Dear INFORMS Friends and Colleagues,

Welcome to the 2015 INFORMS Annual Meeting! It is my great pleasure and privilege to welcome you to Philadelphia. The City of Brotherly Love is a vibrant city of rich history and a rapidly evolving city of diverse culture, where emerging industries are right at home alongside centuries-old universities. The conference program reflects the intellectual richness that the host city can offer. Its broad scope covers cutting-edge topics from data analytics to healthcare applications; from novel optimization methodologies to comprehensive analysis strategies; from powerful modeling and software tools to intriguing industrial applications.

The vibrant intellectual sphere of the conference offers endless opportunities to meet old and new friends, network, and build and enhance your career. Please take advantage of the many networking opportunities, including the Welcome Reception on Sunday evening, the General Reception on Tuesday evening, and mingling in the melting pot of the conference exhibition and job fair area.

The 2015 Annual Meeting offers captivating plenary and semi-plenary presentations, panel discussions, tutorials, and thousands of oral and poster presentations from leading academics and industry experts.

The presentations survey the state-of-the-art of the analytics movement as it penetrates industry and society. The plenary speakers set the tone: Margaret Brandeau reviews how O.R. creates impact in healthcare; Michael Jordan explores ways to think about big data; Bill Rouse sheds light on the complexity of healthcare; and Alfred Spector discusses the role of empiricism and optimization in the world of big data. Another highlight of the program is the Presidents' Panel, at which four university presidents discuss the role that analytics and data-driven decision making play in the rapidly changing landscape of higher education.

The prize winners' presentations are always a treat for the curious mind. Besides the numerous subdivision-supported award presentations, the winners of the Franz Edelman Award, the UPS George D. Smith Prize, and the Daniel H. Wagner Prize, and the finalists of the Nicholson Student Paper Competition, will give presentations. Please join those sessions to celebrate the exceptional achievements of the finalists and winners.

Organizing such a major event would not be possible without having a solid organization, and without the efforts of many people. My special appreciation goes to the highly professional and efficient INFORMS staff, who are always there to help and guide the organizing committee. The INFORMS Meetings Committee is dedicated to do all that is possible, and beyond, to ensure that the Annual Meeting is a sound success. Program co-chairs Larry Snyder and Jeff Lindereth were responsible for assembling a high-quality program overall. Gino Lim and Mohammad Oskorouchi served as Invited Cluster Chairs; Noah Gans and Ted Ralphs worked with sections and societies as Sponsored Session Chairs; Contributed Session Chairs Hande Benson and Virginia Miori organized the overall submissions into coherent sessions; Wenjing Shen, Ming Wang, and Allen Holder organized the poster competition and poster sessions; Tutorial Chairs Dionne Aleman and Aurelie Thiele assembled a superb set of tutorials; Keynote Chairs Paul Griffin and Katya Scheinberg lined up an exceptional set of featured speakers; Practice Chairs Manoj Chari and Stefan Karish coordinated the industry contributions; and Neil Desnoyers organized plant tours and local arrangements. I would like to thank all who contributed to the success of this great meeting. Without your support and contribution, the general chair's job would have been impossible.

I would also like to thank to all of the sponsors for their generous support of the conference. Special thanks go to our Platinum sponsors: AIMMS, IBM and Seth Bonder Foundation. Finally, I acknowledge the tremendous support of Lehigh University, which celebrates its 150th anniversary this year. In addition to being a Platinum sponsor of the conference, the university, its College of Engineering, and the ISE Department generously supported the organizing committee and the student volunteers.

I thank you for your participation and continued support of INFORMS, and I hope you enjoy the conference and will have fond memories of the 2015 INFORMS Annual Meeting. I also encourage you to explore the rich history and vibrant cultural life that Philadelphia has to offer.

A handwritten signature in black ink that reads "Terlaký Tamás".

Tamás Terlaký, General Chair

BADGES REQUIRED FOR TECHNICAL SESSIONS

2015 INFORMS Annual Meeting badges must be worn to all sessions and events. Badges will be checked at the entrance to technical session areas, as well as the Exhibit Hall. Attendees without badges will be directed to the INFORMS registration desk to register and pick up their badges. *All attendees, including speakers and session chairs, must register and pay the registration fee. Lost badges can be replaced at the registration desk for a fee of \$5.*

REGISTRATION FEE

Your registration fee includes admittance to the complete technical program, the Exhibit Hall, Career Center, Technology Center, and most special programs. The following social/food events are also included: Sunday evening Welcome Reception and Awards Ceremony, Tuesday evening General Reception, and all morning and afternoon coffee breaks. No other meals are included.

Guest Registration

If your guest would like to accompany you to the major social events, you can purchase a guest registration (\$80) that covers admission to the Sunday Welcome Reception, Sunday Awards Ceremony, and Tuesday General Reception. Guests are not eligible to attend the technical sessions. You can register your guest at the INFORMS Registration Desk.

INFORMS CENTER

Visit the INFORMS Center in Exhibit Hall A for key Annual Meeting activities.

SUNDAY

12noon–2pm

Headshots taken for INFORMS Connect.

12noon–12:30pm

Trivia Challenge in the Student Lounge.

3:30–5pm

Crop Challenge/Syngenta/Analytics Section and **Bonder Scholarships**.

7:30–8:30pm

Meet the **INFORMS Board of Directors and Staff**.

MONDAY

9–10:30am

Meet the editors from **INFORMS Journal on Computing, Math of OR**, and **Information Systems Research**

9:30–10am

Come volunteer for **Pro Bono Analytics**

12:30–1:30pm

Do you need some pointers on **INFORMS Connect**? Meet in the Student Lounge for a tutorial.

3:30–5pm

Speak with editors from **Organization Science** and **Editor's Cut**. See the website that the **History & Traditions Committee** built to celebrate the history of our profession. Meet with officers from the **SpORts** section.

TUESDAY

9–10:30am

Meet the editors from **Management Science** and **INFORMS Transactions on Education**.

11am–1pm

Headshots taken for INFORMS Connect

3:30–5pm

Celebrate 40 years of **Omega Rho** and 20 years of Women in OR/MS (**WORMS**). Propose new **INFORMS initiatives**.

WEDNESDAY

9–10:30am

Health of INFORMS

11am–1pm

Headshots taken for INFORMS Connect.

TUESDAY, NOVEMBER 3

Registration

What do **YOU** need to stand out in the field of **operations research?**

A master's degree in computational decision science and operations research from Illinois Tech.

What type of operations research professional is in demand today? It's the person who knows how to use advanced analytics methods, algorithms, and machine learning to make informed decisions. And with your M.S. in Computational Decision Science and Operations Research from Illinois Institute of Technology in Chicago, you'll graduate with a distinctive advantage. The degree program combines applied mathematics, computer science, business, and engineering—and will definitely help you stand out from the crowd.

This program is designed for professionals with bachelor's degrees in mathematics, computer science, engineering, business, or a related area.

SATURDAY, OCTOBER 31**INFORMS Membership Meeting & Reception**

5–6pm
Salon H, Level 5, Marriott

The INFORMS Board of Directors encourages all members to bring their ideas, opinions, and suggestions to this annual meeting. Current business and future directions for INFORMS are on the agenda. Wine and cheese will be served.

SUNDAY, NOVEMBER 1**New Member Welcome Breakfast**

7–8am
By Invitation Only
Salon E, Level 5, Marriott

New INFORMS members received an invitation for this welcome breakfast. The session will feature a presentation on member benefits, a brief orientation to navigating the meeting, and a chance to relax and connect with colleagues. Representatives from INFORMS Communities will facilitate networking tables where you can meet other members who share your professional interests.

Junior Faculty Interest Group Luncheon

12:30–1:30pm
Salon F, Level 5, Marriott
\$35 (\$25 students, \$45 nonmember)

A limited number of tickets may be available on-site. Go to *INFORMS Registration* for information on availability. **No tickets will be sold at the door.**

The winners of the 2015 JFIG Paper Competition will be presented with awards. All junior faculty are invited to participate. This event gives junior faculty in engineering and business schools the opportunity to discuss career development and exchange ideas.

Sponsored by *University of Arkansas, Department of Industrial Engineering; North Carolina State University, Department of Industrial Systems Engineering, Georgia Southern University; Iowa State University, Department of Industrial and Manufacturing Systems Engineering; and University of Tennessee, Knoxville*

INFORMS Connect and Social Networking Reception

6:30–7:30pm
Salon L, Level 5, Marriott

What's your social networking strategy for yourself or for INFORMS? We invite all contributors to INFORMS social networking

sites to come and meet face-to-face. Join us for refreshments and drinks - we are your INFORMS Online community!

Minority Issues Forum Reception

8–9pm
Salon F, Level 5, Marriott

Come meet old friends and make new ones while talking about minority issues, other intellectual issues, and opportunities. Posters submitted to the Minority Issues Forum Poster Competition will be on display during the reception.

Sponsored by *North Carolina Agricultural and Technical State University, Department of Industrial and Systems Engineering; Texas A&M University, Industrial and Systems Engineering; North Carolina State University, Industrial and Systems Engineering; University of Michigan; University of Maryland, Department of Operations and Information Technology; and Cornell University*

MONDAY, NOVEMBER 2**BYOL - Bring Your Own Laptop and Learn About INFORMS Connect**

12:30–1:30pm
Exhibit Hall A, Student Lounge, Convention Center

Bring your laptop, your INFORMS username and password, and a lunch. We will cover frequently asked questions about this INFORMS member benefit. Prepare your questions and enjoy the chance to Connect with members both virtually and IRL (in real life).

COIN-OR Members & Users Meeting – (Bring Your Own) Bag Lunch

12:30–1:30pm
Franklin 9, Level 4, Marriott

Anyone interested in open-source software tools, open standards, and data/model repositories for any aspect of operations research are encouraged to attend this Computational Infrastructure for OR (COIN-OR) meeting. Please bring your own lunch and ideas.

PSOR Business Meeting/Lunch

12:30–1:30pm
Salon C, Level 5, Marriott
\$15 Section member (\$25 nonmember)

A limited number of tickets may be available on-site. Go to *INFORMS Registration Desk* for information on availability. **No tickets will be sold at the door.**

This lunch and business meeting is open to members of the INFORMS Section on Public Programs, Service and Needs, and those who are interested in joining the section.

PSOR Lunch sponsored by *George Washington University, Department of Engineering Management and Systems Engineering; and University of Michigan, Department of Industrial and Operations Engineering*

INFORMS Fellows Luncheon

12:45–2:30pm
By Invitation Only
Salon H, Level 5, Marriott

This luncheon honors INFORMS Fellows, examples of outstanding lifetime achievement in operations research and the management sciences. These individuals have demonstrated exceptional accomplishments and made significant contributions to the advancement of OR/MS over a period of time. Their service to the profession and to INFORMS has culminated in election to the INFORMS Fellow Award.

Class of 2015 Newly-Elected**INFORMS Fellows**

C. Allen Butler	Jack Levis
G�rard Cachon	Pitu Mirchandani
Pinar Keskinocak	Benjamin Van Roy
Eva K. Lee	Rakesh V. Vohra

Student Awards Ceremony & Student Reception

Awards Ceremony: 7:30–8pm
Reception: 8–9:30pm
Salon E/F, Level 5, Marriott

All students registered for the meeting are invited to attend the Student Awards Ceremony. The Chapters/Fora Committee will present the winners of the Student Chapter Annual Awards and the Judith Liebman Awards. Join us to recognize the great contributions of our most dynamic student volunteers. Plan to stay for the Student Reception, which immediately follows the ceremony.

The reception that follows the Student Awards Ceremony is open to all students – join us for an evening of food and drink, fun and networking. Come relax after a busy day of sessions and mingle with fellow students from universities around the world.

Thank You

 The Seth Bonder Foundation

WORMS 20th Anniversary Networking Dessert Reception

8–10pm
Maggiano's Little Italy, 1201 Filbert St.,
Philadelphia, PA 19107

Come celebrate the 20th anniversary of the Forum for Women in OR/MS with a buffet of delicious Italian desserts. Make new connections in an informal setting. Open to all INFORMS members (members of WORMS or not), female and male! Soft drinks are complimentary. One free alcoholic drink for the first 50 guests.

TUESDAY, NOVEMBER 3

Women in OR/MS Forum Luncheon

12:30–1:30pm
Salon H, Level 5, Marriott
\$28 (\$18 students) **SOLD OUT. No Tickets will be sold at the door.**

All those interested in issues related to women professionals in OR/MS are invited to join us.

Sponsored by University of Southern California, Marshall School of Business; Gilbert Laporte, Ph.D., University of

Michigan, Industrial and Operations Engineering Department; The Department of Operations & Decision Technologies at the Kelley School of Business; Eindhoven University of Technology; Inverse Limit, LLC; UCLA Anderson School of Management; University of Texas at Austin; University of Texas at Dallas; Texas A&M University; Harvey Mudd College; European Business School (ICSM); The Ohio State University, Integrated Systems Engineering; University of Arizona, Systems and Industrial Engineering; New York University; University of Chicago, Booth School of Business; California State University, Long Beach; H. Milton Stewart School of Industrial and System Engineering, Georgia Institute of Technology; University of Illinois at Urbana-Champaign, ISE Department; Candace Yano; University of Florida, College of Engineering; Southern Methodist University, Cox School of Business; Southern Methodist University, Lyle School of Business; Duke University, Fuqua School of Business; Pennsylvania State University, Supply Chain and Information Systems Department; University of Florida, Warrington College of Business; and The University of Texas at Arlington, Department of Industrial, Manufacturing, and Systems Engineering

ESPECIALLY FOR STUDENTS

Coffee with a Member

This wonderful program connects INFORMS students with some of INFORMS most enthusiastic members for 15-minute impromptu meetings and some sage INFORMS advice. We know the Annual Meeting can be a bit overwhelming and hope these casual meetings will make students more comfortable, knowledgeable, and enthusiastic about both the meeting and INFORMS. Student attendees were offered the opportunity to sign up before the meeting on a first-come, first-served basis (it is not possible to sign up in Philadelphia.) We will follow up after the meeting with a short survey to the students and members who participated to help us improve the program for future meetings.

SUNDAY

WELCOME RECEPTION
& EXHIBITS

7:30–9pm

Exhibit Hall A, 200 Level, Convention Center

The Welcome Reception is the perfect venue to meet with colleagues and visit the exhibits. Light snacks will be served. Soft drinks are complimentary, with a cash bar for other beverages.

INFORMS AWARDS CEREMONY
& DESSERT RECEPTION

8:30–9:45pm (Doors close at 8:45pm)
Salon G/H, Level 5, Marriott

The INFORMS Board of Directors invites you to honor and celebrate the achievements of our colleagues at the annual Awards Ceremony. You can attend the Welcome Reception first and then proceed to Salon G/H in the Marriott for the Awards Ceremony. Following the ceremony, you'll have an opportunity to congratulate the awardees at a special dessert reception. Please note that the reception is part of the ceremony event, open to the awardees, their friends and colleagues, and all those who attend the Award Ceremony itself. We are sorry we cannot accommodate guests at the reception who do not also attend the ceremony.

These prestigious awards will be presented during the ceremony:

Saul Gass Expository Writing Award
Martin Lariviere, Northwestern University

INFORMS President's Award
To Be Announced at Awards Ceremony

Frederick W. Lanchester Award
To Be Announced at Awards Ceremony

Prize for the Teaching of OR/MS Practice
Thomas W. Lucas, Naval Postgraduate School

George E. Kimball Medal
Jack Levis, UPS
Anne G. Robinson, Verizon Wireless

John von Neumann Theory Prize
To Be Announced at Awards Ceremony

Bonder Scholarship for Applied Operations Research in Health Services
Hadi El-Amine, Virginia Tech

Bonder Scholarship for Applied Operations Research in Military Applications
Major Ross Schuchard, George Mason University

Four student awards will also be announced during the ceremony: George E. Nicholson Student Paper Competition, George B. Dantzig Dissertation Prize, Doing Good with Good OR Student Competition, and Undergraduate Operations Research Prize.

TUESDAY

GENERAL RECEPTION

7:30–9:30pm

Grand Hall, 200 Level,
Convention Center

Philadelphia is the home of many culinary institutions, both gourmet and local. Join us as we serve up a fun, locally inspired menu including the Philly cheesesteaks created in Philadelphia in the 1930s. This year's General Reception will also feature a traditional Mummers string band for entertainment. Complimentary soft drinks and a cash bar will be available. This reception provides the perfect atmosphere for fellowship and networking, while also having a bit of fun after a long day of sessions.

informs

EDITOR'S CUT®

INFORMS Editor's Cut is a comprehensive online multimedia portal designed to enrich the knowledge base of those interested in analytics and operations research applied across a variety of topics. These unique collections, curated by recognized thought leaders, provide users with a simple and effective way to access the vast wealth of INFORMS content.

Current volumes include Healthcare in the Age of Analytics and Analytics in Sports. Visit the INFORMS Center on Monday, 3:30–5pm to meet editors and learn about Editor's Cut.

<http://pubsonline.informs.org/editorscut>

MOBILE APP

The INFORMS Meetings App is available for iOS and Android devices. Detailed information, including the schedule of sessions, session abstracts, meeting locations maps, exhibit details, and much more can be found on the app. This dynamic app can be downloaded directly to your device by visiting the iTunes Store or the Google Play Store and searching for "INFORMS Meetings."

When you view the meeting program in the app, you can either browse through the parallel sessions and special events or search for a specific speaker or keywords. As you locate the events, sessions and presentations you are interested in, click on the star button, which bookmarks it to the My Schedule itinerary. Use My Schedule for a quick reference tool.

One of the great features of the conference app is that it allows you to use the Badge Scanner - located in the top-right of the user menu - to send another member a contact request through INFORMS Connect. Simply scan the QR code on their meeting badge, click "Add Friend" and it will send them a contact request.

New This Year: INFORMS Walking Leaderboard

Who can accumulate the most steps over the course of the Annual Meeting? Log into "My Profile" found in the user menu of the app, select INFORMS Walking Leaderboard, and enter in the number of steps you walked that day by checking your phone or fitness tracker for steps. To be a leader for a particular day, you must enter your steps by 11:59pm EST. If you forget to track a day's steps, you can still enter your steps to be added to your cumulative total. We will award daily prizes, in addition to a FitBit sponsored by the **INFORMS SpORtS** section for the cumulative total champion.

SELF-SERVICE KIOSKS

Receipts – Print your conference receipt on demand by going to Exhibit Hall A, 200 Level, Convention Center, located near INFORMS Registration.

Program Flip Books – Three kiosks are available for full program information. Two are located in Exhibit Hall A and the third kiosk will be located in the Marriott on Level 4.

Express On-site Registration – Avoid the lines and make use of the two express kiosks that are available for express on-site registration in Exhibit Hall A, 200 Level, Convention Center near INFORMS Registration.

Ribbons – Are you a Session Chair, Cluster Chair or an attendee that is "Going Green" and need your ribbons? New this year we have a 'ribbon wall' where you can select a ribbon or ribbons that can be added to your badge holder!

Share Your Conference Photos

Attendees are encouraged to take photos and videos at the meeting. Send your photos to photosandvideo@mail.informs.org so we can post them in our Flickr album and on the meeting blog.

eNews Daily

INFORMS is publishing the eighth volume of its popular Annual Meeting eNews Daily in Philadelphia. This official record of the Annual Meeting is delivered each day to your inbox, providing a recap of the previous day's happenings and a preview of the upcoming can't-miss events. There are links to each issue on the Annual Meeting website. If you would like to advertise in eNews Daily, visit the sponsor page on the Annual Meeting website.

All Plenary & Keynote Presentations will take place in the Convention Center.

SUNDAY, NOVEMBER 1

WELCOME & PLENARY

10–10:50am

Grand Ballroom B, Upper 200 Level

Welcome

Tamás Terlaky, General Chair, INFORMS Annual Meeting Chair: Department of Industrial and Systems Engineering, Lehigh University

Edward H. Kaplan, President-Elect, INFORMS
William N. and Marie A. Beach Professor of Operations Research, Professor of Public Health & Professor of Engineering, Yale University

PLENARY

Omega Rho Distinguished Lecture

Creating Impact with Operations Research in Health

Margaret L. Brandeau, Coleman F. Fung Professor of Engineering and Professor of Medicine (by Courtesy), Stanford University

OR-based analyses have the potential to improve decision making for many important problems in healthcare. However, scholars – particularly junior scholars – often avoid working on practical applications in health because promotion and tenure processes tend to value theoretical studies more highly than applied studies. This talk discusses the speaker's experiences in using OR to inform and influence decisions in health, and provides a blueprint for researchers who wish to find success by taking a similar path. We also suggest how journals, funding agencies, and senior academics can encourage such work by taking a broader and more informed view of the potential role and contributions of OR to solving healthcare problems.

Margaret L. Brandeau is Coleman F. Fung Professor of Engineering and Professor of Medicine (by Courtesy) at Stanford University. Her research focuses

on the development of applied mathematical and economic models to support health policy decisions. Her recent work has focused on HIV prevention and treatment programs, programs to control the spread of hepatitis

B virus, and preparedness plans for bioterror response. She has published extensively in the areas of health policy modeling, operations management, management science applications, and bioterrorism preparedness planning. She is an INFORMS Fellow, and has received the INFORMS President's Award (recognizing important contributions to the welfare of society), the Pierskalla Award from INFORMS (for research excellence in healthcare management science), the Award for Excellence in Application of Pharmacoeconomics and Health Outcomes Research from the International Society for Pharmacoeconomics and Outcomes Research (ISPOR), and a Presidential Young Investigator Award from the National Science Foundation, among other awards. Professor Brandeau earned a BS in mathematics and an MS in operations research from MIT, and a PhD in engineering-economic systems from Stanford University.

OMEGA RHO

OMEGA RHO, the official Honor Society of INFORMS, was founded in 1976 to recognize superior scholarship and encourage leadership in operations research, management science, and related disciplines. The society has 40 active collegiate chapters, more than 5,000 student and faculty members, and is a member of the Association of College Honor Societies. In addition to sponsoring OMEGA RHO Distinguished Lectures at INFORMS Annual and International meetings, OMEGA RHO provides financial support to the annual INFORMS Colloquium. Honorary membership in OMEGA RHO is bestowed upon individuals who provide leadership and extraordinary support for the encouragement of operations research and management science through their professional activities. Prior to delivering the OMEGA RHO Distinguished Lecture, Margaret L. Brandeau will be inducted as an Honorary Member of OMEGA RHO.

Stochastic Networks: Scaling Limits, Performance Analysis and Optimization

Kavita Ramanan, Professor, Division of Applied Mathematics, Brown University

Stochastic networks are ubiquitous and arise in diverse fields including telecommunications, service systems for call centers and healthcare, computer networks, and biological systems. These networks are typically too complex to admit an exact analysis. However, it is often possible to obtain tractable approximations of both transient and equilibrium behavior that can provide key insight into network performance. These include both deterministic or fluid approximations that describe mean behavior and diffusion approximations that capture stochastic variability. The accuracy of these approximations in a suitable network parameter regime can be rigorously justified through "limit theorems." While the mathematical methods required to justify these approximations are fairly well developed for some classes of single-server networks that use so-called head-of-the-line scheduling policies, new approaches are required to analyze many other classes of networks that are of relevance for applications, such as large-scale load-balancing networks used, for example, in distributed memory machines and Web servers. We provide a survey of these mathematical methods and the associated scaling limits, with an emphasis on recent developments, and illustrate through a number of concrete examples how these approximations can be used to develop new algorithms and optimize network design.

Kavita Ramanan is a professor in the Division of Applied Mathematics at Brown University. She was a professor at the Mathematical Sciences Department at

Carnegie Mellon University and a member of technical staff at the Mathematical Sciences Research Center at Bell Laboratories. Her research lies in the area of probability theory, stochastic processes, and their applications, including the study of stochastic networks that arise in telecommunications and operations research. She has served on numerous editorial boards including the

All Plenary & Keynote Presentations will take place in the Convention Center.

Annals of Probability, Annals of Applied Probability, and Mathematics of Operations Research and Queueing Systems. She is a recipient of the Erlang Prize of the INFORMS Applied Probability Society (2006), was elected fellow of the Institute for Mathematics and Statistics (IMS) in 2013, and was an IMS Medallion Lecturer in 2015.

Optimization Techniques in Data Analysis

Stephen J. Wright, Professor of Computer Sciences, University of Wisconsin-Madison

Optimization perspectives have provided valuable insights into machine learning and data analysis problems, and optimization formulations have led to practical algorithms with good theoretical properties. In turn, the rich collection of problems arising in learning and data analysis is driving new fundamental research in optimization, reviving interest in well-established techniques and stimulating development of new methods. We discuss research on several areas of learning and data analysis, including regression/classification, signal and image reconstruction, and manifold learning, in each case describing problem areas in which optimization algorithms have been developed and successfully applied.

Stephen J. Wright is a professor of computer sciences at the University of Wisconsin-Madison. His research focuses on computational optimization and its

applications to many areas of science and engineering. Prior to joining UW-Madison in 2001, Wright was a senior computer scientist at Argonne National Laboratory (1990–2001), and a professor of computer science at the University of Chicago (2000–2001). He has served as chair of the Mathematical Optimization Society and as a Trustee of the Society for Industrial and Applied Mathematics (SIAM). He is a Fellow of SIAM. In 2014, he won the W.R.G. Baker Award from IEEE. Wright is the author or coauthor of widely used text/reference books in optimization including *Primal Dual Interior-Point Methods* (SIAM 1997) and *Numerical Optimization* (2nd ed., Springer 2006, with J. Nocedal). He has published on optimization theory, algorithms, software, and applications.

Wright is editor-in-chief of the *SIAM Journal on Optimization* and has served as editor-in-chief or associate editor of *Mathematical Programming: Series A and B*, *SIAM Review*, and *Applied Mathematics and Computation*.

Reprise of 2015 Edelman Award-Winning Presentation

Joseph Byrum, Craig Davis, Gregory Doonan, Tracy Doubler, David Foster, Bruce Luzzi, Ronald Mowers, Chris Zinselmeier

Syngenta, a leading developer of crop varieties (seeds) that provide food for human and livestock consumption, is committed to bringing greater food security to an increasingly populous world by creating a transformational shift in farm productivity. Syngenta Soybean Research & Development (R&D) is leading Syngenta's corporate plant-breeding strategy by developing and implementing a new product development model that is enabling the creation of an efficient and effective soybean breeding strategy. Key to the new strategy is the combination of advanced analytics and plant-breeding knowledge to find opportunities to increase crop productivity and optimize plant-breeding processes. Syngenta uses discrete-event and Monte Carlo simulation models to codify Syngenta Soybean R&D best practices, and uses stochastic optimization to create the best soybean breeding plans and strategically align its research efforts. As a result of using these new analytical tools, Syngenta estimates that it will save more than \$287 million between 2012 and 2016.

FRANZ EDELMAN AWARD

The Franz Edelman Award for Achievement in Operations Research and the Management Sciences calls out, recognizes, and rewards outstanding, high impact applications of OR/MS. Each year, six finalists compete in the "Super Bowl" of O.R. in practice. The 2015 finalists include IBM, Ingram Micro, LMI/Defense Logistics Agency, Saudi Arabia Ministry of Municipal and Rural Affairs, Syngenta, and U.S. Army. In this keynote, the first-place Syngenta will reprise their winning presentation.

PLENARY

10–10:50am
Grand Ballroom B, Upper 200 Level

Computational Thinking, Inferential Thinking and Big Data

Michael I. Jordan, Pehong Chen
Distinguished Professor in the Department of Electrical Engineering and Computer Science, Department of Statistics, University of California, Berkeley

The rapid growth in the size and scope of datasets in science and technology has created a need for novel foundational perspectives on data analysis that blend the inferential and computational sciences. The fact that classical perspectives from these fields are not adequate to address emerging problems in "Big Data" is apparent from their sharply divergent nature at an elementary level—in computational science, the growth of the number of data points is a source of "complexity" that must be tamed via algorithms or hardware, whereas in statistics, the growth of the number of data points is a source of "simplicity" in that inferences are generally stronger and asymptotic results can be invoked. On a formal level, the gap is made evident by the lack of a role for computational concepts such as "runtime" in core statistical theory and the lack of a role for statistical concepts such as "risk" in core computational theory. I present several research vignettes aimed at bridging computation and statistics, including the problem of inference under privacy and communication constraints, algorithm weakening as a tool for trading off the speed and accuracy of inference, and the theoretical study of lower bounds that embody computational and statistical constraints.

Michael I. Jordan is the Pehong Chen Distinguished Professor in the Department of Electrical Engineering and Computer Science and the Department

of Statistics at the University of California, Berkeley. His research interests bridge the computational, statistical, cognitive, and biological sciences, and have focused in recent years on Bayesian nonparametric analysis, probabilistic graphical models, spectral methods, kernel machines, and applications to problems in distributed computing systems, natural language

All Plenary & Keynote Presentations will take place in the Convention Center.

MONDAY CONTINUED

processing, signal processing, and statistical genetics. Professor Jordan is a member of the National Academy of Sciences, National Academy of Engineering, and American Academy of Arts and Sciences. He is a Fellow of the American Association for the Advancement of Science. He has been named a Neyman Lecturer and a Medallion Lecturer by the Institute of Mathematical Statistics. He received the David E. Rumelhart Prize in 2015 and the ACM/AAAI Allen Newell Award in 2009. He is a Fellow of the AAAI, ACM, ASA, CSS, IEEE, IMS, ISBA, and SIAM.

President's Panel

Moderated by Tamás Terlaky, General Chair, INFORMS Annual Meeting Chair: Department of Industrial and Systems Engineering, Lehigh University

Panelists: Mark C. Reed, Saint Joseph's University; Dr. Ali A. Houshmand, Rowan University; Stephen Klasko, Thomas Jefferson University and Jefferson Health System; John D. Simon, Lehigh University

Mark C. Reed, Ed.D., began his tenure as the 28th president of Saint Joseph's University, and the first lay president in the University's 164-year history, on July 1,

2015. Formerly, Dr. Reed served as senior vice president and chief of staff at Fairfield University, in Fairfield, CT.

A 1992 graduate of St. Joseph's Preparatory School in Philadelphia, Reed received a B.S. in mathematics from Fairfield University in 1996, a Master of Education in secondary educational administration from Boston College in 1999, an MBA from Fairfield in 2002, and a Doctorate of Education in higher education management from the University of Pennsylvania in 2008.

During his 15-year career at Fairfield and prior to his most recent position as senior vice president and chief of staff, Reed served as the institution's interim vice president for university advancement; vice president for administration and student affairs; vice president for student affairs; associate vice

president and dean of students; and dean of students. He is a past president of the Jesuit Student Affairs Association, and also taught mathematics as an adjunct faculty member at Fairfield. He recently received Fairfield's Distinguished Faculty/Administrator Award. Preceding his career in higher education, Dr. Reed worked as a teacher and administrator in Catholic secondary education.

Dr. Ali A. Houshmand became Rowan University's seventh president in June 2012 after serving approximately six years as provost/senior vice president, CEO, and

interim president. His vision and leadership have set the University on a path of unprecedented transformation, most recently earning Rowan regard as New Jersey's second comprehensive research university.

In just the past three years under Dr. Houshmand's leadership, Rowan opened Cooper Medical School of Rowan University and integrated the School of Osteopathic Medicine from the former University of Medicine and Dentistry of New Jersey. Rowan is now just the second university in the nation to offer M.D. and D.O. degree programs.

Dr. Houshmand remains steadfast in believing the University must stay loyal to its core mission: top-quality, affordable, undergraduate education. To that end, he committed to not raising undergraduate tuition beyond the cost of inflation during his tenure.

Dr. Houshmand is an active partner in economic development. A hallmark of this commitment is the Rowan Boulevard project—a \$300-million collaboration of private developers, the Borough of Glassboro, and the University to create an educational and economic corridor that is reinventing the historic downtown and changing the definition of "town-gown" relations.

He has broadened this philosophy to make the University more entrepreneurial, with a goal of increasing research and academic offerings at the intersection of science, technology, business, engineering, and medicine. Plans are under way to expand the University's technology park and introduce several Ph.D. programs.

Determined to address the severe shortage of access to high-quality undergraduate education in New Jersey's southern half,

Dr. Houshmand has committed to increase Rowan's enrollment from 15,000 to 25,000 students by 2023, increase annual research funding from \$25 million to \$100 million, and increase Rowan's operating budget from \$400 million to \$1 billion, making Rowan one of the region's most important economic engines.

Dr. Houshmand earned his bachelor's and master's degrees in mathematics and mathematical statistics from the University of Essex, United Kingdom. He earned a second master's degree and a doctoral degree in industrial and operations engineering from the University of Michigan, Ann Arbor. He then worked as a staff analyst for United Airlines, developing large-scale optimization and forecasting models. Leaving industry for academia, he joined the University of Cincinnati and, later, Drexel University, where he taught and held several academic administrative positions before coming to Rowan.

Stephen Klasko is president of Thomas Jefferson University and CEO of Jefferson Health System after serving as CEO of USF Health and dean of the University

of South Florida College of Medicine. A board certified OB-GYN, he is bridging the art and science of medicine and healthcare information technology through an entrepreneurial-academic model. After receiving his M.D. and completing his obstetrics and gynecology residency, he completed his M.B.A. at the Wharton School of Business, University of Pennsylvania.

At Jefferson, Dr. Klasko leads an academic medical center that consistently ranks among the top academic health systems in the country with 19,000 employees, five hospitals, and over 2,000,000 patient visits. In 2015, he led the merger of Thomas Jefferson University and Health System and Abington Health Network in one of the nation's first shared governance, "hub and hub" academic medical center mergers.

Over the last several years, he has led the development of the first medical school choosing students based on emotional intelligence, led the team that built the country's largest assessment of technical and teamwork competence center, and created an innovative primary care-driven, patient-centric, Medicare-based accountable care model within the country's largest retirement community and created Jeff Connect:

All Plenary & Keynote Presentations will take place in the Convention Center.

Medicine Without Walls, a unique telehealth and unscheduled care innovation entity.

Dr. Klasko has been on the boards of several national nonprofit hospital systems and is currently on the corporate board of Teleflex (TFX: NYSE), a global medical device company. He has recently been named as a trustee of Lehigh University. He has written extensively on the need to change the "DNA of healthcare" by transforming the selection and education of health professionals. To that end, he has received over two million dollars in grants researching the biases affecting physicians' willingness to accept change. He has written over 200 peer-reviewed articles and books including *The Phantom Stethoscope* (Hillsboro Press 1999) and "Mamas Don't Let Your Babies Grow Up to Be OB-GYNs."

John D. Simon became the 14th president of Lehigh University in July 2015. He previously was executive vice president and provost of the

University of Virginia, where he oversaw the academic activities of more than 20,000 undergraduate and graduate students as well as 2,200 faculty. Under his leadership, the University of Virginia launched several important programs including UVA's Data Science Institute; he created a new physical presence in Asia and established an Endowment for the Arts, among many other notable accomplishments. Before arriving at the University of Virginia, John served as vice provost of academic affairs at Duke University and chairman of Duke's chemistry department. He received his B.A. in chemistry from Williams College and Ph.D. from Harvard University. He is a fellow of the American Physical Society and the American Association for the Advancement of Science. He is the author of more than 250 scientific papers and three textbooks. His most recent research focuses on the chemical properties of pigments preserved in the fossil record.

The Advent of the Intelligent Electronic Health Record

John Glaser, Executive Vice President, Cerner

We have made great progress in embedding the electronic health record (EHR) in our

healthcare processes, with use reaching unprecedented rates. Now, we are poised to take it the next level with the intelligent EHR. The intelligent EHR will look very similar to the traditional system – one can still look up patient results and history and write prescriptions but the application will move past transactional functions. The intelligent EHR will be characterized by sophisticated and flexible decision support, rules engines, process monitoring engines, intelligent displays of important patient data, access to knowledge resources, the ability to collect data from multiple care settings through a health information exchange, and tools that enable provider collaboration.

The advent of the intelligent EHR will be necessary if healthcare is to effectively address challenges such as those generated by payment reform and managing the care of chronically ill populations.

John Glaser, executive vice president at Cerner, is responsible for driving technology and product strategies, interoperability, and government policy development.

Glaser has devoted his career to furthering healthcare through innovation. He is committed to helping clients maximize their investment in HIT. Prior to joining Cerner, Glaser was CEO of the Health Services business unit of Siemens Healthcare, where he was responsible for heading Siemens' global healthcare IT business. Cerner acquired Siemens Health Services in February 2015. Formerly, Glaser was vice president and chief information officer at Partners HealthCare, Inc. Prior to that, he was vice president of information systems at Brigham and Women's Hospital. Glaser is a well-respected industry thought leader. He was the founding chair of the College of Healthcare Information Management Executives (CHIME), the past president of the Healthcare Information & Management Systems Society (HIMSS), and has served on numerous boards including the eHealth Initiative, National Alliance for Health Information Technology, and American Medical Informatics Association (AMIA). Additionally, Glaser is a fellow of HIMSS, CHIME, and the American College of Medical Informatics. He is also a former senior advisor to the Office of the National Coordinator for Health Information Technology (ONC). Glaser has published more than 150 articles and three books on the strategic application of information technology in healthcare,

including the most widely used textbook on the topic, *Healthcare Information Systems: A Practical Approach for Health Care Management*. Glaser is on the faculty of the Wharton School at the University of Pennsylvania, the Medical University of South Carolina, and the Harvard School of Public Health. He received his PhD in healthcare information systems from the University of Minnesota.

Reprise of the 2015 UPS George D. Smith Prize

The Centre for Operations Excellence and the Master

of Management in Operations Research program at the Sauder School of Business, University of British Columbia, provides rigorous practical training in the quantitative analysis of business problems. We will present an overview of the program, starting with a look back at its history, outlining details of how the program is structured (focusing in particular on the "industry project"), and sharing ideas about what has helped the program succeed.

UPS SMITH PRIZE

The UPS George D. Smith Prize recognizes an academic department or program for effective and innovative preparation of students to be good practitioners of O.R., management science, or analytics. The UPS George D. Smith Prize is created in the spirit of strengthening ties between industry and the schools of higher education that graduate young practitioners of operations research. INFORMS, with the help of CPMS, awards the prize annually to an academic department or program for effective and innovative preparation of students to be good practitioners of operations research, management science, or analytics. The UPS George D. Smith Prize is named in honor of the late UPS chief executive officer who was a champion of operations researchers at a leading Fortune 500 corporation. UPS has generously underwritten the award in his memory.

All Plenary & Keynote Presentations will take place in the Convention Center.

Empiricism and Optimization in the World of Big Data

Alfred Z. Spector, (retired) Vice President of Research and Special Initiatives, Google

In its first decades, computer science combined mathematical analysis (e.g., the study of computability and algorithms) and engineering (e.g., abstraction, encapsulation, and re-use). However, empiricism became an equally important third leg in the 1980s. This happened because of the (1) growth in computer usage and data availability, (2) exponential growth in communications, computation, and storage capabilities, (3) progress in machine learning and optimization, and (4) significant economic and scientific rewards. This presentation will cover the growth and benefits of empirical computer science to date but will focus on key challenges moving forward, particularly considering the advantages, and consequences, of various forms of optimization. In particular, I will discuss open questions regarding big data and artificial intelligence, issues in big data and science (including a discussion of the role of the hypothesis), and some fascinating, if not problematic, societal implications.

Alfred Z. Spector

recently retired as vice president of Research and Special Initiatives at Google. There, he was responsible for research at Google and also

Google's open source, university relations, internationalization, and various education initiatives. He was also the executive engineering lead for Google.org. Previously, Dr. Spector was vice president of strategy and technology at IBM's Software Business, and prior to that, he was vice president of services and software research across IBM. He was also founder and CEO of Transarc Corporation, a pioneer in distributed computing, and was a professor of computer science at Carnegie Mellon University. Beginning in 2004, Dr. Spector has been the lead proponent of "CS+X" – a short-hand for the need to infuse computer science into the study and practice of every discipline, X. Dr. Spector received his Ph.D. in computer science from Stanford and a bachelor's degree in applied mathematics

from Harvard. He is a member of the National Academy of Engineering and a Fellow of IEEE, ACM, and American Academy of Arts and Sciences. Dr. Spector is also the recipient of the 2001 IEEE Computer Society's Tsutomu Kanai Award for work in scalable architectures and distributed systems.

Optimizing Healthcare and Using Healthcare to Motivate the Development of New Optimization Models, Methods, and Tools

Sanjay Mehrotra, Director, Center for Engineering at Health, Northwestern University

Healthcare globally is a significantly underoptimized system. Policies are determined based on legislated priorities, and decisions are often made without scientific rigor. There is a growing interest in optimal resource utilization while achieving greater equity and access in healthcare. Solutions require a transdisciplinary collaborative approach, where members of the INFORMS community are making significant contributions by developing increasingly realistic data-driven modeling approaches to promote evidence-based decision making and informing policy changes. The need to bring greater realism to the decision models also motivates new methodological developments that can then benefit application in areas other than health.

The central consideration in developing innovative strategies to improve the health system is to save and improve the quality of life of patients. This must be balanced against risks and cost to individuals and society. It leads to problems with multiple objectives, and input from multiple experts weighing in on these objectives. The parameters of the functions modeling the objectives and constraints are uncertain as model recommendations have implications on an unknown future.

In this presentation, after briefly reviewing the global healthcare landscape, we will focus on a few specific examples from our research illustrating how close interactions with transplant surgeons and nephrologists led to the development of alternative strategic models for improving geographical disparity in waiting time for kidney transplant; consideration of a budgeting problem arising in diabetes prevention programs provided insights toward developing new concepts of weight-robustness in multiobjective decision

making; and the need for solving realistic staffing and scheduling problems under demand uncertainty led to the development of a highly efficient computational tool for solving a general class of stochastic mixed-integer programs.

Sanjay Mehrotra is the director of Center for Engineering at Health at Northwestern University. He received his PhD in operations research from Columbia University.

Mehrotra is known for his methodology research in optimization that has spanned from linear, convex, mixed integer, stochastic, multiobjective, distributionally robust, and risk-adjusted optimization. His healthcare research includes topics in predictive modeling, budgeting, hospital operations, and policy modeling using modern operations research tools. He is the immediate past chair of the INFORMS Optimization Society. He has also been an INFORMS vice president representing Chapters/Fora. He is the current Healthcare Department editor of the Institute of Industrial Engineers journal *IIE Transactions*, and also held the role of Optimization Department editor for the same journal.

Conic Integer Optimization

Alper Atamturk, Professor of Industrial Engineering and Operations Research, University of California, Berkeley

In the last 25 years we have experienced significant advances in conic optimization. Polynomial interior point algorithms that have already been developed for linear optimization are extended to second-order cone optimization and semidefinite optimization. The availability of efficient algorithms for convex conic optimization spurred many novel optimization and control applications in diverse areas ranging from medical imaging to statistical learning, from finance to truss design. However, the advances in convex conic optimization and linear integer optimization have, until recently, not translated into major improvements in conic integer optimization, i.e., conic optimization problems with integer variables. In this talk, we will review the recent progress in conic integer optimization. We will discuss cuts, lifting methods, and conic reformulations for improving

All Plenary & Keynote Presentations will take place in the Convention Center.

computations for general as well as special structured problems and connections to submodular optimization for the 0-1 case. We will present applications of conic integer optimization in probabilistic optimization, portfolio optimization, and location/inventory optimization with risk pooling.

Alper Atamturk is a professor of industrial engineering and operations research at the University of California, Berkeley. He received his Ph.D. from the Georgia

Institute of Technology in 1998 with a major in operations research and minor in computer science. His current research interests are in discrete optimization and optimization under uncertainty with applications to energy, finance and operations interface, cancer therapy, and defense. He serves on the editorial boards of *Discrete Optimization*, *Journal of Risk*, *Mathematical Programming Computation*, *Networks*, and *Operations Research*. He served on the organizing committees of INFORMS, IPCO, MIP, among others. He served as vice chair-integer programming of the INFORMS Optimization Society during 2008–2009. Dr. Atamturk is a U.S. Department of Defense National Security Science and Engineering Fellow.

Getting More Out of a Modern Power Grid: The Role of Mathematical Modeling and Optimization

Mihai Anitescu, Senior Computational Mathematician, Mathematics and Computer Science Division, Argonne National Laboratory, and Professor, Department of Statistics, University of Chicago

The electrical power grid (the electricity transmission and distribution system) is one of the most complex engineering achievements of the 20th century. It is also at the center of massive changes in the way we create and consume energy. Such changes are brought about by many drivers, including an increasing use of renewable energy and natural gas. Moreover, the power grid exhibits persistent conceptual difficulties that, while generally successfully contained by engineering practice, have never been fully resolved. In this talk, we discuss some of these difficulties and the important role that mathematical modeling

and optimization can play in solving them. We argue that in some cases a change of the problem framework may be desirable and that this may be made while keeping the solution computationally achievable. We outline a number of existing and emerging fundamental research challenges and discuss some recent promising avenues in the area. A distinguishing feature of power grid applications is that optimization is ubiquitous and it must accommodate simultaneously multiple complexity drivers. These include not only discrete variables, nonconvexity, or stochasticity, but also ordinary and—with the increased usage of natural gas—partial differential equations. We discuss the productivity and performance implications of this fact for the modeling and computational environments.

Mihai Anitescu is a senior computational mathematician in the Mathematics and Computer Science Division at Argonne National Laboratory and a professor in the

Department of Statistics at the University of Chicago. His research interests are in the areas of numerical optimization, computational science, numerical analysis, and uncertainty quantification. He has used techniques from these areas in key applications in power grid and related infrastructure, nuclear engineering, materials science, geosciences, chemistry, chemical engineering, and signal processing. He has co-authored more than 100 peer-reviewed papers in scholarly journals, book chapters, and conference proceedings, and he is on the editorial board of *Mathematical Programming A and B*, *SIAM Journal on Optimization*, *Optimization Methods and Software*, *SIAM Journal on Scientific Computing*, and *SIAM/ASA Journal on Uncertainty Quantification*.

2015 Daniel H. Wagner Prize Winner Announcement and Reprise

Daniel H. Wagner earned his PhD in mathematics in 1951 from Brown University. He began his career in the U.S. Navy's Operations Evaluation Group (OEG) at the

Pentagon, where he worked on operations research for naval warfare. In 1963, he created the firm of Daniel H. Wagner Associates, Inc., which is still in existence today. During his years as president and principal owner of Wagner Associates, Dan brought many high-quality mathematicians into the operations research community. This led to significant advances in the firm's fields of endeavor and delivery of significant applications to the Navy, Coast Guard, and other clients; many of these applications are still in service today. After retirement from his eponymous company, Dan Wagner continued his commitment to the field of operations research, serving in various teaching and research positions with the U.S. Naval Postgraduate School and the U.S. Naval Academy. He was an active member of ORSA, and then INFORMS, for more than 40 years.

WAGNER PRIZE

The Daniel H. Wagner Prize is awarded for a paper and presentation that describe a real-world, successful application of operations research or advanced analytics. The prize criteria emphasize innovative, elegant mathematical modeling and clear exposition.

All Plenary & Keynote Presentations will take place in the Convention Center.

Understanding and Managing the Complexity of Healthcare

William Rouse, Alexander Crombie Humphreys Chair, School of Systems & Enterprises, and Director, Center for Complex Systems and Enterprises, Stevens Institute of Technology

The overall nature of the healthcare system is considered. It is argued that this enterprise is best modeled as a complex adaptive system. The stakeholders in this enterprise and their interests and objectives are outlined. This provides the basis for discussion of five case studies. The first presents an analysis of the complexity of healthcare using information theoretic metrics. The second case study uses production learning theory to determine how efficient the system would have to be to keep healthcare costs from rising faster than GDP. The third derives providers' optimal response to Medicare price controls. The fourth case study develops a multilevel model of the healthcare enterprise and uses this model to project the economic benefits of employer-based prevention and wellness programs. The final case study considers how providers in New York City have responded to the Affordable Care Act.

William Rouse is the Alexander Crombie Humphreys Chair within the School of Systems & Enterprises, and Director of the Center for Complex Systems

and Enterprises at Stevens Institute of Technology. He is also professor emeritus, and former chair, of the School of Industrial and Systems Engineering at the Georgia Institute of Technology. His research focuses on understanding and managing complex public-private systems such as healthcare delivery, urban systems, and national security, with emphasis on mathematical and computational modeling of these systems for the purpose of policy design and analysis. Rouse has written hundreds of articles and book chapters, and has authored many books, including, most recently, *Modeling and Visualization of Complex Systems and Enterprises* (Wiley 2015), *Understanding and Managing the Complexity of Healthcare* (MIT Press 2014), *Economic Systems Analysis and Assessment* (Wiley 2011), *People and Organizations: Explorations of Human-Centered Design* (Wiley 2007), *Essential Challenges of Strategic Management* (Wiley 2001), and the award-winning *Don't Jump to Solutions* (Jossey-Bass 1998). He has edited or co-edited numerous books including *Engineering the System of Healthcare Delivery* (IOS Press 2010), *The Economics of Human Systems Integration* (Wiley 2010), *Enterprise Transformation: Understanding*

and Enabling Fundamental Change (Wiley 2006), *Organizational Simulation: From Modeling & Simulation to Games & Entertainment* (Wiley 2005), the best-selling *Handbook of Systems Engineering and Management* (Wiley 1999, 2009), and the eight-volume series *Human/Technology Interaction in Complex Systems* (Elsevier). Among many advisory roles, he has served as chair of the Committee on Human Factors of the National Research Council, a member of the U.S. Air Force Scientific Advisory Board, and a member of the DoD Senior Advisory Group on Modeling and Simulation. He has been designated a lifetime National Associate of the National Research Council and National Academies. Rouse is a member of the National Academy of Engineering and has been elected a fellow of four professional societies: Institute of Electrical and Electronics Engineers (IEEE), International Council on Systems Engineering (INCOSE), Institute for Operations Research and the Management Sciences (INFORMS), and Human Factors and Ergonomics Society (HFES). Rouse received his B.S. from the University of Rhode Island, and his S.M. and Ph.D. from Massachusetts Institute of Technology.

Worcester Polytechnic Institute

CONVENTION CENTER - EXHIBIT HALL - 200 LEVEL

INFORMS CENTER

New this year at the Annual Meeting, INFORMS Center will be located in the center of the Exhibit Hall. This dynamic space is the hub for your Annual Meeting activities. Be sure to stop by and see key INFORMS leadership and staff, and learn more about the many programs and activities taking place both at the Annual Meeting and throughout the year. Make sure to check the Mobile App or the website for an up-to-date schedule of INFORMS Center activities.

STUDENT LOUNGE

A space in the Exhibit Hall for our students to relax, hang out, meet other members, and take advantage of free Wi-Fi. Make sure to follow @INFORMS2015 for special pop-up events in the Student Lounge.

TECHNOLOGY CENTER

Free Wi-Fi

The Technology Center will be open during the following hours:

Sunday	12noon–5pm
Monday	9am–5pm
Tuesday	9am–5pm
Wednesday	9am–3pm

Free wireless internet and a Technology Center are located in the Exhibit Hall. There are a limited number of computers available in the Technology Center if you do not have your own computer. Name badges must be worn for admittance.

INFORMS CAREER CENTER

INFORMS Career Center (ICC) is the largest source of operations research and analytics jobs and resumes. It's where job seekers go to land the right job in academia or industry and where employers post their jobs and search our resume database for qualified candidates.

This service provides employers and applicants with a convenient venue for on-site interviews to explore opportunities in academia, industry, and government. In addition, the job placement service offers:

- Online access to job listings and applicant files
- Expanded information about jobs and applicants
- Daily updates of the database
- Improved database search capabilities
- Online data entry for applicants and employers
- Extended availability of the database at <http://careercenter.informs.org>

Career Fair

Sunday, 12noon–5pm
Exhibit Hall A, 200 Level, Convention Center

The Career Fair provides an opportunity for job seekers to meet the participating employers in an informal atmosphere and discuss employment opportunities within those organizations. Employers meet and collect resumes from many job seekers in a short period of time early in the meeting, giving them the chance to set up interviews during the Annual Meeting.

ICC On-site Interviews

Monday & Tuesday, 9am–5pm
Wednesday, 9am–3pm
Exhibit Hall A, 200 Level, Convention Center

ICC On-site Resume Review

(Must have previously scheduled appointment.)

Sunday, 12noon–5pm
Monday, 9am–5pm

Panel Discussions

Select panels will lead informal discussions about the industry and academic interview process.

Industry Job Search (SD26)

Sunday, 4:30–6pm
403, Level 4, Marriott

Academic Job Search (MC26)

Monday, 1:30–3pm
403, Level 4, Marriott

POSTER SESSIONS

Monday & Tuesday, 12:30–2:30pm
Exhibit Hall A, 200 Level, Convention Center

Researchers, practitioners, and students share their O.R. and analytics projects in these special sessions presented as poster displays, laptop demonstrations, and other creative formats.

Abstracts and authors for posters are listed in the chronological program under the day and time for each interactive session.

Monday, page 139
Tuesday, page 210

Competition

INFORMS places a special emphasis on high quality poster presentations. All poster session presenters were invited to submit their posters to the competition. In Round 1 of the process, submitters sent a PDF of their finished poster to the judging panel for review. The judges have evaluated these submissions and selected a group of semifinalists. The judging panel is made up of distinguished OR/MS professionals, both academics and practitioners, many of whom are INFORMS leaders.

In Round 2, the judging panel will review the semifinalist presentations during the Poster Sessions in Philadelphia. In Round 3, also held during the Poster Sessions, the judges will name the 1st, 2nd, and 3rd place winners. These winners will also be identified and awarded each day. Recognition includes a certificate, a monetary award, and announcements on the INFORMS website, newsletters, and in *OR/MS Today*.

EXHIBIT HOURS

Sunday	12noon–5pm (7:30–9pm Welcome Reception)
Monday	9am–5pm
Tuesday	9am–5pm
Wednesday	9am–3pm

All Software Demonstrations will take place in the Convention Center, 300 Level.

ACT Operations Research 46

<http://www.act-operationsresearch.com>

ACT OR is a company of mathematicians and engineers dedicated to improving customer businesses by creating Executive Decision Support Systems based on forecasting, mathematical optimization, and statistical models, and using “big data.” The purpose of our software toolsets and solutions are to assist customers in improving processes, assets, and labor – utilization by optimization or simulation models that can offer the most efficient policies or systems to help customers cut operating costs. Our tools are “prescriptive and predictive” analytical by design, for risk reduction capabilities for business investments.

http://www.act-operationsresearch.com/Products/Before_Predictive_Analytics.html

AIMMS 27

www.aimms.com

AIMMS is an innovative technology company with offices in Europe, United States, and Asia. Half of the global Fortune top 20 corporations rely on AIMMS because of its unique analytics, modeling, and optimization platform that supports complex business decision making at every organizational level. AIMMS customers can quickly create high business impact with optimization apps to support both strategic and daily operational challenges on a single platform that works seamlessly with your ERP system. AIMMS is trusted by companies like Alstom, BP, Kroger, Nike, Unilever, Shell, and many others. Visit www.aimms.com to learn more.

Software Tutorial:

Experience Optimization Modeling in Real Time, Deanne Zhang, Optimization Specialist, AIMMS, deanne.zhang@aimms.com

Monday, 1:30–2:15pm, Room 302 (MC79)

What can you do in 45 minutes? Attend a lecture? Watch a TED Talk online? Maybe go on a 5-mile run? There is a lot that can be accomplished in 45 minutes that can provide both a sense of achievement and generate new ideas. We invite you to experience this same kind of feeling in a 45-minute journey

with AIMMS! We are going to build an optimization model in real time and publish it on AIMMS PRO, an enterprise level app store. This 45-minute software demo will provide you with a fresh view of how AIMMS delivers broader usage and greater benefits for business users.

AMPL Optimization Inc. 28

www.ampl.com

AMPL's modeling language and system give you an exceptionally powerful and natural tool for developing and deploying the complex optimization models that arise in diverse business applications. AMPL lets you formulate problems the way you think of them, while providing access to the advanced algorithmic alternatives that you need to find good solutions fast. It features an integrated scripting language for automating analyses and building iterative optimization schemes; access to spreadsheet and database files; and application programming interfaces for embedding within larger systems. AMPL works with more than 30 powerful optimization engines including all of the most widely used large-scale solvers.

Software Tutorial: *Developing Optimization Applications Quickly and Reliably with Algebraic Modeling, Robert Fourer, President, AMPL Optimization Inc., 4er@ampl.com*

Monday, 11–11:45am, Room 302 (MB79)

Can you negotiate the complexities of the optimization modeling lifecycle, and deliver a working application before the problem owner loses interest? Algebraic languages were invented to streamline the key steps of model formulation, testing, and revision. Today, they are supported by powerful facilities for embedding models into larger systems and deploying them to users. This presentation introduces algebraic modeling for optimization through examples using classic and recently introduced features of the AMPL language and system.

AnyLogic North America, LLC 22-23

www.anylogic.com

The AnyLogic Company along with AnyLogic Software is a global organization with headquarters in Chicago, St. Petersburg, and Paris, comprising consulting, sales, and marketing professionals. Founded in 1992, the AnyLogic team that design, develop, and market AnyLogic Software – the first and only tool that brings together System Dynamics, process-centric (Discrete Event), and Agent-Based methods within one modeling language and one model development environment – have been the leading provider of dynamic simulation tools, technologies, and consulting services

for business applications. The language of AnyLogic has unmatched flexibility enabling modelers to capture the complexity of business, economy, and social systems at any level of detail to gain deeper insight into interdependent processes inside and around an organization.

Software Tutorial: *anyLogistix – Every Supply Chain is Unique, Capture Yours!, Timofey Popkov, Director of Business Development and Co-owner, AnyLogic North America, tim@anylogic.com*

Monday, 8:45–9:30am, Room 302 (MA79)
Supply chain optimization software must capture the uniqueness of your supply chain as well as produce fast results. The supply chain is the backbone of your business; it is what distinguishes you from competitors and enables you to win business. Experience a complete solution, anyLogistix, which allows you to carefully design, continuously analyze, and adjust to environmental changes. Learn how to maintain a competitive advantage in your industry through supply chain optimization.

Aptech Systems, Inc. 36

www.aptech.com

GAUSS is a powerful, highly adaptive suite of analytical software and tools that maximize the probability of success, giving analysts the ability to dig deeper into data to unlock actionable results. GAUSS is the product of decades of innovation and enhancement by Aptech Systems, a supportive team of experts dedicated to the success of the worldwide GAUSS user community. From physics to finance, Aptech is committed to helping people achieve their goals by offering flexible products and applications that define the leading edge of statistical analysis capabilities.

Artelys 21

www.artelys.com

Artelys is internationally known as an expert in the field of optimization and analytics and continues its growth with the recent acquisition of Ziena Optimization, author of KNITRO.

Dedicated to provide sound decision making through technology, operations research, and statistics with top international engineers, Artelys also develops, distributes, and supports a comprehensive portfolio of efficient and robust tools: Artelys Kalis, FICO® Xpress Optimization Suite, KNITRO, and AMPL. Relying on these tools and a high level of expertise in quantitative methods, Artelys has been successful in delivering 100+ efficient solutions to the most complex business problems. Located in France, United States, and Canada.

Software Tutorial: See the Artelys KNITRO 10.0 Optimization Solver in Action, Richard Waltz, Senior Scientist, Artelys Corp., waltz@ziena.com

Sunday, 4:30–6pm, Room 302 (SD79)

KNITRO is the premier solver for nonlinear optimization and recent winner of the GECCO 2015 Black Box Optimization Competition, finishing first among 28 solvers. This software demonstration will highlight the latest KNITRO features, including a new object-oriented interface and SQP algorithm for derivative-free optimization (DFO). The demo will also provide an overview of how to effectively use KNITRO in a variety of environments and applications, and present recent benchmarking results for DFO and nonlinear optimization.

Cambridge University Press 31
http://www.cambridge.org/us/academic

Cambridge publishes books and journals combining state-of-the-art content with the highest standards of scholarship, writing, and production. Visit our booth to browse new titles, available at a 20% discount, and to pick up sample issues of our journals. Visit our website to see everything we do: www.cambridge.org/us/academic.

COIN-OR 10
www.coin-or.org

The Computational Infrastructure for Operations Research publishes high quality, free, open-source tools for OR professionals and students, suitable for commercial, educational, and personal use. COIN-OR is the place to go when you need a “white box” for algorithm research and development. COIN-OR is a strategic partner of the INFORMS Computing Society.

Darden Business Publishing 15
http://store.darden.virginia.edu

Darden Business Publishing produces and markets case-based materials written by the renowned faculty at the University of Virginia Darden School of Business. Darden maintains a catalogue of student-centered learning materials that energize classrooms around the world with dynamic interactive multimedia cases, innovative simulations, and thought-provoking paper cases.

Do Analytics 12
www.doanalytics.net

OPTEx Mathematical Modeling System represents the new paradigm to make mathematical models. OPTEx separates the algebraic formulation from the source code of the models, and generates computer programs in multiple optimization technologies (C, GAMS, IBM-OPL, MOSEL, AIMMS, and

AMPL). It is based on its own unique database algebraic language that supports MS-EXCEL algebraic formulation. OPTEx supports every stage of mathematical modeling process (data model definition, data validation, SQL connection, graphic user interface generation, algebraic model formulation, numerical model generation, problem solution, and results visualization). Easy and fast, OPTEx represents the new generation to DO ANALYTICS. (http://www.doanalytics.net/Documents/OPTEx-Presentation.pdf)

Software Tutorial: OPTEx Mathematical Modeling System: The New Paradigm, Jesus Maria Velasquez, Chief Scientist, Do Analytics LLC, jesus.velasquez@decisionware.net

Monday, 5:15–6pm, Room 302 (MD79)

Do Analytics presents OPTEx Mathematical Modeling System, a powerful expert system that is changing the way to make large-scale mathematical programming models. OPTEx:

- Generates programming codes in the most powerful optimization technologies, including the SQL statements to connect any DBMS
- Mixes the power of an optimization technology with the ease of EXCEL
- Works as a client and as an optimization server in the cloud.

Dynamic Ideas, LLC 33
www.dynamic-ideas.com

Dynamic Ideas is a publisher of scientific books that have quality and originality in the areas of operations research and applied mathematics. The key objective of our titles is to “educate the next generation.” Many of our books are currently being used as the main textbook in academic courses in some of the finest universities and research institutions in the world.

Elsevier 13
www.elsevier.com

Elsevier is a leading publisher in the Operations Research and Decision Sciences fields, with over 25 high-quality peer-reviewed journals, including *European Journal of Operational Research*, *Omega*, and the newly launched *Operations Research Perspectives*. Elsevier’s OR/MS journals occupy 8 of the Top 10 positions in the Operations Research & Management Science category of Thomson Reuters’ Science Citation Index. Visit us to sign up for one-to-one feedback on your research from top journal editors.

FICO 55-56
www.fico.com

FICO is a leading analytics software company, helping businesses around the world make better decisions that accelerate growth,

profitability, and customer satisfaction. FICO’s optimization tools, which include FICO® Xpress Optimization Suite, feature high-performance solvers, flexible modeling, and application development tools. FICO’s optimization capabilities are now available on the FICO® Analytic Cloud and the FICO® Decision Management Suite, providing an easy, cost-effective way to evaluate, customize, deploy, and scale state-of-the-art analytics and decision management solutions.

Join us for the workshop to learn about the latest Xpress features and visit our exhibition area booth. Learn more at www.fico.com.

Software Tutorial: Turnkey Optimization on the Cloud, Oliver Bastert, Ph.D., oliver.bastert@fico.com

Wednesday, 11:45am–12:30pm, Room 302 (WB79)

In this workshop, we will demonstrate enhancements for modeling and solving linear, mixed integer and nonlinear optimization problems using the latest release of FICO® Xpress version 7.9. We will show how to rapidly turn optimization models into collaborative applications deployed on the FICO® Analytic Cloud. Also, learn how these capabilities can be combined with analytic modeling and decision rules to deliver powerful cloud-based or on-premises decision management solutions via the FICO® Decision Management Suite.

Forio Simulations 40
www.forio.com

Forio builds and hosts online business simulation games used by Harvard Business School, Wharton, MIT Sloan, and other universities and major corporations. Learners are actively engaged because they play a role, not just reading and analyzing. More than 60% of all MBAs currently enrolled at business schools worldwide will play a Forio simulation game before they graduate. We also build multiplayer collaborative or competitive simulation games with several Fortune 500 clients. Forio Epicenter, our simulation development software, allows for the rapid creation of simulation front-ends, as well as dashboards and data visualizations.

Software Tutorial: Publishing Interactive Analytics or Operations Research Models on the Web, Michael Bean, Co-Founder and President, Forio Simulations, mbean@forio.com

Sunday, 11:45am–12:30pm, Room 302 (SB79)

Forio’s Web platform makes your analytic model available to hundreds of people within your organization through the browser. We will start with an introduction to the platform and example analytics applications. Then we’ll divide the workshop into two parts. In the first part, we will teach you how to get your analysis on a server so it can be shared. In the second part, we will focus on creating a user interface for your model.

Frontline Systems, Inc.

www.solver.com

Frontline Systems is democratizing analytics, enabling business analysts and managers to get fast results—without expensive enterprise software and steep learning curves. See how easily you can solve optimization, simulation/risk analysis, and predictive analytics models in Excel Online, Google Sheets, and Apple's iPad—starting for free. See new Analytic Solver® Platform V2016 for desktop Excel, the easy-to-use integrated software that builds on Excel's Solver, Tableau, Power BI, and other tools. See our developer SDKs for data mining, simulation, and optimization, and our new RASON® modeling language and REST API. You'll be surprised by how little this costs, and how quickly you can get results.

Software Tutorial: *Analytic Solver® Platform: Integrated Data Mining, Simulation and Optimization in Microsoft Excel*

Tuesday, 2:15–3pm, Room 302 (TC79)

Analytic Solver Platform in Microsoft Excel has everything you need for forecasting and data mining, Monte Carlo simulation and risk analysis, conventional and stochastic optimization – with data from Apache Spark and visualization of results in Excel, Tableau, and Power BI. See how you can use it to build your own analytic expertise and teach others, leveraging what you already know, build and solve industrial-scale models with the world's best Solvers, and effectively communicate business results.

GAMS Development Corp.

www.gams.com

The General Algebraic Modeling System (GAMS) is a high-level modeling system for mathematical programming and optimization. It consists of a language compiler and a stable of integrated high-performance solvers. GAMS is tailored for complex, large-scale modeling applications, and allows you to build large, maintainable models that can quickly adapt to new situations.

Software Tutorial: *GAMS – An Introduction*, Steve Dirkse, Director of Optimization, GAMS Development Corp, sdirkse@gams.com

Sunday, 5:15–6pm, Room 302 (SD79)

This workshop will show you how to use the General Algebraic Modeling System (GAMS) in an efficient and productive way. There will be an introduction to the system and a presentation of the key concepts in GAMS. The largest part of the workshop consists of hands-on exercises. The workshop will demonstrate how GAMS interacts with

other applications and you will see how to analyze and debug problems using the tools available within GAMS.

Gurobi Optimization, Inc.

www.gurobi.com

Gurobi Optimization provides high performance math programming solvers using the most advanced implementations of the latest algorithms. We offer best-in-class performance, support a broad range of interfaces and modeling languages, and offer flexible licensing together with transparent, no surprises pricing, all backed by outstanding, easy-to-reach support.

Software Tutorial: *Modeling with the Gurobi Python Interface*, Dr. Renan Garcia, Optimization Support Engineer, Gurobi Optimization, garcia@gurobi.com

Monday, 11:45am–12:30pm, Room 302 (MB79)

Are you looking for an environment that combines the expressiveness of a modeling language with the power and flexibility of a programming language? The Gurobi Python interface allows you to build concise and efficient optimization models using high-level modeling constructs. Moreover, Python itself has a vast ecosystem of packages designed to increase your productivity, such as a notebook-style interface (iPython Notebook), data access capabilities, and Web development tools. This tutorial will provide an overview of these features, including detailed examples that show how to use the Python interface to build models that can be turned into full optimization applications.

Hong Kong Polytechnic University

www.polyu.edu.hk

The Department of Logistics and Maritime Studies is one of the three departments in the Faculty of Business, The Hong Kong Polytechnic University. We take a multidisciplinary approach to establishing an area of excellence in logistics, supply chain, and operations management. We would like to enhance and accelerate through the recruitment of ambitious, high-caliber candidates to join our academic team (<http://www.lms.polyu.edu.hk/en/footer/careeropportunities/>). You are welcome to join our tea reception, which will be held on November 2 from 5–6pm and November 3 from 11am–12pm in the Three Bay Hospitality Suite of Marriott Philadelphia.

IBM

www.ibm.com

IBM is paving the way to the next generation of analytics solutions and platforms, combining descriptive, predictive, and prescriptive analytics with the power of

cloud and cognitive insights. IBM Decision Optimization, which includes the market-leading IBM CPLEX Optimizer, has helped more organizations drive performance improvements from prescriptive analytics than any other company, including four times as many Edelman Award finalists. Visit the IBM Analytics booth to learn more about prescriptive analytics with IBM Decision Optimization, as well as the IBM Academic Initiative offering for all fields of analytics.

Software Tutorial: *IBM Decision Optimization for Python* (IBM Optimization group)

Sunday, 4:30–5:15pm, Room 204B (SD75)

In this tutorial, you will learn how to use the new CPLEX Modeling API for Python with standard development tools. You will learn how to install this open source library, configure your environment to use it, and write optimization models in a few minutes. At the end of the session, you will be able to write your own optimization model and solve them with the free IBM Decision Optimization offers (either with the DCloud trial or with the Community Edition of CPLEX Optimization Studio). The hands-on part of the tutorial requires a 64-bit machine (Windows, Linux, or Mac) and access to Wi-Fi, but all participants will be able to follow along. Follow us on Twitter @IBMOptimization

Software Tutorial: *IBM Academic Initiative for Cloud...Building Next-Generation Skills* (IBM Academic Initiative Group)

Wednesday, 11–11:45am, Room 302 (WB79)

Digital transformations are requiring students, no matter what their major, to understand how to leverage and build solutions on the cloud. With the new Academic Initiative for Cloud offering, faculty and students can have hands-on cloud-based experiences to propel radical ideas and innovation using IBM Watson, Internet of Things, big data, analytics, mobile, and more. Join us to collaborate on best practices to empower innovation in the classroom and beyond! <http://ibm.biz/aiforcloud>

IdeaConnection

www.ideaconnection.com

IdeaConnection provides a full suite of open innovation services to help accelerate your R&D initiatives and speed your products to market. Whether it's finding licensing opportunities, searching for collaboration partners, solving technical problems, crowdsourcing, or giving you the tools and help to make your open innovation portal successful, our model ensures that you are using the right tool for the job.

IdeaConnection uses multidisciplinary teams of highly qualified, hand-picked experts to solve your technical challenges. The result is an unparalleled level of confidentiality, lower burden on your technical staff, and highest success rate in the industry. Better yet, you only pay for success.

IEOM Society

www.iieom.org

IEOM Society promotes and encourages critical thinking in the field of Industrial Engineering (IE) and Operations Management (OM), provides means to communicate and network among people enthused with similar interests through conferences, seminars, workshops, membership, student and professional chapters across the globe, and illustrative research publications to disseminate the earned knowledge and experience. IEOM Global Engineering Education addresses challenges and opportunities for readiness of engineering graduates from various parts of the world. IEOM Society focuses on how to reduce the readiness gap around the world. IEOM Industry Solutions showcases industrial case studies and their impacts using IE/OM tools and techniques.

Lehigh University, ISE Department

<https://ise.lehigh.edu>

Recognized among the nation's premier research universities, Lehigh offers a rigorous academic community for nearly 7,000 students. Lehigh's SESQUICENTENNIAL celebrations are shining light on the people, places, breakthroughs, and traditions of the 150 years that made Lehigh a prime institution. The ISE Department pursues excellence and national prominence in OR, analytics, IT, and related fields through innovative teaching, distinguished research, and professional leadership. Building on its unique strength and reputation, ISE strives for leadership in educational innovation, multidisciplinary cutting edge research, and industrial partnership. Our ultimate mission is to produce leaders who have learned to think critically and analytically, have the skills to comprehend and create new knowledge, and are willing to serve and inspire others.

LINDO Systems, Inc.

www.lindo.com

LINDO Systems offers three products hooked to industrial strength solvers for linear, integer, stochastic, NLP, and global optimization. LINGO includes a powerful modeling language and convenient data options to make building models faster and easier. What'sBest! allows you to build large optimization models in Excel. Models are easy to build and understand for anyone comfortable with Excel. LINDO API allows

you to plug the power of the LINDO solvers right into customized applications that you have written. Find out about the latest solver enhancements and pick up a full capacity evaluation license to try or a free educational research license.

Software Tutorial: *Optimization Modeling Made Easy*, Mark Wiley, VP Marketing, LINDO, mwiley@lindo.com, and Gautier Laude, Software Development Manager, LINDO, glaude@lindo.com

Monday, 4:30–5:15pm, Room 302 (MD79)

Come and learn how easy it is to: quickly build linear, nonlinear, quadratic, conic, and integer optimization models; incorporate uncertainty into optimization models; access data from Excel and databases; and seamlessly embed a solver into your own application. Come see a demonstration of the power and flexibility of the new releases of LINDO API – a callable solver engine; LINGO – an integrated modeling language and solvers; and What'sBest! – a large-scale solver for Excel.

MathWorks

www.mathworks.com

The MATLAB and Simulink product families are fundamental applied math and computational tools adopted by more than 5000 universities and colleges. MathWorks products help prepare students for careers in industry, where the tools are widely used for data analysis, mathematical modeling, and algorithm development in collaborative research and new product development.

Software Tutorial: *MATLAB: An Environment for Operations Research and Data Analytics*, Seth DeLand, Data Analytics Product Manager, MathWorks, seth.deland@mathworks.com

Tuesday, 8:45–9:30am, Room 302 (TA79)

MATLAB is a platform for analysis, visualization, simulation, and optimization. You can access and analyze real-world data and develop customized algorithms that scale to your largest problems. Join us to see how MATLAB can help you explore data, develop algorithms, and integrate analytics into enterprise applications. You'll also learn about new features including mixed-integer linear programming, machine learning, and working with big data.

Maximal Software, Inc.

www.maximalsoftware.com

Maximal Software will be introducing the new release 5.0 of the MPL Modeling System and the OptiMax Component Library during the Annual Meeting. This new release represents a major milestone for MPL, and offers

numerous new features and enhancements. We will also be introducing both the MPL Academic Program and MPL Free Development Program, which provide access to free full-size development versions of the MPL software for academic faculty, students, and even commercial users and consultants. To sign up for your free copy of MPL, please visit us at our Exhibit Booth anytime during the conference, or attend our Software Demonstration session.

Software Tutorial: *Introducing New Release 5.0 of the MPL Modeling System and the OptiMax Component Library*, Bjarni Kristjansson, President, Maximal Software, Inc., Bjarni@maximalsoftware.com

Wednesday, 8–8:45am, Room 302 (WA79)

Maximal Software is introducing a new major release 5.0 of the MPL Modeling System, which represents a major milestone for MPL. We will be demonstrating the many new features and enhancements of MPL, including new directory structure, redesigned documentation, new solver updates, Reverse Hessian for nonlinear models, and enhanced Stochastic support. Major updates for the MPL OptiMax Library and the MPL Callable Library, include new callbacks, new exception handlers, and enhanced multithreaded support.

Microsoft Power BI

<https://powerbi.microsoft.com>

At Microsoft, our mission and values are to help people and businesses throughout the world realize their full potential. We are striving to empower a culture of data by visualizing any data, any place, in any way. Our Power BI solution allows everyone in an organization to become data-driven decision makers. Power BI simplifies complex analytics and provides proactive alerting on all kinds and sizes of data from structured and unstructured to real-time streaming data.

Software Tutorial: *Power BI: Bring Your Data to Life*, Jen Underwood, Microsoft Sr. Program Manager, Microsoft Power BI, jenunder@microsoft.com

Sunday 8:45–9:30am, Room 302 (SA79)

In this tutorial session, you will explore Power BI with Microsoft engineering product team members. Feel free to bring a sample of your own data to create your own personalized dashboards. You will learn:

- Data preparation: Discover, transform, and combine data from various sources
- Data models: Create relationships, categorize your data and author business calculations
- Interactive visual reports: Author professional reports to slice/dice data to discover insights

- Power BI Dashboards: Ask language questions, create real-time dashboards, and share insights
- Power BI Mobile Apps: Interact with dashboards from iOS, Android, or Windows devices

MOSEK ApS**37**www.mosek.com

MOSEK ApS provides optimization software that helps customers make better decisions. The customer base consists of financial institutions and companies, engineering and software vendors, among others. MOSEK ApS was established in 1997 by Erling D. Andersen and Knud D. Andersen and it specializes in creating advanced software for solution of mathematical optimization problems. In particular, the company focuses on solution of large-scale linear, quadratic, and conic optimization problems. For more details visit our website: www.mosek.com.

Software Tutorial: *Using MOSEK at Its Best*, Andrea Cassioli, Product Manager, MOSEK ApS, andrea.cassioli@mosek.com

Monday, 2:15–3pm, Room 302 (MC79)

MOSEK provides high-quality software for conic optimization. The software tutorial focuses on:

1. the key features and benefits of our objective-oriented API called FUSION API: speed, expressiveness, and simplicity;
2. modeling issues and best practices that may be helpful in many cases; and
3. insight on the upcoming new release will be presented.

Customer inspired examples will be used to show how to use MOSEK at its best.

North Carolina State University, Industrial and Systems Engineering**47**<http://www.ise.ncsu.edu>

The Edward P. Fitts Department of Industrial and Systems Engineering at NC State University is among the top-ranked programs in the country. The department features educational and research programs in optimization, stochastic processes, simulation, systems analysis and analytics, quality and reliability, logistics, and health systems. We offer Masters (resident and online) and Doctoral degrees in Industrial Engineering as well as a Master of Supply Chain Engineering and Management. With external from NSF, NIH, DoD, and industry and location near Research Triangle Park, the department provides a vibrant environment for more than 200 graduate students.

North Carolina State University, Engineering Online**48**<http://engineeringonline.ncsu.edu/>

The College of Engineering at North Carolina State University has 12 academic departments and more than 20 centers, institutes, and laboratories. Professional engineers and computer scientists can participate in the College's Engineering Online program and take classes for professional development or toward the completion of one of the 16 online master's degree programs available for distance students. For more information, visit these websites: www.engr.ncsu.edu and <http://engineeringonline.ncsu.edu>.

Optimization Direct Inc.**9**www.optimizationdirect.com

Optimization Direct Inc., co-founded by Dr. Robert Ashford, a pioneer in the field of optimization, and Dr. Alkis Vazacopoulos, a leader in the industry, markets IBM® ILOG® CPLEX Optimization Studio®, the world's leading software product for modeling and optimization. CPLEX Optimization Studio solves large-scale optimization problems and enables better business decisions and resulting financial benefits in areas such as supply chain management, operations, healthcare, retail, transportation, logistics, and asset management. It has been applied in sectors as diverse as manufacturing, processing, distribution, retailing, transport, finance, and investment.

Software Tutorial: *Solving Large-Scale Optimization Problems using CPLEX Optimization Studio*, Drs. Robert Ashford and Alkis Vazacopoulos, Optimization Direct, Inc, alkis@optimizationdirect.com

Wednesday, 8:45–9:30am, Room 302 (WA79)

Recent advancements in linear and mixed programming give us the capability to solve larger optimization problems. CPLEX Optimization Studio solves large-scale optimization problems and enables better business decisions and resulting financial benefits in areas such as supply chain management, operations, healthcare, retail, transportation, logistics, and asset management. In this tutorial using CPLEX Optimization Studio, we will discuss modeling practices, case studies, and demonstrate good practices for solving hard optimization problems. We will also discuss recent CPLEX performance improvements and recently added features.

Palisade Corporation**34**www.palisade.com

Maker of the world's leading risk and decision analysis software, @RISK & the DecisionTools Suite.

We're the difference between taking a guess and taking control. At Palisade, we turn the art of decision-making into a science that works for you. Our innovative software solutions create usable insights from uncertain situations. As the leading provider of risk and decision analysis software for three decades, Palisade enables companies and organizations to evaluate risk at any level and decide what step comes next. With offices around the world, Palisade offers a truly global presence. And, with over 150,000 decision makers using our products at top research universities and Fortune 500 companies, Palisade has a diverse client base that spans a broad range of industries and organizations.

Software Tutorial: *Introduction to Risk and Decision Analysis using Palisade @RISK and The DecisionTools Suite*, Jose Raul Castro, Palisade Corporation

Wednesday, 1:30–3pm, Room 302 (WC79)

This event is designed to provide an entry-level introduction into probabilistic analysis and will show how Monte Carlo simulation, decision trees, and optimization can be applied to your everyday business analyses. If you build models in Excel then Palisade solutions can almost certainly help you to make more informed decisions, right from your desktop.

The webinar will explore some of the ways in which organizations are applying Palisade tools. From oil and gas, insurance and finance to healthcare, defense and construction, the DecisionTools Suite improves decision making at many of the world's most successful companies.

Palgrave Macmillan**26**www.palgrave.com

Palgrave Macmillan is a cross-market publisher specializing in cutting edge academic and trade nonfiction, reference, and journals.

Provalis Research**19**www.provalisresearch.com

Provalis Research is a leading developer of text analytics software with groundbreaking qualitative and quantitative analysis programs, such as QDA Miner, an innovative mixed-methods qualitative data analysis software; WordStat, a powerful add-on module for computer-assisted content analysis and text mining; and Simstat, an easy, yet powerful statistical software. One of the most distinctive features of these tools

is their interoperability, allowing researchers to integrate numerical and textual data into a single project file and seamlessly move back and forth between quantitative and qualitative data analysis, as well as to easily explore relationships between numerical and textual data.

Software Tutorial: *How to Analyze Big Text Data with Provalis Text Analytics Tools*, Normand Peladeau, CEO, Provalis Research, peladeau@provalisresearch.com

Sunday, 1:30–2:15pm, Room 302 (SC79)

Provalis Research will showcase its integrated collection of text analytics software. QDA Miner is easy-to-use qualitative and mixed-methods software that meets the needs of researchers performing qualitative data analysis and would like to code more quickly and more consistently larger amounts of documents. It offers high-level computer assistance for qualitative coding with innovative text search tools that help users speed up the coding process as well as advanced statistical and visualization tools. Users with even bigger text data can take advantage of WordStat. This add-on module to QDA Miner can be used to analyze huge amounts of unstructured information, quickly extract themes, find trends over time, and automatically identify patterns and references to specific concepts using categorization dictionaries.

Responsive Learning Technologies 4
www.responsive.net

Responsive Learning Technologies develops online competitive exercises used to teach operations management and supply chain management in business and industrial engineering programs. Our games provide a dynamic context for teaching concepts like capacity management, lead time management, inventory control, supply network design, and logistics. Beginning with our first game, Littlefield Technologies developed at Stanford's Graduate School of Business in 1999, our simulation games have been widely used with all levels of students from undergraduate to post-graduate and executives. In addition, we offer Business Foundations, an online adaptive learning system designed to help students prepare for beginning their MBA studies.

Software Tutorial: *Online Games to Teach Operations and Supply Chain Management*, Sam Wood, President, Responsive Learning Technologies, wood@responsive.net

Tuesday, 5:15–6pm, Room 302 (TD79)

Learn about online competitive exercises that are used in operations management and supply chain management courses to

teach topics like capacity management, lead time management, inventory control, supply chain design, and logistics. These games are typically used as graded assignments

River Logic, Inc. 43
www.riverlogic.com

Founded in 2000, River Logic is a privately held technology firm with a mission to establish prescriptive analytics (optimization) as the leading scientific approach to business planning and decision support. Its focus is on helping customers and business partners increase their performance, decision-making agility, and ability to predict business outcomes. River Logic provides a prescriptive analytics platform, Enterprise Optimizer®, on a service-oriented architecture that supports SaaS and on-premises deployments. This is complemented by an Integrated Business Planning application that simplifies customer adoption of the solution and platform into their business. These solutions enable customers and partners to quickly configure scalable, high-ROI white space planning and decision support applications.

Software Tutorial: *Code-Free Modeling for Large-Scale LP and MIP Problems using Enterprise Optimizer*, Eric Kelso, VP Product Management, River Logic, Inc., ekelso@riverlogic.com

Tuesday, 11:45am–12:30pm, Room 302 (TB79)

Enterprise Optimizer is a code-free, visual LP and MIP optimization modeling platform. Using EO's intuitive drag-and-drop interface, learn how to rapidly create integrated process and financial models. Learn about EO's wizard-driven data integration, query designer, user-defined schema, dashboard builder, VBA integration, APIs, and job automation component. Outputs demonstrated include detailed unit costs and audit-quality P&L, balance sheet, and cash flow statements. The entire session will be spent discussing major features and showing real-world applications.

SAS 5
www.sas.com

Successful organizations today rely heavily on analytics to guide and support operational, tactical, and strategic decision making. Many of the most successful rely on SAS, which provides a full spectrum of coordinated analytic capabilities, including data integration, statistics, data and text mining, econometrics and forecasting, and operations research (optimization, simulation, and scheduling). SAS helps organizations around the world build analytic models, populate them with relevant data and insights, communicate recommended decisions effectively, and surface these

capabilities within accessible, business-oriented interfaces. Visit us to see how SAS can help you understand the past and present, anticipate the future, and make better decisions.

Software Tutorial: *Building and Solving Optimization Models with SAS*, Ed Hughes, Principal Product Manager, and Rob Pratt, Senior R&D Manager, SAS

Tuesday, 4:30–5:15pm, Room 302 (TD79)

SAS provides a broad spectrum of data and analytic capabilities, including statistics, data and text mining, econometrics and forecasting, and operations research—optimization, simulation, and scheduling. OPTMODEL from SAS provides a powerful and intuitive algebraic optimization modeling language and unified support for building and solving LP, MILP, QP, NLP, CLP, and network-oriented models. We'll demonstrate OPTMODEL for basic and advanced problems, highlighting its newer capabilities and its support for both standard and customized solution approaches.

SAS JMP Division 7
www.jmp.com

JMP is desktop statistical discovery software from SAS that links interactive graphs with deep statistics. In the classroom, its visual approach to data exploration and analysis promotes understanding and collaboration. JMP reveals context and insight not seen in a table of numbers. The academic version of the software includes the same comprehensive and extensible capabilities that are used in the industry version. JMP is available for both Macintosh and Windows systems.

Software Tutorial: *Interactive and Visual Data Analysis with JMP 12 Pro*, Darryl Revenew, JMP Academic Ambassador, SAS JMP Division, Darryl.revenew@jmp.com

Monday, 8–9:30am, Room 302 (MA79)

JMP Statistical Discovery Software is interactive and visual desktop software for Windows and Mac, with a complete array of integrated graphical and statistical procedures. We will demonstrate JMP tools for data analysis, visualization, and exploration, including, Graph Builder®, bubble plots, the data filter, and our popular mapping tools. In addition to interactive techniques for univariate and bivariate analysis, we will look at methods for multivariate analysis including clustering, principal components, and data mining.

SAS Education Practice

6

www.sas.com/en_us/industry/higher-education.html

SAS is the leader in business analytics software and services, and the largest independent vendor in the business intelligence market. Through innovative solutions, SAS helps customers at more than 75,000 sites improve performance and deliver value by making better decisions faster. Since 1976, SAS has been giving customers around the world THE POWER TO KNOW®.

Software Tutorial: *Introduction to SAS Data Mining*, F. Michael Speed, Ph.D., Analytical Consultant, SAS, mike.speed@sas.com, and Tom Bohannon, Ph.D., Analytical Consultant, SAS, tom.bohannon@sas.com

Sunday, 2:15–3pm, Room 302 (SC79)

This introduction covers the skills required to assemble analysis flow diagrams using the rich tool set of SAS Enterprise Miner for both pattern discovery and predictive modeling. Participants will learn how to: define a SAS Enterprise Miner project; modify data for better analysis results; build and understand predictive models; and compare and explain complex models.

SIAM

8

www.siam.org

Visit the Society for Industrial and Applied Mathematics (SIAM, Booth #8) to check out our new publications, including recent titles in the MOS-SIAM Series on Optimization such as *Evaluating Gas Network Capacities* (Koch et al.), *Arc Routing: Problems, Methods, and Applications* (Corberán and Laporte), *Introduction to Nonlinear Optimization: Theory, Algorithms, and Applications with MATLAB* (Beck), and other bestselling SIAM books, all available at a conference discount. You'll also find sample issues of SIAM's renowned journals, including SIOPT, along with information and applications for anyone interested in becoming a SIAM member. And don't forget to pick up a copy of SIAM News for the road.

SigmaXL, Inc.

17

www.sigmaxl.com

Established in 1998, SigmaXL, Inc. is a leading provider of user-friendly Excel Add-ins for Lean Six Sigma graphical and statistical tools and Monte Carlo simulation. Our customers include market leaders like FedEx, Microsoft, Motorola, and Shell. Our flagship product, SigmaXL®, was designed from the ground up to be a cost-effective, powerful, but easy-to-use tool for process improvement, quality, and statistics. DiscoverSim™ enables you to quantify your risk through Monte Carlo simulation and

minimize your risk with global optimization. Version 2 is now bundled with MIDACO-SOLVER, one of the world's strongest evolutionary solvers for mixed discrete-continuous-constrained optimization.

Software Tutorial: *What's New in SigmaXL® Version 7*, John Noguera, CTO & Co-founder, SigmaXL, Inc., jnoguera@sigmaxl.com

Tuesday, 8–8:45am, Room 302 (TA79)

SigmaXL is a user-friendly Excel Add-In tool for process improvement, Six Sigma quality, and statistics. We introduce SigmaXL and the new features in Version 7: "Traffic Light" Automatic Assumptions Check for T-tests and ANOVA, Automatic Normality Check for Pearson Correlation and Small Sample Exact Statistics for One-Way Chi-Square, Two-Way (Contingency) Table and Nonparametric Tests. Exact statistics are appropriate when the sample size is too small for a chi-square or normal approximation to be valid.

Simio Simulation and Scheduling Software

45

www.simio.com

Simio Simulation and Scheduling Software is the most advanced solution on the market. With simulation, it is the only software that is fully object-oriented with process and objects being defined graphically with no programming. Unlike other scheduling software, Simio allows you to introduce risk into your production schedule with its patented Risk-based Planning and Scheduling. This dual function in Simio not only helps you improve your business performance from a facility design perspective, but also helps you maximize business results by optimizing the use of critical resources and assessing the risk associated with operational decisions.

Software Tutorial: *Introduction to Simio Simulation and Scheduling Software*, C. Dennis Pegden, CEO and Founder, Simio, cdpegden@simio.com, and Eric Howard, Director of Marketing, Simio, ehoward@simio.com

Sunday, 11–11:45am, Room 302 (SA79)

Simio is a premier simulation and scheduling software that allows you to expand traditional benefits of simulation to improve daily operations. In this tutorial, we will demonstrate Simio's 3D rapid modeling capability to effectively solve real problems. Explore how a single tool can be used to not only optimize your system design, but also provide effective planning and scheduling. Come explore the Simio difference and see why so many professional and novice simulationists are changing to Simio.

Springer

2-3

www.springer.com

Looking to publish your research? Discover Springer's print and electronic publication services, including open access! Get high-quality review, maximum readership, and rapid distribution. Visit our booth or www.springer.com/authors. You can also browse key titles in your field and buy (e)books at discount prices. With Springer you are in good company.

Statistics.com

20

www.statistics.com

The Institute for Statistics Education at Statistics.com offers 100+ courses in statistics, analytics, data mining, text mining, social network analysis, optimization, risk management, biostatistics, etc., plus courses that focus on tools like Python, R, SAS, SQL, and Hadoop. Our typical course is four weeks long and organized into weekly lessons that include readings, short videos, instant feedback exercises, homework due weekly, and a project. Courses are attended every day by an expert instructor, staffed by TAs who help the instructor with posting content and grading homework – participants do not need to be online at particular times.

Software Tutorial: *A Survey of Data Analytics Methods*, Peter Bruce, Founder and President, The Institute for Statistics Education at Statistics.com, peter.bruce@statistics.com

Tuesday, 11–11:45am, Room 302 (TB79)

This workshop will survey the field of data analytics, reviewing both traditional statistical methods and machine learning methods, including predictive modeling, unsupervised learning, text mining, statistical inference, time series forecasting, recommender systems, network analytics, and more. It will be a broad brush treatment aimed at newcomers, as well as those with knowledge in one area who wish to understand where other analytic methods fit into the picture.

Syncopation Software, Inc.

1

www.syncopation.com

Syncopation Software is a leading provider of business analytic tools for decision and risk analysis, Monte Carlo simulation, real option valuation, and portfolio management. Our range of software solutions, backed by our responsive support and variety of efficient training courses, can help you tackle a wide variety of decision problems with inherent uncertainty. From quick risk assessments within a spreadsheet (DPL Direct), to complex decision support applications

(DPL Professional), to the prioritization of a demanding portfolio (DPL Portfolio and DPMX), Syncopation has robust tools grounded in solid management science principles that are sure to lead you to better outcomes and enhanced value creation.

Software Tutorial: DPL Portfolio and DPMX™: A Decision Analysis-based System for Better Portfolio Decisions, Chris Dalton, CEO, Syncopation Software, Inc., cdalton@syncopation.com

Tuesday, 1:30–2:15pm, Room 302 (TC79)

This demonstration will show how the DPMX™ system can serve as the analytical backbone for an effective portfolio analysis process. We'll start with an overview of DPL Professional, a proven modelling environment for decision analysis, risk analysis, and Monte Carlo simulation. Next, we'll cover DPL Portfolio, the modelling environment for portfolio analysis, visualization, and prioritization. Finally, we'll show DPMX, a Web-based system for managing project data and presenting portfolio results in attractive, management-friendly charts. The motivating examples will be drawn from the prioritization of an R&D portfolio in the pharmaceutical industry.

Taylor & Francis

49

www.tandf.co.uk

Taylor & Francis boasts an excellent portfolio of journals specializing in operations research and management science. Our journals are edited by leading academics and offer several accommodating options for prospective authors. Visit our booth to talk to us about your work and browse our Operations Research and Management Science journals.

Cogent OA is an open access publisher of peer-reviewed research. Part of the Taylor & Francis Group, Cogent OA publishes original academic research articles across different subject areas, including engineering, mathematics, business, and management. Discover the benefits of open access and submit your manuscript: <http://cogentoa.tandfonline.com/>.

Wiley

42

www.wiley.com

Wiley is the leading society publisher. We publish on behalf of more societies and membership associations than anybody else, and offer libraries and individuals 1250 online journals, thousands of books and e-books, reviews, reference works, databases, and more. For more information, visit www.wiley.com, or our online resource library: www.onlinelibrary.wiley.com.

2016 INFORMS ANNUAL MEETING
NOVEMBER 13-16 IN NASHVILLE

How to Navigate the Technical Sessions

There are four primary resources to help you understand and navigate the Technical Sessions:

- This Technical Session listing, which provides the most detailed information. The listing is presented chronologically by day/time, showing each session and the papers/abstracts/authors within each session.
- The Author and Session indices provide cross-reference assistance (pages 510-553).

Quickest Way to Find Your Own Session

Use the Author Index (page 510) — the session code for your presentation will be shown along with the room location. You can also refer to the full session listing for the room location of your session.

The Session Codes

Time Blocks

Sunday - Tuesday

- A — 8:00am - 9:30am
- B — 11:00am - 12:30pm
- C — 1:30pm - 3:00pm
- D — 4:30pm - 6:00pm

Wednesday

- A — 8:00am - 9:30am
- B — 11:00am - 12:30pm
- C — 12:45pm - 2:15pm
- D — 2:45pm - 4:15pm
- E — 4:30pm - 6:00pm

Room Locations /Tracks

All tracks and technical sessions will be held in the Convention Center and Marriott. Room numbers are shown on the Track Schedule and in the technical session listing.

Sunday, 8:00am - 9:30am

■ SA01

01-Room 301, Marriott

Modeling and Combating Terrorism

Sponsor: Military Applications

Sponsored Session

Chair: Gary Kramlich, Orsa Team Leader, US Army INSCOM, 5837 New England Woods Dr, Burke, VA, 22015, United States of America, gary.r.kramlich.mil@mail.mil

1 - Combating Terrorism: How to Degrade a Terrorist Network by Strengthening a US Support Network

Chané Jackson, Instructor, United States Military Academy, Department of Mathematics, West Point, NY, 10996, United States of America, chane.jackson@usma.edu
Nedialko Dimitrov, Anthony Johnson

To combat terrorism abroad, the US Forces seek to degrade a terrorist support network and strengthen a US support network. We describe a general framework for the problem of influence maximization in a social network. Solutions identify key individuals to serve as a focus for US efforts to expand support. Our framework both captures previous work in the area and yields many novel problem formulations. We demonstrate the framework's applicability through insights gained on several examples.

2 - Countering Improvised Explosive Devices with Adaptive Sensor Networks

Jorge Buenfil, PhD Student, Stevens Institute of Technology, 1 Castle Point Rd, Hoboken, NJ, 07030, United States of America, jbuensfil@stevens.edu, Jose Emmanuel Ramirez-marquez

A combination of statistical analysis, artificial intelligence and human-machine interface with an adaptive system is presented as a way to infer the presence of IEDs in a dynamic environment. Specific algorithms, pattern recognition, and statistical data processing are applied to this problem to accurately indicate the presence of explosives with low probability of false alarms, high probability of detection, and the ability to automatically improve the sensor network's accuracy over time.

■ SA02

02-Room 302, Marriott

Interdiction and Fortification Models: Applications

Cluster: Homeland Security

Invited Session

Chair: Taofeek Biobaku, University of Houston, Houston, TX, United States of America, tobiobaku@uh.edu

1 - A Network Interdiction Approach to the Rural Postman Problem

Gokhan Karakose, University of Missouri, Lafferre Hall, Columbia, MO, United States of America, gkz7c@mail.missouri.edu, Ronald McGarvey

We consider a network where some required arcs need to be traversed by a manager who wishes to minimize his total distance traveled. Opposing this manager an interdicator seeks to disrupt arcs in order to impede the manager's travel. Given that the manager can invest limited resources to protect a subset of arcs from disruption, what investment strategy minimizes the maximum distance that the manager might need to travel?

2 - Allocating Resources to Enhance Resilience, with Application to Superstorm Sandy

Cameron MacKenzie, Assistant Professor, Iowa State University, 3004 Black Engineering, Ames, IA, 50011, United States of America, camacken@iastate.edu, Chris Zobel

We construct a framework to allocate resources to increase an organization's resilience to a system disruption. We first look at characterizing the optimal resource allocations associated with several standard allocation functions. Next, we apply the resource allocation model for resilience to uncertain disruptions. The optimization model is applied to an example of increasing the resilience of an electric power network to Superstorm Sandy.

3 - A Branch and Cut Method for Solving the Bilevel Clique Interdiction Problem

Timothy Becker, Rice University, 6100 Main Street, Houston, TX, 77005, United States of America, tjb5@rice.edu, Illya Hicks

I introduce an algorithm to solve the current formulation of the bilevel clique interdiction problem. The problem defines a defender who attempts to minimize the number of cliques removed by an attacker. The algorithm presented in this talk uses a branch and cut approach to solve the proposed problem and give preliminary results. This algorithm is expected to be usable on any social network, thereby improving the study of many network problems including terrorist cells or marketing strategies.

■ SA03

03-Room 303, Marriott

Scheduling and Optimization in Logistics, Energy, Manufacturing Industries

Cluster: Scheduling and Project Management

Invited Session

Chair: Lixin Tang, Professor, Northeastern University, Institute of Industrial Engineering and, Logistics Optimization, Shenyang, 110819, China, lixintang@mail.neu.edu.cn

1 - Integrated Production, Inventory and Delivery Problems: Complexity and Algorithms

Zhi-Long Chen, Professor, University of Maryland, Robert H. Smith School of Business, College Park, MD, 20742, United States of America, zchen@rhsmith.umd.edu, Feng Li, Lixin Tang

We consider integrated production, inventory and delivery scheduling problems that arise in practical settings where customer orders have delivery time windows, and are first processed in a plant and then delivered to the customers by transporters with fixed delivery departure times. We study their complexity by showing NP-hardness of a problem or giving polynomial-time algorithms. For two problems, we propose column generation based heuristics that can find near optimal solutions quickly.

2 - Smart Port Automation System

Loo Hay Lee, National University of Singapore, Department of Industrial & Systems, Engineering, Singapore, iseleelh@nus.edu.sg, Ek Peng Chew

In this talk we will present several innovative port automation concepts, which include the Frame-bridge system developed by ZPMC, Grid System developed by BEC, AGV system and the double storey container port system (SINGA port). SINGA port has won the grand prize of US\$ 1 million for the next generation container port challenge.

3 - Scheduling a Single Batching Machine with Makespan and Total Rejection Cost Objectives

Kangbok Lee, York College, CUNY, York College, The City University of New York, Jamaica, NY, 11451, United States of America, klee5@york.cuny.edu, Cheng He, Joseph Leung, Michael Pinedo

We consider a single batching machine scheduling problem with rejection being allowed. Two bi-criteria problems are considered: (a) minimize makespan with a given threshold of the total rejection cost, and (b) minimize the total rejection cost with a given threshold of makespan. For problem (a) we present an $O(n^2)$ -time 2-approximation algorithm and for both problems (a) and (b) we provide dynamic programming algorithms and fully polynomial-time approximation schemes.

4 - Production, Logistics and Energy Scheduling in the Steel Industry

Lixin Tang, Professor, Northeastern University, Institute of Industrial Engineering and, Logistics Optimization, Shenyang, 110819, China, lixintang@mail.neu.edu.cn

We discuss three scheduling problems in steel industry: 1) production scheduling in steel-making and hot/cold rolling operations; 2) logistics scheduling in storage/stowage, shuffling, transportation and (un)loading operations; 3) energy analytics and scheduling including energy consumption estimation, energy diagnosis and benchmarking, energy prediction and dynamic energy allocation. Some on-going interesting topics on coordinated scheduling of production, logistics and energy are discussed.

■ SA04

04-Room 304, Marriott

JFIG Paper Competition I

Sponsor: Junior Faculty Interest Group

Sponsored Session

Chair: Asoo Vakharia, Professor, University of Florida, Department of ISOM, Gainesville, FL, 32611, United States of America, asoov@ufl.edu

Co-Chair: Arda Yenipazarli, Assistant Professor of Operations Management, Georgia Southern University, COBA 2224, Statesboro, GA, 30460, United States of America, ayenipazarli@georgiasouthern.edu

1 - JFIG Paper Competition I

The 2015 JFIG paper competition features paper submissions from a diverse array of talented junior faculty members. The prize committee evaluated submissions based on the importance of the topic, appropriateness of the approach, and significance of the contribution. After careful review, the prize committee selected a group of finalists to present their research in one of the two JFIG sessions. For information on the finalists and their papers, please refer to the online program.

■ SA05

05-Room 305, Marriott

Scalable Business Analytics in Social Media

Cluster: Social Media Analytics

Invited Session

Chair: Kunpeng Zhang, Assistant Professor, University of Maryland, College Park, Maryland, College Park, United States of America, kpzhangs@gmail.com

1 - Assessing Factors that Drive People to Invest in Crowdfunding Projects

Yuheng Hu, Assistant Professor, University of Illinois at Chicago, 601 S Morgan St, Chicago, IL, United States of America, yuhenghu@gmail.com

Crowdfunding platforms have gained popularity in recent years. However, little is known about the factors driving people to invest in crowdfunding projects. In this paper, we examine factors associated with three different perspectives that drive people's investment in over 6K funded projects on Kickstarter: 1) founder's personality, 2) founder's social network, and 3) project-based factors. We find that people's personality and the project topics variously affect the investment choices.

2 - Production Diffusion and Identity Signaling on Social Shopping Platforms

De Liu, Associate Professor, University of Minnesota Twin Cities, deliu@umn.edu, Pei Xu

We study the diffusion of products on social shopping platforms, where consumers can endorse the products they discover and like and follow one another's endorsements. We find that the diffusion of product endorsements is consistent with the identity-signaling model. Consumers endorse products endorsed by their aspiration groups (whom they follow) but avoid products endorsed by the crowd.

3 - Winning Strategies in Dynamic Innovation Tournaments

Jie Zhang, Associate Professor, University of Texas, Arlington, 701 S West St. Box 19437, Arlington, TX, 76019, United States of America, jiezhang@uta.edu, Indika Dissanayake

Innovation tournaments have become a popular method of finding creative solutions. Using weekly contest data collected from an innovation tournament platform, we studied the winning strategies of solvers in a dynamic tournaments setting. Our analyses suggest that solvers strategically exert efforts over time to enhance their probability of winning. Furthermore, teams strategically merge with other team to enhance their chances of winning.

4 - On the Stormy Side of Twitter: The Role of the Network in Public Engagement with Climate Change

Lauren Rhue, Visiting Assistant Professor, Wake Forest University, 1834 Wake Forest Road, Farrell Hall 235, Building 60, Winston-Salem, NC, 27106, United States of America, rhuela@wfu.edu, Graham Gottlieb, Irina Feygina

Our study examines millions of tweets from TV meteorologists' accounts to understand the influence of meteorologists' network positions, the tweet sentiment, and major weather events on the public engagement with weather and climate change. We find that the effectiveness of their tweets, measured by retweets and favorites, is affected by all these drivers and that negativity and disasters sparks interest in the weather.

■ SA06

06-Room 306, Marriott

Financial Engineering

Sponsor: Financial Services

Sponsored Session

Chair: Abel Cadenillas, Professor, University of Alberta, Department of Mathematical Sciences, Central Academic Building 632, Edmonton, AB, T6G2G1, Canada, abel@ualberta.ca

1 - Robust Dynamic Optimization of Credit Portfolios

Agostino Capponi, Columbia, Mudd 313, New York, NY, 10027, United States of America, ac3827@columbia.edu

We introduce a dynamic credit portfolio framework where optimal investment strategies are robust against misspecifications of the reference credit model. We provide an explicit characterization of the optimal robust bond investment strategy, in terms of default state dependent value functions associated with the max-min robust optimization criterion. The value functions can be obtained as the solutions of a recursive system of HJB differential equations.

2 - Optimal Investment and Liability Ratio Policies in a Multidimensional Regime Switching Model

Abel Cadenillas, Professor, University of Alberta, Department of Mathematical Sciences, Central Academic Building 632, Edmonton, AB, T6G2G1, Canada, abel@ualberta.ca, Bin Zou

We consider an insurer who faces an external jump-diffusion risk that is negatively correlated with the capital returns in a multidimensional regime switching model. The insurer selects investment and liability ratio policies continuously to maximize her/his expected utility of terminal wealth. We obtain explicit solutions for optimal investment and liability ratio policies for logarithmic power, and exponential utility functions.

3 - Dynamic Programming in Mathematical Finance

Alain Bensoussan, Professor, The University of Texas at Dallas, United States of America, axb046100@utdallas.edu

Mathematical Finance has introduced new type of stochastic control problems. In this context, the martingale method has been used to solve them. This gives the impression that probabilistic techniques are the only way to obtain a solution. We show that purely analytical techniques can be used for the same result. Not only it is useful to have additional techniques, but also analytical techniques allow for more constructive solutions. We will discuss the main techniques, and give examples.

4 - A Data-driven Perspective on Transaction Costs in Portfolio Selection

Victor Demiguel, Professor, London Business School, Regent's Park, London, United Kingdom, avmiguel@london.edu, Alba V. Olivares-nadal

We show that a transaction cost term can result in portfolios that are robust with respect to estimation error. Theoretically, we show that the problem with transaction costs is equivalent to: a robust portfolio problem, a robust regression problem, and a Bayesian portfolio problem. Empirically, we propose a data-driven approach to portfolio selection with transaction costs. We demonstrate using five empirical datasets that the proposed data-driven portfolios perform well out of sample.

■ SA07

07-Room 307, Marriott

Quantitative Financial Risk Management

Cluster: Risk Management

Invited Session

Chair: Tim Leung, Professor, Columbia University, 116th Street, New York, NY, 10027, United States of America, tl2497@columbia.edu

1 - A Limit Order Book Model for Small-tick Stocks

Xinyun Chen, Stony Brook University, Math Tower, B148 #4, New York, United States of America, xinyun.chen@stonybrook.edu, Jose Blanchet, Yanan Pei

We construct a limit order book model to inform the joint evolution of the spread and the price processes for small-tick stocks. Under the multi-scale asymptotic regime suggested by empirical observations, we solve the price return distribution in terms of the order flow rates. We test our model using US stock market data. Under different scaling regimes, with respect to the autocorrelation of order flows, our results leads to different jump-diffusion models for the price dynamics.

2 - Optimal Static Quadratic Hedging

Tim Leung, Professor, Columbia University, 116th Street, New York, NY, 10027, United States of America, tl2497@columbia.edu

We propose a flexible framework for hedging European or path-dependent derivatives by holding static positions in vanilla European calls, puts, bonds, and forwards. A model-free expression is derived for the optimal static hedging strategy that minimizes the expected squared hedging error subject to a cost constraint. The versatility of our approach is illustrated through a series of examples.

3 - The Martingale Extraction Method with Applications to Long-term Cash Flows

Hyunbin Park, Worcester Polytechnic Institute, 100 Institute Road, Worcester, MA, 01609, United States of America, hpark@wpi.edu

The martingale extraction method is discussed with applications. We determine the exponential decay (or growth) rate of long-term cash flows and, as one of examples, long-dated leveraged ETFs are analyzed. We then explore a sensitivity analysis with respect to perturbations in the underlying process. The method of Fournie is combined with the martingale extraction to analyze the sensitivity.

4 - Drawdown-Based Measures of Risk

Olympia Hadjiladis, Professor, Brooklyn College and the Graduate Center CUNY, 32 Willow Place, Apt. 3, Brooklyn, NY, 11201, olympia.hadjiladis@gmail.com, Hongzhong Zhang, Tim Leung, Chris Knaplund

Common risk measures, such as value-at-risk and conditional value-at-risk, are based on the distribution of terminal returns, and do not incorporate path dependence of returns. The drawdown process can be used to describe the path-wise risk – it is defined as the difference between the running maximum and the current position of a process. We define and discuss the risk measures drawdown-at-risk, conditional drawdown-at-risk, maximum drawdown-at-risk and the co-drawdown-at-risk.

Node Location, Node Disruption and Routing

Sponsor: Telecommunications

Sponsored Session

Chair: Timothy Matis, Professor, Texas Tech University, 2500 Broadway, Texas, United States of America, Timothy.Matis@ttu.edu

1 - A Robust Optimization Approach for Identifying Disruptive Nodes in Networks

Joe Naoum-sawaya, IBM Research, Damastown Industrial Estate, Dublin 15, Ireland, jnaoumsa@uwaterloo.ca, Christoph Buchheim

The critical node selection problem (CNP) has important applications in telecommunication, supply chain design, and disease propagation prevention. In practice the weights on the connections are uncertain. Thus robust optimization approaches have been considered. In this presentation, we address general uncertainty sets and propose an exact approach based on Benders decomposition. In particular, we can deal with discrete scenario based uncertainty, gamma uncertainty, and ellipsoidal uncertainty.

2 - Location of Wireless Mobile Relays

David Shallcross, Applied Communication Sciences, 150 Mt Airy Road, Basking Ridge, NJ, 07920, United States of America, dfs@jhu.edu

We consider the placement of wireless mobile relays to enable communication between clients, focusing on minimizing the maximum link length in the resulting network. We present new bounds and complexity results for the centralized problem, and analysis of an algorithm distributed among the relays themselves.

3 - A Game-Theoretic Model of Network Routing under Strategic Link Disruptions

Mathieu Dahan, Master Student, Massachusetts Institute of Technology, 70 Pacific Street #648C, Cambridge, MA, 02139, United States of America, mdahan@mit.edu, Saurabh Amin

We consider a network security game where the defender routes flow through a network and the attacker disrupts one or more links. The defender (resp. attacker) faces disutility (resp. utility) of lost flow, and incurs transportation cost (resp. cost of attack). We show that, under certain conditions, Nash equilibria of this game can be characterized by max-flow and min-cut of the network. We study equilibrium structure in terms of the player valuations of effective flow and the incurred costs.

Global Value Chains and New Organizational Architectures

Sponsor: Technology, Innovation Management & Entrepreneurship
Sponsored Session

Chair: Saikat Chaudhuri, The Wharton School, University of Pennsylvania, 2000 Steinberg Hall-Dietrich Hall, 3620 Locust Walk, Philadelphia, PA, 19104, United States of America, saikatc@wharton.upenn.edu

1 - Collaboration Between Specialist Physicians in Multiple Countries Enabled by Information Technology

Ravi Aron, Johns Hopkins University, 100, International Drive, Room 1331, Baltimore, MD, 21202, United States of America, raviaron@jhu.edu, Praveen Pathak

Medical Tourism refers to patients that travel abroad for surgery. This involves collaboration between the doctor in the patient's home country that provides ongoing care and the specialist surgeon and hospital offshore that provides the surgical services. We look at how technology plays a role in enabling collaboration between physicians internationally. We disaggregate the different elements of IT and their impact on clinical outcomes and patient satisfaction levels.

2 - Operationalizing Enterprise Architecture and Evaluating Enterprise Flexibility

Alan MacCormack, Harvard Business School, Soldiers Field, Boston, MA, 02163, United States of America, amaccormack@hbs.edu

We develop a network-based methodology for analyzing a firm's enterprise architecture. We demonstrate the application of this method to the analysis of enterprise IT flexibility, using data from a large pharmaceutical firm. We show that measures of architecture derived from our methodology predict the cost of change for software applications within the firm. In particular, applications that are tightly coupled to other system components cost significantly more to change.

3 - The Voice of Ideas: Understanding Impact of Diverse Modes of Open Innovation

Natalia Levina, Stern School of Business, New York University, 44 W 4th Street., KMEC 8-78, New York, NY, United States of America, nlevina@stern.nyu.edu, Emmanouil Gkeredakis, Anne-laure Fayard

Organizations are increasingly engaging in open innovation by hiring consultants and using crowdsourcing platforms in the hopes of solving their long-standing R&D problems. Yet, the impact of these diverse modes of open innovation on organizations is not well understood. The talk builds on an in-depth field study of such engagements and argues that diverse modes of sourcing ideas have very different potential for enabling organizations to learn new perspectives on their long-standing problems.

4 - Global Sourcing of Key Resources: Emerging-market Firms' Acquisitions of Developed-Market Companies

Saikat Chaudhuri, The Wharton School, University of Pennsylvania, 2000 Steinberg Hall-Dietrich Hall, 3620 Locust Walk, Philadelphia, PA, 19104, United States of America, saikatc@wharton.upenn.edu

Emerging-market firms are increasingly acquiring developed-market companies to obtain high-value technology and market resources, challenging traditional paradigms. We offer a perspective that provides a more balanced focus on the role of both firm and location specific resources in the value creation of these acquisitions. Applying our conditional approach, we develop testable propositions on the distinct antecedents, processes, and outcomes of such acquisitions, as a basis for future work.

Sponsored Session

Chair: Lei Wang, Assistant Professor, Penn State University, 440 Business Building, University Park, PA, 16802, United States of America, luw21@psu.edu

1 - The Positive Spillover Effect of Mobile Social Games on App Literacy

Sang-Pil Han, Assistant Professor, Arizona State University, BA 301D, Tempe, AZ, 85287, United States of America, shan73@asu.edu, Wonseok Oh, Sungho Park, Mihyun Lee

Despite the massive influx of mobile apps into the market, not everyone is "mobile literate." This study uses an individual level mobile app usage dataset to examine the potential of mobile platform-based social games as training tools for mobile literacy. Results reveal that high social game app consumption increases the duration of app usage and the number of apps used. This positive spillover effect is more pronounced among users with limited mobile experiences or are in their 50s or older.

2 - Trajectory-based Mobile Advertising

Beibei Li, Assistant Professor, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, beibeili@andrew.cmu.edu, Siyuan Liu, Anindya Ghose

We propose a new mobile ad strategy that leverages full information on consumers' offline moving trajectories. To examine the effectiveness of this new mobile ad strategy, we design a large-scale randomized field experiment in a large shopping mall in Asia. We found that mobile trajectory-based ads can lead to the highest redemption probability and highest satisfaction rate from customers.

3 - Learning from your Friends' Check-Ins: An Empirical Study of Location-Based Social Networks

Liangfei Qiu, Assistant Professor, University of Florida, Department of ISOM, Gainesville, FL, United States of America, liangfeiqiu@ufl.edu, Zhan Shi, Andrew Whinston

Recently, mobile applications have offered users the option to share their location information with friends. Using data from a major location-based social networking app in China, we estimate a structural model of restaurant discovery and observational learning and conduct counterfactual analysis on seeding strategies. The unique feature of repeated customer visits in the data allows us to separate observational learning from non-informational confounding mechanisms.

4 - How Does the Taxi-hailing App Improve Driver's Efficiency? An Empirical Evidence from China's "UBER"

Kaiquan Xu, Nanjing University, 22#, Hankou Road, Nanjing, China, xukaiquan@nju.edu.cn

With the Uber's rapid development, there is no any study to assess the taxi-hailing app's advantages and disadvantages. Using the unique dataset from the large taxi-hailing app company in China, this study finds some interesting results. Drivers can earn more 1.249 RMB when the order is acquired from the app. Our study shows that the taxi-hailing app increases the time to pick up customers. This is the first study of using the driver-level objective data to examine the taxi-hailing app's impact.

Polynomial and Nonconvex Optimization

Sponsor: Optimization/Integer and Discrete Optimization
Sponsored Session

Chair: Daniel Bienstock, Columbia University, 500 W 120th St, New York, NY, 10027, United States of America, dano@columbia.edu

1 - Lifted Formulations for Optimization Problems with Small Width

Daniel Bienstock, Columbia University, 500 W 120th St, New York, NY, 10027, United States of America, dano@columbia.edu, Gonzalo Muñoz

We present polynomial-size lifted formulations for optimization problems where the intersection matrix of the constraints has bounded tree-width. For a binary problem with n variables and tree-width w , our formulation has $2wn$ constraints and variables, and is exact. We used this construction to obtain polynomial-size formulations for mixed-integer polynomial optimization problems of bounded width, which attain desired feasibility and optimality guarantees.

2 - Algebraic Decomposition of Polynomials by Linear and Second Order Cone Programming

Amir Ali Ahmadi, Princeton University, Department of ORFE, Princeton University, Sherrerd Hall, Charlton Street, Princeton, NJ, 08544, United States of America, a_a_a@princeton.edu

We present several LP/SOCP based algebraic decomposition algorithms for multivariate polynomials that can be used to solve polynomial optimization problems.

3 - Approximation Tools for Structured Nonconvex Optimization Problems

Fatma Kilinc Karzan, Assistant Professor Of Operations Research, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, fkilinc@andrew.cmu.edu, Levent Tuncel

We study the structured nonconvex optimization problem of maximizing a convex function over a convex domain. Such problems generalize computing matrix norms and often arise in applications in robust optimization and machine learning. In many cases, these problems are NP-Hard; and thus we establish a framework for building tractable convex relaxations. We study various properties, approximation quality, and exactness of these relaxations, and establish connections to existing results.

Surrogate-Based and Derivative-Free Optimization I

Sponsor: Optimization/Mixed Integer Nonlinear Optimization and Global Optimization

Sponsored Session

Chair: Rommel Regis, Saint Joseph's University, Mathematics Department, 5600 City Avenue, Philadelphia, 19131, United States of America, rregis@sju.edu

1 - A Swarm Intelligence Based Data-driven Optimizer using Adaptive Meta-modeling

Mengqi Hu, University of Illinois at Chicago, Chicago, IL, United States of America, mhu@uic.edu

Although many different meta-models are developed to reduce computational cost for time-intensive model, it is not conclusive that any meta-model performs better than others across diverse set of problems. To this end, we develop an adaptive model selection algorithm to adaptively select the most suited meta-model for different problems. This approach is integrated with a novel swarm intelligence algorithm for data-driven optimization which can achieve good result with less computational cost.

2 - Response Correction Techniques for Multifidelity Design Optimization

Leifur Leifsson, Iowa State University, Department of Aerospace Engineering, 2271 Howe Hall, Ames, IA, 50011, United States of America, leifur@iastate.edu

Simulations are widely used in engineering for analysis and design. A key challenge is the computational cost. Conventional design techniques typically require a large number of model evaluations. Thus, the use of simulations in the design process can be prohibitive. Physics-based surrogates, so-called multifidelity models, can be used to accelerate the optimization process. This talk describes several response correction techniques developed specifically for multifidelity design optimization.

3 - FALCON: A Function Approximation Algorithm for Large-scale Constrained Black-box Optimization

Rommel Regis, Saint Joseph's University, Mathematics Department, 5600 City Avenue, Philadelphia, PA, 19131, United States of America, rregis@sju.edu

This talk presents the FALCON algorithm for constrained expensive black-box optimization that uses surrogates to approximate the objective and constraint functions. Unlike previous methods, FALCON can handle infeasible start points and equality constraints. FALCON is implemented using an interpolating radial basis function surrogate and compared with alternatives on benchmark problems, including a large-scale automotive application with 124 decision variables and 68 black-box constraints.

Nonconvex Statistical Optimization

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Han Liu, Princeton University, Sherrerd Hall, Charlton Street, Princeton, NJ, United States of America, hanliu@princeton.edu

1 - Blessing of Massive Scale: Spatial Graphical Model Inference with a Total Cardinality Constraint

Ethan X. Fang, Princeton University, Sherrerd Hall ORFE, Charlton Street, Princeton, NJ, 08544, United States of America, ethanfangxy@gmail.com, Han Liu, Mengdi Wang

We propose a novel inferential framework for estimating large-scale spatial graphical models with a total cardinality constraint. This work has two major contributions. (i) From a computational perspective, we show that the computational accuracy increases when the problem scale increases. (ii) From a statistical perspective, we justify the obtained graph estimator achieves the minimax optimal rate of convergence under weak assumptions.

2 - A General Theory of Pathwise Coordinate Optimization

Tuo Zhao, Johns Hopkins University, 12124 East Run Drive, Lawrenceville, NJ, 08648, United States of America, touzhaot@gmail.com, Tong Zhang, Han Liu

The pathwise coordinate optimization achieves superior empirical performance for solving high dimensional nonconvex sparse learning problems, but at the same time poses significant challenge to theoretical analysis. To tackle this long lasting problem, we develop a new theory showing that the unique algorithmic structure of the pathwise coordinate optimization plays pivotal roles in guaranteeing its optimal statistical and computational performance.

Stochastic Optimization with Discrete Moments

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Anh Ninh, College of William and Mary, 200 Stadium Dr, Williamsburg, VA, 23186, United States of America, ninhantuanh@gmail.com

1 - Binomial Moments and Boolean Bounding for Functions in Random Variables

Jinwook Lee, Drexel University, 3220 Market Street, Philadelphia, PA, United States of America, jw78kr@gmail.com, Jongpil Kim, Andras Prekopa

For a desirable statistical precision level, it is often required to run a simulation more than million times. A new mathematical model is introduced for sharp bounds of a function of random variables. For the model construction we use the binomial moment scheme for systematic mathematical representation, and it's further developed by the use of Boolean logic over set algebra. Numerical examples of various probability distributions are presented.

2 - Improved Bounds on the Probability of the Union of Events Some of Whose Intersections are Empty

Kunikazu Yoda, Rutgers University, 100 Rockafeller Rd, Piscataway NJ 08854, United States of America, kunikazu.yoda@rutgers.edu, Andras Prekopa

We formulate a linear program whose optimal objective function value can be used in other formulations to yield improved upper and lower bounds on the probability of the union of events if we know some empty intersections of small numbers of events. The LP relaxation of an extension of the maximum independent set problem provides an upper bound on the largest number of events that have a nonempty intersection. We present numerical experiments demonstrating the effectiveness of our formulation.

3 - New Methods for Probabilistically Constrained Optimization Problem with Degenerate Distribution

Olga Myndyuk, Rutgers University, 100 Rockafeller Rd, Piscataway, NJ, 08854, United States of America, olik.myn@gmail.com

The problem under consideration is probabilistically constrained optimization problem with degenerate continuous probability distribution of the random variables in the constraints. Upper and lower bounds were obtained using the results of A.Prekopa and degeneracy of the distributions. Existing and new methods for solving are discussed: supporting hyperplane method, Prekopa-Vizvari-Badics hybrid algorithm and two derivative-free methods.

4 - Some Aspects of Discrete Moment Problem from the Linear Programming Perspective: Numerical Approach

Mariya Naumova, Rutgers University, Dept. of Mathematics, 110 Frelinghuysen Rd., Piscataway, NJ, 08854, United States of America, mariya.v.naumova@gmail.com

We present a brief survey of some of the basic results related to the discrete moment problems. We illustrate how piecewise polynomial lower and upper bounds on the function, created in connection with suitable dual feasible bases in the univariate discrete moment problem can be used to approximate definite integrals. Numerical illustrations of valuations of financial instruments are presented.

Nonlinear Optimization in Energy Systems

Sponsor: Optimization/Nonlinear Programming

Sponsored Session

Chair: Nai-Yuan Chiang, Argonne National Laboratory, 9700 South Cass Avenue, Lemont, IL, United States of America, nychiang@mcs.anl.gov

Co-chair: Yankai Cao, Ph.D. Student, Purdue University, FRNY G053B, 480 Stadium Mall Drive, West Lafayette IN 47907, United States of America, cao142@purdue.edu

1 - Clustering-Based Interior-Point Strategies for Convex Stochastic Programs

Yankai Cao, PhD Student, Purdue University, FRNY G053B, 480 Stadium Mall Drive, West Lafayette, IN, 47907, United States of America, cao142@purdue.edu, Victor M. Zavala, Carl Laird

We present a clustering-based interior-point strategy for two-stage stochastic programs. The key idea is to perform adaptive clustering of scenarios inside the solver. The resulting compressed KKT system is much smaller and is used as a preconditioner. We derive spectral and error properties for the preconditioner. We also describe our parallel implementation and demonstrate that high compression rates of 87% and speedups of 30 are achievable for electricity market clearing problems.

2 - Arc Search Methods for Linearly Constrained Optimization

Nick Henderson, Research Associate and Instructor, Stanford University, Stanford, CA, nwh@stanford.edu

We present an arc search algorithm for linearly constrained optimization. The method constructs and searches along smooth arcs that satisfy a small set of properties. When second derivatives are used, the method is shown to converge to a second-order critical point. We discuss use of arc search in Quasi-Newton methods and different strategies for handling constraints.

3 - A Progressive Method to Solve Large-scale AC Optimal Power Flow with Discrete Variables

Maxime Fender, Optimization Consultant, Artelys Canada Inc., 2001 Boulevard Robert-Bourassa, #1700, Montréal, QC, H3A 2A6, Canada, maxime.fender@artelys.com, Manuel Ruiz, Jean Maeght, Alexandre Marié, Patrick Panciatici

This study on power system networks aims to produce a dynamic simulation based security assessment taking into account uncertainties. An extended OPF without any guarantee on feasibility leads to the resolution of a Mixed-Integer NonLinear Problem, very challenging, and even harder to solve when the problem is not convex. A custom filtering method which tries to explain infeasibilities and uses the nonlinear solver KNITRO to reformulate discrete variables into nonlinear constraints is proposed.

4 - A Robust Approach to Chance Constrained Optimal Power Flow with Renewable Generation

Yury Dvorkin, PhD Student/Research Assistant, University of Washington, 185 Stevens Way NE, Paul Allen Center, Room AE104R, Seattle, WA, 98195, United States of America, iouridvorkin@gmail.com, Miles Lubin, Scott Backhaus

We formulate a Robust Chance Constrained (RCC) OPF that accounts for uncertainty in the parameters of these probability distributions by allowing them to be within an uncertainty set. The RCC OPF is solved using a scalable cutting-plane algorithm. We evaluate the RCC OPF on a modified BPA test system, which includes 2209 buses and 176 controllable generators. Deterministic, chance constrained (CC), and RCC OPF formulations are compared using several cost and reliability metrics.

Sponsored Session

Chair: John Mitchell, Professor, Rensselaer Polytechnic Institute, Mathematical Sciences Dept, Troy, NY, 12180, United States of America, mitchj@rpi.edu

1 - A Rounding Procedure for a Maximally Complementary Solution of Semidefinite Optimization Problems

Ali Mohammad Nezhad, PhD Student, Lehigh University, 200 West Packer Ave., Industrial and Systems Engineering Dept., Bethlehem, PA, 18015, United States of America, ali.mohammadnezhad@gmail.com, Tamás Terlaky

In this paper, we deal with the identification of optimal partitioning in semidefinite optimization. We derive some bounds on the condition numbers of the problem using the first order theory of reals and estimate the magnitude of the eigenvalues in the vicinity of the central path, which depends on the degree of singularity of the optimality conditions. We then present a rounding procedure for the solution of an interior point method to get a maximally complementary solution.

2 - Convex and Structured Nonconvex Stochastic Optimization with Stochastic Constraints

Zhiqiang Zhou, University of Florida, 2330 SW Williston RD, Apt3034, Gainesville, FL, 32608, United States of America, brianzhou1991@gmail.com, Guanghui Lan

We present a new stochastic approximation (SA) algorithm to minimize a class of convex or nonconvex objective functions subject to certain expectation constraints. We show that this algorithm exhibits the optimal rates of convergence in expectation and with high probability under different conditions. Some numerical results are provided for portfolio management and machine learning.

3 - Benders Decomposition for Discrete-constrained Problems with Complementarity Constraints

John Mitchell, Professor, Rensselaer Polytechnic Institute, Mathematical Sciences Dept, Troy, NY, 12180, United States of America, mitchj@rpi.edu, Jong-shi Pang, Andreas Waechter, Francisco Jara-Moroni

We discuss a logical Benders decomposition approach to discrete-constrained mathematical programs with complementarity constraints. This is an extension of our prior approach to linear and quadratic programs with complementarity constraints. The inclusion of discrete and binary constraints broadens the applicability of the approach.

Social Network Modeling and Optimization

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Alexander Nikolaev, Assistant Professor, University at Buffalo (SUNY), 312 Bell Hall, Buffalo, NY, 14260-2050, United States of America, anikola@buffalo.edu

1 - Seed Selection Scheduling for Long-term Campaign Planning on Large Social Networks

Mohammadreza Samadi, PhD Candidate, University at Buffalo SUNY, 327 Bell Hall, Buffalo, NY, 14260, United States of America, msamadi@buffalo.edu, Alexander Nikolaev, Naji Rakesh

The influence maximization problem lies in finding a set of seeds that can optimally initiate a diffusion-driven cascade. We explore flexible, time-dependent seed activation solutions for long-term intervention/campaign planning on networks. The Seed Selection Scheduling Problem (SSSP) is that of selecting an optimal policy for seed activation over a finite time horizon under knapsack constraints. The ideas from the wireless sensor scheduling domain are used to tackle SSSP on large networks.

2 - Critical Nodes in Network Cohesion

Alexander Veremyev, University of Florida, 1350 N Poquito Road, Shalimar, FL, United States of America, averemyev@ufl.edu, Oleg Prokopyev, Eduardo Pasiliao

We consider a class of critical nodes detection problems that involves minimization of a graph cohesion measure (e.g., graph efficiency or harmonic average geodesic distance, Harary index, characteristic path length, communication utility) that depends on the actual pairwise distances between nodes in the remaining graph after nodes removal. We derive linear integer programming formulations along with additional enhancements, and develop an exact iterative algorithm to solve this problem.

3 - Detecting Cliques of Maximum and Minimum Centrality: Methods and Applications

Chrysafis Vogiatzis, Assistant Professor, North Dakota State University, 1410 14th Avenue North, Room 202 Civil & Industrial Engineering, Fargo, ND, 58102, United States of America, chvogiat@ufl.edu, Alexander Veremyev

In this talk, we consider the problem of finding the most and least “influential” or “influenceable” cliques in graphs based on three classical centrality measures: degree, closeness, and betweenness. In addition to standard betweenness, we also consider its optimistic and pessimistic counterparts along with a new metric for cluster closeness, namely residual closeness centrality. Applications discussed include analysis of information and social networks, and results on the stock market graph.

4 - Social Structure Optimization in Nurse Scheduling Problem

Alireza Farasat, Graduate Research Assistant, University at Buffalo (SUNY), 327 Bell Hall, Department of Industrial and Systems Eng, Amherst, NY, 14260, United States of America, afarasat@buffalo.edu, Alexander Nikolaev

This paper presents a mathematical framework for treating the Nurse Scheduling Problem (NSP) explicitly incorporating Social Structure (NSP-SS). While traditional approaches generate a configuration of individual schedules, the presented framework introduces models that assign nurses to working shifts to achieve an optimal structure of individual attributes and social relations within the teams. For an NP-Hard instance of NSP-SS, an integer program is presented, followed by a LK-NSP heuristic.

Recent Advances on Support Vector Machines Research

Cluster: Modeling and Methodologies in Big Data

Invited Session

Chair: Shouyi Wang, Assistant Professor, University of Texas at Arlington, 3105 Birch Ave, Grapevine, TX, 76051, United States of America, shouyiw@uta.edu

1 - Fast Scalable Support Vector Machines for Big Bimodal Data Analytics

Talayeh Razzaghi, Postdoctoral Research Fellow, Clemson University, 221 McAdams Hall, Clemson University, Clemson, United States of America, trazzag@clemson.edu, Ilya Safro, Mark Wess

Solving the optimization model of support vector machines is often an expensive computational task for very large biomedical training sets. We propose an efficient, effective, multilevel algorithmic framework that scales to very large data sets. Our multilevel framework substantially improves the computational time without loosing the quality of classifiers for balanced and imbalanced datasets.

2 - Value-at-Risk Support Vector Machine (Var-SVM): MIP Representation and Equivalence of Formulations

Victoria Zdanovskaya, Research And Teaching Assistant At Industrial And Systems Engineering Department, University of Florida, 303 Weil Hall, Gainesville, FL, 32611, United States of America, ladyvi@ufl.edu, Konstantin Pavlikov

SVMs is a widely used data classification technique. A class of Var-SVMs is known to be robust to the outliers in the training dataset. Unfortunately Var-SVM is a nonconvex optimization problem. We consider MIP representations of Var-SVM, that can be solved by standard Branch & Bound algorithm. We also consider different techniques that help to dramatically improve computational performance of such formulations.

3 - A Comparison of Constraint Relaxation and Bagging Policies in Support Vector Classification

Petros Xanthopoulos, University of Central Florida, 12800 Pegasus Dr., Orlando, FL, 32816, United States of America, petrosx@ucf.edu, Onur Seref, Talayeh Razzaghi

In classification, when data are available in uneven proportions the problem becomes imbalanced and the performance of standard methods deteriorates. Imbalanced classification becomes a more challenging in the presence of outliers. In this presentation, we study several algorithmic modifications of support vector machines for such problems. We show that the combined used of cost sensitive learning with constraint relaxation performs better compared to approaches that involve bagging.

4 - Semi-supervised Proximal Support Vector Machine with Sparse Representation Regularization

Jiaxing Pi, University of Florida, 3800 SW 34th St. Apt. P138, Gainesville, FL, 32608, United States of America, jiaxing@ufl.edu, Panos Pardalos

Proximal Support Vector Machine has been an efficient technique to generate classifiers. Sparse representation can detect neighborhood for a signal by reconstructing it with the linear span of other data. We applied sparse representation to build a regularization which can achieved semi-supervised assumptions for unlabeled data. Experiment on standard datasets are performed to compare the proposed framework with PSVM with manifold regularization.

5 - Extending Relaxed Support Vector Machines

Orestis Panagopoulos, University of Central Florida, 12800 Pegasus Dr., Orlando, FL, 32816, United States of America, opanagopoulos@knights.ucf.edu, Onur Seref, Talayeh Razzaghi, Petros Xanthopoulos

In this work, we propose Relaxed Support Vector Regression (RSVR) and One-Class Relaxed Support Vector Machines (ORSVM). The methods constitute extensions of Relaxed Support Vector Machines (RSVM). They are formulated using both linear and quadratic loss functions and are solved with sequential minimal optimization. Numerical experiments on public datasets and computational comparisons with other popular classifiers depict the behavior of our proposed methods.

1 - Declarative Cloud Performance Analytics

Boon Thau Loo, Associate Professor, University of Pennsylvania, Philadelphia, PA, 19104, United States of America, boonloo@cis.upenn.edu

This talk presents Scalanytics, a declarative platform that supports high-performance cloud application performance monitoring. Scalanytics uses stateful network packet processing techniques for extracting application-layer data from network packets, a declarative rule-based language for compactly specifying analysis pipelines, and a parallel architecture for processing network packets at high throughput. I will next describe the commercialization of Scalanytics as Gencore (gencore.io).

2 - Event-driven Predictive Models for Socio-economic Indicators

Lakshminarayana Subramanian, Associate Professor, NY, NY,
United States of America, lakshmi@cs.nyu.edu,
Sunandan Chakraborty

I will describe how to extract real-world events using unstructured news streams to understand their impact on the volatility macro-economic indicators. The hypothesis is that the factors triggering sudden fluctuations in such indicators can be characterized by events. Given a news corpus, we describe how to build event-driven predictive models that can potentially predict fluctuations in specific indicators. We describe specific results about what triggers fluctuations in food prices in India.

3 - Efficient Coflow Scheduling in Data Center Networks

Yuan Zhong, Columbia University, 500 W. 120th Street,
New York, NY, 10027, United States of America,
yz2561@columbia.edu, Cliff Stein, Zhen Qiu

In this talk, we consider the efficient scheduling of coflows - an abstraction introduced in [Chowdhury and Stoica 2012] to capture communication patterns of large-scale data center jobs. We introduce the problem of minimizing the total weighted coflow completion times, show that it is strongly NP-hard, and develop the first polynomial-time approximation algorithms for this problem. We also evaluate the practical performances of a variety of algorithms through numerical experiments.

4 - Optimizing for Tail Response Times of Cloud Clusters

Lydia Chen, IBM Zurich, yic@zurich.ibm.com, Natarajan Gautam

Motivated by the volatile system dynamics in cloud cluster, we develop an approximation scheme that can capture the high performance variability caused by neighboring VMs, especially in terms of tail response times. The approximation of tail response times is based on the large deviation analysis. We evaluate the proposed analysis on simulation as well a wiki prototype cluster in the cloud.

Stochastic Models for Medical Decision Making and Healthcare Delivery

Sponsor: Health Applications

Sponsored Session

Chair: F. Safa Erenay, Assistant Professor, University of Waterloo, 200 University Ave. CPH 4323, Waterloo, Canada, ferenay@uwaterloo.ca

1 - The Impact of Optimization on the Allocation of Livers for Organ Transplantation

Mustafa Akan, Associate Professor, Carnegie Mellon University,
5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of
America, akan@andrew.cmu.edu, James Markmann, Heidi Yeh,
Zachary Leung, Sridhar Tayur

Patients on the waitlist for liver transplantation are prioritized according to their MELD scores, which reflects the severity of liver disease. Recent studies have shown that hepatocellular carcinoma (HCC) patients have significantly higher liver transplant rates than non-HCC patients. We recommend a family of alternative MELD score policies based on a fluid model approximation of the queueing system and an optimization model that achieves an optimal balance between efficiency and equity.

2 - Physician Staffing in the Emergency Department: Opening the Blackbox

Caglar Caglayan, Georgia Institute of Technology, Atlanta, GA,
United States of America, ccaglayan6@gatech.edu, Kalyan
Pasupathy, David Nestler, Mustafa Sir, Thomas Hellmich,
Turgay Ayer, Gomathi Marisamy, Thomas Roh

We propose an “intuitive”, “realistic” and “tractable” model of the emergency department (ED) by a multi-class multi-stage queueing network with multiple targeted service levels. Based on infinite-server approximation and offered load analysis, we employ square-root safety principle to determine the right number of physicians in the ED. Our model is detailed enough to capture the key dynamics of the ED but simple enough to understand, infer results and implement in a clinical setting.

3 - Deriving Better Strategies for Influenza Vaccines Allocation

F. Safa Erenay, Assistant Professor, University of Waterloo,
200 University Ave. CPH 4323, Waterloo, Canada,
ferenay@uwaterloo.ca, Osman Ozaltin, Onur Ozden Dalgic

In influenza pandemics, available vaccines are allocated considering individual risk profiles of the patients. Using a network based stochastic simulation model and mesh adaptive direct search, we derived effective age-specific vaccine allocation strategies for cost, health outcomes, and equity metrics. In most scenarios, the proposed method outperforms the current guidelines and policies developed based on deterministic compartmental models.

4 - Reliable Facility Location Model for Disaster Response

Abdelhalim Hiasat, PhD Student, University of Waterloo,
ahhiasa@uwaterloo.ca, Osman Ozaltin, F. Safa Erenay

We formulate a reliable facility location model for disaster response, and consider the problem of minimizing expected service cost. Candidate facility locations might become unavailable after the disaster, and victims patronize relief facilities based on their preferences. We propose a Lagrangian-decomposition-based branch-and-bound method for this problem. Our computational results show the efficiency of the solution approach and the significance of incorporating preferences into the model.

Matching Markets

Sponsor: Applied Probability

Sponsored Session

Chair: Itai Ashlagi, MIT, 100 Main St, Cambridge, MA, 02139,
United States of America, iashlagi@mit.edu

1 - Welfare-sensitive Assortment Optimization: An Application to School Choice

Peng Shi, MIT Operations Research Center, 1 Amherst Street,
E40-149, Cambridge, MA, 02139, United States of America,
pengshi@mit.edu

In many settings, a planner gives a set of options to agents who choose among them to maximize their own value, but agents' choices have externalities on system revenue/cost. Examples include school choice, public housing, and health insurance. Welfare-Sensitive Assortment Optimization is to find a set of options that maximize the sum of agents' values and system revenue. We give efficient algorithms under MNL utilities and various constraints, and apply this to improve school choice in Boston.

2 - Near Feasible Stable Matchings with Couples

Thanh Nguyen, Krannert School of Management, Purdue
University, West Lafayette, IN, United States of America,
nguye161@purdue.edu, Rakesh Vohra

The National Resident Matching program strives for a stable matching of medical students to teaching hospitals. With the presence of couples, stable matchings need not exist. For any student preferences, we show that each instance of a matching problem has a “nearby” instance with a stable matching. The nearby instance is obtained by perturbing the capacities of the hospitals.

3 - Matching with Externalities

Jacob Leshno, Columbia University, 3022 Broadway, Uris Hall,
406, New York, NY, 10027, United States of America,
jleshno@columbia.edu

We show existence of stable matching in markets with a continuum of students. Stable matchings are characterized as rational expectations market clearing cutoffs.

4 - What Matters in Tie-breaking Rules? How Competition Guides Design

Afshin Nikzad, Stanford University, 37 Angell Court, APT 116,
Stanford, Ca, 94305, United States of America,
afshin.nikzad@gmail.com, Assaf Romm, Itai Ashlagi

School districts that adopt the Deferred Acceptance (DA) mechanism to assign students to schools face the tradeoff between fairness and efficiency when selecting how to break ties among equivalent students. We analyze a model with with random generated preferences for students and compare two mechanisms differing by their tie-breaking rules: DA with one single lottery (DA-STB) and DA with a separate lottery for each school (DA-MTB). We identify that the balance between supply and demand in the market is a prominent factor when selecting a tie-breaking rule. When there is a surplus of seats, we show that neither random assignments under these mechanisms stochastically dominates each other, and, the variance of student's assignments is larger under DA-STB. However, we show that there is essentially no tradeoff between fairness and efficiency when there is a shortage of seats: not only that DA-STB (almost) stochastically dominates DA-MTB, it also results in a smaller variance in student's rankings. We further find that under DA-MTB many pairs of students would benefit from directly exchanging assignments ex post when there is a shortage of seats, while only few such pairs exist when there is a surplus of seats. Our findings suggest that it is more desirable that “popular” schools use a single lottery over a separate lottery in order to break ties, while in other schools there is a real tradeoff.

Sponsored Session

Chair: Alexander Stolyar, Lehigh University, 200 W. Packer Ave, Room 484, Bethlehem, United States of America, als714@lehigh.edu

1 - Diffusion Approximations for Large-scale Buffered Systems

Tonghoon Suk, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30305, United States of America, tonghoon.suk@gmail.com

Motivated by a desire to design stochastic systems satisfying certain quality of service, we establish mean-field limit theorems to approximate systems. We start with a simple model consisting of n buffers and a server, and develop diffusion approximations for the system with the randomized LQF scheduling algorithm. We achieve this by allowing the number of sampled buffers $d = d(n)$ to depend on the number of buffers n , which yields an asymptotic decoupling of the queue length processes.

2 - Stability Verification: A Monte-Carlo Approach

Neil Walton, University of Amsterdam, Science Park 904, Amsterdam, Netherlands, n.s.walton@uva.nl, Brendan Patch, Michel Mandjes

We implement a form of simulated-annealing as a method for detecting if a queueing system is unstable for a given set of loads.

3 - A Large-Scale Service System with Packing Constraints: Greedy-Random Algorithm with Sub-Linear Error

Alexander Stolyar, Lehigh University, 200 W. Packer Ave, Room 484, Bethlehem, PA, United States of America, als714@lehigh.edu, Yuan Zhong

There are multiple input flows of different customer types and infinite number of servers. Each server may simultaneously serve multiple customers, subject to general "packing constraints". Each customer leaves after an independent random service time. We consider a version of a Greedy-Random customer assignment (packing) algorithm, and prove that it has an asymptotic competitive ratio 1, as the input flow rates grow to infinity.

4 - Heavy-traffic Behavior of the Maxweight Algorithm in a Switch with Non-uniform Traffic

R. Srikant, University of Illinois Urbana-Champaign, CSL 107, Urbana, IL, United States of America, rsrikant@illinois.edu, Siva Theja Maguluri

We consider a switch operating under the MaxWeight scheduling algorithm. The traffic pattern is assumed to be such that all ports are saturated, but otherwise can be non-uniform. It is shown that the heavy-traffic scaled queue length under MaxWeight is within a factor of two compared to the smallest achievable queue length.

Sponsored Session

Chair: Iljoo Kim, Assistant Professor, Saint Joseph's University, 347 Mandeville Hall, 5600 City Avenue, Philadelphia, PA, 19131, United States of America, ikim@sju.edu

1 - Rating Corporate Bonds using Deanfis Analysis – A Multi-modeling Approach

Rashmi Malhotra, Associate Professor, Saint Joseph's University, 5600 City Avenue, Philadelphia, PA, 19131, United States of America, rmalhotr@sju.edu, Davinder Malhotra

This paper illustrates the use of data envelopment analysis (DEA) and Adaptive Neuro-Fuzzy Inference Systems (ANFIS) to differentiate between bonds with credit ratings. This study measures the relative performance of corporate bonds using DEA. The ANFIS model creates a rule-based system that can aid the decision-maker in making decisions regarding the implications of a decision. This study proposes a modeling technique that jointly uses the two techniques to benefit from the two methodologies.

2 - Mining Hidden Organizational Structures from Meeting Records

Jiexun Li, Assistant Professor, Oregon State University, College of Business, Corvallis, OR, 97331, United States of America, jiexun.li@oregonstate.edu, Zhaohui Wu, Bin Zhu

Organizations often contain complex structures formed by social relationships. This study introduces an approach to finding hidden structures by mining meeting records. Using text-mining techniques, we extract information about persons and their opinions on topics. We conducted cluster analysis and network analysis to uncover hidden structures within the organization. Our preliminary study shows promising results. We are in the process of improving our approach and conducting more analyses.

3 - An Analytical Framework for Intelligent Reviewer Recommendation

Harry Wang, Association Professor, University of Delaware, 42 Amstel Ave, Newark, DE, 19716, United States of America, hjwang@udel.edu, Kunpeng Zhang, Sean Kilgallon

Recruiting reviewers for academic conferences and journals is a daunting task for conference organizers and journal editors. In this paper, we propose an intelligent approach for reviewer identification based on techniques such as text mining, social network analysis, and recommender system. We collect data from online paper repositories and research social network sites. We evaluate our approach by conducting user studies and experiments.

4 - Semi-supervised Article Selection for Medical Systematic Reviews

Jun Liu, Assistant Professor, Dakota State University, 422 SW 8th Street, Apt. 16, Madison, SD, 57042, United States of America, jun.liu@dsu.edu, Prem Timsina, Omar El-gayar

We developed a semi-supervised learning based classifier to identify articles that can be included in of medical systematic reviews. Through an empirical study, we demonstrated that semi-supervised approach is a viable technique for selecting articles for systematic reviews when only a few number of training samples are available, and a combination of semi-supervised and active learning can further optimize the article selection process.

Business Analytics and Innovation

Sponsor: Information Systems

Sponsored Session

Chair: Yan Huang, Assistant Professor, Stephen M. Ross School of Business, University of Michigan, 701 Tappan St. R5322, Ann Arbor, MI, 48109, United States of America, yphuang@umich.edu

1 - Who Hath the Crystal Ball? Antecedents of Advanced Analytics Adoption in Firms

Ajit Sharma, Ross School of Business, 701 Tappan Street, Ann Arbor, MI, United States of America, asharmaz@umich.edu, Mayuram Krishnan, Yan Huang

It is increasingly evident that the ability to gain forward-looking insight from advanced analytics will differentiate the winners from the losers. However, it is not clear what differentiates firms that are able to leverage these new technologies from those that do not. In this paper we attempt to answer this question by empirically investigating the antecedents of predictive analytics usage within firms. We present our findings and discuss managerial implications.

2 - Gain from Loss: Crowdsourcing Contests Bring Favorable Superstar Effect

Shunyuan Zhang, Tepper School of Business, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, shunyuanz@andrew.cmu.edu, Param Vir Singh, Anindya Ghose

We report favorable superstar effect, which contradicts with adverse superstar effect in Economic literature, and argue the unique crowdsourcing setting is the cause. Competing with superstars decreases one's chance of winning but leads to an improved performance in the next competition. Contestants are self-selected to solve the trade-off problem. Our work suggests a promising crowdsourcing practice that generates spill-over effects and identifies participants who are more capable of learning.

3 - Learning from the Offline Trace: A Case Study of the Taxi Industry

Yingjie Zhang, Carnegie Mellon University, 5000 Forbes Avenue,
Pittsburgh, PA, 15213, United States of America,
yingjie2@andrew.cmu.edu, Ramayya Krishnan,
Siyuan Liu, Beibei Li

The growth of mobile and sensor technologies leads to the digitization of individual's offline behavior. We instantiate our research by analyzing the digitized taxi tails to study the impact of different type and scale of information on driver behavior. We propose a Bayesian learning model and validate it on a unique data set containing complete information on 10.6M trip records from 11,196 taxis in a large Asian city in 2009. We find strong heterogeneity in individual learning behavior.

Biotechnology and Bioinformatics

Contributed Session

Chair: Kan Wang, Georgia Institute of Technology, 813 Ferst Drive NW,
Atlanta, GA, 30332, United States of America, kan.wang@gatech.edu

1 - Convex: De Novo Transcriptome Error Correction by Convexification

Meisam Razaviyayn, Stanford University, Packard Building,
Palo Alto, CA, 94305, United States of America,
meisamr@stanford.edu, David Tse, Elizabeth Tseng

De novo RNA sequencing with long reads requires accurate denoising as the first step. Unlike the initial combinatorial formulation, we propose an iterative convex reformulation which leads to a parallel algorithm for joint error correction and abundance estimation. The numerical experiments on the heart tissue PacBio samples show that, in addition to computational gain, the proposed algorithm results in 10% improvement in the number of denoised reads as compared to the existing software TOFU.

2 - Collection and Distribution of Cord Blood (CB) and Stem Cells (SC) by EU Blood Banks

Katrina Nordstrom, Professor, Aalto University School of
Chemical Technology, Department of Biotechnology, Kemistintie
1A, Espoo, 02150, Finland, katrina.nordstrom@aalto.fi,
Ari Vepsäläinen

Novel biomedical therapies call for expanding involvement of blood banks in collection, storage and distribution of cells. This study examines operations involving UB and SC in several EU countries. Wide variations are evident with major differences in amounts of cells collected and discarded. Most efficient operators are identified by minimized unnecessary collections.

3 - An Extended Formulation of the Convex Recoloring Problem on a Tree

Sangho Shim, Northwestern University, 2001 Sheridan Road
Suite 548, Kellogg School of Management, Evanston, IL, 60208,
United States of America, shim@kellogg.northwestern.edu,
Kangbok Lee, Minseok Ryu, Sunil Chopra

We introduce a strong extended formulation of the convex recoloring problem on a tree, which has an application in analyzing a phylogenetic tree. The extended formulation has only polynomial number of constraints, but dominates the conventional formulation and the exponentially many valid inequalities which are previously known. The extended formulation solves the problem instances from TreeBASE.org at the root node of the branch-and-bound tree without branching.

4 - Dual-material 3d Printed Metamaterials with Tunable Mechanical Property for Patient-Specific Phantom

Kan Wang, Georgia Institute of Technology, 813 Ferst Drive NW,
Atlanta, GA, 30332, United States of America,
kan.wang@gatech.edu, Mani Vannan, Changsheng Wu,
Zhen Qian, Chuck Zhang, Ben Wang

Patient-specific phantoms have a wide range of biomedical applications. Current 3D printed phantoms can only mimic Mechanical properties of soft tissues at small strain situations. This study investigated the feasibility of mimicking the strain-stiffening behavior of soft tissues using dual-material 3D printed metamaterials. Both FEA and tensile experiments indicated that those dual-material designs were able to exhibit strain-stiffening effects. Property tuning was also demonstrated.

Sponsored Session

Chair: Banu Lokman, Assistant Professor, Middle East Technical
University, Department of Industrial Engineering, Cankaya, Ankara,
06800, Turkey, lbanu@metu.edu.tr

1 - A Line Rebalancing Problem with Disruption Cost and Production Rate Criteria

Ece Sanci, Research Assistant, Middle East Technical University
(1100004144), ODTU Endustri Muhendisligi 325, Ankara, 06800,
Turkey, esanci@metu.edu.tr, Meral Azizoglu

In this study, we consider a line rebalancing problem with two objectives. We assume that there is an initial set of assignments and a disruption on one or more workstations that could alter the initial assignments. Our stability objective is to minimize the disruption cost which is defined as the weighted distance between the original and new workstations. Our efficiency objective is to maximize the production rate. We develop some exact and heuristic procedures and report on the results.

2 - Optimizing a Linear Function over the Nondominated Set of Multi-objective Optimization Problems

Banu Lokman, Assistant Professor, Middle East Technical
University, Department of Industrial Engineering, Cankaya,
Ankara, 06800, Turkey, lbanu@metu.edu.tr

We present an algorithm to optimize a linear function over the nondominated set of multi-objective optimization problems. The algorithm iteratively generates nondominated points and converges to the optimal solution. We also develop a variation of this algorithm to approximate the optimal point with a desired level of accuracy. We conduct experiments on multi-objective combinatorial optimization problems and show that the algorithm works well.

3 - Representative Nondominated Sets in Multi-objective Integer Programs

Gokhan Ceyhan, Middle East Technical University,
Department of Industrial Engineering, Ankara, 06800, Turkey,
gceyhan@metu.edu.tr, Banu Lokman, Murat Koksalan

We develop an algorithm to generate a representative nondominated set for multi-objective integer programs. We define a density based representation measure that evaluates the representativeness of a nondominated set considering the estimated regional densities of the nondominated frontier. We also develop a web application that is available to researchers to generate all or a representative subset of nondominated points.

4 - Iterative Method for Finding Pareto-dominant Shift Schedules for a Pediatric Emergency Department

Young-chae Hong, University of Michigan, 1205 Beal Avenue,
Ann Arbor, MI, 48109, United States of America,
hongyc@umich.edu, Amy Cohn

Building resident shift schedules for the U-M Pediatric Emergency Department is a multi-objective combinatorial problem. Chiefs cannot provide a single objective function or weights to trade off metrics of patient safety, educational training requirements, and resident satisfaction. We have developed an algorithm for generating Pareto-dominant schedules to reduce the solution space for Chief Residents to review and to help elicit their preferences.

Combinatorial Auctions

Cluster: Auctions

Invited Session

Chair: Richard Steinberg, Chair In Operations Research, London School
of Economics, Department of Management, NAB 3.08, Houghton
Street, London, WC2A 2AE, United Kingdom, r.steinberg@lse.ac.uk

1 - The Performance of Deferred-acceptance Auctions

Vasilis Gkatzelis, Stanford University, 474 Gates Building,
353 Serra Mall, Stanford, CA, 94305, United States of America,
gkatz@cs.stanford.edu, Paul Duetting, Tim Roughgarden

Milgrom and Segal recently introduced deferred-acceptance auctions and proved that they satisfy a remarkable list of incentive guarantees. We study these auctions through the lens of two canonical welfare-maximization problems. For knapsack auctions, we show a strong separation between deferred-acceptance mechanisms and arbitrary strategyproof mechanisms. For single-minded combinatorial auctions, we design novel deferred-acceptance mechanisms with near-optimal approximation guarantees.

2 - Inapproximability of Truthful Mechanisms via Generalizations of the VC Dimension

Gal Shahaf, PhD Candidate, Hebrew University, Nataf 63, Nataf, 9080400, Israel, gal.shahaf@mail.huji.ac.il, Amit Daniely, Michael Schapira

Algorithmic mechanism design (AMD) studies the delicate interplay between computational efficiency, truthfulness, and optimality. We focus on AMD's paradigmatic problem: combinatorial auctions, and present new inapproximability results for truthful mechanisms in this scenario. Our main technique is a generalization of the classical VC dimension and the corresponding Sauer-Shelah Lemma. Joint work with Amit Daniely and Michael Schapira

3 - Efficient Procurement Auctions with Increasing Returns

Lawrence Ausubel, Professor of Economics, University of Maryland, Department of Economics, College Park, MD, 20742-7211, United States of America, ausubel@econ.umd.edu, Christina Aperjis, Oleg Baranov, Thayer Morrill

For procuring from sellers with decreasing returns (or selling to buyers with diminishing marginal values), there are known efficient dynamic auction formats. In this paper, we report progress in designing an efficient dynamic procurement auction for the case where bidders have increasing returns. The auctioneer names a price, and bidders report the minimum and maximum quantities that they would sell at that price. The process repeats with lower prices, until the efficient outcome is discovered.

4 - Competing Combinatorial Auctions

Marion Ott, RWTH Aachen University, Templergraben 64, Aachen, 52062, Germany, marion.ott@rwth-aachen.de, Thomas Kittsteiner, Richard Steinberg

What is the benefit of an auction format that allows for package bids for a seller who wants to sell a set of distinct items? We show that the answer depends on whether a seller faces competition from another seller. For a simple, tractable model we give conditions under which a seller with the choice between VCG mechanisms with or without package bidding prefers to disallow package bidding if another seller with the same options is present.

1 - Identifying Shortfalls in Library Holdings through Analysis of References in Faculty Publications

Ziyi Kang, University of Pittsburgh, 1048 Benedum Hall, Department of Industrial Engineering, Pittsburgh, PA, 15261, United States of America, zik3@pitt.edu, Shi Tang, Louis Luangkesorn, Fan Zhang, Yunjie Zhang, Berenika Webster

University libraries measure their contribution to research in part through providing reference material cited by faculty in their publications. One difficulty is that article references are often abbreviated in non-standard ways. To compare references with library holdings we apply text processing methods such as normalization, string distances, and word splitting to determine if a reference is held by the library. We apply this to one subject area and validate the accuracy of the method.

2 - Assessing the Effects of Cross-Season Fairness Scheme on the Competitive Balance of NFL Schedules

Niraj Pandey, University at Buffalo, 342 Bell Hall, North Campus, Buffalo, NY, 14260, United States of America, npandey@buffalo.edu, Murat Kurt, Mark Karwan, Kyle Cunningham

The National Football League (NFL) is the highest revenue generating sports league in the world. Although the league's scheduling routine has evolved over the years to ensure fairness, recent schedules exhibit significant imbalances in several dimensions, particularly in teams' rest durations between games. We develop a two-phase MILP approach to create fairer schedules and evaluate the price of the league's practice of rotating venues of the games on a multi-year basis on their competitiveness.

1 - Overview of "The Richard E. Rosenthal Early Career Connection Program"

Aurelie Thiele, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, aut204@lehigh.edu

This short talk will provide an overview of the Richard E. Rosenthal Early Career Connecting Program, held in conjunction with the yearly Analytics conference in the spring. It will focus on the 2015 edition of the program, co-organized by Michelle Opp of SAS and myself.

2 - A Protein Scoring Function using Support Vector Machine

Shokoufeh Mirzaei, Cal Poly Pomona, 3801 West Temple Avenue, Pomona, CA, 91768, United States of America, smirzaei@cpp.edu, Silvia Crivelli

In this paper a knowledge-based scoring function for quality assessment of protein decoy models is developed. To this end, a benchmark data set from CASP 8, 9 and 10 is used. The dataset includes measurements of proteins structural features that are seemingly having significant impacts on the quality of predicted structures.

3 - Biologically-guided Radiotherapy Treatment Plan Optimization

Ehsan Salari, Wichita State University, 1845 Fairmount St, Wichita, KS, Ehsan.Salari@wichita.edu

Radiotherapy treatments are delivered in daily fractions over the course of one to several weeks. There is clinical evidence suggesting that patients with specific tumor sites may benefit from delivering larger radiation doses in fewer fractions. However, current treatment regimens use a fixed radiotherapy plan in all fractions. This research aims at developing a spatiotemporal planning approach that allows to investigate the potential benefit of temporal variation in the plan across fractions.

1 - Learning Tailored Risk Scores from Large Scale Datasets

Berk Ustun, PhD Candidate, MIT, 20 Highland Avenue Apt. 2, Cambridge, MA, 02139, United States of America, ustunb@mit.edu, Cynthia Rudin

Risk scores are simple models that let user assess risk by adding, subtracting and multiplying a few small numbers. These models are widely used in medicine and crime prediction but difficult to learn from data because they need to be accurate, sparse, and use integer coefficients. We formulate the risk score problem as a MINLP, and present a cutting-plane algorithm to solve it for datasets with large sample sizes. We use our approach to create tailored risk scores for recidivism prediction.

2 - A Multi-objective Approach to Visualize Proportions and a Binary Relation by Rectangular Maps

Dolores Romero Morales, Copenhagen Business School, Porcelaenshaven 16 A, Frederiksberg, DK-2000, Denmark, drm.eco@cbs.dk, Emilio Carrizosa, Vanesa Guerrero

We address the problem of representing individuals, to which there are proportions attached and a binary relationship, by means of a rectangular map, i.e., a subdivision of a rectangle into rectangular portions, so that each portion is associated with one individual, the areas of the portions reflect the proportions, and portions adjacencies reflect adjacencies in the binary relationship. We formulate this as a three-objective Mixed Integer Nonlinear Problem and numerical results are presented.

3 - Balanced Tree Partitioning with Compact Mathematical Programming Formulations

Onur Seref, Virginia Tech, 2060 Pamplin Hall (0235), Blacksburg, VA, 24061, United States of America, seref@vt.edu, J. Paul Brooks

In this paper, we study mathematical programming formulations for the balanced subtree partitioning problem, some variations of which are known to be NP-complete. We introduce compact exact mixed integer programming formulations for different variations of the problem. We explore the effect of different sets of constraints on our formulations and provide comparative computational results among our formulations as well as other exact formulations and approximation algorithms.

1 - Nonlinear Dimensionality Reduction for Analysis of Electroencephalography Records

Anton Kocheturov, Research Assistant, Department of Industrial and Systems Engineering, University of Florida, 303 Weil Hall, Gainesville, FL, 32611-6595, United States of America, antrubler@gmail.com

We suggest using nonlinear dimensionality reduction technique called the Local Linear Embedding for analysis of EEG records. This approach enabled us to distinguish between different states of the brain in a more efficient way comparing to the existing machine learning techniques since it is faster and doesn't require training of the algorithm. We also detected evidence for local linearity of the brain in the resting state and introduced a new model of the brain based on it.

2 - The Gap Statistics for Determining the Number of Linear Autoregressive Modes in a Multimode Model

Vahid Tarokh, Professor, Harvard University, 33 Oxford Street, MD347, Cambridge, MA, 02138, United States of America, vahid@seas.harvard.edu, Jie Ding, Mohammad Noshad

We consider modeling of non-stationary stochastic-processes using a multi-mode linear autoregressive (AR) model. Each process is modeled as a mixture of unknown AR components (modes) with an unknown number of modes. We are interested in online determination of the number of modes, and also in identification of each mode. A new model selection approach based on GAP statistics for this purpose is introduced with applications in modeling and prediction of financial and biological data, etc.

3 - Online Machine Learning Framework for Detecting EEG Abnormalities

Sina Khanmohammadi, SUNY Binghamton, 4400 Vestal Parkway East, Binghamton, NY, 13902, United States of America, skhanmo1@binghamton.edu, Chou-An Chou

Electroencephalogram (EEG) signals provide insight about human brain function. EEG signal abnormalities can be a sign of mental disorders such as depression, epilepsy, etc. Hence, detecting EEG abnormalities can be beneficial for diagnosis, prognosis, and overall improvement of patient's quality of life. In this work, we present a new online classification framework to detect EEG signal abnormalities in real time. The proposed framework is validated using public EEG datasets.

1 - Multi-Criteria, Multi-Place, Multi-Time: Evaluating System Strategies with the Rethink Health Model

Jack Homer, Owner, Homer Consulting, 72 Station Hill Rd., Barrytown, NY, 12507, United States of America, jhomer609@gmail.com, Gary Hirsch, Bobby Milstein

The ReThink Health Dynamics Model simulates many possible interventions to improve a local health system by lowering costs and deaths and boosting equity and productivity through 2040. It has been carefully calibrated to represent several localities across the U.S. A multi-criteria weighting scheme reflecting local values helps to select a single "best" intervention strategy. The best strategy may also depend upon a locality's room for improvement with regard to health care and health risks.

2 - Systems Models of Post-traumatic Stress Disorder

Navid Ghaffarzadegan, Professor, Virginia Tech, 231 Durham Hall, 1185 Perry Street, Blacksburg, VA, 24060, United States of America, navidg@vt.edu, Richard Larson

Little agreement exists about effective methods of screening for PTSD, optimal cutoff values, and even the number of PTSD patients. In a series of modeling efforts, we uncover five vicious cycles that inhibit PTSD treatment, and investigate characteristics of an optimal cutoff value for screening. We then show a population level model of PTSD patients in a military/post-military system. The models represent different levels of complexities of PTSD at individual and societal levels.

3 - Patient Flows in Mental Health Clinics

Anne Claire Collin, Graduate Student, MIT, 235 Albany Street, Ashdown House #5052, Cambridge, MA, 02139, United States of America, acollin@mit.edu

There are different factors that can hinder access and quality of care for veterans in a mental health clinic, many of which are not related to the treatment itself. The purpose of this research is to analyse the flows of patients in Veterans Affairs' Mental Health clinics in order to improve access. After a thorough work of understanding patients' conditions and paths through the different services, simulation is used to find a configuration which improves wait times.

4 - Cost Escalation in Health Systems Dominated by Private Health Insurance

Nisa Onsel, Research Assistant, Bogazici University, Bogazici University, Industrial Engineering Dept, Bebek, Istanbul, 34342, Turkey, nisa.guler@boun.edu.tr, Yaman Barlas, Güneş Yöcel

Adverse selection and moral hazard are effective in individuals' health insurance plan choice and healthcare service utilization. The inefficient behaviors have a potential impact on increasing insurance premiums. In the existence of increasing healthcare costs due to advanced health technologies, cost escalation in health systems is a complex problem. A system dynamics model is constructed and analyzed for understanding financial sustainability of health systems dominated by private insurance.

Health-care Decision Making

Sponsor: Health Applications

Sponsored Session

Chair: Ebru Bish, Associate Professor, Virginia Tech, Dept of Industrial and Systems Eng, 250 Durham Hall, Blacksburg, VA, 24061-0118, United States of America, ebru@vt.edu

1 - The Management of Mass Casualty Incident Response

Behrooz Kamali, PhD Candidate, Virginia Tech, 250 Durham Hall (MC 0118), Blacksburg, VA, 24061, United States of America, kamali@vt.edu, Douglas Bish

In this research we seek to systematically investigate triage and transport of casualties in the aftermath of a mass-casualty incident. We study the structure of the optimal policies using novel models that incorporate available resources, quantity, and mix of casualties. Insights gained allow us to derive special cases that can be solved to optimality with simple heuristics. We compare results from our models to that of other models in the literature and the current practices.

2 - A Study on the Spatial Spread and Optimal Control of the 2014-2015 Ebola Outbreak in West Africa

Esra Buyuktahtakin, Assistant Professor, Wichita State University, 1845 N Fairmount, Wichita, KS, 67260, Wichita, United States of America, Esra.Buyuktahtakin@wichita.edu, Eyyub Kibis, Emmanuel Des-bordes

We develop an optimization approach to capture the disease dynamics of the deadly Ebola virus. We illustrate our model on a case study from Guinea, Liberia, and Sierra Leone. Numerical results demonstrate the accuracy of our predictions and suggest that the model can be used as a decision-making tool to optimally allocate resources for epidemic prevention and control.

3 - Multi-Server Queues with Impatient Customers as Level-Dependent QBDs with Applications in Healthcare

Amir Rastpour, University of Alberta, Alberta School of Business, PhD office, Edmonton, AB, T6G 2R6, Canada, amir.rastpour@ualberta.ca, Burhaneddin Sandikci, Armann Ingolfsson

We investigate the use of level-dependent quasi-birth-death (QBD) processes to analyze priority queues with impatient customers, such as emergency departments where patients are triaged into priority classes and some patients leave without being seen. We report numerical results and discuss algorithm performance (accuracy and speed).

4 - Optimal Cut-off Points for RNA-based Testing to Minimize the Transfusion-transmitted Infection Risk

Hrayr Aprahamian, PhD Student, Virginia Tech, Dept of ISE, Blacksburg, VA, 24061-0118, United States of America, ahrayer@vt.edu, Ebru Bish, Douglas Bish

The safety of blood products, in terms of being free of infectious agents (e.g., human immunodeficiency virus, hepatitis viruses), is essential. We develop a novel mathematical model to determine the optimal cut-off points for RNA-based individual and pooled screening tests, considering all recognized and emerging infections that can be transmitted through the use of blood products. Using real data, we show that our model improves upon current practices.

Chair: Nilay Argon, University of North Carolina, Department of Statistics and Operations, Chapel Hill, NC, 27599, United States of America, nilay@unc.edu

Co-Chair: Serhan Ziya, Associate Professor, UNC Department of Statistics & Operations Research, 356 Hanes Hall, CB#3260, Chapel Hill, NC, 27599 - 32, United States of America, ziya@unc.edu

1 - Scale and Skill Mix Efficiencies in Nursing Home Staffing

Ger Koole, VU University Amsterdam, De Boelelaan 1081a, Amsterdam, Netherlands, ger.koole@vu.nl, Dennis Moeke, Lineke Verkooijen

Care workers account for a significant proportion of the total health expenditure in nursing homes and are by far the largest controllable resource. Therefore determining the appropriate number and type of care workers required plays an important role in the search for more efficiency. This study provides insights in how and why scale of scheduling and blending tasks of different qualification levels effect the number and type of staff required to meet the preferences of nursing home residents.

2 - Myopic Scheduling of Jobs with Decaying Value with Applications in Patient Scheduling

Neal Master, Stanford University, 350 Serra Mall, Stanford, CA, 94305, United States of America, nmaster@stanford.edu, Carri Chan, Nicholas Bambos

In healthcare settings, delays in receiving treatment can result in worse outcomes for patients. We introduce a clearing model in which the reward generated by completing service for an individual job decays over time. Because computing an optimal policy for such a model is computationally intractable, we focus on a number of myopic heuristics. We provide performance guarantees for each heuristic and use simulation to gain further insight into patient scheduling problems.

3 - Wait Time Announcements at Hospital Emergency Departments

Zhankun Sun, Haskayne school of business, University of Calgary, 2500 University Drive NW, Calgary, AB, Canada, zhankun.sun@haskayne.ucalgary.ca, Marco Bijvank

We study a multiclass multiserver priority queue with delayed feedback to predict the wait time for low-priority patients to be seen by a physician for the first time after triage in ED. We model the patients reassess process and develop a procedure to predict the state-dependent wait time based on an busy-period analysis. With a case study at the four major hospitals in the Calgary area we illustrate the performance of our wait time predictions.

4 - Evaluating Different Policies: A Real Life Operating Room Scheduling Problem

Elvin Coban, Ozyegin University, Cekmekoy, Istanbul, Turkey, elvin.coban@ozyegin.edu.tr, Gulsah Alper

We study a real life operating room scheduling problem using a dataset from a leading hospital in Turkey. We solve the daily and weekly scheduling problems by a mixed integer linear programming model. Various objective functions and performance metrics are analyzed including minimizing the waiting time of patients while maximizing fairness. We examine surgery delays and incorporate possible delays in surgery durations. We also propose a method to compute robust operating room schedules.

Humanitarian Applications I

Sponsor: Public Sector OR

Sponsored Session

Chair: Burcu Balcik, Ozyegin University, Nisantepi Mah. Orman Sok. Cekmekoy, Istanbul, Turkey, burcu.balcik@ozyegin.edu.tr

1 - The Needs Assessment Routing Problem in Humanitarian Relief

Burcu Balcik, Ozyegin University, Nisantepi Mah. Orman Sok. Cekmekoy, Istanbul, Turkey, burcu.balcik@ozyegin.edu.tr

In the immediate aftermath of a disaster, it is important for relief agencies to develop accurate estimates about the effects of the disaster in the affected region. Since assessments must be completed quickly, it may not be possible to visit each site in the affected region to collect information. We present mathematical models and solution approaches to support site selection and routing decisions of the rapid needs assessment teams. We present a case study to illustrate our approach.

2 - Effective Response to Disable and Elderly Populations in Short-notice Disasters

Jacqueline Griffin, Assistant Professor, Northeastern University, 334 Snell Engineering Center, 360 Huntington Ave, Boston, MA, 02125, United States of America, ja.griffin@neu.edu, Rana Azghandi

We develop a mixed integer programming model to simultaneously account for the different protection strategies for the elderly and disabled population in short-notice disasters. The modeling poses a split-delivery vehicle routing problem with time windows and multiple uses of heterogeneous vehicles. We examine the effect of multiple objectives for this disaster response application. Moreover, the value of cooperation among neighboring jurisdictions as compared with greedy policies is examined.

3 - A Dynamic Model for Disaster Response Considering Prioritized Demand Points

Gina Galindo, Dr., Universidad del Norte, Km 5 Antigua Via a Puerto Colombia, Barranquilla, Colombia, ggalindo@uninorte.edu.co, Daniel Rivera

This research addresses the problem of distributing relief supplies after the occurrence of a natural disaster. We develop a dynamic model to define an action plan to serve demand, while prioritizing the response according to the level of urgency of demand points. Our model considers capacity constraints and dynamic priorities. To evaluate its applicability, we use a case study of a flood occurred in Colombia. We also test the solvability of our model for large instances of our problem.

4 - The Role of Media Exposure on Humanitarian Donation and Coordination

Mahyar Eftekhari, Arizona State University, P.O. Box 874706, Tempe, AZ, 85287, United States of America, eftekhari@asu.edu, Luk Van Wassenhove, Hongmin Li, Scott Webster

Despite their resource and financial limitations and despite the considerable level of demand uncertainty they face, Humanitarian Organizations (HOs) do not typically share resources. Considering the impact of media exposure, our study unveils the conditions in which humanitarians will coordinate. This paper contains both empirical and analytical modeling.

Health Care Modeling and Optimization I

Contributed Session

Chair: Michal Jakubczyk, Warsaw School of Economics, Al. Niepodleglosci 162, Warsaw, 02-554, Poland, michal.jakubczyk@sgh.waw.pl

1 - The Optimal Timing of Medical Tests

Thomas Weber, Associate Professor, EPFL, CDM-ODY 3.01, Station 5, Lausanne, VD, 1015, Switzerland, thomas.weber@epfl.ch

This paper considers the optimal timing of tests based on a known law of motion for the statistical evolution of a random population prevalence. In a Bayesian setting, we find for a given imperfect binary disease diagnostic and action thresholds the optimal time to test and retest a potentially ill individual, conditional on past test outcomes. The framework allows for complex disease dynamics, including multiple populations, contagion, and stochastic lifetimes.

2 - A Fuzzy Approach to Modeling the Willingness-to-Pay for Health and Supporting Decision Making

Michal Jakubczyk, Warsaw School of Economics, Al. Niepodleglosci 162, Warsaw, 02-554, Poland, michal.jakubczyk@sgh.waw.pl

Choosing between health technologies involves multiple criteria (e.g., effects & cost), uncertainty, and often multiple alternatives. I advocate that, due to peculiarity of health, fuzziness additionally needs to be introduced to model the willingness-to-pay/accept (WTP/WTa). I show how to do that by redefining notions typically used in health technology assessment. Properties of new approach are discussed. Accounting for fuzziness additionally explains the WTP-WTA disparity in this context.

3 - Emergency Department Length-of-stay Estimation using Time-variant Predictors

Seung Yup Lee, Graduate Research Assistant, Wayne State University, 4815 4th St., Detroit, MI, 48202, United States of America, seung.lee@wayne.edu, Ratna Babu Chinnam, Alper Murat, Evrim Dalkiran

The accurate length-of-stay (LOS) estimation for patients in emergency departments (ED) is a pre-requisite for quality resource coordination between ED and inpatient wards. We investigate how time-variant levels of crowding in ED can be captured and incorporated in LOS estimation models by using vector autoregression (VAR). We will also report results and insights from testing the models on data from VA Medical Centers.

4 - An Integrated Framework to Model the Trajectories of Chronic Conditions

Adel Alaeddini, University of Texas at San Antonio (UTSA), One UTSA Circle, San Antonio, United States of America, adel.alaeddini@utsa.edu

Any medical condition that requires long term monitoring and management to control symptoms and shape the course of the disease is known as chronic conditions. Nearly 45% of the general population has 1 chronic condition or more. This accounts for more than 75% percent of health care expenditures. We present an integrated probabilistic framework for modeling the trajectories of chronic conditions. The proposed methodology will be validated using a large dataset from a medical center in Texas.

Big Data I

Contributed Session

Chair: Ellick Chan, Exponent, 149 Commonwealth Dr., Menlo Park, CA, 94025, United States of America, echan@exponent.com

1 - A Structural Service Model for Describing and Designing Services with Data

Chie-Hyeon Lim, Post-doc, POSTECH, Engineering Building #4-316, Pohang, 790-784, Korea, Republic of, arachon@postech.ac.kr, Min-Jun Kim, Kwang-jae Kim, Paul Maglio

Using big data effectively in service design requires having a model that describes the service in question along with the data in use. In this talk, we propose a generic structural service model to describe a service with a set of predefined variables, facilitating design of services that use big data. The variables include service objective, indicators, customer and context variables, and delivery contents. We discuss the model in the context of several case studies of service design.

2 - Increasing Productivity and Minimizing Errors in Spreadsheet Analytics

Larry LeBlanc, Professor, Owen Graduate School of Management, Vanderbilt University, 401 21st Avenue South, Nashville, TN, 37203, United States of America, larry.leblanc@owen.vanderbilt.edu, Thomas Grossman, Michael Bartolacci

Spreadsheets have proliferated for business analytics, and spreadsheet errors can result in poor supply chain, manufacturing, or investment decisions, including the failure to identify good opportunities. We examine potential problem areas for spreadsheet design and suggest alternative design approaches that seek to increase productivity and reduce the likelihood of errors. Even careful analysts might send their spreadsheet to assistants for updating, and s/he might need these guidelines

3 - A Practical Big Data Precision Marketing – Cross-Selling Mobile Bank to Internet Bank

Jian Xu, IBM, Diamond Bld, ZGC Software Park, Beijing, China, xujianx@cn.ibm.com, Ming Xie, Yuhang Liu, Zhen Huang, Tianzhi Zhao, Yuhui Fu

The bank wants improve mobile bank users and transform customers from online bank channel to mobile bank. Mobile bank represents the future E-channel. Large amount of data is integrated and analyzed on E-channel users' behavior. The users' online behaviors are also considered. We build the cross-selling model to identify the potential customers who are more likely to become mobile bank users, and improve the marketing success rate significantly.

4 - Forecasting Unemployment Rate by using Ensemble Hybrid Ann- Bayesian Model Combination

Farzad Radmehr, West Virginia University, 900 Willowdale Road, Morgantown, WV, United States of America, fradmehr@mix.wvu.edu

The goal of this paper is to predict the future data by using ensemble Bayesian model. Our dataset is UK unemployment rate from Floros C. paper in 2005 (Floros, 2005). In this paper, the Bayesian Ensemble Model Combination (BMC) will be proposed. For this purpose, we run ANN multiple times and these results will be the initial values for BMC. Then by giving the weight to each value, we predict the new value. The goal is to compare the values in BMC and ANN.

5 - Deep Learning Approaches to Digging Data Out of Digitized Paper Documents

Ellick Chan, Exponent, 149 Commonwealth Dr., Menlo Park, CA, 94025, United States of America, echan@exponent.com, Glen Depalma

Many organizations scan paper documents for fast search, however, existing search approaches generally require carefully crafted search terms to find documents. In this talk, we discuss deep learning approaches for OCR and search. We use computer vision to improve OCR accuracy and apply deep learning using Google's Word2Vec natural language processing (NLP) to identify topics of interest automatically. We've processed more than 300 boxes of documents with our techniques.

Game Theoretic Models in Operations and Marketing Interface

Cluster: Operations/Marketing Interface

Invited Session

Chair: Tao Li, Santa Clara University, 500 El Camino Real, Santa Clara, CA, 95053, United States of America, tli1@scu.edu

1 - Online Manufacturer Referral to Heterogeneous Retailers

Gangshu Cai, Santa Clara University, OMIS Department, Lucas Hall 216N, Santa Clara, CA, 95053, United States of America, gcai@scu.edu, Hao Wu, Chwen Sheu, Jian Chen

Since the development of the Internet, thousands of manufacturers have been referring consumers visiting their websites to some or all of their retailers. Through a model with one manufacturer and two heterogeneous retailers, we investigate whether it is an equilibrium for the manufacturer to refer consumers exclusively to a retailer or nonexclusively to both retailers.

2 - Strategic Risk Management in Spot Market for Supply Chains under Competition

Xuan Zhao, Associate Professor, Wilfrid Laurier University, 75 University Avenue West, Waterloo, ON, Waterloo, Canada, xzhao@wlu.ca, Shanshan Ma, Wei Xing

This paper studies two risk management strategies related to spot market to mitigate firms' exposure to demand uncertainty, namely, operational hedging and financial hedging. We provide insights on the dynamics of each hedging strategy under competition.

3 - Overconfident Competing Newsvendors

Meng Li, University of Illinois, Wohlers Hall, 1206 S Sixth St.,
Champaign, IL, 61820, United States of America,
mengli@illinois.edu, Jun Zhang, Nicholas Petruzzi

In this paper, we study the effects and implications of overconfidence in a competitive newsvendor setting. This bias unequivocally leads to a lower expected profit for a newsvendor that does not compete on inventory availability. Nevertheless, it can be a positive force for competing newsvendors. In a similar vein, we also show that the more biased of two competing newsvendors is not necessarily destined to a smaller expected profit than its less biased competitor.

4 - Transshipment in a Supply Chain with Competing Retailers

Tao Li, Santa Clara University, 500 El Camino Real, Santa Clara,
CA, 95053, United States of America, tli1@scu.edu, Meng Li

We study a supply chain with one manufacturer and two retailers who transship inventory between each other. We show the manufacturer's profit increases in customer search probability. We study the effect of bargaining power over the transshipment decision. We show the manufacturer always prefers to control the transshipment price rather than to control whether to transship, while the retailer can prefer both. We find bargaining power always benefits the manufacturer but could hurt the retailer.

40- Room 101, CC

Organization Theory I

Contributed Session

Chair: Robert Ryan, Doctoral Candidate, University of Pittsburgh, 6 Hillstream Rd, Newark, DE, 19711, United States of America, ryanrc111@gmail.com

1 - On Dynamics of Mirroring Hypothesis: How Product's Architecture Influences Social Network of Developers

Mahdi Ebrahim, PhD Candidate, Bocconi University, Via Rontgen
1, Milan, MI, 20138, Italy, mahdi.ebrahim@phd.unibocconi.it

Organization literature implies that product architecture and organizational structure mirror each other. Recent studies, though, show cases of mismatch between the two. Adverse effect of mismatch on product is well documented. Yet, its drivers are still unclear. We hypothesize that design elements with different complexity levels cause various forms of mismatch, the most harmful of which caused by Core elements. A dataset of elements' dependencies & developers' communications used to test hypotheses.

2 - Behavioral Motivation for Diversification: A Linkage Between Aspiration and Environment

Christine Choi, Seoul National University, 1 Gwanak-ro,
Gwanak-gu, Seoul, Korea, Republic of, kiky1001@snu.ac.kr,
Taewoo Roh

We explore how performance relative to aspiration level influences firms' choice of diversification strategy contingent upon task environment. Using sample of U.S. manufacturing firms, we propose that motivation to pursue specific diversification strategy is simultaneously affected by individual performance feedback condition and environmental dimensions. The study contributes both to the behavioral theory and diversification literatures by identifying antecedents for diversification strategy.

3 - Balancing of Exploration and Exploitation: from Punctuated Equilibrium to Dynamic Ambidexterity

Julio Pertuze, Assistant Professor, Pontificia Universidad Catolica de Chile, Av. Vicuña Mackenna 4860, Macul, Santiago, RM,
Chile, jpertuze@ing.puc.cl, Stephen X. Zhang

We clarify the process through which firms balance exploration, exploitation, and the origins of ambidexterity. Based on inductive case studies of academic startups, we found that firms initially balance exploration and exploitation sequentially and later develop ambidexterity. High-frequency switching between exploration and exploitation enhanced the fitness of routine assembly. We contribute to the understanding of the assembly of routines and to the nascent dynamic view on ambidexterity.

4 - Routines, Frictions, and Parenthetical "MAN": The Model of Managerial Rationality

Robert Ryan, Doctoral Candidate, University of Pittsburgh, 6 Hillstream Rd, Newark, DE, 19711, United States of America, ryanrc111@gmail.com, Barry Mitnick

The question of "what managers do" is an abandoned line of research, but shouldn't be. For studies of managed organizations, we still lack a model of how managerial actions and routines interact to create value for the firm. We address this gap. We call the logic of managerial actions, "managerial rationality" with three necessary conditions: "I break it" "I own it" "I fix it". This model includes four meta-cognitive action types: problematizing, objectivizing, planning, and committing.

Joint Session MSOM-Health/HAS/Analytics: Data-driven Modeling in Healthcare I

Sponsor: Manufacturing & Service Oper Mgmt/Healthcare Operations, HAS & Analytics

Sponsored Session

Chair: Nan Liu, Columbia University, 722 W. 168th. St., New York, United States of America, nl2320@columbia.edu

Co-Chair: Yichuan Ding, UBC, 2053 Main Mall, Sauder School of Business, Vancouver, BC, V6T1Z2, Canada, daniel.ding@sauder.ubc.ca

1 - Effective Mechanisms for Reducing Hospital Readmissions

Jon Stauffer, Indiana University, 1309 E. Tenth Street,
Bloomington, IN, 47405, United States of America,
stauffer@indiana.edu, Kurt Bretthauer, Jonathan Helm

In this work we consider the problem of optimal design and capacity allocation for monitoring and treatment mechanisms to reduce patient readmissions. Using actual data, we analyze how groups in the healthcare provider system (hospitals, physicians, post-discharge follow-up care) would adjust their approach to readmission reduction in terms of what monitoring approaches / interventions to employ and when to employ them.

2 - Admission Control in a Network of ICUS and PCU/IMC Units Based on Patient Mortality Risk

Amirhossein Meisami, PhD Student, University of Michigan,
1205 Beal Avenue, Ann Arbor, MI, 48109, United States of
America, meisami@umich.edu, Jivan Deglise-hawkinson,
Mark Cowen, Jennifer Czerwi, Mark Van Oyen

Traditional admission to ICU and step-down/intermediate care units emphasizes acuity and specific treatment needs for "mandatory" placement. This revised work optimizes the selective admission of highest risk "non-mandatory" patients to the higher care unit network. The MIP models the queuing network dynamics to avoid excessive blocking of mandatory patients.

3 - Mitigating the Effect of Schedule Dependent No-show

Zhenzhen Yan, National University of Singapore, NUS, Business
School 1 Business Lin, PhD Program Deans Office Biz2,
Singapore, 117592, Singapore, a0109727@u.nus.edu,
Qingxia Kong, Shan Li, Chung Piau Teo, Nan Liu

Based on empirical study of two sets of data from US and Chile, we observe patient's no show probability is related to the appointment schedule. We develop a conic programming approach to study the effect of schedule dependent no-show on the design of the optimal schedule, and its impact on the choice of overbooking strategy. Our method is able to overcome the deficiency of standard stochastic LP approach, which is not able to handle this problem.

4 - Managing Appointment-based Health Services under Patient Choices

Nan Liu, Columbia University, 722 W. 168th. St., New York, NY,
United States of America, nl2320@columbia.edu,
Peter Van De Ven, Bo Zhang

This talk provides a framework to critique two main scheduling paradigms currently used in the healthcare market: non-sequential (online) appointment scheduling and sequential (similar to over-the-phone) scheduling. We develop dynamic programming models and approximate algorithms to solve them. We show that a significant efficiency improvement can be achieved by carefully modeling the scheduling process and explicitly accounting for patient choice.

Joint Session HAS/MSOM-Health-Practice: Operations Management of Emergency Services I

Sponsor: Health Applications/MSOM

Sponsored Session

Chair: Maria Mayorga, Associate Professor, University of North Carolina, Dept. of Industrial & Systems Engineering, Campus Box 7906, Raleigh, NC, 27695-7906, United States of America, memayorg@ncsu.edu

1 - Two-stage Stochastic Programming to Redeploy and Dispatch Ambulances with Restricted Workload

Shakiba Enayati, Research Assistant- PhD Candidate, North Carolina state university, NC State University 373 Daniels Hall, Raleigh, NC, 27695-79, senayat@ncsu.edu, Osman Ozaltin, Maria Mayorga

EMS system is responsible to dispatch ambulances to arriving emergency calls. Redeployment strategy potentially improves the EMS performance as ambulances becoming busy erratically. This study proposes a stochastic approach comprising two steps. Each step is a two-stage stochastic programming in which the redeployment occurs only for idle ambulances in the first stage. Dispatching decisions are made in the second stage. Numerical results are provided based on simulation for a large real dataset.

2 - Assessing the Impact of Flexible use of Observations Units

Gabriel Zayas-Caban, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, gzayasca@umich.edu

We assess tradeoffs that result from flexible use of Observation Units (OUs). A potential solution to reduce delays to care is to relocate boarding patients to an OU, which offer an alternative to discharging or admitting ED patients by allowing doctors to observe patients for an extended time. This allows ED beds to become available, resulting in decreased times to first treatment for patients. However, this has the potential to block the OU for patients needing observation.

3 - Dynamic Ambulance Management: Theory and Practice

Rob Van Der Mei, CWI, Kruislaan 123, Netherlands, R.D.van.der.Mei@cwi.nl, Thijs Van Barneveld, Sandjai Bhulai, Martin van Buuren, Caroline Jagtenberg

Dynamic Ambulance Management (DAM) is a powerful means to reduce response times for ambulance services, and the use of DAM is rapidly gaining momentum. Over the past few years, we have developed a variety of DAM-algorithms, each with their pros and cons. Recently, we have started a real-life pilot to evaluate the different algorithms in practice. In this talk I will give an overview of the algorithms developed, and discuss the lessons learned from the DAM-pilot.

4 - Modeling Ambulance Dispatch Systems During Extreme Weather Events

Eric Dubois, PhD Student, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, edubois2@wisc.edu, Laura Mclay

Ambulance dispatch models traditionally focus on steady state systems operating under normal conditions. We develop a Markov decision process to model the system during extreme weather events where patient queueing and patient health deterioration is relevant. We determine that under certain situations with high ambulance utilization, average patient survival can be increased by withholding ambulances from less serious patients in the expectation of more emergent future calls.

Revenue Management and Learning I

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: He Wang, MIT, 77 Mass Ave, E40-149, Cambridge, MA, 02139, United States of America, wanghe@mit.edu

1 - Learning via External Sales Networks

Ankur Mani, NYU, 44 W 4th St, New York, NY, United States of America, amani@stern.nyu.edu, Josh Reed, Ilan Lobel

We consider the problem of demand learning faced by a firm selling through an external sales network. The firm is not able to control its product experimentation and needs to rely on the decisions made by its sales agents. The only control available to the firm is to remove products from its lineup. We show that if the firm utilizes a well designed policy, it is able to obtain near-optimal experimentation when the sales force is sufficiently large.

2 - Learning and Pricing using Thompson Sampling

He Wang, MIT, 77 Mass Ave, E40-149, Cambridge, MA, 02139, United States of America, wanghe@mit.edu, Kris Johnson Ferreira, David Simchi-levi

We consider a network revenue management problem where a retailer aims to maximize revenue from multiple products with limited inventory. As common in practice, the retailer does not know the expected demand at each price and must learn the demand information from sales data. We propose an efficient and effective dynamic pricing algorithm, which builds upon the Thompson sampling algorithm used for multi-armed bandit problems by incorporating inventory constraints into the pricing decisions.

3 - Nonparametric Self-adjusting Price Control

Stefanus Jasin, Stephen M. Ross School of Business, University of Michigan, Ann Arbor, MI, United States of America, sjasin@umich.edu, George Chen, Izak Duenyas

We consider dynamic pricing of multiple products with limited inventories. The functional form of demand is not known. We devise a nonparametric heuristic that consists of four elements: Spline approximation of the unknown demand during the exploration stage, linear approximation of the estimated demand, quadratic approximation of the estimated revenue, and self-adjusting control during the exploitation stage. Our heuristic significantly improves the theoretical bound of existing heuristics.

4 - Incomplete Learning and Certainty-equivalence Control

Bora Keskin, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708-0120, United States of America, bora.keskin@duke.edu, Assaf Zeevi

Motivated by dynamic pricing applications, we consider a dynamic control and estimation problem where a system manager sequentially chooses controls and makes observations on a response variable that depends on chosen controls and an unknown sensitivity parameter. The system manager uses a certainty-equivalence decision rule to determine subsequent controls based on estimates, and we characterize the asymptotic accuracy performance of this policy.

Chair: Mikhail Nediak, Queen's University, 143 Union Str., Kingston, ON, K7L3N6, Canada, mnediak@business.queensu.ca

Co-Chair: Yuri Levin, Queen's School of Business, 143 Union St. West, Kingston, Canada, ylevin@business.queensu.ca

1 - A Non-parametric Approach to Dynamic Pricing with Demand Learning

Guyves Achtari, Queen's School of Business, 143 Union Str., Kingston, ON, Canada, 11ga10@queensu.ca, Mikhail Nediak

In many industries, firms have the capability of observing both sales and the refusal to buy from their customers. In situations where demand is unknown, firms may use early sales data to forecast demand. We consider a situation where the firm does not know demand, but can observe arriving customers refuse or accept to buy a product at a given price. We formulate a dynamic program which aims to dynamically adjust the price of the product in order to maximize the firm's total expected revenue.

2 - Turnpike Equilibrium for Oligopolistic Dynamic Pricing Competition with Strategic Consumers

Jue Wang, Post-doctoral Fellow, Queen's School of Business, 143 Union St. West, Kingston, ON, K7L 3N6, Canada, jw171@queensu.ca, Yuri Levin, Mikhail Nediak

We consider the oligopolistic price competition when the prices are dynamic and the customers are strategic. We formulate the problem as a fluid model in the optimal control framework, and show that the equilibrium has a turnpike property. We characterize the structure of turnpike for symmetric oligopoly and asymmetric duopoly. The impact of non-stationary demand is also examined.

3 - Quantity Competition in a Multi-product Exchange Market with Strategic Consumers and Dynamic Preference

Samuel Kirshner, UNSW Business School, Kensington, NSW, Australia, skirshner@business.queensu.ca, Mikhail Nediak, Yuri Levin

We study a general multi-product multi-period exchange market for gross substitute products. Consumers maximize surplus under the uncertainty of their future product preferences deciding the quantity of products to purchase and sell in each period. Under mild assumptions, the equilibrium trades and price path is unique. The model is used to explore how strategic behavior of consumers and preference dynamics impact the equilibrium and aggregate welfare.

4 - Capacity and Price-matching Competition with Strategic Consumers

Mikhail Nediak, Queen's University, 143 Union Str., Kingston, ON, K7L3N6, Canada, mnediak@business.queensu.ca, Yossi Aviv, Andrei Bazhanov, Yuri Levin

Price matching (PM) is important to all market participants since PM can not only mitigate the loss from strategic customer behavior but even lead to gains from higher levels of this behavior under competition. Retailer profit with PM can be less than the worst profit without PM. Manufacturer never benefits from PM except for branded products when the sales at reduced prices are undesirable. On the other hand, policymakers may encourage PM since it can improve the aggregate welfare.

