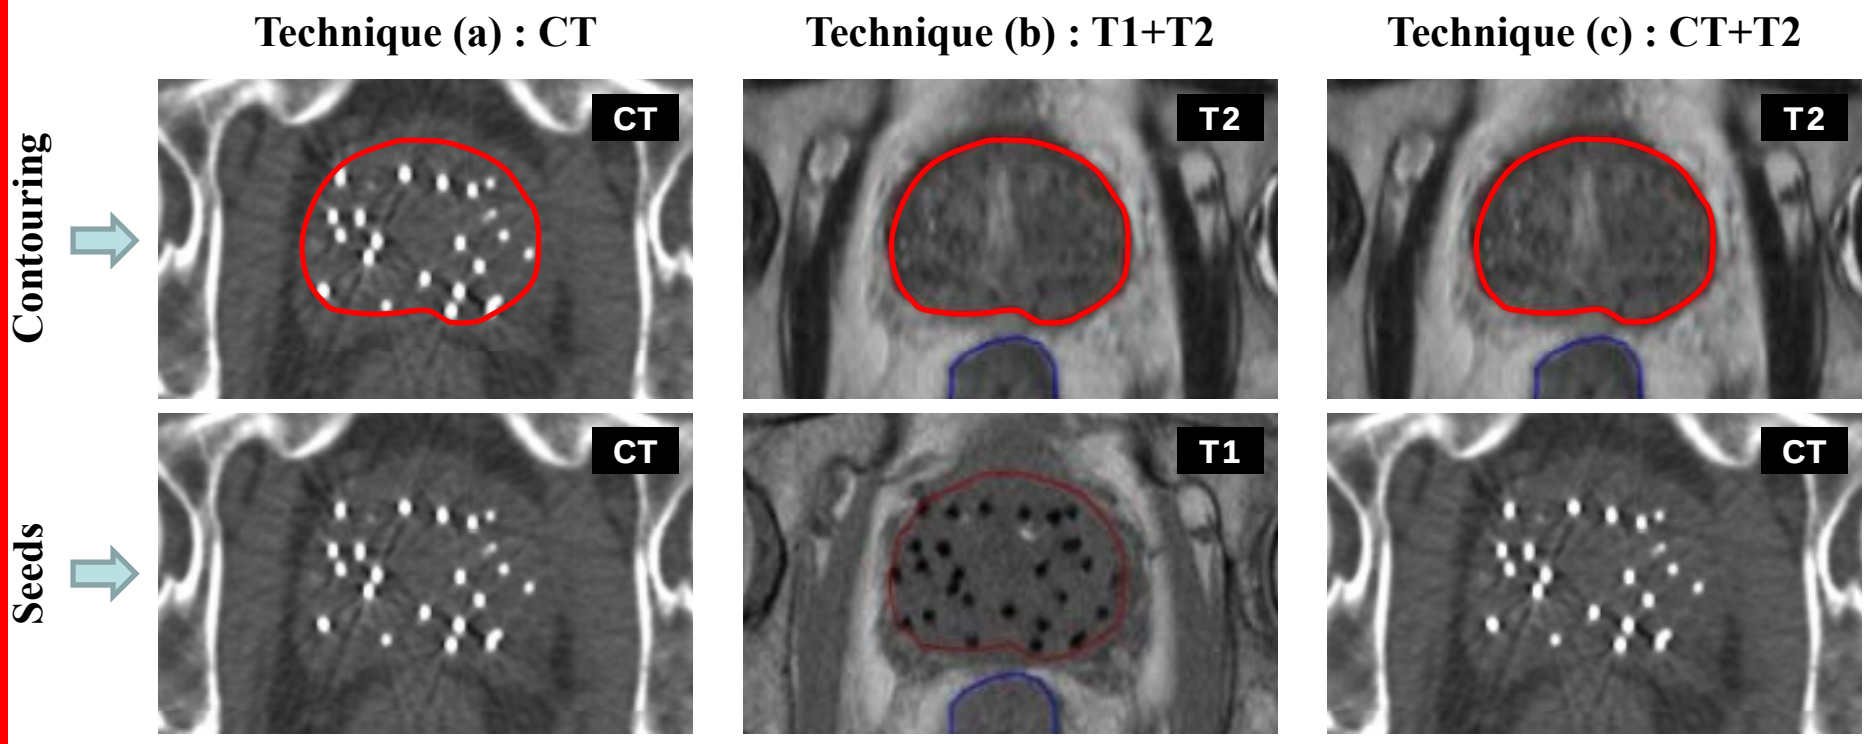
Marisol De Brabandere [a,*], Peter Hoskin [b], Karin Haustermans [a], Frank Van den Heuvel [a], Frank-André Siebert [c]

[a] University Hospital Gasthuisberg, Leuven, Belgium; [b] Mount Vernon Cancer Centre, Middlesex, UK; [c] University Hospital of Schleswig-Holstein, Kiel, Germany

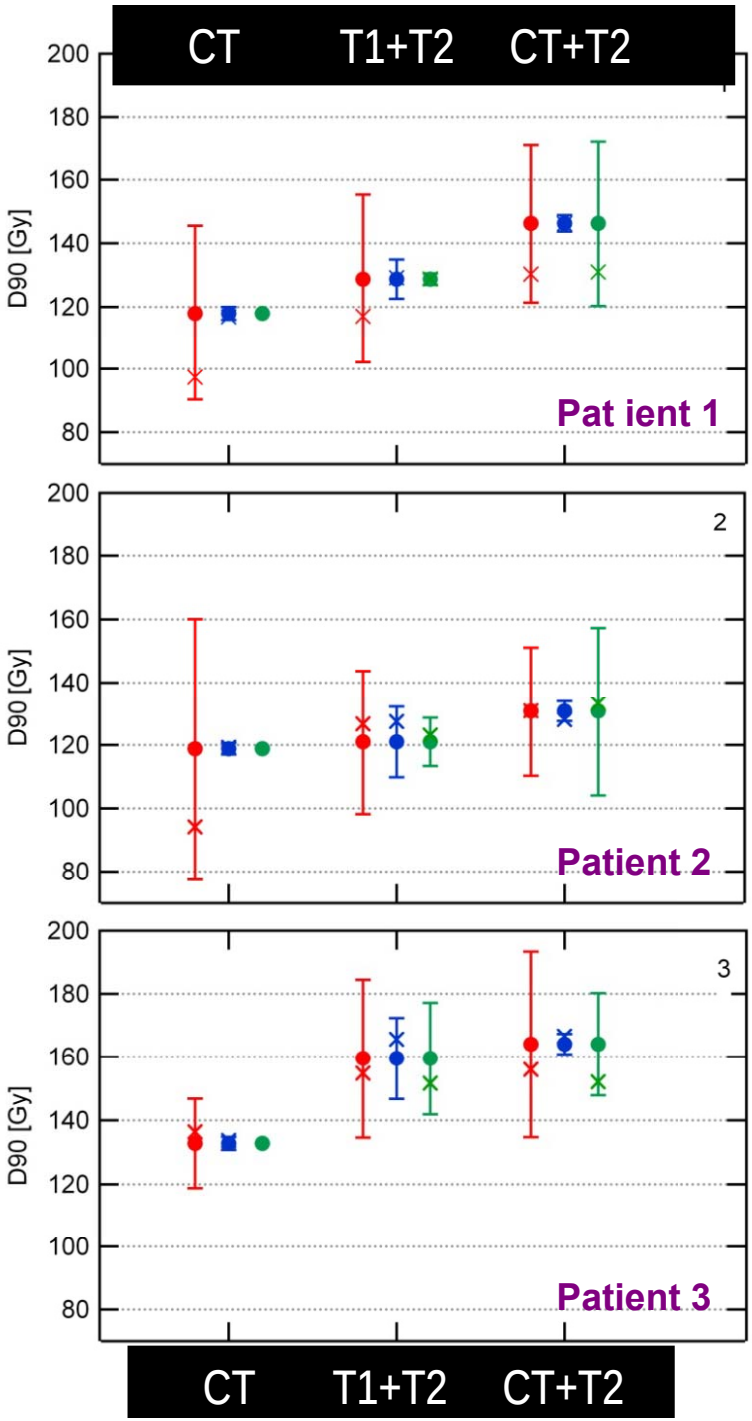
- 3 LDR Patients from Leuven
- MRI (T1 and T2), CT, radiographs
- Prostate volumes: 38, 21, 42 ml
- Seeds: 76, 62, 87 (single sources, Oncura 6711)
- VariSeed 8.0

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Image Fusion T1+T2, CT+T2



→ Campus Kiel, Clinic of Radiotherapy



Impact of interobserver variability on D90

- ● Ref_D90
- × MeanObs_D90
- | SD_{ref} interobserver variability with respect to reference (1SD)

Contouring
large interobserver variability for D90 for all techniques

Seeds
- CT: small interobserver spread for D90
- slightly larger for technique (b), using T1 for seeds

Fusion
- T1 + T2 : interobserver variability relatively small, but patient dependent
- CT + T2 : large interobserver variability

Treatment planning techniques

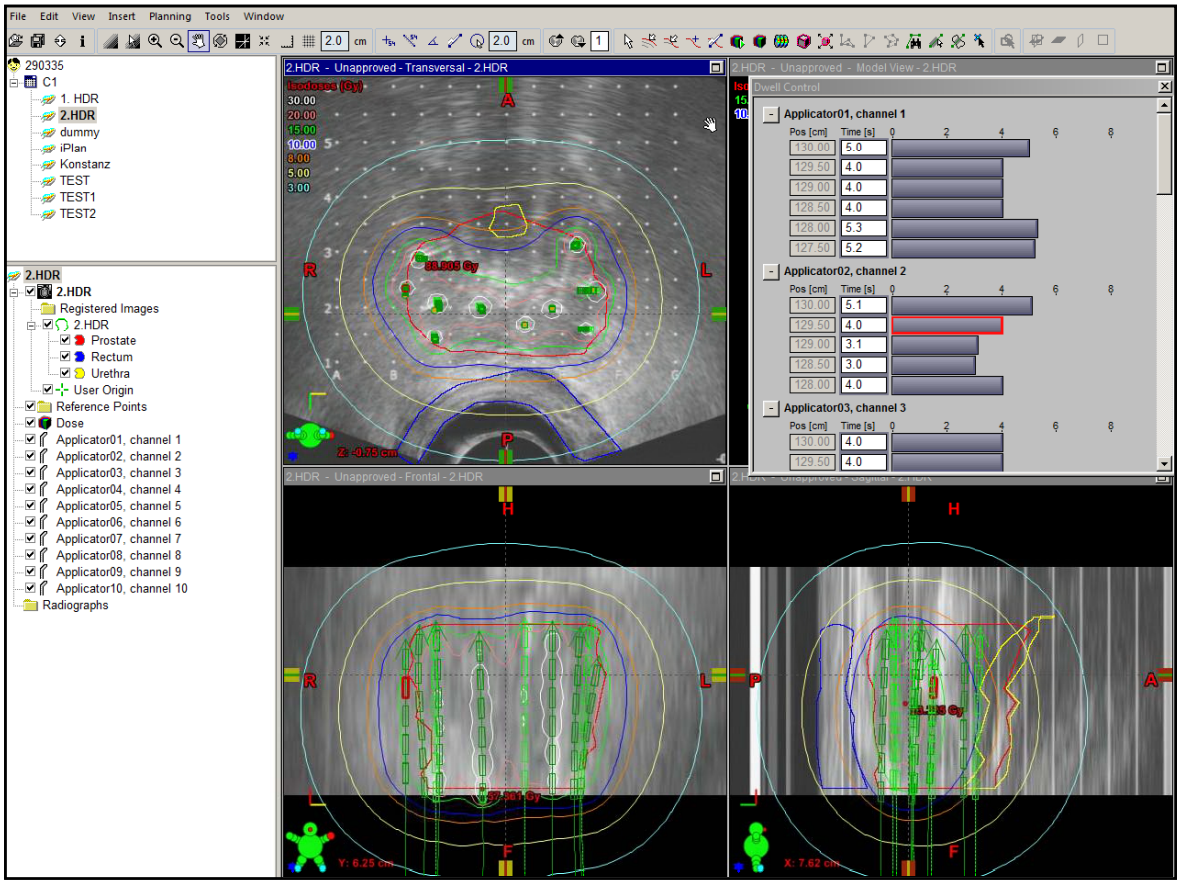
How can I persuade the planning computer to calculate a proper plan?

1. Forward planning
2. Geometrical optimization
3. Inverse planning (volume optimization)

4. Combinations 1.-3.

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Forward planning

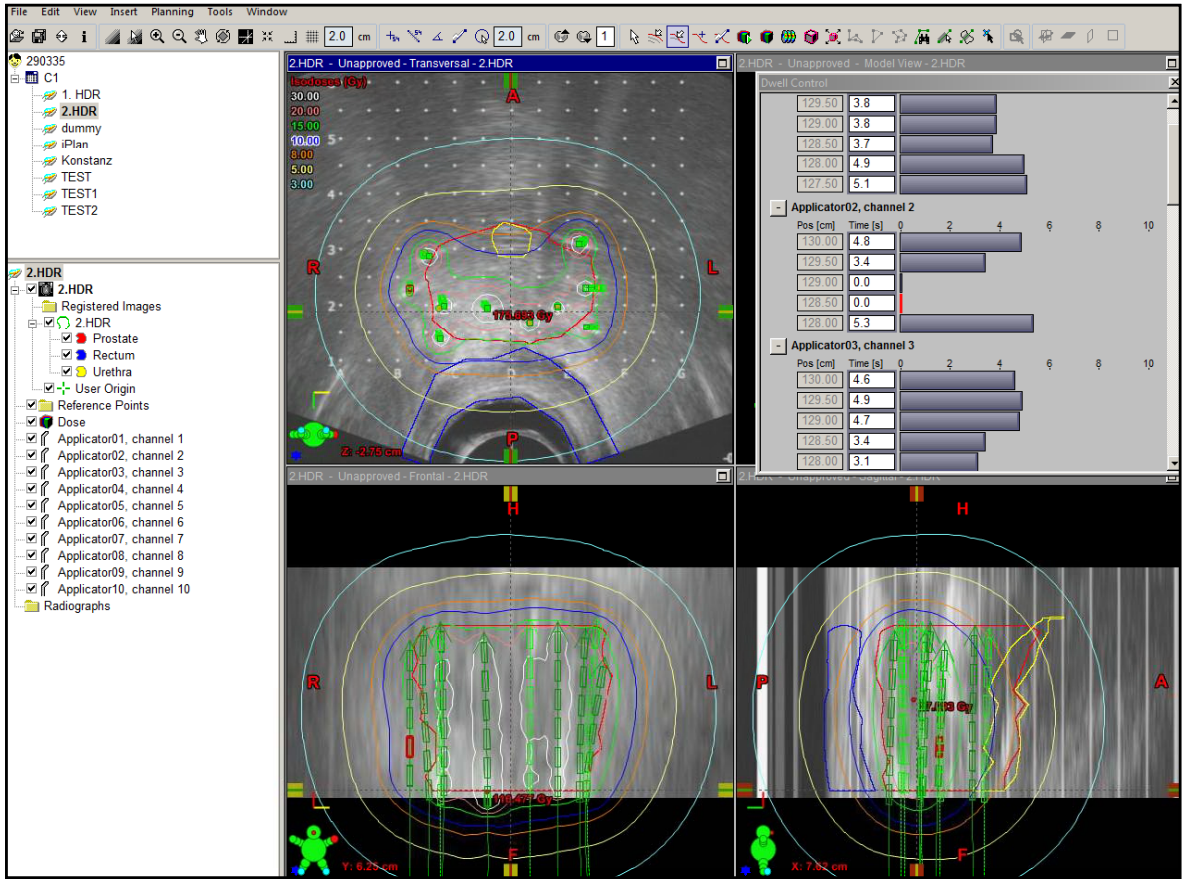


- User biased
- Needs experience
- Fast

→ **Campus Kiel, Clinic of**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Forward planning, *shaping* tools



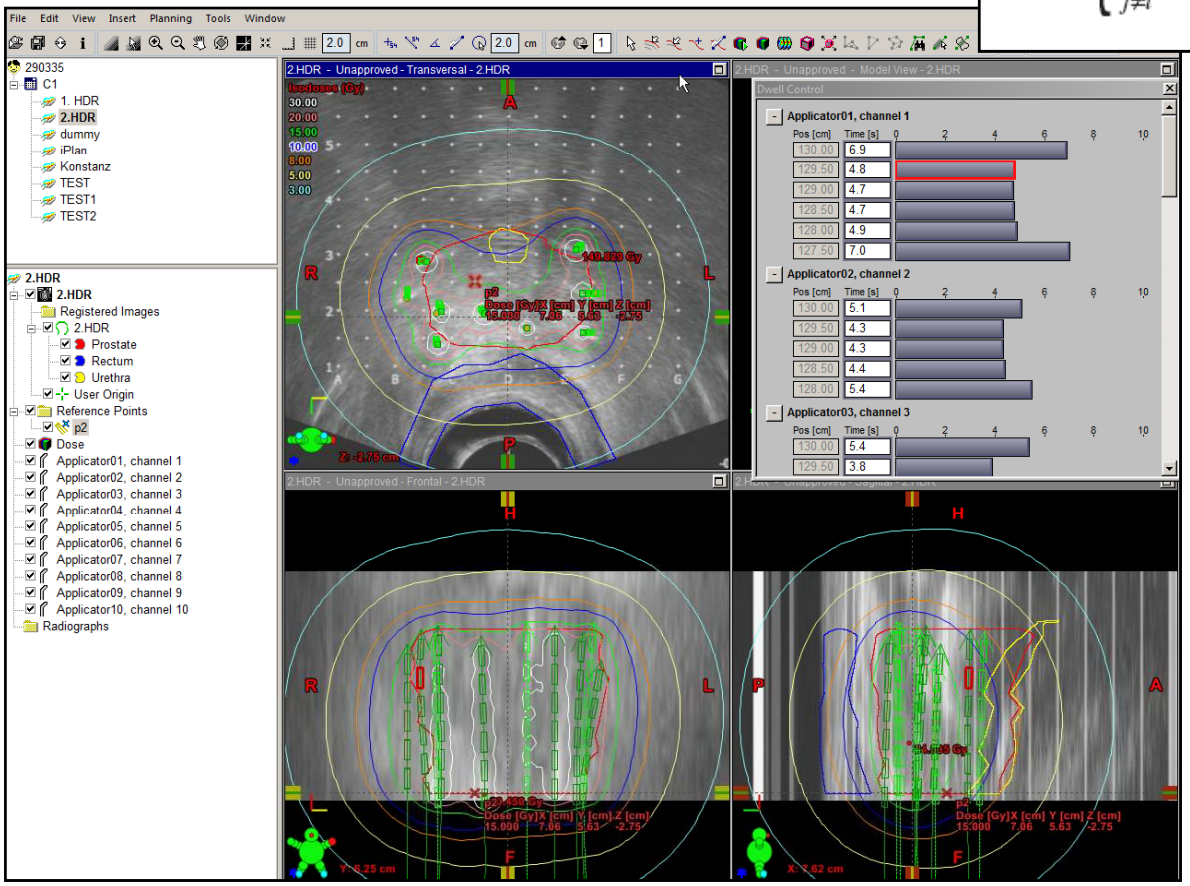
- Good tools, but check dwell times!

→ **Campus Kiel, Clinic of**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Geometrical optimization

$$T_i = \left\{ \sum_{\substack{j=1 \\ j \neq i}}^{n} T_j [(x_j - x_i)^2 + (y_j - y_i)^2 + (z_j - z_i)^2]^{-1} \right\}$$



- Easy to use
- Fast
- Not anatomy based

→ **Campus Kiel, Clinic of**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

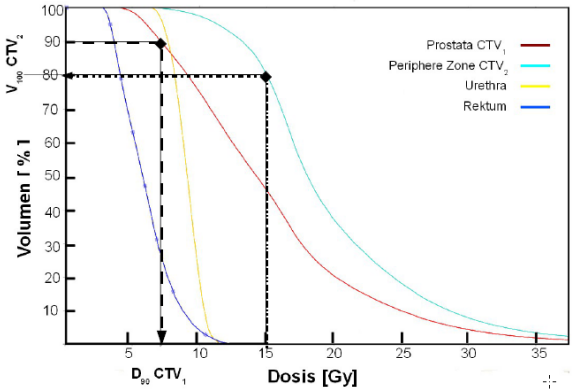
→ Inverse Planning

Is like…

Christmas!

But before we get presents,
we have to write a wish list

In Inverse Planning wishes are normally expressed in terms of dose constraints

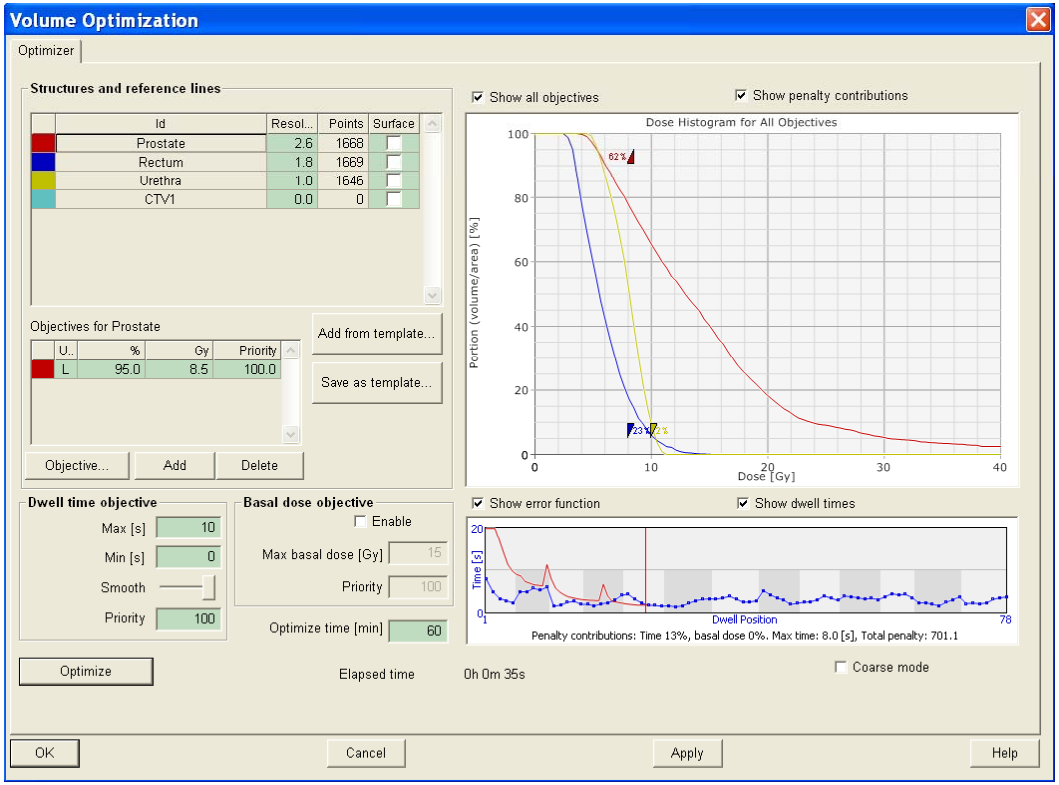


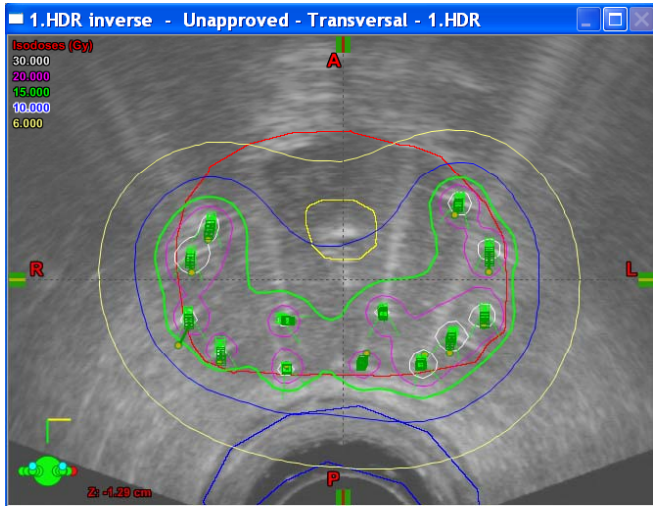
→ **Campus Kiel, Clinic of Radiotherapy**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Inverse Planning

Dose constraints for individual organs needed





→ **Campus Kiel, Clinic of Radiotherapy**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Inverse planning

Convert dose distribution D_i to penalty value w_i
(d_{ij}: dose rate matrix)

$$D_i = \sum_j d_{ij} t_j$$

$$w_i = \begin{cases} m_L(D_i - L) & \text{if } D_i < L \\ m_R(D_i - R) & \text{if } D_i > R, \\ 0 & \text{if } L \leqslant D_i \leqslant R, \end{cases}$$

$$E_n = \sum_i^m \frac{w_i}{m}.$$

(Summation over all dose points)

$$E(k) = \sum_{n=1}^{4} E_n(k).$$

(Summation over clinical criteria)

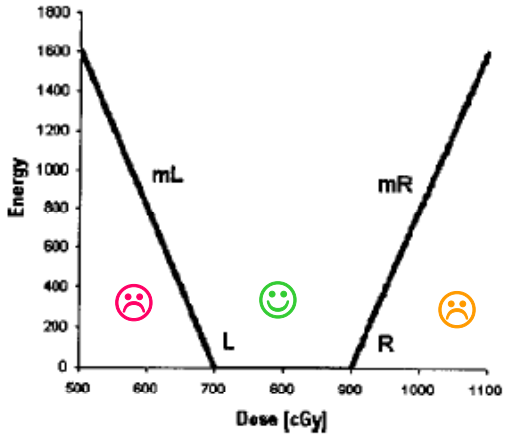


FIG. 4. Dose potential defined by the Eq. (5).

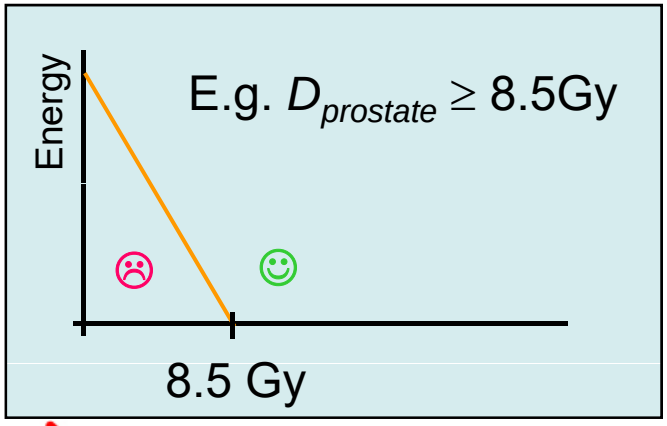
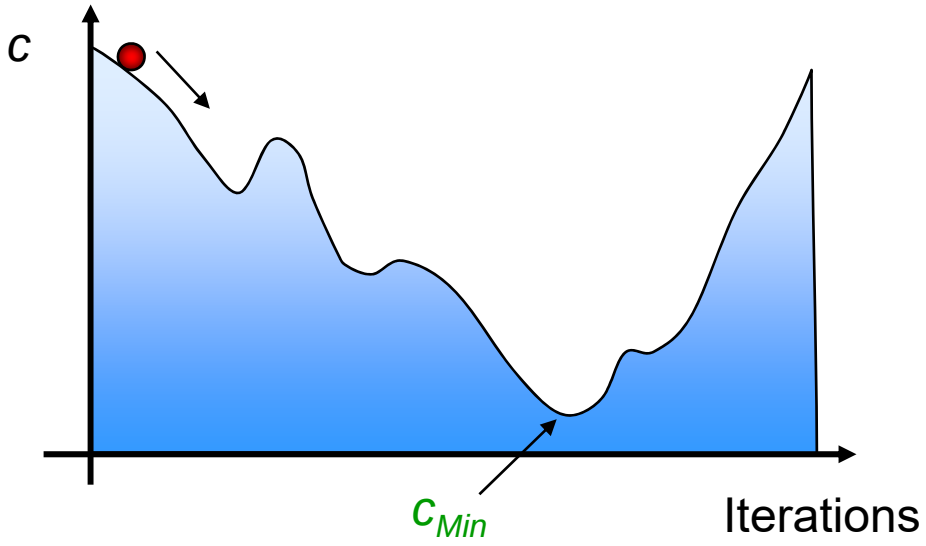


→ **Campus Kiel, Clinic of Radiotherapy**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Inverse planning

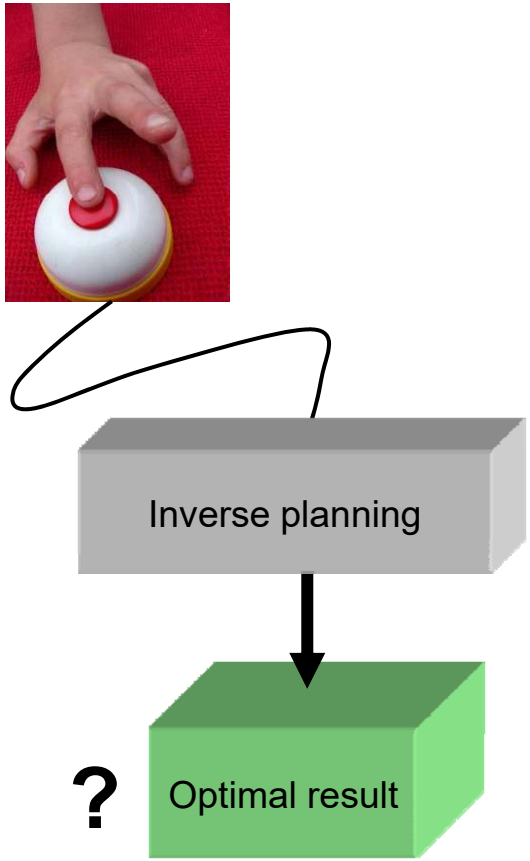
Dwell times t_j change until
global minimum c_{Min} is reached.



UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Inverse planning

- No *one-click* solution
- Constraints must be adapted
- User-independant solution
- Can save time
- Check the results



UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

Uncertainties in Brachytherapy

Table 5
Example 5 – HDR ^{192}Ir source for temporary prostate BT.

Category	Typical level (%)	Assumptions
Source strength	2	PSDL traceable calibrations
Treatment planning	3	Reference data with the appropriate bin width
Medium dosimetric corrections	1	Full scatter conditions in the pelvic region and for the prostate location are assumed
US-based Treatment planning and delivery: Catheter reconstruction and source positioning accuracy	2	Assuming usage of dedicated catheter reconstruction tools (catheter free-length measurement based methods) for an accurate (0.7 mm) reconstruction of catheter tip and 1.0 mm source positioning accuracy by the afterloader for straight catheters and transfer tubes
US-based 2D and 3D-imaging overall effect	2	US QA performed according to AAPM TG-128 report
Changes of catheter geometry relative to anatomy between intraoperative treatment planning and intraoperative treatment delivery	2	Assuming that new image acquisition and treatment plan calculation is done always before each fraction. It is also required that no manipulation of the implant and anatomy occurs, as it is the case when removing/manipulating the US-probe or moving the patient from the operation table before treatment delivery
Target contouring uncertainty	2	Using CT or CT + T2 imaging
Total dosimetric uncertainty ($k = 1$)	**5**	For treatment delivery without patient movement and changes in the lithotomic set-up and with the US probe at the position of the acquisition (transversal plane at the prostate base)

Kirisits et al. Radiother Oncol. Jan 2014; 110(1): 199–212.

Kiel experience with BrachyVision (v8.8) for HDR prostate

- 38 implants tested

  Conventional vs. Inverse planning

Table 2
Dosimetric and quantitative parameters used for analysis

Parameters	Conventional planning	Inverse planning	*p*-Value
D_{90} CTV_1 (Gy)	5.62	5.63	0.67
D_{90} CTV_2 (Gy)	11.03	10.89	0.38
V_{200} CTV_1 (%)	29.83	29.87	0.80
V_{200} CTV_2 (%)	5.76	8.14	<0.01
DNR CTV_1	0.70	0.68	0.87
DNR CTV_2	0.34	0.36	<0.01
COIN CTV_1	0.26	0.30	0.17
COIN CTV_2	0.54	0.52	0.86
$D_{2\ cc}$ rectum (Gy)	6.04	6.12	0.09
$D^*_{2\ cc}$ rectum (Gy)	6.04	6.00	0.32
$D_{0.1\ cc}$ urethra (Gy)	9.57	9.02	0.34
$D^*_{0.1\ cc}$ urethra (Gy)	9.57	8.94	<0.01

CP = conventional planning; IP = inverse planning optimization; CTV = clinical target volume; DNR = dose nonhomogeneity ratio; COIN = conformity index.

The means of 38 plans considered are shown. Statistically significant is the difference in V_{200} CTV_2 and the reduction of the urethral dose of $D^*_{0.1\ cc}$ urethra.

Siebert et al. Brachytherapy 2014; 13(3)

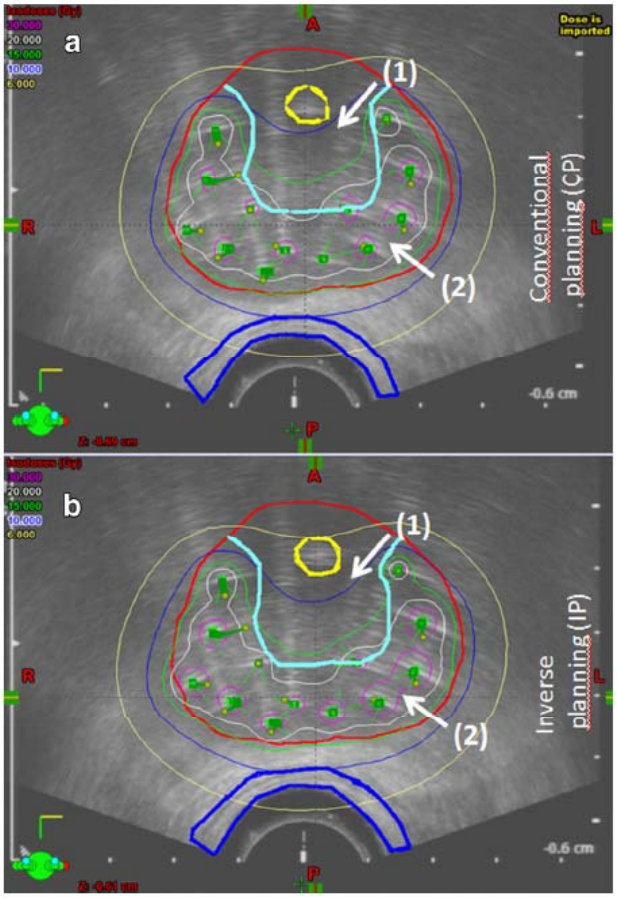

Fig. 1. Comparison of the dose distribution of an arbitrary patient using conventional planning (CP; a) and inverse planning (IP; b). White arrows outline the major differences between those two planning types: The CP leading to more dosage to the organs at risk (1), the IP creating hot spots within the clinical target volume (2).

