We develop a methodology to re-assign sales employees across departments in a large retail store in order to improve productivity. Our method seeks to maximize the effectiveness of labor by allocating employees to departments that require immediate assistance and where this assistance has a larger impact of sales. The method combines empirical methods to measure the impact of assistance and store operational data collected through video analytics to reassign employees in real-time.

4 - Consumer Search and the Structure of Personal Networks

Raghuram Iyengar, Associate Professor, The Wharton School, University of Pennsylvania, 3730 Walnut Street Suite 700, Philadelphia, PA, 19104, United States of America, riyengar@wharton.upenn.edu

We study how consumers' information search for and purchase of new products are affected by structure of their personal network. To address threats to internal validity common in network studies, we conduct a randomized experiment in which we manipulate the similarity of preference among consumers and their network contacts. We estimate consumers' utility function and determine how network antecedents moderate the weight on others' information.

Sustainability in Food Supply Chains

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Erkut Sonmez, Assistant Professor, Boston College, 140 Commonwealth Ave, Fulton Hall, Chestnut Hill, MA, 02446, United States of America, erkut.sonmez@bc.edu

1 - Supply Chain Analysis of Contract Farming

A. Serdar Simsek, Cornell ORIE, 282 Rhodes Hall, Ithaca, NY, 14853, United States of America, as2899@cornell.edu, Awi Federgruen, Upmanu Lall

Contract farming sustains the operations of vulnerable farmers while better positioning the manufacturers to manage their supply risks. In this setting, a manufacturer who owns several production plants -each with a random demand for the crop- selects the set of farmers that minimizes her expected procurement and distribution costs before the growing season. We present two solution methods to this problem. We applied our model to a company contracting with hundreds of small farmers in India.

2 - Processed Produce: Introduction, Pricing, and Profit Orientation

Omkar Palsule-desai, Faculty, Indian Institute of Management Indore, Rau Pithampur Road, Indore, India, omkardpd@iimahd.ernet.in, Muge Yayla-Kullu, Nagesh Gavirneni

We examine product characteristics and market dynamics to identify conditions under which it is optimal to introduce the processed produce, and it should be managed by cooperatives instead of private firms. We develop a mathematical model capturing (i) competition between non-profit and for-profit firms, (ii) consumers' valuation discount, and (iii) product perishability. We provide ample evidences to policy makers promoting processed products offered by cooperatives.

3 - Converting Retail Food Waste Into By-product

Deishin Lee, Assistant Professor, Boston College, 140 Commonwealth Ave., Fulton Hall 344, Chestnut Hill, MA, 02467, United States of America, deishin.lee@bc.edu, Mustafa Tongarлак

By-product synergy (BPS) is a form of joint production that uses the waste stream from one (primary) process as useful input into another (secondary) process. We investigate how BPS can mitigate food waste in a retail grocer setting, and how it interacts with other mechanisms for reducing waste (i.e., waste disposal fee and tax credit for food donation). We derive the retailer's optimal order policy under BPS, showing how it affects the amount of waste.

4 - Improving Food Bank Gleaning Operations: An Application in New York State

Erkut Sonmez, Assistant Professor, Boston College, 140 Commonwealth Ave, Fulton Hall, Chestnut Hill, 02446, United States of America, erkut.sonmez@bc.edu, Miguel Gomez, Deishin Lee, Xiaoli Fan

We develop a stochastic optimization model to help food banks to improve their gleaning operations. Gleaning refers to collecting food from what is left in the fields after harvest, and donating the goods to food banks or pantries that service food insecure individuals.

Managing Contracts and Financial Flow in Supply Chain

Sponsor: Manufacturing & Service Oper Mgmt/IFORM
Sponsored Session

Chair: Lingxiu Dong, Associate Professor, Washington University in St. Louis, One Brookings Drive, St. Louis, MO, 63132, United States of America, dong@wustl.edu

1 - Buyer Intermediation in Supplier Finance

Tunay Tunca, ttunca@rhsmith.umd.edu, Weiming Zhu

We analyze the role and the efficiency of buyer intermediation in supplier financing (BIF). We theoretically demonstrate that BIF can significantly improve the supply chain surplus over traditional financing. Using data from a large Chinese online retailer, we estimate model parameters, empirically verify the theory, and predict efficiency gains.

2 - Financial Pooling in Supply Chains

S. Alex Yang, Assistant Professor, London Business School, Sussex Place, London, United Kingdom, sayang@london.edu, Qu Qian, Ming Hu

Trade credit pools liquidity between suppliers and retailers. Due to this pooling effect, even if the supplier's cost of capital is higher, the retailer may still demand for trade credit. Supply chain finance increases the efficiency of this pooling effect, and hence reduces the overall chain financing cost.

3 - Trade Credit and Supplier Competition

Jiri Chod, Boston College, Carroll School of Management, Chestnut Hill, MA, jiri.chod@bc.edu, S. Alex Yang, Evgeny Lyandres

We study the effect of competition among suppliers on their willingness to provide trade credit. Providing trade credit to a financially constrained buyer allows this buyer to reallocate his cash budget to purchasing from competing suppliers. Thus, relaxing the buyer's financial constraint may backfire at the supplier who provides financing. This is a possible explanation of the empirical regularity that firms selling differentiated products tend to offer more trade credit.

4 - Push, Pull, and Delayed Payment Contracts when a Manufacturer Expands His Product Line

Xiaomeng Guo, PhD Candidate, Olin Business School, Washington University in St. Louis, Campus Box 1156, One Brookings Drive, St. Louis, MO, 63130, United States of America, xiaomeng.guo@wustl.edu, Lingxiu Dong, Danko Turcic

A manufacturer's ability to sell a new product often depends on a retailer's willingness to stock the product. We construct a game-theoretic model of a supply chain with stochastic, price-sensitive demand and consider three basic wholesale price contracts: push, pull and delayed payment contracts. We show how a manufacturer can influence the retailer's incentive to carry a second product by choosing a "correct" contract type and clarify which contract should be expected in equilibrium.

49-Room 105B, CC

Uncertainty in Sourcing and Procurement

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain
Sponsored Session

Chair: Zohar Strinka, PhD Candidate, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, zstrinka@umich.edu

1 - Supplier Diversification under Random Yield and Price Dependent Demand

Guang Xiao, Olin Business School, Washington University in St. Louis, St. Louis, United States of America, xiaoguang@wustl.edu, Lingxiu Dong, Nan Yang

We consider a firm's supply diversification problem under supply random yield and price sensitive demand. We study two pricing schemes: responsive pricing and ex ante pricing. We characterize the sourcing decisions under each pricing scheme and compare them to study the strategic relation between diversification and responsive pricing.

2 - Risk Pooling under Price and Demand Uncertainty

Refik Gullu, Professor, Bogazici University, Industrial Engineering Dept., Bebek, Istanbul, 34342, Turkey, refik.gullu@boun.edu.tr, Nesim K. Erkip

We consider purchasing and distribution decisions for a commodity whose price is random and correlated with its demand. A model, where the purchasing decisions of locations are pooled is proposed. We obtain the optimal purchase quantity, time and quantity of allocation, and quantify the benefits of pooling price risk.

3 - Bunching Supply Contracts with Information Asymmetry in a Two-echelon Supply Chain

Zahra Mobini, Erasmus University Rotterdam, Rotterdam, Netherlands, mobinidehkordi@ese.eur.nl, Albert Wagelmans, Wilco Van Den Heuvel

In a two-echelon supply chain consisting of a supplier and a retailer where the latter has private information about his cost parameter, we analyze the design of the supplier's optimal menu of contracts. Instead of offering a separating menu, the supplier offers a menu of bunching contracts where each contract is intended to appeal to more than one retailer type. We investigate the effects of offering such a menu on the supplier's profit.

4 - Overstock Goods Auctions

Zohar Strinka, PhD Candidate, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, zstrinka@umich.edu, H. Edwin Romeijn

Manufacturers sometimes find themselves with a considerable quantity of overstock goods. In these cases, some turn to online liquidation auctions to sell excess inventory. We propose implementing US Treasury-style auctions in this setting which allow bidders to specify pairs of bid price and a desired quantity at that price. We consider bidders who are themselves retailers and face newsvendor-type costs based on the number of units won and uncertain demand.

Operations Management and Marketing Interface

Sponsor: Manufacturing & Service Operations Management
Sponsored Session

Chair: Ozge Sahin, Johns Hopkins University, ozge.sahin@jhu.edu

Co-Chair: Yao Cui, Cornell University, 401N Sage Hall, Ithaca, United States of America, yao.cui@cornell.edu

1 - Econometric Models of Pairwise Externalities and Social Attractiveness for the Music Industry

Stefano Nasini, Post-doctoral Researcher, IESE Business School, 3-7, Arnau i Gari, Barcelona, Spain, snasini@iese.edu, Víctor Martínez-de-Albéniz

We developed an econometric model of social attractiveness that integrates time variation of individual decisions with the structural information concerning their spillovers. The exponential family of distributions is used to jointly deal with the dynamic and structural aspect of such a complex statistical setting. It resulted in a well-suited model for the analysis of artist goods. An application to a large data set of song diffusion on the radio is presented.

2 - Inventory Management for Luxury Goods

Ruslan Momot, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, ruslan.momot@insead.edu, Elena Belavina, Karan Girotra

Firms selling conspicuous goods face a trade-off: producing more allows for extracting more revenues but compromises the product's reputation for exclusivity. We capture this trade-off in a dynamic model of strategic customer and firm behavior that includes limited memory. Firms should follow stationary cyclic strategies alternating scarcity and overproduction. The former builds a reputation whereas the latter exploits it. The longer the customer memory, shorter is the overproduction phase.

3 - A Newsvendor Model with Product Bundling

Qingning Cao, University of Science and Technology of China, 96 Jinchai Rd, SM 611, Hefei, China, caoq@ustc.edu.cn, Jun Zhang, Kathy Steckle, Xianjun Geng

This paper studies a firm's optimal ordering decision of a primary product when the firm can bundle this product with another product. The firm makes an ordering decision before demand uncertainty resolves, and then retails this primary product either alone or in a mixed bundle with a secondary product. Our results suggest that as compared to a no-bundling benchmark, the firm should overstock (understock) when the wholesale price is high (low).

4 - Strategic Consumers, Revenue Management and the Design of Loyalty Programs

So Yeon Chun, McDonough School of Business, Georgetown University, 3700 O St. NW, Washington, DC, United States of America, scl286@georgetown.edu, Anton Ovchinnikov

Several major airlines recently switched their loyalty programs from "mileage/segment-based" toward "spending-based". We study the impact of this switch on firm's profit and consumer utility. We present a novel model of strategic consumers' response to firm's pricing and loyalty program decisions, incorporate such response into the firm's pricing and loyalty program design problem, compare the solutions under the mileage-based versus spending-based design, and discuss managerial implications.

Economics of Innovation in Supply Chains

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Ayhan Aydin, Assistant Professor Of Operations Management, George Mason University School of Business, 4400 University Drive MS 5F4, Fairfax, VA, 22030, United States of America, aaydin2@gmu.edu

1 - Product Quality in a Decentralized Supply Chain: Value of Information Asymmetry

Narendra Singh, Narendra.Singh@scheller.gatech.edu, Stylianos Kavadias, Ravi Subramanian

We study an OEM's optimal product design quality and sourcing strategies in a supply chain consisting of an OEM, who has in-house option, and a supplier, who has more favorable cost structure and the power to dictate contract terms. We show that a two-part tariff contract, as opposed to a price-only contract, may leave both the OEM and the supplier worse off. Further, we show that asymmetric information about the OEM's cost structure may lead to higher profits for both the OEM and the supplier.

2 - Information Acquisition and Innovation in Competitive Markets

Yi Xu, Associate Professor, Smith School of Business, University of Maryland, College Park, MD, 20742, United States of America, yxu@rhsmith.umd.edu, He Chen, Manu Goyal

In this paper, we study firms' information acquisition strategies and innovation strategies in a competitive market with uncertainty. The firms can resolve the market uncertainty through different information acquisition methods. We highlight the strategic interactions between information acquisition and innovation investments in such a market.

3 - Investment in Core Technologies and Consumer Markets

Ayhan Aydin, Assistant Professor Of Operations Management, George Mason University School of Business, 4400 University Drive MS 5F4, Fairfax, VA, 22030, United States of America, aaydin2@gmu.edu, Rodney Parker

We consider a two-tier supply chain, an upstream tier composed of two competing providers of a component that is used by multiple OEMs (integrators) in the lower tier. Upstream firms invest to develop the technology of the component further. We investigate the effects of downstream market factors, the nature of technology, competition, and the level of uncertainties in the R&D process on the level of upstream investments and the adoption of the higher technologies by the downstream firms.

Consumer-driven Management Science

Sponsor: Marketing Science

Sponsored Session

Chair: Ricardo Montoya, Assistant Professor, University of Chile, Republica 701, Santiago, Chile, rmontoya@dii.uchile.cl

1 - Product Showcasing in the Presence of Experience Attributes

Daria Dzyabura, Assistant Professor of Marketing, NYU Stern School of Business, 40 West 4th Street, Tisch 805, New York, NY, 10012, United States of America, ddzyabur@stern.nyu.edu, Srikanth Jagabathula

We formalize a firm's showcase decision, or selecting a subset of products to carry in a physical store, while a 'large' product line is offered through the online channel. Some customers visit the offline store to gain information about product features. We formalize the showcase problem as an IP, which we show to be NP-complete, derive closed-form solutions for special cases, and adapt the local search heuristic to the general problem. We gather conjoint data to estimate the model parameters.

2 - Price Drop Protection Policy with Partial Refunds

Dinah Cohen-Vernik, Assistant Professor Of Marketing, Rice University, 6100 Main St, Houston, TX, 77006, United States of America, dv6@rice.edu, Amit Pazgal

Many retailers now offer to refund customers the full price difference as long as the price drop occurred within a specified short period of time after the purchase. Despite the popularity of such policy, the existing marketing research on the topic is scarce. In this paper we investigate the price difference refund policy (referred to as price drop protection) and demonstrate how it can improve retailer's profits.

3 - Clicks and Editorial Decisions: How Does Popularity Shape Online News Coverage?

Pinar Yildirim, Assistant Professor Of Marketing, The Wharton School, University of Pennsylvania, 748 Huntsman Hall, Philadelphia, PA, 19104, United States of America, pyild@wharton.upenn.edu, Ananya Sen

Using online news data from a large Indian English daily newspaper, this paper analyzes how demand side incentives shape news media reporting. To establish a causal link, we instrument the views of articles using days with rain and days with electricity shortage as exogenous shocks to reader attention. We provide evidence for extended coverage and higher resource allocation to issues which receive high number of clicks.

4 - Stock-out Detection System Based on Sales Transaction Data

Ricardo Montoya, Assistant Professor, University of Chile, Republica 701, Santiago, Chile, rmontoya@dii.uchile.cl, Andres Musalem, Marcelo Olivares

We present a methodology based on real-time point-of-sales data to infer on-shelf product availability. We develop our methodology using process control theory and apply it to a big-box retailer. We use historical transactional data to develop our methodology and empirically test it in two field studies. We analyze the results and implications.

Behavior in Operational Contexts

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Anton Ovchinnikov, Queen's University, 143 Union Str, West, Kingston, Canada, anton.ovchinnikov@queensu.ca

1 - Behavioral Ordering: Inventory, Competition and Policy

Bernardo Quiroga, Assistant Professor, Business And Behavioral Science, Clemson University, 100 Sirrine Hall, Clemson, SC, 29634, United States of America, bfquirog@gmail.com, Anton Ovchinnikov, Brent Moritz

We study the effect of observed inventory decisions on performance. Our goal is to measure and understand profit losses due to behavioral (intuitive but suboptimal) ordering. The current literature, primarily focused on a newsvendor making decisions in isolation, reports results implying profit losses of 1-5% compared to the analytical optimum. In contrast, we show that when a behavioral inventory manager competes against a management-science-driven competitor, profit losses are much larger.

2 - Inequity and Loss Aversion in Pay What You Want

Yulia Vorotyntseva, PhD Candidate, The University of Texas at Dallas, Richardson, United States of America, Yulia.Vorotyntseva@utdallas.edu, Ozalp Ozer

Pay-What-You-Want pricing is an exemplar of fairness-driven behavior in a business context: the price for a product is fully determined by a buyer, and the seller cannot reject any offer. The objective of our work is to find out key factors affecting the buyers' selection of prices under PWYW. We use a distributional fairness approach and build a hierarchical Bayesian model of buyers' behavior. We then test it in a controlled laboratory experiment.

3 - Inventory Decisions in the Presence of Strategic Consumers

Yaozhong Wu, National University of Singapore, NUS Business School, Singapore, yaozhong.wu@nus.edu.sg, Yang Zhang, Benny Mantin

In the presence of strategic consumers, who may delay their purchase to the markdown season, a retailer is faced with an extra consideration in addition to the traditional newsvendor setting: excess inventory may induce strategic consumers to delay their purchase and may further harm the revenue. We develop a model that accounts for both the strategic consumers and the retailer's inventory decisions. We design behavioral experiments to test our model predictions.

4 - When to Hire the First Employee? Behavioral Evidence and Insights

Beatrice Boulu-reshef, Behavioral Research Associate, Darden School of Business, 100 Darden Boulevard, Charlottesville, VA, 22903, United States of America, Boulu-ReshefB@darden.virginia.edu, Anton Ovchinnikov, Charles Corbett

Effectively any entrepreneur shifts from doing all the work him/herself to hiring someone to do part of that work. We use an analytical model and behavioral experiments to study when entrepreneurs should and do hire their first employee. Understanding both the optimal timing/conditions of hiring and the deviations of the hiring patterns from optima have the potential to provide insights to a very broad spectrum of entrepreneurs at the critical early stage of their new venture formation process.

Applying Machine Learning in Online Revenue Management

Cluster: Tutorials

Invited Session

Chair: David Simchi-Levi, Professor, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, dslevi@mit.edu

1 - Tutorial: Applying Machine Learning in Online Revenue Management

David Simchi-Levi, Professor, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, dslevi@mit.edu

In a dynamic pricing problem where the demand function is unknown a priori, price experimentation can be used for demand learning. In practice, however, online sellers are faced with a few business constraints, including the inability to conduct extensive experimentation, limited inventory and high demand uncertainty. In this talk we discuss models and algorithms that combine machine learning and price optimization that significantly improve revenue. We report results from live implementations at companies such as Rue La La, Groupon and a large European Airline carrier.

■ TA55

55-Room 108B, CC

Extensions of DEA

Cluster: Data Envelopment Analysis

Invited Session

Chair: Endre Bjørndal, Associate Professor, Norwegian School of Economics, Helleveien 30, Bergen, 5045, Norway, Endre.Bjørndal@nhh.no

1 - Assessment of Alternative Approaches to Include Exogenous Variables in DEA Estimates

Jose M. Cordero, Universidad de Extremadura, Av Elvas sn, Badajoz, Spain, jmcordero@unex.es, Daniel Santin

The aim of this paper is to compare the performance of some recent methods developed in the literature to incorporate the effect of external variables into the estimation of efficiency measures such as the conditional approach developed by Daraio and Simar (2005, 2007) or the one-stage model proposed by Johnson and Kuosmanen (2012). To do this, we conduct a Monte Carlo experiment using a translog function to generate simulated data.

2 - Compensating for Exogenous Cost Drivers in the Regulation of Electricity Networks

Endre Bjørndal, Associate Professor, Norwegian School of Economics, Helleveien 30, Bergen, 5045, Norway, Endre.Bjørndal@nhh.no, Maria Nieswand, Mette Bjørndal, Astrid Cullmann

The present yardstick model used by the Norwegian regulator compensates, via two-stage DEA efficiency analysis, for a number of environmental factors. These factors are correlated with measured efficiency and company size. We compare conditional nonparametric methods to current benchmarking model, and we discuss whether the choice of method affects the revenue caps of companies in a systematic manner.

3 - Slacks-based Measure Variations Revisited

Kaoru Tone, Professor, National Graduate Inst. for Policy Studies, 7-22-1 Roppongi, Minato-ku, Tokyo, 106-8677, Japan, tone@grips.ac.jp

In Tone (2010), I developed four variants of the SBM model where main concerns are to search the nearest point on the efficient frontiers of the production possibility set. However, in the worst case, a massive enumeration of facets of polyhedron associated with the production possibility set is required. In this paper, I will present a new scheme for this purpose which requires a limited number of additional linear program solutions for each inefficient DMU.

■ TA56

56-Room 109A, CC

Execution Mode Choices for NPD

Cluster: New Product Development

Invited Session

Chair: Pascale Crama, Singapore Management University, 50 Stamford Road, Singapore, 178899, Singapore, pcrama@smu.edu.sg

1 - Managing Exploration and Execution

Nittala Lakshminarayana, University of California San Diego, 9256 Regents Road Apt. G, La Jolla, CA, 92037, United States of America, Lakshminarayana.Nittala@rady.ucsd.edu, Sanjiv Erat, Vish Krishnan

We model Innovation as a multi-stage activity consisting of Exploration and Execution. Within this parsimonious model that mimics many contexts in Innovation, we consider the effect of incentives and several institutional features on the optimal idea generation and development strategy.

2 - Customer Co-design: The Role of Product Lines

Sreekumar Bhaskaran, sbhaskar@mail.cox.smu.edu, Amit Basu

Involving customers in the new product design can be a powerful means to achieve high levels of customer satisfaction and market success. However, the "co-design" process may require participating customers to commit significant time and effort, while facing the uncertainty that the firm may overprice the custom product. Since this reduces a customers incentive to commit effort up-front, co-design can be difficult to motivate. We develop analytical models that capture these various effects.

3 - Flexibility and Knowledge Development in Product Development: Insights from a Landscape Search Model

Mohsen Jafari Songhori, Jsp Research Fellow, Tokyo Institute of Technology, J2 Bldg., Room 1704, 4259 Nagatsuta-cho., Tokyo, 226-8502, Japan, mj2417@gmail.com, Majid Abdi, Takao Terano

This study introduces a landscape model of Product Development (PD). The model captures different PD performance aspects (e.g. development time, quality and cost) and their trade-offs. Moreover, knowledge development dynamics and flexibility are incorporated in the model to investigate how strategies toward these, in PD process, are associated with the performance measures.

57-Room 109B, CC

Applications of Stochastic and Dynamic Programming in Energy

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Andrew Liu, Assistant Professor, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47907, United States of America, andrewliu@purdue.edu

1 - Approximate Dynamic Programming for Pricing-based Real-time Demand Management

Ozgur Dalkilic, The Ohio State University, 205 Drees Labs, 2015 Neil Ave, Columbus, OH, 43210, United States of America, dalkilic.1@buckeyemail.osu.edu, Atilla Eryilmaz, Antonio Conejo

We consider the real-time demand management problem of a load aggregator that coordinates the consumer demand to match a predetermined daily load. The aggregator's objective is to minimize its payment to the real-time market. Under uncertainty of the market prices, we derive dynamic pricing algorithms that approximate the optimal dynamic programming solution. We show via numerical investigations that the proposed algorithms coordinate flexible demand and achieve close to optimal allocation.

2 - A Revenue Adequate Stochastic Programming Market Clearing Mechanism for Effective Integration of Volatile Renewable Generation

Golbon Zakeri, Dr., University of Auckland,
Auckland, New Zealand, g.zakeri@auckland.ac.nz

Petration of generation from volatile renewable sources of electricity generation has substantially increased in electricity markets around the world. Various authors (e.g. Pritchard et al and Morales et al) have proposed mechanisms to deal with this however these approaches are not revenue adequate under each scenario (although they are in expectation). We will introduce a variation of the stochastic dispatch mechanism that is revenue adequate under each scenario and present its properties.

3 - Parallel Computing of Stochastic Programs with Application to Energy System Capacity Expansion

Andrew Liu, Assistant Professor, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47907, United States of America, andrewliu@purdue.edu, Run Chen

Power grids' planning and operations exhibit extreme multiscale, ranging from hourly operation to decades of planning. The linkage between decisions at different time scales may be relaxed to produce multiple independent subproblems. We propose to use an augmented Lagrangian multiplier method to design parallel algorithms to solve such multiscale problems. Convergence of the embedded algorithm for convex problems will be shown, along with preliminary numerical results.

Topics in Oil, Natural Gas, and Alternative Fuels

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Sauleh Siddiqui, Assistant Professor, Johns Hopkins University, 3400 N. Charles St. Latrobe 205, Baltimore, MD, 21218, United States of America, siddiqui@jhu.edu

1 - Rate-of-return Regulation and Investment in a Natural Gas Pipeline

Olivier Massol, IFP School, 228-232 avenue Napoléon Bonaparte, Rueil-Malmaison, France, olivier.massol@ifpen.fr, Florian Perrotton

We examine the economics of a natural gas pipeline project provided by a foreign private firm in a LDC. The infrastructure could trigger possible future developments of the domestic gas sector. We address two questions. First, can a rate-of-return (ROR) type of regulatory organization induce the firm to rationally accept to build ahead of proven demand? Second, how far would the allowed ROR have to rise for the pipeline design to be adopted be congruent with the socially desirable one?

2 - Multistage Stochastic Model for Natural Gas Contract and Maintenance Scheduling of Power Plants

Zhouchun Huang, University of Central Florida, 4000 Central Florida Blvd, Orlando, FL, 32816, United States of America, hzclinger@gmail.com, Qipeng Zheng

Natural gas contracting and equipment maintenance scheduling are two major factors that affect the profit of a natural gas power plant. We consider both of them together and propose a multistage stochastic model to address the uncertainties of gas and electricity prices in the market. A scenario-based decomposition strategy is applied to solve the model and the numerical results will be present.

3 - A Crude Oil Market Model for the United States

Olufolajimi Oke, PhD Candidate, Johns Hopkins University, 3400 N Charles St, Latrobe 205, Baltimore, MD, 21218, United States of America, ooke1@jhu.edu, Max Marshall, Ricky Poulton, Sauleh Siddiqui, Daniel Huppman

The United States' crude oil industry currently faces infrastructural and environmental challenges, as production surges and crude-by-rail shipments and incidents increase. We adapt Huppman and Egging's dynamic Generalized Nash Equilibrium model (Multimod) to the US market. Thus, we can analyze the transportation of crude oil and explore possible scenarios to recommend decisions for safe movement, as well as gauge the economic impact of new regulations and policy interventions.

4 - Volumes for the Renewable Fuel Standard using Multiobjective Programs with Equilibrium Constraints

Sauleh Siddiqui, Assistant Professor, Johns Hopkins University, 3400 N. Charles St. Latrobe 205, Baltimore, MD, 21218, United States of America, siddiqui@jhu.edu, Adam Christensen

We apply a Multiobjective Program with Equilibrium Constraints to the United States renewable fuel market to help understand why it has been so difficult in releasing the 2014 mandate for the Renewable Fuel Standard. Our analysis provides a variety of policy alternatives to aid in setting these volume obligations and is applicable to a wide variety of climate and energy market settings.

Fire Management 1: Suppression

Sponsor: ENRE – Environment II – Forestry

Sponsored Session

Chair: Vitaliy Krasko, Colorado School of Mines, 1500 Illinois St, Golden, CO, United States of America, vkrasko@mymail.mines.edu

1 - Efficient use of Aerial Firefighting Assets

Matthew Thompson, US Forest Service, 800 E Beckwith, Missoula, MT, 59801, United States of America, mpthompson02@fs.fed.us

This presentation will explore themes in measuring and improving the efficiency of aerial firefighting assets. Insights from case studies in the US and Italy will be highlighted.

2 - The Development and use of Forest Fire Detection System Performance Measures

Dave Martell, david.martell@utoronto.ca

Forest fire detection systems are designed to detect fires while they are small but concerted efforts to minimize detection size can enhance the performance of the detection sub-system at the expense of overall fire management system performance. We describe the development and use of a detection system performance measure designed to overcome such problems.

3 - A Network Interdiction Approach for Mitigating a Pyro-Terror Attack

Eghbal Rashidi, PhD Student, Mississippi State University, 1212 Louisville St, # 58, Starkville, MS, 39759, United States of America, er442@msstate.edu, Hugh Medal

We study a problem in which a group of terrorists seek to maximize the impact of a pyro-terror attack by optimally locating the fire ignition points on a landscape, whereas fire managers wish to interdict the expansion of fire and mitigate the damage using an optimal fuel treatment plan. We model the problem as a Stackelberg game and develop a decomposition algorithm to solve it.

4 - Machine Learning Methods to Improve Fire Suppression Policies on Simulated Landscapes

Hailey Buckingham, hailey.buckingham@oregonstate.edu, Claire Montgomery

Any policy which informs wildfire suppression decisions affects the future evolution of the landscape as patterns of growth, harvest, and fire each adjust to the influence of the policy's fire suppression regime. Improving a policy is difficult because the long-term effects may not be obvious a priori because present decisions change future states. In this study, we use machine learning techniques and monte carlo simulations of forested landscapes to improve a wildfire suppression policy.

Chair: Nabil Belacel, Senior Research Officer, NRC, 100 des Aboiteaux Street, Moncton, NB, E1A7R1, Canada, nabil.belacel@nrc.gc.ca

1 - Co-Author Network Analysis of Operations Management Journals

Bonie(he) Zhang, PhD Candidate, Rutgers Business School, 1 Washington Park, Newark, United States of America, boni.zhang@rutgers.edu, Yao Zhao, Xinxin Xuan

We study the co-author network of flag-ship INFORMS journals in operations management such as Management Science and Operations Research. Our empirical exploration characterizes the changing patterns of the co-author network and provides insights to authors on how to improve productivity through exploitation of the academic social network.

2 - Case Study: Vastrapur Car Rental Services

Balaraman Rajan, Assistant Professor, California State University East Bay, 25800 Carlos Bee Blvd, Hayward, CA, 94542, United States of America, balaraman.rajan@csueastbay.edu, Ravichandran Narasimhan

In this case we discuss the revenue model for a rental car business in India. The case can be used for teaching topics in probability and decision modeling at both undergraduate and graduate level. The first part of the case focuses on expected value and the second part of the case involves decision making under uncertainty and strategic choices. It can also be extended to train students in basic simulation using Crystal Ball or other such tools.

3 - A Learner-Analytics Based Approach for Attenuating the Course-Level Dropout Rate

Aysegul Demirtas, Graduate Student, Arizona State University, 699 S Mill Avenue, Tempe, AZ, 85281, United States of America, ademirt2@asu.edu, Jennifer Bekki, Esma Gel, George Runger

Despite their potential to attract larger numbers of students, online courses remain plagued by a student attrition problem. We apply data mining and learner analytics techniques to better understand online learner behavior in an effort to attenuate the online course drop-out rate. We present our modeling approach, utilizing data from student interactions with the course LMS, and our findings on course-level persistence based on the application of our approach to data from multiple courses.

4 - The School Closing Problem

Jing Xu, University of Pennsylvania, 209S 33rd Street, Department of Mathematics, Philadelphia, PA, 19104, United States of America, xjing@sas.upenn.edu

When school districts face declining enrollments, schools must be closed to reduce costs. The choice of which schools to be shuttered is controversial. Surprisingly, few papers have considered this problem. This paper considers the effect of using existing school choice mechanisms to close schools. It turns out simple modifications of existing algorithms produce perverse results. We also establish non-existence of a Pareto-efficient and strategy-proof mechanism in a basic school closing model.

Sustainability in Energy Sector: Policy Analysis and Technology Assessment

Sponsor: ENRE – Environment I – Environment and Sustainability Sponsored Session

Chair: Yihsu Chen, Associate Professor, University of California, Merced, 5200 N. Lake Rd, Merced, CA, 95343, United States of America, ychen26@ucmerced.edu

1 - Market Impacts of Energy Storage in a Transmission-Constrained Power System

Afzal Siddiqui, University College London, Department of Statistical Science, Gower Street, London, UK, WC1E 6BT, United Kingdom, afzal.siddiqui@ucl.ac.uk, Vilma Virasjoki, Paula Rocha, Ahti Salo

Intermittent renewable energy (RE) technologies require conventional power plants to ramp up more often. In turn, energy storage may offset the intermittency of RE technologies and facilitate their integration into the grid. In order to assess the consequences of storage, we use a complementarity model with market power, transmission constraints, and uncertainty in RE output. We find that although storage reduces congestion and ramping costs, it may actually increase greenhouse gas emissions.

2 - Do Emissions Caps Lead to Carbon Leakage in Regional Markets? The Case of South-east Europe

Verena Viskovic, PhD Student, University College London, 50 Tiber Gardens, London, N/, N10XE, United Kingdom, verena.viskovic@gmail.com, Yihsu Chen, Afzal Siddiqui

We examine the extent of carbon leakage in neighbouring jurisdictions with different carbon emissions reduction policies. We use a complementarity model to illustrate carbon leakage on a three-node power system. Subsequently, we model a 19-node Southeastern European network in order to study carbon leakage on the periphery of the EU.

3 - Equilibrium Investment Strategies in Renewable Portfolio Standards under Uncertainty

Yuta Kamobayashi, Tokyo University of Science, 2641 Yamazaki, Noda-shi, Chiba, Japan, 7414609@ed.tus.ac.jp, Ryuta Takashima, Makoto Tanaka, Yihsu Chen

Recently renewable portfolio standard (RPS) has been introduced due to further penetration of renewable energies. In this paper, we propose a two-period competition model in an oligopolistic electricity industry with uncertain demand in order to consider investment behaviors for firms in a framework of the PRS. We analyze an effect of the RPS on investments in renewables and non-renewables. Additionally, we show how a percentage of production from renewables affects the market equilibrium.

4 - Analysis of Regional Market Impact of EPA's Clean Power Plan: Mass-based or Rate-based Standard?

Duan Zhang, University of California, Merced, 1392 Dynes St, Merced, CA, 95348, United States of America, dzhang8@ucmerced.edu, Yihsu Chen, Makoto Tanaka

We studied the market and emission outcomes of the EPA proposed rate-based emission policy or the Clean Power Plan. A theoretical model was built to generate contestable hypothesis. A large-scale simulation of the Pennsylvania-Jersey-Maryland electricity market in 2012 was used to validate the hypotheses and quantify the magnitude of impacts, including distribution of economics rent as well as the shift of pollution emissions. We report the preliminary results in this talk.

Reliability and Random Factors in Power Systems

Cluster: Energy Systems: Design, Operation, Reliability and Maintenance

Invited Session

Chair: Bo Zeng, Assistant Professor, University of South Florida, Tampa, 4202 E. Fowler Avenue, Tampa, FL, 33620, United States of America, bzeng@usf.edu

1 - Protect Power System from Electromagnetic Pulse

Feng Pan, Research Engineer, Pacific Northwest National Laboratory, P.O. Box 999 MSIN K1-85, Richland, WA, 99352, United States of America, feng.pan@pnnl.gov, Russell Bent, Aric Hagberg

Power grids are vulnerable to Electromagnetic pulse (EMP) that can lead a power grid to collapse in a short time. We introduce an optimization model to configure a power grid prior to an EMP so that the damage caused by EMP is reduced. This talk will focus on the modeling aspect.

2 - Modeling Cascading Failures and Restoration Times in Power Networks to Address Resilience

Sinan Tas, Assistant Professor, Penn State University-Berks College, sut12@psu.edu, Vicki Bier

Prevention is generally the default solution in security investments of critical infrastructure. Electric power networks are capacity-constrained systems, which makes them a perfect candidate for cascading failure. Moreover, different components take substantially different times to recover. In this study, we will analyze investments that will possibly improve overall resilience of the network (rather than preventive ones that decreases the likelihood of such attacks).

3 - Joint Planning of Energy Storage and Transmission for Wind Energy Generation

Wei Qi, PhD Candidate, University of California, Berkeley, 1117 Etcheverry Hall, Berkeley, CA, 94720, United States of America, qiwei@berkeley.edu, Yong Liang, Zuo-jun Max Shen

Abstract: Regions with abundant wind energy usually have no ready access to power infrastructure. We propose models of transmission network planning with co-location of energy storage systems for wind energy delivery. Our models determine the sizes and sites of storage stations as well as the corresponding topology and capacity of the transmission network. Then we present various insights regarding storage value, technology advancements and layout robustness.

KINFORMS Sponsored Session

Sponsor: KINFORMS

Sponsored Session

Chair: Chang Won Lee, Corresponding Author, Hanyang University, School of Business, Seoul, 133-791, Korea, Republic of, leecw@hanyang.ac.kr

1 - Study on the Supply Chain Management Critical Success Factors (csf)

Chang Won Lee, Corresponding Author, Hanyang University, School of Business, Seoul, 133-791, Korea, Republic of, leecw@hanyang.ac.kr, Gary Gaukler

For many companies, managing their supply chain has become increasingly central to their business success. Thus, it is crucial to investigate and identify appropriate supply chain practices for today's business environment. We call these practices, the Critical Success Factors (CSF) for supply chain management (SCM). Appropriate measures are developed and tested with a questionnaire survey. The results of the empirical analysis confirm that SCM-CSF can be conceptualized.

2 - Retailer's Optimal Sourcing Strategy under Consumer Stockpiling: A Risk Management Approach

Jiho Yoon, Michigan State University, N468 North Business Complex, Michigan State University, East Lansing, MI, 48824-1121, United States of America, yoon@broad.msu.edu, Ram Narasimhan, Myungkyo Kim

We study a retailer's sourcing strategy under consumers' stockpiling behavior and the factors associated with the selection of an optimal strategy in multi-tier supply chains in the presence of supply disruption risk. Stockpiling behavior occurs when consumers attempt to mitigate the negative impact of a supply shortage. Our analysis shows that optimal sourcing strategy is highly dependent on multiple factors.

3 - Relationships in Servitization, Satisfaction and Intention to Reuse: Customers' Perspective

Sang Hyung Ahn, Professor, Seoul National University, Graduate School of Business, Seoul, Korea, Republic of, shahn@snu.ac.kr, Chang Won Lee

This study presents to find out a relationship among characteristics of servitization, satisfaction and intention to reuse in terms of customers' perspective. The results were examined to identify significant factors affecting servitization, satisfaction and intention to reuse. The study provides decision-makers with more accurate information to develop appropriate servitization practices in terms of customers perspective.

4 - Industrialization, Productivity and the Shift to Services and Information

Hosun Rhim, Professor Of Logistics, Service, And Operations Management, Korea University Business School, Anam-dong, Seongbuk-gu, 136-701, Seoul, Korea, Republic of, hrhim@korea.ac.kr, Uday Karmarkar, Kihoon Kim

The traditional explanation for the shift to services was the steady growth of manufacturing productivity. But this does not explain the initial growth in manufacturing, or that of information intensive services relative to physical services. The authors adduce a second factor that explains both trends: the relative maturity of a market.

The Journey to Organizational Decision Quality (ODQ)

Sponsor: Decision Analysis

Sponsored Session

Chair: Carl Spetzler, CEO, Strategic Decisions Group, 745 Emerson Street, Palo Alto, CA, 94301, United States of America, cspetzler@sdg.com

1 - Progress in the Adoption of ODQ (Organizational Decision Quality)

Carl Spetzler, CEO, Strategic Decisions Group, 745 Emerson Street, Palo Alto, CA, 94301, United States of America, cspetzler@sdg.com

To set the stage for the following speakers, this session will provide a quick review of ODQ, the ODQ maturity curve, and the progress that companies are making on the journey to ODQ. After the following speakers, we will have a panel discussion on the challenges faced by champions on the journey to ODQ and how they are best met.

2 - Lessons Learned Deploying ODQ

Larry Neal, Independent, 3667 Cantelow Rd, Vacaville, CA, 95688, United States of America, lnealjr@wildblue.net, Frank Koch

A panel of seasoned practitioners will discuss the lessons learned in deploying the concepts of Decision Quality throughout their organization, or ODQ. After brief opening remarks, the panel will discuss the learnings both positive and negative, of their experiences. The focus of this session is to help other institutions follow suit and raise the bar on their organization decision making practices. Attendees will come away with readily usable insights and tips for their own use.

3 - Applying Decision Analysis at Pfizer – Lessons Learned from the Field

Rodger Thompson, Sr. Director/team Leader, Pfizer, Inc., 500 Arcola Road, Collegeville, PA, 19426, United States of America, rodger.thompson@pfizer.com

This presentation will discuss the journey that the Portfolio and Decision Analysis (PDA) group at Pfizer has undertaken to bring decision excellence to the Pfizer organization. The discussion will focus on lessons learned on adapting the Dialog Decision Process to Pfizer to enable integration of the six components of decision quality.

Recent Findings and Experiences in Probability Elicitation

Sponsor: Decision Analysis

Sponsored Session

Chair: Saurabh Bansal, Assistant Professor, Penn State Univrsity, 405 Business Building, University Park, PA, 16802, United States of America, sub32@psu.edu

1 - Indirect Elicitation of Subjective Probabilities through Pair-Wise Comparisons

David Budescu, Professor, Fordham University, 441 E Fordham Road, 220 Dealy Hall, Bronx, NY, 10458, United States of America, budescu@fordham.edu, Han Hui Por

We test a new method for eliciting subjective probabilities. Judges compare pairs of possible outcomes and identify which of the two is more likely, and by how much. These judgments generate a matrix from which the target probabilities are estimated by the geometric means. We compared the quality of our estimates with traditional direct estimates and show that they were significantly more accurate, suggesting that the new approach is a good candidate for replacing standard elicitation methods.

2 - Eliciting and Modeling Continuous Forecasts

Joe Tidwell, University of Maryland, Biology/Psychology Building, College Park, United States of America, jtidwell@umd.edu

Accurate forecasting models for continuous outcomes offer many benefits, including eliminating most close-call counterfactuals, better information about tail risks, and the ability to obtain forecasts for any value across the range of possible outcomes. In a series of experiments, we evaluate various methods for eliciting small sets of judgments from individual forecasters regarding real-world events and then aggregating these judgments over forecasters into continuous forecast models.

3 - Estimating Continuous Distributions by Quantifying Errors in Probability Judgments for Fixed Values

Asa Palley, Duke University, The Fuqua School of Business, 100 Fuqua Drive, Box 90120, Durham, NC, 27708, United States of America, asa.palley@duke.edu, Saurabh Bansal

In many managerial decision problems, the distribution for a continuous random variable must be obtained from expert judgments. Using a scale-free model of judgmental errors, we present a method for estimating distribution parameters through linear combinations of the judgments provided, where the weights are explicit functions of the expert's errors. Finally, we demonstrate the application and benefits of our approach using data collected in an experimental study.

4 - A Turning Point Model Based on Exponential Smoothing

Xiaoja Guo, University College London, Dept. of Management and Innovation, Gower Street, London, WC1E 6BT, United Kingdom, x.guo.11@ucl.ac.uk, Casey Lichtendahl, Yael Grushka-Cockayne

We propose a turning point model that extends the damped multiplicative trend exponential smoothing model. Our model offers the ability to dynamically update the local level and the growth trend, and ultimately to predict the turning point. This dynamic turning point model can be contrasted with non-dynamic models that are popular in the literature, such as the Bass diffusion model. We fit the model to several well-studied time series and examine the model's performance.

1 - A Simulation-optimization Approach for Robust Aircraft Routing and Flight Retiming

Mohamed Haouari, Professor, Qatar University, BP 2713, Doha, Qatar, mohamed.haouari@qu.edu.qa, Mohamed Ben Ahmed, Farah Zeghal Mansour

We propose a novel simulation-optimization approach for solving the robust aircraft routing and flight retiming problem. The approach requires iteratively solving a mixed-integer quadratic programming problem that aims at optimally inserting buffer times between consecutive flights, and invoking a Monte-Carlo procedure for assessing the robustness of the generated schedules. We present the results of extensive computational experiments that were carried out on a real data.

2 - Airlines' Hedging Policies: An Empirical Approach to the U.S. Domestic Market

Soheil Sibdari, Associate Professor, UMass Dartmouth, 285 Old Westport Rd, North Dartmouth, MA, Dartmouth, United States of America, ssibdari@umassd.edu

We study airlines's hedging policies during years 2002-2015 according to their corporate's yearly report. An empirical study examines airlines' policy and determine the impact of airline size, market share, and the airlines' aircraft sizes on the hedging effectiveness.

3 - Meta-heuristic Algorithm for the Multiple Runway Aircraft Scheduling Problem

Bulent Soykan, Old Dominion University, Dep. of Eng. Mngt. and Systems Eng., Norfolk, VA, United States of America, bsoyk001@odu.edu, Ghaith Rabadi

Multiple Runway Aircraft Scheduling Problem involves assigning both landing and taking-off aircrafts to runways, sequencing them on each runway and assigning each aircraft a landing or take-off time while considering predetermined time windows for each aircraft to land or take-off. This research aims to develop a tabu search/path relinking algorithm for the static case of the problem, where all information of aircraft is known in advance.

4 - A Two-Stage Airport Surface 4D Taxiing Trajectory Scheduling Strategy Considering Runway Exit Select

Xiang Zou, Tsinghua University, Room 430, Main Building, Tsinghua Univ., Beijing, China, x-zou10@mails.tsinghua.edu.cn, Bang An

This paper proposes a two-stage airport taxing scheduling policy. In the first stage, all of the interested aircrafts are assigned initial routes. Then, aircrafts unavailable to fulfill their initially assigned routes are rescheduled. We do not fix the runway exits of landing aircrafts. Instead, we introduce Runway Exit Availability and a MIP model to assign 4D taxiing trajectories. Test in the environment of Beijing Capital Airport shows the effectivity and efficiency of the approach.

Advanced Routing Models

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Qie He, University of Minnesota, 111 Church Street SE, Minneapolis, United States of America, qhe@umn.edu

1 - Pollution-routing Problems with Speed and Departure Time Optimization

Raphael Kramer, PhD Student, Universita degli Studi di Modena e Reggio Emilia, Via Amendola 2, 42122, Reggio Emilia, Italy, raphael.kramer@unimore.it, Thibaut Vidal, Anand Subramanian, Nelson Maculan

We consider the Pollution-Routing Problem with possible departure time optimization. This enables to better allocate human resources to time periods with higher delivery needs. An algorithm for speed and departure time optimization is introduced for any fixed route. Its optimality is proven. Integrating this algorithm into a classical metaheuristic generates high-quality routing solutions. Experimental analyses show the impact of departure time on speeds decision, emissions and labor costs.

2 - Exact Formulations and Algorithms for the Pollution Routing Problem

Yongjia Song, Virginia Commonwealth University, 821 W Franklin Street, Richmond, VA, United States of America, ysong3@vcu.edu, Ricardo Fukasawa, Qie He

We propose for the first time exact formulations of the pollution routing problem. These formulations are all mixed integer convex programs, with one being a mixed integer second-order cone program. The lower bounds provided by the continuous relaxations of these formulations are compared theoretically. Based on our formulations, instances with up to 25 customers in the literature are solved to optimality for the first time.

3 - A Column Generation Algorithm to Solve the Pollution Routing Problem

Fernando Santos, PhD, University of Waterloo, 200 University Avenue West, Waterloo, Canada, fernandoafonso1@gmail.com, Qie He, Ricardo Fukasawa, Yongjia Song

We introduced a set partitioning formulation and a column generation algorithm to solve the Pollution Routing Problem (PRP). To price out negative reduced cost routes we proposed a labelling algorithm that derives novel dominance rules in order to prune out unpromising labels and perform faster.

4 - The Deterministic Dispatch Waves Problem

Mathias Klapp, PhD Student, Georgia Tech, 755 Ferst Drive NW, Main Building #326, Atlanta, GA, 30332-0205, United States of America, maklapp@gatech.edu, Alan Erera, Alejandro Toriello

We study last-mile delivery systems by formulating the deterministic dispatch waves problem (DWP) that models a distribution center where geographically positioned orders arrive at known action periods (waves) throughout the day. At each wave, the decision maker chooses whether to dispatch a single vehicle or not and the subset of open orders to serve in the vehicle's route, with the objective of minimizing operational costs and penalties for unserved requests.

Chair: Mohammad Khodayar, Southern Methodist University, 6251 Airline Rd, Junkins Bldg, suite 334, Dallas, TX, 75275, United States of America, mkhodayar@mail.smu.edu

1 - Interdiction Analysis of Coupled Electricity and Natural Gas Networks

Bowen Hua, The University of Texas at Austin, 1616 Guadalupe St, Austin, TX, 78701, United States of America, bhua@utexas.edu, Ross Baldick

We present a bilevel optimization model to identify the critical components of the coupled power and natural gas pipeline system. The upper-level problem involves the interdiction decisions and the lower-level problem represents the operation of the coupled system. We model the system operation as an MILP to include the nonlinear flow-pressure relations. Some theoretical properties of this bilevel program are analyzed. A decomposition algorithm is proposed to solve the problem.

2 - Quantifying the Resilience of an Urban Traffic – Electric Power Coupled System

Elise Miller-Hooks, Professor, University of Maryland, College Park, MD, elisemh@umd.edu, Seksun Moryadee, Steven Gabriel, Hossein Fotouhi

A nonlinear, stochastic, mixed integer program is presented for quantifying the resilience of the coupled traffic-power network to a disruption. The model captures interdependencies in this system, and seeks an optimal allocation of limited mitigation, preparedness and response resources to obtain an efficient resource allocation plan and maximum resilience estimate.

3 - Improving the Resilience of Multiple Energy Carrier Microgrids Against Deliberate Disruptions

Saeed Dehghan Manshadi, Southern Methodist University, 6251 Airline Rd, Junkins Bldg, Dallas, TX, 75275, United States of America, manshadi@mail.smu.edu, Mohammad Khodayar

This paper proposes a framework to identify the vulnerable components in the coordinated natural gas and electricity distribution networks in microgrids and to ensure the resilient operation of such interdependent networks. The proposed framework addresses deliberate actions to disrupt the energy flow in the microgrids and proposes reinforcement strategies to increase the resilience of the energy supply.

1 - Solving the Pre-Marshalling Problem to Optimality

Kevin Tierney, Assistant Professor, University of Paderborn,
Warburger StraÙe 100, Paderborn, 33098, Germany,
kevin.tierney@upb.de, Stefan Voss, Dario Pacino

The pre-marshalling problem is a key problem at container terminals. The goal is to find a minimal sequence of re-shuffling containers in a set of stacks such that they are arranged according to the time each container must leave the stacks. We present a novel algorithm using A* and IDA* combined with several novel branching and symmetry breaking rules. We solve over 500 previously unsolved benchmark instances to optimality clearly outperforming current state-of-the-art methods.

2 - A Genetic Algorithms Based Approach to Develop Cost-Effective Annual LNG Delivery Program

Fatih Mutlu, Asst. Professor, Qatar University, Doha, Doha, Qatar,
fatihmutlu@qu.edu.qa

Developing a cost effective annual delivery program for liquefied natural gas suppliers is known to be among the most challenging integrated inventory, production, and maritime delivery routing problems. We use a genetic algorithms based approach to solve this problem. We produce alternative routes for the vessels, each of which represents a chromosome. Our method performs better than the exact solution method in all of the problem instances we solved.

3 - A Mathematical Model for the Ship Scheduling and Cargo Assignment Problem

Salomon Wollenstein Betech, Student, Instituto Tecnológico de
Estudios Superiores de Monterrey, Av Carlos Lazo 100, Alvaro
Obregón, DF, 01389, Mexico, s.wollenstein@gmail.com

Middle-size companies with maritime shipping face a scheduling and cargo-assignment problem. Given a set of demands, suppliers, contracts, and ships, the company must design their operations to minimize cost. A mathematical model is proposed that simultaneously solves the ship scheduling and cargo assignment problem for a period of a year, discretizing time in days. The algorithm is capable of solving the problem at a rate of five ships and ports in ten minutes.

4 - A Bivariate Probit Model to Analyze Perspectives for Container Shipping on the Northern Sea Route

Irina Benedyk, United States of America, birina@purdue.edu,
Srinivas Peeta

This study seeks to explore opportunities and barriers for container freight shippers to use the Northern Sea Route. A stated preference survey of freight shippers in East Asia and Europe is conducted. A Bivariate Probit Model is used to investigate attitudes towards the usage of the North Sea Route, and identify key factors that influence them.

1 - Forecast Locomotive Surplus and Deficit to Balance the Terminals and Shops

Kamalesh Somani, CSX Transportation, 500 Water St,
Jacksonville, FL, 32202, United States of America,
Kamalesh_Somani@CSX.com, Shankara Kuppa,
Artyom Nahapetyan

Number of locomotives coming into a terminal may not be same as number of locomotives going out. This creates imbalance where some terminals are in constant need for locomotives and some other terminals usually have spare locomotives. Similarly a shop may receive more locomotive than its capacity and at the same time another shop may not be used to its full capacity. We developed advance analytics tools which help to minimize network balancing cost and any train delay because of locomotives.

2 - Failure Prediction and Sensor Spacing Optimization Along Track Corridors

Yanfeng Ouyang, Univ. Of Illinois, 205 N. Mathews Ave, Urbana,
United States of America, yfouyang@illinois.edu, Zhaodong Wang

This talk describes a machine-learning based framework for determining sensor deployment to ensure optimal reporting of potential incident-prone failures of the passing traffic. A simulation-based optimization model is used to find the optimal sensor spacing.

3 - Development and Application of Line-of-road Emulator Tool in CSX

Yu Wang, Manager Operations Research, CSX Transportation
Inc., 500 Water Street, Jacksonville, FL, 32202,
United States of America, Yu_Wang@csx.com, Eric Pachman

Line-of-Road Emulator is a web-based tool to visualize train movements in a GIS view. The tool can highlight slow-moving and/or long-dwell trains with different styles of bubbles, which provides informative insights to help railroad managers understand the situation and investigate the reasons causing congestions. The tool was used to create an illustration video about the congestion happened on the northern tier of CSX network in 2014 winter, and has received high evaluation from the users.

4 - Optimization Algorithms for Hump Yard Decision Support System

Alexey Sorokin, Senior Systems Engineer, Optym, 7600 NW 5th
Place, Gainesville, FL, 32607, United States of America,
alexey.sorokin@optym.com, Ravindra Ahuja, Krishna Jha

Rail cars are classified to their appropriate outbound trains in yards. Important decisions made by yardmasters include the order in which trains should be humped and classification track on which a block should be built at any point in time. We developed optimization modules for a real-time decision support system that can assist yardmasters with these decision. Benefits of the optimization algorithms were computed using a hump-yard simulation system previously developed by Optym.

yuding@iemail.tamu.edu

1 - Dynamic Data Driven Applications Systems (DDAS): New Capabilities in Data Analytics

Frederica Darema, Program Director, Air Force Office of Scientific
Research, United States of America, frederica.darema@us.af.mil

This talk provides an overview of future directions enabling in new methodologies for analytics through the DDAS (Dynamic Data Driven Applications Systems) paradigm. We will discuss how DDAS allows new capabilities in data analytics to enable optimized and fault tolerant systems management, improved analysis and prediction of system conditions, in a diverse set of application areas ranging from aerospace applications to smart cities, to manufacturing planning and control, and cybersecurity.

2 - Offline Learning for Dynamic Data-driven Capability Estimation for Self-aware Aerospace Vehicles

Douglas Allaire, Assistant Professor, Texas A&M University,
425 MEOB, 3123 TAMU, College Station, TX, 77843,
United States of America, dallaire@tamu.edu, Benson Isaac

A self-aware aerospace vehicle can dynamically adapt the way it performs missions by gathering information about itself and its surroundings and responding intelligently. We present an information-theoretic approach to offline learning via the optimization of libraries of strain, capability, and maneuver loading using physics-based computational models. Online capability estimation is then achieved using a Bayesian classification process that fuses dynamic, sensed data.

Functional Data Analysis

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Moein Saleh, Discover Financial Services/ Arizona State University, 699 S Mill Ave, Tempe, AZ, 85281, United States of America, Moein.Saleh@asu.edu

1 - On the Use of Gaussian Processes for Surface and Profile Data

Enrique Del Castillo, Penn State University, Industrial Eng. and Statistics Depts., State College, United States of America, exd13@psu.edu

Standard applications of Gaussian Processes in manufacturing data have traditionally been based on models of the form $z(x,y)$ where x,y,z are coordinates acquired with some sensor, so correlation is assumed to occur on euclidean space external to the surface. We show new methodology that assumes instead correlation exists on the intrinsic surface points along geodesic distances, and show how this leads to better surface reconstruction in both simulated and real datasets.

2 - Functional Clustering with Applications in Single Molecule Experiments

Ying Hung, yhung@stat.rutgers.edu

Cell adhesion experiments refer to biomechanical experiments that study protein, DNA, and RNA at the level of single molecules. Motivated by analyzing a single molecule experiment, a new statistical framework is proposed based on functional clustering approaches. Simulations and applications to real experiments are conducted to demonstrate the performance of the proposed method.

3 - Design of Experiments for Functional Response

Moein Saleh, Discover Financial Services/ Arizona State University, 699 S Mill Ave, Tempe, AZ, 85281, United States of America, Moein.Saleh@asu.edu, Rong Pan

Applications of DOE for single response variable can be seen in nearly every disciplines in science and engineering. However, there are very few publications that discussed optimal design for the experiments with multiple responses taken over different points of a continuum variable. This continuum can be any other continuous variable for functional data analysis such as time in longitudinal study. My study focuses on developing a framework for designing the experiments for functional response.

4 - Monitoring and Diagnostics of High Dimensional Multi-stream Data

Samaneh Ebrahimi, Research Assistant, Georgia Institute of Technology, 755 Ferst Drive, Atlanta, GA, 30332, United States of America, samaneh.ebrahimi@gatech.edu, Kamran Paynabar, Chitta Ranjan

Correlated high-dimensional data streams (HDDS) pose significant challenges in Statistical Process Monitoring. In this research, we integrate PCA and Adaptive Lasso, and propose a novel approach for effective process monitoring and diagnosis of HDDS. The effectiveness of the proposed approach is validated through simulation and a case study.

Chair: Linkan Bian, Assistant Professor, Mississippi State University, 260 McCain Building, Mississippi State, Starkville, MS, 39762, United States of America, bian@ise.msstate.edu

1 - Accelerated Process Optimization for Laser-based Additive Manufacturing (LBAM)

Amir M. Aboutaleb, Mississippi State University, 260 McCain Building, Mississippi State, MI, 39762, United States of America, aa1869@msstate.edu, Linkan Bian, Alaa Elwany, Nima Shamsaei, Scott M. Thompson

A novel Design-of-Experiment methodology is proposed to efficiently optimize process control parameters for LBAM by leveraging data obtained from prior related but non-identical studies. Our method accounts for unavoidable difference between the experimental conditions of the current and prior studies and quantify the associated uncertainty, which is further updated using real-world data generated in the current study.

2 - Concurrent Process Plan Optimization for Additive Manufacturing

Bahir Khoda, Professor, North Dakota State University, Room # 202F Civil and Industrial Enginee, 1410 14th Avenue North, Fargo, ND, 58102, United States of America, akm.khoda@ndsu.edu, Amm Nazmul Ahsan, Md Habib

Implementing additive manufacturing processes effectively requires addressing issues of process proficiencies and resource utilization, both of which have a strong environmental impact. In this paper, both part build orientation and material deposition direction are concurrently optimized by analyzing part geometry to minimize the resource requirement. A concurrent multicriteria process plan optimization framework is developed using Genetic Algorithms (GA) technique.

3 - Online Sensor-based Monitoring in Aerosol Jet Printing Process

Prahalad Rao, SUNY Binghamton, 4400 Vestal Pkwy. E, Binghamton, NY, United States of America, prao@binghamton.edu, Roozbeh Salary, Jack Lombardi, Mark Poliks

Aerosol Jet Printing (AJP) is an additive manufacturing process (AM) is emerging as a viable method for printing conformal electronics. However, teething quality related problems in AJP remain unresolved. We propose approaches based on image processing and sensor data analytics to achieve online quality monitoring in the AJP process. The effectiveness of the proposed approach is assessed and evaluated with several real case studies implemented on an aerosol jet printer setup.

IBM Research Best Student Paper Award I

Sponsor: Service Science

Sponsored Session

Chair: Ming-Hui Huang, National Taiwan University, Taiwan - ROC, huangmh@ntu.edu.tw

1 - Best Student Paper Competitive Presentation

Ming-Hui Huang, National Taiwan University, Taiwan - ROC, huangmh@ntu.edu.tw

Finalists of the IBM Research Best Student Paper Award present their research findings in front of a panel of judges. The judging panel will decide the order of winners, which will be announced during the business meeting of the Service Science Section at the Annual Conference.

1 - Service Innovation and the Role of Collaboration

Cong Feng, Syracuse University, 721 University Avenue, Syracuse NY, United States of America, feng@congfeng.net, K. Sivakumar

Results show that (1) the effect of service innovation on firm performance is greater for service firms than manufacturing firms; (2) the relationship between the propensity for service innovation and three types of collaboration is significant; and (3) vertical and third-party collaborations are more beneficial than horizontal collaboration for service firms.

2 - Brand Equity and Extended Service Contract Purchase Decisions

Moein Khanlari Larimi, University of Alberta, Canada, khanlari@ualberta.ca, Paul Messinger

In this paper, we explore the role of brand equity on consumers' extended service contract (ESC) purchase decisions. We draw from past findings to show that higher brand equity has an overall positive impact on ESC purchase decisions. We also explore the positive impact of stores on ESC purchase decisions.

3 - Regulating Greed over Time

Stefano Traca, Massachusetts Institute of Technology, Cambridge, MA, United States of America, stet@mit.edu, Cynthia Rudin

In retail, there are predictable yet dramatic time-dependent patterns in customer behavior, such as periodic changes in the number of visitors, or increases in visitors just before major holidays (e.g., Christmas). The current paradigm of multi-armed bandit analysis does not take these known patterns into account, which means that despite the firm theoretical foundation of these methods, they are fundamentally flawed when it comes to real applications. This work provides a remedy that takes the time-dependent patterns into account, and we show how this remedy is implemented in the UCB and e-greedy methods. In the corrected methods, exploitation (greed) is regulated over time, so that more exploitation occurs during higher reward periods, and more exploration occurs in periods of low reward. In order to understand why regret is reduced with the corrected methods, we present a set of bounds that provide insight into why we would want to exploit during periods of high reward, and discuss the impact on regret. Our proposed methods have excellent performance in experiments, and were inspired by a high-scoring entry in the Exploration and Exploitation 3 contest using data from Yahoo! Front Page. That entry heavily used time-series methods to regulate greed over time, which was substantially more effective than other contextual bandit methods.

4 - Assessing the Impact of Product and Service Quality on Consumer Returns: A Data Analytics Study

Necati Ertekin, Texas A&M University, Mays Business School,
College Station TX 77840, United States of America,
nertekin@mays.tamu.edu, Gregory Heim, Michale Ketzenberg

We contribute to the understanding of consumer return behavior by examining the association between in-store customer experience during a purchase and a subsequent return. We demonstrate that retail efforts such as increasing salesperson competence and improving store environment that are so long believed to prevent returns may indeed induce returns.

Advances in Simulation-based Optimization I

Sponsor: Simulation

Sponsored Session

Chair: Jie Xu, George Mason University, 4400 University Dr., MS 4A6,
Engr Bldg, Rm 2100, Fairfax, VA, 22030, United States of America,
jxu13@gmu.edu

1 - Estimating the Probability of Convexity of a Function Observed with Noise

Nanjing Jian, PhD Student, Operations Research and Information
Engineering, 288 Rhodes Hall, Cornell University, Ithaca, NY,
14850, United States of America, nj227@cornell.edu,
Shane Henderson

Given estimates of the values of a function observed with noise from simulation on a finite set of points, we wish to sequentially estimate the probability that the function is convex. By updating a Bayesian posterior on the function values, we iteratively estimate the posterior probability of convexity by solving certain linear programs in a Monte Carlo simulation. We discuss a variety of variance reduction methods for the estimation and the linear programs associated with each.

2 - Adaptive Sampling Trust Region Optimization

Sara Shashaani, Associate Professor, Department of Statistics,
Purdue University, 250 N University Street, West Lafayette, IN,
47907, United States of America, pasupath@purdue.edu,
Raghu Pasupathy

We develop derivative free algorithms for optimization contexts where the objective function is observable only through a stochastic simulation. The algorithms we develop follow the trust-region framework where a local model is constructed, used, and updated as the iterates evolve through the search space. We incorporate adaptive sampling to keep the variance and the squared bias of the local model in lock step, in a bid to ensure optimal convergence rates.

3 - Parallel Empirical Stochastic Branch & Bound

Sajjad Taghiye, George Mason University, 4400 University Dr.,
MS 4A6, Engr Bldg, Rm 2100, Fairfax, VA, 22030,
United States of America, staghiy2@gmu.edu, Jie Xu

To efficiently solve problems with time-consuming high-fidelity simulations, we develop a new parallel algorithm known as parallel empirical stochastic branch & bound (PESBB) to exploit the power of high performance computing. We will discuss synchronous and asynchronous versions of PESBB and present initial numerical results to demonstrate the scalability of PESBB.

4 - Finding the Best using Multivariate Brownian Motion

Seong-hee Kim, Professor, Georgia Institute of Technology,
755 Ferst Dr NW, Atlanta, GA, 30332, United States of America,
skim@isye.gatech.edu, Ton Dieker, Seunghan Lee

We present a new fully sequential procedure based on multivariate Brownian motion when variances are known but unequal. The procedure uses an ellipsoid as a continuation region, and a system with the worst sample mean is eliminated whenever the procedure's statistic exits the ellipsoid. The size of the ellipsoid changes as the number of survivors decreases. Experimental results are provided for both equal and unequal variances.

Green Supply Chain Management

Contributed Session

Chair: Vinay Gonela, Assistant Professor Of Management, Southwest
Minnesota State University, CH 214, 1501 State Street, Marshall, MN,
56258, United States of America, vinay.gonela@smsu.edu

1 - The Impact of Contracts on Environmental Innovation in a Supply Chain

Seyoun Jung, PhD Student, KAIST (Korea Advanced Institute of
Science and Technology), 85 Hoegiro, Dongdaemun-gu, Seoul,
Korea, Republic of, ssebea@business.kaist.ac.kr, Bosung Kim,
Kun Soo Park

We examine the impact of contracts between a supplier and a manufacturer on the supplier's environmental innovation. We calculate and compare the equilibrium outcomes under three types of contract such as wholesale-price, revenue-sharing, and quality-dependent contracts.

2 - Producer-dominated Green Supply Chain Collaboration under Trade-in Programs

Chih-Tien Chiu, Doctoral Student, National Taiwan University,
No.1, Sec. 4, Roosevelt Rd., Taipei, 10617, Taiwan - ROC,
d03741001@ntu.edu.tw, Mu-chen Chen, Jiuh-bing Sheu

This paper aims to address new-product/used-product pricing in a green logistics. We adopt the dynamic programming approach integrated with the logit model to formulate the n-period trade-in pricing-logistics problem, where the logit model is utilized for trade-in service channels choice. Data collected via stated preference experiments are used for the parameter estimation of the logit model, followed by conducting quantitative analyses to provide important findings and managerial insights.

3 - Metrics for Sustainable Operations: Current State and Path to Improvement

Remi Charpin, Clemson University, 100 Sirrine Hall, Clemson,
United States of America, rcharpi@clemson.edu, Aleda Roth

From an operations and supply chain management lens, we examine sustainability metrics currently being reported by firms. We propose that certain metrics are 'attractors,' as they are apt to lead the business towards sustainability, whereas others are deemed to be 'detectors' that are likely to be used for 'greenwashing.'

4 - Stochastic Optimization of Sustainable Industrial Symbiosis Based Hybrid Generation Bioethanol Supply Chain

Vinay Gonela, Assistant Professor Of Management, Southwest
Minnesota State University, CH 214, 1501 State Street, Marshall,
MN, 56258, United States of America, vinay.gonela@smsu.edu,
Atif Osmani, Jun Zhang, Joseph Szmerekovsky

This paper focuses on designing a new industrial symbiosis based hybrid generation bioethanol supply chain (ISHGBSC). A SMILP model is proposed to design the optimal ISHGBSC under different sustainability standards. The result provides guidelines for policy makers to determine the appropriate standard to use under different sustainable concerns. In addition, it provides investors a guideline to invest in different technologies under different sustainability standards.

Big Data and Energy

Contributed Session

Chair: Feng Gao, SGRI North America, 5451 Great America Parkway,
Santa Clara, CA, 95054, United States of America, feng.gao@sgrina.com

1 - Resilient Power System State Estimation using Compressive Sensing

Hanif Livani, Assistant Professor, University of Nevada Reno,
Electrical & Computer Engineering, MC 0111, 1185 Perry St, /
Room 302, Reno, NV, 89557, United States of America,
hlivani@unr.edu

Phasor Measurement Units (PMU) have become widely used for power system monitoring and control. However, they are not installed on all the buses in a network. Therefore, PMU-only state estimation encounters problems arising from a limited number of installed PMUs and probable data losses as the results of congestion or disconnection in communications. In this study, we propose power system state estimation using Compressive Sensing (CS) algorithm which is resilient to loss of data.

2 - Data Exploration of Publicly Reported Power Outages to Assess Grid Reliability and Damages

Michael Sohn, Staff Scientist, Lawrence Berkeley National Laboratory, One Cyclotron Road, Mail Stop: 90R2008, Berkeley, CA, 94720, United States of America, mdsohn@lbl.gov, Joseph Eto, Kristina Lacomme, Laurel Dunn

We have amassed a database of power outages, with high temporal resolution, from across the US. We present an analysis of the database, focusing on the distribution of outages by duration, customers affected, location, time, etc. We also link the data to orthogonal datasets to estimate the types of customers affected for a particular outage. Finally, we estimate the cost of power interruptions, and discuss implications on the reliability costs nationwide.

3 - Energy Disaggregation Based on Stochastic Dynamic Programming with Collocation Method

Feng Gao, SGRI North America, 5451 Great America Parkway, Santa Clara, CA, 95054, United States of America, feng.gao@sgrina.com, Chris Saunders, Yang Yu, Wendong Zhu, Guangyi Liu

The purpose of energy disaggregation is to separate energy consumption for a consumer into the energy data for individual appliances. The benefit lies in the promotion of improved consumption behaviors and adaptation of energy-efficient devices. The paper presents a dynamic model for devices power consumption; considers uncertainty of consumption; and proposes a fix-point iterative schema to efficiently resolve the stochastic problem. The paper demonstrates its result on a simulated data set.

4 - Transmission Planning with Renewable Distributed Generation Uncertainty

Fikri Kucuksayacigil, Iowa State Uni. Industrial Engineering, 3004 Black Engineering, Ames, IA, 50011, United States of America, fksayaci@iastate.edu, Kyung Jo Min

There have been substantial developments of distributed generation from renewable energy sources. This has created new challenges in transmission planning as distributed generation leads to uncertainties on the use of transmission lines. To address this uncertainties, we utilize a jump-diffusion demand process and binomial lattice to show how the best transmission is planned under the risk of self-supporting communities. From the resulting analysis, economic implication and managerial insights will be discussed.

Cyber and Logistics Applications

Sponsor: Military Applications

Sponsored Session

Chair: Natalie Scala, Assistant Professor, Towson University, Dept. of e-Business and Tech Management, 8000 York Road, Towson, MD, 21252, United States of America, nscala@towson.edu

1 - Operations Research Initiatives in Cyber Defense

Paul Goethals, Army Cyber Institute, United States Military Academy, West Point, NY, United States of America, paul.goethals@usma.edu

Despite the reduction in the total Army population, the cyber force structure continues to grow in strength and impact. This presentation describes a number of Operations Research initiatives that could benefit the cyber community. Research trends and areas of future work are also offered.

2 - Automated Identification Technology Devices for Naval Seabasing

Natalie Scala, Assistant Professor, Towson University, Dept. of e-Business and Tech Management, 8000 York Road, Towson, MD, 21252, United States of America, nscala@towson.edu, Jennifer Pazour

We present a value focused decision model for naval seabasing. We discuss automated identification technology devices as alternatives to a multi-objective decision model with the goal of selecting the preferred device for seabasing logistics support. Criteria for this model include metrics and associated measures related to seabasing.

3 - Logistics Engineering Solution for Reverse-engineering Topology

Alan Briggs, INFORMS Maryland, 8606 Aspen Grove Court, Odenton, MD, 21113, United States of America, awbriggs@gmail.com

Using monte carlo simulation, author uses proximate location data to reverse engineer network topology.

Homeland Security Decision Making

Cluster: Homeland Security

Invited Session

Chair: Jun Zhuang, University at Buffalo, SUNY, 317 Bell Hall, Buffalo, NY, 14221, United States of America, jzhuang@buffalo.edu

Co-Chair: Fei He, Assistant Professor, Texas A&M University-Kingsville, 700 University Blvd., Kingsville, TX, 78363, United States of America, fei.he@tamuk.edu

1 - Multi-Objective Optimization Models in Urban Security

Jose Emmanuel Ramirez-Marquez, Associate Professor, Stevens Institute of Technology, 1 Castle Point Rd, Hoboken, NJ, 07030, United States of America, jmarquez@stevens.edu, Mohammed Muaafa

The allocation of limited resources is a daily dilemma for police commanders. More than 50% of police department costs go into patrolling operations, which include responding to emergencies and maintaining police presence. This study aims to address the challenging tradeoff police face when designing patrolling strategies between lessening the economic burden of crime prevention and maintaining high levels of public safety.

2 - A Literature Review of Recent Attacker-defender Games

Fatemeh Mousapour, SUNY Buffalo, 338 Bell Hall, Buffalo, NY, United States of America, f.mousapoor@yahoo.com, Jun Zhuang

This research provides an extensive review of game-theoretic analysis of attacker-defender models. Those models are categorized according to different defense measures, attack tactics, system structures, game types, player rationality and risk preferences. Statistical charts and tables are presented to identify patterns and trends in this area. Through the content analysis framework, some research gaps and future research directions are identified.

3 - Protecting and Restoring Facilities from Intentional Attacks

Chi Zhang, Assistant Professor, Tsinghua University, 100084
Beijing, Department of Industrial Engineering, Beijing, China,
czhang@tsinghua.edu.cn, Sachuer Bao

Besides protecting facilities from intentional attacks, another paramount issue is taken into consideration- restoring destroyed facilities to optimal service level within a given time interval. The defender decides which facilities to protect before an attack, and resource allocation between improving capacities of operational facilities and rebuilding destroyed facilities after an attack, to maximize profit by satisfying customer demands. The problem is solved by an ant colony algorithm.

4 - Coordinating Pre- and Post-disaster Resource Allocation at Multiple Locations

Fei He, Assistant Professor, Texas A&M University-Kingsville, 700
University Blvd., Kingsville, TX, 78363, United States of America,
fei.he@tamuk.edu, Jun Zhuang

Resource allocation in the face of disaster aims to improve the efficiency and effectiveness of disaster relief. In this research, disaster preparedness and relief at multiple locations are modeled in a two-stage stochastic programming framework with the objective of loss minimization. New insights of coordinating preparedness and relief at multiple locations are provided.

5 - Model Validation for a Public-private Partnerships Model in Disaster Management

Vineet Madasseri Payyappall, PhD Student, University at Buffalo,
305 Winspear Avenue (Upper), Buffalo, NY, 14215, United States
of America, vineetma@buffalo.edu, Peiqiu Guan, Jun Zhuang

This research designed and conducted an experiment to validate a public-private partnerships model in disaster management. A two-staged experiment was conducted in a computer simulated environment. The risk behaviors of the subjects were evaluated in the first stage, and the second stage collected the decision of the subjects, who played the role of the private sectors, under different scenarios. The experiment shows that our model results are consistent with the experimental results.

03-Room 303, Marriott

New Topics in Scheduling

Cluster: Scheduling and Project Management

Invited Session

Chair: Rainer Kolisch, rainer.kolisch@wi.tum.de

1 - Coordinating Subcontractor Scheduling with Divisible Jobs

Behzad Hezarkhani, Assistant Professor, Nottingham University
Business School, Jubilee Campus, Nottingham, United Kingdom,
behzad.hezarkhani@nottingham.ac.uk, Wieslaw Kubiak

We study a decentralized scheduling problem with a single subcontractor and several agents having divisible jobs. Under complete information, we design pricing schemes that always make the agents' decisions coincide with efficient schedules. Under private information, we prove that the pivotal mechanism makes truth-telling the only optimal choice of the agents when announcing their processing times. We comment on the subcontractor's revenue under complete and private information.

2 - Single Machine Scheduling via Decision Theory

J.J. Kanet, Department of MIS/OM/DSC, 300 College Park,
University of Dayton, Dayton, OH, 45419-2130,
United States of America, Kanet@udayton.edu

We consider the following procedure for scheduling a single machine. At time t the machine is free with a set N of n jobs ready to occupy it. Thus, we have n choices for jobs to occupy the machine starting at time t with the remaining $n-1$ jobs completed later. Given that a job k is tentatively chosen to next occupy the machine, we calculate its completion time and the expected value (E) of the completion times of the remaining $n-1$ jobs. We do this for each of the n choices, producing for each the set of completion times $C = \{C_j | j \in N\}$. We then evaluate the objective $Z = f(C)$ choosing that job k for which Z is minimum to next occupy the machine. We provide an unbiased estimator of the set C and show that the procedure provides optimum results when the objective Z is to minimize flow time or maximum tardiness.

3 - Scheduling on a Single Machine under Time of Use Tariffs

Kan Fang, Tianjin University, No 92 Weijin Road, Nankai District,
Tianjin, 300072, China, zjumath@gmail.com, Nelson Uhan

We consider the problem of scheduling jobs on a single machine to minimize the total electricity cost of processing these jobs under time-of-use electricity tariffs. We show the computational complexity of this problem for both the uniform-speed and speed-scaling cases, present different approximation algorithms for the speed-scaling case and analyze their computational performance. We also show how to compute optimal schedules for the preemptive version of the problem in polynomial time.

4 - The Value of Flexibility and Shift Extensions in Physician Scheduling

Andreas Fögener, University of Augsburg, Universitätsstraße 16,
Universität Augsburg, WiWi, Augsburg, De, 86159, Germany,
andreas.fuegener@unikat.uni-augsburg.de, Jens Brunner

Scheduling physicians is a relevant topic in hospitals. In the literature, demand is usually assumed to be deterministic. However, surgery durations and emergencies contain uncertainty. We model stochastic physician demand using a scenario-based approach. We introduce flexible shift extensions, where physicians might have to work longer to match supply with demand and simultaneously increase predictability of working hours. We propose a mixed-integer model and a column generation heuristic to solve our problem.

04-Room 304, Marriott

The Business of Music and Emotion in Social Media

Cluster: Social Media Analytics

Invited Session

Chair: Chris Smith, TRAC-MTRY, 28 Lupin Lane, Carmel Valley, 93924,
United States of America, cmsmith1@nps.edu

1 - Philippine Language and Emotion During Typhoon Haiyan/Yolanda

Amanda Andrei, Graduate Student, Georgetown University,
aa1436@georgetown.edu

An investigation of language and emotion in tweets from the Philippines before and after 2013 super typhoon Haiyan/Yolanda using Linguistic Inquiry and Word Count (LIWC), breakpoint analysis, and a computational clustering tool revealed differences in topics and emotions depending on whether messages were expressed in English or Filipino.

2 - Subscribe or Sell: iTunes vs. Google Play Music all Access

Hooman Hidaji, PhD Student, University of Alberta, #1604 8515
112 St. NW, Edmonton, AL, T6G1K7, Canada,
hooman.hidaji@ualberta.ca

Recently, subscription has become a popular method of user monetization in online media business along with selling model. It is expected that firms utilize both approaches to cover as much demand as possible. However, pricing strategy of the firms is crucial in determining the demand for the two. In this study, using an economic model with endogenous demand, we set to model how the firm decides on the business model. Different user types and business model-dependent demand are considered.

3 - Stock Market Prediction using Disparate Data Sources

Bin Weng, Auburn University, 425 Opelika Rd Apt. 224, Auburn,
AL, 36830, United States of America, bhw0018@auburn.edu,
Fadel Megahed

Stock market prediction has attracted much attention from academia as well as business. In recent years, social media is considered as a new source to affect human's behavior and decision-making. In this paper, we will develop a new way to predict the movement of the stock market using disparate data source, social media data and market data. In order to predict the stock price more accurately, the model is developed using multivariable selection method and machine learning statistic methods.

05-Room 305, Marriott

Social Media in Business

Cluster: Social Media Analytics

Invited Session

Chair: Dokyun Lee, Carnegie Mellon University, Pittsburgh, PA,
United States of America, leedokyun@gmail.com

1 - Understanding the Impact of Discussions on Quality of Crowdsourced Content – The Case of Wikipedia

Srikar Velichetty, PhD Student, Eller College of Management,
University of Arizona, 1130 E Helen St, Tucson, AZ, 85719,
United States of America, srikarv@email.arizona.edu,
Jesse Bockstedt, Sudha Ram

We investigate the impact of discussions on the quality of Crowdsourced content using a data science approach that involves conducting an exploratory study to uncover the associations among different discussion characteristics and article quality and building a prediction model. By identifying appropriate instruments to overcome selection, we build a model to quantify the impact of these characteristics. Our results show that most of these characteristics have a positive impact on quality.

2 - Toward Effective Information Diffusion on Social Media Platforms: An Analysis of Dyadic Relationship

Jing Peng, The Wharton School, University of Pennsylvania, 3730 Walnut Street Suite 500, Philadelphia, PA, 19104, United States of America, jingpeng@wharton.upenn.edu, Ashish Agarwal, Kartik Hosanagar, Raghuram Iyengar

We investigate the impact of dyadic network characteristics on information diffusion in social media platforms with directed networks. We propose a novel hazard model to deal with the problem that a user may receive the information from multiple others. The model is estimated using diffusion of ads on Digg.com. We find that a non-reciprocal follower is more likely to adopt than a reciprocal follower and the effects of network embeddedness are more complicated than that in undirected networks.

3 - Monetizing Sharing Traffic through Incentive Design: A Randomized Field Experiment

Tianshu Sun, University of Maryland Smith School of Business, 3330 Van Munching Hall, College Park, MD, 20740-2840, United States of America, tianshusun@rhsmith.umd.edu, Siva Viswanathan, Elena Zheleva

Customers share product information with each other everyday. While the share of a product indicates clear purchase intent of either sender or recipient, most of such sharing traffic does not lead to successful purchases. In collaboration with a daily deal platform, we conduct a large field experiment to study whether and how firms can monetize sharing traffic, by targeting senders with incentive. Specifically, we examine the impact of incentive design on sender's purchase as well as referrals

4 - Founder and Funder, Just One Click Apart: How Social Media Facilitates Investor Entrepreneur Match

Fujie Jin, the Wharton School, University of Pennsylvania, 500 Jon M Huntsman Hall, 3730 Walnut Street, Philadelphia, PA, 19104, United States of America, jinfujie@wharton.upenn.edu

This study examines how entrepreneurs' social media presence facilitates the funding process across geographic regions. Comparison will be drawn between traditional angel investors or VCs and the new crowdfunding platform to show how entrepreneurs could optimally manage their social media profile to appeal to different investor groups.

Engineering Approaches in Finance

Sponsor: Financial Services

Sponsored Session

Chair: James Primbs, Associate Professor, California State University Fullerton, 800 N. State College Blvd., Fullerton, CA, United States of America, jprimbs@fullerton.edu

1 - On Feedback Control-based Stock Trading: Some Back Tests with High-frequency Data

B. Ross Barmish, Professor, University of Wisconsin, ECE Department, Madison, WI, 53706, United States of America, barmish@engr.wisc.edu

The takeoff point for this paper is a new paradigm for stock trading involving adaptive feedback control loops. I will first overview the key elements of our theory with emphasis on "model-free" trading and money management. Subsequently, I will describe recent back tests of our trading algorithms using high-frequency data. Given that our underlying theory requires continuity of the stock price, it is natural to study whether performance improves as a function of the trading frequency.

2 - Construction of Nonlinear Simultaneous Equations Models for Electricity Supply and Demand Functions

Yuji Yamada, Professor, University of Tsukuba, 3-29-1 Otsuka, Bunkyo-ku, Tokyo, 112-0012, Japan, yuji@gssm.otsuka.tsukuba.ac.jp

In this work, we develop a new methodology for estimating supply and demand functions in the Japan Electric Power Exchange (JEPX) spot market. To this end, we generalize the standard simultaneous equations approach using linear regressions for nonlinear case and show that the nonlinear structural equations may be constructed based on the reduced equations of a nonparametric regressions model. Then, we demonstrate the proposed approach using empirical data.

3 - Trading a Portfolio of Pairs in the Presence of Transaction Costs

James Primbs, Associate Professor, California State University Fullerton, 800 N. State College Blvd., Fullerton, CA, United States of America, jprimbs@fullerton.edu, Yuji Yamada

In this work we consider the problem of trading a portfolio of pairs when transaction costs are present. We develop a receding horizon approach based on a power utility function and proportional transaction costs. The resulting methodology is very computational tractable, even for a portfolio of many potentially correlated pairs. Backtested results on historical data are provided.

4 - Backtesting Simultaneous Long-short and Proportional-integral Investment Schemes

Sean Warnick, Associate Professor, Brigham Young University, TMCB 2222, Provo, UT, 84602, United States of America, sean.warnick@gmail.com, Scott Condie, Nathan Woodbury

Simultaneous Long-Short is an investment strategy analyzed by Barmish and Primbs that uses feedback control techniques to make investment decisions. An extension of the technique uses proportional-integral control to make such decisions. Importantly, these methods use a feedback architecture—and no explicit market model—to manage investments. This study explores the performance of these methods compared to other methods that use some estimate of a market model through various backtests.

Quantitative Risk Measurement and Modeling

Cluster: Risk Management

Invited Session

Chair: Nan Chen, Professor, Chinese University of Hong Kong, 709A William Mong Engineering Building, Hong Kong, Hong Kong - PRC, nchen@se.cuhk.edu.hk

1 - On the Measurement of Economic Tail Risk

Xianhua Peng, Assistant Professor, Hong Kong University of Science and Technology, Department of Mathematics, Hong Kong, Hong Kong - PRC, maxhpeng@ust.hk

We show that the only risk measures that satisfy a set of economic axioms for the Choquet expected utility and the statistical property of elicibility (i.e. there exists an objective function such that minimizing the expected objective function yields the risk measure) are the mean functional and the median shortfall, which is the median of tail loss distribution. We argue that median shortfall is a better alternative than expected shortfall for setting capital requirements in Basel Accords.

2 - Leverage, Market Liquidity, and Financial Fragility

Nan Chen, Prof, Chinese University of Hong Kong, 709A William Mong Engineering Building, Hong Kong, Hong Kong - PRC, nchen@se.cuhk.edu.hk, Jing Chen

We provide a simple model to show how systemic fragility is built up as highly leveraged investors crowd to similar trading strategies. As their wealth grows over time, the destabilizing impact of their trading becomes more imminent, causing amplified volatility, jump risk, and correlation co-movements in the security prices.

3 - A Simulation Measure Approach to Monte Carlo Methods for Default Timing Problems

Alex Shkolnik, University of California, Berkeley, CA, United States of America, ads2@berkeley.edu, Kay Giesecke

Reduced-form models of name-by-name default timing are widely used to measure portfolio credit risk and to analyze securities exposed to a portfolio of names. Monte Carlo (MC) simulation is a common computational tool in such settings. We introduce a new change of measure perspective for MC simulation for default timing problems. The perspective provides the means of analyzing current methods and suggests a new MC algorithm which outperforms a widely used and standard technique.

Sharing Economy and Peer-to-Peer Marketplaces

Cluster: Business Model Innovation

Invited Session

Chair: Jose Guajardo, University of California Berkeley,
545 Student Services Bldg #1900, Berkeley, CA, 94720-1900,
United States of America, jguajardo@berkeley.edu

1 - The Efficacy of Incentives in Scaling up Marketplaces

Ashish Kabra, INSEAD, Boulevard de Constance, Fontainebleau,
France, ashish.kabra@insead.edu, Elena Belavina, Karan Girotra

Achieving scale is key to the efficacy, survival and eventual domination of marketplaces. Marketplace operators often run aggressive promotions and incentive schemes to attract new users or increase the usage of existing users. Using detailed transaction and location data from a leading transportation marketplace, we estimate and compare the short-term and long-term effects of incentives given to the “buyer” side and “seller” side of the marketplace.

2 - Business Models in the Sharing Economy: Manufacturing Durables in Presence of Peer-to-peer Markets

Zhe Zhang, PhD Student, Carnegie Mellon University, 5000
Forbes Avenue, Pittsburgh, PA, 15213, United States of America,
zhezhang@cmu.edu, Jose Guajardo, Vibhanshu Abhishek

We investigate the interaction between a manufacturer of durable goods and a peer-to-peer marketplace where consumers trade the temporary use of the durable good as a service. We analyze market outcomes under alternative business models and market structures.

3 - Outsourcing Tasks Online: Matching Supply and Demand on Peer-to-peer Internet Platforms

Chiara Farronato, Harvard Business School, Soldiers Field,
Boston, United States of America, chiara.farronato@gmail.com,
Zoe Cullen

We study a central problem for peer-to-peer markets: how to create matches when demand and supply are highly variable. We develop a model of a matching market for services, and estimate it using data from TaskRabbit. We find that supply is highly elastic and estimate average gains from each trade to be \$37. Because of the matching frictions, the ex-ante gains are more modest, but are maximized by the elastic supply. Finally, we explore heterogeneity of platform success across cities.

4 - First Ranked First to Serve: Strategic Agents in a Service Contest

Konstantinos Stouras, PhD Candidate, INSEAD,
Bd. de Constance, Fontainebleau, 77305, France,
Konstantinos.STOURAS@insead.edu, Karan Girotra,
Serguei Netessine

We develop a model of a virtual call center that pays its agents on-demand, by committing to a (relative) performance agent ranking prioritization scheme. We show that the optimal design of such a “service contest” is often coarse. Discarding available information about agents’ relative performance, or deploying coarser priority classes can paradoxically create higher incentives for agents to voluntarily participate and provide better service.

09-Room 309, Marriott

Ecosystem Analytics & Visualization

Sponsor: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Rahul Basole, Associate Professor, Georgia Institute of
Technology, 85 Fifth Street NW, Atlanta, GA, 30332,
United States of America, basole@gatech.edu

1 - Integrated Analytics Framework for Business Ecosystem Dynamics

Hyunwoo Park, Georgia Institute of Technology, 85 5th St. NW
Rm 339, Atlanta, GA, 30309, United States of America,
hwpark@gatech.edu, Rahul Basole

We propose a computational framework and interactive prototype for specifying and analyzing business ecosystem dynamics. Our research fuses simulation with data/process mining and information visualization techniques, enabling decision makers to specify micro-behavior of firms, generate and test hypotheses, gain insights, and communicate results effectively. We illustrate our approach using real-world examples based on a unique curated dataset from multiple sources.

2 - Network Visualization Analysis of Main Paths and Directions of Firm Innovation

Jianxi Luo, Assistant Professor, Singapore University of
Technology and Design, 8 Somapah Rd, Singapore, 487372,
Singapore, luo@sutd.edu.sg, Bowen Yan

We present a method to represent the technology space as a network of patent technology classes, and then overlay the network map to visualise firms’ technology capability positions and main paths of diversification over time. Based on a few case studies, we show this method can reveal the differences in innovation behaviours and strategies of different firms and aid in the assessment of the firm’s past and existing capability positions and the exploration of future innovation directions.

3 - Quantifying the Ecosystem of Digital Platform Companies

Rahul Basole, Associate Professor, Georgia Institute of
Technology, 85 Fifth Street NW, Atlanta, GA, 30332,
United States of America, basole@gatech.edu, Peter Evans

The rise of digital platforms is transforming industries and economies. Using an integrated dataset (Crunchbase and Capital IQ), we quantify, compare, and visualize the structure of 1,000+ platform companies. We discuss theoretical and managerial implications.

4 - Visualizing the Start-Up Genome

Raul Chao, ChaoR@arden.virginia.edu, Rahul Basole

Our study uses novel visual analytic techniques to analyze start-up activities. Specifically, drawing on an analogy from genetics, we aim to visualize what we refer to as the “Start-Up Genome” – a unique sequence of activities that defines and differentiates one start-up from another.

5 - Data-driven Visualizations of Market Differentiation in Emerging Sectors

Martha Russell, Executive Director, mediaX at Stanford
University, 210 Panama Street, Cordura Hall,
Stanford, CA, 94305-4115, United States of America,
martha.russell@stanford.edu, Jukka Huhtamäki,
Neil Rubens, Kaisa Still

Using keywords from a dataset built from online promotional information, we visualize the character and strength of startups’ market objectives in emerging sectors.

Frontiers in IS Research

Sponsor: E-Business

Sponsored Session

Chair: Min-Seok Pang, Assistant Professor, Temple University, 1810 N
13th St, Speakman 201c, Philadelphia, PA, 19122, United States of
America, minspang@temple.edu

1 - Fundraising Patterns and Entrepreneurial Performance in Crowdfunding Platforms

Eun Ju Jung, George Mason University, Enterprise Hall, 4400
University Drive, School of Business, Fairfax, VA, 22030, United
States of America, jej978@gmail.com, Vallabh Sambamurthy,
Anjana Susarla

Crowdfunding provides entrepreneurs with new opportunities for funding and ultimately fosters entrepreneurship and new firm creation. However, there is a dearth of research on entrepreneurial performance after fundraising success. In this paper, we examine how the dynamics in fundraising processes are related to entrepreneurial performance. This study will contribute to crowdfunding and entrepreneurship literature and offer practical implications.

2 - IT Security Effectiveness: Influence of Breach Type and Public Attention

John D’arcy, University of Delaware, 207A Purnell Hall,
Newark, DE, 19716, United States of America, jdarcy@udel.edu,
Asli Basoglu

This study explores factors that bias auditor judgments of companies’ information security effectiveness. We developed a dataset consisting of security breaches against publicly traded companies, public attention attributed to these breaches in the form of abnormal Google search volume, and auditor evaluations of these companies’ IT internal controls. Our results suggest that breach source and abnormal public attention both contribute to biased evaluations of information security effectiveness.

3 - Studying Influence of Comments in Online News Papers

Iljoo Kim, Assistant Professor, Saint Joseph's University, 347 Mandeville Hall, 5600 City Avenue, Philadelphia, PA, 19131, United States of America, ikim@sju.edu, Gautam Pant

In this work, we study online comments and their influence in online news articles. Using text-mining techniques, we attempt to explain and/or predict influence of online newspaper comments on the context of the original article or even on creating a new agenda through the discussions among commenters. This is done based on the textual signals embedded within comments as well as news articles.

4 - Politics and Information Technology Investments in The U.S. Federal Government in 2003-2015

Min-Seok Pang, Assistant Professor, Temple University, 1810 N 13th St, Speakman 201e, Philadelphia, PA, 19122, United States of America, minsipang@temple.edu

What makes some US federal agencies digitally advanced and others lagging? This study investigates how politics affects IT investment in federal agencies. With a panel dataset from 133 federal agencies, our empirical analyses produce several intriguing findings. A federal agency makes more capacity-building IT investments (i) when its head is appointed with legislative approval, (ii) when the federal government is less divided, and (iii) when it is neither too conservative nor too liberal.

Machine Learning under a Modern Optimization Lens

Sponsor: Optimization/Integer and Discrete Optimization
Sponsored Session

Chair: Dimitris Bertsimas, Professor, MIT, 77 Massachusetts Ave., Cambridge, MA, 02139, United States of America, dbertsim@mit.edu

1 - Sparse Principal Component Analysis via a Modern Optimization Lens

Lauren Berk, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, lberk@mit.edu, Dimitris Bertsimas

We develop tractable algorithms that provide provably optimal solutions to the exact Sparse Principal Component problems of up to 1000 dimensions, using techniques from Mixed Integer Optimization and first order methods. Unlike earlier SPCA methods, our approach retains complete control over the degree of sparsity of the components, and provides solutions with higher explained variance.

2 - Robust Support Vector Machines

Colin Pawlowski, MIT, 77 Massachusetts Ave., Cambridge, MA, 02139, United States of America, cpawlows@mit.edu, Dimitris Bertsimas

We consider a maximal-margin classifier which is the non-regularized formulation of SVM. Using Robust Optimization, we develop new, computationally tractable methods that are immunized against uncertainty in the features and labels of the training data. Experiments on real-world datasets from the UCI Machine Learning Repository show out-of-sample accuracy improvements for robust methods in a significant number of problems analyzed.

3 - Optimal Trees

Jack Dunn, Operations Research Center, MIT, 77 Mass Ave, Bldg E40-130, Cambridge, MA, 02139, United States of America, jackdunn@mit.edu, Dimitris Bertsimas

Decision trees are widely used to solve the classical statistical problem of classification. We introduce a new method for constructing optimal decision trees using Mixed-Integer Optimization, and show using real data sets that these trees can offer significant increases in accuracy over current state-of-the-art decision tree methods. We also demonstrate the benefits of using Robust Optimization when constructing these trees.

4 - Logistic Regression using Robust Optimization

Daisy Zhuo, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, zhuo@mit.edu, Dimitris Bertsimas

Logistic regression is one of the most commonly used classification methods, yet the solution can be sensitive to inaccuracy and noise in data. Here we propose an approach using Robust Optimization to find stable solutions under uncertainties in data features and labels. Using more than 80 real-world problems, we demonstrate that the robust logistic regressions lower misclassification error significantly in the majority of the data sets.

Nonlinear Programming in Stochastic and Multilevel Problems

Sponsor: Optimization/Mixed Integer Nonlinear Optimization and Global Optimization
Sponsored Session

Chair: Alexander Vinel, Auburn University, 3301 Shelby Center, Auburn, AL, 36849-5346, United States of America, alexander.vinel@auburn.edu

1 - Branch-and-cut Algorithm for Integer Bilevel Linear Optimization Problems

Sahar Tahernejad, Graduate Student, Lehigh University, 12 Duh Drive- No. 132, Bethlehem, PA, 18015, United States of America, sat214@lehigh.edu, Ted Ralphs

We extend the branch-and-cut framework of Denegre and Ralphs for solving integer bilevel linear optimization problems (IBLPs). IBLPs differ from standard integer optimization problems in that there are solutions which are integer but not feasible and they should be removed from the feasible solution set. Our proposed algorithm applies a variety of cut generation techniques for removing such solutions. We report on numerical experiments on some benchmark IBLPs.

2 - On Pessimistic Versus Optimistic Bilevel Linear Programs

M. Hosein Zare, University of Pittsburgh, 1048 Benedum Hall, Pittsburgh, PA, 15261, United States of America, moz3@pitt.edu, Osman Ozaltin, Oleg Prokopyev

We study the relationships between Pessimistic and Optimistic Bilevel Linear Programs. In particular, we focus on the case when the upper-level decision-maker (i.e., the leader) needs to consider the uncertain behavior of the lower-level decision maker (i.e., the follower). We derive some computational complexity properties, and illustrate our results using a defender-attacker application.

3 - Identifying Risk-averse Low-diameter Clusters in Graphs with Random Vertex Weights

Maciej Rysz, NRC-AFRL, 1350 N. Poquito Road, Shalimar, FL, United States of America, mwrysz@yahoo.com, Pavlo Krokhmal

We consider the problem of finding a k-club of minimum risk contained in a graph whose vertices have stochastic weights. A stochastic programming framework that is based on the formalism of coherent risk measures is used to find the corresponding subgraphs. A combinatorial branch-and-bound solution algorithm is proposed.

4 - Solution Procedures for a Class of Mixed-integer Nonlinear Programming Problems

Alexander Vinel, Auburn University, 3301 Shelby Center, Auburn, AL, 36849-5346, United States of America, alexander.vinel@auburn.edu, Pavlo Krokhmal

We study solution approaches for a class of mixed-integer non-linear programming problems with our interest stemming from recent developments in risk-averse stochastic programming. We explore possible applications of some of the solution techniques that have been successfully used in mixed-integer second-order conic programming and show how special structure of problems under consideration can be utilized.

Stochastic Approximation

Sponsor: Optimization/Optimization Under Uncertainty
Sponsored Session

Chair: Raghu Pasupathy, Associate Professor, Department of Statistics, Purdue University, 250 N University Street, West Lafayette, IN, 47907, United States of America, pasupath@purdue.edu

1 - Budget-constrained Stochastic Approximation

Uday Shanbhag, The Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16801, United States of America, udaybag@engr.psu.edu, Jose Blanchet

We consider a convex constrained stochastic convex optimization problem in which the simulation budget is fixed and computation is expensive. We consider stochastic approximation schemes in which the sample-size is either constant or updated at every step while meeting this budget and provide suitable finite-time error bounds.

2 - Optimal Averaging Schemes for Stochastic Approximation Methods

Farzad Yousefian, Postdoctoral Research Associate, Penn State, 333 Logan Ave., Apt. 307, State College, PA, 16801, United States of America, szy5@psu.edu, Angelia Nedich, Uday Shanhag

We develop optimal weighted averaging stochastic approximation schemes for solving stochastic variational inequality problems. We show that the gap function associated with the averaged sequence diminishes to zero at the optimal rate. We also develop a window-based variant of this scheme that displays the optimal rate and the superiority in the constant factor of the bound comparing to the classic averaging schemes. Preliminary numerical results on a stochastic Nash-Cournot game are presented.

3 - Adaptive Sampling Line Search for Local Simulation Optimization

Raghu Pasupathy, Associate Professor, Department of Statistics, Purdue University, 250 N University Street, West Lafayette, IN, 47907, United States of America, pasupath@purdue.edu, Fatemeh Hashemi

We present an algorithm for continuous simulation optimization that combines adaptive sampling ideas with a classical line search method from deterministic nonlinear programming. We will discuss theoretical properties and a brief example.

4 - Noisy Collective Nonconvex Optimization

Mengdi Wang, Assistant Professor, Princeton University, 302 Trinity Ct #2, Princeton, NJ, 08540, United States of America, mengdiw@princeton.edu

Joint Session OPT/ICS: Stochastic Programming: Progressive Hedging and Related Methods

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Jonathan Eckstein, Professor, Rutgers University, 100 Rockefeller Road, Piscataway, NJ, 08854, United States of America, jeckstei@rci.rutgers.edu

1 - Scalable Lower and Upper Bounding Techniques for Stochastic Unit Commitment with Progressive Hedging

Jean-paul Watson, Sandia National Laboratories, P.O. Box 5800, MS 1326, Albuquerque, United States of America, jwatson@sandia.gov, David Woodruff, Sarah Ryan

We describe configurations of a scenario-based decomposition strategy for solving the stochastic unit commitment problem, based on the progressive hedging algorithm. We consider both upper and lower bounding aspects of progressive hedging in the mixed-integer case, and demonstrate parameterizations that yield extremely tight optimality gaps for 100-generator cases and moderately tight optimality gaps for 350-generator cases.

2 - Progressive Hedging and Dual Decomposition

David Woodruff, UC Davis, One Shields Avenue, Davis, CA, 95616, United States of America, dlwoodruff@ucdavis.edu

The PH algorithm proposed by Rockafellar and Wets and the DDSIP algorithm proposed by Caroe and Schultz can both be thought of as primal-dual algorithms and both can be used to address stochastic mixed-integer programs. In this talk I describe work with numerous co-authors to use the two algorithms together. In addition we describe an algebraic modeling language (Pyomo) interface to DDSIP that is useful with, or without, PH.

3 - Asynchronous Projective Progressive-hedging-like Stochastic Programming Decomposition Methods

Jonathan Eckstein, Professor, Rutgers University, 100 Rockefeller Road, Piscataway, NJ, 08854, United States of America, jeckstei@rci.rutgers.edu

We present a class of stochastic programming algorithms based on new Combettes-Eckstein monotone operator splitting methods. Unusually, these splitting methods need to re-solve only a subset of the subproblems at each iteration, using boundedly outdated information. Applying these techniques to stochastic programming yields methods that resemble progressive hedging, but can operate in a fully asynchronous manner. Convergence is guaranteed under the same conditions as for progressive hedging.

Recent Advances in Nonlinear Programming

Sponsor: Optimization/Nonlinear Programming

Sponsored Session

Chair: Hande Benson, Associate Professor, Drexel University, LeBow College of Business, Philadelphia, PA, 19104, United States of America, hvb22@drexel.edu

1 - Solving the Problem of Portfolio VAR Minimization as a Nonlinear Program

Arun Sen, Director, Navigant Consulting, 685 3rd Avenue, 14th Floor, New York, NY, 10017, United States of America, arunsen@alumni.princeton.edu

Minimizing Value at Risk (VAR) is challenging as the optimization problem is non-convex. In previous work the problem was formulated as an MPEC (mathematical program with equilibrium constraints), that was solved using branch-and-bound techniques. We show that the same MPEC can be solved effectively as a nonlinear program, specifically by use of interior-point methods, and that this a flexible approach that is easily able to incorporate additional constraints on the optimal portfolio.

2 - Fast Algorithms for LAD Lasso Problems

Robert Vanderbei, Princeton University, ORFE, Sherrerd Hall, Princeton, NJ, 08544, United States of America, rvdb@princeton.edu

We will present a new algorithm for the LAD Lasso problem. We will compare this new algorithm against existing state-of-the-art algorithms.

3 - Cubic Regularization for First-order Methods

David Shanno, RUTCOR - Rutgers University (Emeritus), Rutgers University, New Brunswick, NJ, United States of America, shannod@comcast.net, Hande Benson

Regularization techniques have been used to help existing algorithms solve "difficult" nonlinear optimization problems. Over the last decade, regularization has been proposed to remedy issues with equality constraints and equilibrium constraints, bound Lagrange multipliers, and identify infeasible problems. In this talk, we will focus on the application of cubic regularization in the context of the symmetric rank one and the conjugate gradient methods for nonlinear programming.

4 - Value Driven Design Delegation - An Optimization Model

Vinod Cheriyan, Enova International, 1255 S Michigan Ave. Apt 3711, Chicago, IL, 60605, United States of America, vinod.cheriyan@gmail.com, Chris Paredis, Anton Kleywegt

Rather than satisfaction of stakeholder needs, the Value Driven Design approach focuses on maximization of economic value. For large, complex systems, the systems designer maximizes the value by delegating detailed design to many subsystem teams. We study the convergence properties of such a value-driven, delegation-based system design process, where knowledge is distributed. We model the design as an optimization problem. We propose an algorithm and show that it converges to a critical point.

Various Aspects of Mixed Integer Conic Optimization

Sponsor: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Sertalp Cay, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, sec312@lehigh.edu

1 - Portfolio Optimization Problems with Cone Constraints and Discrete Decisions

Umit Saglam, Assistant Professor, East Tennessee State University, Department of Management and Marketing, College of Business and Technology, Johnson City, TN, 37614, United States of America, saglam@etsu.edu, Hande Benson

In this study we consider both single-period and multiperiod portfolio optimization problems based on the Markowitz (1952) mean/variance framework. Our model is aggregated from current literature. We solve these models with a MATLAB based Mixed Integer Linear and Nonlinear Optimizer (MILANO). We have devised and implemented the first solution method for such problems and demonstrate its efficiency on large-scale portfolio optimization models. We also provide substantial improvement in runtimes.

2 - Computational Study of a Second Order Cone Relaxation for Binary Quadratic Polynomial Problems

Julio Goetz, Postdoctoral Fellow, Ecole Polytechnique Montreal and GERAD, 2900 Boulevard Edouard-Montpetit, Montréal, QC, H3T 1J4, Canada, jgoetz1@gmail.com, Miguel Anjos

This work presents a computational study of the second order cone relaxation for binary quadratic problems proposed by Ghaddar, Vera and Anjos (2011) who used a polynomial optimization approach. We explore how this relaxation can be strengthened using additional constraints, and also, we explore the relation of disjunctive conic cuts with this relaxation.

3 - Computational Approaches to Mixed Integer Second Order Cone Optimization

Aykut Bulut, PhD Candidate, Lehigh University, 200 W. Packer Ave., Bethlehem, PA, 18015, United States of America, aykut@lehigh.edu, Ted Ralphs

We introduce an open-source Mixed Integer Second Order Cone Optimization (MISOCO) solver. We present computational experiments on various approaches to solve MISOCO problem. We test using outer approximation method to solve continuous relaxations. We also discuss using various valid inequalities to improve the continuous relaxations. We discuss computational performance of these approaches on conic benchmark library (CBLIB 2014) problems.

4 - Solving Robust Portfolio Optimization Problems in Practice

Sarah Drewes, Senior Consultant, Dr., MathWorks, Adalperostr. 45, Ismaning, Germany, Sarah.Drewes@mathworks.de

Robust versions of the Markowitz mean-variance model can reduce the estimation risk induced by its sensitivity to changes in expected returns or the covariance matrix. Probabilistic versions of the classical model can be formulated as nonlinear and often second order cone programs. We study how to solve these problems also by general nonlinear solvers (MATLAB Optimization Toolbox) and in case of discrete variables. We evaluate both computational performance and complexity of implementation.

Network Modeling and Design

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Mario Ventresca, Assistant Professor, School of Industrial Engineering, Purdue University, 315 N Grant St, Lafayette, IN, 47906, United States of America, mventresca@purdue.edu

1 - Action-based Network Models

Viplove Arora, Graduate Student, School of Industrial Engineering, Purdue University, 45 N Salisbury St, Apt. 9, West Lafayette, IN, 47906, United States of America, arora34@purdue.edu, Mario Ventresca

Complex networks are very useful representations of real world complex systems. A number of network generation procedures have been proposed that are capable of producing networks with a restricted subset of structural properties. However, a unifying model remains elusive. We present initial results on an action-based perspective that has potential to yield more general network structures than existing techniques. A machine learning approach to learn a probabilistic model will be presented.

2 - Automatically Inferring Complex Network Models

Mario Ventresca, Assistant Professor, School of Industrial Engineering, Purdue University, 315 N Grant St., Lafayette, IN, 47906, United States of America, mventresca@purdue.edu

Complex networks are becoming increasingly important across many disciplines. However, the problem of network modeling is extremely intricate and time consuming. Hence, frameworks have been proposed to estimate model parameters, but are focused on capturing a small subset predefined network characteristics such as degree distribution. I will present recent work on a highly robust automated inference approach that is able to discover arbitrary network models with minimal human insight.

3 - Cut-set Separation Schemes for the Robust Single-commodity Network Design Problem

Daniel Schmidt, Carnegie Mellon University, 720 S Negley Ave, Pittsburgh, PA, 15232, United States of America, schmidt@cmu.edu, Chrysanthos Gounaris

We address the exact solution of the Robust Single-Commodity Network Design Problem in which customer demands are uncertain and realize from within an appropriately defined uncertainty polytope. We explore techniques to approximate the arc-flow based formulation with fewer variables. We also evaluate the use of meta-heuristics for the NP-hard problem of separating cut-set inequalities in the context of a branch-and-cut solution approach.

4 - Network Design Problem for Battery Electric Bus

Yousef Maknoon, EPFL, Route Cantonale, Lausanne, Switzerland, yousef.maknoon@epfl.ch, Shadi Sharif Azadeh, Michel Bierlaire

In electric bus planning, for battery installation, we need to investigate two points: (1) the type and location of charger stations (2) the capacity of battery of each bus. In this presentation, first we describe the problem and the design elements. Then, we present its mathematical form followed by the resolution approach. Finally, we demonstrate the computational results on our case study and discuss about the robustness of the plan.

Data Mining for Different Type of Big Data

Cluster: Modeling and Methodologies in Big Data

Invited Session

Chair: Young-seon Jeong, Chonnam National University, Department of Industrial Engineering, Gwangju, Korea, Republic of, youngseonjeong@gmail.com

1 - Classification of Uncertain Data using Group to Object Distances

Behnam Tavakkol, PhD Candidate, Rutgers University, 5200 BPO Way, Piscataway, NJ, 08854, United States of America, btavakkol66@gmail.com, Myong K (MK) Jeong, Susan Albin

Uncertain data problems have features represented by multiple observations or their fitted PDFs. We propose two approaches for classifying uncertain data objects. The first uses existing Probabilistic Distance Measures for object-to-object distances and classifies with KNN. The second features a new probabilistic distance measure for object to class distances.

2 - The Classification Methodology of Chip Quality using Canonical Correlation Analysis

Ki-hyun Kim, Samsung Electronics Co., Banwol-dong, Hwaseong-si, Gyeonggi-do, Korea, Republic of, bluenamja@daum.net

In this study, we proposed classification methodology using a canonical correlation analysis as feature selection method at multi-dimensional chip level data generated in the semiconductor manufacturing industry. As the result of this research, we were able to extract important variables in the various PCM variables from the correlation of the multiple FBC variables and PCM variables. The proposed method was improved the accuracy of quality classification for a chip tested in the probe test.

3 - Multivariate Monitoring for Metal Fabrication Process in Mobile Devices Manufacturing

Seonghyeon Kang, M.s. Candidate, Korea University, Innovation Hall 817, Korea University, 145 Anam-ro, Seongbuk-gu, Seoul, 136-713, Korea, Republic of, shyeon.kang@gmail.com, Seoung Bum Kim

In mobile industry, using metal case of devices is rapidly increased for thin and attractive design. However, fabricating metal is the difficult process because accurate control of equipment are required. In this study, we propose an efficient multivariate monitoring procedure to observe more than 40 parameters of metal fabrication equipment. The effectiveness of the proposed procedure is demonstrated by real data from the mobile plant in one of the leading mobile companies in South Korea.

4 - Multivariate Monitoring of Automated Material Handling Systems in Semiconductor Manufacturing

Sangmin Lee, Korea University, Innovation Hall 817, Korea University, 145 Anam-ro, Seongbuk-gu, Seoul, 136-713, Korea, Republic of, smlee5679@gmail.com, Seoung Bum Kim

Monitoring all possible contingencies in automated material handling system (AMHS) of semiconductor manufacturing is a difficult task because tremendous hardware and software systems are involved. This study presents an efficient multivariate monitoring procedure to monitor more than 100 KPIs in AMHS. The effectiveness and applicability of the proposed procedure is demonstrated by real data from semiconductor fabrication plant in one of the leading semiconductor companies in South Korea.

5 - Quantifying the Level of Risk of Functional Chips in Semiconductor Wafers

Young-seon Jeong, Chonnam National University, Department of Industrial Engineering, Gwangju, Korea, Republic of, youngseonjeong@gmail.com, Byunghoon Kim, Seung-hoon Tong, Inkap Chang, Myong K (MK) Jeong

This talk presents the procedure to quantify the level of risk of functional chips in dynamic random access memory (DRAM) wafers. To screen risky functional chips, the risk level of each chip is estimated by the posterior probability for functional chips. The functional chips closer to the class of defective chips may have a higher probability of being failed in the near future. The experimental results by using real-life wafers show the effectiveness of the proposed method.

Bundled Payment Systems

Sponsor: Health Applications

Sponsored Session

Chair: Danny Hughes, Harvey L. Neiman Health Policy Institute, 1891 Preston White Drive, Reston, VA, 20191, United States of America, dhughes@neimanhpi.org

1 - Optimizing Provider Decisions under Bundled Payments

Brenda Courtad, University of Cincinnati, 2925 Campus Green Dr, Cincinnati, OH, 45221, United States of America, courtabl@mail.uc.edu

When moving from fee-for-service to bundled payments the providers focus shifts from revenue generating to cost reducing. We develop a partially observable Markov decision process to aid providers in deciding which interventions to implement to reduce costs.

2 - Increasing Healthcare Value in Accountable Care Organizations through Incentive Redesign

Christian Wernz, Virginia Tech, Industrial and Systems Engineering, Blacksburg, VA, 24060, United States of America, cwernz@vt.edu, Hui Zhang, Barry Barrios, Danny Hughes

ACOs are incentivized by the Centers for Medicare and Medicaid Services (CMS) to lower costs while meeting quality standards. We determined how CMS' incentive program can be improved, and how ACOs can optimally distribute incentives among their members. Using multiscale decision theory, we performed an in-depth analysis of computed tomography (CT) scanner investments and use in ACO hospitals, calibrated the model with Medicare data, and show how CT scan cost can be lowered and outcomes improved.

3 - Mitigating Small Provider Financial Risk under Prospective Bundled Payment Systems

Danny Hughes, Harvey L. Neiman Health Policy Institute, 1891 Preston White Drive, Reston, VA, 20191, United States of America, dhughes@neimanhpi.org, Jeremy Eckhause

Retrospective bundled payment models, which cover all medical services within an episode of care, usually include stop loss provisions to manage financial risk. As payments shift to prospective bundled payments, the mechanisms to manage these stop loss provisions may no longer exist. We develop nonlinear programming models to develop pricing strategies that address the inherent higher risk to smaller providers under such a payment system.

4 - Bundled Payments: The Roles of Organization and Diagnosis

Turgay Ayer, Georgia Institute of Technology, 765 Ferst Dr., Atlanta, GA, 30332, United States of America, ayer@isye.gatech.edu, Mehmet Ayyaci, Jan Vlachy

Medicare has started contracting with healthcare providers for bundled payments. However, most providers do not have experience with the risks and opportunities for such payment mechanism. We propose a game-theoretic model to capture the power dynamics between physicians and the hospital under various patient pathways. We use the model to generate hypotheses and test these hypotheses using real data.

Learning High-dimensional/ Sparse Models

Sponsor: Applied Probability

Sponsored Session

Chair: Varun Gupta, University of Chicago Booth School of Business, Chicago, IL, United States of America Varun.Gupta@chicagobooth.edu

1 - Robust Methods for High-dimensional Regression

Po-ling Loh, Assistant Professor, University of Pennsylvania, 3730 Walnut St, 466 Jon M. Huntsman Hall, Philadelphia, PA, 19104, United States of America, loh@wharton.upenn.edu

We discuss new methods for robust regression in high-dimensional settings. Our procedures draw upon classical approaches in robust statistics, designed for scenarios where the number of parameters is fixed and the sample size grows to infinity — however, these methods may be adapted to perform robust inference in high dimensions, as well. We also prove that the robust estimators, which involve minimizing nonconvex functions, may nonetheless be optimized to desirable accuracy.

2 - Statistical Guarantees for Individualized Rank Aggregation

Sahand Negahban, Yale University, 24 Hillhouse Ave, New Haven, CT, 06510, United States of America, sahand.negahban@yale.edu

We study a version of rank aggregation known as collaborative ranking. In this problem we assume that individual users provide us with pairwise preferences and from those preferences we wish to obtain rankings on items that the users have not had an opportunity to explore. We provide a theoretical justification for a nuclear norm regularized optimization procedure.

3 - Inference in High-dimensional Varying Coefficient Models

Mladen Kolar, Assistant Professor, Chicago Booth, 5807 South Woodlawn Avenue, Chicago, IL, 60637, United States of America, mkolar@chicagobooth.edu, Damian Kozbur

We focus on the high-dimensional linear varying-coefficient model and develop a novel procedure for estimating the coefficient functions. Our procedure works in a high-dimensional regime, under arbitrary heteroscedasticity in residuals, and is robust to model misspecification. We derive an asymptotic distribution for the normalized maximum deviation of the estimated coefficient function and demonstrate how these results can be used to make inference in high-dimensional dynamic graphical models.

4 - Elementary Estimators for High-dimensional Statistical Models

Eunho Yang, IBM T.J. Watson, P.O. Box 218, Yorktown Heights, United States of America, eunho@cs.utexas.edu

We propose a class of closed-form estimators for sparsity-structured high-dimensional models. Our approach builds on observing the precise manner in which the classical MLE breaks down under high-dimensional settings. We provide a rigorous statistical analysis that shows that our simple estimators recovers the same asymptotic convergence rates as those of computationally expensive L1-regularized MLEs. We corroborate statistical performance, as well as computational advantages via simulations.

New Advances in Production Planning and Scheduling

Cluster: Stochastic Models: Theory and Applications

Invited Session

Chair: Jingshan Li, Professor, 1513 University Ave, Madison, WI, 53706, United States of America, jli252@wisc.edu

1 - Coordination in Multi-product Manufacturing Systems: Modeling and Analysis

Cong Zhao, Research Assistant, University of Wisconsin-Madison, 1513 University Ave, Room 3235, Madison, WI, 53706, United States of America, czhao27@wisc.edu, Ningxuan Kang, Li Zheng, Jingshan Li

Multi-product systems are common in today's manufacturing process. Effective coordination between products in such systems is important in operation. We study a two-product geometric manufacturing system and derive closed-form expressions of performance measures. An optimal allocation policy of buffer thresholds is developed, and the monotonicity of optimal buffer size with respect to machine parameters is investigated. The managerial insights to achieve optimal production control are discussed.

2 - Level Scheduling in Automotive Assembly Lines and its Effect on the Consumption of Resources

Heinrich Kuhn, Professor, Catholic University of Eichstaett-Ingolstadt, Supply Chain Management & Operations, Auf der Schanz 49, Ingolstadt, 85049, Germany, heinrich.kuhn@ku-eichstaett.de, Dominik Woerner

Level scheduling approaches in sequencing of assembly lines are used as substitutional model for the underlying economic and sustainable objectives since a leveled distribution of materials requirements does not necessarily contribute directly to these objectives. We conduct a case study at a major German automotive company selecting relevant part families whose consumption is currently unequal distributed by an extensive simulation study.

3 - A New Scenario Based Sales and Operations Planning Model

Nico Vandaele, Professor, KU Leuven, Naamsestraat 69 Box 3555, Leuven, 3000, Belgium, nico.vandaele@kuleuven.be, Catherine Decouttere, Gerd Hahn, Torben Sens

We apply a scenario-based approach to the sales and operations planning process where both model-based and non-model based Key Performance Indicators are taken into account. This allows us to balance customer service, derived from aggregate order lead times, and relevant costs of operations when determining volume/mix decisions for internal and external production. An industry-derived case example with distinct outsourcing options is used to highlight the benefits of the approach.

Urban Data Analytics and Mining

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Xun Zhou, Assistant Professor, University of Iowa, S210 Papajohn Business Building, 21 E Market Street, Iowa City, IA, 52242, United States of America, xun-zhou@uiowa.edu

1 - A Data Mining Approach to the Discovery of Emerging Hotspot Patterns in Urban Data

Amin Vahedian Khezerlou, University of Iowa, S283 Papajohn Business Building, The University of Iowa, Iowa City, IA, 52242-1994, United States of America, amin-vahediankhezerlou@uiowa.edu, Xun Zhou

Emerging hotspots can be observed in urban data, e.g., cellular service or traffic congestions due to non-periodic events (e.g., sport games, accidents). Efficiently identifying these patterns help city planners and service providers respond early to the congestions. Previous hotspot detection techniques focused on patterns with fixed footprints. We propose an efficient data mining approach to detect emerging congestion patterns with dynamic footprints and validate our method on real urban data.

2 - Exploiting Geographic Dependencies for Real Estate Ranking

Yanjie Fu, Rutgers University, 504 N 5th St, Harrison, NJ, 07029, United States of America, yanjie.fu@rutgers.edu, Hui Xiong, Hui Xiong

We propose a geographic method, named ClusRanking, for estate evaluation by leveraging the mutual enforcement of ranking and clustering power model the geographic dependencies of estates for enhancing estate ranking. Indeed, the geographic dependencies of the investment value of an estate can be from the characteristics of its own neighborhood (individual dependency), the values of its nearby estates (peer dependency), and the prosperity of the affiliated latent business area (zone dependency).

3 - A General Geographical Probabilistic Factor Model for Point of Interest Recommendation

Bin Liu, Rutgers University, 900 Davidson Road, 47 Nichols Apartment, Piscataway, NJ, 08854, United States of America, binben.liu@rutgers.edu

The problem of point of interest recommendation is to provide personalized places. The decision process for a user to choose a POI can be influenced by numerous factors, such as personal preferences, geographical considerations, and user mobility behaviors. We propose a general geographical probabilistic factor model framework which takes various factors into consideration. Extensive experimental results show promise of the proposed methods.

Sponsored Session

Chair: Narayan Ramasubbu, University of Pittsburgh, 354 Mervis Hall, Pittsburgh, PA, 15228, United States of America, nramasubbu@katz.pitt.edu

1 - Business Value of the Mobile Enterprise: An Empirical Study of Mobile Sales Force in Banking

Ajit Sharma, Ross School of Business, 701 Tappan Street, Ann Arbor, MI, United States of America, asharmaz@umich.edu

The press and research on mobility has remained focused on the customer-firm interface. While there is sufficient evidence of gains from mobile marketing in better targeting and lift, the benefits of mobile-centric enterprise processes remain under-studied. In this paper, we empirically assess the reduction in process time and error rates by shifting from a traditional "sales person in the field-computer in the office" sales process to a "sales person in the field with a tablet" sales process.

2 - Lost in Cyberspace: An Investigation of Digital Borders, Location Recognition, and Experience Attribution

Brian Dunn, Assistant Professor, University of Oklahoma, 307 West Brooks Ste. 307D, Norman, OK, 73072, United States of America, bkdunn@ou.edu, Narayan Ramasubbu, Dennis Galletta, Paul Lowry

Do website users know where they are? Given that they may visit multiple sites in the same session, they may not, which has important implications for the owners of those sites. However, past research has yet to account for this possibility. To understand when users recognize where they are online and how they attribute credit to the sites that are helpful to them, we introduce the

concepts of 'digital borders' and 'border strength' and use them in an experimental investigation.

3 - Design Control in Open Innovation: An Examination of Open Source Software Production

Shivendu Pratap Singh, University of Pittsburgh, Room 229, Mervis Hall, Pittsburgh, 15260, United States of America, shs161@pitt.edu

Firms are opting for co-creating software, by attracting developers on platforms like GitHub. This shared model of development requires flexible software design controls to influence community engagement, which could result in proliferation of design options. Flexible design control policy could have side effects such as accumulation of technical debt and need to be judiciously managed. This paper examines the antecedents and consequences of design control policies in social software production.

4 - Time-dependent Pricing for Mobile Data: Analysis, Systems, and Trial

Soumya Sen, ssen@umn.edu, Carlee Joe-wong, Mung Chiang, Sangtae Ha

Dynamic pricing of mobile data traffic can alleviate network congestion by creating temporally-varying price discounts. But realizing it requires developing analytical models for price point computation, systems design, and field experiments to study user behavior. In this paper, we present the architecture, implementation, and a user trial of a day-ahead time-dependent pricing.

Retailer Pricing

Cluster: Operations/Marketing Interface

Invited Session

Chair: Kathy Steckle, UT Dallas, SM30 JSOM, 800 W Campbell Rd, Richardson, TX, 75080, United States of America, ksteckle@utdallas.edu

Co-Chair: Xuying Zhao, University of Notre Dame, Notre Dame, IN, Xuying.Zhao.29@nd.edu

1 - Optimal Price Trajectories and Inventory Allocation for Inventory Dependent Demand

Stephen Smith, Professor, Santa Clara University, 500 El Camino Real, Lucas Hall 216H, Santa Clara, CA, 95053-0382, United States of America, ssmith@scu.edu, Narendra Agrawal

Retail demand is often inventory dependent because larger inventories create more attractive displays and low inventories can create broken assortments. This research jointly optimizes the price trajectory and the allocation of a given amount of inventory across a set of non-identical stores with inventory dependent demands.

2 - The Effect of Reward Purchase on Dynamic Pricing

Hakjin Chung, Stephen M. Ross School of Business, University of Michigan, Ann Arbor, MI, United States of America, hakjin@umich.edu, So Yeon Chun, Hyun-soo Ahn

In many loyalty programs, consumers are provided with an option to acquire products by redeeming loyalty points instead of cash. We characterize when consumers use points or cash depending on their willingness-to-pay in cash as well as in points. Then, we incorporate this consumer choice model into the seller's dynamic pricing model, where the revenues from both posted price and reimbursement for reward sales are embedded in each period.

3 - An Off-price Retailer with Two Ordering Opportunities

Moutaz Khouja, Professor, UNC Charlotte, 9201 University City Blvd, Charlotte, NC, 28223, United States of America, mjkhouja@uncc.edu, Jing Zhou

We develop a model of an off-price retailer who has two procurement opportunities for next season. The first opportunity occurs after the end of the current season where she buys excess inventory from retailers and manufacturers and store them until next season. The second opportunity occurs before the selling season begins again. The product quantity available in the first opportunity is limited while the price in the second opportunity is a random variable that depends on consumer demand.

4 - Multi-product Price Promotions with Reference Price Effects

Kevin Li, UC Berkeley, IEOR Department, Berkeley, CA, 94720, United States of America, kbl4ew@berkeley.edu, Candace Yano

We consider a retailer's problem of setting prices, including promotional prices, over a multi-period horizon for multiple products with correlated demands, considering customer stockpiling and the effect of reference prices on customers' buying behavior. These factors limit the efficacy of deep discounts and frequent promotions. We present structural results and numerical examples that provide insight into the nature of optimal policies and the impact of various parameters.

Multiple Criteria Decision Aiding

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Roman Slowinski, Prof., Poznan University of Technology, Pl. Marii Skłodowskiej-Curie 5, Poznan, PL, 60-965, Poland, roman.slowinski@cs.put.poznan.pl

1 - FITradeoff: Flexible and Interactive Tradeoff Elicitation Procedure

Adiel T. DeAlmeida, Professor, Universidade Federal de Pernambuco, Caixa Postal 7462, Recife, PE, 50630-971, Brazil, almeidaatd@gmail.com, Adiel De Almeida Filho, Jonas Araujo De Almeida, Ana Paula Costa

FITradeoff is a Flexible and Interactive Tradeoff elicitation procedure for multicriteria additive models in MAVT scope. The classical tradeoff procedure is one of the approaches with strongest theoretical foundation. However, behavioral studies have shown inconsistencies of DM during elicitation. The FITradeoff reduces DM's effort in the process, by using partial information, thereby contributing for reducing inconsistencies. It is implemented in a DSS, which is illustrated by applications.

2 - An Enhanced "Election Machine" for the Finnish Parliamentary Elections: Theory and Implementation

Jyrki Wallenius, Professor, Aalto University School of Business, Runeberginkatu 22-24, Helsinki, Finland, jyrki.wallenius@aalto.fi, Tommi Pajala, Akram Dehnokhalaji, Pekka Korhonen, Pekka Malo, Ankur Sinha

Web-based questionnaires to match candidates' and voters' views play an important role in Finland. We have collaborated with Helsingin Sanomat, who runs the most influential of such questionnaires, to enhance and further develop it. Our algorithm was tested in last April's Parliamentary Elections. We describe our algorithm and the feedback.

3 - Multicriteria and Multiobjective Models for Risk, Reliability and Maintenance Context

Rodrigo J P Ferreira, Assistant Professor, Universidade Federal de Pernambuco, Av. Professor Moraes Rego, 1235., Recife, PE, 50670-901, Brazil, rodjpf@gmail.com, Adiel T De Almeida, Cristiano A V Cavalcante, Marcelo H Alencar, Adiel De Almeida Filho, Thalles V Garcez

The use of multiple criteria and multiobjective models in risk, reliability and maintenance research has increased in recent years. These models may affect the strategic results of any organization, as well as, human life and the environment. In such situations, optimal solutions for one objective function cannot be suitable. These issues are presented according to the reference Multicriteria and Multiobjective Models for Risk, Reliability and Maintenance Decision Analysis.

4 - Constructive Preference Learning in Value-driven Multiple Criteria Sorting

Roman Slowinski, Prof., Poznan University of Technology, Pl. Marii Skłodowskiej-Curie 5, Poznan, PL, 60-965, Poland, roman.slowinski@cs.put.poznan.pl, Milosz Kadzinski, Krzysztof Ciomek

We present an interactive preference learning technique for multiple criteria sorting driven by a set of additive value functions compatible with a rich preference information acquired from the user. This information may include: (1) imprecise assignment examples, (2) desired class cardinalities, and (3) assignment-based pairwise comparisons. The output results are necessary and possible assignments, and extreme class cardinalities.

Empirical Market Design

Cluster: Auctions

Invited Session

Chair: Peng Shi, MIT Operations Research Center, 1 Amherst Street, E40-149, Cambridge, MA, 02139, United States of America, pengshi@mit.edu

1 - Market Congestion and Application Costs

John Horton, Assistant Professor, NYU Stern School of Business, 44 West Fourth Street, Kaufman Management Center, New York, NY, 10012, United States of America, John.Horton@stern.nyu.edu, Ramesh Johari, Dana Chandler

We report the results of an experimental intervention that increased the cost of applying to vacancies in an online labor market by requiring workers to answer

questions about the job. Although the ordeal positively selected candidates, it was the information in the answers that mattered for match formation. Although the overall number of matches and speed to fill a vacancy was unchanged, employers engaged in less recruiting activities and formed higher quality matches.

2 - Experiments as Instruments: Heterogeneous Position Effects in Sponsored Search Auctions

Justin Rao, Researcher, Microsoft Research, 641 Avenue of Americas, New York, NY, 10014, United States of America, Justin.Rao@microsoft.com, Matthew Goldman

The Generalized Second Price auction has been shown to achieve an efficient allocation and favorable revenue properties provided the causal impact of ad position on user click probabilities is a constant the scaling factor for all ads. We develop a novel method to re-purpose internal business experimentation at a major search engine and we strongly reject the conventional multiplicatively-separable model, instead finding substantial heterogeneity of the causal impact of position on CTR.

3 - Optimal Design of Two-sided Market Platforms: An Empirical Case Study of Ebay

Brent Hickman, Assistant Professor Of Economics, University of Chicago, 1226 E 59th St, Chicago, IL, 60637, United States of America, hickmanbr@uchicago.edu, Joern Boehnke, Aaron Bodoh-creed

We investigate design of platform markets that house many auctions over time. We combine a unique dataset with a model of bidding where the option value of re-entering the market creates incentive for buyers to shade bids below private valuations in the current period. We show the model is identified using the Bellman equation for a representative bidder. We estimate the model and investigate the degree to which eBay is able to reduce transaction costs and approach the efficient allocation.

4 - Stability of Demand Models Across Policy Reforms: An Empirical Study with Boston Public Schools

Peng Shi, MIT Operations Research Center, 1 Amherst Street, E40-149, Cambridge, MA, 02139, United States of America, pengshi@mit.edu, Parag Pathak

In counterfactual analysis using demand modelling, an important but seldom checked assumption is that the proposed reform does not affect the demand model. We validate this assumption across a major school choice reform in Boston in 2014. To control for post-analysis bias, we precommit to forecasts before the reform. We find that while our prediction of the number of applicants were off, the logit and mixed-logit demand models we fit were stable before and after the reform.

1 - Combating Attrition through New Developments in Transaction Analytics and Customer Dialogue

Gerald Fahner, Analytic Science Senior Director, FICO, 181 Metro Drive, San Jose, United States of America, gerald.fahner@fico.com

"Silent" attrition remains a costly problem requiring fast detection and insight to create effective retention offers. Our credit card case study shows how ensemble models instrumented with low-latency transaction features rapidly detect card-level and merchant category-level attrition. We explain our models and relate performance to profitability. We show how to boost persuasiveness of offers by customer dialogues to learn their preferences. Using a simulation we illustrate the value of dialogue.

2 - How Bringing Decision Optimization to the Cloud Will Democratize Optimization

Susara Van Den Heever, IBM France, 1681 Route des Dolines, France, svdheever@fr.ibm.com, Xavier Ceugniet, Alain Chabrier, Stéphane Michel

Even though Decision Optimization has been used effectively across industries for decades, it remains under-utilized. Complexity and costs are often cited as barriers to wider adoption. The emergence of cloud computing, as well as the renewed emphasis on cognitive analytics platforms, breaks down these barriers to bring the benefits of optimization to a wider audience. We will demonstrate this vision through a case study involving IBM Decision Optimization on Cloud, and IBM Watson Analytics.

3 - An Approach to Estimating Customer Lifetime Values for Apartment Tenants

Jian Wang, Vice President, Research & Development, The Rainmaker Group, 4550 North Point Parkway, Alpharetta, GA, 30022, United States of America, jwang@letitrain.com

Estimating tenant lifetime values is important for apartment revenue management. We propose a heuristic approach to predicting renewal likelihoods and estimating tenant lifetime values. We then present empirical results based on real apartment data.

Intelligent Agents and Systems

Contributed Session

Chair: Mohsen Moghaddam, PhD Candidate, Purdue University, 1155 Anthrop Dr., Apt. 9, West Lafayette, IN, 47906, United States of America, mmoghadd@purdue.edu

1 - Optimizing Physician to Patient Consults using Robot-based Virtual Systems

Henry Ibekwe, Post Doctoral Researcher, Independent, Richmond, United States of America, hibekwe1@gmail.com

The delivery of quality healthcare for chronically ill patients is burdened by the limited resources available to physicians and healthcare facilities. We propose the use of virtual-presence autonomous robot systems to optimize the physician to patient consultation by minimizing the patient wait-time and maximizing the number of physician consults given limited resources. We formulate a robot-patient interaction model as a stochastic process and solve using discrete-time dynamic programming.