Networks: Games and Control

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Kimon Drakopoulos, Massachusetts Institute of Technology, Cambridge, MA, United States of America, kimondr@mit.edu

Co-Chair: Asu Ozdaglar, Massachusetts Institute of Technology, 32 Vassar St, Cambridge, MA, United States of America, asuman@mit.edu

1 - Controlling Epidemics on Networks

Kimon Drakopoulos, Massachusetts Institute of Technology, Cambridge, MA, United States of America, kimondr@mit.edu, Asu Ozdaglar, John Tsitsiklis

We study the problem of optimally allocating curing resources to cure an epidemic on a graph. We assume a curing budget constraint at each time instant. We prove that for graphs with large CutWidth efficient curing is impossible while for graphs with small CutWidth, efficient curing is possible and provide a near optimal policy.

2 - Privacy Constrained Network Formation

Ali Makhdoumi, Massachusetts Institute of Technology, 32 Vassar St, Cambridge, MA, 02139, United States of America, makhdoum@mit.edu, Daron Acemoglu, Asu Ozdaglar, Azarakhsh Malekian

With the increasing ease with which information can be shared in social media, the issue of privacy has become central for the functioning of various online platforms. In this talk, we consider how privacy concerns affect individual choices in the context of a network formation game.

3 - Consensus Expectations and Conventions

Ben Golub, Assistant Professor, Harvard University, 1805 Cambridge St, Cambridge, MA, 02144, United States of America, ben.golub@gmail.com, Stephen Morris

Players have uncertainty over both an external random variable and each other's beliefs. We study the iteration of an operator that takes a network-weighted average of others' expectations. By relating this process to a Markov chain, we characterize its limit, generalizing prior results on games with common priors and on complete-information network games. As applications, we study coordination games, over-the-counter financial markets, and the robustness of equilibrium.

4 - On the Efficiency of Networked Stackelberg Competition

Adam Wierman, California Institute of Technology, 1200 E California Blvd, Pasadena, CA, 91125, adamw@caltech.edu, Desmond Cai, Yunjian Xu, Subhonmesh Bose

We study the impact of strategic anticipative behavior in networked markets. We focus on the case of electricity markets and model the market as a game between a system operator (market maker) and generators at different nodes of the network. We compare the efficiency of a networked Stackelberg equilibrium, where generators anticipate the market clearing actions of the system operator, with a networked Cournot equilibrium, where generators are not anticipative.

Empirical Research in Services and Retail

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations
Sponsored Session

Chair: Santiago Gallino, Tuck School of Business, 100 Tuck Hall, Hanover, NH, United States of America, santiago.gallino@tuck.dartmouth.edu

Co-Chair: Antonio Moreno-Garcia, Northwestern University, 2001 Sheridan Rd, Evanston, IL, 60208, United States of America, a-morenogarcia@kellogg.northwestern.edu

1 - The Reference Effect of Delay Announcements

Qiuping Yu, Assistant Professor, Indiana University, 1309 E. 10th Street, Bloomington, IN, 47405, United States of America, qiupyu@indiana.edu, Gad Allon, Achal Bassamboo, Pengfei Guo

We study whether delay announcements induce the reference effect using data from a call center. Our empirical results show that customers are loss averse in response to the delay announcements. We then provide insights on whether and how we should provide announcements to the customers accounting for their loss averse behavior.

2 - The Operational Value of Social Media Information

Dennis Zhang, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, j-zhang@kellogg.northwestern.edu, Antonio Moreno-Garcia, Santiago Gallino, Ruomeng Cui

We study how social media information can be used to improve forecasting and discuss the implications of this relation for operations management.

3 - The Value of Rapid Delivery in Online Retailing

Santiago Gallino, Tuck School of Business, 100 Tuck Hall, Hanover, NH, United States of America, santiago.gallino@tuck.dartmouth.edu, Marshall Fisher, Joseph (Jiaqi) Xu

For online retailers who sell physical goods, every transaction has two main components: the physical product a customer buys and the services by which the retailer facilitates the customer's purchase. Delivery speed is arguably the most important service component for online retailers. We use a quasi-natural experiment to assess the impact of faster delivery on revenue.

4 - A Holistic Perspective to Shrinkage: Antecedents and Consequences

Daniel Corsten, IE Business School, Calle Maria de Moina 12 Bajo, Madrid, 28006, Spain, daniel.corsten@ie.edu, Shivom Aggarwal

Vendor-side fraud has been overlooked in literature due to intractability, but poses to be significant antecedent of shrinkage. Using multi-store longitudinal data from a US retailer, we investigate holistic antecedents of shrinkage and how they affect store performance. The unified framework will contribute to extant literature on efficient retail operations.

Emerging Topics in Healthcare Operations

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations
Sponsored Session

Chair: Mor Armony, NYU Stern, 44 West 4th Street, New York, NY, 10012, United States of America, marmony@stern.nyu.edu

1 - An Examination of Early ICU Admissions based on a Physiologic Risk Score

Wenqi Hu, Columbia Business School, 3022 Broadway, Ur 4V, New York, NY, 10027, United States of America, whu17@gsb.columbia.edu, Gabriel Escobar, Carri Chan, José Zubizarreta

Unplanned transfers of patients from the ward to the Intensive Care Unit (ICU) can occur due to rapid deterioration and may increase the patients' risk of death. This work examines the potential costs and benefits of preventive ICU admissions based on a new dynamic warning system. We find that preventive ICU admissions have the potential to improve patient outcomes, and physicians' fears of needlessly clogging the ICU may not be as dire as initially assumed.

2 - The Impact of Online Reviews on Demand for Outpatient Care: An Empirical Study

Yuqian Xu, NYU Stern School of Business, 44 West 4th Street, New York, NY, 10002, United States of America, yxu@stern.nyu.edu, Anindya Ghose, Mor Armony

New platforms for online patient reviews and appointment scheduling provide an unprecedented opportunity to examine the relationship between patient reported satisfaction and demand for outpatient care. We study data from a leading online appointment booking site and use structural estimation and data mining to determine the influence of patient reviews on physician demand. We pay special attention to operational factors in patient care such as service time, waiting time and ease of appointment.

3 - Process Information in Healthcare Systems: Applications to Delay Estimations and Management

Galit Yom-tov, Technion, IE&M Faculty, Technion, Haifa, Israel, gality@tx.technion.ac.il, Chen Shapira, Sarah Kadish, Shoshi Levavi, Avi Mandelbaum, Nitzan Carmeli, Arik Senderovich, Craig Bunnell

Extracting process information data for healthcare services is a challenge due to the combination of multiple non-integrated IT systems. In this talk we consider an (open traditional) emergency department and an (appointment-driven) outpatient hospital. We discuss operational benefits of information processing efforts and the theoretical challenges they present. We then focus on the evolution of delays through these service networks, and the use of process (and RTLS) data to estimate delays.

4 - Optimal Emergency Department Wait Time Prediction

Sara Kwasnick, Stanford Graduate School of Business, 655 Knight Way, Stanford, United States of America, kwasnick@stanford.edu, Erica Plambeck, Mohsen Bayati

We implement a real-time wait time prediction system at a partner hospital, and explore how the accuracy and format of wait time estimates affects patient behavior. In particular, we find that accurate provision of wait time information appears to improve satisfaction and decrease the rate at which patients leave without being seen. We propose a new wait time prediction objective based on these results.

Sponsored Session

Chair: Michael Lim, University of Illinois, 1206 S. 6th street, Champaign, IL, 61822, United States of America, mlim@illinois.edu

Co-Chair: Nicholas Petruzzi, The Pennsylvania State University, 210 Business Building, University Park, PA, 16802, United States of America, ncp12@psu.edu

1 - On the Formation of Farmer Producer Organizations in Developing Economies

Qiao-Chu He, PhD Candidate, University of California, Berkeley, 1117 Etcheverry Hall, Berkeley, United States of America, heqc0425@berkeley.edu, Ying-ju Chen, Zuo-jun Max Shen

We study the incentives for small and marginal farmers in developing economies to form farmer producer organizations (FPOs). We shall focus on the FPOs' institutionalized efforts in linking small farmers by integrating market information. By a stylized Cournot competition model endowed with endogenous information acquisition and sharing decisions, we offer insights on the governments or NGOs' dual roles in providing market information as well as mobilizing farmers to build FPOs.

2 - The State of Scope 3 Carbon Emissions Reporting

Christian Blanco, christian.noel.blanco@gmail.com, Charles Corbett, Felipe Caro

We compare upstream supply chain carbon emissions (scope 3) reported to CDP to estimates from Economic Input-output Life Cycle Assessment (EIO-LCA) models. We find that several opportunities remain in measuring and reporting upstream carbon emissions reported to CDP relative to EIO-LCA estimates.

3 - Design Implications of Extended Producer Responsibility: Durable or Recyclable Products?

Ximin (Natalie) Huang, Scheller College of Business, Georgia Institute of Technology, 800 West Peachtree, NW Atlanta, GA, United States of America, ximin.huang@scheller.gatech.edu, Beril Toktay, Atalay Atasu

We consider a monopolist who has two product design options to manage the end-of-life costs/revenues associated with its products: making products more durable or recyclable. We explore how the recyclability and durability choices are affected by the requirements of take-back legislation.

4 - The Impact of Ecolabeling on the Green Product Line

Karthik Murali, kmurali4@illinois.edu, Michael Lim, Nicholas Petruzzi

The use of ecolabels allows firms to convey credible information about environmental attributes in their products to consumers. In a competitive setting, we study the role of a firm's credibility and certification from external agencies with differing objectives on a firm's ecolabeling choices and ensuing consequences from a triple bottom line perspective using game-theoretic models.

Frontiers of Supply Chain Research

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain
Sponsored Session

Chair: Karen Zheng, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, yanchong@mit.edu

1 - Impact of Technology Adoption on Product Assortment Planning

Duo Shi, Washington University in St. Louis, St. Louis, United States of America, dshi@wustl.edu, Fuqiang Zhang, Lingxiu Dong

This paper studies the impact of technology adoption on firms' product assortment planning. Consider two types of production technologies, dedicated technology and flexible technology. We aim to address the following questions that may arise when the firm contemplates the adoption of the flexible technology: What is the optimal product assortment under different technology choices? How does the adoption of flexible technology affect the firm's assortment decision?

2 - Omnichannel Retail Operations

Fei Gao, The Wharton School, University of Pennsylvania, 3730 Walnut Street, 500 Jon M. Huntsman Hall, Philadelphia, United States of America, feigao@wharton.upenn.edu, Xuanming Su

Omnichannel consumers strategically make use of online and offline channels to gather information and purchase products. We study different omnichannel information strategies and their profit implications for firms.

3 - Quality in Supply Chain Encroachment

Xiaoyang Long, PhD Student, Hong Kong University of Science and Technology, Hong Kong - PRC, xlongaa@connect.ust.hk, Albert Ha, Javad Nasiry

We study a supply chain with manufacturer encroachment in which product quality is endogenous and customers have heterogeneous preferences for quality. We find that encroachment always makes the retailer worse-off. In addition, we show that a manufacturer offering differentiated products through two channels prefers to sell its high-quality product directly. Contrary to conventional wisdom, quality differentiation does not always benefit either manufacturer or retailer.

4 - Measuring the Bullwhip Effect with Material Flow Data: Biases and Remedies

Wei Luo, IESE Business School, Av. Pearson 21, Barcelona, Spain, wluo@iese.edu, Li Chen, Kevin Shang

This paper focuses on understanding the bullwhip measurement and providing methods to infer demand and order variance from available material flow data. We derive conditions under which estimation bias occurs and characterize the driving factors. We also propose a debiasing method that helps the practitioners and empirical researchers to further improve their estimation and assessment of the magnitude of the bullwhip effect.

Emerging Issues and Recent Trends in Sourcing

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Eda Kemahilioglu-Ziya, NC State, Poole College of Management, Raleigh, United States of America, ekemahl@ncsu.edu

Co-Chair: Olga Perdikaki, Texas A&M University, College Station, TX, United States of America, operdikaki@mays.tamu.edu

1 - Cooperation in Assembly Systems: The Role of Knowledge Sharing Networks

Fernando Bernstein, Duke University, 100 Fuqua Drive, Durham, NC, United States of America, fernando.bernstein@duke.edu, Ana Meca, Gurhan Kok

Process improvement plays a significant role in reducing production costs over the life cycle of a product. We consider the role of process improvement in a decentralized assembly system in which a buyer purchases components from first-tier suppliers. Suppliers make investments in process improvement. The assembler establishes a knowledge sharing network among suppliers. We investigate the benefits and challenges associated with establishing a knowledge sharing network.

2 - Managing Dependent Random Supply Capacities in Dynamic Inventory-pricing Problems

Qi Annabelle Feng, Professor, Purdue University, 100 S. Grant St., West Lafayette, IN, United States of America, annabelle.feng@purdue.edu, Justin Zheng Jia, J. George Shanthikumar

Most work on multi-sourcing assumes independent supplies, though dependence among different sources is commonly observed. This is mainly due to the difficulty in analyzing models with dependent supplies. Extending the notion of stochastic linearity via transform the problem into one defined on a function space, we show that the dynamic inventory-pricing problem with dependent supply capacities is concave. This observation allows us to derive the optimal policy and generate interesting insights.

3 - Allocation of Greenhouse Gas Emissions in Supply Chains

Greys Sosis, University of Southern California, Marshall School of Business, Bridge Hall 401, Los Angeles, Ca, 90089, United States of America, sosis@marshall.usc.edu, Daniel Granot, Hailong Cui, Sanjith Gopalakrishnan, Frieda Granot

We formulate the greenhouse gas (GHG) emission responsibility problem as a cooperative game, referred to as the GREEN game, and suggest allocations of GHG responsibility among supply chain members. We prove that the GREEN game has a nonempty core and identify some allocations that are extreme core points and are used in practice. We derive an expression for the Shapley value of this game, which has a simple and intuitive interpretation, and provide its three distinct axiomatic characterizations.

4 - Outsourcing under Competition: When to Choose a Competitor as a Supplier?

Olga Perdikaki, Texas A&M University, College Station, TX, United States of America, operdikaki@mays.tamu.edu, Eda Kemahilioglu-Ziya

Motivated by several examples of sourcing from direct competitors in different industries, we study a stylized supply chain model with a single OEM that could outsource either to an independent supplier or to an integrated firm that carries out manufacturing in-house and competes with the OEM. We model different contractual relationships between the OEM and the firm it sources from and aim to identify whether and how the bargaining power of the OEM affects its supplier choice.

Service Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Masha Shunko, Assistant Professor, Purdue University, 403 W State St., West Lafayette, IN, 47907, United States of America, mshunko@purdue.edu

1 - Understanding Customers Retrials in Call Centers: An Empirical Study

Gad Allon, Professor, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, g-allon@kellogg.northwestern.edu, Kejia Hu, Achal Bassamboo

We study the impact of waiting times and service quality on the retrieval behavior of customers in a call center.

2 - Humans are not Machines: How Server Behavior Affects Queueing Systems

Masha Shunko, Assistant Professor, Purdue University, 403 W State St., West Lafayette, IN, 47907, United States of America, mshunko@purdue.edu, Julie Niederhoff, Yaroslav Rosokha

Using behavioral experiments, we examine the impact of queueing system design on server productivity. We manipulate queue layout (parallel or single) and load visibility. Our results provide the following insights: 1) behavioral factors may slow down the single-queue system, which makes this design choice less attractive than predicted theoretically, and 2) providing good visibility of the queue length may speed up the servers and thus improve service performance.

3 - Operations in the On-demand Economy: Staffing Services with Self-scheduling Capacity

Martin Lariviere, Northwestern University, 2001 Sheridan Rd, Evanston, IL, 60208, United States of America, m-lariviere@kellogg.northwestern.edu, Itai Gurvich, Antonio Moreno-Garcia

Under self scheduling, agents choose for themselves whether or not to work in each period. The firm thus controls its service level only indirectly. Relative to when the firm sets the schedule, the firm has lower profits and the customers have a higher chance of not being served. An unconstrained firm recruits a large pool of agents to reduce compensation. If the firm is constrained to offer a minimum wage, it limits the pool of size and agent scheduling flexibility.

4 - E-commerce, the On-demand Economy and Sustainability

Ekaterina Astashkina, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, ekaterina.astashkina@insead.edu, Karan Girotra, Elena Belavina

On-demand services are heralding the next era of the e-commerce revolution. This talk examines the sustainability of using these on-demand services in certain high impact categories.

Models of Service Systems

Sponsor: Service Science

Sponsored Session

Chair: Ralph Badinelli, Professor, Virginia Tech, Dept. of Business Information Technology, Virginia Tech 0235, Blacksburg, VA, 24061, United States of America, ralphb@vt.edu

1 - A Big Data Approach to Assessing the Quality of Higher Education Services

Robin Qiu, Professor, Penn State, 1025 Braxington Dr, Collegeville, PA, 19426, United States of America, robinqiu@psu.edu

This talk introduces a real-time, scalable, and model-driven higher education ranking system with the support of big data technologies. Text sentiment analysis is included in the developed ranking service system. The proposed approach has promising potential of wide application across the service industry.

2 - Impact of Top Service Designers on Experience Service Performance

Gregory Heim, Associate Professor, Mays Business School at Texas A&M University, Wehner Hall 320, College Station, TX, 77843-4217, United States of America, GHeim@mays.tamu.edu

Service firms today leverage many designers known for design excellence. Despite expanding use of top designers, no research examines practical implications of top designers as compared to mainstream designers. In considering whether to use top designers, service managers must consider benefits from investment in high quality designs. Using data on golf courses and golf course designers, we study how top designers influence performance of Texas golf courses.

3 - Applying Normalized Systems Theory to Service System Design

Ralph Badinelli, Professor, Virginia Tech, Dept. of Business Information Technology, Virginia Tech 0235, Blacksburg, VA, 24061, United States of America, ralphb@vt.edu

This paper applies Normalized Systems Theory (NST) as a new framework for the modular design of service systems. We synthesize a prescription for service system design from principles of NST and principles of the Viable Systems Approach (VSA). A mathematical model of the effects of system coupling on evolvability and entropy is derived. Evolvability and entropy are related to autopoiesis, homeostasis and viability. An example of an NST-inspired service system design is provided.

Experiments in Supply Chains

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Andrew Davis, Cornell University, 401J Sage Hall, Ithaca, NY, 14850, United States of America, adavis@cornell.edu

1 - Inventory Decisions under Epistemic and Aleatory Demand Uncertainty

John Aloysius, University of Arkansas, WCOB 475d University of Arkansas, Fayetteville, AR, 72701, United States of America, JAloysius@walton.uark.edu, Siqi Ma

Research on inventory decisions under uncertainty has primarily focused on aleatory uncertainty due to stochastic variability. Epistemic uncertainty due to a lack of confidence in knowledge however routinely features in such decisions. Our experiment orthogonally manipulates the two forms of uncertainty in a newsvendor task. We partial out biases due to each form of uncertainty and also report on learning as well as interaction effects.

2 - Bargaining and the Allocation of Risk in Supply Chains: An Experimental Study

Kyle Hyndman, University of Texas at Dallas, 800 W Campbell Rd (SM 31), Richardson, TX, 75080, United States of America, KyleB.Hyndman@utdallas.edu, Andrew Davis

We study the impact of bargaining and inventory risk location in a supply chain. We conduct a human-subjects experiment where a retailer and supplier engage in free-form bargaining over wholesale price, order quantity and inventory location. We show: (1) our bargaining environment leads to higher efficiency than in past studies; (2) the party incurring the inventory risk always earns a substantially lower profit than the other party; (3) more restrictive environments lead to lower efficiency.

3 - Sharing in the Benefits of Learning-by-doing: A Laboratory Study of Procurement Auction Mechanisms

Blair Flicker, PhD Candidate, The University of Texas at Dallas, 800 W Campbell Road, Mailstop AD23, Richardson, TX, 75208, United States of America, bflicker@utdallas.edu, Wedad Elmaghaby, Elena Katok

Buyers looking to share in suppliers' learning-by-doing savings can either (i) draft long-term contracts with payment reduction schedules or (ii) encourage competition via sequential short-term contracts. Theoretically, there is minimal cost difference between the two approaches, but behavioral findings suggest that humans do respond differentially to the two mechanisms.

4 - Supply Base Diversification in the Presence of High Impact, Low Probability Supply Disruptions

Doug Thomas, Penn State, 463 Business Building, University Park, PA, 16802, United States of America, dthomas@psu.edu, Mirko Kremer, Kyle Goldschmidt, Chris Craighead

We investigate sourcing decisions in the presence of high impact, low probability supply disruptions. We develop a model that captures a key sourcing tradeoff: A consolidated (diversified) supply base reduces (increases) transaction costs but increases (reduces) the exposure to disruptions. We predict, and using a laboratory experiment, find evidence for, an oscillating pattern - decision makers diversify immediately after a severe disruption and consolidate during stretches without disruptions.

Data-Driven Stochastic Programming using Phi-Divergences

Cluster: Tutorials

Invited Session

Chair: Guzin Bayraksan, Associate Professor, The Ohio State University, Integrated Systems Engineering, Columbus, OH, 43209, United States of America, bayraksan.1@osu.edu

1 - Data-Driven Stochastic Programming using Phi-Divergences

Guzin Bayraksan, Associate Professor, The Ohio State University, Integrated Systems Engineering, Columbus, OH, 43209, United States of America, bayraksan.1@osu.edu, David K. Love

Phi-divergences provide a measure of distance between two probability distributions. They can be used in data-driven stochastic optimization to create an ambiguity set of distributions centered around a nominal distribution and hedge against distributional uncertainty. In this tutorial, we present two-stage models with distributional uncertainty using phi-divergences and tie them to risk-averse optimization. We examine the value of collecting additional data and discuss convergence properties.

55-Room 108B, CC

Airline Economics: Competition and Collaboration

Sponsor: Aviation Applications

Sponsored Session

Chair: Yi Liu, UC Berkeley, 107 McLaughlin Hall, Berkeley, Ca, 94720, United States of America, liuyi.feier@gmail.com

1 - Airline Competition and Market Frequency: A Comparison of the S-curve and Schedule Delay Models

Yi Liu, UC Berkeley, 107 McLaughlin Hall, Berkeley, CA, 94720, United States of America, liuyi.feier@gmail.com, Mark Hansen

We compare two models for an airline market served by identical carriers who compete on fare and frequency: s-curve model and schedule delay model. They only differ structurally with respect to how they handle frequency competition. The demand side of our model is an approximation of a nested logit model which yields endogenous travel demand by including not travelling in the choice set. The results of our comparison support the schedule delay model over the s-curve model.

2 - Game-theoretic and Empirical Models for Airline Capacity and Fare Decisions under Competition

Vikrant Vaze, Assistant Professor, Dartmouth, 14 Engineering Drive, Hanover, NH, 03755, United States of America, Vikrant.S.Vaze@dartmouth.edu, Reed Harder

Airline capacity and fare decisions under competition affect passenger choice and the overall efficiency of airline networks. We develop Nash equilibrium models as well as empirical models to characterize these interactions. We analytically prove desirable properties of the resulting games and describe numerical experiments that extend our theoretical results to more complicated competition settings. Our results, validated against real-world data, provide new insights into airline competition.

3 - An Equitable and Collaborative Mechanism for Scheduling Interventions at Congested Airports

Alexandre Jacquillat, PhD Candidate, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Building E40-240, Cambridge, MA, 02136, United States of America, alexandre.jacquillat@gmail.com, Vikrant Vaze

Flight scheduling interventions can mitigate airport congestion by controlling the imbalances between peak-hour demand and capacity. We design, optimize and assess non-monetary congestion-mitigating scheduling mechanisms that ensure inter-airline equity and enable airline collaboration. Theoretical and computational results suggest that large equity gains can be achieved at small efficiency losses and that accounting for airline preferences can improve the outcome of scheduling interventions.

4 - A Majority-judgment-based Multi-criteria Consensus Building Method

Chiwei Yan, Massachusetts Institute of Technology,
77 Massachusetts Avenue, E40-130, Cambridge,
United States of America, chiwei@mit.edu, Michael Ball,
Vikrant Vaze, Prem Swaroop, Cynthia Barnhart

We propose a multi-criteria consensus building method based on Majority Judgment proposed by Balinski and Laraki recently. This problem setting originally stems from strategic air traffic flow management, but is applicable to a wide range of social choice problems. We propose two methods: 1) a multi-round estimation approach and 2) a single-shot robust approach to find majority winner under this setting. Case studies from real-world applications demonstrate the effectiveness of our approach.

Hub Location

Sponsor: Location Analysis

Sponsored Session

Chair: Sibel Alumur, University of Waterloo, 200 University Avenue West, Waterloo, ON, N2L 3G1, Canada, sibel.alumur@uwaterloo.ca

1 - Models and Algorithms for Robust Hub Location

Ivan Contreras, Concordia University and Interuniversity
Research Center on Enterprise Networks, Logistics and
Transportation (CIRRELT), H3G 1M8, MONTREAL, Qu, Canada,
ivan.contreras@cirrelt.ca, Jean - Francois Cordeau, Carlos Zetina

In this talk we present robust hub location problems in which uncertainty is associated with demands and flow costs. We study three robust counterparts of the uncapacitated hub location problem with multiple assignments. The first focuses on demand uncertainty, the second one deals with flow cost uncertainty and the third one considers both demand and flow cost uncertainty. We present mathematical models and exact algorithms for each one of these variants. Computational experiments are reported.

2 - On Single-allocation P-hub Median Location Problems with Flow Thresholds-based Discounts

Armin Luer Villagra, Universidad Andres Bello, Engineering
Sciences Department, Antonio Varas 880, Piso 6, Providencia,
Santiago, Chile, armin.luer@unab.cl, H A Eiselt,
Vladimir Marianov

Appropriate modeling of economies of scale on hub and spoke networks is an active research trend. We present a single allocation p-hub location problem where a fixed discount is applied to the flow in an arc if it exceeds a fixed threshold, and the inter-hub network can be incomplete. We solve using standard software and literature instances. Aggregated performance indicators are used to analyze and compare solutions. The results show the appropriateness of our model.

3 - Hub Network Design in Air Transportation

Armaghan Alibeyg, Concordia University and Interuniversity
Research Center on Enterprise Networks, Logistics and
Transportation (CIRRELT), 1455 de Maisonneuve Blvd. West,
Montreal, QC, H3G 1M8, Canada, a.alibeyg@gmail.com,
Elena Fernández, Ivan Contreras

We present a class of hub network design problems that consider a profit-oriented objective. Potential application arise in the design of air transportation networks, where companies need to determine not only the location of hub facilities but also the design of the hub network. This class of problems considers the simultaneous optimization of the collected profit, the setup cost of the hub network and the transportation cost.

4 - The Design of Capacitated Intermodal Hub Networks with Different Vehicle Types

Sibel Alumur, University of Waterloo, 200 University Avenue
West, Waterloo, ON, N2L 3G1, Canada,
sibel.alumur@uwaterloo.ca, Elif Zeynep Serper

We determine the locations and capacities of hubs, which transportation modes to serve at hubs, allocation of non-hub nodes to hubs, and the number of vehicles of each type to operate on the hub network to route the demand between origin-destination pairs with minimum total cost. A mixed-integer programming model is developed and a local search heuristic is proposed. Computational analyses are conducted on the Turkish network and CAB data sets.

Real Options in the Energy Sector

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Afzal Siddiqui, University College London, Department of
Statistical Science, Gower Street, London, UK, WC1E 6BT,
United Kingdom, afzal.siddiqui@ucl.ac.uk

1 - Structural Estimation of Real Switching Options in Peak Power Plants

Stein-erik Fleten, NTNU, Industrial Economics and Technology
mana, Trondheim, Norway, Stein-Erik.Fleten@iot.ntnu.no,
Carl J. Ullrich, Erik Haugom, Alois Pichler

Peak power plants have high operating and maintenance costs when kept ready to operate. Therefore, plant managers sometimes put their plants in a standby state, or retire them. Using structural estimation, we estimate the maintenance cost for the operating states (operating ready, standby) and switching costs for startup, shutdown and retirement actions. Our approach extends recent contributions in structural estimation, combining nonparametric statistics with nonlinear programming.

2 - Real Options Analysis of Investments in Flexibility Measures for Gas-fired Power Plants

Reinhard Madlener, RMadlener@eonerc.rwth-aachen.de,
Barbara Glensk, Christiane Rosen

Conventional power generation will remain important for quite some time for balancing electricity demand and supply. We propose a real options model for the flexible operation of existing gas-fired power plants, enabling to study the optimal timing of investment and valuation of alternative flexibility measures. We use the spark spread for valuing the flexible plant operation in light of different load levels and corresponding efficiency factors. The proposed model is applied to a case study.

3 - Capacity Mechanisms and Investment Decisions in Electricity Market

Ryuta Takashima, Tokyo University of Science, 2641 Yamazaki,
Noda-shi, Chiba, Japan, takashima@rs.tus.ac.jp, Yuto Takano,
Naoki Makimoto, Yuji Yamada

The power producers can sell their generating capacities kWe in a market of the capacity or via a bilateral contract by means of a capacity mechanism. In this paper, we consider an investment problem of capacity expansion taking into account a scheme of the capacity mechanisms. We analyze an investment timing for different ratios of selling the capacity. In addition, we compare the investment timing for the standard energy-only market with that for the capacity market.

4 - Transmission and Power Generation Capacity Investment under Uncertainty

Verena Hagspiel, Norwegian University of Science and
Technology, Alfred Getz vei 3, Trondheim, Norway,
verena.hagspiel@iot.ntnu.no, Afzal Siddiqui, Jannicke Sletten,
Nora Midttun

In a decentralized electricity market transmission system operators must anticipate the investment behaviour of power companies when deciding on investment transmission-capacity expansion. We propose a novel RO model that captures both the investment decisions of a TSO and power companies allowing to account for the conflicting objectives of the distinct agents and study how potential generation expansion affects the optimal timing and sizing of transmission expansion.

Multi-Agent Decision-Making for Smart Grids Operation I

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Amin Kargarian, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15232, United States of America, amin.kargarian@gmail.com

1 - A Fast Distributed Algorithm for Power Optimization Problems

Ramtin Madani, Columbia University, 116th St. & Broadway, New York, NY, 10027, United States of America, madani@ee.columbia.edu, Abdulrahman Kalbat, Javad Lavaei

This talk aims to develop an efficient numerical algorithm for power optimization problems by leveraging the small treewidth of real-world power grids. To this end, a distributed algorithm is proposed for arbitrary conic programs with a low treewidth, based on the alternating direction method of multipliers (ADMM). The iterations of this algorithm consist of two subproblems, which are highly parallelizable and enjoy closed-form solutions. The algorithm is tested on several power systems.

2 - Demand Response using Supply Function Bidding

Na Li, Assistant Professor, Harvard University, 33 Oxford St, MD 147, Cambridge, Ma, 02138, United States of America, nali@seas.harvard.edu, Lijun Chen, Munther Dahleh

An abstract market model based on supply function bidding is proposed for demand response to match power supply fluctuations. We characterize the resulting equilibria in competitive and oligopolistic markets and analyze the efficiency of the equilibria. The equilibrium in competitive market maximizes social welfare, and the equilibrium in oligopolistic market has bounded efficiency loss under certain mild assumptions. We also propose distributed algorithms to achieve the equilibria.

3 - Community Storage for Firming

Chenye Wu, Postdoctoral Fellow, UC Berkeley, 60 Panoram Way, Berkeley, CA, 94704, United States of America, wcy@ieee.org, Kameshwar Poolla

We analyze the benefit of storage capacity sharing for a set of residential consumers in a community. Each consumer has its own choice of either installing its own storage system or investing in a shared storage system. In the latter case, they must also decide on a scheme to allocate the costs. We formulate the problem as a cooperative game and identify an efficient and stable cost allocation rule. We further show this cost allocation rule induces a weakly incentive compatible mechanism.

4 - Fully Distributed Approach for Optimal Power Flow Calculations

Javad Mohammadi, Carnegie Mellon University, Electrical and Computer Engineering, CMU, Pittsburgh, PA, 15232, United States of America, jmohamma@andrew.cmu.edu

In this talk, we propose a method which enables a fully distributed solution of the DC Optimal Power Flow problem. The approach consists of an iterative procedure that aims at solving the first order optimality conditions in fully distributed manner at both nodal and regional level.

59-Room 110B, CC

Open Pit Mining

Sponsor: ENRE – Natural Resources I – Mining

Sponsored Session

Chair: Alexandra Newman, Professor, Colorado School of Mines, Mechanical Engineering, Golden, CO, 80401, United States of America, anewman@mines.edu

1 - Open Pit Mine Scheduling with Variants on Inventory Considerations

Mojtaba Rezakhah, PhD Student, Colorado School of Mines, Golden, CO, 80401, United States of America, mrezakha@mymail.mines.edu

We present several ways of modeling stockpiling (with and without considering degradation) in open pit mine production scheduling, including (i) individual stockpiles for each block and (ii) binned stockpiles with pessimistic grade estimates. These models are formulated for a currently operational mine and compared to results without stockpiling in order to assess the benefits of stockpiling and to analyze the relationship between milling capacity and stockpiling value.

2 - Models for Inventory Allocation of Erratic-demand Spare Parts in a Multi-echelon System

Andrea Arias, PhD Student, Universidad Catolica de Valparaiso, Avda Brasil 2241, Piso 6, Valparaiso, V, 2362807, Chile, andari20@gmail.com, Jimena Pascual, Timothy Matis

Mining industry has processes that are carried out by complex machines with many parts, which are repairable upon failure. We consider a two-level supply chain inventory system for high cost/low demand repairable items. The aim is to determine inventory levels for each item at every warehouse in order to maximize system availability. We will present a comparative study between two approaches used for addressing this problem from which some interesting ideas for further research are proposed.

3 - Operational Flexibility in the Gold Mining Industry

Panos Markou, IE Business School, Calle Maria de Moina 12 Bajo, Madrid, 28006, Spain, pmarkou.phd2016@student.ie.edu, Daniel Corsten

Gold mining companies are highly exposed to commodity price risks. We examine the effects of using “high-grading” (to combat these risks) on the operational and financial performance of the miners. We find that although high-grading can increase gross margin and profitability, it also increases profit variance and inventory levels. Further, we show that these undesirable effects can be reduced through financial hedging strategies.

4 - Using The Bienstock-Zuckerberg Algorithm for Large-scale, Real-world Mine Planning Problems

Alexandra Newman, Professor, Colorado School of Mines, Mechanical Engineering, Golden, CO, 80401, United States of America, anewman@mines.edu, Marcos Goycoolea, Eduardo Moreno, Daniel Espinoza, Andrea Brickey

We apply an algorithm that solves the LP relaxation of precedence-constrained knapsack problems to mine planning models which determine when to extract a notional three-dimensional block of ore or waste, or when to commence an activity (e.g., development, extraction) so as to maximize net present value, subject to spatial precedence constraints and resource bounds. A simple heuristic provides good integer-feasible solutions. Real-world instances from various settings provide compelling results.

60-Room 111A, CC

Evaluating Student Learning

Sponsor: INFORM-ED

Sponsored Session

Chair: Sadan Kulturel-Konak, Professor, Pennsylvania State University, Berks Campus, Reading, PA, 19609, United States of America, sadan@psu.edu

1 - Assessing Students' Global Awareness

Sadan Kulturel-Konak, Professor, Pennsylvania State University, Berks Campus, Reading, PA, 19609, United States of America, sadan@psu.edu

Students are expected to become increasingly globally aware in order to be better prepared for a career in an international knowledge-based society. We define global awareness knowledge, skills and abilities (KSA) that need to be met for a student to be proficient in global awareness and define an assessment framework based on the Model of Domain Learning (MDL). The preliminary findings for the effectiveness of the proposed global awareness interest assessment will be presented.

2 - A Web-based Peer Evaluation Tool for Professional Skills Assessment

Abdullah Konak, Professor, Penn State Berks, Tulpehocken Road, P.O. Box 7009, Reading, PA, 19610, United States of America, konak@psu.edu

We introduce the Peer Evaluation & Assessment Resource (PEAR), which is a web-based solution that was created to efficiently assess the teamwork skills of students through peer and self-evaluations. The PEAR application allows instructors to form teams and choose a rubric to assess their teamwork skills and contributions. In addition to built-in PEAR rubrics, instructors can also create custom rubrics based on the Model of Domain Learning to better suit their specific courses.

3 - Use of Pretesting to Assess Retention of Prerequisite Knowledge

Jill Wilson, Northwestern University, 2145 Sheridan Rd.,
Room C211, Evanston, IL, 60208, United States of America,
jill.wilson@northwestern.edu, Karen Smilowitz, Barry Nelson

We describe a pretest assessment scheme designed to test student retention of knowledge obtained in prerequisite courses. Although useful in documenting continuous improvement for ABET accreditation, pretests most importantly help identify students who are unprepared for the current course and help faculty to identify course-wide deficiencies that need remediation. We describe content of pretests, details of implementation, and insights gleaned from data collected in the first two years.

4 - Georgia Tech's Systematic Approach to Improving PhD Students' Academic Job Talks and Interviews

Judith Norback, judith.norback@isye.gatech.edu, Alan Erera

Our goal is improving the academic job talks and interviews of IE/OR PhD candidates currently on the job market. We describe the systematic work done to identify instructional activities for the students. The seven steps we took were: 1) observing PhD student INFORMS talks, 2) interviewing faculty to identify what they expect in an excellent talk, 3) conducting a workshop where each student gives a brief presentation and receives feedback from a presentation expert, 4) holding oral skills meetings for instruction and practice, and 5) having a faculty panel discussion of how to conduct interviews. 6) Finally, once a student has arranged an interview, they give a practice talk to their advisers and the presentation expert, and 7) the expert joins them in a final oral skills meeting. Preliminary feedback from students and faculty, and instructional materials, will be shared.

Electricity Markets and Renewable Power

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Nur Sunar, Assistant Professor, University of North Carolina, Kenan-Flagler School of Business, Chapel Hill, NC,
United States of America, Nur_Sunar@kenan-flagler.unc.edu

1 - Stochastic Co-Optimization Framework for Renewable Power Generation

Shijie Deng, Georgia Inst of Tech, 755 Ferst Dr, Atlanta, GA,
United States of America, sd111@gatech.edu,
Anthony Papavasiliou

We propose a stochastic programming framework for solving the optimal scheduling problem faced by a renewable power producer that simultaneously participates in multiple markets. Specifically, the renewable-generator participates in both the electricity spot market and the ancillary services market as a price taker. Numerical case studies on the advantages of the proposed strategy for a wind-generator to hedge market uncertainties are carried out with a set of realistic parameters.

2 - Lessons from Large Scale Transmission Planning using Stochastic Programming in WECC

Qingyu Xu, Johns Hopkins University, 3400 North Charles Street,
Baltimore, MD, 21218, United States of America, qxu25@jhu.edu,
Saamrat Kasina, Jonathan Ho, Pearl Donohoo-vallett,
Yueying Ouyang, Benjamin Hobbs

A 21-zone model and a 300-bus model of the western North America interconnection are used to optimize transmission and generation investment and production, facing uncertain economic, regulatory and climate scenarios. The stochastic optima show very different patterns of transmission/generation investment compared to deterministic solutions. The economic impacts of various model simplifications are compared, including the network, number of scenarios, and generator unit commitment.

3 - Supply Function Bidding with Uncertain Supply and Demand: Electricity Markets and Renewable Power

Nur Sunar, Assistant Professor, University of North Carolina, Kenan-Flagler School of Business, Chapel Hill, NC, United States of America, Nur_Sunar@kenan-flagler.unc.edu, John Birge

Motivated by high penetration of renewables into electricity generation mix, we introduce and analyze a supply function competition model with both supply and demand uncertainty. Using the ODE theory, we characterize a supply function equilibrium, and analyze the implications of different penalty schemes and subsidy for equilibrium day-ahead market clearing price, production schedules and actual production quantities of generators. We also calibrate our model based on MISO's data.

Optimization Models for Bioenergy Production and Delivery

Sponsor: ENRE – Environment I – Environment and Sustainability

Sponsored Session

Chair: Mohammad Roni, Computational Energy Analyst, Idaho National Laboratory, P.O. Box 1625,, Idaho Falls, ID, 83401,
United States of America, mohammad.roni@inl.gov

1 - Economic, Environmental and Social Optimization of an Integrated Bioenergy and Biofuel Supply Chain

Taraneh Sowlati, University of British Columbia, 2931-2424 Main
Mall, Vancouver, BC, V6T1Z4, Canada, taraneh.sowlati@ubc.ca,
Claudia Cambero

A multi-objective optimization model is proposed for the network design and strategic planning of integrated bioenergy and biofuel supply chains using forestry by-products as feedstock. The objectives of the model are to maximize the NPV, maximize the GHG emissions savings, and maximize the number of direct jobs created. The model was applied to a case study in British Columbia, and a set of Pareto-optimal solutions was obtained using the augmented ϵ -constraint (AUGMECON) method.

2 - Analyzing Stranded Biomass Resource: Regional Case Study in the United States of America

Mohammad Roni, Computational Energy Analyst, Idaho National Laboratory, P.O. Box 1625,, Idaho Falls, ID, 83401, United States of America, mohammad.roni@inl.gov, Ross Hays, Damon Hartley, Erin Searcy

National assessment such as Billion Ton Study has projected biomass resources to meet biofuel production targets. But resources are often inaccessible because of unfavorable economics—labeled as “stranded resources”. This study quantifies stranded resources under conventional and proposed distributed depot based supply design. A mixed integer, linear programming is formulated to quantify the stranded resource. We perform a regional case study based on agricultural residues and energy crops.

3 - Potential Savings and Cost Allocations for Forest Fuel Transportation in Sweden

Mario Guajardo, Assistant Professor, NHH Norwegian School of Economics, Helleveien 30, Bergen, 5045, Norway,
Mario.Guajardo@nhh.no, Patrik Flisberg, Mikael Frisk, Mikael Ronnqvist

Efficient logistics is crucial to make forest fuels a competitive source of bioenergy. By using optimization models and a decision support system, we study alternatives to lower the costs in a case that accounts for all forest fuel transport operations in Sweden. This involves 200,000 transports of about 6.1 million tons of forest biomass. We identify potential savings of about 22%. As one of the alternatives is collaboration, we test cost allocation methods based on cooperative game theory.

4 - GIS-Based Allocation of Lignocellulosic Biorefineries and Depots

Daniela S. Gonzales, Texas A&M University, College Station, TX,
United States of America, anielasofia Gonzales@gmail.com,
Stephen W. Searcy

Our objective was to determine the structure of the likely biomass feedstock supply chain that will develop in the US based on the DOE concept of an advanced uniform feedstock format; the predicted availability of biomass (presented in the 2011 Billion Ton Study Update), the geographic location of suitable lands for biomass (based on the 2011 National Land Cover Data), and the transportation infrastructure. We use ArcGIS tools to identify the location of biorefineries and depots in the US.

Experts & Algorithms

Sponsor: Decision Analysis

Sponsored Session

Chair: Jason Merrick, Professor, Virginia Commonwealth University, P.O. Box 843083, 1015 Floyd Avenue, Richmond, VA, 23284, United States of America, jrmerrick@vcu.edu

1 - Experts & Algorithms: Lessons in Blending Analytics with Subjective Judgment

Cade Massey, Practice Professor, University of Pennsylvania, 3730 Walnut St., Huntsman 554, Philadelphia, PA, 19104, United States of America, cadem@wharton.upenn.edu, Jason Merrick

We share insights and tools gleaned from an 18-month project implementing an analytics-based decision model for the admissions process at a large graduate school. Issues include preference elicitation, forecasting, optimization and group decision-making. We address both the theoretical and practical challenges involved.

2 - Technology Implementation Decisions: A Multi-objective, Multi-Stakeholder Case Study

Ed Cook, Capital One, ed.cook@capitalone.com, Jason Merrick

Major corporate technology adoption decisions are based on the financial case and take an organization-wide viewpoint. However, technology implementation decisions are different in nature and affect various stakeholders across the organization with multiple, conflicting objectives. Our case study examines how to implement a major technology change across a thousand branches of a national bank and to avoid the costly delays and problems that afflicted other banks implementing this technology.

3 - Overcoming Algorithm Aversion

Berkeley Dietvorst, Doctoral Student, The Wharton School, 3730 Walnut St, Suite 500, Philadelphia, PA, 19104, United States of America, diet@wharton.upenn.edu, Joe Simmons, Cade Massey

How can we get forecasters to use algorithms instead of human judgment? In four experiments, participants decided whether to use an algorithm's forecasts or their own to complete a forecasting task. In the treatment conditions we gave participants the option to modify the algorithm's forecasts if they chose to use it. Participants chose to use the algorithm much more often when they could modify its forecasts, even when the amount that they could modify its forecasts was severely restricted.

4 - Failure to Replicate Hyperbolic Discounting in Large-scale Studies

Yael Grushka-Cockayne, Assistant Professor, Darden School of Business, University of Virginia, FOB 163, 100 Darden Blvd, Charlottesville, VA, United States of America, grushkay@arden.virginia.edu, Daniel Read, Casey Lichtendahl

We propose a simple model in which future income risk can explain hyperbolic and anti-hyperbolic discounting. We present results from multiple experimental studies involving thousands of participants, some of whom were asked Gallup-type questions about future income. Overall, we fail to replicate hyperbolic discounting. Instead, we find that anti-hyperbolic discounting effects are large and reliable across studies, with little dependency on income expectations.

Joint Session DAS/ENRE: Panel Discussion: Climate Assessment and Decision Analysis

Sponsor: Decision Analysis & ENRE

Sponsored Session

Moderator: Melissa Kenney, Research Assistant Professor, University of Maryland, 5825 University Research Court, Suite 4001, College Park, MD, 20740, United States of America, kenney@umd.edu

1 - Decision Analysis in the IPCC and National Climate Assessment

Robert Lempert, Senior Scientist, RAND, 1776 Main St, Santa Monica, CA, 90407, United States of America, lempert@rand.org

Decision and risk analysis is playing an increasingly important role in scientific assessments of climate change. This talk will describe this role, drawing on the speaker's experience as a lead author of the decision support chapters of both the US National Climate Assessment and Intergovernmental Panel on Climate Change (IPCC) Working Group II Fifth Assessment Report.

2 - Climate Change Decision Support Systems: Validation Required

Richard Moss, Senior Scientist, Pacific Northwest National Lab, Joint Global Change Research Institute, 5825 University Research Ct. Ste. 3500, College Park, MD, 20740, United States of America, rhm@pnnl.gov

An increasing number of climate change decision support systems are being offered for use. Overall, little is known about the effectiveness of many of these tools. Failure to assess existing tools and practices is setting the research community up for a loss of trust. This paper describes aspects of climate-related decision support that require evaluation and argues that the decision analysis community has a leadership role to play in this process through the US National Climate Assessment.

3 - Climate Indicators: Do They Help or Hinder Decision Processes?

Melissa Kenney, Research Assistant Professor, University of Maryland, 5825 University Research Court, Suite 4001, College Park, MD, 20740, United States of America, kenney@umd.edu

Though in Decision Analysis indicators measure objectives, in practice indicators may not be linked to specific decision contexts. I will describe an effort to develop recommendations to the U.S. Global Change Research Program for a wide-reaching indicator system to inform decision about climate changes and impacts. I will discuss preliminary work to determine if these kinds of indicators are useful for decision structuring or as attributes in different decision processes.

4 - Discussant

Robert O'Connor, roconnor@nsf.gov

5 - Risk and Resilience for Climate Change

Igor Linkov, Risk and Decision Science Team Lead, US Army Corps of Engineers, Engineer R&D Center, 696 Virginia Rd, Concord, MA, United States of America, Igor.Linkov@usace.army.mil, Catherine Fox-lennt

An urgent need exists to complement the existing knowledge-base of climate change risk by further developing frameworks enabling system-wide analysis. A promising lens is resilience, a system property that can be planned for and managed irrespective of adverse impact or system vulnerability. This presentation will summarize our ideas and case study on the use of risk-based decision making and decision-driven resilience management.

Airlines Network Planning and Scheduling Applications

Sponsor: Aviation Applications

Sponsored Session

Chair: Ahmed Abdelghany, Associate Professor, Embry-Riddle Aeronautical University, 600 S. Clyde Morris blvd, Daytona Beach, United States of America, abdel776@erau.edu

1 - Stochastic Fleeting with Itinerary Attractiveness in MapReduce

Diego Klabjan, Professor, Northwestern University, Evanston IL, United States of America, d-klabjan@northwestern.edu

Stochastic fleeting models with discrete choice based on attractiveness are computationally challenging. Parallel computing via Hadoop and MapReduce have become ubiquitous. We study algorithms under the MapReduce parallel framework for stochastic fleeting with attractiveness.

2 - Airline Trip Segmentation

Manini Madireddy, Sabre, 3150 Sabre Dr, Southlake, TX, 76092,
United States of America, Manini.Madireddy@sabre.com,
Aditya Kothari, Goda Doreswamy, Sergey Shebalov,
Ramasubramanian Sundararajan

We consider the problem of recommending customized product bundles to airline customers based on their behavior and preferences. We present an approach to correlate candidate product designs to traveler behavior, based on historical evidence of travel and purchase patterns. We use clustering algorithms to segment travelers and further demonstrate how the goodness of a clustering result can be measured through the extent to which it enables good product design.

3 - Predicting Operational Performance for Airline Schedules through Simulation

Mahmood Zangui, Senior Systems Engineer, Optym, 7600 NW
5th Place, Gainesville, FL, 32607, United States of America,
mahmood.zangui@optym.com, Eric Camacho, Yu-shiu Lin,
Pranav Gupta, Jeff Borges, Lonny Hurwitz

An airline schedule is a highly interconnected network; where one disruption can propagate through the network and delay several flights. Airlines are interested in measuring the robustness of their schedules against such disruptions, and in forecasting their operational performance. We have built a simulation model that can predict key performance indices for given schedules. We will share our modeling approach, challenges we faced, and lessons learned during development of this model.

4 - A Hybrid Model for Airline Flight Frequency and Scheduling Optimization

Ahmed Abdelghany, Associate Professor, Embry-Riddle
Aeronautical University, 600 S. Clyde Morris Blvd, Daytona
Beach, FL, United States of America, abdel776@erau.edu,
Khaled Abdelghany, Farshid Azadian

An optimization model that considers the joint optimization of airline flight frequency and flight scheduling decisions is presented. The model takes into consideration the schedule of other competing airlines. Several experiments are presented to illustrate the model capabilities.

City Logistics and Sustainable Urban Freight Systems - I

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Johanna Amaya, Rensselaer Polytechnic Institute, 110 8th St.
JEC 4037, Troy, NY, 12180, United States of America, amayaj@rpi.edu

1 - Public Sector Initiatives Sustainable Urban Freight Systems Part I

Jeffrey Wojtowicz, RPI, United States of America, wojtoj@rpi.edu,
Cara (xiaokun) Wang, Johanna Amaya, Jose Holguin-Veras,
Miguel Jaller, Carlos A. Gonzalez-Calderon, Ivan Sanchez-Diaz,
Stacey Hodge, Michael Browne, Daniel Haake

Transportation policy should ensure freight is moved efficiently as it is a physical manifestation of the economy. From this study, planners are provided with guidelines to implement initiatives addressing freight issues. Initiatives were organized as part of a continuum, from supply to demand side; underpinned by stakeholder engagement. This paper focuses on supply side and covers infrastructure management, parking and loading, vehicles, and traffic management along with stakeholder engagement.

2 - Toward a Freight-friendly Built Environment: A Mixed Method Approach

Kazuya Kawamura, Associate Professor, University of Illinois at
Chicago, MC348, 412 S. Peoria St., Chicago, IL, 60607,
United States of America, kazuya@uic.edu, Takanori Sakai

This study uses both parking violation data for quantitative analysis and video images collected from pole-mounted portable video recorders for qualitative contextual assessment to shed light on the relationship between delivery vehicle activities and the built environment including streetscape in Chicago.

3 - Electric Vehicle Routing Problem

Jane Lin, University of Illinois at Chicago, 842 W. Taylor Street
(M/C 246), Chicago, IL, 60607, United States of America,
janelin@uic.edu, Wei Zhou

This paper presents a general Electric Vehicle Routing Problem (EVRP) that finds the optimal routing strategy with minimal travel time cost and energy cost as well as number of EVs dispatched. As demonstrated with a case study in Austin TX, the effect of vehicle load on routing strategy cannot be ignored. Compared to diesel truck VRP, EVRP has comparable travel time and distance but long en-route re-charging time. Lastly, the network topology greatly affects the routing strategies.

4 - A Plugin Hybrid Electric Vehicle Routing Problem with Recharging and Refueling

Matthew Roorda, Associate Professor, University of Toronto, Civil
Engineering Department, University of Toronto, Toronto, On,
M5S 1A4, Canada, roordam@ecf.utoronto.ca, Mehdi Nourinejad,
Sina Bahrami, Glareh Amirjamshidi

This paper presents a Hybrid Electric Vehicle Routing Problem which specifically considers Electric Vehicles and Plugin Hybrid Electric Vehicles. A modified Clarke Wright algorithm is proposed. The model is applied to the City of Toronto. The results of the model provide managerial insight. For instance, the analysis shows the total number of Electric Vehicles is insensitive to the battery capacity but sensitive to the fuel tank capacity of Plugin Hybrid Electric Vehicles.

Geospatial Analysis in Transportation and Logistics

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Eunsu Lee, Assistant Professor, New Jersey City University, 2039
John F. Kennedy Blvd, Jersey City, NJ, 07305, United States of
America, elee3@njcu.edu

1 - Spatial Matching Models: Freight Demand Analyses Considering Partner Selection and Joint Decision

Dapeng Zhang, Doctoral Student, Rensselaer Polytechnic
Institute, zhangd9@rpi.edu, Cara (xiaokun) Wang

Freight demand has not been understood comprehensively due to unique features: the freight activity is a result of collaboration of multiple agents. In specific, the collaboration can be observed by partner selection and joint decision making processes. As existing models cannot capture such features, this research develops an innovative model, spatial matching model, to fill the void. The proposed model is specified based on freight behavior, validated by experiments, and explained by examples.

2 - Stochastic Market Boundaries and Fertilizer Plants

Sumadur Shakyia, Assistant Professor, California State Univ.
Monterey Bay, 100 Campus Center, Seaside, CA, 93955,
United States of America, sshakyia@csumb.edu, William Wilson,
Bruce Dahl

The study analyzes spatial competition among nitrogen-based fertilizer plants in United States, to gain insight on viability of newly announced fertilizer plants and structure of supply chain, now and in future, at a macro level using locational information; linear and mixed-integer based optimization techniques and geographical information systems methods are applied to arrive at current spatial equilibrium and most likely future cases for structure of supply chain in United States.

3 - An Agent-based Modeling for Remotely Piloted Aircraft (RPAS) Package Delivery in Rural Area

Ali Rahim Taleqani, Research Assistant, Upper Great Plains
Transportation Institute, Dept. 2880, P.O. Box 6050, Fargo, ND,
58108-6050, United States of America,
ali.rahimtaleqani@ndsu.edu, Eunsu Lee

The purpose of this paper is to examine the agent-based modeling concept in the context of urgently-needed package delivery system by means of Remotely Piloted Aircraft (RPA). The target market is assumed to be in rural area in Cass County North Dakota where travelling distance to major markets are longer and accessibility is not well developed. The implementation is constructed over Agent Analyst simulation platform in ArcGIS software.

4 - Analysis of Alabama Statewide Freight Flow after the International Capacity Expansion

Jaehoon Kim, University of Alabama in Huntsville, 301
Sparkman Dr., Technology Hall S239, Huntsville, AL, 35899,
United States of America, jk0012@uah.edu, Michael Anderson

This study presents a methodology to estimate state level of freight flow. Using FAF3 database, disaggregated state level O/D matrices are developed and applied to the State of Alabama. Thereafter, the expected freight flow variation affected by the Panama Canal expansion is applied to the O/D matrices. The developed O/D matrices are assigned to the statewide network. The study identifies current Alabama freight flow pattern and new freight flow trend after the Panama Canal expansion.

5 - Facility Location Problem Considering Time Window and Land use Plan using GIS

Eunsu Lee, Assistant Professor, New Jersey City University, 2039 John F. Kennedy Blvd, Jersey City, NJ, 07305, United States of America, elee3@njcu.edu, Sumadhur Shakya, Alan Dybing

This paper investigates the facility location problem through network space, considering traversable truck roads, thereby providing a strategic decision for identifying a depot location in consideration of vehicle routings from a real application. This study provides a ready-to-use example of how to adopt state-of-the-art spatial technology and operations research using Geographic Information Systems (GIS), and bring it to state-of-practice.

Facility Location and Inventory Routing

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Natasha Boland, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332-0205, United States of America, natashia.boland@isye.gatech.edu

1 - Facility Location Design under Continuous Traffic Equilibrium

Zhaodong Wang, University of Illinois, 205 N. Mathews Ave, Urbana, IL, United States of America, zwang137@illinois.edu, Yanfeng Ouyang

This paper proposes both a continuum approximation model and a discrete mixed-integer program model to solve the facility location problem under traffic congestion in continuous space. Customized algorithms are developed and analytical properties are presented. Numerical examples show the advantages of the continuous models and shed managerial insights.

2 - Winter is Coming: A Robust Optimization Approach to Inventory Routing

Joel Tay, Graduate Student, Operations Research Center, MIT, 77 Massachusetts Ave, Bldg. E40-149, Cambridge, MA, 02139, United States of America, joeltay@mit.edu, Swati Gupta, Dimitris Bertsimas

We consider the finite horizon inventory routing problem with uncertain demand, e.g. supplying residential heating oil to customers. Current techniques that solve this problem with stochastic demand do not scale to real-world data sizes. We propose a MIP formulation using robust optimization that is made tractable with heuristic route selection, warm starts and column generation. We show promising computational results that demonstrate scalability to real-world applications.

3 - A Matheuristic for the Multi-vehicle Inventory Routing Problem

Natashia Boland, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332-0205, United States of America, natashia.boland@isye.gatech.edu, Cristina Archer, Grazia Speranza

We consider the inventory routing problem in which a supplier must replenish a set of customers using a limited fleet of capacitated vehicles over a discrete time horizon. The goal is to minimize the total cost of the distribution, comprising the inventory costs at supplier and customers, and the routing cost. We present a matheuristic, combining tabu search and integer programming formulations. Extensive computational experiments on benchmark instances show the effectiveness of the method.

Railway Applications Section Student Paper Award

Sponsor: Railway Applications

Sponsored Session

Chair: April Kuo, BNSF Railway, 2400 Western Center Blvd., Fort Worth, TX, United States of America, April.Kuo@BNSF.com

1 - Railway Applications Student Paper Award

April Kuo, BNSF Railway, 2400 Western Center Blvd., Fort Worth, TX, United States of America, April.Kuo@BNSF.com

Rail Applications Section (RAS) sponsored a student research paper contest on analytics and decision making in railway applications. Papers must advance the application or theory of OR/MS for improvement of freight or passenger railway transportation, and it must represent original research that has not been published elsewhere by the time it is submitted. Authors of the First, Second and Third Place award winning papers will present their papers in this session.

Transportation Network Analysis and Optimization

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Andres Medaglia, Professor, Universidad de los Andes, Cra 1 Este No 19A - 40, Bogota, Colombia, amedagli@uniandes.edu.co

1 - On the Robust Shortest Path Problem:

A Pulse Algorithm Approach

Daniel Duque, Instructor, Universidad de los Andes, Cr 1E N 19A-40, Bogota, Colombia, d.duque25@uniandes.edu.co, Andres Medaglia

In this variant of the robust shortest path problem, the cost of traversing an arc is given by a discrete set of scenarios. The problem is then to find a (robust) path that takes into account the information arising from the multiple cost realizations of the possible scenarios. To account for a robust path, we adopt the bw-robustness criterion, which ameliorates the dramatic role played by the worst case analysis. To solve the problem, we extend the pulse algorithm, a general-purpose solution strategy that has been used on shortest path problems with side constraints. The proposed algorithm compares favorably against an integer programming approach both in terms of speed and scalability.

2 - Reliability of Interdependent Urban Infrastructure Network:

Failure Propagation and Consequential Social Impact

Liquan Lu, UIUC, United States of America, liquanlu2@illinois.edu, Yanfeng Ouyang, Xin Wang

Modern city relies on a network of multiple interdependent infrastructure systems, hence more vulnerable. Random or premeditated infrastructure disruption can propagate to large areas and cause social disasters. The system reliability is investigated under both deterministic and stochastic disruption propagation and social impacts are evaluated by a user equilibrium model.

3 - Lagrangian Relaxation Solution Approach for the Vehicle Routing Problem with Pickup and Delivery

Monirehalsadat Mahmoudi, Arizona State University, School of Sustainable Engineering and the Built Environment, Tempe, AZ, United States of America, mmahmoudi@asu.edu, Xuesong Zhou

We propose a new time-discretized multi-commodity network flow model for the pickup and delivery problem with time windows based on the integration of vehicles' carrying-states within space-time transportation networks. By a Lagrangian relaxation approach, the primal multi-vehicle routing problem is decomposed to a sequence of single vehicle routing sub-problems with Lagrangian multipliers for individual passengers' request, each can be solved by a forward dynamic programming solution algorithm.

4 - Combined Maintenance-routing Optimization: The Case of a Water Utility

Andres Medaglia, Professor, Universidad de los Andes, Cra 1 Este No 19A - 40, Bogota, Colombia, amedagli@uniandes.edu.co, Daniel Duque, Raha Akhavan-Tabatabaei, John E. Fontecha, Juan Pablo Rodriguez

The combined maintenance-routing optimization problem deals with planning and scheduling maintenance operations for a set of geographically-distributed sites that are subject to non-deterministic failures. To solve this problem, a maintenance model determines the optimal time to perform preventive maintenance operations for each site; while a routing optimization engine schedules visits of a set of technicians that perform the operations. We present a case study in the city of Bogot., where the water utility needs to perform maintenance operations to prevent sediment-related blockages of the sewer system.

Predictive Modeling and Control for Additive Manufacturing

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Qiang Huang, Associate Professor, University of Southern California, GER 240, USC, Los Angeles, CA, United States of America, qiang.huang@usc.edu

Co-Chair: Arman Sabbaghi, Assistant Professor Of Statistics, Purdue University, Department of Statistics, 150 N. University Street, West Lafayette, IN, 47907, United States of America, sabbaghi@purdue.edu

1 - Bayesian Additive Modeling for Quality Control of 3D Printed Products

Arman Sabbaghi, Assistant Professor Of Statistics, Purdue University, Department of Statistics, 150 N. University Street, West Lafayette, IN, 47907, United States of America, sabbaghi@purdue.edu, Tirthankar Dasgupta, Qiang Huang

Three-dimensional (3D) printing is a disruptive technology with the potential to revolutionize manufacturing. However, control of product deformation remains a major issue. Quality control requires a generic methodology that can predict deformations for a wide range of designs based on data available for a few previously manufactured products. We develop a Bayesian methodology to update prior conceptions of deformation for a new design based on printed products of different shapes.

2 - Predictive Modeling of in-plane Geometric Deviation for 3d Printed Freeform Products

He Luan, University of Southern California, GER 236, USC, Los Angeles, CA, United States of America, hluan@usc.edu, Qiang Huang

Although additive manufacturing holds great promise, dimensional geometric accuracy remains a critical issue and lacks of generic solve method. Our work fills the gap by establishing a general model predicting in-plane deviations of AM built freeform products. Built upon our previous model for cylinder and polyhedron, this work directly predicts freeform shape deviations from CAD design. SLA experiments validated this method, indicating the prospect of optimal compensation for freeform products.

Data Analytics for Reliability Evaluation and Maintenance Optimization I

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Qingyu Yang, Assistant Professor, Wayne State University, 4815 4th street, Room 2167, Detroit, MI, 48202, United States of America, qyang@wayne.edu

Co-Chair: Eunshin Byon, Assistant Professor, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, ebyon@umich.edu

1 - Modeling of Degradation Data from Disjoint Time Intervals

Xiao Liu, liuxiao@sg.ibm.com

Motivated by real-life problems, this paper presents a statistical model for degradation data collected from disjoint time intervals (blocks). Within each block, high-frequency degradation measurements are available. Of interest is the extreme (i.e., maximum or minimum) of the degradation level within each interval.

2 - A Generic Method for Analyzing Complex Data with Covariates

Haitao Liao, Associate Professor, The University of Arizona, The University of Arizona, Tucson, AZ, 85716, United States of America, hliao@email.arizona.edu, Yiwen Xu, Neng Fan

In this research, we study an automated modeling approach to constructing phase-type (PH) distributions via mathematical optimization and develop PH-based models to analyze complex data with covariates.

3 - A Discrete Semi-markov Model to Determine Optimal Repair Decisions for Trend-renewal Process

Ernie Love, Professor Emeritus, Simon Fraser University, 8888 University Drive, Burnaby, BC, v5a1r5, Canada, love@sfu.ca, Qingyu Yang, Wujun Si

The failure and repair process of a repairable machine (system) is modeled as a trend-renewal process permitting the modeling of imperfect repairs. The state of such a system can be characterized by the real age of the system and the failure count permitting the use of a two-state semi-Markov model to determine optimal repair/replacement decisions. Threshold type policies are established. Failure data from a cement kiln is used to demonstrate the approach.

4 - A Mixed Effect Kijima Model and Application in Optimal Maintenance Analysis

Wujun Si, PhD Student, Wayne State University, Detroit, MI, 48202, United States of America, wujun.si@wayne.edu, Qingyu Yang

The Kijima model has been widely applied to analyzing repairable systems with general repair efficiency. Most existing studies treat the repair efficiency as a fixed value while it can vary among a series of repair actions. In this paper, we propose a mixed effect Kijima model to characterize the variation of repair efficiency. An SAEM algorithm is developed for model parameter estimation. Based on the proposed model an optimal maintenance analysis is developed as a case study.

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Jingshan Li, Professor, 1513 University Ave, Madison, WI, 53706, United States of America, jli252@wisc.edu

1 - A Quality Flow Model in Battery Manufacturing Systems for Electric Vehicles

Feng Ju, Assistant Professor, Arizona State University, Tempe, AZ, 53705, United States of America, jeffrey0930@gmail.com

In this paper, we present a flow model to analyze product quality in battery assembly lines with 100% inspections and repairs for defective parts. A Markov chain based model is introduced to analyze quality propagations along the battery production line. Analytical expressions of final product quality are derived and structural properties are investigated. A case study is presented to illustrate the applicability of the method.

2 - Energy-efficient Production Systems through Schedule-based Operations

Liang Zhang, University of Connecticut, 371 Fairfield Way UNIT 4157, Storrs, CT, 06269-4157, United States of America, liang@engr.uconn.edu, Jorge Arinez, Stephan Biller, Guorong Chen

Control of production operations is considered as one of the most economical methods to improve energy efficiency in manufacturing systems. This paper investigates energy consumption reduction in production systems through effective scheduling of machine startup and shutdown. The theoretical methods are applied through a case study in automotive paint shop operations.

3 - Adaptive Sensor Allocation Strategy for Process Monitoring and Diagnosis in a Bayesian Network

Kaibo Liu, Assistant Professor, UW-Madison, 1513 University Avenue, Madison, 53706, United States of America, kliu8@wisc.edu, Xi Zhang, Jianjun Shi

This talk proposes a novel approach to adaptively reallocate sensor resources based on online observations in a Bayesian Network model, which can enhance both monitoring and diagnosis capabilities. The proposed method addresses two fundamental issues in an integrated manner: when to reallocate sensors and how to update sensor layout. Case studies are performed on a hot forming and a cap alignment process to illustrate the performance of the proposed method under different fault scenarios.

4 - Online Steady-state Detection for Process Control using Multiple Change-point Models

Shiyu Zhou, Professor, University of Wisconsin-Madison, Department of Industrial and Systems Eng, 1513 University Avenue, Madison, WI, 53706, United States of America, shiyuzhou@wisc.edu, Jianguo Wu, Yong Chen, Xiaochun Li

Steady-state detection is critical in process performance assessment, fault detection and process automation and control. We proposed a robust on-line steady-state detection algorithm using multiple change-point model and particle filtering techniques. Extensive numerical analysis shows that the proposed new method is more accurate and robust than the other existing methods.

Invited Session

Chair: Binil Starly, Associate Professor, North Carolina State university, 406 Daniels Hall, Raleigh, NC, 27607, United States of America, bstarly@ncsu.edu

1 - Mining Dynamic Recurrences in Nonlinear and Nonstationary Systems for Innovative Manufacturing

Hui Yang, Associate Professor, Pennsylvania State University, 310 Leonhard Building, Industrial and Manufacturing Eng., State College, PA, 16801, United States of America, huy25@psu.edu, Yun Chen

Nonlinear dynamics arise whenever multifarious entities of a system cooperate, compete, or interfere. Effective monitoring and control of nonlinear dynamics will increase manufacturing system quality and integrity, thereby leading to significant economic and societal impacts. This talk will present novel nonlinear methodologies that mine dynamic recurrences from in-process big data for real-time manufacturing system informatics, monitoring, and control.

2 - In Situ Printing – An Alternative Three Dimensional Laden Structure Fabrication Method

Yigong Liu, Drexel University, 3141 Chestnut St., Mechanical Engineering & Mechanics (MEM), Philadelphia, PA, 19104, United States of America, yl525@drexel.edu

Recapitulating a structure that mimics the anatomic geometries and intratissue cell distribution as in live organism is a major challenge of tissue engineering nowadays. This article presents a Solid Freeform Fabrication (SFF) based in situ printing method which enables simultaneous cross-linking at ambient environmental conditions (temperature and pressure). 3D laden structure with stability time of 14 days in cell culture environment was achieved by the in situ printing method.

3 - Maskless Fabrication of Cell-laden Microfluidic Chips

Qudus Hamid, Drexel University, 3141 Chestnut St, Philadelphia, PA, 19104, United States of America, qh25@drexel.edu, Wei Sun, Chengyang Wang, Yigong Liu

The utilization of the microfabrication technique to fabricate advanced computing chips has exponentially increased in the last few decades. Though many conventional microfabrication techniques today uses very harsh chemicals, the authors believe that the manipulation of system components and fabrication methods may aid in the utilization of the microfabrication techniques used in fabricating computer chips to develop advanced biological microfluidic systems.

Sustainable Infrastructure

Sponsor: Simulation

Sponsored Session

Chair: Hakob Avetisyan, Assistant Professor, California State University, Department of Civil and Environmental En, 800 N. State College Blvd, Fullerton, CA, 92834, United States of America, havetisyan@fullerton.edu

1 - A Genetic Algorithm Based Multi-objective Resource Utilization Model for Construction Projects

Amir Movafegh, California State University, Department of Civil & Environmental Engi, 800 N. State College Blvd., Fullerton, CA, 92834, United States of America, amirmvffgh@csu.fullerton.edu, Hakob Avetisyan

Construction projects are traditionally scheduled assuming unlimited resources. Low efficiency of resource use and the ignorance of limited resource availability are the problems of these techniques. The current trend is towards sustainable construction where the resource-constrained scheduling technique seems more promising. In this study a multi-objective resource utilization model was developed to improve the efficiency level of resources and minimize the peak resource demand of the project.

2 - Use of Bayesian Network for Improving Value for Money Analysis

Deepak Sharma, Assistant Professor, Department of Civil and Environmental Engineering, California State University Fullerton, 800 N State College Blvd, Engineering Building 311, Fullerton, CA, 92831, United States of America, dsharma@fullerton.edu

Value for Money (VfM) analysis is a gateway to Public Private Partnerships (PPPs). Although VfM is the most versatile tool to justify the use of PPPs it has two limitations. First, the analysis cannot integrate qualitative and quantitative outcomes which allows for subjective decision making. Second, the analysis is quiet about risks that are exogenous and have low probability of occurrence. This work uses Bayesian Networks (BN) and simulation to address the shortcomings.

3 - Non-permutation Flowshop with Dependent Set-up Times and Missing Operations

Shaya Sheikh, Visiting Assistant Professor, University of Baltimore, 10 Ecoway Ct., Apt. 1A, Towson, MD, 21286, United States of America, ssheikh@ubalt.edu

In this paper, a mixed-integer linear programming (MILP) model is developed to solve non-permutation flowshop problem with objective of minimizing makespan and increasing service level. Setup times are assumed to be dependent to sequence of jobs on each stage and jobs are allowed to skip one or more stages. The effectiveness and robustness of the model is analyzed and assessed using a case study. A heuristic for finding initial solutions with promising quality is presented.

4 - Environmental System Modeling and Simulation of Atmospheric Fate of Sulfur-dioxide

Sudarshan Kurwadkar, Assistant Professor, California State University - Fullerton, 800 N. State College Blvd, Fullerton, CA, 92833, United States of America, skurwadkar@fullerton.edu

The objective of this study is to illustrate the transformation and deposition of various sulfur compounds using STELLA software for simulations and visualizations to demonstrate the effectiveness of a system-based approach to model environmental processes. This study documents the effectiveness of STELLA software in modeling selected environmental processes such as transformation and deposition of sulfur dioxide in the atmosphere.

5 - Defining Sustainability Index for Construction Equipment and Minimizing Costs and Emissions

Hakob Avetisyan, Assistant Professor, California State University, Department of Civil and Environmental Eng, 800 N. State College Blvd, Fullerton, CA, 92834, United States of America, havetisyan@fullerton.edu

The aim of the research was to develop a measure for assessing the sustainability of construction equipment as "Sustainability Index" (SI) that can be used as a component for construction projects sustainability criteria. The other goal was using SI for minimizing costs and emissions from construction equipment through math modeling. Extended analyses were conducted to collect data and through surveys to statewide contractors. Results indicate that similar approach can be applied nationwide.

Supply Chain Management I

Contributed Session

Chair: Niu Yu, Huazhong University of Science & Technology, 1037 Luoyu Road, Wuhan, China, nyu@hust.edu.cn

1 - The Value of Demand Forecast Updates in a Supply Chain under Asymmetric Information

James Cao, University of Saskatchewan, 118 Chubb Cove, Saskatoon, SK, S7T0E7, Canada, cao@edwards.usask.ca

We explore the role of forecast updating in a supply chain with asymmetric demand information, where a supplier sells to a downstream retailer who benefits from demand updates when sales are realized in each period. Although the supplier is unable to observe the demand, it is possible to infer the state of demand through the retailer's ordering activity. In each period the supplier attempts to extract as much profit as possible based upon her best guess regarding the state of the market.

2 - Dynamic Resource Allocation in Supply Chain Network Systems

Nasim Nezamoddini, SUNY at Binghamton, Binghamton, NY, United States of America, nasim.nezam@gmail.com, Sarah Lam

The robust network design with two different types of uncertainties including uncertainties in environment and system itself is studied. The multi-commodity supply chain network with suppliers, manufacturing plants, distribution centers and markets is considered as a typical network system. The mathematical model is introduced reflecting effect of stochastic variables such as demand, facilities and performance failures. The new method is presented to solve presented multi-stage dynamic model.

3 - Capacity Allocation with Demand Competition: Uniform, Proportional, and Lexicographic Mechanisms

Niu Yu, Huazhong University of Science & Technology, 1037 Luoyu Road, Wuhan, China, nyu@hust.edu.cn, Jianbin Li, Zhixin Liu

We examine capacity allocation mechanisms in a two-echelon supply chain comprising a monopoly supplier and duopoly retailers with asymmetric market powers and demand competition. The supplier allocates limited capacity to retailers according to uniform, proportional, or lexicographic mechanisms. Our results show that regardless of whether retailer market powers are symmetric or asymmetric, lexicographic allocation, regardless of order priority by retailer, is the best choice for the supplier.

4 - Approximate Dynamic Programming and Real Options Approaches for Sourcing Strategies under Risks

Purushottam Meena, Assistant Professor, NYIT, School of Management, Old Westbury NY 11568, United States of America, pmeena@nyit.edu

This paper demonstrates the use of real options for the valuation of different sourcing strategies for supply disruptions risk management. The Approximate Dynamic Programming (ADP) approach is used to solve the problem. The results of ADP are compared with backward recursion to benchmark the performance of ADP.

Managing Supply Chain Disruptions

Contributed Session

Chair: Hsin-Tsz Kuo, National Taiwan University, No.1, Sec. 4, Roosevelt Road, Taipei, 10617, Taiwan - ROC, d01741003@ntu.edu.tw

1 - Topological Resilience Analysis of Supply Networks under Random Disruptions and Targeted Attacks

Wenjun Wang, University of Iowa, S283 Pappajohn Business Building, Iowa City, IA, 52242, United States of America, wenjun-wang@uiowa.edu, Nick Street, Renato De Matta

We exploit the resilience embedded in the supply-network topology by investigating the multiple-path reachability of each demand node to other nodes, and propose a novel network resilience metric. We also develop new supply-network growth strategies that reflect the heterogeneous roles of different types of nodes in the network. We demonstrate the validity of our resilience metric and experimentally show the effectiveness of our growth model.

2 - Post-disaster Disruptive Crop Supply Chain Resilience with Stockpile Hoarding

Hsin-Tsz Kuo, National Taiwan University, No.1, Sec. 4, Roosevelt Road, Taipei, 10617, Taiwan - ROC, d01741003@ntu.edu.tw, Jih-bing Sheu

This paper presents a conceptual model to analyze the members' opportunistic behavior on post-disaster disruptive crop supply chain resilience. In this study, a post-disaster supplier psychology theory is proposed to investigate the antecedents of stockpile hoarding that may be revealed in a disruptive supply chain. Moreover, we examine the decisions of the suppliers with government intervention by selling stockpiled crops to the crop supply chain members for crop market stabilization.

3 - Empirical Research on Supply Chain Resilience Factors

Jingjing Li, Student, Huazhong University of Science and Technology, Luoyu Road 1037, Hongshan District, Wuhan, China, 1471058151@qq.com

Supply chain resilience is an effective index to measure the ability of the supply chain to deal with emergencies, including the ability to resist interruptions and self-healing after emergencies. The conceptual model of supply chain resilience is established on the basis of theory, including five factors. According to the empirical study using SEM, the impact of various factors on the supply chain resilience is quantized. It has substantial significance in improving supply chain resilience.

Network Mapping

Sponsor: Military Applications

Sponsored Session

Chair: Andrew Hall, COL, U.S. Army, 4760 40th St N, Arlington, VA, United States of America, AndrewOscarH@aol.com

1 - Network Inference from Grouped Data

Charles Weko, Senior Reserve Manpower Analyst, US Army, 2812 Nobel Fir Court, Woodbridge, VA, 22192, United States of America, charles.w.weko.mil@mail.mil

In many fields, network structure is not directly observed. Inferring implicit network structure requires a probabilistic model of grouped data. Grouped data records the manner in which a population forms subsets. In the existing literature, network inference from grouped data is performed using descriptive statistics. This presentation defines stochastic models for modeling group formation and applies the parameters to the famous 18th century Chinese novel, Dream of the Red Chamber.

2 - A Graph Comparison Approach to Network Attack and Defense

Jonathan Roginski, Applied Mathematics, NPS, Monterey, United States of America, jwrogins1@nps.edu

The promise of network science is to provide a foundation that supports understanding the large, dynamic, complex networks that characterize life today. In the Department of Defense, we create, manage, and defend against change in these complex networks. However, the scientists and analysts providing decision support are constrained by an acknowledged lack of tools for proper modelling of network topology and quantification of network change. In this research, we begin with the well-known problem of graph isomorphism and abstract it to the idea of similarity between graphs, rather than graph "sameness." We use structure rather than statistics to quantify similarity between graphs by introducing a matrix that captures more graph topological information than existing metrics or descriptive statistics. We show that where current structural metrics fail, the newly introduced distance-k matrix enables discrimination between graphs. We also show a methodology through which a network may be "triaged" to identify vertices which are potentially influential on the network's topology. Those candidate vertices are then analyzed using the distance-k matrix to determine the "distance between graphs," thereby quantifying the change in the network under vertex removal. The result is a "target set" of vertices a decision maker can choose from, based upon mission requirements, desired effect, and resources available-supporting attack, defense, and stability operations.

3 - A Framework for Comparing Networks

Raluca Gera, Naval Postgraduate School, Department of Applied Mathematics, Monterey, CA, United States of America, rgera@nps.edu

A challenging problem in studying large networks is that networks data is generally incomplete and often impossible to observe all members and interactions within the network. Researchers try to infer as much as possible of a network and study its structure and function. Our approach is to create a ground truth topology, infer the topology using several inference algorithms, and then compare the inferred to the true topology, using synthetic and real networks.

4 - Discovering an Unknown Network: An Optimization Based Approach

Piya Pal, University of Maryland, Electrical and Computer Engineering, College Park, United States of America, ppal@umd.edu

A central challenge in network tomography is to discover the structure of the network from partial observations. Depending on the type of the network, these measurements can provide us with different kinds of information. A key question in this regard is: how many measurements (or sensors) are needed to find out the topology of the network, and how should they be placed? We describe a discovery algorithm that iteratively maps the graph, by using entropy as a criterion for sensor placement.

1 - Falling Rule Lists

Fulton Wang, MIT, 5 Cambridge Center #792, Cambridge, MA, 02142, United States of America, fultonwang@gmail.com

Falling rule lists are classification models consisting of an ordered list of if-then rules, where (i) the order of rules determines which example should be classified by each rule, and (ii) the estimated probability of success decreases monotonically down the list. These kinds of rule lists are inspired by healthcare applications where patients would be stratified into risk sets and the highest at-risk patients should be considered first.

2 - Statistical Models for Characterizing the Heterogeneous Wake Effects in Multi-turbine Wind Farms

Mingdi You, PhD Candidate, University of Michigan, 1205 Beal Avenue, IOE 1773, Ann Arbor, MI, 48109, United States of America, mingdyou@umich.edu, Eunshin Byon, Giwhyun Lee

Wind turbines in a wind farm exhibit heterogeneous power generations due to wake effects. Because upstream turbines absorb kinetic energy in wind, downstream turbines produce less power. Moreover, the power deficit at downstream turbines shows heterogeneous patterns, depending on weather conditions. This study introduces a new approach for characterizing heterogeneous wake effects. A case study demonstrates the proposed approach's superior performance over commonly used alternative methods.

3 - Sparse Precision Matrix Selection for Fitting Gaussian Random Field Models to Large Data Sets

Sam Davanloo Tajbakhsh, Visiting Assistant Professor, Virginia Tech, 412 Hutcheson, Blacksburg, VA, 24060, United States of America, sdt144@vt.edu, Serhat Aybat, Enrique Del Castillo

Fitting Gaussian random field models and finding the Maximum Likelihood Estimate (MLE) of the parameters requires a nonconvex optimization. The problem is aggravated in big data settings since the per iteration computational complexity of MLE is $O(n^3)$ where n is the number of distinct spatial locations. We propose a theoretically provable two-stage algorithm which solves a semidefinite program in the first stage and a least square problem in the second stage.

4 - Sensor Driven Condition Based Generation Maintenance and Operations Scheduling

Murat Yildirim, PhD Student, Georgia Institute of Technology, 755 Ferst Drive, Atlanta, GA, 30332, United States of America, murat@gatech.edu, Nagi Gebrael, Andy Sun

We propose an integrated framework, which combines (1) predictive analytics methodology that uses real-time sensor data to predict future degradation and remaining lifetime of generators, with (2) novel optimization models that transforms these predictions into cost-optimal maintenance and operational decisions. We present extensive computational experiment results to show proposed models achieve significant improvements in cost and reliability.

Improving Efficiency and Effectiveness of Supply Chains

Cluster: Scheduling and Project Management

Invited Session

Chair: Chelliah Sriskandarajah, Hugh Roy Cullen Chair In Business Administration, Texas A&M University, 320Q Wehner, 4217 TAMU, College Station, TX, 77843, United States of America, chelliah@mays.tamu.edu

1 - Outpatient Appointment Scheduling under Patient Heterogeneity and Patient No-shows

Seung Jun Lee, PhD Student, Texas A&M University, 320N Wehner Building, College Station, TX, 77845, United States of America, sjlee@mays.tamu.edu, Chelliah Sriskandarajah, Gregory Heim, Yunxia Zhu

We study an outpatient appointment scheduling system under conditions of patient heterogeneity in service times and patient no-shows. We contribute by using more sophisticated sequential block scheduling policies, leading to effective appointment schedules when scheduling two patient types. We extend our algorithm to incorporate patient no-shows. Next, our block scheduling algorithm is adapted where outpatient clinics use an open-access policy.

2 - A Framework for Analyzing the U.S. Coin Supply Chain

Yiwei Huang, Mays Business School, Texas A&M University, 320M Wehner Building - 4217 TAMU, College Station, TX, 77843-4217, United States of America, yhuang@mays.tamu.edu, Subodha Kumar, Bala Shetty, Chelliah Sriskandarajah

We present a framework of analyzing the supply side problem for increasing cost-effectiveness of the U.S. Coin Supply Chain (CSC). We investigate the U.S. CSC from following perspectives: new coin production in the U.S. Mint, circulating coin distribution for the Federal Reserve System (FRS), and coin inventory management and coin demand forecasting at coin vaults (CV). We provide an optimal operating policy for the FRS using a minimum cost flow (MCF) network model for multi-products.

3 - Scheduling Operating Rooms with Elective and Emergent Surgeries

Kyung Sung Jung, University of Florida, P.O. Box 117169, Gainesville, FL, 32611-7169, United States of America, kyungsung.jung@warrington.ufl.edu, Chelliah Sriskandarajah, Vikram Tiwari

Operating rooms (ORs) generate the greatest revenue source for hospitals while they are the largest cost centers. Scheduling ORs are challenging tasks due to the significant uncertainty in the arrival of emergent patients. To increase the responsiveness and efficiency for OR scheduling, we develop an optimization model which deals with block schedules and determines the sequence of elective patients so that the emergency patients who arrive randomly can be accommodated without incurring delays.

4 - Operations in Currency Supply Chains – A Review

Yunxia Zhu, Rider University, Sweigart Hall 358, Lawrenceville, KS, United States of America, yuzhu@rider.edu, Chelliah Sriskandarajah, Neil Geismar

This paper provides an overview of studies of various currency supply chains across the world. The structure of a general banknote supply chain is given before the discussion of the problems from three different perspectives: the supply side, the demand side, and the secure third-party logistics providers. We also provide a framework for analyzing the U.S. coin supply chain and descriptions of the coin supply chains in other countries. Future research directions are also proposed.

JFIG Paper Competition II

Sponsor: Junior Faculty Interest Group

Sponsored Session

Chair: Asoo Vakharia, Professor, University of Florida, Department of ISOM, Gainesville, FL, 32611, United States of America, asoov@ufl.edu

Chair: Arda Yenipazarli, Assistant Professor of Operations Management, Georgia Southern University, COBA 2224, Statesboro, GA, 30460, United States of America, ayenipazarli@georgiasouthern.edu

The 2015 JFIG paper competition features paper submissions from a diverse array of talented junior faculty members. The prize committee evaluated submissions based on the importance of the topic, appropriateness of the approach, and significance of the contribution. After careful review, the prize committee selected a group of finalists to present their research in one of the two JFIG sessions. For information on the finalists and their papers, please refer to the online program.

Bridging Business and Analytics

Cluster: Social Media Analytics

Invited Session

Chair: Mingfei Li, Associate Professor, Bentley University, 175 Forest Street, Waltham, United States of America, Mli@bentley.edu

1 - Implement Business Analytics in Education: An Exploration in Business Education

Mingfei Li, Associate Professor, Bentley University, 175 Forest Street, Waltham, MA, United States of America, Mli@bentley.edu

Do we have a formula for Business Analytics in education? How do we fill the gap between business and analytics in school? Ideas of combining Business with Analytics in education will be explored. Using Bentley's business analytics programs as an example to show works from students in this field.

2 - The Analytics of Kickstarter

David Oury, Lecturer, Bentley University, 175 Forest Street, Morison room 325, Waltham, MA, 02451, United States of America, doury@bentley.edu

Our project investigates those factors that influence the success or failure of crowdfunding projects through analytics on the Kickstarter data set. We compare results, models and capabilities of the following software packages: Alteryx, IBM SPSS Modeler, KNIME, R, RapidMiner, Salford Systems, SAS Enterprise Miner and Semcasting.

3 - Analytics, Interdisciplinary Collaboration, and the Mapping of Brand DNA

Joseph Dery, PhD Student, Sr. Data Scientist, Bentley University, EMC Corporation, 175 Forest Street, Waltham, MA, 02451, United States of America, JDERY@bentley.edu

Do successful analytics projects utilize interdisciplinary collaboration? Leveraging the brand-exclusivity robbing phenomenon of brand genericide, this deceptively marketing-dependent problem is viewed through a combined lens of brand management, legal studies, linguistics and analytics. The result: newly mapped "Brand DNA" with the ability to measure brand-mutations through longitudinal text mining.

4 - An Exploration of Power Structures Utilizing Network Analysis

Kevin Mentzer, PhD Student, Bentley University, 175 Forest Street, Waltham, MA, 02451, United States of America, mentzer_kevi@bentley.edu, Dominique Haughton

This work combines Bayesian analysis with social network analysis to highlight significant change in networks over time. Applications exploring power in interlocked corporate boards as well as power in state government are explored. Findings show capabilities to identify and isolate key data as well as show shifting power dynamics.

Stochastic Systems in Finance

Sponsor: Financial Services

Sponsored Session

Chair: Alexandra Chronopoulou, Assistant Professor, University of Illinois at Urbana-Champaign, 117 Transportation Building, MC-238, 104 South Mathews Avenue, Urbana, IL, 61801, United States of America, achronop@illinois.edu

1 - Efficient Risk Analysis for Loan Pools

Justin Sirignano, Stanford University, Huang Engineering Center, Stanford, Ca, 93404, United States of America, jasirign@stanford.edu, Kay Giesecke

Financial institutions and investors are often exposed to default risk from large numbers of loans. Due to the size of loan pools, brute-force simulation is computationally expensive. We prove weak convergence results in order to construct an efficient Monte Carlo approximation. We test our approximation on a data set of over 25 million actual mortgages. Computational cost is often several orders of magnitude less than brute-force simulation of the actual pool with a similar level of accuracy.

2 - Optimally Thresholded Realized Power Variations for Stochastic Volatility Models with Jumps

Jose Figueroa-lopez, Purdue University, figueroa@purdue.edu

Thresholded Power Variations are popular nonparametric estimators for continuous-time processes with jumps. An optimal threshold selection approach is put forward in the presence of a stochastic volatility risk component. To this end, we further develop current kernel based estimators for the spot volatility, which in turn yield new optimal bandwidth selection procedures for stochastic volatility models.

3 - Principal Component Analysis of High Frequency Data

Dacheng Xiu, University of Chicago, Booth Business School, Chicago, IL, dachxiu@chicagobooth.edu, Yacine Ait-Sahalia

We develop a methodology to conduct principal component analysis at high frequency. The procedure involves estimation of realized eigenvalues, realized eigenvectors, and realized principal components and we provide the asymptotic distribution of these estimators.

4 - Indifference Pricing for Contingent Claims: Large Deviations Effects

Konstantinos Spiliopoulos, Assistant Professor, Boston University, Department of Mathematics and Statistics, 111 Cummington Mall, Boston, MA, 02215, United States of America, kspiliop@math.bu.edu

We study utility indifference prices and optimal positions for a non-traded contingent claim in an incomplete market with vanishing hedging errors, making connections with large deviations. Consider a sequence of semi-complete markets where for each n the claim $h_n = D_n + Y_n$, D_n is replicable and Y_n is unheadgale. In this setting, we show the prices typically are not the unique arbitrage free price in the limiting market and that optimal purchase quantities occur at the large deviations scaling.

Networks and Contagion Risk

Cluster: Risk Management

Invited Session

Chair: Agostino Capponi, Columbia, Mudd 313, New York, NY, 10027, United States of America, ac3827@columbia.edu

1 - Interfirm Relationships and Asset Prices

Carlos Ramirez, Finance PhD Candidate, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, 15213, United States of America, carlosrc@cmu.edu

I study asset pricing in large economies where persistent interfirm relationships generate interdependencies among firms' cash-flows. In the calibrated model: well connected firms command higher risk premium than less connected firms; firm-level return volatilities follow a factor structure; and momentum trading strategies are profitable.

2 - The Price of Uncertainty in Financial Networks

Peng-chu Chen, Purdue University, 315 N. Grant Street, West Lafayette, IN, United States of America, chen621@purdue.edu, Agostino Capponi

We derive lower and upper bounds for systemic losses incurred in networks, under partial information on interbank assets and liabilities. Our findings indicate that the uncertainty gap is highly sensitive to the realization of default events in the network.

3 - Why are Fee-to-Collateral Ratios so Extreme?

Allen Cheng, Graduate Student, Columbia University, 182 Claremont Avenue Apt. 42, New York, NY, 10027, United States of America, msa955126@gmail.com, Agostino Capponi

We develop a game-theoretic model of centralized clearing to analyze a clearinghouse's choice of transaction fee and collateral requirements. The clearinghouse's requirements affect not only the size and riskiness of her participating client base, but also the transaction fees charged to clients by her clearing member. We show that empirically observed extreme fee-to-collateral ratios can be explained as the equilibrium arising from strategic interactions between profit maximizing agents.

4 - Multivariate Systemic and Market Risk Measures

Cagin Ararat, Assistant Professor, Bilkent University, Department of Industrial Engineering, Bilkent University, Ankara, 08540, Turkey, cararat@princeton.edu, Birgit Rudloff

A common framework to study systemic risk measures and risk measures for multi-asset frictional markets is proposed. The structure of the network/market is modeled via a set-valued function whose special cases include the aggregation mechanisms for financial networks and the solvency cones for transaction cost markets. A general dual representation result is presented with economic interpretations for the special cases.

Cooperation and Integration Approaches to Modern Telecommunication Networks Problematics

Sponsor: Telecommunications

Sponsored Session

Chair: Albena Mihovska, Center for TeleInfrastruktur-Aalborg University, Fredrik Bajers Vej 7C1-113, Aalborg y, Da, 9220, Denmark, albena@es.aau.dk

1 - A Game Theoretic Approach to Modeling Telecommunications Security During Disasters

Michael Bartolacci, Professor, Information Sciences and Technology, Penn State University - Berks, Reading, PA, 19610, United States of America, mrb24@psu.edu

During times of crisis, the opportunities for hackers, terrorists, and other disruptive parties to disrupt important communications grows due to the sometimes chaotic conditions. A game theoretic approach is used to model disruptions to emergency management communications. Insight can be gained into how to minimize the probability and the impact of such disruptions.

2 - Behavior Model for Cooperative Communications Based on Stackelberg Game

Albena Mihovska, Center for TeleInfrastruktur-Aalborg University, Fredrik Bajers Vej 7C1-113, Aalborg y, Da, 9220, Denmark, albena@es.aau.dk

In cooperative communications the sender needs to ask a relay to forward its packets toward the destination. The relay responds to the sender about whether or not to relay the packet. This sequential procedure can be modeled by the Stackelberg competition, and the optimal strategy is solved by backward-induction.

3 - Cooperative versus Non-Cooperative Placement of Relay Stations in Wireless Sensor Networks

Chelsea Fogarty, Mba Student, Southwest Minnesota State University, 1501 State street, Marshall, MN, 56258, United States of America, Chelsea.Fogarty@smsu.edu, Vinay Gonela, Joseph Szmerekovsky

This paper focuses on designing a wireless sensor network under cooperative and non-cooperative planning schemes such that the total relay station cost is minimized. An MILP model is proposed that aims to determine the: 1) optimal location of relay stations, and 2) optimal assignment of sensors to relay stations. A case study set based on the Midwest region of the United States is conducted. The results indicate a significant trade-off between the number of relay stations and computational time.

4 - The Power of Integrated Wireless and Mobile Communication Technologies and their Impact on the Corporate World

Izabella Lokshina, Center for TeleInfrastruktur-Aalborg University, Fredrik Bajers Vej 7C1-113, Aalborg O Da 9220, Denmark, Izabella.Lokshina@oneonta.edu

The impact of integrated wireless and mobile communication technologies on the corporate world is very substantial. There is no restriction in terms of the application domains as illustrated by the models and primary scenarios provided in healthcare, education, business organizations and emergency services. Today, the challenge is to build the next generation of applications that will enable more of the models and primary scenarios across many other domains, such as transportation, energy, and manufacturing. It becomes clear through the models and primary scenarios that the power of integrated wireless and mobile technologies is certainly in several orders of magnitude greater than the simple sum of their separate individual impacts. This observation, combined with the continuous growth of wireless access and mobility, leads clearly to the belief that integrated wireless and mobile communication technologies are key success factors, even if there are challenges presented by such issues as the SLA (Service Level Agreement), security, privacy, mixed mode usage and deployment, and finding the appropriate business models for profitable growth.

Healthcare and Population Health in the Digital Economy

Sponsor: E-Business

Sponsored Session

Chair: Brad Greenwood, Assistant Professor, Temple University, 1810 North 13th Street, Philadelphia, PA, 19122, United States of America, brad.n.greenwood@gmail.com

1 - When is an Ounce of Prevention Worth a Pound of Cure? Finding High-risk Patients for Case Management

David Anderson, Assistant Professor, Baruch, davidryberganderson@gmail.com, Margret Bjarnadottir

One of the key questions in case management is which patients to enroll, and most programs target current high-cost patients. However the real potential is including lower cost patients at high risk of future high healthcare costs. Identifying these patient is a hard classification task. In this study we infuse classical classification models with association rules to identify and include higher order interactions.

2 - Reducing Healthcare Spending through Electronic Information Exchange: Aligning Provider and Insurer

Idris Adjerid, Assistant Professor, Notre Dame, 358 Mendoza College of Business, Notre Dame, United States of America, Idris.Adjerid.1@nd.edu

Health information exchanges (HIEs) are entities that enable the electronic sharing of patient information between disparate healthcare providers and other stakeholders but little evidence that speaks to whether promised gains to quality and efficiency have been realized. Leveraging a unique national panel dataset, we find significant cost reductions in healthcare markets that have established operational HIEs with an average reduction in spending of \$139 per Medicare beneficiary per year.

3 - The Spillover Effects of Health it Investments on Regional Health Care Costs

Hilal Atasoy, Assistant Professor, Temple University, Fox School of Business Alter Hall 445, Philadelphia, PA, United States of America, hilal.atasoy@temple.edu, Pei-yu Chen, Kartik Ganju

Electronic medical records (EMR) are often presumed to reduce the significant health care costs in the US. However, evidence on the impact of the EMR on costs is mixed, leading to skepticism about their effectiveness. We argue that the benefits EMR can go beyond the adopting hospital due to patient and physician sharing. We find that EMR investments have significant spillover effects by reducing costs of neighboring hospitals, which suggests that EMR can reduce aggregate health care costs.

4 - Show Me the Way to Go Home: An Investigation of Ride Sharing and Alcohol Related Vehicular Homicide

Brad Greenwood, Assistant Professor, Temple University, 1810 North 13th Street, Philadelphia, PA, 19122, United States of America, brad.n.greenwood@gmail.com, Sunil Wattal

We investigate how the entry of the driving service Uber affects the rate of alcohol related motor vehicle homicides. Using a difference in difference approach, the entry of Uber into markets between 2009 and 2013, results suggest a significant drop in the rate of homicides during that time. Furthermore, results suggest that not all services offered by Uber have the same effect, insofar as the effect for the Uber Black car service is intermittent and manifests only in selective locations.

Combinatorial Network Optimization

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Cole Smith, Professor And Chair, Clemson University, Freeman Hall, Clemson, SC, United States of America, jcsmith@clemson.edu

1 - On the Lagrangian Dual of the Maximum Quasi-clique Problem

Zhuqi Miao, Doctoral Candidate, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, zhuqi.miao@okstate.edu, Baski Balasundaram

Quasi-clique is a useful model in cluster detection. The maximum quasi-clique problem (MQCP) can be formulated as a binary quadratically constrained program (BQCP). In this talk, we present new computational techniques based on the Lagrangian dual of the BQCP formulation that can provide both good feasible solutions and tight upper bounds for MQCP. We report results from our empirical studies, which show that the proposed approaches outperform the leading approaches for solving the MQCP.

2 - A Semi-Continuous Formulation for Maximizing Wireless Sensor Network Lifetime

Rob Curry, Graduate Research Assistant, Clemson University, Freeman Hall, Clemson, SC, 29634, United States of America, rmc Curry@g.clemson.edu, Cole Smith

A wireless sensor network consists of battery-powered sensors that collect and transmit data from a set of targets. Receiving and transmitting data consumes battery life; hence, multiple routes are employed to balance energy utilization and maximize network lifetime. Also, a routing configuration may need to remain stable for a minimum operating time if it is used at all. We formulate a semi-continuous linear program for this problem, along with a branch-and-price algorithm for its solution.

3 - A Branch and Price Algorithm for Solving the Hamiltonian P-median Problem

Ahmed Marzouk, Texas A&M University, 3131, TAMU, College Station, TX, 77843, United States of America, ambadr@email.tamu.edu, Erick Moreno-centeno, Halit Uster

Given an undirected graph, G , the Hamiltonian p -median problem is to find p cycles partitioning G with minimum cost. We present a Branch & Price algorithm that solves instances up to 129 nodes (state-of-the art is 40-nodes). To solve the pricing problem we developed 1) a new efficient algorithm to find the least cost cycle in undirected graphs with arbitrary edge costs but no negative cycles; and 2) an algorithm to find the most negative cycle in undirected graphs with arbitrary edge costs.

4 - A Backward Sampling Framework for Interdiction Problems with Fortification

Leonardo Lozano, PhD Student, Clemson University, 129 Freeman hall, Clemson, SC, 29634, United States of America, llozano@g.clemson.edu, Cole Smith

Three-stage sequential defender-attacker-defender problems are notoriously difficult to optimize, especially when the third-stage (recourse) problem is nonconvex. Our approach allows the third-stage problem to take any form. The algorithm restricts the defender to select a recourse decision from a sample space, and iteratively refines the sample to force convergence. We show the algorithm's effectiveness on various such problems, including games played over the TSP and CLSP.

Recent Advances in Stochastic Integer Programming

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Yongjia Song, Virginia Commonwealth University, 1015 Floyd Ave, 4140 Grace Harris Hall, Richmond, VA, 23284, United States of America, yjsong.pku@gmail.com

1 - On The Quantile Cut Closure of Chance-constrained Problems

Weijun Xie, Georgia Institute of Technology, School of ISYE, 755 Ferst Drive, NW, Atlanta, GA, 30332-0205, United States of America, wxie33@gatech.edu, Shabbir Ahmed

Quantile cuts for a chance-constrained problem (CCP) are projections of a subset of the well-known mixing set inequalities onto the original problem space. We study the closure of quantile cuts, and show that iterative application of the closure recovers the convex hull of a CCP.

2 - A Decomposition Framework for Stochastic Mixed Integer Programming

Suvrajeet Sen, Professor, University of Southern California, University Park Campus, Los Angeles, CA, 90089, United States of America, s.sen@usc.edu

We will summarize decomposition-based algorithms for SMIP problems. The key to these algorithms are parametric cutting planes which are developed from one of three principles: Gomory Cuts, Disjunctive Cuts, and Value Function Cuts. These concepts lead to some of the most effective schemes for SMIP problems. In a companion presentation, we will present computational results with a variety of instances.

3 - A Polyhedral Study of Multistage Stochastic Unit Commitment Polytope

Yongpei Guan, Professor, University of Florida, Weil 413, Gainesville, FL, 32611, United States of America, guan@ise.ufl.edu, Jean-paul Watson, Kai Pan

In this study, we investigate a scenario-tree based multistage stochastic integer programming formulation for the unit commitment problem under uncertainty. By exploring its polyhedral structure, several families of strong valid inequalities are generated. In particular, we obtain convex hull presentations for certain special cases and facets for the general polytope. Finally, the computational results verify the effectiveness of the proposed cutting planes.

Sampling and Learning Methods in Stochastic Optimization

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Peter Frazier, Assistant Professor, Cornell University, 232 Rhodes Hall, Cornell University, Ithaca, NY, 14850, United States of America, pf98@cornell.edu

1 - Variance Reduction Techniques for Sequential Sampling Methods in Stochastic Programming

Jangho Park, PhD Student, The Ohio State University, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, park.1814@osu.edu, Guzin Bayraksan, Rebecca Stockbridge

We present variance reduction techniques, Antithetic Variates and Latin Hypercube Sampling, when used for sequential sampling procedures in stochastic programming. We discuss theoretical justification and present the resulting subtle changes in an implementation due to theoretical consideration. We empirically investigate these variance reduction techniques on a number of test problems from the literature.

2 - Multi-step Bayesian Optimization for One-dimensional Feasibility Determination

Massey Cashore, University of Waterloo, 77 Crossovers St, Toronto, On, M4E 3X3, Canada, jmcashor@uwaterloo.ca, Peter Frazier

Bayesian optimization methods allocate limited sampling budgets to maximize expensive-to-evaluate functions. One-step-lookahead policies are often used, but computing optimal multi-step-lookahead policies remains a challenge. We consider a specialized Bayesian optimization problem: finding the superlevel set of an expensive one-dimensional function, with a Markov process prior. We compute the Bayes-optimal sampling policy efficiently, and characterize the suboptimality of one-step lookahead.

3 - The Knowledge Gradient Policy with Regularized Trees

Yan Li, Princeton, Sherrerd Hall, Charlton Street, Princeton, United States of America, yanli@princeton.edu, Han Liu, Warren Powell

We propose a sequential learning policy for noisy discrete global optimization with regularized trees. Besides selecting the best alternative before the budget is exhausted, we also aim to learn the important features and the low order interactions. We derive a knowledge gradient policy for binary decision trees. Experimental work shows that the method is scalable to high dimension and efficiently learns the underlying low dimensional structures.

4 - The Knowledge Gradient with Logistic Belief Models for Binary Classification

Yingfei Wang, Princeton University, Computer Science Dept., Princeton, NJ, 08540, United States of America, yingfei@princeton.edu, Warren Powell

We consider sequential decision problems where the learner takes an active role in repeatedly selecting alternatives and receives the binary label of the selected alternatives. The goal is to find the best alternative with the highest response. We use logistic regression to model the response of each alternative. By formulating the problem within a dynamic programming framework, we develop a knowledge gradient policy to guide the experiment by maximizing the expected value of information.

Sponsor: Optimization/Nonlinear Programming

Sponsored Session

Chair: Fatma Kilinc Karzan, Assistant Professor Of Operations Research, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, fkilinc@andrew.cmu.edu

1 - Random Block-coordinate Gradient Projection Algorithms

Angelia Nedich, University of Illinois, Urbana IL, United States of America, angelia@illinois.edu, Chandramani Singh, R. Srikant

We discuss gradient projection algorithms based on random partial updates of decision variables. We analyze these algorithms with and without assuming strong convexity of the objective functions. We also present an accelerated version of the algorithm based on Nesterov's two-step gradient method. We show that the randomized algorithms exhibit similar rates of convergence as their full gradient based deterministic counterparts.

2 - An Extended Frank-wolfe Method, with Applications to Low-rank Matrix Completion

Paul Grigas, MIT Operations Research Center, 77 Massachusetts Ave., Cambridge, MA, 02139, pgrigas@mit.edu, Rahul Mazumder, Robert Freund

We present an extension of the Frank-Wolfe method that is designed to induce near-optimal solutions on low-dimensional faces of the feasible region. We present computational guarantees for the method that trade off efficiency in computing near-optimal solutions with upper bounds on the dimension of minimal faces of iterates. We present computational results for large-scale matrix completion problems that demonstrate significant speed-ups in computing low-rank near-optimal solutions.

3 - First-order Methods for Robust Convex Optimization

Nam Ho-nguyen, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh PA, hnh@andrew.cmu.edu, Fatma Kilinc Karzan

Robust optimization is a framework to model parameter uncertainty in optimization problems. Inspired by recent developments, we present several efficient first-order methods to approximately solve robust convex optimization problems. We also introduce the notion of weighted regret online learning and the online saddle-point problem, which form key building blocks for our methods. Finally, we discuss some proximal-type algorithms for these problems.

Recent Advances in Linear and Conic Optimization

Sponsor: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Hande Benson, Associate Professor, Drexel University, LeBow College of Business, Philadelphia, PA, 19104, United States of America, hvb22@drexel.edu

1 - A Generalization of Chubanov's Projection Algorithm

Negar Soheili, Assistant Professor Of Business Analytics, University of Illinois at Chicago, 601 S Morgan Street, University Hall 2416, Chicago, IL, 60607, United States of America, nazad@uic.edu

The Chubanov's algorithm is a projection algorithm for solving linear homogeneous feasibility problems that leverages periodic rescaling. We propose an extension of this algorithm for solving more general conic feasibility problems where our iteration bound is based on a condition measure associated with the geometry of the problem.

2 - Polynomial Time Methods for Optimal Design of Experiments for Regression using Conic Optimization

David Papp, North Carolina State University, 3222 SAS Hall, Campus Box 8205, Raleigh, NC, 27695-8205, United States of America, dpapp@ncsu.edu

Computing optimal experimental designs for regression addresses a fundamental problem regarding the collection of experimental data. Natural formulations of this problem are either semi-infinite convex programs or finite dimensional nonconvex programs. We shall present a novel approach that reduces the solution of the nonconvex formulation to the solution of two coupled semidefinite programs. This leads to the first polynomial time algorithm for the computation of such global optimal designs.

3 - The Parametric Simplex Method and its Application in Machine Learning

Haotian Pang, Princeton University, Department of Electrical Engineering, Olden Street, Princeton, NJ, 08540, United States of America, hpang@princeton.edu, Han Liu, Robert Vanderbei, Tuo Zhao

We formulate a series of machine learning problems, including Dantzig selector for sparse linear regression, CLIME for sparse precision matrix estimation and LPD rule for sparse linear discriminant analysis, into the parametric linear programming form and show that it is fast and efficient to solve it by the parametric simplex method. For the Dantzig selector model, we show that each dual iteration is guaranteed to be sparse as well as under the irrepresentable conditions.

4 - Warmstarts for Mixed-integer Second-order Cone Programming

Hande Benson, Associate Professor, Drexel University, LeBow College of Business, Philadelphia, PA, 19104, United States of America, hvb22@drexel.edu

In this talk, we will discuss warmstarting strategies after different types of cuts within an algorithm for solving mixed-integer second-order cone programming problems. The underlying SOCPs are solved using an interior-point method.

Networks Robustness and Vulnerability Analysis

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Foad Mahdavi Pajouh, Assistant Professor, University of Massachusetts Boston, 100 Morrissey Boulevard, Boston, MA, 02125, United States of America, Foad.Mahdavi@umb.edu

1 - On Imposing Connectivity Constraints in Integer Programs

Austin Buchanan, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, buchanan@okstate.edu, Sergiy Butenko, Yiming Wang

In many network applications, one searches for a connected subset of vertices that exhibits other desirable properties. To this end, we study the connected subgraph polytope of a graph, which is the convex hull of subsets of vertices that induce a connected subgraph. We investigate two classes of valid inequalities—separator inequalities and indegree inequalities—and show when they induce (all nontrivial) facets. We also consider extended formulations, lifting, and separation.

2 - On Biconnected and Fragile Subgraphs of Low Diameter

Oleksandra Yezerska, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, yaleksa@tamu.edu, Sergiy Butenko, Foad Mahdavi Pajouh

An s-club is a subset of vertices inducing a subgraph with a diameter of at most s. It is commonly used to characterize network clusters in applications for which easy reachability between group members is of high importance. In this paper, we study two special cases of the 2-club model – a biconnected 2-club, and a fragile (not biconnected) 2-club, respectively. By investigating certain properties of both models, we develop exact algorithms for their corresponding optimization problems.

3 - Integer Programming Formulations for Solving the Minimum Edge Blocker Spanning Tree Problem

Jose Walteros, University at Buffalo, 342 Bell Hall, Buffalo, NY, United States of America, josewalt@buffalo.edu, Ningji Wei, Foad Mahdavi Pajouh

The minimum edge blocker spanning tree problem consists of removing a minimum number of edges in a weighted graph so that the weight of any spanning tree in the remaining graph is at least r. We study the convex hull of feasible solutions and identify facet-inducing inequalities for this polytope. We develop an exact algorithm that solves our formulation via branch-and-cut. Finally, we provide the computational results obtained after solving a set of randomly generated and real-life instances.

1 - Understanding Patterns or Relations of the Terrorist Attacks in Big Data to Prevent Future Threats

Salih Tutun, Binghamton University, 4400 Vestal Parkway East, Binghamton, NY, 13902, United States of America, stutun1@binghamton.edu, Chou-An Chou

This research interests value in 5Vs that is the useful results about terrorist attacks (incidents) to analyze the terrorist activity patterns or relations, to predict their future moves, and finally to prevent potential terrorist attacks. We focused on understanding of why incident succeed or fail, duration of incident extended, and doubt as to whether the incident is an act of terrorism. The results will be very useful for law enforcement agencies to propose reactive strategies.

2 - Machine Learning Based Robust Optimization with Application to Healthcare Treatment Recommendations

Sung Hoon Chung, Binghamton University, P.O. Box 6000, Binghamton, NY, United States of America, chung@binghamton.edu, Yinglei Li

When making decisions, one may use robust optimization (RO) to reduce the impact of uncertainty modeled from the past data. In RO, uncertain parameters are generally assumed to be within a convex set, within which decision makers want to protect the system against the worst case. We propose a machine learning approach to design such uncertainty sets, and discuss the application of machine learning based robust optimization to healthcare treatment recommendations.

3 - Frequency-based Rule Classification Algorithm with Big Data

Anas Hourani, Binghamton University, 4400 Vestal Parkway, Vestal, NY, United States of America, ahouran1@binghamton.edu, Chou-An Chou

Frequency-based rule classification algorithm is a simple, fast and accurate associative algorithm. In this study, we are going to introduce an improvement on the FRC algorithm to work Hadoop system. Then several comparisons are made between the conventional FRC and FRC on Hadoop to demonstrate the efficiency of the proposed algorithm with big data.

Computational Optimization for Applied Problems I

Sponsor: Computing Society

Sponsored Session

Chair: David Morrison, Inverse Limit, 255 McDowell Lane Unit A, W Sacramento, CA, 95605, United States of America, dmorrison@invlim.com

1 - Enumeration and Bounding Arguments for Infrastructure Resilience Analysis

W. Matthew Carlyle, Naval Postgraduate School, mcarlyle@nps.edu, David Alderson

We propose a functional definition of infrastructure resilience based on attacker-defender models and using a parametric analysis of attacker capability. In general, this parametric analysis requires enumeration of a potentially enormous number of optimization problems. In this talk, we present a computational technique that uses bounding arguments to significantly limit the enumeration while still providing useful measures of infrastructure resilience. We illustrate with a real case study.

2 - Computational Study of Stabilization Methods in Crew Pairing Problems

Jiadong Wang, Senior Operations Research Developer, Sabre, 3150 Sabre Drive, 76092, United States of America, jiadwang@gmail.com, Xiaodong Luo

Column generation has been successfully applied to solve large-scale optimization problems. In this talk, we review the various stabilization methods by revisiting primal-dual subproblem approach. Experiments on large set-partitioning instances from crew pairing problem in Sabre provide insight on the effectiveness of various stabilization methods.

3 - An Implicit Hitting-set Solution Method for the Sensor Location Problem

David Morrison, Inverse Limit, 255 McDowell Lane Unit A, W Sacramento, CA, 95605, United States of America, dmorrison@invlim.com, Paul Rubin

Given a two-way directed network, the sensor location problem seeks to find the minimal number of vertices that must be monitored so that flow over the entire network can be determined, given prior assumptions on flow patterns. We reduce the problem to an implicit hitting set problem and use Benders' decomposition to solve the problem. The decomposition subproblem is a novel network flow problem called the incremental flow problem, for which we present several solution techniques.

Cloud Resource Management and Pricing

Cluster: Cloud Computing

Invited Session

Chair: Daniel Grosu, Wayne State University, 5057 Woodward Ave, Detroit, United States of America, dgrosu@wayne.edu

Co-Chair: Lena Mashayekhy, mlena@wayne.edu

1 - Efficient and Online Reconfigurations in NoSQL Databases

Indranil Gupta, Associate Professor, University of Illinois at Urbana-Champaign, 201 N. Goodwin Ave., Urbana, IL, 61801, United States of America, indy@illinois.edu, Mainak Ghosh, Yosub Shin, Wenting Wang, Gopalakrishna Holla

NoSQL databases are soon to be a multi-billion dollar market. In live NoSQL deployments “reconfiguration operations,” affecting a lot of data at once, are a major pain point, e.g., changing a table’s primary key. We describe techniques to perform reconfiguration in NoSQL systems (sharded and ring-based) quickly and online, i.e., while supporting high availability and low latency for reads/writes. We present results from our implementation and deployment with popular open-source NoSQL systems.

2 - Exploring Market Models for Software-defined Systems

Manish Parashar, Rutgers University, 110 Frelinghuysen Road, Piscataway, NJ, 08854, United States of America, parashar@rutgers.edu

Software-defined platforms, such as those enabled by Cloud services, provide new levels of flexibility, which can lead to very dynamic infrastructures that adapt themselves to application needs. In this talk I will explore how a cloud-of-clouds marketplace can support data-driven applications by programmatically federating geographically distributed resources to satisfy QoS demands. Specifically, I will focus on market and utility based models that can drive the synthesis of such systems.

3 - Stochastic Optimal Control of Time-varying Workloads

Mark Squillante, IBM Research, Thomas J. Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, United States of America, mss@us.ibm.com, Yingdong Lu, Mayank Sharma, Bo Zhang

Motivated by cloud computing, we consider GI/GI/1 queueing systems under time-varying workloads on one time scale and under time-varying controls on another time scale. We derive structural properties for the optimal dynamic control policy in general, establishing that this policy can be obtained through a sequence of convex programs. We also derive fluid and diffusion approximations and solutions for the problem. Computational experiments demonstrate the benefits of our approach.

Healthcare Data Analytics

Sponsor: Health Applications

Sponsored Session

Chair: Donald Lee, Yale School of Management, 165 Whitney Ave, New Haven, CT, United States of America, donald.lee@yale.edu

1 - A Statistical Approach to Cost-effectiveness Analysis under Uncertainty about the Willingness-to-pay

Reza Yaesoubi, Yale School of Public Health, 60 College Street, New Haven, CT, 06510, United States of America, reza.yaesoubi@yale.edu, Forrest Crawford, David Paltiel

Although it plays a central role in cost-effectiveness analysis, societies’ willingness to invest for an additional unit of health is rarely known to policy makers. In this work, we develop a statistical model to help decision makers determine whether a new healthcare alternative is considered cost-effective in the absence of exact value for the willingness-to-pay for health.

2 - Networks Classification via Mathematical Programming

Daehan Won, University of Washington, Seattle, 1415 NE Ravenna Blvd, #401, Seattle, WA, 98105, United States of America, wondae@uw.edu

We are developing mathematical programming models to classify the network structured data. Along the line with the feature selection, we present node selection approach to increase the classification accuracy as well as improving interpretability. To verify the utility of our proposed approach, we demonstrate the result of brain functional connectivity network data set.

3 - Outcome-driven Personalized Treatment Design for Managing Diabetes

Eva Lee, Georgia Institute of Technology, eva.lee@gatech.edu

This work is joint with Grady Memorial Hospital and the Atlanta VA Medical Center. We discuss an evidence-based decision support tool that couples a treatment predictive model with a planning model. Specifically, the predictive model uncovers drug effect based on pharmacokinetics and dynamics analysis. This evidence is then modeled within the personalized planning model for optimal treatment plan design. Results for a collection of patients will be presented.

Experiment Design and A-B Testing

Sponsor: Applied Probability

Sponsored Session

Chair: Ciamac Moallemi, Columbia Business School, 3022 Broadway, Uris Hall, New York, United States of America, ciamac@gsb.columbia.edu

Co-Chair: Vivek Farias, Associate Professor, MIT, 100 Main Street, Cambridge, MA, United States of America, vivekf@mit.edu

1 - Online A-B Testing

Vivek Farias, Associate Professor, MIT, 100 Main Street, Cambridge, MA, United States of America, vivekf@mit.edu, Nikhil Bhat, Ciamac Moallemi

We consider the problem of optimal A-B testing when the impact of a treatment is marred by a large number of covariates and subjects arrive and are assigned to a treatment sequentially. Our objective is to maximize the efficiency of our estimate of the treatment effect. Our main contribution is to show that what is typically thought of as a high-dimensional, intractable problem is, in fact, tractable under reasonable assumptions.

2 - Covariate Balanced Restricted Randomization: Optimal Designs, Exact Tests, and Asymptotic Results

José Zubizarreta, Columbia Business School, 3022 Broadway, Uris Hall, Room 417, New York, NY, 10027, United States of America, jz2313@columbia.edu, Jingjing Zou

We present a new method for the design of randomized experiments that (i) uses integer programming to optimally match subjects before randomization, (ii) assigns matched subjects to treatment and control in a randomized but controlled or restricted fashion, (iii) yields an explicit exact randomization distribution for small samples, and (iv) has good asymptotic properties in large experiments. We illustrate this method with a real experiment and show its advantages beyond standard methods.

3 - Can I Take a Peek? Continuous Monitoring of A/B Tests

Ramesh Johari, Stanford University, 475 Via Ortega, Stanford, Ca, 94305, United States of America, ramesh.johari@stanford.edu, Leo Pekelis, David Walsh

Statistical results for A/B tests are computed under the assumption that the experimenter will not continuously monitor their test. If users continuously monitor experiments, as is common in practice, then what statistical methodology is appropriate for hypothesis testing, significance, and confidence intervals? We present recent work addressing this question, building from results in sequential hypothesis testing. This work was carried out with Optimizely, a leading A/B testing platform.

Chair: Kavita Ramanan, Professor, Brown University, 182, George Street, Box F, Providence, RI, 02912, United States of America, kavita_ramanan@brown.edu

Co-Chair: Mohammadreza Aghajani, Brown University, Providence, RI, United States of America, Mohammadreza_Aghajani@Brown.edu

1 - Reflected Brownian Motions in Stable Models for Large Equity Markets

Ioannis Karatzas, Columbia University, Department of Mathematics, New York, NY, 10027, United States of America, ik@math.columbia.edu

We construct systems of Brownian particles interacting through their ranks. These interactions give rise to invariant measures which are in broad agreement with stability properties observed in large equity markets over long time-periods. The models have connections with the analysis of Queueing Networks in heavy traffic. Their hydrodynamic-limit behavior is governed by generalized porous medium equations with convection. We survey briefly recent progress on some of these fronts.

2 - Pathwise Differentiability of Semimartingale Reflected Brownian Motions in Convex Polyhedrons

David Lipshutz, Postdoctoral Research Associate, Brown University, 182 George Street Box F, Providence, RI, 02912, United States of America, David_Lipshutz@brown.edu, Kavita Ramanan

We consider the pathwise differentiability of semimartingale reflected Brownian motions (SRBMs) in convex polyhedrons with respect to input parameters that determine the initial condition and drift. The derivatives are characterized as solutions to time-dependent Skorokhod type problems associated with the SRBMs. As applications, we characterize derivatives of stochastic flows for SRBMs and compute the sensitivity of SRBMs to small perturbations of the drift.

3 - Existence and Nonexistence Results for Diffusion Limits of Serve-the-Longest-Queue

Rami Atar, Technion, Department of Electrical Engineering, Technion, Haifa, Israel, atar@ee.technion.ac.il, Subhamay Saha

When serve-the-longest-queue is considered for a system with finite buffers that are equal in size, diffusion limits of queue length exist in conventional heavy traffic, while they do not always exist in the Halfin-Whitt regime. This phenomenon will be described, along with implications on a game theoretic set up of the network, in which customers are strategic.

Co-Chair: Chen Kan, University of South Florida, 4202 E. Fowler Ave. ENB118, Tampa, FL, United States of America, chenkan@mail.usf.edu

1 - The Evolution of User Roles in Online Health Communities

Xi Wang, The University of Iowa, S343 PBB, The University of Iowa, Iowa City, IA, 52242, United States of America, xi-wang-1@uiowa.edu, Zhiya Zuo, Kang Zhao

Online health communities (OHCs) have become a major source of social support for people with health problems. By analyzing how users' roles change over time, we constructed transition graphs to illustrate evolution of users' roles in an OHC. It was revealed that the types social support received by a user may facilitate or delay her role transitioning. Our research has implications to for OHC operators to track users' behaviors in order to manage an OHC.

2 - Extracting Biomedical Relationships from Unstructured Documents

Adel Javanmard, Assistant Professor, Marshall School of Business, University of Southern California, Los Angeles, CA, United States of America, ajavanma@marshall.usc.edu

The published biomedical research is growing at an unprecedented rate. On the other hand, the information we need to extract for many research objectives is

becoming increasingly complex. This trend has driven the need for automated curation of scientific literature. We consider the problem of extracting drug-gene relationships from unstructured documents and propose a novel algorithm to this end. Our algorithm is intimately related to new advances in clustering sparse graphs.

3 - Network Models for Monitoring High-Dimensional Image Profiles

Chen Kan, University of South Florida, 4202 E. Fowler Ave. ENB118, Tampa, FL, United States of America, chenkan@mail.usf.edu, Hui Yang

Advanced sensing brings the proliferation of image profiles, which pose significant challenges for process monitoring and control. However, traditional SPC is limited in its ability to readily address complex structures of high-dimensional profiles. This paper presents a novel dynamic network methodology for monitoring and control of high-dimensional imaging streams. Experimental results show that the proposed approach provides an effective online control chart for monitoring image profiles.

1 - Mobile Big Data Analytics

Xueming Luo, Temple University, 1801 Liacouras Walk, Philadelphia, PA, United States of America, Xueming.Luo@temple.edu

This presentation discusses how smart devices (smartphones, machine-to-machine connected solutions, wearables, Internet-of-things technologies) and big data affect advertising, promotions, marketing ROI, and omni-channel targeting effectiveness. Over 3.6 billion people worldwide are deeply engaged with smartphone devices. More than half of adult Americans rely on smartphones to go about daily life.

2 - An Expository Study of Human Geographic Affinity Measurement Based Mobility Network

Rong Duan, AT&T Labs, Research, 1 AT&T Way, Bedminster, NJ, United States of America, rongduan@research.att.com

Geographic data play critical roles in different domains. Based on the nearly complete coverage of mobile cell towers and the frequent activities of mobile devices, we propose a Human Geographic Affinity (HGA) metric. HGA measures the degree of recapture for a crowd in a specific geographic area during a time period. The metric quantifies the stability of a crowd in a geographic area, and categories areas by their dynamic of human mobility. This study is completed in-line with privacy policy.

INFORMS Undergraduate Operations Research Prize I

Cluster: INFORMS Undergraduate Operations Research Prize

Invited Session

Chair: Aurelie Thiele, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, aut204@lehigh.edu

1 - A Composite Risk Measure Framework for Decision Making under Uncertainty

Pengyu Qian, Columbia University, Columbia Business School c/o PhD Office, 3022 Broadway, 311 Uris Hall, New York, NY, 10027, United States of America, qianpengyu@pku.edu.cn, Zizhuo Wang, Zaiwen Wen

In this talk, we present a unified framework for decision making under uncertainty. Our framework is based on the composite of two risk measures accounting for parametric (given distribution) and distributional uncertainty respectively. The framework generalizes many existing models. We also propose new models within this framework whose solutions have probabilistic guarantees and are less conservative comparing to traditional models. Numerical experiments demonstrate the strength of our models.

2 - Optimizing Community Healthcare Coverage in Remote Liberia through an Integer Linear Programming Model

Paige Von Achen, Northwestern University, Sheridan Road,
Evanston, IL, United States of America,
PaigeVonAchen2014@u.northwestern.edu

Here we present a collaborative effort by the NGO, Last Mile Health, and Northwestern University to aid the expansion of healthcare accessibility throughout remote Liberia. Two integer linear programming models are developed that determine (1) the location assignments of healthcare workers and their supervisors and (2) the routing of the supervisors. We highlight the benefits of rigorous data collection and using a cross-disciplinary team to provide proper scoping and representation of a given problem.

3 - A Faster Algorithm for the Resource Allocation Problem with Convex Cost Functions

Chao Qin, PhD Candidate, Northwestern University, 2145
Sheridan Road, Evanston, IL, 60208, United States of America,
chaoqin2019@u.northwestern.edu, Cong Shi, Huanan Zhang

We revisit the classical resource allocation problem with general convex objective functions, subject to an integer knapsack constraint. This class of problems is fundamental in discrete optimization and arises in a wide variety of applications. In this paper, we propose a novel polynomial-time divide-and-conquer algorithm and prove that it has a computational complexity of $O(n \log n \log N)$, which outperforms the best known polynomial-time algorithm with $O(n (\log N)^2)$.

4 - Integrated Optimization of Aircraft Utilization and On-time Performance

Beril Burçak, Bilkent University, 1972. Sok. Melis Sit. D Blok No: 8, Ankara, Turkey, beril.burcak@gmail.com, Alaz Ata Senol, Hakan Sentörk, Ayça Karatepe, Osman Rauf Karaaslan, Dr. Kemal Güler, Kaan Yavuz

This paper concerns the decision-support system created for Pegasus Airlines of Turkey, designed to improve the company's two key performance indicators; aircraft utilization and on-time performance. A unique approach is introduced to tackle the tradeoff between these two indicators via mathematical modeling. Significant improvements in operational performance and customer satisfaction are achieved as the previously manually done flight scheduling process has been automatized.

5 - Routing Optimization of a Drone for Agricultural Inspections

Kaan Telciler, Koc University, Rumelifeneri yolu Koç University,
Main Campus Sariyer, Istanbul, Turkey, ktelciler@ku.edu.tr,
Ezgi Karakas, Cagan Urkup

Drones can be used in various areas with developing drone technologies. In order to provide an automatized usage for drones, there is a need of routing approach. We developed a mathematical model and routing heuristic for drones which considers recharge stations, battery limit, wind changes, restricted regions and sequential routes. We used cluster first, route second approach for heuristic. In several datasets and cases, we obtained near-optimal routing in feasible times.

Multi-objective Choice Problems

Sponsor: Multiple Criteria Decision Making
Sponsored Session

Chair: Ozlem Karsu, Bilkent University, Bilkent Universitesi, Endustri Muhendisligi, Ankara, 06800, Turkey, ozlemkarsu@bilkent.edu.tr

1 - Two Approaches for Inequity-averse Sorting

Ozlem Karsu, Assistant Professor, Bilkent University,
Bilkent, Ankara, Turkey, ozlemkarsu@yahoo.co.uk

We consider multi-criteria sorting problems where the decision maker (DM) has equity concerns. In such problems each alternative represents an allocation of an outcome over multiple entities. We propose two sorting algorithms that are different from the ones in the current literature in the sense that they apply to cases where the DM's preference relation satisfies anonymity and convexity properties. We illustrate their use by sorting countries into groups based on their income distributions.

2 - A Preference-based Approach to Multi-objective Feature Selection

Muberra Ozmen, Middle East Technical University, Industrial Engineering Department, Ankara, 06800, Turkey,
mozmen@metu.edu.tr, Gulsah Karakaya, Murat Koksalan

In feature selection problems, one or more subsets of available features that best characterize the output of interest are selected. In this study, we develop a preference-based approach for the multi-objective feature selection problems considering objectives such as maximizing classification performance and minimizing the number of selected features. We test the approach on several instances.

28-Room 405, Marriott

Contingent Mechanisms

Cluster: Auctions

Invited Session

Chair: Rakesh Vohra, University of Pennsylvania, 3718 Locust Walk, Philadelphia, United States of America, rvohra@seas.upenn.edu

1 - Implementation with Contingent Contracts

Rahul Deb, Assistant Professor, University of Toronto, 150 St. George St, Toronto, ON, m5s3g7, Canada, rahul.deb@utoronto.ca

We study dominant strategy incentive compatibility with contingent contracts where the payoff of each agent is observed by the principal and can be contracted upon. We characterize outcomes implementable by linear contracts and provide a foundation for them by showing that, in finite type spaces, every social choice function (SCF) that can be implemented using a more general nonlinear contingent contract can also be implemented using a linear contract.

2 - Market Selection and the Information Content of Prices

Mehmet Ekmekci, Boston College, 140 Commonwealth Avenue, Chestnut Hill, MA, 02467, United States of America, ekmeckci@bc.edu, Alp Atakan

In an economy where buyers with unit demand decide to purchase one of two possible goods which are traded in two distinct markets. The goods traded within each market are identical, common-value objects and the price formation process as a large uniform-price auction. imperfectly informed bidders choose to participate in one of the markets. If market frictions lead to uncertain gains from trade in any of the two markets, then there is no equilibrium where prices aggregate information.

3 - Contingent Mechanisms with Endogenous Information

Yunan Li, University of Pennsylvania, 160 McNeil Building, 3718 Locust Walk, Philadelphia, PA, 19104, United States of America, yunanli0202@gmail.com

I study the auction design problem when buyers can make payments contingent on their ex-post returns. An example is selling a company using securities like shares. I consider settings where buyers can covertly acquire information at a cost before the auction. I find that auctions using steeper securities provide lower incentives for agents to acquire information, and thus may generate lower revenues. I also study the design of the optimal linear contingent mechanism with endogenous information.

4 - Participation and Unbiased Pricing in CDS Settlement Mechanisms

Ahmad Peivandi, Participation and Unbiased Pricing in CDS Settlement Mechanisms, Georgia State University, 35 Broad St, Atlanta, GA, United States of America, apeivandi@gsu.edu

Credit default swaps are insurance contracts on default. Currently, there are over 20 trillion USD worth of outstanding CDS contracts. These contracts are settled through a centralized market that has been criticized for underpricing the asset. In this paper, I take a mechanism design approach and characterize robust settlement mechanisms that deliver an unbiased price for the asset. A second contribution of my paper is a new notion of the core for games of incomplete information. This is particularly relevant here because participation in the settlement mechanism cannot be compelled.

Sponsored Session

Chair: Michael Katehakis, Professor And Chair, Rutgers University, 100 Rockefeller Rd., Piscataway, NJ, 08854, United States of America, mnk@rutgers.edu

1 - The $[\text{Map}(t) / \text{Ph}(t) / \text{Inf}]^k$ Queueing System and Network

Ira Gerhardt, Manhattan College, 4513 Manhattan College Parkway, Riverdale, NY, 10471, United States of America, ira.gerhardt@manhattan.edu, Michael Taafe, Barry Nelson

We generalize a numerically exact method for evaluating time-dependent moments of the entities in a $\text{Ph}(t) / \text{Inf}$ queueing system to the $\text{MAP}(t) / \text{Ph}(t) / \text{Inf}$ queueing system, and show that these same results can be used to analyze the multiclass $[\text{MAP}(t) / \text{Ph}(t) / \text{Inf}]^K$ queueing network system. Finally we show that the covariance of the number of entities at different nodes and times may be described by a single closed differential equation.

2 - Reliability of a Two Parallel K Out of N System with Removable Repair Mechanism

George Mytalas, S. Lecturer, NJIT, University Heights, Newark, NJ, United States of America, mytalas@njit.edu

We study the reliability of a $(k1, k2)$ -out-of- $(n1, n2)$ system which consists of two different types of components with finite populations and a single repair machine. The system operates under the $(N1, N2)$ -policy i.e. the server is activated for exhaustive repairs. The repaired components are assumed to be as good as new. Repair times of components and life times are assumed to be independent of each other.

3 - Bullwhip Effect in a Pharmaceutical Supply Chain

Ming Jin, University of Utah, 1655 E Campus Center Dr, Salt Lake City, UT, United States of America, ming.jin@utah.edu, Glen Schmidt, Nicole Dehoratius

We investigate the bullwhip effect in a pharmaceutical supply chain. Specifically, we estimate the bullwhip effect at the stock keeping unit (SKU) level, analyze the bias in aggregated measurement of the bullwhip effect, and examine various driving factors of the bullwhip effect. Data aggregation across products or over long time periods tends to mask the bullwhip effect in some cases. Price promotion, order batching, and inventory are three main factors associated with the bullwhip effect.

1 - Descriptive, Predictive and Prescriptive Analysis for and by Business Users

Alain Chabrier, IBM Spain, Santa Hortensia 26-28, Madrid, Spain, achabrier@es.ibm.com, Xavier Ceugniet, Stéphane Michel

Visual analytics tools such as Watson Analytics provide easy ways for business users to benefit of descriptive and predictive analytics. Using configuration and elicitation of constraints and goals based on suggestions and natural language, we show how prescriptive analytics can also be supported and more complex business problems solved using the combinations of the 3 analytics area. We illustrate with a campaign marketing optimization use case.

2 - The Five Minute Analyst

Harrison Schramm, Navy Headquarters Staff, 1507 22nd Street South, Arlington, VA, 22202, United States of America, Harrison.Schramm@gmail.com

A little bit of analysis can go a long way – provided it's both scoped appropriately and presented in a way that is appealing to the layperson. The Five Minute Analyst, appearing in INFORMS/Analytics Magazine, attempts to apply some analysis to everyday problems with the goal of both improving decisions and sharing the power of a little bit – five minutes' worth, to be precise – of analysis towards everyday problems. This session will be a 'best of', going further in depth on the articles I've written, as well as discussing some 'also rans' – interesting problems that did not make the column. The application areas contain (but are not limited to) probability, statistics and game theory, although others may find their way in. Problems addressed will include Star Wars and Downton Abbey. There will be zombies.

Predictive Analytics for Health Care Decision Making

Sponsor: Data Mining

Sponsored Session

Chair: Nick Street, Professor And Departmental Executive Officer, The University of Iowa, 108 Pappajohn Business Building, S210, Iowa City, IA, 52242, United States of America, nick-street@uiowa.edu

1 - Sparse Logical Machine Learning Models

Cynthia Rudin, Associate Professor, Massachusetts Institute of Technology, MIT, Cambridge, MA, United States of America, rudin@mit.edu

CART (Classification and Regression Trees) is possibly the most popular machine learning method in industry. For the last few years, my research group has been trying to build competitors for CART. I will overview our work on sparse logical models that are direct competitors for CART. They are competitive in all ways: accuracy, interpretability, and tractability.

2 - Using Machine Learning Approaches to Predict Patient Risk from EHR Data

Alexander Cobian, Department of Computer Sciences, University of Wisconsin-Madison, 1300 University Ave, Madison, WI, 53706-1532, United States of America, cobian@cs.wisc.edu, Mark Craven

We explore the task of learning from electronic health record (EHR) data to predict patient risk levels for conditions of interest (asthma exacerbation and post-operative deep venous thrombosis.) While standard risk questionnaires focus on small numbers of known risk factors, we consider thousands of variables elicited from the EHR in order to identify novel risk indicators. Further, our approach attempts to discover latent variables that connect related, observed variables.

3 - Reducing Patient Risk through Inverse Classification: An SVM-based Method

Michael Lash, The University of Iowa, 318 MacLean Hall, Iowa City, IA, 52242, United States of America, michael-ash@uiowa.edu, Nick Street, Qihang Lin

In this work we propose a novel algorithm to address the problem of inverse classification, and apply the result to a recommendation system for patient risk minimization. We propose a mixed-integer nonlinear programming based on SVMs that finds the optimal values of the attributes that achieve the targeted probability of being in a desired class. The result is a flexible model that arrives at a set of realistic recommendations to mitigate patient risk.

4 - Understanding Emergency Department 72-hour Revisits Among Medicaid Patients

Kristin Bennett, Mathematical Sciences Dept., Rensselaer Polytechnic Institute, 110 8th Street, AE 327, Troy, NY, 12180, bennek@rpi.edu, James Hendler, James Ryan

We analyze emergency department (ED) usage at one hospital to understand ED return visits within 72 hours. "Frequent flier" patients with multiple revisits account for 47 percent of Medicaid patient revisits over a two year period. Statistical and L1-logistic regression analysis reveals distinct patterns of ED usage between frequent- and infrequent-patient encounters suggesting distinct opportunities for interventions to improve care and streamline ED workflow.

Advances in Community Detection and Influence Analysis in Social Networks

Sponsor: Data Mining

Sponsored Session

Chair: Wenjun Wang, University of Iowa, S283 Pappajohn Business Building, Iowa City, IA, 52242, United States of America, wenjun-wang@uiowa.edu

1 - Finding Hierarchical Communities in Complex Networks

Wenjun Wang, University of Iowa, S283 Pappajohn Business Building, Iowa City, IA, 52242, United States of America, wenjun-wang@uiowa.edu, Nick Street

Based on a Shared-Influence-Neighbor (SIN) similarity measure, we propose two novel influence-guided label propagation (IGLP) algorithms for finding hierarchical communities in complex networks. One is IGLP-Weighted-Ensemble (IGLP-WE), and the other is IGLP-Direct-Passing (IGLP-DP). Extensive tests demonstrate superior performance of our methodology in terms of excellent quality and high efficiency in both undirected/directed and unweighted/weighted networks.

2 - Community Detection in Dynamic Networks with Multiple Attributes

Xiang Li, University of Florida, Room 555, CSE Building U. of Florida, Gainesville, FL, 32611, United States of America, xixiang@cise.ufl.edu, My Thai

In this talk, we provide a mathematical model to qualify the relationship between communities based on network structure and that based on the common node attributes. We next present a dynamic and scalable algorithm to detect such communities, based on the multiplex graph theory.

3 - A Structural Approach to Community Detection in Complex Networks

Song Chew, Associate Professor, Southern Illinois University
Edwardsville, Southern Illinois University-Edwardsville,
Edwardsville, IL, 62026, United States of America,
schew@siue.edu

We in this study develop a novel measure of community structure that gauges the strengths and weaknesses of a proposed community structure against an ideal. In addition, we present an algorithm that may, as it maximizes our measure, return several alternative community structures for consideration. We provide several examples to demonstrate use of our measure, and to illustrate applications of our algorithm as well.

Applications of Markov Models to Medical Decision Making Problems

Sponsor: Health Applications

Sponsored Session

Chair: M. Reza Skandari, University of British Columbia, Vancouver, Vancouver, Canada, reza.skandari@sauder.ubc.ca

1 - Evaluation of Breast Cancer Mammography Screening Policies Considering Adherence Behavior

Maboubeh Madadi, University of Arkansas, mmadadi@uark.edu,
Shengfan Zhang, Louise Henderso

The efficacy of mammography screening guidelines is highly associated with women's compliance with these recommendations. Currently, none of the existing policies take women's behavior into consideration. In this study, we develop a randomized partially observable Markov chain model to evaluate a wide range of screening mammography policies, incorporating heterogeneity in women's adherence behaviors.

2 - Policy Approximation for Optimal Treatment Planning

Wesley Marrero, University of Michigan, 500 South State Street,
Ann Arbor, MI, 48109, United States of America,
wmarrero@umich.edu, Mariel Lavieri, Jeremy B. Sussman,
Gregory J. Schell, Rodney A. Hayward

Markov decision process (MDP) models are powerful tools which enable the derivation of optimal treatment policies, but may incur long computational times and decision rules which are challenging to interpret by physicians. To reduce complexity and enhance interpretability, we study how Poisson regression may be used to approximate optimal hypertension treatment policies derived by a MDP for maximizing a patient's expected discounted quality-adjusted life years.

3 - Optimal Decision Making in a Markov Model with Parameter Uncertainty: The Case of CKD

M. Reza Skandari, University of British Columbia-Vancouver,
Vancouver, BC, Canada, reza.skandari@sauder.ubc.ca,
Steven Shechter, Nadia Zalunardo

We investigate a Markov decision process whose unknown transition parameters are revealed partially through state observation. Decisions are made as the state evolves. We use the model to study the optimal time to start preparing a type of vascular access for chronic kidney disease patients who will need dialysis.

4 - Reinforcement Learning Algorithm for Blood Glucose Control in Diabetic Patients

Mahsa Oroojeni Mohammad Javad, Northeastern University, 334
Snell Engineering, Northeastern Univ, Boston, United States of
America, oroojeni.m@husky.neu.edu, Stephen Agboola,
Kamal Jethwani, Ibrahim Zeid, Sagar Kamarthi

In this paper a reinforcement learning algorithm is proposed for regulating the blood glucose level of Type I diabetic patients. In the proposed reinforcement learning algorithm body weight and A1C level define the state of a diabetic patient. For the agent, insulin dose levels constitute the actions. As a result of a patient's treatment, after each time step t , the patient receives a numerical reward depending on the response of the patient's health condition.

34-Room 411, Marriott

Smart Medical Prognosis and Decision Making via Data Mining

Sponsor: Health Applications

Sponsored Session

Chair: Danica Xiao, PhD Candidate, University of Washington, Seattle, 3900 Northeast Stevens Way, Seattle, WA, 98195, United States of America, xiaoc@uw.edu

Co-Chair: Shouyi Wang, Assistant Professor, University of Texas at Arlington, 3105 Birch Ave, Grapevine, TX, 76051, United States of America, shouyiw@uta.edu

1 - Does Specialization of Health Care Services Increase Operational Efficiency?

Saied Samiedaluie, Postdoctoral Fellow, University of British Columbia, E204 - 4500 Oak Street, BC Women's Hospital, Women's Health Rese, Vancouver, BC, V6H 3N1, Canada, saied.samiedaluie@gmail.com, Vedat Verter

We study a health care network configuration problem considering two scenarios: specialization versus generalization. We characterize the settings in which each scenario is preferred in terms of minimizing the patient admission refusal rate. Our results show that the decision of system configuration for a multi-hospital network requires careful consideration of patient mix among arrivals, relative length of stay of patients, and distribution of patient load between hospitals.

2 - A Model to Predict Depression among Diabetes Patients with Application in Screening Policymaking

Haomiao Jin, University of Southern California, 3715 McClintock Ave, GER 240, Los Angeles, CA, United States of America, haomiaoj@usc.edu, Shinyi Wu

About 30% of diabetes patients are suffering from depression, but nearly half of them are undiagnosed. Universal screening improves depression diagnosis rates but is labor-intensive. A machine learning model is developed to predict depression among diabetes patients. The model is applied in a screening policy to help healthcare providers to better prioritize the use of their resources and time and increase efficiency in managing their patient population with depression.

3 - Data Mining Techniques Applied to the Study of Canines with Disease

Zhenpeng Miao, Saint Joseph's University, 5600 City Ave, Philadelphia, PA, 19131, United States of America, mmkuchi0@gmail.com, Yingdao Qu, Virginia Miori

This paper, the third in a series, aims at providing models effective in predicting the degree of pain and discomfort in canines suffering from osteoarthritis, sarcoma, dermatitis and side effects of radiation treatments. The R programming language and SAS JMP are used to clean data and execute multivariate analyses to predict changes in different activity levels. The predictive models provide information that can assist in effective diagnosis and medication of suffering dogs.

4 - Understanding Linear and Non Linear Brain Dynamics During Manual Lifting Tasks

Awad Aljuaid, PhD Student, UCF, University of Central Florida 4000 Cent, Department of Industrial Engineering, Orlando, FL, 32816-2993, United States of America, amjuaid@knights.ucf.edu, Waldemar Karwowski, Petros Xanthopoulos

The aim of this study is to test the change on different EEG measures during various psychophysical lifting frequencies. High-density wireless dry cell EEG device have been used to record brain signals. Twenty healthy males participated in this experiment performing two physical lifting sessions psychophysical weight lifting (low, medium, and high) and strength measurements (Isometric and isokinetic). EEG recording at different brains locations are analyzed with linear and non-linear methods.

Joint Session HAS/Analytics: Predictive Models for Clinical and Public Health Decision Making

Sponsor: Health Applications

Sponsored Session

Chair: Ozgur Araz, University of Nebraska Lincoln, College of Business Administration, Lincoln, United States of America, ozgur.araz@unmc.edu

1 - Risk Factors for Disease Progression in Sepsis Patients: A Retrospective Cohort Study

Benjamin Whitsitt, University of Nebraska Medical Center, 42nd and Emile, Omaha, NE, 68198, United States of America, benjamin.whitsitt@unmc.edu, Micah Beachy, Lorena Baccaglini, Gleb Haynatzki, Michael Ash, Ozgur Araz

In this study we identify risk factors associated with the progression of sepsis to severe sepsis and/or septic shock and estimate the likelihood of disease progression for different patient groups. We also assess the probability of death and readmission amongst a sepsis population at two area hospitals in Omaha, Nebraska. Multiple logistic regression model is used to determine the likelihood of disease progression, mortality, and readmission.

2 - The Impact of Geographic Localization of Patients on Hospital Performance

Paul Cronin, PhD Student, University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78712, United States of America, paul.cronin@utexas.edu, Douglas Morrice, Jonathan Bard, Luci Leykum

We study the impact of geographic localization of patients on hospital performance using patient-level data from a Texas teaching hospital. Performance is measured by length of stay in ED and hospital, waiting time for bed assignments, patient transfers between teams, and hour of discharge. The results of this study inform admission decision-making including patient allocation to medical teams and admission capacity planning.

3 - A Dynamic Model for Population Screening: Risk Perception and Feedback in Screening Decision

Ozge Karanfil, PhD Candidate, MIT Sloan School of Management, 100 Main Street, E62-379, Cambridge, MA, 02142, United States of America, karanfil@mit.edu, John D. Sterman

In this study we built a behaviorally realistic, bounded simulation model to explain changes in policy action thresholds of clinical practice guidelines, and to document evidence of gaps between scientific evidence-based guidelines and actual practice. This is the first theory building piece for cancer screening dynamics in the US that takes into account the broader cognitive and socio-political environment in which screening decisions are embedded.

4 - Modeling the Impact of Chronic Disease Combinations on 30-day Hospital Readmissions

Sabrina Casucci, University at Buffalo (SUNY), 339B Bell Hall, Amherst, NY, 14260, United States of America, scasucci@buffalo.edu, Alexander Nikolaev, Li Lin, Sharon Hewner

Individuals with chronic disease are at high risk for hospital readmission. There is significant opportunity to reduce utilization and costs by developing new readmission reducing interventions for this population. This work reveals and quantifies the causal impacts of specific chronic disease combinations on hospital readmissions. The results are reported for a subset of the New York State adult Medicaid population using observational causal inference methods and tools.

Humanitarian Applications II

Sponsor: Public Sector OR

Sponsored Session

Chair: Mahyar Eftekhari, Arizona State University, P.O. Box 874706, Tempe, AZ, 85287, United States of America, eftekhari@asu.edu

1 - Blood Storage and Transportation: An Important Component of Humanitarian Logistics

Divya Nagilla, Faculty Associate, Institute of Management Technology, Survey No.38, Cherlaguda Village, Shamshabad, RR District, Hyderabad, 501218, India, ndivya@imthderabad.edu.in, Sourabh Bhattacharya

Supply of blood during and after disasters is a major part in humanitarian logistics. The major problem during disasters is not the lack of blood supply but disruption of the blood distribution system. A large number of practical and

logistical issues related to communication, transportation, managing donors and volunteers arise. Depending upon the phase of the disaster the blood products required to treat the victims vary. Safety of the blood supply and adherence to regulations is crucial.

2 - Humanitarian Logistics in the Philippines: Case of Typhoon Haiyan

Brian Gozun, La Salle - Universitat Ramon Lull, Carrer de Sant Joan de La Salle 42, Barcelona, Spain, bgozun@gmail.com, Francesc Miralles

The study applied a humanitarian logistics framework through a deductive approach on the experiences of various stakeholders in the Philippines after the onslaught of Super Typhoon Haiyan in November 2013. The researchers made use of primary and secondary data in order to explore humanitarian operations management challenges before, during and after the onslaught of the typhoon by analyzing the current humanitarian logistics practices in the country.

3 - Vehicle Management Policies under Stochastic Budget for Humanitarian Development Programs

Milad Keshvari Fard, ESSEC Business School, 1 Avenue Bernard Hirsch, Cergy, France, milad.keshvarifard@essec.edu, Mahyar Eftekhari, Felix Papier

In this paper we attempt to find the optimal fleet management policies in a humanitarian organization running development programs. As the budget of these organizations - mostly financed through donations - is uncertain, the transportation planning is challenging. We try to identify the optimal number of vehicles to be purchased, the fraction of demand to be satisfied, and the fraction of budget that should be saved for future periods with low levels of donations.

4 - A Stochastic Programming Model for Prepositioning and Distributing Emergency Supplies

Xiaofeng Nie, Assistant Professor, Nanyang Technological University, 50 Nanyang Avenue, Singapore, Singapore, xiaofengnie@ntu.edu.sg, Aakil Caunhye, Yidong Zhang, Mingzhe Li

We propose a two-stage stochastic program to preposition and distribute emergency supplies. In the first stage the model decides where to locate warehouses and how many quantities to stock for prepositioning purposes, while in the second stage the model decides how many quantities to transport to demand sites and the corresponding routing. A case study is provided to illustrate our model and compare with other benchmark models.

Health Care Modeling and Optimization II

Contributed Session

Chair: Dongping Du, University of South Florida, Tampa, FL, 33613, United States of America, dongpingdu@mail.usf.edu

1 - A Network Heuristic for Stochastic Healthcare Facilities Location and Configuration in Sequence

Xue Han, Assistant Professor, Southeast Missouri State University, 1933 Rock Creek Ln, Cape Girardeau, MO, 63701, United States of America, xhan@semo.edu, Wilbert Wilhelm

This research aims on finding the best locations and capacities for new healthcare facilities providing multiple services over a 10-20 years planning horizon under stochastic demand in a competitive environment. We develop a heuristic algorithm for introducing new facilities in the market in sequence by solving resource constrained shortest path problem iteratively on a specially-constructed network. This heuristic preserves the advantages in solution time and linearity in objective function.

2 - Simulation Optimization for Reconstructing Rhythmic Mechanisms in Atrial Fibrillation

Dongping Du, University of South Florida, Tampa, FL, 33613, United States of America, dongpingdu@mail.usf.edu, Hui Yang

Atrial fibrillation (AF) is a common cardiac arrhythmia that affects more than 5 million Americans. The understanding of AF initiation and maintenance has remained sketchy due to the inability of reconstructing rhythmic mechanisms. This study develops a multi-scale atrial model and an optimization algorithm to reconstruct fibrillatory conduction and replicate patterns in clinical recordings. The research will produce a computer-aided decision support tool for optimizing AF surgical treatments.

3 - Early Warning Methods and Predictive Models for Hospital Risk and Readmissions

Jakka Sairamesh, CEO and President, CapsicoHealth, Inc, 2225 E Bayshore Rd. Ste. 200, Palo Alto, CA, 94303, United States of America, ramesh@capsicohealth.com, Ruichen Rong

This poster and research abstracts presents the effectiveness of methods for improving patient quality outcomes (e.g. reducing 30-day readmissions) based on clinical and cost based factors. We will present early-warning methods to predict patients at risk of 30-day readmissions based on past admissions, ER visit rates, mortality rates, and charges. The dominant factors include clinical risk, costs, emergency room visits and mortality rates. The prediction showed nearly 88 percent accuracy.

Big Data II

Contributed Session

Chair: Christoph Wunck, Professor, Jade University of Applied Sciences, Friedrich-Paffrath-Str. 101, Wilhelmshaven, 26389, Germany, wunck@jade-hs.de

1 - Making Billions of Decisions a Day: Experiment Driven Bid Optimization in Online Advertising

Daizhuo Chen, PhD Candidate / Senior Data Scientist, Columbia Business School / Dstillery, 470 Park Avenue S, 6th Floor South, New York, NY, 10016, United States of America, dchen16@gsb.columbia.edu, Robert Phillips, Garrett Van Ryzin, Brian D'alessandro, Perlich Claudia

Online advertising is a good playground for operations researchers who want to explore the opportunities and pitfalls of the "Big Data" promise. This talk will focus on bid optimization: as an ad buyer, how to determine the best bid prices for billions of ad opportunities everyday, in today's dynamic and opaque marketplaces of real-time bidding. We introduce a solution based on continuous experimentation and optimization, and touch on a paradox of big data: you never have the data you need.

2 - Fast Gaussian Process Regression for Large Non-Stationary Spatial Data

Babak Farmanesh, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74074, United States of America, babak.farmanesh@okstate.edu, Arash Pourhabib

We propose Sparse Pseudo-input Local Kriging (SPLK) as a predictive model for large non-stationary spatial data. SPLK uses orthogonal cuts to create small domains, where it applies sparse Gaussian process regression. The orthogonal cuts enable SPLK to be applied to spatial datasets that include exogenous variables, hence having a dimension greater than three. We apply SPLK to real and simulated datasets and demonstrate it can efficiently predict the response variable.

3 - Advanced Decision-Making Procedures in Massive Failure Data Classification

Keivan Sadeghzadeh, Graduate Research Assistant, Northeastern University, 27 Payne Rd, Newton, MA, 02461, United States of America, k.sadeghzadeh@neu.edu, Nasser Fard

In many professional areas, management decision-making process is based on the type and size of data where data classification is a necessary procedure. Massive amount of data in high-dimensions are increasingly accessible from various sources and it has become more difficult to process the streaming data in traditional application approaches. This paper presents advanced procedures to analyze high-dimensional failure data in order to facilitate decision-making through data classification.

4 - Preprocessing of Manufacturing Process Signals using Wavelet-based Filters

Christoph Wunck, Professor, Jade University of Applied Sciences, Friedrich-Paffrath-Str. 101, Wilhelmshaven, 26389, Germany, wunck@jade-hs.de

Bringing Big Data to the shop floor is one of the current visions to increase product quality, process reliability and overall productivity in manufacturing. Extracting the information content hidden in the flood of sampled data of process variables in real time requires data reduction and filtering techniques that are not commonly applied in manufacturing processes. A case study on injection molding shows how wavelet-based data preprocessing can simplify any subsequent data analysis.

■ SB39

39-Room 100, CC

Interdisciplinary Focus on Problem Solving

Cluster: Operations/Marketing Interface

Invited Session

Chair: Kathleen Iacocca, University of Scranton, 439 Brennan Hall, Scranton, PA, United States of America, kathleen.iacocca@scranton.edu

1 - A Functional Robust Newsvendor Model with Uncertain Price-Sensitive Demand

Junxuan Li, Graduate Student Instructor, University of Michigan-Dearborn, 23935 W Outer Dr. Apt. H16, Melvindale, MI, 48122, United States of America, junxuanl@umich.edu, Jian Hu, Sanjay Mehrotra

A functional robust newsvendor model with coordination of pricing and inventory decisions in uncertain market is proposed, which specifies an uncertainty set of nonparametric demand curves and seeks the best decisions against the worst case. We discuss the impact of functional robustness and wholesale price and develop a cut generation algorithm for convex demand curve case, while reformulate the model as second-order conic program for concave case. A grocery store case study is then discussed.

2 - Supply Chain Robust Optimization: An Examination of the Relationship Between Flexibility, Agility

Sayed Nooraie, NCAT university, 2205 New Garden Rd #1210, Greensboro, NC, 27410, United States of America, snooraie@aggies.ncat.edu, Mahour Mellat Parast, Paul M Stanfield

A robust multi-objective mixed integer nonlinear programming model is defined for an Aggregate Production Planning (APP) incorporating three conflicting objective functions simultaneously. We propose a theoretical construct linking elements of uncertainty with aspects of agility and flexibility where we use responsiveness to enhance these elements to overcome the future risk.

3 - Spreadsheet Approach for Integrating Production, Marketing, and Finance Decisions in Aggregate Plans

Kathleen Iacocca, University of Scranton, 439 Brennan Hall, Scranton, PA, United States of America, kathleen.iacocca@scranton.edu, Kingsley Gnanendran

The well-known aggregate planning model is extended to explicitly incorporate demand forecasts as modified by any sales promotions, along with working capital constraints. The components of the extended model are implemented on a spreadsheet and linked using VBA programming to demonstrate the ease of managerial applicability. Optimal decision variables include workforce size; production, inventory, and outsourcing levels; and the magnitude and timing of price promotions and infusions of cash.

40- Room 101, CC

Organization Theory II

Contributed Session

Chair: Amit Das, Associate Professor, Qatar University, P.O. Box 2713, Doha, Qatar, amit.das@qu.edu.qa

1 - Refocusing Business Incubator Research: The Process of Business Incubation

David Scheaf, UNC Charlotte, 9201 University City Blvd, Charlotte, NC, United States of America, dscheaf@uncc.edu

Literature on business incubation resembles the early stages of entrepreneurship research. Research has focused on defining business incubators and the associated outcomes. The lack of a cohesive framework has resulted in numerous definitions that have prevented adequate theoretical development. Presented is a conceptualization of the incubation process and how various theories from the organizational sciences can inform future research.

2 - Performance in Knowledge Intensive Environments: Interplay of Worker and Managerial Experience

Juan Pablo Madiedo, PhD Candidate, IE Business School, Calle Maria de Molina 12, Bajo, PhD Program Office, Madrid, 28028, Spain, jpmadiedo.phd2014@student.ie.edu, Aravind Chandrasekaran, Fabrizio Salvador

This study examines the importance of workers and managers as sources of experience in a knowledge intensive work environment. We analyze the interplay of workers and managers and its effect on task performance. We use a dataset with information on over 1500 software maintenance tasks collected from a global IT and consulting corporation for testing our model.

3 - A Hybrid Social Network-system Dynamics Model of Team Performance

Kyle Lewis, Professor, U. California - Santa Barbara, 1318 Phelps Hall, Santa Barbara, CA, 93106, United States of America, klewisl@tmp.ucsb.edu, Edward Anderson

Social network analysis has explored many aspects of inter-personal interaction, yet it is limited in its power to describe important features of team behavior. We present a hybrid system dynamics-agent based methodology that extends the power of SNA to analyzing emergent team behavior. We present a proof-of-concept hybrid model and use it to simulate the: differential effects of hierarchy; impact of overspecialization; role of generalists; and disruption created by member turnover.

4 - IT Governance Mechanisms and Organizational Performance: Investigating the Moderating Role of Platform

Hossein Kalantar, PhD Student, University of Colorado Denver, 1475 Lawrence Street, Denver, CO, 80202, United States of America, Hossein.Kalantar@ucdenver.edu, Jiban Khuntia

Information Technology governance plays a key role in creating value through IT within an enterprise. There are studies that show the positive impacts of IT governance on organizational performance. However, there are not many studies that answer "How IT governance improves organizational performance". In this study, we investigate the moderating role of platforms, on the relationship between IT governance and organizational performance. Context of Health IT organizations was selected to conduct this study.

5 - Organizational Changes to Benefit from Big Data

Amit Das, Associate Professor, Qatar University, P.O. Box 2713, Doha, Qatar, amit.das@qu.edu.qa

While developments in computing have ushered in the age of Big Data, accounts of Big Data being actually used to improve the management of organizations are still relatively rare. We ascribe this to the incompatibility of traditional management practices with the form of evidence-based decision-making enabled by Big Data. We suggest that the profession of management is not alone in its struggle to incorporate Big Data into its established routines.

Optimization Methods in Healthcare Scheduling

Sponsor: Manufacturing & Service Oper
Mgmt/Healthcare Operations
Sponsored Session

Chair: Retsef Levi, J. Spencer Standish (1945) Professor of Operations Management, Sloan School of Management, MIT, 100 Main Street, BDG E62-562, Cambridge, MA, 02142, United States of America, retsef@mit.edu

1 - Real-time Pooling for Multi-site Imaging Facilities

David Shmoys, Cornell University, School of ORIE, Rhodes Hall, Ithaca, NY, 14853, United States of America, david.shmoys@cornell.edu, Chaoux Tong, Shane Henderson

MRI patients waste a great deal of time in the waiting room; this is largely due to the misalignment between scheduled and actual imaging time. By selecting among a pool of nearby MRI facilities, we can redirect patients shortly before their scheduled appointment time. We demonstrate that this improved load-balancing can decrease patient waiting time. Working with New York Presbyterian Hospital, we are implementing a trial for our approach in a complicated real-life environment.

2 - Increasing throughput in a Large Oncology Infusion Unit

Ana Cecilia Zenteno Langle, Massachusetts General Hospital, 55 Fruit Street, White 400, Boston, MA, 02114, United States of America, azentenolangle@mgh.harvard.edu, Retsef Levi, Wendi Rieb, Inga Lennes, Mara Bloom, Bethany Daily, Peter Dunn

We describe a data-driven online scheduling algorithm aimed at generating a more predictable and balanced intra-day resource utilization in the Infusion Unit at the Massachusetts General Hospital Cancer Center. The implementation of the algorithm, which is based on integer optimization and simulation methods, has a projected impact of reducing by 30% the average peak utilization and its standard deviation by 35%. The hospital has contracted with an outside vendor to build a customized IT tool.

3 - Simultaneous Scheduling of Nurses in Multiple Hospital Units using Stochastic Integer Programming

Sanjay Mehrotra, Northwestern University, Industrial Engineering and Management, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, mehrotra@northwestern.edu, Kibaek Kim

We will present theoretical and computational results on simultaneous scheduling of nurses in multiple hospital units using a two-stage stochastic mixed integer programming model. The model allows a nurse pool as well as sharing of nurses from a more specialized unit to a lesser one. We show that the integrality of the second stage can be convexified in our model, which allows for the solution of larger scale models.

4 - Logic-Based Benders' Decomposition Approaches with Application to Operating Room Scheduling

Vahid Roshanaei, PhD Candidate, University of Toronto, 5 King's College Road, Toronto, ON, Canada, vroshana@mie.utoronto.ca, Dionne Aleman, David Urbach

We develop three logic-based Benders' decomposition (LBBD) approaches and a cut propagation mechanism to solve location-allocation integer programs (IPs). Each LBBD is implemented in four different ways, yielding 24 distinct LBBD variants. We illustrate the LBBDs' performance on the distributed operating room scheduling problem, where patients and operating rooms are scheduled across hospitals. Our LBBDs are 10-100x faster than IP+Gurobi and are more successful at finding optimal solutions.

Healthcare Operations Modeling and Optimization

Sponsor: Manufacturing & Service Oper
Mgmt/Healthcare Operations
Sponsored Session

Chair: David Kaufman, University of Michigan, 1205 Beal Ave., 1710 IOE Building, Ann Arbor, MI, United States of America, davidlk@umich.edu

1 - Allocating Operating Room Time for Elective Surgery

Steven Shechter, Associate Professor, Sauder School of Business, University of British Columbia, University of British Columbia, Vancouver, BC, Canada, steven.shechter@sauder.ubc.ca, Mahesh Nagarajan, Stephanie Carew

We examine how to allocate operating room hours to different surgical specialties at the British Columbia Children's Hospital. This is a longer-run planning decision which has major effects on the wait time experience of the patient population. To evaluate policies, we construct and validate a simulation model of patient arrival and appointment processes. We then apply optimization and dynamic programming techniques to recommend improved allocation policies.

2 - Panel Size, Office Visits and Care Coordination Events in Primary Care

Hari Balasubramanian, University of Massachusetts Amherst, 160 Governors Drive, Amherst, MA, 01002, United States of America, hbalasubraman@ecs.umass.edu, Michael Rossi

Using the Medical Expenditure Panel Survey (MEPS, AHRQ), we present a method to estimate office visit and care coordination workload generated by patients in a primary care panel. The method uses individual patient histories for a one year period.

3 - Allocating Scarce Resources in a Patient Centered Medical Home (pcmh)

Jingxing Wang, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, jeffwjx@umich.edu, Romesh Saigal

We consider a two stage stochastic allocation problem to assign the number of hours of Primary Care Physician to teams in a PCMH. In the first stage, a preliminary assignment is made. In the second stage, the demand is observed and the preliminary assignment adjusted to meet it exactly. We use real options theory and present three ways to achieve a fair and consistent mechanism to price the disruption caused by adjustment. The assignments are made such that the price of disruption is the same.

4 - An Outpatient Planning Optimization Model for Integrated Care and Access Management

David Kaufman, University of Michigan, 1205 Beal Ave., 1710 IOE Building, Ann Arbor, MI, United States of America, davidlk@umich.edu, Jivan Deglise-hawkinson, Todd Huschka, Mark Van Oyen, Jonathan Helm

We present a data-driven methodology for outpatient scheduling. Our work is the result of a practice-based collaboration with a major medical destination center. Our capacity planning model seeks to meet visit targets on the time delay from the appointment request to the appointment occurrence by patient type while managing the patient mix, which is steered by goals such as increasing the volume of new patient visits. The focus of the talk is on model validation and insights.

Co-Chair: Omar Besbes, Professor, Columbia University, Graduate School of Business, New York, NY, 10027, United States of America, ob2105@columbia.edu

Co-Chair: Nikolaos Trichakis, HBS, ntrichakis@hbs.edu

1 - Dynamic Pricing in the Presence of Consumers with Stochastically Changing Valuations

Ying Liu, Stern School of Business, New York University, 44 West 4th Street, KMC 8-154, New York, NY, 10012, United States of America, yliu2@stern.nyu.edu, Rene Caldentey, Guillermo Gallego

Motivated by Revenue Management applications, we consider a firm selling a finite inventory of a perishable product to a population of price sensitive customers. We consider the case in which consumers' valuation for the product is not static but rather changes stochastically over time after they purchase the item. The firm can take advantage of this feature to buy back some units and resell them to new arrivals. We investigate the structure of an optimal buy/sell dynamic pricing strategy.

2 - Financing Capacity Investment under Demand Uncertainty

Francis De Vericourt, Professor, ESMT, Schlossplatz 1, Berlin, 101178, Germany, devericourt@esmt.org, Denis Gromb

We consider the capacity choice problem of a firm whose access to external capital markets is hampered by moral hazard. The firm must therefore not only calibrate its capacity investment, but also optimize its sourcing of funds. We find that when higher demand realizations are more indicative of high effort, debt financing is optimal. In this case, the optimal capacity is never below the efficient capacity level but sometimes strictly above that level.

3 - Points for Peanuts or Peanuts for Points: Dynamic Management of Loyalty Programs

So Yeon Chun, McDonough School of Business, Georgetown University, 3700 O St. NW, Washington, DC, United States of America, sc1286@georgetown.edu, Nikolaos Trichakis, Dan Iancu

We study the problem of dynamically managing a loyalty program. While originally viewed as marketing efforts, in the last two decades loyalty programs have grown substantially in size and scope, to the extent that they now often significantly interact with other firm functions, including operations, accounting and finance. We develop a dynamic programming model to study the problem of optimally setting prices and point requirements.

4 - Dynamic Pricing under Convex Incentives

Dan Iancu, Assistant Professor, Stanford University, 655 Knight Way, Stanford, CA, 94305, United States of America, daniancu@stanford.edu, Omar Besbes, Nikolaos Trichakis

We discuss optimal dynamic pricing policies when certain convex incentives govern the terminal payoffs. These could arise in a multitude of settings, including debt financing or sales incentives.

Sponsored Session

Chair: Xuanming Su, The Wharton School, University of Pennsylvania, Philadelphia, United States of America, xuanming@wharton.upenn.edu

Co-Chair: Jaelynn Oh, The University of Utah, 1655 East Campus Center Drive, Spencer Fox Eccles Business Building, Salt Lake City UT, jaelynn.oh@business.utah.edu

1 - Mass Customization, Externalities, and Guardrail Products: iYou Can't be all Things to all People!

Eren Cil, University of Oregon, 1585 East 13th Avenue, Eugene, OR, United States of America, erencil@uoregon.edu, Michael Pangburn

Firms employ mass customization to closely match customers' taste with the delivered product. We additionally consider the brand-level issue of mismatch between customers' tastes and the firm's full range of products. We show that such a brand-level mismatch limits the usage of mass customization, even when costless to the firm, and makes the firm employ differential pricing.

2 - Cannibalization in Secondary Markets

Wedad Elmaghraby, Associate Professor, University of Maryland, University of Maryland, 4311 Van Munching Hall, College Park, MD, 20742, United States of America, welmaghr@rhsmith.umd.edu

We present results from a field experiment conducted on the platform of a leading business-to-business wholesale liquidators. By manipulating starting prices for auctions of iPads, we explore the presence of cannibalization and reference price effects in these online markets.

3 - Advance Selling with Reservations: Optimal Pricing and Overbooking Strategies

Jaelynn Oh, jaelynn.oh@business.utah.edu, Xuanming Su

Customers who make reservations in advance are guaranteed service when they show up. We study whether and how firms should charge for reservations and relate our results to advance selling strategies.

4 - Trade-in Remanufacturing, Strategic Customer Behavior, and Government Subsidies

Renyu Zhang, Doctoral Student, Olin Business School, Washington University in St. Louis, Campus Box 1133, 1 Brookings Drive, St. Louis, MO, 63130, United States of America, renyu.zhang@wustl.edu, Fuqiang Zhang

We study the impact of remanufacturing under strategic customer behavior and government subsidies. We find that trade-in remanufacturing can serve as an effective mechanism to mitigate strategic customer behavior, and that the adoption of remanufacturing and the government subsidies for remanufactured products may not lead to an environmentally better outcome. We also characterize the government subsidy/tax scheme that can induce the socially optimal outcome.

Retail Pricing

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Goker Aydin, Indiana University, 1309 East Tenth Street, Bloomington, IN, 47405, United States of America, ayding@indiana.edu

1 - Group Buying under Consumer's Uncertainty

Victor Araman, American University of Beirut, Beirut, Lebanon, va03@aub.edu.lb, Skander Esseghaier

We develop a model of group buying under consumer uncertainty where a consumers' decision to acquire information and decision to share the acquired information is endogenously determined as a result of a game between these consumers. We determine the optimal group buying strategies and show that when there is sufficient heterogeneity across consumers with respect to their cost of information search and acquisition, group buying dominates the more traditional individual selling strategy.

2 - Online Inventory Disclosure: Consumer Uncertainty and Experience

Tolga Aydinliyim, Baruch College, One Bernard Baruch Way, Dept of Management Box B9-240, New York, United States of America, Tolga.Aydinliyim@baruch.cuny.edu, Michael Pangburn, Elliot Rabinovich

Given varied consumer perceptions of inventory information, online retailers' presentation of such information influences purchase behavior. We investigate optimal inventory disclosure policies assuming two distinct consumer segments: savvy consumers who can predict a retailer's stock levels (even when masked) and naive consumers who rely on priori (stochastic) beliefs regarding inventory.

3 - Better Late than Now: Delayed vs. Instantaneous Retail Price Discounts

Monire Jalili, University of Oregon, 1208 University of Oregon, Eugene, United States of America, mjalili@uoregon.edu, Michael Pangburn

Retailers commonly offer a percent off a purchase and apply it either immediately or toward a future purchase. Permitting rational, forward-looking consumers, we prove that delayed discounting can improve profitability if the market is heterogeneous.

4 - Why Markdown as Pricing Modality? Role of Entry Threat

Elodie Adida, University of California at Riverside, Riverside, CA,
elodie.goodman@ucr.edu, Ozalp Ozer

Retailers commonly use markdowns jointly with inventory rationing with the goal of creating scarcity and segmenting the market when consumers are strategic. We show that the presence of competition can help explain why markdown is a more sustainable pricing strategy than everyday-low-price. We also give a new rationale for inventory rationing as a need to maintain a market share for the competitor. We investigate how consumers' behavioral motives affect this rationing effect.

Drivers of Employee Productivity in Service Settings

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations
Sponsored Session

Chair: Anita Tucker, Associate Professor, Brandeis University,
415 South Street, Waltham, MA, 02453, United States of America,
atucker@brandeis.edu

1 - Collaboration and Professional Labor Productivity: An Empirical Study of Physician Workflows

Lu Wang, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, 5th Floor, Evanston, IL, 60201, United States of America, vivianluluw@gmail.com,
Jan Van Mieghem, Kevin O'leary, Itai Gurvich

Theory predicts that simultaneous collaboration among professionals can introduce a capacity loss due to synchronization requirements. We empirically test the theory with the data collected from closely observing physicians at Northwestern Memorial Hospital in Chicago. We show that there exists a 21% potential productivity improvement if the task preemptions inherent in collaboration can be fully eliminated and estimate that more than 50% can be achieved by eliminating the task preemption cost.

2 - When You Work with a Super Man, Will You Learn to Fly?**An Empirical Study of the Impact of Coworkers**

Fangyun (Tom) Tan, Assistant Professor, Cox Business School, SMU, 6212 Bishop Blvd, Dallas, TX, 75275, United States of America, ttan@cox.smu.edu, Serguei Netessine

We use a large detailed operational data set from a casual restaurant chain to understand how peer effects affect servers' performance. In particular, we analyze the effect of coworkers' sales ability on how servers expend efforts in service speed (measured as meal duration) and quality (measured as sales), separately. Our study highlights a need for more nuanced approaches to leveraging peer effects in optimal scheduling decisions.

3 - How will the Increased Workload of Primary Care Providers Affect Patient Health?

Hessam Bavafa, Assistant Professor, Wisconsin School of Business, Madison, WI, United States of America, hbavafa@bus.wisc.edu

With the implementation of the Affordable Care Act in the United States, the healthcare system will experience an influx of newly insured patients with complex medical needs, thus increasing the workload of the primary care providers (PCPs). It is not clear how this increased workload will affect patient care. In this paper, we seek to understand the impact of primary care provider (PCP) workload on patients' access to care using a large dataset from the Veterans Health Administration.

4 - Queue Discretion, Batching, and Performance in Teleradiology

Maria Ibanez, Doctoral Candidate, Harvard Business School, Soldiers Field, Boston, MA, 02163, United States of America, mibanez@hbs.edu, Jonathan Clark, Robert Huckman, Bradley Staats

We examine how knowledge workers exert discretion on the order in which to execute tasks and the subsequent performance implications of those choices. Using two and a half years of data on more than 2.7 million cases read by outsourced radiologists working at one of the largest teleradiology firms in the US, we explore potential heuristics in ordering decisions, and how this endogenous ordering affects performance.

The Sharing Economy

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Saif Benjaafar, Professor, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States of America, saif@umn.edu

1 - Collaborative Consumption in Peer-to-peer Car Sharing

Saif Benjaafar, Professor, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States of America, saif@umn.edu, Guangwen Kong, Xiang Li

We consider a two-sided market consisting of car owners and renters, mediated by an online platform. Individuals decide on whether to be owners or renters and the platform decides on rental prices, commission rates, and membership fees. We compare car ownership and car usage in economies with and without sharing and the corresponding social welfare, including environmental impact.

2 - The Last Mile of the Sharing Economy

Arun Sundararajan, Professor And Rosen Faculty Fellow, NYU, 44 West 4th Street, New York, NY, 10012, United States of America, asundara@stern.nyu.edu

Disruption associated with what is called the "sharing economy" is altering local logistics dramatically. In my talk, I will discuss recent research on the new economics of the last mile for physical products, analyzing whether they favor the emergence of Amazon-like digital channels that reduce physical store to intelligent warehouses, or an expansion of the footprint of local retail powered by third-party peer-to-peer delivery services.

3 - Collaborative Consumption: Strategic and Economic Implications of Product Sharing

Baojun Jiang, Olin Business School, Washington University, St. Louis, MO, 63130, United States of America, baojunjiang@wustl.edu, Lin Tian

This paper examines the strategic and economic impacts of collaborative consumption-product sharing among consumers. Our analysis shows that friction in the product-sharing market may have a non-monotonic effect on the firm's profits, consumer surplus, and social welfare. When the firm strategically chooses its retail price, product sharing among consumers can be either win-win or lose-lose for the firm and the consumers, depending on whether the firm's marginal cost is high or low.

4 - The Sharing Newsboys

Ming Hu, Associate Professor, University of Toronto, 105 St. George Street, Toronto, Canada, Ming.Hu@Rotman.Utoronto.Ca

We study resource sharing behavior among a network of connected newsboys. Our focus is to investigate the impact of network structure on the sharing behaviors.

Quality and Compliance Enforcement in the Supply Chain

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Saed Alizamir, Assistant Professor, Yale University, 165 Whitney Ave, New Haven, CT, 06511, United States of America, saed.alizamir@yale.edu

1 - Quality Certification under Poor Legal Enforcement

Mariya Bondareva, PhD Candidate, University of Rochester, Simon School PhD Program, UoR, 500 Joseph C. Wilson B., 4-345 Carol Simon, Rochester, NY, 14627, United States of America, Mariya.Bondareva@Simon.Rochester.edu, Edieal Pinker

Outsourcing to developing countries is complicated by imperfect quality monitoring and inefficient legal enforcement. To ensure quality, the brands can use self-enforcing contracts. We study dynamic relational contracts using certification, inspections and penalties and determine when the certification mechanism is justified. The optimal equilibrium is characterized by non-decreasing expected profits for suppliers, non-decreasing penalties for quality failures and non-increasing defect rates.

2 - Increasing the Quality of Agricultural Produce in Developing Countries

Andre Calmon, Assistant Professor, INSEAD, Boulevard de Constance, Fontainebleau, 77300, France, andre.calmon@insead.edu, Sameer Hasija

We introduce and analyze a model to capture the interaction between farmers and retailers in agricultural supply chains that are common in the developing world. Namely, we discuss the problem of a retailer that sources perishable goods from small farmers. The quality of a crop depends on the effort that the farmer exerts and this effort is non-contractable. This problem emerged from a collaboration with a large supermarket chain that has operations in Asia.

3 - Cooperative Approaches to Managing Supplier Quality: Joint Auditing and Information Sharing

Xin Fang, Assistant Professor, Singapore Management University, 50 Stamford Road, #05-01, Singapore, 178899, Singapore, xfang@smu.edu.sg, Soo-Haeng Cho

Product safety incidents in recent years have compelled manufacturers to rethink approaches to manage product quality of their suppliers. We investigate two cooperative approaches: auditing common suppliers jointly ("joint auditing") and sharing independently collected information with other manufacturers ("information sharing"). Our analysis reveals that, while competing manufacturers may voluntarily cooperate with each other, such cooperation does not necessarily improve product safety.

4 - Managing a Responsible Supply Chain under Threat of Public Disclosure

Saed Alizamir, Assistant Professor, Yale University, 165 Whitney Ave, New Haven, CT, 06511, United States of America, saed.alizamir@yale.edu, Sang Kim

We analyze a game-theoretic model in which a downstream supply chain member ("buyer") is penalized disproportionately due to a compliance violation by an upstream member ("supplier"). Buyer's ability to audit the supplier is limited, and she faces a risk of being publicly blamed after the supplier's violation is caught by a third party. Supplier exerts effort to enhance compliance in each period, but risks having his relationship terminated due to a stochastic compliance outcome.

SB49

Understanding and Managing Risk in Extended Supply Chains

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain
Sponsored Session

Chair: Robert Swinney, Associate Professor, Duke University, 100 Fuqua Dr, Durham, NC, 27708, United States of America, robert.swinney@duke.edu

1 - Disruption Cascades and Risk Mitigation in Supply Chains

Shyam Mohan, London Business School, London, NW14SA, United Kingdom, smohan@london.edu, Nitin Bakshi

Disasters such as the Tohoku earthquake in Japan and Thai floods in 2011 serve as a reminder about the extent to which a supply chain is vulnerable to disruptions. The resulting losses arise not only through direct damage but also from disruptions to suppliers belonging to adjacent tiers. As per a recent study, nearly 40% of the disruptions originate in tier 2 and beyond. In this paper, we study the relationship between network structure and disruption cascades in supply chain networks.

2 - Contracting for Shared Value: Efficiencies from Endogenous Process Yield

Joann De Zegher, PhD Candidate, Stanford University, 473 Via Ortega, Stanford, CA, United States of America, jfdezegher@stanford.edu, Dan Iancu, Hau Lee

We focus on agricultural value chains where farmers have an opportunity to create value through the adoption of a new management practice, but the economic benefit is either too small for the farmers or accrues primarily to other parties in the supply chain. In a setting with uncertain and endogenous process yield, we study two components of supply chain design – namely contracts and sourcing channels – as possible mechanisms for creating shared value in decentralized value chains.

3 - Risky Suppliers or Risky Supply Chains?

Yixin Iris Wang, Ross School of Business, University of Michigan, 701 Tappan Street R3410, Ann Arbor, MI, 48109, United States of America, iriswang@umich.edu, Ravi Anupindi, Jun Li

The goal of this research is to assess interdependency of risks in supply network and to understand the process of risk aggregation using firm-level supplier relationship data. We concentrate on the impact of tier-2 overlapping. Our research aims to help firms manage risks more efficiently and acknowledge sub-tier importance.

4 - Supply Chain Disruptions: Evidence from the Great East Japan Earthquake

Alireza Tahbaz-Salehi, Columbia Business School, 3022 Broadway, Uris Hall 418, New York, NY, 10023, United States of America, alirezat@columbia.edu, Vasco Carvalho, Makoto Nirei, Yukiko Saito

This paper examines whether propagation of idiosyncratic, firm-level shocks through input-output linkages can lead to sizable fluctuations at the aggregate level. Using a large-scale dataset on supply chain linkages among Japanese firms together with information on firm-level exposures to a large, but localized, natural-disaster (the Great East Japan Earthquake in 2011) we quantify the earthquake's impact on firms that were (directly or indirectly) linked to affected firms.

Designing Dynamic Markets

Sponsor: Manufacturing & Service Operations Management
Sponsored Session

Chair: Kostas Bimpikis, Stanford GSB, 655 Knight Way, Stanford, CA, 94305, United States of America, kostasb@stanford.edu

1 - Auctions for Assortments of Differentiated Products: Design and Applications

Daniela Saban, Stanford University, 655 Knight Way, Stanford, CA, United States of America, dsaban@stanford.edu, Gabriel Weintraub

We study the problem of a procurement agency using an auction to construct an assortment of differentiated products, to satisfy the demand from heterogeneous customers. This setting arises in "framework agreements" (FAs), commonly used in public procurement. Using mechanism design and auction theory, we propose recommendations to improve the design of FAs. We apply our results to the FAs run by the Chilean government to buy US\$2 billion worth of goods per year.

2 - Mean Field Equilibria in Competitive Exploration

Krishnamurthy Iyer, Assistant Professor, School of Operations Research and Information Engineering, Cornell University, 225 Rhodes Hall, Ithaca, NY, 14853, United States of America, kriyer@cornell.edu, Pu Yang, Peter Frazier

We study a dynamic setting where multiple agents each explore a set of locations. Each location receives stochastic rewards over time, which is shared among all agents at that location. Based on the location's reward level and the number of other agents at that location, each agent decides whether to stay or switch to a new location. We study the equilibrium behavior as the number of agents and locations increase proportionally, and investigate the effect of information sharing.

3 - Designing Dynamic Contests

Shayan Ehsani, Stanford University, 450 Serra Mall, Stanford, CA, 94305, United States of America, shayane@stanford.edu, Mohamed Mostagir, Kostas Bimpikis

Tournaments are best suited for projects that feature a high degree of uncertainty. Information about the status of competition leads to an interesting tradeoff: participants learn about the underlying state from their competitors' progress but on the other hand their incentive to exert effort may weaken if they are lagging behind. We characterize the design that maximizes the (discounted) payoff for the principal and discuss its implications.

4 - Dynamic Mechanism Design with Budget Constrained Buyers under Non-commitment

Santiago Balseiro, Assistant Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, srb43@duke.edu, Omar Besbes, Gabriel Weintraub

We study the dynamic mechanism design problem of a firm repeatedly selling items to budget-constrained buyers when the seller has no commitment power. We argue that this problem is generally intractable. Thus motivated we introduce a fluid model that allows for a tractable characterization of the optimal mechanism. We leverage our characterization to provide insights into the dynamic structure of the optimal mechanism and show that the proposed mechanism is a good approximation in large markets.

Retail Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Amy Pan, Assistant Professor, University of Florida, Dept. of ISOM, Warrington College of Business Administration, Gainesville, FL, 32608, United States of America, amy.pan@warrington.ufl.edu

Co-Chair: Dorothee Honhon, Associate Professor, University of Texas at Dallas, 800 W. Campbell Road, Richardson, TX, 75080, United States of America, Dorothee.Honhon@utdallas.edu

1 - Do MOOCs Work in Retail? Improving Store Execution through Online Learning

Santiago Gallino, Tuck School of Business, 100 Tuck Hall, Hanover, NH, United States of America, santiago.gallino@tuck.dartmouth.edu, Youran Fu, Serguei Netessine

Conversion of retail store traffic into sales depends heavily on store execution. Although a critical piece, performance improvement of sales associates through training has received relatively scant research effort. We focus on a very specific type of training: online learning. Available to date analysis of MOOCs indicates poor engagement of the participants and questionable outcomes. Our analysis shows that online training has a strong positive impact on employee sales performance.

2 - Backroom Effect in Shelf Space Optimization

Zumbul Atan, Assistant Professor, TU/e, Eindhoven, Eindhoven, Netherlands, Z.Atan@tue.nl, Nesim K. Erkip, Tim Huh

Most retailers use backrooms as extra storage space. Backrooms are necessary when inventories do not fit to the available shelf space. We study a continuous review (r,q) policy with limited shelf capacity. We determine the optimal policy parameters and the optimal shelf space and quantify the benefits of considering the existence of backrooms when making replenishment decisions.

3 - Probabilistic Selling for Vertically Differentiated Products

Quan Zheng, Student, University of Florida, Department of ISOM, Gainesville, FL, 32611, United States of America, quanzheng@ufl.edu, Janice E. Carrillo, Amy Pan

We investigate the probabilistic selling strategy for vertically differentiated products. Both deterministic and stochastic demand models are explored. The results show that capacity constraints and demand uncertainty play important roles. The probabilistic products could be offered alone in the deterministic demand model while they are offered alone or with the low quality products in the stochastic demand model.

4 - The Impact of Consumer Search Cost on Assortment Planning and Pricing

Ruxian Wang, Johns Hopkins University, 100 International Dr, Baltimore, MD, 21202, United States of America, ruxian.wang@jhu.edu, Ozge Sahin

We incorporate search cost into consumer choice: a consumer first forms her consideration set; she evaluates and chooses the highest-utility product. We propose the k-quasi attractiveness-ordered assortment and show that it is arbitrarily near-optimal. Assortment problems are generally NP-hard, so we develop efficient exact and approximation algorithms. We propose a new pricing strategy and investigate its optimality: the quasi-same-price policy with a same price for all products except one.

Uncertainty and Performance of Service Processes

Sponsor: Service Science

Sponsored Session

Chair: Genady Grabarnik, St. John's University, 8000 Utopia Parkway, Queens, NY, 11439, United States of America, grabarnig@stjohns.edu

1 - Palm Khinchine Theorem and Performance Evaluation under Uncertainty

Genady Grabarnik, St. John's University, 8000 Utopia Parkway, Queens, NY, 11439, United States of America, grabarnig@stjohns.edu, Yefim Haim Michlin, Larisa Schwartz

We refine estimates for Palm Khinchine theorem, which allows us to tighten boundaries for comparison performance evaluation in sequential testing

2 - Recommending Resolutions for Monitoring Tickets in Automated Service Management

Larisa Schwartz, lshwart@us.ibm.com, Genady Grabarnik

We study the problem of automated resolution recommendation for monitoring tickets. We analyzed monitoring tickets from a production service infrastructure and identified a vast number of repeated resolutions. We improve the similarity measure in comparison to prior work by utilizing both the description and resolution information from historical tickets via a topic-level feature extraction using the LDA model. Furthermore effective similarity measure is learned using metric learning.

3 - Comparison Performance Evaluation for Services Systems

Yefim Haim Michlin, Senior Research Fellow, Technion - Israel Institute of Technology, Faculty of IEM, Technion City, Haifa, 32000, Israel, yefim@technion.ac.il, Ofer Shaham, Genady Grabarnik

Enterprises spend significant effort on introduction of innovations. We suggest a novel method based on Wald's sequential test idea to identify performance gain by running comparison test. The advantage in comparison to the existing tests suggested in textbooks and standards are: more strict limitation on maximum number of trials, wider range of failure ratio, variable risks and wider discrimination ratio. Suggested methodology is oriented on usage by product designers and quality engineers.

From Behavioral/Experimental Economics to Behavioral Operations: Opportunities and Challenges

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Tony Haitao Cui, Associate Professor, University of Minnesota, Carlson School of Management, Minneapolis, MN, 55455, United States of America, tcui@umn.edu

1 - Non-equilibrium Models in Games

Teck-Hua Ho, William Halford Jr. Family Professor of Marketing, University of California, Berkeley, Berkeley, CA, 94720-1900, United States of America, hoteck@haas.berkeley.edu

The notion of equilibrium is central to economic analysis. Standard equilibrium analysis relies on strong assumptions of human cognitive ability, which often do not match actual behavior. Based on this, we explain why management science should embrace non-equilibrium models. We describe recent research on them and discuss the promise that they hold based on their ability to predict better than equilibrium analysis, behavior observed in more than 100 laboratory experiments and field settings.

2 - Economics and Operations: Similarities and Differences

Rachel Croson, Dean, College of Business, University of Texas at Arlington, Arlington, TX, 76019-0377, United States of America, croson@uta.edu

This presentation will identify some of the similarities and differences between the underlying fields of economics and operations, with a goal of highlighting how experimental and behavioral research should be differentially applied to each field.

3 - The Effect of Bargaining on Testing Operations Management Models

Elena Katok, Ashbel Smith Professor of Supply Chain Management, University of Texas at Dallas, 800 W. Campbell Rd., Dallas, TX, 75080, United States of America, ekatok@utdallas.edu

OM models that involve strategic interactions are usually silent about the bargaining process. The outcome of laboratory tests of these models, however, can critically depend on how the bargaining is implemented. I will discuss the challenges and opportunities of incorporating bargaining in laboratory tests.

Pricing Inspired by Data and Practice

Cluster: Tutorials

Invited Session

Chair: Georgia Perakis, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, georgiap@mit.edu

1 - Tutorial: How Analytics Can Impact Promotion Pricing

Georgia Perakis, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, georgiap@mit.edu, Lennart Baardman, Maxime Cohen, Swati Gupta, Jeremy Kalas, Zachary Leung, Danny Segev, Kiran Panchangam, Anthony Smith

Pricing has seen exciting developments in the recent years. A particular area of pricing that has recently emerged is promotion pricing. In many important settings such as in grocery retail, promotions are a key instrument for driving sales. The Promotion Optimization Problem is a challenging problem as the retailer needs to decide which products to promote, what is the depth of price discounts, when to schedule the promotions and how to promote the product. We will discuss our collaboration with Oracle RCU on how analytics can have a key impact.

Airline Revenue Management and Customer Choice

Sponsor: Aviation Applications

Sponsored Session

Chair: Emmanuel Carrier, Delta, emmanuel.carrier@delta.com

1 - Estimation of Airline Itinerary Choice Models using Disaggregate Ticket Data

Laurie Garrow, Georgia Institute of Technology, Mason Building, Atlanta, GA, United States of America, laurie.garrow@ce.gatech.edu, Virginie Lurkin, Michael Schyns

Airline itinerary choice models support many multi-million dollar decisions, i.e., they are used to evaluate potential route schedules. Classic models suffer from major limitations, most notably they use average fare information but to not correct for price endogeneity. We use a novel database of airline tickets to estimate itinerary choice models using detailed fare data and compare these to classic itinerary choice models that use aggregate fare information but correct for price endogeneity.

2 - Insights from Mining Airline Booking Data

Catherine Cleophas, RWTH Aachen, Kackertstrasse 7, 52070, Germany, catherine.cleophas@rwth-aachen.de, Sebastian Vock, Laurie Garrow

We present a new perspective on airline booking data by comparing data from geographically and temporally distinct travel itineraries. To this end, we mine several hundred origin-destination-carrier combinations and several thousand itineraries. By clustering booking class distributions, we measure market similarity. The goal is to use cluster-adherence to compute decision trees, so as to investigate the relevance of traditional assumptions about market differentiation.

3 - Nonparametric Estimation of Demand Structures in Airline Revenue Management

Johannes Jürg, RWTH Aachen University, Kackertstr. 7, Aachen, 52072, Germany, johannes.ferdinand.joerg@ada.rwth-aachen.de, Catherine Cleophas

A central theme of airline revenue management is analyzing historical booking data to draw conclusions on the underlying demand structure. This contribution focuses on the estimation of demand segments present in a market using nonparametrical methods on panel data. We employ finite mixtures to model booking events over time frames and to obtain an estimator for the number of demand segments and their probability distribution over products.

Sponsored Session

Chair: Mihiro Sasaki, Professor, Nanzan University, 18 Yamazato, Showa, Nagoya, 466-8673, Japan, mihiro@nanzan-u.ac.jp

1 - A New Formulation for Energy-efficient Aggregation of Virtual Machines in Cloud Data Centers

Hajime Miyazawa, Nanzan University, 18 Yamazato-cho, Showa-ku, Nagoya, 4668673, Japan, miyazawa@nanzan-u.ac.jp, Mihiro Sasaki

One of the main concerns of cloud computing is energy consumption in data centers. Appropriate aggregation of virtual machines (VMs), which are the computing entities of cloud computing, on limited number of physical servers in data centers can reduce energy consumption by shutting down the rest of the servers. We present a new formulation of assigning VMs among physical servers to achieve energy-efficient VM aggregation in cloud data centers.

2 - Mathematical Properties of New Indices for Evaluating Spatial Demand-and-supply Balance

Takamori Ukai, Tokai University, 143 Shimokasuya, Isehara, 2591193, Japan, ukai@tsc.u-tokai.ac.jp, Mihiro Sasaki

In this presentation, we show some mathematical properties of new indices for evaluating spatial demand-and-supply balance. More precisely, we show that the sequence of solutions generated by the iterative algorithm converges to the proposed indices. We also discuss the relationship between the solutions and those obtained by solving a mathematical programming problem with an objective of minimizing the variance of indices. The objective corresponds to minimize unfairness among customers.

3 - Optimal Location Model for Anti-piracy Activity in Somalia

Daisuke Watanabe, Associate Professor, Tokyo University of Marine Science and Technology, 2-1-6 Etchujima, Koto-ku, Tokyo, 135-8533, Japan, daisuke@kaiyodai.ac.jp, Richard Church

A significant number of pirate attacks have occurred off the coast of Somalia. This is a major threat to ships navigating the major sea lane between Asia and Europe. The purpose of this study is to analyze the optimal location for anti-piracy activity in Somalia using the maximal covering location model.