St James's Institute of Oncology

Functional MRI guided HDR prostate brachytherapy tumour boost

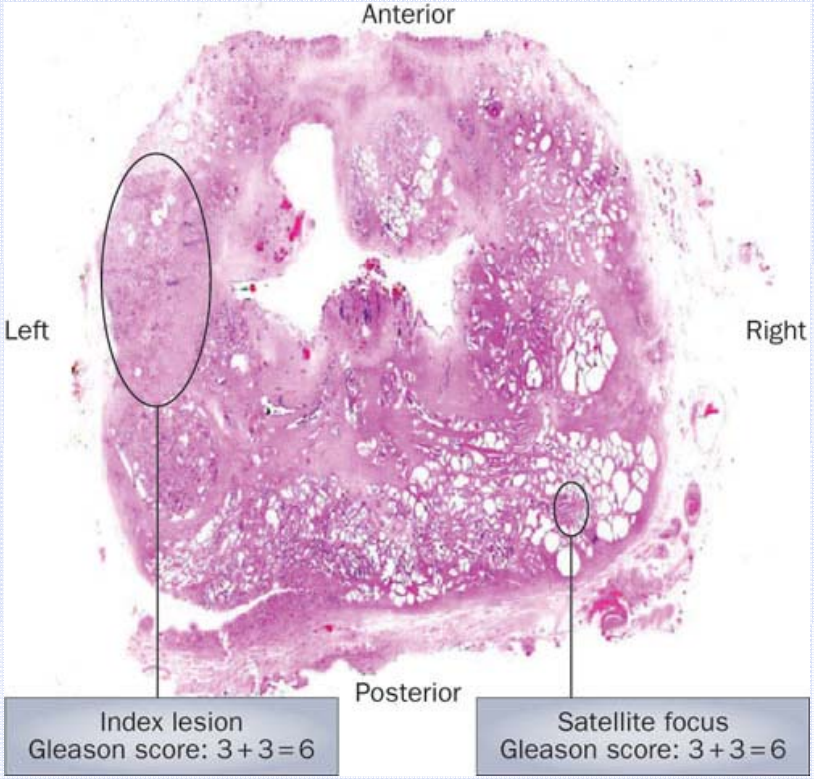
The Leeds Teaching Hospitals NHS
NHS Trust

Background

- HDR prostate brachytherapy
- Trans-rectal ultrasound guided catheter insertion and treatment planning
- 15Gy to whole prostate in 1 fraction followed by 37.5 Gy/15 fraction external beam treatment

Rationale for study

- High dose/fraction may be radiobiologically advantageous
- Multiple randomised controlled trials demonstrate increased prostate cancer cure rates with higher doses of radiation
- Studies have shown that biological behaviour of prostate cancer may be driven by dominant lesion



Karavitakis, M. *et al.* (2010) Tumor focality in prostate cancer: implications for focal therapy *Nat. Rev. Clin. Oncol.* doi:10.1038/nrclinonc.2010.190

MR acquisition/processing

- 15 pts, T2c or T3a disease, 12/15 patients had neo-adjuvant hormone therapy
- T2 weighted (T2W), diffusion weighted (DWI) and dynamic contrast enhanced (DCE) MRI
- Phased-array pelvic and spine coils
- DWI (b-values 0, 150, 500 s/mm^2) - ADC map generated by scanner
- DCE (200 x 2-s 3D acquisitions) - generated Ktrans map from 1-compartment model and arterial input function, using PMI[1]

1 - PMI: Platform for research in medical imaging: see Quantification of cerebral blood flow, cerebral blood volume, and blood-brain-barrier leakage with DCE-MRI. Sourbron S, Ingrisch M, Siefert A, Reiser M, Herrmann K. Magn Reson Med. 2009 Jul;62(1):205-17.

F-GTV delineation

F-GTV = union of suspicious areas in all 3 MRI datasets

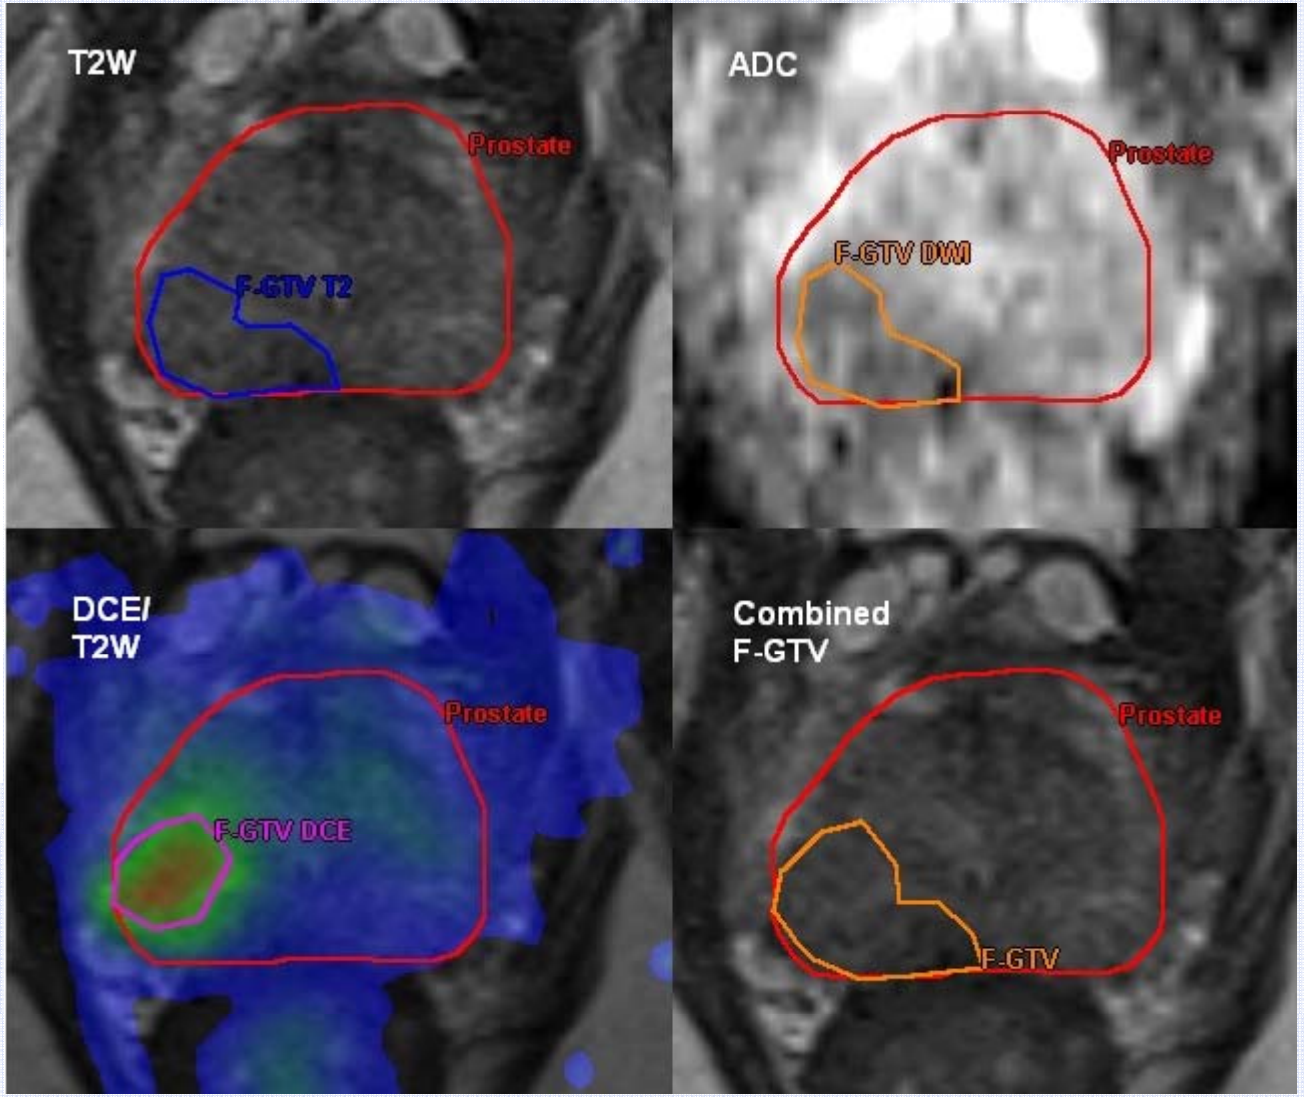


Image registration MRI-TRUS

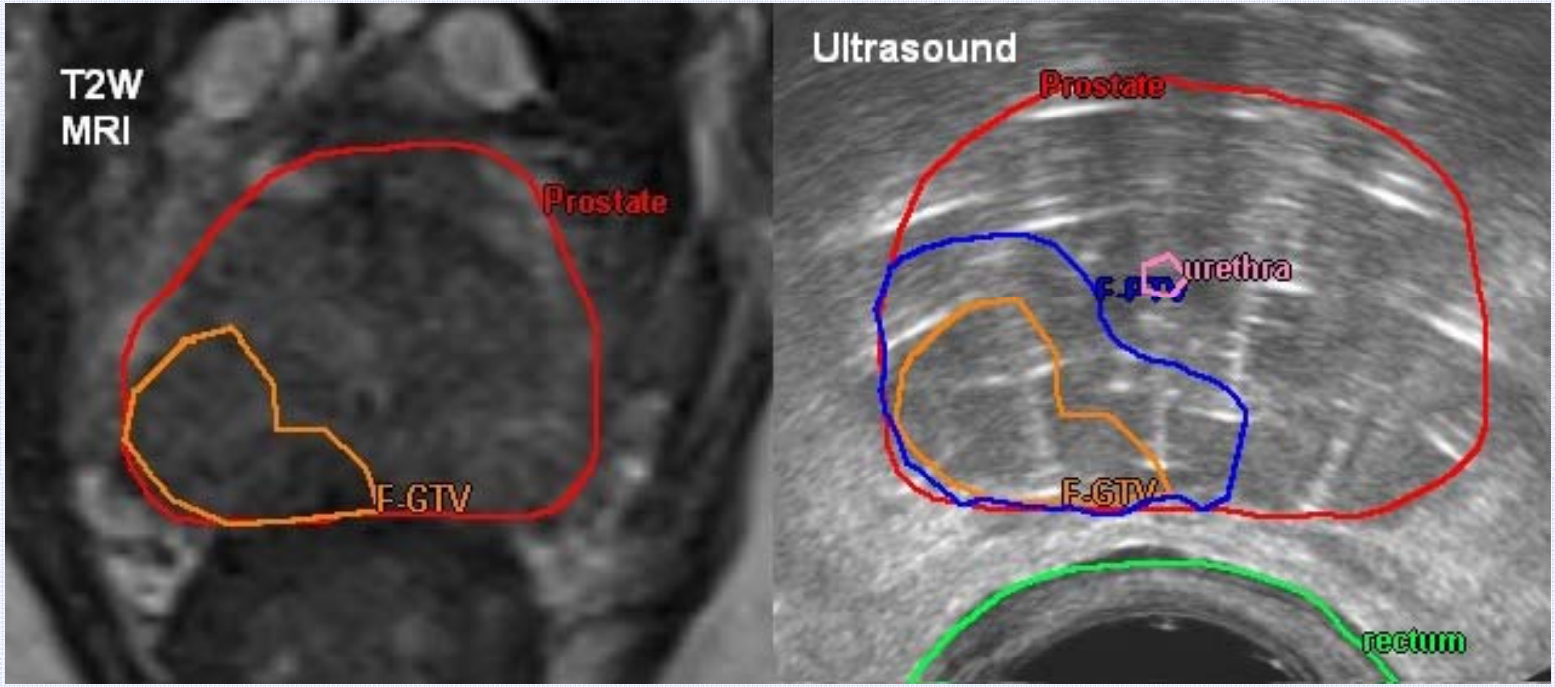
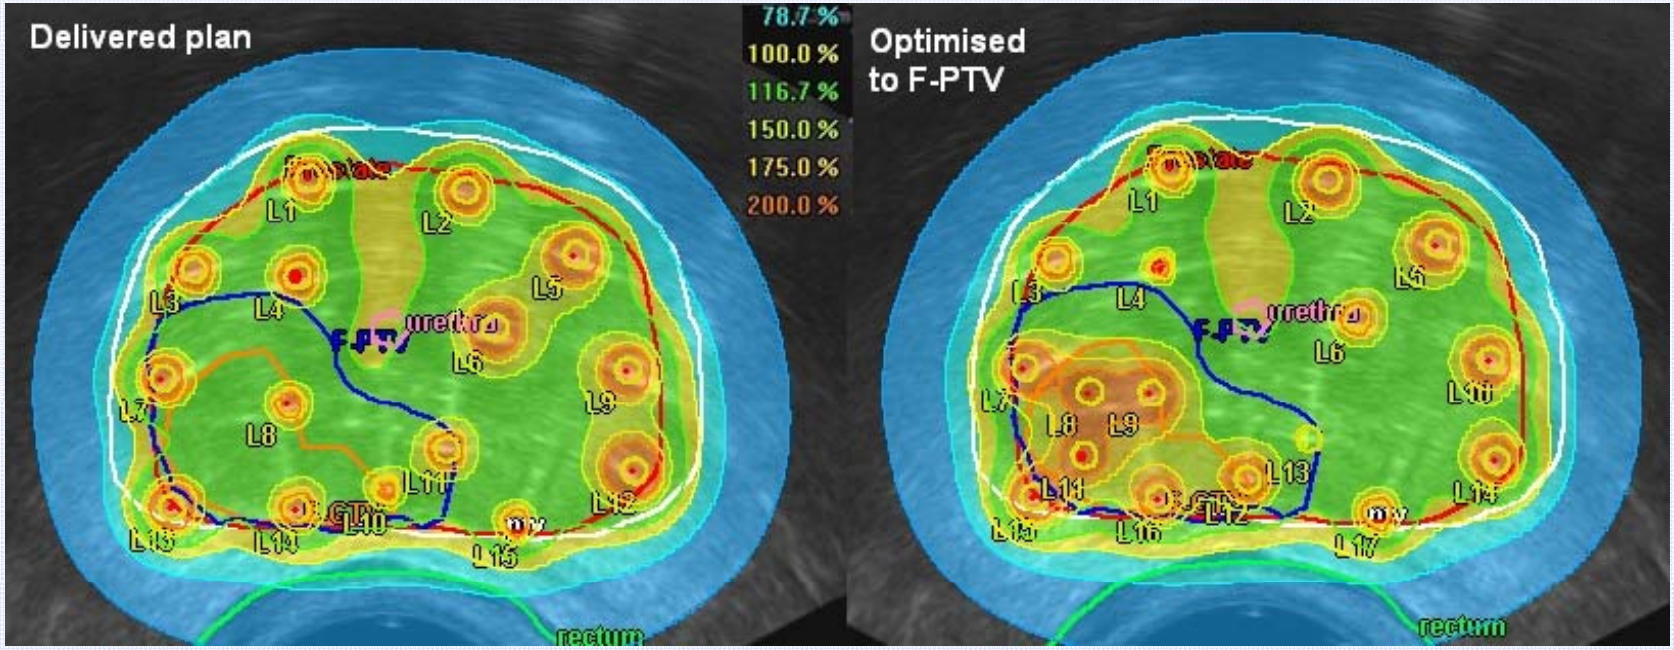
- Manual rigid registration
- Margin added to F-GTV (constrained by prostate/OAR) to create F-PTV



Dose optimisation

- Compared delivered plan to plan optimised to boost dose to F-PTV
- Added up to 2 needles to target F-PTV if necessary
- Maintain dose objectives/constraints for prostate, PTV, urethra, rectum



Results – median values for 15 patients

	Volume (cc)	DVH parameter	Objective/ constraint	Delivered plan	Optimised to F-PTV
Prostate	29.7	V100 (%)	>95%	99.5	99.4
		D90 (Gy)	-	16.8	17.0
PTV	43.3	V100 (%)	>90%	90.7	93.7
Urethra	0.3	D10 (Gy)	<17.5Gy	17.2	17.4
Rectum	13.2	D2cc (Gy)	<11.8 Gy	8.0	9.1
F-GTV	1.9	D90 (Gy)	-	18.2	23.4
		V150 (%)	-	23.2	99.2
F-PTV	6.5	D90 (Gy)	-	17.6	20.9
		V150 (%)	-	27.3	75.9

Summary

- MRI guided tumour boost is feasible
- Main uncertainties are in tumour delineation and image registration
- F-PTV boost dose is achievable in HDR brachytherapy

Prostate Brachytherapy Course

“Outcome of LDR prostate brachytherapy”

C. Salembier

Outcome of LDR prostate brachytherapy

C. Salembier

Department of Radiotherapy-Oncology
Europe Hospitals – Brussels - Belgium

Treatment options - localized prostate cancer

External beam radiotherapy

Hormonal treatment

Interstitial: low or high dose rate

(robotic) surgery

Localized prostate cancer: heterogeneous group of tumours

Prognostic groups: Good – Intermediate - Poor

Depending on:

- Extension of the tumour
- Initial PSA
- Gleason Score

Low Risk	Intermediate Risk	High Risk
Stage: T1 or T2a,b Gleason Sum ≤ 6 PSA ≤ 10 ng/ml	Stage T1 or T1-2 Gleason Score 7 PSA < 10 or Stage T1-2 Gleason 6 PSA 10-20	Stage T2c or T3 Gleason score ≥ 8 PSA > 20 ng/mL

Which treatment should be given?

No randomized trials

Comparing RP, EBRT, seeds:

Outcome:

Up to high risk patients:

- No difference in outcome
- Total BED dose matters

Toxicity

- Type of toxicity differs
- No difference severe toxicity rate

Quality of life

- No difference baseline – 6 months

CLINICAL INVESTIGATION **Prostate**

RADICAL PROSTATECTOMY, EXTERNAL BEAM RADIOTHERAPY <72 Gy, EXTERNAL BEAM RADIOTHERAPY ≥72 Gy, PERMANENT SEED IMPLANTATION, OR COMBINED SEEDS/EXTERNAL BEAM RADIOTHERAPY FOR STAGE T1–T2 PROSTATE CANCER

BJU INTERNATIONAL © 2012 BJU INTERNATIONAL | 109, SUPPLEMENT 1, 22–29

Literature review of all prostate cancer related papers published between 2000 and 2010

-5 strict criteria:
- minimum/median follow-up of 5 years
- stratification into low, intermediate and high risk groups
- clinical (and pathological) stage
- accepted definition for prostatic specific antigen failure
- more than 100 patients in each risk group (high risk > 50)

18000 papers - 848 treatment related – 140 papers encountering these criteria

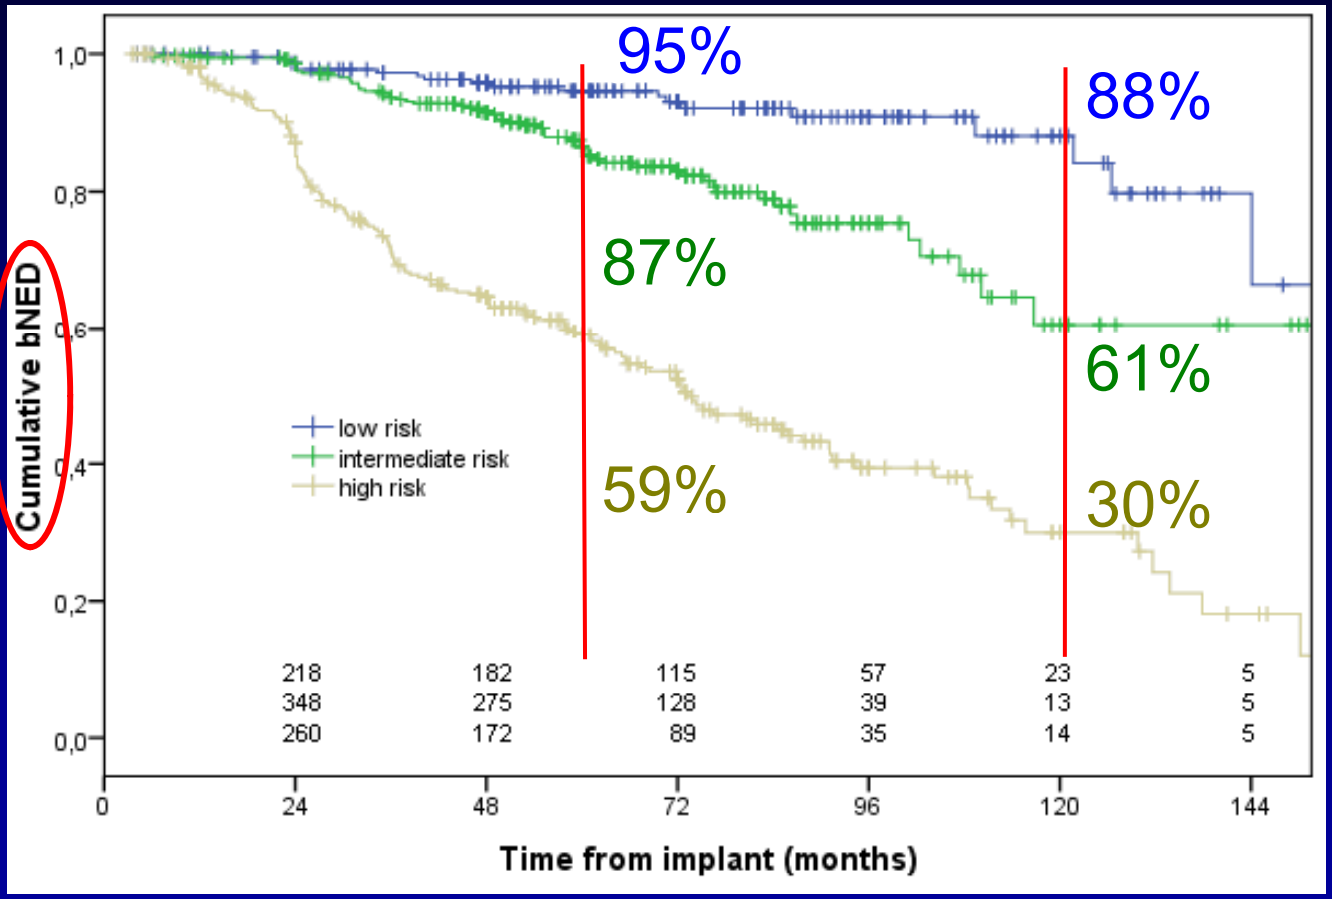
Long-term biochemical and survival outcome of 921 patients treated with I-125 permanent prostate brachytherapy

IJROBP 2010;76(5):1433-8.

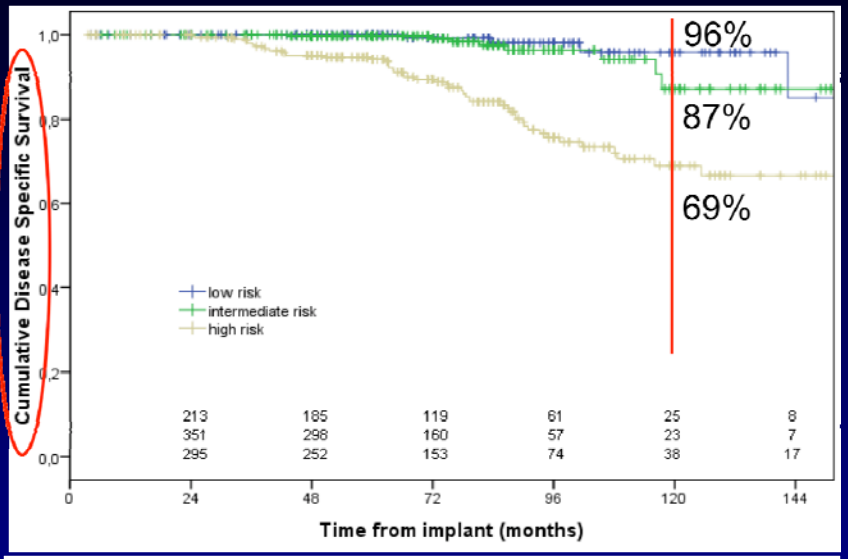
Hinnen et al.



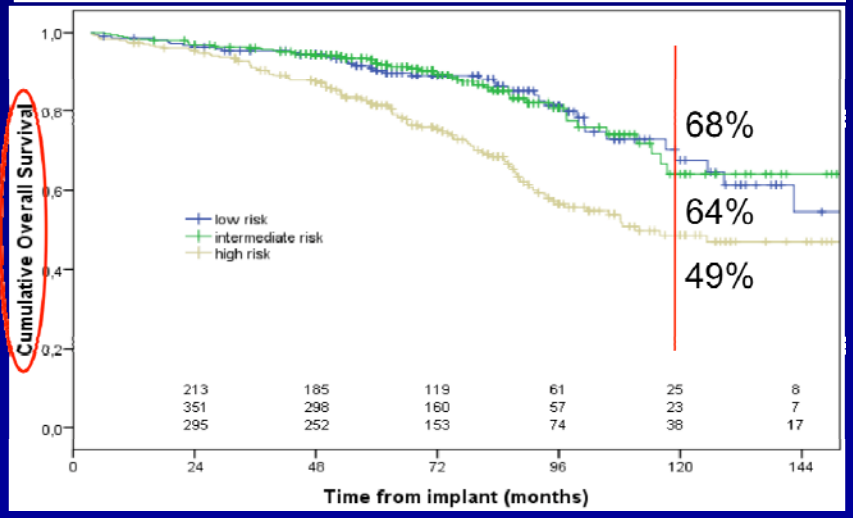
bNED

Long-term biochemical and survival outcome of 921 patients treated with I-125 permanent prostate brachytherapy

Hinnen et al.



Disease specific survival



Overal survival

Results given in terms of biochemical control ….

However, this biochemical control depends on “local” control but also on “distant” control

What about the “local cure rates” after PB?

Patterns of Recurrence After Low-Dose-Rate Prostate Brachytherapy: A Population-Based Study of 2223 Consecutive Low- and Intermediate-Risk Patients

Andrea C. Lo, MD, W. James Morris, MD, FRCPC, Tom Pickles, MD, FRCPC, Mira Keyes, MD, FRCPC, Michael McKenzie, MD, FRCPC, and Scott Tyldesley, MD, FRCPC

"we estimate that the local recurrence rate of LDR-PB in our study cohort likely lies in the range of 1.8% to 2.7%."

"In the context of the limitations of our study design, this population-based analysis indicates that the local recurrence rate after LDR-PB appears to be as low or lower than that following RP in our jurisdiction."

IJROBP, Vol 91, Issue 4, 15 March 2015, Pages 745–751

Distant and local recurrence in patients with biochemical failure after prostate brachytherapy

Richard G. Stock, Jamie A. Cesaretti, Pamela Unger, Nelson N. Stone

"Hence, at a median follow-up of 6.8 years, the local recurrence rate of the Mt. Sinai cohort treated with LDR-PB should fall between 1.3% and 4.5%"

Brachytherapy, 7 (2008), pp. 217–222

Patterns of failure after iodine-125 seed implantation for prostate cancer ☆

David S. Lamb [a,b,*], Lynne Greig [c], Grant L. Russell [d], John N. Nacey [a,d], Kim Broome [e], Rod Studd [d], Brett Delahunt [a], Douglas Iupati [b], Mohua Jain [f], Colin Rooney [c], Judy Murray [a], Peter J. Lamb [a], Peter B. Bethwaite [a]

"by combining the 0.2% who had local failure with the 2.2% whose site of failure was unknown, the local relapse rate should range from 0.2% to 2.4%"

Radiotherapy and Oncology 112 (2014) 68–71

10-YEAR EXPERIENCE WITH I-125 PROSTATE BRACHYTHERAPY AT THE PRINCESS MARGARET HOSPITAL: RESULTS FOR 1,100 PATIENTS

JUANITA CROOK, M.D.,* JETTE BORG, PH.D.,† ANDREW EVANS, M.D.,‡ ANTS TOI, M.D.,¶
E. P. SAIBISHKUMAR, M.D.,* SHARON FUNG, M.SC.,§ AND CLEMENT MA, M.SC.§

In the Toronto study of 776 patients, all patients with a PSA rising beyond 30 months were investigated by prostate biopsy examination,
and, if the biopsy was negative, systemic staging was initiated as PSA approached 10 ng/ml and there were:

- 8 local failures (1.0%)
- 8 distant failures (1.0%)
- 9 failures of unknown site (1.2%)

Thus, *the local relapse rate should range from 1.0% to 2.2%*, but it is likely to be closer to the biopsy-proven 1.0% of patients, because all other men with biochemical failure in this cohort had negative biopsy results

So…….monotherapy gives:

- excellent results for low risk disease
- very good results for intermediate risk disease
- not optimal results for high risk disease

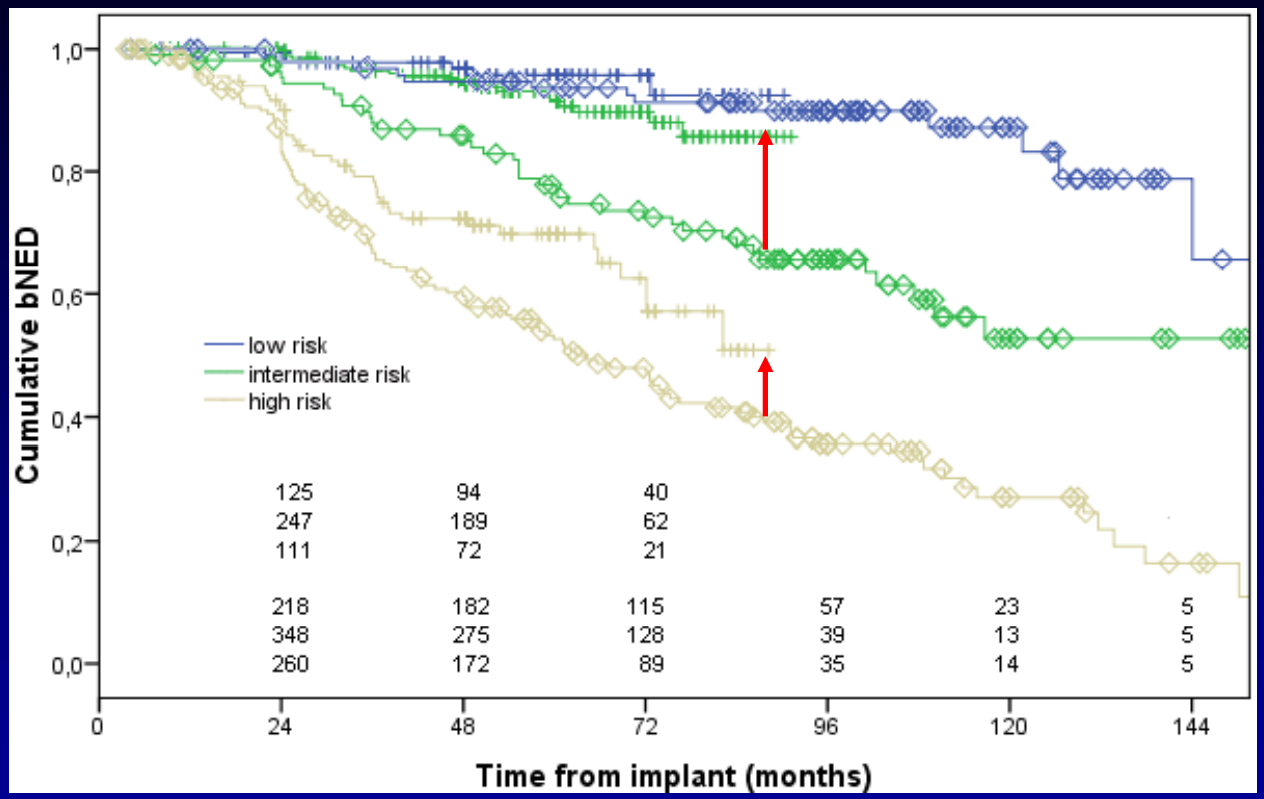
Seeds: factors that might or might not influence outcome

Factors:

1. Implant related -technique:
   - Margins
   - D90
   - Total BED
   - …
2. Risk groups - individual tumor characteristics – staging uncertainties
3. Age

1. Hormonal therapy
2. PSA bouncing
3. Obesity
4. …

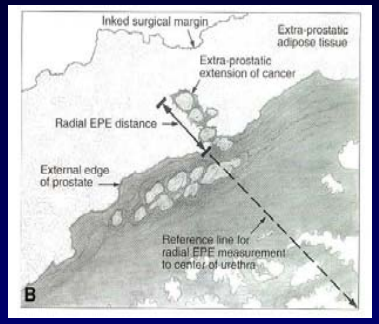
UMC database: bNED before and after 2000



n=921 - 1989-2004

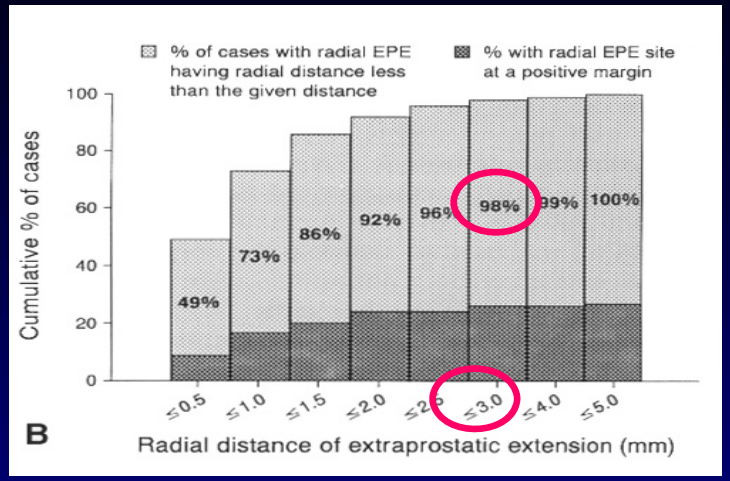
- There seems to be a trend for improved outcome in time
- Raison: technique? patient selection? learning curve? other factors?