2 - A Study on the Influence of Trust and Distrust Ratings in Social Networks on Cold Start Users

Sanjog Ray, Assistant Professor, Indian Institute of Management Indore, Rau Pithampur Road, Indore, 453331, India, sanjogr@iimind.ac.in

This study examines how cold start users get influenced by the trust and distrust scores of other users in a social network. We examine the users trusted by cold start users on the basis of critical parameters: number of trust statements, number of distrust statements, and number of items rated. We base our findings on our analysis of the real life Epinions dataset. Our analysis has implications for design of trust aware recommender systems for cold start users.

3 - Analyzing Inventory Policies in Multi-stage Automatic Manufacturing Systems

Barin Nag, Professor, Towson University, Department of E-Business & Technology Ma, Towson, MD, 21252, United States of America, bnag@towson.edu, Dong-qing Yao, Sungchul Hong

In a multi-stage manufacturing system each stage fills demand from any combination of buffer inventory or production. Lowest inventory levels may not be lowest cost, with contradictions arising from the costs of delays of physical production, backlogs, breakdowns, and bottlenecks. We study best performance inventory policies using varied production architectures.

4 - A Modeling Framework of Cyber-Physical Systems

Ashutosh Nayak, Student, Purdue University, 318 N Salisbury St, Apt. 8, West Lafayette, IN, 47906, United States of America, nayak2@purdue.edu, Shimon Y. Nof, Seokcheon Lee, Rodrigo Levalle

Effective modelling of CPS is a big challenge. In this work, we propose a resource sharing based framework for CPS aimed at maximizing its utility. This framework represents CPS as a network of tasks and resources characterized by utility functions and overlapping resource communities. A distributed control approach backed by utility aggregation function is considered for optimality and stability. Its implementation is illustrated through two examples: Smart factory and multi-robot system.

5 - Collaborative Networked V-organizations: Design & Integration

Mohsen Moghaddam, PhD Candidate, Purdue University, 1155 Anthrop Dr., Apt. 9, West Lafayette, IN, 47906, United States of America, mmoghadd@purdue.edu, Shimon Y. Nof

Modern distributed, networked, and collaborative organizations of humans/machines/firms enable systematic integration of distributed resources for processing dynamic/diverse tasks. We design collaborative networked v-Organizations by integrating physical (location of resources) and virtual (allocation of tasks) dimensions, for higher service level, stability, and utilization. A mixed-integer program and a tabu search are developed for modeling and optimization purposes, respectively.

1 - A System for Estimating Traffic Congestion Measures in a Network using GPS Smartphone

Charles Chung, Vp Products, Brisk Synergies, 295 Hagey Blvd, 1st Flr, Waterloo, Canada, charles.chung@brisksynergies.com

A smartphone app is developed for logging route data. A platform is then built for mapping traffic congestion using speed indicators average speed and speed differential at the link level. The results demonstrate the feasibility and huge potential our data collection system that can be implemented in any city and sets the growth for real-time applications for connected vehicles.

2 - Online Travel Mode Identification with Smartphones

Qing He, Assistant Professor, SUNY Buffalo, 313 Bell Hall, Buffalo, NY, 14051, United States of America, qinghe@buffalo.edu, Xing Su, Hernan Caceres, Hanghang Tong

We propose an online classification algorithm to detect user's travel mode using mobile phone sensors. Our application is built on the latest Android smartphone with multimodality sensors. By applying a hierarchical classification method, we achieve high accuracy in a binary classification wheelers/non-wheelers travel mode, and all six travel modes.

3 - Locating Heterogeneous Traffic Sensors to Improve Network Surveillance Benefit

Xuechi Zhang, Graduate Research Assistant, University of Maryland, 0147C Eng Lab Bld, University of Maryland, College Park, MD, 20742, United States of America, zhangxc90@gmail.com, Ali Haghani

Optimal placement of traffic sensors is significant to improve urban mobility. In this study, a mathematical optimization model of deploying heterogeneous sensors (i.e. Bluetooth sensor and loop detector) to large-scale traffic network is proposed. Maximizing real-time information report reliability and coverage are chosen as dual objectives. In addition, the effect of real-time GPS-based probe vehicle data is also considered. A case study in Washington D.C. area is conducted for demonstration.

4 - Inferring Trajectories for Partial Observations

Juan Li, Member of Research Staff, Xerox Innovation Group, 800 Phillips Road, 128-27E, Webster, NY, 14580, United States of America, Juan.Li@xerox.com, Moshe Lichman, Padhraic Smyth

The amount of spatial trajectory data is growing fast with the rapid increased availability of GPS-embedded vehicles. The trajectory data is mixed with high and low sampling rate with partial observations. In this study, we aim to build probabilistic models to infer possible traversed route for low sampling rate vehicle trajectory data.

Chair: Roger Gung, Director, Business Analytics & Operations Research, University of Phoenix, 3137 E Elwood St, Phoenix, AZ, 85034, United States of America, roger.gung@phoenix.edu

1 - Marketing Mix Optimization

Roger Gung, Director, Business Analytics & Operations Research, University of Phoenix, 3137 E Elwood St, Phoenix, AZ, 85034, United States of America, roger.gung@phoenix.edu

Marketing spend allocation drives the volume of new marketing inquiries (NMI) and enrollments. Two-stage non-linear regression models were built to formulate NMI channels with respect to marketing spends which were defined as either endogenous, exogenous or instrument variables. The optimization model was formed by aggregating all NMI channels' regression models into one objective function. The optimal spend allocation was then derived from the model every quarter to guide marketing strategies.

2 - Contact Center Qualifying Transfer Rate Modeling and Analysis

Jie Yu, Operations Research Scientist, University of Phoenix,
3137 E Elwood St, Phoenix, AZ, 85034, United States of America,
jie.yu@phoenix.edu, Roger Gung, Lin Wang

Impact analysis on transferring marketing inquiries to qualifying leads for potential enrollments and the performance of contact center agents are crucial to contact center and enrollment operations. An impact analysis was conducted on transfer rate with drivers including speed to lead, lead source, time of request as well as program level. A mixed effect logistic regression model was built to rank agents' performance in terms of expected transfer rate with given marketing inquiries. The model was also employed to evaluate the impact of reducing contact center and enrollment operating hours.

3 - Enrollment Service Contact Strategy Optimization

Pan Hu, Operations Research Scientist, University of Phoenix,
3137 E Elwood St, Phoenix, AZ, 85034, United States of America,
pan.hu@phoenix.edu, Yun Ouyang, Jie Yu, Lin Wang,
Roger Gung

This project is to study how contact behaviors of enrollment representatives influence enrollment progression of higher education pursuers. To better serve the needs of potential students, it is critical to communicate effectively by bringing up right topics in the best timing. We examined a list of conversation topics suggested in the internal guideline of University of Phoenix for enrollment representatives, and identified the best contact strategy using statistical models.

Joint Session HAS/MSOM-Healthcare: Modeling Applications for Emergency Departments

Sponsor: Health Applications

Sponsored Session

Chair: Sean Barnes, University of Maryland, 4352 Van Munching Hall,
University of Maryland, College Park, MD, 20742,
United States of America, sbarnes@rhsmith.umd.edu

1 - Review of Queueing Theory Applied to Emergency Departments with Comparable Simulation Studies

Summer (Xia) Hu, PhD Student, University of Maryland,
Department of Mathematics, College Park, United States of
America, xhu64@umd.edu, Sean Barnes, Bruce Golden

Queueing Theory (QT) is an important tool for Emergency Department (ED) design and management. By reviewing all papers with ED QT analysis or applications since 1972, this survey examines the contributions of QT to modeling EDs and identify its benefits and limitations when compared to discrete-event simulation (DES) under similar ED operational settings. Our results indicate that the combination of queueing and DES methods can be a powerful approach to better ED modelling.

2 - Using Simulation to Assess the Impact of an Observation Unit in a Pediatric Emergency Department

Mark Grum, University of Michigan, 1205 Beal Avenue, Ann
Arbor, MI, 48109, United States of America, mgrum@umich.edu,
Gabriel Zayas-Caban, Michelle Macy, Allison Cator, Amy Cohn

Observation units (OUs) provide an alternative disposition decision for ED patients who may benefit from further observation, such as those are not ill enough to be admitted, but not well enough to be discharged. Patients can be placed in an OU for monitoring, diagnostic evaluation, and/or treatment prior to disposition. In this talk, we discuss our approaches (e.g. simulation) for assessing the impact of an OU in the Pediatric ED at the University of Michigan.

3 - Operational Causes of Patients Leaving Before Treatment is Completed in Emergency Departments

David Anderson, Assistant Professor, Baruch,
davidryberganderson@gmail.com, Bruce Golden, Edward Wasil,
Laura Pimentel, Jon Mark Hirshon

Patients leaving before treatment (LBTC) is completed is an indicator of poor Emergency Department performance. Contrary to previous research, volume is not the main driver of patients leaving before treatment is complete. First provider time and lengths of treatment are much more strongly associated with LBTC rate. We show that operational factors such as treatment time and staffing decisions play a role in waiting time and, thus, in determining the LBTC rate.

4 - Strategies for Ebola Containment: A Biological-behavioral-operational Modeling Decision Framework

Eva Lee, Georgia Tech, Atlanta, GA, eva.lee@gatech.edu

This work is joint with CDC. We present a computational decision modeling framework that integrates an agent-based biological disease spread model, a dynamic network-based social-behavior model that captures human behavior and interaction, and a stochastic queueing model that describes treatment characteristics, day-to-day hospital and homecare processes, and resource usage. An optimization engine determines the minimum resource needed to contain the Ebola epidemic in W. Africa.

Data-driven Modeling and Analysis of Health Care Systems

Sponsor: Health Applications

Sponsored Session

Chair: Anil Aswani, UC Berkeley, 4141 Etcheverry Hall, Berkeley, CA,
94720-1777, United States of America, aaswani@berkeley.edu

1 - Constructing Behavioral Models for Personalized Weight Loss Interventions using Integer Programming

Yonatan Mintz, Graduate Student, UC Berkeley, 1822 Francisco
St., Apt. 10, Berkeley, CA, 94703, United States of America,
ymintz@berkeley.edu, Philip Kaminsky, Yoshimi Fukuoka,
Anil Aswani, Elena Flowers

In this paper we describe two (a machine learning and a utility maximization) models for weight loss using clinical trial data. We believe these quantitative models of behavior change can be used to provide personalized interventions, improve adherence and lower costs of current weight loss programs. Given the high prevalence of obesity, these results provide significant insight into more effective approaches to implement weight loss programs.

2 - Modeling Treatment Adherence Behavior in the Treatment of Obstructive Sleep Apnea

Yuncheol Kang, Pennsylvania State University, 236 Leonhard
Building, State College, 16801, United States of America,
kang.yuncheol@gmail.com, Paul Griffin, Vittal Prabhu,
Amy Sawyer

We target patients who suffered from Obstructive Sleep Apnea (OSA) and their treatment behaviors when using Continuous Positive Airway Pressure (CPAP) devices. We model underlying dynamics and patterns of patient treatment behavior using Markov models as a basis for designing effective and economical intervention. Also we suggest a guideline for designing a cost-effective intervention to economically treat the patients.

3 - Inverse Optimization with Noisy Data

Auyon Siddiq, UC Berkeley, 4141 Etcheverry Hall, University of
California, Berkeley, Berkeley, 94720, United States of America,
auyon.siddiq@berkeley.edu, Zuo-jun Max Shen, Anil Aswani

We present an approach for inverse parametric optimization with noisy solution data for convex forward problems. The proposed method yields well-behaved estimates that attain risk consistency or parameter estimation consistency under reasonable conditions. While the formulation is non-convex in general, we provide an approximation algorithm that yields consistent estimates for a class of quadratic programs. Numerical results show competitive performance with state-of-the-art techniques.

4 - Quantifying the Resilience of Hospital Unit Management under High Workloads

Mo Zhou, PhD Student, UC-Berkeley, 4470 Etcheverry Hall,
Berkeley, CA, 94709, United States of America,
mzhou@berkeley.edu, Anne Miller, Anil Aswani, Jason Slagle,
Daniel France

Hospital unit shifts with high admissions/discharges (ADTs) and low nurse-to-patient ratios (NPRs) increase mortality. Nurse managers promote unit resilience, and we quantify this using time series and network analysis of hourly phone calls, ADTs, and NPRs over 2 years from an Intensive Care Unit. Statistical variable selection assessed variable dependency, and time-series estimation demonstrated the validity of phone calls as a resilience measure. Future studies will elucidate adaptive limits.

Using Technology to Enhance Guest Experiences and Performance in Hospitality Management

Cluster: Hospitality, Tourism, and Healthcare

Invited Session

Chair: Alex Susskind, Cornell University, 350 Statler Hall, School of Hotel Administration, Ithaca, NY, 14853, United States of America, ams76@cornell.edu

1 - Picturing Hotels: Attributes of Hotel Images That Attract Consumer Attention Online

Stephani K. A. Robson, Senior Lecturer, Cornell University, 255 Statler Hall, Ithaca, NY, 14853, United States of America, skr4@cornell.edu, Breffni Noone

Images have been shown to be an important element in the online hotel choice process. This exploratory study uses eye tracking technology to investigate the attributes of hotel images that attract consumers' eye fixations during a naturalistic search for lodging, with implications for hotel marketing strategies.

2 - The Connection Between Restaurant Performance and Customer-facing Technology in Restaurants

Alex Susskind, Cornell University, 350 Statler Hall, School of Hotel Administration, Ithaca, NY, 14853, United States of America, ams76@cornell.edu

In this study, the relationship between customer-facing technology, customer satisfaction and restaurant performance are examined. The findings suggest that the use of customer-facing technology in a full-service restaurant experience is positively connected to customers' satisfaction with their service experience in the restaurant, higher average spending in the restaurant and a higher tip percentage paid to the servers.

3 - Does Customer-facing Technology Reduce Service Time in Restaurants?

Ben Curry, Data Scientist, Ela Carte, Ela Carte Headquarters, San Francisco, CA, United States of America, bcurry@elacarte.com

Looking at how table turn time and service labor usage was affected by customers' use of customer facing technology in restaurants, I found that customer-facing technology notably reduced table turn time when customers ordered their meals through the table top device; that figure increased more for customers who ordered their meals and settled their bills using the table-top devices.

Disaster Relief and Humanitarian Logistics

Sponsor: Public Sector OR

Sponsored Session

Chair: Chris Zobel, Professor, Virginia Tech, Business Info. Technology, 880 W. Campus Dr., Suite 1007, Blacksburg, VA, 24061-0235, United States of America, czobel@vt.edu

Co-Chair: Andrew Arnette, Assistant Professor Of Decision Sciences And Governor Geringer Scholar, University of Wyoming, 1000 E. University Ave, Laramie, WY, 82071, United States of America, aarnette@uwyo.edu

1 - Management of Blood Supplies During Humanitarian Crises

Cigdem Gonul Kochan, Ohio Northern University, 525 South Main Street, Ada, OH, 45810, United States of America, c-kochan@onu.edu, Shailesh Kulkarni, David R. Nowicki

This study presents a combined problem of allocating and routing the available blood supplies at the central blood bank to a given set of hospitals with uncertain demand. We develop two multi-product newsvendor (MPNP) –traveling salesman (TSP) models. We examine and compare the results of both models.

2 - A Markov Decision Process Model for Equitable Distribution of Supplies under Uncertainty

Lauren Davis, North Carolina A&T State University, 1601 E. Market St., Greensboro, NC, United States of America, lbdavis@ncat.edu, Sefakor Fianu

Food banks are one of many non-profit organizations assisting in the fight against hunger. Most of the food distributed by the food bank comes from donations which are received from various sources in uncertain quantities at random points in time. We present a finite horizon decision-making model that determines the optimal allocation of supplies to demand locations (charitable agencies) given stochastic supply.

3 - Exploring a Community's Perception of Resilience and its Effect on Public Policy

Roberta Russell, Professor, Virginia Tech, 1007 Pamplin Hall, 0235, Blacksburg, VA, 24060, United States of America, rrussell@vt.edu, Yuhong Li, Michelle Seref

Resilience has been used in many disciplines to describe the ability of an entity to withstand the effects of a disaster, to bounce back from a disaster, or to change and adapt to a new reality post-disaster. This research uses text mining to explore the use of resilience and related terms in newspaper and other media to describe disasters and subsequent recovery efforts. Particular views of resilience are correlated with community actions related to building resilience for the next disaster.

4 - Improving Resource Pre-positioning to Support Disaster Relief Operations

Andrew Arnette, Assistant Professor Of Decision Sciences and Governor Geringer Scholar, University of Wyoming, 1000 E. University Ave, Laramie, WY, 82071, United States of America, aarnette@uwyo.edu, Chris Zobel

This research seeks to address a need for improving asset location modeling for opening overnight shelters in response to natural disasters. Such pre-positioning is crucial for organizations that provide immediate relief to impacted populations, and we discuss a mathematical programming approach that improves on previous attempts to determine more optimal placements for a combination of resources.

Health Care Modeling and Optimization X

Contributed Session

Chair: Songnian Zhao, Student, Kansas State University, 1600 Hillcrest Dr., Apt 4, Manhattan, KS, 66502, United States of America, songnian@ksu.edu

1 - Use of Simulation-optimization Technique in Operating Room Scheduling

Musa Demirtas, Research And Teaching Assistant, Western New England University, 1215 Wilbraham Road, Springfield, MA, 01119, United States of America, demirtasmusa@gmail.com, Mohammad Dehghani, Thomas K. Keyser

In hospitals, operating Rooms (ORs) are the most important and costly departments, and generate a big portion of revenues. This study focuses on maximization of ORs utilization and minimization of inpatients' length of stay to decrease costs and increase patients' satisfaction. Since the arrival of emergency patients may disrupt the schedule, we developed a reactive simulation-optimization model to schedules that optimally allocate limited resources to multiple ORs.

2 - Optimal Delivery and Pickup Planning for Patients with Chronic Diseases using Drones

Seon Jin Kim, University of Houston, Dept. of Industrial Engineering, Houston, TX, 77204, United States of America, sonjin64@gmail.com, Gino Lim, Jaeyoung Cho

Patients with chronic diseases are required to visit clinics for a routine health exam. The cost of chronic diseases has been increasing every year, which became a burden to patients, government, and health insurance companies. We present a robust optimization model to reduce healthcare costs and improve quality of healthcare service using drones. The model finds optimal routes of drones to deliver medicine and pickup necessary samples to analyze patients' health.

3 - Application of Theory of Constraints in Blood Banking

Harshal Lowalekar, Assistant Professor, Indian Institute of Management Indore, Rau-Pithampur Road, Indore, MP, 453556, India, harshal@iimdr.ac.in

We discuss the application of the Theory of Constraints Thinking Processes (TOCTP) methodology in managing inventory at blood banks. Using the Thinking Processes approach the root-cause behind the common inventory problems at blood banks like high shortage and wastage of blood products, high operating expenses and low revenue levels is identified. A TOC based solution is then proposed to address the root-cause.

4 - Study of Optimal Control Strategies for Visceral Leishmaniasis

Songnian Zhao, Student, Kansas State University, 1600 Hillcrest Dr., Apt. 4, Manhattan, KS, 66502, United States of America, songnian@ksu.edu, Chih-hang Wu, Yan Kuang, David Ben-ariel

Visceral Leishmaniasis (VL) is a vector-borne disease which is transmitted by sandflies and it is the second-largest parasitic killer after Malaria. Mathematical models were proposed to assist in the control of spread of VL; however, quantitative conditions for the control of VL transmission are not studied. This paper develops a general mathematical model for VL disease transmission system, performs bifurcation analysis to discuss control conditions, and calculates optimal control strategies.

5 - The Advent of the Intelligent Electronic Health Record

John Glaser, Siemens Healthcare, Malvern, PA,
United States of America, John.Glaser@Cerner.com

We've made great progress in embedding the Electronic Health Record (EHR) in our healthcare processes, with use reaching unprecedented rates. Now, we're poised to take it the next level with the intelligent EHR. The intelligent EHR will look very similar to the traditional system – one can still look up patient results and history and write prescriptions but the application will move past transactional functions. The intelligent EHR will be characterized by sophisticated and flexible decision support, rules engines, process monitoring engines, intelligent displays of important patient data, access to knowledge resources, the ability to collect data from multiple care settings through a health information exchange, and tools that enable provider collaboration. The advent of the intelligent EHR will be necessary if healthcare is to effectively address challenges such as those generated by payment reform and managing the care of chronically ill populations.

Queueing Models I

Contributed Session

Chair: Kaan Kuzu, Assistant Professor, University of Wisconsin-Milwaukee, Lubar School of Business, 3202 N. Maryland Ave., Milwaukee, WI, 53221, United States of America, kuzu@uwm.edu

1 - Optimum Staffing of an Outbound Call Center

Doron Feuer, California Polytechnic State University, Pomona,
6493 Joshua St., Oak Park, CA, 91377, United States of America,
doronfeuer@gmail.com, Saar Yaffe, Saeideh Fallah-Fini

This paper couples regression analysis, Markov chain, and queueing theory techniques and develops a reliable model for optimum staffing of an outbound call center constrained by irregular inbound lead volume. By tracking trends of incoming calls throughout the call center our algorithm predicts the optimum level of staff required to ensure dialing requirements while minimizing wasted agent time.

2 - Optimal Control of a Queue under Overflow Probability Constraint

Abdolghani Ebrahimi, Research Assistant, Iowa State University,
225 Washington Ave, Unit 2, Ames, IA, 50010, United States of
America, gebrahimi91@gmail.com, Arka Ghosh

We develop an optimal policy that minimizes the long-run average cost in a queue system when you have an overflow probability constraint. The queue has a limited buffer size. As our constraint we define long-run average time that the buffer is full less than a number. Our objective is to find the optimal policy. We solve the problem for two cases; one with bounded space and the other with unbounded space.

3 - Analysis of Priority-Based Ticket Queue Data

Kaan Kuzu, Assistant Professor, University of Wisconsin-Milwaukee, Lubar School of Business, 3202 N. Maryland Ave., Milwaukee, WI, 53221, United States of America,
kuzu@uwm.edu, Refik Soyer

We analyze the transactional data from a bank's priority-based ticket queue system and estimate the distributions of inter-arrival and service times based on customer category, day of the week and time intervals in a day. We also predict the customers' patience times for each customer category and day of the week, and develop the corresponding abandonment probabilities using logistic regression models.

Risks Management in Operations/Marketing

Cluster: Operations/Marketing Interface

Invited Session

Chair: Osman Aydas, Instructor & PhD Candidate, University of Wisconsin-Milwaukee, 3202 N Maryland Ave., Milwaukee WI 53211, United States of America, otaydas@uwm.edu

1 - Global Supply Chain Social Responsibility: An Agency Theory Perspective

Xingxing Zu, Morgan State University, 1700 E Cold Spring Lane,
Department of Information Science & Syst, Baltimore, MD,
United States of America, Xingxing.zu@morgan.edu,
Ziping Wang, Yu Xia

This study examines global supply chain social responsibility from a dyad perspective based on agency theory. We analyze how the characteristics of buyer-supplier relationship affect the effectiveness of two different management

approaches – outcome-based management versus behavior-based management. The relationship characteristics include the length of the relationship, goal conflict between the buyer and the supplier, and the risk aversion of the two parties.

2 - Nurse Allocation Policy Evaluation and Analysis of Admissions in an Intensive Care Unit

Osman Aydas, Instructor & PhD Candidate, University of Wisconsin-Milwaukee, 3202 N Maryland Ave., Milwaukee, WI, 53211, United States of America, otaydas@uwm.edu, Kaan Kuzu, Anthony Ross

Nurse staffing is a crucial step in providing quality healthcare. Many patient care units, including Intensive Care Units, have problems in accurately estimating the number of nurses to use on a daily basis. We evaluate the existing staff allocation system of an intensive care unit using clinical operational data and develop a prediction model for estimating the number of admissions to the unit.

3 - Coordinating Contracts for an Express Service Supply Chain

Juzhi Zhang, University of Science & Technology of China, No.96,
JinZhai Road Baohe District, Hefei, 230026, China,
zjuzhi@mail.ustc.edu.cn, Gou Qinglong, Xiaohang Yue

This paper studies the mismatch problem of an express service supply chain, in which the express company delivers the product from online retailer to consumers. We show that displaying information on delivery capacity can decrease consumers' belief on delay risk and increase the centralized supply chain's profit, but it may not be feasible because consumers may not believe it. We then design some contracts to make the supply chain achieve the profit under information display.

4 - Appraisal Viewpoint Disseminate and Evolution Analysis Online Transaction

Xiening Wang, Associate Professor, DongBei University of Finance and Economics, China, No 217, JianShan Street, Shahekou Distri,
Dalian, LN, 116025, China, wangxiening@163.com

Through feature analysis and algorithm analysis, this paper researches the disseminate and evolution of online transaction appraisal view during consumption. The conversion rules of consumer view tendency is proposed, by describing the viewpoint tendency of network users and combining the clustering properties of the network transactions appraisal viewpoint. It analyzes the e-commerce transactions appraisal of the cellular migration model based on small world network effects.

Operations/Sustainability

Contributed Session

Chair: Xin Wang, Carnegie Mellon University, 5000 Forbes Ave,
Pittsburgh, PA, 15213, United States of America,
xinwang1@andrew.cmu.edu

1 - Analysis on the Link Between Corporate Social and Financial Performance of Korean Business Groups

Donghyup Woo, Doctoral Candidate, State University of New York at Buffalo, 326 Jacobs Management Center, University at Buffalo SUNY, Buffalo, NY, 14260, United States of America,
dwoo@buffalo.edu, Nallan Suresh

This research identifies contextual relationships between social responsibility and financial performance in countries transitioning to developed economies. Using Korean data, it explores how business group affiliation "Chaebol" influences strategy and social responsiveness. We test the hypothesis that "Chaebol firms" show strong positive relationship due to institutional pressure and legitimacy issues.

2 - Do Sustainability Practices Really Help?

Hung-yao Liu, ESC Rennes School of Business, 2 Rue Robert
d'Arbrissel CS 76522, Rennes, France, hungyao.liu@gmail.com,
Rohit Nishant

We utilize an extensive dataset on the resource consumption of different firms to investigate the effectiveness of various sustainability practices (i.e., pollution prevention, product stewardship, clean technology, and sustainability vision) as conceptualized in Hart's "sustainability portfolio", embedded in the Natural Resource Based View (NRBV). We seek to understand which sustainability practices help firms achieve resource efficiency.

3 - Building Temperature Control with User Feedback and Energy Optimization

John Wen, Professor, Rensselaer Polytechnic Institute, CII 5015,
110 8th St., Troy, NY, 12180, United States of America,
wenj@rpi.edu

Buildings are occupied by multiple occupants with different comfort preferences in a shared space. This paper proposes a distributed incentive based strategy to balance the user comfort feedback and building energy optimization. We establish the convergence of the proposed algorithm to the optimal temperature set-point that minimizes the total energy cost and the aggregate discomfort of all occupants.

4 - Green Technology Innovations, Adoption, and Regulation

Xin Wang, Carnegie Mellon University, 5000 Forbes Ave,
Pittsburgh, PA, 15213, United States of America,
xinwang1@andrew.cmu.edu, Alan Scheller-wolf

When a government is considering tightening a standard on a pollutant, their decision often is influenced by the number of firms being able to meet the tightened standard, because a higher number indicates a more feasible standard. We study how such regulation may affect a firm's incentive to develop a new technology to reduce a pollutant. We find that stricter regulation may discourage a firm to develop a new technology, but may encourage other firms to adopt the technology once it is invented.

ED Operations Management

Sponsor: Manufacturing & Service Oper
Mgmt/Healthcare Operations
Sponsored Session

Chair: Vedat Verter, James McGill Professor, Desautels Faculty of Management, McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A 1G5, Canada, vedat.verter@mcgill.ca

1 - Specialist Care in Rural Hospitals: from Emergency Department Consultation to Ward Discharge

Michael Klein, PhD Candidate, McGill University,
Desautels Faculty of Management, Montreal, Canada,
michael.klein2@mail.mcgill.ca, Vedat Verter, Brian G. Moses,
Hughie F. Fraser

Patients often wait for admission to inpatient wards, boarding on stretchers in hallways. These delays are the key contributor to Emergency Department (ED) crowding, resulting in adverse effects including higher mortality. We consider the ED boarding problem from the perspective of specialists. We focus on Internal Medicine at two hospitals in Nova Scotia, Canada. We propose a stochastic dynamic programming model to analyze current practice and identify strategies for improvement.

2 - Impact of Coordination and Information Sharing in Urban Incident Response

Jonathan Helm, Indiana University Bloomington,
1309 E. Tenth Street, Bloomington, IN, United States of America,
helmj@indiana.edu, Alex Mills, Andres Jola-sanchez,
Mohan Tatikonda, Bobby Courtney

Following a disaster in an urban area, on-scene responders must decide how to distribute casualties among hospitals. This is typically done without information (real-time or otherwise) about hospital capacities, ED and inpatient. We study a new type of organization, called a healthcare coalition, and use real data to study what types of information this organization should share with responders after a multiple casualty incident to improve response.

3 - Optimal Admission/Discharge Criteria for Patients with Heart Failure in Observation Units

Sanket Bhat, McGill University, 1001 Sherbrooke Street West,
Room 520, Montreal, QC, H3A 1G5, Canada,
sanket.bhat@mcgill.ca, Beste Kucukyazici, Rick Mah

Although more than 80% of the patients presented to Emergency Departments with symptoms related to acute decompensated heart failure (ADHF) are hospitalized, the majority of patients are not in need of an acute intervention beyond decongestion. These patients could be managed in observation units and be discharged without hospitalization. We develop a stochastic model that dynamically assess the risk levels of ADHF patients, and determine criteria to optimally discharge, observe, or admit them.

4 - A Data-driven Stochastic Model of an Emergency Department

Xiaopei Zhang, Columbia University, 1 Morningside Drive,
Apt. 1710, New York, NY, 10025, United States of America,
xz2363@columbia.edu, Ward Whitt

We explore arrival and length-of-stay (LoS) data from an Israeli Emergency Department. We fit a time-varying two-class (hospitalized or not) infinite-server queueing model with nonhomogeneous Poisson arrivals, where the arrival rate/admission/LoS is periodic over a week/day/day. Departures after long LoS tend to occur at midnight.

Joint Session MSOM-Health/HAS: Global Health Delivery

Sponsor: Manufacturing & Service Oper
Mgmt/Healthcare Operations
Sponsored Session

Chair: Jonas Jonasson, Student, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, jjonasson@london.edu

1 - Demand vs. Supply-side Investment in Humanitarian Operations

Karthik V. Natarajan, Assistant Professor, University of Minnesota, 321 19th Avenue South, 3-150, Minneapolis, MN,
United States of America, knataraj@umn.edu,
Jayashankar Swaminathan

Both supply- and demand-side constraints impact program coverage in humanitarian settings. We first study the problem of identifying the optimal mix of supply- and demand-side investments faced by a budget-constrained organization in a centralized setting. We then consider a decentralized setting and identify the optimal performance-based contract to mobilize demand. In addition, we also compare the performance of the optimal contract against three contracts frequently used in practice.

2 - Assessing the Impact of U.S. Food Assistance Delivery Policies on Child Mortality in Sub-Saharan Africa

Alex Nikulkov, Stanford GSB, 655 Knight Way, Stanford, CA,
94305, United States of America, nikulkov@stanford.edu,
Lawrence Wein

The U.S. is one of the few countries in the world that delivers its food assistance via transoceanic shipments of commodity-based in-kind food, which is more costly and less timely than cash-based assistance. Using household survey data, geospatial data and supply chain modeling, we estimate that child mortality in sub-Saharan Africa can be reduced by 16.2% if the U.S. switches entirely to cash-based interventions.

3 - How Good are Uniform Co-Payments in Increasing Market Consumption?

Gonzalo Romero, Rotman School of Management, 105 St. George Street, Toronto, Canada, Gonzalo.Romero@rotman.utoronto.ca,
Retsef Levi, Georgia Perakis

We analyze the problem of a central planner allocating co-payment subsidies to competing heterogeneous firms, under an endogenous market response and a budget constraint. We present the first worst-case performance guarantees in maximizing market consumption for the frequently implemented policy of uniform co-payments. Namely, allocating the same co-payment to each firm is guaranteed to induce a significant fraction of the optimal market consumption, even if the firms are highly heterogeneous.

4 - Deployment Guidelines for Community Health Workers in Sub-Saharan Africa

Jonas Jonasson, Student, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, jjonasson@london.edu,
Anne Liu, Sarang Deo, Jérémie Gallien, Carri Chan

Community health workers (CHWs) are increasingly important to the delivery of health care in many African countries. Leveraging an extensive dataset featuring time, clinical findings and GPS information for CHW visits in Ghana, we develop a stochastic model describing the health dynamics of a population served by a time-constrained CHW. This model supports the design of managerial guidelines for the patient prioritization, catchment area assignment and task profile definition in a CHW operation.

Choice Modeling and Assortment Optimization

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Vineet Goyal, Columbia University IEOR department, 500 West 120th Street, 304 Mudd, New York, NY, 10027, United States of America, vg2277@columbia.edu

1 - Approximation Algorithms for Dynamic Assortment Optimization Models

Ali Aouad, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, aaouad@mit.edu, Danny Segev, Retsef Levi

We study the joint assortment and inventory management problem, where demand consists in a random sequence of heterogeneous customers. Although the problem is hard in general, we provide the first polynomial time algorithms that attain constant approximations, for variants proposed in previous literature as well as more general choice models. In addition, our algorithms provide practical means for solving large-scale instances and for incorporating more realistic constraints.

2 - Capacity Constrained Assortment Optimization under the Markov Chain Based Choice Model

Chun Ye, Columbia University IEOR department, 500 West 120th Street, Mudd 315, New York, NY, 10027, United States of America, cy2214@columbia.edu, Danny Segev, Vineet Goyal, Antoine Desir

We consider a capacity constrained assortment optimization problem under the Markov Chain based choice model proposed by Blanchet et al. We first show that even severely-restricted special cases are APX-hard. We then present a constant factor approximation for the general problem. Our algorithm is based on a "local-ratio" method that allows us to transform a non-linear revenue function into a linear function over appropriately modified item prices.

3 - Assortment Optimization under a Random Swap Based Distribution over Permutations Model

Antoine Desir, Columbia University IEOR department, 500 West 120th Street, Mudd 315, New York, NY, 10027, United States of America, ad2918@columbia.edu, Vineet Goyal, Danny Segev

We consider a special class of distribution over permutations model based on modeling the consumer preferences by a random number of random swaps from a small set of fixed preference lists. This model is motivated from practical applications where preferences of "similar" consumers differ in a small number of products. We present polynomial time approximation schemes for capacity constrained assortment optimization problem under the random swap based distribution over permutation model.

4 - Design of an Optimal Membership Promotion Policy with Experiments

Spyros Zoumpoulis, Insead, spyros.zoumpoulis@insead.edu, Duncan Simester, Artem Timoshenko

Deciding what customer to target with what type of membership promotion is among the most important decisions that wholesale clubs face. We use the results of a large-scale membership promotion field experiment involving multiple types of membership promotions to propose various promotion policies, each relying on a different algorithm for customer segmentation. We then evaluate the performance of the proposed policies as implemented in a large-scale field test.

Machine Learning in Operations

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Srikanth Jagabathula, NYU, 44 West Fourth Street, New York, United States of America, sjagabat@stern.nyu.edu

1 - Prediction vs Prescription in Data-driven Pricing

Nathan Kallus, MIT, 77 Massachusetts Ave., E40-149, Cambridge, MA, 02139, United States of America, kallus@mit.edu, Dimitris Bertsimas

We study the problem of data-driven pricing and show that a naive but common predictive approach leaves money on the table. We bound missed revenue relative to the prescriptive optimum, which we show is unidentifiable from data. We provide conditions for identifiability and appropriate pricing schemes. A new hypothesis test shows that predictive approaches are practically insufficient while parametric approaches often suffice but only if they take into account the problem's prescriptive nature.

2 - The Big Data Newsvendor: Practical Insights from Machine Learning

Gah-Yi Vahn, Assistant Professor, London Business School, Sussex Place, Regent's Park, London, NW1 4SA, United Kingdom, gvahn@london.edu, Cynthia Rudin

We study the newsvendor problem when one has n observations of p features related to the demand as well as demand data. Both low- and high-dimensional data are considered. We propose Machine Learning (ML) and Kernel Optimization (KO) approaches, and derive tight bounds on their performance. In a nurse staffing case study we find that the best KO and ML results beat best practice by 23% and 24% respectively.

3 - Applying Machine Learning to Revenue Management at Groupon

David Simchi-levi, Professor, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, dslevi@mit.edu, Alexander Weinstein, He Wang, Wang Chi Cheung

We propose a new data-driven pricing algorithm for online retailers, which learns customer demand from online transaction data. Our method first generates multiple demand functions using a clustering algorithm, and then learns on the fly which demand function is more likely to be correct. We will also discuss some field experiment result through collaborating with Groupon, a large daily deal website.

4 - Demand Forecasting when Customers Consider, Then Choose

Ying Liu, Stern School of Business, New York University, 44 West 4th Street, KMC 8-154, New York, NY, 10012, United States of America, yliu2@stern.nyu.edu, Srikanth Jagabathula

We consider the problem of demand forecasting when customers choose by first forming a consideration set and then choosing the most preferred product from the consideration set. The consideration set is sampled from a general model over subsets. We propose techniques to estimate such models from purchase transaction data.

Revenue Management for Marketing

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: John Turner, Assistant Professor, University of California, Irvine, Room SB2 338, The Paul Merage School of Business, Irvine, CA, 92697-3125, United States of America, john.turner@uci.edu

1 - Scheduling of Guaranteed Targeted Display Advertising under Reach and Frequency Requirements

Ali Højat, University of California Irvine, Paul Merage School of Business, Irvine, CA, 92697, United States of America, hojjats@uci.edu, John Turner, Suleyman Cetintas, Jian Yang

We propose a novel mechanism for the scheduling of guaranteed targeted advertising in online media. We consider a new form of contract in which advertisers specify the number of unique individuals (reach) and the minimum number of times (frequency) each individual should be exposed. We further integrate a variety of new features such as desired diversity and pacing of ads over time or the number of competing brands seen by each individual. We perform extensive numerical tests on industry data.

2 - Transaction Attributes and Customer Valuation

Michael Braun, Associate Professor Of Marketing, Southern Methodist University, 6212 Bishop Blvd., Fincher 309, Dallas, TX, 75275, United States of America, braunm@smu.edu, Eli Stein, David Schweidel

We propose a model of customer value and marketing ROI that incorporates transaction-specific attributes and unobserved heterogeneity. From this model, one can estimate an upper bound on the amount to invest in retaining a customer. This amount depends on the recency and frequency of past customer purchases. Using data from a B2B service provider, we estimate the revenue lost by the firm when it fails to deliver a customer's requested level of service.

3 - Auctions with Dynamic Costly Information Acquisition

Negin Golrezaei, Auctions With Dynamic Costly Information Acquisition, University of Southern California, Bridge Memorial Hall, 3670 Trousdale Parkway, Los Angeles, CA, 90089, United States of America, golrezae@usc.edu, Hamid Nazerzadeh

We study the mechanism design problem for the seller of an indivisible good in a setting where buyers can purchase the additional information and refine their valuations for the good. This is motivated by information structures in online advertising where advertisers can target users using cookie-matching services. For this setting, we propose a rich class of dynamic mechanisms, called Sequential Weighted Second-Price, which encompasses the optimal and the efficient mechanisms as special cases.

4 - Learning, Revising, and Forgetting Multidimensional Contextual Features for Online Ad Selection

John Turner, Assistant Professor, University of California, Irvine, Room SB2 338, The Paul Merage School of Business, Irvine, CA, 92697-3125, United States of America, john.turner@uci.edu, Tianbing Xu, Amelia Regan, Yaming Yu

We study how best to match ads to viewers using high-dimensional contextual features (demographic, browsing behavior) to predict click-through probability. Using Thompson Sampling in a Bayesian framework, our model learns the importance of contextual features while adapting/forgetting over time, capturing changing individuals' tastes and shifts in the viewing population's composition.

Service Models in MSOM

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations
Sponsored Session

Chair: Opher Baron, University of Toronto, 105 St George St, Toronto, ON, Canada, opher.baron@rotman.utoronto.ca

1 - Worker Flexibility Training and Production Decision Rights

Gad Allon, Professor, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, g-allon@kellogg.northwestern.edu, Achal Bassamboo, Evan Barlow

We explore the interaction between production decision rights and workers' decisions on training to become flexible resources. Research on flexible resources is prevalent in the operations management literature. Human resources, however, are decision makers and have rights to decide on their own training levels. Many firms, however, have also given workers some production decision rights. We show how the workers' training decisions are affected by the identity of the production decision maker.

2 - Revenue Maximization for Cloud Computing Services

Cinar Kilcioglu, Columbia Business School, New York, NY, 10027, United States of America, ckilcioglu16@gsb.columbia.edu, Costis Maglaras

We study a stylized model of revenue maximization for cloud computing services, analyze price data traces from the biggest cloud service provider, Amazon, provide some possible explanation for price spikes based on intuitive asymptotic analysis arguments in systems with large scale capacity and large market potential, and ultimately study the revenue maximization problem faced by the service provider that operates in an infinite capacity system and in a market with multiple customer types.

3 - Admission and Discharge Decisions in Intensive Care Units

Huiyin Ouyang, UNC Department of Statistics & Operations Research, 318 Hanes Hall, CB# 3260, Chapel Hill, NC, 27599-3260, United States of America, ouyang5@live.unc.edu, Serhan Ziya, Nilay Argon

We formulate a MDP model for admission decisions in an ICU where patients' health conditions change over time according to Markovian probabilities. We find that the optimal decision can depend on the mix of patients in the ICU and provide an analytic characterization of the optimal policy. We also identify conditions under which the optimal policy is state-independent.

4 - Tandem Queues with Reneging – Analysis and Insights

Jianfu Wang, Assistant Professor, Nanyang Business School, NTU, 50 Nanyang Avenue, NTU, Singapore, Singapore, wangjf@ntu.edu.sg, Opher Baron, Oded Berman, Hossein Abouee Mehrizi

This paper considers tandem queueing systems with reneging. We develop a new technique to solve two dimensional Markov Chains with non-repeating structure. Our technique can be applied to additional settings and used to derive different service level measures. We demonstrate this technique on a two-station tandem queueing model with reneging, which has been considered analytically intractable.

Supply Chain Social Responsibility

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Robert Swinney, Associate Professor, Duke University, 100 Fuqua Dr, Durham, NC, 27708, United States of America, robert.swinney@duke.edu

1 - Supply Chain Social and Environmental Performance: Measurement, Improvement and Disclosure

Basak Kalkanci, Georgia Institute of Technology, 800 W Peachtree St. NW, Atlanta, GA, United States of America, Basak.Kalkanci@scheller.gatech.edu, Erica Plambeck

Firms are beginning to measure the social and environmental impacts associated with their products and (in a few cases) report those impacts to investors and consumers. Supply chain strategy and structure influence a firm's costs and benefits from impact measurement, reduction and disclosure. We evaluate how a mandate for disclosure affect impacts, firm expected profit, and its valuation by investors.

2 - Impact of Supply Chain Transparency on Sustainability under NGO Scrutiny

Shi Chen, Assistant Professor, University of Washington, Michael G. Foster School of Business, University of Washington, Seattle, WA, 98195, United States of America, shichen@uw.edu, Qinqin Zhang, Yong-Pin Zhou

We study the use of supply chain transparency as an effective tool to mitigate supply chain sustainability issues, and in particular, whether the buyer should reveal her supplier list, knowing that revealed suppliers could face a different level of NGO scrutiny than the unrevealed ones. We incorporate the strategic interactions among a buyer, her suppliers, and the independent NGOs.

3 - Responsible Sourcing via Vertical Integration and Horizontal Sourcing

Adem Orsdemir, Assistant Professor, University of California Riverside, School of Business Administration, Anderson Hall, Riverside, CA, 92507, United States of America, adem.orsdemir@ucr.edu, Bin Hu, Vinayak Deshpande

Vertical integration is a viable way to achieve responsible sourcing. In a competitive setting, we analyze a firm's integration and responsible sourcing decisions. We find that demand externality and possibility of supplying the competitor may fundamentally change firms' behaviors. Furthermore, high probability of violation detection may discourage responsible sourcing.

4 - Investing in Supply Chain Transparency for Social Responsibility

Leon Valdes, lvaldes@mit.edu, Tim Kraft, Karen Zheng

We study a manufacturer's decisions when the social responsibility performance of his supplier cannot be perfectly observed. The manufacturer can invest to increase the transparency of his supply chain and the performance of his supplier. An NGO may communicate to consumers the true level of social responsibility, potentially decreasing profits.

Operational Issues in Agriculture

Sponsor: Manufacturing & Service Oper Mgmt/iFORM

Sponsored Session

Chair: Onur Boyabatli, Assistant Professor of Operations Management, Singapore Management University, 50 Stamford Road 04-01, Lee Kong Chian School of Business, Singapore, 178899, Singapore, oboyabatli@smu.edu.sg

1 - Agricultural Cooperative Pricing of Premium Product

Burak Kazaz, Associate Professor, Syracuse University, 721 University Avenue, Syracuse, NY, 13244, United States of America, bkazaz@syr.edu, Scott Webster, Nur Ayvaz-cavdaroglu

We consider the problem of price-setting by a cooperative for an agricultural product with the following characteristics: (1) the open-market price for the product depends on yield and on quality and (2) the quality of the product is influenced by farmer investments over the growing season. We identify a simple pricing scheme that shows potential to improve performance, and we characterize the drivers and the magnitude of performance improvement.

2 - Planning for Product Substitution in Seed Business

Saurabh Bansal, Assistant Professor, Penn State University,
405 Business Building, University Park, PA, 16802,
United States of America, sub32@psu.edu

We present new analytical results to manage seed substitution in the agribusiness domain, and discuss results of an empirical case study in collaboration with an industry partner.

3 - Government Intervention and Crop Diversification in Agricultural Supply Chains

Duygu Gunaydin Akkaya, Stanford GSB, 655 Knight Way,
Stanford, CA, 94305, United States of America,
duygug@stanford.edu, Kostas Bimpikis, Hau Lee

Agricultural supply chains face immense risks including yield and market price uncertainty. In order to mitigate these risks, farmers can engage in crop diversification. Governments also take a role in supporting farmers' income and implement various subsidies to alleviate poverty in the farmer population. We study how interventions and diversification practices impact the supply chain in the presence of random yield and endogenous market price.

4 - Corn or Soybean: Dynamic Farmland Allocation under Uncertainty

Onur Boyabatli, Assistant Professor of Operations Management,
Singapore Management University, 50 Stamford Road 04-01, Lee
Kong Chian School of Business, Singapore, 178899, Singapore,
oboyabatli@smu.edu.sg, Javad Nasiry, Yangfang Zhou

This paper studies the farmland allocation decision of a farmer between two crops in a multi-period framework. In each period, the farmer chooses the allocation in the presence of revenue uncertainty, and crop rotation benefits across periods. We characterize the optimal policy and investigate the impact of revenue uncertainty. We propose a heuristic allocation policy which is near-optimal.

Retail Operations

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain
Sponsored Session

Chair: Chris Parker, Pennsylvania State University, 411 Business
Building, University Park, PA, 16802, United States of America,
chris.parker@psu.edu

1 - Supply Chain Structure and Multimarket Competition

O. Cem Ozturk, Assistant Professor Of Marketing, Georgia
Institute of Technology, 800 West Peachtree St. NW., Atlanta, GA,
30308, United States of America,
cem.ozturk@scheller.gatech.edu, Necati Tereyagoglu

We study the role of supply chain structure in determining competitive intensity when manufacturers and retailers encounter in multiple markets. Our theoretical model shows how the differences in supply network overlap across multiple markets lead to higher retail prices. Using an extensive scanner data set, we find empirical support for the analytical results. These findings show the importance of supply chain structure in assessing multimarket competition among firms.

2 - Value of Downward Substitution under Stochastic Prices

Fehmi Tanrisever, Bilkent University, Bilkent, Ankara, Turkey,
tanrisever@bilkent.edu.tr, Zumbul Atan, Junchi Tan

Downward substitution as a form of operational flexibility has received significant academic attention. The literature on downward substitution follows the main stream inventory literature and assumes uncertain demand and/or yield and explores the value of substitution flexibility. They, however, assume fixed prices which may distort the analysis in many industries where prices may fluctuate. In this paper, we explore the effect of price uncertainty on the value of downward substitution.

3 - Supply Chain Contracts that Prevent Information Leakage

Yiwei Chen, Assistant Professor, Renmin University of China, NO.
59 Zhongguancun Street, Beijing, China, chenyiwei@rbs.org.cn,
Ozalp Ozer

We study a supply chain with one supplier and two competing retailers (incumbent and entrant). The incumbent has better but imprecise private forecast. We explore general conditions that a wide range of contracts need to satisfy to prevent the supplier from leaking the incumbent's private forecast to the entrant. We define two groups of contracts based on how the supplier and retailers share inventory risks. We find only these two groups of contracts may avoid information leakage.

4 - Experience and Competition Effects in Penny Auctions

Chris Parker, Pennsylvania State University, 411 Business
Building, University Park, PA, 16802, United States of America,
chris.parker@psu.edu, Pranav Jindal, Tony Kwasnica,
Peter Newberry

The internet has created many new online retail opportunities. One such model is the penny auction, an ascending first-price auction where bidders pay a fee to bid and increase the price by a nominal amount. The winning bidder pays the auction price and receives the item with all other bidders receiving nothing. We utilize a detailed dataset from a penny auction company to investigate the effects of experience and competition on bidding behavior and auction outcomes.

Value Chain Innovations in Developing Economies

Sponsor: Manufacturing & Service Operations Management
Sponsored Session

Chair: Saibal Ray, Professor, McGill University, 1001 Sherbrooke Street
West, Montreal, Canada, saibal.ray@mcgill.ca

Co-Chair: Fei Qin, Post-doc Research Fellow, McGill University,
Desautels Faculty of Management, Montreal, QC, Canada

1 - Milking the Quality Test: Improving the Milk Supply Chain under Competing Collection Intermediaries

Liyang Mu, Assistant Professor, University of Delaware,
20 Orchard Rd, Newark, 19716, United States of America,
muliying@udel.edu, Milind Dawande, Xianjun Geng,
Vijay Mookerjee

We examine the quality issues of milk — via deliberate adulteration by milk farmers — acquired by competing collection intermediaries in developing countries. Interestingly, some intuitive interventions such as providing collection stations with better infrastructure (e.g., refrigerators) or subsidizing testing costs could hurt the quality of milk in the presence of competition. The goal of this study is to provide recommendations that address the quality problem with minimal testing.

2 - Low Cost Cataract Surgery in India: What Can Western Health Systems Learn from it?

Harish Krishnan, Sauder School of Business, University of British
Columbia, Vancouver, Canada, Harish.Krishnan@sauder.ubc.ca

The Aravind Eye Care System (AECS) in India is known for its low-cost business model. However, few studies have done a detailed analysis of the cost structure of a cataract surgery at the AECS. This talk will present cost data from AECS and compare it to similar data at an eye hospital in Canada. The goal is to identify root causes of the cost differences between AECS and western health systems. The barriers to implementing AECS' innovations in the west will also be discussed.

3 - Multi-treatment Inventory Allocation in Humanitarian Health Settings under Funding Constraints

Jayashankar Swaminathan, UNC-Chapel Hill, 300 Kenan Drive,
Chapel Hill, NC, 27599, United States of America,
Jay_Swaminathan@kenan-flagler.unc.edu, Karthik V. Natarajan

We study the problem of allocating inventory procured using donor funding to patients in different health states over a finite horizon with the objective of minimizing the number of disease-adjusted life periods lost. The optimal policy is state-dependent and hence, we develop two heuristics for the allocation problem. We also provide analytical results and computational insights regarding how the funding level and funding timing impact program performance.

4 - Micro-entrepreneurship in Agri-food Supply Chains in Developing Economies

Fei Qin, McGill University, Desautels Faculty of Management,
Montreal, QC, H3A1G5, Canada, fei.qin@mcgill.ca,
Mehmet Gumus, Saibal Ray

Motivated by Veggie-Kart direct farm-to-food initiative for marginal farmers and retailers in developing economies, we examine the impact of supply chain innovations involving micro-entrepreneurs at both upstream and downstream stages, which compete with the traditional spot-market based channel in presence of supply uncertainty.

■ TB51

51-Room 106B, CC

Procurement Mechanisms

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Tharanga Rajapakshe, Assistant professor, University of Florida, W. University Ave, Gainesville, FL, 32611, United States of America, tharanga@ufl.edu

1 - Distressed Selling by Farmers: Model, Analysis, and Use in Policy-Making

Shivam Gupta, PhD Candidate, UT Dallas, NJ School of Management, 800 W. Campbell Rd., Richardson, TX, 75080, United States of America, sxl04920@utdallas.edu,
Ashutosh Sarkar, Ganesh Janakiraman, Milind Dawande

The surprising practice of distressed selling, where farmers sell produce to outside agents at prices much lower than the government's guaranteed price, is common in developing countries. We build a tractable stochastic DP model that captures the ground realities – limited and uncertain procurement capacity, high holding costs, and lack of affordable credit – that lead to distressed sales. Using real procurement data, we establish the accuracy of our model and develop useful policy suggestions.

2 - Coordinating Procurement Decisions in Multi-division Firms

Fang Fang, Ph. D. Candidate, University of Miami, 5250 University Drive, Coral Gables, FL, 33124, United States of America, f.fang@umiami.edu, Hari Natarajan

Central procurement organizations (CPO) of large firms must coordinate firm-wide procurement to leverage volume discounts from suppliers. Facing such a procurement coordination problem, we examine how a CPO can design internal prices to maximize firm-wide cost savings. Our analysis of commonly-used internal pricing rules shows interesting impacts on vendor selection, divisional participation, and gain allocation.

3 - Does Quality Knowledge Spillover at Shared Suppliers? – An Empirical Investigation

Suresh Muthulingam, Assistant Professor Of Supply Chain Management, SMEAL College of Business, The Pennsylvania State University, 460 Business Building, State College, PA, 16802, United States of America, sxm84@psu.edu, Anupam Agrawal

We study the spillover of quality knowledge across supply chains. We observe the quality performance of 191 suppliers who use the same facilities to manufacture similar products for two distinct businesses. We find that quality knowledge spills over under three conditions: (i) When quality efforts focus on organizational members; (ii) When quality efforts focus on output activities of suppliers; and (iii) When quality knowledge is developed at suppliers with low complexity.

4 - Contracting Between a Blood Bank and Hospitals

Anand Paul, University of Florida, 351 Stuzin Hall, Gainesville, FL, United States of America, paulaa@ufl.edu, Tharanga Rajapakshe

The supply of blood at a regional blood bank (RBB) is uncertain and often insufficient to satisfy the total demand for it. The RBB typically does not observe the demand at each hospital before determining the allocation policy. Inefficient allocation leads to shortages at hospitals which necessitates reallocation of blood and significant blood outdated cost. We make an analytical study of socially optimal contracting decisions of an RBB serving multiple hospitals.

52-Room 107A, CC

Marketing and Optimal Control

Sponsor: Marketing Science

Sponsored Session

Chair: Olivier Rubel, UC Davis, Graduate School of Management, One Shields Avenue, Davis, United States of America, orubel@ucdavis.edu

1 - Optimal Learning to Select the Best Alternative

Tony Ke, Assistant Professor, Marketing Department, MIT Sloan School of Management, 100 Main Street, E62-535, Cambridge, MA, 02142, United States of America, kete@mit.edu,
Miguel Villas-boas

A decision maker is deciding among several alternatives with uncertain payoffs and an outside option with known payoff. Before making a choice, he can purchase informative signals on each alternative. We solve for the decision maker's optimal learning as well as stopping problem, and discuss the implications.

2 - Automatic Feedback Control for Shunt Drainage in Hydrocephalus Patients

Kalyan Raman, Professor, Northwestern University, Medill School, Evanston, IL, United States of America, kalyaraman@gmail.com, Vijay Viswanathan

Excessive intracranial pressure (ICP) resulting from insufficient drainage of cerebrospinal fluid (CSF) leads to a neurological disorder called hydrocephalus, which is treated by implanting shunts to reduce ICP by draining excess CSF. We use non-linear control theory to develop a mathematical algorithm for a regulator to achieve shunt action that is significantly more sophisticated than that of a switch.

3 - Multiattribute Pricing

Thomas Weber, Associate Professor, EPFL, CDM-ODY 3.01, Station 5, Lausanne, VD, 1015, Switzerland, thomas.weber@epfl.ch

We provide a technique for constructing second-best multiattribute screening contracts in a general setting with one-dimensional types based on necessary optimality conditions. Our approach allows for type-dependent participation constraints and arbitrary risk profiles. As an example we discuss optimal insurance contracts.

4 - Dynamic Incentives in Sales Force Compensation

Olivier Rubel, UC Davis, Graduate School of Management, One Shields Avenue, Davis, CA, United States of America, orubel@ucdavis.edu, Ashutosh Prasad

We propose dynamic principal-agent model to investigate how to incentivize sales people when current selling efforts and carryover sales drive present sales. We show that the carryover effect increases not only expected sales, but also sales uncertainty. We then find that the manager incentivizes the high risk-aversion salesperson with a concave compensation and the low risk-aversion salesperson with a convex compensation.

■ TB53

53-Room 107B, CC

Behavioral Issues in the OM / Marketing Interface

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Ozalp Ozer, The University of Texas at Dallas, 800 West Campbell Road, Richardson, TX, United States of America, oozar@utdallas.edu

Co-Chair: Upender Subramanian, United States of America, upender@utdallas.edu

1 - Pricing Cause Marketing Products in the Presence of Social Comparison

Paola Mallucci, Assistant Professor of Marketing, University of Wisconsin at Madison, 4261 Grainger Hall, 975 University Ave, Madison, WI, 53706, United States of America, pmallucci@bus.wisc.edu, Tony Haitao Cui, George John

The broad takeaway from the literature on cause marketing campaigns, where firms donate to charities with purchase, is that they generally work well, because of "warm glow". We conjecture that far from creating only positive feelings, such firm donations can create discomfort by encouraging social comparison. We find that firms can find it profitable to exploit such discomfort even if it decreases consumers utility. Results apply in both monopoly and competition.

2 - Pricing and Quality Perception: Theory and Experiment

Karen Zheng, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, yanchong@mit.edu, Rim Hariss, Georgia Perakis, Wichinpong Sinchaisri

We study how a constant pricing strategy versus a markdown strategy may induce different perceptions of quality among consumers, and how a firm should take these quality perceptions into account when optimizing its pricing policy for competitive products. We empirically elicit the relationship between consumers' perceived quality and prices under either pricing strategy, and incorporate these relationships into our consumer model to analyze the firm's optimal pricing policy.

3 - Conflict of Interest and Market Structure in Multiplayer Games

Sung Ham, Assistant Professor of Marketing, George Washington University, 2201 G St. NW, Washington, DC, 20052, United States of America, sungham@gwu.edu, Jiabin Wu, Noah Lim

When a firm serves customers who compete with one another, a conflict of interest may arise. We develop a multi-player game where firms serve competing customers, and examine how the market structure faced by the firms impacts the extent to which conflicts of interest affect behavior. We test our theory using an incentive-aligned experiment and find that the decisions are consistent with the model predictions.

4 - The Behavioral Cost of Quality Nonconformance: Risk-averse and Experience-sampling Customers

Jordan Tong, Assistant Professor, University of Wisconsin at Madison, WI, United States of America, jordan.tong@wisc.edu, Greg Decroix

Why do customers purchase less when quality is inconsistent? A common explanation is that customers have risk-averse preferences: they inherently prefer less uncertainty. Another explanation, however, is that tendencies towards low-variance alternatives are due to a learning process from experience. We show that optimal pricing and promotion decisions can differ significantly depending on which explanation is modeled, thereby illuminating the costs of nonconformance and how to mitigate them.

Stochastic Methods in Efficiency Analysis

Cluster: Data Envelopment Analysis

Invited Session

Chair: Ole Olesen, Professor, University of Southern Denmark, Campusvej 55, Odense, 5230, Denmark, ole@sam.sdu.dk

1 - Estimating Production Functions and Frontiers using Stochastic DEA

John Ruggiero, Professor, University of Dayton, Dayton, OH, United States of America, jruggiero1@udayton.edu

In this paper, we present two methods to estimate production functions and frontiers (deterministic and stochastic). We constrain the technology using the Afriat conditions and consider minimizing the sum of absolute and/or squared errors. We extend this method using locally weighted least squares in the spirit of loess (local regression.)

2 - Endogeneity in Stochastic Frontier Models

Artem Prokhorov, U Sydney, CIREQ, St. Petersburg State U, Business School, Sydney, NS, 2006, Australia, artem.b.prokhorov@gmail.com, Peter Schmidt, Christine Amsler

Stochastic frontier models are typically estimated by MLE or corrected OLS. The consistency of either estimator depends on exogeneity of the explanatory variables (inputs, in the production frontier setting). We will investigate the case that one or more of the inputs is endogenous, in the simultaneous equation sense of endogeneity. We will consider modifications of standard procedures under endogeneity for the stochastic frontier setting.

3 - Shape Constrained Kernel Weighted Least Squares for the Estimation of Production Functions

Andrew Johnson, Texas A&M, College Station, TX, United States of America, ajohnson@tamu.edu, Daisuke Yagi

This paper proposes a unifying model and estimator we call Shape Constrained Kernel-weighted Least Squares (SCKLS). We show the relationship between the SCKLS estimator and both the Convex Nonparametric Least Squares (CNLS) and Du's estimators. Specifically, the SCKLS estimator converges to the CNLS estimator as the bandwidth goes to zero. We compare the performance of the three estimators (SCKLS, CNLS, and Du's estimator) via Monte Carlo simulations.

4 - Two Different Approaches to Stochastic DEA

Ole Olesen, Professor, University of Southern Denmark, Campusvej 55, Odense, 5230, Denmark, ole@sam.sdu.dk, Niels Chr. Petersen

Focus is on different views on extending DEA to a stochastic setting. The management science framework does not focus to model performance using a statistical model based on a specific Data Generating Process (DGP). Some stochastic DEA models focus on replacing the observed input output observations with DMU specific distributions. The statistical framework insists on an axiomatic approach to a statistical model, including a specification of a DGP. We illustrate these differences.

Assorted Topics in Renewable Energy

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Anthony Papavasiliou, Université Catholique de Louvain, Voie du Roman Pays 34, Louvain la Neuve, Ou, 1348, Belgium, tpapva@hotmail.com

1 - A Controlled Approximation Scheme for Managing Hydroelectric Generation with Multiple Reservoirs

Bernard Lamond, Professor, Université Laval, Dep. Operations & Systemes de Decision, 2325, Rue de la Terrasse #2620, Quebec, QC, G1V 0A6, Canada, Bernard.Lamond@fsa.ulaval.ca, Pascal Lang, Pascal Cote, Luckny Zephyr

We present an approach for adaptive approximation of the value function in stochastic dynamic programming. We use a simplicial partition of the state space to construct a nonseparable piecewise affine approximation which is refined iteratively using lower and upper bounds on the value function. The proposed scheme is experimented numerically in the context of hydroelectric production across multiple reservoirs and power plants.

2 - Demand-side Power Procurement with Renewable Generation and Energy Storage

Soongeol Kwon, Texas A&M University, 3131 TAMU,
College Station, TX, 77843, United States of America,
soongeol@tamu.edu, Natarajan Gautam

We consider operational decisions to satisfy power demand while minimizing purchase cost over time-varying electricity prices. In our scenario, consumers use renewable sources to serve power demand and operate energy storage. We propose a two-stage stochastic optimization problem to control purchase, consumption and operations based on day-ahead and real-time procurement while responding to variability and uncertainty in power demand, renewable sources and electricity prices.

3 - Wind Speed Forecasting for Wind Parks: A Sequential Modeling Approach

Vignesh Subramanian, Dept. of Industrial and Management
Systems Engineering, University of South Florida, ENB118,
Tampa, FL, United States of America, vigneshs@mail.usf.edu,
Tapas K. Das

Inherently intermittent nature of wind energy makes it essential to accurately predict wind speed for reliable operation of power systems comprising wind generation. We propose a two-stage model. Stage I uses SVM to classify wind speed into three clusters: zero power, rated power, and continuous power. Stage II employs a Bayesian additive regression kernel (BARK) method to the continuous power cluster to estimate the wind speed. The model is tested on numerical weather prediction (NWP) data.

4 - Capacity Remuneration in the Belgian Electricity Market

Anthony Papavasiliou, Université Catholique de Louvain,
Voie du Roman Pays 34, Louvain la Neuve, Ou, 1348, Belgium,
tpapva@hotmail.com

Belgium experienced a serious shortage in capacity recently due to the unplanned outage of nuclear capacity. This has motivated an investigation of Belgian capacity remuneration mechanisms. In this presentation we compare the existing fixed reserve requirements mechanism with the introduction of operating reserve demand curves in reserve auctions.

58-Room 110A, CC

Topics in Nuclear Energy

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas,
Climate Change)

Sponsored Session

Chair: Alexandra Newman, Professor, Colorado School of Mines,
Mechanical Engineering, Golden, CO, 80401, United States of America,
anewman@mines.edu

1 - Optimizing the Placement of Radioactive Isotope Measurement Devices in a Nuclear Fuel Cycle

Ben Johnson, PhD Student, Colorado School of Mines,
Golden, CO, 80401, United States of America,
bebjohns@mymail.mines.edu, Alexandra Newman, Jeffrey King

The purpose of nuclear safeguards is to prevent proliferation of radioactive material. Enhancing methods to detect potential proliferation will help reduce the increasing threat of malicious entities successfully obtaining nuclear material. We create a mixed integer program to determine how many, where, and which types of radioactive isotope measurement devices should be used in the nuclear fuel cycle to minimize the weighted sum of Type I and Type II measurement errors.

2 - Modeling Societal Disruption from Nuclear Accidents to Inform Regulatory Decision-making

Vicki Bier, Professor, University of Wisconsin - Madison, 1513
University Avenue, 53706A Mechanical Engineering Building,
Madison, WI, 53706, United States of America,
vicki.bier@wisc.edu, Michael Corradini, Caleb Roh, Shuji Liu,
Robert Youngblood

Nuclear regulation in the U.S. focuses on preventing radiation-related fatalities. However, recent experience shows that societal disruption from relocation can be considerable, arguably more significant than radiation-induced health effects. We have evaluated the population relocation that could occur after severe reactor accidents as a proxy for societal disruption, and argue that regulatory guidance should constrain societal disruption as well as radiation exposure.

3 - Economics of High-temperature Reactors for Industrial Cogeneration: A Utility's Perspective

Reinhard Madlener, RMadlener@eonerc.rwth-aachen.de, Jona
Hampe

This paper studies the economic potential of using HTRs for cogeneration of industrial process heat and electricity. We find that a reference case HTR can deliver cost-competitive process heat (at 200 °C), thus rendering the chemical and pulp & paper industries potential candidates. We use real options analysis to deal with uncertainty and the managerial flexibilities of the project. We also propose a model to calculate the option of switching between two different operation modes.

4 - Selecting the Optimum Nuclear Fuel Cycle Including Quasi-rational Opinions and Public Perception

Sama Bilbao Y Leon, Associate Professor, Virginia Commonwealth
University, 401 W Main St, Richmond, VA, 23284, United States
of America, sbilbao@vcu.edu,
John Swanson, Ishoc Salaam, Jonathan Hill

Although much work has been done to address the technological challenges associated with the management and ultimate disposal of used nuclear fuel, less attention has been given to public perception and acceptance of the selected fuel cycle. This work presents current progress in a decision making model based on Multi-Attribute Utility Theory that contains the fundamental objectives for both technical and non-technical factors.

Fire Management 2: Landscape & Modeling

Sponsor: ENRE – Environment II – Forestry

Sponsored Session

Chair: Hailey Buckingham, hailey.buckingham@oregonstate.edu

1 - Timber Harvest and Fuel Treatment Decisions with Fire Risk

Chris Lauer, cjlaue@gmail.com, Claire Montgomery

This paper attempts to determine the optimal timing and location of fuel treatments and timber harvests for a multi-stand landscape, accounting for the spatial interactions that drive the fire behavior. An optimization method known as value iteration is used to solve the dynamic program. Outcomes for multiple land ownership configurations are explored.

2 - Integrating Wildfire Risk and Spread in a Cellular Forest Harvesting Model

Marc McDill, Pennsylvania State University, University Park, PA,
United States of America, mmdill@psu.edu, Susete Marques,
José Borges

We present a stochastic, cellular multi-objective forest harvest scheduling model incorporating a mechanistic model of fire risk probability based on the state of a cell and the probability of fire in neighboring cells. The model illustrates a potential approach to integrate management activities including fuel treatments and harvesting to address multiple objectives.

Education II

Contributed Session

Chair: Omar Ben-ayed, Professor of Management, Qatar University,
Al Jameaa Street, P.O. Box 2713, Doha, 2713, Qatar,
omar.benayed@qu.edu.qa

1 - Challenges of Imbedding a Built-In OR/MS Paradigm among Engineering Graduates

Thong Goh, Professor, National University of Singapore,
1 Engineering Drive 2, Singapore, 117576, Singapore,
tng@nus.edu.sg

There are many OR/MS courses at various levels that undergraduates can take. However, many non-OR/MS disciplines may offer such courses as credit accumulators, with both teachers and students having them as a subject of learning and not something permanent that lasts into the students' subsequent working lives. This presentation discusses this issue with particular reference to engineering undergraduate education, and explore ways to alleviate the situation.

2 - Measuring Interculture Competence Among Business, Education and Social Work Students

Amarpreet Kohli, Assistant Professor, Farmingdale State College, SUNY, Farmingdale, NY, United States of America, kohlias@farmingdale.edu, Hermeet Kohli, Cheng Peng

Purpose of this interdisciplinary research was to measure the level of multicultural awareness, sensitivity to, and understanding of difference, and intercultural competence when working in diverse environments in the undergraduate and graduate Business, Education and Human Development, and Social Work students using the UDO (MGUD-S Survey). Convenient purposive sampling was utilized to invite students enrolled in these three schools to participate in web based descriptive survey research.

3 - Redesigning Qatar University Class Meeting Pattern to Improve Performance

Omar Ben-ayed, Professor Of Management, Qatar University, Al Jameaa Street, P.O. Box 2713, Doha, 2713, Qatar, omar.benayed@qu.edu.qa, Heba Younis, HEND Hammad

This study examines the existing class meeting pattern at Qatar University based on the strategic plan of the University in addition to the perception of students and faculty members. The study shows that there is a need for a new class meeting pater with two additional non-teaching half-days. A capacity analysis proves the feasibility of such a pattern. Accordingly, alternative class meeting patterns are proposed and one is selected based on technical, academic and cultural perspectives.

Economics of Reverse Logistics and Sustainable Operations

Sponsor: ENRE – Environment I – Environment and Sustainability

Sponsored Session

Chair: Shouqiang Wang, Assistant Professor, Clemson University, 131D Sirrine Hall, Clemson, SC, 29672, United States of America, shouqiw@clemson.edu

1 - Versioning, Trade-ins and Refurbishing: An Integrative Analysis

Avinash Geda, University of Florida, 361B Stuzin Hall, Gainesville, FL, 32611, United States of America, avinashgeda@ufl.edu, Tharanga Rajapakshe, Asoo Vakharia

We consider a monopolist durable goods manufacturer who markets its products via a single retailer. In the first period, the manufacturer introduces first version of the product while he may introduce the second and refurbished versions of the product in the second period. We consider there exists a secondary market where consumers can resell the old products. We investigate the impact of introduction of a trade-in and refurbishing program on the product versioning decision of the manufacturer.

2 - Trade-Ins Versus Upgrades: A Behavioral Exploration

Mahdi Mahmoudzadeh, Georgia Institute of Technology, 800 W Peachtree ST NW, Atlanta, GA, United States of America, Mahdi.Mahmoudzadeh@scheller.gatech.edu, Beril Toktay, Basak Kalkanci

Understanding customers' behavior in selling positions or exchanging their products would help better manage replacement purchases and product return streams. We study trade-ins and upgrades, which so far have been assumed to be equivalent. We find that customers perceive trade-ins and upgrades differently; perceived importance of the quoted price for current product is more salient in trade-ins than in upgrades. Our results are useful to find dominant replacement offers and pricing strategies.

3 - Design and Technology Choice for Recycling: The Value of Collaboration and Capacity Ownership

Luyi Gui, Assistant Professor, UC Irvine, United States of America, luyig@exchange.uci.edu, Morvarid Rahmani, Atalay Atasu

Efficient and effective treatment of end-of-life products requires not only product design improvements but also advancement in recycling technologies. We analyze how Extended Producer Responsibility (EPR) legislation would affect incentives for improving product recyclability and processing technology. In particular, we take into account the mutually reinforcing effect between product and process improvements and explore the implication of such complementarity in EPR implementation.

4 - Inducing Environmental Disclosures: A Dynamic Mechanism Design Approach

Shouqiang Wang, Assistant Professor, Clemson University, 131D Sirrine Hall, Clemson, SC, 29672, United States of America, shouqiw@clemson.edu, Peng Sun, Francis De Véricourt

This paper studies the design of voluntary disclosure regulations that jointly uses inspections and monetary rewards. We formulate this problem in a dynamic mechanism design framework with state verification and obtain complete analytical solution.

Aviation Applications

Contributed Session

Chair: Jinkun Lee, The Pennsylvania State University, 236 Leonhard, University Park, United States of America, jinkunlee@psu.edu

1 - An Airspace Sectorization Approach Based on Spectral Clustering and NSGA-II

Bang An, Tsinghua University, Room 616, Main Building, Beijing, China, ab13@mails.tsinghua.edu.cn, Peng Cheng, Xiang Zou

We propose an airspace sectorization approach based on spectral clustering and NSGA-II. With the method embedded in the constrained NSGA-II, all of the critical constraints can be easily handled. Besides, an initial sectorization method based on spectral clustering is proposed to generate the first generation of NSGA-II. We test our method on the high-altitude airspace controlled by Beijing Area Control Center. The results show that our method can obtain better solutions.

2 - A Preemptive Scheduling Model with Overtime Allocation for Minimum Weighted Tardiness

Fernando Jaramillo, University of Miami, 1251 Memorial Drive, Department of Industrial Engineering, Coral Gables, FL, 33146, United States of America, f.jaramillo2@umiami.edu, Busra Keles, Murat Erkoc

We develop a model and solution procedure for preemptive scheduling with overtime option. The problem is mainly motivated by the aviation MRO industry where late deliveries of overhaul orders are costly. Our model aims at minimizing the total cost of overtime and tardiness over a finite number of jobs with different weights, release dates and due dates. A multi-pass heuristic algorithm is proposed to solve the scheduling and capacity allocation problem.

3 - Optimal Learning Control of Drone Operation

Jinkun Lee, The Pennsylvania State University, 236 Leonhard, University Park, PA, United States of America, jinkunlee@psu.edu, Vittal Prabhu

An optimal learning control of individual delivery drone has been considered. This enables each drone to adapt its path for the minimum travel time according to its own repetitive experience of the dynamic environment. The estimated travel times of drones are fed back into the central server, and this server determines the proper number of drones to fulfill the delivery service level based on the accumulated real time demands during the previous drone operation time window.

4 - Integrating Taxi Planning and Gate Assignment

Angel Marin, Professor, Polytechnical University of Madrid, ETSI Aeronautica y Del Espacio, Plaza Cardenal Cisneros, 3, Madrid, MA, 28040, Spain, angel.marin@upm.es

In the presentation is studied the Taxi Planning and Gate Assignment Integration. These problems are considered under a binary multicommodity network flow, in the context of routing and scheduling models with additional Side Constraints (SC). The model is a multiobjective approach balancing conflictive objectives: airport throughput, travel time, delays, operation safety and costs, etc. The computational tests are realized on test airports, simulating actual ones.

Panel Discusssion: A Heated Discussion on Decision Analysis and Systems Engineering

Sponsor: Decision Analysis

Sponsored Session

Chair: Ali Abbas, Professor Of Industrial And Systems Engineering And Public Policy And Director Of Create, University of Southern California, 3710 McClintock Avenue, RTH 314, Los Angeles, CA, United States of America, aliabbas@price.usc.edu

1 - The Need for a Sound Decision Making System

Moderator: Ali Abbas, Professor Of Industrial And Systems Engineering And Public Policy And Director Of Create, University of Southern California, 3710 McClintock Avenue, RTH 314, Los Angeles, CA, United States of America, aliabbas@price.usc.edu

This talk reflects on some widely used methods of multi-objective decision making in both public and private enterprises, and demonstrates the issues with their use and the need for a sound decision making system.

2 - Ethical Decision Analysis

Ronald Howard, Professor, Stanford University, 646 Tennyson Avenue, Palo Alto, CA, 94301, United States of America, rhoward@stanford.edu

Decision analysis is inherently amoral. Like fire or nuclear energy it can be used for good or ill. The decision analyst and the decision maker have the ethical responsibility for decisions. The decision maker for the choice of action and the decision analyst as a conspirator or accomplice in clarifying what is to be done. The daily news shows the consequences of abdicating ethical responsibility.

3 - There is No Rational Framework for Systems Engineering

George Hazelrigg, Deputy Division Director, National Science Foundation, Civil, Mech. & Mfg Innovation, 4201 Wilson Boulevard, Arlington, VA, 22230, United States of America, ghazelri@nsf.gov

Decision analysis for systems engineering is an oxymoron. Systems engineering requires teams of people, for which decision analysis does not apply. Failure to recognize this can lead to serious problems.

4 - Decision Analysis for Systems Engineering Trade-off Analyses

Greg Parnell, Professor, University of Arkansas, Department of Industrial Engineering, Fayetteville, AR, 72701, United States of America, gparnell@uark.edu

Critical systems decisions are made throughout the system life cycle. Decision analysis offers a sound foundation for developing a composite model of complex system alternatives, major uncertainties, and stakeholder values to provide insights to systems decision makers.

5 - Decision Analysis - Towards a Theoretical Foundation of Systems Engineering and Design

Chris Paredis, Program Director, National Science Foundation, 4201 Wilson Blvd, Arlington, VA, United States of America, cparedis@nsf.gov

In a rapidly changing global context, our approach for engineering large-scale, complex engineered systems must also adapt quickly. A theoretical foundation for systems engineering and design is needed to help guide this adaptation in a rigorous, systematic fashion. Decision analysis is an important cornerstone of this foundation.

Modeling in Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Jeffrey Keisler, University of Massachusetts Boston, 100 Morrissey Boulevard, Boston, MA, 02125, United States of America, Jeff.Keisler@umb.edu

1 - When Decision Analysis Serves to Connect a Network

Jeffrey Keisler, University of Massachusetts Boston, 100 Morrissey Boulevard, Boston, MA, 02125, United States of America, Jeff.Keisler@umb.edu

An organization may wish to construct analytic models combining contributions from different experts and stakeholders in order to guide decisions. We represent this as a network of agents with reporting relationships, each with a vocabulary, a knowledge base, potential observations. Is the network rich enough to ensure the decider's success? Recent results from mathematical logic give some answers and possible implications for decision consulting.

2 - How Little Do Models Tell Us?

Eva Regnier, Associate Professor, Naval Postgraduate School, 699 Dyer Road, Monterey, CA, 93943, United States of America, eregnier@nps.edu, Erin Baker

In arenas including weather forecasting and climate policy, simulation modeling is used to estimate uncertainty attributed to initial conditions. Model uncertainty (sometimes called structural uncertainty) is much harder to quantify. We outline a qualitative approach using Bayesian logic to answer the question: how much do model results tell us?

3 - Agile Modeling Focused on Decision Making

Max Henrion, CEO, Lumina Decision Systems, Inc, 26010 Highland Way, Los Gatos, CA, 95033, United States of America, henrion@lumina.com

Agile modeling borrows methods from agile software development, an alternative to the conventional approaches starting from formal requirements. Instead modelers start building a simple prototype, and refine it progressively, learning and improving as they go. Decision analysis and sensitivity analysis helps focus development on areas most decision-relevant.

Delay Propagation and Robust Airline Operations

Sponsor: Aviation Applications

Sponsored Session

Chair: Milind Sohoni, Associate Professor Of Operations Management And Sr. Associate Dean Of Programs, Indian School of Business, Gachibowli, Indian School of Business, Gachibowli, Hyderabad, PL, 500032, India, milind_sohoni@isb.edu

1 - Improving Maintenance Robustness using a Route Adjustment Tail Assignment Problem

Stephen Maher, Zuse Institute Berlin, Takustr. 7, Berlin, BE, 14195, Germany, maher@zib.de, Guy Desaulniers, François Soumis

Maintenance planning is critical for airline operations. Daily schedule perturbations regularly prohibit aircraft from receiving maintenance as required. A robust approach employing one-day routes has been proposed, however, perturbations still affect the delivery of maintenance. A tail assignment problem that modifies routes to satisfy maintenance requirements is presented. This will demonstrate that route modifications are a necessary augmentation to a robust maintenance planning solution.

2 - Examining the Robustness of Airline Operations under Weather Disruptions

Donald Richardson, University of Michigan, Ann Arbor, MI, donalric@umich.edu, Luke Stumplos, George Tam, Amy Cohn, Chhavi Chaudhry

We have compiled a database containing twelve years' worth of flight data from the Bureau of Transportation Statistics. By connecting this data with hourly National Oceanic and Atmospheric Administration weather reports, we are able to analyze how the weather affects the relationship between planned airline schedules and the actual flight performance. The purpose of this research is to provide a foundation for better understanding the robustness of airline operations under weather disruptions.

3 - Data-driven Models for Robust Aircraft Routing

Lavanya Marla, Assistant Professor, University of Illinois at Urbana-Champaign, 104 S. Mathews Avenue, 216E, Urbana, IL, 61801, United States of America, lavanyam@illinois.edu, Vikrant Vaze

We address the issue of pro-actively building robust aircraft routings that are less vulnerable to uncertainty, by focusing on reducing delay propagation. We present a series of data-driven models drawn from the classes of Robust Optimization and Chance-Constrained Programming that generate solutions that (i) are faithful to implicit information in the underlying data, and (ii) are less fragile to disruption. We conclude with results from a real-world airline network to provide proof-of-concept.

4 - Can Time Buffers Lead to Delays? The Role of Operational Flexibility

Milind Sohoni, Associate Professor Of Operations Management And Sr. Associate Dean Of Programs, Indian School of Business, Gachibowli, Indian School of Business, Gachibowli, Hyderabad, PL, 500032, India, milind_sohoni@isb.edu, Sanjiv Erat

In operating systems where the feasible start time of activities is uncertain, the actual buffers for conducting the activities are distinct from scheduled buffers. We study how, and why, do these buffers affect operating performance? We propose a theoretical model and evaluate its empirical content and predictions using airline industry data. Our main result shows that both buffers impact performance and their effects are moderated by flexibility. Thus ex-ante plans must consider flexibility.

Advances in Vehicle Routing Problem and its Variants

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Ibrahim Capar, The University of Alabama, Box 870226, Tuscaloosa, AL, United States of America, icapar@cba.ua.edu

1 - The Vehicle Routing Problem with Drones: A Worst-case Analysis

Xingyin Wang, University of Maryland, Mathematics department, University of Maryland, College Park, MD, 20742, United States of America, wangxy@umd.edu, Stefan Poikonen, Bruce Golden

We introduce the Vehicle Routing Problem with Drones (VRPD). A fleet of trucks equipped with drones delivers packages to customers. Drones can be dispatched from and picked up by the trucks at the depot or the customer locations. The objective is to minimize the maximum duration of the routes. We compare VRPD to the min-max Vehicle Routing Problem from a worst-case perspective and show that the maximum savings from using the drones depends on the number and the speed of the drones.

2 - Online and Open Vehicle Routing Problem with Split Delivery

Ibrahim Capar, The University of Alabama, Box 870226, Tuscaloosa, AL, United States of America, icapar@cba.ua.edu, Burcu Keskin

We consider an online, open vehicle routing problem with split deliveries. This type of problem is usual for companies that use common carriers with TL, LTL, or container services. We develop an integer programming model and propose a reduction technique to solve real life problem with commercial software. We investigate the effect of lead time on cost and outstanding orders and explore different policies to minimize total cost. We show more than eight percent savings compared to the literature.

3 - Distributionally Robust Adaptive Vehicle Routing

Arthur Flajolet, MIT, Operations Research Center, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, flajolet@mit.edu, Patrick Jaillet, Sebastien Blandin

We consider an adaptive solution to the vehicle routing problem with stochastic travel times with the objective of minimizing a risk function of the lateness. To mitigate the impact of the lack of information on the travel times, we develop a distributionally robust dynamic programming formulation for risk-averse travelers and illustrate the practicality of the approach with field data from the Singapore road network.

4 - A Metaheuristic for the Electric Vehicle Routing Problem with Recharging Stations and Time Windows

Site Wang, Graduate Student, Clemson University, 854 Issaqueena Trail, APT908, Central, SC, 29630, United States of America, sitew@clemson.edu, Eric Huang, Scott Mason

In this study, we consider electric vehicles and recharging stations in the vehicle routing problem with time windows. We examine two objectives for this problem, separately and in concert, to provide insights for the location-routing problem with time windows. Due to the problem's complexity, we demonstrate the efficacy of our two-phase metaheuristic that combines variable neighborhood search and Tabu search for practical-sized problems.

68-Room 201B, CC

TSL Invited Cluster Keynote Address

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Irina Dolinskaya, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, dolira@northwestern.edu

1 - Stochastic Vehicle Routing: An Overview and Some Research Directions

Michel Gendreau, Full Professor, École Polytechnique de Montréal, P.O. Box 6128, Station Centre-ville, Montreal, QC, H3C 3J7, Canada, michel.gendreau@cirrelt.ca

While Vehicle Routing Problems have now been studied extensively for more than 50 years, those in which some parameters are uncertain at the time where the routes are made have received significantly less attention, in spite of the fact that there are many real-life settings where key parameters are not known with certainty. In this talk, we will examine the main classes of Stochastic Vehicle Routing Problems: problems with stochastic demands, stochastic customers, and stochastic service or travel times. We will emphasize the main approaches for modeling and tackling uncertainty: a priori models, a posteriori approaches, and chance-constrained models. The end of the talk will devoted to a brief presentation of some interesting research directions in this area.

■ TB69

Joint Session TSL/Public Sector: Health-care, Education, and Emergency Applications of Logistics

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Sung Hoon Chung, Binghamton University, P.O. Box 6000, Binghamton, NY, United States of America, chung@binghamton.edu

1 - Public Transportation Planning for Mass-Scale Evacuations

Rahul Swamy, Graduate Research Assistant, University at Buffalo (SUNY), 412 Bell Hall, Buffalo, NY, Jee Eun Kang, Rajan Batta

This research provides a public transportation planning strategy in an urban setting for evacuating population groups to safe locations before a mass-scale disaster. Under the objective of maximizing the number of evacuees, the proposed model first identifies pickup locations and then constructs special type of routing to serve a time-varying demand.

2 - Minimizing the Cost of Routing Blood Collection Vehicles

Okan Orsan Ozener, Ozyegin University, Cekmekoy, Istanbul, Turkey, orsan.ozener@ozyegin.edu.tr

We study the routing of blood collection vehicles to minimize the total routing costs. Donated blood has to be processed within a certain amount of time. We analyze the routing decisions and propose an integrated framework to minimize the total cost while collecting a pre-specified number of donations.

3 - A Heuristic for School Bus Routing of Special-education Students

Hernan Caceres, SUNY Buffalo, 342 Bell Hall, Buffalo, NY, United States of America, hernanan@buffalo.edu, Rajan Batta, Qing He

The problem of routing special-education students differs in many aspects with that of routing regular students. A bus can be configured to also support wheelchairs, students may be served differently depending on their disability, and they need to be picked up and dropped off in their homes. In our study we modeled a mixed integer program that accounts for these and other characteristics. We use column generation to find approximated solutions for real and benchmark instances.

4 - Disaster Relief Routing under Uncertainty: A Robust Optimization Approach

Sung Hoon Chung, Binghamton University, P.O. Box 6000, Binghamton, NY, United States of America, chung@binghamton.edu, Yinglei Li

We explicitly consider uncertainty in travel times when planning vehicle routes for delivering critical supplies to the affected population in need in the aftermath of a large disaster. In particular, we propose the robust optimization approach to minimize the impact of uncertainty and eventually to achieve enhanced resilience in the aftermath of disasters. We also explore several numerical methods and algorithms.

■ TB70

70-Room 202A, CC

Yard and Terminal Simulation

Sponsor: Railway Applications

Sponsored Session

Chair: Roger Baugher, President, TrAnalytics, LLC, 100 Villamouira Way, Johns Creek, GA, 30097, United States of America, rwbaugher@aol.com

1 - Exploiting Data to Create Yard and Terminal Replay Capabilities

Roger Baugher, President, TrAnalytics, LLC, 100 Villamouira Way, Johns Creek, GA, 30097, United States of America, rwbaugher@aol.com

Yard automation technology, GPS sensors, time lapse cameras and new low cost computer processors enable large amounts of yard operation data to be captured inexpensively. Processes can transform these data, and the yard's GIS data, into inputs for simulation, enabling the deployment of yard replay systems. With such a system, management can analyze operational failures, develop improved processes, train new employees, examine the impact of proposed capital improvements and more.

2 - Simulation Model for a Large Railroad Flat Switching Yard

Clark Cheng, Senior Director Operations Research, Norfolk Southern Railway, Atlanta, GA, 30309, United States of America, Clark.Cheng@nscorp.com, Rajesh Kalra, Mabby Amouie, Edward Lin

We will present a discrete-event simulation model for the largest railroad flat switching yard in the Western Hemisphere. The model is being used to evaluate yard capacity and improve yard operations and customer service.

3 - Conflict Avoidance in Yards and Terminals

Brigitte Jaumard, Professor And Concordia Research Chair On The Optimization Of Communication Networks, Concordia University, Computer Science and Software Eng., 1455 de Maisonneuve Blvd. West, Montreal, QC, H3G 1M8, Canada, bjaumard@cse.concordia.ca, Roger Baugher, Thai Hoa Le, Bertrand Simon

Activities of a rail yard focus on freight delivery and vehicle maintenance, while train movements are generally line-of-sight ones. Many of the yard activities share one or two connecting tracks for through traffic. While these tracks need to remain clear for through traffic, stopping yard activities on them to let a passenger train through may result in disruption to freight operations, and in conflicts. We will propose different mechanisms and tools in order to avoid conflicts.

4 - Applying Dynamic Simulation to Validate and Improve New Transloading Terminal Operations

Martin Franklin, Partner, MOSIMTEC LLC, 297 Herndon Parkway, Suite 301, Herndon, VA, 20170, United States of America, martin@mosimtec.com

A chemical manufacturing and handling company is expanding and re-configuring facilities to create a new interface point between rail transport and pipeline transport. The client recognized the need to apply modeling and simulation technology to represent the system in a dynamic environment, therein incorporating inherent variability, to validate the design and make informed decisions. Simulation analysis of the rail network and operators and related integration will also be reviewed.

Co-Chair: Yu Ding, Professor, Texas A&M University, ETB 4016, MS 3131, College Station, YX, United States of America, yuding@iemail.tamu.edu

1 - Multi-stage Nanocrystal Growth Identifying and Modeling via in-situ TEM Video

YanJun Qian, PhD Candidate, TAMU, 1501 Harvey Rd, Apt. 806, College Station, TX, 77840, United States of America, qianyanjun09@gmail.com, Yu Ding, Jianhua Huang

While in-situ transmission electron microscopy technique has caught a lot of recent attention, one of the bottlenecks appears to be the lack of automated and

quantitative analytic tools. We introduce an automated tool suitable for analyzing the in-situ TEM videos. It learns and tracks the normalized particle size distribution and identifies the phase change points delineating the stages in nanocrystal growth. We furthermore produce a quantitative physical-based model.

2 - Cooperative Unmanned Vehicles for Vision-based Detection and Real-world Localization of Human Crowds

Sara Minaeian, The University of Arizona, 1127 E James E. Rogers Way, Room 111, Tucson, AZ, 85716, United States of America, minaeian@email.arizona.edu, Young-jun Son, Jian Liu

In crowd control using unmanned vehicles (UVs), the crowd detection and real-world localization are required to perform key functions such as tracking and motion planning. In this work, a team of UVs cooperates under a DDAMS framework to detect the moving crowds by applying computer-vision techniques and to localize them using a new perspective transformation. A simulation model is also developed for validation, and the experimental results reveal the effectiveness of the proposed approach.

3 - Fault Identifiability Analysis of Beam Structures using Dynamic Data-driven Approaches

Yuhang Liu, Research Assistant, University of Wisconsin-Madison, 1513 University Ave, ME3255, Madison, WI, 53706, United States of America, liu427@wisc.edu, Shiyu Zhou

In this research, we study the parameterization and localization identifiability of beam structures based on the dynamic response information. We show that the stiffness parameters can be locally identifiable in general cases for the collocated single input and single output system. The unique relationship between the damage location and the dynamic response are also investigated. The identifiable sensitivity is studied for practical damage identification.

Chair: Eunshin Byon, Assistant Professor, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, ebyon@umich.edu

Co-Chair: Arash Pourhabib, Assistant Professor, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, arash.pourhabib@okstate.edu

1 - Multi-Component Replacement in a Markov Modulated Environment

David Abdul-Malak, dta10@pitt.edu, Jeffrey Kharoufeh

In this talk we will present a model for jointly replacing multiple components that degrade in a shared, exogenous, Markov modulated environment. Continuous state variables and a high dimensional state space cause the problem to be computationally intractable. To overcome this complication, an approximate dynamic programming (ADP) approach is employed and illustrated through multiple numerical examples.

2 - Importance Sampling with a Novel Information Criterion for Efficient Reliability Evaluation

Youngjun Choe, PhD Candidate, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, yjchoe@umich.edu, Eunshin Byon

Importance sampling can significantly accelerate the rare event probability estimation. However, the theoretically optimal sampling requires some approximation in practice, such as the cross-entropy method. We extend the cross-entropy method by incorporating the expectation-maximization (EM) algorithm and deriving a model selection criterion analogous to Akaike information criterion. We apply the proposed method to the reliability evaluation of the wind turbine.

3 - Monitoring Performance of Wind Turbines Based on Power Curve Estimation

Hoon Hwangbo, PhD Student, Texas A&M University, College Station, TX, United States of America, hwhangbo@tamu.edu, Andrew Johnson, Yu Ding

Quantifying performance of a wind turbine is crucial for decision makings such as turbine upgrade or replacement. Yet, there is a lack of systematic ways to quantify a turbine's performance, while considering the diverse sources of variation in the energy generation. In this study, we estimate power curves and quantify performance of a wind turbine while controlling for some significant factors of variation. Using the measures we derive, we monitor performance change of a wind turbine over time.

4 - Wake Effect Characterization in Wind Power Systems

Mingdi You, PhD Candidate, University of Michigan, 1205 Beal Avenue, IOE 1773, Ann Arbor, MI, 48109, United States of America, mingdyou@umich.edu, Eunshin Byon, Jionghua (judy) Jin

The rapid growth of wind power underscores the need to understand the dynamic characteristics of wind turbine operations. Wind turbines in a wind farm exhibit heterogeneous power generations due to the wake effect. This study provides a computational framework for characterizing the wake effects via a data-driven approach by extending the Gaussian Markov Random field framework. The computational results show that this approach improves the prediction capability over other methods.

System and Process Informatics in Additive Manufacturing (II)

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Linkan Bian, Assistant Professor, Mississippi State University, 260 McCain Building, Mississippi State, Starkville, MS, 39762, United States of America, bian@ise.msstate.edu

1 - Accelerated Bi-objective Process Optimization for Laser-based Additive Manufacturing (LBAM)

Amir M. Aboutaleb, Mississippi State University, 260 McCain Building, Mississippi State, MS, 39762, United States of America, aa1869@msstate.edu, Alaa Elwany, Scott M. Thompson, Linkan Bian, Nima Shamsaei, Mohammad Marufuzzaman

Material properties of fabricated parts via LBAM have demonstrated to either be correlated, interdependent or inconsistent with process parameters. In many cases the goal is optimize the LBAM process considering several material properties of interest as a multi-objective problem. We propose a novel methodology for leveraging current experimental data to guide and accelerate the bi-objective Design-of-Experiment process for Pareto Front approximation by the minimum number of experiments.

2 - Spatial Gaussian Process Models for Porosity Prediction in Selective Laser Melting

Alaa Elwany, Texas A&M University, 3131 TAMU, College Station, TX, United States of America, elwany@tamu.edu, Gustavo Tapia, Huiyan Sang

We develop a Gaussian process-based predictive model for predicting the porosity in metallic parts produced using Selective Laser Melting (SLM – a laser-based AM process). A case study is conducted to validate this predictive framework through predicting the porosity of 17-4 PH stainless steel manufacturing on a commercial SLM system.

3 - Automatic Feature Priority Assignment for Automated Production Processes

Ola Harryson, Professor, North Carolina State University, 400 Daniels Hall, 111 Lampe Dr, Raleigh, NC, 27606, United States of America, oaharrys@ncsu.edu, Richard Wysk, Sidharth Chaturvedi, Harshad Srinivasan

This work describes a system for the prioritization of features at the near-net production stage in order to minimize the effort required for any subsequent finish machining. Heuristics are used to assign weights to features based on value and produceability. A graph of feature relationships is used to modify the assigned weights based on design and tolerancing principles. An implementation of this system for use with the AIMS hybrid process is described and demonstrated with sample parts.

4 - Additive Manufacturing of Biomedical Implants: Feasibility Assessment via Supply-chain Cost Analysis

Adindu Emelogu, Mississippi State University, 260 McCain Building, Mississippi State, MS, 39762, United States of America, emeloguadindu@yahoo.com, Linkan Bian, Mohammad Marufuzzaman

We investigate the economic feasibility of fabricating biomedical implants close to hospitals by additive manufacturing (AM) instead of traditional manufacturers (TM) located far from point-of-use. We develop a stochastic mixed-integer programming model which helps to decide the location of AM centers and volume of product flows that minimize supply chain cost. A case study of hospitals in Mississippi, USA recommends AM only when the production cost of AM to TM ratio (ATR) reduces to 3 or less.

IBM Research Best Student Paper Award II

Sponsor: Service Science

Sponsored Session

Chair: Ming-Hui Huang, National Taiwan University, Taiwan - ROC, huangmh@ntu.edu.tw

1 - Best Student Paper Competitive Presentation

Ming-Hui Huang, National Taiwan University, Taiwan - ROC, huangmh@ntu.edu.tw

Finalists of the IBM Research Best Student Paper Award present their research findings in front of a panel of judges. The judging panel will decide the order of winners, which will be announced during the business meeting of the Service Science Section at the Annual Conference.

2 - Online Network Revenue Management using Thompson Sampling

He Wang, MIT, Cambridge, MA, United States of America, wanghe@mit.edu, Kris Johnson Ferreira, David Simchi-Levi

Mobile apps have great potential to provide promising services to improve consumers' engagement and behaviors. Focusing on healthy eating, this study shows that an image-based professional support greatly improves consumer engagement and eating behaviors, while social media and a heuristic approach of self-management might have negative effects in some occasions. Mobile apps have great potential to provide promising services to improve consumers' engagement and behaviors. Focusing on healthy eating, this study shows that an image-based professional support greatly improves consumer engagement and eating behaviors, while social media and a heuristic approach of self-management might have negative effects in some occasions.

3 - How Environmental Certification Can Affect Performance in the Service Industry: Evidence from the Adoption of LEED Standards in the U.S. Hotel Industry

Matthew Walsman, Cornell University, Ithaca, NY United States of America, mcw237@cornell.edu, Suresh Muthulingam, Rohit Verma

This study uses a mixed method approach (difference-in-differences and multi-level modeling) to measure the impact of environmental certification (i.e. LEED certification) on financial performance in the US hospitality industry. We find that certification does contribute to higher revenue for the certifying hotel, relative to its competitors.

4 - Optimal Coinsurance Rates for a Heterogeneous Population under Inequality and Resource Constraints

Gregory J. Schell, Center for Naval Analyses, 3003 Washington Blvd, Arlington, VA, United States of America, schellg@cna.org, Rodney A. Hayward, Mariel Lavieri, Jeremy B. Sussman

We derive prescription coinsurance rates which maximize the health of a heterogeneous patient population. We analyze the problem as a bilevel optimization model where the lower level is a Markov decision process and the upper level is a resource allocation problem with constraints on expenditures and coinsurance inequality.

5 - Managing Rentals with Usage-Based Loss

Vincent Slaugh, Penn State University, University Park, PA, United States of America, vslaug@cmu.edu, Bahar Biller, Sridhar Tayur

We study the operation of a discrete-time stochastic rental system over a single selling season in which rental units may be purchased or damaged by customers. We provide structural results related to the expected profit function and the optimal policy for allocating rental units to meet customer demand. In an industrial use case motivated by a high-fashion dress rental business, we show significant value to accounting for inventory loss and using the optimal inventory recirculation rule.

Advances in Simulation-based Optimization II

Sponsor: Simulation

Sponsored Session

Chair: Enlu Zhou, Assistant Professor, Georgia Institute of technology, 755 Ferst Drive, NW, Atlanta, United States of America, enlu.zhou@isye.gatech.edu

1 - A Set Approach to Simulation Optimization with Probabilistic Branch and Bound

Hao Huang, PhD Candidate, University of Washington, Industrial and Systems Engineering, Seattle, WA, 98195-2650, United States of America, haoh7493@uw.edu, Zelda Zabinsky

Probabilistic Branch and Bound (PBnB) is a partition-based random search simulation optimization algorithm for stochastic problems. PBnB determines a set of solutions through an estimated bound on the performance. For single objective problem, PBnB approximates a desirable level set with quantile estimation. In a multiple objective circumstance, PBnB considers a bound of the closeness to the efficient frontier and approximates the Pareto optimal set of solutions.

2 - A Model-based Approach to Multi-objective Optimization

Joshua Hale, Graduate Student, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, Atlanta, GA, 30332, United States of America, jhale32@gatech.edu, Enlu Zhou

We develop a model-based algorithm for the optimization of multiple objective functions that can only be assessed through black-box evaluation. The algorithm iteratively generates candidate solutions from a mixture distribution over the solution space and updates the mixture distribution based on the sampled solutions' domination count such that the future search is biased towards the set of Pareto optimal solutions. We demonstrate the performance of the proposed algorithm on benchmark problems.

3 - Simulation Optimization: Review and Exploration

Chun-hung Chen, George Mason University, 4400 University Drive, MS 4A6, SEOR Dept, GMU, Fairfax, VA, 22030, United States of America, cchen9@gmu.edu, Edward Huang, Jie Xu, Loo Hay Lee

Recent advances in simulation optimization research and explosive growth in computing power have made it possible to optimize complex stochastic systems that are otherwise intractable. We will review some recent developments. We will also discuss how simulation optimization can benefit from cloud computing and high-performance computing, its integration with big data analytics, and the value of simulation optimization to help address challenges in engineering design of complex systems.

4 - MO-MO2TOS for Multi Objective Multi Fidelity Simulation Optimization

Loo Hay Lee, National University of Singapore, Department of Industrial & Systems Engineering, Singapore, iseleelh@nus.edu.sg, Giulia Pedrielli, Chun-hung Chen, Ek Peng Chew, Haobin Li

In simulation-optimization, low fidelity models can be particularly useful. However, we need to account for their inaccuracy while searching for the optimum. In 2015, Xu et al. proposed MO2TOS, which exploits multiple fidelities to improve the simulation optimization procedure. We extend the approach proposing MO-MO2TOS for the multi-objective case, using the concepts of non-dominated sorting and crowding distance. Several interesting insights specific to the multi-objective case are drawn.

Logistics I

Contributed Session

Chair: Leily Farrokhhvar, Virginia Tech, 250 Durham Hall (0118), Blacksburg, VA, 24061, United States of America, leily@vt.edu

1 - Analysis of a New Dual-Command Operation in Puzzle-Based Storage Systems with Block Movement

Hu Yu, PhD Student, University of Science and Technology of China, Number 96, JinZhai Road, HeFei, China, yuhu0421@mail.ustc.edu.cn, Yugang Yu

Dual-command operation jointly performing storage and retrieval requests has been widely discussed in classical warehouse systems, but has been rarely studied in puzzle-based storage systems with block movement. We analytically derive the travel time of completing dual requests that randomly locate in the system. Comparison results with traditional dual-command operation in different scenarios show that significant reduction in the expected travel time is obtained in puzzle-based systems.

2 - Flexibility Analysis on a Supply Chain Contract using a Parametric Linear Programming Model

Eric Longomo, PhD student, University of Portsmouth, Lion Gate Building, Lion Terrace, Hampshire, Portsmouth, PO1 3HF, United Kingdom, eric.longomo@port.ac.uk, Xiang Song, Djamila Ouelhadj, Chengbin Chu

This study considers a multi-period Quantity Flexibility contract between a car manufacturer (buyer) and an external parts supplying company. The buyer -in concert with the supplier- aims to develop a policy -at strategic level, that determines the optimal nominal order quantity and variation rate underpinning the contract. The feasibility and convexity of the proposed LP model are examined. Simulations are carried out to evaluate the theoretical results.

3 - Assigning Non-Fixed Parts of a Delivery Area to Fixed Tours Serviced by Electric Vehicles

Sarah Ubbel, RWTH Aachen University, Kackertstraße 7, Aachen, Germany, ubber@dpor.rwth-aachen.de

We consider last mile distribution where a delivery area is operated by different tours. Parts of this area are serviced by fixed tours in a fixed sequence every day. Other parts are not assigned to fixed tours. To respond e.g. to variable battery ranges or to fluctuations in demand, it is useful to reassign daily the non-fixed parts to the tours, whereby the assignment must not significantly alter the usual delivery sequence. We have developed a model and a heuristic for solving this problem.

4 - Asset Allocation in the Industrial Gas Bulk Supply Chain

Leily Farrokhhvar, Virginia Tech, 250 Durham Hall (0118), Blacksburg, VA, 24061, United States of America, leily@vt.edu, Kimberly Ellis

We study an asset allocation problem in a vendor managed inventory system of an industrial gas distribution network where customer demands vary over time. The objective is to determine the preferred size of bulk tanks to assign to customer sites to minimize recurring gas distribution costs and initial tank installation costs while accommodating customers' time varying demand. The problem is modeled as a mixed-integer program and then solved using a periodically restricting heuristic approach.

Planning and Scheduling in Energy Applications

Contributed Session

Chair: Yanyi He, Senior Scientist, IBM, 1001 E Hillsdale Blvd, Foster City, Ca, 94404, United States of America, heyanyidaodao@gmail.com

1 - Stochastic and Robust Optimization of the Scheduling and Market Involvement for an Energy Producer

Ricardo Lima, KAUST, Thuwal, Saudi Arabia, ricardo.lima@kaust.edu.sa, Sabique Langodan, Ibrahim Hoteit, Antonio Conejo, Omar Knio

We will present three optimization methods based on stochastic programming, robust optimization, and a hybrid method for the scheduling and market involvement for an electricity producer. This producer operates a system with thermal, hydro, and wind sources. The wind power and the electricity prices are uncertain. The methods are implemented using parallel optimization runs. The computational performance, scheduling results, and the impact of risk management are presented and discussed.

2 - A Two-Echelon Wind Farm Layout Planning Model

Huan Long, City University of Hong Kong, Room 601, Nam Shan Estate, Hong Kong, China, hlong5-c@my.cityu.edu.hk, Zijun Zhang

In this paper, a two-echelon layout planning model is proposed to determine the optimal wind farm layout to maximize its expected power output. In the first echelon, a grid composed of identical cells is utilized to model the wind farm while the cell center is the potential slot. In the second echelon, the model for determining the optimal coordinate in a grid cell is formulated. The comparative analysis between the two-echelon planning model and the traditional grid/coordinate models is conducted.

3 - Demand Side Participation for a Major Consumer in a Co-optimized Electricity and Reserve Markets

Mahbubeh Habibian, Miss, University of Auckland, 6A-Short St, Auckland Central, Auckland, 1010, New Zealand, mhab735@aucklanduni.ac.nz, Golbon Zakeri, Anthony Downward

The paper probes demand side participation for a large consumer through demand response and offering in interruptible load reserve. Our model is a bi-level optimization problem that embeds the dispatch model, where electricity and reserve are co-optimized, as the lower level and the profit maximization problem for the consumer (over 2 sets of supply functions) as the upper level. The objective function is transformed into piecewise linear form via utilizing a new interpretation of offer stacks.

4 - Analysis of Best Practices for Energy Efficient Buildings through Building Energy Modeling in Design

Chung-suk Cho, Assistant Professor, Khalifa University, Al Saada St. and Muroor Rd., Abu Dhabi, 127788, United Arab Emirates, chung.cho@kustar.ac.ae, Young-ji Byon

Building energy performance modeling evaluates energy efficient design options. There are significant amount of misused opportunities of energy efficiency-related decisions that could be incorporated into the building design through quality building energy performance modeling. The best practice analysis will help optimize the building design and will allow the design team to prioritize investment in the strategies that will have the greatest effect on the building's energy use.

5 - Two-stage Optimal Demand Response with Battery Energy Storage Systems

Yanyi He, Senior Scientist, IBM, 1001 E Hillsdale Blvd, Foster City, CA, 94404, United States of America, heyanyidaodao@gmail.com, Zhaoyu Wang

Proposes a two-stage co-optimization framework for the planning and energy management of a customer with battery energy storage systems (BESSs) and demand response (DR) programs. The first stage is to assist a customer to select multiple DR programs to participate and install batteries to coordinate with the demand side management. The second stage is to perform energy management according the planning decisions, including dispatches of batteries, loads, and DGs.

79-Room 302, CC

Software Demonstration

Cluster: Software Demonstrations

Invited Session

1 - Statistics.com - A Survey of Data Analytics Methods

Peter Bruce, Founder and President, The Institute for Statistics Education at Statistics.com

This workshop will survey the field of data analytics, reviewing both traditional statistical methods and machine learning methods, including predictive modeling, unsupervised learning, text mining, statistical inference, time series forecasting, recommender systems, network analytics, and more. It will be a broad brush treatment aimed at newcomers, as well as those with knowledge in one area who wish to understand where other analytic methods fit into the picture.

2 - River Logic - Code-free modeling for large-scale LP and MIP problems using Enterprise Optimizer

Eric Kelso, VP Product Management, River Logic

Enterprise Optimizer is a code-free, visual LP and MIP optimization modeling platform. Using EO's intuitive drag-and-drop interface, learn how to rapidly create integrated process and financial models. Also learn about EO's wizard-driven data integration, query designer, user-defined schema, dashboard builder, VBA integration, APIs and job automation component. Outputs demonstrated include detailed unit costs and audit-quality P&L, Balance Sheet and Cash Flow statements. The entire session will be spent discussing major features and showing real-world applications.

Tuesday, 12:30pm - 2:30pm

Exhibit Hall A

Tuesday Poster Session

Contributed Session

Chair: Min Wang, Drexel University, 3141 Chestnut Street, Philadelphia, PA, United States of America, mw638@drexel.edu

Co-Chair: Allen Holder, Rose-Hulman Mathematics, Terre Haute, IN, United States of America, holder@rose-hulman.edu

Co-Chair: Wenjing Shen, Drexel University, Philadelphia, PA, United States of America, ws84@drexel.edu

1 - Surgery Scheduling with Recovery Resources

Maya Bam, University of Michigan, Industrial and Operations Engineering, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, mbam@umich.edu, Mark Van Oyen, Mark Cowen, Brian Denton

Surgery scheduling is complicated by the post-anesthesia care unit, the typical recovery resource. Based on collaboration with a hospital, we present a novel, fast 2-phase heuristic that considers both surgery and recovery resources. We show that each phase of the heuristic has a tight provable worst-case performance bound. Moreover, the heuristic performs well compared to optimization based methods when evaluated under uncertainty using a discrete event simulation

model.

2 - Inventory Control with Unknown Demand and Nonperishable Product

Tingting Zhou, Rutgers University, 1 Washington Park, Newark, NJ, 07102, United States of America, tingzhou@rutgers.edu, Michael Katehakis, Jian Yang

We study an inventory control problem with unknown discrete demand distribution, focusing on the analysis of an adaptive algorithm based on empirical distributions and the newsvendor formula. When items are nonperishable, the algorithm can achieve a near square-root-of-T bound on its regret over the ideal case where demand distribution were known.

3 - Optimizing Information System Security Investments with Risk: Insights for Resource Allocation

Yueran Zhuo, PhD Candidate, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, yzhuo@som.umass.edu, Senay Solak

Information security has become an integral component of a firm's business success, and thus investing on information security countermeasures is an important decision problem for many businesses. We use a portfolio approach to study the optimal investment decisions of a firm, where the uncertainty of information security environment is captured through a stochastic programming framework. Results cast managerial insights for information security investment planning by a firm.

4 - Adaptive Decision-Making of Breast Cancer Mammography Screening: A Heuristic-Based Regression Model

Fan Wang, University of Arkansas, Fayetteville, AR, United States of America, fxw005@uark.edu, Shengfan Zhang

The American Cancer Society currently recommends all U.S. women undergo routine mammography screenings beginning at age 40. However, due to the potential harms associated with screening mammography, such as overdiagnosis and unnecessary work-ups, the best strategy to design an appropriate breast cancer mammography screening schedule remains controversial. This study presents a mammography screening decision model that aims to identify an adaptive screening strategy while considering disadvantages of mammography. We present a two-stage decision framework: (1) age-specific breast cancer risk estimation, and (2) annual mammography screening decision-making based on the estimated risk. The results suggest that the optimal combinations of independent variables used in risk estimation are not the same across age groups. Our optimal decisions outperform the existing mammography screening guidelines in terms of the average loss of life expectancy. While most earlier studies improved the breast cancer screening decisions by offering lifetime screening schedules, our proposed model provides an adaptive screening decision aid by age. Since whether a woman should receive a mammogram is determined based on her breast cancer risk at her current age, our "on-line" screening policy is adaptive to a woman's latest health status, which causes less bias in reflecting the individual risk of every woman.

5 - Optimization of Netting Scheme in Large-scale Payment Network

Shuzhen Chen, University of Science & Technology of China, No. 98, Jinzhai Road, Hefei, China, csz@mail.ustc.edu.cn

As netting becomes combined with real-time settlement, an efficient netting method is required to deal with the large-scale payment network. Network optimization may not be optimal due to repeated searching of shortest path. A new method is proposed to optimize the netting process by assembling payments in two specific routes. It can minimize the amount of total payments for the whole network and ensure unchanged net payment for each bank. Moreover, it has polynomial time-complexity.

6 - Wasserstein Metric and the Distributionally Robust TSP

Mehdi Behrooz, University of Minnesota, Minneapolis, MN, United States of America, behro040@umn.edu, John Gunnar Carlsson

Recent research on the robust and stochastic travelling salesman problem and the vehicle routing problem has seen many different approaches for describing the region of uncertainty, such as taking convex combinations of observed demand vectors or imposing constraints on the moments of the spatial demand distribution. One approach that has been used outside the transportation sector is the use of statistical metrics that describe a distance function between two probability distributions. In this paper, we consider a distributionally robust version of the Euclidean travelling salesman problem in which we compute the worst-case spatial distribution of demand against all distributions whose earth mover's distance to an observed demand distribution is bounded from above. This constraint allows us to circumvent common overestimation that arises when other procedures are used, such as fixing the center of mass and the covariance matrix of the distribution.

7 - Intersection of a Tree Network for the Single Refueling Station Location Problem

Sang Jin Kweon, PhD Student, The Pennsylvania State University, 310 Leonhard Building, State College, PA, 16802, United States of America, svk5333@psu.edu

An intersection is the vertex whose degree is greater than two in the network. In this talk, we consider intersections and develop the methodology that determines the continuous interval of the potential locations for a single alternative-fuel refueling station on a tree network, with an objective of maximizing the amount of traffic flows in round trips per time unit captured by the station.

8 - Intelligent Tutoring Systems: Future Paradigm of Educational Environments

Alireza Farasat, University at Buffalo (SUNY), 4433 Chestnut Ridge Rd Apt. 7, Amherst, NY, 14228, United States of America, afarasat@buffalo.edu, Alexander Nikolaev

Educational systems have witnessed a substantial transition from traditional educational methods mainly using text books, lectures, etc. to newly developed systems which are artificial intelligent-based systems and personally tailored to the learners. We have developed a web-based tool, Crowdlearning which concentrates on creating an intelligent system that learns to interact with students and motivates them to more actively participate in the learning process by proposing their own problems.

9 - Optimized Scheduling of Sequential Resource Allocation Systems

Ran Li, PhD Student, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332, United States of America, rli63@gatech.edu, Spyros Reveliotis

We consider the scheduling problem of allocating finite reusable resources to concurrent sequential processes. This problem also involves the logical issue of deadlock avoidance. Our approach is based on the formal model of the generalized stochastic Petri-net. Special emphasis is placed on the representational and computational complexity of the proposed methods, which are controlled through (i) a pertinent (re-)definition of the target policy spaces, and (ii) simulation optimization.

10 - Operation Research for Data Mining: An Application to Medical Diagnosis

Shahab Derhami, Auburn University, 3301 Shelby Center, Auburn, GA, 36849, United States of America, sderhami@auburn.edu

Fuzzy rule based classification systems (FRBCSs) have been successfully employed as a data mining technique where the goal is to discover the hidden knowledge in a data set and develop an accurate classification model. Despite various heuristic approaches that have been proposed to learn fuzzy rules for these systems, no exact optimization approach has been developed for this problem. We propose integer programming models to learn fuzzy rules for a FRBCS used for medical diagnosis purpose.

11 - Forecasting Surges in the Hospital Emergency Department (ED)

Alexander Gutfraind, Chief Healthcare Data Scientist, Uptake Technologies, 600 W. Chicago Avenue, Chicago, IL, 60654, United States of America, sasha.gutfraind@uptake.com, Nelson Bowers, Jim Herzog, Madeline Jannotta, Ilan Kreimont, Adam Mcelhinney

A major hospital system in the Chicago metro area experiences large unexpected surges in its Emergency Department (ED).

Using five years of ED admissions we predict ED surges and improve scheduling of staff.

Data indicates the time of arrival, rooming and discharge and acuity. Total arrivals per day cannot be predicted accurately with epidemiological climatological, calendar variables but the state of the ED could be predicted 1-4 hours in advance with high accuracy using VAR methods.

12 - A New Measure for Testing Independence

Qingcong Yuan, Graduate Student, University of Kentucky, 300 Alumni Drive Apt. 166, Lexington, KY, 40503, United States of America, qingcong.yuan@uky.edu, Xiangrong Yin

We introduce a new measure for testing independence between two random vectors. Our measure differs from that of distance covariance, by using expected conditional difference of characteristic functions. We propose one empirical version by slicing on one of the random vectors. This empirical measure is based on certain Euclidean distance. Its properties, asymptotics and applications in testing independence are discussed. Implementation and Monte Carlo results are also presented.

13 - Graph Based Non-isometric Curve to Surface Matching for Local Calibration

Babak Farmanesh, PhD Student, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078-5016, United States of America, babak.farmanesh@okstate.edu, Balabhaskar Balasundaram, Arash Pourhabib

Calibration refers to the process of adjusting parameters of a computer simulation so that the simulation responses match the corresponding physical responses.

Calibration can be interpreted as a curve to surface matching problem. We propose a graph-theoretic non-isometric matching approach to solve this problem using the graph shortest path algorithm in one-dimensional spaces. For higher dimensional spaces, we introduce the generalized shortest path concept to solve the matching problem.

14 - Location and Coverage Models for Preventing Attacks to Interurban Transportation Networks

Ramón Auad, Associate Professor, Universidad Católica del Norte, Of. 318, Bldg. Y1, 0610 Angamos Avenue, Antofagasta, 1240000, Chile, rauad@ucn.cl, Rajan Batta

We develop a binary integer programming model to solve this problem, whose objective is to maximize the expected vehicle coverage across the network over a time horizon, using decomposition heuristics. To introduce a measure of equity, we propose two sets of time constraints, considering total vehicle coverage, inequity and network coverage. We explore scalability of the model for excessively large instances. All of these features are applied to a case study in Northern Israel.

15 - An Information-based Framework for Incorporating Travel Time Uncertainty in Transportation Modeling

Jiangbo Yu, University of California, Irvine, 4101 Palo Verde Rd, Irvine, CA, 92617, United States of America, jiangby@uci.edu, Jay Jayakrishnan

This paper proposes a modeling framework aimed at systematically incorporating perceived uncertainty into decision making. The model uses theoretically sound concepts from information theory, communication, and cognitive science. Potential applications and implications are identified and demonstrated with examples.

16 - Database of Identified Poly and Mono ADP-ribosylated Proteins

Charul Agrawal, Undergraduate Student, Indian Institute of Technology (IIT) Delhi, Room No ED-16, Himadri Hostel, Hauz Khas, New Delhi, 110016, India, agrawalcharul09@gmail.com

Poly(ADP-ribose) polymerase (PARP) is a family of enzymes with 17 known members regulating post translational modification of proteins by attaching a single ADP ribose unit (MARylation) or a chain of ADP ribose (PARylation). In this study we have attempted to identify all proteins known to be modified by PARPs and the methods as well as drugs used in such studies. Our study aims to create the first ever tool for characterizing these modifications.

17 - Configuring Ecommerce Driven Supply Chains in the FMCG Sector

Stanley Lim, PhD Candidate, Cambridge University, Department of Engineering, 17 Charles Babbage Road, Cambridge, United Kingdom, wtsfl2@cam.ac.uk

Omnichannel has become the engine of growth in retailing. However, it remains unclear as to how distribution networks should be configured. This research will shed light through a framework development, and by drawing theories from supply chain configuration, resource based view, and transaction cost economics. Case study approach is adopted to identify the critical factors driving operational choices and seeks to elaborate the relationships between configuration, capability and performance.

18 - Benchmarking Construction and Improvement Heuristics for Classification using Markov Blankets

Daniel Gartner, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, dgartner@andrew.cmu.edu, Rema Padman

This study examines construction heuristics in connection with a tabu search-based improvement heuristic for classification in high dimensional data sets. Using the UCI machine learning data repository containing benchmark instances in e.g. health care, we evaluate computation times and information about the evolution of the Markov blanket graphical models in each phase of the heuristics. We compare the performance of the approaches using evaluation measures such as classification accuracy.

19 - A Sim-heuristic Algorithm for Robust Vehicle Routing Problems with Stochastic Demand

Abdulwahab Almutairi, Technology, 9 Horizon Building, Portsmouth, PO4 8EW, United Kingdom, abdulwahab.m.almutairi@gmail.com

We consider the VRPSD in which customers' demands are stochastic. We propose to model and solve the VRPSD by developing a robust optimisation model with a sim-heuristic solution method to minimise the cost while satisfying all demands. The method combines MCS with CWS in order to efficiently solve the VRPSD combinatorial optimisation problem. The results are generating very good quality solutions compared to those in the literature.

20 - Rocket Stage Optimization in Kerbal Space Program

Nathan Arrowsmith, Rochester Institute of Technology,
2800 Butternut Lane, Canandaigua, NY, 14424,
United States of America, nea4305@rit.edu

Kerbal Space Program is a space exploration simulation game. Players design, launch, and fly multi-stage rockets using a variety of parts. The performance of these vehicles is governed by a realistic physics engine. A model was developed which minimizes the total mass of each rocket stage by choosing motor and fuel tank combinations which accurately satisfy the Tsiolkovsky Rocket Equation. By iteratively solving this problem, the lowest mass or least expensive multi-stage rocket can be determined.

21 - Investigation of the Effect of Location, Built Environment and Urban Forms on Customer Satisfaction

Homa Atefyekta, Sharif University of Technology, No.14, 5th St.,
South Piruzan st, Tehran, 1466643479, Iran,
homa.atefyekta@gmail.com, Hamed Ahangari, Hoda Atef Yekta

In this study we examine the effect of location factors, urban forms, transportation accessibilities, and built environment on the customer satisfaction and business success in restaurant market. We investigated these relationships in two different geographical areas: the US and Iran by using Yelp and Fidelity data respectively. The results of this study could be helpful for urban policy makers to improve the urban livability and business entrepreneurs to enhance the odd of their success.

22 - What do Equity Hedge Funds Really do? Evidence in the QE Period

Geum Il Bae, KAIST, 291, Daehak-ro, Yuseong-gu, Daejeon,
Korea, Republic of, gi_bae@kaist.ac.kr, Sun Young Park,
Woo Chang Kim

We examine why the hedge fund industry has experienced a slump during the "Quantitative Easing (QE)" period. We analyze the risk-adjusted performances of equity hedge funds in the pre-crisis, crisis, and QE periods. We show that the disappeared alpha is the main reason for the inferior performance of hedge fund industry these days, and reduction in exposure to systematic risks further explains the underperformance of hedge funds in the QE period.

23 - NEOS Server: State-of-the-art Solvers for Numerical Optimization

Rosemary T. Berger, University of Wisconsin - Madison, 330 N.
Orchard St., Madison, WI, 53715, United States of America,
rosemary.t.berger@gmail.com, Michael Ferris, Jeff Linderoth

The NEOS Server is a free internet-based service for solving numerical optimization problems. Hosted by WID at the University of Wisconsin in Madison, the NEOS Server provides access to more than 60 state-of-the-art solvers in more than a dozen optimization categories. Solvers run on distributed high-performance machines enabled by the HTCondor software. We describe recent enhancements to the NEOS Server and highlight new interactive optimization cases studies available on the NEOS Guide.

24 - Provable Submodular Function Minimization via Wolfe's Algorithm

Deeparnab Chakrabarty, Dr, Microsoft, 9 Lavelle Road,
Bangalore, India, deeparnab@gmail.com

Submodular function minimization (SFM) is an essential paradigm which appears in many areas such as large scale learning and computer vision. The Fujishige-Wolfe Algorithm is agreed to be the fastest empirical SFM algorithm. Despite its good practical performance, very little is known about Wolfe's minimum norm algorithm theoretically. In this paper we give the first polynomial time convergence analysis of Fujishige-Wolfe's algorithm.

25 - Stochastic PDE-constrained Optimization of Vibrations of a Plate under a Piecewise-linear Current

Dmitry Chernikov, The University of Iowa, 1010 W Benton St.
#208F, Iowa City, IA, 52246, United States of America,
scher.de@gmail.com, Pavlo Krokhmal, Olesya Zhupanska

In this work a two-stage stochastic PDE-constrained optimization framework is applied to the problem of vibration control of a thin composite plate in the presence of electromagnetic field. The electric current is assumed to be of a piecewise-linear form. We compute the gradient of the objective function using adjoint numerical differentiation method. The value of the objective function is calculated by solving the governing PDEs, and a black-box approach is used for the minimization problem.

26 - Assessing Kernel-based Anomaly Detection Algorithms

Hyun-chang Cho, Seoul National University, Banpo-gu,
Seocho-dong, Seoul, Korea, Republic of, hccho@dm.snu.ac.kr,
Sungzoon Cho

Anomaly detection is the process of finding items which do not comply with the normal pattern of the data set. Although kernel-based approaches seem to be promising for detecting anomalies, they have not been compared in a systematic way. In this study, we generated numerous well-calibrated benchmark data set and use them to evaluate the performance of various kernel-based anomaly detection algorithms. The effect of kernel parameters will also be empirically investigated.

27 - Simulation Analysis of Chaotic Storage Policies in Amazon Class Fulfillment Centers

Sanchoy Das, New Jersey Institute of Technology, University
Heights, Newark, NJ, 07102, United States of America,
das@njit.edu, Sevilyay Onal

We evaluate storage policies in Amazon Class Fulfillment (ACF) Centers that primarily serve internet retail. In classical warehouses a SKU is stored in few fixed locations, no comingling, in bulk volumes and long interval supply. In a chaotic policy each SKU is stored in any location, comingled, closer to retail volumes and frequent supply. In an ACF fulfillment time is the primary objective. We use a simulator model to analyze and present the relative performance for given levels of workforce.

28 - Spatial-temporal Coverage Evaluation Methodology for Multi-satellite Embedded Sensors

Monica Maria De Marchi, Dra, Institute for Advanced Studies, Cel
Av Jose Alberto A do Amarante,1, Sao Jose dos Campos, SP,
12228001, Brazil, monica@ieav.cta.br, Osvaldo Catsumi Imamura,
Diogo Maciel Almeida, Maria Jose Pinto

The intent of this research is to propose an optimized coverage model for satellite systems and support the decision-making process related to choosing the best satellites in a scenario of interest. The appropriate satellites are those whose sensors are able to visualize and identify targets. The decision model proposed trades off between temporal resolution and the coverage area extension, but also considers the cost to obtain the image and the resolution provided by the different sensors.

29 - Stochastic Optimization Methods for Nurse Staffing in Inpatient Settings

Parisa Eimanzadeh, Wichita State University, 1845 Fairmount
Street, Wichita, KS, 67260, United States of America,
pxeimanzadeh@wichita.edu, Ehsan Salari

In this study, we use Queueing Theory and discrete-event simulation techniques to determine nurse-staffing strategies that minimize staffing costs and ensure timely delivery of nursing care to patients while accounting for the heterogeneity in patients' acuity and staff skill levels.

30 - A Systems Dynamics Model for Flight Test Knowledge Management

Roberto Follador, Mr, Institute for Advanced Studies - IEAv, Trevo
Coronel Av Jose A.A. Amarante, 01, Putim, Sao Jose dos Campos,
SP, 12228-001, Brazil, rcfollador@gmail.com

The research investigated how Knowledge Management (KM), in a Brazilian Air Force (BAF) flight test environment can be represented via a Systems Dynamics Model. A documental research regarding the flight test environment KM was done and a questionnaire was submitted to identify KM characteristics.

31 - A Supply Chain Network Equilibrium Model with Carbon Capacity and Social Responsibility

Xiaoling Fu, School of Economics and Management,
Southeast University, Si Pai Lou 2#, Nanjing, 210096, China,
fufei1980@163.com, Lin Zhu, Xiangxiang Huang, Xiaogan Jiang

This paper investigates a three-tier supply chain network equilibrium problem. We first relate the decision makers' social responsibility with transaction decisions under the desired carbon capacity. Then we formulate the optimality of this problem as a monotone variational inequality. Next, we propose a self adaptive projection-based prediction—correction algorithm to solve the proposed model. Finally, we report the numerical results and give some analysis on the equilibrium solution.

32 - How to Catch a Black Swan

David Gallop, Professor Of Program Management, Defense
Acquisition University, 6735 Surbiton Dr, Clifton, VA, 20124,
United States of America, davegallop@aol.com

Projects are increasingly complex. We use risk-based management to address complexity. Risk identification is the most important step in risk management because risks that are unidentified are implicitly assumed. Group dynamics such as silent dissent and group-think are weaknesses in team-based risk identification. The PreMortem technique makes it safe for the team to address risks that may otherwise go unidentified.

33 - Cost-effectiveness Analysis of Immunosuppression Therapy in Primary Deceased Donor Renal Transplantation

Zahra Gharibi, SMU, 5507 Stonehenge Drive, Richardson, TX,
75082, United States of America, zgharibi@smu.edu,
Mehmet Ayvaci, Bekir Tanriover, Michael Hahsler

The primary cure for patients with end stage renal disease (ESRD) is kidney transplantation. In this study, we evaluate the cost-effectiveness of three common immunosuppressive induction therapies, alemtuzumab, thymoglobulin, and IL2RB as well as a no-induction strategy, from Medicare's perspective. Using non-parametric bootstrapping method, we calculate the incremental cost-effectiveness ratios for comparing the available strategies.

34 - The Effect of High Socioeconomic Inequalities on Public Education Efficiency

Maria Cristina Gramani, Insper - Business Department,
Rua Quatá, 300, Vila Olímpia, São Paulo, SP, 04546042, Brazil,
mariaacng@insper.edu.br

A model is proposed to capture the full picture of educational efficiency in an emerging country. Because of regional discrepancies, the model uses variables related to education and to socioeconomic inequalities. The empirical results are based on data from 5,129 Brazilian municipalities and the correlation factor between the HDI-M and the educational efficiency score indicates that the HDI-M index could not capture the discrepancies of a country with high levels of socioeconomic inequality.

35 - Improving Scheduling and Control of the OHTC Controller in Wafer Fab AMHS Systems

Shreya Gupta, Ms/phd Student And Graduate Research
Assistant, University of Texas at Austin, Austin, TX, 78751,
United States of America, shreya.gupta@utexas.edu,
John Hasenbein

Automated Material Handling Systems (AMHS) in wafer fabs have complex requirements. Thus, a larger number of AMHS vehicles are now required to pick-up and transport these lots within the production facility. This has increased vehicular traffic jams and the wait time for lots requiring pick-up and delivery. Hence, to increase the system throughput, we present improved routing algorithms for the over hoist transport control (OHTC) system.

36 - An Adaptive Large Neighborhood Search Heuristic for the Inventory Routing Problem with Time Windows

Mina Hadianniasar, University of Arkansas, 901 N Pollard Street,
Arlington, VA, 22203, United States of America,
mhadiann@uark.edu, Ashlea Milburn

This research models an integrated distribution and inventory control problem (IRP) which is faced by a retail chain in the US. Currently, a direct shipping policy with time window constraints is used for replenishing stores. This paper develops an Adaptive Large Neighborhood Search Heuristic to determine the optimal timing and magnitudes of deliveries to stores. The optimal plan considers direct shipping policy as well as options combining deliveries for multiple stores into a single route.

37 - Forecasting-based Truck Wait Time Reduction at Logistic Nodes

Alessandro Hill, Hamburg University of Technology,
Am Schwarzenbergcampus 4, Hamburg, Germany,
alessandro.hill@tuhh.de, Finn Meissner, Juergen Boese

Truck wait times at logistic nodes such as container depots, packing facilities or terminals cause delays in transport chains and traffic congestion. Truck companies and nodes experience economical losses due to vehicle idle times and a lack of planning reliability regarding routes, personnel or machinery, respectively. In this work we present a flexible forecasting-based real world approach using artificial neural networks to predict both, the truck wait times and the arrival rates at the nodes.

38 - Impact of Overbooking in Appointment Scheduling of Primary Care Services

Babak Hoseini, PhD Candidate, New Jersey Institute of
Technology, University Heights, Newark, NJ, 07102,
United States of America, bh77@njit.edu, Wenbo Cai

No-shows and late cancellations not only reduce the providers' utilization, but also results in long waiting time for other patients. Overbooking has the potential to mitigate these negative impacts. However, excess overbooking may lead to even longer waiting times for patients and prolonged working days for the care team. We use a mathematical model to evaluate the benefit of overbooking and develop a scheduling policy that reduces patients' waiting time, and increase provider's utility.

39 - Research on Combination of Container Yard Allocation and Automatic Lifted Vehicle Path Optimization

Hongtao Hu, Shanghai Maritime University, Room101, No 96,
555 Guzong Road, Shanghai, China, hu.hongtao@foxmail.com

This paper brings in a new type of automatic transport machinery—automatic lifted vehicle which has the ability to lift container from the floor or put it down on the floor. Meanwhile, a mixed integer programming model is established to ensure that all the containers handled as far as possible in the time window. The model also considers the problem of allocating blocks to discharge containers and optimizing path of automatic lifted vehicle.

40 - Shipping Commodities Between a Container Terminal and Different Destination Zones using Heavy Trucks

Mazen Hussein, Assistant Professor, University of Wisconsin-
Platteville, Platteville, WI, 53818, United States of America,
husseinm@uwplatt.edu

The cost model for shipping commodities by truck developed by Hussein M. (2010) is extended to consider the impact of tollway policies on truck route selection for shipping containers of specific commodity groups near a container terminal. A path-finding model is built for this purpose. The values of time were used to mimic the truck's choices to ship containers of different commodities

between a container terminal and different facilities.

41 - Network Motif Analysis for an Infrastructure System Against Vulnerability

Jing Jiang, PhD, Shanghai Jiao Tong University, Shanghai, China,
sjtjiangjing@163.com, Xiao Liu

A motif-based evolutionary perspective is provided for infrastructure network design. First, a multi-objective vulnerability-cost model is proposed to optimize network structure. Secondly, an evolutionary algorithm is developed. Thirdly, a network is tested by structure analysis, and motifs are traced during the evolutionary process. Finally, Western States Power Grid is analyzed. Results have revealed some principles in network design towards lower cascading vulnerability and construction cost.