4 - Optimal Real-time Pricing of Electricity for Supply and Demand Control in a Smart Community

Mihiro Sasaki, Professor, Nanzan University, 18 Yamazato, Showa, Nagoya, 466-8673, Japan, mihiro@nanzan-u.ac.jp, Yoichi Tanaka, Yasuaki Oishi, Masao Fukushima, Masaki Yasunishi

We consider a smart community where the supplier of electricity presents the electricity price varying with different time, and consumers determine their own optimal levels of buying/selling electricity in responding to the time-varying price. We formulate the problem of finding supplier's optimal pricing as a bilevel programming problem. Computational results show that real-time pricing can effectively control supply and demand of electricity.

Electricity Market Models

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Hung Po Chao, Energy Trading Analytics, 2842 Main St., Suite 206, Glastonbury, CT, 06033, United States of America, hungpo.chao@gmail.com

1 - Decentralized Markets with LMP for Efficient Congestion Management of Renewable Electricity Feed-in

Hans Schermeyer, Research Associate, Karlsruhe Institute of Technology, Hertzstr. 16, Karlsruhe, 76187, Germany, hans.schermeyer@kit.edu, Valentin Bertsch, Wolf Fichtner

In this work, we analyse electricity grid congestion caused by renewables and their necessary curtailment on distribution grid level. To explore the possibilities of enhanced congestion management, we develop an agent-based simulation model that represents a distribution grid in Germany which faces frequent congestion caused by renewables. Inspired by (Distribution) Locational Marginal Pricing theory we implement a decentralized market design for a more efficient congestion management.

2 - Operational Flexibility in Dutch Electricity Markets

Robin Broder Hytowitz, Johns Hopkins University, 3400 North Charles Street, Ames 313, Baltimore, MD, United States of America, robin.hytowitz@gmail.com, Ozge Ozdemir, Benjamin Hobbs

A two-stage study is performed to evaluate the impact of renewable energy on operational flexibility in the Dutch market given current demand projections. A unit commitment model for a pan-European network simulates the day-ahead market, and the successive balancing market is simulated for the Netherlands alone. The two stages are run for several business cases to analyze resources that can provide further flexibility, including demand-side management, storage, and reserve constraints.

3 - A Market Mechanism for Electric Distribution Networks

Na Li, Assistant Professor, Harvard University, 33 Oxford St,
MD 147, Cambridge, MA, 02138, United States of America,
nali@seas.harvard.edu

An efficient electricity market in distribution networks plays an important role in incentivizing end-users to participate in smart grid. However, the externalities associated with the voltage capacity constraints and line losses constitute a significant barrier. In this paper, we present a market mechanism to internalize the external effects within private decisions by defining trading rules. A competitive market is established to achieve a social optimum within a radial distribution network.

4 - Ramsey Pricing of Transmission System Platform

Hung Po Chao, Energy Trading Analytics, 2842 Main St., Suite
206, Glastonbury, CT, 06033, United States of America,
hungpo.chao@gmail.com

This paper examines second-best pricing for jointly optimized investments in a transmission network subject to a budget constraint. Ramsey pricing I works by setting energy prices to raise revenue to cover investment costs, and Ramsey pricing II obtains revenue from injection and withdrawal charges. We show that Ramsey pricing II achieves allocation that not only is better than Ramsey pricing I but achieves nearly the first-best allocation.

Smart Grids and Demand Response

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Mahdi Kefayati, Senior Software And Control Engineer, Electric Power Engineers, Inc., 13001 Highway 71, Suite G100, Austin, TX, 78738, United States of America, kefayati@utexas.edu

1 - Optimizing Intelligent Infrastructure Coupled with the Power Grid

Mahnoosh Alizadeh, Stanford University, Packard EE Building,
Room 372, 350 Serra Mall, MC 9515, Stanford, Ca, 94305,
United States of America, malizade@stanford.edu,
Andrea Goldsmith

Electric utilities are leveraging smart grid networks to extend demand response programs to a broad class of loads. What is commonly ignored is that a significant amount of flexibility that DR programs aim to harness will be due to electricity consumption that supports the delivery of goods and services by other networked infrastructure. Thereby, DR could introduce a complicated closed-loop interaction between the power grid and various other infrastructures that we highlight in this talk.

2 - Plug-in Vehicle to Home (V2H) Operation under a Grid Outage

Hunyoung Shin, University of Texas at Austin, 1616 Guadalupe
UTA, Austin, TX, 78759, United States of America,
hunyoung@utexas.edu, Ross Baldick

During a grid outage, Vehicle to Home (V2H) system with photovoltaic generation can be used to create a small micro-grid. In this work, we investigate V2H operation under a grid outage that provides backup power without the help of an external electric grid. First, we introduce a novel optimization model that maximizes backup duration. Motivated by the solution of optimization problem, a new algorithm for V2H system is suggested. Then we extend the work to Vehicles-to-Homes (V2Hs) system.

3 - Convexification of Power Flow Problem over Arbitrary Networks

Javad Lavaei, Assistant Professor, UC Berkeley, 4121 Etcheverry
Hall, University of California, Berkeley, CA, 94720, United States
of America, lavaei@berkeley.edu, Ramtin Madani, Ross Baldick

Consider an arbitrary power network with PV and PQ buses, where active powers and voltage magnitudes are known at PV buses, and active and reactive powers are known at PQ buses. The classical power flow (PF) problem aims to find the unknown complex voltages at all buses. The objective of this talk is to propose a class of convex optimization problems with the property that they all solve the PF problem as long as the solution belongs to a good regime containing voltage vectors with small angles.

4 - Ancillary Services Potential of Plug-in Electric Vehicle Charging

Mahdi Kefayati, Senior Software And Control Engineer, Electric Power Engineers, Inc., 13001 Highway 71, Suite G100, Austin, TX, 78738, United States of America, kefayati@utexas.edu, Ross Baldick

Taking a data driven approach, we show that, plug-in electric vehicles can provide a substantial amount of ancillary services. We propose algorithms to realize this potential and demonstrate that in ERCOT market, as an example, less than 20% electrification can potentially cover all regulation service needs.

Underground Mining

Sponsor: ENRE – Natural Resources I – Mining

Sponsored Session

Chair: Alexandra Newman, Professor, Colorado School of Mines, Mechanical Engineering, Golden, CO, 80401, United States of America, anewman@mines.edu

1 - Logistics Planning at LKAB

Mikael Ronnqvist, Professor, Université Laval, 1065, Avenue de la
Médecine, Québec, QC, Canada, mikael.ronnqvist@gmc.ulaval.ca,
Patrik Flisberg, Olivier Sirois, Dick Carlsson

The logistic planning at a mining company is a complex task. There are large volumes of products of uncertain quality and many unforeseen events. There is a need to keep inventories within distinct bounds and use the fleet of train systems in an efficient way. We report on some planning models based on optimization and describe results from tests.

2 - Maintenance Planning of Freight Train for a Mining Company

Olivier Sirois, Student, Université Laval, 1065, Avenue de la
Médecine, Québec, QC, Canada, olivier.sirois.1@ulaval.ca

We conduct an analysis based on a simulation model of a real-case railway network for LKAB, a large mining company, on which we investigate two maintenance planning issues. First, the implementation of a strategic planning for locomotives maintenance is evaluated in terms of capacity usage of the maintenance facility throughout a fixed horizon. Second, we analyzed different strategies for post maintenance wagons sorting in order to minimize the shunting time linked to those operations.

3 - Crown Pillar Placement in an Open-Pit-to-Underground Mining Transition

Barry King, PhD Candidate, Colorado School of Mines, 1500
Illinois Street, Golden, CO, 80401, United States of America,
barking@mymail.mines.edu

Open pit and underground mine planning, i.e., scheduling three-dimensional, notional blocks to maximize a deposit's value, are often performed independently. We show how the placement of the crown pillar (that separates open pit and underground operations) is affected by discount rate, production capacities, and metal content of the deposit. Our methodology incorporates scheduling at the block level, accounts for detailed precedence and capacity constraints, and allows for parametric analysis.

4 - From Opening Towards Closing a Mine – A Case for Popmusic and Generalized Local Branching?

Alessandro Hill, Hamburg University of Technology,
Schwarzenbergstrasse 95 D, Hamburg, Germany,
alessandro.hill@tuhh.de, Stefan Voss

Within our research on sustainable mining we came across the needs to develop some solid closure plans for mining. Here we investigate to which extent combinatorial optimization may be useful in the lifecycle of a mine including its eventual closure. For some problems we encountered the option to apply matheuristics like POPMUSIC or generalized local branching being successful while others are more of a handwaving nature. We exemplify in both cases with specific examples and related results.

Case Competition I

Sponsor: INFORM-ED

Sponsored Session

Chair: Palaniappa Krishnan, Associate Professor, University of Delaware, 212 Townsend Hall, 531 S.College Avenue, Newark, DE, 19711, United States of America, baba@udel.edu

1 - Using Optimization for Team Information

Wendy Roth, Assistant Professor, Georgia State University,
6230 Forest Park Dr, Signal Mountain, TN, 37377,
United States of America, wroth@gsu.edu

Introductory Business Modeling classes often focus on types of models (linear, integer and nonlinear) and tool usage to solve various problems. Textbook and single solution cases help develop skills, but are often more straight forward than the business problems students will face in their careers. Additionally, the subjects of these problems, including production, can be unfamiliar or uninteresting to many students. This case focuses on something students are very familiar with, dividing participants into teams. Since there are many ways teams can be formed, this case is created to encourage groups to take different approaches to solve this problem.

2 - Baseball- Discovering the Moneyball Effect

Sean Barnes, University of Maryland, 4352 Van Munching Hall,
University of Maryland, College Park, MD, 20742, United States
of America, sbarnes@rhsmith.umd.edu, Margret Bjarnadottir

This case uses player evaluation and personnel decision-making in the Major League Baseball to introduce many of the key steps of data mining projects. The data mining process is a unique combination of art and science, and teaching the art of data mining is challenging to do in a standard classroom setting with small data sets. The goal of this case is to move beyond the simple "cookie cutter" data sets, and introduce students to the challenges of dealing with real data to answer important questions, as well as introduce or reinforce multiple data mining methods. The case builds on a very rich data set collected by the authors, which allows for students or groups of students to arrive at very different answers to the same question. For example, what is the best predictive model? Which players should be pursued?

3 - Medication Waste Reduction in an In-hospital Pharmacy: A Case that Bridges Problem Solving between a Traditional Case and an Industry Project

Gregory Dobson, University of Rochester, University of Rochester,
Rochester, NY, United States of America,
greg.dobson@simon.rochester.edu, Vera Tilson

This Operations Management case describes a waste-reduction project in a compounding pharmacy in a hospital. Every day, pharmacy technicians prepare a large number of patient-specific medication doses and then deliver these doses to various hospital units. With the rising cost of medications, pharmacy managers become concerned that a significant number of compounded medication doses are not administered to patients and are subsequently wasted. The students are asked to quantitatively evaluate proposed changes to the compounding and delivery process and to estimate savings from process reconfiguration. Two large datasets are provided with the case to facilitate hypothesis generation regarding probable causes of waste and to analyze proposed changes. The analysis will deepen students' spreadsheet skills as well as mathematical modeling of inventory problems. The case is presented in parts, and it is discussed over one and a half class meetings – simulating the steps of a field project: interviewing a client, framing the client's problem, formulating a data request, and then analyzing the data and delivering a recommendation. This case has been used in a core MBA operations management class; it could also be used in a health-care operations or in a business modeling course.

Dimensionality Reduction Techniques for Generation Capacity Expansion Problems with Intermittent Resources

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Fernando de Sisternes, Argonne National Laboratory - MIT
Energy Initiative, 77 Massachusetts Avenue, E19-341, Cambridge, MA,
02139, United States of America, ferd@mit.edu

1 - On the Temporal Resolution of Electric Sector Capacity Expansion Models

James Merrick, Stanford University, Huang Engineering Center,
Stanford, CA, 94305, United States of America,
jmerrick@stanford.edu

When hours are assumed to be independent, we can capture hourly information by removing similar hours and weighting a representative. Applying hierarchical clustering to a sample dataset, I show that while the variability of demand can be captured in the order of 10 hours, including wind and solar resources warrants in the order of 1000. A similar analysis is undertaken for days and weeks. I conclude with how the approach can reduce resolution further using information about problem structure.

2 - A Robust Method to Choose Representative Weeks in Renewable Generation Capacity Expansion Problems

Fernando de Sisternes, Argonne National Laboratory - MIT
Energy Initiative, 77 Massachusetts Avenue, E19-341, Cambridge,
MA, 02139, United States of America, ferd@mit.edu,
Ignacio Núñez

We propose a new week selection method for capacity expansion formulations with unit commitment constraints that is robust to the renewable capacity in the system. This method enables the use of such formulations in determining the optimal amount of thermal and renewable capacity. The proposed method selects a week combination with hourly resolution that represents the energy below the net load duration curve and its inter-temporal variability across different renewable capacity scenarios.

3 - Optimization-based Method for Scenario Reduction in Generation Expansion Models

Ignacio Núñez, Research Assistant Professor, University of the
Andes, Av. Monseñor Alvaro del Portillo 12.455, Las Condes,
Santiago, RM, 7620001, Chile, ijnunez@uandes.cl, Fernando de
Sisternes

Including intermittent generation in generation expansion models requires a detailed representation of the short-term operation of the system, increasing dramatically the dimensionality of the problem. We present a mixed integer linear model that selects a specific number of representative scenarios (e.g. days or weeks) and weights to minimize the maximum error in representing the net load duration curve for different capacities of solar photovoltaic and wind power.

4 - Modeling a Paradigm Shift: Distributed vs. Centralized Options in Electricity Capacity Planning

Jesse Jenkins, PhD Student And Researcher, MIT Engineering
Systems Division and MIT Energy Initiative, 77 Massachusetts
Avenue, Cambridge, MA, 02139, United States of America,
jessedj@mit.edu

Distributed energy resources such as solar PV, combined heat and power, batteries, and demand response, may compete with conventional power plants in the provision of electricity services. This research employs state-of-the-art dimensionality reduction techniques to ensure the computational tractability of a generation capacity expansion model that considers tradeoffs between distributed and centralized energy options, including impacts on network costs, losses, congestion, and system services.

Modeling, Analysis, and Management of Water-Centric Systems

Sponsor: ENRE – Environment I – Environment and Sustainability
Sponsored Session

Chair: Nagesh Gavirneni, Associate Professor, Cornell University, 325
Sage Hall, Ithaca, United States of America, nagesh@cornell.edu

1 - Inland Waterway System Dynamics

Furkan Oztanriseven, University of Arkansas, 1900 N. Garland
Avenue, Apt. #26, Fayetteville, AR, 72703, United States of
America, oztanriseven@gmail.com, Heather Nachtmann

The growth of population and economic advancement led to a higher demand for transportation services. However, the expansion in the transportation sector comes with substantial costs, such as higher gas emissions and traffic congestion. Inland waterways offer an environmental friendly and economically sound transportation alternative. In this study, we utilized a system dynamics model to better understand the interconnected relationships between the economy and the inland waterways performance.

2 - A Novel Mathematical Model for Water Value Chain Management

Mengqi Hu, University of Illinois at Chicago, Chicago, IL,
United States of America, mhu@uic.edu, Afshin Ghassemi

The amount of water in the world is limited and a large amount of water is wasted due to ineffective operation for water infrastructure. A decision model which can efficiently manage the water value chain is urgently needed to reduce water consumption. In this research, we develop a model for water management where the water flows at different stages of transitions (e.g., source, distribution) are modeled. The proposed model is demonstrated to be able to significantly reduce water consumption.

3 - Automated Analysis of Online Reviews to Improve Visitor Experience in New York State Parks

Nagesh Gavirneni, Associate Professor, Cornell University, 325
Sage Hall, Ithaca, NY, United States of America,
nagesh@cornell.edu, Hari Udayapuram

The New York State Park system has a large volume of visitor feedback on online platforms such as Yelp, TripAdvisor, and Google. We design, develop, and implement software systems that can download, organize, and analyze the text from these online reviews and help the park managers identify strategies to improve the visitor experience at their facilities.

1 - Optimal Policy Design to Motivate Blood Donation: Evidence from a Randomized Field Experiment and a Structural Model

Tianshu Sun, University of Maryland Smith School of Business,
3330 Van Munching Hall, College Park, MD, 20740-2840,
United States of America, tianshusun@rhsmith.umd.edu

Using a randomized field experiment involving 80,000 participants, we test the effect of different policies in driving donation. We find: blood banks can use group reward to motivate group formation to increase donation; such group reward is four times more cost effective than individual reward. We build a structural model and perform simulations to identify optimal incentive and targeting strategy.

2 - Improving Blood Collection Policies for Cryoprecipitate

Chenxi Zeng, Georgia Tech, Atlanta, GA, United States of America, czeng8@gatech.edu, Turgay Ayer, Chelsea White Iii, Roshan Vengazhiyil, John Deshane

Working closely with the American Red Cross (ARC), we have developed and analyzed a donor collection model for whole blood that is to be processed into cryoprecipitate (cryo), a critical blood product for controlling massive hemorrhaging. Our numerical results show that the proposed solution approaches may reduce the expected cryo collection cost by up-to 70%, compared with the current practice. Implementation of the model at the ARC supports our estimates.

3 - Ebola Treatment Facility Location Planning in Guinea

Chu Qian, Georgia Tech, GA, United States of America, qianchu31@gmail.com, Charmaine Chan, Matt Daniels, Javiera Javiera, Caleb Mbuvi, Ivan Renaldi, Jonathan Sutomo, Kimberly Adelaar

In the recent Ebola outbreak, treatment facilities were critical but beds were unavailable in some areas while unused in others. A spatial simulation was built to project the spread within Guinea, overlaid with heuristics on when and where to place treatment facilities. Results showed units set up quickly or in advance could have saved more than 2000 lives.

Applications of Decision Analysis & Large-Scale Data Analytics

Sponsor: Decision Analysis

Sponsored Session

Chair: Mazen Skaf, Partner & Managing Director, Strategic Decisions Group, 745 Emerson St, Palo Alto, Ca, 94301, United States of America, mskaf@sdg.com

1 - Expert Calibration and Elicitation for Large Scale Investment Decisions

Saurabh Bansal, Assistant Professor, Penn State University, 405 Business Building, University Park, PA, 16802, United States of America, sub32@psu.edu, Genaro Gutierrez

We discuss a new approach for the use of expert calibration and elicitation for estimating probability distributions. The approach has been in use since last two years at a Fortune 500 firm for making an annual large-scale investment decision. Practical insights for expert elicitation are also discussed.

2 - Reducing Risk and Improving Incentives in Funding Entrepreneurs

Samuel E. Bodily, Professor, Darden Graduate Business School, Univ. of Virginia, 100 Darden Boulevard, Charlottesville, VA, 22903, United States of America, BodilyS@Darden.virginia.edu

Backer financing mechanisms that encourage an entrepreneur are identified, risk analysis models are developed, and insights are obtained about how mechanisms (e.g. equity capital, incentive gifts, insurance, revenue contracts, and derivative swaps) can best reduce risk to the entrepreneur and give proper incentives, at given cost to the backers. Attention is given to avoiding problems of moral hazard and providing proper incentives. Certainty equivalents for financing alternatives are derived.

3 - Using Decision Analysis and Large Data Analytics to Enhance Decision Quality

Mazen Skaf, Partner & Managing Director, Strategic Decisions Group, 745 Emerson St, Palo Alto, CA, 94301, United States of America, mskaf@sdg.com

Increasingly, in multiple domains, the use of large data analytics is enhancing the way we apply DA from identifying a decision opportunity, to framing, generating new alternatives, and evaluating alternatives. We present cases from various industries to illustrate how using large data analytics contributes to decision quality and how, in some situations enables a totally new approach to alternatives generation and strategy development.

Quantifying Uncertainty in Decision Analysis Practice

Sponsor: Decision Analysis

Sponsored Session

Chair: Christopher Hadlock, PhD Student, The University of Texas at Austin, 1 University Station Austin, TX 78713, United States of America, cchadlock@austin.utexas.edu

1 - A Theory of Tail Behavior for Decision Analysis

Brad Powley, Senior Consultant, Strategic Decisions Group, 745 Emerson Street, Palo Alto, CA, 94301, United States of America, bpowley@sdg.com

On occasion, it is useful for a decision analyst to encode a decision maker's probability distribution with one or more infinite tails. However, an infinite tail of one probability distribution might be heavier than that of another, adding a wrinkle to probability encoding. This talk defines heavier tails and introduces a theory of tail behavior tailored to help a decision analyst encode a probability distribution with one or more infinite tails.

2 - Assessment Error and Discrete Approximations to Continuous Distributions

Robert Hammond, Decision Analyst, Chevron, 1400 Smith St, Houston, TX, United States of America, rhammond@chevron.com, Eric Bickel

Decision analyses often use continuous probability distributions, elicited from subject matter experts, and discretized for use in decision trees. In practice, cognitive biases reduce the precision of the assessments, and discretization introduces approximation error. We compare several discretization methods when the assessments are imprecise, and show that assessment precision often has significantly more impact on model performance than accuracy tradeoffs between discretization methods.

3 - Decision Making under Incomplete Information: Sequential Probability Assessment Heuristics

Tao Huang, The University of Texas at Austin, 204 E. Dean Keeton Street, Stop C2200, ME department, ETC II, Room 5.152, Austin, TX, 78712, United States of America, huangt55@gmail.com, Eric Bickel

Expected utility of an alternative is not explicitly computable in cases where probability mass function is partially known. Previous research has tried to establish dominance to solve the problem. In practice, however, dominance is rarely established and further probability assessments are needed. In this paper, we propose a novel way called Sequential Probability Assessment Heuristic that iteratively selects a feasible assessment based on a method from machine learning to solve this problem.

4 - Assessment-adaptive Discretizations (AAD) for Decision Analysis Practice

Christopher Hadlock, PhD Student, The University of Texas at Austin, 1 University Station Austin, TX 78713, United States of America, cchadlock@austin.utexas.edu, Eric Bickel

It is common practice in decision analysis to discretize continuous uncertainties into several points, and then assign probabilities to these points. Shortcuts pre-specify percentiles to assess, along with the probabilities to assign to each of them. However, shortcuts optimized towards matching the mean often differ from those optimized to match the variance. We present assessment-adaptive discretization methods, which adapt the probability assignments based upon the observed assessments.

Aviation Applications Section: Best Student Presentation Competition 1

Sponsor: Aviation Applications

Sponsored Session

Chair: Bo Zou, University of Illinois at Chicago, 2095 Engineering Research Facility, 842 W. Taylor Street (M/C 246), Chicago, IL, 60607-7023, United States of America, bzou@uic.edu

1 - Predicting Airport Arrivals using Data Mining Techniques

Sreeta Gorripaty, Student, University of California Berkeley, 116 McLaughlin Hall, UC Berkeley, Berkeley, CA, 94720, United States of America, gorripaty@berkeley.edu, Yi Liu, Alexey Pozdnukhov, Mark Hansen

One way to define similarity between two days in the NAS is measuring the difference in their airport arrival counts. Similar historical days can be extracted by predicting the airport arrivals for a given day and can be subsequently used in decision support tools. In our work, we use machine learning algorithms of support vector regression and random forest to predict the number of arrivals. These models also quantify the contribution of factors such as weather and demand, on airport arrivals.

2 - Airline Alliance and Product Quality: The Case of the U.S. Domestic Airline Industry

Jules Yimga, Kansas State University, KS, United States of America, jjules@ksu.edu, Philip Gayle

Collusion on price and service levels tends to be the main concern of policymakers when appraising an airline alliance formation. We posit that product quality is an important dimension to be considered in alliance appraisals. This paper investigates the product quality implications of the Delta/Continental/Northwest codeshare alliance with a particular focus on the codeshare effects in markets where the alliance partners competed prior to the alliance.

3 - Statistical Analysis of Dispatcher Fuel Loading Behavior

Lei Kang, University of California, Berkeley, 107D McLaughlin Hall, UC Berkeley, Berkeley, Ca, 94720, United States of America, lkang119@gmail.com, Mark Hansen, Megan Ryerson, Lu Hao

Airlines are moving aggressively to reduce fuel consumption. Thus, gaining a better understanding of dispatcher fuel loading behavior regarding discretionary fuel (i.e. contingency fuel and alternate fuel) is of great interest to airlines. By combining a large flight level fuel loading dataset with a dispatcher survey provided by a major US airline, dispatcher heterogeneity and its impacts in loading discretionary fuel regarding domestic and international flights will be quantified and compared.

1 - Exploring Operational Problems for Future Delivery Service Operations using Unmanned Aerial Vehicles

Heng Chen, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, heng@som.umass.edu, Senay Solak

It is well accepted that commercial use of UAVs in the near future will involve delivery service operations by retailers and courier companies. We outline some strategic and tactical decisions that these companies will face in UAV based delivery operations, and use currently available data to develop preliminary models for guiding such decisions by a firm. Specifically, optimal policies on certain capacity and revenue management decisions under stochastic demand are studied and derived.

2 - Crowdshipping for Same-day Delivery

Niels Agatz, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, Rotterdam, Netherlands, nagatz@rsm.nl, Alp Arslan

Crowdshipping entails obtaining transportation services from approved drivers and carrier companies with spare capacity rather than from traditional logistics partners. The key idea is to exploit unused capacities and existing transportation flows of the crowd to save delivery cost and provide faster delivery. This study investigates the use of crowdshippers for last-mile delivery in a same-day delivery setting.

3 - The Pickup and Delivery Problem with Time Windows, Scheduled Lines and Stochastic Demands

Tom Van Woensel, Full professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, NB, Netherlands, t.v.woensel@tue.nl

This paper concerns scheduling a set of vehicles to serve a set of requests, whose expected demands are known in distribution when planning, but are only revealed with certainty upon vehicles' arrival. In addition, a part of the transport plan can be carried out on limited-capacity scheduled public transportation lines using bus, train, tram, metro, etc. We present the model, solution approach and numerical results.

Joint Session TSL/Public Sector: Transportation Issues in Emergency Response

Sponsor: Transportation, Science and Logistics & Public Sector

Sponsored Session

Chair: Kash Barker, Associate Professor, University of Oklahoma, 202 W Boyd St, Rm. 124, Norman, OK, 73019, United States of America, kashbarker@ou.edu

1 - Combining Worst and Average Case Considerations in an Integrated Emergency Response Network Design

Jyotirmoy Dalal, Assistant Professor, Indian Institute of Management Udaipur, IIM Udaipur, MLSU Campus, Udaipur, 313001, India, jyotirmoy.dalal@gmail.com, Halit Uster

We design an emergency response network, integrating relief (supply) and evacuation (demand) sides under uncertainties in demand amount and location. We formulate a MIP, combining stochastic and robust optimization concepts as the weighted sum of the corresponding objectives. For varying relative weights, we devise alternative approaches to solve large scale problem instances. We present computational result and insights gained by applying the model to a GIS-based case study on coastal Texas.

2 - A Multi-period Dynamic Location Planning Model for Emergency Response

Burcu Keskin, Associate Professor, The University of Alabama, 345 Alston Hall, 361 Stadium Drive, Tuscaloosa, AL, 35487, United States of America, bkeskin@cba.ua.edu, Jianing Zhi, Sharif Melouk

We propose a deferred service model to analyze the daily operations of ambulances that involve dispatch and redeploy. Given incident priority levels and patterns, we decide which incidents to serve immediately or to defer to following periods while incurring deferral penalty costs. Considering network size, fleet size, incident patterns, and time-dependent parameters, we compare the results in terms of service, response time, and cost through experimentation and offer new dispatch policies.

3 - Replenishment Location Planning for Service Trucks under Network Congestion and Routing Constraints

Leila Hajibabai, Clinical Assistant Professor, Washington State University, 405 Spokane St., Sloan 119, P.O. Box 64291, Pullman, WA, 99164, United States of America, leila.hajibabai@wsu.edu

It is often challenging to plan service trucks operations under network design constraints, especially on congested roadways. An integrated model is developed to simultaneously determine the optimal location design of replenishment facilities, minimize routing cost in the proposed network, assign traffic, and select candidate links for capacity expansion. A genetic algorithm is proposed that integrates a continuous approximation model for routing cost estimation and traffic assignment algorithm.

Routing Problems with Uncertainty I

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Shu Zhang, School of Economics and Business Administration, Chongqing University, No. 174 Shazheng Street, Shapingba, Chongqing, 400030, China, zhangshu@cqu.edu.cn

1 - Technician Scheduling Problem with Experience-based Service Times

Xi Chen, The University of Iowa, Iowa City IA 52242
xi-chen-3@uiowa.edu, Michael Hewitt, Barrett Thomas

We study a dynamic technician scheduling problem with experience-based service times. We use well-established models from the psychology community to model how gains in experience impact service times. We assume that customer requests are uncertain. We model the problem as a Markov decision process with the objective of minimizing the expected total service times over a finite horizon. We also propose a number of lookahead schemes and present results.

2 - Route Evaluators for the Vehicle Routing Problem with Stochastic and Correlated Travel Times

Jorge E. Mendoza, Associate Professor, Polytech Tours, 64 Avenue Jean Portalis, Tours, 37200, France, jorge.mendoza@univ-tours.fr, Andres Medaglia, Andrés Sarmiento, Carlos Felipe Ruiz, Raha Akhavan-Tabatabaei

Vehicle routing problems with stochastic travel times (VRPSTTs) consist in designing transportation routes of minimal expected cost over a network where times are represented by random variables. In this research we consider the case of correlated random variables. We present two methodologies, one analytical and one based on simulation, to efficiently evaluate routes. We present computational experiments showing the value of considering correlations in VRPSTTs.

3 - Revenue Driven Supply Chains under Uncertainty

Nizar Zaarour, Northeastern University, Boston, MA, United States of America, n.zaarour@neu.edu, Emanuel Melachrinoudis, Marius M. Solomon

We consider the discount pricing of products that are being phased-out in retail stores. This triggers a time horizon for the retailer to sell the existing inventory or sell it at a major discount in a reverse logistics move. We develop mathematical programming models to deal with this issue. The models are tested on real data provided by a national retailer.

4 - Multi-Period Orienteering with Uncertain Adoption Likelihood and Waiting at Customers

Shu Zhang, School of Economics and Business Administration, Chongqing University, No. 174 Shazheng Street, Shapingba, Chongqing, 400030, China, zhangshu@cqu.edu.cn, Barrett Thomas, Jeffrey Ohlmann

We consider a problem in which a traveler visits customers over a multi-period horizon to influence and observe the chance of customer adoption. Over the multiperiod horizon, each customer's likelihood of adopting the traveler's product stochastically evolves. We model the problem as a partially observed Markov decision process with an objective to maximize the expected sales. Each period, the traveler must decide which customers to schedule and which order to visit, knowing that due to uncertain wait times the traveler may not be able to meet customers even if they are on the schedule.

1 - Railway Applications Society Problem Solving Competition

Francesco Corman, Delft University Of Technology, Mekelweg 2, Delft, Netherlands, F.Corman@tudelft.nl

This session is reserved for the finalists of the RAS Problem Solving Competition (PSC). The presenters and their abstracts won't be determined until we finish the judging process, which happens around mid-October. The selection committee will identify the top three teams who will present their results during the session. PSC asks participants to build a model to predict track failures on a railway network. Data about recorded traffic over a railway network is given, together with yellow and red tags. Yellow tags are measured deviations from the railway regulations for track layout, alignment and condition, which would require

maintenance, but still allow for running traffic. Red tags are failures with require immediate intervention. The goal of the PSC is to predict when yellow tags will turn red, to be able to plan optimally maintenance and repair actions.

Chair: Kai Yin, Nomis Solutions, 1111 Bayhill Drive, Suite 230, San Bruno, CA, 94066, United States of America, yinkai1000@gmail.com

1 - Trip Splitting Approximation to Link Travel Time Estimation on a Transportation Network

Kai Yin, Nomis Solutions, 1111 Bayhill Drive, Suite 230, San Bruno, CA, 94066, United States of America, yinkai1000@gmail.com, Bruce Wang, Wen Wang, Teresa Adams

We study link travel time estimation using time stamps of trips on a transportation network. Assuming that each link associates with a random travel time, a statistical inference method, trip splitting approximation, is proposed to deal with a general link travel time distribution and also address the case that the routes of some trip observations are unknown. We explore an iterative procedure analogous to the Expectation-Maximization (EM) algorithm and apply the Bayesian method for solutions. The properties of solutions and the effect of data quality are examined.

2 - Map Inference using Probe Vehicle GPS Data with Low Reporting Frequency

Wen Jin, Tsinghua University, 519A Shunde Building, Beijing, 100084, China, jinw11@mails.tsinghua.edu.cn, Hai Jiang

The accuracy of road maps is critical to providing quality navigation services. As rapid urbanization takes place in Chinese cities, there are frequent changes to road networks due to the expansion of the city to suburban areas as well as urban redevelopment in developed districts. Most, if not all, existing literature on map inference problems requires GPS data with high reporting frequency (≥ 1 Hz). In this talk, we present a network optimization based approach to solve the map inference problem when the reporting frequency is low. Our algorithm is validated using real data from a leading navigation service provider in China.

3 - Predicting the Status of Traffic Signals using GPS Data from Probe Vehicles

Xin Qi, Department of Industrial Engineering, Tsinghua University, Shunde Building 519A, Tsinghua University, Beijing, China, qixin19900808@126.com, Hai Jiang

It has been recognized that intersection delay accounts for over 1/3 of the total travel time for a trip in the city. To provide quality route guidance to drivers, it is therefore critical to be able to estimate the delays caused by traffic signals. Since intersection delays are dependent on the status of traffic signals, in this talk we develop models to estimate key operating parameters of intersection signals: their cycle lengths as well as the corresponding signal timings. We test our models in the city of Beijing and results show that satisfactory results can be obtained in a wide variety of scenarios.

QSR Student Introduction and Interaction and Best Student Poster Competition

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Kaibo Wang, Associate Professor, Tsinghua University, Department of Industrial Engineering, Beijing, China, kbwang@tsinghua.edu.cn

Co-Chair: Hui Yang, Associate Professor, Pennsylvania State University, 310 Leonhard Building, Industrial and Manufacturing Eng., State College, PA, 16801, United States of America, huy25@psu.edu

1 - QSR Student Introduction and Interaction and Best Student Poster Competition

Kaibo Wang, Associate Professor, Tsinghua University, Department of Industrial Engineering, Beijing, China, kbwang@tsinghua.edu.cn

Student poster exhibition starts at 10:00am in the session room; all are welcomed to arrive earlier to interact with the students. The Introduction&Interaction session formally starts at 11:00am. Each of the student members presents a 2-min elevator speech first; interactions with invited guests are then followed. A lunch gathering in the same room for student members and invited guests with tickets starts at 12:30pm. The student poster exhibition continuous until 1:00pm.

Data Analytics for Quality Control and Improvement II

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Xi Zhang, Assistant Professor, Peking University, 5 Yiheyuan Rd., Beijing, 100871, China, xi.zhang@pku.edu.cn

Co-Chair: Kaibo Liu, Assistant Professor, UW-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, kliu8@wisc.edu

1 - Multistage Process Monitoring through Mewma Control Chart with Generalized Smoothing Parameters

Sangahn Kim, Rutgers University, 96 Frelinghuysen Road CoRE Building, Room 201, Piscataway, NJ, 08854, United States of America, sk1389@scarletmail.rutgers.edu, Myong K (MK) Jeong, Elsayed Elsayed

The multivariate exponentially weighted moving average (MEWMA) control chart is effective in monitoring a multistage process when the residual is applied to remove variance propagation effect. In this paper, we propose a generalized model of multivariate EWMA, which uses appropriate non-diagonal elements in the smoothing matrix based on the correlation between stages and within a stage, and suggest an optimal design for the proposed chart.

2 - Modeling In-Process Data of Machining Operations: Time Series vs. Spatial Point Cloud

Mohammed Shafae, PhD Candidate, Virginia Tech, 112 Durham Hall, Blacksburg, VA, 24061, United States of America, shafae1@vt.edu, Lee Wells, Jaime Camelio, Marco Ferreira

Traditional approaches for analyzing machining data revolve around representing them as time-series. The world of time-series analysis has provided several techniques for data analysis. However, they are implemented without asking, "Is time-series the most appropriate way to represent this data, and if not, how should the data be represented and what techniques need to be developed to analyze this alternate representation?" Exploring the answer to this question is the focus of this presentation.

3 - Separation and Prognostics of HRV Based on a Kernel-distance-based Multivariate Control Chart

Lili Chen, Peking University, 5 Yiheyuan Rd., Beijing 100871, China, chenlili@coe.pku.edu.cn, Xi Zhang

Isolating component signals directly from the observed heart rate variability signals can be a challenge. In this article, a signal separation based on integration of EMD and ICA is developed to separate the frequency components in HRV. A prognostics framework with Kernel-distance based multivariate control chart for disease detection has been developed to monitor the component signals. A real case study demonstrates the effectiveness of the proposed method.

4 - Data Fusion Approach for Degradation Modeling and Prognostics with Multiple Failure Modes

Abdallah Chehade, UW-Madison, 1513 University Avenue, Madison, 53706, United States of America, chehade@wisc.edu, Xi Zhang, Kaibo Liu

Operating units often suffer from multiple modes of failure in practice. This study proposes a data fusion approach to online classify the failure mode of the operating unit based on multiple degradation-based sensor data and then predict the remaining lifetime of the unit. A case study that involves a degradation dataset of aircraft gas turbine engines is used to numerically evaluate and compare the performance of the developed method with existing literature.

Advanced Manufacturing I

Cluster: Advanced Manufacturing

Invited Session

Chair: Yuan-Shin Lee, Professor, North Carolina State University, 400 Daniels Hall, Department of Industri, Raleigh, NC, 27695, United States of America, yslee@ncsu.edu

1 - Supply Chain Design Implications of Modular Production Systems

Satya Malladi, Graduate Student, Georgia Institute of Technology, 755 Ferst Drive NW, ISyE., Atlanta, GA, 30332, United States of America, mss@gatech.edu, Alan Erera, Chelsea White

Modular/mobile production systems allow production capacity to be transported closer to demand. We address the following questions: When should some or all production capacity be modular? When should spatial changes in customer demand result in logistics adjustments only and when should it also be met by relocating modular production capacity?

2 - Regenerative Medicine Manufacturing – Challenges and Tools for Scale-up and Scale-out

Rohan Shirwaiker, North Carolina State University, 406 Daniels Hall, Raleigh NC 27607, United States of America, rashirwa@ncsu.edu, Binil Starly

Regenerative medicine technologies continue to be developed and successfully tested in labs, but their translation to commercial-scale viable production continues to be a significant challenge. This talk will discuss the current state of the art, hurdles in bench to bedside translation, and manufacturing and systems engineering tools and approaches that can be used to enable efficient scale-up and scale-out.

3 - A Simulation Model of the EBM Additive Manufacturing Process

Richard Wysk, Dopaco Distinguished Professor, North Carolina State University, 400 Daniels Hall, 111 Lampe Dr, Raleigh, NC, 27606, United States of America, rawysk@ncsu.edu, Michael Blum, Ismail Lekorchi, Ola Harryson, Kali Drake, Christopher Kelly, Timothy Horn

Electron beam melting is a 3D printing process that has deficiencies that need improvement. This paper defines, and analyzes each step in the EBM process. A simulation model of the process is created to determine time required to process a part. This model focuses on the processing steps required to bring about the production of mechanical metal parts. An investigation to improve the efficiency of each step has been created to model this additive process. This model and process is described.

4 - Smart Machining and Manufacturing Systems

Yuan-Shin Lee, Professor, North Carolina State University, 400 Daniels Hall, Department of Industri, Raleigh, NC, 27695, United States of America, yslee@ncsu.edu

With recent advancements in manufacturing process, information technology, sensing and automation technologies, it is envisioned a new kind of smart manufacturing that can locally deliver customized products with high quality but with the cost structure of a mass manufactured product. One of the major building block is the new generation smart CNC machines. In this talk, we will discuss the new generation smart machines and manufacturing systems.

Efficient Learning in Stochastic Optimization

Sponsor: Simulation

Sponsored Session

Chair: Ilya Ryzhov, University of Maryland, 4322 Van Munching Hall, Robert H. Smith School of Business, College Park, MD, 20742, United States of America, iryzhov@rhsmith.umd.edu

1 - Cost-efficient Learning for Crowdsourced Ranking

Qihang Lin, The University of Iowa, 21 East Market Street, Iowa City, IA, 52245, United States of America, qihang-lin@uiowa.edu, Xi Chen, Kevin Jiao

Crowdsourcing is often used as a tool to rank a list of items based on pairwise comparisons. However, the comparison results by crowdsourcing have a low quality due to unreliable workers. To reduce the cost and increase the accuracy of ranking, we propose a multistage strategy where pairs of items are assigned to workers based on a joint learning of item's ranking and worker's reliability. The performances of our strategies are evaluated over simulated and real data.

2 - Sequential Allocation for Customer Acquisition

Eric Schwartz, University of Michigan, ericmsch@umich.edu, Katie Yang, Peter Fader

To acquire customers, firms allocate resources across a range of sources of acquisition, but they are uncertain about which ones are best. Over time they learn about their customers and sequentially reallocate their resources to earn a better return on acquisition spend. We frame the sequential acquisition decisions as a multi-armed bandit problem, and comparing a set of acquisition policies to assess their ability to acquire from the right sources of customers.

3 - Optimal Dynamic Pricing with Demand Model Uncertainty:

A Squared-Coefficient-of-Variation Rule

Bora Keskin, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708-0120, United States of America, bora.keskin@duke.edu

We consider a price-setting firm that sells a product over a continuous time horizon. The firm is uncertain about the sensitivity of demand to price changes, and updates its prior belief on an unobservable sensitivity parameter by observing demand responses. We derive and solve a partial differential equation to show how the value of learning should be projected onto prices in an optimal fashion.

4 - Expected Improvement is Equivalent to OCBA

Ilya Ryzhov, University of Maryland, 4322 Van Munching Hall, Robert H. Smith School of Business, College Park, MD, 20742, United States of America, iryzhov@rhsmith.umd.edu

We consider ranking and selection with independent normal observations, and analyze the asymptotic sampling rates of expected improvement (EI) methods in this setting. EI often performs well in practice, but general rate results have been largely unavailable. We prove that variants of EI produce simulation allocations that are essentially identical to those chosen by the optimal computing budget allocation (OCBA) methodology. This is the first general equivalence result between EI and OCBA.

Supply Chain Management II

Contributed Session

Chair: Ehsan Bolandifar, Assistant Professor, The Chinese University of HongKong, Room 922, 9/F, Cheng Yu Tung Building, No.12, Chak Cheung Street, Shatin, N.T., HongKong, Hong Kong - PRC, ehsan@baf.cuhk.edu.hk

1 - Cooperative Replenishment in the Presence of Intermediaries

Behzad Hezarkhani, Assistant Professor, Nottingham University Business School, Jubilee Campus, Nottingham, United Kingdom, behzad.hezarkhani@nottingham.ac.uk, Marco Slikker, Tom Van Woensel

In complex supply chains, individual downstream buyers would often rather replenish from intermediaries than directly from manufacturers. Direct replenishment from manufacturers can be a less costly alternative when carried out by the buyers cooperatively. This talk presents a framework for cooperative/non-cooperative replenishment in multi-product supply chains with intermediaries.

2 - Two-class Single-period Inventory Allocation Policies in Smart Meter Installation Projects

Behzad Samii, Vlerick Business School, Ave de Boulevard 21, Brussels, Belgium, behzad.samii@vlerick.com

Smart meter device are the costliest elements of rollout projects. Complexity stems from supply inflexibility due to strict tendering procedures and high holding cost due to fast obsolescence. If some partial information regarding the bottom line impact of a shortage in one customer class compared to the other can be conjectured, then we can derive closed form expressions for the expected number of units short in each demand class under commonly used SN and TN nesting allocation mechanisms.

3 - Architecting Fail-safe Supply Networks

Shabnam Rezapour, The University of Oklahoma, 2248 Houston Ave., apt # 2, Norman, OK, 73071, United States of America, shabnam_rezapoor@yahoo.com, Amirhossein Khosrojerdi, Janet K. Allen, Farrokh Mistree

A fail-safe network is one which mitigates the impact of disruptions and provides an acceptable service level. This is achieved by designing its topology (structurally fail-safe) and coordinating flow dynamics (operationally fail-safe). We analyze the importance of being robust, resilient, and controllable in having structurally fail-safe against disruptions. We show to have an operationally fail-safe supply network, flow dynamics should be reliable against demand and supply-side variations.

4 - Waveless Warehousing ? Why and Why Not ?

Adrian Kumar, Exel Inc, 570 Polaris Parkway, Westerville, OH, United States of America, adrian.kumar@exel.com, Manjeet Singh

E-fulfillment operations constantly struggle with processing peak volumes quickly due to system, labor and equipment constraints. Waveless is a dynamic order fulfillment method that pulls demand into a resource/sub-system when it becomes available. The dynamic order set is built on optimal real time decisions based on productivity, equipment utilization, etc. This study defines complete and partial waveless systems and discusses the pros and cons of implementing them.

5 - Component Procurement through Group Purchasing Organizations

Ehsan Bolandifar, Assistant Professor, The Chinese University of Hong Kong, Room 922, 9/F, Cheng Yu Tung Building, No.12, Chak Cheung Street, Shatin, N.T., Hong Kong - PRC, ehsan@baf.cuhk.edu.hk, Mojtaba Soleimani

This paper studies component procurement in a supply chain setting where two competing Original Equipment Manufacturers (OEMs) source a common component from a competitive supply market. We assume that ordering happens after procurement negotiations, i.e., OEMs first compete in the market before they negotiate for their component procurement potentially through Group Purchasing Organizations (GPOs). We show that procurement through a GPO may hurt an OEM with a lower bargaining power.

Supply Chain Practice and Empirics

Contributed Session

Chair: Faraz Ramtin, University of Central Florida, 2011 Puritan Rd, Orlando, FL, 32807, United States of America, faraz.ramtin@ucf.edu

1 - Is Supply Chain Success Emulatable? A Framework of Analogous Learning from Supply Chains and a Case Study

Violette Wen, PhD Student, The University of Auckland, 12 Grafton Rd, CBD, Auckland, 1010, New Zealand, violette.wen@auckland.ac.nz, Tiru Arthanari

We explore the feasibility of emulating from one successful supply chain to another produce line in agri-fresh produce. The case will study the state-of-art New Zealand kiwifruit supply chain and provide a framework with key enablers and disablers for transferring knowledge to the struggling Xinjiang Hami melon industry in China. The research will provide rich empirical evidence about a developing country's agri-fresh supply chain at various levels.

2 - The Inventory Value of Cross Docking in a Supply Chain: An Empirical Study

Xingyue Zhang, Lehigh University, 621 Taylor Street, Bethlehem, PA, 18015, United States of America, xiz313@lehigh.edu, Oliver Yao, Jiazhen Huo, Yongrui Duan

Cross docking is a supply chain strategy to enhance supply chain performance by directly moving inbound orders to outbound shipments without storage. Using a large-scale, SKU level data set collected from a large retail chain, we find that cross docking reduces store-level inventory by 101 units on average and that cross docking is more beneficial to reduce inventories for products with higher prices or higher demand rate, or for the stores that are closer to their distribution center.

3 - An Empirical Analysis of Sustainable Supply Chain Capabilities and Cross-Value Integration

Peiran Gao, Huazhong University of Science and Technology, School of Management, 1037 Luoyu Road, Wuhan, China, gaopeiran2007@126.com, Yeming Gong, Jinlong Zhang

Using multi-source data from more than 100 organizations in retailing industry, we apply structural equation modeling to understand nonlinear relationship among cross-value integration, supply chain coordination and integration, and the performance of sustainable supply chain. We find the moderate effect of cross-value integration on the relationship between sustainable supply chain capabilities and operational competencies.

4 - Storage Location and Pick Position Assignment Problem for MIAPP-AS/RS

Faraz Ramtin, University of Central Florida, 2011 Puritan Rd, Orlando, FL, 32807, United States of America, faraz.ramtin@ucf.edu, Jennifer Pazour

MIAPP-AS/RS is a semi-automated case-level order fulfillment technology. The put-away to the storage locations and replenishment to pick positions are performed by the crane and the in-the-aisle case-picking is done by human order pickers. We develop binary integer models to find the optimal assignment of SKUs to storage locations, as well as to pick positions for a dedicated storage policy. We develop an accelerated Benders Decomposition approach to improve the tractability of the models.

1 - Simio Simulation and Scheduling Software - Introduction to Simio Simulation and Scheduling Software

C Dennis Pegden, CEO and Founder, Simio Simulation and Scheduling Software, Eric Howard

Simio is a premier simulation and scheduling software that allows you to expand traditional benefits of simulation to improve daily operations. In this tutorial, we will demonstrate Simio's 3D rapid modeling capability to effectively solve real problems. Explore how a single tool can be used to not only optimize your system design, but also provide effective planning and scheduling. Come explore the Simio difference and see why so many professional and novice simulationists are changing to Simio.

2 - Forio Simulations - Publishing Interactive Analytics or Operations Research Models on the Web

Michael Bean, Co-Founder and President, Forio Simulations

Forio's web platform makes your analytic model available to hundreds of people within your organization through the browser. We will start with an introduction to the platform and example analytics applications. Then we'll divide the workshop into two parts. In the first part we will teach you how to get your analysis on a server so it can be shared. In the second part we'll focus on creating a user interface for your model.

Chair: Michael Hirsch, ISEA TEK, 620 N. Wymore Rd., Ste. 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com

1 - An Algorithm for Solving the Convoy Routing Problem

Ambika Tiwari, Research Scholar, IIT Madras, DoMS, Delhi Avenue, 834, Sabarmati Hostel, Chennai, 600036, India, tiwariambika4@gmail.com, Chandrasekharan Rajendran, Hans Zeigler

The problem of routing military convoys from a specific origin to a destination adhering to certain constraints is considered. An algorithm for minimizing the sum of arrival times at destination of the convoys is proposed. Its performance with respect to that of existing algorithm is analyzed. Computational results are presented.

2 - The Spectrum of Anarchy: Algorithmic Game Theory in UAV Routing

Michael Couche, University at Buffalo, 342 Bell Hall, Buffalo, United States of America, mjcouche@gmail.com, Nagi Rakesh, Mark Karwan

Game theoretic routing approaches lend insight into the price of anarchy that occurs due to decentralization. We can model a team of UAVs using several different approaches, ranging from greedy-based routing, competitive gaming, leader-follower gaming, to cooperative gaming. A comparison of the algorithms used is presented, along with a discussion of using these approaches as a fast routing heuristic that competes with mathematical programming models.

3 - Optimization of UAV Teams

Hector Ortiz-pena, CUBRC, Genesee St, Buffalo, United States of America, hector.ortiz-pena@cubrc.org, Michael Hirsch, Moises Sudit, Mark Karwan

We develop a formulation to maximize the information gain from a team of autonomous unmanned vehicles (UxVs) to support Intelligence, Surveillance and Reconnaissance (ISR) mission objectives. The formulation is used to evaluate the Price of Anarchy.

Cyber-Physical Protection Models and Analysis

Cluster: Homeland Security

Invited Session

Chair: Feng Pan, Research Engineer, Pacific Northwest National Laboratory, P.O. Box 999 MSIN K1-85, Richland, WA, 99352, United States of America, feng.pan@pnnl.gov

Co-Chair: Guanhua Yan, Assistant Professor, Binghamton University, Department of Computer Science, Binghamton, NY, 13902, United States of America, ghyan@binghamton.edu

1 - Analytical Framework for Cyber-physical Integrated Assessment: An Overview

Matthew Oster, Pacific Northwest National Laboratory, 902 Battelle Blvd, Richland, WA, 99352, United States of America, matthew.oster@pnnl.gov, Casey Perkins

Cyber and physical security systems present a unique challenge for security analyses traditionally charged with focusing on only a singular aspect of the system, either physical or cyber. Looking at an integrated security environment requires revisiting vulnerability analysis methods and integrating previously isolated evaluations. This talk will focus on the challenge of creating an integrated modeling framework with both physical and cyber security elements to quantify hidden vulnerability.

2 - A Big Data Approach to Automating Malware Analysis

Guanhua Yan, Assistant Professor, Binghamton University, Department of Computer Science, Binghamton, NY, 13902, United States of America, ghyan@binghamton.edu, Yunus Kucuk

Thwarting the severe threat posed by the voluminous malware variants demands effective, yet efficient, techniques for malware analysis. We propose a big data framework for automated malware analysis. This framework combines various big data tools to provide a unifying and scalable solution to a wide range of malware analysis tasks, such as classification, clustering, and indexing. We will present our experience with developing this framework, as well as the research challenges ahead.

3 - A Mixed Integer Program for Securing a Cyber-physical System

Feng Pan, Research Engineer, Pacific Northwest National Laboratory, P.O. Box 999 MSIN K1-85, Richland, WA, 99352, United States of America, feng.pan@pnnl.gov, Casey Perkins, Samrat Chatterjee, Satish Chikkagoudar, Matthew Oster

Securing a modern facility has to consider both cyber and physical aspects. In this talk, we present a set of metrics for measuring facility security. Given the complexity of facilities, simulation models are often used to measure the overall security. Combining simulation results, we introduce a mixed integer programming approach to allocate security assets in both cyber and physical layers for enhancing security of a facility.

4 - Spotting Anomalies in Cyber Physical Datasets: The Case of Mobility Data

Konstantinos Pelechrinis, Assistant Professor, University of Pittsburgh, 135 N. Bellefield, IS 717B, Pittsburgh, PA, United States of America, kpele@pitt.edu, Evangelos Papalexakis, Christos Faloutsos

How can we discover latent patterns in heterogeneous CPSs datasets and classify them as anomalous or not without labeled data? We propose using tensors to model heterogeneous data and obtain latent patterns. We then propose a generic data-driven method for classifying each of the obtained patterns as normal or not. The realization of our technique is domain-specific. We showcase our method by applying it on a mobility dataset that captures locations visited by users at different times.

Contemporary Scheduling

Cluster: Scheduling and Project Management

Invited Session, Chair: Joseph Y.T. Leung

Distinguished Professor, New Jersey Institute of Technology, Department of Computer Science, University Heights, Newark, NJ, 07102, United States of America

1 - Improved Algorithms for Single Machine Scheduling with Release Dates and Rejections

Kangbok Lee, York College, CUNY, York College, The City University of New York, Jamaica, NY, 11451, United States of America, klee5@york.cuny.edu, Cheng He, Joseph Leung, Michael Pinedo

We consider bi-criteria scheduling problems on a single machine with release dates and rejections and both the makespan and the total rejection cost have to be minimized. We consider two scenarios: (i) minimize the sum of the makespan and the total rejection cost, and (ii) minimize the makespan subject to a bound on the total rejection cost. We summarize the results obtained in the literature and provide for several cases improved approximation algorithms and FPTASs.

2 - Integrated Production and Delivery on Parallel Batching Machines

Kai Li, Associate Professor, Hefei University of Technology, 193 Tunxi Rd, Hefei, 230009, China, hfutlk@139.com, Joseph Leung, Zhao-hong Jia

We consider an integrated scheduling problem of production and delivery on parallel batching machines. The company will earn a positive profit only if a job is delivered by its due date. A 3PL provider is used to deliver the jobs. The goal is to maximize the total profit. We show that the problem is solvable in polynomial time if the jobs have identical sizes, but it becomes unary NP-hard if the jobs have different sizes. We propose heuristics for NP-hard cases and analyze their performances.

3 - Minimizing Total Completion Time in Flow Shop with Machine Unavailability using Meta-heuristics

Hairong Zhao, Associate Professor, Purdue University at Calumet, Dept. of Math, C. S. & Statistics, Hammond, IN, 46323, United States of America, hairong@purduecalumet.edu, Yumei Huo

We consider flow shop scheduling subject to machine availability constraints. The objective is to find a schedule that minimizes total completion time. This problem is strongly NP-hard even if machines are always available. Simple bounds are derived to slightly speed up the elimination process of a branch-and-bound algorithm. Then we propose a meta-heuristic algorithm based on genetic algorithms. Computational results show that the proposed meta-heuristic performs effectively and efficiently.

4 - Application of MGSA for the Coordinated Scheduling Problem in a Two-Stage Supply Chain

Jun Pei, Assistant Professor, Hefei University of Technology, 193 Tunxi Rd, Hefei, 230009, China, feiyijun198612@126.com, Xinbao Liu

This paper investigates a products and vehicles scheduling problem in a two-stage supply chain, where jobs need to be processed on the serial batching machines of multiple manufacturers distributed in various geographic zones and then transported by vehicles to a customer. A modified gravitational search algorithm (MGSA) is proposed to solve the problem. In MGSA, several improvement strategies and the batching mechanism DP-H are introduced.

Gender Inspired Research

Sponsor: Women in OR/MS

Sponsored Session

Chair: Margret Bjarnadottir, Assistant Professor of Management Science and Statistics, Robert H. Smith School of Business, University of Maryland, 4324 Van Munching Hall, College Park, MD, 20742, United States of America, margret@rhsmith.umd.edu

1 - Innovative Pedagogical Interventions to Increase Retention of Women in Engineering

Susana Lai-yuen, Associate Professor, University of South Florida, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, laiyeun@usf.edu, Grisselle Centeno

This work addresses the broad challenge of identifying practices and developing resources to help overcome evident gender equity issues in science and engineering education. Specifically, a set of pedagogical resources focused on healthcare systems and OR applications have been developed. Experiences related to development, implementation and outcomes will be discussed.

2 - Bridging the Gap: Responses to Equal Pay Legislation

David Anderson, Assistant Professor, Baruch, davidryberganderson@gmail.com, Margret Bjarnadottir

We study how firms can reduce the estimated pay gap between men and women in the most cost efficient way. We show that by intelligently increasing workers' wages who will have the greatest impact, we can meet the "Equal Pay for Equal Work" standard for less than half the cost of the naive method of increasing all female workers' wages equally. We further explore the impacts of equal cost mandates on compensation, fairness and the implications of this work on outside verification parties.

3 - Work-Life Balance for Women

Wendy Casper, The University of Texas at Arlington, Dept. of Management, Arlington, TX, United States of America, wjcasper@uta.edu, Victoria Chen

Work-life balance is important to many women. Despite this, there is little agreement about what work-life balance is. This presentation discusses the notion of balance and identifies commonly held definitions of this concept, concluding with a few ideas about how women can gain a greater sense of balance in their lives.

Extracting Business Value from Social Media Analytics: Techniques and Applications

Cluster: Social Media Analytics

Invited Session

Chair: Shih-Hui Hsiao, University of Kentucky, 550 S. Limestone, Lexington, KY, 40526, United States of America, shs222@uky.edu

1 - Who are the Opinion Leaders? A Relative Assessment of Opinion Leader Mining Algorithms

Shih-Hui Hsiao, University of Kentucky, 550 S. Limestone, Lexington, KY, 40526, United States of America, shs222@uky.edu, Ram Pakath

Several methods have been proposed in the Social Media Analytics literature for identifying Opinion Leaders (OL) in online social networks. In this talk, I will describe the design and implementation of, as well as preliminary findings from, an experiment that compares existing OL mining algorithms to one another in terms of solution speed and quality. This study is a prelude to a larger project that also seeks to improve upon extant procedures.

2 - Real-time Social Media Analytics in Health Care:

Discovery Knowledge from Online Communities

Yichuan Wang, Industrial & Systems Engr St, Department of Industrial and Systems Engineering, Shelby Center, Auburn University, Auburn, AL, 36849, yzw0037@auburn.edu, Yedurang Babu, Terry Byrd

Dramatic changes in business environments have galvanized firms toward searching for external knowledge from social media to complement the insufficiency of organizational resource. However, in healthcare social media sources rarely have been analyzed and used to support medical decision making. This study proposes a real-time knowledge discovery framework to support effective exploration of knowledge which has been prototypically implemented on the base of Web data from healthcare communities.

3 - The Impact of Facebook on Offline Sales: Evidence from the U.S. Automobile Industry

Yen-yao Wang, Michigan State University, N270A Business College Complex, East Lansing MI 48824, United States of America, wangyen@broad.msu.edu, Anjana Susarla, Vallabh Sambamurthy

This study examines the dynamic interactions between firm-generated content, user-generated content, and offline car sales in the U.S. automobile industry. We collected the official Facebook pages of 31 car companies in the U.S., and supplemented the data from these firms' traditional media efforts, and offline car sales from 2009 to 2014. A panel vector autoregressive (PVAR) model is conducted to examine our research framework. Implications for researchers and managers are discussed.

4 - An Investigation of Factors that Influence the Success of Social Commerce Platforms

Suning Zhu, sz0012@auburn.edu, Jiahe Song, Pei Xu

This paper introduces a descriptive framework for understanding factors that influence the success of social commerce platforms. It identifies three main classes of influencing factors (self-expression, communication, and style) and characterizes the individual factors in each class. The resultant framework can be used by researchers for reference of theories and hypothesis generation, and by practitioners for benchmarking social commerce practices.

Computational Methods in Options Pricing and Portfolio Selection

Sponsor: Financial Services

Sponsored Session

Chair: Liming Feng, Associate Professor, University of Illinois at Urbana-Champaign, 104 S Mathews Ave, Urbana, IL, 61801, United States of America, fenglm@illinois.edu

Co-Chair: Xuewei Yang, Associate Professor, Nanjing University, School of Management and Engineering, #22, Hankou Road, Gulou District, Nanjing, 210093, China, xwyang@nju.edu.cn

1 - Investor Behavior and Turbo Warrant Pricing

Xuewei Yang, Associate Professor, Nanjing University, School of Management and Engineering, #22, Hankou Road, Gulou District, Nanjing, 210093, China, xwyang@nju.edu.cn, Xindan Li, Avaniidhar Subrahmanyam

Turbo warrants are options that can be called back when underlying prices reach a threshold. We find that investors treat turbo warrants like lotteries in that they prefer those with low prices, high volatilities, and high skewness, and prefer trading them when underlying prices are near callback thresholds. As a result, turbo warrants are overpriced: during 2012, investors lost 1.82 billion HKD (US\$235 million) by trading turbo warrants written on the Hang Seng Index.

2 - Asymptotic Expansions of Discretely Monitored Barrier Options under Stochastic Volatility Models

Chao Shi, Assistant Professor, Shanghai University of Finance and Economics, 100 Wudong Road, Yangpu District, Shanghai, 200433, China, shichao@connect.ust.hk, Ning Cai, Chenxu Li

This paper proposes an algorithm for pricing discretely monitored barrier options under stochastic volatility models. It turns out that the celebrated Hilbert transform recursion algorithm proposed by Feng and Linetsky (2008) becomes the leading term and building block in our expansion formula under stochastic volatility models. Our expansions are automatic and fast. Numerical results show that our algorithm is efficient and robust.

3 - Distributions with Analytic Characteristic Functions in Financial Modeling

Runqi Hu, PhD Student, University of Illinois at Urbana-Champaign, 104 S Mathews Ave, Urbana, IL, 61801, United States of America, runqihu2@illinois.edu, Liming Feng

In this talk, we consider a class of distributions with characteristic functions that are analytic in a horizontal strip in the complex plane. Such distributions can be inverted from their characteristic functions very efficiently using simple rules with exponentially decaying approximation errors. The results can be applied in accurate valuation of options in models with jumps and stochastic volatility. Numerical examples illustrate the effectiveness of the schemes.

4 - Robust Portfolio Selection with Fixed Transaction Cost

Yufei Yang, PhD Candidate, Singapore University of Technology and Design, Pillar of Engineering Systems and Design, 8 Somapah Road, Singapore, 48732, Singapore, yufei_yang@mymail.sutd.edu.sg, Selin Damla Ahipasaoglu, Jingnan Chen

We study a robust mean-variance portfolio selection problem under fixed transaction cost. We provide a novel analysis on the portfolio composition and a closed-form formula is derived to unify various types of portfolios. We uncover the impact of the uncertainty level and fixed transaction cost to the position change of each asset.

Big Risks, Big Data

Cluster: Risk Management

Invited Session

Chair: Paul Glasserman, Columbia Business School, 3022 Broadway, Uris Hall, New York, United States of America, pg20@columbia.edu

1 - Large-dimensional Factor Modeling Based on High-frequency Observations

Markus Pelger, Assistant Professor, Management Science & Engineering, Stanford University, Huang Engineering Center, 475 Via Ortega, Stanford, CA, 94305, United States of America, markus.pelger@gmail.com

I provide a statistical theory and empirically estimate an unknown factor structure based on financial high-frequency data for a large cross-section. I develop an estimator for the number of factors and consistent and asymptotically mixed-normal estimators of the loadings and factors for a large number of cross-sectional and high-frequency observations. In an extensive empirical study of the U.S. equity market I identify four continuous and one jump factor that explain most of the variation.

2 - Price Contagion through Balance Sheet Linkages

Agostino Capponi, Columbia, Mudd 313, New York, NY, 10027, United States of America, ac3827@columbia.edu

We study price linkages between assets held by financial institutions that maintain fixed capital structures over time. Our analysis suggests that regulatory policies aimed at stabilizing the system by imposing capital constraints on banks may have unintended consequences: banks' deleveraging activities may amplify asset return shocks and lead to large fluctuations in realized returns. We show that these effects can be mitigated by encouraging banks to hold liquid, rather than illiquid, assets.

3 - Incorporating GICS and High-Frequency Data into Portfolio Allocation and Risk Estimation

Jianqing Fan, Princeton, Dept of Operations Res & Fin Eng, Princeton University, Princeton, NJ, 08544, United States of America, jqfan@princeton.edu, Alexander Furger, Dacheng Xiu

We document a striking block-diagonal pattern in the factor residual covariances of the S&P 500 constituents, after sorting the assets by their assigned GICS codes. We propose combining a location-based thresholding approach based on sector inclusion with the Fama-French and SDRP sector ETF's. We investigate the performance of our estimators in a portfolio allocation study. We provide justification for the empirical results by jointly analyzing the in-fill and diverging dimension asymptotics.

4 - Estimating the Correlation Matrix of Credit Default Swaps for Market Risk Management

Richard Neuberger, Columbia University, 1255 Amsterdam Avenue, Dept of Statistics, 10th Floor, New York, NY, 10027, United States of America, rn2325@columbia.edu, Paul Glasserman

We propose a portfolio perspective to better understand the properties of correlation matrix estimators and loss functions for market risk management. We find the commonly used latent factor model to systematically misestimate the risk of certain portfolios. The normal likelihood appears more appropriate than Frobenius' and Stein's loss. We derive specific loss functions. We assess a range of estimators using CDS data. We also study implied CDS correlations using distance-to-default processes.

Topics in Telecommunications

Sponsor: Telecommunications

Sponsored Session

Chair: Stanko Dimitrov, Assistant Professor, University of Waterloo, 200 University Avenue West, Waterloo, Canada, sdimitro@uwaterloo.ca

1 - On the Robust Design of Access Networks Integrating Optical Fiber and Wireless Technologies

Fabio D'Andreagiovanni, Senior Researcher, Konrad-Zuse-Zentrum für Informationstechnik, Takustr. 7, Berlin, Germany, d.andreagiovanni@zib.de, Jonad Pulaj, Axel Werner

An important recent trend in telecommunication access networks is the integration of optical fiber and wireless technologies (Fi-Wi). The design of Fi-Wi networks can be formulated as variants of Connected Facility Location Problems, including fiber connectivity and wireless coverage constraints. We consider here an uncertain version of the Fi-Wi design problem, tackling signal propagation uncertainty. We introduce a new model for it and present computational results on realistic instances.

2 - Two Terminal Reliability in a Mobile Ad-hoc Network

Timothy Matis, Professor, Texas Tech University, 2500 Broadway, Texas, United States of America, Timothy.Matis@ttu.edu, Binchao Chen, Aaron Phillips

The spatial distribution of nodes in a random waypoint model of a Mobile Ad-hoc communications networks exhibits central tendency. In this presentation, we will discuss analytical expressions for one and two hop connectivity as a function of node location.

3 - Impact of Security Concerns on Online Shopping by Device

Stanko Dimitrov, Assistant Professor, University of Waterloo, 200 University Avenue West, Waterloo, Canada, sdimitro@uwaterloo.ca, Brian Cozzarin

As various devices are used to access online stores, it is unclear if consumers' security concerns impact shopping decisions equivalently regardless of access device. In this study we characterize the impact of security concerns across device types and show that consumers with security concerns are far less likely to make purchases using a mobile device than a personal computer. Similarly, we show that individuals without security concerns are the major drivers behind mobile commerce.

09-Room 309, Marriott

Managing Innovation: Products, Services, Employee Attributes and Organizational Performance

Sponsor: Technology, Innovation Management & Entrepreneurship
Sponsored Session

Chair: Juliana Hsuan, Professor, Copenhagen Business School, Dept. of Operations Management, Solbjerg Plads 3, Frederiksberg, DK-2000, Denmark, jh.om@cbs.dk

1 - The Relationship Between Individual Employee Attributes and Radical Innovation

Lee Davis, Associate Professor, Copenhagen Business School, Department of Innov and Org Econ, Kilevej 14A, Frederiksberg, 2000, Denmark, ld.ino@cbs.dk, Karin Hoisl, Jerome Davis

We investigate the impact of individual employee attributes like experience, ability or motivation on radical innovation and whether the organizational context moderates this relationship. We find that the importance of individual attributes varies with organizational context.

2 - The Impact of Organizational Routines in Cumulative Innovation

Leonardo Santiago, Associate Professor, Copenhagen Business School, Department of Operations Management, Solbjerg Plads 3, Blok B 5. sal, Frederiksberg, 2000, Denmark, ls.om@cbs.dk, Julia Couto

The capacity to continuously innovate is crucial for organizations to achieve or maintain their competitive advantage. A sequence of innovations can provide to a company not just a new product or technique but also a platform of knowledge that will support their future innovations. This work investigates the way knowledge is accumulated by a company over time, associating managerial decisions to the dynamics of innovation.

3 - Product and Service Modularity Strategies Game for Mass Customization

Anu Bask, Assistant Professor, Aalto University School of Business, P.O. Box 21220, Helsinki, 00076 Aalt, Finland, anu.bask@aalto.fi, Juliana Hsuan, Mervi Rajahonka, Markku Tinnilä

Modularity has been recognized as a powerful concept for improving the efficiency and management of product design and manufacturing. However, the integrated view on product and service modularity approaches is under researched. We propose four strategies to match combinations of products and services through modularization strategies for mass customization.

4 - The Impact of Product and Service Modularity on Business Performance – A Survey of Danish Manufacturers

Thomas Frandsen, Copenhagen Business School, Dept. of Operations Management, Solbjerg Plads 3, Frederiksberg, DK-2000, Denmark, tfr.om@cbs.dk, Juliana Hsuan, Jawwad Z. Raja

Manufacturers are increasingly turning towards services and integrated solutions as a way of strengthening their competitiveness, a transition receiving growing attention in the literature. However, the relation between product and service architecture and its impact on service strategy and the performance of manufacturers is not well understood. Based on a survey of Danish manufacturers we explore the relationship between product and service modularity and their effects on business performance.

Online Consumer Conversion and Developer Strategy

Sponsor: E-Business

Sponsored Session

Chair: Young-Jin Lee, Assistant Professor, University of Denver, 2101 S. University Blvd, Denver, CO, 80208, United States of America, youngjin.lee@du.edu

1 - Competition Among Proprietary and Open-source Software Firms: The Role of Licensing

Wei Chen, Assistant Professor, University of Arizona, 1130 East Helen Street, McClelland Hall 430, P.O. Box 210108, Tucson, AZ, 85721, United States of America, weichen@email.arizona.edu, Kevin Zhu, Terrence August

Open-source software (OSS) firms are increasingly using service-based business models to compete with established proprietary software firms. We study a 3-way game with strategic contribution from the community and focus on how open-source licensing affects competition among an open-source originator, open-source contributor, and a proprietor competing in the same software market.

2 - An Empirical Study of Market Switching Behavior of Mobile App Developers

Hossein Ghasemkhani, Assistant Professor, Purdue University, 425 W. State Street, West Lafayette, IN, 47907, United States of America, hossein@purdue.edu, Young-Jin Lee, Karen Xie, Yong Tan

Mobile app developers switch the positioning of their apps between free and paid submarkets. They offer their previously paid apps for free to create positive network effects, and set prices on previously free apps to reap the benefits. We empirically study the developers' decision to determine the instantaneous market of their apps, and examine how it affects performance. We find that prior performance and duration in either market are significantly related to the developer's decision.

3 - How Does Communication Improve Conversion Rate on E-commerce: A Bayesian Approach

Haoyan Sun, PhD Candidate, University of Washington, Mackenzie 328, Seattle, WA, 98115, United States of America, haoyan@uw.edu, Ming Fan

We examine communication of buyers and sellers on the E-commerce platform through Instant Message (IM) to understand the ways of improving conversion rate. By casting this problem in a hierarchical bayesian framework, we are able to address the endogeneity problem where IM communication is endogenous in determining the conversion rate. Using data collected from TaoBao, China's leading C2C online marketplace, we show that communication can significantly drive the conversion rate.

4 - The World at Our Fingertips: Consumer Conversion from Search, Click-through, to Book

Karen Xie, Assistant Professor, University of Denver,
Fritz Knoebel School of Hospitality Mgmt, Denver, CO,
United States of America, Karen.Xie@du.edu, Young-Jin Lee

We examine how informational cues displayed influence consumer conversion in a sequential process of search, click-through, and booking when shopping hotels online. Using an empirical analysis of a large online travel agent site that provides information of individual searches, we find consumers are likely to click through hotels with higher consumer ratings and the industry-endorsed star rating. However, when committing to booking consumers refer to consumer ratings rather than the star rating.

Joint Session OPT/OPT Under Uncertainty: IP Methods for Stochastic Optimization

Sponsor: Optimization/Integer and Discrete Optimization
Sponsored Session

Chair: Siqian Shen, Assistant Professor, University of Michigan,
1205 Beal Avenue, Ann Arbor, MI, 48105, United States of America,
siqian@umich.edu

1 - Scenario Decomposition of Risk Averse Stochastic 0-1 Programs

Yan Deng, University of Michigan, 3730 Greenbrier Blvd,
Ann Arbor, MI, 48105, United States of America,
yandeng@umich.edu, Siqian Shen, Shabbir Ahmed

We present a scenario decomposition approach for risk averse stochastic 0-1 programs. The approach uses decomposition that processes subproblems easy to parallelize, and LP/IP techniques that combine subproblem results to yield strong valid inequalities. We also design various parallelization paradigms and demonstrate on stochastic server location problems and stochastic multiple 0-1 knapsack problems that the approach improves computational efficacy significantly.

2 - Polyhedral Study of Static Probabilistic Lot-sizing Problem

Xiao Liu, Research Associate, The Ohio State University, 210
Baker Systems Building 1971 Neil Ave, Columbus, OH, 43210,
United States of America, liu.2738@osu.edu, Simge Kucukyavuz

We explore the polyhedral structure of the static probabilistic lot-sizing problem and propose new valid inequalities. We show the relationship between the proposed inequalities and those that would be obtained by projecting the natural or the extended formulation of the deterministic lot-sizing problem for each scenario on to the space of the production variables. We show that the proposed inequalities are facet-defining under certain conditions. We report preliminary computational results.

3 - Computational Experience with a Benders Algorithm for Two-stage Stochastic Integer Programming

Ted Ralphs, Professor, Lehigh University, 200 W. Packer Ave.,
Bethlehem, PA, 18015, United States of America, ted@lehigh.edu,
Anahita Hassanzadeh

We briefly outline a Benders-type algorithm for solving two-stage stochastic programs with mixed integer recourse and describe our experience implementing the algorithm in practice, as well as its theoretical connection to bilevel optimization. Computational results with benchmark instances from the literature will be presented.

Mixed Integer Programming and Location Routing Problem

Sponsor: Optimization/Mixed Integer Nonlinear Optimization and
Global Optimization
Sponsored Session

Chair: Emre Tokgoz, Assistant Professor, Quinnipiac University,
275 Mount Carmel Ave. TH-ENR, Hamden, CT, 06518,
United States of America, Emre.Tokgoz@quinnipiac.edu

1 - Manifold Location Routing Problem

Emre Tokgoz, Assistant Professor, Quinnipiac University,
275 Mount Carmel Ave. TH-ENR, Hamden, CT, 06518,
United States of America, Emre.Tokgoz@quinnipiac.edu

A new Location Routing Problem named Manifold Location Routing Problem and the most recent developments to solve this problem will be explained in this talk.

2 - Cost Effective Energy Optimization by Solving Facility Allocation on Riemannian Manifolds

Iddrisu Awudu, Assistant Professor, Quinnipiac University,
275 Mount Carmel Ave., Hamden, CT, 06518,
United States of America, Iddrisu.Awudu@quinnipiac.edu

Delivering goods and services in an efficient (cost) and effective (value) manner is crucial to every supply chain. In this presentation, a recently developed technique for solving the Location Routing Problem on Manifold surfaces called Manifold Location Routing Problem (MLRP) is used to design a renewable energy distribution system for a single ethanol production facility. The results with the corresponding managerial insights of the model are discussed.

Multi-armed Bandits and Online Optimization

Sponsor: Optimization/Optimization Under Uncertainty
Sponsored Session

Chair: Andrew Lim, National University of Singapore/Department of
Decision Sciences, Mochtar Riady Building, BIZ1 08-69, 15 Kent Ridge
Drive, Singapore, Singapore, andrewlim@nus.edu.sg

1 - Dynamic Pricing and Product Differentiation with Cost Uncertainty and Learning

Bora Keskin, Duke University, Fuqua School of Business,
100 Fuqua Drive, Durham, NC, 27708-0120, United States of
America, bora.keskin@duke.edu, John Birge

Motivated by applications in the health insurance industry, we consider a seller who designs and sells a set of products to a population of quality-sensitive customers. The seller faces an uncertainty about production costs. We prove that, while a seller facing static cost uncertainty degrades the quality in its product offering, a dynamically learning seller improves the quality of its products to accelerate information accumulation.

2 - Efficient Experimentation via the Bootstrap

Ian Osband, Stanford University, 450 Serra Mall, Stanford, CA,
United States of America, iosband@stanford.edu,
Benjamin Van Roy

If you want to use data to make good decisions, you need good data. Often, the decisions you make influence both performance and the data collected. Balancing exploration with exploitation can be complex. We present a fully non-parametric version of Thompson sampling that uses the bootstrap to produce approximate posterior samples. We show that, under some assumptions, this simple heuristic satisfies strong performance guarantees. This algorithm performs well in simulation.

3 - Approximate Learning Trajectories for Bayesian Bandits

Michael Kim, University of Toronto, 5 King's College Road,
Toronto, Canada, mikekim@mie.utoronto.ca, Andrew Lim

It is known that the optimal policy for a multi-armed bandit problem is the Gittins index policy. For bandit problems with Bayesian learning (Bayesian bandits) however, computing the Gittins index is intractable due to the curse of dimensionality. In this talk, we introduce the concept of an approximate learning trajectory, which approximates the dynamics of future learning. We show how this can be used to simplify the DP equations, which allows for an efficient computation of the Gittins index.

4 - Bandits with Global Convex Constraints and Concave Objective

Shipra Agrawal, Researcher, Microsoft Research,
#9 Lavelle Road, Bangalore, India, ashipra@gmail.com

I will present recent advances on multi-armed bandit problems that involve arbitrary concave objective functions and convex constraints on the aggregate of decisions across time, in addition to the customary limitation on the time horizon.

■ SC14

New Developments in Robust and Adaptive Optimization

Sponsor: Optimization/Optimization Under Uncertainty
Sponsored Session

Chair: Dimitris Bertsimas, Professor, MIT, 77 Massachusetts Ave.,
Cambridge, MA, 02139, United States of America, dbertsim@mit.edu

1 - Multistage Robust Mixed Integer Optimization with Adaptive Partitions

Iain Dunning, PhD Candidate, MIT, 77 Massachusetts Ave,
Building E40, Cambridge, MA, 02139, United States of America,
idunning@mit.edu, Dimitris Bertsimas

We present a partition-and-bound method for multistage adaptive mixed integer optimization problems that extends previous work on finite adaptability. The method analyzes the solution to a non-adaptive problem to determine how the uncertainty set is restricting the objective, and uses this to partition the set. A lower bound is calculated, and the partitioning is repeated until a desired gap is reached. We demonstrate in computational experiments that the method produces good solutions quickly.

2 - The Role of Robustness in Modern Statistical Regression

Martin Copenhaver, MIT, 77 Massachusetts Avenue, E40-135,
Cambridge, MA, 02139, United States of America,
mcopen@mit.edu, Dimitris Bertsimas

Sparsity is a key driver in modern statistical estimation problems, yet reliably sparse solutions remain elusive. Despite this, many regularization methods often perform well in the face of noise in the data. In the domains of linear, median, and matrix regression, we characterize precisely when regularization problems correspond to simple robust optimization problems. In doing so, we contend that it is robustness, not sparsity, which is critical to the success of modern statistical methods.

3 - Robust Ambulance Deployment

Yee Sian Ng, Massachusetts Institute of Technology,
77 Massachusetts Ave, Cambridge, MA, 02139, United States of
America, yeesian@mit.edu, Dimitris Bertsimas

In Emergency Medical Systems (EMS), operators deploy a fleet of ambulances to a set of locations before dispatching them in response to emergency calls. The goal is to minimize the fraction of calls with late response times, which we formulate as a two-stage Robust Optimization model with integer recourse. We propose a practical algorithm for solving the model, and demonstrate the benefits of this approach in a realistic case study of the EMS in Washington DC.

Nonlinear Optimization Methods with Stochastic and Second Order Information

Sponsor: Optimization/Nonlinear Programming

Sponsored Session

Chair: Katya Scheinberg, Lehigh University, 200 W Packer ave,
Bethlehem, PA, 18015, United States of America, kattyas@lehigh.edu

1 - Stochastic Optimization using a Trust-region Method and Random Models

Matt Menickelly, Lehigh University, 200 W. Packer Ave.,
Bethlehem, PA, 18015, United States of America,
mjm412@lehigh.edu, Katya Scheinberg, Ruobing Chen

We propose and analyze a trust-region model-based method for solving unconstrained stochastic optimization problems. The convergence analysis relies only on requirements that random models and point estimates are sufficiently accurate with sufficiently high, but fixed, probability. We present examples of generating sufficiently accurate random models under different noise assumptions and compare with existing approaches based on sample averaging or stochastic gradients.

2 - Accelerated Proximal Quasi-newton Algorithm with Global Complexity Analysis

Hiva Ghanbari, Lehigh University, Harold S. Mohler Laboratory,
200 W. Packer Ave., Bethlehem, PA, 18015, United States of
America, hig213@lehigh.edu, Katya Scheinberg

We propose a proximal quasi-newton algorithm in the spirit of the Nesterov's accelerated scheme for solving convex composite optimization problems. We present the analysis reflecting the convergence properties of the proposed algorithm, which preserves the sublinear rate of convergence under some mild assumptions. Furthermore, we show that, under careful use of second order information, this method obtains the same rate of convergence of Accelerated Proximal Gradient Algorithm.

3 - Selective Linearization Algorithm for Multi-block Convex Optimization

Yu Du, Rutgers University, 100 Rockefeller Road, Rutgers
business school, Piscataway, NJ, 08854, United States of America,
duyu197@gmail.com, Andrzej Ruszczyński, Xiaodong Lin

We consider the problem of minimizing the multi-block structured convex non-smooth functions. We introduce the Selective Linearization (SLIN) Algorithm which iteratively solves a series of subproblems by linearizing some blocks and approaches the optimal solution. Global convergence is achieved and SLIN algorithm is proven to converge at rate of $O(1/k)$. We apply the SLIN algorithm on structured regularization applications, showing fast running time for large scale problems.

4 - Quasi-newton Methods for Nonsmooth Optimization

Nitish Shirish Keskar, Northwestern University, 2145 Sheridan
Road, Room C210, Evanston, IL, 60208, United States of
America, keskar.nitish@gmail.com, Jorge Nocedal,
Andreas Waechter

We study the behavior of quasi-Newton methods on large-scale nonsmooth optimization problems. We concentrate specifically on a modified BFGS approach and its limited memory implementation. We contrast this approach with other popular methods including Limited Memory Bundle Methods and Gradient Sampling methods and describe detailed numerical results from both academic and practical test problems. Finally, we briefly provide some new theoretical guarantees for this class of methods.

5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America,
ckroer@cs.cmu.edu

1 - Games People (could not) Play

Swati Gupta, MIT, 77 Massachusetts Avenue, E40-149,
Cambridge, MA, 02139, United States of America,
swatig@mit.edu

Every two-player zero-sum game has an optimal strategy that can be found by solving an LP. But this approach is not polynomial time when the number of pure strategies for each player is exponential in the input, e.g. each player plays spanning trees of a graph. We present fast algorithms to compute Nash-equilibria for these games for bilinear payoff functions using ideas from convex and combinatorial optimization and machine learning.

2 - Maximal Cooperation in Repeated Games on Social Networks

Catherine Moon, Duke University, 213 Social Sciences,
Box 90097, Durham, NC, 27705, United States of America,
csm17@duke.edu, Vincent Conitzer

Standard results on repeated games assume that defections are instantly observable. In reality, it may take some time for agents in a network to learn that a defection has occurred. How does this affect the structure of equilibria and algorithms for computing them? In games of cooperation and defection, we prove existence of a unique maximal set of forever-cooperating agents in equilibrium, give an efficient algorithm for computing it and a condition for when the equilibrium found is credible.

3 - Faster First-order Methods for Extensive-form Game Solving

Christian Kroer, PhD Student, Carnegie Mellon University, 5000
Forbes Ave, Pittsburgh, PA, 15213, United States of America,
ckroer@cs.cmu.edu, Kevin Waugh, Fatma Kilinc Karzan, Tuomas
Sandholm

We investigate first-order methods for Nash equilibrium computation in zero-sum sequential games. We introduce the dilated entropy function as a distance-generating function, and develop strong-convexity bounds on this function over convex polytopes that generalize sequential-game strategy spaces. In terms of game solving, this improves the convergence rate of several first-order methods. We instantiate these methods with our results, and show that our algorithms outperform prior algorithms.

4 - Simultaneous Abstraction and Equilibrium Finding in Games

Noam Brown, Carnegie Mellon University, 5000 Forbes Ave,
Pittsburgh, PA, 15213, United States of America,
noamb@andrew.cmu.edu, Tuomas Sandholm

The leading approach to solving infeasibly large imperfect-information extensive-form games is to solve a smaller abstract version of the game and then map the solution back to the original. However, it is difficult to know which actions should be included in the abstraction without first solving the game. We introduce a method that combines abstraction with equilibrium finding by enabling actions to be added to the abstraction at run time in points that the current abstraction deems important.

Sponsored Session

Chair: Kelly Sullivan, Assistant Professor, University of Arkansas, Fayetteville, AR, 72701, ksulliv@uark.edu

1 - A Decomposition Approach for Dynamic Network Interdiction Models

Chase Rainwater, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, United States of America, cer@uark.edu, Forough Enayaty Ahangar

This work details the development of a large-scale optimization approach for solving dynamic bilevel network interdiction problems. A benders decomposition approach is proposed that utilizes constraint programming to exploit the scheduling nature of the network interdiction subproblem solved over a finite time horizon. Computational results comparing the proposed approach to traditional constraint programming and mixed-integer programming approaches are discussed.

2 - Supply Chain Design through Acquisition: A Robust Multi-objective Approach

Amin Khademi, Assistant Professor, Clemson University, 130-D Freeman Hall, Clemson University, Clemson, SC, 29634, United States of America, khademi@clemson.edu, Mariah Magagnotti, Scott Mason

Combining supply chain networks for an acquisition is a complicated process; making decisions for strategic merging of the supply chains when working with incomplete or incorrect data is even more so. Our work presents a robust optimization model that allows the decision maker to adjust for an expected degree of uncertainty, thus producing solutions that are less responsive to incorrect or incomplete data without being excessively cautious.

3 - Multiple-scenario Approach for a Dynamic Disaster Relief Routing Problem with Uncertain Social Data

Emre Kirac, PhD Candidate, University of Arkansas, Department of Industrial Engineering, Fayetteville, AR, 72701, United States of America, ekirac@email.uark.edu, Ashlea Milburn

Social media may play an important role and improve situational awareness in disaster response by providing real-time information. We present decision support models capable of considering input streams from social data when planning for disaster response. Specifically, a dynamic routing problem is presented in which social data and information from trusted sources are available and change over time. Alternative decision policies are presented and compared across a variety of request scenarios.

4 - The Wireless Network Jamming Problem Subject to Protocol Interference

Hugh Medal, Mississippi State University, Industrial & Systems Engineering, Starkville, United States of America, hugh.medal@msstate.edu

We study a wireless network jamming problem, solving it using a cutting plane approach that is able to solve networks with up to 81 transmitters. Our study yields the following insights into wireless network jamming: 1) increasing the number of channels is the best strategy for designing a robust network, and 2) increasing the jammer range is the best strategy for the attacker.

Invited Session

Chair: Daehan Won, University of Washington, Seattle, 1415 NE Ravenna Blvd, #401, Seattle, WA, 98105, United States of America, wondae@uw.edu

1 - General Framework for Rulebased Medical Diagnosis and Decision Making

Chunyan (sally) Duan, Tongji University & University of Washington, A503, Sino-French Center, Tongji University, No.1239, Siping Road, Shanghai, 200092, China, duanchunyan87@gmail.com, Daehan Won, Ying Lin, Shuai Huang, Jianxin You, W. Art Chaovalitwongse

A new mixed integer programming model is developed to select rules with minimization of prediction errors and control the costs of the features in the framework. The Diabetes Prevention Trial-Type 1 dataset is used to evaluate and compare our model with other State-of-the-Art methods. The results show that

our model not only dramatically reduce the number of selected features and control the costs of the features, but also has a promising accuracy in medical diagnosis.

2 - Networked Data Classification with Node Selection

Daehan Won, University of Washington, Seattle, 1415 NE Ravenna Blvd, #401, Seattle, WA, 98105, United States of America, wondae@uw.edu

We present a framework for classification of networked structure data. Due to the huge size of the network, we apply a feature selection scheme. Instead of general feature selection methods, we present a node selection scheme to determine the most relevant sub-networks which might yield insightful information underlying complex networks.

3 - A Structural Model and Bayesian Estimation of New Technology Adoption

Sebastian Souyris, PhD Candidate, The University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78712, United States of America, sebastian.souyris@utexas.edu, Jason A. Duan, Anant Balakrishnan, Varun Rai

We present a structural model and estimation algorithm to analyze the adoption of a new technology at individual consumer level. The model incorporates networks, e.g. geographical distance, to estimate the potential effect of word of mouth by assuming that the previous adoptions affect the predisposition of a consumer towards the technology. For inference, we use a Bayesian algorithm that overcomes the computational burden of classical estimation methods of structural models.

Application in Transportation Systems

Sponsor: Computing Society

Sponsored Session

Chair: Jingyang Xu, The Walt Disney Company, 1375 East Buena Vista Drive, Orlando, FL, 32830, United States of America, jxu7@buffalo.edu

1 - Consolidation and Last-mile Costs Reduction in Intermodal Transport

Martijn Mes, University of Twente, P.O. Box 217, Enschede, Netherlands, m.r.k.mes@utwente.nl, Arturo Pérez Rivera

We consider a carrier that transports freight periodically, using long-haul round trips from a single origin to multiple last-mile locations, and vice versa. Since the long-hauls are always traveled, the last-mile locations determine the costs of each trip. The challenge is to select, for each trip, the combination of orders which reduces costs over time. We propose an approximate dynamic programming (ADP) approach, which we illustrate using data from a Dutch intermodal carrier.

2 - A Real-time Run-curve Computation Framework for Trains with Dynamic Travel Restrictions

Jingyang Xu, The Walt Disney Company, 1375 East Buena Vista Drive, Orlando, FL, 32830, United States of America, jxu7@buffalo.edu, Daniel Nikovski, Sae Kimura

We study the problem to generate the most energy efficient run-curves subject to given travel time requirements and speed limit changes. We propose a two stage procedure framework. With derived geometric relations, the actual run-curves are generated in the real-time stage using approximate dynamic programming. Computational results show that the framework is capable to generate near-optimal run-curves in real time.

3 - Emission Oriented Multi-objective Sensor Location Model on Freeway

Ning Zhu, Assistant Professor, Tianjin University, Weijin Road, No. 92, Tianjin, China, zhuning@tju.edu.cn, Shoufeng Ma, Qinxiao Yu, Yuche Chen

In our study, an interpolation method is proposed to reconstruct the vehicle trajectory on a second-by-second base by using traffic sensors. A multi-objective traffic sensor location model is proposed aiming to estimate four major pollutants accordingly. Different numerical experiments are conducted in various freeway topological structures. It shows that the interpolated method for estimating vehicle trajectory can have a reasonable good emission accuracy.

4 - An Exact Algorithm for the Pickup and Delivery Problem with Time Windows and Scheduled Lines

Veaceslav Ghilas, PhD Student, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612 AZ, Netherlands, v.ghilas@tue.nl, Jean - Francois Cordeau, Tom Van Woensel, Emrah Demir

The Pickup and Delivery Problem with Time Windows and Scheduled Lines (PDPTW-SL) concerns routing and scheduling a set of vehicles to serve a set of freight requests such that a part of the journey can be carried out on a scheduled public transportation line. We propose a branch-and-price algorithm for the PDPTW-SL. A path-based set partitioning formulation is used as master problem, and a variant of elementary shortest path problem with resource constraints is studied as pricing problem.

5 - Signal Timing Detection Based on "Pseudo Vehicle Trajectory" on the Spatial-temporal Map

Seyedamirali Mostafavizadeh, Graduate Research Assistant, Rutgers University, Core 736, 96 Frelinghuysen Road, Piscataway, NJ, 08854, United States of America, amirali.mostafavizadeh@rutgers.edu, Peter J. Jin

This study introduces a new CCTV video based traffic signal timing detection method. A spatial-temporal (ST) map is generated by stacking the raw pixels along scan lines defined at the middle of each lane. Vehicles leave time-accurate but space-distorted "pseudo trajectories" on ST map without the need of intensive camera calibration. A moving Hough Line Transforms (MHLT) based method is then introduced to detect straight lines (queueing) to generate the starting and ending time of red lights.

Resource Allocation and Pricing in Cloud Computing

Cluster: Cloud Computing

Invited Session

Chair: Julie Ward, Distinguished Technologist, HP Labs, 1501 Page Mill Rd, Palo Alto, CA, 94301, United States of America, jward@hp.com

1 - Cost-efficient Cloud Computing

Vivek Farias, Associate Professor, MIT, 100 Main Street, Cambridge, United States of America, vivekf@mit.edu, Muhammad Amjad, Andrew Li, Devavrat Shah

Cloud users today must navigate through a variety of pricing mechanisms, and must contend with issues such as supply/demand forecasting and the high-dimensional control problems that naturally arise when attempting to minimize cost. We study the problem of computation under a deadline. We provide a simple, scalable algorithm that requires no tuning and enjoys robust performance guarantees. Along the way, we address a generalization of the classical Secretary Problem and prophet inequalities.

2 - Results-based Pricing and Resource Allocation in Cloud Computing

Filippo Balestrieri, HP Labs, 1501 Page Mill Rd, Palo Alto, CA, 94301, United States of America, filippo.balestrieri@hp.com, Julie Ward, Bernardo Huberman

Cloud services are sold today via a resource-based model, in which customers pay per instance-period. New technologies for predicting job requirements and completion times allow Cloud providers to consider new mechanisms. We compare a resource-based model to a results-based mechanism, in which the provider offers a menu of completion times and prices to each customer for his specific job. We identify conditions under which one mechanism produces higher revenue for the provider than the other.

3 - Selling Guaranteed Completion Times on the Cloud

Andrew Li, MIT Operations Research Center, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, aali@mit.edu, Filippo Balestrieri, Julie Ward

In today's cloud market, users execute their own jobs without a guarantee that deadlines will be met. Instead, providers can take control of job execution and charge for guaranteed completion times, but they face the joint challenges of dynamically pricing such contracts and scheduling jobs to fulfill these contracts. We address these challenges with a revenue management formulation, and apply a fluid approximation that is computationally efficient and optimal for large systems.

Applied Operations in Health Services: Research by Bonder Scholars

Sponsor: Health Applications

Sponsored Session

Chair: Jonas Jonasson, Student, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, jjonasson@london.edu

1 - Optimal Liver Cancer Surveillance in Hepatitis C-infected Populations

Qiushi Chen, chenqiushi0812@gatech.edu, Turgay Ayer, Jagpreet Chhatwal

Every 6-month surveillance for liver cancer is currently recommended in cirrhotic hepatitis C patients, but the optimal surveillance policy remains unknown. We develop a mixed-integer programming-based framework to analyze the most cost-effective surveillance policies, and find that (1) the optimal surveillance interval should depend on patients' stage of hepatitis C and age, and (2) expanding surveillance to earlier stage of hepatitis C improves the cost-effectiveness of HCC surveillance.

2 - Ambulance Dispatching, Redeployment and Reallocation

Amir Ali Nasrollah Zadeh, Clemson University, Freeman Hall 129, Clemson University, Clemson, SC, 29634, United States of America, snasrol@g.clemson.edu, Amin Khademi, Cem Saydam, Hari Rajagopalan, Maria Mayorga

Larger cities, expensive medical cares and heavy traffics have led to an increasing number of medical emergency calls and associated costs. In this work we develop an optimization model to find near-optimal solutions to ambulance dispatching, redeployment and reallocation problem to minimize the total expected waiting time of patients. We use approximate dynamic programming to find high-quality solutions and compare our policies with current practices via a simulation model.

3 - Robust Post-donation Blood Screening under Uncertainty

Hadi El-amine, PhD Student, Virginia Tech, 250 Durham Hall Perry St., Blacksburg, VA, 24061-0118, United States of America, hadi@vt.edu, Douglas Bish, Ebru Bish

Blood product safety, in terms of being free of transfusion-transmittable infections, is crucial. Under uncertainties in testing parameters and prevalence rates, various objective functions were considered in order to determine a "robust" post-donation blood screening strategy that minimizes the risk of releasing an infected unit of blood into the blood supply.

Adaptive Sampling and Selection in Simulation, Medicine and Machine Learning

Sponsor: Applied Probability

Sponsored Session

Chair: Peter Frazier, Assistant Professor, Cornell University, 232 Rhodes Hall, Cornell University, Ithaca, NY, 14850, United States of America, pf98@cornell.edu

1 - Large Scale Parallel Ranking and Selection

Susan Hunter, Purdue University, Grissom Hall, 315 N. Grant St., West Lafayette, IN, United States of America, susanhunter@purdue.edu, Florin Ciocan, Eric Ni, Shane Henderson

We discuss a new ranking and selection procedure that provides a good-selection guarantee and is suitable for parallel implementation on large scale problems. Two implementations, one using message-passing interface (MPI) and the other using MapReduce, both perform well in a high-performance computing environment. MPI is more efficient than MapReduce in the sense that cores are more heavily utilized, but less robust to issues such as core failure that may arise in cloud computing environments.

2 - Active Learning for Conjoint Analysis

Stephen Pallone, Cornell University, 290 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States of America, snp32@cornell.edu, Peter Frazier, Shane Henderson

Conjoint analysis is a method of learning a user's preferences, where the user is offered a set of alternatives and chooses the preferred option. We model the user's preferences as being characterized by a linear classifier, but allow for noise to contaminate responses. The rate at which we learn depends on the alternatives offered. We explore different policies for offering these alternatives, such as knowledge gradient and greedy posterior entropy reduction, and analyze their performance.

3 - Optimal Online Selection of a Monotone Subsequence:**A Central Limit Theorem**

Vinh V. Nguyen, PhD Student, The Fuqua School of Business,
Duke University, 100 Fuqua Drive, Durham, NC, 27708,
United States of America, vn26@duke.edu, Alessandro Arlotto,
J. Michael Steele

Consider a sequence of n independent random variables with common continuous distribution and consider the task of choosing an increasing subsequence where the observations are revealed sequentially and must be accepted or rejected when they are first revealed. There is a unique selection policy that maximizes the expected number of selected observations. We prove a central limit theorem for this number of optimally selected observations and characterize its mean and variance for large n .

4 - A Bayesian Decision-theoretic Model of Sequential Clinical Trials with Delayed Responses

Stephen Chick, Professor, INSEAD, Technology Management
Area, Boulevard de Constance, Fontainebleau, 77300, France,
stephen.chick@insead.edu, Martin Forster, Paolo Pertile

Clinical trials are necessary for evaluating the benefit of health technologies but are quite costly, but most analysis do not account for the effect of delayed observations on optimal trial design. We take a Bayesian sequential learning approach to the economics of clinical trial design with dynamic programming. We provide structural results and apply optimal stopping time solutions to data from recent clinical trials.

Solutions for Large Markov Chains

Sponsor: Applied Probability

Sponsored Session

Chair: Mor Harchol-Balter, Professor, Carnegie Mellon University,
Computer Science Dept., 5000 Forbes Ave., Pittsburgh, PA,
United States of America, harchol@cs.cmu.edu

1 - Clearing Analysis on Phases: Distribution of Skip-free, Unidirectional, Quasi-birth-death Processes

Sherwin Doroudi, PhD Candidate, Carnegie Mellon University,
sdoroudi@andrew.cmu.edu, Mor Harchol-Balter, Brian Frailix

A wide variety of problems in manufacturing, service, and computer systems can be modeled by infinite repeating quasi-birth-death process (QBD) Markov chains with infinitely many levels and finitely many phases. Many such chains have transitions that are skip-free in level and unidirectional in phase. We present the Clearing Analysis on Phases (CAP) method, which yields the exact limiting probabilities of the states in such chains as a linear combinations of scalar bases raised to powers.

2 - M/M/C Queue with Two Priority Classes

Opher Baron, University of Toronto, 105 St. George St, Toronto,
ON, Canada, opher.baron@rotman.utoronto.ca, Jianfu Wang,
Alan Scheller-wolf

We provide the first exact analysis of a preemptive M/M/C queue with two priority classes with different service rates. We introduce a technique to reduce the 2-dimensionally Infinite Markov Chain (IMC), representing this problem, into a 1-dimensionally IMC. We derive the law for the number of low-priority jobs. Numerical examples demonstrate the accuracy of our algorithm and generate new insights. We demonstrate how our methodology solves other problems.

3 - Product-Form Solutions for a Class of Structured Multi-Dimensional Markov Processes

Jori Selen, PhD Candidate, Eindhoven University of Technology,
De Zaale, Eindhoven, Netherlands, j.selen@tue.nl,
Johan Van Leeuwen, Ivo Adan

Motivated by queueing systems with heterogeneous parallel servers, we consider a class of structured multi-dimensional Markov processes whose state space can be partitioned into two parts: a finite set of boundary states and a structured multi-dimensional set of states, exactly one dimension of which is infinite. Using separation of variables, we show that the equilibrium distribution, typically of the queue length, can be represented as a linear combination of product forms.

1 - Fashion-Telling: Predicting the Future of Digital Innovations

Ping Wang, Associate Professor, University of Maryland, College
Park, 4105 Hornbake Bldg., College of Information Studies,
College Park, MD, 20742, United States of America,
pwang@umd.edu

The fusion of digital technologies and fashion makes innovation trajectories notoriously fickle and hard to predict. This study combines organizational ecology and network theories to conceptualize digital innovation ecosystems and proposes to use the ecology and structure of these ecosystems to predict the trajectories of digital technologies. The utility of this approach is illustrated in a case study, with implications to Information Systems strategy and management articulated.

2 - Making Sense of Materiality: The Case of 3d Printed Fashion

Ning Xu, Assistant Professor, Ivey Business School, Western
University, 1255 Western Road, London, ON, N6G 0N1, Canada,
nsu@ivey.uwo.ca

3D printing is increasingly embraced by fashion designers. Due to the nascent and evolving nature of 3D printing, however, there is significant uncertainty around its affordances and constraints. Drawing on qualitative data, this exploratory study shows that fashion designers seek to make sense of this emerging technology by pursuing a collective design process with multiple stakeholders. The ongoing interaction among diverse actors gives rise to innovative perceptions, practices, and products.

3 - Fashion and Text Analytics

Heng Xu, Associate Professor, Pennsylvania State University,
316H IST Building, University Park, PA, 16802,
United States of America, hxu@ist.psu.edu, Yilu Zhou

The Fashion Industry is extremely competitive in terms of adapting to fast evolving fashion trends and consumer demand. Building upon various fashion theories, we empirically examine fashion designer's evolution by studying a variety of data including fashion articles, magazines, blogs, and social media. By using text analytics, we envision the color, print, and style for upcoming trends and help retailers to stay on top of the latest fashion.

4 - Mining Social Media and Press Release for Competitive Intelligence: A Case Study on IBM

Yuan Xue, The George Washington University, 2201 G Street,
NW, Suite 515, Washington, DC, United States of America,
xueyuan@gwmail.gwu.edu, Subhasish Dasgupta, Yilu Zhou

Competitive intelligence (CI) refers to the study of competitors and competitive environment in support of decision-making. CI is usually generated by CI professionals. The recent CI trend is to collect competitor information online. We believe that social media analysis can help us to identify both direct and indirect competitors, rank competitors based on their market commonality and learn the strength and weakness of focal company.

1 - Measuring Display Advertising Effects on Online Search Behavior

Vilma Todri, PhD Candidate In Information Systems, NYU, 44 W
4th St, KMC Room 8-181, New York, Ne, 10012, United States of
America, vtodri@stern.nyu.edu, Anindya Ghose

The increasing availability of individual-level data has raised the standards for measurability and accountability in online advertising. Using a novel data set with granular measurements of advertising exposures, we examine a wide range of consumer behaviors and capture the effectiveness of display advertising across channels as well as the dynamics of these effects across the purchasing funnel path of consumers. We discover rich findings with important managerial implications.

2 - The Value of Fit Information in Online Retail

Antonio Moreno-Garcia, Northwestern University, 2001 Sheridan Rd, Evanston, IL, 60208, United States of America, a-morenogarcia@kellogg.northwestern.edu, Santiago Gallino

We conduct a field experiment to quantify the value of fit information in online retail.

3 - The Effect of Music Labels on Song Popularity in Electronic Markets Without Barriers-to-Entry

Marios Kokkodis, Assistant Professor, Boston College, 34 E 10th, New York, NY, 10009, United States of America, mkokkodis@stern.nyu.edu

In this work we study the effect of music labels on song popularity in electronic markets without barriers to entry.

4 - The Moderating Effects of Product Attributes and Reviews on Recommender System Performance

Dokyun Lee, Carnegie Mellon University, United States of America, leedokyun@gmail.com, Kartik Hosanagar

We investigate the moderating effect of several product attributes on the efficacy of a recommender system for increasing conversion rate via a field experiment on one of the top North American retailer's website. Our results provide many managerial implications on when to utilize recommenders and how recommenders interact with reviews and product attributes.

1 - Piecewise Static Policies for Two-stage Adjustable Robust Optimization Problems under Uncertainty

Omar El Housni, Industrial Engineering and Operations Research, Columbia University, 547 Riverside Drive Apt. 1B, New York, NY, 10027, United States of America, omar.el-housni@polytechnique.edu, Vineet Goyal

We consider two-stage adjustable robust linear optimization problems under uncertain constraints and study the performance of piecewise static policies. We show that surprisingly there is no piecewise static policy with polynomial number of pieces with performance significantly better than a static policy in general. We also present a family of piecewise static policy with exponential pieces that has a significantly better performance than a static solution and admits a compact MIP formulation.

2 - Multi-step Bayesian Optimization for One-dimensional Feasibility Determination

Massey Cashore, University of Waterloo, 200 University Ave W, Waterloo, On, N2L 3G1, Canada, masseycashore@gmail.com, Peter Frazier

Bayesian optimization methods allocate limited sampling budgets to maximize expensive-to-evaluate functions. One-step-lookahead policies are often used, but computing optimal multi-step-lookahead policies remains a challenge. We consider a specialized Bayesian optimization problem: finding the superlevel set of an expensive one-dimensional function, with a Markov process prior. We compute the Bayes-optimal sampling policy efficiently, and characterize the suboptimality of one-step lookahead.

3 - Alleviating Competitive Imbalances in NFL Schedules: An Integer Programming Approach

Kyle Cunningham, Northeastern University, Healthcare Systems Engineering Institute, Boston, MA, United States of America, cunningham.k@husky.neu.edu, Murat Kurt, Niraj Pandey, Mark Karwan

While the NFL uses complex rules in scheduling its games, NFL schedules are not robust in creating a consistent competitive appeal. We propose a two-stage MILP approach to reduce competitive disadvantages in schedules arising from various sources including rest differentials due to bye-weeks and Thursday games, long streaks of road games, and short-week travel. Our results for the 2012-2015 seasons indicate that our approach can substantially improve NFL schedules in various fairness metrics.

4 - Robust Multi-Objective Clustering

Andy Zheng, Northwestern University, 1501 Leavenworth, San Francisco, CA, 94109, United States of America, azheng92@gmail.com

We propose a multi-objective method that leverages robust optimization for hierarchical clustering (rMOC). rMOC chooses clusters based on a weighted sum of data-intrinsic objective functions, determining a threshold that is most robust to uncertainties in these weights. We compare this method to the reference methods of K\$-means and Gaussian mixture models. In terms of misassignment rate, rMOC outperforms both other methods on several benchmark datasets.

5 - Optimal Resource Allocation in Breast Cancer Screening with Different Risk Groups

Magdalena Romero, Universidad Adolfo Ibañez, Santiago, Santiago, Chile, maromero@alumnos.uai.cl, Qingxia Kong, Susana Mondschein

This paper investigates how many lives can be saved from breast cancer death through optimal allocation of limited resources in public health. We build a two-stage stochastic dynamic programming model to optimally allocate a limited number of mammograms, among women with different risk levels in breast cancer, which is applied to the case in Chile. We find that simply through dividing women into 3 risk groups, we can save 88 lives per 100,000 women, compared to the current practice in Chile.

1 - Multi-criteria Evaluation of Sustainable Manufacturing

Jian-bo Yang, Professor Of Decision And System Sciences, Manchester Business School, The University of Manchester, Manchester, M15 6PB, United Kingdom, jian-bo.yang@mbs.ac.uk, Panitas Sureeyatanapas

Sustainable manufacturing becomes increasingly important. The paper explains how a manufacturer can maintain its business and operations in long term by combining green manufacturing, corporate social responsibility and green supply chain. It then focuses on discussing how criteria and indicators for evaluating progress to sustainable manufacturing can be established. A case study for evaluating sustainability performance in the sugar manufacturing industry of a developing country is discussed.

2 - Recent Development and Applications of Evidential Reasoning Approach for Decision Making

Dong-ling Xu, Professor Of Decision Science And Systems, Manchester Business School, The University of Manchester, Manchester, United Kingdom, ling.xu@mbs.ac.uk, Jian-bo Yang

We report the recently discovered relationship between Bayesian inference and the Evidential Reasoning approach for multiple criteria decision making under uncertainty. It is significant because it opens up new research avenues in many fields such as the extension of Bayesian inference with imperfect probability information which may not be fully reliable and the enhancement of evidence and random set theories. A few applications are reported with a focus on extracting evidence from big data.

3 - The Primary Aluminum Industry as a Complex Adaptive System

David Olson, Professor, University of Nebraska Lincoln, CBA 256, Lincoln, NE, 68588-0491, United States of America, dolson3@unl.edu

Supply chains are critically important elements of global business, involving high levels of interdependence. Supply chains have been suggested to be complex adaptive systems. Supply chains usually emerge rather than result from the purposeful design of a single controlling entity. This paper presents the global primary aluminum industry viewed from the perspective of complex adaptive systems. Unintended consequences of actor decisions in this industry in the past forty years.

4 - MCDM Methods Inspired by Prospect Theory

Luiz Autran Gomes, Ibmecc/RJ. Rio de Janeiro – RJ, Brazil, autran@ibmeccrj.br

This paper reviews attempts to develop discrete MCDM methods inspired by Kahneman and Tversky's prospect theory. After going through the first steps making use of linear prospect theory the essentials of the TODIM method and extensions are presented. The paper closes with outlining how qualitative methods of MCDM such as DEX or Verbal Decision Analysis can be combined with TODIM-based methods in order to approach complex decision making problems.

Market Design

Cluster: Auctions

Invited Session

Chair: Gabriel Weintraub, Professor, Columbia University, Uris Hall, New York, NY, 10027, United States of America, gyw2105@columbia.edu

1 - Incentive Issues in Paired Organ Donation

Eduardo Azevedo, Assistant Professor, Wharton, 3620 Locust Walk, Wharton, SHDH 1400, Philadelphia, PA, 19102, United States of America, eazevedo@wharton.upenn.edu, Nikhil Agarwal, Itai Ashlagi, Clayton Featherstone

In the last few years a new type of organ donation has arisen. In a paired kidney exchange two recipients with incompatible live donors receive organs from each other's live donor. Sometimes transactions involve more recipients and/or donors. While many exchanges happen in a decentralized way, others happen in large centralized exchanges. We empirically examine how agents in these markets respond to incentives and whether incentives are misaligned with social goals.

2 - Optimal Procurement Mechanisms for Differentiated Products

Gabriel Weintraub, Professor, Columbia University, Uris Hall, New York, NY, 10027, United States of America, gyw2105@columbia.edu, Daniela Saban

We study the mechanism design problem faced by a buyer that selects an assortment of differentiated products and unit prices from a set of suppliers with private costs. Then, consumers can choose their most preferred product from this set. The buyer maximizes consumer surplus; to do so, he must balance the trade-off between variety and price competition. We characterize the optimal mechanism and use these results to analyze practical mechanisms.

3 - Efficiency and Stability in Large Matching Markets

Yeon-koo Che, Columbia University, 420 West 118th Street, 1029 IAB, New York, NY, United States of America, yeonkooche@gmail.com, Olivier Tercieux

We study efficient and stable mechanisms in matching markets when the number of agents is large and individuals' preferences and priorities are drawn randomly. When agents' preferences are correlated over objects, the prevailing mechanisms are either inefficient or unstable even in the asymptotic sense. We propose a variant of deferred acceptance which is asymptotically efficient, asymptotically stable and also asymptotically incentive compatible.

4 - Market Fragmentation

Rakesh Vohra, University of Pennsylvania, 3718 Locust Walk, Philadelphia, PA, United States of America, rvohra@seas.upenn.edu, Ahmad Peivandi

Centralized markets reduce the costs of search for buyers and sellers. Their 'thickness' increases the chance of order execution at competitive prices. In spite of the incentives to consolidate, some markets, have fragmented into multiple trading venues. We argue in this paper that fragmentation is an unavoidable feature of any centralized exchange. Our argument introduces a new way to think about participation in a mechanism when the outside option is endogenous.

Creating and Sustaining an Analytics Advantage

Sponsor: CPMS

Sponsored Session

Chair: Peter Bell, Ivey Business School at Western University, 1255 Western Road, London, ON, N6G 0N1, Canada, pbell@ivey.uwo.ca

1 - Advanced Analytics at Verizon Wireless Supply Chain

Anne Robinson, Verizon Wireless, anne.robinson@verizonwireless.com, Mustafa Dogru

Supply Chain Advanced Analytics Team carries out projects in the areas of forecasting, inventory optimization, assortment planning, etc. We give an overview of our engagement approach with the internal business units, discuss how our models are implemented and transferred to the business, and conclude with the lessons learned.

2 - Capability Portfolio Analyses Tool (CPAT)

Pooja Dewan, BNSF Railway, Fort Worth TX 76092, United States of America, Pooja.Dewan@bnsf.com

The Capability Portfolio Analyses Tool (CPAT) delivers unparalleled insight into multi-decadal modernization planning for the Army's large ground combat fleet. This first-of-its-kind capability optimizes modernization plans while considering the complex interrelationship between performance, budgets, schedules, production capacities, etc. Over 40 studies have been completed- informing stakeholders up to Army Vice Chief of Staff, OSD, and Army Acquisition Executive levels.

3 - The Analytics Advantage: Some Reflections from Business and Policy-making

Doug Samuelson, InfoLogix, Inc., 8711 Chippendale Court, Annandale, VA, 22003, United States of America, samuelsondoug@yahoo.com

Analytics / OR / MS (or whatever we want to call it) involves injecting more intellectual rigor into decision-making. Key elements of how to do this include using the decision-makers' language, understanding their needs and time frame, and building multiple constituencies of decision-makers who trust your recommendations. This is not as obvious in practice as it sounds in summary.

4 - Sustaining an Analytics Advantage

Peter Bell, Ivey Business School at Western University, 1255 Western Road, London, ON, N6G 0N1, Canada, pbell@ivey.uwo.ca

Many claim that the use of analytics can create a competitive advantage but research suggests that any advantage created is often fleeting: most analytics is easily replicated. There are, however, examples of firms that have sustained a competitive advantage through analytics for years, even decades. How have they done this? What are the lessons for analytics leaders? This presentation will provide examples that may provide lessons on how to sustain an advantage created through analytics.

1 - The Forest or the Trees? Tackling Simpson's Paradox with Classification and Regression Trees

Galit Shmueli, Professor, National Tsing Hua University, Institute of Service Science, 101, Sec. 2, Kuang-Fu Road, Hsinchu, 30013, Taiwan - ROC, galit.shmueli@gmail.com, Inbal Yahav

Social science research often uses observational data to study causality because randomized experiments are impossible, unethical or expensive. Simpson's paradox arises in observational causal studies, due to confounders. We propose using Classification & Regression Trees to detect Simpson's paradox in large observational data. The approach relies on the tree structure and the location of the cause vs. the confounders in the tree. We illustrate our approach on several real applications.

2 - A Statistical Learning Approach to Personalization in Revenue Management

Zachary Owen, Massachusetts Institute of Technology, 77
Massachusetts Ave, E40-149, Cambridge, MA, 02139, United
States of America, zowen@mit.edu, David Simchi-levi, Xi Chen,
Clark Piton

We develop a framework for modeling personalized decision problems which gives a data driven algorithm for revenue maximization using contextual information. We apply our method to pricing and assortment optimization. We prove a high-probability bound on the gap between the revenue of the estimated policy and the revenue generated under full knowledge of the demand distribution. We demonstrate the performance of our method on both airline seating data and simulated data.

3 - Uncovering Hidden Decision Processes through Integration of Independent Databases

Nooshin Valibeig, Northeastern University,
334 Snell Engineering, Boston, MA, 02115, United States of
America, nooshin.valibeig@gmail.com, Jacqueline Griffin

Data is a key driver in analyzing and evaluating the effectiveness of decision processes. We develop an algorithm to uncover hidden information about decision processes in resource allocation systems. Specifically, the algorithm joins event-oriented and snapshot-in-time databases to extract new knowledge about decision processes. The precision and robustness of the algorithm is quantified with simulated data. A case study with hospital patient flow data is presented.

4 - Reinforcement Learning Algorithms for Regret Minimization in Structured Markov Decision Processes

Theja Tulabandhula, Xerox Research Centre India, Bangalore,
Bangalore, India, theja2t@gmail.com, Prabuchandran K. J.,
Tejas Bodas

For several RL problems the optimal policy of the underlying Markov Decision Process (MDP) is characterized by a known structure. We develop new RL algorithms that exploit the structure of the optimal policy to minimize regret. Numerical experiments on MDPs with structured optimal policies show that our algorithms have better performance than current state of the art, are easy to implement, have a smaller run-time, can be parallelized and require less number of random number generations.

Sponsored Session

Chair: Chaojiang Wu, Drexel University, 727 Gerri LeBow Hall, 3220
Market Street, Philadelphia, PA, 19104, United States of America,
cw578@drexel.edu

1 - Sparse Nonlinear Feature Selection by Locally Discriminative Constraints

Chuanren Liu, Assistant Professor, Drexel University, 3220
Market St, Philadelphia, PA, 19104, United States of America,
liuchuanren@gmail.com, Kai Zhang

We present an approach to sparse nonlinear feature selection for K-nearest neighbor (KNN) classification. First, the factors for selecting feature are optimized with locally discriminative constraints, which encourage smaller distances between neighbors from the same class and larger distances between neighbors from different classes. Then, we use lasso to achieve the sparse feature selection. We also show an interesting connection between our formulation and the support vector machines (SVMs).

2 - Maximum Tangent Likelihood Estimation and Robust Variable Selection

Yichen Qin, Assistant Professor, University of Cincinnati, 2925
Campus Green Dr., Cincinnati, OH, 45221, United States of
America, yichenqin@gmail.com, Yan Yu, Yang Li, Shaobo Li

In this article, we propose a new class of likelihood function, called Tangent Likelihood function, that can be used to obtain robust estimates, termed as Maximum Tangent Likelihood Estimator (MtLE). We show that the MtLE is root-n consistent and asymptotically normally distributed. Furthermore, we consider robust variable selection based on our proposed tangent likelihood function. The proposed MtLE-Lasso can perform robust estimation and variable selection simultaneously and consistently.

3 - Pseudo Sufficient Dimension Reduction

Wenbo Wu, University of Oregon, Lundquist College of Business,
Eugene, OR, 97403, United States of America,
wuwenboug@gmail.com

We propose a new concept of pseudo sufficient dimension reduction based on an underlying relationship between ridge regression and measurement error regression. With such a connection, we propose a general sufficient dimension reduction estimation procedure to obtain an estimate from a different subspace instead of the targeted population parameter space. Variable selection based on pseudo estimate works effectively for both highly correlated predictors and for the small n large p problem.

4 - Structured Multitask Feature Selection

Fei Wang, Associate Professor, University of Connecticut,
371 Fairfield Way, Unit 4155, Storrs, CT, 06269,
United States of America, fei_wang@uconn.edu

Identification of important features for specific tasks is an important problem in modern data analytics. In this talk, I will focus on the multitask feature selection problem, where multiple related tasks are considered simultaneously and the important features for each task is selected. I propose a structured optimization approach, where similar tasks share similar important feature set. I applied the proposed approach for risk factor identification in Comprehensive Geriatric Assessment.

Statistics and Optimization Methods for Pain Management

Sponsor: Health Applications

Sponsored Session

Chair: Jay Rosenberger, Associate Professor, University of Texas at
Arlington, Box 19017 UT, Arlington, TX, 76019,
United States of America, jrosenbe@uta.edu

1 - Iterative Data Imputation for Adaptive Pain Management

Yeqing Li, University of Texas Arlington, P.O. Box 19017,
Arlington, TX, 76019, United States of America,
yeqing.li@mavs.uta.edu, Junzhou Huang

Pain management is a major global health problem. Many efforts have been devoted to developing data-driven decision models. However, the raw data is usually subject to various levels of missing. The missing values in data limit the quality and quantity of data and additionally limit the performance of the decision models. To address this problem, we proposed an iterative data imputation algorithm, which can accurately recover various kinds of missing values.

2 - Inverse Probability of Treatment Weighting for Adaptive Interdisciplinary Pain Management

Victoria Chen, The University of Texas at Arlington, Dept. of Ind.,
Manuf., & Sys. Engr., Campus Box 19017, Arlington, TX, 76019,
United States of America, vchen@uta.edu, Li Zeng,
Aera Leboulluec, Robert Gatchel

We present a process based on the inverse probability of treatment weighting method to address the endogeneity while estimating state transition and outcome models for a two-stage adaptive interdisciplinary pain management program. First, a method is developed for independent treatments then a general method is developed for correlated treatments.

3 - Two-stage Feature Selection for Efficient Modeling of Pain Management Data

Rohit Rawat, University of Texas Arlington, P.O. Box 19017,
Arlington, TX, 76019, United States of America,
rohit.rawat@mavs.uta.edu, Michael Manry

We use data from a pain management study in which treatment variables and two pain intensity metrics were recorded in two treatment stages. Data sets for the 235 subjects had 899 features for stage one and 1889 for stage two. A two-stage feature selection algorithm was developed that fits a piecewise linear network to the data, and removes useless inputs. We prevent overfitting through the use of random probes and regularization. The method results in smaller datasets and reduced testing error.

4 - Two-stage Stochastic Programming for Adaptive Interdisciplinary Pain Management

Gazi Iqbal, University of Texas Arlington, P.O. Box 19017, Arlington, TX, 76019, United States of America, gazimddaud.iqbal@mavs.uta.edu, Jay Rosenberger, Victoria Chen, Robert Gatchel, Na Wang

This research uses a two-stage stochastic programming method to optimize personal adaptive treatment strategies to improve current and future pain outcomes. A piecewise linear approximation method is developed to approximate non-convex quadratic functions. Equivalent deterministic mixed integer linear programs are developed to optimize treatment strategies for patients.

Sponsored Session

Chair: Diana Negoescu, Assistant Professor, University of Minnesota, 111 Church St. SE, Minneapolis, MN, United States of America, negoescu@umn.edu

1 - Optimal Timing of Drug Sensitivity Testing for Patients on 1st-line Tuberculosis Treatment in India

Sze Suen, Stanford University, 117 Encina Commons, Stanford, CA, 94305, United States of America, ssuen@stanford.edu

We seek to determine the optimal time to administer drug sensitivity testing (DST) for first-line tuberculosis treatment patients in India to improve health outcomes and reduce costs. Using a POMDP model, we find that India should revise the protocol to provide DST during the first month of treatment in areas of average or high MDR TB prevalence and transmission, and may wish to consider individually tailored DST regimens in low transmission, low MDR prevalence areas to reduce financial costs.

2 - Cost-effectiveness of HIV Preexposure Prophylaxis for Injection Drug Users in the United States

Cora Bernard, Stanford University, Department of Management Science and Eng, Huang Engineering Center, Stanford, CA, 94305, United States of America, clb210@stanford.edu, Eran Bendavid, Margaret L. Brandeau, Keith Humphreys, Mark Holodniy, Christopher Weyant, Douglas K. Owens, Jeremy D. Goldhaber-fiebert

Recent CDC guidelines recommend HIV preexposure chemoprophylaxis (PrEP) for adults who are active injection drug users (IDUs) in the US. However, the potential population health benefits and costs of this policy remain unclear. We developed a dynamic HIV epidemic model to evaluate oral PrEP (Truvada) for IDUs in the US. We find that PrEP for IDUs can provide substantial health benefits for the entire US population, but at the current cost of Truvada is a very expensive intervention.

3 - Diagnostic Sequences for Evaluating Post-stroke Atrial Fibrillation: A Cost-effectiveness Analysis

Sepehr Nemati, Postdoctoral Fellow, Ivey School of Business, University of Western Ontario, 1255 Western Road London, London, Canada, Sproon@ivey.uwo.ca, Lauren Cipriano, Luciano Spasato

Patients with atrial fibrillation and a history of stroke are at higher risk of stroke. It has been shown that sequentially combining cardiac monitoring methods might detect atrial fibrillation in nearly a quarter of patients with stroke or transient ischemic attack. However, the cost-effectiveness of these strategies remains unknown. We propose a decision analytic model to evaluate the costs, benefits, and cost-effectiveness of various post-stroke atrial fibrillation diagnostic strategies.

4 - Analysis of Electronic Health Record Based Depression Trajectory and Monitoring

Ying Lin, University of Washington, Box 352650, Seattle, WA, 98195-2650, United States of America, linyeliana.ie@gmail.com, Shuai Huang, Shan Liu

Depression is a common, complex and dynamic mental disorder. We established a trajectory-based framework for depression diagnosis/prognosis adaptable to population heterogeneity using electronic health record data. We analyzed patterns in the depression trajectories of a treatment population and proactively probed new trajectories for monitoring treatment outcomes. A five-group trajectory pattern was found using clustering, recursive partitioning, and collaborative degradation model.

Chair: Paul Kantor, Prof, Rutgers, 96 Frelinghuysen Dr, Piscataway, NJ, United States of America, paul.kantor@rutgers.edu

1 - Is Secure and Usable Smartphone Authentication Asking too Much?

Janne Lindqvist, Rutgers, 96 Frelinghuysen Dr, Piscataway NJ, janne@winlab.rutgers.edu

Smartphones are a convenience, but they present also considerable security and privacy risks. Using your smartphone gives access to snapshots of your whole life. In this talk, we will discuss smartphone user authentication issues and solutions. This talk is based on work published in IEEE Computer May 2015, (w/ Dr. Alexander De Luca), IEEE Pervasive Computing Jan/Mar 2015 (w/ Gradeigh D. Clark), and other published works by Dr. Lindqvist's group on usable and secure authentication.

2 - Vertical Data Integration for Homeland Security: The Moynihan Principle

Paul Kantor, Prof, Rutgers, 96 Frelinghuysen Dr, Piscataway, NJ, United States of America, paul.kantor@rutgers.edu

The disparate parts of DHS have complex legacy information systems. To achieve full potential decision makers at every level need access to the data, and they must have confidence that it is the same data that their subordinates and their superiors are seeing. While technically possible, this is a disruptive departure from the hierarchical and stovepiped systems that are in place now. We discuss some technical and cultural challenges that hinder the development of such a much-needed system.

3 - Fusing Disparate Threat Reports

John Hollywood, Senior Operations Researcher, RAND Corporation, 1200 South Hayes Street, Arlington, VA, 22202, United States of America, jshollywood@gmail.com

We discuss a nonlinear programming approach to fusing disparate, including openly conflicting, intelligence reports about a potential threat. The method yields estimates of threat level probabilities that are as conservative (i.e., uncertain, in an information-theoretic sense) as possible given what has been reported about a subject. It may be implemented using off-the-shelf Microsoft Excel Solver, which is important for operations centers that typically lack high-end solvers.

4 - The Challenge of Maritime Cyber Security

Fred Roberts, CCICADA, 96 Frelinghuysen Rd, Piscataway, NJ, United States of America, froberts@dimacs.rutgers.edu

The vulnerabilities to cyber attacks of today's marine transportation system have not been well studied. This paper explores vulnerabilities of shipboard systems, oil rigs, cargo, and port operations and explores some suggested remedies.

Chair: Arnold I Barnett, Professor, MIT, E62-568, MIT, Cambridge, MA, 02139, United States of America, abarnett@mit.edu

1 - Insights from Anomalies in the Age-crime Curves for Homicide

Alfred Blumstein, University Professor, Heinz College, Carnegie Mellon University, 5000 Forbes Ave., Pittsburgh, PA, 15213, United States of America, ab0q@andrew.cmu.edu

The age-crime curve is the age-specific ratio of arrests to population $[A(a)/N(a)]$ that rises quickly to a peak at about age 18 and then declines more slowly. This curve displayed a particularly anomalous pattern between 1985 and 1993, thereby suggesting some distinctive activity during that period. The insights by looking at features of those changes provided strong indications of the factors contributing to the homicide growth during that period.

2 - A “Unified Field Theory” of Accidental Death Risk?

Arnold I Barnett, Professor, MIT, E62-568, MIT, Cambridge, MA, 02139, United States of America, abarnett@mit.edu

We consider cross-national mortality risk tied to accidents in various forms of transport, and also unintentional deaths from other causes like industrial accidents. We relate these risk metrics to national life expectancies absent these accidents (e.g. from diseases), and inquire whether an underlying factor akin to IQ explains common patterns of dispersion for various causes of accidental death risk.

3 - Modeling the HIV Treatment Cascade

Edward Kaplan, Beach Professor Of Operations Research, Yale University, School of Management, 165 Whitney Avenue, New Haven, CT, 06511, edward.kaplan@yale.edu, Gregg Gonsalves

Only a quarter of HIV-infected persons in the US have undetectable viral loads. Increasing the number virally suppressed requires increasing the throughput of the HIV “treatment cascade” from infection to diagnosis, linkage to care, and retention in care; and also time spent suppressed. Using available data, we estimated stage times and progression probabilities in the treatment cascade, enabling identification of bottlenecks and a basis for increasing the number virally suppressed.

4 - Dynamic Games of Drug Legalization: Death and Taxes?

Jonathan Caulkins, Professor, Carnegie Mellon University, Heinz College, 5000 Forbes Ave, Pittsburgh, PA, 15237, United States of America, caulkins@andrew.cmu.edu

Several states and countries have legalized marijuana; others contemplate legalizing cocaine. These actions alter incentives for other jurisdictions to change their policies, creating a giant dynamic game. This paper discusses insights from viewing this as a dynamic game and associated insights about limitations of game theoretic analysis for informing policy.

1 - Implementing Night-shift Scheduling System for Residents in Aichi Medical University Hospital

Mari Ito, Nanzan University, 18 Yamazato-Cho, Showa-Ku, Nagoya, Japan, d13mm002@nanzan-u.ac.jp, Akira Imamura, Takuya Ito, Rina Nakayama, Aino Onishi

We develop a support system for generating a night-shift scheduling for residents in Aichi Medical University Hospital. We formulate the problem as a weighted constraint satisfaction problem using weights decided by Analytic Hierarchy Process. We implement the system on a standard PC and obtain better schedules within a few seconds.

2 - Scheduling System for the Resident Training Program in Aichi Medical University Hospital

Aino Onishi, Nanzan University, 18 Yamazato-cho, Showa-ku, Nagoya, Japan, m14ss008@nanzan-u.ac.jp, Akira Imamura, Rina Nakayama, Mari Ito, Takuya Ito

We develop a system that makes monthly rotation schedule of training program of the residents. We formulate the problem as a 0-1 integer programming problem, and solve it using CPLEX. The system is in trial use in the hospital, and the schedule obtained improves the quality of the resident training.

3 - Improving Timeliness in Lung Cancer Diagnosis Process

Hyo Kyung Lee, UW Madison, 1513 Engineering Drive, Madison, WI, 53706, United States of America, hlee555@wisc.edu, Raymond Osarogiagbon, Xinhua Yu, Nicholas Faris, Fedoria Rugless, Jingshan Li, Feng Ju

Lung cancer diagnosis procedure is a series of complex and fragmented investigation, resulting in undesirable delays in wait times. Bottleneck analysis method is applied to identify the waiting time whose reduction can lead to the largest improvement in the overall efficiency of lung cancer diagnosis procedure. The impact of reducing waiting times on the timeliness of lung cancer diagnosis process is quantified and the severities are compared to provide a way to alleviate wait time delays.

4 - Appointment Scheduling and Overbooking to Improve Patient Access and Reduce Patient Backlog

Linda Laganga, Vp Of Quality Systems, Mental Health Center of Denver, 4141 East Dickenson Place, Denver, CO, 80302, United States of America, linda.laganga@mhc.org, Stephen Lawrence

Patient no-shows continue to trouble outpatient clinical service delivery. We continue our piloting and implementation of scheduling models developed in our earlier research to develop new techniques to assist clinics in meeting their goals to improve patient flow and reduce backlog in scheduling. We utilize medical practice experience to develop realistic estimates of costs and their effect on the selection of high-performing scheduling alternatives.

5 - Scheduling Physicians to Improve Emergency Room Efficiency

Amir Mousavi, PhD Candidate, The George Washington University, Washington, DC, United States of America, amousavi@gwu.edu, Hernan Abeledo, Jesse Pines

Shift schedules of emergency room physicians may span several months and involve rules such as rest periods between consecutive shifts and balancing different types of shifts fairly across physicians. Schedules must consider the individual exceptions, preferences, availability and hired hours of each provider. Our goal is to create schedules that also improve patient flow by taking physician performance into account. We present integer programming models that were tested at the GWU hospital.

1 - Attention, Reward and Customer Strategies for Sustainable Growth

Kalyan Raman, Professor, Northwestern University, Medill School, Evanston, IL, United States of America, kalyraman@gmail.com, Vijay Viswanathan

The key aspects of human behavior are governed by three fundamental neurobiological processes and their interaction: attention, reward and memory. The study of human behavior commonly focuses on attention or reward/aversion as independent functions. This project studies how these processes interact at the systems level and maps a functional relationship between them. We specifically focus on variables for reward/aversion as empirically measured with a neuroscience-based keypress paradigm that quantifies variables from relative preference theory and variables implicated in attention as measured by signal detection theory.

2 - Managing Sales of a New Product Though Competing Brokers

Rahul Bhaskar, Professor, California State University, Fullerton,
800 north college boulevard, fullerton, ca, 92834, United States of
America, rbhaskar@fullerton.edu, Vahideh Abedi

A new product typically rely on sales efforts of brokers to enhance sales. Customers make their purchase decision not only based on the word of mouth they have received from other customers about the product, but also based on the collective information received from the brokers. Therefore, brokers act synergistically to generate sales while competing. We develop an analytical framework for this sales process and show how it can facilitate important managerial decision making.

3 - Simultaneous vs. Sequential Crowdsourcing Contests

Lu Wang, Rotman School of Management, 105 St. George Street,
Toronto, Canada, Lu.Wang12@Rotman.Utoronto.CA, Ming Hu

In a crowdsourcing contest, innovation is outsourced from an open crowd. We consider two alternative mechanisms for an innovative product involving multiple attributes. One is to run a simultaneous contest, where the best solution is selected from the single solution simultaneously submitted by each contestant. The other is to run multiple sequential sub-contests, with each dedicated to one attribute. While both mechanisms have their own advantages, either could win over depending on parameters.

4 - To Tier or Not to Tier: A Comparative Analysis of Different Loyalty Program Structures

Amir Gandomi, Assistant Professor, Ryerson University,
350 Victoria Street, Toronto, ON, M5B 2K3, Canada,
agandomi@ryerson.ca, Amirhossein Bazargan, Saeed Zolfaghari

This study analyzes the effectiveness of two common loyalty program structures, namely, linear and multi-tier structures. Using a game theoretic approach, we formulate the market conditions under which different structures are more profitable. Market conditions are characterized by the proportion of members who are active and the degree to which they are forward-looking. The binary logit model is used to capture the customers' buying behavior in a multiple-period setting.

1 - The Minimum Expected Penalty Relocation Problem for the Computation of Ambulance Compliance Tables

Thije Van Barneveld, PhD-student, Centrum Wiskunde en
Informatica, Science Park 123, Amsterdam, Netherlands,
t.c.van.barneveld@vu.nl

We study the ambulance relocation problem in which one tries to retain the ability to respond to possible future incidents quickly. For this purpose, we consider compliance table policies. To compute efficient compliance tables, we introduce the Minimum Expected Penalty Relocation Problem (MEXPREP), in which one has the ability to control the number of waiting site relocations. Moreover, different performance measures related to response times, e.g., survival probabilities, can be incorporated.

2 - Optimizing Aircraft Configuration for Air-ambulance Service Provider in Ontario

Pieter Van Den Berg, Delft University of Technology, Mekelweg 4,
Delft, 2628 CD, Netherlands, P.L.vandenBerg@tudelft.nl,
Shane Henderson, Karen Aardal

Ornge provides air-ambulance services to patients in the province of Ontario. For this service, both fixed wing aircraft and helicopters are used. The fixed wing aircraft have a wider range but are restricted to land on airports. Helicopters, on the other hand, are more flexible in landing sites. Currently, Ornge operates a 24/7 flat schedule. We apply both simulation and optimization techniques to find good configurations of the aircraft and helicopters for both day and night.

3 - Optimality of the Closest-idle Policy in Advanced Ambulance Dispatching

Sandjai Bhulai, VU University Amsterdam, De Boelelaan 1081a,
Amsterdam, 1081 HV, Netherlands, s.bhulai@vu.nl,
Caroline Jagtenberg, Rob Van Der Mei

In ambulance dispatching it is commonly believed that the 'closest idle ambulance' rule is the best choice. We present two alternatives to this classical rule and show that significant improvements can be obtained. The first alternative is based on a Markov decision problem, and the second is a heuristic that can handle regions with large numbers of ambulances. The heuristic reduces the fraction of late arrivals by 18% for a large emergency medical services region in the Netherlands.

4 - An Information-based Bound on the Performance of Ambulance Redeployment Policies

Kenneth Chong, PhD Student, Cornell University,
257 Rhodes Hall, Ithaca, NY, 14853, United States of America,
kcc66@cornell.edu, Shane Henderson, Mark Lewis,
Huseyin Topaloglu

Ambulance redeployment is the practice of strategically relocating idle ambulances in real time to improve coverage of future demand. We present an upper bound on the performance that can be attained by any redeployment policy. Our approach involves formulating the redeployment problem as a stochastic dynamic program, considering an information relaxation of this problem, and penalizing policies that violate nonanticipativity constraints.

1 - Estimating Lipid Management Guidelines' Risk Value of a Life Year on TreatmentMurat Kurt, Merck Research Labs, 351 N. Summeytown Pike,
North Wales, PA, 19454, United States of America,
murat.kurt7@gmail.com, Niraj Pandey, Mark Karwan

Statins reduce the risk of heart attack and stroke with adverse side effects, but how to quantify these effects to help physicians make treatment decisions remains to be an open question. We gauge these adverse effects for patients with Type 2 diabetes from a central policy maker's point of view by formulating a dynamic decision model in which the objective is to minimize the risk of a first major cardiovascular event where time spent on treatment is penalized by a perceived risk increase. We seek penalty factors that make published lipid management guidelines as close as possible to optimal. We present computational results using clinical data and derive insights.

2 - Predicting No-show Behavior of Patients at a Mental Health ClinicFan Wang, University of Arkansas, 4207 Bell Engineering Center,
Fayetteville, AR, United States of America,
fxw005@email.uark.edu, Shengfan Zhang

Mental health clinics have relatively high no-show rates of patients, which reduce provider productivity and clinic efficiency. This study presents two approaches for no-show prediction: a logistic regression model and an artificial neural network. The models are formulated using multiple factors including visit type, ICD-9 classification, insurance type, lead time to visit, no-show history, month, weekday and hour. The predictive performances are evaluated based on AUC values.

3 - Optimizing Dynamic Interventions in Sleep StudiesMaryam Zokaenikoo, Graduate Research Assistant, University of
Tennessee, 1700W. Clinch Ave., Apt. 505, Knoxville, TN, 37916,
United States of America, mzokaenikoo@vols.utk.edu, Anahita
Khojandi, Oleg Shylo

We discuss a mathematical framework that takes advantage of the technological advances in wearable neuro-headsets to provide an objective, reliable, inexpensive and scalable approach to sleep interventions. This framework is based on semi-Markov decision models that rely on general signal processing methods for continuous sleep assessment.

Singapore, Singapore, ioana.popescu@insead.edu**1 - Is It Enough? Evidence from a Natural Experiment in India's Agricultural Markets**Kamalini Ramdas, kramdas@london.edu, Nicos Savva,
Chris Parker

Does access to timely and accurate information provided through ICT applications have additional impact over and above access to mobile phones, in improving market efficiency? Using data from the Reuters Market Light text message service in India that provides daily price information to market participants and a natural experiment where bulk text messages were banned unexpectedly, we find that this information reduces crop price dispersion by about 12%, over and above access to mobile phones.

2 - Certainty Equivalent Planning for Multi-product Batch DifferentiationYang Wang, UC Berkeley, IEOR Dept., Berkeley, CA, 48109,
United States of America, yangwang0803@berkeley.edu,
Philip Kaminsky, Stefanus Jasin

Motivated by a problem in biopharmaceutical manufacturing, we consider a discrete time finite horizon inventory problem where several retailers place orders to meet stochastic demand, and in each period, the sum of order quantities across retailers must be a multiple of a standard batch size. We propose several easy-to-

implement heuristics using certainty equivalence and derive their performance bounds analytically.

3 - Bridging the Gap between for Profit and Social Responsibility StrategiesEnno Siemsen, Associate Professor, University of Minnesota, 321
19th Ave S, Minneapolis, MN, 55455, United States of America,
siemsen017@umn.edu, Lisa Jones-christensen,
Sridhar Balasubramanian

This field experiment compares two different for-profit market entry strategies with a philanthropic strategy in terms of how each influences consumer behavior in base-of-the-pyramid communities. We analyze reactions to a water purification product offered at three price points (moderate discount, deep discount, and free) in rural Malawi.

4 - Revenue Models for Providing Clean Energy at the Bottom of the PyramidIoana Popescu, INSEAD, 1 Ayer Rajah Avenue, 138676,
Singapore, Singapore, ioana.popescu@insead.edu,
Bhavani Shanker Uppari, Serguei Netessine

One in every five people does not have access to electricity, relying mostly on kerosene for light. Solar technologies are healthier and offer greater value, yet they require significant one-time investments which are not affordable to people living on \$2/day. We develop a consumer behavior model that accounts for income variability and liquidity constraints specific to bottom of the pyramid markets, and investigate alternative revenue models, based on a case study in Rwanda.

Revenue Optimization and Related Methodologies

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Michael Katehakis, Professor And Chair, Rutgers University,
100 Rockefeller Road, Room, Piscataway, NJ, 08854,
United States of America, mnk@rutgers.edu**1 - An Inventory System with Multiple Demand Classes**Min Wang, Assistant Professor, Drexel University, 3220 Market
St, Gerri C. LeBow Hall 740, Philadelphia, PA, 19104,
United States of America, mw638@drexel.edu

We consider a single-product inventory system with multiple demand classes. Inventories are replenished using a (R, Q) policy and are rationed among demand classes according to a threshold policy. We establish structural results for the key performance measures and develop an efficient algorithm for computing the policy parameters.

2 - Optimal Pricing for a GI/M/k/N Queue with Several Customer Types and Holding CostsEugene Feinberg, Distinguished Professor, Stony Brook
University, Department of Applied Mathematics & Stat,
Stony Brook, NY, United States of America,
eugene.feinberg@stonybrook.edu, Fengshu Yang

This paper deals with optimal pricing for a GI/M/k/N queueing system with several types of customers. A price for a new arrival depends on the number of customers in the system. In addition, the system incurs costs caused customer delays. The holding costs are non-decreasing and convex with respect to the number of customers in the queue. This paper describes average-reward optimal, canonical, bias optimal, and Blackwell optimal policies for this pricing problem.

3 - Efficient Markov Models for Dynamic Pricing ProblemsLaurens Smit, Leiden University, Niels Bohrweg 2, Leiden,
Netherlands, laurens@pipe.nl, Flora Spiessma, Michael Katehakis

We model revenue problems as a two dimensional Markov chain, where the arrival rate of customers depend on the charged price. We consider processes that satisfy down entrance state or the restart entrance state classes of quasi skip free processes. We derive explicit solutions and bounds for the steady state probabilities of both processes, and show that these methods work fast and efficiently. In addition we present a procedure to decompose Markov processes into separate thinned processes.

4 - Models and Problems of Dynamic Pricing in the Multi-armed Bandit FrameworkWesley Cowan, Rutgers University, 110 Frelinghuysen Rd.,
Piscataway, NJ, United States of America,
c.wes.cowan@gmail.com, Michael Katehakis

After a brief review of basic issues of dynamic pricing under partial information on the underlying demand distributions, we provide new models that address some of these issues. A main contribution is a new model and solutions for problems that involve unobserved lost sales.

Revenue Management in Online Advertising

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Hamid Nazerzadeh, University of Southern California, Bridge Memorial Hall, 3670 Trousdale Parkway, Los Angeles, CA, 90089, United States of America, hamidnz@marshall.usc.edu

1 - Recent Results in Internet Advertising Allocations

Nitish Korula, Research Scientist, Google, New York, nitish@google.com, Morteza Zadimoghaddam, Hossein Esfandiari, Vahab Mirrokni

Advertising provides the economic foundation of the Internet. Internet advertising applications motivate a host of optimization problems with unique challenges and as such, there is a large body of literature on optimizing various aspects of ad allocations. I will survey some of the recent work in this field, with special focus on two problems: Designing algorithms that work well in both adversarial and stochastic settings, and algorithms that balance multiple system objectives.

2 - Multi-stage Intermediation in Online Internet Advertising

Ozan Candogan, University of Chicago, Booth School of Business, Chicago, United States of America, ozan.candogan@chicagobooth.edu, Santiago Balseiro, Huseyin Gurkan

We consider a setting where an advertiser tries to acquire impressions from an ad exchange, through a chain of intermediaries. We characterize equilibrium profits of intermediaries as a function of their position in the chain. We consider three value distributions for the advertiser: (i) exponential, (ii) Pareto, (iii) uniform. We establish that in (i) all intermediaries have the same profit, whereas in (ii) and (iii) respectively downstream/upstream intermediaries have higher profits.

3 - Adverse Selection and Auction Design for Internet Display Advertising

Nick Arnosti, Stanford University, Stanford, CA, United States of America, narnosti@stanford.edu, Marissa Beck, Paul Milgrom

We model an online display advertising environment with brand advertisers and better-informed performance advertisers. We consider a mechanism which assigns the item to the highest bidder only when the ratio of the highest bid to the second highest bid is sufficiently large. For fat-tailed match-value distributions, this mechanism captures most of the gains from good matching and improves match values substantially compared to the common practice of setting aside impressions in advance.

4 - Deals or No Deals: Contract Design for Selling Online Advertising

Hamid Nazerzadeh, University of Southern California, Bridge Memorial Hall, 3670 Trousdale Parkway, Los Angeles, CA, 90089, United States of America, hamidnz@marshall.usc.edu, Vahab Mirrokni

I will discuss some of the challenges in maximizing revenue of online advertising market. I will explain preferred deals: a new generation of contracts for selling display advertising that allow publishers to offer their inventory to "first look" buyers before the inventory is made available to other buyers (advertiser) in the general auction. I present algorithms for deal recommendation and show that deals can obtain significantly higher revenue than auctions.

Managing Professional Services

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Morvarid Rahmani, Assistant Professor, Georgia Tech, morvarid.rahmani@scheller.gatech.edu

1 - The Design of Multi-stage Service Processes

Ioannis Bellos, Assistant Professor, George Mason University-ISOM Area, Enterprise Hall, 4400 University Drive, MS 5F4, Fairfax, VA, 22030, United States of America, ibellos@gmu.edu, Stelios Kavadias

Motivated by the practices of design firms we build on the customer journey concept, which describes services as multi-stage processes. We develop a parsimonious model and we analyze the provider's decisions on the amount of effort she exerts at each stage of the process and the overall price she charges.

2 - Skill and Capacity Management in Large-scale Service Marketplaces

Eren Cil, University of Oregon, 1585 East 13th Avenue, Eugene, OR, United States of America, erencil@uoregon.edu, Achal Bassamboo, Gad Allon

We characterize the optimal skill screening mechanism of a firm moderating a large-scale service marketplace where the ability of a service provider to cater customers, who can be of two classes, varies. We show that when the values that a service provider generates for each customer class are independent, the firm may need to refuse some of the service providers via its screening mechanism whereas this is never optimal when these values are perfectly correlated.

3 - Pricing Diagnosis-based Services when Customers Exhibit Sunk Cost Bias

Guangwen Kong, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55414, United States of America, gkong@umn.edu, Sampath Rajagopalan, Chunyang Tong

We build a model to shed light on how sunk-cost effect influences the SP's choice of pricing scheme. We provide an analysis on how the sunk cost effect influences a monopolistic SP's choice of pricing scheme, and then examine the impact of sunk-cost effects in a competitive setting. Further, we consider customers with differing levels of sophistication (being naïve or sophisticated) and investigate how a mixture of customer types further impacts the choice of pricing scheme.

4 - Balancing Experience in Fluid Teams: Team Familiarity, Partner Diversity and Performance

Sarang Deo, Assistant Professor, Indian School of Business Hyderabad, ISB Hyderabad, Gachibowli, Hyderabad, TS, 500032, India, sarang_deo@isb.edu, Kamalini Ramdas, Zeynep Aksin, Jonas Jonasson

We use data from London Ambulance Service to study the impact of partner diversity of new paramedics on their operational performance. We find that the greater diversity in prior partners directly improves performance for an unstandardized process. For a more standardized process, this effect is moderated by a new recruit's total experience. We explore the implications of our results for team formation strategies by balancing the benefits of partner diversity with those of team familiarity.

47-Room 104B, CC

Incentives and Investment in Renewable Energy and Energy Efficiency

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Owen Wu, Indiana University, 1309 E. 10th Street, Bloomington, IN, 47405, United States of America, owenwu@indiana.edu

1 - Impact of Electricity Pricing Policy on Renewable Energy Investments and Carbon Emissions

Safak Yucel, PhD Candidate, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, safak.yucel@duke.edu, Gurhan Kok, Kevin Shang

We investigate the impact of electricity pricing policy (i.e., flat pricing versus peak pricing) on renewable energy investments and carbon emissions. We find that flat pricing generally leads to a higher investment level and lower carbon emissions. Furthermore, our results indicate that the pricing policy that leads to higher investments may not reduce carbon emissions. We also study the effects of subsidy policies on the investments and emissions.

2 - Robustness of Renewable Energy Support Schemes

Stefan Spinler, Professor, WHU-Otto Beisheim School of Management, Burgplatz 2, Vallendar, 56179, Germany, stefan.spinler@whu.edu, Ingmar Ritzenhofen, John Birge

Renewable portfolio standards (RPS), feed-in-tariffs (FIT), and market premia (MP) are widely used policy instruments to promote investments in renewable energy sources (RES). Regulators continuously evaluate these instruments along the main electricity policy objectives of affordability, reliability, and sustainability. We assess these policies using a long-term dynamic capacity investment model and compare their robustness in the light of uncertain RES feed-in and ambiguous future regulation.

3 - Feed-in Tariff Versus Rebate for Renewable Generation

Ruben Lobel, Operations and Information Management Department at The Wharton School of the University of Pennsylvania, Jon M. Huntsman Hall 3730 Walnut Street, Office 568, Philadelphia, PA, 19104, United States of America, rlobel@wharton.upenn.edu, Vlad Babich

We compare two types of subsidies used to stimulate renewable energy generation: a feed-in tariff and an upfront rebate. The former guarantees a steady cash flow over the long term, while the latter reduces the upfront capital requirement. We show how uncertainty and strategic customer behavior determines policy efficiency.

4 - Energy Efficiency and Demand Response on a Production Line

Eric Webb, Graduate Student, Indiana University, 1309 E. 10th Street, Bloomington, IN, 47405, United States of America, ermwebb@indiana.edu, Owen Wu

Demand response (DR) programs incentivize industrial firms to halt production during times of peak electricity demand. We consider a firm faced with the option of investing in energy efficiency (EE) improvements at individual machines on the production line. When viewed in isolation, EE incentives may not be enough to induce the firm to invest in the socially optimal level of EE, due to the loss of DR revenue after installation. We suggest a new policy for EE incentives in light of DR.

Co-Chair: Selvaprabu Nadarajah, Assistant Professor Of Information And Decision Sciences, College of Business, University of Illinois at Chicago, 601 S Morgan Street, 24th Floor, Chicago, IL, 60607, United States of America, selvan@uic.edu

1 - Electricity Derivative Trading with Private Information on Price Distributions

Eddie Anderson, University of Sydney, Business School, Sydney, Australia, edward.anderson@sydney.edu.au, Andy Philpott

When trading forward contracts, firms try to hedge risk, but at the same time want to benefit from superior price forecasting. We model a negotiation between generator and retailer on forward contracts when both have private information on the probability of different price outcomes. Both firms submit a schedule of prices and quantities, and the market clears. Can a firm gain by looking at the offers that the other player makes in order to improve its own estimate of the real probabilities?

2 - Optimal Production and Shortfall Hedging

Liao Wang, Department of Industrial Engineering and Operations Research, Columbia University, S.W. Mudd Building, Room 315, 500 West 120th Street, New York, NY, 10027, United States of America, lw2489@columbia.edu, David D. Yao

Over a given time horizon, we study the one-time production quantity decision at the beginning, and the real-time risk-hedging strategy throughout the horizon. The objective is to minimize the shortfall from a given target profit, and we derive the joint optimal solution to both production and hedging. In addition, we characterize the efficient frontier, and quantify the improvement in risk-return tradeoff achieved by the shortfall hedging.

3 - Least Squares Monte Carlo: Duality Perspective and Energy Real Option Application

Selvaprabu Nadarajah, Assistant Professor Of Information And Decision Sciences, College of Business, University of Illinois at Chicago, 601 S Morgan Street, 24th Floor, Chicago, IL, 60607, United States of America, selvan@uic.edu, Nicola Secomandi

Least squares Monte Carlo (LSM) is a common approximate dynamic programming approach. We provide a duality perspective on a version of this approach, which leads to an equivalent formulation of this approach as a relaxed approximate linear programming (ALP) model. We provide both theoretical and numerical support for the use of LSM rather than ALP. Our numerical study deals with merchant ethanol production, an important energy application.

1 - A Tractable Discrete Choice Model - Beyond Logit

Aydin Alptekinoglu, Penn State, Smeal College of Business, University Park, PA, 16802, United States of America, aydin@psu.edu, John Semple

We explore the mixed (random coefficients) and heteroscedastic versions of the Exponential Choice (EC) model. EC has attractive analytical features like closed-form choice probabilities, logconcave likelihood, and more realistic cross-price elasticities compared to multinomial logit. Allowing heteroscedasticity in error terms, and allowing random coefficients with normal distribution, retain closed-form choice probabilities but not some of the other properties.

2 - How Should a Retailer Share Demand Information with the Supplier?

Qi Annabelle Feng, Professor, Purdue University, 100 S. Grant St., West Lafayette, IN, United States of America, annabellefeng@purdue.edu, J. George Shanthikumar

We consider a supplier selling through a retailer who possesses private demand information. The retailer can choose to share a Bayesian plausible demand signal with the supplier. We define the notion of information accuracy and analyze the structure of demand information to understand the retailer's incentive of information sharing and its effect on supply chain performance.

3 - Minimum Advertised Price Policy: Economic Analysis and Implications

Ozge Sahin, Johns Hopkins University, ozge.sahin@jhu.edu, Liang Ding, Roman Kapuscinski

Manufacturers frequently use Minimum Advertised Price (MAP) to protect retailers' margin and to encourage them to exert more sales effort. This paper analyzes the performance of MAP under various market situations and compares it with another vertical price restraint policy – Resale Price Maintenance. Results indicate that MAP could be beneficial to manufacturers and also to customers when the information search is costly and the consumers are moderately heterogeneous in their valuation.

4 - Revenue Management with Loyalty Programs

Xingwei Lu, University of Pennsylvania, The Wharton School, Philadelphia, United States of America, xingwei@wharton.upenn.edu, Xuanming Su

We study loyalty programs in firms with limited capacity. Based on the classic Littlewood's model, our model additionally reserves some capacity for awards and allows customers to choose between paying with cash and redeeming with points. We investigate the optimal capacity allocations and compare program designs.

Sponsored Session

Chair: Damian Beil, Associate Professor of Technology & Operations, Ross School of Business, University of Michigan, 701 Tappan St, Ann Arbor, MI, 48109, United States of America, dbeil@umich.edu

1 - Multi-channel Service with Heterogeneous Customers

Shiliang Cui, Georgetown University, McDonough School of Business, Washington, DC, 20057, United States of America, shiliang.cui@georgetown.edu, Yong-Pin Zhou

When firms offer multiple service channels, it gives customers a chance to choose the channel that better fits their need (cost, convenience, advice, etc.). On the other hand, firms can also use carefully designed multiple service channels to achieve customer segmentation. We study mechanisms to achieve this.

2 - Win-win Capacity Reservation Contracts in Co-manufacturing and Co-distribution Alliances

Guillaume Roels, Associate Professor, UCLA, 110 Westwood Plaza, Los Angeles, CA, 90095, United States of America, guillaume.roels@anderson.ucla.edu, Chris Tang

In some strategic alliances, a firm shares its manufacturing capacity with another, and the latter shares its distribution capacity with the former. Even though such bidirectional alliances have become common, they remain challenging to manage due to the frequent disputes over capacity allocation when demand is uncertain. In this talk, we investigate whether there exists a contractual mechanism that can mitigate the extent of these disputes while improving the profits of all participating firms.

3 - Optimal Allocation Rules with Waste Considerations

Sara Rezaee Vessal, HEC Paris, 1 Rue de la Liberation, Jouy en Josas, 78350, France, sara.rezaee-vessal@hec.edu, Sam Aflaki, Dimitrios Andritsos

We study capacity allocation of a scarce and perishable product among stock-out-averse retailers that face stochastic demand. We focus on two commonly practiced allocation mechanisms and—using a dynamic model—characterize the conditions under which each allocation mechanism performs superior from a waste and profit point of view.

4 - Using Transparency to Manage the Sourcing of Complex Non-routinized Services

Jacob Chestnut, PhD Candidate, Ross School of Business, University of Michigan, 701 Tappan Avenue, Ann Arbor, MI, 48109, United States of America, jacobpc@umich.edu, Damian Beil

Complex services such as non-routine litigation are often billed on an hourly basis, creating opportunities for the service provider (e.g., outside counsel) to drive up costs for the buyer (e.g., in-house counsel) through the inefficient use of time and resources (e.g., partner versus associate level work). The buyer can manage these costs with greater front-end transparency, about the work to be performed; however this transparency comes at a cost. We study this tradeoff.

Social Network Analysis

Sponsor: Service Science
Sponsored Session

Chair: Dr. Joanna F. DeFranco, Assistant Professor Of Software Engineering, The Pennsylvania State University, 30 East Swedesford Road, Malvern, PA, United States of America, jfd104@psu.edu

1 - Social Network Dynamics in Software Development Teams

Adrian Barb, The Pennsylvania State University, asb16@psu.edu, Dr. Joanna F. DeFranco

We present a social network analysis of the communication of 112 developers in seven software development teams distributed around the world. The project was conducted between October 2005 and October 2006 and includes communications among team members with different roles varying from architect to integrator over six development iterations. A social network analysis was performed to evaluate the progression of communication over this period during a collaborative software development project.

2 - Exploring Networks of Faculty Paper Co-authorship

Regina Collins, New Jersey Institute of Technology, regina.s.collins@njit.edu, Nancy Steffen-fluhr

This research, funded by an NSF Advance grant, examined the hypothesis that women STEM faculty suffer low retention rates due to their relative isolation within the social and informational networks of their organizations. To test this, a network based on co-authorship of scholarly papers was created and analyzed from a social network perspective, examining network attributes including female faculty's centrality in these networks.

3 - Reconciling Infinite Choice and Zero Effort: Applying Data Science to Rejuvenate the TV Experience

Venu Vasudevan, Senior Director, Arris, Venu.Vasudevan@arris.com

TV's long reign has been driven by its ability to be both simple and entertaining. Yet the proliferation of web technologies has ushered a 'viewers choice' era - where viewers seek more control over the TV experience (when/where/for how long/). This talk is about the use of data science to address TV's next challenge - that of finding the right balance of simplicity and richness (both from viewer and advertiser point of view).

4 - Social Discovery Builds the Social Network

Richard Friedman, Cto Meetme, MeetMe, 518 Kings Dr, Cherry Hill, NJ, 08003, United States of America, richfriedman@gmail.com

Social Networking is the broadest of terms representing any online service that facilitates some form of communication between a network of friends, colleagues, and personal contacts. Social Discovery, on the other hand, can be defined as the creation of the social network. It is the discovery of people through content and conversation that leads to building a network related to a topic or a purpose. We will cover from discovery, interest, conversation, connection, network, and platform.

Bounded Rationality, Social Preferences, and Risk Management in Behavioral Operations

Sponsor: Behavioral Operations Management
Sponsored Session

Chair: Kay-Yut Chen, Professor, University of Texas Arlington, 701 West Street, Arlington, United States of America, kychen@uta.edu

1 - The Behavioral Traps of Making Multiple, Simultaneous, Newsvendor Decisions: An Experimental Study

Shan Li, Assistant Professor, Zicklin School of Business, Baruch College, City University of New York, 55 Lexington Ave, New York, NY 10010, United States of America, Shan.Li@baruch.cuny.edu, Kay-Yut Chen

We conducted an experimental study to compare behaviors of newsvendors who manage one versus two independent stores. We find that ordering decisions are closer to optimal quantities in one-store treatment. More interestingly, we discover a significant correlation between order quantities of individuals only in the two-store setting. We propose the concept of decision segmentation reinforcement and develop a behavior model to capture multiple interacting simultaneous decisions.

2 - Process-driven Discussion in Team-based Decision Making for Operational Risk Management

Karen Zheng, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, yanchong@mit.edu, Retsef Levi, Shujing Wang

We experimentally study how different group discussion processes affect the outcome of team-based decision making in a risk management context. Members in each team in the experiment are provided private information about the status of the risk. The team will make the optimal decision only if all private information is shared. We manipulate the structure of discussion among team members to study how it affects information sharing within the team.

3 - Pay-it-forward: Theory, Experiments, and Managerial Implications

Narayanan Janakiraman, Asst Professor, University of Texas at Arlington, 701 S. West Street, Arlington, 76019, United States of America, janakira@uta.edu, Zhiyong Yang, Kay-Yut Chen

We study the pay-it-forward (PIF) phenomenon, where a person who received a stranger's kindness would act similarly kind to a future stranger. Using lab experiments, we find that the recipient's PIF likelihood depends on firms' pricing strategies, expectation of further PIF from the receiver, and social distances between the giver and the receiver. We explain the findings in a behavioral model, and develop a price optimization framework to enhance firms' profitability in this context.

4 - Contract or Trust? An Experimental Study Based on VMI Setting

Dezhen Si, Tsinghua University, Shunde Building, Beijing, China, sidezhen@126.com, Zuo-jun Max Shen, Xiaobo Zhao

We conduct experiments to study decision behaviors in trust game and contract game under a VMI setting. We recruit both strangers and acquaintances as subjects to participate in our experiments. The results show that preferences such as reciprocity and fairness exist in the games, and as a result, acquaintances in the trust game perform the best. We also develop behavioral models to explain the findings.

Uncertainty in Demand Response – Identification, Estimation, and Learning

Cluster: Tutorials

Invited Session

Chair: Josh Taylor, Assistant Professor, University of Toronto, 10 King's College Rd., SF 1021C, Toronto, ON, M5S3G4, Canada, josh.taylor@utoronto.ca

1 - Uncertainty in Demand Response – Identification, Estimation, and Learning

Josh Taylor, Assistant Professor, University of Toronto, 10 King's College Rd., SF 1021C, Toronto, ON, M5S3G4, Canada, josh.taylor@utoronto.ca, Johanna Mathieu

Demand response from flexible electric loads such as electric vehicles, air conditioners and smart home appliances represents a vast, clean and potentially high-performance resource for the electric power system, but loads are highly uncertain. In this tutorial, we survey techniques for managing load uncertainty in demand response for three problem types: identifying load models, estimating load states and learning these features in conjunction with deploying the loads for demand response.

Applications of DEA

Cluster: Data Envelopment Analysis

Invited Session

Chair: Kankana Mukherjee, Babson College, Wellesley, Massachusetts, kmukherjee@babson.edu

1 - Analysis of Technological Gap of Agricultural Productivity among Sub-Saharan African Countries

Olajide Abraham Ajao, PhD, Ladoke Akintola University of Technology, Agricultural Economics Department, Ogbomos, Nigeria, oajao57@lautech.edu.ng, Ogunniyi Laudia Titilola, Abdulrasheed Mutolib

The study compared the productivity differences of technical efficiency and technological gap ratios in SSA agriculture by adapting metafrontier DEA approach using cross-country panel input-output data obtained from the FAO. It was found that the metafrontier scores varied widely among the countries and also, the regional differences in the production technologies was observed

2 - Capacity Utilization and Energy Efficiency in Indian Manufacturing

Kankana Mukherjee, Babson College, Wellesley, MA, United States of America, kmukherjee@babson.edu

This study uses Data Envelopment Analysis and data from the Annual Survey of Industries, India, to measure capacity utilization and explores the relationship between an energy efficiency index and a capacity utilization index for each of the energy intensive industries in India over the period 1998-99 through 2007-08.

3 - The Analysis of Productivity Pattern of Cereals in Nigeria (1995 - 2006)

Ogunniyi Laudia Titilola, Ladoke Akintola University of Technology, Agricultural Economics Department, Ogbomos, Nigeria, titiogunniyi@yahoo.com, Olajide Abraham Ajao, Gbenga Fanifosi

This study analysed the productivity pattern of cereals in Nigeria between the periods of 1995-2006 using Data Envelopment Analysis to estimate total factor productivity(TFP)index. A decomposition of TFP measures revealed that productivity is due largely to technological change over the reference period and the technical efficiency indexes showed Taraba state and the Federal Capital Territory(FCT) to be consistently efficient and lie on the best - practice frontier.

4 - Economic Measures of Capacity Utilization: A Nonparametric Cost Function Analysis

John Walden, Economist, NOAA/NMFS/NEFSC, 166 Water St., Woods Hole, MA, 02543, United States of America, john.walden@noaa.gov, Subhash Ray

Capacity utilization (CU) is an important economic metric which conveys information about a firm's output level. We adopt the methods proposed by Ray (2014) to estimate cost based CU using DEA for a group of commercial fishing vessels which are characterized by a multi-input, multi-output technology. Results show the cost minimizing output level and CU for vessels operating in the years 2007-2012, and how these have changed in the light of recent regulatory shifts.

5 - Technical Efficiency Gains from Two Land Management Options in Maize Farming, Southwestern Nigeria

Luke Olarinde, Dr, Ladoke Akintola University of Technology, Department of Agricultural Economics, PMB 4000, Ogbomos, Oy, 210001, Nigeria, loolarinde@lautech.edu.ng

This study investigated the contribution of two Land management (LM) options (crop protection and crop management practices) to technical efficiencies (TEs) in Maize farming in Southwestern Nigeria. Data Envelopment Analysis (DEA) results (for the TE gains) indicate slight differences in the TEs of farms in the two LM options.

New Directions in Locational Analysis

Sponsor: Location Analysis

Sponsored Session

Chair: Dmitry Krass, Rotman School of Management, 105 St.George Street, M5S 3E6, Canada, Krass@rotman.utoronto.ca

1 - The Big Tetrahedron Small Tetrahedron Method for Three Dimensional Location Problems

Rina Nakayama, Nanzan University, 18 Yamazato-cho, Showa-ku, Nagoya, Japan, m14ss007@nanzan-u.ac.jp, Zvi Drezner, Atsuo Suzuki, Tammy Drezner

We extend the Big Triangle Small Triangle method to three dimensions. We call it the Big Tetrahedron Small Tetrahedron method. We apply it to three dimensional location problems such as three dimensional Weber problem with Attraction and Repulsion (WAR) and time space location problems.

2 - Locating a New Facility to Maximize its Voronoi Region

Dmitry Krass, Rotman School of Management, 105 St.George Street, M5S 3E6, Canada, Krass@rotman.utoronto.ca, Jonathan Lorraine

Consider a set of competing facilities in a planar region where demand is continuously distributed and the trading area of each facility is its Voronoi cell (all points closest to the facility). We wish to add a new facility that will capture as much demand as possible. We develop a fast solution method based on Big Triangle-Small Triangle approach. The method is applicable to both uniform and non-uniform demand distributions. Applications to real-life facility sets will be demonstrated.

3 - Planning Service Maintenance under Disruption Threats

Mozart Menezes, Associate Professor, Kedge Business School-Bordeaux, 680 Cours de la Libération, Bordeaux, 33405, France, mozart.menezes@me.com, Dmitry Krass

We investigate the situation where facilities serving nodes may have service disrupted forcing nodes to be served by facilities providing service at higher cost. Disruption threats can be reduced when facilities undergo maintenance at a cost. The decision maker also incurs cost for repairing facilities and for maintaining facilities. We focus on the trade-off between planned maintenance versus allowing facilities to continue operation but risking a much higher cost when disruption happens.

Energy Technology, Climate Change, and Uncertainty

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Erin Baker, University of Massachusetts, MIE Department, 220 ELAB, Amherst, MA, United States of America, edbaker@ecs.umass.edu

1 - Equilibrium vs. Optimality: Trading in Renewable Energy CertificatesEkundayo Shittu, George Washington University, Washington, DC, United States of America, eshittu@email.gwu.edu,
Linus Nyiwul

We propose the harmonization of independent renewable energy credit markets, and study their impacts on a firm's energy technology choice and capacity decisions. The industry is struggling with this issue right now, and we inform this policy debate by comparing market mechanisms in which each participant independently maximizes their targets. We find that while there are optimal market conditions, the equilibrium is not only unstable, the overall efficiency gains are not always positive either.

2 - Managing Climate Risks with Carbon Mitigation: A Stochastic Programming Approach with Merge

Delavane Diaz, Stanford University, Huang Engineering Center, Stanford, CA, 94305, United States of America, delavane@stanford.edu, Geoffrey Blanford

Carbon policy is fundamentally about risk management – balancing the costs of reducing emissions and the benefits of avoided climate change, both of which are uncertain due to incomplete scientific understanding and complex interactions. This paper presents a framework for decisionmaking under uncertainty in MERGE, examining optimal carbon mitigation given uncertainty about the physical climate system and climate damages. This work provides insight into managing downside risks of climate change.

3 - An Approximate Dynamic Programming Algorithm for Unit Commitment with Energy Storage

Mort Webster, mdw18@psu.edu

We present a novel formulation of a stochastic unit commitment model including energy storage using approximate dynamic programming. We demonstrate that the non-linear dynamics of energy storage lead to different optimal strategies for using storage as compared with the typical linear formulation used in most UC models.

4 - An Approach to Deep Uncertainty in Climate Change: Robust Portfolio Decision Analysis

Erin Baker, University of Massachusetts, MIE Department, 220 ELAB, Amherst, MA, United States of America, edbaker@ecs.umass.edu, Valentina Bosetti, Ahti Salo

We advance the concept of Robust Portfolio Decision Analysis and apply it to analyzing public energy technology R&D portfolios in response to climate change. We consider 3 sets of expert elicitations over 5 energy technologies. We identify technology projects that are in all, none, or some of the non-dominated portfolios, where non-dominated is defined in terms of multiple priors. We discuss the implications for value of information and for generating new alternatives with high option value.

Resiliency and Reliability Optimization of Electric Power Systems

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Frank Felder, Associate Research Professor, Rutgers University, 33 Livingston Ave, New Brunswick, NJ, 08901, United States of America, ffelder@rci.rutgers.edu

Co-Chair: David Coit, Professor, Rutgers University, coit@rci.rutgers.edu

1 - Long-Term Mitigation for Improved Restoration in Power Networks

Emily Heath, Graduate Student, Rensselaer Polytechnic Institute, 110 8th St., Troy, NY, 12180, United States of America, heathe@rpi.edu, Thomas Sharkey, John Mitchell

This research looks at how the best mitigation plan can be selected for a power network using a ranking and selection procedure. The power system is modeled using the direct current (DC) model, and a performance measure is developed to

measure how a mitigation plan can contribute to the rapid restoration of the network following a disruption. We discuss the computational challenges of using the DC model, and compare results using a flow-based model on the same network.

2 - Combined Natural Gas and Electric System Operation with Wind Energy

Dan Hu, Iowa State University, 3004 Black Engineering Bldg, Ames, IA, United States of America, danhu@iastate.edu, Sarah Ryan

We formulate a model of a combined natural gas and electric power system including wind energy. A two-stage stochastic programming model for day-ahead scheduling is proposed with uncertainty in wind power production. Joint optimization of gas delivery and electricity production, with the ability to store natural gas, help to maintain equilibrium in the combined system while meeting demand with high reliability and low cost.

3 - An Adjustable Robust Optimization Approach to Provision of Interruptible Load

Qi Zhang, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, qi.zhang13@gmail.com, Michael F. Morari, Ignacio E. Grossmann, Jose M. Pinto, Arul Sundaramoorthy

In modern electricity markets, large electricity consumers can sell operating reserve by providing capacities to reduce their electricity load upon request. Providing such interruptible load can be very lucrative; however, one does not know in advance when load reduction will actually be requested. In this work, an adjustable robust optimization approach is applied to model this uncertainty, using affine decision rules that allow recourse decisions in the resulting scheduling problem.

Just the Facts: Empirical Patterns in Strategy

Cluster: Strategy Science

Invited Session

Chair: Myles Shaver, University of Minnesota, 321-19th Ave S, Suite 3-365, Minneapolis, MN, 55455, United States of America, Mshaver@umn.edu

1 - How Competition Affects the Governance of R&D Projects: Evidence from Biotechnology Clinical Trials

Mazhar Islam, Drexel University in Philadelphia, PA, mui27@drexel.edu

Although almost all biotechnology firms participate in R&D alliances, we highlight that when one looks at a more micro-level of analysis – drug compounds within a therapeutic area – the majority of projects are done internally. Using a unique data set of clinical trials in 24 therapeutic areas in the U.S. biotechnology industry between 1996 and 2008, we show that biotechnology firms prefer internal organization absent competition from other biotechnology firms in the therapeutic area. With greater competition, we observe that these firms are more likely to utilize non-equity alliances compared to internal development – presumably to speed time to market within a competitive arena. We present two contingencies that aid in identifying the mechanism underlying this empirical finding – scope of applicability of the drug compound and the biotechnology firm's previous success with drug development projects.

2 - Innovation and Competition among Different Size Firms

Siddharth Sharma, PhD Candidate, Strategic Management, Robert H. Smith School of Business, University of Maryland, MD, United States of America, siddharth@rhsmith.umd.edu, Wilbur Chung

We examine the Consumer Electronics trade show (CES) as a microcosm of competitive interaction among different size firms. In this dense space, firms seek to position their booths to maximize exposure during this punctuated event. While industry heavy weights occupy key spots and little known ones are in the periphery, we still observe that firms of quite different sizes can be neighbors. We expect smaller firms armed with an innovation to seek out larger firms. We develop a simulation model with different size firms that have differing probability and value of innovations. Once their innovation draw is known, firms chose where to locate on a two-dimensional space with heterogeneous demand and look to maximize their demand. Firms compete by locating adjacent to others to capture some of their neighbors' demand. But locating with others can also generate externalities – agglomeration economies – that may offset competition. We compare the simulation's predictions versus actual booth locations. The setting and resulting simulation provide insights into the competitive dynamics underlying industry evolution.

3 - Have You Been Served? The Relationship between Corporate Social Responsibility and Lawsuits

Rob Salomon, rsalomon@nyu.edu

Does corporate social responsibility (CSR) protect firms against lawsuits? We conduct a study of 1047 firms from 46 countries over the period 2002 to 2011. We find, surprisingly, that CSR is positively associated with lawsuits. However, the relationship between CSR and lawsuits is moderated by advertising spending. Firms with high CSR that advertise heavily are buffered from lawsuits. Those firms with high CSR that maintain a low advertising profile, as well as those that focus their CSR efforts on social and environmental responsibility, tend to suffer more lawsuits. These results suggest that as a firm increases its CSR activities, it also increases its exposure to lawsuits, but differentiated products and good governance counter the increased risk. We posit that the positive relationship between CSR and lawsuits is likely a function of putting stakeholder concerns above shareholder concerns. The findings call for more research on the contingencies that affect the business case for CSR.

Sponsored Session

Chair: Palaniappa Krishnan, Associate Professor, University of Delaware, 212 Townsend Hall, 531 S. College Avenue, Newark, DE, 19711, United States of America, baba@udel.edu

1 - Temporary Staffing at Christie's

Qing Li, Associate Professor, HKUST, Department of ISOM, HKUST, Hong Kong, Hong Kong - PRC, imqli@ust.hk

The case is based on an actual challenge faced by Christie's Hong Kong, the Hong Kong subsidiary of the renowned auction house. For its biannual auctions, the company needs to hire 200 to 300 temporary sales assistants and assign them to different positions on different days. The human resources team believes that the current manual process of hiring and assignment is labor intensive and is unable to cope with sudden changes. They are looking to streamline the process and use decision tools.

2 - Distributions Strategies at Yaka Pharmaceuticals

Kathleen Iacocca, University of Scranton, 439 Brennan Hall, Scranton, PA, United States of America, kathleen.iacocca@scranton.edu

Yaka Pharmaceuticals, a large North American pharmaceutical manufacturing company, is considering changing their distribution strategy. Yaka Pharmaceuticals has four distribution options. The first option is the buy-and-hold contract, which was used by Yaka Pharmaceuticals and their distributors until recently. They moved away from this contract because the government issued a new law – the Sarbanes-Oxley Act, restricting the channel-stuffing accounting practice and distributor's investment buying. Since then the Fee-for-Service (FFS) contract, initiated by the Big-Three distributors – AmerisourceBergen, Cardinal Health, and McKesson – has been the contract that is in place. Under the FFS contract, Yaka pharmaceuticals pays a fee to the distributors for their distribution services while everything else remains more or less the same as under the buy-and-hold contract. Executives at Yaka Pharmaceuticals are not happy with the additional fee for almost the same service they previously received free of charge. The third option is to work with 3rd party logistics service providers on distribution. Although it looks promising, Yaka may be traveling down uncharted waters as the 3rd party logistics providers are just emerging in the pharmaceutical industry and have yet to be widely accepted. Finally, a consulting company suggested the Fee-for-Distribution contract, which allows Yaka pharmaceuticals to work with existing distributors but under a different relationship which resembles that of a third party logistics contract.

Optimal Power Flow in Electric Power Systems I

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Andy Sun, Assistant Professor, Georgia Institute of Technology, 755 Ferst Drive, Atlanta, GA, 30332, United States of America, andy.sun@isye.gatech.edu

1 - Graph-theoretic Convexification of Power Optimization Problems

Javad Lavaei, Assistant Professor, UC Berkeley, 4121 Etcheverry Hall, University of California, Berkeley, CA, 94720, United States of America, lavaei@berkeley.edu, Ramtin Madani

The objective is to design efficient algorithms for finding a near-global solution of a power optimization problem. Our approach is based on the notions of OS-vertex sequence and treewidth in graph theory, matrix completion, and low-rank

optimization. We apply our results to the highly non-convex optimal power flow problem. We offer several simulations on the nationwide Polish grid, for which we find near-global feasible solutions with global optimality guarantees of at least 99.9%.

2 - Computational Advances for Moment-based Relaxations of Optimal Power Flow Problems

Daniel Molzahn, Dow Postdoctoral Fellow, University of Michigan, 1301 Beal Avenue, Room 4234A, Ann Arbor, MI, 48109, United States of America, dan.molzahn@gmail.com, Ian Hiskens

Optimal power flow (OPF) is the key problem in operating electric power systems. A hierarchy of "moment-based" relaxations globally solves many non-convex OPF problems for which existing relaxations fail. After showing the capabilities of the moment relaxations, this presentation demonstrates how to exploit sparsity and selectively apply the higher-order relaxation to globally solve large problems. Other computational advances, including a mixed SDP/SOCP relaxation, are also discussed.

3 - Strong Socp Relaxations for the Optimal Power Flow Problem

Andy Sun, Assistant Professor, Georgia Institute of Technology, 755 Ferst Drive, Atlanta, GA, 30332, United States of America, andy.sun@isye.gatech.edu, Burak Kocuk, Santanu Dey

We propose three strong SOCP relaxations for the AC OPF problem. One of these relaxations is based on a new bilinear extended formulation of OPF. These three relaxations are incomparable to each other and two of them are incomparable to the standard SDP relaxation. Extensive computational studies show that these relaxations have several advantages over existing convex relaxations and provide a practical approach to obtain feasible OPF solutions with extremely good quality in real-time operation.

Biofuel Supply Chain and Market Analysis

Sponsor: ENRE – Environment I – Environment and Sustainability

Sponsored Session

Chair: Guiping Hu, Assistant Professor, Iowa State University, 3014 Black Engineering, Ames, IA, 50011, United States of America, gphu@iastate.edu

1 - An Optimization Model for Precision Farm Management Considering Water Resources

Qi Li, Iowa State University, 0076 black engineering, Ames, IA, 50011, United States of America, qili@iastate.edu, Baskar Ganapathysubramanian, Guiping Hu

An optimization model is formulated to study precision farm management. Genotype and phenotype of each crop are considered. In addition, soil fertility, water holding capability, and land slope have been incorporated. A case study for central valley in California has been conducted to validate the model considering the water constraints.

2 - A Bottom-up Equilibrium Model for Emerging Advanced Biofuel Market

Leilei Zhang, Iowa State University, 3004 Black Engineering, Ames, IA, 50010, United States of America, leileizh@iastate.edu, Yihsu Chen, Guiping Hu

We develop a bottom-up equilibrium model to study the interactions among the stakeholders in the biofuel supply chain. We analyze the effects of substitution on farmers' land allocation, biofuel production, blending, and market prices under a variety of market structures. Policies impacts are analyzed on biofuel markets and social welfare.

3 - A Real Options Approach to Study Investment Timing for Cellulosic Biofuels

Yihua Li, Iowa State University, 3004 Black Engineering, Ames, IA, 50010, United States of America, yihuali@iastate.edu, Chung-li Tseng, Guiping Hu

We present a real options approach to evaluate the investment of a new technology to produce cellulosic biofuels subject to construction lead times and uncertain fuel price. We conduct a case study on Iowa, in which the decision maker finds the optimal investment timing subject to production and distribution constraints.

4 - A New Approach for Optimal Electricity Planning and Dispatching with Hourly Time-scale Air Quality

Paul Kerl, Georgia Tech, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, paul.kerl@gmail.com, Valerie Thomas

Energy production from coal, natural gas, oil and biomass generates air pollutants and health impacts. Pollutant exposure depends on the relative location to power plants and atmospheric conditions which vary by hour, day and season. We have developed a method to evaluate pollutant formation from source emissions which we integrate with an electricity production model. In a case study of Georgia we show how to reduce health impacts by shifting production during select hourly periods.

1 - Finding Patterns with a Rotten Core: Data Mining for Crime Series Detection

Tong Wang, Graduate Student, MIT, 70 Pacific Street, Apt. 242A, Cambridge, MA, 02139, United States of America, tongwang@mit.edu

We worked with the Cambridge Police Department to build a model that can automatically detect crime series, which analysts spend hours per day doing it manually. NYPD is currently working with our code, aiming to incorporate it into a custom software package they are developing which can assist in their daily job. This project has received widespread media attention.

2 - Infusion Center Process Improvement and Patient Wait Time Reduction

Mengnan Shen, Georgia Tech, Atlanta, GA, United States of America, motion0720@gatech.edu, Xiaoyang Li, Allen Liu, James Micali, Jisu Park, Yunjie Sun, Emilie Wurmser, Sung Keun Baek

Winship experienced long wait times and low patient satisfaction. Combining data analytics, stakeholder interviews, queuing network principles, and detailed simulation analysis, we improved flow, communication, and visibility throughout the process. Winship implemented our suggestions, resulting in a 28% reduction in patient wait times from check-in to chair, a 8.5% increase in patient satisfaction, and a 6 patients/day increase in throughput.

3 - Using Operations Research to Improve the Health of Patients with Type 2 Diabetes

Yuanhui Zhang, NC State, United States of America, yuanhui.zhang@gmail.com

We developed OR models for policy evaluation and robust optimization of clinical regimens for glycemic control for patients with type 2 diabetes. We used the models to address controversial questions including: whether protocols based on new medications are more effective than standard regimens. A publication from this work received substantial press and may help inform treatment recommendations in the future.

Joint Session DAS/ENRE: Decision Analysis Applications in Oil and Gas

Sponsor: Decision Analysis & ENRE

Sponsored Session

Chair: Brad Powley, Senior Consultant, Strategic Decisions Group, 745 Emerson Street, Palo Alto, CA, 94301, United States of America, bpowley@sdg.com

1 - Defining Prospects for Decision Analysis

Ahren Lacy, Decision Analysis Advisor, Chevron, 1400 Smith St, #31-128, Houston, TX, 77007, United States of America, Ahren@chevron.com

The prospect is the building block of decision analysis. We express our belief about the likelihood of a prospect's occurrence (by assigning a probability), and we express our preference should we obtain it (often using a monetary value

measure). Clarity of action in a complex decision requires careful selection of distinctions in order to define useful prospects. The author will discuss several real-world applications in oil and gas projects where clear distinctions led to clarity of action.

2 - A Probabilistic Analysis of Drilling Strategies in Unconventionals

Robert Hammond, Decision Analyst, Chevron, 1400 Smith St, Houston, TX, United States of America, rhammond@chevron.com

This talk will focus on a probabilistic decision analysis of drilling strategies in an unconventional oil and gas play that has sporadic areas with low chances of drilling success. The analysis helped determine the optimal drilling strategy, including whether to drill multiple wells from a single surface location, which reduces development costs and environmental footprint, or a spaced well approach, which in some cases can be used to avoid drilling issues and additional development costs.

3 - Meta-modeling in Decision Analysis: A Case Study

Brad Powley, Senior Consultant, Strategic Decisions Group, 745 Emerson Street, Palo Alto, CA, 94301, United States of America, bpowley@sdg.com, Eric Bickel

A sophisticated physical model, despite representing an organization's best thinking, may be excluded from a decision analysis because it cannot complete a requisite number of runs in a reasonable amount of time. When facing such a situation, we created a statistical model of a hydrocarbon reservoir model based on a handful of previous runs, and used it to conduct a probabilistic simulation on project economics. This talk introduces that approach, and discusses its merits and challenges.

4 - A Cognitive Decision Room for High-stakes Decision Making

Jeffrey Kephart, IBM, T. J. Watson Research Center, Yorktown Heights, NY, 10598, kephart@us.ibm.com, Debarun Bhattacharjya

We have built a cognitive room in which decision makers use a combination of speech and gesture to interact with a multi-agent system of decision and information agents. We overview the hardware and software infrastructure of the cognitive room, describe a set of interacting decision agents, and illustrate via several examples how the room enables human decision makers to make better, more informed decisions in the context of high-stakes decisions in domains such as mergers and acquisitions.

Chair: Robert Bordley, Expert Systems Engr Professional, Booz-Allen-Hamilton, 525 Choice Court, Troy, MI, 48085, United States of America, Bordley_Robert@bah.com

1 - Limits to Rationality in Systems Engineering

George Hazelrigg, Deputy Division Director, National Science Foundation, Civil, Mech. & Mfg Innovation, 4201 Wilson Boulevard, Arlington, Va, 22230, United States of America, ghazelri@nsf.gov

Rationality is a worthwhile goal in any engineering activity enabling optimization and averting poor choices. But attempts to create a rational framework for systems engineering fail at the time the second person is assigned to the project. We outline the limits to rationality in systems engineering and illustrate consequences. Systems design approaches can have destructive impacts on system design. This paper presents simple procedures to avoid such problems.

2 - Improving Systems Engineering Trade-Off Studies

Greg Parnell, Professor, University of Arkansas, Department of Industrial Engineering, Fayetteville, AR, 72701, United States of America, gparnell@uark.edu

Today's complex systems involve significant uncertainties, multiple stakeholders with conflicting objectives, and growing affordability concerns. SE trade-offs arise throughout the system life cycle. Surprisingly many of the published trade-off studies do not have a strong mathematical foundation, do not provide an integrated assessment of value and risk, and many do not even consider uncertainty. We report on a book project to provide best practices using decision analysis.

3 - Making Product Development Decisions with Decision Analysis

Dennis Buede, President And Executive Director, Innovative Decisions, 8230 Old Courthouse Road, Suite 460, Vienna, VA, 22182, United States of America, dbuede@innovatedecisions.com

Formal decision processes during system design are commonly called trade studies or analyses of alternatives (AoAs). This paper will give an overview of the process for systems engineering and product development, describe the many kinds of trade studies that should be undertaken, relate decision analysis to these trade studies and discuss complexities of system design about which decision analysts should be aware. Numerous real world examples will be given along the way.

4 - Obtaining Engineering Design Targets in the Presence of Uncertainty

Robert Bordley, Expert Systems Engr Professional,
Booz-Allen-Hamilton, 525 Choice Court, Troy, MI, 48085, United
States of America, Bordley_Robert@bah.com, Steve Pollock

A typical systems engineering process selects a design concept to meet the customer's stated objectives. To implement this concept, design targets are assigned to various engineering teams. It is important that target assignments explicitly recognize uncertainty about what is technically feasible and about the customer's objectives. This paper addresses the problem of determining optimal design targets (and the associated design margins) using a decision analytic approach.

1 - Quantifying Delay Propagation through Crew Connections

Keji Wei, Dartmouth College, Thayer School of Engineering,
Hanover, NH, United States of America,
Keji.Wei.TH@dartmouth.edu, Vikrant Vaze

The purpose of this study is to investigate delay propagation through airline crew pairings. In order to solve the crew pairing sub-problem, we develop a heuristic that combines column generation with branch-and-bound for computational speedup and solution accuracy. Based on multiple criteria that serve as a proxy for the extent of delay propagation through crew pairing, we build learning hyper-models to generate crew pairings that are similar to those in the real world crew pairing samples.

2 - A Strategic Prioritization Approach to Airline Scheduling during Disruptions

Prateek Srivastava, Graduate Student, University of Texas at
Austin, 204 E. Dean Keeton Street, Stop C2200 ET, ETC II 5.160,
Austin, TX, United States of America, prateekrs@utexas.edu

Whenever the arrival capacity of an airport reduces due to bad weather, the FAA uses a Ration By Schedule approach to allocate arrival slots to airlines. The major drawback of this approach is that it does not take the airline operations into account. In our study, we consider a framework in which airlines can prioritize their flights at different airports based on their needs. We show through simulations on historical data that significant cost benefits are achieved using this framework.

3 - Characterizing the Tradeoff between Planned and Operational Costs in Robust Crew Scheduling

David Antunes, University of Coimbra, Portugal, dantunes@uc.pt,
Antonio Antunes, Vikrant Vaze

To mitigate disturbances created by delays in an airline's network, we develop a robust crew scheduling model. Input delay profiles were built using real-world data. To avoid the implementation and customization challenges associated with the well-established crew pairing models, and tractability challenges associated with adding robustness features to them, we use an integer programming model that's easy to solve using commercial software and reduces the need for calibrations and fine-tuning.

Advances in Network Design

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Michael Hewitt, Loyola University Chicago, 820 N. Michigan
Ave, Chicago, IL, 60611, United States of America, mhewitt3@luc.edu

1 - The Price of Discretizing Time in Service Network Design

Luke Marshall, Georgia Institute of Technology,
North Ave NW, Atlanta, GA, United States of America,
luke.jonathon.marshall@gmail.com, Natasha Boland,
Martin Savelsbergh, Michael Hewitt

When solving transportation problems using time-expanded networks, the choice of discretization has a strong impact on solution quality; the choice trades off solution accuracy to solution time. We empirically investigate this trade-off to be able to make a more informed choice.

2 - Real-time Dynamic Load Planning for Less-than-truckload Motor Carriers

Belgacem Bouzaïene-ayari, Research Staff, Princeton, 113A
Sherrerd Hall, Princeton University, Princeton, NJ, 08540, United
States of America, belgacem@princeton.edu, Warren Powell

LTl motor carriers need to plan the flows of shipments and trailers over time to minimize costs while meeting service commitments. These decisions need to be made dynamically, responding to current and forecasted shipments. We present a novel formulation that allows us to solve large problems while obtaining high quality solutions. This approach enables us to optimize balance in a network where loaded movements might be handled with company drivers, purchased transportation and intermodal.

3 - Solving Large-scale Service Network Design Problems

Michael Hewitt, Loyola University Chicago, 820 N. Michigan Ave,
Chicago, IL, 60611, United States of America, mhewitt3@luc.edu,
Martin Savelsbergh

In this talk we will discuss how aggregation techniques can be used to solve large-scale service network design problems. We will discuss methods for two dimensions of the service network design problem that contribute to its size: (1) the precision with which time is modeled, and, (2) the number of shipments to be delivered. We will present the results of an extensive computational study based on instances derived from a large, U.S. Less-than-truckload transportation company.

4 - Dynamic Shortest-path Interdiction

Jorge A Sefair, Arizona State University, 699 S. Mill Ave. BYENG
330, P.O. Box 878809, Tempe, AZ, 85287-8809, United States of
America, jorge.sefair@asu.edu, Cole Smith

We study a dynamic network game between an attacker and a user. The user seeks a shortest path between a pair of nodes, and the attacker seeks to interdict a subset of arcs to maximize the user's shortest-path cost. The attacker can interdict arcs any time while the user travels the network, and the user can respond by altering its chosen path. We propose an optimal dynamic-programming algorithm as well as upper and lower bounds based on interdiction and robust optimization.

1 - Management of Water and Transportation Networks during Flood Disasters

Mehdi Nourinejad, University of Toronto, Civil Engineering
Department, University of Toronto, Toronto, ON, M5S 1A4,
Canada, mehdi.nourinejad@mail.utoronto.ca

Flood disaster death tolls can be reduced through in-time evacuation planning. An optimal evacuation schedule takes into account the route and intensity of the water flow. Evacuation priority should be given to regions prone to being overflowed faster than others. To enhance evacuation planning, water flow can be managed through appropriate reservoir design to create a time lag for evacuation. A model is developed that simultaneously considers evacuation planning and reservoir design.

2 - Freight Transportation Network Recovery Based on Interdependent Impact

Mohamad Darayi, mdarayi@ou.edu, Kash Barker,
Nazanin Morshedlou

Freight transportation networks, considered a means to enable the flow of commodities and to facilitate economic productivity, are prone to natural and human-made hazards. This research pursues an approach to improve restoration order decision making based on the broader perspective of their impact to multiple industries and multiple regions.

3 - Stochastic Resilience Modeling with Bayesian Kernel Methods: Application to Inland Waterway Networks

Hiba Baroud, Vanderbilt University, 400 24th Avenue South,
Nashville, TN, 37205, United States of America,
hiba.baroud@vanderbilt.edu, Kash Barker

This work applies a Bayesian kernel approach to model the resilience of infrastructure systems. The approach quantifies the resilience of transportation systems under the uncertainty of disruptive events given data describing the characteristics of the infrastructure system and disruption scenario. The model is deployed in an application to an inland waterway transportation network for which the recovery of disrupted links represented by sections of the river is

analyzed.