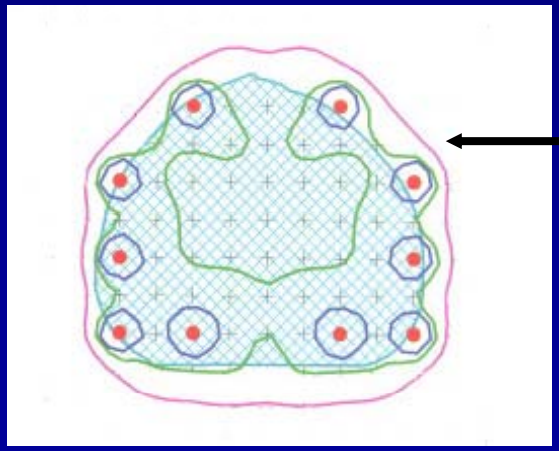
Implant related: Margins:



-105 prostatectomies
-Gleason 6.3 (range 3-9)
-PSA 8.6 (range 0.3-98)

Davis et al. Cancer 85(12) 1999



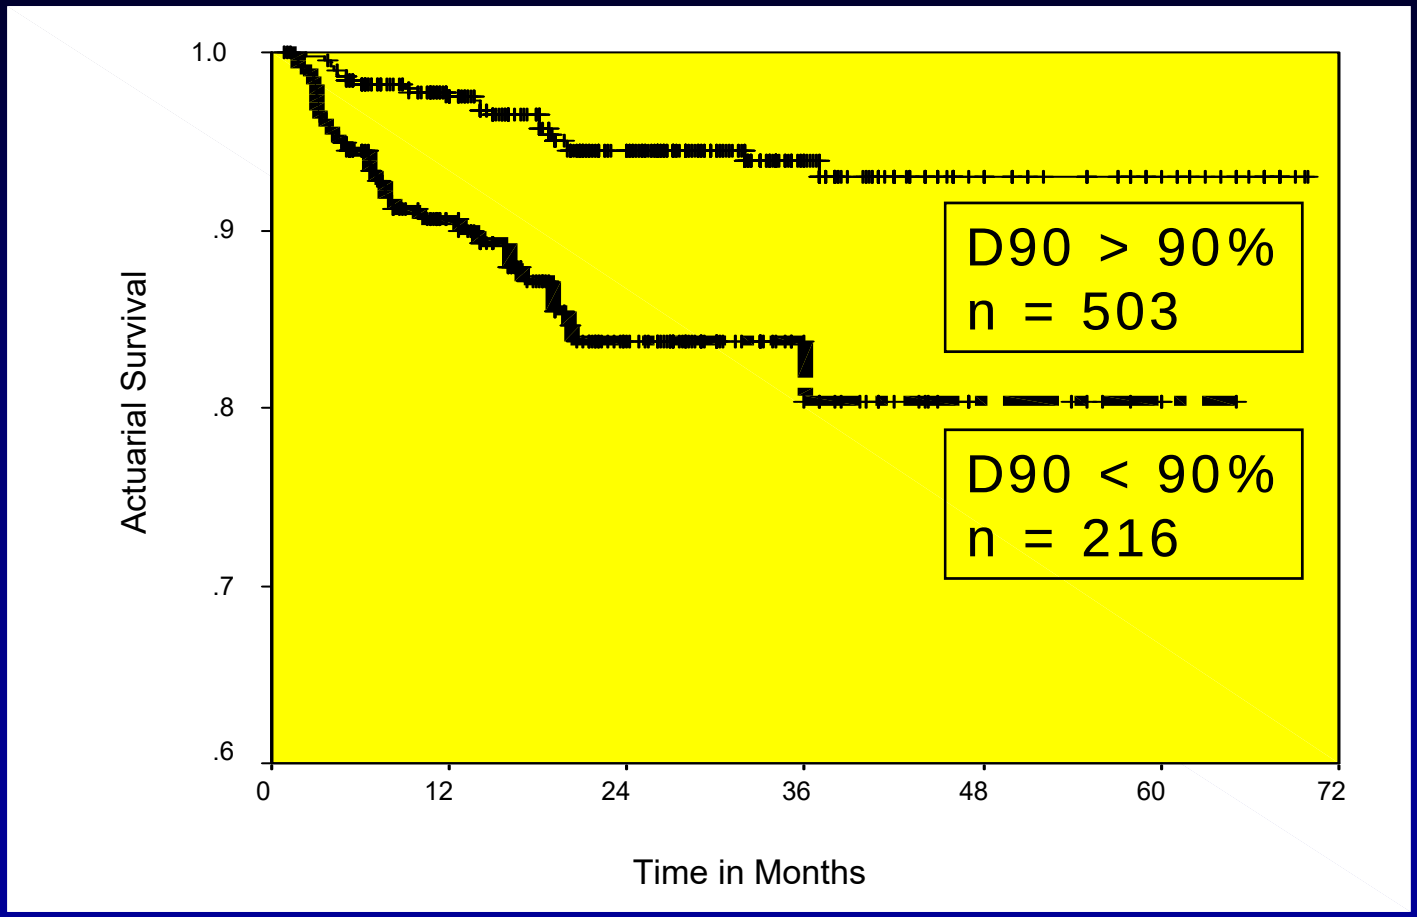


Extraprostatic disease

3 mm margins :

critical to success

Implant quality: Post-implant D90:



Potters et al Urology 62 (6) 2003

Risk groups - Staging:

- Finding capsula infiltration large consequences with regard to outcome
  - Choice of treatment (outcome, hormonal therapy)

- Differentiate between stage 2 and 3: specificity
  - Ultrasound 40 – 50%
  - MRI 80 – 90%

Still, current clinical practice Ultrasound….

Conclusion: many brachy studies in literature contain T3 patients

Risk groups – Individual tumor characteristics:

Biopsies: at random - systematic

- Chance of hitting tumor per biopsy=15-20%

Gleason score: poorly reproducible

- Biopsy agreement with prostatectomy: (n=1670)
  - Gleason 5-6 undergrading: 35%
  - Gleason 8-10 overgrading: 35%

PSA

- Suspected linear relation with amount of tumor cells
- Irreliable due to leakage, often false positive

Conclusion: Literature contains probably higher Gleason scores too

Age:

Treatment outcomes in men aged ≤55 yrs (1)

Abstract #2283

Men aged ≤55 yrs have excellent outcomes after treatment with Permanent Implant Brachytherapy

Age:

Figure 1. Kaplan–Meier curve for freedom from biochemical failure in patients aged ≤60 years versus >60 years. Log-rank test p=0.1

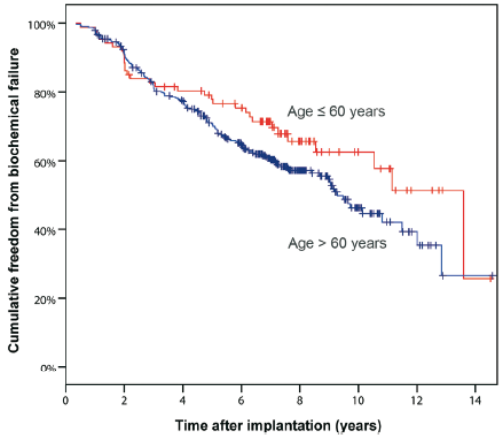

Figure 2. Kaplan–Meier curve for disease-specific survival in patients with aged ≤60 years versus > 60 years. Log-rank test p=0.1

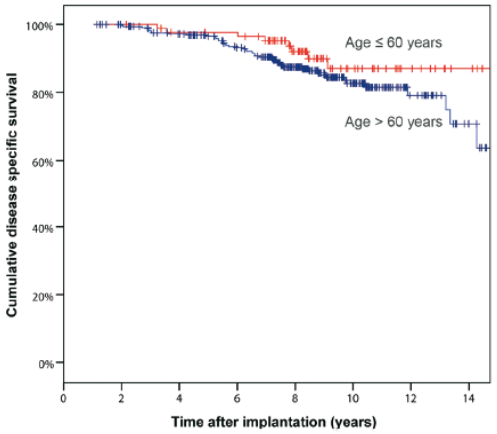

Figure 3. Kaplan–Meier curve for overall survival in patients aged ≤60 years versus >60 years. Log-rank test p<0.01

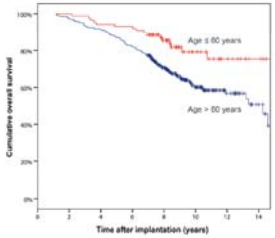
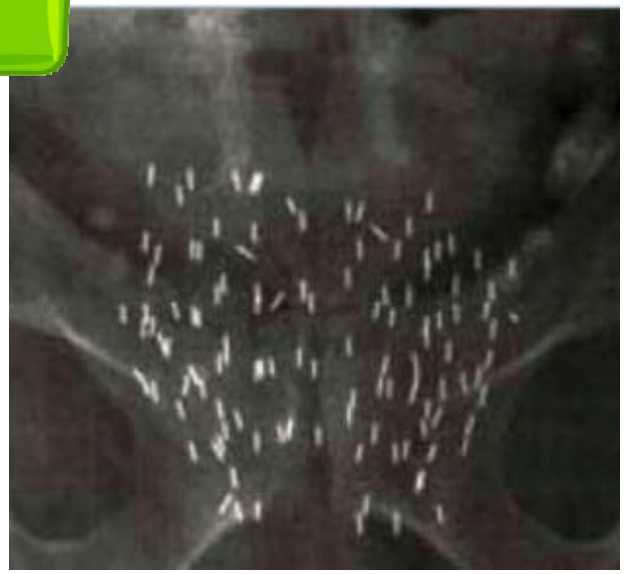


Karel A. Hinnen et al.
BJU International 05/2011
107(12):1906 - 1911.

Younger patients have excellent outcomes after treatment with Permanent Implant Brachytherapy



EBRT + seeds versus prostatectomy

Biochemical Relapse–Free Survival in Prostate Cancer Patients With Gleason Score ≥ 8 Treated With Radical Prostatectomy or Interstitial Brachytherapy Implant With Supplemental Beam Radiation

Treatment Modality	Institution	Sample Size	Follow-up	Failure Definition	BRFS Rate
Radical prostatectomy	Johns Hopkins University[76]	220	10 yr	PSA > 0.2 ng/mL	27%
	Mayo Clinic[77]	584	7 yr	PSA > 0.4 ng/mL	37%-47%
	Memorial Sloan-Kettering[78]	274	10 yr	PSA > 0.4 ng/mL	47%
	Northwestern University[79]	237	10 yr	PSA > 0.2 ng/mL	32%
Brachytherapy + EBRT (± ADT)	Dattoli Cancer Center[15]	26	14 yr	ASTRO consensus; PSA > 0.2 ng/mL; and nadir + 2 ng/mL	80% (Gleason 8) 56% (Gleason 9)
	Seattle Prostate Institute[3]	23	15 yr	2 consecutive PSA rises	61%
	Mount Sinai[11]	124	7 yr	ASTRO consensus	77.5%
	Schiffler Cancer Center[14]	120	10 yr	PSA > 0.4 ng/mL	89% (+ADT) 80% (–ADT)
	Puget Sound VA Hospital[80]	47	5 yr	PSA > 0.5 ng/mL	56% (Gleason 8) 60% (Gleason 9)

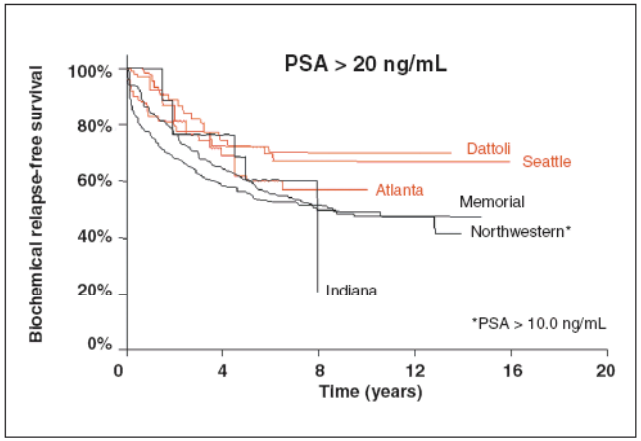


Figure 5: Survival After Brachytherapy vs Prostatectomy, by PSA Level—Biochemical relapse-free survival among patients with prostate-specific antigen (PSA) > 20 ng/mL treated definitively with brachytherapy and supplemental external-beam radiation (red) or radical prostatectomy (black).

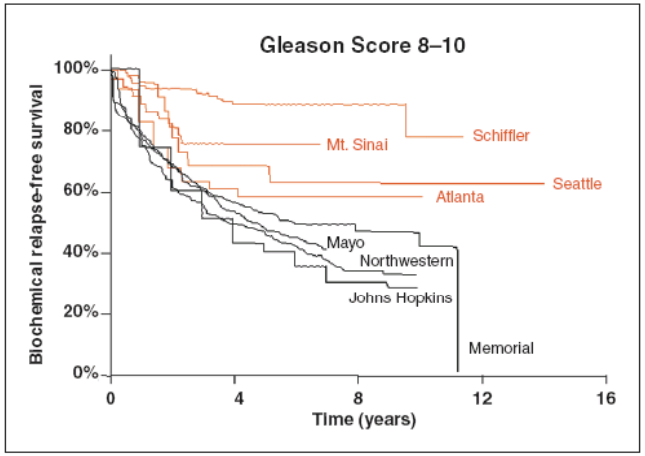

Figure 4: Survival After Brachytherapy vs Prostatectomy, by Gleason Score—Biochemical relapse-free survival among patients with Gleason score 8–10 treated definitively with brachytherapy and supplemental external-beam radiation (red) or radical prostatectomy (black).

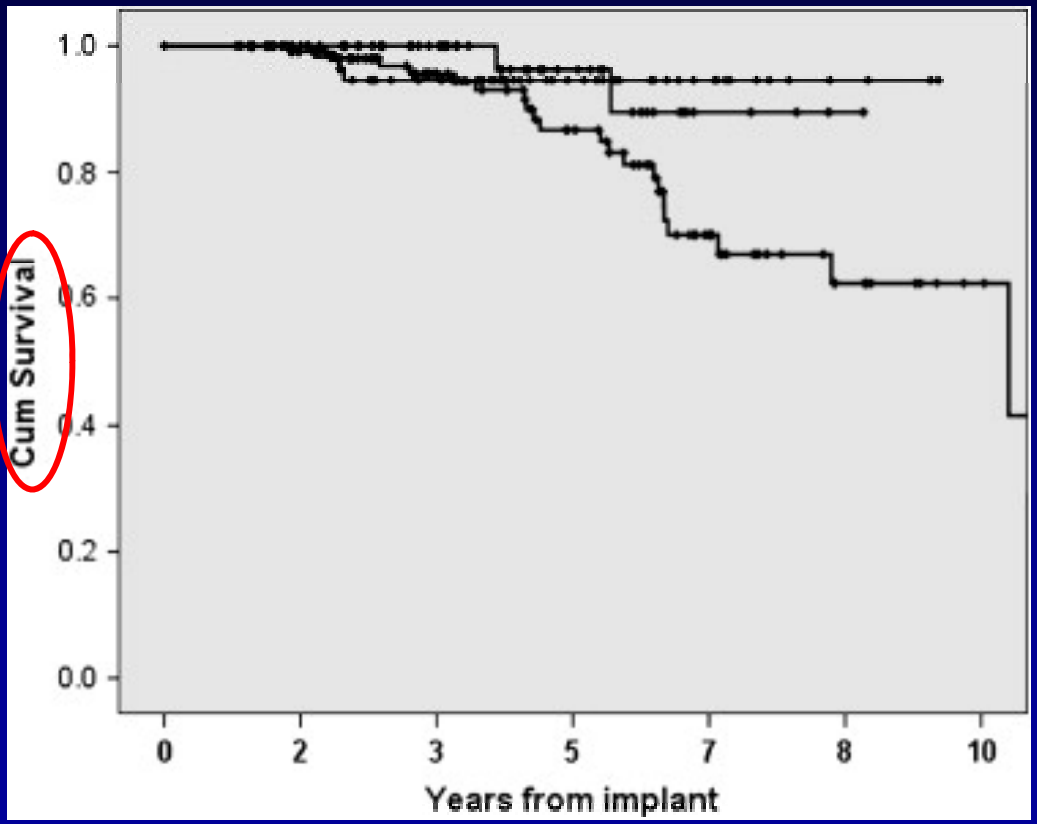
High risk patients: EBRT + seeds (+ADT)

Survival by dose group for Gleason 8–10
Treatment: EBRT + seed implant + ADT



Overall survival

- < 200 Gy 86.6%
- 200–220 Gy 89.4%
- > 220 Gy 94.6%

($p < 0.05$)

(Stone 2009)

The Addition of Low-Dose-Rate Brachytherapy and Androgen-Deprivation Therapy Decreases Biochemical Failure and Prostate Cancer Death Compared With Dose-Escalated External-Beam Radiation Therapy for High-Risk Prostate Cancer

Mark Shilkrut, PhD, MD[1]; Gregory S. Merrick, MD[2]; P. William McLaughlin, MD[1]; Matthew H. Stenmark, MD[1]; Eyad Abu-Isa, MD[1]; Sean M. Vance, MD[1]; Howard M. Sandler, MD[3]; Felix Y. Feng, MD[1]; and Daniel A. Hamstra, MD, PhD[1]

In conclusion, the results from this multi-institutional, retrospective study suggest that, for patients with HiRPCa, the receipt of an LDR brachytherapy boost decreased the risk of BF and PCSM compared with dose-escalated EBRT. Furthermore, even with dose-escalated EBRT or combination therapy, ADT decreased BF and PCSM in a duration-dependent fashion, and the greatest benefit was observed for long-term ADT. Validation of these findings in the University of British Columbia Androgen Suppression Combined with Elective Nodal and Dose-Escalated RT trial, which is comparing dose-escalated EBRT (78 Gy) versus CMRT plus ^{125}I LDR boost (both with 12 months of ADT), may significantly change the treatment standard for patients with HiRPCa.[31]

RTE + Seeds (+ ADT) > (Dose escalated) RTE (+ ADT)

Cancer 2013;119:681-90.

Comparison of high-dose (86.4 Gy) IMRT vs combined brachytherapy plus IMRT for intermediate-risk prostate cancer

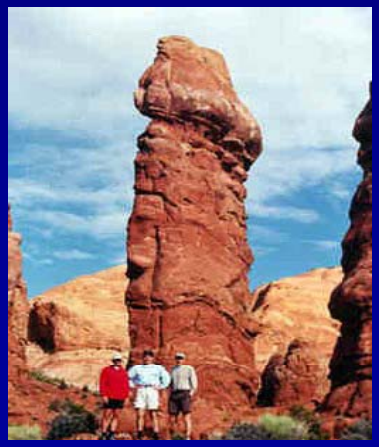
Quality of Life – Side Effects



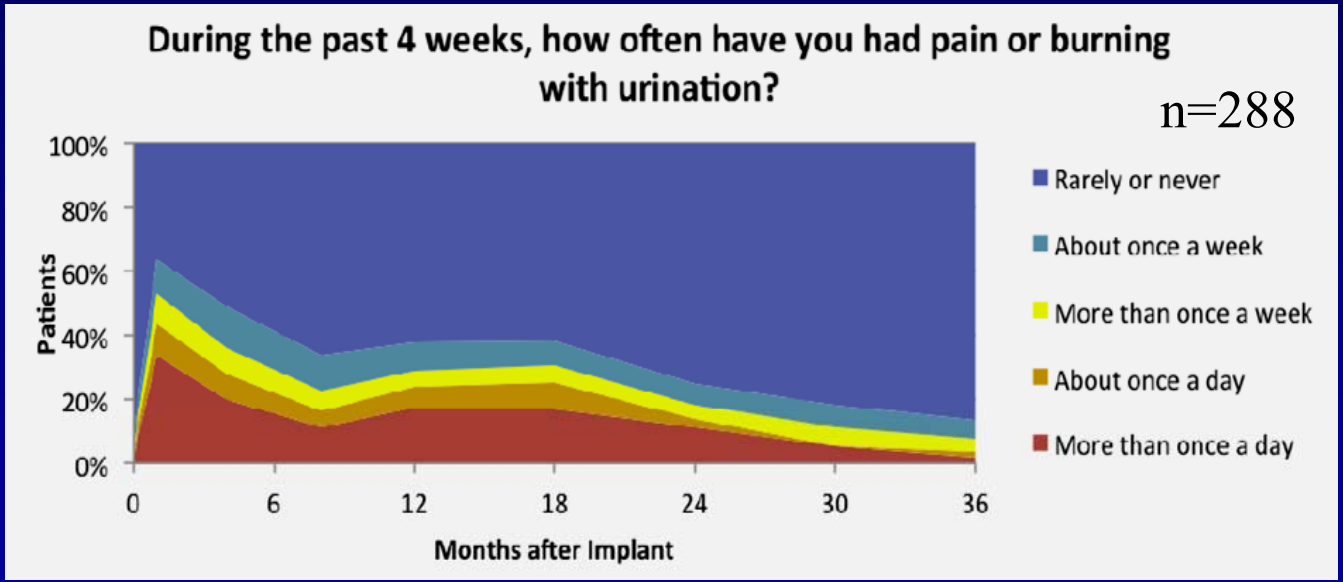
Toxicity grading:

- Severe toxicity (grade ≥ 3) most important
- Urinary Grade ≥ 3 toxicity rates:
  - Acute urinary retention: ± 10% (5-34%) = highest incidence
  - Urinary incontinence: ±1.5% (0-17%)
  - Urinary bother: ± 1-3%
  - Hemorr. cystitis <<<1%
  - Infection <<<1%
  - Fistula <<<1%
- Rectal Grade ≥ 3 toxicity rates: <1%
- Erectile dysfunction: complicated, baseline function matters

Anderson et al. Urol 2009;74:601-5
Gore et al. JNCI 2009;101:888-92
Bottomley et al. RO 2007;82-46-9
Chen et al. JCO 2009;27:3916-22

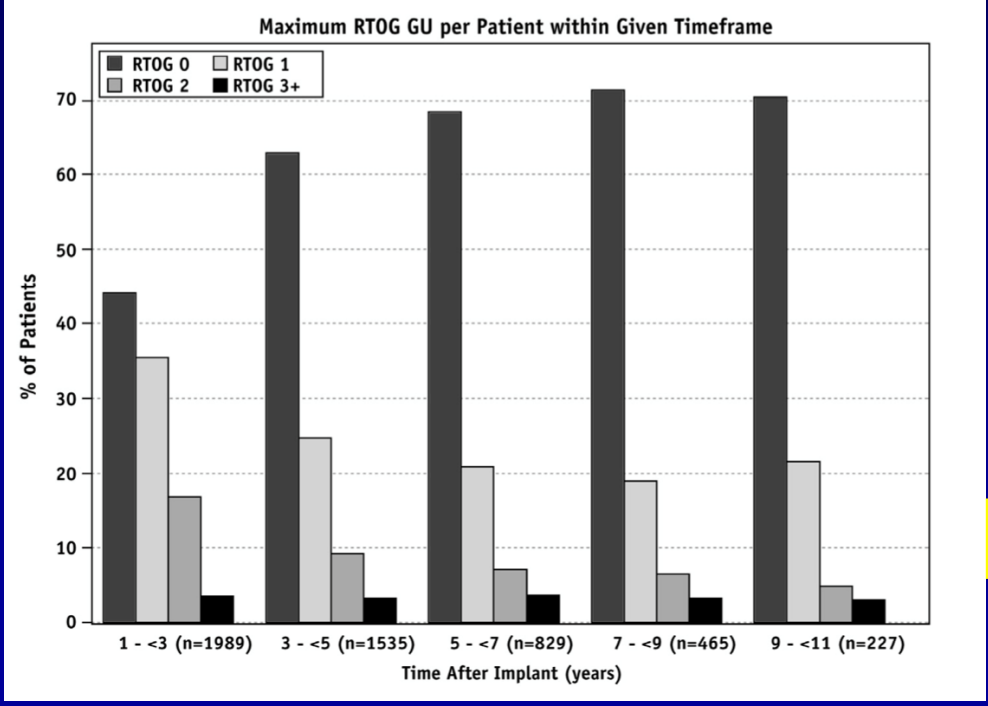
Urinary Bother

- Is pain or burning with urination
- Cause: detrusor overactivity
- Grade 3 urinary bother: 1-3%
- Even grade I and 2 urinary bother may severely disturb quality of life



Late Urinary Side Effects 10 Years After Low-Dose-Rate Prostate Brachytherapy: Population-Based Results From a Multiphysician Practice Treating With a Standardized Protocol and Uniform Dosimetric Goals

Mira Keyes, MD, Stacy Miller, MD, Tom Pickles, MD, Ross Halperin, MD, Winkle Kwan, MD, Vincent Lapointe, BSc, Michael McKenzie, MD, Ingrid Spadinger, PhD, Howard Pai, MD, Elisa K. Chan, MD, and W. James Morris, MD



"At 5-13 years' follow-up, 90% of patients have no (RTOG 0) or minimal (RTOG 1) urinairy morbidity"

"Long-term urinary toxicity is low"

Dose to the Bladder Neck Is the Most Important Predictor for Acute and Late Toxicity After Low-Dose-Rate Prostate Brachytherapy: Implications for Establishing New Dose Constraints for Treatment Planning

Lara Hathout, MD,* Michael R. Folkert, MD,* Marisa A. Kollmeier, MD,* Yoshiya Yamada, MD,* Gil'ad N. Cohen, MS,† and Michael J. Zelefsky, MD*

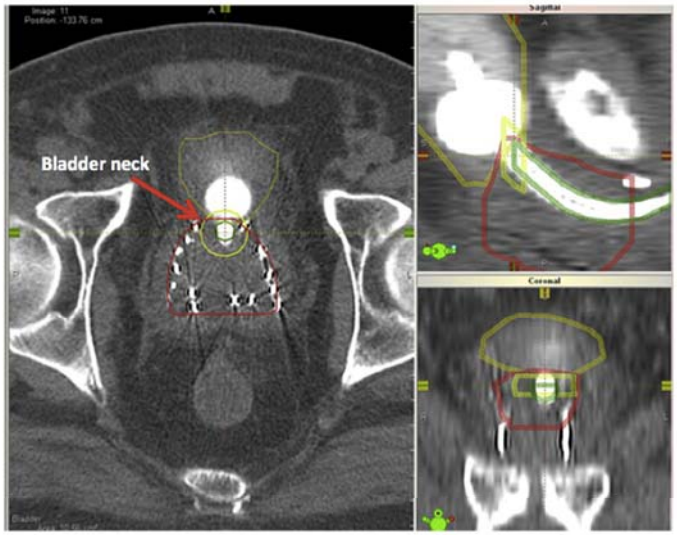


Fig. 1. Contour of bladder neck on computed tomographic scan on day 0 after implantation.

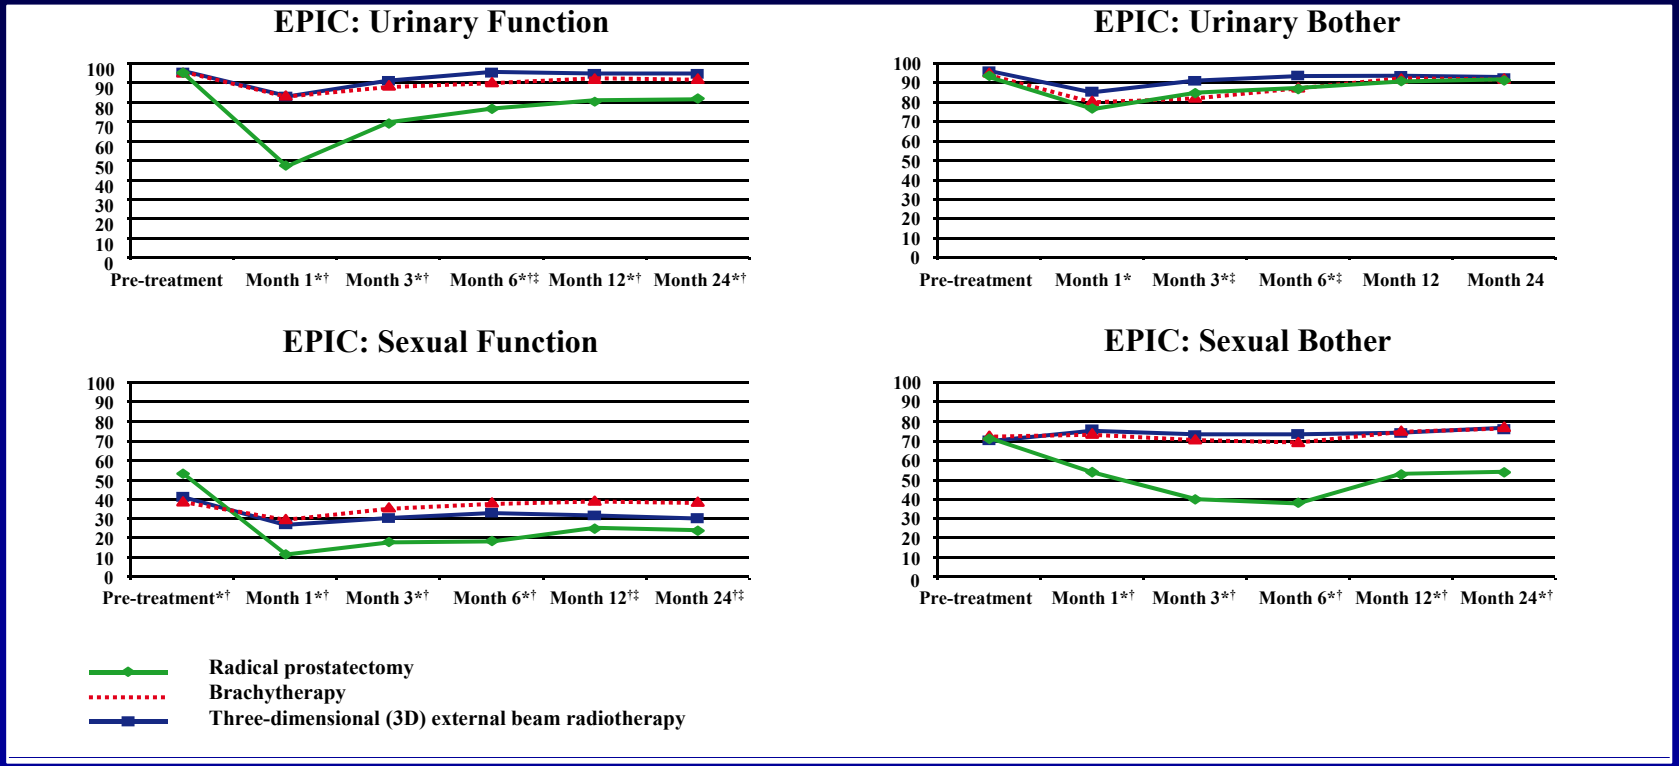
Bladder neck D2cc >50% was identified as a strong predictor of acute and late urinary toxicity in patients treated with LDR brachytherapy with and without supplemental EBRT. These data support the potential benefit for inclusion of bladder neck constraints into brachytherapy treatment planning, because constraining the dose to this region may decrease urinary-related symptoms after treatment. Our findings will require further studies to validate. A prospective study is presently under way at our institution to assess the validity of the proposed bladder neck dose constraint.

Int J Radiation Oncol Biol Phys, Vol. 90, No. 2, pp. 312-319, 2014

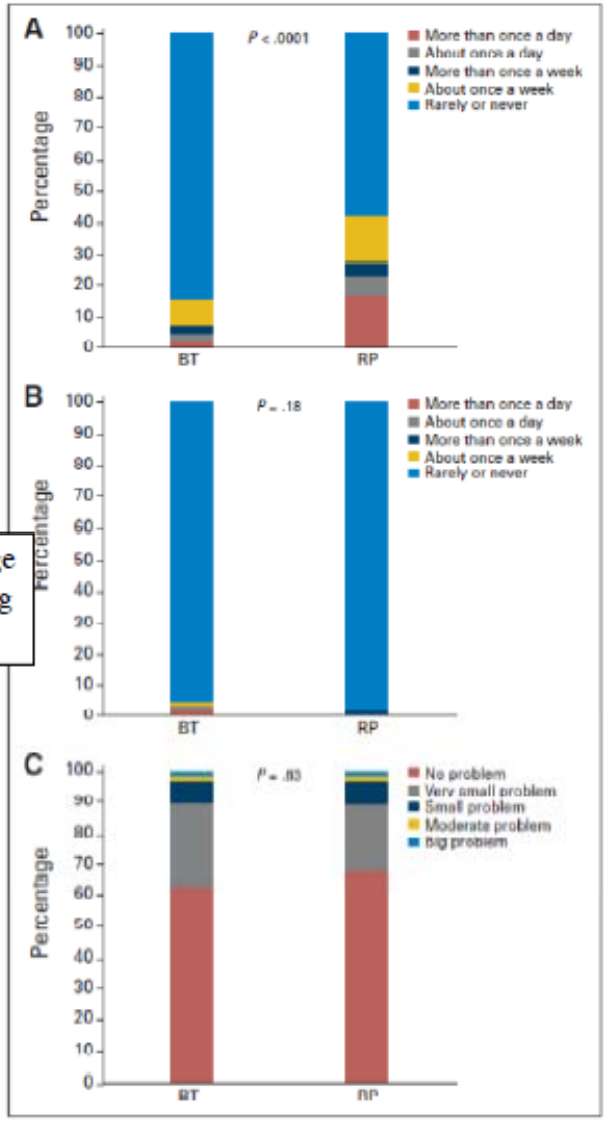
Quality of life following prostate cancer treatment

Prostate brachytherapy, prostatectomy and EBRT have different effects on patients' quality of life

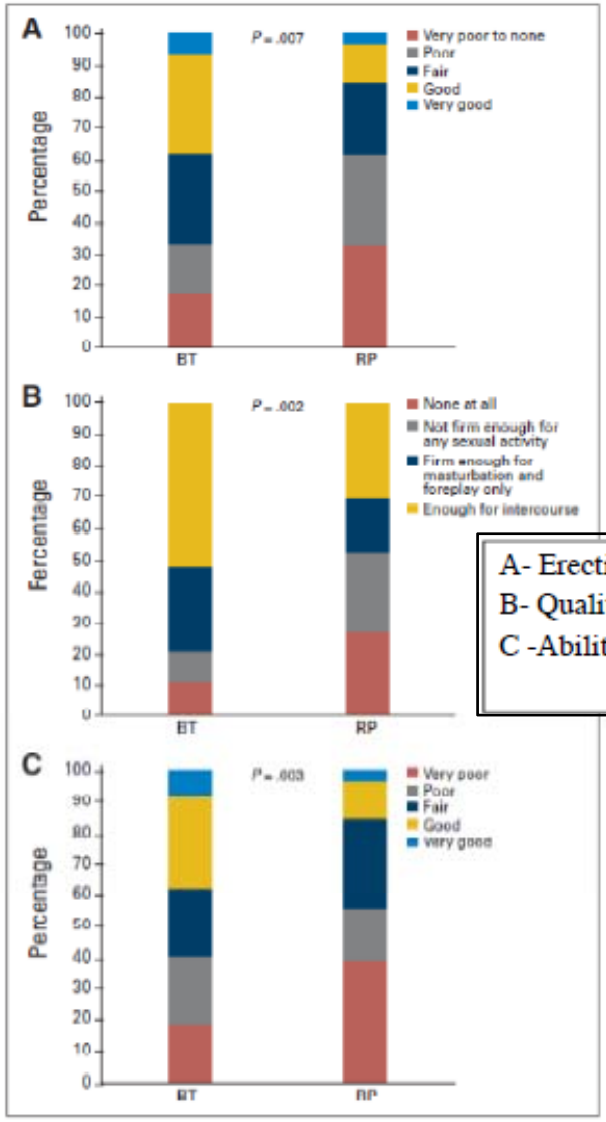


Ferrer M et al. *Int J Radiat Oncol Biol Phys* 2008; 72: 421–32.