42 - Patient Reaction to Healthcare Data Breaches

Eric Johnson, Vanderbilt University, Owen School of
Management, Nashville, TN, United States of America,
eric.johnson@owen.vanderbilt.edu, Juhee Kwon

We investigate consumer reaction to data breaches. Using a propensity score matching technique, we analyze a matched sample of U.S. hospitals. We investigate how breaches affect subsequent outpatient visits and admissions, accounting for geographically-based competition. We find that the cumulative effect of multiple breaches significantly decreases outpatient visits and admissions.

43 - Enhancing Distribution Performance through Improved Relationship Quality and Logistics Integration

Sung-tae Kim, Assistant Professor, SolBridge International School
of Business, 128 Uam-ro, Dong-gu, Daejeon, Korea, Republic of,
stkim1@solbridge.ac.kr, Moon-jung Yoo

Prior research has argued that business relationship quality mediated by logistics integration has shown positively related to distribution service performance. Hence, firms attempt to achieve higher levels of logistics service and distribution service performance through logistics integration. This study examines relationship quality and logistics integration to understand how the two factors are linked to distribution service performance.

44 - Smart Logistics: Distributed Control of On-demand Green Transportation Services

Seokgi Lee, Assistant Professor, University of Miami, 1251
Memorial Drive 281, Coral Gables, FL, 33146, United States of
America, sgl14@miami.edu, Yunchool Kang, Vittaldas V. Prabhu

We develop a strategic decision-making framework for on-demand delivery services, considering both operational and environmental performance explained by Just-In-Time delivery service, fuel consumption, and carbon emissions. The optimal policies based on the Markov decision process are established to make admission plans of delivery requests, and an integrated dynamic algorithm for admission control and route scheduling is developed.

45 - Extreme-point Search Heuristics For Interval-flow Generalized Network Problems

Angelika Leskovskaya, Southern Methodist University, 3145 Dyer
St., Suite 372, Dallas, TX, 75205, United States of America,
aleskovs@smu.edu, Richard Barr

Interval-flow generalized networks are a new extension of the classic generalized network formulation that adds a conditional lower bound constraint on the arcs. An interval-pivoting heuristic that exploits the quasi-tree-forest basis structure to explore extreme points is developed and computational testing is presented.

46 - Hedge Fund Leverage Choice under Time-inconsistent Preference

Bo Liu, University of Electronic Science and Technology of China,
No.2006, Xiyuan Ave, West Hi-Tech Zone, Chengdu, SC, 611731,
China, b.liu07@fulbrightmail.org

We show that time inconsistency preference discourages the manager from underinvesting because of the high liquidation risk. The payment of incentive fees may induce the irrational manager to be more aggressive and to overinvest. The naive manager is more conservative than the sophisticated manager and prefers a lower leverage level in normal times. Interestingly, investors are not sensitive to the manager's irrational investment behavior.

47 - New Assay Implementation Planning at Clinical Laboratory

Wei Liu, Industrial Engineer, MD Anderson Cancer Center, 8515
Fannin St, Houston, TX, 77054, United States of America,
wliu8@mdanderson.org, Cindy Lewing, Bedia Barkoh,
Pramod Mehta, Mark Routbort, Humin Lu, Justin Villarreal,
Raja Luthra, Keyur Pravincha Patel, Geeta S Mantha,
Mylene Bole, Haobo Yang, David Garcia, Zou Zhuang

Implementation of a new complex laboratory assay at our high-volume and high-complexity clinical Molecular Diagnostics Laboratory was facilitated by application of multiple engineering approaches including workflow assessment, historical volume-based demand prediction, IT solution, and resource allocation. The new assay implementation is expected to be successful with minimal workflow interruptions, no patient care interruptions, low implementation cost and optimal resource utilization.

48 - Big Data Analytics for Singapore Public Train System

Nang Laik Ma, Senior Lecturer, SIM University, 461 Clementi Road, Singapore, 599491, Singapore, nlma@unisim.edu.sg, Beng Yee Wong

This paper focus on capacity planning of the Singapore public transport system. We analyse the commuters' travelling patterns from historical transactions data. Secondly, by simulating train schedule and capacity constraints, the model mimicked the real-world situations to generate the waiting time for each commuter. Finally, a web-based visualization tool is created to provide the average waiting time for the next train at the station to enhance the commuter's experience.

49 - Hospital Residents Problem: A Survey Including a New Variant

Kaitlyn Manley, College of Charleston, 66 George St, Charleston, SC, 29424, United States of America, manleykm@g.cofc.edu, Tyler Perini, Amy Langville

We survey several variations of the Stable Matching Problem, including the Hospital Residents Problem used to assign American medical residents to hospitals. We also present a new variation of the stable matching problem that uses an binary integer linear program to determine the minimum number of interviews that hospitals should conduct in order to still maximize the number of residents assigned.

50 - Exploring the Multi-objective Portfolio Tradespace

Simon Miller, Graduate Student, Penn State Applied Research Lab, P.O. Box 30, State College, PA, 16804, United States of America, ses224@arl.psu.edu, Gary Stump, Sara Lego, Michael Yukish

Faced with strategic choices, senior decision makers must often make trades to meet competing requirements. In collaboration with the U.S. Army, ARL has developed tools and methods to treat large scale, multi-objective optimization problems for binary portfolios with dynamic constraints. Methodology and implementation schema for real-world cases are presented, highlighting the ability to balance a combinatorial explosion of parameters in complex trades spaces with the need for timely decisions.

51 - Experimental Designs for Metal Detectors at Large Venues

Christie Nelson, Rutgers University, CCICADA, 4th Floor, CoRE building, 96 Frelinghuysen Rd, Piscataway, NJ, 08854, United States of America, christie.l.nelson.phd@gmail.com, Paul Kantor, John Edman, Vijay Chaudhary

Walk-through metal detectors (WTMDs) are being used increasingly more as a security measure at large events, particularly at stadiums. Currently, WTMDs are tested using a robotic tester which tests metallic objects at level heights by sending them straight through at a constant speed. However, this is not a proper representation of how a person would enter the WTMD. We will show that the way a person walks through the WTMD impacts detection rate through our experimental results.

52 - Leading Metrics for Progress Measurement and Performance Assessment in Construction Projects

Resulali Orgut, Graduate Research Assistant, North Carolina State University, Dept. of Civil, Cons. and Env. Eng., 2510 Stinson Dr., 222 Mann Hall, Raleigh, NC, 27695, United States of America, reorgut@ncsu.edu, Jin Zhu, Mostafa Batouli, Ali Mostafavi, Edward Jaselskis

Progress measurement and performance assessment are critical to the management of construction projects. We perform statistical analyses to highlight key indicators for successful construction project controls by using data collected through an online survey from 27 companies. We analyze core metrics commonly used in the construction industry to develop guidelines for improving their reliability and recommend practices for interpreting metrics and indicators.

53 - Toward Consistent and Efficient Anomaly Detection in Hyperspectral Imagery

Todd Paciencia, USAF, AF/A9, Pentagon, Washington D.C., United States of America, todd.j.paciencia.mil@mail.mil

This research will showcase development of an approach to making an unsupervised anomaly detector for Hyperspectral Imagery (HSI). The algorithm is developed to be robust to different image scenes, different sensors, and noisy spectral bands. Specifically, fusion of spectral, spatial, and Signal-to-Noise information is used, in combination with a factor analysis approach, to identify anomalies. The algorithm is shown to be desirable when compared to current state-of-the-art techniques.

54 - Comprehensive Performance Evaluation of High-gravity Carbonation Process in the Steelmaking Industry

Shu-Yuan Pan, National Taiwan University, No 71 Chou-Shan Rd., Taipei, 10673, Taiwan - ROC, d00541004@ntu.edu.tw, Pen-chi Chiang

An integrated portfolio of multi-waste treatment (steelmaking slag and wastewater) combined with CO₂ capture in the steelmaking industry can be achieved by the high-gravity carbonation (i.e., HiGCarb) process using a rotating packed bed (RPB). In this study, the HiGCarb process was comprehensively

evaluated according to engineering, environmental, and economic (3E) criteria using a cradle-to-gate life-cycle approach.

55 - Analysis on the Effect of Energy Efficient Technologies in Industry Sector using Times Model

Sang Yong Park, Senior Researcher, Korea Institute of Energy Research, Yuseong-gu, Gajeong-ro 152, Daejeon, 305-343, Korea, Republic of, gspeed@kier.re.kr, Jong Chul Hong, Nyunbae Park, Boyeong Yun

The South Korea established energy policy which is focusing demand management rather than energy supply to secure a stable energy supply and to cope with climate change efficiently through 2nd national energy basic plan in 2014. This research developed energy system model which can analyze the effect of energy efficient technologies on demand management based on TIMES(The Integrated MARKAL-EFOM System) model and conducted case study on industry sector in Korea.

56 - The Humility Project: NMF and Other Matrix Factorizations for Textual Analysis

Tyler Perini, Student, College of Charleston, 66 George St, Charleston, SC, 29424, United States of America, perinita@g.cofc.edu, Amy Langville

This is one of the first studies on the use of matrix decompositions as the primary engine for describing and predicting psychological characteristics in a corpus of language data. With text parsing tools, large written samples are parsed into a sparse matrix. A low-rank matrix factorization of a weighted version of this matrix is then used to determine which documents are humble and which are not humble. Three factorizations, the SVD, NMF, and weighted NMF, are compared.

57 - Distributed Online Modified Greedy Algorithm for Networked Storage Operation under Uncertainty

Junjie Qin, PhD Candidate, Stanford University, 126 Blackwelder Ct, 1004, Stanford, CA, 94305, United States of America, jqin@stanford.edu

The optimal control of energy storage networks in stochastic environments is an important open problem. This paper provides an efficient algorithm to solve this problem with performance guarantees. A sub-optimality bound for the algorithm is derived which can be minimized by solving a semidefinite program. Distributed implementation is derived based on alternating method of multipliers. Numerical examples verify our theoretical performance bounds and demonstrate the scalability of the algorithm.

58 - Should Retailers Adopt 3d Printing?

Sharareh Rajaei Dehkordi, PhD Candidate, New Jersey Institute of Technology, University Heights, Newark, NJ, 07102, United States of America, sr552@njit.edu, Wenbo Cai

Should retailers provide 3D printing services in addition to the traditional off-the-shelf product? We answer the question by examining retailers' optimal joint decisions on his inventory management policy and pricing scheme while considering consumers' heterogeneous preferences for self-designed, 3D printed products vs. off-the-shelf products. We use a multi-server queue with limited capacity to capture customers' production selection process and its impact on the retailer's expected profit.

59 - Stochastic Network Design with Decision-dependent Uncertainties

Nathaniel Richmond, University of Iowa, 14 MacLean Hall, Iowa City, IA, 52242, United States of America, nathaniel-richmond@uiowa.edu

Little research has been conducted on stochastic network design problems in which the probability distribution of future random events is affected by prior actions. However, such problems are ubiquitous and important. For example, planned reinforcements of a power network directly influence which nodes are more likely to fail. We present a stochastic two-stage programming model with decision-dependent uncertainties, discussing solution methods for the associated unique computational challenges.

60 - Scheduling Part-time Employees with Interactive Optimization

Robert Rose, President, Optimal Decisions LLC, 4 Kirby Lane, Franklin Park, NJ, 08823, United States of America, robertl.rose@verizon.net

Many employee scheduling problems are very challenging: they are hard combinatorial optimization problems that contain multiple objectives and 'soft' constraints. Such problems do not lend themselves to a pure optimization approach. A 'Human Centered' approach, will be described: an initial schedule is generated analytically through a series of heuristic procedures, and a final schedule is produced using an interactive graphics module. A prototype scheduling program will be demonstrated.

61 - Fast, Provable Algorithms for Isotonic Regression in All Lp-norms (to Appear At NIPS 2015)

Sushant Sachdeva, Postdoctoral Associate, Yale University, Yale Institute of Network Sciences, P O Box 208263, New Haven, CT, 06520, United States of America, sachdevasushant@gmail.com, Rasmus Kyng, Anup Rao

Given a directed acyclic graph G , and values y on the vertices, the Isotonic Regression of y is a vector x that respects the partial ordering given by G , and minimizes $\|x - y\|_p$, for a given norm. We present improved algorithms for Isotonic Regression for all weighted L_p norms, with rigorous performance guarantees. Our algorithms combine interior point methods with provable fast solvers for the associated linear systems. The algorithms are practical and lend themselves to fast implementations.

62 - Mathematical Modelling and Analysis of New Zealand Legislation Network

Neda Sakhaee, University of Auckland, 38 Princes Street, Auckland, New Zealand, nsak206@aucklanduni.ac.nz

In 2015 the concept of Legislation Network is proposed as a mathematical tool for studying the current and future status of the legislation system in European Union. Unlike perhaps the relations between documents are at least as important as the content. This type of network has some novel features which make it an excellent test case for new network science tools.

63 - Deadhead Selection Strategies for Crew Recovery

Sujeevraja Sanjeevi, Senior Operations Research, Sabre Holdings, 3150 Sabre Drive, Southlake, TX, 76092, United States of America, sujeevraja.sanjeevi@sabre.com, Chunhua Gao, Helder Inacio

Crew recovery is the problem of minimizing the impact of a disruption to an airline by getting disrupted crews back on plan while minimizing incurred costs. Deadheads are flights that transport crew members as passengers and are a critical part of crew recovery. Consideration of all available deadheads to recovery makes problem sizes prohibitive. We present a few deadhead selection strategies that significantly improve solution quality without impacting run-time for real-world scenarios.

64 - Talk is Cheap - Action is Expensive

Simone Schmid, University of Chemnitz, Huebschmannstrasse 24, Chemnitz, 09112, Germany, simone.schmid@wirtschaft.tu-chemnitz.de, Peter Pawlowsky

Adequate response to uncertain and unpredictable environmental changes requires innovative, agile, and adaptive team competencies. We use an interdisciplinary approach to assess and evaluate team competencies. From theory and previous research we derive indicators and test these by training teams accordingly. Experimental groups were given theoretical and practical trainings with regard to these team competencies. Control groups acted as usual. A succeeding standardized simulation in a high fidelity simulation environment showed significant effects with regard to team performance. From these results we propose behavioral markers for team competencies that can be used to assess team performance in critical situations.

65 - Euro/Roadef Challenge

Tejinder Singh, Air Liquide, 12800 W. Little York Rd, Houston, TX, United States of America, tejinder.singh@airliquide.com, Jean Andre, Michele Quattrone, Rodrigue Fokouop, Jeffrey Arbogast

The French OR Society (ROADEF) along with EURO, periodically organizes an OR challenge dedicated to industrial applications. This year, Air Liquide proposes the challenge problem concerning an IRP for the bulk distribution of liquefied gases. The challenge is open to everyone and will be presented during the EURO 2015 in Glasgow, Scotland in July 2015 and the results will be announced at EURO 2016 in Poznan, Poland. Prizes totaling 20,000 Euros will be awarded to the best teams.

66 - Usability Evaluation of a Mobile App to Reduce Congestive Heart Failure (CHF) Readmissions

Minal Singhee, Master's Student, H. John Heinz III College, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, msinghee@andrew.cmu.edu, Daniel Gartner, Rema Padman, Jina Lee, Sriram Iyengar

Congestive Heart Failure (CHF) is a major chronic condition affecting more than 5 million people in the US. CHF readmissions is one of the major contributors to the burgeoning healthcare cost. In our study, we evaluate factors associated with the usability and acceptability of a mobile application intended to reduce CHF readmissions. A fixed protocol was developed which included Think Aloud Protocol, Quiz and a Questionnaire. Qualitative and quantitative analyses were performed.

67 - An Optimization Approach to Warehouse Line Striping

Sudharshana Srinivasan, Research Scientist, Altria Client Services, 601 E. Jackson St., Richmond, VA, 23219, United States of America, sudharshana.srinivasan@altria.com, David Kane

We present a mixed-integer programming model to optimize product storage at an industrial warehouse, while adhering to safety standards stipulated by the county and the business. The model is applied to a tobacco warehouse and the results provide a storage solution comparable to current practice with an improved operational efficiency. The model recommends more walking aisles to facilitate increased spacing and airflow around the product; both of which are valued business objectives.

68 - Testing the Applicability of Genetic Algorithms for Simulation-based Healthcare Optimization

Cory Stasko, MIT, 4 Garden Court, Apt. #4, Cambridge, MA, 02138, United States of America, cstasko@mit.edu

We apply genetic algorithms to three distinct cases of highly non-linear healthcare optimization problems. In the first problem, OR schedules are designed to minimize downstream bottlenecks. The second problem involves network management for an accountable care organization. The third problem involves promoting the spread of ideas among connected professionals. In each case, the objective (fitness) function is the output of a simulation, and a brute force solution search is not feasible.

69 - How Do We Capture the Potential Risk of Intravenous Drug Infusion using Alert Data?

Wan-ting Su, Graduate Student, Purdue University, 3376 Peppermill Drive, West Lafayette, IN, 47906, United States of America, su333@purdue.edu, Poching Delaurentis, Mark Lehto

The use of smart infusion pumps is one such mechanism in ensuring the safety of medication infusions in clinical settings. We aim to utilize the data of different alert types from the Infusion Pump Informatics system to capture averted or potential medication errors and define and determine the overall risk of potential harm within a certain period of time in a medical facility. Our analysis can be used as a measure in improving intravenous medication safety and infusion drug-delivery process.

70 - Developing Freeway Demand Estimation Alternatives with Mixed Integer Linear Programming

Joseph Trask, North Carolina State University, 909 Capability Drive, Raleigh, NC, United States of America, jltrask@ncsu.edu, Behzad Aghdashi, John Baugh, Nagui Roupail

This research presents a Mixed Integer Linear Programming optimization model for traffic demand estimation based on the methodology developed in the Highway Capacity Manual (HCM). Due to a lack of uniqueness for solution demand sets, a Modeling to Generate Alternatives (MGA) approach is developed to investigate the wide ranges of optimal solution sets. These solution sets can be compared through their effects on intermediate performance measures and sensitivity analysis.

71 - Batch Testing of a Series System

Tonguç mloyurt, Sabanci University, Orhanli, Tuzla, Istanbul, Turkey, tonguc@sabanciuniv.edu, Ozgur Ozluk, Rebi Daldal, Baris Selcuk, Zahed Shahmoradi

We consider the problem of determining the correct value of an AND function when it is costly to learn the values of its variables, with the minimum expected cost. We refer to a subset of variables whose values can be learnt at the same time a meta-test. The cost of learning the values of the variables in a meta-test includes a fixed cost plus the costs of the tests in the meta-test.

72 - Shape-preserving L1 Spline Fits: Calculation and Capability

Ziteng Wang, Department of Industrial and Systems Engineering, North Carolina State University, 3120 Walnut Creek Parkway, Apt. E, Raleigh, NC, 27606, United States of America, zwang23@ncsu.edu, Tiantian Nie, Shu-chen Fang

L1 spline fits have been developed over the past decades to approximate multi-scale data and have been shown to preserve shapes well. Local approaches are designed for efficient calculation. Quantitative measures are proposed to evaluate the shape-preserving capability of different types of L1 spline fits.

73 - Evolutionary Optimization Tools of Nanostructures for Solar Cells

Baomin Wang, University of Pittsburgh, 1048 Benedum Hall 3700 O'Hara Street, Pittsburgh, PA, 15261, United States of America, baw57@pitt.edu

Simulation plays a significant role in optimizing solar cell efficiency. Current used optimization is exhaust search, only feasible for small group of parameters, 3 or 4. But for 7 or 8, it takes months. In this work, we integrate genetic algorithm with FDTD methods to optimize the nanostructure. This evolutionary method can decrease the simulation time to 1/6 of original time. This work demonstrates the ability of genetic algorithm technique to quickly search through a large parameter space.

74 - Surgical Operations Scheduling with Machine Eligibility and Resource Constraint

Shan Wang, Shanghai Jiaotong University, 704 West 180th Street, First Floor, #4, New York City, NY, 10033, United States of America, wangshan_731@sjtu.edu.cn, Guohua Wan, Huiqiao Su

We study a problem in surgical operations scheduling and model it as a resource-constrained machine scheduling problem with eligibility restriction to minimize the makespan. By decomposing it into two subproblems, we develop effective heuristic algorithms to solve the problem. We test the proposed algorithms on randomly generated instances as well as real data set from a large hospital. The numerical results show the effectiveness and potential practical value of the models and the algorithms.

75 - Optimizing System-Level Preventative Maintenance Cost of Multistate Series-Parallel Systems

Sallamar Worrell, The George Washington University, 3117 Icehouse Place, Bryans Road, MD, 20616, United States of America, skaw7@gwu.edu, James Moreland Jr., Steve Doskey

Maintenance costs for complex systems are often overpaid due to the lack of maintenance harmony between the individual subsystems. The research in this study proposes the use of a new meta-heuristic optimization method, the Grey Wolf Optimizer algorithm developed by Mirjalili and Lewis, to identify the optimal system-level maintenance strategy for multistate series-parallel systems and aims to produce better results than the methods previously applied to this problem in published literature.

76 - Predicting Digital Currency Price from Social and Traditional Media

Peng Xie, Georgia Institute of Technology, Room 907, 100 10th Street, Atlanta, GA, 30309, United States of America, peng.xie@scheller.gatech.edu

Using daily Bitcoin price data and Bitcoin Forum discussion, we try to understand if social media can affect Bitcoin price and how long does it take. We use the percentage of negative words as the measure of the article sentiment. The results show that social media can affect price. However, for information sources focusing on speculation, the effects on prices are immediate. In contrast, information concerning fundamentals impacts prices in a longer holding period.

77 - The Dimensions of Supervision-subordinate Relationship

Liuqing Yang, Xi'an Jiaotong University, No.28, Xianning West Road, Xi'an, China, yqlq2011@stu.xjtu.edu.cn, Qiaozhuan Liang

Subordinate can form distinguishable social exchange relationships with their immediate supervisor. The exchange resources differ between organizational and personal. Based on the taxonomy, social exchange relationship can development a construct of four dimensions: work, flatter, private, selfless. Various dimension have different impact on performance as a mediator or intervening variable. The construct can explain the puzzle of relationship between social exchange relationship and performance.

78 - Counterfeits, Anti-counterfeit Technology and Monitoring Strategy

Shiqing Yao, The Chinese University of Hong Kong, 9/F, Cheng Yu Tung Building, No.12 Chak Cheung Street, Shatin, N.T., Hong Kong, Hong Kong - PRC, sqyaochuk@gmail.com, Kaijie Zhu

We consider an authentic company that sells its products to a customer market. In the same market, a counterfeiter may sell its low-quality counterfeits. The authentic company can put effort into developing an anti-counterfeit technology to distinguish its products from counterfeits while the authority can monitor the market and outlaw counterfeiting localities. We derive the company's optimal decision on its anti-counterfeit effort and highlight its difference from conventional wisdom.

79 - Optimization of Area Traffic Control: A Binary Mixed Integer Linear Programming Approach

Zhao Zhang, Research Assistant, Tsinghua University, Room 615, Shunde Building, Haidian District, Beijing, 100084, China, zzaxx@tsinghua.edu.cn

This paper proposes a model aims at optimizing area traffic control. We use network total delay as the objective in the model. In this research, cell transmission model is used to discretize research time into many intervals and signal coordination, lane settings, phase, start of green and green split can be optimized simultaneously. The model is linear in nature and can be solved by standard branch and bound algorithm.

80 - Identify Naturally Occurring Healthcare Provider Referral Networks for Diabetic Patients

Yuchen Zheng, PhD Student, Georgia Institute of Technology, Atlanta, GA, 30032, United States of America, richardzyc@gatech.edu, Kun Lin, Jeremy Pickreign, Thomas White, Gigi Yuen

The pioneer Accountable Care Organizations (ACOs), where doctors voluntarily form groups to deliver coordinated quality care, saved Medicare \$400 million in two years. To improve ACOs design, we utilize past care patterns and adopt modularity maximization to detect pre-existing referral networks for diabetic patients, within which doctors share patients frequently. We further identify the

driving forces of the underlying community structures and understand the relation to cost and utilization.

81 - Real-time Heat Exchanger Efficiency Monitoring

Yousif Abualsoud, Saudi Aramco, Al-Midra, Dhahran, Saudi Arabia, yousif.abualsoud@aramco.com

Saudi Aramco Engineering Services developed a systematic model to calculate shell and tube heat exchangers efficiency in real time using data analytics technique. Monitoring the heat exchanger efficiency in real time supports the decisions making to plan for turnaround time by detecting the failure time proactively. Moreover, it provides the field engineers continuous monitoring to energy consumer and highlights the wasted energy locations, quantity and cost.

82 - A Decision-analytic Approach to Inferring Preference from Choice Behavior

Matthew D. Wood, Research Psychologist, US Army Engineer Research & Development Center, Concord, MA, United States of America, Matthew.D.Wood@usace.army.mil, Matthew Bates, Danielle M. Beeler, Jeffrey M. Keisler

Decision making in resource management requires consideration of multiple conflicting objectives. Traditional elicitation methods (e.g., swing weighting) work well with clearly defined problem spaces and effects between decisions and consequences. In more complex domains, an inferential approach is needed to estimate preference using system feedback over samples with subject-matter experts. We describe a decision analysis game with an environmental case study problem.

83 - Artificial Variability and Case Mix in Relation to Patient Flow at a Hospital Outpatient Clinic

Monique Bakker, City University of Hong Kong, Hong Kong, 999077, Hong Kong-PRC, moniquebakker121@gmail.com

We aim to improve the patient flow through first, second, and nth visits to a specialist outpatient clinic and elective surgery. We investigate variability in key resource availability (i.e. the specialists) in relation to case mix decisions, sub-specialization restrictions, and resource allocation: how is indirect wait time (or access time). We use Discrete Event Simulation to schedule patients under a broad and realistic set of rules and restrictions to compare alternate scenarios.

Tuesday, 1:30pm - 3:00pm**TC01**

01-Room 301, Marriott

Logistics and Operations Research

Sponsor: Military Applications

Sponsored Session

Chair: Andrew Hall, COL, U.S. Army, 4760 40th St N, Arlington, Va, United States of America, AndrewOscarH@aol.com

1 - Scheduling the Transition of the C-130 Aircraft Fleet to a New Maintenance Process

Melissa Bowers, mrbowers@utk.edu, Bogdan Bichescu, Kenneth Gilbert, Anurag Agarwal, Doug Keene

The US Air Force is tasked to increase aircraft availability through a new initiative, the High Velocity Maintenance program, which seeks to increase availability of aircraft to the US military through a reduction in the time an aircraft spends on the ground undergoing planned maintenance. The transition of a fleet of aircraft from the standard process to shorter HVM cycles is a complex task that requires careful planning. A mixed-integer programming approach is used to generate a schedule which maintains a constant annual workload and yields lower flow times and work-in-process levels.

2 - Learning and Bayesian Updating in Made-to-order (MTO) Production

Keith Womer, Professor, University of Missouri - St. Louis, One University Blvd, St. Louis, MO, 63121, United States of America, womerk@umsl.edu, Jeffrey Camm, Haitao Li, Colin Osterman, Rajesh Radhakrishnan

The case of production planning for made-to-order (MTO) manufacturing. We minimize expected discounted cost by controlling production rate. A dynamic and adaptive approach to estimate the effects of learning and to optimize next period production is developed. This approach offers a closed-loop solution through stochastic dynamic programming. The approach is illustrated using data from the Black Hawk Helicopter Program.

3 - Retail Inventory Optimization for the U.S. Navy

Javier Salmeron, Naval Postgraduate School, Operations Research Dept., GL-214, Monterey, CA, 93943, United States of America, jsalmero@nps.edu, Emily Craparo

We present a mixed-integer linear model to guide retail (site-based demand level) inventory decisions for the Naval Supply Systems Command (NAVSUP), Weapons Systems Support. An (s,Q) model optimizes reorder points and order quantities for thousands of items in order to minimize deviations from target fill rates, with demand uncertainty, budget and order quantity constraints. We compare branch-and-bound with Lagrangian relaxation solutions, and our results with those from other NAVSUP tools.

Network Applications in Homeland Security

Cluster: Homeland Security

Invited Session

Chair: Thomas Sharkey, Rensselaer Polytechnic Institute, 110 8th Street, Troy, NY, 12180, United States of America, sharkt@rpi.edu

1 - Novel Bilevel Programming Approaches for Interdicting Multi-tiered Illegal Supply Chains

N. Orkun Baycik, Rensselaer Polytechnic Institute, 110 8th Street, Center for Industrial Innovation, Troy, NY, 12180, United States of America, baycin@rpi.edu, Thomas Sharkey, Chase Rainwater

We study a resource allocation problem faced by law enforcement in arresting criminals in the drug flow and information flow networks. The objective of law enforcement is to minimize the maximum amount of drugs reaching end users. There exist interdependencies between the networks which leads to a network interdiction problem with a discrete inner problem. We apply a novel dual-based reformulation technique to solve an equivalent single-level problem and present computational results.

2 - Bi-level Stochastic Network Interdiction Model for Deployment of Cyber-security Countermeasures

Apurba Nandi, Mississippi State University, P.O. Box 9542, Mississippi State University, Mississippi State, MS, 39762, United States of America, akn77@msstate.edu, Hugh Medal

We study how best to deploy cyber-security countermeasures to protect a cyber-network against attacks. We propose a bi-level stochastic network interdiction model capturing the interaction between the attacker and the defender as a sequential stackelberg game played on an attack graph. We consider that the attacker's knowledge about the topology of the attack graph, and the attacker's and the defender's knowledge about each other's actions are uncertain. We develop algorithm to solve the model.

3 - Vitality Measures for Multigraphs with Applications to Communications Networks

Sarah Nurre, Assistant Professor, Air Force Institute of Technology, 2950 Hobson Way, WPAFB, OH, 45433, United States of America, Sarah.Nurre@afit.edu, Christopher Hergenreter

We consider the problem of determining the most vital arcs to protect within a multigraph, such as a communications network. Traditional vitality measures are insufficient as they often examine single arc failures which have no impact on multigraphs due to parallel arcs between pairs of nodes. Herein, we propose and examine set based vitality measures for multigraphs. We perform and present the results of promising computational results multi-mode military communications networks.

4 - Efficient Resilience Optimization of Interdependent Networks

Andres Gonzalez, Rice University, 6100 Main Street, MS-318, Ryon 203, Houston, TX, 77005, United States of America, andres.gonzalez@rice.edu, Leonardo Dueñas-osorio, Andres Medaglia, Mauricio Sánchez-silva

MIP models of the Interdependent Network Design Problem (INDP) have proved to be effective tools to study and improve the resilience of systems of interdependent infrastructure networks. Nevertheless, these MIP models have limited scalability for large realistic systems. In this work, we present an enhanced methodology to optimize the resilience of interdependent networks, based on the joint use of decomposition techniques and efficient reformulations of the INDP models.

Inventory Management I

Contributed Session

Chair: Jun-yeon Lee, California State University, Northridge, 18111 Nordhoff St, Northridge, CA, 91330-8378, United States of America, junyeon.lee@csun.edu

1 - Forecasting of Demand Tail Distribution for Inventory Optimization

Antony Joseph, Staff Data Scientist, Walmart Labs, 1001 National Avenue, Apt. 107, San Bruno, CA, 94066, United States of America, AJoseph0@walmartlabs.com

We discuss a novel technique for forecasting demand tail distribution for items in the Walmart e-commerce inventory. The methodology first estimates the quantiles of the demand distribution, followed by fitting a parametric distribution using a suitable metric. The method is seen to be robust to high observed variability in demand. Performance of the proposed approach is assessed using Supply Chain metrics such as Weeks of Supply and Met Demand.

2 - Strategic Safety Stocks under Guaranteed Service and Constrained Service Models

Ton De Kok, TU Eindhoven, Paviljoen E.04, P.O. Box 513, Eindhoven, Netherlands, a.g.d.kok@tue.nl

In this presentation we discuss our findings on a set of real-life supply chains concerning the positioning of safety stocks in the supply chain. We compare the results from models under the guaranteed service assumption and under the constrained service assumption. The latter assumption follows the classical Clark and Scarf model for serial multi-echelon systems. Furthermore, we discuss some implications of the guaranteed service assumption in case of a bounded demand formulation.

3 - Scarcity Effect on Dual-channel Supply Chain

Baoshan Liu, PhD Student, Huazhong University of Science and Technology, School of Management, 1037 Luoyu Road, Wuhan, China, liubaooshan@qq.com, Shihua Ma

We consider manufacturer's dual-channel sale system where customers get the product the direct channel with limited quantity. The limited quantity of the direct channel releases a scarcity message that consumers will increase their purchasing desire. Both the manufacturer and the retailer choose their own decision variable to maximize their respective profits considering scarcity effect. We model the problem using Stackelberg games and try to find the best solution from different perspectives.

4 - An Optimal Inventory Replenishment Considering Product Life Cycle

Shunichi Ohmori, Assistant Professor, Waseda University, Room 51-15-05, Okubo 3-4-1, Shinjuku, Tokyo, 169-8555, Japan, ohmori0406@gmail.com, Kazuho Yoshimoto

We consider a problem of determining initial and replenishment order quantities that minimize the cost of lost sales, inventory holding cost, fixed ordering cost, and obsolete inventory subject to stochastic demands. We model this problem as a multi-stage problem where the demands and prices of products lie in some uncertainty set depending on their life cycle. We develop a dynamic programming method to solve this problem.

5 - Vendor-managed Inventory with a Time-dependent Stockout Penalty

Jun-yeon Lee, California State University, Northridge, CA, 18111 Nordhoff St, Northridge, CA, 91330-8378, United States of America, junyeon.lee@csun.edu

We examine the problem of designing a vendor-managed inventory (VMI) contract with a time-dependent stockout penalty in a stochastic (Q, r) inventory system, in which the supplier is charged a stockout penalty that depends on the length of the time during which stockouts occur at the customer. The customer chooses the stockout penalty and offers the VMI contract to the supplier, and the supplier can accept or reject the contract. We examine the optimal behaviors of the two parties.

Social Media Analytics Best Papers Finalist Competition

Cluster: Social Media Analytics

Invited Session

Chair: Theodore Allen, Associate Professor, The Ohio State University, 1971 Neil Avenue, 210 Baker Systems, Columbus, OH, 43221, United States of America, allen.515@osu.edu

1 - Social Media Analytics: The Effectiveness of Marketing Strategies in Online Social Media

Vilma Todri, PhD Candidate In Information Systems, NYU, 44 W 4th St, KMC Room 8-181, New York, NY, 10012, United States of America, vtodri@stern.nyu.edu, Panagiotis Adamopoulos

This paper studies a novel social media venture and seeks to understand the effectiveness of marketing strategies in social media platforms by evaluating their impact on participating brands. We use a real-world data set and employ a promising research approach combining econometric with predictive modeling techniques.

2 - Predicting Crowd Behavior with Big Public Data

Nathan Kallus, MIT, 77 Massachusetts Ave., E40-149, Cambridge, MA, 02139, United States of America, kallus@mit.edu

We present efforts to predict the occurrence, specific timeframe, and location of crowd actions before they occur based on public data collected from over 300,000 open content web sources in 7 languages, from all over the world, ranging from mainstream news to government publications to blogs and social media.

3 - Participation vs. Effectiveness of Paid Endorsers in Social Advertising Campaigns: A Field Experiment

Jing Peng, The Wharton School, University of Pennsylvania, 3730 Walnut Street Suite 500, Philadelphia, PA, 19104, United States of America, jingpeng@wharton.upenn.edu, Christophe Van den Bulte

We investigate the participation and effectiveness of paid endorsers in viral-for-hire social advertising. Specifically, we investigate (i) how financial incentives affect potential endorsers' participation and effectiveness in generating online engagements (likes, comments, and retweets), and (ii) which network characteristics and prior engagement characteristics are associated with participation and effectiveness. We conduct a large scale field experiment with an invitation design in which we manipulate both financial incentives and the soft eligibility requirement to participate in the campaign. The latter provides a strong and valid instrument to separate participation from outcomes effects. Since likes, comments, and retweets are count variables, and since potential endorsers can self-select to participate in multiple campaigns we ran, we use a Poisson lognormal model with sample selection and correlated random effects to analyze variations in participation and effectiveness. There are three main findings. (1) Financial incentive did not affect either participation or effectiveness. (2) Potential endorsers more likely to participate are often less effective. (3) Which characteristics are associated with effectiveness depends on whether success is measured in likes, comments, or retweets. Our findings provide new insights on how marketers can improve social advertising campaigns by better targeting and incenting potential endorsers.

4 - A Visual Monitoring Technique Based on Importance Score and Twitter Feeds

Zhenhuan Sui, Graduate Research Assistant, The Ohio State University, 2501 Gardenia Drive, Columbus, Oh, 43235, United States of America, sui.19@osu.edu, David Milam, Theodore Allen

We propose a visual monitoring technique based on topic models, a point system, and Twitter feeds for monitoring. The method generates a chart showing the important and trending topics that are discussed over a given time period which is illustrate the methodology using cyber-security cases.

1 - Big Data Means Big PR: A Review of News Coverage of Big Data in the Popular Press

Amir Gandomi, Assistant Professor, Ryerson University, 350 Victoria Street, Toronto, ON, M5B 2K3, Canada, agandomi@ryerson.ca, Murtaza Haider

In this paper, we undertake a content analysis of the news feed regarding big data analytics. We develop a corpus of related news items. We code the corpus and prepare it for analysis by the Natural Language Processing (NLP) algorithms. Our purpose is to conduct a systematic analysis of the news contents to determine the primary themes being projected by the proponents of big data. We will explore ways to identify real value content that may help to draw meaningful inferences.

2 - Modeling Message Dissemination in Social Media for Emergency Communication

Justin Yates, Professor, Francis Marion University, 4822 E Palmetto St, Florence, SC, United States of America, jyates@fmarion.edu, Xin Ma

We introduce the Single-network Multi-message Social Media Message Dissemination Problem (SM-SMMDP) as a discrete optimization model to examine message dissemination in social media and to explore message dissemination strategies for government and non-government emergency management agencies. We implement a detailed computational experiment on representative small-scale networks and discuss implications for real-world application.

3 - Analyzing and Predicting Threatening Language in #gamergate Tweets

Cheyenne Baird, Senior Linguistic Specialist, SAS Institute Inc., Boston Regional Office, Prudential Tower, 800 Boylston St., Suite 2200, Boston, MA, 02199, United States of America, Cheyenne.Baird@sas.com, Michael Wallis, Praveen Lakkaraju

Aggressive language in online communities can thrive, escalate, and signal palpable threat. This is apparent in #gamergate tweets. Using SAS Text Analytics, we will show how language transitions from negative sentiment to threatening language in #gamergate tweets, building a model to predict probable threat in social media.

Dynamics and Information in Commodity Markets

Sponsor: Financial Services

Sponsored Session

Chair: Richard Sowers, Professor, University of Illinois at Urbana-Champaign, Urbana, IL, 61801, United States of America, r-sowers@illinois.edu

1 - Model Uncertainty in Commodity Markets

Sebastian Jaimungal, University of Toronto, Department of Statistical Sciences, Toronto, Canada, sebastian.jaimungal@utoronto.ca, Ivaro Cartea, Zhen Qin

This paper studies the effect that model ambiguity in commodities have on the value of derivative contracts. The base model consists of three drivers: a mean-reverting diffusion, a mean-reverting jump, and a stochastic volatility component. We allow the agent to consider a wide class of alternate models, and penalize the differing components of the model individually. We demonstrate how agents alter their behavior in the presence of ambiguity and how derivatives and spreads are affected by it.

2 - Index Tracking with Futures

Brian Ward, Columbia University, New York, NY, bmw2150@columbia.edu, Tim Leung

Exchange Traded Funds (ETF) market continues to grow. Many ETFs are designed to track an index, and their leveraged benchmarks (2x, 3x, etc.) Since many of these indices are not directly traded, we consider tracking them using futures of various maturities. We do so both statically and dynamically, and backtest our strategies with empirical data.

3 - Investment in Commodities ETFs and Management of Contango

Andrew Papanicolaou, NYU Polytechnic, 6 Metrotech Center, Brooklyn, Ny, 11201, United States of America, apapanic.brown@gmail.com

The last two decades have seen growing investment in commodities markets. Commodities ETFs are popular but not a passive investment, as they will post losses in contango markets. The focus of this talk will be storable commodities, where uncertainty in the convenience yield reduces the Sharpe ratios. Losses are seen as an information premium, which is quantified through a Merton-type control problem.

4 - Speculative Oil

Anna Kruglova, Research Affiliate, MIT Center for Finance and Policy, 30 Memorial Drive, Cambridge, MA, 02142, United States of America, Kruglova@mit.edu, Andrei Kirilenko

The long-standing framework predicated on a premise that producers are the main drivers of energy prices, the so-called "hedging pressure" theory, has been shown to be less consistent with the empirical regularities present in the oil prices. We hypothesize that with the influx of financial investors, the last needed barrel is traded not between a hedger and a speculator, but between two speculators: a commodity trader and/or a bank. We use granular information on shipments of seaborne crude oil into the US during 2008-2012 to examine the industry structure and determine who holds the crude oil that supports the determination of prices in financial markets.

Systemic Risk: Methods and Models

Cluster: Risk Management

Invited Session

Chair: David Brown, Duke University Fuqua School of Business, 1 Towerview Rd, Durham, NC, United States of America, dbbrown@duke.edu

1 - Time-varying Systemic Risk: Evidence from a Dynamic Copula Model of CDS Spreads

Dong Hwan Oh, Economist, Federal Reserve Board, 20th Street and Constitution Avenue N.W., Washington, DC, 20551, United States of America, donghwan.oh@frb.gov, Andrew Patton

This paper proposes a new class of copula-based dynamic models for high-dimensional conditional distributions, facilitating the estimation of a wide variety of measures of systemic risk. We use the proposed new models to study a collection of daily credit default swap spreads on 100 U.S. firms. We find that while the probability of distress for individual firms has reduced since the financial crisis of 2008-09, the joint probability of distress is substantially higher now than in the pre-crisis.

2 - An Optimization View of Financial Systemic Risk Modeling

Nan Chen, Prof, Chinese University of Hong Kong, 709A William Mong Engineering Building, Hong Kong, Hong Kong - PRC, nchen@se.cuhk.edu.hk, Xin Liu, David D. Yao

We develop an optimization-based formulation on financial systemic risk. A partition algorithm is constructed to solve the problem. The sensitivity analysis helps us identify two multipliers to characterize the amplification effects caused by liability networks and market liquidity. The effects of policy intervention are also discussed in the paper.

3 - Optimal Capital Requirements in Interbank Networks with Fire Sales Externality

Jongsoo Hong, Duke University, 1 Towerview Rd, Durham, NC, 27707, United States of America, jongsoo.hong@duke.edu, David Brown

We consider an interbank network with fire sales externality and study the problem of optimally trading off between capital reserves and systemic risk. We find that the optimal capital requirements is a solution to a stochastic linear programming without fire sales externality and a stochastic mixed integer programming with fire sales externality. We offer an iterative algorithm that converges to the optimal. We demonstrate the methods on an example using data from a central bank.

Different Facets of Innovation: Product, Technology and Business Models

Cluster: Business Model Innovation

Invited Session

Chair: Serguei Netessine, Professor, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Serguei.Netessine@insead.edu

1 - Identifying and Analyzing Styles in Design Patents

Tian Chan, INSEAD, TianHeong.CHAN@insead.edu, Jurgén Mihm, Manuel Sosa

We introduce an approach to identify styles (categories of product designs similar in form) among 400,000 US design patents. We combine state-of-the-art clustering techniques with experimental validation to create, for the first time, a dataset of styles. Building on this platform, we find that i) the level of turbulence (unpredictability of changes) in styles follows a U-shaped pattern to the level of turbulence in functionality, and ii) styles turbulence is increasing over time.

2 - Free Riding in Team Projects: The Role of the Leadership Style

Morvarid Rahmani, Assistant Professor, Georgia Tech, morvarid.rahmani@scheller.gatech.edu, Uday Karmarkar, Guillaume Roels

In order to remain innovative in today's global market, firms are increasingly organizing work around teams. In this paper, we investigate the role of the leadership style (autocratic or democratic) on free-riding in teams and characterize which leadership style is the most efficient depending on the project characteristics.

3 - Different Approaches to Crowdfunding: Kickstarter vs. Indiegogo

Simone Marinesi, Wharton, 562 Jon M. Huntsman Hall, 3730 Walnut St, Philadelphia, PA, 19104, United States of America, marinesi@wharton.upenn.edu, Karan Girotra

We compare the different modes of interaction between backers and creators offered in the two most famous crowdfunding platforms, and provide prescriptions on their implementation, taking the view of project creators.

4 - Are Good Idea Generators also Good at Evaluating Ideas

Otso Massala, INSEAD, 1 Ayer Rajah Avenue, Singapore, Singapore, Otso.MASSALA@insead.edu

Using data collected from a series of innovation tournaments we relate different business opportunity generation skills with evaluation skills. We find that prolific generators are worse evaluators while generators that produce high quality ideas tend to also be good at evaluating. We provide implications for design of innovation tournaments and innovative organizations.

1 - Time-Based Crowdsourcing Contests

Ersin Korpeoglu, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, United States of America, ekorpeog@andrew.cmu.edu, Laurence Ales, Soo-Haeng Cho

We study a crowdsourcing contest wherein a seeker solicits a population of agents to solve a problem. Each agent's stochastic solution time depends on her effort and expertise. We show that it is optimal for the seeker to screen and compensate only the highest-expertise agents when their solution times are less uncertain, but a larger group of agents when they are highly uncertain. An agent's optimal compensation is based on her solution time and whether the seeker can observe agents' efforts.

2 - Payoffs in Contests

Kevin Boudreau, Harvard University and London Business School, Harvard Business School, Cambridge MA, United States of America, kboudreau@hbs.edu, Karim Lakhani, Nichale Menietti

Many tournament outcomes possess signaling value. In this article, the results of a field experiment on signaling incentives are presented. Using a structural model, we obtain estimates of the value of nominal prizes, as well as extra value associated with the contest. Signaling and cash values exhibit large interaction effects. In all conditions, the perceived value of the prizes differs from the nominal value. Competitors tend to undervalue small prizes and overvalue large prizes.

3 - Achieving Efficiency in Dynamic Contribution Games

George Georgiadis, Assistant Professor, Northwestern University, 2001 Sheridan Rd, Evanston, IL, 60208, United States of America, g-georgiadis@kellogg.northwestern.edu, Jaksa Cvitanic

We analyze a dynamic contribution game, in which a group of agents exert costly effort over time to make progress on a project that generates a lump-sum payoff once the cumulative effort reaches a pre-specified threshold. We characterize a budget balanced mechanism which overcomes the free-rider problem, and at every moment, induces each agent to exert the first-best effort level in a Markov Perfect Equilibrium. Applications include early-stage entrepreneurial ventures and joint R&D ventures.

4 - Creativity under Fire: The Effects of Competition on Creative Production

Daniel P. Gross, Post-doctoral Fellow, NBER/Harvard Business School, Soldiers Field Road, Boston, MA, 02163, United States of America, dgross@hbs.edu

This paper studies the incentive effects of competition on individuals' creative production. Using a sample of commercial logo design competitions, and a novel, content-based measure of originality, I find that competition has an inverted-U effect on creativity. The results reconcile conflicting evidence from an extensive literature on the effects of competition on innovation, with implications for R&D policy, competition policy, and organizations in creative or research industries.

1 - Does the Adoption of EMR Systems Inflate Medicare Reimbursements?

Kartik Ganju, Temple University, Fox School of Business, Philadelphia, PA, United States of America, tuc67632@temple.edu, Hilal Atasoy, Paul Pavlou

We study if the adoption of the CPOE system is associated with an increase in the complexity of the case mix that hospitals report (upcoding). We use the staggered roll-out of the Recovery Audit Program as a natural experiment to assess the impact of the adoption of the CPOE systems on the case mix that a hospital reports. We find that the adoption of CPOE systems is associated with an increase in the reported case mix of hospitals but the Audit program has had an effect on reducing this.

2 - Profit Complementarities in Adopting Electronic Medical Records by U.S. Hospitals

Jianjing Lin, University of Arizona, 1130 E Helen St, Tucson, AZ, 85719, United States of America, jianjingl@email.arizona.edu

This paper tries to examine by how much hospitals' profit can be increased if they choose the locally market-leading vendor. Using a nationwide sample of U.S. hospitals from 2006 to 2010, I construct a dynamic oligopoly model and recover the model primitives with a classic approach in Economics. I find hospitals gain significant benefits from choosing the local leader and if hospitals were incentivized to choose such a technology, it would help improve the market coordination substantially.

3 - Get in Shape with Online Friends: Obesity and Social Networks

Behnaz Bojd, University of Washington, Seattle WA, United States of America, behnaz@uw.edu, Yong Tan, Lu Yan

Obesity is one of the most prevalent health problems in the world. Individuals suffering from this condition may use online social networks to get medical information or emotional support. In this study, we examine the effects of online social networking on individual weight-loss behavior, using a unique data set from a platform where people can track their weight, seek food and fitness information, share experiences, find buddies, and participate in different challenges.

4 - Digital Word-of-mouth and Consumer Demand for Credence Services: Evidence from a Natural Experiment

Aishwarya Deep Shukla, PhD Student, University of Maryland, College Park, 3330C R H Smith School of Business, College Park, 20742, United States of America, adshukla@rhsmith.umd.edu, Ritu Agarwal, Gordon Gao

This paper examines the impact of online word-of-mouth on consumer demand for credence services. We utilize a natural experiment setting from one of the largest physician appointment booking platforms in India, when the website made the doctor "recommendations" visible to users. In addition, we explore the long term effect of this visibility of recommendations in the context of matching the severity of the patient to the skill of the doctor.

Advances in Discrete Optimization

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Gustavo Angulo, Assistant Professor, Pontificia Universidad Católica de Chile, Vicuña Mackenna 4860, Macul, Santiago, 7820436, Chile, gangulo@ing.puc.cl

1 - Optimization over Structured Subsets of Positive Semidefinite Matrices via Column Generation

Sanjeeb Dash, IBM Research, Yorktown Heights, NY, United States of America, sanjeebd@us.ibm.com, Amir Ali Ahmadi, Georgina Hall

We describe LP and SOCP algorithms that optimize over some structured subsets of the cone of positive semidefinite matrices (PSD cone) in an iterative fashion via column generation, starting with an initial linear approximation of the PSD cone given by Ahmadi and Majumdar (2014). We apply our techniques to sum-of-squares programming for nonconvex polynomial optimization problems, and to a copositive programming relaxation of the stable set problem.

2 - Cutting Planes from Extended LP Formulations

Merve Bodur, UW-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, mbodur@wisc.edu, Sanjeeb Dash, Oktay Gunluk

For mixed-integer sets, we study extended formulations of their LP relaxations. We show that applying split cuts to such extended formulations can be more effective than applying split cuts to the original formulation. For any 0-1 mixed-integer set with n integer and k continuous variables, we construct an extended formulation with $2n+k-1$ variables whose split closure is integral. We extend this to general mixed-integer sets and construct the best extended formulation with respect to split cuts.

3 - Robust (MONOTONE) Submodular Function Maximization

Rajan Udhwani, ORC, MIT, 70 Pacific Street, 324C, Cambridge, MA, 02139, United States of America, rudhwani@mit.edu, James Orlin, Andreas Schulz

Consider two common instances of monotone submodular function maximization with cardinality constraint, feature selection (machine learning) and sensor placement. In both, it is often the case that out of the chosen set of features (sensors), some may be corrupt (may fail). Thus, we would like our chosen set to be robust to removal of some elements. We consider a previously known formulation of this problem and give the first constant factor approximation algorithms.

4 - On a Semicontinuous Relaxation of Fixed-charge Network Flow Problems

Gustavo Angulo, Assistant Professor, Pontificia Universidad Católica de Chile, Vicuña Mackenna 4860, Macul, Santiago, 7820436, Chile, gangulo@ing.puc.cl

Usual formulations of fixed-charge network flow problems make use of binary variables to indicate whether an arc is open or not, and to impose lower and upper bounds on the flow whenever an arc is used. We propose a relaxation where both binary and flow variables are treated as unbounded semicontinuous variables. We derive a complete linear description of the convex hull of this relaxation and show the tractability of the associated separation problem.

Optimization Integer Programming I

Contributed Session

Chair: John Chinneck, Professor, Carleton University, Systems and Computer Engineering, 1125 Colonel By Drive, Ottawa, ON, K1S5B6, Canada, chinneck@sce.carleton.ca

1 - School Districting Problem (SDP) Framed as a Spatial Optimization Model/mixed Integer Program

Shawn Helm, Senior Manager, Portland Public Schools, 501 North Dixon Street, Portland, OR, 97227-1807, United States of America, shelm@pps.net, Will Kearney, Sahan Disnayake

SDPs assign neighborhoods to schools given physical, demographic, and policy constraints. We control capacity; compactness; contiguity; amount of demographic change. Users specify class size; grade band; neighborhood capture assumptions; room uses; which current assignments are retained. The integrated framework uses real GIS data from Portland Public Schools and available solvers to identify best school-neighborhood assignments; solves model to display results and inform boundary decisions.

2 - Facility Location Problem with Appointment Scheduling in Healthcare

Mengnan Chen, University of Central Florida, Department of IEMS, Orlando, FL, 32816, United States of America, cmn891127@knights.ucf.edu, Qipeng Zheng

Facility location problem with appointment scheduling in healthcare is used to schedule elective surgeries for physician, as well as to provide multiple choices for patients. Facility location problem aims to improve the match between healthcare resources (physician, clinic location) and patient needs (preferences and types of diseases). By solving this problem, we can meet the minimum of loss for the hospital (the total travel time) and satisfied the each patient preference as much as possible.

3 - Exploiting Variability with Machine Learning Based Restart Strategies for MIP Solvers

Lars Beckmann, University of Paderborn, Warburger StraÙe 100, Paderborn, De, 33100, Germany, lars.beckmann@gmail.com

Performance variability, a.k.a. the heavy-tail phenomenon, can greatly affect the solution time of combinatorial problems, especially mixed-integer programming (MIP) models. We present a machine learning based restart strategy that exploits variability for quickly solving MIP problems. We show that this approach is effective on a large dataset of MIP models. Our approach can be integrated in any MIP solver and can potentially be generalized for solving other combinatorial problems as well.

4 - Faster Infeasibility Analysis for Mixed Integer Linear Programming

John Chinneck, Professor, Carleton University, Systems and Computer Engineering, 1125 Colonel By Drive, Ottawa, ON, K1S5B6, Canada, chinneck@sce.carleton.ca, Andrew Scherr

Finding an Irreducible Infeasible Subset of Constraints in an infeasible mixed integer linear program is extremely time consuming due to the need to solve many different MILPs. We present a number of new algorithms that greatly speed the process of analyzing infeasibility by reducing the number and size of MILP subproblems solved.

5 - Algorithms for Determining Internal Credit Ratings

Srinivas Bollapragada, Chief Engineer, General Electric, 1 Research Circle, Niskayuna, NY, 12309, United States of America, bollapragada@ge.com, Xing Wang

Financial Institutions assign credit ratings to customers for managing risks. Underwriters use these ratings to determine risk-based pricing. We developed an efficient algorithm to assign credit ratings to customers. Our algorithm partitions the probability of defaults associated with customers into a specified number of risk classes to achieve a target mean probability of default for each class. GE Capital Services uses our algorithm for its risk management needs.

1 - Finite Horizon Markov Decision Problems and a Central Limit Theorem for Total Reward

Alessandro Arlotto, Duke University, Durham, NC, United States of America, aa249@duke.edu, J. Michael Steele

We prove a CLT for a class of additive processes that arise naturally in the theory of finite horizon Markov decision problems (MDPs). The theorem generalizes a result of Dobrushin for temporally non-homogeneous Markov chains. The innovation is that here the summands are permitted to depend on the current state and a bounded number of future states of the chain. We show through examples that this flexibility gives a direct path to asymptotic normality of the total reward of finite horizon MDPs.

2 - Simplifying Ensembles of Trees

Sean Skwerer, Yale, 300 George Street, Suite 523, New Haven, CT, United States of America, sean.skwerer@yale.edu

Recursive partition functions (RPFs) are used in a wide variety of statistical methods including classification and regression trees, regression splines, random forests and boosting. The focus of this research is to find a framework for aggregating an ensemble into a single tree or a small number of trees which have comparable predictive strength to the entire ensemble. I will discuss advances made in aggregating ensembles of recursive partition functions.

3 - Large Submatrix Detection in Gaussian Random Matrices

Quan Li, Massachusetts Institute of Technology, 550 Memorial Drive Apt. 12B4, Cambridge, MA, 02139, United States of America, quanli@mit.edu, David Gamarnik

Iterative Search Algorithm is widely used to find large average submatrices of a real-valued matrix in the exploratory analysis. It alternately updates rows and columns until no further improvement is obtained. We present first theoretical analysis of its performance in Gaussian random matrices. We show that the algorithm terminates within finite iterations w.h.p.. This result implies that it converges to a local maximum submatrix w.h.p., leading to a constant factor gap from the global maximum.

4 - Locality in Optimization

Patrick Rbeschini, Yale University, New Haven, CT, United States of America, Patrick.rebeschini@yale.edu, Sekhar Tatikonda

How does the solution of a constrained network optimization problem behave under perturbations of the constraints with respect to the topology of the network? Typically, sensitivity results concern the objective function evaluated at the optimal point, not the optimal point itself. We develop a general theory for the local sensitivity of optimal points on networks. In the context of the network flow problem, this theory yields that local perturbations on the constraints have an impact on the components of the optimal point that decreases exponentially with the graph-theoretical distance. These results suggest a notion of decay of correlation for (non-random) optimization procedures. This notion can be used to develop local algorithms that can substantially reduce the computational complexity of canonical optimization procedures.

Chair: Miguel Lejeune, Associate Professor, The George Washington University, 2201 G Street, NW, Funger Hall, Suite 415, Washington, DC, 20052, United States of America, mlejeune@gwu.edu

1 - Scenario Decomposition for a Class of Risk-averse Stochastic Programs

Pavlo Krokhmal, University of Iowa, 2136 Seamans Center, Iowa City, IA, United States of America, krokhmal@engineering.uiowa.edu

We consider nonlinear convex stochastic optimization problems where objective or constraints involve downside coherent or convex risk measures of special form. A scenario decomposition algorithm that exploits the constraint structure induced by the corresponding risk measures is proposed. Numerical experiments on portfolio optimization problems illustrate the computational effectiveness of the developed procedure.

2 - Risk-budgeting Multi-portfolio Optimization with Portfolio and Marginal Risk Constraints

Ran Ji, PhD Candidate, The George Washington University, 2201 G St, NW, Funger 415H, Washington, DC, 20052, United States of America, jiran@gwmail.gwu.edu, Miguel Lejeune

We propose several stochastic risk budgeting multi-portfolio optimization models with portfolio and marginal risk constraints. The models permit the simultaneous optimization of multiple sub-portfolios with a downside risk measure assigned to each asset and sub-portfolio. Each model includes a joint chance constraint with random technology matrix. We expand a combinatorial modeling framework to represent the feasible set of the chance constraint as a set of mixed-integer linear inequalities.

3 - Factor-based Robust Indexing

Roy Kwon, Associate Professor, University of Toronto, 5 King's College Road, Toronto, Canada, rkwon@mie.utoronto.ca, Dexter Wu

We present an approach for tracking a benchmark index using robust factor models. Robust versions of the Fama-French 3 and 5 factor models are developed to construct uncertainty sets for a robust conic integer program. Constraints limit risk, tracking error, and number of tickets. A Lagrangian-based strategy is developed and computational results in tracking the SP 100 and SP 500 show that robust indexing can offer enhanced indexation in turbulent market conditions.

Optimization Models in Radiotherapy Treatment Planning

Sponsor: Optimization in Healthcare

Sponsored Session

Chair: Victor Wu, PhD Student, University of Michigan,
1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America,
vwu@umich.edu

- 1 - Tractable Approaches to Multiple-needle Radiofrequency Ablation**
Shefali Kulkarni-thaker, Graduate Student, University of Toronto,
5 Kings College Road, Medical Operations Research Lab (RS304),
Toronto, ON, (416) 978, Canada, shefali@mie.utoronto.ca,
Dionne Aleman, Aaron Fenster

In radiofrequency ablation (RFA), needles are used to apply extreme heat to tumors, eradicating cancerous cells. To optimize multiple-needle RFA treatments, we first obtain needle trajectories and positions using minimum volume covering sphere and ellipse formulations. Then, we optimize the heat delivery duration for each needle using tractable approximations to several thermal damage models. We discuss resulting clinical treatment quality for four 3D patient models.

- 2 - Robotic Path Finding Techniques in Stereotactic Radiosurgery Treatment Optimization**

Marlee Vandewouw, University of Toronto, 5 King's College
Road, Toronto, Canada, marleev@mie.utoronto.ca,
Kimia Ghobadi, Dionne Aleman, David Jaffray

We investigate applying robotic path finding techniques to develop treatment plans for Gamma Knife Perfexion where the radiation is delivered continuously. We explore the use of simultaneous localization and mapping, combined with heuristic exploration techniques, to generate a path. A mixed integer model is then used to find the beam times for this selected path. We discuss the advantages and challenges of this method in comparison to the conventional forward and inverse step-and-shoot plans.

- 3 - Adaptive and Robust Radiation Therapy in the Presence of Drift**

Philip Allen Mar, Dept. of MIE, University of Toronto,
5 King's College Road, Toronto, ON, M5S 3G8, Canada,
philip.mar@mail.utoronto.ca, Timothy Chan

We present our computational study of an adaptive and robust optimization radiation therapy (ARRT) method. Previously, it was shown that this ARRT method provides asymptotically optimal treatment plans for convergent sequences of tumor motion distributions. In this work, we generate simulated sequences of tumor motion distributions that exhibit baseline, amplitude and breathing phase drift, and show the effectiveness of the ARRT method applied to these sequences.

- 4 - Vmat Radiation Therapy: Modeling Treatment Delivery Time Versus Plan Quality**

David Craft, Massachusetts General Hospital, 30 Fruit St, Boston,
MA, 02114, United States of America, dcraft@alum.mit.edu,
Marleen Balvert

Volumetric modulated arc therapy is a radiation method where the gantry delivers dose continuously as it rotates around the patient. Metal leaves sweep across the field to modulate the intensity fields. In commercial software, leaf trajectories are solved by heuristics without any guarantee of an optimality gap. VMAT is a large scale non-convex optimization problem with many local minima. We offer a solution approach and explore the tradeoff between treatment quality and delivery time.

Department, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States
of America, sam.ganzfried@gmail.com

- 1 - A Stochastic Approach for Dynamic Urban Supply Chain Management**

Afroz Ansari-pour, Pennsylvania State University, 244 Leonhard
building, State College, PA, United States of America,
afroz.ansari-pour2000@gmail.com, Wenjing Song,
Terry Friesz, Yiou Wang, Zhaohu Fan

Lack of information sharing causes negative impacts such as traffic and pollution. City logistics aims to optimize urban freight systems. This paper is an extension of recent stochastic vehicle routing and scheduling frameworks. These frameworks do not necessarily account for real-time variability in traffic. This paper

incorporates uncertainty in demand and presents a real-time stochastic production plan and scheduling framework. SDVI will be used to obtain the equilibrium solution.

- 2 - A Mixed Cooperative Dual to the Nash Equilibrium**

Bill Corley, Professor, The University of Texas at Arlington,
P.O. Box 19017, Arlington, TX, 76019, United States of America,
corley@uta.edu

A mixed dual to the Nash equilibrium is defined for n-person games in strategic form. This dual extends the Berge equilibrium from pure to mixed strategies so that mutual cooperation is achieved for the expected payoffs. Conditions are established for the existence of a dual equilibrium. However, it is shown that for each $n > 2$ there exists a game for which no dual equilibrium exists. This fact may be interpreted as there are mathematical as well as sociological obstacles to mutual cooperation.

- 3 - Nash's Continuous Transformation and a Smooth Homotopy Method for Computing Nash Equilibrium**

Yabin Sun, PhD, City University of Hong Kong, R5218, Academic
Building 2, Tat Chee Avenue, Kowloon, Hong Kong, Hong Kong -
PRC, yabinsun-c@my.cityu.edu.hk, Chuangyin Dang, Yin Chen

A different procedure often results in the different selection of Nash equilibrium. To prove the existence of Nash equilibrium, Nash defined a continuous transformation. This paper applies Nash's continuous transformation to develop a smooth homotopy method by introducing just one extra variable. Starting from any given totally mixed strategy profile, the method numerically follows a smooth path that ends at a Nash equilibrium. Extensive numerical results show that the method is very efficient.

- 4 - When to Release Feedback in a Dynamic Tournament**

Ruoyu Wang, PhD Candidate, Fuqua School of Business,
Duke University, 100 Fuqua Drive, Durham, NC, 27708,
United States of America, rw120@duke.edu, Brendan Daley

We study dynamic tournaments in which time is modeled explicitly, as opposed to with the abstract notion of periods. By doing so, we characterize the effects of the ex-ante-designated timing of an interim progress report. Whether a policy of reporting increases total expected effort does not depend on the release time. We find that total expected effort is single-peaked/single-troughed in the report's release time, with the peak/trough located at a time more than halfway through the tournament.

- 5 - Endgame Solving in Large Imperfect-information Games**

Sam Ganzfried, Carnegie Mellon University, Computer Science
Department, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United
States of America, sam.ganzfried@gmail.com, Tuomas Sandholm

Sequential games of perfect information can be solved in linear time by a straightforward backward induction procedure; however, this procedure does not work in games with imperfect information since different endgames can contain nodes that belong to the same information set and cannot be treated independently. We present an efficient algorithm for performing endgame solving in large imperfect-information games and demonstrate its success experimentally in two-player no-limit Texas hold 'em.

Road, Shalimar, FL, United States of America, averemyev@ufl.edu

- 1 - Optimizing Network Recovery Time under Uncertainty**

Juan Borrero, University of Pittsburgh, 3700 O'Hara Street,
Pittsburgh, PA, 15213, United States of America, jsb81@pitt.edu,
Pavlo Krokhmal, Oleg Prokopyev

We consider a network under attack, where its nodes can recover either on their own, by receiving support from neighboring nodes, or by receiving support from outside the network. A decision maker has to determine how to invest his budget on these options in order to minimize recovery time. We propose a novel hierarchical and stochastic model to address the issue, derive closed form equations for the optimal resource allocation, and study its behavior as the number of nodes grows to infinity.

2 - s-plex and s-defective Numbers of a Graph

Vladimir Stozhkov, University of Florida, 2330 SW Williston Rd
Apt. 2826, Gainesville, FL, 32608, United States of America,
vstozhkov@ufl.edu, Eduardo Pasiliao, Vladimir Boginski

The presentation is dedicated to two clique relaxation models: s-plex and s-defective clique. Theoretical properties of the specified objects are investigated. Analytical and computational bounds for the related optimization problems are provided. The extensions of the Motzkin-Straus formulation for s-plex and s-defective clique are derived. The outline of the general procedure for solving the corresponding maximization problems is given.

3 - Minimum Edge Blocker Dominating Set Problem

Foad Mahdavi Pajouh, Assistant Professor, University of
Massachusetts Boston, 100 Morrissey Boulevard, Boston, MA,
02125, United States of America, Foad.Mahdavi@umb.edu,
Eduardo Pasiliao, Jose Walteros, Vladimir Boginski

Dominating sets are widely used in social and communication networks analysis. Given a weighted graph and $r > 0$, we consider the problem of removing a minimum number of edges so that the weight of any dominating set in the remaining graph is at least r . Complexity results, polyhedral results, a linear 0-1 programming formulation, and an exact algorithm for solving this problem will be presented.

4 - Minimum Risk Network Covering Location Problem

Konstantin Pavlikov, University of Florida, 1350 N. Poquito Road,
Shalimar, FL, 32579, United States of America,
kpavlikov@ufl.edu, Alexander Veremyev, Vladimir Boginski,
Eduardo Pasiliao

The network coverage problem under uncertainty is considered. In this problem, components of the covering set and links connecting them to remaining nodes of the network are subject to random failures. The emphasis is put on minimizing the risk of losing coverage in presence of such failures. We formalize the model and discuss its connection to the maximum expected covering location model.

1 - Remote Sensing Data Mining for Extracting Data Center Site Characteristics

Yunpeng Pan, South Dakota State University, Mathematics & Statistics, Box 2220, Brookings, SD, 57007, United States of America, yunpeng.pan@gmail.com, Adam Buskirk

Data centers are powerhouses of cloud. Companies rush to build out their cloud infrastructure to meet fast growing demand. The environmental impact such as carbon footprint falls into the category of public good, and therefore, calls for appropriate public policy decisions, which in turn require good information. Our current work intends to achieve this by mining the Landsat remote sensing data to extract characteristics of data centers in operation and under construction at a global scale.

2 - A Dynamic Workflow Framework for Server Provisioning

Wei Lin, Software Engineering Researcher, IBM,
8 Dongbeiwang Western Road, Haidian Dist, Beijing, China,
linweilw@cn.ibm.com, Brian Peterson, Qinhua Wang,
Zongying Zhang, Christopher Young, Sai Zeng

Cloud service providers support server provisioning to large number of enterprise customers, who have different functional, security and compliance requirements. We propose a framework which composes dynamic workflow at runtime to cater individualized provisioning procedures. In this framework, an onboarding module configures process steps and dependencies for each customer, and a composition module dynamically composes execution workflow based on dependency validation and sequence calculating.

3 - Minimizing Costs in Distributed Cloud Resource Provisioning

Julio Goez, Postdoctoral Fellow, Ecole Polytechnique Montreal and GERAD, 2900 Boulevard Edouard-Montpetit, Montréal, QC, H3T 1J4, Canada, jgoez1@gmail.com, Juan F. Pérez

We consider the problem of minimizing the cost of provisioning resources at different cloud locations, constrained to satisfying a required service-level objective. We present a mixed integer non-linear optimization model for this problem and show an equivalent mixed integer second order cone formulation. We also show that a simple round-up provides an initial feasible solution for the

problem. We use this property to design a heuristic procedure to improve the quality of the initial solution.

4 - Renewable Energy Prediction and Prescription in the Internet-of-things (IoT)

Hans Schlenker, IBM, Hollerithstr 1, Munich, 81829, Germany,
hans.schlenker@de.ibm.com, Yianni Gamvros

The IoT connects all sorts of devices — from sensors to embedded devices to smartphones to laptops to servers. IBM connected 1600 solar fields to its Renewable Energy IoT. Sensor data is collected, combined in the cloud, and further analyzed by analytics services to generate accurate local energy production forecast. These predictions are then used by (prescriptive) mathematical optimization in a network distribution model to balance under-runs and over-production in all connected areas.

1 - An Optimization Procedure for a Delta Neutral Constrained Theta with Maximum Gamma Portfolio

Arik Sadeh, Dean, HIT Holon Institute of Technology,
52 Golomb St. 5810201, Holon, Israel, sadeh@hit.ac.il

A large gamma portfolio is attractive for investors in order to get benefits from large increase or decrease in the value of the underlying asset. In large gamma portfolio the theta is negative. In this study, a delta neutral portfolio with maximum gamma and constrained theta, was developed. An optimization model was designed and solved for small time steps within a planning horizon. The model was run for many simulation scenarios as well as real world data, followed by statistical tests.

2 - Optimal Portfolio Liquidation and Dynamic Mean-variance Criterion

Jiawen Gu, Postdoc, University of Copenhagen, Department of Mathematical Science, University of Copenhagen, Copenhagen, 2100, Denmark, kaman.jwgu@gmail.com, Mogens Steffensen

We consider the portfolio liquidation problem under the dynamic mean-variance criterion and derive time-consistent solutions in three important models. We get explicit trading strategies in the basic model and when random pricing signals are incorporated. When consider stochastic liquidity and volatility, we construct an exact HJB equations under general assumptions for the parameters.

3 - Genetic Programming Optimization for a Sentiment Feedback Strength Based Trading Strategy

Steve Yang, Assistant Professor, Stevens Institute of Technology,
1 Castle Point on Hudson, Hoboken, NJ, 07030,
United States of America, steve.yang@stevens.edu

Based on the evidence that tweets are faster than news in revealing new market information, whereas news is regarded broadly a more reliable source of information than tweets, we develop a trading strategy based on the sentiment feedback strength between the news and tweets using generic programming optimization method. Result shows that this strategy generates over 14.7% Sterling ratio compared with 10.4% and 13.6% from the technical indicator-based and the buy-and-hold strategy respectively.

4 - Algorithmic Options Trading by Integer Programming

Vadim Timkovski, Keiser University, Port St. Lucie, FL,
United States of America, vtimkovski@keiseruniversity.edu

Algorithmic options trading has only begun its evolution. This work presents an integer programming system that simulates the activities of an experienced option trader on the construction and adjustment of option portfolios. The system adopts algorithms based on a recent discovery of an algebraic classification of option trading strategies, without which this kind of automation would not be possible and which has not been considered before as attainable.

5 - Linear Programming Approach to American Option Pricing

Zhen Liu, Options Clearing Corp (OCC), One North Wacker Drive, Suite 500, Chicago, IL, 60606, United States of America, zhenliu@alum.northwestern.edu

We solve the variational inequality (VI) from American option pricing problem by linear programming (LP) approach. We approximate its solution by a combination of Chebyshev basis functions. The objective is to minimize the absolute error of the solution and the max operator in VI is converted into linear constraints of LP. We discuss its convergence, and compare our results with Longstaff-Schwartz least-square approach and numerical partial differential equation (PDE) approach.

1 - Incentizing Less-Than-Fully-Qualified Providers for Early Diagnosis of Tuberculosis in India

Sarang Deo, Assistant Professor, Indian School of Business Hyderabad, ISB Hyderabad, Gachibowli, Hyderabad, TS, 500032, India, sarang_deo@isb.edu, Milind Sohoni, Neha Jha

A major driver of TB epidemic in India is delay in diagnosis by less-than-fully-qualified providers (LTFQs), who are typically the first point of contact for patients. This work is motivated by pilots funded by international donors to provide monetary incentives to LTFQs to induce earlier diagnosis. We develop a game-theoretic model to design an incentive contract that should be offered to LTFQs and calibrate it using realistic parameter estimates obtained from primary and secondary data.

2 - Optimizing Spatiotemporal Antiviral Release Schedules in a Pandemic Influenza

Bismark Singh, Assistant Professor, University of Texas at Austin, Austin, TX, United States of America, ned@austin.utexas.edu, Nedialko Dimitrov

To help the state of Texas plan influenza pandemic interventions, we build a stochastic MIP to compute time-based antiviral releases. We derive scenarios for the stochastic program from an epidemic simulator that accounts for the large amount of uncertainty in disease progression. We study the hardness of this problem, and present models and methods to solve it, even though a direct-solve is intractable because of the large number of scenarios.

3 - Online Scheduling of Operating Rooms

Chaitanya Bandi, Kellogg School of Management, Northwestern University, Evanston, IL, United States of America, c-bandi@kellogg.northwestern.edu, Diwakar Gupta

We consider the online operating room scheduling problem where we do not know the sequence of requests and associated surgery lengths beforehand. Given the uncertainty and the objective of feasible schedules, we model the uncertainty using a Robust Optimization (RO) approach, and utilize a RO framework to develop an interval-classification scheduling algorithm optimized under the RO framework. We obtain provable lower bounds on the performance and show promising results based on real data.

4 - Is Technology Eating Nurses? – Staffing Decisions in Nursing Homes

Feng Lu, Assistant Professor, Purdue University, 403 W State St, West Lafayette, IN, 47907, United States of America, lu428@purdue.edu, Huaxia Rui, Abraham Seidmann

We study the effect of IT-enabled automation on staffing decisions in healthcare facilities using a unique nursing home IT data from 2006 to 2012. We also develop a strategic staffing model that incorporates technology adoption.

Analysis and Control of Queues

Sponsor: Applied Probability

Sponsored Session

Chair: Hayriye Ayhan, Georgia Tech, Atlanta, GA, United States of America, hayriye.ayhan@isye.gatech.edu

1 - Control of Multiserver Energy-aware Queueing Systems

Vincent Maccio, McMaster University, 1280 Main Street West, Hamilton, Canada, macciov@mcmaster.ca, Douglas Down

We study the problem of controlling a multiple server system, where servers may be turned on or off. The cost function of interest is a combination of holding costs and energy costs (and potentially switching costs). We provide several structural results on the optimal policy - these structural results are enough to allow for the derivation of the optimal policy for a wide range of systems. Finally, we discuss how these policies compare with those extant in the literature.

2 - The Snowball Effect of Customer Slowdown in Critical Many-server Systems

Jori Selen, PhD Candidate, Eindhoven University of Technology, De Zaale, Eindhoven, Netherlands, j.selen@tue.nl, Johan Van Leeuwen, Vidyardhar Kulkarni, Ivo Adan

Customer slowdown describes the phenomenon that a customer's service requirement increases with experienced delay. In healthcare settings, there is

substantial empirical evidence for slowdown, particularly when a patient's delay exceeds a certain threshold. For such threshold slowdown situations, we design and analyze a many-server system that leads to a two-dimensional Markov process. Analysis of this system leads to insights into the potentially detrimental effects of slowdown.

3 - Maximizing throughput in Non-collaborative Networks of Queues

Tugce Isik, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332-0205, United States of America, tugceisik@gatech.edu, Hayriye Ayhan, Sigrun Andradottir

We study queueing networks with flexible non-collaborative servers. We introduce a processor sharing (PS) scheme that yields maximal throughput when buffers are infinite. For systems where the servers cannot work together at a station, we develop non-collaborative round-robin policies that approximate PS as the rotation of the servers becomes more frequent. We evaluate the performance of these policies in queueing networks with tandem, merge, and split topologies for different buffer sizes.

4 - Optimal Assignment of Authentication Servers to Different Customer Classes

Daniel Silva, Georgia Tech, 755 Ferst Drive, Atlanta, GA, United States of America, dfs3@gatech.edu, Hayriye Ayhan, Bo Zhang

Consider a system where user requests for authentication arrive from several classes of customers, following independent Poisson processes. Each arrival has a class-dependent probability of being an impostor. The system has several authentication methods; each one has a known service time distribution, and a Type I and II error probability. A controller assigns a method to each user request. We model the system as a queueing network and find the structure of a cost-optimal routing policy.

Stochastic Modeling and Control of Production Systems

Cluster: Stochastic Models: Theory and Applications

Invited Session

Chair: Sanket Bhat, McGill University, 1001 Sherbrooke Street West, Room 520, Montreal, QC, H3A 1G5, Canada, sanket.bhat@mcgill.ca

1 - Using an Artificial Neural Network Model and Approximate Dynamic Programming for Stochastic Control

Han Wu, Student, University of Louisville, 2301 S 3rd St, Louisville, KY, 40218, United States of America, han.wu@louisville.edu, Gerald Evans, Kihwan Bae

Development of efficient control policies for dynamic production systems is difficult. The uncertain demands and large set up times on machines can cause significant problems. Consider an assembly line for dishwashers which require multiple types of wire racks that must be fabricated and coated at different machines. An Artificial Neural Network model is embedded within an approximate dynamic programming algorithm to search for a better production and inventory control policy.

2 - Resource Allocation Policies to Provide Differentiated Service Levels to Customers

Ananth Krishnamurthy, Associate Professor, University of Wisconsin-Madison, 1513 University Avenue., ME 3258, Madison, WI, 53706, United States of America, akrishn2@wisc.edu, Sanket Bhat

We analyze resource allocation decisions for component manufacturers who supply components to several original equipment manufacturers (OEMs). OEMs differ in their demand variability and service level expectations. We derive policies that provide differentiated service to OEMs depending on their demand variability. Under the dynamic programming framework, we investigate the value of these policies to component manufacturers.

3 - A Newsvendor Problem with Price-sensitive and Uncertain Supply

Z. Melis Teksan, University of Florida, ISE Dept. 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32611, United States of America, zmtksan@gmail.com, Meltem Tutar, Joseph Geunes

We study a newsvendor problem in which the supply quantity depends on the price offered by the newsvendor to suppliers. We analyze the optimal ordering policy, which depends on the economics of overage and underage costs, as well as the relationship between price and supply quantity. We characterize the optimal supply-pricing policies for cases in which suppliers are also unreliable, i.e., supply capacity is both price-dependent and random.

4 - Optimal Control of an Inventory System with Stochastic and Independent Leadtimes

Mohsen Elhafi, Professor, University of California, School of Business Administration, 900 University Avenue, Riverside, CA, 92521, United States of America, mohsen.elhafi@ucr.edu, Saif Benjaafar, Rui Chen

We study a continuous review inventory system with stochastic independent leadtimes. Because orders may not be delivered in the same sequence in which they have been placed, characterizing the optimal policy is difficult and much of the available literature assumes a fixed base-stock policy which we show is sub-optimal and can perform poorly. Instead, the optimal policy is state-dependent and specified in terms of an inventory-dependent threshold function characterized by at most m parameters.

Search Across Disciplines: Artificial Intelligence and Operations Research

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Nathan Sturtevant, University of Denver, 2280 S. Vine St., Denver, CO, 80210, United States of America, sturtevant@cs.du.edu

1 - The Cyclic Best-first Search Strategy for Branch-and-bound Algorithms

Jason Sauppe, University of Illinois at Urbana-Champaign, 201 North Goodwin Avenue, Urbana, IL, 61801, United States of America, sauppej@gmail.com, Edward Sewell, Sheldon Jacobson, David Morrison

The Cyclic Best-First Search (CBFS) strategy is a generalization of best-first search that splits unexplored subproblems over a collection of heaps, referred to as contours. During the search process, CBFS repeatedly cycles through a list of non-empty contours, selecting one subproblem to explore from each during every pass. Contours can be defined in various ways to influence the search process. This talk will present some properties of CBFS and computational results for a variety of problems.

2 - Adding Random Exploration to Search Algorithms

Rick Valenzano, Alberta Innovates Centre for Machine Learning, 2-21 Athabasca Hall, University of Alberta, Edmonton, AB, T5K1X4, Canada, valenzan@ualberta.ca

In this work, we will use a simple technique called epsilon-greedy node selection to demonstrate the value of enhancing search algorithms with random exploration. Through empirical evaluation, this technique is shown to substantially improve the performance of search-based automated planners. We also formally analyze this technique to demonstrate that algorithms that employ random exploration are more robust to heuristic error.

3 - Exploiting Large Admissible Heuristics in Search

Nathan Sturtevant, University of Denver, 2280 S. Vine St., Denver, CO, 80210, United States of America, sturtevant@cs.du.edu

Admissible heuristics, which do not overestimate the cost to the goal, are particularly useful in shortest-path search problems, as they can guide the search. They also can, if necessary, guarantee optimal solutions. This talk looks at recent heuristics that are larger than the memory, and suggests ways of exploiting the problem structure to reduce the memory overhead of storing the heuristic. Two methods, bloom filters and value range compression are discussed, along with their tradeoffs.

Online Crowds: Crowdfunding and Social Media

Sponsor: Information Systems

Sponsored Session

Chair: Qiang Gao, University of Arizona, 3700 N 1st Ave. #1020, Tucson, AZ, 85719, United States of America, qiangg@email.arizona.edu

1 - A Distant Supervision Approach for Social Media Pharmacovigilance

Xiao Liu, University of Arizona, 1130 E. Helen St., Room 430, Tucson, AZ, 85721, United States of America, xiaoliu@email.arizona.edu, Hsinchun Chen

Pharmacovigilance refers to the science relating to the detection, assessment, understanding, and prevention of adverse drug events. Prior studies showed

social media can be used to identify adverse drug events with supervised learning approaches. However, they require expert annotation and are not scalable for large datasets. In this study, we develop a framework for pharmacovigilance in social media using distant supervision. Our framework achieves competent performance without annotation.

2 - The Effect of Rating System Design on Negativity Bias

Ying Liu, Arizona State University, 1201 S McClintock Dr, Apt 221, Tempe, AZ, 85281, United States of America, yingliu_is@asu.edu, Pei-yu Chen, Kevin Hong

Does rating system design affect consumers' negativity bias in reporting product ratings? We examine the effect with both observational and experimental study. Results suggest that consumers tend to reflect their experiences in the least satisfied dimension in single-dimensional rating systems, whereas the overall ratings in multi-dimensional systems tend to reflect consumers' average experience. The study suggests that multidimensional rating systems could mitigate consumers' negativity bias.

3 - Predict Campaign Quality: An Empirical Analysis of the Value of Video in Crowdfunding Markets

Qiang Gao, University of Arizona, 3700 N 1st Ave. #1020, Tucson, AZ, 85719, United States of America, qiangg@email.arizona.edu, Mingfeng Lin

Videos are prevalent in crowdfunding campaigns where there is usually little verifiable information. Yet to date there is virtually no systematic study of its roles in this new context. We investigate how video features predict campaign quality using data from a leading rewards-based crowdfunding website by implementing both explanatory and predictive models.

4 - Content Monetization in Social Media: Estimation of Demand and Supply for User Generated Content

Ruibin Geng, Zhejiang University, 388 Yuhangtang Road, Hangzhou, ZJ, 310058, China, grace.bin1207@gmail.com, Bin Zhang, Paulo Goes

Social networking is reaching a maturity stage with fewer new registrations but more user churning. Our study investigates how a new market mechanism, content monetization, reduces turnover rate by using data from the largest Chinese social network Sina Weibo. It examines the factors that affect both the demand and supply for user-generated content (UGC) in social media. Our results confirm that this nascent mechanism effectively motivates the supply for UGC and also improves its quality.

Gray Market, Sustainability, Competition, and Diffusion

Cluster: Operations/Marketing Interface

Invited Session

Chair: Samar Mukhopadhyay, Professor, Sungkyunkwan University-GSB, 25-2 Sungkyunkwan-ro, Jongno gu, Seoul, 110 745, Korea, Republic of, samar@uwm.edu

1 - Countering Gray Market Threat using Marketing Effort

Samar Mukhopadhyay, Professor, Sungkyunkwan University-GSB, 25-2 Sungkyunkwan-ro, Jongno gu, Seoul, 110 745, Korea, Republic of, samar@uwm.edu, Xuemei Su

Gray markets are likely when there is a significant price difference of the same product in different markets. This paper studies the role of an important variable, marketing effort, in fighting gray market, in addition to price. We find that when both marketing effort and prices are controlled, the manufacturer's profit is improved. Sometimes, it may even be better not to sell through the authorized channel, but to manage the gray market by controlling the marketing effort levels and prices.

2 - Designing Sustainable Products under Co-Production Technology

Yen-Ting Lin, University of San Diego, School of Business Administration, 5998 Alcala Park, San Diego, CA, United States of America, linyt@sandiego.edu, Haoying Sun, Shouqiang Wang

We consider a manufacturer who takes a natural resource to make two products through co-production technology. Some consumers are green and additionally value conservation of the natural resource. We show that increasing the portion of green consumers may actually elevate resource consumption.

3 - Online Vs. Traditional Education: A Competitive Framework.

Vashkar Ghosh, University of Florida, Department of ISOM,
Gainesville, FL, 32611, United States of America,
vashkar.ghosh@warrington.ufl.edu, Gulver Karamemis,
Asoo Vakharia

Innovation and technological advancement are eliminating a lot of constraints (eg. physical presence) bringing sweeping changes to higher education. We examine how technology in higher education is likely to develop and what its impacts will be on existing institutions. We examine a university's incentive to offer online programs in addition to the traditional program in a competitive environment. We consider two different games: the simultaneous and the sequential leader/follower location game.

4 - The Diffusion of Product Generation of Auto Industry

Gary Chao, Kutztown University, P.O. Box 730, Kutztown, PA,
18031, United States of America, chao@kutztown.edu,
Maxwell Hsu

Instead of a whole new model, every a few years, automakers introduce a new generation of their existing model to continue their success of old models or to correct the mistakes in the old models. Based on the Bass diffusion theory, we would like to study whether the different sales behavior among models and generations in US market.

Evolutionary Bilevel Optimization

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Kalyanmoy Deb, Koenig Endowed Chair Professor, Michigan State University, 428 S. Shaw Lane, 2120 EB, East Lansing, MI, 48864, United States of America, kdeb@egr.msu.edu

1 - Bilevel Decision Making and Optimization

Pekka Malo, Assistant Professor, Aalto University School of Business, Runeberginkatu 22-24, Helsinki, Finland,
pekka.malo@aalto.fi, Ankur Sinha, Kalyanmoy Deb,
Jyrki Wallenius, Pekka Korhonen

Bilevel decision making and optimization problems are commonly framed as leader-follower problems, where the leader desires to optimize his own decision while taking the decisions of the follower into account. In such cases, the Pareto-optimal frontier of the leader is influenced by the decision structure of the follower facing multiple objectives. In this paper, we analyze this effect by modeling the lower level decision maker using value functions.

2 - Handling Uncertainties in Decision Variables for Bilevel Optimization Problems

Kalyanmoy Deb, Koenig Endowed Chair Professor, Michigan State University, 428 S. Shaw Lane, 2120 EB, East Lansing, MI,
48864, United States of America, kdeb@egr.msu.edu, Zhichao Lu

Bilevel problems involve two optimization problems in hierarchy and are challenging problems often found in practice. In this talk, we present evolutionary optimization algorithms and results on test and practical bilevel problems with uncertainties in decision variables for finding robust and reliable solutions. Uncertainties are considered for both lower and upper level variables and problems with and without constraints.

3 - Expected Frontiers: Incorporating Weather Uncertainty into an Integrated Bilevel Optimization

Moriah Bostian, Assistant Professor, Lewis & Clark College,
Department of Economics, 0615 SW Palatine Hill Rd, Portland,
OR, 97219, United States of America, mbbostian@lclark.edu,
Gerald Whittaker, Bradley Barnhart, Rolf Fare, Shawna Grosskopf

Weather is a main driver of agricultural nutrient fate and transport in the environment. We use bilevel optimization and a time-series bootstrap to evaluate a water pollution policy subject to a distribution of weather outcomes. Our results show that the deterministic Pareto frontier is sensitive to climate variation. Some policy configurations that appear equally effective in a deterministic model setup are strongly differentiated when weather uncertainty is included in the policy evaluation.

New Frontiers in Market Design

Cluster: Auctions

Invited Session

Chair: Tunay Tunca, ttunca@rsmith.umd.edu

1 - Integrating Market Makers, Limit Orders, and Continuous Trade in Prediction Markets

Sebastien Lahaie, Microsoft Research, New York, NY, United States of America, sebastien.lahaie@gmail.com, Hoda Heidari, David Pennock, Jenn Wortman Vaughan

We provide an algorithm that combines market makers and limit orders in a prediction market with continuous trade. We define the notion of an approximate trading path, a path in security space along which orders execute at their limit prices to within a fixed tolerance. We show that a trading path with efficient endpoint exists under supermodularity, but not in general. We develop an algorithm for the general case, and evaluate it using real combinatorial predictions over election outcomes.

2 - Multi-dimensional Virtual Values and Second-degree Price Discrimination

Nima Haghpahanah, MIT, Boston, MA, United States of America, nima.haghpahanah@gmail.com, Jason Hartline

We consider a problem of selling a product with multiple quality levels and derive conditions that imply only selling highest quality is optimal. With multi-dimensional preferences, virtual values from integration by parts on arbitrary paths may not be incentive compatible. To resolve this issue, we impose additional conditions that are satisfied only by a unique choice of paths, and identify distributions that ensure the resulting virtual surplus is indeed point-wise optimized by the mechanism.

3 - Optimal Pricing for Two-sided Platforms with Externalities

Levi Devalve, Duke University, Durham, NC,
United States of America, levi.devalve@duke.edu, Sasa Pekec

We consider pricing strategies of two-sided platforms serving consumers and marketers. We show that competing platforms can achieve optimal profit through "subscription-only" pricing. We identify settings in which competition increases both consumer prices and advertising volumes. We also derive the platform's optimal price menu under incomplete information about the consumer's disutility for advertising. We characterize when the optimal menu includes free use and no ad options.

4 - The Role of a Market Maker in Networked Cournot Competition

Desmond Cai, California Institute of Technology, 1200 E California Blvd, Pasadena, CA, 91125, wccai@caltech.edu, Subhmesh Bose, Adam Wierman

We study the role of a market maker (or market operator) in a transmission constrained electricity market. We model the market as a one-shot networked Cournot competition. We analyze the class of market maker objective functions given by linear combinations of social welfare, residual social welfare, and consumer surplus. We show that there exist cost functions for which the maximum possible social welfare at equilibrium is not attained when the market maker chooses to maximize social welfare.

Joint Session Analytics/HAS: Analytics Innovations in Healthcare and Medicine

Sponsor: Analytics

Sponsored Session

Chair: Issac Shams, Postdoctoral Research Fellow, University of Michigan, 1205 Beal Ave, Ann Arbor, United States of America, issacsh@umich.edu

1 - Improving Societal Outcomes in the Organ Donation Value Chain

Priyank Arora, Georgia Institute of Technology, 800 W Peachtree St. NW, Atlanta, GA, 30308, United States of America, priyank.arora@scheller.gatech.edu, Ravi Subramanian

We examine a unique principal-agent problem in the cadaver organ donation value chain (ODVC) where the principal in our case is a social planner that has an overall quality-adjusted-life-year improvement objective. The agents include a non-profit organ procurement organization with a volume-of-care objective and a for-profit hospital (trauma center).

2 - Appointment Scheduling and Overbooking to Improve Patient Access and Reduce Patient Backlog

Linda Laganga, Vp Of Quality Systems, Mental Health Center of Denver, 4141 East Dickenson Place, Denver, CO, 80302, United States of America, linda.laganga@mhcd.org, Stephen Lawrence

Patient no-shows continue to trouble outpatient clinical service delivery. We continue our piloting and implementation of scheduling models developed in our earlier research to develop new techniques to assist clinics in meeting their goals to improve patient flow and reduce backlog in scheduling. We utilize medical practice experience to develop realistic estimates of costs and their effect on the selection of high-performing scheduling alternatives.

3 - Improving HIV Early Infant Diagnosis Supply Chains in Sub-Saharan Africa: Models and Application to Mozambique

Jonas Jonasson, Student, London Business School, Regent's Park, London NW1 4SA, United Kingdom, jjonasson@london.edu, Sarang Deo, Jérémie Gallien

Most countries in sub-Saharan Africa experience delays in HIV early infant diagnosis (EID). We develop a two-part modeling framework to generate operational improvements in EID networks and evaluate their impact on public health. For the case of Mozambique, we estimate that the interventions of optimally re-assigning clinics to labs and optimally re-allocating diagnostic capacity would result in 11% and 22% shorter turnaround times and 4% and 7% more infants starting treatment, respectively.

Decision Support Systems I

Contributed Session

Chair: Mohamad Hasan, Associate Professor, Kuwait University, Department of Quantitative Methods & IS, CBA, Kuwait University, Kuwait City, 13055, Kuwait, mkamal@cba.edu.kw

1 - Review of Consistency Among Pairwise Comparisons: Relationship Between Indices and Human Perception

Yuji Sato, Graduate School of Management, Chukyo University, 101 Yagotohonmachi, Showa, Nagoya, 466-8666, Japan, ysatoh@1988.jukuin.keio.ac.jp

This paper reviews the Consistency Index (CI) of AHP. Since AHP requires redundant pairwise comparisons, transitivity in judgment is often violated. The review focuses on the detection capability of CI, and the relationship between the size of CI and the goodness-of-fit of weight to decision maker's perception. The results imply that CI may not distinguish the consistency of judgment nor the size may have no relation with the degree of goodness-of-fit of weight to decision maker's perception.

2 - Transformations and Materializations of Uncertainty Sets in Robust Optimization

Abhilasha Aswal, International Institute of Information Technology, Bangalore, 26/C Electronics City, Bangalore, KA, 560100, India, abhilasha.aswal@iiitb.ac.in, Prasanna Gns

We present a polyhedral representation of uncertainty for robust optimization and a volume based uncertainty measure for it. Our decision support framework enables easy transformations and materializations of a given uncertainty set and also easy set-theoretic operations on alternative uncertainty sets. These operations are quite useful in practice and are more difficult with probabilistic representations of uncertainty and non-polyhedral robust uncertainty sets.

3 - Open Source or Proprietary? A Study on Software Diffusion in a Competitive Market

Chao Ding, Assistant Professor, University of Hong Kong, KKL 807, Hong Kong, Hong Kong - PRC, chao.ding@hku.hk

When choosing between open source software and proprietary software, consumers will consider software quality, cost, consumer reviews, promotions, compatibility, technical support, ease of use, etc. In this paper, we consider three important decision making factors as identified in literature: external influence, internal influence and ownership cost and study their impact on consumers' adoption decision.

4 - A Decision Support System for Predicting International Freight Flows for Trade

Mohamad Hasan, Associate Professor, Kuwait University, Department of Quantitative Methods & IS, CBA, Kuwait City, 13055, Kuwait, mkamal@cba.edu.kw

A decision support system is developed that can help decision makers to take right decisions about the country international trade system. It helps them to evaluate deferent scenarios to improve the multimodal Transport system and import, export, re-export, and transit operations. These improvements will enhance the competitiveness and integration of this system. The overall results will help in increasing the international trade share for the country.

Chair: Shuai Huang, University of Washington, Dept. of Industrial and Systems Eng., Seattle, WA, United States of America, shuai.huang.ie@gmail.com

1 - Social Media Analytics for the Promotion of Mental Health

Qingpeng Zhang, Assistant Professor, City University of Hong Kong, Kowloon, Hong Kong - PRC, qingpeng.zhang@cityu.edu.hk

The digital footprints of Web users left on social media present important mental health proxies. In this work, we aim to characterize the dynamics of the online social groups for the mutual help of people suffering from depression. We identified unique features in both language and social interaction patterns, and interesting relationship between the two, which could have important implications of the causes and factors of depression.

2 - Adaptive Cluster-based Oversampling Method: Application to Gynecological Surgery Failure Prediction

Iman Nekooimehr, PhD Candidate, University of South Florida, 14304 Wedgewood Ct., Apt. 201, Tampa, FL, 33613, United States of America, nekooimehr@mail.usf.edu, Stuart Hart, Allison Wyman, Susana Lai-yuen

A new oversampling method called Adaptive Semi-Unsupervised Weighted Oversampling is presented for imbalanced dataset classification. It is adaptive, and avoids overgeneralization and overfitting. The method was used with Support Vector Machines to predict surgical failure after gynecological repair operations. Results show 76% weighted accuracy and improvement over other oversampling methods.

3 - Real-time Detection of System Change Points via Graph Theoretic Sensor Fusion

Prahalad Rao, SUNY Binghamton, 4400 Vestal Pkwy. E, Binghamton, NY, United States of America, prao@binghamton.edu, Chou-An Chou, Samie Tootooni

We propose a novel graph theoretic approach for detection of system change points from multidimensional sensor data. The approach is based on transform time series data into an un-weighted and undirected planar graph, and subsequently extracting topological invariants. This approach outperforms conventional statistics-based monitoring techniques. We demonstrate the effectiveness of the approach based on experimentally acquired sensor data from advanced manufacturing processes and healthcare.

4 - High-throughput Screening for Rule Discovery from High-dimensional Datasets

Mona Haghighi, University of South Florida, 3202 E Fowler Avenue, Tampa, FL, 33620, United States of America, monahaghighi@mail.usf.edu, Shuai Huang, Xiaoning Qian, Bo Zeng

We propose a rule-based methodology to Identify risk-predictive baseline patterns of Alzheimer's disease through a network-based mathematical model. We apply data-mining techniques to reduce dimensionality while taking care of synergistic interaction of variables. Selecting a set of rules to monitor the progression of the disease is the second part of this study.

Decision Support Systems for Data Mining

Contributed Session

Chair: Zhiguo Zhu, Associate Prof., Dongbei University of Finance and Economics, No. 217 JianShan St., Shahekou District, Dalian, 110625, China, zhuzg0628@126.com

1 - A Mixture Method of Multivariate Time Series Clustering

Cheng-Bang Chen, Penn State University, 233 Leonhard Building, University Park, PA, 16802, United States of America, czc184@psu.edu, Soundar Kumara

Time series clustering is widely used in different domains. Although much literature is available on time series clustering, only a few articles relate to multivariate time series clustering. This research developed a clustering methodology and applies different similarity/dissimilarity measures to multivariate time series datasets. It can reduce the data size and has good clustering performance.

2 - Mining Association between Promotions and Transactions to Find Optimum Time for Targeted Promotions

Hari Koduvely, Dr. Samsung, # 2870, Orion Building, Outer Ring Road, Bangalore, K, 560037, India, hari.koduvely@gmail.com, Roshni Mohandas

In the usual Targeted Promotion scenario one optimizes the promotion content tailored towards a consumer's purchase interests to maximize response. However time of targeting a promotion also equally important. In this paper we present a new method, based on the temporal association patterns between promotion and transaction events, to find the optimum time for targeted promotions. We validate our method against existing approaches on a real retail data set and show significantly better results.

3 - The Effect of Non-local Diversity in Dynamic Class Prediction

Senay Yasar Saglam, PhD Student, University of Iowa, 108 Pappajohn Business Building, S210, Iowa City, IA, 52242, United States of America, senayyasarsaglam@gmail.com, Nick Street

Classifiers' agreement in the region where a new data instance resides in has been considered a major factor in dynamic ensembles. We hypothesize that in this region the agreement among classifiers that are different is more important than among the similar ones. In other words, high local accuracy and confidence, and high diversity in other regions, is desirable. In this study, we check the validity of this hypothesis and verify that diversity still plays a role in the dynamic class prediction.

4 - Measuring Influence in Online Social Network Based on the User-content Bipartite Graph

Zhiguo Zhu, Associate Prof., Dongbei University of Finance and Economics, No. 217 JianShan St., Shahekou District, Dalian, 110625, China, zhuzg0628@126.com

How to precisely identify and measure influence has been a hot research direction. Differentiating from existing researches, we are devoted to combining the status of users in the network and the contents generated from these users to synthetically measure the influence diffusion. In this paper, we firstly proposed a directed user-content bipartite graph model. Finally, the experiment results verify our proposed model can discover most influential users and popular broads effectively.

1 - Ensuring Timely Access and Adequate Capacity for an Endocrinology Clinic

Moses Chan, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, United States of America, mosesyh@umich.edu, Amy Cohn, Amy Rothberg

The weight management program was designed to promote weight loss for morbidly obese patients. Program participation is associated with reductions in BMI and improvements in cardiovascular risk factors and quality of life. Providers are booked weeks out, posing a challenge to schedule consecutive weekly visits. Non-adherence to schedule undermines the effectiveness of the program. The purpose of this study is to improve patient compliance with the program and to increase program access.

2 - An Online Appointment Scheduling Model

Ali Kemal Dogru, Om PhD Student, University of Alabama, 315 Bidgood Hall, 361 Stadium Drive, Tuscaloosa, AL, 35487, United States of America, akdogru@crimson.ua.edu, Sharif Melouk

Incorporating patient centered medical home (PCMH) principles, we develop an online appointment scheduling system (OASS) for a primary care setting. We propose a simulation optimization solution approach that uses two models working in concert to provide high quality solutions (i.e., schedules) in short time. We aim to minimize: 1) weighted cost of expected patient waiting time and 2) doctor idle time and overtime. Key Words: Online Appointment Scheduling, Simulation Optimization, PCMH

3 - Managing Series Patients in a Healthcare Facility

Siyun Yu, STOR Department, UNC-Chapel Hill, B26 Hanes Hall, Chapel Hill, NC, 27514, United States of America, yusiyun@live.unc.edu, Vidyadhar Kulkarni, Vinayak Deshpande

Series patients are scheduled for a series of appointments, such as patients in physical therapy clinic, dialysis center, etc. To balance the demands from different

types of new as well as returning patients and the available appointment slots, we develop stochastic models to determine the number of slots and the scheduling policy that optimize performance. Heuristic policies are proposed which share the same structural properties of the optimal policy and are more computationally efficient.

4 - Managing Virtual Appointments in Chronic Care

Armagan Bayram, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60201, United States of America, abayram@northwestern.edu, Seyed Iravani, Sarang Deo, Karen Smilowitz

Virtual visits can assist in managing chronic conditions by providing low cost monitoring, treatment and education. Motivated by these benefits, we develop capacity allocation models that decide which patients to schedule given limited availability of both office and virtual visit slots. We model this problem using a dynamic programming framework over a finite horizon, and perform analytical and numerical analyses to identify policies for scheduling patients for different medical interventions.

1 - Nonstationary Spatiotemporally Integrated Fractionation

Ali Ajdari, University of Washington, Industrial and Systems Engineering, Seattle, WA, 98195, ali.adr86@gmail.com, Archis Ghate

We consider the optimal fractionation problem where the fluence-maps are allowed to change over treatment sessions. This results in a high-dimensional nonconvex dynamic optimization problem. We present an approximate solution method rooted in convex and dynamic programming.

2 - Treatment of Chronic Myeloid Leukemia with Multiple Targeted Therapies

Qie He, University of Minnesota, 111 Church Street SE, Minneapolis, MN, United States of America, qhe@umn.edu, Junfeng Zhu, Kevin Leder, Jasmine Foo

Recently several targeted therapies have been developed to treat Chronic Myeloid Leukemia (CML). A significant problem is the development of resistance to therapy in patients. Therapy combination can slow this development, but the number of combinations is huge. We develop a model to find combinations that are promising for clinical trials. The model captures cell evolution and toxicity constraints. Our optimal combinations are predicted to significantly outperform common clinical practice.

3 - Combined Therapy in Acute Lymphoblastic Leukemia

Kevin Leder, Assistant Professor, University of Minnesota, 111 Church St, Minneapolis, MN, 55455, United States of America, lede0024@umn.edu

Acute lymphoblastic leukemia is a cancer of the blood system. While successful treatment of the disease in juvenile patients is possible, it is difficult to treat in adult patients. One treatment modality is the use of the targeted therapy nilotinib. However, drug resistance is a serious issue. To avoid this drug resistance we consider the combination of nilotinib and radiation. We develop a mathematical model for this combined therapy and compare with experimental observations.

Disaster and Emergency Management I

Contributed Session

Chair: Rafael Diaz, Research Associate Professor, Old Dominion University, 1040 University Blvd, Suffolk, VA, 23435, United States of America, rdiaz@odu.edu

1 - An Optimization Model for Seismic Hazard Loss Analysis for Spatially Distributed Infrastructure

Hasan Manzour, Industrial & Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98195-2650, United States of America, hmanzour@uw.edu, Rachel Davidson

The new Optimization-based Probabilistic Scenario method produces a small set of probabilistic ground motion maps to represent the seismic hazard for analysis of spatial distributed infrastructure. A set of just 124 ground motion maps were able to match the hazard curves based on a million-year Monte Carlo simulation. This enormous computational savings has substantial implications for regional-scale since it can allow many more downstream analyses.

2 - A Model of the Effect of Pandemic Influenza on the U.S. Blood Supply

Hussein Ezzeldin, FDA, CBER, 10903 New Hampshire Ave, Bldg 71 Rm 1009C, Silver Spring, MD, 20993, United States of America, hussein.ezzeldin@fda.hhs.gov, Arianna Simonetti, Richard Forshee

We present the spatial and temporal impact of Pandemic Influenza (PI) on the US blood supply through an inter-regional blood transfer system. We utilize a hybrid optimization heuristic to enhance the global performance of the network. Using Neural Networks trained by Particle Swarm Optimization, we model a function of regional factors to optimize the daily blood transfers among US regions. We simulate the effect of PI on regional blood transfers and compare to those during normal operations.

3 - Agent-Based Modeling to Simulate Resilience of Water Systems for Healthy and Secure Communities

Emily Berglund, Associate Professor, North Carolina State University, CB 7908, Raleigh, NC, 27695, United States of America, emily_berglund@ncsu.edu, Jacob Monroe, Hayden Strickling, Michael Knepper, Elizabeth Ramsey, M. Ehsan Shafiee

Civic water systems are vulnerable to attacks and disasters that threaten the health and security of communities. When water service is lost due to a water quality failure or an attack on critical infrastructure, the decision-making of perpetrators, security personnel, utility managers, and the public can influence event outcomes. An agent-based modeling approach is developed to simulate the impact of sensing, communication, security, and infrastructure management on community resilience.

4 - Decision Support to Air Rescue Unit Allocation in Disaster Management Operations

Sergio Reboucas, ITA, Rua H9C, Apt. 302, São Jose Dos Campos, SP, 12228612, Brazil, reb@ita.br

After a disaster break up, rescue helicopters have a valuable role in response phase. The allocation of these air rescue units requires knowledge about certain conditions that are most of times uncertain and its analysis and trade-offs must be thoroughly done. This paper aims to suggest a methodology to support the air rescue unit allocation decision in a natural disaster response phase context.

5 - Modeling Housing Stock Recovery after a Catastrophic Storm Event

Rafael Diaz, Research Associate Professor, Old Dominion University, 1040 University Blvd, Suffolk, VA, 23435, United States of America, rdiaz@odu.edu, David Earnest, ManWo Ng, Joshua G. Behr

Severe catastrophic storm events adversely affect housing stock and regional capacity to build and repair houses. Rebuilding this capacity takes time while the region faces an unexpected surge in the demand. We present a simulation model that considers a supply chain perspective. The model provides significant insights for policy makers into how the production of permanent housing depends upon the uncertainties and feedback effects of material, labor, funds, and regulatory environments.

Sponsored Session

Chair: Melih Celik, Middle East Technical University, ODTÜ Kampüsü Endüstri Mühendisliği, Oda 219 Cankaya, Ankara, 06800, Turkey, cmelih@metu.edu.tr

1 - Pre-disaster Unmanned Air Vehicle Base Location and Routing for Road Damage Assessment and Repair

Seyyed Kian Farajkhah, Middle East Technical University, METU-Cankaya, Metu Campus Endüstri Mühendisliği, Ankara, 06800, Turkey, kian.farajkhah@metu.edu.tr, Melih Celik

Following large-scale disasters, unmanned air vehicles (UAVs) can help efficiently gather data on the status of the roads in the network. Given a set of potential disaster scenarios, we address the problem of establishing connectivity between relief supply and demand by means of road repair. A two-stage stochastic model is developed to determine a UAV base location and time-limited routes so that the expected shortest path length between the supply and demand nodes is minimized.

2 - Disaster Operations Management: Recovery Classification and Research Framework

Niratcha Grace Tungtisanont, PhD Candidate, Clemson University, 100 Regency Dr, #22, Central, SC, 29630, United States of America, ntungti@g.clemson.edu, Aleda Roth, Yann Ferrand

We propose a research framework for improving post-disaster phase recovery. We address what types of investments should be made and their relative allocations in the "pre" and "during" emergency phases to improve the effectiveness of the recovery process? We use the proposed framework to draw managerial and policy implications.

37-Room 414, Marriott

Kidney Allocation and Exchange

Contributed Session

Chair: Naoru Koizumi, Assoc Professor, GMU, 3351 N Fairfax Dr, Arlington, VA, 22203, United States of America, nkoizumi@gmu.edu

1 - The Dynamics of Kidney Exchange

John Dickerson, CMU, 9219 Gates-Hillman Center, Pittsburgh, PA, 15213, United States of America, dickerson@cs.cmu.edu, Tuomas Sandholm

We discuss analytic, optimization, and game-theoretic approaches to matching in dynamic kidney exchange. We consider dynamism (i) at the post-match pre-transplant stage (ii) as patients and donors arrive and depart over time, and (iii) as multiple exchanges compete for overlapping sets of participants. We empirically validate our models and theoretical results on over 150 match runs of the UNOS national kidney exchange.

2 - A New Model to Decide Kidney-Offer Admissibility Dependent on Patients' Lifetime Failure Rate

Michael Bendersky, Ben Gurion University of the Negev, Beersheba, Israel, michael.bendersky@gmail.com, Israel David

We propose a new model to decide kidney-offer admissibility depending on patient's age, estimated lifetime probabilistic profile and prospects on the waiting list. We allow for a broad family of lifetime distributions - Gamma - thus enabling flexible modeling of one's survival under dialysis. It yields the optimal critical times for acceptance of offers of different qualities and may serve the organizer of a donation program, the surgeon and the individual recipient practicing patient-choice.

3 - Preemptive Approach to Kidney Allocation in USA

Philip Appiah-Kubi, Ohio University, 14 Pine St, Apt. #1B, The Plains, OH, 45780, United States of America, pa809911@ohio.edu

The new kidney allocation policy improves kidney utilization. However, the policy has no consideration for allocation of cadaveric kidneys under emergency situations; a problem observed by the National Kidney Foundation. This research evaluates a point scoring model with considerations for emergency allocation. Simulated results indicate that the model minimizes number of waitlist deaths by 2% while prioritizing sensitive candidates and waiting time.

4 - Optimal Integration of Kidney Exchange Programs with Antibody Reduction Therapy

Naoru Koizumi, Assoc Professor, GMU, 3351 N Fairfax Dr,
Arlington, VA, 22203, United States of America,
nkoizumi@gmu.edu, Monica Gentili, Keith Melancon

Kidney paired donation (KPD) allows incompatible pairs to exchange kidneys with other incompatible pairs. However, evidence suggests there stills exist barriers to KPD utilization, especially among difficult-to-match transplant candidates and positive actual or virtual crossmatches. Using mathematical models, we investigate how to optimally integrate antibody reduction therapy in KPD to increase successful living-donor kidney transplants among difficult to match candidates.

38-Room 415, Marriott

Queueing Models II

Contributed Session

Chair: Benjamin Legros, Ecole Centrale Paris,
Grande Voie des Vignes, Chateauf-Malabry, 92290, France

1 - A New Look at Markov Processes of G/M/1-type

Jason Joyner, PhD Student, Clemson University, Clemson
University O-110 Martin Hall, Box 340975, Clemson, SC, 29634,
United States of America, jjoyner@g.clemson.edu

We present a new method for deriving the stationary distribution of an ergodic Markov process of G/M/1-type in continuous-time. Our method derives and makes use of a new representation for each element of the rate matrices contained in the stationary distribution. This method can also be modified to derive the Laplace transform of each transition function associated with Markov processes of G/M/1-type.

2 - Exact Simulation of Non-Stationary Reflected Brownian Motion

Mohammad Mousavi, Assistant Professor, University of
Pittsburgh, 1048 Benedum Hall, Pittsburgh, PA, 15212,
United States of America, mousavi@pitt.edu

We discuss the challenges that arise in the planning simulations of systems with time dependent arrival and service rates. Estimating how far back in time a simulation must be initialized is an essential problem in planning simulations. We propound using reflected Brownian motion (RBM) with time-dependent drift and volatility as a guide for estimating this initialization time. We develop the first exact simulation method for RBM with time-dependent drift and volatility.

3 - Traffic Volume and Travel Time Variability under Random Interruptions

Marcelo Figueroa, PhD Student, Rutgers University, 93 Marvin
Lane, Piscataway, NJ, 08854, United States of America,
marcelo.figueroa@rutgers.edu, Melike Baykal-görsoy

We show the advantages of modeling the number of vehicles on a freeway corridor as an M/M/Infinity queueing system subject to random service degradation in order to obtain variability estimates for congestion and travel time delay. We make use of the analytical stationary distribution of the number of customers thus avoiding the use of traffic simulation. We validate our approach by using traffic count data, and relevant weather events and traffic incidents as causes of service degradation.

4 - Admission Control Policies for Multi-Channel Call Centers: Should We Delay the Call Rejection?

Benjamin Legros, Ecole Centrale Paris, Grande Voie des Vignes,
Chateauf Malabry, France, belegros@laposte.net

We study strategies of rejection in call centers with inbound and outbound calls. The firm is looking for the best possible trade-off between the inbound and outbound calls performance. Rejection at arrivals, so-called rejection "a priori" and rejection after experimenting some wait, so-called rejection "a posteriori" are considered. Our main finding is that rejection a posteriori provides a better performance in terms of waiting time for served customers than a rejection a priori.

■ TC39

39-Room 100, CC

Distribution Channel Management

Cluster: Operations/Marketing Interface

Invited Session

Chair: Xiaowei Xu, Associate Professor, Rutgers Business School-New Brunswick, 100 Rockefeller Rd., Piscataway, NJ, 08854,
United States of America, xiaoweix@andromeda.rutgers.edu

1 - Co-Advertising and Channel Power in Distribution Channels

Xiaowei Xu, Associate Professor, Rutgers Business School-New Brunswick, 100 Rockefeller Rd., Piscataway, NJ, 08854,
United States of America, xiaoweix@andromeda.rutgers.edu

We study a manufacturer-retailer channel, in which the manufacturer decides wholesale price as the channel leader and the retailer decides the retail price as the channel follower. Besides the retail price, customer demand is influenced by non-price marketing instruments, such as advertising. We identify business scenarios, under which the manufacturer should not participate any co-advertising campaign even if it's free, since doing so will increase the channel power of the retailer.

2 - Effects of Channel Intermediaries on Quality-price Competition

S. Chan Choi, Rutgers Business School-New Brunswick,
100 Rockefeller Road, Piscataway, NJ, 08854,
United States of America, chancoi@rci.rutgers.edu

We show that when products are vertically differentiated, the optimal channel structure depends on whether a company is a high- or low-quality producer. Either manufacturer benefits by channel integration while the competitor uses an intermediary, but this effect is stronger for the low-quality manufacturer. If an intermediary is to be used, the low-quality manufacturer has more incentive to use an exclusive dealer. But the total channel profit is higher with a common retailer.

3 - Fairness in Supply Chain Contracts with Sales Efforts

Ju Myung Song, Rutgers Business School, Room 430, 1
Washington Park, Newark, NJ, 07102, United States of America,
jumyung.song@rutgers.edu

Fairness is an important incentive for supply chain contract design. I consider a setting where a retailer chooses both retail price and sale effort to maximize profit, and analyze how fairness in a supply chain affects supplier and retailer's behaviors and their expected profits.

4 - A Longitudinal Analysis of Supplier Working Relations in Component Markets

Sengun Yeniyurt, Associate Professor, Rutgers Business School,
100 Rockefeller Rd, Piscataway, NJ, 08854, United States of
America, yeniyurt@business.rutgers.edu, Steven Carnovale,
John W. Henke

This study utilizes a longitudinal dataset that includes information regarding supplier working relations and sourcing transactions in the North American Automotive industry. Econometric models are developed and estimated utilizing information provided by first tier component suppliers to major automotive manufacturers. The estimates reveal the interplay between past interactions, future expectations, and working relations and their effect on transactional decisions in component markets.

Contributed Session

Chair: Robert Bordley, Expert Systems Engr Professional,
Booz-Allen-Hamilton, 525 Choice Court, Troy, MI, 48085,
United States of America, Bordley_Robert@bah.com

1 - How Cultural Difference Influences Consumer Behavior in Hypermarket Industry

Mei-Wen Chao, Assistant Professor, Kao Yuan University, 1821
Zhongshan Rd., Luzhu Dist., Kaohsiung, 82151, Taiwan - ROC,
t80149@cc.kyu.edu.tw

No empirical research exists to discuss the issues of culture and consumer behavior in the hypermarket industry using the territory of Taiwan and the U.S. as the units of comparison. This paper attempted to explore grocery consumers' inner world and how their shopping perceptions vary between Taiwanese and American cultures. The contexts of interviews are given and additional findings are also put forward. Salient results and practical issues are discussed in detail in this paper.

2 - The Effect of Price Ending on Consumer Behavior

Yoshiyuki Okuse, Professor, Senshu University, 2-1-1,
Higashi-Mita, Tama-Ku, Kawasaki, 2148580, Japan,
okuse@isc.senshu-u.ac.jp

In the area of pricing research, a lot of researches on price endings have been developed. The purpose of this research is to specify the effect of price endings on consumer behavior in Japan.

3 - I Like using My Mobile Apps But...**A Study of Post Consumption Appraisal**

Anubha Mishra, Assistant Professor Of Marketing,
University of Idaho, 875 Perimeter Dr, Moscow, ID, 83844,
United States of America, amishra@uidaho.edu

The study of mobile app consumption suggested three distinct dimensions. Users' evaluation of control, freedom, newness, assimilation, and fulfillment of need from apps was captured by Perceived Benefits; Perceived Apprehension, covered chaos, enslavement, obsolescence, isolation, and creation of needs and Perceived Obscurity, examined ambiguity. Perceived usefulness positively influenced all dimensions indicating that while apps may be perceived as helpful, it can also create isolation.

4 - Increasing User Engagement with Mobile Analytics

Chaitanya Sagar, Chief Executive Officer, Perceptive Analytics,
353 West 48th Street, New York, NY, 10036,
United States of America, cs@perceptive-analytics.com

Mobile represents a tectonic platform shift with great opportunities and challenges. 80% of users do not return to an app after the first day of downloading it. 80% of total app revenue is 'in-app' purchases - so unless an app can engage users, it cannot generate significant revenue. Add to that, top 20% apps generate 97% of the revenue making fierce competition among 1.2 million apps. I focus on the heart of this problem increasing engagement with users specifically using push-notifications.

5 - Maximum Entropy Models of Individual Choice

Robert Bordley, Expert Systems Engr Professional, Booz-Allen-Hamilton, 525 Choice Court, Troy, MI, 48085, United States of America, Robert_Bordley@bah.com, Ehsan Soofi

Many forecasts are based on economic models of individual choice. But these models assume actual individual choice is rational, an assumption which some viewed as having been refuted. To avoid making this assumption, this paper shows that maximum entropy models can approximate general discrete choice models. This paper also shows how to parameterize such models in order to use them for forecasting.

Chair: Alireza Sabouri, Assistant Professor, Haskayne School of Business, University of Calgary, Calgary, AB, Canada,
alireza.sabouri@haskayne.ucalgary.ca

1 - A Queueing Model for Liver Transplant Waiting List Process

Zinan Yi, Operations Research, North Carolina State University,
Raleigh, NC, United States of America, zyi@ncsu.edu, Maria Mayorga, Stephanie Wheeler, Sidney Barritt, Eric Orman

Liver transplant is the only therapy for patients with end stage liver disease. The composition and dynamics of the waiting list are the interest of both patients and doctors. In this paper, we used the United Network for Organ Sharing and Organ Procurement and Transplantation Network database to develop a queueing model for the waiting list population. Using the model, we will predict future waiting list and other characteristics.

2 - Investigating Steroid Withdrawal Strategies for Kidney Transplant Recipients

Yann Ferrand, Assistant Professor, Clemson University,
100 Sirmine Hall, Clemson, SC, 29634, United States of America,
yferran@clemson.edu, Vibha Desai, Christina Kelton,
Teresa Cavanaugh, Jaime Caro, Jens Goeble, Pamela Heaton

We evaluate various steroid withdrawal strategies for kidney transplant recipients. The goal is to minimize major complications resulting from these complex drug regimens over the long term. We develop a model calibrated with an econometric study of patient data from a national registry to simulate the long-term course of these patients. We report on the frequency and timing of adverse events and identify trade-offs in the steroid withdrawal strategies.

3 - Dynamic New Patient Consult Scheduling for Medical Oncology

Antoine Sauré, University of British Columbia, 2053 Main Mall,
Vancouver, BC, V6T 1Z2, Canada, antoine.sauere@sauder.ubc.ca,
Claire Ma, Jonathan Patrick, Martin Puterman

Motivated by an increasing demand for cancer care and long waits for new patient consults, we undertook a study of medical oncology scheduling practices at a regional cancer center. As a result, we formulated and approximately solved a discounted infinite-horizon MDP model that seeks to identify policies for allocating oncologist consultation time to incoming new patients, while reducing waits in a cost-effective manner. The benefits from the proposed method are evaluated using simulation.

4 - Optimal Issuing Policies for Hospital Blood Inventory

Alireza Sabouri, Assistant Professor, Haskayne School of Business,
University of Calgary, Calgary, AB, Canada,
alireza.sabouri@haskayne.ucalgary.ca, Steven Shechter, Tim Huh

We propose a model for allocating red blood cells for transfusion to patients, which is motivated by recent evidence suggesting that transfusing older blood is associated with increased mortality rate. We study the properties of blood issuance policies that balance the trade-off between "quality" measured in average age of blood transfused and "efficiency" measured in the amount of shortage. Based on our analysis, we design efficient issuance policies and evaluate their performance.

Joint Session MSOM-Health/HAS: Workarounds, Errors and Interruptions in Healthcare

Sponsor: Manufacturing & Service Oper
Mgmt/Healthcare Operations

Sponsored Session

Chair: Anita Tucker, Associate Professor, Brandeis University,
415 South Street, Waltham, MA, 02453, United States of America,
atucker@brandeis.edu

1 - Hospital Operations and Patient Satisfaction

Sarah Zheng, Doctoral Candidate, Boston University, 16 Gold Star Rd., Cambridge, MA, 02140, United States of America,
xinzheng@bu.edu, Amy McLaughlin, Aubrey Podell,
Anita Tucker, Z. Justin Ren

We look at the impact of operations performance on service quality. Our study site is a nationally-ranked major hospital in the Boston area. Service quality is measured by both medical errors and patient satisfaction. Daily operations are measured by performance in about a dozen of its supporting services. We attempt to answer questions such as: What are the operational drivers of medical errors? To what extent does higher operations performance lead to higher patient satisfaction?

2 - Medical Errors in the Healthcare Delivery: An Econometric Analysis of the Operational Sources

Sriram Thirumalai, Associate Professor, Texas Christian University, Neeley School of Business, TCU Box 298530,
Fort Worth, TX, 76116, United States of America,
s.thirumalai@tcu.edu

Medical errors in the delivery of care is a significant cause of concern in healthcare supply chains. Based on an econometric analysis of a panel dataset on medical errors, this study serves to examine the sources of medical errors and error mitigation in the delivery of care in hospitals.

3 - The Impact of Workarounds on Patient Falls and Pressure Ulcers

Anita Tucker, Associate Professor, Brandeis University, 415 South Street, Waltham, MA, 02453, United States of America,
atucker@brandeis.edu

We present results from a survey of 100 medical/surgical nursing units that tests the impact of workarounds and operational failures on nursing sensitive patient outcomes, such as pressure ulcers, falls, patient satisfaction and infections.

4 - Batching of CSP Medication in In-Hospital Pharmacy

Vera Tilson, Simon School of Business, University of Rochester,
Rochester, NY, 14627, United States of America,
vera.tilson@simon.rochester.edu, Gregory Dobson, David Tilson

Hospital pharmacy departments batch production of Compounded Sterile Products (CSP). A change in a patient's condition can lead to change or cancellation of physician's orders. A very large proportion of orders are cancelled, which leads to waste custom compounded medication. We create an integer programming model to help pharmacies plan batch production trading off the cost of waste and the cost of employee labor.

43-Room 103A, CC

Joint Session RMP/MSOM: Choice Models: Estimation and Optimization

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Sumit Kunnumkal, Indian School of Business, Gachibowli, Hyderabad, India, Sumit_Kunnumkal@isb.edu

1 - Formulation, Motivation, and Estimation for the D-Level Nested Logit Model

Guang Li, University of Southern California, Bridge Hall 401, None, Los Angeles, CA, 90089-0809, United States of America, guangli@usc.edu, Huseyin Topaloglu, Paat Rusmevichientong

Using a tree of depth d , we provide a novel formulation for the d -level nested logit model. Our model is consistent with the random utility maximization principle and equivalent to the elimination by aspects model. Using new concavity results on the log-likelihood function, we develop an effective parameter estimation algorithm. Numerical results show that the prediction accuracy of the d -level nested logit model can be substantially improved by increasing the number of levels d in the tree.

2 - Assortment Optimization Over Time

James Davis, Cornell University, 290 Rhodes Hall, Ithaca, NY, United States of America, jamesmariodavis@gmail.com, Huseyin Topaloglu, David Williamson

Inspired by online retail we introduce a new type of assortment optimization problem: assortment optimization over time. In this problem the retailer must choose which products to display but must also choose an ordering for the products. This is a relevant problem when items are displayed as a list; this is common when returning results from a search query, for example. We provide a framework to analyze this problem, provide an approximation algorithm, and some hardness results.

3 - Tractable Bounds for Assortment Planning with Product Costs

Sumit Kunnumkal, Indian School of Business, Gachibowli, Hyderabad, India, Sumit_Kunnumkal@isb.edu, Victor Martínez-de-Albéniz

Assortment planning under a logit demand model is a difficult problem when there are product specific costs associated with including products into the assortment. In this paper, we describe a tractable method to obtain an upper bound on the optimal expected profit. We provide performance guarantees on the upper bound obtained. We describe how the method can be extended to incorporate additional constraints on the assortment or multiple customer segments.

4 - Clustering Consumers Based on Their Preferences

Ashwin Venkataraman, New York University, 715 Broadway, New York, NY, United States of America, ashwin.venkataraman@gmail.com, Srikanth Jagabathula, Lakshminarayana Subramanian

Preference-based clustering is an important and challenging problem. We propose a non-parametric method to cluster consumers based on their preferences for a set of items. Our method combines the versatility of model-free clustering (such as k -means) with the flexibility and rigor of model-based clustering (based on EM algorithm). Our approach is fast, can handle missing data, identify general correlation patterns in consumer preferences, and has provable guarantees under reasonable assumptions.

■ TC44

Pricing in Online Markets

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Kostas Bimpikis, Stanford GSB, 655 Knight Way, Stanford, CA, 94305, United States of America, kostasb@stanford.edu

1 - Modeling Growth for Services: Evidence from the App Economy

Ken Moon, PhD Candidate, Stanford GSB, 655 Knight Way, Stanford, CA, 94305, United States of America, kenmoon@stanford.edu, Haim Mendelson

We present a model of service operations to grow and sustain customers by the operational design and performance of services, rather than marketing alone. Applying our framework to data from services in the app economy, we show (i) that customers' engagement contributes as powerfully to growth as virality; and (ii) evidence of an experience curve (from customer interactions) for service operations. We present a model of incentive-compatible pricing for this setting.

2 - Mobile Technology in Retail: The Value of Location-based Information

Marcel Goic, Assistant Professor Of Marketing, University of Chile, Republica #701, Santiago, 8370438, Chile, mgoic@dii.uchile.cl, Jose Guajardo

We analyze the value of location-based information in mobile retailing and the conditions under which incorporating geolocation information increase effectiveness metrics for retailers.

3 - Dynamic Pricing in Ride-Sharing Platforms

Siddhartha Banerjee, Postdoc, Stanford University, 475 Via Ortega, Stanford, CA, 94305, United States of America, sidb@stanford.edu, Carlos Riquelme, Ramesh Johari

We develop a model for ride-share platforms, which combines a queueing model for the platform dynamics with strategic models for passenger and driver behavior. Using this, we study various aspects of this system - the value of dynamic pricing versus static pricing; the robustness of these policies; the effect of heterogeneous ride-request rates and traffic between different locations. Joint work with Ramesh Johari, Carlos Riquelme and the Data Science team at Lyft.

4 - Pricing with Limited Knowledge of Demand

Maxime Cohen, MIT, 70 Pacific Street, Apt. 737B, Cambridge, MA, 02139, United States of America, maxcohen@mit.edu, Georgia Perakis, Robert Pindyck

How should a firm price a new product with limited information on demand? We propose a simple pricing rule that can be used if the firm's marginal cost is constant: the firm estimates the maximum price it can charge and then sets price as if demand were linear. We develop bounds that show that if the true demand is one of many commonly used demand functions, the firm will do "very well" - its profit will be close to what it would earn if it knew the true demand.

45-Room 103C, CC

Behavioral Issues in RM

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Anton Ovchinnikov, Queen's University, 143 Union Str West, Kingston, Canada, anton.ovchinnikov@queensu.ca

1 - Should Consumers be Strategic?

Arian Aflaki, Doctoral Student, Duke University, 100 Fuqua Drive, Box 90120, Durham, NC, 27708, United States of America, arian.aflaki@duke.edu, Robert Swinney, Prina Feldman

We consider whether strategic consumer behavior benefits consumers when they purchase from a rational, revenue-maximizing firm that sets prices over multiple periods. We show that strategic behavior does not benefit all consumers. Then, by studying a wide range of pricing and inventory strategies in a unified setting, we find that different strategies may induce different levels of interest in strategic behavior.

2 - Intertemporal Pricing under Minimax Regret

Ying Liu, Stern School of Business, New York University, 44 West 4th Street, KMC 8-154, New York, NY, 10012, United States of America, yliu2@stern.nyu.edu, Rene Caldentey, Ilan Lobel

We consider a monopolist selling a product to a population of consumers who are heterogeneous in valuations and arrival times. We study the policies that attain minimum regret when selling to either myopic or strategic customers. We characterize the set of optimal policies and demonstrate their structural properties.

3 - Behavioral Anomalies in Consumer Wait-or-Buy Decisions and the Implications for Markdown Management

Nikolay Osadchiy, Emory University, 1300 Clifton Rd NE, Atlanta, GA, 30322, United States of America, nikolay.osadchiy@emory.edu, Anton Ovchinnikov, Manel Baucells

A decision to buy at a tag price or wait for a possible markdown involves a trade-off between the value, delay, risk and markdown magnitude. We build an axiomatic framework that accounts for three well-known behavioral anomalies along these dimensions and produces a parsimonious generalization of discounted expected utility. We consider a pricing/purchasing game and show that accounting for the behavioral anomalies results in substantially larger markdowns and leads to noticeable revenue gains.

4 - Selling a Dream: Pricing under Savoring and Anticipation

Javad Nasiry, Assistant Professor, Hong Kong University of Science and Technology, ISOM, LSK Building, HKUST, Hong Kong, Hong Kong - PRC, nasiry@ust.hk, Ioana Popescu

We study a market where customers derive emotional utility from anticipating pleasurable purchase outcomes, but experience disappointment if outcomes fall short of what they anticipated. In this context, we show that firms can profit by adopting randomized pricing policies.

■ TC46

Issues Related to Supply Chain Management

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Achal Bassamboo, Professor, Kellogg School of Management, 2001 Sheridan Road, Evanston, IL, 60208, United States of America, abassamboo@kellogg.northwestern.edu

1 - Worker Poaching in a Supply Chain: Enemy from Within?

Evan Barlow, Northwestern University, Evanston, IL, United States of America, e-barlow@kellogg.northwestern.edu, Gad Allon, Achal Bassamboo

Poaching workers has become a universal practice. We explore worker poaching between firms linked in a supply chain. We show that the classical intuition from labor economics is insufficient in explaining poaching between supply chain partners. We also show how and under what conditions worker poaching can actually improve supply chain performance. Finally, we show how the equilibrium identity of the supply chain bottleneck depends on the interaction between hiring, poaching, and productivity.

2 - Dynamic Clustering and Assortment Personalization: The Value of Information Pooling

Sajad Modaresi, Duke University, 100 Fuqua Drive, Durham, NC, United States of America, sajad.modaresi@duke.edu, Denis Saure, Fernando Bernstein

A retailer faces heterogeneous customers with initially unknown preferences. The retailer can personalize assortment offerings based on available profile information; however, users with different profiles may have similar preferences, suggesting that the retailer can benefit from pooling information among customers with similar preferences. We propose a dynamic clustering approach that adaptively adjusts customer segments and personalizes the assortment offerings to maximize cumulative profit.

3 - Policing a Self-policing Firm: Incentives for Detection and Disclosure of Compliance Violations

Sang Kim, Yale School of Management, New Haven, CT, United States of America, sang.kim@yale.edu

One of the challenges in enforcement of environmental regulations is designing an effective incentive mechanism that elicits firms' voluntary detection and disclosure of compliance violations. With a right incentive, a firm self-polices its internal operations to detect random violations before a regulator does, and subsequently puts a remedial action in place. We study this incentive dynamic using a game-theoretic framework.

4 - Reshoring Manufacturing: Supply Availability, Demand Updating, and Inventory Pooling

Bin Hu, Assistant Professor, UNC Kenan-Flagler Business School, CB#3490 McColl Bldg, University of North Carolina, Chapel Hill, NC, 27519, United States of America, Bin_Hu@kenan-flagler.unc.edu, Li Chen

Reshoring shortens the distance from factory to market, however limited onshore supply availability may force reshoring manufacturers to remain dependent on offshore suppliers, leading to increased distance from supplier to factory. In this case, we show that manufacturers' preferences toward reshoring boil down to trade-offs between operational flexibilities. We characterize when manufacturers prefer reshoring, and further identify operational strategies that can swing such preferences.