4 - Effective and Equitable Supply of Gasoline to Impacted Areas in The Aftermath of a Natural Disaster

Rajan Batta, Suny Distinguished Professor, University at Buffalo (SUNY), 410 Bell Hall, Buffalo, United States of America, batta@buffalo.edu, Changhyun Kwon, Xiaoping Li

Supply chain disruptions of hazmat commodities, such as gas shortages, have resulted from the post-natural disaster conditions as seen during and after Hurricane Sandy, 2008, China winter storms and the 2010 Chilean earthquake. We develop a transportation logistics model aimed at providing feasible and cost-effective solutions to alleviate the impact of gasoline shortage.

1 - Distribution Operations with Item Location Uncertainty

Jennifer Pazour, Assistant Professor, Rensselaer Polytechnic Institute, 110 Eighth Street, Troy, NY, 12180, United States of America, pazouj@rpi.edu

Item location uncertainty can occur in a number of environments, including sea-based, healthcare, and retail logistics environments. Yet, such existence has been ignored in existing warehouse and distribution decision making models. Thus, we develop analytical models to study the impact of item location uncertainty on order-fulfillment policies and logistics performance measures.

2 - Optimal Assignment of Airport Baggage Unloading Zones to Outgoing Flights

Marc Goetschalckx, marc.goetschalckx@isye.gatech.edu, Pratik Mital, Edward Huang

In this work, the airport outbound baggage assignment problem is modeled as a Vector Assignment Problem (VAP). VAP is a new category of optimization problems which belongs to the class of Assignment Problems (AP), but has unique properties which make it harder to solve. A real airport case study is presented, to which the optimization models developed are applied. The performance of the optimization models is compared to typical heuristics used in the literature to solve this problem.

3 - Using Real-time Employee Location to Make Hospital Transport Assignments

Dale Masel, Associate Professor, Ohio University, 270 Stocker Center, Athens, OH, 45701, United States of America, masel@ohio.edu, Connor McMahon, Seth Hostetler

In a hospital, employees who are responsible for transporting patients and equipment are a critical resource for patient care and efficient operations. Getting patients to appointments on time is essential for preventing delays at the labs and clinics in the hospital. By knowing where each transporter is located when a request is received, their time to reach a patient who needs to be transported can be determined. This allows assignments to be made more effectively, reducing patient waiting.

4 - Zone Based Dynamic Facility Layout Problem

Sadan Kulturel-Konak, Professor, Pennsylvania State University, Berks Campus, Reading, PA, 19609, United States of America, sadan@psu.edu

In this study, a zone-based Dynamic Facility Layout Problem (DFLP) is under consideration to design manufacturing and logistics facilities considering material handling infrastructure. A hybrid approach is proposed to solve the problem and promising numerical results are presented for a comprehensive set of test problems from the literature.

RAS Roundtable: Part I Railroad Operations Efficiency and Recovery

Sponsor: Railway Applications

Sponsored Session

Chair: Erick Wikum, Principal Scientist, Tata Consultancy Services, 1000 Summit Drive, Milford, OH, 45150, United States of America, erick.wikum@tcs.com

1 - Railroad Operations Efficiency and Recovery

Erick Wikum, Principal Scientist, Tata Consultancy Services, 1000 Summit Drive, Milford, OH, 45150, United States of America, erick.wikum@tcs.com, Jeffrey Guelker, Bob Gutman, Clark Cheng

In the railroad industry, achieving efficient operations and developing the capability to recover from inevitable disruptions are key to both customer service and financial performance. In this session, the first of two, panelists from the railroad industry worldwide explore how to define and measure efficiency and recovery and share case studies and a vision for the role OR/MS and analytics has played and can play in operational efficiency and recovery.

■ SC71

Public Transportation Modeling

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Nicholas Lowmes, University of Connecticut, 261 Glenbrook Rd, U-3037, Storrs, Co, 06269, United States of America, nlowmes@engr.uconn.edu

1 - Optimizing Transit Network Design for Equity

Kelly Bertolaccini, Ph. D. Candidate, University of Connecticut, 260 Glenbrook Rd, Storrs, CT, 06269, United States of America, klb06003@engr.uconn.edu, Nicholas Lowmes

The equitable provision of public transit services is a major concern for planners worldwide, yet few tools are currently available for those seeking to incorporate equity into their transit network designs. This research proposes a method for directly incorporating equity into the stop grouping and stop sequencing components of the Transit Network Design Problem. An iterative process is used to combine the stop sequencing and grouping models to design equitable, multi-route transit systems.

2 - Integrated Planning of Park-and-Ride Facility and Transit Service

Ziqi Song, Assistant Professor, Utah State University, 4110 Old Main Hill, Logan, UT, 84322-4110, United States of America, ziqi.song@usu.edu

This research proposes an integrated planning framework to strategically locate park-and-ride (P&R) facilities and optimize transit service frequency simultaneously. P&R users' route choice behavior is explicitly considered and a link-based multimodal user equilibrium model is established. The optimal P&R facility and transit service design problem is formulated as a mathematical program with complementarity constraints, and a solution algorithm based on the active-set approach is used.

3 - Evaluating Zoning Strategies for Demand Responsive Transit Systems

Mahour Rahimi, University of Massachusetts, Amherst, 139 Marston Hall, 130 Natural Resources Rd., Amherst, MA, 01003, United States of America, mrahimi@umass.edu, Eric Gonzales

DRT systems often divide their service area into smaller regions in order to simplify operations. However, this management strategy can create inefficiencies. This paper develops an analytical formulation to explain the relation between agency cost and zoning strategies. The two main objectives are to understand when a service area needs to be divided into smaller regions to reduce the total costs of a DRT system and how the split should be done in order to be the most cost effective.

4 - Effects of Real-time Information Services over the Performance of Transit Systems

Ricardo Giesen, Assistant Professor, Pontificia Universidad Catolica de Chile, Vicuna Mackenna 4860, Macul, Santiago, Chile, giesen@ing.puc.cl, Emilio Nacelle, Leandro Segura, Matías Estrada, Antonio Mauttone

We study the influence of real-time information services over the performance of bus transit systems from the users' perspective. Six variants of passenger behavior models representing different degrees of information availability are proposed and embedded into a simulation framework. We perform a comprehensive set of experiments, using a small city. The impact of different assumptions concerning information availability is analyzed in terms of user travel time.

73-Room 203B, CC

Quality Engineering

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Trevor Craney, Shell, Houston, TX, United States of America, Trevor.A.Craney@shell.com

1 - Integrated Approach for Field Reliability Prediction Based on Accelerated Life Testing

Mingxiao Jiang, Medtronic, 7000 Central Ave NE, Fridley, United States of America, mingxiao.jiang@medtronic.com

To predict field reliability using analytic modeling, several important reliability activities should be conducted, including FMEA, stress and usage condition analysis, PoF, ALT, and cumulative damage modeling if needed. This paper builds an integrated process and comprehensive modeling framework, especially with cumulative damage rules when the certain field stresses are random processes. An engineering product is provided as an application of proposed method.

2 - The Constant Shape Parameter Assumption in Weibull Regression

Steve Rigdon, Professor, Saint Louis University, 3545 Lafayette Ave, Salus 481, Saint Louis, MO, 63104, United States of America, srigdon@slu.edu, Georgia Mueller

The usual assumption in Weibull regression is that the scale parameter is a function of the predictor variables and the shape parameter is constant. We consider the problem of estimating parameters in the presence of a nonconstant shape parameter and the effect of assuming a constant shape parameter when it really isn't constant. The misspecification of a constant shape parameter leads to loss of power for tests of the slope parameters and inaccurate prediction intervals.

3 - Model Specification and Confidence Intervals for Voice Communication

Sara Wilson, NASA Langley Research Center, Mail Stop 131, Hampton, VA, 23681, United States of America, sara.r.wilson@nasa.gov, Robert Leonard, David Edwards, Kurt Swieringa, Jennifer Kibler

The performance of a system often depends on the accuracy of information transferred via voice communications. This paper presents a case study from a human-in-the-loop experiment using a simulated flight environment that required a complex voice clearance issued by Air Traffic Control to a flight crew. The lognormal and loglogistic distributions are found to model the time required for voice communication, and extensive investigation of outliers was performed to identify procedural anomalies.

4 - Determining Test Sample Size for Reliability Demonstration Retesting after Product Design Change

Andre Kleyner, Global Reliability Engineering Leader, Delphi Electronics & Safety, 2151 E. Lincoln Rd, M.S. CTC4E, Kokomo, IN, 46902, United States of America, andre.v.kleyner@delphi.com, David Elmore, Ben Zion Boukai

Last minute design changes after completed product testing is a common occurrence. It is also common for a redesigned product to be retested to demonstrate compliance to the original reliability requirements. This paper discusses the application of Bayesian techniques to reduce the sample sizes required for retesting after design change. The proposed method helps to reduce the test sample size while demonstrating the required reliability and helping to reduce the cost of product development.

Advanced Manufacturing Systems and Planning

Cluster: Advanced Manufacturing

Invited Session

Chair: Jun-Qiang Wang, Professor, Northwestern Polytechnical University, Box 554, No. 127 West Youyi Road, Department of Industrial Engineering, Xi'an, 710072, China, wangjq@nwpu.edu.cn

1 - Real-time Data Driven Visual Decision Support System for the Factory Floor

Mohammad Rahdar, Iowa State University, 133 University Village, Unit F, Ames, IA, 50010, United States of America, rahdar@iastate.edu, Guiping Hu, Dave Sly, Lizhi Wang

The manufacturing industries face significant challenges in operational planning due to the uncertainties in demand, lead-time, logistic, etc. This study aims to improve the efficiency of the production planning system and provide the visibility of real-time operations. The decision support system can access real-time data and use the models and analytical techniques to support the manufacturing decision making.

2 - Data-based Scheduling System for Semiconductor Wafer Fabrication Facility

Li Li, Professor, Tongji University, No.4800, Cao'an Road, Shanghai, China, lili@tongji.edu.cn

Based on the analysis of the differences and relations between traditional and data-based scheduling methods, we propose a data-based scheduling framework and discuss how to implement it for a semiconductor manufacturing system. Then we introduce the state-of-the-art research on the key technologies of data-based scheduling and point out their development trends. Finally, we develop a data-based scheduling prototype system and also use some examples to demonstrate the superiority of the system.

3 - Cloud Manufacturing Ecosystem – Scheduling and Evolving

Shengkai Chen, Zhejiang University, School of Mechanical Engineering, 38# Zheda Road, Hangzhou, China, 372927638@qq.com, Shuiliang Fang, Haoke Peng

In the Cloud Manufacturing Ecosystem, a benign mode and methodology for massive services schedule is required, in order for the collaboration within the whole Industry Chain. This paper studied the data of the resources and services, and modeled the services scheduling problem in the chain. With the Big Data analysis on the Cloud Platform, optimal assessment/schedule methods were developed, which could gradually evolve the ecosystem to an optimal situation.

4 - Initiative Scheduling Mode for Physical Internet-based Manufacturing System

Jun-Qiang Wang, Professor, Northwestern Polytechnical University, Box 554, No. 127 West Youyi Road, Department of Industrial Engineering, Xi'an, 710072, China, wangjq@nwpu.edu.cn, Guo-qiang Fan, Shu-dong Sun, Ying-feng Zhang

We categorize scheduling as passive scheduling and initiative scheduling, depending on who takes the initiative and controls the decision-making of scheduling in physical internet-based manufacturing systems. Focusing on initiative scheduling mode, we model a p-shaped framework for scheduling elements, analyze the decentralized operation mode, explore the individual and organizational scheduling behaviors among enabling units. Finally we discuss some future research directions.

Design of Experiments and Statistical Analysis for Simulation

Sponsor: Simulation

Sponsored Session

Chair: Feng Yang, Associate Professor, West Virginia University, P.O.Box 6070, Morgantown, United States of America, Feng.Yang@mail.wvu.edu

Co-Chair: Hong Wan, Associate Professor, Purdue University, 315 N. Grant Street, GRIS 327, West Lafayette, United States of America, hwan@purdue.edu

1 - Simulation Experiments Involving Stochastic Optimization Models for Disaster Relief

Susan Sanchez, Professor, Naval Postgraduate School, Operations Research Dept, 1411 Cunningham Rd, Monterey, CA, 93943, United States of America, smsanche@nps.edu, Emily Craparo, Maxine Gardner

Stochastic optimization approaches have been used for determining effective disaster relief operations, but may not fully capture the uncertainty that is inherent in these disasters and the demands that result. We use large-scale design of experiments to more fully investigate the effect of variability on the solution of a two-stage mixed-integer stochastic optimization model that explores using UAVs as logistics assets when planning the Navy's logistics response to natural disasters.

2 - Sequential Experimental Designs for Stochastic Kriging

Xi Chen, Assistant Professor, Industrial and Systems Engineering at Virginia Tech, 1145 Perry St., Blacksburg, VA, 24061, United States of America, xchen.ise@vt.edu

In this work, we establish a sequential experimental design framework for applying Stochastic Kriging (SK) to predicting performance measures of complex stochastic systems. We show how the integrated mean squared error of prediction decreases as additional simulation runs are allocated sequentially, and derive some efficient sequential design strategies from these analytic results. The performance of the proposed sequential design strategies is demonstrated through numerical examples.

3 - Block-coordinate Strong for Large Scale Simulation Optimization

Hong Wan, Associate Professor, Purdue University, 315 N. Grant Street, GRIS 327, West Lafayette, United States of America, hwan@purdue.edu, Wenyu Wang

STRONG is a response surface methodology (RSM) based algorithm that iteratively constructs linear or quadratic fitness model to guide the searching direction within the trust region. For high-dimensional problem, this paper modify the Block Coordinate Descent framework to fit the STRONG algorithm, and propose an algorithm which guarantees to converge to a stationary point. This is the first result establishing the BCD framework in high dimensional simulation optimization problems.

Supply Chain Management III

Contributed Session

Chair: Pengyu Chen, PhD Student, Huazhong University of Science & Technology, 1037 Luoyu Road, Wuhan, China, andychen@hust.edu.cn

1 - Control and Emergence in Supply Networks

Anand Nair, Michigan State University, 632 Bogue St., East Lansing, MI, United States of America, nair@broad.msu.edu, Ilaria Giannoccaro, Thomas Choi

In this paper we consider the supply network of Honda as the focal firm and develop an empirically-informed NK simulation model to examine how varying levels of control influence performance of supply networks.

2 - A Study on Internet of Things and Supply Chain Agility

Bo Li, Ashland University, 401 College Ave, Ashland, OH, United States of America, bli@ashland.edu

Internet of Things (IoT) changes our daily life and business world, thus supply chain managers must answer the question about how IoT can improve their supply chain performances. This research develops a conceptual model with simulation demonstration, to study the relationship among IoT, supply chain agility, and supply chain performances.

3 - Orders and Reciprocity in the Technology Supply Chain

Heejong Lim, Purdue University, 403 W. State Street, West Lafayette, IN, United States of America, limh@purdue.edu, Ananth Iyer

Motivated by the semiconductor and the LCD industry, we incorporate the reciprocal game in a dyadic (buyer-supplier) supply channel. In our model, the buyer's anticipated reciprocal behavior influences the seller's order so as to protect the seller during the oversupply period. We provide an analysis under different level of reciprocity following accepted economic models in order to explore the impact on order size and channel coordination. Insights from practice are then provided.

4 - Vertical Integration in Two-tier Decentralized Supply Chain

Pengyu Chen, PhD Student, Huazhong University of Science & Technology, 1037 Luoyu Road, Wuhan, China, andychen@hust.edu.cn, He Xu

We study a supply chain with three types of firms (i.e. suppliers, manufacturers and integrated firms). Integrated firms can sell parts and final products while suppliers and manufacturers can sell only one of them. We find the conditions under which integrated firms sell parts to other manufacturers and investigate how prices and social wealths are affected. We also answer the question when two individual firms prefer to vertically merging.

78-Room 301, CC

Supply Chain Risk Management I

Contributed Session

Chair: Lisa Yeo, Assistant Professor, Loyola University Maryland, 4501 N. Charles St., Sellinger Hall 306, Baltimore, MD, 21210, United States of America, mlyeo@loyola.edu

1 - Perspectives on Supply Chain Corruption and Risk Management

Xiaoqing Liu, PhD Candidate, The University of Auckland, 12 Grafton Road, Auckland City, Auckland, 1010, New Zealand, xiaoqing.liu@auckland.ac.nz, Tiru Arthanari

Research on supply chain risk management is still immature and of increasing importance. Corruption from the perspective of supply chains largely lacks research. We propose a conceptual framework for managing corruption risk in supply chains. Case studies help verify and establish factors. System dynamics modelling clarifies complex relationships. We anticipate exploring how corruption risks modify supply chain risk factors and performance, and how to safeguard supply chains against such risks.

2 - An Examination of the Impact Supplier Flexibility and Reliability on Supply Chain Resilience

Masoud Kamalahmadi, Student, North Carolina A&T State University, 1601 E. Market St, Greensboro, NC, 27411, United States of America, Mkamalah@aggies.ncat.edu, Mahour Mellat Parast

In this paper, the impact of supplier flexibility and reliability on supply chain resilience is examined. We develop a mathematical model to minimize the impact of two types of supply chain disruptions (supply disruption and environmental disruption), and propose strategies for supplier selection and allocation to minimize supply chain risks and costs. Risk of delivery reliability is also examined in this study.

3 - Assessing the Relationship of Supply Chain Risk Management to Quality Management

Tyler Florio, East Carolina University, College of Business,
Greenville, NC, 27858, United States of America,
floriot11@students.ecu.edu, Scott Dellana

This research explores the relationship between an organization's supply chain risk management maturity (SCRMM) and quality management (QM) practices. QM practices and SCRMM were measured using a survey questionnaire of organizations in the USA. ISO 9001 status was also determined. Preliminary results suggest that ISO 9001 is not related to SCRMM, while QM is related to SCRMM. Organizations with more mature quality management programs appear to also have more mature risk management programs.

4 - Mitigating Contagion Risk in Supply Chains

Alireza Azimian, Wilfrid Laurier University, 55 Hickory St,
E, Waterloo, ON, N2J 3J5, Canada, azim9110@mylaurier.ca,
Hamid Noori, Marc Kilgour

Rivals often benefit from each other's failures because of demand shifts; however some incidents may adversely affect an entire industry causing all firms to suffer. We explore whether investment in the safety measure of the rivals who just comply with minimum standards can be employed as a risk mitigation strategy.

5 - Information Security Investments: Better Together?

Lisa Yeo, Assistant Professor, Loyola University Maryland, 4501
N. Charles St., Sellinger Hall 306, Baltimore, MD, 21210, United
States of America, mlyeo@loyola.edu, Erik Rolland, Bora Kolfal,
Raymond Patterson, Hooman Hidaji

Security breaches are often the result of the weakest link in a chain of related businesses; a firm may have strong security practices and yet still experience a loss due to a weaker business partner. We propose allocating some firm resources to a supplier in order to improve that supplier's security posture with possible positive spillover to a competitor. In a symmetric duopoly setting, where demand reacts to breach notification, we find the conditions in which a shared supplier is desirable.

Software Demonstration

Cluster: Software Demonstrations

Invited Session

1 - Provalis Research – How to Analyze Big Text Data with Provalis Text Analytics Tools

Normand Peladeau, CEO, Provalis Research

Provalis Research will showcase its integrated collection of text analytics software. QDA Miner is an easy to use qualitative and mixed methods software that meets the needs of researchers performing qualitative data analysis and would like to code more quickly and more consistently larger amounts of documents. It offers high level computer assistance for qualitative coding with innovative text search tools that help users speed up the coding process as well as advanced statistical and visualization tools. Users with even bigger text data, can also take advantage of WordStat. This add-on module to QDA Miner can be used to analyze huge amounts of unstructured information, quickly extract themes, find trends over time, and automatically identify patterns and references to specific concepts using categorization dictionaries.

2 - SAS Education Practice – Introduction to SAS Data Mining

Tom Bohannon, Analytical Consultant, SAS,
tom.bahannon@sas.com, F. Michael Sped, PhD,
Analytical Consultant, SAS, mike.speed@sas.com

This introduction covers the basic skills required to assemble analysis flow diagrams using the rich tool set of SAS Text Mining. Also, participants will be shown how unstructured data can be converted into numeric data that can be utilized for pattern discovery and predictive modeling. Simple example will be used to illustrate the basic concepts of text mining.

Sunday, 4:30pm - 6:00pm

Military O.R. and Applications II

Sponsor: Military Applications

Sponsored Session

Chair: Michael Hirsch, ISEA TEK, 620 N. Wymore Rd., Ste. 260,
Maitland, FL, 32751, United States of America, mhirsch@iseatek.com

1 - Efficient Information Distribution in the Presence of Unknown Cognitive Capacity in HRI

Siddhartha Mehta, Research Assistant Scientist, University of
Florida, 1350 N. Poquito Rd., Shalimar, FL, 32579, United States
of America, siddhart@ufl.edu, Monali Malvankar,
Eduardo Pasillao

In military applications, unmanned aerial vehicles (UAVs) remotely operated by a ground crew may require significant human interaction. UAVs share information with human operators to perform geographically-dispersed priority-based tasks within a specified time. Asymmetric information including cognitive capacity and efficacy exists within the groups of operators. We develop a model incorporating asymmetric information to optimally share information by maximizing efficiency of the entire system.

2 - Robust and Adaptive Optimization Applied to Operator Task Scheduling

Luca Bertuccelli, UTRC, 411 Silver Lane, East Hartford, 06107,
United States of America, bertudlf@utrc.utc.com,
Taimoor Khawaja, Cali Fidopiastis

This work is concerned with human-in-the-loop decision making when the human is interacting with robust scheduling systems. We provide a comprehensive literature review of the area of robust optimization as applied to human-in-the-loop scheduling. We then demonstrate the impact of uncertainty in scheduling problems solved in both a "one-shot" optimization and a receding horizon framework with a simulated user-in-the-loop.

3 - A Bayesian Framework for Integrating Human and Machine Perceptions

Emily Doucette, Air Force Research Laboratory,
101 W. Eglin Blvd., Eglin AFB, United States of America,
emily.doucette@us.af.mil

Current methods for human-autonomy interaction are largely implemented through rigid schemes that transfer control between humans and autonomy. The authors propose a generalizable framework utilizing Bayesian estimation and decision theory that incorporates the concepts confidence and consequence in all agents in a human-autonomous system to yield a decision structure for heterogeneous teams, where a human supervisor is aided by a risk-based representation of the target state estimate.

4 - A Framework Supporting the Separation of Cognitive Performance from Execution Environment

Katie McConky, Assistant Professor, Rochester Institute of
Technology, 81 Lomb Memorial Dr, Rochester, NY, 14623,
United States of America, ktmeie@rit.edu, Moises Sudit,
Hector Ortiz-pena

This project aims to enhance a decision maker's mission planning capabilities by providing decision aids that predict anticipated human performance based on civil, environmental and physical conditions. A framework is presented that isolates human performance factors from environmental and situational mission characteristics that facilitates the ability to estimate the capability of units to accomplish tasks to expected standards under specified conditions.

OR and Homeland Security 1: Data Driven Decisions

Cluster: Homeland Security

Invited Session

Chair: Paul Kantor, Prof, Rutgers, 96 Frelinghuysen Dr, Piscataway, NJ, United States of America, paul.kantor@rutgers.edu

1 - Detecting and Locating GPS Jamming

Jeff Coffed, Senior Marketing Manager, Exelis Inc., 400 Initiative Drive, Rochester, NY, 14606, United States of America, Jeffrey.Coffed@exelisinc.com, Joe Rolli

GPS has become a ubiquitous service supporting critical infrastructure. Its signal is susceptible to service blockages due to jamming. Recognizing this threat, Exelis set out to develop technology that identifies and locates jamming sources. The system can be located around high-risk areas to instantaneously sense and locate jamming sources. Users will receive pin-point geolocation information in order to respond. We will share information about the threat, the technology and test results.

2 - Walk through Metal Detectors at Sports Stadiums

Christie Nelson, Postdoctoral Associate, CCICADA, Rutgers University, 96 Frelinghuysen Rd, 4th Floor, CoRE Building, Piscataway, NJ, United States of America, Christie.L.Nelson.PHD@gmail.com, Paul Kantor, Fred Roberts, Dennis Egan, Brian Ricks, Michael Tobia, Brian Nakamura, Ryan Whytlaw, Michael Young

Experimental designs are presented for walk through metal detectors (WTMDs) in stadium settings. Experiments were created to understand how WTMDs perform in real settings, typically outdoors, as opposed to idealized indoor lab scenarios. Experiments were then carried out at sports stadiums. Because of the large number of experimental factors involved, a combinatorial experimental design approach was taken.

3 - A Differential Privacy Mechanism for Graph Problems Protecting Confidential Network Data

William Pottenger, Rutgers University, 96 Frelinghuysen Road, CoRE Building, Piscataway, NJ, 08854, United States of America, billp@dimacs.rutgers.edu, Kunikazu Yoda

Graph problems are important for homeland security since most critical infrastructure such as a power grid can be modeled by a graph. Such network data often contains highly sensitive information and a publicly released summary must not give hints to terrorists who might exploit the data in developing targets. We present a differential privacy mechanism for graph problems whose solutions reveal useful global information while not revealing significant confidential individual information.

4 - Fusion Learning by Individual-to-Clique (FLIC): Efficient Approach to Enhancing Individual Inference

Minge Xie, Professor, Rutgers University, 501 Hill Center, Piscataway, United States of America, mxie@stat.rutgers.edu

Learning from multiple studies can often be fused together to yield a more effective inference. We present a new approach, named "Fusion Learning by Individual-to-Clique (FLIC)", to enhancing inference of an individual study through adaptive combination of confidence distributions obtained from its clique (namely similar studies). Drawing inference from the clique allows borrowing strength from similar studies to enhance the inference. It can also substantially reduce computational expense.

5 - The Unaccompanied Alien Children Challenge: Applying Queuing Theory to Improve Logistics in Immigration

Javier Rubio-Herrero, Rutgers University, Piscataway, NJ, United States of America, javier.rubioherrero@rutgers.edu

The recent wave of unaccompanied alien children that crossed the border of the United States posed a very important logistic challenge for the US DHS and US DHHS. In this presentation, Queuing Theory is presented as an option to forecast the performance of facilities aimed at carrying pre-screenings of these immigrants before their final placement in shelters. We present a mathematically tractable queuing model, illustrate its capabilities, and discuss opportunities that this approach offers.

Application of Scheduling Theory

Cluster: Scheduling and Project Management

Invited Session

Chair: Zhixin Liu, University of Michigan-Dearborn, 19000 Hubbard Drive, Dearborn, MI, United States of America, zhixin@umich.edu

1 - Optimization Based Production Scheduling with Batching

Lixin Tang, Professor, Northeastern University, Institute of Industrial Engineering and, Logistics Optimization, Shenyang, 110819, China, lixintang@mail.neu.edu.cn

We discuss the production scheduling problems with batching decision arising from steel, petrochemical and non-ferrous metal industry. For general problems, complexity and optimal solution properties are analyzed; polynomial time algorithm for solvable cases, and approximation algorithm with theoretical analysis for NP-hard problems are proposed. For complicated problems, row-column generation algorithm, LR&CG based dual algorithm, and improved Benders decomposition algorithm are proposed.

2 - An Optimization Model for Loan Collection

Ping He, Zhejiang University, 866 Yuhangtang Rd, Hangzhou, China, phe@zju.edu.cn, Zhongsheng Hua, Zhixin Liu

This paper studies how to make efficient collection decisions over consumer term-loan accounts. Since a loan's onset, an account experiences state transition across ages. We model the state transition of loan accounts using a Markov transition matrix, and provide optimization method to determine the collection action at each state and age for each consumer type that maximizes the lender's expected value. Managerial insights and general rules for consumer loan collection are recommended.

3 - Two-Agent Scheduling on a Single P-Batching Machine with Equal Processing Time and Non-Identical Job

Jun-Qiang Wang, Professor, Northwestern Polytechnical University, Box 554, No. 127 West Youyi Road, Department of Industrial Engineering, Xi'an, 710072, China, wangjq@nwpu.edu.cn, Cheng-wu Zhang, Yingqian Zhang, Guo-qiang Fan, Joseph Leung

We schedule two agents on a single parallel-batching machine. For the linear weighted sum model, we presented an approximation algorithm and analyze the absolute/asymptotic worst-case ratio. For the restriction model, no approximation algorithm with a finite bound exists, unless $P = NP$. We propose two polynomial-time heuristic algorithms using two restriction-solving strategies. For the non-domination model, we define a boundary of Pareto-optimal set. The proposed heuristics outperform NSGA-II.

4 - Vessel and Containing Planning in Feeder Lines

Yu Wang, PhD Candidate, Dept. of IELM, HKUST, Rm 5567, Academic Building, Clear Water Bay, Kowloon, 999077, Hong Kong - PRC, ywangbi@connect.ust.hk, Xiangtong Qi

We consider the vessel and container planning problem in feeder lines. A feeder vessel sequentially visits n ports, collecting containers from each port and transporting to hub port. The route of the vessel is pre-defined. The optimal serving policy for the vessel to load and unload under stochastic demand is investigated. The process is described as a Markov decision process, which aims to maximize the expected revenue. Furthermore, the optimal loading and unloading policy is derived.

1 - Tutorial: Collecting and Analyzing Twitter Data with Python

Chris Marks, MIT, 50 Memorial Drive, Cambridge, MA, 02139, United States of America, cemarks@mit.edu, Tauhid Zaman

We present a few methodologies and working libraries in Python that enable an analyst to retrieve information through the Twitter API and provide quick-turn exploratory analyses. These analyses include spatial analyses of data with geo-location, network analyses, and analyses of the timeline and scale of information cascades.

Asset Returns and Portfolio Management

Sponsor: Financial Services

Sponsored Session

Chair: Xianhua Peng, Assistant Professor, Hong Kong University of Science and Technology, Department of Mathematics, Hong Kong, Hong Kong - PRC, maxhpeng@ust.hk

1 - Three Fund Portfolio Rules and the Mean-variance-skewness Frontier

Luis Chavez-bedoya, Professor, ESAN University, Alonso de Molina 1652, Surco, Lima, Lima 33, Peru, lchavezbedoya@esan.edu.pe, John Birge

Assuming that asset returns follow a generalized hyperbolic (GH) distribution, we study the optimal solution of a particular portfolio optimization problem and relate it to common three-fund rules and to the mean-variance-skewness frontier of Mencia and Sentana (2009). Finally, we describe the optimal portfolio in terms of the location, dispersion and skewness parameters of the GH distribution.

2 - Jumps in Equity Returns Before and During the Recent Financial Crisis: A Bayesian Analysis

Haowen Zhong, Department of Industrial Engineering and Operations Research, Columbia University, 500 West 120th Street, New York, United States of America, hz2193@columbia.edu, Cindy Yu, Steven Kou

We attempt to answer two questions in this talk. (i) How did jumps in equity returns change after the 2008-2009 financial crisis? (ii) Can the performance of affine jump-diffusion models be improved if jump sizes are with tails heavier than those of the normal distribution?

3 - Separating Skilled and Unskilled Fund Managers by Contract Design

Sang Hu, Risk Management Institute, National University of Singapore, 21 Heng Mui Keng Terrace, Icub Building #04-03, Singapore, rmihsa@nus.edu.sg, Steven Kou, Xuedong He

Foster and Young (2010) shows that it is very difficult to design performance fee contracts that reward skilled fund managers while screening out unskilled fund managers. We show that (1) if there is a liquidation boundary, meaning that the fund investors liquidate their stake as soon as the fund returns hit the boundary, and (2) the fund manager has to use his/her own money to set up a deposit to offset the potential losses from investors, then skilled and unskilled managers can be separated.

4 - Optimal Exit Time from Casino Gambling: Why a Lucky Coin and a Good Memory Matter

Xuedong He, Assistant Professor, Department of Industrial Engineering and Operations Research, Columbia University, xh2140@columbia.edu, Xunyu Zhou, Sang Hu, Jan Obloj

We consider a dynamic casino gambling model and study the optimal strategy of a gambler with cumulative prospect theory (CPT) preferences. We develop a systematic and analytical approach to finding the gambler's optimal strategy, illustrate how Markovian strategies can be strictly improved by reviewing the betting history or by tossing an independent coin, and explain that the improvement generated by using randomized strategies results from the lack of quasi-convexity of CPT preferences.

Systemic Risk in Financial Networks

Cluster: Risk Management

Invited Session

Chair: Luitgard Veraart, Associate Professor, London School of Economics and Political Science, Houghton Street, London, WC2A 2AE, United Kingdom, L.Veraart@lse.ac.uk

1 - Control of Interbank Contagion under Partial Information

Andreea Minca, Cornell University, Ithaca, United States of America, acm299@cornell.edu

We consider a core-periphery financial network in which links lead to the creation of projects in the outside economy but make banks prone to contagion risk. The controller seeks to maximize the value of the financial system under partial information. Our results show that the value of the system depends on the connectivity in a non-monotonous way. It may be optimal to increase the rate of intervention in the peripheral banks rather than in core banks.

2 - The Joint Impact of Bankruptcy Costs, Fire Sales and Cross-holdings on Systemic Risk

Kerstin Awiszus, Leibniz Universität Hannover, Welfengarten 1, Hannover, 30167, Germany, awiszus@stochastik.uni-hannover.de, Stefan Weber

The paper presents a comprehensive model of a banking system that integrates network effects, bankruptcy costs, fire sales and cross-holdings. For the integrated financial market we prove the existence of a price-payment equilibrium and design an algorithm for the computation of the greatest and the least equilibrium. The number of defaults corresponding to the greatest price-payment equilibrium is analyzed in several comparative case studies.

3 - Systemic Risk Measures

Zachary Feinstein, Assistant Professor, Washington University in St. Louis, 1 Brookings Drive, CB 1042, St. Louis, MO, 63130, United States of America, zfeinstein@wustl.edu, Birgit Rudloff, Stefan Weber

We propose a framework for measuring systemic risk in terms of capital endowments of the financial firms. Their construction requires two ingredients: a cash flow or value model that assigns to the capital allocations of the entities in the system a relevant stochastic outcome, and an acceptability criterion, i.e. those outcomes that are acceptable from the point of view of a regulatory authority. Systemic risk is measured by the set of allocations of capital that lead to acceptable outcomes.

4 - A Bayesian Methodology for Systemic Risk Assessment in Financial Networks

Luitgard Veraart, Associate Professor, London School of Economics and Political Science, Houghton Street, London, WC2A 2AE, United Kingdom, L.Veraart@lse.ac.uk, Axel Gandy

We study the interbank market as a network in which the nodes represent banks and the directed edges represent interbank liabilities. In practice, the network of interbank liabilities is not fully observable. We present a Bayesian methodology to deal with this lack of information when performing stress tests on such interbank networks.

1 - An Efficient Branch-column-cut Algorithm for Capacitated Survivable Network Design

Richard Chen, Principal Member Of Technical Staff, Sandia National Laboratories, 7011 East Ave, Livermore, CA, 94550, United States of America, rlchen@sandia.gov, Cynthia Phillips

We consider a capacitated survivable network design problem that requires a feasible multicommodity flow to exist after any k edge failures. Existing approaches generate violated inequalities based on static failure scenarios. We present new valid inequalities that dynamically cover all failure scenarios pertaining to a given vulnerability. We then present a branch-column-cut algorithm and empirical studies on SNDlib and random instances to demonstrate the effectiveness of our approach.

2 - A Satellite Detection and Ranging System

Yupo Chan, University of Arkansas at Little Rock, 2801 S University Ave., Little Rock, AR, 72204-1099, United States of America, yxchan@ualr.edu, A. S. M. Sarwar Zahan, Po-hao Adam Huang, Edmond Wilson

A satellite detection and ranging system is proposed to track CubeSats for close-up operations. Two existing, promising signal-processing/image-processing algorithms have been identified. The first is for tracking satellites flying in formation. The second algorithm is used for tracking satellites for close-up operations such as inspection or docking, or simply being out of control. These two algorithms are modified and improved for deployment in the austere environment of outer space.

3 - A Network Server Assignment Problem under Attacks

Abdullah Konak, Professor, Penn State Berks, Tulpehocken Road, P.O. Box 7009, Reading, PA, 19610, United States of America, konak@psu.edu, Larry Snyder, Sadan Kulturel-Konak

We present the problem of server assignment in telecommunications networks to maximize the availability of critical network services under the presence of deliberate attacks. The problem is formulated as a bi-level optimization problem with two decision makers, the network designer and the attacker, on unreliable networks. A game theory-based genetic algorithm is proposed to solve the problem, and the convergence property of the proposed algorithm is discussed.

4 - A Biased Random-Key Genetic Algorithm for the Capacitated Minimum Spanning Tree Problem

Mauricio Resende, Principal Research Scientist, Amazon.com, 333 Boren Ave N, Seattle, Wa, 98109, United States of America, resendem@amazon.com, Efrain Ruiz, Maria Albareda, Elena Fernández

We describe a biased random-key genetic algorithm (BRKGA) for the capacitated minimum spanning tree (CMST) problem. We explore several solution encodings as well as different strategies for some steps of the algorithm. Computational experiments are presented showing the effectiveness of the approach: Seven new best-known solutions are presented for the set of benchmark instances used in the experiments. This paper was published in *Computers & Operations Research*, vol. 57, pp. 95-108, 2015.

distributed unevenly across the industry, with lower-end hotels and hotels not catering to business travelers being the most affected.

2 - Endogenous Slant and Revision in Online Production: The Case of Wikipedia

Feng Zhu, Harvard University, Harvard Business School, Soldiers Field, Morgan Hall 431, Boston, MA, 02163, United States of America, fzh@hbs.edu, Yuan Gu, Shane Greenstein

The diffusion of the Internet and digital media has increased the number of opportunities for individuals to collaborate with each other. One feature of this production model is that participants self-select into the production process. In this paper, we examine the potential ideological segregation in the crowd-sourced production model using data from Wikipedia. Our finding suggests that contributors with different ideologies engage in active dialogues with each other through their edits.

3 - Shopping in the Multi-screen World: How the Browsing Device Matters in Online Shopping

Quan Wang, PhD Student, Carnegie Mellon University, 4716 Ellsworth Ave, Apt. 514, Pittsburgh, PA, 15213, United States of America, quanw@andrew.cmu.edu, Beibei Li, Kaiquan Xu

Nowadays people are living in a multi-screen world where they move between devices such as smartphone, tablet, and PC on a regular basis. Understanding the multi-screen behavior becomes imperative for business practitioners as well as researchers. Using a unique data set with device specific clickstream information from Alibaba, we show how the browsing channels and the sequence of browsing pages reflect a consumer's goals, which would be helpful in predicting purchase conversion.

4 - All World's a Home – Analyzing the Hotel Industry's Response to Airbnb

Uttara Ananthakrishnan, umadurai@andrew.cmu.edu, Beibei Li, Michael D Smith

Sharing economy has empowered consumers to communicate their needs with one another and thus has helped them to assume the role of both suppliers and producers seamlessly. In this paper, using a natural experiment set up and a novel dataset, we analyze how Airbnb has impacted the traditional way of conducting the hotel business. We study if the hotels have responded to the increasing Airbnbs by increasing their quality and whether this response varies across different types of hotels.

Recent Theoretical and Computational Advances in Mixed Integer Programming

Sponsor: Optimization/Integer and Discrete Optimization
Sponsored Session

Chair: Manish Bansal, Postdoctoral Fellow, Department of Industrial Engineering and Management Science, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, manish.bansal@northwestern.edu

1 - Feasible Versus Infeasible Intersection Points for Cut Generation

Aleksandr Kazachkov, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, akazachk@cmu.edu, Francois Margot, Egon Balas

Generalized intersection cuts offer a non-recursive paradigm for cut generation in mixed-integer linear programs using a linear program formulated from a set of intersection points. Based on computational investigations, we identify characteristics of intersection points that lead to strong cuts.

2 - Generation of Feasible Integer Solutions on a Massively Parallel Computer

Utku Koc, Assistant Prof, MEF University, Ayazaga cad no:4, Maslak Sariyer, Istanbul, Turkey, utku.koc@mef.edu.tr, Sanjay Mehrotra

We present the results of an empirical study on heuristically generating feasible solutions for unstructured mixed integer linear programs in a parallel distributed memory high performance computing environment. The starting solutions of parallel subroutines are generated by rounding the most fractional k variables of an optimal solution of the relaxation. Extensive computational results up to 512 processors suggests that the improvement due to parallelization is statistically significant.

3 - Parallel Algorithms for MIP Feasibility

Lluís Miquel Munguía, Georgia Institute of Technology, 266 Ferst Drive, Room 1343, Atlanta, GA, 30332, United States of America, lluis.munguia@gatech.edu, Shabbir Ahmed, David A. Bader, George L. Nemhauser, Yufen Shao

We present highly parallelizable methods for obtaining feasible solutions to Mixed Integer Programming (MIP) instances. The use of several relaxations allows us to leverage parallelism to successfully obtain feasible solutions to large-scale instances. We give computational results that demonstrate the effectiveness of the parallel algorithms.

4 - Facets for Continuous Multi-mixing Set with General Coefficients and Bounded Integer Variables

Kiavash Kianfar, Associate Professor, Texas A&M University, TAMU 3131, College Station, TX, 77843-3131, United States of America, kianfar@tamu.edu, Manish Bansal

Bansal and Kianfar developed facet-defining inequalities for continuous multi-mixing set where the coefficients satisfy certain conditions. We first generalize their inequalities for the continuous multi-mixing set with general coefficients and show that they are facet-defining in many cases. Next, we introduce a family of valid inequalities for the continuous multi-mixing set with general coefficients and bounded integer variables, and investigate their facet-defining properties.

Strong Relaxations and Computations for Mixed Integer Nonlinear Programs

Sponsor: Optimization/Mixed Integer Nonlinear Optimization and Global Optimization

Sponsored Session

Chair: Jeff Linderoth, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706-1572, United States of America, linderoth@wisc.edu

1 - Convex Hull of Two Quadratic or a Conic Quadratic and a Quadratic Inequality

Sina Modaresi, Discover/University of Pittsburgh, 2402 W Beardsley Road, Phoenix, AZ, United States of America, sim23@pitt.edu, Juan Pablo Vielma

We consider an aggregation technique introduced by Yildiran [2009] to study the convex hull of regions defined by two quadratic or by a conic quadratic and a quadratic inequality. We show how this technique can be used to yield valid conic quadratic inequalities for the convex hull of sets defined by two quadratic or by a conic quadratic and a quadratic inequality. We also show that in many cases, these valid inequalities characterize the convex hull exactly.

2 - Relaxations and Heuristics for the General Multiple Nonlinear Knapsack Problem

Luca Mencarelli, CNRS LIX, Ecole Polytechnique, Palaiseau, 91120, France, mencarelli@lix.polytechnique.fr, Claudia D'ambrosio, Silvano Martello

We consider the multiple mixed-integer nonlinear knapsack problem. These problems are very difficult to solve, both from a theoretical and a practical viewpoint. We analyze different relaxations and extend known theoretical results for the multiple linear knapsack problem. Moreover, we propose fast constructive heuristic algorithms and a local search procedure.

3 - Recent Advances in CPLEX for Mixed Integer Nonlinear Optimization

Pierre Bonami, IBM, Santa Hortensia 26, Madrid, Spain, pierre.bonami@es.ibm.com, Andrea Tramontani

We present some of the new algorithmic techniques that have been recently added to the IBM CPLEX solver to address nonlinear optimization models. We focus in particular on mixed integer second order cone programming and quadratic optimization. We present extensive computational analysis to assess the performance gain from these techniques.

4 - Strong Convex Nonlinear Relaxations of the Pooling Problem

Jeff Linderoth, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706-1572, United States of America, linderoth@wisc.edu, Jim Luedtke, Claudia D'ambrosio

We investigate convex relaxations for the pooling problem. We characterize the extreme points of the convex hull of our non-convex set, and we derive valid nonlinear convex inequalities. Computational results demonstrate that the inequalities can significantly strengthen the convex relaxation of even the most sophisticated formulations of the pooling problem.

Uncertainty in Energy and Natural Resource Systems

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Alexandra Newman, Professor, Colorado School of Mines, Mechanical Engineering, Golden, CO, 80401, United States of America, anewman@mines.edu

1 - Complementarity Effects Between Wind and Hydro in the Context of Power Generation Scheduling

Anderson Rodrigo De Queiroz, Assistant Professor, Federal University of Itajubá, 1303 BPS Avenue, Itajubá, MG, 37500000, Brazil, ar_queiroz@yahoo.com.br, Saulo Ribeiro Silva, Luana Marangon Lima

We present a computational model able to determine the optimal economic generation scheduling in a system with hydro, thermal and wind power plants. Our model takes into account the stochastic nature of wind speed and its complementarity with water inflows. We use sampling-based decomposition algorithms to solve such model and present results for a case study. Our analysis suggests that complementarity is relevant and should be taken into consideration during the scheduling of generators.

2 - Global Thermal Coal Optimization under Uncertainty

Ashley Arigoni, PhD Candidate, Colorado School of Mines, 1500 Illinois St, Golden, CO, 80401, United States of America, aarigoni@mymail.mines.edu

Our objective is to minimize the cost to ship thermal coal to global fill demand while respecting import and export port capacities, ship size constraints, and coal specification requirements under spot market price uncertainty. Coal blending is allowed at demand nodes to meet coal specification requirements. We develop a two-stage stochastic model in which forward purchases are made before spot market uncertainties are realized.

3 - Mitigating Uncertainties with Stochastic Decomposition: Applications in Operations Management.

Yifan Liu, University of Southern California, 3715 McClintock Ave, GER 240, Los Angeles, CA, 90089, United States of America, yifanl@usc.edu, Suvrajeet Sen

Uncertainties are common in operation and production management. In this talk, we will discuss applying stochastic decomposition for solving a wide range of operations management applications including single period multi-products inventory problem, multi-location transshipment problem and process flexibility design problem. The first two problems are modeled as two-stage stochastic linear programs while the last one contains first stage binary variables.

4 - Quantifying Uncertainty in an Optimization Model using Exponential EPI-spline Density Estimation

Michael Teter, Ltc, Colorado School of Mines, Golden, CO, 80401, United States of America, mteter@mymail.mines.edu

Using a capital budgeting optimization model, we explore fusing hard and soft information through constrained nonparametric density estimation in order to quantify the uncertainty of the future. A comparison of solutions from data sets derived from traditional distributions and those derived from epi-splines demonstrate the benefits of nonparametric density estimation. These solutions prescribe a set of technologies in which the U.S. Army should invest to maximize effectiveness.

Topics in Dynamic Programming

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Francesca Maggioni, Assistant Professor, University of Bergamo, Via dei Caniana n 2, Bergamo, 24127, Italy, francesca.maggioni@unibg.it

1 - ADP for Risk-Averse Markov Decision Processes using Dynamic Quantile-Based Risk Measures

Daniel Jiang, Princeton University, Sherrerd Hall, Charlton Street, Princeton, NJ, 08540, United States of America, drjiang@princeton.edu, Warren Powell

We consider Markov decision process (MDP) for which the objective is to minimize a quantile-based risk measure of the sequence of future costs. In particular, we consider dynamic risk measures constructed using the one-step quantile (VaR) and the one-step conditional value at risk (CVaR). We propose simulation-based approximate dynamic programming (ADP) algorithms, modeled after Q-learning, and apply the algorithms in the context of an application in the energy market.

2 - Generalized Sequential Assignment Problem

Arash Khatibi, University of Illinois, 201 North Goodwin Avenue, Urbana, IL, United States of America, khatibi2@illinois.edu, Sheldon Jacobson

The Sequential Stochastic Assignment Problem (SSAP) assigns sequentially arriving tasks with stochastic parameters to workers with fixed success rates so as to maximize the total expected reward. This paper uses the Secretary Problem to propose assignment policies for the SSAP, when there is no prior information on task values. This paper also discusses the Doubly Stochastic Sequential Assignment Problem (DSSAP), which is an extension of SSAP with the workers' success rates assumed to be random.

3 - Stochastic Versus Dynamic Programming for a Transportation Procurement Problem

Francesca Maggioni, Assistant Professor, University of Bergamo, Via dei Caniana n 2, Bergamo, 24127, Italy, francesca.maggioni@unibg.it, Luca Bertazzi

We consider the problem of a producer which has to ship a load to a customer at discrete times and fixed horizon. Different companies offer a transportation price with realization available at the end of the time period. A penalty is paid for the quantity that remains to be sent. We consider two variants of the problem: the minimum expected cost and the min-max total cost. We compare the performance of stochastic and dynamic programming approaches. Theoretical worst-case results are provided.

4 - Data-driven Schemes for Resolving Misspecified MDPs: Asymptotics and Error Analysis

Hao Jiang, UIUC, 104 S. Mathews Ave., Urbana, IL, United States of America, jiang23@illinois.edu, Uday Shanbhag

We consider the solution of a finite-state infinite horizon Markov Decision Process (MDP) in which both the transition matrix and the cost function are misspecified, the latter in a parametric sense. Learning-enhanced value and policy iteration schemes are proposed and shown to be convergent almost surely. Finally, we present a constant steplength misspecified Q-learning scheme and provide an error analysis.

1 - A Stochastic Programming Model for Nurse Staffing in Post-Anesthesia Recovery Units

Yueling Loh, Johns Hopkins University, 3400 North Charles Street, Baltimore, MD, 21218, United States of America, yueling.loh@gmail.com, Sauleh Siddiqui, Daniel Robinson

We present a stochastic programming model to determine nurse staffing requirements in Post-Anesthesia Recovery Units under high variability in patient flow and length-of-stay. We will formulate the problem as a two-stage stochastic mixed integer program and provide some numerical results.

2 - Distributed Parallel Coordinate Descent Methods for Sparse Inverse Covariance Problem

Seyedalireza Yektamaram, Lehigh University, Mohler Laboratory, 200 West Packer Ave, Bethlehem, PA, 18015, United States of America, sey212@lehigh.edu, Katya Scheinberg

In graphical models, recovering the structure of underlying graph corresponding to conditional dependencies of random variables is of great importance, which is obtained by recovering the corresponding Sparse Inverse Covariance matrix. However, as the problem size grows larger, efficiency of most solution approaches reduce significantly, thus using distributed parallel techniques becomes essential. Here we explore distributed parallel coordinate descent methods to solve this problem efficiently.

3 - A Nonconvex Nonsmooth Optimization Algorithm with Global Convergence Guarantees

Frank E. Curtis, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, frank.e.curtis@gmail.com, Xiaocun Que

An algorithm for minimizing nonconvex nonsmooth objective functions is presented. The algorithm is based on a BFGS strategy, enhanced with gradient sampling mechanisms to ensure convergence to a stationary point with probability one. An open source C++ implementation of the algorithm is also described along with results for a set of test problems.

Sponsored Session

Chair: Jiming Peng, Associate Professor, University of Houston, UH, Dept of Industrial engineering, Engineering Bldg 2 221A., Houston, TX, 77204, United States of America, jopeng@Central.UH.EDU

1 - Dropconnect in Deep Learning via Lagrangian

Diego Klabjan, Professor, d-klabjan@northwestern.edu, Mark Harmon

Dropconnect is a regularization technique for deep neural nets when random weights are enforced to be zero. We present a Lagrangian-based algorithm for restricting weight values.

2 - New Global Algorithm for Linearly Constrained Quadratic Programming

Jiming Peng, Associate Professor, University of Houston, UH, Dept of Industrial engineering, Engineering Bldg 2 221A., Houston, TX, 77204, United States of America, jopeng@Central.uh.edu

How to find the global optimal solution to LCQP has been a long-standing challenge in optimization. In this talk, we introduce a new design framework for LCQP that integrates several simple effective optimization techniques such as Lagrangian methods, Alternate update method, convex relaxation, initialization and partitioning. We establish the global convergence of the algorithm and estimate its complexity. Promising numerical results for large-scale LCQPs will be reported.

3 - An Optimization Perspective on Systemic Risk

Aein Khabazian, PhD Student/research Assistant, University of Houston, UH, Dept of Industrial engineering, Engineering Bldg 2, Houston, TX, 77204, United States of America, akhabazian@uh.edu, Jiming Peng, Aida Khayatian

We consider the issue of assessing the systemic risk under uncertainty in a financial system based on the model proposed by Eisenberg and Noe, in which the interbank liabilities are assumed to be known, and the non-interbank assets are assumed to be constant. However, in real world application this information is typically unknown or subject to market fluctuation. In this regard, we develop robust optimization and worst case optimization to account for the uncertainties in the constraints.

Chair: Vladimir Stozhkov, University of Florida, 2330 SW Williston Rd Apt 2826, Gainesville, FL, 32608, United States of America, vstozhkov@ufl.edu

1 - A Distributed Hierarchical Shortest Path Algorithm for Large-Scale Transportation Networks

Ala Alnawaiseh, Postdoctoral Researcher, Southern Methodist University, 3101 Dyer St., #219, Dallas, TX, 75205, United States of America, aalnawai@smu.edu, Khaled Abdelghany, Hossein Hashemi

This paper presents a distributed hierarchical shortest path algorithm for large-scale transportation networks. The algorithm integrates a network augmentation as well as a divide-and-conquer techniques to solve the all-to-all shortest path problem in a distributed fashion. Preliminary results that illustrate the superiority of the algorithm are presented.

2 - How to Design an Effective Off-hour Delivery (OHD) Program: A Network Design Perspective

Sevgi Erdogan, Faculty Research Associate, University of Maryland-NCSG, 1112 J Preinkert Field House, College Park, MD, 20742, United States of America, serdogan@umd.edu, Jiangtao Liu, Wenbo Fan, Xuesong Zhou

The OHD has been considered as an effective policy to overcome the negative externalities like congestion due to freight traffic in urban areas during business hours. This study proposes a network design approach to determine links to be restricted for truck traffic to shift truck demand to off-hours and routes to less congested areas so that the maximum benefit from an OHD program can be achieved. The approach will guide cities in implementing effective OHD programs.

3 - Evacuation Modeling and Betweenness Centrality

Chrysafis Vogiatzis, Assistant Professor, North Dakota State University, 1410 14th Avenue North, Room 202 Civil & Industrial Engineering, Fargo, ND, 58102, United States of America, chvogiat@ufl.edu

Disaster management and evacuation modeling are vital for the welfare of modern urban societies. However, it is true that evacuating large urban areas is a very difficult problem due to the large scale of operations and the dynamic nature of most hazard phenomena. In this talk, we present two novel islanding techniques with the goal of decomposing large-scale network problems to smaller ones of manageable size. Computational results are also presented to show the success of our methodologies.

4 - Variable Versus Fixed Congestion Pricing under Day-to-Day Traffic Dynamics

Zhengtian Xu, University of Florida, 511 Weil Hall, Gainesville, FL, 32611, United States of America, zhengtianxu@ufl.edu, Yafeng Yin

This paper compares the effectiveness of fixed and variable congestion pricing on evolving network flows to a target flow distribution under day-to-day traffic dynamics. Fixed pricing charges constant tolls while variable pricing updates tolls every day based on recent days' traffic conditions. The paper proves that the latter does not necessarily perform better than the former and provides conditions when this situation arises. Numerical experiments are presented to demonstrate the comparison.

5 - Vulnerability Modeling and Analysis of Complementary Transportation Systems

Liu Hong, Associate Professor, Huazhong University of Science and Technology, Room W.308, South 1, 1037#, Luoyu Road,, Wuhan, China, liu.hong.science@gmail.com, Min Ouyang, Xiaozheng He

This paper proposes a network-based approach to model and analyze the vulnerability of complementary transportation systems, with main focus on quantifying their complementary strength, assessing dynamic vulnerability and discussing critical components. Two level complementary systems are used to illustrate the tractability and effectiveness of the proposed method, including railway and airline system in China (national level), metro and bus system in Wuhan city in China (Urban level).

1 - Block Coordinate Stochastic Gradient Method

Yangyang Xu, University of Minnesota, Institute of Math and Application, Minneapolis, MN, United States of America, xuyang.gucas@gmail.com, Wotao Yin

Stochastic gradient (SG) can quickly solve a problem with many components in the objective to a moderate accuracy, and block coordinate descent (BCD) method can quickly solve problems with multiple (blocks of) variables. In this talk, we will introduce a block stochastic gradient (BSG) method that combines SG and BCD for problems with many components in the objective and with multiple blocks of variables. We will show its convergence and demonstrate its superiority over SG and BCD.

2 - Proximal Methods for Sparse Discriminant Analysis

Brendan Ames, Assistant Professor, University of Alabama, Department of Mathematics, Box 870350, Tuscaloosa, AL, 35487, United States of America, bpames@ua.edu

We consider the problem of simultaneously performing classification and feature selection in the high-dimension, low sample size setting, where the number of features of our data is large while the number of samples is limited. In particular, we propose an alternating direction method for performing optimal scoring-based linear discriminant analysis with a sparseness criterion, where proximal gradient methods are used to update the decision variables in the alternating direction framework.

3 - Iteration Complexity Analysis of Block Coordinate Descent Methods

Mingyi Hong, Iowa State University, 3015 Black Engineering, Ames, IA, 50011, United States of America, mingyi@iastate.edu

We provide a unified iteration complexity analysis for a family of block coordinate descent methods. We unify these algorithms under the so-called Block Successive Upper-bound Minimization framework, and show that they achieve a global sublinear iteration complexity. Moreover, for the case of block coordinate minimization where each block is minimized exactly, we establish the sublinear convergence rate of $O(1/r)$ without per block strong convexity assumption.

4 - Self Equivalence of the Alternating Direction Method of Multipliers

Ming Yan, Assistant Professor, Michigan State University, 220 Trowbridge Rd, East Lansing, MI, 48824, United States of America, yanm@math.ucla.edu

In this talk, we show that ADM applied to a primal formulation is equivalent to ADM applied to its Lagrange dual; ADM is equivalent to a primal-dual algorithm applied to the saddle-point formulation of the same problem. In addition, when one of the two objective functions is quadratic, we show that swapping the update order of the two primal variables in ADM gives the same algorithm.

Computational Data Analytics

Sponsor: Computing Society
Sponsored Session

Chair: Dorit Hochbaum, University of California, IEOR, "Etcheverry Hall, Berkeley, CA, 94720, United States of America, dhochbaum@berkeley.edu

1 - Improved Algorithms Solving Generalizations of Isotonic Median Regression

Cheng Lyu, University of California, 4141 Etcheverry Hall, Berkeley, CA, 94720, United States of America, chenglu@berkeley.edu, Dorit Hochbaum

Isotonic median regression (IMR) problem is a well-known statistical nonparametric regression problem. We address here generalizations of IMR for which we devise efficient algorithms. Our algorithms improve on the best previously known complexity for the special case of IMR. Some applications of independent interest of the generalized problems include total variation on a path, signal processing, and nearly-isotonic regression.

2 - Big Data Aggregation and Truncation by Pseudo-boolean Polynomials

Boris Goldengorin, C. Paul Stocker Visiting Professor, Ohio University, 283 Stocker Center, Athens, OH, United States of America, goldengorin@gmail.com

In this talk we show how to aggregate and truncate the numerical data in huge m (rows) times n (columns) tables by means of ordering the entries within their columns in a non-decreasing (non-increasing) order. The ordered columns can be represented by the corresponding permutations and differences between the neighboring entries. Our computational study shows that for complete networks containing thousands of vertices we are able to reduce the number of entries by more than 90%.

3 - Adjacency-clustering for Yield Prediction in Integrated Circuit Manufacturing (ICM)

Dorit Hochbaum, University of California, IEOR, Etcheverry Hall, Berkeley, CA, 94720, United States of America, dhochbaum@berkeley.edu, Sheng Liu

Accurate yield prediction in ICM enables early detection of processing problems. It is noted that defects tend to be clustered and a circuit likely to be defective if its neighbors are defective. This Neighborhood Effect NE is not captured in traditional spatial modeling approaches. We model the yield prediction problem with NE as a Markov Random Field model (MRF). A comparison with leading approaches (GLM and GLMM) demonstrates that MRF provides superior accuracy and time complexity.

Queueing with Redundancy for Cloud Computing

Cluster: Cloud Computing

Invited Session

Chair: Mor Harchol-Balter, Professor, Carnegie Mellon University, Computer Science Dept., 5000 Forbes Ave., Pittsburgh, United States of America, harchol@cs.cmu.edu

1 - Exact Queueing Analysis of Redundancy-d Systems

Mor Harchol-Balter, Professor, Carnegie Mellon University, Computer Science Dept., 5000 Forbes Ave., Pittsburgh, United States of America, harchol@cs.cmu.edu, Kristen Gardner, Sam Zbarsky, Alan Scheller-wolf

Recent cloud research has proposed using redundant requests to reduce latency by copying a request to multiple servers and waiting for only one copy to complete. We study the Redundancy-d system, in which each arriving job sends copies to d randomly selected servers. We provide the limiting state distribution. We also derive the exact mean response time in this system for any number of servers and any degree of redundancy.

2 - Scaling Redundancy to Many-server Systems

Kristen Gardner, PhD Student, Carnegie Mellon University, Computer Science Dept., 5000 Forbes Ave., Pittsburgh, PA, 15213, ksgardne@cs.cmu.edu, Mor Harchol-Balter, Alan Scheller-wolf, Sam Zbarsky

This talk is a continuation of the previous talk on the Redundancy-d system. Here, we study the system in the limit as the number of servers approaches infinity. We derive the full response time distribution and use this result to discuss the effect of the number of copies per job on response time.

3 - Optimal Scheduling of Partially Replicated Jobs

Rhonda Righter, Professor, University of California, Berkeley, IEOR, UC, Berkeley, CA, 94720, United States of America, righter@berkeley.edu, Mor Harchol-Balter, Esa Hyytia

We consider systems in which there is a mix of tasks that can be replicated and tasks that cannot. We explore the effect of the amount of replication on latency, and find the optimal service discipline in the presence of partial replication.

4 - Analysis and Routing in Parallel Queues with Class-based Redundancy

Leela Nageswaran, PhD Candidate, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, United States of America, lnageswa@andrew.cmu.edu, Alan Scheller-wolf

We study the performance of two parallel queues when some customers are redundant: a redundant customer joins both queues and is considered served when any one of his requests finishes service, instantly removing the other one. We examine the policy other (non-redundant) customers use to join a queue upon arrival. We find that while joining the shortest queue does not always minimize delay if the entire state information is available, it is optimal if only the queue lengths are observable.

Natural History Modeling for Medical Decision Making

Sponsor: Health Applications

Sponsored Session

Chair: Julie Hagle, Professor And Chair, University of Southern California, Epstein Dept of Indus & Sys Eng, Los Angeles, CA, 90089, United States of America, hagle@usc.edu

1 - Developing and Validating Markov Decision Processes for Chronic Diseases

Brian Denton, Associate Professor, University of Michigan, 1205 Beal Ave, Ann Arbor, United States of America, btdenton@umich.edu

Chronic diseases are the leading cause of death in many countries including the United States. Building models for chronic diseases can be challenging because of the need to characterize severity of the disease, uncertainty in disease progression, and a potentially large number of strategies for screening and treatment. In this talk I will discuss my experiences in developing Markov decision processes (MDPs) for optimization of disease screening and treatment decisions in several contexts.

2 - Challenges and Opportunities for Developing Natural History Models

Oguzhan Alagoz, UW-Madison, 3242 Mechanical Engineering Building, 1513 University Avenue, Madison, WI, 53706, United States of America, alagoz@engr.wisc.edu

Natural history of a disease, which represents the onset and progression of a disease without an intervention, provides critical inputs for operations research models in health care. In this presentation, we will share our experiences in developing natural history models for various diseases including end-stage liver diseases and breast cancer.

3 - Robust Parameter Selection for Natural History Models

Julie Hagle, Professor And Chair, University of Southern California, Epstein Dept of Indus & Sys Eng, Los Angeles, CA, 90089, United States of America, hagle@usc.edu, Suvrajeet Sen

Natural history models are often used to facilitate an understanding of the potential impact of disease screening and/or treatment options. We consider a method for calibrating a natural history model that explicitly considers uncertainties in the calibration targets. The calibration model is designed to yield a robust parameter selection, especially with respect to medical decisions that result.

4 - Modeling Ductal Carcinoma in Situ (DCIS)

Shadi Hassan Goodarzi, PhD Student, North Carolina State University, Fitts Dept of ISE, Raleigh, No, 27695, United States of America, shassan3@ncsu.edu, Julie Ivy

Ductal Carcinoma In Situ (DCIS) is arguably a direct precursor of invasive breast cancer. Approximately 14–53% of DCIS turn into IBC, after long follow-up periods. So about 47%-86% of the DCIS cases are over diagnosed and as a result, treatment can only cause harm for these patients. This framework will allow us to study the progression of DCIS into IBC more clearly and as a result aid both patients and doctors in decision making.

Queues in Heavy-Traffic: Approximations and Control

Sponsor: Applied Probability

Sponsored Session

Chair: Yunan Liu, Assistant Professor, North Carolina State University, 111 Lampe Drive, #400, Raleigh, No, 27695, United States of America, yunan_liu@ncsu.edu

1 - A Many-Server Heavy-Traffic Limit for the Overloaded $G_t/GI/n+GI$ Queue

Ahmet Korhan Aras, North Carolina State University, 307 Daniels Hall, Raleigh, NC, United States of America, akaras@ncsu.edu, Yunan Liu, Xinyun Chen, Ward Whitt

We establish a many-server heavy-traffic FCLT for key performance processes such as potential waiting time, number of abandonment and queue length for the $G_t/GI/n+GI$ queue in the overloaded regime. We obtain a stochastic differential equation driven by a Gaussian process in the limit for the scaled waiting time process. The Gaussian limit and Gaussian integral appear in the limit of the departure process which is not a Brownian motion when the service distribution is not exponential.

2 - Diffusion Approximation for Efficiency-driven Queues: A Space-time Scaling Approach

Shuangchi He, National University of Singapore, National University of Singapore, Singapore, heshuangchi@nus.edu.sg

Using a scaling approach in both space and time, we obtain a diffusion model for the virtual waiting time process in a $GI/GI/n+GI$ queue in the ED regime. Besides the commonly used scaling in space by the number of servers, we also change the time scale by using the mean patience time as the factor. This approach leads to a simple one-dimensional diffusion limit, enabling us to obtain useful performance formulas such as the distributions of the steady-state virtual waiting time and queue length.

3 - Non-markovian State-dependent Networks in Critical Loading

Chihoon Lee, Stevens Institute of Technology, Howe School of Technology Management, Hoboken, NJ, United States of America, chihoon@stat.colostate.edu, Anatolii Puhalskii

We establish a heavy traffic limit theorem for the queue-length process in a critically loaded single class queueing network with state-dependent arrival and service rates. A distinguishing feature of our model is non-Markovian state dependence. The limit stochastic process is a continuous-path reflected process on the nonnegative orthant. We give an application to a generalised Jackson network with state-dependent rates.

4 - Gaussian Limits for Many-server Queues with Arrival Dependent Services

Guodong Pang, Assistant Professor, Penn State University,
363 Leonhard Bldg, University Park, PA, 16802,
United States of America, gup3@engr.psu.edu, Yuhang Zhou

We consider many-server queues whose service time distributions depend on the arrival times. We prove heavy traffic limits for the queue length processes in the many-server regimes. We obtain Gaussian approximations for the transient distributions of queue lengths in these systems.

Online Search, Social Network and Advertisement

Sponsor: Information Systems

Sponsored Session

Chair: Harpreet Singh, University of Texas at Dallas, 800 West Campbell Road, Richardson, United States of America, Harpreet@utdallas.edu

1 - Distances and Brands: An Empirical Analysis of Mobile Local Search

Yi-jen Ho, PhD Candidate, University of California, Irvine,
Merage School of Business, Irvine, CA, 92617, United States of
America, hoy1@uci.edu, Sanjeev Dewan

In this paper, we study mobile local search, focusing on user click-through behavior as a function of distance, search rank and brand popularity. We implement a hierarchical Bayes model on a unique data of local search data from a major mobile carrier. We find CTR is positively related to brand popularity, search rank and screen position (e.g., above or below the scroll) while negatively related to distance.

2 - A Dynamic Social Network Advertisement Allocation in a Fuzzy Multi-Segmented Environment

Yingying Kang, Principal Or Consultant, Sabre Inc.,
1409 Huntington Dr, Richardson, TX, 75080,
United States of America, eing.008@gmail.com

Advertisement is a major contribution to the revenue of social network sites. Therefore, how to optimally allocate the advertisements in the social network is significant. Advertisers tend to post ads on highly influential sites with no fixed schedule, which adds the complexity in managing the advertiser segmentation. This presentation introduces a dynamic advertisement allocation model based on the fuzzy multi-advertiser segmentation and generates the maximum revenue for

the network.

3 - Inferring Demographic Attributes of Users from Web Browsing History

Satish V, Sr. Data Scientist, Maxpoint Interactive,
3020 Carrington Mill Blvd, Morrisville, United States of America,
vsatish@gmail.com

Demographic information such as gender, age, income etc. of online users can make digital advertisements more personalized to users. However, such information not available when advertising through online ad exchange networks. In this talk we present a probabilistic framework to infer these demographic data using aggregate domain-level data and user-level web browsing behavior. Simulation and validation using ground-truth data showed the model accuracy to be over 80%.

Industry Job Search Panel

Cluster: INFORMS Career Center

Invited Session

Chair: Warren Hearnes, cardlytics, whearnes@cardlytics.com

1 - Industry Job Search Panel

Moderator: Warren Hearnes, cardlytics,
whearnes@cardlytics.com, Panelists: Adam McElhinney, Beverly
Wright, Aly Megahed

Do you have an interest in applying your analytical skills in industry? Come learn more about the process for landing that opportunity and what it's like to work as an operations research practitioner. The panelists will discuss their perspectives on the industry job search/interview process, typical roles and expectations for a practitioner, as well as give advice and answer questions from the audience based on their experience in a variety of verticals such as marketing, manufacturing, fin-tech, consulting, and private research. Panelists include Adam McElhinney, Director of Data Science at Uptake (Chicago), Dr. Aly Megahed, Research Staff Member at IBM Research (San Francisco), and Dr. Beverly Wright, Managing Director of the Business Analytics Center at Georgia Tech (Atlanta). The panel is moderated by Dr. Warren Hearnes, Vice President of Analytics & Data Sciences at Cardlytics (Atlanta)..

MCDM in Agriculture

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Jay Parsons, Associate Professor, University of Nebraska, 208A Filley Hall, P.O. Box 830922, Lincoln, Ne, 68583-0922, United States of America, jparsons4@unl.edu

1 - An Overview of Multi-criteria Decision Making Methods Applied to Agricultural Problems

Jay Parsons, Associate Professor, University of Nebraska, 208A
Filley Hall, P.O. Box 830922, Lincoln, Ne, 68583-0922,
United States of America, jparsons4@unl.edu

Examples of multiple criteria decision making in agriculture abound over many years and many topics including but not limit to: land use decisions; genetic selections; environmental trade-off assessments; irrigation applications; crop rotation analysis; and, risk-return trade-off analysis. This presentation will provide an overview of MCDM applied to agriculture with a focus on recent publications with the hope of stimulating conversation and future MCDM research in agriculture.

2 - Intensive Dairying vs. Dairy Farm Eco-Efficiency: A Study with DEA and Structural Equation Modeling

Andreas Soteriades, PhD Student, Scotland's Rural College,
SRUC, King's Buildings, West Mains Road, Edinburgh, EH9 3JG,
United Kingdom, Andreas.Soteriades@sruc.ac.uk,
Philippe Faverdin, Alistair Stott

We studied the relationship between the eco-efficiency (EE), intensification (I) and autonomy (A) of French specialized dairy farms. We created composite EE, I and A indicators with Life Cycle Analysis, Data Envelopment Analysis and Structural Equation Modeling. The results showed a significant negative relationship between EE and I; and an insignificant one between EE and A. Our findings suggest that intensive dairy production might not compromise the environment.

3 - Engineering Sustainable Complex Coevolutionary Agricultural Systems

Dr Alejandro N. Martinez-Garcia, Professor, Instituto Tecnológico del Valle de Morelia-Tecnológico Nacional de México, km 6.5 Carretera Morelia-Salamanca s/n, Col. Los Angeles, Morelia, 58100, Mexico, alejandro.martinez.garcia@gmail.com

Achieving sustainability (including food security) under the dynamic conditions of climatic change, increasing human population, and poverty reduction, while preserving the ability of ecosystems to provide the services on which humanity depends, implies the need for solving multi-objective optimization problems, under a new paradigm: sustainable complex coevolutionary systems engineering.

4 - A Multi-objective Mathematical Programming Analysis of Forest Carbon Management

Midhun Mohan (Mickey), Graduate Student Researcher, North Carolina State University, 15404 Bragaw Hall, Raleigh, NC, 27607, United States of America, mmohan2@ncsu.edu, Henrique Scolforo, Jean Chung, Juan Posse, Tiantian Shen, Bruno Kanieski, Joseph Roise, Glenn Catts, Kevin Harnish

This study analyzes the valuation and production possibilities on a working forest using Multi-objective programming, Woodstock, Timber NPV, and Carbon Storage and Sequestration, and present a forest management model for optimizing Net Present Value (NPV) and carbon sequestration at Hofmann forest.

Advances in Auction Theory

Cluster: Auctions

Invited Session

Chair: Benjamin Lubin, Asst. Professor, Boston University, 595 Commonwealth Ave, 621A, Boston, Ma, 02215, United States of America, blubin@bu.edu

1 - Are you going to do that? Contingent-payment Mechanisms to Improve Coordination

David C. Parkes, Professor, Harvard University, Cambridge, MA, United States of America, parkes@eecs.harvard.edu, Hongyao Ma, Reshef Meir, James Zou

We consider coordination problems, such as allocating the right to use a shared sports facility or picking the time of a meeting. Outcomes are designated as either good or bad (is the facility used, will people show up?), and the goal is to attain good outcomes. Reports in period zero about agents' uncertain values are used to design a choice set for agents in period one, defining also payments that depend on agents' actions (e.g., using the facility.)

2 - Efficient Interdependent Value Combinatorial Auctions with Single Minded Bidders

Valentin Robu, Assistant Professor, Heriot-Watt University, Edinburgh, School Eng. & Physical Sciences, EM3.15, Riccarton Campus, Edinburgh, EH144AS, United Kingdom, V.Robu@hw.ac.uk, David C. Parkes, Takayuki Ito, Nicholas R. Jennings

We study the design of efficient auctions where bidders have interdependent values, that depend on signals of other bidders. In particular, we consider a contingent bid model in which bidders may explicitly condition the value of their bids on the bids submitted by others. We derive constraints which allows the efficient second price, fixed point auction to be implemented in single-minded CAs, and present an alternative mechanism for cases in which the required single crossing condition fails.

3 - New Core-selecting Payment Rules with Better Fairness and Incentive Properties

Sven Seuken, Assistant Professor Of Computation And Economics, University of Zurich, Binzmühlestrasse 14, Zurich, ZH, 8050, Switzerland, sven.seuken@gmail.com, Benjamin Lubin, Benedikt Bönz

We introduce four "Small" rules, which are new core-selecting payment rules for combinatorial auctions. Via a Bayes-Nash equilibrium analysis, we first show for a domain with 2 goods and 3 bidders, that one of our rules outperforms the state-of-the-art Quadratic rule along all dimensions (efficiency, incentives, fairness, and revenue). We then use a computational approach to evaluate 85 different rules in a setting with 25 goods and 10 bidders, and show that our new rules still perform best.

4 - A Faster Algorithm for Computing Prices in Core-selecting Combinatorial Auctions

Benjamin Lubin, Asst Professor, Boston University, 595 Commonwealth Ave, 621A, Boston, Ma, 02215, United States of America, blubin@bu.edu, Benedikt Bunz, Sven Seuken

We present a new, faster algorithm for the computationally hard problem of pricing core-selecting combinatorial auctions. First, we provide an alternative definition of the core using weakly stronger constraints. Using these, we offer two new algorithmic techniques that 1) exploit separability in allocative conflicts between bidders, and 2) leverage non-optimal solutions. Using large auction instances we show that our algorithm is between 2 and 4 times faster than the current state of the art.

Baseball Analytics

Sponsor: Analytics

Sponsored Session

Chair: Sean Barnes, University of Maryland, 4352 Van Munching Hall, University of Maryland, College Park, MD, 20742, United States of America, sbarnes@rhsmith.umd.edu

Co-Chair: Margret Bjarnadottir, Assistant Professor of Management Science and Statistics, Robert H. Smith School of Business, University of Maryland, 4324 Van Munching Hall, College Park, MD, 20742, United States of America, margret@rhsmith.umd.edu

1 - The Effectiveness of Dynamic Pricing Strategies on Single-game Ticket Revenue in Baseball

Joseph (Jiaqi) Xu, The Wharton School, University of Pennsylvania, 3730 Walnut Street, Suite 500, Philadelphia, PA, United States of America, jiaqixu@wharton.upenn.edu, Peter Fader, Senthil Veeraraghavan

We develop a comprehensive demand model for single-game tickets that can be used to predict revenue associated with a particular pricing strategy over the course of sport season. We apply the model to actual sales and pricing data from an anonymous MLB franchise during a recent baseball season and evaluate the effectiveness of the dynamic pricing policy. We propose pricing heuristics and find that optimized dynamic pricing policy can improve revenue by 14.3% compared to a flat pricing policy.

2 - Pitch Sequence Complexity and Long-Term Pitcher Performance

Joel Bock, Booz Allen Hamilton, 901 15th Street NW, Washington, DC, United States of America, sauerkraut@gmail.com

Patterns of a baseball pitcher's pitch type sequencing can be learned by machine learning models trained on historical data. Individual pitch-wise predictability is connected with broader performance statistics (ERA, FIP) by a regression model that may be used to forecast player performance. Less complexity correlates with higher values of ERA and FIP. This talk outlines the analytical approach and presents results from a study of Major League Baseball pitchers covering three recent seasons.

3 - The Value of Positional Flexibility

Timothy Chan, University of Toronto, 5 King's College Road, Toronto, ON, M5S 3G8, Canada, tcychan@mie.utoronto.ca, Douglas Fearing

Drawing from the theory of production flexibility in manufacturing networks, we provide the first optimization-based analysis of the value of positional flexibility (the ability of a player to play multiple positions) for a major league baseball team in the presence of injury risk. Using publicly available data on baseball player performance, we derive novel baseball-related insights that can be generalized to the manufacturing context.

4 - A Bayesian Hierarchical Model for Modeling Called Strikes in Major League Baseball

Abraham Wyner, Professor, University of Pennsylvania, The Wharton School, University of Pennsylvania, 400 JMH, Philadelphia, Pe, 19104, United States of America, ajw@wharton.upenn.edu, Sameer Deshpande

We measure a catcher's ability to "frame" a pitch. The effect exists, but there remains debate on the effect size. We introduce a systematically constructed, parametric Bayesian hierarchical model for the probability of a called strike. Our model adjusts, accounts borrows strength from data on all participants. By sharing information across all participants we are able to accurately quantify the player's framing effect on a pitch and translate that effect into runs added across a season.

1 - Co-clustering Based Dual Prediction for Cargo Pricing Optimization

Yada Zhu, Research Staff Member, IBM, Thomas J. Watson Research Center, 1101 Route 134 Kitchawan Rd, Yorktown Heights, NY, 10598, United States of America, yzhu@us.ibm.com

In the air cargo business, given the features associated with a pair of origination and destination, how can we simultaneously predict both the optimal price for the bid stage and the outcome of the transaction (win rate) in the decision stage? In this paper, we propose a probabilistic framework and a COCOA algorithm to simultaneously construct dual predictive models and uncover the co-clusters of originations and destinations.

2 - An Efficient Orthogonal-polynomial-based Approach for Time Series Representation and Prediction

Shouyi Wang, Assistant Professor, University of Texas at Arlington, 3105 Birch Ave, Grapevine, TX, 76051, United States of America, shouyiw@uta.edu

We present a new efficient time series representation and prediction framework, called orthogonal-polynomial-based variant-nearest-neighbor (OPVNN) approach, for complex and highly nonlinear time series data. The proposed approach achieved the most robust prediction performance compared to the state-of-the-art time series modeling and prediction methods for the challenging respiratory motion prediction problem. It has a great potential to handle complex time series data streams efficiently.

3 - Online Social Network (OSN) Fake Account Detection System with Cluster Level Features

Danica Xiao, PhD Candidate, University of Washington, Seattle, 3900 Northeast Stevens Way, Seattle, WA, 98195, United States of America, xiaoc@uw.edu

Most online social networks (OSN) are often faced with users with undesired activities during the network’s growth and expansion. Most of them are malicious. Many of malicious activities start with fake accounts (aka “sybil accounts”) attack. This paper presents a supervised learning based system to address such challenge.

4 - Unsupervised Data Mining for Medical Fraud Detection

Tahir Ekin, Assistant Professor, Texas State University, 601 University Dr. McCoy Hall 411, San Marcos, TX, 78666, United States of America, t_e18@txstate.edu, Greg Lakomski, Rasim Muzaffer Musal

U.S. governmental agencies report that three to ten percent of the annual health care spending is lost to fraud, waste and abuse. These fraudulent transactions have direct cost implications to the tax-payers, in addition to diminishing the quality of the medical services. This talk discusses the use of unsupervised data mining approaches such as latent Dirichlet allocation for medical fraud detection. Our main objective is to identify the billing behaviors and find providers that are outliers.

Computational and Statistical Challenges in Big Data Genomics

Cluster: Big Data Analytics in Computational Biology/Medicine

Invited Session

Chair: Li-San Wang, Associate Professor, University of Pennsylvania, 423 Guardian Drive, 1424 Blockley Hall, Philadelphia, PA, 19104, United States of America, lswang@upenn.edu

1 - Big Data Analyses Reveal Many New Short Non-coding RNAs in Health and Disease

Isidore Rigoutsos, Professor, Computational Medicine Center, Jefferson Medical College, Thomas Jefferson University, 1020 Locust Street, Suite #M81, Philadelphia, PA, 19108, United States of America, isidore.rigoutsos@jefferson.edu

By analyzing transcriptomic datasets from healthy individuals and patients we have uncovered numerous novel regulatory non-coding RNAs. These molecules include novel microRNAs, isoforms of microRNAs, fragments of transfer RNAs (tRNAs), and other. Importantly, we find that these molecules’ composition and abundances are dependent on an individual’s race, population, and gender as well as on tissue, tissue state and disease subtype.

2 - Awsomics: A Knowledge Discovery Infrastructure Based on Annotated Genomic Data

Zhe Zhang, Bioinformatics Scientist, Children’s Hospital of Philadelphia, 3535 Market Street, Suite 1067, Philadelphia, PA, 19104, United States of America, zhangz@email.chop.edu

Knowledge discovery is adversely lagging behind data and information generation in the field of genomic research. To assist biomedical researchers to digest the overwhelming amount of genomic data, we developed a system based on Amazon Web Service. It includes an archive of curated data and results, various methods supporting integrative analysis, and a web-based toolbox. It will be a valuable resource for biomedical researchers to gain novel insights about the complicated biological systems.

3 - Quality Control of Whole Genome and Exome Data in a Large Sequencing Study of Alzheimer Disease

Adam Naj, Instructor, Department Of Biostatistics And Epidemiology, University of Pennsylvania, 423 Guardian Drive, 229 Blockley Hall, Philadelphia, PA, 19104, United States of America, adamnaj@mail.med.upenn.edu

The Alzheimer’s Disease (AD) Sequencing Project (ADSP) is an NIH project to sequence 578 familial genomes and 10,692 unrelated exomes of cases and controls to identify causal genomic variants. Here we describe extensive bioinformatics applications in a multi-center quality control effort: performing genotype calling, integrating data from multiple calling pipelines, filtering low-quality samples, and incorporating external annotation to facilitate identifying rare variants affecting AD risk.

1 - Design of Financial Incentives for Maternity Care Safety and Quality

Beste Kucukyazici, McGill University, 1001 Sherbrooke Street West, Room 526, Montreal, QC, H3A 1G5, Canada, beste.kucukyazici@mcgill.ca, Cheng Zhu

Rate of C-section, which exposes potential harms on mothers and newborns as well as heavy economic burden, has been increasing constantly and this growth raises some concerns for the policy makers. This research focuses on optimizing the financial incentives, i.e. choosing best payment scheme and optimizing how to reimburse obstetricians under this scheme, in order to reduce the C-section rates without sacrificing birth quality while alleviating economic burden for overall health care system.

2 - Cost-Effectiveness of Malaria Preventive Treatment for HIV-Infected Pregnant Women in South Africa

Sung Eun Choi, Stanford University, 44 Olmsted Rd Apt. 121, Stanford, Ca, 94305, United States of America, sungeunc@stanford.edu, Margaret L. Brandeau, Eran Bendavid

Combined malaria and HIV infection during pregnancy increases the susceptibility of both mother and child to the negative effects of malaria, such as anemia, low birth weight, and placental malaria. A microsimulation model of HIV-infected pregnant women in sub-Saharan Africa was developed to assess the cost-effectiveness of different malaria preventive treatment approaches, including co-trimoxazole and intermittent preventive treatment in pregnancy with sulfadoxine-pyrimethamine (IPTp-SP).

3 - Mammography Screening Policies under Budgetary Restrictions

Mucahit Cevik, University of Wisconsin - Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, cevik2@wisc.edu, Oguzhan Alagoz

Cost of mammography and lack of resources in terms of number of diagnostic machines and the number of trained workforce to interpret mammograms limit the widespread use of mammography for screening in many countries. We investigate the breast cancer screening problem in a resource-constrained setting where the objective is to maximize total quality adjusted life years of the patients, and present a novel approach to obtain clinically intuitive policies.

4 - The Optimal Control of Child Delivery for Women with Hypertensive Disorders of Pregnancy

Aysegul Demirtas, Graduate Student, Arizona State University, 699 S Mill Avenue, Tempe, AZ, 85281, United States of America, ademirt2@asu.edu, Esma Gel, Soroush Saghafian

Hypertensive disorders of pregnancy (HDP) are one of the leading cause of maternal and neonatal mortality and morbidity in the world. We consider the decision problem of timing and mode of delivery for women with HDP. We formulate a discrete-time, infinite-horizon Markov decision process model in which the objective is to minimize the risks of maternal and neonatal adverse outcomes. We use clinical data in our computational results and provide delivery strategies under various scenarios.

1 - Assessing Prevention Strategies for Mid-life Adults: An Agent-based Modeling Approach

Yan Li, Research Scientist, The New York Academy of Medicine, 99-52 66th Rd. Apt. 9M, Rego Park, NY, 11374, United States of America, yli@nyam.org

70 percent of mid-life adults in the US have been diagnosed with at least one chronic condition and nearly half of them have two or more. We developed an agent-based model to capture the development and consequences of several

prevalent cardio-metabolic conditions, including obesity, hypertension, hypercholesterolemia, and diabetes, in mid-life adults. We conducted simulated trials to assess the impact of different lifestyle interventions on the health outcomes of general mid-life adults.

2 - Developing a Clinical Decision Support System for Diabetic Retinopathy

Saeed Piri, Research Assistant, Oklahoma State University, IEM department, 322 Engineering North, Stillwater, Ok, 74078, United States of America, saeed.piri@okstate.edu, Tieming Liu

About 29.1 million American have diabetes and about 30% of the diabetic patients develop diabetic retinopathy. The purpose of this research is to develop a clinical decision support system that could be used by the physicians and clinicians to manage the condition and progression path of the diabetic retinopathy. We are analyzing two sets of data, first EHR data of about 3 million diabetic patients, and second, detailed data of about 2000 diabetic retinopathy patients.

3 - Readmission Reduction Strategies in Medicaid / Medicare – Hospital System

Michelle Alvarado, Visiting Assistant Professor, Texas A&M University, 3131 TAMU, College Station, TX, 77840, United States of America, alvarado.michelle.m@gmail.com, Yi Zhang, Mark Lawley

In 2012 the Centers for Medicare and Medicaid Services implemented a penalty-only system for hospitals with high readmission rates. We develop a penalty-incentive model for hospital readmissions in a basic game theoretic setting between Medicaid/Medicare and a Hospital. Medicaid/Medicare designs a penalty-incentive mechanism that can inspire the Hospital to adopt a proper level of care. We identify the win-win region for the penalty-incentive factor and present preliminary analysis results.

Chair: Ebru Bish, Associate Professor, Virginia Tech, Dept of Industrial and Systems Engg, 250 Durham Hall, Blacksburg, VA, 24061-0118, United States of America, ebru@vt.edu

1 - Value of Inventory Information in Allocating Flu Vaccine with Limited Supply

Zihao Li, PhD Student, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332-0205, United States of America, zli66@gatech.edu, Pinar Keskinocak, Julie Swann

Timely vaccination can prevent influenza, but flu vaccine supply is often limited. We study the allocation of vaccines when the uptake rates vary geographically. We derive allocation strategies based on inventory information and compare them to strategies that are population based. We quantify how many cases of flu can be prevented, how much inventory is saved, and the unmet demand under both policies. The results emphasize the need for greater visibility in public health supply chains.

2 - Modeling for the Equitable and Effective Distribution of Food Donations under Stochastic Capacities

Irem Sengul Orgut, Lenovo, 1009 Think Place, Morrisville, NC, United States of America, isengul@ncsu.edu, Reha Uzsoy, Julie Ivy

In partnership with the Food Bank of Central and Eastern North Carolina, which distributes donated food to a 34-county service area, our objective is to achieve the equitable and effective food distribution among the population at risk for hunger. Counties' capacities are the main source of uncertainty in this system as they constrain the total food distribution due to the need to distribute food equitably. We develop stochastic models for optimal food distribution and prove structural results.

3 - Resource Deployment and Donation Allocation for Epidemic Outbreaks

Azrah Azhar, Graduate Student, George Washington University, 800, 22nd Street NW, Washington, DC, 20052, United States of America, azrah@gwu.edu, Miguel Lejeune

We propose an epidemic response model for developing countries that determines the number and location of treatment facilities and ambulances; deploys medical staff; and organizes the transportation of patients. We develop a framework to optimize the utilization of earmarked donations, and carry out a cost-benefit analysis for intervention strategies financed by a donation.

4 - Optimal Post-donation Blood Screening under Prevalence Rate Uncertainty

Hadi El-amine, PhD Student, Virginia Tech, 250 Durham Hall Perry St., Blacksburg, VA, 24061-0118, United States of America, hadi@vt.edu, Ebru Bish, Douglas Bish

Blood product safety, in terms of being free of transfusion-transmissible infections, is crucial. Under prevalence rate uncertainty, various objective functions, including minimization of a mean-variance objective and minimization of the maximum regret, were considered in order to determine a "robust" post-donation blood screening strategy that minimizes the risk of releasing an infected unit of blood into the blood supply. Efficient and exact algorithms are provided.

Chair: Ece Zeliha Demirci, PhD Candidate, Bilkent University, Department of Industrial Engineering, Bilkent University, Ankara, 06800, Turkey, edemirci@bilkent.edu.tr

1 - Designing Intervention for Public-interest Goods

Ece Zeliha Demirci, PhD Candidate, Bilkent University, Department of Industrial Engineering, Bilkent University, Ankara, 06800, Turkey, edemirci@bilkent.edu.tr, Nesim K. Erkip

We study intervention design problem for public-interest goods with two intervention tools: investment on demand increasing strategies and subsidies. We consider a setting composed of a retailer whose demand is exponentially distributed and a central authority with fixed budget. We characterize the optimal solution structure and enrich our findings with detailed analysis of results.

2 - A Two-stage Model for Dynamic Staff-job Assignments in the Non-for-profit Sector

Tina Rezvanian, PhD Student, Northeastern University, Huntington Ave, Boston, 02115, United States of America, rezvanian.t@husky.neu.edu, Ozlem Ergun

We design mechanisms for large-scale assignment problems that appear in public sector applications by identifying complete, stable, and fair staff-job matchings over time, even when preference lists are truncated. To address these issues we consider dynamic and multi-stage negotiation policies using stochastic optimization. Equilibrium concepts and heuristics are proposed to approximate the proposed problem to optimality.

3 - Modelling and Analysis of New Zealand (NZ) Legislation Network

Neda Sakhaee, PhD Candidate, University of Auckland, Room 576, 38 Princes Street, Auckland, 1010, New Zealand, nsak206@aucklanduni.ac.nz, Golbon Zakeri, Mark Wilson

Network representation of legal documents is a novel approach to study this complex system. The result is a huge citation network of legal documents (as nodes) and links between them (as edges). We present this network for NZ acts using a data set of more than 700 year old acts from NZ legislation website. We study the structure of the network, measures, clusters and time evolution. Then, we present correlation studies between the clusters and government policies considering longitudinal changes

4 - Optimizing Government Resource Allocation to Increase Community Resilience

Saba Pourreza, PhD Candidate, University of North Texas, 1307 West Highland Street, Denton, TX, 76201, United States of America, saba.pourrezajourshari@unt.edu, Brian Sauser

This study constructs an optimization model that considers two decision variables job creation, goods and service production. The aim of the model is to enhance the community impact of small medium size businesses (SMB) when a disruption hits.

Health Care Modeling and Optimization IV

Contributed Session

Chair: Xiang Zhong, University of Wisconsin, 5019 Old Middleton Rd, Madison, WI, 53706, United States of America, oliver040525@gmail.com

1 - A Predictive Readmissions Model for Coronary Bypass Artery Grafting Patients

Jingyun Li, California State University Stanislaus, 7740 McCallum Blvd., Dallas, TX, 75252, United States of America, jli9@csustan.edu, Steves Ring, Indranil Bardhan

Short-term hospital readmissions due to CABG surgery is a burgeoning problem. Drawing on archival data of CABG patients from 27 hospitals in North Texas, during a three-year period, our model predicts the 30-day readmission propensity of CABG patients, as well as their frequency, and time to readmission.

2 - Innovation in Healthcare Management using Data-driven Clinical Pathways

Yiye Zhang, Carnegie Mellon University, 4800 Forbes Ave, Pittsburgh, PA, 15213, United States of America, yiyez@andrew.cmu.edu, Rema Padman

This paper investigates how service innovations in the management of healthcare delivery can be facilitated through the development of data-driven clinical pathways. We propose a clinical pathway learning algorithm that models the association between treatments and patients health conditions as a hidden Markov model, and also makes predictions for patients' future states. We customize clinical pathways by patient and treatment types using hierarchical clustering and frequent sequence mining.

3 - Analysis of the Impact of Electronic Visits on Patient Care Delivery

Xiang Zhong, University of Wisconsin, 5019 Old Middleton Rd, Madison, WI, 53706, United States of America, oliver040525@gmail.com, Jingshan Li, Philip Bain, Albert Musa

To improve care access, many healthcare organizations have introduced electronic visits to provide patient-physician communication. In this study, we introduce an analytical model to study the care delivery with e-visits. Analytical formulas to evaluate the mean and variance of patient length of stay during access to care are derived. The impact of e-visits on patient access to other care delivery venues is investigated. Scheduling and control policies to improve care access are discussed.

1 - A Simulation-Optimization Method for Quantitative Aggregation of Prior Statistical Findings

Mohammad Jalali, Massachusetts Institute of Technology, Cambridge, MA, 02141, United States of America, jalali@mit.edu

We introduce a simulation-optimization method for quantitative aggregation of prior statistical findings. The method uses only available statistical results from prior studies to estimate a meta-model that is consistent with those original findings. As an empirical demonstration, we aggregate prior studies of the determinants of basal metabolic rate. Our model proves more accurate than existing models in the literature and the models by World Health Organization and Institute of Medicine.

2 - Guaranteed Matrix Completion via Non-convex Factorization

Ruoyu Sun, Stanford University, Menlo Park, CA, 94025, United States of America, sundirac@gmail.com, Zhi-Quan Luo

Matrix factorization is very popular for large-scale matrix completion. However, due to the non-convexity, there is a limited theoretical understanding of this approach. We show that under similar conditions to those in previous works, many standard optimization algorithms converge to the global optima of the non-convex factorization based formulation, thus recovering the true low-rank matrix. Our result is the first one that provides exact recovery guarantee for many standard algorithms.

3 - Developing Adaptive Islamic Law BPS Models for Islamic Finance and Banking by Text Mining the Qurnian

Munir Majdalawieh, Associate Professor, Zayed University,
Academic City, Dubai, United Arab Emirates,
munir.majdalawieh@zu.ac.ae, Farhi Marir, Ahmed Al-dawoody

In this study we will attempt to develop a Quranic financial corpus and use computational and analytical approaches to mine the Quran (the Muslim holy book) and the Hadith (actions and words of the prophet Muhammad peace be upon him) to uncover hidden knowledge on Islamic financial business processes and controls. The knowledge acquired from this investigation will be translated into an IFBPs model to be adapted by financial institutions when moving to Islamic finance and banking.

4 - Randomized Matrix Algorithms in Parallel and Distributed Environments

Jiyan Yang, Stanford University, 44 Olmsted Road, Stanford, CA,
United States of America, jiyanyang12@gmail.com

We first review recent work on developing and implementing random projection and random sampling algorithms for very large very overdetermined least squares regression problems in parallel and distributed environments. We evaluate the their performance on up to terabyte-sized data in existing distributed systems using Spark. In the second part of the talk, we discuss how randomized linear algebra can be used in low-rank factorization of large-scale matrix with applications in bioimaging.

Pricing and Consumer Behavior in Retail and Service Operations

Cluster: Operations/Marketing Interface

Invited Session

Chair: Arvind Sainathan, Nanyang Business School, 50 Nanyang Avenue, Singapore, Singapore, asainathan@ntu.edu.sg

1 - Production Planning with Advance Demand Information using Real Options

Geoffrey Chua, Assistant Professor, Nanyang Technological University, 50 Nanyang Avenue, S3-B2A-04, Singapore, Si, 639798, Singapore, GBACHUA@ntu.edu.sg, Shaoxiang Chen, Zhiguang Han

We consider a newsvendor in a B2C setting who sells a real option in period 1 ahead of the spot market in period 2 and find the optimal production and option pricing decisions. We show that option selling is better than advance selling. We also find two benefits of option selling: revenue management and demand updating. For a market with two segments, we compare three policies: selling one option to the higher segment, selling one option to both segments, and selling one option to each segment.

2 - Optimal Promotion Strategy for a Service Firm with Delay Sensitive Customers

Guangwen Kong, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55414, United States of America, gkong@umn.edu

Online social advertising tools such as Groupon generate new business for service providers and at the same time generate new challenges. Discount-seeking customers may impose externalities on the system that could drive away regular customers. We analyze these trade-offs and devise recommendations as to when would Groupon promotions be beneficial.

3 - Stockout Recovery under Consignment: The Role of Inventory Ownership in Supply Chains

Rui Yin, Associate Professor, Arizona State University, Dept of Supply Chain Management, W.P.Carey School of Business, Tempe, AZ, 85287, United States of America, Rui.Yin@asu.edu, Yan Dong, Kefeng Xu

We examine how a supply chain firm may implement an incentive contract under inventory consignment to recover stockouts and to retain customers. We formulate principal-agent models to capture the strategic interactions in a supply chain and explore the impact of supply chain opportunisms on the value of inventory consignment.

4 - Prioritization and Price-plus-delay Competition with Self-selecting and Heterogeneous Customers

Arvind Sainathan, Nanyang Business School, 50 Nanyang Avenue, Singapore, Singapore, asainathan@ntu.edu.sg

In service operations, with the absence of severe capacity constraints, prioritization has been "taken for granted" and presumed to do better when customers are heterogeneous in their delay sensitivities. We show that it is not true when customers self-select. In particular, we identify two key novel aspects – sufficient customer heterogeneity and customer composition – that become crucial, due to self-selection and competition respectively, in determining the performance of prioritization.

Behavioral Operations II

Contributed Session

Chair: Bernard M Groen, Dr, Durham University, Durham Business School, Durham, DH1 5LB, United Kingdom, b.m.groen@durham.ac.uk

1 - Managerial Deviance in High-Volume Store Replenishment Decisions: Cognition vs. Computation Power

Shivom Aggarwal, IE Business School, Instituto de Empresa, S.L., CIF: B823343, C/ Maria de Molina, 12 Bajo, Madrid, 28006, Spain, dr.shivom@gmail.com, Antti Tenhiala

The behavior of deviating from recommendations of artificially intelligent systems is rife and often encouraged. Past research has found that the ordering behavior of managers is subjected to their incentives, but lacks investigation of its antecedents and consequences. Using longitudinal data from a multi-site implementation of an Automatic Store Replenishment (ASR) system in a retail chain, this study investigates the factors that explain the success of managerial decisions to deviate.

2 - Can Safe Drivers be Productive Too? Empirical Evidence from Long-Duration Truck Trips

Debjit Roy, Associate Professor, Indian Institute of Management Ahmedabad, Vastrapur, Ahmedabad, 380015, India, debjit@iimahd.ernet.in, Rene De Koster, Jelle De Vries

Road safety still remains a prime concern for public policy makers. Through empirical investigation, we attempt to understand the relationship between safety conscious drivers and their trip productivity for long route trips.

3 - A Behavioral Study of Service Recovery Process – Focusing on the Compensation

Hyejeong Gwon, PhD Candidate, Korea University, 408 LG-POSCO Business bldg., Anam-Dong, Seongbuk-Gu, Seoul, Korea, Republic of, 11ku11@korea.ac.kr, Daeki Kim

Even though a company provides best service, the company cannot satisfy all the customers and prevent all service failure. The proper service recovery, especially the proper compensation can determine the level of customer satisfaction. On this paper, we investigate the effect of compensation on customer satisfaction focusing on its several dimensions after service failure.

4 - Complex Organisational Integration – A Behavioural Approach

Bernard M Groen, Dr, Durham University, Durham Business School, Durham, DH1 5LB, United Kingdom, b.m.groen@durham.ac.uk

Understanding the psychological aspects which underpin any organisational change is considered to be increasingly vital in the 21st century. This paper focuses on the implicit and explicit behaviour and the possible 'dissonance' between what teams say, and the actual behaviour displayed. I will briefly evaluate the relative merits of explicit and implicit behavioural methods, before drawing out the main reasons and provide useful solutions to increase the likelihood of successful change.

Healthcare Capacity and Patient Flow Analytics

Sponsor: Manufacturing & Service Oper
Mgmt/Healthcare Operations

Sponsored Session

Chair: Retsef Levi, J. Spencer Standish (1945) Professor of Operations Management, Sloan School of Management, MIT, 100 Main Street, BDG E62-562, Cambridge, MA, 02142, United States of America, retsef@mit.edu

- 1 - The Impact of Delays in Transfer out of the Intensive Care Unit**
David Scheinker, Postdoctoral Research Fellow, MIT Sloan School of Management, 50 Memorial Dr, E52-289, Cambridge, MA, 02142, United States of America, dscheink@mit.edu, Sara Dolcetti, Benjamin Christensen, Ulrich Schmidt, Retsef Levi, Peter Dunn

Few studies examine delays in transfer out of the ICU. We studied four years of patient flow through six ICUs at a large academic medical center. Over 36% of ICU patients transferring to a general care unit experienced a non-clinical delay of over 12 hours. Each day a patient was delayed added approximately a full day to their total hospital length of stay. These results have direct implications for hospital capacity design, bed assignments, and care processes across units within the hospital.

- 2 - Using Data Analytics and Systems Modeling to Inform Hospital Obstetrics Capacity Planning**

Nan Liu, Columbia University, 722 W. 168th. St., New York, NY, United States of America, nl2320@columbia.edu, Linda Green

Using a recent large data set that contains all hospital obstetrics units (n=40) in NYC, we demonstrate and validate the use of data analytics and systems modeling for planning hospital bed capacity. We estimate capacity needs based on the probability of delay experienced by patients in getting a bed. Our analysis reveals significant variation in obstetrics capacity utilization in NYC; and shows that the whole city can save \$26.5M a year with an appropriate reallocation of obstetrics capacity.

- 3 - Optimization-driven Framework to Understand Healthcare Networks Cost and Resource Allocation**

Fernanda Bravo, Assistant Professor, UCLA-Anderson, 110 Westwood Plaza, Los Angeles, CA, United States of America, fbravo@mit.edu, Retsef Levi, Marcus Braun, Vivek Farias

Consolidation in the HC industry has resulted in the creation of large delivery networks. Traditional practices in cost accounting, e.g., overhead and labor cost allocation to activities, are not suitable for addressing network challenges. We develop an optimization-driven framework inspired by network revenue management to better understand network costs and support strategic network design and capacity allocation decisions. We report the application of this approach on a real case study.

Mgmt/Healthcare Operations

Sponsored Session

Chair: Hossein Abouee Mehrizi, University of Waterloo, 200 University Avenue West, Department of Management Sciences, Waterloo, ON, N2L 3G1, Canada, habouee@uwaterloo.ca

- 1 - Optimal Mix of Elective Surgical Procedures under Stochastic Patient Length of Stay**

Hessam Bavafa, Assistant Professor, Wisconsin School of Business, Madison, WI, United States of America, hbavafa@bus.wisc.edu

We consider the problem of allocating daily hospital service capacity among several types of elective surgical procedures. Our focus is on the interaction between two major constraining hospital resources: operating room and bed capacity. In our model, each type of surgical procedure has an associated revenue, deterministic procedure duration and stochastic hospital length of stay.

- 2 - Appointment Scheduling Problem when the Server Responds to Congestion**

Zheng Zhang, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, 48105, United States of America, zzhang0409@gmail.com, Brian Denton, Xiaolan Xie

We describe a stochastic programming model for appointment scheduling that incorporates server response to congestion, i.e., the server increases the service rate as the workload grows. It materially differs from previous studies in the sense that the uncertainty in appointment systems is endogenous with respect to the decision variables. We describe properties of the model, methods to solve it efficiently, and results that illustrate the impact of congestion in practice.

- 3 - Multi-priority Online Scheduling with Cancellations**

Van-Anh Truong, Columbia University, 500 West 120th St, New York, NY, 10027, United States of America, vt2196@columbia.edu, Xinshang Wang

We study a fundamental model of resource allocation in which a finite amount of service capacity must be allocated to a stream of jobs of different priorities arriving randomly over time. Jobs incur costs and may also cancel while waiting for service. To increase the rate of service, overtime capacity can be used at a cost. This model has application in healthcare scheduling, server applications, make-to-order manufacturing systems, general service systems, and green computing.

- 4 - Multi-speciality Surgery Scheduling under Hospital Resource Constraints**

Shrutivandana Sharma, Singapore University of Technology and Design, 8 Somapah Road, Singapore, 487372, Singapore, shrutivandana@sutd.edu.sg, Hossein Abouee Mehrizi

We consider a surgery scheduling problem, where the decision is to schedule surgeries of two different types over a finite planning horizon. The number of surgeries of each type that can be performed in any period is bounded by the availability of operating resources and the availability of beds. We formulate the problem as a multi-period inventory problem, and characterize the optimal solution.

Sponsored Session

Chair: Pelin Pekgun, Assistant Professor, University of South Carolina, 1014 Greene Street, Columbia, SC, 29208, United States of America, pelin.pekgun@moore.sc.edu

- 1 - Resource Pricing in Hospitality Industry**

Xiaodong Yao, SAS Institute Inc, SAS Campus Drive, Cary, NC, 27519, United States of America, xiaodong.yao@sas.com, Tugrul Sanli, Matt Maxwell, Jason Chen

Best Available Rate (BAR) pricing is probably the most important pricing decision for hotels. There are two forms: BAR by Day, and BAR by LOS (Length of stay). In BAR by Day, prices are set for each resource, i.e., a pair of (room type, stay night), and a LOS price is just the sum of prices on each resource. While in BAR by LOS, prices are set for each product, a triple of (room type, arrival date, LOS). In this talk, we discuss several methods for solving the resource pricing problem.

- 2 - Estimating Revenue Variance in the Pricing Models**

Darius Walczak, Principal Research Scientist, PROS Inc., 3100 Main Street, Suite 900, Houston, TX, 77002, United States of America, dwalczak@pros.com, David McCaffrey

Variance and other distributional moments are important in modeling risk in optimization problem. They are more challenging computationally than linear load metrics such as load factor. We adopt an approach found in the Markov Decision Process literature to calculate variance of revenue under dynamic policies in single-resource pricing problems. We discuss possible extensions to network problems.

- 3 - Advanced Behavioral Models in Integer Optimization**

Shadi Sharif Azadeh, EPFL, EPFL ENAC TRANSP-OR GC B3 444, (Batiment GC) Station 18, Lausanne, Switzerland, shadi.sharifazadeh@epfl.ch, Bilge Atasoy, Moshe Ben-akiva, Michel Bierlaire

We are interested in discrete optimization models where supply and demand closely interact (airlines). We propose a general methodology leading to an integrated supply and demand model, based on discrete choice that is linear in its decision variables. We illustrate it with an example where a supplier (such as an airline, or a chain of movie theaters) needs to decide to offer some services, and to decide about the price of each slot of the available capacity in order to maximize its revenues.

4 - Analysis of Competitive Pricing with Multiple Overlapping Competing Bids in Revenue Management

Goutam Dutta, Professor, Indian Institute of Management, Wing 3, PMQ Area, Room No 3H, Old Campus, Ahmedabad, 380015, goutam@iimahd.ernet.in, Sumeetha Natesan

We analyze the competitive pricing situation of one company with more than one competitor. Based on the past experience one can have some idea about what the competitors will bid which can be described by various distributions. The prices of company and its competitors follow independent, overlapping uniform distribution. First we derive expression for probability of win and then, we attempt to derive conditions for maximizing the expected contribution to profit.

5 - Data Science, Operations Research, Analytics and Revenue Management

Jon Higbie, Managing Partner & Chief Scientist, Revenue Analytics, 3100 Cumberland Blvd., Suite 1000, Atlanta, GA, 30339, United States of America, jhigbie@revenueanalytics.com

The term Data Science and the job title Data Scientist are much in vogue right now. How does Data Science relate to Operations Research? What lessons might we learn about the past boom in Operations Research that can be applied to the current boom in Analytics? How is the increased emphasis on Business Analytics impacting Revenue Management? These questions will be explored through a series of case studies, and discussion.

Algorithmic Revenue Management with Strategic Customers

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Vivek Farias, Associate Professor, MIT, 100 Main Street, Cambridge, United States of America, vivekf@mit.edu

Co-Chair: Yiwei Chen, ywchen@ckgsb.edu.cn

1 - Analysis of Discrete Choice Models: A Welfare-Based Framework

Guiyun Feng, University of Minnesota, 1006 27th Avenue SE,, Minneapolis, MN, 55414, United States of America, fengx421@umn.edu, Zizhuo Wang, Xiaobo Li

We propose a framework for discrete choice models through a welfare function. The framework provides a new way of constructing choice models. It also provides great analysis convenience for establishing connections among existing choice models. We define a new property in choice models: substitutability/complementarity and study conditions for a choice model to be substitutable. We show that our framework is flexible in this property, which is desirable in capturing practical choice patterns.

2 - Robust Dynamic Pricing with Strategic Customers

Yiwei Chen, Assistant Professor, Renmin University of China, No. 59 Zhongguancun Street, Beijing, China, chenyiwei@rbs.org.cn, Vivek Farias

We consider the canonical revenue management problem that a seller sells finite number of a product over a finite horizon via dynamic pricing. We assume that customers are forward looking with heterogeneous strategic factors (time discount rates and monitoring costs). We propose a class of pricing policies that achieve at least 29% of revenue under an optimal dynamic mechanism. Our policies require no knowledge of customers' strategic factors and ensure customers to behave myopically.

3 - Managing Multi-period Production Systems with Limited Process Flexibility

Yehua Wei, Fuqua School of Business, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, yehua.wei@duke.edu, Cong Shi, Yuan Zhong

We develop a theory for the design of process flexibility in a multi-period production system. We propose and formalize a notion of "effective chaining" termed the Generalized Chaining Condition (GCC). We show that any partial flexibility structure that satisfies GCC is near-optimal under a class of policies called the Max-Weight policies. Furthermore, we show that GCC can be satisfied using just k arcs, where k is the equal to the number of products plus the number of plants.

4 - Optimal Dynamic Pricing with Patient Customers

Yan Liu, University of Minnesota, Room L123, ME Building, 111 Church ST, Minneapolis, MN, 55455, United States of America, liux0984@umn.edu, William Cooper

We consider a single-product pricing problem in which a fraction of customers is patient and the remaining fraction is myopic. A patient customer will wait up to some fixed number of time periods for the price to fall below his valuation, at which point the customer will make a purchase. If the price does not fall below a patient customer's valuation at any time during those periods, then the customer will leave without buying. We identify the structure of an optimal pricing policy.

Sponsored Session

Chair: Georgia Perakis, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, georgiap@mit.edu

1 - Balancing Profit Maximization and Inventory for Recommending Personalized Bundles

Anna Papush, MIT, 77 Massachusetts Avenue, Cambridge, MA, United States of America, apapush@mit.edu, Georgia Perakis, Pavithra Harsha

Market forecasts show that e-commerce stands to ultimately inherit a significant proportion of the retail market. Gaining a competitive edge in this sector is of utmost importance to any firm's success. The model presented in this work guarantees customer satisfaction by providing relevant recommendations at personalized prices in a way that balances profit maximization with business operations. We demonstrate its value on actual e-tailer data.

2 - Pricing for a Satellite Service Provider

Charles Thraves, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, thraves@mit.edu, Georgia Perakis

We present a pricing optimization formulation of the data plans of a satellite service provider. First, to estimate reservation prices for all customers (including unobserved customers) we deal with the missing data problem. We introduce a MIP formulation and develop properties and heuristics for the problem. We develop analytical bounds for our heuristics and conclude that they can help the company increase its profits by more than 10%.

3 - Scheduling Promotion Vehicles to Boost Profits

Lennart Baardman, MIT, Operations Research Center, Cambridge, MA, 02139, United States of America, baardman@mit.edu, Kiran Panchamgam, Danny Segev, Georgia Perakis, Maxime Cohen

Retailers use promotion vehicles (e.g. flyers, commercials) to increase profits. We model how to assign promotion vehicles to maximize profits as an NLP. The problem is NP-hard and even hard to approximate. However, we construct an epsilon-approximation in the form of an IP of polynomial size. Also, we propose a greedy algorithm with a provable guarantee and on average near-optimal performance. Finally, using supermarket data we show that our model can lead to a significant increase in profits.

4 - Dynamic Pricing through Combinatorial Methods

Jeremy Kalas, MIT, Cambridge, United States of America, jkalas@mit.edu, Swati Gupta, Kiran Panchamgam, Georgia Perakis, Maxime Cohen

We explore fast combinatorial methods for the multi-period, multi-item Promotion Optimization Problem under general demand functions that depend on past prices. As the problem is NP-hard for large memory, we consider an approximation via the reference price model, and give a PTAS. We extend this model to handle cross-item effects using a "virtual" reference price. We report a projected 4-6% increase in profits on real-world data sets, in collaboration with the Oracle Retail Science group.

Empirical Operations Management: Services

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Robert Bray, robertlbray@gmail.com

1 - Free Riding and Auto Recalls: An Asymmetric Dynamic Discrete Choice Game

Ahmet Colak, Northwestern University, 1116 W Loyola Ave Apt 3S, Chicago, IL, 60626, United States of America, a-colak@kellogg.northwestern.edu, Robert Bray

We structurally study auto recalls. Two agents can initiate a recall: the manufacturer and the federal regulator. Initiating recalls is an entry game with optimal stopping. We unexpectedly find that the regulator has no deterrence power over the manufacturer, and that the two agents free ride off each other's recall efforts. Free riding decreases the regulator's and manufacturer's median recall probabilities by 2.9% and 0.7% respectively, and increases society's exposure to defective parts.

2 - Consumer Behavior in Pay-as-you-go Business Models

Jose Guajardo, University of California Berkeley,
545 Student Services Bldg #1900, Berkeley, CA, 94720-1900,
United States of America, jguajardo@berkeley.edu

Pay-As-You-Go business models have become widely adopted for the diffusion of energy solutions in developing economies. In this research, we analyze consumer behavior in pay-as-you-go environments and discuss implications for firms operating in these novel markets.

3 - Price to Compete...with Many: How to Identify Price Competition in High Dimensional Space

Jun Li, Assistant Professor, Ross School of Business, University of Michigan, 701 Tappan St, Ann Arbor, 48103, United States of America, junwli@umich.edu, Serguei Netessine, Sergei Koulayev

We study price competition in markets with large (in magnitude of hundreds or thousands) number of potential competitors, using the hotel industry as a test bed. This research addresses two methodological challenges: simultaneity bias and high dimensionality.

4 - Measuring the Effectiveness of Self-service: An Empirical Investigation of Supermarket Self-checkout

Marcelo Olivares, Assistant Professor, Universidad de Chile, Republica 701, Santiago, Chile, molivares@u.uchile.cl

Using transactional data from a large supermarket chain, we study the impact of self-checkouts in customer purchases. We combine video analytics data with point-of-sale transactions to analyse how waiting time in checkouts affects consumer decisions on which lines to join, basket expenditures and visiting frequency.

Topics in Remanufacturing and Consumer Product Returns

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: V. Daniel R. Guide, Jr., Mary Jean And Frank P. Smeal Chaired Professor Of Operations And Supply Chain Management, Pennsylvania State University, 480 Business Bldg., University Park, PA, 16802, United States of America, drgl6@psu.edu

1 - Measuring the Value of Return Policies in Online Retailing

Guangzhi Shang, Assistant Professor, Florida State University, College of Business, RBB354, Tallahassee, FL, 32306, United States of America, gshang@business.fsu.edu, Michael Galbreth, Mark Ferguson, Pelin Pekgun

Lenient return policies are popular in the industry. However, how much consumers value such a policy is difficult to measure from firm's perspective. We tackle this challenge and measure the value of return policies to consumers in the online retail context.

2 - False Failure Returns: An Experimental Investigation of Supply Chain Coordination

Yue Cheng, Doctoral Student, The Pennsylvania State University, 460A Business Bldg, University Park, PA, 16802, United States of America, yuc190@smeal.psu.edu, Brent Moritz, V. Daniel R. Guide, Jr.

To reduce false failure returns, prior research has proposed a target rebate contract to coordinate the closed-loop supply chain. We modify the model to account for the best response to a proposed contract. We conduct two experiments, and observe sub-optimal coordination caused by mid-point bias and inequality aversion.

3 - Product Acquisition Management – A Third Party Remanufacturer Perspective

Akshay Mutha, Doctoral Student, The Pennsylvania State University, Business Bldg, University Park, PA, 16802, United States of America, axm536@smeal.psu.edu, Saurabh Bansal, V. Daniel R. Guide, Jr.

We examine various acquisition strategies for a third party remanufacturer (3PR). We develop a model for the 3PR's profit maximization problem and characterize the optimal solution. We derive the structural properties of the model. Using realistic data for a smartphone remanufacturer, we show that the hybrid acquisition strategy increases the profit by up to 12%.

4 - A Typology of Closed-loop Supply Chains with Remanufacturing

V. Daniel R. Guide, Jr., Mary Jean And Frank P. Smeal Chaired Professor Of Operations And Supply Chain Management, Pennsylvania State University, 480 Business Bldg., University Park, PA, 16802, United States of America, drgl6@psu.edu, James Abbey

We present a typology of closed-loop supply chains with remanufacturing.

Empirical Topics on OM/Finance Interface

Sponsor: Manufacturing & Service Oper Mgmt/IFORM

Sponsored Session

Chair: S. Alex Yang, Assistant Professor, London Business School, Sussex Place, London, United Kingdom, sayang@london.edu

1 - Sourcing with Financing in an Unreliable Supply Chain: Should Buyers Offer Loans to Suppliers?

Jing Wu, jwu7@chicagobooth.edu, S. Alex Yang, Chris Tang

Two financing schemes related to sourcing from a financial constrained supplier are characterized and discussed. Choosing between purchase order financing or supply chain financing, the manufacturer balances its information advantage and the bank's financing advantage.

2 - An Empirical Study of Liquidation Value for Retail Inventories

Nathan Craig, Ohio State University, 2100 Neil Avenue, 630 Fisher Hall, Columbus, OH, 43210, United States of America, craig.186@osu.edu, Ananth Raman

The liquidation value of a firm's assets appears in models in operations management (e.g., the newsvendor) and finance (e.g., cost of debt). Yet relatively little is known about the liquidation process and its outcomes. To characterize liquidation values for retail inventories, we use proprietary data on liquidation outcomes for 70 retailers and \$8B of inventory. We complement this with data from multiple sources to identify economic factors that significantly affect liquidation value.

3 - Size Distribution of Manufacturing Firms in India : Empirical Evidence and Theoretical Models

Sridhar Seshadri, Professor, Indian School of Business, Faculty Housing, Gachibowli, Hyderabad, AP, 500032, India, sridhar_seshadri@isb.edu, Yangfang Zhou

The dualism of the manufacturing sector in India resulting in employment concentration in small and large firms has puzzled researchers. We provide a possible explanation for the missing middle phenomenon using supply chain models and models of competition. We discuss the policy implications of our findings.

4 - Dynamic Discounting

Nitish Jain, Assistant Professor, London Business School, Regents Park, London, United Kingdom, njain@london.edu, S. Alex Yang

Using a proprietary dataset, we empirically investigate how firms behave on a dynamic discounting platform.

Service Process Design

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Mustafa Akan, Associate Professor, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, akan@andrew.cmu.edu

1 - Maintenance and Spare Part Optimization for Moving Assets

Ayşe Sena Eruguz, Eindhoven University of Technology, P.O. Box 513, Eindhoven, 5600 MB, Netherlands, a.s.eruguz@tue.nl, Tarkan Tan, Geert-Jan Van Houtum

We consider an integrated maintenance and spare part planning problem for a single critical component of a moving asset for which the degradation level is observable. Degradation level is a function of the system state, mostly dictated by where the moving asset physically is, e.g., in harbour, in transit, or in mission for a maritime application. Possible actions and their consequences are also dependent on the system state.

2 - Role of Alternative Payment Models in Incentivizing Information Sharing in Healthcare

Mehmet Ayvaci, Asst. Professor, University of Texas-Dallas, School of Management, Richardson, TX, 75080, United States of America, mehmet.ayvaci@utdallas.edu, Srinivasan Raghunathan, Huseyin Cavusoglu

We explore the incentive alignment problem for electronic sharing of health information (HIE) under episode and performance-based payments. In particular, we study what quality improvement provisions should be embedded into the payments and which of the specific performance incentives associated with alternative payment models; rewards, penalty, or a combination of the two better aligns the incentives for HIE adoption.

3 - Design of Multi-stage Services with Diagnostic Tasks

Mohammad Delasay, Post-doctoral Fellow, Tepper School of Business, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, United States of America, delasays@andrew.cmu.edu, Itai Gurvich, Mustafa Akan

Many services require diagnostic tasks, e.g., diagnostic testing in an emergency room. The time spent on these tasks and the sequence in which they are performed is usually discretionary. We explore how discretionary diagnostic tasks should be distributed among different stages of a multi-stage operations system to deliver high quality service with minimum wait cost. We are interested in situations where the extent of information gained from diagnostic tasks varies across different stages.

4 - Coordinating Product Support Supply Chains under Outcome-based Compensations

Dong Li, Singapore University of Technology and Design, 8 Somapah Road, Singapore, Singapore, dong_li@sutd.edu.sg, Nishant Mishra

We look at contracting between an OEM and a supplier, where the supplier manufactures the part, and the OEM assembles the final product and manages product availability for the customer under an outcome-based contract. We find that wholesale price contracts and repair cost sharing contracts cause under-investment in failure reduction effort and over-investment in service capacity. Penalty sharing contracts can achieve the first best solution and coordinate the supply chain.

Retail Operations

Sponsor: Manufacturing & Service Operations Management
Sponsored Session

Chair: Vidya Mani, Assistant Professor, Pennsylvania State University, 461 Business Building, University Park, 16801, United States of America, vmani@psu.edu

1 - The Effect of Cyber Attack on Customers' Purchase and Channel Choice Behavior

Ramkumar Janakiraman, Darla Moore School Of Business, University of South Carolina, 1014 Greene Street, Columbia, SC, 29208, United States of America, ram@moore.sc.edu, Joon Ho Lim, Kumar Subodha, Rishika Rishika, Ram Bezawada

This paper examines the effect of data breach announcement on customer shopping behavior in terms of spending level, frequency of shopping trips and channel migration. By using actual customer transaction data from a multichannel retailer and exploiting a natural experiment, we find that the cyberattack announcement leads to a 22.5% decrease in sales and a 14.1% decrease in shopping trips made by customers. Also, we find that customers tend to migrate to channels that were not breached.

2 - Learning about Customer Preferences from Clickstream Data

Dorothee Honhon, Associate Professor, University of Texas at Dallas, 800 W. Campbell Road, Richardson, TX, 75080, United States of America, Dorothee.Honhon@utdallas.edu

We study the problem of an e-tailer who learns about consumer preferences from observing sales or clickstream data in a Bayesian fashion. The e-tailer decides which products to display on the search page and which products are available for purchase. We show that in some cases, it may be optimal to display products which are not purchasable so as to learn about consumer preferences.

3 - Optimal Replenishment in the Presence of Phantom Inventories using Point-of-sales Data

Ioannis Stamatopoulos, Doctoral Candidate, Northwestern University, Kellogg School of Management, 2001 Sheridan, Evanston, IL, 60208, United States of America, i-stamatopoulos@kellogg.northwestern.edu, Antonio Moreno-Garcia, Achal Bassamboo

We study how inventory managers can fully utilize point-of-sales (POS) data for the design of replenishment strategies that account for the existence of phantom inventories. We show that even though the optimal replenishment timing in the presence of phantom inventories is complex in nature, there is a simple policy that performs very close to optimally, and provides the same recommendation as the optimal policy for a vast majority of scenarios.

4 - Impact of Tabletop Technology on Restaurant Performance

Fangyun (Tom) Tan, Assistant Professor, Cox Business School, SMU, 6212 Bishop Blvd, Dallas, TX, 75275, United States of America, ttan@cox.smu.edu, Serguei Netessine

We analyze a large data set of transactions in a casual restaurant chain to understand the effect of implementing a tabletop technology on service performance (measured in sales and meal duration). We find the technology directly increases sales and significant reduces the meal duration. We provide insights on how to manage technology in restaurant operations.

Designing Services: Marketing and Operations Inter-related Issues I

Sponsor: Service Science
Sponsored Session

Chair: Rohit Verma, Professor, Cornell University, School of Hotel Administration, 338 Statler Hall, Ithaca, NY, 14853-6902, United States of America, rohit.verma@cornell.edu

1 - A Data-driven Approach to Designing Service Concepts for Vehicle Operations Management

Min-Jun Kim, PhD Student, POSTECH, Engineering Building #4-316, Pohang, 790-784, Korea, Republic of, minjun@postech.ac.kr, Kwang-jae Kim, Chie-Hyeon Lim

This talk proposes a data-driven approach to designing service concepts for vehicle operations management (VOM). The proposed approach first collects VOM-related data through various sensors installed on vehicles, analyzes the data to extract insights regarding vehicle operations, and then designs service concepts to support the operation of vehicles. This talk also presents case studies on passenger and commercial vehicles.

2 - Characteristics of Consulting Firms and Their Challenges**Co-producing with their Clients**

Matthew Walsman, Student, Cornell University, 455 Statler Hall,
Ithaca, United States of America, mcw237@cornell.edu,
Rohit Verma, Michael Lewis, Alistair Brandon-jones

Using mixed methods (best-worst survey-based study supported by qualitative interviews) we uncover characteristics of consulting firms and their managerial challenges that are often different than those suggested by traditional frameworks of Professional Service Firms. We extend this with an experiment designed to test some of our initial findings regarding consultant's primary function as advisers or those tasked with making decisions for (or giving recommendations to) others.

3 - A Comparative Analysis of Technology Usage and Utility Between Experts and Customers in Hospitality

Min Kyung Lee, Clemson University, 100 Sirrine Hall,
Box 341305, Clemson, SC, 29634, United States of America,
minl@g.clemson.edu, Aleda Roth, Rohit Verma

With great development in social media and peer-to-peer markets, sharing economy has emerged as alternative suppliers of services. Sharing economy has taken a power away from experts and focused more on peer-to-peer feedback. This empirical study analyzes the usage and utility of technology innovations between experts and customers.

Analysis of Infrastructure using DEA

Cluster: Data Envelopment Analysis

Invited Session

Chair: Hyojung Kang, Postdoctoral Associate, Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16801, United States of America, hqk5116@psu.edu

1 - Highway Safety Performance Evaluation of Commercial Transportation using Data Envelopment Analysis

Yaote Tsai, Auburn University, 3332 Shelby Center, Auburn University, Auburn, AL, 36832, United States of America, yzt0007@auburn.edu, Stephen Startz, Fadel Megahed

Transportation safety has been one of the most important issues discussed in recent years. An effective method to measure and improve the current safety performance is needed to decrease the total number of incidents and costs of job-related injuries. The proposed methodology uses Data Envelopment Analysis (DEA) for benchmarking the safety performance. The results of this research are to provide an objective safety performance and improvement recommendations for commercial transportation.

2 - Airport Site Selection using Analytical Hierarchy Process and Data Envelopment Analysis

Gulsah Hancerliogullari, Istanbul Bilgi University, Eski Silahtaraga Elektrik Santrali Kazim, Karabekir Cad. No: 2/13 34060 Eyüp, Istanbul, 34060, Turkey, gulsah.hancerli@bilgi.edu.tr, Emrah Koksalmis

The aim of a site-selection problem is to find the optimum location that satisfies a number of predetermined selection factors. The identification of alternative sites, assessment criteria and priorities for the construction of a new airport is a complex task that requires the cooperation of multiple stakeholders. This study deals with the problem of finding the optimum location for an airport to serve in Turkey, using the methods of analytical hierarchy process and data envelopment analysis.

3 - Assessing Efficiency and Quality of Emergency Departments using Data Envelopment Analysis

Hyojung Kang, Postdoctoral Associate, Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16801, United States of America, hqk5116@psu.edu, Nathaniel Bastian, Harriet Nembhard

Emergency departments (EDs) seek ways to improve quality while achieving operational efficiency. However, it is not clear if EDs have mutually satisfied these objectives. Using data envelopment analysis, this study investigates the relationship between efficiency and quality of EDs in the U.S. The results provide insights into resource management in the EDs.

Location Models

Sponsor: Location Analysis

Sponsored Session

Chair: Oded Berman, University of Toronto, 105 St. George Street, Toronto, M5S 3E6, Canada, Berman@rotman.utoronto.ca

1 - New Product Network Design: Facility Location and Capacity Decisions under Uncertainty

Mozart Menezes, Associate Professor, Kedge Business School-Bordeaux, 680 Cours de la Libération, Bordeaux, 33405, France, mozart.menezes@me.com, Kai Luo, Oihab Allal-Cherif

We attempt to shed light on the effect of stochastic demand on the location and capacity of production facilities. The framework is that of a traditional Newsvendor problem where decisions will generate expected under- and over-capacity costs, which are function of both unitary cost of acquiring capacity and transportation cost (function of facility location). In this work the 'critical fractile' is not uniform across facilities.

2 - Comprehensive Framework for Hazmat Network Design, Response Team Location, and Equity of Risk

Rajan Batta, Suny Distinguished Professor, University at Buffalo (SUNY), 410 Bell Hall, Buffalo, United States of America, batta@buffalo.edu, Masoumeh Taslimi, Changhyun Kwon

Control variables are locations of hazmat response teams and which additional links to include. Regulatory authorities (upper level) aim to minimize the maximum transport risk incurred by a transportation zone. Our measure of risk incorporates average response time. Hazmat carriers (lower level) seek to minimize travel cost. Using optimality conditions, we reformulate the non-linear bi-level model into a single-level mixed integer linear program, and propose a greedy heuristic approach.

3 - Primal and Dual Algorithms for Min-max Location with Euclidean Distance Plus Fixed Distance in R^n

Lin Dearing, Professor Emeritus, Clemson University, 520 Bentbrook Lane, Clemson, SC, 29631, United States of America, pmdrn@g.clemson.edu, Akshay Gupta

Primal and dual algorithms are given for one center min-max location using Euclidean distance plus fixed distance in R^n , based on a directional search method along paths that are a ray or a two-dimensional hyperbola in R^n . Search paths are derived from the intersection of bisectors of points, which may be hyperplanes or hyperboloids in R^n , and the step size is determined explicitly. The problem is equivalent to finding the minimum covering Euclidean ball of a given set of balls in R^n .

4 - Stochastic Location Models with Congestion

Oded Berman, University of Toronto, 105 St. George Street, Toronto, Canada, Oded Berman, Dmitry Krass

We review facility location models where consumers generate stochastic demands, and service times are stochastic. We focus on the customer-facility interaction, developing a classification of models based on the how customer demand is allocated to facilities and whether the demand is elastic or not. We use this classification to organize the variety of models considered in the literature into four thematic groups that share common assumptions and structural properties.

Small Firms, Mobility, and Entrepreneurial Spawning

Cluster: Strategy Science

Invited Session

Chair: Todd Zenger, todd.zenger@eccles.utah.edu

1 - A New Small Firm Effect? Ability Sorting by Firm Size among Ph.D.s in Science and Engineering

Daniel Elfenbein, Associate Professor of Strategy, Washington University at St. Louis, Olin School of Business, St. Louis, MO, United States of America, elfenbein@wustl.edu

2 - Forged in the Heat of Battle: New Organizations and Small Firms as Business Incubators

Tiantian Yang, Assistant Professor, Duke University, Durham, NC, United States of America, ty41@duke.edu, Howard Aldrich, Frederic Delmar

Organizational scholars have long been interested in the question of where do organizations come from. In this study, we revisit this central question within organization theory by establishing links between macro approaches that emphasize institutional conditions and micro approaches that stress organizational conditions. Using a unique data set that has comprehensive coverage of individual employees and employing organizations in Sweden from 1990 to 2002, we demonstrate that institutional conditions encouraging monopoly but discouraging individual entrepreneurial efforts amplify entrepreneurial spawning in small and autonomous organizations. Conditions in small and new organizations amplify peer influence on nascent entrepreneurs, whereas intra-firm job mobility in large corporations suppresses it. Results from a novel method – Ridge Regression – address unobserved heterogeneity, and provide compelling evidence for the argument that nascent entrepreneurs are forged in the heat of battle, as small and new organizations struggle to survive in an economy dominated by monopolistic corporations. We call for greater attention to the genesis of organizations through research on the interplay between organizations and their environments.

3 - Educational Mismatch, Work Outcomes, and Entry into Entrepreneurship

Briana Sell, Georgia Institute of Technology, Atlanta, GA,
United States of America, brian.sell@scheller.gatech.edu,
Henry Sauermann

A growing body of research explores how employees' organizational context shapes entrepreneurial activity. We contribute to this line of work by examining how "educational mismatch" – when a job does not utilize the skills an employee has acquired during formal education – relates to subsequent transitions into entrepreneurship. While prior research has focused on mismatch due to labor market frictions, workers may also enter mismatches for a variety of other reasons such as a change in career interests or family obligations. Different reasons, in turn, may relate in distinct ways to wages and job satisfaction and thus to the opportunity costs of entering entrepreneurship. Moreover, mismatch may also affect human capital development, including the formation of a broader range of skills that is beneficial in entrepreneurship. Using longitudinal data from over 22,000 scientists and engineers, we document a broad range of reasons for educational mismatch and show that the relationships between educational mismatch and wages, job satisfaction and skill variety differ significantly depending upon the reason for a mismatch. Mismatched individuals are more likely to enter into entrepreneurship in a subsequent period, an effect that goes beyond higher labor mobility per se. In addition to lower opportunity costs, greater skill variety appears to be an important factor linking educational mismatch to subsequent entrepreneurship. We discuss implications for research, managers, and policy makers.

Publications in Education

Sponsor: INFORM-ED

Sponsored Session

Chair: Susan Palocsay, Professor, James Madison University, CIS & BSAN Department, Harrisonburg, VA, 22807, United States of America, palocsw@jmu.edu

1 - Education Issues in the Wiley Encyclopedia of OR/MS

Susan Palocsay, Professor, James Madison University, CIS & BSAN Department, Harrisonburg, VA, 22807,
United States of America, palocsw@jmu.edu

This presentation will give a synopsis of articles on Education Issues in the Wiley Encyclopedia of OR/MS. This topic area is aimed at providing a reference on pedagogical methods and instructional materials for teaching OR/MS. The process for developing a new article will be described with discussion of possible subjects.

2 - Panel Discussion: Publishing in Inform Transactions on Education

Armarn Ingolfsson, University of Alberta, University of Alberta,
Edmonton, Canada, aingolfs@ualberta.ca, Moderator: Jill Wilson,
Panelists: Anita Tucker, Jeroen Belijn

The panelists include ITE editors and authors who have published recently in ITE. The authors will discuss their experiences with submitting articles to ITE. The editors will provide suggestions to authors who wish to submit their work to ITE—in particular, articles about case studies and about educational games.

Decision Analysis IV

Contributed Session

Chair: David Rogers, University of Cincinnati, Carl H. Lindner College of Business, Operations, Business Analytics, and IS, Cincinnati, OH, 45221-0130, United States of America, David.Rogers@UC.edu

1 - Comparative Techno-economic Analysis of Biofuel Production Considering Logistic Settings

Qi Li, Iowa State University, 0076 Black Engineering, Ames, IA, 50011, United States of America, qili@iastate.edu, Guiping Hu

A new comparative techno-economic analysis methodology is introduced of commercial biorefinery by considering the practical logistic settings and constraints. This new method would give benefit for pathway selection and parameters estimation. A case study of Iowa is conducted to illustrate and validate the proposed methodology.

2 - Optimization of Maintenance Policy in the Presence of Competing Risks

Nilofar Varzani, PhD Student, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States of America, nilofarv@scarletmail.rutgers.com, Michael Katehakis, Suresh Govindaraj

We study the optimal replacement and maintenance policy for a single unit system which undergoes periodic inspection in order to decide if the system should be replaced or not. The system is subject to competing risks of deterioration; regular depreciation due to usage and random shocks. We model it as a discrete time semi-markovian process and use competing risk models to search for the existence of an optimal replacement and maintenance policy.

3 - Decision-Making for Portfolio Optimization using Information Entropy

David Rogers, University of Cincinnati, Carl H. Lindner College of Business, Operations, Business Analytics, and IS, Cincinnati, OH, 45221-0130, United States of America, David.Rogers@UC.edu, George Polak

Information entropy, a measure of the uncertainty based upon the probabilities encountered, is appropriate for decision makers wanting to proactively deal with risk. An optimization model for a risk-return trade-off will be examined with entropy as either the objective to minimize subject to a constraint on expected returns or expressed as an upper-bounded constraint for the objective of maximizing return. A comparison to other objectives will be assessed with a portfolio optimization setting.

4 - Why Classical Hybrids are so Risky for Entrepreneurs, and What to do About It

Gaston De Los Reyes, Assistant Professor, George Washington University School of Business, 2201 G St. NW, Fungler 615, Washington, DC, 20052, United States of America, gdlr@gwu.edu

Williamson (1991) insufficiently characterized the institutions of hybrid governance, emphasizing forms that feature neoclassical devices to co-govern past contract close. Entrepreneurs, however, frequently resort to hybrids of classical form, lacking terms to protect from 'lawful' opportunism in case of disruption. I explicate the implications, drawing upon my dissertation study of contract law. I discuss a novel institutional solution and managerial strategies for the status quo.

Transportation

Contributed Session

Chair: Mohammed Obeidat, Kansas State University, Manhattan, KS, 66502, United States of America, moh2001ie@yahoo.com

1 - Forecasting Bike Sharing Demand in New York City: A Study of Environmental Factors

Stanislav Mamonov, Assistant Professor, Montclair State University, 1 Normal Ave, Montclair, NJ, 07043, United States of America, stanislav.mamonov@montclair.edu, Andrada Ivanescu

Bike-sharing programs are universally praised for their potential to provide a sustainable and eco-friendly public transportation option. In a year since its launch, NYC Citi Bike program became the largest bike-sharing program in North America with over 100,000 annual members. In this study, we perform functional regression modeling of environmental factor (temperature, humidity, wind, rain, etc.) impact on the demand for Citi bikes in NYC to assist in system rebalancing efforts.

2 - Reliability-based Bridge Maintenance and Rehabilitation Budget Planning and Allocation

Haotian Liu, Rutgers, The State University of New Jersey, 100 Brett Road, Piscataway, NJ, 08854-8018, United States of America, yunbai.cait@rutgers.edu, Ali Maher, Yun Bai

This research develops a reliability-based model to mitigate infrastructure deterioration uncertainty for optimal planning and allocation of annual budgets for bridge maintenance and rehabilitation, a process that minimizes total social costs, the sum of agency- and user- costs, for a network of bridges. The risk of budget overruns can be reduced by explicitly considering budget variances quantified through our proposed model.

3 - A Hybrid Algorithm for Bicycle Network Design

Chin Sum Shui, The University of Hong Kong, Seat 16, Room LG208, Composite Building, Pokfulam Road, Hong Kong, Hong Kong - PRC, samshui2004@hotmail.com, Wy Szeto

This study introduces a bicycle network design problem that maximizes coverage and demand satisfaction within a limited budget. Two metaheuristics, Genetic Algorithm and Artificial Bee Colony Algorithm, are combined to solve this network design problem. Computational experiments are conducted and showed that this hybrid algorithm outperforms both GA and ABC in solving large-scale bicycle network design. The tradeoff between two objectives is investigated through varying the weighting factor.

4 - Morning Commute Management Considering Commuters' Aversion to Credit Loss

Mohammad Miralinaghi, Purdue University, West Lafayette, IN, 47906, United States of America, mohammad.miralinaghi@gmail.com, Srinivas Peeta

Under the tradable credit scheme, this study analyzes commuters' departure time choices considering their aversion to credit loss. The analysis helps in determining credit price to manage morning commute congestion. The existence and uniqueness of the equilibrium credit price are investigated and a linear model is developed to obtain system optimum credit allocation and charging schemes.

5 - Effect of Glare on Shoulder-mounted Guide Sign Visibility

Mohammed Obeidat, Kansas State University, Manhattan, KS, 66502, United States of America, moh2001ie@yahoo.com, Malgorzata Rys

Glare is a serious concern in roadway safety during nighttime driving. Shoulder-mounted guide sign visibility will be evaluated under presence of glare in a field experiment using different retroreflective sheeting. Several variables will be considered. Data will be analyzed statistically to determine the significant variables that contribute to sign's visibility.

Value of Information

Sponsor: Decision Analysis
Sponsored Session

Chair: Debarun Bhattacharjya, IBM T. J. Watson Research Center, 1101 Kitchawan Road, Rt. 134, Yorktown Heights, NY, 10598, United States of America, debarunb@us.ibm.com

1 - Balancing Research and Funding Needs: Value of Information and Portfolio Tools for Nano Risk Decisions

Matthew Bates, Research Engineer, US Army Corps of Engineers, Engineer R&D Center, 696 Virginia Rd, Concord, MA, 01742, United States of America, Matthew.E.Bates@usace.army.mil, Jeffrey Keisler, Niels Zussblatt, Kenton Plourde, Ben Wender, Igor Linkov

Nanotechnologies are economically and technically promising yet pose risks. Research may identify risks and paths to make technologies less hazardous or more acceptable. Given limited resources, funders need to prioritize research efforts. Current prioritization is done primarily thorough committee or executive decision. We apply value of information and portfolio analysis techniques to develop an efficient frontier of hazard research sets across three prominent nanomaterials (Ag, TiO₂, MWCNTs).

2 - Scoring Rules, Value of Information, and Sensitivity Analysis

Victor Richmond Jose, Georgetown University, 544 Hariri Bldg, 37th & O Sts NW, Washington, DC, United States of America, vrj2@georgetown.edu, Emanuele Borgonovo, Gordon Hazen, Elmar Plischke

Scoring rules & value of information (VOI) are useful tools in decision analysis that measure the information content of data. In this talk we bridge these two seemingly separate areas of research. We obtain analytic expressions for VOI associated with some scoring rules and show that the resulting VOI sensitivity measures are global sensitivity measures that fall in a common rationale. We study this common rationale & obtain conditions that characterize properties of these sensitivity measures.

3 - Valuing Data: A Closed Form Solution for the Expected Value of Sample Information

Adam Fleischhacker, Assistant Professor Of Operations Management, University of Delaware, 222 Lerner Hall, Newark, DE, 19716, United States of America, ajf@udel.edu, Pak-wing Fok, Mokshay Madiman

We present a method for valuing sample data prior to its collection. This valuation is given in closed-form and is flexible enough to mimic multiple decision making contexts. Compared to existing techniques, it provides tighter estimates of information value, insight as to the conditions under which data is valuable, and insight into the amount of data required to achieve certain levels of value.

4 - Preference Elicitation Schemes, Random Utility Models and the Value of Information

Debarun Bhattacharjya, IBM T. J. Watson Research Center, 1101 Kitchawan Road, Rt. 134, Yorktown Heights, NY, 10598, United States of America, debarunb@us.ibm.com, Stephane Deparis

Behavioral research indicates that when posed with preference elicitation queries, people provide inconsistent responses that depend on contextual factors. Random utility models have been proposed as a potential way to represent such inconsistencies. In this talk, we introduce a hierarchical Bayesian approach where the system is uncertain about the noise in a decision maker's responses to queries, and present a methodology to compute the value of information from various elicitation schemes.

Decision Analysis in Procurements and Procurement Auctions

Sponsor: Decision Analysis
Sponsored Session

Chair: Janne Kettunen, Assistant Professor, The George Washington University, 2201 G Street, NW, Washington, DC, 20052, United States of America, jkettune@email.gwu.edu

1 - Evaluating Technology Readiness for Adoption and Integration at Navy Installations

Eva Regnier, Associate Professor, Naval Postgraduate School, 699 Dyer Road, Monterey, CA, 93943, United States of America, eregnier@nps.edu, Robert Barron, Daniel Nussbaum

While the DOD has adopted and adapted NASA's technology readiness level (TRL) definitions in many contexts to measure its technologies' progress, the achievement of high TRL levels has not necessarily led to adoption operationally. We propose a measure of the progress in removing specific barriers to technology adoption and integration in Navy installations that includes criteria for technical readiness, as well as stakeholder acceptance and removal of barriers to procurement.

2 - Scheduling Procurement Auctions

Janne Kettunen, Assistant Professor, The George Washington University, 2201 G Street, NW, Washington, DC, 20052, United States of America, jkettune@email.gwu.edu, Young Kwak

We derive conditions when scheduling procurement auctions impacts significantly on their expected costs. To help the procurement auction owner in scheduling the auctions, we develop a non-linear integer programming model, which we reformulate as a mixed integer programming problem to make it computationally amenable. We apply the model for the Florida Department of Transportation procurement auction data. Our results indicate that the optimal schedule can provide substantial cost savings.

3 - Decision Analysis Concepts in Public Procurement

Jay Simon, American University, jaysimon@american.edu

Decision analysis can play a significant role in helping carry out public procurement effectively. Public procurement decisions often require assessing preferences over multiple attributes. There may also be uncertainty regarding one or more elements of the process. Recent work has examined some of the unique challenges in public procurement, and how decision analysis techniques can be used to improve outcomes.

4 - On the Inefficiency of Multiattribute Auctions for Post-Auction Produced Goods

Gregory Kersten, Prof, Concordia University, 1455 De Maisonneuve Blvd. W, 1450 Guy Street, Montreal, Qu, H3H 0A1, Canada, gregory.kersten@concordia.ca

Multiattribute auctions are used to procure heterogeneous products. If they are produced post-auction, then the price and other attributes are interrelated and the assumption of the buyers' and the sellers' quasi-linearity utility does not hold. The implication is that while winning bids may be efficient solutions the auctions are inefficient mechanisms. The inefficiency and the possibility of improving the winning efficient bids via the side payment is illustrated with Cobb-Douglas economy.

Aviation Applications Section: Award Finalists

Sponsor: Aviation Applications

Sponsored Session

Chair: Senay Solak, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, solak@isenberg.umass.edu

1 - Robust Aircraft Routing

Chiwei Yan, Massachusetts Institute of Technology, 77 Massachusetts Avenue, E40-130, Cambridge, MA, United States of America, chiwei@mit.edu

We propose a robust optimization approach to minimize total propagated delay in the aircraft routing problem, a setting first developed by Lan et al. (2006) and then extended by Dunbar et al. (2012). The major contribution of our model is that it allows us to model correlated flight leg delays that existing approaches cannot efficiently incorporate. Using both historical delay data and simulated data, we show our model outperforms the state-of-the-research stochastic approach.

2 - Optimization and Analytics for Air Traffic Management

Michael Bloem, NASA, Ames Research Center, Moffett Field, CA, United States of America, michael.bloem@nasa.gov

We discuss three types of decisions in the air traffic management system: (1) how to configure available airspace and other resources to ensure safe and efficient operations in a region of airspace, (2) how to assign a set of flights to a set of slots in an Airspace Flow Program, and (3) when to implement a Ground Delay Program.

Container-based Logistics

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Mahir Yildirim, Turkey, mahiryldrm@sabanciuniv.edu

1 - Service Design for Liner Shipping with Service Levels

Jan Fabian Ehmke, Assistant Professor, Freie Universität Berlin, Garystr. 21, Berlin, 14195, Germany, JanFabian.Ehmke@fu-berlin.de, Ann Campbell, Kevin Tierney

We consider the liner shipping route design problem, where each port has a time window, and travel times between ports are assumed to be stochastic. We ensure that each time window is satisfied with a given service level while minimizing the costs of a single route. We investigate how different service levels affect the costs of a route. We also allow the model to increase the speed of a vessel to ensure the service level, and we analyze the trade-off between vessel costs and costs of speeding.

2 - Decision Support for Flexible Liner Shipping

Johan Oppen, Norway, Johan.Oppen@hiMolde.no

We present a transportation problem representing a combination of liner and tramp shipping, where using other modes of transportation is also an option. As an example, we consider transportation of palletized frozen fish from Russia and Norway to terminals in Norway, the Netherlands and the UK. We present a mathematical model for the planning problem associated with each tour and show that problem instances of realistic size can be solved to optimality using standard software.

3 - A Biased Random-Key Genetic Algorithm for the Container Pre-Marshalling Problem

Kevin Tierney, Assistant Professor, University of Paderborn, Warburger StraÙe 100, Paderborn, 33098, Germany, kevin.tierney@upb.de, Andre Hottung

Container terminals re-order containers they are storing through a pre-marshalling process in order to streamline their operations. Even small pre-marshalling problems are difficult for state-of-the-art techniques to solve. We introduce a biased random-key genetic algorithm with several novel heuristics for solving the container pre-marshalling problem. Our approach can be easily integrated into a decision support system for terminal operators to help them increase port efficiency.

4 - Scheduled Service Network Design Problems with Balance and Synchronization Constraints

Mahir Yildirim, Turkey, mahiryldrm@sabanciuniv.edu, Tom Van Woensel, Theo Crainic

In this study, we address the problem of scheduled service network design (SND) for container freight distribution along rivers, canals, and coastlines. We propose a new concise continuous-time mixed-integer linear programming model where the objective is to build a minimum cost SND and container distribution plan defining services, their departure and arrival times, as well as vehicle and container routing. The model is solved with an ALNS-based heuristic with specific neighborhood structures.

Electric Vehicles I

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Hong Zheng, Purdue University, United States of America, zheng255@purdue.edu

1 - Charging Efficiency Analysis of the Dynamic Charging Electric Vehicle

Young Jae Jang, Assistant Professor, KAIST, 291 Daehak ro, Industrial and Systems Eng, KAIST, Daejeon, 305701, Korea, Republic of, yjang@kaist.ac.kr

The Dynamic Wireless Charging Electric Vehicle (DWC-EV) charges the battery in the vehicle from a power transmitter embedded in the road. The advantage of the system is that the charge can be done while the vehicle is in motion. The KAIST On-Line Electric Vehicle (OLEV) is a commercially available DWC-EVs. We present the charging efficiency analysis of DWC-EVs with data collected from the OLEV. We discuss how the power transmitters are effectively allocated with the finding from the analysis.

2 - Adaptive Routing and Recharging Policies for Electric Vehicles

Irina Dolinskaya, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, dolira@northwestern.edu, Timothy M. Sweda, Diego Klabjan

Recharging costs for an electric vehicle (EV), which increase as the battery's charge level increases, are fundamentally different than for conventional vehicles. Furthermore, the availability of charging stations along the way must be considered. We study the problem of finding an optimal routing and recharging policy for an EV in a grid network. We develop and analyze a variety of models depending on the amount and timing of information available to the EV driver while traveling.

3 - Electric Vehicle Routing and Network Design of Charging Station Locations

Hong Zheng, Purdue University, United States of America, zheng255@purdue.edu, Xiaozheng He, Srinivas Peeta

An electric vehicle (EV) cannot travel beyond its range without stopping to recharge its battery. This study addresses two problems for EVs. We show that the EV routing subject to range feasibility and maximum number of stops can be reduced to a dynamic program solving the shortest path problem on an auxiliary network. We then present a mixed-integer linear programming formulation and a solution algorithm for the network design problem of determining the charging station locations.

Facility Logistics II

Sponsor: TSL/Facility Logistics

Sponsored Session

Chair: Clara Novoa, Associate Professor, Texas State University, 601 University Dr., San Marcos, TX, 78666, United States of America, cn17@txstate.edu

1 - New Aisle Designs for Order Picking Warehouses

Sabahattin Ozden, Auburn University, Shelby Center, Auburn, United States of America, sgo0002@auburn.edu, Alice Smith, Kevin R. Gue

We reveal results of a three year effort to find new aisle designs for order picking warehouses. We describe a computational system that searches all possible designs within a design class using an evolutionary strategy. To assess the fitness of a design, the system allocates SKUs to locations and then builds optimal routes from real orders. The results, we believe, are surprising and significant.

2 - Optimizing Storage-class Formation in Unit-load Warehouses

Yun Fong Lim, Associate Professor, Singapore Management University, 50 Stamford Road, #04-01, Singapore, 178899, Singapore, yflim@smu.edu.sg, Marcus Ang

We propose a new approach to optimize storage classes for a unit-load warehouse with a general layout. Under this approach, the “attractiveness” of each storage location is determined by its frequency of visits, which is estimated by a linear program that considers the warehouse’s layout and the products’ arrivals and demands. We group the locations with similar visit frequencies in the same class. Our approach gives a lower average travel cost than a cost-based method and a grid-based method.

3 - Two Single Instruction Multiple Data Implementations for Solving the Quadratic Assignment Problem

Clara Novoa, Associate Professor, Texas State University, 601 University Dr., San Marcos, TX, 78666, United States of America, cn17@txstate.edu, Apan Qasem, Abhilash Chaparala

We solve the Quadratic Assignment Problem by implementing 2-opt and tabu search in the Graphical Processing Unit (GPU). For the 2-opt we fine tune the thread block configuration and exploit inter-thread data locality through shared memory allocation. In the tabu search we exploit dynamic parallelism. We experiment with QAPLIB data sets. Tabu search accuracy is very satisfactory while 2-opt performance is impressive. Results are contrasted to a Tabu search GPU implementation from other authors.

4 - Optimizing Vehicle Travel Speed in Green Vehicle Routing Problems

Xiaoren Duan, Teaching Assistant, University of Louisville, Department of Industrial Engineering, University of Louisville, Louisville, KY, 40292, United States of America, duanxiaoren@gmail.com, Sunderesh Heragu

A Green Vehicle Routing problem with various travel speed is formulated to minimize total carbon emission. Heuristic algorithm based on Savings Algorithm and Tabu Search is developed to solve this problem. Numerical experiments show that the heuristic performs better compared with GAMS and can achieve 15.69% and 32.27% carbon emission reduction compared with basic G-VRP with and without time window limitation respectively. Impact of congestion on carbon emission is also investigated.

We develop a probabilistic flow-based location model to optimally deploy electric vehicle (EV) charging stations on traffic network, taking into account the probability of a demand node becoming an EV adopter. We demonstrate the model with the Sioux Falls network and solve the model using a Lagrangian relaxation based algorithm.

2 - Optimization-based Planning of Capacitated Infrastructure for Intercity Trips of Electric Vehicles

Yu Nie, Northwestern University, y-nie@northwestern.edu, Ali Zockaie, Mehrnaz Ghamami

The main purpose of this study is to facilitate the long-distance trips of electric vehicles. The objective is to minimize the construction cost of charging stations, battery cost, and refueling delay, while maintaining a certain level of service. To this end, a nonlinear optimization model is developed. To overcome computational difficulties of the commercial solvers, a metaheuristic algorithm is proposed to solve the nonlinear model, as the size of problem grows in real world case studies.

3 - Multi-period Capacitated Flow Refueling Location Problem

Anpeng Zhang, University at Buffalo, SUNY, 339 Bell Hall, Buffalo, NY, 14228, United States of America, anpengzh@buffalo.edu, Jee Eun Kang, Changhyun Kwon

We formulate a new flow refueling location problem for electric vehicles, considering the capacity of rechargers and the time span of construction. The model will help us determine the optimal locations of recharging stations as well as the number of recharging modules at each station over multiple time periods. We develop heuristic methods and present computational experiments based on the freeway network that spans between Washington DC and Boston.

4 - Infrastructure Planning for Fast Charging Stations in a Competitive Market

Zhaomiao Guo, University of California, Davis, 614 Sycamore Lane, Apt. 232, Davis, CA, United States of America, zmguo@ucdavis.edu, Yueyue Fan, Julio Deride

We study the fast charging infrastructure planning under competition using Multi-agents Optimization Problem with Equilibrium Constraints modeling framework. We find that the investment pattern could be affected by consumers’ weights on charging price and charging availability: if consumers care more about charging availability, the investment may cluster to a few locations; on the contrary, the investment may diffuse through out the network.

1 - Progressive Measurement and Monitoring for Multi-resolution Data in Surface Manufacturing Considering Cross Correlations

Hui Wang, Assistant Professor, Florida State University, 2525 Pottsdamer St, Tallahassee, FL, 32310, United States of America, hwang10@fsu.edu

This paper develops a new approach to modeling and monitoring surface variations by fusing in-plant multi-resolution measurements and process information. The fusion is achieved by considering cross correlations among measured data and manufacturing process variables based on cutting dynamics. The model can make Bayesian inference on surface shapes progressively. A new monitoring scheme is then proposed for jointly detecting and locating defects without significantly increasing false alarms.

2 - Prediction of the Failure Interval with Maximum Power Based on the Remaining Useful Life Distribution

Junbo Son, PhD Candidate, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, json5@wisc.edu, Qiang Zhou, Shiyu Zhou, Mutasim Salman

Prognosis of remaining useful life (RUL) of a unit or a system plays an important role in system reliability. One key aspect of the RUL prognosis is constructing the best prediction interval. In this paper, we propose a new method, namely maximum prediction power interval (MPI). The MPI guarantees the best prediction performance under the given acceptable error range. A numerical simulation study and case study with real data confirm the better features of MPI over existing prediction intervals.

3 - Time Series Forecasting for Nonlinear and Non-stationary Processes: A Review and Comparative Study

Changqing Cheng, USF, 4202 E. Fowler Avenue, Tampa, FL, United States of America, cheng.changqing@gmail.com, Hui Yang, Zhenyu Kong, Satish Bukkapatnam

Forecasting of time series data is critical for the monitoring of complex systems. This article presents a review of nonlinear and non-stationary time series forecasting models and a comparison of their performances in certain real-world applications. Conventional approaches do not adequately capture the system evolution, from the standpoint of forecasting accuracy, computational effort, and sensitivity to quantity and quality of a priori information in these applications.

Multicriteria and Multiobjective Models in Risk, Reliability and Maintenance

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Adiel De Almeida Filho, Assistant Professor, Universidade Federal de Pernambuco, Caixa Postal 7471, Recife, PE, 50630-971, Brazil, adieltaf@googlemail.com

Co-Chair: Adiel T De Almeida, Professor, Universidade Federal de Pernambuco, Caixa Postal 7462, Recife, PE, 50630-971, Brazil, almeidaatd@gmail.com

1 - Multicriteria and Multiobjective Models for Risk, Reliability and Maintenance Decision Analysis

Adiel T De Almeida, Professor, Universidade Federal de Pernambuco, Caixa Postal 7462, Recife, PE, 50630-971, Brazil, almeidaatd@gmail.com, Adiel De Almeida Filho, Marcelo H Alencar, Rodrigo J P Ferreira

Many decisions on Risk, Reliability and Maintenance (RRM) problems involve multiple objectives and multicriteria methods (MCDM). RRM decision problems may affect strategic results of organizations, human life (e.g. safety) and the environment, in order to comply with modern society demands. A framework for structuring MCDM in the RRM context is presented, based on the reference Multicriteria and Multiobjective Models for Risk, Reliability and Maintenance Decision Analysis.

2 - Multicriteria and Multiobjective Models on Maintenance Outsourcing

Adiel De Almeida Filho, Assistant Professor, Universidade Federal de Pernambuco, Caixa Postal 7471, Recife, PE, 50630-971, Brazil, adieltaf@googlemail.com, Thalles V Garcez, Adiel T De Almeida

This work presents key aspects of MCDM approaches for decisions on maintenance outsourcing, which including contract selection and supplier selection. Given the MCDM nature of maintenance outsourcing, models to address this problem include maintainability, dependability, quality of repair besides cost, which are detailed in the reference Multicriteria and Multiobjective Models for Risk, Reliability and Maintenance Decision Analysis.

3 - Multidimensional Risk Evaluation Based on Multicriteria and Multiobjective Models

Marcelo H Alencar, Universidade Federal de Pernambuco, Av. Professor Moraes Rego, 1235., Recife, PE, 50670-901, Brazil, marcelohazin@gmail.com, Adiel T De Almeida, Rodrigo J P Ferreira, Adiel De Almeida Filho, Thalles V Garcez

When considering a multidimensional risk evaluation model a broader view is enabled by considering financial, environmental and safety aspects simultaneously. This work presents MCDM approaches in two different contexts: natural gas pipelines and underground electricity distribution system. These models are part of the reference Multicriteria and Multiobjective Models for Risk, Reliability and Maintenance Decision Analysis.

4 - Multicriteria and Multiobjective Models on Preventive and Condition-based Maintenance

Rodrigo J P Ferreira, Assistant Professor, Universidade Federal de Pernambuco, Av. Professor Moraes Rego, 1235., Recife, PE, 50670-901, Brazil, rodjpf@gmail.com, Cristiano A.V. Cavalcante, Adiel T De Almeida, Adiel De Almeida Filho

Classical optimization models consider only the cost optimization for defining the best time interval for preventive maintenance. This work presents a framework to support the selection of time interval for equipment preventive maintenance involving reliability and availability aspects besides cost. A complete framework for such decisions is presented in the reference Multicriteria and Multiobjective Models for Risk, Reliability and Maintenance Decision Analysis.

Emerging Development in Simulation and Optimization

Sponsor: Simulation

Sponsored Session

Chair: Chun-hung Chen, George Mason University, 4400 University Drive, MS 4A6, SEOR Dept, GMU, Fairfax, VA, 22030, United States of America, cchen9@gmu.edu

1 - Slice Sampling Approaches to Stochastic Optimization

John Birge, Professor, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu

Crude Monte Carlo approaches are often used to approximate stochastic optimization problems, but such approaches suffer from both high variance and bias. This presentation will describe the slice sampling approach, which can significantly reduce variance, and mode identification, which can eliminated bias.

2 - Simulation Analytics

Barry Nelson, Walter P. Murphy Professor, Northwestern University, Dept. of IEMS, 2145 Sheridan Road, C210, Evanston, IL, 60208, United States of America, nelsonb@northwestern.edu, Yujing Lin

The influence of queueing theory on stochastic simulation is substantial, including simulation's emphasis on long-run averages of predetermined performance measures. As a result, the analysis of simulation data and real-world "big data" are entirely different. In this talk we explore how a data analytics perspective could significantly change the use of simulation.

3 - Conditional Probability of Correct Selection for Ranking and Selection Procedures

Dave Goldsman, Professor, Georgia Tech, School of ISyE,
Georgia Tech, Atlanta, GA, 30332, United States of America,
sman@gatech.edu, Joshua McDonald

Ranking and selection (R&S) procedures seek to select the best of a number of competing populations, subject to a guarantee on the achieved probability of correct selection (PCS). In the usual formulations of R&S problems, the guaranteed PCS is specified a priori. We instead study the conditional PCS after sampling has concluded - which may be substantially different than the a priori version. In particular, we show how to compute or estimate the conditional PCS given the observed scenario.

4 - Efficient Optimization via Multi-fidelity Simulation

Jie Xu, George Mason University, 4400 University Dr., MS 4A6,
Engr Bldg, Rm 2100, Fairfax, VA, 22030, United States of
America, jxu13@gmu.edu, Si Zhang, Edward Huang, Loo Hay
Lee, Nurcin Celik, Chun-hung Chen

To efficiently solve optimization problems involving time-consuming high-fidelity simulations, we propose a new multi-fidelity optimization framework known as MOTOS. MOTOS uses low-fidelity simulations to broadly explore the solution space and focuses high-fidelity simulations on promising solutions. MOTOS integrates low- and high-fidelity simulations in an efficient and rigorous manner and has been shown to lead to significant computational savings.

Supply Chain Management IV

Contributed Session

Chair: Chun Hung Chiu, Associate Professor, Associate Professor,
Sun Yat-sen University, Business School, Sun Yat-sen University,
No 135, Xingang West Rd., Guangzhou GD 510275, China,
zhaojx5@mail.sysu.edu.cn

1 - Public Versus Private Quality Disclosure of Counterfeit Goods

Laura Wagner, Zaragoza Logistics Center, Calle Bari, Zaragoza,
Spain, laurawa@mit.edu, Mustafa Cagri Görböz, Mahmut Parlar

Some manufacturers have been accused for withholding information on counterfeit incidences, while others have proactively warned. We analyse this situation in a supply chain setting. In particular we are interested in manufacturer's willingness to disclose the quality of the potentially counterfeit good, intermediary's purchasing decision in response to the disclosure strategy and consumers' responses to such warnings.

2 - Mean Variance Analysis for Supply Chain Contract

Jinfeng Yue, Professor, Middle Tennessee State University and
Shanghai University of Finance and Economics, Department of
Management and Marketing, Murfreesboro, TN, 37132,
United States of America, jinfeng.yue@mtsu.edu

This research studies the supply chain coordination by mean-variance analysis. When only the mean and variance information is available, the coordination conditions are obtained for wholesale price contract. The maximum number of retailers can also be determined. For general cases, the conditions to select the retailers are also obtained. Finally, an optimal designed wholesale price contract can coordinate the supply chain and split the total profit by any designed level.

3 - Economic Contracts Improving the Efficiency of Cotton Supply Chains

Jian Li, Associate Professor, Northeastern Illinois University, 5500
N. St. Louis Ave, Chicago, IL, 60625, United States of America,
jli@neiu.edu, Panos Kouvelis

We study the use of economic contracts to improve the efficiency of a stylized cotton supply chain structure of a ginner and a farmer. The benchmark is a standard transfer price contract that reflects the current practice on which a minimum price is imposed from the government. We show that the minimum transfer price is not necessarily effective. An incentive contract is proposed. Numerical studies show that the incentive contract achieves a win-win improvement.

4 - Supply Chain Performance Assessment and Supplier and Component Importance Identification

Dong Michelle Li, Assistant Professor of Supply Chain
Management, Department of Management & Marketing,
Kansas State University, Jonesboro, AR, 72467,
United States of America, dli@astate.edu, Anna Nagurney

We develop a multitiered competitive supply chain network game theory model with firms and associated potential suppliers. All decision-makers seek to maximize their profits. The supply chain network performance measures, which assess efficiency, are constructed for the full supply chain and the individual firm levels. The identification and ranking of the importance of suppliers as well as the components of suppliers with respect to the full supply chain or individual firm are also proposed.

5 - Channel Coordination under Information Asymmetry by Target Sales Rebate Quantity Discount Contracts

Chun Hung Chiu, Associate Professor, Sun Yat-sen University,
Business School, Sun Yat-sen University, No 135, Xingang West
Rd., Guangzhou, GD, 510275, China, zhaojx5@mail.sysu.edu.cn,
Jian Li, T.c.e. Cheng, Tsan Ming Choi

We study a target sales rebate quantity discount (TSR-QD) contract in a single-manufacturer and multi-retailer supply chain. The manufacturer is risk-neutral. Retailers are mean-variance seekers with different target profits which are unknown to the manufacturer. We explore how a Menu of TSR-QD Contracts (MTQ) can be applied to enhance the benefit of the manufacturer and the supply chain's efficiency.

Supply Chain Risk Management II

Contributed Session

Chair: Saravanan Kuppasamy, Assistant Professor, Quinnipiac
University, 275 Mt Carmel Ave, Hamden, CT, 06518, United States of
America, saravanan.kuppasamy@quinnipiac.edu

1 - A Fair Optimization of Expected Cost and Expected Service under Disruption Risks

Tadeusz Sawik, Professor And Chair, AGH University of Science &
Technology, Al. Mickiewicza 30, Krakow, 30059, Poland,
ghsawik@cyf-kr.edu.pl

A new decision-making problem of equitably efficient optimization of cost and service level in a supply chain under local and regional disruption risks is presented. The problem is formulated as a mixed integer program with the ordered weighted averaging aggregation of the two conflicting objective functions. Computational examples and some managerial insights are reported.

2 - Risk Assessment in a Large Retail Supply Chain

Burak Kazaz, Associate Professor, Syracuse University,
721 University Avenue, Syracuse, NY, 13244, United States of
America, bkazaz@syr.edu, Mert Hakan Hekimoglu, John Park

This study develops a new risk exposure index for various infrastructures in a large retail supply chain. It identifies detrimental disruptions, considers operational and financial metrics with excess capacity at distribution centers and fulfillment centers that can serve as backup facilities. It provides risk levels at all facilities.

3 - Risk Modeling in Food Supply Chain, Insights

Saravanan Kuppasamy, Assistant Professor, Quinnipiac
University, 275 Mt Carmel Ave, Hamden, CT, 06518, United
States of America, saravanan.kuppasamy@quinnipiac.edu,
Mario Norbis, Iddrisu Awudu

Issues related to food supply chain are becoming increasingly critical for the business and policy makers alike. We propose a food supply chain research framework that consider issues related to location, legislation, corporate responsibility, collaboration, risk measures, food safety and security measures. In addition to managerial insights and implications, we discuss the challenges and opportunities in food supply chains.

4 - Decision Model for Prioritization of Reverse Supply Chain Risks

Dr Jitender Madaan, Professor, Indian Institute of Technology
Delhi, Room No 606 DMS, VK Bhawan, Hauz Khas, New Delhi,
110016, India, jmadaan@dms.iitd.ac.in

This paper presents a flexible, generalized decision model that integrates and prioritize high-level and detailed RSC design decisions that incorporates risks.

5 - Design of a Responsive Vaccine Supply Chain under Supply and Demand Uncertainty

Stef Lemmens, KU Leuven, Naamsestraat 69 Box 3555, Leuven, 3000, Belgium, stef.lemmens@kuleuven.be, Nico Vandaele, Catherine Decouttere

Both literature and industrial evidence emphasize the challenge and the importance of the design of a responsive vaccine supply chain. We model the interrelationships between multi-echelon inventory, production capacity and lead time and take supply and demand uncertainty into account by the use of a methodology which combines the guaranteed service approach and queueing theory. Furthermore, we show the results of applying our methodology to a real-life industrial rotavirus vaccine supply chain.

■ SD79

79-Room 302, CC

Software Demonstration

Cluster: Software Demonstrations

Invited Session

1 - Artelys - See the Artelys KNITRO 10.0 Optimization Solver in Action

Richard Waltz, Senior Scientist, Artelys Corp

KNITRO is the premier solver for nonlinear optimization and recent winner of the GECCO 2015 black-box optimization competition, finishing first among 28 solvers. This software demonstration will highlight the latest KNITRO features, including a new object-oriented interface and new SQP algorithm for derivative-free optimization (DFO). The demo will also provide an overview of how to effectively use KNITRO in a variety of environments and applications, and present recent benchmarking results for DFO and nonlinear optimization.

2 - GAMS Development Corp - GAMS – An Introduction

Steve Dirkse, Director of Optimization, GAMS Development Corp

This workshop will show you how to use the General Algebraic Modeling System (GAMS) in an efficient and productive way. There will be an introduction to the system and a presentation of the key concepts in GAMS. The largest part of the workshop consists of hands-on exercises. Amongst others, it will be demonstrated how GAMS interacts with other applications and you will see how to analyze and debug problems using the tools available within GAMS.

Monday, 8:00am - 9:30am**■ MA01**

01-Room 301, Marriott

Military O.R. and Applications III

Sponsor: Military Applications

Sponsored Session

Chair: Michael Hirsch, ISEA TEK, 620 N. Wymore Rd., Ste. 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com

1 - Electronic Attack Decision Framework using Pomdp

Brandon Ha, Sr. Systems Engr II, Raytheon Company, 2000 E. El Segundo Blvd, E1/B2208D, El Segundo, CA, 90245, United States of America, Brandon.C.Ha@raytheon.com

The objective of this research is to develop a suite of machine learning algorithms to address the need for engaging with future advanced unknown agile RF threats and co-evolve with the adversary's response. Our approach uses POMDP to represent the unobservable elements in the environment and actions that can provide partial information about these elements – to learn (characterize) the unknown emitters and then to predict the intent and deploy optimal EA technique(s).

2 - Pursuit on a Graph using Partial Information: Max-delay

David Casbeer, Dr., Air Force Research Laboratory, 2210 8th Street, B20146 R300, Wright Patterson AFB, OH, 45433, United States of America, david.casbeer@us.af.mil, Krishna Kalyanam, Meir Pachter

The optimal control of a “blind” pursuer searching for an evader on a graph is presented. At specific locations on the graph (road network), unattended ground sensors (UGS) have been placed which detect the intruder. The pursuer (UAV) visits the sensors and decides where to travel in order to capture the evader. An algorithm is presented to compute the maximum initial delay for which capture is guaranteed. The algorithm also returns the corresponding optimal pursuit policy.

3 - Improved Sensor Placement in Multistatic Sonar Networks

W. Matthew Carlyle, Naval Postgraduate School, mcarlyle@nps.edu, Emily Czaparo, Mumtaz Karatas, Christoph Hof

Multistatic sonar networks containing non-collocated sources and receivers represent an important generalization of traditional sonar systems. Although they convey many tactical and operational advantages, multistatic sensor networks are difficult to model and to employ optimally. We discuss the multistatic sensing problem and describe algorithms for placing sources and receivers.

4 - Optimal Deployment of Network Defenses

David Myers, Research Engineer, United States Air Force, 26 Bedford Drive, Whitesboro, NY, 13492, United States of America, david.djm.myers@gmail.com

Optimally deploying an ever-growing slate of network defense capabilities, while maintaining the ability to perform the mission, is a critical component of future USAF operations. Utilizing a system's attack graph, this defense configuration problem (DCP) is a network interdiction problem where the network defender is the interdictor and the attacker is the evader. The purpose of this presentation is to formulate and describe the DCP and discuss extensions into a dynamic posture problem.

02-Room 302, Marriott

Game Theory in Practice for Homeland Security

Cluster: Homeland Security

Invited Session

Chair: Milind Tambe, USC, 941 Bloom Walk, Los Angeles, CA, United States of America, tambe@usc.edu

1 - Game Theoretic Applications in Coast Guard Operations

Erich Stein, USCG, 1 Chelsea St., New London, CT, 06339, United States of America, Erich.V.Stein@uscg.mil, Craig Baldwin, Sam Cheung

The Coast Guard has tested and operationalized game theory applications in several mission areas including port security and fisheries. A model was created to mitigate effects of illegal fishing and generate schedules for USCG assets. The Port Resilience Operational Tactical Enforcement to Counter Terrorism (PROTECT) game model optimizes limited security resource allocations. Finally, development of innovative patrol strategies for drug and migrant interdiction efforts is ongoing.

2 - New Trends in Perence Modeling of Adversary Decisions

Ali Abbas, Professor of Industrial and Systems Engineering and Public Policy and Director of Create, University of Southern California, 3710 McClintock Avenue, RTH 314, Los Angeles, CA, United States of America, aliabbas@price.usc.edu

This talk will discuss the need for new models of preferences in both competitive and cooperative games. Simulation results and videos of cooperative autonomous vehicles will also be presented using new models of preferences.

Teaching Modern Project Management

Cluster: Scheduling and Project Management

Invited Session

Chair: Nicholas G. Hall, The Ohio State University, Fisher College of Business, Columbus, OH, United States of America, hall.33@osu.edu

1 - Modern Project Management Curriculum

Ted Klastorin, Professor, University of Washington, Foster School of Business, Box 353226, Seattle, WA, 98195-3226, United States of America, tedk@u.washington.edu

Empirical evidence has documented the failure to adequately manage many complex projects, including IT and new product development projects. At the same time, the need to successfully manage large and risky projects has never been greater. As a result, the need for effectively educating students in the project management (PM) area is critical. In this talk, I will explore the main directions and concepts that should be included in a PM curriculum and how this differs from current courses.

2 - Designing a Project Management Game

Enno Siemsen, Associate Professor, University of Minnesota, 321 19th Ave S, Minneapolis, MN, 55455, United States of America, siems017@umn.edu

As a capstone event in my project management class, I have designed a game to capture organizational dynamics in the context of a project management organization. Teams in the game form a hierarchy, with players taking the role of Vice Presidents, Project Managers or Resources. Having different incentives, these three types of roles need to learn to cooperate to see their projects to completion.

3 - Everything is a Project

Nicholas G. Hall, The Ohio State University, Fisher College of Business, Columbus, OH, United States of America, hall.33@osu.edu

This talk describes the development of an MBA course on project management that is the most popular elective at Fisher College of Business. The course uses various teaching methods - games and group activities, graded in-class problem solving exercises, guest speaker presentations with hands-on activities, HBS simulations, case reports with student presentations, along with traditional lecture and class discussion. The course currently enrolls students from seven graduate programs across campus.

4 - Teaching a Quantitative Approach to Project Management

Rainer Kolisch, Technische Universität München, TUM School of Management, Arcisstraße 21, Munich, Germany, rainer.kolisch@wi.tum.de

I will report on my course "Project Management – A quantitative approach". The course is an elective in the third (and final) year of the undergraduate program in Management and Technology at TUM School of Management, Germany. The course covers a number of quantitative topics ranging from operational to strategic project management. I will report on the content of the course, pedagogical concepts used and feedback received from the students.

Applying Advanced Analytics to Social Media data

Cluster: Social Media Analytics

Invited Session

Chair: Mohsen Parsafard, University of South Florida, 4202 E. Fowler Avenue ENG 214, Tampa, FL, 33620, United States of America, parsafard@mail.usf.edu

1 - Estimating Social Media's Financial Contribution to the Hospitality Sector

Mark Gerner, Sr. Lead Economic Scientist, Booz Allen Hamilton,

22 Battery March St., Boston, MA, United States of America, gerner_mark@bah.com

In this paper we present a methodology leveraging natural language processing and machine learning techniques to estimate the reputational and financial contribution from customer social media conversation, customer ratings, and associated comments from multiple online travel sites.

2 - Efficient Community Partition Algorithm in Networks

Jiaofei Zhong, CSUEB, Dept. of Comp Sci., 25800 Carlos Bee Blvd, Hayward, CA, United States of America, fayzhong08@gmail.com, David Haley, Ehsan Kamalinejad

One fundamental problem in analyzing complex big data sets is the task of classification of the data. Community partitioning plays a crucial role in data analysis of scientific, social, and technological networks. As the study of isoperimetric inequalities is a well-explored field, it is possible to extend specific mathematical theory to its equivalent form in data clustering. We propose an efficient community partition algorithm to analyze the relationships among data via the network topology.

3 - Topic Dependent Edge Importance Measures in Social Media Platforms

George Michailidis, University of Florida, 1 University Ave, Gainesville, FL, United States of America, gmichail@umich.edu

Social media platforms produce large amounts of both structured and unstructured data. A key question for such platforms is to identify important interactions between nodes in the corresponding user network. We address this problem by using a stochastic model of interacting counting processes on a graph, so that topic dependent interactions can also be identified. We illustrate the results of our model on a US Senators Twitter data set.

4 - Role of Social Media in Healthcare via Analytics

Sinjini Mitra, Assistant Professor, California State University, Fullerton, ISDS Department, 800 N State College Blvd, Fullerton, CA, 92831, United States of America, smitra@exchange.fullerton.edu

The advance of computing resources and increased availability of large amounts of data in the recent decade has made it possible to use extensive analytics for effective decision-making in the healthcare industry. Based on a member survey of a large health plan, we identify factors (demographic, clinical and technological) that are significantly associated with member interest in adopting social and mobile media for obtaining health information via predictive and descriptive analytics.

5 - Time Geography Based Mobility Measures for Geo-tagged Twitter Data

Mohsen Parsafard, University of South Florida, 4202 E. Fowler Avenue ENG 214, Tampa, FL, 33620, United States of America, parsafard@mail.usf.edu, Guangqing Chi, Xiaopeng Li

Social media data present tremendous opportunities for studying individuals' travel behaviors. In this study, we propose a set of fundamental measures to quantify the bounds of an individual's spatial and temporal activity range. We further develop an interpolation approximation method to improve the computation efficiency of these measures. Our results reveal an interesting pattern of people's traveling and tweeting behavior where the proposed measures follow a power-law distribution.

1 - Mean Field Game with Singular Controls

Joon Seok Lee, UC Berkeley, 2033 Haste St. #313, Berkeley, CA, 94704, United States of America, ljshope@berkeley.edu, Xin Guo

We introduce a mean field game framework with singular controls. To solve this singular control problem with multiple agents, we derive the Fokker-Planck equation for the singular control, which is a generalization of the mean field game with regular controls. Both single controls of a bounded velocity and of a finite variation will be discussed. Finally, we will present some applications to optimal execution and systemic risk.

2 - Algorithmic Trading under the Effects of Volume Order Imbalance

Ryan Donnelly, EPFL, Quartier UNIL - Dorigny, Extrane 214, 1015, Lausanne, Switzerland, ryan.donnelly@epfl.ch

Shortcomings of some order book models are noted with motivation provided by data from the NASDAQ. The influence of volume order imbalance on order book dynamics is incorporated into a model which allows the agent to adjust their strategy based on an easily observable quantity. The imbalance allows the agent to

decide when they should trade more aggressively to take advantage of price movements, and when they should trade more conservatively to protect against adverse selection effects.

3 - Bettering Investment Performance using Market Implied Information

Duan Li, Professor, The Chinese University of Hong Kong,
Dept of Systems Eng. & Eng. Manag., Shatin, Hong Kong - PRC,
dli@se.cuhk.edu.hk

Financial markets are heavily driven by people's expectations of the future. Thus portfolio decisions should take into consideration the market implied forward-looking information, in addition to the backward-looking information from historical data. This talk discusses a formal framework in identifying hidden utilities of different representative investor groups by analyzing market implied information using inverse optimization solution schemes.

4 - Optimal Spread Crossing in a Limit Order Book

Xuefeng Gao, Assistant Professor, The Chinese University of Hong Kong, xfgao@se.cuhk.edu.hk, Nan Chen, Xiang Ma

We study when a precommitted trader converts a limit order to a market order in algorithmic executions of orders. We formulate the problem as an optimal stopping problem. We present structural properties of the optimal strategy and show how it depends on market conditions. We also study the optimal spread crossing problem under a Bayesian learning model for the fundamental value of an asset. Our numerical experiments illustrate how the price-learning affects the optimal spread crossing time.

07-Room 307, Marriott

Systemic Risk Measurement: Data and Algorithmic Aspects

Cluster: Risk Management

Invited Session

Chair: Andreea Minca, Cornell University, Ithaca, NY, United States of America, acm299@cornell.edu

1 - Systemic Impact in Fund Networks – Part I

Somya Singhvi, Cornell University, Ithaca, NY, United States of America, ss989@cornell.edu, Divya Singhvi, Andreea Minca

We analyze portfolios of equity funds to understand their impact on other portfolios. Further, we develop an algorithm that calculates the systemic impact of a fund on a network of funds. The algorithm captures the premature liquidation in response to investor outflows for different funds. Finally, we also show that our algorithm converges.

2 - Systemic Impact in Fund Networks Part II

Divya Singhvi, Cornell University, 516 University Ave, Apt. B8, Ithaca, NY, 14850, United States of America, ds576@cornell.edu, Andreea Minca, Somya Singhvi

Using the holdings data for US equity funds, we implement the systemic risk measure algorithm. We analyze the second order impact of a fund on the other funds. Our analysis suggest that the network structure leads to a significant additional impact on other funds. Further, we show that the funds begin to cluster themselves into groups of high and low impact based on their network properties.

3 - Inhomogeneous Financial Networks and Contagious Links

Andreea Minca, Cornell University, Ithaca, NY, United States of America, acm299@cornell.edu

We propose a framework for testing the possibility of large cascades in financial networks. This framework accommodates a variety of specifications for the probabilities of emergence of 'contagious links', where a contagious link leads to the default of a bank following the default of its counterparty. We give bounds on the size of the first order contagion and testable conditions for it to be small.

08-Room 308, Marriott

Topics in Innovative and Entrepreneurial Operations

Cluster: Business Model Innovation

Invited Session

Chair: Onesun Steve Yoo, University College London, Gower Street, London, WC1E 6BT, United Kingdom, o.yoo@ucl.ac.uk

1 - The Time-money Trade-off for Entrepreneurs: When to Hire the First Employee?

Onesun Steve Yoo, University College London, Gower Street, London, WC1E 6BT, United Kingdom, o.yoo@ucl.ac.uk, Charles Corbett, Guillaume Roels

Hiring the first employee is a major step in a firm's life cycle, marking the transition from an entrepreneur-dominated firm to a phase of rapid growth. It is also a significant operational problem because how an entrepreneur operates with an employee is fundamentally different than without. We present hiring as a time money tradeoff for entrepreneurs and examine when the entrepreneur should make the hiring decision depending on whether time or money is the chief bottleneck constraint.

2 - Collective Choice in Dynamic Public Good Provision: Real Versus Formal Authority

George Georgiadis, Assistant Professor, Northwestern University, 2001 Sheridan Rd, Evanston, IL, 60208, United States of America, g-georgiadis@kellogg.northwestern.edu, Renee Bowen, Nicolas Lambert

We study a game in which two heterogeneous agents exert effort over time to bring a project to completion, and the project scope can be determined at any point via collective choice. A larger project scope requires greater cumulative effort and delivers higher benefits on completion. We show that the efficient agent prefers a smaller project scope than the inefficient agent, but their preferences are time-inconsistent. We study the optimal allocation of property rights to minimize disagreement.

3 - Third Party Legal Funding under Asymmetric Information

Noam Shamir, Assistant Professor, Tel-Aviv University, Haim Levanon, Tel-Aviv, Israel, nshamir@post.tau.ac.il, Julia Shamir

Third party legal funding describes the phenomenon in which a company that has no direct stake in a legal claim, covers the legal costs of this claim in exchange for future share of the monetary outcome of the claim. We study the implications of this phenomenon in terms of its effect on the litigation strategy and court congestion.

4 - Entrepreneurship Company Formation from University Technology Commercialization

Vish Krishnan, UCSD, La Jolla, CA, 92037, United States of America, vkrishnan@ucsd.edu, Kanetaka Maki

We study how the commercialization of university technologies leads to company formation and collaboration with industrial partners. Specifically, using a mathematical model and empirical testing, we detail the way in which the technology transfer offices both moderate and mediate collaboration.

Understanding Knowledge Sources and Politics in Technology Management

Sponsor: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Zhijian Cui, Assistant Professor of Operations and Technology Management, IE Business School, Calle de Maria de Molina 12, Madrid, 28006, Spain, Zhijian.Cui@ie.edu

1 - The Differential Effect of Knowledge Sources on Innovation Strategy: A Contingency Approach

Beatriz Rodriguez-Prado, University of Valladolid, Avda. Valle del Esgueva, Valladolid, 47011, Spain, bprado@eco.uva.es, Elena Revilla, Zhijian Cui

We examine how innovation strategy determines the sources of knowledge (own-generated, bought-in and co-developed) and their impact on innovation performance. Data of 9054 firms belonging to fourteen European Countries constitute the empirical base of the study. Results derived from Cluster analysis, ANOVAs and Generalized Linear Models strongly indicate investments in innovation activities may generate differential value depending on key contextual factors.

2 - The Effects of Outsourcing Knowledge on the Dynamics of Outsourcing Modes

Qiong Chen, University of Science and Technology of China, School of Management, USTC, 96 Jin Zhai Road, Bao He District, Hefei, 230026, China, qiongc@g.clemson.edu, Shouqiang Wang, Gulru Ozkan-Seely, Alveda Roth

We evaluate buyer's dynamic choice of outsourcing channels: directly through in-house procurement department or indirectly through an intermediary. Using a two-period game theoretic model, we demonstrate the critical yet interesting role of outsourcing knowledge and highlight effects of direct and indirect learning on the change of buyer's strategies over time.

3 - Politics as an Impediment to Technology Strategy Implementation

Marc Finkelstein, IE Business School, 52 Lawrence Ave West,
Toronto, ON, M5M1A4, Canada, marc.finkelstein@gmail.com

Organizations expend significant resources to develop a technology strategy, yet too often fail to accomplish it. They commonly perceive the failure to stem from a lack of resources and capabilities, yet exploratory research suggests that organizational politics are significantly more impactful. Research will outline the types of political maneuvering exhibited and how it is impactful to the achievement of the technology strategy.

Economics of Digital Channels

Sponsor: E-Business

Sponsored Session

Chair: Yi-Chun (Chad) Ho, Assistant Professor, George Washington University, 2201 G Street NW, Washington, DC, 20052, United States of America, chadho@gwu.edu

1 - Loyalty Program: The Dilemma of Shipping Fee

Xue Tan, University of Washington, 4747 30th Ave NE J171,
Seattle, WA, 98105, United States of America, xuetan@uw.edu,
Yi-chun (chad) Ho, Yong Tan

Loyalty programs that offer one year of free shipping after consumers prepay a membership fee has become prevalent in recent years. This paper studies the mechanism of membership free shipping and compare it with contingent free shipping which waives the shipping fee when the order size reaches a threshold in a game theoretical setting. By changing the speed consumers receive their products, membership free shipping changes the product value.

2 - Help Doesn't Help: A Partially Ordinal Discrete Choice Model on Review with Review in Review

Jinyang Zheng, PhD Student, University of Washington,
Mackenzie Hall (MKZ), Room 342, University of Washington,
Seattle, WA, 98105, United States of America, zhengjy@uw.edu,
Yong Tan, Guopeng Yin

We investigate the objectivity of content on review platform with review in review function. By applying a partially ordinal discrete choice model, our research identifies the social capital maximization behavior when user gives rating. We find that rating giving distribution is generated by a mixed distribution of quality driven incentives and expected RIR performance driven incentives, which indicates a consequence of less objectivity of reviewers and less variety of the system.

3 - Corporate Information Disclosure: Social Media Vs. Investor Website

Behnaz Bojd, University of Washington, Seattle WA,
United States of America, behnaz@uw.edu, Yong Tan, Qixing Qu

Traditionally, investors' had access to key information only through the company's websites. Nowadays, companies can also use social media platforms such as Twitter and Facebook, to release information and communicate with the market and shareholders. In this study we compare the nature of information disseminated on each channel and estimate their effectiveness on market behavior.

4 - Incentive Pricing and Quality Screening in Two-sided Markets: The Case of Zocdoc.com

Yuan Jin, University of Connecticut, School of Business, OPIM,
2100 Hillside Road Unit 1041, Storrs, CT, 06269,
United States of America, yuan.jin@business.uconn.edu

Patients and doctors can schedule appointments on an online two-sided market platform, ZocDoc.com. ZocDoc's profits depend on its doctors' market quantity, and this quantity is associated with patients' market quantity, which is in turn determined by doctors' market quantity and quality. In this paper, I study the effect of pricing in ZocDoc's case, and conclude that the addition of monetary incentives for high-quality doctors can improve both profits and overall doctor quality.

1 - Sparse Cuts for Sparse Integer Programs

Qianyi Wang, Georgia Institute of Technology, 755 Ferst Drive,
NW, Atlanta, GA, 30332, United States of America,
crown200x@gmail.com, Marco Molinaro, Santanu Dey

In this talk, we present an analysis of the quality of sparse cuts for IPs with sparse formulations. In order to accomplish this analysis, we define a notion of an induced graph based on the constraint matrix. Then, we are able to relate the strength of sparse cutting-planes to graph-theoretic parameters of the induced graph.

2 - Envelopes of Bilinear Functions over Polytopes with Application to Network Interdiction

Danial Davarnia, University of Florida, 303 Weil Hall,
Gainesville, FL, United States of America, d.davarnia@ufl.edu,
Mohit Tawarmalani, Jean-philippe P Richard

We present a convexification technique to obtain, in the space of their defining variables, a linear description of the convex hull of graphs of bilinear functions over the Cartesian product of a general polytope and a simplex. We apply this procedure to study envelopes of various bilinear functions over certain polytopes. For network interdiction, our procedure yields an improved set of linearization constraints for bilinear objective terms that is cognizant of paths and cycles in the network.

3 - Convexification Techniques for Disjunctive Conic Sets

Sercan Yildiz, PhD Student, Carnegie Mellon University, 5000
Forbes Ave, Pittsburgh, PA, 15213, United States of America,
syildiz@andrew.cmu.edu, Fatma Kilinc Karzan

We study the convex hull of disjunctions applied to a set defined as the intersection of a cone with an affine subspace. The resulting nonconvex sets are of fundamental importance in mixed-integer conic programming where they are used to derive valid inequalities. We identify and study the cases where a single convex inequality is sufficient to describe the convex hull and where this inequality can equivalently be expressed in an appropriate conic form.

4 - How to Convexify the Intersection of a Second Order Cone and a Nonconvex Quadratic

Samuel Burer, Professor, University of Iowa, S346 Pappajohn
Business Building, Iowa City, IA, 52242-1994, United States of
America, samuel-burer@uiowa.edu, Fatma Kilinc Karzan

We study how to convexify the intersection of a second-order cone and a nonconvex quadratic. Under several easy-to-verify conditions, we derive a simple, computable convex relaxation. Under further conditions, we prove that this relaxation captures precisely the corresponding convex hull. Our approach unifies and extends previous results, and we illustrate its applicability and generality with many examples.

Distributionally Robust Optimization

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Karthik Natarajan, Singapore University of Technology and Design, Singapore, Singapore, 487372, Singapore, karthik_natarajan@sutd.edu.sg

1 - Robust Optimization using Inconsistent Overlapping Marginals

Anulekha Dhara, Postdoctoral Fellow, Singapore University of
Technology and Design, 8 Somapah Road, Singapore, 487372,
Singapore, anulekha@sutd.edu.sg, Karthik Natarajan

In this paper, we consider a robust linear optimisation problem with random objective coefficients belonging to a Frechet class of distributions with inconsistent overlapping marginal. For this class of problem the goal is to find the tightest possible bound on the expected optimal value. To solve this problem we apply the notion of closest consistent marginal to obtain an approximate upper bound.

2 - Sparse but Efficient Operation: A Conic Programming Approach

Gao Yini, National University of Singapore, 1 Business Link,
Singapore, Singapore, yini.gao@u.nus.edu, Chung Piau Teo,
Zhenzhen Yan

Standardization and flexibility are two competing paradigms in designing efficient operations. We ask whether there is a sparse but flexible operation mode to reap the benefits of both. Using copositive conic programming, we develop a new mechanism which gives sparse but efficient network structures. It recovers a chain in the context of process flexibility. We further apply it to Singapore Changi Airport "roving team" deployment problem and obtain a sparse yet efficient deployment network.

3 - SDP Reformulation of CP Programs: Best-worst Choice and Range Estimation Applications

Karthik Natarajan, Singapore University of Technology and
Design, Singapore, 487372, Singapore,
karthik_natarajan@sutd.edu.sg, Chung Piau Teo

We show that the worst case moment bound on the expected optimal value of a mixed integer linear program with a random objective c is obtained from a SDP reformulation of a completely positive program. We illustrate the usefulness of the distributionally robust bounds in estimating the expected range of random variables with two applications arising in random walks and best-worst choice models.

4 - Robust Inventory Models with Demand Partitioning Information

Joline Uichanco, Asst. Professor, University of Michigan, Ross
School of Business, 701 Tappan Ave, Ann Arbor, MI, 48109,
United States of America, jolineu@umich.edu, Karthik Natarajan,
Melvyn Sim

We present the distributionally robust newsvendor with demand asymmetry information through partition statistics. We derive a closed-form for the robust order quantity under the special case of semivariance, implying a simple rule-of-thumb for setting order quantities under limited information. The distribution can be calibrated from primitive demand data. We demonstrate the performance of the method in computational experiments on data from an automotive spare parts company.

Stochastic Optimization Applications to Renewable Energy Integration

Sponsor: Optimization/Optimization Under Uncertainty
Sponsored Session

Chair: Lindsay Anderson, Assistant Professor, Cornell University, 316
Riley Robb Hall, Ithaca, NY, 14853, United States of America,
landerson@cornell.edu

1 - Multi-Objective Optimal Sensor Deployment under Uncertainty for Advanced Power Systems

Urmila Diwekar, President, Vishwamitra Research Institute, 2714
Crystal Way, Crystal Lake, IL, 60012, United States of America,
urmila@vri-custom.org, Pallabi Sen, Kinnar Sen

Advanced power plants using an integrated gasification combined cycle (IGCC) offer a competitive and economical means to produce electricity with reduced emission levels. An efficient, safe, and reliable operation of an IGCC plant requires effective strategies for monitoring and control. The results of this multi-objective framework for optimizing observability, efficiency, and cost for an IGCC system are presented in this work.