- Crook J. et al : JCO 2010 29 362-368



A- urinary leakage
B -pain & burning
C -weak stream



A- Erection
B- Quality of E
C -Ability to sex

Brachytherapy	External Beam	Surgery
Less time of work	8 weeks of treatment + recuperation	6 -12 weeks recovery
Continence unaffected Mild LUTS in 70% Moderate LUTS in 30%	Continence unaffected Mild LUTS in majority Moderate LUTS in 50%	50% immediate continence 75% by 3 months 90-95% by 6 months
Very low gastro-intestinal toxicity	Moderate GI toxicity in majority Severe GI toxicity low, but dose related	Extremely low GI toxicity
Preservation of potency Preservation of ejaculation but may be reduced Fertility is preserved	Relative preservation of potency Preservation of ejaculation but may be reduced Potential impact on fertility	Potency never the same True ejaculation does not occur Infertile (need IVF)

Cave: - adjunction of adjuvant external beam after surgery
- adjunction of hormonal treatment

Conclusions

- Excellent long term results of permanent seed implants for low-risk and intermediate-risk patients
- High-risk patients may benefit from combined EBRT and seed treatment
- Toxicity is low and acceptable
- No decrease in long term QoL
- Quality assurance very important
- Anti-androgen therapy does not seem to influence outcome in seed monotherapy

THANK
YOU!

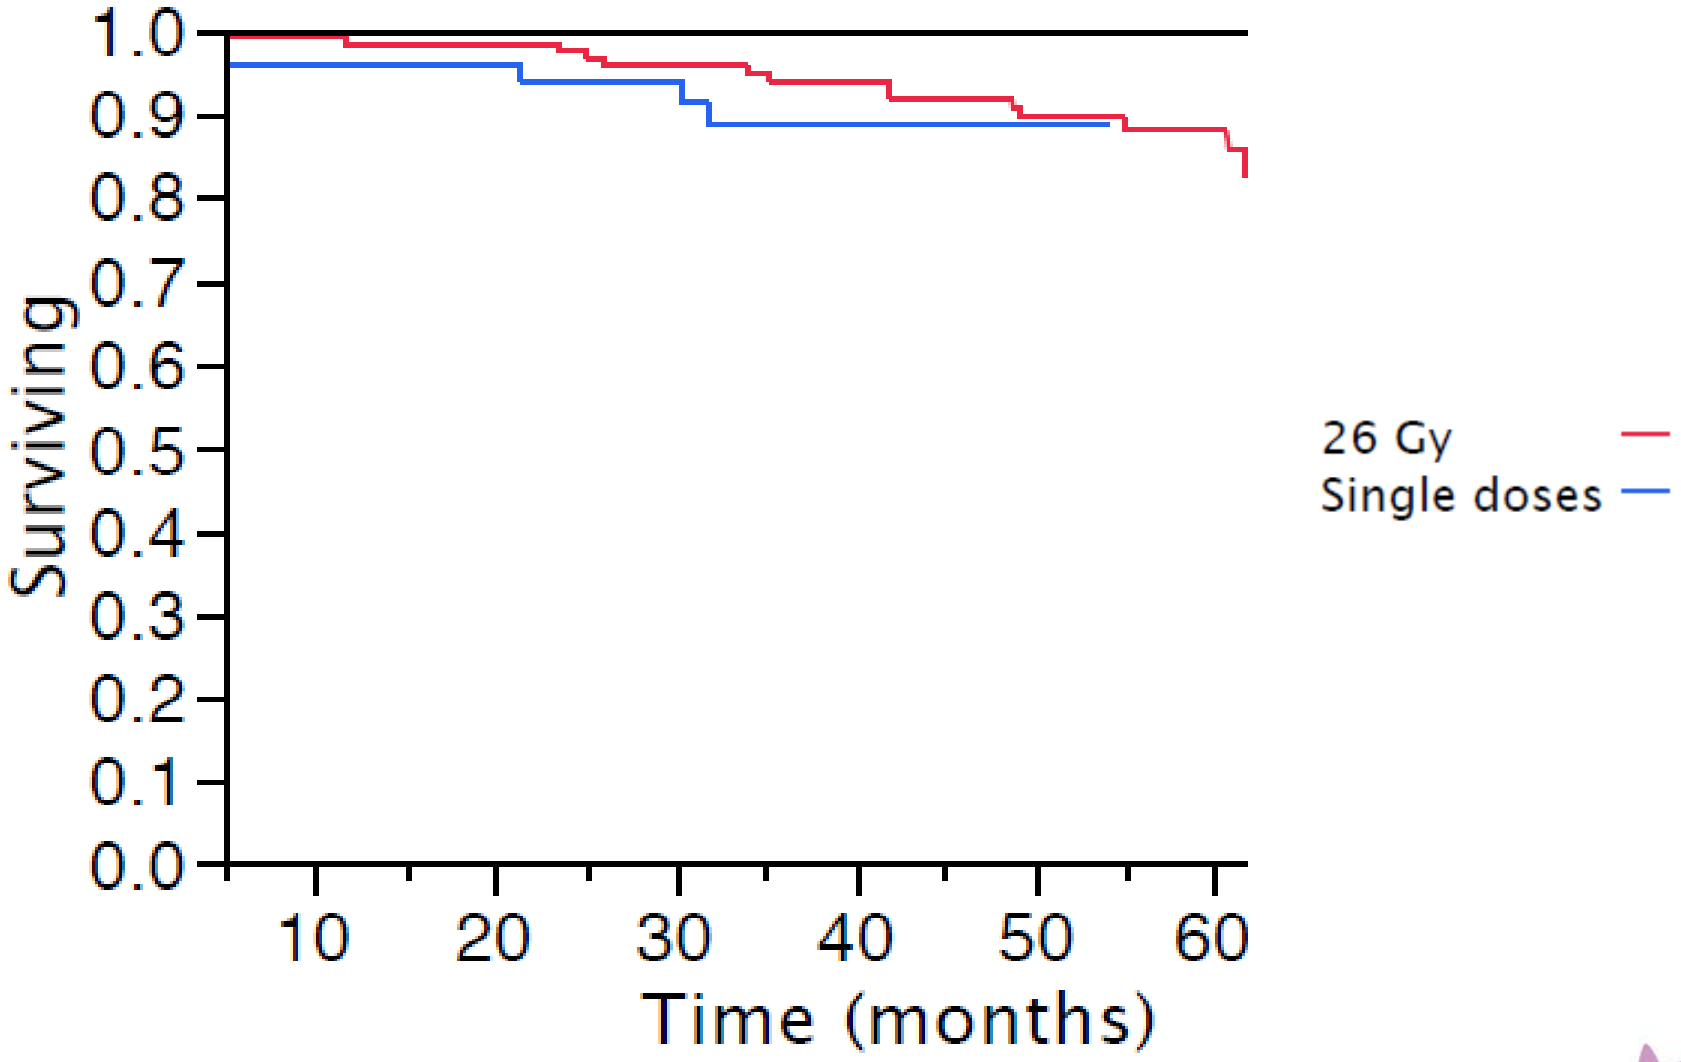
MVCC Biochemical RFS



ESTRO School

HDR BOOST

- **Optimal means of dose escalation for intermediate/high risk patients**
- **Dose escalation results in better PSA RFS**

- **Acute toxicity equivalent or less than external beam**
- **Late toxicity equivalent to external beam…but ?SABR**

HDR MONOTHERAPY

- **Early experience in advanced cases suggests high rates of biochemical control**
- **Optimal indication yet to be defined: ?intermediate/high risk…?low risk**

- **Acute toxicity less than seed brachytherapy**
- **Late toxicity profile may also be favourable with lower rates of late urinary and erectile dysfunction**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

Post plan imaging and dosimetry

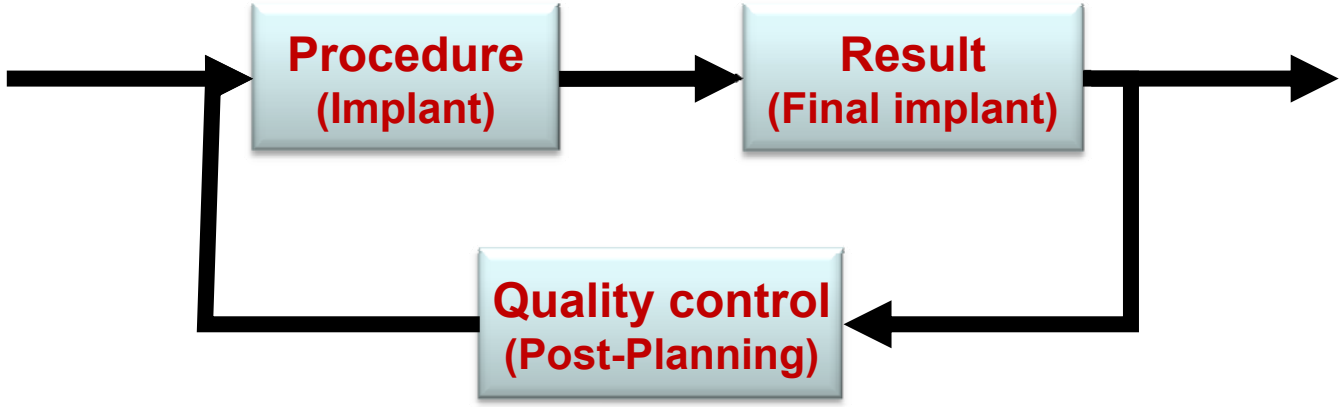
Frank-André Siebert

Campus Kiel, Clinic of Radiotherapy

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Why post-planning ?

Quality control feedback loop

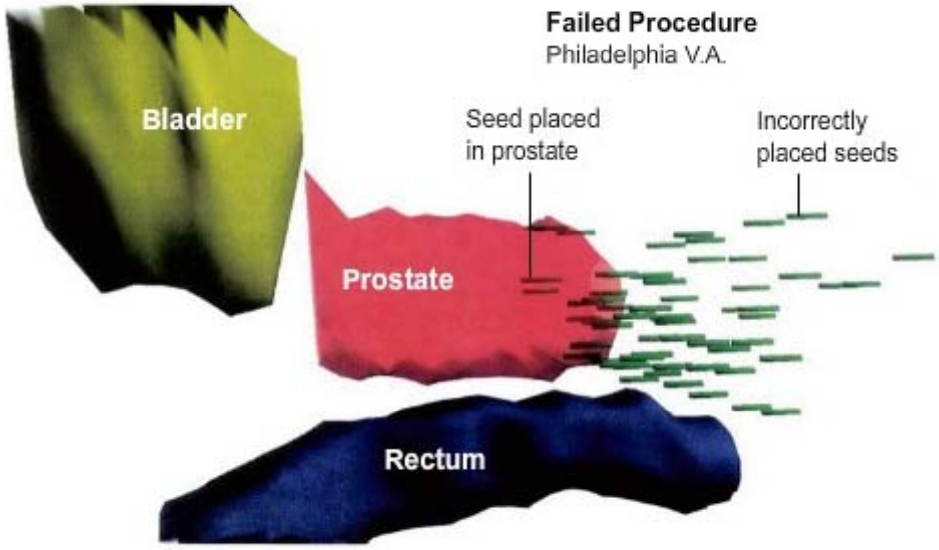


- Detection of severe under-/ overdosage
- Important for systematic treatment
- Feed-back of the results, benefit for future patients

→ **Campus Kiel, Clinic of Radiotherapy**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Why post-planning ?



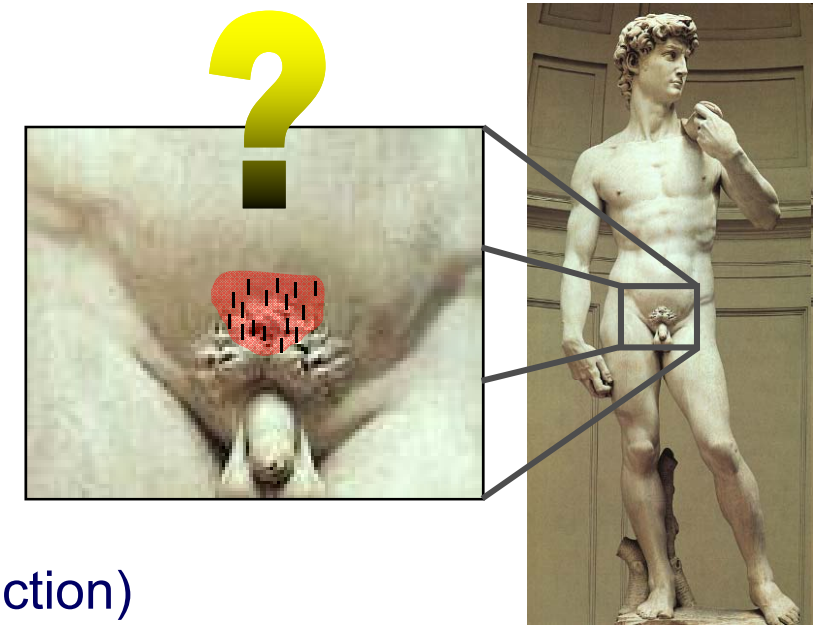
In this case, nearly all of the seeds have been placed outside of the prostate, in the perineum. Of the prescribed dose of 160 gray, the prostate received only 24. This means that the patient's prostate cancer was only minimally treated by the procedure.

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Aim of post-planning dosimetry

Determination of

- Dose to organs at risk
- Dose at target



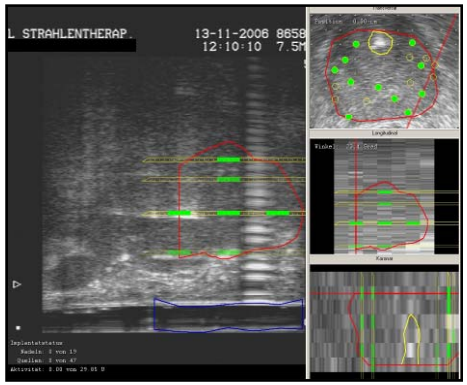
Knowledge of

- Organs (-> Contouring)
- Position of seeds (-> Detection)

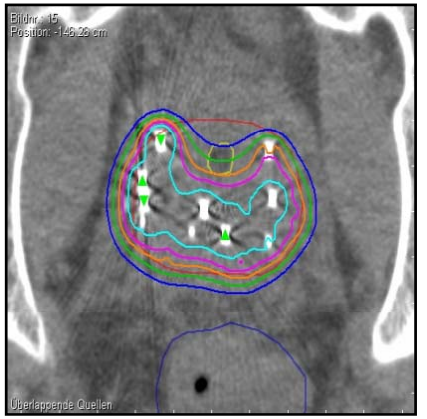
UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ Image modality

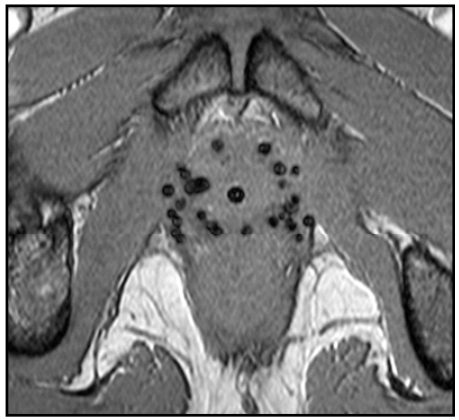
TRUS



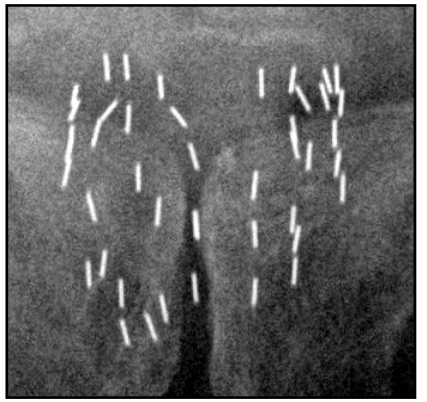
CT



MRI



X-ray



→ **Campus Kiel, Clinic of Radiotherapy**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ CT post-planning

Volume 26, Number 1, 1993

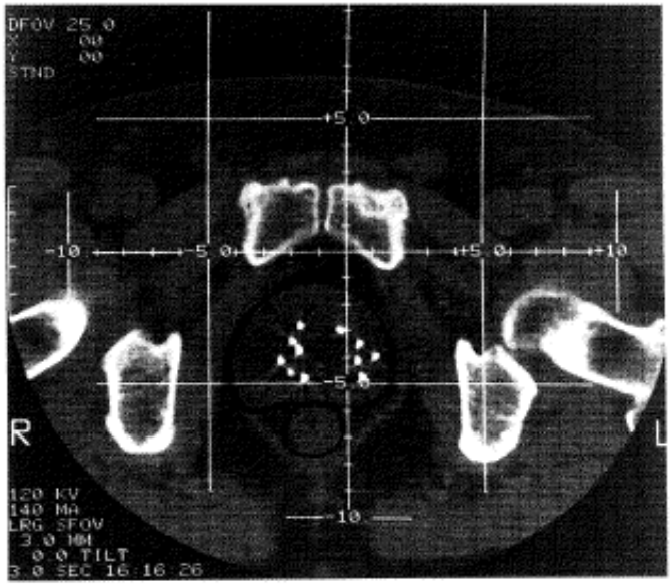


Fig. 1. The seed-images (white dots) on a transverse CT scan.

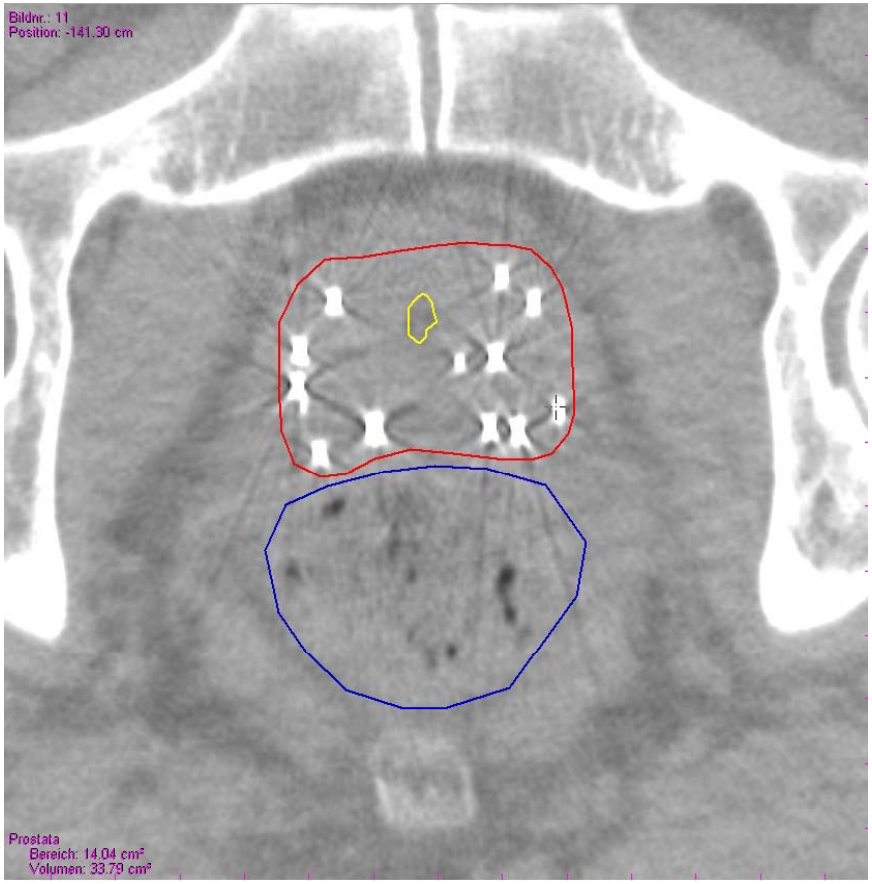
Roy et al. IJROBP 1993 (26) 163-169



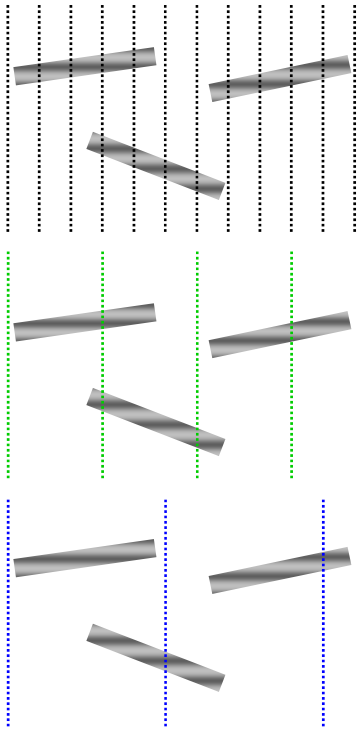
„gold standard“

→ **Campus Kiel, Clinic of Radiotherapy**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ CT post-planning

1. **Source detection**
2. **Anatomical information**



1 mm spacing

3 mm spacing

5 mm spacing
(under sampling,
seed sorting)

Scan parameters varies widely:

- Slice spacing, 1-5 mm
- Field of view
- Axial/spiral scan

Accurate detection of seed orientation in CT difficult.

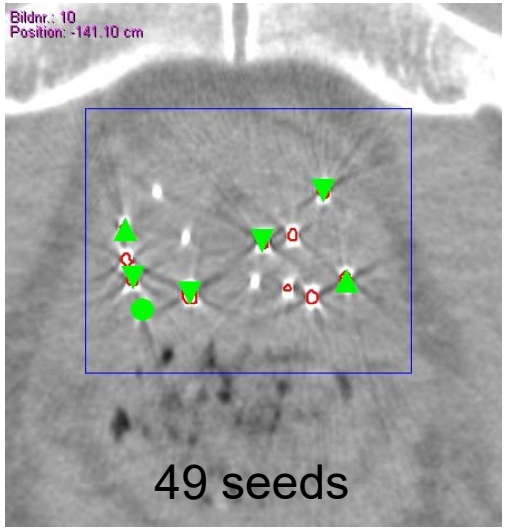
→ **Campus Kiel, Clinic of Radiotherapy**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

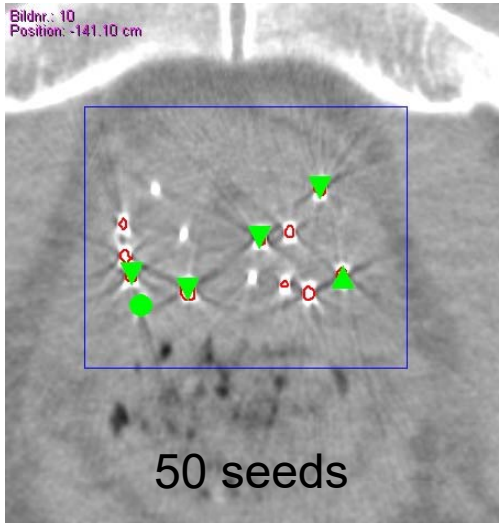
→ Automatical seed finding

Advantage: Time saving, reproducible method

But…check the results!



49 seeds



50 seeds

Problems may occur with

- Calcifications
- Close sources
- Unknown seed number

→ **Campus Kiel, Clinic of Radiotherapy**

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ CT post-planning

Can we trust the CT post-planning results?

Two questions:

1. Is CT post-planning of different centers comparable?
2. What is the influence of CT parameters and seed models?

=> Phantom check

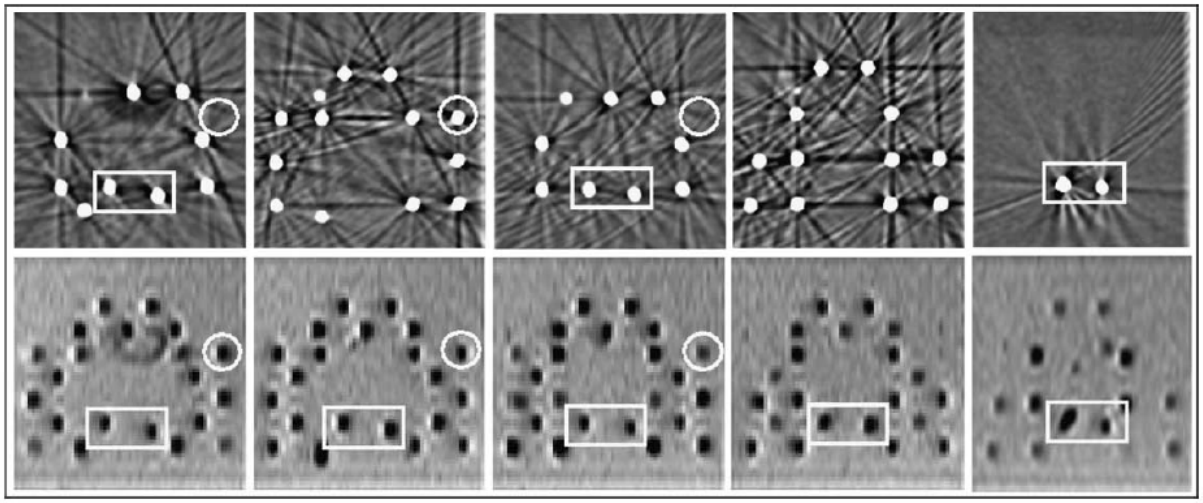

Fig. 4. Five consecutive slices for CT (Siemens) and MRI (Philips 1.5T) taken with 5 mm slice thickness. MR images are displayed below the corresponding CT slices. For the same geometry, more seed signal voids are visible on MRI than CT. Some examples are marked with a circle and rectangle.

De Brabandere et al. Radiother Oncol, 2006

UNIVERSITÄTSKLINIKUM
Schleswig-Holstein

→ TRUS post-implant dosimetry

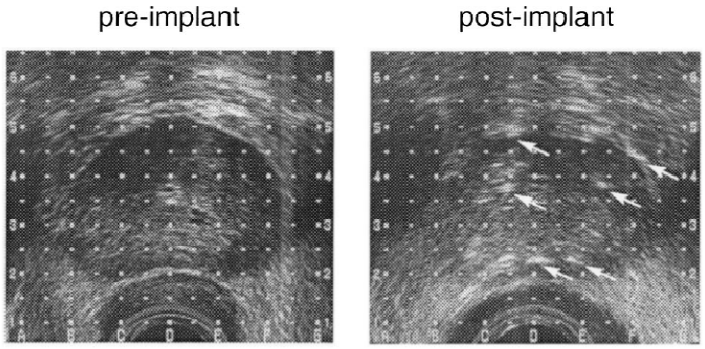

FIG. 1. Pre and post-implant TRUS images. Placement of sources partially obscures the prostatic margin. There are many bright spots that might be interpreted as sources (small arrows), but many could also be an air artifact, leading to false positive source identifications. And some sources might not produce enough signal to be seen, leading to false negative source identifications.

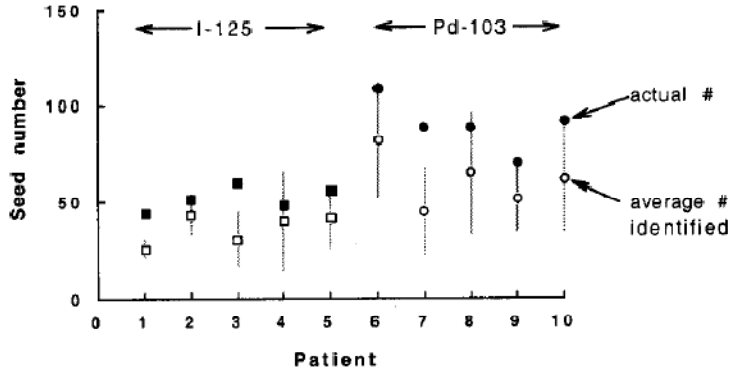

FIG. 3. The actual number of seeds implanted versus the average number identified by observers. Note that the I-125 patients are on the left, and the Pd-103 patients are on the right. Error bars represent the standard deviations of the number of seeds identified (alleged).

The average percent of the seeds allegedly identified per patient ranged from 51% to 83% ~mean: 74%!

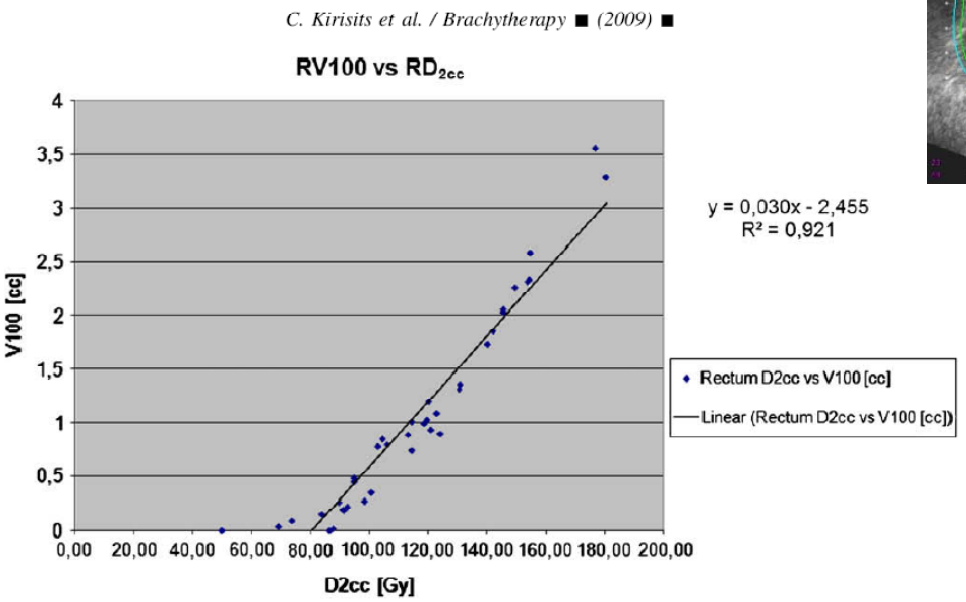
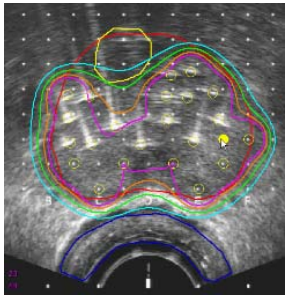
„Only absolute volume parameters are stable in relation to different contouring concepts.“

High correlation between D_R1, D_{R2cc}, $D_{R0.1cc}$ (<5%).

Reporting D_u5, D_u10, D_u30 is redundant.





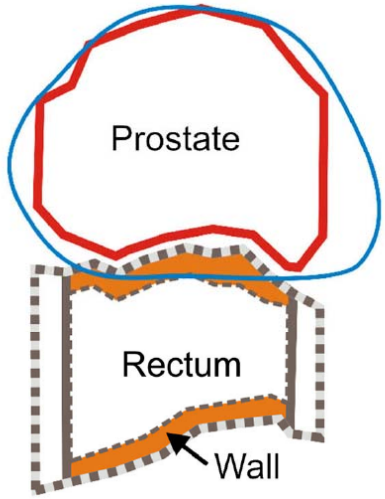


Fig. 1. Sagittal view showing the prostate and different rectum contours. The initial rectum structure is extended by additional contours (dotted line) in the next cranial and caudal slice, respectively. The shaded region indicates the rectum wall contour, if a second inner contour is delineated. The isodose is related to the RD_{2cc}, which will remain at a constant value for all variations of contours shown in this example. A detailed discussion of this figure can be found in the text.

Radiation proctitis - Acute

athophysiology

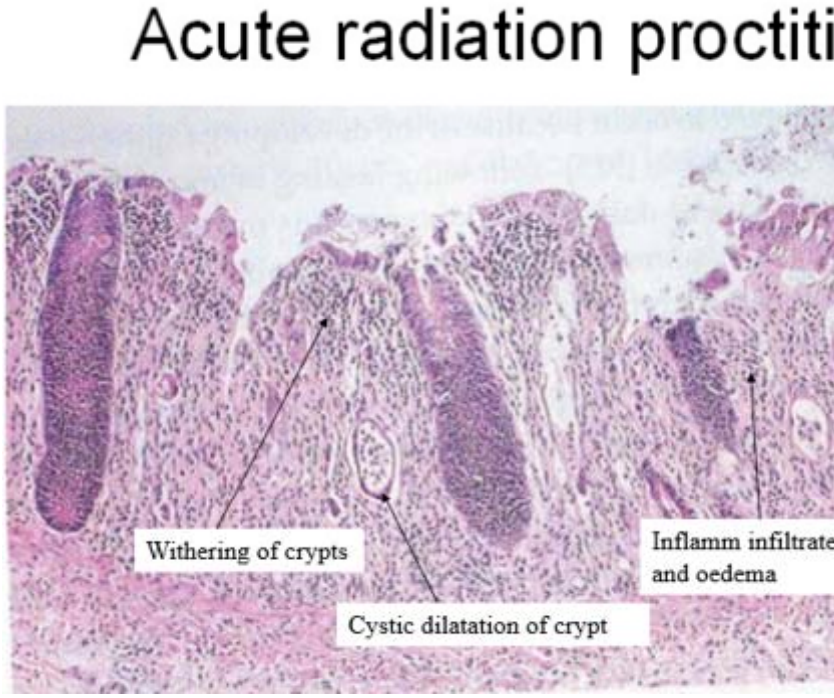
istopathology findings

Transient mucosal atrophy

Submucosal oedema

Inflammation and infiltration of the lamina propria with polymorphonuclear leukocytes and plasma cells

In addition, mitotic arrest, karyorrhexis, and lysis of the crypt and deep epithelial cells



Radiation proctitis - Acute

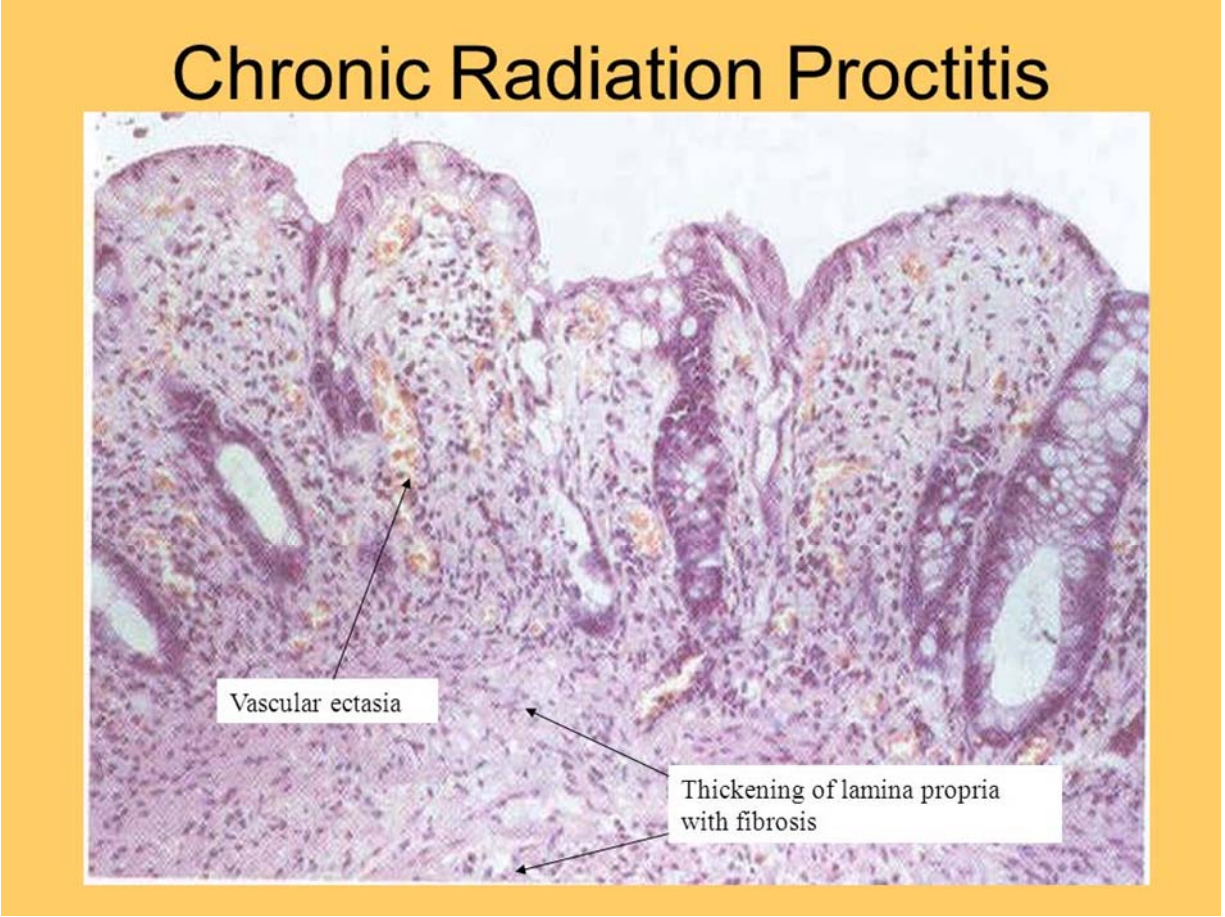
- If the submucosal damage is not prominent, the epithelial cells regenerate and the changes regress.
- Severe submucosal changes leads to progression of mucosal injury, ulcerations, and erosion of the villi.
- histologic findings in the acute phase correlate poorly with clinical symptoms.