Co-Chair: James Abbey, Texas A&M University, 4217 TAMU 320P, College Station, TX, 77843, United States of America, jabbey@mays.tamu.edu

1 - Recycling as a Strategic Supply Source

Gal Raz, Associate Professor, Ivey Business School, Western University, 1255 Western Road, London, ON, Canada, RazG@darden.virginia.edu, Gilvan (Gil) Souza

In this paper we investigate how recycling can be used as a strategic source of supply in the presence of competition and a powerful material supplier. We examine the economic and environmental impact of a manufacturer's decision to recycle its products and the implications on the customers, supplier and society as a whole.

2 - The Effect of Environmental Regulation on DFE Innovation: Social Cost in Primary/ Secondary Markets

Cheryl Druehl, George Mason University, 4400 University Dr MS 5F4, Fairfax, VA, 22030, United States of America, cdruehl@gmu.edu, Vered Blass, Gal Raz

We examine DFE innovations in the use stage and for refurbishing of a firm selling new primary market products and refurbished products in a separate secondary market. The firm determines innovations, prices, and fraction collected. Using LCA data from cell phones, we compare EPR and Use stage regulations on profits and environmental impact.

3 - New Versus Refurbished: Key Factors that Influence Consumers' Decisions

Erin Mckie, University of South Carolina, 1014 Greene Street, Columbia, SC, 29208, United States of America, erinmckie@gmail.com, Mark Ferguson, Michael Galbreth, Sriram Venkataraman

Remanufacturing is increasingly providing new profit opportunities for firms, and more product condition options – such as new, refurbished, and used – for consumers to choose between. Using secondary data and choice model analysis techniques, this study estimates the influence of various factors on consumers' purchasing decisions.

4 - The Value of Competition in Remanufacturing

Narendra Singh, Georgia Institute of Technology, Atlanta, GA, United States of America, Narendra.Singh@scheller.gatech.edu, Karthik Ramachandran, Ravi Subramanian

We study an OEM's product strategy when the OEM offers a new product that depreciates over time and consumers are strategic. The OEM competes with a third-party remanufacturer for acquisition and remanufacturing of the depreciated products. We study how competition from the third-party remanufacturer affects the OEM.

Managing Finances and Risk in Supply Chains

Sponsor: Manufacturing & Service Oper Mgmt/iFORM

Sponsored Session

Chair: Danko Turcic, Associate Professor Of Operations, Olin Business School, Washington University in St. Louis, St Louis, MO, United States of America, turcic@wustl.edu

Co-Chair: Panos Kouvelis, Professor, Olin Business School, Washington University in St. Louis, St Louis, MO, United States of America, kouvelis@wustl.edu

1 - Quality at the Source or Quality at the End? Managing Supplier's Quality under Information Asymmetry

Mohammad Nikoofal, Católica Lisbon School of Business & Economics, UCP, Palma de Cima, Lisbon, 1649-023, Portugal, mohammad.nikoofal@ucp.pt

In this paper, we first develop and then compare two different mechanisms for the buyer in order to control quality improvement efforts exerted by the supplier when the supplier has private information about his inborn reliability.

2 - Optimal Monitoring Decisions for Asset Based Lending

Nikolaos Trichakis, Harvard Business School, Boston, MA, United States of America, HBS, ntrichakis@hbs.edu, Dan Iancu, Do Young Yoon

We consider a firm financing its operations by collateralizing its working assets, e.g., inventory. To mitigate the risk due to the assets' uncertain valuation, the lender has a monitoring option entitling him to early repayment by liquidation. We derive the optimal liquidation policy, showing that it can have a nonthreshold structure. We derive bounds on the optimal monitoring time, and leverage them to devise simple heuristics, which perform well in numerical studies.

3 - Capital Structure with Flexible Future Investments

Qi Wu, Case Western University, Cleveland, OH, United States of America, Weatherhead School of Management, CWRU, qxw132@case.edu, Peter Ritchken

We analyze the interaction between investment and financing decisions in a dynamic contingent claims model where the firm has the ability to dynamically control production decisions of assets in place and has growth options to invest in that can be financed with debt and equity. The fundamental question to be addressed is how investment timing and financing decisions are affected by the existing capital structure and the nature of the operating flexibility inherent in the growth options.

4 - Make-to-Order vs. Make-to-Stock when Firms Compete, Input Costs, and Demand are Stochastic

Danko Turcic, Associate Professor of Operations, Olin Business School, Washington University in St. Louis, St. Louis, MO, United States of America, turcic@wustl.edu, Guang Xiao, Panos Kouvelis

This paper provides a new rationale for why firms choose long and short production lead times that is based, in part, on non-competitive behavior in product markets. We identify a set of conditions, which imply that some, otherwise identical, production firms want to choose long production lead times, while others choose short production lead times. The conditions are: (i) stochastic production costs, (ii) price-dependent demand, and (iii) strategic inventory withholding.

Multi-Echelon Inventory Modeling

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain
Sponsored Session

Chair: Sean Willems, University of Tennessee, 453 Haslam Business Building, Knoxville, TN, 37996, United States of America, willems@bu.edu

1 - Velocity-based Storage in a Semi-automated Order Fulfillment System

Stephen Graves, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, sgraves@mit.edu, Rong Yuan

Online retailers continue to invest in technology to improve the efficiency of order fulfillment. This technology creates new operating challenges and opportunities. We examine a semi-automated fulfillment system in which pickers and stowers are stationary, and the inventory storage units are brought to them. We evaluate the effectiveness of velocity-based storage and consider how to deploy a velocity-based storage policy in light of picking, stowing and storage decisions.

2 - Incorporating an Operational Layer into the Guaranteed-service Inventory Optimization Approach

Steffen Klosterhalfen, University of Richmond, 1 Gateway Road, Richmond, VA, 23173, United States of America, steffenklosterhalfen@googlemail.com, Daniel Dittmar

The existing guaranteed-service contributions assume bounded demand and do not explicitly model how excess demand is handled by some type of flexibility measure. The lack of a clear operational description leaves the material flow representation somewhat incomplete and renders the approach controversial. We incorporate operating flexibility in the form expediting. By doing so we can work directly with the external (unbounded) demand and the entire material flow is easy to trace and understand.

3 - Multi-item Spare Parts Inventory Planning with Selective use of Advance Demand Information

Geert-Jan Van Houtum, Full Professor, Eindhoven University of Technology, P.O. Box 513, Eindhoven, 5600MB, Netherlands, g.j.v.houtum@tue.nl, Tarkan Tan, Engin Topan

We propose a multi-item, spare parts inventory system model with a general representation of imperfect demand information. We determine which parts should be monitored and how much stock should be kept for each component so that a given aggregate system availability is maintained. Our model allows excess inventory on stock and on order to be returned to the central depot or external supplier at a certain return cost. We also characterize the optimal ordering and return policy.

Operations Economics

Sponsor: Manufacturing & Service Operations Management
Sponsored Session

Chair: Terry Taylor, U.C. Berkeley, Haas School of Business, 2220 Piedmont Avenue, Berkeley, CA, United States of America, taylor@haas.berkeley.edu

Co-Chair: Wenqiang Xiao, Associate Professor, New York University, Stern School of Business, 44 West Fourth Street, 8-72, New York, NY, 10012, United States of America, wxiao@stern.nyu.edu

1 - Strategic Outsourcing under Competition and Asymmetric Information

Lusheng Shao, University of Melbourne, Melbourne, Australia, lusheng.shao@unimelb.edu.au, Xiaole Wu, Fuqiang Zhang

This paper studies two firms' outsourcing strategies under competition and asymmetric cost information. We find that without asymmetric information, the firms will choose the supplier with smaller cost uncertainty. However, with information asymmetry, the supplier with greater cost uncertainty may be preferred.

2 - Information Preferences in the Supply Chain under Strategic Inventory

Abhishek Roy, PhD Student, McCombs School of Business, University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78712, United States of America, abhishek.roy@utexas.edu, Steve Gilbert, Guoming Lai

We investigate how the possibility of strategic inventory influences the preferences for information sharing between supply chain partners. Among other results, we show that the presence of strategic inventory may alter traditional information preferences of the supply chain partners regarding the creation of a mechanism for sharing information about the retailer's operation with the supplier.

3 - Product Quality in a Distribution Channel with Inventory Risk

Kinshuk Jerath, Columbia University, 521 Uris Hall, 3022 Broadway, New York, NY, 10027, United States of America, jerath@columbia.edu, Sang Kim, Robert Swinney

We analyze a situation in which a product has to be designed and sold under demand uncertainty. We consider the jointly optimal quality and inventory decision in both a centralized channel (a single firm determines both) and a decentralized channel (a manufacturer determines quality while a retailer determines inventory), and discuss how demand uncertainty impacts the optimal quality-inventory pair and how coordination of the decentralized channel may be achieved.

4 - Congested Platforms

Terry Taylor, U.C. Berkeley, Haas School of Business, 2220 Piedmont Avenue, Berkeley, CA, United States of America, taylor@haas.berkeley.edu

In a platform business model, the platform firm provides a per-service wage payment to independent agents (e.g., drivers in riding-sharing services (e.g., Uber), shoppers in delivery services (e.g., Instacart)) to motivate them to provide service to customers. This paper uses a queueing model to examine the impact of congestion on the platform's optimal price and wage.

Online Retailing

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Dorothee Honhon, Associate Professor, University of Texas at Dallas, 800 W. Campbell Road, Richardson, TX, 75080, United States of America, Dorothee.Honhon@utdallas.edu

Co-Chair: Amy Pan, Assistant Professor, University of Florida, Dept. of ISOM, Warrington College of Business Administration, Gainesville, FL, 32608, United States of America, amy.pan@warrington.ufl.edu

1 - Counteracting Strategic Purchase Deferrals: The Impact of Online Retailers' Return Policy Decisions

Tolga Aydinliyim, Baruch College, One Bernard Baruch Way, Dept of Management Box B9-240, New York, United States of America, Tolga.Aydinliyim@baruch.cuny.edu, Mehmet Sekip Altug

We study the impact of (i) forward-looking (i.e., discount-seeking) consumer behavior and (ii) consumers' sensitivity to clearance period stock availability on retailers' returns management decisions and the ensuing demand segmentation and profit effects in both monopolistic and competitive settings.

2 - Replenishment under Uncertainty in Online Retailing

Jason Acimovic, Penn State University, 462 Business Building, University Park, PA, 16802, United States of America, jaa26@smeal.psu.edu, Stephen Graves

Online retailers often may serve most customers from any warehouse location. Simple order-up-to policies are easy to implement; however, they may perform suboptimally leading to high shipping costs. We propose a replenishment heuristic based on bringing inventory up to a target level on the day inventory arrives. We calculate robust target levels, taking into account demand uncertainty, shipping costs, and estimated stockout costs. We show how this policy performs on realistic data.

3 - Optimal Spending for a Search Funnel

Shengqi Ye, The University of Texas at Dallas, 800 West Campbell Road, Richardson, TX, 75080, United States of America, sxy143530@utdallas.edu, Goker Aydin, Shanshan Hu

Sponsored search marketing has been a major advertising channel for online retailers. Recent observation indicates that not all customers finalize their purchase decision after their first search query. Instead, customers might take a path of keywords and clicks - a search funnel - to complete a conversion. Noting this behavior, we investigate a retailer's optimal advertising budget allocation across keywords in the search funnel.

4 - Omnichannel Inventory Management with Buy-Online-and-Pickup-in-Store

Fei Gao, The Wharton School, University of Pennsylvania, 3730 Walnut Street, 500 Jon M. Huntsman Hall, Philadelphia, PA, United States of America, feigao@wharton.upenn.edu, Xuanming Su

Many retailers offer customers the option to buy online and pick up orders in store. We study the impact of this omnichannel strategy on store operations and offer recommendations to retailers.

Machine Learning Applications in Marketing

Sponsor: Marketing Science

Sponsored Session

Chair: Daria Dzyabura, Assistant Professor of Marketing, NYU Stern School of Business, 40 West 4th Street, Tisch 805, New York, NY, 10012, United States of America, ddzyabur@stern.nyu.edu

1 - Big Data Pricing

Eric Schwartz, University of Michigan, Ann Arbor, Michigan, United States of America, ericmsch@umich.edu, Kanishka Misra

We study how a firm should maximize revenue by dynamically setting its price over time for a new product. We solve this optimal experimentation problem as a multi-armed bandit problem combined with economic theory. The approach adds to dynamic pricing in marketing and econometrics using non-parametric identification of demand by using reinforcement learning. In particular, we derive a pricing algorithm based on upper confidence bound and illustrate its theoretical and empirical properties.

2 - Nonparametric Demand Predictions for New Products

Srikanth Jagabathula, NYU, 44 West Fourth Street, New York, NY, United States of America, sjagabat@stern.nyu.edu, Lakshminarayanan Subramanian, Ashwin Venkataraman

Predicting demand for new products is important and challenging. Existing parametric approaches require selection of relevant features of products and specification of the parametric structures, both of which are challenging. We propose a non-parametric approach combining ideas from "Learning to Rank" in machine learning and "Choice Estimation" in operations and marketing. The resulting methods can be used out-of-the-box and allow us to predict the impact of changes in product features.

3 - A Structured Analysis of Unstructured Big Data Leveraging Cloud Computing

Xiao Liu, Assistant Professor Of Marketing, New York University, 44 West 4th Street, New York, NY, 10012, United States of America, xiaoliu@andrew.cmu.edu, Kannan Srinivasan, Param Vir Singh

In this study, we combine methods from cloud computing, machine learning and text mining to illustrate how content from social media can be effectively used for forecasting purposes. We conduct our analysis on a staggering volume of nearly two billion Tweets. Our main findings highlight that, in contrast to basic surface-level measures such as volume or sentiment, the information content improve forecasting accuracy significantly.

4 - Modeling Multi-taste Consumers

Liu Liu, NYU Stern School of Business, 40 West 4th Street, Tisch Hall, Room 825, New York, NY, 10012, United States of America, lliu@stern.nyu.edu, Daria Dzyabura

In many product categories where recommendation systems are used, a single consumer may have multiple different tastes. We propose a framework for modeling choice behavior of such a multi-taste consumer and an iterative algorithm for estimation. We test it in numerical studies and an empirical application (Allrecipes.com). Our results show that it has superior out-of-sample predictive performance than single-taste models and is able to accurately recover parameters in simulation studies.

Grab Bag of Behavioral Papers

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Kenneth Schultz, Associate Professor, AFIT, 2950 Hobson Way, WPAFB, OH, 45433, United States of America, Kenneth.Schultz@afit.edu

1 - The Influence of Education and Experience Upon Contextual and Task Performance in Warehouse Operations

Allen Miller, Student, Air Force Institute of Technology, 2950 Hobson Way, WPAFB, OH, 45433, United States of America, Allen.miller@afit.edu

We believe worker-performance may be affected by the individual's knowledge of why and where they fit into a larger system, defined as mission clarity. We conduct a controlled experiment to discern how education, experiences and subject characteristics impact mission clarity and subsequently contextual and task performance in a pick-and-pack operation.

2 - Personal Bias and Contract Setting

Julie Niederhoff, Syracuse University, Syracuse, NY, United States of America, jniederh@syr.edu

The efficacy and necessity of coordinating contracts has a strong analytical support, but experimental work shows that decision makers do not set the contracts as theory prescribes. Alternative objective functions of risk and fairness are explored at the individual level to understand when and for whom the contracts are most and least effective and necessary.

3 - The Influence of Emergency Medical Services Load on Paramedics On-scene Clinical Decisions

Mohammad Delasay, Post-doctoral Fellow, Tepper School of Business, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, United States of America, delasays@andrew.cmu.edu, Kenneth Schultz, Armann Ingolfsson

We investigate the effect of emergency medical system load on paramedics' medical decisions. We hypothesize that paramedics' decisions about on-scene time and transporting a patient to hospital are influenced by the emergency system load. We test our hypotheses by analyzing a data set of emergency responses in Calgary, Canada.

4 - The Bright Side of Managerial Overconfidence

Juan Li, Assistant Professor, Nanjing University, No. 5 Ping Cang Xiang, Nanjing, China, juanli@nju.edu.cn, Baojun Jiang, Fuqiang Zhang

Managers are often overconfident about the accuracy of their demand forecast. This paper shows that the firm may actually benefit from such overconfidence bias whether or not its competitor has such bias. Further, such bias can lead to a win-win situation for both competing firms.

Discrete Optimization Models for Homeland Security and Disaster Management

Cluster: Tutorials

Invited Session

Chair: Laura Mclay, Associate Professor, University of Wisconsin, 1513 University Ave, ISYE Department, Madison, WI, 53706, United States of America, lmclay@wisc.edu

1 - Discrete Optimization Models for Homeland Security and Disaster Management

Laura Mclay, Associate Professor, University of Wisconsin, 1513 University Ave, ISYE Department, Madison, WI, 53706, United States of America, lmclay@wisc.edu

Preparing for and responding to disasters, including acts of terrorism, is an important issue of national and international concern. Recent disasters underscore the need to manage disasters to minimize their impact on critical infrastructure and human suffering. In this tutorial, we survey the operations research literature that develops, analyzes and applies discrete optimization models to effectively mitigate, prepare for, respond to and recover from a wide variety of disasters.

Outsourcing I

Contributed Session

Chair: Ting Luo, University of Texas at Dallas, 800 W Campbell Rd, Richardson, TX, 75080, United States of America, ting.luo@utdallas.edu

1 - Outsourcing Supplier Selection: Quality-driven Demand and Taguchi Loss Function

Yanni Ping, Drexel University, 3220 Market Street, Gerri C. LeBow Hall 730, Philadelphia, PA, 19104, United States of America, yp86@drexel.edu, Seung-lae Kim, Min Wang

Facing limited capacity, a manufacturer would often rely on external suppliers. How to select suppliers to work with becomes a strategic decision particularly when demand for the final product is quality driven. In this talk, we adopt a Taguchi loss function as a supplier's quality measurement and present a dynamic programming model to explore how supplier quality affects manufacturer's outsourcing strategy. We propose simple and efficient algorithms for supplier selection in a dynamic setting.

2 - Fixed Entry Cost Effect on Contract Length and Renewals in a Maintenance Service Contract Systems

Rodrigo Ulloa, Pontificia Universidad Católica de Chile, Av. Vicuña Mackenna 4860, Santiago, Chile, rsulloa@uc.cl, Alejandro Mac Cawley, Rodrigo Pascual, Gabriel Santelices

We analyze how the inclusion of a fixed entry cost will affect the decision making of a maintenance contract, using a model that evaluates the contract value for the vendor according to the contract duration and its renewals. The analysis considers different scenarios that show the existence of a relationship between the length of the contract and the amount of renovations from which the contract is valuable for the vendor.

3 - Long-term Outsourcing under Stochastic Learning and Information Asymmetry

Ting Luo, University of Texas at Dallas, 800 W Campbell Rd, Richardson, TX, 75080, United States of America, ting.luo@utdallas.edu

Suppliers can reduce their cost through learning by doing, however their learning abilities and outcomes are kept as private information. When buyers design the procurement contract, they must consider the above effects. We study the interplay of stochastic learning and information asymmetry. We show that the stochastic learning has a profound impact on the optimal contract.

4 - Opportunism in Manufacturing Outsourcing

Keith Skowronski, The Ohio State University, Fisher 251A, 2100 Neil Avenue, Columbus, OH, 43210, United States of America, skowronski.2@osu.edu, W. C. Benton

Using dyadic buyer-supplier data, we empirically examine two types of supplier opportunism, poaching and shirking, in manufacturing outsourcing relationships. In this multi-country study, the legal environment of the supplier's location is hypothesized to moderate the relationships between exchange hazards, relational governance mechanisms and the different forms of opportunism.

5 - Suppliers as Liquidity Providers

Panos Markou, IE Business School, Calle Maria de Moina 12 Bajo, Madrid, 28006, Spain, pmarkou.phd2016@student.ie.edu, Daniel Corsten

Using a novel dataset comprising the top 10 suppliers of more than 80,000 public and private companies, we examine the value of having a supplier that is not financially constrained. For financially constrained customers, holding cash is costly. However, we show that having even one financially unconstrained supplier allows these customers to "outsource" some of their cash holdings. Financial standing is an important consideration when choosing suppliers.

Long-Term Electric Power System Planning Models

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Ramteen Sioshansi, Associate Professor, The Ohio State University, Integrated Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, sioshansi.1@osu.edu

1 - Optimizing Storage Operations in Longer-term Power System Models

Sonja Wogrin, Comillas Pontifical University, Calle Alberto Aguilera 23, Madrid, Spain, sonja.wogrin@comillas.edu,
David Galbally, Javier Reneses

In a rapidly changing power system the proper characterization of storage behavior becomes an increasingly important issue. We propose a new formulation to capture storage behavior in medium- and long-term power system models that use a load duration curve. In such models the chronology among individual hours is lost; our approach addresses related shortcomings and is able to accurately replicate hourly evolution of storage levels while keeping computational time tractable.

2 - Multi-stage Investment in Renewable Energies via Linear Decision Rules

Maria Ruth Dominguez Martin, Universidad de Castilla - La Mancha, Av. Carlos III, s/n, Toledo, Spain,
Ruth.Dominguez@uclm.es, Miguel Carrion, Antonio Conejo

Investment in generating capacity involves high uncertainty. In the real world, these decisions are usually made in several stages. We propose a multi-stage investment model to transform a thermal-based power system into a renewable-dominated one. We consider the uncertainty of the demand growth and the investment costs, as well as the variability of the renewable power production throughout the year.

3 - Impact of Unit Commitment Constraints on Generation Expansion Decisions under Wind Uncertainty

Jalal Kazempour, Technical University of Denmark, Department of Electrical Engineering, Kgs. Lyngby, 2800, Denmark,
seykaz@elektro.dtu.dk, Amin Nasri, Antonio Conejo

Most of available generation expansion decision-making tools in the literature neglect a number of unit commitment (UC) constraints, e.g., on/off commitment status, ramping limits and minimum production level of thermal units. This study analyzes the impact of those constraints on generation expansion decisions in power systems with significant wind power integration. To this end, a two-stage stochastic programming problem is proposed and solved using a decomposition technique.

4 - Stochastic Generation and Transmission Investment Planning Model

Yixian Liu, The Ohio State University, 210 Baker Systems Bldg., 1971 Neil Ave., Columbus, OH, 43210, United States of America,
liu.2441@osu.edu, Ramteen Sioshansi

Increasing electricity demand makes it necessary to expand the capacity of the current electrical grid. We propose a multi-stage stochastic linear programming model to seek an optimal investment plan in generators, storage devices and transmission lines in a long time horizon. Multiple uncertainties are considered involving both investment and dispatch decisions. The model is large in scale and may take excessive computational time to be solved. Decomposition methods will be applied to solve it.

1 - Stochastic Model for Assessment of Thermoelectric Power Generation Drought Risk under Climate Change

Royce Francis, George Washington University, 800 22nd St. NW B1850, Washington, DC, 21212, United States of America,
seed@gwu.edu, Behailu Bekera

The objective of this article is to propose a stochastic method for analyzing drought risk to the thermoelectric power generation infrastructure sector due to its heavy reliance on freshwater availability. In particular, this article proposes a thermoelectric drought characterization framework from which a stochastic

drought risk assessment model is constructed from the thermoelectric power sector's operational perspective.

2 - Portfolio Approach for Optimal Rooftop Solar Arrays Selection for Distributed Generation

Olufemi Omitaomu, Senior Research Scientist, Oak Ridge National Laboratory, 1 Bethel Valley Road, MS-6017, Oak Ridge, TN, 37831, United States of America, omitaomuoa@ornl.gov,
Xueping Li

We present a portfolio selection approach that consider thousands of buildings with different solar energy potential and that are being considered for utility-scale distributed power generation. Our approach uses Markowitz mean-variance portfolio selection model to select suitable rooftops by identifying a combination of buildings that will maximize solar energy outputs and minimize system variability. Our approach is implemented using some real data-sets.

Impacts of Climate Change

Sponsor: ENRE – Environment II – Forestry

Sponsored Session

Chair: Chris Lauer, Oregon State, Portland, OR, United States of America, cjlaue@gmail.com

1 - Planning Forest Harvesting under Climate Change: A Stochastic Optimization Model

Jordi Garcia, Researcher, Instituto Superior de Agronomia, Universidade de Lisboa, Portugal, Tapada da Ajuda., Lisbon, Portugal, jordigarcia@isa.ulisboa.pt, Andres Weintraub,
Cristobal Pais, Joanna Bachmatiuk

In this paper we consider a medium term forest planning problem in the presence of uncertainty due to climate change. For each time period the forest planner must decide which areas to cut in order to maximize expected net profit. A multistage stochastic model using 32 climate scenarios was developed and solved to determine optimal harvesting decisions under uncertainty. The stochastic solutions were compared to the solution of a deterministic model where an average climate scenario was used.

2 - Will Climate Change Induced Effects Cause Harm to Value Chains of the Bio-based Industry?

Peter Rauch, Pd, BOKU, Feistmantelstrasse 4, Wien, 1180, Austria, peter.rauch@boku.ac.at

Uncertainty increasingly affects ecosystems and storms and bark beetle infestations are the main causes of forest damage. Risks and their impacts on value chains of the bio-based industry are evaluated by a System Dynamics model of the Austrian wood supply including a stochastic simulation of risk agents. Results provide insights on probabilistic future wood supply security for sawlogs, pulpwood resp. energy wood and reveal a contra-intuitive system effect for the climate change scenario.

3 - Multiobjective Optimization to Study the Impact of Climate Change on the Joint Provision of Ecosystem Services

Nick Kullman, Masters Student, University of Washington, 360 Bloedel Hall, Seattle, WA, United States of America, nick.kullman@gmail.com, Sventlana Kushch, Sandor Toth

Climate change has been shown to alter the provision of forest ecosystem services such as carbon sequestration and wildfire mitigation. Less understood is how climate change will alter the tradeoffs among ecosystem services acquired simultaneously. We present a scenario-based multi-objective mathematical programming method to study these changes on the joint provision of ecosystem services in the Deschutes National Forest.

4 - Incorporating Acclimation and Feedback into Reserve Selection During Climate Change

Austin Phillips, University of Washington, Seattle, WA, United States of America, austinjphillips90@gmail.com, Sandor Toth, Robert Haigh

Climate change threatens many species, and conservation in such a dynamic setting is challenging. We developed a mixed integer reserve selection model that pairs population dynamics and sequential selection in a nonlinear feedback loop. The model accounts for species' ability to acclimate, as well as disperse, to track suitable conditions. We explore optimal management strategies to facilitate species' survival as they disperse and acclimate in response to warming.

Disruption Management

Contributed Session

Chair: Min Ouyang, Associate Professor, Huazhong University of Science and Technology, Room W308 in S1 Building, 1037 Luoyu Road, Wuan, 430074, China, mouyang618@gmail.com

1 - Transportation Network Protection: A Model with Variable Flow Demand

Stefano Starita, PhD Researcher, Kent Business School, University of Kent, University of Kent, Canterbury, CT2 7PE, United Kingdom, s.starita@kent.ac.uk, Dr. Maria Paola Scaparra

Protecting transportation infrastructure is critical to avoid life and economic losses. We model a fortification problem on an all-pairs, flow-based network. To model system users' behavior, the traffic demand is assumed to be dependent on the length of the shortest path available. We present an efficient heuristic solution approach and a case study on the London tube.

2 - Comparison of Supply Chain Recovery Policies After a Major Disruption

Joanna Marszewska, Assistant Professor, Jagiellonian University, Department of Japanology and Sinology, Krakow, 31120, Poland, rokimi@op.pl, Tadeusz Sawik

Different recovery policies of a supply chain after major disruption caused by natural disasters are presented. The Japan's competitiveness-robustness dilemma is discussed against a resilient supply chain design strategy. Single, dual or multiple sourcing, improved suppliers visibility, protection of suppliers against natural disasters and prepositioning of emergency inventory of product-specific parts along a supply chain are considered and their impact on the recovery process is analyzed.

3 - Cargo Prioritization and Terminal Allocation in Case of Inland Waterway Disruption

Liliana Delgado Hidalgo, Graduate Student, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States of America, ld002@uark.edu, Heather Nachtmann

We propose a solution approach to reroute barges in case of an Inland waterway disruption. The first part of the solution uses an Analytic Hierarchical Process (AHP) to assign priority index to the barges. We formulate a Integer Linear Problem to assign the barges to the terminals where the cargo is offloaded to be transported by a different transportation mode. The AHP results are used to schedule the barges assigned to a terminal. A case example is presented to illustrate our results.

4 - Resilient Design in Agribusiness Supply Chain under Supply Disruptions

Golnar Behzadi, PhD Student, University of Auckland, Level 2, Room 439-215, 70 Symonds St, Auckland, 1010, New Zealand, gbeh681@aucklanduni.ac.nz, Abraham Zhang, Tava Olsen, Michael O'sullivan

Agribusiness supply chains have limited lifecycle of products, seasonality of supply and demand, long lead time for production and delivery, and supply that is affected by climatic variability, which makes them especially vulnerable to supply disruptions. A special approach to risk management is required and here we consider resilience. Resilience incorporates concepts from vulnerability and risk management to address the recovery of a system from disruptions (rare high-impact risks).

5 - Decision Support for Critical Infrastructure Resilience Enhancement

Min Ouyang, Associate Professor, Huazhong University of Science and Technology, Room W308 in S1 Building, 1037 Luoyu Road, Wuan, 430074, China, mouyang618@gmail.com

It develops a framework of resilience decision support system RDSS for critical infrastructures. This RDSS includes seven modules: Data Input, Property Statistics, Scenario Generation, Vulnerability Analysis, Restoration Simulation, Resilience Assessment and Strategy Exploration, which together allow for statistically and visually exploration of critical infrastructure system resilience under point and period disruption scenarios and facilitates effectiveness analysis of resilience strategies.

Sustainable and Responsible Supply Chain Management

Sponsor: ENRE – Environment I – Environment and Sustainability
Sponsored Session

Chair: Jose Cruz, Associate Professor, University of Connecticut, 2100 Hillside Road, Storrs, CT, 06269, United States of America, Jose.Cruz@business.uconn.edu

1 - Corporate Social Responsibility and Supply Chain Profitability

Zugang Liu, Associate Professor, Penn State Hazleton, 76 University Dr, Hazleton, PA, United States of America, zxl23@psu.edu, Trisha Anderson, Jose Cruz

We find that environmental and social responsible activities have different impacts on different stages of supply chains. For manufacturers, positive social activities and negative environmental activities increase the return on assets; for wholesalers, neither social nor environmental activities has significant impact; for retailers, negative environmental activities negatively affect the return on assets.

2 - The Amazon Tax and E-tailer Supply Chains

Trisha Anderson, Associate Professor, Texas Wesleyan University, 1201 Wesleyan Street, Fort Worth, TX, United States of America, trdanderson@txwes.edu, Kevin McGarry

We study two hypothesis to address a key legal question that e-tailers consider when opening up distribution centers: whether they should operate under the assumption that collecting state sales tax for all online transactions is inevitable or continue to strategically position themselves to minimize the tax burden where possible, even if it compromises supply chain strategic positioning. We also study the environmental implications of these e-tailer supply chain decisions.

3 - Social Responsibility Investments: Financial Networks, Transaction Cost, and Risk Effects

Jose Cruz, Associate Professor, University of Connecticut, 2100 Hillside Road, Storrs, CT, 06269, United States of America, Jose.Cruz@business.uconn.edu

This paper develops a network equilibrium model in conjunction with capital asset pricing model (CAPM) and the net present value (NPV) to determine the optimal portfolio, prices, profits, and equity values of financial network firms under financial risks and economic uncertainty. We investigate how social responsible financial investment decisions affect the values of interconnected financial firms from a network perspective.

4 - Green Building Decision-making using an Exploration and Exploitation Approach

John Dickson, Symphony Teleca Analytics, 5360, Legacy Drive, Plano, TX, United States of America, john.dickson@mavs.uta.edu, Jay Rosenberger, Victoria Chen

The experiments or simulations conducted by computers can be a tedious task, which require substantial computational time. This research focuses on developing a surrogate based optimization, in which we iteratively build a surrogate model, using few points and then optimize the model by adding more points until the best solution is found. A single story residential green building based in California is used as a case study.

Optimization in Bio-energy

Cluster: Energy Systems: Design, Operation, Reliability and Maintenance
Invited Session

Chair: Mohammad Marufuzzaman, Mississippi State University, Industrial & Systems Engineering, Starkville, MS, 39762, United States of America, mm2006@msstate.edu

1 - Designing a Dynamic Multimodal Transportation Network under Biomass Supply Uncertainty

Sushil Poudel, Mississippi State University, Starkville, MS, United States of America, srp224@msstate.edu, Mohammad Marufuzzaman, Linkan Bian, Hugh Medal

This study presents a two-stage stochastic programming model that assigns multimodal facilities dynamically to design a biomass supply chain network under feedstock supply uncertainty. We develop algorithms combining sample average algorithm, progressive hedging algorithm, and rolling horizon algorithm to solve this challenging NP-hard problem.

2 - Designing a Reliable Bio-fuel Supply Chain Network Considering Link Failure Probabilities

Linkan Bian, Assistant Professor, Mississippi State University, 260 McCain Building, Starkville, MS, 39762, United States of America, bian@ise.msstate.edu, Sushil Poudel, Mohammad Marufuzzaman

This study presents a pre-disaster planning model that seeks to strengthen the multi-modal facilities links for a bio-fuel supply chain system under limited budget availability. The failure probability of the links are estimated using a spatial-statistical model. We developed a combinatorial Benders decomposition algorithm to solve this challenging NP-hard problem.

3 - Managing Congestion in a Multi-modal Facility Location Problem under Uncertainty

Mohammad Marufuzzaman, Mississippi State University, Industrial & Systems Engineering, Starkville, MS, 39762, United States of America, mm2006@msstate.edu

This paper presents a mathematical model that studies the impacts of the congestion effect in a multi-modal facility location design problem under feedstock supply uncertainty. The model is solved using a hybrid algorithm that integrates constraint generation, sample average approximation, progressive hedging and rolling horizon algorithm.

Operations Management I

Contributed Session

Chair: Mohammed Darwish, Associate Professor, Kuwait University, Industrial and Management Systems Eng., P.O. Box 5969, Safat, 13060, Kuwait, m.darwish@ku.edu.kw

1 - Probabilistic Estimation of the Inventory Shortage Cost

Feng Xu, Georgia Southwestern State University, 800 GSW State University Drive, School of Business Administration, Americus, GA, 31709, United States of America, feng.xu@gsu.edu

Due to the difficulty in calculating the loss of goodwill, in estimating the shortage cost practitioners and researchers often assume a fixed penalty cost or switch to assigning a specific customer service level. This paper proposes probabilistic measurements of the shortage cost, based on mathematical relationship between the cost and the shortage amount. The derived closed-form estimates of the expected shortage cost can then be applied to determining the optimal inventory control policy.

2 - Optimal Staffing with Endogenous Goals

Buket Avci, Singapore Management University, 50 Stamford Road, Singapore, 248196, Singapore, buketavci@smu.edu.sg

We investigate the optimal staffing level decision of a firm, when employee performance is indirectly affected by staffing levels through workload. In the spirit of Prospect Theory, we posit that goals act as reference points, and there is an asymmetry between under and over-performance relative to a goal. We solve the corresponding principal-agent model in a queueing context and characterize conditions when endogenous goals are relevant for staffing decisions.

3 - Quality Management Theory Development via Meta-analysis

Xianghui Peng, University of North Texas, 1307 West Highland Street, College of Business, Denton, TX, 76201, United States of America, xianghui.peng@unt.edu, Victor Prybutok, Robert Pavur

A meta-analysis is conducted on the empirical studies in quality management (QM). The results allow evaluation of the relationship strength among QM practices, performance, and content factors. The longitudinal evaluation in this study investigates how relationships and content factors in the post-2005 period compare with the pre-2005 period.

4 - Determination of the Maximum Worth of Auctioned Lots using Acceptance Sampling Method

Mohammed Darwish, Associate Professor, Kuwait University, Industrial and Management Systems Eng., P.O. Box 5969, Safat, 13060, Kuwait, m.darwish@ku.edu.kw, Fawaz Abdulmalek

In recent years, auction becomes an important method of buying and selling different items around the world. The most common type of auctions that is found in practice is the English Auction where a bidder inspects the auctioned lot by taking a sample and based on the number of defective items found in the sample, he or she takes a critical decision regarding the maximum worth of the auctioned lot. We show how the maximum worth of an auctioned lot can be determined using acceptance sampling.

5 - Progressive Modeling: Towards a New Complex Systems Optimization Paradigm

Mohamed Ismail, Assistant Professor, University of Regina, 3737 Wascana Parkway, Regina, SK, S4S0A2, Canada, mohamed.ismail@uregina.ca

Progressive Modeling (PM) is a multidisciplinary forward-looking modeling approach that finds pragmatic solutions for many complex and large-scale industrial problems. Many related applications will be presented to demonstrate the principles and the techniques adopted in this paradigm. The new modeling paradigm is expected to have many engineering applications and influence many disciplines such as systems optimization, Operations management, and system of systems engineering.

65-Room 113B, CC

Joint Session DAS/MAS: Game Theory, Decision Analysis, and Homeland Security, Part B

Sponsor: Decision Analysis

Sponsored Session

Chair: Jun Zhuang, University at Buffalo, SUNY, 317 Bell Hall, Buffalo, NY, 14221, United States of America, jzhuang@buffalo.edu

1 - Modeling A Multi-target Attacker-defender Resource Allocation Game Considering Risk Preferences

Jing Zhang, University at Buffalo, SUNY, 338 Bell Hall, Buffalo, NY, 14221, United States of America, jzhang42@buffalo.edu, Jun Zhuang, Victor Richmond Jose

Although evidence has been found that people often demonstrate risk preference when faced with risky decisions, the literature mostly assumed that adversaries are risk-neutral. This paper models a sequential attacker-defender game where the defender allocates defensive resources to multiple targets while considering the risk preferences of both the defender and attacker. We study the cases when the attacker could be either non-strategic, or strategic.

2 - Game Theoretic Analysis of Secret and Reliable Communication

Melike Baykal-görsoy, Rutgers, The State University of New Jersey, 96 Frelinghuysen Road, CoRE Building, Room 201, Piscataway, NJ, 08854, United States of America, gursoy@rci.rutgers.edu

Secret and reliable communication presents a challenge involving a double dilemma for a user and an adversary. To get insight into this problem, we present two simple stochastic games. Explicit solutions are found. In addition, we show that under some conditions, incorporating in the transmission protocol a time slot dealing just with the detection of malicious threats can improve the secrecy and reliability of the communication without extra transmission delay.

3 - Optimal Cost-sharing in General Resource Selection Games

Konstantinos Kollias, Stanford University, 474 Gates Building, 353 Serra Mall, Stanford, CA, 94305, United States of America, kkollias@stanford.edu, Tim Roughgarden, Vasilis Gkatzelis

Resource selection games provide a model for a diverse collection of applications where a set of resources is matched to a set of demands. In reality, demands are often selfish and congestion on the resources results in negative externalities for their users. We consider a policy maker that can set a priori rules to minimize the inefficiencies induced by selfish behavior and we characterize the control methods that minimize the worst-case inefficiency of equilibria.

4 - Strategic Security Screening Queue with Abandonments

Ali Pala, PhD Student, University at Buffalo, 441 Delta Rd, Apt. 2,
Amherst, NY, 14226, United States of America,
alipala@buffalo.edu, Jun Zhuang

Risk of threats and congestion are the major problems in security screening procedures. Strict security screening policies help detect or deter the adversary applicants, but also lead to congestion which may discourage good applicants from applying or cause unnecessary abandonment from the screening queue. This research focuses on a novel strategic queueing system and proposes a data supported game-theoretical model to study this problem.

5 - When Security Games Go Green: Designing Defender Strategies to Prevent Poaching and Illegal Fishing

Fei Fang, University of Southern California, 941 Bloom Walk,
SAL 300, Los Angeles, CA, United States of America,
feifang@usc.edu, Milind Tambe, Peter Stone

Building on the successful applications of Stackelberg Security Games (SSGs) to protect infrastructure, researchers have begun focusing on applying game theory to green security domains such as protection of endangered animals and fish stocks. We introduce Green Security Games (GSGs), a novel game model for green security domains and provide algorithms to plan effective sequential defender strategies and to learn adversary models that further improves defender performance.

Managing Airport Arrival Flows

Sponsor: Aviation Applications
Sponsored Session

Chair: John-Paul Clarke, Georgia Tech, 270 Ferst Drive, N.W.,
Atlanta, GA, United States of America, johnpaul@gatech.edu

1 - Combining Control by CTA and Enroute Speed Adjustment to Improve Ground Delay Program Performance

James Jones, University of Maryland, 3117 A.V Williams, College
Park, MD, 20742, United States of America, jonesjc1@umd.edu,
Michael Ball, David Lovell

Over the past several years there have been proposals and discussions regarding a move from the use of controlled times of departure (CTDs) to controlled times of arrival (CTAs) for ground delay programs (GDPs) in the U.S. In this talk we show that, by combining control by CTA with the judicious use of en route speed control, significant improvements to GDP performance can be achieved.

2 - Robust Airport Gate Planning – First Order Stability Concept

Bruno Santos, Assistant Professor, TU Delft, Faculty of Aerospace
Engineering, Delft, Netherlands, B.F.Santos@tudelft.nl,
Dennis Buitendijk, Joris De Kaey, John-Paul Clarke

We present a novel approach to the airport gate assignment problem entitled "First Order Stability" (FOS). The FOS has the goal of increasing gate plans robustness and uses two key concepts to achieve this: it postpones the gate scheduling to a moment when uncertainty is reduced significantly; and it stabilizes the order of flights, minimizing the risk on disturbances. A real case study application showed that FOS provides more stable solutions that can make equal or higher usage of the capacity.

3 - Heuristic Gate Assignment Model for Airports with Multiple Parallel Concourses

Parth Shah, Graduate Research Assistant, Georgia Tech, 401 17th
Street, Apt. 5205, Atlanta, GA, 30363, United States of America,
parth.shah1053@gmail.com, John-Paul Clarke

Ramp operation model of Atlanta International airport is simulated to understand the characteristic of aircraft movement on ramp. A new heuristic approach is adopted in which aircraft are assigned gates based on their direction of ramp entry and exit points. The model is calibrated using ASPM traffic data. The results show that the proposed new method achieves 23% reduction in total ground delay by significantly reducing the gate wait, taxi blocking and pushback blocking time.

Consolidation in Transport

Sponsor: TSL/Freight Transportation & Logistics
Sponsored Session

Chair: Wentao Zhang, University of Southern California,
Los Angeles, CA, United States of America, United States of America,
wentao@usc.edu

1 - Frequency-Location Clustering for Efficient Inbound Routes to Consolidation Centers

Zhijie Dong, Cornell University, United States of America,
zd57@cornell.edu, Mark A. Turnquist

An optimization model addresses joint decisions of frequency of pickup from individual suppliers and grouping suppliers into collection routes by clustering in both time and space. The objective is to minimize total logistics (transportation plus inventory) cost. The optimization problem is equivalent to a single-source fixed charge facility location problem, and near-optimal solutions are found using a very efficient heuristic algorithm. Results of numerical experiments show the effectiveness of both the model formulation and the heuristic solution method. A case study demonstrates that substantial total cost savings can be achieved in realistic applications using the combined frequency-location clustering method.

2 - A Lagrangian-based Strategy to Consolidate Freight of Perishable Products

Christine Nguyen, Northern Illinois University, DeKalb, IL, United
States of America, United States of America, cnguyen@niu.edu,
Alejandro Toriello, Maged Dessouky

Our research focuses on a supply chain of suppliers with low demand for perishable products, where consolidating their product would take advantage of better shipping FTL rates versus LTL or courier rates. We consider a Lagrangian Relaxation formulation that includes a capacity constraint for a shared consolidation center. We develop an LR-based heuristic that aims to balance the consolidated economical shipping cost and the inventory cost at the consolidation center.

3 - Cost Sharing Mechanism Design for Supply Chain Consolidation and Cooperation in Agriculture Industry

Wentao Zhang, University of Southern California, Los Angeles,
CA, United States of America, United States of America,
wentao@usc.edu, Nelson Uhan, Alejandro Toriello,
Maged Dessouky

We design cost sharing mechanisms for a consolidation center where suppliers who need to ship products to a common destination can consolidate their shipments and save transportation costs. Using the Moulin mechanism framework, we propose cost sharing mechanisms that are group strategyproof and budget-balanced. By studying the efficiency of these mechanisms empirically and analytically, we show that the outcome of these mechanisms often closely resembles an optimal solution of a central planner.

4 - Temporal Shipment Consolidation under Stochastic Dynamic Demand

Sila Cetinkaya, SMU, EMIS and ITOM Departments, Dallas, TX,
United States of America, sila@smu.edu, Liqing Zhang

We consider stochastic dynamic shipment consolidation problems with general demands and characterize the structural properties of optimal shipment release policies under general cost structures with scale economies and quantity discounts.

Multimodal Traffic Signal Control in a Connected Vehicle Environment

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: K. Larry Head, University of Arizona, Tucson, AZ, United States of America, larry@sie.arizona.edu

1 - The Multi Modal Intelligent Traffic Signal Control System (MMITSS)

K. Larry Head, University of Arizona, Tucson, AZ, United States of America, larry@sie.arizona.edu, Yiheng Feng, Mehdi Zamanipour, Shayan Khoshmagham, Byunho Beak, Sara Khosravi

The Multi Modal Intelligent Traffic Signal Control System (MMITSS) is a Dynamic Mobility Application for connected vehicles in signalized networks. MMITSS provides intelligent signal control, priority control for emergency vehicles, transit, trucks, and pedestrians, and performance observation. MMITSS has been implemented in the Arizona Connected Vehicle Testbed in Anthem, AZ.

2 - Personalized Signaling for Connected Travelers in a Multi Modal Traffic Signal System

Sara Khosravi, University of Arizona, Tucson, AZ, United States of America, sarakhosravi@email.arizona.edu, Sriharsha Mucheli, K. Larry Head

Smartphones have become standard equipment for almost all travelers. The smartphone can be used to provide personalized signaling information for multi modal travelers including pedestrians and bicycles at signalized intersections, transit riders, and automobile drivers using navigation applications. This talk will explore how smartphone applications can impact the transportation system.

3 - Multi-Modal Intelligent Traffic Signal System, Optimal Priority Control

Mehdi Zamanipour, University of Arizona, Yiheng Feng, K. Larry Head, Shayan Khoshmagham

A priority control algorithm is presented that simultaneously considers the needs of different modal users in a Connected Vehicle environment. A mathematical programming framework that allows multiple priority requests to be considered simultaneously based on a hierarchical control policy at the intersection level will be presented.

4 - Real-Time Performance Observation under Connected Vehicle Technology

Shayan Khoshmagham, University of Arizona, K. Larry Head, Yiheng Feng, Mehdi Zamanipour

This paper introduces an approach to observe the performance measures of a multi-modal transportation system in a connected vehicle environment. Different types of metrics including traffic-based, CV-based and signal-based measures are observed and estimated by mode by movement. Challenges regarding low market penetration rate and privacy of the road users are addressed respectively

Predictive Analytics in Railway – Practice

Sponsor: Railway Applications

Sponsored Session

Chair: Dharma Acharya, President, KOSU Services LLC, 241 Auburndale Dr., Ponte Vedra, FL, 32081, United States of America, acharya.dharma@gmail.com

1 - State of Railway Analytics

Dharma Acharya, President, KOSU Services LLC, 241 Auburndale Dr., Ponte Vedra, FL, 32081, United States of America, acharya.dharma@gmail.com

A brief overview of how the new emerging technology “Analytics” has been leveraged by railroads will be presented. Potential new areas where railways might be able to further utilize this new techniques to bring bottom line value to the company will also be discussed.

2 - Big Data Analytics for Optimized Track Maintenance and Renewal Management

Luca Ebreo, MERMEC Inc., 110 Queen Parkway, Columbia, NY, United States of America, Luca.ebreo@mermecgroup.com, Pietro Pace

Nowadays, track inspection technology allows railways to collect more and more data on track's condition. These data are comparable to “big data” and require proper analysis in order to extract information for properly managing Track

Maintenance and Renewals. Since railways need to make use as much as possible of the available data for optimizing their maintenance programs, the required analytics to support key decisions in an efficient and effective manner will be illustrated and discussed.

3 - Using Data Visualization to Assess Performance Risk

Eric Pachman, Director, Network Modeling & Analytics, CSX, 500 Water Street, Jacksonville, FL, 32202, United States of America, Eric_Pachman@csx.com

At CSX, the way we think about “capacity” is changing. By adding data visualization to traditional industry modeling tools, discussions on capacity are shifting to discussions on risk and reliability. Our evolution in capacity analysis is helping CSX better prioritize infrastructure projects to improve network fluidity. In addition, through data visualization, we can start to “see” how various operating and commercial requirements and initiatives impact line of road capacity and risk.

4 - Deploying Predictive Analytics Solutions in the Rail Industry and Seeing a Return on the Investment

Robert Morris, Chief Science Officer, Predikto, Inc., 1320 Ellsworth Industrial Blvd, Suite A1600, Atlanta, GA, 30318, United States of America, Robert@predikto.com, Mario Montag

In this panel, Predikto will provide an overview of automated dynamic predictive analytics solutions specific to the rail industry. Use cases currently in deployment across the globe specific to predicting and reducing downtime in freight and commuter locomotives are discussed alongside the challenges that organizations face during the process of deploying such technology. Also considered are strategies to assist in expediting monetary return on investments in predictive maintenance.

Transportation Planning I

Contributed Session

Chair: Antonio Antunes, Professor, University of Coimbra, Dept. of Civil Engineering, Coimbra, Portugal, antunes@dec.uc.pt

1 - Plug-in Electric Vehicle Charging Infrastructure Planning using Cellular Network Data

Jing Dong, Assistant Professor, Iowa State University, 350 Town Engineering Building, Ames, IA, 50011, United States of America, jingdong@iastate.edu, Luning Zhang

This paper presents a method to identify activity-travel patterns, in terms of timing and duration at home, work, and other major destinations, using multiday cell phone records. A Hidden Markov Model (HMM) is built to link traveler's activity transitions to the observed cell tower locations. The probabilistic parameters of HMM are estimated using the Baum-Welch algorithm. The derived travel distances and dwell times are key inputs for plug-in electric vehicle charging infrastructure planning.

2 - The Barriers of Electric Vehicles Spread Adoption in China

Faping Wang, Ph.d Candidate, Tsinghua University, Shenzhen Graduate School of Tsinghua, Shenzhen, GD, 518100, China, wfp13@mails.tsinghua.edu.cn

This paper present a survey research about barriers of electric vehicle spread adoption in China, 1000 questionnaire was designed and send to participants which come from Beijing, Shanghai, Guangzhou and Shenzhen, all of which are large city in China. Majority of participants have EVs driving experience or owner of EV or PHEV. The demographic data was analyzed by statistic methods which reveal that more different choice behavior exist between western consumer and Chinese in EVs consumption.

3 - Strategic Infrastructure Development for Alternative Fuel Vehicles with Routing Considerations

Seong Wook Hwang, PhD Student, The Pennsylvania State University, 232 Leonhard Building, The Pennsylvania State University, University Park, PA, 16802, United States of America, soh5223@psu.edu, Sang Jin Kweon, Jose A. Ventura

This research considers decisions on the siting of alternative fuel (AF) refueling stations and on the routing of AF vehicles when drivers take a detour to refuel. Supposing that a driver takes any path whose distance is less than or equals to a detour distance, we provide an algorithm that finds feasible paths between origins and destinations. Then, a mathematical model is proposed to determine the locations of AF refueling stations with the objective of maximizing the covered flows.

4 - Optimization Model for Floating Carsharing System Planning

Antonio Antunes, Professor, University of Coimbra, Dept. of Civil Engineering, Coimbra, Portugal, antunes@dec.uc.pt

The focus of this presentation is an optimization model aimed to assist a floating carsharing company in the making of its key planning decisions – the area to be operated by the company (called home area), the price rate or rates to be charged to customers, the relocation operations to perform across zones of the home area, and, indirectly, the size of the fleet to be used by the company. The results that can be obtained through the model are exemplified for a real-world setting.

DDDAS for Industrial and System Engineering Applications III

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Shiyu Zhou, Professor, University of Wisconsin-Madison, Department of Industrial and Systems Eng, 1513 University Avenue, Madison, WI, 53706, United States of America, shiyuzhou@wisc.edu

Co-Chair: Yu Ding, Professor, Texas A&M University, ETB 4016, MS 3131, College Station, TX, United States of America, yuding@iemail.tamu.edu

1 - The Predict Project: Enhancing DDDAS/Infosymbiotics with Privacy and Security

Vaidy Sunderam, Emory University, 400 Dowman Dr #W-401, Math & CS, Atlanta, GA, 30322, United States of America, vss@emory.edu, Li Xiong

The ubiquitousness of mobile devices will greatly expand the applicability of DDDAS, provided privacy and security issues are addressed. The PREDICT project is developing: (1) approaches to assign data-targets to participants with privacy protection; (2) methods for aggregating and fusing data that quantify veracity of the data sources and maintain high fidelity; and (3) secure distributed computation for field- and region-level deployment of the DDDAS paradigm with adaptation and feedback.

2 - Securing Industrial Control Systems with Software-defined Networking

Dong Jin, Assistant Professor, Illinois Institute of Technology, 10 W 31st Street, Stuart Building 226E, Chicago, IL, 60614, United States of America, dong.jin@iit.edu

Modern industrial control systems (ICSes) are increasingly adopting Internet technology to boost control efficiency, which unfortunately opens up a new frontier for cyber-security. With the goal of safely incorporating existing networking technologies in ICSes, we design a novel software-defined networking (SDN) architecture for ICSes, with innovative security applications (e.g., network verification and intrusion detection) and rigorous evaluation using IIT's campus microgrid.

3 - A DDDAS Approach to Distributed Control in Computationally Constrained Environments (UAV Swarms)

Vijay Gupta, Univ. of Notre Dame, 275 Fitzpatrick Hl Engrng, Notre Dame, IN, 46556, United States of America, vgupta2@nd.edu, Greg Madey, Daniel Quevedo, Wann-jiun Ma

In modern applications of distributed control, the traditional assumption of ample processing power at every time step at each agent can be challenged by use of processor intensive sensors such as cameras. Inspired by the Dynamic Data Driven Application System approach, we present an algorithm that shifts computational loads among the agents to guarantee performance in spite of reduced average processor availability. Analytical results and numerical simulations illustrate the approach.

Quality Monitoring and Analysis in Complex Manufacturing Processes

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Li Zeng, Assistant Professor, Texas A&M University, Industrial and Systems Engineering, College Station, TX, 77843, United States of America, lizeng@tamu.edu

Co-Chair: Qiang Zhou, Assistant Professor, City Univ of Hong Kong, Kowloon, Hong Kong, China, q.zhou@cityu.edu.hk

1 - Monitoring Uniformity of Particle Distributions in Manufacturing Processes using the K Function

Xiaohu Huang, Graduate Student, City University of Hong Kong, 106B, Hall 8, Student Residence, CityU, Hong Kong, China, xhhuang6-c@my.cityu.edu.hk, Qiang Zhou

Data in the form of spatial point patterns are frequently encountered in manufacturing processes. The distributional characteristics of a spatial point pattern can be summarized by functional profiles like K function. In this study, a Gaussian process is designed to characterize its behaviour under complete spatial randomness. A T2 control chart is proposed to monitor the uniformity of point patterns.

2 - Bayesian Hierarchical Linear Modeling of Profile Data with Apps to Quality Control of Nanomanufacturing

Jianguo Wu, Assistant Professor, University of Texas-El Paso, El Paso, TX, United States of America, jwu2@utep.edu, Yuhang Liu, Shiyu Zhou

To achieve a highly automatic quality control, simultaneous profile monitoring and diagnosis is often required. This paper presents a general framework by using a hierarchical linear model to connect profiles with both explanatory variables and intrinsic processing or product parameters for simultaneous monitoring and diagnosis. The effectiveness is illustrated through numerical studies and applications to NDE profiles for quality control of nanocomposites manufacturing.

3 - Modeling of Optical Profiles in Low-E Glass Manufacturing

Qian Wu, Graduate Student, Texas A&M University, Industrial and Systems Engineering, College Station, TX, 77843, United States of America, hi.wuqian@gmail.com, Li Zeng

Quality of low-E glass is measured by optical profiles. This study considers modeling of the optical profile data in Phase I analysis.

4 - Wafer Yield Prediction Based on Virtual Metrology-generated Parameters

Wan Sik Nam, Seoung Bum Kim/Korea University, Korea University, 145 Anam-ro, Seongbuk-, Seoul, Korea, Republic of, wansiknam@korea.ac.kr

Yield prediction is one of the most important issues in semiconductor manufacturing. Especially, for a fast-changing environment of the semiconductor industry, accurate and reliable prediction techniques are required. In this study, we propose a procedure to predict wafer yield using process parameters generated from the virtual metrology of the semiconductor fabrication, which is based on a variety of regression and classification algorithms.

Innovative Methods for System Informatics

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Peihua Qiu, Professor, University of Florida, 2004 Mowry Road, Gainesville, FL, 32610, United States of America, pqiu@phhp.ufl.edu

1 - When Importance Sampling Meets Stochastic Simulation Models

Eunshin Byon, Assistant Professor, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, ebyon@umich.edu, Youngjun Choe, Nan Chen

Importance sampling has been used to improve the efficiency of simulations where the simulation output is uniquely determined, given a fixed input. We extend the theory of importance sampling to estimate a system's reliability with stochastic simulations where a simulator generates stochastic outputs. Given a budget constraint on total simulation replications, we derive the optimal importance sampling density that minimize the variance of an estimator.

2 - QQ Models: Joint Modeling for Quantitative and Qualitative Quality Responses in Manufacturing System

Ran Jin, Virginia Tech., Grado Department of Industrial and Systems Engineering, Blacksburg, VA, 24061, United States of America, jran5@vt.edu, Xinwei Deng

A manufacturing system with both quantitative and qualitative (QQ) responses is widely encountered. The QQ responses are closely associated with each other, but current methodologies often model them separately. This paper presents a novel modeling approach, called "QQ models", to jointly model the QQ responses through a constrained likelihood estimation. Both simulation studies and a case study are used to evaluate the performance of the proposed method.

3 - Discussant's Presentation

Yu Ding, Professor, Texas A&M University, ETB 4016, MS 3131,
College Station, TX, United States of America,
yuding@iemail.tamu.edu

As a discussant in this Technometrics special issue session on system informatics, I will present my understanding of strengths and weaknesses of the two papers selected by Technometrics editor for this session. I will also discuss other related research problems on the similar topics.

IBM Research Best Student Paper Award III

Sponsor: Service Science

Sponsored Session

Chair: Ming-Hui Huang, National Taiwan University, Taiwan - ROC,
huangmh@ntu.edu.tw

1 - Best Student Paper Competitive Presentation

Ming-Hui Huang, National Taiwan University, Taiwan - ROC,
huangmh@ntu.edu.tw

Finalists of the IBM Research Best Student Paper Award present their research findings in front of a panel of judges. The judging panel will decide the order of winners, which will be announced during the business meeting of the Service Science Section at the Annual Conference.

2 - Efficient Information Heterogeneity in a Queue

Yang Li, Rotman School of Management, University of Toronto,
105 St. George Street, Toronto ON M5S3E6, Canada,
Yang.Li10@Rotman.Utoronto.Ca, Ming Hu

How would the growing prevalence of real-time delay information affect a service system? We consider an M/M/1 queueing system in which only a fraction of customers are informed about real-time delay. Surprisingly, we find that system throughput and social welfare can be unimodal in the fraction of informed customers.

3 - Scheduling and Pricing Services for Online Electric Vehicle Charging

Mark Nejad, Assistant Professor, University of Oklahoma,
Industrial and Systems Engineering, Norman OK, United States of
America, mark.nejad@ou.edu, Ratna Babu Chinnam, Daniel
Grosu, Lena Mashayekhy

We design mechanisms for EV charging services in online settings. We prove that our proposed mechanisms are incentive compatible, that is, truthful reporting of price and the amount of charging is a dominant strategy for self-interested EV drivers. Our preemption-aware charging mechanisms allow providers to manage fluctuations in renewable energy production.

4 - Scheduling with Testing

Thomas Magnanti, Institute Professor, MIT, 77 Massachusetts
Avenue, 32-D784, Cambridge MA 02139, United States of
America, magnanti@mit.edu, Retsef Levi, Yaron Shaposhnik

We study a new class of scheduling problems that captures a common tradeoff between using resources for processing jobs, and investing resources to 'test' jobs and learn more about their uncertain attributes. This can inform future decisions, but also delay service. We derive intuitive structural properties of the optimal policies, and use a new cost-accounting scheme to devise a surprisingly low dimensional dynamic programming formulation, which ultimately leads to an FPTAS.

5 - Trading Time in a Congested Environment

Luyi Yang, Doctoral Student, University of Chicago Booth School
of Business, Chicago, IL, United States of America,
luyi.yang@chicagobooth.edu, Laurens Debo, Varun Gupta

We propose a time-trading mechanism, mediated by a revenue maximizing broker, in which customers privately informed about their waiting costs mutually agree on the ordering in a queue via trading positions. To that end, we show that the broker can implement an auction with a trade-participation fee and two trade restriction prices on customer bids. Under the optimal auction, there is partial pooling in the bidding strategies and therefore customers are not strictly prioritized.

Advances in Stochastic Simulation

Sponsor: Simulation

Sponsored Session

Chair: Henry Lam, University of Michigan, 1205 Beal Ave., Ann Arbor,
MI, United States of America

1 - Risk Assessment for Input Uncertainty

Helin Zhu, School of Industrial and Systems Engineering, Georgia
Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332,
United States of America, hzhu67@gatech.edu, Enlu Zhou

When simulating a complex stochastic system, the behavior of the output response depends on the input parameter estimated from finite real-world data, and the finiteness of data brings input uncertainty to the output response. Risk assessment for input certainty, which quantifies the extreme behavior of the mean output response, is extremely important. In the present paper, we introduce the risk measures for input uncertainty and study the corresponding estimators.

2 - Projected Directional Derivatives for High Dimensional Gradient Estimation

Raghu Pasupathy, Associate Professor, Department of Statistics,
Purdue University, 250 N University Street, West Lafayette, IN,
47907, United States of America, pasupath@purdue.edu,
Boqian Zhang

We present a method to estimate gradients in high dimensions by projecting randomly generated directional derivatives onto the various axes. We discuss theoretical properties and sampling measures that minimize the resulting estimator's error norm. The method appears particularly relevant in high dimensions since only two observations are needed for a complete gradient estimator.

3 - Perfect Sampling of GI/GI/C Queues

Yanan Pei, Columbia University, 500 W. 120th St, Mudd 313,
New York, NY, 10027, United States of America,
yp2342@columbia.edu, Jose Blanchet, Jing Dong

We introduce the first class of perfect sampling algorithms for the steady-state distribution of multi-server queues with general inter-arrival time and service time distributions. Our algorithm is built on the classical dominated coupling from the past protocol using a coupled multi-server vacation system as the upper bound process. The algorithm has finite expected termination time with mild moment assumptions on the inter-arrival time and service time distributions.

4 - Rare Event Simulation in the Neighborhood of a Rest Point

Konstantinos Spiliopoulos, Assistant Professor, Boston University,
Department of Mathematics and Statistics, 111 Cummington
Mall, Boston, MA, 02215, United States of America,
kspiliop@math.bu.edu

We construct efficient importance sampling Monte Carlo schemes for finite time exit probabilities in the presence of rest points. The main novelty of the work is the inclusion of rest points in the domain of interest. We motivate the construction of schemes that perform well both asymptotically and non-asymptotically. We concentrate on the regime where the noise is small and the time horizon is large. Examples and simulation results are provided. Joint work with Paul Dupuis and Xiang Zhou.

Parkland Blvd, Mayfield Heights, OH, 44124, United States of America,
fateme.fotuhi@gmail.com

1 - Using Heuristics to Solve the Container Loading Problem Focusing on Priority Levels and Utilization

Crystal Wilson, Clemson University, 6 Natalie Ct., Greer, SC,
29651, United States of America, crysta3@clemson.edu,
Mary Beth Kurz

Just-in-time manufacturers need the parts to arrive to the facility by a scheduled time to keep the assembly line moving smoothly. How small containers, such as parts, are loaded onto a larger container is a special type of packing problem. This research will focus on creating a heuristic that creates loading patterns that balances priority levels, while also maximizing the utilization of the container with respect to the weight and cube.

2 - Bundling and Pricing Truckload and Less-than-truckload Services with Stochastic Demand

Rodrigo Mesa Arango, Assistant Professor, Florida Institute of Technology, 150 W. University Blvd, Melbourne, FL, 32901, United States of America, rmesaara@purdue.edu, Satish V. Ukkusuri

Algorithms to bundle and price Truckload (TL) and Less-than-truckload (LTL) services are proposed considering stochastic demand, value-based pricing, and demand segmentation. A two-stage min-cost flow problem accounts for uncertain demand. Its deterministic equivalent is formulated as a regular min-cost flow problem and efficiently solved. Deterministic models overestimate benefits. Numerical experiments reveal the cost of uncertainty and demonstrate improvements in bundle quality.

3 - Stochastic Models for Optimal Reusable Pallets Management and Sustainable Supply Chain Configuration

Xiangxiang Fan, Huazhong University of Science and Technology, Wuhan, China, goodman432700@163.com, Yeming Gong, Xianhao Xu

This paper compares the impact of supply chain configuration and operating rules on the management of reusable pallets in closed-loop supply chains. We evaluate how pallet management strategy could affect the whole performance of a supply chain in terms of minimizing the number of pallets and the cycle time and propose semi-open queuing network models to analysis four different alternatives which could provide an effective tool for optimal pallet management.

4 - Iterative Mechanisms for Shippers' Collaboration in Production-Shipping Schedule Planning

Minghui Lai, Assistant Professor, Southeast University, Economics and Management Building, Jiulonghu Campus, Nanjing City, China, laimh@seu.edu.cn

We study the collaborative distribution problem of the shippers with sensitive private information. We propose iterative mechanisms that are convergent, strategy-proof, individually rational, and budget balanced in most cases. The mechanisms are implemented by efficiently computable distributive algorithms. Extensive simulations show that the mechanisms converges fast and have high efficiency.

5 - Dynamic Capacitated Intermodal Terminal Location Problem

Fateme Fotuhiardakani, Data Scientist, TMW Systems, 6085 Parkland Blvd, Mayfield Heights, OH, 44124, United States of America, fateme.fotuhi@gmail.com, Nathan Huynh

In this paper we introduce a dynamic intermodal terminal location problem which intends to locate new intermodal terminals to dynamically meet fluctuations in customers' demands. The planning horizon is partitioned into multiple consecutive time periods with a given budget for network configuration in each time period. A lagrangian relaxation approach embedded with a heuristic algorithm for upper bound computation is developed to solve this NP-hard problem.

Optimization of Energy Systems

Contributed Session

Chair: Florian Perrotton, IFP Energies Nouvelles & GDF Suez, 228-232 avenue Napoléon Bonaparte, Rueil-Malmaison, France, florianperrotton@gmail.com

1 - Distributed Algorithms for the DC-OPF Problem

Hesam Ahmadi, Student, Pennsylvania State University, 107 Holerman Hall, University Park, PA, 16802, United States of America, ahmadi.hesam@gmail.com, Uday Shanbhag

In this talk, an ADMM-based distributed algorithm is presented for the solution of the Direct Current Optimal Power Flow (DC-OPF) problem. We consider a dual formulation that respects privacy concerns and leverage the structure to develop a distributed scheme. We show that the resulting sequence of primal and dual iterates is provably convergent. Preliminary numerics are provided.

2 - What Short-term Market Design for Efficient Flexibility Management in Gas Systems?

Florian Perrotton, IFP Energies Nouvelles / GDF SUEZ / Université Paris Ouest Nanterre, 7 Rue de Rochechouart, Paris, 75009, France, florian.perrotton@gmail.com

With the increase of electric intermittent renewables, often backed-up by CCGTs, variability has been transferred to the gas network. Balancing the network has become a technical and economic issue. Applied to gas systems, market designs similar to locational marginal pricing might improve the situation. However, in such markets, flexibility can be handled in different ways. Using a linearized transient model of the gas network (LP), we analyze the efficiency of two different auction designs.

3 - Optimal Decision Support System for Large Scale Energy Management in Smart Grid

Sunil Vuppala, IIITB, Electronics City, Bangalore, India, sunil.vuppala@iiitb.ac.in, Prasanna Gns

We propose a decision support system with modeling methodologies to handle large scale energy management problems in smart grid. The convexified model is solved in rolling horizon approach using solvers (Cplex) both at consumer and utility levels. The systems comes with heuristic for quick run times. We analyze the stability and accuracy of the system for millions of users with sensitivity analysis. The results indicate that our system is beneficial to both consumers and utility companies.

4 - Asset Management Strategies for Wind Turbines

Suna Cinar, Wichita State University, 1845 Fairmount Street, Wichita, KS, 67260, United States of America, sxcinar@wichita.edu, Bayram Yildirim

The decision to retrofit or keep an aged Wind Turbine (WT) can be a difficult decision. Based on existing operation and maintenance cost or budget allocated, one can either retrofit a WT or maintained the existing WT with a preventive maintenance. The difficult question is which of these options is superior. In this study, a mixed integer linear programming (MILP) modelling approach is proposed to determine the trade-off between these two options.

Software Demonstration

Cluster: Software Demonstrations

Invited Session

1 - Syncopation Software - DPL Portfolio and DPMX™ : A Decision Analysis based System for Better Portfolio Decisions

Chris Dalton, Syncopation Software, 6 State Street, Suite 308, Bangor, ME, 04401, United States of America, cdalton@syncopation.com

This demonstration will show how the DPMX System can serve as the analytical backbone for an effective portfolio analysis process. We'll start with an overview of DPL Professional, a proven modelling environment for decision analysis, risk analysis and Monte Carlo simulation. Next, we'll cover DPL Portfolio, the modelling environment for portfolio analysis, visualization and prioritization. Finally we'll show DPMX, a web-based based system for managing project data and presenting portfolio results in attractive, management-friendly charts. The motivating examples will be drawn from the prioritization of an R&D portfolio in the pharmaceutical industry.

2 - Frontline Systems, Inc. – Analytic Solver® Platform: Integrated Data Mining, Simulation and Optimization in Microsoft Excel

Frontline Systems

Analytic Solver Platform in Microsoft Excel has everything you need for forecasting and data mining, Monte Carlo simulation and risk analysis, conventional and stochastic optimization – with data from Apache Spark and visualization of results in Excel, Tableau and Power BI. See how you can use it to build your own analytic expertise and teach others, leveraging what you already know, build and solve industrial-scale models with the world's best Solvers, and effectively communicate business results.

Optimizing Decisions in Conflict, Deterrence, and Peace

Sponsor: Military Applications

Sponsored Session

Chair: Brian Lunday, Assistant Professor Of Operations Research, Department of Operational Sciences, Grad. Sch. of Engr. & Mgmt., Air Force Institute of Technology, Wright Patterson AFB, OH, 45433, United States of America, Brian.Lunday@afit.edu

1 - Active Target Defense Cooperative Differential Game

David Casbeer, Dr., Air Force Research Laboratory, 2210 8th Street, B20146 R300, Wright Patterson AFB, OH, 45433, United States of America, david.casbeer@us.af.mil, Meir Pachter, Eloy Garcia

This work addresses an active target defense differential game where an Attacker pursues a Target. The Target cooperatively teams with a Defender, to maximize the distance between the Target and the point where the Attacker is intercepted by the Defender, while the Attacker tries to minimize said distance. The solution to this differential game provides the min-max optimal heading angles for the Target and the Defender team, as well as the Attacker.

2 - Approximate Dynamic Programming for the Military Inventory Routing Problem with Direct Delivery

Matthew Robbins, Assistant Professor Of Operations Research, Department of Operational Sciences, Grad. Sch. of Engr. & Mgmt., Air Force Institute of Technology, Wright Patterson AFB, OH, 45433, United States of America, matthew.robbins@afit.edu, Brian Lunday, Ian McCormack, Rebeka Mckenna

The military inventory routing problem (IRP) with direct delivery is formulated to model resupply decisions concerning a set of geographically dispersed brigade combat team elements operating in an austere combat situation. We construct a Markov decision process model of the military IRP and obtain solutions via approximate dynamic programming. Designed computer experiments are conducted to determine how problem features and algorithmic features affect the solution quality of our policies.

3 - Improving Chemotherapy Delivery through the Simulation of Scheduling Heuristics

Ryan Slocum, Instructor, Department of Mathematical Sciences, Building 601, United States Military Academy, West Point, NY, 10996, United States of America, ryan.slocum@usma.edu, Javad Taheri, Thom Hodgson

In the last decade, chemotherapy delivery has largely become an outpatient service. This has challenged clinics to administer complex treatments to as many patients as possible within a fixed period of time. We apply selected scheduling heuristics to reduce patient waiting times and minimize nurse overtime hours. We present the results of a case study for which our heuristics found two solutions that respectively reduce the average patient's waiting time by 20% and annual overtime by 60%.

4 - A Game Theoretic Model for the Optimal Disposition of Integrated Air Defense Missile Batteries

Brian Lunday, Assistant Professor Of Operations Research, Department of Operational Sciences, Grad. Sch. of Engr. & Mgmt., Air Force Institute of Technology, Wright Patterson AFB, OH, 45433, United States of America, Brian.Lunday@afit.edu, Chan Han, Matthew Robbins

We examine the allocation of air defense batteries to protect a country's population as a three-stage sequential, perfect information, zero-sum game between two opponents. We formulate a trilevel nonlinear integer program, but instead apply both an enumeration algorithm and a customized heuristic to search the game tree. We test both on small instances to assess the efficacy of the heuristic, and we demonstrate the computational efficiency of the heuristic on realistic-sized instances.

02-Room 302, Marriott

Military Applications

Contributed Session

Chair: Irene Gerlovin, PhD Candidate/ Part Time Lecturer, Rutgers Business School, 1 Washington Pl, Newark, NJ, 07102, United States of America, irene.gerlovin@gmail.com

1 - Modeling Disease Mortality in The National Operational Environment Model (NOEM)

Venkat Venkateswaran, Rensselaer Polytechnic Institute, 275 Windsor St., Hartford, CT, 06033, United States of America, venkav3@rpi.edu, John Salerno

The National Operational Environment Model (NOEM) is a large scale stochastic model that can be used to simulate the operational environment of a nation-state. Effects of various action alternatives can then be studied through simulations. In this work we describe the methodology developed to estimate disease mortality. Extensive V&V tests show that estimated disease death rates compare well with published values, year by year, for several countries tested.

2 - Optimization of The Canadian Armed Forces Domestic Transportation Network

Raman Pall, Defence Scientist, Department of National Defence, 1600 Star Top Road, Ottawa, ON, K1B 3W6, Canada, raman.pall@forces.gc.ca, Abdeslem Boukhouta

The Canadian Armed Forces domestic transportation network transports goods between military bases and depots throughout Canada using a combination of military transport assets and commercial carriers. In this presentation, we provide an overview of the network, describing it as a directed graph and analyzing its efficiency. Recommendations are made on how utilization of the military resources can be maximized through improvements to the route scheduling.

3 - Supply Chain Program Management (SCPM) to the Rescue! F-35 Program

Irene Gerlovin, PhD Candidate/ Part Time Lecturer, Rutgers Business School, 1 Washington Pl, Newark, NJ, 07102, United States of America, irene.gerlovin@gmail.com, Yao Zhao

F-35 program had a number of technical challenges. Since its inception in 2001, the program is seven years behind the schedule and 70% over initial budget. We review its key SCPM practices to identify root causes for the delays and to enhance the chance of success for future DOD acquisitions.

Inventory Management II

Contributed Session

Chair: Ruiqi Hou, University of Science and Technology of China, East Campus USTC, No. 96 Jinzhai Road, Room 367-414, Hefei, 230026, China, qiqimath@gmail.com

1 - A Continuous Formulation for a Location-Inventory Problem Considering Demand Uncertainty

Matias Schuster Puga, Université Catholique de Louvain, Chaussée de binche, 151, Mons, 7000, Belgium, matias.schuster@uclouvain.be, Jean-sébastien Tancrez

We propose a location-inventory model that can be applied to design large supply chain networks. We address a continuous non-linear formulation that minimizes transportation, inventory, order, safety stock and facility opening costs. We solve the non-linear model with an heuristic algorithm that relies on the fact that the model simplifies to a continuous linear program when two auxiliary variables are fixed. We show the efficiency of the algorithm with the computation of numerical experiments.

2 - SQRTN and Portfolio Effect Inventory Models: Notes on Practical Use and Accuracy for Practitioners

Tan Miller, Director Global Supply Chain Management Program, Rider University, 12 Winding Way, Morris Plains, NJ, 07950, United States of America, tanjean@verizon.net, Renato De Matta, Minghong Xu

We conduct simulations of alternative logistics network inventory stocking strategies. We then evaluate the accuracy and practical utility to network planners of using multiple portfolio effect models and the SQRTN model to predict changes in inventory investment requirements under alternative inventory network strategies and configurations.

3 - A Critique of Empirical Tests on the Inventory-performance Relationship in U.S. Manufacturing

Daesung Ha, Professor, Marshall University, 415 Corbly Hall,
1 John Marshall Drive, Huntington, WV, 25755,
United States of America, ha@marshall.edu

In this study, we discuss the estimation errors and the model specification problem of the existing studies which investigated the relationship between inventory productivity and firm performance in U.S. manufacturing industry. Using the panel data of U.S. manufacturing firms over the period of 1980–2014 collected from the Compustat database, we provide the corrected estimation results.

4 - The Effect on Inventories Assets Turnover Change Ratio by Firm Characteristics

Jihye Lee, Kyungpook National University, Sangyeok
3-Don Buk-Gu, Daegu, Korea, Daegu, Korea, Republic of,
jj2083@gmail.com, Pansoo Kim

This study analyzed the effect on ratio of change of inventories turnover by firm characteristics using panel data targeting manufacturing companies listed on the Korea Stock Exchange securities market since January 1, 1999 to December 31, 2012. Firm size, sales growth rate, ROA(return on assets), leverage ratio, credit rating, age of firm were used as a 6 important firm characteristic variables.

5 - Service Management in Dynamic Online Markets with Positive and Negative Word of Mouth

Ruiqi Hou, University of Science and Technology of China,
East Campus USTC, No. 96 Jinzhai Road, Room 367-414, Hefei,
230026, China, qiqimath@gmail.com

We consider that comments online may lead to customers' leaving the market. We use the effect that value for money level may have on market size to measure the economic effect. The model considers both single and two-firm model and the decision is setting investment cost. Customers are distinguished by their types which induce heterogeneous rates of adoption information. The information of value for money level diffuses and affects the transitions of consumers. We establish conditions for a Nash equilibrium policy.

04-Room 304, Marriott

Economics I

Contributed Session

Chair: Patrick O'Reilly, PhD Candidate, Mineral And Energy Economics, Colorado School of Mines, P.O. Box 11, Golden, CO, 80402, United States of America, poreilly@mines.edu

1 - Foreign Direct Investment and Organized Crime in Mexico: A Spatial Approach

Lorena Berumen, Head Of Academic Area In Operations
Management, Universidad Panamericana, Augusto Rodin 498,
Ciudad de México, Mexico, laberumen@up.edu.mx, Roldán
Andrés-rosales, Margarita Hurtado

Foreign Direct Investment (FDI) has played an important role in the growth and development of the Mexican economy. In this paper our main contribution is the analysis of FDI by sector and its spillover effect in the different regions in which FDI has been concentrated. Using spatial panel data and a spatial Durbin Model to assess the direct and indirect effects of FDI on the sectors affected by organized crime.

2 - The Role of Social Planner in Closed-loop Supply Chain

Lan Wang, Assistant Professor, California State University at East
Bay, 25800 Carlos Bee Blvd., Hayward, CA, 94401, United States
of America, lan.wang@csueastbay.edu, Tharanga Rajapakshe,
Asoo Vakharia

Our paper studies the problem of legislation practices on who should be responsible for recycling, and compares the existing mechanisms on the efficiency of environmental protection. Given different social objectives – prioritized consumer welfare, prioritized environmental benefit, or jointly social objective, we aim to provide roadmap to the social planner on legislation and incentives for remanufacturing and the end-of-life/use product recycling activities.

3 - Modelling Heterogeneous Economies – Two Competing Paradigms

Grzegorz Koloch, Warsaw School of Economics, Al.
Niepodległości 162, Warsaw, 02-554, Poland,
gkoloch@gmail.com, Mateusz Zbikowski, Bogumil Kaminski

Two modelling paradigms gained most popularity in the field of heterogeneous agent macroeconomic modelling: the heterogeneous agent DSGE models and Agent Based Macroeconomic simulation models. The first approach, is based on neoclassical foundations and uses dynamic programming paradigm. It is considered to be a mainstream. The second one still is not used to a comparable extent both by researchers and policy makers. In this paper we propose an explanation of the reasons for such a situation.

4 - An Optimization Model for Allocation and Routing of Municipal Solid Waste in Flanders

Jens Van Engeland, KU Leuven Campus Brussels, Warmoesberg
26, Brussels, 1000, Belgium, jens.vanengeland@kuleuven.be

Historical evolutions and inter-municipal cooperations decide on the current allocation of municipal solid waste (MSW) to treatment facilities in Flanders. However, in the near future the region will be confronted with a number of important waste dilemmas. Therefore it is important to know what gains could be achieved by redesigning the current allocation in the first place. The proposed model optimizes the allocation and routing of MSW from municipalities to treatment plants.

5 - A Network Formulation of Competing Demands for Water: Transaction Costs, Property Rights, and Rents

Patrick O'Reilly, PhD Candidate, Mineral And Energy Economics,
Colorado School of Mines, P.O. Box 11, Golden, CO, 80402,
United States of America, poreilly@mines.edu

Markets and centrally-planned regimes may be seen as having network structure, exhibiting not only spatial dependence, but transaction costs and the dual notion of economic property rights. Water allocation problems pose a range of institutional questions that network models may be uniquely suited to answer. This paper investigates transaction cost and economic rent consequences of choosing between market and command-oriented institutions in light of their respective network structure.

Social Media Engagement

Cluster: Social Media Analytics

Invited Session

Chair: Les Servi, The MITRE Corporation, 202 Burlington Road,
Bedford, MA, United States of America, lservi@mitre.org

1 - Development and Evaluation of Tagalog LIWC Dictionaries for Negative and Positive Emotion

Amanda Andrei, Graduate Student, Georgetown University,
Washington, DC, United States of America
aal436@georgetown.edu

Developing non-English sentiment analysis tools can ensure that data is not lost due to language. A proof-of-concept Tagalog Linguistic Inquiry and Word Count (LIWC) dictionary for positive and negative emotion was developed for use in analyzing mixed language Twitter data from the Philippines and evaluated against human-annotated sentiment for Twitter, referred to as groundtruth.

2 - Consumer Engagement with Green Brands on Facebook as Revealed in Refined Sentiment Analysis

Tiffany Ting-Yu Wang, Associate Professor, College of
Informatics, KNU, 70-7 Xianyan Rd. Lane 16, Taipei, No. 11688,
Taiwan - ROC, tiffanyt.wang122@gmail.com

The fast-growing number of social media users together with inundating user generated content has posed significant challenges to firms trying to detect consumers' attitudes. This research aims to uncover consumer experiences with two green brands in the cosmetics industry through collecting and analyzing public Facebook posts. We refine sentiment analysis by applying the Tetraclasse model to identify social media context and/or green product attributes as satisfaction determinants.

3 - Tailored Incentives and Least Cost Influence Maximization on Social Networks

Rui Zhang, University of Maryland, College Park, MD, United
States of America, ruizhang@rhsmith.umd.edu, S. Raghavan

We wish to promote a product over a social network and attain 100% adoption. We study a cost minimization problem where incentives can be tailored to each individual. A totally unimodular formulation is proposed for trees. Observing that the influence propagation network is acyclic, we apply this formulation (along with an exponential set of anti-cycle inequalities) to general networks. Next, a branch-and-cut approach is developed and used to solve problems on real-world graphs with 5000 nodes.

4 - Large-scale Bid Optimization in Online Advertising Auctions

Mustafa Sahin, University of Maryland, Van Munching Hall 3330,
College Park, MD, 20742, United States of America,
mustafa.sahin@rhsmith.umd.edu, Abhishek Pani, S. Raghavan

In sponsored search ads, the search operator collects bids for a given keyword and determines whose ads will be displayed in what position. The advertisers have to decide on keywords and positions to bid on given a budget, which can be modeled as a Multiple Choice Knapsack Problem. The number of keywords and positions considered can be in the order of hundreds of millions for this application. We offer an algorithm that is both time and memory efficient and present results on hard instances.

Quantitative Finance and Risk Management

Sponsor: Financial Services

Sponsored Session

Chair: Ning Cai, Associate Professor, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, China, ningcai@ust.hk

1 - Pricing Asian Options under Markov Processes

Ning Cai, Associate Professor, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, China, ningcai@ust.hk

We derive analytical approximations to both continuous and discrete Asian option prices under general Markov processes. Numerical results illustrate that our pricing methods are accurate and fast under diffusion models, jump diffusion models, and pure jump models.

2 - Transform Methods for Default Timing Problems

Alex Shkolnik, University of California, Berkeley, CA, United States of America, ads2@berkeley.edu, Kay Giesecke

Reduced-form models of name-by-name default timing are widely used to measure portfolio credit risk. Combinatorial aspects of many default timing problems render them NP-complete. Nevertheless, well designed transform methods do yield efficient algorithms. We illustrate such an algorithm on an application of CDO pricing. The proposed method reduces computational complexity by orders of magnitude over those encountered in the literature. A complete error analysis is provided.

3 - Closed-Form Valuation of Barrier Options

Haohong Lin, Department of Industrial Engineering and Logistics Management, HKUST, Hong Kong, Hong Kong - PRC, hlinaa@ust.hk, Ning Cai

We study the pricing problem of barrier options that are among the most popular exotic options in the financial market and derive closed-form pricing formulas under some option pricing models. Numerical results suggest that our pricing method is accurate and efficient.

4 - Does the Prohibition of Trade-throughs Hurt Liquidity Demanders?

Ningyuan Chen, Columbia University, S. W. Mudd 321, 500 W 120th Street, New York, NY, 10027, United States of America, nc2462@columbia.edu, Steven Kou

We study the impact of prohibiting trade-throughs on liquidity demanders. We find that after trade-throughs are prohibited, the transactions of a liquidity demander might have higher execution cost and effective spread. However, the additional cost is insignificant for small trades and stocks with abundant liquidity provision. Our results favor the enforcement of the Order Protection Rule, as the cost it incurs on liquidity demanders may be outweighed by its benefit.

Topics in Optimal Investment

Cluster: Risk Management

Invited Session

Chair: Mykhaylo Shkolnikov, Princeton University, ORFE, Princeton, NJ, 08540, United States of America, mshkolni@gmail.com

1 - Arbitrage-free Valuation and Hedging of XVA

Maxim Bichuch, Johns Hopkins University, Baltimore, MD, United States of America, mbichuch@jhu.edu, Agostino Capponi, Stephan Sturm

We introduce a framework for computing the Total Valuation Adjustment (XVA) of an European claim accounting for funding costs, counterparty risk, and collateral mitigation. We derive the nonlinear BSDEs associated with the replicating portfolios of long and short positions, and define the buyer and seller's XVAs. When borrowing and lending rates coincide we provide a fully explicit expression for the XVA. When they differ, we derive the semi-linear PDEs, and conduct a numerical analysis.

2 - Rationalizing Behavioral Portfolio Choice

Stephan Sturm, Worcester Polytechnic Institute, Worcester, MA, United States of America, ssturm@wpi.edu, Carole Bernard

Classical portfolio optimization theory postulates that investors' preferences are rational and the optimization criterion is expected utility, for some increasing and concave utility function. This contrasts with with empirical finding of cognitive psychology. In this talk we try to answer the question if a given behavioral portfolio choice in a general incomplete semimartingale market can be replicated

in the rational expected utility framework.

3 - Sequential Monte Carlo with Parameter Learning for Long-memory Processes

Konstantinos Spiliopoulos, Assistant Professor, Boston University, Department of Mathematics and Statistics, 111 Cummington Mall, Boston, MA, 02215, United States of America, kspiliop@math.bu.edu

We consider state-space models specified up to an unknown vector of parameters and in which the unobserved state process exhibits long-memory. We estimate both the state process and the parameter vector and propose a sequential Monte Carlo method that is based on smoothing of the sample points of model parameters. We establish a central limit theorem for the state and parameter filter. We apply the approach to S&P 500 data in the context of a stochastic volatility model with long memory.

4 - Leveraged ETF Portfolios with Delta-vega Control

Zheng Wang, Columbia University, 116th Street, New York, NY, 10027, United States of America, zw2192@columbia.edu, Tim Leung

We analyze a collection of static portfolio strategies that allow an investor to control portfolio sensitivity with respect to the short-term return and realized volatility of a reference asset. This is done by choosing appropriate weights of each constituent in a portfolio of leveraged ETFs. We backtest our proposed strategies using empirical data of major equity leveraged ETFs and illustrate the efficacy of our methodology.

1 - Incentivizing External Experts in New Product Development

Shantanu Bhattacharya, Singapore Management University, Lee Kong Chain School of Business, Grange Heights, Singapore, 238145, Singapore, shantanub@smu.edu.sg, Sameer Hasijsa

We create a model of new product development where information on external factors like market potential and technology feasibility is sought from external experts. The firm has to adequately incentivize these experts to truthfully reveal their judgment. Contracts are presented to alleviate the resulting adverse selection problem.

2 - Supplier Incentives in Collaborative Product Development with Internal Competition

Timofey Shalpegin, Lecturer, University of Auckland, 12 Grafton Road, Auckland, 1010, New Zealand, t.shalpegin@auckland.ac.nz

Internal competition in new product development has a profound, yet unexplored effect on the incentives of the suppliers involved in a development project through collaboration with the manufacturer's competing development teams. We study the optimal assignment of development teams to different suppliers. We find that due to the effect of competition on supplier incentives, the manufacturer may find it optimal to allocate more development teams to a supplier with lower capabilities.

3 - Dynamic Delegated Search

Morvarid Rahmani, Assistant Professor, Georgia Tech,
Atlanta, GA, morvarid.rahmani@scheller.gatech.edu,
Karthik Ramachandran

Firms often delegate the search for solution of their innovative problems to third parties (e.g., search for designs, advertisements, executive leaders, etc.) In this paper we study how the client's choice of search process (i.e., defined or open-ended) depends on the strategic behavior of the provider. Taking the client's and provider's perspective, we identify conditions for which a defined search is preferred to an open-ended search.

4 - The Impact of Health Information Technology Bundles on Hospital Performance: An Econometric Study

Aravind Chandrasekaran, Associate Professor, The Ohio State
University, 2100 Neil Avenue, Columbus, OH, 43210, United
States of America, chandrasekaran.24@osu.edu, Luv Sharma

We examine how two HIT bundles: Clinical (used for patient data collection, diagnosis and treatment) and Augmented Clinical (used for integrating patient information and decision making) jointly impact operating cost and process quality. Results suggest complementarities between these bundles with respect to process quality but not cost. A posthoc analyses offers additional explanation on the lack of association with cost.

19th Ave S, Minneapolis, MN, United States of America,
jchanf@umn.edu

1 - Dynamic Strategies for Successful Online Crowdfunding

Zhuoxin (Allen) Li, Assistant Professor, Boston College,
140 Commonwealth Avenue, Chestnut Hill, MA, 02467,
United States of America, zhuoxin.li@gmail.com, Jason A. Duan

This paper empirically investigates the dynamics of investors' backing behaviors in the presence of network externalities and a finite time window. Model estimation shows that investors are more likely to back a project that has already attracted a critical mass of funding. For the same amount of achieved funding, the backing propensity declines over time.

2 - The Effect of Disclosing Purchase Information on Review Helpfulness: Evidence from Amazon.com

Marios Kokkodis, Assistant Professor, Boston College,
34 E 10th, New York, NY, 10009, United States of America,
mkokkodis@stern.nyu.edu

In this work, we study how the introduction of the Verified Purchase (VP) feature affected review helpfulness on the Amazon platform. We find that all else equal, 'search' product VP reviews are on average 3.6% more helpful than nonVP reviews, and 'experience' product VP reviews are 5.6% more helpful than non-VP reviews.

3 - The Business Value of Recommendations: A Privacy-preserving Econometric Analysis

Panagiotis Adamopoulos, Doctoral Candidate, New York
University, 44 W 4th St, New York, NY, United States of America,
padamopo@stern.nyu.edu, Alexander Tuzhilin

We study the effectiveness of different types of mobile recommendations and their impact on economic demand, using a privacy-preserving econometric analysis. Our observational data set is based on a real-world mobile recommender system, which we further supplement with climate, geospatial, and population and household data. Based on our findings, an increase by 10% in the number of times a venue is recommended raises the demand by about 6.7%.

4 - Effect of Valuation Uncertainty on Buyer Indecision and Bidder Regret in Online Labor Markets

Kevin Hong, Assistant Professor, Arizona State University,
400 E Lemon St, Tempe, AZ, United States of America,
hong@asu.edu, Paul Pavlou, Alvin Zheng

In online labor markets, 60% of projects fail to reach to a contract, and significant bidder remorse is observed, indicating a waste of time and effort for both buyers and freelancers. This paper empirically examines how valuation uncertainty - measured as bids price dispersion - affects buyer's contract indecision and bidders' regret after the buyer awards a contract. We find bids valuation uncertainty increases both buyer's contract indecision and bidders' regret.

Engineering Systems Applications

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Honggang Wang, Assistant Professor, Rutgers University,
96 Frelinghuysen Rd, 201 CoRE, Piscataway, NJ, 08854,
United States of America, honggang.w@rutgers.edu

1 - Optimization of Maintenance Planning for Water Distribution Network under Stochastic Failures

Xin Chen, Assistant Professor, Southern Illinois University,
P.O. Box 1805, Edwardsville, IL, 62034, United States of America,
xchen@siue.edu, Honggang Wang

Cost-effective and preventive maintenance for water distribution networks (WDN) is essential for sustainable and reliable use of water resources. We develop mathematical models and apply optimization procedures for optimal WDN maintenance planning under stochastic failures. We demonstrate the mathematical models and optimization approach using a regional WDN in a large U.S. city. We apply genetics algorithms to solve the optimization problem and find the optimum maintenance plan for the WDN.

2 - Optimal Development of Shale Gas Field

Honggang Wang, Assistant Professor, Rutgers University,
96 Frelinghuysen Rd, 201 CoRE, Piscataway, NJ, 08854,
United States of America, honggang.w@rutgers.edu

Optimal development of shale gas involves determining the most-productive fracturing network via hydraulic stimulation processes in shale reservoirs. Shale gas development problems can be formulated with mixed-integer optimization models. We apply a simplex interpolation based optimization method to solve mixed integer optimization problems associated with shale gas production projects. The optimization performance is demonstrated with the example case of developing the Barnett shale field.

3 - Resource Abstraction in Planning and Design of Virtual Data Centers

Dimitri Papadimitriou, Copernicuslaan 50, 2018, Antwerp, 2018,
Belgium, dimitri.papadimitriou@alcatel-lucent.com

Virtual data centers enable flexible allocation of capacity to customer demands by aggregating physical resources taken out of a subset of data centers (facilities) to satisfy customer demands. The goal is to determine the capacity to be provisioned on opened facilities and the assignment that minimize the cost of opening, supplying demands and connecting each customer to a subset of facilities. We compare the resulting cost against the corresponding capacitated facility location problem.

Capacity Management in Healthcare Operations

Sponsor: Optimization in Healthcare

Sponsored Session

Chair: Sandeep Rath, PhD Candidate, UCLA Anderson, B501 Gold Hall, UCLA Anderson, Los Angeles, CA, 90024, United States of America, Sandeep.Rath.1@anderson.ucla.edu

1 - Workforce Optimization with Patient Volume Variations and Scheduling Pattern Generation for Hospital

Xuanqi Zhang, Philips Research North America, 345 Scarborough Rd, Briarcliff Manor, NY, 10510, United States of America, Xuanqi.Zhang@philips.com, Jingyu Zhang

A two-stage model is created to optimize hospitals' workforce which directly affects hospital cost and patients satisfaction. The model uses simulation-based stochastic optimization and heuristics to reduce staffing cost, avoid understaffing and improve scheduling efficiency. The two-stage solution mechanism helps diminish the gap between staffing optimization research and hospital scheduling practice. Results were delivered to and tested in hospitals.

2 - Integer Programming Model to Solve Bloodmobiles Routing Problem

Grisselle Centeno, Associate Professor, Univ. of South Florida, 4202 E. Fowler Ave., Tampa, FL, 33620, United States of America, gcenteno@usf.edu, Serkan Gunpinar

Blood is a scarce and perishable resource. Approximately 80% of the blood donations are handled remotely via bloodmobiles. Blood center must determine the number of bloodmobile units to operate, and designate their daily location(s) to avoid shortfalls. In this study, a vehicle routing problem is developed using IP. Optimal routing for each bloodmobile is identified using CPLEX solver & column generation algorithm. Computational results will be discussed.

3 - A Binary Integer Programming Approximation for Vaccine Vial Distribution

Zahra Azadi, Clemson University, 854 Issaqueena Trl. Apt#902, Central, SC, 29630, United States of America, zazadi@clemson.edu, Sandra Eksioglu

One of the challenges faced by health care providers is designing an inventory replenishment policy for vaccines to ensure a successful immunization of patients while minimizing purchasing, inventory and wastage costs. Wastage incurs when doses are disposed from opened vials after their safe use time. We propose an (s, S) policy which determines the vial size, the reorder quantity, and the order up to point which optimizes system-wide costs.

Inverse Optimization

Sponsor: Optimization/Linear and Conic Optimization

Sponsored Session

Chair: Daria Terekhov, Concordia University, 1455 De Maisonneuve Blvd. W., Montreal, Canada, dterekho@encs.concordia.ca

1 - A Goodness-of-fit Measure for Inverse Optimization

Daria Terekhov, Concordia University, 1455 De Maisonneuve Blvd. W., Montreal, Canada, dterekho@encs.concordia.ca, Taewoo Lee, Timothy Chan

Using an analogy between regression and inverse optimization, we develop a framework for cost function estimation in linear optimization consisting of a general inverse optimization model and a corresponding goodness-of-fit metric. We propose several natural specializations of the framework that evaluate goodness-of-fit in both the space of decisions and objective value.

2 - Inverse Optimization for the Analysis of Competitive Markets

Michael Pavlin, Wilfrid Laurier University, 75 University Ave, Waterloo, ON, Canada, mpavlin@wlu.ca, John Birge, Ali Hortacsu

We consider use of inverse optimization as an empirical tool for uncovering unobservable parameters in competitive markets. In particular, we apply these techniques to the recovery of transportation and production cost parameters in natural gas markets.

3 - Three Newsvendor Models for Capacity Allocation

Sam Choi, Assistant Professor, Shenandoah University, 1460 University Dr., Winchester, VA, 22601, United States of America, schoi@su.edu

We propose three newsvendor models to allocate capacity under uncertainty: inverse newsvendor, sequential newsvendor, and inverse sequential newsvendor models. The inverse newsvendor model tries to find optimal demand size under capacitated environment. The sequential newsvendor model deals with optimal time durations given that demand sizes. Lastly, the inverse sequential newsvendor model determines optimal demand sizes given that time durations. We apply three models to healthcare settings.

Routing and Multidimensional Assignment Applications

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Jose Walteros, University at Buffalo, 342 Bell Hall, Buffalo, NY, United States of America, josewalt@buffalo.edu

1 - Gasoline Replenishment and Routing Problem with Variable Demands and Time Windows

Yan Cheng Hsu, University at Buffalo (SUNY), 412 Bell Hall, Buffalo, NY, 14228, United States of America, yhsu8@buffalo.edu, Rajan Batta, Jose Walteros

An iterative procedure is presented to tackle the gasoline replenishment problem of gas stations and vehicle routing problem. The problem is formulated as inventory model with a send-back cost due to the gasoline delivery property that gas stations should accept ordered quantity completely, to find order quantity and time window of gas stations, minimizing expected total cost, and as MIP model to resolve vehicle routing problem, maximizing total profit for transporters.

2 - Solving Multidimensional Assignment Problems with Combinatorial Decomposable Cost Functions

Hadi Feyzollahi, State University of New York at Buffalo, 316 Bell Hall, Buffalo, NY, United States of America, hadifeyz@buffalo.edu, Jose Walteros

We consider several variants of the multidimensional assignment problem (MAP) where the costs of the optimal assignments are calculated by solving combinatorial optimization problems. We focus our attention on the cases where the assignments represent optimal TSP tours, spanning trees, and cliques. We formulate these MAPs as set partitioning problems and solve them via branch and price. We develop specific algorithms for solving the corresponding subproblems for each of the aforementioned cases.

3 - Location-capacity-routing Problem of All-electric Delivery Vehicles

Nan Ding, University of Buffalo, Buffalo, NY, United States of America, nanding@buffalo.edu, Rajan Batta

All-electric truck adoption becomes one of the main addressees of green logistic activities, with challenges of limited driving range and long charging time to route these trucks. This problem aims to handle the challenges of congestion and waiting at the charging stations. A joint location-capacity-routing (LCR) problem to determine the optimal location and capacity of charging stations is formulated and a meta-heuristic approach is proposed to solve this LCR problem.

4 - Large-scale Neighborhood Search for the Multi-dimensional Assignment Problem

Alla Kammerdiner, New Mexico State University, P.O. Box 30001, MSC 4230, Las Cruces, NM, 88003, United States of America, alla@nmsu.edu, Charles Vaughan

The multi-dimensional assignment problem is an NP-hard problem in high-dimensional combinatorial optimization. This problem arises in the military surveillance applications (e.g. sensor data fusion and target tracking) and in healthcare for ranking exposures to falls. We propose and investigate a new large-scale search algorithm for this computationally difficult problem. We evaluate the performance of new algorithm on various instances and compare it to other state-of-the-art procedures.

Recent Advances in First Order Methods for Large-Scale Optimization

Cluster: Modeling and Methodologies in Big Data

Invited Session

Chair: Mingyi Hong, Iowa State University, 3015 Black Engineering, Ames, IA, 50011, United States of America, mingyi@iastate.edu

1 - On the Information-adaptive Variants of the Admm: An Iteration Complexity Perspective

Shuzhong Zhang, Professor, University of Minnesota, Department of Industrial and Systems Eng, Minneapolis, MN, 55455, United States of America, zhangs@umn.edu, Xiang Gao, Bo Jiang

We present a suite of variants of the ADMM, where the trade-offs between the required information on the objective and the computational complexity are explicitly given. The new variants allow the method to be applicable on a much broader class of problems where only noisy estimations of the gradient or the function values are accessible, yet the flexibility is achieved without sacrificing the computational complexity bounds.

2 - An Optimal Randomized Incremental Gradient Method

Guanghui Lan, University of Florida, Gainesville, FL, United States of America, glan@ise.ufl.edu

We present a randomized incremental gradient method and show that this algorithm possesses unimprovable rate of convergence for convex optimization. We provide a natural game theoretic interpretation for this method as well as for the related Nesterov's optimal method. We also point out the situations when this randomized algorithm can significantly outperform the deterministic optimal method.

3 - On the Expected Convergence of Randomly Permuted ADMM

Ruoyu Sun, Stanford University, Menlo Park, CA, 94025, United States of America, sundirac@gmail.com, Zhi-Quan Luo, Yinyu Ye

Recently, it has been shown that the direct extension of the alternating direction method of multipliers (ADMM) to the multi-block case fails to converge when solving a simple square system of linear equations. In this paper, however, we prove that, if in each step one randomly and independently permutes the updating order of any given number of blocks, the method will converge in expectation for solving the square system of linear equations.

4 - Alternating Direction Method of Multipliers for Distributed Sparse Principal Component Analysis

Davood Hajinezhad, Iowa State University, 62 B Schilleter village, Ames, IA, 50010, United States of America, dhaji@iastate.edu, Mingyi Hong

We propose distributed algorithms to perform sparse PCA. They are quite flexible, in the sense that they are able to handle different forms of data partition (i.e., partition across rows or columns of the data matrix). Numerical experiments based on both real and synthetic data sets, conducted on high performance computing clusters, demonstrate the effectiveness of our approaches.

Network Inference

Sponsor: Computing Society

Sponsored Session

Chair: Nediako Dimitrov, Assistant Professor, UT Austin, University of Texas at Austin, Austin, United States of America, ned@austin.utexas.edu

1 - Fast, Approximate Inference on Graphical Models by Reducing Treewidth

Areesh Mittal, University of Texas at Austin, 1626 West 6th St. Apt. F, Austin, TX, 78703, United States of America, areesh0612@gmail.com, Nediako Dimitrov

Complexity of exact inference algorithms in graphical models is exponential in treewidth. We develop technique to perform approximate inference by removing edges and updating factors, leading to reduced treewidth. We prove bounds on error in approximation. Finding updated factors involves solving a geometric program (GP) with exponential number of constraints. We develop row generation technique to solve the GP. We demonstrate the results on discrete graphical models applied to social networks.

2 - Non-aggressive Adaptive Traffic Routing

Madhushini Narayana Prasad, Graduate Research Assistant, Cockrell School of Engineering, University of Texas at Austin, Austin, TX, 78712, United States of America, madhushini@utexas.edu, Nediako Dimitrov

Routing a person through a traffic network presents a dilemma to choose between fixed route which is an easier to navigate route and adaptive route which minimizes the travel time by adjusting to the traffic conditions. We investigate methods for non-aggressive, adaptive routing that is middle-ground seeking the best of both these extremes, i.e. adaptive routes restricted in number of route shifts allowed at a critical juncture, and investigate the trade-offs between the extremes.

3 - Social Network Echo Chambers and Popularity

Yinhan Liu, University of Texas Austin, 1901 Crossing Place #3301, Austin, TX, 78741, United States of America, yinhan.liu@utexas.edu, Nediako Dimitrov

Social network users often have the goal of building a large follower base. Some users are members of what we term echo chambers, a small group of users that re-share each other's messages. We present an empirical study on the impact of echo chambers on the popularity of users using historical data from Twitter. Specific questions we address are: Does echo chamber membership increase re-shares outside the echo chamber? Does echo chamber membership increase follower base?

Banking and Insurance

Contributed Session

Chair: Linna Du, Data Scientist, CACS, 2259 Adam Clyton Powell, New York, NY, 10027, United States of America, linna.du@gmail.com

1 - Success Drivers of Online Equity Crowdfunding Campaigns for Unaccredited Investors

Anna Lukkarinen, Aalto University, P.O. Box 21220, Helsinki, 00076, Finland, anna.lukkarinen@aalto.fi, Jeffrey Teich, Hannele Wallenius, Jyrki Wallenius

Using data from a leading equity crowdfunding platform in Northern Europe, we explore success factors of campaigns. The results suggest that the investment criteria traditionally used by professional investors are not of prime importance for success in equity crowdfunding. Instead, success is related to pre-selected crowdfunding campaign characteristics and networks. Understanding the success factors of online equity crowdfunding campaigns is important to the design of online platforms.

2 - The Mover-Stayer Process for the Credit Data

Anna Matuszyk, Assistant Professor, Warsaw School of Economics, Niepodleglosci 162, Warsaw, 02-554, Poland, amatuszyk@matuszyk.com, Halina Frydman

Using the credit data set, coming from the European bank, we estimate the mover-stayer model, which is an extension of the Markov chain. This model assumes that the population is heterogeneous: there are "stayers" and "movers". "Movers" evolve according to a Markov Chain with the one-step transition matrix, while "stayers" never leave their initial states. The probability of a customer being a stayer in a paid up state is modeled using the logistic regression.

3 - Monopolistic Dealer Versus Broker: Impact of Proprietary Trading with Transaction Fees

Yuan Tian, Ryukoku University, 67 Tsukamoto-cho, Fukakusa, Fushimi-ku, Kyoto, Japan, tian@econ.ryukoku.ac.jp, Katsumasa Nishide

We consider a one-period financial market with a monopolistic dealer/broker and an infinite number of investors. While the dealer (with proprietary trading) simultaneously sets both the transaction fee and the asset price, the broker (with no proprietary trading) sets only the transaction fee, given that the price is determined according to the market-clearing condition among investors. We effectively demonstrate how proprietary trading affects market equilibrium and welfare of investors.

4 - A Data Analytics Based Approach for Building 360 View of Banking Customer

Tianzhi Zhao, IBM, Diamond Bld, ZGC Software Park, Beijing, China, zhaotzhi@cn.ibm.com, Zhen Huang, Ming Xie, Bing Shao, Yuhang Liu, Jian Xu, Wenjun Yin, Yuhui Fu

Banks today are experiencing transformation from product centricity to customer centricity. With advent of big data, it enables banks to fully and deeply understand customers by building 360 degree customer view. In this paper, a data analytics based approach for 360 degree view of banking customer is proposed. It can help banks quick build customer centricity for customer segments, targeted marketing, personalized recommend, etc.

5 - Credit Scoring using Dynamic State Space Model under Statistical Volatility

Linna Du, Data Scientist, CACS, 2259 Adam Clayton Powell,
New York, NY, 10027, United States of America,
linna.du@gmail.com

In emerging market where the credit score and credit history are not trustworthy, the estimation and prediction of the credit score and prepayment risks are very important. In the paper, we propose a dynamic state space model considering the volatility and dynamic feature of the lending market. We found that the time varying volatility model provides better prediction than other time series models. We also identify the key factors that drive the lending risks.

Disease Modeling in OR

Sponsor: Health Applications

Sponsored Session

Chair: Emine Yaylali, Senior Service Fellow, Centers for Disease Control and Prevention, 1600 Clifton Road, Atlanta, GA, 30333, United States of America, wq3@cdc.gov

1 - The Potential Impact of Reducing Indoor Tanning on Melanoma Prevention in the United States

Yuanhui Zhang, CDC, Chamblee GA 30341,
United States of America., yfp5@cdc.gov, Donatus Ekwueme,
Sun Hee Rim, Meg Watson, Gery Guy

More than 700,000 adults in the United States are treated for melanoma each year, resulting in annual direct medical costs of \$3.3 billion dollars and 9,000 deaths. We developed a Markov model to estimate the health and economic impacts of reducing indoor tanning for melanoma prevention in the United States under certain assumptions. According to this model, reducing indoor tanning may result in favorable savings in medical costs and life-years, comparable to other national prevention efforts.

2 - Estimating the Impact of HIV Care Continuum Interventions on the Reproduction Number

Yao-Hsuan Chen, CDC, Chamblee GA 30341,
United States of America, xhj1@cdc.gov, Andrew Hill,
Paul G. Farnham, Stephanie L. Sansom

We used a compartmental model to study HIV transmission in the United States from 2006 through 2020 among heterosexuals, men who have sex with men, including bisexual men, and injection drug users. We analyzed the impact of interventions to improve HIV diagnosis, care, and treatment on the reproduction number. Analyses using this model can provide insights into the long-term effectiveness of HIV prevention strategies.

3 - Stratifying Risk Groups in Compartmental Epidemic Models: Where to Draw the Line?

Margaret L. Brandeau, Professor, Stanford University, MS&E
Department, Stanford, CA, 94305, United States of America,
brandeau@stanford.edu, Jeremy D. Goldhaber-fiebert

Disease models used to support cost-effectiveness analyses of health interventions are often stratified to reflect population heterogeneity (e.g., age, gender, risk behaviors). We examine the impact of population stratification in dynamic disease transmission models: specifically, the impact of different divisions of a population into a low-risk and a high-risk group. We show that the way in which the population is stratified can significantly affect cost-effectiveness estimates.

4 - Developing a Dynamic Compartmental Model of HIV in the United States

Emine Yaylali, Senior Service Fellow, Centers for Disease Control and Prevention, 1600 Clifton Road, Atlanta, GA, 30333, United States of America, wq3@cdc.gov, Paul G. Farnham, Stephanie L. Sansom, Katherine A. Hicks, Emily L. Tucker, Amanda Honeycutt

Over 1 million people in the US are living with HIV. To observe trends in HIV and evaluate the effectiveness of prevention interventions, we developed a dynamic compartmental model of disease progression and transmission. The population was stratified by age, sex, circumcision status, race/ethnicity, transmission group, and risk level. People progressed between compartments defined by disease status and care and treatment stage. Outcomes included HIV incidence, prevalence, and care status.

Contact Centers

Sponsor: Applied Probability

Sponsored Session

Chair: Rouba Ibrahim, University College London, London, N7 8EP, United Kingdom, rouba.ibrahim@ucl.ac.uk

1 - Telephone Call Centers: Asymptotic Optimality of Myopic Forecasting-scheduling Scheme

Han Ye, University of Illinois at Urbana Champaign, 350 Wohlers Hall, 1206 South Sixth Street, Champaign, IL, 61820, United States of America, hanye@illinois.edu, Noah Gans, Haipeng Shen, Yong-Pin Zhou

We determine workforce schedules for call center arrivals that are doubly stochastic. Period-by-period arrival rates follow a hidden AR(1) process, and only arrival counts are observed. We formulate stochastic programs to minimize long-run average staffing costs, subject to a long-run average constraint on abandonment. We show that, in steady state, repeated, myopic solution of the single-period problem is stable, has low cost, and meets the abandonment constraint.

2 - A Structural Model for Agents' Strategic Behavior in Call Centers

Dongyuan Zhan, University of Southern California, Los Angeles, CA, United States of America, Dongyuan.Zhan.2015@marshall.usc.edu, Amy Ward, Seyed Emadi

We do an empirical study of agent behavior in call centers. We begin by observing that regression analyses have low explanatory power, even though the data shows that agents speed up or slow down depending on the system load and their fatigue level. This leads us to investigate utility based structural models for agent behavior.

3 - Capacity Sizing with a Random Number of Agents

Rouba Ibrahim, University College London, London, N7 8EP, United Kingdom, rouba.ibrahim@ucl.ac.uk

We study the problem of staffing many-server queues with general abandonment and a random number of servers. For example, uncertainty in the number of servers may arise in virtual call centers where agents are free to set their own schedules. We rely on a fluid model to determine optimal staffing levels, and demonstrate the asymptotic accuracy of the fluid prescription. We also characterize the optimal staffing policy with self-scheduling agents.

Markov Decision Models and Approximations for Manufacturing

Cluster: Stochastic Models: Theory and Applications

Invited Session

Chair: Tugce Martagan, Eindhoven University of Technology, 5600 MB Eindhoven, Eindhoven, Netherlands, T.G.Martagan@tue.nl

1 - Robust Approximate Dynamic Programming and Structured Policies for Degradable Energy Storage

Marek Petrik, IBM, 1101 Kitchawan Rd., Yorktown Heights, NY, 10598, United States of America, mpetrik@us.ibm.com

Batteries hold great promise for energy storage in arbitrage in electric grids but can degrade rapidly with use. In this talk, we analyze the impact of storage degradation on the structure of optimal policies and describe robust approximate dynamic programming methods that take advantage of the policy structure.

2 - Component Reservation for Asymptotically Optimal Allocation in Assemble to Order Production Systems

Haohua Wan, University of Illinois at Urbana-Champaign, 104 South Mathews Ave., Urbana, IL, United States of America, hwan3@illinois.edu, Qiong Wang

Component reservation is not myopically optimal as it sometimes holds back components from existing demands. We prove that in many cases, without reservation, component allocation cannot be asymptotically optimal, i.e., the percentage difference of the discounted inventory cost from its lower bound does not converge to zero as demand and production volumes increase, even though such convergence is achievable under other policies that reserve components for high-value product demands.

3 - Replenishment and Fulfillment Based Aggregation for General Assemble-to-Order Systems

Emre Nadar, Assistant Professor, Bilkent University, Department of Industrial Engineering, Bilkent University, Ankara, Turkey, emre.nadar@bilkent.edu.tr, Alan Scheller-wolf, Alp Akcay, Mustafa Akan

We present an approximate dynamic programming method to optimizing Markovian assemble-to-order systems. We alleviate the computational burden by reducing the large state space of the problem via a novel aggregation method that builds upon certain component and product characteristics. We show the optimality of a lattice-dependent base-stock and rationing policy for the aggregate problem. We also derive finite error bound for the cost function of the aggregate problem under a mild condition.

4 - Optimal Manufacturing Policies for Engineer-to-Order Proteins

Tugce Martagan, Eindhoven University of Technology, 5600 MB Eindhoven, Eindhoven, Netherlands, T.G.Martagan@tue.nl, Ananth Krishnamurthy

We develop continuous state Markov decision models to optimize design decisions related to protein purification operations. We focus on engineer-to-order proteins with strict production requirements on quality and yield. We present a state aggregation mechanism to solve industry-size problems. Our models and insights are implemented in practice.

Social Network Analytics

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Xi Wang, The University of Iowa, S343 PBB, Iowa City, IA, 52242, United States of America, xi-wang-1@uiowa.edu

1 - Optimizing Hurricane Warning Dissemination Problem for Evacuation Decision Making

Dian Sun, Harbin Engineering University, 172 Princeton Ave. Apt 1, Buffalo, NY, 14226, United States of America, sundian@hrbeu.edu.cn, Yan Song, Zifeng Su

Individual make evacuation decisions based on risk perception which can be socially influenced as evacuation warnings spread through social networks. In this study a formal model for evacuation warning dissemination in social networks through time is presented to characterize the social influence of the risk perception in the evacuation decision making process. Simulation models are developed to investigate the effects of community mixing patterns and the strength of ties on evacuation decision.

2 - Inferring User Location from Geographic and Social Network

Da Xu, PhD Student, University of Utah, 1032 E 400 S, Apt 504B, Salt Lake City, UT, 84102, United States of America, Da.Xu@business.utah.edu, Xiao Fang

The lack of tools to monitor the time-resolved locations of individuals constrains us to gain a deep understanding of human mobility. While, despite the diversity of people's travel history, human mobility follows a high of temporal and spatial regularity. In this paper, we study the human mobility through social and geographic networks, give a deep insight to how individual mobility pattern and social network impact with each other, and build a probabilistic model to depict human mobility.

3 - Concurrent Diffusions of Information and Behaviors in Online Social Networks

Shiyao Wang, University of Iowa, 634 Westgate St. Apt. 55, Iowa City, IA, 52246, United States of America, shiyao-wang@uiowa.edu, Kang Zhao

Using the spread of the Ice Bucket Challenge (IBC) on Twitter as a case study, this research compared the concurrent diffusion patterns of both information and behaviors in online social networks. Individual behaviors related to IBC were detected by text mining techniques. Comparison between diffusion dynamics of information and behaviors at different levels revealed interesting differences and interactions between the two diffusion processes and laid foundations for future analytics.

Economic Models and Analysis of Networks and Platforms

Sponsor: Information Systems

Sponsored Session

Chair: Soumya Sen, University of Minnesota, Minneapolis, MN, United States of America, ssen@umn.edu

1 - Payments for Transactions Versus Payments for Discoveries: Theoretical Analyses

Karthik Kannan, Purdue University, 403 W.State Street, West Lafayette, IN, 47907, United States of America, kkarthik@purdue.edu, Rajib Saha

eBay.com in the U.S. charges payments for transactions but Taobao.com in China charges for discoveries. We theoretically study such payment schemes used by the platforms. We surprisingly find that when payments are for discoveries, the platform has an incentive to make welfare-decreasing matches between sellers and buyers. Similarly, in order for payments for transactions to be sustained, buyers and sellers should sufficiently value factors such as trust provided by the platform.

2 - The Impact of Online Word of Mouth on Channel Disintermediation for Information Goods

Brian Lee, University of Connecticut, 2100 Hillside Road Unit 1041, Storrs, CT, 06268, United States of America, brian.lee@business.uconn.edu, Xinxin Li

With the advance in digital technology, creators of intellectual products can sell their work directly to consumers without the help of publishers. In this study, we construct an analytical model to examine the role of online word of mouth (eWOM) in this trend of disintermediation. We find that eWOM may encourage creators to reintermediate publishers for high quality work. Our model makes predictions on when eWOM benefits publishers and for what types of products/creators it has the most impact.

3 - Electric Vehicle Power Plants: Carsharing Optimization with Smart Electricity Markets

Micha Kahlen, Erasmus University Rotterdam, Burgemeester Oudlaan 50, Rotterdam, Netherlands, kahlen@rsm.nl, Wolf Ketter

We study electric vehicles as power plants to bridge weather dependent energy shortages from wind and solar energy. Particularly, we are interested in the allocation of electric vehicles by making a trade-off between driving and storing electricity. This allocation is optimized in a first-price sealed bid auction with pricing signals from smart electricity markets and the availability of electric vehicles. Results show positive effects for drivers, carsharing operators, and the environment.

4 - Should You Go with "Pay as You Go"?:

Optimal Design of Bucket Plans for Multi-unit Goods

Manish Gangwar, Assistant Professor, ISB, ISB Campus, Gachibowli, Hyderabad, India, manish_gangwar@isb.edu, Hemant Bhargava

Among the class of nonlinear tariffs, "Three Part Tariff" is the most general tariff but it tends to focus on heavy users. Given the evident optimality of a bucket plan, we ask what are the pros and cons of alternative pricing models? We derive the closed-form expressions for commonly used demand function and specify a system of equations with economic interpretation for the general problem. We also examine the properties of optimal "Three Part Tariff" in the presence of a per-unit plan.

26-Room 403, Marriott

Production and Scheduling I

Contributed Session

Chair: Srimathy Mohan, Associate Professor, Arizona State University, Department of Supply Chain Management, Tempe, AZ, United States of America, srinathy@asu.edu

1 - Weekly Production Planning on the Basis of Average Value-at-Risk by Shapley Value

Nobuyuki Ueno, Hiroshima University of Economics, 5-37-1 Gion Asaminami-ku, Hiroshima, Japan, ueno@pu-hiroshima.ac.jp, Hiroshi Morita, Koji Okuhara

Under demand uncertainty, they used stock-out ratio for estimating the risk. In this presentation, we propose a formulation for weekly production planning problem that reflects the AVaR (Average value-at-risk) for weighing tail risk and a solution by Shapley value. The characteristics of the solution procedure is proved. It has the features that it does not require strict probability distribution of stock-out and it enables an extension to the case where demand for each period is correlated.

2 - A Generalized Dantzig-Wolfe Decomposition Algorithm for Mixed Integer Programming Problems

Xue Lu, London School of Economics and Political Science, Houghton Street, London, WC2A 2AE, United Kingdom, X.Lu7@lse.ac.uk, Zeger Degraeve

We propose a generalized Dantzig-Wolfe decomposition algorithm for mixed integer programming. By generating copy variables, we can reformulate the original problem to have a diagonal structure which is amendable to the Dantzig-Wolfe decomposition. We apply the proposed algorithm to multi-level capacitated lot sizing problem and production routing problem. Rigorous computational results show that our algorithm provides a tighter bound of the optimal solution than all the existing methods.

3 - The Impact of Postponement Practices on the Lot-sizing Decisions of a Wine Bottling Plant

Sergio Maturana, Professor, Pontificia Universidad Catolica de Chile, Vicuna Mackenna 4860, Santiago, Chile, smaturan@ing.puc.cl, Mauricio Varas

Export-focused wineries face a difficult problem when planning their bottling lines due to the number of different products they have to bottle and label. A way of reducing misallocation due to demand variability is by postponing the labeling process. We propose two MIP planning models that support tactical lot-sizing decisions. We tested both models in a rolling horizon framework, under different conditions of capacity tightness, horizon length, and demand uncertainty and we report the results.

4 - Scheduling of Maximizing Total Job Value with Machine Availability Constraint

Eun-Seok Kim, Middlesex University, The Burroughs, London, NW4 4BT, United Kingdom, e.kim@mdx.ac.uk, Joonyup Eun

We study a single machine scheduling problem of maximizing total job value with machine availability constraint. The value of each job is given as a non-increasing step function of its completion time. We develop a branch-and-bound algorithm and a heuristic algorithm for the problem. Finally, we perform computational experiments showing that the developed algorithms provide efficient and effective solutions.

Applications of Multi-objective Optimization

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Matthias Ehrgott, Professor, Department: Management Science, Lancaster University, The Management School, Lancaster, 00, LA1 4YX, United Kingdom, m.ehrgott@lancaster.ac.uk

1 - A Hybrid Decision Making Approach for Multi-Objective Infrastructure Planning

Hana Chmielewski, North Carolina State University, Campus Box 7908, Raleigh, NC, 27695, United States of America, hchmiel@ncsu.edu, Ranji Ranjithan

A hybrid approach using evolutionary computation and dynamic programming is used to optimize investments and operational decisions in a water supply case study system. Solutions are categorized by network centralization metrics, and analyzed with respect to multiple planning objectives.

2 - Evaluating Lignocellulosic Biomass Supply Chains Considering a Multi-objective of Optimizing Cost

Burton English, Professor, The University of Tennessee, 2621 Morgan Hall, Knoxville, TN, 37922, United States of America, benglish@utk.edu, James Larson, Edward Yu, Jia Zhong

A switchgrass supply chain that considers the optimization of cost, GHG emissions and soil erosion for a cellulosic biofuel plant is developed. Using an augmented epsilon constraint multi-objective optimization model and a compromise solution method, along with high-resolution spatial data the optimal placement of feedstock supply chains can be estimated. Spatial characteristics, including land coverage and infrastructure availability, are crucial to both the cost and the environmental results.

28-Room 405, Marriott

Dynamic Matching Markets

Cluster: Auctions

Invited Session

Chair: John Dickerson, CMU, 9219 Gates-Hillman Center, Pittsburgh, PA, 15213, United States of America, dickerson@cs.cmu.edu

1 - Global Kidney Exchange

Afshin Nikzad, Stanford University, 37 Angell Court, Apt 116, Stanford, CA, 94305, United States of America, afshin.nikzad@gmail.com, Mohammad Akbarpour, Alvin Roth

In some countries, many patients die after a few weeks of diagnosis mainly because the costs of kidney transplantation and dialysis are beyond the reach of most citizens. We analyze the two proposals in which patients with financial restrictions who have willing donors participate in kidney exchange without paying for surgery. Our proposals can save thousands of patients, while substantially decreasing the average dialysis costs; in particular, we prove that they are "self-financing"

2 - Matching with Stochastic Arrival

Neil Thakral, Harvard, 1805 Cambridge Street, Cambridge, MA, United States of America, nthakral@fas.harvard.edu

We study matching in a dynamic setting, with applications to public-housing allocation. Objects of different types that arrive stochastically over time must be allocated to agents in a queue. When objects share priorities over agents, we propose an efficient, envy-free, and strategy-proof mechanism. The mechanism continues to satisfy these properties if and only if the priority relations are acyclic. Estimated welfare gains over existing housing-allocation procedures exceed \$5000 per applicant.

3 - Dynamic Kidney Exchange with Heterogeneous Types

Maximilien Burq, Student, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, mburq@mit.edu, Itai Ashlagi, Vahideh Manshadi, Patrick Jaillet

Kidney exchange programs face growing number of highly sensitized patients. We develop an online model that models such heterogeneity, and we prove that having some easy-to-match patients in the pool greatly reduces waiting times both in the presence of bilateral matching and chain matching. We provide simulations showing that some prioritizing leads to improved overall efficiency.

4 - Competing Dynamic Matching Markets

Sanmay Das, WUSTL, One Brookings Dr, CB 1045, St. Louis, MO, 63130, United States of America, sanmay@wustl.edu, John Dickerson, Zhuoshu Li, Tuomas Sandholm

We extend a framework of dynamic matching due to Akbarpour et al. to characterize outcomes in cases where two rival matching markets compete. One market matches quickly while the other builds thickness by matching slowly. We present analytical and simulation results, both in general and for kidney exchange, demonstrating that rival markets increase overall loss compared to a single market that builds thickness.

Joint Session Analytics/HAS: The Emerging Role of Health Systems Engineering and its Impact on Clinical Informatics and Analytics

Sponsor: Analytics

Sponsored Session

Chair: John Zaleski, Chief Informatics Officer, Nuvon, Inc.,
4801 S. Broad Street, Suite 120, Philadelphia, PA, 19112,
United States of America, jzaleski@nuvon.com

1 - How to Make Clinically Actionable Alarms

Jeanne Venella Dnp, Chief Nursing Officer, Nuvon,
4801 S Broad St, Philadelphia, PA, 19112,
United States of America, jvenella@nuvon.com

How to Make Clinically Actionable Alarms The very alarm systems that were created to enhance patient safety have themselves become an urgent patient safety concern. We need to fix our current state of alarm systems. We must achieve both a higher level of sensitivity and specificity. Therefore; reducing both false and non-actionable alarms. Our goal is ignite the talk on alarm fatigue, begin to define algorithms for smarter actionable alarms and provide a safer health care environment.

2 - The Kalman Filter and its Application to Real-time Physiologic Monitoring of High-acuity Patients

John Zaleski, Chief Informatics Officer, Nuvon, Inc.,
4801 S. Broad Street, Suite 120, Philadelphia, PA, 19112,
United States of America, jzaleski@nuvon.com

The Kalman Filter (KF) has seen application in many fields owing to its rapid computational framework and intrinsic optimality in tracking time-series. In this presentation, the KF is used to optimally track and smooth signal artifact associated with patient physiologic monitoring.

3 - Predicting the Effect of Introducing Walk in Hours on Staff Workload at a Pediatrics Practice

Saurabh Jha, University of Pittsburgh, 1048 Benedum Hall,
Department of Industrial Engineering, Pittsburgh, PA, 15261,
United States of America, saj79@pitt.edu, Louis Luangkesorn,
Diana Hoang, Lindsey Jones, Tricia Pil

A local pediatrics practice has introduced patient walk-in hours in response to competition from urgent care clinics and has asked to determine the effect on staff workload. We evaluate the effect of walk-in hours on the practice workload, then develop and validate a predictive model for the various types of visits and phone calls. After validating the predictive model, we develop a forecast for the remainder of the 12 months period following the introduction of all-day walk-ins.

1 - Routing Recommendation System for Uber

Yuhan Wang, University of California Irvine, 6478 Adobe Cir,
Irvine, CA, 92617, United States of America,
wangyuhan1101@gmail.com

Paper not available at this time.

2 - Optimising Allocation of Investor Funds in Multi-objective Public Infrastructure Investment Programs

Martin Spollen, Queens University Belfast, David Bates Building,
University Road, Belfast, BT7 1NN, United Kingdom,
mspollen01@qub.ac.uk

This session will examine the development and application of Strategic Infrastructure Planning Models (SIPMs) as an emerging class of investment appraisal techniques for public investment management. The techniques focus attention on the network effects of investment on total portfolio performance. Application to a major regional schools investment and rationalization program is demonstrated.

3 - A Decision Support System for Traffic Diversion around Construction Closures

Arezo Memarian, Graduate Research Assistant, University of Texas at Arlington, 425 Nedderman Hall, 416 Yates St.,
Box 19308, Arlington, TX, 76019, United States of America,
arezo.memarian@mavs.uta.edu, Siamak Ardekani

The objective of this study is to develop a PC-based decision support tool with a user-friendly graphical interface to allow development of optimal traffic management plans around highway construction sites. In addition to the capability to identify optimum traffic diversion routes, such a tool would also allow simulation of various traffic management plan scenarios envisioned by experts.

4 - Can Virtualization Maturity Impact Software Development Project Performance: An Empirical Study

Rohit Nishant, Assistant Professor, ESC Rennes School of Business, 2 Rue Robert d'Arbrissel CS 76522, Rennes, 35065,
France, rohit.nishant@esc-rennes.com, Bouchaib Bahli

In this article we invoke IT asset classes' taxonomy and IT capability maturity model to examine the impact of virtualization maturity on software development project performance. Our findings suggest that virtualization capability has a distinct impact on software development project and process performance. Finally, this study extends virtualization maturity model's validity. Implications for research and practice are discussed.

Time Series Data Mining

Sponsor: Data Mining

Sponsored Session

Chair: Mustafa Gokce Baydogan, Assistant Professor, Bogazici University, Department of Industrial Engineering, Bebek, Istanbul, 34342, Turkey, mustafa.baydogan@boun.edu.tr

1 - On the Parameter Identification of a New Knot Selection Procedure in Mars

Cem Iyigun, Associate Professor, Middle East Technical University, ODTU Kampusu Endustri Muhendisligi Bolum,
Oda 331 Cankaya, Ankara, 06801, Turkey, iyigun@metu.edu.tr,
Elcin Kartal Koc

Multivariate Adaptive Regression Splines (MARS) is a popular nonparametric regression for estimating the nonlinear relationship within data via piecewise functions. A clustering based knot selection method has been proposed to the literature recently. This study proposes a parameter selection criteria based on Schwarz's Bayesian Information for determining the optimum grid size and threshold value of this new procedure. Numerical studies are conducted via artificial and real datasets.

2 - Discovering Interpretable Nonlinear Variation Patterns in High-Dimensional Data over Spatial Domains

Phillip Howard, Arizona State University, 699 S Mill Ave, Tempe, AZ, 85281, United States of America, prhoward@asu.edu,
Daniel Apley, George Runger

The objective of this research is the identification of distinct and interpretable nonlinear variation patterns in high-dimensional data through dimensionality reduction. We present a new method for learning reduced dimension representations which characterize interpretable variation sources when mapped to the original feature space. A new metric for measuring how well the solution can be interpreted is also proposed. We compare our work to alternative methods using several examples.

3 - EEG Signal Classification using Functional Principal Component Analysis

Woo-Sik Choi, Mr., Korea University, 145, Anam-Ro, Seongbuk-Gu, Innovation Hall, 816, Korea University, Seoul, Korea,
Republic of, etpist@korea.ac.kr, Seoung Bum Kim

Electroencephalogram (EEG) is recordings of the electrical potentials of the brain. Identifying human activities from EEG is the main goal of brain computer interface area. To analyze events, selecting important features is a crucial step. In this study, we propose a feature extraction using functional principal component analysis with general classification methods. The effectiveness of the proposed method is demonstrated through a real data from the brain computer interface competition 2003.

4 - Modeling Time-varying Autocorrelation for Time Series Classification

Mustafa Gokce Baydogan, Assistant Professor, Bogaziçi University, Department of Industrial Engineering, Bebek, Istanbul, 34342, Turkey, mustafa.baydogan@boun.edu.tr, George Runger

We introduce a novel approach to model the dependency structure in time series (TS) that generalizes the concept of autoregression to local auto-patterns. A learning strategy that is fast and insensitive to parameter settings is the basis for the approach. This unsupervised approach to represent TS generally applies to a number of data mining tasks. We provide a research direction that breaks from the linear dependency models to potentially foster other promising nonlinear approaches.

Data Mining

Contributed Session

Chair: Gustavo Lujan-Moreno, Arizona State University, Tempe, AZ, United States of America, glujanmo@asu.edu

1 - Open-source Statistical Packages: The True Cost of “Free” Software

Ronald Klimberg, Saint Joseph’s University, 35 Moorlinch Blvd., Medford, NJ, 08055, United States of America, klimberg@sju.edu, Rick Pollack, Susan Foltz Boklage

Open source software is typically free and widely accessible to the public. In the statistical realm, R is the dominant open-source player. Is it really free? Where do you go for support? Are there possible significant costs associated with using R? Further, to what degree should open-source statistical software be used and taught in academia? This article will explore these questions, as well as others, in discussing what are often the hidden costs of using open-source statistical software

2 - Study on Effects on Emotional Intensities of Negative Online Reviews on its Usefulness

Cuiping Li, Huazhong University of Science and Technology, 1037 Luoyu Rd, Hongshan District, Wuhan, Hubei, 430074, China, 412543536@qq.com, Qian Yuan, Shuqin Cai

Aimed at recognizing high quality reviews from mass data, this paper explores how reviews’ negative emotions influence the usefulness of negative online reviews by using data mining technology and regression analysis. The result reveals that strong negative emotions reduce negative reviews’ usefulness and moderate negative emotions have opposite effect. Results also show that different intensities of negative emotions have significant interactions on reviews’ usefulness.

3 - Impact of Library Online Resource use on Students Academic Outcome

Fan Zhang, University of Pittsburgh, 1048 Benedum Hall, Department of Industrial Engineering, Pittsburgh, PA, 15261, United States of America, faz31@pitt.edu, Louis Luangkesorn, Ziyi Kang, Yunjie Zhang, Shi Tang

University libraries have a need to demonstrate the impact of their resources on the University mission: academics and research. However, for electronic resources, research has shown that students often do not recognize they are using library resources, making surveys and other assessments not useful. We use undergraduate demographic and academic outcome data along with logs of online library resource access to determine if relationship exists between online resource use and academic outcome.