2 - Optimal Microgrid Design under Load and Photovoltaic Power Uncertainty

Alex Zolan, University of Texas at Austin, 204 E. Dean Keeton
Street, Stop C2200, Austin, TX, 78712, United States of America,
alex.zolan@utexas.edu, Alexandra Newman, David Morton

We present a model for establishing the design and energy dispatch for a microgrid that minimizes cost and fuel requirements given the set of technologies (diesel generators, solar arrays and batteries), photovoltaic power (PV) availability on location, and probability model that governs the load and PV availability of a forward operating base. We introduce a policy-based restriction of the problem that allows for the solution of a multiple scenario problem while preserving solution quality.

3 - Tracking a Stochastic Generate-pump Schedule for a Pumped-storage Hydroelectric Unit

Bismark Singh, The University of Texas at Austin, 204 E. Dean
Keeton Street, Stop C2200 ET, Austin, TX, 78705, United States
of America, bismark.singh@utexas.edu, Surya Santoso

Using a stochastic dynamic program, we first optimize the generate-pump schedule for a pumped-storage hydroelectric unit to maximize profit. Since energy prices are stochastic, we find an adaptive policy for the schedule. And,

since we must submit bids to an ISO, we seek a bidding strategy that will allow us to track the desired generate-pump schedule. Thus, we solve a model that yields an optimal block-bidding policy in the sense of tracking the desired stochastic generate-pump policy.

4 - A Stochastic Model to Determine Probabilistic Reserves Requirements for Unit Commitment Problems

Gabriela Martínez, Cornell University, Ithaca, NY, United States of
America, gabriela.martinez@cornell.edu, Lindsay Anderson

In this work, we propose a stochastic unit commitment model to decide appropriate spinning and non-spinning reserve requirements for a power system with high penetration of renewable energy. The day-ahead scheduling of the systems is formulated as a chance-constrained model in which the network power balance of the systems is ensured with a high-probability level and the system reserves are allocated in a risk-averse fashion by selection of quantiles of the uncertain generation.

Radiation Therapy Optimization

Sponsor: Optimization in Healthcare
Sponsored Session

Chair: Arka Roy, Bowling Green State University, 440 W. Barry Ave.,
Chicago, IL, United States of America, arkaroy1@gmail.com

1 - A Robust Optimization Method for Homogeneous Magnet Design in MR-guided Radiation Therapy

Iman Dayarian, University of Toronto, 5 King's College Road,
Toronto, ON, M4Y 2P9, Canada, iman@mie.utoronto.ca,
Timothy Chan, Teodor Stanescu

Magnetic resonance imaging uses a magnetic field generated by a configuration of coils to image patients. An optimization-generated coil configuration can be sensitive to small perturbations that affect the homogeneity of the magnetic field. This sensitivity is especially important when the coils are mounted on a treatment device that rotates during treatment, which is the case in MR-guided radiation therapy (MRgRT). This talk presents a robust optimization approach to magnet design for MRgRT.

2 - Incorporating Lung Ventilation Function in Intensity-modulated Radiation Treatment Planning

Fujun Lan, Postdoctoral Fellow, University of Maryland,
Baltimore, 22 S. Greene St., GGJ02, Baltimore, MD, 21201,
United States of America, flan@email.arizona.edu,
Warren D'Souza, Hao Zhang

4DCT-derived ventilation images were used for pencil-beam intensity modulation to achieve functional sparing of lung on a voxel-by-voxel basis. This functional approach was compared to the conventional anatomical planning on 10 patients retrospectively. Significant reductions (p -values < 0.001) of V20 (lung volume receiving ≥ 20 Gy) (11%), functional V20 (18%), mean lung dose (MLD) (7%) and functional MLD (11%) were achieved without significantly increasing doses to the other organs-at-risk.

3 - Optimizing Global Liver Function in Stereotactic Body Radiotherapy Treatment Planning

Victor Wu, PhD Student, University of Michigan, 1205 Beal
Avenue, Ann Arbor, MI, 48109, United States of America,
vwu@umich.edu, H. Edwin Romeijn, Marina Epelman,
Martha Matuszak, Yue Cao, Mary Feng, Hesheng Wang,
Randall Ten Haken

We propose a radiotherapy treatment planning optimization model for liver cancer cases. In this work, we plan treatment using voxel-based liver dose-response model: post-treatment liver function depends on its pre-treatment function and the dose received. We maximize predicted post-treatment global liver function. We approximately solve the resulting non-linear non-convex problem with a customized mixed-integer linear programming-based algorithm. 2D synthetic and 3D clinical cases were studied.

4 - Robust Adaptive Optimization in Radiation Therapy

Arka Roy, Bowling Green State University, 440 W. Barry Ave.,
Chicago, IL, United States of America, arkaroy1@gmail.com,
Omid Nohadani

Radiotherapy treatments degrade over time in the presence of uncertainties. Robust models leap beyond such limitations. However, traditional robust models solve for the worst-case realization of the uncertainty prior to the start of the treatment, which may be too conservative at later fractions. We propose a robust two-stage approach that adapts to the first-stage decisions during treatment. The results are demonstrated through a clinical prostate case.

**Conic Convex Optimization:
New Algorithms and Results**

Sponsor: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Robert Freund, Professor, MIT Sloan School of Management, Building E62-567, 77 Massachusetts Ave., Cambridge, MA, 02139, United States of America, rfrend@mit.edu

1 - Approximation Schemes for Linear Programming in Inner Product Spaces

Sergei Chubanov, University of Siegen, Kohlbeistr. 15, Siegen, Germany, sergei.chubanov@uni-siegen.de

The size of an LP is the sum of binary sizes of the coefficients describing this LP. Such LPs are known to be polynomially solvable. The situation changes if each element of the data can be accessed only via an oracle and the size is defined as the size of the data used by the oracle. This class includes dynamic flows and DP formulations of some other NP-hard problems. A further generalization leads to LPs in inner product spaces. In this talk, we discuss a new algorithm for such problems.

2 - Solving General Convex Conic Problems with First-order Methods
James Renegar, Professor, Cornell University, 224 Rhodes Hall, Ithaca, NY, 14853, United States of America, renegar@cornell.edu

We present recent results in ongoing research pertaining to a framework that is novel in allowing any convex, conic optimization problem to be recast as an equivalent convex optimization problem whose only constraints are linear equations and whose objective function has Lipschitz constant no greater than one, to which a broad class of first-order methods can be applied.

3 - New Computational Guarantees for First-order Methods for Convex Optimization, via a Function Growth Constant

Robert Freund, Professor, MIT Sloan School of Management, Building E62-567, 77 Massachusetts Ave., Cambridge, MA, 02139, United States of America, rfrend@mit.edu, Haihao Lu

We present new algorithms and complexity bounds for solving convex optimization problems using first-order methods. We presume we are given a strict lower bound on f^* . We introduce a new functional measure called the growth constant G for $f(x)$ that measures how quickly the function level sets grow and that plays a fundamental role in the complexity analysis. We present new computational guarantees for non-smooth and smooth optimization that improves on existing complexity bounds in many ways.

Network Optimization under Uncertainties

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Neng Fan, University of Arizona, 1127 E. James E. Rogers Way Room 111, Tucson, AZ, 85721, United States of America, nfan@email.arizona.edu

1 - Identifying Critical Nodes of Interdependent Networks by Integer Programming

Shanshan Hou, University of Arizona, Tucson, AZ, 85721, United States of America, shanshanh@email.arizona.edu, Neng Fan, Andres Garrido

In this talk, we analyze the vulnerability of interdependent networks by identify a set of nodes in power grid, whose removal results high impacts by the cascading failures in the interdependent communication network and itself. We propose an approach by integer programming to identify such set of nodes. Knowing the behavior of these networks can help to be more prepared before attacks and failures that may affect the power network supply and functionality.

2 - Improving the Global Pre-positioning Network for Natural Disaster Recovery

Adam Prokop, Graduate Msc Student In Supply Chain Management, Wilfrid Laurier University, 75 University Avenue West, Waterloo, ON, N2L3C5, Canada, prok3910@mylaurier.ca

Pre-positioning critical supplies in strategic locations can increase the effectiveness of humanitarian relief aid for natural disasters. An optimization model, utilizing recent global disaster risk indexes, was developed to evaluate the current United Nations Humanitarian Response Depot network. Alterations of the current network were shown to significantly minimize the average distance between pre-positioning facilities and demand regions.

3 - Network Optimization under Non-linear Utility

Chin Hon Tan, National University of Singapore, 1 Engineering Drive, Singapore, 117576, Singapore, isetch@nus.edu.sg

Decision makers are rarely risk neutral in practice. Hence, solutions that maximize expected rewards or minimize expected costs, which assumes that the decision maker is risk neutral, may not be appropriate. In this presentation, we study the sensitivity of solutions with respect to the risk neutral assumption and discuss how solutions that are robust to the decision maker's utility can be improved upon.

4 - An Integer Programming Approach for Mixed Fault Diameters

Elham Sadeghi, Graduate Research Assistant, University of Arizona, Tucson, AZ, United States of America, sadeghi@email.arizona.edu, Neng Fan

We consider the minimum (k,l) -connected d -dominating set problem which is a fault-tolerance dominating set. This problem is a generalization of minimum connected dominating set problem. The integer programming formulations based on vertex-cut and edge-cut is introduced and a cutting plane algorithm is proposed to solve it.

Chair: Danica Xiao, PhD Candidate, University of Washington, Seattle, 3900 Northeast Stevens Way, Seattle, WA, 98195, United States of America, xiaoc@uw.edu

1 - A Dynamic Active-Set Method for Linear Programming

Alireza Noroziroshan, University of Texas at Arlington, 600 Grand Ave, Apt#103, Arlington, TX, 76010, United States of America, alireza.norozir.en@gmail.com, Bill Corley, Jay Rosenberger

An active-set method obtains solution for linear programming problems by adding one or more constraints at a time to solve smaller problems iteratively. We present an efficient constraint selection rule for adding varying numbers of constraints at each iteration. This approach is significantly faster than the standard linear programming algorithms.

2 - Big Data Analytics for RFID-Enabled Logistics Data from Ubiquitous Manufacturing Shopfloors

Ray Y. Zhong, Post-doctoral Fellow, The University of Hong Kong, 8-16 Haking Wong Building, IMSE, Pokfulam Road, HKU, Hong Kong, Hong Kong - PRC, zhongzry@gmail.com, George Q. Huang

RFID has been widely used in logistics and supply chain management. This paper discusses the manufacturing shopfloor where typical logistics resources are converted into smart manufacturing objects (SMOs) by using RFID and wireless technologies to create a RFID-enabled intelligent shopfloor environment. In such environment, enormous RFID data has been captured and collected. This paper introduces a Big Data Analytics for the RFID logistics data by defining different behaviors of the SMOs.

3 - On the Mixed Set Covering, Packing and Partitioning Polytope

Yong-Hong Kuo, Research Assistant Professor, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong - PRC, yhkuo@cuhk.edu.hk, Janny Leung

We study the polyhedral structure of the mixed set covering, packing and partitioning problem, derive the mixed odd hole inequality, and identify sufficient condition for it to be facet-defining. In the special case when the induced graph is a (mixed) odd hole, the inclusion of this new facet-defining inequality provides a complete polyhedral characterization. Computational experiments show that these new valid inequalities achieve a significant time reduction in solving the mixed problems.

4 - Using Big-Data Analytics for Identifying Hot Spots of Border Security

Haibo Wang, Killam Distinguished Asso Prof, Texas A&M International University, 5201 University Blvd, Laredo, TX, United States of America, hwang@tamiu.edu, Yaquan Xu, Jun Huang, Wei Wang

This project develops a comprehensive data aggregation and analysis system to provide the decision support for identifying hot spots of border security using a complex network model for transportation infrastructure in the border region. All these research related data will be aggregated on both space and time dimensions and analyzed by using "big data" models and tools developed in this study

Distributed and Parallel Optimization

Sponsor: Computing Society

Sponsored Session

Chair: Mohammad Javad Feizollahi, Assistant Professor of Business Analytics, Robinson College of Business, 35 Broad St. NW, Room 1109, Georgia State University, Atlanta, GA, 30303, United States of America, mfeizollahi@gsu.edu

1 - Object-parallel Solution of Large-scale Lasso Problems

Gyorgy Matyasfalvi, Doctoral Candidate, Rutgers University, 100 Rockefeller Road, Piscataway, NJ, 08854, United States of America, matyasfalvi@gmail.com, Jonathan Eckstein

We describe an “object-parallel” C++ approach to implementing first-order optimization methods. Using a “symbolic temporaries” technique to improve operator overloading efficiency, high-performance parallel algorithms may be expressed with MATLAB-like simplicity. As an example application, we solve large-scale Lasso problems on a distributed-memory supercomputer with the spectral projected gradient (SPG) method. We can efficiently accommodate highly unbalanced sparsity patterns.

2 - Decentralized Mixed Integer Programming

Mohammad Javad Feizollahi, Assistant Professor of Business Analytics, Robinson College of Business, 35 Broad St. NW, Room 1109, Georgia State University, Atlanta, GA, 30303, United States of America, mfeizollahi@gsu.edu, Shabbir Ahmed

We propose a decentralized mixed integer programming (MIP) approach based on adding primal cuts and restricting the Lagrangian relaxation of the original MIP problem. A key challenge is that, because of the non-convex nature of MIPs, classical distributed and decentralized optimization approaches cannot be applied directly to find their optimal solutions. We test the proposed method on the unit commitment problem and discuss its pros and cons comparing to the central MIP approach.

3 - Dealing with Asynchrony and Information Delays in Parallel Optimization

Hamid Reza Feyzmahdavian, PhD Student, Royal Institute of Technology (KTH), Osquldas Väg 10, Floor 6, Stockholm, 10044, Sweden, hamidrez@kth.se, Arda Aytekin, Mikael Johansson

This talk presents an asynchronous and parallel mini-batch algorithm for regularized stochastic optimization problems that allows multiple workers to work at different rates and perform computations independently of each other. Several examples are worked out to demonstrate that the impact of asynchrony on the convergence rate of the algorithm is asymptotically negligible, and a near-linear speedup in the number of workers can be expected.

4 - Deep Learning with Auxiliary Coordinates, with an Application to Fast Image Search

Miguel Carreira-Perpinan, Associate Professor, University of California, Merced, 5200 N. Lake Road, Merced, CA, 95343, United States of America, mcarreira-perpinan@ucmerced.edu, Ramin Raziperchikolaei

Many nonconvex problems in machine learning arise from nested functions consisting of nonlinear processing layers, such as deep neural nets. We describe a generic technique to train such models, the method of auxiliary coordinates. This introduces significant parallelism in the optimization, is easy to implement by reusing existing algorithms, and can handle nonsmooth layers. We illustrate it with a binary hashing application involving an intermediate layer of binary variables.

5 - Decentralized Approximation Methods for Potential Games under Exogenous Uncertainty

Harikrishnan Sreekumaran, PhD Candidate, Purdue University, 315 N Grant St., West Lafayette, IN, 47906, United States of America, harikrishnan.sreekumaran@gmail.com, Andrew Liu

We consider computing Nash equilibria of certain classes of games under exogenous uncertainty and analyze distributed algorithms for solving such problems. We establish convergence of parallel Gauss-Jacobi and sequential Gauss-Seidel type methods, when combined with approximation schemes such as Monte Carlo sampling. Implementation schemes and numerical results for the proposed approach are presented for applications such as traffic routing and network design games.

1 - Massively Parallel Queueing Networks

Mariana Olvera-Cravioto, Associate Professor, Columbia University, New York, NY, 10027, United States of America, mo2291@columbia.edu

We study a network with many parallel servers where jobs are split into a number of pieces to be processed in parallel on a random subset of servers, with the constraint that all pieces of a job must be processed in a synchronized fashion. We discuss an analytically tractable model where all fragments of a job must initiate their service at the same time and compare it to the one where the synchronization occurs at the end, as in MapReduce. We also compare it against the optimal routing model.

2 - Heavy-traffic Behavior of the Maxweight Algorithm in a Switch with Uniform Traffic

Siva Theja Maguluri, Postdoctoral Researcher, IBM TJ Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, smagulu@us.ibm.com, R. Srikant

We consider a switch with uniform traffic operating under the MaxWeight scheduling algorithm. This traffic pattern is interesting to study in the heavy-traffic regime since the queue lengths exhibit a multi-dimensional state-space collapse. We characterize the heavy-traffic behavior of the expectation of the sum queue lengths in steady-state and show that MaxWeight algorithm has optimal queue-length scaling behavior with respect to the size of a switch. This settles an open conjecture.

3 - Flexible Queueing Architectures

Kuang Xu, Stanford University, Stanford, CA, United States of America, kuangxu@stanford.edu, John Tsitsiklis

We consider a service system with n independent job streams and n servers, where each server can only serve a relatively small number, d , of job streams. We wish to design a service architecture so that the system has as large a capacity region as possible, and a scheduling policy under which queueing delays become vanishingly small as the system size, n , increases. We show that our objective can be accomplished by combining an expander graph architecture and a batching policy.

1 - Engineering Effective Responses to Influenza Outbreaks

Stan Finkelstein, MIT, 1 Amherst Street, Cambridge, MA, 01773, United States of America, snfinkel@mit.edu, Richard Larson, Karima Nigmatulina, Anna Teytelman

The year 2009 witnessed a worldwide flu pandemic. Our questions: In the absence of vaccines, what steps can be taken to reduce the chance of becoming infected? When vaccines arrive late, what allocation policy will minimize the number who become infected? We discuss how to reduce the exponential growth factor by hygiene and social distancing behaviors, and recommend a data-driven adaptive vaccine allocation policy that, if used in 2009, might have reduced infections in the U.S. by five million.

2 - A Stochastic Programming Approach to Reduce Patient Wait Times and Overtime in an Outpatient Infusion Center

Jeremy Castaing, University of Michigan, IOE 1205 Beal Ave., Ann Arbor, MI, United States of America, jctg@umich.edu, Amy Cohn, Brian Denton

Chemotherapy infusion treatments for cancer have significant and unpredictable variability in duration. We present an algorithm for designing patient appointment schedules under uncertainty in treatment times. The objective is to minimize a trade-off between expected patient wait times and expected total time required to treat patients. Computational experiments based on real-world data are presented and used to draw managerial insights.

3 - Optimal Screening Policies for Women at High Risk of Breast Cancer

Caglar Caglayan, Georgia Institute of Technology, Atlanta, GA,
United States of America, ccaglayan6@gatech.edu, Turgay Ayer,
George Rust

Women with breast density, family history of breast or ovarian cancer, or BRCA1 and BRCA2-mutation-carriers are at higher risk of breast cancer. For such women, non-mammographic modalities such as ultrasound or MRI, adjunct to or instead of mammogram, can be beneficial but they lead to an increased screening cost. Considering both potential health benefits and financial aspects, we study this multi-modality breast cancer screening problem and identify cost-effective optimal screening policies.

4 - Modeling Supply Chain System Structure to Trace Sources of Food Contamination

Abigail Horn, PhD Candidate, Engineering Systems Division,
Massachusetts Institute of Technology, 77 Massachusetts Ave.,
E40-240, Cambridge, MA, 02139, United States of America,
abbyhorn@mit.edu, Richard Larson, Stan Finkelstein

We are developing a methodology to identify high probability sources of contamination in the event of large-scale outbreaks of foodborne disease based on a graph-theoretic Bayesian inference algorithm. We present results from 2 modeling frameworks used to develop the inference algorithm: analytical models of stylized versions of the problem leading to new, general insights, and a Bayesian Network model used to support decision making and targeted information gathering during investigations.

University Park, PA, 16802, United States of America,
gup3@engr.psu.edu

1 - Networks with Several Types of Interacting Tasks

Yuri Suhov, Professor, University of Cambridge/Penn State
University, yms@maths.cam.ac.uk

I am going to present and discuss new analytic results on a class of reversible networks with several types of interactive customers. The main result is product-type formulas for the equilibrium distributions.

2 - Staffing Large-scale Service Systems with Stochastic Arrival Rates

Ying Chen, PhD Candidate, University of Texas at Austin,
1 University Station, ETC 5.112, Austin, TX, 78712,
United States of America, lesley@utexas.edu, John Hasenbein

We minimize the staffing level for large-scale queueing systems with random arrival rates, where a QoS constraint is enforced on the probability a customer is queued. For single-station systems, we consider an Erlang-C model with only partial information provided for the discrete arrival-rate distribution, and we present a numerically stable procedure to obtain asymptotically optimal results. In the multi-station case, we introduce a joint QoS constraint and explore the corresponding solutions.

3 - Ergodic Control of Multiclass Multi-pool Networks in the Halfin-Whitt Regime

Ari Arapostathis, Professor, University of Texas at Austin,
Electrical and Computer Engineering, Austin,
United States of America, ari@ece.utexas.edu, Guodong Pang

We study the scheduling and routing control of Markovian multiclass multi-pool networks under the long-run average (ergodic) cost criteria in the Halfin-Whitt regime. We develop a new framework to study the associated ergodic diffusion controls and characterize the optimal solutions via the HJB equations. The asymptotic optimality results are established via a spatial truncation technique to approximate the solutions to the HJB.

4 - Pricing Server Information in Distributed Systems

Mauro Escobar, Columbia University, 500 W 120th Street,
3rd Floor, New York, NY, 10027, United States of America,
me2533@columbia.edu, Mariana Olvera-Cravioto

We consider a queueing network where each job consists of a random number of pieces to be served in parallel, and such that all the pieces of a same job must begin their processing simultaneously. We analyze the performance of two models, one where the different pieces are routed to a random subset of servers and another one where they are optimally assigned to the servers with the shortest workloads. We illustrate how to use these two models to evaluate intermediate routing policies.

Co-Chair: Mor Armony, NYU Stern, 44 West 4th Street, New York, NY,
10012, United States of America, marmony@stern.nyu.edu

1 - Stein's Method for Diffusion Approximations of Many-Server Queues

Anton Braverman, Cornell University, Ithaca, NY, 14850,
United States of America, ab2329@cornell.edu, J. G. Dai

Diffusion approximations for many-server queues have been studied extensively since the pioneering work of Halfin and Whitt (1981). We focus on many-server queues that have phase-type service time distributions and exponential customer patience distributions. We establish rate of convergence of the steady-state distribution of a many-server queue in the Halfin-Whitt regime. Our proof technique connects naturally with Stein's method for establishing normal approximations.

2 - Optimal Traffic Schedules

Harsha Honnappa, Purdue University, West Lafayette, IN,
United States of America, honnappa@purdue.edu, Rami Atar,
Mor Armony

We consider the problem of optimally scheduling a finite, but large, number of customers over a finite time horizon at a single server FIFO queue, in the presence of 'no-shows'. We study the problem in a large population limiting regime as the number of customers scales to infinity and the appointment duration scales to zero. We show that in the fluid scaling heavy-traffic is obtained as a result of asymptotic optimization. We also characterize the diffusion-scale optimal schedule.

3 - Collaboration and Multitasking in Networks: Capacity Versus Queue Control

Jan Van Mieghem, Professor, Kellogg School of Management,
2001 Sheridan Road, 5th Floor, Evanston, IL, 60201, United
States of America, vanmieghem@kellogg.northwestern.edu,
Itai Gurvich

We study networks where some activities require the simultaneous processing by multiple types of multitasking human or indivisible resources. The capacity of such networks is generally smaller than the bottleneck capacity. This paper shows how this capacity is achieved through, and affected by, dynamic queue control. Prioritizing specific queues comes at a significant loss of capacity. We present policies that balance capacity and queue control while guaranteeing stability and optimal scaling.

4 - Dynamic Scheduling in a Many-Server Multiclass System with General Abandonment Distributions

Amy Ward, Professor, University of Southern California,
Marshall School of Business, Los Angeles, CA, 90089,
United States of America, amyward@marshall.usc.edu

Our purpose is to understand how the assumed customer abandonment distribution affects scheduling decisions in a multiclass M/M/N+GI queue. To do this, we set up and solve an approximating diffusion control problem. We find that threshold control is in general sub-optimal. For two classes, we establish conditions for the optimal policy to have a "U-shape", instead of the step function that characterizes a threshold policy.

Sponsored Session

Chair: Bin Zhang, Assistant Professor, University of Arizona,
Department of MIS, Tucson, AZ, 85721, United States of America,
binzhang@arizona.edu

1 - Predicting Hacker IRC Participation using Discrete-time Duration Modeling with Repeated Events

Victor Benjamin, University of Arizona, 1130 E Helen St,
Room 430, Tucson, AZ, 85719, United States of America,
vabenji@email.arizona.edu, Bin Zhang, Hsinchun Chen

Literature documents the existence of many active online hacker communities containing thousands of users. Some participants are expert cybercriminals, but

many have fleeting interests and only generate noise that skew analyses. Thus we propose an automated and scalable approach to identify top hacker participants in big online communities. Specifically, we utilize discrete-time duration modeling with recurrent events for extracting top participating hackers among large hacker IRC communities.

2 - Semi-supervised Learning for Structured Regression on Partially Observed Attributed Graphs

Zoran Obradovic, Laura H. Carnell Professor Of Data Analytics; Director, Center For Data Analytics And Biomedical Informatics; Professor, Computer And Information Sciences Department; Professor, Statistics Department, Temple University, 1925 N. 12th St., 386 SERC, Philadelphia, PA, 19122, United States of America, zoran.obradovic@temple.edu, Jelena Stojanovic, Djordje Gligorijevic, Milos Jovanovic

We propose a structured regression model for temporal applications where a large fraction of observations is missing. The benefits are demonstrated on precipitation prediction and on hundreds of evolving graphs with up to 80% labels missing under various mechanisms. The proposed method and result were published at SDM 2015 conference proceedings.

3 - From Spot Market to Customized Contract: Role of Reputation on Market Choice of Crowdsourcing Vendors

Xiao Han, Shanghai Jiaotong University, 1954 Huashan Rd, Shanghai, China, hanxiao@sjtu.edu.cn, Pei-yu Chen, Bin Gu, Pengzhu Zhang

Based on a unique dataset obtained from a large online crowdsourcing platform with different markets in China, we examine the effect of reputation on vendors' winning chance and revenues as well as their market choices over time. Our results show that as vendors become more experienced and establish more successful relationships with buyers, they will move from spot market to customized contract market, at the same time, they will win more and earn more.

4 - The Heterogeneity of Online Searching and Its Impact on Stock Returns

Qiang Ye, Harbin Institute of Technology, School of Management, Harbin, China, yeqiang@hit.edu.cn, Xianwei Liu

Internet search frequency on stocks has been widely used to measure investor attention in recent studies. Researchers found that weekly searching frequency strongly associated with weekly returns for certain stocks. But we have limited knowledge about the heterogeneity of Internet searches under different circumstances and its varying impact on stock market. In this study, we seek to explore whether searches done on different circumstances guarantee equal attention.

Chair: Gordon Burtch, Assistant Professor, University of Minnesota, 321 19th Ave. S., Minneapolis, MN, 55455, United States of America, gburtch@umn.edu

1 - Motivating Group Donation: Evidence from a Large Field Experiment

Tianshu Sun, University of Maryland Smith School of Business, 3330 Van Munching Hall, College Park, MD, 20740-2840, United States of America, tianshusun@rhsmith.umd.edu, Gordon Gao, Ginger Zhe Jin

Using a randomized field experiment involving 80,000 participants, we study how mobile messaging can leverage recipients' social connections to increase blood donation. We find 1) blood banks can motivate group formation to increase donation, but only with group reward; 2) group reward works through a sorting mechanism; 3) participants donate more blood when donating in a group. Our study provides insights on the optimal design of mobile messaging for charities to leverage donors' social network

2 - Field Experiment on the Impact of Recommender Systems on Sales Volume and Diversity

Dokyun Lee, Carnegie Mellon University, Pittsburgh, PA, United States of America, leedokyun@gmail.com, Kartik Hosanagar

We investigate the impact of collaborative filtering recommender algorithms, commonly used in e-commerce, on sales volume and diversity. We do this by running a randomized field experiment with a top retailer in North America. We show results for sales volume and diversity. We further investigate the genre cross-purchase behavior to shed insight into mechanism behind diversity shift.

3 - Randomized Experiment(s) Evaluating the Drivers of User Content Generation

Gordon Burtch, Assistant Professor, University of Minnesota, 321 19th Ave. S., Minneapolis, MN, 55455, United States of America, gburtch@umn.edu, Kevin Hong, Ravi Bapna, Vidas Griskevicius

UGC under-provision is a persistent problem in many online communities. We undertake a set of randomized experiments aimed at understanding the drivers of increased UGC production, in terms of both quantity and quality. We consider i) the role of peer feedback on past content (stated approval vs. download), and ii) incentives to contribution (social vs. monetary).

2015 INFORMS Special Session for JIPE and IJOR

Cluster: Globalization and International Activities

Invited Session

Chair: Kuo-Hao Chang, National Tsing Hua University, Hsinchu, Taiwan, China, chang@mx.nthu.edu.tw

1 - An Activity-Driven Optimization Model for Smart Space

Kuo-Hao Chang, National Tsing Hua University, Hsinchu, Taiwan, China, chang@mx.nthu.edu.tw

In this paper, we propose an activity-driven optimization model, followed by the development of a solution method, to enable the optimal and automatic control of environmental conditions, including humidity and temperature, so as to provide people with the most comfortable environment but with the least energy consumption. A computational study based on instances of realistic size is conducted at the end to show the viability of the research.

2 - Optimal Arc Restoration Schedules with Resource Constraints for Recovering Nodes in a Network of Damaged Arcs

I-Lin Wang, Professor, Department of Industrial and Information Management, National Cheng Kung University, Tainan, Taiwan, China, ilinwang@mail.ncku.edu.tw

Consider a network containing some damaged arcs with estimated restoration time and resource. In order to access all nodes in minimum time, we aim to find optimal arc restoration schedules that determine the timing and resources required for restoring some damaged arcs. We will show that special cases of this problem can be converted to minimum spanning tree, shortest path, and NP-hard parallel machine scheduling problems. Finally, proposed IP formulations and solution methods will be discussed.

3 - The Coopetition Game in International Liner Shipping

Dung-Ying Lin, Associate Professor, Department of Transportation and Communication Management Science, National Cheng Kung University, Tainan 70101, Taiwan, China, dylin@mail.ncku.edu.tw

In maritime freight transportation, carriers build a collaborative relationship with other carriers while competing with each other to optimize their own profits. In this scenario, a game of competition is formed. We formulate a nonlinear mixed-integer problem to determine the optimal levels of coopetition for a single company and embed the resulting problem into a general game theoretic framework. A diagonalization algorithm that incorporates an ascent direction search technique is developed to effectively evaluate the game. The numerical results show that carriers choose similar coopetition levels to maximize their profits, and the coopetition game can reach equilibrium under general conditions.

Theory and Applications of the Analytic Network Process

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Orrin Cooper, University of Memphis, 332 Fogelman, Memphis, TN, United States of America, olcooper@memphis.edu

1 - Coherence within the ANP Supermatrix

Orrin Cooper, University of Memphis, 332 Fogelman, Memphis, TN, United States of America, olcooper@memphis.edu, Idil Yavuz

In an ANP network there is both the ability and the need to check for additional levels of consistency and coherence. A Supermatrix with priority vectors that were obtained from either perfect or nearly perfect consistent pairwise comparison can generate suboptimal decisions. Simulations demonstrate the frequency of these events in general ANP networks. A form of cross validation within the Supermatrix called linking validation and a Linking Coherency Index (LCI) is developed and demonstrated.

2 - Using an AHP Approach for Eyewitness Identification

Enrique Mu, Carlow University, Pittsburgh, PA,
United States of America, emu@carlow.edu,
Tingting Rachel Chung, Lawrence Reed

Eyewitnesses of a crime are usually asked to identify a potential criminal out of a lineup of suspects. An online experiment using Amazon MT was conducted. Results show that an AHP approach may offer better eyewitness identification success and more importantly less false positive identification ratios than currently sequential lineup approach.

3 - Modeling the Sensitivity and Stability of Preferences Among Colorectal Cancer Screening Alternatives

Magda Gabriela Sava, PhD Candidate, Joseph M. Katz Graduate School of Business, University of Pittsburgh, 241 Mervis Hall, Pittsburgh, PA, 15260, United States of America, mgsava@katz.pitt.edu, Luis Vargas, James G. Dolan, Jerrold H. May

Patients are faced with multiple alternatives when selecting the preferred method for colorectal cancer screening, and there are multiple criteria to be considered in the decision process. We model the patient's choice using an Analytic Network Model and propose a new approach for characterizing the idiosyncratic preference regions for each patient. We show how to use that characterization to derive insights as to the sensitivity and stability of a patient's individual choice of alternative.

4 - A Stakeholder-theory Based Employer Health Plan Selection Model

Mehdi Amini, Professor, The University of Memphis, Department of Marketing & SCM, Fogelman College of Business & Economics, Memphis, TN, 38152, United States of America, mamini@memphis.edu, Orrin Cooper, Mike Racer

Organizations are called to re-evaluate current plan offerings and potentially, for the first time, select new healthcare providers and policies to ensure that a minimum level of coverage required by law. A new stakeholder-theory based Analytic Network Process (ANP) model is developed to capture a health plan selection decision with the consideration of multiple stakeholders' interests. What-if analysis is used to explore the robustness of the selected plan.

Matching Markets and Their Applications

Cluster: Auctions

Invited Session

Chair: Thayer Morrill, NC State University, Raleigh, NC, United States of America, thayer_morrill@ncsu.edu

1 - Incentives in the Course Allocation Problem

Hoda Atef Yekta, University of Connecticut School of Business, Storrs, CT, United States of America, Hoda.AtefYekta@business.uconn.edu

Kominers et al. (2011) introduced a heuristic for comparing incentives among the course allocation problem (CAP) algorithms. We investigate their method and adapt it to a more realistic setting with course overlap and a limited number of courses for each student. We compare algorithms including the bidding-point mechanism, the draft mechanism, and recently proposed algorithms like the proxy-agent second-price algorithm in their vulnerability to non-truthful bidding.

2 - Near-optimal Stochastic Matching with Few Queries

John Dickerson, CMU, 9219 Gates-Hillman Center, Pittsburgh, PA, 15213, United States of America, dickerson@cs.cmu.edu, Avrim Blum, Nika Haghtalab, Ariel Procaccia, Tuomas Sandholm, Ankit Sharma

In kidney exchange, patients with kidney failure swap donors. Proposed swaps often fail before transplantation. We explore this phenomenon through the lens of stochastic matching, which deals with finding a maximum matching in a graph with unknown edges that are accessed via queries, and its generalization to k-set packing. We provide adaptive and non-adaptive algorithms that perform very few queries, and show that they perform well in theory and on data from the UNOS nationwide kidney exchange.

3 - The Secure Boston Mechanism

Thayer Morrill, NC State University, Raleigh, NC, United States of America, thayer_morrill@ncsu.edu, Unut Dur, Robert Hammond

We introduce the first mechanism that Pareto dominates the Deferred Acceptance algorithm (DA) in equilibrium. Our algorithm, the Secure Boston Mechanism (sBM), is a hybrid between the Boston Mechanism and DA. It protects students that are initially guaranteed a school but otherwise adjusts priorities based on student rankings. We demonstrate that sBM always has an equilibrium that weakly dominates the DA assignment, and that in equilibrium no student receives worse than a fair assignment.

4 - Mechanism Design for Team Formation

Yevgeniy Vorobeychik, Vanderbilt University, 401 Bowling Ave, Nashville, TN, United States of America, eug.vorobey@gmail.com, Mason Wright

We present the first formal mechanism design framework for team formation, building on recent combinatorial matching market design literature. We exhibit four mechanisms for this problem, two novel, two simple extensions of known mechanisms from other domains. We use extensive experiments to show our second novel mechanism, despite having no theoretical guarantees, empirically achieves good incentive compatibility, welfare, and fairness.

1 - Tracking the Regional Economy in Real Time (through Rain and Snow)

Michael Boldin, Federal Reserve Bank of Philadelphia, 10 Independence Mall, Philadelphia, PA, 19106-1574, United States of America, Michael.Boldin@phil.frb.org

The project involves enhancing real-time econometric tracking models for a regional economy to use weather station measurements. Most econometric models use pre-filtered data that excludes seasonal patterns that can distort the effects of important weather events. This project makes use of data that is not pre-filtered and simultaneously derives normal seasonal patterns, the effects of specific weather events, and a measure of the adjusted 'health' of the regional economy.

2 - Threadlab: An Analytics Driven Online Clothing Service for Men

John Toczec, ThreadLab, Philadelphia, PA, United States of America, toczek@gmail.com

ThreadLab is a startup company that provides a convenient and customer-friendly online clothing service to men. It elegantly solves a common challenge for a majority of men: Men simply do not like to shop for clothes. ThreadLab takes the work out of clothes shopping by moving the entire decision process onto an analytics platform. All decisions at ThreadLab (from what to stock, what to ship, etc.) are driven by analytical techniques such as mathematical modeling and optimization.

3 - Geospatial Analysis of Bike Share Data

Matthew Windham, Director, Analytics, NTELX, Inc., 1945 Old Gallows Rd, Vienna, VA, 22182, United States of America, mwindham@ntelx.com

We will explore an end-to-end example of processing Washington DC Bike Share data with BASE SAS. We will walk through the data ingest, cleaning, analysis, and visualization. The results will be visualized in Google Earth. All of the SAS code will be made available to attendees, including the code to write Google Earth KML files that underpin the visualization and exploration capabilities.

1 - Assortment Planning for Consumers Learning their Tastes

Canan Ulu, Assistant Professor, Georgetown University, McDonough School of Business, Washington, DC, 20057, United States of America, Canan.Ulu@georgetown.edu, Dorothee Honhon

We study a firm that offers novel products to consumers who do not have set preferences. Consumers try different products to learn which product suits their tastes better.

2 - Optimal Stocking Decisions in a Multi-channel Retail Environment

Nevin Mutlu, PhD Candidate, Virginia Tech, Department of Industrial and Systems Eng, Blacksburg, VA, 24061, United States of America, nmutlu@vt.edu, Ebru Bish, Erick Wikum

As traditional brick-and-mortar retailers are expanding their sales channels to online and mobile channels, consumer adoption rates of these emerging channels is increasing over time. We develop a novel, dynamic demand model, and integrate it within an optimization model to understand the implications of this dynamic environment on the retailers' optimal stocking decisions considering different products and different market settings.

3 - Inventory Mirroring in a Heterogeneous Network

Zhiwei (Tony) Qin, Staff Data Scientist, Walmart Labs, 850 Cherry Ave, San Bruno, CA, 94066, United States of America, TQin@walmartlabs.com

Inventory mirroring determines how many fulfillment centers (FC) and where each stock-keeping unit (SKU) should be stocked. Optimizing inventory mirroring is necessary when the FCs have SKU count limits. We propose an approximate inventory mirroring algorithm for a heterogeneous network, where the fulfillment centers (FC) have different capacities and SKU type eligibilities. We present analysis results of the output to validate the effectiveness of algorithm.

4 - Parameter Estimation Procedures for a Hierarchical Assortment Planning Decision

Matthew Lanham, Doctoral Candidate, Virginia Tech, Dept of Business Information Technology, Blacksburg, VA, 24061, United States of America, malanham@gmail.com, Ralph Badinelli

Estimating a consumer's propensity to purchase a product as well as their substitution behavior are critical parameters to a retailer's assortment decision. We investigate the methodologies used to understand consumer demand, substitution behavior, and formulate a novel approach that could be used strategically in a hierarchical assortment planning decision model.

1 - Robust Optimal Control for Medical Treatment Decisions

Yuanhui Zhang, NC State, Raleigh, NC, United States of America, yuanhui.zhang@gmail.com

In this dissertation, we develop a new data-driven robust stochastic optimization model for optimizing medical treatment decisions. We present computationally efficient methods for solving this model and theoretical analysis of the optimal policies. We illustrate the application of this model for optimizing treatment decisions for patients with type 2 diabetes and show that robust optimal policies could potentially provide guidance for clinicians and policy makers to make treatment decisions.

2 - Integrated Allocation and Utilization of Airport Capacity to Mitigate Air Traffic Congestion

Alexandre Jacquillat, PhD Candidate, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Building E40-240, Cambridge, MA, 02116, United States of America, alexandre.jacquillat@gmail.com

This thesis jointly optimizes airport operating procedures at the tactical level and flight scheduling interventions at the strategic level for congestion mitigation. It

relies on an original modeling architecture that integrates an Integer Programming scheduling model, a Dynamic Programming operational model and a Stochastic Queuing Model of congestion. Results suggest that operating enhancements and limited, targeted scheduling adjustments can significantly reduce delays at busy airports.

3 - Design and Analysis of Matching and Auction Markets

Daniela Saban, Stanford University, 655 Knight Way, Stanford, CA, United States of America, dsaban@stanford.edu

Auctions and matching mechanisms have become an increasingly important tool for planners to allocate scarce resources among competing individuals or firms. This thesis addresses several questions that arise when designing and analyzing such markets. For example, we design auctions to construct catalogs of goods for government use, and matching mechanisms that can potentially be used to handle appeals in the public school assignments of thousands of incoming high school students.

1 - HIV and STIS Among Young MSM and the Operational Issues of Expanding Testing

Benjamin Armbruster, Northwestern University, 2514 Sheridan Rd, Evanston, IL, United States of America, armbrusterb@gmail.com

We discuss the health policy conclusions one can draw from a detailed and validated agent-based network simulation model of HIV, gonorrhea, and chlamydia spread among young men who have sex with men (YMSM) in Chicago. We focus on racial disparities and the operational issues of expanding HIV and STI testing such as combined testing, cost-effectiveness, roll-out speed, and uptake behavior.

2 - Data Driven Approach to Bundled Payments

Margret Bjarnadottir, Assistant Professor of Management Science and Statistics, Robert H. Smith School of Business, University of Maryland, 4324 Van Munching Hall, College Park, MD, 20742, United States of America, margret@rhsmith.umd.edu, Wenchang Zhang, Ruben Proano, David Anderson, Renata Konrad

Healthcare reimbursement is at the forefront of healthcare reform debates. Bundled payments reimburse a single amount for an episode of care and have been proposed as a practical and promising reimbursement alternative to the current fee-for-service system. In this talk we investigate data driven methods to automatically define sets of services constituting episode of care.

3 - Improving the Equity of Access to Primary Care

Mike Carter, University of Toronto, Mechanical & Industrial Engineering, 5 King's College Rd., Toronto, ON, M5S 3G8, Canada, mike.carter@utoronto.ca, Anna Graber, Vedat Verter

Many countries experience disparities in the distribution of health professionals. There is evidence that trainees from a rural background are more likely to choose to practice in rural areas. Our proposed optimization model incorporates interests of two main stakeholders in the system, namely the regulator and the health professionals, and provides the optimal training locations and required background of trainees in each location.

4 - Evaluating Policy and Network Interventions to Improve Dental Accessibility and Availability for Children

Ben Johnson, Georgia Institute of Technology, Georgia Institute of Technology North Av, Atlanta, GA, 30332, United States of America, benjohnson@gatech.edu, Nicoleta Serban, Paul Griffin, Susan Griffin

We develop an intervention optimization model to match supply and need for pediatric dental care in Georgia under different dental care policies and provider networks. The model is used to assess the trade-off between efficiency (expenditure) and equity (systematic variations in accessibility and availability) under different policies for managing decision making and outcomes. Network and policy interventions are then determined to provide optimal improvements in dental access.

1 - Coordination between Service Professionals in Health Care**Delivery: A Multiple-case Study**

Claire Senot, Tulane University, 7 McAlister Dr., New Orleans, LA, United States of America, csenot@tulane.edu,
Aravind Chandrasekaran, Peter T. Ward

We investigate the specific coordination challenges faced by hospital's caregivers (physicians and nurses) and the organizational mechanisms that allow them to combine their expertise. We employ a case study methodology that involves 49 semi-structured interviews from the heart-failure units of five U.S. acute care hospitals.

2 - Patient Portals in Primary Care: Impacts on Patient Health and Physician Productivity

Hessam Bavafa, Assistant Professor, Wisconsin School of Business, Madison, WI, United States of America, hbavafa@bus.wisc.edu

Interest in innovative healthcare delivery models has increased due to measures such as the Affordable Care Act, which is designed to expand insurance coverage and contain healthcare costs. One innovation that has been forwarded as a low-cost alternative to physician office visits is "e-visits," or secure messaging between patients and physicians. We evaluate the effect of e-visit adoption on patient health and physician productivity using a panel dataset from a primary care provider in the US.

3 - Quantifying the Impact on Care Coordination on Health Outcomes

Vishal Ahuja, Southern Methodist University, P.O. Box 750333, Dallas, TX, United States of America, vahuja@smu.edu,
Hari Balasubramanian, Ian McCarthy

This paper quantifies the impact of care coordination on patient health outcomes, using data on outpatient health encounters for diabetes patients. Considering that a PCP's task is to consciously facilitate the patient's navigation of the health system, we use the number of PCP visits as a proxy for care coordination. We define new measures to capture the fragmentation of care.

4 - Does Medical Litigation Against Physicians Increase Inpatient Hospital Costs?

Zeynal Karaca, Senior Economist, Agency for Healthcare Research and Quality, 540 Gaither Road, Rockville, MD, United States of America, zeynal.karaca@ahrq.hhs.gov, Mehmet Ayvaci, Turgay Ayer, Herbert Wong

We empirically assess the impact of medical litigations against physicians on hospital inpatient costs using Healthcare Cost and Utilization Project (HCUP) State Inpatient Databases. We separately assess the cost impact on individual physicians facing the lawsuit and other physician colleagues (spillover effects). We find increased inpatient costs due to medical litigation and substantial variation in the degree of impact across board certified medical specialties.

1 - A Bilevel Optimization Model for Health Information Exchange Policy Design

Diego A. Martinez, Postdoctoral Fellow, Johns Hopkins School of Medicine, 733 N Broadway, Baltimore, MD, 21205, United States of America, dmart101@jhmi.edu, Tapas K. Das, Jose L. Zayas-Castro, Felipe Feijoo

Health information exchange (HIE) requires collaboration among competitors. While exceptions exist, reluctance to engage in information sharing is abundant from small medical practices to large hospital systems. To study the potential impact of federal policy stimulating HIE participation, we present a strategic gaming model formulated as a bilevel optimization program. Numerical examples from a hospital network in Florida are presented.

2 - Mapping Chikungunya Disease Transmission and Implications for Surveillance

Elaine Nsoesie, Assistant Professor, IHME, University of Washington, 2301 5th Avenue Suite 600, Seattle, WA, United States of America, en22@uw.edu

A Chikungunya virus epidemic, which started in December 2013 in the Caribbean island of St. Martin has spread to several countries and islands in the Americas, affecting an estimated one million people within a year. We applied a comprehensive approach involving the integration of data from multiple sources to assess and map the global occurrence of Chikungunya. A thorough knowledge of Chikungunya transmission globally has significant implications for surveillance and burden estimation.

3 - Value of Perfect Information and Perfect Implementation: Anyi-VEGF Therapy for Ophthalmologic Use

David Hutton, Assistant Professor, Department of Health Management and Policy, University of Michigan, 1420 Washington Heights, Ann Arbor, MI, 48109, United States of America, dwhutton@umich.edu, Eric Ross, Joshua Stein

We discuss differences between the value of information and value of implementation in the case of high-cost anti-VEGF therapy for ophthalmologic use. We review uncertainty in clinical trial data and discuss how it is used to create prior distributions necessary to ascertain value of information. We review Markov modeling and Monte Carlo methods for calculation, provide examples of these results for anti-VEGF therapy (billions of dollars), discuss next steps, and insights for other diseases.

4 - Data-driven Monitoring of Medical Recommendations for Breast Cancer Treatment

Milton Soto, PhD Candidate, Western Michigan University, 4601 Campus Drive, Kalamazoo, MI, 49008, United States of America, miltonrene.sotoferrari@wmich.edu, Diana Prieto

Medical recommendations for Breast Cancer healthcare may create overtreatment or undertreatment. Overtreatment may occur when aggressive courses are prescribed to patients with low risk of cancer spreading, while undertreatment may be generated by patients' behaviors, as well as by social, economical or racial disparities. We describe techniques for the monitoring of over or undertreatment using data mining methods to identify possible mistreatment candidates.

5 - Performance of Machine Learning Models in Predicting Presence of BRCA Mutations

Mehrnaz Abdollahian, University of South Florida, 4202 East Fowler Avenue, Tampa, FL, 33620, United States of America, mehnaz@mail.usf.edu, Tapas K. Das

BRCA1/2 gene mutations drastically increase chances of developing breast and ovarian cancers. These mutations are present in most hereditary breast and ovarian cancer patients. It is common practice for the physicians to require genetic BRCA testing for those that fit the rules of national cancer comprehensive network. However, historically 70% of tested are found negative. We have examined the power of predicting BRCA mutations using machine learning models on a nation-wide survey data.

Resilient Public Health Supply Chains

Sponsor: Public Sector OR

Sponsored Session

Chair: Jacqueline Griffin, Assistant Professor, Northeastern University, 334 Snell Engineering Center, 360 Huntington Ave, Boston, MA, 02125, United States of America, ja.griffin@neu.edu

1 - Minor Disruptions Lead to a Major Problem for the U.S. Saline Supply Chain

Rana Azghandi, Northeastern University, 334 Snell Engineering Center, 360 Huntington Ave, Boston, MA, 02125, United States of America, rana.azghandi@gmail.com, Ozlem Ergun, Jacqueline Griffin

In January 2014, FDA announced an ongoing national shortage of saline which has resulted in increased health risks for patients across the country. The underlying cause of this shortage has been the simultaneous occurrence of many small disruptions such as recalls and increased demand. A system dynamics model is used to analyze the saline supply chain network and to characterize how such a phenomenon results from minor supply disruptions due to feedback processes.

2 - New Strategies for Quantifying the Resilience of Supply Chains to Temporally Distinct Disruptions

Jacqueline Griffin, Assistant Professor, Northeastern University,
334 Snell Engineering Center, 360 Huntington Ave, Boston, MA,
02125, United States of America, ja.griffin@neu.edu,
Ozlem Ergun, Shiqing Liu

The saline supply chain network flow formulation applied for a multi-level supply chain with lead time between each level and concerning about how factors would influence each other in different time periods. We present closed form expressions to characterize the resilience of a supply chain network to varying combinations of temporally distinct disruptions.

3 - Exploring Strategies for Private Sector Transportation in Uganda

Jarrod Goentzel, MIT, 77 Massachusetts Avenue, Cambridge, MA,
02139, United States of America, goentzel@mit.edu,
Mark Brennan, Emily Gooding

New product technology is commonly introduced in developing countries through subsidized pilot programs run by non-governmental organizations (NGOs). Low landed cost is key for further scaling up product distribution through the private sector. This study uses a pilot program for agricultural storage products in Uganda to explore strategies to reduce transportation cost.

4 - Tracking Healthcare Associated Infections at Individual Level over Dynamic Human Networks

Ziye Zhou, The Chinese University of Hong Kong, William M W
Mong Engineering Bldg., Hong Kong, Hong Kong - PRC,
zhouzy@se.cuhk.edu.hk, Chun-hung Cheng, Dobin Ng

Healthcare associated infections (HAIs) have become a major challenge to public healthcare. This work addresses the problem of tracking the transmission of HAIs at an individual level. We present a framework with three key components of time-varying contact network construction, individual-level transmission tracking and HAI parameter estimation. Experiments on human positioning data collected in a four-month tracking study in a hospital are conducted to evaluate the performance.

Health Care Modeling and Optimization VI

Contributed Session

Chair: Md Noor E Alam, Post Doctoral Fellow, Massachusetts Institute of Technology, 135 Quincy Ave, Apt 204, Quincy, MA, 02169, United States of America, mnalama@mit.edu

1 - Shift Scheduling for an Anesthesiology Residency Program

Hernan Abeledo, Associate Professor, George Washington University, 800 22 St. NW, Washington, DC, 20052, United States of America, abeledo@gwu.edu, Michael Kanter, Ian Morgan, Jean - Max Buteau, Liam Nealon

Creating shift schedules for resident physicians is a notoriously difficult task that is typically done manually by the chief residents. Shift assignments need to observe a large number of rules, as well as adhere to fairness and desirability factors while populating a very complex schedule structure. We present an integer programming model developed to schedule anesthesiology residents at the George Washington University Hospital.

2 - Shift Scheduling for Medical Residency Programs

Anthony Coudert, George Washington University, 800 22 St. NW, Washington, DC, United States of America, coudert@gmail.com, Hernan Abeledo

Creating shift schedules for resident physicians is a tedious task that is typically done manually by the chief residents. Shift assignments need to observe a large number of rules, as well as adhere to fairness and desirability factors while populating a very complex schedule structure. We present integer programming models used to schedule residency programs at the George Washington University Hospital.

3 - Open-access Outpatient Clinic Scheduling

Yu Fu, ISEN Dept. Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, yufu@tamu.edu, Amarnath Banerjee

This study aims at exploring cost-efficient offline and online scheduling methods under the open access policy which allows the visits of the same-day-request patients and walk-in patients as compensation for no-shows of regular patients to improve clinic performance and revenue benefit. The offline scheduling uses approximation and heuristic methods on scenarios and data generated by prediction and simulation. The online scheduling relies on heuristic methods and stochastic programming models.

4 - Integer Linear Programming Based Statistical Techniques for Causal Inference

Md Noor E Alam, Post Doctoral Fellow, Massachusetts Institute of Technology, 135 Quincy Ave, Apt. 204, Quincy, MA, 02169, United States of America, mnalama@mit.edu, Cynthia Rudin

Organizations are fiercely struggling to realize valuable information from large-scale data that are increasingly used for understanding important cause and effect relationships. This research developed a methodological frameworks to solve such critical problems with ILP based statistical techniques. One of the key idea is to develop robust techniques to handle uncertainty in data driven decision making, particularly as applied to healthcare.

MA38

38-Room 415, Marriott

Applied Probability I

Contributed Session

Chair: Giang Trinh

Senior Research Associate, Ehrenberg-Bass Institute, University of South Australia, 70 North Terrace, Adelaide, SA, Australia, giang.trinh@marketingscience.info

1 - Value of Communication in a One-leader, Two-followers Partially Observed Markov Game

Yanling Chang, PhD Candidate, Georgia Institute of Technology, 765 Ferst Dr, Atlanta, GA, 30332, United States of America, changyanling@gatech.edu, Alan Erera, Chelsea White

We consider a one-leader, two-followers partially observed Markov game and analyze how the value of the leader's criterion changes due to changes in the communication quality between the two followers. We present conditions under which the value of the leader's criterion degrades or improves, as a function of this communication quality and the type of game (collaborative or non-collaborative).

2 - Multi-period Corporate Survival Probability Estimation with Stochastic Covariates

Ahmad Reza Pourghaderi, Assistant Professor, Abdullah Gul University, Department of Industrial Engineering, Melikgazi, Kayseri, 38039, Turkey, pourghaderi@u.nus.edu, Ebrahim Sadreddin

We propose an econometric method to obtain maximum likelihood estimation of multi-period corporate survival probabilities conditional on macroeconomic and firm-specific covariates. We then provide an empirical implementation of the proposed method for about 300 Iran-listed Industrial firms. Our method combines traditional duration analysis of the dependence of default intensity on time varying covariates with time-series analysis of covariates.

3 - Managing Capacity with Optimal Buffer Size Selection

Melda Ormeci Matoglu, University of New Hampshire, 10 Garrison Ave., Durham, NH, 03824, United States of America, melda.ormecimatoglu@unh.edu

We model the problem of managing capacity and determining optimal buffer size in a BTO environment as a Brownian drift control problem. We seek a policy that minimizes long-term average cost. The controller can, at some cost, shift the processing rate among 2 rates and has the option of rejecting orders and idling. We show that the optimal policy follows a simple policy and determine the optimal policy parameters. We also calculate important policy performance metrics.

4 - Modeling and Predicting Purchasing Behavior with an Erlang-2 Poisson Lognormal Model

Giang Trinh, Senior Research Associate, Ehrenberg-Bass Institute, University of South Australia, 70 North Terrace, Adelaide, SA, Australia, giang.trinh@marketingscience.info

We note some practical and theoretical shortcomings of the Erlang-2 Poisson gamma mixture model or the condensed NBD, which has been successfully employed for modeling and predicting consumer purchases. We develop a new model, the Erlang-2 Poisson lognormal mixture model, which has a sounder theoretical base. We derive the conditional expectation of the new model and use it to predict future purchases. We show that the new model predicts future purchases better than the condensed NBD model.

Topics in Mental Accounting, Newsvendor and Pricing

Cluster: Operations/Marketing Interface

Invited Session

Chair: Jun Ru, Assistant Professor, University at Buffalo, 326D Jacobs, Buffalo, NY, 14260, United States of America, junru@buffalo.edu

1 - Dynamic Pricing with a Fare-lock Option

Ming Chen, Assistant Professor, California State University Long Beach, 1250 Bellflower Blvd, Long Beach, CA, 90840, United States of America, ming.chen@csulb.edu, Zhi-Long Chen

We study a dynamic pricing problem frequently seen in the airlines industry where customers are offered an option to lock a fare at a small fee for a certain period of time. The free 24 hour cancellation enforced by DOT can be viewed as a special case of this problem. This provides a valuable option for those undecided travelers when finalizing their travel plans. We build a dynamic pricing model to investigate the implications of this type of practice on both the airlines and the passengers.

2 - Mental Accounting and Payment Schemes in Manufacturer's Returns Policies

Charles Wang, Associate Professor, University at Buffalo, Buffalo, NY, United States of America, cxwang@buffalo.edu, Jun Ru

Returns policies have been used between the manufacturer and retailer in supply chains with uncertain demand. This research extends our understanding of returns policies by adopting the concept of mental accounting to describe the manufacturer's behavioral decisions under returns policies. We also investigate two alternative payment schemes that help mitigate the manufacturer's mental accounting effect in returns policies and improve channel performance.

3 - Price Discount and Capacity Planning under Demand Postponement with Opaque Selling

Zhengping Wu, Associate Professor, Syracuse University, 721 University Ave, Syracuse, NY, 13244, United States of America, zwu12@syr.edu, Jianghua Wu

We consider the opaque selling strategy of a firm that uses a price discount to induce demand postponement. Under demand postponement, the firm offers a price discount to advance customers in exchange for the option to fulfill their orders after the spot demand has been satisfied. In effect, the price discount enables the firm to create a capacity buffer for the spot demand. We characterize the firm's optimal capacity and price discount decisions.

4 - A Two Product Newsvendor Problem with Partial Demand Substitution

Jun Zhang, Associate Professor, Fudan University, 670 Guoshun Rd, Faculty Building 520, Shanghai, China, jxz063000@outlook.com, Jun Ru, Ruixia Shi

We show that a two-product newsvendor problem with partial demand substitution is equivalent to the classical newsvendor problem with the same economic parameters but an adjusted demand. By comparing the adjusted demand and the primary demand stochastically, we examine the impacts of substitution on the expected profit and optimal order quantities. Our analysis does not rely on assumptions on particular demand distributions or correlation structures.

Investigating Mobility Dynamics within Markets and Organizations

Sponsor: Organization Science

Sponsored Session

Chair: Y. Sekou Bermiss, University of Texas, Austin, TX, United States of America, ysb@austin.utexas.edu

1 - Racial Disparity in Promotion Rates of NFL Coaches

Chris Rider, Georgetown University, Washington, DC, chris.rider@georgetown.edu, Jim Wade, Anand Swaminathan, Andreas Schwab

We examine differences in the rates at which white and black coaches are promoted within the NFL between 1985 and 2012. We demonstrate continuing race-based sorting into positions with limited upward mobility chances (e.g., RB coach) and lower mobility rates conditional on attaining any position (e.g., LB coach). We discuss how high-level interventions designed to increase representation at the highest levels are likely to be ineffective absent accompanying lower level interventions.

2 - Should I Stay or Should I Go: Movement of Artists and Producers between Labels When New Music Categories Emerge

Eugene Paik, University of Arizona, Tucson, AZ, paikth@email.arizona.edu, Joseph P. Broschak

The 1950's began the rise of new genres of recorded American music. We investigate how, in the wake of new genres emerging, music label identity changes (e.g., changes in the portfolio of music genres that labels choose to produce) affected the mobility of music artists and producers between music labels.

3 - Employee Mobility and Firm Performance: An Integrative Theoretical Framework and Research Agenda

John Mawdsley, University of Illinois at Urbana Champaign, Urbana, IL, mawdsle1@illinois.edu, Deepak Somaya

We review of research on employee mobility and its organizational impacts, and casting it within a novel integrative theoretical framework. We highlight the various organizational impacts of employee mobility, describe how contextual factors moderate the transfer of human and relational capital through mobile individuals, and how constraining factors that impede employee mobility may also be used for effectuating the same organizational impacts as mobility events.

4 - Individual Status Attainment and Entrepreneurial Entry: The Mobility of Award Winning Creative Directors in the Advertising Industry

Michelle Rogan, INSEAD, Boulevard de Constance, Fontainebleau Cedex 77305, France

Michelle.Rogan@insead.edu, Andrew von Nordenflycht

This study is an investigation into the type of firms to which "stars" are likely to move. In particular, we examine the effect of stardom on the likelihood of moving to a higher status firm vs. starting or joining an entrepreneurial firm, in other words choosing status or autonomy. We test our arguments on a sample of award winning creative directors in the advertising industry. We find that industry awards provide a means of resource redistribution and new organizational foundations.

5 - Ideological Misfits: Political Affiliation and Employee Departure in the Private Equity Industry

Y. Sekou Bermiss, University of Texas, Austin, TX, United States of America, ysb@austin.utexas.edu, Rory McDonald

Building on social psychological theories of organizational fit we develop theory to explain how ideological mismatch between an individual and their immediate peers impacts their likelihood of firm departure. Tracking the movement of over 40,000 investment professionals within the U.S. private equity industry over ten years, we investigate how impact of ideological misfit that arises when individuals hold political ideologies that depart substantially from the dominant ideology of the firm.

41-Room 102A, CC

Joint Session MSOM-Health/HAS: Data-Driven Modeling in Healthcare II

Sponsor: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Yichuan Ding, UBC, 2053 Main Mall, Sauder School of Business, Vancouver, BC, V6T1Z2, Canada, daniel.ding@sauder.ubc.ca

Co-Chair: Nan Liu, Columbia University, 722 W. 168th. St., New York, United States of America, nl2320@columbia.edu

1 - What Drives the Geographical Differences in Deceased Donor Organ Procurement in the United States?

Mazhar Arikan, Assistant Professor, University of Kansas, 1300 Sunnyside Ave., Lawrence, KS, 66045, United States of America, mazhar@ku.edu, Baris Ata, Rodney Parker, John J Friedewald

The deceased-donor kidney allocation system suffers from severe shortages of available organs while there is significant variation in the procurement rates across different geographies in the US. The empirical analysis reveals that the intent of procurement increases with organ quality, the median waiting time for a transplant, and the competition among transplant centers. A counterfactual study shows that broader sharing of lower quality organs leads to an increase in the procurement rates.

2 - Dynamic Assignment of Emergency Department Patients to Primary and Secondary Inpatient Units

Derya Kilinc, Arizona State University, 699 S. Mill Ave., Tempe, AZ, 85281, United States of America, dkilinc@asu.edu, Soroush Saghaian, Stephen J. Traub

One of the main reasons for Emergency Department (ED) crowding is the long boarding time, of patients who are waiting for admission to inpatient wards. We study suitable mechanisms to overflow such patients to alternative wards. An overflow policy can improve ED waiting times and Length of Stay (LOS), but may reduce the quality of care. We study an MDP-based approach to gain insights into the impact of overflow policies on waiting times and quality of care.

3 - Data Driven Staffing of Hospital Support Staff

Cassandra Hall, PhD Student, Northwestern University, IEMS Department, Evanston, IL, CassandraHall2017@u.northwestern.edu, Sanjay Mehrotra, Seyed Iravani

We study hospital patient transport requests as a multiclass queue with server specialization and construct an approximation for the minimum number of servers required to achieve a probabilistic bound on the patient waiting time. We also explore the effects of different specialization and routing policies on performance at a given staffing level. Output is then compared with theoretical worst case waiting time bounds derived from the literature.

4 - A Clinical Decision Support System for Treatment-resistant Depression: A Pilot Study

Martin Cousineau, Desautels Faculty of Management, McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A 1G5, Canada, martin.cousineau@mail.mcgill.ca, Gustavo Turecki, Vedat Verter, Joelle Pineau

This research project aims to develop a clinical decision support system to assist psychiatrists seeking to achieve remission in treatment-resistant depression patients. This system is based on a longitudinal dataset of outpatient mental health clinic patients, and consists of (1) a predictive model of the patient outcome depending on the selected treatment, and (2) a decision-theoretic module for recommending treatment strategies based on similar patient files.

5 - An Empirical Study of Patient Prioritization in Emergency Department Triage Systems

Mahesh Nagarajan, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, mahesh.nagarajan@sauder.ubc.ca, Eric Park, Yichuan Ding

We analyze patient choice behavior of the ED personnel who decides which patient waiting in the ED will be seen by the next available physician. We use a discrete choice framework consistent with random utility theory. The choice maker's valuation of each patient depends on both the patient's medical and operational characteristics including wait time and ED congestion. We study over 270,000 patient choices in five EDs using the Canadian Triage and Acuity Scale (CTAS).

Modeling Healthcare Provider and Processes Interaction

Sponsor: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Vikram Tiwari, Vanderbilt University Medical Center, Nashville, TN, United States of America, vikram.tiwari@vanderbilt.edu

1 - Quantifying Case Cancellations and Add-On Case Scheduling among Patients Inpatient Preoperatively

Franklin Dexter, Professor, University of Iowa, Anesthesia, 200 Ha, Iowa City, IA, 52242, United States of America, franklin-dexter@uiowa.edu, Richard Epstein

Among 24,735 inpatient scheduled cases, $22.6 \pm 0.5\%$ (SE) of scheduled minutes cancelled after 7 AM the day before or day of surgery ($14.0\% \pm 0.3\%$ day of). Most ($83.1\% \pm 0.6\%$) cases performed were evaluated the day before surgery, $62.3\% \pm 1.5\%$ before 6:00 PM. The cancelled procedures were very diverse (Herfindahl index 0.021 ± 0.001). When cancelled, often no procedure was subsequently performed ($50.6\% \pm 0.9\%$), showing the surgical indication no longer existed or patient/family decided no surgery.

2 - The Role of Wearable Devices Data in Physician-patient Relationship

Zafar Özdemir, Professor, Miami University, Farmer School of Business, Oxford, OH, 45056, United States of America, ozdemir@miamioh.edu, Shailesh Kulkarni, Hakan Tarakci

We investigate a medical provider's optimal level of investment in remote monitoring where, unlike the current norm, the provider can initiate a face-to-

face visit or a remote treatment depending on the information streamed from the patient's wearable device. Our model provides valuable insights across a variety of payment models.

3 - Evaluating Peer-to-peer Performance of Anesthesiology Fellows using Data Envelopment Analysis

Vikram Tiwari, Vanderbilt University Medical Center, Nashville, TN, United States of America, vikram.tiwari@vanderbilt.edu, Avinash Kumar

Factors that contribute to the success of individuals at a critical care fellowship have not been well studied. We explore what aspects of the educational program and work characteristics contribute the most to an individual fellow's success as determined by year end Multidisciplinary Critical Care Knowledge Assessment Program scores and summative evaluations. We show the feasibility of using data envelopment analysis to evaluate the academic performance of fellows compared to their peers.

Game Theoretic Models in Revenue Management I

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Ozan Candogan, University of Chicago, Booth School of Business, Chicago, IL, United States of America, ozan.candogan@chicagobooth.edu

Co-Chair: Santiago Balseiro, Assistant Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, srb43@duke.edu

1 - Customer Referral Incentives and Social Media

Ilan Lobel, NYU, 44 W 4th St, New York, NY, 10012, United States of America, ilobel@stern.nyu.edu, Evan Sadler, Lav Varshney

We study how to optimally attract new customers using a referral program. Whenever a consumer makes a purchase, the firm gives her a link to share with friends, and every purchase coming through that link generates a referral payment. The firm chooses the referral payment function and consumers play an equilibrium in response. We show that the optimal payment function is nonlinear and complex, and prove revenue properties of simple approximate solutions such as linear and threshold policies.

2 - Dynamic Reserve Prices for Repeated Auctions: Learning from Bids

Yash Kanoria, Assistant Professor, Columbia University, New York, NY, United States of America, ykanoria@columbia.edu, Hamid Nazerzadeh

A large fraction of online advertisements are sold via repeated second price auctions. In these auctions, the reserve price is the main tool for the auctioneer to boost revenues. We present a simple approximately incentive-compatible and optimal dynamic reserve mechanism that can significantly improve the revenue over the best static reserve when there is uncertainty in the distribution of valuations.

3 - A Dynamic Model of Crowdfunding

Mohamed Mostagir, Assistant Professor, University of Michigan Ross School of Business, 701 Tappan Ave, R5316, Ann Arbor, MI, 48109, United States of America, mosta@umich.edu, Saeed Alaei, Azarakhsh Malekian

Crowdfunding has emerged as an alternative to traditional methods of funding new products. Backers arrive over time and decide whether to pledge money to a crowdfunding campaign. If the total contribution reaches a certain threshold, the campaign is successful and production takes place. We identify a fundamental tension in these environments that leads to a sharp characterization of empirical outcomes, and we show how to determine the optimal duration and price to maximize campaign success.

4 - Effect of Network Perturbation on Aggregate Performance

Azarakhsh Malekian, Rotman School of Management, University of Toronto, Toronto, Canada, azarakhsh.malekian@rotman.utoronto.ca, Opher Baron, Ming Hu

In this work, we characterize the role of perturbing network interactions in macroeconomic aggregate performance. We then provide a fairly tight characterization of the aggregate performance under worst-case network perturbation as well as average-case random network perturbation. Finally, we identify robust networks under perturbation.

44-Room 103B, CC

Data Driven Pricing

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Wedad Elmaghraby, Associate Professor, University of Maryland, University of Maryland, 4311 Van Munching Hall, College Park, MD, 20742, United States of America, welmaghr@rhsmith.umd.edu

Co-Chair: Shawn Mankad, Assistant Prof Of Business Analytics, University of Maryland, 4316 Van Munching Hall, College Park, MD, 21201, United States of America, smankad@cornell.edu

1 - More than Just Words: on Discovering Themes in Online Reviews to Explain Restaurant Closures

Shawn Mankad, Assistant Prof Of Business Analytics, University of Maryland, 4316 Van Munching Hall, College Park, MD, 21201, United States of America, smankad@cornell.edu, Anand Gopal, Jorge Mejia

We complement the existing research on online reviews by proposing a novel use of modern text analysis methods to uncover the semantic structure of online reviews and assess their impact on the survival of merchants in the marketplace. We analyze online reviews from 2005 to 2013 for restaurants in a major metropolitan area in the United States and find that variables capturing semantic structure within review text are important predictors of the survival of restaurants.

2 - Cost-per-impression Pricing for Display Advertising

Sami Najafi-Asadolahi, Santa Clara University, 500 El Camino Real, Santa Clara, CA, United States of America, snajafi@scu.edu

We consider a web publisher posting display ads on its website and charging based on the cost-per-impression pricing scheme. The publisher is faced with uncertain demand for advertising slots and uncertain supply of visits from viewers. Advertisers choose ad campaigns that specify their targeted viewers. We determine the publisher's optimal price to charge and show that it can increase in the number of impressions, which is in contrast to the quantity-discount commonly offered in practice.

3 - Pricing Personalized Bundles: A New Approach and Industrial Application

Zhengliang Xue, IBM, Yorktown Heights, NY, United States of America, IBM, zxue@us.ibm.com, Zizhuo Wang, Markus Ettl

We optimize the pricing strategies for personalized bundles where a seller provides a variety of products using which customers can configure a bundle and send a request-for-quote. The seller, after reviewing the RFQ, has to determine a price based on customers' willingness to buy. Such problems are difficult because of the potential unlimited possible configurations of the bundle and the correlations among individual products. We propose a new approach and show the business value by real data.

4 - Measuring the Effects of Advertising: The Digital Frontier

Justin Rao, Researcher, Microsoft Research, 641 Avenue of Americas, New York, NY, 10014, United States of America, Justin.Rao@microsoft.com, Randall Lewis, David Reiley

Online advertising offers unprecedented opportunities for measurement. A host of new metrics have become widespread in advertising science. New experimentation platforms open the door for firms and researchers to measure the true causal impact of advertising. We dissect the new metrics, methods and computational advertising techniques currently used by industry researchers, highlighting their strengths and weaknesses, and discuss the novel analyses could impact the advertising market.

RM in Practice

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Wei Wang, Scientist, PROS, Inc., 3100 Main Street, Suite #900, Houston, TX, 77002, United States of America, weiwang@pros.com

1 - Modeling Issues and Best Practices in Price and Revenue Optimization

Yanqi Xu, Director Of Applied Technology, Princess Cruises, 24305 Town Center Rd, Valencia, CA, 91355, United States of America, yxu@princesscruises.com

Price and revenue optimization is proven to be critical to improving the top lines in various industries where relatively fixed capacity has to be used to satisfy fluctuating demand. However, there exist ways to set up the models to achieve

better profits than others. In this talk, we will discuss some practical issues frequently encountered in the modeling of price and revenue optimization, and we will go through several real world examples to illustrate some of the best practices.

2 - Revenue Functions: Demand Aggregation for Fleet Allocation in Car Rental Industry

Manu Chaudhary, Scientist, PROS, 3100 Main Street, Suite #900, Houston, TX, 77002, United States of America, mchaudhary@pros.com

Fleet allocation for car rental industry is a multi-dimensional, large scale network optimization which is computationally expensive. We address this complexity by introducing an intermediate optimization that generates Revenue Functions which aggregate the demand forecast to a higher level. This reduces the dimensional complexity of the modified fleet allocation problem significantly and makes it feasible to run in a live production system.

3 - Identifying a More Accurate Historical Data Subset from a Noisy Historical Dataset: A Forecasting Example

Gregory Vogel, Manager, Revenue Science, Holland America Line, 300 Elliott Ave W, Seattle, WA, 98119, United States of America, gvogel@hollandamerica.com

When looking at similar products that have overlapping booking periods, noise is common. It is common practice to compile a dataset for processes such as demand forecasting by compiling the complete set of relevant history. We ask the question, can we identify a subset of history that will produce a more accurate forecast? We utilize a cruise example to demonstrate and improved forecast and present the method developed.

4 - Joint Optimization of Pricing and Marketing for Globally Maximum Profit

Sharon Xu, UCLA Statistics Department, 8125 Math Sciences, Los Angeles, CA, 90095, United States of America, sharon.xu@ucla.edu

With the recent influx of high-granularity data, businesses are able to achieve a more comprehensive understanding of their customers. To better leverage this data, we present a new way to maximize profit by jointly optimizing pricing and advertising spend. We first create a predictive model to quantify how pricing and advertising influence consumer purchase decisions, then use this to inform a model that simultaneously optimizes pricing and advertising decisions to obtain the maximum profit.

5 - An Airline RM Model with Capacity Sharing

Ang Li, Scientist, PROS, Inc., 3100 Main St. #900, Houston, TX, 77002, United States of America, ali@pros.com, Darius Walczak

We consider a single-leg airline RM problem with shared seating capacities between business and economy compartments. In particular, a curtain that separates the two compartments can be installed on the day of flight departure. We solve the control problem as a dynamic program that jointly considers the booking levels on both sides of the curtain. We then compare the optimal revenue achieved to an alternative scenario with an optimal curtain position but without capacity sharing.

Chair: Carri Chan, Columbia Business School, 3022 Broadway, Uris Hall, Room 410, New York, NY, 10027, United States of America, cwchan@columbia.edu

1 - Service Decisions with Two-dimensional Customer Heterogeneity

Tolga Tezcan, Associate Professor, London Business School, Regent's Park, London, UK, NW14SA, United Kingdom, ttezcan@london.edu, Balaraman Rajan, Avi Seidmann

In this work we analyze the operational decisions of a server dealing with customers who are heterogeneous on two dimensions. We apply the results in the context of a specialist seeing patients suffering from chronic conditions and patients who differ in their preferences to a newly introduced telemedicine technology. Our results help analyze telemedicine adoption and optimal decisions for a service provider.

2 - An Approximation for the Bed Occupancy Process in Inpatient Wards

Ohad Perry, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, ohad.perry@northwestern.edu

We consider queueing dynamics of bed-occupancy processes in inpatient wards. These are time varying, and have departures that are highly concentrated within a short time period each day, following the physicians' daily inspection round. We characterize a necessary and sufficient condition for the system to be stable, and employ a fluid approximation to prove an asymptotic periodic behavior of the system. That "periodic equilibrium" can be used to optimize systems' performance.

3 - Operations Management of a Stool Bank for Fecal Transplantations

Abbas Kazerouni, Stanford University, Electrical Engineering Department, Stanford, CA, United States of America, abbask@stanford.edu, Lawrence Wein

We describe our work with OpenBiome, a nonprofit firm that enables fecal transplants for treating *Clostridium difficile*, which is responsible for 25,000 deaths and \$1 billion annually in the U.S. We optimize the timing of new donor acquisitions and the individualized (based on donor production rate) testing frequency for each donor, with the goal of meeting nonstationary demand (increasing at 10% per month) at minimum cost.

4 - Queues with Time-varying Arrivals and Inspections with Applications to Hospital Discharge Policies

Carri Chan, Columbia Business School, 3022 Broadway, Uris Hall, Room 410, New York, NY, 10027, United States of America, cwchan@columbia.edu, Linda Green, Jing Dong

To discharge a patient from a hospital unit, a physician must determine that the patient is stable enough to be discharged. As such, patients may occupy a bed longer than medically necessary. Motivated by this phenomenon, we introduce a queueing system with time-varying arrival rates in which servers who have completed service cannot be released until an inspection occurs. We examine how such a dynamic impacts system dynamics and consider how to optimize the timing of inspections.

MSOM Sustainability and Energy

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Yangfang Zhou, Assistant Professor, Lee Kong Chian School of Business, Singapore Management University, Singapore, Singapore, helenzhou@smu.edu.sg

1 - Investments in Renewable and Conventional Energy: Role of Operational Flexibility

Kevin Shang, Duke University, 100 Fuqua Drive, Durham, NC, United States of America, kevin.shang@duke.edu, Gurhan Kok, Safak Yucel

We study investments of a utility firm in renewable and conventional energy sources with different levels of operational flexibility, i.e., the ability to quickly ramp up or down the output of a generator. We consider supply characteristics of conventional and renewable sources to investigate their interaction with each other. We find that inflexible sources (e.g., nuclear energy) and renewables are strategic substitutes; flexible sources (e.g., natural gas) and renewables are complements.

2 - Promoting Clean Technology Products: to Subsidize Consumers or Manufacturer?

Ho-Yin Mak, University of Oxford, Said Business School, Park End Street, Oxford, United Kingdom, makho06@gmail.com, Guangrui Ma, Michael Lim, Zhixi Wan

We study the dynamic adoption process of Clean Technology Products, which is often hampered by the chicken-and-egg dilemma: at the early stage of commercialization, firms are reluctant to invest in support infrastructure before sufficient consumers adopt the products; on the other hand, consumers hesitate to adopt the products without such infrastructure. We study two lines of widely-discussed policy instruments, government subsidies and mandated information disclosure, to tackle this dilemma.

3 - Is Electricity Storage "GREEN"? A Case Study with Commercial Buildings for Reducing Demand Charge

Yangfang Zhou, Assistant Professor, Lee Kong Chian School of Business, Singapore Management University, Singapore, Singapore, helenzhou@smu.edu.sg

Electricity storage systems, e.g., grid-scale industrial batteries, are known in the literature to increase carbon emission when used for arbitrage. However, we show that when these storage systems are used for reducing demand charge (on peak load), they can potentially decrease carbon emission. We model the problem of managing electricity storage and solar panels in a commercial building (e.g., those for hotels, banks, and supermarkets), and examine the "greenness" of storage with real data.

4 - Dynamics of Capacity Investment in Renewable Energy Projects

John Birge, Professor, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu, Nur Sunar

We study the dynamics of the capacity investment for renewable power generators. Using a continuous time Brownian model, we explicitly identify the optimal dynamic capacity investment strategy of a renewable power generator. Our analysis offers important insights for renewable power generators. We also include some numerical analysis to shed light on the optimal strategy.

Supply Chain Finance and Risk Management

Sponsor: Manufacturing & Service Oper Mgmt/IFORM

Sponsored Session

Chair: Wei Luo, IESE Business School, Av. Pearson 21, Barcelona, Spain, wluo@iese.edu

Co-Chair: Kevin Shang, Duke University, 100 Fuqua Drive, Durham, NC, United States of America, kevin.shang@duke.edu

1 - The Strategic Role of Business Insurance

Juan Serpa, Assistant Professor, Kelley School of Business, Indiana University, 2111 Lower Mall, Bloomington, IN, United States of America, juan.serpa@sauder.ubc.ca, Harish Krishnan

We show that, in a multi-firm setting, insurance can be used strategically as a commitment mechanism to prevent excessive free-riding by other firms. In the presence of wealth imbalances, contracts alone leave wealth-constrained firms with inefficiently low incentives to exert effort, and firms with sufficient wealth with excessive incentives. Insurance allows the latter to credibly commit to lower effort, thereby mitigating the incentives of the wealth-constrained firms to free ride.

2 - Supply Chain Financing with Buy-back Contracts

Tunay Tunca, University of Maryland, College Park, MD, United States of America, ttunca@rhsmith.umd.edu, Weiming Zhu

Facing a budget-constrained buyer, a novel approach for large suppliers is adopting buy-back financing schemes to relieve their downstream partners and reduce channel costs. We analyze the efficiency of these financing schemes, and explore their impact on operational decisions and contract design. We find that such contract agreements can improve channel efficiency significantly over traditional financing methods.

3 - Supply Chain Network Formation and Risk Propagation

John Birge, Professor, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu, Jing Wu

The structure of supply chain networks impacts firm's performance through direct effects from shocks to linked firms as well as indirect effects from systematic risk exposure across the entire network. This talk will discuss a motivating model of network formation in this context and its implications for firms' supply chain choices.

4 - Trade Credit and Price Elasticity of Demand

Eduard Calvo, IESE School of Business, IESE, Barcelona, Spain, ECalvo@iese.edu, Wei Luo

This paper investigates how price elasticity of demand impacts trade credit in virtually integrated supply chains. We derive a theoretical model wherein trade credit is expressed as a function of margins, financing costs and elasticity. Ceteris paribus, we predict that suppliers of products with higher demand elasticity should be paid earlier to unlock higher profits. We further test the model using data from a large Spanish supermarket chain and its virtually integrated suppliers.

1 - New Business Models for Green Technology Adoption in Split Property Rights and Rents Situations

Anton Ovchinnikov, Queen's University, 143 Union St. West, Kingston, Canada, anton.ovchinnikov@queensu.ca

In many situations, the owner of the asset that is being improved with green technology is not one that enjoys the benefits from the improvement. For example, the landlord may incur the costs of energy-efficiency upgrades, while the tenant will enjoy the savings in energy costs. Such split in property rights and rents is a major deterrent in the adoption of green technologies. I will discuss two case studies highlighting the industry practice and issues, and opportunities to resolve them.

2 - The Impact of Extended Producer Responsibility on Selling and Leasing Strategies

Ni Fang, HEC Paris, 1, Rue de la Liberation, HEC Paris, Jouy en Josas, DI, 78351, France, ni.fang@hec.edu, Andrea Masini

While product take-back legislation based on the Extended Producer Responsibility (EPR) concept is becoming an increasingly popular instrument to reduce waste, its actual operational and environmental impact remains unclear. This paper examines how EPR legislation affects the optimal channel allocation decisions of a firm that either sells, leases, or concurrently sells and leases durable products, and it discusses the competitive and environmental implications of regulation.

3 - The Buyer's Role in Improving Energy Efficiency in Supply Chains

Jason Nguyen, University of Minnesota, 321 19th Ave S, Minneapolis, MN, 55455, United States of America, nguy1762@umn.edu, Karen Donohue, Mili Mehrotra

We investigate the equipment-focused EE investment decision in the context of a supply chain where a capital constrained manufacturer sets the investment level and its buyer sets contract prices. We investigate the impact of different factors including policy incentives and global competition on the investment decisions.

50-Room 106A, CC

The Role of Behavioral Modeling Features in Revenue Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Eren Cil, University of Oregon, 1585 East 13th Avenue, Eugene, OR, United States of America, erencil@uoregon.edu

1 - What if Hotelling's Firms Can Deliver Their Products? Competitive and Social Implications

Alireza Yazdani, University of Oregon, 2250 Patterson St., Unit 220, Eugene, OR, 97405, United States of America, syazdani@uoregon.edu, Eren Cil, Michael Pangburn

We study the competition between two firms serving dispersed customers, which we model using Hotelling's classic linear city model. In the classic framework, travel costs are borne by consumers, but potentially firms could absorb those costs by making deliveries to customers. We explore the competitive and social implications of these two alternatives for serving customers demands, considering both product design and pricing decisions.

2 - Dynamic Pricing of Multiple Substitutable Products with Search Cost and Local Behavioral Influences

Sajjad Najafi, PhD Candidate, University of Toronto, RS206, 5 King's College Road, Toronto, ON, M5S 3G8, Canada, snajafi@mie.utoronto.ca, Chi Guhn Lee, Sami Najafi-Asadolahi, Steven Nahmias

We consider a seller offering n types of substitutable products over T time periods. Customers incur a search cost for inspecting the products, and may examine only a subset of the products. They are also assumed to have a local behavior in the search process. Given inventory state and time, the firm aims to find the optimal price of the products maximizing its profit.

3 - Social Loafing and Queue Driven Speedup: Evidence from a Supermarket

Yong-Pin Zhou, Associate Professor of Operations Management, University of Washington, Seattle, WA, 98195-3226, United States of America, yongpin@uw.edu, Jingqi Wang

We study factors affecting cashiers' service rate using data from a supermarket. We find that customer waiting pushes cashiers to work faster. We also observe that pooling has a negative impact on cashiers' service rate.

4 - Physician Dual Practice; When Revenue is Not the Only Thing that Matters

Vasiliki Kostami, London Business School, London Business School (MSO dept), Regent's Park, London, NW1 4SA, United Kingdom, vkostami@london.edu, Dimitrios Andritsos

Physician dual practice refers to the simultaneous practice of medicine by physicians in both public and private settings. In the presence of dual-practice, we are looking at the optimal proportion of time that physicians may be willing to invest in a private practice. How does that proportion depend on the physicians objective? And how does this affect the severity of the patients that are treated in the public versus the private clinics?

Models for Fashion Operations Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Victor Martínez-de-Albéniz, Associate Professor, IESE Business School, Av. Pearson 21, Barcelona, 08034, Spain, Valbeniz@iese.edu

1 - Assortment Planning Decisions in a Two-sided Market

Ying Cao, University of Texas at Dallas, 800 W. Campbell Rd, Richardson, TX, 75080, United States of America, Ying.Cao@utdallas.edu, Dorothee Honhon, Sridhar Seshadri

We consider the problem of a firm optimizing its assortment when facing a two-sided market. The firm receives revenues from customers purchasing the products as well as from advertising company who offer to pay various amounts for reaching customers from different segments. We explore structural properties of the optimal assortment and compare it to the solutions of the one-sided market problems.

2 - Managing Online Content to Build a Follower Base: Model and Applications

Felipe Caro, University of California Los Angeles, 110 Westwood Plaza, Box 951481, Los Angeles, CA, 90095-1481, United States of America, felipe.caro@anderson.ucla.edu, Victor Martínez-de-Albéniz

Content providers typically manage a dual objective of generating interest for current content and at the same time reaching out to new audiences that may become repeat users. The pace at which content is created must thus take into account how much current content contributes to the follower base. We develop a simple model to study base build-up dynamics, and use it to optimize the total traffic received by the content provider through stochastic dynamic programming.

3 - Choosing an Assortment Rotation Strategy to Boost Sales

Kris Johnson Ferreira, Harvard Business School, Morgan Hall 492, Boston, MA, 02163, United States of America, kferreira@hbs.edu, David Simchi-levi

Assortment rotation strategies vary widely across fashion retailers; the flash sales industry uses a frequent assortment rotation strategy, introducing new products every day. We build a finite-horizon stochastic dynamic programming model to better understand the consumer's purchase decisions under this strategy. We analyze and compare our model to the setting where all products are offered for the entire selling season and explore under what conditions the retailer should employ each strategy.

4 - Estimating and Optimizing the Impact of Inventory on Consumer Choices in Fashion Retail

Victor Martínez-de-Albéniz, Associate Professor, IESE Business School, Av. Pearson 21, Barcelona, 08034, Spain, Valbeniz@iese.edu, Pol Boada

We empirically study the impact of inventory (as opposed to availability) on sales. We develop a market share model where we show that product-level inventory has a large impact on its market share within the category. This supports the idea that inventory plays a major role in helping customers choose a particular product within the assortment. We finally describe how a retailer should optimally decide its inventory levels within a category.

Designing Services: Marketing and Operations Inter-related Issues II

Sponsor: Service Science

Sponsored Session

Chair: Rohit Verma, Professor, Cornell University, School of Hotel Administration, 338 Statler Hall, Ithaca, NY, 14853-6902, United States of America, rohit.verma@cornell.edu

1 - Investigating Performance Insights: Leveraging Online Text Reviews using Natural Language Processing

Hyun Jeong Han, National Research University Higher School of Economics, Moscow, Russia, hhyun@hse.ru, Rohit Verma, Joel Goh, Nagesh Gavirneni, Shawn Mankad

In this study, we quantify the relationship between textual content of reviews and financial performances. To achieve our research objectives and to illustrate our methodologies, we partnered with leading hotel review website and hotel-data company to obtain their reviews and performance data on many hotels in Moscow, Russia.

2 - Explore Resource Configuration and Performance Link through Thick and Thin

Jie Zhang, Assistant Professor, University of Vermont, 55 Colchester Ave., Burlington, VT, 05401, United States of America, jie.zhang@uvm.edu, Rohit Verma

We study the patterns of resource configurations at operating unit level through the peaks and troughs of a business cycle. Using a large panel dataset from the US hotel industry, we identify subgroups of distinct resource configurations and link their resource configuration choices to performance.

3 - Who Wants to Share? Understanding the Participants of the Sharing Economy

Rohit Verma, Professor, Cornell University, School of Hotel Administration, 338 Statler Hall, Ithaca, NY, 14853-6902, United States of America, rohit.verma@cornell.edu, Lu Kong, Robert Kwortnik

The models of sharing economy include renting, bartering, loaning, gifting, swapping and forms of shared ownership such as cooperative structures. However, the academic cognition of sharing economy is lagging behind the public cognition. Thus, more research questions need to be asked and answered to unveil the essence and potential of sharing economy. In this article, we try to find out who the people participant in sharing economy are and what personality traits they share.

Behavioral Issues in Coordination and Pricing

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Elena Katok, Ashbel Smith Professor of Supply Chain Management, University of Texas at Dallas, 800 W. Campbell Rd., Dallas, TX, 75080, United States of America, ekatok@utdallas.edu

1 - An Experimental Investigation of Managing Quality through Deferred Payment Mechanisms

Andrew Davis, Cornell University, 401J Sage Hall, Ithaca, NY, 14850, United States of America, adavis@cornell.edu, Kyle Hyndman

We conduct an experiment investigating the efficacy of deferred payment mechanisms in inducing high quality products from suppliers. In particular, we explore a setting where a retailer offers a supplier a fixed fee and a bonus, where the bonus constitutes a deferred payment that is only paid out after a review period has passed and the product is deemed high quality. In one set of our treatments, in both one-shot and repeated settings, we observe significantly higher quality and efficiency.

2 - Size Matters: Supplier Coordination with Endogenously-selected Groups

James Fan, PhD Student, Pennsylvania State University, 426A Business Building, University Park, PA, 16802, United States of America, juf187@psu.edu, Tony Kwasnica

We study the endogenous selection of supplier groups via experimental coordination games. Players first choose between one of two groups, one with an entry fee and one without; they then simultaneously makes a capacity choice. The minimum choice within each group dictates profits for members. The group with an entry fee always observes higher capacity outcomes. This group also has fewer players, suggesting that players recognize the increasing difficulty of coordination in larger groups.

3 - Project Management under Risk-sharing Contracts

Sina Shokoohyar, PhD Student, University of Texas at Dallas, 7815 Mccallum Blvd, Apt. 18205, Dallas, TX, 75252, United States of America, sxs137430@utdallas.edu, Elena Katok, Anyan Qi

We study coordination between contractors in a project under the risk-sharing contracts where payoff of contractors critically depends on the lowest exerted effort. The lowest possible effort may emerge as a result of the Maxmin strategy. To improve coordination, we propose information feedback policy. We show in theory that the coordination risk can be mitigated with periodic information feedback. We also report experimental data which is in line with our theoretical findings.

4 - A Behavioral Study of Competitive Dynamic Pricing with Fixed Capacities

Bahriye Cesaret, PhD Student, The University of Texas at Dallas, 800 W Campbell Rd, Richardson, TX, 75080, United States of America, bahriye.cesaret@utdallas.edu, Elena Katok

We consider two firms that offer substitutable capacity to the same customer pool. Customers arrive sequentially to the market and demand exactly one unit of capacity, and price is the main consideration for the purchasing decisions. Each firm quotes a price for its current unit of capacity simultaneously. We use a 2x2 between-subjects design with two levels of arrival uncertainty and two different length of selling horizon. We report on the results of these laboratory experiments.

A Practical Guide to Ranking and Selection Methods

Cluster: Tutorials

Invited Session

Chair: Dave Goldsman, Professor, Georgia Tech, School of ISyE, Georgia Tech, Atlanta, GA, 30332, United States of America, sman@gatech.edu

1 - Tutorial: A Practical Guide to Ranking and Selection Methods

Dave Goldsman, Professor, Georgia Tech, School of ISyE, Georgia Tech, Atlanta, GA, 30332, United States of America, sman@gatech.edu

We discuss the branch of statistics known as ranking and selection (R&S), which has garnered significant interest in the operations research literature. We introduce some common R&S terminology and go over a number of archetypal procedures to select (i) that one of a number of normal populations having the largest mean, (ii) the Bernoulli population having the largest success parameter, and (iii) the most-probable multinomial cell. We show how these types of procedures can be used in meaningful applications, particularly involving computer simulation.

Innovative Uses of DEA

Cluster: Data Envelopment Analysis

Invited Session

Chair: Tim Anderson, Portland State University, 1900 SW 4th Ave, Suite LL-50-02, Portland, OR, United States of America, tim.anderson@pdx.edu

1 - Reexamining Baseball Careers for Possible Drug use with DEA

Tim Anderson, Portland State University, 1900 SW 4th Ave, Suite LL-50-02, Portland, OR, United States of America, tim.anderson@pdx.edu, Monica Morawa, John Ruggiero

This paper revisits previous work on using DEA to identify potential performance enhancing drug use with an updated DEA model, polynomial regression, and the Malmquist Productivity Index.

2 - Superfood or Not? DEA Makes the Call

Thomas Sexton, Professor, Stony Brook University, College of Business, Stony Brook, NY, 11794-3775, United States of America, thomas.sexton@stonybrook.edu, Christine Pitocco

The use of the term superfood has grown by a factor of almost 20 over the past 40 years. Yet, there is no operational definition. We use a variable returns to scale, mixed orientation DEA model to evaluate 164 foods that are listed on at least one of 8 published lists of purported superfoods. We use 35 nutrients and find that 145 of the foods are on the efficient frontier. The remaining 19 foods lie below the efficient frontier and cannot be classified as superfoods under this definition.

3 - Efficiency Analysis of Internal Combustion Engines: Naturally Aspirated vs Turbo/super-charged

Dong-Joon Lim, Portland State University, 1900 SW 4th Ave,
Suite LL-50-02, Portland, OR, United States of America,
dongjoon@pdx.edu, Tim Anderson

This study investigates the technical efficiency of NA and T/SC engines to identify varying technology adoption patterns as well as breakthrough engines over the past 10 years. The results indicate that T/SC engines are enlarging their dominance on the technology frontier and if current environmental and fuel economy regulations continue to be stiffer, a return to high displacement unblown engines is unlikely to happen without a major breakthrough in the NA technologies.

Facility Location and Supply Chain Network Design

Sponsor: Location Analysis

Sponsored Session

Chair: Kayse Lee Maass, Ph.D. Candidate, University of Michigan,
1205 Beal Ave., Ann Arbor, MI, 48109, United States of America,
leekayse@umich.edu

1 - Selective Newsvendor Problem with Quantity-dependent Leadtime and Marketing Decisions

Jianing Zhi, The University of Alabama, 300 Alston Hall, 361
Stadium Drive, Tuscaloosa, AL, 35487, United States of America,
jzhi@crimson.ua.edu, Burcu Keskin

We consider a selective newsvendor problem with limited sales force and quantity-dependent leadtime to maximize the expected profit for a company. We evaluate our models with demands, capabilities of agents, leadtime, and waiting time tolerance of customers to estimate their impacts on the profit, ordering policies, and marketing decisions.

2 - Constrained Connected Facility Location Problems

Maria Gisela Bardossy, Assistant Professor, University of
Baltimore, 1420 N. Charles Street, Merrick School of Business,
Baltimore, MD, 21201, United States of America,
mbardossy@ubalt.edu

We investigate and propose heuristics for two variants of the Connected Facility Location (ConFL) problem: degree constrained and hop constrained. The ConFL problem combines features of the uncapacitated facility location problem with the Steiner tree problem and is known to be NP-complete. However, in certain practical applications, the number of connections at the facility nodes and/or the connections between open facilities is limited, which we address in this presentation.

3 - A Supply Chain Network Design Problem Considering Market Cannibalization

Yanzi Zhang, Tsinghua University, Beijing, China,
zhzhang@mail.tsinghua.edu.cn

The paper studies a supply chain network design problem with cannibalization of new products sales by remanufactured products. Location, inventory, and pricing decisions are considered in a two-tier supply chain network. New and remanufactured products are supplied together with price-dependent demands. The cannibalization effect of them is considered. The problem is formulated as a nonlinear program. Managerial insights are explored by numerical experiments.

4 - Stochastic Inventory Modulated Capacitated Facility Location Models

Kayse Lee Maass, Ph.D. Candidate, University of Michigan,
1205 Beal Ave., Ann Arbor, MI, 48109, United States of America,
leekayse@umich.edu, Mark Daskin, Siqian Shen

We compare various approaches to modeling a stochastic capacitated facility location problem in which processing facilities are able to accept demands in excess of the capacity constraint for short periods of time. We show that the location and allocation decisions obtained from our models can result in significantly reduced costs when compared to models that do not account for the likelihood that demands may exceed capacity on some days.

Optimization for Wind Energy

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas,
Climate Change)

Sponsored Session

Chair: Zana Cranmer, University of Massachusetts, Amherst, MA,
acranmer@umass.edu

1 - Lagged Processes and Nested Decisions: Modeling for Renewables

Warren Powell, Faculty (Advisor), Princeton University, Sherrerd
Hall, Charlton Street, Princeton, NJ, 08540, United States of
America, powell@princeton.edu, Weidong Han, Genna Gliner,
Hugo Simao

The proper modeling of wind integration in an energy system requires modeling the lags between when decisions are made and when they are implemented, the evolution of forecasts (and forecast accuracy), as well as the nesting of decisions. We describe how to correctly model these problems, and contrast our approach with popular modeling and algorithmic strategies currently used in the study of wind integration. We describe how modeling inaccuracies can lead to errors in policy conclusions.

2 - Modeling Economic and Environmental Tradeoffs in Offshore Wind Development

Zana Cranmer, University of Massachusetts, Amherst, MA,
acranmer@umass.edu, Erin Baker

Using a portfolio model to capture interactions between siting choices, we can estimate the impact of different environmental policies on the economic value of the wind resources in an area. Policies include site restrictions, maximizing continuous space for ecosystems, and establishing set backs from hot spots.

3 - Optimizing Storage Technologies to Add Value to Wind Energy

Jessika Trancik, Massachusetts Institute of Technology,
Cambridge, MA, United States of America, trancik@mit.edu

Energy storage can increase the value of wind energy if costs are sufficiently low. Evaluating diverse storage technologies on a common scale has proven a challenge, however, due to their differing cost structures. Here we present a new conceptual and quantitative model for comparing storage technologies. Some storage technologies today are found to add value to wind energy in some locations, but cost reduction is needed to reach widespread profitability.

4 - Understanding How Generation Flexibility and Renewable Energy Affect Power Market Competition

Owen Wu, Indiana University, 1309 E. 10th Street, Bloomington,
IN, 47405, United States of America, owenwu@indiana.edu,
Xiuli Chao, Majid Algaiz

We study supply function competition among power generators with different levels of flexibility. We analyze how generators' (in)flexibility affects the equilibrium behavior and market price. We also investigate the impact of intermittent renewable energy on the equilibrium, focusing on the effects of renewable energy penetration level, dispatch priority, and the production-based subsidies. We find that the economic curtailment policy increases market competition and reduces price volatility.

Analytics in the Petrochemical and Petroleum Industries I

Sponsor: ENRE – Natural Resources II – Petrochemicals and
Petroleum

Sponsored Session

Chair: Margery Connor, Chevron, 6001 Bollinger Canyon, F-2080,
San Ramon, CA, 94583, MHCO@chevron.com

1 - Hydrocarbon Procurement with Take-or-Pay Contracts

Metin Cakanyildirim, Professor, University of Texas at Dallas,
800 W. Campbell Road SM30, Richardson, TX, United States of
America, metin@utdallas.edu, Koray Simsek, Cagri Haksoz

This paper studies a take-or-pay procurement contract for petrochemicals in the presence of spot market trading and storage capability in a dynamic setting. Main decisions are purchase and storage quantities and their relation with the take-or-pay penalty and net convenience yield. A computationally efficient formulation is sought and analyzed.

2 - Big Data in the Energy Industry

Margery Connor, Chevron, 6001 Bollinger Canyon, F-2080,
San Ramon, CA, 94583, MHCO@chevron.com

This presentation will discuss our internal efforts to build a big data platform. It will include a couple of use cases. It will also include challenges and lessons learned.

3 - Emerging Applications of Optimization in the Energy Industry

Haraldur Haraldsson, Aimmms Optimization Specialist, AIMMS,
500 108th Avenue NE, Ste. #1780, Suite 1780, Bellevue, WA,
98004, United States of America,
haraldur.haraldsson@aimms.com

With data analytics and optimization gathering focus in many organizations, there is an increased opportunity to leverage advanced analytics. We will share some examples on potential use of advanced analytics in the energy industry for future cases.

■ MA59

59-Room 110B, CC

Strategy, Innovation, and Entry

Cluster: Strategy Science

Invited Session

Chair: Hart Posen, University of Wisconsin, 4263 Grainger Hall, 975
University Avenue, Madison, WI, 53705, United States of America,
hposen@bus.wisc.edu

**1 - Spinout Formation and Parent Firm Performance:
A Multi-industry Examination**

Seth Carnahan, University of Michigan, 701 Tappan St., R4460
Ross School of Business, Ann Arbor, MI, 48104, United States of
America, scarnaha@umich.edu, Benjamin Campbell,
Rajshree Agarwal

Some scholars find an increase in firm performance when former employees create startup organizations ("spinouts"), while others find a decrease. We articulate the competing mechanisms that underlie these positive and negative results, and we argue that conflicting findings are driven largely by industry differences. We utilize a multi-industry sample based on US Census microdata that allows us to identify and test the competing mechanisms.

**2 - Spinout Formation: Do Opportunities and Constraints Benefit
High Human Capital Founders?**

Natarajan Balasubramanian, Syracuse University, 721 University
Ave, Syracuse, NY, United States of America, nabalasu@syr.edu,
Mariko Sakakibara

Using a large sample of individuals who formed spinouts and their co-workers who did not, we show industry contexts affect the relative advantage of high human capital founders. We find that such individuals are less likely to form spinouts in capital-intensive and R&D-intensive industries. This suggests that in capital intensive industries, high human capital founders face greater constraints while R&D intensive industries offer opportunities for both high and low human capital founders.

3 - Entrepreneurial Joiners

Michael Roach, Cornell University, Dyson School, Ithaca, NY,
14853, United States of America, michael.roach@cornell.edu,
Henry Sauermann

Startups rely not only on founders, but also on "joiners"—individuals attracted to entrepreneurship as an employee rather than a founder. We find that individuals with joiner interests share preferences for entrepreneurial job attributes often considered unique to founders, but differ with respect to contextual factors. This study reveals that preferences and context interrelate in unique ways to shape entrepreneurial interests and highlights joiners as a distinct type of entrepreneurial actor.

**4 - (how) Do Individual Characteristics Influence Resource Allocation
and Competitive Advantage?**

Michael Leiblein, Ohio State University, Fisher College of
Business, Columbus, OH, 43220, United States of America,
leiblein.1@osu.edu, Barclay Burns, Sheen Levine

A fundamental issue in the field of strategic management regards the identification of sources of competitive advantage. Why do firms differ and how do managers influence firm behavior? If individuals matter and theories of competitive advantage are correct, then unique individuals should differ in their resource allocation decisions and outcomes. This proposal promises to report emerging evidence associating individual characteristics, resource allocation decisions, and competitive advantage.

United States of America, tagrossman@usfca.edu

1 - Teaching Modeling to Business Students

Wendy Roth, Assistant Professor, Georgia State University,
6230 Forest Park Dr, Signal Mountain, TN, 37377,
United States of America, wroth@gsu.edu

Due to the popularity of business analytics, interest in business modeling classes appears to be increasing. When considering the student skill level as compared to a few years ago, this has resulted in a broader variety of student backgrounds, not necessarily self-selected based on a strong math background. This session will discuss some of those differences and modifications made to the classroom to help address these differences.

2 - Teaching Distribution Planning: A PBL Approach

Alex Grasas, Associate Professor, EADA Business School, Arago
204, Barcelona, Spain, agrasas@eada.edu, Helena Ramalhinho

This work presents a problem-based learning (PBL) activity that uses a decision support system (DSS) to teach one of the most fundamental topics in distribution planning: vehicle routing. This pedagogical activity, employed in a logistics and supply chain management course, also seeks to create awareness among students on the importance of DSS for complex problems. The paper is written as a teaching guide for other instructors, detailing how the activity may be carried out in class.

**3 - Spreadsheet Engineering: The Foundation for OR/MS
Applications by Business Students**

Vijay Mehrotra, Professor, University of San Francisco, School of
Management, 101 Howard St., Suite 500, San Francisco, CA,
94105, United States of America, vmehrotra@usfca.edu,
Thomas Grossman, Mouwafac Sidaoui

To access the power of OR/MS on non-trivial models, business students must first learn to apply software engineering principles to develop high quality spreadsheets. We have developed a methodology for teaching this skill to business students, many of whom have little or no relevant technical experience prior to our course. This talk describes how we successfully teach business students to build complex spreadsheet models that then serve as the foundation for OR/MS applications.

Transmission and Generation Expansion Planning

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Enzo Sauma, Pontificia Universidad Catolica de Chile, Santiago,
Chile, esauma@ing.puc.cl

**1 - Risk-averse Transmission and Generation Planning:
A WECC Case Study**

Harry Van Der Weijde, University of Edinburgh, The King's
Buildings, Mayfield Road, Edinburgh, EH9 3JL, United Kingdom,
h.vanderweijde@ed.ac.uk, Francisco Munoz, Benjamin Hobbs,
Jean-paul Watson

We investigate the effects of risk aversion on optimal transmission and generation expansion planning. To do so, we formulate a stochastic model in which transmission and generation planners minimize a weighted average of expected costs and their conditional values at risk. This model is then applied to a 240-bus representation of the Western Electricity Coordinating Council, in which we examine the impact of risk aversion on levels and spatial patterns of investment, costs, and prices.

2 - Robust Transmission Expansion Planning

Antonio Conejo, Prof., The Ohio State University, 286 Baker
Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210,
United States of America, conejonavarro.1@osu.edu

This presentation discusses a number of critical issues to successfully design and implement transmission expansion planning algorithms using an adaptive robust optimization approach. These issues include formulation format, selection of robust sets, sensitivity analysis, and out-of-sample simulation.

3 - The Economic Effects of Interregional Trading of Renewable Energy Certificates in the WECC

Francisco Munoz, Assistant Professor, Universidad Adolfo Ibañez, Diagonal Las Torres 2640, Santiago, Chile, elpanchomunoz@gmail.com, Benjamin Hobbs, Andres Perez, Enzo Sauma

In the U.S., individual states enact RPSs for renewable electricity production with little coordination. Using a co-optimization (transmission and generation) planning model, we quantify the long run economic benefits of allowing flexibility in the trading of Renewable Energy Credits (RECs) among the U.S. states that belong to the WECC. We find that up to 90% of the economic benefits are captured if approximately 25% of unbundled RECs are allowed to be acquired from out of state.

4 - Reliable Transmission Expansion Planning for Large Renewable Energy Penetration

David Pozo, PUC, Ave. Vicuna MAckenna 4860, Santiago, Chile, davidpozocamara@gmail.com, Alexandre Moreira, Alexandre Street, Enzo Sauma

We presents a novel approach to jointly address transmission network and renewable capacity expansion planning dealing with renewables variability under multiple n - K security criteria. An adjustable robust optimization approach is presented to circumvent the tractability issues associated with conventional contingency-constrained methods relying on explicitly modeling the whole contingency set and renewables generation scenarios. The adjustable robust model is formulated as a trilevel problem.

OR Models for Ocean and River Energy

Sponsor: ENRE – Environment I – Environment and Sustainability

Sponsored Session

Chair: Alberto Lamadrid, Assistant Professor, Lehigh University, 27 Memorial Drive, Bethlehem, PA, 18015, United States of America, ajlamadrid@lehigh.edu

Co-Chair: Larry Snyder, Associate Professor, Lehigh University, 200 West Packer Ave., Mohler Lab, Bethlehem, PA, 18015, United States of America, larry.snyder@lehigh.edu

1 - Portfolio Assessment of Run-of-River Hydrokinetic Power Generation

Seth Blumsack, Associate Professor, Pennsylvania State University, 153 Hosler Building, University Park, PA, 16802, United States of America, sethb@psu.edu, Mehdi Shahriari, Frank Liu, Ben Hodges

Spatially distributed run-of-river hydrokinetic power generation resources are a portfolio of assets whose value varies with prices and output. We quantify the locational contribution of hydrokinetic generation to the value of a spatial portfolio and derive a variance decomposition indicating how variance in portfolio value depends on variance in output, prices and spatial co-fluctuations. Individual sites have nearly uniform value contributions over fast time scales, but not longer time scales.

2 - Towards a Holistic Modeling of River Networks

Radu Marculescu, Professor Of Electrical And Computer Engineering, Carnegie Mellon University, Dept. of ECE, Pittsburgh, PA, 15213, United States of America, radum@cmu.edu, Diana Marculescu, Paul Bogdan

River dynamics are dependent on both terrain and environmental conditions. While AR-based models can be sufficiently accurate for forecasting river dynamics, we show that spatio-temporal variability can only be uncovered through a multi-fractal spectrum formalism. Moreover, a network-based model of cloud movement can estimate precipitation levels, thereby providing a first step towards modeling the complete hydrological cycle and developing control methods for run-of-river power projects.

3 - Hydro-structural Design Optimization for Marine Hydrokinetic Turbines

Ashwin Vinod, Graduate Student, Lehigh University, 19 Memorial Drive West, Mechanical Engineering & Mechanics, Bethlehem, PA, 18015, United States of America, asv312@lehigh.edu, Arindam Banerjee

An optimization methodology for a fixed pitch horizontal axis hydrokinetic turbine will be presented using a combination of a coupled hydro-structural analysis and genetic algorithm based optimization. Preliminary hydro-structural analysis indicates low hydrodynamic performance and high flap-wise bending stresses developed in turbine blades. A multi-objective optimization methodology is used to design a variable chord, twisted blade turbine which yielded improved hydro-structural performance.

Daniel H. Wagner Prize Competition I

Cluster: Daniel H. Wagner Prize Competition

Invited Session

Chair: Allen Butler, President & CEO, Daniel H. Wagner Associates, Inc. 2 Eaton Street, Hampton, VA 23669, United States of America, Allen.Butler@va.wagner.com

1 - Using Analytics to Enhance Shelf Space Management in a Food Retailer

Teresa Bianchi-Aguar, University of Porto and LTPlabs, INESC TEC & Faculty of Engineering, Portugal, mtbaguiar@fe.up.pt, Elsa Silva, Luis Guimarães, Maria Antónia Carravilla, José F. Oliveira, Jorge Liz, João Gönther Amaral, Sérgio Lapela

This talk describes a collaboration with the leading Portuguese food retailer, addressing the allocation of products to shelves. The result is GAP, a DSS that is today used on a daily basis. GAP has a modular structure and systematically applies tailor-made mathematical programming models combined with heuristics. It is able to incorporate different merchandising rules, allowing the company to test several product allocation strategies with a trade-off between customization and optimization.

2 - Strategic Re-design of Urban Mail and Parcel Networks at La Poste

Stefan Spinler, Professor, WHU-Otto Beisheim School of Management, Burgplatz 2, Vallendar, 56179, Germany, stefan.spinler@whu.edu, Alain Roset, Matthias Winkenbach

We devise a decision model that allows La Poste, the French postal operator, to assess the benefits of merging the urban mail and parcel delivery networks which used to be run as separate entities. Based on data from the French city of Nantes, we find that merging the mail and parcel delivery yields cost benefits of around 31% which prove to be robust under various scenarios tested. These findings corroborated management's expectation of cost savings and entailed a new organizational structure.

Joint Session DAS/HAS: Dependencies in Pharmaceutical Portfolio Management: Challenges and Pragmatic Approaches

Sponsor: Decision Analysis

Sponsored Session

Chair: Chris Dalton, Syncopation Software, 6 State Street, Suite 308, Bangor, ME, 04401, United States of America, cdalton@syncopation.com

1 - Assessing Technical Risk Dependencies in Pharmaceutical Drug Development

Elayne Ko, Pfizer, 500 Arcola Road, Collegeville, PA, 19426, United States of America, Elayne.Ko@pfizer.com

The presentation explores the process and framework of evaluating pharmaceutical R&D investment projects with technical risk dependencies. This occurs when either 1) compounds in the portfolio share the same mechanism of action or 2) a compound is being developed for more than one indication. Assuming probability independence and simply aggregating individual compound evaluations into portfolio view would not adequately reflect the risks of the compounds.

2 - Play the Portfolio Game

Chris Dalton, Syncopation Software, 6 State Street, Suite 308, Bangor, ME, 04401, United States of America, cdalton@syncopation.com, Phil Beccue, Elayne Ko

This segment will feature an interactive portfolio management exercise designed to foreshadow and highlight the central concepts of the talks that follow. Participants will work in small groups, selecting the best portfolio they can from a pool of risky projects. Uncertainties will be resolved throughout the session, so that a final portfolio value can be calculated. There will be prizes for the winning team.

3 - Global Uncertainties in Pharma R&D Portfolio Management

Chris Dalton, Syncopation Software, 6 State Street,
Suite 308, Bangor, ME, 04401, United States of America,
cdalton@syncopation.com

R&D portfolio management in pharma tends to be focused on individual project risk factors, technical and commercial. Global risk factors affecting many projects are usually ignored, on the theory that while they may change the value of the portfolio they are unlikely to alter the project ranking. The possibility of far reaching changes in government policy suggests that this assumption should be tested. This talk examines the impact of some potential policy changes on a notional portfolio.

4 - Manufacturing Investments in Pharmaceutical R&D: Should I Pull the Trigger?

Phil Beccue, White Deer Partners, Westlake Village, CA,
United States of America, phil@beccue.com

Capital investments to manufacture biopharmaceuticals require long lead times and large expenditures that require board approval. These facilities produce multiple products in highly competitive markets with uncertain demand, and if not planned carefully, can result in a loss of economic value or inefficient allocation of scarce resources. Based on recent case studies, we will explore how decision analytics helps guide manufacturing choices.

■ MA65

65-Room 113B, CC

From Value of Information to Sensitivity Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Emanuele Borgonovo, Professor, Bocconi University, Via Roentgen 1, Milan, 20136, Italy, emanuele.borgonovo@unibocconi.it

1 - Importance Measures and Value of Information

Alessandra Cillo, Assistant Professor, Bocconi University,
Via Roentgen 1, Milan, Italy, alessandra.cillo@unibocconi.it,
Emanuele Borgonovo

The importance measures are sensitivity indices. Despite their wide use, no work has systematically addressed the relationships among them. We provide new probabilistic relationships that link each measure to the remaining ones. These new relationships also allow us to introduce new importance measures, value of information based. We compare an importance measure and the value of information-based measure, which depends upon the same measure: interesting differences emerge.

2 - Integral Sensitivity in Linear Programming

Richard Wendell, Professor, University of Pittsburgh, Katz
Graduate School of Business, Pittsburgh, PA, 15238, United States
of America, wendell@katz.pitt.edu, Emanuele Borgonovo,
Greg Buzzard

Herein we provide a general framework merging two well known sensitivity analysis approaches, namely, the tolerance sensitivity and global sensitivity approaches. This unification leads to a series of novel results, ranging from analytical formulae for computing global sensitivity measures to conditions ensuring that uncertainty in the parameters is immaterial. Moreover, the results provide the basis for a numerical approach for assessing key problem drivers and determining tolerance regions.

3 - Robust Importance Measures

Emanuele Borgonovo, Professor, Bocconi University,
Via Roentgen 1, Milan, 20136, Italy,
emanuele.borgonovo@unibocconi.it

Importance measures are probabilistic indicators that deliver information about key risk drivers. They are defined for aleatory uncertainty. We show that, relying on their probabilistic meaning, one can obtain a natural extension of importance measures also when probabilities are not known.

Air Traffic Management and Airline Operations

Sponsor: Aviation Applications

Sponsored Session

Chair: Peng Wei, Assistant Professor, Iowa State University, Aerospace Engineering Department, 2312 Howe Hall, Ames, IA, 50011, United States of America, pwei@iastate.edu

1 - Modeling Airport Operations for Capacity Planning by Airport Planners and Individual Carriers

L. Douglas Smith, University of Missouri-St. Louis, St. Louis, MO,
United States of America, ldsmith@umsl.edu, Jan Fabian Ehmke,
Deng Pan, Liang (leon) Xu, Ziyi Wang

We discuss a blend of statistical modelling, LP optimization and discrete-event simulation that was used in the construction, calibration, validation and application of a model for capacity planning at commercial airports. With results from simulated scenarios, we examine the effects of changing usage of runways, taxiways, ramps and gates under different traffic conditions. We also see how concentration of activity at hub airports can cause flight delays to cascade for individual carriers.

2 - Real-time Gate Assignment

Diego Klabjan, Northwestern University, Evanston, IL 60208,
United States of America, Professor, d-klabjan@northwestern.edu

Due to unpredictable events airlines have to frequently adjust gate assignments. We propose a network flow model that also considers crew and passenger connections. A thorough computational study is presented based on data from a big US airport.

3 - An Alternative Approach to Capacity Allocation at Congested Airports

Amedeo Odoni, Professor, MIT, Room 33-219, MIT,
77 Mass Ave, Cambridge, MA, 02139, United States of America,
arodoni@mit.edu, Alexandre Jacquillat

Current slot allocation at congested airports worldwide is based on long-standing guidelines developed by IATA. An alternative approach, developed after extensive research, will be outlined: it is more responsive to airline preferences, integrates airport operating capabilities, minimizes interference with airline competitive scheduling and is based on achieving user-specified performance goals, instead of being solely driven by arbitrary and administratively-determined capacity constraints.

4 - Airline Passenger Origin-Destination Reaccommodation with Spare Aircraft

Peng Wei, Assistant Professor, Iowa State University, Aerospace Engineering Department, 2312 Howe Hall, Ames, IA, 50011, United States of America, pwei@iastate.edu

The researchers at Amadeus have presented a method to formulate airline passenger origin-destination reaccommodation into a multi-commodity flow problem, for which they also designed the solution algorithm. In this paper we consider the Airline Passenger Origin-destination Reaccommodation with Spare Aircraft, which no one has tackled before.

City Logistics and Sustainable Urban Freight Systems - II

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Johanna Amaya, Rensselaer Polytechnic Institute, 110 8th St. JEC 4037, Troy, NY, 12180, United States of America, amayaj@rpi.edu

1 - Public Sector Initiatives Sustainable Urban Freight Systems Part I

Johanna Amaya, Rensselaer Polytechnic Institute, 110 8th St.
JEC 4037, Troy, NY, 12180, United States of America,
amayaj@rpi.edu, Jose Holguin-Veras,
Carlos A. Gonzalez-Calderon, Stacey Hodge, Michael Browne,
Miguel Jaller, Jeffrey Wojtowicz, Cara (xiaokun) Wang,
Daniel Haake, Ivan Sanchez-Diaz

Transportation policy should ensure freight is moved efficiently as it is a physical manifestation of the economy. In this study, planners are provided with guidelines to implement initiatives addressing freight issues. Initiatives were organized as part of a continuum, from supply to demand side; underpinned by stakeholder engagement. This paper discusses pricing, incentives, taxation; logistical management; and freight demand/land use, along with a methodology to identify potential initiatives

2 - Quantifying the Impacts of City Logistics Strategies in the Mexico City Metropolitan Area

Miguel Jaller, Assistant Professor, University of California, Davis,
One Shields Ave, Ghausi Hall, 3143, Davis, CA, 95616, United
States of America, mjaller@ucdavis.edu, Sergio Sanchez,
Joanne Green

This paper discusses the assessment of the potential impacts of city logistics strategies proposed for the Metropolitan Area of the Mexico City Valley: off-hour delivery programs; cargo consolidation to decrease empty trips; and preferential truck routes. The analyses consider the impacts on travel distances, travel times, accidents, emissions and health impacts under various scenarios. The paper discusses the proposed strategies, the methodology, information and the assumptions adopted.

3 - Factors Influencing the Performance of Urban Consolidation Schemes

Sonke Behrends, Chalmers University of Technology, Technology
Management and Economics, Logistics and Transportation,
Gothenburg, Sweden, sonke.behrends@chalmers.se

Many urban consolidation centers (UCC) have struggled to operate on a commercial basis and are either terminated or depend on government subsidies. Hence there is a general scepticism about their commercial viability among practitioners. This paper contributes to a better understanding under which preconditions UCCs can be feasible. This paper quantifies a UCCs impact on the key stakeholders in urban logistics and analyses the relevance of several factors for the UCC performance.

4 - Land Use Patterns, Logistics, and Emissions

Erica Wygonik, RSG, 55 Railroad Row #101,
White River Junction, VT, 05001, United States of America,
ewygonik@gmail.com, Nathan Mayes, Anne Goodchild

This work compares and contrasts two approaches to quantifying the relationships between landuse, logistics, and emissions. These two approaches are used to consider of a variety of delivery strategies, including personal travel to stores and delivery services on cost, CO2 emissions, as well as criteria pollutants. Conclusions can be drawn as to the most efficient distribution strategies under different urban forms.

5 - Economic and Environmental Comparison of Different Order Scheduling Policies

Dincer Konur, Assistant Professor, Missouri University of Science
and Technology, 206 EM 600 W. 14th St., Rolla, MO, 65409,
United States of America, konurd@mst.edu, James Campbell

This study analyzes a continuous review inventory model with multiple carriers under carbon trading regulation. We analyze and compare the optimal carrier selection and order splitting decisions with single sourcing and two alternative delivery schedules for multi-sourcing, namely, sequential ordering and sequential delivery. For each of the three order scheduling policies, a solution method is proposed and these policies are compared in terms of both economic and environmental performance.

Electric Vehicles II

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: M. Hadi Amini, PhD Fellow, Carnegie Mellon University,
5700 Centre Ave, Apt 317, Pittsburgh, PA, 15206,
United States of America, amini@cmu.edu

1 - Routing Aspects of Electric Vehicle Users and Their Effects on Network Performance

Shubham Agrawal, Purdue University, West Lafayette, IN 47906,
United States of America, shubham@purdue.edu, Amit Kumar,
Srinivas Peeta, Hong Zheng

This study investigates the dynamic equilibrium for mixed traffic involving Battery Electric Vehicles (BEVs) and Internal Combustion Engine Vehicles (ICEVs). The BEVs' routing behavior with preference to minimize battery consumption and reduce range anxiety is modeled and analyzed. Due to the energy efficiency considerations in route selection for BEVs, the network performance in terms of total travel time is analyzed under different market penetrations of BEVs.

2 - A Continuum Approximation Model for Electric Vehicle Sharing

Xiaopeng Li, University of South Florida, Department of Civil and
Environmental Engineering, 4202 E. Fowler Avenue, Tampa, FL,
33620, United States of America, xiaopengli@usf.edu,
Jiaqi Ma, Jianxun Cui, Fang Zhou, Amir Ghiasi

This paper proposes a Continuum Approximation (CA) model for design of a one-way Electrical Vehicle (EV) sharing system that serves a metropolitan area. This

model determines the optimal EV sharing station locations and the corresponding EV fleet sizes to minimize the comprehensive system cost (including station construction investment, vehicle maintenance, transportation, and vehicle balancing) under stochastic and dynamic trip demands.

3 - Modeling Network Equilibrium with Mixed Flows of Electric and Gasoline Vehicles

Xiaozheng He, Research Associate, Purdue University,
Nexttrans Center, 3000 Kent Avenue, West Lafayette, IN, 47906,
United States of America, seanhe@purdue.edu, Srinivas Peeta,
Hong Zheng

This study develops a variational inequality formulation for the network equilibrium of mixed traffic flows consisting of electric and gasoline vehicles, where energy consumption is modeled as a function of traffic flow and considered in the drivers perceived travel cost. Numerical examples illustrate the impact of energy prices on network equilibrium and provide insights for policy-making to promote the usage of electric vehicles.

4 - On the Effect of Electric Vehicle Parking Lots' as Dispatchable Loads on the Power System Loss

M. Hadi Amini, PhD Fellow, Carnegie Mellon University, 5700
Centre Ave, Apt. 317, Pittsburgh, PA, 15206, United States of
America, amini@cmu.edu, Marija D. Ilic, Orkun Karabasoglu

We investigate the effect of parking lots characteristics (charging rate, capacity in terms of number of EVs, and location in the power network) on the network's hourly loss and daily energy loss. Parking lots are modeled as EV demand aggregators. To this end, we define four scenarios to determine the effect of charging rate and distribution of EVs over the network on the system loss. We also evaluate the effect of EV parking lot's location on the system loss.

69-Room 201C, CC

Facility Logistics III

Sponsor: TSL/Facility Logistics

Sponsored Session

Chair: Pratik Parikh, Associate Professor, Wright State University,
207 Russ, 3640 Col Glenn Hwy, Dayton, OH, 45435,
United States of America, pratik.parikh@wright.edu

1 - Multiple-shelf Space Optimization in Automated Dispensing Cabinets

Nazanin Esmaili, PhD Candidate, University of Pittsburgh,
1048 Benedum Hall, Pittsburgh, PA, United States of America,
nae22@pitt.edu, Bryan Norman, Jayant Rajgopal

We propose a novel MIP approach for stocking Automated Dispensing Cabinets (ADCs) in a hospital so as to maximize savings in expected staff effort required to retrieve out-of-stock items from central storage. We investigate both position-free and grid-based position paradigms to allocate shelf space optimally under constraints designed to reduce selection errors. We also develop model enhancements to facilitate solving large real-world instances, and investigate the robustness of the results.

2 - Consideration of Product Exposure in Retail Design

Corinne Mowrey, Wright State University, 3640 Colonel Glenn
Hwy., Dayton, OH, 45435, United States of America,
mowrey.4@wright.edu, Pratik Parikh, Kevin R. Gue

We discuss an approach to quantify exposure, what the customer sees; an important aspect of retail design. We consider that some locations are exposed to shoppers more frequently than others, referred to as the intensity of exposure, and explore how intensity changes with rack orientation. Accounting for bi-directional traffic flow, we explore the effect rack orientation has on exposure and investigate how optimal rack orientation for a pathway changes when the amount of directional flow varies.

3 - Covering and Connectivity Constraints in Designing a Loop Flow Pattern

Ardavan Asef Vaziri, Professor, California State University,
Northridge, 18111 Nordhoff Street, Northridge, CA, 91330-8245,
United States of America, ardavan.asef-vaziri@csun.edu,
Gilbert Laporte

The shortest loop covering the workcenters in a facility layout is an instance of the generalized traveling salesman problem. The optimal solution to this problem is a promising design for most types of conveyors and power-and-free systems where the length of the loop is the main driver of the total costs. This design further provides a promising solution to minimize the total loaded and empty flow in systems such as automatic guided vehicles. Our formulation is in the favor of this requirement.

4 - A Network Design Model for Dual-channel Commerce with Uncertain Demand

Guoqing Zhang, Professor, University of Windsor,
401 Sunset, Windsor, ON, Canada, gzhang@uwindsor.ca

We study the supply network problem with dual-channel, where a manufacturer or a retailer sells their products from both direct channel and traditional retail channel. An optimization model is established to examine central and local distribution/fulfilling center strategies, and determine inventory levels at each location and market allocation with taking into account uncertain demands from both channels.

Rail Safety and Risk Analysis

Sponsor: Railway Applications

Sponsored Session

Chair: Xiang Liu, Assistant Professor, Rutgers University, CoRE 606,
96 Frelinghuysen Road, Piscataway, NJ, 08854-8018,
United States of America, xiang.liu@rutgers.edu

1 - Using Text Mining and Data Visualization to Analyze Railroad Grade Crossing Accidents

Trefor Williams, Professor of Civil Engineering, Rutgers
University, 96 Frelinghuysen Rd, Piscataway, NJ, 08540,
United States of America, tpw@rci.rutgers.edu, John Betak

This paper will discuss how probabilistic topic modeling, clustering, text visualization and data visualization have been used to study the nature of accidents that occur at grade crossing. The data analyzed were from the Federal Railroad Administration grade crossing accident database. The paper will illustrate how trucks, particularly tractor-trailer trucks have been identified as a major cause of highway-railroad accidents from analysis of the text fields of grade crossing accident reports.

2 - Comparative Train Accident Analysis for Class I U.S. Freight Railroads

Zhao Wang, Graduate Research Assistant, University of Illinois at
Urbana-Champaign, 205 N. Mathews Ave., B-118 Newmark
Engineering Laboratory, MC, Urbana, IL, 61801, United States of
America, zwangl144@illinois.edu, Christopher Barkan,
Mohd Rapik Saat

This paper studies the U.S. Class I freight train accident rates between 2004 and 2013. By utilizing train accident data and statistical theories, the investigation compares and contrasts train accident rates, trends, accident cause distributions, and accident severity between two time periods. The decreasing trend in accident rate and the changing trend in accident cause distributions are analyzed.

3 - Fault Tree Analysis of Train Accidents on Shared-use Rail Corridor

Chen-Yu Lin, Graduate Research Assistant, University of Illinois
at Urbana-Champaign, 205 N. Mathews Ave., Urbana, IL, 61801,
United States of America, clin69@illinois.edu, Mohd Rapik Saat,
Christopher Barkan

Safety issues regarding shared-use rail corridors are emerging due to the introduction of faster and more frequent passenger trains. In this research, a general risk framework is presented for shared-use rail corridors. A standard risk management procedure is implemented to identify potential hazards and evaluate the risk associated with them. Fault tree analysis is performed to hazards with higher level of risk. An example fault tree for a specific hazard, adjacent track accident, is presented.

4 - Risk-based Rail Inspection and Repair

Xiang Liu, Assistant Professor, Rutgers University, CoRE 606,
96 Frelinghuysen Road, Piscataway, NJ, 08854-8018,
United States of America, xiang.liu@rutgers.edu

Broken rails are the leading causes of freight-train derailments in the United States. Each year, the railroad industry spends millions of dollars on rail inspection and repair. This research develops a simulation-based risk analysis model to optimize ultrasonic rail inspection and repair strategies.

jeeeunka@buffalo.edu

1 - Locating Battery Exchange Facilities on Lines and Trees

Pitu Mirchandani, Arizona State University, Tucson, AZ,
United States of America, pitu@asu.edu, Yazhu Song

We introduce a new location problem for battery exchange facilities (BEF) for Electric Vehicles. First we study the problem of location feasibility on lines. Given feasibility, the location problem becomes “where should BEFs be located to minimize a charge-related objective”. e.g., the objective of minimizing the maximum distance between BEFs minimizes the anxiety of the drivers. Scenarios include single OD pair, multiple OD pairs, round trips, etc. Extensions to tree networks is discussed.

2 - Design for EV Market Systems

Namwoo Kang, Research Fellow, University of Michigan, 2350
Hayward Street, Ann Arbor, MI, 48109, United States of America,
nwkang@umich.edu, Panos Papalambros, Fred Feinberg

Electric Vehicle (EV) market systems are generally run by three key players: EV manufacturers, charging station operators, and government. This study presents a decision-making framework for the players to maximize profits and greenhouse gas reductions by quantitative modeling and linking of consumer demand prediction (marketing), charging station siting (operations), EV powertrain design (engineering), and investment allocations (public policy). Several scenarios and case studies are examined.

3 - Optimal Deployment of Charging Lanes in Transportation Networks

Zhibin Chen, University of Florida, 365 Weil Hall, Gainesville,
United States of America, yafeng@ce.ufl.edu, Fang He,
Yafeng Yin

This paper attempts to develop a mathematical model to optimally deploy in a large-scale highway network charging lanes that charge electric vehicles while they are on the move. We first describe network flow equilibrium conditions under a particular deployment plan of charging lanes, and then formulate the design of charging lanes as a mathematical program with equilibrium constraints.

4 - Modeling Intra-household Interactions for the Use of Battery Electric Vehicles

Yashar Khayati, Graduate Research Assistant, State University of
New York at Buffalo, 327 Bell Hall, Buffalo, NY, 14226, United
States of America, yasharkh@buffalo.edu, Jee Eun Kang

This study assesses the potential use of Battery Electric Vehicles in place of conventional Internal Combustion Engine Vehicles at household level. A sequential activity allocation and insertion heuristic is developed to implement on HAPPEV. The results show that if BEVs would be used at household level the travel disutility of households can be decreased about \$42 per day in average. In comparison, if a BEV is used to do exact same activity pattern the average saving for the day is only \$7.

ebyon@umich.edu

1 - 2015 QSR Best Student Paper Award

Eunshin Byon, Assistant Professor, University of Michigan, 1205
Beal Avenue, Ann Arbor, MI, 48109, United States of America,
ebyon@umich.edu

Best Student Paper Award recognizes excellence among QSR student members. Four finalists for the Best Student Paper Award will make presentations. The winner will be announced at the QSR business meeting during the conference.

2 - Real-time Monitoring for Additive Manufacturing using Online Sparse Estimation Based Classification

Kaveh Bastani, Research Assistant, Virginia Tech University,
106 Durham Hall (MC 0118) 1145 Perry Str, Blacksburg, VA,
United States of America, kaveh@vt.edu, Zhenyu Kong

The objective of this work is to realize real-time monitoring of additive manufacturing processes using multiple sensor signals. To achieve this objective, an approach invoking the concept of sparse estimation called online sparse estimation-based classification (OSEC) is proposed. The OSEC approach is equipped with a novel computationally fast sparse estimation algorithm to facilitate real-time monitoring applications.

3 - Diagnostic Monitoring of Multivariate Process via a LASSO-BN Formulation

Yan Jin, University of Washington, 530 NE 103rd St, Seattle, WA,
98125, United States of America, yanjin@uw.edu,
Guan Wang, Shuai Huang, Houtao Deng

Fault detection and root-cause diagnosis are usually considered as two separate tasks in most existing process monitoring methods. While they could reinforce each other, we propose a diagnostic monitoring approach that unifies monitoring and root-cause diagnosis by integrating process monitoring, Bayesian network, and sparse learning.

4 - Multi-stage Nanocrystal Growth Identifying and Modeling via In-situ TEM Video

YanJun Qian, PhD Candidate, TAMU, 1501 Harvey Rd,
Apt 806, College Station, TX, 77840, United States of America,
qianyanjun09@gmail.com

While in-situ transmission electron microscopy technique has caught a lot of recent attention, one of the bottlenecks appears to be the lack of automated and quantitative analytic tools. We introduce an automated tool suitable for analyzing the in-situ TEM videos. It learns and tracks the normalized particle size distribution and identifies the phase change points delineating the stages in nanocrystal growth. We furthermore produce a quantitative physical-based model.

5 - Rul Prediction Based on Noisy Condition Monitoring Signals using Constrained Kalman Filter

Junbo Son, PhD Candidate, University of Wisconsin-Madison,
1513 University Avenue, Madison, WI, 53706, United States of
America, json5@wisc.edu, Shiyu Zhou, Chaitanya Sankavaram,
Yilu Zhang, Xinyu Du

In this paper, a robust statistical prognostic method is proposed to predict the remaining useful life of individual units based on condition monitoring signals that are contaminated by severe noises. The proposed method defines a set of inequality constraints so that satisfactory prediction accuracy can be achieved regardless of the noise level. The advantageous features of the proposed method is demonstrated by both numerical studies and a case study with real world automotive battery data.

1 - N-k Power Problem in the Power Systems: A Budget Allocation Perspective

Loo Hay Lee, National University of Singapore,
Department of Industrial & Systems, Engineering, Singapore,
iseleelh@nus.edu.sg, Chun-hung Chen, Ek Peng Chew,
Giulia Pedrielli, Haobin Li, John Shortle, Yue Liu

In the stochastic N-k power network problem, N choose k failures result in a probability of the entire system to fail (unsafe system). We want to determine if the system is unsafe, when failures are estimated through noisy simulations, by optimal computing budget allocation. The solution method is based on the likelihood of the system to be safe (unsafe), whose estimation is sequentially improved to be given as input to a tailored budget allocation that also considers the observed system state.

2 - Integrating OCBA and GA to Find the Approximate Pareto Patient Flow Distribution

Jie Song, Peking University, Room 512, Fangzheng Building,
Beijing, China, songjie@coe.pku.edu.cn, Zekun Liu, Yunzhe Qiu

We develop a methodology to find the optimal macro-level patient flow distribution in terms of multi-dimension inputs and outputs for the hierarchical

healthcare system. The proposed method integrates the discrete event simulation, the multi-objective optimization, and the simulation budget allocation to comprehensively improve the overall system performances. A case study based on the real data is carried out to validate and implement the proposed method.

3 - Improving Response-Time Performance in Acute Care Delivery: A Systems Approach

Xiaolei Xie, Department of Industrial Engineering, Tsinghua
University, 614 Shunde Building, Tsinghua University, Beijing,
China, xxie@tsinghua.edu.cn, Colleen Swartz, Paul Depriest,
Jingshan Li

In response to a patient with acute physiological deterioration, we study the probability that an appropriate decision is made within a desired time period, referred to as response time performance (RTP). First, a closed formula to evaluate RTP is derived by assuming exponential response time, which is followed by bottleneck analysis. Then, under general case, an approximation approach is proposed to evaluate RTP. Finally, a case study is introduced to illustrate the applicability of the method.

4 - Spatiotemporal Differentiation of Myocardial Infarctions

Chen Kan, University of South Florida, 4202 E. Fowler Ave.
ENB118, Tampa, FL, United States of America,
chenkan@mail.usf.edu, Hui Yang

This paper presents a novel warping approach to quantify the dissimilarity of disease-altered patterns in 3-lead VCGs. The hypothesis testing shows that there are significant space-time differences between healthy and diseased subjects. Further, we optimize the embedding of each VCG as a feature vector in the high-dimensional space that preserves the dissimilarity distance matrix. Experimental results demonstrated that this novel approach improves the performance of predictive models.

Data Analytics for Quality Control and Improvement I

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Kaibo Liu, Assistant Professor, UW-Madison, 1513 University
Avenue, Madison, WI, 53706, United States of America,
kliu8@wisc.edu

1 - A Distribution Free Procedure for Fault Identification in High-Dimensional Processes

Mehmet Turkoz, Rutgers University, 16 Rachel Terrace,
Piscataway, NJ, 08854, United States of America,
turkoz@scarletmail.rutgers.edu, Sangahn Kim, Young-seon
Jeong, Myong K (MK) Jeong, Elsayed Elsayed, K.N. Al-khalifa,
Abdel Magid Hamouda

In a process with high-dimension, identifying which variables cause an out-of-control signal is a challenging issue for quality problems. Even though there are many procedures for fault identification, most of them assume the normal distribution. However, many real life problems come from multivariate non-normal distribution. We present a new fault identification method that does not assume any specific probability distribution.

2 - Broaching Process Modeling Based on Non-repeating Cyclic Signals

Meg Tian, Graduate Student, Virginia Tech, 250 Durham Hall,
Blacksburg, VA, 24060, United States of America,
tian0414@vt.edu, Jaime Camelio, Ran Jin, Lee Wells

Broaching is often used to produce complex contours by sequentially removing material via multiple cutting teeth. The broaching force signal exhibits a non-repeating cyclic pattern. A new approach is proposed to model the non-repeating cyclic signals and thus detect changes in a broaching process.

3 - Heterogeneous Recurrence T^2 Charts for Monitoring and Control of Nonlinear Dynamic Processes

Yun Chen, University of South Florida, 4202 E. Fowler Ave.
ENB118, Tampa, FL, United States of America,
yunchen@mail.usf.edu, Hui Yang

This paper presents a new approach of heterogeneous recurrence T^2 control chart for online monitoring and anomaly detection in nonlinear dynamic processes. An effective partition scheme is firstly developed to delineate local recurrence regions in the multi-dimensional continuous state space. Further, we designed a new fractal representation of state transitions among recurrence regions, and then develop new measures for on-line monitoring and predictive control of process recurrences.

4 - Optimize the Signal Quality of Health Index via Data Fusion for Degradation Modeling and Prognostics

Abdallah Chehade, UW-Madison, 1513 University Avenue,
Madison, WI, 53706, United States of America,
chehade@wisc.edu, Changyue Song, Kaibo Liu

In this talk, a new signal-to-noise ratio (SNR) metric that is tailored to the needs of degradation signals is proposed. By maximizing this new metric, we develop a data fusion model to construct a health index (HI) via fusion of multiple degradation-based sensor data. The case study was based on the degradation dataset of aircraft gas turbine engines, which will demonstrate the effectiveness of developed HI for better characterization and prediction of the health condition of units.

New Research Topics on Innovation

Cluster: New Product Development

Invited Session

Chair: Manuel Sosa, Associate Professor of Technology and Operations Management, INSEAD, 1 Ayer Rajah Ave., Singapore, Singapore, manuel.sosa@insead.edu

1 - Technology Readiness Levels at 40: A Study of State-of-the-art Use, Challenges, and Opportunities

Alison Olechowski, MIT, School of Engineering, Cambridge,
United States of America, alisono@mit.edu, Steven Eppinger,
Nitin Joglekar

Since their introduction by NASA in the 1970s, the Technology Readiness Levels (TRLs) have become a widely used scale for assessing technology maturity during new product and system development. We empirically investigate current TRL usage in a cross-industry study, identifying challenges related to TRL implementation and use in technology-related decision-making. Some challenges are already addressed by uncommon best practices however others are opportunities for new methods and models.

2 - Idea Generation and the Role of Feedback

Joel Wooten, University of South Carolina, Columbia, SC 29208,
United States of America, joel.wooten@moore.sc.edu, Karl Ulrich

In many innovation settings, ideas are generated over time and managers face a decision about if and how to provide in-process feedback about the quality of submissions. We use innovation tournament field experiments to examine the effect of feedback on idea generation and show individual-level differences between no feedback, random feedback, and directed feedback.

3 - Sole Inventor vs Team of Inventors: What's Best?

Tian Chan, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676,
Singapore, TianHeong.Chan@insead.edu,
Jurgen Mihm, Manuel Sosa

History has often attributed sole individuals as the source of innovative breakthroughs. However, recent research has shown that teams of individuals are the ones that tend to produce breakthroughs. In this work we use patent data covering both function and form to systematically analyze the source of successful innovations. Our work moves towards reconciling the sole versus team conundrum by finding evidence of situations where the sole individual shine, and of situations where they do not.

Simulation Optimization and Ranking and Selection

Sponsor: Simulation

Sponsored Session

Chair: Demet Batur, Assistant Professor, University of Nebraska-Lincoln, CBA 209, Lincoln, NE, 68588, United States of America, dbatur@unl.edu

1 - Probability of Correct Selection: More May Not Be Better!

Yijie Peng, Fudan University, School of Management, Shanghai,
China, 10110690016@fudan.edu.cn, Michael Fu, Jianqiang Hu,
Chun-hung Chen

We present a simple counterexample where the probability of correct selection decreases with additional sampling under certain allocation schemes. We then characterize the general setting where this phenomenon may occur, which highlights the importance of an appropriate allocation scheme. Simulation experiments illustrate our findings.

2 - Asymptotic Validity of the Bayes-inspired Indifference Zone Procedure

Saul Toscano-palmerin, 113 Lake Street, Ithaca, NY, 14850,
United States of America, st684@cornell.edu, Peter Frazier

This talk considers the indifference-zone (IZ) formulation of the ranking and selection problem. Conservatism leads classical IZ procedures to take too many samples in problems with many alternatives. The Bayes-inspired Indifference Zone (BIZ) procedure, proposed in Frazier (2014), is less conservative than previous procedures, but its proof of validity requires strong assumptions. In this talk, we present a new proof of asymptotic validity that relaxes these assumptions.

3 - Reconstructing Input Models via Simulation Optimization

Aleksandrina Goeva, Boston University, 111 Cummington Mall,
Boston, MA, 02215, United States of America, agoeva@bu.edu,
Henry Lam, Bo Zhang

We consider the inverse problem of calibrating the distribution of a stochastic input model from only output data, in contexts where the input-output relation is accessible via stochastic simulation. We take a nonparametric approach, and formulate this problem as a stochastic program by maximizing the entropy of the input distribution subject to moment or tail-probability matching between simulation and empirical output. We propose an iterative scheme to approximately solve the program.

4 - Quantile Based Comparison for System Selection

Demet Batur, Assistant Professor, University of Nebraska-Lincoln,
CBA 209, Lincoln, NE, 68588, United States of America,
dbatur@unl.edu, Fred Choobineh

We present a fully-sequential selection procedure for comparing simulated systems based on a quantile of interest. The quantile of interest corresponds to a specific quantile of the simulated probability distribution of a comparison metric. The procedure is designed to asymptotically guarantee the selection of the best system or the best set of equivalent systems with a pre-specified probability of correct selection.

Supply Chain Management V

Contributed Session

Chair: Pritha Dutta, Doctoral Student, University of Massachusetts, Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, pdutta@umass.edu

1 - The Value of Conversion for a Refinery Firm with Both Forward and Spot Procurement

Mengmiao Chen, Fudan University, Lidasan Building, School of
Management, 670 Guishun Rd, Yangpu District, Shanghai, China,
12110690007@fudan.edu.cn

Our work analyzes the optimal procurement strategy, processing, and production decision of a refinery firm with both forward and spot procurement (hereafter, "dual sourcing"). Also the firm is capable of converting which improves the quality. A four-stage stochastic model is applied to investigate the value of dual sourcing and conversion. We find that both dual sourcing and conversion adds value to the refinery by improving the quality, unit profit, and enlarging the feasible producing region.

2 - Do Responsible Buyers Source from Responsible Suppliers?

Hsiao-Hui Lee, Assistant Professor, University of Hong Kong, KKL
814 School of Business, Hong Kong - ROC, hhlee@hku.hk

I examine the role of corporate social responsibility (CSR) in supply-chain formation. I first introduce the CSR similarity between buyers and suppliers as a selection criterion and examine why good (bad) buyers source from good (bad) suppliers. However, concerns over sourcing cost moderates the CSR similarity effect for good buyers, explaining why good buyers buy from bad suppliers. Supplier transparency (CSR signals) serves as a moderator to explain why bad buyers buy from good suppliers.

3 - The Effect of Commitment Completeness on Opportunism

Alex Scott, Penn State University, 463A Business Building,
University Park, PA, 16802, United States of America,
alexscott@psu.edu

Buyers often solicit non-contractual commitments from suppliers to provide services as the need arises. The level of detail of these commitments vary because, ceteris paribus, more detailed commitments are costlier and more time-consuming to develop than less detailed commitments. In this study, we examine how commitment completeness interacts with active and passive opportunism. We explore this question using a transactional dataset in the for-hire trucking sector.

4 - Firm's Green Supply Chain Performance: Effects of Outsourcing to Emerging Markets

Pritha Dutta, Doctoral Student, University of Massachusetts, Amherst, Isenberg School of Management,, UMass, Amherst, MA, 01003, United States of America, pdutta@umass.edu, Adams Steven

"Outsourcing" and "sustainability" are the two most significant buzz words in the realm of supply chain management today. The past decade has seen a growing trend of outsourcing and off-shoring of operations by companies. This is also an age where firms are becoming more and more aware of their corporate social responsibilities and environmental impacts. Hence in this paper we intend to study the effect of a company's outsourcing/off-shoring policies on the overall green performance.

Supply Chain Risk Management III

Contributed Session

Chair: Sungyong Choi, Assistant Professor, Yonsei University, 1 Yonseidae-gil, Wonju, Korea, Republic of, sungyongchoi@gmail.com

1 - Do Credit Agencies Predict the Financial Strength of a Supply Chain?

Gurkan Akalin, Eastern Illinois University, 905 A Street, Apt. 4, Charleston, IL, 61920, United States of America, gurkanakalin@hotmail.com

This study shows the results from our research about the effectiveness of Credit Agencies in predicting the strength of a company's supply chain.

2 - Inventory Control Policy in a Decentralized Assembly System: The Role of Vendor Inventory Liability

Guo Li, Dr., Beijing Institute of Technology, No. 5 Zhongguancun South Street, Beijing, 100081, China, lg4229682@163.com, Xu Guan

We investigate a decentralized assembly system that consists of one dominant manufacturer and multiple suppliers who produce the complementary components. The manufacturer initially sets a VILP to control the suppliers' delivery times, and multiple suppliers simultaneously determine when to deliver their components. We yield many interesting results based on their decision.

3 - Ripple-Effect and Structure Dynamics in the Supply Chain

Dmitry Ivanov, Professor Dr., Berlin School of Economics and Law, Badensche Str. 50, Berlin, 10825, Germany, divanov@hwr-berlin.de

This study aims at presenting the ripple effect in the supply chains in terms of structure dynamics framework. The supply chain structure dynamics framework is presented. We show an example of considering the ripple effect and structure dynamics in a supply chain design and planning obtained in a practical project for a multi-stage production-distribution network. Finally we identify gaps in current research and delineate future research avenues.

4 - Product Recalls, Category Effects and Competitor Response

Ram Bala, Santa Clara University, 500 El Camino Real, Santa Clara, CA, 95050, United States of America, rbala@scu.edu, Pradeep Bhardwaj, Pradeep Chintagunta

Product recalls are ubiquitous in a variety of industries. We focus on product categories where an individual firm's product recall may have negative consequences for the entire category. In such contexts, competitors in the category would have to respond to the recall through their sales effort. We provide a prescriptive road map for firms facing this decision based on several factors such as the anticipated category level loss and economies of scope in sales resource use across categories.

5 - A Parametric Study of Risk-Averse Inventory Models

Sungyong Choi, Assistant Professor, Yonsei University, 1 Yonseidae-Gil, Wonju, Korea, Republic of, sungyongchoi@gmail.com

I study a few dynamic risk-averse inventory models using additive utility functions. I add Markovian behavior of purchasing costs in my models. Such Markovian purchasing costs can reflect a market situation in a global supply chain such as random fluctuations at exchange rates or the existence of product spot markets. I provide my parametric analytical results with finite and infinite MDP (Markovian Decision Process) problems.

1 - Sea Escort Transportation

Azar Sadeghnejad Barkousa, SUNY at Buffalo, 4545 Chestnut Ridge Rd, Apt. 221A, Amherst, NY, 14228, United States of America, azarsade@buffalo.edu, Rajan Batta, Moises Sudit

Increasing number of violent pirate attacks causes a significant threat to the global shipping industry, with annual costs estimated at up to US\$12 billion. On the other hand, countries facing piracy are usually poor countries whose governments are unable to invest as much money as needed to protect the area. In this study we model the assignment and scheduling of escort ships along with commercial ships in danger zones to maximize protection with limited number of escort vessels.

2 - Anthropometric Casualty Estimation Methodologies for Modeling and Simulation

Daniel Rice, Technology Solutions Experts, Inc., 209 W. Central Street, Natick, MA, United States of America, daniel.rice@tseboston.com, Medhat Korna, Daniel Louzeiro, Ashley Drag

The design of Personal Protective Equipment (PPE) is critical to soldier survivability for a range of combat operations. Digital human modeling, simulation, and analysis play a critical role in supporting this technology priority. This research provides new capabilities for analysis of PPE fit and form for a range of body shapes and sizes through the use of high-resolution digital 3D models for improved analysis capabilities to support scientists engaged in the design of future PPE systems.

3 - Combining Simulation and Optimization to Increase Insights

Walt Degrange, Principal Operations Research Analyst, CANA Advisors, 6727 Falconbridge Rd., Chapel Hill, NC, 27517, United States of America, wdegange@canallc.com, Benjamin Thengvall

This research uses a simulation modeling USMC Maritime Prepositioning Force (MPF) exercises in ExtendSim and an optimization tool (OptDef) to increase the insight gained over using a simulation or optimization individually. We start by demonstrating the methodology with a small scale model and then increase the size of the model to test the robustness of the technique. We also cover the pros and cons of using this combination and lessons learned through integrating these tools.

4 - Command and Control Metrics in Studies of Unit Structure and Effectiveness

Doug Samuelson, InfoLogix, Inc., 8711 Chippendale Court, Annandale, VA, 22003, United States of America, samuelsondoug@yahoo.com

The recent Marine Corps Combat Development Command study, "Composition of the Infantry Battalion," raised a number of issues, especially: better metrics to assess likely leader effectiveness; leadership structures, communication methods and protocols; decision-making about logistics and intelligence; and the extent to which joint training improves coordinated effect. We summarize findings to date and sources cited and suggest future assessments of unit structure and resulting effectiveness.

Supply Chain Scheduling

Cluster: Scheduling and Project Management

Invited Session

Chair: Zhi-Long Chen, Professor, University of Maryland, Robert H. Smith School of Business, College Park, MD, 20742, United States of America, zchen@rhsmith.umd.edu

1 - Integrated Production and Delivery with Multiple Factories and Customers

Joseph Leung, New Jersey Institute of Technology, 4202 GITC, Department of Computer Science, Newark, United States of America, joseph.y.leung@njit.edu, Xun Zhang, Ba-Yi Cheng, Kai Li

We consider a scheduling problem where machines are geographically distributed and hence the production costs are different. The delivery costs are also different, depending on where the products are produced. Given a threshold U of the total cost, we want to minimize the makespan or total completion time, subject to the constraint that the total cost is not more than U . Heuristics are proposed and their performances are evaluated through computational studies.

2 - Personnel Scheduling and Supplies Provisioning in Emergency Relief Operations

Lian Qi, Rutgers Business School, Department of Supply Chain Management & Rutgers, United States of America, lianqi@business.rutgers.edu, Lei Lei, Michael Pinedo, Shengbin Wang, Jian Yang

The practice of emergency operations often involves travelling of medical teams and distribution of medical supplies. The coordination of the scheduling of the medical teams and supplies is critical. We introduce a math programming based rolling horizon heuristic that is able to quickly find near optimal solutions. A polynomial time solvable case, which leads to the design of the proposed heuristic, is discussed. Managerial insights drawn from numerical studies are provided.

3 - Makespan Minimization on Parallel Machine Subject to Machine Release Times and Minimum Total Completion Time

Yumei Huo, Associate Professor, City University of New York, College of Staten Island, 2800 Victory Blvd. 1N-215, Staten Island, NY, 10314, United States of America, Yumei.Huo@csi.cuny.edu

We study the preemptive bi-criteria scheduling problem on m parallel machines such that machines have different release times and once the machines are released, they are always available. The goal is to minimize the makespan subject to the constraint that the total completion time is minimized. We show that there is an optimal polynomial time algorithm for this problem.

4 - Latest Developments in Supply Chain Scheduling

Zhi-Long Chen, Professor, University of Maryland, Robert H. Smith School of Business, College Park, MD, 20742, United States of America, zchen@rhsmith.umd.edu

Supply chain scheduling studies detailed order scheduling issues in the supply chain and addresses a variety of applications in the real world. Supply chain scheduling is a relatively new area with about 15 years of history. A large body of literature on supply chain scheduling problems has appeared in academic journals including some surveys. Research interest in this area is still growing. We report the latest developments in this area.

1 - Inventory Pooling under Correlated Fat-tail Demands

Zhen Liu, Options Clearing Corp (OCC), One North Wacker Drive, Suite 500, Chicago, IL, 60606, United States of America, zhenliu@alum.northwestern.edu

We study inventory pooling problem in Eppen (1979) under multivariate Normal Inverse Gaussian demands. We obtain the optimal inventory level in a closed form by employing standardized NIG density function, and express the optimal expected costs in terms of unit NIG loss function. Our results complement Bimpikis and Markakis (2015) by considering the correlation of demands. We further consider transshipment problem of Dong and Rudi (2004) under NIG demands, and provide some analytical results.

2 - Assessing Systemic Risk in Financial Systems under Uncertainty

Jiming Peng, Associate Professor, University of Houston, Houston, TX, 77204, United States of America, jopeng@uh.edu, Aein Khabazian

We consider the issue of assessing systemic risk under uncertainty in a financial system based on the linear optimization model proposed by Eisenberg and Noe (2001). The coefficients of this model representing interbank liabilities and non-interbank assets are assumed to be known and constant. However, in real world application these coefficients are typically unknown and subject to market fluctuation, respectively. We develop robust and worst case optimization to account for the uncertainties.

1 - Competition and Firms' Willingness to Implement Industrial Symbiosis

Nagesh Gavirneni, Associate Professor, Cornell University, 325 Sage Hall, Ithaca, NY, United States of America, nagesh@cornell.edu, Yunxia Zhu, Vaidy Jayaraman, Milind Dawande

Industrial Symbiosis is a resource-sharing strategy that encourages traditionally separate industries to exchange water, energy and by products. Inspired by the paper-sugar industrial complex, we model and analyze symbiotic systems and establish that competition from firms that produce only regular (both regular and green) products encourages (discourages) implementation of industrial symbiosis.

2 - Is Buying Grocery Online Good for the Environment?

Ekaterina Astashkina, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, ekaterina.astashkina@insead.edu, Elena Belavina, Karan Girotra

Buying groceries online is catching on. We compare the carbon footprint of offline and online grocery retail. The different economics in the two lead to distinct supply chain structures, inventory management policies and customer ordering behavior, and, consequently, differences in transportation and food waste related emissions.

3 - Adoption of Residential Solar Energy Systems under Third-party Ownership and Direct Ownership

Ernesto Guerra, University of California Berkeley, Berkeley, CA, United States of America, ernestoguerra@berkeley.edu, Jose Guajardo

We formulate an empirical model to characterize the adoption of solar energy systems under third-party ownership and direct ownership in the U.S. residential market. The analysis is developed in the context of government incentives and supply-side determinants.

4 - The Potential of Servicing as a Green Business Model

Vishal Agrawal, Assistant Professor, Georgetown University, Washington, DC, United States of America, va64@georgetown.edu, Ioannis Bellos

In recent years, manufacturers in various industries have begun to orient their practices towards selling the use of the product as opposed to selling the product itself. We investigate the economic and environmental implications of the manufacturer's design and pricing decisions under different forms of servicing business models.

1 - Managing Informal Networks for Innovation

Russell Funk, Assistant Professor, University of Minnesota, 321 19th Avenue South, #3-354, Minneapolis, MN, 55455, United States of America, rfunk@umn.edu

This dissertation examines how informal networks affect innovation in organizations. Using data on nanotechnology and pharmaceutical firms, the first two studies show that the overall structure of collaboration among inventors differs dramatically across organizations and these differences matter for innovation performance. Motivated by these findings about the contingent benefits of network configurations, study three examines strategies for changing networks using data from online communities.

2 - Property Rights Theory and Ownership of Firm-specific Advantages within the Multinational Firm

Catherine Magelssen, Assistant Professor, London Business School, Sussex Place, Regent's Park S342, London Business School, London, NW1 4SA, United Kingdom, cmagelssen@london.edu

This dissertation extends property rights theory to inside the firm. I examine how multinational firms allocate ownership rights to knowledge assets to subsidiaries within the firm. The ownership of knowledge assets has implications on the internal distribution of risk, incentives, resources, and power. Using a unique dataset, I examine the determinants of the internal structure of ownership of knowledge assets and the impact of ownership on innovation within the multinational firm.

3 - Three Essays on Technological Changes and Competitive

Advantage: Evidence from the Newspaper Industry

Alessio Cozzolino, Assistant Professor in Strategy, University College Dublin, UCD Quinn School of Business, Dublin, Ireland, alessio.cozzolino@ucd.ie

The dissertation explores the relationship between technological change and competitive advantage, studying the transformation of the Italian newspaper industry after the Internet (1995-2014). Using quantitative and qualitative methods, and building on a hand-collected longitudinal database and on a large set of interviews, Alessio theorizes and tests the consequences of a new type of technological change, one that destroys incumbents' complementary assets while preserving their core know-how.

4 - Shifting LOCI of Innovation: A Study of Knowledge Boundaries, Identity and Innovation at NASA

Hila Lifshitz-assaf, NYU, 100 Bleecker street, 13B, New York, NY, 10012, United States of America, h@nyu.edu

This dissertation explores how the ability to innovate is being transformed by the Web and the information age, as well as the challenges and opportunities it entails. It is based on an in-depth longitudinal field study at NASA, exploring their experiment with online open innovation platforms and communities. I investigate the impact of using open innovation on the process of knowledge and innovation production, on R&D professionals, and its boundary conditions for successful problem solving.

1 - Modeling the Dynamics of Network Technology Adoption and the Role of Converters

Soumya Sen, University of Minnesota, Minneapolis, MN, United States of America, ssen@umn.edu, Youngmi Jin, Kartik Hosanagar, Roch Guerin

We study the role of converters in the adoption of competing network technologies by heterogeneous users. Converters can play an ambiguous role in the adoption process: they allow entrants to overcome the effect of incumbent's user base but also introduce performance degradation and functionality limitations. Our analysis reveals a number of interesting and unexpected outcomes in this competition between network technologies.

2 - The Diffusion and Business Value of User Generated Content on Social Media: Evidence from Twitter

Lanfei Shi, University of Maryland Smith School of Business, Van Munching Hall, College Park, MD, 20742, United States of America, lanfeishi@rhsmith.umd.edu, Siva Viswanathan, Tianshu Sun

Social media platforms and user generated content (UGC) have become valuable marketing aids to firms; however, there is little systematic understanding of whether, and how, the diffusion of UGC through these platforms creates value for firms. Collaborating with one of the leading IT firms in the US, we examine the conditions under which the diffusion of UGC on Twitter adds value, with a specific focus on the role of content and user characteristics in creating value.

3 - Piracy and Information-goods Supply Chain

Antino Kim, PhD Candidate, Foster School of Business, University of Washington, University of Washington, Seattle, WA, 98195-3200, United States of America, antino@uw.edu, Atanu Lahiri, Debabrata Dey

In the presence of a retailer between the manufacturer and consumers of information goods, the legal channel faces two menaces; the internal issue of channel coordination and the external issue of piracy. We develop an economic model to study the interaction of the two.

4 - Issues in Supporting Older Versions of Software: A Game-theoretic Model

Atanu Lahiri, University of Texas at Dallas, Jindal School of Management, Richardson, TX, 75080-3021, United States of America, atanu.lahiri@utdallas.edu, Debabrata Dey, Abhijeet Ghoshal

A software manufacturer needs to stop supporting older versions of its product to encourage consumers to upgrade to the newest version. Consumers, however, can respond by holding out, to compel the manufacturer to do exactly the opposite, as it cannot really afford leaving too many nodes vulnerable in the user network. What should the manufacturer do then, and what are the welfare implications?

Discrete Decision Making and Computation

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Ruiwei Jiang, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, ruiwei@umich.edu

1 - A Comparison of SMIP Decomposition Methods

Semih Atakan, PhD Student, University of Southern California, University Park Campus, Los Angeles, CA, 90089, United States of America, atakan@usc.edu, Suvrajeet Sen

Many practitioners appear to use deterministic equivalent formulations (DEF), and off-the-shelf MIP solvers to address their SMIP problems. Since such approaches do not scale well, they have to remain satisfied with models that allow only a handful of scenarios. In contrast, SMIP decomposition is able to provide solutions to models whose DEF contain millions of mixed-integer variables in both stages. We compare results from a variety of such decomposition methods.

2 - Cut Generation Enhanced by Learning for Two-stage Stochastic Linear Programming

Yiling Zhang, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, United States of America, zyiling@umich.edu, Siqian Shen

We propose a new decomposition and cut generation paradigm for solving two-stage stochastic linear programs with complete recourse. Specifically, we "learn" from the Benders cuts and solution bounds from previous iterations (via Thomson Sampling or Imitation Learning approaches), to online select a subset of subproblems for deriving new cuts that could converge to optimum more quickly. Computational results are provided to demonstrate the efficacy of the approach.

3 - Forced and Natural Nestedness

David Morton, Professor, Northwestern University, IEMS Department, Evanston, IL, 60208, United States of America, david.morton@northwestern.edu, Michael Nehme, Ali Koc

We consider two combinatorial optimization problems in which we seek nested solutions. For the first, we formulate two types of two-stage stochastic integer programs to force nestedness. For the second, we maximize a supermodular gain function subject to a resource-availability constraint, and give conditions which ensure nested solutions at certain budget increments. A stochastic facility location problem, a graph clustering problem, and a chance-constrained program illustrate ideas.

4 - An Abstract Model for Branching and its Application to Mixed Integer Programming

Pierre Le Bodic, Georgia Tech, Atlanta, GA, United States of America, lebodid@gatech.edu, George L. Nemhauser

We present an abstraction of Mixed-Integer Programs (MIPs) to a simpler setting in which it is possible to analytically evaluate the dual bound improvement of choosing a given variable. We then discuss how the analytical results can be used to choose branching variables for MIPs, and we give experimental results that demonstrate the effectiveness of the method on MIPLIB instances where we achieve a 7% node improvement over the default rule of SCIP, a state-of-the-art MIP solver.

Sponsored Session

Chair: Yash Puranik, Carnegie Mellon University, Pittsburgh, PA, United States of America, ypp@andrew.cmu.edu

1 - Lagrangean Disjunctive Branch and Bound for Linear Generalized Disjunctive Programs

Francisco Trespalacios, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, ftrespal@andrew.cmu.edu, Ignacio E. Grossmann

In this work we present a novel Lagrangean relaxation of the continuous relaxation of the (HR) reformulation of linear GDPs. This Lagrangean relaxation is simpler to solve than the (HR) and, even more relevant, its solution (a continuous LP) always yields 0-1 values for the binary variables. We present a disjunctive branch and bound for linear GDPs that exploits the proposed Lagrangean relaxation of the HR.

2 - A Novel Strategy for General Polynomial Partitions in Multiparametric Programming

Stratos Pistikopoulos, Texas A&M University, Artie McFerrin Dept. of Chem. Eng., College Station, TX, 77843, United States of America, stratos@tamu.edu, Richard Oberdieck

Currently, the solution to multiparametric mixed-integer programming problems is presented as a polyhedral partitioning of the considered parameter space, because no strategy exists to explicitly handle any nonconvex partitions. In this work, we demonstrate a novel approach which allows for the handling of general, polynomial partitions in multiparametric programming using a combination of suitable linearizations and global optimization strategies.

3 - Polyhedral Cut Generation for Global Optimization of Problems with Edge-concave Intermediates

Yash Puranik, Carnegie Mellon University, Pittsburgh, PA, ypp@andrew.cmu.edu, Nikolaos Sahinidis

We describe a branch-and-cut implementation for obtaining facet defining cuts that utilizes a highly efficient solution strategy for linear separation problems. These cuts are valid for edge-concave functional forms which admit polyhedral convex envelopes. Computational performance results of this implementation are presented on standard test libraries.

4 - Recent Developments in BARON for Global Optimization of NIPS and MINLPS

Mustafa Kilinc, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, United States of America, mkilinc@andrew.cmu.edu, Nikolaos Sahinidis

We report recent developments in the integer arsenal of branch-and-reduce and their implementation in the global optimization software BARON. Extensive computational results will be presented on problems from a collection of test sets.

Distributed Stochastic Optimization for Large-Scale Machine Learning

Sponsor: Optimization/Optimization Under Uncertainty
Sponsored Session

Chair: Qihang Lin, The University of Iowa, 21 East Market Street, Iowa City, IA, 52245, United States of America, qihang-lin@uiowa.edu

1 - Adding vs. Averaging in Distributed Primal-dual Optimization

Chenxin Ma, PhD Student, Lehigh University, 200 West Packer Avenue, Bethlehem, PA, 18015, United States of America, machenxin622@gmail.com, Peter Richtárik, Virginia Smith, Martin Jaggi, Michael Jordan, Martin Takac

Reducing communication makes the efficient aggregation of partial work from different machines more challenging. We present a novel generalization of the recent communication efficient primal-dual coordinate ascent framework (CoCoA). Our framework, CoCoA+, allows for additive combination of local updates to the global parameters at each iteration, whereas previous schemes only allowed conservative averaging.

2 - DSCOVER: A Randomized Asynchronous Algorithm for Distributed Learning with Parameter Server

Adams Wei Yu, PhD Student, Carnegie Mellon University, Pittsburgh, PA, United States of America, adamsyuwei@gmail.com, Qihang Lin, Lin Xiao, Weizhu Chen

Machine learning with big data often involves big models, where the number of variables in a model can be too large for frequent communication and synchronization. In this case, we can set up a parameter server to maintain the overall model and coordinate updates of subsets of the parameters at different machines. We propose an algorithm DSCOVER, which exploits the double partitions in both data and model to gain parallelism, and applies periodic variance reduction to achieve linear convergence.

3 - Massively Distributed Optimization: Beyond the Traditional Setting

Jakub Konecny, University of Edinburgh, James Clerk Maxwell Building, 5406, Peter Guthrie Tait Road, Edinburgh, EH9 3DF, United Kingdom, J.Konecny@sms.ed.ac.uk, Brendan McMahan

The purpose of this work is to present a new, increasingly important setting for distributed optimization in machine learning. Main assumption is that we have a very large number of computers available, each of which has access to relatively small number of training examples. This is arising if the data are not stored on datacenters owned by companies, but instead kept at users' devices, a arising trend driven primarily by privacy concerns. We demonstrate that encouraging results are achievable.

Statistical Optimization

Sponsor: Optimization/Optimization Under Uncertainty
Sponsored Session

Chair: Mengdi Wang, Assistant Professor, Princeton University, 302 Trinity Ct #2, Princeton, NJ, 08540, United States of America, mengdiw@princeton.edu

1 - Minimax-optimal Private-preserving Sparse PCA in Distributed Systems

Jian Ge, Princeton University, Operations Research and Financial Engine, Sherrerd Hall, Charlton Street, Princeton, NJ, 08544, United States of America, jiangex@exchange.Princeton.EDU

We propose a distributed private-preserving sparse PCA (DPS-PCA) algorithm that generates a minimax-optimal sparse PCA estimator in polynomial time under differential privacy constraints. Data providers can use this algorithm to collaboratively analyze the union of their data sets in a distributed system while limiting the disclosure of their private information.

2 - Upper Bounds for the Correlated Bayesian Information Filtering Problem

Bangrui Chen, Cornell University, 55 Lois Ln, Ithaca, NY, 14850, United States of America, bc496@cornell.edu, Peter Frazier

We present a Bayesian sequential decision-making formulation of the information filtering problem, in which an algorithm presents items (blog posts, scientific papers, emails) arriving in a stream, learning relevance from user feedback on presented items. Our formulation uses a linear model, and is similar to a Bayesian linear bandit. We compute an upper bound on the value of the optimal policy, which allows computing an optimality gap for heuristic policies, and motivates an index policy.

3 - Statistical Limits of Convex Relaxations

Zhaoran Wang, Graduate Student, Princeton University, Sherrerd Hall, Charlton Street, Princeton, NJ, United States of America, zhaoran@exchange.Princeton.EDU, Quanquan Gu, Han Liu

In this paper, we study the statistical limits of convex relaxations. Particularly, we consider two problems: Mean estimation for sparse principal submatrix and edge probability estimation for stochastic block model. We exploit the sum-of-squares relaxation hierarchy to sharply characterize the limits of a broad class of convex relaxations. Our result shows statistical optimality needs to be compromised for achieving computational tractability using convex relaxations.

4 - Post-regularization Confidence Bands for High Dimensional Nonparametric Models with Local Sparsity

Junwei Lu, Princeton University, Sherrerd Hall, Charlton St., Princeton, NJ, 08540, United States of America, junweil@princeton.edu, Mladen Kolar, Han Liu

We propose a novel high dimensional nonparametric model named ATLAS which is a generalization of the sparse additive model. We aim to estimate high dimensional function using a novel kernel-sieve hybrid regression estimator that combines the local kernel regression with the B-spline basis approximation. We show the estimation rate of true function in the supremum norm. We also propose two types of confidence bands for true function.

Unconstrained and Bound-Constrained Optimization

Sponsor: Optimization/Nonlinear Programming
Sponsored Session

Chair: Daniel Robinson, Assistant Professor, Johns Hopkins University, 3400 N. Charles Street, Baltimore, MD, 21218, United States of America, daniel.p.robinson@gmail.com

1 - A Solver for Nonconvex Bound-constrained Quadratic Optimization

Daniel Robinson, Assistant Professor, Johns Hopkins University, 3400 N. Charles Street, Baltimore, MD, 21218, United States of America, daniel.p.robinson@gmail.com, Hassan Mohy-ud-din

I present a new method for optimizing quadratic functions subject to simple bound constraints. If the problem happens to be strictly convex, the algorithm reduces to an efficient method by Dostal and Schöberl. Our algorithm, however, is also able to efficiently solve nonconvex problems. During this talk I will present the algorithm, a sketch of the convergence theory, and numerical results for convex and nonconvex problems.

2 - Handling Negative Curvature in Gradient Methods for Unconstrained and Bound Constrained Optimization

Wei Guo, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, weg411@lehigh.edu, Frank E. Curtis

A gradient-descent method is proposed for unconstrained and bound constrained optimization. Emphasis is placed on techniques for computing appropriate step sizes when negative curvature is present. It extends Barzilai-Borwein two-point step size method, its variants and gradient projection method for unconstrained and bound constrained optimization. Global convergence is guaranteed under mild assumptions. Numerical results illustrate the benefits of the method in the presence of non-convexity.

3 - A Trust Region Algorithm with a Worst-case Iteration Complexity of $O(\epsilon^{-(3/2)})$

Mohammadreza Samadi, Lehigh University, 200 West Packer, Bethlehem, PA, 18015, United States of America, mos213@lehigh.edu, Daniel Robinson, Frank E. Curtis

We present a trust region method for unconstrained nonconvex optimization that is able to drive the norm of the gradient of the objective below a prescribed threshold $\epsilon > 0$ after at most $O(\epsilon^{-(3/2)})$ iterations, while maintaining standard global and fast local convergence guarantees through employing modified step acceptance criteria and a novel trust region updating mechanism. We also present ideas for the constrained case and show numerical results.

4 - A Modified DC Algorithm for Solving Linear Programs with Equilibrium Constraints

Francisco Jara-Moroni, Northwestern University, 2145 Sheridan Road, Room C210, Evanston, IL, 60208, United States of America, franciscojaramoroni2013@u.northwestern.edu, Jong-Shi Pang, Andreas Waechter

We propose a method for finding local optima of linear programs with equilibrium constraints. The complementarity restriction is handled by a penalty term that can be expressed as the difference of convex functions. The reformulated problem is solved to optimality by the difference-of-convex functions algorithm with some variations exploiting the specific structure of the penalization.

Trends in Optimization

Sponsor: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Angelia Nedich, University of Illinois, Urbana, IL, United States of America, angelia@illinois.edu

1 - Convex Optimization for Low Rank Models

Madeleine Udell, Postdoctoral Fellow, Caltech, CMS, Mail Code 9-94, Pasadena, CA, 91125, United States of America, madeleine.udell@gmail.com

Many of the most popular methods for unsupervised learning can be formulated as a kind of bi-convex optimization problem which we call a low rank model, including nonnegative matrix factorization, matrix completion, sparse and robust PCA, and k-means. In this talk, we discuss three approaches to fitting low rank models: alternating minimization, stochastic gradient methods, and methods based on convex relaxations.

2 - Resolution of Misspecified Constrained Optimization Problems via Augmented Lagrangian Schemes

Hesam Ahmadi, Student, Pennsylvania State University, 107 Holerman Hall, University Park, PA, 16802, United States of America, ahmadi.hesam@gmail.com, Necdet Serhat Aybat, Uday Shanbhag

We consider a misspecified optimization problem that requires minimizing of a convex function $f(x; y)$ in x over constraint set represented by $h(x; y)=0$ where y is an unknown (or misspecified) vector but can be learnt by a distinct learning problem. We develop joint first-order augmented Lagrangian scheme for computing x while learning y . Iteration complexity analysis is provided when penalty parameters are constant.

3 - Convex and Stochastic Optimization under Indirect Observations

Niao He, Georgia Tech, Atlanta, GA
United States of America, nhe6@gatech.edu

We examine convex optimization problems involved with misspecified parameters or distributions, while only a limited number of indirect observations are available. We establish safe and computationally tractable approximations of these problems and equip them with efficient algorithms. We show that in several important cases, the estimates yielded by our approach exhibit consistency and sublinear convergence. We also demonstrate the efficiency of our approach through several examples.

Cliques and Clique Relaxations

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Sergiy Butenko, Texas A&M University, 4037 ETB, College Station, TX, United States of America, butenko@tamu.edu

1 - Characterizing and Detecting Independent Union of Cliques

Zeynep Ertem, Texas A&M, 2400 Central Park Ln, Apt. 407, College Station, TX, United States of America, zeynepertem@tamu.edu, Sergiy Butenko, Yiming Wang

This paper introduces maximum independent union of cliques problem for which maximum clique and maximum independent set solutions are lower bound. We present structural properties as well as complexity results. We show IP formulation, B&B algorithm and the heuristic approaches.

2 - The Maximum S-stable Cluster Problem

Chitra Balasubramaniam, Texas A&M University, College Station, TX, United States of America, bcvidayanath@tamu.edu, Sergiy Butenko

We introduce a new clique relaxation model called s-stable cluster, that restricts the size of the independent set found in the cluster, and is applicable in areas that employs data mining techniques. In particular, the structural properties of the model will be explored, and exact algorithms for solving the maximum s-stable cluster problem will be presented.

Big Data Analytics: Methodology and Applications

Cluster: Modeling and Methodologies in Big Data

Invited Session

Chair: Danica Xiao, PhD Candidate, University of Washington - Seattle, 3900 Northeast Stevens Way, Seattle, WA, 98195, United States of America, xiaoc@uw.edu

1 - "Big Data" in Bioenergy Supply Chain

Shiyang Huang, Iowa State University, 0076 Black Engineering, Ames, IA, 50011, United States of America, shuang@iastate.edu, Guiping Hu

We study the development of bioenergy and its supply chain, which consists of large numbers of independent stakeholders and sophisticated spatial and environmental information. We introduce "Big data" optimization methodologies into the study to mine the hidden information that can help in promoting the bioenergy production.

2 - Learning from Business Transactions Data

Sunil Kothari, Researcher, Hewlett-Packard, 1501 Page Mill Road, Bldg 2U, Palo Alto, CA, 94304, United States of America, sunil.kothari@hp.com, Zhijun Yin, Gary Dispoto, Jun Zeng, Gregory Player

In a contractual environment, the engagement starts with the sales process and continues through the contract period generating valuable data across the life cycle of the contract period. HP's managed print services business generates transaction data covering the entire life cycle of a contract. We apply the machine learning techniques to counter the notion that price alone determines the win/loss outcome for a deal and predict the win/loss probabilities for deals currently in the pipeline.

3 - An Integer Programming Formulation of Training Set Selection

Walter Bennette, Research Engineer, Air Force Research Laboratory, 26 Electronic Parkway, Rome, NY, 13441, United States of America, wdbennette@gmail.com

Aspects of a data set can make building a useful classifier difficult. Training Set Selection (TSS) addresses some of these aspects by selecting a subset of the data in such a way that learning from the reduced data set leads to a better model. This work utilizes an integer programming formulation of TSS that relies on column generation to obtain an improved selection of training instances. We then inform current state of the art genetic algorithms for TSS with our formulation.

4 - Applications of Big Data Summarization through Polyhedral Uncertainty Sets

Anushka Chandrababu, Research Scholar, IIITB, 26/C, Electronic City, Bangalore, India, anushka.babu@iiitb.org, Prasanna Gns

We present our works of summarizing structured or unstructured big data into polyhedral uncertainty sets, orders of magnitude smaller than the original data using a generalized multi-dimensional German tank method. Relational algebraic operations to check disjointness, subset or intersecting relationships between such polyhedral objects can be performed. We show the results of such big data summarization using real world data to solve specific business needs.

5 - Assessing Demand Trends using Real Time Order

Transaction Data

Parvaneh Jahani, University of Louisville, 781 Theodore Burnett Ct., Apt. 2, Louisville, KY, 40217, United States of America, p0jaha01@louisville.edu, Suraj Alexander

Assessing demand trends using real time order transaction data is essential aspect of warehouse management system. Selecting the method of demand forecasting differs for different demand trends. We propose a new approach for classification of Stock Keeping Units (SKUs) demand trends using Control Charts Pattern Recognition (CCPR). After demand trend class recognition, the best method of forecasting is selected. Bootstrapping method is used for forecasting intermittent demand time series.

6 - Unsupervised Ensemble, or Consensus Clustering, Consists in Finding the Optimal Combination Strategy

Ramazan Ünlü, University of Central Florida, 12100 Sterling University Ln, Apt. 2-2419, Orlando, FL, United States of America, ramazanunlu@gmail.com

Unsupervised ensemble, or Consensus clustering, consists in finding the optimal combination strategy of individual clusterings that is robust with respect to the selection of the algorithmic clustering pool. In this paper, we propose a weighting policy for this problem that is based on internal clustering quality measures and compare against other popular approaches.

OR and AI

Sponsor: Computing Society

Sponsored Session

Chair: Scott Sanner, Asst. Professor, Oregon State University, 1148 Kelley Engineering Center, Corvallis, OR, 97331, United States of America, ssanner@gmail.com

1 - Pruning in Decision Diagrams for Optimization

Christian Tjandraatmadja, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, ctjandra@andrew.cmu.edu, Willem-Jan Van Hoeve

Many enumerative techniques to solve discrete optimization problems benefit greatly from using bounds to prune the search tree. We study the application of pruning strategies to decision diagrams, which can be viewed as a compact form of enumeration trees. In particular, we discuss how pruning strategies can be incorporated in relaxed and restricted decision diagrams to obtain improved primal and dual bounds.

2 - Concise Representation of Near-optimal Solutions with Decision Diagrams

Thiago Serra, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, tserra@cmu.edu, John Hooker

Decision diagrams have recently been used to compactly encode sets of solutions to discrete optimization problems. In this talk we study Sound Decision Diagrams (SDDs), which encode near-optimal solutions along with worse feasible and infeasible solutions. We provide a formal characterization of SDDs and algorithms to find those with minimum size. Empirical results show that SDDs are smaller than conventional decision diagrams representing the same near-optimal solution set as its gap increases.

3 - Stochastic Optimization of the Scheduling of a Radiotherapy Center

Antoine Legrain, Polytechnique Montreal, C.P. 6079, Succursale Centre-ville, Montreal, QC, H3C 3A7, Canada, antoine.legrain@polymtl.ca, Marie-andr   Fortin, Nadia Lahrichi, Louis-Martin Rousseau, Marino Widmer

Radiotherapy centers can improve their efficiency by optimizing the utilization of the linear accelerators. We propose an online method to schedule patients on such machines taking into account their priority, the maximum waiting time, and the preparation of this treatment (dosimetry). We have implemented a genetic algorithm and a constraints program, which schedule the dosimetry. This approach ensures the beginning of the treatment on time and thus avoids the cancellation of treatment sessions.

Decision Analytics in Cloud

Cluster: Cloud Computing

Invited Session

Chair: Yue Tan, The Ohio State University, 1971 Neil Ave, Columbus, OH, 43210, United States of America, tanyue01@gmail.com

1 - Cyber Vulnerability Maintenance Policies for Universities

Chengjun Hou, Graduate Research Associate, The Ohio State University, 1971 Neil Ave., Columbus, Oh, 43210, United States of America, hou.91@buckeyemail.osu.edu, Theodore Allen

The case study application of Markov decision processes and generalizations to a real world University policy design problem are described. Related mathematical issues are briefly explored. The derived policy includes incentives for not continuing the use of vulnerable software. The magnitude of saving in dollars is estimated.

2 - throughput Scalability of Fork-join Queueing Networks with Blocking

Yun Zeng, The Ohio State University, 1971 Neil Ave, Columbus, OH, United States of America, zeng.153@buckeyemail.osu.edu, Augustin Chaintreau, Don Towsley, Cathy Xia

With emerging applications such as cloud computing and big data analytics, modern information networks are growing increasingly complex. A critical issue concerns the throughput performance as the system expands to large scale. This paper models the distributed information processing systems as fork-join queueing networks with blocking. We present necessary and sufficient conditions to ensure throughput scalability. Algorithms to check these features for given networks are proposed.

3 - Data-driven Decision Making via Adaptive Control for Cyber Password Management

Yue Tan, The Ohio State University, 1971 Neil Ave, Columbus, OH, 43210, United States of America, tanyue01@gmail.com, Cathy Xia

Cyber attacks have been widely recognized as a major international and domestic cyber security threat. Although an increasing number of high technology mechanisms have been developed, passwords remain as the frontline against cyber attacks both for personal and organizational security settings in cloud services. In this talk, we present a data-driven adaptive control framework that converges to the optimal password expiry duration which balances between accounts safety and user experience.

Re-Designing the (US) Healthcare System

Sponsor: Health Applications

Sponsored Session

Chair: Aurelie Thiele, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, aut204@lehigh.edu

1 - Designing Narrow Network Plans for Healthcare:

A Bi-objective Optimization Approach

Victoire Denoyel, ESSEC Business School, Avenue Bernard Hirsch, Cergy, 95000, France, victoire.denoyel@essec.edu, Aurelie Thiele, Laurent Alfandari

We build a quantitative decision model for healthcare payers willing to offer Narrow Network (NN) plans to customers. NN have received significant attention in the implementation of the Affordable Care Act. A payer selects a limited list among all possible providers, and steers patients to these providers by limiting coverage to this list. Our research question is: how to select a limited number of providers so as to reduce the cost for the payer without decreasing the utility for customers?

2 - The Effects of Ambulatory Surgery Centers on Hospital's Financial Performance

Cheng Wang, Lehigh University, 621 Taylor Street, Department of Economics, Bethlehem, PA, 18015, United States of America, chw410@lehigh.edu

Ambulatory surgery centers (ASCs), which treat surgical patients who do not need an overnight stay, are a health care service innovation that has proliferated in the U.S. in the past four decades. This paper examines the effect of ASCs on the net patient revenues and total operating costs of hospitals. Overall, results suggest that ASCs are competitors to general hospitals.

3 - Examining Change in Hospital Quality and Efficiency after ACA using Dynamic Network DEA

Yasar Ozcan, Professor, Virginia Commonwealth University,
P.O. Box 980203, Richmond, VA, 23298-0203,
United States of America, ozcan@vcu.edu, Jaya Khushalani

Dynamic Network DEA was used to examine change in both quality and efficiency of hospitals between 2009 and 2013, pre and post Affordable Care Act (ACA). Quality and efficiency improved significantly with no trade-off between the two. Urban and teaching hospitals were less likely to improve quality and efficiency together.

4 - Robust Decisions for the Partially Diversified Disease Management Model

Shuyi Wang, Lehigh University, 200 W Packer Ave,
Bethlehem, PA, United States of America, shw210@lehigh.edu

We discuss a model to help pharmaceutical companies determine the optimal strategy under high uncertainty for a business model called the Partially Diversified Disease Management Model, which includes disease care pathways as well as health management, diagnostics & devices, and medication, and incentivizes patients' health. Our MIP provides a tradeoff between diversification and specialization.

5 - When is the Outside Care Utilization Optimal for Acos? Trade-off Between Cost, Access, and Quality

Tannaz Mahootchi, Postdoctoral Research Associate,
Northeastern University, 360 Huntington Ave, Boston, MA,
02115, United States of America, t.mahootchi@neu.edu

Accountable Care Organizations (ACOs) are responsible for the health outcomes and the care expenses of their patients. We investigate the details of patient diversion process to an alternative provider when the primary ACO is experiencing congestion. ACOs choose the alternative provider based on the performance measures and the costs of patient diversion. We derive the transfer price and the performance measures that makes the diversion decision optimal.

Learning and Random Graphs

Sponsor: Applied Probability

Sponsored Session

Chair: Marc LeLarge, INRIA-ENS, 23 Avenue d'Italie, Paris, France,
marc.lerlarge@ens.fr

1 - Typical Distances in Directed Random Graphs

Mariana Olvera-Cravioto, Associate Professor, Columbia
University, New York, NY, 10027, United States of America,
mo2291@columbia.edu

We study the distance between two randomly selected nodes in a directed configuration model under the assumption that the degree distributions have finite variance. In particular, we show that the distance grows logarithmically in the size of the graph. The method of proof uses a coupling between a graph exploration process and a weighted branching tree, since unlike the undirected case, we need to keep simultaneous control of both the in-degrees and the out-degrees.

2 - Competitive Contagion in Networks

Moez Draief, Imperial College London and Huawei Research
Paris, South Kensington Campus, London, United Kingdom,
moez.draief@huawei.com

There has been a growing interest, over the past few years, in studying models of competing products/opinions on social networks. The question of interest is what is the impact of the first adopters of a product on the outcome of a series of adoption by other nodes in the system influenced by those initial nodes. More precisely, the decision of a node to adopt a product is influenced by the behaviour of its neighbours in the social network. This raises challenging and intriguing mathematical, algorithmic and game theoretic questions. In this talk, I will present an overview of recent developments in this topic.

3 - Learning in Networks: Multi-armed Bandits with Structure

Richard Combes, Assistant Professor, Centrale-Supelec, Plateau de
Moulon, 3 rue Joliot-Curie, Gif-Sur-Yvette, 91192, France,
richard.combes@supelec.fr

The design of networks and online services can often be mapped to a multi-armed bandit problem with structure. With this approach, problems such as link adaptation, resource allocation, or ad-display optimization can be solved in a provably optimal manner. Namely, the learning speed of the proposed schemes matches a fundamental limit verified by any scheme. A review of the relevant mathematical tools and literature is provided.

4 - Community Detection with the Non-backtracking Operator

Marc LeLarge, INRIA-ENS, 23 Avenue d'Italie, Paris, France,
marc.lerlarge@ens.fr, Charles Bordenave, Laurent Massoulié

Community detection consists in identification of groups of similar items within a population. In the context of online social networks, it is a useful primitive for recommending either contacts or news items to users. We will consider a particular generative probabilistic model for the observations, namely the so-called stochastic block model and prove that the non-backtracking operator provides a significant improvement when used for spectral clustering.

5 - Rumor Source Obfuscation

Peter Kairouz, Graduate Research Assistant, University of Illinois
at Urbana Champaign, 408 E Clark St, Apt. 6, Champaign, IL,
61820, United States of America, kairouz2@illinois.edu,
Sewoong Oh, Pramod Viswanath

Anonymous messaging platforms have recently emerged as important tools for sharing one's thoughts without the fear of being judged by others. Such platforms are crucial in nations with authoritarian regimes where the right to free expression depends on anonymity. Existing messaging protocols are vulnerable against adversaries who can collect metadata. We introduce a novel messaging protocol and show that it spreads the messages fast and achieves perfect obfuscation of the source.

Role of Information in Large-scale Stochastic Resource Allocation Problems

Sponsor: Applied Probability

Sponsored Session

Chair: Kuang Xu, Stanford University, Stanford, CA,
United States of America, kuangxu@stanford.edu

1 - Centralized Seat Allocation for Engineering Colleges in India

Yash Kanoria, Assistant Professor, Columbia University, New
York, NY, United States of America, ykanoria@columbia.edu

The central government funds over 75 engineering colleges in India with 50,000 seats a year, and a diversity of programs and admissions criteria. We deploy a new, centralized, seat allocation mechanism, that accounts for the preferences of students as well as the admissions criteria for different colleges/programs using a deferred acceptance inspired approach.

2 - Learning to Optimize via Information-directed Sampling

Daniel Russo, Stanford University, 218 Ayrshire Farm Lane,
Apt. 102, Stanford, CA, 93405, United States of America,
djrusso@stanford.edu, Benjamin Van Roy

We offer a fresh, information-theoretic, perspective on the exploration/exploitation trade-off and propose a new algorithm—information-directed sampling—for a broad class of online optimization problems. We establish a general expected regret bound and demonstrate strong simulation performance for the widely studied Bernoulli, Gaussian, and linear bandit problems. Simple analytic examples show information-directed sampling can dramatically outperform Thompson sampling and UCB algorithms.

3 - Online Advertising Matching in the Large Market

Jian Wu, Cornell University, Ithaca, NY, United States of America,
jw926@cornell.edu, Peter Frazier, J. G. Dai

We study online advertising matching in a large market asymptotic regime, in which the number of opportunities and the number of advertisers increase simultaneously. We develop a matching policy based on the LP solution to a certain deterministic problem. Under certain conditions, we prove that the policy is asymptotically optimal under the fluid-scaling to maximize click-through-rate (CTR) while satisfying all contractual agreements with overwhelming probability.

4 - Robust Scheduling in a Flexible Fork-join Network

Yuan Zhong, Columbia University, 500 W. 120th Street,
New York, NY, 10027, United States of America,
yz2561@columbia.edu, Ramtin Pedarsani, Jean Walrand

We consider a general flexible fork-join processing network, motivated by applications in e.g., cloud computing, manufacturing, etc, in which jobs are modeled as directed acyclic graphs, and servers are flexible with overlapping capabilities. A major challenge in designing efficient scheduling policies is the lack of reliable estimates of system parameters. We propose a robust scheduling policy that does not depend on system parameters, and analyze its performance properties.

Data Mining and Network Inference for Social and Health Application II

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Sung Won Han, New York University, 650 First Avenue, New York, NY, United States of America, sungwonhan2@gmail.com

Co-Chair: Chen Kan, University of South Florida, 4202 E. Fowler Ave. ENB118, Tampa, FL, United States of America, chenkan@mail.usf.edu

1 - Optimizing Display Advertising in Online Social NetworksZeinab Abbassi, PhD Candidate, Columbia University,
1214 Amsterdam Ave, 450 CSB, New York, NY, 10027,
United States of America, za2153@columbia.edu

Conventional online advertising methods need to be customized for OSNs. We propose probabilistic models and study the problem: given a number of impressions, what is the optimal order of users to show the ad to, to maximize the expected number of clicks? We show that this problem is hard to approximate. Therefore, we propose several heuristic algorithms. We evaluate the performance of these heuristics on real data sets, and observe that our two-stage heuristic outperforms baselines.

2 - Blood Donation Tailoring Problem to Improve Blood Supply ManagementGuven Kaya, PhD Student, Industrial Engineering, University of
Houston, E206 Engineering Bldg 2, Houston, TX, 77204,
United States of America, gkaya@central.uh.edu, Ali Ekici

Blood donation tailoring is to identify blood donation types and collect blood products. Donors perform donation types that provide blood products to patients, having collection/inventory/spoilage costs. We collect data about donation types with demand, cost, time, eligibility percentages, compatibility from blood banks. We develop MIP models to find collected/spoiled/carried blood product amount on single and multi-period settings. We provide results based on data from blood donation centers.

Data Analytics Applications for Smart Industries

Cluster: Globalization and International Activities

Invited Session

Chair: Grace Lin, Data Analytic Technology and Applications (DATA),
Data Analytic Technology and Applications (DATA), Taipei,
Taiwan - ROC, gracelin@iii.org.tw**1 - Is the Conventional Association Analysis Practical for Big Data Analytics? New Perspectives on Application and Computation**Hao-Ting Pai, Data Analytics Technologies & Applications
Research Institute, Institute for Information Industry,
Taiwan - ROC, httpai@iii.org.tw

Association analysis has been proven an NP-Complete problem. Owing to the inevitable challenge, it is necessary to devise an alternative way of discovering representative patterns. We present relative patterns discovery (named RPD) for big data analytics, which possesses four features: effectiveness, efficiency, panorama, and scalability.