Normal tissue effects and injury – **Acute effects** – LDR prostate brachytherapy – **rectal mucosa**

	Acute effects	symptoms	outcome	management
tal cosa	Inflammation, oedema, hyperaemia, cellular loss with loss of epithelial integrity	• diarrhoea • tenesmus • mucoid discharge • haematochezia • anorectal pain • cramps	• Mostly self-limiting • Resolves spontaneously • Typically takes a few months • Does not generally convey risk of late complications	Reassurance Pharmacological • Antidiarrhoeals • Antispasmodics • laxatives • Dietary modification • Steroid enemas

Radiation proctitis - Chronic

- Repopulation of the mucosal cells occurs in the later stage of the acute phase
- The severity of the damage to supportive connective tissue limits the degree of reepithelialization
- Fibrosis of the underlying connective tissue causes patchy ischemia of the mucosa, which may cause ulceration
- Local trauma or infection often precipitates these ulcers



Radiation proctitis - Chronic

Histological findings

- obliterative endarteritis of the small vessels in the intestinal wall characterizes chronic radiation intestinal injury
- Associated lymphoid atrophy, lymphatic dilation, and fibrosis of the submucosal tissue are observed
- The progressive vascular sclerosis leads to chronic ischemia of the overlying tissue, ultimately resulting in mucosal atrophy
- Scar tissue replaces the submucosal tissue, resulting in further decrease in vascularity and contracture of the intestinal wall
- Chronic mucosal ulceration may result in fistula formation and hemorrhage

Rectal Morbidity

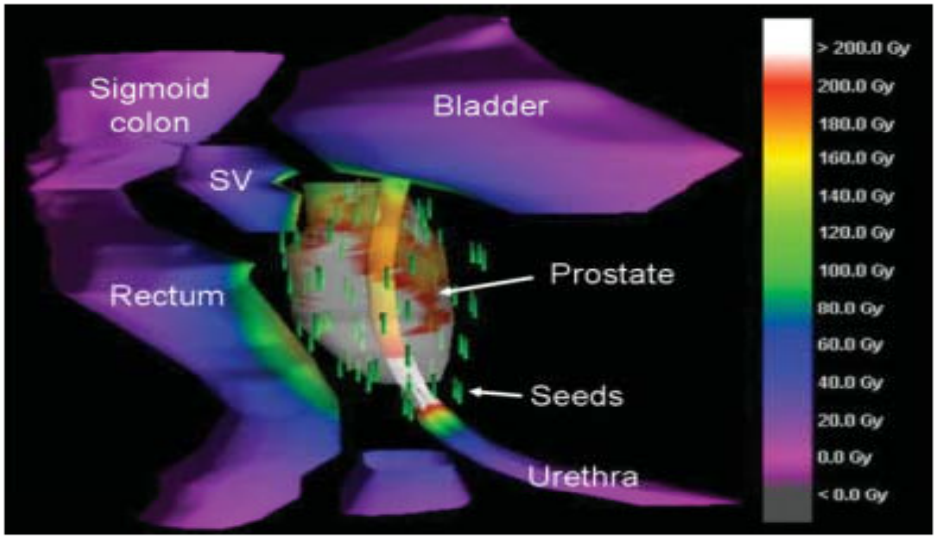


FIGURE 1. A typical 3-dimensional-rendered plan (lateral view) of a stranded seed implant. The close proximity of the anterior rectal makes it difficult to limit radiation dose to this area without compromising prostate dose coverage. Stranded seeds were used to maintain better seed spacing and alignment. SV indicates seminal vesicle; Gy, grays.

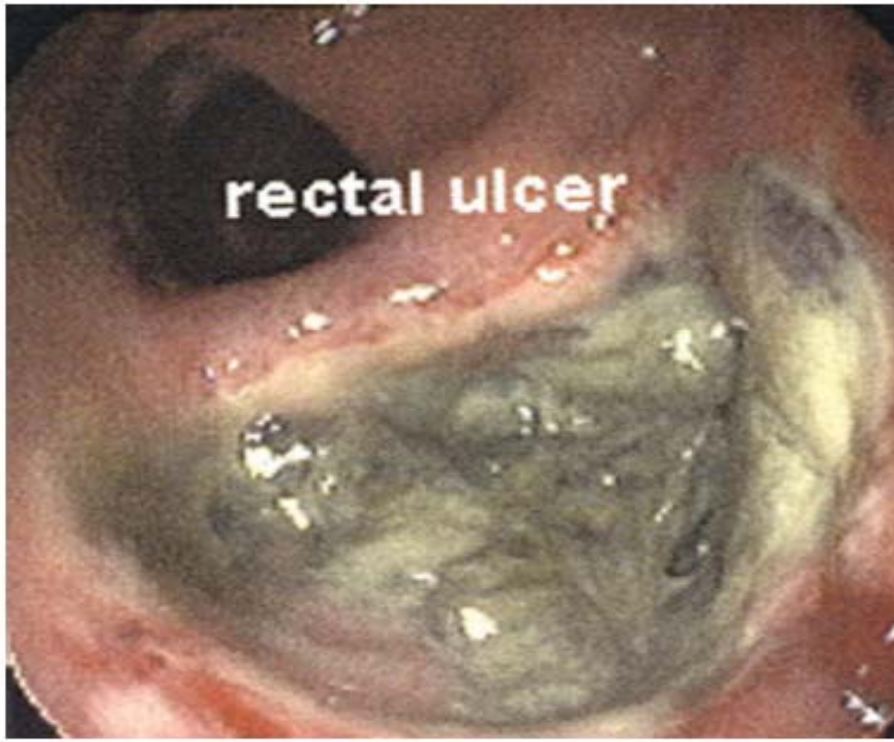

Cancer 2009;115:1827–39. © 2009 American Cancer

Classification of Rectal Morbidity

Table 1. Modified Radiation Therapy Oncology Group Rectal Toxicity Scale

Grade 1	Mild and self-limiting	Minimal, infrequent bleeding or clear mucous discharge, rectal discomfort not requiring analgesics, loose stools not requiring medications
Grade 2	Managed conservatively, lifestyle (performance status) not affected	Intermittent rectal bleeding not requiring regular use of pads, erythema of rectal lining on proctoscopy, diarrhea requiring medications
Grade 3	Severe, alters patient lifestyle	Rectal bleeding requiring regular use of pads and minor surgical intervention, rectal pain requiring narcotics, rectal ulceration
Grade 4	Life-threatening and disabling	Bowel obstruction, fistula formation, bleeding requiring hospitalization, surgical intervention required

RTOG indicates Radiation Therapy Oncology Group.

Cancer 2009;115:1827–39.

Rectal toxicity and rectal dosimetry in low-dose-rate iodine-125 permanent prostate implants: A long-term study in 1006 patients

Mira Keyes[1,*], Ingrid Spadinger[1], Mitchell Liu[1], Tom Pickles[1], Howard Pai[2], Amy Hayden, Veronika Moravan[1], Ross Halperin[3], Michael McKenzie[1], Winkle Kwan[4], Alexander Agranovic[4], Vince Lapointe[1], W. James Morris[1]

RESULTS: Rectal dosimetry in 93.5% and rectal toxicity in 96.2% have been recorded. Median VR_{100} = 1.05 cc. Late RTOG Grades 0, 1, 2, 3, and 4 were recorded in 68%, 23%, 7.3%, 0.9%, and 0.2% patients, respectively. On multivariate analysis, acute RTOG ≥2 rectal toxicity was associated with urinary retention ($p = 0.036$) and learning curve ($p = 0.015$); late RTOG ≥2 was associated with the presence of acute toxicity ($p = 0.0074$), higher VR_{100} ($p = 0.030$) and learning curve ($p = 0.027$).

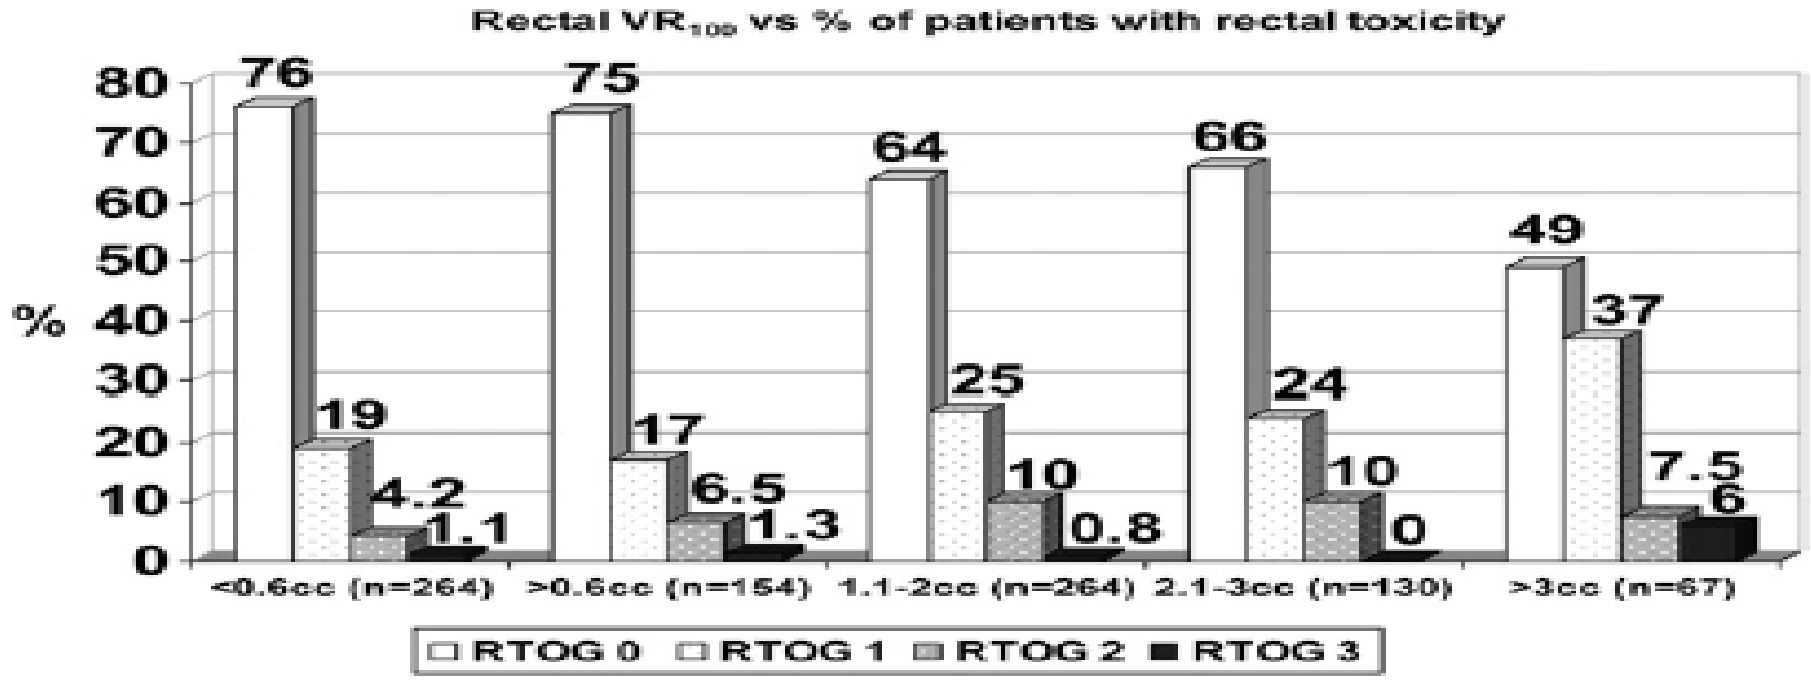

Fig. 1. Percentage of patients with late rectal toxicity by rectal V_{100cc}, patients with available toxicity data ($\geq$12 months followup) and available rectal dosimetry ($n = 879$). For each dose—volume histogram group, we gave number of patients and percentage of patients in the group with Radiation Therapy Oncology Group (RTOG) 0, 1, 2, and $\geq$3 toxicity. For patients with $VR_{100} \leq 3$ cc incidence of RTOG 3 is 0.8%. For those with $VR_{100} > 3$ cc, incidence of RTOG $\geq$3 is 6%.

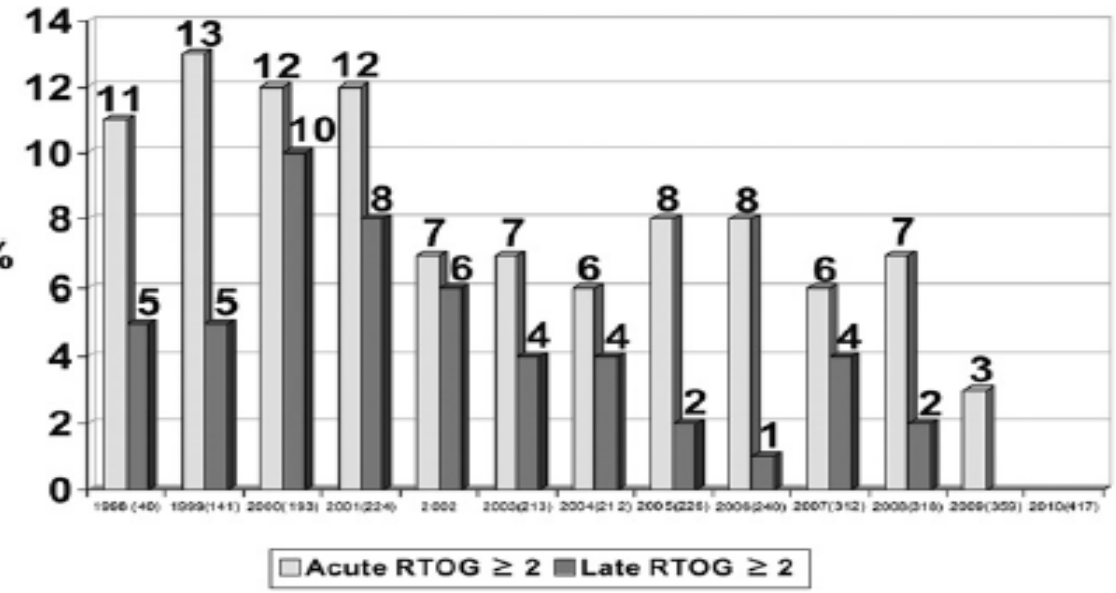

g. 3. Institutional crude Radiation Therapy Oncology Group ≥2 acute
d late rectal toxicity, expressed as a percentage of patients wit
xicity recorded for each implant year 1998–2009.

ABSTRACT

INTRODUCTION: Patients with prominent median lobe hyperplasia and/or high International Prostate Symptom Score (IPSS) are often contraindicated for prostate brachytherapy, mainly because of the risk of post-implant urinary retention. We evaluated an approach combining in the same operative step a limited transurethral resection (TURP) of the median lobe, immediately followed by permanent implant-free seed brachytherapy.

METHODS AND MATERIALS: From January 2007 to November 2008, 22 patients underwent a customized limited TURP of their median lobe immediately before brachytherapy. All patients fulfilled our criteria for permanent implant brachytherapy, but presented with a more or less prominent median lobe and/or a high IPSS.

RESULTS: The procedure appeared to be technically feasible, with only 0.3% of migrating seeds, a mean post-implant D90 of 173.4 Gy and a mean post-implant V100 of 96.6%. However, 5 patients (23%) experienced a urinary retention, with two patients having to undergo a complementary post-implant TURP. Moreover, urinary toxicity was more pronounced than in our current experience, with high IPSS at 2 months (mean 19.2) and 6 months (mean 15.8).

CONCLUSION: Although technically feasible, with relatively few migrating seeds and satisfactory post-implant dosimetric parameters, one-step TURP and brachytherapy was found to be poorly tolerated, with higher than usual urinary retention and urinary toxicity rates. Considering those results, our group is presently evaluating a two-step procedure, with a customized TURP followed after 4–6 months by brachytherapy.

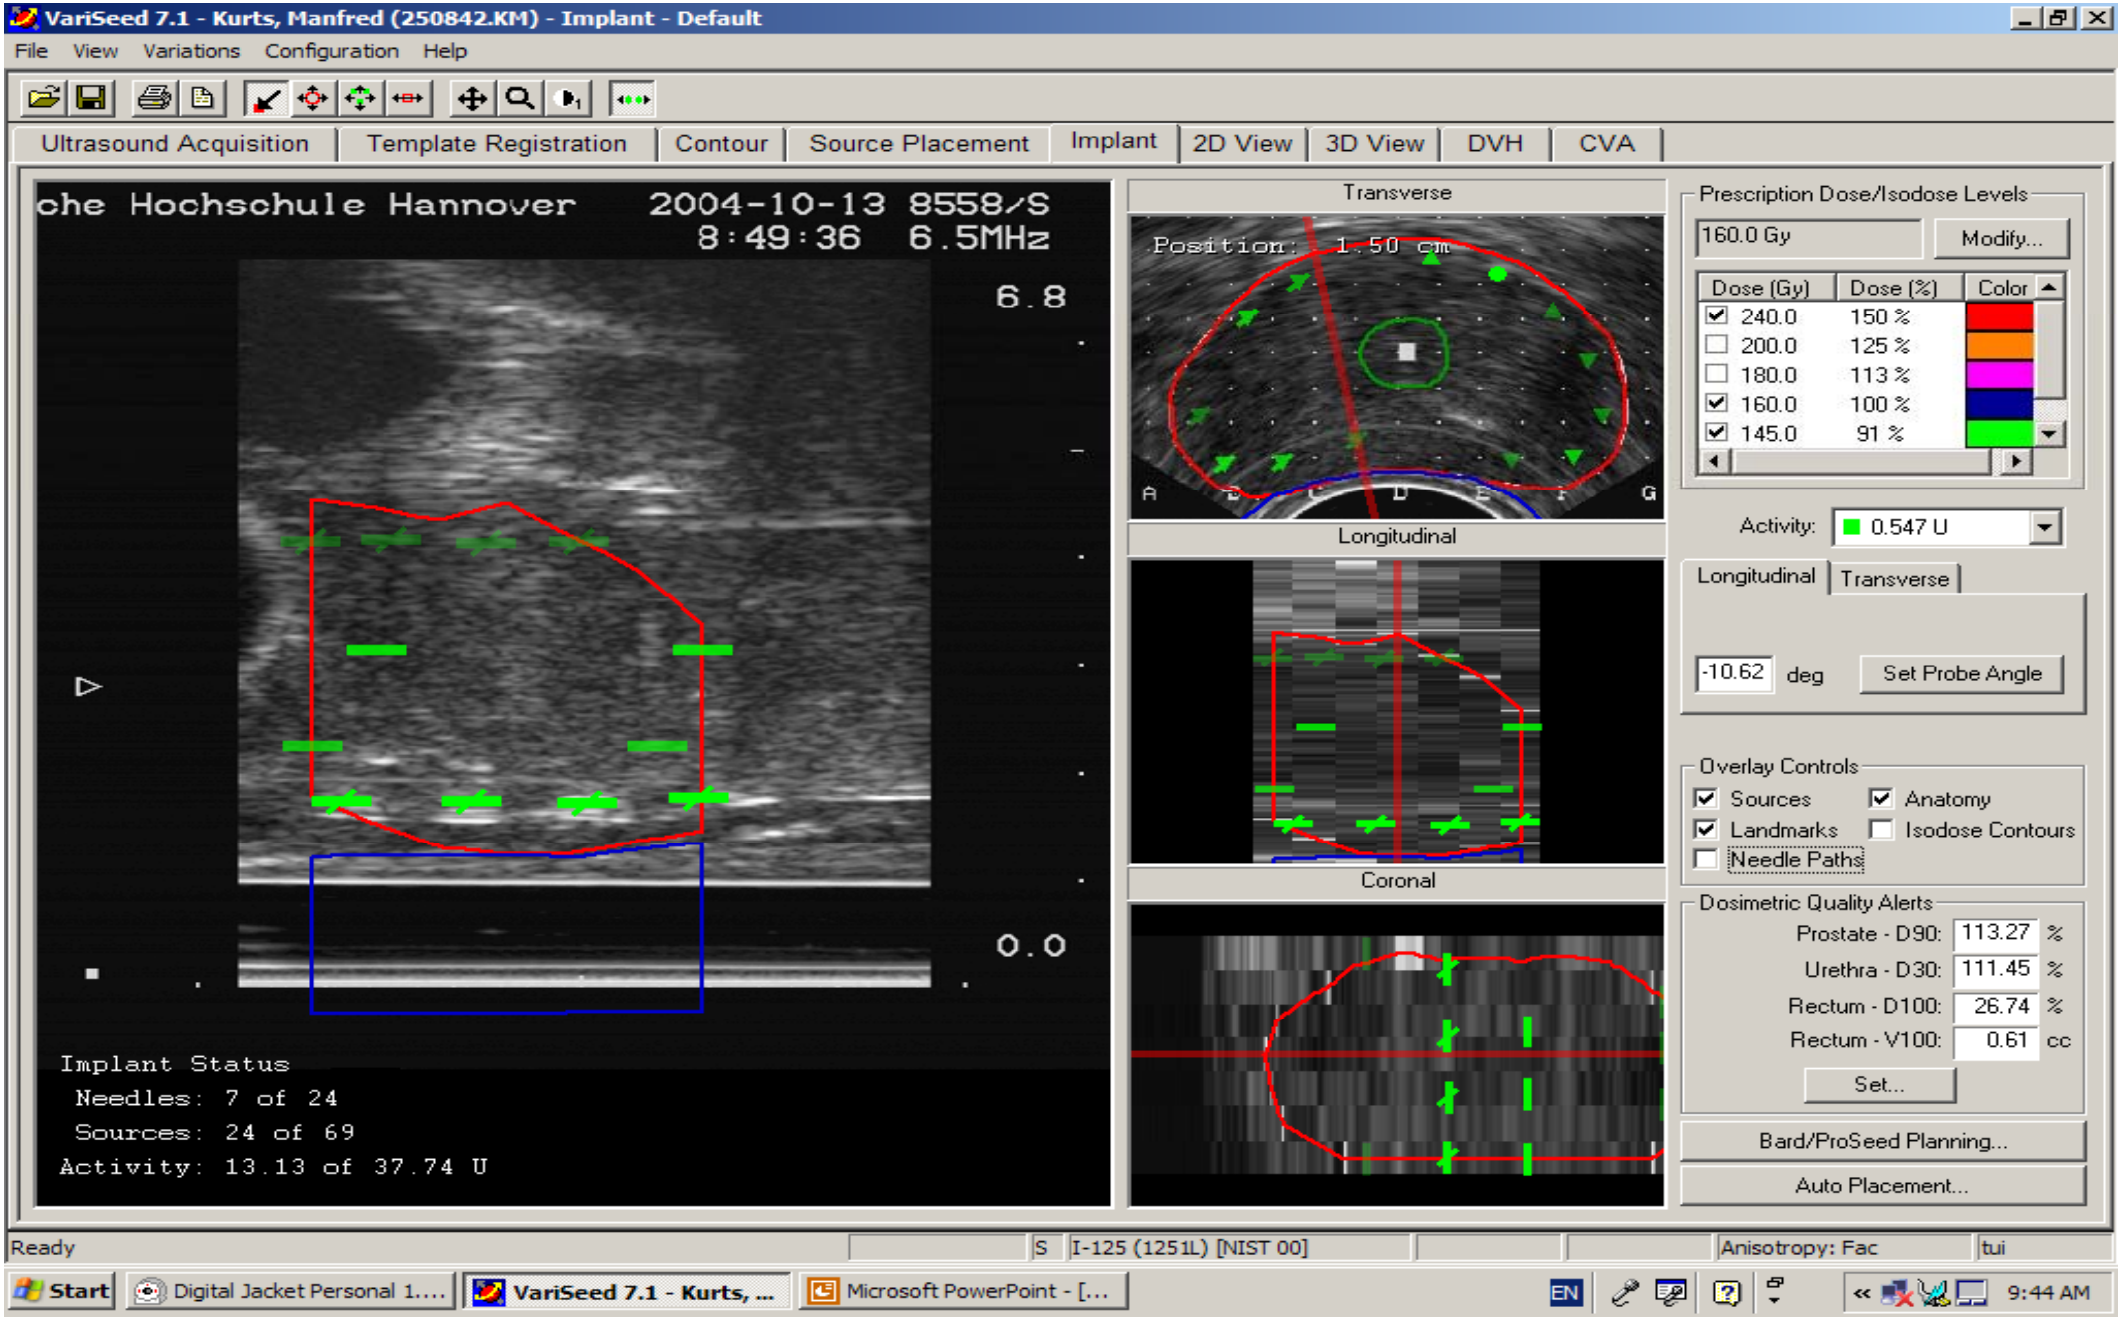
Summary of first presentation

- **Long-term morbidity rate is low. (LoE: III)**
- **Technical advances improve tumor control and lower toxicity.**
- **Careful patient selection is important to avoid unacceptable morbidity.**
- **Urgent need for prospective trials to investigate on medical approaches to the treatment of morbidity.**

Reduction of rectal morbidity

- **Limiting the anterior maximal mucosal dose to 120% mPD.**
- **Limiting the length of the rectal mucosa receiving 100-120% mPD to 10 and 5mm.**
- **Avoid constipation.**



ESTRO School

- **Moving seeds from 5mm to 3mm from the edge increases maximum rectal dose by 17%.**

- **Posterior seeds 3mm from edge:**

  - 1mm margin: 187±6Gy; ≤ 1% (max. rectal dose; % late rectal toxicity)

  - 2mm margin: 222±8Gy; ≤ 2%

  - 3mm margin: 257±11Gy; ≤ 3%

  -4 mm margin: 292±14Gy; ≤ 5%

  -5mm margin: 327 ±17Gy; ≤ 7%

[Waterman et al.; Int J Radiat Oncol Biol Phys, 2003]

Reduction of rectal morbidity

- **3/3 (1455) patients with recto-urethral fistulas had undergone endoscopy and low rectal biopsy.**

[Shakespeare et al., May 9(4):328-331, 2007

Reduction of rectal morbidity

- **Biopsies of the anterior rectal wall should be avoided !!!**
- **Injection of hyaluronic acid into the anterior rectal wall in the end of procedure.**

Treatment of rectal complications

- **Calm the patient! Expectative management as long as possible.**
- **Local application of corticosteroides.**
- **Protective AP in case of fistulas.**

Type of Therapy	Proposed Mechanism	Summary
Medical therapies		Historically used as first-line therapy with mixed results; few randomized trials available; HBOT appears to be effective
5-Aminosalicylic acid	Anti-inflammatory	
Sucralfate	Anti-inflammatory	
Steroid enemas	Anti-inflammatory	
Short-chain fatty acid enemas	Promote healing	
HBOT	Promote healing	
Endoscopic therapies		More effective than medical therapies but associated with higher rectal complication rate; APC is preferred over laser coagulation
Topical formalin	Chemical cauterization	
Heater and bipolar cautery	Thermoelectric cauterization	
Nd:YAG and KTP laser	Noncontact electrocoagulation	
Argon plasma coagulation	Noncontact electrocoagulation	
Surgical therapies		High risk of postoperative morbidity, reserved for severe rectal strictures and rectal fistulas
Proctectomy		
Diverting colostomy