4 - A Case-Crossover Study to Evaluate the Effect of Player Affective State on Performance in Video Game

Gustavo Lujan-Moreno, Arizona State University, Tempe, AZ, United States of America, glujanmo@asu.edu

Using an electroencephalogram (EEG) headset we examined whether there was a significant change in the affective state reported by the EEG when a participant made a mistake while playing a popular video game. There were five affective constructs that were examined: engagement, frustration, meditation, short and long term excitement. We propose a case-crossover methodology to analyze this type of events. Results show that there is a significant difference in three affective states.

5 - Enterprise Social Networking and Firm Creativity

Donghyun Kim, Delta State University, 1003 West Sunflower Road, Cleveland, MS, 38733, United States of America, dskim@deltastate.edu, Jaemin Kim

This study examines the influence of firm’s IT social networking (SN) capacity on the firm’s creativity and innovation. Analyzing data on utility patents of 7 firms using enterprise SN, we tested our predictions on a balanced panel of the firms’ data. The results illustrate how IT SN capacity can aid in the generation of an idea.

Decision and Prediction Models in Healthcare

Sponsor: Health Applications

Sponsored Session

Chair: Jakob Kotas, University of Washington, Dept. of Applied Mathematics, Box 353925, Seattle, WA, 98195, United States of America, jkotas@uw.edu

1 - A Stochastic Program with Chance-constrained Recourse for Surgery Scheduling and Rescheduling

Gabriel Zenarosa, PhD Candidate, University of Pittsburgh, 3700 O’Hara Street, Benedum Hall 1048, Pittsburgh, PA, 15261-3048, United States of America, glz5@pitt.edu, Andrew J. Schaefer, Oleg Prokopyev

Aggregate surgical expenditures in the US amount to a significant percentage of GDP. About 42% of hospital revenues are generated by operating rooms (ORs), yet ORs run at only 68% capacity on average. The most important issues in OR management are centered on scheduling. Advance schedules improve OR efficiency; however, surgeries are rescheduled in practice as they rarely go as planned. We present a stochastic program with chance-constrained recourse for surgery scheduling and rescheduling.

2 - Dynamic Scheduling of a Post-discharge Follow-up Organization to Reduce Readmissions

Sean Yu, Indiana University-Bloomington, 1275 E. Tenth Street, Bloomington, IN, 47405, United States of America, xy9@indiana.edu, Shanshan Hu, Jonathan Helm

Hospital readmissions are a growing problem. Many readmissions are preventable by properly monitoring patients post-discharge. We consider an organization that dynamically will schedule and staff post-discharge monitoring schedules for a cohort of patients being randomly discharged from client hospitals. We formulate this problem as an infinite horizon dynamic program that can be solved using approximate dynamic programming.

3 - Predictive Capabilities in Hierarchical Node-based Clustering of Time Series

Hootan Kamran, PhD Candidate, University of Toronto, 12 Rodney Blvd., North York, ON, M2N4B6, Canada, hootan@mie.utoronto.ca, Dionne Aleman, Kieran Moore, Mike Carter

Flu activity is shown to be affected by local variables such as climate. Therefore, localized activity must be monitored to study spatiotemporal spread patterns of the disease. Using a 10-year flu dataset from 103 hospitals in Ontario, we compare predictive capabilities extracted from existing aggregation scheme (LHIN) with those extracted from the novel hierarchical node-based clustering scheme and show that the new method will extract more statistically significant predictive capabilities.

4 - A Stochastic Dynamic Programming Model for Response-guided Dosing

Jakob Kotas, University of Washington, Dept. of Applied Mathematics, Box 353925, Seattle, WA, 98195, United States of America, jkotas@uw.edu, Archis Ghate

We discuss a stochastic dynamic programming (DP) model to assist with dosing decisions in response-guided dosing (RGD). The goal in this framework is to deliver the right dose to the right patient at the right time. We present robust, optimal learning, and optimal stopping variants of this problem. The structure of optimal policies in these problems will be explored both analytically and numerically.

Joint Session HAS/MSOM-Healthcare: Operational Issues and Information Sharing in Healthcare

Sponsor: Health Applications

Sponsored Session

Chair: Subodha Kumar, Carol And G. David Van Houten, Jr. '71 Professor, Mays Business School, Texas A&M University, Wehner 301F - 4217 TAMU, College Station, TX, 77843, United States of America, skumar@mays.tamu.edu

1 - Sustainability Planning for Healthcare Information Exchanges

Tharanga Rajapakse, Assistant Professor, University of Florida, W. University Ave, Gainesville, FL, 32611, United States of America, tharanga@ufl.edu

We develop an analytical framework to study sustainability of Healthcare Information Exchanges and to demonstrate its use when the revenue is generated (i) under one revenue model (like membership fee), and (ii) under a combination of multiple revenue models (like membership fee and rebate structure for the practice from supporting vendors).

2 - The Impacts of Healthcare Information Exchanges:

An Empirical Investigation

Emre Demirezen, Assistant Professor, Binghamton University SUNY, 4400 Vestal Parkway East, AA-242, Binghamton, NY, 13902, United States of America, edemirezen@binghamton.edu, Subodha Kumar, Ramkumar Janakiraman

In the last decade, the U.S. government has been aggressively promoting the use of electronic health records and the establishment of regional healthcare information exchanges (HIEs). HIEs facilitate electronic health information exchange among healthcare providers that is considered to be beneficial for the society. However, the real benefits of HIEs are not well understood. Hence, in this study, we work with an HIE provider based in the state of New York to investigate the benefits of HIEs.

3 - Chance Constrained Operating Room Scheduling with Uncertain and Ambiguous Information

Zheng Zhang, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, 48105, United States of America, zzhang0409@gmail.com, Brian Denton, Xiaolan Xie

We describe stochastic programming and distributionally robust optimization models that allow for uncertain or ambiguous surgery duration data, respectively. Each of the models considers surgery-to-OR allocation decisions in the context of probabilistic constraints on completion time that vary by OR. We describe column generation approaches that are tailored to these two model formulations. Results are presented to illustrate the potential use of these models in practice.

4 - Bundled Payments for Healthcare Services: A Framework for the Healthcare Provider Selection Problem

Seokjun Youn, PhD Student, Research Assistant, Mays Business School, Texas A&M University, 320R Wehner Building, 4217 Texas A&M University, College Station, TX, 77843, United States of America, syoun@mays.tamu.edu, Chelliah Sriskandarajah, Subodha Kumar

Identifying competitive healthcare providers is an important issue for the successful operation of bundled payments. We develop a selection framework via data envelopment analysis and combinatorial auction (CA). Based on efficiency and effectiveness measures, outstanding performers are pre-selected. Finally, CA determines winners. To evaluate the impact of design issues on the CA performance, we combine and utilize several real dataset from the healthcare sector.

Disaster and Emergency Management II

Contributed Session

Chair: Shaligram Pokharel, Professor, Qatar University, Doha, Qatar, shaligram@qu.edu.qa

1 - Solution Methodologies for Debris Removal in Disaster Response

Bahar Y. Kara, Associate Professor, Bilkent University, Industrial Engineering, Ankara, Turkey, bkara@bilkent.edu.tr, Oya E. Karasan, Nihal Berktaş

In this study we provide solution methodologies for debris removal problem in the response phase. Debris removal activities on certain blocked arcs have to be scheduled in order to reach a set of critical nodes such as schools and hospitals. Two mathematical models are developed with different objectives. The models are tested over real data from districts of Istanbul.

2 - Service-based Distribution Network Model for Location of Temporary Relief Facilities

Shaligram Pokharel, Professor, Qatar University, Doha, Qatar, shaligram@qu.edu.qa, Rojee Pradhananga, Fatih Mutlu, Jose Holguin-Veras

A supply allocation and distribution model is proposed to minimize the total waiting times at the demand points by considering the possibilities of transferring excess resources between the temporary facilities and backordering of demand in different time periods. Model is applied on a test instance to analyze the service and cost trade-offs. (This research is made possible by a NPRP Award NPRP 5-200-5-027 from the Qatar National Research Fund (a member of the Qatar Foundation). The statements herein are solely the responsibility of the authors.)

3 - The Network Structure: What it Can Tell About Disaster Warning Effectiveness?

Xiangyang Guan, University of Washington, 201 More Hall, Box 352700, Seattle, WA, 98195-2700, United States of America, guanxy@uw.edu, Cynthia Chen

Knowing how public awareness and action change after disaster warning is critical for effectiveness of warning issuance. Multiple data sources – social media, taxi trips and subway ridership – are leveraged. Temporal evolutions of the structure (motifs) of social media network and subway network are established as measures of public awareness and action. Our result identified a lag of one day in average between warning issuance and public awareness, and between public awareness and action.

Fire and Emergency Medical Services

Sponsor: Public Sector OR

Sponsored Session

Chair: Laura Mclay, Associate Professor, University of Wisconsin, 1513 University Ave, ISYE Department, Madison, WI, 53706, United States of America, lmclay@wisc.edu

1 - Predicting the Spatial Distribution of Heart Attack Incidence in Alberta

Armann Ingolfsson, University of Alberta, Edmonton, Canada, aingolfs@ualberta.ca, Amir Rastpour, Reidar Hagtvedt

We use Poisson regression with a linear-without-intercept link function to predict the incidence of heart attacks by geographic region, as a function of age, gender, education, and income characteristics. We discuss model specification and validation and we present results based on 10 years of empirical data.

2 - Dynamic Ambulance Allocation Utilizing Demand Data Analytics for Pre-hospital EMS

Yu-Ching Lee, Assistant Professor, Department of Industrial Engineering and Engineering Management, National Tsing Hua University, No. 101, Section 2, Kuang-Fu Road, Hsinchu, Taiwan - ROC, ycllee@ie.nthu.edu.tw, Albert Chen, Yu-shih Chen

Pre-hospital Emergency Medical Services (EMS) provide the critical function of on-site medical treatment and stabilization of patients. The quality of EMS affects the survival of patients in emergency situations. A better management of ambulances could potentially improve the effectiveness and efficiency of EMS. We study a real-time decision support system featuring demand prediction, distribution estimation, scenario generation, robust ambulance deployment, and the optimal ambulance dispatching

3 - A Simulation Optimization Method for Emergency Service Location

Rozhin Doroudi, PhD Student, Northeastern University, 260 Washington St. Apt. 305, Malden, MA, 02148, United States of America, doroudi.r@husky.neu.edu, Gerald Evans, Gail Depuy

A fire department with an available fleet wants to determine the location of its fire stations and how to distribute its fleet among those locations. An iterative approach involving the use of a linear program and a simulation model is proposed for the problem

Therapy and Treatment

Contributed Session

Chair: Animesh Garg, PhD Student, UC Berkeley, 4141 Etcheverry Hall, Berkeley, CA, 94720-1777, United States of America, garg.animesh@gmail.com

1 - Assessment of a Novel Device for Elbow Rehabilitation in Humans

Aline Callegaro, Researcher, UFRGS, 99 Osvaldo Aranha Avenue, 5 Floor, Porto Alegre, RS, 90035190, Brazil, nimacall@gmail.com, Carlos Fernando Jung, Clarissa Brusco, Marcelo Gava Pompermayer, Márcia Elisa Echeveste, Carla Schwengber ten Caten

This study aimed to assess a novel device for elbow rehabilitation in humans. The functional prototype assessment was based on data collection in two stages: application of local muscle vibration; and its association with Continuous Passive Motion. Two way ANOVA was used to analyse the main factors. An average increase of the muscle electrical activation resulted in first stage. The main factors (frequency, sex, and treatment) had significant effect, as well as a few interactions.

2 - Minimizing Metastatic Risk in Radiotherapy Fractionation Schedules

Hamidreza Badri, Graduate Student, University of Minnesota, ISyE Departemnt, 111 Church Street S.E., Minneapolis, MN, 55455, United States of America, badri019@umn.edu, Jagdish Ramakrishnan, Kevin Leder

The treatment of metastatic cancer remains an extremely challenging problem. Here we consider the problem of developing fractionated irradiation schedules that minimize production of metastatic cancer cells. We observe that the resulting fractionation schedules are different than those that result from more standard objectives such as minimization of final primary tumor volume. Delivering large doses in small fractions is suggested even in cases when a/b value of the tumor is large.

3 - Customized 3D Printed Implants with Internal Channels for Intracavitary High Dose Rate Brachytherapy

Animesh Garg, PhD Student, UC Berkeley, 4141 Etcheverry Hall, University of California, Berkeley, CA, 94720-1777, United States of America, garg.animesh@gmail.com, Jean Pouliot, J. Adam M. Cunha, I-Chow Hsu, Alper Atamturk, Ken Goldberg

High-Dose Rate Brachytherapy is an internal radiation therapy frequently used for cancer treatment. Radioactive sources are briefly placed proximal to tumors. Current methods for intracavitary HDR-BT use generic templates which limits dose distribution to a small set of linear channels. We propose the use of algorithmically customized 3D Printed implants with curved internal channels that fit cavities without tissue puncture and aim to improve dose distribution and treatment quality.

4 - Surgery Sequencing and Scheduling in Multiple ORs with PACU Constraints

Miao Bai, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, mib411@lehigh.edu, Gregory Tonkay, Robert Storer

We study a multiple-OR surgery sequencing and scheduling problem with PACU constraints. To minimize the cost incurred by waiting, idleness, OR blocking and overtime, a two-stage solution scheme is proposed. In the first stage, a time-indexed integer program is formulated and solved by Lagrangian relaxation and dynamic programming to determine surgery sequences. Given surgery sequences in all ORs, scheduled times of patients are found in the second stage by a sample-gradient-based algorithm.

Probability

Contributed Session

Chair: Gene Hahn, Associate Professor, Salisbury University, 1101 Camden Ave., Salisbury, MD, 21801, United States of America, edhahn@salisbury.edu

1 - Fluctuation Analysis and the Marked Poisson Process

Randy Robinson, Bemidji State University, Bemidji, MN, United States of America, rrobinson@bemidjistate.edu

This presentation studies the marked point process with position dependent marking. The focus was on predicting the first passage time of the marked random walk when exiting a given rectangular set and the value of the process upon the exit. A new density function for the related processes has been obtained: a product of a negative exponential and modified Bessel functions

2 - Moments of a Random Set

Kemal Gursoy, Rutgers University, 100 Rockafeller Road, Department of MSIS, Piscataway, NJ, 08854, United States of America, kgursoy@rci.rutgers.edu

Let X be a random subset of the n -dimensional Euclidean space. Then the moments of the measure of X could be constructed by the Lebesgue integral of the probability measure of every point in X , over the n -dimensional Euclidean space.

3 - A New Representation for the Stationary Distribution of Markov Chains

Patrick Buckingham, Clemson University, Mathematical Sciences, Clemson, SC, United States of America, pbuckin@clemson.edu, Brian Fralix

We present a new representation for the stationary distribution of ergodic Markov chains, as well as analogous representations for Laplace transforms of transition functions associated with such chains. Applications to hysteretic queues and other models will be discussed.

4 - Queueing Systems with Adaptive Service Rates

Raik Stollertz, University of Mannheim, Room SO 230, Schloss Schneckenhof Ost, Mannheim, Germany, stollertz@bwl.uni-mannheim.de, Jannik Vogel

In many service systems, for example call centers, the service rate could be considered as a time-dependent decision variable to improve and stabilize the performance of a queueing system. We present an $M(t)/M(t)/c$ queueing model with adaptive service rates. The SBC-approach is used to approximate the time-dependent behaviour of by stationary models. This results in non-linear optimization problem. Numerical examples show the benefits of assuming the service rate as a decision variable.

5 - Modeling with the Tilted Beta Distribution

Gene Hahn, Associate Professor, Salisbury University, 1101 Camden Ave., Salisbury, MD, 21801, United States of America, edhahn@salisbury.edu

The beta distribution has an important limitation for the modeling of bounded data. Its density is either zero or infinite at the endpoints except for special cases. This makes modeling certain kinds of data difficult. The tilted beta distribution can be used to easily model this data. We adopt a Bayesian perspective and examine its usage in modeling real-world data.

Product Brand Differentiation and Pricing Decisions

Cluster: Operations/Marketing Interface

Invited Session

Chair: Ruixia Shi, California State University, Fullerton, 800 N. State College Blvd., Fullerton, CA, 92834, United States of America, sandy.shi@gmail.com

1 - New Product Pricing Strategy in the Social Media Era

Gou Qinglong, Associate Professor, University of Science & Technology of China, No.96, JinZhai Road Baohe District, Hefei, China, tslg@ustc.edu.cn, Kumar Subodha, Xiuli He, Juzhi Zhang

With the popularity of various social media platforms, the impacts of the word of mouth effect and the reference price effect on a consumer's purchasing behavior have been significantly amplified in the current era. We incorporate these two effects into a two period pricing model to investigate whether and in which condition should a firm utilize a skimming or a penetration price strategy. Our results show how these two effects influence a firm's pricing strategy when he launches a new product.

2 - Competition and Coordination in Online Retailers and Express Companies

Yihong Hu, Assistant Professor, Tongji University, yhhu@tongji.edu.cn

We consider an online market as Taobao with homogenous and heterogeneous consumers sensitive to service quality. Retailers collect a separate product price plus shipping fee from consumers. They treat shipping fee as a source of revenue by asking a large discount of shipping fee from shippers. We use game-theoretic framework to study the competition and coordination between retailers and shippers under different scenarios. The study finds that retailers' behavior increases consumers' benefit.

3 - Supply Chain Power and Store Brand

Jun Ru, Assistant Professor, University at Buffalo, 326D Jacobs,
Buffalo, NY, 14260, United States of America, junru@buffalo.edu,
Ruixia Shi, Jun Zhang

This paper relates a retailer's store brand strategy to the relative powers of channel members and offers a new explanation for the differences in retailers' store brand strategies. Our analysis shows that store brands become less appealing to a retailer as it becomes more powerful.

4 - Consumer Preference Mismatch and Channel Choice Decisions under Competition

Kunpeng Li, Utah State University, 3555 Old Main Hill,
Logan, UT, United States of America, kunpeng.li@usu.edu,
Suman Mallik, Dilip Chhajed

We consider a product consisting of two components sold by two firms. A product/firm is integrated when both components are designed by a single firm, and is non-integrated otherwise. The consumers choose to purchase a product that better matches the specifications of their ideal product. Using a duopoly model, we study the effects of consumer preference mismatch on channel integration strategies.

Marketing II

Contributed Session

Chair: Faryal Salman, Assistant Professor, SZABIST, 90 Clifton,
Karachi, Pakistan, faryal.salman@szabist.edu.pk

1 - An Analysis of Menus of Multi-Part Tariffs

Ryan Choi, PhD Candidate, UC Irvine, 6219 Adobe Circle, Irvine,
CA, 92617, United States of America, jihungc@uci.edu

This paper study which characteristics of three-part tariffs make the seller more profitable than two-part tariffs. Given a full extraction of low type segment's surplus, the seller can extract more of high type surpluses, whose magnitude is dependent on both of the level of quantity allowances and the fixed fee for high type consumers. With 3PTs, firms earn more rent from the high type, and so offers both high and low contracts regardless of the taste parameter and of the low type proportion.

2 - Research and Practice – Friends of Foes? Perceptions of Marketing Academicians and Practitioners.

Salma Rahman, Assistant Professor, SZABIST, 100 Clifton,
Block 5, Shabrae Iran, Karachi, Pakistan, sal_haider@yahoo.com,
Sana Rehman

This research is more of an exploratory nature that focuses initially on precipitating the perceptions of marketing academicians as well as marketing practitioners regarding the existence of the research practice gap using diffusion of innovations theory. The results indicated that generally both agree on the prevalence of the gap. Further, their perception is the same for discovery and translations stage whereas it differs for the dissemination and change stage.

3 - Customer Commitment in Customer Churn Prediction

Huili Liu, Beijing University of Posts and Telecommunications,
Xitucheng Road, No 10, Beijing, BJ, 100876, China,
yucaihl@163.com

We present a customer commitment model to predict the customer churn. Instead of probability method, we use consumer learning to get the customer commitment from his/her purchase history, and then use it to predict the customer churn. In comparison to existing models, we consider the customer commitment model is more feasible with an accurate prediction. Thereby we provide a new insight into the customer base analysis.

4 - Socio-economic Class Difference in Movie Consumption Among Pre-adolescents

Saima Husain, Lecturer, Institute of Business Administration,
University Campus, University Road, Karachi, Si, Pakistan,
shusain@iba.edu.pk

This research uses the laddering technique, in semi-structured in depth interviews, to study hierarchical constructs explaining personal value system that drive movie consumption behaviour among children aged 9 - 12 years. Young informants were recruited from different socio economic class (SEC) households in Pakistan. Findings show that children from higher SECs are significantly different in the type of movie selection, consumption setting and medium used for movie consumption.

5 - An Empirical Study to Examine Consumer Behavior towards Luxury Brands in Pakistan

Faryal Salman, Assistant Professor, SZABIST, 90 Clifton, Karachi,
Karachi, Pakistan, faryal.salman@szabist.edu.pk, Usman Warraich

Current study seeks to expand an understanding of consumer behavior towards branded goods. The data for this exploratory study was collected from urban youth of Pakistan. The study postulates significant relationship between consumer behavior and the predictors for various product categories. Regression analysis shows that these variables pose the positive impact on the buying behavior (p value (0.05) and this model shows R2 of 0.73.

1 - Determinants of Distribution Channel Choice in Pharmaceutical Industry – Specialty Drugs

Liang (Leon) Xu, University of Missouri-St. Louis, St. Louis, MO,
United States of America, lxpx2@umsl.edu, Vidya Mani, Hui Zhao

We use privately collected multi-year transaction data to study determinants of the choice of distribution channels for specialty and non-specialty drugs. Further, we explore how this channel choice explains observed variations in supply chain metrics in this industry.

2 - Transforming Drug Development via System Computational Modeling

Jinha Lee, Georgia Institute of Technology, 755 Ferst Dr. NW,
Atlanta, GA, United States of America, jlee68@gatech.edu,
Eva Lee

We describe the first-in-silico drug design system model to accelerate drug discovery. The model spans preclinical, clinical, IND and NDA tasks; and allows global risk analysis. It identifies bottlenecks, and performs system optimization that offers a holistic view of discovery pathways. Rapid development is achieved through parallel processes that shorten critical paths from start to registration of a new drug. The generalizable design allows rapid testing, and minimizes risk, cost, and time.

3 - Operational Performance Evaluation of Reverse Referral Partnership in the Chinese Healthcare System

Nan Kong, Associate Professor, Purdue University, 206 S. Martin
Jischke Dr., West Lafayette, IN, United States of America,
nkong@purdue.edu, Quanlin Li, Na Li, Zhibin Jiang

Reverse referral of patients from upper-level hospitals to lower-level hospitals after their acute care, has been promoted in the tiered Chinese care system to alleviate resource pressure at high-level hospitals and balance utilizations throughout the system. However, it remains unclear how to implement reverse referral partnerships given the conflicting interests. We develop a two-level queueing network model to capture patient flows and derive analytical results on queueing performance measures. Our work is expected to guide the establishment of hospital alliances in China.

4 - Influenza Vaccine Supply Chain with Vaccination Promotion Effort and its Coordination

Xinghao Yan, Assistant Professor, Ivey Business School, Western
University, 1255 Western Road, London, ON, N6G0N1, Canada,
xyan@ivey.uwo.ca, Gregory Zaric

We develop an influenza vaccine supply chain model consisting of a health authority, a vaccine manufacturer, and population. The health authority decides order quantity and effort exerted to increase vaccination demand; the manufacturer decides production effort; and population decides the vaccination probability. We find that the three parties' decisions at equilibrium and different coordinating contract formats, such as a contract with payment linear/piecewise linear w. r. t. order quantity.

Patients and Practice: Using the Right Resources to Deliver Care

Sponsor: Manufacturing & Service Oper

Mgmt/Healthcare Operations

Sponsored Session

Chair: Jonathan Helm, Indiana University Bloomington, 1309 E. Tenth Street, Bloomington, IN, United States of America, helmj@indiana.edu

1 - An Empirical Study of The Impact of Physician Assistants During Critical Care Consultations

Yunchao Xu, New York University, 44W 4th St, 8-152, New York, NY, 10012, United States of America, yxu4@stern.nyu.edu, Carri Chan, Mor Armony

Trained with a broad set of clinical skills, physician assistants (PAs) can be cost-effective alternatives to physicians in healthcare systems. However, not much is known on the impact of PAs on patient delivery in certain settings. Using data from a major urban hospital system, we utilize a difference-in-differences approach to explore the effects of introducing PAs into the critical care consultation process. One key finding is the reduction in boarding times due to this intervention.

2 - Missed Opportunities in Preventing Hospital Readmissions: Redesigning Post-discharge Checkup Policies

Xiang Liu, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, 48109, United States of America, liuxiang@umich.edu, Jonathan Helm, Ted Skolarus, Michael Hu, Mariel Lavieri

Hospital readmissions affect hundreds of thousands of patients, placing a tremendous burden on the healthcare system. Post-discharge checkup can reduce readmissions through early detection of conditions. Our work develops optimal checkup plans to monitor patients following hospital discharge using methods including phone calls and office visits. By analyzing the structure of optimal policies, we develop checkup schedules that mitigate 32% more readmissions.

3 - Incentive-compatible Prehospital Triage in Emergency Medical Services

Eric Webb, Graduate Student, Indiana University, 1309 E. 10th Street, Bloomington, IN, 47405, United States of America, ermwebb@indiana.edu, Alex Mills

The Emergency Medical Services (EMS) system is designed to handle life-threatening emergencies, but a large and growing number of non-emergency patients seek healthcare through EMS. We evaluate the incentives underlying prehospital triage, where EMS staff are allowed to identify patients that could be safely diverted away from the hospital and toward appropriate care. Continued transition from fee-for-service payments to bundled payments may be necessary for prehospital triage implementation.

Revenue Management with Consumer Choice Models

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Ruxian Wang, Johns Hopkins University, 100 International Dr, Baltimore, MD, 21202, United States of America, ruxian.wang@jhu.edu

1 - Dynamic Pricing for Mobile Apps

Kejia Hu, Kellogg School of Management, Northwestern University, 2169 Campus Drive, Evanston, IL, United States of America, k-hu@kellogg.northwestern.edu, Chaitanya Bandi, Srikanth Jagabathula

Mobile apps are special in the following aspects. It has no inventory constraint, almost zero marginal cost and free version updates. In our research, we will model these features and show the dynamic pricing for mobile apps.

2 - Product Line Design and Pricing under Logit Model

Anran Li, Columbia University, 345 Mudd, New York, NY, 10027, United States of America, al2942@columbia.edu, Guillermo Gallego, Jose Beltran

We study a firm who wants to design and price a set of products characterized by a number of features where each feature has one or multiple levels. We model consumers' demand by a feature-level based Logit model and optimize the assortment on the features space. We find a price independent index of each feature level that plays a key role. This makes a greedy algorithm, derived from the K-shortest paths algorithm, able to find an optimal K products' configuration in polynomial time.

3 - Optimal Pricing for a Multinomial Logit Choice Model with Network Effects

Chenhao Du, Student, University of Minnesota, 425 13th Ave SE, Apt. 1502, Minneapolis, MN, 55414, United States of America, duxxx181@umn.edu, William Cooper, Zizhuo Wang

We consider a seller's problem of determining revenue-maximizing prices for an assortment of products that exhibit network effects. Customers make purchase decisions according to a modified MNL choice model. We show that the optimal strategy is either to maintain a semblance of balanced sales among all product or to boost the sales of exactly one product. We also show the importance of taking the network effects into consideration.

4 - Pricing Ancillary Service Subscriptions

Ruxian Wang, Johns Hopkins University, 100 International Dr, Baltimore, MD, 21202, United States of America, ruxian.wang@jhu.edu, Maqbool Dada, Ozge Sahin

We investigate customer choice behavior in the presence of main products, ancillary services with options of pay-per-use and subscription, as well as the outside option. Analytical results and numerical experiments show that offering service subscriptions may result in "win-win-win" "win-win-lose" "lose-lose-win" and other situations for the firm, competitors and customers in the monopolistic and competitive scenarios.

Recent Trends in Retailing

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Mehmet Sekip Altug, Assistant Professor, George Washington University, Washington, DC, United States of America, maltug@gwu.edu

1 - Analyzing Big-Box Retailer in an Emerging Market

Mehmet Gumus, McGill University, 1001 Sherbrooke Street West, Montreal, Canada, mehmet.gumus@mcgill.ca, Aditya Jain, Saibal Ray

We consider the impact of the entry of a big-box retailer in a market dominated by small retailers. The small retailers are characterized by local coverage of the market, whereas the big-box retailer provides services valued by customers. Since both types of retailers obtain supplies from a common manufacturer, big-box retailer's entry affects the supply conditions. Our work thus highlights roles of direct competition as well as indirect supply side effect on small retailers and customers.

2 - Dynamic Pricing with Customer Upgrades

Oben Ceryan, Assistant Professor, Drexel University, 3220 Market St., Philadelphia, PA, United States of America, oc43@drexel.edu, Ozge Sahin, Izak Duenyas

We study the impact of product upgrades on a firm's pricing and replenishment policies by considering a multiple period, two-stage model where the firm first sets prices and replenishment levels, and after observing the demand, it decides whether to upgrade any customers to a higher quality product. We characterize the structure of the optimal upgrade, pricing, and replenishment policies and find that offering upgrades assists in preserving the vertical price differentiation of the products.

3 - Return Abuse, Countermeasures, and Privacy Concerns

Serkan M. Akturk, PhD Candidate, Texas A&M University, 4217 TAMU Wehner 320 M, College Station, TX, United States of America, makturk@mays.tamu.edu, Michael Ketzenberg

This paper analytically investigates return abuse with respect to both fraudulent and opportunistic consumer returns and potential countermeasures to deal with them. The research also shows how those countermeasures impact a retailer's profitability, demand structure, and policy parameters with respect to price and refund. To some extent, our findings contradict common suggestions in the literature.

4 - Store-clearance or Secondary Markets? Evaluation of Inventory Clearance Opportunities in Retailing

Mehmet Sekip Altug, Assistant Professor, George Washington University, Washington, DC, United States of America, maltug@gwu.edu, Garrett Van Ryzin

One main assumption in the newsvendor model is that the salvage value is exogenous and retailers can sell their excess stock at this fixed salvage value. However, the salvage value of excess stock is mostly determined endogenously. We compare consolidated secondary markets vs. store clearance with myopic and strategic customers.

Topics in Dynamic Pricing and Revenue Management

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Robert Phillips, Columbia Business School, 2790 Broadway Urin Hall, New York, NY, 10027, United States of America, rp2051@columbia.edu

1 - Dynamic Pricing with Demand Covariates

Sheng Qiang, Student, Stanford University, 41 Olmsted Road, Apt 108, Stanford, CA, 94305, United States of America, sqiang@stanford.edu, Mohsen Bayati, Michael Harrison

A firm sells products over T periods, without knowing the demand function. The firm sets prices to earn revenue and learn the demand function. In each period before setting the prices, the firm observes some demand covariates, like marketing expenditure, consumer's attributes, etc. The performance is measured by the regret, which is the expected revenue deviation from the optimal pricing policy when demand function is known. We study the asymptotic near-optimal algorithms to optimize the regret.

2 - What Really Happens in Implementing Revenue Management Capabilities and What to Expect in the Future

Vedat Akgun, Director, Revenue Analytics, 3100 Cumberland Blvd SE, Suite 1000, Atlanta, GA, 30339, United States of America, vakgun@revenueanalytics.com, Jon Higbie

Implementation of Revenue Management started more than thirty years ago and Revenue management concepts have evolved over time providing extraordinary benefits to companies. In addition to realizing great success, we also face challenges and learn lessons based on our experience and research. We want to discuss what really happens in implementing Revenue Management capabilities and what we can expect in the future.

3 - Nonparametric Algorithm for Joint Pricing and Inventory Control with Lost-sales and Censored Demand

Boxiao (Beryl) Chen, University of Michigan-Ann Arbor, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, boxchen@umich.edu, Xiuli Chao, Cong Shi

We consider the classic joint pricing and inventory control problem with lost-sales and censored demand in which the demand distribution is not known to the firm a priori. Conventional learning algorithms are not applicable as the firm can observe neither the realized value nor any derivative information of the true objective function, and the estimate of the expected profit function from data is not unimodal. We develop a data-driven algorithm which converges and provide its convergence rate.

■ TD46

46-Room 104A, CC

Service Operations

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations

Sponsored Session

Chair: Gad Allon, Professor, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, g-allon@kellogg.northwestern.edu

1 - Managing Service Systems in Presence of Social Networks

Gad Allon, Professor, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, g-allon@kellogg.northwestern.edu, Dennis Zhang

We study a service system with the presence of a social network. In our model, firms can differentiate resource allocations among customers, and customers learn the service qualities from the social network. We study the interplay among network structure, customer characteristics, and information structure, and characterize the optimal policy. We further calibrate our model with data from Yelp.com and quantify the value of social network knowledge empirically.

2 - Keeping Up with the Joneses: using Social Network Information to Manage Availability

Ruslan Momot, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, ruslan.momot@insead.edu, Elena Belavina, Karan Girotra

Growing availability of data on the patterns of customers' social interactions has opened up new opportunities for businesses. We identify an optimal distribution strategy for a firm selling to socially connected customers engaged in social comparison. We build a stylized game-theoretic model of strategically interacting customers in a general network. We find that the optimal strategy is non

monotonic-neither most nor least connected customers are prime targets for making the product available.

3 - Supply Disruptions and Optimal Network Structures

Kostas Bimpikis, Stanford GSB, 655 Knight Way, Stanford, CA, 94305, United States of America, kostasb@stanford.edu, Ozan Candogan, Shayan Ehsani

This paper studies multi-tier supply chain networks in the presence of disruption risk. Firms compete with one another by participating in one of K production stages. We provide a characterization of the equilibrium prices, profits, and sourcing decisions and derive insights on how the network structure and the reliability of production in different tiers affect firms' profits and the prices of intermediate goods.

4 - Creating Reciprocal Value through Operational Transparency

Ryan Buell, Harvard Business School, Morgan Hall 429, Boston, MA, 02163, United States of America, rbuell@hbs.edu, Tami Kim, Chia-Jung Tsay

We investigate whether organizations can create value by introducing visual transparency between consumers and producers. Two field and three laboratory experiments in food service settings suggest that transparency that 1) allows customers to observe operational processes and 2) allows employees to observe customers not only improves customer perceptions, but also increases service quality and efficiency.

1 - Mobile Money Agent Inventory Management

Karthik Balasubramanian, Harvard Business School, 25 Harvard Way, Boston, MA, 02163-1011, United States of America, kbalasubramanian@hbs.edu, David Drake, Douglas Fearing

Mobile money agents exchange cash for electronic value and vice versa, forming the backbone of an emerging electronic currency ecosystem in the developing world. Unfortunately, low agent service levels are a major impediment to the further development of these ecosystems. We model the agent's inventory problem and numerically determine optimal quantities. Finally, we evaluate our recommendations with a large dataset of mobile money agent transactions in an East African country.

2 - Energy Efficiency Contracting in Supply Chains under Asymmetric Bargaining Power

Ali Shantia, HEC-Paris, 7, Avenue De La Gare, Bievres, 91570, France, ali.shantia@hec.edu, Andrea Masini

In a supply chain, consisting of a buyer and a supplier, this study analyzes the effect of relative bargaining power and technology uncertainty on the supplier's decision to invest in energy efficiency (EE) measures. We analyze price commitment and shared investment contracts and compare the two mechanisms in their ability to boost EE investment when the buyer's high bargaining power in addition to high technology uncertainty prevent the supplier from investing in EE.

3 - Competitive Industry's Response to Environmental Tax Incentives for Green Technology Adoption

Anton Ovchinnikov, Queen's University, 143 Union Str West, Kingston, Canada, anton.ovchinnikov@queensu.ca, Dmitry Krass

We consider operational aspects of how an industry composed of heterogeneous firms responds to an environmental tax by choosing production quantities and emissions-reducing technologies. We show the existence and uniqueness of the "market-only equilibrium" and demonstrate its many interesting properties. We then discuss the technology-and-market equilibria under different structural assumptions.

4 - Carbon Tariffs: Effects in Settings with Technology Choice and Foreign Production Cost Advantage

David Drake, Assistant Professor, Harvard Business School, Morgan Hall 425, Boston, MA, United States of America, ddrake@hbs.edu

When firms can choose from a set of potential production technologies and offshore facilities hold a production cost advantage, I show that carbon leakage due to offshoring and/or foreign entry can result despite the implementation of a carbon tariff. However, in such a setting, carbon leakage is shown to conditionally decrease global emissions, contradicting prevailing popular opinion and widely reported results that do not account for technology choice or foreign production cost advantage.

Chair: Gerry Tsoukalas, Assistant Professor, Wharton, 3730 Walnut street, Philadelphia, PA, 19104, United States of America, gtsouk@wharton.upenn.edu

Co-Chair: Vlad Babich, Georgetown University, Washington, D.C., Volodymyr.Babich@georgetown.edu

1 - Supply Chain Contract Design under Financial Constraints and Bankruptcy Costs

Panos Kouvelis, Professor, Olin Business School, Washington University in St. Louis, St. Louis, MO, United States of America, kouvelis@wustl.edu, Wenhui Zhao

We study contract design in a supply chain of two capital constrained firms in need of short-term financing. The failure of loan repayment leads to bankruptcy with fixed and variable default costs. With only variable default costs, buyback contracts remain equivalent to revenue-sharing contracts, which coordinate with working capital adjustments. With fixed default costs, a revenue-sharing contract with working capital coordination might have higher expected profit than the one-firm system.

2 - Network Recovery using Transactional Information

John Birge, Professor, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu

Firms operate as components of complex networks of physical and financial flows. The structure of these networks is however not easily observed. This talk will discuss methodologies to uncover such hidden structure using inverse optimization techniques.

3 - Does Operational Investment Vary with Capital Structure?

Vishal Gaur, Cornell University, 321 Sage Hall, Ithaca, NY, 14850, United States of America, vg77@cornell.edu, Yasin Alan

We investigate the relationship between the operational investment of firms and their capital structure choices using data for U.S. manufacturing and retail trade sectors.

4 - Entrepreneurial Finance: Crowdfunding, Venture Capital, and Bank Financing

Vlad Babich, Georgetown University, Washington, DC, United States of America, Volodymyr.Babich@georgetown.edu, Gerry Tsoukalas

We study the interplay between bank financing, venture capital and crowdfunding, in a multi-stage bargaining game, with double-sided moral hazard. We find that while crowdfunding usually serves a positive role, enabling funding for good projects, and avoiding investments in bad projects, it may also hurt VCs, entrepreneur, and the society.

Demand Driven Supply Chains

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Muge Yayla-Kullu, RPI, 110 8th St, Troy, NY, 12180, United States of America, YAYLAH@rpi.edu

1 - The Effect of Targeted Coupons on Product Quality Assortment and Competition

Amit Eynan, Professor, University of Richmond, 1 Gateway Rd, Richmond, VA, 23173, United States of America, aeynan@richmond.edu, Benny Mantin

Manufacturers who sell to customers with heterogeneous valuation of quality can segment the market by offering multiple products at different qualities and prices. We investigate the effect of targeted marketing efforts (coupons) on product line assortment of a monopolist as well as under competition. While coupons help the monopolist, in the competitive setting, we find that both firms end up exerting marketing efforts but only one of them is better off whereas the other is worse off.

2 - Competition and Perceptions of User Reviews

Michael Galbreth, Associate Professor Of Management Science, Moore School of Business, University of South Carolina, Columbia, SC, United States of America, galbreth@moore.sc.edu, Pelin Pekgun, Bikram Ghosh

We analyze the interaction of user reviews and valuation uncertainty for experience goods, with a specific focus on the potential for negative vs. positive reviews to be weighted differently by consumers. The competitive impact of this unequal weighting is not always intuitive. For example, we show that if a lower quality firm has a large user base, overweighting of negative reviews can lead to higher profits and higher prices in equilibrium than its higher quality competitor.

3 - Analysis of Consumers' Purchase Timing Decisions

Emre Ertan, PhD Candidate, UT Dallas, Sm30 Jindal School of Management, 800W Campbell Dr, Richardson, TX, 75080, United States of America, emre.ertan@utdallas.edu, Kathy Steckle, Ozalp Ozer

The consumer purchase timing decision is analyzed by using discounted expected utility theory, where consumers act to maximize their utility over time. The consumer's sequential decision-making process is formalized under uncertain product availability. An optimal purchase timing policy is identified in a market environment, in which a strategic customer knows the markdown pricing scheme, available inventory level, and remaining time to the end of the selling horizon.

4 - Product Line Design and Capacity Management:**The Role of Consumer Behavior Uncertainty**

Muge Yayla-Kullu, RPI, 110 8th St, Troy, NY, 12180, United States of America, Yaylah@rpi.edu, Jennifer Ryan, Jayashankar Swaminathan

We study the effects of uncertainty in consumer spending due to economic volatility on the product line decisions of a firm with limited resources. We consider a firm that offers products with differing qualities, unit production costs, and resource consumption rates. Making capacity allocation decisions in the face of such an uncertainty is challenging, demanding careful consideration of product variety and available resources.

5 - A Manufacturer's Outlet Decision: The Impact of Quality, Innovation and Market Awareness

Jennifer Ryan, RPI, ISE, CII, Troy, NY, 12180, United States of America, ryanj6@rpi.edu, Daewon Sun

We consider a manufacturer of a luxury good who must determine whether to sell products only through a manufacturer-owned retail store, or to also sell products through the factory outlet store. We study how this decision depends on the relative qualities of the products offered on the two channels, as well as the manufacturer's ability to innovate and introduce new product lines. In addition, our multi-period model captures the impact of market share on the manufacturer's brand awareness.

Supply Network Management: Collaboration and Competition

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Hyoduk Shin, UC-San Diego, San Diego, CA, United States of America, hshin@rady.ucsd.edu

1 - Optimal Procurement in Assembly Supply Chains: Contracting Timing and Supplier Mergers

Bin Hu, Assistant Professor, UNC Kenan-Flagler Business School, CB#3490 McColl Bldg, University of North Carolina, Chapel Hill, NC, 27519, United States of America, Bin_Hu@kenan-flagler.unc.edu, Anyan Qi

OEMs often procure components from several suppliers to assemble into products. Such an OEM needs proportional component quantities, calling for a coordinated procurement mechanism. We propose the use of two-part tariff contracts for coordinated procurement. We further show that simultaneous and sequential contracting are equivalent. Finally, we investigate the impact of a supplier merger in an assembly supply chain.

2 - Long-Term Partnership for Achieving Efficient Capacity Allocation

Fang Liu, Assistant Professor, Nanyang Business School, Nanyang Technological University, 50 Nanyang Avenue, South Spine S3-B2A-13, Singapore, 639798, Singapore, liu_fang@ntu.edu.sg, Tracy Lewis, Nataliya Kuribko, Jeannette Song

We consider a manufacturer and a group of buyers who share a scarce but expensive-to-build capacity over a finite period. Each member has private history-dependent demand information and makes unverifiable investments. Because of the high uncertainty, achieving supply chain efficiency while sustaining under a dynamic environment is challenging for the partnership. We construct a membership agreement that enforces efficient capacity allocation and investments by introducing a novel breach remedy.

3 - The Perils of Sharing Information in a Trade-association

Noam Shamir, Assistant Professor, Tel-Aviv University, Haim Levanon, Tel-Aviv, Israel, nshamir@post.tau.ac.il, Hyoduk Shin

Studying the incentives of a group of retailers, organized as a trade association, to exchange forecast information, we compare between two industry policies: exclusionary and non-exclusionary information sharing. Although non-exclusionary policy has been advocated to promote information sharing, we show the opposite can happen and explain the reason.

4 - Aligning Incentives in Omni-channel Sale

Elnaz Jalilipour Alishah, PhD Candidate, University of Washington, Seattle, Foster School of Business, Mackenzie Hall 358, Seattle, WA, 98195-3200, United States of America, jalilipo@uw.edu, Yong-Pin Zhou, Jingqi Wang

We consider a retailer with both online and offline channels. While the online store exerts costly effort to attract customers, the offline store handles inventory for both locations – including fulfillment of online orders. We study how the retailer should appropriately credit both channels to align their incentives.

Innovative and Entrepreneurial OM

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Onesun Steve Yoo, University College London, Gower Street, London, WC1E 6BT, United Kingdom, o.yoo@ucl.ac.uk

1 - Pricing and Capacity Planning for Flexible Consumption

Sanjiv Erat, UCSD, Gilman Drive, La Jolla, CA, United States of America, serat@ucsd.edu, Sreekumar Bhaskaran, Rajiv Mukherjee

Motivated by the emergence of flexible consumption opportunities - such as the rollover cellphone plans offered by many mobile providers - we study a firm's pricing and capacity planning decision when the timing of consumption is a choice variable for consumers. Subsequently, we explore the effect of heterogeneity in consumer preferences and its effect on a firm's decision of how much flexibility to offer.

2 - Improving Supply Chain Compliance using Buyer Consortia

Prashant Chintapalli, Anderson School of Management, University of California, Los Angeles, CA, 90095, United States of America, prashant.chintapalli.1@anderson.ucla.edu, Kumar Rajaram, Felipe Caro, Chris Tang

Motivated by the Accord on Fire and Building Safety in Bangladesh we study the effectiveness of buyer consortia. We show that a consortium can increase factory compliance and improve the buyers' profits, though possibly at the expense of the supplier. We also study the conditions under which a buyer should join the consortium and characterize the settings in which the whole supply chain is better off.

3 - Startup as a Process: Increase Your Chances of Success via a Just-in-time Approach

Christophe Pennetier, PhD Student, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Christophe.Pennetier@insead.edu, Karan Girotra, Serguei Netessine

Using a unique and novel dataset, we study the success of startups modeled as a process: what is the best configuration for batches of funding cash –in terms of size and frequency– to exit successfully? Our results suggest that founders should not be obsessed by the amount of money they raise in any single round. It is better to raise small batches more often than the other way around.

4 - Selling Fashionable Products: Change Price or Facilitate Learning?

Yufei Huang, PhD Student, University College London, Gower Street, London, United Kingdom, yufei.huang.10@ucl.ac.uk, Onesun Steve Yoo, Bilal Gokpinar, Chris Tang

Firms selling new fashionable products are shifting their focus away from pricing and towards facilitating the learning process for customers. To understand this phenomenon, we present a stylized model with pricing and three channels through which customers learn. We find that for new fashionable products, facilitating learning can lead to greater profit than variable pricing. Moreover when firms facilitate learning, variable pricing has only a marginal effect on firm profits.

1 - Attribution Metrics and Return on Keyword Investment in Paid Search Advertising

Hongshuang Li, Indiana University, Bloomington, IN, United States of America, lhshruc@gmail.com, Siva Viswanathan, Abhishek Pani, P.k. Kannan

In this paper, we analyze the impact of the attribution metric used for imputing conversion credit to search keywords on the overall effectiveness of keyword investments in search campaigns. We model the relationship among the advertiser's bidding decision for keywords, the search engine's ranking decision for these keywords, and the consumer's click-through rate and conversion rate on each keyword, and analyze the impact of the attribution metric used on the overall return-on-investment of paid search advertising.

2 - Controlling for Self Selection Bias in Customer Reviews

Leif Brandes, University of Warwick, Coventry, CV4 7AL, United Kingdom, Leif.Brandes@wbs.ac.uk, David Godes, Dina Mayzlin

Customers frequently use user online reviews as a valuable information resource before making a purchase. This observation has motivated a large number of empirical studies, and it is now a well-established finding that customer online reviews impact product sales. However, one possible criticism of online user reviews as a source of information is the self-selection inherent in the review process. That is, consumers self-select into choosing whether to review a product, which suggests that reviews may be prone to the extremity bias: the distribution of reviews may be more polarized than the true preference distribution. This of course implies that posted review valence may not always provide an unbiased representation of customers' true product experiences. We provide survey evidence that demonstrates that customers who post an online review tend to have more extreme opinions than customers who never post a review. We hypothesize that the consumers who have more extreme opinions post their reviews quicker, while the consumers with more moderate opinions may take longer to post a review, which implies that in the limit some consumers with moderate opinions may never post a review. One implication of this is that reviews that arrive after a long time lapse are more similar to the opinions of the non-responders. Hence, a firm that is able to observe the time lapse between the experience and the review should be able to calculate the valence of reviews in a way that corrects for the non-response bias. That is, we suggest how to correct for the extremity bias by taking into account the latency of response data. To test our hypotheses, we use a new dataset from a large online travel portal. Overall, we have detailed information on 1.26 million bookings and 2.75 million reviews over the complete history of the firm (twelve years). Because we observe hotel bookings and review provision behavior at the individual customer level, we know for each customer the exact duration between her last travel day and the day that she provided the review. Based on our empirical results, we show how customer self-selection across time impacts her review behavior and suggest a method for controlling for this bias.

3 - Deal or No Deal? The Quality Implications of Online Daily Deals and Competition

Jorge Mejia, University of Maryland, Robert H. Smith School of Business, College Park, MD, United States of America, jmejia@rhsmith.umd.edu, Anand Gopal, Michael Trusov

Consumers use online reviews to inform purchasing decisions about many products / services. Moreover, online daily deals have become an important part of the marketing mix for merchants. The objective of this study is to understand the effect of daily deals on consumers' quality perceptions, expressed through online reviews and investigate potential moderators for this effect, such as merchant characteristics and competition. We combine online reviews for restaurants from Yelp with data from online deals in a major American metropolitan area. We find that online deals have a significant negative effect on online reviews. Additionally, this effect is moderated by certain merchant characteristics such as price point and restaurant age. We also find that the reviews of merchants who do not offer deals are affected by nearby deal competition. We replicate our empirical findings by conducting three lab studies using subjects from MTurk and find consistent results, thus showing robustness.

4 - Swayed by the Numbers: The Consequences of Displaying Review Counts in Purchase Decisions

Jared Watson, University of Maryland, College Park, MD, United States of America, jwatson@rhsmith.umd.edu, Michael Trusov, Anastasiya Pocheptsova

Online retailers often display customers' review to aid consumers' decision-making. While prior literature postulates that an increase in review counts leads to an increase in consumers' purchase intentions, the authors find an important corollary: holding purchase intentions constant, revealing a small review count systematically biases consumers' preferences between choice options. Further, withholding review count information increases purchase intention relative to a small review count. These findings are contrasted with current retailer practices of revealing small review count information.

Inventory and Information Sharing

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Enno Siemsen, Associate Professor, University of Minnesota, 321 19th Ave S, Minneapolis, MN, 55455, United States of America, siems017@umn.edu

1 - Decision Dependent Bounded Rationality in Dual Sales Channel Management

Ozalp Ozer, The University of Texas at Dallas, 800 West Campbell Road, Richardson, TX, United States of America, ooz@utdallas.edu, Kay-Yut Chen

We experimentally study behaviors in a dual sales channel in which a manufacturer sells through his direct channel and an independent retailer. The channels compete on demand. The manufacturer sets the wholesale price for the retailer, and also delivery times for customers in his direct channel. The retailer decides on its inventory level. We show and discuss why bounded rationality differs, in the same subject pool, across three decisions and model the behavior as quantal response equilibrium.

2 - Behavioral Inventory Sharing

Enno Siemsen, Associate Professor, University of Minnesota, 321 19th Ave S, Minneapolis, MN, 55455, United States of America, siems017@umn.edu, Hui Zhao

The benefits of aggregating demand for reducing required safety stock investments in supply chains are well known. Yet if decision makers are decentralized and keep separate stockpiles of inventory, these benefits can only be reaped if they agree to transship their inventory to others. Using behavioral experiments, we explore the conditions under which decision makers share inventory, and the implication of inventory sharing on initial order quantities.

3 - Communication Strategies in Assembly Systems: An Experimental Investigation

Jud Kenney, McGill University, Bronfman Building, Montreal, Canada, jud.kenney@mail.mcgill.ca, Jim Engle-Warnick, Saibal Ray

This study investigates how supply chain partners in an assembly system react to three different strategies of communicating supply risk. Our behavioral experiment uses a minimum game to model suppliers deciding on the amount of capacity to build when facing certain end customer demand, but uncertain supply from their peers. We find effective communication strategies can significantly improve performance and such improvements are more significant under higher critical ratios.

4 - Is Non-linear Pricing Contract Always Better than Linear Pricing Contract?

Guangwen Kong, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55414, United States of America, gkong@umn.edu, Tony Haitao Cui

We study supply chain contracts with consideration of information sharing and bounded rationality. We examine a dyadic supply chain where a supplier with more accurate demand information sells products to a bounded rational retailer. The research suggests that the supplier can be better-off by using a linear pricing contract than adopting a buy-back contract. The supplier either shares information with the retailer or help improve the retailer's bounded rationality but not both in equilibrium.

Meta-algorithms: From Algorithm Tuning and Configuration to Algorithm Portfolios

Cluster: Tutorials

Invited Session

Chair: Meinolf Sellmann, IBM, Yorktown Heights, NY, United States of America

1 - Meta-algorithms: from Algorithm Tuning and Configuration to Algorithm Portfolios

Meinolf Sellmann, IBM, Yorktown Heights, NY, United States of America

Efficiency and accuracy are of primary concern when developing analytics solutions in OR. Typically, there is more than one possible algorithmic approach and none dominates the others. Moreover, algorithms usually have implicit or explicit parameters that greatly affect performance. Meta-algorithms focuses on the development of effective automatic tools that tune algorithm parameters and, at runtime, choose the approach best suited for the given input. Here we summarize the lessons learned when devising such tools.

Chair: Samir Srairi, Ministry of Higher Education and Scientific Research, 14 Avenue de Tunis, Arian, 2080, Tunisia, srairisamir3@gmail.com

1 - Combination of Hybrid Two Level DEA with SVM for Indicator Weighting in Financial Failure Prediction

Chao Huang, Southeast University, Xuan Wu District, Sipailou No.2, Nanjing, 210096, China, huangchao@seu.edu.cn

A new WPF two level DEA is proposed to identify the bankruptcy firms by constructing a worst-practice frontier. Combining traditional BPF two level DEA and WPF two level DEA, a hybrid model is put forward as a tool for cooperates financial failure prediction. To improve the accuracy, a new indicator weighting method based on SVM is also proposed. The empirical results show that the proposed hybrid method has excellent bankruptcy prediction ability.

2 - A Cross-Dynamic Evaluation of Warehouse Operations

Jose Humberto Ablanado Rosas, Associate Professor, University of Texas at El Paso, 500 W University Avenue, Marketing & Management Department, El Paso, TX, 79968, United States of America, jablanedorosas2@utep.edu, Faruk Arslan

We report a cross-dynamic comparison of distribution centers worldwide. This problem has been analyzed with the Malmquist productivity index; we introduce an approach based on cross-efficiency assessment which eliminates the drawbacks of traditional cross-efficiency methods. A comparison between both approaches is discussed and managerial recommendations for decision makers are derived.

3 - Performance Evaluation of Dynamic Supply Chain using Dea

Somayeh Mamizadeh-Chatghayeh, Asia Business Clusters & Networks Development (ABCD) Foundation Cooperation, Tehran, Tehran, Iran, somayeh_mamizadeh@yahoo.com, Abbas Ali Noura

One of the main researches in supply chain management is to improve the overall efficiency based on dynamic performance of supply chain. In this paper, by developing the basic dynamic model, different methods for evaluating the supply chain are studied. Dynamic Data Evolution Analysis as an efficient tool is new research focus in supply chain benchmarking. We develop DDEA models that can be evaluating the overall efficiency of supply chains and subsystems.

4 - On Integrating DEA and AHP for the Facility Layout Design in Manufacturing Systems

Toloo Mehdi, Technical University of Ostrava, Ostracew,
Czech Republic, mehdi.toloo@vsb.cz

Analytic hierarchy process (AHP) is a decomposition multiple-attribute decision making (MADM) method, which can represent human decision making process and help to achieve better judgments based on hierarchy, pair-wise comparisons, judgment scales, allocation of criteria weights and selection of the best alternative from a finite number of variants by calculation of their utility functions. Data envelopment analysis (DEA) is a well-known non-parametric method to evaluate the performance of a set of homogeneous decision making units (DMUs) with multiple inputs and multiple outputs.

5 - The Efficiency of Tunisian Universities: An Application of a Two-Stage Dea Approach

Samir Srairi, Ministry of Higher Education and Scientific
Research, 14 Avenue de Tunis, Arian, 2080, Tunisia,
srairisamir3@gmail.com

This paper examines the efficiency of eleven universities in Tunisia during the period 2009-2013. Regression analysis suggests that a higher share of professors, a higher number of women in academic staff and a better quality of student in secondary education improve the efficiency of the university.

Project Selection, Evaluation and Collaboration

Cluster: New Product Development

Invited Session

Chair: Yaozhong Wu, National University of Singapore, NUS Business School, Singapore, Singapore, yaozhong.wu@nus.edu.sg

1 - An Experimental Study of Idea Selection Process

Zhijian Cui, Assistant Professor of Operations and Technology
Management, IE Business School, Calle de Maria de Molina 12,
Madrid, 28006, Spain, Zhijian.Cui@ie.edu, Shijith Payyadak,
Dilney Gonçalves

In this study, we design several online experiments to compare the efficacy of two commonly observed processes of idea selection: scoring vs. ranking. In scoring process, subjects are asked to evaluate the quality of each idea and give a score while in ranking process, subjects are asked to only rank the ideas according to their preferences. We find that the choice of idea selection process depends on some contextual factors.

2 - Overvaluation of Process Innovation Ideas

Fabian Sting, Erasmus University Rotterdam, Rotterdam,
Netherlands, fsting@rsm.nl, Christoph Fuchs, Maik Schlickel

Ideas by employees are a vital source for innovation. But are such ideas overvalued by their creators? If so, which ideas in particular? Drawing on a unique data set that comprises the generation, election, and implementation of process improvement ideas of an automotive supplier, we identify antecedents of overvalued ideas. Overvaluation is greater for ideas generated by higher-level employees, collaboratively versus individually, and by employees with previously lower ideation success.

3 - Project Evaluation and Selection via Risk-adjusted Net Present Value

Nicholas G. Hall, The Ohio State University, Fisher College of
Business, Columbus, OH, United States of America,
hall.33@osu.edu, Zhixin Liu, Wenhui Zhao

We consider a project with risk that declines over time as its tasks are completed, as reflected in a declining discount rate. The objective is to maximize the NPV of the project. This problem is highly nonlinear, since the discount rate at any point in time is a function of previous scheduling decisions. We solve this model and show that risk-adjusted NPV varies significantly from traditional NPV, and that the use of the risk-adjusted measure significantly improves project selection decisions.

4 - Resource Competitions for Research Projects

Pascale Crama, Singapore Management University, 50 Stamford
Road, Singapore, 178899, Singapore, pcrama@smu.edu.sg, Anand
Nandkumar, Reddi Kotha

Academic research is funded by governments, but is often seeded through grants from university administered research funds (UARF) and other charitable institutions. We compare the effectiveness of UARF and other sources of funds in obtaining subsequent federal funding and value creation. We build a parsimonious model that can explain the superior productivity of UARF funding and make recommendations on the ideal way to organize UARF funding.

Modeling the Economics of Low-Carbon Power Systems

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Todd Levin, Energy Systems Engineer, Argonne National
Laboratory, 9700 S Cass Ave, Lemont, IL, 60439,
United States of America, tlevin@anl.gov

1 - Revenue Sufficiency and Resource Adequacy in Systems with Variable Generation Resources

Todd Levin, Energy Systems Engineer, Argonne National
Laboratory, 9700 S Cass Ave, Lemont, IL, 60439,
United States of America, tlevin@anl.gov, Audun Botterud

An efficient MIP framework is applied to analyze the impact of increasing wind power capacity on generator profitability. The model is executed with hourly time steps on a test case that approximates the ERCOT system for a range of wind capacity levels. We analyze three market policies that support resource adequacy and find that some additional market incentives may be required to ensure long term revenue sufficiency and resource adequacy in systems with significant variable energy resources.

2 - An Approximate Model for Scheduling Energy and Reserve in Renewable-Dominated Power Systems

Miguel Carrion, Universidad de Castilla - La Mancha,
Av. Carlos III, s/n, Toledo, Spain, miguel.carrion@uclm.es,
Rafael Zarate-miñano

Since most of renewable energies are non-dispatchable, an appropriate schedule of reserves in renewable-dominated power systems is crucial. We propose an alternative formulation that co-optimizes energy and reserve considering the uncertainty involved in demand and renewable production. This formulation requires a significantly smaller number of variables and constraints than the classical stochastic economic dispatch problem. The proposed formulation is tested in a realistic case study.

3 - Hydroelectric Bid Optimization under Uncertainty

Andy Philpott, University of Auckland, Engineering Science
Department, Private Bag 92019, Auckland, 1025, New Zealand,
a.philpott@auckland.ac.nz, Faisal Wahid, Frederic Bonnans,
Cedric Gouvernet

We consider the problem faced by the operator of a cascade of hydroelectric generating plants offering energy to a wholesale electricity pool market to maximize revenue. Both energy prices and uncontrolled inflows to the reservoirs of the cascade are assumed to be stochastic. We describe a stochastic dynamic programming model that generates an optimal offer for the next period given current observed prices. This is solved using SDDP when value functions are concave or MIDAS when they are not.

4 - Optimal Timing to Invest, Mothball, Reactivate, and Decommission a Coal Power Plant

Paul Rebeiz, Doctoral Candidate In Operations Management,
UCLA Anderson School of Management, 110 Westwood Plaza,
Los Angeles, CA, 90025, United States of America,
paul.rebeiz.1@anderson.ucla.edu, Christian Blanco

Transitioning to a low-carbon economy will require most coal power plants to be replaced by other sources of generation such as wind and solar. We present a dynamic program to solve for the optimal price signals to invest, mothball, reactivate, and decommission a coal power plant. We find that our results are consistent with current industry trends. We conclude with some insights on the effect of renewable energy policy on mothballing and retiring a coal plant.

58-Room 110A, CC

New Insights on Electricity Markets with Uncertain Supply

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Juan M. Morales, Associate Professor, Technical University of Denmark, Matematiktorvet, Building 303b, 008, Kgs. Lyngby, 2800, Denmark, jmmgo@dtu.dk

1 - The Benefits of Sharing Reserves Between Countries: A Case Study of the European Electricity System

Kenneth Van Den Bergh, PhD Researcher, KU Leuven, Celestijnenlaan 300 Box 2421, Leuven, Belgium, kenneth.vandenbergh@kuleuven.be, Robin Broder Hytowitz, Benjamin Hobbs, William D'Haeseleer, Erik Delarue

Reserves are scheduled day-ahead in order to deal with forecast errors from wind and sun. This study examines reserve coordination in time and space for the Central European electricity system. Four scenarios involving various degrees of coordination for reserves are simulated. A large-scale unit commitment model is used to simulate the electricity markets. The study indicates savings in reserve allocation costs of up to 90% with increasing degree of coordination.

2 - Effect of Ramping Pricing Scheme in Systems with High Wind Energy Penetration

Yves Smeers, Professor Emeritus, Université Catholique de Louvain, Voie du Roman Pays, 34, Louvain-la-neuve, B-1384, Belgium, yves.smeers@uclouvain.be, Sebastian Martin

We consider the continuous version of a unit commitment problem with wind penetration, and subject to ramping constraints. The optimization problem assumes that ramping providers are priced at opportunity cost. We explore the impact of having different pricing schemes for ramping. We use a complementarity formulation in several versions that differ to reflect different policy proposals based on pricing schemes for ramping.

3 - A Stochastic Electricity Market Clearing Formulation with Consistent Pricing Properties

Victor M. Zavala, Computational Mathematician, Argonne National Laboratory, 9700 South Cass Avenue, Argonne, IL, 60439, United States of America, vzavala@mcs.anl.gov

Deterministic clearing formulations introduce arbitrary distortions between day-ahead and real-time prices that bias economic incentives. We analyze a stochastic clearing formulation in which the social surplus function induces absolute value penalties between day-ahead and real-time quantities. We prove that the formulation yields price distortions that are bounded by the bid prices and we prove that day-ahead quantities and flows converge to the medians of real-time counterparts.

4 - On the Inefficiency of the Merit Order in Forward Electricity Markets with Uncertain Supply

Juan M. Morales, Associate Professor, Technical University of Denmark, Matematiktorvet, Building 303b, 008, Kgs. Lyngby, 2800, Denmark, jmmgo@dtu.dk, Salvador Pineda, Marco Zugno

We derive analytically the dispatch rule for a stylized power system with infinite transmission capacity under a stochastic market-clearing mechanism. We provide conditions for this clearing procedure to break the merit order and for virtual bidding to ensure maximum market efficiency under a classical merit-order dispatch. Finally, we provide a reinterpretation of these two market-clearing procedures as members of a broader family that allows for marked-up forward production costs.

Optimal Design and Operation of Smart Electrical Grids

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Baosen Zhang, University of Washington, 185 Stevens Way, Seattle, WA, United States of America, zhangbao@uw.edu

1 - Design of Resilient Distribution Network Against Natural Disasters: A Robust Optimization Approach

Bo Zeng, Assistant Professor, University of South Florida, Tampa, 4202 E. Fowler Avenue, Tampa, FL, 33620, United States of America, bzeng@usf.edu, Wei Yuan, Feng Qiu, Chen Chen, Jianhui Wang

Natural disasters such as Hurricane Sandy have seriously disrupted the power grids. To increase the resilience of a distribution system under natural disaster attacks, we propose a resilient distribution network design model considering hardening and distributed generation unit placement to minimize the load shedding under worst-case natural disaster attacks.

2 - Electric Resource Optimization with High Penetration Renewables and Varying Reliability Measures

Cynthia Bothwell, Student, Johns Hopkins University, 117 Meridian Lane, Towson, MD, 21286, United States of America, cdbothwell@gmail.com, Calvin Wood

As intermittent wind and solar energy resources increase in use throughout the electricity sector, techniques to assess system reliability are evolving. The optimization of investment in new capacity resources changes as a result of the reliability criteria applied to the system. This work overviews for policy and decision makers the tradeoffs between reliability criteria and generation investment with high penetrations of intermittent renewables for capacity planning and market design.

3 - Scheduling Energy Storage Resources to Provide Multiple Services

Johanna Mathieu, Assistant Professor, University of Michigan, 1301 Beal Ave, Ann Arbor, MI, 48109, United States of America, jlmath@umich.edu, Goran Andersson, Olivier Megel

Most energy storage devices in power systems are only partially used most of time, and so they could also be used to help balance electricity supply and demand. The challenge is how to allocate their energy and power capacities to different services given uncertainty from multiple sources. We formulate the scheduling problem and apply both stochastic dynamic programming and stochastic dual dynamic programming to several case studies, and compare performance and computational complexity.

4 - Bidding Models for Price-responsive Loads in Electricity Markets

Javier Saez-gallego, PhD Candidate, Technical University of Denmark, Matematiktorvet Building 303B, 019, Kgs. Lyngby, 2800, Denmark, jsa@dtu.dk, Juan M. Morales, Marco Zugno

This paper presents a data-driven approach to estimate the parameters of the market bid that best represents the stochastic and dynamic behavior of a pool of price-responsive consumers. The proposed methodology is based on inverse optimization and is able to leverage exogenous information, besides the electricity price, to partly explain the parameters of the bid. We use data relative to the Olympic Peninsula project to assess the performance of the proposed method.

Chair: Huan Liu, PhD, Xi'an Jiaotong University, 28# Xianning West Road, Shaanxi Province, Xi'an, 710049, China, liuhuan-look@163.com

1 - Rapid Analysis of Attentional Processes While Looking at Print Advertisements Based on Eye Tracking

Hirota Aoki, Dr., Tokyo Institute of Technology, 2-12-1-W9-75, Oh-Okayama, Meguro-Ku, Tokyo, 152-8552, Japan, aoki.h.ad@m.titech.ac.jp

This paper develops an eye tracking-based analysis framework for attentional processes during viewing print advertisements. The framework consists of a scheme for classification of information in advertising and principles for data interpretation from attentional processes perspectives. Based on a case study in which 20 consumers' data during looking at insurance advertisements were collected, the potentials of our framework as well as implications for effective advertising design are discussed.

2 - Destructive Testing Gauge Capability Analysis

David Kim, Professor, Oregon State University, 204 Rogers, Corvallis, OR, 97331, United States of America, david.kim@orst.edu, Xinyu Luo

This research examines the current state-of-the-art in gauge capability analysis for destructive testing. Results are then presented that extend the specific destructive testing situations where gauge repeatability can be estimated.

3 - Project Timeliness or Project Effectiveness: Which One is Sacrificed?

Asghar Afshar Jahanshahi, Postdoc, Pontifical Catholic University, Av. Vicuña Mackenna 4860. Macul, Santiago, Chile, asghar@ing.puc.cl, Khaled Nawaser

There is a consensus among scholars that real options reasoning is crucial for project performance under conditions of high environmental uncertainty. However, few empirical studies have confirmed this claim. Our longitudinal analysis of 101 electronic commerce projects, drawn from new technology ventures, indicated the differential effects of real options reasoning on project performance under conditions of high environmental state, effect and response uncertainty.

4 - A New Framework for Sustainability Measurement

Anthony Afful-Dadzie, University of Ghana, P.O. Box LG 78,
Legon, Accra, Ghana, atosarsah@gmail.com

This presentation explores a new sustainability measurement and scoring system for assessing the efforts of organizations at meeting sustainability targets. Based on TOPSIS, the proposed measurement and scoring system incorporates all three sustainability dimensions and enables the establishment of a threshold below which an organization is considered to have failed a sustainability test. A time-independent threshold is also introduced to help compare performance over time.

5 - Government Intervention and Technovation Performance: An Empirical Study of Soes from Mainland China

Huan Liu, PhD, Xi'an Jiaotong University, 28# Xianning West
Road, Shaanxi Province, Xi'an, 710049, China,
liuhuan-look@163.com, Jiannan Wu

We use a comprehensive provincial-level panel data set of 30 provinces during 2005-2012. Our results show that project funding and tax break at the provincial level have no impact on new products sales. Project funding has a negative impact on invention patents, by contrast, tax break has a positive impact on invention patents. The interaction term of project funding and tax break has an invert U-shaped relationship with new products sales, but it has no impact on invention patent.

Environmentally Responsible Operations Management

Sponsor: ENRE – Environment I – Environment and Sustainability
Sponsored Session

Chair: Arda Yenipazarli, Assistant Professor of Operations Management,
Georgia Southern University, COBA 2224, Statesboro, GA, 30460,
United States of America, ayenipazarli@georgiasouthern.edu

1 - Competitive Positioning and Pricing of Green Products with Multiple Environmental Attributes

Arda Yenipazarli, Assistant Professor of Operations Management,
Georgia Southern University, COBA 2224, Statesboro, GA, 30460,
United States of America, ayenipazarli@georgiasouthern.edu

To address consumers' sustainability-related product concerns, a thorough approach to improving the environmental profile of one's products is required. Using one dimension of green may hide possible trade-offs and overlook the fact that consumers' preferences exhibit different orders in different green attributes. We study a duopoly model that explicitly incorporates multiple environmental attributes into the green product positioning and pricing, along with the trade-offs among them.

2 - Product Line Design: The Impact of Consumers' Varied Perceptions of Recycled Content

Monire Jalili, University of Oregon, 1208 University of Oregon,
Eugene, OR, United States of America, mjalili@uoregon.edu,
Nagesh Murthy, Tolga Aydinliyim

We consider a monopolist selling ordinary and green product versions to consumers whose differential (dis)utility vary by consumer type, and is a function of the firm's quality decision (i.e., the amount of recycled content in the green version.) We discuss how the optimal quality and pricing decisions drive demand and profit and whether/when it is optimal for the firm to only offer the green version (go completely green).

3 - Replenishment Decisions of Perishable Products under Price and Emissions Sensitive Demand

Gokce Palak, Assistant Professor Of Operations Management,
Shenandoah University, Harry F. Byrd, Jr. School of Business,
Winchester, VA, 22601, United States of America, gpalak@su.edu

We extend economic lot sizing models for age dependent perishable products to maximize profit and minimize emissions. This model captures the tradeoffs between supplier and mode selection decisions, profits and emissions, and transportation lead time and remaining shelf life of products. We analyze impacts of price and emissions sensitive demand on the replenishment decisions.

4 - Maximizing Sustainability of Ecosystem Model through Socio-economic Policies

Urmila Diwekar, President, Vishwamitra Research Institute, 2714
Crystal Way, Crystal Lake, IL, 60012, United States of America,
urmila@vri-custom.org, Kirti Yenkie, Rohan Doshi,
Pahola Benevades, Heriberto Cabezas

Current practices in natural resources consumption are unsustainable and may eventually lead to ecosystem extinction. This paper uses a simple mathematical model of an integrated ecological and economic system representing our planet's sectors. The aim of the project is to maximize the sustainability of this system, using Fisher Information as a measure of sustainability, and derive socio-economic policies using multivariable optimal control techniques.

Optimization on Power Grid Application

Cluster: Energy Systems: Design, Operation, Reliability
and Maintenance

Invited Session

Chair: Chaoyue Zhao, Oklahoma State University, 322G Engineering
North, Stillwater, OK, United States of America,
chaoyue.zhao@okstate.edu

1 - Risk-based Admissibility Assessment of Wind Generation Integrated into a Bulk Power System

Cheng Wang, Tsinghua University, 3-211, West Main Building,
Beijing, China, shlwangcheng2008@163.com, Feng Liu, Wei Wei,
Jianhui Wang, Shengwei Mei

In this talk, a risk-based admissibility assessment approach is proposed to quantitatively evaluate how much wind generation can be accommodated by the bulk power system under a given UC strategy. Firstly, the operational risk brought by wind generation is developed as an admissibility measure. Then a risk-minimization model is established to mathematically characterize the admissible region. Simulations demonstrate the effectiveness and efficiency of the proposed methodology.

2 - Strong Formulations for Unit Commitment Problem

Kai Pan, PhD Student, University of Florida, 411 Weil Hall,
Gainesville, FL, 32608, United States of America, kpan@ufl.edu,
Yongpei Guan

In this talk, we will present the strong formulations for unit commitment problem under different settings. Technical proofs are provided accordingly. Our computational experiments verify the effectiveness of proposed strong formulations.

3 - A Scalable Decomposition Method for the Two-Stage Stochastic Unit Commitment Problem

Farzad Yousefian, Postdoctoral Research Associate, Penn State,
333 Logan Ave., Apt. 307, State College, PA, 16801, United States
of America, szy5@psu.edu, Wendian Wan, Uday Shanbhag

We consider a two-stage stochastic unit commitment problem modeled as a large-scale mixed integer nonlinear optimization problem. The state-of-the-art commercial packages, e.g. CPLEX, do not scale with the number of the units and scenarios. Motivated by the structure of the KKT system and employing the ideas of Schur complements, we propose a multiphase primal-dual algorithm that scales with the size of the scenarios. Preliminary simulation results are presents.

Operations Management II

Contributed Session

Chair: Xiaoyan Qian, PhD, The University of Auckland, 486 Parnell
Road, Auckland, New Zealand, x.qian@auckland.ac.nz

1 - Flexible Commitment Contract in the Presence of Goodwill-sensitive Customers

Xiaoya Han, University of Science and Technology of China,
No. 96, Jinchai Road, Hefei, China, xyhan@mail.ustc.edu.cn,
Yugang Yu

This paper focuses on a retailer's dynamic decision problem: how to determine a minimum commitment at the beginning of the planning horizon and periodically variable order quantities to maximize its profit when facing goodwill-sensitive customers. We obtain that the next-period goodwill decreases in the current-period one, and the goodwill monotonically converges to a constant steady-state one over time. Moreover, we find that the steady-state goodwill may decrease in minimum commitment.

2 - Flexible Capacity Management with Advanced Information

Julian Kurz, Chair of Logistics and Quantitative Methods in Business Administration, University of Wuerzburg, Stephanstrasse 1, Wuerzburg, 97070, Germany, julian.kurz1@uni-wuerzburg.de

We consider a maintenance service provider that overhauls technical equipment for customers in a central facility. A flexible capacity control policy is developed such that capacity costs and queue length-related holding costs are minimized. We investigate three operating modes, each taking into account a different amount of information (reactive/single-/multi-stage proactive modes). In the proactive modes, advanced information regarding future jobs is utilized.

3 - How to Take Advantage of Crowdsourcing to Collect New Ideas about Product Innovation?

Wanjiang Deng, Huazhong University of Science and Technology, School of Management, Luoyu Road 1037, Hongshan District, Wuhan, 430074, China, dengwj01@foxmail.com, Shihua Ma

Crowdsourcing is gaining more and more attention in both practice and research field. We stand on the position of the company who is going to propose a task about product innovation on one online crowdsourcing platform, and investigate its best strategies of both choice of platform and reward setting. We derive solutions of the base model and then extend it to some detail aspects. Finally, we discuss the managerial insights of our research.

4 - A Heuristic for Hospital Operating Theatre Scheduling under Uncertainty

Milad Zafar Nezhad, Wayne State University, Industrial and Systems Engineering Dep, Detroit, MI, 48202, United States of America, fq3963@wayne.edu, Hossein Badri, Kai Yang

Resource planning is one of the most important issues in healthcare operating management. In this research a heuristic solution algorithm based on the shifting bottleneck method is developed for hospital operating theatre scheduling when some parameters are not deterministic. The developed algorithm is applied on several instances to evaluate its applicability and performance.

5 - Contractual Coordination of Agricultural Cooperatives with Quality Specifications

Xiaoyan Qian, PhD, The University of Auckland, 486 Parnell Road, Auckland, New Zealand, x.qian@auckland.ac.nz

This talk examines how agricultural cooperatives can motivate farmers' effort when the market price depends on the quantity of high quality produce. We assume that a quality premium is offered to farmers and that their pay-outs are made progressively. We propose a two-stage stochastic model. The main findings are conditions for when the supply chain can be coordinated, that effort is motivated by the quality requirement, and that the progressive payment is needed for coordination.

1 - A Multi-criteria Decision Analysis Approach for Importance Ranking of Network Components

Yasser Almoghathawi, PhD Candidate, University of Oklahoma, 202 W Boyd St., Norman, OK, 73019, United States of America, moghathawi@ou.edu, Kash Barker

Analyzing network vulnerability is a key element of network planning and preparing for a disruptive event that might impact the performance of the network. Many importance measures have been proposed to identify and rank the important components in a network to focus on preparedness efforts. We integrate a number of flow-based importance measures with a multi-criteria decision analysis technique, TOPSIS, highlighting how different weighting schemes can lead to different rankings.

2 - Modeling Uncertainty in Risk-preference Elicitation

Dharmashankar Subramanian, Research Staff Member, IBM Research, 1101 Kitchawan Rd, Rte 134, Yorktown Heights, NY, 10598, United States of America, dharmash@us.ibm.com, Debarun Bhattacharjya, Mengyang Gu

Utility functions are used to model a decision-maker's risk-preferences. However, interactive elicitation of a precise utility function is fraught with many practical challenges such as noise, inconsistency and bias in the responses to questions. In this work, we provide a flexible model along with Bayesian analysis to calibrate random utility functions and to quantify different sources of uncertainty. We present both theoretical and numerical results.

3 - Modeling Reference Dependence using One-switch Independence

David Vairo, Virginia Commonwealth University, 2415 Krossridge Road, N. Chesterfield, VA, 23236, United States of America, vairodl@vcu.edu, Jason Merrick

We present an application of multi-attribute one-switch independence to single attribute gambles by modeling chance as an attribute, which models reference dependence and shows it is equivalent to one-switch independence. The resulting form obeys stochastic dominance while incorporating probabilistic sensitivity, utility curvature, reference dependence, and loss aversion. The approach connects single-attribute behavioral and multi-attribute prescriptive decision analysis.

4 - Multiobjective Network Resilience Model with Parallel Component Recovery

Nazanin Morshedlou, PhD Student, University of Oklahoma, 202 W. Boyd St., Room 424, Norman, OK, 73071, United States of America, nazanin.morshedlou@ou.edu, Kash Barker

This work introduces a multiobjective formulation that trades off investments to enhance network resilience in the form of (i) strengthening link capacity following a disruptive event to decrease vulnerability, and (ii) introducing "parallel component at a time" recovery scheduling to improve recoverability. Given the uncertainty associated with critical infrastructures, robust interval optimization is used to solve the multiobjective formulation

Near Miss and Threshold Events and Their Influence on Risk Perception and Behavior

Sponsor: Decision Analysis

Sponsored Session

Chair: Florian Federspiel, IE Business School, Maria de Molina 12, Bajo, Madrid, 28006, Spain, ffederspiel.phd2014@student.ie.edu

1 - Conceptualizing Perceptions of Near Misses

Richard John, Associate Professor, University of Southern California, 3620 McClintock Ave., Dept. of Psychology, MC-1061, Los Angeles, CA, 90266-1061, United States of America, richardj@usc.edu, Jinshu Cui, Heather Rosoff

I will present a dynamic probabilistic model for describing and defining near miss events. The model is useful for highlighting characteristics of a near miss that determine the extent to which the event is perceived as a near miss. Measurement of individual differences in perceptions of near misses will also be discussed.

2 - Small Near-Misses: Too Weak of a Warning Signal

Robin Dillon-Merrill, McDonough School of Business, Georgetown University, Washington, DC, 20057, United States of America, rld9@georgetown.edu

This research demonstrates that individuals too often evaluate near-misses as successful events even when it was fortunate chance that prevented the same event from resulting in a failed outcome. These weak signals of problems are then overlooked as the warnings they could potentially be. This problem is exacerbated as small near-misses accumulate over time, and decision makers increasing accept more risk.

3 - Learning from Threshold Events

Wenjie Tang, IE Business School, Calle de Maria de Molina 12, Piso 5, Madrid, MA, 28006, Spain, Wenjie.Tang@ie.edu, Steffen Keck, Matthias Seifert

Threshold events are events that are triggered when an observable underlying random variable passes a known threshold. We suggest that when individuals learn from past threshold events, their judgments depend strongly on whether the realization of the underlying variable triggers the threshold event; the extent to which the realization has been close to the threshold will be discounted. Results from a laboratory experiment support our main hypothesis.

4 - The Experience of Near Miss Events under Ambiguity

Florian Federspiel, IE Business School, Maria de Molina 12, Bajo, Madrid, 28006, Spain, ffederspiel.phd2014@student.ie.edu, Matthias Seifert

Near miss events are often clouded in ambiguity, allowing for hubris and misattribution of what caused success or prevented failure. We investigate the experience of near miss events, probabilistic events nearly resulting in loss outcomes that do not materialize due to chance circumstances, and related changes in risk perception and behavior under both ambiguity and unawareness. We find that the near miss effect (an increase in risk taking behavior) principally occurs under ambiguity.

Air Cargo

Sponsor: Aviation Applications

Sponsored Session

Chair: Jose Quesada, Université Catholique de Louvain, Chaussée de Binche, 151, Mons, 7000, Belgium, jose.quesada@uclouvain-mons.be

1 - An Economic Analysis of the Air Cargo Problems in an Integrated Supply Chain

Kwon Gi Mun, PhD Candidate, Rutgers University, SCM, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States of America, kwongimun@gmail.com, Yoondong Jung, Yao Zhao, Endre Boros, Arim Park

In this model, we demonstrate an integrated forecasting approach to coordinate ground and air transportation for a Korean air cargo company. Therefore, we present expected benefits of this integrated approach compared to current practice.

2 - A Multi-Stage Air Service Network Design Problem for an Express Carrier

Yusuf Secerdin, University of Miami, 1251 Memorial Drive, Department of Industrial Engineering, Coral Gables, FL, 33146, United States of America, yusufsecerdin@miami.edu, Murat Erkoc

We study the air service network configuration problem for a global express carrier. We propose a multi-stage modeling framework for the company's Central and South America region by incorporating multiple service types in terms of time commitments for the air network. The proposed approach consists of three phases in which we formulate a hub location problem, generate feasible pick-up and delivery routes and formulate the service network design problem using the composite variable formulation.

3 - An Adaptive Search Network for the Pickup and Delivery Problem with Time Windows

Ferdinand Kiermaier, TU Munich, Arcisstr. 21, Munich, Germany, ferdi.kiermaier@googlemail.com, Jonathan Bard, Markus M. Frey

We present an innovative "out-of-the-box" algorithmic framework coupling existing heuristics with a learning-based network structure applicable to many variants of the Pick-Up and Delivery Problem with Time-Windows (PDPWTW) and, thus, for the Vehicle Routing Problem with Time-Windows. We show an application to a real-world airport baggage and cargo transportation problem and prove the effectiveness of our new approach by a comparison with state-of-the-art solution algorithms for the PDPWTW.

4 - Express Air Network Design with Multi-Hub Flexible Connections

Jose Quesada, Université Catholique de Louvain, Chaussée de Binche, 151, Mons, 7000, Belgium, jose.quesada@uclouvain-mons.be, Jean-sébastien Tancrez, Jean-charles Lange

We present a model for the Air Network Design for the next day delivery within an Express company. Most of the existing models rely on a pre-definition of connections for each commodity through a specific hub. We present a model in which we integrate the decision of connectivity simultaneously with the network design. When two hubs are so close from each other that they can serve (almost) the same nodes, the results show that savings can be obtained by taking both decisions at the same time.

Sponsored Session

Chair: Zahra Mokhtari, Oregon State University, Corvallis, OR, United States of America, mokhtarz@onid.oregonstate.edu

1 - A Hybrid Heuristic Method for the Compressed Natural Gas Truck Routing Problem with Fueling Stations

Yihuan (Ethan) Shao, University of Southern California, Los Angeles, CA, United States of America, yihuansh@usc.edu, Maged Dessouky

We introduce the Compressed Natural Gas Truck Routing Problem with Fueling Stations to model decisions to be made with regards to the vehicle routes including the choice of fueling stations. A hybrid heuristic method is proposed, which combines an Adaptive Large Neighborhood Search (ALNS) with a mixed integer program. By solving a set of benchmark instances, we show the effectiveness of the method. We also conduct experiments based on the data from the Ports of Los Angeles and Long Beach.

2 - Designing a Biorefinery Supply Chain: a Real Case in Navarre (Spain)

Adrian Serrano, Public University of Navarra, Pamplona Spain, adrian.serrano@unavarra.es, Javier Beloso, Javier Faulin, Alejandro G. del Valle

New alternative energy sources are spreading around the world to reduce greenhouse gas emissions and oil dependence. Our paper proposes a procedure to manage a biorefinery supply chain in Navarre (Spain) which involves, among others, which farms are going to be harvested, when they are going to be collected, and the storage levels. Moreover, a Facility Location Problem is solved inside a MILP model. Promising results are obtained at both levels: strategic (location) and operational (SCM).

3 - Train Dispatching Problem under Exact Travel Time Estimation for a Double Track Rail System

Lance Fu, University of Southern California, Los Angeles, CA, United States of America, luncfu@usc.edu, Maged Dessouky

We consider the problem of dispatching trains through double track railway system, where track segments have different speed limits. We take the train's dynamics into consideration, which differentiates our model from the previous literature. The objective is to minimize the traveling time under no-deadlock and no-collision constraints. We give a mixed integer programming (MIP) formulation for the train dispatching problem. Also we provide certain conditions which can ensure that there exists an optimal integer solution to relaxation of the MIP. A local search based heuristic is also proposed to solve the problem. Simulation on the railway system in Los Angeles County is conducted to verify the efficiency of the proposed algorithms.

4 - A Stochastic Programming Approach for Truckload Relay Network Design under Demand Uncertainty

Zahra Mokhtari, Oregon State University, Corvallis, OR, United States of America, mokhtarz@onid.oregonstate.edu, Hector A. Vergara

This study addresses the problem of strategic relay network design for truckload transportation under demand uncertainty and proposes a stochastic programming model and solution algorithm. The solution methodology uses Sample Average Approximation (SAA) to address a very large number of scenarios of demand realization. The examined number of scenarios determines the trade-off between optimality of the solutions obtained for the stochastic programming model and its computational complexity. Numerical results on a set of instances of this problem are presented along with areas for future research.

Resilience in Electricity Infrastructure Systems

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Yong Fu, Associate Professor, Mississippi State University, Starkville, MS, United States of America, fu@ece.msstate.edu

1 - Microgrids for Enhancing the Power System Resilience, Reliability, & Economics

Mohammad Shahidehpour, Professor, IIT, 10 West 35th Street, Suite 1600, Chicago, IL, 60616, United States of America, ms@iit.edu

Microgrids form the building blocks of perfect power systems which promote the use of real-time pricing and demand response for optimizing the distributed control of electric power systems. This presentation will highlight some of the key issues in the design and the operation of microgrids and discuss the role of recent innovations and, in particular, the significance of smart grid applications to power system operations and control.

2 - Mitigating Cascading Outages under Severe Weather using Simulation-based Optimization

Jianhui Wang, Argonne National Laboratory, 9700 South Cass Avenue, Building 221, Argonne, IL, 60439, United States of America, jianhui.wang@anl.gov, Feng Qiu, Jie Xu

In this work, we investigate cascading outage mitigation under severe weather conditions. Since the cost function, expected cascading outage costs, cannot be expressed as an explicit function of protection actions and system status, we develop a power system security simulator to estimate the cascading outage costs of given mitigation actions and use a simulation-based optimization approach.

3 - A Decentralized Decision Making System to Enable Resilient Microgrid Clusters

Yong Fu, Associate Professor, Mississippi State University,
Starkville, MS, United States of America, fu@ece.msstate.edu

Microgrid has been proposed to ensure resilience in power systems. The microgrid can treat connected neighboring microgrids as local energy buffers thus freely forming a cluster to share, exchange, and aggregate site-generated energy. This research proposes a decentralized decision making system to improve the microgrid clusters' resilience capability to power disturbances and extreme events, consequently minimizing down-time for both consumers and the grid.

Connected and Autonomous Vehicles I

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Yong Hoon Kim, Purdue University, United States of America,
kim523@purdue.edu

1 - Multi-agent Based Formation Control of Connected Autonomous Vehicles

Yongfu Li, Chongqing University of Posts and
Telecommunications, Chongqing, China, laf1212@163.com,
Kezhi Li, Li Zhang, Srinivas Peeta, Xiaozheng He, Hong Zheng,
Taixiong Zheng

This study seeks to improve network throughput and reduce energy consumption under V2V communications environment through formation control. A multi-agent systems based formation control is proposed using consensus theory. We analyze the formation of autonomous vehicles in longitudinal and lateral gaps simultaneously. Numerical experiments illustrate the effectiveness of the proposed method in terms of position and velocity consensus.

2 - Macroscopic Modeling of the Spatial-temporal Information Flow Propagation Waves under Vehicle-to-Vehicle Communications

Yong Hoon Kim, Purdue University, West Lafayette, IN,
United States of America, kim523@purdue.edu, Srinivas Peeta,
Xiaozheng He

This study proposes an integrated model consisting of integro-differential equations to describe the information flow propagation process and a partial differential equation to describe the traffic flow dynamics. It incorporates the success rate of communication with distance and interference as a probability density function, and provide a closed-form solution for the speed of the information propagation wave. Numerical experiments are conducted to analyze the performance of the proposed model.

3 - Vehicle Trajectory Reconstruction under the Mixed Connected Vehicle Environment

Feng Zhu, Purdue University, West Lafayette, IN,
United States of America, zhu214@purdue.edu,
Satish V. Ukkusuri

This paper sets out to reconstruct the trajectory of non-connected vehicles based on the trajectory of connected vehicles only. The trajectory reconstruction problem is formulated in the linear state-space modeling (SSM) framework, where the state dynamics is captured by the simplified car following model. Next a modified EM (Expectation-Maximization) algorithm is developed to obtain the optimal estimation of the unknown trajectory and model parameters simultaneously. The performance of the EM algorithm is tested and validated through the simulation data.

4 - A Mathematical Model to Locate Optimal Lane Changing Zone at a Highway Off-ramp

Siyuan Gong, Illinois Institute of Technology, Chicago, IL,
United States of America, sgong1@hawk.iit.edu, Lili Du

This research seeks to locate an optimal temporal-spatial lane change zone around a highway off-ramp. This zone will grant enough opportunities for vehicles to proposed and validated by simulation experiments so that the resulted time delay can be minimized. A mathematical model combining traffic flow analysis is conduct smooth lane change maneuvers before an off ramp

Plymouth, MI, 48170, United States of America,
yohan.shim@scenaria.com, Travis Tamez, Christopher Molloy,
Frederic Jacquelin

The United States National Highway Traffic Safety Administration (NHTSA) has issued in August 2012 final rules and regulations for Corporate Average Fuel Economy (CAFE) for model years 2017 and beyond. NHTSA sets national CAFE standards under the Energy Policy and Conservation Act to improve fuel economy for passenger cars and light trucks. We present a mathematical program model and efficient heuristics to support vehicle manufacturer's long-term strategic decisions on CAFE credit utilization.

2 - Highway Cost Allocation for Vehicle Classes with Variable Traffic Capacity Requirements

Saurav Kumar Dubey, PhD Student, Department Of Industrial
And Systems Engineering, University of Tennessee at Knoxville,
1615 Laurel Avenue, Knoxville, TN, 37916, United States of
America, skumardu@vols.utk.edu, Alberto Garcia-Diaz

A Highway Cost Allocation model with variable traffic capacity levels is developed to distribute costs among vehicle classes. The discrete Aumann-Shapley value is used to generate costs for all coalitions in the least core model. Rules for tie breaking to get a unique allocation known as the nucleolus are discussed.

3 - Competition and Regulation of the Taxi Market with Ride-sourcing Platforms

Liteng Zha, University of Florida, 365 Weil Hall, Gainesville, FL,
32611, United States of America, seuzha@gmail.com, Yafeng Yin

Ride-sourcing platforms such as Uber and Lyft are eroding the traditional taxi market. Despite of their attractiveness, controversies arise over the legality and reliability of their services as well as the fairness of the competition to regular taxis. This study offers a quantitative investigation of the taxi market with ride-sourcing platforms and investigates its regulation strategies.

4 - Biobjective Efficient Driving of Electric Vehicles on an Edge of a Network

Hadi Farhangi, Research Assistant, Missouri University of Science
and Technology, 1870 Miner Cir, Rolla, MO, 65401, United States
of America, hfrhc@mst.edu, Dincer Konur, Warren Vaz,
Umit Koylu

This study analyzes driving profile for an electric vehicle between two nodes, i.e., on an edge of a network. We consider acceleration, maximum speed, and deceleration as decision variables. The energy consumed and the travel time required are functions of these variables as well as the load carried and the distance traveled. We investigate the energy and time minimizing driving profiles through a bi-objective optimization approach.

Design and Analysis of Data with Complex Structure

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Xinwei Deng, Assistant Professor, Department of Statistics, Virginia Tech, 211 Hutcheson Hall, Blacksburg, VA, United States of America, xdeng@vt.edu

Co-Chair: Ran Jin, Virginia Tech., Grado Department of Industrial and Systems Engineering, Blacksburg, VA, 24061, United States of America, jran5@vt.edu

1 - Markov Switching Autoregressive Models with Applications in Cell Biology

Ying Hung, Rutgers University, Piscataway, NJ, United States of America, yhung@stat.rutgers.edu

We will introduce a new framework based on Markov switching autoregressive models for the analysis of experiments in cell biology.

2 - Sparse Particle Filtering

Yun Chen, University of South Florida, 4202 E. Fowler Ave. ENB118, Tampa, FL, United States of America, yunchen@mail.usf.edu, Hui Yang

Wireless sensor network has emerged as a key technology for monitoring space-time dynamics of complex systems. Distributed sensing gives rise to spatially-temporally big data. Realizing the full potentials of distributed sensing calls upon the development of space-time modeling of measured signals in dynamically-evolving physical environment. This paper will present a new approach of sparse particle filtering to model spatiotemporal dynamics of big data in distributed sensor network.

3 - Graphical Modeling with Functional Variables

Ran Jin, Virginia Tech., Grado Department of Industrial and Systems Engineering, Blacksburg, VA, 24061, United States of America, jran5@vt.edu, Hongyue Sun, Shuai Huang

Graphical models are widely used to model variable relationship. Traditional graphical models are mainly used to model scalar variables. In this paper, a graphical model with functional variables is proposed. Functional regression models, combined with sparsity-inducing norms, are applied for the graphical modeling. A case study and simulation will be used to evaluate the proposed method.

4 - Optimal Design of Experiments for Generalized Linear Models

Abhyuday Mandal, University of Georgia, Department of Statistics, 101 Cedar Street, Athens, GA, 30602-7952, United States of America, amandal@stat.uga.edu, Liping Tong, Jie Yang, Dibyen Majumdar

Generalized linear models have been used widely for modeling the mean response both for discrete and continuous random variables with an emphasis on categorical response. Here we find efficient designs in the context of several optimality criteria, namely D-optimality, EW-optimality and Bayesian optimality. Regular fractional factorials with uniform replications are often used in practice. We show that these popular designs are often not optimal for binomial, Poisson and multinomial cases.

Recent Advances in Analyzing Experiments

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Rong Pan, Associate Professor, Arizona State University, P.O. Box 878809, Tempe, AZ, United States of America, rong.pan@asu.edu

1 - Performance of Standard Mixture Designs in Modeling Ordinal Responses

Mickey Mancenido, Arizona State University, 699 S. Mill Ave., Tempe, AZ, United States of America, mmanceni@asu.edu, Douglas Montgomery, Rong Pan

Mixture designs for the proportional odds model — the widely used model for ordinal data — are lacking in literature. A viable surrogate are the standard mixture designs for linear models with normal errors. We are interested in the performance of the simplex-lattice with axial runs, simplex-centroid, computer-generated I-optimal, and the uniform space-filling designs when used in a mixture study with an ordinal response.

2 - Generating and Comparing Pareto Fronts of Experiment Designs to Account for Multiple Objectives

Byran Smucker, Assistant Professor, Miami University, 100 Bishop Circle, 311 Upham Hall, Oxford, OH, 45056, United States of America, smuckerb@miamiOH.edu, Yongtao Cao, Tim Robinson

In many design scenarios the experimenter entertains multiple, conflicting objectives. The Pareto approach to experiment design is to construct a set of designs while explicitly considering trade-offs between criteria. The true Pareto front is not known, which creates problems in assessing front quality, and existing algorithms are inefficient, ineffective, or both. Here, we introduce an improved measure of front assessment, and present a new algorithm to generate Pareto fronts of designs.

3 - Cost Constrained ALT with Exponentially Changing Stress Durations

David Han, University of Texas, One UTSA Circle, San Antonio, TX, United States of America, David.Han@utsa.edu

When designing ALT, several variables such as the allocation proportions and stress durations must be determined carefully because of constrained resources. This talk discusses the optimal decision variables based on the popular optimality criteria under the constraint that the total cost does not exceed a pre-specified budget. A general scale family of distributions is considered to accommodate different lifetime models for flexible modeling with exponentially decreasing stress durations.

4 - Integration of Computer and Physical Experiments for Improving Predictive Inference

Arda Vanli, Associate Professor, Florida State University, Tallahassee, FL, avanli@fsu.edu, Spandan Mishra

A Bayesian predictive approach is developed to combine data from designed experiments on physical process and computer predictions. Predictive distribution of a regression model is used for inference on the outcome variable and issues including predictive capability, model adequacy and sensitivity to prior specifications are discussed. Applications from structural loss prediction and quality control are presented for illustrations.

Bayesian Applications in Industrial Statistics

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Refik Soyer, The George Washington University, 2201 G St NW, Washington, DC, United States of America, soyer@gwu.edu

1 - What do Coin Tosses, Vessel Traffic Risk Assessment and Return Time Uncertainty Have in Common?

Johan Rene Van Dorp, Professor, The George Washington University, 800 22nd Street NW, Suite 2800, Washington, DC, United States of America, dorpr@gwu.edu, Jason Merrick

Via a coin toss argument we will advocate decision making under uncertainty in vessel traffic risk assessment to be informed by relative risk comparisons by highlighting the analogy of an accident potentially occurring in a traffic situation with the toss of a biased coin. That same analogy is next used to demonstrate the large uncertainty bands that result for average return times of accidents in this context.

2 - Integrating Expert Judgement and Bayesian Analysis

Thomas A. Mazzuchi, Professor And Chairman, George Washington University, Washington DC, DC, 20052, United States of America, mazzu@gwu.edu

There is a growing need for marrying the fields of expert judgement and Bayesian Analysis that is, using the Expert Judgement approach to define prior distributions and for understanding the effects of the elicitation, codification and combination on the prior distribution and subsequent posterior analysis. This paper presents an investigation of the above for a simple model using the Classical Model for Expert Judgment by Cooke (2001).

3 - An Augmented Simulation Approach for Bayesian Design of Life Tests

Refik Soyer, The George Washington University, 2201 G St. NW, Washington, DC, United States of America, soyer@gwu.edu

In this talk we consider a Bayesian decision theoretic setup for optimal design of life tests. More specifically, we consider use of augmented probability simulation with a conjugate class of utility functions for design of life tests. We illustrate the implementation of the approach in one and two stage designs.

4 - Bayesian Updating of Dirichlet Process Prior via Kernel Estimate

Ehsan Soofi, University of Wisconsin, Lubar School of Business,
Milwaukee, WI, United States of America, esoofi@uwm.edu,
Neshat Beheshti, Jeffrey Racine

The standard nonparametric Bayesian approach uses multinomial proportions to update the Dirichlet Process Prior (DPP). We use kernel-smoothed CDF instead of the multinomial proportions for updating DPP. Applications include Bayesian measures and inferences for distributional fit and for dependence of random variables via the information measure of copula. The posterior mean of the quantized entropy provides a Bayes estimate of the dependence.

IBM Research Best Student Paper Award IV

Sponsor: Service Science

Sponsored Session

Chair: Ming-Hui Huang, National Taiwan University, Taiwan - ROC,
huangmh@ntu.edu.tw

1 - Best Student Paper Competitive Presentation

Ming-Hui Huang, National Taiwan University, Taiwan - ROC,
huangmh@ntu.edu.tw

Finalists of the IBM Research Best Student Paper Award present their research findings in front of a panel of judges. The judging panel will decide the order of winners, which will be announced during the business meeting of the Service Science Section at the Annual Conference.

2 - Can Objective Early Warning Scores and Subjective Risk Assessments Predict Patient's Hospital Length of Stay and Mortality?

Nasibeh Azadeh-Fard, PhD Candidate, Virginia Tech,
544 Whittemore Hall, Virginia Tech, Blacksburg VA 24061,
United States of America, nasibeh@vt.edu, Jaime Camelio, Navid Ghaffarzadegan

This paper presents a dynamic simulation model of patient's health outcome and length of stay based on initial health risk and physician's assessment of risk. Simulation results are empirically supported by analyzing a detailed dataset of 1,031 patients admitted to a large southeastern hospital in US.

3 - Dynamic Personalized Monitoring and Treatment Control of Glaucoma

Pooyan Kazemian, PhD Candidate, University of Michigan-Ann Arbor, 1205 Beal Ave., Ann Arbor MI 48105, United States of America, pooyan@umich.edu, Jonathan Helm, Mariel Lavieri, Joshua Stein, Mark Van Oyen,

We develop an innovative modeling framework for chronic disease patients to help guide clinicians to quickly detect disease progression and adjust the treatment plan over time to limit disease progression. The model is able to (1) optimize the time interval between sequential monitoring tests; (2) specify the best set of tests to take during each patient's office visit; and (3) provide target values for the controllable disease risk factors. Glaucoma is discussed as a case study.

4 - Evaluating Consumer m-Health Services for Promoting Healthy Eating: A Randomized Field Experiment

Yi-Chin Lin, CMU, 5000 Forbes Avenue, Pittsburgh PA 15213,
United States of America, yichinl@cmu.edu, Vibanshu Abhishek,
Julie Downs, Rema Padman

Mobile apps have great potential to provide promising services to improve consumers' engagement and behaviors. Focusing on healthy eating, this study shows that an image-based professional support greatly improves consumer engagement and eating behaviors, while social media and a heuristic approach of self-management might have negative effects in some occasions.

5 - Dynamic Matching in a Two-Sided Market

Yun Zhou, University of Toronto, 105 St. George Street, Toronto,
ON, Canada, Yun.Zhou13@Rotman.Utoronto.ca, Ming Hu

A two-sided market often shares a common structure that engages three parties: the supply side, the demand side and an intermediate firm facing intertemporal uncertainty on both supply/demand sides. We propose a general framework of dynamically matching supply with demand of heterogeneous types (with horizontally or vertically differentiated types as special cases) by the intermediary firm and explore the optimal and heuristic matching policies.

Rare Event Simulation and Network Applications

Sponsor: Simulation

Sponsored Session

Chair: John Shortle, George Mason University, 4400 University Dr.,
MSN 4A6, Fairfax, VA, United States of America, jshortle@gmu.edu

1 - Rare-event Simulation for Queues with Time-varying Arrivals

Ni Ma, Columbia University, 500 West 120th Street, Room 345,
New York, NY, 10027, United States of America,
nm2692@columbia.edu, Ward Whitt

We show that the exponential tilting approach for rare-event simulation in the GI/G/1 queue can also be applied to efficiently estimate the time-varying periodic-steady-state probability of large delays in a Mt/GI/1 single-server queue with periodic arrival rate function.

2 - Green Simulation Designs for Repeated Experiments

Mingbin Feng, PhD Candidate, Northwestern University, 2145
Sheridan Rd, Rm C210, Evanston, IL, 60208, United States of
America, benfeng@u.northwestern.edu, Jeremy Staum

In many applications of simulation, such as in financial risk management, experiments are usually repeated with similar inputs. In these cases simulation outputs should be viewed as useful resource that should be recycled and reused to improve the efficiency of subsequent experiments. We consider a periodic credit risk evaluation problem in the KMV model and the numerical results show improving accuracy over time, measured by mean squared error, as more and more outputs are recycled.

3 - A General Golf Course Simulation Tool: Keeping Delays Down and throughput Up

Moonsoo Choi, Columbia University, Department of Industrial
Engineering, New York, NY, 10027, United States of America,
mc3983@columbia.edu, Qi Fu, Ward Whitt

We describe a simulation tool for designing and managing golf courses. Group play is represented by eighteen queues with precedence constraints, in series, where the primitives are the random group playing times on each stage of a hole. We characterize balanced courses and show the advantages over unbalanced courses.

4 - Rare-event Simulation for Vulnerability Analysis of Power Grids

John Shortle, George Mason University, 4400 University Dr.,
MSN 4A6, Fairfax, VA, United States of America,
jshortle@gmu.edu, Jie Xu, Chun-hung Chen

Vulnerability of a power grid can be evaluated by systematically considering failures of individual elements and estimating the likelihood of a large-scale blackout following these initial failures. This talk presents a method for identifying vulnerable links by using a low-fidelity model of the power system to guide simulation of a higher-fidelity model. Numerical examples using real power systems are given.

1 - A Practical Application of Large-Scale Capacitated Facility Location

Uday Rao, Professor, OBAIS Department, College of Business,
University of Cincinnati, Cincinnati, OH, 45221, United States of
America, uday.rao@uc.edu, Amit Raturi, Maria Caridi

We study a large-scale capacitated facility location problem motivated by interaction with a company in the US Midwest. The problem has 1000 locations with demand seasonality, several facility types differing in capacity, fixed installation and variable operating costs, and transportation costs depending on transportation speed / mode selected. We present solution approaches using mathematical programming, clustering and quick heuristics. We test sensitivity to problem parameters.

2 - A Branch-and-Price Algorithm for Switchgrass Logistic Supply Chain Design

Maichel M. Aguayo Bustos, Virginia Tech, 250 Durham Hall, 1145 Perry Street, MC 0118, Blacksburg, VA, 24061, United States of America, maiguay@vt.edu, Subhash C. Sarin, John S. Cundiff

Given the locations of a bio-energy plant and storage facilities for a switchgrass-based bio-ethanol supply chain, we introduce a multi-period mixed integer programming model to determine both strategic and tactical decisions. A novel branch-and-price approach is used to obtain near-optimal solutions for large-sized problem instances. Results of its implementation to a case study are also presented.

3 - A Newsvendor Problem with Multiple, Capacitated Suppliers and Marginal Quantity Discounts

Roshanak Mohammadivojdan, PhD Student, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32611, United States of America, rmohammadivojdan@ufl.edu, Joseph Geunes

We consider a newsvendor who may order stock from multiple, capacitated suppliers, each of which offers a marginal quantity discount pricing structure. The newsvendor seeks to minimize its total procurement plus expected overstock and understock costs, resulting in an objective function consisting of a sum of convex and concave terms. We provide an algorithmic approach that permits solving this non-convex problem in pseudopolynomial time by solving a set of 0-1 knapsack subproblems.

4 - An Integrated Model for Supplier Selection and Optimal Order Allocation Considering Uncertainty

Majid Hooshmandi Maher, Allameh Tabatabaie University, Faculty of Management & Accounting, Hemmat Exp, Tehran, Iran, majidhooshmand@gmail.com

This paper first presents an approach for supplier evaluation based on integrated multiple criteria decision making model and then proposes a mathematical model to optimize the order allocation in a supply chain considering uncertainty in different parameters. An Iranian automobile company is utilized as a case study. The mathematical model is solved by genetic algorithm and the performance of the model is verified using other optimization approaches.

5 - The Production Routing Problem with Vehicle Costs

Robert Russell, Professor of Operations Management, Univ. of Tulsa, 800 S Tucker Drive, College of Business, Tulsa, OK, 74104, United States of America, russell@utulsa.edu

This paper addresses the integration of production, inventory, distribution, and vehicle costs for supplying retail demand locations from a production facility. A mixed integer model is used to determine an approximate solution to the production routing problem with vehicle costs and a vehicle routing metaheuristic is used to sequence routes for each time period. Computational results are reported and compared to results from the traditional production routing problem.

Electricity Markets and Utilities

Contributed Session

Chair: Chung-Hsiao Wang, LG&E and KU, 102 Spruce Ln, Louisville, KY, United States of America, chunghsiao@hotmail.com

1 - Analysis of Consumer Behavior Towards Dynamic Residential Electricity Pricing

Prajwal Khadgi, PhD Candidate, University of Louisville, Speed School of Engineering, Louisville, KY, 40219, United States of America, p0khad01@louisville.edu, Lihui Bai

Variable electricity pricing for the control of residential load has attracted much interest in the field of demand response, and static variable pricing such as time of use rates has had successful applications in the US as an optional service. However, dynamic variable pricing remains an open question, due to lack of understanding on consumer behavior. We study consumer behavior against two dynamic rates, i.e., demand charge and load-following rates, using utility functions and simulation.

2 - A Dynamic Garch Model for Energy Portfolio Allocation in Electricity Markets

Reinaldo Garcia, Associate Professor, University of Brasilia - UnB, Faculty of Technology, Industrial Engineering Department, Brasilia, 70904-970, Brazil, rcgarcia@unb.br, Javier Contreras, Virginia González, Janiele E. S. C. Custodio

In the deregulated electricity markets, a Generation Company (Genco) has to optimally allocate their energy portfolio. Modern Portfolio Theory (MPT) allows a Genco to maximize their profit and decrease their associated risk. This paper proposes a model where MPT is combined with a Generalized Autoregressive Conditional Heteroskedastic (GARCH) prediction model for a Genco to optimally diversify their energy portfolio. The model is applied to the PJM electricity market showing its capabilities.

3 - Intraday Electricity Load Forecasting using Rule-based Model

Myung Suk Kim, Professor, Sogang University, #1 Shinsu-Dong, Mapo-Gu, Seoul, Korea, Republic of, myungkim@sogang.ac.kr

A rule-based model selection methodology incorporating a multiplicative seasonal autoregressive with exogenous variables (ARX) model and a support vector machine (SVM) is provided and applied to Korean hourly electricity load data. We set up a rule that determines which of the SVM and ARX models should be applied to forecasting a specific hour within a day. The proposed rule-based model selection methodology outperforms its benchmarks.

4 - Modeling Grid Operations in China's Partially-Restructured Electricity Market

Michael Davidson, Massachusetts Institute of Technology, 400 Main Street, E19-411, Cambridge, MA, 02139, United States of America, michd@mit.edu, Valerie Karplus, Ignacio Perez Arriaga

Long transitions of restructuring vertically-integrated electric utilities can affect interim market operations and assumptions underlying tools for policy assessment. We develop a mixed integer unit commitment model of China's northeast region with several legacy central planning mechanisms modeled as regulatory constraints and penalties. We analyze their influence on system operation, test tractability of formulations and validate with actual operational outcomes.

5 - Fuel Hedging Strategy for Electric Power Utilities

Chung-Hsiao Wang, LG&E and KU, 102 Spruce Ln, Louisville, KY, United States of America, chunghsiao@hotmail.com, Kyung Jo Min

In recent years, natural gas combined cycle power plants have started to replace aging and less efficient coal power plants. Because fuel costs represent the majority of total costs for an electric power utility, how to manage volume and price risks for coal and natural gas fuel is critically important. In this paper, we develop mathematical models for structured and analytical guidelines on fuel hedging strategies for a utility owning both types of generation units.

1 - Planning Naval Aircraft Procurement, Enhancements, and Retirements Over 30 Years

Robert Dell, Professor And Chairman Of Operations Research,
Naval Postgraduate School, Code OR/De, Monterey, Ca, 93943,
United States of America, dell@nps.edu, Holly Zabinski,
Gerald Brown

This talk describes an integer linear program (ILP) developed to plan annual procurement of new United States Navy and Marine Corps aircraft, enhancements to aircraft, and retirement of aircraft over a 30-year horizon. ILP prescriptions must adhere to numerous annual and cumulative budget constraints, age requirements, and mission requirements. We present computational experience for realistic planning scenarios.

2 - An Optimization Approach to Integrated Requirements Development for Acquisition Programs

Alexander Dessanti, Sandia National Laboratories, P.O. Box 5800,
Albuquerque, NM, 87185-1188, United States of America,
adessan@sandia.gov

Requirements for defense acquisition programs have traditionally been developed in isolation with little regard for their interactive effects. Too often this results in program cancellation and billions of dollars wasted. This research seeks to improve defense acquisition processes by enabling a deep understanding of the interactions and potential conflicts between system requirements during their inception and suggesting defensible, mutually compatible goals that satisfy multiple stakeholders.

3 - Certification of Logistics Officers in the USAF

Kenneth Schultz, Associate Professor, AFIT, 2950 Hobson Way,
WPAFB, OH, 45433, United States of America,
Kenneth.Schultz@afit.edu

We study the costs and benefits for supporting Logistics Officer certification for Logistics Officers in the USAF. We compare civilian certification programs with a self developed program.

Scheduling I

Contributed Session

Chair: Qiong Zhu, Shanghai Jiao Tong University, Mechanical Engineering Building 715, Shanghai, 200240, China, 7384702@qq.com

1 - Scheduling Operations of Pumping Units in Onshore Oilfields under Electric-power Constraints

Eduardo Camponogara, Professor, Federal University of Santa Catarina, Depart. Automation and Systems Eng., Florianopolis, SC, 88040900, Brazil, eduardo.camponogara@ufsc.br

In onshore oilfields, rod pumps are powered by electric motors to lift oil from the bottom of production wells. The pumps operate according to cyclic control policies that alternate between on and off pumping periods designed to drive maximum production. This cyclic behavior gives rise to the problem of scheduling pumpoff operations to minimize the system power peak. This work presents MILP formulations for the coordination of control policies and their reconfiguration during operations.

2 - Operational Scheduling of Storage in Decentralized Energy Management

Johann Hurink, University of Twente, P.O. Box 217,
Enschede, 7500 AE, Netherlands, j.l.hurink@utwente.nl,
Thijs Van Der Klauw, Marco Gerards

Within decentralized energy management an important task is to steer a local micro grid towards a pre-specified energy profile over a given period. To reach this goal, storage is one of the crucial ingredients. In this talk we present concepts and algorithms to use storage devices to influence the energy profile of a micro grid. The objective takes into account the cost of the energy and the deviation from the desired profile.

3 - Assembly Flowshop Scheduling to Minimize Maximum Tardiness

Harun Aydilek, GUST University, Mishref, Mishref, Kuwait,
aydilek.h@gust.edu.kw, Asiye Aydilek, Ali Allahverdi

Two-stage assembly flowshop scheduling problem with the objective of minimizing maximum tardiness is addressed where setup times are separate. A hybrid simulated annealing algorithm is proposed. Results show that the algorithm not only performs well for separate setup times case but also for zero setup times case.

4 - Multi-agent Based Production Scheduling Service for Cloud Manufacturing

Qiong Zhu, Shanghai Jiao Tong University, Mechanical Engineering Building 715, Shanghai, 200240, China,
7384702@qq.com, Jie Zhang

This paper applies the multi-agent system and cloud computing technologies to establish production scheduling service for cloud manufacturing paradigm. Each Multi-Agent system is packed with an intelligent algorithm solution for different types of workshop. The self adaptive parameter setting mechanism is designed for the algorithm based on the workshop parameter.

5 - Genetic Algorithm Based Approach for the Airline Crew Pairing Problem

Muhammet Deveci, Yildiz Technical University, Yildiz Campus A block 34349, Besiktas/Istanbul, Istanbul, Turkey,
muhammetdeveci@gmail.com, Nihan «etin Demirel

The aim of the airline crew-pairing problem (CPP) is to generate a set of minimal cost crew pairings covering all flight legs. The model has been formulated as set covering problem. The proposed approach is based on a hybrid genetic algorithm (GA). In fact, some heuristics are developed in the GA's process. Also a branch-and-bound algorithm is applied to test the airline CPP. Our results clearly demonstrate the success of our solution approaches on real-world instances

03-Room 303, Marriott

Logistics and Inventory Management

Contributed Session

Chair: Olga Rusyaeva, Kuehne Logistics University, Grofler Grasbrook 17, Hamburg, Germany, olga.rusyaeva@the-klu.org

1 - Managing Inventory of Perishable Products in Multiple Locations

Fang Liu, Assistant Professor, Nanyang Business School, Nanyang Technological University, 50 Nanyang Avenue, South Spine S3-B2A-13, Singapore, 639798, Singapore, liu_fang@ntu.edu.sg,
Yun Fong Lim

Consider a retailer selling multiple products with random demands over a single season. Upon receiving the products, the retailer stores them to multiple warehouses, each with a limited storage capacity. Because the costs to store and retrieve a unit of product vary with the warehouses, the retailer needs to properly assign the products and choose from which warehouses to retrieve these products after demand realizes. We study the retailer's optimal decisions in these two stages.

2 - Responsiveness Improvements in Inventory Management Systems with Imperfect Information

Sayed Shahab Mofidi, Rensselaer Polytechnic Institute, 110 8th St, CII 5007, Troy, NY, 12180, United States of America,
mofids@rpi.edu, Jennifer Pazour

In inventory management systems, discrepancies between recorded and physical stock in warehouses cause undesirable response times. To our knowledge, most of the existing research highlights the attained benefits of eliminating errors. In contrast, this research incorporates existing errors and associated costs of inappropriate response times in order-fulfillment decisions. We develop mathematical models that recommend policies to improve responsiveness in existing situations.

3 - Travel-time Models for 3D Compact Automated Storage and Retrieval Systems

Xiaozen Zhao, Huazhong University of Science and Technology, No.1037, Luoyu Road, Hongshan District, Wuhan, HB, 430074, China, zxzhu@163.com, Xianhao Xu

In the 3D compact automated storage and retrieval systems, the stacker cranes are used to store or retrieve loads into/from the storage location. And the conveyors can move loads in the orthogonal direction. In this paper, we make the expected travel time model of the S/R machine, considering different I/O points and the dwell strategies of the S/R machine.

4 - An Inventory Control Model for Modal Split in Transportation: A Tailored Base-Surge Approach

Chuanwen Dong, Kuehne Logistics University,
Grosser Grassbrook 17, Hamburg, Germany,
chuanwen.dong@the-klu.org, Sandra Transchel, Kai Hoberg

We study an inventory control problem where a firm ships products from a plant to a distribution center via two transportation modes, a slow and cheap mode (e.g., rail) and fast but expensive mode (e.g., truck). In the slow mode, products are shipped with a constant volume, whereas fast-mode ordering follows a base-stock policy every period. We extend the tailored base-surge (TBS) policy to less frequent slow-mode shipments and present an approximated analytical solution approach.

5 - Optimal Time to Reposition Inventories in Multi-location Centralized Networks

Olga Rusyaeva, Kuehne Logistics University,
Grosser Grassbrook 17, Hamburg, Germany,
olga.rusyaeva@the-klu.org, Joern Meissner

Repositioning of inventories between locations aims to decrease the impact of inventory imbalance caused by e.g. imperfect demand information or delayed delivery. In practice, it is often done via lateral transshipments. Our dynamic transshipment policy answers questions – when within the order cycle, how much, and from which location to transship to maximize the revenue of the network. A myopic policy and a near-optimal policy based on approximation are suggested for real-size problems.

Station 5, Lausanne, VD, 1015, Switzerland,
maryam.razeghian@epfl.ch

1 - Discrete Choice Modeling Approach to Decide The Digital Divide Policy Issue

Subhabrata Bapi Sen, Adjunct Faculty, Sillberman College of
Business, 32 Rolling Hill Dr, Chatham, NJ, 07928,
United States of America, bapi45@fd.edu

Discrete choice framework to address the digital divide issue as reported in NY Times story “F.C.C. Chief Seeks Broadband Plan To Aid The Poor” Bridging Digital Divide. To focus on the main issue - we need to access to Broadband demand using a conditional logit formulation. The service attributes/demographics will be explanatory variables. June 6, 2015 in The Wall Street Journal article “Is the U.S. Ready to pay for ‘Quad Play’?” is analyzed here.

2 - On the Relevance of Probability Distortions in the Extended Warranties Market

Mike Abito, Assistant Professor, University of Pennsylvania
(Wharton), 3620 Locust Walk, SHDH 1407, Philadelphia, PA,
19104, United States of America, abito@wharton.upenn.edu

We study the reasons for high profits in the extended warranties market. Using data from a big US consumer electronics retailer, we find that overweighting of failure probabilities is a relevant factor in determining economic outcomes: without probability overweighting, profits drop by 90% and consumer surplus more than doubles. We also find that overweighting is affected by the environment and is reduced with learning.

3 - To Share or Not to Share: Adjustment Dynamics in Sharing Markets

Maryam Razeghian, Doctoral Student, EPFL, CDM-ODY 4.16,
Station 5, Lausanne, VD, 1015, Switzerland,
maryam.razeghian@epfl.ch, Thomas Weber

To describe and further predict the growth of sharing markets, we construct a model for the dynamic sharing decisions of heterogeneous suppliers in a market with frictions, allowing for a mismatch between supply and demand. In each time period, an agent can enter or leave the sharing market, subject to an adjustment cost. We provide a closed-form expression for the nonlinear evolution of the rational-expectations equilibrium in this economy, typically resulting in an S-shaped diffusion pattern.

Identifying Sentiment Change and Geographic Location in Social Media

Cluster: Social Media Analytics

Invited Session

Chair: Chris Smith, TRAC-MTRY, 28 Lupin Lane, Carmel Valley, 93924,
United States of America, cmsmith1@nps.edu

1 - Identifying Changes in Twitter Sentiment

Sam Buttrey, Assoc. Prof., Naval Postgraduate School,
Code OR/Sb, Monterey, CA, 93943, United States of America,
buttrey@nps.edu, Jon Alt

This ongoing research demonstrates the application of statistics and machine learning to identify spatio-temporal changes in population sentiment using 10 TB of recent Twitter data. It also seeks to compare Twitter sentiment to results of surveys taken in the same places and times. This comparison may inform uses of sentiment analysis as an alternative to the use of structured surveys in areas where surveying is infeasible. Practical difficulties in analyzing big data of this sort are discussed.

2 - Changes in Network Topography to Predict Social Unrest using Social Media

Rob Schroeder, Naval Postgraduate School, 526 Union St.,
Monterey, CA, 93940, United States of America,
rscshroe@nps.edu

In recent years, social media has become a common communication medium for social movements. These social movements are able to interact with members, sympathizers, and the general public using social media. This research analyzes how the overall structure of their interactions via Twitter change over time and compares the changes to planned events by the social movement.

3 - Better Defining Location and Attribute Data in Twitter by Utilizing Wikipedia Localization Text

Patrick Dudas, Contractor, NPS, 1215 Wisconsin Ave, Pittsburgh,
PA, 15216, United States of America, dudasp@gmail.com

Within Twitter understanding users' geolocation is subject to either the user geotagging their tweets or a high-level profile location. Working with Wikipedia and Twitter, we better define locations and their localized names and attributes by means of Wikipedia's rich datasets. Parsing Wikipedia, we can produce location objects and their localized translation of the location around the world, producing a better means of understandings both the user's location and voice on Twitter.

4 - Non-linear Dynamics of Human Emotions: Analysis of Twitter Data and its Implications

Les Servi, The MITRE Corporation, 202 Burlington Road,
Bedford, MA, United States of America, lservi@mitre.org,
Waldemar Karwowski, Dylan Schmorow, Nabin Sapkota

Exploration of the extent that human emotions, expressed in Twitter data, have chaotic and non-linear dynamics has profound implications in its use for forecasting a population's mood. This study examines such dynamics through the analysis of hundreds of thousands of Twitter messages.

Modeling and Computations in Financial Engineering

Sponsor: Financial Services

Sponsored Session

Chair: Lingfei Li, Assistant Professor, The Chinese University of Hong Kong, 608 William M.W.Mong Engineering BLD, Shatin, Hong Kong - PRC, lli@se.cuhk.edu.hk

1 - Long Term Risk: A Martingale Approach

Likuan Qin, Northwestern University, 2145 Sheridan Rd, Tech
C210, Evanston, IL, 60208, United States of America,
LikuanQin2012@u.northwestern.edu, Vadim Linetsky

We extend long-term factorization of the pricing kernel to general semimartingale environments, without assuming the Markov property. We explicitly construct long-term factorization in HJM models and affine models and decompose the market price of Brownian risk into the volatility of the long bond plus an additional risk premium defining the permanent martingale component in the long-term factorization.

2 - From Bermudan to American

Liming Feng, Associate Professor, University of Illinois at Urbana-Champaign, 104 S Mathews Ave, Urbana, IL, 61801, United States of America, fenglm@illinois.edu

The price of an American option could be approximated by that of a Bermudan option when the number of monitoring times is large enough. This talk presents results on convergence of the Bermudan option price and the early exercise boundary. Examples illustrate the effectiveness of pricing American contracts through the Bermudan approach.

3 - A Primal-dual Iterative Method for Stochastic Dynamic Programming

Nan Chen, Prof, Chinese University of Hong Kong, 709A William Mong Engineering Building, Hong Kong, Hong Kong - PRC, nchen@se.cuhk.edu.hk, Xiang Ma

We use the information relaxation technique to develop a value-and-policy iterative method to solve stochastic control problems. A sequence of upper and lower bound estimations on the true value functions and suboptimal policies are generated. We prove that the sequence converge to the optimal value and policy in a finite number of iterations.

4 - Modelling Time Dependence in Finance: A Time Change Approach

Lingfei Li, Assistant Professor, The Chinese University of Hong Kong, 608 William M.W. Mong Engineering BLD, Shatin, Hong Kong - PRC, lli@se.cuhk.edu.hk

We propose a time change method named as additive subordination for constructing time-inhomogeneous Markov processes with tractability for financial modelling. As an application, we develop an analytically tractable model for pricing VIX options that is able to achieve excellent fit to the volatility surface.

07-Room 307, Marriott

Risk Management Approaches in Engineering Applications

Cluster: Risk Management

Invited Session

Chair: Stan Uryasev, University of Florida, 303 Weil Hall, Gainesville, FL, United States of America, uryasev@ufl.edu

1 - Multidimensional Buffered Probability of Exceedance: Risk Averse Tail Probability Approximations

Alexander Mafusalov, University of Florida, P.O. Box 116595, 303 Weil Hall, Gainesville, FL, 32611-6595, United States of America, mafusalov@ufl.edu

Probability of exceedance (POE) is widely used but has major drawbacks. Buffered probability of exceedance (bPOE) is a conservative approximation of POE and eliminates some of its drawbacks. We suggest a new multidimensional generalization of bPOE (M-bPOE). M-bPOE is used to control exceedances for several random variables simultaneously. Calculation formulas and optimization formulations for M-bPOE are provided. Mathematical properties and possible applications for M-bPOE are studied.

2 - Soft Margin Support Vector Classification as Buffered Probability Minimization

Matthew Norton, University of Florida, 2449 NW 93rd St, Gainesville, FL, 32606, United States of America, mdnorton@ufl.edu, Alexander Mafusalov

We discuss a new concept called Buffered Probability of Exceedance (bPOE) and show that soft margin support vector classification is equivalent to bPOE minimization. This allows us to provide new insights into SVM's. We provide a new SVM formulation, called the EC-SVM, based upon these insights. We also provide a general framework connecting soft margin support vector classification and superquantile concepts.

3 - Support Vector Machines Based on Convex Risk Functionals and General Norms

Stan Uryasev, University of Florida, 303 Weil Hall, Gainesville, FL, United States of America, uryasev@ufl.edu, Jun-ya Gotoh

We study unified formulations of support vector machines (SVMs) for binary classification, minimizing a combination of an arbitrary convex risk functional and an arbitrary norm-based regularizer. Especially, we investigate a condition under which nontrivial formulations can be obtained and what properties of risk functionals play roles in attaining interpretable dual formulations and/or tractable robust counterparts for robust optimization modelings.

4 - Energy Commodities: A Tool for Hedging and Investments

Rita D'Ecclesia, Birkbeck, University of London, Department of Economics, Mathematics and Statistics, rita.decclesia@uniroma1.it

Energy commodity prices in US and in Europe have shown increasing volatility, change in the relationship with other commodity prices and the traditional financial assets is also observed. Given the non stationarity of their returns we aim to measure the relationship existing between them and traditional financial assets using time varying volatility and correlation estimators. A portfolio diversification framework is also set using stochastic optimization modelling.

Innovation and Technology Management

Contributed Session

Chair: Zhongyuan Xu, Harbin Engineering University, 61th Building, 3046 Room, Harbin, China, xuruby0624@163.com

1 - Exploring Creative Collaboration in Maker Communities

Yi-tzu Chang, Department of Public Relations and Advertising, Shih-Hsin University, No.1, Ln. 17, Sec. 1, Muzha Rd., Wenshan, Taipei, Taiwan - ROC, silverzal315@gmail.com, Cheng-chieh Hsiao

The maker movement has drawn more and more attention from both management research and practice regarding information, technology, and innovation. Makers are creators who use digital technologies (e.g., 3D printing) to design and fabricate products collaboratively in DIY communities like FabLabs and makerspaces. This study interviews with 3D printing makers and develops a motivation-ability-opportunity framework to delineate creative collaboration in maker communities.

2 - How Much do Firms Earn in a Cooperative Innovation? From the Perspective of Relational Rent

Si Zhang, University of Chinese Academy of Sciences, 1-1-23A Zhong Hai Fu Yuan, Zengguang Rd 37, Haidian District, Beijing, China, zhangsi@ucas.ac.cn, Jizhen Li, Na Li

The paper first constructs an evaluation system that allows quantitative estimation and categorization of the relational rent generated by partners in collaborative innovation. Three types of rent are discovered, i.e. the individual, interactive and serendipitous rent. We then examine how the interdependence/relationship of focal paired firms affects the generation of rent. Valuable implications are provided to enterprises in the gaining and maximizing of benefits in innovative collaborations.

3 - Equity Split and Performance of High-technology Ventures: Whose Hands to Put the Company in?

Yueheng Wang, Tsinghua University, Room 729B, Zijing Apartment No.14, Tsinghua University, Beijing, 100084, China, wangyh.08@gmail.com, Yanbo Wang, Jizhen Li

The impact of equity split on firm performance is a crucial yet controversial topic regarding high-technology ventures in which shareholders play comparatively significant roles. With data of 626 Chinese high-technology ventures, we founded a curvilinear relationship between share concentration and firm performance, together with opposite moderating effects of board's functional diversity and firm age, which reveal significant implications for shaping shareholder compositions within those firms.

4 - Innovation Networks and Innovation Performance: The Intermediary Role of Knowledge Management Capability

Zhongyuan Xu, Harbin Engineering University, 61th Building, 3046 Room, Harbin, China, xuruby0624@163.com

This study extends the relationships between different innovation networks and innovation performance from a new perspective of knowledge management capability. Based on a survey to 239 Chinese knowledge intensive firms, this study empirically demonstrates how knowledge management capability plays an intermediary role from different innovation networks to innovation performance.

5 - Corporate Venture Capitalist Dependability and Their Inclusion in Venture Capital Syndicates

Joseph Cabral, PhD Student, Rensselaer Polytechnic Institute, 124 Ferry Street, Apt. 213, Troy, NY, 12180, United States of America, cabraj2@rpi.edu

Given that the venture capital industry involves great uncertainty, mutual dependency and staged investment, the reliability of partners is critical to the decision to co-invest. Using logic consistent with transaction cost economics Corporate Venture Capitalists are argued to be less predictable than traditional venture capitals and as a result are excluded from earlier rounds of investment where the greatest uncertainty and need for flexibility exists.

Optimization Large Scale II

Contributed Session

Chair: Lukas Bach, SINTEF, Forskningsveien 1, Oslo, 0373, Norway, lukas.bach@sintef.no

1 - Assortment Planning for Configurable Products with Consideration for Substitution

Ying Tang, Graduate Research Assistant, Wayne State University, 4815 Fourth Street, Detroit, MI, 48202, United States of America, ei3512@wayne.edu, Ratna Babu Chinnam, Alper Murat, Joshua Lyon

We develop assortment planning models for vehicle programs of a large automaker to support its strategic product planning efforts. We emphasize two objectives: 1) Utilizing both non-parametric and parametric approaches for characterizing demand. 2) Scalability of the models to support real-world programs. We will also present results representative of a North American vehicle program.

2 - Natural Gas System Operations and Expansion Planning for Reliability

Conrado Borraz-sanchez, Associate Postdoctoral Researcher, Los Alamos National Laboratory, 1927 22nd Street Apt. D, Los Alamos, NM, 87544, United States of America, conrado.borraz@gmail.com, Pascal Van Hentenryck, Scott Backhaus, Russell Bent, Hassan Hijazi

We present a MINLP formulation to tackle natural gas network expansion planning problems. Our model captures physical, operational, directionality and on/off constraints. However, given its non-convexity, we propose a second-order cone relaxation that proves to be highly effective on large-scale cases that include existing Belgian and German networks. Comparisons against a piecewise linearization approach also show the advantages of our approximation in terms of its robustness and scalability.

3 - Adaptive Large Neighborhood Search using the Graphics Processing Unit

Lukas Bach, SINTEF, Forskningsveien 1, Oslo, 0373, Norway, lukas.bach@sintef.no, Geir Hasle, Christian Schulz

We investigate the efficiency of Adaptive Large Neighborhood Search on the Graphics Processing Unit (GPU). We do this by implementing the algorithm for the Distance-constrained Capacitated Vehicle Routing Problem (DCVRP), which we benchmark towards a state of the art CPU implementation. The computational power of the GPU in ordinary computers has increased significantly in recent years. Therefore it is interesting to utilize this computing power. We perform tests on well-known DCVRP instances.

Optimization Stochastic I

Contributed Session

Chair: Sebastian Maier, Imperial College London, South Kensington Campus, London, SW7 2AZ, United Kingdom, s.maier13@imperial.ac.uk

1 - A Hierarchical Markov Decision Process for Finding the Best Replacement Policy of Fattening Pigs

Reza Pourmoayed, PhD Student, Aarhus University, Department of Economics and Business, Fuglesangs Allé, Aarhus, 8210, Denmark, rpourmoayed@econ.au.dk, Lars Relund Nielsen

We use a hierarchical Markov decision process to model the sequential decision problem of replacing fattening pigs for slaughter. State of the system includes the weight and the price information acquired by two statistical models based on a Bayesian updating approach. Transition probabilities and rewards are calculated using the statistical models and a simulation method, respectively. Numerical examples are given to show the functionality of the proposed model.

2 - Quantile Optimization for Heavy-tailed Distributions using Asymmetric Signum Functions

Ricardo Collado, Stevens Institute of Technology, Howe School of Technology Management, Hoboken, NJ, United States of America, rcollado@stevens.edu, Jae Ho Kim, Warren Powell

We present an algorithm for computing the quantile of a continuous random variable that does not require the existence of expectation or storing all of the sample realizations. We use this to optimize the quantile of a random function satisfying some strict monotonicity and differentiability properties. We apply this to the problem of electricity trading in the presence of storage, where electricity prices are known to be heavy-tailed with infinite variance.