2 - Towards Industry 4.0: Applying Big Data Analytics to Improve Manufacturing PerformanceFish Yu, Data Analytics Technologies & Applications Research
Institute, Institute for Information Industry, Taiwan - ROC,
fishyu@iii.org.tw

As a step towards the development of cyber-physical systems which play an important role in the transformation of manufacturing industry to the next generation known as Industry 4.0, this talk describes a log analytics framework that is capable of collecting, managing and analyzing large amount of machine data to enable real-time and predictive decision-making across various manufacturing processes. Experimental results using realistic data from semiconductor packaging tools show the effectiveness of the proposed framework.

3 - Green Multi-temperature Logistics using Time-dependent Data AnalysisWei-Ting Chen, Data Analytics Technologies & Applications
Research Institute, Institute for Information Industry, Taiwan -
ROC, weitingchen@iii.org.tw

Multi-temperature food logistics contributes a considerable amount of greenhouse gas due to fuel burn and HFCs and PFCs generated by refrigeration. In this talk,

we will introduce how to estimate emissions depend on various levels of traffic condition, temporal demand patterns, delivery time windows, and different temperature control techniques. It helps carriers to respond to green policies of governments.

4 - Emerging Trends in ICT: using Big Data Analytics to Infuse New Energy into Smart Tourism IndustryTim Lin, Data Analytics Technologies & Applications Research
Institute, Institute for Information Industry, Taiwan - ROC,
timlin@iii.org.tw

As many leading global organizations have applied Big Data Analytics to various public and commercial areas, valuable applications such as consumer insight, business operations optimization, and service innovation have been continuously increasing. In this talk, we will introduce a smart tourism solution which provides tourists real-time, personal, and proactive services by leveraging Big Data Analytics, resulting in a deep and authentic experience. The developed solution can support tourism-related businesses to connect with prospective customers and build responsive, efficient, and health smart cities and homelands.

Advances in Multiobjective Programming

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Margaret Wiecek, Department of Mathematical Sciences,
Clemson University, Clemson, SC, 29634, United States of America,
wmalgor@clemson.edu**1 - Parametric Simplex Algorithm for Linear Vector Optimization Problems**Firdevs Ulus, Princeton University, ORFE, Sherrerd Hall,
Princeton, NJ, 08544, United States of America,
fulus@princeton.edu, Birgit Rudloff, Robert Vanderbei

A parametric simplex algorithm for linear vector optimization problems is proposed. The efficiency of the algorithm is compared with Benson's algorithm and the multiobjective simplex algorithm. For nondegenerate problems it outperforms Benson's algorithm and is on par with the multiobjective simplex algorithm. For degenerate problems Benson's algorithm excels the simplex-type algorithms; however, the proposed algorithm performs much better than the multiobjective simplex algorithm.

2 - An LP-based Branch-and-bound Algorithm for Biobjective Mixed Integer ProgramsNathan Adelgren, Clemson University, Department of
Mathematical Sciences, Clemson, SC, 29634, United States of
America, nadelgr@g.clemson.edu, Akshay Gupta

We introduce a new LP-based branch-and-bound (BB) method for solving biobjective mixed integer linear programs (BOMILP). New branching, fathoming, cutting plane and node relaxation techniques are incorporated into a traditional BB framework. Computational results show that this method is competitive with current techniques for BOMILP.

3 - The Quadrant Shrinking Method for Solving Triobjective Integer ProgramsMartin Savelsbergh, Prof. H. Milton Stewart School of Industrial
& Systems Engineering, Georgia Institute of Technology, 765 Ferst
Dr NW, Atlanta, GA, 30332-0205, United States of America,
martin.savelsbergh@isye.gatech.edu, Hadi Charkhgard,
Natashia Boland

We present a new variant of the full (p-1)-split algorithm for finding all nondominated points of a triobjective integer program. The algorithm is easy to implement and solves at most $3n+1$ integer programs, where n is the number of nondominated points. Computational experiments demonstrate its efficacy.

4 - Optimizing a Linear Function Over the Efficient Set of a Multi-objective Integer ProgramHadi Charkhgard, University of Newcastle, University Drive,
Callaghan, Australia, hadi.charkhgard@gmail.com,
Natashia Boland, Martin Savelsbergh

We present a new algorithm to optimize a linear function over the set of efficient solutions of a multi-objective integer program. Because the algorithm maintains both a lower and an upper bound on the optimal objective value, it can easily be converted into a fast approximation algorithm. Finally, we demonstrate that the algorithm can be used to efficiently compute the nadir point of a multi-objective integer program.

28-Room 405, Marriott

Economic Models of Auctions

Cluster: Auctions

Invited Session

Chair: Brian Baisa, Assistant Professor, Amherst College, 100 Boltwood Ave, Amherst, MA, 01002, United States of America, bbaisa@amherst.edu

1 - A Detail-free and Efficient Auction for Budget Constrained Bidders

Brian Baisa, Assistant Professor, Amherst College, 100 Boltwood Ave, Amherst, MA, 01002, United States of America, bbaisa@amherst.edu

I study auctions for divisible goods where bidders have private values and private budgets. My main result shows that when bidders have full-support beliefs over their rivals' types, a clinching auction played by proxy-bidders implements a Pareto efficient outcome. Bid behavior is derived using two rounds of iterative deletion of weakly dominated strategies. This contrasts with recent work that shows efficient auction design is incompatible with dominant strategy incentive compatibility.

2 - Weak Cartels and Collusion-proof Auctions

Jinwoo Kim, Associate Professor, Seoul National University, 1 Gwanak-ro Gwanak-gu, Seoul, Korea, Republic of, jjkim72@gmail.com, Yeon-koo Che, Daniele Condorelli

We study collusion in auctions by cartels whose members cannot exchange side-payments (i.e., weak cartels). We provide a complete characterization of outcomes that are implementable in the presence of weak cartels, identifying the set of circumstances under which standard auctions are susceptible to them. We then solve for optimal collusion-proof auctions and show that they can be made robust to the specific details of how cartels are formed and operated.

3 - Multi-unit Auctions with a Large Bidder

Justin Burkett, Wake Forest University, Box 7505, Winston-Salem, NC, 27104, United States of America, burkettje@wfu.edu, Brian Baisa

Recent work in IPV settings shows that the uniform-price and discriminatory auctions are approximately efficient if there are many bidders with relatively small demands bidding for a homogenous good. We study a setting where a large bidder competes against a continuum of small bidders, and show that the small bidders prefer the uniform-price over the discriminatory auction, the large bidder has the reverse ranking, and there is no clear efficiency or revenue ranking between the two formats.

4 - A Truthful-in-expectation Mechanism for the Generalized Assignment Problem

Salman Fadaei, Technische Universität München, Munich, Germany, salman.fadaei@tum.de, Martin Bichler

We propose a truthful-in-expectation, 1-1/e-approximation mechanism for the generalized assignment auction. In such an auction, each bidder has a knapsack valuation function. We present a novel convex optimization program for the problem which yields an MIDR allocation rule. We show how to implement the convex program in polynomial time using a fractional greedy algorithm which approximates the optimal solution within an arbitrarily small error.

Joint Session Analytics/MIF/HAS: Healthcare Analytics

Sponsor: Analytics

Sponsored Session

Chair: Shannon Harris, Katz Graduate School of Business, 241 Mervis Hall, Pittsburgh, PA, 15213, United States of America, sharris@katz.pitt.edu

1 - Optimal Staffing of Revenue Centers in Healthcare Delivery Organizations

Jerome Niyirora, SUNY Polytechnic Institute, 100 Seymour Rd, Utica, NY, 13502, United States of America, jerome.niyirora@gmail.com, Jamol Pender

In the operations management literature, little attention is paid to profitability in healthcare delivery organizations. But such an important issue cannot be overlooked since an unprofitable organization is unlikely to meet the quality of service demands. To address this issue, we introduce a nonstationary queueing model and apply optimal control theory to derive a new closed form square root staffing formula to allow for optimal staffing based on the cost-to-revenue ratio.

2 - Managing Customer Arrivals in Service Systems with Multiple Servers

Christos Zacharias, Visiting Assistant Professor, University of Miami, School of Business Administration, Miami, FL, United States of America, czacharias@miami.edu, Michael Pinedo

We analyze a discrete multi-server queueing model for scheduling customer arrivals in service systems with parallel servers. Theoretical and heuristic guidelines are provided for the effective practice of appointment overbooking to offset no-shows. The benefits of resource-pooling are demonstrated in containing operational costs and increasing customer throughput.

3 - A Hierarchical Bayes Model of No-show Rates

Joseph Johnson, Associate Professor, University of Miami, 5250 University Drive, 501 Kosar Epstein Building, Coral Gables, FL, 33146, United States of America, jjohnson@bus.miami.edu, Yu Tang, Yutian Li

Patient no-shows in US clinics can sometimes shoot up to 80%. Accurate predictions of no-shows help clinics optimally schedule appointments. We develop a Hierarchical Bayes logit model which improves prediction accuracy over the widely-used simple logit model. The accuracy gain arises from the individual patient-level coefficients provided by the Bayesian method. Comparison of model fit on 12-months of appointment data shows that the Bayesian model vastly outperforms the simple logit model.

4 - Appointment Scheduling with No-shows and Cancellations

Shannon Harris, Katz Graduate School of Business, 241 Mervis Hall, Pittsburgh, PA, 15213, United States of America, sharris@katz.pitt.edu, Jerrold H. May, Luis Vargas

Appointment no-shows and cancellations can be disruptive to clinic operations. Scheduling strategies such as overbooking or overtime slot assignments can assist with mitigating these disruptions. We propose a scheduling model that accounts for both no-show and cancellation rates, and show properties of optimal scheduling models under specific conditions.

1 - Optimization Models for Planning and Dispatch in Large-scale Freight Operations

Ted Gifford, Distinguished Member Of Technical Staff, Schneider National, Inc., P.O. Box 2545, Green Bay, WI, 54306, United States of America, GiffordT@schneider.com

Schneider National operates a fleet of 13,000 tractors and 48,000 trailers in a random network and accepts 10,000 customer orders daily. In order to maximize revenue and asset utilization, Schneider current employs math programming models providing real-time decision support for load acceptance, asset re-positioning and dispatch assignment. We will describe a number of these models and the operational challenges that accompany them, as well as enhancements and new models in development.

2 - Management Science at Bank of America Merrill Lynch

Russ Labe, Director, Analytics & Modeling, Bank of America, 1500 Merrill Lynch Drive, First Floor, Pennington, NJ, 08534, United States of America, russ.labe@bankofamerica.com

This paper will discuss the impact of analytics at Bank of America Merrill Lynch. Russ Labe, Director of Analytics & Modeling, will provide an overview of his group and discuss a few examples of business issues, analytic approaches, and results. He will also discuss how OR/MS drives business benefits, lessons learned, and best practices.

3 - Predictive Modeling at Scale

Kathy Lange, Sr. Director, Global Analytics Practice, SAS, SAS Campus Drive, Cary, NC, 27518, United States of America, Kathy.Lange@sas.com

Most organizations realize that analytics can help them become more competitive, more profitable, save money, or improve lives. Now they need to expand their analytical impact. This presentation will discuss new capabilities that address how organizations can scale up the modeling process, how to generate many hundreds or thousands of predictive models simultaneously, automating the creation and management of models.

Data Mining and Predictive Analytics in Health Care

Sponsor: Data Mining

Sponsored Session

Chair: Lior Turgeman, Data Mining and Operations Research, Joseph M. Katz Graduate School of Business, Roberto Clemente Dr, Pittsburgh, PA 1526, Pittsburgh, United States of America, tur.lior@gmail.com

1 - Predicting Hospital Readmission using Patient Encounter Data

Atish Sinha, Professor, University of Wisconsin-Milwaukee, Lubar School of Business, Milwaukee, WI, 53201-0742, sinha@uwm.edu, Amit Bhatnagar, Arun Sen

Under the Affordable Care Act, readmission rate has become a critical issue for hospitals. We analyze patient encounter data, obtained from an HIE, during a two-year period for a chain of hospitals. Our model incorporates two sets of factors, consumer demographics and encounter data, to predict readmission likelihoods and durations.

2 - A Mixed-ensemble Predictive Model for Hospital Readmission

Lior Turgeman, Data Mining and Operations Research, Joseph M. Katz Graduate School of Business, Roberto Clemente Dr, Pittsburgh, PA 1526, United States of America, tur.lior@gmail.com, Jerrold H. May, Johnson Moore, Youxu Cai Tjader

We present a novel approach for predictive modeling, using a mixed-ensemble classifier. The approach integrates a C5.0 tree as the base ensemble classifier, and a support vector machine (SVM) as a secondary classifier. By implementing our method for predicting hospital readmission of CHF patients, we were able to overcome some of the limitations of both C5.0 and SVM, as well as to increase the classification accuracy for the minority class, particularly when strong predictors are not available.

3 - A Decision Analytic Approach to Modeling Heart Transplant Survival

Asil Oztekin, Assistant Professor Of Operations & Information Systems, Participating Faculty Of Biomedical Engineering & Biotechnology Program, University of Massachusetts Lowell, One University Ave. Southwick 201D, Lowell, MA, 01850, United States of America, Asil_Oztekin@uml.edu, Ali Dag, Fadel Megahed

Due to the scarcity of donor hearts for transplantation, an accurate prediction of transplantation success plays an important role in the matching procedure between donors and recipients. A decision analytic framework based on Bayesian Belief Network is deployed here to address this issue. The results indicate that this decision analytic methodology yields superior results than the ones in the transplantation literature. It is a generic model which can be implemented in other transplant cases.

Big Data Analytics in Genomics

Cluster: Big Data Analytics in Computational Biology/Medicine

Invited Session

Chair: Michael Hoffman, Scientist, Assistant Professor, Princess Margaret Cancer Centre/University of Toronto, Toronto Medical Discovery Tower 11-311, 101 College St, Toronto, ON, M5G 1L7, Canada, michael.hoffman@utoronto.ca

1 - A Spectral Approach for the Integration of Functional Genomics Annotations for Genetic Variants

Iuliana Ionita-laza, Assistant Professor, Columbia University, 722 West 168 St, New York, NY, 10032, United States of America, ii2135@columbia.edu

Over the past few years, substantial effort has been put into the functional annotation of variation in human genome sequence. Such annotations can play a critical role in identifying putatively causal variants among the abundant natural variation that occurs at a locus of interest. The main challenges in using these various annotations include their large numbers, and their diversity. I will discuss an unsupervised approach to derive an integrative score of these diverse annotations.

2 - Big Data Regression and Prediction in Functional Genomics

Weiqiang Zhou, Johns Hopkins University Bloomberg School of Public Health, 615 N Wolfe Street, Rm E3638, Baltimore, MD, 21205, United States of America, kenandzhou@hotmail.com, Hongkai Ji

The rapid growth of functional genomic data makes it possible to build models for predicting one high-throughput genomic data type from another data type. This can be formulated as a challenging big data regression problem which involves fitting millions of high-dimensional regressions simultaneously. To cope with the high dimensionality and heavy computation, we developed BIRD algorithm that leverages the correlation structure in the data to make computation fast and predictions accurate.

3 - Semi-automated Human Genome Annotation using Chromatin Data

Michael Hoffman, Scientist, Assistant Professor, Princess Margaret Cancer Centre/University of Toronto, Toronto Medical Discovery Tower 11-311, 101 College St, Toronto, ON, M5G 1L7, Canada, michael.hoffman@utoronto.ca

Segway is an integrative method to identify patterns from multiple functional genomics experiments. It discovers joint patterns in multiple genomic datasets using a dynamic Bayesian network model, simultaneously segmenting the genome and identifying clusters of similar segments. We apply Segway to ENCODE ChIP-seq and DNase-seq data and identify patterns associated with transcription start sites, gene ends, enhancers, and repressed regions.

4 - Identifying Genetic Risk Factors for Complex Traits using Functional and Association Data

Jo Knight, Centre for Addiction and Mental Health, 250 College Street, Toronto, Canada, jo.knight@camh.ca, Mike Barnes, Mike Weale, Sarah Gagliano

Our aim is to identify the genetic risk variants that contribute to disease. Genome wide association studies have identified some but many remain unknown. We seek to combine the association data with functional characteristics of the genome. Machine learning is used to derive a score to indicate whether a genetic variant is likely to be causal based on large amounts of functional data. We combine the functional score and the association score together in a Bayesian framework.

Sponsored Session

Chair: Tolga Tezcan, Associate Professor, London Business School, Regent's Park, London, UK, NW14SA, United Kingdom, ttezcan@london.edu

Co-Chair: Nicos Savva, London Business School, Park Road, London, NW14SA, United Kingdom, nsavva@london.edu

1 - Why is Big Data Underutilized?

Kraig Delana, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, kdelana@london.edu, Nicos Savva, Tolga Tezcan

The advent of big data has brought the opportunity to track customer needs and offer service proactively. Motivated by a healthcare application we develop a queueing and game theoretic model to show that enrolling in such a data-tracking scheme generates positive externalities in the form of reduced waiting times. Nevertheless, we show that self-interested consumers will under-utilize this opportunity, leading to a welfare loss.

2 - A Two-sided Mechanism to Coordinate the Influenza Vaccine Supply Chain

Kenan Arifoglu, University College London, Gower Street, London, WC1E 6BT, United Kingdom, k.arifoglu@ucl.ac.uk

Rational consumer behavior and uncertain yield lead to frequent supply/demand mismatches in the influenza (flu) vaccine supply chain. To eliminate the inefficiency in the flu vaccine supply chain, we propose a two-sided mechanism which implements tax/subsidy payments on the demand side and a transfer payment on the supply side and aligns consumers' and vaccine manufacturer's incentives with the social optimum. The two-sided mechanism improves social welfare significantly.

3 - Analysis of Triage Systems in Emergency Departments

Ozlem Yildiz, Simon Business School, University of Rochester, CSH 4-333, Simon Business School, Rochester, NY, 14627, United States of America, oyildiz@london.edu, Tolga Tezcan, Michael Kamali

We study triage method decisions in emergency departments and provide a policy for determining when to apply provider triage (PT) based on operational and financial considerations using a queueing framework. We obtain closed-form expressions for the range of arrival rates in which PT economically outperforms traditional nurse triage using a steady-state many-server fluid approximation. We show via simulation experiments that the proposed policy performs within 0.82% of the best solution.

4 - Who is Better off in a Focused Factory and Why?**A Comparison of On-site and Off-site Surgery**

Michael Freeman, University of Cambridge, Cambridge, CB2
1AG, United Kingdom, mef35@cam.ac.uk, Stefan Scholtes

We study a teaching hospital with a substantial off-site "focused factory" operation for elective surgery and compare outcomes of patients in the focused factory with outcomes of similar patients operated on on-site. In line with OM theory, we find superior performance at the off-site focused factory. We then use the off-site plant to explore the reasons why operations at the on-site plant are less efficient and less effective.

Sponsored Session

Chair: Retsef Levi, J. Spencer Standish (1945) Professor of Operations Management, Sloan School of Management, MIT, 100 Main Street, BDG E62-562, Cambridge, MA, 02142, United States of America, retsef@mit.edu

1 - Chicken Jerky Pet Treats Reveal Troubling Supply Chain Vulnerabilities

Shannon Stewart, Research Scientist, MIT Center for Biomedical Innovation, 77 Massachusetts Ave, E19-604, Cambridge, MA, 02139, United States of America, srstew@mit.edu, Amine Anoun, Stacy Springs, Retsef Levi, Karen Zheng, Sabrina Cheng, Louis Chen, James Leung, Tyngwei Chen

For the last eight years, the FDA has been grappling with an ongoing contamination of jerky treats for pets that are made in China. To date, 5,800 dogs have been sickened by the products, and 1,000 have died. Careful analysis of the clinical signs, product ingredients, and associated supply chains has revealed vulnerabilities in the supply chain. We will explore supply chain structures in China and learn how they can lead to unsafe practices that have important implications for product quality.

2 - A Data Driven Approach to Mitigate Risk in Global Food Shipments

Amine Anoun, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, aanoun@mit.edu, Tauhid Zaman, Retsef Levi, Shannon Stewart

Investigating global shipping data can help predict high risk behavior among companies. We collect over 67,000 bills of lading for honey shipments and focus on global shipping patterns to investigate whether signals produced in shipping documents are predictive of adulteration. We identify features that may be predictive of high risk behavior, then develop a Bayesian statistical model to predict which shippers are at risk of committing some form of adulteration.

3 - Risk Drivers in Farming Supply Chains

Karen Zheng, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, yanchong@mit.edu, Retsef Levi, Shujing Wang

We study how the structure of a farming supply chain impacts the quality risk for agricultural products. We develop a methodology to quantify the dispersion of a farming supply chain and use farm-level data from different agricultural industries to test the hypothesis that a more distributed farming supply chain is subject to higher quality risk. Our results suggest that dispersion is a key driver to quality risk for food products.

1 - Assignment and Scheduling of Community Health Workers

Karen Smilowitz, Northwestern University, 2145 Sheridan Road, Evanston, IL, United States of America, ksmilowitz@northwestern.edu, Paige Von Achen, Avi Kenny, Ross Feehan, Mallika Raghava

We present location-routing models for the assignment and scheduling of community health workers and their supervisors in remote settings. This work is a collaborative project with Last Mile Health, an NGO with the aim to expand access to health care in rural Liberia.

2 - Locating and Sizing FEMA's Disaster Recovery Centers

Julia Moline, FEMA, FEMA, Washington, DC, United States of America, julia.moline@fema.dhs.gov, Jarrod Goentzel, Erica Gralla

We create a data-driven decision process for Federal Emergency Management Agency's (FEMA) Disaster Recovery Centers (DRCs) program. We develop thresholds and optimization models to dynamically locate, size, and staff DRCs. We apply the process to recent disaster response scenarios and show that FEMA could have reduced cost significantly while providing sufficient capacity.

3 - Aid Transportation Procurement Analysis: The Case of the World Food Programme in Kenya

Feyza Sahinyazan, PhD Candidate, McGill University, 1001 Rue Sherbrooke Ouest Room 520, Montreal, QC, H3A 1G5, Canada, feyza.sahinyazan@mail.mcgill.ca, Vedat Verter, Marie-Eve Rancourt

In East Africa, a region which suffers from chronic insecurity, The World Food Programme usually contracts with third-party carriers based on a competitive bidding mechanism; however, collected bids show inconsistencies with high variances. In such a context, determining fair market prices is a complex task. In this study, we analyze the factors that can explain these variances, such as seasonality and road condition. We provide recommendations for better transportation procurement practices.

4 - Facilitating Production of Grain Storage Products in Uganda

Mark Brennan, MIT, 77 Massachusetts Avenue, MIT, E38-648, Cambridge, MA, 02139, United States of America, mbrenn@mit.edu, Emily Gooding, Jarrod Goentzel

Using local manufacturing and distribution capacity in a humanitarian or development context has the potential to be more effective and sustainable. Examining the crop storage sector in Uganda, this study explores how NGOs quickly scaling up local capacity can help risk-averse firms increase profit and reduce costs through supply chain coordination.

1 - The Humanitarian Pickup and Distribution Problem

Michal Tzur, Professor, Tel Aviv University, Industrial Engineering Department, Tel Aviv, 69978, Israel, tzur@eng.tau.ac.il, Ohad Eisenhandler

We study the logistic challenges of a food bank that coordinates food rescue operations on a daily basis, using limited resources. We model it as a routing-allocation problem, with the aim of maintaining equitable allocations to the different agencies, while delivering as much as possible in total. We then present characteristics of the optimal solution to the problem, an efficient algorithm to solve sub-problems of it, and heuristic approaches to solve the problem.

2 - Community-Engaged Decision Modeling for Local Economic Development

Michael P. Johnson, Associate Professor, University of Massachusetts Boston, 100 Morrissey Blvd., McCormack Hall, Room 3-428A, Boston, MA, 02125-3393, United States of America, Michael.Johnson@umb.edu, Sandeep Jani

Main Street organizations develop local development initiatives that support economic and social goals. This requires appropriate data and capacity to apply analytic methods. We discuss a pilot study for Boston Main Streets that links values, data, communication, analysis and action. Results demonstrate the benefits of qualitative and quantitative methods to enable practitioners to make best use of primary and secondary data for decision-making and information systems design.

3 - Introducing Pro Bono Analytics

David Hunt, Manager, Oliver Wyman, One University Square,
Suite 100, Princeton, NJ, 08540, United States of America,
David.Hunt@oliverwyman.com, Michael P. Johnson

Pro Bono Analytics is a new initiative within INFORMS to match INFORMS members willing to volunteer their operations research and advanced analytical skills with non-profit organizations working in underserved and developing communities. This presentation will provide an overview of the Pro Bono Analytics program, describe how OR/analytics professionals can make a difference, and show how you can become a Pro Bono Analytics volunteer.

4 - Predicting Areas of Low HPV Vaccination Coverage to Target Vaccination Promotion Efforts

Brittany Green, University of Cincinnati, Carl H. Linder School of Business, 2925 Campus Green Dr., Cincinnati, OH, 45221, United States of America, brittanydianeg@gmail.com, Josh Haupt, Louis Luangkesorn

The Jewish Healthcare Foundation is trying to promote Human Papillomavirus (HPV) vaccination efforts in southwestern Pennsylvania. HPV is a sexually transmitted disease which can be prevented with a three dose vaccine. However, vaccination rates among adolescents is short of target rates. We develop a predictive model of vaccination coverage based on the National Immunization Survey. We then apply this model to census data to identify zip codes to target for HPV vaccination promotion programs.

Health Care Modeling and Optimization V

Contributed Session

Chair: Karti Puranam, Assistant Professor, La Salle University, 1900 W Olney Ave, Philadelphia, PA, 19141, United States of America, puranam@lasalle.edu

1 - Differential Impact of Health it on Duplicate Testing

Sezgin Ayabakan, Assistant Professor, University of Baltimore, 1420 N Charles St, Baltimore, MD, 21201, United States of America, sayabakan@ubalt.edu, Indranil Bardhan, Zhiqiang Zheng, Kirk Kirksey

We investigate and compare the impact of intra- and inter- hospital information sharing technologies on duplicate radiology and laboratory tests for Congestive Heart Failure patients. We use a comprehensive dataset of 39,600+ visits across outpatient clinics of 68 hospitals in North Texas from 2005 to 2012 in our quasi-experimental approach. Our results support the need for implementation of health information exchanges as a potential solution to reduce incidences of duplicate tests.

2 - Manpower Planning for Health Care Services

Utpal Bhattacharya, Dr., Indian Institute of Management Indore, Prabandh Sikhar, Indore, MP, 453556, India, utpalb@iimind.ac.in

The article Manpower planning for health care services “ introduces various key issues on management of manpower system for health care services. The motivation in this article is to make a study on how to choose proper type of manpower as and when required, upgrading the existing people, managing the attrition rate by using various measures, giving promotions to the employees, in order to keep healthy atmosphere in the organization.

3 - Optimal Block Scheduling for the Operating Room Suite: From Tactical to Strategic Planning

Thomas Sexton, Professor, Stony Brook University, College of Business, Stony Brook, NY, 11794-3775, United States of America, thomas.sexton@stonybrook.edu, Kenneth Rosenfeld, Melissa Dolan, Kelly Stickle, Herbert Lewis

We present a multicriteria nonlinear optimization model for allocating operating room time among surgical services in a major academic medical center. The model incorporates three objectives: the hospital's financial success; its overall mission; and its contribution to community needs. These factors elevate OR scheduling from the tactical realm, with its focus on utilization, to the strategic realm, in which the OR suite is viewed as central to the hospital's higher-level objectives.

4 - Can Obesity be Completely Eradicated by Physical Activity?

He Huang, Beijing Institute of Technology, Beijing, 100081, China, huanghe@bit.edu.cn, Yaohui Pan, Yahong Chen, Tianmei Wang, Zhijun Yan

The inter-person dynamics of obesity epidemic have rarely been revealed. We develop a belief decision model to simulate the spreading of two competing obesity-related behaviors from people to people. Results show that both behaviors have thresholds, below which obesity will be quickly eradicated, and that social discrimination may play contrary effects in different cases.

5 - An Ordering Heuristic for RBCS under Multiple Independent Sources of Supply

Karti Puranam, Assistant Professor, La Salle University, 1900 W Olney Ave, Philadelphia, PA, 19141, United States of America, puranam@lasalle.edu, Marilyn Lucas, David Novak

We introduce a multi-period, perishable inventory model under two independent sources of supply, where blood is randomly transferred from hospitals to a large blood bank. We formulate a dynamic program to solve the multi-period cost minimization problem. We compare our results to the ordering policy that was followed in practice.

Applied Probability II

Contributed Session

Chair: Chiel Van Oosterom, PhD Student, Eindhoven University of Technology, P.O. Box 513, Eindhoven, 5600MB, Netherlands, c.d.v.oosterom@tue.nl

1 - Statistical Inference Theory using Truncated Statistics with Applications

Byung Rae Cho, Professor, Clemson University, 152 Freeman Hall, Clemson, SC, 29634, United States of America, bcho@clemson.edu, Russell Krenek

There are many production situations where specification limits on a process are implemented externally, and the end product is typically reworked or scrapped if its performance does not fall in the tolerance range. As such, the actual distribution after inspection becomes truncated. The purpose of this presentation is to develop a set of hypothesis testing procedures under this truncated environment and explore application areas.

2 - Development of Convolutions for Industrial and Service Processes

Russell Krenek, Graduate Student, Clemson University, 129 Freeman Hall, Clemson, SC, 29634, United States of America, rkrenek@g.clemson.edu, Byung Rae Cho

Understanding truncated random variables and their roles in production inspection processes is a key to modern industry, as this type of review arises in many engineering applications. It is important to note that these production inspection processes require the convolution of truncated distributions due to multiple production stages. This paper focuses on the development of the convolutions resulting from truncated normal and truncated skew normal random variables, and their applications.

3 - Condition-based Repair Prioritization in Repairable Inventory Supply Chains

Chiel Van Oosterom, PhD Student, Eindhoven University of Technology, P.O. Box 513, Eindhoven, 5600MB, Netherlands, c.d.v.oosterom@tue.nl, Geert-Jan Van Houtum

We propose a model for exploiting condition information to dynamically prioritize repairs in a capacitated repair shop. The repair shop supports a system with a number of different repairable components. The system is down whenever a component fails and no ready-for-use spare part is available for that component. The objective in prioritizing repairs is to maximize the long-run availability of the system.

4 - Calendar-based Age Replacement Policy with Dependent Renewal Cycles

Maliheh Aramon Bajestani, University of Toronto, Unit 804, 141 Davisville Ave, Toronto, ON, M4S 1G7, Canada, maramon@mie.utoronto.ca, Dragan Banjevic

We introduce an age-based replacement policy in which the preventive replacements are restricted to specific calendar times. This policy is logistically applicable in industries, having large and geographically diverse populations of deteriorating assets with different installation times. Using the theory of Markov chains with general state space and a suitably defined ergodic measure, we analyze the policy, minimizing the long-run expected cost per time unit.

Contracts, Quality, and Pricing for OM-Marketing

Cluster: Operations/Marketing Interface

Invited Session

Chair: Haresh Gurnani, Professor, Wake Forest University, School of Business and Center for Retail, Winston Salem, NC, 27106, United States of America, gurnanih@wfu.edu

Co-Chair: Shouqiang Wang, Assistant Professor, Clemson University, 131D Surrine Hall, Clemson, SC, 29672, United States of America, shouqiw@clemson.edu

1 - Signaling Trustworthiness using a Buy-back Contract

Shouqiang Wang, Assistant Professor, Clemson University, 131D Surrine Hall, Clemson, SC, 29672, United States of America, shouqiw@clemson.edu, Haresh Gurnani

Not all suppliers are trustworthy: retailers face risk dealing with suppliers who may not honor their buy-back contracts. We examine whether an upstream manufacturer is able to signal her trustworthiness via the buy-back contract terms (i.e., the wholesale and return prices) offered to a retailer; and if so, how such a buy-back contract needs to be structured.

2 - Optimal Design of Sales Service Channel

Huaqing Wang, Asst Professor, University of Wisconsin Stout, 262 JHTW, 410 10th Ave E, Menomonie, United States of America, wangh@uwstout.edu, Haresh Gurnani, Yu Tang

Customers buying certain products may lack functional knowledge and need help after purchase. The retailer (or manufacturer) can invest in pre-sales effort to educate customers; We study the service channel design problem with different structures and show that the retailer would even be worse off in a cost-sharing contract.

3 - Quality Provision with Heterogeneous Consumer Reservation Utilities

Rachel Chen, Associate Professor, University of California, Davis, CA, United States of America, rachen@ucdavis.edu, Lian Qi, Leon Chu

This paper examines a firm's quality and price decisions when consumers differ in both their willingness-to-pay for quality and in their reservation utility for the basic product. We find that the optimal quality may increase with a negative shift in consumers' reservation utilities. When the firm offers a vertically differentiated product line, the concern for cannibalization may distort the quality upwards under heterogeneous reservation utilities.

4 - Dynamic Matching in a Two-sided Market

Yun Zhou, University of Toronto, 105 St. George Street, Toronto, Canada, Yun.Zhou13@Rotman.Utoronto.Ca, Ming Hu

A two-sided market often shares a common structure that engages three parties: the supply side, the demand side and an intermediate firm facing intertemporal uncertainty on both supply/demand sides. We propose a general framework of dynamically matching supply with demand of heterogeneous types (with horizontally or vertically differentiated types as special cases) by the intermediary firm and explore the optimal and heuristic matching policies.

Nonmarket Strategy

Sponsor: Organization Science

Sponsored Session

Chair: Jiao Luo, University of Minnesota, 321-19th Ave S, Suite 3-365, Minneapolis, MN, 55455, United States of America, luoj@umn.edu

1 - Radical Repertoires: The Incidence and Impact of Corporate-Sponsored Social Activism

Mary-hunter McDonnell, The Wharton School, University of Pennsylvania, Philadelphia, PA, marymcd@wharton.upenn.edu

This article explores situations in which firms respond to contentious social activist challenges by openly sponsoring social movements. I empirically explore the emergence and implications of a new strategic phenomenon in non-market strategy – the corporate-sponsored boycott – in which firms voluntarily cooperate with social movement organizations to protest contested social practices of other companies or entities at higher orders of market organization, such as industries and states.

2 - When Does a Stakeholder Attack Become a Reputational Crisis? Stakeholder Capital and the Micro-Foundations of Corporate Reputation

Sinziana Dorobantu, New York University, New York, NY, sdoroban@stern.nyu.edu, Witold J. Henisz, Lite Nartey

We provide and demonstrate empirical support for theoretical arguments on the micro-foundations of corporate reputation thereby explaining which stakeholder attacks are more likely to become organizational reputational crises that destroy financial value. We evaluate stakeholder reactions to attacks targeting 19 gold mining firms between 2000 and 2008 as reported in over 20,000 media articles, and link these reactions to the daily abnormal returns of these publicly traded companies.

3 - Micro-foundations of Corporate Social Responsibility and Irresponsibility

Olga Hawn, UNC Kenan-Flagler Business School, Chapel Hill, NC, United States of America, Olga_Hawn@kenan-flagler.unc.edu, Catherine Shea

This study examines how two fundamental dimensions of social perception—warmth and competence—mediate and moderate the effects of corporate social responsibility (CSR) and irresponsibility (CSI) on specific outcomes. The results of our experimental studies suggest that firms from high-warmth countries receive lower benefits for CSR and pay higher penalties for CSI than firms from low-warmth countries; furthermore, this effect reverses when combined with high competence.

4 - The Economic Case for CSR: Competitive Advantage of For-profit Firms in the Market for Social Goods

Jiao Luo, University of Minnesota, 321-19th Ave S, Suite 3-365, Minneapolis, MN, 55455, United States of America, luoj@umn.edu, Aseem Kaul

We develop a formal model of CSR, examining competition between a for-profit firm and a nonprofit in the supply of social goods. We argue that firms can benefit both stakeholders and shareholders only if their CSR efforts are sufficiently differentiated from those of non-profits. Thus, our paper makes an economic case for CSR, specifying conditions under which CSR is Pareto optimal, and highlighting the potentially divergent effects of CSR activities for shareholders and stakeholders.

New Development in Health Care Operations

Sponsor: Manufacturing & Service Oper

Mgmt/Healthcare Operations

Sponsored Session

Chair: Lauren Lu, Associate Professor, University of North Carolina at Chapel Hill, Kenan-Flagler Business School, Chapel Hill, NC, 27599, United States of America, lauren_lu@unc.edu

Co-Chair: Feng Lu, Assistant Professor, Purdue University, 403 W State St, West Lafayette, IN, 47907, United States of America, lu428@purdue.edu

1 - Do Mandatory Overtime Laws Improve Quality? Staffing and Operational Flexibility of Nursing Homes

Lauren Lu, Associate Professor, University of North Carolina at Chapel Hill, Kenan-Flagler Business School, Chapel Hill, NC, 27599, United States of America, lauren_lu@unc.edu, Feng Lu

During the 2000s, over a dozen U.S. states passed laws that prohibit health care employers from mandating overtime for nurses. Using a nationwide panel dataset from 2004 to 2012, we find that these mandatory overtime laws reduce the service quality of nursing homes. This outcome can be explained by two undesirable changes in the staffing hours of registered nurses: decreased hours of permanent nurses and increased hours of contract nurses per resident day.

2 - The Hidden Costs of Hospitals' "Custom Contracting" with Group Purchasing Organizations

Avi Seidmann, Simon Business School, University of Rochester, Rochester, NY, 14627, United States of America, avi.seidmann@simon.rochester.edu, Vera Tilson, Rajib Saha

Most hospitals in the US join Group Purchasing Organizations (GPOs) to lower procurement costs by demand aggregation. Some larger hospitals further negotiate private deals through custom contracts directly with the GPO vendors. We present a game-theoretic model where the decisions by the hospitals and the vendor are endogenous, and we prove that – counter to the industry's expectations – the resulting savings for the hospitals are always lower when the GPOs go for custom contracting.

3 - Resource Pooling and Flexibility to Improve ED Boarding

Aaron Ratcliffe, Assistant Professor, University of North Carolina at Greensboro, 438 Bryan Building, P.O. Box 26170, Greensboro, NC, 27402, United States of America, aaron.ratcliffe@uncg.edu, Alex Mills

ED boarding worsens health outcomes and compromises hospital care. We investigate how resource pooling can improve ED boarding by aligning ED admissions with inpatient discharges using a dynamic queueing control model. We compare strategies which jointly manage inpatient resources under a traditional and pay-for-performance setting.

4 - Optimal Mobile Healthcare Delivery Aimed at Minimizing Social Healthcare Costs

Jiu Song, Nanyang Technological University, 50 Nanyang Avenue, Singapore 639798, Singapore, Jiusong@ntu.edu.sg, Fang Liu, Pengfei Guo, Yulan Wang

Developing countries set up mobile health programs to improve public health service and people's access to medical care in the remote regions. We model the disease progression following a discrete time Markov chain and focus on improving the efficiency of the mobile healthcare delivery system. We identify conditions under which mobile healthcare is beneficial, and find the optimal duration a mobile hospital visits a community. We provide some managerial insights through numerical study.

1 - Slow First, Fast Later: Empirical Evidence of Speed-up in Service Episodes of Finite Duration

Aditya Jain, Baruch College, New York City, New York, NY, United States of America, aditya.jain@baruch.cuny.edu, Sarang Deo

In service episodes of finite duration with time-varying dynamics, operating variables that affect work speed have not been rigorously studied. We employ the trade-off faced by workers between cost of providing service and cost of customer wait to identify two previously unexplored drivers of work speed: time within the episode and anticipated remaining workload. We empirically test our predictions using data from a high volume, tertiary care outpatient department.

2 - Designing a Network of Accident-and-emergency Facilities to Improve Cost Efficiency for the Elderly

Houyuan Jiang, University Senior Lecturer, University of Cambridge, Judge Business School, Cambridge, United Kingdom, h.jiang@jbs.cam.ac.uk, Manmohan Sodhi

We concern ourselves with the elderly in an Accident-and-Emergency system. The system, while already stressed with a rapidly increasing load, faces an increasing percentage of the elderly as in many other countries, and closure of facilities due to costs. We characterize the sufficient and necessary conditions for one Accident-and-Emergency to have a split or pooled system and for a network of two Accident-and-Emergency departments to be merged or operated separately.

3 - Dynamic Exam Room Allocation to Improve Patient Wait Time and Provider Satisfaction

Sarah Kadish, Director Performance Measures And Improvement, Dana-Farber Cancer Institute, 450 Brookline Avenue, Boston, MA, 02215, United States of America, Sarah_Kadish@dfci.harvard.edu, Beth Overmoyer, Kristen Camuso, Courtney Haskett, Chris Reilly, Lillian Pedulla, Craig Bunnell

Allocation of exam rooms drives capacity, provider efficiency, and patient wait time. We sought to improve our algorithm for allocating rooms from a static provider-to-room ratio to a dynamic model, utilizing a Real-Time Locating System. Post-implementation, 83% of providers reported the rooming process was efficient compared with 43% at baseline, corroborated by a statistically significant reduction in patient wait time.

4 - Regional Routing Model for Healthcare Pickup and Delivery Networks

Joseph Szmerekovsky, Professor Of Management, North Dakota State University, Richard H. Barry Hall, # 350, Fargo, ND, 58108, United States of America, joseph.szmerekovsky@ndsu.edu, Luke Holt

We study a healthcare distribution network with delivery deadlines. It involves a large geographic road network visiting hospitals, clinics, and long-term care facilities. Supply chain planners are forced to determine route schedules that provide appropriate service levels while considering time constraints. We present a vehicle routing model that minimizes the system costs associated with vehicle routes.

Innovation, Technology Management and Networks

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Nur Sunar, Assistant Professor, University of North Carolina, Kenan-Flagler School of Business, Chapel Hill, United States of America, Nur_Sunar@kenan-flagler.unc.edu

1 - A Simple Model of Cascades in Networks

Asu Ozdaglar, Massachusetts Institute of Technology, 32 Vassar St, Cambridge, MA, United States of America, asuman@mit.edu, Yongwhan Lim, Alex Teytelboym

We consider a stochastic linear threshold model of cascades in networks. We define a new measure of an agent's ability to influence a cascade in a given network, called cascade centrality, which is the expected size of the cascade when the agent is the only seed in the network. We provide analytical characterizations of cascade centrality for certain network topologies. We also study a competition model in which firms seed their products and products diffuse according to the threshold model.

2 - Risk Aversion, Information Acquisition, and Technology Adoption

James Smith, Duke University, Fuqua School of Business, Durham, NC, United States of America, jes9@duke.edu, Canan Ulu

We study the impact of risk aversion and uncertainty on technology adoption decisions using a dynamic programming model: in each period, the consumer may adopt or reject the technology or pay to acquire a signal about the technology's uncertain benefit. With risk neutrality, the value functions and optimal policies satisfy natural monotonicity properties. However, with risk aversion, the policies need not be monotonic unless we impose additional assumptions on the utility functions involved.

3 - Innovation Internalization in Technology-intensive Supply Chains

Vish Krishnan, UCSD, La Jolla, CA, 92037, United States of America, vkrishnan@ucsd.edu, Junghee Lee, Hyoduk Shin

We study supply chains where technology is a critical determinant of product success and is often licensed from upstream firms by downstream supply chain entities through a royalty contract. We investigate the impacts of two prevalent royalty bases, Full System Base(FSB) and Sub System Base(SSB). We derive optimal royalty approaches for different market settings. FSB, despite its similarity to revenue sharing, is not always pareto-efficient in technology supply chains.

4 - Dynamic Product Development and Optimal Launch for a Customer Network

Nur Sunar, Assistant Professor, University of North Carolina, Kenan-Flagler School of Business, Chapel Hill, NC, United States of America, Nur_Sunar@kenan-flagler.unc.edu, Sinit Vitavasiri, John Birge

Development and the launch of products with network externalities require a deep understanding of social or commercial relationships among customers. Using a continuous time Brownian model, we analyze the optimal dynamic product development and launch strategies of a firm that sells an indivisible product to a network of customers. Our analysis shows that the network structure has a drastic impact on the optimal product quality and timing of the product launch.

Joint Session RMP/HAS: Health Care Pricing

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Margret Bjarnadottir, Assistant Professor of Management Science and Statistics, Robert H. Smith School of Business, University of Maryland, 4324 Van Munching Hall, College Park, MD, 20742, United States of America, margret@rhsmith.umd.edu

Co-Chair: Wedad Elmaghraby, Associate Professor, University of Maryland, University of Maryland, 4311 Van Munching Hall, College Park, MD, 20742, United States of America, welmaghr@rhsmith.umd.edu

1 - Drug Pricing for Pharmaceutical Manufacturers Distributing through a Common PBM

Nan Yang, Assistant Professor, University of Washington at St. Louis, St. Louis, MO, 63130, United States of America, yangn@wustl.edu, Yixuan Xiao, Panos Kouvelis

We model the competition among branded drug manufacturers on prices when contracting with a common PBM, who manages the prescription drugs of all manufacturers on behalf of their clients. We analyze the PBM's optimal formulary design problem and characterize the equilibrium pricing behavior of competing drug manufacturers. We discuss the impact of various parameters on the equilibrium outcomes for plan enrollees, PBM, and drug manufacturers.

2 - Bundle Payments vs. Fee-for-Service: Impact of Payment Scheme on Performance

Elodie Adida, University of California at Riverside, Riverside, CA, elodie.goodman@ucr.edu, Hamed Mamani, Shima Nassiri

Healthcare payments in the US have been based on a fee-for-service scheme, which provides incentives for high volume of care. The new healthcare legislation tests Bundled Payments that remove such incentives. We analyze effects of different payment schemes on the extent of patient selection and treatment intensity decisions by a risk-averse provider. We benchmark performance on the socially optimal outcome. We investigate modified payment systems that induce this social optimum.

3 - Information Elicitation and Influenza Vaccine Production

Sameer Hasija, Assistant Professor, INSEAD, 1 Ayer Rajah Avenue, Grange Heights, Singapore, Sameer.Hasija@insead.edu, Javad Nasiry, Stephen Chick

We explore the procurement of influenza vaccines by a government whose objective is to minimize the expected social costs (including vaccine, vaccine administration, and influenza treatment costs) when a for-profit vaccine supplier has production yield uncertainty, private information about its productivity (adverse selection) and potentially unverifiable production effort (moral hazard).

Dynamic Pricing: Learning, Personalization, Equilibrium, and Consumer Benefit

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Stefanus Jasin, Stephen M. Ross School of Business, University of Michigan, Ann Arbor, MI, United States of America, sjasin@umich.edu

1 - Dynamic Pricing and Learning with Online Retail Rankings

Arnoud Den Boer, Assistant Professor, University of Twente, Gebouw Zilverling, kamer 4013, Drienerloaan 5, Enschede, 7522 NB, Netherlands, a.v.denboer@utwente.nl, Bora Keskin

In online market environments such as Amazon or Google Shopping, firms receive advertisement space if they satisfy certain conditions. It is beforehand not clear if the benefits of this increased exposure outweigh the potential costs. We investigate this question in a dynamic pricing-and-learning setting.

2 - Personalized Assortment Planning with Finite Inventory and Demand Uncertainty

David Simchi-levi, Professor, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, dslevi@mit.edu, Clark Pixton

Motivated by the trend among consumers of smartphone usage for shopping online, we develop an algorithm for personalized assortment optimization over a finite horizon with finite inventory, in the case where customer choice parameters are not known. The algorithm simultaneously balances short term revenues, marginal cost of inventory, and exploration to achieve good performance in terms of regret.

3 - Stochastic Market Equilibrium for RM

Florin Ciocan, INSEAD, Boulevard de Constance 77305, Fontainebleau, France, florin.ciocan@insead.edu, Vahab Mirrokni, Mohammadhossein Bateni, Yiwei Chen

We present a dynamic pricing scheme for a seller who is allocating a volatile stream of goods to a set of budgeted buyers. Our prices are computed as a stochastic market equilibrium. We provide performance guarantees both in terms of revenues for the seller and in terms of fairness for the buyers. We apply our scheme to online ad allocation and using a dataset from a large ad network we empirically compare the performance of our scheme with the second price ad auction which is currently run.

4 - Do Consumers Benefit from Dynamic Pricing?

Guillermo Gallego, Columbia University, 820 CEPSPR, 530 West 120th Street, MC 470, New York, NY, 10027, United States of America, gmg2@columbia.edu, Ningyuan Chen

Intuitively, the seller benefits from dynamic pricing by extracting more of the consumers' surplus. Is this right? We start by looking at simpler questions: Do consumers prefer random prices? Is the consumer surplus a decreasing convex function of price? Is the optimal price an increasing concave function of cost? If true, is dynamic pricing better than optimal fixed pricing for consumers? We show that the answer to these questions are positive most of the time, but there are some exceptions.

Chair: Saif Benjaafar, Professor, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States of America, saif@umn.edu

Co-Chair: Guangwen Kong, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55414, United States of America, gkong@umn.edu

1 - Contracting with Overconfident Customers in Car Sharing

Guangwen Kong, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55414, United States of America, gkong@umn.edu, Diwakar Gupta

Although the economic and environmental benefits of car-sharing services are well documented, many potential customers are reluctant to utilize such services. This has been attributed to, in part, the lack of flexibility of short-term rental contracts. We study potential impact of customers' overconfidence when making reservations, and design the contracts that incorporate customers' bounded rationality.

2 - Inventory Rebalancing in Vehicle Sharing Networks

Saif Benjaafar, Professor, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States of America, saif@umn.edu, Xiaobo Li, Xiang Li

We study the problem of inventory rebalancing in vehicle sharing networks. We characterize the structure of an optimal policy.

3 - Dynamic Service Management of One-way Car Sharing Systems

Ho-Yin Mak, University of Oxford, Saod Business School, Park End Street, Oxford, United Kingdom, makho06@gmail.com, Guangrui Ma

One-way car sharing services (e.g., Car2go) are gaining popularity. The key operational challenge is unbalanced flow of vehicles within the service region, as customers are allowed to return cars anywhere within the service region. We investigate dynamic service blocking, i.e., restrictions of the set of return locations, as a possible measure to counter imbalance. We formulate a model that determines the blocking policy dynamically, incorporating customer destination choice behavior.

Chair: Atalay Atasü, Associate Professor, Georgia Tech, 800, West Peachtree Street, Atlanta, GA, 30318, United States of America, Atalay.Atasu@scheller.gatech.edu**1 - Extended Producer Responsibility (EPR) for Pharmaceuticals**Isil Alev, Georgia Tech, Atlanta, GA, United States of America, isilalev@gatech.edu, Atalay Atasü, Ozlem Ergun, Beril Toktay

EPR-based approaches have gained traction for managing pharmaceutical coverage. In our work, we analyze the effectiveness of these approaches, particularly Source Reduction and End-of-Pipe Control, by developing a game-theoretic model of pharmaceutical chain with a focus on factors causing overage. We uncover conditions for effective EPR implementation from the welfare perspective and obtain critical factors determining stakeholder perspectives in the pharmaceuticals context.

2 - Extended Producer Responsibility and Secondary MarketsAtalay Atasü, Associate Professor, Georgia Tech, 800, West Peachtree Street, Atlanta, GA, 30318, United States of America, Atalay.Atasu@scheller.gatech.edu, Vishal Agrawal, Isil Alev

EPR-based take-back legislation is the prevalent policy for several durable products such as electronics. However, existing research on EPR ignores durable nature of the products and secondary markets. Accordingly, we analyze EPR implementations in the presence of secondary markets and provide policy guidelines that can help improve the effectiveness of EPR.

3 - Optimal Service Infrastructure Planning for New Product Adoption under Network ExternalityYiwei Wang, UC Irvine, 4293 Pereira Drive, Irvine, United States of America, willwangyiwei@gmail.com, Luyi Gui

Introducing services that complements a new product (e.g., charging service for electric vehicles) can accelerate adoption of the new product. The success of such strategies critically depend on how service infrastructure is deployed and adjusted over the product's life-cycle. We study this issue by a product diffusion analysis and derive insights regarding the optimal deployment strategy for complementary services.

4 - Lemons, Trade-ins, and RemanufacturingXimin (natalie) Huang, Scheller College of Business, Georgia Institute of Technology, 800 West Peachtree, NW Atlanta, Georgia, Atlanta, GA, United States of America, ximin.huang@scheller.gatech.edu, Atalay Atasü, Beril Toktay

Trade-in programs have been shown to partially mitigate the lemons problem in secondary markets. In this paper, we show when and how remanufacturing traded-in products can further improve the efficiency in secondary markets.

Chair: Fehmi Tanrisever, Bilkent University, Bilkent, Ankara, Turkey, tanrisever@bilkent.edu.tr**1 - Effects of Downstream Entry in a Supply Chain with Spot Market**Xuan Zhao, Associate Professor, Wilfrid Laurier University, 75 University Avenue West, Waterloo, ON, Waterloo, Canada, xzhao@wlu.ca, Qi Zhang, Wei Xing, Liming Liu

This paper investigates the effect of downstream entry on a two-echelon supply chain with risk-averse players in the presence of a spot market. We find that the manufacturers consider three factors in deciding contract procurement quantities: production, demand-hedging and speculation. Entry may decrease the contract input price, and thus may not always benefit the supplier and hurt the incumbent manufacturers, but it enhances the utilization of contract channel.

2 - Buyer-backed Purchase-order Financing for Suppliers Facing Yield UncertaintyArun Chockalingam, Assistant Professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612AZ, Netherlands, A.Chockalingam@tue.nl, Matthew Reindorp, Richa Jain

We consider a retailer whose supplier is prone to severe yield shortfall. The threat of shortfall entails that the supplier cannot independently finance production. In a single period setting, we find that the retailer can increase profit for both parties by offering a purchase order commitment that incorporates a (partial) loan guarantee. We determine the retailer's optimal commitment and the benefits for both parties. We show how the commitment varies with the supplier's yield uncertainty.

3 - Integrated Risk Management in Commodity MarketsFehmi Tanrisever, Bilkent University, Bilkent, Ankara, Turkey, tanrisever@bilkent.edu.tr

In this paper, we examine the integrated operating and financial hedging decisions of a value maximizing firm, in the presence of capital market frictions. We show that the working capital and the hedging policies of the firm interact with each other in a multi-period dynamic inventory model. In particular, looser working capital policies lead the managers to take relatively more speculative position in the market to maximize firm value. This issue may also be mitigated by asset based financing.

4 - The Midas Touch: Operational Flexibility and Financial Hedging in the Gold Mining IndustryPanos Markou, IE Business School, Calle Maria de Molina 12 Bajo, Madrid, 28006, Spain, pmarkou.phd2016@student.ie.edu, Daniel Corsten

We examine the commodity risk management strategies of gold mining firms over 36 quarters. Miners use financial hedging and operational flexibility to mitigate exposure to volatile gold prices. We find that, in line with theory, hedging reduces firm profit variance and inventory levels. On the other hand, operational flexibility increases profit variance and inventory. However, operational flexibility becomes valuable when used in a complementary fashion with financial hedging.

Sustainability in Supply Chains

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Suresh Muthulingam, Assistant Professor Of Supply Chain Management, SMEAL College of Business, The Pennsylvania State University, 460 Business Building, State College, PA, 16802, United States of America, sxm84@psu.edu**1 - An Analysis of Time-based Pricing in Electricity Supply Chains**Asligul Serasu Duran, Northwestern University, Kellogg School of Management, 2001 Sheridan Road, 5th Floor, Evanston, IL, 60208, United States of America, a-duran@kellogg.northwestern.edu, Baris Ata, Ozge Islegen

This study builds a framework for the retail electricity market to empirically evaluate the impact of time-based tariffs on the electricity supply chain. We find that optimal time-based tariffs reduce peak demand, but do not change consumers' electricity bills significantly. Time-of-use tariffs with predetermined rates can capture most of the benefits of real-time prices. The environmental impact of time-based tariffs depends on the characteristics of the electricity market under study.

2 - An Empirical Investigation of Emissions Reductions under Changing Assessments of HazardWayne Fu, Georgia Institute of Technology, 800 West Peachtree Street NW, Atlanta, GA, 30308, United States of America, Wayne.Fu@scheller.gatech.edu, Basak Kalkanci, Ravi Subramanian

Governmental organizations such as the CDC provide extensive public information on potential hazards of industrial chemicals. We investigate facility-level emissions reductions of chemicals in relation to changes in their assessments over time. We also examine the effects of important external and internal factors such as competition and operational leanness.

3 - The Role of Real-time Feedback on Conservation and Energy Efficiency Adoption: An Empirical StudyChristian Blanco, UCLA Anderson School of Management, Los Angeles, CA, United States of America, christian.noel.blanco@gmail.com, Magali Delmas

Non-linear pricing schedules may make it difficult for consumers to know the marginal price they currently pay for energy services. Our results show that consumers that receive real-time information on marginal prices decrease consumption by about 5 to 15%. We also show the relationship between information and residential energy efficiency adoption.

4 - Online Reuse Marketplaces: An Empirical Analysis

Suvrat Dhanorkar, Assistant Professor, Penn State University,
University Park, State College, PA, United States of America,
dhanorkarsuvrat@gmail.com

Online Reuse Marketplaces promote matching between producers and consumers of used products. We examine questions related to the evolution and design of one such marketplace.

Supply Chain Risk Management Strategies

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Yiming Wang, Arizona State University, Department of Supply Chain Management, Tempe, AZ, 85287, United States of America, yimin_wang@asu.edu

1 - Payment Timing in Multiechelon Supply Chains: Cost Assessment, Incentives, and Coordination

Greg Decroix, Professor, University of Wisconsin-Madison,
975 University Avenue, Madison, WI, 53706, United States of America, gdecroix@bus.wisc.edu, Jeannette Song, Jordan Tong

Developments in information technology have led to increased variety in payment arrangements between supply chain members. In this paper we introduce a new system for capturing the financing costs resulting from a general class of such payment schemes. Under wholesale price contracts, we use this framework to demonstrate the impact of payment timing on firm incentives, and show that partially delayed payments can achieve coordination in settings where standard or fully delayed payments cannot.

2 - Global Sourcing under Yield Uncertainty

Shahryar Gheibi, Doctoral Candidate, Syracuse University, 721 University Ave., Syracuse, NY, 13244, United States of America, sgheibi@syr.edu, Burak Kazaz, Scott Webster

We study the sourcing policies of a firm operating in an agricultural environment where yield uncertainty influences the firm's crop supply. Our analysis examines the direct trade sourcing policy which is perceived as an alternative to the fair trade policy. It is often believed that hedging is not advantageous in risk-neutral settings; our work, however, shows that there are conditions when the firm benefits from utilizing futures contracts simultaneously with direct trade sourcing policies.

3 - Wine Analytics: Fine Wine Pricing and Selection under Weather and Market Uncertainty

Mert Hakan Hekimoglu, Doctoral Candidate, Syracuse University,
721 University Avenue, Syracuse, NY, 13244, United States of America, mhekimog@syr.edu, Burak Kazaz, Scott Webster

We investigate a distributor's portfolio selection problem of wine futures and bottled wine. Using Liv-ex.com data, we first empirically show how the evolution of futures prices for young wines can be predicted by changes in weather and market conditions. We then examine the distributor's investment decisions in wine futures, bottled wine, and cash position analytically using a Value-at-Risk measure.

4 - Production Decisions for New Products under Yield and Demand Learning

Candace Yano, University of California, Berkeley, IEOR Dept. and Haas School of Business, Berkeley, CA, 94720, United States of America, yano@haas.berkeley.edu, Kai-chuan Yang

Manufacturers launching new products can schedule the first production run well before product introduction, allowing them to learn about the uncertain yield. But early production would occur before an accurate demand forecast is available, thus risking overproduction. We explore how a firm facing capacity constraints should optimize these decisions when new products share capacity with existing products whose demands are uncertain but whose yields are more predictable.

Behavior-driven Operations Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Fuqiang Zhang, Olin Business School, Washington University, St. Louis, MO, United States of America, fzhang22@wustl.edu

1 - Are Strategic Customers Bad for a Supply Chain?

Ali Parlakturk, Associate Professor, UNC Kenan-Flagler Business School, 300 Kenan Center Drive, MC #4708, Chapel Hill, NC, 27599, United States of America, Ali_Parlakturk@kenan-flagler.unc.edu, Yen-Ting Lin, Jayashankar Swaminathan

We contrast the results of forward-looking strategic customers with the myopic customers benchmark in a supply chain of a manufacturer and a retailer. The combination of Strategic customer behavior and decentralization does not necessarily result in the worst supply chain performance. In fact, when customers are sufficiently patient, a decentralized supply chain that faces strategic customers outperforms the supply chain with only one of those factors at play.

2 - Managing Social Responsibility in Multi-tier Supply Chains

Robert Swinney, Associate Professor, Duke University,
100 Fuqua Dr, Durham, NC, 27708, United States of America, robert.swinney@duke.edu, Lu Huang, Jeannette Song

We examine a three level supply chain in which a Tier 2 supplier sells to a Tier 1 supplier which sells to a downstream (Tier 0) firm, and consider whether Tier 0 should manage social responsibility in Tier 2 directly or delegate to Tier 1. We focus on the impact of external stakeholder behavior (consumers, NGOs, and governments) on the Tier 0 firm's optimal strategy, and show that increasing pressure from these stakeholders may backfire and lead to a less responsible supply chain.

3 - A Model of Rational Retrials in Queues

Shiliang Cui, Georgetown University, McDonough School of Business, Washington, DC, 20057, United States of America, shiliang.cui@georgetown.edu, Senthil Veeraraghavan, Xuanming Su

Consumers suffer dis-utility in waiting for a service. When they can self-organize the timing of their service visits, they may avoid long queues and choose to retry later. We study an observable queue in which consumers make rational join, balk and costly "retry" decisions upon their arrival. Retrial attempts could be costly due to factors such as transportation costs, retrial hassle and visit fees. We characterize the equilibrium under such retrial behavior, and study its welfare effects.

4 - CEO Overconfidence, Inventory Management, and Firm Performance

Fuqiang Zhang, Olin Business School, Washington University, St. Louis, MO, United States of America, fzhang22@wustl.edu, Tianjun Feng, Qing Zhang

Using the data of U.S. manufacturing firms during 1999-2011, we investigate the relationship between CEO overconfidence and firm inventory management. We find that firms with overconfident CEOs have lower inventory levels. In addition, we provide empirical evidence of the mediation effect of inventory level on firm financial performance.

Chair: Tor W. Andreassen, Professor, NHH Norwegian School of Economics, Helleveien 30, Bergen, Norway, tor.w.andreassen@nhh.no

1 - Design of Informatics-based Services in Manufacturing Industries: Case Studies and Discussion

Chie-Hyeon Lim, Post-doc, POSTECH, Engineering Building #4-316, Pohang, 790-784, Korea, Republic of, arachon@postech.ac.kr, Jun-yeon Heo, Min-Jun Kim, Kwang-jae Kim

A key component of servitization in manufacturing industries is informatics, which transforms product and customer data into information for customers. Informatics-based service is defined as a type of service wherein informatics is crucial to customer value creation. In this talk, we introduce two case studies on the design of informatics-based services in manufacturing industries. Various aspects of informatics-based service design in manufacturing are also discussed.

2 - An Analytical Framework for Value Co-Production in Services

Guillaume Roels, Associate Professor, UCLA, 110 Westwood Plaza, Los Angeles, CA, 90095, United States of America, guillaume.roels@anderson.ucla.edu, Uday Karmarkar

Although services are often defined as co-productive of value, the concept of value is often difficult to measure. Yet, measuring value is not necessarily a prerequisite for service process improvement. In this paper, we propose a general framework for the modeling and analysis of services with co-production. The framework identifies three major process stages: (i) the production stage, which involves co-production, (ii) the output sharing stage, and (iii) the consumption stage.

Social Media, Sales and Pricing

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Wedad Elmaghraby, Associate Professor, University of Maryland, 4311 Van Munching Hall, College Park, MD, 20742, United States of America, welmaghr@rhsmith.umd.edu

1 - Scarcity Strategies under Quasi-Bayesian Social Learning

Nitin Bakshi, London Business School, Regent's Park, London, United Kingdom, nbakshi@london.edu, Yiangos Papanastasiou, Nicos Savva

The introduction of popular experiential products is often accompanied by temporary stock outs. This paper proposes a mechanism based on an empirically-motivated behavioural model of social learning. We show that such strategies may be beneficial for the firm and may also increase consumer surplus.

2 - Integrating Social Media Metrics

Wendy Moe, University of Maryland, 3469 Van Munching Hall, College Park, MD, United States of America, wendy_moe@rhsmith.umd.edu, David Schweidel

The primary goal of this paper is to offer a modeling approach that integrates multiple social media metrics. We do this by jointly modeling the number of mentions, the number of co-mentions and expressed sentiment across brands in a given market as a function of a latent map that represents the underlying competitive landscape in the industry. We demonstrate how a brand can use this model to establish benchmark metrics and calculate a measure of differentiation.

3 - Optimizing Donation Campaigns with Social Media

Shawn Mankad, Assistant Prof Of Business Analytics, University of Maryland, 4316 Van Munching Hall, College Park, MD, 21201, United States of America, smankad@cornell.edu, William Rand, Chen Wang

The rising popularity of social media has resulted in organizations of all types attempting to use the social streams to inform managerial decisions. However, using social media data can be challenging due to its varied and dynamic nature. In this work, we discuss how donations to a major nonprofit organization can be substantially increased by integrating Twitter usage around crisis events to determine the timing and targeting of marketing communications.

Applications of DEA II

Cluster: Data Envelopment Analysis

Invited Session

Chair: Alan Pritchard, University of Maryland, Robert H. Smith School of Business, Van Munching Hall, College Park, MD, 20742, United States of America, apritchard@rhsmith.umd.edu

1 - Nurse Staffing Performance Evaluation: Data Envelopment Analysis vs. Expert Assessment

Fan Tseng, University of Alabama in Huntsville, Dept of Mgt, Mkt, & IS, Huntsville, AL, 35899, United States of America, tsengf@uah.edu, Karen Frith, Faye Anderson, Patricia Patrician

When using Data Envelopment Analysis (DEA) to evaluate the efficiency of nurse staffing, the results are greatly influenced by the selection of input and output metrics. To evaluate different DEA models for their usefulness, we enlisted experts in nurse administration to evaluate the performance of nursing units using data from multiple hospitals. We compare the results between experts and the models, and discuss the issues in DEA modeling for evaluating nurse staffing performance.

2 - It Productivity Paradox: A New Frameworks Integrating Configuration Theory and Dynamic DEA

Liu Jiawen, PhD, Huazhong University of Science and Technology, 1037 Luoyu Road, Wuhan, 430074, China, jiawen_liu@hust.edu.cn, Yeming Gong

While some research argues that information technology (IT) can improve organizational productivity, others maintains that the impact of IT may be negative. This paper advances a new perspective based on data envelopment analysis (DEA) to investigate the IT productivity paradox. We propose a new theoretical framework based on dynamic two-stage network DEA models, considering multiple periods, multiple inputs and multiple outputs, to study and understand IT productivity paradox.

3 - An Oligopolistic Emissions Trading System with Uncertain Demand

Alireza Tajbakhsh, PhD Candidate, DeGroote School of Business, McMaster University, 1280 Main St. W, Hamilton, ON, L8S 4L8, Canada, alirezt@mcmaster.ca, Elkafi Hassini

We propose a static Cournot oligopoly game to investigate a perfectly competitive market in which supply chains compete in a non-cooperative manner in their product markets. Partners of each supply chain engage in a cooperative triopoly game where initial permit allocations of the pollutants are given on the basis of their sustainability performance that is derived from a data envelopment analysis model.

4 - Product Variety and Productivity: Evidence from the North American Beverage Industry

Alan Pritchard, University of Maryland, Robert H. Smith School of Business, Van Munching Hall, College Park, MD, 20742, United States of America, apritchard@rhsmith.umd.edu, Martin Dresner, Xiang Wan

Using data taken directly from a major North American soft drink beverage bottler and distributor, we examine distribution center (DC) productivity. First, we employ data envelopment analysis (DEA) and a double bootstrapping procedure to estimate the relative efficiency of 108 DCs over a four year period (2008-2011). Then, we use a Tobit regression model to investigate the factors that influence DC productivity – that is, unexplained variation in efficiency, over time.

Recent Advances in Location Analysis

Sponsor: Location Analysis

Sponsored Session

Chair: Sibel Alumur, University of Waterloo, 200 University Avenue West, Waterloo, ON, N2L 3G1, Canada, sibel.alumur@uwaterloo.ca

1 - Green Charging Station Location Problem

Okan Arslan, Bilkent University, Department of Industrial Engineering, Ankara, Turkey, okan.arslan@bilkent.edu.tr, Oya E. Karasan

We deal with 'charging station location problem' as a variant of 'flow refueling location problem' (FRLM) by additionally considering the hybrid vehicles such as PHEVs. The objective is to maximize the environmental benefits through maximizing electricity usage in transportation. To solve the problem, we propose an arc-cover model, and apply Benders decomposition. The structure of this formulation allows us to construct Pareto-optimal cuts without having to solve any linear programming problems.

2 - Regenerator Location Problem in Flexible Optical Networks

Baris Yildiz, Bilkent University, Universiteler MAH., Ankara, 06800, Turkey, baris.yildiz@bilkent.edu.tr, Oya E. Karasan

We present the regenerator location problem in flexible optical network that solves the regenerator placement, routing, bandwidth allocation and modulation selection problems jointly. We propose a novel branch and price algorithm for this challenging problem. Our results show that making routing, bandwidth allocation, modulation selection and regenerator placement decisions in a joint manner, it is possible to obtain drastic capacity enhancements with a limited regeneration capability.

3 - Risk Based Facility Location by using Fault Tree Analysis in Disaster Management

Ibrahim Akgun, Assoc. Prof., Abdullah Gül University, Department of Industrial Engineering, Kayseri, 38080, Turkey, ibrahim.akgun@agu.edu.tr

We develop an optimization model that minimizes the risk that a disaster-prone area may be exposed to because it is not supported by facilities located for prepositioning supplies. The risk is calculated as the multiplication of threat, vulnerability of the area, and consequence. The vulnerability is computed by using fault tree analysis and incorporated into the optimization model innovatively. The resulting non-linear integer program is linearized and solved as a linear integer program.

4 - Service System Design with Economies-of-scale and Congestion

Samir Elhedhli, University of Waterloo, 200 University Avenue, Waterloo, Canada, elhedhli@uwaterloo.ca

We formulate and provide solution methodologies for the service system design problem with immobile servers, stochastic demand, and capacity economies of scale. We start by reformulating the problem, and then provide solution approaches based on piecewise linearization, Second Order Cone Programming (SOCP), and Lagrangian Relaxation. Numerical results are provided

Optimization of Power Systems Planning and Operation

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Miguel Anjos, Polytechnique Montreal, Mathematics and Industrial Engineering, Montreal, Canada, miguel-f.anjos@polymtl.ca

1 - Chance-constrained Generation Expansion Planning Incorporating Bus Sensitivities

William Rosehart, Schulich School of Engineering, University of Calgary, Calgary, AB, Canada, rosehart@ucalgary.ca, Monisha Manick, Miguel Anjos

A Generation Expansion Planning problem with load uncertainty is formulated based on joint chance-constrained programming. Sensitivities are used to allow greater emphasis to be placed on regions with high demand relative to generation, and similarly to allow for lesser emphasis on regions that are generation-rich. Numerical results are presented for IEEE test systems.

2 - Interrelationship Between Power Transmission and Storage Elements of the Power Network

Enzo Sauma, Pontificia Universidad Catolica de Chile, Santiago, Chile, esauma@ing.puc.cl, Carlos Bustos, David Pozo, Javier Contreras, Sebastian De La Torre, Jose Aguado

We study the interrelationship between the construction of new power transmission lines to integrate wind farms and the installation of new power-storage elements in the network. In particular, we analyze the effect of adding new power-storage components into the power system over the optimal transmission expansion plan. We illustrate our analysis using a stylized version of the Chilean main power system (Sistema Interconectado Central).

3 - Bilateral Contract Optimization in Power Markets

Miguel Anjos, Polytechnique Montreal, Mathematics and Industrial Engineering, Montreal, Canada, miguel-f.anjos@polymtl.ca, François Gilbert, Patrice Marcotte, Gilles Savard

We consider an energy broker linking its customers and the power grid through a two-sided portfolio of bilateral contracts. The contracts cover a number of actions taken by the customers on request within specified periods. Managing this portfolio raises a number of modelling and computational issues due to the aggregation of disparate resources. We propose an innovative algorithmic framework that models short-term decisions factoring in long-term information obtained from a separate model.

Analytics in the Petrochemical and Petroleum Industries II

Sponsor: ENRE – Natural Resources II – Petrochemicals and Petroleum

Sponsored Session

Chair: Tejinder Singh, Sr. Research Scientist, Delaware Research and Technology Center - Houston, TX, tejinder.singh@airliquide.com

1 - A Simulation and Optimization Framework for Petroleum Refinery Operations

Ariel Uribe, Ecopetrol S.A., Km 7 Via Piedecuesta, Piedecuesta, Colombia, ariel.uribe@ecopetrol.com.co, Sandra Montagut, Omar Guerra

In this work we present a framework for the simulation and optimization of petroleum refinery operations at strategic and tactic decision levels. Concerning the adequate modeling of processing units, the developed framework allows for the integration of economic models with both linear and non-linear empirical process models based on historical data, rigorous process simulators, or pilot plant data using scale up techniques.

2 - Long-term Demand Forecasting in Industrial Gas Markets

Bin Yu, Air Liquide, 200 GBC Dr, Newark, DE, 19702, United States of America, bin.yu@airliquide.com, Adel Basli, Gildas Bonnier, Athanasios Kontopoulou, Brian Besancon

In this talk we will focus on long-term demand forecasting of liquid oxygen and liquid nitrogen in the U.S. in 5-10 years. We analyzed the predictive performance of several forecasting techniques for IP in each sector using the employment and GDP as leading and associated variables. Moreover, we developed the method of decomposing the demand from the national level to local markets and identified the sectors that drive or restrain market growth in each local market.

3 - A Multi-period MINLP Model for Long-term, Quality-sensitive Shale Gas Development

Markus G. Drouven, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, mdrouven@cmu.edu, Ignacio E. Grossmann

In this work we address the long-term shale gas development problem which involves determining the optimal development strategy for drilling and fracturing gas wells, and designing a pipeline gathering infrastructure. The problem is formulated as a large-scale nonconvex MINLP involving concave investment costs and bilinear terms in the flow balances. We present a solution strategy that relies on an MILP approximation coupled with a restricted MINLP, which yields near optimal global solutions.

Panel Discussion: The Impact of the Value-Based Approach on the Field of Strategy

Cluster: Strategy Science

Invited Session

Chair: Nicolaj Siggelkow, University of Pennsylvania, 2000 SHDH, Philadelphia, PA, 19104, United States of America, siggelkow@wharton.upenn.edu

1 - The Impact of the Value-Based Approach on the Field of Strategy

Moderator: Michael Ryall, University of Toronto, Rotman School, Toronto, ON, Canada, m.ryall@mikeryall.com, Panelists: Peter Zemsky, Tomasz Obloj, Harborne Stuart

Value-based strategy provides an intuitive, economic theory for business strategy. An immediate benefit is that it provides a coherent alternative to ad-hoc frameworks, and, in the process, it makes explicit the fact that profits are typically part of some larger economic pie. More broadly, by providing a theory for the economic aspect of strategy, it allows strategy research to focus on some of the richer issues in strategy, including, for example, organizational design, leadership, and execution. The discussion will also consider the empirical questions that arise from the general value capture model (i.e., bi-form games applied in the context of strategy). The mathematics indicate novel issues for empirical investigation. For example, whether the distinction between “competitive” vs “persuasive” resources is meaningful (as the model suggests it should be) and, if so, in which real-world settings one type is more efficacious than the other for superior returns.

Cases in the Undergraduate OR Curriculum

Sponsor: INFORM-ED

Sponsored Session

Chair: Michael Veatch, Gordon College, 255 Grapevine Rd, Dept. of Mathematics, Wenham, MA, 01984, United States of America, Mike.Veatch@gordon.edu

1 - Strategies for using Cases in the Undergraduate Classroom

Matthew Drake, Associate Professor Of Supply Chain Management, Duquesne University, 925 Rockwell Hall, 600 Forbes Avenue, Pittsburgh, PA, 15282, United States of America, drake987@duq.edu

Students often develop a better understanding of quantitative material by applying the analytical techniques to realistic decision scenarios. Cases provide OR/MS instructors with an effective vehicle to introduce applications of business analytics in practice. While they are common at the graduate level, cases are not used as often with undergraduates. In this session we will discuss strategies for using cases effectively with undergraduate students.

2 - On the Development of Case Studies for an Undergraduate Business Analytics Course

Eric Huggins, Professor Of Management, Fort Lewis College, 1000 Rim Drive, Durango, CO, 81301, United States of America, huggins_e@fortlewis.edu

Over the past three years I have developed half a dozen case studies for an undergraduate business analytics course. Each case study started as a big data set with a few objectives attached to it, and with the help of my students, they have evolved into current (for now), relevant (I think), interesting (I hope) OR-related case studies.

3 - Where Do I Find Classroom Cases?

James Cochran, Professor Of Applied Statistics And The Rogers-spivey Faculty Fellow, University of Alabama, P.O. Box 870226, Tuscaloosa, AL, 35487-0226, United States of America, jcochran@cba.ua.edu

Many OR/analytics instructors want to incorporate short cases into their undergraduate courses but have difficulty finding suitable, relevant, and topical cases. Where can an instructor find such cases? If s/he is willing to experiment with writing cases, s/he can find the bases of cases in the news, popular culture, and her/his own life (and perhaps publish their efforts in INFORMS Transactions Today). We will demonstrate through several examples from the speaker's experience writing cases.

4 - Teaching Undergraduate Analytics using Cases

Peter Bell, Ivey Business School at Western University, 1255 Western Road, London, ON, N6G 0N1, Canada, pbell@ivey.uwo.ca, Mehmet Begen, Fredrik Odegaard

Ivey's undergraduate analytics courses have used cases extensively for many years. This interactive presentation will discuss some of the benefits (and costs) of a case-based approach to undergraduate teaching.

Stochastic and Robust Optimization Models in Electric Power Systems

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Andy Sun, Assistant Professor, Georgia Institute of Technology, 755 Ferst Drive, Atlanta, GA, 30332, United States of America, andy.sun@isye.gatech.edu

1 - Two-stage Distributionally Robust Unit Commitment with Generalized Linear Decision Rules

Yuan Guo, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, yuanguo@umich.edu, Ruiwei Jiang, Jianhui Wang

It is challenging to accurately estimate the joint probability distribution of the renewable energy. In this paper, based on a small amount of marginal historical data, we propose a two-stage distributionally robust unit commitment model that considers a set of plausible probability distributions. This model is less conservative than classical robust unit commitment models and more computationally tractable by using generalized linear decision rules.

2 - Stochastic Unit Commitment with Topology Control Recourse for Renewables Integration

Jiaying Shi, University of California, Berkeley, CA, United States of America, United States of America, shijy07@Berkeley.edu, Shmuel Oren

We introduce a two stage stochastic unit commitment formulation in which the second stage recourse actions include possible reconfiguration of the transmission grid through line switching. Switching action in the second stage are determined by a heuristic method. Such topology control capability can mitigate adverse variability in realized renewables output and improve unit commitment efficiency.

3 - Multistage Robust Unit Commitment with Dynamic Uncertainty Sets

Alvaro Lorca, Georgia Tech, 251 10th St. NW Apt. A622, Atlanta, GA, 30318, United States of America, alvarolorca@gatech.edu

We present a multistage robust unit commitment model with renewables and storage using a simple but effective affine policy for dispatch decisions, while considering dynamic uncertainty sets that integrate wind and solar power resources taking into account spatial and temporal correlations. Our solution algorithm contains enhancements that allow solving the resulting problem efficiently. We also present simulation experiments to evaluate the benefits of our approach.

4 - Multi-stage Stochastic Unit Commitment with SDDP

Jikai Zou, Graduate Research Assistant, Georgia Institute of Technology, 755 Ferst Dr. NW, Atlanta, GA, 30332, United States of America, jikai.zou@gatech.edu, Shabbir Ahmed, Andy Sun

Despite the great amount of research, stochastic unit commitment (UC) problems, where binary commitment decisions adapt to uncertainty with a multi-stage structure, still remain one of the most challenging stochastic programming problems. In this paper, we investigate a sampling based algorithm that combines stochastic dual dynamic programming (SDDP) and the integer L-shaped method for solving multistage stochastic UC. Numerical results and algorithmic improvement will be discussed.

Optimization Approaches for Invasive Species and Pest Management

Sponsor: ENRE – Environment I – Environment and Sustainability
Sponsored Session

Chair: Esra Buyuktahtakin, Assistant Professor, Wichita State University, 1845 N Fairmount, Wichita, KS, 67260, Wichita, United States of America, Esra.Buyuktahtakin@wichita.edu

1 - Optimal Inspection of Imports to Prevent Invasive Pest Introduction

Robert Haight, USDA Forest Service, Northern Research Station, St. Paul, MN, United States of America, rhaight@fs.fed.us, Rebecca Epanchin-niell, Cuicui Chen

Based on our work with USDA-APHIS, we study an acceptance sampling problem that incorporates several features of quality control in public safety programs, including the simultaneous inspection of many heterogeneous lots, a budget constraint that limits inspection, inspection error, and an objective of minimizing cost to consumers. We apply our results to inspecting live plant imports to prevent invasive pest introduction.

2 - Cost-effective Planning of Invasive Species Surveillance with the Maximum Expected Coverage Concept

Denys Yemshanov, Research Scientist, Natural Resources Canada, Canadian Forest Service, Great Lakes Forestry Centre, 1219 Queen Street East, Sault Ste Marie, ON, P6A2E5, Canada, Denys.Yemshanov@NRCan-RNCan.gc.ca, Robert Haight, Frank Koch, Bo Lu, Jean Turgeon, Ronald Fournier

We present two invasion survey models based on the maximum expected coverage principle (MECP). The models maximize the expected number of invaded sources that are covered by the surveys, where a source is covered if at least one of its transmission pathways connects to a surveyed destination. We present one- and two-stage models designed to survey invasive forest pests in Canada and the U.S. Overall, the approach provides flexible solution to survey the long-distance spread of invasive pests.

3 - A Multistage Stochastic Programming Model for the Optimal Surveillance & Treatment of Invasive Species

Eyyub Kibis, Graduate Research Assistant, Wichita State University, 1845 N Fairmount, Wichita, KS, 67260, United States of America, eyyubyunus@gmail.com, Esra Buyuktahtakin, Robert Haight

In this study, we develop a multistage stochastic programming model to address the invasive species surveillance and treatment while minimizing the expected damages of invasive species. We use a discontinuous discrete decision tree and incorporate discretized surveillance decisions along with the probabilities of each scenario into the spatially-explicit model. The model allows policy makers to take the best surveillance and treatment decisions over time by exploiting various scenarios.

4 - Import Inspections: Harnessing Enforcement Leverage to Prevent Invasive Species Introductions

Rebecca Epanchin-Niell, Resources for the Future, Washington DC, United States of America, epanchin-niell@rff.org, Michael Springborn, Amanda Lindsay

Allocating scarce border inspection resources over a diverse set of imports to prevent invasive pest entry presents a substantial policy design challenge. We develop a risk-based inspection system in which sampling intensities vary across imports based on risk. We determine optimal sampling of imports to minimize invasive pest introduction accounting for strategic responses of exporters.

Daniel H. Wagner Prize Competition II

Cluster: Daniel H. Wagner Prize Competition

Invited Session

Chair: Allen Butler, President & CEO, Daniel H. Wagner Associates, Inc. 2 Eaton Street, Hampton, VA 23669, United States of America, Allen.Butler@va.wagner.com

1 - Integrated Planning of Multi-type Locomotive Service Facilities under Location, Routing and Inventory Considerations

Kamalesh Somani, CSX Transportation, 500 Water St, Jacksonville, FL, 32202, United States of America, Kamalesh_Somani@CSX.com, Xi Chen, Yanfeng Ouyang, Siyang Xie, Zhaodong Wang, Jing Huang

Long term infrastructure planning of locomotive service facilities is vital to the efficiency of the railroad. We developed a large-scale optimization model that integrates decisions on (i) location, capability, and capacity of fixed facilities, (ii) home location and routing plan of movable facilities, and (iii) assignment of a variety of service demands. A decomposition-based solution framework was developed and shown to bring significant economic benefits in full-scale implementations.

2 - Scheduling Crash Tests at Ford Motor Company

Daniel Reich, Leadership Program, Ford Motor Company, Dearborn, MI, United States of America, dreich8@ford.com, Amy Cohn, Ellen Barnes, Yuhui Shi, Marina Epelman, Erica Klampfl

We present the problem of scheduling crash tests for new vehicle programs at Ford. We developed a completely custom-made scheduling system that transforms a labor-intensive scheduling process relying on high levels of expertise, to a more automated one that utilizes optimization and institutionalizes expert knowledge. Our system enables engineers and managers to consider multiple scheduling scenarios, using efficient interfaces to specify problem instances and efficient methods to solve them

Joint Session DAS/ENRE: Environmental Decision Analysis: Theory and Applications

Sponsor: Decision Analysis

Sponsored Session

Chair: Melissa Kenney, Research Assistant Professor, University of Maryland, 5825 University Research Court, Suite 4001, College Park, MD, 20740, United States of America, kenney@umd.edu

1 - Decision Analysis for Sustainable Management of the Yellow River Delta

Liang Chen, Student, Johns Hopkins University, 3900 N Charles St. Apt. 1302, Baltimore, MD, 21218, United States of America, chenliang1468@gmail.com, Benjamin Hobbs, Jeff Nittrouer, Hongbo Ma, Andrew Moodie

We develop a stochastic programming model for channel management and flood control that can characterize risks and impacts of possible natural avulsions, and provides solutions for prevention and mitigation. Reflecting the physical mechanism in coastal delta, our model imbeds a 1D hydrodynamic model to simulate sediment transport, channel aggradation and flooding. Our case study is Huanghe (Yellow River) Delta, China, one of the world's most dynamic and heavily urbanized coastal landscapes.

2 - Adaptive Stormwater Management with Green Infrastructure using Two-stage Stochastic Programming

Fengwei Hung, Student, The Johns Hopkins University, 3400 N. Charles Street, Ames Hall 313, Baltimore, MD, 21218, United States of America, fwhung0807@gmail.com, Benjamin Hobbs, Arthur Mcgarity

Green Infrastructure manages stormwater with natural processes involving significant uncertainty. Thus, many cities choose to implement it adaptively to learn how it works. We define "learning" as updating of distribution parameters of the stochastic program's coefficients, representing: automatic learning, triggering learning, multi-state learning, and multi-stage learning with technology improvement. Finally, we calculate risk-return tradeoffs for a Philadelphia stormwater case study.

3 - Framing Effects Created by Ambiguity Aversion in Static Decisions

Erin Baker, University of Massachusetts, MIE Department, 220 ELAB, Amherst, MA, United States of America, edbaker@ecs.umass.edu, Eva Regnier

In climate policy-making, many respected economists recommend using ambiguity-averse decision rules. The vulnerabilities created by ambiguity aversion in dynamic decision making have been demonstrated previously. We show that even in static, one-time, decisions, ambiguity-averse decision rules make policy makers susceptible to bias created by framing effects.

4 - Using Multi-criteria Decision Analysis to Explore Management Options in the Grand Canyon

Michael C. Runge, USGS Patuxent Wildlife Research Center, 12100 Beech Forest Road, Laurel, MD, 20708, United States of America, mrunge@usgs.gov, Kendra Russell, Kirk E. Lagory

The Bureau of Reclamation and the National Park Service are developing a Long-term Experimental and Management Plan (LEMP) for managing water releases from the Glen Canyon Dam and related activities. We conducted multi-criteria decision analysis to evaluate the proposed alternatives, integrating scientific input from a dozen modeling teams, and values-focused input from a wide set of deeply-involved stakeholder groups. We used value-of-information analysis to inform experimental design.

65-Room 113B, CC

Risk Attitudes in Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Andrea Hupman, University of Missouri-St. Louis, 1 University Blvd, St. Louis, MO, United States of America, hupman1@illinois.edu

1 - Individualized Predictions of Normative Decision Making

Andrea Hupman, University of Missouri-St. Louis,
1 University Blvd, St. Louis, MO, United States of America,
hupman1@illinois.edu, Ali Abbas

Understanding how individuals make decisions in practice and predicting behavior is important in many practical applications, giving rise to numerous descriptive models of decision making behavior. In this talk, a behavioral decision making experiment is described. The results are consistent with a bounded rationality explanation of decision making behavior in which making accurate predictions of decisions hinges on individualized information about the decision maker's risk attitude.

2 - Marriage and Managers' Attitudes to Risk

Pavel Savor, Fox School of Business, Temple University,
Philadelphia, PA, pavel.savor@temple.edu

We explore the impact of marriage on corporate CEOs and find that firms run by single CEOs exhibit higher stock return volatility, pursue more aggressive investment policies, and do not respond to changes in idiosyncratic risk. These effects are weaker for older CEOs. Our results continue to hold when we use variation in divorce laws across states to instrument for marital status, supporting the hypothesis that marriage itself drives choices rather than it just reflecting innate heterogeneity.

3 - Using Means Objectives to Present Risk Information

Candice Huynh, Cal Poly - Pomona, CA, United States of
America, candicehuynh@cpp.edu, Jay Simon

When making decisions involving alternatives with risk, individuals are not always able to express or view the possible outcomes in terms of a fundamental objective. To apply information about a means objective correctly, a decision maker must first translate it into information about a fundamental objective. This paper presents the results of a study regarding decision makers' preferences when information is presented either in terms of a means objective or a fundamental objective.

4 - Evolving Risk Perceptions of Cybersecurity Events

Heather Rosoff, Research Assistant Professor, University of
Southern California, Price School of Public Policy & CREATE,
3710 McClintock Avenue, Los Angeles, CA, 90089-2902, United
States of America, rosoff@usc.edu, Robin Dillon-Merrill

Mitigating cyber risks requires understanding how people evaluate risks in this challenging context and in particular, how they respond to repeated warnings over time. In the case of the Target credit card breach in 2013, evidence now shows that Target had failed to follow through on security alerts triggered by the hacker's activities. We speculate on why Target's security team, and why people in general, might not respond to such alarms in the cyber-security context.

Air Traffic Management Decision Support: Learning from History

Sponsor: Aviation Applications

Sponsored Session

Chair: Yi Liu, UC Berkeley, 107 McLaughlin Hall, Berkeley, CA, 94720, United States of America, liuyi.feier@gmail.com

1 - The Identification of Similar Days in the New York Area for Air Traffic Flow Management Initiatives

Kenneth Kuhn, RAND Corporation, 1776 Main Street, Santa
Monica, CA, 90407, United States of America, kkuhn@rand.org,
Akhil Shah

Analysis of air traffic flow management initiatives can show the relative success of decisions, but must account for conditions during planning and operations. We apply cluster analysis to identify similar days, using features detailing aviation weather and air traffic around New York. An example is the degree to which jet route J75 is blocked by convective weather at 9am according to a 7am weather forecast. Some features are based on automated approaches such as Principal Component Analysis.

2 - Similar Days? A Story Based on User-defined Similarity

Yi Liu, UC Berkeley, 107 McLaughlin Hall, Berkeley, CA, 94720,
United States of America, liuyi.feier@gmail.com, Mark Hansen,
Alexey Pozdnukhov

In this work, we propose a supervised data-mining algorithm for measuring similarity between two days. First, the algorithm trains the distance matrix between hours according to user-defined similarity and dissimilarity. Then it calculates the daily distance as a weighted sum of hourly distances. The approach can be applied to measure similarity between two days post-operation or identify similar days in the past for a given day.

3 - Representative Traffic Management Initiative Decisions

Alex Estes, University of Maryland-College Park, 3117 AV
Williams, College Park, MD, 20742, United States of America,
aestes@math.umd.edu, Michael Ball, David Lovell

We provide a method for presenting data on traffic management initiatives so that it may more easily be interpreted by researchers or by TMI decision makers. This method involves solving a dominating set problem to produce a set of TMIs which are representative of the range of TMI decisions that have been taken in the past.

■ MB67

The Role of Information in Transportation Models

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Dirk Mattfeld, Germany, d.mattfeld@tu-braunschweig.de

1 - Approximate Dynamic Programming for Temporal-spatial Anticipation and Routing of Service Requests

Justin Goodson, Saint Louis University, St. Louis, MO, United
States of America, goodson@slu.edu, Marlin Ulmer, Dirk Mattfeld

We consider the problem of dynamically routing a vehicle to respond to service requests arriving randomly over a given time horizon. Building on a value-function approximation (VFA) that estimates rewards-to-go via the temporal components of the state variable, we use rollout algorithms to explicitly consider spatial dimensions. Our method improves upon the VFA scheme in isolation and points to the potential benefit of using two different approximate dynamic programming techniques in tandem.

2 - A Look-ahead Solution Framework for the Dynamic Vehicle Routing Problem

Han Zou, University of Southern California, Los Angeles, CA
United States of America, hanzou@usc.edu, Maged Dessouky

The problem concerns routing a fleet of capacitated vehicles in real time to fulfill orders placed by a known set of customers. Some of the orders are known a priori, while the rest are placed in real time. We develop a look-ahead solution framework that periodically re-optimizes current vehicle routes by using both realized and forecasted information. With fine-tuned parameter settings, our approach has the potential to outperform both a priori routing and total dynamic dispatching schemes.

3 - Optimal Information Collection in the Vehicle Allocation Problem in Mega-Cities

Yixiao Huang, Tsinghua University, China,
huangyx12@mails.tsinghua.edu.cn, Warren Powell, Ilya Ryzhov,
Lei Zhao

In mega-cities, urban freight delivery companies serve customers spread in a large area. These companies typically divide the city into several regions and allocate the delivery vehicles to serve these regions. The precise cost evaluation of a vehicle allocation decision can be very expensive, due to the volume and uncertainty of the delivery demand. We study on, given a fixed information collection budget, how to collect the cost evaluation information (possibly through real-life practice) to gain the best knowledge to allocate the vehicles optimally.

4 - Data-Driven Vehicle Routing with Profits

Dauwe Vercamer, Ghent University, Ghent, Belgium,
Dauwe.Vercamer@ugent.be, Dirk Van Den Poel,
Michel Gendreau, Philippe Baecke

In sales teams, making optimal visits is crucial. Customer Profitability models help in identifying top customers, but do not consider the associated visit costs. Vehicle Routing models make efficient schedules, but use naive estimates rather than good forecasts. Our prescriptive analytics approach uses auxiliary data and statistical learning to approximate full-information vehicle routes. The results show this approach improves customer selection in vehicle routes and maximizes profitability.

5 - Data Mining for Problem-Specific State Space Design in Routing Applications

Dirk Mattfeld, Technische Universität Braunschweig,
Braunschweig, 38106, Germany, d.mattfeld@tu-braunschweig.de,
Ninja Soeffker, Marlin Ulmer

We consider a dynamic routing problem, where a vehicle serves customer requests arriving stochastically over time. Due to a time limit, not every request can be served. Rejections are possible to maximize the overall number of served requests. For anticipation of future requests, we apply value function approximation (VFA). For improvement of the approximation process, we combine VFA with data mining operations to derive a problem specific VFA-state space based on the observed problem states.

Green Vehicle Routing

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Mesut Yavuz, Associate Professor, University of Alabama, Alston Hall Box 870226, Tuscaloosa, AL, 35487, United States of America, myavuz@cba.ua.edu

1 - Pathways to Green Logistics: Past, Present and Future of the Green Vehicle Routing Problem (GVRP)

Sevgi Erdogan, Faculty Research Associate, University of Maryland-NCSG, 1112 J Preinkert Field House, College Park, MD, 20742, United States of America, serdogan@umd.edu

This talk will give a brief background to the GVRP and a review of the variants and extensions to the problem as well as techniques to their modeling and solution. A close analysis of the state of literature will be given. Pathways for future research will be discussed.

2 - The Electric Fleet Size and Mix Vehicle Routing Problem with Time Windows and Recharging Stations

Richard Hartl, Professor, University of Vienna, Oskar-Morgenstern-Platz 1, Vienna, Austria, richard.hartl@univie.ac.at,
Gerhard Hierman, Jakob Puchinger, Stefan Ropke

When routing electrical vehicles, limited battery capacity makes detours to recharging stations necessary. We introduce the E-FSMVRPTW to model decisions regarding the fleet composition and the actual routing including the choice of recharging times and locations. We propose a branch-and-price method as well as an ALNS with an embedded local search and labelling procedure. The effectiveness of the proposed approach is shown on a newly created set of benchmark instances and existing benchmarks.

3 - An Iterated Beam Search Algorithm for the Green Vehicle Routing Problem in Service Fleets

Mesut Yavuz, Associate Professor, University of Alabama, Alston Hall Box 870226, Tuscaloosa, AL, 35487, United States of America, myavuz@cba.ua.edu

We present a novel Iterated Beam Search (IBS) solution to the Green Vehicle Routing Problem (GVRP) in Service Fleets. The problem allows internal and external refueling and aims to minimize the total travel distance of a homogeneous fleet. Two mathematical formulations (vehicle flows and set partitioning) are built and a lower bound is obtained for each. Two heuristics (savings and insertion) are adopted for upper bounding. We also present preliminary results of a computational experiment.

4 - Fleet Sizing and Scheduling for Mixed Fleets with Alternative Fuel Vehicles

Ismail Capar, Texas A&M University, College Station, TX, United States of America, capar@tamu.edu

We present a mixed-integer formulation for a new type of fleet sizing and scheduling problem. The formulation consider special need for refueling of alternative fuel vehicles due to their limited range and/or limited refueling infrastructure, such as availability of charging stations for electric vehicles. We provide results of numerical analysis together with managerial insights.

Facility Logistics IV

Sponsor: TSL/Facility Logistics

Sponsored Session

Chair: Debjit Roy, Associate Professor, Indian Institute of Management Ahmedabad, Vastrapur, Ahmedabad, 380015, India, debjit@iimahd.ernet.in

1 - Robust Supply Chain Design and Operation under Uncertainty

Deniz Tursun, Postdoctoral Research Associate, University of Illinois Urbana Champaign, 3308 Sharp Drive, Champaign, IL, 61822, United States of America, utursu2@illinois.edu

Robust supply chain design and operation under uncertainty problems lead to confluence of integer and continuous variables, which call for Mixed-Integer Nonlinear Programming (MINLP) algorithms. We consider a comprehensive random projection algorithm for a subclass of MINLP's, where the objective and constraints are defined by convex functions and integrality restrictions are imposed on a subset of the decision variables.

2 - Batching Decisions in Stock-to-Picker Order Picking

Debjit Roy, Associate Professor, Indian Institute of Management Ahmedabad, Vastrapur, Ahmedabad, 380015, India, debjit@iimahd.ernet.in, Vibhuti Dhingra, Jennifer Pazour

We develop new analytical models to analyze performance of static vs. dynamic batching policies in stock-to-picker order pick systems. In particular, we analyze the effect of batch size, variability in item inter-arrival times, and item commonality on order pick performance.

3 - Branch-and-Price for the Capacitated Mobile Facility Location Problem

S. Raghavan, Professor, Smith School of Business & Institute for Systems Research, University of Maryland, College Park, MD, 20742, United States of America, raghavan@umd.edu, Mustafa Sahin, Sibel Salman

The Capacitated Mobile Facility Location Problem (CMFLP) is a combinatorial optimization problem with applications in supply chain operations and distribution of medical services. We propose two Mixed Integer Programming formulations for the CMFLP and discuss a branch-and-price algorithm for a set partitioning formulation, where the linear programming relaxation is solved with a column generation procedure. We demonstrate the quality of the algorithm on instances adapted from the literature.

4 - Store Fulfillment for Online Orders: A Planning Model in a Collaborative Store Environment

Ming Ni, SUNY Buffalo, 326 Bell Hall, University at Buffalo, Amherst, NY, 14260, United States of America, mingni@buffalo.edu, Arun Hampapur, Qing He, Xuan Liu

This study on online order fulfillment aims to identify the seasonal planning dimensions from local retailing outlets perspective. It develops optimization models and heuristic algorithms which solve order assignment and fleet sizing problems to construct the supply chain plan. The numerical examples are derived from same day delivery from a real-world retailer store network.

Joint Session RAS/TSL/AAS: Real-Time Decision Support Practice

Sponsor: Railway Applications

Sponsored Session

Chair: Ravindra Ahuja, President, Optym, 7600 NW 5th Place, Gainesville, FL, 32607, United States of America, ravindra.ahuja@optym.com

1 - Simulation-guided Optimization Algorithms for Real-time Train Scheduling

Pedram Sahba, Senior Systems Engineer, Optym, 7600 NW 5th Place, Gainesville, FL, 32607, United States of America, pedram.sahba@optym.com, Ravindra Ahuja, Abbas Bozorgirad

In this presentation, we will describe several algorithms for real-time train scheduling (also known as meet-pass planning) using simulation, mixed integer programming and network optimization techniques including their computational results. These algorithms are in production at a railroad in Australia and we will give a demonstration of the system using these algorithms. We will also share our lessons about how these algorithms evolved, what worked, and what did not work.

2 - Real-time Airline Schedule Recovery

Dejun Hang, Jeppesen, Englewood, CO,
United States of America, Darren.Hang@jeppesen.com

In airline daily operations, the schedule is often disrupted by events unforeseen at the planning stage. Recovering the disrupted schedule as fast as possible with good quality is critical to protect revenue. We present how Jeppesen's Fleet Management System approaches this problem. We will discuss the underlying models and algorithms used to solve the aircraft and crew schedule recovery problems, and also some of the critical support processes.

Mobility Choices in Urban Transportation

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Hai Jiang, Tsinghua University, Dept of Industrial Engineering, Beijing, China, haijiang@tsinghua.edu.cn

1 - Determinants of Private Vehicle use Intensity: Evidence from Disaggregate Household Data in China

Hai Jiang, Tsinghua University, Dept of Industrial Engineering, Beijing, China, haijiang@tsinghua.edu.cn, Zhao Zhang

The level of congestion is primarily determined by the number of vehicles owned by the residents and their use intensity (that is, annual vehicle miles driven). Existing literature typically conduct the analysis using aggregated macroeconomic variables. In this talk, we use disaggregate household data to identify determinants of private vehicle use intensity in China. We find that gasoline price plays little role in use intensity, which is consistent with results from existing literature using macroeconomic data. We also find that the socioeconomic characteristics of the household has considerable effect in vehicle use intensity.

2 - A Comparison of Mixed Logit and Latent Class Methods for Mode Choice Analysis

Yuntao Guo, Purdue University, Lyles School of Civil Engineering, West Lafayette, IN, 47907-2051, United States of America, guo187@purdue.edu, Jian Wang, Srinivas Peeta

This study aims to investigate the differences between the mixed logit and the latent class methods in terms of model fit, model insights, predicted travel mode choice, and spatial transferability using a large sample of revealed preference travel mode choice data. The model can help planners to develop effective strategies to foster more sustainable transportation mode choice behaviors by reducing automobile dependency and encouraging the usage of alternative modes of travel.

3 - Traffic Equilibrium and Pricing with Information in a Correlated Network

Song Gao, Associate Professor, University of Massachusetts Amherst, Department of Civil and Env. Engineering, 214C Marston Hall 130 Nat. Resources Rd, Amherst, MA, 01003, United States of America, sgao@engin.umass.edu, Andre de Palma

We study the impacts of correlation and information penetration rate in a network with correlated, random link capacities, in terms of the types of equilibrium solution (corner vs interior for informed and uninformed respectively), the user cost for informed and uninformed, the social cost, and the optimal price for system optimum.

Journal of Quality Technology (JQT) Invited Session

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Fugee Tsung, Prof., HKUST, Clear Water Bay, Kowloon, Hong Kong - PRC, season@ust.hk

1 - An Introduction to Statistical Issues and Methods in Metrology

Joanne Wendelberger, Los Alamos National Laboratory, Statistical Sciences Group, MS F600, Los Alamos, NM, 87545, United States of America, joanne@lanl.gov, Michael Hamada, Max Morris, Stephen Vardeman, J. Marcus Jobe, Tom Burr, Huaqing Wu, Leslie Moore

Statistical science and metrology provide valuable concepts and approaches for assessing the quality of measured data. Measurement quality impacts the knowledge that can be gained by collecting and analyzing data using statistical methods, and appropriate data collection and analysis quantifies the quality of measurements. An overview of statistical issues and methods in metrology is presented that includes both frequentist and Bayesian methodologies.

2 - From Profile to Surface Monitoring: SPC for Cylindrical Surfaces via Gaussian Processes

Bianca Colosimo, Professor, Politecnico MILANO, via La Masa, 1, Milano, 20156, Italy, biancamaria.colosimo@polimi.it, Massimo Pacella

Quality of machined products is often related to the final shapes of the manufactured surfaces. This paper presents a novel method for surface monitoring, which combines Gaussian processes to model the manufactured shape and multivariate control charting for monitoring the deviations of the actual surface from the in-control pattern. Regardless of the specific case study, the proposed approach is general and can be extended to deal with different kinds of surfaces or profiles.

3 - Multimode Geometric Profile Monitoring with Temporally Correlated Image Data

Abhishek Shrivastava, Assistant Professor, FAMU-FSU College of Engineering, Dept of Industrial & Manufacturing Eng, Tallahassee, FL, 32310, United States of America, ashrivastava@fsu.edu, Park Chiwoo

We propose a new method for monitoring changes in geometrical profiles of objects in a dynamic process; changes in profiles occur in various modes. This work is motivated by the need for monitoring changes in geometrical shape and sizes of nanoparticles during self-assembly process. The proposed multimode geometric profile monitoring method addresses three specific issues - profiling of functional data, monitoring of multimode processes, and monitoring of time-correlated processes.

4 - Statistical Surface Monitoring by Spatial-Structure Modeling

Kaibo Wang, Associate Professor, Tsinghua University, Department of Industrial Engineering, Beijing, China, kbwang@tsinghua.edu.cn, Fugee Tsung, Andi Wang

We propose a new chart based on the Gaussian-Kriging model to monitor a two-dimensional (2-D) surface. A parametric model that considers three components of the surface, the global trend, the spatial correlations, and independent errors, is first constructed; then we monitor the process by detecting changes in the estimated parameters. This method is utilized to monitor a wafer-manufacturing process and its performance is compared with that of an existing method through simulation.

Game-theoretical Models in Maintenance and Reliability

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Maryam Hamidi, PhD Candidate, University of Arizona, 1127 E. James E. Rogers Way, Room 111, P.O. Box 210020, Tucson, AZ, 85721, United States of America, mhamidi@email.arizona.edu

1 - A Cooperative Game of Spare-Parts Systems

Ulas Ozen, Ozyegin University, Ozyegin University Cekmekoy Campus, Istanbul, Turkey, ulas.ozen@ozyegin.edu.tr

We consider a group of firms that keep spare-parts inventory to maintain their equipments. The firms can cooperate by pooling their spare-parts inventory and reduce costs. One important question is how the benefit of such cooperation should be shared between the participating firms. The firms' spare-parts investment problem is modeled as a queueing model and we study the associated cooperative game. We show that the resulting game has a non-empty core. Several extensions are studied further.

2 - Non-cooperative Game Theory Analysis in Supply Chain Internal Financing

Wanying Shi, Western New England University, 1215 Wilbraham Street, Springfield, MA, 01119, United States of America, wanying.shi@wne.edu, Julie Drzymalski

This paper evaluates the effect of wholesale price discount contract on coordinating non-cooperative supply chain financing between a liquid supplier and a capital constrained retailer at a risk-free rate. Optimal policies for retailer and supplier are found. Profits and efficiencies of retailer, supplier and supply chain are compared in both the retailer- and supplier-led Stackelberg games. Results show that internal financing will increase overall profits.

3 - A Competitive Dynamics Approach to Supply Chain Management: Competitive Action and Performance

Xinyi Ren, PhD Student, University of Maryland, 3330 Van Munching Hall, College Park, MD, 20742, United States of America, xinyi.ren@rhsmith.umd.edu, Christian Hofer, Curtis Grimm, David Cantor

This study investigates how the actions of supplier and manufacturer (focal firm) dyads impact focal firm's performance. Grounded in competitive dynamics and the relational view, theory will be developed regarding actions and performance. A panel dataset will be built combining data from FACTSET, Compustat and LexisNexis. This paper will contribute to both the competitive dynamics literature and relational view by studying competitive actions in a supply chain context.

Sustainable Operations in the Manufacturing Industry

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Wilkistar Otieno, Assistant Professor, University of Wisconsin-Milwaukee, 3200 N Cramer St, Milwaukee, WI, 53209, United States of America, otieno@uwm.edu

1 - Inventory Optimization in a Three Echelon Closed Loop Supply Chain with Stochastic Quality in Return

Sajjad Farahani, PhD Student, University of Wisconsin-Milwaukee, 4046 N Wilson Dr Apt2, Milwaukee, WI, 53211, United States of America, farahani@uwm.edu, Farshid Zandi, Wilkistar Otieno

We considered three echelon closed loop supply chain in which returned product arrive to the re-manufacturing system with different quality level inspect to estimate needed time to re-manufacture as a new product. We proposed an analytical queuing models with the time value of money consideration to optimize inventory level of two warehouses and the admission decision, which decides on the acceptance of returned products based on quality and processing time.

2 - A Simulation Based Model for Performance Evaluation of Control Drive Remanufacture

Thomas Omwando, Graduate Student, University of Wisconsin-Milwaukee, 3200 N Cramer St. EMS 503, Milwaukee, WI, 53211, United States of America, tomwando@uwm.edu, Wilkistar Otieno

Process complexities and uncertainties in product remanufacture affect system performance. In this study a discrete event simulation approach is employed to model process performance with the objective of improving system performance. A case study of two product families in control drive remanufacture is used to illustrate the applicability of the model. A sensitivity analysis is carried out to assess the effect of changes in various decision variables on the overall system performance.

3 - Warranty Analysis of Remanufactured Electrical Products

Yuxi Liu, Graduate Student, University of Wisconsin-Milwaukee, 3438 N Oakland Ave #302, Milwaukee, WI, 53211, United States of America, yuxiliu@uwm.edu, Wilkistar Otieno

This study considers a remanufactured electrical product under warranty. Warranty is key ensuring a good manufacturer-consumer relationship. Manufacturers hope to minimize warranty costs while consumers believe warranty promises product quality. This paper presents an optimal warranty period from the perspective of a manufacturer to maximize the total expected profits, while sustained consumer relation. We use data from a local company with a global supply chain to provide a numerical example.

Managing Search and Problem Solving in Innovation Settings

Cluster: New Product Development

Invited Session

Chair: Sezer Ülkü Associate Professor, Georgetown University McDonough School of Business, 545 Hariri Building, 37 & O Streets, Washington, DC, 20057, United States of America, su8@georgetown.edu

1 - When to Leave the Building? Search and Pivoting in a Lean Startup

Onesun Steve Yoo, University College London, Gower Street, London, WC1E 6BT, United Kingdom, o.yoo@ucl.ac.uk, Kenan Arifoglu, Tingliang Huang

An early stage entrepreneurial firm with a new product concept must maximize the chance of successful product launch. To avoid developing an unwanted product, practitioners suggest a lean approach to development, i.e., a firm should iteratively launch an unfinished product to learn what the consumers want and to alter the final product goal whenever necessary. We formalize this approach via the Bayesian learning framework, and investigate the optimal development strategy.

2 - How (and When) to Encourage Cooperation Across Projects

Fabian Sting, Erasmus University Rotterdam, Rotterdam School of Management, 3000 DR Rotterdam, Netherlands fsting@rsm.nl, Pascale Crama, Yaozhong Wu

Inspired by an innovative practice, we model a Project Management system that incorporates and shapes cooperative problem solving. Help is at the core of this system, in which project managers may ask for and provide help. We find that companies should take a nuanced approach when designing help exchange and time-based incentives.

3 - Search under Constraints - An Experimental Study

Sezer Ülkü, Associate Professor, Georgetown University McDonough School of Business, 545 Hariri Building, 37 & O Streets, Washington, DC, 20057, United States of America, su8@georgetown.edu

In contexts of innovation, slack resources are required due to the many unknowns. At the same time, according to some, "necessity is the mother of invention", and resource constraints might improve innovative performance. Through a series of experiments, we examine how constraints influence search strategies, and the ultimate performance.

Simulation Optimization and Input Uncertainty

Sponsor: Simulation

Sponsored Session

Chair: Enlu Zhou, Assistant Professor, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, United States of America, enlu.zhou@isye.gatech.edu

1 - Insights on Ranking and Selection when there is Input Uncertainty

Barry Nelson, Walter P. Murphy Professor, Northwestern University, Dept. of IEMS, 2145 Sheridan Road, C210, Evanston, IL, 60208, United States of America, nelsonb@northwestern.edu, Eunhye Song

We examine the impact of input uncertainty (inaccuracies in the stochastic input models that have been estimated from real-world data) on the simplest form of simulation optimization: ranking and selection among a finite number of alternatives. We show that the conclusions from the optimization must be altered, establish the limits of what can be attained by increased simulation effort alone, and suggest alternative ways to attack the problem that lead to interpretable conclusions.

2 - Distributionally Robust Stochastic Optimization using Divergences- A Data Driven Strategy

Anand Vidyashankar, Associate Professor, George Mason University, Department of Statistics, Volgeneau School of Engineering, Fairfax, VA, 22030, United States of America, avidyash@gmu.edu, Jie Xu

We propose a new paradigm for data-driven distributionally robust stochastic optimization (DRSO). This paradigm integrates existing approaches to decision making under uncertainty with robust and efficient statistical procedures. Specifically, it extends the scope of DRSO by centering the ambiguity sets on density estimates neighborhoods in the space of probability densities. The proposed approaches are transparent, theoretically justified, and accessible to researchers and decision makers.

3 - Some Statistical Perspectives on Optimization under Parameter Uncertainty

Henry Lam, Assistant Professor, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, khlam@umich.edu, Jeff Hong

We consider approaches to improve the quality of solutions for optimizations under parameter uncertainty, in the case of limited data. We analyze two computationally tractable methods: bootstrap aggregation, or bagging, and Bayes estimator in the decision-theoretic framework. Both are simulation-based schemes that aim to improve the distributional behavior of the optimality gap by reducing its frequency of hitting large values.

4 - Simulation Optimization When Facing Input Uncertainty

Enlu Zhou, Assistant Professor, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, United States of America, enlu.zhou@isye.gatech.edu, Xie Wei

This talk makes an attempt at the question of what is a good formulation for simulation optimization when there is input uncertainty. We propose a risk formulation of simulation optimization that tries to balance the trade-off between optimizing under the estimated input model and hedging against the risk brought by input uncertainty.

77-Room 300, CC

Supply Chain Management VI

Contributed Session

Chair: Bisheng Du, Assistant Professor, Ningbo University, 818 Fenghua Road, Ningbo, China, dubisheng@nbu.edu.cn

1 - Supplier Development Investments under Competition

Tarun Jain, IIM Bangalore, FPM Office, IIM Bangalore, Banerghatta R, Bangalore, India, tarun.jain@iimb.ernet.in, Jishnu Hazra

We model a case, where a buyer is evaluating a new supplier. The buyer allocates some capacity to the incumbent supplier and makes supplier development investments in the entrant supplier. Both incumbent and entrant supplier also exerts improvement investments. We find the optimal investments strategy of these players and the optimal capacity allocation strategy of the buyer.

2 - Analysis and Design of Retail Backrooms and its Impact on Supply Chain

Lita Das, Student, MIT, 77 Massachusetts Avenue, E40-286, Cambridge, MA, 02139, United States of America, litadas@mit.edu, Edgar Blanco

Backroom space management and supply chain operations are closely linked. We propose a model to optimally manage backroom space and demonstrate the impact on retail supply chain planning and design.

3 - An Evaluation of the Progressive Formulation (PF) through the Modeling of the PCSA

Daniel Mota, Researcher, MIT, Rua Jose de Magalhaes 373, Vila Clementino, Sao Paulo, SP, 04026, Brazil, danmota@mit.edu, Roberto Perez-franco

Progressive Formulation (PF), an ad-hoc approach recently proposed for formulating a supply chain strategy, has shown potential in applied projects but has never been objectively evaluated. This paper attempts a first evaluation of the merits of the PF approach, by modeling PF as a greedy algorithm and comparing its results against an optimal solution for the same data set. Results are compared in terms of the quality of the solution generated and the amount of information needed to achieve it.

4 - Capacity Planning over a Finite Time Horizon with Dual Contracts: An Optimization Approach

Ramya Ravi, Student, Indian Institute of Technology, Madras, Chennai, 600036, India, ramya.tcemdu@gmail.com, Haritha Thirumalai, Rajendran Chandrasekharan, Vivekanandan Srinivasan

We consider a supply chain with multiple products manufactured using processes outsourced to suppliers by the manufacturer. Capacity planning contracts (i.e., fixed charge and option, with setup/order costs) are considered. We present an algorithm to determine the capacity investments, considering the total supply chain profit over a finite time horizon.

5 - Optimal Fulfillment Decisions in a Capacitated Online Retailing System with Different Leadtimes

Bisheng Du, Assistant Professor, Ningbo University, 818 Fenghua Road, Ningbo, China, dubisheng@nbu.edu.cn

Online retailers offer more options, like flexible delivery, pricing, etc. We consider an inventory system where customers may have different lead-times under the retailer's capacity. The retailer has a primary warehouse and many regional warehouses. The regional warehouses fulfill the customers' orders by on-hand inventory, or the primary warehouse will fulfill orders with longer time. Our intention is to analyze the performance of the capacitated retailing system under the multistage setting.

78-Room 301, CC

Shipping and Transportation for Supply Chains

Contributed Session

Chair: Sherif Masoud, Operations Research Analyst, RockTenn, 3950 Shackleford Rd., Duluth, United States of America, smasoudphd@gmail.com

1 - Port Logistics and the Voice of the Customer

Richard Monroe, Visiting Assoc Prof, Longwood Univ, College of Business and Econ, 201 High Street, Farmville, VA, 23120, United States of America, rickmon53@gmail.com

Customers are key stakeholders for logistics services through the various modes which include seaports, trucking, rail and inland ports. Primary customers such as manufacturers and retailers are highly dependent on the smooth flow of freight through the logistics system. Customer expectations for logistics services have received limited attention in previous research. This paper will utilize a combination of approaches to explore the voice of the customer in the port logistics setting.

2 - A New Formulation for the Cyclic Inventory Routing Problem and the Solution Method

Zhe Liang, Professor, Tongji University, No. 1239, Siping Road, Shanghai, 200092, China, liangzhe@tongji.edu.cn, W. Art Chaovalitwongse

We study a cyclic inventory routing problem (IRP). The traditional exact methods for IRP use an arc-based model, in which a variable represents a possible vehicle flow between a pair of customers. We develop a Dantzig-Wolfe reformulation for the arc-based model. To solve the problem efficiently, we develop a set of valid inequalities and a column generation algorithm. Computational results show that the new model can obtain near optimal solutions to very large test cases in a reasonable time.

3 - Robust Supply Chain System under Yield Uncertainty

Samir Alsobhi, PhD Candidate, Wichita State University, 11328 E Pine Meadow Ct, Wichita, KS, 67206, United States of America, samiralsobhi@gmail.com, Krishna Krishnan

Products are often damaged in transit. These damages are stochastic in nature. To minimize the impact of damage, the selection of routes should consider not only the expected damage but also the variability of damage. In this research, the first model is of the supply chain network in order to minimize total cost, which consists of product cost and transportation cost while considering multiple routes and products. In the second model, the concept of robust design has been applied to minimize damage.

4 - A Floating Price Contract for the Ocean Freight Industry

Ruina Yang, Xi'an Jiaotong University, No. 28 West Xianning Road, Xi'an, China, rnyang@mail.xjtu.edu.cn

We propose a floating price policy to address the shipper default issue. Specifically, the shipper has to make a tradeoff between not fulfilling all committed capacity to secure a lower spot price in the low season and purchasing the capacity at a higher floated price in the high season. The results reveal that the non-capacity commitment contract serves both parties' best interests under a tight-capacity market, while the floating price contract is the most effective in an over-capacity market.

5 - Minimizing Automotive Supply Chain Costs under Mixed Transportation Modes

Sherif Masoud, Operations Research Analyst, RockTenn,
3950 Shackleford Rd., Duluth, MN, United States of America,
smasoudphd@gmail.com, Scott Mason

We present an industry-motivated integrated production and transportation problem focused on short-term automotive supply chain planning. We consider multiple, heterogeneous modes of transportation that offer a cost vs. delivery time option to the manufacturer. Computational results demonstrate the efficiency of a proposed metaheuristic-based solution approach, given the problem's NP-hard computational complexity.

■ MB79

Software Demonstration

Cluster: Software Demonstrations

Invited Session

1 - AMPL - Developing Optimization Applications Quickly and Reliably with Algebraic Modeling

Robert Fourer, President, AMPL Optimization Inc., 2521 Asbury Ave, Evanston, IL, 60201, United States of America,
4er@ampl.com

Can you negotiate the complexities of the optimization modeling lifecycle, and deliver a working application before the problem owner loses interest? Algebraic languages were invented to streamline the key steps of model formulation, testing, and revision. Today they are supported by powerful facilities for embedding models into larger systems and deploying them to users. This presentation introduces algebraic modeling for optimization through examples using classic and recently introduced features of the AMPL language and system.

2 - Gurobi Optimization, Inc. – Modeling with the Gurobi Python Interface

Renan Garcia, Optimization Support Engineer, GAMS Development Corp

Are you looking for an environment that combines the expressiveness of a modeling language with the power and flexibility of a programming language? The Gurobi Python interface allows you to build concise and efficient optimization models using high-level modeling constructs. Moreover, Python itself has a vast ecosystem of packages designed to increase your productivity, such as a notebook-style interface (iPython Notebook), data access capabilities and web development tools. This tutorial will provide an overview of these features, including detailed examples that show how to use the Python interface to build models that can be turned into full optimization applications.

Monday, 12:30pm - 2:30pm

Exhibit Hall A

Monday Poster Session

Contributed Session

Chair: Wenjing Shen, Drexel University, Philadelphia, PA,
United States of America, ws84@drexel.edu

Co-Chair: Allen Holder, Rose-Hulman Mathematics, Terre Haute, IN,
United States of America, holder@rose-hulman.edu

Co-Chair: Min Wang, Drexel University, 3141 Chestnut Street,
Philadelphia, PA, United States of America, mw638@drexel.edu

1 - Big Data

Marwah Halwani, University of North Texas, 2812 Loon Lake Road, Denton, TX, 76210, United States of America,
marwahhalwani@my.unt.edu, Victor Prybutok, Adam Corwin,
Daniel Peak

The Big Data Model developed to provide a foundation for the proper use of Big Data and Data Visualization in Social Media environments that will drive positive bottom-line results. This research addresses how can Big Data represented with Data Visualization in a Social Media environment contribute to better decisions

2 - Brightness-location Congruency Effects on Consumer Behavior in Retail Context

Tsutomu Sunaga, Professor, Kwansei Gakuin University, 1-1-155, Uegahara, Nishinomiya, Hyogo, 662-8501, Japan,
sunaga@kwansei.ac.jp, Jaewoo Park

The study investigates the effects of the crossmodal correspondence between colour and visual heaviness on consumer purchase behavior. The results of the experiments demonstrate that brightness-location congruence, specifically products with bright (dark) colour at the higher (lower) shelf positions, increases shoppers' perceptual fluency and promotes their purchase behaviour.

3 - A Kalman Filter Algorithm for Artillery Firing Shift

Michael Bendersky, Ben Gurion University of the Negev,
Beersheba, Israel, michael.bendersky@gmail.com, Israel David

We propose an innovative algorithm for artillery firing shift using the Kalman Filter approach. Firing shift implies an immediate artillery engagement of a target ("fire for effect") without a prior fire adjustment (by a forward observer). The capability of firing shift provides undeniable operational advantages. Implementing the Kalman Filter allows sequential fire adjustment relying on multiple auxiliary targets.

4 - Demand Forecasting and Area Marketing for Gas Appliances

Kosuke Shaku, Tokyogas, 1-5-20, Kaigan, Minato-ku, Tokyo,
Japan, shaku@tokyo-gas.co.jp

Tokyo gas has been utilizing O.R. to a lot of fields such as marketing, emergency response, and so on. Demand Forecasting of gas appliances has been a big problem for gas appliances sales. We managed to establish the method of quantitatively rational demand forecast by utilizing the CRM data of appliances stocks, survival analysis, and transience of appliances types in replacement. The result of this work has been adopted to many Tokyo gas measures such as sales goal setting and area marketing.

5 - Who to Call Predictive Modeling of Potential Customers Based on Customer Behavior Data

Lin Shi, Kihhihi Network Information Systems Technology, China,
shilin@baixing.com

A telemarketing campaign is operated in a classified advertisements website Baixing.com. A model is needed to predict the possibility of customers order and then those with highest possibility can be selected. The paper designed and implemented a practical decision support system which could generate and distribute customer lists to sales representative. The poster introduces the object, business background, specific aims, modeling procedures, modeling data, final result and the conclusions of the work. Four techniques have been used to compare the performance. Random forest gives the best result. The final dynamic model integrates customers online behavior data, which is also called click-stream data as indicators of willingness to pay. The result from field study inspired that in the future work, we may push dynamic modeling for more robust and precise prediction.

6 - The Opportunity Cost of Federal Subsidies for Electricity Generation in the U.S.

James Gibson, USMC, 2414 Turtle Bay Dr, New Bern, NC, 28562,
United States of America, gibson.james.r@gmail.com

This study is the first investigation of the opportunity cost associated with electric utility sector federal subsidies using the mean-variance portfolio theory. The application of portfolio theory provides for an examination of how policy decisions influence electricity generation costs. The results indicate federal subsidies have an uncertain effect on electricity generation costs and the associated tax burden becomes an opportunity cost assumed by society and individual taxpayers.

7 - The Effect of Shape and Semantic Novelty in Product Design Usage

Harris Kyriakou, Stevens Institute of Technology, 1 Castle Point on Hudson, Hoboken, NJ, 07087, United States of America,
ckyriako@stevens.edu

Our study examines 35,727 product designs submitted to the largest 3D printing online community from January 2009 to June 2013, showing how (i) shape novelty, (ii) semantic novelty and (iii) their interaction affect product design usage. We develop both a shape-based and a text-based measure of novelty by identifying designs that are dissimilar to any preexisting design.

8 - Who Wants My Product? Affinity-based Marketing

Leyla Zhuhadar, Assistant Professor, Western Kentucky University, 1906 College Heights Blvd, Grise Hall, Bowling Green, KY, 42101, United States of America, leyla.zhuhadar@wku.edu

In this research, we have developed a marketing application for data mining with the goal of publicizing a new product to those customers with a high affinity for it. We assembled suitable data to test and evaluate different mining algorithms on it. We have used the buyers of our product of interest as "model customers" for finding similar customers among the non-buyers. Finally, we deployed our final model to our customer base.

9 - Robust Security-constraint Unit Commitment with Dynamic Rating

Anna Danandeh, University of South Florida, Tampa, FL, 33613,
United States of America, annadanandeh@mail.usf.edu, Bo Zeng,
Brian Buckley

A challenge in UC is the impact of uncertain factors such as ambient temperature on generation and transmission capacities. Since system capacity is mostly determined statically, weather changes can cause outages and/or congestions. We developed a 2 stage robust security-constraint UC formulation which dynamically rates the assets and hedges against possible efficiency drops. Leveraging the correlation between weather and load, it yields a less conservative decision and a faster computation.

10 - Advanced Decision-making Procedures in Massive Failure Data Classification

Keivan Sadeghzadeh, Northeastern University,
27 Payne Rd, Newton, MA, 02461, United States of America,
k.sadeghzadeh@neu.edu

In many professional areas, management decision-making process is based on the type and size of data where data classification is a necessary procedure. Massive amount of data in high-dimensions are increasingly accessible from various sources and it has become more difficult to process the streaming data in traditional application approaches. This poster presents advanced procedures to analyze high-dimensional failure data in order to facilitate decision-making through data classification.

11 - Exploring Residents Attitude Towards Solar Photovoltaic System Adoption in China

Yaqin Sun, Drexel University, 38 Clarence Avenue, Bridgewater, PA, United States of America, ys23@drexel.edu, Xiangrong Liu

The research aimed to identify the drivers and dynamics that most encourage Chinese customers to install solar PV systems (SPS) in their residential buildings. A survey was designed and conducted among Chinese residents. The first hand data indicated the importance of increasing awareness of SPS among potential consumers. This research also assessed the impacts of gender on their knowledge of, concerns, and attitudes towards PV adoption. However, no significant difference among gender was found.

12 - Design of Financial Incentive Programs to Promote Net Zero Energy Buildings

Alireza Ghalebani, University of South Florida, Tampa, FL, United States of America, alireza@mail.usf.edu, Tapas Das

Promoting net zero energy buildings (NZE) is among key carbon emissions reduction approaches in the U.S. and in the EU countries. We present a mixed integer programming (MIP) model to aid determining the minimum thresholds of financial incentives that would spur growth in NZEBs. Several combinations of production tax credit and loan interest rates have been investigated for different commercial buildings in Tampa, FL. The results indicate the threshold values of the incentive program parameters.

13 - Multi-objective Scenario Discovery for Climate Change Adaptation

Julie Shortridge, PhD Student, Johns Hopkins University, 3400 N. Charles St., Ames Hall 317, Baltimore, MD, 21218, United States of America, julieshortridge@gmail.com, Seth Guikema

New methods for decision support under non-probabilistic uncertainty are becoming increasingly popular in the climate change adaptation field. Scenario discovery, as part of the robust decision making framework, uses machine learning to identify multivariate scenarios where a plan or system will perform poorly. In this work, we evaluate different methods for incorporating multiple criteria into the scenario discovery process to assess whether the method used impacts the scenarios identified.

14 - The Unit Commitment Model for Power Interruption Contracts

Lakshmi Palaparambil Dinesh, PhD Candidate, University of Cincinnati, 221 Piedmont Avenue Apt. 21, Cincinnati, OH, 45219, United States of America, lakshmi603@gmail.com, Jeffrey Camm

The term unit commitment implies which power generation units should be turned on or off in a power plant. When the demand for power is high, power could either be bought from the spot market or the customers could be interrupted using a contract. The problem deals with choosing the right set of customers for interruption using a technique called conjoint optimization and hence reducing the overall costs for the supplier.

15 - Virtual Metrology for Copper Clad Laminate Manufacturing

Misuk Kim, Seoul National University, 39-339, Gwanak-ro, Gwanak-gu, Seoul, Korea, Republic of, misuke88@naver.com

Virtual metrology predicts wafer quality properties based on sensor values of the equipment in semiconductor manufacturing. It reduces the cost associated with physical metrology as well as identifies important equipment sensor values. We applied it to copper clad laminate for printed circuit board with data from a Korean manufacturer. We not only obtained prediction models with a high accuracy, but also found a number of important, yet previously unknown to engineers, equipment sensors.

16 - Goodness of Fittest for Multinomial Model with Clustered Data

Zhiheng Xie, PhD Candidate, University of Kentucky, Lexington, KY, 40503, United States of America, zhiheng.xie@uky.edu

Discrete-time Markov chains have been used to analyze the transition of subjects from intact cognition to dementia with transient states, and death as competing risk. We proposed a modified chi-square test statistic which can deal with the clustering effects for the multinomial assumption. We showed our new statistic has a better type I error control when clustering effects presents. We apply the test to the data from the Nun Study, a cohort of 461 participants.

17 - Discrete Event Dynamic Simulation for Modeling a Real Job Shop System

Golshan Madraki, Ohio University, 15 Station St, Apt. F, Athens, OH, 45701, United States of America, gm705913@ohio.edu

A new approach for simulating a job shop system is introduced. The interarrival time of jobs, processing time of machines, time between failures, repair time have general distribution. Previous models consider these parameters deterministic or exponentially distributed. We facilitate estimation of maximum production rate where Buffers capacity, Number of machines in each shop, Number of Lift-truck are efficient

18 - Optimization of Food Production (Ready-To-Eat Meat Sticks)

Rebecca Brusky, Data Science Student, University of Nebraska Omaha, 3602 Lincoln Blvd, Omaha, NE, 68131, United States of America, rbrusky@unomaha.edu, Betty Love

In the production of ready-to-eat meat sticks, the bottlenecks (dependencies) need to be minimized and number of sticks produced needs to be maximized. Dependent components include equipment flow constraints, smoke room duration and cleaning downtime. The largest downtime factor is the required four-hour cleaning when switching to a non-compatible flavor. This poster documents how a six-flavor production line governed by a set of flavor ordering rules and production demands can be optimized.

19 - Rethinking Principal Component Analysis in EEG Classification

Xiaoxia Li, North Dakota State University, 124 East Bison Court, Fargo, ND, 58108-6050, United States of America, xiaoxia.li@ndsu.edu

Principal Component Analysis (PCA) is considered to be a powerful tool in dimension reduction. However, it is worth thinking of the suitability of application for EEG signal data. Two EEG datasets collected from alcoholic and control groups were used to test the prediction accuracy before and after PCA transformation with SVM and KNN methods. Based on the classification results, we found that PCA is not valid in EEG signal processing. We also concern that other factors might be confounding.

20 - Strategic Exclusive Supply Contract for Carbon Fiber Reinforced Plastic in the Aviation Industry

Kenju Akai, The University of Tokyo, 7-3-1 Hongo, Bunkyo-Ku, Tokyo, Japan, akai@css.t.u-tokyo.ac.jp, Kazuma Sakamoto, Nariaki Nishino, Kazuro Kageyama

We investigate the rationality of an exclusive supply contract for Carbon Fiber Reinforced Plastic (CFRP) between Boeing and a Japanese CFRP supplier, Toray. We build a mathematical model of the market for CFRP comprising Toray and the oligopolistic market for aircraft, assuming Airbus, as Boeing's rival. The subgame perfect Nash equilibria show that both Boeing and Toray obtain the higher profits rather than that in the Cournot Competition.

21 - Hand Motion Identification from Electroencephalography Recordings using Recurrent Neural Network

Jinwon An, SNU, 1 Gwanak-ro, Gwanak-gu, Seoul 151-742, Seoul, Korea, Republic of, jinwon@dm.snu.ac.kr, Sungzoon Cho

Neurological disabled patients can be aided by brain-computer interface (BCI) prosthetic devices. Grasp and lift tasks are basic actions that needs to be implemented in those devices. In this study, grasp and lift tasks were analyzed by using electroencephalography (EEG) recordings. Various recurrent neural network models were used. It shows that EEG can identify hand motions such as reaching, grasping, loading and retracting with high accuracy.

22 - On Optimization of Carbon Capture, Utilization, and Storage Supply Chains under Uncertainty

Mahnaz Asghari, Virginia Tech, 1406 University City Blvd., Blacksburg, VA, 24060, United States of America, mahnaz@vt.edu, Hamed Shakouri Ganjavi

Carbon capture, utilization, and storage (CCUS) is a crucial technology to mitigate climate change. Due to the high costs of the technology, a great deal of attention has been focused on how the captured CO₂ can be optimally utilized or stored. We study optimizing CCUS supply chains under uncertain environment. In this poster, we present an algorithm to generate a candidate network for CO₂ transportation and a model for optimizing the utilization and storage of the captured CO₂ in CCUS systems.

23 - On Two-row Chvatal Gomory Cuts

Babak Badri Koohi, Doctoral Student, Virginia Tech, 1406 University City Blvd., Blacksburg, VA, 24060, United States of America, babakbk@vt.edu, Diego Moran

Chvatal-Gomory (CG) cuts are a very important class of cutting planes for solving mixed-integer programs. CG cuts for a polyhedron P are obtained by computing integer hulls of its 1-row relaxations. We study 2-row CG cuts, a generalization of CG cuts that are obtained by computing integer hulls of 2-row relaxations of P. In this poster, we present some basic properties of 2-row CG cuts and discuss their relation to other well-known classes of cuts such as split cuts and (crooked) cross cuts.

24 - Stable Strategic Marriages

James Bailey, Graduate Student, Georgia Institute of Technology, 116 Ponce De Leon Ave NE, Atlanta, GA, 30308, United States of America, james.bailey@gatech.edu, Craig Tovey

The effect of lying on the stability of marriages is a long standing open problem. When men and women behave strategically, an ideal decision mechanism selects a marriage that is (1) stable, and (2) egalitarian, with respect to sincere preferences. We provide a positive result to (1) and a negative result to (2) under two natural conditions. We strengthen current results about the Gale-Shapley algorithm, showing that the woman-optimal marriage is the only obtainable one when men propose.

25 - Decision Analytics for Managing Invasive Wild Pigs

Matthew Brondum, U.S. Army Corps of Engineers, 3909 Halls Ferry Rd., Vicksburg, MS, 39180, United States of America, matthew.c.brondum@usace.army.mil, Igor Linkov, Zach Collier, Buddy Goatcher

Wild pigs pose significant environmental, economic, and social risks to the United States and around the world. A number of wild pig eradication and control measures exist, but many eradication campaigns are ultimately unsuccessful due to a variety of complexities across multiple domains. We are developing a decision analytic tool which will assist affected landowners in deciding which eradication technique best suits their site-specific interests.

26 - The Regional Logistics Hubs Location Problem Based on the Topsis and Genetic Algorithm: A Case of Sichuan

Si Chen, Southwest Jiaotong University, #1 Jingqu Road, Emei, China, chensi@swjtu.edu.cn, Qian Guo, Mi Gan

The regional logistics demands, which are the key factors for logistics hubs location problem, are changing with the developing regional economic and the structure of industry. Then we aim to modeling this problem with an integrated approach of multi-criteria decision making and integer programming model. And the real data case of Sichuan is employed to verify the feasibility of proposed models and approach. Moreover, the numerical results are corresponding to the actual logistics situation.

27 - Promotional Mix and Pricing Strategy with Risk-averse Buyers in the Age of Social Media

Wei-yu Kevin Chiang, City University of Hong Kong, P7614, Academic 1, Hong Kong, Hong Kong - PRC, wchiang@cityu.edu.hk, Qiao Wang, Lu Qiang

How should a firm minimize the wastage on marketing expenditure with an efficient promotional mix? The firm has two promotional strategies, hype advertising campaign (HAC), which refers to a basic publicity that makes consumers aware of the product's existence, and referral reward program (RRP), which refers to an incentive-based program that offers rewards to the existing buyers for bringing in new buyers. We study the firm's optimal promotional mix and pricing strategy with risk-averse buyers.

28 - A Game Theoretic Analysis of Electricity Time-of-use (TOU) Tariff for Residential Customers

Dong Gu Choi, Senior Researcher, Korea Institute of Energy Research, 152 Gajeong-ro, Yuseong-gu, Daejeon, 34129, Korea, Republic of, doonggus@gmail.com, Valerie Thomas

We properly formulate a game-theoretic model for analyzing not only the optimal behaviors of both an electric utility and residential customers but also their monetary gains or losses under a TOU tariff. With two heterogeneous customer types in terms of consumption pattern, we identify that a win-win situation is not possible. Also, we emphasize our analytic results by describing a numerical example, and we discuss the implications of our results for electric utilities and regulatory agencies.

29 - Why Classical Hybrids are so Risky for Entrepreneurs, and What to do About it

Gaston De Los Reyes, Assistant Professor, George Washington University School of Business, 2201 G St. NW, Funger 615, Washington, DC, 20008, United States of America, gdlr@gwu.edu

Williamson (1991) insufficiently characterized the institutions of hybrid governance, emphasizing forms that feature neoclassical devices to co-govern past contract close. Entrepreneurs, however, frequently resort to hybrids of classical form, lacking terms to protect from 'lawful' opportunism in case of disruption. I explicate the implications, drawing upon my dissertation study of contract law. I discuss a novel institutional solution and managerial strategies for the status quo.

30 - An Integrated Make-pack-route Problem of Fresh Agri-food Online Retailing in China

Mu Du, Institute of Systems Engineering, Dalian University of Technology, No.2 Linggong Road, Dalian, China, dumu.dlut@gmail.com, Xiangpei Hu, Nan Kong

Fresh agri-food sold by farm-to-home online retail is produced through a make-pack-route process at farm's distribution centers. Due to the large variety of produce and high cost of intermediate storage, an integrated decision model is employed to coordinate these different operations. We introduce a make-pack-route model that minimizes the total cost and propose an effective heuristic method. We report a case study based on real-world business practice in China.

31 - Decision Analytic Modeling of the Five Competitive Forces in the Residential Solar Industry

Karim Farhat, PhD Candidate, Management Science and Engineering, Stanford University, 475 Via Ortega, Huang Engineering Center 245A, Stanford, CA, 94305, United States of America, kfarhat@stanford.edu

Using a first-of-kind quantitative decision-analytic model of Michael Porter's five competitive forces, we investigate an international solar firm's plan to enter and properly position in the US residential solar PV industry. Applying a Bayesian probabilistic approach, the model assesses the uncertain profitability of the overall competitive market, and it provides several insights on the firm's go-to-market strategy, including: regional focus, vertical integration, and customer finance.

32 - Portfolio Analysis for Army Corps of Engineers Business Line Integration

Cate Fox-lent, US Army Corps of Engineers, 333 Massachusetts Ave 7, Arlington, MA, 02474, United States of America, catherine.fox-lent@usace.army.mil, Matthew Bates, Christy Foran

Portfolio analysis is used to demonstrate opportunities to leverage synergies across business lines. Coastal systems can benefit from reduced cost, reduced environmental impact, or increased project performance when planning for Navigation, Environmental Restoration, and Coastal Storm Risk Management projects is intentionally integrated. Long-term monitoring to improve quantification of project interactions can lead to improved utility of this type of analysis.

33 - Incorporating Passenger Recovery Decisions During Airline Operations Recovery

Dinakar Gade, Senior Operations Research, Sabre, 3150 Sabre Drive, Southlake, TX, 76092, United States of America, dinakar.gade@sabre.com, Sureshan Karichery, Shahram Shahinpour

Airlines are faced with several types of disruptions that impede regular operations. The Sabre AirCentre Recovery Manager (Ops) helps airlines quickly recover both the schedule and aircraft rotations from disruptions. We introduce a new feature of Recovery Manager called the Passenger Flow Module (PFM) that incorporates passenger re-accommodation decisions during schedule recovery. The solutions generated reduce the impact to passenger flows in the network and reduce passenger inconvenience.

34 - The Impact of Roadway Traffic Flow in Regional Network Design Problem

Mi Gan, Dr, Southwest Jiaotong University, 111 N 2nd Bound Erhuang Road, Chengdu, SC, 610031, China, migang@swjtu.cn, Si Chen

In order to solving the problem that the existed logistics network design models(LND) are lack of consider on roadway traffic flow. The uncover degree function of logistics facility nodes based on impedance function was constructed. Then, integrated logistics network design models and corresponding algorithms were proposed with the basis of uncover degree function. The comparison of general LND models and models we developed by real case reveals the impact of roadway traffic flow on LND.

35 - Evaluating Zoning Strategies for Demand Responsive Transit Systems

Eric Gonzales, University of Massachusetts, Amherst, Department of Civil & Environmental Eng., 130 Natural Resources Road, Amherst, MA, 01003, United States of America, gonzales@umass.edu, Mahour Rahimi

DRT systems often divide their service area into smaller regions in order to simplify operations. However, this management strategy can create inefficiencies. This paper develops an analytical formulation to explain the relation between agency cost and zoning strategies. The two main objectives are to understand when a service area needs to be divided into smaller regions to reduce the total costs of a DRT system and how the split should be done in order to be the most cost effective.

36 - Supply Enhancement in Capital-constraint Assembly System: Financing Suppliers or Dual Sourcing?

Chaocheng Gu, PhD Candidate, Huazhong University of Science and Technology, 1037 Luoyu Rd., 326 School of Management, Wuhan, HB, 430074, China, chaocheng@hust.edu.cn, Shiming Deng

We study two mechanisms for supply reliability enhancement in capital constraint assembly system. Financial mechanism. Three financial strategies are examined; that is, bank finance, buyer finance and a combined peer finance. The manufacturer can also avail of a more expensive backup sourcing. When bank finance and buyer

finance both present, the manufacturer always prefer buyer finance. The optimal mechanism switches back and forth as the equilibrium order quantity increases.

37 - Rating Aggregation in Multi-dimensional Rating Systems: How do Reviewers Form Overall Ratings?

Dominik Gutt, PhD Candidate, University of Paderborn, Warburger Str. 100, Paderborn, 33098, Germany, dominik.gutt@wiwi.uni-paderborn.de, Dennis Kundisch

A recent strain of literature on online product reviews has focused in particular on multi-dimensional product reviews. Multi-dimensional product reviews usually allow the reviewer to rate a product first, based on one overall rating, and second, based on a set of several sub-dimensions. Mostly, overall ratings do not equal e.g. the calculated mean of the sub-dimensions. Our research will shed light on the question, which heuristics reviewers use to form an overall rating.

38 - Cyclic Timetabling and Platforming of Mixed Train Types on a Bidirectional Railway Line

Mojtaba Heydar, University of Newcastle, University Drive, Callaghan, Australia, mojtaba.heydar@newcastle.edu.au

We present a mixed integer program for cyclic train timetabling and platforming problem. It is assumed that there are different types of trains moving on a single, bidirectional railway line. Two objectives: timetable cycle length and total journey time of all train types are considered. Constraints include infrastructure characteristics, safety regulations, and operational rules. Heuristics and exact methods are combined with math model to solve large problem instances are solved and discussed.

39 - The Impact of Platform Update Interval on Platform Diffusion in a Cooperative Mobile Ecosystem

Yoo S. Hong, Professor, Seoul National University, 1 Gwanak-ro, Gwanak-gu, Seoul, 08826, Korea, Republic of, yhong@snu.ac.kr, Gyesik Oh

Periodic platform upgrading is one of the effective strategies for potential participants as well as existing stakeholders. However, the diffusion of an updated platform is ineffective in a cooperative mobile ecosystem where a manufacturer modifies a platform released as open-source software on its smartphones. This paper models the effectiveness of platform diffusion with respect to the platform update interval in consideration of the manufacturer's decision mechanism.

40 - Operational Health Information Exchange Platform

Kang-yu Hsu, PhD Student, Purdue University, 610 Purdue Mall, West Lafayette, IN, 47907, United States of America, hsu66@purdue.edu, Poching Delaurentis, Yuehwen Yih, Rich Zink

Health Information Exchange (HIE) has been focusing on utilizing patient electronic health records to improve service quality and patient safety. The exploitation of HIE, however, can go beyond patient records. This study aims to build an infusion drug limit library database and embedded analytical tools as a pilot for the operational HIE platform that may house and utilize other types of data with similar usage and functionality.

41 - Design and Pricing of Crop Insurance Based on NDVI

Jing Huang, Hohai University, No.8 Focheng Road, Nanjing, China, huangjingshow@hotmail.com, Anna Shi, Huimin Wang, Jinping Tong

The crop index-insurance is a possible approach to solve the dilemmas in traditional crop insurance. In this study, the crop insurance contract is designed based on remote sensed Normalized Difference Vegetation Index (NDVI). Then the crop yield estimation models in different expectations is proposed. Lastly, the pure rate of premium is presented under different triggers using nonparametric kernel density model. The paddy rice in three cities in Yunnan Province, China are chosen as an example.

42 - An Infinite Time Horizon Portfolio Optimization Model with Delays

Azmat Hussain, PhD Student, North Carolina State University, Raleigh, NC, 27606, United States of America, ahussai@ncsu.edu

We consider a portfolio optimization problem over an infinite time horizon. The problem is formulated as a stochastic control problem and the state is governed by a stochastic process with delay. The goal is to choose investment and consumption controls such that the total expected discounted utility is maximized. Under some conditions, the corresponding HJB equations for exponential, log and HARA utility functions are solved and verification results and the optimal control are also established.

43 - Optimization of the Order-up-to and Reorder Levels for Each Item in the Forward Area of Warehouse

Takashi Irohara, Professor, Sophia University, 7-1 Kioi-cho, Chiyodaku, Tokyo, 1028554, Japan, irohara@sophia.ac.jp

We propose an optimization procedure to solve a forward reserve allocation problem and determine the order-up-to and reorder levels for each item in the forward area. In the target warehouse or distribution center, the forward area stores items in a unit of piece for efficient order picking and the reserve area stores items in a unit of case. There is a tradeoff between replenishment frequency and inventory space in the forward area. We show the effectiveness of the proposed method.

44 - Net Energy Analysis of Wind/Solar Generation and Electric Vehicles: Are They as Green as They Seem?

Tongdan Jin, Texas State University, 601 University Drive, San Marcos, TX, United States of America, tj17@txstate.edu, Joseph Duke

Wind and solar energy are widely hailed as "free" and "clean" energy. Similarly, electric vehicles (EV) that run on batteries are considered to be much greener than their gasoline counterparts. But is it possible that the environmental benefits from new energy and transport technologies may be exaggerated? The goal of this research is to perform an analysis of the lifecycle CO₂ emissions, from wind turbines, solar photovoltaic panels, and EV, to weigh together the cost and benefits.

45 - Design and Modelling of Crowdsourced Enabled Relay System for Urban Parcel Delivery

Nabin Kaffle, Research Assistant, UIC, 842 W Taylor St, Chicago, IL, 60616, United States of America, nkaffle3@uic.edu, Bo Zou, Jane Lin

We propose a new relay-based intermodal system for urban parcel delivery enabled by crowdsourcing technology. A mathematical model is formulated which (i) identifies relay locations and their visiting order by the delivery truck; and (ii) uses local green modes in place of the delivery truck for last-leg pickup/delivery from the chosen relay points, where crowdsources are selected through auction. We develop a heuristic algorithm to solve the model.

46 - Automatic Sentiment Words Extraction from Online Reviews for Product Comparison

Eunji Kim, Data Mining Lab., 39-339, Seoul Natl' Univ., Gwanak-ro, Gwanak-gu, Seoul, Korea, Republic of, eunjikim@dm.snu.ac.kr, Sungzoon Cho

Online customer reviews are potentially a great source for improving the quality of products or services. However, it is technically tough to automate it because the review data is vast and unstructured. We propose a text mining approach that can handle a context dependent sentiment of a word in reviews. A word is associated with different sentiment values for different product categories. This enables us to extract pros and cons of a product when compared to similar products.

47 - A Cooperative Game Theory Approach to Highway Cost Allocation

Saurav Kumar Dubey, PhD Student Department of Industrial and Systems Engineering, University of Tennessee at Knoxville, 1615 Laurel Avenue, Box-203, Knoxville, TN, 37916, United States of America, skumardu@vols.utk.edu, Alberto Garcia-Diaz

Traditional methods of allocating highway cost among vehicle classes include proportional and incremental procedures. Two non-traditional game-theoretic concepts of Least Core and Discrete Aumann-Shapley Value will be shown to be effective in integrating Traffic Capacity and Pavement Thickness requirements. The Nucleolus solution concept will be implemented to strengthen the core stability of Highway Cost Allocation game and reinforce the principles of fairness and rationality.

48 - Incorporating the Impact of Product Reviews on Future Propensity to Purchase

Matthew Lanham, Doctoral Candidate, Virginia Tech, Dept. of BIT (0235), Blacksburg, VA, 24061, United States of America, lanham@vt.edu, Ralph Badinelli

This study investigates the potential impact that publically accessible product reviews might have on future sales and propensity to purchase for a national retailer and provides a means to incorporate this knowledge posteriori to already derived demand forecasts. The study is motivated by the emergence of Big Data Analytics (BDA) in the retail industry to improve consumer experience, products, and services.

49 - Active Fund Performance: A Full-distributional Analysis

Yongjae Lee, Korea Advanced Institution of Science and Technology, 291 Daehak-ro, Yuseong-gu, Daejeon, 34141, Korea, Republic of, yongjae.lee@kaist.ac.kr, William T. Ziemba, Woo Chang Kim

Performance evaluation of active funds has been eagerly studied by many scholars in finance. They have compared the performance distribution of active funds to relevant benchmarks. Most of these studies were naïve comparisons of a full distribution to a small number of points that do not reveal distributional characteristics. Therefore, we analyze the Sharpe ratio distributions of active funds in comparison with analytically derived Sharpe ratio distributions of all feasible portfolios.

50 - Behavioral Ordering Decision under Downward Substitution

Yan Li, Dr., China University of Mining and Technology, Ding 11, Xueyuan Road, Beijing, China, liyan@cumtb.edu.cn, Bojiao Mu

Downward substitution is one common strategy for selling multi-class products. The previous research assumes perfect rationality. This paper relaxes the assumption and utilizes the MNL model to depict the ordering behaviors for substitutable products. We compare the ordering quantity considering substitution with that without substitution. The substitution effect shows non-monotonicity regarding the extent of rationality and is superior to the one predicted by rationality.

51 - Optimal Capital Structure and Credit Spread under Partial Information

Bo Liu, UESTC, No.4, Section 2, North Jianshe Rd., Chengdu, China, liub@uestc.edu.cn

The paper first incorporates partial information friction to extend the classic optimal capital structure model. We derive closed-form results for the value of risky debt, credit spread, default threshold, and for optimal capital structure. We find that under partial information, dynamic learning significantly increases the optimal coupon level and firm's leverage, and improves the tax advantage to debt.

52 - Optimal Production and Inventory Policy in Solar Photovoltaic Supply Chain

Xiangrong Liu, Bridgewater State University, 95 Grove Street, Bridgewater, PA, United States of America, Xiangrong.Liu@bridgew.edu, Chuanghui Xiong

The development and utilization of solar photovoltaic (PV) energy has progressed at a very fast pace. With decreasing price of PV module and uncertain government incentives, this research models the production and inventory strategies in the setting of a PV supply chain with a PV manufacturer, an installer and an end customer. Based on the manufacturer's and installer's optimal decision, this study discusses how to improve supply chain performance through parameters setting in contract design.

53 - Optimal Stopping Game with Investment Spillover Effect

Akira Maeda, Professor, The University of Tokyo, 3-8-1 Komaba, Meguro, Tokyo, 153-8902, Japan, maeda@global.c.u-tokyo.ac.jp, Motoh Tsujimura, Ryuta Takashima

The purpose of this study is to analyze the game over optimal choice of firm's investment time, focusing on the case that there is positive externality in the effect of investment. We consider a situation where firms can increase their subsequent revenue stream by making an irreversible investment, and the investment has a spillover effect to other firms. This setup describes gaming over optimal stopping problems. We examine the property of the subgame perfect Nash equilibrium.

54 - Recent Trends in Blood Banking Systems: A Supply Chain Perspective

Amir Masoumi, Assistant Professor Of Management, Manhattan College, 4513 Manhattan College Parkway, DLS 504, Riverdale, NY, 10471, United States of America, amir.masoumi@manhattan.edu

Blood service operations are a key component of the healthcare system all over the world. In the US prior to 2008, there were several reported cases of blood shortages; however, the scenario has significantly changed thereafter. The total number of whole blood and red blood cells collected annually decreased from 17.3 to 15.7 million units during the 2008-2011 period. We investigate the recent trends in supply and demand management of blood banking systems from a logistics perspective.

55 - Optimal Sizing of a Price-maker Energy Storage Facility Considering Uncertainty

Ehsan Nasrolahpour, University of Calgary, 2500 University Dr. NW, Calgary, AB, Canada, enasrola@ucalgary.ca

This paper proposes a strategic investment model for a price-maker energy storage facility considering market uncertainties. The proposed model is a stochastic bi-level optimization problem where planning and operation decisions of the energy storage facility are made in the upper level, and market clearing is modeled in the lower level under different operating conditions. The bi-level optimization problem is recast as an Mathematical Program with Equilibrium Constraints (MPEC).

56 - Army Materiel Systems Analysis Activity (AMSAA)

Joseph Olah, AMSAA, 392 Hopkins Road, APG, MD, United States of America, joseph.m.olah.civ@mail.mil, Tiffany Gutowski

AMSAA is the Army's independent source of data, modeling & simulation, and materiel lifecycle & logistics systems analysis to support the Army's Equipping, Sustaining and Warfighting decisions. AMSAA's Core Competencies are Independent Materiel Performance and Effectiveness Analysis, Independent Logistics Analysis, Field Data Collection and Analysis, Program Management of DoD's JTCG-ME Program, Strategic/Corporate Level Decision Analysis, and Certified System Level Performance Data.

57 - Reinforcement Learning Algorithm for Blood Glucose Control in Diabetic Patients

Mahsa Oroojeni Mohammad Ja, Northeastern University, 334 Snell Engineering, Boston, MA, United States of America, oroojeni.m@husky.neu.edu

In this paper a reinforcement learning algorithm is proposed for regulating the blood glucose level of Type I diabetic patients. In the proposed reinforcement learning algorithm body weight and A1C level define the state of a diabetic patient. For the agent, insulin dose levels constitute the actions. As a result of a patient's treatment, after each time step t , the patient receives a numerical reward depending on the response of the patient's health condition.

58 - Modeling the Stockist

Omkar Palsule Desai, Associate Professor, Indian Institute of Management Indore, Prabandh Shikhar, Rau Pithampur Road, Indore, MA, 453556, India, omkardpd@iimahd.ernet.in, Ananth Iyer

We focus on the problem of distribution to the millions of small shops that constitute the retail sector in India, as well as many other developing countries. We model the role of a stockist - a supply chain entity whose role is to facilitate distribution. We use a principal agent model structure, with a complements or substitutes relationship between manufacturer assistance and retailer impact, to understand the optimal contract structure, i.e., level of assistance and associated retail margin.

59 - Automatic Design of Methods for Combinatorial Optimization Problems

Lucas Parada, General Manager, Universidad de Concepcion, Avenida Inglesa 134 / 504, Concepcion, 4040409, Chile, lucasparada20@gmail.com

Designing an method to solve an optimization problem is a complex intellectual task. However, to design an algorithm is also an optimization problem. To solve this second level problem we combine and evolve elementary algorithmic components through genetic programming. The produced algorithms show promising features such as low solution errors and small computational times for several classical optimization problems.

60 - Bayesian Adjusted Uplift Modeling for Direct Mail Campaign

Yidong Peng, Conclusive Analytics, 13620 Reese Boulevard E. Suite 300, Huntersville, NC, 28078, United States of America, yidong.peng@ndsu.edu

The study compares the performance of traditional respond model, uplift model and our proposed Bayesian adjusted uplift model on selecting customers for direct mail campaign. The proposed model applies customers' responses to historical campaign to generate the posterior uplift estimates based on result of uplift model. A case study is conducted to verify that the proposed model provides higher sales lift by using the real monthly directly campaign data from a top auto-parts retail company.

61 - How to Make Big Blue (IBM) Business Segments Fast and Responsive

Alan Picacchio, Senior Technical Staff Member / Lead Request For Service Business Analyst In Rfs, IBM, 2455 South Road, Poughkeepsie, NY, 12590, United States of America, alanpic@us.ibm.com, Jose Cano, Skip Jahn

This poster will describe how a big company like IBM can be nimble and fast and responsive. Over the past 3 years - in the growth segment (hundreds of millions of dollars yearly) of IBM's Global Technology Services unit, an impactful set of analytics and actions have been deployed to dramatically improve business revenue by tens of millions of dollars, via a 65% improvement in cycle time.

62 - Continuum Approximation Modeling of Freight Distribution Systems

Mahour Rahimi, University of Massachusetts, Amherst, 139 Marston Hall, 130 Natural Resources Rd., Amherst, MA, 01003, United States of America, mrahimi@umass.edu, Eric Gonzales

This study presents a continuous approximation model for truck deliveries which relate the operating parameters to the characteristics of the service and network, service area, and demand rate. The objective of this study is to minimize the total cost of distributing multicommodity freight from an origin to randomly distributed points, with or without transshipments, and within a limited amount of time. Two different distribution methods are considered: peddling, and peddling with transshipment.

63 - Modeling Relation Between Natural Problems and Formal Structures: A Health Systems Application

Edmond Ramly, University of Wisconsin-Madison, 20 Sherman Terrace, Unit 6, Madison, WI, 53704, United States of America, edmond.ramly@gmail.com

We formulate a class of cyber-social systems where formal (mathematical) and natural (problem structuring) operations research are complementary and insufficient separately. We adapt the Hertz-Rosen Modeling Relation from systems biology as a unifying framework relating natural and formal systems with encoding and decoding operations. We present a category-theoretic axiomatization and a demonstration of complementarity in a health IT evaluation case.

64 - Analytic Network Process: Assisting Computers to Think Like Humans?

Elena Rokou, Chief Research Officer, Creative Decisions Foundation, Ellsworth Ave, Pittsburgh, PA, United States of America, erokou@gmail.com

Whatever your stance is on Artificial intelligence, it is generally admitted that it has not yet enabled computers to make satisfactory decisions. Methods like Neural Networks, can train computers to make decisions for simpler types of tasks, but the ANP can factor in morality, ethics and broader considerations associated with complex decisions. We want computers to think more like humans, thoughtful and compassionate in their choices, and ANP enables this type of higher-level decision-making.

65 - An Energy-aware Multiobjective Scheduling Optimization Framework for Sustainable Manufacturing

Saeed Rubaiee, Wichita State University, 2119 Malcolm Street, Wichita, KS, 67208, United States of America, ssal21@gmail.com, Mehmet Bayram Yildirim

The goal of this paper is to minimize the total tardiness and total energy cost under time-of-use electricity tariffs, where energy prices vary hourly, on a non-preemptive single-machine. The problem is modeled using a mixed-integer multiobjective mathematical programming model to obtain an approximate Pareto front. Results show that the proposed multiobjective NSGA-II genetic algorithm finds a good approximate Pareto front with better diverse solutions and shorter computational CPU times.

66 - Early Warning Methods and Predictive Models for Hospital Risk and Readmissions

Jakka Sairamesh, CEO And President, CapsicoHealth, Inc, 2225 E Bayshore Rd STE 200, Palo Alto, CA, 94303, United States of America, ramesh@capsicohealth.com, Ruichen Rong

This poster and research abstracts presents the effectiveness of methods for improving patient quality outcomes (e.g. reducing 30-day readmissions) based on clinical and cost based factors. We will present early-warning methods to predict patients at risk of 30-day readmissions based on past admissions, ER visit rates, mortality rates, and charges. The dominant factors includes clinical risk, costs, emergency room visits and mortality rates. The prediction showed nearly 88 percent accuracy.

67 - Software License Optimization Model for Software Asset Management

Seungbae Sim, Korea Institute for Defense Analyses, 37 Hoegi-ro, Seoul, Korea, Republic of, sbsim@kida.re.kr, Cheonsoo Yoo

Information System can be generally comprised of hardware and software. As software has been getting more important than hardware, most organizations must reduce increasing software costs and control software assets. Especially, commercial software can be licensed to end-users. We propose the mathematical model considering the complexity of software license types. Also, the case example is presented for validating the proposed optimization model.

68 - Optimization Problems Arising in Stability Analysis of Discrete Time Recurrent Neural Networks

Jayant Singh, Dept. of Mathematics, North Dakota State University, 1210 Albrecht Boulevard Minard 408, Fargo, ND, 58102, United States of America, Jayant.Singh@ndsu.edu

We consider the method of Reduction of Dissipativity Domain to prove global Lyapunov stability of Discrete Time Recurrent Neural Networks. It involves a multi-step procedure with maximization of special nonconvex functions over polytopes on every step. We derive conditions which guarantee an existence of at most one point of local maximum for such functions over every hyperplane. This nontrivial result is valid for wide range of neuron transfer functions.

69 - Modular Function Deployment Adapted to the Project Typology in the Development of Modular Products

Monique Sonogo, Universidade Federal do Rio Grande do Sul, Av. Osvaldo Aranha 99 - PPGEP 5Jandar, 90035-190, Porto Alegre, Brazil, hgmonique@gmail.com, Angela Danilevicz, Márcia Echeveste

Modular Function Deployment (MFD) is one of the best-known methods for modularization in New Product Development. However, this method is not tailored to different project typologies. We propose an adaptation for the MFD method for different levels of complexity and novelty of each project. This adaptation provides companies with the possibility of choosing the setting of stages and tools that best fit their specific projects by customizing the application of the MFD.

70 - Enriching Competitiveness and Connectivity with HLED-inspired Air Service Agreement

Andrew Stapleton, Professor Of Supply Chain Management, University of Wisconsin La Crosse, 1725 State Street, La Crosse, WI 54650, La Crosse, WI, 54650, United States of America, Astapleton@uwlax.edu

U.S. cargo and passenger airlines will have a greater opportunity to compete for a larger share of freight trade and traffic between the U.S. and Mexico when the new Air Services Agreement (ASA) takes effect January 2016. It is a key element

of the US-Mexico High Level Economic Dialogue (HLED), that aims to promote competitiveness and connectivity, foster economic growth, productivity and innovation, and partner for regional and global leadership.

71 - The Value of Flexibility in Dynamic Ride-sharing

Mitja Stiglic, University of Ljubljana, Kardeljeva Ploščad 17, Ljubljana, 1000, Slovenia, mitja.stiglic@ef.uni-lj.si, Mirko Gradisar, Niels Agatz, Martin Savelsbergh

We consider a dynamic ride-sharing system that allows people with similar itineraries and time schedules to share rides. Participants are willing to somewhat adapt their trip plans in order to be matched. We study how participants' flexibility in departure times and the willingness of drivers to perform detours influence the matching rate and the sustainability of the system. We conduct an extensive computational study to quantify the impact on system performance in a variety of settings.

72 - Managing a Bike-sharing System using Wireless Mobility Data

Rahul Swamy, University at Buffalo, 49 Englewood (Lower), Buffalo, NY, 14214, United States of America, rahulswa@buffalo.edu, Jose Walteros

This research aims to provide a mathematical framework for operating a campus bike-sharing system. We use wireless network (WiFi) usage logs to generate a detailed estimation of the inter-building demand across campus. We propose solving a sequence of MILPs to determine: 1) the optimal location of bike stations, 2) the number of bikes to be added to or removed from each station every hour to satisfy the demand-supply needs, and 3) the redistribution logistics, while minimizing overall costs.

73 - Configurations of Distribution Strategies

Jing Tang, Em-lyon Business School, 23 Avenue Guy de Collongueresear, Ecully, France, TJ11.Jessie@gmail.com, Yeming Gong

Based on 124 quantitative samples with both first-hand and second hand data, as well as 56 qualitative samples, this paper examines the strategic fit of distribution strategies from the perspective of configuration theory. We find that the fit between operational decisions including infrastructural and structural decisions, and operational competencies including cost and flexibility, has an important effect on business performance.

74 - Teaching Machine Learning Methods Based on Systematic Approach Derived from Potential Theory

Nadia Udler, Fordham University, 113 West 60 St, New York, NY, United States of America, nadiakap@optonline.net

Many real word problems can be reduced to black box optimization. One of the challenges in the design of black box optimization software is identifying a minimal set of modules for building hybrids for real word applications. Existing software provides such building blocks but they are heuristic thus difficult to teach. We discuss black box optimization library based on systematic approach derived from potential theory. It can be used as educational tool to teach machine learning techniques.

75 - Optimizing Player Lineups in Daily Fantasy Sports

Nicholas Valentour, Graduate Student, University of Nebraska Omaha, Department of Mathematics, Omaha, NE, United States of America, nvalentour@gmail.com, Betty Love

The growing market of online fantasy sports has increased demand for providers of daily player projections and optimal fantasy lineups. Fantasy lineup optimization is a variant of the multiple choice knapsack problem. We develop an integer linear programming algorithm to identify optimal daily lineups. Further, we combine the algorithm with forecasting to examine the overall fantasy performance on historical basketball data.

76 - Design and Operation of a Last Mile Transportation System

Hai Wang, MIT ORC, 2D 550 Memorial Drive, Cambridge, MA, 02139, United States of America, haiwang@smu.edu.sg

The Last Mile Problem refers to the provision of travel service from the nearest public transportation node to a home or office. Last Mile Transportation Systems (LMTS) are critical extensions to traditional public transit systems. We study the design and operation of a LMTS from three perspectives: (1) performance evaluation from a queueing perspective; (2) system operation from an optimization perspective; and (3) demand estimation from an inference perspective.

77 - Competition Strategies of Platform-based Retailing

Man Wang, Guanghua School of Management, Peking University, No.5 Yiheyuan Road Haidian District, Beijing, China, dream26@pku.edu.cn, Lihua Chen

While collaborating with third-party sellers via opening infrastructure online, platform-based retailers and third-party sellers run into a head-to-head price competition. We show that when the inventory of the platform-based retailer is sufficient, higher service quality can bring larger competitive profits. However, it may not always be optimal for a platform-based retailer to improve its service quality. The platform-based retailer may be worse off when the inventory is shortage.

78 - Using Past Scores and Regularization to Create a Winning NFL Betting Model

Eric Webb, Graduate Student, Indiana University, 1309 E. 10th Street, Bloomington, IN, 47405, United States of America, ermwebb@indiana.edu, Wayne Winston

Is the National Football League betting market efficient? We have devised a profitable betting model that would win 52.9% of the 7,554 bets against the spread it would have made over 33 seasons. Scores from previous weeks are used to estimate the point value of each team's offense and defense. These values predict next week's scores, and a bet is placed against the advertised spread. The sum of squares of offensive/defensive point values are constrained to be less than a regularization constant.

79 - Self-organized Deliberative Agent and its Application in Medical Claim Editing

Jack Xue, Exec. Application Architect, National Government Services, Anthem, 8115 Knue St., Indianapolis, IN, 46250, United States of America, xinjian.xue@anthem.com

In this system each agent self-adjusts its organization per environments before execution and optimizes itself both in structure and in execution steps to meet Service Level Agreement. The scheduling algorithm is formatted as an LP or MILP then generalized to stochastic with uncertainty in phase transitions. The efficacy is demonstrated in a medical claim editing system that identifies irregularities in million claims with calculations of terabyte current and historical data, in near real-time.

80 - Behavioral Analysis of Participants in Community Outreach Intervention Projects

Haoxiang Yang, Northwestern University, 2145 Sheridan Road, Room C151, Evanston, IL, 60208, United States of America, haoxiangyang2019@u.northwestern.edu, David Morton, Alexander Gutfraind

The Community Outreach Intervention Projects (COIP) serves the Chicago metropolitan area, providing support for drug users to help prevent infectious diseases. Using about 10 years of data, we study the behavior of participants in COIP's syringe exchange program, focusing on the temporal process governing their visits to storefronts and demographics. With a better understanding of the participants' behavior, we aim to help develop an improved marketing plan for COIP.

81 - A Schatten-p Norm Perturbation Inequality and its Application in Low Rank Matrix Recovery

Man Chung Yue, The Chinese University of Hong Kong, RM 2511, Man Tai House, Tsz Man Est., Tsz Wan Shan, KLN, Hong Kong, Hong Kong - PRC, mcyue@se.cuhk.edu.hk, Anthony Man-cho So

Low-rank matrix recovery, with its applications in finance, network localization, etc, has recently attracted intense research and can be formulated as a rank minimization. Because of the NP-hardness, a common heuristic is to use the Schatten-p norm minimization as a surrogate. However, the equivalence property of this remains elusive and hinges on a conjectured matrix inequality. We prove this conjecture and derive sufficient conditions for low-rank matrix recovery using Schatten-p heuristics.

82 - Demand Prediction and Two-stage Inventory Policy for an Online Flash Sale Retailer

Mengzhenyu Zhang, University of Michigan, Stephen M. Ross School of Business, 701 Tappan Ave, Ann Arbor, MI, 48109, United States of America, zhenyuzh@umich.edu

We show the work cooperated with an online flash sale retailer in China. With millions history sales records, we use machine learning techniques to predict demand and propose a two stage inventory policy, which requires to response quickly to early-hour real sales and restock inventory thereafter. A model is built to explain positive and negative effects of our policy. Experimenting on real data, we help this firm increase profit by approximately 18% and reduce remaining inventory by over 50%.

83 - Heuristics for Bicycle Sharing System Repositioning Problem

Mary Kurz, Clemson University, 110 Freeman Hall, Clemson, SC, 29634, United States of America, mkurz@clemson.edu, Ling Zu

This paper studies the static bicycle repositioning problem with real NYC Citi system data. It selects a subset of stations to visit, sequences them, and determines the pick-up/drop off quantities in each visited station. The study incorporates real problem characteristics by minimizing total penalties of lacking/ overflowing bicycles and routing cost. A Variable Neighborhood Search heuristic is introduced to solve the described problem.

84 - Ranking Universities: Practices, Problems and Way Forward

Muhammad Mukhtar, Professor, American University of Ras Al Khaimah, (AURAK), Ras Al Khaimah 10021, United Arab Emirates, mukhtar.muhammad@gmail.com, Sarah Mukhtar, Zahida Parveen, Brian Wigdahl

We report here a comparison of various global ranking systems of universities and their impacts in the society. Five global ranking systems parameters evaluations revealed that Times Higher Education Ranking System is more appropriate when compared with other ranking systems. Our analyses revealed that discipline wise ranking by various global rankers are creating dilemmas for the parents and public to decide about their children education. We propose normalization of ranking systems.

1 - Predicting the Use of Violence using Machine Learning Methods

Erkam Guresen, KHO, Dikmen, Ankara, Turkey, erkamguresen@gmail.com, Salih Tutun, Gulgun Kayakutlu

Use of Violence by Ethno-Political Organizations is threatening not only individually countries but also all humanity. As a consequence governments are obliged to take measures in their budget for this threat. Obviously it does not mean that whole of security budgets consist of spending for Use of Violence, however it has important effects on them. For all these reasons, the aim of this study is to examine the predetermine models for use of violence.

2 - Unmanned Aerial Vehicle Routing in the Presence of Threats

Kamil Alotaibi, Taibah University, College of Engineering, P.O. Box 344, Almadinah Almunawwarah, PC41411, Saudi Arabia, kamilalotaibi@hotmail.com, Jay Rosenberger, Siriwat Visoldilokpun, Stephen Mattingly

We study the routing of Unmanned Aerial Vehicles (UAVs) in the presence of enemy threats. We formulate a mixed integer linear program that maximizes the total number of visited targets for multiple UAVs while maintaining both the route travel time and the total threat level to predetermined constant parameters. Several waypoint generation methods are proposed. Branch and price is used to solve the problem. A computational study is done and results for different scenarios are presented.

3 - Variants of the Target Visitation Problem

Michael Hirsch, ISEA TEK, 620 N. Wymore Rd., Ste. 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com

In this research, we consider the target visitation problem, and discuss some variants. Mathematical formulations are derived, heuristics are developed, and results are presented.

Logistics and Transportation Security

Cluster: Homeland Security

Invited Session

Chair: Gary Gaukler, Drucker School of Management, Claremont Graduate University, Claremont, CA, 91711, United States of America, Gary.Gaukler@cgu.edu

1 - Cyber Vulnerability Models

Murat Karatas, The University of Texas at Austin, 1 University Station Austin TX 78712, United States of America, mkaratas@utexas.edu, Nedialko Dimitrov

Infrastructures, such as university nuclear reactors, are controlled through cyber-physical systems. Assessing the vulnerability of these system is key in directing defensive investment. We present an MDP to compute an optimal attack policy. The MDP has an exponential number of states, and is based on tracking the set of available attacks for each link in the network. Surprisingly, we show it is possible to compute values for each MDP state, and optimal attack policies, using s-t reliability.

2 - Stochastic Network Interdiction with Risk Preference

Jing Zhang, University at Buffalo, SUNY, 338 Bell Hall, Buffalo, NY, 14221, United States of America, jzhang42@buffalo.edu, Jun Zhuang, Brandon Behlendorf

This paper studies the stochastic network interdiction problem, where the defender maximizes the length of the shortest path between a source and a destination by allocating sensors to the arcs with a limited budget. There is a detecting probability of the sensor, and the defender is unaware of the type of the attacker (strategic, or non-strategic). We develop game-theoretic models, solution methods, and illustrate the models using a portion of the Arizona-Mexico border transportation network.

3 - Keeping Pace with Criminals: Designing Patrol Allocation Against Adaptive Opportunistic Criminals

Milind Tambe, USC, 941 Bloom Walk, Los Angeles, CA, United States of America, tambe@usc.edu, Arunesh Sinha, Chao Zhang

A distinctive feature of urban crimes is that criminals react opportunistically to patrol officers' assignments. Opportunistic criminals are less strategic in planning attacks and flexible in executing them. Our goal is to recommend optimal police patrolling strategy against such opportunistic criminals. Our key contribution is to learn the criminal model from real-world crime and patrol data by representing the criminal behavior as parameters of a Dynamic Bayesian Network.

4 - Improving Logistics Security by using Distributed Container Inspection History Data

Gary Gaukler, Drucker School of Management, Claremont Graduate University, Claremont, CA, 91711, United States of America, Gary.Gaukler@cgu.edu

We present a two-stage interdiction model for smuggled nuclear materials in which prior container inspection data from an upstream inspection stage is used as a low-cost way of increasing overall interdiction performance. We provide insights into how a decision maker at a downstream inspection stage should optimally use detection data from the upstream stage to improve the overall detection capability.

Innovative Scheduling Applications

Cluster: Scheduling and Project Management

Invited Session

Chair: Tolga Aydinliyim, Baruch College, One Bernard Baruch Way, Dept of Management Box B9-240, New York, NY, United States of America, Tolga.Aydinliyim@baruch.cuny.edu

1 - Throughput Optimization in Single and Dual-gripper Robotic Cells

Manoj Vanajakumari, Texas A&M University, 3367 TAMU, College Station, TX, 77845, United States of America, manojuv@tamu.edu, Chelliah Sriskandarajah, Sushil Gupta

In view of maximizing throughput, practitioners use a class of cycles known as 1-unit cycles in which the cell returns to the same state after the production of each unit. The complexity of throughput optimization in the class of 1-unit cycles in single and dual-gripper robotic cells is the main focus of this paper. We provide some insights for throughput optimization using two-unit cycles.

2 - A Decision Support System for Appointment System Templates with Operational Performance Targets

William Millhiser, Associate Professor, Baruch College, One Bernard Baruch Way, Box B9-240, New York, NY, 10011, United States of America, William.Millhiser@baruch.cuny.edu, Emre Veral

We present a web-based scheduling system for outpatient services that meets user-defined operational targets to achieve managed/fair waiting times, dependable session end times, and minimal unintended idle time for providers. Using historical service times and an underlying model based on prior research, we demonstrate that appointments that meet these operational targets can be scheduled in a real-time environment, while the software provides dynamic assistance in selecting appointment slots.

3 - Improving Blood Products Supply through Donation Tailoring

Ali Ekici, Assistant Professor, Ozyegin University, Industrial Engineering, Nisantepe Mah., Orman Sok, Cekmekoy, Istanbul, 34794, Turkey, ali.ekici@ozyegin.edu.tr, Elvin Coban, Okan Orsan Ozener

Multicomponent apheresis (MCA) allows the donation of more than one component and/or more than one transfusable unit of each component. It provides several opportunities including (i) increasing the donor utilization, and (ii) tailoring the donations based on demand. In this study, we develop mathematical models to develop donation schedules for repeat donors while considering factors such as blood products demand, shelf-life of the blood products, donation costs, and deferral times.

4 - Optimal Schedule of Elective Surgery Operations Subject to Disruptions by Emergencies

Xiaoqiang Cai, The Chinese University of Hong Kong, Shatin, Hong Kong, Hong Kong - PRC, xqcai@se.cuhk.edu.hk, Xianyi Wu, Xian Zhou

Elective surgery operations are to be scheduled at an operating theater, which can accommodate one operation at a time. Emergency cases may arrive randomly, which have higher priority. Any operation, no matter it is normal or emergent, has to be processed until it is completed. Optimal dynamic policies are derived.

5 - Optimal Movement and Transshipment of Rail Freight Shipments

Chinmoy Mohapatra, PhD Candidate, University of Texas at Austin, 3500 Greystone Drive, Apt. 126, Austin, TX, 78731, United States of America, chinmoym@utexas.edu, Anant Balakrishnan

We study the problem of assigning shipments to scheduled transport services that share common capacitated resources. At each node, shipments using same outbound service are assigned in a first-in first-out order. We develop modeling and algorithmic enhancements to effectively solve this large-scale optimization problem, and present computational results for real-life instances.

Predictive Models of Human Behavior in Social Media

Cluster: Social Media Analytics

Invited Session

Chair: Tauhid Zaman, MIT Sloan School of Management, 50 Memorial Drive, Cambridge, MA, 02139, United States of America, zlisto@mit.edu

1 - Adaptive Searches in Twitter

Chris Marks, MIT, 50 Memorial Drive, Cambridge, MA, 02139, United States of America, cemarks@mit.edu

We present a methodology for adaptively collecting data from the Twitter microblogging application. Based on an initial search query or filter, our method uses network structure and count data from the returned results to update the search query so that additional relevant results are returned. Measures of result relevance will also be presented and discussed.

2 - Graph Control over Social Media: The Follow-back Problem

Krishnan Rajagopalan, Graduate Student, MIT, 50 Memorial Drive, Cambridge, MA, 02139, United States of America, krishraj@mit.edu, Tauhid Zaman

We create a new influence maximization problem on social media where an agent seeks to form a connection with a specific user, the target, in an online social network. We model the problem as an MDP. We use transition probabilities, learned from analysis of Twitter data and find a policy that gives the agent the optimal sequence of interactions with the target's friends to maximize the probability the target will form a connection with the agent. We identify heuristics for certain topologies.

3 - Influence Maximization Revisited

Paramveer Dhillon, MIT Sloan School of Management,
77 Massachusetts Avenue, Cambridge, MA, 02139,
United States of America, dhillion@mit.edu, Sinan Aral

Most research on influence maximization has focused on a single task: to devise algorithms with better approximation guarantees for the NP-Hard discrete optimization problem. The influence models over which the optimization operates, however, remain simplistic and disconnected from empirical evidence on influence in real networks. We propose extensions to existing models of influence propagation that incorporate the most recent empirical evidence and study the implications of these extensions.

4 - Is Exercise Contagious? Evidence from a Global Natural Experiment

Christos Nicolaides, Postdoctoral Fellow, MIT Sloan School of
Management, 100 Main St, E62-489, Cambridge, MA, 02142,
United States of America, chrisnic@mit.edu, Sinan Aral

Health-related behaviors, such as fitness habits, cluster amongst connected peers in social networks. Clustering of behaviors is in part attributable to causal social influence but can also arise through alternate means like homophily of preferences. Using fined grain individual running data from Nike+ we devise a natural experiment to quantify social contagion, identify influential members and groups and determine under which conditions influence is the dominant factor in behavior clustering.

1 - Revisiting Eisenberg - Noe: A Dual Perspective

Deung-geon Ahn, KAIST, #2111, E2-2, 291 Daehak-ro, Yuseong-gu,
Daejeon, Korea, deungeon.ahn@kaist.ac.kr,
Kyoung-kuk Kim

In this paper, we consider the Eisenberg-Noe framework for systemic risk with random shocks. Using duality, we characterize the amount of shock amplification due to the network structure and find the region for the shock vector that makes a specific bank default. These results enable us to improve some of the existing results of the network effect on systemic risk. More importantly, we propose efficient simulation schemes for the systemic risk measurement based on the characterization.

2 - A Partitioning Algorithm for MDPs and its Application to Limit Order Books with Stochastic Market Depth

Ningyuan Chen, Columbia University, S. W. Mudd 321, 500 W
120th Street, New York, NY, 10027, United States of America,
nc2462@columbia.edu

Linear-quadratic control plays a central role in control theory, but its analytical solution, the so-called linear-quadratic regulator, fails in the presence of constraints. We consider a class of Markov decision processes (MDPs), with linear inequality constraints, non-convex quadratic cost, and linear state dynamics, governed by a Markov chain. By the proposed partitioning algorithm, we find the explicit solution to this class of MDPs: The value function and the optimal policy have analytical quadratic and linear forms, respectively, subject to a linear partition of the state space. The algorithm is applied to two applications. In the main application, we present a model for limit order books with stochastic market depth to study the optimal order execution problem. As a feature of our model, stochastic market depth is consistent with empirical studies and necessary to accommodate various order activities, such as limit order submission at and outside the best quotes and order cancellation, which may account for a large proportion of limit order activities. As a result, the optimal order execution policy is also stochastic and adapted to the random changes of market depth.

3 - An Optimization View of Financial Systemic Risk Modeling: The Network Effect and the Market Liquidity Effect

Xin Liu, Doctoral Student, The Chinese University of Hong Kong,
609, William Mong Engineering Building, Hong Kong,
Hong Kong - PRC, liuxin@se.cuhk.edu.hk

Abstract not available at this time.

4 - Accounting for Estimation Risk when Pricing under Adverse Selection

Richard Neuberg, Columbia University, 1255 Amsterdam Avenue,
Dept of Statistics, 10th Floor, New York, NY, 10027,
United States of America, rn2325@columbia.edu

Financial product prices often depend on unknown parameters. Their estimation introduces the risk that a better informed counterparty may strategically pick mispriced products. We discuss how overall estimation risk can be minimized by selecting a probability model of appropriate complexity. Such a model has small bias, which allows measuring product-specific estimation risk. We illustrate how to determine a premium for estimation risk, using a simple example from pricing regime credit scoring.

5 - Combined Estimation-Optimization (CEO) Approach for High Dimensional Portfolio Selection

Chi Seng Pun, PhD Candidate, The Chinese University of Hong
Kong, Department of Statistics, Lady Shaw Building, Shatin, N.T.,
Hong Kong - PRC, cspun@link.cuhk.edu.hk

We propose a combined estimation-optimization (CEO) approach that directly estimates the optimal trading strategy (optimal control), instead of separating the estimation and optimization procedures. This paper investigates a constrained ℓ_1 -minimization for estimating the optimal control and applies it to the mean-variance portfolio (MVP) problems under static and dynamic settings when the number of assets (p) is larger than the number of observation times (n). We prove that the classical sample-based MVP strategy makes the probability that the optimal portfolio will outperform the bank account tend to 50% for $p \gg n$ and a large n . The CEO approach, however, converges to the true optimal solution. In addition, the CEO scheme automatically filters out unfavorable stocks based on historical data, and works for dynamic portfolio problems and non-Gaussian distributions. Simulations validate the theory and the behavior of the proposed approach. Empirical studies show that the CEO-based portfolios outperform the equally-weighted portfolio, the MVP with shrinkage estimators and other competitive approaches.

Modeling and Quantification of Risk

Cluster: Risk Management

Invited Session

Chair: Patrick Cheridito, Princeton University, ORFE, Princeton, NJ,
United States of America, dito@princeton.edu

1 - Assessing Financial Model Risk

Pauline Barrieu, Professor, London School of Economics,
Statistics Department, Houghton Street, London, WC2A2AE,
United Kingdom, P.M.Barrieu@lse.ac.uk, Giacomo Scandolo

Model risk has a huge impact on any risk measurement procedure and its quantification is therefore a crucial step. In this paper, we introduce three quantitative measures of model risk when choosing a particular reference model within a given class: the absolute measure of model risk, the relative measure of model risk and the local measure of model risk. Each of the measures has a specific purpose and so allows for flexibility.

2 - Multivariate Shortfall Risk and Monetary Risk Allocation

Samuel Drapeau, Shanghai Jiao Tong University, 211 West
Huaihai Road, Shanghai, 200030, China,
samuel.drapeau@gmail.com, Stephane Crepey, Yannick Armenti,
Antonios Papapantoleon

We present a measure designed to address the global and intrinsic risk of interconnected system (banks, CCP...). The goal is twofold: first, provide the total amount of liquidity to be reserved to overcome financial stress situations. Second, address its allocation to each member in function of the systemic risk they put on the system. Finally, we present how these high dimensional computations can be solved in an efficient manner using Fourier methods.

3 - Variable Annuities with Guaranteed Withdrawal Benefits

Patrick Cheridito, Princeton University, ORFE, Princeton, NJ,
United States of America, dito@princeton.edu

Variable annuities with withdrawal benefits have become popular over the last couple of years. Their cost to the issuer not only depends on market conditions but also on policyholder behavior. In this talk we discuss a contract whose withdrawal guarantees are based on the running maximum of the account value. The optimal withdrawal strategy is derived, and the cost of the contract to the issuer is determined.

Empirical Perspectives on Business Model Innovation

Cluster: Business Model Innovation

Invited Session

Chair: Karan Girotra, Associate Professor, INSEAD, Boulevard de Constance, Fontainebleau, 77300, France, Karan.girotra@insead.edu

1 - Channel Integration, Sales Dispersion, and Inventory Management

Ioannis Stamatopoulos, Doctoral Candidate, Northwestern University, Kellogg School of Management, 2001 Sheridan, Evanston, IL, 60208, United States of America, i-stamatopoulos@kellogg.northwestern.edu,
Antonio Moreno-Garcia, Santiago Gallino

Channel integration initiatives are a rapidly increasing trend in retail, creating uncharted areas in marketing, logistics and inventory management. Using data from a leading retailer, we analyze the effects of implementing of a "ship-to-store" functionality, which improves access to SKUs not available in brick-and-mortar stores, to sales dispersion and inventories.

2 - Bike-share Systems: Accessibility and Availability

Ashish Kabra, INSEAD, Boulevard de Constance, Fontainebleau, France, ashish.kabra@insead.edu, Elena Belavina, Karan Girotra

This paper estimates the effects on ridership of station accessibility and of bike-availability. Our analysis is based on a structural demand model that considers the choices of spatially distributed commuters, and it is estimated using high-frequency system-use data from the bike-share system in Paris. To make the method computationally tractable, we develop a novel transformation of our estimation problem: from the time domain to the "station stockout state" domain.

3 - The Role of Surge Pricing: Managing Capacity and Competition in a Peer-to-peer Service Network

Kaitlin Daniels, The Wharton School, 3730 Walnut Street, Suite 500, Philadelphia, PA, United States of America, kaitd@wharton.upenn.edu, Gerard Cachon, Ruben Lobel

We study the incentive design problem of a platform that coordinates a network of service providers who encounter nontrivial, stochastic opportunity cost when they offer their services for hire through the service network. In particular, we examine the role of demand-contingent pricing in determining short and long term service capacity and measure the efficacy of a heuristic in approximating the optimal incentive scheme.

09-Room 309, Marriott

Collaborative Innovation

Sponsor: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Fabian Sting, Erasmus University Rotterdam, Rotterdam School of Management, 3000 DR Rotterdam, Netherlands, fsting@rsm.nl

1 - The Effect of Environmental Changes on Employee Idea Value

Philipp Cornelius, University College London, UCL School of Management, Gower Street, London, WC1E 6BT, United Kingdom, philipp.cornelius.12@ucl.ac.uk, Bilal Gokpinar, Fabian Sting

Employee ideas are a valuable starting point to improve operational efficiency. Manufacturing organizations therefore systematically tap into employee knowledge and creativity. In this paper we empirically investigate how changes in task nature and manufacturing environment affect the value created by employee ideas for the organization.

2 - Managing New Product Development Knowledge Between Competing Firms

Gulru Ozkan-Seely, Georgia Institute of Technology, 800 W Peachtree St. NW, Atlanta, GA, United States of America, gulru.ozkan@scheller.gatech.edu, Cheryl Gaimon, Sriram Venkataraman

We introduce a two period stochastic game on KM for NPD of two competing firms. First, leader sets price for knowledge transfer (patents); follower decides how much knowledge to acquire. Next, firms pursue knowledge development (problem solving). Finally, both firms release new products. Insights include impact of uncertain market forces.

3 - The Impact of Hospital Information Technology Adoption Process on Quality of Care

Luv Sharma, PhD Student, The Ohio State University, 650 Fisher, Columbus, OH, 43210, United States of America, sharma.154@osu.edu, Aravind Chandrasekaran

This paper looks at the process of adoption of Health Information Technologies (HIT) for 979 hospitals to identify an ideal implementation strategy. We define process of adoption in terms of the sequence and intensity of adoption of HITs. Results demonstrate an ideal sequence whose benefits depend on the intensity of adoption.

4 - How Communication and Incentives Transform a Strategic Plan into Action

Jeremy Hutchison-Krupat, Darden UVA, Darden, VA, KrupatJ@darden.virginia.edu

A senior manager primarily uses two levers to influence a direct report's actions: financial incentives and communication. Financial incentives are explicit and unambiguous but lack flexibility; communication is flexible but may be ambiguous. We study a principal who decides whether to add a new initiative with an uncertain value to the organization's portfolio. We compare results between settings of incentives alone, non-strategic communication, and strategic communication.

1 - Building Reputation through Charitable Giving in Online Social Networking Environment

Xue Tan, University of Washington, 4747 30th Ave NE J171, Seattle, WA, 98105, United States of America, xuetan@uw.edu, Yingda Lu, Yong Tan

When online social network introduces charity service, fundraising can be more efficient. Unlike in traditional channels, users of online social platform can take the role of solicitor. This paper empirically examines the motivation of charitable giving through a leading micro-blogging platform where charity service is embedded. We employ a quasi-natural experimental setting resulting from platform design change, and identify different factors in individual donation decisions.

2 - An Empirical Study of Customer Strategic Switching Behavior in Multi-channel E-commerce System

Shahryar Doosti, PhD Student, University of Washington, Foster School of Business, University of Washington, Seattle, WA, 98195, United States of America, shahryar@uw.edu, Xi Chen, Yong Tan

This work uses a dataset from a leading e-retailer which offers multi-channels, such as TV shopping, websites, smart-phone applications, microblog-channel store, and call center, to examine how customers strategically select various methods to purchase. We also analyze how customers learn from their experience to gain knowledge about products and channel efficiency. We further run policy simulations to make suggestions for the retailer to improve its operational efficiency.

3 - Impact of Firm Social Media Engagement on Sales Revenue: Evidence from Taobao

Fei Wan, Peking University, Beijing, China, wanfei0304@pku.edu.cn, Yong Tan, Fei Ren

In this paper, we study the impact of marketer generated content on sales revenue. We collect data from taobao.com and its microblogging platform WeiTao. Using Propensity Score Matching and Difference-in-Differences, we find that MGC significantly promotes sales. Firms selling low-involvement products benefit more from MGC efforts, compared to those selling high-involvement products. Our findings suggest that MGC plays an important role in firm marketing activities.

Symmetry and Extended Formulations in Integer Programming

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Sebastian Pokutta, Georgia Tech, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, sebastian.pokutta@isye.gatech.edu

Co-Chair: Daniel Zink, Georgia Tech, 755 Ferst Drive, NW, Atlanta GA 30332, United States of America, zink.dani@gmail.com

1 - Strong Mixed-integer Formulations for the Floor Layout Problem

Joey Huchette, MIT, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, huchette@mit.edu, Juan Pablo Vielma, Santanu Dey

The floor layout problem (FLP) asks a designer to position a collection of rectangular boxes on a fixed floor in such a way that minimizes total communication costs between the components. This work presents a framework for generating mixed-integer formulations for the FLP by “encoding” a union of polyhedra in a higher dimensional space. We present theoretical and computational evidence for the strength of the resulting formulations and valid inequalities.

2 - Detecting Almost Symmetries of Graphs

Bernard Knueven, University of Tennessee, 851 Neyland Dr, Knoxville, TN, 37996, United States of America, bknueven@vols.utk.edu, Sebastian Pokutta, Ben Knueven

We present a branching framework to solve the following problem. Given a graph G and an integer k , find the symmetries on subgraphs of G formed by removing no more than k edges. We call such symmetries “ k -almost symmetries” of G . We specialize the framework and present and implement a branch-and-bound algorithm to find the best such subgraph for a given k . Computational results are reported, showing that for some popular graphs, few edges need be removed to induce additional symmetry.

3 - LP and SDP Inapproximability of Combinatorial Problems

Daniel Zink, Georgia Tech, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, zink.dani@gmail.com, Sebastian Pokutta, Gábor Braun

Motivated by [arXiv:1309.0563], we provide a framework for studying the size of LP formulations as well as SDP formulations of combinatorial optimization problems without encoding them first as linear programs. As a result we define a consistent reduction mechanism that degrades approximation factors in a controlled fashion. As a consequence we establish strong linear programming inapproximability (for LPs with a polynomial number of constraints) for several problems that are not 0/1-CSPs.

4 - Maximizing a Class of Utility Functions Over the Vertices of a Polyhedron

Andres Gomez, PhD Student, University of California at Berkeley, 4141 Etcheverry Hall, University of California Berkeley, Berkeley, CA, 94720-1777, United States of America, a.gomez@berkeley.edu, Alper Atamturk

Given a polyhedron, a concave univariate function g , and two vectors c and d , we consider the optimization problem of finding a vertex that maximizes the function $c'x + g(d'x)$, which is NP-hard. We propose a 1/2-approximation algorithm. Improved approximation ratio of 4/5 is given for specific cases in project scheduling and reinforcement learning. Computational experiments indicate that the suggested approach finds solutions within 1% of the optimal solution for most of the instances quickly.

Global Optimization: Algorithms and Applications

Sponsor: Optimization/Mixed Integer Nonlinear Optimization and Global Optimization

Sponsored Session

Chair: John Chinneck, Professor, Carleton University, Systems and Computer Engineering, 1125 Colonel By Drive, Ottawa, ON, K1S5B6, Canada, chinneck@sce.carleton.ca

1 - CCGO: A Fast Heuristic Global Optimizer

John Chinneck, Professor, Carleton University, Systems and Computer Engineering, 1125 Colonel By Drive, Ottawa, ON, K1S5B6, Canada, chinneck@sce.carleton.ca, Mubashsharul Shafique

Our CCGO multistart heuristic trades off some accuracy to gain speed. It generally finds good quality solutions quickly. The main steps are a latin hypercube scatter of initial points, rapid movement towards feasibility via Constraint Consensus, clustering, simple point improvement, and local solver launch. Much of the work is done concurrently. Our results are very promising in comparison to several existing global optimizers, especially for larger nonconvex models.