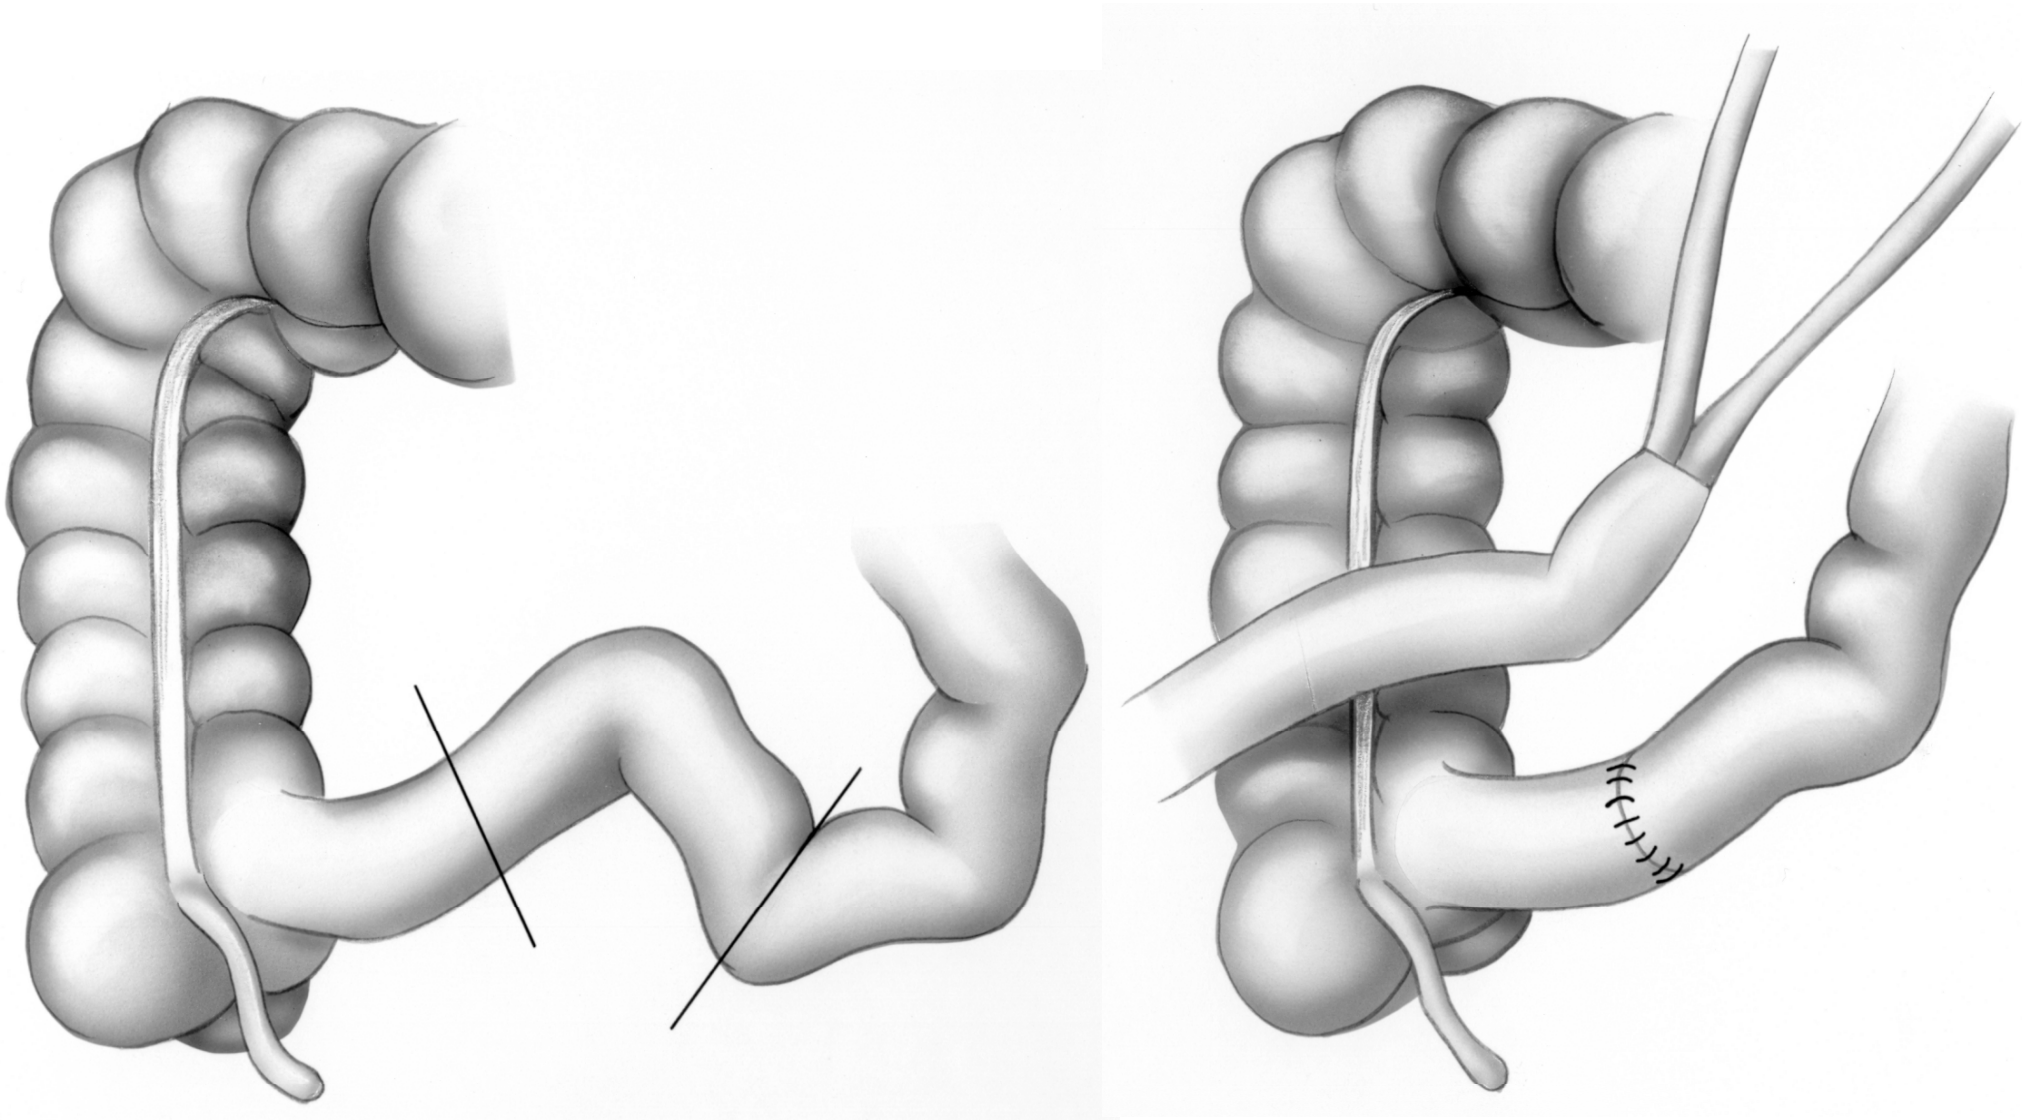
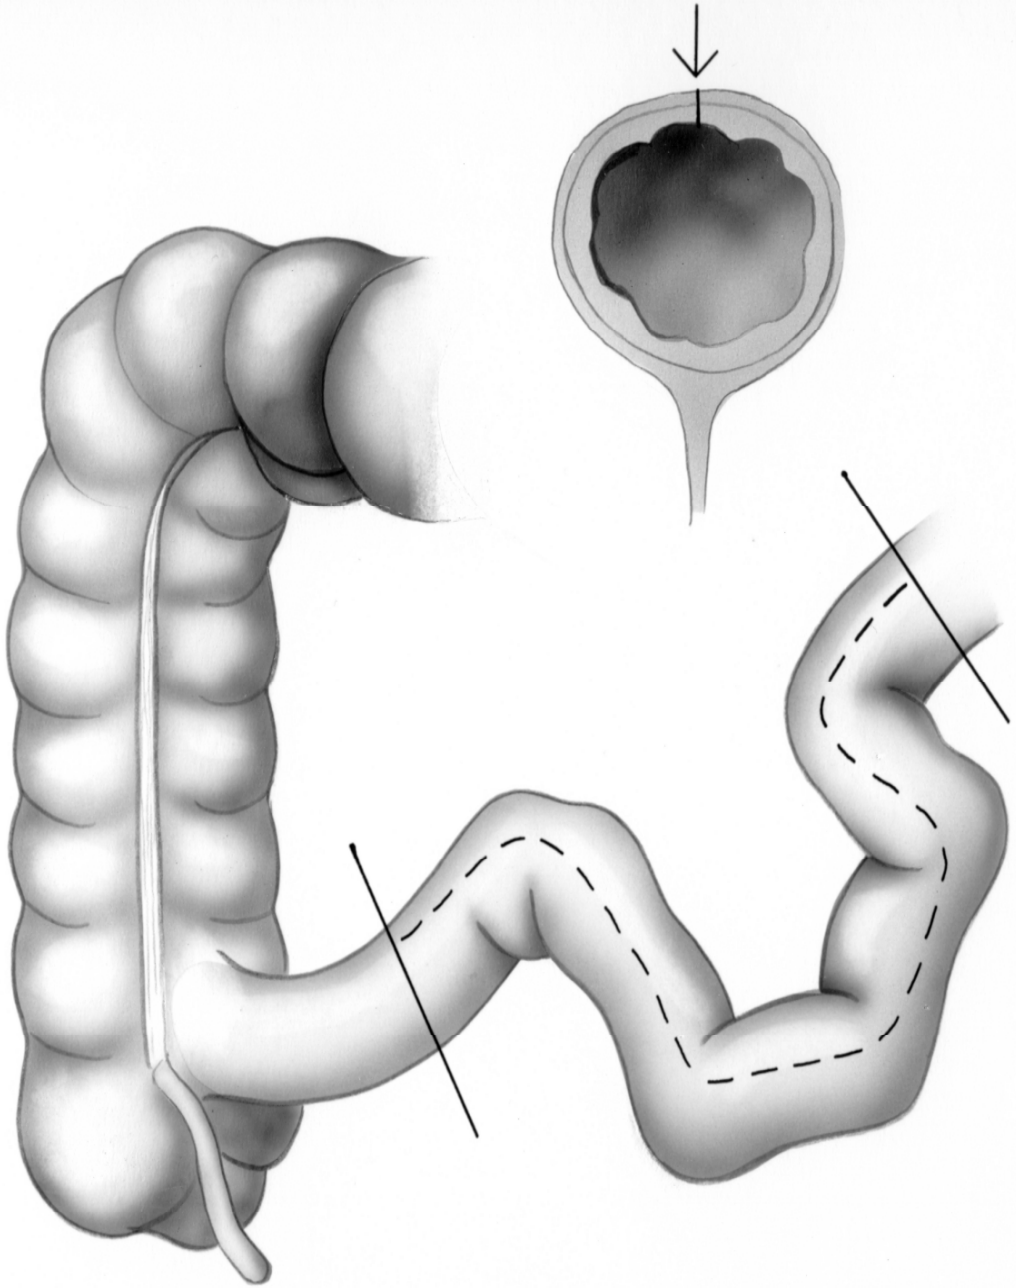
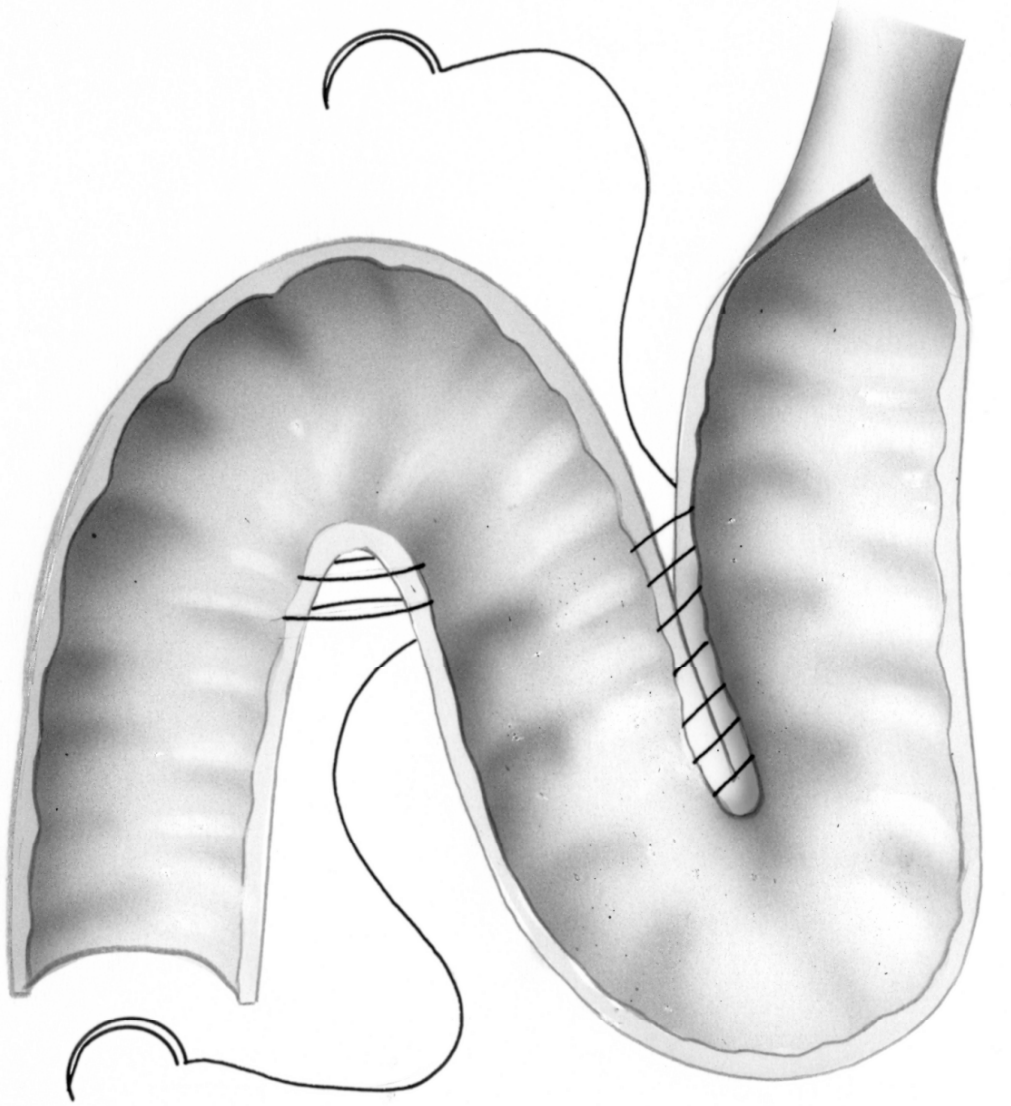
Treatment of rectal complications

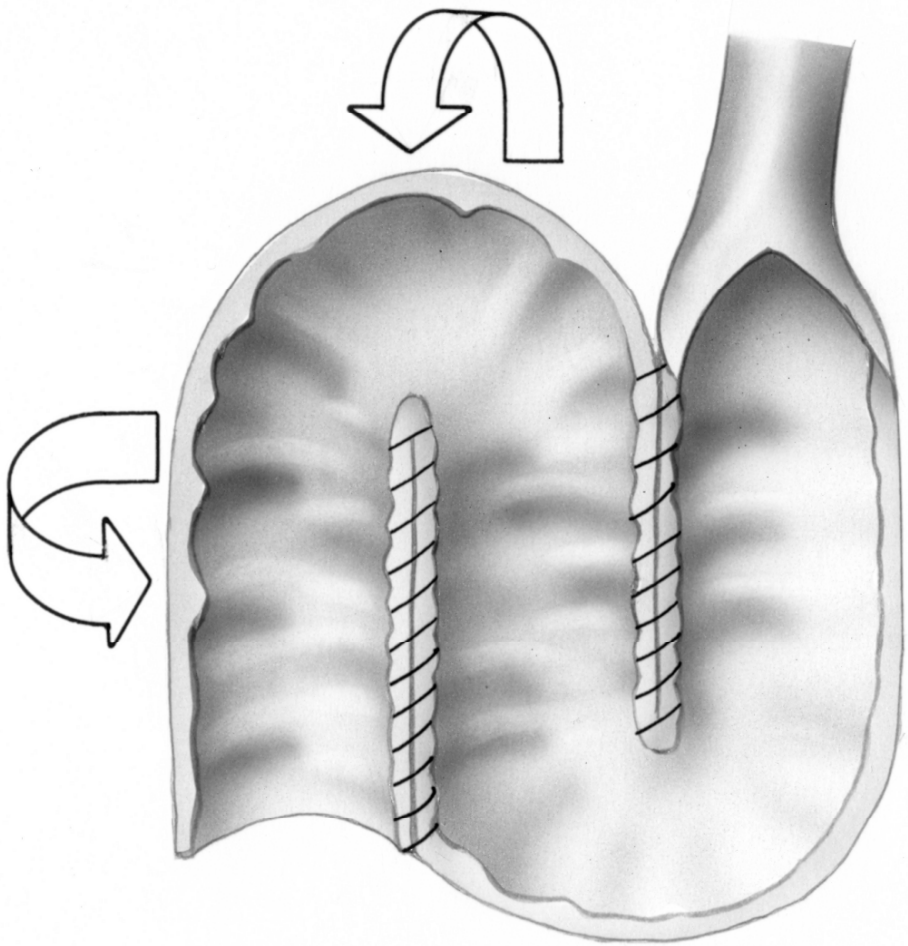
- **Plastic reconstruction of the rectal wall with gracilis muscle.**
- **Radical operation with construction of neobladder.**

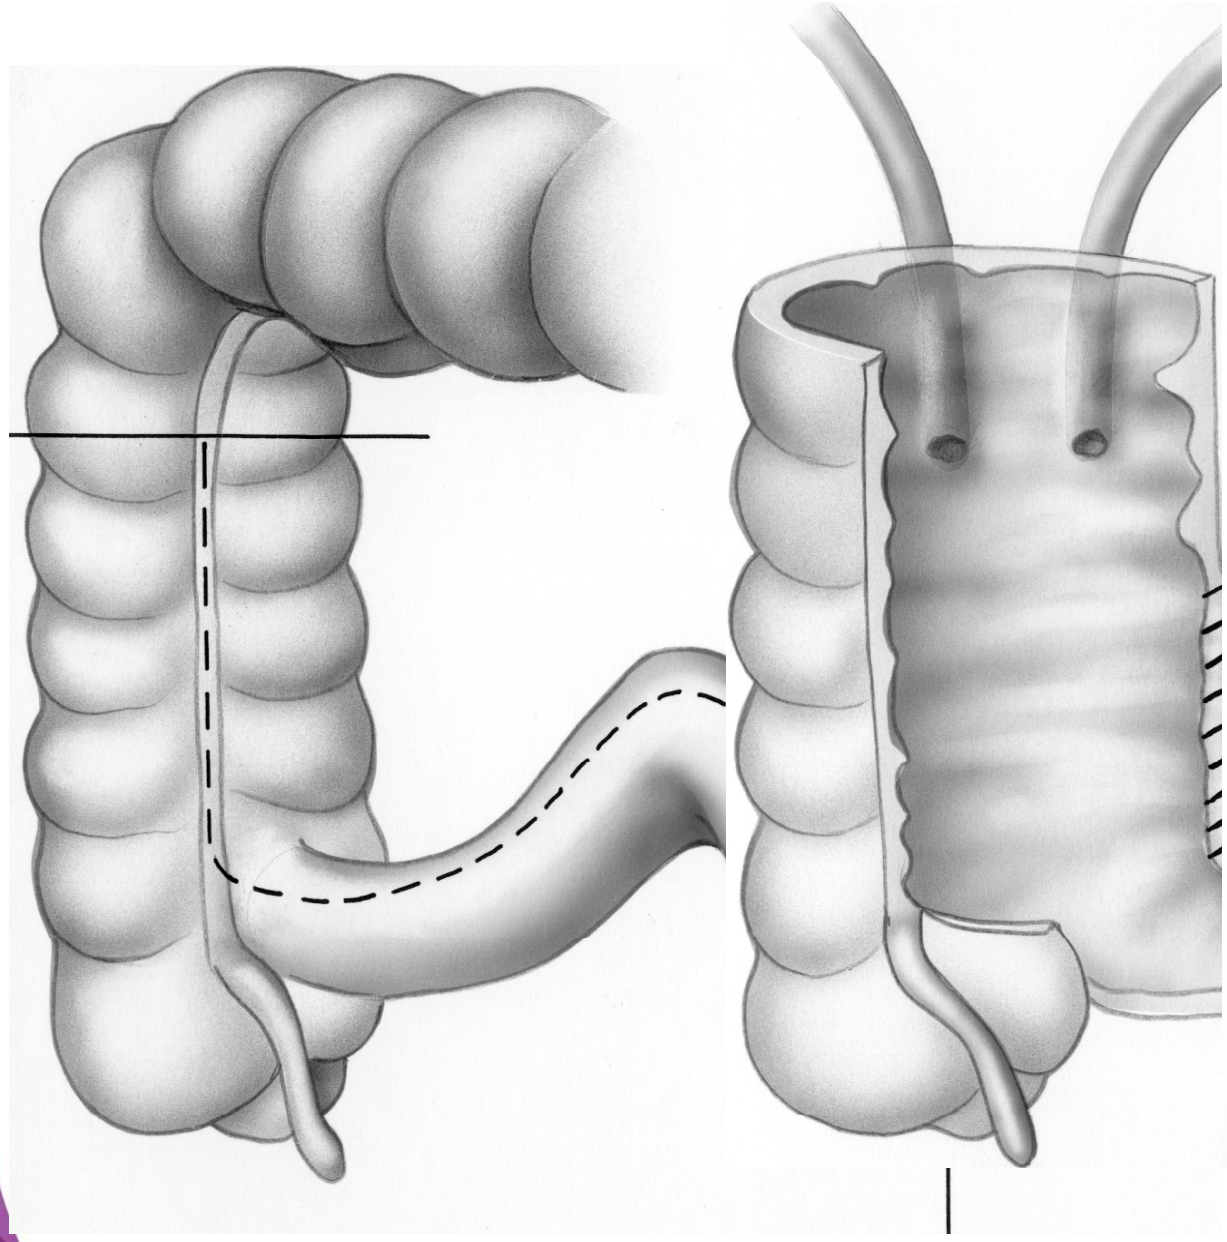


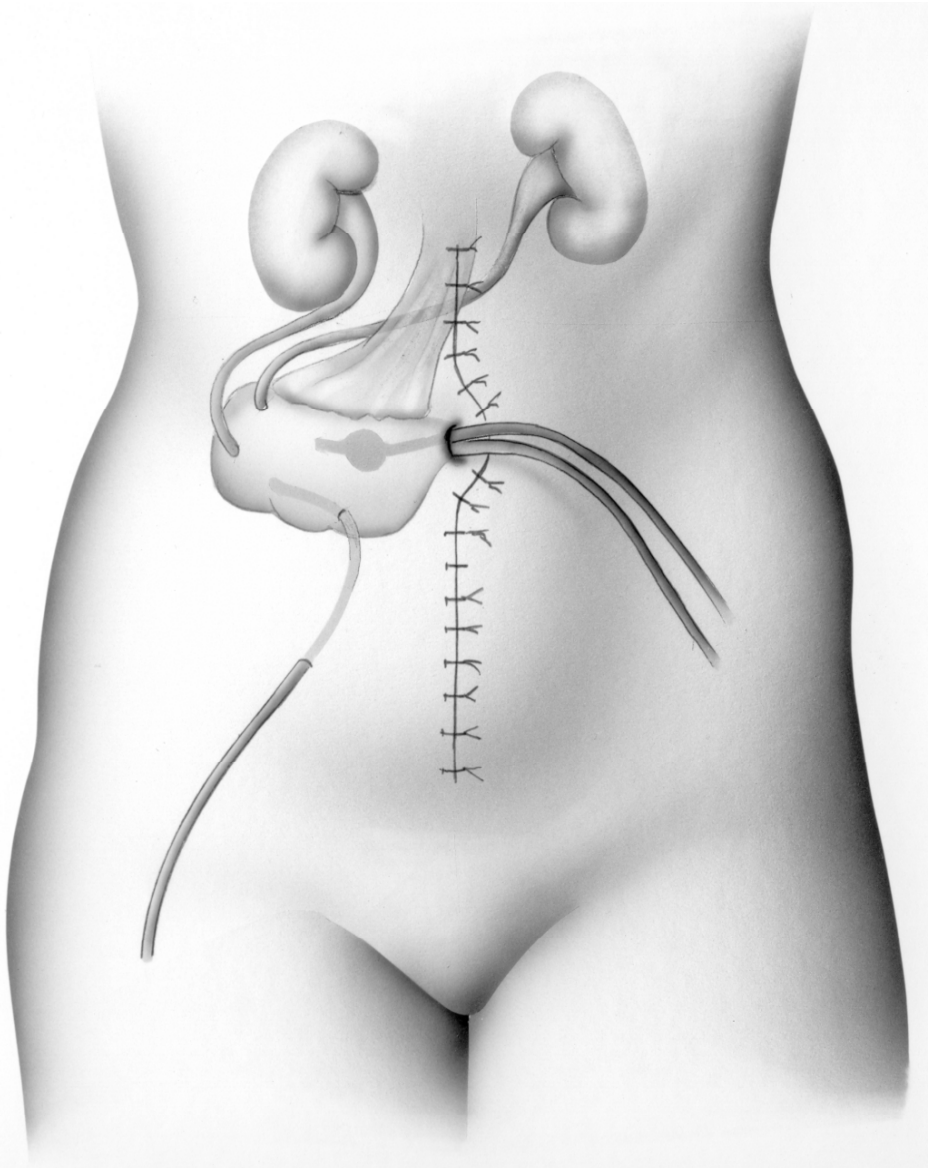




ESTRO School







Reduction of urinary morbidity

- **Careful selection of patients by IPSS.**
- **Technical considerations in planning.**
- **Careful resection of large medium lobes preinterventionally.**
- **Expectative management in the first 12 months after implant.**

Treatment of urinary morbidity

- α-Blockers in obstructive patients.
- Suprapubic catheter in case of complete urinary retention for 12 months.
- Anticholinergics in irritative patients
- Increase in urinary pH by medication. Avoidance of acidic diet.

The pathophysiology of lower urinary tract symptoms after brachytherapy for prostate cancer

Jerry G. Blaivas, Jeffrey P. Weiss and Mark Jones
The Joan and Sanford I. Weill Medical College of Cornell University, New York, NY, USA

JOURNAL COMPILATION © 2006 BJU INTERNATIONAL | 98, 1233–1237 | doi:10.1111/j.1464-410X.2006.06491.x

- **Comparison of 47 men with LUTS after brachytherapy with 541 men with LUTS without prostate cancer.**
- **Significant more detrusor overactivity (47 vs.85%) after brachytherapy.**
- **Higher incidence of urethral and prostatic strictures.**

ESTRO School

Treatment of urinary morbidity

- **Hyaluronic acid intravesically after failure of anticholinergics.**
- **Botox injection to the bladder neck in patients with prolonged irritation.**
- **Careful TUR-P after 12 months in patients with complete urinary retention without irritation.**

TUR-P after implantation

- **As late as possible.**
- **Best timíng between 12-24months after implantation to avoid incontinence .**
- **Safe 5‘ and 7‘ o clock position at the baldder neck.**

Technical considerations in TUR-P

URINARY MORBIDITY AND INCONTINENCE FOLLOWING TRANSURETHRAL RESECTION OF THE PROSTATE AFTER BRACHYTHERAPY

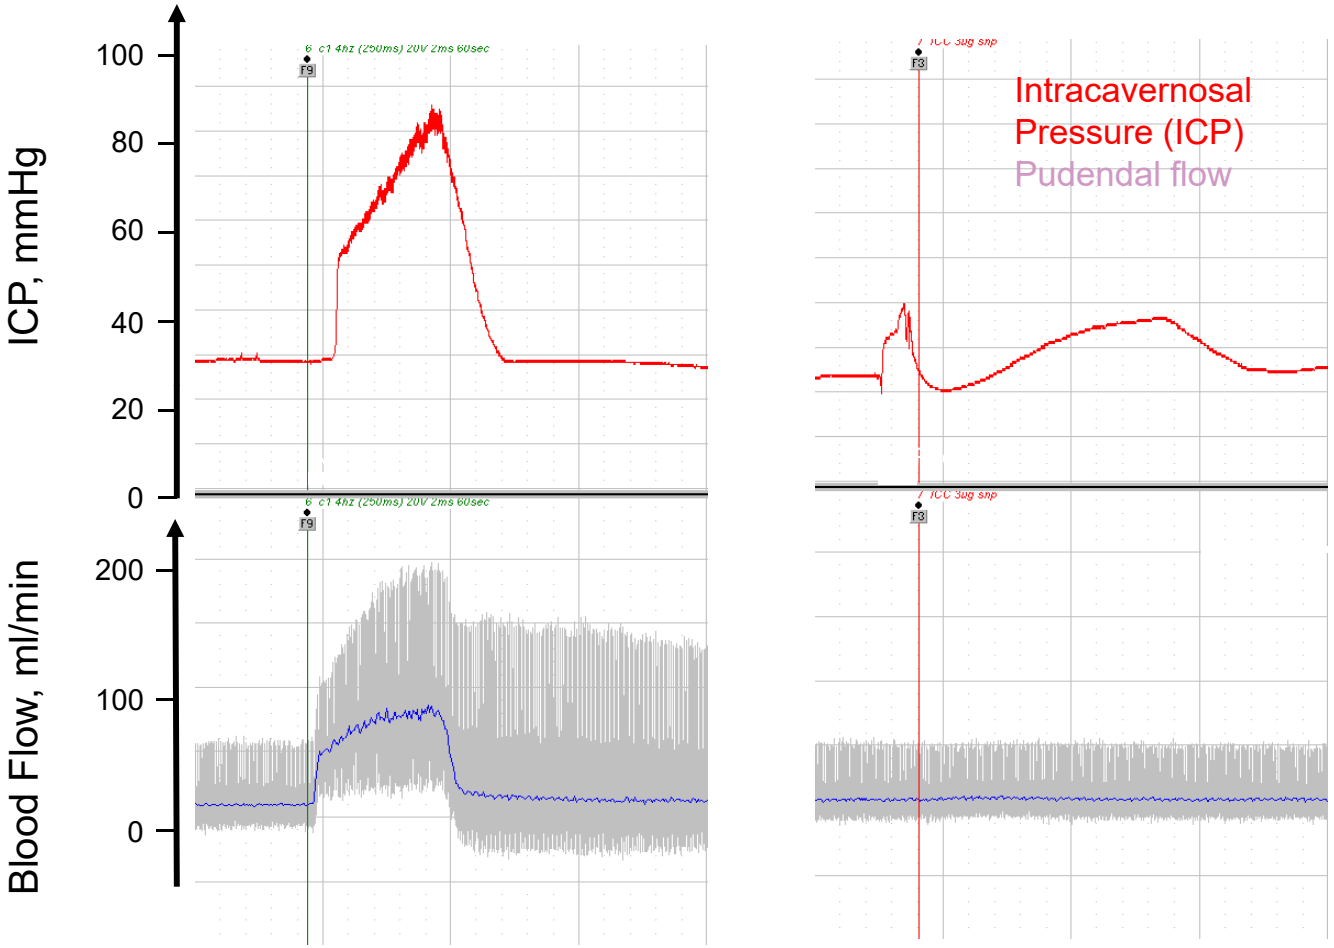
M. A. KOLLMEIER,* R. G. STOCK, J. CESARETTI AND N. N. STONE
From the Departments of Radiation Oncology and Urology (NNS), Mount Sinai School of Medicine, New York, New York

- **38/2050 (2%) patients underwent minimal TUR-P.**
- **7/38 (18%) with incontinence.**
- **2/24 (8%) against 5/14 (36%) with incontinence in case TUR-P was performed <1 or > 2years after implant.**
- **No correlation of incontinence with D90 prostate or D30 urethra or dose to 5cm^2 urethra.**

Reduction of erectile dysfunction

- **50% of the bulb of the penis should not receive more than 40% mPD.**
- **Judicious use of EBRT and hormonal therapy.**
- **Early use of PDE Inhibitors.**

Rate of Erection Hardness (ICP) Increases With Increased Pudendal Flow to the Penis



- Electrical cavernous nerve stimulation increases pudendal blood flow and provides rapid increases in intracavernosal pressure (ICP)
- Intracavernosal injection of a nitric oxide donor, sodium nitroprusside, produces slow increases in ICP but has no effect on pudendal flow

Illustrates importance of flow-mediated vasodilation in the initiation and maintenance of penile erection in preclinical model

Principles of the management of complications

- **Avoidance is better than treatment.**
- **Management as minimal invasive as possible.**
- **Overtreatment can cause series of serious further complications.**

Measures to improve outcome and minimize risk of complications

- Work patients up thoroughly
- Identify and alleviate obstructive prostates beforehand
- Tailor the seed activity according to the volume
  – NB volume measurement of the prostate should always be done at initial assessment prior to referral
- Optimal procedure setup, good u/s visualization
- Accurate contouring of structures of interest
- Critically observe dose constraints

Measures to improve outcome and minimize risk of complications

- Apply meticulous technique
- Don’t drag seeds back into the rectal hump
- Keep implant needles closest to the rectum at the prostato-rectal interface at least 5mm higher than the posterior prostatic boundry (c1 and d1 – use the 1.5 row rather) particularly in thin patients and prostates with longer sagittal measurements (long prostates – more than 8 slices)
- Keep the urethra and TURP defect cooler than the periphery
- Avoid implanting seeds into the urethra or TURP defect
- If the seeds are too hot for the volume, use some cooler seeds even if they are just used for the rows closest to the rectum or urethra

Measures to improve outcome and minimize risk of complications

- Understand the biology and pathophysiology of the type of radiation being delivered and timing of side effects and complications
- Patients must be well informed regarding anticipated irritative and obstructive symptoms and duration, risks of rectal procedures after BT and informed to seek guidance from their Radonc or Urologist first before undergoing any investigation or intervention
- Avoid biopsy the rectum or prostate transrectally after BT
- Manage side effects and complications with efficiency
- Many side effects and complications resolve spontaneously
  - don't be in a rush to intervene!

ESTRO School

Salvage options

1. Salvage radical prostatectomy (RPE) after radiation therapy
2. Salvage EBRT after RPE
3. Salvage HDR or LDR brachytherapy after EBRT or after seeds
4. Salvage EBRT after EBRT
5. (Cryotherapy, HIFU)

There are these two dogmas…

- 1. RPE after radiation therapy is not possible
- 2. If performed, significant complications will occur

Salvage RPE (SRP)

- In the past major morbidity after SRP
- New datas show acceptable morbidity because of better radiotherapeutic and surgical techniques

best candidate

- histologically verified recurrent prostate cancer
- neg. CT scan and skeletal scintigraphy
- PSADT> 12 months
- PSA $\leq$ 15ng/ml
- bladder capacity $\geq$ 300ml, competent sphincter, no bladder neck invasion

ESTRO School

ICRP 86 , released in 2000, was dealing with all types of accidents in radiotherapy, *with specific chapters for LDR and HDR brachytherapy*

- After an analysis of the accidents reported at that moment (2000),
- ICRP tried to identify the causes and the factors contributing to accidental exposures in brachytherapy

ESTRO School

The main chapters

- Equipment problems
- Source ordering, delivery, calibration and acceptance
- Treament planning
- Source preparation
- Treatment delivery
- Source removal
- Accidents involving public exposure and environmental contamination

ESTRO School

ICRP 86 : Generic lessons learned :

- In most of the accidents, a combination of contributing factors allowed an initial mistake to escalate into an accidental exposure ...
- Often , the lack of concern of management was the underlying root cause...

Among the main contributing factors ;

- Lack of appropriate staff ressources
- Insufficiently qualified or untrained staff
- Lack of effective, systematic quality assurance programme/procedures
- Lack of effective communication procedures....

Not to be forgotten:

- Hospital management, source suppliers, and importers, can cause catastrophic accidents involving the public and severely affecting the environment (Examples ; the Mexico,Brazilian - Goïana- and Istanbul accidents ...)
- *(Although those accidents were linked to the loss of external radiotherapy sources).*

ESTRO School

- Radioactive materials in recycled metals ; an update
- Lubenau JO , Yusko,JG
- Health physics, 1998 ,74(3):293-9

- *« The steel manufacturer Association made available data collected by its members beginning in 1994, that expanded the database for* ***radioactive materials found by the metal recycling industry in recycled metal scrap to over 2,300 reports as of 30 June 1997…*** *»*

ESTRO School

In 2005 ; the more specific ICRP 97 publication on « Prevention of High-dose-rate Brachytherapy accidents »

- Again, the reported accidents were analyzed ...

ESTRO School

The most severe case …

- Occurred in 1992 ;
- The source (HDR Iridium) became detached from the drive mechanism during an anorectal cancer treatment
- Conflicting signals; the area monitor actually detected the radiation, while the equipment indicated « source shielded »
- Unfortunately, previous radiation monitor malfunctions encouraged misinterpretation and induced the staff not to trust it ...

ESTRO School

- Therefore the wrong indication of the equipment was accepted ...
- And the patient, clothes and room were not checked with another radiation monitor
- The patient kept the HDR source 4 days , for a total dose of about 16,000 Gy ! (18 Gy prescribed .....)
- The catheter with the source felt at that time with necrotic tissues,
- ... and was disposed in a waste container, without identification of the source ...

ESTRO School

- The waste container was picked up by a commercial medical waste disposal company 5 days later ,
- It was then taken to an incinerator where (at last...) the source radiation was detected.
- The patient died on day 4
- During the days the source remained in the patient or in the waste container, it irradiated at various levels 94 persons ...

The ICRP 97 Main points

- High-dose-rate (HDR) brachytherapy is a rapidly growing technique that has been replacing low-dose-rate (LDR) procedures over the last few years in both industrialised and developing countries. It is estimated that about 500,000 procedures (administrations of treatment) are performed by HDR units annually.

- LDR equipment has been discontinued by many manufacturers over the last few years, leaving HDR brachytherapy as the major alternative.

- HDR techniques deliver a very high dose, of the order of 1.6-5.0 Gy/min, so mistakes can lead to under- or overdosage with the potential for clinical adverse effects.

ESTRO School

The ICRP 97 main points

- More than 500 HDR accidents (including one death) have been reported along the entire chain of procedures from source packing to delivery of dose. Human error has been the prime cause of radiation events.
- Many accidents could have been prevented if staff had had functional monitoring equipment and paid attention to the results.
- Since iridium has a relatively short half-life, the HDR sources need to be replaced approximately every 4 months. Over 10,000 HDR sources are transported annually, with the resultant potential for accidents.

The ICRP 97 main points

- A team of trained personnel following quality assurance (QA) procedures is necessary to prevent accidents. QA should include peer review of cases.

- Accidents and incidents should be reported and the lessons learned should be shared with other users to prevent similar mistakes.

- Strahlenther Onkol. 1999 Oct;175(10):524-9.
- **Emergency rescue in accidents with HDR afterloading units.**
- Kaulich TW, Becker G, Lamprecht U, Nüsslin F, Bamberg M.

- **Abstract**
- HDR brachyradiotherapy has minimized the exposure to radiation of the personnel working in this field. Nonetheless there are periodically reported troubles with afterloading units concerning the retraction of sources that require **immediate action** for the limitation of possible damage

ESTRO School

- “…The quickest possible rescue of a patient in an emergency demands an unequivocal definition of responsibilities….
- …The organizational structure of the clinic allowing, the emergency physician should invariably be the physician who placed the applicator
- … A well-practiced emergency management can be of life-saving importance for the patient.”

ICRP 98 :

Radiation safety aspects of brachytherapy for prostate cancer using permanently implanted sources

published in 2005

ESTRO School

- **At the time of publication**
- **No « real » accident reported with this technique :**
- ***« No adverse effects to medical staff and/or the patient family have been reported to date »***

However ; since that time: the reports on the Philadelphia Veteran hospital « accident »

- Actually : not a real « accident »
- But a succession of « malpractices » leading to ***97 medical errors out of 116 prostate cancer implantations***
- ***During 6 years,*** from 2002 to 2008 !! ....

ESTRO School

- February 2002 : the Philadelphia Veterans Affairs Medical Center (PVAMC) initiated its prostate brachytherapy program

- February 2003 ; during a seed prostate implant**, 40 out of 74 seeds were « implanted » in the patient's bladder**; they were subsequently expelled and recovered ...

- October 2005 ; 45 out of 90 seeds were again mistakenly implanted into the patient's bladder and recovered...

- May 2008 ; the National Health Physics Program (NHPP) notified the U.S. NRC (Nuclear Regulatory Commission) of a possible medical event involving a patient that received a dose less than 80 % of the prescribed dose....