3 - A Dynamic Size Sample Average Approximation for Stochastic Optimization

Adindu Emelogu, Mississippi State University, 260 McCain Building, Mississippi State, MS, 39762, United States of America, emeloguadindu@yahoo.com, Linkan Bian, Mohammad Marufuzzaman

The Sample Average Approximation (SAA) is a method of solving stochastic optimization problems by replacing the objective function with an approximation. The size of the sample affects the convergence of the solution of the approximation and the computation time. We propose an algorithm that dynamically updates the sample size in SAA and ensures both convergence and reasonable computation time. We apply our algorithm to a supply chain problem in health care, and compare it with other algorithms.

4 - Risk-averse Stochastic Path Interdiction

Stephan Meisel, University of Muenster, Department of Information Systems, Muenster, Germany, stephan.meisel@uni-muenster.de, Laura Priekule, Ricardo Collado

We propose a new risk-averse approach to allocating security resources in a network. Resources are allocated for blocking with high probability an attacker that selects a path for traversing the network. The attacker is characterized by an unknown probability distribution and resources are allocated based on beliefs about the distribution. We formulate the problem as a linear program and use coherent risk measures for getting solutions that are risk-averse with respect to errors in the beliefs.

5 - Appraising Interdependent Physical and Digital Infrastructure Investments: An Option Games Approach

Sebastian Maier, Imperial College London, South Kensington Campus, London, SW7 2AZ, United Kingdom, s.maier13@imperial.ac.uk, David Gann, John Polak

We present a new option games-based appraisal framework for selecting a portfolio of interdependent physical and digital infrastructure investments. We have used this framework to formulate a multistage stochastic optimisation model that combines the Least Squares Monte Carlo algorithm with the modelling of infrastructure interdependencies. We investigate the sensitivity of the optimised portfolio value and option exercise strategies to changes in competitor's decisions and strategic behaviour.

Stochastic Integer Programming Methods and Applications

Sponsor: Optimization/Optimization Under Uncertainty
Sponsored Session

Chair: Lewis Ntamo, Associate Professor, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, ntamo@tamu.edu

Co-Chair: Saravanan Venkatachalam, Texas A&M University, saravanan@tamu.edu

1 - Scaling Scenario Decomposition Methods for 0-1 Stochastic Programming

Kevin Ryan, Georgia Institute of Technology, kryan31@gatech.edu, Deepak Rajan, Shabbir Ahmed

A recently proposed scenario decomposition algorithm for stochastic 0-1 programs finds an optimal solution by evaluating and removing individual solutions discovered by solving scenario subproblems. We develop techniques for applying a parallel implementation of this algorithm to difficult problems with many first stage variables and a moderate number of scenarios. Challenges include problem symmetry and effective parallelization. Computational results from large scale problems are presented.

2 - Robust Multicriteria Risk-averse Stochastic Programming

Simge Kucukyavuz, Associate Professor, The Ohio State University, 210 Baker Systems Building 1971 Neil Ave, Columbus, OH, United States of America, kucukyavuz.2@osu.edu, Xiao Liu, Nilay Noyan

We study risk-averse models for multicriteria optimization problems under uncertainty. We use a weighted sum-based scalarization and consider a set of scalarization vectors to address the ambiguity and inconsistency in the relative weights of each criterion. We introduce a model that optimizes the worst-case multivariate CVaR and develop a finitely convergent algorithm for finite effectivity spaces. Our computational study illustrates the effectiveness of the proposed methods.

3 - Decomposition Algorithm for Two-stage Stochastic Integer Programs with Deviation Risk Measures

Saravanan Venkatachalam, Texas A&M University,
3131 TAMU, College Station TX 77843, saravanan@tamu.edu,
Lewis Ntamo, Bernardo Pagnoncelli

In this talk, we present a decomposition algorithm for two-stage stochastic integer programs (SIP) with absolute semi-deviation (ASD) risk measures. These types of problems are hard to decompose due to the lack of amenable problem structure. We propose a methodology that uses the information from expected excess risk measure to solve SIPs with ASD risk measures. Preliminary computational results will be presented.

Advances in Information Modeling

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Eugene Perevalov, Lehigh University, 200 W Packer Ave, Bethlehem, PA, United States of America, eup2@lehigh.edu

1 - Information Sources' Knowledge Structure, Question/Answer Depth and Information Relevance

Eugene Perevalov, Lehigh University, 200 W Packer Ave, Bethlehem, PA, United States of America, eup2@lehigh.edu,
Xing Wang

To optimize the process of information acquisition, a problem solving agent analyzes both the available information and the information relevant to the given problem, and, based on such analysis, selects the information source(s) that can help obtain the largest improvement of the solution quality. Currently, this is done on a largely ad hoc case-by-case basis. Our goal is to develop a general theory providing a regular way of performing such a selection.

2 - Towards the Full Information Theory: Knowledge Structure of Information Sources

Xing Wang, Lehigh University, 200 W Packer Ave, Bethlehem, PA, United States of America, xiw313@lehigh.edu,
Eugene Perevalov

The classical Information Theory was able to properly describe the sheer quantity of information which allowed for optimization of information transmission leaving the process of information acquisition still in the "pre-theoretical" state relying on ad-hoc approaches. We initiate the study of the latter which makes it necessary to describe the ability of information sources to change the agent's information state depending on the specific information requested.

3 - Using Network Diversity in Analytics and Visualization

Seifu Chonde, Student, The Pennsylvania State University,
311 Leonhard Building, University Park, PA, 16802,
United States of America, sjc294@psu.edu, Soundar Kumara

In 2007, the Rao-Stirling diversity framework was introduced to capture changes in the variety, balance, and disparity among nodes in networks. We extended this diversity measure to include coherence, which captures network density. We show how our diversity measure improves approaches in clustering, link prediction, and tracking evolutionary networks. We use a case study in drug design with hundreds of thousands of journal articles to motivate the study of diversity.

Monitoring and Prevention of Hospital Acquired Infections

Sponsor: Optimization in Healthcare

Sponsored Session

Chair: Eduardo Pérez, Assistant Professor, Texas State University,
601 University Drive Ingram School of Eng, San Marcos, TX, 78666,
United States of America, eduardopr@txstate.edu

1 - Network Effects on Hand-hygiene Behavior

Reidar Hagtvedt, University of Alberta, Edmonton, AB, Canada,
hagtvedt@ualberta.ca, Brian Whiteside,
Bruce Wright, Sarah Forgie

Hand-hygiene in healthcare settings is a phenomenon that has been studied a great deal, both on the individual and on the group level, but to our knowledge detail on the group working as a network in this context has not been studied. We use sociometric badges to gather data from a large teaching hospital and estimate network statistics. We then model the relationship between the network

and individual behaviors.

2 - Agent-Based Mediation Modeling of a Controlled Trial to Reduce Transmission of Resistant Organisms

Sean Barnes, University of Maryland, 4352 Van Munching Hall,
University of Maryland, College Park, MD, 20742, United States
of America, sbarnes@rhsmith.umd.edu, Daniel Morgan,
Lisa Pineles, Anthony Harris

In 2012-2013, the University of Maryland School of Medicine led a 20-site trial to assess the benefits of universal gloves and gowns in reducing the transmission of multidrug-resistant organisms in acute-care hospitals. We develop an agent-based model to simulate transmission in an ICU, and calibrate this model to best match the outcomes from the 20 sites. Then, we validate the model against the study's analysis, and perform a factorial design to quantify the direct benefit of this intervention.

3 - A Systems Approach to Reducing Central Line Associated Blood Stream Infections

Eva Lee, Georgia Institute of Technology, eva.lee@gatech.edu

The study aims to reduce central line associated bloodstream infections (CLABSI) at Grady Hospital by 20% from current levels. A systems model is designed that comprises the entire process of central line insertion and maintenance. Hospital data is analyzed to identify potential increased risk of CLABSI-related deaths. A second objective includes predicting death among CLABSI-infected patients while minimizing Type II errors; enabling providers to intervene early to reduce unnecessary deaths.

4 - Assessing CAUTI Prevention Interventions in Intensive Care Units

Eduardo Pérez, Assistant Professor, Texas State University, 601
University Drive Ingram School of En, San Marcos, TX, 78666,
United States of America, eduardopr@txstate.edu

This research extend the current methods for addressing CAUTIs to a new level beyond the current state of practice by introducing a new simulation model for system assessment and determination of the clinical efficacy and effectiveness of CAUTI preventive interventions. The simulation model provide a platform where specific interventions can be computed and analyzed, giving an idea on possible expectations of the intervention before clinical research is conducted.

1 - Royalty Licensing Mechanisms in a Leadership Structure

Masashi Umezawa, Professor, Tokyo Univesity of Science, School
of Management, 500 Shimokiyoku, Kuki, Saitama, 346-8512,
Japan, m.omezawa@gmail.com

This paper studies a patent licensing of a cost-reducing innovation which is developed by an internal patentee, one of the firms of the industry. Royalty licensing is mainly focused. Most patent licensing contracts observed empirically include either per-unit or ad valorem royalties. We consider that in a Stackelberg duopoly which types of royalty the patentee prefers. Moreover, we examine the effect of royalty licensing from the point of consumers and social welfare.

2 - Horizontal Product Differentiation in the Presence of Core Products

Hiroki Kishihara, Keio University, Hiyoshi 3-14-1 Kohoku-ku,
Yokohama, Japan, kishihara@z5.keio.jp, Nobuo Matsubayashi

We study horizontal product differentiation between two firms by a game-theoretic approach. We suppose that to introduce their new products, firms must incur "repositioning cost" which increases with the position difference from their core products exogenously given in a product space. We show that the presence of repositioning costs can have a significant impact on the equilibrium outcomes, which also depends on their cost structures.

3 - A General Method for Checking the Core Emptiness of Traveling Salesman Games

Lei Sun, Development Specialist, Praxair Inc., 175 E. Park Dr.,
Tonawanda, NY, 14150, United States of America,
Lei_Sun@Praxair.com, Mark Karwan

We study the core of traveling salesman games from an optimization perspective and propose a new variant of the traveling salesman problem building a link between the two problems. An exact formula is found to measure the gap between the best achievable cost allocation and the core. With network optimization models and algorithms, we develop an implementable method to check whether an empty core exists in general for both symmetric and asymmetric traveling salesman games.

4 - An Effective Approach to the Determination of Proper Equilibrium

Chuangyin Dang, Professor, City University of Hong Kong, Dept. of SEEM, 83 Tat Chee Avenue, Kowloon, Hong Kong - PRC, mecdang@cityu.edu.hk, Yin Chen

As a powerful refinement of Nash equilibrium, proper equilibrium plays an important role in the development of game theory. This paper aims to develop an effective smooth path-following method for computing proper equilibria. By appropriately incorporating barrier terms into payoff functions, we construct a smooth path to a proper equilibrium through closely approximating some Nash equilibrium of a perturbed game. Extensive numerical results further confirm the effectiveness of the method.

Network Analysis II

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Bahar Cavdar, Middle East Technical University, Ankara, Turkey, bcavdar@metu.edu.tr

1 - A Network-Based Approach to Bushfire Fuel Management

Dmytro Matsypura, The University of Sydney,
Rm 478 Merewether Building H04, Sydney, Australia,
dmytro.matsypura@sydney.edu.au, Oleg Prokopyev

Bushfires represent a real and continuing problem that can have a major impact on people, wildlife and the environment. One way to reduce the severity of their effect is through fuel management. We propose a general methodology to address the problem of optimal resource allocation for bushfire fuel management subject to landscape connectivity and stochastic fuel regeneration.

2 - Empty Repositioning under Demand Uncertainty in Large-scale Transportation Networks

Ilke Bakir, PhD Student, Georgia Institute of Technology, H. Milton Stewart School, 765 Ferst Dr NW, Atlanta, GA, 30332-0205, United States of America, ilkebakir@gatech.edu, Alan Erera, Martin Savelsbergh

We consider a transportation network where loaded demand quantities are uncertain, and only estimates are known. We introduce different methods of solving the repositioning problem on relatively sparse networks to satisfy as much demand as possible, using loaded demand estimates. We first experiment with various sharing group policies (hub/spoke structures for empty repositioning), and then introduce a robust optimization approach to further improve demand satisfaction.

3 - A Robust Framework for Event Prediction in Partially Unobserved Networks

Aaron Schecter, Northwestern University, 2240 Campus Drive, 1-459, Evanston, IL, 60208, United States of America, aaronschecter2016@u.northwestern.edu, Noshir Contractor

Longitudinal social network analysis is typically framed as a series of decisions by rational actors. However, individuals only have access to partial information about the whole network. As a result, behaviors are functions of both observed local ties as well as perceived second order relationships. We propose a statistical model for the prediction of dyadic link events under this assumption of network uncertainty; our technique draws from robust optimization and simulation principles.

4 - A Tabu Search with Time-based Preprocessing for Vehicle Routing Problem with Time Windows

Bahar Cavdar, Middle East Technical University, Ankara, Turkey, bcavdar@metu.edu.tr, Joel Sokol

Recent applications of Vehicle Routing Problem (VRP) such as online grocery shopping require finding solutions in a short time with little knowledge of the instance in advance. Current solution methods put more emphasis on the solution quality rather than the computation time. In this talk, we present a new heuristic for VRP with time windows. We combine a tabu search approach with a preprocessing of the instance using arc-based waiting time information to speed up the computation.

1 - Dynamic-programming-based Inequalities for the Multi-dimensional Unbounded Knapsack Problem

Xueqi He, University of Florida, 3800 SW 34th St. Apt. P138, Gainesville, FL, 32608, United States of America, xueqihe@gmail.com

We present a new branch-and-cut approach for solving the multi-dimensional unbounded knapsack problem, where valid inequalities are generated for an integer programming formulation based on intermediate solutions of an equivalent dynamic programming formulation. These inequalities tighten the initial LP relaxation, and therefore improve the computational efficiency.

2 - An Exact Algorithm for Biobjective Mixed Integer Linear Programming Problems

Gazi Bilal Yildiz, Res. Assist., Erciyes University, Engineering Faculty, Industrial Engineering, Kayseri, 38039, Turkey, bilalyildiz@erciyes.edu.tr, Banu Soylu

In this study, we develop an algorithm to generate all Pareto line segments of BOMILPs. Our algorithm starts with the solution of an individual objective function and then sequentially generates all line segments of the Pareto frontier. At each iteration of the algorithm, one line segment of the Pareto frontier is detected. If there is no new Pareto line segment available, the algorithm ends. We provide a numerical example and present the performance of the algorithm over several test problems.

3 - Virtual Mixed Integer Nonlinear Programming Model for Integrated Electricity Distribution System

Burcin Cakir Erdener, Dr., Baskent University, Eskisehir Yolu 20 km. Baglica Kampusu, Muhendislik Fak. Etimesgut, Ankara, 06800, Turkey, burcincakir55@gmail.com, Berna Dengiz, Zulal Gungor, Imdat Kara

An electricity network design problem with distributed generation, which is called the Integrated Electricity Distribution System (IEDS) design problem is considered. The design procedure aims at the minimization of total system design cost while ensuring the optimum location and routing decisions for several system elements. To solve IEDS, a mixed-integer nonlinear-programming model is proposed. A new network transformation approach called virtual node duplicating is introduced within the model.

1 - Scip-jack - A Solver for the Steiner Tree Problem and Variants with Parallelization Extensions

Stephen Maher, Zuse Institute Berlin, Takustr. 7, Berlin, BE, 14195, Germany, maher@zib.de, Gerald Gamrath, Thorsten Koch, Daniel Rehfeldt, Yuji Shinano

The Steiner tree problem in graphs (STP) arises in practical applications as one of many variants. A relationship exists between the different STP variants, suggesting the potential for a generic solver. However, problem specific solutions approaches are commonly observed. SCIP-Jack is a general purpose solver to solve both the STP and many of its variants. Transformations are employed that permit STPs to be solved using a MIP-framework. The result is a massively parallel general STP solver.

2 - Compact MIP Formulation of the Selective Delivery and Pickup Problem

Yuan Yuan Dong, Southern Methodist University, 3101 Dyer Street, Dallas, TX, 75205, United States of America, ydong@smu.edu, Eli Olinick

We present a compact MIP for the selective delivery and pickup problem with the objective of maximizing profit by accepting unscheduled deliveries during the time-limited trip. The MIP is inspired by a novel formulation of multicommodity flow that significantly reduces the size of the constraint matrix and the LP upper bound compared to a model based on the classical approach. This in turn leads to faster solution times when using commercial MIP codes, as we demonstrate in an empirical study.

3 - Solving A Real-world Snow Plow Optimization Problem: An Integrated Solution Approach

Joris Kinable, Post-doctoral Researcher, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, jkinable@cs.cmu.edu, Stephen F. Smith, Willem-Jan Van Hoeve

Each year, many northern cities are faced with significant expenditures pertaining winter road maintenance. Snow plowing constitutes a significant part of these costs. This work presents an integrated, adaptive solution approach for a real-world snow plow optimization problem. The large number of routing and scheduling constraints render this problem particularly hard to solve. The performance of our solution approach is demonstrated on data from the city of Pittsburgh (USA).

4 - On Solving Quadratic Assignment Problems in Wireless Communications

Hans Mittelmann, Arizona State University, Box 871804, Tempe, AZ, United States of America, mittelmann@asu.edu

In digital wireless communications optimal index assignment leads to difficult quadratic assignment problems. Those are standard QAPs for single transmissions or for sequential multiple transmissions. They become higher dimensional QmAPs when simultaneously optimizing over several retransmissions. We report on the exact and approximate solution of such problems that arise in practice.

Health Care Operations

Sponsor: Health Applications

Sponsored Session

Chair: Qiushi Chen, chenqiushi0812@gatech.edu

1 - Can an Early Warning Score Predict Patients' Hospital Length of Stay and Mortality?

Nasibeh Azadeh-fard, PhD Candidate, Virginia Tech, 544 Whittemore Hall, Virginia Tech, Blacksburg, VA, 24061, United States of America, nasibeh@vt.edu, Jaime Camelio, Navid Ghaffarzadegan

The Modified Early Warning Score (MEWS) is used in hospitals to quickly predict and prevent catastrophic events such as death. The prediction power of MEWS, however, is an empirical question. We analyze effectiveness of MEWS in a major hospital in the US over six months for a sample of 1021 patients. We find that MEWS modestly predicts hospital length of stay and death, while physicians' specific characteristics and their subjective assessments are much better predictors of health outcomes.

2 - Routing Patients to Community Health Services to Maintain Patient Access after Facility Merger

Aaron Ratcliffe, Assistant Professor, University of North Carolina at Greensboro, 438 Bryan Building, P.O. Box 26170, Greensboro, NC, 27402, United States of America, aaron.ratcliffe@uncg.edu

Merging the facilities dedicated to a health service may allow for cost savings in terms of economies of scale and other efficiency improvements at the expense of poorer access to services for patients. We develop a queueing network model to examine how a social planner should route heterogeneous patient classes to community health resources to improve patient access in the absence of a previously dedicated facility.

3 - Integrated Staff and Room Scheduling for Surgeries: Methodology and Application

Sandeep Rath, PhD Candidate, UCLA Anderson, B501 Gold Hall, UCLA Anderson, Los Angeles, CA, 90024, United States of America, Sandeep.Rath.1@anderson.ucla.edu, Kumar Rajaram

We consider the problem of minimizing resource usage and overtime costs across multiple parallel resources such as anesthesiologists and operating rooms at a large multi-specialty hospital. We develop a two stage optimization program with recourse. We develop a data driven robust optimization method that solves large-scale real-sized versions of this model close to optimality. We validate and implement this model as a decision support system at the UCLA Ronald Reagan Medical Center.

4 - Arbovirus Risk Maps in Texas

Xi Chen, University of Texas at Austin, Austin, TX 78712, Austin, TX, United States of America, carol.chen@utexas.edu, Nediako Dimitrov

Dengue fever and Chikungunya virus two key mosquito-borne diseases in Texas. To focus state resources, public health officials need to identify the geographic risk areas for these diseases. We consider thousands of possible risk models, based on maximum entropy methods, combined with data on the transmission vectors, environmental, and socio-economic factors. We select the best model empirically, using historical Texas Dengue data. The final model is in use by Texas health officials.

Stochastic Modeling and Analysis with Applications

Sponsor: Applied Probability

Sponsored Session

Chair: Jing Dong, Northwestern University, 2145 Sheridan Road, Tech C210, Evanston, United States of America, jing.dong@northwestern.edu

Co-Chair: Jose Blanchet, Associate Professor, Columbia University, 500 W 120th St., Mudd Building, IEOR, 3rd Floor., New York, NY, 10027, United States of America, jose.blanchet@columbia.edu

1 - Stationarity and Interchange of Limits in Heavy Traffic Analysis

Hengqing Ye, Associate Professor, Hong Kong Polytechnic University, Hung Hom, Kowloon, Hong Kong - PRC, lgyehq@polyu.edu.hk, David D. Yao

We develop a streamlined approach for justifying the heavy traffic stationary approximation of stochastic processing networks. First, we demonstrate that the stability of a deterministic dynamic complementarity problem is sufficient for both the diffusion limit and pre-limit networks to have stationary distributions. Then, given an additional mild condition, we show the convergence of stationary distributions of pre-limit networks to that of the diffusion limit.

2 - Resource Allocation in Bike Sharing using Coupling and Linear Programming

Shane Henderson, Professor, Cornell University, Rhodes Hall, Ithaca, NY, 14853, United States of America, sgh9@cornell.edu, David Shmoys, Eoin O'mahony

We propose an optimization problem that allocates bike racks and bikes to stations across a city. The objective is a transient performance measure from a continuous-time Markov chain. We show that the objective possesses a (joint) discrete convexity property that allows for efficient solution via linear programming. The proof uses a combination of geometrical arguments and coupling theory. The results are illustrated using Citibike data in NYC.

3 - Tail Analysis Without Tail Information: A Worst-case Perspective

Henry Lam, Assistant Professor, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, khlam@umich.edu, Clementine Mottet

One common bottleneck in tail modeling is that, due to their very nature, tail data are often very limited. Rather than using conventional parametric fitting, we will describe a robust alternative that is based on a worst-case analysis under the geometric premise of tail convexity. We demonstrate that the worst-case convex tail behavior is either extremely light-tailed or extremely heavy-tailed, and construct numerical schemes to distinguish between the two cases and find the worst-case tail.

4 - On the Stability of Matching Queues

Pascal Moyal, Université de Technologie de Compiègne, Rue du Dr Schweitzer, Compiègne, 6023, France, pascal.moyal@utc.fr, Ohad Perry

Consider a model in which, to each node of a graph G is associated an arrival process, and any entering item associated to node k either leaves the system if it finds in line, another item corresponding to a neighbor of k , or is stored in queue. Using fluid analysis, we investigate the stability of such matching models, which are of increasing practical importance. We show that, aside for a specific class of graphs, they can always be unstable even under a natural necessary stability condition.

Robustness and Approximation in Markov Decision Processes

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Marek Petrik, IBM, 1101 Kitchawan Rd., Yorktown Heights, NY, 10598, United States of America, mpetrik@us.ibm.com

1 - Algorithms for Risk-sensitive Optimization in MDPS

Mohammad Ghavamzadeh, Senior Analytics Researcher, Adobe Research, 321 Park Ave., E7412, San Jose, CA, 95126, United States of America, mohammad.ghavamzadeh@inria.fr

In many sequential decision-making problems we may want to manage risk by minimizing some measure of variability in costs in addition to minimizing a standard criterion. We consider variance-related and percentile-based risk-sensitive criteria. For each criterion, we devise algorithms for estimating its gradient and updating the policy parameters in the descent direction. We establish the convergence of our algorithms and demonstrate their usefulness in a variety of control problems.

2 - Ambiguous Joint Chance Constraints with Conic Dispersion Measures

Grani A. Hanasusanto, École Polytechnique Fédérale de Lausanne, EPFL-CDM-MTEI-RAO, Station 5, Lausanne, 1015, Switzerland, grani.hanasusanto@epfl.ch, Daniel Kuhn, Wolfram Wiesemann, Vladimir Roitch

We analyse the complexity of a class of ambiguous joint chance constrained programs where the uncertain parameters are described through their mean values and through upper bounds on general dispersion measures. We derive explicit conic reformulations for tractable problem classes and suggest efficiently computable conservative approximations for intractable ones. We illustrate the effectiveness of our reformulation in numerical experiments in project management and image denoising problems.

3 - Learning the Uncertainty in Robust Markov Decision Processes

Xu Huan, Assistant Professor, National University of Singapore, 9 Engineering Drive 1, Singapore, Singapore, mpexuh@nus.edu.sg, Shie Mannor, Shiao Hong Lim

Robust MDP models the parameter uncertainty as arbitrary element of uncertainty sets, and seeks the minimax policy. A crucial problem of robust MDP is how to find appropriate uncertainty. We address this using an online learning approach: we devise an algorithm that, without knowing the true uncertainty model, is able to adapt its level of protection to uncertainty, and in the long run performs as good as the minimax policy knowing the uncertainty model.

4 - Robust Approximate Dynamic Programming

Marek Petrik, IBM, 1101 Kitchawan Rd., Yorktown Heights, NY, 10598, United States of America, mpetrik@us.ibm.com

I describe how robust MDPs can be used to improve solution quality of both on-policy and policy approximate dynamic programming methods. The robustness addresses both model and sampling error. Finally, I show the utility of robust optimization when computing implementable policies in MDPs.

Managing Sustained Participation in Online Communities

Sponsor: Information Systems

Sponsored Session

Chair: Pratyush Nidhi Sharma, Assistant Professor, University of Delaware, 010 Purnell Hall, University of Delaware, Newark, DE, 19716, United States of America, pnsharma@udel.edu

1 - The Impact of Person-organization Fit and Psychological Ownership on Turnover in Open Source Software Projects

Tingting Rachel Chung, Chatham University, 106 Woodland Road, Pittsburgh, PA, United States of America, Rchung@chatham.edu, Pratyush Nidhi Sharma, Sherae Daniel

Open source software projects represent an alternate form of software production by relying on voluntary contributions. Most projects fail to sustain their development due to high turnover. Using 574 survey responses from GitHub, we examined the impact of Person-Organization fit and psychological ownership on developers' turnover intentions. Results show value and demands-abilities fit negatively impact turnover intentions and that psychological ownership moderates these effects.

2 - Coordinating Co-opetition: Insights from Open-source Cloud Software Development

Yash Raj Shrestha, ETH Zurich, Weinbergstrasse 56/58, Zurich, Switzerland, yshrestha@ethz.ch, Shiko Ben-Menahem, Georg Von Krogh

Using longitudinal data from OpenStack, an open-source cloud computing software development platform, this study explores why some participating firms exhibit greater success than others in their ability to coordinate activities in a co-opetitive ecosystem. Focusing on patterns of strategic task allocation and completion by firms facing strong competition for highly skilled developers, our study advances understanding on co-opetition and coordination in new organizational forms.

3 - The Movement of Open Source Communities

Georg J.P. Link, University of Nebraska Omaha, 6001 Dodge St, Omaha, NE, 68182, United States of America, glink@unomaha.edu, Matt Germonprez

In 2010, Oracle acquired OpenOffice during its acquisition of Sun Microsystems. At that time, community members formed the LibreOffice fork under The Document Foundation. And in the following year, Oracle transferred ownership of OpenOffice to the Apache Foundation. We explore thresholds for communal movement and how the transfer of open source projects affects the community. We find that understanding communities as movable reveals their nature as commoditized and consolidated objects of value.

Production and Scheduling II

Contributed Session

Chair: Katariina Kemppainen, School of Business, Aalto University, Runeberginkatu 22-24, Helsinki, 00076 Aalto, Finland, katariina.kemppainen@aalto.fi

1 - A Capacitated Multi-Item Lot-Sizing Problem with Stochastic Setup Times

Raf Jans, Professor, HEC Montreal, 3000 Chemin de la Cote-St-Catherine, Montreal, QC, H3T 2A7, Canada, raf.jans@hec.ca, Michel Gendreau, Duygu Tas, Ola Jabali

We introduce uncertainty with respect to the setup times in the standard capacitated lot sizing problem. The company fixes a production plan (i.e. timing and level of the production quantities). The company can use overtime if the given capacity is not sufficient due to the specific realizations of the setup times. We develop an efficient procedure to evaluate the expected overtime assuming a specific probability distribution. We also present several MIP-based heuristics to solve this problem.

2 - Issues in Batch Flowshop and Lot Streaming Problems

Ramakrishna Govindu, Instructor, University of South Florida, 8350 N Tamiami Tr, SMC-C263, Sarasota, FL, 34243, United States of America, rgovindu@sar.usf.edu, Anurag Agarwal

The lot streaming problem attempts to find sublots to reduce the makespan. We treat this problem as a multiobjective problem that attempts to strike a balance between makespan and cost of handling the sublots. We propose some heuristics and properties of the problem.

3 - Routing and Spectrum Assignment in Rings

Sahar Talebi, North Carolina State University, Operations Research and Computer Science, Raleigh, NC 27695, United States of America, stalebi@ncsu.edu

We present a theoretical study of the routing and spectrum assignment (RSA) problem in ring networks. We show that the RSA problem with fixed-alternate routing in general topology networks is a special case of a multiprocessor scheduling problem. We then investigate two problems: the spectrum assignment problem under the shortest path assumption and the general RSA whereby a routing decision must be made jointly with spectrum allocation. We then develop a suit of heuristic algorithms.

4 - Cutting Stock with Sequence Dependent Set-up Times: An Application to a Large Scale Industry Problem

David Wuttke, EBS University, EBS University, ISCM, Burgstr. 5, Oestrich-Winkel, 65375, Germany, david.wuttke@ebs.edu, Sebastian Heese, Florian Gojny

We consider a two-dimensional cutting stock problem with sequence dependent set-up times and tolerances as witnessed in textile and fiber-composite industries. To solve real-life instances we provide a decomposition heuristic that first identifies optimal cutting patterns and then optimizes their sequence by minimizing the number of knife relocations.

5 - Open Priority Scheduling Protocol for Sourcing and Supply Management

Katariina Kemppainen, School of Business, Aalto University,
Runeberginkatu 22-24, Helsinki, 00076 Aalt, Finland,
katariina.kemppainen@aalto.fi, Ari Vepsäläinen

Are you happy with the first-come-first-served priority rule when ordering goods online? The extensive scheduling literature has few answers from real-life applications, whereas in procurement case studies abound but theoretical analyses are few. We propose an open protocol for manufacturing and procurement which beats consistently not only FCFS but any other rule. It offers a sophisticated solution for one universal rule. Our protocol is backed up with simulation results and real-life cases.

Multi-objective Optimization and Applications

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Matthias Ehrgott, Professor, Department: Management Science, Lancaster University, The Management School, Lancaster, 00, LA1 4YX, United Kingdom, m.ehrgott@lancaster.ac.uk

1 - Ultra-high-dimensional Optimization for Trade Space Exploration: Challenges and Lessons Learned

Matthew Hoffman, Sandia National Laboratories, P.O. Box 5800
MS 1188, Albuquerque, NM, 87185-1188, United States of
America, mjhoffm@sandia.gov, Alexander Dessanti,
Stephen Henry, Jack Gauthier

In projects with many conflicting stakeholder objectives, negotiating compromise requires understanding tradeoffs. Existing multiobjective approaches build “coalitions” of objectives to reduce dimensionality – either explicitly via aggregation, or implicitly – which favors solutions that compromise across many objectives, but can severely obfuscate or distort the tradeoffs between them. We discuss our progress thus far in true ultra-high-dimensional optimization for trade space exploration.

2 - Special Constraint Treatment for Multi-objective Optimization

Sijie Liu, Graduate Student, University of Alabama, 714 1/2 12th
St. B, Tuscaloosa, AL, 35401, United States of America,
sliu28@crimson.ua.edu

Several methods have been developed for finding pareto set and pareto front for multi-linear objective optimization problem subjective to one additional special constraint (such as bi-linear constraint or N-linear constraint) over a bounded interval domain subjective to linear equality constraint. These methods provide us fast approaches to plot the entire pareto frontier. Algorithms have been proved and numerical results demonstrate the effectiveness of these methods.

3 - A Nonparametric Approach to the Multi-Objective Sequential Decision Problem

Young H. Chun, Professor, Louisiana State University,
E. J. Ourso College of Business, Baton Rouge, LA, 70820,
United States of America, prof@drchun.net

Many choices are presented one at a time. You must decide whether to choose the current choice and stop the search process or to reject it and move to the next stage. The decision is irrevocable and each choice is evaluated based on multiple objectives. We propose a rank-based optimal decision strategy that minimizes the weighted rank of the selected choice. It can be shown that many sequential decision problems are special cases of the generalized multi-objective sequential decision problem.

4 - Deliverable Radiotherapy using Multiobjective Optimisation and Column Generation

Matthias Ehrgott, Professor, Department: Management Science,
Lancaster University, The Management School, Lancaster, 00,
LA1 4YX, United Kingdom, m.ehrgott@lancaster.ac.uk,
Kuan-min Lin

We propose a column generation based approach to compute deliverable radiotherapy treatment plans based on a multi-objective optimisation problem. We compute a representative set of non-dominated treatment plans using the revised normal boundary intersection method. The generation of each non-dominated treatment plan uses column generation to generate apertures that directly deliverable, obviating the need for a separate segmentation step that deteriorates plan quality.

Bidding Mechanisms

Cluster: Auctions

Invited Session

Chair: Bernardo Quiroga, Assistant Professor, Business and Behavioral Science, Clemson University, 100 Sirrine Hall, Clemson, SC, 29634, United States of America, bfquirog@gmail.com

1 - One-dimensional Strategyproof Facility Location

Itai Feigenbaum, Columbia University, New York, NY,
United States of America, itai@ieor.columbia.edu, Chun Ye,
Jay Sethuraman

Consider a set of agents on an interval, where a planner wishes to locate a facility so as to maximize some social benefit function. The agents have linear preferences over the location of the facility, and their locations are unknown to the planner. Thus, the planner wishes to locate the facility in a strategyproof manner while approximating social benefit. We discuss mechanisms, lower bounds, and characterizations for various versions of this model.

2 - Greening Multi-tenant Data Center Demand Response with Supply Function Bidding

Niangjun Chen, California Institute of Technology, Pasadena, CA,
United States of America, ncchen@caltech.edu, Adam Wierman,
Shaolei Ren, Xiaoqi Ren

Data centers have become critical resources for emergency demand response (EDR). In this talk, we focus on “greening” demand response in multi-tenant data centers by incentivizing tenants’ load reduction and reducing on-site diesel generation. Our proposed mechanism, ColoEDR, which is based on parameterized supply function mechanism, provides provably near-optimal efficiency guarantees, both when tenants are price-taking and when they are price-anticipating.

3 - Optimal Bidding for Bundles in Sequential Auctions

Karti Puranam, Assistant Professor, La Salle University, 1900 W
Olney Ave, Philadelphia, PA, 19141, United States of America,
puranam@lasalle.edu, Michael Katehakis

We study the problem of optimal bidding for a firm that in each period procures items to meet a random demand by participating in a finite sequence of auctions where in each auction involves bids for bundles of items. We develop a new model for a firm where its item valuation derives from the sale of the acquired. We establish monotonicity properties for the value function and the optimal dynamic bid strategy and we present computations.

4 - Complexity and Transparency in Sealed-bid Procurement Auctions with Multi-dimensional Bids

Bernardo Quiroga, Assistant Professor, Business and Behavioral Science, Clemson University, 100 Sirrine Hall, Clemson, SC,
29634, United States of America, bfquirog@gmail.com,
Brent Moritz, V. Daniel R. Guide, Jr.

We experimentally analyze A+B (price-and-quality) bidding behavior in two closely related sealed-bid scenarios: One where the rule to assign the contract is transparently communicated to bidders before they submit their offers, and another where the assignment rule is only known to the buyer and not to the bidders. Our results show substantial losses in terms of social welfare and buyer surplus as a direct effect of transparency loss in this procurement system.

Chair: Jon Alt, Assistant Professor, Naval Postgraduate School, Department of Operations Research, Naval Postgraduate School, Monterey, CA, 93943, United States of America, jkalt@nps.edu

1 - Improved U.S. Army Reserve Stationing using Recruitable Market Demographics

Nathan Parker, U.S. Army, 4120 Crest Rd, Pebble Beach, CA,
93953, United States of America, nparker@nps.edu

The objective of this work is to develop a model to predict a U.S. Army Reserve (USAR) unit's manning level based on the demographics of the unit's reserve center recruitable market (RCRM). This study first develops an allocation method to determine the RCRM available to each reserve center. Classification and regression models are then developed to determine the ability of the RCRM to support the reserve center's manning requirements.

2 - Comprehensive Analysis of the U.S. Army's Global Assessment Tool

Cardy Moten, Maj, TRADOC Analysis Center-Monterey, 700 Dyer Road, Room 183, Monterey, CA, 93943, United States of America, cmoten@nps.edu

The focus of this research is to investigate new interpretations of the Global Assessment Tool in order to provide more informed feedback to the Soldier and improve prediction of Soldier outcomes. We used factor analysis, cluster analysis, and data visualization techniques to evaluate similarities and differences between the services and provide a more comprehensive picture of the component data that is more readily understood by Soldiers.

Information Systems for E-Business/Commerce

Contributed Session

Chair: Anwesha Bhattacharjee, Student, University of Texas, Dallas, 2200 Waterview Pkwy, #1836, Richardson, TX, 75080, United States of America, axb094820@utdallas.edu

1 - Investigating the Effect of Social Connections on Usefulness of Online Reviews

Pouya Khansaryan, University of Connecticut, 101 South Eagleville, Apt. 18B, Storrs, CT, 06268, United States of America, seyedamirpouya.khansaryan@business.uconn.edu

Online reviews are a form of eWOM which are nowadays available to prospective customers. In this study, we try to answer the question: "what are the key factors that contribute to the consumer's perception of the usefulness of online reviews?". The data from Yelp in different time spots show that star ratings, total votes, review length, average writer's star rating, number of fans and elapsed time are the most significant measures for the perceived usefulness.

2 - Online Activities in Virtual World and Money Spending in Real World

Gwangjae Jung, Korea Information Society Development Institute, 18, Jeongtong-ro, Deoksan-myeon, Jincheon, Korea, Republic of, indioblu@gmail.com, Youngsoo Kim

We examine the relationship between online activities virtual world and money spending in real world. We collected users' log data in an online game from Feb. to Aug. 2010. Our analyses show that virtual money spending complements real money spending in playing an online game. Another finding is that group play in an online game facilitates real money spending on avatar decorations, but not on gaming efficiency. Real money spending also decreases as users advance to the latter stage of game.

3 - Differences in Hedonic and Utilitarian Apps through Consumer Addiction, Frustration and Evaluation

Bidyut Hazarika, University of Colorado Denver, 1475 Lawrence St, Denver, CO, 80202, United States of America, bidyut.hazarika@ucdenver.edu, Madhavan Parthasarathy, Jahangir Karimi, Jiban Khuntia

Hedonic and utilitarian apps differ in addiction, frustration and subsequent evaluation scores. This study analyzes scores on these factors for more than 18136 apps data to establish this differentiation values using interaction models and econometric analyses.

4 - How Could We Cope with Malicious Rater? A New Detection Method for Trustworthy Reputation Systems

Yuanfeng Cai, CUNY—Baruch College, 55 Lexington Ave, New York, NY, United States of America, Yuanfeng.Cai@baruch.cuny.edu, Dan Zhu

Reputation systems are vulnerable to rating fraud. To address it, we use data from TripAdvisor, Expedia and Amazon to empirically exploit the rating time series features of malicious rater. Then we propose the two-phase method for detection. First, it examines the rating series associated with each entity and filters out those under attack. Second, the clustering method is applied to discriminate malicious raters. Experimental studies have demonstrated the effectiveness of the proposed method.

5 - Searching the Global Distribution System: A Double-edged Sabre

Anwesha Bhattacharjee, Student, University of Texas, Dallas, 2200 Waterview Pkwy, #1836, Richardson, TX, 75080, United States of America, axb094820@utdallas.edu, Vijay Mookerjee, Mehmet Ayyaci, Radha Mookerjee

As the demand for travel grows, so does the need for travel agencies. Travel agencies, in turn, use a global distribution system to find the appropriate service for their clients. In this paper, we look at one such travel service market segment: hotel shopping. We identify search behaviors among agencies and we identify the tradeoff for the global distribution system itself which invest millions on setting up the search want to increase the number of bookings with the minimum number of searches.

Sponsored Session

Chair: Seth Guikema, Associate Professor, Johns Hopkins University, 3400 N Charles Street, Ames Hall 313, Baltimore, MD, 21218, United States of America, sguikem1@jhu.edu

1 - Data Mining Approaches to Characterize Non-uniform Wind Farm Power Production

Andrea Staid, PhD Candidate, Johns Hopkins University, 3400 N. Charles St., 313 Ames Hall, Baltimore, MD, 21218, United States of America, astaid@gmail.com, Claire Verhulst, Seth Guikema

Power production of wind farms with non-uniform layouts is more difficult to analyze using traditional wake-decay models. We present some of the discrepancies that arise when modeling these types of farms and highlight the sources of error. We then present new methods to characterize farm production based on data mining instead of wake modeling, and we show the benefits of using these methods in conjunction with more traditional means.

2 - Analysis of Low Probability Streamflow Outcomes in the Mid-atlantic Region

Gina Tonn, PhD Candidate, Johns Hopkins University, 115 Broadbent Road, Wilmington, DE, 19810, United States of America, gtonn2@jhu.edu, Seth Guikema

Standard flood frequency analysis methods are widely used, but involve much uncertainty and low probability outcomes can occur. In this study, statistical analysis is used to identify watershed characteristics that are correlated with low probability streamflow outcomes. Methods include a Random Forest model and clustering analysis.

3 - Data Mining for Understanding Tsunami Death Rates in Japan

Seth Guikema, Associate Professor, Johns Hopkins University, 3400 N Charles Street, Ames Hall 313, Baltimore, MD, 21218, United States of America, sguikem1@jhu.edu, Roshanak Nateghi

Then 2011 Tsunami in Japan caused widespread destruction and led to a large number of deaths. It was the most recent in a strong of tsunamis in the Tohoku region of Japan. We use data from the 1896, 1933, 1960, and 2011 tsunamis together with modern data mining methods to better understand the factors affecting death rates during these events.

4 - Prediction of Mean Harvest Weight of Royal Gala Apples

Tom Logan, PhD Student, University of Michigan, 3700 N Charles Street, Baltimore, MD, 21218, United States of America, tom.logan@jhu.edu, Seth Guikema, Stella Mcleod

Early prediction of the mean harvest size of apples is useful for decision makers in the apple and horticultural industry. Decisions including logistics and marketing are made prior to harvest and are generally based on estimates of the crop. A random forest model was developed using data for the apple variety Royal Gala from orchards within the Hawkes Bay Region of New Zealand. For the eight years of data available it has been shown to have a mean predictive error of 2.4%.

Data Mining with Marketing Applications

Contributed Session

Chair: Elham Khabiri, IBM, 1101 Kitchawan Rd, Yorktown Heights, NY, United States of America, ekhabiri@us.ibm.com

1 - Evaluating Database Marketing Models: More than Meets the Eye

Sam Koslowsky, Senior Analytic Consultant Modeling Solutions and Delivery, Harte Hanks, 2118 Avenue T, Brooklyn, NY, 11229, United States of America, sam.koslowsky@hartehanks.com

Managers are most pleased with using the gains table to assess their predictive models. Identifying more 'HIVES' at the top, and fewer on the bottom is most desirable. But, more needs to be examined. Some use standard statistical criteria. This may be fine. But, some common sense features are frequently ignored as it relates to model evaluation and the gains table. These include variations in lift, unevenness in decile performance, the stability of predictions and the interpretations of results.

2 - Marketing-driven Content Management in Large Organizations

Roman Vaculin, IBM, 1101 Kitchawan Rd, Yorktown Heights, NY, United States of America, vaculin@us.ibm.com, Yi-min Chee, Ashish Jagmohan, Elham Khabiri, Richard Segal, Noi Sukaviriya

Content management in large organizations is a complex process involving range of approaches such as text analysis or classification with taxonomies. We focus on facilitating management of legacy and creation of new content to improve marketing content effectiveness. We discuss techniques for (1) content characterization based on semantic concept models, (2) mapping textual content to legacy taxonomies, and (3) taxonomy enhancement for data-driven taxonomy rationalization, extension and mapping.

3 - Product Recommendations with Discovered Hidden Topics in Online Reviews

Julie Zhang, Assistant Professor, University of Massachusetts Lowell, One University Ave., Lowell, MA, 01854, United States of America, juheng_zhang@uml.edu

We use LDA (latent Dirichlet Allocation) to discover hidden information embedded in online product reviews for consumers to make informed purchase decisions. The discovered topics are used to make product recommendations to offer consumers better utility.

4 - Towards Automatic Identification of B2B Marketing Prospects

Elham Khabiri, IBM, 1101 Kitchawan RD, Yorktown Heights, NY, United States of America, ekhabiri@us.ibm.com, Roman Vaculin, Richard Hull, Matthew D. Riemer

In B2B marketing, it is critical to identify marketing leads effectively. We investigate into what extent the B2B leads identification process can be automated using online and historical data, and if algorithmic leads mining can achieve better performance than leads identified by human experts. We present a solution that combines deep learning to identify look-a-like companies with respect to historical leads, and mining of online data for identification of signals indicating potential leads.

Data-driven Healthcare Operations

Sponsor: Health Applications

Sponsored Session

Chair: Muge Capan, Value Institute, Christiana Care Health System, 4755 Ogletown-Stanton Road, John H. Ammon Medical Education Center, Newark, DE, 19718, United States of America, Muge.Capan@ChristianaCare.org

1 - Determining an Optimal Schedule for Pre-mixing Chemotherapy Drugs

Donald Richardson, University of Michigan, Ann Arbor, MI, donalric@umich.edu, Amy Cohn

In collaboration with the University of Michigan Comprehensive Cancer Center, we have developed a data-driven, optimization-based approach to improving the timeliness of drug preparation for chemotherapy infusion patients while reducing staff workload and improving resource utilization. We compare the results from both static and dynamic decision policies to determine the optimal schedule for pre-mixing chemotherapy drugs at the cancer center.

2 - Using Text Analytics to Identify Labor and Delivery Sentiment from the Internet and Social Media

Karen Hicklin, PhD Student, North Carolina State University, 111 Lampe Drive, Campus Box 7906, Raleigh, NC, 27695, United States of America, kthickli@ncsu.edu, Julie Ivy, Fay Cobb Payton, Evan Myers, Meera Viswanathan, Michael Wallis, Vidyadhar Kulkarni

Pregnant women often seek counsel online from doctors, midwives, experienced and other expectant mothers to understand if their experience lines up with that of others and to seek opinions, suggestions and recommendations. We use text analytics to identify key attributes and preferences for women from internet data to identify important attributes that influence patient perceptions in regards to the birth experience that can be used as input parameters to inform delivery mode decision models.

3 - Data-driven and Analytical Approaches to Falls Injury Prediction and Rescue Resources Allocation

Tze Chiam, Associate Director, Research Informatics, Christiana Care Health Systems, 4755 Ogletown-Stanton Road, Newark, DE, 19718, United States of America, Tze.C.Chiam@ChristianaCare.org, Kristen Miller, Bailey Ingraham Lopresto

As an effort to improve patient safety, Christiana Care Health Systems embarked on work to evaluate current rescue strategies for patient fall events. This study investigates the use of age, bone density, coagulation, surgery and fall type to

identify patients at high risk for injury due to falls and the appropriate responses based on these criteria. A discrete-event simulation is used to evaluate rescue strategies that yield fastest response time while minimizing interruptions to the system.

4 - Nurse Scheduling Optimization in the Neonatal Intensive Care Unit

Muge Capan, Value Institute, Christiana Care Health System, 4755 Ogletown-Stanton Road, John H. Ammon Medical Education Center, Newark, DE, 19718, United States of America, Muge.Capan@ChristianaCare.org, Eric V. Jackson, Robert Locke

Nurse scheduling is the process of assigning nurses to work shifts. A suboptimal schedule can impact the staffing ratios, nurses' well-being, job satisfaction, and quality of care. Nurse scheduling in the Neonatal Intensive Care Unit is particularly challenging due to the complexity of care environment and required nursing skillset. We present a multi-objective optimization approach to allocate nurses to shifts while considering institutional requirements, workload fairness and nurses' health.

Real World Problems, Innovative Approaches and Implementations at Geisinger Health System

Sponsor: Health Applications

Sponsored Session

Chair: Christopher Stromblad, Senior Modeler - Operations Research, Geisinger Health System, 100 N. Academy Ave, Danville, PA, 17822, United States of America, ctstromblad@geisinger.edu

1 - Implementing Predictive Models in Five Operating Suites Improved Surgical Case Duration Accuracy

Ronald Dravenstott, Geisinger Center for Healthcare Systems Engineering, 100 N Academy Ave, Danville, PA, 17822, United States of America, rwdravenstott@geisinger.edu, Eric Reich, Cheng-bang Chen, Priyantha Devapriya

The length of a surgical procedure is generally predicted using a moving average of previous procedures performed by a given surgeon, a method which is often inaccurate and complicates Operating Room scheduling. This research developed and implemented predictive models for high-volume surgeries to seamlessly improve surgical scheduling by leveraging patient and provider data. The models now in place overcame real-time data inconsistencies and have improved scheduling.

2 - Anticipating Provider Orders in Outpatient Clinics

Yi-shan Sung, Research Assistant, Penn State, 425 Waupelani Dr., Apt. 509, State College, PA, 16801, United States of America, yqs5097@psu.edu, Ronald Dravenstott, Priyantha Devapriya, Soundar Kumara

Understanding provider ordering patterns for patients can enhance resource utilization in hospitals. By using patient and provider retrospective data, this research aims to develop statistical and network-based techniques to predict orders for upcoming appointments. These predictions can lead to a recommendation system supporting providers to increase order effectiveness and ease order documentation. The models will be validated with outpatient data from pulmonary clinics.

3 - RTLS Data Applications in Healthcare Analytics and Modeling

Seth Hostetler, Lead Process Engineer, Geisinger Health System, 100 N Academy Ave, Danville, PA, 17822-2550, United States of America, sthostetler@geisinger.edu

Often, when developing models in healthcare, the lack of accurate and complete data is cited as a limitation. A real-time location system is able provide additional information concerning patient, staff, and asset locations and flows. This presentation will present results from applications in three application areas (ambulatory, inpatient, and emergency department) where RTLS data has been utilized to provide additional insight via analytic methods and improved modeling capabilities.

4 - Outpatient Clinic Provider Scheduling under Uncertainty

Deepak Agrawal, PhD Candidate, Pennsylvania State University, 801 Southgate Drive, A4, State College, PA, 16801, United States of America, dual43@psu.edu, Christopher Stromblad, Soundar Kumara, Mort Webster

Current clinic provider scheduling systems are inefficient, because scheduling is done manually and months in advance, most of the demand, capacity, and other constraints and their uncertainties are not considered. There is no objective way to evaluate the quality of a schedule; until after the fact. Therefore, the original schedule becomes suboptimal at the time of realization. A stochastic program to provider scheduling is proposed considering demand and capacity uncertainties using real data.

Joint Session PPSN/TSL: Network Infrastructure Recovery and Resilience

Sponsor: Public Sector OR and TSL

Sponsored Session

Chair: Ozlem Ergun, Assoc. Prof, Northeastern University, 360 Huntington Avenue, Boston, ma, 02115, United States of America, o.ergun@neu.edu

1 - Restoration of Network Connectivity in Large-scale Disaster Response Problems

Aybike Ulsan, PhD Student, Northeastern University, 360 Huntington Avenue, Boston, MA, 02115, United States of America, ulsan.a@husky.neu.edu, Ozlem Ergun

The goal of this study is to establish the connectivity of a disrupted road network in a timely manner by determining a schedule for recovering/repairing damaged edges. Due to the complex nature of the problem, we propose a heuristic that prioritizes the edges based on their head and tail nodes' centrality measures. By capturing the particular features of the network topology with these measures, we are able to acquire near-optimal solutions in a rapid fashion.

2 - On the Value of Information-sharing in Interdependent Infrastructure Restoration

Thomas Sharkey, Rensselaer Polytechnic Institute, 110 8th Street, Troy, NY, 12180, United States of America, sharkey@rpi.edu, Huy Nguyen, John Mitchell, William Wallace

We consider the problem of restoring multiple disrupted infrastructure networks after an extreme event. This work analyzes the loss in restoration effectiveness resulting from decentralized planning across these networks in forming their restoration plans. We then examine different levels of information-sharing schemes and their impact in reducing this loss. Computational results based on realistic damage scenarios to networks are presented.

3 - An Integrated Network Design and Scheduling Problem for Network Restoration

Suzan Afacan, Graduate Student, University of Wisconsin Madison, 1415 Engineering Dr, Madison, WI, 53706, United States of America, iloglu@wisc.edu, Laura McIay

Infrastructure recovery is important for delivering time-sensitive services and commodities after a disaster. To examine this issue, we present an extension of the p-median problem that allows for network components to be installed by repair crews with a goal of minimizing the cumulative weighted distance. The model is illustrated with a computational example.

Bayesian Approach I

Contributed Session

Chair: Babak Zafari, The George Washington University School of Business, 2201 G Street NW, Funger Hall, Suite 415, Washington, DC, United States of America, zafari@gwu.edu

1 - Bayesian Inference for Deadline Reactivity

Ji-eun Kim, PhD Student, The Pennsylvania State University, Department of Industrial Engineering, 310 Leonhard Building, University Park, PA, 16802, United States of America, jxk594@psu.edu, David A. Nembhard

In time management phenomenon, human generally exhibit the rush before a deadline. This means relatively little time is devoted to tasks at the beginning, and most of the work is performed in close time proximity to the deadline. A Bayesian inference is applied to course website data to obtain reliable individual differences in pacing styles. We observe large reductions in error on data sets, which suggests that Bayesian estimation is a useful tool for learning deadline reactivity.

2 - Bayesian Estimation of Time of the First Bid in Retail Secondary Market Online Auctions

Babak Zafari, The George Washington University School of Business, 2201 G Street NW, Funger Hall, Suite 415, Washington, DC, United States of America, zafari@gwu.edu

In this work, we propose to develop a model to estimate the distribution of the time of the first bid in retail secondary market online auctions. The proposed estimation is based on a Bayesian mixture model of finite beta distributions. Our main interest is to study this distribution from auctions heterogeneity point of view. We also discuss managerial implications and suggest how auctioneers can benefit from this study.

3 - A Framework for Pediatrics Clinic No-show Prediction using Elastic Net and Bayesian Belief Network

Kazim Topuz, Wichita State University, 3737 N. Rushwood St. Apt. 1205, Wichita, KS, 67226, United States of America, mktopuz@gmail.com

This study predicts the no-show probability of the patient with using demographic, social and appointment as well as appointment attendance information. We develop a hybrid probabilistic prediction framework based on statistics and Bayesian network. We utilized Elastic Net for selection of the variables and state of art structural learning algorithm for building the Bayesian Belief Network.

Supply Chain Management with Marketing Considerations

Cluster: Operations/Marketing Interface

Invited Session

Chair: Yusen Xia, Georgia State University, 35 Broad St., Atlanta, GA, United States of America, yxia@gsu.edu

1 - Product Quality Strategy in the Presence of Consumer Heterogeneity of Technology Platform

Xiuli He, University of North Carolina Charlotte, 9201 University City Blvd, Charlotte, NC, United States of America, xhe8@uncc.edu, Yong Zha

This paper investigates quality strategy of the technology product which is attached to the platform when consumers convey a transaction utility on platform. We show that seller will choose different product quality strategies when consumers are homogeneous or heterogeneous on platform and seller has different platform cost strategies.

2 - Modeling Risk and Ambiguity-on-Nature in Normal-Form Games

Jian Yang, Associate Professor, Rutgers University, 1 Washington Park RM1084, Newark, NJ, 07102, United States of America, jyang@business.rutgers.edu

We propose multi-player frameworks that mitigate decision-theoretical difficulties with the traditional normal-form game. We react to Allais's (1953) paradox by concerning players with potentially nonlinear functionals of the payoff distributions they encounter. To deal with Ellsberg's (1961) paradox, we let players optimize on vectors of payoff distributions in which every component corresponds to one nature action. Equilibria are linked to nonlinear programs.

3 - Supply Chain Excellence and Firm Values

Min Shi, Associate Professor, California State University, Los Angeles, 5151 University Drive, Los Angeles, CA, 90032, United States of America, mshi2@exchange.calstatela.edu, Wei Yu

We empirically investigate the impacts of supply chain excellence, measured by AMR Research's Supply Chain Top 25 list, on firms' financial market performance under different macroeconomic scenarios from 2004-2014. In addition, this paper examines how the characteristics of SCM excellence influence the leading SCM firms on the financial market.

4 - Price or Quality-based Competition and Channel Structure with Consumers Loyalty

Sujan Wang, Institute of Management and Decision, Shanxi University, NO. 92 Wucheng Road, Xiaodian District, Taiyuan, 030006, China, tt_kkcn@sxu.edu.cn, Qiying Hu

In the practices of Chinese household appliance industry, we introduce a model for two manufacturers with different customer loyalty who may sell products through a decentralized channel or an integrated channel to consumers and face deterministic demand depending on quality, retail price and customer loyalty. We show that channel choices are closely related to market types and find decentralized channel structures is more likely.

40- Room 101, CC

Marketing III

Contributed Session

Chair: Fouad El Ouardighi, ESSEC Business School, BP 105, Cergy Pontoise, 95021, France, elouardighi@essec.fr

1 - Segment's Competitive Environment and Dynamics of Segment Entry and Segment Exit

Setiadi Umar, PhD Candidate, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States of America, setiadi.umar@rutgers.edu, Sengun Yenyurt

This study examines how segment's competitive conditions influence firms' patterns of segment selection: which segment to enter to and which segment to exit from in the context of business ecosystems. The study showed that high concentration and low density segment attract potential entrants to enter the segment and inhibit incumbents in the segment to exit. However, competitors' competitive moves might counter this condition.

2 - Optimal Promotion Strategies

Krista Foster, PhD Candidate, University of Pittsburgh, Katz Graduate School of Business, 241 Mervis Hall, Pittsburgh, PA, 15260, United States of America, kmf88@pitt.edu, Jennifer Shang

Given a portfolio of three products and a fixed pool of consumers, which form of promotion will maximize a seller's profits? We consider a number of promotional strategies to determine if and when each is optimal.

3 - The Marketing Dilemma: To Market or Not to Market During a Competitor's Product Harm Crises

Amirhossein Alamdar Yazdi, PhD Student, 121 Presidents Drive, 24 Rolling Green Drive, Amherst, MA, 01003, United States of America, aalamdaryazd@som.umass.edu, Adams Steven

What is the impact of advertising on a firm's performance during unfavorable news coverage of a close competitor? Positive? Likely. Negative? Possible. This study investigates the effect of advertising intensity on a firm's marketing and financial performance and the moderating influence of a competitor's product recalls.

4 - Advertising and Quality-Dependent Word-of-Mouth in a Contagion Sales Model

Fouad El Ouardighi, ESSEC Business School, BP 105, Cergy Pontoise, 95021, France, elouardighi@essec.fr, Dieter Grass, Richard Hartl, Peter Kort, Gustav Feichtinger

The omission of negative evaluations by current customers in contagion sales models and, more importantly, of the originating factors of such negative evaluations, may lead to prescribing of improper communication policy and therefore poor brand building strategy. This paper bridges the gap by suggesting a sales model where both positive and negative word-of-mouth affect the attraction rate of new customers, along with advertising.

Healthcare Operations Management

Sponsor: Manufacturing & Service Oper Mgmt/Healthcare Operations

Sponsored Session

Chair: Andrew Trapp, Assistant Professor, Worcester Polytechnic Institute, 100 Institute Rd., Worcester, MA, 01609, United States of America, atrapp@wpi.edu

1 - Impact of Breast Density on Designing Mammography Screening Policies

Mucahit Cevik, University of Wisconsin - Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, cevik2@wisc.edu, Burhaneddin Sandikci

Mammography screening is the golden standard for breast cancer screening, but it is also known to be less accurate for women with dense breasts. Therefore, some patients are often referred to receive supplemental screenings. We incorporate the breast density information to the breast cancer screening decisions and use a discrete-time partially observable Markov decision process model to assess the effectiveness of the supplemental screening tests.

2 - A Simulation Model for the Heart Allocation Process

Farhad Hasankhani Kohneh Sh, PhD Graduate Assistant, Clemson University, #4, 129 Freeman Hall, Clemson University, Clemson, SC, 29631, United States of America, fhasank@g.clemson.edu, Amin Khademi

Heart failure occurs when a heart loses its ability to properly circulate blood in the body. Over 5.8 million people in the US are suffering from heart failure. Heart transplantation is a life-saving treatment for such patients. The Number of donors, the only source of hearts, is limited, and demand far exceeds supply. In this study we create a simulation model to investigate the impacts of a variety of allocation policies on several outcomes such as expected life-years of the population.

3 - Scheduling with Stochastic Processing Times in a Medical Clinic

David Phillips, dphillip@usna.edu, Marcus Colyer, Marisa Molkenbuhr

We consider the problem of scheduling patients in a medical clinic. Patients must see one of the clinic's doctors and some must also receive a scan prior to seeing the doctor. Complications of the problem include stochastic processing times and model selection based on the decision problem of interest. We present models as well as computational results based on both integer programming and approximation algorithms approaches.

4 - Optimal Adjusted Panel Size for Balancing Patient and Physician Risk

Zelda Zabinsky, Professor, University of Washington, Industrial and Systems Engineering, Box 352650, Seattle, WA, 98195, United States of America, zelda@u.washington.edu, David Linz, Hao Huang, Paul Fishman, Joseph Heim

An issue in healthcare is sizing physician adjusted panels. Patient concerns (wait time, disruption of care, inequitable care) as well as physician concerns (inequitable workload, panel size preference) need to be balanced in any fair strategy for adjusted panel size. This paper proposes a multi-objective optimization model for minimizing the risk of patient and physician concerns that accounts for acute instances of inequality and risk. We provide an efficient frontier for administrative use.

Choice Modeling Applications in Revenue Management

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Adam Elmachtoub, Assistant Professor, Columbia IEOR, 500 West 120th St, New York, NY, United States of America, adam@ieor.columbia.edu

1 - Revenue Management under the Markov Chain Choice Model

Huseyin Topaloglu, Professor, Cornell University, 223 Rhodes Hall, Ithaca, NY, 14853, United States of America, ht88@cornell.edu, Jacob Feldman

We consider static assortment, network revenue management and single-leg revenue management problems under the Markov chain choice model. For static assortment problem, we give structural properties of the optimal assortment. For network revenue management, we give a tractable linear programming formulation. For single-leg revenue management, we characterize the optimal policy as a protection level policy.

2 - A Multi-attempt Approximation of Choice Model

Hakjin Chung, Stephen M. Ross School of Business, University of Michigan, Ann Arbor, MI, United States of America, hakjin@umich.edu, Boying Liu, Hyun-soo Ahn, Stefanus Jasin

We consider the problem of approximating an arbitrary mixture of logits with a series expansion. The degree of the expansion can be interpreted as the number of attempts that a customer is willing to make before leaving the system because his preferred product is not available. There are at least two benefits of using this approximation: the optimization problem becomes tractable and its parameters can be estimated using linear regression. We derive some bounds.

3 - Managing Product Transitions via Strategic Customer Selection

Roger Lederman, IBM, T. J. Watson Research Center, Yorktown Heights, NY, United States of America, rldederm@us.ibm.com, Adam Elmachtoub

The talk will discuss tools for shaping demand to better match supply capabilities, with a specific focus on product transitions. We describe a framework for managing transitions, including the role that sales targeting can have in shaping customer decisions. We then formulate as a customer selection problem in which a seller with limited inventories must prioritize sales effort across a set of heterogeneous customers with differing historical patterns of adoption.

4 - A Dynamic Learning Approach for Personalized Promotion Recommendations

Adam Elmachtoub, Assistant Professor, Columbia IEOR, 500 West 120th St, New York, NY, United States of America, adam@ieor.columbia.edu, Markus Ettl, Sechan Oh, Marek Petrik

Many companies are aiming to offer real-time personalized promotions to online shoppers with the goal of increasing conversion rates and revenue. In this work, we provide a dynamic learning model and algorithm that simultaneously maximizes revenue while learning how customers choose based on their attributes and the promotions they receive. We provide theoretical bounds on the regret as well as new analytical tools to determine feature importance in the context of promotion recommendations.

44-Room 103B, CC

Dynamic Pricing

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Candace Yano, University of California, Berkeley, IEOR Dept. and Haas School of Business, Berkeley, CA, 94720, United States of America, yano@haas.berkeley.edu

1 - Optimal Dynamic Pricing for Trade-in Programs

Mohammad Ghuloum, Doctoral Student, Indiana University, 1309 E 10th St, Bloomington, IN, 47405, United States of America, mghuloum@indiana.edu, Goker Aydin, Gilvan (Gil) Souza

Trade-in managers continuously monitor their inventory of used products, and adjust the acquisition and selling prices accordingly. Considering such a firm, we study a novel dynamic pricing problem, where not only the demand of the product is random and sensitive to the selling price, but also its supply is random and sensitive to the acquisition price.

2 - Pricing in Crowdfunding

Ming Hu, Associate Professor, University of Toronto, 105 St. George Street, Toronto, Canada, Ming.Hu@Rotman.Utoronto.Ca, Mengze Shi, Xi Li, Longyuan Du

We study the pricing decisions under an all-or-nothing crowdfunding scheme. First, menu or intertemporal pricing is more likely than a single price to be optimal. Second, dynamic pricing (contingent on the pledge amount) can help the creator to stay over the funding tipping point over time, increasing success rate and profitability.

3 - Dynamic Competition under Market Size Dynamics:

Balancing the Exploitation-induction Trade-off

Nan Yang, Assistant Professor, University of Washington at St. Louis, St. Louis, MO, 63130, United States of America, yangn@wustl.edu, Renyu Zhang

We study a dynamic competition model, in which retail firms periodically compete on promotional effort, sales price, and service level over a finite planning horizon. The key feature of our model is that the current decisions influence the future market sizes through the service effect and the network effect. Using the linear separability approach, we characterize the pure strategy Markov perfect equilibrium in both the simultaneous competition and the promotion-first competition.

4 - Optimizing Pre-season Order Quantities in the Presence of Planned Promotions

Dimin Xu, UC Berkeley, Haas School of Business, Berkeley, CA, United States of America, dimin_xu@haas.berkeley.edu, Candace Yano

Most retailers plan major promotions well before a product's selling season, possibly to coincide with storewide sales events. We optimize the pre-season order quantity for a product considering planned promotions (and consequent time-varying prices), when demand is price- and time-sensitive and stochastic. Our approach accounts for both systematic fluctuations and uncertainty in the implied salvage value over the season. We present structural results and managerial insights.

Topics in Revenue Management

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Florin Ciocan, INSEAD, Boulevard de Constance 77305, Fontainebleu, France, florin.ciocan@insead.edu

1 - When Fixed Pricing Meets Priority Auctions: Service Systems with Dual Modes

Jiayang Gao, PhD Candidate, Cornell University, 507 Hasbrouck Apts, Ithaca, NY, 14850, United States of America, jg838@cornell.edu, Huseyin Topaloglu, Krishnamurthy Iyer

Suppose a firm offers two modes of service: a fixed price, FIFO queue, and a priority queue. Customers choose a mode to participate, as well as their bids if they join the priority queue. We prove that in the unique symmetric equilibrium, customer behavior has a threshold structure, in which customers with very high and very low patience levels join the priority queue, whereas those with intermediate patience levels join the FIFO queue. We then discuss the firm's server allocation problem.

2 - Product Support Forum: Customers as Partners in Service Delivery

Konstantinos Stouras, PhD Candidate, INSEAD, Bd. de Constance, Fontainebleau, 77305, France, Konstantinos.Stouras@insead.edu, Serguei Netessine, Karan Girotra

Online product support forums where customers can post complaints and questions, or report issues about a product or service abound. More and more companies crowdsource their product and service support back to their customers, employing a few dedicated service operators. Through an analytical model, we characterize the equilibrium behavior of such a service system and compare it with a call center model.

3 - Econometrics for Learning Agents

Vasilis Syrgkanis, Microsoft Research, 641 Avenue of the Americas, New York, United States of America, vasy@microsoft.com, Eva Tardos, Denis Nekipelov

The goal of this paper is to develop a theory of inference of player valuations from observed data in the generalized second price auction without relying on the Nash equilibrium assumption. Existing work assumes that each player's strategies are best responses to the observed play of others. We show how to perform inference relying on the weaker assumption that players use some form of no-regret learning. We apply our techniques to a dataset from Microsoft's sponsored search auction system.

4 - Adwords Equilibria with Budgeted Bidders

Florin Ciocan, INSEAD, Boulevard de Constance 77305, Fontainebleu, France, florin.ciocan@insead.edu, Krishnamurthy Iyer

We examine a model of the AdWords market where bidders strategically choose their budgets and bids, while the network can throttle bidders to optimize its own revenues. We show the equilibria in this market take a simple form and that for these equilibria the network's optimal throttling policy is greedy.

1 - A Multiple Case Study of Resource Flow in Education Systems

Samantha Meyer, Research Fellow, University of Michigan, Ross School of Business, R5340, Ann Arbor, MI, 48109, United States of America, srmeyer@umich.edu, Karen Smilowitz

The US spends more to educate its children than nearly every other developed nation, but scores near the bottom on international tests. Yet, how the US could better use its resources is hard to know. Social scientists focus on the way resources influence power, trust, and competition, whereas operations scholars focus on technical problems of resource distribution and use. The reality is that both matter. In this study we examine the way social and technical issues interact in education systems.

2 - Motivating Process Compliance through Electronic Monitoring

Bradley Staats, Associate Professor, UNC-Chapel Hill, United States of America, Bradley_Staats@kenan-flagler.unc.edu,
Hengchen Dai, David Hofmann, Katy Milkman

We investigate the deployment of electronic monitoring as a way to drive process compliance. We do so using a unique, RFID-based system implemented in 72 hospital units at 42 hospitals. We found that the implementation of electronic monitoring resulted in a large, positive effect on compliance although compliance rates initially increased before they began a gradual decline. Additionally, where monitoring was removed we found that compliance rates declined to below pre-intervention levels.

3 - Social Engagement and Learning in Massive Open Online Courses: Evidence from Field Experiments

Dennis Zhang, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, j-zhang@kellogg.northwestern.edu, Gad Allon, Jan Van Mieghem

We study the impact of students' social engagement levels on their learning outcomes in Massive Open Online Courses (MOOCs) with several field experiments.

4 - Patient Perception and Hospital Choice in Mitral Valve Surgery

Guihua Wang, Ross School of Business, University of Michigan, 701 Tappan Avenue, Ann Arbor, MI, 48109, United States of America, guihuaw@umich.edu, Jun Li, Wallace Hopp

Using a patient-level dataset across 35 New York hospitals, we document wide quality gap among hospitals. We then use a discrete choice model to estimate what influences patient perception of hospital quality and quantify the level of sub-optimality of their choices of hospitals.

1 - Coopeting for Sustainability

Karthik Murali, University of Illinois, Urbana-Champaign, IL, United States of America, kmurali4@illinois.edu, Anupam Agrawal

Motivated by the observation of a spate of collaborative alliances between competing firms to source and sell more sustainable products, we study vertical and horizontal environmental R&D collaboration within and across competing supply chains and the ensuing environmental, social, and economic implications.

2 - The Value of Product Returns: Intertemporal Product Management with Strategic Consumers

Narendra Singh, Narendra.Singh@scheller.gatech.edu, Karthik Ramachandran, Ravi Subramanian

Consumer product returns are a significant and growing concern in many industries, and firms typically deem returns to be undesirable. We study the impact of returns on the intertemporal product strategy of a firm facing strategic consumers. Importantly, we show that returns may act as a device for the firm to mitigate the well-known time inconsistency problem, and firm profit could increase with the return rate.

3 - Contracting for Reuse under Condition Uncertainty

Aditya Vedantam, Assistant Professor, State University of New York, Buffalo, State University of New York, Buffalo, Buffalo, NY, United States of America, avedanta@purdue.edu, Ananth Iyer

Managing the operations of traditional end-of-life disposition of used electronics involving reuse and recycling is complicated by the varying condition of incoming units. We show how uncertainty in the reverse supply chain can be managed by sharing the resale value between the product recovery facility and the customer. Data from a large IT Asset retirement company is presented to support our findings.

4 - Relationship Between Appointments of Sustainability Officers and Performance

Priyank Arora, Georgia Institute of Technology, 800 W Peachtree St. NW, Atlanta, GA, 30308, United States of America, priyank.arora@scheller.gatech.edu, Ravi Subramanian, Manpreet Hora

In recent years, firms have been creating and staffing senior-level environmental and sustainability positions. We investigate the association between announcements pertaining to appointments of senior-level environmental or sustainability officers and firm performance.

Supply Chain Risk Management

Sponsor: Manufacturing & Service Oper Mgmt/iFORM

Sponsored Session

Chair: Nikolaos Trichakis, HBS, ntrichakis@hbs.edu

1 - Learning from Precursors to Disasters: The Role of Incentives

Heikki Peura, London Business School, Regent's Park, London, United Kingdom, hpeura@london.edu, Nitin Bakshi

Disaster investigations often reveal that the accident was preceded by near misses – precursor events that could have led to a disaster but did not – that went unreported or unheeded. To avoid disasters, a firm has to rely on employees for mitigation effort; to learn about disaster risk through precursors, it may be dependent on their reports. We examine the role of incentives in mediating the resulting three-way tradeoff between learning, mitigation and reporting.

2 - Inventory Decisions and Signals of Demand Management Capability to Investors

Guoming Lai, Univ. of Texas Austin, 2110 Speedway Stop B6500, Austin, TX, United States of America, Guoming.Lai@mcombs.utexas.edu, Wenqiang Xiao

We study the effects of asymmetric information of demand volatility on the inventory decision of a public firm who cares about not only its operational profits but also its market value. We find that the firm, when it faces a high demand volatility (less efficient), overstocks if the profit margin is low and understocks if the profit margin is high, while the firm with a low demand volatility (more efficient) may either overstock or understock in both cases.

3 - Operationalizing Financial Covenants

Gerry Tsoukalas, Assistant Professor, Wharton, 3730 Walnut Street, Philadelphia, PA, 19104, United States of America, gtouk@wharton.upenn.edu

We analyze the effectiveness of debt covenants in mitigating "operationally-driven" agency costs. It is shown that a leveraged firm's inherent operating flexibility can lead to significant agency distortions when optimal interest-only debt contracts are chosen, potentially wiping out as much as half the firm's value. Conversely, we show that the inclusion of simple financial covenants (widely used in practice) can eliminate these agency distortions and fully restore firm value.

Inventory Problems in Online Retail

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Annie I. Chen, Massachusetts Institute of Technology, P.O. Box 426068, Cambridge, MA, 02139, United States of America, anniecia@mit.edu

1 - Sparsity-constrained Inventory Placement for Online Retail

Annie I. Chen, Massachusetts Institute of Technology, P.O. Box 426068, Cambridge, MA, 02139, United States of America, anniecia@mit.edu, Stephen Graves

We study the problem of placing online retail inventory in the presence of sparsity constraints, which limit the number of fulfillment centers holding an item. The large-scale and combinatorial nature of the problem makes it challenging to obtain the exact optimal solution in a computationally efficient manner. We propose a technique that combines column generation and item aggregation to compute near-optimal solutions efficiently.

2 - Affinity-guided Assortment Selection for Inventory Deployment

Zhiwei (tony) Qin, Staff Data Scientist, Walmart Labs, 850 Cherry Ave, San Bruno, CA, 94066, United States of America, TQin@walmartlabs.com, Jagtej Bewli, Arash Asadi

We consider assortment selection problems arising from online retailing inventory deployment, e.g. forward deployment, cross-channel migration. Typically, reducing fulfillment costs due to order splits is an important factor in the selection decision. We describe an optimization framework based on product affinity network and mathematical programming, which is able to adapt to different cost drivers. We also present fulfillment simulation results on real orders data.

3 - Localized Assortment Selection

Graham Poliner, Vice President Merchandise And Supply Chain Analytics, Macy's Inc., 1440 Broadway, New York, NY, 10018, United States of America, graham.poliner@macys.com, Bhagyesh Phanse, Mark Posner

We consider the assortment selection problem for omnichannel selling locations to support multiple fulfillment alternatives (e.g. direct to consumer, walk in store customers, and buy online pick up in store). The total assortment breadth offered is much larger than the capacity of a single store or fulfillment center. We describe how cross-channel demand information and product affinities can be used to inform localized assortment decisions, and we present the results of pilot implementations.

4 - Optimal Inventory Placement under Warehouse Capacity Constraints

Salal Humair, Principal Research Scientist, Amazon.com, Inc., 500 Westlake Ave N, Seattle, WA, 98109, United States of America, salal@amazon.com, Onur Ozkok, Erdem Eskigun

We consider how to place initial stocks for multiple products in multiple warehouses that serve multiple regions, when demand from a region can be fulfilled by more than one warehouse. We obtain the optimal initial stocks using a constructive algorithm with reasonable complexity. We use numerical experiments to understand how the algorithm distributes products across warehouses. We use these insights to decompose the problem of how much to buy vs. how to distribute it across the warehouses.

New Models and Algorithms for Exploration and Exploitation Tradeoff Optimization

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Retsef Levi, J. Spencer Standish (1945) Professor of Operations Management, Sloan School of Management, MIT, 100 Main Street, BDG E62-562, Cambridge, MA, 02142, United States of America, retsef@mit.edu

1 - Approximate Gittins Indices for The Multi-armed Bandits

Eli Gutin, Mr, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, gutin@mit.edu, Vivek Farias

Multi-armed bandits is a fundamental problem that deals with the tradeoff between exploration and exploitation. While theoretical regret bounds have been proved for many solution methods, only in special cases have these bounds been shown to be optimal. By using Gittins' theorem, that applies to the discounted infinite horizon MAB problem, we propose an efficient, asymptotically optimal algorithm, AGI, that is competitive with IDS, UCB and Thompson Sampling methods for Bernoulli rewards.

2 - Stochastic Selection Problems with Testing

Chen Attias, Weizmann Institute of Science, 234 Herzl Street, Rehovot, 7610001, Israel, attiasc@mit.edu, Retsef Levi, Thomas Magnanti, Yaron Shaposhnik, Robert Krauthgamer

We study a new class of stochastic selection problems, where the goal is to choose the minimal cost option among alternatives with a-priori stochastic costs, by introducing a testing option that has fixed cost but reveals the realization of the random cost of the option being tested. For several interesting cases of this model, we obtain the optimal testing order and show that local decision rules that only consider the value of the currently tested option are optimal.

3 - When and How to Test in Scheduling Nonhomogeneous Job Classes

Yaron Shaposhnik, MIT, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, shap@mit.edu, Retsef Levi, Thomas Magnanti

We study a fundamental tradeoff that arises in many operational settings of performing work under uncertainty (exploitation) and investing capacity to reduce the underlying uncertainty (exploration). Sample domains include emergency departments, maintenance, scheduling, and project management. Our work leverages innovative analysis based on stochastic orders to obtain crisp descriptions of computationally efficient optimal exploration-exploitation policies, and provides managerial insights.

Analyzing and Managing Incentives

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Tinglong Dai, Assistant Professor, Johns Hopkins University, 100 International Dr, Baltimore, MD, 21202, United States of America, dai@jhu.edu

Co-Chair: Fuqiang Zhang, Olin Business School, Washington University, St. Louis, MO, United States of America, fzhang22@wustl.edu

1 - Incorporating Customer Response in an Online-to-offline Fulfillment Strategy

Elnaz Jalilipour Alishah, PhD Candidate, University of Washington, Seattle, Foster School of Business, Mackenzie Hall 358, Seattle, Wa, 98195-3200, United States of America, jalilipo@uw.edu, Yong-Pin Zhou

We study an omni-channel retailer who fulfills online customer orders using inventory from offline retail stores. We examine the practice of fulfilling from the nearest location, and suggest other strategies in response to customer price and leadtime preferences.

2 - Signalling by Testing

Tinglong Dai, Assistant Professor, Johns Hopkins University, 100 International Dr, Baltimore, MD, 21202, United States of America, dai@jhu.edu, Shubhranshu Singh

Diagnostic experts, such as medical specialists, often only imperfectly observe customers' true conditions, and may resort to advanced testing procedures. We model a diagnostic expert's diagnostic decision tree problem when the expert's level of competence is unknown to customers. We characterize perfect Bayesian equilibria, and prove the existence and uniqueness of a separating equilibrium. Our results offer insights into diagnostic experts' testing behavior driven by their signaling efforts.

3 - Information Sharing in Competing Supply Chains with Production Cost Reduction

Shilu Tong, Chinese University of Hong Kong, Shenzhen, 2001, Longxiang Blvd, Longgang District, Shenzhen, China, tongshilu@cuhk.edu.cn, Albert Ha, Quan Tian

We consider the problem of sharing demand information in two competing supply chains, each consisting of one manufacturer and one retailer. A supply chain that engages in information sharing triggers a reaction from the rival chain. Such a reaction may benefit or hurt the first supply chain, depending on whether the retailers compete on quantity or price, and whether the manufacturers are efficient in cost reduction or not.

4 - Push vs. Pull: How to Best Allocate Supply Risk in Random Yield Supply Chains

Guang Xiao, Olin Business School, Washington University in St. Louis, St. Louis, United States of America, xiaoguang@wustl.edu, Panos Kouvelis

We consider a bilateral supply chain with supply random yield and propose three variants of wholesale price contracts, which induce different risk allocations between the supply chain parties. We completely characterize the Pareto set of any contract type combination to fully explore the price negotiation possibilities and profit improvement opportunities within the supply chain.

Retail Management I

Contributed Session

Chair: Anurag Agarwal, Professor, University of South Florida, 8350 N Tamiami Tr, Sarasota, FL, 34243, United States of America, agarwala@sar.usf.edu

1 - Shrinking Shrinkage: An Empirical Investigation into Antecedents and Countermeasures

Shivom Aggarwal, IE Business School, Instituto de Empresa, S.L., CIF: B823343, C/ Maria de Molina, 12 Bajo, Madrid, 28006, Spain, dr.shivom@gmail.com, Daniel Corsten

Vendor-side fraud has been overlooked in literature due to intractability, but poses to be significant antecedent of shrinkage. Using multi-store longitudinal data from a US retailer, we investigate holistic antecedents of shrinkage and how they affect store performance. The unified framework will contribute to extant literature on efficient retail operations.

2 - Inventory Allocation in Omni-channel Retailing

Alexander Huebner, Associate Professor, Catholic University
Eichstaett-Ingolstadt, Auf der Schanz 49, Ingolstadt, 85049,
Germany, alexander.huebner@ku.de, Heinrich Kuhn,
Andreas Holzapfel

Omni-channel retailers need to allocate inventories to their stores and the warehouse for online fulfillment. The objective is to reduce for all channels operational replenishment costs, stock-out costs and margin losses for overaged inventory. We develop a decision model for inventory allocation and setting the end-season discounts. The problem is solved with stochastic dynamic programming. We show insights from a case study with a German fashion retailer, where the model is applied.

3 - Vendor Influence on Inventory Adjustments

Daniel Corsten, IE Business School, Calle Maria de Molina 12
Bajo, Madrid, 28006, Spain, daniel.corsten@ie.edu,
Shivom Aggarwal

Vendor-side factors have been overlooked in the literature on shrinkage due to intractability. Using multi-store longitudinal data from a US retailer we investigate antecedents of shrinkage and how they affect store performance. Our holistic framework will contribute to extant literature on retail operations.

4 - Efficient Algorithm for Assortment Planning with Limited Shelf Space

Chun-miin Chen, Assistant Professor, Bucknell University,
313 Taylor Hall, 701 Moore Ave., Lewisburg, PA, 17837,
United States of America, cmc052@bucknell.edu, Zhaolin Li

We study the impact of limited shelf space on assortment planning in a single-period model. As the shelf-space constraint makes the optimization problem NP-complete, we investigate a comprehensive measure which enables efficient identification of the variants to be added into the assortment and efficient allocation of the available shelf space.

5 - An Analytics Framework for the Retail Shelf Space Management

Anurag Agarwal, Professor, University of South Florida, 8350 N
Tamiami Tr, Sarasota, FL, 34243, United States of America,
agarwala@sar.usf.edu, Ramakrishna Govindu, James Curran

Due to advancements in information technology, retailers are collecting a lot of data and trying to optimize their limited shelf space. In this presentation, we propose an analytics framework that integrates predictive and prescriptive analytics for optimizing the retail shelf space.

Behavioral Models in Operations Management

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Xuanming Su, The Wharton School, University of Pennsylvania,
Philadelphia, United States of America, xuanming@wharton.upenn.edu

1 - The Impact of Decision Rights and Long Term Relationships on Innovation Sharing

Ruth Beer, Kelley School of Business, Indiana University, 1275 E
10th St, Bloomington, IN, 47405, United States of America,
ruthbeer@indiana.edu, Stephen Leider

We study a supplier's incentives to share an innovation with a buyer when sharing the innovation increases efficiency but makes the supplier vulnerable to the buyer sharing it with other suppliers. We show, both theoretically and experimentally, that the supplier's optimal decision depends on the length of the relationship and in particular, on how the buyer allocates decision rights among its employees.

2 - Linking Customer Behavior and Delay Announcements using a Probability Model

Qiuping Yu, Assistant Professor, Indiana University, 1309 E. 10th
Street, Bloomington, IN, 47405, United States of America,
qiupyu@indiana.edu, Eric Webb, Kurt Bretthauer

Service systems often offer announcements to customers about their anticipated delay. We empirically examine how announcements affect queue abandonment behavior using a duration model accounting for potential behavioral factors. Our results show announcements induce the reference effect and customers exhibit loss aversion. We also find evidence indicative of the sunk cost fallacy. We then provide insights for staffing and delay announcement policy accounting for observed behavioral factors.

3 - Trust, Social Networks, and Information Sharing Among Executives

Karen Zheng, MIT, 77 Massachusetts Avenue, Cambridge, MA,
02139, United States of America, yanchong@mit.edu, Emily Choi,
Ozalp Ozer

We experimentally study how trust and social networks influence forecast information sharing behavior among executives with an average 17 years of professional experience. We demonstrate an intricate interaction among trust preconditioned by prior experiences, trust measured from social network, and trust in supply chain information exchange. We show when trust from social network significantly impacts trust in the supply chain and the resulting information sharing efficiency.

4 - Behavioral Impact of Irrelevant Market Information on Buying Decisions

Kay-Yut Chen, Professor, University of Texas Arlington,
701 West Street, Arlington, TX, United States of America,
kychen@uta.edu, Diana Wu

We study how market information such as past sales, current stock levels and stock-out probability influences purchase behavior. Experiments are conducted in which buyers, who are exposed to different information, evaluate trade-offs between the likelihood of out-of-stock and future price discounts. We found that individuals can be swayed by information that is non-informative and irrelevant. We develop a behavioral model that captures such behavioral reactions to explain the lab findings.

Resource Allocation

Contributed Session

Chair: Marc Jansen, PhD Candidate, Judge Business School,
University of Cambridge, Trumpington Street, Cambridge,
United Kingdom, mcj32@cam.ac.uk

1 - Optimal Allocation of Conference Rooms to Meeting Requests

Pawan Chowdhary, Software Research, IBM Research,
650 Harry Road, San Jose, CA, 95120, United States of America,
chowdhar@us.ibm.com, Robert Moore, Susanne Glissmann,
Sunhwan Lee, Ray Strong, Anca Chandra, Jeanette Blomberg

We present an analytics driven solution that dynamically allocates the conference rooms based on time and other constraints. The approach initially assigns a conference room using greedy heuristic and later reassigns or reaffirms the room as responses from attendees arrive. We will show the results of both traditional and optimal approach along with algorithm. We will also discuss how we can leverage mobile to further enhance the solution and analytics to further improve the outcomes.

2 - Optimizing Campsites Accommodation and Prices

Dasong Cao, Principal Scientist, Wyndham Exchange and Rental,
14 Sylvan Way, Parsippany, NJ, 07054, United States of America,
dasong.cao@rci.com

European vacation rental company offers package camping holidays, the accommodation includes mobile homes, lodges and tents. Each year, they put together a contracting plan, to decide which sites to choose to place accommodation units on and how many units of each type to offer on each site, and then a process to set the prices. We first built a mathematical model to pick optimal site location and unit mix, and then built an Yield Management System to set the prices dynamically.

3 - Managing Escalation: Support System Failure and Response Capacity Allocation

Marc Jansen, PhD Candidate, Judge Business School, University
of Cambridge, Trumpington Street, Cambridge, United Kingdom,
mcj32@cam.ac.uk, Nektarios Oraopoulos, Daniel Ralph

Recent high profile IT system disruptions highlight the dependency of large client pools on continuous availability of equipment provided and maintained by a single vendor. At the onset of disruption, the scale of the disruption is typically unknown. This paper examines how contracting decisions between an IT vendor and multiple clients can enable efficient allocation of response capacity under imperfect information on the true nature of the disruption.

Forecasting

Contributed Session

Chair: Arnd Huchzermeier, WHU-Otto Beisheim School of Management, Production Management, Burgplatz 2, Vallendar, 56179, Germany, ah@whu.edu

1 - Modeling Effects of Price Changes on Sales for Improved Forecasting and Promotion Planning

Shubhankar Ray, Walmart Labs, 850 Cherry Ave., San Bruno, CA, 94066, United States of America, sr02@walmartlabs.com, Brian Seaman, Ashin Mukherjee

In online retail, the high sales variability & missing samples makes item-level estimation of price elasticities unreliable. We use a mixed-effects framework to fit autoregressive distributed lag models on item groups to get reliable population-level estimates of short/long-run elasticities while pooling information across items. This model can be layered with any forecasting model to generate price sensitive forecasts & can help steer the sales in a desired direction during promotion planning.

2 - A Better Accuracy Measure than Mean Absolute Percentage Error

Chris Tofallis, Professor of Decision Science, Hertfordshire Business School, College Lane, Hatfield, AL10 9AB, United Kingdom, c.tofallis@herts.ac.uk

Although Mean Absolute Percentage Error is widely used, it suffers from bias: its use in selecting a forecasting method favours methods whose predictions are too low. We explain why this happens and present an alternative relative accuracy measure which is unbiased. This measure can be used to estimate prediction models. Minimum MAPE models do not predict a known statistic. By contrast, when the proposed metric is used, the resulting least squares regression model predicts the geometric mean.

3 - Information Sharing in Supply Chains Facing Autoregressive Demand.

Vladimir Kovtun, Syms School of Business, 215 Lexington Avenue, New York, NY, 10016, United States of America, vladimir.kovtun@yu.edu, Avi Giloni, Clifford Hurvich

We introduce a general class of potentially valuable sharing arrangements in a multi-stage supply chain in which the retailer observes stationary ARMA demand with respect to Gaussian white noise (shocks). We demonstrate how a typical supply chain player can create an incentive-compatible sequence of partial-information shocks (PIS) based on its available information and share these with an adjacent upstream player, potentially reducing the upstream players lead-time demand forecast error.

4 - Judgemental Demand Forecasts for Online Sales of a Premium Bike Manufacturer

Arnd Huchzermeier, WHU-Otto Beisheim School of Management, Production Management, Burgplatz 2, Vallendar, 56179, Germany, ah@whu.edu, Christoph Diermann

We present a judgmental demand forecast model for a premium bike manufacturer selling each season a new collection of products online. Forecast accuracy could be improved by using a team approach, by de-biasing the expert forecasts and by selecting the appropriate segmentation of bike types. Forecast accuracy could be improved by 26% and profit increased by more than 40%.

Operations Management VII

Contributed Session

Chair: Xueyuan Cai, Huazhong University of Science and Technology, 1037 Luoyu road, Wuhan, China, comeon1644@163.com

1 - Configurations of Distribution Strategies

Jing Tang, Em-Lyon Business School, 23 Avenue Guy de Collongueresear, Ecully, 69134, France, tangacade@gmail.com, Yeming Gong

Based on 124 quantitative samples with both first-hand and second hand data, as well as 56 qualitative samples, this paper examines the strategic fit of distribution strategies from the perspective of configuration theory. We find that the fit between operational decisions including infrastructural and structural decisions, and operational competencies including cost and flexibility, has an important effect on business performance.

2 - Exchange-old-for-new Program: An Incentive to Induce Early Purchases with Product Rollover

Yongbo Xiao, Associate Professor, Tsinghua University, School of Economics and Management, Beijing, 100084, China, xiaoyb@sem.tsinghua.edu.cn, Qian Liu

Many customers may choose to wait for new generation of products in face of product roll-overs. We propose to adopt an exchange-old-for-new program to induce customers to make early purchase. Starting from the choice behavior of strategic customers and based on a dynamic programming model, we study the optimal pricing decision involved in the exchange program.

3 - Model and Algorithms for the Integrated Production and Vehicle Routing Problem

Ling Liu, Huazhong University of Science & Technology, 1037 Luoyu Road, Wuhan, Hubei, China, Wuhan, China, 182028870@qq.com

In this paper, the integrated production and vehicle routing problem is considered in a Make-to-Order (MTO) manufacturer, where there is a single machine for production and limited vehicles with capacity constraints for transportation. The objective is to determine the decisions about production scheduling, transportation batching and vehicle routing, to minimize the maximum order delivery time. An optimal property is proposed and based on the property, an improved genetic algorithm is developed.

4 - Optimizing Multi-item Joint Replenishment under Stochastic Demand and Uncertain Leadtime

Xueyi Ai, School of Management, Huazhong University of Science and Technology, 1037 Luoyu Road, Wuhan, China, aixueyi1030@gmail.com, Jinlong Zhang, Lin Wang

In real-life practice, leadtime uncertainty is a common phenomenon which may be caused by various factors. The purpose of this paper is to develop a more realistic joint replenishment model considering both stochastic demand and uncertain leadtime simultaneously, and propose an improved fruit fly optimization algorithm (IFOA) to solve the problem, minimizing the long-run average total costs. Experimentation results show the standard deviation of leadtime has large effect on the system.

5 - Strategy Comparison of Capacity Allocation in a Supply Chain with One Dominant Retailer

Xueyuan Cai, Huazhong University of Science and Technology, 1037 Luoyu road, Wuhan, China, comeon1644@163.com, Jianbin Li

We consider a distribution system with one supplier and two retailers. The supplier will implement allocation mechanisms or improve her wholesale price when the capacity can't match demand. Conventional wisdom thinks that the impact to the supplier by "order-inflation" mechanisms is not the same as that by "truth-telling" mechanisms. But we show that this is not true in our setting where each retailer faces a oligopoly market and places order to the supplier considering the capacity constraints.

Electric Transportation Systems Modelling

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Ramteen Sioshansi, Associate Professor, The Ohio State University, Integrated Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, sioshansi.1@osu.edu

1 - Optimization of Incentive Policies for Plug-in Electric Vehicles

Yu Nie, Northwestern University, Evanston, IL, United States of America, y-nie@northwestern.edu, Mehrnaz Ghamami

High initial purchase prices and the lack of supporting infrastructure are major hurdles to the adoption of plug-in electric vehicles (PEVs). It is widely recognized that the government could help break these barriers through incentive policies, such as offering purchase rebates and funding charging stations. The objective of this paper is to propose a modeling framework to optimize the design of such incentive policies.

2 - Incentive-compatible Charging Mechanisms for Plug-in Electric Vehicles

Mark Nejad, Assistant Professor, University of Oklahoma, Industrial and Systems Engineering, Norman, OK, United States of America, mark.nejad@ou.edu, Lena Mashayekhy

We design charging mechanisms for plug-in electric vehicles considering different charging rates. We prove that our proposed mechanisms are dominant-strategy incentive compatible, so that EV drivers have no incentive to misreport their charging requests or their arrival-departure dynamics.

3 - Public Electric Vehicle Fast Charging Station**Management Strategies**

Fei Wu, The Ohio State university, 1971 Neil Ave., Columbus, OH, 43210, United States of America, wu.1557@osu.edu, Ramteen Sioshanshi

Fast EV charging stations typically use high-power chargers. Without control, transformers serving the stations will suffer accelerated aging. A charging station control model (CSCM) is introduced. It is formulated as a two-stage stochastic programming model to minimize the station's expected operation cost. A sequential sampling procedure with sample average approximation is proposed to solve the CSCM. Simulations show that the operation costs are significantly reduced by using the CSCM.

Renewables Integration: Market Clearing, Optimal Siting and Energy Storage

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Dalia Patino-Echeverri, Assistant Professor, Duke University, Box 90328, Duke University, Durham, NC, 27708, United States of America, dalia.patino@duke.edu

1 - Co-optimizing Battery Storage for Energy Arbitrage and Frequency Regulation

Bolong Cheng, Princeton University, Olden Street Engineering Quadrangle, Electrical Engineering, Princeton, NJ, 08544, United States of America, bcheng@princeton.edu, Warren Powell

We want to optimize battery storage for multiple applications; this problem requires the battery to make charging/discharging decisions at different time scales while accounting for the stochastic information. Solving the problem for even a single-day operation would be computationally inefficient due to the large state space and time steps. We propose a dynamic programming approach that takes advantage of the nested structure of the problem by solving smaller sub-problems of different sizes.

2 - Optimizing Wind Site Placement to Minimize Variability Effect

Amelia Musselman, Graduate Research Assistant, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, amusselman@gatech.edu, Valerie Thomas, Dima Nazzal

As a result of increased environmental awareness, wind power has drawn considerable attention as a potential renewable energy alternative. However, the intermittency and uncontrollability of wind warrant concerns about its reliability as an energy resource. In this research we develop a power generation expansion planning model that aims to mitigate the effects of wind variability by selecting sites to complement each other such that the overall wind energy available is both high and consistent.

3 - Assessing Operation of Wind-coal Hybrid Units with Flexible Carbon Capture and Storage(CCS) in MISO

Rubenka Bandyopadhyay, PhD Candidate, Duke University, Box 90328, Duke University, Durham, NC, 27707, United States of America, rb171@duke.edu, Xin Li, Ali Daraeepour, Dalia Patino-Echeverri

We simulate the optimal dispatch of coal-wind hybrid units (i.e. existing coal plants retrofitted with flexible post-combustion amine based CCS and co-located wind farms) in a Unit Commitment/Economic Dispatch (UC/ED) model of MISO. We assess market benefits derived from provision of ramp-capability and its impacts on wind curtailment, system reliability and systems costs.

4 - Generation Expansion Planning under Flexible Performance Standards with Alternative Compliance Payments

Dalia Patino-Echeverri, Assistant Professor, Duke University, Box 90328, Duke University, Durham, NC, 27708, United States of America, dalia.patino@duke.edu

This research explores the effects on costs and emissions from making Alternative Compliance Payments (ACP) part of the policy mechanisms for reducing CO₂ emissions from power plants. Under an ACP States set an emissions rate target, a fee (the ACP) that emitters pay for each ton of emissions in excess of the target, and a deadline to permanently reduce emissions (by retrofitting or replacement). A Stochastic Mixed Integer Linear Program represents the decisions of a regulated electric utility.

Joint Session ENRE & Integer and Discrete Optimization: Emerging Operational Approaches in Electric Power Systems – Transmission Switching, Data-Driven Maintenance, and Natural Gas Coordination

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Andy Sun, Assistant Professor, Georgia Institute of Technology, 755 Ferst Drive, Atlanta, GA, 30332, United States of America, andy.sun@isye.gatech.edu

1 - New Formulation and Strong MISOCP Relaxations for AC Optimal Transmission Switching Problem

Burak Kocuk, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, burak.kocuk@gatech.edu, Santanu Dey, Andy Sun

In this work, we formulate the AC Optimal Transmission Switching (AC OTS) problem as a MINLP. We propose a mixed integer SOCP (MISOCP) relaxation and strengthen this relaxation via several types of valid inequalities, some of which have demonstrated excellent performance for AC OPF and some others are specifically developed for the AC OTS. Finally, we propose practical algorithms that utilize the solutions from the MISOCP relaxation to obtain high quality feasible solutions for AC OTS problem.

2 - Flexible Transmission Decision Support: Scalable Heuristics for Power Flow Control Devices

Kory Hedman, Professor, Arizona State University, P.O. Box 875706, GWC 206 School of ECEE, Tempe, AZ, 85287-5706, United States of America, Kory.Hedman@asu.edu, Mostafa Ardakani, Xingpeng Li, Mojdeh Abdi-khorsand, Pranavamoorthy Balasubramanian

While power flow control devices can greatly enhance the efficiency and reliability of the high voltage power grid, the modeling of such devices in network flow (optimal power flow) models is limited due to the added computational burden. We will present two types of power flow control: transmission switching and variable impedance based series devices. We will present simple heuristics that reduce the computational burden, are scalable, and still produce high quality solutions.

3 - Sensor Driven Condition Based Generation Maintenance

Murat Yildirim, PhD Student, Georgia Institute of Technology, 755 Ferst Drive, Atlanta, GA, 30332, United States of America, murat@gatech.edu, Nagi Gebrael, Andy Sun

We provide an adaptive optimization model to determine the optimal generation maintenance scheduling by leveraging sensor health monitoring data and considering network constrained unit commitment decisions. We propose new mixed-integer optimization models and efficient algorithms that exploit the special structure of the proposed formulation. We present extensive computational experiment results to show proposed models achieve significant improvements in cost and reliability.

4 - Incorporating Natural Gas Pipeline Constraints in Intraday Unit Commitment and Dispatch

Jeff Baker, Southern Company, 600 18th Street North, Birmingham, AL, United States of America, jeffbake@southernco.com

Southern Company secures a reliable natural gas supply for its generation fleet by procuring firm transportation on several pipelines under long-term contracts. When there is a significant discrepancy between the day ahead and real time demand, utilization of gas along a pipeline must be optimized. This talk will discuss the impact of adding gas burn constraints into intraday unit commitment and dispatch algorithms as well as the impacts to scheduling on system operators.

Electricity Access in Developing Countries

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Valerie Thomas, Professor, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, United States of America, valerie.thomas@isye.gatech.edu

1 - The Case for Distributed Energy in the Developing World

Todd Levin, Energy Systems Engineer, Argonne National Laboratory, 9700 S Cass Ave, Lemont, IL, 60439, United States of America, tlevin@anl.gov, Valerie Thomas

In developing countries where infrastructure is underdeveloped, there may be potential for decentralized technologies to leapfrog the centralized electrification model. We present a service based economic analysis that incorporates the true, unsubsidized cost of energy access in rural regions. We show that distributed options may be cost-effective if consumption is modest and suggest that some grid subsidies may be more effectively channeled to support distributed approaches to energy access.

2 - Risk-aware Control of Solar Micro-grids

Carlos Abad, Columbia University, 500 W 120th St. Rm 321, New York, NY, 10027, United States of America, carlos.abad@columbia.edu, Garud Iyengar, Vijay Modi

Providing power to widely spread out communities using the conventional power grid is not economically feasible. The most attractive alternative source of affordable energy for these communities is solar micro-grids. We discuss risk-aware robust methods to optimally size and operate micro-grids in the presence of uncertain demand and uncertain generation. These algorithms help system operators to increase their revenue while making their systems more resilient to inclement weather conditions.

Research in Environmentally Sustainable and Socially Responsible Operations

Sponsor: ENRE – Environment I – Environment and Sustainability

Sponsored Session

Chair: Jason Nguyen, University of Minnesota, 321 19th Ave S, Minneapolis, MN, 55455, United States of America, nguy1762@umn.edu

1 - Perceived Operational Impacts and Investment in Carbon Abatement

Chien-ming Chen, Nanyang Technological University, 50 Nanyang Avenue, Singapore, Singapore, cmchen@ntu.edu.sg, Maria Montes-sancho

This study examines how the perceived operational impacts from reducing carbon emissions are associated with long-term investment in environmental technology portfolios. We examine our hypotheses based on recent carbon disclosure data.

2 - Evaluating Alternative Strategies for Fostering Responsibility Among Suppliers

Avijit Raychaudhuri, PhD Candidate, Nanyang Business School, Nanyang Technological University, 50 Nanyang Avenue, South Spine S3-01B-73, Singapore, 639798, Singapore, avijit001@e.ntu.edu.sg, Fang Liu, S Viswanathan

We look at global supply chains which comprise suppliers of varying degrees of responsibility. In order to promote responsibility in such supply chains, global buyers generally follow a strategy of dual investment in supplier responsibility audit and supplier improvement. We evaluate the relative profitability of these strategies under different scenarios. We also analyze how the buyer's optimal investment policy affects supply chain responsibility.

3 - A Bilevel Optimization Model for Bioenergy Contract Price Determination

Lizhi Wang, Associate Professor, Iowa State University, 3016 Black Engineering, Ames, IA, 50011, United States of America, lwzhang@iastate.edu, Liu Su, Guiping Hu, Emily Heaton

We study farmers crop selection problem in the face of crop price uncertainty, yield uncertainty, and environmental concerns. We then propose a bilevel optimization to help bioenergy companies determine appropriate contract prices to encourage farmers to switch from conventional crops to energy crops.

4 - Net-zero Carbon Manufacturing and Supply Chain Operations: A Fantasy or a Possibility?

Tongdan Jin, Texas State University, 601 University Drive, San Marcos, United States of America, tj17@txstate.edu, An Pham, Fei Sun

We address two fundamental questions confronted by manufacturing and supply chain design: 1) is it cost-effective to deploy onsite wind and solar power to achieve net-zero carbon environmental performance? and 2) how to design a reliable onsite energy system to meet the variable demand without storage devices? We conclude that zero carbon operations are achievable at affordable cost provided the local wind speed is above 5 m/s or the overcast days are less than 35% of a year.

Energy and Supply Chain Management

Cluster: Energy Systems: Design, Operation, Reliability and Maintenance

Invited Session

Chair: Yao Zhao, Rutgers University, 1 Washington street, Newark, NJ, 07102, United States of America, yaozhao@andromeda.rutgers.edu

1 - Energy Supply Chain: Insights, Security, and Sustainability

Kwon Gi Mun, PhD Candidate, Rutgers University, SCM, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States of America, kwongimun@gmail.com, Yao Zhao, Endre Boros, Rafique Raza

We test and design heuristics and an optimal decision model for introducing new strategies to design energy supply network. A main contribution is that well-formulated energy supply network can explain how to ensure energy supply and energy security. We consider all of possible T&D technology such as HVAC/HADC together, and we found that a design of energy supply network may cause an inefficient supply of electricity unless it is optimized with an integrated network.

2 - Expected Value and Chance Constrained Stochastic Unit Commitment Ensuring Wind Power Utilization

Chaoyue Zhao, Oklahoma State University, 322G Engineering North, Stillwater, OK, United States of America, chaoyue.zhao@okstate.edu

In this talk, we propose an expected value and chance constrained stochastic optimization approach for the unit commitment problem with uncertain wind power output. A combined SAA framework that considers both the expected value and the chance constraints is proposed to construct statistical upper and lower bounds for the optimization problem. Finally, a revised IEEE 118-bus system is studied to show the scalability of the proposed model and algorithm.

3 - Energy Supply Chain: Future Energy Security

Raza Rafique, Assistant Professor, Lahore University of Management Science, Suleman Dawood School of Business, Lahore, 54600, Pakistan, raza.ali@lums.edu.pk, Yao Zhao, Kwon Gi Mun

Electricity crisis is a major hindrance towards economic growth of Pakistan and poses a serious national security threat to the country. The crisis has resulted into political turmoil and social instability. We have provided a framework to address energy supply chain design. The study shows great potential and provide guidelines to ensure future energy security of Pakistan.

4 - Data-Oriented Decision Making in Demand Response

Weiwei Chen, Assistant Professor, Rutgers University, Rutgers Business School, Newark, NJ, 07102, United States of America, wchen@business.rutgers.edu

Demand response (DR) programs have emerged among electric utilities to reduce peak electricity demand and enhance customer satisfaction. A critical issue is to accurately estimate the customers' baseline power consumptions and the load reduction. A cohort based approach is introduced to improve the estimation accuracy utilizing customer historic data. Then, methods to manage various DR events considering exogenous information are developed to optimize the expected savings for utility companies.

Operations Management III

Contributed Session

Chair: Sang Jo Kim, MIT-Zaragoza International Logistics Program, Calle Bari 55, Edificio Nayade 5, Zaragoza, 50197, Spain, sjkim@zlc.edu.es

1 - A New Approach to the Multi-Product Newsvendor Problem with Customer Choice

Amr Farahat, Washington University in St. Louis, One Brookings Drive, St. Louis, MO, 63104, United States of America, farahat@wustl.edu, Joonkyum Lee

We present a methodology that yields upper bounds and feasible solutions to the multiproduct newsvendor problem with customer choice. The methodology is based on an approximate Jordan decomposition of the state transition matrix. Specializations include a decomposition by customer into a sequence of assortment optimization problems and a decomposition by product into a collection of independent newsvendor problems.

2 - Stackelberg-game Analysis of Retailers' Joint Procurement

Tianyuan Wang, Lingnan (University) College of Sun Yat-Sen University, NO.135, Xingang West Road, Guangzhou, China, wty-2@163.com, Ke Fu

We consider two retailers who face a Stackelberg game in joint procurement. They have to determine the optimal inventory and pricing strategies in the presence of both cooperation and competition. We show that both retailers prefer joint purchasing if they have similar market penetrations. We demonstrate how different problem parameters affect the game outcomes.

3 - Consumer Showrooming and the Length of Product Line

Yilong Luo, PhD Candidate, Illinois Institute of Technology, 6716 Idaho Ave., Hammond, IN, 46323, United States of America, luoyilong@gmail.com, Jiong Sun

It is known that consumers' showrooming behavior, i.e., inspecting products at brick-and-mortar stores and then making a purchase at a competing online store, can result in the brick-and-mortar store losing potential customers. We show that such showrooming behavior can soften competition and hence can benefit both retailers. We also show that this showrooming behavior may or may not induce the brick-and-mortar retailer to reduce the length of the product line it carries.

4 - The Optimal Dynamic Policy for Periodic Stocking and Bundling

Sang Jo Kim, MIT-Zaragoza International Logistics Program, Calle Bari 55, Edificio Nayade 5, Zaragoza, 50197, Spain, sjkim@zlc.edu.es, Youyi Feng, Jianjun Xu

We consider a firm that offers two individual products and a bundle of them. They periodically order the two products as well as bundle them aiming to maximize the total discounted profit over a finite planning horizon. We assume that the customer demand is random, unmet demand is backlogged and unsold items are carried over to the next period. Optimal joint decisions on ordering and bundling follow a well-structured policy that also draws significant managerial insights.

Risk-Based Decision Making in Interdependent Systems

Sponsor: Decision Analysis

Sponsored Session

Chair: Hiba Baroud, Vanderbilt University, 400 24th Avenue South, Nashville, TN, 37205, United States of America, hiba.baroud@vanderbilt.edu

1 - Multi-criteria Inoperability Analysis of Commodity-specific Dock Disruptions of Inland Waterway Port

Mackenzie Whitman, Graduate Student, University of Oklahoma, 1018 Timber Ridge Road, Harrah, OK, 73045, United States of America, mgwhitman@ou.edu, Hiba Baroud, Kash Barker

Decision making for managing risk to infrastructure systems requires accounting for impacts of disruptions that render systems inoperable. This paper integrates a dynamic risk-based interdependency model with multi-criteria decision analysis to evaluate dock-specific resource allocation alternatives to provide tangible assessments of port preparedness planning. We analyze a set of discrete allocations for the inland waterway Port of Catoosa in Oklahoma to assess total expected loss per industry.

2 - How Much Should We Spend on Preparing for Disruptions?

Cameron MacKenzie, Assistant Professor, Iowa State University, 3004 Black Engineering, Ames, IA, 50011, United States of America, camacken@iastate.edu

Every time a disruption causes major economic damages and/or leads to several fatalities, the public questions why more wasn't done to prepare for the disruption. Prevention and preparedness require allocating resources (usually money) that could be used for other purposes. I will present a model to help a decision maker determine how much should be allocated before a disruption for both a risk neutral and risk averse case. The model is applied to the Deepwater Horizon oil spill.

3 - Infrastructure Resilience Framework for Decision Making Comparison and Real Time Monitoring

Dante Gama Dessavre, Ph. D. Candidate, Stevens Institute of Technology, Castle Point on Hudson, Hoboken, NJ, 07030, United States of America, dante.gamadessavre@gmail.com, Jose Emmanuel Ramirez-marquez

Understanding impacts of disruptions to systems is a critical component to enable infrastructure modifications that improve their resilience. We present a framework and optimization formulations that enable direct comparison of the resilient behavior of a system due to different design choices; We also show how it can be adapted to monitor the resilient behavior of a system in real time in order to enhance the tools available to decision makers for disruption management.

4 - How Performance Measure Selection Impacts Risk Characterization in Interdependent Infrastructure

Allison Reilly, Johns Hopkins University, 3400 N Charles Street, Baltimore, MD, 21218, United States of America, acr@jhu.edu, Andrew Samuel, Seth Guikema

A perturbation in one infrastructure system stemming from a failure, an investment, or some other change, is known to impact multiple performance measures in dependent systems. However, most interdependent infrastructure models evaluate influences on performance using only one measure. We evaluate the implications of using one performance metric on decision-making and system-wide risk and discuss how multiple performance measures could be used to build a more holistic view.

5 - Bayesian Method for Thermo-electric Power Generation Drought Risk Assessment

Royce Francis, George Washington University, 800 22nd St. NW B1850, Washington, DC, 21212, United States of America, seed@gwu.edu, Behailu Bekera

This paper presents a Bayesian framework for thermoelectric drought risk assessment, focusing on current and future risk of drought driven by climate and socio-economic changes. Uncertainties vary across regions based on the climate condition, technology choices, regulations, demographic changes. These factors are taken into consideration in updating uncertainty in parameters of a cost model currently being developed by the authors.

Decision Analysis Applications in Operations Management

Sponsor: Decision Analysis

Sponsored Session

Chair: Barry Cobb, Missouri State University, 901 S. National Ave., Springfield, MO, 65897, United States of America, BarryCobb@MissouriState.edu

1 - Import Security: Assessing the Risks of Imported Food

Jonathan Welburn, PhD Student, University of Wisconsin - Madison, 1513 University Avenue, 3237 Mechanical Engineering, Madison, WI, 53706, United States of America, welburn@wisc.edu, Vicki Bier, Steven Hoerning

We quantitatively address risks associated with imported foods using data on the rate of FDA import violations, an indicator of risk. Using regression to analyze these risks, we explore how risk varies by product and violation type. Additionally, we explore improvements from finer categorization of product types. While this might make results more useful, inconsistencies between current databases make this difficult to achieve.

2 - Inventory Control for Returnable Transport Items in a Closed Loop Supply Chain

Barry Cobb, Missouri State University, 901 S. National Ave.,
Springfield, MO, 65897, United States of America,
BarryCobb@MissouriState.edu

A model for determining inventory control parameters for returnable transport items in a closed-loop supply chain is presented. To incorporate uncertain container returns, cycle time and return rate distributions are estimated from radio frequency identification data. The effect of estimation errors due to a partial tagging of containers is examined.

3 - Target-Oriented Utility in Operations Management

Robert Bordley, Expert Systems Engr Professional,
Booz-Allen-Hamilton, 525 Choice Court, Troy, MI, 48085,
United States of America, Bordley_Robert@bah.com

Target-Oriented Utility allows utility theory (and thus risk-attitude) to be seamlessly integrated into applications focused on meeting targets. Previous work demonstrated its applicability in project management. This paper demonstrates its applicability in production scheduling.

4 - Supplier Competition under Carbon Policy

Nikoo Sabzevar, University of Calgary, 2500 University Dr. NW,
Calgary, AB, T2N1N4, Canada, nikou.sabzvar@gmail.com, Janne
Kettunen, Joule Bergerson, Silvanus T. Enns

We assess the impacts of carbon cap policy on the profitability of two suppliers that compete against each other in supplying CO₂ emission intensive products. We capture the competitive interactions using a Cournot model. Our results show, counterintuitively, that tightening the carbon cap can, under certain conditions, increase firms' profits. Also, we show that firms can increase their profits further by engaging in bilateral trading of emission permits.

Reducing Impact of Delay through Improved Airport Operations and Recovery Procedures

Sponsor: Aviation Applications

Sponsored Session

Chair: Heng Chen, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, heng@som.umass.edu

1 - Integrated Airline Recovery: Capturing Passenger Compensation Impacts

Luis Cadarso, Rey Juan Carlos University, Camino del Molino s/n,
Fuenlabrada, 28943, Spain, luis.cadarso@urjc.es, Vikrant Vaze

The European flight delay compensation regulation (EC) No 261/2004 establishes common rules on compensation to passengers in the event of disruptions. We develop an integrated approach that recovers airline timetable, fleet assignment, aircraft routings, and passenger itineraries capturing the impacts of airlines' decisions on passenger compensation. We evaluate scenarios involving disruptions, and optimize recovery decisions to maximize profits by modeling passenger no-shows after disruptions.

2 - A Large Neighborhood Search Heuristic for an Optimal Ad-hoc Hubbing Strategy in an Airport Outage

Daniel Suh, Doctoral Student, University of Pennsylvania, 210
South 34th Street #102, Philadelphia, United States of America,
dansuh@design.upenn.edu

Abrupt airport outages resulting from terrorism, natural disasters, and incidents can cause reroutes and fuel-critical situations for flights. The objective of this study is to design a heuristic that identifies an ad-hoc hubbing strategy: a strategy to reroute flights bound for a disrupted airport to a hub airport that is not disrupted, with the goal of accommodating passengers on existing flights departing the non-disrupted hub while maintaining physical feasibility.

3 - Value of using a Departure Metering Area at Airports

Senay Solak, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, solak@isenberg.umass.edu, Heng Chen

Departure metering is an airport surface management procedure that limits the number of aircraft at the runway queue by holding aircraft at gates or at a predesigned metering area. We identify the optimal capacity for such a metering area, and quantify the overall value of the presence of a departure metering area at airports. The analysis is performed through stochastic dynamic programming, which is used to generate optimal metering decisions based on the status of each flight.

4 - Impacts of Alternative Aircraft Taxiing Systems on Airport Operations

Yu Zhang, Associate Professor, University of South Florida,
Tampa, 4202 E. Fowler Avenue, Tampa, FL, 33620, United States
of America, yuzhang@usf.edu, Rui Guo, Yuan Wang

Alternative taxiing is an innovative way of moving aircraft between airport gates and runways without turning the main engines on. The existing alternative aircraft taxiing systems (AATS) include on-board system such as WheelTug and EGTS, and external systems such as TaxiBot. This study investigates the impacts of AATS to airport operations, from both environmental and economic point of view and use presentative US airports as the case study to demonstrate the outcomes.

Connected and Autonomous Vehicles II

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Henry Liu, University of Michigan College of Engineering, Ann Arbor, MI, henryliu@umich.edu

1 - Envy-free Intersection Control with Value of Time Heterogeneity

Roger Lloret-Batlle, rlloretb@uci.edu, R. Jayakrishnan

Current traffic signal systems do not incorporate heterogeneity in the value of time of drivers. Including this information can improve intersection efficiency. We do this by allocating the green times according to a travel cost minimization rule, and then evaluate and discuss different payment schemes with different incentive and fairness properties.

2 - Optimizing Reservation-based Intersections for System Efficiency

Michael Levin, University of Texas at Austin, Ernest Cockrell, Jr. Hall (ECJ) 6.204, 301 E. Dean Keeton St. Stop C1761, Austin, TX, 78712, United States of America, michaellevin@utexas.edu,
Stephen Boyles

Reservation-based intersection controls for autonomous vehicles (AVs) have been demonstrated to reduce delays beyond optimized traffic signals. The question we address is how to optimize the reservation controls themselves. We present an integer programming (IP) formulation for reservation controls in dynamic traffic assignment and consider delay and energy objectives. We use a heuristic to solve the IP on a city network and obtain significant improvements under user equilibrium behavior.

3 - A Cooperative Active Collision Avoidance (CACA) Model for Connected Vehicles

Henry Liu, University of Michigan, Ann Arbor, MI, United States of America, henryliu@umich.edu, Xuan Di, Guizhen Yu

The emergence of the connected vehicle technology, which enables real-time V2V/V2I, holds the potential to enhance traffic safety applications such as vehicle collision avoidance. In this paper, we develop a novel cooperative active collision avoidance system for connected vehicles that can either avoid rear-end crashes or reduce rear-end crash severity by applying deceleration to the following vehicle and acceleration to its leading vehicles

4 - Auction-based Ridesharing with Pick-up and Drop-off Time Window

Alireza Khani, Assistant Professor, University of Minnesota, St. Paul, MN, United States of America, akhani@umn.edu,
Stephen Boyles

An auction-based ridesharing system is proposed in which users place bids for guaranteed door-to-door service with time constraints, and service provider selects a subset of bids to maximize the profit given operational cost in a time-dependent network. The problem is formulated as a MIP model and solution methods are investigated.

Chair: Jeremiah Dirnberger, Manager-Network Modeling & Analytics, CSX, 500 Water St, J300, Jacksonville, FL, 32202, United States of America, jeremiah_dirnberger@csx.com

1 - Integrated Systems Management Framework to Analyze the Critical Role of PTC in Rail Safety

Yalda Khashe, USC, University Park Campus, Los Angeles, CA, 90089-0193, United States of America, khashe@usc.edu,
Najmedin Meshkati

It seems that there has been a rash of serious and horrific railroad crashes and derailments in the US in this year that has claimed the lives of more than 14 people and injured hundreds. Authorities have issued a new rule on tank cars and renewed the call for speeding up the installation of the PTC systems on Class I railroads. However, PTC is designed to prevent a specific group of accidents and over reliance on this technology could potentially impair the overall safety of the system.

2 - Managing Rail Transportation for Hazardous Materials

Ginger Ke, Assistant Professor, Memorial University of Newfoundland, Faculty of Business Administration, St. John's, NL, A1A4J9, Canada, gke@mun.ca, Kan Fang, Manish Verma

This paper studies the routing and scheduling of rail shipments of hazardous materials with due dates. In particular, we minimize the weighted sum of earliness and tardiness for each demand plus the holding cost at each yard, while forcing a risk threshold on each service leg at any time instant. A mixed-integer programming model and two heuristic-based solution methods are proposed for preparing the shipment plan. Numerical experiments are conducted to provide managerial insights.

3 - Potential Areas Affected by a Liquid Hazardous Material Release

Jose Manuel Martin Ramos, University of Illinois (RailTEC), 205 N. Mathews Ave., Urbana, IL, United States of America, mrtmrms2@illinois.edu, Mohd Rapik Saat

The increase of crude oil traffic by rail in the U.S. and several severe release incidents highlight the need to further improve railroad transportation safety. Accurate estimation of the potential consequences of a release incident is a key element in risk assessment. This paper describes a specific methodology for evaluating more precisely the consequences of liquid hazardous releases. The model is developed using GIS software allowing anybody to easily implement it in time-efficient manner.

4 - A General Solution for Rail Yard Simulation with Conflicting Routes

Yuan Wang, SWJTU, 111 Erhuan Road Bei Yi Duan, Chengdu, China, yuan_wang2@hotmail.com, Gongyuan Lu

The biggest challenge in the yard simulation is to handle route conflicts of trains if their moving has shared tracks. The traditional agent-based simulation is usually very complicated and can hardly describe a lot of details. We will present a general event-based solution which can simplify the modeling process tremendously for all kinds of yards. A successful use case from the largest high-speed train station in Asian will be presented.

1 - Using Cumulative Prospect Theory to Model Unexpected Driver Response to Congestion Pricing

Christopher Gaffney, Drexel University, 3141 Chestnut St, Philadelphia, PA, 19104, United States of America, cgaffney@stevens.edu, Michael Pennock

Dynamic congestion pricing is commonly used to reduce demand on roads. In practice, stated preference surveys are used to gauge drivers' value of time and set toll prices, while utility theory is often used for theoretical modeling. Evidence from Minneapolis and San Diego has shown the unexpected result that demand for tolled lanes increases with toll price. To account for this, we argue that an alternative measure of driver response to tolling, such as prospect theory, is needed.

2 - A New Quantitative Measure of Network Resilience

Hongcheng Liu, Pennsylvania State University, 240 Leonhard Building, State College, PA, United States of America, hql5143liu@gmail.com, Afroz Ansari, Terry Friesz, Wenjing Song, Haipeng Wang, Yiou Wang, Tao Yao, Zhao Fan

We propose a new quantitative measure of network resilience, called performance centrality, which generalizes the notion of betweenness centrality to explicitly capture not only topology but also distribution of demand and traffic controls. Numerical experiments indicate that performance centrality is a useful resilience index that provides new insights regarding how well traditional network resilience may be integrated with road network operational characteristics.

3 - Optimization of Active Traffic Management Strategies using Mixed Integer Linear Programming

Joseph Trask, North Carolina State University, 909 Capability Dr, Raleigh, NC, 27606, United States of America, jltrask@ncsu.edu, John Baugh, Nagui Roupail, Behzad Aghdash

In order to reduce congestion and improve travel times Active Traffic Management (ATM) strategies are often used to better control flow on freeways. This work presents a Mixed Integer Linear Programming formulation for the oversaturated method of the Highway Capacity Manual. The model is then used to optimize and provide insight into the usage of ATM strategies such as hard shoulder running and ramp metering.

4 - Constrained Optimization for the Morning Commute Problem with Flat Toll and Nonidentical Commuters

Xiaolei Guo, Associate Professor, University of Windsor, 834 Hacienda Court, Odette School of Business, Windsor, Canada, guoxl@uwindsor.ca, Da Xu

We study the morning commute problem with a peak period flat toll on a single bottleneck. Commuters' values of time are assumed to be continuously distributed. We consider that, for public acceptance reason, the toll has a maximum acceptable toll level and a maximum acceptable length of tolling period, both exogenously given. Under such a constrained optimization setup, we investigate the problems of system cost minimization, Pareto improvement, and revenue maximization.

5 - Research on the Decision Method of Concession Period for Bot Highway Projects

Yinhua Yang, Huazhong University of Science and Technology, Luoyu Road 1037, Hongshan District, Wuhan, China, 1143185408@qq.com

Private provision of public roads through build-operate-transfer (BOT) contracts is increasing around the world. In this paper, based on a flexible BOT contract with demand updating, we build a decision model of Concession Period for Highway BOT Projects to maximize social welfare and allow the private sector an acceptable profit. Finally, we select a BOT project of Guangfu highway for concession period decision-making analysis.

1 - Modeling an Augmented Lagrangian for Improved Blackbox Constrained Optimization

Robert Gramacy, The University of Chicago, 5807 S Woodlawn Ave, Chicago, IL, 60605, United States of America, rbgramacy@chicagobooth.edu

We propose a combination of response surface modeling, expected improvement (EI), and the augmented Lagrangian (AL) numerical optimization framework, allowing the statistical model to think globally and the AL to act locally. Our hybridization presents a simple yet effective solution that allows existing objective-oriented statistical approaches, like those based on Gaussian process surrogates and EI, to be applied to the constrained setting with minor modification.

2 - Empirical Orthogonal Function Calibration with Simulator Uncertainty

Matthew Pratola, Assistant Professor, The Ohio State University, 1958 Neil Avenue, Columbus, OH, 43210, United States of America, mpratola@stat.osu.edu

Model-assisted inference has become increasingly popular when predicting real-world processes. Computer model calibration is a statistical framework combining mathematical model simulators of the process with statistical techniques to improve predictions by treating the simulator as deterministic. However, these simulators are often uncertain. We develop a Bayesian approach to incorporate such uncertainty using EOF's, and map simulator uncertainty into inferences for parameters and predictions.

3 - Challenges in Solar Power Forecasting Based on Multiple Computer Models

Youngdeok Hwang, Research Staff Member, IBM Research, 1101 Kitchawan Road, Route 134, Rm 34-224, NY, 10603, United States of America, yhwang@us.ibm.com

Solar energy forecasting based on large scale computer model needs to address some unique challenges. Development of a forecasting system requires both the accuracy and stability for large scale operation. Statistics has an important role in quantifying uncertainty and providing guidance to decision-makers in the

market. I will discuss some of these unique challenges and research opportunities in using complex computer models in solar energy industry.

4 - Multivariate Gaussian Process Model with Sparse Covariance Estimation

Qiong Zhang, Virginia Commonwealth University, 1015 Floyd Avenue, Richmond, VA, 23294, United States of America, qzhang4@vcu.edu

We propose a method to obtain a sparse estimation of the covariance matrix for multivariate Gaussian process model. We formulate the optimization problem as the L1 penalized log-likelihood function. To solve the optimization problem, we applied the majorization-minimization approach and the generalized gradient descent algorithm. Numerical experiments are provided to show the computational efficiency of the proposed method.

Chair: Rong Pan, Associate Professor, Arizona State University, P.O. Box 878809, Tempe, AZ, United States of America, rong.pan@asu.edu

1 - Start-up Demonstration Tests with Sparse Connection

David Coit, Professor, Rutgers University, coit@rci.rutgers.edu, Xiaoyue Wang, Xian Zhao

A start-up demonstration test is important for selecting equipment with high start-up reliability. Based on the concept of sparse connection, three tests with sparse connection are introduced which are called CSTF with sparse d1, TSCF with sparse d2 and CSCF with sparse d3 and d4. By finite Markov chain imbedding approach, probabilistic indexes are given. Besides, the procedure for obtaining optimal parameters of tests is proposed and new tests have higher efficiency than traditional ones.

2 - Bayesian Melding Methods for System Reliability Inference using Multilevel Information

Zhaojun Li, Assistant Professor, Western New England University, 1215 Wilbraham Rd, Springfield, MA, 01119, United States of America, zhaojun.li@wne.edu, Jian Guo

This paper investigates Bayesian melding methods for the system reliability analysis using various sources of test data and expert knowledge at both subsystem and system levels. The adaptive Sample Importance Resampling (SIR) method is proposed to address the computational challenges for updating the subsystem and system level posterior reliability. System posterior reliability assessments are compared under three scenarios of available subsystem and system data and prior information.

3 - Early System Reliability Analysis for New Products using Existing Components

Xiaoping Du, Professor, Missouri Science and Technology University, 400 West 13th Street, Toomey Hall, Rolla, MO, 65409, United States of America, dux@mst.edu

A new product may use existing components, and predicting its reliability is difficult due to dependent components. This presentation discusses how to address this issue. One way is to provide a narrow bound of the system reliability by a physics-based approach. The other way is to require component designers provide the relationship between the component reliability and the component load. This allows for an accurate prediction of the system reliability.

4 - A Computational Bayesian Approach to Dependency Assessment in System Reliability

Petek Yontay, Research Associate, Arizona State University, 699 S. Mill Ave., Tempe, AZ, 85281, United States of America, pyontay@asu.edu, Rong Pan

Due to the increasing complexity of engineered products, it is of great importance to use a model that can handle the complex reliability dependency among components, subsystems and systems. We propose a Bayesian network approach for assessing conditional dependencies within a complex system, using a hierarchical setting. We estimate the posterior distributions of these conditional probabilities in the Bayesian network by combining failure information at component, subsystem and system levels.

Decision Analysis Approaches and Predictive Modeling to Managing Uncertainty in Manufacturing and Service Systems Design & Operations

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Zhenyu Kong, Associate Professor, Virginia Tech University, 123 Durham Hall (MC 0118) 1145 Perry Str, Blacksburg, VA, 24061, United States of America, zkong@vt.edu

1 - Self-Organizing Network for Variable Clustering and Predictive Analytics

Gang Liu, University of South Florida, 4202 E. Fowler Ave.
ENB118, Tampa, FL, United States of America, gliu@mail.usf.edu,
Hui Yang

This paper presents a new methodology of self-organizing network for variable clustering and predictive modeling. Specifically, nonlinear interdependence structures are characterized and measured among variables. Further, we embedded these variables as nodes in a complex network. Nonlinear-coupling forces move these nodes to derive a self-organizing topology of network. As a result, sub-network communities delineates the cluster structure of variables.

2 - A State Space Model for Multivariate Poisson Count Series

Nan Chen, National University of Singapore, isecn@nus.edu.sg,
Chen Zhang

This paper proposes a state space model to model and monitor multivariate count series. The model is built on multivariate log-normal mixture of independent Poisson distribution and allows for serial dependence by considering the Poisson mean vector as a latent process driven by a state space model. Based on this model, we furthermore propose a statistical process control scheme for multivariate count series. Finally we present a case study in an electrical system.

3 - Generalized Wavelet Shrinkage of Raman Spectra for Quality Control of Continuous Nanomanufacturing

Xiaowei Yue, Georgia Institute of Technology, 755 Ferst Drive
NW, Atlanta, GA, 30332, United States of America,
xiaowei.ysye@gmail.com, J.g. Park, Jianjun Shi, Hao Yan, Kan
Wang, Chuck Zhang, Zhiyong Liang

Raman spectroscopy is an attractive in-line quality characterization and quantification tool for continuous nanomanufacturing. A signal analysis model with signal-dependent noises for Raman spectra is developed and validated. And a novel generalized wavelet shrinkage approach is introduced to remove noise in all wavelet coefficients by applying individual adaptive wavelet thresholds. The effectiveness of this method is demonstrated using both simulation and experimental case studies.

4 - A Novel Bayesian Learning Algorithm for Sparse Estimation under Mixed Gaussian-Laplacian Noise

Babak Barazandeh, Research Assistant, Virginia Tech University,
Room 211 Graduate life center- 155 Otey, Blacksburg, VA, 24061,
United States of America, babak7@vt.edu, Zhenyu Kong,
Kaveh Bastani

Sparse estimation problem is very challenging due to the ill-posedness of the problem. Typically the sparsity assumption provides some viable algorithms to approximate the solution. However, most of these algorithms minimize the l_2 norm error due to the Gaussian noise assumption, which is sensitive to outliers caused by Laplacian noise. We propose a novel Bayesian learning algorithm with a parameterized prior encouraging sparsity under the mixture of Gaussian and Laplacian noise.

Supply Chain Management IX

Contributed Session

Chair: Wan Libing, Huazhong University of Science & Technology, 1037 Luoyu Road, Wuhan, P.R. China, Wuhan, China,
wanlibingwlb@163.com

1 - A Mathematical Model of Vehicle Routing Problem for Third-Party Logistics Service Providers

Birasnav M, New York Institute of Technology, Broadway,
61st Street, Manhattan, NY, 10023, United States of America,
birasnav@gmail.com

Third-party logistics service providers play a major role in the distribution of matchboxes from southern towns to northern towns of India. These service providers operate a facility called cross-docking that receives bundles of

matchboxes from various suppliers located around the facility and consolidates and dispatches these bundles to customers.

2 - Multi Region Input Output Model for Scope-based Carbon Footprint Accounting

Murat Kucukvar, Assistant Professor, Istanbul Sehir University,
Altunizade, No 27, Istanbul, 34662, Turkey,
muratkucukvar@sehir.edu.tr, Vural Aksakalli

This research aims to advance the body of knowledge on carbon footprint analysis of the manufacturing sectors with a holistic approach combining the scope-based carbon footprint accounting standards with a time series multi-region input-output (MRIO) analysis framework. To achieve this goal, a global scope-based carbon footprint analysis of the Turkish manufacturing sectors has been conducted as a case study.

3 - Optimal Remanufacturing Strategies in Name-your-own-price Auctions with Limited Capacity

Qifei Wang, Huazhong University of Science and Technology,
Luoyu Road, 1037 Building, Wuhan, Hubei, Wuhan, China,
qifeiwang@hust.edu.cn, Chengxiu Gao, Hong Yan, Stuart X. Zhu,
Jianbin Li

We study optimal remanufacturing strategies in a closed-loop supply chain. The returns are collected under a name-your-own-price (NYOP) bidding mechanism. We find the manufacturer's optimal strategies mainly depend on bidding cost, cost saving, production capacity, and market scale. We also compare this mechanism with traditional list price mechanism and find the conditions under which the manufacturer prefers the NYOP mechanism. Some managerial insights are obtained through numerical studies.