2 - A Mixed Integer Nonlinear Program for Remote Hybrid Energy System Design and Dispatch

Michael Scioletti, Colorado School of Mines, 1500 Illinois Street, Golden, CO 80401, United States of America, msciolet@mymail.mines.edu, Alexandra Newman

Our remote hybrid energy system design and dispatch problem is a non-convex, mixed-integer nonlinear program that determines the optimal mix of technologies (generators, batteries, and solar panels) and their dispatch to minimize system costs. Constraints meet load and satisfy operational rules. Most notably, we model the batteries in some detail. Linearization techniques yield near-optimal solutions to instances containing real data over a yearly horizon at hourly fidelity in a matter of hours.

3 - Which Programming Language should you choose for your Optimization Project?

Bjarni Kristjansson, President, Maximal Software Inc., 2111 Wilson Boulevard, Suite 700, Arlington VA 22201, United States of America, bjarni@maximalsoftware.com

When working on real-world optimization projects which are intended to be deployed for end-users, it is often not enough to use just a modeling language with a state-of-the-art solver. To implement user-interfaces, data preparation, and integrating the optimization solution into an easy-to-use application, you will typically have to use also a programming language. In this presentation, we will compare the pros and cons between popular programming languages, such as C/C++, CSharp, Visual Basic, Java, and Python.

Robustness in Optimization, Complementarity, and Queueing systems

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Uday Shanbhag, The Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16801, United States of America, udaybag@engr.psu.edu

1 - On Robust Solutions to Uncertain Linear Complementarity Problems and Their Variants

Yue Xie, Research Assistant, PSU IE, 351 Leonhard Building, University Park, PA, 16802, United States of America, xieyue1990@gmail.com, Uday Shanbhag

Complementarity problems have been well studied in modeling optimization and equilibrium problems. Yet, less progress has been seen in the uncertain context. We present an avenue for obtaining robust solutions to uncertain linear complementarity problems in a distribution-free environment by solving a low-dimensional program. Particularly, robust solutions to uncertain non-monotone LCPs are provided by customizing an existing scheme. Preliminary numerics suggest that such avenues hold promise.

2 - Percentile Optimization in Multi-class Queueing Systems with Parameter Ambiguity

Austin Bren, PhD Student, Arizona State University, 1537 East Palmdale Drive, Tempe, AZ, 85282, United States of America, hasbren@gmail.com, Soroush Saghafian

In a multi-class queueing system that experiences system ambiguity through unknown service rate parameters, we incorporate robustness in control policies by applying a novel percentile optimization technique that allows for the expression of a controller's optimism level and utilizes incoming data to learn the true system parameters. We identify structural results of the optimal policy and use our technique in a hospital emergency department application using data from Mayo clinic.

3 - A Convexity Result for Nonlinear Gaussian Chance Constraints

Miles Lubin, MIT, 77 Massachusetts Avenue, E40-149, Cambridge, MA, 02139, United States of America, miles.lubin@gmail.com, Juan Pablo Vielma, Daniel Bienstock

We present an extension of the well-known convexity result for linear chance constraints under Gaussian uncertainty. We derive an exact convex reformulation for certain nonlinear chance constraints, together with a tractable SOCP formulation with provable approximation guarantees. We apply these results to tackle a more challenging chance constraint which arises from nonlinear power flow equations.

1 - Optimization Society Awards

The Optimization Society sponsors four awards annually. They are a) the Khachiyan Prize for lifetime contributions in optimization, b) the Farkas Prize for exceptional mid-career accomplishments, c) the Young Optimization Researcher award, and finally, d) the student paper prize competition. The award winners will present brief overviews of their contributions in this session. The speakers will be Dr. J-B Lasserre (Khachiyan Prize), Professor Robert Weismantel (Farkas Prize), Fatma Kilinc-Karzan, Javad Lavaei, and Somayeh Sojoudi (all for the Young Optimization Researcher award), and Paul Grigas for the best student paper. These awards are highly competitive and coveted, and this session is dedicated to congratulating the winners, and their lasting contributions to optimization.

Theory and Applications of Convex Optimization

Sponsor: Optimization/Nonlinear Programming

Sponsored Session

Chair: Amir Ali Ahmadi, Princeton University, Department of ORFE, Sherrerd Hall, Charlton Street, Princeton, NJ, 08544, United States of America, a_a_a@princeton.edu

1 - Finding Stable Periodic Solutions to the N-body Problem via Robust Optimization

Robert Vanderbei, Princeton University, ORFE, Sherrerd Hall, Princeton, NJ, 08544, United States of America, rvd@princeton.edu

It is rather easy to use nonconvex nonlinear optimization techniques to find periodic solutions to the n-body problem in celestial mechanics. But, the vast majority of the solutions found are dynamically unstable. In this talk, I will discuss how one can adapt ideas from robust optimization to coerce the optimization toward local solutions that are in fact stable. Some preliminary results will be shown.

2 - Efficiency of Supply Function Equilibrium in Networked Markets

Ermin Wei, Assistant Professor, Northwestern University, 2145 Sheridan Rd, Tech L310, Evanston, IL, 60208, United States of America, ermin.wei@northwestern.edu, Chaitanya Bandi, Yuanzhang Xiao

We study the efficiency loss of the supply function equilibrium (SFE). Specifically, we consider a market where the demand is inelastic, the suppliers submit their supply functions, and a uniform price is set to clear the market. Literature is limited to the markets with no network structure, and suggest that SFE is asymptotically efficient. Motivated by power grid, we study how network topology affects the efficiency of SFE. We identify the structure where the intuition from literature holds.

3 - DC Decomposition of Nonconvex Polynomials with Algebraic Techniques

Georgina Hall, Princeton University, ORFE Department, Sherrerd Hall, Charlton Street, Princeton, NJ, 08540, United States of America, gh4@princeton.edu, Amir Ali Ahmadi

The concave-convex procedure is a majorization-minimization algorithm for difference of convex (DC) optimization, where the constraints and the objective are given as the difference of two convex functions. In this talk, we focus on polynomial optimization: we introduce LP, SOCP, and SDP based algorithms for finding optimal DC decompositions by appealing to the algebraic concepts of "DSOS-Convex, SDSOS-Convex, and SOS-Convex" polynomials.

Advances in Infinite-Dimensional Linear Programming

Sponsor: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Marina Epelman, University of Michigan, Industrial and Operations Engineering, 1205 Beal Ave, Ann Arbor, MI, 48109, United States of America, mepelman@umich.edu

1 - Analysis of Algorithms for Non-stationary Markov Decision Processes

Ilbin Lee, Postdoctoral Researcher, Georgia Tech, 755 Ferst Dr., NW, Atlanta, GA, 30332, United States of America, ilbinlee@umich.edu, Marina Epelman, H. Edwin Romeijn, Robert L. Smith

We consider infinite-horizon discounted Markov decision processes (MDPs) with finite state space and non-stationary problem data. Existing solution methods for such MDPs are receding horizon approach and simplex algorithm. For each method, we establish an upper bound on number of iterations to find a near-optimal solution and compare the theoretical guarantees. We also provide experimental results comparing their empirical performances.

2 - Policy Iteration for Robust Nonstationary Markov Decision Processes

Archis Ghatge, University of Washington, Industrial & Systems Engineering, Box 352650, Seattle, WA, United States of America, archis@uw.edu, Saumya Sinha

In this talk, we will present an implementable policy iteration algorithm for solving robust nonstationary Markov decision processes. Its convergence analysis will be discussed.

3 - Dual Pricing in Semi-infinite Linear Programming

Christopher Ryan, University of Chicago, Booth School of Business, Chicago, IL, United States of America, chris.ryan@chicagobooth.edu, Kipp Martin, Amitabh Basu

LPs satisfy strong duality (SD) and the dual pricing (DP) property, which means that given a small perturbation of the right-hand side, there exists a dual solution that computes the exact change in optimal value. SD and DP fail in general for semi-infinite LPs. For a restricted constraint space SD and DP hold. We give conditions for when DP holds in general. Dual solutions may exist that guarantee DP but have awkward structure. "Nice" solutions can be seen as integrals that price constraints.

4 - The Slater Conundrum: Duality and Pricing in Infinite Dimensional Optimization

Matthew Stern, University of Chicago - Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, stern@chicagobooth.edu, Kipp Martin, Christopher Ryan

For a general class of infinite dimensional vector spaces, we show that the existence of interior points required by common constraint qualifications for zero duality gap (such as Slater's condition) implies the existence of singular dual solutions that are difficult to find and interpret. We then provide sufficient conditions that guarantee the existence an optimal dual solution that is not singular.

Network Flows and Combinatorial Optimization

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Baski Balasundaram, Associate Professor, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, baski@okstate.edu

1 - A Branch Decomposition Algorithm for Better P-median Solutions

Caleb Fast, Rice University, 6100 Main St., Houston, TX, 77005, United States of America, ccf5@rice.edu, Ilyia Hicks

This talk presents a branch decomposition algorithm for improving approximate solutions to the p-Median problem. Since the p-Median problem is NP-hard, heuristics are commonly used to generate approximate solutions. We use a branch decomposition algorithm on the support graph generated from multiple heuristic runs to find an approximate solution of higher quality than that provided by the heuristic. We report numerical results for some common heuristics.

2 - Generalizations of the Dominating Set Problem on Social Networks

Raghu Raghavan, University of Maryland, Institute for Systems Research, A. V. Williams Building, College Park, MD, 20742, United States of America, raghavan@rhsmith.umd.edu, Rui Zhang

The positive influence dominating set problem is a generalization of the dominating set problem that arises on social networks. First, we show that it can be solved in linear time on trees. Next, we provide a tight and compact extended formulation, and derive a complete description of its polytope on trees. The formulation is also valid on general graphs, thus providing a new and stronger one. Facet defining conditions for the new inequalities are provided. A computational study is conducted.

3 - Flow Networks with Interdependent Commodities

Kelly Sullivan, Assistant Professor, University of Arkansas, Fayetteville, AR, 72701, ksullivan@uark.edu, Sarah Nurre, Matthew Robbins, Brian Lunday

We model an extension of the minimum cost flow problem to a multi-layered network in which each layer is associated with a commodity that flows through the network. Nodes in this network must consume certain commodities before they are able to transport other commodities. We discuss model properties, solution approaches, and application of the model to characterize vulnerabilities in interdependent systems where disruptions may propagate across layers.

Optimization Metaheuristics

Contributed Session

Chair: Celso Ribeiro, Universidade Federal Fluminense, Institute of Computing, Niterói, Brazil, celso@ic.uff.br

1 - Healing the Achilles' Heel: Finding and Preserving Feasibility in Evolutionary Algorithms

Stephen Henry, Senior Member Technical Staff, Sandia National Labs, 7304 Laster Ave NE, Albuquerque, NM, 87109, United States of America, smhenry@sandia.gov

Evolutionary algorithms can be powerful tools for optimizing discrete, multidimensional, nonlinear design problems. Finding or maintaining solution feasibility, however, is often an "Achilles' heel" of these approaches - confounding genetic operators and stifling optimization progress. In this presentation, we give an overview of Sandia's WSTAT genetic algorithm system design tool, the gene healing approaches that have been implemented, and the resulting improvements in algorithm performance.

2 - Heuristics for the Generalized Median Graph Problem

Leonardo Musmanno, Universidade Federal Fluminense, Institute of Computing, Niteroi, Brazil, lmusmanno@ic.uff.br, Celso Ribeiro

The graph edit distance is often used to measure the similarity between two graphs. The generalized median graph of S is any graph that minimizes the sum of the distances to all graphs in S . We propose two new heuristics for solving the generalized median graph problem: a greedy adaptive algorithm and a GRASP heuristic. Numerical results indicate that both heuristics can be used to obtain good approximate solutions for the generalized median graph problem.

3 - A Memetic Algorithm to Minimize Latency in Location-Routing Problems

Mohammad Moshref-Javadi, School of Industrial Engineering, Purdue University, 315 N. Grant St., West Lafayette, IN, 47907, United States of America, moshref@purdue.edu, Seokcheon Lee

Latency-Location Routing Problem determines the locations of depots and the routes of the vehicles aiming at minimizing waiting time of the customers. In this paper, we formulate the problem mathematically and propose an efficient Memetic Algorithm and compare it with a Granular Variable Neighborhood Search on different problems. The Latency-LRP has important applications in customer-oriented supply chain and disaster relief logistic.

4 - Hybridizing Meta-raps with Machine Learning

Fatemah Al-Duoli, Old Dominion University, Dep. of Eng.Mngt. and Systems Eng., 5115 Hampton Blvd., Norfolk, VA, 23529, United States of America, fateamah.aldouli@gmail.com, Ghaith Rabadi

The performance of Meta-heuristics for Randomized Priority Search (Meta-RaPS) is improved by integrating a learning phase to its original construction and improvement phases. Information collected during the original Meta-RaPS phases is used by machine learning algorithms in the new learning phase. The proposed approach will be demonstrated using instances for the Capacitated Vehicle Routing Problem (CVRP).

5 - Extending Time-to-target Plots to Test Sets with Multiple Problem Instances

Celso Ribeiro, Universidade Federal Fluminense, Institute of Computing, Niterói, Brazil, celso@ic.uff.br, Alberto Reyes

Time-to-target plots (tttplots) or runtime distributions are a useful tool to characterize, evaluate, and compare the behavior of randomized algorithms. However, they are limited to the evaluation of one single problem instance at-a-time. In this work, we propose their extension to address sets of test problems with multiple instances. Numerical results for different problems illustrate the applicability and usefulness of the newly proposed m-tttplots tool.

Tools for Optimization Modeling

Sponsor: Computing Society

Sponsored Session

Chair: Robert Fourer, President, AMPL Optimization Inc., 2521 Asbury Ave, Evanston, IL, 60201, United States of America, 4er@ampl.com

1 - The Surprising Difficulties of Supporting Quadratic Optimization in Algebraic Modeling Languages

Robert Fourer, President, AMPL Optimization Inc., 2521 Asbury Ave, Evanston, IL, 60201, United States of America, 4er@ampl.com

Algebraic modeling languages can readily convey quadratic functions to general nonlinear solvers, but support for recent quadratic extensions to mixed-integer linear solvers has proven much more challenging. The difficulty is due in part to the limited range of representations that solvers recognize and in part to the variety of transformations that must be considered. This presentation surveys the principal issues, and their implications for anyone building large-scale convex quadratic models.

2 - Modeling by Learning: The Problem Definition Repair Process

Choat Inthawongse, Lehigh University/Ramkhamhaeng University, 200 W Packer Ave., Bethlehem, PA, 18015, United States of America, choat@lehigh.edu, George R. Wilson

This research puts forward a framework for restructuring the problem and decision analysis template, representing an important extension to the cognitive computing systems, powered by IBM Watson. We develop an optimization model representation for model redefinition as a steppingstone toward creation of a decision support system motivated by cognitive computing. Broadening from the former models representation by Geoffrion as a semantic instrument for solution-method association state.

Modeling and Optimization of Big Data Systems

Cluster: Cloud Computing

Invited Session

Chair: Li Zhang, IBM T. J. Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, zhangli@us.ibm.com

1 - Stage Aware Performance Modeling for Dag-based Analytic Platforms

Min Li, Dr., IBM Research, United States of America, minli@us.ibm.com, Li Zhang, Yangdong Wang

In this presentation, we introduce a stage aware performance modeling tool for DAG based analytic platforms. The main idea of stage aware performance modeling is to divide the job execution flow into stages and derive the job execution time based on the DAG of the workflow to cope with the variances such as different program and job parameter configuration of the data analytic frameworks.

2 - The Power of Slightly More than One Sample in Randomized Load Balancing

Xiaohan Kang, Associate Professor, Arizona State University, GWC 436, Tempe, AZ, 85287, United States of America, leiying07@gmail.com, R. Srikant, Lei Ying

In this paper, we show that the number of sampled queues in randomized load balancing can be dramatically reduced by using the fact that tasks arrive in batches (called jobs). In particular, we sample a subset of the queues such that the size of the subset is slightly larger than the batch size, and equalize the load among the sampled servers. We show that our algorithm maintains the same asymptotic performance as the power-of-two-choices algorithm while using only half the number of samples.

3 - Towards Multi-resource Fairness in Big Data Systems

Zhenhua Liu, Assistant Professor, Stony Brook University,
Stony Brook, NY, 11794, United States of America,
zhenhua.liu@stonybrook.edu

Big data systems nowadays involve multiple resources such as CPU, memory, network during multiple stages. On the other hand, these systems are usually shared among multiple tenants with different demand characteristics. How to optimally align these two complexities while maintaining fairness among tenants has significant theoretical challenges, while generates great practical value. In this talk, I will briefly introduce our recent progress along this.

Message Passing for Inference

Sponsor: Applied Probability

Sponsored Session

Chair: Jinwoo Shin, Korea Advanced Institute of Science and Technology, 291 Daehak-ro, Yuseong-gu, Daejeon, Korea, Republic of, jinwoos@kaist.ac.kr

1 - How Hard is Inference for Structured Prediction?

David Sontag, Assistant Professor, NYU, 715 Broadway, 12th Floor, Room 1204, New York, NY, 10003, United States of America, dsontag@cs.nyu.edu

Structured prediction tasks in machine learning involve the simultaneous prediction of multiple labels. This is typically done by maximizing a score function on the space of labels, which decomposes as a sum of pairwise terms, each depending on two specific labels. Although marginal and MAP inference for these models are NP-hard in the worst-case, approximate inference algorithms are often remarkably successful. In this talk, we develop a theoretical framework to explain why.

2 - Tractable Graphical Modeling and the Bethe Approximation

Tony Jebara, Professor, Columbia University, 500 West 120 St., Room 450, Mail Code 0401, New York, NY, 10027, United States of America, jebara@cs.columbia.edu

We consider three NP-hard graphical modeling problems. For maximum a posteriori inference, we identify the limits of tractability via perfect graph theory. For marginal inference, we provide efficient solutions using Bethe free energy approximations and discretization. For learning, we combine Bethe with a Frank-Wolfe algorithm to avoid intractable partition functions. Applications include link prediction, social influence estimation, computer vision, financial networks and power networks.

3 - Lifts of Graphs and Approximate Inference

Nicholas Ruozi, Assistant Professor, UT Dallas, 2601 N. Floyd Rd. MS EC31, Richardson, TX, 75080, United States of America, nicholas.ruozzi@utdallas.edu

The approximate maximum a posteriori inference problem (MAP) for graphical models over finite state spaces is an NP-hard problem in general. As a result, approximate MAP inference techniques based on convex relaxations are often employed in practice. These convex relaxations are relatively well-understood in the discrete case but many open questions remain in the continuous setting. I will

discuss how to extend many of the discrete results to the continuous setting using lifts of graphs.

4 - Factor Graphs, Kramers-Wannier Duality, and the Sum-product Algorithm

Ali Al-Bashabsheh, Postdoc, The Chinese University of Hong Kong, Hong Kong, Hong Kong - PRC, entropyali@gmail.com, Pascal O. Vontobel

A key object associated with a graphical model is its partition function. Although the partition function is often intractable, it can be estimated (e.g., via the sum-product algorithm) or analyzed (e.g., via factor graph transforms). An example of the latter, and also the main focus of this talk, is the analysis of 2D-Ising models via Kramers—Wannier duality. At various places we will point out connections to optimization problems.

Optimal Control of Stochastic Systems

Sponsor: Applied Probability

Sponsored Session

Chair: Jiheng Zhang, HKUST, Clear Water Bay, Hong Kong, Hong Kong - PRC, j.zhang@ust.hk

1 - Distributionally Robust Inventory Control when Demand is a Martingale

Linwei Xin, Assistant Professor, University of Illinois at Urbana-Champaign, 104 S. Mathews Ave., Urbana, IL, 61801, United States of America, lxin@illinois.edu, David Goldberg

Independence of random demands across different periods is typically assumed in multi-period inventory models. In this talk, we consider a distributionally robust model in which the sequence of demands must take the form of a martingale with given mean and support. We explicitly compute the optimal policy and value, and shed light on the interplay between the optimal policy and worst-case martingale. We also compare to the analogous setting in which demand is independent across periods.

2 - Join the Shortest Queue with Customer Abandonment

Ping Cao, University of Science and Technology of China, Room 707A, School of Management, Hefei, China, pcao@ustc.edu.cn, Junfei Huang

We consider an overloaded queueing system with many servers and customer abandonment under the join-the-shortest-queue policy. Diffusion approximations for system performances are established. The approximation expressions depend on the traffic intensity: in some cases a one-dimensional Ornstein-Uhlenbeck process is enough while in other cases a two-dimensional process is necessary. We also compare the results with that of the one-global-queue system.

3 - Asymptotic Optimal Control of Perishable Inventory

Jiheng Zhang, HKUST, Clear Water Bay, Hong Kong, Hong Kong - PRC, j.zhang@ust.hk, Rachel Zhang, Hailun Zhang

We study joint replenishment and clearance of perishable products when the demand rate is large. We propose two policies based on fluid and diffusion approximations, respectively. The fluid based policy can achieve asymptotic optimality with the gap explicitly computed. The diffusion based policy can significantly improve the gap when the initial inventory is small. When the initial inventory is large, we prove that depletion-once is enough to achieve asymptotic optimality.

Network Modeling and Analysis

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Junming Yin, University of Arizona, Department of MIS, Tucson, AZ, 85721, United States of America, junmingy@email.arizona.edu

1 - Analysis of Network Experiments with Nonnegative Treatment Effects

David Choi, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, United States of America, davidch@andrew.cmu.edu

Randomized experiments in network settings are potentially useful for understanding the effects of peer influence and other social mechanisms. However, the analysis of experiments is an open problem when the individuals in the experiment are assumed to be able to influence each other's decisions. We propose a new method that requires much weaker assumptions than existing methods, which often impose stylized models of individual behavior that may not be valid in practice.

2 - How Our Networks Shape Our Privacy

Yotam Shmargad, University of Arizona, 1515 E. First St., Tucson, United States of America, yotam@email.arizona.edu

In this study, I relate characteristics of people's networks to the level of privacy they experience in their social environments. I analyze over half a million users with nearly 40 million connections on a social network site, and show that characteristics of users' networks can be used to predict various behaviors on the site – including decisions to share and consume information. In particular, users with networks containing several distinct social groups are more active on the site.

3 - Inter-firm Managerial Social Ties, IT Supplier Selection and IT Standardization

Oliver Yao, George N. Beckwith, Professor, Lehigh University, 621 Taylor Street, Bethlehem, PA, 18015, United States of America, yuy3@lehigh.edu, Ling Xue, Ke Yang

We empirically test links between inter-firm managerial social ties (IMST) and IT supplier selection and IT standardization. We find that: (1) A firm is more likely to use an IT vendor if the firm has more IMST with the IT vendor. (2) A firm with more IMST with its potential IT vendors uses more IT vendors. (3) More IT vendors is associated with lower IT standardization for the firm, and such relationship is strengthened when the firm has a greater number of IMST with its IT vendors.

4 - Latent Space Inference of Internet-Scale Networks

Junming Yin, University of Arizona, Department of MIS, Tucson, AZ, 85721, United States of America, junmingy@email.arizona.edu, Qirong Ho, Eric Xing

The rise of internet-scale networks with hundreds of millions to billions of nodes, presents new scientific opportunities, such as overlapping community detection to discover the structure of the internet. However, many existing models are difficult or impossible to deploy at these massive scales. We propose a scalable approach for overlapping community detection in internet-scale networks, and we demonstrate our method on real networks with up to 100 million nodes and 1000 communities.

Data-Driven Research on Economics of Digitization

Sponsor: Information Systems

Sponsored Session

Chair: Hossein Ghasemkhani, Assistant Professor, Purdue University, 425 W. State Street, West Lafayette, IN, 47907, United States of America, hossein@purdue.edu

1 - Predicting Buying Opportunity in Retail Market with Machine Learning

Warut Khern-Am-Nuai, Purdue University, 403 W. State Street, West Lafayette, IN, 47907, United States of America, wkhernam@purdue.edu, Karthik Kannan, Hossein Ghasemkhani

Previous literature has shown that many machine learning techniques are effective in predicting stock price. However, it is not clear if those practices can be applied to a non-financial context or not. This paper employs three machine learning algorithms: ANNs, SVMs, and MARS to predict buying opportunities of products in a retail market. The preliminary results suggest that machine learning could be one potential avenue to help managers in optimizing buying decisions.

2 - Dynamic Estimation of Peer Effects and Product Engagement

Daniel Rock, Doctoral Candidate, MIT Sloan School of Management, 30 Memorial Drive, Office 341, Cambridge, MA, 02142, United States of America, drock@mit.edu, Sinan Aral, Sean Taylor

After product adoption, consumers make decisions about continued use. These choices can be influenced by peer decisions in networks, but identifying causal peer influence effects is challenging. Using engagement data for Yahoo Go, a mobile application, we apply a dynamic version of the Bramoullé et al. (Journal of Econometrics 2009) identification strategy to estimate usage peer effects. We compare the performance of a variety of prediction models for the instrumental variables "first stage".

3 - Information Technology and the Rise of the Power Law Economy

Guillaume Saint-jacques, PhD Candidate, MIT Sloan School of Management, 100 Main St, E62-459, Cambridge, MA, 02142, United States of America, gsaintja@mit.edu, Erik Brynjolfsson

We show that the dramatically increasing share of income going to top earners can be explained by the rise of the "power law economy" and argue this reflects increased digitization and networks. Specifically, tax data (1960-2008) show that more individual incomes are drawn from a power law, as opposed to the long-established log-normal distribution. We present a simple theoretical model to argue that the increased role of power laws is consistent with the growth of information technology.

4 - The Value of Live Chat in Online Purchase

Xue Tan, University of Washington, Seattle, WA, United States of America, Youwei Wang, Yong Tan

In today's competitive online marketplace, adopting a live chat tool is widely considered by merchants as a way to conduct one-to-one selling like in physical store. By allowing customer representatives to talk to potential buyers, e-tailer can answer consumers' questions and decrease the level of information asymmetry. This paper empirically examine the role of live chat in terms of purchase conversion.

Multi-objective Design Problems

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Diclehan Tezcaner Ozturk, Dr., TED University, Industrial Engineering, Ankara, Turkey, diclehan.ozturk@tedu.edu.tr

1 - A Control Chart Recommendation System

Sidika Tunc, Research Assistant, Middle East Technical University, Cankaya, Ankara, Turkey, tsidika@metu.edu.tr, Gulser Koksak

An approach is developed to recommend the most appropriate control chart to a novice decision maker in statistical process control. The chart selection problem is formulated as an MCDM problem. Overall desirability of each chart is determined. Expert knowledge is utilized. The system is tested and calibrated by statistical experiments.

2 - Estimating Non-additive Value Functions with Active Learning in the Ordinal Classification Setting

Levent Eriskin, Middle East Technical University, Industrial Engineering Department, Ankara, Turkey, levent.eriskin@gmail.com, Gulser Koksak

Preference modeling is used to represent Decision Maker's subjective preference structure. Preference structure having some kind of interaction among criteria is hard to model. In this study, we present results of analyses conducted for estimating non-additive value functions having interaction structure by utilizing active learning techniques in the ordinal classification setting.

3 - Interactive Mean-variance-covariance Optimization for Two Responses

Melis Ozates, Research Assistant, Middle East Technical University, Universiteler Neighborhood, Dumlupinar Avenue No.1, Ankara, 06800, Turkey, mozates@metu.edu.tr, Gulser Koksak, Murat Koksak

We develop an interactive approach for the two-response product and process design optimization problem, explicitly considering decision maker preferences and allowing for correlated responses. We use several performance measures to represent the objectives that facilitate effective communication with the decision maker.

4 - Bi-objective Route Planning for Unmanned Air Vehicles in Continuous Space

Diclehan Tezcaner Ozturk, Dr., TED University, Industrial Engineering, Ankara, Turkey, diclehan.ozturk@tedu.edu.tr, Murat Koksalan

We consider the route planning problem of a single unmanned air vehicle visiting multiple targets in continuous space under two objectives: minimization of total distance traveled and minimization of total radar detection threat. We develop solution approaches to generate the nondominated frontier of this problem. We also develop an interactive algorithm that asks for comparison between solutions and progressively reduces the search area around the decision maker's most preferred solutions.

28-Room 405, Marriott

Auctions and Trading Agents

Cluster: Auctions

Invited Session

Chair: Wolf Ketter, Professor, Rotterdam School of Management, Burgemeester Oudlaan 50, Rotterdam, 3062 PA, Netherlands, WKetter@rsm.nl

1 - Understanding, Replicating, and Leveraging Dynamics of Bidder Behavior in Combinatorial Auctions

Ali Mahdavi, Carlson School of Management, 321 19th Ave S, #3-365, Minneapolis, MN, 55455, United States of America, mahd0008@umn.edu

We use an agent-based modeling approach to simulate human bidder behaviors observed in continuous combinatorial auctions. After validating our bidding agents, we leverage them to simulate a wide variety of competition types (i.e., compositions of bidder behavior) and demonstrate how different competition types affect auction outcomes, such as revenue and allocative efficiency.

2 - An Experimental Agent-based Approach for Intelligent Decision Making on Electricity Future Markets

Derck Koolen, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, Rotterdam, 3062 PA, Netherlands, koolen@rsm.nl, Wolf Ketter, Liangfei Qiu, Ronald Huisman

We study the determinants of forward prices and hedging decisions on electricity future markets in an experimental agent-based setting. Faced with imperfect storability and depending on price expectations, the agent supports producers using different technologies with varying risks from fuel trading, emission prices and weather conditions. Presenting different information treatments, the decision making of wholesale market participants is assessed.

3 - Moral Hazard in Auctions: A Principal-agent Model of Bidding Firms

Martin Bichler, Professor, TU München, Boltzmannstr. 3 Germany, bichler@in.tum.de, Per Paulsen, Salman Fadaei

We model auctions where the bidders are firms consisting of a principal and an agent. The agent wants to win the package with the highest expected value. Bayesian Nash equilibrium strategies in sealed-bid auctions illustrate possibilities for profitable manipulation of agents. For small markets we prove a non-truthful ex-post Nash equilibrium. Sometimes it is impossible for the principal to set allowances such that the agent bids truthful. In larger markets, there are multiple equilibria.

4 - An Auction Mechanism for Scheduling Electric Vehicle Charging

Konstantina Valogianni, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, Rotterdam, Netherlands, kvalogianni@rsm.nl, Wolfgang Ketter, Soumya Sen, Alok Gupta, Eric Van Heck

We present an auction-based framework for scheduling electric vehicle charging. We account for individual arrival and departure preferences and aim to service as many customers as possible without suffering major delays regarding their departure time. We show how the payments need to be allocated to minimize the system's delay cost. We examine the effect of the presented mechanism to smart grid's stability and reliability.

5 - Dynamic Decision-making in Sequential B2b Auctions

Yixin Lu, Assistant Professor, VU University Amsterdam, Netherlands, y2lu@vu.nl, Eric Van Heck, Alok Gupta, Wolfgang Ketter

We develop a dynamic structural model of competitive bidding in sequential B2B auctions. Given that bidders often have multiple purchase opportunities in these auctions, we formulate the optimal bidding problem as a partially observable Markov decision process. We apply the model to a unique dataset from the world's largest flower wholesale market.

Joint Session Analytics/CPMS: Panel Session: Extending the Reach of Certification: The New Associate Certified Analytics Professional

Sponsor: Analytics

Sponsored Session

Chair: Polly Mitchell-Guthrie, Sr. Mgr., Advanced Analytics Customer Liaison Group, SAS Institute, SAS Campus Dr., Cary, NC, 27513, United States of America, Polly.Mitchell-Guthrie@sas.com

1 - Extending the Reach of Certification: The New Associate Certified Analytics Professional

Moderator: Polly Mitchell-Guthrie, Sr. Mgr., Advanced Analytics Customer Liaison Group, SAS Institute, SAS Campus Dr., Cary, NC, 27513, United States of America, Polly.Mitchell-Guthrie@sas.com, Panelists: Louise Wehrle, Esma Gel, Randy Bartlett

The Certified Analytics Professional (CAP®) Program will soon be within reach of more people with the launch this fall of the Associate Certified Analytics Professional. This new certification will retain the rigor of the current CAP and will allow candidates to pass the certification exam without the required work experience if those candidates have an MS in a related field. To earn the CAP, experience is still required. We expect this new offering to be particularly attractive to graduates of the many MS in Analytics degree programs where demand has been high. This panel will include the Chair of the Analytics Certification Board; the Certification Program Manager; a member of the Analytics Certification Board who is also the INFORMS VP of Sections and Societies; and a noted author, speaker, analytics professional as well as CAP. The panel will discuss the overall CAP program, the new offering, and where the program is headed.

1 - A Consultancy's Perspective on the Evolution of and Future Opportunity for Operations Research

Nick Nahas, Booz Allen Hamilton, 8283 Greensboro Drive, McLean, VA, 22102, United States of America, nahas_nicholas@bah.com, Cenk Tunasar

Big Data is popular and computation is fast and distributed, yet has the practice truly taken advantage of this in the same way as the Data Scientist? And what can the practice do, to use Big Data to enhance management decision making? And what innovations will this lead to? Booz Allen will explore these questions from our perspective as a global management and technology consulting firm with a diverse set of experiences solving today's greatest challenges in the public and private sector.

2 - Change Management for Analytics Projects

Irv Lustig, Optimization Principal, Princeton Consultants, 2 Research Way, Princeton, NJ, 08540, United States of America, irv@princeton.com, Zahir Balaporia, John Milne, Karl Kempf, Rahul Saxena

To gain the acceptance of analytics used for decision support, analytics professionals should use organizational change management principles. This paper provides advice to these professionals on these principles as they work with key users to gain acceptance of analytics. These ideas are drawn from the collective observations and insights of practitioners with decades of experience in the development and deployment of analytic methods for improved decision making.

3 - Engineering Technician Location Analytics

Dwayne Otis, Air Products and Chemicals, 7201 Hamilton Boulevard, Allentown, PA, 18195, United States of America, otisdk@airproducts.com

In this talk we present a model whose objective is to determine, within a given physical region, the near-optimal required number of technicians and their assigned home base locations in order to satisfy defined customer service levels. Ideally, the workload for each technician would be balanced and the total cost to meet the desired service level is minimized. Furthermore, we examine additional areas where this general technique could be applied.

Data Mining in Healthcare

Sponsor: Data Mining

Sponsored Session

Chair: Ramin Moghaddass, Assistant Professor, University of Miami, 1251 Memorial Dr, Coral Gables, FL, 33146, United States of America, ramin@miami.edu

1 - Influential Neighbor Analysis with a Hierarchical Bayesian Model

Ramin Moghaddass, Assistant Professor, University of Miami, 1251 Memorial Dr, Coral Gables, FL, 33146, United States of America, ramin@miami.edu, Cynthia Rudin

For a doctor with enough experience, almost every patient would have similarities to key cases seen in the past and each new patient could be viewed as a mixture of important pieces of these key past cases. Because doctors often tend to reason this way, an efficient computationally aided diagnostic tool might be helpful in locating key past cases of interest that could assist with diagnosis. We develop a model to mimic the type of logical thinking that physicians use when considering past cases.

2 - Falling Rule Lists

Fulton Wang, MIT, 5 Cambridge Center #792, Cambridge, MA, 02142, United States of America, fultonwang@gmail.com, Cynthia Rudin

Falling rule lists are classification models consisting of an ordered list of if-then rules, where (i) the order of rules determines which example should be classified by each rule, and (ii) the estimated probability of success decreases monotonically down the list. These kinds of rule lists are inspired by healthcare applications where patients would be stratified into risk sets and the highest at-risk patients should be considered first.

3 - Machine Learning for Clinical Decision Support for Heart Failure(HF) Readmission

Wei Jiang, PhD Student, Johns Hopkins University, 6606 Copper Ridge Drive Apt. 201, Baltimore, MD, 21209, United States of America, wjiang1990@gmail.com, Sean Barnes, Matthew Toerper, Scott Levin, Eric Hamrock, Sauleh Siddiqui, Stephanie Cabral

Predicting risk of HF readmission have gained increasing attention. Previous studies mainly used administrative data. We will focus on using clinical data from EMR for predicting HF readmission by creating structured data from unstructured clinical data and combining it with administrative data. Then we use classification models such as random forest and support vector machine for predicting purpose. In the end, we will demonstrate the value of clinical data in predicting HF readmission.

4 - Or's of and's for Interpretable Machine Learning: Prediction and Explanation

Tong Wang, Graduate Student, MIT, 70 Pacific Street, apt 242A, Cambridge, MA, 02139, United States of America, tongwang@mit.edu, Cynthia Rudin

We present a form of interpretable models for data prediction and explanation. The model is comprised of a small number of disjunctions of conjunctions (or's of and's). We apply OA models to solve two machine learning tasks, classification and causal effect analysis. We formed two integer linear programs to construct the optimal OA models that can achieve good performance and interpretability, by incorporating regularizations on the sparseness. We show that regularizations reduce computation.

Statistical Innovations in Computational Biology and Genomics

Cluster: Big Data Analytics in Computational Biology/Medicine
Invited Session

Chair: Mingyao Li, Statistical Innovations in Computational Biology and Genomics, University of Pennsylvania, 213 Blockley Hall, 423 Guardian Drive, Philadelphia, PA, 19104, United States of America, mingyao@mail.med.upenn.edu

1 - Prediction using Multinomial Inverse Regression in Microbiome Studies

Hongzhe Li, Professor of Biostatistics, University of Pennsylvania, 215 Blockley Hall, Philadelphia, PA, United States of America, hongzhe@mail.med.upenn.edu

Next-generation sequencing technologies allow 16S rRNA gene surveys or metagenome shotgun sequencing in order to characterize taxonomic composition. The data can be summarized as k-mer counts. We consider the regression problem for such high dimensional in order to build a model for predicting the clinical outcomes based on microbiome data and demonstrate its applications.

2 - Computational Validation of NGS Variant Calls using Genotype Data

Margaret Taub, Assistant Scientist, Johns Hopkins Department of Biostatistics, 615 N Wolfe St, E3527, Baltimore, MD, United States of America, mtaub@jhsph.edu, Suyash Shringarpure, Ingo Ruczinski, Rasika Mathias, Kathleen Barnes

We performed a comparison of different variant calling algorithms on 642 samples whole-genome sequenced to an average depth of 30x, focusing on characteristics of variants called by different subsets of callers. We developed a classifier which uses genotyping array data, often collected for all sequenced individuals, as a gold standard to improve calibration of variant calls. We found little difference in quality between single- and multi-sample calling methods at 30x coverage.

Topics in Health Systems

Sponsor: Health Applications

Sponsored Session

Chair: Douglas King, University of Illinois at Urbana-Champaign, 117 Transportation Bldg., 104 S. Mathews Ave., MC-238, Urbana, IL, 61801, United States of America, dmking@illinois.edu

1 - Methods in Treatment Planning with Continuous Dose Delivery

Kimia Ghobadi, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, United States of America, kimiag@mit.edu, David Jaffray, Dionne Aleman, Caroline Chung

In this work we investigate continuous dose delivery models and algorithms for head-and-neck patients. We discuss the necessary changes and considerations in the optimization models and algorithms for different tumour sites. We will also present the clinical realization of the plans and compare the obtained clinical results with the simulated treatment plans.

2 - Optimal Timing of Living-donor Liver Transplantation under Risk-aversion

Ozlem Cavus, Bilkent University, Department of Industrial Engineering, Ankara, 06800, Turkey, ozlem.cavus@bilkent.edu.tr, Umit Emre Kose, Oguzhan Alagoz, Andrew J. Schaefer

The timing of liver transplantation is crucial as it affects the quality and the length of the patients' life. Previous studies used risk-neutral Markov Decision Processes to optimize the timing of the transplantation. In this study, we model the risk-averse behavior of the patients using coherent dynamic measures of risk. We obtain optimal policies for different patients and donated organs. We also derive the structural properties of the optimal policy. Supported by TUBITAK [Grant 213M442].

3 - Forecasting Outcomes of Donor Liver Allocation Policies Given Growing Disparities in Supply and Demand

Rachel Townsley, North Carolina State University, Industrial and Systems Engineering, Raleigh, NC, rmtownsl@ncsu.edu,
Maria Mayorga

Health trends in the US general population point to a growing gap in the supply and demand of livers for transplantation. Obesity, diabetes, and an aging population are the cause of declining donor liver quality as well as the cause of growing transplant waitlists. We use UNOS data to develop agent based simulation models and evaluate 30-year outcomes of liver allocation in the US in light of these trends.

4 - An Efficient Contiguity-enforcement Algorithm for Practical Geographic Districting Problems

Douglas King, University of Illinois at Urbana-Champaign, 117 Transportation Bldg., 104 S. Mathews Ave., MC-238, Urbana, IL, 61801, United States of America, dmking@illinois.edu,
Sheldon Jacobson, Edward Sewell

Geographic districting applications include congressional districting, police districting, and deployment of emergency services. Often, these districts are required to be contiguous, imposing a substantial computational burden during optimization. By integrating assessment of district holes (i.e., enclaves), this talk presents efficient algorithms for enforcing contiguity when district composition is optimized with local search. Practical scaling properties of these algorithms will be discussed.

Joint Session HAS/MSOM-Healthcare: Managing Healthcare Operations

Sponsor: Health Applications

Sponsored Session

Chair: Craig Froehle, Professor, University of Cincinnati, Lindner College of Business, Lindner College of Business, Cincinnati, OH, 45221-0130, United States of America, froehlec@ucmail.uc.edu

1 - Data-driven Decision Making at Triage: Toward Better Patient Streaming in the Emergency Department

Elham Torabi, University of Cincinnati, Cincinnati, OH, torabiem@mail.uc.edu, Craig Froehle, Christopher Miller

The inadequacy of the ESI triage system potentially contributes to suboptimal patient routing and ED congestion. Using partitioning methods, we define new prioritization policies to further stratify the ESI-3 patients who make 50% of all patients. We evaluate the performance of the system under new policy using queueing models.

2 - The Cost of Waiting in Healthcare and Hospitality Services

Craig Froehle, Professor, University of Cincinnati, Lindner College of Business, Lindner College of Business, Cincinnati, OH, 45221-0130, United States of America, froehlec@ucmail.uc.edu,
Rohit Verma

The perceived cost of waiting to patients and customers has proven difficult to measure. Using a set of experiments, we compare how waiting is perceived in the contexts of healthcare and hospitality services. We examine the perceptions of waiting as well as "sequence" effects — where the wait occurs within the service process — and draw preliminary conclusions about how healthcare and hospitality services might better approach the management and mitigation of customer and patient waiting.

3 - Impact of Inspection Outcomes on Nursing Home Care Quality - Role of Ownership and Affiliation

Rachna Shah, Professor, University of Minnesota, Minneapolis, MN, United States of America, shahx024@umn.edu,
Gopalakrishnan Narayanamurthy, Anand G

Inspections and their impact on quality outcomes have been studied in many different settings. Surprisingly, this relationship has not been examined in the healthcare sector. In this study, we investigate the impact of inspection outcomes on future clinical (evidence-based) and experiential (patient-centered) quality in nursing homes using a unique secondary panel data.

4 - Addressing Challenges of Scheduling Providers at Major Teaching Hospitals

Brian Lemay, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, blemay@umich.edu,
Amy Cohn

When using optimization models for solving healthcare provider scheduling problems, multi-criteria objective functions are necessary, but often result in undesirable schedules. Additionally, it is frequently not possible to satisfy every scheduling preference, so compromises must be made to resolve the infeasible problem instances. We discuss our methods for overcoming these multi-criteria objective and infeasibility challenges for scheduling providers at two major teaching hospitals.

Practice-Based Research in Humanitarian Operations Management

Sponsor: Public Sector OR

Sponsored Session

Chair: Maria Besiou, Kuehne Logistics University, Grosser Grasbrook 17, Hamburg, Germany, Maria.Besiou@the-klu.org

1 - Fundraising for Operational Expenditures in International Humanitarian Aid

Laura Turrini, Köhne Logistics University, Großer Grasbrook 17, Hamburg, 20457, Germany, Laura.Turrini@the-klu.org,
Maria Besiou, Joern Meissner

Effectiveness of humanitarian programs depends on funding. Based on the programs operational needs, international humanitarian organizations estimate the operational expenditures and then appeal for donations. Donations affect services and the number of beneficiaries they will be able to reach. In this paper, using multiple regression analysis, we aim to shed more light on the operational implications of fundraising and on possible improvements of fundraising strategies for humanitarian programs.

2 - Disaster Response Test Cases: Representing Real Disasters

Azrah Azhar, Graduate Student, George Washington University, 800, 22nd Street NW, Washington, DC, 20052, United States of America, azrah@gwu.edu, Erica Gralla

In the humanitarian logistics literature, algorithms and policies are recommended based on their performance in test problem instances. Therefore, it is important that these test problems are representative of real disasters. We study twenty-seven real disaster instances, identify their characteristics and compare them to test problems from the humanitarian literature.

3 - Transition to Practice of Access Restoration in Post-disaster Humanitarian Logistics

Felipe Aros-Vera, Rensselaer Polytechnic Institute, Troy, NY, United States of America, arosvm2@rpi.edu, Jose Holguin-Veras

This presentation focuses on the technical challenges of the transition to practice of access restoration methodologies after disasters. It gives an overview of the integration of systems that provide: (1) initial assessment of transportation network conditions, (2) mathematical modeling, and (3) decision making process on the ground. The presentation builds on the implementation of access restoration models into the disaster response plans in the city of New York.

4 - Volunteer Management in Charity Storehouses

Maria Besiou, Kuehne Logistics University, Grosser Grasbrook 17, Hamburg, Germany, Maria.Besiou@the-klu.org,
Alfonso Pedraza-Martinez

We study volunteer management at a large faith-based organization. The whole supply chain operates exclusively with volunteers (from supply to delivery). We focus our study on the preparation of the beneficiaries' orders by volunteers in a storehouse. There are different categories of volunteers; some are more experienced while others may work in the system for the first time. Using empirical data we build a model to explore the drivers of on-time order fulfillment at the storehouse level.

Community-Based Operations Research II

Sponsor: Public Sector OR

Sponsored Session

Chair: Michael P. Johnson, Associate Professor, University of Massachusetts Boston, 100 Morrissey Blvd., McCormack Hall Room 3-428A, Boston, MA, 02125-3393, United States of America, Michael.Johnson@umb.edu

1 - Resource Allocation for Sustaining Interventions in the Education System

Donna Llewellyn, Executive Director, Boise State University, 1910 University Drive, ISDI - ACS 104, Boise, ID, 83725-1155, United States of America, donnallewellyn@boisestate.edu, Pratik Mital, Roxanne Moore

In this work, the Education System Intervention Modeling Framework (ESIM) is developed that can be used to analyze interventions in the K-12 education system. The framework aids in allocating resources to the more important parts of the system such that probability of sustaining the intervention can be maximized and the cost of implementation remains within the budget constraints. The framework can also be extended to analyze other complex systems like Healthcare, Humanitarian aid etc.

2 - Blending Systems Thinking Approaches for Organisational Diagnosis: Child Protection in England

David Lane, Henley Business School, Reading, United Kingdom d.c.lane@henley.ac.uk

The Department for Education's high-profile 'Munro Review of Child Protection' used a blend of systems thinking ideas. First, a compliance culture that had emerged was diagnosed. Then system dynamics generated a complex map of the intended and unintended consequences of previous policies and helped identify the sector's drivers. This led to recommendations that were systemically coherent, avoiding problems produced by previous policies. Government supported and implemented the recommendations.

3 - Multiple Resource Type Straddling a Standard with Applications in Election Resource Allocation

Theodore Allen, Associate Professor, The Ohio State University, 1971 Neil Avenue, 210 Baker Systems, Columbus, OH, 43221, United States of America, allen.515@osu.edu, Muer Yang

The challenge of guaranteeing that no one will wait over 30 minutes using simulation optimization is explored. Novel selection and ranking methods are proposed. Numerical results illustrate potential new guidelines and associated computational savings.

4 - Measures and Inference of Spatial Access to Pediatric Dental Care in Georgia

Monica Gentili, Georgia Tech, North Ave NW, Atlanta, GA, United States of America, mgentili3@mail.gatech.edu, Shanshan Cao, Nicoleta Serban, Susan Griffin

We develop a measurement and modeling framework to infer the impact of policy changes on disparities in spatial accessibility to pediatric dental care in Georgia. Our measurement models are based on optimization models that match need of service with supply under a series of user and provider system constraints. We compare the derived measures and evaluate the impact of policy interventions for two population groups (publicly insured and privately insured children) and for rural and urban areas.

Health Care Modeling and Optimization VII

Contributed Session

Chair: Kamil Ciftci, PhD Candidate, Lehigh University, H.S. Mohler Laboratory, 200 West Packer Ave., Bethlehem, PA, 18015, United States of America, kac208@lehigh.edu

1 - A Multi-Objective Algorithm for Optimizing Service Consistency in Periodic Vehicle Routing Problems

Kunlei Lian, University of Arkansas, Bell 4113, 1 University of Arkansas, Fayetteville, AR, 72701, United States of America, klian@uark.edu, Ashlea Milburn, Ronald Rardin

This research concerns optimizing service consistency in periodic vehicle routing problem, in which customers require repeatable visits over a time horizon and visits to a customer can only happen on one of his allowable visit day combination. Service consistency, including driver consistency and time consistency is optimized together with travel cost using a heuristic multi-objective algorithm. Large neighborhood search is used in the algorithm framework to optimize each objective separately.

2 - Conjugate Gradient Algorithms to Optimize RBE-weighted Dose in Intensity Modulated Proton Therapy

Guven Kaya, PhD Student, Industrial Engineering, University of Houston, E206 Engineering Bldg 2, Houston, TX, 77204, United States of America, gkaya@central.uh.edu, Gino Lim

Intensity modulated proton therapy (IMPT) usually operates a constant relative biological effectiveness (RBE). In fact, RBE is not constant. RBE is described as a function of dose, linear energy transfer (LET) and tissue type in the structure of the linear-quadratic (LQ) model. We study the optimization of radiobiological effects (dose and rbe-weighted dose) in the context of LQ model by using two conjugate gradient algorithms. For results, we use data for head and neck cancer case.

3 - Robust Surgery Scheduling with Exception Analytics

Yoonseun Lee, The Pennsylvania State University, 236 Leonhard Building, University Park, PA, 16802, United States of America, yxl5250@psu.edu, Vittaldas Prabhu

In this study, we address a surgery scheduling problem with uncertain surgery duration where surgical procedure takes place in multiple operating rooms. We present a robust surgery scheduling model and study its performance using exception analytics approach. We perform numerical experiments to compare performances of various models including simple heuristics, and find out that the results illustrate that the robust models with exception analytics works well across different instances.

4 - Intertemporal Decisions in Hospital Capacity Planning

Jorge Vera, Professor, Universidad Catolica de Chile, Dept. Industrial and System Engineering, Vicuna Mackenna 4860, Santiago, Chile, jvera@ing.puc.cl, Ana Batista

Correct planning of capacity in a hospital is crucial for high standards of service to patients. The problem is complex not only because of the different areas in a large hospital but also because of several uncertainties present in the system, like patient demand or length of stay. In this work we show how we could use an intertemporal hierarchical decisions modeling to address this problem. We present model alternatives as well as solution methods based on Stochastic Optimization

5 - Workload Balancing Problem in an Outpatient Center under Uncertainty

Kamil Ciftci, PhD Candidate, Lehigh University, H.S. Mohler Laboratory, 200 West Packer Ave., Bethlehem, PA, 18015, United States of America, kac208@lehigh.edu

Creating fair nurse workload in infusion center is a difficult task due to uncertainty in patient late cancelation and no-show while patient satisfaction is top priority for hospital. In this study, we propose two-stage stochastic program model to find best combination of nurse workload balancing schedule (NWBS) and patient waiting time (PWT) under different uncertainties. Computational results show that proposed methodology provides better NWBS and keeps average PWT under hospital goal.

Dynamic Programming and Control I

Contributed Session

Chair: Jefferson Huang, Stony Brook University, Dept. Applied Mathematics & Statistics, Stony Brook, NY, 11794-3600, United States of America, jefferson.huang@stonybrook.edu

1 - Dynamic Pricing Mapreduce Model

Minghong Xu, Doctoral Student, University of Illinois at Chicago, 600 S. Morgan St., Chicago, IL, 60607, United States of America, summerinxu@gmail.com, Sid Bhattacharya, Kunpeng Zhang

Dynamic programming breaks the problem down into a collection of simpler subproblems and has the optimal substructure. But it suffers from "curse of dimensionality". On the other hand, distributed implementation using MapReduce has been proved to be an efficient tool that solved a lot of large-scale problems. In this study, the Big Data era technics is used to solve Big State Space. A MapReduce Model is proposed for a Dynamic Pricing problem using E-Commerce data.

2 - Energy Storage Management in Microgrids: A Supplier's Perspective

Arnab Bhattacharya, University of Pittsburgh, 6236 Fifth Avenue, Apt. 102A, Pittsburgh, PA, 15232, United States of America, arb141@pitt.edu, Jeffrey Kharoufeh

We consider a renewable energy supplier's problem of optimally procuring, selling and storing energy when renewable supplies and real-time prices are uncertain. A finite-horizon MDP model is formulated and solved to maximize the supplier's total expected (discounted) net profits, subject to storage capacity and transmission constraints.

3 - Dynamic Credit-collections Optimization

Naveed Chehraz, Assistant Professor, McCombs School of Business, 2110 Speedway Stop B6500, Austin, TX, 78705, United States of America, naveed.chehraz@mcombs.utexas.edu, Peter Glynn, Thomas Weber

We develop a dynamic model of consumer repayment behavior on delinquent credit-card loans using a marked point process. The intensity of this point process can be influenced by costly treatment actions. Both the type and the timing of the account-treatment actions are subject to optimization, leading to an optimal impulse control problem. Using the HJB equation, we obtain a quasi-closed form solution for this control problem.

4 - Complexity Estimates for Policy and Value Iteration Algorithms for Total-cost and Average Cost MDPs

Jefferson Huang, Stony Brook University, Dept. Applied Mathematics & Statistics, Stony Brook, NY, 11794-3600, United States of America, jefferson.huang@stonybrook.edu, Eugene Feinberg

We present two groups of results: an example showing that the value iteration algorithm and its modifications are not strongly polynomial for discounted MDPs, and reductions of certain total-cost and average-cost MDPs to discounted ones. Combining the latter with Yinyu Ye's result on the strong polynomiality of the simplex method and policy iterations for discounted MDPs allows us to design strongly polynomial algorithms for important classes of total-cost and average-cost MDPs.

Branding and Bundling

Cluster: Operations/Marketing Interface

Invited Session

Chair: Kathy Steckle, UT Dallas, SM30 JSOM, 800 W Campbell Rd, Richardson, TX, 75080, United States of America, ksteckle@utdallas.edu

1 - Consumer Taste Uncertainty in the Context of Store Brand and National Brand Competition

Saibal Ray, Professor, McGill University, 1001 Sherbrooke Street West, Montreal, Canada, saibal.ray@mcgill.ca, Tamer Boyaci, Arcan Nalca

We focus on the uncertainty in consumer taste and study how a retailer can benefit from acquiring that taste information in the presence of competition between its store brand and a national brand. We also identify the optimal information sharing strategy of the retailer as well as the equilibrium product positioning and pricing of the brands. We generate insights as to when it is most valuable for the retailer to acquire taste information as well its value for the manufacturer.

2 - Retail Assortment and Price Competition when Consumers are Uncertain about Product Tastes

Steve Gilbert, Professor, University of Texas at Austin, 1 University Station, B6500, The University of Texas at Austin, Austin, TX, 78712, United States of America, Steve.Gilbert@mcombs.utexas.edu, Haoying Sun

For many products, at least some consumers may need to physically experience them in order to assess their valuations. For such products, we provide conditions under there will be an equilibrium between two symmetric retailers in which one carries both products and the other carries only one. In addition, we find that the pricing strategy that should be adopted by each retailer differs substantially depending upon his rival's assortment.

3 - Demand Shaping through Bundling and Configuration:**A Dynamic Multiproduct Inventory-pricing Model**

Zhengliang Xue, IBM Research Center, Yorktown Heights, NY, United States of America, zxue@us.ibm.com, Jeannette Song

Motivated by the industrial practice of using product bundling to shape demand, we present a dynamic model to analyze the optimal joint inventory, pricing, and bundling decisions for a firm selling vertically differentiated bundles over a finite horizon. We study the factors driving the bundling strategy, and provide insights into when to change the bundling strategies. Such strategies have a broad application in practice such as pricing the configuration of server and accessories.

4 - Should a Retailer Consider Adding a Social Network Enabled Channel?

Gulver Karamemis, University of Florida, 355A STZ, Gainesville, FL, 32611, United States of America, gulver.karamemis@warrington.ufl.edu, Narendra Agrawal, Subhajyoti Bandyopadhyay, Asoo Vakharia

Social networks are one of the most exciting recent developments that have influenced the relationships between individuals and between individuals and organizations. However, due to its relative infancy as well as the myriad data and security related concerns of consumers, retailers have been slow to dive into social networks as a sales channel. Our research sheds light on the question of when retailers should consider adding a social network channel to their existing channel architecture.

Micro-Underpinnings of Mobility, Knowledge, and Performance in Groups and Organizations

Sponsor: Organization Science

Sponsored Session

Chair: Aimee Kane, Duquesne University, Pittsburgh, PA, kanea@duq.edu

Co-Chair: Gina Dokko, University of California, Davis, CA

1 - Managing Talent across Organizations: the Portability of Individual Performance

Gina Dokko, University of California, Davis, Davis, CA, Winnie Jiang

As individuals' careers increasingly unfold in diverse ways, the question of what they carry with them as they cross organizational or institutional boundaries becomes increasingly important. In this essay, we review findings on the portability of individual performance and develop a framework for thinking about talent management in organizations that accounts for the movement of individuals in and out of organizations and the complexity of modern careers.

2 - Using What You Know: Inventor Mobility to Young Firms

Erin Fahrenkopf, Carnegie Mellon University, Pittsburgh, PA, efahrenkopf@gmail.com

The research addresses the conditions under which individuals at entrepreneurial firms exploit knowledge from prior organizational experiences. In particular, I examine the effect of engaging in collaborative work and organizational roles on individuals' knowledge use at young firms. I study a sample of inventor movements, both founders and employees, in the US laser industry and provide implications for the study of entrepreneurship and knowledge transfer by employee movements.

3 - Overcoming Barriers to Team Receptivity to Newcomers

Aimee Kane, Duquesne University, Pittsburgh, PA, kanea@duq.edu, Floor Rink

Newcomers bring with them unique perspectives drawn from prior experience, but, due to social psychological barriers, there is a pervasive tendency for teams to push newcomers to assimilate to the team rather than utilize their valuable knowledge. This contribution draws on evidence from small group experiments and vignette studies to suggest ways of replacing this resistance with receptivity to newcomer's unique knowledge, which are also amendable to managerial, team, and newcomer intervention.

4 - Shady Characters: How Illicit Roles Contribute to Team Performance

Colleen Stuart, Johns Hopkins University, Baltimore, MD, cstuart@jhu.edu, Celia Moore

In this paper we theorize about illicit roles, roles that specialize in activity that contravenes rules or regulations to support group goals. We use data on professional hockey teams to examine how team performance is disrupted when the enforcer, a player who specializes in the prohibited activity of fighting, is injured. We discuss how our understanding of illicit roles can be used to build theory about informal organizational roles and the implications of these roles for mobility in teams.

Sponsor: Manufacturing & Service Oper

Mgmt/Healthcare Operations

Sponsored Session

Chair: Mehmet Ayyaci, Asst Professor, University of Texas-Dallas, School of Management, Richardson, TX, 75080, United States of America, mehmet.ayyaci@utdallas.edu

1 - Making the Case for Case Management

Margret Bjarnadottir, Assistant Professor of Management Science and Statistics, Robert H. Smith School of Business, University of Maryland, 4324 Van Munching Hall, College Park, MD, 20742, United States of America, margret@rhsmith.umd.edu, David Anderson

Most case management programs target current high-cost patients. However the real cost savings potential is including lower cost patients at high risk of future high costs. We demonstrate the potential of association rules for identification of these high value patients and derive a general upper bound methodology on classification performance.

2 - Managing Office Revisit Intervals and Patient Panel Sizes in Primary Care

Hessam Bavafa, Assistant Professor, Wisconsin School of Business, Madison, WI, United States of America, hbavafa@bus.wisc.edu

In recent years, the drive to contain health care costs in the US has increased scrutiny of the traditional mode of delivering primary care where a patient is treated by his primary care physician during a face-to-face visit. In particular, two approaches, the use of “e-visits” and greater reliance on non-physician providers, have been suggested as lower-cost alternatives to the traditional set-up. In this paper, we consider a patient panel and develop a new model of patient health dynamics.

3 - Outpatient-clinic Capacity Management when Continuity of Care Matters

Yichuan Ding, UBC, 2053 Main Mall, Sauder School of Business, Vancouver, BC, V6T1Z2, Canada, daniel.ding@sauder.ubc.ca, Diwakar Gupta, Xiaoxu Tang

We study how to manage capacity in an outpatient clinic with the goal of maximizing service volume as well as maintaining high level of continuity of care (COC). We consider a simple strategy that doctors may use to improve COC — book a follow-up appointment (FUA) for a patient before she leaves the clinic. In order to encourage the doctor to use this strategy, the current fee-for-service mechanism must be revised to compensate doctors for FUAs that are no show or late cancelled.

4 - The Impact of Health Information Exchanges on Emergency Department Length of Stay

Jan Vlachy, PhD Student, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, vlachy@gatech.edu, Turgay Ayer, Mehmet Ayyaci, Zeynal Karaca

Electronic exchange of health information (HIE) is expected to improve coordination in emergency departments (ED). We empirically study the impact of HIEs on ED length of stay (LOS) using a large longitudinal dataset comprising about 5.8 million visits to 63 EDs over three years. Overall, we find that HIE adoption is associated with substantial reductions in LOS, but this impact depends on various contextual and situational factors.

Joint Session MSOM-Health/HAS/Analytics: Healthcare Analytics

Sponsor: Manufacturing & Service Oper

Mgmt/Healthcare Operations

Sponsored Session

Chair: Tinglong Dai, Assistant Professor, Johns Hopkins University, 100 International Dr, Baltimore, MD, 21202, United States of America, dai@jhu.edu

Co-Chair: Song Hee Kim, Assistant Professor, Marshall School of Business, University of Southern California, Los Angeles, CA, United States of America, songheck@marshall.usc.edu

1 - Efficient Spatial Allocation of Epidemic Intervention Resources with a Focus on Ebola in West Africa

Eike Nohdurft, Research Assistant, WHU - Otto Beisheim School of Management, Burgplatz 2, Vallendar, 56179, Germany, eike.nohdurft@whu.edu, Elisa Long, Stefan Spinler

The recent Ebola outbreak has shown that containment of an infectious disease relies on deployment and allocation of intervention resources. A model reducing the number of infections through improved allocation is proposed. Allocation decisions are based on a spatial compartmental epidemic model with a novel factor dynamically incorporating behavioral change in the population. Our approach could avoid up to 23% of the infections.

2 - Information Aggregation and Classification under Anchoring Bias: Application to Breast Imaging

Mehmet Eren Ahsen, Researcher, IBM Research, 1101 Route 134 Kitchawan RD #13-146C, Yorktown Heights, NY, 10598, United States of America, mahsen@us.ibm.com, Mehmet Ayyaci, Srinivasan Raghunathan

We study optimal aggregation and subsequent classification for the case of two sources of information where the interpretation of the primary information (mammography) is biased by the secondary information (risk profile). We examine the relationship between bias, weights assigned, and the decision thresholds in the context of optimal utility or the optimal discriminative ability.

3 - Priority and Predictability

Jillian A Berry Jaeker, Assistant Professor, Boston University, 595 Commonwealth Avenue, Boston, MA, 02215, United States of America, jjaeker@bu.edu

This study explores how patient admission characteristics (i.e. whether a patient is scheduled or emergent; medical or surgical) moderate the effects of high workload and demand. In particular, the probabilities of admission and discharge, by patient type are analyzed. The results of this study provide an estimation of the impact of predictability on patient flow.

4 - Decision Ambiguity and Conflicts of Interests in Interventional Cardiology Decision-Making

Tinglong Dai, Assistant Professor, Johns Hopkins University, 100 International Dr, Baltimore, MD, 21202, United States of America, dai@jhu.edu, Chao-wei Hwang, Xiaofang Wang

With the rapidly rising cost of health care, there is a renewed urgency for reducing inappropriate use of percutaneous coronary interventions (PCI). In this work, we provide a quantitative analytical model of clinical and non-clinical factors influencing PCI decision-making processes. Our model helps inform policy-makers designing guidelines to optimize the use of PCI.

Game Theoretic Models in Revenue Management II

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Santiago Balseiro, Assistant Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, srb43@duke.edu

Co-Chair: Ozan Candogan, University of Chicago, Booth School of Business, Chicago, IL, United States of America, ozan.candogan@chicagobooth.edu

1 - Learn and Screen: A Strategic Approach to Collaborative Inventory Management

Bharadwaj Kadiyala, PhD Candidate, The University of Texas at Dallas, 800 West Campbell Road, 3.218, Dallas, TX, 75080, United States of America, bharadwaj.kadiyala@utdallas.edu, Ozalp Ozer

We propose a dynamic mechanism for a supplier who periodically replenishes inventory with partial knowledge of demand distribution. By combining the best of Bayesian updating and screening mechanism, we show that in addition to maximizing profit, inventory decisions also serve a strategic purpose in eliciting demand information from the buyer.

2 - Optimal Contracts for Intermediaries in Online Advertising

Santiago Balseiro, Assistant Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, srb43@duke.edu, Ozan Candogan

The prevalent method online advertisers employ to acquire impressions is to contract with an intermediary. We study the optimal contract offered by the intermediary when advertisers' budgets and targeting criteria are private. We introduce a novel approach to tackle the resulting multi-dimensional dynamic mechanism design problem, and show that an intermediary can profitably provide bidding service to a budget-constrained advertiser and at the same time increase the overall market efficiency.

3 - Selling Information in Oligopolies

Alireza Tahbaz-Salehi, Columbia Business School, 3022 Broadway, Uris Hall 418, New York, NY, 10023, United States of America, alirezat@columbia.edu, Kostas Bimpikis, Davide Cripis

This paper studies the strategic interaction between a monopolist seller of an information product and a set of potential buyers that compete in a downstream market. We argue that the nature of competition among the buyers largely determines the price and accuracy of the product that the monopolist decides to sell.

4 - Analysis of a Simple Cost Allocation Rule for Joint Replenishment

Xuan Wang, New York University, 44 West 4th Street, Suite 8-154, New York, NY, 10012, United States of America, xwang3@stern.nyu.edu, Jiawei Zhang, Simai He, Jay Sethuraman

We consider the joint replenishment game in which the major setup cost is split equally among the retailers who place an order together. Each retailer pays his own holding and minor setup cost. Under this allocation rule each retailer determines his replenishment policy to minimize his own cost anticipating the other retailers' strategy. We show that a payoff dominant Nash equilibrium exists and quantify the efficiency loss of the non cooperative outcome relative to the social optimum.

Co-Chair: Serguei Netessine, Professor, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Serguei.Netessine@insead.edu

1 - Interpreting "3 Seats Left": An Empirical Analysis of Airline Inventory Announcements

Kate Ashley, UC Berkeley Haas School of Business, 2220 Piedmont Ave, Berkeley, CA, 94720, United States of America, kate_ashley@haas.berkeley.edu, Pnina Feldman, Jun Li

Does inventory announcement affect the timing of customer purchases? We estimate the impact of inventory announcement policy on purchases of airline tickets. We analyze the extent to which customers treat messages from the firm as cheap talk or credible information, and the extent to which firms use announcements strategically to influence demand.

2 - Contextual Treatment Selection and its Application to Pricing Optimization

Yan Zhao, MIT, 77 Mass Ave, 1-245, Cambridge, MA, United States of America, zhaoyan@mit.edu

With the rapid growth of eCommerce, the wealth of data makes it possible to exploit the heterogeneity among customer pricing sensitivity and maximize revenue. We develop a general framework for the customized pricing problem and propose a tree-based algorithm, which shows superior performance on both simulated data and real transaction data. Under mild regularity conditions we prove the upper bound of the difference of expected revenue between a simplified version of our algorithm and an oracle.

3 - Dynamic Pricing and Inventory Management: An Empirical Perspective

Yan Shang, PhD Student, Duke University, 845 Ivy Meadow Ln, Apt. 3D, Durham, NC, 27707, United States of America, yan.shang@duke.edu, Yiting Deng, Jing-Sheng Song

This paper applies structural modeling to study joint inventory and pricing management of perishable product, using fresh vegetable data from the largest state-owned supermarket chain in China. Demand of fresh vegetables depends not only on price but also freshness, and complementarity exists between items. We use a multiple continuous model to incorporate these features. Based on demand estimates, optimal prices are solved, which achieves significant profit improvement and waste reduction.

From Store to Omni-Channel: Choice-Driven Pricing Models

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Stefanus Jasin, Stephen M. Ross School of Business, University of Michigan, Ann Arbor, MI, United States of America, sjasin@umich.edu

Co-Chair: Joline Uichanco, Asst. Professor, University of Michigan, Ross School of Business, 701 Tappan Ave, Ann Arbor, MI, 48109, United States of America, jolineu@umich.edu

1 - Drivers of Demand for Consumer Packaged Goods that Have Wide Variations in Price and Perceived Quality

Olga Pak, Student, University of South Carolina, 1014 Greene Street, Columbia, SC, 29208, United States of America, olga.pak@grad.moore.sc.edu, Mark Ferguson

In joint work with Oracle Retail, we identify the drivers of demand for consumer packaged goods that have wide variations in price and perceived quality. We investigate the problem with the use of hierarchical models on retail transaction data across multiple market and store locations to analyze the influence of prices, promotions and individual store effects.

2 - Integrated Lifecycle Price and Inventory Optimization in an Omni-channel Environment

Pavithra Harsha, IBM, 1101 Kitchawan Road, Room 34-225, Yorktown Heights, NY, 10598, United States of America, pharsha@us.ibm.com, Shivaram Subramanian, Joline Uichanco, Markus Ettl

In an omni-channel environment, inventory is shared across channels through multiple fulfillment options (e.g. ship-from-store). Without accounting for this, existing pricing solutions take steep markdowns in stores. We present a tractable optimization model to determine optimal lifecycle channel prices, inventory allocations and partitions across channels that maximizes the total chain level profit. Our experiments show a 6-12% improvement in profit over multiple categories of a large retailer.

3 - Data-driven Learning in Dynamic Pricing using Adaptive Optimization

Phebe Vayanos, Assistant Professor, University of Southern California, 3551 Trousdale Pkwy, University Park, Los Angeles, CA, 90089, United States of America, pvayanos@mit.edu, Dimitris Bertsimas

We consider the pricing problem faced by a retailer endowed with a finite inventory of a product with unknown demand curve offered to price-sensitive customers. We formulate the seller's problem as an adaptive optimization problem with decision-dependent uncertainty set and propose a tractable solution approach.

■ MC46

Pricing and Strategic Behavior in Queueing Systems

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Philipp Afeche, Associate Professor, University of Toronto, 105 St. George Street, Toronto, ON, M5S3E6, Canada, afeche@rotman.utoronto.ca

1 - Pricing, Diagnosis and Overtreatment in Expert Services

Senthil Veeraraghavan, Associate Professor, The Wharton School, 3730 Walnut St, Philadelphia, PA, 19104, United States of America, senthily@wharton.upenn.edu

In many services, consumers must rely on advice of experts to identify the type of treatment/service they need. The information asymmetry between service provider and the consumers creates inefficiencies in the form of cheating and over-treatment. We show that congestion and waiting costs act as natural "fraud costs" which mitigate cheating, inducing honesty and increasing social welfare. We show the informational value of pricing in inducing either honesty or overtreatment.

2 - Value of Dynamic Pricing in Congestible Systems

Jeunghyun Kim, University of Southern California, Marshall School of Business, Bridge Hall 401, Los Angeles, CA, 90089, United States of America,
jeunghyun.kim.2015@marshall.usc.edu, Ramandeep Randhawa

From UBER to express lanes on highways, dynamically changing the premium for access to limited resources based on congestion is prevalent. Our research question is: what is the value of dynamic pricing over static pricing in such systems. By modeling a firm that caters to price- and delay-sensitive customers, we analytically prove that the value can be significant and a simple dynamic scheme of using only two price points reaps most of this value.

3 - Price Competition with Customer Search in Congested Environments

Laurens Debo, Associate Professor, Dartmouth College, 100 Tuck Hall, Hanover NH 03755, United States of America,
laurens.g.debo@tuck.dartmouth.edu, Varun Gupta, Luiyi Yang

We study how firms compete in service rate when congestion-sensitive customer search, at some cost, for the firm with the shortest line. We find that decreasing search costs increases search and intensifies service rate competition, which reduces firms' equilibrium profits. Firms can get around by inflicting random costs on customers.

4 - Learning and Earning for Congestion-prone Service Systems

Philipp Afeche, Associate Professor, University of Toronto, 105 St. George Street, Toronto, ON, M5S3E6, Canada,
afeche@rotman.utoronto.ca, Bora Keskin

We consider a firm that sells a service in a congestion-prone system to price- and delay-sensitive customers. The firm faces Bayesian uncertainty about the consumer demand for its service and can dynamically make noisy observations on the demand. We characterize the structure and performance of the myopic Bayesian policy and well-performing variants. Our results show that capacity constraints have an important effect on performance.

Energy Operations and Energy Efficiency

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Nur Sunar, Assistant Professor, University of North Carolina, Kenan-Flagler School of Business, Chapel Hill, NC, United States of America, Nur_Sunar@kenan-flagler.unc.edu

1 - A Unifying Framework for Consumer Surplus under Stochastic Demand

Georgia Perakis, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, georgiap@mit.edu, Maxime Cohen, Charles Thraves

We present a general extension of the consumer surplus for stochastic demand under several capacity rationing rules. We derive this extension from a graphical approach as well as from a utility maximization perspective. We then use this definition to study the impact of demand uncertainty on consumers in interesting applications including the electric vehicle market. We show that in many cases demand uncertainty may actually hurt consumers.

2 - Optimal Utilization of Energy Storage for Energy Shifting

Gilvan (Gil) Souza, Professor, Indiana University, Kelley School of Business, Bloomington, IN, 47405, United States of America, gsouza@indiana.edu, Shanshan Hu, Shanshan Guo

Batteries may be used for energy shifting in the power system: storing electricity when the power supply is abundant and cheap, and releasing electricity when the supply is tight and more expensive. Both permanent capacity loss and useful life of a battery are affected by discharge decisions in energy shifting. This paper studies the optimal discharge decisions that maximize the total profit of energy shifting in a battery's entire life.

3 - Do Profitable Carbon Emission Reduction Opportunities Decrease Over Time? A Perspective Based on CDP

Christian Blanco, University of California-Los Angeles, Los Angeles, CA, United States of America
christian.noel.blanco@gmail.com, Felipe Caro, Charles Corbett

Using climate change-related surveys collected by CDP (formerly the Carbon Disclosure Project), we investigate if firms experience decreasing opportunities for profitable initiatives to reduce greenhouse gas emissions. We also characterize payback and marginal abatement costs of these energy efficiency investments over time.

4 - Strategic Commitment to a Production Schedule with Supply and Demand Uncertainty: The Renewable Power

Nur Sunar, Assistant Professor, University of North Carolina, Kenan-Flagler School of Business, Chapel Hill, United States of America, Nur_Sunar@kenan-flagler.unc.edu, John Birge

How should a renewable power producer strategically commit to a production schedule in a day-ahead electricity market? How does this commitment affect the day-ahead price? Motivated by these important questions, we introduce and analyze via the ODE theory a supply function competition model with demand and supply uncertainty. Using our novel equilibrium characterization, we study the implications of different penalty schemes and subsidy for equilibrium production schedules and market outcomes.

Chair: Hakjin Chung, Stephen M. Ross School of Business, University of Michigan, Ann Arbor, MI, United States of America, hakjin@umich.edu

Co-Chair: Kun Soo Park, Assistant Professor, KAIST College of Business, 85 Hoegi-ro, Dongdaemun-gu, Seoul, 130722, Korea, Republic of, kunsoo@kaist.ac.kr

1 - The Newsvendor under Demand Ambiguity: Combining Data with Moment and Tail Information

Soroush Saghafian, Harvard University, 79 JFK Street, Cambridge, MA, 02138, United States of America, Soroush.Saghafian@asu.edu, Brian Tomlin

Data-driven approaches typically assume that the planner has no information beyond the evolving history of demand observations. The planner may, however, have partial information about the demand distribution in addition to demand observations. We propose a non-parametric, maximum-entropy based technique, termed SOBME (Second Order Belief Maximum Entropy), which allows the planner to effectively combine demand observations with partial distributional information.

2 - Managing The Supply-demand Mismatch with Complementary Product Flow Options

Alexander Angelus, University of Texas, Jindal School of Management, Dallas, TX, United States of America, alexandar.angelus@utdallas.edu, Ozalp Ozer

To address the pervasive supply-demand mismatch in multi-stage supply chains with stochastic demand, we use the option to expedite shipments downstream to manage excess demand, and allow for returns of stock upstream to deal with excess inventory. We identify the optimal policy that decomposes this multi-dimensional problem into single-dimensional subproblems. Our numerical studies of supply chains with both expediting and returns of stock find those two product flow options to be complementary.

3 - Capacity Investment with Demand Learning

Anyan Qi, Assistant Professor, University of Texas at Dallas, 800 W Campbell Rd, Richardson, TX, 75080, United States of America, axq140430@utdallas.edu, Amitabh Sinha

We study a firm's strategy to adjust its capacity using information learned from observed demand. We characterize the firm's optimal policy and develop an easily-implementable and data-driven heuristic about when and by how much the firm should adjust its capacity. We also numerically validate the performance of our heuristic.

4 - Sequential Capacity Allocation under Order Manipulation: Efficiency and Fairness

Kun Soo Park, Assistant Professor, KAIST (Korea Advanced Institute of Science and Technology), 410 Supex Bldg, 85 Hoegiro, Dongdaemun-g, Seoul, Korea, Republic of, kunsoo@business.kaist.ac.kr, Seyed Iravani, Bosung Kim

We analyze the strategic behaviors of the supplier and manufactures in sequential capacity allocations when the manufacturers' order strategy is not necessarily truthful to the supplier. We show how an allocation changes under order manipulation and consider two directions to improve sequential allocation mechanisms under order manipulation from the perspective of efficiency and fairness of an allocation.

■ MC50

50-Room 106A, CC

Retail Supply Chain: From Demand Forecast to Order Fulfillment

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Santiago Gallino, Tuck School of Business,
100 Tuck Hall, Hanover, NH, United States of America,
santiago.gallino@tuck.dartmouth.edu

1 - How an e-Retailer can Profit from the Right Free Shipping Policy: A Model and Evidence

Joseph (Jiaqi) Xu, The Wharton School, University of
Pennsylvania, 3730 Walnut Street, Suite 500, Philadelphia, PA,
United States of America, jiaqixu@wharton.upenn.edu,
Gerard Cachon, Santiago Gallino

We present a model of online retail profitability when customers purposely increase their order size to qualify for free shipping. While this behavior results in more sales, it also adds cost from less shipping revenue and more product returns. We find that free shipping threshold often decreases profitability and is effective only for retailers with high fulfillment cost relative to shipping revenue and with low probability of return. The model is applied to data from an online retailer.

2 - Can Supply Chain Flexibility Facilitate Information Sharing?

Mohammad M. Fazel-Zarandi, PhD Candidate, Rotman School of
Management, 105 St. George Street, Toronto, M5S 3E6, Canada,
M.FazelZarandi10@Rotman.Utoronto.Ca, Oded Berman,
Dmitry Krass

We attempt to provide an explanation for a long-standing observation in supply chain management: while simple contracts cannot induce credible forecast sharing between different supply chain parties, firms often use them in practice, and exchange information through unverifiable communication. Using a stylized supply chain model, we show that if the reporting firm is uncertain about the receiving firm's reaction to its report, it may truthfully share its private information in equilibrium.

3 - Improving Color Trend Forecasting using Social Media Data

Youran Fu, PhD Student, The Wharton School,
3730 Walnut St, Philadelphia, PA, United States of America,
youranfu@wharton.upenn.edu, Marshall Fisher

We partnered with a leading apparel retailer to investigate how to use social media data to improve fashion color trend forecasting. We find that using fine-grained Twitter data and a Google search volume index to predict style-color sales three months out reduces forecast error by 11% compared to conventional methods.

4 - Wisdom of Crowds: Forecasting using Prediction Markets

Ruomeng Cui, Assistant Professor, Indiana University, 309 E.
Tenth Street, Bloomington, IN, 47401, United States of America,
cui@indiana.edu, Achal Bassamboo, Antonio Moreno-Garcia

Prediction markets are virtual markets created to aggregate predictions from the crowd. We examine data from a public prediction market and internal prediction markets run at three corporations. We study the efficiency of these markets in extracting information from participants. We show that the distribution forecasts, such as sales and commodity prices predictions, generated by the crowds are perfectly calibrated. In addition, we run a field experiment to study drivers of forecast accuracy.

Dynamic Contracts in Operations Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Hao Zhang, Associate Professor, University of British Columbia,
Sauder School of Business, Vancouver, BC, V6T1Z2, Canada,
hao.zhang@sauder.ubc.ca

1 - Optimal Long-term Supply Contracts with Asymmetric Demand Information

Wenqiang Xiao, Associate Professor, New York University, Stern
School of Business, 44 West Fourth Street, 8-72, New York, NY,
10012, United States of America, wxiao@stern.nyu.edu,
Ilan Lobel

We consider a manufacturer selling to a retailer with private demand information arising dynamically over an infinite time horizon. We show that the manufacturer's optimal dynamic long-term contract takes a simple form: in the first period, based on her private demand forecast, the retailer selects a wholesale

price and pays an associated upfront fee, and, from then on, the two parties stick to a simple wholesale price contract with the retailer's chosen price.

2 - Dynamic Mechanisms for Online Advertising

Hamid Nazerzadeh, University of Southern California, Bridge
Memorial Hall, 3670 Trousdale Parkway, Los Angeles, CA, 90089,
United States of America, hamidnz@marshall.usc.edu,
Vahab Mirrokni

I will discuss designing dynamic contracts for selling display advertising. I will show that under natural but rather restricted assumptions, the traditional reservation contracts can be revenue-optimal. I will also present the optimal mechanism in a general setting and discuss their practical implementations.

3 - Dynamic Short-term Contracts under Private Inventory Information and Backlogging

Lifei Sheng, PhD Candidate, University of British Columbia, 2053
Main Mall, Vancouver, BC, V6T1Z2, Canada,
Fay.Sheng@sauder.ubc.ca, Mahesh Nagarajan, Hao Zhang

We study a setting where a supplier sells to a retailer facing random demand over multiple periods. At the beginning of each period, the supplier offers a one-period contract and the retailer decides his order quantity before the demand realizes. The retailer carries leftover inventory or backlogs unmet demand, which is unobservable by the supplier. We show interesting properties of the supplier's optimal contract and study special cases when the problem is tractable.

4 - Structures of Optimal Dynamic Mechanisms

Alexandre Belloni, Professor Of Decision Sciences, Duke
University, 100 Fuqua Drive, Duke University, Durham, NC,
27708, United States of America, abn5@duke.edu, Peng Sun,
Bingyao Chen

Consider a principal procures up to one unit of a product/service in every period from an agent who is privately informed about its marginal production cost in each period. We identify regularity conditions on the distribution of private information under which the optimal contracts offer at most two different procurement levels depending on the newly reported cost. Our results rely on "dynamic virtual valuation," a generalization of the Myersonian virtual valuation in the static setting.

Sponsored Session

Chair: Aly Megahed, Research Staff Member, IBM Research, 650 Harry
Road - Office D3-428, San Jose, CA, 95120, United States of America,
aly.megahed@us.ibm.com

1 - Operations Research and Analytics Solutions for IT Service Providers

Aly Megahed, Research Staff Member, IBM Research,
650 Harry Road - Office D3-428, San Jose, CA, 95120,
United States of America, aly.megahed@us.ibm.com,
Hamid Reza Motahari Nezhad, Peifeng Yin, Taiga Nakamura

Large IT service providers compete to win highly-valued outsourcing IT deals via submitting proposals to potential clients. In this talk, you will learn about some of the analytics and OR work done for managing such complex service engagements. A case management approach that analyzes costs and prices of deals in preparation will be presented. Additionally, a predictive analytics tool for identifying the influential factors on the outcome of deals will be shared.

2 - Measuring Cloud Services Profitability

Ray Strong, Impact Of Future Technology, IBM Research,
650 Harry Road, San Jose, CA, 95120, United States of America,
hrstrong@us.ibm.com, Jeanette Blomberg, Sunhwan Lee, Anca
Chandra, Pawan Chowdhary, Susanne Glissmann, Robert Moore

The costs of providing cloud services are not easily attributable to revenue. We present a complex modeling approach to understanding the profitability of individual service offerings and individual service contracts. We explore ways of creating long running models of cloud service performance in spite of the month-to-month and pay-for-use nature of many cloud contracts. We suggest an approach to estimating the total current value of a cloud service contract to a vendor.

3 - Request for Service Process (RFS) Process Reengineering for IBM Strategic Outsourcing (SO) Business

Pawan Chowdhary, Software Research, IBM Research,
650 Harry Road, San Jose, CA, 95120, United States of America,
chowdhar@us.ibm.com, Jeanette Blomberg, Anca Chandra

RFS's are small work items that were not covered in strategic SO contract and are highly profitable. For a typical contract there could be hundreds of RFS that needs to be executed. The traditional processes to manage these RFS's were very cumbersome and often got delayed. In this talk, I will present the findings and the process reengineering work that IBM Research did to improve the performance of the RFS's along with increased customer satisfaction.

Efficiency in the Higher Education and Banking Sectors

Cluster: Data Envelopment Analysis

Invited Session

Chair: Jill Johnes, Professor, University of Huddersfield, The Business School Queensgate, Huddersfield, HD1 3HG United Kingdom j.johnes@hud.ac.uk

1 - Does Bank Performance and Corruption Matter for Economic Growth? An International Exploratory Study

Abdel Latif Anouze, Assistant Prof, Qatar University, College of Business and Economic-DMM, Doha, No, 2713, Qatar, a.anouz@qu.edu.qa

While previous economic development studies take into account the impact of financial sector performance on economic growth, the role of corruption as economic factors remain yet to be assessed. This paper integrates DEA and Structural Equation Modelling (SEM) to explore these relationships. Experimental experiences are reported on a sample of banks from different countries. The analytical results provide illustration on how to integrate DEA and SEM to examine and predict economic development

2 - Bank Branch Operational Performance: A Robust Multivariate and Clustering Approach

Kostas Triantis, John Lawrence Professor, Virginia Tech, 7054 Haycock Rd, Room 428, Falls Church, VA, 22043, United States of America, triantis@vt.edu, Joseph Paradi, Haiyan Zhu, Oscar Herrera-restrepo, William Seaver

We investigate bank branch operational performance by integrating robust techniques for clustering analysis and data envelopment analysis (DEA). By applying robust techniques based on principal component analysis, we look for the detection of branches exhibiting extreme operating behaviors (i.e., influential), and the clustering of branches based on operating characteristics. Our premise is that influential branches affect both the clustering and the determination of efficiency performance.

3 - Costs and Efficiency in the English Higher Education Sector: Latent Class Stochastic Frontier Models

Jill Johnes, Professor, University of Huddersfield, The Business School Queensgate, Huddersfield, HD1 3HG United Kingdom j.johnes@hud.ac.uk, Geraint Johnes

Using panel data from 2002/03 to 2010/11 we estimate a cost function for English higher education institutions (HEIs) using the latent class variant of the stochastic frontier model. We are able to: identify clusters of institutions based on the data; evaluate the parameters of the cost function for each cluster; estimate economies of scope and of scale within each cluster; measure efficiency of each institution relative to all HEIs and other HEIs in the same cluster.

Location Analytics

Sponsor: Location Analysis

Sponsored Session

Chair: Alan Murray, Professor, Drexel University, 3141 Chestnut Street, Philadelphia, PA, 19104, United States of America, amurray@drexel.edu

1 - Locating Units in a Data Network with Full Reliability and Redundancy

Sergio García Quiles, Lecturer In Operational Research, University of Edinburgh, James Clerk Maxwell Building, Peter Guthrie Tait Road, Edinburgh, EH9 3FD, United Kingdom, sergio.garcia-quiles@ed.ac.uk, Lukas Schaefer, Andreas Mitschke, Vassili Srithammavanh

We study the problem of designing a data network that has to fulfil some restrictions while being optimal under certain criteria. Some data flows must be sent between certain units to be located and there must be full reliability and redundancy. A network is fully reliable if the probability of any given function failing is less than a given safety threshold. Full redundancy means that no single failure leads to the loss of any function. This problem is motivated by a real application.

2 - A Maximal Conditional Covering Location Problem to Relocate Emergency Response Enterprise Units

Brian Lunday, Assistant Professor Of Operations Research, Department of Operational Sciences, Grad. Sch. of Engr. & Mgmt., Air Force Institute of Technology, Wright Patterson AFB, OH, 45433, United States of America, Brian.Lunday@afit.edu, Nicholas Paul, Sarah Nurre

We analyze the collective effectiveness of three hierarchical tiers within an existing enterprise of Department of Defense units designated to respond to a large-scale emergency (e.g., a chemical, biological, or radiological attack), and we identify their optimal locations via a maximal conditional covering problem formulation with side constraints. Acknowledging fiscal and political restrictions on facility relocations, we apply a multiobjective approach to identify Pareto optimal solutions.

3 - Location of Milk Collection Points for the Blended Milk Collection Problem

Vladimir Marianov, Pontificia Universidad Catolica de Chile, Vicuña Mackenna 4860, Macul, Santiago, Chile, marianov@ing.puc.cl, Armin Löer Villagra, Germán Paredes - Belmar, Andrés Bronfman

Different qualities of milk are collected from farms, using a heterogeneous truck fleet. Each farm produces single quality milk. Milk can be blended in the trucks, if convenient. The blend takes the quality of its lower quality component. Collection points are located for farthest farms to bring their milk. Trucks visit some of the farms and the collection points. A model is presented and solved using Branch and Cut for small instances. A heuristic is presented to solve a real problem.

4 - Sensor Location Problems: Open Locating-dominating Sets

Robin Givens, College of William & Mary, Computer Science Department, McGlothlin 126, Williamsburg, VA, 23185, United States of America, rmgivens@cs.wm.edu, Gexin Yu, Rex Kincaid

We consider the problem of fault location via sensors in parallel and multiprocessor networks with the goal of minimizing the number of sensors required throughout the system. We prove the lower bound of the minimum open locating-dominating set size for two different circulant graphs using two proof techniques, the discharging method and Hall's Theorem. We also provide constructions for the upper bound at the same size.

Policy Issues in Energy Markets

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Andrew Liu, Assistant Professor, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47907, United States of America, andrewliu@purdue.edu

1 - Environmental and Economic Performance of Stochastic Market Clearing under High Wind Penetration

Ali Daraeepour, PhD Student, Duke University, Box 90328, Duke University, Durham, NC, 27707, United States of America, a.daraeepour@duke.edu, Xin Li, Dalia Patino-Echeverri

Using a scaled version of PJM, and generated wind scenarios and demand data from BPA data, this paper explores a comparison of the performance between stochastic and deterministic models for market clearing in terms of total operational costs, wind curtailment, and air emissions. Operating reserves in the deterministic-day-ahead model and Value of Lost Load in the Stochastic-day-ahead model are chosen so that both result in commitments that have the same expected reliability.

2 - Risk and Return under Renewable Support Mechanisms – Towards a Coherent Framework

Christoph Weber, Prof., University Duisburg-Essen, Universitaetsstr. 11, Essen, 45117, Germany, christoph.weber@uni-duisburg-essen.de, Lena Kitzing

Risk exposure resulting from renewable support mechanisms such as feed-in tariffs impacts the incentives for investors. We consider multi-stage decision making, including regulatory settings, financing and investment decisions and operations. Both systematic and unsystematic risks are included in a stochastic cash flow approach. The model is applied to a wind park in Germany. Feed-in-tariffs are found to require lower support levels than other support schemes but transfer more risk to society.

3 - A Natural Gas Model for North America: Impact of Cross-border Flows of Natural Gas with Mexico.

Felipe Feijoo, Postdoctoral Fellow, Johns Hopkins University Whiting School of Engineering, 3400 N Charles St, Baltimore, MD, 21218, United States of America, ffeijoo@jhu.edu, Sauleh Siddiqui, Daniel Huppmann, Larissa Sakiyama

Natural gas is becoming an important energy source due to its low environmental impact and price. New regulations in Mexico and Canada will highly affect the North American natural gas market. We present a long-term dynamic partial-equilibrium model that incorporates a range of regulatory measures to study impacts of various policies, assess the costs and benefits from cross-border flows of natural gas and electricity, and quantify the emissions avoided in Mexico through a switch to natural gas.

Sponsored Session

Chair: Bora Tarhan, Research Specialist, ExxonMobil, 22777 Springwoods Village Parkway, Spring, TX, 77389, United States of America, bora.tarhan@exxonmobil.com

1 - Convex Relaxations for Calculating Voltage Stability Margins and Certifying Power Flow Insolvability

Daniel Molzahn, Dow Postdoctoral Fellow, University of Michigan, 1301 Beal Avenue, Room 4234A, Ann Arbor, MI, 48109, United States of America, dan.molzahn@gmail.com, Ian Hiskens, Bernard Lesieutre, Christopher Demarco

Ensuring the reliability of electric power systems requires operating with sufficient stability margins. We present a non-convex optimization problem which provides a voltage stability margin. Convex relaxations of this problem upper bound the voltage stability margin and can certify insolvability of the network power flow equations. These relaxations have SOCP and SDP formulations and may include integer constraints to model reactive-power-limited generators.

2 - Inventory and Maintenance Optimization in Oil and Gas Production System

Farnaz Ghazi Nezami, Assistant Professor, Kettering University, 1700 University Ave, Flint, MI, 48504, United States of America, fghazinezami@kettering.edu, Prasanna Tamilselvan

This research is aiming at developing an optimal spare provisioning policy for an offshore oil and gas production facility to jointly optimize the production system availability and maintenance cost. The proposed policy minimizes the downtime which is a function of subsea intervention equipment lead time and spare parts availability.

3 - Oil Supply Chain Risk Identification in Saudi Arabia

Julio Daza, Universidad de Valencia, Valencia, Valencia, Spain, julio.daza@uv.es, Mario Ferrer, Ricardo Santa, Alvaro Sierra, Daniel Romero-Rodriguez

This investigation has a twofold purpose: to operationalize the constructs of the of Supply-Chain-Risk-Management (SCRM), Supply-Chain-Resilience (SCR) and Supply-Chain-Vulnerability (SCV), and to quantitatively test the nature as well as the strength of the relationship between these three constructs within the context of the oil-industry in the Kingdom of Saudi Arabia.

Strategy and Geography

Cluster: Strategy Science

Invited Session

Chair: Joanne Oxley, University of Toronto, 105 St. George Street, Toronto, Canada, Joanne.Oxley@Rotman.UToronto.CA

1 - Agglomeration Economies and the Geographic Dimension of Firm Boundaries

Juan Alcacer, Harvard Business School, Soldiers Field, Boston, MA, United States of America, jalcacer@hbs.edu, Jasmina Chauvin

We provide new insights into firm boundary decisions by comparing location strategies of multi-business and single-business firms in the same industry. We find that establishments belonging to multi-business firms agglomerate more, and the difference is related to the potential for sharing of labor resources. Our results suggest that strategic decisions about the geographic and product boundaries of the firm are intimately related, and that resource sharing is implicated in both decision

2 - Ethnic Communities, Informal Institutions, and Foreign Location Choice

Exequiel Hernandez, University of Pennsylvania, Wharton School of Management, Philadelphia, PA, United States of America, exequiel@wharton.upenn.edu

This study examines the institutional role of transnational ethnic communities in MNEs' location choice. We propose that ethnic communities fulfill a governance function by facilitating entry into locations that present high transaction hazards for foreign firms. We test our ideas using a unique dataset on the location choices of Korean banks across Chinese provinces during 1992-2013, taking advantage of a historical event that created a quasi-random distribution of Koreans across provinces.

3 - Vertical Scope and Location Decisions: Evidence from us Manufacturers in Mexico

Octavio Martinez, INCAE, Montefresco, Managua, Nicaragua, Octavio.Martinez09@Rotman.Utoronto.Ca, Joanne Oxley

We explore how vertical integration affects firms' propensity to locate in dense industrial clusters. We argue that since vertically-integrated firms are less dependent on external economies they benefit less from locating within a dense cluster, and thus may opt for lower-cost locations away from the cluster, particularly in the face of high congestion costs. Analysis of location data on new US-owned plants established in Mexico after NAFTA generates evidence consistent with our claims.

4 - Community and Capital in Entrepreneurship and Economic Growth

Olav Sorenson, Yale University, School of Management, New Haven, CT, United States of America, olav.sorenson@yale.edu, Sampsa Samila

We argue that social and financial capital have a complementary relationship in fostering innovation, entrepreneurship and economic growth. Using panel data on metropolitan areas in the US, our analyses reveal that social integration – in the microgeography of residential patterns – moderates the effect of venture capital, with more integrated regions benefitting more from expansions in the supply of financial capital.

Project Based Learning

Sponsor: INFORM-ED

Sponsored Session

Chair: Palaniappa Krishnan, Associate Professor, University of Delaware, 212 Townsend Hall, 531 S. College Avenue, Newark, DE, 19711, United States of America, baba@udel.edu

1 - A Stepwise Approach to Implement Flipped Learning in Operations Management

Sungyong Choi, Assistant Professor, Yonsei University, 1 Yonseidae-gil, Wonju, Korea, Republic of, sungyongchoi@gmail.com

This work describes a stepwise and evolutionary process to implement flipped learning in Operations Management classes. It is important to determine initially what should be done in flipped classrooms instead of unilateral lecture. I suggest that a possible strategy can be class discussion based on TBL (Team-Based Learning) and PBL (Problem-Based Learning). Then, I summarize the lessons learned from my Operations Management class.

2 - Bank Service Simulation using ProModel

Palaniappa Krishnan, Associate Professor, University of Delaware, 212 Townsend Hall, 531 S. College Avenue, Newark, DE, 19711, United States of America, baba@udel.edu, Guang Xiao

The problem on hand was to simulate the queuing service of a local branch of a national bank "XYZ" on a Saturday. The students in the graduate simulation class collected data of the customers coming into the branch and leaving the branch. The students calculated the inter arrival data and the service time of the tellers. They then set up the (M/M/c) queuing model. The students used ProModel to conduct the simulation process. During this project, the students learned first hand the importance of collecting good data. The students also worked with different What-if scenarios in their simulation model.

3 - Math and the Mouse: Explorations of Math and Science at Walt Disney World

Kevin Hutson, Associate Professor Of Mathematics, Furman University, 330 Poinsett Hwy, Greenville, SC, 29613, United States of America, kevin.hutson@furman.edu, Liz Bouzarth, John Harris

We developed an immersive, three-week May course providing students the opportunity to see applications of mathematics and science at Walt Disney World. The course focused on typical problems faced by not only Disney professionals but also the consumer who visits the theme parks. In this talk, we will discuss various experiences and projects in which students engaged in the areas of scheduling, touring, and queuing.

Nonconvex and Stochastic Electricity Pricing

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Antonio Conejo, Prof., The Ohio State University, 286 Baker Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, conejonavarro.1@osu.edu

1 - Pricing Electricity in a Stochastic Market Model with Non-convexities

Farzaneh Abbaspourtorbati, PhD Student, EPFL, Route Cantonale, Lausanne, 1015, Switzerland, farzaneh.abbaspourtorbati@epfl.ch

This presentation describes a pricing scheme for a nonconvex stochastic market-clearing model. Our goal is to obtain a set of uniform clearing prices so that the producers recover their costs without uplifts. For this purpose, a model is proposed whose objective is to minimize the duality gap of the relaxed primal market-clearing problem subject to primal, dual, and integrality constraints, plus cost recovery constraints that can be enforced at the market stage, in expectation or per scenario.

2 - Convex Hull Pricing: Rigorous Analysis and Implementation Challenges

Dane Schiro, ISO New England, 1 Sullivan Road, Holyoke, MA 01040, United States of America, dschiro@iso-ne.com, Eugene Litvinov, Feng Zhao, Tongxin Zheng

Several important properties of Convex Hull Pricing are analyzed by studying a new primal formulation. Counterintuitive pricing outcomes are discussed and illustrated through simple examples, and foreseeable difficulties with a realistic application of the method are described. Because Convex Hull Pricing can only be implemented for a very specific market framework, it is unlikely that its perceived benefits could be realized in current electricity markets.

3 - Extended LMP – Pricing of Non-convexities and Demand Responsive Resources

Congcong Wang, Market Design Engineer, MISO, 720 City Center Dr., Carmel, CA, United States of America, cwang@misoenergy.org, Dhiman Chatterjee

This presentation highlights MISO's recent price formation efforts to provide efficient market prices that are more accurately reflective of marginal system cost under all conditions. Developed from the convex hull of the total cost function, ELMP can effectively reflect the cost of committing and dispatching fast-start resources to meet demands and has been proved to minimize uplift payments. ELMP is then expanded to price demand response resources and other emergency resources.

4 - The Trade-off Between Market Efficiency and Compensation Payments in Unit Commitment Problems

Daniel Huppmann, Postdoctoral Fellow, Johns Hopkins University, German Institute for Economic Research (DIW Berlin), 3400 N. Charles St., Baltimore, MD, 21218, United States of America, dh@dergelbesalon.at, Sauleh Siddiqui

We apply an exact solution method for binary equilibrium problems to a large-scale power market unit commitment problem based on a realistic dataset. We illustrate the trade-off between efficient market operations (least-cost dispatch) against the budget required for compensation payments to guarantee incentive-compatibility of all market participants. The results are contrasted with prices and dispatch according to the current practice in market operation.

Operations Management with Carbon Restrictions Environmental Concerns

Sponsor: ENRE – Environment I – Environment and Sustainability
Sponsored Session

Chair: Ulku Gurler, Professor, Ihsan Dogramaci Bilkent University, Industrial Engineering Department, Ankara, 06800, Turkey, ulku@bilkent.edu.tr

Co-Chair: Emre Berk, Bilkent University, Management Faculty, 06800 Bilkent, Ankara, Turkey, eberk@bilkent.edu.tr

1 - Supply Chain Coordination with Resource Constraints: Analysis of Buyback and Target Rebate Contracts

A. Serdar Simsek, Cornell ORIE, 282 Rhodes Hall, Ithaca, NY, 14853, United States of America, as2899@cornell.edu, Ulku Gurler, Malek Ebadi

We analyze certain supply chain contracts under resource constraints such as carbon emission or cash constraints. We consider a setting where both the manufacturer and the retailer can trade with their available resources in the marketplace after they decide the order quantities and analyze the range of buyback and target rebate contract parameters that would achieve coordination and the resulting profit share structure. We also provide extensive numerical analysis to study some practical cases.

2 - Multiple Input Newsvendor Problem with Environment Concious Customers

Ulku Gurler, Professor, Ihsan Dogramaci Bilkent University, Industrial Engineering Department, Ankara, 06800, Turkey, ulku@bilkent.edu.tr, Nazli Sonmez

In this work the inventory replenishment problem of a newsvendor with multiple inputs is considered when the customers have environmental concerns. In particular, it is assumed that the carbon emission of the final product is a function of the carbon emissions of the inputs and the customer demand decreases with the product's carbon emissions. The optimal order quantity of the newsvendor is investigated and some numerical results are provided.

3 - Technology Selection for Production Firms in a Carbon Economy

Emre Berk, Bilkent University, Management Faculty, 06800 Bilkent, Ankara, Turkey, eberk@bilkent.edu.tr, Onurcan Ayas

In this study, we address public policy structures and their implications on technology selection decisions for product design and pollution abatement in the presence of carbon emission restrictions and carbon markets. We consider a number of demand/utility functions to capture the firm behavior. We model technology primarily as a knowledge-based input in a multi-input setting. We provide some analytical results on technology enhancement conditions and illustrative numerical examples.

4 - How to use Data Analytics for Smarter Energy Management

Ozge Islegen, Assistant Professor, Northwestern University, Kellogg School of Management, 2001 Sheridan Road, Evanston, IL, 60208, United States of America, o-islegen@kellogg.northwestern.edu

The electricity industry has recently enjoyed the influx of “big data”. Through smart grid technologies, many firms now have access to the consumption behavior of their customers in unprecedented detail. This talk demonstrates how firms use this data to design effective demand side management programs to change the consumption behavior of their customers.

Advanced Manufacturing II

Sponsor: Advanced Manufacturing
Invited Session

Chair: Binil Starly, Associate Professor, North Carolina State University, 406 Daniels Hall, Raleigh NC 27607, United States of America, bstarly@ncsu.edu

1 - Out-of-plane Geometric Error Prediction for Additive Manufacturing

Qiang Huang, Associate Professor, University of Southern California, GER 240, USC, Los Angeles CA, United States of America, qiang.huang@usc.edu, Yuan Jin

We aim to establish a methodology to predict the out-of-plane geometric error prediction in additive manufacturing processes. We provide a novel spatial deviation formulation in which both in-plane and out-of-plane errors are placed under a consistent mathematical framework. The derived predictive model for out-of-plane errors is validated through experimentation using a stereolithography process.

2 - Engineering of Surface Microstructure using Severe Plastic Deformation in Machining

Sepideh Abolghasem, Postdoctoral Researcher, Universidad de los Andes, Carrera 1 Este # 19 A - 40, Bogota, Colombia, sea40@pitt.edu, Raha Akhavan-Tabatabaei, Meenakshisundar Ravi Shankar, Roberto Zarama Urdaneta

Severe Plastic Deformation leads to surface microstructures with enhanced properties, which is unfortunately limited by poorly elucidated process-parameters linkages. While research in manufacturing has been traditionally dedicated to phenomenological models, here the effort is to bridge these gaps through understanding the underlying physics of materials and application of statistical techniques. This will provide a powerful tool for microstructure prediction, control, and optimization.

3 - Cellular Biomanufacturing: Expansion of Stem Cells in Rotating Wheel Bioreactors

Binil Starly, Associate Professor, North Carolina State University, 406 Daniels Hall, Raleigh NC 27607, United States of America, bstarly@ncsu.edu

Stem cells are critical components of regenerative medicine therapy. However, the therapy will require millions to billions of therapeutic stem cells. To address the need, we have recently cultured stem cells in 3D microgels and use them as a vehicle for cell expansion within a low shear stress rotating wheel type bioreactor within a 500ml volumetric setting. This study specifically highlights the cell encapsulation, harvesting and operation of microbeads within a dynamic bioreactor environment.

■ MC64

Behavioral Decision Analysis

Sponsor: Decision Analysis
Sponsored Session

Chair: Johannes Siebert, University of Bayreuth, Bayreuth, D-95440, Germany, Johannes.Siebert@uni-bayreuth.de

1 - Bayes and Prejudice

Detlof Von Winterfeldt, Professor, University of Southern California, Viterbi School of Engineering, Industrial and Systems Engineering, Los Angeles, CA, 90089, United States of America, winterfe@usc.edu

When judging probabilities, people ignore statistical base rates. For example, when judging the likelihood of fatal pitbull attacks, they think of dramatic examples, ignoring the fact that fatal dog attacks are very rare, by pitbulls or other breeds. Ignoring base rates explains prejudice against minorities among dogs and humans.

2 - Debiasing Overconfidence

Valentina Ferretti, Politecnico di Torino, Corso Castelfidardo 30/A, Torino, Italy, valentina.ferretti@polito.it, Sule Guney, Gilberto Montibeller, Detlof Von Winterfeldt

Overconfidence is a persistent and difficult to correct bias in decision and risk analysis. We conducted an experiment to test the effectiveness of several best practices to reduce this bias. The results suggest that changing the stimulus-response mode from the fixed probability (fractile) method to a fixed value method is effective

3 - Stimulating the Creation of More and Better Alternatives using Objectives

Ralph L. Keeney, Fuqua School of Business, Duke University,
101 Lombard Street, #704W, San Francisco, CA, 94111,
United States of America, KeeneyR@aol.com, Johannes Siebert

The quality of alternatives considered, perhaps more than the quality of the decisions made, influences the desirability of the subsequent consequences. Several experiments investigated the implications of different procedures to create alternatives. From the results, we developed guidelines to effectively create better alternatives for decisions with incomplete sets of alternatives.

4 - Proving the Effectiveness of an Online-course on Decision-making

Johannes Siebert, University of Bayreuth, Bayreuth, D-95440,
Germany, Johannes.Siebert@uni-bayreuth.de, Reinhard Kunz

We use the proactive decision-making (PDM) scale before and after an online-course on decision-making to prove its positive impact on its participants. In line with our hypotheses, the four proactive cognitive skills systematic identification of objectives, systematic search for information, systematic identification of alternatives, and using a 'decision radar' improved significantly while the two proactive personality traits showing initiative and striving for improvement remain stable.

Chair: Jun Zhuang, University at Buffalo, SUNY, 317 Bell Hall, Buffalo, NY, 14221, United States of America, jzhuang@buffalo.edu

1 - Deterrence and Risk Preferences in A Sequential Attacker-defender Game with Continuous Defense Effort

Vineet Madasseri Payyappall, PhD Student, University at Buffalo,
305 Winspear Avenue (Upper), Buffalo, NY, 14215, United States
of America, vineetma@buffalo.edu, Jun Zhuang,
Victor Richmond Jose

Most attacker-defender games consider players as risk-neutral, whereas in reality, attackers and defenders may be risk-seeking or risk-averse. We study the impact of player's risk preferences on their equilibrium behavior and their impact on the notion of deterrence. We present analytic results, numerical illustration, and discussion which provide insights that could be used by policy analysts and decision makers involved in investment decisions in security and safety.

2 - Dynamic Modeling of Bombing Attack Threat Based on Time-series Process and Intervention Analysis

Shuying Li, Tsinghua University, 1017, Building Liuqing,
Tsinghua Uni., Beijing, China, 474042502@qq.com, Jun Zhuang,
Shifei Shen

In the recent years, various kinds of terrorist attacks occurred frequently. Among all tactics of attacks, bombing attack is the highest threat, followed by armed assault. A model for analyzing and predicting bombing attacks threat based on time-series process is developed. The model is validated by using terrorist attack data from the Global Terrorism Database between 2004 and 2014. Intervention analysis is used to analyze the sudden increase in the process.

3 - Identifying and Structuring the Objectives of ISIL and its Followers

Richard John, Associate Professor, University of Southern
California, 3620 McClintock Ave., Dept. of Psychology, MC-1061,
Los Angeles, CA, 90266-1061, United States of America,
richardj@usc.edu, Detlof Von Winterfeldt, Johannes Siebert

This study addresses three questions: (1) What are the objectives of the leaders of ISIL? (2) What are the objectives of the followers of ISIL? (3) How are the two sets of objectives related? We analyzed the transcripts of interviews and presentations of 59 subject matter experts (SMEs) and conducted a separate analysis of speeches of ISIL leaders and Internet sources. In both efforts we identified and structured the strategic, fundamental, and means objectives of ISIL and its followers.

4 - A Robust Resolution of Newcomb's Paradox

Thomas Weber, Associate Professor, EPFL, CDM-ODY 3.01,
Station 5, Lausanne, VD, 1015, Switzerland,
thomas.weber@epfl.ch

Newcomb's problem is viewed as a dynamic game. Depending on whether or not a risk-neutral agent's belief about the move order exceeds a threshold, one obtains the one-box outcome or the two-box outcome, respectively. The findings extend to an agent with arbitrary increasing utility, featuring in general two thresholds. All solutions require only minimal assumptions about the being's payoffs and it is always sure to predict the agent's choice in equilibrium. Some practical settings are discussed.

Ongoing Challenges in Airline Operations Planning

Sponsor: Aviation Applications

Sponsored Session

Chair: Norbert Lingaya, Manager Of Optimization Technologies, Kronos Incorporated, 3535 Queen Mary Road, Suite 500, Montreal, QC H3V 1H8, Canada, nlingaya@Kronos.com

1 - Broadening the Manpower Planning Horizon with Altitude Insight

Luc Charest, Operations Research Specialist, AD OPT, A Kronos
Division, 3535 chemin Queen-Mary Ouest, Montréal, QC, H3V
1H8, Canada, luc.charest@kronos.com, Alain Marcotte

AD OPT's Altitude Insight addresses crew manpower planning for airline operations by producing optimized staffing plans that satisfy expected company requirements. In the short and medium term, Insight identifies position openings to be assigned and scheduled as trainings to crew members. As the horizon widens, the focus shifts to budgetary objectives with constraints on volumetric distributions. In this talk, we present some long-term manpower planning concepts and their related challenges.

2 - Improving Branching in Airline Crew Pairing Problem with Base Constraints

Frederic Quesnel, GERAD, 2900 Boulevard Edouard-Montpetit,
Montreal, Canada, frederic.quesnel@gerad.ca, François Soumis,
Guy Desaulniers

In the context of crew pairing, many of the real-world crew pairing solvers consider restrictions on the total number of working time at each crew base. These base constraints have not been often studied academically. We propose a Danzig-Wolfe decomposition formulation for crew pairing problem that includes base constraints. We show how they degrade the resolution of the problem. We propose different branching schemes to improve the computational time and the objective value of our instances.

3 - Simultaneous Airline Crew Recovery Problem

Atoosa Kasirzadeh, GERAD & Ecole Polytechnique de Montreal,
André-Aisenstadt Building, 2920, Chemin de la Tour, 4th Floor,
Montreal, Canada, atoosa.kasirzadeh@gerad.ca, François Soumis

Different sources of unpredicted disturbances such as adverse weather conditions may affect the planned schedules for airline crew members. These disruptions may result in delayed or canceled flights and affect the crew schedules. Due to delay propagation, robust crew recovery problem will be very significant. We study the simultaneous cockpit recovery problem where the planned schedules are constructed using personalized scheduling approach.

4 - Airline Fleet Assignment with Stochastic Demand and Limited Re-fleeting Recourse Actions

Guy Desaulniers, Polytechnique Montreal and GERAD,
2900 Boulevard Edouard-Montpetit, Montreal, Canada,
guy.desaulniers@gerad.ca, David Lasalle lalongo

We introduce a new fleet assignment model that considers a stochastic demand and the possibility to perform re-fleeting on pre-computed chains of flights as recourse actions. This integer model is solved by the Cplex MIP solver and embedded in a loop with a passenger assignment model to compute the revenues. We report computational results on data sets derived from a North American carrier schedule involving more than 5,000 flights over a week and 20,000 passenger itineraries.

Integrated Vehicle Routing Problems I

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Bhupesh Shetty, University of Iowa, Iowa City, IA, United States of America, bhupesh-shetty@uiowa.edu

1 - Vehicle Routing with Mileage Bands

Maciek Nowak, Loyola University Chicago, Chicago, IL, United States of America, mnowak4@luc.edu, Michael Hewitt

A gap in vehicle routing research is the use of mileage bands as a basis for determining travel costs. While the trucking industry regularly uses mileage bands to price routes, research has widely ignored this pricing structure. In this research, we develop a methodology for shippers to create routes that minimize cost based on mileage bands and for carriers to create bands that maximize profits.

2 - Solving the Fleet Size and Mix Vehicle Routing Problem with Backhauls: A Successive Approximation Approach

Javier Belloso, Spain, javier.belloso@unavarra.es, Javier Faulin, Adrian Serrano, Angel A. Juan

The Fleet Mixed Vehicle Routing Problem with Backhauls (FSMVRPB) is a variant of the vehicle routing problems where delivery and pick-up customers are served from a central depot and the fleet of vehicles is unlimited and heterogeneous. The proposed algorithm utilizes a successive approximation approach that obtains a heterogeneous solution by iteratively solving homogeneous problems. The method combines three randomized criteria to improve the greedy behavior of the base heuristic applied to solve each particular problem. An ILP is presented for the FSMVRPB considering both fix and variable costs. Benchmark instances for the FSMVRPB have been selected in order to assess the efficiency of our approach, and results show that our approach is able to provide promising solutions by improving some of the best solutions reported in the literature.

3 - Inventory Routing in a Two-Echelon Supply Chain with Cross-Docks

Forough Pourhossein, University of Waterloo, Waterloo, ON, Canada, fpourhossein@uwaterloo.ca, Hossein Abouee Mehrizi, James Bookbinder

Consider a supply chain whose suppliers serve multiple customers, each ordering several product types. Products are shipped to cross-docks from the suppliers, and several customers are served by each route from a cross-dock; multiple routes can originate from a single cross-dock. We design optimal routes considering the total transportation, inventory carrying, and pipeline inventory costs. We restructure the model as a set-covering problem and develop a column generation algorithm to solve it.

4 - Periodic Vehicle Routing with Inventory Considerations

Bhupesh Shetty, University of Iowa, Iowa City, IA, United States of America, bhupesh-shetty@uiowa.edu, Jeffrey Ohlmann

We study the problem of designing the inbound supply routes for a manufacturing plant to minimize transportation and inventory costs. We consider a routing plan that is periodic and supports pickup amounts that are proportional to the amount of time between visits. We develop a heuristic and present computational results to demonstrate the effect of inventory holding costs on the routing plans.

1 - G-Network Models for Relief Activity Coordination at Disaster Sites

Merve Ozen, University of Wisconsin, Madison, WI, United States of America, mozen@wisc.edu, Ananth Krishnamurthy

We use generalized queuing networks (G-network) to model relief item distribution and activity coordination following a major disaster. The models capture key aspects of victim behavior including changing needs for relief items and variability in staffing. We investigate the existence of product form solution for the queuing network models and develop theoretical approximations to estimate performance measures. We analyze the developed networks under

various conditions and provide insights.

2 - Hierarchical Emergency Shelter Location Optimization

Brett Decker, University of Connecticut, 261 Glenbrook Rd, Unit 3037, Storrs, CT, 06269, United States of America, brett.decker@uconn.edu, Nicholas Lownes

Many jurisdictions use only qualitative methods of locating emergency shelters and supply hubs. A hierarchical capacitated emergency shelter location problem is presented. The tradeoffs between local access and economies of scale are investigated. The model is applied to a case study along the southern shore of Connecticut.

3 - Reliable Supply Chain Design with Expedited Shipment Service

Meng Zhao, Harbin Institute of Technology, Harbin Institute of Technology, Harbin, China, 14b332001@hit.edu.cn, Xiaopeng Li, Jianxun Cui, Mohsen Parsafard

This study proposes a reliable location-inventory model that considers expedited shipments under probabilistic supplier disruptions. This model allows a facility to be reassigned to backup suppliers when its primary supplier disrupts. A customized algorithm is developed and numerical examples are conducted to test the algorithm and draw managerial insights.

4 - Humanitarian Facility Location and Supply Prepositioning Considering Road Vulnerability

Melih Celik, Middle East Technical University, ODTÜ Kampüsü Endüstri Mühendisliği, Oda 219 Cankaya, Ankara, 06800, Turkey, cmelih@metu.edu.tr, Ece Aslan

An important challenge in relief item and service delivery in the aftermath of a disaster is that roads may become unusable. In this study, we consider the problem of locating distribution centers and prepositioning supplies in the pre-disaster stage, and routing of deliveries in the aftermath. Given the uncertainty of various aspects of the disaster, we develop a two-stage stochastic programming model and propose heuristics, which we test on real-life disaster scenarios for Istanbul, Turkey.

Facility Logistics V

Sponsor: TSL/Facility Logistics

Sponsored Session

Mahmut Tutam, PhD Student, University of Arkansas, 1617 N. Evening Shade Dr., Fayetteville AR 72703, United States of America, mtutam@uark.edu

1 - Performance Analysis of Vehicle-based Order-pick Systems with Dual-command Cycles

Kaveh Azadeh, PhD Candidate, Rotterdam School of Management Erasmus University, Burgemeester Oudlaan 50, Mandeville Building T09-41, Rotterdam, 3062PA, Netherlands, azadeh@rsm.nl, Debjit Roy, Rene De Koster

In the new generation of vehicle-based order-pick systems, vehicles travel in both horizontal and vertical direction using the racking structure to access all storage positions within an aisle. We develop queuing models to evaluate the performance measures and analyze the performance trade-offs with other vehicle-based goods-to-picker systems.

2 - A Conceptual Model for Operational Control in Discrete Event Logistics Systems (DELS)

Timothy Sprock, Georgia Tech, 755 Ferst Dr NW, Atlanta, GA, 30332, United States of America, tsprock3@gatech.edu, Leon McGinnis

To support design of smart operational controllers, this paper proposes a conceptual model capable of integrating a description of the control activities with a description of the physical system and an explicit interface to optimal-control analyses. These smart operational control mechanisms must not only integrate real-time data from system operations, but also formulate and solve a wide variety of optimal-control analyses efficiently and then translate the results into executable commands.

3 - Effects of Multiple Docks on Expected Distance Traveled in a Unit Load Warehouse with a Cross-aisle

Mahmut Tutam, PhD Student, University of Arkansas, 1617 N. Evening Shade Dr., Fayetteville, AR, 72703, United States of America, mtutam@uark.edu, John A. White

The warehouse configuration that minimizes expected travel distance is obtained for a unit load warehouse with a cross-aisle and multiple docks. Single- and dual-command operations are considered. Continuous and discrete formulations are employed. Considering multiple docks and their locations yields more general formulations than found in the research literature. Cases treated include receiving from an adjacent production area and external suppliers and the use of multiple docks for shipping.

4 - Optimizing Space Utilization in Block Stacking Warehouses

Shahab Derhami, PhD Student, Auburn University, 3301 Shelby Center, Auburn University, Auburn, AL, 36849, United States of America, sderhami@auburn.edu, Kevin R. Gue, Jeffrey S. Smith

Block stacking storage systems are unit load storage systems which are widely used in manufacturing facilities. However, determining the optimal lane depth in this storage system under the finite production rate constraint has not been adequately addressed in the literature. In this research, we propose mathematical models to obtain the optimal lane depth for a single and multiple SKUs where the pallet production rates are finite.

International Rail Freight

Sponsor: Railway Applications

Sponsored Session

Chair: Steven Harrod, Associate Professor, Technical University of Denmark, Building 116B, Niels Koppels Allé, Kgs. Lyngby, 2800, Denmark, stehar@transport.dtu.dk

1 - Growth Potential for Rail Freight in Short Distance Markets

Steven Harrod, Associate Professor, Technical University of Denmark, Building 116B, Niels Koppels Allé, Kgs. Lyngby, 2800, Denmark, stehar@transport.dtu.dk, Matthias Schett

The Scandinavian countries have traditionally been maritime economies, dependent on sea shipping. Recent bridge and tunnel links now connect Scandinavia to the European continent, but a large volume of freight still moves by sea. This presentation discusses the successful short distance intermodal shuttles operating in Scandinavia, and their potential for expansion. Examples from Sweden and Denmark are presented.

2 - Freight Operations from a North American Perspective

Marc Meketon, Oliver Wyman, 1 University Square, Princeton, NJ, 08540, United States of America, Marc.Meketon@oliverwyman.com, Carl Van Dyke

Freight operations in Europe differ in many respects to those in North America for reasons including regulatory, physical differences, IT systems (especially wagon ordering systems) and interactions with passenger trains. This talk will describe freight operations in several European countries, and also contrast them to North American operations.

3 - An Integrated Model for Locomotive Routing and Fueling Facility Locating

Gongyuan Lu, Southwest Jiaotong University, 111 Erhuan Road, Bei yi Duan, Chengdu, China, lugongyuan@qq.com, Xuesong Zhou

In this presentation, we will present a 3-dimensional time-space network which adds the resource dimension to the traditional TS network. Via this method, the problem formulation can be simplified tremendously. Meanwhile, the Lagrangian relaxation associated with Dynamic Programming is applied to solve this model efficiently.

Shared Mobility Analysis and Optimization

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Wei Lu, Texas A&M University, CE/TTI Building, Room 601-D, 3136 TAMU, College Station, TX, 77843-3136, United States of America, luwei.blues@gmail.com

1 - Optimizing Ridesharing Services

Wei Lu, Texas A&M University, CE/TTI Building, Room 601-D, 3136 TAMU, College Station, TX, 77843-3136, United States of America, luwei.blues@gmail.com, Luca Quadrioglio

Ridesharing services, which aim to bring together travelers with similar itineraries, may provide substantial societal and environmental benefits. We study the most generalized setting of ridesharing problems – given a set of travelers and their origins/destinations, we aim to simultaneously make optimal decisions on driver/rider role assignment, customer partition and route planning, with the goal of minimizing/maximizing the system-wide total vehicle-miles/ridesharing value.

2 - Ride-Matching Problem in Peer-to-Peer Multi-Hop Ridesharing Systems with Stochastic Demand

Neda Masoud, University of California, Irvine, CA, United States of America, R. Jayakrishnan

We propose a stochastic program with recourse to formulate the peer-to-peer multi-hop ride-matching problem with stochastic demand. We propose an algorithm to efficiently generate a set of scenarios that can be used to formulate and solve the IP equivalence of the stochastic program, and solve it using an L-shaped algorithm.

Modeling and Analysis of Data with Quantitative and Qualitative Variables

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Xinwei Deng, Assistant Professor, Department of Statistics, Virginia Tech, 211 Hutcheson Hall, Blacksburg, VA, United States of America, xdeng@vt.edu

Co-Chair: Ran Jin, Virginia Tech., Grado Department of Industrial and Systems Engineering, Blacksburg, VA, 24061, United States of America, jran5@vt.edu

1 - Bayesian Hierarchical Models for Quantitative and Qualitative Responses

Lulu Kang, Assistant Professor, Illinois Institute of Technology, 10 W 32nd Street, E1-208, Chicago, IL, 60615, United States of America, lkang2@iit.edu, Xinwei Deng

In many engineering systems both quantitative and qualitative output measurements are collected. If modeled separately, the important relationship between the two type of responses is ignored. In this paper we propose a Bayesian hierarchical modeling framework to jointly model a continuous and a binary response. Both simulation and real case studies are shown to illustrate the proposed method.

2 - A Latent Process Approach to Modeling and Analysis of Mixed-type Observations

Shuyu Chu, Virginia Tech, 1210 University City Blvd, J113, Blacksburg, VA, 24060, United States of America, cshuyu@vt.edu, Xinwei Deng

In many applications, mixed-type observations are commonly present. To analyze the data with mixed-type observations, one key challenge is to quantify the hidden association among them. In this work, we proposed a latent process approach to jointly modeling the mixed observations. The proposed method adopts the combined Discrete Particle Filter and Sequential Monte Carlo algorithm for parameter estimation and Bayesian inference.

3 - Quantitative and Qualitative Evaluation of Printed Electronics Based on Microscopic Images

Hongyue Sun, Virginia Tech., Grado Department of Industrial and Systems Engineering, Blacksburg, VA, 24061, United States of America, hongyue@vt.edu, Yifu Li, Chuck Zhang, Ran Jin, Kan Wang

Aerosol jet printing is an additive manufacturing technology to fabricate printed electronics. Although various types of machine vision sensors are used to take images for qualitative evaluation, no methods have been reported to use image features to quantitatively characterize the quality of electronics. This work use a quantitative method to model the correlation of image features and quality variables. A case study to fabricate silver conducting wires is used to evaluate the performance.

4 - On the Asymptotics of Pairwise Modeling for Multivariate Gaussian Process

Yongxiang Li, Research Assistant, City University of Hong Kong, Department of SEEM, 83 Tat Chee Avenue, Kowloon, Hong Kong - PRC, novern.li@gmail.com, Qiang Zhou

Multivariate Gaussian process is a popular method for emulating computer models with multiple outputs. But its complexity poses significant challenges to parameter estimation due to high dimensionality and huge computational burden. A pairwise modeling approach is proposed to solve the issue. The asymptotic normality for parameter estimation is studied. Simulation studies are conducted and the pairwise method is applied to model the low-E glass data for such purposes as quality control.

Modern Monitoring Applications

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Irad Ben-Gal, Professor, Tel Aviv University, Tel Aviv, Israel, bengal@tauex.tau.ac.il

1 - An Application of Sensor Selection Based on Information Theoretic Measurements for Change Detection

Marcelo Bacher, PhD Candidate, Tel Aviv University, Ramat Aviv, Tel Aviv, Israel, mgbacher@post.tau.ac.il, Irad Ben-Gal

Feature selection based on Information Theoretic measurements has been used with great success in Machine Learning applications in special for classification tasks. Nevertheless, less effort has been applied to process monitoring. In this work we propose a framework that aims at finding the most significant subset of features for change detection and bounded false alarm rate when monitoring a process.

2 - Correlated Gamma-based Hidden Markov Model for Asthma Control Status Diagnosis

Junbo Son, PhD Candidate, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, json5@wisc.edu, Patricia Brennan, Shiyu Zhou

To effectively manage the asthma as a chronic disease, a statistical model based on the everyday patient monitoring is crucial. Taking advantages from the remote patient monitoring system, we propose a data-driven diagnostic tool for assessing underlying asthma condition of a patient based on hidden Markov model (HMM). The proposed correlated gamma-based HMM can visualize the asthma progression to aid therapeutic decision making. Its promising features are shown in both simulation and case study

3 - Project Management Monitoring

Irad Ben-Gal, Professor, Tel Aviv University, Tel Aviv, Israel, bengal@tauex.tau.ac.il

We consider the monitoring of large projects (software/hardware) and propose an analytical approach for identifying the optimal project monitoring points by using concepts from the Information Theory. The methodology used is based on simulation-optimization scheme - selecting the monitoring points that provide the highest potential information gain on the project duration. (joint work with Shiva Kashi-Cohen and Shay Rozanes)

4 - Leveraging Analytics to Support Health-monitoring and Management of Infrastructure Facilities

Pablo Durango-Cohen, Associate Professor, Northwestern University, 2145 Sheridan Road, A332, Evanston, IL, 60208, United States of America, pdc@northwestern.edu, Yikai Chen

Motivated by recent technological advances, we describe the development and validation of a statistical framework to support health-monitoring and management of transportation infrastructure. The framework consists of formulation of structural time-series models to explain, predict, and control for common-cause variation, and use of multivariate control charts to detect special-cause variation. We present several examples from an in-service bridge to validate the framework.

Innovations in Healthcare Products and Services

Cluster: New Product Development

Invited Session

Chair: Nitin Joglekar, Boston University, Questrom School of Business, Boston, MA, United States of America, joglekar@bu.edu

1 - Healthtech Platforms: Barriers to Innovation

Edward Anderson, Professor, McCombs School of Business, The University of Texas at Austin, 1 University Station B6500, Austin, TX, 78712-1277, United States of America, Edward.Anderson@mcombs.utexas.edu, Shi Ying Lim

The state of mobile and digital health is far behind that of other platform industries, such as travel, retail, and even banking. Using qualitative analysis, we present some of the more important barriers to healthtech startup success (and, but extension, health tech in general) and outline some initial suggestions to create an ecosystem to counter them.

2 - Platform Innovations in Healthcare Delivery

Geoffrey Parker, Professor, Tulane University, 7 McAlister Drive, New Orleans, LA, 70118, United States of America, ggparker@tulane.edu

Network platform systems have reshaped the computer and telecommunications industries and are now transforming other industries such as transportation, lodging, and contract labor. The shift to platforms is slower in highly regulated industries, but changes are coming quickly. We survey likely mechanisms and entry points for a platform shift in healthcare.

3 - Patient, Heal Thyself! A Learning Algorithm to Predict How Telemedicine Affects Patient Activation

Kellas Cameron, PhD Student, Boston University, Questrom School of Business, Boston, MA, 02215, United States of America, kellas@bu.edu, Carrie Queenan, Nitin Joglekar

The Patient Activation Measure (PAM) assesses an individual's knowledge and confidence for managing one's health. This paper proposes a learning algorithm to predict a patient's PAM with data from a controlled telemedicine study, accounting for social and technology effects. The algorithm allows for the analysis of Type I and II errors and learning versus testing tradeoffs. Implications of this study create opportunities for operational improvements to reduce patient readmission rates.

Accounting for Input Uncertainty in Stochastic Simulations

Sponsor: Simulation

Sponsored Session

Chair: Canan Gunes Corlu, Assistant Professor, Boston University, 808 Commonwealth Avenue, Boston, MA, 02215, United States of America, canan@bu.edu

1 - A Sequential Experiment Design for Input Uncertainty Quantification in Stochastic Simulation

Xie Wei, Assistant Professor, Rensselaer Polytechnic Institute, 400 McChesney Ave. Ext. 5-9, Troy, NY, United States of America, xiew3@rpi.edu

When we use simulations to estimate the performance of a stochastic system, simulations are often driven by input distributions that are estimated from real-world data. Non-parametric bootstrap could be used to quantify both input model and parameter uncertainty. A sequential experiment design is proposed to efficiently propagate the input uncertainty to output mean and deliver a percentile confidence interval to quantify the impact of input uncertainty on the system performance estimate.

2 - Input Uncertainty in Stochastic Simulations: Dependent Input Variables of Mixed Types

Alp Akcay, Eindhoven University of Technology, Department of Industrial Engineering, Netherlands, A.E.Akcay@tue.nl, Bahar Biller

We consider stochastic simulations with correlated input random variables having NORMal-To-Anything (NORTA) distributions. We assume that the marginal distribution functions and the NORTA base correlation matrix are unknown. Given that the dependent input variables can take discrete and continuous values, we develop a Bayesian procedure that decouples the input model estimation into two stages. We investigate the role of the corresponding input uncertainty in simulation output data analysis.

3 - Norta Random Vector Generation with Deterministic Constraints

Kalyani Nagaraj, Department of Statistics, Purdue University,
250 N University Street, West Lafayette, IN, 47907, United States
of America, kalyanin@purdue.edu, Raghu Pasupathy,
Soumyadip Ghosh, Jie Xu

We consider the problem of a NORTA random vector generation with given deterministic constraints. This question is of relevance in settings such as CVaR estimation in finance, and estimation of expected penalties in large-scale service systems. We propose a Weibull-like importance sampling twist to NORTA that is easily implemented and frequently achieves surprising reductions in variance. We will discuss the asymptotic optimality of the proposed estimator with an implementable sampler.

Supply Chain Management VII

Contributed Session

Chair: Sang Won Kim, Assistant Professor, CUHK Business School,
Shatin, N.T., HK, Hong Kong - PRC, skim@cuhk.edu.hk

1 - Competition under Power Structure in a Two-echelon Supply Chain

Abhishek Chakraborty, XLRI, Jamshedpur, 831001, India,
abhishekc@xlri.ac.in

In this work we bring the importance of power in decision making in a two echelon supply chain in which a single manufacturer sells to multiple retailers. We have analyzed the role of differential power structure within the retailers in affecting the supply chain performance in a Manufacturer-Stackelberg case where the retailers compete on quantity. Further, we bring in the countervailing nature of the same where the benefits from the fringe retailers are passed on to the final customers.

2 - Revenue Management in a Manufacturing Supply Chain

Ahmet Ozkul, Associate Professor Of Management, University of
New Haven, 14 Wellington Dr, Orange, CT, 06477, United States
of America, aozkul@newhaven.edu, Mehmet Barut

In this paper, we take the yield/revenue management problem in a capacity restrained manufacturing company, and put it in a supply chain framework integrating customer order acceptance decisions with the supplier end in a manufacturing supply chain. A conceptual model is presented.

3 - How Joint Ventures Business Environment and Vertical Partnering Relationship Influence Performance

Weixi Han, University of Southampton, Building 2 Highfield
Campus, Southampton, SO17 1BJ, United Kingdom,
WH3G12@soton.ac.uk

There is a paucity of research regarding vertical partnering relationship played in a cross-border setting. This study focus on the dyadic relationships as the unit of analysis, using a qualitative case study and interview in the Chinese automotive industry, shows how relationship played is performance by both buyers and suppliers, and how it is critical when viewing the different nationalities joint ventures backgrounds.

4 - A Study on Supply Chain Sustainability Impact Factors and Related Empirical Analysis

Zhiduan Xu, Professor, School of Management,
Xiamen University, 422 Siming South Road, Xiamen, China,
zhidianx@xmu.edu.cn, Danxia Guo

This paper mainly discusses the impact factors of supply chain sustainability. The empirical results showed that supply chain context has a significant positive effect on learning and development ability of the supply chain, and the learning and development ability have a significant positive effect on supply chain sustainability. Some of the cases in the enterprises have a significant effect on its supply chain context, learning and development ability, and supply chain sustainability.

5 - Supplier Development in Competitive Supply Chains

Sang Won Kim, Assistant Professor, CUHK Business School,
Shatin, N.T., HK, Hong Kong - PRC, skim@cuhk.edu.hk,
Yannan Jin, Qiying Hu, Sean Zhou

We study manufacturers' decisions on supplier integration and supplier development in a competitive environment, considering two key factors: manufacturers' capabilities and the supply structure. We find the efficiency improvement via supplier integration outweighs the negative impact of increased competition for the more capable manufacturer, and the reverse for the less capable. Also, the shared supply structure lowers market competition and strengthens the benefits of supplier integration.

Integer Programming Applications in Energy

Contributed Session

Chair: Mohsen Rahmani, Research Scientist, Carnegie Mellon
University, 5000 Forbes Ave, BH 131, Pittsburgh, PA,
United States of America, rahmani@andrew.cmu.edu

1 - Supply Chain Network Optimization for Biomass Generation

Qiu Dong, Huazhong University of Science and Technology,
School of Management, 1037 Luoyu Road, Wuhan, 430074,
China, 304520244@qq.com, Liu Zhixue

This paper focuses on supply chain design for biomass generation plant. A new biomass supply mode with purchasing station is proposed. An integer programming model about facility location-allocation is build. And a genetic algorithm is design for the model. A case study of Xinneng Company, one of the biggest biomass generation companies of China, is used as an application of the proposed model. In addition, sensitivity analysis is conducted to provide deeper understanding of the proposed model.

2 - Mathematical Optimization Techniques for Selective Catalytic Reduction for a Fleet of Power Plants

Antonio Alanis, University of Texas at Arlington, Box 19017
Arlington, TX, 76019, United States of America,
antonio.alanispena@mavs.uta.edu, Jay Rosenberger, Anoop Ade

Selective Catalytic Reduction (SCR) reduces emissions of oxides of nitrogen (NOx) in coal-fired power plants. With a given set of scheduled outages for a fleet of power plants, we use a multi-commodity flow problem with schedule elimination constraints from the literature and a modified knapsack problem to create an SCR management plan, which minimizes the total SCR operational cost of the entire fleet of power plants and maintains NOx emissions below a desired target.

3 - A Search Space Reduction Strategy for Security Constrained Unit Commitment Problem

Mohsen Rahmani, Research Scientist, Carnegie Mellon
University, 5000 Forbes Ave, BH 131, Pittsburgh, PA,
United States of America, rahmani@andrew.cmu.edu

We proposed a special heuristic algorithm to reduce the number of variables and constraints in the day-ahead security constrained unit commitment (SCUC) problem. SCUC is a mixed integer linear programming problem (MIP) in which a least cost combination of generators are defined to follow the next day electricity demand while considering transmission and generator's thermal and temporal constraints. The size of the SCUC is thus reduced, and it becomes tractable by the MIP solvers.

4 - Strategic Trading in a Multi-leader Multi-follower Framework

Chiara Lo Prete, Assistant Professor Of Energy Economics, The
Pennsylvania State University, 213 Hosler Building,
University Park, PA, 16802, United States of America,
chiaraloprete@psu.edu

Enforcement actions in regard to allegations of electricity price manipulation by financial players have been the source of a great deal of controversy in recent years. We focus on one type of manipulation strategy (placing unprofitable virtual bids to enhance the value of related FTR positions) and construct examples of equilibrium manipulation in the context of a multi-leader multi-follower game played by generators and financial players.

Cyber Security

Cluster: Homeland Security

Invited Session

Chair: Laura Mclay, Associate Professor, University of Wisconsin, 1513 University Ave, ISYE Department, Madison, WI, 53706, United States of America, lmclay@wisc.edu

1 - Data-driven Markov Decision Processes Applied to Cyber Vulnerability Maintenance

Theodore Allen, Associate Professor, The Ohio State University, 1971 Neil Avenue, 210 Baker Systems, Columbus, OH, 43221, United States of America, allen.515@osu.edu, Chengjun Hou

Issues relating to parametric uncertainty in Markov decision processes are described. Recent methods and results are over-viewed including relating to partially observable Markov decision processes. The application to cyber vulnerability maintenance is described using real world data.

2 - A Supply Chain Game Theory Framework for Cybersecurity Investments under Network Vulnerability

Shivani Shukla, PhD Candidate, Isenberg School of Management, University of Massachusetts, 121 Presidents Dr., Amherst, MA, 01003, United States of America, sshukla@som.umass.edu, Ladimer Nagurney, Anna Nagurney

We develop a supply chain game theory framework consisting of retailers and consumers who engage in electronic transactions via the Internet and, hence, may be susceptible to cyberattacks. The retailers compete noncooperatively in order to maximize their expected profits by determining their optimal product transactions as well as cybersecurity investments in the presence of network vulnerability. Theoretical and computational results are given.

3 - Budgeted Maximum Multiple Coverage Problem and its Extensions

Kaiyue Zheng, Industrial & Systems Engineering Department, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, United States of America, kzheng23@wisc.edu, Laura Mclay

This talk will discuss a cyber-security planning application for securing global information technology (IT) supply chain from the myriad of cyber-security risks and vulnerabilities that exist. We propose a budgeted maximum multiple coverage problem for selecting mitigations and discuss its multiple extensions. We examine the problem structures and introduce integer programming and greedy approximation algorithms for identifying optimal and near-optimal solutions.

4 - Managing Technology and Information Sharing in Information Systems Security

Yueran Zhuo, PhD Candidate, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, yzhuo@som.umass.edu, Senay Solak

Investment in technology and information sharing with other firms are critical components of a firm's information security strategy. We model the interplay between these two operational decisions for a firm, and identify policies that define optimal technology investments and information sharing levels under different operating environments. We also present results on the value of sharing security information within and across industries.

Scheduling with Applications

Cluster: Scheduling and Project Management

Invited Session

Chair: Hui-Chih Hung, Assistant Professor, National Chiao Tung University, 1001 University Rd., Hsinchu, Taiwan - ROC, hhc@cc.nctu.edu.tw

1 - Job Shop Scheduling with Task Similarity and Knowledge Transfer

Huan Jin, University of Iowa, S210 Pappajohn Business Building, The University of Iowa, Iowa City, IA, 52242, United States of America, huan-jin@uiowa.edu, Michael Hewitt, Barrett Thomas

We consider job shop scheduling problem in which workers improve through experience, both from repeatedly working the same task but also through working similar tasks. In addition, we incorporate knowledge gained through transfer from co-located employees. We demonstrate how we linearly reformulated the problem to overcome the nonlinearity of the learning curves. The reformulation adds many additional variables. We present solution methods as well as insights gained from solutions.

2 - A Simple and Effective Appointment Sequencing Heuristic Algorithm Based on the First Half Rule

Boray Huang, National University of Singapore, 1 Engineering Drive 2, Singapore, Singapore, borayhuang@msn.com, Ahmad Reza Pourghaderi

We propose a simple and effective heuristic algorithm for appointment sequencing that could find solutions with about 60% lower total waiting time compare to the smallest variance first and the shortest expected processing time first rules. This heuristic method is inspired by a new appointment sequencing rule, the first half rule, which implies that the customer with stochastically smaller excess service time must be scheduled in the first half of the available appointment slots.

3 - Appointment Scheduling with Uncertain Patient Arrivals

Mabel C. Chou, National University of Singapore, Mochtar Riady Building, 15 Kent Ridge Dr, BIZ1 #8-66, Singapore, 119245, mabelchou@nus.edu.sg, Cheng-han Yu, Hui-Chih Hung

We consider a single class patient appointment scheduling problem with uncertain patient arrival times and seek to determine the optimal appointment schedule for patient arrivals. We study the trade-off between the expected patient waiting time and the expected makespan of the doctor's working hours. "Passing" occurs when a patient is seen earlier than another patient whose appointment is earlier. We study the problem under no-passing, one-passing, and infinite-passing scenarios analytically.

4 - Order Scheduling with Preemptive Jobs on Fully Flexible Machines to Minimize Number of Late Orders

Hui-Chih Hung, Assistant Professor, National Chiao Tung University, 1001 University Rd., Hsinchu, Taiwan - ROC, hhc@cc.nctu.edu.tw, Jun-min Wei

We consider order scheduling problem with preemptive jobs on fully flexible machine environment. The objective is to minimize number of late orders. It is noted as PFM | pmtn, pk | ?Ui, which is shown to be NP-hard. Integer programming models are prepared for rational and real processing time problems. Traditional heuristics of forward arrangement is considered, but unbounded in worst case. By backward arrangement, we build a tight lower bound and propose a heuristic bounded in worst case.

Predicting Customer Behavior using Facebook Data

Cluster: Social Media Analytics

Invited Session

Chair: Michel Ballings, Assistant Professor Of Business Analytics, The University of Tennessee, 249 Stokely Management Center, Knoxville, TN, 37996, United States of America, michel.ballings@utk.edu

1 - Using Customers' Facebook Pages to Improve Lead Qualification in a B2B Acquisition Process

Matthijs Meire, PhD Student, Ghent University, Tweekerkenstraat, 2, Ghent, 9000, Belgium, Matthijs.Meire@ugent.be, Michel Ballings, Dirk Van Den Poel

The purpose of this study is to investigate the added value of Facebook data in B2B customer acquisition. We use a Random Forest prediction model. The results indicate that adding customers' Facebook page data can indeed improve B2B lead qualification. Our contribution is twofold. First, to the best of our knowledge it is the first to use Facebook data in B2B lead qualification. Second, we quantify the monetary gains of using Facebook data by conducting a real-life lead targeting experiment.

2 - Investigating the Drivers of Likes and Comments on Facebook

Steven Hoornaert, PhD Student, Ghent University, Ghent, 9000, Belgium, Steven.Hoornaert@ugent.be, Michel Ballings, Dirk Van Den Poel

The objective of this study is to investigate the added value of user context data in Facebook post popularity prediction models. For this purpose, two Random Forest models were built: one including only post variables (e.g., post type) and another containing both post and user variables (e.g., age). Predictability is improved for likes (x3.7) and comments (x3.6). This study is the first to augment post popularity prediction models with user context data and analyze a large quantity of posts.

3 - Predicting Buyer Behavior using Social Media Data

Matthias Bogaert, PhD Student, Ghent University, Tweekerkenstraat 2, Ghent, 9000, Belgium, matthias.bogaert@ugent.be, Michel Ballings, Dirk Van Den Poel

The purpose of this study is to explain customer behavior (offline event attendance) based on SM data. In order to substantiate our findings, we used propensity score matching and built a Random Forest model. This study reveals that social media data can predict offline event attendance with high predictive accuracy. Moreover, the results suggest that the number of friends that are attending the focal event and event attendance on Facebook were highly significant.

4 - The Power of Facebook to Predict Customer Acquisition and Defection

Michel Ballings, Assistant Professor Of Business Analytics, The University of Tennessee, 249 Stokely Management Center, Knoxville, TN, 37996, United States of America, michel.ballings@utk.edu, Matthijs Meire, Dirk Van Den Poel

The main purpose of this study is to investigate the value of Facebook data in predicting individual customer behavior. In addition we study the importance of different online engagement variables such as likes, answers to event RSVP's, and group memberships in predicting acquisition and defection. The results indicate that customer acquisition can be predicted very accurately using Facebook data. In addition Facebook data significantly improve defection prediction over and above customer data.

Finance and Risk Management

Sponsor: Financial Services

Sponsored Session

Chair: Samim Ghamami, Board of Governors of the Federal Reserve System, 20th Street and Constitution Avenue N.W., Washington, DC, United States of America, samim.ghamami@frb.gov

1 - Derivatives Pricing under Bilateral Counterparty Risk

Samim Ghamami, Board of Governors of the Federal Reserve System, 20th Street and Constitution Avenue N.W., Washington, DC, United States of America, samim.ghamami@frb.gov

We consider risk-neutral valuation of a contingent claim under bilateral counterparty risk in a setting similar to that of Duffie and Singleton (1999). We develop probabilistic valuation formulas that have closed-form solution or can lead to computationally efficient pricing schemes. Drawing upon the work of Ghamami and Goldberg (2014), we show that derivatives values under wrong way risk (WWR) need not be less than the derivatives values in the absence of WWR.

2 - Stochastic Intensity Margin Modeling of Credit Default Swap Portfolios

Dong Hwan Oh, Economist, Federal Reserve Board, 20th Street and Constitution Avenue N.W., Washington, DC, 20551, United States of America, donghwan.oh@frb.gov, Samim Ghamami, Baeho Kim

We consider the problem of initial margin (IM) modeling for portfolios of credit default swaps (CDS) from the perspective of a derivatives CCP. Inspired by Cont and Kan (2011), the CCPs' IM models in practice are based on theoretically-unfounded direct statistical modeling of CDS spreads. Using the well-known reduced-form approach, our IM model prices the portfolio constituents in a theoretically meaningful way and shows that statistical IM models can underestimate CCPs collateral requirements.

3 - Evaluating Central Counterparty Risk

Anton Badev, Economist, Federal Reserve Board, 1801 K St. NW, Washington, DC, 20006, United States of America, anton.i.badev@frb.gov, Samim Ghamami

A conceptually sound and logically consistent definition of the CCP risk capital is challenging, and incoherent CCP risk capital requirements may create an obscure environment. Based on novel applications of well-known mathematical models in finance, this paper introduces a risk measurement framework that coherently specifies all layers of the default waterfall resources of typical derivatives CCPs. We apply the proposed framework on DTCC data and evaluate various risk management practices.

4 - Risk Screening in Microfinance: Modeling and an Extragradient-based Online Learning Algorithm

Yuqian Xu, NYU Stern School of Business, 44 West 4th Street, New York City, NY, 10002, United States of America, yxu@stern.nyu.edu, Michael Pinedo, Binqing Xiao

In this paper, we get the business loan application and default data from one of the leading banks in China. We then propose a statistical model with three different types of indexes to quantify the potential performance of a firm: its financial level index, operational level index, and business owner level index and provide an efficient extragradient-based online learning algorithm to solve it.

Quantitative Methods for Financial Applications

Cluster: Risk Management

Invited Session

Chair: Rafael Mendoza-Arriaga, McCombs School of Business,
1 University Station, Austin, TX, 78712, United States of America,
rafael.mendoza-arriaga@mcombs.utexas.edu

1 - Storage Valuation

Long Zhao, PhD Student, UT McCombs Business School, 2110
Speedway Stop B6500, CBA 5.202, Austin, TX, 78712-1277,
United States of America, zhaolong.soul@gmail.com,
Stathis Tompaidis, Kumar Muthuraman

We use moving boundary method to approach the valuation problem of storage with transaction costs. If the storage facility is a price taker and price follows a mean-reverting process with seasonality, we are able to find the optimal strategy of injection and withdraw. Because of discounting, we may hold even price is super cheap. We may choose to hold instead of injection when the price is low because high selling transaction costs prevent us from selling them in the future.

2 - Predictable Forward Mean Variance Preferences

Xiao Han, PhD Student/Teaching Assistant, The University of
Texas at Austin, 7802 Leconte Rd., Austin, TX, 78717, United
States of America, xiao.han@utexas.edu, Thaleia Zariphopoulou

The classical mean variance preference poses a serious challenge when applied in the context of long term portfolio management. In the spirit of the forward utility preference of Musiela and Zariphopoulou, we propose a dynamic, self generating, mean variance preference that is flexible with both horizon and the associated model/parameter uncertainties. We will show that the new preference generates a much higher Sharpe ratio in a market with uncertain, time varying risk premium.

3 - Modelling of Electricity Supply Curves under Correlated Plant Behavior

Vishwakant Malladi, Doctoral Student, UT Austin,
Austin, TX, 78703, United States of America,
Vishwakant.Malladi@phd.mcombs.utexas.edu,
Rafael Mendoza-arriaga, Stathis Tompaidis

We present a framework where the electricity plants in a region are modeled as subordinated Markov Chains. We also develop a factor model for Markov chain generators to separate both the idiosyncratic and correlated behavior of the plants. Calibration shows that supply curves are bent resulting in lower generation capacity available at higher reliability levels.

4 - Modeling Electricity Prices: A Time Change Approach

Rafael Mendoza-Arriaga, McCombs School of Business,
1 University Station, Austin, TX, 78712, United States of America,
rafael.mendoza-arriaga@mcombs.utexas.edu, Zhiyu Mo,
Lingfei Li, Daniel Mitchell

We develop a new framework for modeling electricity spot prices by time changing the basic affine jump diffusion, which successfully captures seasonal spikes. Our model is easy to estimate from data and it is tractable for pricing electricity derivatives.

Mobile-Based Business Model Innovations

Cluster: Business Model Innovation

Invited Session

Chair: Vibhanshu Abhishek, Carnegie Mellon University, 5000 Forbes
Avenue, Pittsburgh, PA, 15213, United States of America,
vibs@andrew.cmu.edu

1 - Big Data Business Analytics from Mobile Marketing Innovation Perspectives

Xueming Luo, Temple University, 1801 Liacouras Walk,
Philadelphia, PA, United States of America,
Xueming.Luo@temple.edu

Xueming Luo will address big data business analytics from mobile marketing innovation perspectives. Over 3.6 billion people worldwide are deeply engaged with smartphone devices, machine-to-machine connected solutions, wearables, Internet-of-things technologies. As marketers can send ads to smartphone users anywhere they are, marketing discipline now faces tremendous opportunities of coming up with new theory and industry practices for manager and consumer insights. Xueming will explore how mobile technologies and connected smart devices affect advertising, promotions, marketing ROI, and omni-channel targeting effectiveness.

2 - Empirical Analysis of the Effectiveness of Mobile Channels

Marcel Goic, Assistant Professor Of Marketing, University of
Chile, Republica #701, Santiago 8370438, Chile,
mgoic@dii.uchile.cl, Jose Guajardo

The continuously growing use of mobile devices provides the opportunity to use this new channel to complement the value proposition that companies offer to their customer. However, the nature of customer responses to these initiatives remains largely unexplored. We empirically investigate the drivers of effectiveness in managing a mobile transactional channel and how to use location-based information to interact with consumers.

3 - Nudging Mobile Advertising with Offline Social Contexts

Beibei Li, Assistant Professor, Carnegie Mellon University, 5000
Forbes Ave, Pittsburgh, PA, 15213, United States of America,
beibeili@andrew.cmu.edu, Anindya Ghose, Siyuan Liu

We conducted a large-scale field experiment in a major shopping mall in Aisa for three weeks in 2015 based on a total of 52,500 unique user responses. Our results allow us to examine how offline social context would affect the effectiveness of mobile advertising.

4 - Evaluating Consumer M-health Services for Promoting Healthy Eating: A Randomized Field Experiment

Vibhanshu Abhishek, Carnegie Mellon University, 5000 Forbes
Avenue, Pittsburgh, PA, 15213, United States of America,
vibs@andrew.cmu.edu, Rema Padman, Yi-chin Lin, Julie Downs

In this paper we provide a systematic study on the effectiveness of using mHealth to promote healthy eating. We examine the effects of an mHealth app on food choices in a 4-month randomized field experiment. Mixed models showed that the mobile-based visual diary might be effective in increasing engagement. Results also showed strong evidence that dietitian support significantly improves consumer engagement in self-monitoring, and this effect was mediated by consumers' intention.

IT-Enabled Competitive Strategies

Sponsor: E-Business

Sponsored Session

Chair: Hong Guo, University of Notre Dame, 356 Mendoza College of
Business, Notre Dame, IN, 46556, United States of America,
hguo@nd.edu

1 - An Analysis of the Delay in Customer Support Forums: An Analytical and Empirical Approach

Wael Jabr, Assistant Professor, Georgia State University, 35 Broad
Street, Robinson College of Business, Atlanta, GA, 30303,
United States of America, wjabr@gsu.edu, Radha Mookerjee,
Vijay Mookerjee

User forums are a popular alternative to traditional support channels. To understand the dynamics of problem resolution there, we analyze the delay incurred by users waiting for a solution. Using datasets from support forums we find that users who initiate threads suffer a shorter delay than those who join later on. We explain this counter-intuitive result with queuing theory. We use the empirical findings to devise a policy for firm involvement aiming at minimizing overall delay.

2 - Has Production Interdependence Been Changed with Information Technology?

Fengmei Gong, Assistant Professor Of Information Technology,
University of La Verne, La Verne, CA, 91750, United States of
America, fgong@laverne.edu, Barrie R. Nault, Zhuo (June) Cheng

Industries have become increasingly integrated with their suppliers' business processes such as purchasing and Just-in-time (JIT) production; however, whether industries in a supply chain have become more interdependent remains an open question. We examine the impact of an industry's IT investment on its production interdependence with upstream suppliers, where we measure interdependence as direct backward linkage (DBL).

3 - New Platform Announcement Strategies: A Duopoly of Two-sided Platforms

Rajiv Mukherjee, Assistant Professor, Southern Methodist
University, Dallas, TX, United States of America,
rmukherjee@mail.smu.edu, Ramnath Chellappa

We study a duopoly where two firms that are horizontally differentiated in their two sided platform offerings evaluate their release strategies for a new version. The firms chose between two release strategies: I) Formal release whereby the firms commit to their future offering, II) Informal release whereby the firms employ rumor or other seeding mechanisms to announce to the market.

4 - Social Interactions and Product Sales in Social Shopping: An Experimental Approach

Annibal Sodero, Assistant Professor, University of Arkansas,
Sam M. Walton College of Business, Fayetteville, AR, 72701,
United States of America, ASodero@walton.uark.edu,
Elliot Rabinovich, Bin Gu

Social shopping revolves around deeply discounted deals that are offered for a limited time through social networking websites. In this study, we investigate the effect of social interactions on product sales and the contingencies surrounding the interactions. Using an experimental approach, we investigate five social interaction mechanisms and find that three mechanisms act in tandem to accelerate a deal's demand: opinion leadership, network integration, and boundary spanning of early buyers.

Convex Relaxations for Structured Integer Programs

Sponsor: Optimization/Integer and Discrete Optimization
Sponsored Session

Chair: Akshay Gupte, Clemson University, Dept of Mathematical
Sciences, Clemson, SC, 29634, United States of America,
agupte@clemson.edu

1 - On The Polyhedral Structure of a Multi-capacity Mixing Set

Ayse Arslan, PhD Student, University of Florida, Weil 413,
Gainesville, FL, 32611, United States of America,
arslan.aysenur@gmail.com, Jean-philippe P Richard,
Yongpei Guan

In this talk, we study the polyhedral structure of a multi-capacity mixing set. This set arises as part of the formulation of production planning and logistics problems. We derive two families of facet-defining inequalities for the set under consideration by lifting mixing inequalities. We discuss the properties of the associated lifting function and show that lifting can be performed efficiently. We thereby strictly generalize earlier results of Marchand and Wolsey [1998].

2 - Sparse Principal Component Analysis (SPCA) via Convexification

Jinhak Kim, Purdue University, 610 Purdue Mall, West Lafayette,
IN, 47906, United States of America, kim598@purdue.edu,
Mohit Tawarmalani, Jean-philippe P. Richard

We characterize the convex hull of the feasible set of SPCA. The convex hull is described in a lifted space by dualizing the separation problem. The convex hull can be reformulated in terms of majorization inequalities. This interpretation allows us to express each point in the convex hull as a convex combination of points that satisfy the cardinality constraint. We propose an SDP relaxation in the lifted space which is stronger than that of d'Aspremont et al (2007).

3 - A Bilevel Programming Problem Occurring in Smart Grids

Leo Liberti, CNRS & Ecole Polytechnique, LIX Ecole
Polytechnique, Palaiseau, France, liberti@lix.polytechnique.fr,
Sonia Toubaline, Pierre-louis Poirion, Claudia D'Ambrosio

A key property to define a power grid "smart" is its real-time, fine-grained monitoring capabilities. For this reason, a variety of monitoring equipment must be installed on the grid. We look at the problem of fully monitoring a power grid by means of Phasor Measurement Units (PMUs), which is a graph covering problem with some equipment-specific constraints. We show that, surprisingly, a bilevel formulation turns out to provide the most efficient algorithm.

Surrogate-Based and Derivative-Free Optimization II

Sponsor: Optimization/Mixed Integer Nonlinear Optimization and
Global Optimization

Sponsored Session

Chair: Rommel Regis, Saint Joseph's University, Mathematics
Department, 5600 City Avenue, Philadelphia, PA, 19131,
United States of America, rregis@sju.edu

1 - A DFO-based Approach to Computer-aided Mixture Design

Nick Austin, Graduate Student, Carnegie Mellon University, 5000
Forbes Ave, Pittsburgh, PA, 15213, United States of America,
ndaustin@andrew.cmu.edu, Nikolaos Sahinidis, Daniel Trahan

Computer-Aided Mixture Design (CAMxD) relies on complex physicochemical simulation models to design a blend of compounds. We present a novel approach to CAMxD that relies on the use of derivative-free optimization (DFO). We present comparative results from the application of 27 DFO solvers to this challenging problem.

2 - Surrogate-based Optimization for Oral Solid Drug Product Manufacturing

Zilong Wang, Graduate Research Assistant, Rutgers University, 98
Brett Rd, Chemical and Biochemical Engineering, Piscataway, NJ,
08854, United States of America, wzpublic@gmail.com,
M. Sebastian Escotetepinoza, Ravendra Singh,
Fernando J. Muzzio, Marianthi Ierapetritou

Surrogate-based optimization is used to solve computationally expensive simulation models and to optimize functions when the model is not available. However the applicability of such methods can be limited due to the high dimensionality of problem variables. In this presentation we focus on solving high-dimensional design problems in pharmaceutical manufacturing using RBF-based surrogate modeling strategies. Case studies will be used to illustrate the applicability of the proposed approaches.

3 - Applied Results from the Techno-economic Optimization of a High-flux Solar Thermal Receiver

Michael Wagner, Mechanical Engineer, National Renewable
Energy Lab, 15013 Denver West Parkway, Golden, CO, 80401,
United States of America, Michael.Wagner@nrel.gov,
Alexandra Newman, Robert Braun

We optimize a novel concentrating solar power tower receiver technology by choosing the geometry and optical design. We use computationally expensive engineering models to generate surrogates that represent the objective function, which accounts for revenue as a function both of the design of the system and of the annual plant electricity production. Nonlinear constraints are incorporated via Lagrangian terms. We present results that guide the applied technology configuration.

4 - Applications of Surrogate-based Optimization

Cameron Turner, Associate Professor Of Mechanical Engineering,
Colorado School of Mines, 1500 Illinois St., Department of
Mechanical Engineering, Golden, CO, 80401,
United States of America, cturner@mines.edu

Many engineering design problems are characterized by nonlinear behaviors, mixed discrete-continuous variables, multiple objective functions, & uncertain or limited precision data about the problem. What data that exists is often derived from empirical measurements, experimental studies, or models & simulations; each with errors, limited precision & data collection costs. We focus on the use of the techniques, tradeoffs and decisions necessary to employ surrogates in optimization.

Stochastic Integer Programming

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Kibaek Kim, Argonne National Laboratory, 9700 South Cass Avenue, Argonne, IL, 60439, United States of America, kimk@anl.gov

1 - A Scalable Approach to Solving Multi-stage Stochastic Integer Programs

Osman Ozaltin, Assistant Professor, North Carolina State University, Raleigh, NC, United States of America, oyozahti@ncsu.edu, Burhaneddin Sandikci

Despite being a flexible modeling framework, multi-stage SPs are not widely adopted in practice, mostly due to their unbearable size. Moreover, incorporating integer variables renders multi-stage SPs even less tractable. We propose a bounding-based solution approach, which does not assume convexity but it rather relies on scenario decomposition and is inherently parallelizable. Our results demonstrate that the proposed method scales nicely with problem size and produces high quality solutions.

2 - On Solving General Two-stage Stochastic Programs

Manish Bansal, Postdoctoral Fellow, Department of Industrial Engineering and Management Science, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, manish.bansal@northwestern.edu, Sanjay Mehrotra

We study general two-stage stochastic programs (TSSPs) and present conditions under which the second stage programs can be convexified. This generalizes the results of Bansal et al. (2015) for two-stage stochastic mixed integer programs. We present finitely convergent decomposition algorithms to solve many classes of TSSPs including TSSP with some non-convex program in the second stage. We computationally evaluate our convexification approach by solving two-stage stochastic lot-sizing problems.

3 - Algorithmic Innovations and Software for the Dual Decomposition Method Applied to SMIP

Kibaek Kim, Argonne National Laboratory, 9700 South Cass Avenue, Argonne, IL, 60439, United States of America, kimk@anl.gov, Victor M. Zavala

We develop algorithmic innovations for the dual decomposition method to address two-stage stochastic programs with mixed-integer recourse and provide a parallel software implementation. Our innovations include the derivation of valid inequalities that tighten Lagrangian subproblems and the stabilization of dual variables by solving the master problem with a primal-dual interior point method and provide termination criteria that guarantee finite termination of the algorithm.

4 - Updates to PIPS-SBB: A Parallel Distributed Memory Stochastic Mip Solver

Geoff Oxberry, Lawrence Livermore National Laboratory, P.O. Box 808, L-792, Livermore, CA, United States of America, oxberry1@llnl.gov, Deepak Rajan, Thomas Edmunds, Pedro Sotorrio, Lluís Miquel Munguía, Cosmin Petra

Deterministic equivalent formulations of stochastic MIPs from applications such as unit commitment (UC) can exceed available memory on a single workstation. To overcome this limitation, we have developed PIPS-SBB, a parallel distributed memory stochastic MIP solver based on the distributed memory stochastic LP solver PIPS-S. Here, we discuss ongoing work on PIPS-SBB, with a focus on parallel implementations of B&B techniques. We also present a path forward to solving large UC problem instances.

Robust Optimization in Radiation Therapy Planning

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Wei Liu, Assistant Professor, Mayo Clinic Arizona, 5777 E Mayo Blvd., Phoenix, AZ, 85054, United States of America, Liu.Wei@mayo.edu

1 - Scenario-based Radiotherapy Margins: Handling Tissue Inhomogeneity, Range Errors, and Organ Motion

Rasmus Bokrantz, RaySearch Laboratories, Sveavägen 44, Stockholm, 111 34, Sweden, rasmus.bokrantz@raysearchlabs.com, Albin Fredriksson

We consider a scenario-based optimization formulation to handle the effects of errors in radiotherapy planning. The formulation coincides with margin-based planning if the implicit assumptions made when the margins are delineated are valid, but also generalizes to more difficult situations such as irradiation of

inhomogeneous tissue or irradiation with proton fields. We extend the model to account for tissue inhomogeneity, proton range errors, and organ motion.

2 - Robust Optimization Methods for Breast Cancer Radiation Therapy

Houra Mahmoudzadeh, University of Toronto, Toronto ON, Canada., houra@mie.utoronto.ca, Timothy Chan, Thomas Purdie

We explore robust optimization methods for improving the quality of treatment in left-sided breast cancer radiation therapy. Our robust models take into account breathing uncertainty and minimize the dose to the organs at risk while meeting the clinical dose-volume limits on the cancerous target. We use clinical data from several breast cancer patients and compare the outcomes of our robust models with those of the current clinical methods.

3 - Chance-constrained Robust Optimization in Proton Therapy to Account for Beam Delivery Uncertainties

Yu An, Mayo Clinic, 5777 East Mayo Blvd., Phoenix, AZ, 85054, United States of America, an.yu@mayo.edu, Jianming Liang, Wei Liu

We propose a chance-constrained model in intensity-modulated proton therapy treatment planning by explicitly accounting for range and patient setup uncertainties in optimization algorithm. Decomposition methods are applied to render the large-scale optimization problems tractable and achieve the best trade-off between plan quality and robustness. The results are then checked by patient population study to demonstrate the statistically significant advantages of our planning method.

4 - Robust Spatiotemporally Integrated Fractionation in Radiotherapy

Archis Ghate, University of Washington, Industrial & Systems Engineering, University of Washington Box 352650, Seattle, United States of America, archis@uw.edu, Ali Ajdari

Feasibility of the fluence-maps in the spatiotemporally integrated fractionation problem crucially depends on the linear-quadratic dose-response parameters of the organs-at-risk. We present a robust formulation of this problem whereby the resulting dosing schedule remains feasible as long as the dose-response parameters vary within a known range. This robust model is non-convex and high-dimensional. We discuss approximate solution techniques rooted in convex programming.

Distributed Convex Optimization

Sponsor: Optimization/Nonlinear Programming

Sponsored Session

Chair: Necdet Serhat Aybat, Assistant Professor, Industrial Engineering Dept., Penn State University, University Park, PA, United States of America, nsa10@engr.psu.edu

1 - A New Globally Convergent Incremental Newton Method

Mert Gurbuzbalaban, Massachusetts Institute of Technology, 32 Vassar St, Cambridge, MA, United States of America, mertg@mit.edu, Asu Ozdaglar, Pablo Parrilo

We develop and analyze a new globally convergent incremental Newton method for minimizing the sum of strongly convex functions, motivated by machine learning problems over large data sets and distributed optimization over networks. We discuss its convergence rate and prove its linear convergence under some assumptions.

2 - Multiagent Distributed Admm: Rate of Convergence

Ali Makhdomi, Massachusetts Institute of Technology, 32 Vassar St, Cambridge, MA, 02139, United States of America, makhdom@mit.edu, Asu Ozdaglar

We consider a multi agent optimization problem where a network of agents collectively solves a global optimization problem with the objective function given by the sum of locally known convex functions. This problem arises in many applications in large-scale distributed statistical estimation. We propose a fully distributed ADMM algorithm and characterize its rate of convergence as well as its dependence on the network structure.

3 - An Asynchronous Distributed Proximal Method for Composite Convex Optimization

Zi Wang, Penn State University, 1400 Martin St, Apt. 2112, State College, PA, 16803, United States of America, zwx121@psu.edu, Necdet Serhat Aybat, Garud Iyengar

We propose an asynchronous distributed first-order augmented Lagrangian (DFAL) algorithm to minimize sum of composite convex functions, where each term is a private function to one node, and only nodes connected by an edge can communicate. We show any limit point of iterates is optimal; an eps-optimal and eps-feasible solution can be computed with probability at least $1-p$ within $O(1/(\text{eps} \log(1/p)))$ communications. We demonstrate the efficiency of DFAL on large scale sparse-group LASSO problems.

Application of Linear and Conic Programs with Complementarity Constraints

Sponsor: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Xin Shen, RPI, 110 8th Street, Troy, NY, 12180, United States of America, shenx5@rpi.edu

1 - Robust Optimization for Network Design Problems with Equilibrium Flows

Liu Su, Iowa State University, 0076 Black Engineering, Ames, IA, 50011, United States of America, suliu@iastate.edu, Lizhi Wang, Guiping Hu

To identify optimal network capacity expansion, we build up a bi-level model for network design problems with equilibrium flows under the robust optimization paradigm. We transformed the lower level problem into a mixed-integer linear program and use a branch and cut algorithm to solve the bi-level optimization problem.

2 - Application of Complementarity Problems in Multibody Dynamics and Robotics

Ying Lu, Rensselaer Polytechnic Institute, 2408 21st St. Apt. 6, Troy, NY, 12180-1811, United States of America, rosebudflyaway@gmail.com, Jeff Trinkle

Frictional contacts in multibody dynamics and robotic simulation are generally written as differential Complementarity Problems (dCPs), which are solved as a series of CPs. We compare several models and solution algorithms, as well as a GPU based CUDA parallel solver to solve the Complementarity Problems arising in physical simulation.

3 - Property of a Relaxation Scheme for Rank Constrained Optimization Problems

Xin Shen, RPI, 110 8th Street, Troy, NY, 12180, United States of America, shenx5@rpi.edu, John Mitchell

Recently rank constrained optimization problems have received increasing interest because of their wide application. This class of problems has been considered computationally challenging because of its nonconvex nature. In this talk we focus on a mathematical program with semidefinite cone complementarity constraints formulation of the class. We'll consider a relaxation scheme for the formulation and discuss its properties including stationary conditions and local optimality.

4 - Heuristics for QPLCCS using Nlp Solvers Aided by Semidefinite Relaxations

Patricia Gillett, PhD Candidate, Département de Mathématiques et de Génie Industriel, École Polytechnique de Montréal, Montréal, QC, Canada, patricia-lynn.gillett@polymtl.ca, Miguel Anjos, Joaquim Júdice

We present a semidefinite programming relaxation technique with iterative cutting planes for quadratic programs with linear complementarity constraints (QPLCC). We discuss how an optimal solution to the SDP relaxation can be used to warmstart the solution of the QPLCC using common local and global NLP solvers. We report some numerical results demonstrating the quality of the SDP bound and the effectiveness of the warmstarting procedures.

Modeling Social Influence in Networks

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Vladimir Boginski, University of Florida, 303 Weil Hall, Gainesville, FL, United States of America, boginski@reef.ufl.edu

1 - Fashion Supply Chain Network Competition with Ecolabelling

Min Yu, Assistant Professor, University of Portland, 5000 N. Willamette Blvd., Portland, OR, 97203, United States of America, yu@up.edu, Jonas Floden, Anna Nagurney

We develop a competitive supply chain network model for fashion that incorporates ecolabelling. We capture the individual profit-maximizing behavior of the fashion firms which incur ecolabelling costs with information associated with the carbon footprints of their supply chains revealed to the consumers. Consumers, in turn, reflect their preferences for the branded products of the fashion firms through their demand price functions, which include the carbon emission information.

2 - Impact of Sub-networks on the Diffusion of Innovation

Xu Dong, Research Assistant, University of Miami, 1251 Memorial Drive, Coral Gables, FL, 33146, United States of America, x.dong3@umiami.edu, Nazrul Shaikh

Extant research shows that the structural properties of social networks influence the diffusion of innovation; however, these studies assume that the network is one giant cluster. Networks can have disconnected clusters (sub-networks) that introduce discontinuities in the diffusion pathways. Our research provides an understanding of the impact of discontinuities on diffusion.

3 - Identifying High Value Customers in a Network: Individual Characteristics Versus Social Influence

Sang-Uk Jung, Assistant Professor, Hankuk University of Foreign Studies, Imunro 102, Dongdaemun-gu, Seoul, 130-791, Korea, Republic of, sanguk.jung@hufs.ac.kr, Qin Zhang, Gary Russell

Firms are interested in identifying customers who generate the highest revenues. In a social network setting, customer interactions can play an important role in purchase behavior. This study proposes a spatial autoregressive model that explicitly shows how network effects and individual characteristics interact in generating firm revenue. Using model output, we develop a method of identifying individuals whose purchase behavior most impacts the total revenues in the network.

Methodologies in Text Mining for Big Data

Cluster: Modeling and Methodologies in Big Data

Invited Session

Chair: Onur Seref, Virginia Tech, 2060 Pamplin Hall (0235), Blacksburg, VA, 24061, United States of America, seref@vt.edu

1 - A Tangled Web: Evaluating the Impact of Displaying Fraudulent Reviews on Review Portals

Uttara Ananthakrishnan, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh PA 15213, United States of America, umadurai@andrew.cmu.edu, Michael D Smith, Beibei Li

This paper studies how users respond to fraudulent reviews and how platforms can leverage such knowledge to design better fraud management. We combine randomized experiments, behavioral economics with machine learning using large-scale data from Yelp. We find to improve user trust platforms should display the fraudulent information. Finally, our statistical analysis using MLE allows us to design a novel fraud-awareness reputation system.

2 - Strength in Numbers: Can Big Data Eliminate the Need for Complex Opinion-mining Algorithms?

Theodoros Lappas, Assistant Professor, Stevens Institute of Technology, 335 Washington, Apt. 2, Hoboken, NJ, 07030, Greece, tedlappas@gmail.com

Opinion mining, defined as the task of identifying the polarity of text segments, is a building block for many popular applications. Relevant methods have evolved from simple lexicon-based approaches to expensive NLP algorithms that try to emulate human thought. What if there was a simpler way to capture complex linguistic patterns, by utilizing the unprecedented availability of opinion-rich datasets? Our work addresses this question and motivates a new line of applications for Big Data.

3 - Restaurant Hygiene Grades and Online Reviews

Jorge Mejia, University of Maryland, Robert H. Smith School of Business, College Park, MD, United States of America, jmejia@rhsmith.umd.edu, Shawn Mankad, Anand Gopal

We focus on understanding the relationship between online reviews and a significant public health problem: restaurant-related foodborne illness. Recent initiatives to publicize the results of restaurant health inspections have been shown to reduce the occurrence of foodborne illness. We use the semantic information in online reviews to forecast health inspection results for restaurants in NYC. This approach can be used to improve the effectiveness of health inspection programs.

4 - Automatic Sequence Extraction for Sequence Alignment in Text Mining

Michelle Seref, Virginia Tech, Pamplin 1007, 0235, Blacksburg, VA, 24061, United States of America, mmhseref@vt.edu, Onur Seref

We illustrate novel methods to automatically extract sequences from pre-labeled text in order to apply sequence alignment for classifying text. Sequences are initially generated using n-gram approaches and then aggregated into semantically unique sequences. Sequence alignment uses these sequences to detect semantically equivalent text with either exact word or synonym matches. We demonstrate our method on several text domains.

Application of Nonlinear Optimization using Sequential Linear Programming Techniques with Xpress

Sponsor: Computing Society

Sponsored Session

Chair: Zsolt Csizmadia, Principal Engineer, FICO, FICO House, Starley Way, Birmingham, B37 7GN, United Kingdom, zsolt.csizmadia@gmail.com

1 - State of Optimization in Advanced Process Control

Rishi Amrit, Shell International, Houston, TX, United States of America, R.Amrit@shell.com

Process Control forms the backbone as well as the driving agent for almost all of process industries today. Smart algorithms combined with superior computational capabilities allow us to automate processes in a controlled fashion while optimizing environmental, safety and economic performance. This talk discusses recent advances in commercial Advanced Process Control technology by harnessing the latest developments in the optimization community along with the challenges going forward.

2 - Modeling Recursive Formulae in Xpress using Variable Eliminations

Libin Varghese, Lead Modeling Developer, FICO, 1500 Broadway, Suite 1101, New York, NY, 10036, United States of America, LibinVarghese@fico.com

Modeling a deposit pricing problem, that optimizes rates for a multiyear period, involves handling of various recursive formulae that link each time period to the next. We shall focus on how we modeled the problem in the Mosel modeling language using the new variable elimination feature of Xpress-Nonlinear and the performance improvements achieved.

3 - A New Optimality Measure for Sequential Linear Programming Methods

Zsolt Csizmadia, Principal Engineer, FICO, FICO House, Starley Way, Birmingham, B37 7GN, United Kingdom, zsolt.csizmadia@gmail.com

The KKT conditions are regarded as the definite first order optimality conditions for nonlinear programming though regularity conditions relatively rarely hold in practice. The convergence of nonlinear optimization algorithms based on first order approximations often focus on the progress made rather than the solution properties. We introduce a new optimality measure derived from the KKT conditions and explore the connection between the convergence of first order methods and the new measure.

Stochastic Models and Analysis for Cloud Computing

Cluster: Cloud Computing

Invited Session

Chair: Yingdong Lu, IBM Research, 1101 Kitchawan Rd, Yorktown Heights, United States of America, yingdong@us.ibm.com

1 - Model Based Autoscaling of Hadoop Clusters

Parijat Dube, IBM, 1101 Kitchawan Road, Yorktown Heights, United States of America, pdube@us.ibm.com, Li Zhang, Andrzej Kocut, Anshul Gandhi

We develop novel performance models for Hadoop workloads that relate job execution time to various workload and system parameters such as input size and resource allocation. We employ statistical techniques to tune the models for specific workloads, including TeraSort and Kmeans. The tuned models are used to determine the resources required to successfully complete the Hadoop jobs as per the user-specified execution time SLA.

2 - Navigating the Amazon Cloud

Aaron Yan, Data Scientist, Gravitant, 11940 Jollyville Road, #325N, Austin, TX, 78759, United States of America, aaron.yan@gravitant.com, Ilyas Iyooob

Selecting the right level of reservation in the cloud is a tricky problem, especially when there are multiple reservation levels. In this paper, we explore the optimal levels of reservation for a portfolio of cloud servers that satisfy the CapEx and OpEx budget. The team has developed a web application that solves this problem and demonstrates the savings incurred from choosing the correct reservation pricing models.

3 - Optimal Resource Allocation Algorithms for Cloud Computing

Siva Theja Maguluri, Postdoctoral Researcher, IBM TJ Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, smagulu@us.ibm.com

Jobs arrive at a cloud computing system according to a stochastic process and request resources like CPU, memory, etc and need service for a random amount of time. These jobs need to be scheduled on servers. The jobs are first routed to one of the servers when they arrive and are queued at the servers. Each server then chooses a set of jobs from its queues so that it has enough resources to serve all of them simultaneously. We present an optimal load balancing and scheduling algorithm.

Stochastic Models in Healthcare

Sponsor: Health Applications

Sponsored Session

Chair: Sait Tunc, UW-Madison, 3233 Mechanical Engineering Building, 1513 University Avenue, Madison, WI, 53706, United States of America, stunc@wisc.edu

Co-Chair: Oguzhan Alagoz, UW-Madison, 3242 Mechanical Engineering Building, 1513 University Avenue, Madison, WI, 53706, United States of America, alagoz@engr.wisc.edu

1 - Robustness of Markov Decision Processes for Medical Treatment Decisions

Lauren Steimle, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, steimle@umich.edu, Brian Denton

Markov decision process (MDP) models are frequently used to study optimal policies for treatment of patients with chronic diseases. However, these models can be sensitive to estimates of transition probabilities and rewards. We discuss an approach for quantifying robustness of MDP-based policies with respect to parameter uncertainty. We illustrate our findings based on a model for optimal treatment of blood pressure and cholesterol in patients with type 2 diabetes.

2 - Ambulance Emergency Response Optimization in Dhaka, Bangladesh

Justin Boutillier, University of Toronto, 5 King's College Road, Toronto, ON, M5S 3G8, Canada, j.boutillier@mail.utoronto.ca, Moinul Hossain, Timothy Chan

Dhaka, the capital city of Bangladesh and the tenth largest city in the world, does not currently have a centralized emergency medical service (EMS) system or 9-1-1 type number. As a result, patients experience restricted access to healthcare. To address this problem, we have developed a novel data-driven robust location-routing model that can be applied to Dhaka and other developing urban centers. The model uses traffic data collected via GPS to construct an uncertainty set for travel times.

3 - Score Based Anticipative Transfer Requests in the Intensive Care Units

Yasin Ulukus, University of Pittsburgh, Pittsburgh PA, United States of America, myu1@pitt.edu, Gilles Clermont, Guodong Pang, Andrew J. Schaefer

The efficient operation and management of ICUs is critical to providing high quality of care while managing costs. We construct a new Transfer Score to estimate readmission and death probabilities. We further show that an anticipative transfer request policy combined with effective use of clinical markers can significantly decrease transfer delays without increasing the capacity. We present a Markov Decision Process (MDP) model for the transfer request problem and solve it via approximations

4 - Optimal Breast Cancer Diagnostic Decisions under the Consideration of Overdiagnosis

Sait Tunc, UW-Madison, 3233 Mechanical Engineering Building, 1513 University Avenue, Madison, WI, 53706, United States of America, stunc@wisc.edu, Oguzhan Alagoz, Elizabeth Burnside

Breast cancer overdiagnosis issue becomes more severe every year, a recent study approximates the annual cost of overdiagnosis to the United States as \$243 million. We propose a large-scale MDP model to determine the optimal diagnostic strategy under the consideration of overdiagnosis by incorporating cytologic grade into the traditional breast cancer diagnostic decision problem.

Sponsor: Applied Probability

Sponsored Session

Chair: Tolga Tezcan, Associate Professor, London Business School, Regent's Park, London NW14SA, United Kingdom, ttezcan@london.edu

Co-Chair: Neil Walton, University of Amsterdam, Science Park 904, Amsterdam, Netherlands, n.s.walton@uva.nl

1 - Risk Analytics

David D. Yao, Columbia University, Department of Industrial Engineering, 500 West 120 St, New York, NY, 10027-6699, United States of America, yao@columbia.edu, Jose Blanchet, Paul Glasserman

This year's Markov lecture and discussions will provide a survey of risk analytics as a fundamental tool in operations research. While the focus of business analytics is on issues of productivity and efficiency: cost savings and revenue/profit optimization, risk analytics address the complementary issues of sustainability and resiliency: risk-return tradeoff and related resource allocation decisions and mitigation strategies. Some of the applications to be highlighted include: resilient urban infrastructures, production planning with risk hedging, financial systemic risk, and securitized insurance products.

Latent Variable Models in Biomedical Informatics

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Madeleine Udell, Postdoctoral Fellow, Caltech, CMS, Mail Code 9-94, Pasadena, CA, 91125, United States of America, madeleine.udell@gmail.com

1 - Computational Phenotyping from Electronic Health Records using Tensor Factorization

Joyce Ho, University of Texas at Austin, 1 University Station C0803, Austin, TX, 78712, United States of America, joyceho@utexas.edu, Jimeng Sun, Joydeep Ghosh

A computational phenotype (a set of clinical features or clinical condition) can enable cohort identification, allow decision-makers to identify patients for interventions, and be integrated with systems for real-time clinical decision support. We developed sparse, nonnegative tensor factorization models to obtain phenotypes with minimal human supervision. Results on real EHRs demonstrate the effectiveness of our models to extract medically interpretable concepts from complex health data.

2 - Unfolding Physiological State: Mortality Modelling in Intensive Care Units

Marzyeh Ghassemi, MIT, 32 Vassar Street., 32-257, Cambridge, MA, 02139, United States of America, mghassem@mit.edu

Accurate knowledge of a patient's disease state and trajectory is critical in modern clinical settings. We examined the use of latent variable models to decompose free-text hospital notes into meaningful features, and the predictive power of these features for patient mortality. We found that latent topic-derived features were effective in determining patient mortality both in-hospital and post-discharge, and a combination of structured and topic features performed best.

3 - Unsupervised Learning of Disease Progression Models

David Sontag, Assistant Professor, NYU, 715 Broadway, 12th Floor, Room 1204, New York, NY, 10003, United States of America, dsontag@cs.nyu.edu

Chronic diseases such as diabetes and COPD progress slowly over many years, causing increasing burden to patients and the healthcare system. Better understanding progression is instrumental to early diagnosis and precision medicine. Inferring disease progression from real-world evidence is challenging due to the incompleteness and irregularity of observations, as well as the heterogeneity of patient conditions. We propose a probabilistic disease progression model that address these challenges.

Sponsored Session

Chair: Lin Hao, University of Notre Dame, 351 Mendoza College of Business, Notre Dame, IN, United States of America, lhao@nd.edu

1 - Exploring a New Marketing Platform of Credit Card Companies

Soohyun Cho, University of Florida, 355F STZ, Gainesville, FL, United States of America, soohyun.cho@warrington.ufl.edu, Subhajyoti Bandyopadhyay, Liangfei Qiu

Some credit card companies (CCs) and partner merchants have launched an exclusive marketing platform for their cardholders. The platform provides either public promotion through Social Network Services (SNS) or targeted promotion through their websites. We examine which promotion is more profitable to CCs and to competitive partner merchants.

2 - Bundling of Digital Products in Music Industry: An Empirical Study

Kyungsun Rhee, PhD Student, University of Washington, University of Washington, Seattle, WA, 98105, United States of America, ksr22@uw.edu, Yong Tan, Jianping Peng

It is becoming increasingly competitive for music websites nowadays. Due to highly heterogeneous demand, offering music bundles is a popular strategy to attract consumers. In this work, we examine the effectiveness of various bundling strategies using a unique dataset from a music mobile application which contains variables such as music downloads, ringtone purchase logs and user behavior in monthly subscription.

3 - E-book Platform Competition in the Presence of Two-sided Network Externalities

Yabing Jiang, Florida Gulf Coast University, 10501 FGCU Blvd, Fort Myers, FL, United States of America, yjiang@fgcu.edu

The success of the Kindle e-book platform and the increased popularity of e-books among readers have attracted extensive competition in the e-book market. We model the direct competition in the e-book platform market through a two-sided network externality model and show that publishers can influence consumers' e-book platform adoption decisions and the total e-book sales by strategically deciding the size of contents available on each platform.

4 - The Effect of Online "Following" on Contributions to Open Source Communities

Mohammadmahdi Moqri, University of Florida, 299 Diamond Blvd, Apt. 5, Gainesville, United States of America, mahdi.moqri@warrington.ufl.edu, Liangfei Qiu, Subhajyoti Bandyopadhyay, Ira Horowitz

Although numerous studies have examined members' motivation to contribute to online communities, the positive effect of social factors has not been unanimously confirmed in different settings. In this study, we estimate the effect of social factors on members' contributions in an open source software (OSS) community, using a large scale dataset of 4 million online members. The results have implications for online community designers and OSS scholars.

Spatial Multi-Criteria Decision Analysis

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Valentina Ferretti, Politecnico di Torino, Corso Castelfidardo 30/A, Torino, Italy, valentina.ferretti@polito.it

1 - Decision Analysis with Geographically Varying Outcomes

Jay Simon, American University, Washington, DC, jaysimon@american.edu

This work develops theory to support decisions based on data from geographic information systems (GIS). Preference conditions are introduced, leading to corresponding value and utility functions over GIS data for both single-attribute and multiple-attribute cases. These models of preferences are then applied to example decisions based on GIS data.

2 - Application of the New Gear Geospatial MCDA Tool to Humanitarian Assistance Site Selection Decisions

Matthew Bates, Research Engineer, US Army Corps of Engineers, Engineer R&D Center, 696 Virginia Rd, Concord, MA, 01742, United States of America, Matthew.E.Bates@usace.army.mil, Patrick Doody, John Nedza, Erin Hughey, Richard Curran, Igor Linkov, Heather Bell, Paul Kailiponi, Michelle Hamilton

Humanitarian assistance and disaster response (HADR) decisions are multifaceted, involving many stakeholders, limited funding and competing areas of need. Spatially explicit data are increasingly available to support these decisions at fine scales. We introduce GEAR, a new US-Govt-developed tool for spatial multi-criteria decision analysis that is currently being transitioned to the Pacific Disaster Center to support the HADR community. We demonstrate its application to site selection decisions.

3 - Key Challenges and Meta-choices in Designing Spatial Multi-criteria Evaluations

Gilberto Montibeller, London School of Economics, Houghton Street, London WC2A 2AE, London, United Kingdom, G.Montibeller@lse.ac.uk, Valentina Ferretti

Spatial multi-criteria decision analysis is being increasingly employed in environmental decision-making and in related fields. However, there are key challenges when designing such evaluations, which impose important meta-choices to decision analysts, as they may lead to different contents of the evaluation model and to distinctive outcomes of the analysis. In this paper we provide a systematic and comprehensive discussion of these key challenges and the associated meta-choices.

4 - Terrestrial Condition Assessment for National Forests of the USDA Forest Service in the Continental U.S.

Keith Reynolds, Research Forester, USDA Forest Service, PNW Research Station, 3200 SW Jefferson Way, Corvallis, OR, 97331, United States of America, kreynolds@fs.fed.us, David Cleland, Barbara Schrader, Robert Vaughan

The Terrestrial Condition Assessment of the National Forest System is using a spatial decision support system to assess effects of uncharacteristic stressors and disturbance agents, with an emphasis on identifying restoration opportunities at a national scale. When outcomes were classified into categories of very good, good, moderate, poor, and very poor terrestrial condition, corresponding percent areas on national forests were 9.78, 46.37, 19.22, 16.75, and 7.89%, respectively.

Auctions for Spectrum

Cluster: Auctions

Invited Session

Chair: Robert Day, University of Connecticut, 2100 Hillside Road, U-1041, Storrs, CT, 06269, United States of America, Bob.Day@business.uconn.edu

1 - Optimal Bidding Strategies in Core Selecting Auctions

Van Vinh Nguyen, The Fuqua School of Business, Duke University, 100 Fuqua Drive, Durham, NC, van.vinh.nguyen@duke.edu, Ozan Candogan, Sasa Pekec

We analyze optimal bidding strategies of a single bidder in core selecting auctions with homogeneous items. We use robust optimization approach to formulate the bidder's optimization problem and show that gains from non-truthful reporting are significant.

2 - Vickrey-based Pricing in Iterative First-price Auctions

Oleg Baranov, University of Colorado Boulder, Boulder, CO, United States of America, oleg.baranov@colorado.edu, Lawrence Ausubel

For achieving efficient outcomes in practical auction settings, an auction design should use the opportunity cost pricing principle to the extent possible to promote truthful revelation of bidder preferences, and the pricing mechanism should be implemented via an iterative "first-price" process where all bidders are fully informed about their current price at each iteration. For the heterogeneous environment with substitutes, we develop an auction design that adheres to both principles.

3 - The Use of the Clearing Target Optimization Model Within the FCC Incentive Auction

Karla Hoffman, Systems Eng and OR Dept., George Mason University, Fairfax, VA, 22030, United States of America, khoffman@gmu.edu, Brian Smith, Steven Charbonneau, James Costa, Tony Coudert, Steve Schmidt, Rudy Sultana

We present an important component of the upcoming FCC Incentive Auction: How to choose a "clearing target", i.e. the maximum amount of spectrum to try to buy back from broadcasters to sell to the broadband industry. A difficult combinatorial optimization problem is used to determine this target. This talk will present the formulation of this problem and our approaches to solving the problem. We also describe how this model was used to inform policy at the FCC.

4 - Multi-option Descending Clock Auction

Tuomas Sandholm, Professor, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, sandholm@cs.cmu.edu, Tri-dung Nguyen

In descending clock auctions (DCAs), bidders (sellers) can accept or reject. Yet in many settings, e.g., the FCC's upcoming incentive auction, each bidder can sell one from a set of options. We present a DCA that offers each bidder prices for the options. We develop a Markov chain model of the dynamics of each bidder's state, and a method for optimizing prices to offer in each round. Experiments with real FCC constraint data show it dramatically outperforms percentile-based price decrements.

1 - Xpress-mosel: New Modeling Features for Distributed and Cloud Computing

Susanne Heipcke, FICO Xpress Optimization, FICO House, Starley Way, Birmingham, B37 7GN, United Kingdom, susanneheipcke@fico.com

A major concern when deploying optimization models in distributed computing environments are questions related to security for the transmission and storing of data, and the protection of the model itself - we show examples how these are addressed by the new Mosel module mmsl. We further discuss the new concept of model annotations, metadata that can be used to configure optimization applications, and touch on new interfaces (HTTP, XML, JSON, Hadoop, R).

2 - Solving the Airline Pilot Manpower Planning Problem.

Per Sjögren, Jeppesen systems AB, Odinsgatan 9, Gothenburg, 41311, Sweden, per.sjogren@jeppesen.com

The pilot manpower planning problem consists of the long term planning of recruitment and promotion to meet the forecasted crew need. Complicating factors are strict seniority promotion rules and limited training resources. We further consider movable activities such as vacation and overtime distribution as well as required recurrent training. We will present a high level description of the mixed integer model, the heuristic solution process and successful applications.

3 - Prescriptive Analytics on the Cloud with Python

Vincent Beraudier, Architect And Program Manager, IBM ILOG CPLEX, Porte Neuve, Bat A, 4 Av Alphonse Morel, Grasse, AL, 06130, France, vincent.beraudier@fr.ibm.com, Philippe Couronne

Python's scipy provides tools for large-scale predictive/ prescriptive analysis for manipulating, cleaning, and crunching data, and publication-quality graphics. The use of these web based tools with both state-of-the-art OR solvers and cloud computing will allow new users to enter the world of OR. Users with few development skills can leverage state-of-the-art solvers to develop, tune and publish their results without installing software. Come and discover those scientific python pillars.

4 - A Mixed Integer Programming Model for Optimizing Wheel Tru Operations for a Locomotive

Rajeev Namboothiri, GE Global Research, John F Welch Technology Centre, Bangalore, India, Rajeev.Namboothiri@ge.com, Srinivas Bollapragada, Reejo Mathew, Mark Smith

FRA regulations mandate tolerance limits on locomotive wheel measurements for safe locomotive operations. The wheel tru machine operator needs to decide the amount of material to be trued from each wheel, and the wheels that need to be replaced with inventory wheels, in order to comply with FRA regulations. In this

talk, we will present a novel MIP formulation for automating this complex decision, which minimizes the total cost of the wheel tru operation, thereby enhancing locomotive wheel life.

Chair: Jian Peng, Assistant Professor, University of Illinois, 2118 Siebel Center, 201 N Goodwin Ave, Urbana, IL, 61801, United States of America, jianpeng@illinois.edu

1 - Reconstruction of Species Histories using Genomic Data

Siavash Mirarab, UCSD, Jacobs Hall, EBU1, 2nd Floor, University of California, San Diego, San Diego, CA, 92093, United States of America, smirarab@gmail.com, Shamsuzzoha Bayzid, Bastien Boussau, Tandy Warnow

Reconstructing phylogenies, trees that show evolutionary histories of species, can be now attempted using genomic data. Building these species trees is complicated by potential differences between evolutionary histories across the genome. In this talk, we introduce two new methods used to infer whole-genome phylogenies of 48 birds and 103 plants. These new algorithms can analyze datasets with thousands of genes and species with high accuracy, and can account for weak signal across the genome.