- This triggered (at last ...) an on site inspection
- With the first results available, the PVAMC prostate brachytherapy program was suspended in June 2008
- In October 2008, prostate cancer brachytherapy was suspended in three other VA hospitals ; Cincinatti, Jackson, and Washington ...

- The first survey identified 92 medical events:
- 57 were due to a dose less than 80% of the prescribed dose (underdose),
- 35 were due to a dose to an organ or tissue out of the treatment site that exceeded 0.5 Sv
  (Overdoses of rectum, bladder wall or prostate surrounding tissues)

  AGREEMENT STATE

ESTRO School

- **AGREEMENT STATE REPORT - MEDICAL EVENT INVOLVING THE MISADMINISTRATION OF I-125 SEEDS IN A PROSTATE CANCER TREATMENT**
-

  "On Thursday, September 15, the Radiation Safety Officer (RSO) for the licensee called [the state] to make a preliminary advisement that a medical event involving a prostate cancer treatment had occurred at their facility".

- 71 seeds planned to be implanted in the prostate
- **Actual number of seeds implanted in the prostate : 3 (!) .....**
- The other seeds ; in the bladder, in the bladder and rectal wall, in the perineum etc .....

Rare accidents with implanted seeds

- Iodin contamination from seeds accidentally ruptured ; 4 cases reported ;
- Broga DW, Gilbert MA ; Health Physics 1983, 45(3):593-7
- Caldwell C et al. Health Physics 2007, 92 (2suppl.) :S8-S12
- Patients demonstrated significant thyroid uptake and were administered potassium iodide as a blocking agent

- Contamination from Iodin seeds ;
- May be due to the accidental rupture of a seed during the implantation (very rare)
- May be also due to a *poor design of the seeds,* with iodin leakage ...

Frequently forgotten accidents !

- Actually, the main risk of « accident » in permanent implant prostate brachytherapy could be ...
- The accidental puncture (and blood contamination) of the finger(s) of the operator !
- Therefore ; take care of you !
- And beware of seropositive patients ...

ESTRO School

Conclusions

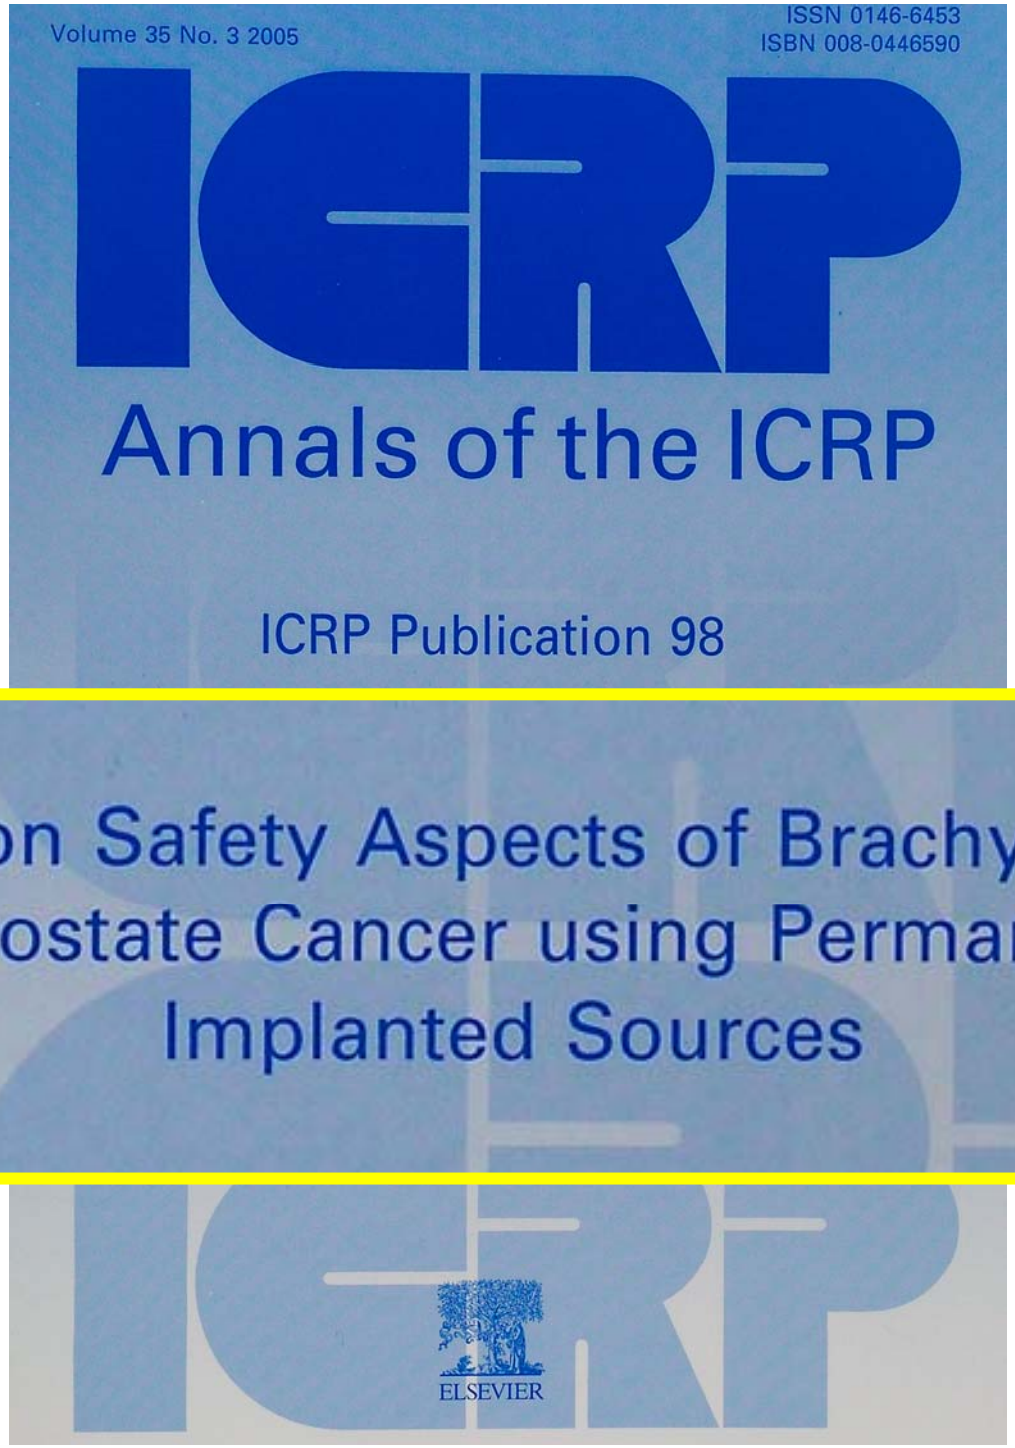
- Accidents in LDR and HDR brachytherapy are rare (++) but may occur ...
- But should not !
- *« The majority of the accidental exposures that occurred with brachytherapy can be linked to sources parameters, to dose calculation procedures and to insufficient training of personnel » (ICRP 86)*

ESTRO School

A last (important) point

- In the same way it has to be done in external radiotherapy, all precursor events, incidents or accidents in brachytherapy ***have to be immediately reported and analyzed***, in order to rapidly propose corrective measures, to circulate the information and to learn from experience !

ESTRO School



ESTRO School

ICRP 98 ; the general background :

- Prostate cancer ; now the first cancer in males (in terms of incidence) in most developed countries
- More and more localized stages (screening)
- Able to benefit from brachytherapy ...
- In the US ; 30 to 40 000 (more ?) implantations each year
- In Europe (and in some other countries) several thousands cases already treated annually, and rapid increase ...
- (very) encouraging results

ICRP 98 ; the radioprotection background :

- Permanent seed implantation;
- No adverse effects to medical staff and/or the patient's family reported so far ...
- However, ICRP felt necessary to address a number of Radioprotection issues raised by the procedure.

ICRP 98 writing Committee :

- *Chairman* : **JM COSSET (Paris, France)**
- *Full members* : **D.ASH (Leeds, UK)**
- **L.PINILLOS-ASHTON (Peru)**
  T.McKENNA (IAEA)
  M.ZELEFSKY (New-York, USA)
  M.HIRAOKA (Kyoto, Japan)
- *Corresp. members* : **W.YIN (Beijing, China)**
  L.DAUER (New-York, USA)
  C.PEREZ (USA)
  JC.ROSENWALD (France)

2.3. Theoretical calculations 16
2.4. Direct dose monitoring of family and household members 19
2.5. Recommendations 20

ESTRO School

One large-scale study in the literature;

- Michalski et al; (2003):
- For 44 patients ;
- Dosimeters to the patient, spouse, children, pets (!), and monitoring of 4 rooms frequently occupied by the patient
- *Very low levels of exposure :*
- Example; Calculated mean lifetime dose to a spouse; 0.1 mSv for a ^{125}I implant ...

To make a long story short ;

- ***Very low*** doses to family and household members
- Usually well below the 1 mSv limit for the public
- Not even reaching the « constraint level » of 5 mSv set for comforters and carers of such patients by the IAEA (1996)...

- **A New recent study (paper submitted in 2016):**

- **Prospective study of direct radiation exposure measurements for family members living near patients with prostate iodine-125 seed implantation: Proof of radiation safety**
- Takashi Hanada, Ph.D.*1, 2, Atsunori Yorozu, M.D., Ph.D.2, Yukiko Shinya, M.D.2, et al.

- MATERIAL AND METHODS: Twenty-five patients who underwent 125I seed implantation, along with their family members, were provided dosimeters to measure direct radiation 10 exposure. The estimated lifetime exposure dose (ELED) and precaution time for holding children near the patient's chest were calculated.

- **“According to findings, our sample size was large enough to suggest that no precautions are necessary for most family members who 194 are approaching implanted patients”**

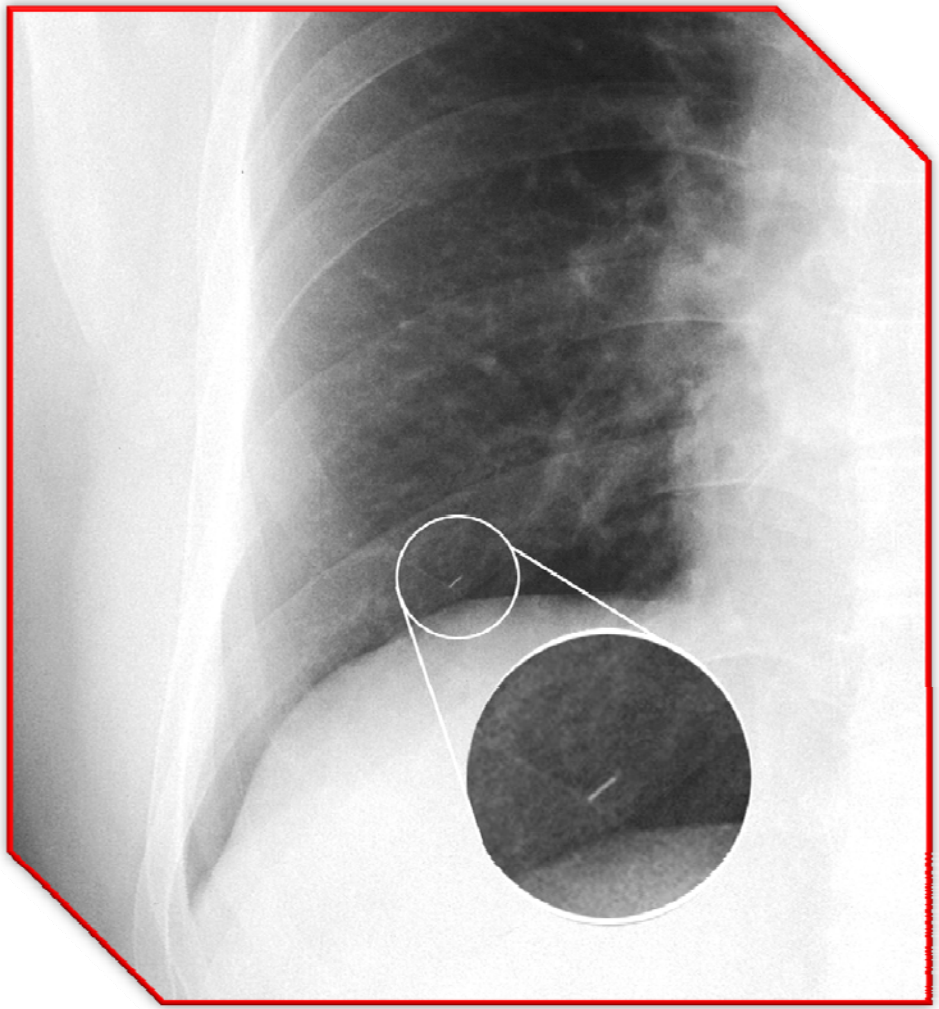
ESTRO School

- **Recommendations**
- Doses to family or others will be below 1mSv therefore no routine precautions necessary
- Children not to sit on lap of patient for 2 months
- Avoid prolonged close contact with pregnant women

- NB: If partner is pregnant consider individual risk assessment with dose rate measurement.

3. EXPELLED SOURCES 23
3.1. Migrating and expelled sources 23
3.2. Radiation risks related to an expelled source 23
3.3. Recommendations 24

Seeds may migrate to the lungs (no radioprotection problem …)



- And may be expelled from the patient's body in three ways ; urine, semen, and gastro-intestinal tract (this last case very rare !)
- More frequent with « free » seeds than with « stranded » seeds .

In experienced teams, those migrations are now very rare (even with free seeds), but :

- Recommandations should be given to the patients:
- Sieving the urine at least for a few days
- Use of a condom for the first five ejaculates
- Recommandations also for the brachytherapists; they should adapt their technique in order to reduce the number of migrations !

Result of the discussions within the task group :

... " Expelled seeds may represent a hazard for people finding them if unaware of the (small) risk of touching them (particularly young children), this is the reason why sieving the urine is often recommended.

However, one has to keep in mind that two risks have to be balanced : the risk of a patient dealing inadequately with a (or several) seed(s) found by sieving their urine , and the risk (actually negligible) of flushing a source in the toilets." ...

ESTRO School

… "Therefore, identification of migrating sources is useful from a medical point of view (at least to try and improve the technique in order to reduce those migrations)…

…while from a radiation safety perspective it is better to have the seeds flushed down the toilet instead of stored by the patient and transported back to the physician." …

- **Recommendations**

- (1) sieve the urine while in hospital and for 3 days after implant
- (2) wear condom for first five ejaculations
- (3) if seed “found” do not touch. Put in protective container with spoon or tweezers and return to department.
- (4) if seed in lavatory bowl - flush away

4. CREMATION 27
4.1. Current national recommendations 27
4.2. Activity remaining in patients' ashes 28
4.3. Potential airborne releases 29
4.4. Recommendations for cremation 29

4. CREMATION 27
4.1. Current national recommendations 27
4.2. Activity remaining in patients' ashes 28
4.3. Potential airborne releases 29
4.4. Recommendations for cremation 29

A difficult topic …

ESTRO School

Cremation

- Uncommon in a number of countries
- Frequent in some others (China, India ...)
- The rule in Japan !

Current national recommandations

- Delay before allowing cremation : Large variations from country to country …
- Briefly;
- From 1 year or less (Japan, US NCRP -with precautions -)
- To 2 years (Canada)
- And even 3 years (UK , France)

ESTRO School

After considering and calculating the activity remaining in the patient's ashes and the potential airborne release,

- The ICRP considered that :
- *« Cremation can be allowed… if 12 months have elapsed since an implantation performed with ^{125}I (3 months for ^{103}Pd)… »*
- *However, it must be kept in mind that some national authorities (UK , France) selecting worse-case scenarios and using different types of calculations are recommending much longer times … (up to 3 years for ^{125}I) »*

ESTRO School

5. SUBSEQUENT PELVIC OR ABDOMINAL SURGERY 31

- In rare cases, limited and careful transurethral resection may be necessary after brachytherapy ;
- Must be done by an ***experienced surgeon***, aware of the brachytherapy technique,
- And no sooner than 6 months after an ^{125} I implantation.
- Moreover , in case of subsequent abdominal or pelvic surgery ; warn the surgeon ! (« wallet card » ; see below)

6. FATHERING OF CHILDREN 33

- Due to the drastic reduction in the volume of the ejaculate, patients may think they are definitively infertile ....
- Actually, the dose from the implant may not reach the threshold for castration, and a few cases of fatherhood have been reported after permanent implants !

A recent paper (Mydlo 2004), after an extensive review of the literature and an estimation of only 20 cGy for the dose to testis, speculates that *the effects of prostate brachytherapy on spermatogenesis in prostate cancer patients are minimal.*

What about the genetic risk ?
(Collaboration with ICRP Committee 1)

- *Current estimates of the genetic risks from radiation (UNSCEAR 2001) suggest that a paternal testicular dose of 1 Gy to a patient would result in an excess of around 1 case in 300 live born offspring…"*

What about the genetic risk ?

- *“ This is a small percentage increase (~4 %) over the natural incidence of these genetic effects and these figures may serve to reassure patients on the relatively low risk of genetic effects in their children.”*

ESTRO School

7. TRIGGERING OF RADIATION DETECTION MONITORS..... 35

- Some radiation detection monitors are set at a very low alarm level (1.5-2 times the natural background level in given places ...)
- Entry/exit of nuclear plants and nuclear research centers, waste areas, scrap metal factories/yards, and, more and more;
- Airports and crossing borders (« nuclear terrorism »)
- Should be explained to the patient !
- Wallet card +++

8. SECONDARY CANCERS 37
8.1. Secondary cancers after prostate brachytherapy 37
8.2. Secondary cancers after treatment of prostate cancer 37
8.3. Secondary cancers after external irradiation for prostate cancer 37
8.4. Secondary cancers: conclusions 38

- Almost no case of second cancers reported after prostate brachytherapy
- But ; possible problem of follow-up ...

ESTRO School

Secondary cancers: The conclusions of the task group (2005);

- The risk of a second radio-induced cancer (in the life time of a patient) after prostate brachytherapy therefore appears to be either nil , or extremely low
- The benefits of the technique clearly outweigh (by far !) the (limited) risk of second malignancies ...

Cancer. 2006 Sep 1;107(5):991-8. Links

Cancer incidence after localized therapy for prostate cancer.

Moon K, Stukenborg GJ, Keim J, Theodorescu D.
Department of Urology, University of Virginia, Charlottesville, Virginia 22908, USA.

- CONCLUSIONS: Patients who received EBRT had significantly higher odds of developing second cancers both overall and in the areas that were exposed to radiation. It is noteworthy that, to the authors' knowledge, this report shows for the first time that, despite the higher doses of radiation delivered, **patients who received radioactive implants had the lowest odds of developing second cancers.** *(Actually no increase at all for those patients!)*

ESTRO School

Second cancers after prostate cancer RT

- . Strahlenther Onkol. 2007 Nov;183(11):605-9.
- **Risk of second malignancies after prostate irradiation?**
- Müller AC, Ganswindt U, Bamberg M, Belka C.
- **DISCUSSION:**
- Up to now, all available data are highly heterogeneous. Thus, a low risk for secondary cancer cannot be ruled out completely **Nevertheless, it seems very unlikely that there is a relevant risk for secondary cancer since the largest of the published series did not document an increased risk for any secondary cancer.**

Second primary cancers occurring after I-125 brachytherapy as monotherapy for early prostate cancer.

- Musunuru H[1], Mason M[1], Murray L[1], Al-Qaisieh B[2], Bownes P[2], Smith J[3], Franks K[1], Carey B[3], Bottomley D[1], Henry AM[4].

- **AIMS:**
- Prostate brachytherapy may be associated with a lower risk of radiation-induced second primary cancer (SPC) as a significantly smaller volume of normal tissue is irradiated when compared with external beam techniques.
- **MATERIALS AND METHODS:**
- SPC incidence was retrieved by conducting a UK cancer registry search (Northern and Yorkshire Cancer Registry and Information Service) for 1805 consecutive patients with localised prostate cancer who received monotherapy with I-125 brachytherapy from 1995 to 2006 at a single public hospital.
- **RESULTS:**
- In total, 170 patients (10.8%) were diagnosed with second primaries (1 year or more after implant); 20 of these were bladder and 10 rectal cancers.
- CONCLUSIONS:
- Overall, the incidence of SPC after I-125 is comparable with other published data with no significant excess more than 5 years from treatment. Mortality secondary to SPC of the bladder or rectum is unusual.

- Murray L[1], Henry A[2], Hoskin P[3], Siebert FA[4], Venselaar J[5]; PROBATE group of the GEC ESTRO.

- **Abstract**
- The development of a radiation induced second primary cancer (SPC) is one the most serious long term consequences of successful cancer treatment.
- An increased risk of radiation-induced SPC has been identified in several studies, particularly those with longer durations of follow-up.
- **The risk of radiation-induced SPC appears small,** in the range of 1 in 220 to 1 in 290 over all durations of follow-up, and may increase to 1 in 70 for patients followed up for more than 10years,

ESTRO School

Radiother Oncol. 2014 Feb;110(2):213-228.

Second primary cancers after radiation for prostate cancer: A systematic review of the clinical data and impact of treatment technique.

Murray L[1], Henry A[2], Hoskin P[3], Siebert FA[4], Venselaar J[5]; PROBATE group of the GEC ESTRO.

To date there are insufficient clinical data to draw firm conclusions about the impact of more modern techniques such as IMRT and brachytherapy on SPC risk, although limited evidence is encouraging.

In conclusion, despite heterogeneity between studies, an increased risk of SPC following radiation for PCa has been identified in several studies, and this risk appears to increase over time. This must be borne in mind when considering which patients to irradiate and which techniques to employ.

ESTRO School

A reminder ; the ICRP 98 Main Points

- 1/ The use of permanent radioactive implants .... is rapidly increasing all over the world
- 2/ No adverse effects to the medical staff and/or patient family have been reported so far.
- 3/ The dose from the patients ... remains in almost all cases well below 1 mSv.
- 4/ Expulsion of sources through urine, semen or gastro-intestinal tract is a rare event. Simple recommendations should be given to the patient
- 5/ Cremation can be allowed if 12 months have elapsed since the implantation (more ?)
- 6/ The patient must be provided with specific recommendations (+++)...

ESTRO School

2010 ; A key paper !

Dauer LT, Kollmeier MA, Williamson MJ, St Germain J, Altamirano J, Yamada Y, Zelefsky MJ.

Less-restrictive, patient specific radiation safety precautions can be safely prescribed after permanent seed implantation

- Brachytherapy. 2010.

ESTRO School

Editorial

Prostate brachytherapy patients are (almost) normal people !

Jean-Marc Cosset 1,2

- 1. Department of Oncology/Radiotherapy, Institut Curie, Paris, France
- 2. Vice chairman, International Commission on Radiological Protection (ICRP) committee 3

- “ ….Actually, the precise instructions to be given to the patients were left to the discretion of the facilities performing brachytherapy; those instructions were *frequently amplified* by the hospitals, with recommendations being often more conservative than those published by ICRP… “

- ....Moreover, those radioprotection aspects have also sometimes been reported in the general press, and here again with a significant enhancement of the message (For example *"Avoid all contacts with children for six months" !*...) .

- Such a drift may be responsible for two types of risk;
- first, the risk to induce in some implanted patients the feeling to be somewhat “plague-stricken”,
- and secondly, the risk that some others give up the brachytherapy proposal, simply because they fear to endanger their family...

- In this specific context, Lawrence T. Dauer and his colleagues of the MSKCC have to be commended for the cardinal work published in the present issue of “Brachytherapy”(2), because this study is going to allow *to significantly refine the recommendations to the patients*, in terms of the duration time during which precautions are really required.

- This study is based on a large cohort of patients (1279 cases), for whom precise radiation exposure rate measurements have been obtained between 1995 and 2008.
- The first (important) message of L.T.Dauer and colleagues is that ***no precaution*** (e.g, no precaution at all !) is necessary for a large panel of persons approaching the patients after a prostate implantation ;

- : that is the case for all implantations with Pd 103.
- After a typical implantation with I 125, no precaution at all is required for coworkers and non pregnant adults (even those sleeping with the patient). Only the pregnant adult sleeping with the patient and children can in some situations reach the “limits”.
- *Of note, the limits chosen here are still “conservative”, since set at 50 % only of the ALARA guidelines…*

ESTRO School

- The second message, maybe more important, is that the authors propose an algorithm enabling to determine the precaution time for a given patient, based upon the precise exposure rate measured at 30 cm from the patient. *As mentioned above, those calculations are only useful for the case of a pregnant adult sleeping with the patient, and in case of children in the house and held. The crude result is that it is now possible to customize the precaution time for each patient case.*

- For example, at their median exposure rate of 0.5 mR/h at 30 cm (for I 125) , the authors report that the patient should avoid sleeping “in contact” with a pregnant adult for 84 days, and avoid holding children in the lap for long periods of time (more than 1-3 hours) for 42 days.

- However, direct measurements on the patient and use of the algorithm now allow to refine this precaution time; in the case of a very obese patient, with few seeds implanted, and with consequently a very low measured exposure rate, precaution time may be anticipated *to be much shorter, and even nil in some specific cases.*

- In contrast, for a skinny patient with a large number of implanted seeds, with a higher exposure rate (The authors report a maximum level of 3.6 mR/h), the precaution time can be calculated to be significantly longer.

- Those customized recommendations should serve to reassure both the patients and the authorities.

In conclusion, in almost all cases, prostate brachytherapy patients should be considered as normal people !

Thank You !

ESTRO School

- In Paris, **focal brachytherapy was initiated in February 2010**,
- According to a protocol approved by the IMM ethics committee, with all patients receiving detailed information and signing an informed consent.

- **In this Phase II non-randomized study,**
- **Patient selection is based on (at least) two series of prostate biopsies (with a minimum of 20 biopsies overall)**
- **and on a high-resolution endorectal MRI.**

- **Only patients with very limited and localized tumors, according to strict criteria, (*actually almost the same as in the "consensus" paper*), were selected for the procedure.**

ESTRO School

- **The entry criteria being almost identical to the French active surveillance's ones,**
- **All patients were proposed active surveillance, but they expressed their (written) will to choose focal treatment.**
- **Among those patients reffered to our group for discussion of a focal brachytherapy, only 2 chose the surveillance strategy *(but clear selection of patients)*...**

ESTRO School

- **The technique is directly derived from the "real-time" procedure (already published by our team) with the permanent implantation of "free" LDR 125 Iodine seeds,**
- **The reason for the choice of the I 125 seeds:**
- **An experience of more than 3600 patients implanted with 125 I seeds since 1998 by our group,**
- **And the recommendations of the 2012 BJU Consensus paper :**
- ***"When reviewing the characteristics of the different permanent seed isotopes available (125I, 103Pd and 131Cs) it was noted that 125I had the most favourable characteristics"***

ESTRO School

- **The reasons for the choice of a permanent-implant free-seed technique :**
- **Again, our experience of more than 3600 treated patients,**
- **And again, the recommendations of the 2012 consensus paper:**
- ***" The greater flexibility afforded by loose seeds may be important for implanting the central portion of the prostate as in a hemi-gland implant."***
- ***"For the ultra-focal protocol, loose seeds might be preferable."***

ESTRO School

- **We chose to deliver to the focal volume the dose usually recommended by the GEC-ESTRO for the whole prostate (145 Gy).**
- **Sticking to the same dose constraints to the surrounding structures : see :**
- ***Tumour and target volumes in permanent prostate brachytherapy: the ESTRO/EAU/EORTC recommendations on prostate brachytherapy.***

- 3 Department of Radio-Oncology, Hospital Charles LeMoyne, Montréal, Canada
- 4 Department of Statistics, Institut Curie, 75005 Paris, France

- **Brachytherapy, 2013, 12, 331-337**

ESTRO School

In this first series :

- **21 focal implantations** were performed and analyzed,
- *(Today -June 2016- : 48)*
- The treated volume corresponded to a **mean value of 35% of the total prostatic volume (range 20-48 %).**
- For the focal volume, **mean D90 was 182 Gy, and the mean V100 was 99.6 %.**

ESTRO School

- **In our experience, the technique could be entirely performed in approximately an hour and a half, that is to say not significantly different from a usual "whole prostate" brachytherapy.**

- **Early urinary toxicity (still being evaluated) seems to be somewhat *inferior* to what is usually observed after brachytherapy of the whole prostate.**

ESTRO School

- **Table 1 : Urinary toxicity (scored by IPSS) and sexual toxicity (scored by IIEF5) for focal prostate brachytherapy. *Incontinence score (ICS) and rectal toxicity (almost constantly nil in this series) not shown.***
- Mean (range)
- **Initial IPSS** **5.3** (0-15)
- IPSS at 2 months 11.8 (1-28)
- IPSS at 6 months 6.6 (2-17)
- IPSS at 12 months **5.4** (2-9)

- **Initial IIEF5** **18.2** (1-25)
- IIEF5 at 2 months 16.6 (1-25)
- IIEF5 at 6 months 17.7 (1-25)
- IIEF5 at 12 months **18.3** (1-25)

- **we did compare the toxicities observed in this first series of focal brachytherapy with the ones that were registered in a series of 100 patients treated by a “whole prostate” brachytherapy by our group in the same institution (Institut Mutualiste Montsouris) , and analyzed with the same questionnaires**
- **(Questionnaires filled in by the patient himself and NOT by the physician).**

ESTRO School

- **Since almost no change in the ICS score nor in the rectal toxicity score was noted in both series, we concentrated on the evolution of IPSS and IIEF.**

- **We first checked that the two groups (“Focal” and “total”) were comparable in terms of initial IPSS (p=0.95) and initial IIEF (p=0.51).**
- **In both groups, we analyzed the mean scores at 2, 6 and 12 months, and also the variations of these scores (comparing the scores at distance with the initial values).**

ESTRO School

- **For IPSS, the mean scores and variations were comparable at 2 and 12 months in both groups, focal and total, *but there was a borderline difference favoring the "focal"group at 6 months*,**
- ***both in terms of direct comparison of the mean scores (p=0.04) and in terms of variation compared with the initial values (p=0.05).***

ESTRO School

- **For erectile toxicity (IIEF)**, we did not observe any significant difference between the mean scores in the “focal” and “total” groups at 2, 6 and 12 months (p=0.43 ; p=0.46 ; p=0.17 respectively),
- ***but the re-increase of the score was significantly better in the focal group at 6 and 12 months (p=0.014 et p=0.012, respectively).***

ESTRO School

Update 2016 : A trend ?

- **With now 48 patients implanted (focal):**
- **Possible trend for less early urinary toxicity after focal implantation of the apex**
- **Compared with an implantation of the prostate base (?)**

ESTRO School

Update 2015

	Mean IPSS 2 months	Mean IPSS 6 months
All cases	**11.4**	**8**
Focal base	**13.4**	**10.1**
Focal apex	**9.9**	**6.7**

To be confirmed …

ESTRO School

Update 2016

- **Control biopsies** ; planned between 18 and 24 months post-implantation,
- 35 Patients accepted the control biopsies (10 to 28 cores) :
- 3 patients refused ...
- 1 relapsed before 2 years (lymph node relapse)
- 1 patient living abroad ...
- **In 27/35 cases ; control biopsies were negative,**
- **In 8 cases** ; **positive biopsies (23%)**

ESTRO School

8 positive control biopsies at 2 years

- **(- 1 case** ; **1 controlateral microfocus** ; active surveillance, but MRI suspect image at 4 years ; second series of biopsies ; **negative)**
- **- 1 case** ; 1 controlateral positive biopsy (Gleason 6) ; normal IRM and Pet-cholin and PSA still decreasing : **active surveillance.**
- **- 4 cases :** controlateral (+ homolateral in one case) : ***controlateral complementary focal brachytherapy*** (1 + 1 planned) or ***active surveillance*** (2)
- **- 2 homolateral : <u>above</u>** the focal treated volume ; **salvage treatment being discussed**

ESTRO School

Moreover :

- - **1 <u>nodal</u> (iliac) relapse** at 1 year ½ ; **hormone therapy.**
- - 1 relapse at (controlateral) biopsies performed at 3 years ½ *(while the 2 years control biopsies were negative)*; T3 MRI ; **radio-hormonotherapy.**

- *+ 1 case suspect ++ of homolateral relapse on MRI at 3 years (just above the treated focal volume) with a rising PSA ; Second series of biopsies (24) ; all negative : ?? …*

ESTRO School

Overall : update 2015

- Among 48 patients , 35 with a follow-up > 2 years.
- 10 (11 ?) relapses have been registered:
- A rate of about 21 % at 3 years ?
- Acceptable ?

Conclusion:

- **The French experience on 48 patients :**
- **Focal prostate treatment by brachytherapy is easily feasible,**
- **With apparently little acute urinary toxicity (essentially when treating the apex ?)**
- **No relapse occurred in the treated area (among 48 patients, but 2 “borders”),**
- **10 relapses / 48, with a relatively short follow-up of three years : too much ?**

ESTRO School

- **Therefore : non-negligible relapse rate outside the treated volume ,**
- **In spite of the relatively short follow-up,**
- **and of the severe selection of patients in this series …**
- **Tentative conclusion : PRUDENCE …**
- **Further investigation is needed to more precisely assess the long-term tumor control rate,**
- **Taking into account the possibility and efficacy of salvage therapies …**

ESTRO COURSE Brussels 2016

New indications of prostate brachytherapy :

Salvage brachytherapy

Jean-Marc Cosset

ESTRO School

The rationale

- **After external irradiation,**
- **20-50 % of patients may experience a biochemical relapse**

- **Such a relapse may be related to microscopic dissemination, but also , in an unknown percentage of cases, to a pure LOCAL relapse.**

ESTRO School

- **The prognosis of such local relapses is poor ;**

- . Fuks Z, Leibel SA, Wallner KE et al. **The effect of local control on metastatic dissemination in carcinoma of the prostate: long-term results in patients treated with 125I implantation.** Int J Radiat Oncol Biol Phys 1991; 21: 537-547.
- . Kuban DA, el-Mahdi AM, Schellhammer PF. **Effect of local tumor control on distant metastasis and survival in prostatic adenocarcinoma.** Urology 1987; 30: 420-426.

- **Consequently,**
- **Several attempts to « salvage » those local failure after external irradiation :**
- **Essentially:**
- **Surgery**
- **Cryotherapy**
- **HIFU (ultrasounds)**

- **Until recently ; results usually poor, with frequent complications/Side effects.**

ESTRO School

What about **Salvage brachytherapy** for localized prostate cancer after failure of a previous radiotherapy ?

- The literature :
- In the large majority of cases after failure of an ***external irradiation***
- In rare cases after a ***first-line brachytherapy***…
- Mostly proposed to date with ***permanent implants, but more and more with HDR.***

ESTRO School

- **A review of the papers available in 2016,**
- **Reporting on series of patients treated by permanent implants after external RT** ***(or brachytherapy)***
- **About 500 cases found to date in the literature.**

ABSTRACT

PURPOSE: To evaluate the role of salvage prostate brachytherapy for locally recurrent prostate cancer after external beam radiation alone.