4 - Optimal Price and Sales Effort Level in a Dual-channel Supply Chain in Case of Bidirectional Free Riding

Mengping Zhu, Huazhong University of Science and Technology,
Luoyu Road, 1037 Building, Wuhan, Hubei, Wuhan, China,
zhumpluck@163.com, Jianbin Li, Bin Dai

We study the optimal policy in case of bidirectional free riding and price competition. Results show that: in the decentralized supply chain, retailers' optimal sales effort depends on wholesale price, effort cost and the free riding coefficient: when the effort cost is too high or too low, the manufacturer will offer the same wholesale price for both retailers, otherwise, the manufacturer engages in wholesale price discrimination.

5 - The Competition Strategy Analysis in a Mixed Duopoly Market

Wan Libing, Huazhong University of Science & Technology, 1037
Luoyu Road, Wuhan, P.R. China, Wuhan, China,
wanlibingwlb@163.com

So far, China's express industry has formed a mixed oligopoly market in which state-owned enterprise and private enterprises compete together. This thesis studies duopoly express service providers' price and capacity based on mathematical models. We compare social welfare between the two competition strategies of state-owned company. The result shows that state-owned company should either maximum social welfare or maximum profit as its objective which is depended on technological conditions.

1 - Optimal Design Models for 3d Automated Parking Systems

Guangmei Wu, Doctoral Student, Huazhong University of Science
& Technology, 1037 Luoyu Road, Wuhan, 430070, China,
wuguangmei163@163.com, Xianhao Xu, Yeming Gong

In this paper, we consider a newly designed for automatic parking garage system. We mainly use queuing network models to estimate the system expected travel time when we retrieve the cars. Our research objective is to analyze the system performance and optimally design for automatic parking garage system.

2 - Efficient Sampling of the Brown-resnick Process

Zhipeng Liu, PhD Candidate, Columbia University, 424 West
119th Street, 6B, New York, NY, 10027, United States of America,
zl2337@columbia.edu, Jose Blanchet

We propose a perfect simulation algorithm for the Brown-Resnick process. This algorithm has an optimal computational cost in the sense that it has nearly linear complexity with simulation of the basic Gaussian Random field. We mainly use importance sampling and acceptance-rejection procedure to construct this algorithm.

3 - Modeling Processing Times for Based on Expert's Estimates: Pert or Triangular? Uniform or Beta?

Martha Centeno, Full Professor, University of Turabo, P.O. Box 3030, Industrial and Management Engineering, Gurabo, 00778-3030, Puerto Rico, centenom1@suagm.edu, Kimberly Diaz, Karla Acevedo

Simulating a system may require relying on the estimates of the experts to obtain a range and a most likely value. The question is: what is to use: Triangular or Pert? We present a study of the effect on typical measures of performance of using Pert or Triangular, Uniform or Beta. Based on results, we present guidelines to select one of these distributions. For example, Pert and concave Beta should be used for conservative decision making and triangular and convex Beta for an optimistic one.

4 - Agent Based Modeling of Uncertain Dynamic Markets with Contracts

Pratik Misra, Air Products and Chemicals, Inc., 7201 Hamilton Boulevard, Allentown, PA, 18195, United States of America, Misrap@airproducts.com, Sanjay Mehta, Cem Ozen, Yang Liu, Erdem Arslan

Agent based modeling technique is employed to simulate uncertain markets that have geographical limits due high distribution costs and have time-bound contracts. Suppliers and customers are modelled as agents and macro-economic conditions are modelled as environment in which the agents interact and follow their programmed decision-rules. In this presentation, we will present general features of these models and share example case studies to show their utility in understanding such markets.

5 - An Agent Based Modeling Approach to Predicting Adoption of Critical Health Practices

Noshir Contractor, Northwestern University, 2145 Sheridan Road, Tech D241, Evanston, IL, 60208, United States of America, nosh@northwestern.edu, Aaron Schecter

The adoption of new health practices in rural areas is driven by a variety of factors, including opinions, opportunity, and external influences. However, it is analytically infeasible to determine exactly how opinions spread. Thus, we propose a series of agent based models to uncover the processes that lead to widespread adoption, as well as which individuals are most influential. Our models are based on survey data collected from over 10,000 government agents in India.

Supply Chain Closed Loop I

Contributed Session

Chair: Mohammadsadegh Mobin, PhD Fellow, Western New England University, 1215 Wilbraham Road., Springfield, MA, 01119, United States of America, mm337076@wne.edu

1 - Quality Uncertainty and the Value of Coordination in a Closed Loop Supply Chain

Juan Pedro Sepúlveda-Rojas, Associate Professor, University of Santiago de Chile, 3769 Ecuador Ave, Santiago, Chile, juan.sepulveda.ro@usach.cl

We analyze total cost optimization in a SC with returns through global coordination. We develop a LP model that incorporates a quality factor about returning items for remanufacturing processes; the model is validated with different demand and returns scenarios, allowing comparison between instances with different variability in customer demand. The results highlight the value of the quantity and quality of returned products for supply chain members and how it might influence the uncertainty

2 - An Accelerated Benders Decomposition for Closed-Loop Supply Chain Network Design

Mohammad Jeihoonian, PhD Candidate, Concordia University, 1455 De Maisonneuve Blvd. W., Montreal, QC, H3G 1M8, Canada, m_jeihoon@encs.concordia.ca, Michel Gendreau, Masoumeh Kazemi Zanjani

We present a mixed-integer programming formulation to design a closed-loop supply chain network for modular-structured products. The choice of the recovery option depends on the quality level of the composing components in the returned product. We develop an accelerated Benders decomposition-based solution algorithm. Computational results illustrate the efficiency of the solution method.

3 - Performance Evaluation of Closed Loop Systems with General Failure and Repair Times

Mohammadsadegh Mobin, PhD Fellow, Western New England University, 1215 Wilbraham Road., Springfield, MA, 01119, United States of America, mm337076@wne.edu, Morteza Assadi, S. Hossein Cheraghi, Zhaojun Li

This paper evaluates the performance of closed loop supply systems using the proposed modified extended bottleneck algorithm. It is shown that the algorithm exhibits better performance than the existing bottleneck algorithm for closed loop systems with generally distributed failure and repair times. The effectiveness of the developed algorithm is verified using a simulation model.

Energy Applications

Contributed Session

Chair: Zhenhong Lin, Oak Ridge National Laboratory, 2360 Cherehala Blvd, Knoxville, TN, 37932, United States of America, linz@ornl.gov

1 - A Risk-Based Approach to Modeling Industrial Loads in Non-Residential Buildings

Seyed Vaghefi, Research Associate, Center for Advanced Infrastructure and Transportation, 100 Brett Rd, Piscataway Township, NJ, 08854, United States of America, vaghefi@rutgers.edu, Mohsen Jafari, Farbod Farzan

This work aims to develop a data-driven framework to predict and optimally control industrial loads in nonresidential buildings. In this framework, first, a set of predictive analytics tools are employed to identify the patterns of industrial loads over time. This includes a high-dimensional cluster analysis and a classification model to predict the day-ahead load profiles. The results are fed into a cost-based risk model to calculate and evaluate the total risk of energy decisions.

2 - An Iterative Two-stage Convex Relaxation Approach for Natural Gas Pipeline Transmission: A CNPC Case

Mengying Xue, Tsinghua University, Department of Industrial Engineering, Beijing, 100084, China, xmy14@mails.tsinghua.edu.cn, Dingzhi Liu, Tianhu Deng

The optimal dynamic planning of natural gas consumption is important to a nation's economic sustainability and environmental protection. We study how China National Petroleum Corporation, the largest oil and natural gas producer and supplier in China, should dynamically plan its gas production, transportation and sales amount under certain nonlinear physical requirements. The designed system has been implemented and used and is projected to save \$34Billion from 2016-2020.

3 - Natural Gas Storage Valuation under Uncertainty

Ebisa Wollega, Assistant Professor, Colorado State University-Pueblo, 2200 Bonforte Blvd, Pueblo, CO, 81001, United States of America, ebisa.wollega@csupueblo.edu, Hank Grant

This paper presents a heuristic algorithm that natural gas storage decision makers can use to make storage decisions under uncertainty. The algorithm decreases the computation time significantly from hundreds of days to fractions of a second at a reasonable solution quality.

4 - Scenario Generation via Copula-arima Models: Risk Management for a Gas-fired Power Plant

Xiaojia Guo, University College London, Dept. of Management and Innovation, Gower Street, London, WC1E 6BT, United Kingdom, x.guo.11@ucl.ac.uk, Afzal Siddiqui, Giampiero Marra

Gas-fired power plants face uncertainty in both electricity and natural gas prices, which tend to be positively correlated. We propose a copula-based approach to link two independent models and to generate scenarios for solving stochastic programming problems. We compare our approach with established methods, e.g., independent ARMA models and transfer functions, in terms of forecasting performance and providing solutions for the stochastic programming problem.

5 - Optimize Electric Driving Range under Range Uncertainty

Zhenhong Lin, Oak Ridge National Laboratory, 2360 Cherehala Blvd, Knoxville, TN, 37932, United States of America, linz@ornl.gov

This paper optimizes the driving ranges of battery electric vehicles (BEV) for U.S. drivers based on driving pattern, household vehicle flexibility, vehicle price, range anxiety, range uncertainty. Key results are the cumulative share of U.S. BEV consumers for a given optimal range and the sensitivity of such range distributions to battery cost, charging infrastructure, and range uncertainty.

MAS Tutorial: A Logistics Planning System for Military Contingency Missions

Sponsor: Military Applications

Sponsored Session

Chair: Greg Parlier, Past President, MAS of INFORMS, 255 Avian Lane, Madison, AL, 35758, United States of America, gparlier@knology.net

1 - A Logistics Planning System for Military Contingency Missions

Matthew B. Rogers, U.S. Army / N.C. State University, 121 E. Cedar Ave, Wake Forest, NC, 27587, United States of America, mbroger2@ncsu.edu, Greg Parlier, Russell King, Brandon Mcconnell, Kristin Thoney-barletta, Thom Hodgson, Michael Kay

Logistical considerations are a critical part of mission planning for contingency operations. A form of (near real-time) adaptive discrete event simulation is used to identify requirements for a logistic system during contingency mission planning. Mission-based forecasting is used to generate sustainment demand for the simulation. Network performance is used to modify interactively the logistic network until the contingency mission can be properly supported.

1 - Risk Measures of Machine Breakdowns in Job Shop Scheduling

Shu-dong Sun, Prof, Northwestern Polytechnical University,
No127 West Youyi RD, Xi'An, China, sdsun@nwpu.edu.cn,
Zhigao Wu

A mathematical measure for the risk of job shop scheduling with random machine breakdowns is presented. However, the mathematical measure is too hard to implement, a simulation-based and a calculation-based approximate measures are put forward. The performance of the two approximate measures is studied. Experiment results show that the calculation-based risk measure is more time saving than the simulation-based risk measure while the performance of the two measures are nearly the same.

2 - A Computational Study of the Two-Machine No-Wait Flow Shop Problem Subject to Unequal Release Dates and Non-Availability Constraints

Mohamed Labidi, Assistant Professor, King Saud University,
Industrial Engineering Dept., Riyadh, Saudi Arabia,
mlabidi@ksu.edu.sa, Anis Kooli, Talel Ladhari

We consider the problem of scheduling a set of jobs subject to unequal release dates on a two-machine flow shop where the no-wait and non-availability constraints are considered so as to minimize the makespan. We propose several new lower bounds that are embedded within a branch-and-bound algorithm. Computational results show that our procedure outperforms state-of-the art exact method.

3 - Heuristic Approach for an Unrelated Parallel Machine Scheduling Problem with Ready Times, Due Dates

Bin Li, University of Arkansas, 4110 Bell Engineering Center,
Fayetteville, AR, 72701, United States of America,
binli@email.uark.edu, Ashlea Milburn

We present a scheduling problem with unrelated parallel machines, ready times, due dates, limited machine availability and job splitting. The objective is to minimize the total job processing time. This research is motivated by a real warehouse labor scheduling problem. The effectiveness of exact and heuristic methods in developing solutions to a large variety of test instances are compared in a computational study. Results are presented.

4 - Single-machine Preemptive Scheduling of Equal-processing-time Jobs

Vadim Timkovski, Keiser University, Fort Lauderdale, FL,
United States of America, vtimkovski@keiseruniversity.edu

We show that the problem of minimizing the total weighted tardiness with different release dates can be solved in pseudo-polynomial time.

5 - Integrated Production and Shipping Scheduling for A Single Manufacturer and Multiple Customers

Fangzhou Sun, Virginia Tech, 250 Durham Hall, 1145 Perry
Street, Blacksburg, VA, 24060, United States of America,
fangzhou@vt.edu, Subhash C. Sarin, Yuqiang Wang

We investigate a supply chain scheduling problem consisting of a single manufacturer and multiple customers, which integrates the production and shipping decisions so as to minimize the weighted sum of costs incurred due to shipping and number of tardy orders. We develop a heuristic and an optimum-seeking algorithm both of which exploit the structural properties of the problem. Computational results reveal efficacy of the proposed methods and significant benefits that accrue from integration.

Newsvendor Model and Extensions

Contributed Session

Chair: Layth Alwan, Associate Professor, University of Wisconsin-Milwaukee, P.O. Box 742, Milwaukee, WI, 53201, United States of America, alwan@uwm.edu

1 - Can Server Behavior and Service System Design Outweigh the Benefits of Pooling?

Marilyn Lucas, University of Vermont, 55 Colchester Ave.,
Burlington, VT, 05405, United States of America,
mlucas@bsad.uvm.edu, Hung Do, David Novak, Masha Shunko

It is widely accepted that multi-server single-queue (SQ) systems outperform multi-server parallel-queue (PQ) systems due to the pooling effect. We investigate the impact of two server behaviors - social loafing and workload-dependent speedup - and one physical factor - walking time - on the performance of SQ and PQ systems.

2 - Either Forecast Optimally or Opt Out: Newsvendor Perspective

Layth Alwan, Associate Professor, University of Wisconsin-Milwaukee, P.O. Box 742, Milwaukee, WI, 53201,
United States of America, alwan@uwm.edu, Xiaohang Yue

The newsvendor model assumes IID demand. In application, demand can exhibit serial correlation. The natural adaptation is to develop a forecast-based implementation. For stationary processes, such as an AR(1), an implementation based on an MSE optimal forecasting method always provides long-term savings. However, under certain conditions, commonly implemented smoothing methods fail to provide long-term benefits. As a result, it best to ignore the correlation and opt out of forecasting.

Economics III

Contributed Session

Chair: Wei Ye, Tongji University, Shanghai, China, Siping Rd 1239, Shanghai, China, Shanghai, China, yw0129@126.com

1 - Contractual Adaptation through Voluntary Renegotiation

Jiulin Teng, HEC Paris, 1 rue de la Liberation, Department of Strategy, Jouy-en-Josas, 78351, France, jiulin.teng@hec.edu

I study the efficiency benefits of contractual adaptation. With a game theoretic model that delves into the microfoundation of bilateral interaction in a non-stochastic, non-deterministic environment, I find the dynamic contract that is 'temporarily' renegotiation-proof benefits from inter-temporal, Pareto-improving updates – I refer to them as 'voluntary renegotiation'. Their efficiency advantage over static contracting alternatives arises from the balance between flexibility and precision.

2 - Evaluation of City-Production Integration Based on DEA Model and Coupling Method

Jingjing Jia, Tongji University, School of Economic and Management, Siping Road No.1239, Shanghai, China, yjshsl@163.com, Lin Su, Yixi Xue

The level of city-production integration is essential for urban development; however the current research mainly focuses on the definition of the concept. In this paper, we took typical cities in China as cases by using the combination of Dea Model And Coupling Method to quantitatively evaluate and classify the level of city-production fusion, and finally proposed policy recommendations.

3 - The Impact of Corporate Welfare Policy on Firm's Productivity: Evidence from Unemployment Insurance

Heedong Kim, PhD Student, Robert H. Smith School of Business, University of Maryland, 6100 Westchester Park Drive, Apt. 1007, College Park, MD, 20740, United States of America, hekim@rhsmith.umd.edu, Emanuel Zur, Masako Darrouh

We examine the relation between the state-run unemployment insurance benefits (UIBs) and firm productivity. We test two competing theories and find that our results support the efficiency wage rather than the compensating wage differential theory. We find that an increase in UIBs is likely to exacerbate moral hazard and leads to a decrease in firm productivity. We also find that firms tend to enhance their employee welfare policies as a complementary mechanism to manage moral hazard problems.

4 - How the Family Life Cycle Affects Rural Labor Migration: Evidence from China

Wei Ye, Tongji University, Shanghai, China, Siping Rd 1239, Shanghai, China, Shanghai, China, yw0129@126.com

This paper studies how the family life cycle affects rural labor migration in China. We constructed an unique 5-stage family life cycle model and used a logistic regression model to examine the effect. The original data is from a valid questionnaire of 2107. Empirical results showed that the family life cycle has significant impact on rural labor migration. Different stage has different impact on migration. As the family becomes older, the possibility of migration shows a "S-curve" fluctuation.

1 - Predicting Digital Currency Price from Social and Traditional Media

Peng Xie, Georgia Institute of Technology, Room 907, 100 10th Street, Atlanta, GA, 30309, United States of America, peng.xie@scheller.gatech.edu

Using daily Bitcoin price data and Bitcoin Forum discussion, we try to understand if social media can affect Bitcoin price and how long does it take. We use the percentage of negative words as the measure of the article sentiment. The results show that social media can affect price. However, for information sources focusing on speculation, the effects on prices are immediate. In contrast, information concerning fundamentals impacts prices in a longer holding period.

2 - What Products to Feature on Retail Website Landing Pages?

Patrali Chatterjee, Professor, Montclair State University, 1 Normal Avenue, Montclair, NJ, 07043, United States of America, chatterjee@montclair.edu

Landing pages on retailer websites are critical in inducing new shoppers to browse deeper and ultimately purchase. Using field-experiment data this research examines the relative effectiveness of using various real-time marketing analytics like social media likes/pins (unique vs. shared) with site-specific behavioral data (most purchased/most placed in cart/searched) on conversion.

3 - Decision Sciences Initiative in Analytics: The Nexus of Operations Efficiency and Big Data

Tom Stafford, Editor, Decision Sciences Journal, Fogelman College of Business, University of Memphis, Memphis, TN, 38152, United States of America, descieditor@gmail.com, Ramesh Sharda

Decision Sciences Journal has a strong interest in the analysis and understanding of large-scale data. We offer a panel describing analytics research publication opportunities, and prospective authors will receive one-on-one mentorship with key editors in preparation for Journal submission. Topics of interest span social media, descriptive, predictive and prescriptive analytics.

4 - Situational Understanding: A Military Perspective of Where we Need to Go and the Exploitation of Open Source Data Utilizing "Social Signal Processing for Anomaly Determination"

Michael A. Kolodny, Senior Technology Advisor, Army Research Laboratory, michael.a.kolodny.ctr@mail.mil

We are drowning in the deluge of data that is being collected world-wide, while at the same time starving for knowledge and understanding. In the military domain, there is a need to autonomously access & synthesize all relevant available data & information into situational understanding for the Warfighters to rapidly & effectively make critical decisions. A key aspect of this process is to provide only information that is relevant and useful for the needed mission decision at hand. Innovative research is needed to achieve the necessary situational understanding required by military decision makers especially at the tactical edge. This presentation will discuss the following topics: • The different levels of understanding from physical representation to the levels of comprehension (insight) and prediction (foresight). • The types of data processing and analytics needed to understand group behaviors and their mutability and resiliency. • A military perspective on data-to-decision to provide Situational Understanding at the tactical edge. • The exploitation of open-source data such as social media for the determination of anomalous group behaviors • The ARL's initiatives to enable collaborative research "Social Signal Processing for Anomaly Determination".

1 - Entry Deterrence by Location under Stochastic Demand

Kuno Huismans, Tilburg University, Post Office Box 90153, Tilburg, 5000LE, Netherlands, k.j.m.huismans@tilburguniversity.edu, Peter Kort

Huismans and Kort (2015, RJE) showed that by overinvesting an incumbent firm can delay entry by a competitor. This paper analyzes how location can play a role in entry deterrence strategies. Location can be geographical, but can also relate to product positioning

2 - Assessing Pollution Abatement Investment Policy under Ambiguity

Motoh Tsujimura, Associate Professor, Doshisha University, Kamigyo-ku, Kyoto, 602-8580, Japan, mtsujimu@mail.doshisha.ac.jp

This paper investigates a pollution abatement investment policy under ambiguity. We consider there are representative consumer and firm in an economy and formulate the social welfare maximization problem. Then we derive the optimal abatement investment timing. Furthermore, we analyze the comparative static effects of the model's parameters.

3 - Product Innovation under Declining Demand and Uncertainty

Verena Hagspiel, Norwegian University of Science and Technology, Alfred Getz vei 3, Trondheim, Norway, verena.hagspiel@iot.ntnu.no, Peter Kort, Claudia Nunes

This paper studies a firm's optimal product innovation decision facing volatile and deteriorating product demand. The firm has to decide about the optimal time to adopt new technology required to successfully launch a new product generation and therewith boost demand. The innovation process is considered stochastic with uncertainty about the speed of the arrival. Besides timing we also study the optimal capacity choice for the new product.

4 - Competitive Capacity Investment with Learning

Urbana, IL, ykim180@illinois.edu, Dharma Kwon,
Kuno Huisman, Verena Hagspiel

Two competing firms consider an investment with uncertain profitability. In particular, each firm needs to decide when to invest as well as how much to invest. Depending on the order of the investment, the leader and the follower naturally arise, and whoever becomes the follower can learn the leader's performance and take that information into consideration. We investigate the equilibrium strategy in this game and study the impact of learning on the equilibrium.

Large-scale Portfolio Risk

Cluster: Risk Management

Invited Session

Chair: Justin Sirignano, Stanford University, Huang Engineering Center, Stanford, CA, 93404, United States of America, jasirign@stanford.edu

1 - Large-Scale Loan Portfolio Selection

Justin Sirignano, Stanford University, Huang Engineering Center, Stanford, CA, 93404, United States of America, jasirign@stanford.edu, Kay Giesecke, Gerry Tsoukalas

The problem of optimally selecting a large portfolio of risky loans is a high-dimensional nonlinear integer program. Portfolios can range from thousands to even hundreds of thousands, making the problem extremely computationally challenging. Using weak convergence results, we develop an approximate optimization approach which is accurate and typically significantly faster than nonlinear integer program solvers.

2 - Modeling Large Portfolio Risks with Covariates

Jianqing Fan, Princeton, Dept of Operations Res & Fin Eng, Princeton University, Princeton, NJ, 08544, United States of America, jqfan@princeton.edu, Weichen Wang, Yuan Liao

We propose a flexible factor model for estimating large covariance matrices with covariates and introduce a Projected-PCA technique. We show that the unobserved latent factors can be more accurately estimated than the conventional. By using the newly proposed Projected-PCA, the rates of convergence of the smooth factor loading matrices are obtained, which are much faster than those of the conventional factor analysis. The proposed methods are illustrated by extensive numerical studies.

3 - Geometry of Defaults

Richard Sowers, Professor, University of Illinois at Urbana-Champaign, Urbana, IL, 61801, United States of America, r-sowers@illinois.edu

We develop a geometric picture of defaults in an Eisenberg-Noe setting. We adapt some recent work to generate global rankings from local (pairwise) comparisons based on shortfalls. This work is joint with Henry Schenck and Rui Song

08-Room 308, Marriott

Optimization Nonlinear Programming II

Contributed Session

Chair: Alex Feild, Human Systems Engineer, Naval Surface Warfare Center, 18444 Frontage Road, Ste 327, Dahlgren, VA, 22405, United States of America, alexander.feild1@navy.mil

1 - A Hub-and-Spoke Network Design with Nonlinear Penalty Function

Ramez Kian, Bilkent University, Industrial engineering Department, Bilkent University, Ankara, Turkey, ramezk@bilkent.edu.tr, Kamyar Kargar

In this paper, a bi-objective uncapacitated hub location problem is addressed. The first objective is to minimize the traditional cost function and the second objective tries to maximize the amount of flow transported via the hub network. It corresponds to logistics companies which makes it impossible for them to route all the flow in the network. The mixed integer nonlinear model, the proposed solution approaches and numerical results are provided.

2 - Convex Relaxations in Gas Network Optimization Problems

Pelin Cay, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, pec212@lehigh.edu, Camilo Mancilla, Robert Storer, Luis Zuluaga

Non-convexity, non-linearity and the need for a real time solutions are the main

challenges of gas network optimization problems. In this study, we show the benefits of using convex SOCP relaxations of the problem. This convexification provides lower bound information which can be useful in solving large scale real life problems more efficiently.

3 - Goal Reaching Kinematic Chain using a General Purpose Inverse Kinematic Approach

Alex Feild, Human Systems Engineer, Naval Surface Warfare Center, 18444 Frontage Road, Ste 327, Dahlgren, VA, 22405, United States of America, alexander.feild1@navy.mil, Michael Hamilton, Patrick Mead

The goal was to solve the problem of creating a general purpose model for partially analytical goal reaching kinematic chain. Our model is largely based on the Cyclic Coordinate Descent algorithm (CDD). We included a step in the cycle where the joint under evaluation was able to use its parent's axial freedom to rotate its hinge axis prior to applying its own rotation. The model implementation took 56% fewer iteration and an estimated 27% fewer calculations to stabilize than a traditional CCD.

Venture Capital Funding, Crowd Sourcing, New Product Development, and Supply Chain Transparency

Sponsor: Technology, Innovation Management & Entrepreneurship
Sponsored Session

Chair: Zhili Tian, Assistant Professor, Florida International University, 11200 S.W. 8th Street, Miami, FL, United States of America, ztian@fiu.edu

1 - Too Successful to Innovate? Dynamic Entrepreneurial Reputation and Venture Capital

Noam Shamir, Assistant Professor, Tel-Aviv University, Haim Levanon, Tel-Aviv, Israel, nshamir@post.tau.ac.il, David Zvilichovsky

This research integrates entrepreneurial experience, success, reputation and venture financing into a dynamic model which explores the execution of innovative projects under asymmetric information. We are interested in exploring the tension between the desire of the entrepreneur to exploit the current project opportunity and her understanding that the success or failure in this current project also impacts her future reputation.

2 - Hunters and Gatherers: Strategy Identification of the Leading Open Firms

John Angelis, Elizabethtown College, 1 Alpha Drive, Elizabethtown, PA, United States of America, angelisj@etown.edu, John Ettlie, Joseph Miller

We analyzed 73 (of 100 original) firm open innovation efforts via their press releases. Using path and cluster analysis to analyze the coded data, we obtained statistically significant results. Our data shows at least two types of crowdsourcing: 1) Hunters, incumbent firms, learning open methodologies, that accelerate a single (often one time) experiment to implement crowd sourcing; or 2) Gatherers, often newcomers, born open, with less urgency that continuously interact with the crowd.

3 - Product Development by a Firm and its Supplier: Insights from a Problem-solving Approach

Mohsen Jafari Songhori, Jsps Research Fellow, Tokyo Institute of Technology, J2 Bldg., Room 1704, 4259 Nagatsuta-cho., Tokyo, 226-8502, Japan, mj2417@gmail.com, Takao Terano, Sunny S. Yang

This study conceptualizes Product Development (PD) by a firm and a supplier as a problem solving process. The firms decompose the PD problem into sub-problems, and use different solution strategies (e.g. different design approaches with costs, quality). We investigate the firms' problems (e.g. optimal design strategy) and their interactions (e.g. contract setting).

4 - An Empirically Grounded Model of Supply Chain Transparency

Anton Shevchenko, York University, 4700 Keele St, Toronto, Canada, absh1986@gmail.com, Moren Lévesque, Mark Pagell, David Johnston

Using multiple case studies our study explores how firms achieve the requisite transparency to manage their supply chains. We explore the barriers and enablers of transparency inherent in complex networks of buyer-supplier relationships and external stakeholder involvement before discussing firm strategies for managing escalating requirements for transparency.

5 - Advantages of Dual Sourcing in the Presence of a Demand-exploiting Supplier

Sunny S. Yang, Southampton Business School,
University of Southampton, Southampton, United Kingdom,
s.s.yang@soton.ac.uk, Li-ming Chen, Moren Lévesque

Dual sourcing has become a widespread supply-chain structure in today's rapidly changing, competitive global markets. We analyze a supply chain model involving a new unproven supplier that is potentially unreliable but has the capability of increasing the end-product demand. We show that a business start-up can leverage its growth through an experienced supplier in the supply chain competing for the buyer's order.

Openness and IT

Sponsor: E-Business

Sponsored Session

Chair: Chen Zhang, Associate Professor, University of Memphis,
Department of MIS, Fogelman College of Business and Econ, Memphis,
TN, 38152, United States of America, czhang12@memphis.edu

1 - Adoption of Big Data Analytics in Healthcare:

An Economic Perspective

He Li, PhD Student, The University of Memphis,
Fogelman College of Business and Economi, Memphis, TN,
United States of America, oliver.lihe@gmail.com, Jing Wu

We investigate the effects of big data analytics (BDA) on health IT products competition. We model BDA's healthcare efficiency and privacy risk from consumer perspective and BDA's benefit and cost from provider perspective in a two-dimensional differentiation framework. Our model shows the impacts of BDA on firms' performances and social welfare. The conditions when firms should invest on BDA are pointed. Implications, limitations, and future directions are also discussed.

2 - Platform Openness and Evolution of its Ecosystem

Qizhi Dai, Associate Professor, Drexel University,
United States of America, qd24@drexel.edu, Chen Zhang

An IT platform and products compatible with this platform form an ecosystem, where the strategy of the platform provider plays a central role in determining the structure and evolutionary path of the ecosystem. This study empirically investigates the impact of the platform provider's openness strategy on the performance of firms in its ecosystem, which in turn influences the performance of the platform provider.

3 - Adoption of Interorganizational Systems Standards under Two-sided Network Effects

Kexin Zhao, Associate Professor, University of North Carolina at
Charlotte, 9201 University City Blvd, Charlotte, NC,
United States of America, kzha02@uncc.edu

Interorganizational systems (IOS) standards play a critical role in achieving interoperability among supply chain partners. While users and vendors play distinct yet complementary roles in the market, no prior research has examined their adoption decisions simultaneously in a single study. We investigate IOS standards adoption from both users' and vendors' perspectives to reveal interesting cross-group complementarity in the technology adoption stage.

4 - An Empirical Study of Open Data Mobile Application Services

Deepti Agrawal, Assistant Professor, College of Charleston, 66
George Street, Charleston, SC, 29424, United States of America,
agrawald@cofc.edu

Open data in government refers to making data generated by government transactions and sources available public in a usable format. Recently there has been a rise in mobile apps developed by government agencies and third parties that mash open data from different sources to enhance citizens' experience and interaction with the government. This study aims to empirically examine the factors that influence the adoption of the open data mobile apps.

Planning

Contributed Session

Chair: Phillip O. Kriett, Technische Universitaat München,
TUM School of Management, Arcisstraße 21, München, 80333,
Germany, phillip.kriett@tum.de

1 - Large-scale Transmission Capacity Expansion Planning under N-1 Contingency Analysis

Mohammad Majidi Qadikolai, University of Texas at Austin,
1616 Guadalupe UTA 2.304, Austin, TX, 78712-1684,
United States of America, m.majidi@utexas.edu, Ross Baldick

We propose a method for large scale transmission expansion planning (TEP) by integrating N-1 contingency analysis into a mixed integer programming formulation. It uses contingency identification index integrated into a filtering algorithm to detect unimportant lines for contingency analysis in different loading conditions and remove them from the TEP optimization problem to reduce problem size. The numerical result shows the capabilities of the proposed method for solving challenging problems.

2 - Automatic Cell Design for Production Facility

Manoj Gupta, XEROX, PTP, Karnataka, India,
manoj.gupta@xerox.com, Sudhendu Rai, Jagadeesh Prabhakara

Consider a cell design algorithm in a print shop facility in which we have to assign machines to cells such that for the arriving jobs, the following quantities are minimized. 1) Number of late jobs. 2) Define the inter cellular movement of a job J, the inter cellular movement of J is the number of times a job J moves from one cell to the other. We design an algorithm that assigns machines to cells such that both the above quantities are minimized.

3 - Optimization Technique for Energy Storage Control in Distribution Network

Khashayar Mahani, Rutgers the State University of New Jersey,
96 Frelinghuysen Road, Piscataway, NJ, United States of America,
mahani.khashayar@gmail.com, Mohsen Jafari

Finding near optimal control schemes, including various applications of Energy Storage Systems (ESSs) has been a challenge for utilities and micro-grid (MG) operators. In this presentation, we consider a utility-owned distribution system or MG with high penetration of renewable resources. We present an approximate model for both capacity planning and optimal operation of ESSs in the distribution network. Efficient control is obtained by analyzing the inputs' behavior which affects the optimal action.

4 - Confessions of a Supply Chain Architect

Katariina Kemppainen, School of Business, Aalto University,
Runeberginkatu 22-24, Helsinki, 00076 Aalt, Finland,
katariina.kemppainen@aalto.fi

Coming from the POMS community and landing as Vice President at AMR Best Supply Chain Award Winner, what did I see over the seven years? A highly integrated Sales & Operations Planning process with basic methods, decision-making biases and myopic KPIs for outrageously complex and dynamic operations, and a major transformation program to bring it up-to-date. Come to share our experiences dealing with the epic business process that could boost the relevance and rigor of our research.

5 - Generation of Low-dimensional Capacity Constraints for Unrelated Parallel Machines

Phillip O. Kriett, Technische Universität München, TUM School of
Management, Arcisstraße 21, München, 80333, Germany,
phillip.kriett@tum.de, Martin Grunow

We generate the non-redundant set of low-dimensional linear capacity constraints that model the feasible throughput of unrelated parallel machines. Such constraints allow rapid feasibility assessment of production plans by simple insertion. We decompose constraint generation into the Minkowski addition and the facet enumeration of convex polytopes. Since the complexity of solution algorithms is critical, we reduce the problem size based on symmetries among machines and graph partitioning.

Optimization Stochastic II

Contributed Session

Chair: Ruediger Schultz, Prof., University of Duisburg-Essen, Faculty of Mathematics, Thea-Leymann-Str. 9, Essen, D-45127, Germany, ruediger.schultz@uni-due.de

1 - Sampling-based Approximation Schemes for Capacitated Stochastic Inventory Control Models

Wang Chi Cheung, Graduate Student, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States of America, wangchimit@gmail.com,
David Simchi-levi

We study the multi-period capacitated stochastic inventory control problem in a data-driven setting, where the demand distributions can only be accessed through samples. We apply the Sample Average Approximation (SAA) method, and establish a polynomial upper bound on the number of samples needed for achieving near-optimality. However, the underlying SAA problem is #P-hard. Thus we provide a polynomial time approximation scheme, which involves a subgradient sparsification procedure.

2 - Competitive Capacity Investment under Uncertainty

Xishu Li, PhD Candidate, Erasmus University, Dept. Technology&Operations Management, Burgemeester Oudlaan 50, Rotterdam, Ro, 3062 PA, Netherlands, x.li@rsm.nl, Rob Zuidwijk, Rommert Dekker, Rene De Koster

Our research explores a fleet capacity investment problem under market uncertainty. We study how competition between firms affects investment strategies, and investigate the optimal investment policy. Here, we focus on a single vessel type with the intention to extend our results to also incorporate green vessels.

3 - ADMM for Two-Stage Stochastic Programs with Quadratic Objective Function

Sebastian Arpon, Universidad Adolfo Ibañez, Diagonal Las Torres 2640, Peñalolen, Santiago, Chile, sebarpon@gmail.com,
Tito Homem-de-mello, Bernardo Pagnoncelli

We discuss a decomposition method for two-stage stochastic programs with quadratic objective functions. Our algorithm is based on the Alternating Direction Method of Multipliers (ADMM) developed in the literature, and decomposes the problem by scenarios. Some attractive features of the algorithm are the low computational cost per iteration and its suitability for parallelization. We discuss some aspects related to convergence of the method and present numerical results to illustrate the ideas.

4 - The Dynamic Multi-newsvendor Problem

Zhaohu Fan, PhD Student, The Pennsylvania State University, 244 Leonhard Building, State College, PA, 1680001, United States of America, zxf109@psu.edu, Terry Friesz, Yiu Wang, Tao Yao

We articulate a dynamic model of newsvendors where a set of service providers form an oligopoly that is equilibrium tending. The price setting mechanism involving the providers resembles the replicator dynamics of evolutionary game theory. We show that generalization of the news vendor problem to a Cournot-Nash differential game based on replicator dynamics in a stochastic setting takes the form of a stochastic differential variational inequality.

5 - Stochastic Programming in Gas Transportation using Symbolic Computation

Ruediger Schultz, Prof., University of Duisburg-Essen, Faculty of Mathematics, Thea-Leymann-Str. 9, Essen, D-45127, Germany, ruediger.schultz@uni-due.de

Nomination validation, i.e., to decide technical feasibility of a transportation order with balanced in- and output, is among the challenges in daily operation of gas networks. We address the problem in the steady-state case with uncertain orders. In particular we provide parametric solution procedures for polynomial equations resulting from Kirchhoff's Laws based on insights and procedures from computational algebra.

Robust Optimization: Theory and Applications

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Chaitanya Bandi, Kellogg School of Management, Northwestern University, Evanston, United States of America, c-band@kellogg.northwestern.edu

1 - On the Adaptivity Gap in Two-stage Robust Linear Optimization under Constraints

Vineet Goyal, Columbia University IEOR department, 500 West 120th Street, 304 Mudd, New York, NY, 10027, United States of America, vg2277@columbia.edu, Brian Lu

We consider two-stage adjustable robust linear optimization problem with uncertain constraint coefficients that models many important applications including resource allocation with uncertain requirements. The adjustable problem is hard to approximate within a factor better than $O(\log n)$ in general. We show that the static solution gives a $O(\log^2 n)$ -approximation for the adjustable robust problem. Surprisingly, this is nearly the best possible approximation for the problem.

2 - A Robust Optimization Approach to Optimizing Expected Performance

Nataly Youssef, MIT, 20 Palermo Street, Cambridge, MA, United States of America, youssefn@mit.edu

We propose a tractable approach for optimizing the expected performance of stochastic systems via robust optimization. We model uncertainty via parameterized polyhedral sets inspired by probabilistic limit laws and characterized by variability parameters. We then cast the performance optimization problem as a robust optimization problem. We demonstrate the tractability and accuracy of our approach via an inventory management example.

3 - Resource Allocation under Coherent Distortion Risk Measures

Chaitanya Bandi, Kellogg School of Management, Northwestern University, Evanston, IL, United States of America, c-band@kellogg.northwestern.edu, Paat Rusmevichientong

We consider high dimensional resource allocation problems faced by a decision maker with a sophisticated risk attitude modeled by a fairly general risk measure known as a coherent distorted risk measure (CDRM) which encompasses many popular risk measures such as spectral risk measures and law-invariant coherent risk measures. We address the problem of tractability and obtain explicit closed form solution for the this problem while identifying new properties of the optimal solution.

Risk-Averse Control of Markov Systems

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Andrzej Ruszczyński, Rutgers University, 100 Rockafeller Road, Rutgers Business School, Piscataway, NJ, 08854, United States of America, rusz@business.rutgers.edu

1 - Risk-averse Control of Markov Chains in Discrete and Continuous Time

Andrzej Ruszczyński, Rutgers University, 100 Rockafeller Road, Rutgers Business School, Piscataway, NJ, 08854, United States of America, rusz@business.rutgers.edu

We shall consider risk-averse control problems for controlled Markov chains in discrete and continuous time. The concept of a dynamic risk measure and its of time consistency will be resined. We shall derive optimality conditions and discuss solution methods for discrete-time problems. For continuous-time problems, we shall derive the structure of time-consistent Markov risk measures and optimality conditions.

2 - Process-based Risk Measures for Observable and Partially Observable Discrete-time Controlled Systems

Jingnan Fan, Rutgers University, 100 Rockafeller Road, Rutgers Business School, Piscataway, NJ, 08854, United States of America, jingnan.fan@rutgers.edu, Andrzej Ruszczyński

For controlled discrete-time stochastic processes we introduce process-based dynamic risk measures to measure risk of processes. We also introduce a new concept of conditional stochastic time consistency and we derive the structure of risk measures enjoying this property. We show that they can be equivalently represented by a collection of static law-invariant risk measures on the space of functions of the state space. This structure can be applied to Markov controlled problems, including POMDP.

3 - Risk-averse Optimal Learning for Clinical Trial Design

Curtis Mc Ginity, Rutgers University, Piscataway, NJ, United States of America, curtis.mcginity@rutgers.edu

We formulate the risk-averse optimal learning problem for the exploration vs. exploitation dilemma in clinical trial design. We establish the class of logistic toxicity models leading to log-concave posteriors in the Markov model. We then offer risk-averse approximate dynamic programming methods of the resulting single- and multistage problems. Finally, we compare performance of prominent policies for this problem class in terms of multivariate stochastic dominance.

4 - Risk-averse Control of Diffusion Processes

Jianing Yao, Doctoral Student, Rutgers University, 18M Reading Road, Edison, NJ, 08817, United States of America, jy346@scarletmail.rutgers.edu

In this paper, we study the risk-averse control problem for diffusion processes. We make use of a forward-backward system of stochastic differential equations to evaluate a fixed policy and to formulate the optimal control problem. Weak formulation is established to facilitate the derivation of the risk-averse dynamic programming equation. We prove that the value function of the risk-averse control problem is a viscosity solution of a risk-averse analog of HJB equation.

Healthcare Informatics

Sponsor: Optimization in Healthcare

Sponsored Session

Chair: Satyender Goel, Research Assistant Professor, Northwestern University, 633 St. Clair St, 20th floor, Chicago, IL, 60611, United States of America, s-goel@northwestern.edu

1 - Hep C Registry to Link, Track, Test and Treat Patients in Chicago

Satyender Goel, Research Assistant Professor, Northwestern University, 633 St. Clair St, 20th Floor, Chicago, IL, 60611, United States of America, s-goel@northwestern.edu, Abel Kho

Health information technology is the key to identify and track specific patient population cohorts and improve public health surveillance and follow-up. The CDC-funded Hepatitis C Community Alliance to Test and Treat (HepCCATT) technical infrastructure supports connections among multiple public and private partners including: community clinic sites, community and specialty pharmacies, public and private healthcare systems, city and state departments of public health, and labs.

2 - The Pragmatic Trial App Suite (PTAS): using Tablets to Engage Patients at the Point of Care

Eliel Oliveira, Associate Director, LPHI, eoliveira@lphi.org, Iben Ricket, Elizabeth Nauman, Rebekah Angove, Kristin Layman, Lindsay Hendryx, Thomas Carton

PTAS is an electronic medical record agnostic, tablet-based software system integrated in examination rooms designed to engage patients in research by electronically recruiting them in pragmatic research trials, providing targeted health information, and facilitating trial management. A pilot of PTAS is currently recruiting patients into a research network. The pilot began in March 2015 and has recruited 320 patients into HiOH (30%) and collected GLOBAL PROMIS surveys from 457 patients (40%).

1 - Finding a Nash Equilibrium in EPCC: An Application to Dynamic Electricity Markets

Sébastien Debia, PhD Candidate, HEC Montréal, 10-6100 Av, Wilderton, Montréal, QC, Canada, sebastien.debia@hec.ca

Equilibrium Problem with Complementarity Constraints (EPCC) formulation is widely used to analyze strategic interactions in electricity markets. However, each individual problem is not convex, and the collection of problems is not square. Hence a Nash Equilibrium is not proven to exist. This contribution aims at showing sufficient conditions to find numerically a Nash Equilibrium if it exists. We provide an application to dynamic electricity markets with hydro-power.

2 - Recycling Models of Power Batteries in Electric Vehicles Based on Product Life Cycle Theory

Qihao Jin, Huazhong University of Science and Technology, School of Management, 1037 Luoyu Road, Wuhan, 430074, China, 390987833@qq.com, Zhixue Liu

This paper studies impacts of different characteristics of electric vehicle power batteries recycling in four life cycles of the electric vehicle development on recycling models of power batteries. Closed-loop supply chains are established with the manufacturer, the Stackelberg leader, having three reverse channels: (1) it collects by itself, (2) it collects by a retailer, (3) it subcontracts the collection. Decisions of the manufacturer on recycling channels in four life cycles are considered.

3 - Cooperative Games with Multiple Objectives by Means of Bi-Allocation Games

Igor Kozeletskyi, University of Duisburg-Essen, Lotharstr. 65, Duisburg, 47057, Germany, igor.kozeletskyi@uni-due.de, Alf Kimms, Ana Meca

In this presentation a new class of non-transferable utility games is introduced. This class of games describes multi-objective cooperative situations where every player follows two objectives: his individual objective and a common objective for all players. For bi-allocation games we present a solution concept, defined as an extension of the Shapley NTU value, state that this value always exists and introduce a computation algorithm based on iterative search and multi-objective optimization.

4 - Easier Than We Thought – A Practical Scheme to Compute Pessimistic Bilevel Optimization Problems

Bo Zeng, Assistant Professor, University of Pittsburgh, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States of America, bzeng@pitt.edu

We present a new computation scheme for pessimistic bilevel optimization problems (PBL), which so far does not have any computational methods generally applicable yet. We first develop a tight relaxation and then design a simple scheme to ensure a feasible and optimal solution to PBL. Then, we discuss using this scheme to compute linear PBL and several variants. We also provide numerical demonstrations on linear PBL problems.

5 - Claudico and the First Heads-up No-limit Texas Hold'em Man-machine Match

Tuomas Sandholm, Professor, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, sandholm@cs.cmu.edu, Sam Ganzfried, Noam Brown

Claudico is the next-generation version of our Tartanian7 program, which won the 2014 Annual Computer Poker Competition in heads-up no-limit Texas Hold'em by beating all opponents with statistical significance. This talk will discuss Claudico and the "Brains vs. AI" match where four top-10 heads-up no-limit Texas Hold'em pros played 80,000 hands of poker against Claudico under controlled conditions for two weeks in 2015.

Chair: Tachun Lin, Assistant Professor, Bradley University, 1501 W Bradley Ave, Peoria, IL, 61625, United States of America, djlin@fsmail.bradley.edu

1 - Routing Battery Electric Vehicles in Stochastic Networks Considering Vehicle Range Uncertainty

Xing Wu, Assistant Professor, Lamar University, P.O. Box 10024, Cherry Engineering Building RM C-2032, Beaumont, TX, 77710, United States of America, xwu1@lamar.edu, Changzheng Liu

The distance that a battery electric vehicle (BEV) can travel with a full charge varies greatly in the real driving environment. Based on the collected BEV travel data, this study assumes a stochastic effective battery range following a normal distribution. With such an assumption, this paper aims to develop the optimal routing policy for a BEV in a stochastic network, considering the uncertainty of both travel time and vehicle range.

2 - Selecting Inland Waterway Maintenance Projects Subject to Random Disruptions

Khatereh Ahadi, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States of America, kahadi@uark.edu, Kelly Sullivan

We study the problem of maintenance project selection for the inland waterway transportation network. Uncertainty arises from unpredictable natural/hydrologic conditions associated with shoaling. Thus, we propose a scenario-based stochastic programming model which considers project interdependence and multi-commodity flow between several supply and demand nodes. We model this problem as a mathematical program, develop solution approaches, and analyze computational results.

3 - Optimizing Electric Bus Operations and Charging Station Deployment in Singapore

Tachun Lin, Assistant Professor, Bradley University, 1501 W Bradley Ave, Peoria, IL, 61625, United States of America, djlin@fmail.bradley.edu, Zhili Zhou

In this study, we build a framework for electric bus deployment in urban area, which supports charging facility deployment and impacts analysis on both traffic network and power grid with limited data sources. This framework can be utilized as a test bed for cities considering electric bus adoption and as a fundamental structure for exploring the impacts of electric vehicles to local power distribution networks.

Optimization Combinatorial II

Contributed Session

Chair: Chong Hyun Park, PhD Candidate, Purdue University, 403 W. State St., West Lafayette, IN, 47907, United States of America, park456@purdue.edu

1 - Procedures for The Bin Packing Problem with Precedence Constraints

Jordi Pereira, Universidad Adolfo Ibáñez, Avda. Pedro Hurtado 750, Viña del Mar, Chile, jorge.pereira@uai.cl

The bin packing problem with precedence constraints is a recently proposed variation of the bin packing problem, which corresponds to a basic model featuring many underlying characteristics of several scheduling and assembly line balancing problems. In this work we propose a dynamic programming based heuristic, and a modified exact enumeration procedure. These methods use several new lower bounds and dominance rules. The results show the effectiveness of the proposed methods.

2 - Does Road Network Density Matter in Optimally Locating Facilities?

Johan Hakansson, Professor, Dalarna University, Sweden, Högskolan Dalarna, 79188 Falun, Falun, 79188, Sweden, jhk@du.se, Pascal Rebreyend, Xiaoyun Zhao

The aim is to investigate how the density of a road network affects solutions of heuristics by applying the specific case of p-median model in finding optimal location of facilities. The specific experiments are conducted by optimally locating 5 to 50 facilities on a complex road network of Dalarna, Sweden. Two different heuristics being the vertex-substitution method and the simulated annealing algorithm are applied to solve the p-median problem to have a benchmark and validated performance.

3 - Statistical Bounds in Combinatorial Optimization

Xiangli Meng, Dr, Dalarna University, Dalarna University, Falun, Da, 79188, Sweden, xme@du.se, Kenneth Carling

We use statistical optimum estimation techniques (SOETs) to assess the quality of heuristic solutions in combinatorial optimization. We examine the performance of different implementations of SOETs and compare with deterministic bounds. Performance is assessed by extensive computer experiments on test problems. We find SOET to give (substantially) tighter gap than deterministic bounds, but SOET needs to be applied cautiously.

4 - Parametric Approaches to Fractional Combinatorial Problems: Analytical and Computational Studies

Chong Hyun Park, PhD Candidate, Purdue University, 403 W. State St., West Lafayette, IN, 47907, United States of America, park456@purdue.edu, Yanjun Li, Robert Plante

A parametric modeling approach provides effective technique for obtaining optimal solutions of the linear fractional combinatorial optimization problems. We consider two algorithms for solving the parametric model and investigate the efficiency of the algorithms both theoretically and computationally. For the computational study, the algorithms are used to solve fractional knapsack problems and are compared to other algorithms (e.g., Newton's method).

5 - Combinatorial Auctions with Items Arranged in Rows

Dries Goossens, Ghent University, Tweekerkenstraat 2, Gent, 9000, Belgium, Dries.Goossens@ugent.be, Bart Vangerven, Frits Spieksma

We consider combinatorial auctions of similar goods (seats, land, ...) that can be arranged in rows. We describe a dynamic programming algorithm which, for a 2-row problem with connected and gap-free bids, solves the winner determination problem optimally in polynomial time. We also study a number of extensions, and generalize our result to a setting with connected bids in a 3-row problem. Finally, we study the complexity for bids in a grid, complementing known results in literature.

Retail Analytics and Optimization

Sponsor: Computing Society

Sponsored Session

Chair: Tulay Flamand, University of Massachusetts, Amherst, Isenberg School of Management, 121 Presidents Drive, Amherst, MA, 01003, United States of America, tulayvarol@gmail.com

1 - Maximizing Impulse Buying via Store-wide Shelf Space Analytics

Bacel Maddah, Associate Professor, American University of Beirut, Beirut, Lebanon, bacel.maddah@aub.edu.lb, Tulay Flamand, Ahmed Ghoniem

Impulse (unplanned) buying constitutes a common shopping behavior. We investigate how retailers can optimize product shelf allocation in a fashion that improves product visibility to consumers and maximizes impulse buying. We examine the interplay between a retail store layout, the location of products, and their allocated shelf space with the notion of impulse buying. Specifically, we develop and analyze a mixed-integer nonlinear program (NLP) that allocates shelf space to product categories.

2 - Optimization Approaches for Generalized Assignment Problems with Location/allocation Considerations

Tulay Flamand, University of Massachusetts, Amherst, Isenberg School of Management, 121 Presidents Drive, Amherst, MA, 01003, United States of America, tulayvarol@gmail.com, Ahmed Ghoniem, Mohamed Haouari

We address a novel type of generalized assignment problems with location/allocation considerations that arise in retail shelf space allocation. Single- and multiple-knapsack variants of this problem are formulated along with modeling enhancements. Our proposed branch-and-price algorithm yields significant computational savings over the branch-and-bound/cut algorithm in CPLEX for challenging instances.

3 - Dynamic Assortment Planning under Cross-selling and Cannibalization Effects

Ameera Ibrahim, Assistant Professor, Saint Mary's College of California, 1928 St. Marys Rd, Moraga, CA, 94556, United States of America, ai7@stmarys-ca.edu, Ahmed Ghoniem, Bacel Maddah

We study the problem where a decision-maker optimizes the assortment and release times of products that belong to different categories over a multi-period horizon. Products have a longevity over which their attractiveness decays while being positively or negatively impacted by the specific mix of products that were introduced. We propose a 0-1 fractional program that employs an attraction demand model. A mixed-integer linear reformulation is developed that enables exact solutions to the problem.

Operations Research Applications in Vaccine Pricing and Distribution

Sponsor: Health Applications

Sponsored Session

Chair: Maryam Hasanazadeh Mofrad, University of Pittsburgh, 1048 Benedum Hall, Pittsburgh, 15261, United States of America, hasanazadeh.mofrad@gmail.com

1 - Exploring Market Segmentation in a Centralized Vaccine Market under Stochastic Reservation Prices

Galo Mosquera, Vaccine Access And Affordability In a Centralized Market Under Stochastic Reservation Prices, Rochester Institute of Technology, 81 Lomb Memorial Drive, Rochester, NY, 14623, United States of America, gem9454@mail.rit.edu, Ruben Proano

We consider a vaccine market in which, a monopsonistic entity aims to maximize total social surplus and the willingness to pay for different vaccines are stochastic. Preliminary experimental results show that increasing the number of market segments has undesirable effects on the profitability and affordability of key market segments.

2 - Redesign of Vaccine Distribution Networks in Low and Middle-income Countries

Jung Lim, Ph. D. Candidate, University of Pittsburgh,
1048 Benedum hall, 3700 O'hara st., Pittsburgh, PA, 15261,
United States of America, gljace@gmail.com, Bryan Norman,
Jayant Rajgopal

In many low and middle income countries, vaccines are distributed through a legacy medical supply chain, which is typically not cost-efficient. In order to improve vaccine distribution, redesigning the vaccine supply chain is considered, which includes: choosing intermediate hub locations, determining flow paths and vehicles for each flow path, and selecting storage devices for each location. We develop a mixed-integer optimization model and also suggest heuristic methods for larger problems.

3 - Optimal Two-phase Vaccine Allocation to Geographically Different Regions under Uncertainty

Hamed Yarmand, Umass Boston, College of Management,
University of Massachusetts Boston, Boston, MA, 02125,
United States of America, hamed.yarmand@umb.edu,
Brian Denton, Alun Lloyd, Julie Ivy

We consider a two-phase vaccine allocation policy which is formulated as a two-stage stochastic linear program (2-SLP) and then reduced to a linear program with a similar size to that of the first stage problem. We also present a Newsvendor model formulation of the problem which provides a closed form solution for the optimal allocation. Numerical results for seasonal influenza in North Carolina show a considerable reduction in the attack rate and vaccination cost.

4 - Joint Optimization of Vaccine Clinic Locations and Outreach Trips under Various Constraints

Maryam Hasanzadeh Mofrad, University of Pittsburgh, 1048
Benedum Hall, Pittsburgh, 15261, United States of America,
hasanzadeh.mofrad@gmail.com, Bryan Norman, Jayant Rajgopal,
Lisa Maillart

We investigate the tradeoffs involved with establishing (additional) healthcare clinics versus conducting outreach trips to vaccinate patients in remote locations. Given a network of population centers, we develop a mixed integer linear programming model to minimize cost over a specified period of time subject to constraints on coverage, trip distance, trip size, trip frequency and patient travel.

Queueing Models for Manufacturing and Service Systems

Cluster: Stochastic Models: Theory and Applications

Invited Session

Chair: Tugce Martagan, Eindhoven University of Technology, 5600 MB
Eindhoven, Eindhoven, Netherlands, T.G.Martagan@tue.nl

1 - Delay Announcement for Admission Control under Competition

Siddharth Prakash Singh, PhD Candidate, Tepper School of
Business, Carnegie Mellon University, 5000 Forbes Avenue,
Pittsburgh, PA, United States of America, sps1@andrew.cmu.edu,
Mohammad Delasay, Alan Scheller-wolf

We study queueing models of two competing service providers, e.g., emergency departments or restaurants, where one of the service providers, the "participant," is capable of announcing its delay information to customers by incurring some cost. We characterize conditions under which the participant could benefit by making real-time announcements, while the other provider continues not to disclose delay information.

2 - Sourcing Strategies for Assembled Products under Information Leakage and Competition

Ashesh Kumar Sinha, University of Wisconsin-Madison, 1402
Regent St, Apt. 731C, Madison, WI, 53711, United States of
America, asinha4@wisc.edu, Ananth Krishnamurthy

We analyze a multi-period decentralized assembly system where a product is assembled from multiple components sourced from vendors. The assembler provides the pricing scheme to the vendor whereas the vendor determines the production quantity for each component. Using stochastic games, we analyze tradeoffs and determine sourcing strategies to mitigate risks of divulging product knowledge while meeting costs and service level objectives.

3 - Simultaneous Buffer and Service Rate Allocation in Open Finite Queueing Networks

James Smith, University of Massachusetts Amherst,
jmgsmith@acad.umass.edu

Simultaneous buffer and service rate allocation in finite queueing networks is an NP-Hard optimization problem. We utilize an efficient performance algorithm combined with a mixed integer sequential quadratic programming algorithm to solve a number of open network design problems involving series, split, and merge topologies.

4 - On the Many-servers Queues under SJF Discipline

Amir Motaei, PhD Student, University of Florida, Department of
Industrial and Systems Eng, 303 Weil Hall, P.O. Box 116595,
Gainesville, FL, 32611-6595, United States of America,
motaei@ufl.edu

We are studying the $G/GI/n$ under the Shortest-Job-First (SJF) discipline in the Halfin-Whitt regime. Process-level convergence of the number of customers in the system is established in terms of the limit of corresponding infinite-server model. This is accomplished by relating $G/GI/n$ under SJF to a family of two class priority queueing systems where within each class the arrival to service happens according to a FCFS discipline.

Modern Market Microstructure: Stochastic Models of Limit Order Books

Sponsor: Applied Probability

Sponsored Session

Chair: Costis Maglaras, Columbia Business School, New York, NY,
10027, United States of America, c.maglaras@gsb.columbia.edu

Co-Chair: Ciamac Moallemi, Columbia Business School, 3022
Broadway, Uris Hall, New York, United States of America,
ciamac@gsb.columbia.edu

1 - Optimal Execution in a Limit Order Book and an Associated Microstructure Market Impact Model

Hua Zheng, Columbia University, 3022 Broadway, New York,
United States of America, hzheng14@gsb.columbia.edu,
Costis Maglaras, Ciamac Moallemi

We model an electronic limit order book as a multi-class queueing system under fluid dynamics, and formulate and solve a problem of limit and market order placement to optimally buy a block of shares over a short, predetermined time horizon. We use structure of the optimal policy to identify microstructure variables that affect short-term costs and propose a microstructure-based market impact model. Analysis of a proprietary dataset highlights its increased accuracy over macroscopic models.

2 - A Closed-form Execution Strategy to Target Vwap

Sebastian Jaimungal, University of Toronto,
Department of Statistical Sciences, Toronto, ON, Canada,
sebastian.jaimungal@utoronto.ca, Alvaro Cartea

We provide two explicit closed-form optimal execution strategies to target VWAP. We do this under very general assumptions about the volume process, and account for permanent price impact stemming from all agents. The first strategy consists of TWAP adjusted upward by instantaneous order-flow and adjusted downward by expected future order-flow. The second strategy consists of the Almgren-Chriss execution strategy adjusted by expected volume and net order-flow during the life of the strategy.

3 - Hydrodynamic Limit of Order Book Dynamics

Xuefeng Gao, Assistant Professor, The Chinese University of Hong
Kong, xfgao@se.cuhk.edu.hk, J. G. Dai, Ton Dieker, Shijie Deng

We study the temporal evolution of limit order book shape on the macroscopic time scale, motivated by a desire to better understand the interplay among order flows, order book shape and price impact. Our main result states that in the scaling regime where time goes to infinity and price tick size goes to zero, a pair of measure-valued processes representing the sell side shape and buy-side shape of an order book converges weakly to a pair of deterministic measure-valued processes.

Joint Session AI/ICS: Decision Diagrams for Optimization and Artificial Intelligence

Sponsor: Artificial Intelligence and ICS

Sponsored Session

Chair: Andre Augusto Cire, Assistant Professor, University of Toronto Scarborough, 1265 Military Trail, Toronto, ON, M1C 1A4, Canada, acire@utsc.utoronto.ca

1 - Consistency as Projection

John Hooker, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, jh38@andrew.cmu.edu

We interpret various forms of consistency in constraint programming as projection and propose a new form of consistency, J-consistency, that is achieved by projecting the constraint set onto a subset J of variables. We show how J-consistency can reduce backtracking when constraints are propagated through decision diagrams. We introduce J-consistency algorithms for SAT, among, sequence, regular, and alldiff constraints.

2 - Decision Diagram Decomposition of Optimization Problems

David Bergman, David.Bergman@business.uconn.edu, Andre Augusto Cire

Decision diagrams (DDs) can be used to compactly represent solutions to optimization problems, but the representation grows exponentially large in general, prohibiting their direct application. However, it is often the case that the diagram has limited size when representing the solution set for a substructure of a given problem. In this talk we discuss how DDs can be used when a problem decomposes in such a way that each individual portion has a limited-size DD.

3 - Decision Diagrams for Efficient Inference and Optimization in Expressive Continuous Domains

Scott Sanner, Asst. Professor, Oregon State University, 1148 Kelley Engineering Center, Corvallis, OR, 97331, United States of America, ssanner@gmail.com

I will introduce the XADD — an extension of the algebraic decision diagram to continuous variables — and show how to define and efficiently compute elementary arithmetic operations, integrals, and maximization for various restrictions of these functions. I will then cover a range of applications where the XADD has yielded novel closed-form solutions: (a) structured probabilistic inference, (b) parametric constrained optimization, and (c) sequential decision-making problems.

4 - Sentential Decision Diagrams and their Applications

Adnan Darwiche, UCLA, 4532-D Boelter Hall, Los Angeles, CA, 90095-1596, United States of America, darwiche@cs.ucla.edu, Guy Van Den Broeck, Arthur Choi

Sentential decision diagrams (SDDs) are a new class of decision diagrams that branch on arbitrary sentences instead of individual variables. They generalize ordered binary decision diagrams (OBDDs) and carry over many desirable OBDD properties, such as canonicity and support for bottom-up compilation with Boolean operators, while being more compact than OBDDs. These key properties have enabled several successful AI applications in recent years, particularly for reasoning about uncertainty.

Economics of Information Systems

Sponsor: Information Systems

Sponsored Session

Chair: Liangfei Qiu, Assistant Professor, University of Florida, Department of ISOM, Gainesville, FL, United States of America, liangfei@ufl.edu

1 - Cross-market Integration and Sabotage

Hong Guo, University of Notre Dame, 356 Mendoza College of Business, Notre Dame, IN, 46556, United States of America, hguo@nd.edu, Yabing Jiang, Asoo Vakharia, Arthur Lim

Recent industry developments motivate the study of cross-market firm integrations, which often raises controversies and regulatory concerns due to the potential negative effects through the integrated firms' sabotage activities. In this paper, we analyze integrations of firms in two interrelated markets and the integrated firm's incentive to sabotage its rival in both markets. Our findings provide important managerial and policy implications for cross-market firm integrations.

2 - What Makes Geeks Tick? A Study of Stack Overflow Careers

Tingting Nian, NYU Stern, 44 West 4th Street, New York, NY, 10012, United States of America, tnian@stern.nyu.edu, Luis Cabral, Lei Xu

We study user contributions to Stack Overflow, the largest online programmers community. Using a diff-in-diff approach, we show that the event of finding a new job implies a reduction of 25% in reputation-generating activity, but only a reduction of 8% in non-reputation-generating activity. We consider a series of robustness tests to tease out alternative explanations for these variations; together, the results suggest that career concerns play an important role in explaining user contributions.

3 - Sentiment Manipulation in Online Platforms and Opinion Forums: A Regression Discontinuity Approach

Shun-yang Lee, University of Texas at Austin, Austin, TX, United States of America, shunyang.lee@utexas.edu, Andrew Whinston, Liangfei Qiu

Online platforms are prone to abuse and manipulations from strategic parties. We characterize strategic firms' manipulation incentives through a rational expectation equilibrium framework (REE), and conduct empirical analysis on a Twitter data set through a regression discontinuity design (RDD) approach. We find that both the average Twitter sentiment and the proportion of highly positive tweets exhibit a significant drop on the movie's release day, suggesting firms' strategic manipulation.

4 - Open Platform Ecosystem Dynamics and System Efficiency with Advertising Investment

Gou Qinglong, Associate Professor, University of Science & Technology of China, No.96, JinZhai Road Baohe District, Hefei, China, tslg@ustc.edu.cn, Ruibing Wang, Yonghua Ji

We utilize a dynamic model to explore the advertising strategies for an open platform ecosystem where the platform and app are to determine their advertising efforts. We find that a transfer payment can improve system efficiency significantly.

Production and Scheduling III

Contributed Session

Chair: Alejandro MacCawley, Assistant Professor, P. Universidad Catolica de Chile, Vicuna Mackenna 4860 Macul, Santiago, 7820436, Chile, amac@ing.puc.cl

1 - Minimizing Demand Oriented Maintenance Cost

Marcus Poggi, PUC-Rio Informatica, Rua Marquês de São Vicente, 225, Gávea, Rio de Janeiro, Brazil, poggi@inf.puc-rio.br, Ivan Lima

In a production environment, machines fail with a given probability, function of its operating time since last maintenance. Facing a demand scenario for a planning horizon, one is interested in estimating the efficient frontier for maintenance cost and risk of not fulfilling a demand SLA. This stochastic problem with endogenous uncertainty is modeled over a discrete space-time network. Heuristic and exact approaches are devised.

2 - Minimizing Working Capital Requirements in a Dynamic Lot Sizing Model with Infinite Capacity

Thomas Yeung, Associate Professor, Ecole des Mines de Nantes, 4 Rue Alfred Kastler, BP20722, Nantes, 44307, France, thomas.yeung@mines-nantes.fr, Nathalie Bostel, David Lemoine, Yuan Bian

Traditional tactical production planning models do not consider a minimum financial need in terms of working capital requirements (WCR) to maintain operations. We introduce a first link by proposing a new generic WCR model for the dynamic lot sizing problem with single-site/level/product and infinite capacity. We show that our model adheres to the zero-inventory ordering policy allowing an exact polynomial algorithm to be formulated. Numerical tests compare the results with traditional models.

3 - Minimizing Tardiness and Maintenance Costs in Flow Shop Scheduling using Lower-bound-based GA

Andrew Yu, Associate Professor, The University of Tennessee, Industrial and Systems Engineering, Knoxville, TN, 37996, United States of America, ajyu@utk.edu, Javad Seif

A permutation flow shop scheduling problem is reformulated as a mixed-integer linear program after incorporating flexible and diverse maintenance activities for minimizing tardiness and maintenance costs. The MILP model is NP-hard for a large size of problem. Thus a lower-bound based genetic algorithm is developed. The algorithm is further tuned using design experiment to control and determine the GA parameters.

4 - Lot Sizing on Multiple Lines with a Single Setup Operator

Dirk Briskorn, University of Wuppertal, Rainer-Gruenter-Str. 21,
Lehrstuhl für Produktion und Logistik, Wuppertal, 42119,
Germany, briskorn@uni-wuppertal.de

We consider a lot sizing problem with multiple production lines. There is a single setup operator who needs to be present at a line during setup operations. The lines are otherwise independent and underlie the characteristics of the capacitated lot sizing problem. We present an heuristic approach focussing on the setup sequence of the setup operator. We outline a method yielding initial solutions to be fed to a neighbourhood search algorithm. Finally, we provide first computational results.

5 - Stochastic Lot-sizing and Cyclical Scheduling with Sequence Dependent Setup Time: The Case of Wine

Alejandro Mac Cawley, Assistant Professor, P. Universidad
Catolica de Chile, Vicuna Mackenna 4860 Macul, Santiago,
7820436, Chile, amac@ing.puc.cl

We modified a dynamic vehicle routing formulation to determine optimal cyclical schedules and lot sizes with a stochastic component. Which is: variability of setup times and the probability of a certain product or SKU to require production on a given planning horizon is added into the formulation. Solutions will be benchmarked using the variability (variance) of the optimized solution and two different metrics for the objective function: first, line utilization and second, minimize total costs.

Applications and Methodological issues on MCDM

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Danielle Morais, Assistant Professor, Universidade Federal de Pernambuco, Management Engineering Department, Recife, PE, Brazil, daniellemorais@yahoo.com.br

Co-Chair: Adiel T De Almeida, Professor, Universidade Federal de Pernambuco, Caixa Postal 7462, Recife, PE, 50630-971, Brazil, almeidaatd@gmail.com

1 - Subcontractor Selection in Civil Construction

Luciana Alencar, UFPE, Rua Académico Hélio Ramos, s.n.,
Recife, Brazil, alencarlh@gmail.com, Adiel T De Almeida

Most of the activities in construction projects are carried out by subcontractors. Based on this, it is essential for the contractor to have a structured methodology for selecting them. In this study, it is presented a model for subcontractor selection using an additive-veto multicriteria model, in which the contractors can incorporate the veto notion for those subcontractors' criteria performances that he thinks that is unacceptable. An application is presented.

2 - An Mcdm Model to Assist Preventive Maintenance for a Water Well Equipment in a Low Income Community

Adiel De Almeida Filho, Assistant Professor, Universidade Federal de Pernambuco, Caixa Postal 7471, Recife, PE, 50630-971, Brazil, adieltaf@googlegmail.com, Madson Monte

This work presents a multiple criteria decision model for the preventive maintenance planning of a water well equipment located at a low-income community in Brazil. This specific problem has been addressed considering the local context and limitations in order to find a compromise between cost and service level when defining the time interval for preventive maintenance.

3 - PROMETHEE Method with Surrogate Weights for Group Decision Making

Danielle Morais, Assistant Professor, Universidade Federal de Pernambuco, Management Engineering Department, Recife, PE, Brazil, daniellemorais@yahoo.com.br, Luciana Alencar, Tharcylla Negreiros, Adiel T De Almeida

A large number of multicriteria group decision models have been developed, differing from each other the quality and quantity of information required. PROMETHEE has been applied in many group decisions, mainly when it is possible to define criteria weights. However, establishing weights can be hard and in some cases is necessary deal with imprecise information regarding the importance of criteria. Thus, we propose a group decision model, integrating the PROMETHEE method with surrogate weights.

Economics of Auctions

Cluster: Auctions

Invited Session

Chair: Lin Hao, University of Notre Dame, 351 Mendoza College of Business, Notre Dame, IN, United States of America, lhao@nd.edu

1 - Who Benefits from Free Lunch? An Examination of Return Policies at Private Fashion Sale Sites

Yixin Lu, Assistant Professor, VU University Amsterdam, Netherlands, y2.lu@vu.nl, Alok Gupta, Wolf Ketter

This paper examines the role of return policy at private fashion sale sites (PFSS) that offer limited-time deals of fashion merchandise to registered customers. Compared to traditional online fashion retailers, PFSS often employ more strict return policies to minimize the product return rate. We propose a simulation framework to compare the effects of different return policies on seller's revenue.

2 - The Cost of Running an Auction and Implications to the Optimal Reserve Price

Zohar Strinka, PhD Candidate, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, zstrinka@umich.edu

A common question in the auction literature is whether a seller can credibly commit to keep a good if the bidders fail to meet the reserve price. This paper shows that by modeling the seller's problem as a multi-round auction with reserve prices in each round, we can distinguish an inability to commit from failure to model the full problem. In addition to our parametric analysis, this modeling framework opens the door to a more sophisticated understanding of the costs of a failed auction.

3 - Understanding the Effect of Jump Bidding in Overlapping Online Auctions

Lin Hao, University of Notre Dame, 351 Mendoza College of Business, Notre Dame, IN, United States of America, lhao@nd.edu, Yong Tan, Arvind Tripathi

In electronic markets, overlapping online auction has emerged as a viable and efficient mechanism for large retailers desiring to clear off their excessive inventories. In this paper, using a dataset from a reputable website we empirically studied the effect of jump bidding behavior on the outcomes of overlapping online auctions.

Data Analytics in Pricing and Revenue Management

Sponsor: Analytics

Sponsored Session

Chair: Jian Wang, Vice President, Research & Development, The Rainmaker Group, 4550 North Point Parkway, Alpharetta, GA, 30022, United States of America, jwang@letitrain.com

1 - Competitive Rate Information: Use and Misuse in Hospitality Revenue Management

Alex Dietz, Advisory Industry Consultant, SAS Institute, 100 SAS Campus Drive, Cary, NC, 27513, United States of America, Alex.Dietz@sas.com

In today's Big Data environment, most hotels that are actively managing their pricing use a competitive rate shop mechanism as a vital tool to assist them in pricing. But simply following the lead of competitors can lead to a significant loss in revenue. This presentation will discuss the importance of rate information, how this information can be used in revenue management, and common traps associated with use of this data – including data quality, limitations, and misuses of the information.

2 - Making Television Ad Inventory More Valuable through Optimization

Bob Bress, Sr. Director, Prod. Mgmt & Analytics, Visible World, 460 W. 34th Street, NY, NY, 10001, United States of America, bob.bress@visibleworld.com

Approaching TV advertising programmatically with advanced data and dynamic decisioning provides the ability to add tremendous value to TV inventory. In this session we will cover: iHow optimization methods are being deployed to enhance the value of TV inventory through dynamic decisioning iHow analytics are allowing advertisers to benefit from advanced data through more targeted advertising iHow both inventory holders and advertisers are benefiting through new data-driven applications for TV.

3 - Why Revenue Management is a Good Thing?

Emmanuel Carrier, Delta, emmanuel.carrier@delta.com

From its roots in the airline industry, RM has expanded to many industries such as hospitality, retail and B2B. While they are affecting a growing number of B2C and B2B transactions, RM practices have become increasingly controversial with consumers. In this paper, we look at long series of empirical data to show that RM is a win-win strategy for producers and consumers and leads to higher utilization rates. We discuss how to keep this legacy alive given the emergence of “big data” techniques.

4 - A Heuristic Approach to Predicting Customer Lifetime Values for Apartment Tenants

Jian Wang, Vice President, Research & Development, The Rainmaker Group, 4550 North Point Parkway, Alpharetta, GA, 30022, United States of America, jwang@letitrain.com

Estimating tenant lifetime values is important for apartment revenue management. We propose a heuristic approach to predicting renewal likelihoods and estimating tenant lifetime values. We then present empirical results based on real apartment data.

Information Systems I

Contributed Session

Chair: Xu Han, Uconn School of Business, 2100 Hillside Rd, Storrs, CT, 06268, United States of America, xu.han@business.uconn.edu

1 - The Impact of it Maturity and IS Planning Process on IS Planning Success

Tomoaki Shimada, Associate Professor Of Operations Management, Kobe University, 2-1 Rokkodai-cho, Nada-ku, Kobe, 657-8501, Japan, shimada@b.kobe-u.ac.jp,
Robert De Souza, James Ang, Yoshiaki Matsui, Darren Ee

In this study, we examine the impact of information technology (IT) maturity and information system (IS) planning process on IS planning success. Using data collected from the self-administrated questionnaire survey, we show complex relationships between IT maturity and IS planning success as well as between IS planning process and IS planning success in a non-linear regression approach.

2 - Why Do High-tech Firms Offer Perks at Work?

Xuan Ye, PhD Student, New York University, 44 West 4th ST, KMEC 8-186, New York, NY, 10012, United States of America, xye@stern.nyu.edu, Prasanna Tambe

We study whether and why high-tech firms rely more heavily on non-wage benefits, such as free meals, transportation subsidies, and athletic facilities (“work-related perks”). We find that employers engaged in IT innovation are more likely to offer work-related perks. Additionally, we find that high-tech firms offer work-related perks to attract and motivate IT workers who can quickly adapt to technological change.

3 - Merger and Acquisitions in it Industry

Kangkang Qi, Michigan State University, 632 Bogue Street, BCC N204, East Lansing, United States of America, qikang@broad.msu.edu

I study M&A in IT industry. There are three major research questions: (1) Does making M&A really help IT firms with long term profitability and/or innovation gains? (2) For each specific M&A, what are the antecedents that are related to market reaction? (3) Can we attribute the misalignment between firms' characteristics and M&A decision to CEO overconfidence/narcissism?

4 - Nursing Home Rating System Fraud Detection

Xu Han, Uconn School of Business, 2100 Hillside Rd, Storrs, CT, 06268, United States of America, xu.han@business.uconn.edu,
Niam Yaraghi, Ram Gopal

Potential fraud may exist in the rating procedure of CMS's Nursing Home Compare System, leading to misuses of ratings. This study empirically examines the factors affecting the ratings. We find a significant association between ratings and profits, pointing to a financial incentive to cheat. We show that this association does not always lead to legitimate efforts, but can induce cheating. A prediction model is then developed, and 6% of the suspect nursing homes are identified as likely cheaters.

1 - Quantitative Imaging in Medicine

Teresa Wu, Arizona State University, Tempe, AZ, United States of America, teresa.wu@asu.edu

The ASU-Mayo Clinic Imaging Informatics Laboratory is a collaborative effort between the Industrial Engineering program at Arizona State University and the Department of Radiology at Mayo Clinic Arizona. Our goal is to improve patient care by analyzing and managing information in radiology images and databases. In this talk, I will briefly discuss some on-going projects on the use of quantitative imaging in the clinical context.

2 - Process Execution Monitoring and Controlled Violations

Russell Barton, Senior Associate Dean, Penn State, Smeal College of Business, 210 Business Building, University Park, PA, 16802, United States of America, rrb2@psu.edu, Akhil Kumar

Service processes do not lend themselves to SPC methods common in manufacturing settings. Monitoring activity timing and activity sequencing presents special opportunities for statistical characterization, and opportunities for taking corrective action. Violations in activity timing and/or sequencing are unavoidable. We show how to monitor a running process, and through constraint satisfaction find a schedule for its completion to minimize total penalty from the violations.

3 - Data Driven Approach for Modeling the Coupled Dynamics of Machine Degradation and Repair Processes

Hoang Tran, Texas A&M University, College, TX, United States of America, tran@tamu.edu, Satish Bukkapatnam

We proposed a data driven approach to model the coupled dynamics of recurring degradation and restoration processes that take place in manufacturing systems. Unlike previous methods, interactions between the two processes that influence downtimes and throughput rate can be explicitly considered. Theoretical and numerical analyses prove that our model can capture multimodal distribution and dynamic couplings between the time between failures and the time to repair.

Data Mining in Health Care

Contributed Session

Chair: Hamed Majidi Zolbanin

Oklahoma State University, 309 S. West St, Unit 6, Stillwater, Ok, 74075, United States of America, hamed.majidi@gmail.com

1 - Predicting Inpatient Ward Demand Based on The Emergency Department Patient Characteristics

Nooshin Valibeig, Northeastern University, 334 Snell engineering, Boston, 02115, United States of America, nooshin.valibeig@gmail.com, Jacqueline Griffin

Bed assignment is the process of assigning patients to the targeted ward in a reasonable time or to an overflow ward when the assignment time increases. Predicting demand for each ward helps bed managers to decrease assignment time and overflow assignments which results in lower costs and better quality of care. In our study we apply data mining methods on historical data of an emergency department (ED) to predict the probability of inpatient admission and potential targeted ward for ED patients.

2 - Mining Process Patterns from Noisy Audit Logs with Application to Emr Systems

He Zhang, Assistant Professor, University of South Florida, 4202 E. Fowler Avenue, CIS1040, Tampa, 33620, United States of America, hezhang@usf.edu, Sanjay Mehrotra, David Liebovitz, Carl Gunter, Bradley Malin

We present a four-step framework to analyze process models with noise. The first step is to establish correlations among events and separate each trace of access logs into blocks. These blocks are then clustered into several groups and the original traces of access logs are transformed to traces consisting of high level blocks. The traces are then clustered into subgroups, each of which can be used to analyze the process. We implement our approach using data from a large academic medical center.

3 - Using Linear Programming Based Exploratory Techniques in Gene Expression Consensus Clustering

Victoria Ellison, North Carolina State University, Campus Box 7913, 2500 Stinson Drive, Raleigh, NC, 27695, United States of America, vmelliso@ncsu.edu, Yahya Fathi, Amy Langville

We propose a divisive hierarchical consensus clustering algorithm (DHCCA) by modifying a BILP formulation of the Median Partition problem and applying several proposed parametric programming algorithms based on the optimal partition parametric programming algorithm. We prove that executing our DHCCA, under certain assumptions, is equivalent to solving the minimum ratio cut problem. This equivalency can be useful in creating fast heuristics to the Median Partition problem.

4 - Using Data Mining to Predict Drug Courts Outcome

Hamed Majidi Zolbanin, Oklahoma State University, 309 S. West St, Unit 6, Stillwater, Ok, 74075, United States of America, hamed.majidi@gmail.com, Durand Crosby, Dursun Delen

Drug court is an alternative for traditional criminal courts that attempts to shift from a punitive to a therapeutic jurisprudence. Under this new philosophy, the eligible offenders are held as individuals in need of rehabilitative treatments. The initiative is proved to be effective in lowering the costs and breaking the cycle of narcotics use. To better manage the resources and maximize the benefits, this study develops a model to predict who will or will not graduate from these courts.

Methods and Applications in Disease Detection and Treatment

Sponsor: Health Applications

Sponsored Session

Chair: Shan Liu, Assistant Professor, University of Washington, Seattle, WA, United States of America, liushan@uw.edu

1 - Sequencing Chemotherapy Agents for Metastatic Colorectal Cancer Patients

Lakovos Toumazis, PhD Candidate, Department of Industrial and Systems Engineering, University at Buffalo, SUNY, Buffalo, United States of America, iakovost@buffalo.edu, Artemis Toumazi, Loukia Karacosta, Daniel A. Goldstein, Changhyun Kwon, Murat Kurt

Colorectal cancer is the third most lethal cancer in the US affecting both genders. Despite advancements in chemotherapy treatment, long-term survival for the advanced stage of the disease remains poor. With the goal of improving the effectiveness of chemotherapy treatment for metastatic colorectal cancer patients we developed a Markov decision process model that jointly optimize the duration and sequence of the available drugs. The obtained optimal policy improves survival by at least 6 months.

2 - Large-scale Personalized Health Surveillance by Selective Sensing

Ying Lin, University of Washington, Box 352650, Seattle, WA, 98195-2650, United States of America, linyeliana.ie@gmail.com, Shan Liu, Shuai Huang

Detecting subjects who have been on the trajectory towards disease onset holds promises for preventative healthcare. Development of personalized health surveillance is enabled by sensing and information technologies. To scale up personalized surveillance, we developed a selective sensing method that integrates degradation modeling, prognosis, and optimization, which can cost-effectively monitor a large number of individuals by exploiting the similarities of their disease trajectories.

3 - Cost Effectiveness of Expanding Anti-retroviral Therapy to Untreated Subpopulations in Botswana

Thomas Keller, University of Minnesota, 111 Church St. SE, Minneapolis, MN, 55455, United States of America, kelle665@umn.edu, Gregory Bisson, Diana Negoescu, Daniel Winetsky

In 2002 the Botswana government initiated Africa's first national anti-retroviral program, which has enrolled over 200,000 Botswana HIV-infected patients since its inception. We develop a dynamic compartmental model to evaluate the cost effectiveness of expanding this program to serve more Botswana citizens as well as migrant workers, who constitute a significant proportion of HIV-infected patients.

4 - Minimizing Overdiagnosis in Cancer Screening

Maboubeh Madadi, University of Arkansas, mmadadi@uark.edu, Shengfan Zhang, Edward Pohl, Chase Rainwater

Overdiagnosis is defined as the diagnosis of screen-detected cancers that would not have presented clinically in a woman's lifetime in the absence of screening. Overdiagnosis is known to be the most important disadvantage of cancer screening and it can adversely affect people's lives. In this study a mathematical programming model is developed to find the optimal cancer screening policy with respect to overdiagnosis risk, while maintaining the lifetime cancer mortality risk at a low threshold.

Medical Decision Making

Sponsor: Health Applications

Sponsored Session

Chair: Pooyan Kazemian, PhD Candidate, University of Michigan-Ann Arbor, 1205 Beal Ave., Ann Arbor, MI, 48105, United States of America, pooyan@umich.edu

1 - Why is Screening so Common for Some Diseases when Evidence is so Uncertain?

Ozge Karanfil, PhD Candidate, MIT Sloan School of Management, 100 Main Street, E62-379, Cambridge, MA, 02142, United States of America, karanfil@mit.edu, John D. Sterman

Practice guidelines for routine screening such as mammography or PSA testing have changed significantly over time. Evidence-based guidelines are often not followed by clinicians and patients, with significant over or under screening. In this study we describe a dynamic model to explain changes in policy action thresholds. We use quantitative and qualitative data to document evidence of gaps between guidelines and practice. Qualitative data includes interviews with health/medical professionals.

2 - Planning for HIV Screening, Testing, and Care at the Veteran's Health Administration

Kumar Rajaram, Professor of Decisions, Operations, and Technology Management, UCLA Anderson School of Management, B410 Gold Hall, UCLA Anderson, Los Angeles, CA, 90024, United States of America, krajaram@anderson.ucla.edu, Matthew Goetz, Uday Karmarkar, Sandeep Rath, Sarang Deo

CDC has recommended a routine screening policy for HIV. We modeled a QALY maximizing nonlinear mixed integer program incorporating system dynamics and disease progression and found that routine screening may not be always feasible. We applied this model to the Greater Los Angeles station of the Veterans Health Administration and used it to develop and evaluate managerially relevant policies within existent capacity and budgetary constraints to improve upon the current screening policy.

3 - Value of Patient-centric Treatment Policies for Pelvic Organ Prolapse in Women

Yueran Zhuo, Ph.D. Candidate, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, yzhuo@som.umass.edu, Senay Solak

Pelvic organ prolapse (POP) is a common condition that impacts many women's health and quality of life. The selection of a treatment option for POP depends on several factors, but personal preferences of the patient play a more significant role than most other similar conditions. We specifically take this aspect of POP into account and identify patient-centric treatment recommendations for this syndrome. The value of these policies is then assessed through comparisons with physician decisions.

4 - On Low-cost In-home Sensor Placement for Personalized Tracking of Activity of Older Adults

Alexander Nikolaev, Assistant Professor, University at Buffalo (SUNY), 312 Bell Hall, Buffalo, NY, 14260-2050, United States of America, anikolaev@buffalo.edu, Ann Bisantz, Siddhartha Nambiar, Melissa Green, Lora Cavuoto

Activity-tracking sensors can now be used for personalized care; yet, challenges with usability and cost may prevent their adoption by the elderly. We assess how low-cost in-home sensor systems help infer physical activity levels of tenants. The American Time Use Survey and real apartment layouts are used to study optimal sensor count, placement, and activity prediction error levels. We describe sensor placement strategies and apartment layouts best suited for sensor technology use.

Urban Planning

Contributed Session

Chair: Richard Zapata, Universidad del Desarrollo, Avda Sanhueza 1750, Concepcion, Ch, 4040418, Chile, rlzapata@gmail.com

1 - Parking Equilibrium Model with Urban Truck Tour Deliveries

Joseph Chow, Assistant Professor, Ryerson University,
350 Victoria Street, MON 407, Toronto, ON, M5B 2K3, Canada,
joseph.chow@ryerson.ca, Ahmed Amer

Arnott and Inci's (2006) parking equilibrium model is extended to include urban truck tour deliveries and corresponding variables: double-parking stock, delivery duration, number of stops on tour, tour length, and fleet size. Effects of double-parking on traffic flow are estimated using AIMSUN microsimulation. The model is applied to downtown Toronto to provide policy recommendations including pricing, scheduling, geometric design, and zoning.

2 - Urban Freight Distribution with Batch Arrivals

Marco Schutten, Associate Professor, University of Twente,
P.O. Box 217, Enschede, 7500 AE, Netherlands,
m.schutten@utwente.nl, Martijn Mes, Wouter Van Heeswijk

We study a dispatch problem with uncontrolled batch arrivals of LTL orders at an urban consolidation center. The specific order properties may be highly varying in city logistics. Directly distributing an incoming batch may yield high costs. Instead, the hub operator may decide to wait for incoming batches that allow for more efficient distribution. We show that an ADP approach closely approximates the exact values for small instances, and outperforms two benchmark policies for larger instances.

3 - Evaluating Overtopping Risks of Reservoir Systems Based on Rare Event Simulation

Qianli Deng, University of Maryland, College Park, 0147H
Engineering Lab Building, College Park, MD, 20742,
United States of America, dqianli@umd.edu, Gregory B. Baecher

Overtopping risks of reservoir systems, in most cases, have very small probabilities of occurring. Estimation with crude Monte-Carlo simulation requires a prohibitively large numbers of trials. Otherwise, estimation would not be accurate. Computational expense served as one of the prohibitive reasons that simulation has not been widely applied to reservoir operation. A rare event simulation-based approach is thus proposed in this study to address the overtopping risks of reservoir systems.

4 - Effect of Infrastructure Investment and Freight Accessibility on Gross Domestic Product

Ruben Yie Pinedo, Full Time Professor, Universidad del Norte,
Km5 via Puerto Colombia, Barranquilla, AT, Colombia,
ryie@uninorte.edu.co, Maria Saltarin, Carlos Paternina,
Julian Arellana

This paper analyzes the effect of infrastructure investment and freight accessibility on Gross Domestic Product (GDP) by using a non-linear regression approach. We use accessibility measurements to test improvements in transportation costs as road networks are improved. Our results show that GDP significantly benefits from (i) higher investments in infrastructure and better accessibility, and (ii) from multimodal transportation compared to pure road transportation.

5 - Integrating Land Use and Urban Water Management through Mathematical Models

Richard Zapata, Universidad del Desarrollo, Avda Sanhueza 1750,
Concepcion, CH, 4040418, Chile, rlzapata@gmail.com,
Cristian Palma

The urban land use planning and the water resources management are not always integrated. This lack of integration usually translates into over cost for users and even no chance for companies to provide the service in some areas. In this talk, we describe how we estimate the water demand by land use, and how we integrate this demand with the water supply and the land use planning process.

Sponsored Session

Chair: Tina Wakolbinger, Professor, Vienna University of Economics and Business (WU), Welthandelsplatz 1, Vienna, 1020, Austria,
tina.wakolbinger@wu.ac.at

1 - Data Driven Resource Allocation Decisions: Fema's Disaster Recovery Centers

Julia Moline, FEMA, FEMA, Washington, DC, United States of America, julia.moline@fema.dhs.gov, Erica Gralla,
Jarrod Goentzel

We create a data-driven decision process for Federal Emergency Management Agency's (FEMA) Disaster Recovery Centers (DRCs) program. We develop thresholds and optimization models to dynamically locate, size, and staff DRCs. We apply the process to recent disaster response scenarios and show that FEMA could have reduced cost significantly while providing sufficient capacity.

2 - Humanitarian Logistics: Pre-Positioning of Relief Items in Istanbul

Serhan Duran, Associate Professor, Middle East Technical
University, ODTU Endustri Muhendisligi Bolumu, Ankara, 06800,
Turkey, sduran@metu.edu.tr, Sinem Konu, Ertan Yakici

In this study, we investigate pre-positioning of relief items while considering the transportation vulnerability effect of a potential earthquake in Istanbul and suggest disaster response facility locations accordingly, utilizing the data and information about Istanbul from the JICA Report. The model considers the effects of combined transportation mean vulnerability, warehouse building vulnerability, demand intensity and distance traveled based on warehouse location decision.

3 - Outsourcing Humanitarian Logistics Activities to Commercial Logistics Providers

Ioanna Falagara Sigala, Research Fellow, Vienna University of
Economics and Business (WU), Welthandelsplatz 1, Vienna, 1020,
Austria, ioanna.falagara.sigala@wu.ac.at, Tina Wakolbinger

This study explores the potential of outsourcing humanitarian logistics activities to commercial logistics providers. We follow a qualitative approach by interviewing both private and humanitarian organizations to identify the current status and to determine the potential of future cooperation between those two sectors. We integrate both Transaction Cost and Resource-Based View theories to suggest propositions leading to the construction of a framework for outsourcing in the humanitarian sector.

Modeling and Optimization of Health Care Processes

Contributed Session

Chair: Yifeng Yu, PhD Student, Penn State University, 445 Waupelani
Dr, Apt A14, State College, PA, 16801, United States of America,
yyf870314@gmail.com

1 - Monitoring Hip-Surgery Quality by Risk-Adjusted Control Charts

Yifeng Yu, PhD Student, Penn State University, 445 Waupelani
Dr, Apt. A14, State College, PA, 16801, United States of America,
yyf870314@gmail.com, Harriet Nembhard

Risk-adjusted statistical process control charts are used for real-time monitoring of the readmission rate after hip surgery. An alarm occurs if sufficient evidence shows that there is a change in readmission rate. A logistic regression model is incorporated to determine the pre-surgery risk of each patient. The difference in pre-surgery risk is revealed in the risk-adjusted control statistics, thus changes in the hip-surgery quality can be detected.

2 - Improving Patient Care using Integrated Health Monitoring Systems for Diabetes and Hypertension

Saligrama Agnihotri, Professor, Binghamton University,
Binghamton University, Binghamton, NY, 13902,
United States of America, Agni@binghamton.edu, Anu Banerjee

Patient care can be improved using smart technology in home health monitoring systems. We implement a smart mobile application integrating 1200 patients and multiple providers to improve communication, change treatment plans, and reduce office visits. We provide preliminary data analysis for the vital signs and identify stakeholder's impact.

3 - Managing Access to Primary Care Facilities

Sina Faridimehr, Wayne State University, 4815 Fourth St.,
Detroit, MI, United States of America, fb1562@wayne.edu,
Ratna Babu Chinnam

In this research, we propose an MDP model to improve timely access for patients while maintaining clinic capacity utilization in primary care facilities. The model leverages correlations between scheduling practice, panel size management and access performance. Results from testing the models at VA facilities are promising.

4 - Comparing Emergency Room Performances Before and After Initiating Full Capacity Protocol

Suman Mallik, University of Kansas, 1300 Sunnyside Ave,
Lawrence, KS, 66045, United States of America, suman@ku.edu,
Mazhar Arikian, Lu Wang

Using a data from a large teaching hospital we compare the emergency department operating performances before after initiation of the full capacity protocol (a set of rules designed to alleviate crowding).

5 - Why are Medical Device Connectivity Standards so Elusive?

John Zaleski, Chief Informatics Officer, Nuvon, Inc.,
4801 S. Broad Street, Suite 120, Philadelphia, PA, 19112,
United States of America, jzaleski@nuvon.com

Medical devices still remain highly proprietary in terms of interoperability. Health Level Seven (HL7), as a healthcare information standard, only works when medical devices can export data in this common format. Gaps remain between the proprietary, manufacturer-specific language of many devices and the HL7 messaging format. Here we explore approaches for standardizing proprietary equipment around HL7 and related messaging languages and how lack of interoperability impacts patient care.

Bayesian Approach II

Contributed Session

Chair: Ray Fung, Self-Employed, 10 Soden Street, #16, Cambridge, MA, 02139, United States of America, raymondfung@gmail.com

1 - Enterprise Personalized Learning At Scale

Ashish Jagmohan, IBM Research, 1101 Kitchawan Road,
Yorktown Heights, United States of America,
ashishja@us.ibm.com, Wesley Gifford, Anshul Sheopuri,
Yi-min Chee, Noi Sukaviriya, John Ambrose, Laura Rexford,
Sue Rodeman

We address the problem of facilitating skill development in enterprises by devising personalized learning paths. Traditional methods of manual curation are incapable of scaling to meet the needs of growing user bases and content-libraries. The proposed system uses big-data cognitive technology to reason about large-scale user behavior and content characteristics. We will discuss algorithmic data mining and Bayesian techniques to identify learning sequences best suited for each user's goals.

2 - Identifying Key Rule-based Subgroups for Driver Or Graphical Models via Modified Decision Tree Logic

Michael Egner, Senior Vice President, Ipsos, 10567 Jefferson
Blvd., Culver City, CA, 90232, United States of America,
mike.egner@ipsos.com, Andrew Christianson, Richard Timpone

Modelers often wish to understand the role of moderator variables. In some cases, such as graphical models, the typical solution (adding interaction terms) can fall short. Building on previous research modifying decision trees to split on the strength of bivariate relationships, this study explores modifying tree logic to maximize differences in association matrices, such that researchers can obtain practical, rule-based splits for generating maximally-different drivers or graphical models.

3 - Causal vs. Correlational Analysis using Bayesian Networks

Ray Fung, Self-Employed, 10 Soden Street, #16, Cambridge, MA,
02139, United States of America, raymondfung@gmail.com

I show how Bayesian Networks can be utilized not only to differentiate correlation and causation in an intuitive manner but also how to illuminate difficult-to-understand scenarios such as Simpson's Paradox, the Ecological Fallacy, and the Low Birthweight Paradox. I also show how concepts such as instrumental variables, LATE, overidentification tests, natural experiments, ITT, block randomization, mediation tests, colliders, and measurement error can be easily illustrated.

Channel Management and Pricing

Cluster: Operations/Marketing Interface

Invited Session

Chair: Shuya Yin, University of California, Irvine, Merage School of Business, Irvine, United States of America, shuya.yin@uci.edu

Co-Chair: Saibal Ray, Professor, McGill University, 1001 Sherbrooke Street West, Montreal, Canada, saibal.ray@mcgill.ca

1 - Strategic Value of Bogo Offers under Competition

Sreekumar Bhaskaran, sbhaskar@mail.cox.smu.edu,
Saibal Ray, Haresh Gurnani

In the grocery and retail industries, firms routinely offer BOGO (buy one get one off) offers in which a consumer is able to obtain lower price on larger quantity purchases. We examine the a firm's pricing decision for such BOGO bundles under competition. The effect of consumer heterogeneity and market characteristics on this decision is also considered.

2 - Signing Up for Guaranteed Buyback Programs? Perspectives of Manufacturers and Customers

Shuya Yin, University of California, Irvine, Merage School of Business, Irvine, United States of America, shuya.yin@uci.edu,
Saibal Ray, Houcai Shen, Wenju Niu, Mehmet Gumus

Guaranteed buyback programs offer customers protection against price drops and encourage them to upgrade their products. This, in turn, motivates manufacturers to improve and innovate their products. These insurance contracts are often offered by third-parties. Our goal is to understand how such programs impact the preferences of the manufacturer and the customers.

3 - Analyzing the Entry of Big-box Retailers in an Emerging Market

Aditya Jain, Baruch College, New York City, New York,
United States of America, Aditya_Jain@isb.edu, Saibal Ray,
Mehmet Gumus

We consider the impact of the entry of a big-box retailer (BBR) in a market dominated by small, mom-and-pop retailers. The small retailers are characterized by local coverage of the market, whereas BBR provides services valued by all customers. Since both types of retailers obtain supplies from a common manufacturer, BBR's entry affects the supply conditions. Our work thus highlights roles of direct competition as well as indirect supply side effect on small retailers and customers.

4 - Channel Contract Preferences under Dynamic Market Conditions

Long Gao, Associate Professor of Operations and Supply Chain
Mgt, University of California Riverside, 900 University Ave,
Riverside, CA, 92507, United States of America,
long.gao@ucr.edu

Downstream retailers often have private information about consumer market conditions that may evolve over time. We study the long-term channel contracting problem under market fluctuations. We characterize the optimal contract, and show that incorporating market evolution is critical for contract design and execution.

1 - Competitive Time-Locked Free Trial Strategy

Hai-ping Wang, Xi'an Jiaotong University, School of
Management, Xi'an, China, whp1989@stu.xjtu.edu.cn,
Jun Lin, Shu-lin Liu

Offering time-locked free trials has been a common practice in the software industry to reduce consumers' uncertainty about product quality. This paper develops a game-theoretic model to determine the optimal time-locked free trial strategy in a duopoly market. Allowing consumers to have very different, and even opposite experiences after trial, this paper analyzes the impact of consumer learning heterogeneity on the equilibrium outcome. Several new and important insights are provided.

2 - Should Firms Invest in Joint Promotions?

Salma Karray, UOIT, 2000 Simcoe Street North, Oshawa, ON, Canada, salma.karray@uoit.ca, Simon Pierre Sigue

We investigate whether firms should invest in joint promotions for their complementary products with partners that are competitors in other product categories. We develop a game-theoretic model and solve for Nash equilibrium strategies. The main results show that spillover effects significantly affect the viability of such promotions.

3 - The Lot Sizing Problem under Price Competition

Alejandro Lamas, Assistant Professor, NEOMA Business School, 1 Rue du Maréchal Juin, Mont Saint Aignan Cedex, 76825, France, alejandro.lamas@neoma-bs.fr, Philippe Chevalier

We study simultaneous pricing and operations planning when two competitors face price sensitive demands. We model the operations of each competitor as a Lot Sizing Problem. We assume competitors choose prices from a discrete set, thus the complexity of computing a Nash Equilibrium increases with the size of the instance. By characterizing a Nash Equilibrium, we reduce the computational time of the problem.

41-Room 102A, CC

Joint Session MSOM-Health/HAS: Incentives in Healthcare Value Chain for Drugs and Consumables

Sponsor: Manufacturing & Service Oper
Mgmt/Healthcare Operations
Sponsored Session

Chair: Sepehr Nemati, Postdoctoral Fellow, Ivey School of Business, University of Western Ontario, 1255 Western Road London, London, Canada, Sproon@ivey.uwo.ca

1 - Modeling the Ethics of Donating Dated Medical Supplies

Quan Zhou, University of Auckland, 12 Grafton Road, Auckland, 1010, New Zealand, q.zhou@auckland.ac.nz, Tava Olsen

Many developed countries hold medical supplies in reserve for emergencies that eventually become dated. For example, sterile packaging begins to lose its sterile seal over time. Although donating such dated medical supplies to developing nations could reduce expiration and benefit the recipients, it is not encouraged due to ethical concerns. Using a series of stochastic models, we investigate how donation would impact a recipient country's social welfare, considering possible corruption effects.

2 - Two-Echelon Pharmaceutical Reverse Supply Chain Coordination with Customer Incentives

Du'a Weraikat, PhD Candidate, Concordia University, 1420 Rue Towers Apt. 317, Montreal, Canada, d_wer@encs.concordia.ca, Masoumeh Kazemi Zanjani, Nadia Lehoux

We explore the role of providing incentives to customers to encourage the returns of unexpired medications and to improve the performance of real pharmaceutical reverse supply chains (RSC). Also, we investigate the effect of having a coordination method between RSC entities on the recovery rate. Finally, a proper technique is proposed to share the RSC savings. The results indicate that introducing incentives enhances the recovery rate by 11.5% while improving the profitability of the RSC.

3 - How to Fight Fake Medicine with SMS Verification Technology

Michael Beeler, PhD Candidate, Massachusetts Institute of Technology, 77 Massachusetts Avenue, E40-149, Cambridge, MA, 02139, United States of America, beeler@mit.edu, David Simchi-levi, Cynthia Barnhart, Louis Chen

The WHO estimates that up to 25% of medicine in poor countries could be counterfeit. We show that using covert, single-use product codes verifiable by SMS can reduce counterfeiting levels while improving manufacturer profit. Moreover, we find for certain drug markets, manufacturers can obtain further gains by offering small SMS-based rebates to consumers who verify products. Our paper presents an analytical framework for selecting such rebate levels to fight counterfeit drugs.

4 - Companion Diagnostics Co-Development with Patent Expiry and Additional Effort on Quality

Sepehr Nemati, Postdoctoral Fellow, Ivey School of Business, University of Western Ontario, 1255 Western Road London, London, Canada, Sproon@ivey.uwo.ca, Mehmet Betgen, Gregory Zaric

Developing safe and reliable companion diagnostic tests for an existing drug before the drug patent expires is shown to be a viable strategy for pharma companies to thrive their business. We study the problem that pharma companies face when they offer a contract to form partnerships with biotech companies for developing these tests. We propose a contract that maximizes the pharma's profit while giving enough incentives to the biotech company to timely develop a high quality test.

Mgmt/Healthcare Operations
Sponsored Session

Chair: Pengyi Shi, Assistant Professor, Krannert School of Management, Purdue University, 403 W State St, West Lafayette, IN, 47907, United States of America, shi178@purdue.edu

1 - Approximating Emergency Department Census Levels via Simple Queueing Models

Wanyi Chen, University of North Carolina at Chapel Hill, 131 Providence Glen Dr, Chapel Hill, NC, 27514, United States of America, wanyic@live.unc.edu, Debbie Travers, Serhan Ziya, Nilay Argon, Kenneth Lopiano, Thomas Bohrmann, Abhi Mehrotra, Jeffery Strickler

Using data from an emergency department, we investigate whether single station queueing models with time or state dependent arrival and service rates can be used to obtain good approximations for the census levels in practice.

2 - The Impact of Delay Announcement on Hospital Network Coordination

Jing Dong, Northwestern University, 2145 Sheridan Road, Tech C210, Evanston, IL, United States of America, jing.dong@northwestern.edu, Elad Yom-tov, Galit Yom-tov

We investigate the impact of delay announcement on the coordination within hospital networks using a combination of empirical observations and numerical experiments. We provide empirical evidence that patients do take delay information into account when choosing Emergency Departments. We also investigate factors that may affect the coordination level between hospitals.

3 - Identify Optimal Overflow Policies using Approximate Dynamic Programming

Pengyi Shi, Assistant Professor, Krannert School of Management, Purdue University, 403 W State St, West Lafayette, IN, 47907, United States of America, shi178@purdue.edu, J. G. Dai

To alleviate Emergency Department congestion, boarding patients who wait to be admitted to inpatient wards may have to be overflowed to a non-primary ward when they wait too long. We develop approximate dynamic programming tools to identify the optimal overflow policies under different system states.

4 - A Data-driven Model of an Appointment-Generated Arrival Process at an Outpatient Clinic

Ward Whitt, Columbia University, IEOR Department, S. W. Mudd Building, New York, NY, United States of America, ww2040@columbia.edu, Won Chul Cha, Song Hee Kim

We analyze appointment-system data from an endocrinology outpatient clinic and develop a stochastic arrival process model that can be used to simulate the clinic and evaluate alternative appointment strategies. Variability is caused by uncertain no-shows, unscheduled arrivals and earliness or lateness, but most importantly by the schedule itself.

Revenue Management Problems with Consumer Choice Behaviors

Sponsor: Revenue Management and Pricing
Sponsored Session

Chair: Zizhuo Wang, Assistant Professor, University of Minnesota, 111 Church Street S.E., Minneapolis, MN, United States of America, zwang@umn.edu

1 - When to Offer Upgrades?

Rowan Wang, Singapore Management University, 50 Stamford Rd, Singapore, 178899, Singapore, rowanwang@smu.edu.sg, Yimin Yu, Huihui Wang

We consider a firm that sells multiple product models corresponding to multiple classes of demand. The firm may offer customers free upgrade to a more expensive model when there is insufficient stock of the one preferred. However, customers may not accept the upgrade due to their preference on features of the desired model. It is interesting to see that, knowing some customers may reject the upgrade option, it might be optimal to offer upgrade earlier and before stockout.

2 - Eliciting Product Information via Public Rating and Local Experience Sharing

Shihong Xiao, HKUST, Clear Water Bay, Hong Kong,
Hong Kong - PRC, sxiaoab@connect.ust.hk, Ying-ju Chen

Customers resort to public ratings and friends' experience sharing in purchasing goods. This paper investigates how these two sources of information impact customers' purchase decisions and how they are manipulated by firms' selective targeting in free trials distribution. We show that more information may induce customer to make worse decision. A firm with higher quality good tends to offer limited free trials to boost product rating, which may be accompanied by lower price.

3 - Consumer Choice Models with Endogenous Network Effects

Zizhuo Wang, Assistant Professor, University of Minnesota,
111 Church Street S.E., Minneapolis, MN,
United States of America, zwang@umn.edu, Ruxian Wang

We propose and analyze a new choice model that takes into account network effects. We characterize the choice probabilities under such model and conduct comparative statics studies. Then we investigate the assortment optimization problem under such choice model. We show that a new class of assortments, called quasi-revenue-ordered assortments, is optimal under mild conditions and performs well in practice. We also conduct an empirical study on a mobile game dataset to validate our results.

Assortment Optimization

Sponsor: Revenue Management and Pricing
Sponsored Session

Chair: Huseyin Topaloglu, Professor, Cornell University, 223 Rhodes Hall, Ithaca, NY, 14853, United States of America, ht88@cornell.edu

1 - Assortment Optimization with Consideration Sets

Jacob Feldman, Cornell University, 136 Hoy Road, Ithaca, NY,
United States of America, jbf232@cornell.edu, Huseyin Topaloglu

We consider a series of assortment optimization problems when customers only consider purchasing a subset of the offered products. This subset of products is referred to as a customer's consideration set. In very simple instances, we show that this problem is NP Hard and provide an FPTAS when the offered assortment is space or cardinality constrained.

2 - Quality Consistent Pricing under the Nested Logit Model

James Davis, Cornell University, 290 Rhodes Hall, Ithaca,
United States of America, jamesmariodavis@gmail.com,
Huseyin Topaloglu, David Williamson

We consider pricing problems where customers choose among products according to the nested logit model and there is a quality consistency constraint. The quality consistency constraint ensures that the posted prices of products reflect the quality of the products. We consider variations of this problem and provide polynomial time algorithms.

3 - Capacitated Assortment Optimization under Non-parametric Choice Models

Alice Paul, Cornell University, 136 Hoy Road, Ithaca, NY, 14850,
United States of America, ajp336@cornell.edu, Jacob Feldman,
James Davis

We consider the capacitated assortment optimization problem. Given a collection of items with associated revenues, we must choose a subset of items of size at most k to display to customers to maximize expected revenue. In this talk, we consider restricted classes of the non-parametric choice model, and present a polynomial time algorithm for the associated assortment problem.

Sustainability I

Contributed Session

Chair: Andriy Shapoval, Georgia Institute of Technology, 765 Ferst Dr. NW, Atlanta, GA, 30332, United States of America, ashapoval3@gatech.edu

1 - Managing Production and Sales in The Presence of Scarce Resources and Market Price Variability

Xiaobo Li, University of Minnesota, 1006, 27th Ave SE, Apt. E,
Minneapolis, MN, 55414, United States of America,
lix3195@umn.edu, Guiyun Feng, Saif Benjaafar

A firm is subject to a production allowance over a compliance period, which consists of multiple production periods. The firm sells its output to a spot market.

In each production period, the firm observes the market price, the inventory level, and the remaining allowance. It then decides on how much to produce and how much to sell. We characterize the structure of the optimal policy and study the impact of various parameters, including allowance amount, production capacity and leadtime.

2 - Socio-emotional Wealth: An Extensive Construct for CSR of Family Firms

Wei-jun Hsueh, PhD Candidate, Bocconi University, Via Sarfatti
25, PhD School, Milan, MI, 20136, Italy, jwjhsueh@gmail.com

Socio-emotional wealth (SEW) is a dominant decision logic premised on the non-economic goals of the controlling family in family firms. It can enhance the stewardship practices of a family firm beyond economic goals. This paper expands the existing SEW construct by adding family leadership and culture to examine the stewardship practices of family firms in terms of corporate social responsibility performance. It examines the intricate relationship among various SEW dimensions of family firms.

3 - Analysis of National Transportation Sustainability Changes in the U.S. and Selected European Countries

Hamed Ahangari, PhD Candidate, University of Connecticut, 142
Vernon Ave, No 83, Vernon, CT, 06066, United States of America,
hamed.ahangari@uconn.edu, Norman Garrick,
Carol Atkinson-Palombo

In this study we measure national surface transportation index in all three environmental, social, and economic dimensions. Based on these measurement we develop a composite index called National Sustainable Transportation Index (NSTI). We run these models for different time period 2005-2012 in the US and 27 selected European countries. Finally, we offer a framework to answer why some countries are improving in terms of sustainability and the others are getting worse over the course of time.

4 - Sustainability Measures in Strategic Supply Chain Management Decisions

Ismail Civelek, Assistant Professor, Western Kentucky University,
1906 College Heights Blvd., #11058, Bowling Green, KY, 42101,
United States of America, ismail.civelek@wku.edu

We investigate how companies can implement sustainability measures strategically. We approach sustainable supply chains from the value chain perspective by identifying opportunities for sustainable actions and policies at different phases in the product life cycle, especially in inventory management. We discuss sustainability measures in inventory management and provide both short and long term managerial implications for a decision maker to promote sustainability in inventory management.

5 - On Sustainability and Corporate Social Responsibility Reporting

Andriy Shapoval, Georgia Institute of Technology,
765 Ferst Dr. NW, Atlanta, GA, 30332, United States of America,
ashapoval3@gatech.edu, Henry Aigbedo, Marina Matterna,
Ivan Oliver Hilliard

Sustainability and corporate social responsibility is becoming an increasingly important topic around the world. Many businesses are uncertain about the value of reporting initiatives in this area. We provide a regression model and analyze factors leading to the decisions about voluntary reporting (and at which level, if any) in some industrial sectors.

Role of Information in Service Systems

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations
Sponsored Session

Chair: Senthil Veeraraghavan, Associate Professor, The Wharton School, 3730 Walnut St, Philadelphia, PA, 19104,
United States of America, senthilv@wharton.upenn.edu

1 - Contracting in Medical Equipment Maintenance Services: An Empirical Investigation

Tian Chan, INSEAD, TianHeong.CHAN@insead.edu,
Omar Besbes, Francis De Vericourt

Fixed-fee and pay-per-service contracts are two forms of maintenance service plans that structure payment between operators and service providers. Using data from 712 medical scanners, we empirically compare their effects on service outcomes. We exploit a warranty period to isolate incentive effects from adverse selection. We find that a pay-per-service contract leads to relatively higher reliability at a lower cost. Hence, it produces greater value to the service chain.

2 - On Public Warnings in Counterterrorism Operations

Nitin Bakshi, London Business School, Regent's Park, London, United Kingdom, nbakshi@london.edu, Edieal Pinker

Public warnings, or terror alerts, might be a victim of their own success. Previous alerts that negated an attack result in the perception of a false alarm. We study the trade-off between the short-term benefit of a deferred attack, and long-term costs such as erosion of credibility through false alarms.

3 - Dynamic Pricing, Product Evaluation Behavior, and Evolution of Product Reviews

Necati Tereyagoglu, Assistant Professor of Operations Management, Scheller College of Business, Georgia Institute of Technology, 800 W Peachtree St. NW, Suite 4424, Atlanta, GA, 30308, United States of America, Necati.Tereyagoglu@scheller.gatech.edu

Product review posters can exhibit bandwagon or differentiation behavior in their evaluations in online marketplaces. Such differences can cause changes in the composition of the posters over time, which in turn influence the evolution of the ratings environment. In this paper, we examine the relationship between the composition of posters and the evolution of the ratings environment, leading to its effect on consumers' purchase behavior, and dynamic pricing decisions of a monopolist.

Sustainable Supply Chain

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Xi Chen, Assistant Professor, University of Michigan-Dearborn, 4901 Evergreen Rd, Dearborn, MI, 48128, United States of America, xichenxi@umich.edu

1 - Service Region Design for Urban Electric Vehicle Sharing Systems

Long He, University of California, Berkeley, 1117 Etcheverry Hall, University of California, Berkeley, CA, 94720, United States of America, longhe@berkeley.edu, Zuo-jun Max Shen, Ho-Yin Mak, Ying Rong

We consider the service region design problem for electric vehicle sharing systems. We then develop a model that incorporates both customer adoption behavior and fleet operations under spatially-imbalanced and time-varying travel patterns. To address the uncertainty in adoption patterns, we employ a distributionally-robust optimization framework. Applying this approach to the case of Car2Go's service in San Diego, CA, with real operations data, we address a number of planning questions.

2 - Sourcing under Supplier Responsibility Risk: The Effects of Certification, Audit and Contingency Pay

Li Chen, Associate Professor, Cornell University, 114 East Ave, Ithaca, NY, United States of America, li.chen@cornell.edu, Hau Lee

Companies that source from emerging economies often face supplier responsibility risks, namely, financial and reputational burdens that the companies have to bear when their suppliers' engagement in noncomplying labor and environmental practices is discovered by stakeholders or becomes public. In this paper, we study how certification, audit and contingency payment can help mitigate such risks.

3 - Green Sourcing-the Role of Premium Sharing and Consulting Services

Xi Chen, Assistant Professor, University of Michigan-Dearborn, 4901 Evergreen Rd, Dearborn, MI, 48128, United States of America, xichenxi@umich.edu, Niyazi Taneri, Saif Benjaafar

Certified sustainable products often times enjoy a significant green premium in the retail market. In this paper, we study a retailer's use of a sourcing contract as a tool of incentivizing suppliers to exert greening efforts which improves the chances of receiving certification, and in turn capturing the green premium. We also explore the rationale for retailer to involve in suppliers' greening efforts.

4 - Optimal Feed-in Tariff Policies: The Role of Technology Manufacturers

Shadi Goodarzi, PhD Student, HEC Paris, 1 Rue de la Liberation, Jouy en Josas, 78350, France, shadi.goodarzi@hec.edu, Andrea Masini, Sam Aflaki

We assess the effectiveness of feed-in tariff policies in promoting renewable energy technologies taking into account technology manufacturers' decisions. Modeling a three-tier supply chain that includes potential adopters, technology manufacturers and a grid operator, we show that the ability of feed-in tariffs to induce renewable energy adoption is strongly affected by the technology manufacturers' market characteristics.

Information-Related Issues in Supply Chain Management

Sponsor: Manufacturing & Service Oper Mgmt/iFORM

Sponsored Session

Chair: Mohammad Nikoofal, Catolica Lisbon School of Business & Economics, UCP, Palma de Cima, Lisbon, 1649-023, Portugal, mohammad.nikoofal@ucp.pt

Co-Chair: Mehmet Gumus, McGill University, 1001 Sherbrooke Street West, Montreal, Canada, mehmet.gumus@mcgill.ca

1 - Generalized Reverse Auctions: Efficiency and Credibility under Information Asymmetry

Hedayat Alibeiki, McGill University, 1001 Sherbrooke St. West, Montreal, Qc, H3A 1G5, Canada, hedayat.alibeiki@mail.mcgill.ca, Mehmet Gumus, Shanling Li

Non-price factors such as product quality and reliability can be even more important than bidding prices for the buyers when selecting the winner of an e-Auction. In practice, buyers usually evaluate and assign an originally-private "quality score" to each supplier that determines the relative position of the supplier toward its competitors. In this paper, we study whether or not and in what fashion the buyer can credibly share suppliers' quality scores with them.

2 - Towards a Counterfeit Proof Global Supply Chain

Morteza Pourakbar, Rotterdam School of Management, Erasmus University, Rotterdam, the Netherlandsmpourakbar@rsm.nl, Rob Zuidwijk

In this paper, we study the role of customs inspection policies on mitigating the infiltration of counterfeiters in the legitimate supply chains. We characterize customs optimal inspection policies taking into account the trade-off between reducing the risk of infiltration and the detrimental impact of increased inspections on supply chains.

3 - Impact of Category Captainship on Retail Competition

Alper Nakkas, Associate Professor, Nova SBE, UNLFE, Campus de Campolide, NIF 506030636, Lisbon, 1099-032, Portugal, alper.nakkas@novasbe.pt

The increasing complexity of product categories led retailers to recognize that managing categories would be increasingly complex, time-consuming and expensive. To answer these challenges and gain competitive edge, retailers began partnering with their suppliers (i.e., category captains) for recommendations about assortment selection, shelf design, displaying issues etc. We examine the incentives of category captains in a setting where two retailers compete to increase their market shares.

4 - Supply Diagnostic Incentives in New Product Launch

Mohammad Nikoofal, Católica Lisbon School of Business & Economics, UCP, Palma de Cima, Lisbon, 1649-023, Portugal, mohammad.nikoofal@ucp.pt, Mehmet Gumus

In launching new products, the newness of the production leads to unexpected reliability issues on supply side. The adverse effect of supply risk can be mitigated via test production. We explore how such a diagnostic technology investment may affect both incentive and information asymmetries across channel partners.

Supermodularity and its Applications in Operations Management

Sponsor: Manufacturing & Service Oper Mgmt/Supply Chain

Sponsored Session

Chair: Daniel Zhuoyu Long, Assistant Professor, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong - PRC, zylong@se.cuhk.edu.hk

Co-Chair: Xin Chen, University of Illinois at Urbana-Champaign, Dept. of Industrial & Enterprise Systems, 216C Transportation Building, Urbana, IL, 61801, United States of America, xinchen@illinois.edu

1 - Preservation of Structural Properties When Decision Variables Are Truncated by Random Variables

Xiangyu Gao, ISE department, UIUC, 04Transportation Building 104 S. Mathews, Urbana, IL, 61801, United States of America, xgao12@illinois.edu, Zhenyu Hu, Xin Chen

A common technical issue in many operations management models is decision variables are truncated by random variables. The challenge is that the objective functions are often not convex in the decision variables. To address this challenge, we develop a powerful transformation technique which converts a non-convex

minimization problem to an equivalent convex one, and preserves some desired structural properties such as convexity and L-natural-convexity. Three applications are discussed.

2 - Some Specially Structured Assemble-to-order Systems

Paul Zipkin, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, paul.zipkin@duke.edu

Assemble-to-order systems are important in practice but challenging computationally. This paper combines some notions from combinatorial optimization, namely polymatroids and discrete convexity, to ease the computational burden significantly, for certain specially structured models. We point out that polymatroids have a concrete, intuitive interpretation in this context.

3 - On A Stochastic Program for Inventory Control in Assemble-to-order M Systems

Qiong Wang, University of Illinois at Urbana-Champaign, 104 South Mathews Ave., Urbana, IL, United States of America, qwang04@illinois.edu, Martin I Reiman, Mustafa Dogru

We consider a two-stage stochastic program (SP) for developing inventory policies for Assemble-to-Order M systems. The first stage SP prescribes a replenishment policy and the second stage SP optimizes component allocation. We show that the M system structure allows the SP to have desirable convexity properties and an explicit form of the optimal solution. We also discuss whether these convenient features can be preserved under various generalizations of the system structure.

4 - Conditions on Preservation of Supermodularity and its Applications

Daniel Zhuoyu Long, Assistant Professor, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong - PRC, zylong@se.cuhk.edu.hk, Xin Chen, Jin Qi

The concept of supermodularity has been proved to be a useful and an important tool to derive monotone comparative statics in parametric optimization problems. One critical concern is whether the supermodularity can be preserved under dynamic programming recursions. In this paper, we provide necessary and sufficient conditions for the preservation of supermodularity in several classes of parametric optimization problems, and show how the theoretical results can be applied in some OM problems.

New Topics in Behavioral Operations

Sponsor: Manufacturing & Service Operations Management
Sponsored Session

Chair: Javad Nasiry, Assistant Professor, Hong Kong University of Science and Technology, ISOM, LSK Building, HKUST, Hong Kong, Hong Kong - PRC, nasiry@ust.hk

1 - The Value of Project Reviews with Reference Effects

Xiaoyang Long, PhD Student, Hong Kong University of Science and Technology, Hong Kong - PRC, xlongaa@connect.ust.hk, Javad Nasiry

In uncertain environments, project reviews provide an opportunity to make continue or abandon decisions in order to maximize the project's expected payoff. However, we show that a behaviorally biased project manager may opt not to review the project and forgo the value of information provided by a review. Further, the project manager may be more likely to launch and continue the project in comparison to rationally optimal decisions.

2 - Price Competition in the Presence of Social Comparison and Demand Uncertainty

Ming Hu, Associate Professor, University of Toronto, 105 St. George Street, Toronto, Canada, Ming.Hu@Rotman.Utoronto.Ca, Yun Zhou

We consider a duopolistic price competition of differentiated substitutable products under demand uncertainty, in which the duopoly socially compare with each other. Conventional wisdom suggests social comparison leads to more competitive behavior. We demonstrate how opposite-directional social comparisons interact with demand variability to change competitive behavior. These insights are robust under multiplicative demand uncertainty, but they are reversed for complementary products.

3 - Optimal Stopping under Present-Biased Preferences

Peiwen Yu, Assistant Professor, Fudan University, Shanghai, China, freypw@connect.ust.hk, Qing Li, Javad Nasiry

We study optimal stopping problems in which agents have present-biased preferences. Agents may be naive and unaware of the bias or sophisticated and aware. We establish the optimality of a threshold stopping policy under a set of intuitive conditions. We show that sophistication may lead to counter-intuitive decisions, but we also identify simple conditions that yield robust predictions on sophisticated agents' behavior. We apply our theory to models of project management and healthcare.

4 - Behavioral Foundations and Antecedent Conditions of Service Slowdowns (and Speedups)

Mirko Kremer, Professor, Frankfurt School of Finance & Management, Room B135, 60314 Frankfurt am Main, Frankfurt, Germany, M.Kremer@fs.de

The assumption that service times are independent of system load is widespread in the operations management literature, despite growing empirical and anecdotal evidence to the contrary. We present some experimental evidence on behavioral drivers and antecedent conditions of service slowdowns (and speedups) in systems that are operated by human servers and/or customers.

Supply Chain Outsourcing

Sponsor: Manufacturing & Service Operations Management
Sponsored Session

Chair: Morvarid Rahmani, Assistant Professor, Georgia Tech, morvarid.rahmani@scheller.gatech.edu

1 - Supply Networks for Relational Sourcing

Elena Belavina, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, United States of America, elena.belavina@chicagobooth.edu

Socially responsible sourcing has become a necessity for many global firms and a competitive advantage for others. Sourcing strategies based on social responsibility now increasingly employ long-term commitments (relational sourcing). This study examines the role that supply network configuration plays in the efficacy of relational sourcing in ensuring socially responsible behavior across the supply network (compliance).

2 - An Economic Model of Knowledge Outsourcing

Jaeseok Lee, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States of America, Jaeseok.Lee@scheller.gatech.edu, Karthik Ramachandran, Cheryl Gaimon

We introduce a game-theoretic model of knowledge outsourcing. We study how the interaction between a knowledge buyer and supplier is affected by two salient aspects of knowledge outsourcing, which distinguish it from component outsourcing: the buyer's absorptive capacity, and the supplier's ability to reuse prior knowledge. We also investigate how uncertainty and information asymmetry influence the equilibrium outcomes of knowledge outsourcing.

3 - Incentives in Contests with Heterogeneous Solvers

Soo-Haeng Cho, Associate Professor, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, soohaeng@andrew.cmu.edu, Ersin Korpeoglu

In a crowdsourcing contest in which heterogeneous solvers make efforts to develop solutions, existing theories predict different outcomes about how solvers will change their efforts in response to increased competition (i.e., more entrants to the contest). This paper presents a unifying model that encompasses different types of heterogeneity, and offers a precise explanation about solvers' rational behavior. Our theoretical prediction is corroborated by empirical evidence.

Retail Management II

Contributed Session

Chair: Shelby Koos, University of Miami, 268, McArthur Engineering Building, Coral Gables FL 33146, United States of America, s.koos1@umiami.edu

1 - Optimal Contract Design in a Co-storing Arrangement

Lama Moussawi-Haidar, Assistant Professor, American University of Beirut, P.O. Box 11-0236 Riad El Solh, Beirut, 1107, Lebanon, lm34@aub.edu.lb, Nagihan Comez-dolgan

We study the optimal design of a revenue sharing agreement between two retailers with complementary products, sharing the same retail location. The landlord retailer rents out some space to a tenant retailer. Each retailer has his/her own random sales, dependent on effort levels of both retailers. We model the problem as a double moral hazard and we show that a linear percentage rent, consisting of a sales share and a based rent, achieves the second-best effort levels.

2 - Efficient Workforce Size and its Schedule in the Retail Store

Peeyush Pandey, Doctoral Student, IIM INDORE, FPM block, room no.-315, IIM Indore, Prabandh Shikhar,, Indore, MP, 453331, India, f12peeyushp@iimindr.ac.in, Bhavin Shah, Ashish Sadh, Hasmukh Gajjar

A Stochastic model is proposed to determine optimal workforce size at the different point of time in the retail store. Further this optimal size is used as an input to workforce-scheduling model considering uncertain and uneven customer traffic, union contracts, labor laws, company policies etc. Proposed optimization model and solution methodology guarantees to provide efficient workforce schedule.

3 - Beyond the Forecast – Risk Based Promotion Management Applied in a Grocery Retail Environment

Ted Matwijec, Managing Director, ACT Operations Research, 1345 Legendary Lane, Morrisville, NC, 28202, United States of America, ted.matwijec@act-operationsresearch.com, Raffaele Maccioni

Promotions are one of the biggest challenges for management for businesses focused on consumer retailing. Each product promotion campaign must contribute to the businesses to attract new customers and still retain existing customers. In this paper we analyze the modeling, which is applied to promotions used at a national grocery retailer. The solution minimizes the risk of running promotions by using optimization techniques which ultimately benefits a retailer profitability.

4 - The Softer Side of Assortment Planning

Nazrul Shaikh, Assistant Professor, University of Miami, 268, McArthur Engineering Building, University of Miami, Coral Gables, FL, 33146, United States of America, n.shaikh@miami.edu, Shelby Koos

Our research focuses on the sensitivity of the optimal assortment plans to soft costs, such as backorder costs, and proposes a methodology for generating robust solutions to the assortment planning problem. This adds a useful element to extant research that only focuses on improving future demand estimates and substitution probabilities.

Chair: Karen Zheng, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, yanchong@mit.edu

1 - A Cognitive Strategy for Reducing Managerial Bias under Censored Demand

Jordan Tong, Assistant Professor, University of Wisconsin at Madison, WI, United States of America, jordan.tong@wisc.edu, Daniel Feiler, Richard Larrick

Existing evidence suggests managers exhibit a censorship bias: demand beliefs and order decisions are biased low when demand is censored by the inventory level. We propose a new cognitive strategy, which is easily implementable in practice, for reducing this bias. Two experiments show that the strategy improves managerial performance across multiple profit margins and outperforms other plausible debiasing techniques. The results also illuminate the underlying causes of the censorship bias.

2 - The Bright and Dark Sides of Perception Biases in Inventory Decisions

Yaozhong Wu, National University of Singapore, NUS Business School, Singapore, Singapore, yaozhong.wu@nus.edu.sg

We study the impact of perception biases in competing inventory decisions. We analyze how a manager's perception bias affects each other's inventory decisions and performances in strategic interactions, and more importantly who benefits from these biases in the short and long runs. We show that a perception bias can serve as a competitive advantage in the sense that a biased manager can achieve a higher profit than an unbiased competitor.

3 - The Exploration – Execution Transition in Product Development: An Experimental Analysis

Stephen Leider, University of Michigan, 701 Tappan Ave R4486, Ann Arbor, MI, 48104, United States of America, leider@umich.edu, Evgeny Kagan, William Lovejoy

We examine experimentally the effect of exogenous and endogenous transition times on performance in a creativity task. Subjects who choose their own transition perform worse, even when the transition time is similar. We find that early design prototyping, testing and even failure improves performance, while the number of ideas does not. Idea selection and execution accounts for more of the performance difference than idea generation.

4 - Pricing When Customers have Limited Attention

Tamer Boyaci, McGill University, Montreal, Canada, tamer.boyaci@mcgill.ca, Yalcin Akcay

We study optimal pricing when customers have limited attention and capability to process information about the value (quality) of the offered products. We model customer choice based on the theory of rational inattention in the economics literature, and capture not only the impact of true qualities and prices, but also the intricate effects of customer's prior beliefs and cost of information acquisition and processing. We consider both monopolistic and competitive settings.

Decision Analysis I

Contributed Session

Chair: Xiaoya Xu, PhD, University of Macau, S9-7025, Macau, Macau, xlwxy@gmail.com

1 - Managing Rental Products with Breakdown

Mohammad Firouz, PhD Candidate, The University of Alabama, 610 13th St, Apt. 19, Tuscaloosa, AL, 35401, United States of America, mfirmouz@crimson.ua.edu, Burcu Keskin, Linda Li

We investigate capacity planning problem of a rental system. Products owned by the system have a life time distribution and may breakdown for an uncertain duration of time. We solve the proposed Quasi-Birth and Death (QBD) model via matrix analytic methods. We also compare the result of our proposed approximation to the problem with the QBD. In our analysis, we prove the convexity of the approximate cost objective function and show conditions under which it may or may not be accurate.

2 - Repeat Purchase Prediction of Loyalty Customers using Survival Analysis

U Dinesh Kumar, Dr., Professor in Quantitative Methods & Information Systems, Indian Institute of Management, Bannerghatta Road, Bangalore, 560076, India, dineshk@iimb.ernet.in

The prediction of purchase behavior of loyalty customers in terms of who will repeat the purchase and when the repeat purchase of a particular category will be done. We use Survival Model combined with Logistic Model and Decision Tree to find when and who will repeat the purchase while retaining the robustness, interpretability of the models.

3 - Selling Probability Service: Profiting from Market Segment and Discrimination

Xiaoya Xu, PhD, University of Macau, S9-7025, Macau, Macau, xlwxy@gmail.com, Zhaotong Lian, Xin Li, Pengfei Guo

We consider a setting where goods A and B are offered to customers of three types: buyers who desire for A, buyers who desire for B, and the third type of buyers who are flexible. A probability selling service is created by the seller to offer the option of getting an unknown item either A or B, targeting at the third type of customers. This paper investigates the role of probability selling service provider in such a setting as Priceline and Hotwire in market segmentation.

Advances in Sustainable Energy and Economic Systems Analysis

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Soheil Shayegh, Postdoctoral Research Scientist, Carnegie Institution for Science, 260 Panama St., Stanford, Ca, 94305, United States of America, sshayegh@carnegiescience.edu

1 - Adapting to Rates of Climate Change

Soheil Shayegh, Postdoctoral Research Scientist, Carnegie Institution for Science, 260 Panama St., Stanford, Ca, 94305, United States of America, sshayegh@carnegiescience.edu, Ken Caldeira, Juan Moreno-Cruz

Most of the discussion around adaptation in IPCC AR5 and other sources has focused on amounts of climate change. However, it is becoming increasingly clear that, as climate continues to change, people and ecosystems will need to continuously adapt to a moving target. We have developed a model that convincingly makes this point and illustrates it with a quantitative example involving coastal development in the face of ongoing sea level rise.

2 - Dynamic Energy Inventory Management for Wastewater Treatment

Jing Ma, Ph.D Candidate, Stanford University, 145M, 475 Via Ortega, Stanford, CA, 94305, China, jingma@stanford.edu, Craig Criddle, Erica Plambeck, Sebastien Tilmans

In this work we aim to optimize energy production and consumption to boost revenue for Wastewater treatment plants. Specifically, using the data from Plants in San Francisco, we analyze the potential benefits of controlling the magnitude of influent sewage pumping rate to minimize energy cost or total emission. We also suggest an easy-to-implement heuristic for Wastewater treatment plants.

3 - Dynamic Regulatory Distortion: Coal Procurement at U.S. Power Plants

Akshaya Jha, Assistant Professor, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, akshayaj@stanford.edu

I estimate a dynamic, plant-level model of coal purchase with storage for U.S. electricity generation plants. Holding constant the plant's pattern of input prices and output, I find that it costs a regulated plant roughly 3% more per month to procure coal relative to the same plant facing market prices. This 3% increase in costs stems primarily from dynamic distortions to when and how often regulated plants purchase coal, rather than static differences in the level of coal stockpiles held.

Non-Convex Equilibrium Problems

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Miguel Anjos, Polytechnique Montreal, Mathematics and Industrial Engineering, Montreal, Canada, miguel-f.anjos@polymtl.ca

1 - An RIT Approach for Solving the Binary-constrained Mixed Linear Complementarity Problem

Franklin Djeumou Fomeni, Postdoc, Ecole Polytechnique Montreal, 5960 Rue Dumas, Montreal, QC, H4E 2Z6, Canada, franklin@aims.ac.za, Miguel Anjos, Steven Gabriel

The BC-MLCP is a formulation of the MLCP in which some variables are restricted to be binary. This paper presents a novel approach for solving the BC-MLCP. First we solve a series of LPs that enables us to replace the complementarity constraints with linear equations. Then we solve an equivalent MILP formulation of the BC-MLCP to guarantee a solution to the problem. Our computational results on a variety of test problems demonstrate the usefulness and effectiveness of our novel approach.