2 - Entropy-Scaling Search of Massive Biological Data Sets

Noah Daniels, MIT, 32 Vassar St., 32G-572, Cambridge, MA, 02139, United States of America, ndaniels@csail.mit.edu

Recently, we have seen an exponential increase in biological data, outpacing advances in computing power. Extracting new science from these massive datasets requires algorithms that scale sublinearly in the size of the datasets. We present a novel entropy-scaling data structure for similarity search. Applying this data structure provides massive acceleration of several standard tools in three biological domains: genomics, high-throughput drug screening, and protein structure search.

Radiation Therapy Optimization: Algorithms and Biological Effects

Sponsor: Health Applications

Sponsored Session

Chair: Gino Lim, Department Chair, Hari And Anjali Agrawal Faculty Fellow, Associate Professor, University of Houston, E206, Engr. Bldg 2, Houston, TX, 77204, United States of America, ginolim@Central.UH.EDU

1 - Benders Decomposition and an LP-based Heuristic for Selecting IMRT Treatment Beam Angles

Sifeng Lin, The University of Texas at Austin, 1 University Station C2200, Austin, TX, 78712, United States of America, sifenglin@utexas.edu, Jonathan Bard, Gino Lim

This talk presents two Benders decomposition algorithms and a novel two-stage integer programming-based heuristic to optimize the beam angle and fluence map in Intensity Modulated Radiation Therapy planning. The results indicated that implementing Benders using the lazy constraint usually led to better feasible solutions than the traditional approach. Moreover, the LP rounding heuristic can generate good solutions quickly, with further improvement obtained with the local branching search.

2 - Robust Optimization for Craniospinal Irradiation using Intensity Modulated Proton Therapy

Li Liao, Research Assistant, University of Houston, 4800 Calhoun Rd, Houston, TX, 77004, United States of America, lliao5@uh.edu, Gino Lim, Xiaodong Zhang

Conventional passive scattering proton therapy (PSPT) is an extremely complex technique for craniospinal irradiation (CSI). In this study, we proposed a robust intensity modulated proton therapy (IMPT) for CSI. A small dose deviation can be achieved when ± 3 mm mis-alignment errors were applied on field junction for the robust IMPT plans, whereas this index was more than 40% for PSPT plans. A simplified dose model was introduced to predict dose deviation in different field arrangement situation.

3 - A Chance Constrained Programming Approach to Handle Uncertainties in Radiation Treatment Planning

Maryam Zaghian, University of Houston, 4800 Calhoun Rd, Houston, TX, United States of America, mzaghian@uh.edu, Azin Khabazian, Gino Lim

A chance constrained programming (CCP) framework is developed to handle set-up uncertainties in radiation treatment planning. By allowing some degree of violations of constraints, the proposed approach optimizes the treatment plan while satisfying the planner's tolerance level on the constraint violation in a probabilistic environment. Linear deterministic equivalences of the chance constraints are derived under distributional assumptions on uncertainties.

Decision Models for Women's and Children's Health

Sponsor: Health Applications

Sponsored Session

Chair: Karen Hicklin, PhD Student, North Carolina State University, 111 Lampe Drive, Campus Box 7906, Raleigh, NC, 27695, United States of America, khickli@ncsu.edu

1 - Modeling Comorbidity in Women with Diabetes

Nisha Nataraj, PhD Student, North Carolina State University, 111 Lampe Drive, Campus Box 7906, Raleigh, NC, 27695, United States of America, nnataraj@ncsu.edu, Fay Cobb Payton, Julie Ivy

Comorbidity is the presence of two or more concurrently existing conditions in an individual. A 2012 CDC report estimates that one in four US adults have comorbid conditions, contributing heavily to healthcare spending. Our focus is on diabetes since it is associated with significant comorbidity. Using National Inpatient Sample data (2006-2011), we build a modeling framework that helps evaluate how comorbidity impacts prognosis and outcomes for women with diabetes at a population level.

2 - Using Simulation to Determine a Balance between Cost and Quality of Care for Critically Ill Infants

Emily Lada, Principal Operations Research Specialist, SAS Institute Inc., SAS Campus Drive, Cary, NC, United States of America, Emily.Lada@sas.com, Chris Derienzo, David Tanaka, Phillip Meanor

Discrete-event simulation techniques are used to assess the relationship between cost, average length of stay, and patient outcomes in a neonatal intensive care unit (NICU). The model represents a general method that can be applied to any NICU, thereby providing clinicians and administrators with a tool to quantitatively support staffing decisions. Over time, the use of the model can lead to significant benefits in both patient safety and operational efficiency.

3 - A Bayesian Markov Decision Process to Evaluate Mode of Delivery for Laboring Women

Karen Hicklin, PhD Student, North Carolina State University, 111 Lampe Drive, Campus Box 7906, Raleigh, NC, 27695, United States of America, khickli@ncsu.edu, Fay Cobb Payton, Vidyadhar Kulkarni, Meera Viswanathan, Evan Myers, Julie Ivy

A laboring woman will deliver through one of two ways: successful trial of labor or C-section. We combine Bayesian updating into a Markov decision process to determine under what circumstances it is appropriate to gather more information before making a decision regarding mode of delivery. The goal is to maximize the utility of health outcomes for the mother and child as a function of the belief that the woman will have a safe vaginal delivery as a function of cervical dilation progression.

Modeling Broader Policy Impacts at the Local Scale

Sponsor: Public Sector OR

Sponsored Session

Chair: Ronald McGarvey, Indust. & Manuf. Systems Engineering; Truman School Of Public Affairs, University of Missouri, 225 Engineering Building North, Columbia, MO, 65211, United States of America, mcgarveyr@missouri.edu

1 - Using Big Data to Inform Mental Health Policies

Maryam Alsadat Andalib, PhD Student, Virginia Tech, 536F Whittemore Hall, 1185 Perry Street, Blacksburg, VA, 24061, United States of America, maryam7@vt.edu, Vida Abedi, Arash Baghaei Lakeh, Ramin Zand, Navid Ghaffarzadegan, Niyousha Hosseinichimeh, Grant Hughes

The accuracy of survey data for analyzing health policy problems depends on people's willingness to admit and honestly respond to survey questions. In the mental health context, stigma is a barrier which affects accuracy of survey data. We investigate fidelity of using another data source, Google search queries, to understand mental health illnesses. We specifically offer three examples of analyzing mental health illnesses in the United States.

2 - Robust Optimization for Biopower Generation

Bayram Dundar, University of Missouri-Columbia, 200 Engineering Building North, Columbia, MO, 65211, United States of America, bd5zc@mail.missouri.edu, Ronald McGarvey, Francisco X. Aguilar

The U.S. Environmental Protection Agency (EPA) has proposed a rule that aims to reduce carbon emissions from coal-fired power plants. We develop an MILP model to identify min-cost approaches for satisfying these proposed standards via biopower generation subject to spatially-explicit biomass constraints. We next propose a robust optimization model to address parameter uncertainty, and compare the two models' results to illustrate the impact of data uncertainty on overall cost and emissions.

3 - Modeling the Recruitment and Retainment of Employees at a Rural Montana Community Health Center

Andreas Thorsen, Assistant Professor Of Management, Montana State University, 330 Jabs Hall, Bozeman, MT, 59717, United States of America, holger3000@gmail.com, Don Greer, Laura Black, Edward Gamble

Community Health Centers (CHC) are not-for-profit health care corporations which provide comprehensive medical and dental care for their communities regardless of the individual's insurance coverage or ability to pay. For a CHC in rural Montana, there are unique challenges related to recruitment and retention of highly qualified, mission-driven employees. We identify and address these challenges using a system dynamics modeling approach.

4 - Technoeconomic and Policy Considerations for Large-scale Solar Deployment in India

Aimee Curtright, Senior Physical Scientist, RAND Corporation, 4570 Fifth Ave, Suite 600, Pittsburgh, PA, 15213, United States of America, acurtrig@rand.org, Zhimin Mao, Oluwatobi Oluwatola, Mridula Dixit Bharadwaj

The SERIUS consortium aims to develop and assess PV and CSP solar technologies that can support India's ambitious solar deployment goals, recently increased to a target of 100 GW by 2022. RAND and CSTEP are collaborating to conduct technoeconomic and policy analyses to support the SERIUS consortium. This presentation will discuss recent and ongoing work, including progress made by U.S.-based Pardee RAND students during their visiting internships at CSTEP in India.

Health Care Modeling and Optimization VIII

Contributed Session

Chair: Yunzhe Qiu, Peking University, NO. 298 Chengfu Road, Haidian District, Beijing, China, qiuyunzhe92@163.com

1 - Improving Surgical Instrument Delivery using Optimization and Process Flow Modeling

Rama Mwenesi, Center for Healthcare Engineering and Patient Safety, University of Michigan, IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, rmwenesi@umich.edu, Joseph Derosier, James Bagian, Shawn Murphy, Amy Cohn

Efficiency in surgical instrument reprocessing is a key challenge for high-volume surgical centers. Insufficiently cleaned or maintained instruments adversely impact patient safety and surgical outcomes. This study examines how i) instrument cleanability and ii) instrument-set configurations impact efficiencies in reprocessing as well as quality of care and costs of delivery. We evaluate process flow variations in the delivery of instruments and present optimization-based models for improvement.

2 - A Queueing Model of Critical Care Outreach Team in Hospitals

Ali Haji Vahabzadeh, PhD Student, The University of Auckland, Private Bag 92019, Auckland, 1142, New Zealand, a.vahabzadeh@auckland.ac.nz, Valery Pavlov

The considerable evidence of failed CCOT implementations in hospitals demonstrate a lack of genuine understanding of the CCOT roles and capabilities. Such an evidence suggests that many times implementations follow, in effect, trial and error approach. To allow hospitals making better informed decisions this research proposes a queueing model for understanding the effectiveness of the CCOT on the intensive care unit performance and patient outcomes.

3 - Optimal Incentives for HIV Prevention Funds Allocation under Asymmetric Information

Monali Malvankar, Assistant Professor, Western University, St. Joseph's Hospital, 268 Grosvenor St., London, ON, N6A 4V2, Canada, mmalvan@uwo.ca, Gregory Zaric, Xinghao Yan

Resource allocation models often require cost and effectiveness data on the results of an intervention. However, these data may not be available in practice due to several reasons. We model information asymmetry in a multi-level HIV/AIDS resource allocation process with an attempt to answer the following questions. What is the impact of incentives if the preferences and infections prevented at the lower level are unknown at the upper level?

4 - Elective Surgery Scheduling for Multiple Operating Rooms Considering Patient Health Condition

Joonyup Eun, PhD Candidate, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47907-2023, United States of America, eunj@purdue.edu, Sang-phil Kim, Yuehwen Yih

This research is motivated by the fact that surgery scheduling considering patient condition can contribute to improving patient safety. Surgeons and patients may want to schedule their surgeries early in order to escape from the risk of worsening patient condition. However, the resource limitation on surgeons, operating rooms, etc., forces surgical schedulers to prioritize surgeries. This research suggests a systematic mathematical model to consider patient condition in surgery scheduling.

5 - Who is the Right Kid for the Next Service? A Real Time Access Control Policy in the Pediatric Clinic

Yunzhe Qiu, Peking University, No. 298 Chengfu Road, Haidian District, Beijing, China, qiuyunzhe92@163.com, Zekun Liu, Jie Song

This paper develops a real-time appointment scheduling policy considering both the difference and fairness of waiting time among heterogeneous patients. We use the utility theory to measure service satisfaction, which is integrated with CTMDP model. A myopic policy considering heterogeneous patients' waiting patience is provided to minimize the overall disutility. A case based on the collaborated hospital is investigated, where the results confirm the effectiveness of the policy.

Dynamic Programming and Control II

Contributed Session

Chair: Akram Khaleghei, University of Toronto, 1706, 35 Charles Street West, Toronto, ON, M4Y 1R6, Canada, akhalegh@mie.utoronto.ca

1 - Tractable Sampling Strategies for Ordinal Optimization

Dongwook Shin, PhD Candidate, Columbia Business School, 612 W 114th Street, Apt. 4R, New York, NY, 10025, United States of America, dshin17@gsb.columbia.edu, Assaf Zeevi, Mark Broadie

We consider the problem of selecting one of several competing configurations (systems), where probability distributions are not known, but can be learned via sampling. The objective is to dynamically allocate a finite sampling budget to ultimately select the best system. We introduce a tractable performance criterion and a sampling policy that seeks to optimize it.

2 - Analysis and Modeling of the Aggregate Production Planning via Control Oriented Approaches

Yasser A. Davizón, Professor, Universidad Politécnica de Sinaloa, Carretera Libre Mazatlán, Mazatlan, Mexico, ydavizon@asu.edu, César Martínez-Olvera

This research work addresses the application of control oriented approaches for the analysis and modeling of the Aggregate Production Planning problem. Analysis is provided for second order dynamical systems with the interest to model Capacity, Inventory level, Work force costs, production rate and demand along the Supply Chain Management by a novel mathematical formulation. Control oriented approaches considered in this paper are: Model Predictive Control and Linear Quadratic Regulator.

3 - Conditional-based Maintenance Policy for a System Subject to Random Failure

Akram Khaleghei, University of Toronto, 1706, 35 Charles Street West, Toronto, ON, M4Y 1R6, Canada, akhalegh@mie.utoronto.ca, Viliam Makis

The maintenance optimization of a partially observable degrading system subject to condition monitoring and observable random failure is investigated considering cost minimization. The deterioration process is modeled as a continuous time hidden semi-Markov model with three states: healthy, warning and failure. Only the failure state is observable. Bayesian control chart is designed to prevent the costly system failure.

4 - Capacity Allocation of Appointment Admission Control in a Hierarchical Healthcare System

Xin Pan, College of Engineering, PKU, Founder Building 512, Chengfu Street 298, Beijing, 100871, China, paxi_91@126.com, Jie Song, Bo Zhang

Motivated by unbalanced demand between General Hospital (GH) and Community Healthcare center (CHC) in a hierarchical healthcare system, we proposed a MDP model where multi-class slots are allocated to multi-class patients. We derive a policy that blocks slots in GH for low-class patients so as to satisfy high-class patients. The policy finally intends to lower the mismatching level in the hierarchical healthcare system, maximizing both the system's and patients' revenue in the long-term.

5 - Identification of Parameters in Mathematical Biology

Ugur Abdulla, Professor of Mathematics, Florida Institute of Technology, 3627 Mount Carmel Lane, Melbourne, FL, 32901, United States of America, abdulla@fit.edu, Roby Poteau

We consider inverse problems for the identification of constant and functional parameters for systems of nonlinear ODEs arising in mathematical biology. We implement a numerical method suggested in U.G.Abdulla,JOTA,85,3(1995). The idea of the method is based on the combination of quasilinearization with sensitivity analysis and Tikhonov's regularization. We apply the method to various biological models such as the bistable switch model in genetic regulatory networks and angiogenesis model.

Innovative Strategies in the Interface of Operations and Marketing

Cluster: Operations/Marketing Interface

Invited Session

Chair: Tingliang Huang, Assistant Professor, Boston College, Carroll School of Management, 140 Commonwealth Avenue, Chestnut Hill, MA, 02467, United States of America, tingliang.huang@bc.edu

1 - Dynamic Management of Opaque Selling with Boundedly Rational Customers

Tingliang Huang, Assistant Professor, Boston College, Carroll School of Management, 140 Commonwealth Avenue, Chestnut Hill, MA, 02467, United States of America, tingliang.huang@bc.edu, Zhe Yin

We study a practically important problem, where a firm sells an opaque product to boundedly rational customers and has to dynamically determine its selling strategies. We characterize the optimal selling policies depending on the market environment.

2 - Optimal Staffing under Endogenous Arrivals with Heterogeneous Customer Time-of-service Preferences

Yang Li, Rotman School of Management, University of Toronto, 105 St. George Street, Toronto, ON, M5S3E6, Canada, Yang.Li10@Rotman.Utoronto.Ca, Philipp Afeche

The service operations literature usually treats arrivals as exogenous processes. However, arrival processes may be endogenous in many settings. That is, customers may account for system congestion in choosing their time of service. We propose an equilibrium model that captures how rational customers with heterogeneous preferences decide their time-of-service. We also study the optimal staffing policies, taking into account customers' time-of-service choices.

3 - Money-back Guarantees in a Distribution Channel: Bargaining Power and Downstream Competition

Yufei Huang, PhD Student, University College London, Gower Street, London, United Kingdom, yufei.huang.10@ucl.ac.uk, Tingliang Huang, Ying-ju Chen

Although existing literature emphasizes the usefulness of Money-back Guarantees (MBG), little is known about why retailers may adopt different MBG choices in practice. To understand this, we examine two competing retailers' MBG decisions, who also simultaneously bargain for wholesale prices with a wholesaler in a distribution channel. We show that, retailers' asymmetric bargaining power may lead to asymmetric MBG choices. We provide economic rationales for all possible MBG outcomes.

4 - Effects of Channel Decentralization on Optimal Product Quality under Uncertainty

Hongyan Shi, Assistant Professor, Nanyang Business School, Nanyang Technological University, BLK S3-B1A-32, 50 Nanyang Ave, Singapore, 639798, Singapore, hyshi@ntu.edu.sg, Qin Geng, Nicholas Petrucci, Yan Liu

We provide insights on how a manufacturer's optimal quality decision depends on its channel structure when its market is defined by consumer heterogeneity and market size uncertainty. We find that, in contrast to the quality-decreasing effect of decentralization by consumer homogenization, market size uncertainty fuels an opposing quality-increasing effect of decentralization. Moreover, we find that the effect by market size uncertainty by and large prevails over that by consumer homogenization.

Gender, Leadership, and Governance

Sponsor: Organization Science

Sponsored Session

Chair: Susan Perkins, Northwestern University, Evanston, IL, s-perkins@kellogg.northwestern.edu

1 - Can Female Leaders Mitigate the Negative Effects of Racial Diversity? National Leaders and Structural Shifts

Susan Perkins, Northwestern University, Evanston, IL, United States of America, s-perkins@kellogg.northwestern.edu, Jae Cho, Katherine W. Phillips, Negin R. Toosi

Using a multi-method research design we study the effects of inequality and exclusion on productivity. We find that female leaders are expected improve economic outcomes more than male leaders; are associated with greater tolerance for diversity and self-expression, and have mitigating effects on diversity that

resulted in positive economic growth. The results imply that leadership in more diverse environments is key to making positive structural shifts around inequality and participation.

2 - Hierarchy Maintenance and Whites' Decreased Support for High-identity White Politicians

Sora Jun, Stanford University, Stanford, CA, sorajun@stanford.edu, Lucia Guillory, Brian Lowery

We hypothesized and found that Whites withhold their political support for high racial identity White candidates (Experiments 1-3) because of concerns that such candidates will provoke minority discontent with the racial hierarchy (Experiment 1). In Experiments 2 (hypothetical candidates) and 3 (real politicians) this effect was eliminated when the social hierarchy was described as stable, suggesting that this reduced support for high-identity candidates is a hierarchy maintenance strategy.

3 - Naming Your Daughter Jack: The Effect of Gender in the Evaluation Process

Tristan L. Botelho, Massachusetts Institute of Technology, Cambridge, MA, tbotelho@mit.edu, Mabel Abraham

Double standards, or the belief that women are held to unfairly higher standards, is commonly invoked as an explanation for observed gender differences in evaluative outcomes. Despite lab-based evidence supporting this argument, it remains unclear whether double standards affect evaluations in organizational and market contexts, where competitive pressures create a disincentive to discriminate. Thus, we lack a complete understanding of when and how double standards penalize women in the evaluation process. Drawing on broader status theory, we identify the conditions under which this status-based source of discrimination is most prevalent. Using data from a financial market setting, comprised of investment professionals, we find that double-standards disadvantaging women are most likely when evaluators are faced with higher levels of uncertainty stemming from search costs and variation in the availability of pertinent information. We also rule out that systematic gender differences in the behavior, or characteristics, of these investment professionals are driving these results.

4 - Leadership and the Single Woman Penalty: A Role Expectations Account of Promotion Penalties toward Female Professionals

Damon Phillips, Columbia University, New York, NY, dp2588@columbia.edu, Jennifer Merluzzi

We advance scholarship on workplace gender inequality by drawing attention to professional single women. We contend that single non-mother status is inconsistent with the role expectations of leadership associated with both men (agentic) and women (communal). We test our thesis on the early careers of business professionals using a multi-method approach. The result support a discrimination-based penalty where the status and role of professional single womanhood conflicts with that of leadership.

High-dimensional Data Models for Cost-effective Healthcare

Sponsor: Manufacturing & Service Oper
Mgmt/Healthcare Operations

Sponsored Session

Chair: Mohsen Bayati, Assistant Professor, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, United States of America, bayati@stanford.edu

1 - Accurate Emergency Department Wait Time Prediction

Sara Kwasnick, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, United States of America, kwasnick@stanford.edu, Mohsen Bayati, Erica Plambeck

We develop a new method for predicting Emergency Department wait times. The method combines fluid model estimators and statistical learning, and is much more accurate than existing approaches to ED wait time prediction. We validate the method on historical and post-implementation data from four hospitals and discuss lessons learned from the implementation.

2 - Online Decision-making with High-dimensional Covariates

Hamsa Bastani, Graduate Student, Stanford University, Stanford, CA, United States of America, hsriddhar@stanford.edu, Mohsen Bayati

Big data has enabled decision-makers to tailor choices at the individual-level. However, this involves learning a model of decision rewards conditional on individual-specific covariates, which are often high-dimensional. We present an efficient method to solve this problem in an online setting and a corresponding regret analysis. Unlike previous methods whose regret scales with the cube of the covariate's dimension, our method's regret scales linearly with the number of sparse features.

3 - A Low-cost Method for Multiple Disease Prediction

Mohsen Bayati, Assistant Professor, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, United States of America, bayati@stanford.edu, Andrea Montanari, Sonia Bhaskar

Recently, in response to the rising costs of healthcare, companies have been investing in programs to improve the health of their workforce. These programs aim to reduce the incidence of chronic illnesses and require a low-cost screening to detect individuals with a high risk of developing such diseases. We offer a multiple disease prediction procedure that maximizes the predictive power while minimizes the screening cost. Our method is based on multi-task learning from machine learning.

■ MD42

Joint Session MSOM-Health/HAS: Operations Research/Management for Public Health: Data-Driven and Dynamic Decision-Making

Sponsor: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Soroush Saghafian, Harvard University, 79 JFK Street, Cambridge, MA, 02138, United States of America, Soroush.Saghafian@asu.edu

1 - New Data-driven Approach to Safety and Risk Management in ICUs

Retsef Levi, J. Spencer Standish (1945) Professor of Operations Management, Sloan School of Management, MIT, 100 Main Street, BDG E62-562, Cambridge, MA, 02142, United States of America, retsef@mit.edu, Patricia Folcarelli, Yiqun Hu, Jeffrey Adam Traina, Daniel Talmor

We develop an innovative system approach to safety in ICUs. The approach is based on the innovative concept of risk drivers, which are states of the ICU, its environment and its staff that affect the likelihood of harms, as well as an innovative aggregated measure of the 'burden of harm'. Using real data we develop statistical models that identify risky states in the ICUs of a major academic medical center.

2 - Developing Optimal Biomarker-Based Prostate Cancer Screening Policies

Christine Barnett, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, United States of America, clbarnet@umich.edu, Brian Denton, James Montie

Recent advances in the development of new biomarker tests, which physicians use for the early detection of cancer, have the potential to improve patient survival by catching cancer at an early stage. We describe a partially observable Markov decision process (POMDP) to compute near optimal prostate cancer screening strategies. We present results based on Monte Carlo simulation to compare the policies developed using our approximated POMDP methods with those recommended in the medical literature.

3 - Optimizing Hepatitis C Screening and Treatment Allocation Strategy

Yuankun Li, University of Washington, Seattle, WA, United States of America, yuankunl@uw.edu, Zelda Zabinsky, Hao Huang, Shan Liu

Chronic hepatitis C (HCV) is a significant public health problem affecting 2.7-3.9 million Americans. The U.S. healthcare systems are ramping up combined HCV screening and treatment efforts, but screening and treatment programs are very costly. We design the optimal HCV screening and treatment allocation strategies in the next 10 years under yearly budget constraint from a national perspective. The method includes simulation optimization using adaptive probabilistic branch and bound.

4 - A Robust POMDP Framework for the Management of Post-transplant Medications

Alireza Boloori, PhD Student Of Industrial Engineering, Arizona State University, 699 S Mill Avenue, Office # 313, Tempe, AZ, 85282, United States of America, aboloori@asu.edu, Curtiss B. Cook, Soroush Saghafian, Harini A. Chakkerla

Patients after organ transplantations receive high dosages of immunosuppressive drugs (e.g., tacrolimus) to reduce the risk of organ rejection. However, this practice has been shown to increase the risk of New-Onset Diabetes After Transplantation (NODAT). We propose a robust POMDP framework to generate effective medication management strategies for tacrolimus and insulin. Our approach increases the patient's quality of life while reducing the effect of transition probability estimation errors.

Empirical Revenue Management

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Dan Zhang, University of Colorado at Boulder, 995 Regent Dr, Boulder, United States of America, Dan.Zhang@colorado.edu

1 - Would You Like to Upgrade to a Premium Room? An Empirical Analysis on Standby Upgrades

Ovunc Yilmaz, PhD Student, University of South Carolina, 1014 Greene St, Columbia, SC, 29208, United States of America, oyilmaz@email.sc.edu, Mark Ferguson, Pelin Pekgun

Standby upgrades, where the guest is only charged if the upgrade is available at the time of arrival, is one technique that has become increasingly popular in the hotel industry. Working on a data set from a major hotel chain, we analyze the linkage between guest attributes, hotel characteristics and guest decision-making for standby upgrades through an empirical study.

2 - Analytics for an Online Retailer – Demand Forecasting and Price Optimization at Rue La La

Kris Johnson Ferreira, Harvard Business School, Morgan Hall 492, Boston, MA, 02163, United States of America, kferreira@hbs.edu, David Simchi-levi, Bin Hong Alex Lee

We present our work with Rue La La, an online retailer who offers limited-time discounts on designer apparel. One of their main challenges is revenue management for new products. We use machine learning to build a demand prediction model, the structure of which poses challenges on creating a pricing policy. We develop theory around multi-product price optimization and use this to create and implement a pricing decision support tool. Field experiment results show significant increases in revenue.

3 - A Model to Estimate Individual Preferences using Panel Data

Gustavo Vulcano, NYU, 44 West Fourth St, Suite 8-76, New York, NY, 10012, United States of America, gvulcano@stern.nyu.edu, Srikanth Jagabathula

In a retail operation, customer choices may be affected by stockout and promotion events. Given panel data with the transaction history of each customer, we use a general nonparametric framework in which we represent customers by partial orders of preferences. Numerical experiments on real-world panel data show that our approach allows more accurate, fine-grained predictions for individual purchase behavior compared to state-of-the-art existing methods.

4 - Estimation of Arrival Rates and Choice Model with Censored Data

Anton Kleywegt, Georgia Tech, 755 Ferst Drive NW, Atlanta, GA, 30332, United States of America, anton@isye.gatech.edu

Revenue management models with customer choice behavior include two types of parameters: (1) customer arrival rates and (2) choice parameters. Revenue managers usually have censored arrival data only, because no-purchase data are not included. For both homogenous and nonhomogeneous Poisson arrivals we give necessary and sufficient conditions for the arrival rates and choice parameters to be identifiable with such censored data, and we give algorithms for parameter estimation, with numerical results with airline data

Pricing and Information in Innovative Business Models

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Jose Guajardo, University of California Berkeley, 545 Student Services Bldg #1900, Berkeley, CA, 94720-1900, United States of America, jguajardo@berkeley.edu

1 - Information Provision Policies in Developing Countries: Heterogeneous Farmers and Market Selection

Chen-Nan Liao, National Taiwan University, No.1, Sec. 4, Roosevelt Rd., Taipei City, Taiwan - ROC, chennan@berkeley.edu, Ying-ju Chen, Chris Tang

We examine the impact of information provision policies on farmer welfare in developing countries where heterogeneous farmers lack relevant information for making market (or crop) selection. We show that the optimal information provision policy may call for limited dissemination, and the government can implement it while overcoming perceived unfairness by providing information to all farmers at a nominal fee. We also examine issues including information dissemination via a for-profit company.

2 - Pay-as-You-go Business Models for Energy Technology Innovations in Developing Economies

Jose Guajardo, University of California Berkeley, 545 Student Services Bldg #1900, Berkeley, CA, 94720-1900, United States of America, jguajardo@berkeley.edu

Pay-As-You-Go business models have become widespread for the diffusion of energy technology innovations in developing economies, yet not much is known about this recent phenomenon. In this research, we analyze central aspects of consumer behavior and contract design in these novel markets.

3 - Selling Freemium Products to Loss Averse Consumers

Sami Najafi-Asadolahi, Santa Clara University, 500 El Camino Real, Santa Clara, CA, United States of America, snajafi@scu.edu, Nishant Mishra, Andy Tsay

We consider a firm selling two versions of a single product, a freemium for free and a premium at a regular price, to consumers who are loss-averse. Each consumer first uses the freemium, and after using it, decides whether to buy the premium. We find that when consumers become slightly dissatisfied from the freemium's valuation they, counter-intuitively, become more willing to purchase the premium, thereby increasing the firm's revenue.

4 - Product Recommendations via Geometric-based Adaptive Choice Conjoint Analysis

Denis Saure, University of Chile, Republica 701, Santiago, Chile dsauere@gmail.com, Juan Pablo Vielma

Aiming to obtain individualized estimates of consumer preferences in the context of product recommendations, we study the construction of adaptive conjoint choice designs under a Bayesian framework. By adopting a geometric interpretation of the problem, we construct near optimal designs when the number of questions is small, and also give a precise interpretation of efficiency criteria and design methods used in extant research, which we show result in suboptimal designs.

Revenue Management and Learning II

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: John Birge, Professor, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu

1 - Learning to Compete Against Dynamic Pricing Strategies

Matthew Stern, University of Chicago - Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, stern@chicagobooth.edu, John Birge

We examine the impact of competition on the design and implementation of dynamic pricing strategies. Observing posted prices in each period, as well as their own private demand realizations, firms compete for revenues while learning the parameters of their underlying demand curves. We show that when firms remain willfully ignorant of their business environment, they can sustain collusive prices. We conclude that incomplete learning is a desired outcome of competing dynamic pricing strategies.

2 - Dynamic Pricing and Learning in Spread Betting

Adam Schultz, PhD Student, University of Chicago Booth School of Business, 5807 S Woodlawn Ave., Chicago, IL, 60637, United States of America, adam.schultz@chicagobooth.edu, John Birge, Bora Keskin

We develop a model in which a sportsbook dynamically prices the point spread for a sporting event. In our model, bettors maximize their expected profits by timing their bets, while the sportsbook follows an easily implementable policy to update the point spread. To analyze the decisions of the betting market, we introduce a mean-field approximation. Using data from online sportsbooks, we reveal insights about the betting market.

3 - Rental System Revenue Management Problem with Totally Unimodular Constraints

Ali Cem Randa, University of Chicago Booth School of Business, 5807 Woodlawn Ave., Chicago, IL, 60637, United States of America, randa@chicagobooth.edu, John Birge, Baris Ata

We analyze the example of a renter which has finite number of identical units that can be loaned for durations of days. The renter has to determine its booking limits for a planning horizon of finite duration which is considerably far in the future. We assume that all permutations of consecutive days in the planning horizon define a different product. The capacity constraints formed by these products are totally unimodular. We solve a multi-stage stochastic program exploiting this structure.

Equilibrium Models and Pricing of Queues

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations
Sponsored Session

Chair: Philipp Afeche, Associate Professor, University of Toronto, 105 St. George Street, Toronto, ON, M5S3E6, Canada, afeche@rotman.utoronto.ca

1 - An Equilibrium Analysis of a Multiclass Queue with Endogenous Abandonments

Xiaoshan Peng, The University of Chicago, Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, x-peng@chicagobooth.edu, Baris Ata, Peter Glynn

This paper studies a multiclass queueing system with endogenous abandonments where the congestion affects customers' abandonment behavior and vice versa. Our model captures this interaction by developing two closely related models: an abandonment model and a queueing model. Combining the results for the two models, we show that there exists a unique equilibrium in which the customers' abandonment time and the virtual waiting time for the various classes are consistent in the two models.

2 - Observational Learning and Abandonment

John Yao, Columbia University, 3022 Broadway, New York, NY, 10027, United States of America, JYao14@gsb.columbia.edu, Costis Maglaras, Assaf Zeevi

Demand models used in service operations often assume that users have accurate knowledge of the service system parameters needed to make decisions, such as whether to join a queue. What if instead, users must form estimates of these system parameters through their own observations or experiences in the system? I show the effect of observational learning on user behavior and equilibrium system performance in the context of abandonment in a queueing model.

3 - Strategic Open Routing in Queueing Networks

Andrew Frazelle, Fuqua School of Business, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, andrew.frazelle@duke.edu, Alessandro Arlotto, Yehua Wei

Motivated by self-interested routing, we propose a two-station queueing network with open routing in which agents require service at both stations and seek to minimize their individual total system times. Agents have no inherent preference over the sequence of stations that they visit apart from the impact of this sequence on their system times. We evaluate system performance and determine Nash or subgame perfect Nash equilibrium customer routing behavior in three different overloaded settings.

4 - Pricing and Prioritizing Time-sensitive Customers with Heterogeneous Demand Rates

Ricky Roet-Green, University of Toronto, 37 Zola Gate, Thornhill, L4J9A7, ON, Canada, rgricky@gmail.com, Opher Baron, Philipp Afeche, Joseph Milner

Providers often face time-sensitive customers that differ in their demand rates. Examples include amusement parks, museums, and ski resorts. However, the pricing literature for queues typically assumes unit demand for all customers. We study a revenue-maximizing provider that designs a price/lead-time menu for customers with heterogeneous demand rates and private information on their preferences. We show under what conditions it is optimal to prioritize customers based on their demand rates and transaction values, even if all are equally time-sensitive.

Sustainability and Transportation

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Ruben Lobel, Operations and Information Management Department at The Wharton School of the University of Pennsylvania, Jon M. Huntsman Hall 3730 Walnut Street, Office 568, Philadelphia, PA, 19104, United States of America, rlobel@wharton.upenn.edu

1 - Compete vs. Cooperate? A Strategic Game Behind the EV Standards War

Ni Fang, HEC Paris, 1, Rue de la Liberation, HEC Paris, Jouy en Josas, DI, 78351, France, ni.fang@hec.edu, Marco Ceccagnoli

In the light of the standards war currently staged in electric vehicle (EV) industry, this paper examines the strategic choice facing the two EV manufacturers as to compete vs. cooperate for the development of an extensive charging infrastructure, a key complementary asset mitigating EV range anxiety. In doing so, this paper demonstrates EV manufacturers' incentives towards standardization and shows how standardization affects EV diffusion rate and firm's performance.

2 - Food, Energy and Environment Trilemma: Land use Configuration for Biofuel Industry Development

Michael Lim, University of Illinois, 1206 S. 6th Street, Champaign, IL, 61822, United States of America, mlim@illinois.edu, Yanfeng Ouyang, Xin Wang

We address the negative side effects of the rapid development of the biofuel industry, which has caused extensive competition among food, energy, and the environment in agricultural land use. Taking into account interactions among multiple stake-holders (e.g., farmers, bioenergy firms, food industry, government), we develop policy guidelines for coordinating subsidy and mandates to better achieve sustainable development of this emerging bio-economy.

3 - Socially Responsible Business Models for Off-grid Energy Access

Serguei Netessine, Professor, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Serguei.Netessine@insead.edu, Bhavani Shanker Uppari, Ioana Popescu

One fifth of the humankind does not have access to electricity. They are mainly poor and rely on unhealthy solid fuels (kerosene etc.) for lighting. Even though cheaper rechargeable lighting technologies are available, their adoption is low and some consumers still use kerosene. We propose a model which explains this preference for kerosene and explore various business models which could alter this preference.

4 - Technology Sharing in Two-sided Markets

Ozge Yapar, Doctoral Candidate, University of Pennsylvania, Wharton School, Operations and Information Mgmt., Philadelphia, PA, 19104, United States of America, yapar@wharton.upenn.edu, Lorin Hitt, Ruben Lobel

This paper investigates the drivers behind Tesla's decision to make its patents freely available to other electric car manufacturers. The two sides of this market, car owners and potential charging stations, rely on each other to increase the value of their investment. We show under what conditions subsidizing the competitors can be profitable. By sharing technology, Tesla may be able to improve the charging station network and increase its own profit from car sales.

1 - How Do Information Spillover and Debt Financing Affect Companies' Innovation Decisions?

Jie Ning, Assistant Professor, Case Western Reserve University, 11119 Bellflower Rd, Cleveland, OH, 44106, United States of America, jie.ning@case.edu, Volodymyr Babich

Information spillover alone leads to inefficient innovation equilibrium by inducing companies to free ride. Debt financing alone also leads to inefficient equilibrium by inducing companies to take excessive risks. This paper examines the interaction of these two economic forces and shows that the presence of both leads to either under-investment, over-investment, or social optimality.

2 - Systematic Risk and Mass Layoffs in the U.S. Manufacturing

Nikolay Osadchiy, Emory University, 1300 Clifton Rd NE, Atlanta, GA, 30322, United States of America, nikolay.osadchiy@emory.edu, Suresh Dasari, Peeyush Taoiri, Sridhar Seshadri

We study the role of systematic risk in jobs relocation decisions of manufacturers. Using the mass layoffs data in the U.S. manufacturing sector for the period from 2002 to 2010, we explore the view voiced by a number of manufacturers that in addition to cheap labor, systematic risk is also an important input in their production decisions.

3 - Risk or Margin: The Role of Trade Credit in Competition

Heikki Peura, London Business School, Regent's Park, London, United Kingdom, hpeura@london.edu, S. Alex Yang, Guoming Lai

We analyze horizontal competition with and without trade credit under the classic Bertrand framework. We find that when the competing firms are financially constrained, trade credit allows them to soften price competition. We further investigate the relationship between firms' financial strength and their physical production capacity, finding that with trade credit, financial constraints are a partial substitute for the role that physical capacity plays in price competition.

4 - Mental Cost Ratios and the Beer Game

Maximiliano Udenio, Technical University of Eindhoven, Eindhoven, Netherlands, M.Udenio@tue.nl, Vishal Gaur, Jan Fransoo

In this study we investigate the underlying behavior of beer-game players through a series of experiments. We argue that players make decisions based, partly, on a dynamic mental cost-ratio that fluctuates following multiple factors. We use a structural estimation model to quantify the mental weighing of underage and overage costs, and discuss several factors driving the decision making.

Supply Chain Operations

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Alp Muharremoglu, Associate Professor, University of Texas at Dallas, 800 W Campbell Rd, Richardson, TX, United States of America, alp@utdallas.edu

1 - Using Retailer Order Commitments to Improve Supply Chain Performance

Nagesh Gavirneni, Cornell University, Ithaca, NY, United States of America, sg337@cornell.edu, Nagesh Gavirneni

We establish that retailer order commitment strategies improve the efficiency of decentralized distribution supply chains whenever the supplier's cost is at least 29.3% of the total supply chain cost. The effectiveness increases as the supplier's share of the total supply chain cost increases. We establish the robustness of these results for settings with non-normal demand distributions, backlogging at the supplier, and positive lead times between the supplier and the retailers.

2 - Can a Zero-margin Demand Stream Increase Profits?

Shaokuan Chen, The University of Texas at Dallas, 800 W. Campbell Road., Richardson, TX, 75080, United States of America, shaokuan.chen@utdallas.edu, Ganesh Janakiraman, Alp Muharremoglu

We consider a firm selling a non-perishable product in its primary market over time with uncertain demand. Suppose a new opportunity arises from a secondary market where the firm's product can only be sold at a zero-margin. Moreover, the firm is required to give priority to the demand from the secondary market. We explore the following question: Can such a zero-margin opportunity increase the firm's profit, and if so, when?

3 - Mitigating Supply Chain Disruptive Risks: A Two-stage Robust Optimization Approach

Peter Yun Zhang, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Building E40-261, Cambridge, MA, 02139, United States of America, pyzhang@mit.edu, Nikolaos Trichakis, David Simchi-levi

We present a model that captures two sets of decisions a supply chain risk manager faces: the placement of inventory in preparation for supply disruption and demand uncertainty, and the recourse decisions that coordinate capacity and inventory allocation after the uncertain events unfold. We take a worst-case perspective and analyze the problem via its Affinely Adjustable Robust Counterpart.

4 - Package Size and Pricing Decisions with a Bulk Sale Option

Ismail Kirci, PhD Student, University Of Texas at Dallas, 800 W. Campbell Road, Richardson, TX, 75080, United States of America, ixk130330@utdallas.edu, Alp Muharremoglu, Dorothee Honhon

In this study we investigate package size and pricing decisions of a retailer for a perishable product. The retailer has the option of bulk sale, which is defined as selling the product in a container that allows customers to buy as much or as little as they want.

50-Room 106A, CC

Procurement, Auction, and Pricing

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Zhixi Wan, Assistant Professor, University of Oregon, Eugene, OR, United States of America, zwan@uoregon.edu

1 - Optimal Descending Mechanisms for Constrained Procurement

Shivam Gupta, PhD Candidate, UT Dallas, NJ School of Management, 800 W. Campbell Rd., Richardson, TX, 75080, United States of America, sxg104920@utdallas.edu, Milind Dawande, Ganesh Janakiraman, Wei Chen

We propose optimal descending mechanisms for procurement under two practically-relevant feasibility constraints. We then show that both mechanisms belong to a larger class of descending mechanisms that are optimal for procurement under polymatroid feasibility constraints.

2 - Dual Sourcing Auctions for Unreliable Suppliers: with or Without Cost Distribution Information

He Huang, Professor, Chongqing University, School of Economics and Business Admin., Chongqing, China, huanghe@cqu.edu.cn, Zhipeng Li, Hongyan Xu

This paper examines dual-sourcing auctions for risk mitigation when a buyer faces uncertain demand and multiple unreliable suppliers with private cost information. Two scenarios involving three auction formats are considered, Generalized First-price Auction, Generalized English Auction and Optimal Auction with Learning. We separately design the above dual-sourcing auctions and then examine the buyer's strategic choice.

3 - Using Procurement Service Providers in Supplier Screening

Zhixi Wan, Assistant Professor, University of Oregon, Eugene, OR, United States of America, zwan@uoregon.edu, Sripad Devalkar

A buyer engages a procurement service provider (PSP) to short-list pre-screened suppliers for final selection. The PSP can exert costly effort to include promising candidates that have a higher probability to be deemed qualified by the buyer. We solve the buyer's joint optimization about the short-list size and the performance bonus.

4 - Dynamic Pricing with Product Returns

Xing Hu, Assistant Professor, University of Oregon, Eugene, OR, United States of America, xingh@uoregon.edu

We consider a monopolist's dynamic pricing problem when the customers may stochastically return the purchased products. We study how the customers' return speed and return probability affect the optimal pricing decisions.

Applications of Operations Management to Pharmaceutical and Healthcare Industry

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Zhili Tian, Assistant Professor, Florida International University, 11200 S.W. 8th Street, Miami, FL, United States of America, ztian@fiu.edu

1 - Process Flexibility with Inventory

Yang Wang, UC Berkeley, IEOR Dept., Berkeley, CA, 48109, United States of America, yangwang0803@berkeley.edu, Philip Kaminsky

Motivated by a capacity planning project undertaken with a biopharmaceutical firm, we explore the benefits of combining process flexibility with inventory to better respond to demand uncertainty. We consider a multi-plant multi-product multi-period supply chain model in which each plant is capable of producing multiple products as well as holding inventory, and characterize conditions under which inventory, flexibility, or a combination of the two are most beneficial.

2 - Optimal Investment in Support of Existing Drug and Development of New Drug

Zhili Tian, Assistant Professor, Florida International University, 11200 S.W. 8th Street, Miami, FL, United States of America, ztian@fiu.edu

Firms invest in the support of existing drug and R&D of new drug. While the investment fund comes from the net sales of the existing drug, a firm has to balance the investment in the two types of competing projects. We determine the optimal resource allocation between the marketing support of the existing product and developing a new product. We estimate the demand as function of investment in marketing. We derive the optimal investment policy for the above two types of investment.

3 - Nurse Staffing Decision in Nursing Homes

Min Chen, Florida International University, 10200 SW 8th St, Miami, FL, 33199, United States of America, mchen2@fiu.edu

Staffing is the dominant input in the production of nursing home services. This paper examined how skilled nursing facilities responded to the minimum nursing hours per resident day regulations. Panel data analyses of facility-level nursing inputs and outputs revealed that nursing homes strategically reallocated their staffing levels and skill mix, which could have important implications for quality management.

Co-Chair: Xiaobo Zhao, Professor, Tsinghua University, Shunde Building, Beijing, China, xbzhao@mail.tsinghua.edu.cn, Beijing, China

1 - Does Elicitation Method Matter? Behavioral and Neuroimaging Evidence from Capacity Allocation Game

Yukun Zhao, Department of Industrial Engineering, Tsinghua University, Department of Industrial Engineering, Tsinghua University, Beijing, 100084, China, zhaoyk1989@gmail.com, Lihong Wang, Yefen Chen, Xiaobo Zhao

Based on the allocation game, we conduct a normative-behavioral experiment and a neuroimaging experiment by adopting fMRI technique to investigate the elicitation-method effect under the direct-response method and the strategy method. No significant difference is observed in either ordering behaviors or brain activities between the two elicitation methods. Our results indicate that in multi-round game experiments without emotion features, the elicitation-method effect is not likely to exhibit.

2 - Transparency and Indirect Reciprocity in Social Responsibility: An Incentivized Experiment

Leon Valdes, Massachusetts Institute of Technology, Cambridge, MA, United States of America, lvaldes@mit.edu, Tim Kraft, Karen Zheng

We design an incentivized experiment to study the impact of transparency on consumers' valuations of a firm's social responsibility practices. We investigate how much of consumers' valuations can be attributed to indirect reciprocity. We also analyze how heterogeneity in prosocial orientation impacts the roles of transparency and indirect reciprocity. Our results demonstrate that consumers are willing to pay a higher price under a higher level of transparency.

3 - Social Influence and Quality Competition: An Experimental Study

Dayoung Kim, Cornell University, 301A, 114 East Avenue, Ithaca, NY, 14850, United States of America, dk668@cornell.edu, Vishal Gaur, Andrew Davis

We investigate the impact that different types of social information have on the market share and demand uncertainty of firms competing through service quality. In particular, we conduct a lab experiment, where a consumer chooses to visit one of two firms, which differ in their average service quality. Our results suggest that the presence and type of social information can dramatically impact the consumers' decisions, a firm's market share and demand uncertainty.

4 - The Effect of Supply Base on Ordering Behavior

Haresh Gurnani, Professor, Wake Forest University, School of Business and Center for Retail, Winston Salem, NC, 27106, United States of America, gurnanih@wfu.edu, Karthik Ramachandran, Saibal Ray, Yusen Xia

Previous experimental research in newsvendor problem has mostly focused on ordering from a single supplier; we investigate how the availability of multiple suppliers would influence the order size and allocation decisions with uncertain demand. We also study how the supply base impacts behavioral insights developed under a single supplier setting.

Environmental Application and Computational Aspects of Efficiency and Productivity Analysis

Cluster: Data Envelopment Analysis

Invited Session

Chair: Herbert Lewis, Associate Professor, Stony Brook University, College of Business, Stony Brook, NY, 11794-3775, United States of America, herbert.lewis@stonybrook.edu

1 - An Algebraic Modeling Language Package for Solving Large-Scale Data Envelopment Analysis Problems

Wen-Chih Chen, National Chiao Tung University, 1001 Ta Hsueh Rd., Hsinchu, Taiwan - ROC, wenchih@faculty.nctu.edu.tw, Yueh-shan Chung

Algebraic modeling languages for mathematical programming provide a flexible and powerful tool for DEA computation. This talk introduces an algebraic modeling language package for solving large-scale DEA problems. While taking the advantage of flexibility and powerful solvers from a modeling language, this package can solve larger-scale DEA problems without limitation on constraints and variables, and with better computational performance.

2 - Frontier Estimation via Penalized Concave Regression

Abolfazl Keshvari, Dr., Aalto University School of Business, Runeberginkatu 22-24, Helsinki, 00100, Finland, abolfazl.keshvari@aalto.fi

Concave regression is an important tool in estimating a productive efficiency frontier. However, computing this estimator is a very difficult and time consuming task. The computational burden rises very quickly with increasing numbers of observations. We develop an unconstrained quadratic programming (QP) problem to the (monotonic) concave regression, which outperforms the conventional constrained QP problem. Using our approach, we solve a problem with hundreds of observations in some seconds.

3 - Productivity Growth and Environmental Efficiency:**A Global Malmquist-Luenberger Index Analysis**

Jayanath Ananda, Dr, Central Queensland University, 120 Spencer Street, Melbourne, 3000, Australia, j.ananda@cqu.edu.au, Benjamin Hampf

The paper analyses the productivity of the urban water sector using the global Malmquist-Luenberger index while incorporating an undesirable output – greenhouse gas emissions. Findings indicate that the productivity growth of the sector has declined in cumulative terms. The water source, the level of wastewater treatment and production density showed a statistically significant influence on the relative efficiency of urban water utilities.

4 - Saving Water in California: using DEA to Allocate**Usage Reductions**

Herbert Lewis, Associate Professor, Stony Brook University, College of Business, Stony Brook, NY, 11794-3775, United States of America, herbert.lewis@stonybrook.edu, Diana Hagedorn, Thomas Sexton

Governor Brown of California has directed the State Water Resources Control Board to implement mandatory urban water reductions of 25%. In this paper, we use DEA in 5 of the 9 water use categories, comprising 95% of the state's water usage, to identify the reductions possible in each county through the elimination of inefficiency. Where the elimination of inefficiency is insufficient to meet the goal, we use a second linear programming model to allocate additional cuts in an equitable manner.

1 - Transmax 2: An Expanded Transit Route Covering Model

Richard Church, Professor, University of California, Santa Barbara, Santa Barbara, CA, 93106, United States of America, rick.church@ucsb.edu, Timothy Niblett

Current et al. (1984, 1985) were the first to suggest a routing problem to minimize distance and maximize demand coverage. This problem characterizes the principal goals of transit route design. Since that time there have been a number of formulations, involving elements like route extension and multiple route design. We discuss the TRANSMAX model of Curtin and Biba (2011) and based upon that propose a new, expanded formulation called TRANSMAX 2, which allows for greater flexibility.

2 - Max Flow with Buyout: Identifying The Minimum Number of Facilities/personnel Required to Meet Demand

Blair Sweigart, Operations Research Analyst, US Coast Guard, 216 Maryland Ave, Norfolk, VA, 23504, United States of America, dbsweigart@email.wm.edu

The USCG needs to ID deployability of personnel and mission impact. This reduces to a facility location problem: mission demands are demand nodes, personnel are potential facilities, arc capacities are time requirements. Objectives are: determine min. number of personnel needed to meet demand; ID if a person is critical. If not, ID the tradeoff cost. This is a modification of a max-flow algorithm that pushes excess out of the network intelligently to minimize the required number of personnel.

Planning Models in Electric Power Systems

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Anya Castillo, Federal Energy Regulatory Commission, 888 1st Street NE, Washington DC, United States of America, anya.castillo@ferc.gov

1 - Optimal Portfolio Investment and Coordinated Scheduling of an Energy Storage Merchant in the Energy

Roderick Go, Johns Hopkins University, 3400 N. Charles St., Ames Hall 313, Baltimore, MD, 21218, United States of America, rgo1@jhu.edu, Anya Castillo, Dennice F. Gayme, Sonja Wogrin

We assess strategic behavior of a merchant energy storage provider in the bulk power market through a bilevel model to represent sequential decisions in investment and operations. We model optimal portfolio investments based on siting, sizing, and technology mix, and explore the effect of strategic operations, such as coordinated scheduling, on decisions. We transform this model into a math program with equilibrium constraints (MPEC), and approximate and solve as a mixed integer program (MIP).

2 - Proactive Transmission Planning: A Case Study of the Eastern Interconnection

Evangelia Spyrou, PhD Student, Johns Hopkins University, 3400 N Charles Street, Dept of Geography, Johns Hopkins University, Baltimore, MD, 21218, United States of America, elina.spyrou@gmail.com, Benjamin Hobbs, Jonathan Ho, Randell Johnson, James Mc Calley

Traditional transmission planning procedures are being challenged by renewable integration due to their reactive character. Meanwhile academic literature proposes the concept of proactive transmission planning. A mixed integer linear program is applied to estimate the benefits of proactively considering response by generation investments to transmission investments. We attempt to examine features of planning procedures that could impede or facilitate optimal planning.

3 - Unit Commitment Approximations in Generation and Transmission Planning: Efficiency & Accuracy

Benjamin Hobbs, Professor, The Johns Hopkins University, 3400 North Charles Street, Baltimore, MD, United States of America, bhobbs@jhu.edu, Saamrat Kasina, Jonathan Ho, Sonja Wogrin

Alternative tight relaxations of unit commitment problems that enable large planning models to be solved with operating subproblems that capture ramp, start-up, and pmin limits and costs. We examine their performance in the context of generation and transmission expansion models, including a stochastic programming analysis of the western interconnection of North America.

4 - Reserve Determination Methods for Variable Generation

Robert Entriken, EPRI, 3420 Hillview Avenue, Palo Alto, CA, United States of America, rentrike@epri.com

We present results of a survey of existing practices in certain power system operators for determining operating reserve requirements for system operators faced with growing penetrations of variable renewables, such as wind or solar generators. Building on existing practices, we review methods proposed in planning and integration studies, as well as in academia, which may become useful as renewable penetrations increase.

Multi-Agent Decision-Making for Smart Grids Operation II

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Amin Kargarian, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15232, United States of America, amin.kargarian@gmail.com

1 - Distributed State Estimation and Energy Management in Smart Grids

Soumya Kar, Assistant Research Professor, Carnegie Mellon University, Electrical and Computer Engineering, CMU, Pittsburgh, PA, 15232, United States of America, soumyak@andrew.cmu.edu

Generally, it is expected that the grid of the future would differ from the current system by the increased integration of distributed generation, distributed storage, demand response, power electronics, and communications and sensing technologies. In this paper, we discuss distributed approaches, all based on

consensus+innovations, for two common energy management functions: state estimation and economic dispatch.

2 - Computational Look-ahead SCOPF via ADMM

Sambuddha Chakrabarti, Graduate Student, UT Austin, 1616 Guadalupe Street, Austin, TX, 78705, United States of America, sambuddha.chakrabarti@gmail.com, Matt Kraning, Ross Baldick, Eric Chu, Stephen Boyd

We present computational scheme and results of the ADMM based Proximal Message Passing as applied to solve the look ahead SCOPF to limit post fault line temperature and current to safe values wrt next set of outages.

3 - Adaptive Bidding Strategies of a Load Serving Entity with Distributed Energy Resources

Jhi-Young Joo, Assistant Professor, Missouri University of Science and Technology, 301 W. 16th St, 235 Emerson Electric Co. Hall, Rolla, MO, 65409, United States of America, joojh@mst.edu

This talk concerns two problems solved by an agent, a load serving entity (LSE), within a large-scale energy system. An LSE with different types of demand and energy resources optimizes energy schedule by mathematical programming. On the other hand, to optimize bids into the markets, a learning algorithm is used to adapt to the uncertain market conditions and rewards. The interdependencies between these two problems within an agent and among multiple agents are examined.

4 - Active Distribution Grid Operation: A System of Systems Framework

Amin Kargarian, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15232, United States of America, amin.kargarian@gmail.com

A system of systems framework is presented to operate an active distribution grid composing of several independent entities. The grid structure includes two layers where the distribution company is in upper layer and microgrids are in lower layer. A hierarchical optimization algorithm is presented to optimally operate the entire active distribution grid.

Forest & Timber Management

Sponsor: ENRE – Environment II – Forestry

Sponsored Session

Chair: Nick Kullman, Masters Student, University of Washington, 360 Bloedel Hall, Seattle, WA, United States of America, nick.kullman@gmail.com

1 - A Joint Model of Strategic Forest Management, Capacity Expansion and Logistics

Eldon Gunn, Dalhousie University, Halifax, NS, B3H 4R2 Eldon.Gunn@Dal.Ca

This paper presents a mixed integer programming model that enables the integrated analysis of strategic forest management, forest industry capacity and the transport logistics that connect them. Some insights that arise from this model are discussed.

2 - Route Selection in Forest Transportation

Patrik Flisberg, Creative Optimization, Tokai, 7945 Cape Town, South Africa, pafli@mweb.co.za, Mikael Ronnqvist, Gunnar Svenson

Determining the best route for logging trucks is difficult as many road features need to be considered. We describe a system called Calibrated Route Finder that is used to invoice about 50% of all 2 million forest transports done annually in Sweden. This system has gradually been developed based on reporting and requests from the users. Recently, we have included detailed description on stops, acceleration and breaking to describe emissions and times. We report on detailed testing and analysis.

3 - Joint Production of Timber and Sitka Deer Habitat Capability on the Tongass National Forest

Michael Bevers, Dalhousie University, Halifax, NS, B3H 4R2 beversm@gmail.com, Curt Flather, Yu Wei, Greg Hayward, Mary Friberg, Thomas Hanley, Ben Case

The Tongass NF uses the FRESH model to estimate Sitka deer habitat capability measured in deer-days based on digestible dry matter and protein from hundreds of forage species occurring in dozens of vegetative communities potentially affected by timber harvests. Landscape effects on deer are accounted for using a moving window analysis. We developed a MILP formulation incorporating FRESH calculations into a whole-stand timber harvest scheduling model for spatially optimizing joint production of timber and deer habitat capability on management units of the Tongass NF.

Chair: Cliff Ragsdale, Bank of America Professor, Virginia Tech, Dept. of Business Information Technology, Pamplin Hall, Room 1007, Blacksburg, VA, 24061, United States of America, Cliff.Ragsdale@vt.edu

1 - Encouraging Professionalism in the Classroom

Moderator: Cliff Ragsdale, Bank of America Professor, Virginia Tech, Dept. of Business Information Technology, Pamplin Hall, Room 1007, Blacksburg, VA, 24061, United States of America, Cliff.Ragsdale@vt.edu, Panelists: James Cochran, Ronald Klimberg, Kevin Scheibe

One of a professor's roles as an educator is to prepare students for the professional workplace. The panelists in this session will share ideas related to how we might treat various aspects of our courses and classrooms as simulators of the professional workplace. Open discussion of these ideas with the audience is encouraged.

Multilevel Optimization Problems in Energy

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Sauleh Siddiqui, Assistant Professor, Johns Hopkins University, 3400 N. Charles St. Latrobe 205, Baltimore, MD, 21218, United States of America, siddiqui@jhu.edu

1 - Strategic Bidding in Multi-unit Auctions with Storage of Electric Energy

Chiara Lo Prete, Assistant Professor Of Energy Economics, The Pennsylvania State University, 213 Hosler Building, University Park, PA, 16802, United States of America, chiaraloprete@psu.edu, Uday Shanbhag

Increased supply variability due to the integration of renewables has raised interest in energy storage resources providing flexibility in the operation of electricity systems. One of the key issues to be addressed by market operators relates to the participation of these resources in wholesale energy markets. We develop a theoretical framework to analyze how the inclusion of storage affects incentives and opportunities for strategic bidding behavior in electricity markets.

2 - An Exact Solution Method for Binary Equilibrium Problems and the Power Market Uplift Problem

Daniel Huppmann, Postdoctoral Fellow, Johns Hopkins University, German Institute for Economic Research (DIW Berlin), 3400 N. Charles St., Baltimore, MD, 21218, United States of America, dh@dergelbesalon.at, Sauleh Siddiqui

We propose a novel method to find Nash equilibria in games with binary decision variables by including compensation and incentive-compatibility directly into an optimization framework in lieu of using a linearization, or relaxation of integrality conditions. The method endogenizes the trade-off between efficiency and compensation payments necessary to align incentives of players. We provide existence results and conditions under which this problem can be solved as a mixed-binary linear program.

3 - How Proactive Transmission Investments Can Incentivize Social Welfare Improving Gencos Investments?

Enzo Sauma, Pontificia Universidad Catolica de Chile, Santiago, Chile, esauma@ing.puc.cl, David Pozo, Javier Contreras

We propose a proactive three-level equilibrium model for power transmission and generation expansion. The lower level models the market outcome; the intermediate level models the equilibrium in generation capacity expansion; and the upper level models the transmission expansion. The second and third levels are modeled as an Equilibrium Problem with Equilibrium Constraints. We study how proactive transmission investments can incentivize generation investments that improve social welfare.

4 - The Impact of Withholding Flexibility: An Application to Ramp Bidding in Electricity Markets

Ekaterina Moiseeva, KTH Royal Institute of Technology, SE-100 44, Stockholm, Sweden, moiseeva@kth.se, Mohammad Reza Hesamzadeh, Sonja Wogrin

We compare a one-level and a bilevel equilibrium game in which firms' flexibility is either: decided at the same time as their production decisions; or sequentially. We analyze the impact that different market structures have on the equilibrium outcomes. Our findings are applied to the ramp bidding game in electricity markets. It is observed that electricity producers may strategically declare a lower ramp rate if they expect such decision to maximize their profit in the production stage.

Spatial Optimization and Conservation Reserve Design

Sponsor: ENRE – Environment I – Environment and Sustainability

Sponsored Session

Chair: Bistra Dilkina, Assistant Professor, Georgia Institute of Technology, Klaus Bldg 1304, Atlanta, GA, 30332-0765, United States of America, bdilkina@cc.gatech.edu

1 - Land Development Uncertainties in the Dynamic Reserve Network Design Problem

Nahid Jafari, Postdoctoral Research Associate, University of Georgia, 180 East Green St., Warnell School of Forestry and Natural R, Athens, GA, 30602, United States of America, nahid.jafari@uga.edu, Clinton Moore

The (conservation) reserve network design problem is a challenge to solve because of the spatial and temporal nature of the problem, stochastic action costs and dynamic land markets. To plan cost-effective conservation over time under stochastic uncertainties, we propose multi-period MIP models for the budget-constrained selection of fully connected sites. The objective is to maximize a summed conservation value for a subset of site availability scenarios at the end of the planning time horizon.

2 - Wildlife Corridors in Harvest Scheduling Models: A Case Study in Northern Sweden

Rachel St. John, University of Washington, Box 352650, Seattle, WA, 98195-2650, United States of America, rachelstjohn1@gmail.com, Sandor Toth

In northern Sweden, commercial forestry and reindeer husbandry compete for forest resources. The former relies on timber - the latter on lichen. We present a new model for maximizing net timber revenues while maintaining a high quality corridor system for reindeer. The model can control such geometric characteristics as corridor length and width by incorporating path finding technology in a mixed integer programming framework. We illustrate the model with a case study in Sweden.

3 - Spatial Considerations and Optimum Reserve Design for Multiple Species

Hayri Onal, University of Illinois, Urbana IL 61801, United States of America, h-onal@illinois.edu, Yicheng Wang

We present a linear MIP model for designing a conservation reserve system for multiple species where compactness and connectivity of the reserves are imposed at species level. We consider both structural connectivity and functional connectivity of the selected sites. An empirical application to the protection of ten state endangered bird species in Illinois will be presented.

4 - Optimal Design of Nature Reserves Considering Connectivity and Buffer Zones

Eduardo Alvarez-miranda, Universidad de Talca, Merced 437, Curicó, Chile, ealvarez@utalca.cl, Ivana Ljubic, Markus Sinnl, Marcos Goycoolea

In this talk we present general ILP models, which address two spatial requirements of nature reserves: connectivity, to avoid spatial fragmentation; and the presence of buffer zones surrounding so-called core areas. Extensive experimental results on synthetic and realistic instances show the effectiveness of a specially tailored algorithm in providing optimal solutions in short computing times. Other desired spatial properties, such as compactness, are also discussed.

Daniel H. Wagner Prize Competition III

Cluster: Daniel H. Wagner Prize Competition

Invited Session

Chair: Allen Butler, President & CEO, Daniel H. Wagner Associates, Inc., 2 Eaton Street, Hampton VA 23669, United States of America, Allen.Butler@va.wagner.com

1 - Machine Learning Framework for Predicting Vaccines Immunogenicity

Eva Lee, Georgia Institute of Technology, Atlanta, GA, United States of America, eva.lee@gatech.edu

The ability to better predict how different individuals will respond to vaccination and to understand what best protects individuals from infection greatly facilitates developing next-generation vaccines. We present a general-purpose, machine-learning framework for discovering gene signatures that can predict vaccine immunity and efficacy. Our models offer unique features not found in other models simultaneously. We will describe the implemented results for yellow fever and influenza vaccines, and highlight their implications for public health and precision medicine.

Decision Analysis Society Awards Session

Sponsor: Decision Analysis

Sponsored Session

Chair: Eric Bickel, Associate Professor & Director, OR&IE, U. of Texas at Austin, ETC 5.128C, Austin, TX, United States of America, ebickel@utexas.edu

1 - 2015 Decision Analysis Student Paper Award

Canan Ulu, Assistant Professor, Georgetown University, McDonough School of Business, Washington, DC, 20057, United States of America, Canan.Ulu@georgetown.edu, Robert Hammond

The Student Paper Award is given annually to the best decision analysis paper by a student author, as judged by a panel of the Decision Analysis Society of INFORMS. Students who did not complete their Ph.D. prior to May 1, 2014 are eligible for this year's competition.

2 - 2015 Decision Analysis Publication Award

Kevin Mccardle, Professor, UCLA, Los Angeles, CA, kevin.mccardle@anderson.ucla.edu

This award is given annually to the best decision analysis article or book published in the second preceding calendar year (i.e. calendar year 2013 for consideration in 2015). The intent of the award is to recognize the best publication in "decision analysis, broadly defined." This includes, but is not limited to, theoretical work on decision analysis methodology (including behavioral decision making and non-expected utility theory), descriptions of applications, and experimental studies.

3 - Practice Award

Frank Koch, Consultant, 2510 Cleveland St, Eugene, OR, 97405, United States of America, Frank@kochdecisions.com

The Decision Analysis Practice Award is awarded to the best example of decision analysis practice as judged by the Decision Analysis Practice Award Committee. The purpose of the award is to publicize and encourage outstanding applications of decision analysis practice. We will present the finalists and this year's winner.

4 - 2015 Ramsey Medal Award

Eric Bickel, Associate Professor & Director, OR&IE, U. of Texas at Austin, ETC 5.128C, Austin, TX, United States of America, ebickel@utexas.edu

The Ramsey Medal of the Decision Analysis Society is awarded for distinguished contributions in decision analysis. Distinguished contributions can be internal, such as theoretical and procedural advances in decision analysis, or external, such as developing or spreading decision analysis in new fields. We will introduce the 2015 Ramsey Medal winner, followed by a presentation by the winner.

Freight Transportation

Contributed Session

Mohammad Torkjazi, PhD Student, University of South Carolina, 620 Heidt St Apt 1, Columbia SC 29205, United States of America, torkjazi@email.sc.edu

1 - An Optimization Model to Assess Freight Movement between Rail and Road

Lokesh Kalahasthi, Research Assistant, Rensselaer Polytechnic Institute, 110 8th Street, Room JEC 4027, Troy, NY, 12180, United States of America, kalahl@rpi.edu, Trilce Encarnacion

The goal of the paper is to obtain an optimization model that gives a freight traffic assignment on a combined network of road and rail; that could be used to assess the freight modal split including vehicle types and intermodal transfers. The challenge is to incorporate various constraints shippers, carriers and receivers face in using rail and truck; such as shipment size restrictions, transfer time restrictions, variations in the costs, etc. The goal is to obtain insights into methodologies.

2 - A Routing Model for Multicommodity Multimodal Freight Shipment under Network Disruptions

Md Majbah Uddin, Graduate Research Assistant, University of South Carolina, 300 Main Street, Civil and Environmental Engineering, Columbia, SC, 29208, United States of America, muddin@cec.sc.edu, Nathan Huynh

This study proposes a model to route multicommodity shipments on an intermodal freight transport network, where network elements are subject to unexpected disruptions. A stochastic mixed integer program is formulated which minimizes not only operational costs but also penalty cost of unmet demand. To solve this model, sample average approximation algorithm is utilized. Numerical tests reveal that the model is capable of finding high quality solutions for a large-scale, real-world network.

3 - Container Shipping Alliances: A Cooperative Game Theory Simulation

Philipp Rau, WHU - Otto Beisheim School of Management, In den Hüfen 5, Wehr, 79664, Germany, philipp.rau@whu.edu, Stefan Spinler

Overcapacity and pressure on margins are keeping the container shipping industry's environment challenging. This has led carriers to enter vessel sharing agreements and alliances, resulting in a quasi-consolidation. To address the investment problem in an industry that has moved to a more cooperative setting, we develop a cooperative game theory simulation model. We assess impact of competitive intensity and investment heuristics on industry capacity, alliance stability, and carrier financials.

4 - How Drayage Schedule Affect the Gate Appointment System at Container Terminals

Mohammad Torkjazi, PhD Student, University of South Carolina, 620 Heidt St. Apt. 1, Columbia, SC, 29205, United States of America, torkjazi@email.sc.edu, Nathan Huynh

The lack of good communication between drayage companies and container terminals is one of the contributing causes for long queues at the terminal gates. To improve the communication process, a comprehensive model of this process is required. This study proposes a mathematical formulation which reflects the process of communication from the view of both sides in detail. Also, a three-step algorithm is proposed to solve the model and tested on hypothetical problems of different sizes.

Sponsored Session

Chair: Senay Solak, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, solak@isenberg.umass.edu

1 - FAA's Modernized Terminal Area Forecast

Dipasis Bhadra, Economist, FAA, 800 Independence Avenue, SW, Washington, DC, 20591, United States of America, dipasis.bhadra@faa.gov

The Terminal Area Forecast tool is designed to integrate views of local, national and international flow of activities and capture effects of socioeconomic and technological factors on aviation. The tool is used to understand airports, passenger routing, and aircraft network impact of NEXTGEN development. It also provides projections for future air transport activity through time using future passengers by origin and destination (O&D) market routes and networks (i.e., segment flows); aircraft operations by markets and network routes; and integrates operations and passenger flows through the National Airspace System (NAS) network. The forecasting tool is used to help understand the policies, procedures, and environmental regulations.

Integrated Vehicle Routing Problems II

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Weihong Hu, Georgia Tech, Atlanta, GA, United States of America, weihongh@gatech.edu

1 - Heuristics for an Integrated Inventory Routing and Freight Consolidation Problem of Perishable Goods

Weihong Hu, Georgia Tech, Atlanta, GA, United States of America, weihongh@gatech.edu, Alejandro Toriello, Maged Dessouky

We study a novel mixed integer programming model that integrates freight consolidation and inventory routing of perishable goods. We propose an iterative framework that combines a decomposition procedure involving three subproblems and an optimization-based local search scheme. Experiments based on empirical distributions of real data demonstrate the effectiveness of both solution approaches for small to medium size problem instances. We further extend the approach for larger problem instances.

2 - Reoptimization Capabilities of Benders Decomposition for the Stochastic Production Routing Problem

Yossiri Adulyasak, HEC, Canada, yossiri.adulyasak@hec.ca, Jean-Francois Cordeau, Raf Jans

We present two approaches that exploit the reoptimization capabilities to speed up the Benders decomposition algorithms for the the production routing problem (PRP), which is a generalization of the inventory routing problem (IRP), under demand uncertainty. The first approach is applied to the two-stage stochastic PRP in the context of a sample average approximation (SAA) method. The second approach is embedded into a rollout algorithm for the multi-period stochastic PRP. Computational results are presented.

3 - Resource-Constrained Dynamic Programming with "Hot-Starting" for the Elementary Shortest

Ahmad Jarrah, George Washington University, Washington, DC, United States of America, jarrah@gwu.edu, Luis Novoa, Xinhui Zhang, Jonathan Bard

We develop the complete theory for designing a dynamic program (DP) for solving elementary shortest path problems with idle time cost. This is integrated with bidirectional extensions, decremental state-space relaxation, 2-cycle elimination and sharpest-to-date restricted sets of unreachable nodes. We describe new hot-starting procedures to significantly improve the DP's run time. The approach can be used in solution algorithms for the capacitated VRPTW problem with idle time cost.

Joint Session TSL/Public Sector: Resilience in Transportation Infrastructure Systems

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Lili Du, Assistant Professor, Illinois Institute of Technology, 3201 S. Dearborn Street, Chicago, IL, United States of America, ldu3@iit.edu

1 - A System-of-Systems Approach toward a Resilient, Dynamically Interdependent Transportation Network

Elise Miller-Hooks, Professor, University of Maryland, College Park, MD, elisemh@umd.edu, Neza Vodopivec

A transportation network's vulnerability to damage depends on the vulnerabilities of other critical systems (i.e. energy, telecommunications, building infrastructure). In a disaster, interdependencies both within a system and between different systems are reshaped dynamically as people take adaptive actions to mitigate impact and repair networks. We explore the interactions between changes in network structures and the evolution of interdependencies between systems.

2 - Infrastructure Investment Decisions in Multimodal Intercity Transportation Networks

Bo Zou, University of Illinois at Chicago, 2095 Engineering Research Facility, 842 W. Taylor Street (M/C 246), Chicago, IL, 60607-7023, United States of America, bzou@uic.edu, Lili Du, Mohamadhosssein Noruzoliaee

Infrastructure investment in multimodal intercity transportation networks involves maintaining existing capacity and adding new capacity to infrastructure facilities. To achieve maximum returns, the infrastructure planner should understand the behavior of players in the network, especially their responses to investment. We develop a bi-level framework to model the decision process, where the upper level pursues social welfare maximization subject to lower-level supply-demand equilibrium.

3 - Optimal Location and Operation of Railroad First-response Resources

Siyang Xie, PhD Student, University of Illinois at Urbana-Champaign, Urbana, IL, United States of America, sxie13@illinois.edu, Yanfeng Ouyang

Railroad incidents such as derailments often seriously impact a large region and block traffic in nearby highway networks, which in turn hinders efficiency of first response efforts. In this paper, we develop a reliable optimization model to characterize and guide positioning and utilization of railroad first-responder resources. Customized solution techniques are employed to effectively solve the model and to provide decision support.

4 - Hazmat Network Design using Time-dependent Consecutive Road Closures Considering Intermediate Stops

Tolou Esfandeh, University at Buffalo, SUNY, Department of Industrial & Systems Eng., 339A Bell Hall, Buffalo, NY, 14260, United States of America, tolouesf@buffalo.edu, Changhyun Kwon, Rajan Batta

We analyze the regulator's problem of identifying the sections of the network and their corresponding times that should be closed to hazmat transportation in a time varying network. We assume that the closure of a section is consecutive in time and the hazmat carriers are allowed to stop in the middle of their trip. We develop a column generation algorithm that accounts for routing and scheduling alternatives which not only reduce the risk but also accounts for drivers' cost perspectives.

Arc Routing Problems and Applications

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Mehmet Basdere, Northwestern University, 2145 Sheridan Road, Tech Institute C210, Evanston, IL, 60208, United States of America, mehmetbasdere2016@u.northwestern.edu

1 - The Windy Rural Postman Problem with a Time-dependent Zigzag Option

Rui Zhang, University of Maryland, College Park, MD, ruizhang@rhsmith.umd.edu, Erwin Pesch, Jenny Nossack, Bruce Golden

We focus on the windy rural postman problem with an additional zigzag option. It combines two classes of arc routing problems known before: those with zigzag options and those with time dependencies. We present two MIP formulations and suggest exact solution approaches. Furthermore, we analyze the effects of zigzag and time window options on the objective value.

2 - Arc Routing Problems to Restore Connectivity of a Road Network after a Disaster

Vahid Akbari, Koc University, College of Engineering, Sariyer, Istanbul, 34450, Turkey, vakbarighadkolaei@ku.edu.tr, Sibel Salman

Routes should be generated to reconnect a disconnected road network in the shortest time by opening blocked roads. We study two versions: 1) minimize the time to reconnect the network, 2) maximize the total prize of components reconnected within a time limit. We develop MIP formulations and heuristic algorithms.

3 - Arc Routing, Vehicle Routing and Turn Penalties

Thibaut Vidal, Professor, Pontifícia Universidade Católica do Rio de Janeiro, R. Marquês de São Vicente, 225 - Gávea, Rio de Janeiro, 22451-900, Brazil, vidalt@inf.puc-rio.br

We introduce a structural decomposition for arc routing problems, in which all decisions about driving lanes, turns, edge traversal and service orientations are addressed via dynamic programming. We show that a neighborhood based on moves on the sequences of services with optimal traversal decisions can be explored in $O(1)$ per move. The approach is integrated into two classical metaheuristic frameworks, leading to remarkable results for many arc routing variants, with possible turn penalties.

4 - The Lock Free Arc Touring Problem with an Application to Marathon Course Design

Mehmet Basdere, Northwestern University, 2145 Sheridan Road, Tech Institute C210, Evanston, IL, 60208, United States of America, mehmetbasdere2016@u.northwestern.edu, Karen Smilowitz, Sanjay Mehrotra

In this talk, we present a new type of arc routing problem in the marathon course design setting. The aim is to find a valid marathon course that minimizes the average distance to the medical facilities within the region of interest without preventing the public access to those facilities while visiting a predetermined subset of landmark streets. A novel solution approach which utilizes visit restrictions and new valid inequalities are introduced.

■ MD70

Railway Analytics

Sponsor: Railway Applications

Sponsored Session

Chair: Qing He, Assistant Professor, SUNY Buffalo, 313 Bell Hall, Buffalo, NY, 14051, United States of America, qinghe@buffalo.edu

1 - Multi-task Learning for Joint Prediction of Failure Time and Failure Types of Train Wheels

Weixin Wang, University at Buffalo, 1357 Millersport Hwy Apt 8, Buffalo, NY, 14221, United States of America, weixinwa@buffalo.edu, Zhiguo Li, Qing He

The failures of train wheels account for half of all train derailments. Both failure time and failure types of wheels are critical for wheel maintenance. Failure time prediction is a regression task, whereas failure type is a classification task. In this work, we propose a multi-task learning approach to jointly predict these two tasks by using a common input space to achieve more desirable results.

2 - Diagnostic Method to Measure the Impact of Railway Traffic Heterogeneity from Field Operations Data

Mei-Cheng Shih, University of Illinois, U-C, 205 North Mathew Ave, Urbana, IL, 61801, United States of America, mshih2@illinois.edu, C. Tyler Dick

Growing demand for freight rail transportation of crude oil and domestic intermodal traffic has increased both the volume and disparity in types of trains operated on many mainlines. Differences in train characteristics and priority, has become one of the major causes of congestion. Based on actual train operations data from a Class 1 railroad, this study develops two indices that help railroads measure the degree to which traffic heterogeneity impacts observed operating performance.

3 - Evaluating Track Maintenance Aggregation in Extended Work Windows on Freight Railroad Lines

Alexander Lovett, Graduate Research Assistant, University of Illinois at Urbana-Champaign, 205 N Mathews Ave, B118 Newmark Lab, Urbana, IL, 61801, United States of America, alovett2@illinois.edu, Christopher Barkan, C. Tyler Dick

Combining track maintenance activities into extended work windows can improve maintenance efficiency. Efficiencies come from reduced set-up time and efforts common to multiple activities at the cost of being more disruptive to train operations. Aggregating activities requires adjusting maintenance cycles which may increase accident risk or maintenance frequency. A methodology for evaluating the costs of aggregating track maintenance into an extended work window is presented.

Transportation Network Modeling and Design

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Antoine Petit, UIUC, Urbana, IL, United States of America, apetit@illinois.edu

1 - Generalized Statistical Traffic Assignment: Methodology, Properties and Variance Analysis

Sean Qian, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, seanqian@cmu.edu, Wei Ma

The traffic assignment problem has been typically used to estimate deterministic network traffic volumes. Day-to-day variations of link and path flow are unfortunately overlooked, but often times they are required for modeling network uncertainty and resilience. We propose a generalized statistical traffic assignment model where variance of demand, route choices and individual perception are considered. We show some statistical properties of this model and discuss the variance analysis.

2 - Construction Schedule Design Considering Cost, Traffic Delay and Energy Consumption

Laura E. Ghosh, UIUC, Urbana, IL, United States of America, vingerh1@illinois.edu, Khaled El-Rayes, Ahmed Z. Abdelmohsen, Yanfeng Ouyang

A model that determines the optimal freeway maintenance schedule over a construction season is presented. It optimally selects work-zone length, workday start time and duration, lane and shoulder widths, temporary lane construction and access strategy in order to (i) minimize the costs of construction-related traffic delay and corresponding mitigation measures and (ii) minimize construction related energy consumption.

3 - Flexible Transit Network Design with and Without Branching under Spatially Heterogeneous Demand

Antoine Petit, UIUC, Urbana, IL, United States of America, apetit@illinois.edu, Yanfeng Ouyang

While public transportation systems are usually designed with fixed routes, this work presents an alternative flexible-route transit system where vehicles travel within predetermined areas in response to trip demand to provide door-to-door service. Two additional features will be considered in the network design, hybrid structure and local branching.

4 - Generalized Bounded Rationality and Robust Multi-Commodity Network Design

Changhyun Kwon, Associate Professor, University of South Florida, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, chkwon@usf.edu, Longsheng Sun, Mark Karwan

When the route-choice behavior of network users are uncertain, the notion of bounded rationality has been used to allow users to choose sub-optimal routes whose length is within a certain bound. In this paper, we provide another framework to explain such bounded rationality assuming that network users make perfectly rational route decisions, but with perception error in link costs. By showing that some cases of the perception error model are equivalent to the bounded rationality models, we establish the notion of generalized bounded rationality. We demonstrate how the notion of generalized bounded rationality can be used for robust multi-commodity network design problems and provide computable optimization frameworks based on both links and paths. We illustrate our approaches in the context of hazardous materials transportation.

1 - Modeling Air Quality Data based on Physical Dispersion Processes

Xiao Liu, IBM, Singapore, liuxiao@sg.ibm.com

In this paper, we investigate a statistical modeling approach based on a commonly used physical dispersion model, called the scalar transport equation. The relationship between the proposed spatial-temporal model and the physical model is well established. The model describes the pollutant concentration by a non-stationary random field with a space-time non-separable and anisotropic covariance structure.

2 - Remaining Useful Life Prediction using Mixed Effects Model with Mixture Prior Distributions

Raed Al Kontar, UW Madison, Eagle Heights 301J, Madison, WI, United States of America, alkantar@wisc.edu, Junbo Son, Shiyu Zhou

In Modern engineering systems, pre-mature failure has become quite rare. Thus, degradation signals used for prognosis are often imbalanced. Such imbalanced data may hinder accurate remaining useful life prediction especially in terms of detecting pre-mature failures as early as possible. We propose a degradation signal based RUL prediction method to address the imbalance in data. This method captures the characteristics of different groups and provides real time updating of an in-service unit

3 - An OSA Detection Approach using a Discriminative Hidden Markov Model

Xi Zhang, Assistant Professor, Peking University, 5 Yiheyuan Rd., Beijing, 100871, China, xi.zhang@pku.edu.cn, Changyue Song, Kaibo Liu

We proposed a novel detection approach for obstructive sleep apnea (OSA) based on ECG signals by considering the temporal dependency. A discriminative hidden Markov model (HMM) and corresponding parameter estimation algorithms are provided, and a real case study shows that a competitive performance including accuracies of 94.3% for per-recording classification and 86.2% for per-segment OSA detection with satisfactory sensitivity and specificity were achieved.

4 - Quantification and Monitoring on Ecommerce Reviews Dataset

Suoyuan Song, HKUST, Dept. of IELM, HKUST, Clear Water Bay, Kowloon, Hong Kong - PRC, songsuoyuan@gmail.com, Fugee Tsung

Recently, the boom of e-merchants have attracted researchers on analyzing those text-rich data. Unfortunately, these technologies have drawn little attention in statistics and quality area. In this article, we aim to (1) use text mining technologies to first quantify customer reviews, and (2) build statistical model to monitor those text-rich reviews data.

Co-Chair: David Coit, Professor, Rutgers University, Piscataway, NJ, United States of America, coit@rci.rutgers.edu

1 - A Gaming Model for Outsourcing Maintenance under Uncertain Fleet Expansion

Tongdan Jin, Texas State University, 601 University Drive, San Marcos, TX, United States of America, tj17@txstate.edu, Shuying Li, Hong-zhong Huang

We propose a multi-criteria, performance-based maintenance contract to maximize the utilities of the customer and the supplier under principal-agent model. We prove that supplier's decision on maintenance time, spares stocking and repair capacity are fully observable to the customer, hence ensuring fully efficient service delivery with no moral hazards. We further show that customers are incentivized to share advance demand information with the supplier for new product acquisition.

2 - A Survey of Condition-based Maintenance Policies for Deteriorating Systems

Suzan Alaswad, Assistant Professor, Zayed University, Kalifa City B, Abu Dhabi, United Arab Emirates, Suzan.Alaswad@zu.ac.ae, Yisha Xiang

This paper reviews CBM literature highlighting the various stochastic modeling approaches. This paper classifies the CBM models based on the system stochastic degradation model (i.e. whether the degradation state is discrete or continuous) into three deterioration models: discrete, proportional hazard model (PHM), and continuous, and surveys existing CBM models based on this classification for both single and multi unit systems.

3 - Markov Additive Processes for Degradation with Jumps under Dynamic Environments

Yin Shu, University of Houston, E206 Engineering Bldg.2, Houston, TX, 77204, United States of America, yinshulx@gmail.com, Qianmei Feng, Edward Kao, Hao Liu, David Coit

We use Markov additive processes to integrally handle the complexity of degradation including internally- and externally-induced stochastic properties with complex jump mechanisms. We derive the Fokker-Planck equations for such processes, based on which we derive explicit results for life characteristics represented by infinitesimal generator matrices and Levy measures. The superiority of our models is their flexibility in modeling degradation data with fluctuation under dynamic environments.

4 - Joint Burn-in and Imperfect Condition-based Maintenance for N-subpopulations

Yisha Xiang, Assistant Professor, Lamar University,
2626 Cherry Engineering Building, Beaumont, TX, 77710, United States of America, yxiang@lamar.edu, David Coit

For some engineering design and manufacturing applications, particularly for evolving and new technologies, some populations of manufactured parts or devices are heterogeneous and consist of a small number of different subpopulations. In this study, we propose a joint burn-in and imperfect condition-based maintenance model with consideration of random effects within subpopulations. Numerical examples are provided to illustrate the proposed procedure.

Deep Dive on Open Innovation – Papers and Discussants

Cluster: New Product Development
Invited Session

Chair: Jeremy Hutchison-Krupat, Professor, University of Virginia, Charlottesville, VA 22901, United States of America, KrupatJ@arden.virginia.edu

1 - Optimal Shapes of Innovation Pipelines

Joel Wooten, University of South Carolina, Columbia, SC, United States of America, joel.wooten@moore.sc.edu, Sriram Venkataraman

New product introductions often occur via R&D pipelines. We explore the optimal number of innovation options to pursue in this complex managerial process. A stylized game simulation of the pharma industry provides additional evidence for our problem.

2 - Discussant

Sanjiv Erat, UCSD, Gilman Drive, La Jolla, CA, United States of America, serat@ucsd.edu

This talk will offer a discussion/critique of the paper titled “Optimal Shapes Of Innovation Pipelines.

3 - How Much Better is Open Innovation?

Sebastian Fixson, Babson College, Tomasso Hall 226, Babson Park, MA, 02457, United States of America, sfixson@babson.edu, Tucker Marion

Over the past 15 years research has emerged that describes many advantages of open innovation, such as unearthing ideas that better match customer needs and/or problem specifications. In this paper, we study in detail the new product development process of a single organization that makes extensive use of external actors throughout its process, and explore the corresponding performance implications.

4 - Discussant

Yi Xu, Associate Professor, Smith School of Business, University of Maryland, College Park, MD, 20742, United States of America, yxu@rhsmith.umd.edu

This talk will offer a discussion/critique of the paper titled “How Much Better Is Open Innovation?

Simulation in Healthcare

Sponsor: Simulation
Sponsored Session

Chair: Tahir Ekin, Assistant Professor, Texas State University, 01 University Dr. McCoy Hall 411, San Marcos, TX, 78666, United States of America, t_e18@txstate.edu

1 - Simulation of Hospital Outpatient Clinics

Lawrence Fulton, Assistant Professor, Texas Tech University, 703 Flint Ave, Lubbock, TX, United States of America, larry.fulton@ttu.edu, Nathaniel Bastian

MedModel was used to provide decision support for a hospital's outpatient clinic organization. Variables of interest included cost, capitation rate, utilization, and throughput. Outpatient areas evaluated included primary care clinics, OB/GYN, pediatrics, internal medicine, same-day surgery, orthopedics, psychology / psychiatry, social work service, and physical therapy / occupational therapy. The modeling demonstrates the usefulness of healthcare simulation for organizational change.

2 - The Use of Lindley's Entropy in Dynamic Sampling Decisions

Rasim Muzaffer Musal, Associate Professor, Texas State University, 601 University Dr., McCoy Hall 411, San Marcos, TX, 78666, United States of America, rm84@txstate.edu, Tahir Ekin

Neyman Allocation (NA) is used to stratify Medicare payments to create relatively homogeneous strata. These strata are assumed to provide a relatively more homogeneous over-payment sub-populations. We suggest an extension to NA by the use of Lindley's expected information gain measure to make efficient sampling decisions. In doing so a novel application is presented under simulated scenarios. A comparison between alternative methods is illustrated.

3 - Using Markov Chain Monte Carlo for Input Models of Surgery Duration in a Multi-specialty Department

Louis Luangkesorn, Research Assistant Professor, University of Pittsburgh, 1048 Benedum Hall, Department of Industrial Engineering, Pittsburgh, PA, 15261, United States of America, lol11@pitt.edu, Zeynep Filiz Eren Dogu

The variety of procedures in a surgery suite means that even with several years of data many surgical cases will have little or no historical data for use in predicting case duration. Parameterizing duration is needed for other procedures such as stochastic optimization. We combine expert judgement, expert classification of procedures by complexity category and historical data in a Markov Chain Monte Carlo (MCMC) model to parameterize cases and test the result against other methods.

4 - Medicare Fraud Analytics using Cluster Analysis

Babak Zafari, The George Washington University School of Business, 2201 G Street NW, Fungler Hall, Suite 415, Washington, DC, United States of America, zafari@gwu.edu, Paulo Macedo, Sewit Araia

In this work, we use of cluster analysis to group healthcare providers based on similar billing patterns. In detecting outliers, comparing providers based on self-reported specialty can cause false positives due to specialization. We use BETOS codes to categorize procedure codes in addressing the issue of aberrant billing behavior. This establishes a representative peer comparison group that minimizes false positives. The efficacy of the proposed method is illustrated through data simulation.

77-Room 300, CC

Supply Chain Management VIII

Contributed Session

Chair: Marcus Bellamy, Assistant Professor, Boston University Questrom School of Business, 595 Commonwealth Avenue, Boston, MA, 02215, United States of America, bellamym@bu.edu

1 - R and D Modes of Manufacturers' Cost Reduction: How to Invest in Supply Chains

Jing Hu, PhD Student, Fudan University, 670 Guoshun Road, Yangpu District, Shanghai, China, jinghu13@fudan.edu.cn, Qiying Hu

Inspired by the Chinese mobile phone industry, we find four R&D modes between vertical firms: two collaborative modes (R&D cartel and R&D joint venture) and two non-collaborative modes (manufacturer-R&D and retailer-R&D). A three-stage game model is considered to explain why these modes coexist. We find that firms prefer the R&D cartel if and only if they have comparable channel powers. When collaboration is impossible, only the firm with sufficiently smaller cost factor prefers R&D by itself.

2 - The Role of Customer Flexibility in Achieving Supply Chain Agility

Vahid Ghomi, PhD Student, University of Mississippi, Marketing Department, School of Business Administration, Oxford, MS, 38655, United States of America, vghomi@bus.olemiss.edu, Bahram Alidaee

A firm's supply chain agility (SCA) is a critical factor affecting its overall competitiveness. To create SCA, most research concentrate on exploring manufacturing flexibility, supply side flexibility, and logistics capabilities. However, there are variety of settings where demand side flexibility (DSF) can be achieved. The purpose of this research is to present, (1) a comprehensive literature review of DSF, (2) research directions as how SCA can be achieved by exploring DSF.

3 - Purchasing Postponement and SC Coordination in a Decentralized N-V Model with Stochastic Demand

Sourabh Bhattacharya, Professor, Institute of Management Technology, Hyderabad, India, 38, Cherlaguda Village Shamshabad, Hyderabad, TS, 500048, India, sbhattacharya@imthyderabad.edu.in

We determine the buyback price for a seller in a purchasing postponement environment. Under stochastic demand a buyer postpones its purchasing decision to reduce inventory cost. The seller on the other, offers a buy back rate to induce higher orders from the buyer. Our model suggests that in a decentralized SC under purchasing postponement, a buy back rate can be arrived at such that the SC profits are maximized and SC coordination is established.

4 - Impact of Supply Relationship Dynamics on Firm Performance: A Multilevel Empirical Analysis

Marcus Bellamy, Assistant Professor, Boston University Questrom School of Business, 595 Commonwealth Avenue, Boston, MA, 02215, United States of America, bellamym@bu.edu, Soumen Ghosh, Manpreet Hora

We develop an empirical model to examine supply relationship dynamics as drivers of firm performance. We use supply chain relationship and financial data from the Bloomberg database. Our unique dataset allows us to investigate manufacturing firms both as customers and suppliers. We use a multilevel mixed-effects model combining firm and dyad level effects.

5 - Logistics Performance Improvement from Information Integration

Sung-tae Kim, Assistant Professor, SolBridge International School of Business, 128 Uam-ro, Dong-gu, Daejeon, 300-814, Korea, Republic of, stkim1@solbridge.ac.kr, Gi-eyun Seo

This study examines the moderating effects of strategic and operational information integration on the relationships between logistics performance and organizational performance. This study measures logistics performance, in terms of effectiveness, efficiency, and differentiation. Organizational performances are classified as operational, financial, and market performances. The data from 321 manufacturing firms are evaluated using moderated hierarchical regression analysis.

78-Room 301, CC

Optimization under Uncertainty with Energy Applications

Contributed Session

Chair: Yu Zhang, University of Minnesota, 1033 29th Ave SE, Apt B, Minneapolis, MN, 55414, United States of America, zhan1220@umn.edu

1 - Predicting and Mitigating Congestion for an Electric Power System under Uncertainty

Dzung Phan, IBM T.J. Watson Research Center, 1101 Kitchawan Road, P.O. Box 218, Yorktown Heights, NY, 10598, United States of America, phandu@us.ibm.com, Soumyadip Ghosh

Operation of a transmission grid has to handle increasing renewables uncertainty. This necessitates probabilistic modeling of the impact of uncertainty over the near-future state of the grid. We propose a multi-period optimization model to estimate the probability of the occurrence of a transmission line congestion event. The model also helps to choose the best mitigation decisions to minimize the chances of experiencing a congestion. A distributed algorithm is presented to efficiently solve it.

2 - Optimal Operation and Services Scheduling for AA Electric Vehicle Battery Swapping Station

Hrvoje Pandzic, Faculty of Electrical Engineering and Computing University of Zagreb, Unska 3, Zagreb, Croatia, Hrvoje.Pandzic@fer.hr, Mushfiqur Sarker, Miguel Ortega-vazquez

For a successful rollout of electric vehicles (EVs), it is required to establish an adequate charging infrastructure. Battery swapping stations are poised as effective means of eliminating the long waiting times associated with charging the EV batteries. These stations are mediators between the power system and their customers. This presentation describes an optimization framework for the operating model of battery swapping stations.

3 - A Multi-period Energy-Aware Inventory Model with CVAR Constraints

Niloofer Salahi, Graduate Research Assistant, Rutgers The State University of New Jersey, 96 Frelinghuysen Road, Piscataway, NJ, 08854, United States of America, niloofer.salahi@gmail.com, Mohsen Jafari

A risk-averse production planning with energy efficiency consideration is introduced for an industrial process subject to stochastic demand. We present an inventory model that minimizes expected costs while maintaining performance requirements. The energy consumption is calculated using energy-performance curves specific to the type of industrial process. We show that significant cost saving is expected when adjusting the production plan according to time dependent electricity pricing schemes.

4 - Robust Optimization vs. Stochastic Programming for Electricity Generating Unit Commitment

Narges Kazemzadeh, Graduate Research Assistant, Iowa State University, Industrial & Mfg. Sys. Engg., Ames, IA, United States of America, kazemzad@iastate.edu, Sarah Ryan

Unit commitment seeks the most cost effective generator commitment decisions to meet net load while satisfying operational constraints. Stochastic programming and robust optimization are the most widely studied approaches under uncertainty in the load less variable generation. We investigate and compare the performance of these approaches for a multi-bus power system in different aspects including economic efficiency as well as the risk associated with the decisions.

5 - Real-time Energy Disaggregation using Online Convex Optimization

Yu Zhang, University of Minnesota, 1033 29th Ave SE, Apt B, Minneapolis, MN, 55414, United States of America, zhan1220@umn.edu, Georgios Giannakis

By decomposing a whole electricity consumption into appliance-level signals, energy disaggregation can induce end users' saving behavior and significantly improve energy efficiency. Capitalizing on underlying features of the sparse and low-rank signals, an online convex optimization problem is formulated for the real-time disaggregation task. An efficient online algorithm is developed with provably sublinear regret. Numerical results corroborate the merits of the proposed approach.

Military Manpower and Force Management

Sponsor: Military Applications

Sponsored Session

Chair: Andrew Hall, COL, U.S. Army, 4760 40th St N, Arlington, VA, United States of America, AndrewOscarH@aol.com

1 - Air Force Officer Accession Planning: Addressing Key Gaps in Meeting Career Field Academic Degree Requirements

Tara Terry, Operations Researcher, RAND Corporation, 1200 S. Hayes St., Arlington, VA, 22202, United States of America, tterry@rand.org

The goal of the Air Force officer accession process is to ensure the USAF accesses officers with the knowledge, skills and attributes to perform missions in particular career fields. Key to this goal for non-rated officers is establishing and enforcing academic degree requirements. We uncovered gaps in accession processes that undermine meeting career field education requirements. We introduced recommendations toward correcting the accession process and meeting career fields academic needs.

2 - A Methodology for Estimating Caseload in the U.S. Army's Disability Rating Process

James Broyles, Operations Researcher, RAND Corporation, 1776 Main Street, Santa Monica, CA, 90401, United States of America, jbroyles@rand.org, Mustafa Oguz

As U.S. Army soldiers separate from service, a portion of them enter the disability rating process to obtain a rating that determines their level of benefits and compensation. The process involves several evaluation steps and appeal processes that cause highly variable and sometimes long processing durations. This research presents a methodology that uses a non-Markovian probability model for estimating disability rating caseload given forecasted future soldier separations.

3 - Aligning Officer Personnel Requirements with a Sustainable Career Lifecycle Model

Michael Needham, DCS G-1, HQDA, 300 Army Pentagon, Washington, DC, United States of America, michael.p.needham2.mil@mail.mil

The U.S. Army is at a critical juncture in determining a supportable military personnel structure that is limited by mandated force structures. Personnel structure adjustments drive near-term force-shaping personnel policies, such as accessions, promotions, and separations. We identify sustainable standards of grade using historical data while accounting for future personnel management policies. The model uses sixteen years of historical data as a foundation to determine future behavior.

4 - Army Officer Grade Distribution for the Army Competitive Category

Francisco Baez, DCS G-1, HQDA, 300 Army Pentagon, Washington, DC, United States of America, francisco.r.baez.mil@mail.mil

The Army's Grade Structure has become significantly senior impacting the potential health of the current and future force by reducing selectivity and competition rates, and forcing early promotions. The propose distribution of officers focuses on re-balancing grade structure for each career management field to ensure balance and health of the force by ensuring leader-to-led ratios, quality, and viable career paths for all soldiers.

Optimization Applications in Homeland Security

Cluster: Homeland Security

Invited Session

Chair: Daniel Faissol, Lawrence Livermore National Laboratory, Livermore, CA, United States of America, faissol1@llnl.gov

1 - Modeling the Global Spread and Impact of Diseases at Various Levels of Aggregation

Daniel Skorski, Operations Research Scientist, Pacific Northwest National Laboratory, 301 Hills Street, Richland, WA, 99352, United States of America, Daniel.Skorski@pnnl.gov, Robert Brigantic, Brent Daniel, Matthew Oster

Diseases spread by various modes of transportation is a never-ending modeling and analysis need. GlobalCURE provides a framework to study the interplay

between global infrastructure, epidemiology, economics, government policy, and regional and/or international populations. This presentation summarizes the development (web and desktop) and use of the GlobalCURE tool. In our analysis, we specifically focus on the interplay of factors across levels of aggregation (e.g., tract through country).

2 - Optimization Planning Tool for Urban Search Missions

Daniel Faissol, Lawrence Livermore National Laboratory, Livermore, CA, United States of America, faissol1@llnl.gov, Claudio Santiago, Richard Wheeler, Thomas Edmunds

We present a prototype tool to support planning of radiological and nuclear search missions in an urban environment using mobile detectors. Two distinct problems are considered with proposed solutions: (1) a nonconvex optimization problem that solves for detector dwell times and locations that maximize the probability of detection for building interiors, and (2) a multiple vehicle routing problem on a directed multigraph that solves for the maximum net benefit given a fixed total search time.

3 - Optimal Sonar Deployment in a Maritime Environment: A Fortification Approach

Taofeek Biobaku, University of Houston, Houston, TX, United States of America, tobiobaku@uh.edu, Gino Lim, Jaeyoung Cho, Hamid Parsaei, Seon Jin Kim

The safety and integrity of maritime assets continue to be of paramount importance in world trade and economy. The marine-based trilevel problem remains computationally challenging. The inherent challenges increase with the risk analysis approach we adopt. We propose algorithms based on modifications of Benders' decomposition; and column-and- constraint general algorithms to attempt an optimal solution. Thereafter, we compare solutions on these two algorithms using a case study.

4 - A Mothership-based UAV Routing Problem in Support of Counterfire Operations

Jaeyoung Cho, University of Houston, 333 Dominion Dr., #1021, Katy, TX, 77450, United States of America, uncmac.rokag@gmail.com, Taofeek Biobaku, Seon Jin Kim, Gino Lim

We describe a model for routing UAVs which are launched and recovered from airborne drone carriers. We formulate and solve this problem with a given fleet of UAVs subject to technical and operational constraints. The spatio-temporal model captures important aspects of a UAV deployment in counterfire operations including collaboration tactics and overlapping observation. The model is designed to provide an insight into issues associated with operating UAVs aided counterfire operations system.

03-Room 303, Marriott

Scheduling in Practice

Cluster: Scheduling and Project Management

Invited Session

Chair: Emrah Cimren, Nike, 1 SW Bowerman Dr., Beaverton, OR, 97005, United States of America, Emrah.Cimren@nike.com

1 - A Sample-Gradient-Based Algorithm for Multiple-OR and PACU Surgery Scheduling

Miao Bai, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, mib411@lehigh.edu, Gregory Tonkay, Robert Storer

We address a multiple-OR surgery scheduling problem constrained by shared PACU capacity within the block-booking framework. Given the surgery sequence, a Discrete Event Dynamic System-based stochastic optimization model is formulated in order to minimize the cost incurred by patient waiting time, surgeon idle time, OR blocking time, OR overtime and PACU overtime. A sample-gradient-based algorithm is proposed to solve the sample average approximation of our formulation.

2 - Leveraging Predictive Analytics for HPC Scheduling in Dynamic Environments

Sarah Powers, Oak Ridge National Laboratory, One Bethel Valley Road, Oak Ridge, TN, United States of America, powersss@ornl.gov

Improvements in heterogeneous HPC scheduling can be obtained by leveraging predictive analytics of job submissions. Development of the necessary workflow models requires historical data and is costly due to the potential high diversity of job types and their evolving patterns over time. We propose a method which learns these patterns dynamically, allowing for unknown jobs types and changing arrival patterns. Prediction gains are thus automated and utilizable in dynamic environments.

3 - Driver Scheduling Optimization Method Proposal for the J.B. Hunt Intermodal Division

Luisa Janer, Graduate Student, University of Arkansas, 759 S Royal Oak Pkwy #201, Fayetteville, AR, 72701, United States of America, mjanerru@uark.edu, Valeria A. Remon Perez, Nicole Taborga Delius, Nakia Lynn Lee

A scheduling tool based on optimization was developed in order to improve the driver and truck scheduling process of the J.B. Hunt Intermodal Division. After having developed six prototypes of an optimization model, the tool manages to effectively lower the outsourcing percentage to ten percent and increases the driver-truck ratio to 1.8.

Social Media and Networks in Business

Cluster: Social Media Analytics

Invited Session

Chair: Xiaojing Dong, Associate Professor, Santa Clara University, 500 El Camino Real, Lucas Hall, Marketing, Santa Clara, CA, 95053, United States of America, xdong1@scu.edu

1 - Predicting Social Influence Based on Dynamic Network Structures

Mandy Hu, Assistant Professor, The Chinese University of Hong Kong, CUHK Business School, Marketing, Shatin, Hong Kong - PRC, mandyhu@baf.cuhk.edu.hk

This study examines how network structure and dynamics interplay with the effect of social influence to facilitate diffusion. The context we consider is the diffusion of a new smartphone from a major wireless carrier in two medium-sized cities in China. We are able to identify the two most significant network measures related to social influence are diversity of connection and time variation of edge numbers. Our findings provide foundation on the network-based targeting strategy.

2 - Matrix Metrics: Network-based Systemic Risk Scoring

Sanjiv Das, William And Janice Terry Professor Of Finance, Santa Clara University, Leavey School of Business, 500 El Camino Real, Santa Clara, CA, 95053, United States of America, srdas@scu.edu

I develop a network-based systemic risk score that depends on individual risk at each financial institution and interconnectedness across institutions. This risk metric is decomposable into risk contributions from each entity, forming a basis for taxing each entity appropriately. Spillover risk determines the scale of externalities that one institution might impose on the system. Splitting up too-big-to-fail banks from the system does not lower systemic risk.

3 - Motivation of User-Generated Content in a Social Network

Xiaojing Dong, Associate Professor, Santa Clara University, 500 El Camino Real, Lucas Hall, Marketing, Santa Clara, CA, 95053, United States of America, xdong1@scu.edu

This study focuses on understanding the motivation of user-generated content in open-source environments and online social networks. In our data, to encourage members to contribute more reviews on the site, the community introduced cash payment to those who offered reviews. We find the effect of such reward actually depends on the level of social connectedness. Those with fewer connections responded positively to the reward, and those with more connections responded negatively.

4 - Within and Cross-channel Effects of Brand Advertising on Word-of-Mouth

Linli Xu, Carlson School of Management, University of Minnesota, 321 19th Ave S, Suite 3-150, Minneapolis, MN, United States of America, linlixu@umn.edu, Mitchell Lovett, Renana Peres

The central theme of this paper is to examine the relationship between advertising and WOM. We study the influence of advertising on word-of-mouth within channel and across channels. Preliminary evidence suggests significant relationships both within and cross-channels. For example, both TV and Internet display advertising appear to be significantly related to offline word-of-mouth with TV having a stronger direct effect than Internet, whereas Internet advertising is stronger online than TV.

5 - Mobile Big Data Analytics

Xueming Luo, Temple Univ, 1801 Liacouras, Philadelphia, PA, 19076, United States of America, luoxm@temple.edu

Over 3.6 billion people worldwide are deeply engaged with smartphone devices. This reach potential proffers unprecedented marketing opportunity. As marketers can send ads to smartphone users anywhere they are, marketing discipline now faces tremendous opportunities of coming up with new theory and industry practices for manager and consumer insights. Xueming will present some recent research findings from his Global center for big data in mobile analytics.

06-Room 306, Marriott

Systemic Risk

Sponsor: Financial Services

Sponsored Session

Chair: Stathis Tompaidis, Professor, University of Texas at Austin, Office of Financial Research, Austin, TX, 78712, United States of America, Stathis.Tompaidis@mcombs.utexas.edu

1 - Gauging form PF: Data Tolerances in Regulatory Reporting on Hedge Fund Risk Exposures

Phillip Monin, Researcher, Office of Financial Research, 717 14th St. NW, Washington, DC, 20005, United States of America, Phillip.Monin@treasury.gov, Mark Flood, Lina Bandyopadhyay

We examine the precision of Form PF as an instrument for measuring risk exposures in the hedge fund industry. Using a novel simulation methodology, we assess the measurement tolerances of Form PF by examining the distribution of actual portfolio risk exposures that are consistent with a fixed presentation on Form PF. We find that Form PF's measurement tolerances are sufficiently large to allow private funds with dissimilar actual risk profiles to report similar risks to regulators.

2 - Systemic Risk: The Dynamics under Central Clearing

Agostino Capponi, Columbia, Mudd 313, New York, NY, 10027, United States of America, ac3827@columbia.edu

We develop a tractable model for asset value processes of financial institutions trading with one central clearinghouse. Each institution allocates assets between his loan book and his clearinghouse account. We show that a unique equilibrium allocation profile arises when institutions adjust trading positions to hedge risks stemming from their loan books. The stochastic dynamic equilibrium path shows a buildup of systemic risk manifested through the increase of market concentration.

3 - Hidden Illiquidity with Multiple Central Counterparties

Kai Yuan, Columbia Business School, 3022 Broadway, 4J, Uris Hall, New York, United States of America, kyuan17@mail.gsb.columbia.edu, Paul Glasserman, Ciamac Moallemi

Convex margin requirements from CCPs create an incentive for a swaps dealer to split its positions across multiple CCPs, effectively "hiding" potential liquidation costs. To compensate, each CCP needs to set higher margin requirements than it would in isolation. In the case of linear price impact, we show that a necessary and sufficient condition for the existence of an equilibrium is that the two CCPs agree on liquidity costs and a difference in views can lead to a race to the bottom.

Pricing and Risk Modeling in Financial Engineering, Operations Research

Cluster: Risk Management

Invited Session

Chair: Hongzhong Zhang, Assistant Professor, Columbia University, 1255 Amsterdam Ave, New York, NY, 10027, United States of America, hz2244@columbia.edu

1 - Counterparty Risk in a Heterogenous Random Network Model

Stephan Sturm, Worcester Polytechnic Institute, ssturm@wpi.edu, Eric Schaanning

We discuss the consequences of the central clearing mandate for OTC derivatives. Analysing the expected total and potential future counterparty exposure in a heterogeneous random graph network allows us to analyse the consequences of central clearing in a realistic model calibrated to actual market data.

2 - On Minimizing Drawdown Risks of Lifetime Investments

Bin Li, University of Waterloo, 200 University Avenue West, M3 Building, Waterloo, Canada, b226li@uwaterloo.ca, David Landriault, Dongchen Li, Xinfu Chen

We study a lifetime investment problem to minimize the risk of occurrence of significant drawdowns. We examine two financial market models and closed-form optimal strategies are obtained. Our results show that it is optimal to minimize the portfolio variance when the fund value is at its historic high-water mark. When the fund value drops, the fund manager should increase the proportion invested in the asset with a higher instantaneous rate of return.

3 - Beating the Omega Clock: An Optimal Stopping Problem with Random Time-horizon

Hongzhong Zhang, Assistant Professor, Columbia University, 1255 Amsterdam Ave, New York, NY, 10027, United States of America, hz2244@columbia.edu, Neofytos Rodosthenous

We study the optimal stopping of a perpetual call option in a random time-horizon under exponential spectrally negative Levy models. The time-horizon is modeled as the so-called Omega default clock, which is the first time the occupation time of the underlying process below a level exceeds an independent exponential random variable. We show that the shape of the value function varies qualitatively with model parameters. In particular, we show the possibility of two disjoint continuation regions.

4 - Impact of Bayesian Learning and Externalities on Strategic Investment

Wenxin Xu, University of Illinois, Urbana IL 61801, United States of America, wxu9@illinois.edu

We investigate the interplay between learning effects and externalities in the problem of competitive investments with uncertain returns. We find a region of a war of attrition between the two firms in which the interplay between externalities and learning gives rise to counterintuitive effects on investment strategies and payoffs.

1 - Online Grocery Retailing

Elena Belavina, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, United States of America, elena.belavina@chicagobooth.edu

Grocery delivery is a market that many try to conquer. Appropriate pricing is key for success. There is little consensus among different players (at times even within one firm operating in different locations) on what is the best pricing scheme. For example, Amazon Fresh in Seattle is using per order pricing while in San Francisco - subscription fee. We provide recommendation for the preferred pricing scheme based on various characteristics (delivery logistics, demand variability etc.).

2 - "If at First You Don't Succeed": Understanding Serial Entrepreneurs on Kickstarter

Hallie Cho, INSEAD, 1 Ayer Rajah Avenue, Singapore, Singapore, hallie.cho@insead.edu, David Clough

From the crowdfunding platform Kickstarter, we have data on 27,399 technology and design projects created by 6960 entrepreneurs—1376 of whom are serial entrepreneurs. We examine characteristics of the projects and the entrepreneurs to understand what distinguishes a serial entrepreneur from a one timer. For 779 of the serial entrepreneurs, their first projects were failures. We investigate how serial entrepreneurs respond to setbacks and how their resource gathering strategy changes over time.

3 - Wisdom or Madness? Comparing Crowds with Expert Evaluation in Funding the Arts

Ethan Mollick, Assistant Professor, U. Penn, 2000 Steinberg Hall-Dietrich Hall, 3620 Locust Walk, Philadelphia, PA, 19004, United States of America, emollick@wharton.upenn.edu, Ramana Nanda

Drawing on a panel of experts and data from the largest crowdfunding site, we examine funding decisions for proposed theater projects. We find significant agreement between the funding decisions of crowds and experts. Our findings suggest that crowdfunding can play a role in complementing expert decisions by allowing projects the option to receive multiple evaluations and thereby lowering the incidence of false negatives.

4 - Crowdsourcing Exploration

Yiangos Papanastasiou, Haas School of Business, UC Berkeley, Berkeley, CA, 94720, United States of America, yiangos@haas.berkeley.edu, Nicos Savva, Kostas Bimpikis

In an online review platform, information on the quality of alternative service providers is both generated and utilized by the consumer population. Inefficiencies arise from the fact that information is generated as a byproduct of self-interested consumer choices, rather than with the benefit of future consumers in mind. Within a multi-armed bandit framework, we study how such inefficiencies relate to alternative policies of information-disclosure to the platform's users.

Using Big Data Analytics for Technology Intelligence: Methods and Cases to Gather Intelligence on Technological Innovations

Sponsor: Technology, Innovation Management & Entrepreneurship
Sponsored Session

Chair: Tugrul Daim, Professor, Portland State University, P.O. Box 751, Portland, OR, 97201, United States of America, ji2td@pdx.edu

1 - Business Partner Recommendation Based on Machine Learning of Customer-Supplier Relationships

Yuya Kajikawa, Tokyo Institute of Technology, 3-3-6 Shibaura, Minato-ku, Tokyo, Japan, kajikawa@mot.titech.ac.jp, Naoko Matsuda, Yi Zuo

Business partnership is vital not only for business development but also information sharing and collaboration for innovation. In this work, we modeled customer-supplier relationships among firms using statistical learning model by support vector machine to support firms to find plausible business partners. The result showed prediction accuracy over 80% in average, but a variance was found between different sizes of firms. We discuss the mechanism determining the relationships.

2 - The Circle of Innovation

Fred Phillips, Distinguished Professor, Yuan Ze University, R60401, Building 6, No.135, Yuan-Tung Rd, Taoyuan, Taiwan - ROC, fred.phillips@stonybrook.edu

There is a high-level feedback between technological innovation and social change. Innovation brings about new products and services, and new ways of using them. These in turn lead to new ways to interact and organize. The new structures generate new unfilled needs, which are opportunities for still more innovation. This changes how we classify innovations, how we should analyze statistics, and our views of technology assessment, market segmentation, and product development for sustainability.

3 - Technology Assessment: Case of Robotics for Power Applications

Tugrul Daim, Professor, Portland State University, P.O. Box 751, Portland, OR, 97201, United States of America, ji2td@pdx.edu, Judith Estep

This paper presents an integration of data analytics methods and expert judgment quantification to evaluate multiple robotics technologies for the power utilities.

4 - Evaluating Technology Adoption in Emerging Regions: Case of Smart Phone in Saudi Arabia

Fahad Aldhaban, Portland State University, P.O. Box 751,
Portland, United States of America, aldhaban@gmail.com,
Tugrul Daim

This paper reviews the adoption factors of smart phones in emerging regions. Saudi Arabia is studied as a case study. This presentation will cover the qualitative part of the work. This part helped filter factors and finalize the survey instrument

Contextual Factors Affecting eBusiness Initiatives

Sponsor: E-Business

Sponsored Session

Chair: Frank MacCrory, Massachusetts Institute of Technology, MIT Initiative on the Digital Economy, 355 Main Street - NE25-768D, Cambridge, MA, 02142, United States of America, maccrory@mit.edu

1 - Social Media Usage Implications for Project Success, Political Preferences, and Leisure Activities

Joseph Vithayathil, Assistant Professor, Washington State University, Carson College of Business, Pullman, WA, 99164, United States of America, joseph.vithayathil@wsu.edu,
John Kalu Osiri, Majid Dadgar

We use a survey to empirically analyze the effect of social media usage on workplace project success, political preferences, and leisure activities such as shopping and television viewing behavior. This work adds to the emerging literature on the impact of social media. We find weak association of social media usage with project success, political preferences and leisure activities. Results are interpreted using social presence and media richness theories, and implications are discussed.

2 - Content Pricing Strategies under Dual Medium Access

Ran Zhang, UC Irvine, CA, ranz2@uci.edu, Shivendu Shivendu

Pricing information goods on physical and digital medium is a challenging question for content providers. We develop an analytical model where consumers are heterogeneous in both valuation for content and preference for medium. We show that while offering both bundle of mediums and digital medium is optimal under some market conditions, offering digital medium only is optimal under other conditions. The optimal price for digital medium can decrease with marginal cost of physical medium.

3 - Incentives for Selective Information Sharing

Aditya Saharia, Associate Professor, Gabelli School of Business - Fordham University, 113 W. 60th Street, New York, NY, 10023, United States of America, saharia@fordham.edu

An increased transparency in inter-organizational systems does not make members of a value chain equally better off. Individual members may then try to influence other members' decisions by introducing strategic ambiguity by not collect demand information or by selectively share information with only some downstream members.

■ TA11

Online Optimization with Integer Applications

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Virgile Galle, PhD Candidate, MIT, vgalle@mit.edu

1 - Real-time Revenue Management under Partially Learnable Demand

Dawson Hwang, PhD Candidate, MIT, 77 Massachusetts Avenue, 32-D678, Cambridge, MA, 02139, United States of America, dawson@mit.edu, Le Nguyen Hoang, Vahideh Manshadi, Patrick Jaillet

We study a real-time revenue management problem where stochastic information about the future demand is unknown a priori and can only be partially learned. We develop adaptive and non-adaptive booking-limit policies parameterized by predictability of the demand. In the two extreme cases of fully learnable and fully unpredictable demand, we recover the known performance guarantees. Our work bridges the gap between classical adversarial and stochastic demand models, and defines value of learning.

2 - Container Relocation Problem with Partial Information

Virgile Galle, PhD Candidate, MIT, Cambridge, MA, vgalle@mit.edu, Cynthia Barnhart, Setareh Borjian, Patrick Jaillet, Vahideh Manshadi

We introduce two new versions of the container relocation problem. First we suppose that container departure times are only partially known and propose an efficient branching algorithm using sampling and pruning to solve this problem. Moreover, the second variation assumes that none of the departure times are known in advance. In that case, we provide lower bounds to support the intuition that the "lowest-height" policy is optimal in both static and dynamic case

3 - Taxi Assignment: Offline and Data-driven Online Optimization

Sebastien Martin, PhD Candidate, MIT, Operations Research Center, MIT, 77 Mass Ave, Bldg E40-130, Cambridge, MA, United States of America, semartin@mit.edu, Dimitris Bertsimas, Patrick Jaillet

This research focuses on taxi routing and assignment to customers: we optimize the actions and revenues of a taxi fleet. We use MILPs and randomized algorithms to solve to optimality the full-information version of the problem where demand is known beforehand. Then, we extend these methods to make data-driven online decisions. We apply our methods on the Manhattan network using actual 2013 yellow cabs demand data.

4 - Online Packing in the Random Time Arrival Model

Le Nguyen Hoang, Postdoctoral Associate, MIT, 77 Massachusetts Ave, Cambridge, MA, 02139, United States of America, lenhoang@mit.edu, Dawson Hwang, Patrick Jaillet

Much interest has recently been given to online packing under a uniformly random permutation of request arrivals. We propose a more general and realistic setting, where, instead, requests arrive at random times. In particular, we do not assume the number of requests to be known ahead of time, and we allow for heterogeneity in the probability distributions of the random arrival times. We present different online algorithms and discuss their respective competitive ratios.

Convexification-based Algorithms for Solving Quadratic and Polynomial Programs

Sponsor: Optimization/Mixed Integer Nonlinear Optimization and Global Optimization

Sponsored Session

Chair: Jitamitra Desai, Professor, Nanyang Technological University, 50 Nanyang Avenue, Singapore, Singapore, jdesai@ntu.edu.sg

1 - Minimum Triangle Inequalities and Algorithms for 0-1 QCQPs

Jitamitra Desai, Professor, Nanyang Technological University, 50 Nanyang Avenue, Singapore, Singapore, jdesai@ntu.edu.sg, Xiaofei Qi, Rupaj Nayak

We present a new class of minimum triangle inequalities (MINTI) for 0-1 QCQPs. We prove that these inequalities are superior to the traditionally used triangle inequalities, and offer several variations of these new cutting planes. We also present an improved branch-and-bound algorithm that incorporates certain properties from the MINTI cuts, and prove the efficacy of these cuts via our computational results.

2 - Non-negative Polynomial and Moment Conic Optimization

Mohammad Mehdi Ranjbar, Rutgers, 100 Rockefeller Rd, Rutgers Business School, Piscataway, NJ, 08854, United States of America, 59ranjbar@gmail.com, Farid Alizadeh

Non-negative polynomial cone and its dual, moment cone, are non-symmetric cones and extremely bad scaled. Then common primal-dual method will not be a good algorithm to be used. Recently Nesterov has proposed a new predictor-corrector path-following method. Skajaa-Ye have proposed a Homogeneous interior point method using Nesterov's predictor-corrector path-following method for some non-symmetric conic problem. We will extend that to non-negative polynomial and moment conic programming.

3 - Robust Sensitivity Analysis of the Optimal Value of Linear Programming

Guanglin Xu, PhD Student, University of Iowa, 321 Finkbine Ln Apt. 11, Iowa City, IA, United States of America, guanglin-xu@uiowa.edu, Samuel Burer

We study sensitivity analysis in linear programming problems where general perturbations in the objective coefficients and right-hand sides are considered. This generality leads to non-convex quadratic programs (QPs) that are difficult to solve in general. We investigate copositive formulations and tight semi-definite relaxations of these QPs and validate our approach on examples existing in the literature, as well as our own examples.

4 - Higher Rank-Order Semidefinite Cutting Planes for Nonconvex QCQPs

Xiaofei Qi, PhD Student, Nanyang Technological University,
50 Nanyang Ave, Singapore, Singapore, xqi001@e.ntu.edu.sg,
Jitamitra Desai, Rupaj Nayak

We introduce a polynomial-time scheme to generate higher rank-order semidefinite cutting planes that serve to tighten convex relaxations of nonconvex quadratically constrained quadratic programs (QCQPs) and significantly improve lower bounds. Suitably defined row-and-column based operations are used to speed up the process of generating these cuts, and computational comparisons across different types of relaxations shows the efficacy of these new cutting plane strategies.

Optimizing Sharing Service/Economy Under Uncertainty

Sponsor: Optimization/Optimization Under Uncertainty
Sponsored Session

Chair: Siqian Shen, Assistant Professor, University of Michigan,
1205 Beal Avenue, Ann Arbor, MI, 48105, United States of America,
siqian@umich.edu

1 - Optimal Location Design of Carsharing Fleet under Uncertain One-way and Round-trip Demands

Zhihao Chen, czhihao@umich.edu, Siqian Shen

We allocate vehicles in a homogeneous carshare fleet to contracted locations, to maximize the expected revenue from random demand for one-way and round trip rentals. We use a spatial-temporal network and optimize both risk-neutral and CVaR-based risk-averse two-stage stochastic programs with high demand satisfaction rates. The two-stage problems are solved via branch-and-cut with mixed integer rounding and we give insights on carsharing location design from data reported by Zipcar in Boston.

2 - Online Resource Allocation with Limited Flexibility

Xuan Wang, New York University, 44 West 4th Street,
Suite 8-154, New York, NY, 10012, United States of America,
xwang3@stern.nyu.edu, Jiawei Zhang, Arash Asadpour

We consider a general class of online resource allocation problems with limited flexibility, where a type j request can be fulfilled by resource j or resource $j+1$, and we call this limited flexibility the long chain pattern. The long chain has been studied in process flexibility and has been shown to be very effective in coping with demand uncertainty under offline arrivals. We provide preliminary results that show the effectiveness of the long chain when the arrivals are online.

3 - On-demand Staffing: Incentive Wage Contracts with Guaranteed Fill Rates

Zhichao Zheng, Singapore Management University, Lee Kong
China School of Business, 50 Stamford Road, Singapore, 178899,
Singapore, danielzheng@smu.edu.sg, Tao Lu, Yuanguang Zhong

We study the on-demand economy and its impact on labor market efficiency. We consider n employers with uncertain and time-varying demands, and a platform operator providing on-demand staffing services. We propose a novel fill rate-based allocation policy enabling the on-demand workforce to be shared efficiently among employers. We propose a form of incentive contracts based on fill rate guarantees, and show that our contracts can induce the system-wise optimality in decentralized systems.

Data-driven Optimization

Sponsor: Optimization/Optimization Under Uncertainty
Sponsored Session

Chair: Gah-Yi Vahn, Assistant Professor, London Business School,
Sussex Place, Regent's Park, London, NW1 4SA, United Kingdom,
gvahn@london.edu

1 - Data-driven Estimation of (s, S) Policy

Gah-Yi Vahn, Assistant Professor, London Business School,
Sussex Place, Regent's Park, London, NW1 4SA, United Kingdom,
gvahn@london.edu

I derive a tractable algorithm for computing the optimal (s,S) policy when the decision maker has access to historical demand data. I show that this scheme yields asymptotically optimal (s, S) policy and derive analytical characterisations of confidence intervals, which is useful for operational decision-making.

2 - Near Optimal Ambiguity Sets in Distributionally Robust Optimization

Vishal Gupta, Assistant Professor, USC Marshall School of
Business, 3670 Trousdale Parkway, Bridge Hall 401 G,
Los Angeles, CA, 90089-0809, United States of America,
guptavis@usc.edu

We assess the strengths of data-driven ambiguity sets in distributionally robust optimization (DRO) by bounding the relative size of a candidate set to a specific, asymptotically optimal set. We find popular ambiguity sets are much larger than this asymptotically optimal set, suggesting current DRO models are overly conservative. We propose new “near-optimal” sets that are only a constant factor larger than the optimal set and satisfy the usual robustness properties.

3 - A Time Based Choice Model

Tauhid Zaman, MIT Sloan School of Management, 50 Memorial
Drive, Cambridge, MA, 02139, United States of America,
zlisto@mit.edu

We present a choice model which incorporates the time it takes the user to make a decision. Our model assumes that the further apart two items are in terms of user preference, the faster a decision is made. We conduct a set of online polls and find that this model captures actual human behavior. We also show that using this time based choice model can learn user preferences with high accuracy than standard choice models for a fixed sample size.

Patient Scheduling in Health Care

Sponsor: Optimization in Healthcare
Sponsored Session

Chair: Joseph Milner, Associate Professor Of Operations Management,
Rotman School of Management, University of Toronto,
105 St. George Street, Toronto, ON, M5S3E6, Canada,
Joseph.Milner@Rotman.Utoronto.Ca

1 - Dynamic Patient Scheduling for Multi-Appointment Health Care Programs

Adam Diamant, Assistant Professor Of Operations Management,
Schulich School of Business, York University,
111 Ian Macdonald Boulevard, Toronto, ON, M3J1P3, Canada,
adiamant@schulich.yorku.ca, Faye Quereshey, Joseph Milner

We investigate the scheduling practices of a multidisciplinary, multistage, outpatient health care program with no-shows. We formulate the problem as a Markov Decision Process and use approximate dynamic programming to find policies to schedule patients to appointments. We examine the quality of our solutions via structural results and compare them to a simulation of the clinic. Our results applied to the operation of a bariatric surgery program at a large tertiary hospital in Toronto, Canada.

2 - Flexible Hospital-wide Patient Scheduling

Daniel Gartner, Carnegie Mellon University, 5000 Forbes Avenue,
Pittsburgh, PA, 15213, United States of America,
dgartner@andrew.cmu.edu, Rema Padman

We study a patient scheduling problem with admission decisions, clinical pathways, day and overnight hospital resources, ward and surgical team assignment flexibility, and overtime considerations. We model the problem using Mixed-Integer Programming and embed it in a rolling horizon planning to take into account uncertain recovery times of and remaining resource capacity for patients. We analyze the impact of flexibility and uncertainty on several metrics.

3 - Coordinated Scheduling for a Multi-station Healthcare Network

Ester Dongyang Wang, PhD Candidate, University of Texas, IROM
Dept., Austin, TX, United States of America, wdy@utexas.edu,
Douglas Morrice, Kumar Muthuraman

As the population ages, our healthcare industry must face the challenge of increasing demand for care under constrained budget and resources. Our research focuses on one of the central factors to the success of healthcare reform-outpatient appointment scheduling. We develop a mechanism that coordinates appointment scheduling among multiple services in a healthcare network to improve access of care and reduce patient no-show rate. Our approach has the potential to yield a global optimal solution.

4 - Appointment Scheduling and Walk-in Strategies with Unpunctual Patients

Mohamad Soltani, University of Alberta, PhD Office, Business
Building,, University of Alberta, Edmonton, AB, T6G 2R3,
Canada, soltani@ualberta.ca, Michele Samorani

It is commonly believed that clinics that schedule appointments have lower patients' waiting time and providers' overtime than clinics that only allow walk-ins. However, if we consider patient unpunctuality, walk-in-only clinics may achieve a higher performance. In this research, we investigate the conditions under which each strategy is preferable.

Disjunctive Conic and Optimization Problems

Sponsor: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Julio Goetz, Postdoctoral Fellow, Ecole Polytechnique Montreal and GERAD, 2900 Boulevard Edouard-Montpetit, Montréal, QC, H3T 1J4, Canada, jgoetz1@gmail.com

1 - A Generalized Trust Region Subproblem with Hollows and Non-Intersecting Linear Constraints

Boshi Yang, The University of Iowa, 14 MacLean Hall, Iowa City, IA, 52242, United States of America, boshi-yang@uiowa.edu, Samuel Burer, Kurt Anstreicher

We study an extended trust region subproblem (eTRS) in which a nonconvex quadratic function is minimized over a structured nonconvex feasible region: the unit ball with r hollows (or holes) and m linear cuts. Under some non-intersecting assumptions, when $r = 0$ or when $r = 1$ and $m = 0$, it is known that the eTRS has a tight, polynomial-time solvable conic relaxation. We show that the conic relaxation is also tight for general r and m precisely when some non-intersecting assumptions are satisfied.

2 - On Disjunctive Conic Cuts: When They Exist, When They Cut?

Mohammad Shahabsafa, Lehigh University, 14 Duh Dr, Apt. 221, Bethlehem, PA, 18015, United States of America, mos313@lehigh.edu

The development of Disjunctive Conic Cuts (DCCs) for MISOCO problems has recently gained significant interest in the optimization community. Identification of cases when DCCs are not existing, or not useful, saves computational time. In this study, we explore cases where either the DCC methodology does not derive a DCC which is cutting off the feasible region, or a DCC does not exist. Among others, we show that deriving DCCs directly for p -order cone optimization problems seems to be impossible.

3 - Disjunctive Conic and Cylindrical Cut Management Strategies for Portfolio Optimization Problems

Sertalp Cay, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, sec312@lehigh.edu, Tamás Terlaky, Julio Goetz

Disjunctive conic and cylindrical cuts lead significant positive impact while solving Mixed Integer Second Order Cone Optimization (MISOCO) problems. The decision for adding and removing these cuts should take depth of the cut and structure of the problem into consideration. In this study, we explore strategies to apply these novel cuts to discrete portfolio optimization problems within a Branch-and-Conic-Cut software package. Preliminary results are provided to compare these strategies.

4 - Novel Family of Cuts for SDP Relaxations for Some Classes of Combinatorial Problems

Elspeth Adams, elspeth.adams@polymtl.ca, Miguel Anjos

k -projection polytope constraints (kPPCs) are a family of constraints that tighten SDP relaxations using the inner description of small polytopes, as opposed to the typical facet description. We examine the properties of kPPCs, methods for separating violated kPPCs and their impact on the bounds in a cutting plane framework. Problems satisfying the required projection property, such as the max-cut and stable set problems, will be considered and results will focus on large instances.

Network Resilience and Applications

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Konstantin Pavlikov, University of Florida, 1350 N. Poquito Road, Shalimar, FL, 32579, United States of America, kpavlikov@ufl.edu

1 - Resilient and Structurally Controllable Supply Networks under Disruptions

Amirhossein Khosrojerdi, The University of Oklahoma, 202 West Boyd Street, Suite 218, Norman, OK, 73071, United States of America, akhosrojerdi@ou.edu, Farrokh Mistree, Janet K. Allen, Krishnaiyan Thulsiraman

A resilient supply network is one that has the ability to recover quickly from disruptions and ensure customers are minimally affected. Designing the structure of supply networks to be controllable is a way toward resilience. A three-stage method is proposed to design a resilient and controllable supply network under structural disruptions. The method is exercised using an example from the

petroleum industry.

2 - Embedding Resilience on Logistic and Supply Chain Networks

Jose Santivanez, Associate Professor, Universidad del Turabo, P.O. Box 3030, Gurabo, PR, 00778, Puerto Rico, santivanezj@suagm.edu, Emanuel Melachrinoudis

This paper develops models for improving resilience to disruptions on critical infrastructures such as logistics and supply chain networks through locational, coverage, and path selection decisions. Network resilience is measured by the ratio of the delivered amount of service over the total requested service when a propagating disruption occurs. Availability of service depends on the capability of the network to establish connectivity between service facilities and customers.

3 - Improving Supply Chain Network Resiliency with Preferential Growth Decision Making

Ashley Skeete, PhD Fellow, Western New England University, 1215 Wilbraham Road, Springfield, MA, 01119, United States of America, ashley.skeete@wne.edu, Julie Drzymalski

Network resiliency is the ability to maintain operations and connectedness under the loss of some structures or functions. This research develops decision making techniques in the supply chain context to improve resiliency of existing supply chain networks as they grow with time. Consideration is given to factors such as network topology, production requirements, the presence of redundancies and cost.

4 - Hub Location-allocation for Combined Fixed-wireless and Wireline Broadband Access

Ramesh Bollapragada, Professor, College of Business, San Francisco State University, 1600 Holloway Avenue, San Francisco, CA, 94132, United States of America, rameshb@sfsu.edu, Uday Rao, Min Li, Junying Wu

This paper studies a telecommunications hub location model that includes the classical capacitated facility location problem on a wireline network, as well as a wireless network with technological as well as capacity constraints. There are multiple wireline and wireless hub types, differing in costs and capacities. We present a mathematical model to maximize network profit, build and test a quick greedy heuristic with the optimal, and conduct sensitivity analysis using representative data.

Scientometric Data Analytics

Cluster: Modeling and Methodologies in Big Data

Invited Session

Chair: Dohyun Kim, Myongji University, Yongin, Korea, Republic of, norman.kim@gmail.com

1 - Ranking Outliers in Patent Citation Network using Attributes and Graph Structure

Ali Tosyali, Rutgers, the State University of New Jersey, Dept. of ISE 96 Frelinghuysen Road, CoRE Building, Room 201, Piscataway, NJ, United States of America, alitosyali4778@gmail.com, Byunghoon Kim, Jeongsub Choi, Byoung-yul Coh, Jae-min Lee, Myong K (MK) Jeong, Andrew Rodriguez

Being able to rank patents in outlieriness is a crucial task for patent analysis. In the past, existing general outlier ranking methods have been applied to patent data. In this work, we propose a new outlier ranking method developed especially for patents in attributed patent citation network. We utilized both graph structure and attributes to rank outlier patents in patent citation network.

2 - Scientometric Analysis of Carbon Capture and Storage Research

Faezeh Karimi, Dr, University of Sydney, Project Management, Sydney, 2006, Australia, faezech.karimi@sydney.edu.au, Rajab Khalilpour

This study investigates the evolutionary trends of the international collaborations among the research community of carbon capture and storage (CCS) by looking at the collaboration network of countries publishing on CCS. The study elaborates how both international collaboration network and knowledge structure of the field have notably developed and interlinked over the years especially after 2005 during which almost 94% of the publications appeared.

3 - Keyword Hierarchy Detection using Keyword Network Analysis

Dohyun Kim, Myongji University, Yongin, Korea, Republic of, norman.kim@gmail.com, We Shim, Oh-jin Kwon, June Young Lee, Sejung Ahn

We developed a keyword hierarchy detection algorithm using the keyword network. Using the detection method, the hierarchy of keywords collected from the same semantic field may be built. The keyword hierarchy detection method can be used for a automatic preprocessing step to refine keywords in various topic modeling methods.

4 - Integrated Variable Importance Assessment in Multi-stage Manufacturing Processes

Gianluca Gazzola, Rutgers Center for Operations Research,
100 Rockefeller Road, Piscataway, NJ, 08854, United States of
America, ggazzola@scarletmail.rutgers.edu, Jeongsub Choi,
Myong K (MK) Jeong, Byunghoon Kim

We introduce a method for the assessment of variable importance in manufacturing processes characterized by a hierarchy of technical relationships between stage variables. Regression models of direct technical relationships and a novel permutation measure are employed to quantify the local contribution of every variable. Global contributions are finally obtained by integrating these local assessments, based on the overall structure of indirect and direct technical relationships in the process.

Medical Decision Making in Cancer Care

Sponsor: Health Applications

Sponsored Session

Chair: Christine Barnett, University of Michigan, 1205 Beal Ave.,
Ann Arbor, MI, United States of America, clbarnet@umich.edu

1 - Predictive Modeling for Optimal Design of Cancer Detection Protocols

Selin Merdan, University of Michigan, 1205 Beal Avenue,
Ann Arbor, MI, 48109, United States of America,
smerdan@umich.edu, Brian Denton

Diagnosis of chronic diseases often involves expensive and invasive tests and procedures. Predictive models can play an important role in determining the optimal diagnostic protocol based on individual patient risk factors. We discuss an approach for developing predictive models using clinical observational data that suffers from common sources of bias such as low disease prevalence and missing data. We illustrate the use of these models for optimization of prostate cancer diagnostic protocols.

2 - Model-based Calibration for Natural History Modeling

Jing Voon Chen, University of Southern California, Epstein Dept
of Indus & Sys Eng, Los Angeles, CA, United States of America,
jingvooc@usc.edu, Julie Hagle

A natural history (NH) model often requires calibration of unobservable model parameters to fit observed data. Uncertainty in the data and in the calibrated parameters impacts confidence in the optimal decision. We propose a method for model-based calibration that is resilient to these uncertainties, especially for comparative analyses of disease screening or treatment strategies. Illustrative examples and sensitivity analyses will be discussed.

3 - Assessment of Individualized Human Papillomavirus (HPV) Vaccination Strategies

Fan Wang, University of Arkansas, 4207 Bell Engineering Center,
Fayetteville, AR, United States of America,
fxw005@email.uark.edu, Shengfan Zhang

The human papillomavirus (HPV) is the most common sexually transmitted virus in the U.S. To prevent multiple cancers attributable to the HPV, HPV vaccine is recommended for preteens and teens who have not been exposed to HPV. We develop a simulation model for the optimal design of personalized HPV vaccination program, which incorporates multiple social-behavioral and demographic risk factors. The efficacy of the HPV vaccination program is evaluated in terms of the HPV-related health outcomes.

4 - Tailoring CRC Screening Strategy for Different Age- and Gender-specific Population Subgroups

Carolina Vivas, Purdue University, West Lafayette, IN 47906,
United States of America, cvivas@purdue.edu, Nan Kong, Robert
Klein, Thomas Imperiale

Standard guidelines for colorectal cancer (CRC) strategies do not consider different age- and gender-specific subgroups for tailored screening recommendations. Recent evidence suggests that men tend to face a higher risk of developing advance adenomas earlier than women. We apply Design of Experiments techniques to quantify the risk differences on CRC disease progression. Model based cost-effectiveness analyses of various screening strategies are conducted for different population subgroups.

1 - On the Efficiency of Stable Matchings in Large Markets

Sangmok Lee, Univ of Pennsylvania, 3718 Locust Walk, Philadelphia, PA, United States of America, sangmok@sas.upenn.edu, Leeat Yariv

We study the wedge between stability and efficiency in large one-to-one matching markets. We show stable matchings are efficient asymptotically for a large class of preferences. In these environments, stability remains an appealing objective even on efficiency grounds, and monetary transfers are not necessary for efficiency purposes. Nonetheless, for severely imbalanced markets, when preferences entail sufficient idiosyncrasies, stable outcomes may be inefficient even asymptotically.

2 - Short Lists in Centralized Clearinghouses

Nick Arnosti, Stanford University, Stanford, CA, United States of America, narnosti@stanford.edu

In the presence of frictions, participants in centralized clearinghouses generally fail to list all acceptable match partners. As a consequence, mutually acceptable pairs are left unmatched. The number of unmatched agents (and the happiness of matched agents) depends crucially on the structure of correlations in participants' preferences. This work identifies a fundamental tradeoff between match quality and quantity, and uses this to offer guidance for the design of school choice mechanisms.

3 - How Much Choice is There in Two-sided Matching Markets?

Itai Ashlagi, MIT, 100 Main St, Cambridge, MA, 02139, United States of America, iashlagi@mit.edu

We study the structure of two-sided random matching markets with tiers. Our results provide insights on the amount of choice agents have in the core.

Asymptotic Optimality in Processing Networks

Sponsor: Applied Probability

Sponsored Session

Chair: Itai Gurvich, Professor, Kellogg School of Management, Northwestern, 2001 Sheridan Rd., Evanston, IL, 60201, United States of America, i-gurvich@kellogg.northwestern.edu

1 - Approximations to Non-stationary Diffusion Processes

Harsha Honnappa, Purdue University, West Lafayette, IN, United States of America, honnappa@purdue.edu, Peter Glynn

Non-stationary diffusion processes emerge as limits to time inhomogeneous queueing processes in appropriately defined 'high intensity' regimes. In general, however, the transition densities of non-stationary diffusion processes are not known in closed form. Thus, in this talk, we present analytical approximations to expectations of these diffusion processes. This is joint work with Peter Glynn.

2 - On the Control of Fork-join Networks

Erhun Ozkan, University of Southern California, Marshall School of Business, Los Angeles, CA, 90089, United States of America, eoarkan@usc.edu, Amy Ward

We study a prototypical fork-join network with two job classes and a shared server that processes both job types. We show that a cmu-type static priority policy is asymptotically optimal when the shared server is in some sense slow at processing the more expensive jobs. Otherwise, a state-dependent slow departure pacing control, under which the shared server sometimes gives priority to the less expensive jobs, is asymptotically optimal.

3 - Insensitivity and Optimality of Load Balancing with Processor Sharing Servers

Varun Gupta, Varun.Gupta@chicagobooth.edu, Neil Walton

We present some recent results and ongoing work on near-optimality and insensitivity properties of shortest queue load balancing under a carefully

constructed many-servers asymptotic regime, when all the servers use the Processor Sharing scheduling rule.

4 - Capacity of Information Processing Systems

Kuang Xu, Stanford University, United States of America, kuangxu@stanford.edu, Laurent Massoulié

We study an information processing system where jobs are to be inspected by a set of experts. Inspections produce noisy results depending on the jobs' hidden labels and the expert types, and an inspection occupies an expert for one time unit. The manager's objective is to assign inspections so as to uncover the jobs' hidden labels, using a minimum number of experts. Our main result is an asymptotically optimal inspection policy as the probability of error tends to zero.

Sponsored Session

Chair: Sam Thangiah, Professor/director, Slippery Rock University, Artificial Intelligence and Robotics Lab, 250 ATS, Slippery Rock, PA, 16057, United States of America, sam.thangiah@sru.edu

1 - A New Mathematical Model for Pattern Recognition in the Context of Feed Forward Neural Networks

Sam Findler, Slippery Rock University, 510 Campus Side Cir, Slippery Rock, PA, 16057, United States of America, srf5132@gmail.com

This paper sets out a new mathematical model for pattern recognition—in the form of what I call Pattern Recognition Circuits (PRCs) and Pattern Recognition Automata (PRAs). These new forms are given formal definitions and some preliminary theorems are proven. Next, the model is applied to feed forward neural networks, providing experimental grounding for the theory. Finally, the place of this new mathematical model in the context of general computational theory is discussed.

2 - Automatic Construction of Relational Features with Dataconda

Michele Samorani, Assistant Professor, University of Alberta, 3-20F Business Building, University of Alberta, Edmonton, AB, T6G 2R6, Canada, samorani@ualberta.ca

Traditional data mining and statistical techniques require a single table as input; by contrast, I tackle the problem of findings patterns in a set of related tables (Customers, Purchases, etc). This is made possible by Dataconda, a software freely available to academics which automatically generates a large number of features using information from all tables. In this talk, I will illustrate the benefits of this approach through an example in retailing.

3 - Massively Parallel GPU Accelerated Genetic Algorithm for Optimal Task Mapping in HPC Applications

Ramanan Sankaran, Computational Scientist, Oak Ridge National Laboratory, P.O. Box 2008 MS 6008, Oak Ridge, TN, 37831, United States of America, sankaranr@ornl.gov

Parallel applications on high performance computing (HPC) systems require network and topology aware task placement to ensure performance and scalability. We present a genetic algorithm for the quadratic assignment problem (QAP) that utilizes thousands of GPU accelerated compute nodes allocated for the application to compute an optimal task mapping in a few seconds. We show its convergence characteristics and impact on real life physics simulations on Titan, the most capable HPC system in the US.

4 - A Nao Humanoid Robot System for Interacting with Autistic Children

Sam Thangiah, Professor/director, Slippery Rock University, Artificial Intelligence and Robotics Lab, 250 ATS, Slippery Rock, PA, 16057, United States of America, sam.thangiah@sru.edu, Daniel Martin, Michael Parnes, Mike Monfore, Stephen Fulton, Zachary Kearney, Brian Atwell, Justin Cather, Andrew Rindt, Sam Findler

The NAO humanoid robot is a two feet tall robot with two hands and two feet with 25 degrees of freedom, cameras, microphones, sonar, infra-red and tactile and pressure sensors. It has various communication devices and an Intel ATOM processor. We describe a system implemented using the NAO robot to interact with autistic children. The system is designed to interact with autistic children in skill levels ranging from social to communication.

Online Information Intermediaries

Sponsor: Information Systems

Sponsored Session

Chair: Animesh Animesh, Associate Professor, McGill University, 1001 Rue Sherbrooke Ouest, Montreal, QC, H3A1G5, Canada, animesh.animesh@mcgill.ca

1 - First-mover Advantage in Online Review Platform

Qianran Jin, McGill University, 1001 Sherbrooke Street West, Montreal, Canada, qianran.jin@mail.mcgill.ca, Animesh Animesh, Alain Pinsonneault

While first-mover advantage has been widely studied at firm-level, our research focuses on individual-level first-mover advantage in online review platform. We study whether early reviews receive higher proportion of helpful votes than later reviews. Our preliminary results show that early reviews are perceived to be more helpful than later reviews. The first-mover advantage is greater for high frequency reviewer than low frequency reviewer.

2 - What Makes Geeks Tick? A Study of Stack Overflow Careers

Lei Xu, McGill University, 855 Sherbrooke Street West, Montreal, Canada, lei.xu2@mail.mcgill.ca, Tingting Nian, Luis Cabral

The success of a platform depends crucially on a thorough understanding of motivations behind user participation. The identification has always been a challenging task. We use a revealed preference approach to show that career concerns play an important role in user contributions to Stack Overflow, the largest online programming community. We show that career concerns explain 16% drop in answers activity after a job change. Robustness tests are conducted to tease out alternative explanations.

3 - The Dynamics of Online Referral Channels and E-commerce Website Performance

Wenjing Duan, Associate Professor, The George Washington University, 2201 G Street, NW, Washington, DC, 20052, United States of America, wduan@gwu.edu, Jie Zhang

This study investigates the dynamic relationship between three referral channels — search engine, social media, and third-party advertising — and e-commerce website performance. Our results derived from vector autoregressive models suggest a significantly differential predictive relationship between referrals from the three channels and sales performance measures.

4 - The Interactions Between Herding and Social Media Word-of-Mouth: Evidence from Groupon

Xitong Li, Dr., HEC Paris, 1 Rue de la Liberation, Batiment V, 2eme etage, Bureau 207, Jouy-en-Josas, 78351, France, lix@hec.fr, Lynn Wu

This study aims to test if there is any complementary interaction between herding and social media WOM. Using a panel data set from Groupon.com, we show they reinforce each other in driving product sales. To explore the underlying mechanisms behind the complementarities, we find the herding effect is more salient for experience goods than for search goods, but the effect of Facebook-mediated WOM does not significantly differ between the two product categories.

Optimal Sourcing, Procurement Design, and Eco-label System in Supply Chain Management

Cluster: Operations/Marketing Interface

Invited Session

Chair: Xiang Fang, Associate Professor, University of Wisconsin-Milwaukee, 3202 N Maryland Avenue, Milwaukee, WI, 53211, United States of America, fangx@uwm.edu

Co-Chair: He Huang, Professor, Chongqing University, School of Economics and Business Admin., Chongqing, China, huanghe@cqu.edu.cn

1 - Eco-label System Impact on Market Share and Profit

Yu Xia, Associate Professor, Northeastern University, 214 Hayden Hall, 360 Huntington Ave, Boston, MA, 02115, United States of America, Y.Xia@neu.edu, Xu Yang, Shilei Yang

This research works on the design of the eco-label and its impact on market share and profit for the company that adopts the eco-label system. To design an eco-label system, we need to determine number of levels of labels to structure and the index standard of each level. The gaps between levels should be significant enough to promote effort in producing greener product. In addition, reaching a higher level will bring additional business benefit such as profit for the engaged manufacturers.

2 - Dynamic Supply Risk Management with Multisourcing, Discretionary Selling, and Signal-based Forecast

Ting Luo, University of Texas at Dallas, 800 W Campbell Rd, Richardson, TX, 75080, United States of America, ting.luo@utdallas.edu, Long Gao, Nan Yang, Renyu Zhang

We study a firm's procurement and selling decisions in a multiclass demand and multisupplier inventory system. The optimal procurement is driven by multisourcing and intertemporal substitution and optimal selling is driven by customer segmentation and intertemporal rationing; they are synchronized with dynamic forecast for adaptive and resilient risk mitigation. We examine the critical role of advance supply signals and understand when and how to use them.

3 - Optimal Procurement Design for a National Brand Supplier in the Presence of Store Brand

Xinyan Cao, PhD Student, University of Wisconsin - Milwaukee, 3202 N Maryland Avenue, Milwaukee, WI, 53202, United States of America, xinyan@uwm.edu, Xiang Fang

We consider a supply chain consisting of a national brand supplier and a retailer which intends to develop its own store brand. We develop a game-theoretic framework to analyze the strategic interaction between the two players in the presence of asymmetric information.

4 - Duopolistic Procurement Contracts with Horizontal Information Asymmetry

Hongyan Xu, Professor, Chongqing University, School of Econ. and Bus. Administration, Chongqing, China, xuhongyan@cqu.edu.cn, Yu Tang, He Huang

We formulate a Cournot competition model of two chains where suppliers possess private information of reliability and manufacturers may or may not share cost information with the opponent. This paper under various scenarios aims to examine the contract design and the interplay of horizontal information asymmetry and vertical information asymmetry.

Application-motivated Theories and Methods for Multiobjective Optimization

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Margaret Wiecek, Department of Mathematical Sciences, Clemson University, Clemson, SC, 29634, United States of America, wmalgor@clemson.edu

1 - Preference Preservation in Inverse Multi-objective Convex Optimization

Taewoo Lee, University of Toronto, 5 King's College Road, Toronto, Canada, taewoo.lee@mail.utoronto.ca, Timothy Chan

We present a new inverse optimization model for convex multi-objective optimization that accommodates any input solution and determines a nonzero weight vector that preserves the original preference of the decision maker who generated the solution. We demonstrate how a linear approximation to the model and a successive linear programming algorithm can trade-off between preference preservation and computational efficiency, using data from prostate cancer radiation therapy.

2 - Biobjective Robust Optimization Problem over the Efficient Set to Aid Decision Making

Daniel Jornada, Texas A&M University, 1700 Research Pkwy, 280B Schlumberger Bldg, College Station, TX, 77843, United States of America, djornada@tamu.edu, Jorge Leon

We present a biobjective robust optimization formulation for identifying robust solutions from a given Pareto set arising from a multiobjective program (MOP). The objective functions consider both solution and model robustness when decision values are subjected to uncertainty at the time of implementation. The solution approach is based on facial decomposition. We illustrate the applicability of the methodology to aid decision making in the area of energy planning.

3 - Spatial Data for Multiobjective Shortest Path Analyses: Small Decisions with Large Consequences

F. Antonio Medrano, Post Doctoral Researcher, University of California at Santa Barbara, Santa Barbara, CA, 93106, United States of America, medrano@geog.ucsb.edu, Richard Church

Multiojective shortest path analysis is often used for developing alternatives in the engineering design of new infrastructure over terrain. While such analysis may appear to be non-subjective, the decisions made in assigning costs from features and in the connectivity of the raster network will have major impacts on the number of solutions, their spatial configuration, and their objective values. We discuss these factors and decisions when using GIS data, and their impacts on the solution set.

4 - Distributed Computation of Pareto Sets

Margaret Wiecek, Department of Mathematical Sciences,
Clemson University, Clemson, SC, 29634, United States of
America, wmalgor@clemson.edu, Brian Dandurand

The needs of multidisciplinary engineering design have motivated the development of a distributed solution approach to computing Pareto solutions to nonconvex decomposable multiobjective optimization problems. Existing results on augmented Lagrangian coordination techniques and the block coordinate descent method are extended into the multiobjective setting. These convergence analyses lead to a MultiObjective Decomposition Algorithm (MODA) that is applied to packaging in automotive design.

Auctions for Ad Space

Cluster: Auctions

Invited Session

Chair: Ian Kash, Microsoft Research, 21 Station Road, Cambridge,
United Kingdom, iankash@microsoft.com

1 - General Truthfulness Characterizations via Convex Analysis

Rafael Frongillo, Postdoctoral Fellow, Harvard University,
29 Oxford Street, Cambridge, MA, United States of America,
raf@cs.berkeley.edu, Ian Kash

We present a model of truthful elicitation which generalizes and extends mechanisms, scoring rules, and related settings. Our main result is a generalization of previous characterizations, including a new one for scoring rules on non-convex sets of distributions. We generalize this model to eliciting some property of the agent's private information, and provide the first general result for this setting. We also show how this yields a new proof of a result in mechanism design due to Saks and Yu.

2 - Inefficiency and Low Revenue in GSP Auctions

Indranil Chakraborty, indro@nus.edu.sg

In symmetric-Nash equilibrium GSP auction is efficient and generates more than VCG revenue. The revenue ranking may fail under Nash conditions but not when the maximum GSP revenue is considered. We let bidders to have values from conversions instead of clicks, and assume recency effect on conversion to show that in a broad range of situations the GSP auction is inefficient. When efficient equilibria exist the maximum efficient equilibrium revenue in many situations is lower than the VCG revenue.

3 - Optimising Trade-offs Among Stakeholders in Ad Auctions

David Kurokawa, PhD Student, Carnegie Mellon University,
Computer Science Department, 5000 Forbes Ave, Pittsburgh, PA,
15213, United States of America, dkurokaw@cs.cmu.edu,
Yoram Bachrach, Sofia Ceppi, Ian Kash, Peter Key

We examine trade-offs among stakeholders in ad auctions. Our metrics are the revenue for the auctioneer, number of clicks for users, and welfare for advertisers. We show how to optimize linear combinations of these utilities via a GSP auction with a per-click reserve price. We then examine constrained optimization of these utilities. Finally, we examine a richer setting that allow using the screen real estate in various ways.

4 - Mechanism Design for Mixed Ads

Ian Kash, Microsoft Research, 21 Station Road, Cambridge,
United Kingdom, iankash@microsoft.com, Sofia Ceppi,
Reza Khani, Yoram Bachrach, Peter Key

The GSP auction works when ads are simple, but does not generalize to richer settings. Truthful mechanisms, such as VCG do. However, a straight switch from GSP to VCG incurs significant revenue loss. We introduce a transitional mechanism which mitigates this revenue loss. The mechanism is equivalent to GSP when nobody has updated their bid and is equivalent to VCG when everybody has updated. Our mechanism is based on a technique for making payment functions into a truthful mechanism.

Applications of Analytics I

Sponsor: Analytics

Sponsored Session

Chair: Tarun Mohan Lal, Mayo Clinic, mohanlal.tarun@mayo.edu

1 - Analytics: A Conceptual Framework

Robert Rose, President, Optimal Decisions LLC, 4 Kirby Lane,
Franklin Park, NJ, 08823, United States of America,
optimaldecisions@mac.com

The term analytics emerged, and went viral, in November 2005. Since then, there have been many different, and often contradictory, definitions proposed for analytics. Questions such as whether or not analytics is a discipline, and what type of relationship it has to disciplines such as statistics, computer science and operations research, have been unanswered. In this talk, a framework will be presented that explains the emergence of analytics, and logically relates it to other disciplines.

2 - Spreadsheet Software for Linear Regression Analysis

Robert Nau, Professor, Duke University, Fuqua School of
Business, Durham, NC, 27708, United States of America,
robert.nau@duke.edu

Spreadsheet add-ins for statistical analysis vary widely in terms of their user interfaces, the detail and design of their output, and support for best practices of analysis. This talk will give a brief overview of some of the market-leading products and compare their linear regression features with a free add-in, RegressIt (<http://regressit.com>), which was originally designed for teaching an advanced elective on forecasting at Duke University and is now publicly available and widely used.

3 - Strategic Research: Analytics Excellence

Charity Maynard, Senior Health System Engineer, Mayo Clinic,
200 First Street SW, Rochester, MN, 55905, United States of
America, Maynard.Charity@mayo.edu

Mayo Clinic has a long rich legacy of integrating analytics, operations research and industrial engineering in clinical care, research and education for achieving excellence. This presentation will highlight the legacy, sophisticated infrastructure, novel application and dissemination of learning. Key success factors for leveraging analytics and engineering to address the formidable challenges in health care today and tomorrow will be discussed.

4 - Analytics to Support Innovation in Outpatient Care Delivery Processes

Tarun Mohan Lal, Mayo Clinic, mohanlal.tarun@mayo.edu

With the growing trend and concern surrounding health care workforce shortages, there is an increasing call for the redesign of office practices to reduce inefficiency and improve capacity through better use of existing office staff. In this presentation, we will discuss some innovative models of care delivery such as increase pre-visit work, non-face face visits being implemented at Mayo Clinic that has potential for improved operational performance and staff satisfaction.

hills@uncw.edu

1 - Does the Number of Days between Professional Sports Games Really Matter?

Keith Willoughby, University of Saskatchewan, 25 Campus Drive,
Saskatoon, SK, S7N 5A7, Canada, willoughby@edwards.usask.ca,
Trevor Hardy

In the sport of football, teams typically play at most one game during a week. Leagues may insert "bye weeks" into the schedule for each team, thereby permitting rest and recuperation for players. Teams may feel unfairly treated if they have more (or less) rest than their opponents. We explored over ten years of regular season results from the Canadian Football League to determine if the number of days off experienced by a team between games impacts team performance.

2 - Optimization of Resource use in Massively Multiplayer Online Games

Betty Love, University of Nebraska at Omaha, UNO Mathematics Dept., 60th & Dodge Sts., Omaha, NE, 68182, United States of America, blove@unomaha.edu, Andrew Cockerill

With over 400 million players worldwide, massively multiplayer online games (MMOs) continue to be a popular source of online recreation. MMOs frequently involve resource management and virtual economies. This project demonstrates the introduction of optimization strategies in the MMO game World of Warcraft. A simulated annealing algorithm was implemented in a Lua script which runs in the game's user interface and determines how to use the player's current resources to maximize virtual profit.

3 - A Gravity Model for Tourist Forecasting at FIFA Soccer World Cups

Ghaith Rabadi, Associate Professor, Old Dominion University, 2102 Eng Systems Build, Dep. of Eng.Mngt. and Systems Eng., Norfolk, VA, United States of America, grabadi@odu.edu, Mohammed Al-salem, Ahmed Ghoniem

FIFA Soccer World Cups are sport mega-events that enjoy tremendous popularity worldwide. This paper analyzes historical bilateral tourist flows over the last two decades to forecast the number of inbound tourists into future World Cup host countries. Hosting sport mega-events will be considered as one of the input factors to measure their impact on the number of tourists forecasted.

4 - Optimal Hiking: Bi-modal Variation of the Traveling Salesperson Problem

Roger Grinde, Associate Professor, University of New Hampshire, Paul College of Business & Economics, 10 Garrison Avenue, Durham, NH, 03824, United States of America, roger.grinde@unh.edu

The problem addressed is motivated by a mountaineering problem where there is a network of peaks (destinations) connected by trails and a network of parking areas connected by roads. Various objectives are possible; generally one wishes to construct a series of hikes that together visit all the destinations. A formulation and solution approach is presented.

5 - Analysis of Potential Solutions to Competitive Imbalance in the NBA

Stephen Hill, Assistant Professor, UNC Wilmington, 601 South College Road, Wilmington, NC, 28403-5611, United States of America, hills@uncw.edu

The National Basketball Association (NBA) is in the midst of an extended period of competitive imbalance with teams in the Western Conference widely viewed as being stronger than those in the Eastern Conference. In this work, we evaluate a set of possible changes to the structure of the NBA. Each of these changes is analyzed via Monte Carlo simulation with the impacts on competitive balance and playoff participation described.

Financial Applications of Data Mining and Machine Learning Techniques

Sponsor: Data Mining

Sponsored Session

Chair: John Guerard, Director Of Quantitative Research, McKinley Capital Management, LLC, 3301 C Street, Suite 500, Anchorage, AK, 99503, United States of America, jguerard@mckinleycapital.com

1 - Optimal Global Efficient Portfolio with Emerging Markets using Earning Forecasts

Shijie Deng, Georgia Inst of Tech, 755 Ferst Dr, Atlanta, GA, United States of America, sd111@gatech.edu

We apply a multi-factor stock selection model which includes earning forecast to analyze the performance of the optimal global portfolio which includes the emerging markets. Under the Markowitz mean-variance framework, applied optimization techniques are employed to address the practical issues of risk-tolerance, turn-over, and tracking-error. The impacts of these practical constraints on the portfolio performance are analyzed through extensive numerical experiments.

2 - Data Mining Corrections Testing

John Guerard, Director of Quantitative Research, McKinley Capital Management, LLC, 3301 C Street, Suite 500, Anchorage, AK, 99503, United States of America, jguerard@mckinleycapital.com, Harry Markowitz, Ganlin Xu

Data mining corrections (DMC) tests of Global, Russell 3000, Non-U.S. stocks, Emerging Markets, Japan-only, and China-only during the 2000-2014 period for 21 individual financial variables and two composite (robust, PCA-based) regression models. We find that earnings forecasting models and regression-based models emphasizing forecasted earnings acceleration and price momentum models dominate the DMC tests which allow us to statistically dismiss Data Mining as a potential source of modeling bias.

3 - Applications of Machine Learning over Alpha Signals to Improve Stock Selection and Boost Returns

Abhishek Saxena, Quantitative Research Analyst, McKinley Capital Management, LLC, Suite 500, 3301 C Street, Anchorage, AK, 99503, United States of America, asaxena@mckinleycapital.com, Sundaram Chettiappan

The paper explores the possibility of enhancing an alpha model through various machine learning techniques. We show that these techniques can have statistically significant additions to both raw returns and simulated returns in various equity universes. These excess returns are mostly attributed to improved stock selection as the risk profile doesn't change significantly in terms of both direct risk measurements (standard deviation based risk models) and exposures to various fundamental factors.

4 - The Rise of the Machines: Machine Learning in Stock Selection

Rochester Cahan, rcahan@empirical-research.com

Models that attempt to forecast the cross-section of future stock returns are often structured as linear multifactor models. In this research we study the efficacy of non-linear modeling techniques in stock selection strategies. We use a range of factors known to predict stock returns as raw ingredients and investigate whether various non-linear and machine learning algorithms can combine those ingredients into predictive alpha signals, using only information known ex ante. We benchmark the predictive power of the non-linear models against traditional linear regression models constructed using the same data and estimation windows.

Principles in Applied Probability

Sponsor: Applied Probability

Sponsored Session

Chair: Josh Reed, Associate Professor, NYU, 44 W. 4th St., New York, NY, 10012, United States of America, jreed@stern.nyu.edu

1 - Relating Busy Period Duration and the Single Big Jump Principle in Heavy Traffic

Bart Kamphorst, PhD Student, CWI, Science Park 123, Amsterdam, 1098 XG, Netherlands, B.Kamphorst@cwi.nl, Bert Zwart

Queueing literature shows many results for the $M/G/1$ queue with a fixed server utilization. However, in practice the server utilization may be increasing due to a growing number of jobs per time unit. This causes a significant increase in waiting times and the busy period duration. I will present asymptotic relations for the tail probabilities of the former characteristics. Moreover, I will illustrate a typical long busy period and discuss its relation with the Principle of a Single Big Jump.

2 - Capacity Allocation in a Transient Queue

Britt Mathijsen, PhD Student, Eindhoven University of Technology, P.O. Box 513, 5600 MB, Eindhoven, Netherlands, b.w.j.mathijsen@tue.nl, Bert Zwart

We consider an optimal capacity allocation problem of a two-period queueing model, being in steady-state in the first time interval, but changing parameters at the instance of the new period. The error in the objective function made by disregarding the transient phase before reaching stationarity in this second interval is quantified and approximated. Furthermore, we analyze the consequence of staffing the system according to its steady-state behavior and propose a corrected staffing rule.

3 - Analysis of Cascading Failures

Fiona Sloothaak, PhD Student, Eindhoven University of Technology, P.O. Box 513, 5600 MB, Eindhoven, Netherlands, f.sloothaak@tue.nl, Bert Zwart

Inspired by analyzing the reliability of energy networks, particularly the occurrence of large blackouts, we consider a stylized model of cascading failures. By using connections with extreme value theory and Brownian bridge approximations, we establish that the number of failed nodes follow a power law. Time permitting, we also discuss connections with similar models and questions from material science.

4 - On a Class of Reflected AR(1) Processes

Josh Reed, Associate Professor, NYU, 44 W. 4th St., New York, NY, 10012, United States of America, jreed@stern.nyu.edu,
Michel Mandjes, Onno Boxma

We study the recursion $Z(n+1) = \max(aZ(n) + X(n), 0)$ when $X(n)$ is i.i.d. with distribution the same as the difference of a positive random variable and an independent, exponential random variable. We find the transform of $Z(n)$ and, when $|a| < 1$, we perform a stationary analysis. In heavy-traffic, we show that the process converges to a reflected Ornstein-Uhlenbeck process and the steady-state distribution converges to the distribution of a normal random variable conditioned to be positive.

Medical Decision Making in Chronic Disease Screening and Treatment

Sponsor: Health Applications

Sponsored Session

Chair: John Silberholz, PhD Student, MIT, 77 Mass Ave, Bldg E40-130, Cambridge, MA, 02139, United States of America, josilber@mit.edu

1 - An Analytics Approach to Designing Combination Chemotherapy Regimens for Cancer

Dimitris Bertsimas, Professor, MIT, 77 Massachusetts Ave., Cambridge, MA, 02139, United States of America, dbertsim@mit.edu, Allison O'hair, Stephen Relyea, John Silberholz

We present a data-driven approach for designing new chemotherapy regimens for advanced gastric and breast cancer. Our approach combines (i) construction of a large-scale database of clinical trial results, (ii) statistical modeling to predict outcomes of new drug combinations, and (iii) optimization models to select novel treatments that strike a balance between maximizing patient outcomes (exploitation) and learning new things about treatments that may be useful in the future (exploration).

2 - On Estimating Optimization Model Parameters in Health and Medicine

Thomas Trikalinos, Associate Professor, Brown University, thomas_trikalinos@brown.edu

Combining information from independent sources (meta-analysis) can increase the likelihood of optimal actions in operational problems. Using as example the optimization of breast cancer screening strategies, I will discuss methods for and implications of synthesizing model parameter estimates from independent studies, while accounting for biases (systematic errors) and nontransferability (differences between the setting specified by the optimization and the settings of the data sources).

3 - A Robust Approach to Designing Cancer Screening Strategies

John Silberholz, PhD Student, MIT, 77 Mass Ave, Bldg E40-130, Cambridge, MA, 02139, United States of America, josilber@mit.edu, Dimitris Bertsimas, Thomas Trikalinos

Many models have been proposed to evaluate screening strategies for detecting cancer. Though each model for some cancer could be used to identify effective screening strategies, models' assumptions and structures can vary dramatically, leading to differing conclusions about the most effective strategy. Using robust and stochastic optimization, we identify screening strategies that are effective across multiple models, which could increase confidence in the quality of the identified strategies.

4 - Prioritizing Hepatitis C Treatment in United States Prisons

Can Zhang, Georgia Institute of Technology, 499 Northside Cir NW, Apt. 315, Atlanta, GA, 30309, United States of America, czhang2012@gatech.edu, Anthony Bonifonte, Turgay Ayer, Jagpreet Chhatwal, Anne Spaulding

Correctional populations, which represent about 30% of the national Hepatitis C virus (HCV) prevalence, offer a great opportunity to control the HCV epidemic. New HCV treatments are very effective but also outrageously expensive. Therefore, prisons are pressed to prioritize treatment decisions for HCV-infected inmates. We propose a mathematical modeling framework for HCV treatment prioritization decisions in prisons and present extensive numerical results based on large datasets from US prisons.

Operations in Emergency Medicine

Sponsor: Health Applications

Sponsored Session

Chair: Yu Wang, PhD Student, Indiana University, yw39@indiana.edu

Co-Chair: Alex Mills, Assistant Professor, Indiana University, 1309 E. 10th Street, Bloomington, IN, 47405, United States of America, millsaf@indiana.edu

1 - Coordinated Response of Health Care Networks in Mass Casualty Incidents

Mercedeh Tariverdi, PhD Student, University of Maryland, mercedeh@umd.edu, Elise Miller-Hooks, Thomas Kirsch, Scott Levin

A hybrid analytical-simulation and system-based approach is presented for assessing the benefits of coordinated response of a health care network in a mass casualty incident. The method accounts for incident-related operational disruptions along with other sources of transient system behavior. Critical resource management is included.

2 - An Empirical Study of Patient Discharge Decisions in Emergency Departments

Eric Park, Postdoctoral Associate, The University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, eric.park@sauder.ubc.ca, Yichuan Ding, Mahesh Nagarajan

We analyze the physician's patient discharge decision in EDs. We study how inpatient wards play a role as additional resources to the ED in the discharge process. We study over 530,000 patient discharges in five Canadian EDs.

3 - Allocation Models for Cooperation between Ambulance Services

Lavanya Marla, Assistant Professor, University of Illinois at Urbana-Champaign, 104 S. Mathews Avenue, 216E, Urbana, IL, 61801, United States of America, lavanyam@illinois.edu

We consider a setting where multiple ambulance service providers cooperate to serve a population. Such settings have been observed in the case of large casualties; and in emerging economies where 911-type services compete with existing ad-hoc services. We first demonstrate the opportunity costs due to lack of cooperation. Then we present a game-theoretic framework to model the allocation of ambulances from competing service providers. We conclude with results from a real-world case study.

4 - Surge: Smoothing Usage of Resources is Good for Emergencies

Yu Wang, PhD Student, Indiana University, yw39@indiana.edu, Alex Mills, Jonathan Helm

Major hospitals often experience demand surges close to or above their capacity. We study the interplay between reactive and proactive surge strategies and their impacts on the hospital's immediate response and recovery. We find that immediate recourse actions at best sacrifice long-term recovery for short-term capacity improvement, while proactive workload smoothing provides a Pareto-improving response in both short- and long-term operational performance.

Innovations on Disaster Response Logistics

Sponsor: Public Sector OR

Sponsored Session

Chair: Felipe Aros-Vera, arosvm2@rpi.edu

1 - Competition Over Funding Resources in Humanitarian Operations

Arian Afflaki, Doctoral Student, Duke University, 100 Fuqua Drive, Box 90120, Durham, NC, 27708, United States of America, arian.afflaki@duke.edu, Alfonso Pedraza-Martinez

Donors seek control over their donations, while it hurts the operational efficiency of Humanitarian Organizations (HOs). We model the trade-off between operational performance, fundraising effort, and donor preferences and find that HOs can benefit from limiting donors' control over their donations; however, competition forces HOs to give control to donors.

2 - Optimizing Humanitarian Logistics Concepts of Operations: The Case of Haiti

Erica Gralla, Assistant Professor, George Washington University, 800 22nd Street NW, Washington, 20052, United States of America, egralla@gwu.edu, Liam Cusack, Phillip Graeter

After a disaster, the Logistics Cluster coordinates logistics for various responding humanitarian agencies. They must quickly set up a supply chain, determining entry points, major transport corridors, storage hubs, and vehicle requirements. This research supports these decisions by finding the minimum-cost supply chain configuration. Results for the case of Haiti are presented.

3 - Assessment of Risk Management and Disaster Response Capabilities through the Process Maturity Framework

Miguel Jaller, Assistant Professor, University of California, Davis, One Shields Ave, Ghausi Hall, 3143, Davis, CA, 95616, United States of America, mjaller@ucdavis.edu, Diego Suero, Melissa Del Castillo, Nuris Calderón, Jose William Penagos

This paper explores the Process Maturity Framework to assess the current state of the risk management and disaster response capabilities of a region in a developing country. Using data collected by the team in Colombia, the paper discusses the results in terms of the maturity levels for the different factors that comprise the processes of: risk management and understanding, risk mitigation, and disaster management and response; and puts forward a number of achievable goals and key practices.

4 - Adaptive Decision Making under Dynamic Information Update in Limited Data Environments

Kezban Yagci Sokat, PhD Candidate, Northwestern University, 2145 Sheridan Road, C210, Evanston, IL, 60208, United States of America, kezban.yagcisokat@u.northwestern.edu, Irina Dolinskaya, Karen Smilowitz

After a disaster, there is often limited information about infrastructure damage. New data sources such as OpenStreetMap are emerging. Utilizing these new data sources, we use clustering and various imputation techniques with pre-disaster and post-disaster attributes to approximate incomplete information in a timely manner for routing decisions.

Health Care Modeling and Optimization IX

Contributed Session

Chair: Parastu Kasaie, Postdoctoral Fellow, Johns Hopkins University, 615 N. Wolfe St, E6039, Baltimore, MD, 21205, United States of America, pkasaie@jhu.edu

1 - Dynamic Advance Overbooking with No-Shows and Cancellations

Van-Anh Truong, Columbia University, 500 West 120th St, New York, NY, 10027, United States of America, vt2196@columbia.edu

We introduce the first tractable model of dynamic advance overbooking with no-shows and cancellations. In this fundamental model, advance appointments must be given to a stream of patients arriving randomly over time. Patients might cancel or miss their appointments, with the likelihood of these events increasing with their wait times.

2 - Integrating Quick-response Methods and Staffing Decisions in a Hospital

Jan Schoenfelder, Research Assistant, Augsburg University, Neusässer StraÙe 47, Augsburg, Ba, 86156, Germany, janschoe@indiana.edu, Daniel Wright, Edwin Coe, Kurt Bretthauer

We present an optimization model that combines hospitals' nurse staffing decisions with two classes of quick-response decisions: (i) adjustments to the assignment of cross-trained nurses working the current shift in each unit and (ii) transfers of patients between units and off-unit admissions. We use a simulation to derive insights into the level of benefit that can be expected from integrating the aforementioned quick-response methods in the staffing process.

3 - Analyzing the Relationship Between Two-phased Room Allocation Policies in an Outpatient Clinic

Vahab Vahdatzad, PhD Candidate, Northeastern University, 360 Huntington Avenue, Boston, MA, 02215, United States of America, vahdatzad.v@husky.neu.edu, James Stahl, Jacqueline Griffin

This research analyzes the relationship between two phases of room assignment in an outpatient clinic. Specifically, we studied the interplay between the use of rooms for Medical Assistant and physicians during a patient visits. We demonstrate that policies for assigning rooms to MA and physicians has a significant impact on patient wait time and length of stay. Several room allocation policies are examined using discrete event simulation and interactions between two phases are investigated.

4 - An Agent-Based Simulation Model of HIV Transmission and Control among Men who have Sex with Men in Baltimore City

Parastu Kasaie, Postdoctoral Fellow, Johns Hopkins University, 615 N. Wolfe st, E6039, Baltimore, MD, 21205, United States of America, pkasaie@jhu.edu, David Dowdy

We present an agent-based simulation model to project the population-level impact of implementing HIV preventive therapy (PrEP) and treatment (ART) for high-risk men who have sex with men (MSM) in Baltimore city. We compare a counterfactual scenario in which PrEP and ART continue to be used at current (low) levels against scenarios in which different levels of coverage and adherence are achieved. The primary outcome of interest is the HIV incidence among MSM in Baltimore over five years.

5 - Estimating the Energy Imbalance Characterizing the Rise in Obesity Among Adults in England

Saeideh Fallah-Fini, California State and Polytechnic University, Pomona, 3801 W. Temple Ave, Pomona, CA, 91768, United States of America, sfallahfini@cpp.edu

This paper uses systems dynamics to present a population-level model that quantifies the energy imbalance gap responsible for the obesity epidemic among adults in England (across different gender and ethnicity subpopulations) during the past two decades. The developed model also estimates the magnitude of calorie reduction that should be targeted by obesity interventions to reverse the current trajectory of the obesity epidemic.

Supply Chain Management and Marketing Interface

Cluster: Operations/Marketing Interface

Invited Session

Chair: Gangshu Cai, Santa Clara University, OMIS Department, Lucas Hall 216N, Santa Clara, CA, 95053, United States of America, gcai@scu.edu

1 - Effects of Demand Uncertainty and Production Lead Time on Product Quality and Firm Profitability

Baojun Jiang, Olin Business School, Washington University in St. Louis, MO, 63130, United States of America, baojunjiang@wustl.edu, Lin Tian

We study the effects of demand uncertainty and production lead time in a distribution channel with one retailer outsourcing its production to one supplier. We show that the supplier may have no incentive to improve its lead time even if it is costless to do so. An increase in the supplier's JIT production capacity can lead to higher or lower product quality, benefiting the retailer but potentially hurting the supplier. A better market can make both the supplier and the retailer worse off.

2 - The Protection Economy: Problem Retention or Problem Prevention?

Oded Koenigsberg, Associate Professor, London Business School, Regent's Park, London, United Kingdom, okenigsberg@london.edu, Eitan Gerstner, Daniel Halbheer

Companies are advised to invest in quality programs to solve and prevent customer problems. This paper shows that profit-maximizing motivate companies to peruse protection strategies under which customer problems are created or preserved so that protection services can be offered to repair the damages created through the problems. Thus, standard economic efficiency measures used in the "solution economy" are inappropriate for the "protection economy".

3 - Co-opetition in Services: The Boardwalk Phenomenon

Lucy Gongtao Chen, National University of Singapore, 15 Kent Ridge Drive, Singapore, Singapore, bizcg@nus.edu.sg, Tinglong Dai, Nagesh Gavirneni, Xuchuan Yuan

We consider two service firms (e.g. restaurants) that compete on price and waiting time and cooperate on entertainment effort that reduces the waiting cost of the patrons. We study monopoly and duopoly settings and in the latter, we consider both individual and joint entertainment efforts. We show that by cooperating on entertainment, the competing service firms are able to achieve efficiency levels equivalent to that of monopoly settings.

Behavioral Operations III

Contributed Session

Chair: Ling Li, Professor, Department Chair of IT, Old Dominion University, 2064 Constant Hall, Norfolk, VA, 23529, United States of America, lli@odu.edu

1 - Newsvendor Decision with Multiple Reference Points

Feng Li, Dr., South China University of Technology, Wushan Road, Guangzhou, China, fenglee@scut.edu.cn, Ying Wei

This paper studies how bottom line and status quo as reference profits influence the newsvendor behavior and the optimal order quantity. Employing tri-reference point theory, psychological value of the profit is regarded as gain, loss, or failure based on the two benchmarks. We find that the presence of bottom line decreases the optimal order quantity. In addition, the optimal order quantity may decrease with the wholesale price and increase with the retail price.

2 - Prediction on Network Public Opinion in Online Communities of Different Age Structures

Tianjiang Boning, Master, Huazhong University of Science and Technology, 1037 Luoyu Road, Wuhan, HU, 430074, China, t.j.mcgrady@hotmail.com

We get the evolution law of different age structures in different internet public opinion events through simulation and analysis, and analyze the effect of youth group, middle-aged group and elderly group in each community on internet public opinion respectively, and also find the special role that the elderly group plays during the public opinion evolution processes. In the end, we propose some effective suggestions for Government according to simulation results.

3 - Employees' Cyber Security Behavior and Information Security Policy

Ling Li, Professor, Department Chair of IT, Old Dominion University, 2064 Constant Hall, Norfolk, VA, 23529, United States of America, lli@odu.edu, Li Xu, Wu He

This research focuses on cybersecurity by theoretically defining the conceptual domains of employees' online security behavior and beliefs. We examined the relative importance of 10 factors that will be used for developing new training methods and materials to improve employee's awareness and skills to defend against cybersecurity risks, and investigated the relationship between the availability of cybersecurity policy and individual employee's behavior and beliefs toward cybersecurity issues.

Studies in Healthcare Productivity

Sponsor: Manufacturing & Service Oper

Mgmt/Healthcare Operations

Sponsored Session

Chair: Robert Batt, Asst. Professor, Wisconsin School of Business, UW-Madison, 975 University Ave., Grainger Hall, 5279, Madison, WI, 53706, United States of America, rbatt@bus.wisc.edu

1 - Mining for Content: A Study of E-visits

Hessam Bavafa, Assistant Professor, Wisconsin School of Business, Madison, WI, United States of America, hbavafa@bus.wisc.edu

We study the micro-structure of e-visits, electronic communications between patients and providers through patient portals. The main promise of e-visits as a new channel for providing primary care services is to decrease the number of office visits and improve patient health. We examine detailed information about the patients, providers, and e-visit details (e.g., timings and text of e-visits) to establish a better understanding of e-visits.

2 - Pareto Improving Flow Control Policies for Multi-server Emergency Departments - New Perspectives

Hung Do, Assistant Professor, University of Vermont, 55 Colchester Ave., Kalkin Hall 207, Burlington, VT, 05405, United States of America, hdo@bsad.uvm.edu, Masha Shunko

Using Emergency Medical Services setting as motivation, we design and analyze flow control policies for service systems with N multiple-server queues. We focus on policies that improve performance of the system and benefit all involved entities. We propose new perspectives on performance measures, novel methods to comparatively analyze flow control policies and reveal managerial insights that help design such Pareto improving policies in practice.

3 - Adopting Best Practices: Public Relative Performance Feedback as a Tool for Standardizing Workflow

Hummy Song, Harvard University, Wyss House, Soldiers Field Road, Boston, MA, 02163, United States of America, hsong@hbs.edu, Karen Murrell, Anita Tucker, David Vinson

In complex service systems, standardizing workflows (not processes) may be an effective way to improve operational performance. We explore how public disclosure of relative performance feedback (RPF) on individual workers' processing times can help standardize workflow and improve productivity. We examine the effect of public RPF on worker productivity and the extent to which this varies by whether standardized processes are in place. We also explore potential mechanisms driving these effects.

4 - The Disposition Decision: Handoffs and End-of-shift Effects in an Emergency Department

Robert Batt, Asst. Professor, Wisconsin School of Business, UW-Madison, 975 University Ave., Grainger Hall, 5279, Madison, WI, 53706, United States of America, rbatt@bus.wisc.edu, Diwas Kc, Bradley Staats, Brian Patterson

We look at the effect of emergency department patients hand-offs on operational variables such as length of stay, revisit rate, physician productivity. We also examine what factors impact the probability of a patient being handed-off at the end of a shift versus being dispositioned by the current doctor.

Operational Decision Making in Healthcare

Sponsor: Manufacturing & Service Oper

Mgmt/Healthcare Operations

Sponsored Session

Chair: Vishal Ahuja, Southern Methodist University, P.O. Box 750333, Dallas, TX, United States of America, vahuja@smu.edu

1 - Impact of Severity-adjusted Workload on Health Status of Patients Discharged from an ICU

Song Hee Kim, Assistant Professor, Marshall School of Business, University of Southern California, Los Angeles, CA, United States of America, songheek@marshall.usc.edu, Edieal Pinker, Elizabeth Bradley, Joan Rimar

We examine whether workload has a direct impact on the health status of patients discharged from ICUs, using data from two ICUs and a new measure of patient acuity called the Rothman Index (RI). The RI is updated hourly in the ICU, enabling us to track the health status of patients. Also, leveraging the RI, we measure ICU workload in a novel way that takes into account not only the census but also patient acuity, and study this severity-adjusted workload's impact on the patient disposition.

2 - Evidence of Strategic Behavior in Medicare Claims Reporting

Hamsa Bastani, Graduate Student, Stanford University, United States of America, hsriddhar@stanford.edu, Joel Goh, Mohsen Bayati

Upcoding is the practice where medical providers alter claims data to receive increased reimbursement. Previous studies on detecting upcoding have been limited by unobserved confounders (e.g. provider quality and patient risk). We present a novel approach using a double regression that exploits state-level variations in adverse event regulation and instrumental variables to provide evidence of upcoding at a national scale. We also make several policy recommendations for reducing upcoding.

3 - Screening for Hepatocellular Carcinoma: A Restless Bandit Model

Elliot Lee, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, 48109, United States of America, elliottl@umich.edu,
 Mariel Lavieri, Michael Volk

Currently, all patients at risk for hepatocellular carcinoma (HCC) are screened every six months. Recent medical discoveries have found a correlation between a biomarker measured at each screening, and his/her risk of developing HCC. We model the problem of simultaneously learning while allocating a limited number of screening resources across a population as a restless bandit model. We prove several structural properties of this problem, and ultimately derive a corresponding optimal policy.

4 - Enhancing FDA's Decision Making using Data Analytics

Vishal Ahuja, Southern Methodist University, P.O. Box 750333, TX, United States of America, vahuja@smu.edu, John Birge

Existing FDA surveillance methods are based on voluntary reporting or meta-analysis primarily geared towards identifying new/unknown adverse events. We propose a statistically robust and evidence-based empirical approach that focuses on evaluating specific drug-related adverse outcomes to aid in the FDA decision-making. We demonstrate our approach using a controversial black box warning. Based on a large dataset from the Department of Veterans Affairs, we find that the warning was not warranted.

Measurement and Optimization in Online Advertising

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Omar Besbes, Professor, Columbia University, Graduate School of Business, New York, NY, 10027, United States of America, ob2105@columbia.edu

Co-Chair: Vineet Goyal, Associate Professor, Industrial Engineering and Operations Research, Columbia University, 500 West 120th Street, 304 Mudd, New York, NY, 10027, United States of America, vgoyal@ieor.columbia.edu

Co-Chair: Garud Iyengar, Columbia University, S. W. Mudd 314, 500W 120th Street, New York, NY, United States of America, garud@ieor.columbia.edu

1 - Advertiser Revenue Versus Consumer Privacy in Online Advertising

Vibhanshu Abhishek, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, vibs@andrew.cmu.edu, Arslan Aziz, Rahul Telang

Increasing concerns around consumer privacy have questioned the value of targeted advertising. In this paper we quantify the value of privacy-intrusive information in targeted advertising. Using individual level browsing/purchase data we find that using more privacy-intrusive information increases the accuracy of prediction of purchases, but at a decreasing rate. Targeted advertising is also effective in increasing purchase probability. In our data, restricting cookies reduces sales by 14%.

2 - Learning and Optimizing Reserve Prices in Repeated Auctions

Hamid Nazerzadeh, University of Southern California, Bridge Memorial Hall, 3670 Trousdale Parkway, Los Angeles, 90089, United States of America, hamidnz@marshall.usc.edu,
 Yash Kanoria, Renato Paes Leme, Afshin Rostamizadeh, Umar Syed

A large fraction of online advertisements are sold via repeated second price auctions. The reserve price is the main tool for the auctioneer to boost revenues. However, the question of how to effectively set these reserves remains essentially open from both theoretical and practical perspectives. The main challenge here is that using previous bids to learn reserves could lead to shading of bids and loss of revenue. I'll present incentive compatible near-optimal learning algorithms in this context.

3 - Advertising on a Map

Sergei Vassilvitskii, Google, 111 8th Avenue, New York, United States of America, sergei@cs.stanford.edu

We study the mechanism design problem for advertising on a map. Unlike traditional search advertising where there is a linear order on the slots, no such structure exists in the case of a map. We begin with a model of the setting, noting that the utility of an ad is discounted by the presence of competing businesses nearby and its position in the set of ads ordered by distance from the user. We present simple, approximately welfare maximizing allocation schemes with good incentive properties.

4 - Attribution in Online Advertising under Markov Browsing Models

Antoine Desir, Columbia University IEOR department, 500 West 120th Street, Mudd 315, New York, NY, 10027, United States of America, ad2918@columbia.edu, Vineet Goyal, Garud Iyengar, Omar Besbes

Web viewers are exposed to multiple ads across different websites before they potentially make a purchase (leading to a conversion). In turn, a key question facing the online advertising industry is that of attribution. We analyze attribution based on Shapley values. While intractable in general, we provide computationally tractable approximations to Shapley values under a general Markov chain customer browsing behavior model and compare this attribution to heuristics commonly used in practice.

Pricing Issues in Revenue Management

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Rene Caldentey, NYU, 44 W 4th St, New York, NY, 10012, United States of America, rcaldent@stern.nyu.edu

Co-Chair: Ying Liu, Stern School of Business, New York University, 44 West 4th Street, KMC 8-154, New York, NY, 10012, United States of America, yliu2@stern.nyu.edu

1 - Incorporating Online Customer Ratings in Pricing Decisions

Marie-claude Cote, Manager, Data Science, JDA Software - Innovation Labs, 4200 Saint-Laurent #407, Montréal, QC, H2W 2R2, Canada, Marie-Claude.Cote@jda.com, Philippe Tilly, Nicolas Chapados

Research have demonstrated that online customer ratings have a huge impact on the decision to choose a product. In hospitality, where the product is a hotel room for a length of stay, customers consult an increasing number of reviews prior to booking. We will describe an approach to automatically incorporate online user rating impact in the pricing decisions of a hospitality revenue management system.

2 - On the Equivalence of Quantity Pre-commitment and Cournot Games

Amr Farahat, Washington University in St. Louis, One Brookings Drive, St. Louis, MO, 63104, United States of America, farahat@wustl.edu, Hongmin Li, Tim Huh

We establish sufficient conditions under which Cournot outcomes solve quantity-followed-by-pricing games. Kreps and Scheinkman (1983) established this connection for homogeneous product duopolies and Friedman (1988) for certain differentiated product oligopolies under restrictive assumptions. Our research provides conditions for more general differentiated product settings, including multinomial logit models.

3 - Pricing Policies for Perishable Products with Demand Substitution

Ying Liu, Stern School of Business, New York University, 44 West 4th Street, KMC 8-154, New York, NY, 10012, United States of America, yliu2@stern.nyu.edu, Rene Caldentey

We study a monopolist's optimal dynamic pricing policy for a family of substitute perishable products. Customers arrive to the market according to an exogenous stochastic process, each with a budget constraint. Upon arrival, each customer first makes a decision among subfamilies that are differentiated by quality, and then selects among horizontally differentiated products within the subfamily. We characterize the optimal pricing policy and study the asymptotic approximation.

4 - Optimal Time and Price of Dynamic Upgrade

Xiao Zhang, PhD Candidate, University of Texas at Dallas, Richardson, TX, United States of America, xxz085020@utdallas.edu, Ozalp Ozer

Upgrade, a strategy used in travel industry to balance the supply-and-demand mismatches among products of different quality levels, is usually offered either at the booking time or the consumption time. We study a revenue management problem of a firm which sells two products at fixed prices and offers upgrade options anytime when necessary. The optimal policy specifies the time and price of the upgrade option, and how many existing customers should be offered this option.

45-Room 103C, CC

Social Learning and Revenue Management

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Costis Maglaras, Columbia Business School, New York, NY, 10027, United States of America, c.maglaras@gsb.columbia.edu

Co-Chair: Alireza Tahbaz-Salehi, Columbia Business School, 3022 Broadway, Uris Hall 418, New York, NY, 10023, United States of America, alirezat@columbia.edu

1 - Monopoly Pricing in the Presence of Social Learning

Davide Crapis, Columbia Business School, 3022 Broadway, New York, NY, 10027, United States of America, dcrapis16@gsb.columbia.edu, Bar Ifrach, Costis Maglaras, Marco Scarsini

A monopolist offers a product to a market of consumers with heterogeneous preferences. Consumers are uninformed about product quality and learn from reviews of others. First, we show that learning eventually occurs. Then, we characterize the learning trajectory via a mean-field approximation that highlights how the learning process depends on price and heterogeneity. Finally, we solve the pricing problem and show that policies that account for social learning increase revenues considerably.

2 - Networks, Shocks, and Systemic Risk

Alireza Tahbaz-Salehi, Columbia Business School, 3022 Broadway, Uris Hall 418, New York, NY, 10023, United States of America, alirezat@columbia.edu, Daron Acemoglu, Asu Ozdaglar

We develop a unified framework for the study of how network interactions can function as a mechanism for propagation and amplification of microeconomic shocks. The framework nests various classes of games over networks, models of macroeconomic risk originating from microeconomic shocks, and models of financial interactions.

3 - Market Entry under Competitive Learning

Kimon Drakopoulos, kimondr@mit.edu, Asu Ozdaglar, Daron Acemoglu

We consider a market entry game with two players, an incumbent and an entrant. The market can be of two types: (a) bad in which case the demand is fully elastic at a price \bar{p} or (b) good in which case there is a positive arrival rate of consumers who are willing to buy at higher prices. The entrant is learning the type of the market by observing the flow of payoffs. We prove that the problem has the structure of a war of attrition game and study its weak perfect Bayesian equilibria.

4 - Social Learning with Differentiated Products

Arthur Campbell, Associate Professor, Yale University, School of Management, 135 Prospect Street, P.O. Box 208200, New Haven, CT, 06520-8200, United States of America, Arthur.Campbell@yale.edu

This paper embeds social learning in a model of firms producing differentiated products. We consider how the structure of social relationships between consumers influence pricing and welfare. The model considers how a variety of characteristics of the social network influence these outcomes. It also serves to highlight the challenges one faces in using metrics such as consumer awareness and the sensitivity of demand to prices as measures of informational efficiency in markets.

Empirical Research in Supply Chains and Service Management

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Marcelo Olivares, Assistant Professor, Universidad de Chile, Republica 701, Santiago, Chile, molivares@u.uchile.cl

1 - Estimating Customer Spillover Learning of Service Quality: A Bayesian Approach

Andres Musalem, Universidad de Chile, Republica 701, Santiago, Chile, amusalem@duke.edu, Yan Shang, Jeannette Song

We propose a Bayesian framework for estimating customer "spillover learning," — the process by which customers' learn from previous experiences of similar but not necessarily identical services. We apply our model to a data set containing shipping and sales historical records provided by a world-leading third-party logistics company.

2 - Spatial Competition and Preemptive Entry in the Discount Retail Industry

Fanyin Zheng, Columbia Business School, 3022 Broadway, New York, NY, United States of America, fanyin.zheng@gmail.com

I study the competitive store location decisions of discount retail chains in this paper. I model firms' entry decisions using a dynamic duopoly location game and allow stores to compete over the shopping-dollars of close-by consumers. I use various economic modeling technics to make the model tractable and infer market divisions from data using a clustering algorithm. The empirical analysis suggests that dynamic competitive considerations are important in chain stores' location decisions.

3 - Using Real-time Operational Data to Increase Labor Productivity in Retail

Marcelo Olivares, Assistant Professor, Universidad de Chile, Republica 701, Santiago, Chile, molivares@u.uchile.cl