METHODS AND MATERIALS: Sixty-nine consecutive patients treated with salvage brachytherapy after a local failure were analyzed.

CONCLUSIONS: A subset of failures after definitive radiation is local in nature, and excellent control is possible with salvage brachytherapy.

In addition: literature reviews :

- Can J Urol. 2012 Dec;19(6):6534-41.
- **Salvage therapy for locally recurrent prostate cancer after radiation.**
- Marcus DM, Canter DJ, Jani AB, Dobbs RW, Schuster DM, Carthon BC, Rossi PJ.
- Department of Radiation Oncology, Emory University, Atlanta, Georgia, USA.
- **MATERIALS AND METHODS:**
- A review of the literature was performed to identify studies of local salvage therapy for patients who had failed primary EBRT for localized prostate cancer.

- **Conclusions :**
- ***As there are no randomized trials comparing salvage treatment modalities for localized prostate cancer recurrence after EBRT, the selection of a local treatment modality should be made on a patient-by-patient basis...***

- Ramey SJ, Marshall DT.
- **PURPOSE:**
- **To review the literature on use of radiation as a salvage option after local-only failure following initial treatment with radiation.**
- **Results:**
- **Biochemical disease-free survival (bDFS) at four to 5 years ranged from 20 to 75 %. Patient selection may have influenced these varying rates since some studies with lower bDFS had higher risk populations.**
- **the crude rate of grade 3-4 genitourinary toxicities among all studies was 13 % (range 0-47 %), and the crude rate of grade 3-4 gastrointestinal toxicities was 5 % (range 0-20 %). Incontinence rates were low among reviewed studies at 4 % (range 0-29 %).**

ESTRO School

- World J Urol. 2013 Apr;31(2):403-9.
- **Patterns of outcome and toxicity after salvage prostatectomy, salvage cryosurgery and salvage brachytherapy for prostate cancer recurrences after radiation therapy: a multi-center experience and literature review.**
- Peters M, Moman MR, van der Poel HG, Vergunst H, de Jong IJ, Vijverberg PL, Battermann JJ, Horenblas S, van Vulpen M.
- **METHODS:**
- A total of 129 patients from five different centers in the Netherlands were retrospectively analyzed.
- **RESULTS:**
- **BF occurred in 25 (81%) patients in the brachytherapy group (mean follow-up 29 ± 24 months), 29 (66%) patients in the prostatectomy group (mean follow-up 22 ± 25 months) and 33 (61%) patients in the cryosurgery group (mean follow-up 14 ± 11 months). Severe (grade >3) genitourinary and gastrointestinal toxicity was observed in up to 30% of patients in all three groups.**

Peters M, Moman MR, van der Poel Hg et al .

- **CONCLUSION:**
- ***"This overview shows clinical practice of prostate cancer salvage. Significant failure and toxicity rates are observed, regardless of salvage technique. Patients should be selected with great care before offering these salvage treatment strategies."***

ESTRO School

A rough analysis of the available literature :

- Rather short series …
- Sometimes lacking a sufficient follow-up,
- Large heterogeneities ! …
- Large variations in BFS ; from about 20 to 90 % …
- Large variations in grade 3-4 toxicities : from 0 to about sometimes 50 % …
- WHY ?

ESTRO School

- **Why such differences ? tentative explanations:**

- **1/ <u>Differences in follow-up ?</u>** the longer the follow-up, the lower the BFS ?
- Battermann and Grado , publishing at 73 and 64 months, report the lowest BFS ; 23 and 34 % , respectively.
- But Beyer, with a 62 months follow-up, reports a BFS of 53 %,
- And Burri, with a follow-up of 86 months, reports an equivalent BFS of 54 %
- ***Therefore, the variations in follow-up durations do not explain all the differences ...***

ESTRO School

- **2/ <u>Selection of the patients ?</u>**
- **Probably a major (the main ?) problem**
- **Essentially for the first (older) papers …**
- **Today , we should insist on this selection:**

In the French phase II trial « CAPRICUR » (Started in 2013, just completed)

- Biopsy-proven relapse
- With biopsies performed more than 2 years after the first irradiation
- PSA < 10 ng/ml
- PSA doubling time (at relapse) > 8 months
- Endorectal MRI eliminating an extra-capsular extension
- No distant metastases (Negative Bone scan - FNa if possible - , negative CT scan and Choline Pet-Scan)

ESTRO School

- **To make a long story short ;**
- **Selection of patients ;**

- **Everything should be done to eliminate an extra-protatic extension of the disease.**
- **Respecting the classical contra-indications of brachytherapy (prostate volume, previous TURP,IPSS >15, etc ...)**
- **A particular attention for the rectum : no previous post-(external) RT severe rectitis ...**

ESTRO School

- **3/ A problem of dose ?**

- **The salvage brachytherapy dose has been usually reduced : with a D90 of about 120 Gy (Beyer, Burri, Lopez ...)**
- **Some other authors (N'Guyen...) used an almost conventional D90 of 145 Gy...**
- **But N'Guyen reported both *a high BFS (70 %) and the highest rate of grade 3-4 toxicities ...***
- **The optimal dose in this setting thus remains to be precisely defined ...**

ESTRO School

Dose for salvage ; a 2015 paper

- Brachytherapy. 2015 Feb 26.
- **Salvage low-dose-rate permanent seed brachytherapy for locally recurrent prostate cancer: Association between dose and late toxicity.**
- Rose JN[1], Crook JM[2], Pickles T[3], Keyes M[3], Morris WJ[3].
- **RESULTS:**
- "...**These 5 patients with late toxicity had higher dose to the prostate (isodose enclosing 90% [D_{90}] median, 151 Gy; range, 135-185 Gy) compared with those without late complications (median, 134 Gy; range, 105-165; p < 0.04). "**
- **CONCLUSION:**
- "...The goal of planning should be to treat the recurrent disease to an adequate dose with careful attention to maintain a conservative D_{90} "

ESTRO School

Dose chosen in the French trial CAPRICUR :

- D90 prostate: **90 Gy**
- GTV or Index tumor (if identified) **: 144 Gy**

- **4/ <u>A problem of technique ?</u>**

- **The different groups have used rather different techniques of implantation**
- **(Preplanning in one or two steps, stranded or loosed seeds, automatic, semi-automatic or manual implantations etc ...)**

- **This could have played a role in the heterogeneity of the results, in terms of BFS as well as in terms of toxicity ...**

- **What about salvage by HDR brachytherapy ?**

- **More and more authors are reporting an experience of salvage brachytherapy using an HDR technique,**
- **The pioneers; Lee B, 2007, Tharp M , 2008, De Cicco L, 2009**
- **Small series ;**
- **Encouraging (but very) preliminary results .**

- *[1]Department of Radiation Oncology, Memorial Sloan-Kettering Cancer Center, New York, NY.*
- ***METHODS:***
- **Forty-two patients with biopsy-proven recurrence were enrolled on a Phase II study of salvage HDR monotherapy** using iridium-192. Median pretreatment EBRT dose was 8100 cGy (6840-8640 cGy) and the median time from completion of EBRT to salvage HDR was 73 months. **The protocol prescription dose of 3200 cGy was delivered in four fractions over 30 hours in a single insertion.** Median follow up after salvage HDR was 36 months (6-67 months).

ESTRO School

- ***RESULTS:***
- **The actuarial prostate-specific antigen biochemical relapse-free survival and distant metastases-free survival rates at 5 years were 68.5% and 81.5%, respectively. Cause-specific survival was 90.3%. Late genitourinary Grade 1and 2 toxicities were found in 38% and 48%, respectively….**
- **No Grade 4 toxicities were observed.**
- ***CONCLUSIONS:***
- **Genitourinary toxicity was the most commonly encountered toxicity observed after salvage HDR but severe toxicities were uncommon.**
- **Salvage HDR is an effective and well-tolerated modality for locally recurrent prostate cancer and should be considered even for patients who have previously been treated with ultra-high dose levels of EBRT.**

Delphi Study ?

A Delphi study is useful to learn from those who have experience with salvage treatment of the prostate in their clinical practice. The Delphi concept involves multiple rounds of questionnaires in which consensus between these experts is sought [10]. The outcome of a Delphi study is based on opinions and arguments of experts and is not always based on facts. An important aspect of a Delphi study is that it will provide an estimation of future developments, which is not available with contemporary data. Four elements characterize a Delphi study: anonymity, iteration, controlled feedback and statistical analysis.

ESTRO School

Two Conclusions :

- **Consensus or majority agreement for most points dealing with patient selection and work-up … :**

Consensus is defined as a ≥80% agreement between participants.
Majority agreement is defined as a 65–80% agreement between participants.
Divided opinion is defined as a <65% agreement between participants.

- **Examples ;**

ESTRO School

Table 1
Overview of the surveys and the score in the different rounds (the bold letters show group consensus).

Question	Answers	Agreement level
A. Indication for Salvage		
Should there be a minimum age?	No	**100**
What is the maximum acceptable ECOG/WHO performance score?	1 (Symptomatic but completely ambulatory (Restricted in physically strenuous activity)	**88.9**
	2 (Symptomatic;<50% in bed during the day)	11.1
Should previous Androgen Deprivation Therapy be a contraindication for salvage brachytherapy?	Yes	15.8
	No	**84.2**
What is the maximum acceptable T-classification at primary treatment?	T2	6.2
	T3a	12.5
	T3b	**81.3**

What is the maximum acceptable T-classification at salvage treatment?	T2	5.9
	T3a	5.9
	T3b	**88.2**
Is there to your opinion a part of the prostate inappropriate for re-irradiation?	No	**100**
Is there a maximal tumor lesion diameter that can be implanted?	No	**83.3**
	Hemigland	16.7
What is the maximum Gleason score at primary treatment?	<7	5.3
	<8	**94.7**
Should International Prostate Symptom Score (IPSS) of the patients be known?	Yes	**84.2**
What is the maximum IPSS for salvage?	<8	12.5
	8–15	**87.5**
Should Maximal Urinary flow (Qmax) of the patients be known?	Yes	**88.9**
	No	11.1

ESTRO School

Table 1
Overview of the surveys and the score in the different rounds (the bold letters show group consensus).

Question	Answers	Agreement level
A. Indication for Salvage		
Should there be a minimum age?	No	**100**
What is the maximum acceptable ECOG/WHO performance score?	1 (Symptomatic but completely ambulatory (Restricted in physically strenuous activity)	**88.9**
	2 (Symptomatic;<50% in bed during the day)	11.1
Should previous Androgen Deprivation Therapy be a contraindication for salvage brachytherapy?	Yes	15.8
	No	**84.2**
What is the maximum acceptable T-classification at primary treatment?	T2	6.2
	T3a	12.5
	T3b	**81.3**

What is the maximum acceptable T-classification at salvage treatment?	T2	5.9
	T3a	5.9

What is the maximum IPSS for salvage?	<8	12.5
	8–15	**87.5**
Should Maximal Urinary flow (Qmax) of the patients be known?	Yes	**88.9**
	No	11.1

No consensus neither agreement on :

- LDR or HDR ?
- Which dose ?
- Which fractionation for HDR ?
- Which volume : total or focal ?
- If focal ; « ultrafocal » ou « hemigland » (one lobe) ?

ESTRO School

C. Salvage brachytherapy treatment		
Minimum time interval between primary and salvage treatment	2 years	Majority agreement
Treatment modality	HDR	Consensus Majority
	LDR	agreement
Treatment volume	Whole gland, hemi gland or focal	Divided opinion
Planned dose	EQD2 (1.5 Gy): 70–150 Gy	Divided opinion
Dose constraints to OAR	Standard or adjusted	Divided opinion
Hormonal therapy	Should not be given	Consensus
Follow up examination	PSA test, record of urinary and bowel side effects and record of potency	Consensus

Consensus is defined as a ≥80% agreement between participants.

Majority agreement is defined as a 65–80% agreement between participants.

Divided opinion is defined as a <65% agreement between participants.

ESTRO School

Conclusions

- **A second-line brachytherapy appears to be able to salvage some selected patients after failure of a previous external irradiation**
- **Long-term BFS could reach up to 50-70 %**
- **With optimal techniques, Grade 3-4 toxicity rates could be low and acceptable**

ESTRO School

- **Complementary trials, such as the RTOG 0526, and French CAPRICUR should allow to better define :**
- **The criterias to propose such a salvage therapy to patients with local relapses,**
- **The dose not to be exceeded (108 Gy ? 120 Gy ? 140 Gy ?)**
- **The technical points allowing to reduce as much as possible the toxicities (urinary and rectal); rectal spacers ?**

- **With a (very) prudent approach, salvage brachytherapy could become a standard in the next years …**

ESTRO School

- **While waiting for complementary data:**
- **Stick to the Delphi Consensus !**

Which is best?

- Surgery vs IMRT
- Surgery vs BT
- BT vs IMRT
- Surgery vs IMRT vs BT
- LDR BT vs HDR BT

Radical prostatectomy

ADVANTAGES

- Pathological diagnosis
- No bowel toxicity
- Relief of LUTS
- Established salvage with external beam RT
- No additional second malignancies

DISADVANTAGES

- Erectile dysfunction 50%+
- Urinary control
- Anaesthetic procedure

IMRT

ADVANTAGES

- Outpatient process
- No anaesthetic
- Low urinary toxicity
- Lymphatic treatment possible

DISADVANTAGES

- No Pathological diagnosis
- Lengthy treatment course
- Bowel toxicity
- Erectile dysfunction
- Adjuvant ADT
- Second malignancies
- Limited salvage options

Which is best?

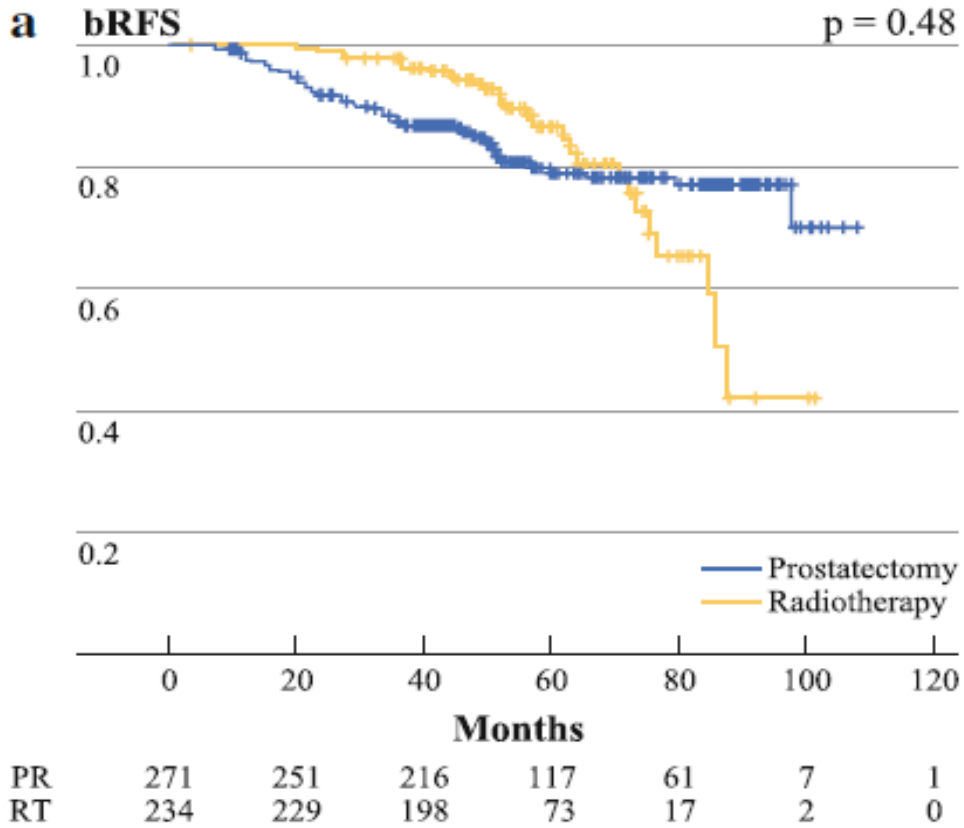
Radical Prostatectomy Versus External-Beam Radiotherapy for Localized Prostate Cancer: Long-Term Effect on Biochemical Control—In Search of the Optimal Treatment

Carmen González-San Segundo, MD, PhD[1], Felipe Herranz-Amo, MD, PhD[2], Ana Álvarez-González, MD[1], Pedro Cuesta-Álvaro, PhD[3], Marina Gómez-Espi, MD[1], Eva Paños-Fagundo, MD[2], and Juan A. Santos-Miranda, MD, PhD[1]

Ann Surg Oncol (2011) 18:2980–2987



Toxicity

Radiation-induced toxicity greater than grade 2 in the rectum (acute 3%, late 0.5%) and bladder (acute 7.5%, late 3%) was low. The risk of incontinence in the surgical group was 25% (international prostate symptom score and/or expanded prostate cancer index composite scores). No sexual toxicity was analyzed because reliable data were only available for 211 cases.

Choice between prostatectomy and radiotherapy when men are eligible for both: a randomized controlled trial of usual care vs decision aid

2012 BJU International | 111, 564–573

Table 2 Patients' final treatment preferences and treatments received in the usual care group ($n = 77$) and the decision aid group ($n = 163$).

	RP (%)	BT (%)	EBRT (%)	Undecided (%)
Treatment preference	67	17	13	4
Treatment received	71	12	18	–

RP, radical prostatectomy; BT, brachytherapy; EBRT, external beam radiotherapy.

Table 3 Effect of the decision aid on final treatment preferences and treatments received in the usual care group ($n = 77$) and the decision aid group ($n = 163$).

	RP (%)	BT (%)	EBRT (%)	Undecided (%)	P
Treatment preference					0.03
Usual care group	73	8	12	8	
Decision aid group	65	20	13	2	
Treatment received					0.04
Usual care group	78	4	18	–	
Decision aid group	68	15	17	–	

RP, radical prostatectomy; BT, brachytherapy; EBRT, external beam radiotherapy.

Which is best?

- Surgery vs IMRT
- Surgery vs BT
- BT vs IMRT
- Surgery vs IMRT vs BT
- LDR BT vs HDR BT

ESTRO School

Relative advantages and disadvantages: LDR vs HDR

LDR

- Single step procedure
- Low radioprotection

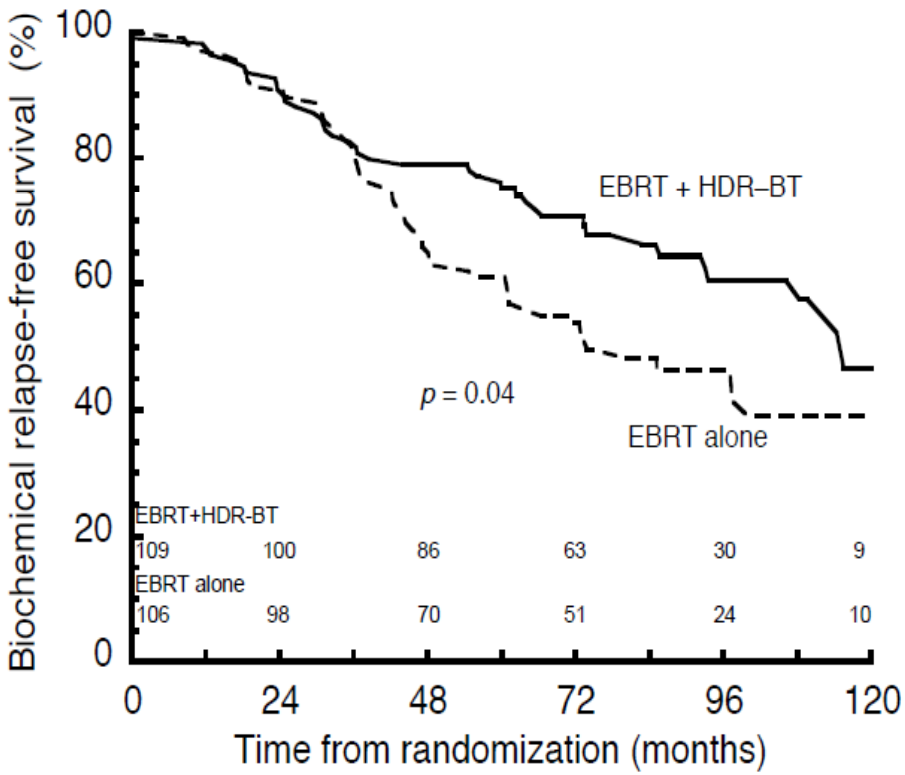
- Volume limited
- Limited cover of ECE/SV
- Dose delivery variable
- Dose limited/fixed
- QA post implant
- Less flexible for boosts

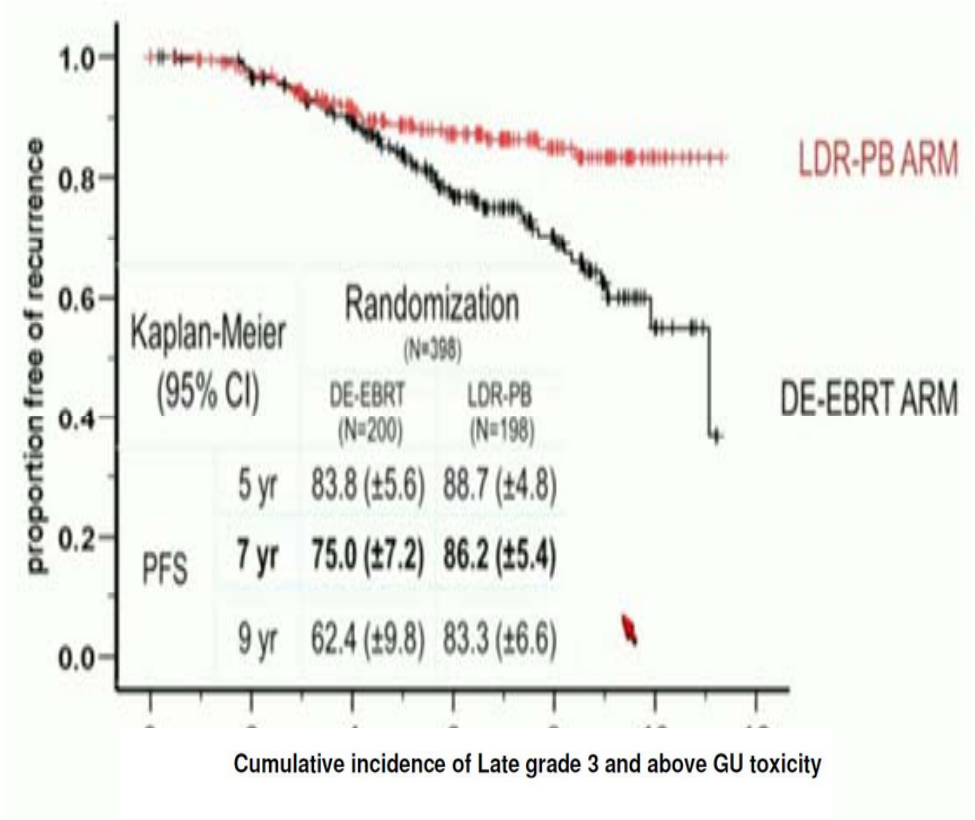
HDR

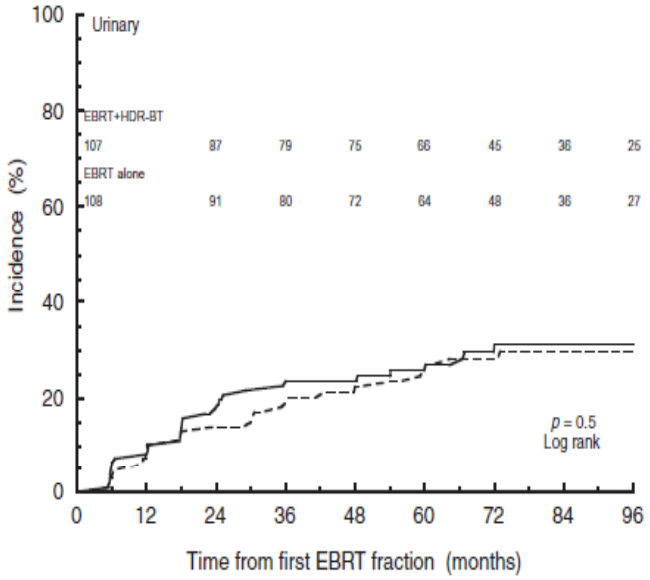
- Fractionation
- Requires HDR facility

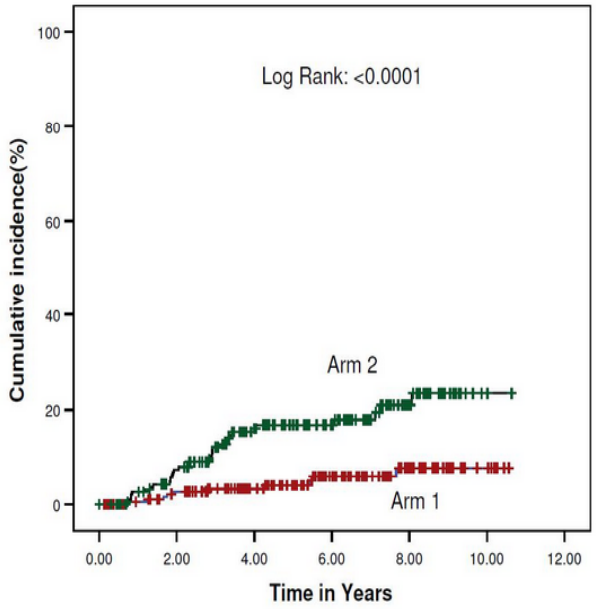
- Can implant large glands
- Can implant ECE and SV
- Accurate dose delivery
- Biologically higher dose
- QA pre delivery
- Focal subvolume boosts

HDR Best Boost ? LDR









ESTRO School

Treatment costs

- Implant equipment similar for PPB and HDR:
  - Fixation device with stepping unit
  - US apparatus
  - Planning system
  - Disposables: catheters, needles etc
  - OR facilities and support
  - Anaesthesia
  - Hospitalisation
  - Supportive medication

Treatment costs

HDR

Use of afterloader

Capital cost

- Assume 30% use for prostate and 50/year
- 400 Euro/patient

Source cost

- Assume as above
- 40 Euro/patient

TOTAL:
440 Euro/patient

LDR SEEDS

Cost of seeds

- Assume average 100 seeds per patient

TOTAL:
3500 Euro/patient

ESTRO School

What is your preferred management for a patient aged 66 years presenting with a PSA of 13.6, Gleason score 4+3 prostate cancer which is stage T2B on MR staging? He has no significant co-morbidities

a) Radical prostatectomy

b) Active surveillance

c) External beam IMRT to 78Gy with ADT

d) LDR seed brachytherapy with ADT

a) External beam IMRT + HDR boost

ESTRO School

What is your preferred management for a patient aged 66 years presenting with a PSA of 13.6, Gleason score 4+3 prostate cancer which is stage T3a on MR staging? He has no significant co-morbidities

a) Radical prostatectomy

b) Active surveillance

c) External beam IMRT to 78Gy with ADT

d) LDR seed brachytherapy with ADT

a) External beam IMRT + HDR boost

ESTRO School

What is your preferred management for a patient aged 66 years presenting with an IPSS of 19, PSA of 13.6, Gleason score 4+4 prostate cancer which is stage T3a on MR staging? He has no significant co-morbidities

a) Radical prostatectomy

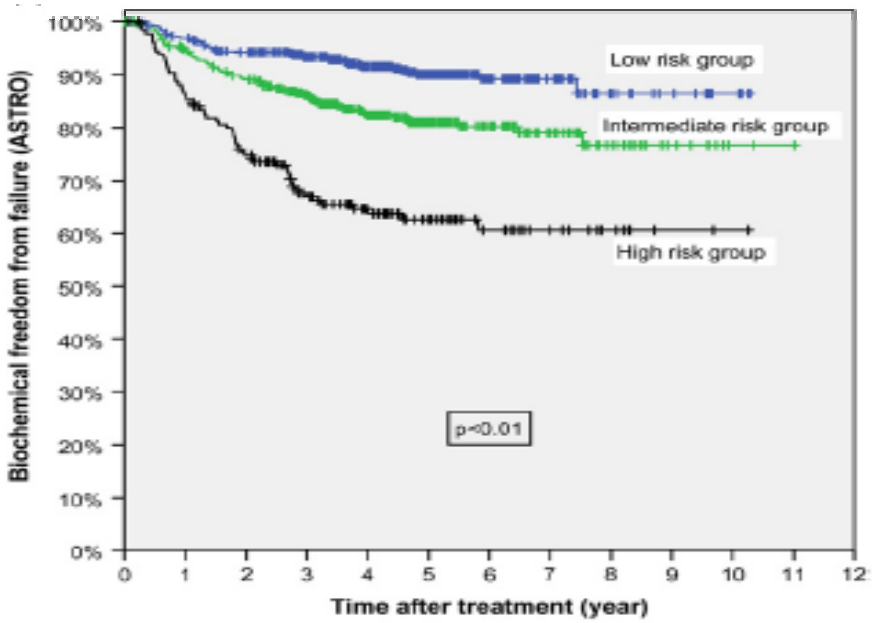
b) Active surveillance

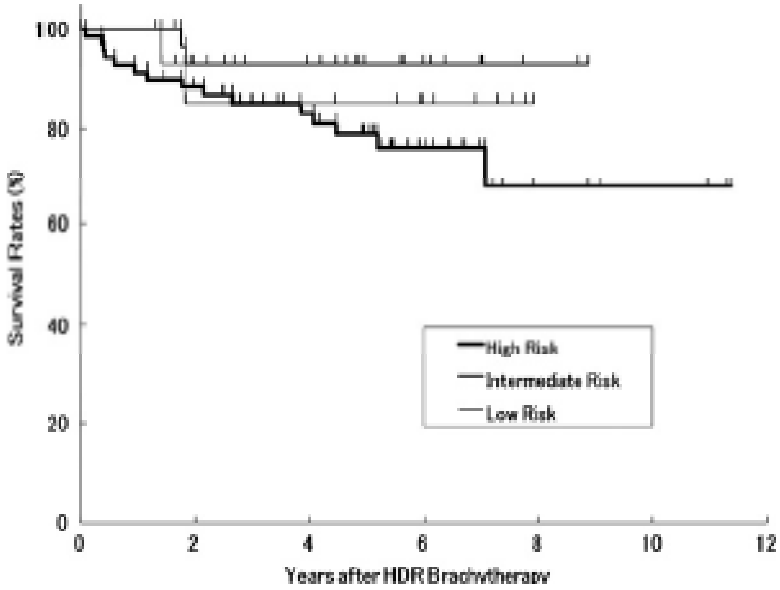
c) External beam IMRT to 78Gy with ADT

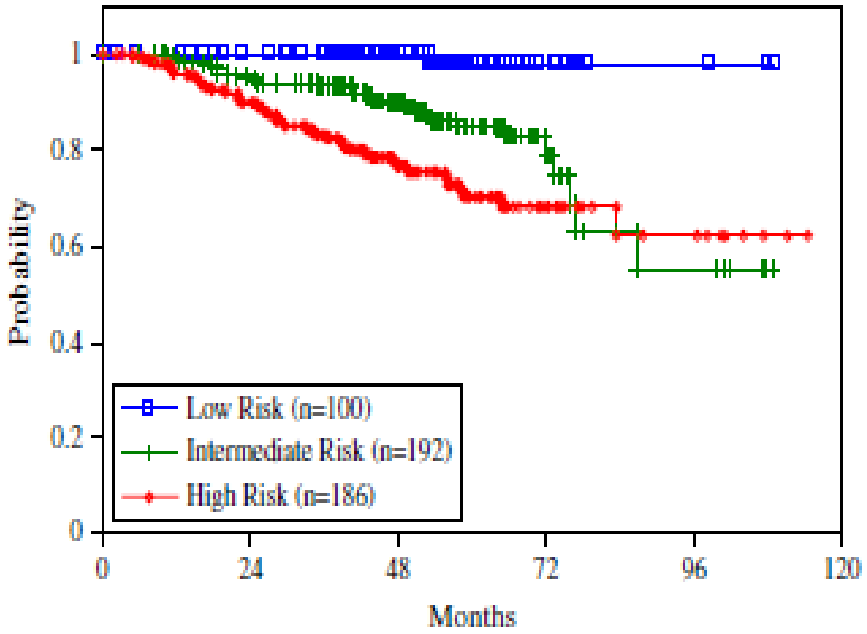
d) LDR seed brachytherapy

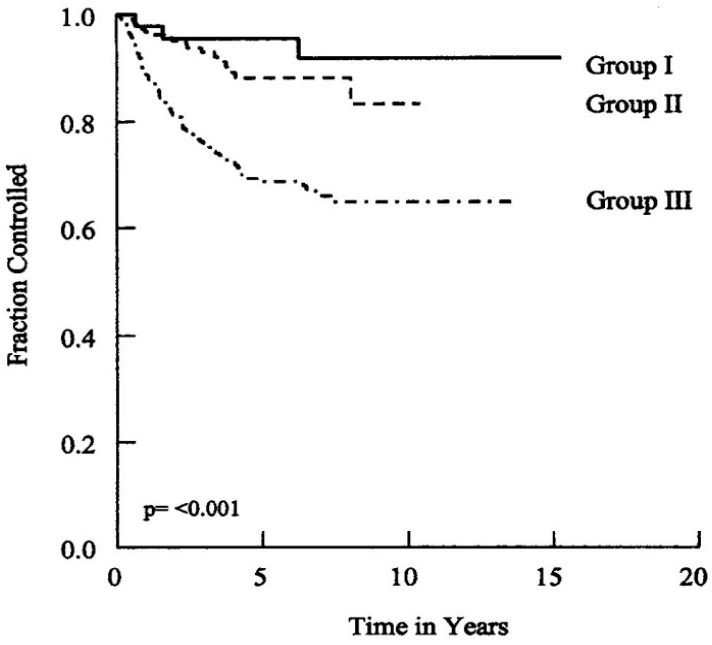
e) External beam IMRT + HDR boost

Does the technique matter?









Prostate brachytherapy has been the subject of heated debate among surgeons and the proponents of the various brachytherapy methods. This very first interdisciplinary book on the subject provides a comprehensive overview of innovations in low dose rate (LDR), high dose rate (HDR), and pulsed dose rate (PDR) interstitial brachytherapy for the management of local or locally advanced prostate cancer. In addition to detailed chapters on patient selection and the use of imaging in diagnostics, treatment guidance, and implantation control, background chapters are included on related medical physics issues such as treatment planning and quality assurance. The results obtained with the different treatment options and the difficult task of salvage treatment are fully discussed. All chapters have been written by internationally recognized experts in their fields who for more than a decade have formed the teaching staff responsible for the successful GEC-ESTRO/EAU Prostate Brachytherapy Teaching Course.

This book will be invaluable in informing residents and others of the scientific background and potential of modern prostate brachytherapy. It will also prove a useful source of up-to-date information for those who specialize in prostate brachytherapy or intend to start an interstitial brachytherapy service.