2 - Energy Pricing Problems for Demand Side and Revenue Management

Luce Brotcorne, INRIA, Parcs Scientifique de la Haute Borne, 40 Avenue Halley, Bat-B Park Plaza., Villeneuve d ascq, 59650, France, luce.brotcorne@inria.fr, Sezin Afsar, Patrice Marcotte, Gilles Savard

Pricing models for demand side management methods are traditional used to control electricity demand which became quite irregular recently and resulted in inefficiency in supply. We propose bilevel models to explore the relation and between energy suppliers and customers who are connected to a smart grid. This approach enables to integrate customer response into the optimization process of supplier who aims to maximize revenue or minimize capacity requirements. Numerical results are given.

Strategy/Strategic Planning I

Contributed Session

Chair: Mukesh Rungta, Research Scientist, Air Liquide, 200 GBC Dr, Newark, DE, 19702, United States of America, mukeshrungta@gmail.com

1 - Organizational Decision-making and Information: Angel Investments by Venture Capital Partners

Andy Wu, PhD Candidate in Applied Economics, The Wharton School of the University of Pennsylvania, 3620 Locust Walk, Suite 3000, Philadelphia, PA, 19104, United States of America, andywu@wharton.upenn.edu

We study the role of information in organizational decision-making for the financing of entrepreneurial ventures. We formally model a decentralized set of

agents who can acquire costly information and vote to allocate resources to an uncertain project. We test our predictions in the setting of venture capital, where partners make their own angel investments. We find the venture capital partners, acting independently, make riskier investments, but have equivalent financial performance.

2 - Alliance Diversity and Multilateral Strategic Alliance Performance: A Faultline Perspective

Angelo Solarino, City Univeristy of Hong Kong, Chee Avenue, Kowloon, Hong Kong, Hong Kong - PRC, mgangelo@cityu.edu.hk, Tao Bai

We examine the effects of alliance diversity on alliance performance from a faultline perspective. We assess how firms' interacting multiple attributes influence the alliance performance jointly. We differentiate demographic from informational faultlines and tested their effects based on global pharmaceutical alliances. Contrary to previous studies, we find that both kinds of faultlines positively influence the alliance performance. Theoretical and methodological implications are discussed.

3 - Effects of Regional, National and Subnational Institutions On Firm Performance – Meta-analysis

Tao Bai, Assistant Professor, Xi'an Jiaotong-Liverpool University, Suzhou Industrial Park, Suzhou, China, baitao2010@gmail.com, Angelo Solarino, Frank McDonald

There has been a growing attention to globalization-regionalization debate in international business. To better answer the phenomenon, we conduct a meta-analysis to assess the strengths of supranational, national, and subnational institutions on firm performance. We further explore the moderating effect of international relations between countries, industry, and firm size, to help clarifying the research landscape. Theoretical implications and future research opportunities are discussed.

4 - Strategic Sourcing in the Industrial Gas Bulk Supply Chain

Mukesh Rungta, Research Scientist, Air Liquide, 200 GBC Dr, Newark, DE, 19702, United States of America, mukeshrungta@gmail.com

In a vendor managed inventory context, effective strategic sourcing is particularly important and can have significant impact on operational costs. Within the context of the industrial gas supply chain, this presentation will focus upon the assignment of customers to production sources and transportation depots in order to minimize the total landed cost subject to production and distribution constraints. A methodology will be outlined and example cases discussed.

5 - Vertical Integration, Industry Relatedness, and the Agglomeration of Multi-business Firms

Juan Alcacer, Harvard Business School, Soldiers Field, Boston, United States of America, jalcacer@hbs.edu, Jasmina Chauvin

We provide new insights into firm boundary decisions by comparing location strategies of multi-business and single-business firms in the same industry. We find that establishments belonging to multi-business firms agglomerate more, and the difference is related to the potential for sharing of labor resources. Our results suggest that strategic decisions about the geographic and product boundaries of the firm are intimately related, and that resource sharing is implicated in both decisions.

Green Manufacturing

Contributed Session

Chair: Kejia Hu, Kellogg School of Management, Northwestern University, 2169 Campus Drive, Evanston, United States of America, k-hu@kellogg.northwestern.edu

1 - Electrical Demand Elasticity of Industrial Loads

Mostafa Ghafoorvarzaneh, University of Tennessee-Knoxville, 851 Neyland drive, 511 John D. Tickle Building, Knoxville, TN, 37996, United States of America, mghafoor@utk.edu, Rupy Sawhney

In the first phase, an optimization model will be introduced for production planning which considers different states of energy consumption (idle, working, setup, startup states) in addition to traditional production planning parameters. In the second step, a DOE will be developed based on real data of production, energy consumption and historical data of LMP. As the result distribution of elasticity and elasticity matrix will be introduced as a function of production parameters.

2 - Energy Performance Indicator in the Manufacturing Industry

Amir Abolhassani, Graduate Research Assistant, West Virginia University, Industrial and Management Systems Dept., Benjamin M. Statler College of Eng., Morgantown, WV, 26506, United States of America, aabolhas@mix.wvu.edu, Bhaskaran Gopalakrishnan

Energy efficiency is becoming an essential aspect of the manufacturing enterprise. Through a series of rigorous assessments, the facilities energy performance was classified in four basic areas of thermal and combustion systems, electrical power and operations, motor systems, and building and grounds. Fuzzy logic is utilized to process historical data obtained from assessments to derive manufacturing facilities energy performance indicator.

3 - Perceptions of Indian Manufacturing Industries in Adopting Green Supply Chain Practises -an Empirical Study

Ashwin Vijayakumar, Management Trainee, Paramount Shipping Services, Parrys, Chennai, 600020, India, vijayakumar.ashwin@gmail.com, Gopinath Bharathi, Vivekanandhan Porselvan

The benefits of adopting green supply chain practises have been realised by industries all over the world apart from India where it is still in its infancy. The study identifies key parameters that play a direct role in adopting green practises in industries such as manufacturing, services, pharmaceuticals etc. Process can be optimised and profits achieved.

4 - Does "Green" Performance Affect Market Share in the Automotive Industry? An Empirical Study

Kejia Hu, Kellogg School of Management, Northwestern University, 2169 Campus Drive, Evanston, United States of America, k-hu@kellogg.northwestern.edu, Sunil Chopra

Our goal is to understand how "Green" performance affects market share for auto manufacturers. Using emission data collected for 14 years from remote sensors installed along a European inter-country highway, our analysis shows the relationship between "Green" performance and market share to be concave. Moreover, we find that "Green" is more significant in affecting market share under loose standards or facing large upcoming reduction in standards.

Integrated Biofuels Supply Chain Design

Sponsor: ENRE – Environment I – Environment and Sustainability

Sponsored Session

Chair: Krystel Castillo, Greenstar Assistant Professor In Energy, The University of Texas at San Antonio, One UTSA Circle, San Antonio, TX, 78249, United States of America, Krystel.Castillo@utsa.edu

1 - An Integrated Biofuel Supply Chain Design Stochastic Model Including Biomass Quality Variability

Krystel Castillo, Greenstar Assistant Professor In Energy, The University of Texas at San Antonio, One UTSA Circle, San Antonio, TX, 78249, United States of America, Krystel.Castillo@utsa.edu, Milad Taherkhorsandi, Sandra Eksioglu

Industry maturity for advanced biofuels supply chains (SCs) faces two main challenges: (1) quantifying and controlling biomass quality variability and (2) moving from local to large-scale SCs to satisfy a nationwide demand. We develop a two-stage stochastic model to (1) better represent the random nature of the biomass quality and technology breakthroughs, and (2) assess the impact of these uncertainties on the SC design and planning. We propose an L-shaped and a multicut L-shaped method.

2 - Analyzing the Impact of Flexible Tax Credit Schemes on Biomass Co-firing in Coal-fired Power Plants

Sandra Eksioglu, Clemson University, 134 Freeman Hall, Clemson, SC, 29634, United States of America, seksiog@clemson.edu, Hadi Karimi

We investigate the impact of flexible tax credit schemes on biomass co-firing. We propose mixed-integer programs to model and compare three schemes: (a) a flat rate tax credit per kwh of renewable energy; (b) a flexible tax rate that changes with plant capacity; (c) a flexible tax rate that is a function of the amount of renewable energy produced. We propose a Benders decomposition algorithm to solve the problems; develop a case study; and derive observations based on numerical results.

3 - An Agent-based Model for Farmers Behavior and Biomass Supply Analysis

Shiyang Huang, Iowa State University, 0076 Black Engineering, Ames, IA, 50011, United States of America, shuang@iastate.edu, Guiping Hu

We build an agent-based simulation model (ABM) with a focus on the farmers' decision making in the biofuel supply chain. The farmers face the planting decision between conventional crops and dedicated energy crops. The ABM model was implemented in AnyLogic and a case study in Iowa was conducted.

Computational Advances in Power System Modeling

Cluster: Energy Systems: Design, Operation, Reliability and Maintenance

Invited Session

Chair: Ben Knueven, University of Tennessee, 519 John Tickle Building, Knoxville, TN, 37996, United States of America, bknueven@utk.edu

1 - Tight and Compact Formulation for a Single Generator in Unit Commitment

Ben Knueven, University of Tennessee, 519 John Tickle Building, Knoxville, 37996, United States of America, bknueven@utk.edu, Bernard Knueven, Jianhui Wang

In this presentation, we will show that there exists a tight and compact formulation for a single generator's operating schedule. While this formulation may not be computationally effective, it does motivate a new (loose) formulation for the unit commitment problem. Computational experiments seem to indicate the the new formulation can offer significant computational savings over traditional formulations.

2 - Modeling Flexibility Investment Decisions in a Regionally-focused Capacity Expansion Model

Elaine Hale, Senior Engineer, National Renewable Energy Laboratory, 15013 Denver West Parkway, MS RSF300, Golden, CO, 80401, United States of America, Elaine.Hale@nrel.gov, Trieu Mai, Clayton Barrows, Anthony Lopez

The Resource Planning Model (RPM) is a capacity expansion model (CEM) structured around a nodal focus region and a zonal representation of the remainder of the interconnect. This paper gives an overview of RPM, including a brief discussion of its use in analysis projects to date, and then provides detail on recent work aimed at modeling flexibility investment decisions. This will necessarily include a discussion of how to capture system flexibility needs in CEMs with coarse temporal resolution.

3 - Interior Point Schemes for Unit Commitment

Wendian Wan, The Pennsylvania State University, 351 Leonhard Building, University Park, PA, 16801, United States of America, wzw121@psu.edu, Uday Shanbhag

This paper presents a two-phase interior-point method solving unit commitment problems. We examine the scalability of the scheme and compare its performance with solutions from commercial solvers.

WB63

63-Room 112B, CC

Operations Management IV

Contributed Session

Chair: Suzanne De Treville, Professor, University of Lausanne, Faculty of Business and Economics, Anthropole 3073, Lausanne, VD, 1015, Switzerland, suzanne.detreville@unil.ch

1 - Supply Contracts Design in Decentralized Assembly Systems with Asymmetric Information

Yanfei Lan, Tianjin University, College of Management and Economics, Tianjin, China, lanyf@tju.edu.cn, Xiaoqiang Cai, Lianmin Zhang

This paper studies a supply contracts design problem, in which two heterogeneous suppliers produce complement products and deliver to the assembler, of which one is more reliable and the other is less reliable. In order to elicit the assembler's truthful report of private information, the two suppliers offer a contract to the assembler, respectively. We study the cases that either supplier moves first, as well as they move simultaneously under symmetric and asymmetric information, respectively.

2 - Planning of Container Movement by Trucks in Metropolitan Area

Samaneh Shiri, PhD Candidate, University of South Carolina,
Department of Civil and Environmental Eng, 300 Main Street,
Columbia, SC, 29208, United States of America,
samashiri@gmail.com, Nathan Huynh

To lower operation time of the drayage problem, the empty container and chassis allocation, and vehicle routing problem need to be coordinated. Most studies have considered these operations individually. In this work drayage firms hire owner-operators and should find the optimal tours for their own trucks and the owner-operators. A mathematical model is developed as an extension of the multiple traveling salesman problem with time windows that jointly schedules these operations.

3 - Using a Volatility Portfolio to Create Value

Suzanne De Treville, Professor, University of Lausanne, Faculty of
Business and Economics, Anthropole 3073, Lausanne, VD, 1015,
Switzerland, suzanne.detreville@unil.ch, Kyle Cattani

Quantitative finance tools allow us to price demand-volatility exposure: The volatility-exposure cost justifies local production. We demonstrate that a volatility portfolio combining time sensitive and time-insensitive products will outperform production of the high volatility product alone. The resulting strengthens the case for local manufacturing in a developed economy, and encourages innovation.

Teaching Methods for Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Richard McGrath, Assistant Professor, United States Naval
Academy, 572M Holloway Rd, Annapolis, MD, 21402,
United States of America, rmcgrath@usna.edu

1 - The Use of Prediction Markets in Teaching Decision Analysis

Richard McGrath, Assistant Professor, United States Naval
Academy, 572M Holloway Rd, Annapolis, MD, 21402,
United States of America, rmcgrath@usna.edu

We present an exercise in prediction markets from an introductory Decision Analysis course. For this assignment, students made predictions about the outcome of future uncertain events, and were incentivized both as individuals and as a group to make accurate predictions through the award or loss of class grade points. Events used for this exercise included major sports competitions, Federal Reserve monetary policy actions, class cancellations due to weather, and popular culture awards.

2 - Teaching Decision Making to Teens, to Executives, to the Government and to the Population at Large

Ali Abbas, Professor of Industrial and Systems Engineering and
Public Policy and Director of Create, University of Southern
California, 3710 McClintock Avenue, RTH 314, Los Angeles, CA,
United States of America, aliabbas@price.usc.edu

This talk will reflect on methods of teaching decision analysis that have been used in various settings. The talk will emphasize what works and what does not work for a given audience. Lessons learned and commonalities will also be presented.

65-Room 113B, CC

Decision Making: Tradeoffs, Risk Processing and Altruism

Sponsor: Decision Analysis

Sponsored Session

Chair: Yitong Wang, University of Technology Sydney, UTS Business
School, University of Technology Sydney, Sydney, NS, 2007, Australia,
Yitong.Wang@uts.edu.au

1 - Markov Cost-Effectiveness Analysis for Cancer Treatment

Jiarui Bai, University of California, Irvine, CA, 6464 Adobe Circle,
Irvine, United States of America, jiarub@uci.edu, Robin Keller

We present a way to build a Markov decision tree to model cancer progression and cost-effectiveness analysis for two or more cancer treatments. We propose several problems researchers can encounter in this kind of research and provide possible solutions.

2 - The Existence of Altruistic Value Functions

Jay Simon, American University, jaysimon@american.edu

Altruism is a popular economic and psychological explanation for a wide range of pro-social decisions and actions, and is a descriptively compelling model of behavior. This work provides a theoretical framework for the existence of ordinal and cardinal altruistic value functions based on an altruistic preference relation over a set of outcomes.

3 - Revisiting Risk-as-feelings: Cognitive Processing Style Moderates The Affect Heuristic

Eugene Chan, Lecturer, University of Technology, Sydney,
P.O. Box 123, Broadway, NS, 2008, Australia,
Eugene.Chan@uts.edu.au

People do not solely rely on their rational evaluations about risks, but also their affect-based intuitions. This paper shows that people's cognitive processing style moderates the affect heuristic. The heuristic primarily occurs among visualizers because they mentally picture risks that might ensue, making them perceive risks as more risky. Thus, this paper illuminates how different individuals perceive risks, with implications for risk research, public policy, and decision-making.

4 - An Eye Tracking Study on Decision Making: Information Processing and Reading Habits

Yitong Wang, University of Technology Sydney, UTS Business
School, University of Technology Sydney, Sydney, NS, 2007,
Australia, Yitong.Wang@uts.edu.au, Tianjun Feng,
Antonin Genot, Lei Zhao

We investigate decision makers' information-processing patterns in decisions under risk and over time by using eye-trackers. We find that decision makers employ more alternative-based than attribute-based procedures. In addition, we find that reading habits play an important role in information processing - the results suggest that screen display moderates decision makers' information-processing procedures.

Aviation Day of Operations and Air Traffic Optimization

Sponsor: Aviation Applications

Sponsored Session

Chair: Alexandre Jacquillat, PhD Candidate, Massachusetts Institute of
Technology, 77 Massachusetts Avenue, Building E40-240, Cambridge,
MA, 02116, United States of America, alexandre.jacquillat@gmail.com

1 - A Mechanism for the Strategic Reduction of Air Traffic Congestion

Luca Corolli, Università degli Studi di Trieste, Via Valerio 10,
Trieste, 4127, Italy, lcorolli@units.it, Tatjana Bolic,
Lorenzo Castelli, Desirée Rignonat

En route congestion is currently detected on the day of operation of flights. We develop a new strategic mechanism based on integer optimization that seeks to prevent en route congestion through an early redistribution of air traffic. The mechanism assigns flights departure and arrival times and routes, based on airline requests. The benefit of using this mechanism is shown on a real instance with 30,000 European flights that is solved in short computation times.

2 - Design and Simulation of a Pushback Rate Control Policy at Philadelphia International Airport

Patrick McFarlane, Graduate Research Assistant, Massachusetts
Institute of Technology, 77 Massachusetts Avenue, Cambridge,
MA, 02139, United States of America, pmcfar@mit.edu,
Hamsa Balakrishnan

This analysis designs and simulates an airport surface congestion management policy that controls the departure pushback rate at Philadelphia airport. The policy mitigates surface congestion at the airport and results in taxi-out time reductions. The simulations also consider issues such as fairness of allocation, and the impacts of operational constraints such as gate conflicts, that would accompany actual implementation of the proposed policy.

3 - Analysis of Congestion Pricing Model to Handle "Day of Operations" Airport Capacity Reduction

Abdul Qadar Kara, Asst. Professor, King Fahd University of
Petroleum and Minerals, P.O. Box 5067, Dhahran, 31261,
Saudi Arabia, aqkara@kfupm.edu.sa

In my earlier work, a model was built on basic econometric principle of congestion pricing embedded within an optimization model. The model provided a mechanism to manage airport runway capacity reduction. The current work reports further analysis of the model and its response against the multiple unscheduled changes in capacity of the runway at different times on day of operation.

4 - The Flight Trajectory Optimization Problem

Marco Blanco, Zuse Institute Berlin, Takustr. 7, Berlin, 14195, Germany, blanco@zib.de, Ralf Borndürfer, Nam Dung Hoang, Thomas Schlechte

We study the problem of computing an optimal flight trajectory on the airway network. The goal is to minimize fuel- and overfly costs while considering weather forecasts and operative constraints. While the problem is NP-hard even in simplified versions, very fast algorithms are required in practice. We present a new solution approach that combines classical shortest-path algorithms with techniques for non-linear pseudo-boolean optimization. We also show computational results on real-world data.

Ocean Container Transport Logistics

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Chung-Yee Lee, Chair Professor, HKUST, Dept. of IELM, Clear Water Bay, Kowloon, Hong Kong - PRC, cylee@ust.hk

1 - Coordinating Pricing and Empty Container Repositioning: An Analysis of Two-depot Shipping Systems

Tao Lu, Hong Kong University of Science & Technology, Clear Water Bay, Kowloon, Hong Kong, Hong Kong - PRC, tluaa@ust.hk, Chung-Yee Lee, Loo Hay Lee

This paper analyzes the joint decision of pricing and empty container repositioning in a two-depot shipping service. Demands (in both directions) are stochastic and dependent on the freight prices being charged. We formulate the problem as a Markov decision process with a three-dimensional state space. While challenging, we prove the L-natural-concavity of value functions, thereby characterizing the structure of optimal policies.

2 - Pricing and Competition in a Shipping Market with Waste Shipments and Empty Container Repositioning

Rongying Chen, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, Hong Kong - PRC, rchenac@connect.ust.hk, Chung-Yee Lee, Jing-xin Dong

We study a shipping market with carriers providing service between two locations. Shipments are classified into two categories: goods and waste. Trade imbalance allows low-valued waste to be shipped at bargain rates. If imbalance persists, empty containers must be repositioned. We build a monopoly and a duopoly model to find the optimal pricing strategy for carriers. We also analyze how the profit of a carrier is affected by potential imbalance, cost structure and competition intensity.

3 - The Time Value of Containerized Cargoes

Shuaian Wang, Old Dominion University, 2147 Constant Hall, IT/Decision Sciences, Old Dominion University, Norfolk, VA, 23529, United States of America, wangshuaian@gmail.com, Xiaobo Qu, Ying Yang

We propose a novel method for estimating the perceived value of transit time of containers by shipping lines. The key idea is that a shipping line's published schedule is the optimal decision that minimizes the sum of fuel cost and time-associated costs of the containers adopted by the shipping line. We estimated the adopted values of transit time for nine trans-Pacific services operated by Orient Overseas Container Line and five trans-Pacific services operated by Maersk Line.

4 - An Economic Evaluation of CO2 Emissions Reductions from Marine Transportation of LNG

Shigwki Toriumi, Associate Professor, Chuo University, 1-23-27 Kasuga, Bunkyo-ku, Tokyo, 112-8551, Japan, toriumi@ise.chuo-u.ac.jp, Ryuta Takashima

This study evaluates relation between transportation cost and reduction of CO2 emissions from marine transportation of LNG. We compare three patterns: (1) a regulation based on the current speed; (2) a regulation based on the optimum speed for minimal CO2 emissions; and (3) the speed for minimal cost with internalized CO2 emissions cost. This study is characterized by using vessel movement database and the sea lane network. Therefore we can estimate spatial distribution of the CO2 emissions.

5 - The Extended Gate Problem: Intermodal Hub Location with Multiple Actors

Yann Bouchery, Ecole de Management de Normandie, 30 Rue de Richelieu, Le Havre, 76087, France, ybouchery@em-normandie.fr, Jan Fransoo, Marco Slikker

Deep-sea terminal operators are looking for solutions to improve their container handling operations. They start opening extended gates, i.e., inland hubs connected by rail to the deep-sea terminal. Intermodal hub location problems are usually solved by considering a single decision maker even though several actors often interact in practice. We analyze here the impact of having multiple actors involved by proposing a formulation of the extended gate location problem based on game theory.

Production and Distribution Systems

Sponsor: Transportation, Science and Logistics

Sponsored Session

Chair: Deniz Tursun, Postdoctoral Research Associate, University of Illinois, Urbana Champaign, 3308 Sharp Drive, Champaign, IL, 61822, United States of America, utursu2@illinois.edu

1 - Determining Transportation Mode Choice to Minimize Distribution Cost

Luca Bertazzi, Associate Professor, University of Brescia, Via Santa Chiara, Brescia, Italy, luca.bertazzi@unibs.it, Jeffrey Ohlmann

We consider a problem in which a supplier must determine the transportation mode for product deliveries to satisfy demand from a set of retailers. Four transportation modes are available: Direct Shipping, Transit Point, 2-Routing and Routing. We provide the tight worst-case performance bound for each couple of transportation modes and we compare their performance in a set of instances generated on the basis of a real case.

2 - Robust Grain Supply Chain Design Considering Post-Harvest Loss and Harvest Time Equilibrium

Kun An, University of Illinois, Champaign, IL, United States of America, ankun@illinois.edu, Yanfeng Ouyang

This paper presents a robust location model, where a food company maximizes its profit by optimally deploying grain processing/storage facilities, while non-cooperative and risk-averse/seeking farmers determine harvest time, shipment, storage, and market decisions under yield uncertainty. Solution methods and numerical examples are also presented.

3 - Stochastic Mixed Integer Convex Minimization Algorithm for Robust Production-Distribution Systems

Deniz Tursun, Postdoctoral Research Associate, University of Illinois Urbana Champaign, 3308 Sharp Drive, Champaign, IL, 61822, United States of America, utursu2@illinois.edu, Nagi Rakesh

Robust supply chain design and operation under uncertainty problems lead to confluence of integer and continuous variables, which call for Mixed-Integer Nonlinear Programming algorithms. We consider a comprehensive random projection algorithm for a subclass of MINLPs, where the objective and constraints are defined by convex functions and integrality restrictions are imposed on a subset of the decision variables. A stochastic convex random projection optimality algorithm for lower bound solution and a stochastic random projection feasibility algorithm for upper bound solution are used in succession converging to the solution set almost surely. We aim to solve a class of robust integrated supply chain network design problems with multiple echelons where uncertain demand leads to random constraints and objective coefficients.

4 - A Bayesian Network Model for Supplier Evaluation

Seyedmohsen Hosseini, University of Oklahoma, 202 W. Boyd St, Norman, OK, 73071, United States of America, m.hosseini@ou.edu, Kash Barker

The selection of suppliers is a multi-criteria decision making problem that includes both tangible and intangible factors. This work presents a novel Bayesian network model that embeds both qualitative and quantitative evaluation factors within a graphical framework. Emphasis is given to supplier resilience in the supplier selection problem, in addition to other supplier characteristics.

ITS in Public Transportation

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Co-Chair: Alireza Khani, Assistant Professor, University of Minnesota, United States of America, akhani@umn.edu

1 - Vehicle-Sharing Network Design and its Integration with Public Transportation ServicesTianli Zhou, Massachusetts Institute of Technology, Cambridge, MA, United States of America, tzhou90@mit.edu,
Virot Chiraphadhanakul, Cynthia Barnhart, Carolina Osorio

We consider the design of a one-way vehicle sharing (VS) system, such that it is complementary with an existing public transportation system. We propose a two-stage MIP formulation to address a VS network design problem. We consider a large-scale case study of the metropolitan area of Boston. To solve the model, we decompose it and develop a cut generation method. We present numerical results for the Boston case study.

2 - A Location and Scheduling Model for a Flexible Intercity Transit Service

Andisheh Ranjbari, University of Arizona, Tucson, AZ, United States of America, aranjbari@email.arizona.edu, Mark Hickman, Yi-Chang Chiu

"Flexpress" is a high-speed intercity bus transit service that has several terminal locations in the urban area and a dynamic schedule. Travelers have the choice to board/alight the vehicle at one of the designated terminals, or pay a premium cost and ask for a door-to-door service. This presentation focuses on the mathematical model for the terminal location and scheduling problems.

3 - Transit Passenger Flow Prediction under Event Occurrences with Social Media Data

Ming Ni, SUNY Buffalo, 326 Bell Hall, University at Buffalo, Amherst, NY, 14260, United States of America, mingni@buffalo.edu, Jing Gao, Qing He

Frist, we propose a hashtag-based method to identify events near NYC subway stations based on tweets data. Second, the relationship between social activities and subway passenger flow is unveiled. Third, a convex optimization based model is developed to predict subway volume with social media data.

4 - Reliable Routing in Schedule-based Transit Networks with Stochastic Travel Times

Alireza Khani, Assistant Professor, University of Minnesota, United States of America, akhani@umn.edu, Stephen Boyles

In schedule-based transit networks where service is time-dependent and stochastic, risk-averse users try to minimize the expected travel time as well as to maximize the chance of arriving on-time. The latter objective is modeled by transfer failure probability and path algorithms are developed to find the most reliable paths.

Vehicle Routing I

Contributed Session

Chair: Sadegh Mirshekarian, PhD Student, Ohio University, 285 Stocker Center, Athens, OH, 45701, United States of America, sm774113@ohio.edu

1 - Branch-and-cut Algorithms for the Time Constrained Covering Salesman Problem

Gizem Ozbaygin, PhD Candidate, Bilkent University, Department of Industrial Engineering, Ankara, Turkey, ozbaygin@bilkent.edu.tr, Hande Yaman, Oya E. Karasan

In this study, we consider the time constrained maximal covering salesman problem which is a generalization of the orienteering problem. We propose a mathematical formulation, valid inequalities and branch-and-cut algorithms for the problem. We test our approaches on several instances we generated based on some existing VRP instances and report the results of our computational study.

2 - A Fuzzy Vehicle Routing Problem with Time Windows under Driving and Working Time Restrictions

Can Celikbilek, Ohio University, Industrial & Systems Engineering, Athens, OH, United States of America, cc340609@ohio.edu, Gursel Suer

A new Fuzzy mathematical model is developed to maximize the total profit of the system while minimizing the total traveled distance. The developed mathematical model is tested considering real driving, service and working time restrictions. A single depot and multiple customers with their working time windows are considered with identical set of vehicles. The developed fuzzy mixed integer mathematical model provided promising solutions to provide insights to real industry problem.

3 - Time Dependent Vehicle Routing Problem Solving Based on Speed Profiles and Speed Drop Coefficients

Martina Ravlic, Faculty of Transport and Traffic Sciences, University of Zagreb, Vukeliceva 4, Zagreb, Croatia, mravlic@fpz.hr, Tomislav Erdelic, Tonci Caric

The vehicle routing problem in real cases can be solved by applying a TDVRP algorithm. We compared two existing methods for determining the minimum travel time in TDVRP algorithm: the first method uses speed profiles of traversed links, while the other uses speed drop coefficients on a wider road network area. We analyzed the relationship between the execution times, depending on the size of the problem, and the computed minimum travel times with measured times.

4 - A Vehicle Routing Problem with Budget and Time Constraints

Elham Kookhahi, Wichita State University, 1845 Fairmount Street, Wichita, KS, 67260, United States of America, exkookhahi@wichita.edu, Bayram Yildirim

In this paper, a mathematical model is presented for a vehicle routing problem in which a sub tour of cities can be visited to maximize the number of served customers with a limited budget and time. The problem is solved using a genetic algorithm and numerical results are presented.

5 - A Generalized Single-Depot Vehicle Routing Problem with Time Windows and Non-Identical Vehicles

Sadegh Mirshekarian, PhD Student, Ohio University, 285 Stocker Center, Athens, OH, 45701, United States of America, sm774113@ohio.edu, Gursel Suer, Can Celikbilek

A generalized variant of VRP with time windows is studied, considering vehicles different in capacity, cost and speed. Vehicles can be used for more than one route, but are subject to driving and working time constraints. A new genetic algorithm with specialized crossover and mutation operators is developed and used to solve the problem, and results are compared with a math model and with state-of-the-art. The developed GA performed well in terms of solution quality and convergence speed.

Chair: Yi Liao, Southwestern University of Finance and Economics, Liutai Ave 555, School of Business Administration, Chengdu, China, yiliao@swufe.edu.cn

1 - Conflict Prevention and Detection for Autonomous and Connected Vehicles

Xin Chen, Assistant Professor, Southern Illinois University, P.O. Box 1805, Edwardsville, IL, 62034, United States of America, xchen@siue.edu, Shimon Y. Nof

An autonomous vehicle is capable of sensing its environment and navigating without human input. Conflicts between vehicles and between vehicles and transportation infrastructure are unavoidable. In this research, the authors develop a common language structure to represent domain knowledge in autonomous vehicles and apply algorithms and protocols to detect and prevent conflicts.

2 - Effective Vehicle Identification and Authentication Mechanism for Intelligent Transportation System

Joonsang Baek, Khalifa University, Al Saada St. and Muroor Rd., Abu Dhabi, United Arab Emirates, joon.baek@kustar.ac.ae, Young-ji Byon

Inspired by Internet of Things (IoT), it is possible to develop an identification mechanism for ITS, which is based on the unique vehicle identification number (VIN). Such identification mechanism would provide a certain level of privacy, which will assist traffic monitoring without compromising drivers' identities by utilizing a strong authentication mechanism based on message authentication codes.

3 - Modeling Location Diffusion, Resource Allocation and Rebalance in Car Sharing Industry-a Zipcar Exam

Wei Chen, Assistant Professor, York College of Pennsylvania,
441 Country Club Rd, York, PA, 17403, United States of America,
wchen@ycp.edu

In this study, we build two novel models to tackle three car-sharing management questions: 1). Car Station Location Selection; 2). Car Station Size problem; and 3). Car Relocation Numbers. Our models require less inputs and offer a quick analytic result to answer three operational issues. Particularly, we use Zipcar as an example to illustrate how our models work, it turns out that our models can perform well and achieve expectations.

4 - Routing Decision Strategy and Resource Allocation Planning for a Two-Echelon Rescue Delivery System

Yi Liao, Southwestern University of Finance and Economics,
Liutai Ave 555, School of Business Administration, Chengdu,
China, yiliao@swufe.edu.cn, Hanpeng Zhang

One of the most important post-catastrophe goals is the effective and efficient allocation of rescue resources. We consider the combined problem of allocating rescue resources between two main warehouses and planning their delivery strategies to several local distribution centers. We suggest three routing strategies-simple, mixed and dynamic mixed-and analyze the effects that different routing strategies have on rescue resource allocation and relief performance.

1 - Demand Modeling in the Presence of Unobserved Lost Sales

Shivaram Subramanian, IBM Research, 1101 Kitchawan Road,
Yorktown Heights, NY, 10598, United States of America,
subshiva@us.ibm.com, Pavithra Harsha

We present an integrated optimization approach to parameter estimation and missing data imputation for calibrating discrete choice demand models where one or more choice alternatives are censored. We jointly determine the prediction parameters associated with the customer arrival rate, as well as their preferences in an assortment. We share experimental results for instances arising in a variety of industrial settings. The results achieved indicate the efficacy of the proposed methods.

2 - Big Data Solutions for Omni-channel Fulfillment Planning and Optimization

Ajay Deshpande, Research Staff Member, IBM Research, 1101
Route 134 Kitchawan Rd, Yorktown Heights, NY, 10598, United
States of America, ajayd@us.ibm.com, Yingjie Li, Dahai Xing,
Brian Quanz, Arun Hampapur, Ali Koc, Xuan Liu

Retailers look to leverage their store networks to fulfill omni-channel demand. Our research efforts focus on developing two Big Data solutions. The Network Planner provides rapid what-if analysis to find the most effective fulfillment plan. The Optimizer dynamically optimizes sourcing of online orders while balancing conflicting business goals.

3 - How Can Manufacturers Help Brick-and-mortar Stores Fight with "Showrooming"?

Dahai Xing, Research Staff Member, IBM Research,
1101 Route 134 Kitchawan Rd, Yorktown Heights, NY, 10598,
United States of America, dxing@us.ibm.com, Tieming Liu

We study a supply chain in which an online retailer free-rides a brick-and-mortar retailer's sales effort. The free riding effect reduces brick-and-mortar retailer's desired effort level, thus hurts the overall supply chain performance. We examine the selective rebate contract with price match in two scenarios: the online channel is owned by or independent of the manufacturer. We show that the contract can allocate the supply chain system profits arbitrarily between the players.

Bayesian Data Analytics for Quality and Reliability Assurance

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Mingyang Li, Assistant Professor, University of South Florida,
4202 East Fowler Avenue, Tampa, United States of America,
mingyangli@usf.edu

1 - Density Estimation with Indirect Data

Park Chiwoo, Assistant Professor, FAMU-FSU College of
Engineering, 2525 Pottsdamer Street, Tallahassee, FL, 32310,
United States of America, cpark5@fsu.edu, Xin Li

We present a general problem of estimating a probability density of a random variable when there are only observations of other random variables that are correlated to the random of interest. The application of the approach to estimating particle size distribution with dynamic light scattering and/or small X-ray scattering data will be also presented.

2 - Bayesian Hazard Modeling of Heterogeneous Lifetime Data with an Unknown Number of Sub-populations

Mingyang Li, Assistant Professor, University of South Florida,
4202 East Fowler Avenue, Tampa, FL, United States of America,
mingyangli@usf.edu, Jian Liu

Lifetime data collected from reliability tests or field operations often exhibit heterogeneity. To quantify such heterogeneous data with an unknown number of sub-populations, a Bayesian hazard modeling approach is proposed. It features in jointly estimating model parameters and determining the number of sub-populations. Effective and efficient sampling schemes are further developed to comprehensively address the model estimation difficulty when non-conjugate priors involve.

3 - A Semi-markov Random Field Gaussian Process Models for Forecasting in Complex Systems

Zimo Wang, Texas A&M University, 3131 TAMU,
College Station, TX, United States of America,
zimowang@tamu.edu

We introduce a Semi-Markov random field approach to extend Gaussian process models for multi-step forecasting in complex systems with transient behaviors. Experimental studies indicate that forecasting approach can predict the onsets of epilepsy episodes 1 min earlier compared to other contemporary methods tested.

4 - Real-time Monitoring for Advanced Manufacturing Processes using a Novel Greedy Bayesian Method

Kaveh Bastani, Research Assistant, Virginia Tech University,
106 Durham Hall (MC 0118) 1145 Perry Str, Blacksburg, VA,
United States of America, kaveh@vt.edu, Zhenyu Kong

The objective of this work is to realize real-time monitoring of process conditions in advanced manufacturing processes. To achieve this objective we propose an approach invoking the concept of sparse representation for multiple sensor signals, and subsequently, develop a novel greedy Bayesian method (GBM) to approximate the sparse solution. We validate the effectiveness of the proposed approach in real-time monitoring of a fused filament fabrication additive manufacturing process.

74-Room 204A, CC

Reliability I

Contributed Session

Chair: Shufeng LI, University of Houston, Room NT0403, 4401
Wheeler, Houston, TX, 77004, United States of America, sli33@uh.edu

1 - Maintenance Policies for a Deteriorating System Subject to Non-self-announcing Failures

Onur Bakir, Associate Professor, Istanbul kemerburgaz University,
Mahmutbey Dilmenler Caddesi, No:26, Bagcilar, Istanbul, 34217,
Turkey, onur.bakir@kemerburgaz.edu.tr

We evaluate various maintenance policies for systems subject to continuous time Markovian deterioration which may result in non-selfannouncing failures. The decision maker inspects the system periodically at the decision epochs, identifies the current state; and chooses an available action. The objective is to minimize the expected long-run cost rate. We provide a numerical example to analyze the effect of various cost parameters on the optimum inspection period and policy.

2 - Stochastic Modeling and Reliability Analysis of Corroded Pipelines for Inspection Planning

Seyedeh Azadeh Miran, Research Assistant Graduate Student, University of Akron, 302 East Buchtel Avenue, ASEC405, Akron, OH, 44325, United States of America, sm214@zips.uakron.edu, Qindan Huang

Time-dependent reliability analysis of inspected defects is performed using first order reliability method based on two failure modes (small and large leaks). Time-dependent corrosion growth models are considered for the defect depth and length where growth model unknown parameters are determined using Bayesian updating through MCMC. Finally, inspection planning is proposed.

3 - Information Source Selection for Multimode Process Monitoring

Marcelo Bacher, PhD Candidate, Tel Aviv University, Ramat Aviv, Tel Aviv, Israel, mgbacher@post.tau.ac.il, Irad Ben-Gal

We present an SPC framework using Information Theoretic measurements for monitoring multi-mode systems. We aim at directly learning the data dependencies representing the modes without relying on prior information. We assume dependence among features and that the data gathered from multiple sensors generate overlapping clusters that are not necessarily Gaussian-like distributed. Comparative results with real data validate the potential use of the proposed method for monitoring such systems.

4 - Battery Life Estimation Based on Statistical Model Combined with Physical Degradation Behaviors

Shufeng Li, University of Houston, Room NT0403, 4401 Wheeler, Houston, TX, 77004, United States of America, sli33@uh.edu, Qianmei Feng, Yin Shu

Remaining useful life prediction methods have been widely applied for lithium ion batteries in the electronics and automotive industries. Statistical models based on physical degradation behaviors of lithium ion batteries have not been well established. This paper develops a statistical method to model the battery performance degradation that is induced by aging mechanism. The life distribution is estimated and case study shows the effectiveness of the proposed method.

1 - Investigation of the Existence of AFIB Sources in Left Atria of Heart using Intracardiac Electrogram

Sharmin Mithy, Graduate Research Assistant, University of South Florida, 4202 E Fowler Ave, Tampa, FL, 33620, United States of America, sharminmithy@mail.usf.edu

This paper concentrates on a way to investigate the existence of AF sources by analyzing Intracardiac Electrogram. Intracardiac Electrogram has been recorded during catheter ablation surgeries of five patients and can be characterized by identifying different properties; i.e. cycle length, interspike interval distance, amplitude. In this paper different features has been extracted from intracardiac electrogram from different sets of patients and later analyzed to identify different patterns.

2 - A System Dynamics Approach to Study the Barriers to Primary Care Access for Socioeconomically Disadvantaged Women

Fatima Irshaidat, Binghamton University, 25 Narwood St, Johnson City, NY, 13790, United States of America, firshai1@binghamton.edu

Socioeconomically disadvantaged women have more capabilities to visit PCP after Medicaid Expansion. This study evaluates whether Medicaid expansion is actually improving access of care for these women in the poor neighborhoods & identify the actual barriers preventing those women from utilizing primary care. A systems dynamics model is created using Vensim to capture causes behind access barriers to PCP. The case of breast and cervical cancer screenings is specifically studied.

3 - Using Multi-agent-based Simulation to Model Pedestrians Behavior and Interactions

Lindsay Alvarez, Full Professor, Universidad Distrital, Carrera 7 No. 40B - 53 Piso 5, Ingenieria Industrial, Bogota, Colombia, lindsayalvarez@yahoo.com, Martha Centeno, Felipe Pacheco, Andrés Sánchez

We present a methodology to use Multi-Agent Based simulation as a tool to model pedestrians as independently thinking individuals, who move at their own speed, and may or may not abide by spatial restrictions. We have conducted fieldwork in Bogotá, developed a methodology, and built simulation models. Results indicate that these type of simulation models are effective to model pedestrian's behavior, so that it can be included in the design and construction of pedestrian's tunnels and crosswalks.

4 - A Simulation Approach for Trading Natural Gas Futures

Amine Kamali, The University of Oklahoma, 202 W. Boyd St., Room 436, Norman, OK, 73019, United States of America, amine@ou.edu, Hank Grant

This research focuses on developing a simulation framework that models the impact of speed of high-frequency traders trading natural gas futures contracts. Different scenarios are simulated and the data collected are compared to historical data. In this setting, faster traders are more profitable.

5 - The Effect of Self-selection Bias on the Effectiveness of Online Reviews

Bharat Bhole, RIT, 92 Lomb Memorial Drive, Rochester, NY, 14623, United States of America, bharat.bhole@rit.edu, Brid Hanna

It has been shown that online reviews suffer from self-selection bias. We investigate whether this bias adversely affects the effectiveness of online reviews. Effectiveness is measured by the market share of the higher quality product in a model with two products. We show that bias can improve the effectiveness of reviews. Further, in situations where it fails to do so, it is mostly when the bias is extreme to the extent that appears unlikely to be the case in reality.

Supply Chain Closed Loop II

Contributed Session

Chair: Yertai Tanai, Kent State University, Department of Management & Information S, Kent State University, Kent, OH, 44242-0001, United States of America, ytanai@kent.edu

1 - Quality and Information Coordination for False Failure Returns

Eylem Koca, Assistant Professor, Ozyegin University, Nisantepi District, Orman Street, Cekmekoy, Istanbul, 34794, Turkey, eylemkoca@gmail.com

A significant portion of consumer returns are false failures with no defects. We consider a supply chain setting with one manufacturer, who decides on the design quality, and one retailer, who decides on informational efforts, both of which affect the false failure returns, and we study supply chain coordination avenues under various scenarios regarding the re-valuation of such returns.

2 - Optimal Incentive and Production Decisions for an Integrated-forward Reverse Supply Chain

Pankaj Dutta, Associate Professor, IITBombay, SJM School of Management, Powai, Mumbai, 400076, India, pdutta@som.iitb.ac.in, Debabrata Das

This paper proposes an optimization model for an integrated forward-reverse supply chain to determine optimum incentive amount that needs to be offered to consumers on returning back a used product. Further, proposed model decides optimum manufacturing, remanufacturing and disposal quantity so that legislation criterion of minimum collection is fulfilled and overall profit of integrated system is maximized. Necessary conditions for the concavity of the proposed profit function are also derived.

3 - Coordinating Supply Chain for Consumers Returns

Yertai Tanai, Kent State University, Department of Management & Information S, Kent State University, Kent, OH, 44242-0001, United States of America, ytanai@kent.edu, Emmanuel Dechenaux, Alfred Guiffreda, Eddy Patuwo

Given the complex nature of processing returned products in a supply chain, firms have adopted the strategy of outsourcing the returns handling to third party reverse logistics providers (3PRLP). We consider a supply chain design where multiple 3PRLP's compete to process the returns. We formulate Nash equilibrium game among 3PRLP's

Natural Resources

Contributed Session

Chair: Wanshan Zhu, Associate Professor, Tsinghua University, Shunde Building 613,, Depart of Industrial Engineering, Beijing, 100084, China, zhuws@tsinghua.edu.cn

1 - A Model to Assess the Impact of Overemployment and Subsidized Fuel Price on National Oil Companies

Sergio Cabrales, Visiting Professor, Universidad de los Andes, Carrera 53A No 127 -30 apt:1204, Bogota, DC, 0111111, Colombia, s-cabral@uniandes.edu.co, Juan Banavides, Rafael Bautista

National Oil Companies (NOCs) produce 61% of worldwide oil. International Oil Companies (IOCs) maximize the expected net present value of their profits, whereas for NOCs are not necessarily the only objective. Indeed, NOCs' objectives often include non-commercial goals such as employment and fuel subsidies. We develop an optimal control model to estimate the impact of overemployment and fuel subsidies in terms of market value, production, and reinvestment.

2 - Strategic Bidding for a Virtual Power Plant: A Price-taker Robust Optimization Approach

Luis Baringo, Assistant Professor, University of Castilla-La Mancha, E.T.S.I.Industriales, Avda. Camilo Jose Cela s/n, Ciudad Real, 13071, Spain, Luis.Baringo@uclm.es, Morteza Rahimiyan

We consider an energy management system that controls a cluster of price-responsive demands, a wind-power plant and an energy storage facility that are interconnected within a small size electric energy system and that constitute a virtual power plant (VPP). We propose a two-stage robust optimization approach for the strategic bidding of this VPP in the day-ahead and the real-time markets. Uncertainties in wind-power production and market prices are represented through confidence bounds.

3 - Faustmann Revisited and Updated with Modern Operations Research Tools

Gysbert Wessels, Consultant, 3748 Bay Tree Pl, Blacksburg, VA, United States of America, wessels.gys@gmail.com

Faustmann's article published in 1849 remains an important contribution to Forestry Economics and Management. What if Faustmann had access to the current tools of OR/MS? The presentation will show how "Faustmann's Formulae" can be updated and generalized. It will be shown that Faustmann's calculations and the generalized approach give the same results under Faustmann's assumptions. Many of the assumptions can be relaxed, making the generalized approach practical to use in modern forestry.

4 - Stackelberg vs Cournot in a Natural Resource Oligopoly

Luca Colombo, Deakin University, Burwood Campus, 221 Burwood Highway, Melbourne, Australia, luca.colombo@deakin.edu.au, Paola Labrecciosa

In this paper, we compare and contrast feedback Nash and Stackelberg equilibrium strategies in a differential oligopoly game in which production requires exploitation of a common-property renewable resource. We find that the incentives for firms to take the lead are higher the higher the stock of the resource. We also find that the Cournot equilibrium can be more efficient than the Stackelberg equilibrium, both in the short-run and at the stationary equilibrium.

5 - Electricity Capacity Planning with Cross Border Exchange

Wanshan Zhu, Associate Professor, Tsinghua University, Shunde Building 613,, Depart of Industrial Engineering, Beijing, 100084, China, zhuws@tsinghua.edu.cn

This paper studies the impact of cross border maximum exchange capacity on the optimal electricity generation capacity mix. We show that models with exogenous spot prices miss the influence of capacity expansion decisions on the market, and suggests a model where spot prices are endogenous, as a function of demand and available capacity. A case study in France with the EPEX Spot prices is made.

Military Cognitive Analysis, Value based Acquisition and Military Recruiting Prediction Models

Sponsor: Military Applications

Sponsored Session

Chair: Mike Teter, Lt, US Army, 515 Michelson Rd, Monterey, CA, 93940, United States of America, Michael.d.teter6.mil@mail.mil

1 - Predicting Market Depth for Military Recruiting

Jon Alt, Assistant Professor, Naval Postgraduate School, Department of Operations Research, Naval Postgraduate School, Monterey, CA, 93943, United States of America, jkalt@nps.edu, Sam Buttrey

This ongoing research demonstrates the application of statistics and machine learning to identify those geographic areas that are more likely to produce military recruits. It also seeks to compare factors influencing service specific market depth. This comparison may inform the development of a common decision support framework. Practical difficulties in preparing and open source data for this purpose are discussed.

2 - Utilizing Socio-economic Factors to Evaluate Recruiting Potential for a US Army Recruiting Company

Sandra Jackson, US Army, Thayer Hall, West Point, United States of America, jackson.sandra.y@gmail.com, Nedialko Dimitrov, Jon Alt

US Army currently calculates recruiting capacity as a four year weighted average of historical data. We investigate two alternate methods for the same task — multiple linear regression (MLR) and Poisson regression (PR). Regression methods can account for the impact of economic factors on recruiting capacity, whereas weighted average methods do not. Surprisingly, we show that MLR models provide better fits than PR models, even though existing literature largely focuses on PR models.

3 - Military Modification of The Iowa Gambling Task and Wisconsin Card Sorting Task

Cardy Moten, Maj, TRADOC Analysis Center-Monterey, 700 Dyer Road, Room 183, Monterey, CA, 93943, United States of America, cmoten@nps.edu, Quinn Kennedy, Jon Alt, Peter Nesbitt

TRAC-Monterey and the Naval Postgraduate School (NPS) have developed tasks to measure military decision-making performance modeled after the Iowa Gambling and Wisconsin Card Sorting Tasks. These tasks focus on high stakes and uncertain environments particular to military decision making conditions. Thirty-four officers were tested on their levels of cognitive flexibility and reinforcement learning. This presentation will discuss task development, validation, and insights of measured components.

Scheduling III

Contributed Session

Chair: Pravin Tambe, Dr., RCOEM, 49, Parate Nagar, Near H.B.Estate, Sonagaon, Nagpur, MS, 440025, India, tambepp@gmail.com

1 - Hybrid Flow Shop Batch Scheduling Problem with a Bi-Criteria Objective

Rasaratnam Logendran, Professor, Oregon State University, School of Mech, Indust, and Mfg. Engr, 204 Rogers Hall, Corvallis, OR, 97331-6001, United States of America, logendrr@engr.orst.edu, Omid Shahvari

We address a batch scheduling problem in hybrid flow shops, wherein one or more stages have unrelated-parallel machines. The objective is to minimize the weighted sum of total weighted completion time and total weighted tardiness. Job release times and machine availability times are assumed to be dynamic. The performance of search algorithms, based on tabu search, is evaluated by developing a mixed-integer linear programming model in order to find the best algorithm, if any, for this problem.

2 - Flowshop Batch Processing Problem with Different Batches on Machines

Nasser Salmasi, Sharif University of Technology, Department of Industrial Engineering,, Sharif University of Technology, Tehran, Te, 11365, Iran, nsalmasi@sharif.edu, Hossein Nick Zinat Matin, Mohsen Varmazyar

We approach the multi-stage flowshop batch processing problem with minimization of makespan. Each batch on each machine has both the maximum number of jobs in each batch and the batch capacity limitations at the same time. The size of batches on machines can be different. The jobs can be assigned to different batches on different stages. We propose a general mathematical model and a metaheuristic algorithm based on particle swarm optimization (PSO) to solve the problem.

3 - Adjustable Robust Optimization for Handling Uncertainty in Process Scheduling

Nikolaos Lappas, Graduate Student, Carnegie Mellon University, DH3122, 5000 Forbes Avenue, Pittsburgh, PA, 15212, United States of America, nlappas@cmu.edu, Chrysanthos Gounaris

We develop an Adjustable Robust Optimization (ARO) framework to address uncertainty in Process Scheduling. Unlike RO, which results in a here-and-now solution, ARO results in a policy that is a function of parameter realizations. We derive the ARO counterpart, propose suitable decision-dependent uncertainty sets, and describe a cutting-plane-based solution approach. ARO results in considerably less conservative solutions, and unlike RO, can address also instances with zero-wait tasks.

4 - Robust Scheduling of Parallel Machines under Uncertainty

Selçuk Güren, Abdullah Gul University, Dept. of Industrial Engineering, Kayseri, Turkey, selcuk.goren@agu.edu.tr, Seyma Bekli

We consider stochastic scheduling of a set of jobs subject to processing time variability on identical parallel machines subject to random breakdowns. We develop a scenario-based integer-programming model that can handle small-size problems without machine breakdowns. We then propose a heuristic algorithm that can also handle large problems with machine breakdowns. Our computational experiments indicate that the performance of the proposed algorithms is promising.

5 - A Simulated Annealing Approach for Scheduling Jobs on Identical Parallel Machines

Pravin Tambe, Dr., RCOEM, 49, Parate Nagar, Near H.B.Estate, Sonagaon, Nagpur, MS, 440025, India, tambepp@gmail.com, Makarand Kulkarni

This paper presents a scheduling problem on identical parallel machines. A hybrid approach using simulated annealing combined with backward-forward heuristic is used for scheduling. The objective is to minimize the total penalty cost of jobs allocation on all the machines. Both earliness and tardiness penalties are considered. The computational experiment results for different problem sizes have been presented.

Inventory Management for Supply Chains I

Contributed Session

Chair: Alireza Sheikhzadeh, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, Ar, 72701, United States of America, asheikhz@uark.edu

1 - Multi-Period Dynamic Inventory Classification: Models and Applications

Dorothy Liu Yang, University of Missouri - St. Louis, 240 JCPN, One University Blvd, Saint Louis, MO, 63121, United States of America, liuyang@umsl.edu, Haitao Li

This talk presents a multi-period inventory classification model that aims to help company optimize profitability when facing nonstationary, stochastic demand. The benefits of multi-period, dynamic inventory policies over single-period, static inventory policies are examined. We offer managerial insights about how various purchasing and inventory parameters/settings impact the optimal dynamic policy and performance measures.

2 - Service-level Estimation in Inventory System Simulations with Model Uncertainty

Canan Gunes Corlu, Assistant Professor, Boston University, 808 Commonwealth Avenue, Boston, MA, 02215, United States of America, canan@bu.edu, Alp Akcay

We consider the simulation of a stochastic inventory system in the presence of input model uncertainty — the input distributions are unknown and there is only a limited amount of historical input data available for input distribution estimation. We develop an algorithm that estimates the mean service level of the inventory system accounting for the model uncertainty without making any assumptions on the form of the input model(s) that can represent the data on hand.

3 - Service Level and Contract Design with Shelf Space Dependent Demand

Peeyush Mehta, Indian Institute of Management Calcutta, NF3/4, IIM Calcutta, Kolkata, 700104, India, pmehta@iimcal.ac.in, R K Amit

We consider supply chain coordination problem when demand is influenced by the amount of inventory displayed on the shelves. First, we determine an optimal service level for shelf space dependent demand. Next, we design individually rational contracts that coordinate the supply chain when the retailer faces inventory level dependent demand.

4 - Incorporating Order Crossover Information in Service-oriented Base Stock Policy Decisions

Alan Pritchard, University of Maryland, Robert H. Smith Scholl of Business, Van Munching Hall, College Park, MD, 20742, United States of America, apritchard@rhsmith.umd.edu, Dean Chatfield

Order crossover, when orders arrive in a different sequence than the sequence in which they were placed, is a prevalent issue for modern supply chains. We utilize a hybrid discrete/continuous simulation model to investigate multiple methods of including order crossover information in the safety stock decision for an (R,S) inventory system with a service level target. Issues related to effective lead times, the normal approximation, and the appropriate protection period are investigated.

5 - Segmentation Methods for Large-scale Multi-echelon Repairable Parts Provisioning Systems

Alireza Sheikhzadeh, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, Ar, 72701, United States of America, asheikhz@uark.edu, Manuel Rossetti

Large-scale manufactured systems are an extremely crucial part of the infrastructure and worldwide competitiveness. Innovative approaches will significantly reduce the size and complexity of problems through the use of segmentation methods. In this research, grouping SKUs based on a no-backorder stocking policy (NBS) considerably reduced the size of problem with the lowest penalty cost. This procedure represents a unique segmentation model that has not been considered in the literature before.

Chair: Ravichandran Narasimhan, Professor, Indian Institute of Management Ahmedabad, Wing- 02 D, Ahmedabad, Gu, 380015, India, nravi@iimahd.ernet.in

1 - Mobile Technology and Emergency Response

Hongwei Du, Professor, California State University, 25800 Carlos Bee Blvd, Hayward, CA, 94542, United States of America, hongwei.du@csueastbay.edu, Jiming Wu

Emergency situations happen every day that requires response. We explore how mobile technology can be part of an effective strategy to manage emergency situations and the risks posed by natural hazards. This is achieved through mobile applications and technology on an individual and community level by taking advantage of the portability, ease of use, and popularity/prevalence of smartphones and tablets. The role of mobile technology in crises is critically explored in three cases studies.

2 - The Information Societies of India and China: Multivariate and Geospatial Comparison

Avijit Sarkar, Associate Professor, University of Redlands, 1200 E. Colton Avenue, Redlands, CA, 92373, United States of America, avijit_sarkar@redlands.edu, James Pick

We present comparative analysis of the information societies of the provinces of China and the states of India. The digital divide in both nations is analyzed and contrasted using multivariate and geostatistical methods. The roles of social capital and societal openness in fostering technology adoption and diffusion are discussed. Policy recommendations are presented and implications contextualized in relation to findings on telecommunications landscape in both countries.

3 - A Constraint Programming Approach for the Team Orienteering Problem with Time Windows

Ridvan Gedik, Assistant Professor, University of New Haven, 300 Boston Post Rd, West Haven, CT, 06516, United States of America, rgedik@newhaven.edu, Ashlea Milburn, Chase Rainwater, Emre Kirac

We discuss how to formulate and solve the NP-hard team orienteering problem with time windows (TOPTW) in constraint programming (CP) context by using interval variables, global constraints and domain filtering algorithms. The proposed CP model with a customized branching strategy obtains three new best solutions and proves the optimality of the three best-known solutions for the benchmark problem instances.

4 - A Canonical Model to Support the Mid Day Meal Supply Chain

Ravichandran Narasimhan, Professor, Indian Institute of Management Ahmedabad, Wing- 02 D, Ahmedabad, Gu, 380015, India, nravi@iimahd.ernet.in

In the Indian context providing Mid day meal at the primary and secondary schools is increases the enrolment and attendance. Several states having varying degree of success in implementing this. Based on the ground realities we propose a simple model to implement this scheme and discuss the implication to manage it.

Capitalizing on Social Media

Cluster: Social Media Analytics

Invited Session

Chair: Chris Smith, TRAC-MTRY, 28 Lupin Lane, Carmel Valley, CA, 93924, United States of America, cmsmith1@nps.edu

1 - Understanding Users' Switching Among Different Kinds of Social Media

Xiongfei Cao, USTC, Anhui province, Hefei City, Hefei, China, caoxf312@126.com

Investigating users' switching between different kinds of social media is important because it is closely related to the survival of technologies. Based on the push-pull-mooring framework, this study investigates social media users' switching behavior and mechanism. The research contents include: identify the factors affecting users' switching among different kinds of social media; elaborate the mechanism of users' switching decision.

2 - A Hawkes Process Based Dynamic Trip Attraction Model using**Open Location Based Social Network Data**

Wangsu Hu, Rutgers, the State University of New Jersey, CoRE 736, 96 Frelinghuysen Road, Piscataway, NJ, 08854, United States of America, nicholas.hu@rutgers.edu, Peter J. Jin

Location based social network (LBSN) services, such as Foursquare and Geo-tagged Twitter, allow users to "check in" to their arriving places of interests. In the proposed research, the public Foursquare check-in data published on Twitter are used. A Hawkes process based model is proposed to formulate both the actual trip arrival and LBSN checkins through a dynamic sensing and activity state transition model. The model is validated with planning data from the City of Austin Texas.

3 - Social Media and the ISIL Narrative

Rob Schroeder, Naval Postgraduate School, 526 Union St., Monterey, CA, 93940, United States of America, rcschroe@nps.edu, Sean Everton, Daniel Cunningham

The Islamic State of Iraq and Syria (ISIS) has attracted the world's attention and much of its wrath, primarily because of its rapid expansion in Iraq and Syria, its brutal treatment of religious minorities, and its beheadings of hostages from Western countries. At this point, it is unclear whether the group represents a global or a sectarian form of jihadism. Is it similar to al-Qaeda, which seeks to target the far enemy, or is it more sectarian in that it focuses on targeting what it perceives to be the near enemies of Islam? In this paper we address this debate by examining ISIS's online presence on the social media platform, Twitter, which serves as a forum for supporters to post and receive messages, images, videos, and links to websites to and from a wide-audience. The speed at which users can transmit and receive information via Twitter suggests that an analysis of ISIS-related user accounts and the key themes and concepts they disseminate can contribute to a better understanding of the group's overall narrative. We examine ISIS's online presence by extracting from Twitter the semantic networks of its most influential users. We find that a shift may be occurring in the ISIS narrative, from one that focuses on the near enemy to one that focuses on the far enemy. Ironically, this shift may have resulted from the actions of the U.S. and its Western allies.

1 - Asset Management Contracts and Equilibrium Prices

Andrea Buffa, Boston University, Questrom School of Business, Boston, United States of America, buffa@bu.edu, Dimitri Vayanos, Paul Woolley

We study the joint determination of fund managers' contracts and asset prices. Because of agency frictions, investors make managers' fees more sensitive to performance and benchmark performance against a market index. This exacerbates price distortions and raises the volatility of overvalued assets. Because trading against overvaluation is riskier than trading against undervaluation, agency frictions bias the aggregate market upwards, and can generate a negative risk-return relationship.

2 - Matching Capital and Labor

Jules Van Binsbergen, University of Pennsylvania, The Wharton School, Philadelphia, United States of America, julesv@wharton.upenn.edu, Jonathan Berk, Binying Liu

We establish an important role for firms by studying capital reallocation decisions of mutual fund firms. At least 30% of the value mutual fund managers add can be attributed to the firm's role in efficiently allocating capital amongst its fund managers. We find no evidence of a similar effect when a firm hires managers from another firm. We conclude that an important reason why firms exist is the private information that derives from the firm's ability to assess the skill of its employees.

3 - The Systemic Effects of Benchmarking

Gustavo Schwenkler, Assistant Professor, Boston University, Questrom School of Business, 595 Commonwealth Ave, Boston, MA, 02215, United States of America, gas@bu.edu, Diogo Duarte, Keith Lee

We show that pressure to beat a benchmark may induce institutional trading behavior that exposes retail investors to tail risk. In our model, institutions are different from a retail investor because they derive higher utility when their benchmark outperforms. This forces institutions to take on leverage to overinvest in the benchmark. Institutions execute fire sales when the benchmark experiences shocks. This behavior increases volatility, raising the tail risk exposure of the retail investor.

4 - Macroprudential Bank Capital Regulation in a Competitive Financial System

Christian Opp, University of Pennsylvania, The Wharton School, Philadelphia, United States of America, opp@wharton.upenn.edu, Markus Opp, Milton Harris

We develop a tractable general equilibrium model to analyze the effects of macroprudential bank capital regulation in an economy where firms of heterogeneous quality and risk seek financing from competitive banks and public markets. Our analysis provides an exact characterization of economy-wide capital allocation and highlights that tighter capital requirements can cause more banks to engage in value-destroying risk-shifting when banks face external financing frictions.

Risk Management and Financial Regulation

Cluster: Risk Management

Invited Session

Chair: Xianhua Peng, Assistant Professor, Hong Kong University of Science and Technology, Department of Mathematics, Hong Kong, Hong Kong - PRC, maxhpen@ust.hk

1 - The Level of Risk-free Rate in China

Chen Yang, National University of Singapore, Department of Mathematics, Blk S17, 10 Lower Kent Ridge Road, Singapore, 119076, Singapore, yang.chen@u.nus.edu, Min Dai, Steven Kou, Zhenfei Ye

In terms of the dual fund, an innovative structured fund capable of capturing the characteristics of both bond market and equity market, we propose an estimation of the level of China's risk-free rate under the Black-Scholes framework, and semi-model-free bounds based on minimal model specification. The level of estimation is uniformly higher than the commonly used risk-free rate proxies, which confirms the presence of a downward bias in the level of proxies as suggested by empirical studies.

2 - Bonus Caps, Deferrals and Bankers' Risk-taking

Xuchuan Yuan, Risk Management Institute, National University of Singapore, 21 Heng Mui Keng Terrace I3 Building, #04-03, Singapore, Singapore, rmiyuanx@nus.edu.sg, Jussi Keppo, Esa Jokivuolle

We model a banker's future bonuses as a series of call options on profits and show that bonus caps and deferrals reduce risk-taking. Optimal risk-taking depends on the cost of risk-taking. We calibrate the model to US banking data and show that increasing the bonus payment interval has no material impact, whereas capping the bonus to the base salary substantially reduces risk-taking. Our results suggest the bonus cap reduces risk-taking whereas bonus clawbacks in Dodd-Frank Act seem ineffective.

3 - A Dual-curve Market Model for Interest Rate Derivatives

Lixin Wu, Professor, Department of Mathematics, Hong Kong University of Science and Technology, malwu@ust.hk

After the 2007 financial crisis, the differences among the forward rates of various tenors are too significant to ignore, which necessitates multi-curve modeling. We introduce the term structure of "mean-loss rates," and adapt the LIBOR market model to the post-crisis reality of interest-rate markets by jointly modeling a forward-rate curve and a mean-loss rate curve of the same tenor. We then demonstrate how the "reshuffle premium" causes the basis spreads, a belief held by market participants.

Finance Theory and Empirics

Contributed Session

Chair: Wenqing Zhang, Assistant Professor, University of Minnesota Duluth, 1318 Kirby Drive, LSBE, UMD, Duluth, MN, 55812, United States of America, wqzhang@d.umn.edu

1 - Expected Commodity Returns and Pricing Models

Gonzalo Cortazar, Pontificia Universidad Católica de Chile, Vicuña Mackenna 4860, Santiago, Chile, gcortaza@ing.puc.cl, Ivo Kovacevic, Eduardo Schwartz

Commodity pricing models provide true (in addition to risk neutral) distributions which are measured with large errors. To increase reliability risk premium parameters should be obtained from other sources and we show that this can be done without losing any precision in the pricing of futures contracts. We show how the risk premium parameters can be obtained from estimations of expected futures returns and provide alternative procedures for estimating these expected futures returns.

2 - Sequential Global Sourcing Investment Decision Making under Extreme Situations

Wenqing Zhang, Assistant Professor, University of Minnesota Duluth, 1318 Kirby Drive, LSBE, UMD, Duluth, MN, 55812, United States of America, wqzhang@d.umn.edu, Prasad Padmanabhan, Chia-hsing Huang

Uncertainty plays an important role in determining a decision maker's choice when making sequential global sourcing investment decisions. This paper presents evidence that firms hiring adventurous managers may be able to generally reap dividends when faced with negative cash flows (extreme or normal) when the cost ratios are small, the investment horizons are high, and the discount rates are small.

Innovation and Entrepreneurship I

Contributed Session

Chair: Magali Delmas, UCLA, Anderson School of Management, Los Angeles, United States of America, delmas@ioes.ucla.edu

1 - Optimal Product Launch Times for a Small Firm in a Competitive Environment

Jacqueline Ng, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, jacquelineng2018@u.northwestern.edu, Izak Duenyas, Seyed Iravani

We consider the optimal production introduction policy for a small firm that produces a single base product that progresses through a series of product generations over time against a large rival firm. We develop a dynamic programming model to analyze the small firm's new product introduction strategy, and prove the optimality of a threshold policy. We then compare and contrast the optimal policy with the common time-pacing and event-pacing product introduction policies used in practice.

2 - A Case Study - Problem Based Learning Works to Foster the Entrepreneurial Minded Engineer

Don Reimer, College Professor, LTU, 21000 West Ten Mile Road, Southfield, United States of America, dreimer@ltu.edu, Ahad Ali

This abstract focuses tools that have successfully engaged engineering students in actively participating in learning the skills. Through the use of Problem Based Learning (PBL) as an interactive tool, engineering students are engaged. Examples of engineering students engaged in PBL will be used in case studies of a class currently being offered at LTU. The case study – Tires, Tires, Tires Everywhere will be used to demonstrate the use of PBL in the classroom.

3 - The Dynamics of Energy Conservation: Novelty and Framing Effects

Omar I. Asensio, UCLA, Institute of the Environment, Los Angeles, United States of America, omar.asensio@ucla.edu, Magali Delmas

Using a field experiment with high frequency data, we investigate dynamic consumer responses to information-based interventions designed to encourage conservation behavior in the residential electricity sector. We discuss novelty and framing effects as temporal mechanisms resulting from new consumer innovations in appliance level metering and information technologies. Our results on dynamic decision-making are based on 52 million observations at 1/30Hz for 118 residences over 8 months.

E-Business/Commerce I

Contributed Session

Chair: Wei Zhang, Assistant Professor, University of Hong Kong, University of Hong Kong, Hong Kong, China, zhangw.03@gmail.com

1 - How Many Crowd Workers should a Requester Hire on Amazon Mechanical Turk?

Arthur Carvalho, Assistant Professor, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, J Building, Room 35-5th Floor, Rotterdam, NA, 3038BG, Netherlands, carvalho@rsm.nl, Stanko Dimitrov, Kate Larson

We investigate the optimal number of workers a requester should hire on the crowdsourcing platform Amazon Mechanical Turk. In particular, we report the results of three studies involving different tasks and payment schemes. Surprisingly, we find that the optimal number of workers a requester should hire is around 10 to 11, no matter the underlying task and payment scheme. To derive such a result, we employ a principled analysis based on segmented linear regression.

2 - Clickstream Big Data and “Delivery Before Order Making” for Online Retailers

Haoxuan Xu, School of Management, Huazhong University of Science and Technology, 1037 Luoyu Road, Hongshan District, Wuhan, 430074, China, juwan.hsu@gmail.com, Yeming Gong, Wilco Van Den Heuvel, Albert Wagelmans, Jinlong Zhang

Our research is inspired by a leading online retailer using clickstream big data to estimate customer demand and then ship items to customers by a mode of “Delivery Before Order Making” (DBOM) operational mode. Using clickstream data to obtain advance demand information (ADI) in order quantities, we integrate the forecasting with a single-item uncapacitated dynamic lot sizing problem in a rolling-horizon environment. Using the simulated clickstream data, we evaluate the performance of DBOM mode.

3 - Estimating Seasonality of E-commerce Sales

Abhay Jha, Walmart E-Commerce, 850 Cherry, San Bruno, CA, United States of America, abhaykj@gmail.com

The assortment of items in e-commerce includes a lot of items with short life-span; hence the traditional methods of estimating seasonality per item by looking at past years' sales are not applicable here. We will formulate this problem as maximizing the penalized likelihood of a state space model, where we penalize the seasonality to have some plausible properties, and use the semantic information about items to constrain similar items to have similar seasonality.

4 - A Simulation Framework of Consumer-to-Consumer Ecommerce Business Model

Oloruntomi Joleto, University of Central Florida, 4000 Central Florida Blvd, Orlando, FL, 32816, United States of America, Tomi.Joleto@knights.ucf.edu, Luis Rabelo

In the past decade, ecommerce transformed the business models of many companies. This paper proposes a modeling and simulation framework to investigate how the actions of stakeholders in consumer-to-consumer ecommerce affect the system performance as well as the business dynamics of the model. The goal is to provide stakeholders with a decision making tool to assess the viability and performance of the consumer-to-consumer business model.

5 - Higher Prices for Larger Quantities? Non-monotonic Price-quantity Relations in B2b Markets

Wei Zhang, Assistant Professor, University of Hong Kong, University of Hong Kong, Hong Kong, China, zhangw.03@gmail.com

We study a microprocessor company that has a limited capacity and negotiates with each buyer for the price. Our analysis of their data reveals that larger purchases do not always result in bigger discounts, and we show that the non-monotonicity is rooted in how sellers value capacity. The value of residual capacity may be initially convex and then concave. Such a value function is sufficient to ensure a non-monotonic price-quantity relationship.

Optimization Integer Programming II

Contributed Session

Chair: Ioannis Fragkos, Post Doctoral Fellow, HEC Montreal, 3000 Chemin de la Cote-Sainte-Catherine, Montreal, Canada, ioannis.fragkos@cirrelt.ca

1 - A Computational Study of Two-Period Relaxations for Big-Bucket Lot-Sizing Problems

Ioannis Fragkos, Post Doctoral Fellow, HEC Montreal, 3000 Chemin de la Cote-Sainte-Catherine, Montreal, Canada, ioannis.fragkos@cirrelt.ca, Mahdi Doostmohammadi, Kerem Akartunali

Lot-sizing problems form the backbone of most modern production planning systems. Despite the significant advancements in optimization theory and software, most methods used in practice lead to higher-than-optimal costs. In this talk we investigate new classes of inequalities that are based on two-period relaxations. We discuss separation procedures and a branch-and-cut implementation. Computational experiments are promising, and show that the proposed inequalities derive improved lower bounds.

2 - A Small-Order-Polynomial-Sized Linear Program for the Traveling Salesman Problem with Tight Bounds

Mark Karwan, University at Buffalo, 342 Bell Hall, North Campus, Buffalo, NY, 14260, United States of America, mkarwan@buffalo.edu, Moustapha Diaby, Lei Sun

We present a polynomial-sized linear program for the n city TSP drawing upon ‘complex flow’ modeling ideas by the authors who used an $O(n^9) \times O(n^8)$ model. Here we have only $O(n^5)$ variables and $O(n^4)$ constraints. We use an assignment problem-based abstraction of tours not employing the traditional city-to-city variables of the standard TSP formulation. We solved thousands of problems with up to 26 cities using the simplex and barrier methods of CPLEX, consistently obtaining all integer solutions.

3 - A Branch and Bound Approach to the Minimum K-enclosing Ball Problem

Marta Cavaleiro, Rutgers University, 100 Rockefeller Rd., Piscataway, NJ, 08854, United States of America, marta.cavaleiro@rutgers.edu, Farid Alizadeh

The minimum k -enclosing ball problem seeks the ball with smallest radius that contains at least k of n given points. This problem is NP-hard. For the minimum enclosing ball problem (requiring the ball to contain all points) there are both primal and dual iterative algorithms that are very similar to the simplex method for LP. We incorporate these methods into a branch and bound search to solve the minimum k -enclosing ball problem. Some computational results will be presented.

4 - Cutting Circles via Piecewise Milp

Steffen Rebennack, Colorado School of Mines, 1500 Illinois Street, Golden, CO, United States of America, sreberra@mines.edu

In circle cutting, one computes an area minimizing rectangle hosting a given set of circles. These circles are not allowed to overlap. This circle cutting problem is typically formulated as a continuous NLP problem where the aforementioned nonoverlap condition make its feasible region nonconvex. We approximate these nonoverlap conditions and the bilinear objective function with piecewise linear and tailored constructs. In doing so, the resulting formulation becomes a MILP problem.

Optimization Stochastic III

Contributed Session

Chair: Michael Metel, PhD Student, McMaster University, 1280 Main St. West, Hamilton, ON, L8S4M4, Canada, Michael Metel <michaelmetel@gmail.com>

1 - A Bilevel Programming Model: Reduction of Dimension of the Upper Level Problem

Vyacheslav Kalashnikov, Assist. Prof., Tecnologico de Monterrey (ITESM), Campus Monterrey, 2501 Av. Eugenio Garza Sada South, Monterrey, NL, 64849, Mexico, kalash@itesm.mx, Nataliya Kalashnykova

Bilevel stochastic programming is often applied to model interaction between a Natural Gas Shipping Company and a Pipeline Operating Company. The problem is reduced to an also bilevel model but with linear constraints. However, this reduction makes the dimension of the upper level problem an unbearable burden even for the modern PC systems. The aim of this paper is a mathematical formalization of the reduction of the upper level problem's dimension without affecting the optimal solution.

2 - Optimization Problem with a Reference Utility Based Stochastic Dominance Constraint

Jian Hu, Assistant Professor, University of Michigan- Dearborn, 2340 Engineering Complex, 4901 Evergreen Rd, Dearborn, MI, 48128, United States of America, jianhu@umich.edu, Gevorg Stepanyan

We address a novel approach to relax the second order stochastic dominance, which characterizes a norm-based functional perturbation region based on a reference utility function recommended by the decision maker. This approach best represents the decision maker's individual preference. We discuss an optimization problem using this dominance constraint, and provide a solution method using Bernstein polynomial approximation.

3 - Hybrid Robust-stochastic Optimization Approach for Closed-loop Supply Chain Network Design

Esmail Keyvanshokoo, PhD Student, University of Michigan, 1205 Beal Ave., Ann Arbor, MI 48109-2117, Ann Arbor, MI, United States of America, keyvan@umich.edu, Elnaz Kabir, Sarah Ryan

Our contribution is to develop a novel hybrid robust-stochastic programming approach to simultaneously model two different types of uncertainties by including stochastic scenarios for transportation costs and polyhedral uncertainty sets for demands and returns. An accelerated stochastic Benders decomposition is proposed for solving this model. Numerical studies are performed to show the benefits of our approach.

4 - Multi-stage Stochastic Lot Sizing Problem with Nervousness Considerations

Esra Koca, Asst. Prof., Sabanci University, Department of Industrial Engineering, Istanbul, 34956, Turkey, esrakoca@gmail.com, M. Selim Akturk, Hande Yaman

We study the multi-stage stochastic lot sizing problem with controllable processing times and nervousness considerations. In multi-stage stochastic programming, one can obtain different production decisions for different scenarios and this situation may lead to lack of coordination. We formulate the problem by considering this drawback of the approach. Some mixing set structures are observed as relaxations of our formulation, and valid inequalities are developed based on these structures.

5 - Chance Constrained Optimization for Pari-mutuel Horse Race Betting

Michael Metel, PhD Student, McMaster University, 1280 Main St. West, Hamilton, ON, L8S4M4, Canada, Michael Metel, michaelmetel@gmail.com, Kai Huang, Antoine Deza

We consider the time horizon of a gambler in the optimization of horse race betting through the use of chance constrained programming. A novel approach to estimating superfecta payouts is presented using maximum likelihood estimation. A computational substantiation with historical race data found an increase in return of over 10% using the chance constrained model.

Sponsored Session

Chair: Jun-ya Gotoh, Chuo university, 1-13-27 Kasuga, Bunkyo-ku, Tokyo, 112-8551, Japan, jgoto@indsys.chuo-u.ac.jp

1 - Performance Analysis of Stochastic Dynamic Programs via Information Relaxation Duality

David Brown, Duke University Fuqua School of Business, 1 Towerview Rd, Durham, NC, United States of America, dbbrown@duke.edu, Santiago Balseiro

A common technique in the analysis of stochastic systems is the use of “hindsight bounds,” in which decisions are made after uncertainties are revealed. In some applications, however, hindsight bounds may lead to very weak performance guarantees. We show how to obtain stronger guarantees by incorporating penalties that punish the use of additional information, and demonstrate the technique on several applications, including stochastic knapsack problems.

2 - A Unified Classification Algorithm Based on Accelerated Proximal Gradient Methods

Akiko Takeda, The University of Tokyo, 7-3-1 Hongo, Bunkyo-ku, Tokyo, 113-8656, Japan, takeda@mist.i.u-tokyo.ac.jp, Naoki Ito, Kim Chuan Toh

The goal of binary classification is to predict the class of a new sample. It is important to find suitable classification models for given datasets for good prediction performances. We design a unified model for various types of classification models and an efficient algorithm for solving the unified model, which speeds up the process of finding the best model. It is based on an accelerated proximal gradient method and performs better than specialized algorithms for specific models.

3 - Demand Clustering and Inventory Optimization for Fashion Products

Tong Wang, Associate Professor, National University of Singapore, 15 Kent Ridge Drive, Singapore, SG, 119245, Singapore, tong.wang@nus.edu.sg

We study demand estimation and inventory optimization for fashion products. Based on historical product covariates and sales, we construct Bayesian structure model to cluster products that share commonality in covariates and sales pattern. At the beginning of a new season after covariates of new products are observed, they are assigned into the clusters, and their demand distributions are estimated. Inventory decisions are made accordingly. Clustering is updated at the end of the season.

4 - Robust Empirical Optimization is Almost the Same as Mean-variance Optimization

Jun-ya Gotoh, Chuo university, 1-13-27 Kasuga, Bunkyo-ku, Tokyo, 112-8551, Japan, jgoto@indsys.chuo-u.ac.jp, Michael Kim, Andrew Lim

We consider a distributionally robust optimization (DRO) problem in which the decision maker optimizes against a worst-case distribution, where a penalty on ϕ —divergence controls the amount that the alternative can deviate from the nominal. Our main finding is that robust empirical optimization is essentially equivalent to solving an in-sample mean-variance problem, which provides insight into the mechanism by which empirical DRO achieves its “robustness.”

Game Theory IV

Contributed Session

Chair: Anastasia Nikolaeva, PhD Student, University at Buffalo, 342 Bell Hall, Amherst, NY, 14260, United States of America, aanikola@buffalo.edu

1 - Bandwagon Investment Equilibrium of a Preemption Game

Kihyung Kim, Postdoc Research Associate, Purdue University, 315 N. Grant Street, West Lafayette, In, 47907, United States of America, kihyung.kim.1@purdue.edu, Abhijit Deshmukh

Given a first mover's advantage in a competitive market, theoretical research supports the preemption strategy that invests earlier than competitors. However, empirical research shows that the preemption strategy is seldom successful, and simultaneous investments are frequently observed. This research addresses this gap by deriving the bandwagon investment equilibrium that elucidates how a firm's investment entices the competitor's investment.

2 - Contingency Inventory Reservation Across Independent Distributors

Sercan Demir, University of Miami, 1251 Memorial Drive, Department of Industrial Engineering, Coral Gables, FL, 33146, United States of America, s.demir@umiami.edu, Murat Erkoc

We study contingency inventory reservation contracts across a single supplier and multiple buyers. Buyers are distributors operating in independent markets and are subject to adverse events. They enter into contractual agreement with the supplier for carrying contingency inventory. The supplier sets the reservation terms to which the buyers respond with their reservation decisions. We investigate equilibrium reservation policies under varying probabilities and market impacts of disruptions.

3 - Vendor Competition in Remanufacturing

Debabrata Ghosh, Assistant Professor, IIM Calcutta, NAB, K-307, D.H. Road, Joka, Kolkata, WB, 700104, India, debabrata.ghosh@iimcal.ac.in, Sirish Gouda

In this paper we study a case where vendors compete during re-manufacturing for an OEM. While studies have highlighted competition between retailers under product take-back, in several emerging economies third party vendors play an interesting role in re-manufacturing. Using game theoretic set up we study the decisions of the OEM and vendors under re-manufacturing. Our study reveals interesting pricing and re-manufacturing decisions under competition.

4 - Selling Format and Contract Type in Electronic Marketplaces with Product and Retail Competition

Baixun Li, Guangdong University of Finance and Economics, 21 Chisha Road, Guangzhou, Guangzhou, 510320, China, libaixun2002qq@163.com

This paper investigates the choices of selling format and contract type of two supply chains, which compete at both manufacturer and retailer levels. We consider two kinds of selling format: agency selling format and reselling format, and two kinds of contract: wholesale price contract and revenue sharing contract. We show that the equilibrium selling format of the online retailers depend on the contract type, channel power, and competitive intensity at both manufacturer and levels.

5 - Approximating Nash Equilibria in a Two Product Two Firm Oligopoly

Anastasia Nikolaeva, PhD Student, University at Buffalo, 342 Bell Hall, Amherst, NY, 14260, United States of America, aanikola@buffalo.edu, Mark Karwan

We consider an oligopoly industry and the Cournot-Nash model with two firms competing on the basis of quantity. In our application there are two homogeneous products of interest and customers sign a one or joint product supply contract. Existing customers and a set of new customers not currently served are competed for by each firm with a goal of profit maximization. We approximate Nash Equilibria using aspects of Game Theory, Simulation and Integer Programming and present empirical results.

Optimization Network

Contributed Session

Chair: Charles Nicholson, Assistant Professor, University of Oklahoma, 202 W. Boyd St., Room 116-H, Norman, OK, 73071, United States of America, cnicholson@ou.edu

1 - 1 Refueling Location Problem on a Continuous Tree Network

Sang Jin Kweon, Ph. D. Student, The Pennsylvania State University, 232 Leonhard Building, The Pennsylvania State University, University Park, PA, 16802, United States of America, svk5333@psu.edu, Jose A. Ventura, Seong Wook Hwang

In this talk, we consider a location problem for 1-refueling station on a tree network. We aim to locate the station anywhere on the network, including along the edge. Our objective is to locate a 1-refueling station to maximize the total traffic flow covered in round trips. For this, we derive reduction properties regarding the problem size and optimality conditions. Then, we develop an exact algorithm to determine the set of optimal locations for the refueling station.

2 - Near Optimal Design of Wavelength Routed Optical Networks

Prahalad Venkateshan, Associate Professor, Indian Institute of Management, Ahmedabad, Vastrapur, Ahmedabad, India, prahalad@iimahd.ernet.in, Yogesh Agarwal

The problem of designing a wavelength routed optical transport network is considered. Valid inequalities are used to augment traditional network design formulations. The resulting network is optimal for a majority of the problem instances tested and in those cases where it is not, a trial-and-error method finds near-optimal solutions. Computational tests are reported on relatively larger problem sizes than have been reported in literature on the wavelength routing problem.

3 - Metrics of Compactness: The Benefits of a Cluster-first, Route-second Approach to the Min-max K WRPP

Oliver Lum, University of Maryland, 3103 Mathematics Building, University of Maryland, College Park, MD, 20742, United States of America, oliver@math.umd.edu, Bruce Golden, Edward Wasil, Carmine Cerrone

In practice, it is often desirable for the routes of vehicles to exhibit certain properties that are not included in the objective function. Two such properties are compactness and separation. We discuss existing metrics that attempt to capture these traits, propose a new metric that combines these intuitions into a single value, and compare computational results for route-first, and cluster-first heuristics for the Min-Max K Windy Rural Postman.

4 - Optimal Flow Analysis, Prediction and Application

Charles Nicholson, Assistant Professor, University of Oklahoma, 202 W. Boyd St., Room 116-H, Norman, OK, 73071, United States of America, cnicholson@ou.edu, Weili Zhang

The fixed charge network flow problem is a classic NP-hard problem with many applications. To the best of our knowledge, this is the first paper that employs statistical learning technique to analyze the characteristics of optimal solutions. We develop an accurate propensity model based on this analysis to predict which arcs will have positive flow in an optimal solution. This propensity score allows for multiple applications such as identification of critical components in complex networks.

Optimization Robust I

Contributed Session

Chair: Zhi Chen, Department of Decision Sciences, PhD B1-02 Biz2 Building, NUS Business School, Singapore, 117592, Singapore, chenchi@u.nus.edu

1 - Competitive Difference Analysis of One-way Trading with Limited Information

Yingjie Lan, Peking University, Guanghua School of Management, Beijing, 100871, China, ylan@pku.edu.cn, Wei Wang

We consider robust one-way trading with limited information on price as a game. Our analysis finds the best guarantee of difference from the optimal performance. We provide closed-form solution, and reveal for the first time all possible worst case scenarios. Numerical experiments show that our policy is more tolerant of information inaccuracy than Bayesian policies, and can earn higher average revenue than other robust policies while keeping a lower standard deviation.

2 - A Robust Optimization Inventory Model with Uncertain Demand and Lead Time

Mohammad Rahdar, Iowa State University, 133 University Village, Unit F, Ames, IA, 50010, United States of America, rahdar@iastate.edu, Lizhi Wang, Guiping Hu

This study aims to improve the efficiency of a supply chain system by optimizing the ordering strategy in a manufacturing facility with uncertain demand and lead-time. A robust optimization model which has tri-level structure is proposed to explicitly address the uncertainty, and make planning decisions which are robust against all scenarios. We propose an exact algorithm for the tri-level programming model and report the numerical results.

3 - An Optimal Solution to a PCA Based Multi-Response Problem

Nasser Fard, Associate Professor, Northeastern University, 334 Snell Engineering Center, 360 Huntington Avenue, Boston, MA, 02115, United States of America, n.fard@neu.edu, Huyang Xu, Yuanchen Fang

It is shown that each eigenvalue obtained from the application of PCA in multi-response optimization has a set of eigenvectors, and different eigenvectors corresponding to each eigenvalue will lead to different results. A method for determining the optimal eigenvector combination is proposed. These eigenvectors are used to calculate the multi-response performance indices, and then the optimal factor-level combination will be uniquely determined.

4 - Distributionally Robust Optimization with Semi-infinite Ambiguity Sets

Zhi CHEN, Department of Decision Sciences, PhD B1-02 Biz2 Building, NUS Business School, Singapore, 117592, Singapore, chenchi@u.nus.edu, Melvyn Sim, Xu Huan

We investigate semi-infinite ambiguity sets that involve infinite expectation constraints besides moments and support. We study the associated intractable distributionally robust optimization by considering relaxed ambiguity sets with finite constraints. Based on worst-case distribution, we demonstrate an algorithm that tightens the relaxation gradually. We present expressive examples of these ambiguity sets, and show examples where the worst-case distribution can be relatively easily verified.

5 - Robust Optimization for a Location Problem with Codependent Uncertain Constraints

Juan Carlos Espinoza Garcia, ESSEC Business School, Av Bernard Hirsch, CS 50105, Cergy-Pontoise, 95021, France, juancarlo.espinoza@essec.edu, Laurent Alfandari

We consider an uncertain problem where the same parameter is liable to variation in both constraints and objective function. We model this problem under the Gamma-Robustness paradigm adapting the framework to include codependency between the uncertain equations. We apply this model to a location problem with uncertain demands and conduct computational experiments on a housing problem.

1 - Heuristic Search of Good Decisions for Evaluating Soft Constraints in Integer Programs

Steve Kimbrough, University of Pennsylvania, 3730 Walnut Street, Philadelphia, PA, 19104, United States of America, kimbrough@wharton.upenn.edu, Monique Guignard-Spielberg, Frederic Murphy

Parameter sweeping seeks insight into (usually simulation) models by examining a plurality of model results obtained using a number of judiciously chosen parameter settings. We introduce decision sweeping (of optimization models), in which we collect a number of judiciously chosen decisions (feasible and infeasible settings of the decision variables) from the larger space of decisions. We focus on the resulting insights, especially with regard to integer programs with soft constraints.

2 - Ordering Objects: What Heuristic Should We Use?

Michael Hahsler, SMU, P. O. Box 750123, Dallas, TX, 75275, United States of America, mhahsler@lyle.smu.edu

Serialization, i.e., finding a suitable linear order for a set of objects given data and a merit function, is a basic combinatorial optimization problem with applications in modern data analysis. Due to the combinatorial nature of the problem, most practical problems require heuristics. We have implemented over 20 different heuristics and more than 10 merit functions. We will discuss the different methods in this presentation and compare them empirically using datasets from several problem domains.

Chair: Mike Carter, University of Toronto, Mechanical & Industrial Engineering, 5 King's College Rd., Toronto, ON, M5S 3G8, Canada, mike.carter@utoronto.ca

1 - Influence of Surge Capacity Protocols on Hospital Bed Capacity Planning

Carolyn Busby, PhD Candidate, University of Toronto, Mechanical & Industrial Engineering, 5 King's College Rd., Toronto, ON, M5S 3G8, Canada, carolyn.busby@mail.utoronto.ca, Mike Carter

Management of finite hospital resources changes as hospitals near capacity. As such, we need to consider these "surge protocols" in order to accurately model bed capacity needs. Preliminary work is presented on a generalize discrete event simulation that models inpatient bed usage by medical and surgical patients, as well as off-servicing rules and surge protocols (ambulance consideration, early discharge, altered admission rates, cancellation of elective procedures etc.)

2 - Tools to Support Managing Access in the Veterans Health Administration

Renata Konrad, Worcester Polytechnic Institute, Worcester, MA, United States of America, rkonrad@wpi.edu, Sharon Johnson, Bengisu Tulu

Creating access to health services requires balancing supply and demand. A capacity cushion must be maintained, representing extra supply to absorb variability or the result is increased wait time. We describe a tool that links analysis of clinic data with actionable strategies to reduce variability in supply and demand in primary and specialty care clinics in the Veterans Health Administration. The tool is piloted in four clinics and has the potential to improve decisions surrounding access.

3 - Designing Offload Zones to Reduce Offload Delay

Peter Vanberkel, Professor, Dalhousie University, P.O. Box 15000, Halifax, Canada, Peter.VanBerkel@Dal.Ca, Richard Boucherie, Corine Laan, Alix Carter

We examine the offload zone - an area where multiple patients who arrive by ambulance can wait allowing the ambulance crew to return to service immediately. Although a reduction in offload delay was anticipated, it was observed that the offload zone is often at capacity. In this study we investigate why this is the case and use a continuous time Markov chain to evaluate interventions to prevent offload zone congestion.

4 - Analyzing Long-term Care Transition Data with a Multi-state Semi-markov Model

Hambisa Keno, PhD Candidate, Purdue University, School of Industrial Engineering, West Lafayette, IN, United States of America, hkeno@purdue.edu, Nan Kong, Steven Landry, Mark Ward, Wanzhu Tu, Chris Callahan

Capacity reconfiguration between nursing homes and home-and-community-based settings is a challenging decision for long-term care delivery. A good indicator to the capacity requirement in these facilities is length of stay. Semi-Markov models have been used to characterize patient flows in a single care facility. We extend these models to the context of multi-facility care networks. Further, we embed higher-order Markov chains to assess the impact of care pathway on the model fitting.

1 - The Armchair Decision: to Depart Towards the Queue or Not

Ricky Roet-Green, University of Toronto, 37 Zola Gate, Thornhill, L4J9A7, Canada, rgricky@gmail.com, Refael Hassin

Consider a GPS user that inspects the traffic from his armchair at home. Given the

expected delays, would she drive to the service facility? A common assumption in queueing models is that there is no time gap between observing the queue and joining it. We challenge it by allowing the queue to evolve while the customer is on her way. We show that as opposed to intuition, customers who balk when the queue is mid-congested departs towards it when it is highly congested.

2 - From Product Form Queues to Queue Decomposition: The State-dependent Mn/gn/1 Example

Opher Baron, University of Toronto, 105 St. George St, Toronto, ON, Canada, opher.baron@rotman.utoronto.ca, Hossein Abouee Mehrizi

In the analysis of Product Form compatible queueing systems we decomposed them into subsystems that can be analyzed independently of each other. Queueing decomposition (QD) was used to approximate solutions for other queueing networks. We formulate QD and discuss its implementation for exact analysis. We demonstrate QD for many systems focusing on Mn/Gn/1 where arrivals and service times are state dependent and service rates can change at arrivals and departures is analyzed.

3 - Rational Abandonment from Priority Queues: Equilibrium Strategy and Pricing Implications

Vahid Sarhangian, University of Toronto, 105 St. George Street, Toronto, ON, Canada, vahid.sarhangian11@rotman.utoronto.ca, Philipp Afeche

The literature on the economics of queues predominantly focuses on the queue-joining decisions of customers and ignores subsequent abandonment decisions. Such abandonment behavior is particularly important in priority queues, which are quite prevalent in practice. We study the equilibrium joining and abandonment behavior of utility-maximizing customers in the context of an observable two-class priority queue and identify important pricing implications.

1 - ATM Replenishment Scheduling

Yu Zhang, UNC Chapel Hill, B04 Hanes Hall, UNC Campus, Chapel Hill, NC, 27599, United States of America, yuzhang@live.unc.edu, Vidyadhar Kulkarni

We develop an ATM replenishment policy for a bank that operates multiple ATMs with an aim to minimize the cost of stock-outs and replenishments, taking into account the economies of scale involved in replenishing multiple ATMs simultaneously. We present the structure of the optimal strategy that minimizes the long run cost per unit time and study a heuristic policy which is easy to implement.

2 - An Emergency Department Resource Allocation Model for Patients of Deteriorating Health

Mark Lewis, Professor, Cornell University, Rhodes Hall, Ithaca, NY, 14853, United States of America, mark.lewis@cornell.edu, Douglas Down, Carri Chan

We consider the allocation of medical service providers (MSPs) when patients health continues to deteriorate while waiting for service. The decision maker must balance the need to see more severely injured patients with the need to not allow those that are injured to continue to deteriorate. Conditions are provided when to prioritize each patient class.

3 - Robust Performance and Optimization of a Series Queue

Michael Veatch, Gordon College, 255 Grapevine Rd, Dept. of Mathematics, Wenham, MA, 01984, United States of America, Mike.Veatch@gordon.edu

Robust optimization (RO) is conservative, but when Central Limit Theorem uncertainty sets are used in an RO queue, the result is optimistic. We explain why, and propose a correction based on a diffusion model of a queue with general arrival and service times. For a series queue, the method is tractable for performance analysis and for optimal allocation of server capacity.

4 - Service Rate Control of an On/Off Server

Douglas Down, McMaster University, 1280 Main Street West, Hamilton, Canada, downd@mcmaster.ca, Guang Mo, Vincent Maccio

We study a server that may be turned on and off, where there is a delay to turn on the server. In addition, the service rate of the server can be chosen from a finite set. Using a cost function that involves server usage and holding costs, we discuss the following questions. Under what conditions should the server never be turned off? If it is advantageous to turn off the server, when should it be turned off? When the server is on, what speed should be chosen?

Constraint and Mixed Integer Programming

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Louis-Martin Rousseau, CIRRELT Ecole Polytechnique de Montréal, CP 6079 Succ Centre-Ville, Montréal, H3C3A7, Canada, louis-martin.rousseau@polymtl.ca

1 - A Constraint Programming Approach for Solving Convex Quadratically Constrained Problems

Chris Beck, University of Toronto, 5 King's College Rd, University of Toronto, Toronto, On, M5S3G8, Canada, jcb@mie.utoronto.ca, Wen-Yang Ku

Inspired by the geometric reasoning exploited in discrete ellipsoid-based search (DEBS) from the communications literature, we develop a constraint programming (CP) approach to solve problems with convex quadratic constraints. Such constraints appear in numerous applications. We strengthen the key aspects of DEBS and implement them as combination of a global constraint and variable/value ordering heuristics. Preliminary experiments on a variety of benchmark instances show promising results.

2 - Strengthening Convex Relaxations with Bound Tightening for Power Network Optimization

Pascal Van Hentenryck, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, pvanhent@umich.edu, Carleton Coffrin, Hassan Hijazi

Convexification is a fundamental technique in (mixed-integer) nonlinear optimization and many convex relaxations are parametrized by variable bounds, i.e., the tighter the bounds, the stronger the relaxations. This paper studies how bound tightening can improve convex relaxations for power network optimization. It adapts traditional constraint-programming concepts to a relaxation framework and shows how bound tightening can dramatically improve power network optimization.

3 - Improved Constraint Propagation via Lagrangian Decomposition

Andre Augusto Cire, Assistant Professor, University of Toronto Scarborough, 1265 Military Trail, Toronto, ON, M1C 1A4, Canada, acire@utsc.utoronto.ca, David Bergman, Willem-Jan Van Hove

Constraint propagation is inherently restricted to the local information that is available to each propagator. We propose to improve the communication between constraints by encoding them as decision diagrams and applying a Lagrangian Decomposition scheme, where penalty costs are incurred when the variable assignments in each constraint do not correspond to one another. We show that propagating Lagrangian cost information can help improve the quality of bounds as well as the solution time.

4 - General Bounding Mechanism for Constraint Programs

Louis-Martin Rousseau, CIRRELT Ecole Polytechnique de Montréal, CP 6079 Succ Centre-Ville, Montréal, H3C3A7, Canada, louis-martin.rousseau@polymtl.ca, Claude-guy Quimper, Hoang Minh Ha

This paper presents an approach based on ideas from Lagrangian decomposition (LD) that establishes a general bounding scheme for any CP. We provide an implementation for optimization problems that can be formulated with knapsack and regular constraints, and we give comparisons with pure CP approaches.

Project Management I

Contributed Session

Chair: Ted Klastorin, Professor, University of Washington, Foster School of Business, Box 353226, Seattle, WA, 98195-3226, United States of America, tedk@u.washington.edu

1 - Project Management for IT-driven Development of Disadvantaged Communities in the Developing World

Devendra Potnis, Assistant Professor, University of Tennessee at Knoxville, 1345 Circle Park Drive, Communications Bldg., Suite 451, Knoxville, TN, 37996, United States of America, dpotnis@utk.edu

Inability of researchers to collect rich data from disadvantaged communities leads to the failure of the projects aiming to develop information systems for the development of disadvantaged communities. This study demonstrates the specific ways in which researchers can contextualize project management principles to address data collection barriers by managing scope, time, cost, human resources, quality, communications, and risks related to "IT for development projects" in the developing world.

2 - On Coordinating Contracts in Decentralized Stochastic Projects

Ted Klastorin, Professor, University of Washington, Foster School of Business, Box 353226, Seattle, WA, 98195-3226, United States of America, tedk@u.washington.edu, Tony Chen, Michael Wagner

We study a decentralized project where a client organization contracts individual tasks to independent subcontractors. We show that a simple linear incentive contract coordinates the project while maximizing the expected project profit and minimizing two risk measures. We show how this contract can be implemented in both bidding and auction environments.

3 - Stochastic Resource-constrained Project Scheduling using Approximate Dynamic Programming

Haitao Li, Associate Professor, University of Missouri - St. Louis, 229 ESH, St. Louis, MO, 63121, United States of America, lihait@umsl.edu, Keith Womer

We present an effective and efficient approximate dynamic programming (ADP) algorithm for the well-known stochastic resource-constrained project scheduling problems. Our approach features a hybrid ADP framework that integrates both the rollout look-ahead policy and the look-back policy via lookup table to enhance solution performance.

4 - Resource Allocation Patterns in a Multi-project Portfolio of Engineering Projects

Vishwanath Hegde, California State University East Bay, 25800 Carlos Bee Blvd, Hayward, CA, 94542, United States of America, vish.hegde@csueastbay.edu, Zinovy Radovilsky

Using historic resource loading data in a multi-project setting, we show that resource distribution patterns can be captured by parametric regression models, which can forecast resource distribution during project lifetime using project due date and attributes. Forecast based on historical data instead of priory assumption can improve the accuracy of resource planning. This macro estimation approach can be deployed easily by project portfolio managers.

Multicriteria Decision Making I

Contributed Session

Chair: Sune Lauth Gadegaard, PhD fellow, Department of Economics and Business, Aarhus University, Fuglesangs Allé 4, bygning 2622, lokale 315a, Aarhus V, 8210, Denmark, sgadegaard@econ.au.dk

1 - A Multi-Objective Decision Making Model based on Uncertain Preference Sequence Information

Xiao Liu, Mr., Huazhong University of Science and Technology, No. 1037, Road Luoyu, Wuhan, 430074, China, liu_xiao@hust.edu.cn, Huimin Ma

In this paper, we put forward a multi-objective decision making model for two-sided matching based on uncertain preference sequence information. We first design a mechanism to get preference ordinal value in uncertain sequence. Then multiple optimal objectives on two-sided matching make up a mixed 0-1 integer linear programming model. At last comparing with the typical two-sided matching optimization approaches, we discuss their characteristics and performance in different evolution criteria.

2 - Preferences Modeling in Goal Programming Model through Satisfaction Functions

Belaid Aouni, Associate Dean, Qatar University, College of Business and Economics, P.O. Box 2713, Doha, Qatar, belaid.aouni@qu.edu.qa

The concept of Satisfaction Functions was developed by Martel and Aouni in 1991 to explicitly integrate the Decision-Maker's preferences within the Goal Programming Model. Through this concept several criticism of the Goal Programming model were addressed. This concept has been widely applied to different Goal Programming variants and utilized in solving several application cases. The aim of this paper is to present an analysis of different applications of this concept with a guideline.

3 - Balancing Faculty and Student Preferences in the Assignment of Students to Groups

Richard Forrester, Associate Professor Of Mathematics, Dickinson College, College and Louthier Streets, Carlisle, PA, 17013, United States of America, forrestr@dickinson.edu, Kevin Hutson

We develop a practical approach for assigning students to groups where the goal is to create diversity within the groups while considering the preferences of the students. A motivating application is the assignment of students to seminars. Faculty want seminars that are balanced with regards to gender and ethnicity, while students want to be assigned to one of their higher ranked seminars. Our model is a multi-objective convex quadratic program that can be solved using a standard solver.

4 - P-center and P-dispersion Problems: A Bi-criteria Analysis

Golbarg Kazemi Tutunchi, North Carolina State University,
1916 Trexler Ct, Raleigh, NC, 27606, United States of America,
gkazemi@ncsu.edu, Yahya Fathi

We consider the p-center and the p-dispersion problems in the context of a bi-criteria location analysis. We discuss a mathematical programming approach to obtain a non-dominated point with respect to these two objectives, and an exact method to obtain the corresponding non-dominated frontier. Through a computational experiment we demonstrate the effectiveness of this approach for different instances of the problem.

5 - A Cut and Branch Approach for a Class of Bi-Objective Combinatorial Optimization Problems

Sune Lauth Gadegaard, PhD fellow, Department of Economics and Business, Aarhus University, Fuglesangs Allé 4, Bygning 2622, lokale 315a, Aarhus V, 8210, Denmark,
sgadegaard@econ.au.dk, Matthias Ehrgott

In this talk we discuss a cut and branch approach for bi-objective optimization problems with integer outcome vectors. The approach improves the LP-relaxation by adding cuts at each extreme point of the efficient frontier of the LP-relaxation. After improving the LP-relaxation, we propose a branch and bound algorithm which alternately branches in objective space and in decision space. Experimental results for the single source capacitated facility location problem is reported.

Chair: Yasaman Kazemi, North Dakota State University, NDSU Dept. 2880, P.O. Box 6050, Fargo, ND, 58108, United States of America,
yasaman.kazemi@ndsu.edu

1 - Multistage Stochastic Programming under Endogenous and Exogenous Uncertainties

Robert M. Apap, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America,
rapap@andrew.cmu.edu, Ignacio E. Grossmann

We address the modeling and solution of mixed-integer linear multistage stochastic programming problems involving endogenous and exogenous uncertain parameters. We propose a composite scenario tree that contains both types of parameters. We then present new theoretical model-reduction properties to drastically reduce the number of non-anticipativity constraints. Lagrangean decomposition and a sequential scenario decomposition heuristic are used to solve large-scale instances.

2 - Stochastic Optimization of Downstream Petroleum Supply Chain under Uncertainties

Yasaman Kazemi, North Dakota State University, NDSU Dept. 2880, P.O. Box 6050, Fargo, ND, 58108, United States of America,
yasaman.kazemi@ndsu.edu, Joseph Szmerekovsky

An integrated multi-product multi-echelon and multi-mode supply chain design is studied in the downstream petroleum supply chain under the risk of facility disruptions. Two-stage stochastic model is proposed to minimize the expected total costs by optimizing the strategic and tactical decisions and selecting appropriate mitigation strategies. In addition, Geographic Information System (GIS) is used to locate facilities, obtain realistic transportation data, and to visualize the process.

3 - Risk-averse Wind Power Investment through Unified Stochastic and Robust Optimization

Kun Zhao, Department of Industrial and Systems Engineering
The University of Florida, FL, United States of America,
zhaokunzk@ufl.edu, Yongpei Guan

A unified stochastic and robust optimization approach is proposed for the wind power investment problems. Two models are developed: a short-term risk-averse wind power investment problem for market participants, and a long-term simultaneous wind power and transmission investment problem for vertically integrated utilities. By reformulation, tractable formulations can be obtained and solved in finite time. Computational results are shown for the effectiveness of our proposed model and solution approaches.

1 - Commercial Time Management Applications in the Media Industry

J. Antonio Carbajal, Sr Operations Research Analyst, Turner
Broadcasting System, Inc., 1050 Techwood Dr., Atlanta, GA,
United States of America, Antonio.Carbajal@turner.com,
W. Chaar

Advertisement-based networks face the challenge of optimally allocating their commercial time capacity to meet audience levels guaranteed to their advertisers. This presentation introduces two systems that support this objective: 1) A spot scheduling engine that maximizes deal delivery while honoring several placement constraints and 2) A make-goods allocation engine that maximizes the liability inventory value and meets advertiser requirements of selling title mix and weekly unit distribution.

2 - Competitive Audience Estimation

W. Chaar, Analytics, Data & Decision Sciences, VP, 106 N Denton Rd, 210, Dallas, TX, 75019, United States of America,
wscemail2002@yahoo.com, J. Antonio Carbajal, Peter Williams

A consumer choice modeling approach is developed and used to model audience behavior across competing media contents. The methodology demonstrates the capability of the approach to generate accurate predictive results of audiences.

3 - Television Programming Optimization in the 24-hour Cable Network Environment

Peter Williams, Sr. Operations Research Analyst, Turner
Broadcasting System, Inc., 1050 Techwood Dr., Atlanta, GA,
30308, United States of America, peter.williams@turner.com,
W. Chaar, J. Antonio Carbajal

A cable network programmer's main objective is to create program schedules that attract viewers. The mix of available programs and various scheduling constraints introduce complexity to organizing a 24-hour program schedule. With Nielsen data, the authors develop a model to predict ratings using features of a program schedule. Using this model, TV program scheduling is formulated as an optimization problem with the objective of maximizing ratings given program airtime constraints.

1 - Cooperate to Dominate?: Empirical Analysis of Cooperation Decisions on Technological Innovation

Ashish Kumar Jha, Doctoral Student, Indian Institute of
Management Calcutta, Diamond Harbor Road, Joka, Kolkata,
WB, 700104, India, ashishkj11@iimcal.ac.in, Indranil Bose

We analyze the importance of cooperation factors and cooperation partners for product and process innovation for Chinese firms. We also test the relationship between product and process innovation which leads to confirmation of our hypothesis that continuous process innovation has a rub off effect on product innovation and product innovation increases but vice versa is not true. We arrive at the conclusions based on analysis of innovation data of over 900 Chinese firms.

2 - Commercial Companies' Open Source Strategies – When Should Competitive Companies Support the Same Operation

Ying Liu, Xi'an Jiaotong University, No.28 Xianning Road,
Beilin District, Xi'an, China, liuyingleyna@stu.xjtu.edu.cn

Nowadays many firms have been involved with open source software through various ways, such as contributing code and providing support to open source community. They do this for profit, mostly through complementary product or service. How much effort should they put into open source project and does their competitor's contribution affect their behavior? How would they design additive product? Does free-riding problem really hurt and which kind of license can mitigate it?

3 - The Impact of Digital Natives on B2B Purchasing Decisions

Haris Krijestorac, PhD Student, Information Systems, University of Texas at Austin, 3106 Speedway, Apt. B203, Austin, Tx, 78705, United States of America, haris.krijestorac@utexas.edu

Our study seeks to better understand how businesses buys from businesses in a marketplace with increasingly digitally oriented decision makers. We analyze how 'Digital Natives' and 'Digital Immigrants' differ when influencing purchasing decisions in a business-to-business (B2B) context. To this end, we are surveying purchase decision makers at B2B companies. The results of our survey can help B2B companies better understand their target market, and refine their approach to marketing and sales.

4 - Improving The Persuasive Effectiveness of Anti-piracy Educational Campaign Messages

Bong Keun Jeong, Assistant Professor, Metropolitan State University of Denver, Campus Box 45, P.O. Box 173362, Denver, CO, 80217, United States of America, bjeong@msudenver.edu, Tom Yoon

Prior literature suggests that anti-piracy educational campaign is an effective way to dissuade users from downloading illegal contents. However, most comments and opinions on public campaigns are against what they seek to achieve. The objective of this study is to explore ways to improve the effectiveness of anti-piracy campaigns. We examine the impact of message frame, issue involvement, risk perception, and message evidence on the persuasive effectiveness of anti-piracy campaign messages.

5 - Collective Innovation in 3D Printing: Novelty, Reuse and Their Interplay

Harris Kyriakou, Stevens Institute of Technology, 1 Castle Point on Hudson, School of Business 642, Hoboken, NJ, 07030, United States of America, ckyriako@stevens.edu, Jeffrey V. Nickerson

We present an empirical fitness landscape of open hardware designs and examine how (i) digital artifact reuse, (ii) novelty and (iii) their interaction affect the success of open innovation endeavors. We use mixed research methods to draw insights about how members of open innovation communities build upon preexisting work and collaborate to create something new. A theory of search in the design space is used to explain how these seemingly contradicting forces affect innovation.

Data-driven Operations Management of Energy Systems

Sponsor: Data Mining

Sponsored Session

Chair: Adrian Albert, Senior Data Scientist, C3 Energy, 1300 Seaport Blvd, Suite 500, Redwood City, CA, 94063, United States of America, adrian.albert@c3energy.com

1 - Data-Driven Structural Health Monitoring of Large-Scale Power Grids

Adrian Albert, Senior Data Scientist, C3 Energy, 1300 Seaport Blvd, Suite 500, Redwood City, CA, 94063, United States of America, adrian.albert@c3energy.com

Physical asset failure on power grids leads to costly loss-of-service. In the past, energy utilities have only performed maintenance retroactively. Yet new sensing and data processing allow for a near real-time picture of network state. However in practice the sensors used to detect faults often malfunction. Here we describe a system for predicting faults on certain asset types. We also develop a model for optimizing sensor replacement as to ensure desired operation profiles.

2 - Simulating Annual Variation in Load, Wind, and Solar by Representative Hour Selection

John Bistline, Technical Lead And Project Manager, Electric Power Research Institute, 3420 Hillview Avenue, Palo Alto, CA, 94305, United States of America, jbistline@epri.com

The spatial and temporal variability of renewables have important economic implications for investment and system operation. This talk describes a method for selecting representative hours to preserve key distributional requirements for regional load, wind, and solar time series with a two orders of magnitude reduction in dimensionality. We discuss the implementation of this procedure in the US-REGEN model and compare impacts on energy system decisions with more common approaches.

3 - C3 Cyberphysics: An Operating System for the Smart Grid

Mehdi Massoumy, Senior Data Scientist, C3 Energy, 1300 Seaport Blvd, Suite 500, Redwood City, CA, 94063, United States of America, mehdi.maasoumy@c3energy.com

We propose an operating system that aggregates data from disparate data sources across the smart grid value chain, applies analytics on the data, and makes

optimal decisions for the operation of the system. The proposed operating system in real-time analyzes the requirements of the supply side, and requirements of the demand and performs optimal operation of the system while taking into account the constraints of all the components of the grid.

4 - Data-Driven Management of Large, Distributed Energy Systems – The Case of Residential Solar Networks

Amir Kavousian, Data Scientist, Sunrun Inc., 747 Anderson St, San Francisco, CA, 94110, United States of America, amirk@alummi.stanford.edu

This talk presents the data-driven operation of one of the largest residential solar fleets in the US. I demonstrate how advanced statistical methods are deployed to proactively identify operational issues and their root causes. The data-driven insights are fed back into operations, customer relations management, sales, marketing, product, and design teams. In particular, I explain a novel method to estimate the long-term, gradual decrease in solar systems productivity, known as degradation.

Data Mining Methodology

Contributed Session

Chair: Xuelei Ni, Associate Professor, Kennesaw State University, 365 Cobb Ave, Suite 209, MD# 1601, Kennesaw, GA, 30144, United States of America, xni2@kennesaw.edu

1 - Multivariate Statistical Analysis in NPD: Customization of a Sustainable Product

Istefani Paula, Professor, UFRGS, Osvaldo Aranha street 99, Porto Alegre, 90035190, Brazil, istefani@producao.ufrgs.br, Manoel Silveira, Angela Marx, Ana Facchini, Márcia Elisa Echeveste

The aim of this poster is to present an approach to identify clusters of consumers using Chi squared Automatic Interaction Detector. Based on the clusters formed it is possible to find different segments and to associate requirements demanded by them what allows the customization by means of product derivation. The method contributes to the Requirements Management area illustrated in the development of an eco friendly household cleaning product.

2 - Change Detection using Local Amplitude and Phase Synchronization in Complex Dynamical Systems

Ashif Sikandar Iquebal, Texas A and M University, 4501 College Main St, Apt. 1002, Bryan, TX, 77801, United States of America, ashif_22@tamu.edu, Satish Bukkapatnam

We propose a novel technique to detect changes in dynamical systems using local phase and amplitude synchronization among its constituent signals, generated using a non-parametric time scale decomposition method. We identify a set of components that is likely to capture the information about dynamical changes of interest using a maximum mutual agreement concept. Finally, a statistic is defined that can be employed to detect changes in complex systems where other methods fail.

3 - Between-Participants' Discourse Bias in Comments Classification: Adjusting Tf-idf

Inbal Yahav, Lecturer, Bar Ilan Business School, Bar Ilan University, Ramat Gan, Is, 52900, Israel, inbal.yahav@biu.ac.il, David Schwartz

Text mining has gained great momentum in recent years. A leading research branch in this regard is the field of comment classification. An essential pre-step in comment classification is words processing, commonly achieved by using the tf-idf formula. This work reveals, analyses and correct the bias introduced by between-participants' discourse to tf-idf. We show that ignoring this bias can manifest in a non-robust method at best, and can lead to an entirely wrong conclusion at worst.

4 - High-Dimensional Semi-Supervised Learning via a Fusion-Refinement Procedure

Xuelei Ni, Associate Professor, Kennesaw State University, 365 Cobb Ave, Suite 209, MD# 1601, Kennesaw, GA, 30144, United States of America, xni2@kennesaw.edu, Xiaoming Huo, Zhikun Lei, Renfu Li

This paper develops a sufficient dimension reduction (SDR) approach for the high-dimensional semi-supervised learning (SSL) problem. We first modify the fusion-refinement procedure, an SDR technique, to extract the essential features for a lower-dimensional representation, then apply an SSL algorithm in the lower-dimensional feature space to tackle the SSL problem. Numerical experiments demonstrated the effectiveness of the new technique.

1 - Improving Outpatient Scheduling through Patient Complexity and Integer Programming

Eva Lee, Georgia Institute of Technology, eva.lee@gatech.edu,
Prashant Tailor, ptailor3@gatech.edu

This work is joint with Emory Brain Center. We develop a clinical tool that classifies and schedules patients based off a patient complexity metric. The goal is to maximize the number of patients seen and increase providers and patient satisfaction. A classification model is first used to predict patient complexity, severity and type of follow-up appointment. This information is then used within the MIP scheduling model.

2 - Classifying Heterogeneous Tumor Subtypes via Matrix Factorization and Mixed-integer Programming

Andrew Trapp, Assistant Professor, Worcester Polytechnic Institute, 100 Institute Rd., Worcester, MA, 01609, United States of America, atrapp@wpi.edu, Patrick Flaherty

We consider tumor subtype classification via regularized mixed-membership matrix factorization, where one factor matrix has a limited number of non-zero entries, and the other has simplex constraints. This provides a mixed-membership representation for each column of the original matrix with sparse mixing components. We transform the original and NP-hard biconvex optimization problem into a mixed-integer linear program, and discuss exact and approximate solution approaches.

3 - Prediction of Operating Room End Time using Regression Modeling

Robert Allen, Clemson University, 130 Freeman Hall, Clemson, SC, United States of America, rallen3@g.clemson.edu,
Kevin Taaffe

The decision to let staff go home or bring more staff in depends on the ability of the nurse manager to predict when certain rooms will be finished for the day. We explore several different methods of enhancing the nurse's predictive capability by using hospital process flow data to build several models aimed at predicting the OR end time. We compare varying predictive models such as a simple offset and regression modeling to better predict the room end offsets as they occur during the day.

Joint Session HAS/Analytics: Unleashing the Potential of Big Data using Visualization in Health Care Delivery

Sponsor: Health Applications

Sponsored Session

Chair: Mustafa Ozkaynak, Assistant Professor, University of Colorado, 13120 E 19th Ave, Aurora, CO, 80045, United States of America, mustafa.ozkaynak@ucdenver.edu

1 - Understanding Adherence and Prescription Patterns using Large Scale Claims Data

Margret Bjarnadottir, Assistant Professor of Management Science and Statistics, Robert H. Smith School of Business, University of Maryland, 4324 Van Munching Hall, College Park, MD, 20742, United States of America, margret@rhsmith.umd.edu,
Sana Malik, Catherine Plaisant, Tanisha Gooden,
Eberechukwu Onukwughu

Traditionally, studies have measured medication adherence using summary statistics. However, advanced computing capabilities and novel visual analytics tools now allow us to move beyond the traditional reporting of "average adherence" to analyze longitudinal adherence patterns. Utilizing EventFlow, a novel discrete event sequence visualization software, we investigate patterns of prescription fills and illustrate the use of visual analytics tools in summarizing large scale claims data.

2 - Visualizing Differences in Patient Use of an EHR Patient Portal Informed by Clickstream Data

Sharon Johnson, Associate Professor, Worcester Polytechnic Institute, Foisie School of Business, 100 Institute Road, Worcester, MA, 01609, United States of America, sharon@wpi.edu,
Farhan Mushtaq, Bengisu Tulu, Diane Strong, John Trudel,
Lawrence Garber

In this paper, we explore patient usage behavior of a patient portal by analyzing patterns of use in clickstream data combined with data on demographics and health system utilization. Directed and undirected mining techniques were used to explore the data and to visualize specific patterns. This type of analysis can be used to improve processes for engaging patients through a patient portal, as well as to enhance the portal interface to support different user needs.

3 - Visualization of Care Delivery to Asthma Patients in Pediatric Emergency Departments

Mustafa Ozkaynak, Assistant Professor, University of Colorado, 13120 E 19th Ave, Aurora, CO, 80045, United States of America, mustafa.ozkaynak@ucdenver.edu, Marion Sills

We used Eventflow (an interactive visualization tool) to examine the temporal relationship between care delivery activities for asthma patients in an academic pediatric emergency department and its four satellite clinics. Time-stamped event logs from Electronic Health Records were processed and workflow patterns in each of the five settings for different acuity level and arrival mode were highlighted. Findings can inform systematic organizational interventions that will improve quality of care.

4 - Healthcare Process Discovery and Visualization

Rahul Basole, Associate Professor, Georgia Institute of Technology, 85 Fifth Street NW, Atlanta, GA, 30332, United States of America, basole@gatech.edu, Mayank Gupta, Mark Braunstein, Polo Chau, Hyunwoo Park, Robert Pienta, Brian Kahng, Vikas Kumar, Nicoleta Serban, Michael Thompson

Healthcare processes are complex activities that span organizational, spatial, and temporal boundaries. Systemic insights are consequently difficult to achieve. Our research develops a data-driven methodology, fusing systems modeling, data mining, and visualization, to identify, describe, and visualize healthcare processes. We illustrate our methodology with a case study in pediatric healthcare.

Global Issues I

Contributed Session

Chair: Satish Nargundkar, Associate Professor, Georgia State University, 35 Broad St., Suite 827, Atlanta, GA, 30302, United States of America, snargundkar@gmail.com

1 - Creative Destruction through Online Education:

What Industry and Students Can Teach Academics

Andrei Villarroel, Professor, Swiss Entrepreneurship Institute, 4 Chemin du Musee, Fribourg, Switzerland, andreiv@mit.edu

Our research spans 54 countries, 44 industries, unveiling the value of a new generation of online education organizations from HEI professors, industry practitioners, and current students. Amongst respondents with first-hand experience with MOOC education, they find it superior to traditional education in 14 out of 15 dimensions long-believed better served by the traditional campus-based education model.

2 - Orientation Determination of Hotel Buildings using 3-d GIS for Maximum Rental Revenue

Young-ji Byon, Assistant Professor, Khalifa University, Al Saada St. and Muroor Rd., Abu Dhabi, 127788, United Arab Emirates, youngji.byon@kustar.ac.ae, Joonsang Baek, Chung-suk Cho

Hotel room rates are strongly related to the quality of scenery from the rooms. In Dubai and Abu Dhabi, great number of new hotel constructions are being planned. By utilizing the 3-D elevation model in GIS, it is possible to quantifiably determine the optimal direction of the hotel buildings before the constructions begin, that would maximize the scenic views of the hotels and hence also the room rental revenue.

3 - Healthcare Analytics Data and Insights on Patient Satisfaction

Satish Nargundkar, Associate Professor, Georgia State University, 35 Broad St., Suite 827, Atlanta, GA, 30302, United States of America, snargundkar@gmail.com, Subhashish Samaddar

The lack of patient satisfaction data across the hospital system limits the ability of researchers to investigate the customer service elements of the patient experience. In this paper we collect and organize hospital-level patient satisfaction data over a six year period from multiple websites, and make it available to the research community. We identify research opportunities in healthcare quality analytics. We analyze the data to offer some insights on patient satisfaction across the U.S.

Modeling Disease Transmissions Using Contact Networks

Sponsor: Public Sector OR

Sponsored Session

Chair: Chaitra Gopalappa, University of Massachusetts, 160 Governors Drive, University of Massachusetts, Amherst, MA, 01003, United States of America, chaitrag@umass.edu

1 - Understanding Feedback Between Behavioral Interventions and Disease Evolution

Kaja Abbas, Assistant Professor, Virginia Tech, Dept. of Vet Med, Blacksburg VA, United States of America, kaja.abbas@vt.edu,
Achla Marathe, Samarth Swarup, Achla Marathe,
Samarth Swarup

Disease evolution and behavioral responses to outbreaks are interrelated through a complicated feedback process. Just like the disease, individuals' perceptions and behaviors continuously evolve resulting in self-guided behavioral adaptations. Some of these adaptations dynamically change the social contact network, which in turn affects the opportunities for transmission of the disease. This research will describe the computational methods that account for these feedback.

2 - Spread on Dynamic Networks: Calibration and Forward Reachable Sets

Benjamin Armbruster, Northwestern University, 2514 Sheridan Rd, Evanston, IL, United States of America, armbrusterb@gmail.com

We discuss various topics about spread on networks including (1) calibrating the network dynamics of a detailed agent-based model of HIV spread and (2) the notion of a forward reachable set, an extension of connectivity or reach to dynamic networks, specifically, the set of all nodes that could have been infected/reached in a certain time. We derive simple analytic results on its growth.

3 - Network Modeling of HIV

Chaitra Gopalappa, University of Massachusetts, 160 Governors Drive, University of Massachusetts, Amherst, MA, 01003, United States of America, chaitrag@umass.edu

Very few models in the literature on HIV consider partnership networks, specifically partnership concurrency, for simulating transmissions. We evaluate the differences in estimated new infections with and without inclusion of concurrency by modeling sexual behavior among the different risk groups in the US.

4 - Impact of a Potential Human-to-Human Transmittable H7N9 Pandemic Outbreak in the U.S.

Walter Silva Sotillo, PhD Student, University of South Florida and Pontificia Universidad Catolica del Peru, 4202 E. Fowler Ave, Av. Universitaria 1801, Lima Peru, Tampa, FL, 33620, United States of America, silvasotillo@mail.usf.edu, Tapas K. Das

From March 2013 until March 2015, WHO reported more than 640 cases (with 35% fatality) of H7N9 flu, most from the mainland of China. There are some cases reported on February 2015 that cannot be excluded from a potential human-to-human transmission scenario. We use data from recent reports and an Agent-based simulation model to predict a potential impact of H7N9 pandemic outbreak in the U.S.

Health Care Strategy and Policy I

Contributed Session

Chair: Jie Song, Peking University, Room 512, Fangzheng Building, Beijing, China, songjie@coe.pku.edu.cn

1 - A Manufacturer's View of the United States Healthcare System

Kurt Masten, Drexel University, Gerri C Lebow Hall, 3220 Market Street, Philadelphia, PA, 19104, United States of America, kam478@drexel.edu

The traditional and idealistic vision of a doctor making a house call to a sick patient is not representative of how the process actually works. This research takes a novel approach to modeling the healthcare system from a parts manufacturing perspective that questions the typical assumptions of healthcare as a service and the patient as the customer. Potential improvements are considered based on JIT, lean, and other established manufacturing practices.

2 - Feedback of Standardized Clinical Process on Patient Satisfaction

Yunsik Choi, PhD Candidate, Clemson University, 100 Sirrine Hall, Clemson, SC, 29634-1305, United States of America, yunsikc@clemson.edu, Aleda Roth, Lawrence Fredendall

To better understand the standardized clinical process that support or inhibit front-line nurses' patient care, this study identifies positive (e.g., task time reduction & problem identification) and negative feedback (e.g., use of shortcuts, perceived workload intensity) driven by the standardized process that affect patient satisfaction.

3 - Supporting Health Policy through Modeling and Microsimulation

Steven Cohen, Vice President, DSDS, Research Triangle Institute, 3040 East Cornwallis Road, Research Triangle Park, NC, 27709, United States of America, scohen@ahrq.gov

There is a growing demand for timely, accurate and precise estimates of health care parameters at the national and sub-national levels in concert with data resources to inform policy and practice. Critical measures include health insurance coverage, health care utilization, and expenditures. This presentation will focus on issues of data quality and the statistical integrity of modeling efforts.

4 - Is the Public-private Partnership Healthcare Program Socially Beneficial?

Jie Song, Peking University, Room 512, Fangzheng Building, Beijing, China, songjie@coe.pku.edu.cn, Jianpei Wen, Frank Youhua Chen, Yimin Yu

Motivated by the long indirect waiting time in Hong Kong's public hospitals, a Public-Private Partnership (PPP) program was proposed for certain elective surgeries, which consists of a government subsidy and a threshold number for the waitlist. We propose a novel queuing model incorporating choice behavior of heterogeneous time-sensitive customers through MNL. The customer equilibrium joining behavior shows how the mechanism affects the overall social welfare in the PPP system.

Optimization Heuristic Programming

Contributed Session

Chair: Jin Qin, Doctoral Student, Huazhong University of Science & Technology, 1037 Luoyu Road, Wuhan, China, Wuhan, China, qinjinhu@163.com

1 - Regression Based Relaxation Solution Approach for Fixed Charge Network Flow Problem

Weili Zhang, Graduate Research Assistant, University of Oklahoma, 829 E Lindsey St, Norman, OK, 73071, United States of America, weili.zhang-1@ou.edu, Charles Nicholson

In this paper, a novel solution approach to the fixed charge network flow (FCNF) problem named regression based relaxation (RBR) is developed. RBR employs the probability of arc usage to form a new linear programming problem. Through rigorous testing, RBR outperforms linear programming relaxation and relaxation induced neighborhood search regardless of the complexity of the problem. In addition, the improvement of integrating RBR in the exact solver is robust for large FCNF problems.

2 - Travelling Salesman with Multiple Means of Transportation and Switching Cost

Qiwen Wang, Peking University, Guanghua School of Management, Beijing, 100871, China, wqw@gsm.pku.edu.cn, Yingjie Lan

We study a modified travelling salesman problem (TSP), where there are multiple transportation means (e.g., by aircraft, train, or car) between cities and there is a cost of switching from one means of transportation to another in a city. Not all transportation means are available between some cities. We provide an integer programming formulation, and design specialized heuristics to solve the problem.

3 - New Robust Efficiency Measures for Knapsack Problems

Christopher Wishon, PhD Candidate, Arizona State University, 633 W. Southern Ave, #1195, Tempe, AZ, 85282, United States of America, cwishon@asu.edu, J. Rene Villalobos

New efficiency measures have been developed for solving all multi-constraint knapsack problem variants. Using these measures, three solution heuristics are presented for solving the multi-demand, multi-dimensional knapsack problem: fixed-core reduction, genetic algorithm, and kernel search. Test cases have been solved using these heuristics demonstrating that the measures can be used to identify the same or better solutions than commercial software in a shorter time in a majority of cases.

4 - An Efficient VNS Heuristic for the Pickup and Delivery Traveling Salesman Problem with FIFO

Jin Qin, Doctoral Student, Huazhong University of Science & Technology, 1037 Luoyu Road, Wuhan, China, Wuhan, China, qinjinhu@gmail.com, Qinghua Wu, Xianhao Xu

In this paper, we present a variable neighborhood search(VNS) algorithm to solve a variant of the traveling salesman problem with pickup and delivery(TSPDP), named the TSPDP with first-in-first-out loading (TSPPDF). The VNS heuristic cooperate with a Simulated Annealing(SA) and two Tabu Search(TS) to solve this problem. Numerical experiment results show that the proposed heuristic produces better solutions than do the previous methods in relatively short computing times.

5 - Heuristic Methods for Automotive Stamping Scheduling

Sayak Roychowdhury, PhD Student, The Ohio State University, 1971 Neil Avenue, Columbus, Oh, 43210, United States of America, roychowdhury.6@osu.edu, Theodore Allen

A major automotive manufacturer plans parts to be made by a large stamping machine on a seven day basis to conform to an overall vehicle schedule. The problem involves setups, part and die set families, storage constraints, and the possibility of downstream process starvation. Multiple heuristics are compared in terms of solution quality and computational speed.

Operations Management and Marketing Interface

Cluster: Operations/Marketing Interface

Invited Session

Chair: Shuya Yin, University of California, Irvine, Merage School of Business, Irvine, United States of America, shuya.yin@uci.edu

1 - Impact of Media Substitution and Synergy in Media Planning Decisions for A New Product Introduction

Vahideh Abedi, Assistant Professor, California State University Fullerton, Fullerton, CA, United States of America, vabedi@exchange.fullerton.edu, Dmitry Krass, Oded Berman

Substitutive and synergic interactions between multiple marketing media can significantly influence media planning strategies of firms. However, the existing literature focuses on only one of these two types of interactions. We show that most typically channel interactions are both substitutive and synergistic at the same time in the context of a new product introduction. We derive several insights on the implications of this co-existence and its influence on the firm's media planning decisions.

2 - Balanced or Unbalanced Market Structure? An Upstream Supplier's Perspective

Yuhong He, Assistant Professor, California State University, Fullerton, Fullerton, United States of America, yuhe@fullerton.edu, Shuya Yin, Saibal Ray

Upstream suppliers often need to decide whether or not to reply on dominant retailers in the market place when they sell through the downstream partners. We propose an economic model to gain some understanding of the basic trade-offs involved in such decision making processes.

3 - Setting the Optimal Pledge and Target in Crowdfunding Campaigns

Rachel Chen, Associate Professor, rachen@ucdavis.edu, Esther Gal-or, Paolo Roma

Crowdfunding campaigns (of consumer products) allow the entrepreneur to raise funds from the crowd, and, if succeeded, sends a positive signal to the VC about how the product is likely to be received by consumers. If the campaign fails, however, the entrepreneur will have great difficulty getting funded by the VC. This paper examines the entrepreneur's decision in setting the pledge and the target in crowdfunding campaigns.

4 - A Generalized Model on Forecasting Repeat Sales

Yibo Zhou, Ruixia Shi

We propose a stochastic model to forecast customers' repeat purchasing. We extend the traditional mixture distribution model (negative binomial distribution) to the general situation, which fully captures customers' heterogeneity. The generalization is made possible through using the Gaussian quadrature. The model retains the elegance of NBD framework and can be easily implemented. Our results show that the proposed method outperforms the traditional forecast methods.

Operations Management/Marketing Interface II

Contributed Session

Chair: Prateek Raj, PhD Student, Department of Management Science and Innovation, UCL, Gower Street, London, WC1E 6BT, United Kingdom, p.raj.12@ucl.ac.uk

1 - Context Dependent Preferences and Bundling Strategy

Qianbo Yin, CUHK, Room 941, CYT, CUHK, HK, HK, Hong Kong - PRC, qianboyin@gmail.com, Sean Zhou

The bundling literature explains pure components strategy and pure bundling strategy are optimal in perfectly and imperfectly competitive industries, respectively. However, when consumers respond to distinct product portfolios and exhibit context-dependent preferences, the optimal bundling strategy may change. This paper finds this consumer behavior boosts the introduction of the bundle and mixed bundling strategy is optimal under certain conditions.

2 - Dominant Retailer's Strategic Response to Efficient Fringe Retailers

Zhong Chen, PhD Student, The Chinese University of HongKong, Room 943, Cheng Yu Tung Building,, The Chinese University of HongKong, N.T., HongKong, Hong Kong - PRC, zhongchen@baf.cuhk.edu.hk, Ehsan Bolandifar

Dominant retailers like Walmart has the power to negotiate their suppliers to get more favourable contract terms while fringe retailers lack such market power. Industry evidences indicates that fringe retailers are becoming more efficient in their operations which puts pressure on dominant retailers to become even more aggressive in their procurement contracts. We present a model to study strategic response of a dominant retailer to such improvement in operational efficiency of fringe retailers.

3 - Licensing Contracts in Conspicuous Markets

Prateek Raj, PhD Student, Department of Management Science and Innovation, UCL, Gower Street, London, WC1E 6BT, United Kingdom, p.raj.12@ucl.ac.uk, Kenan Arifoglu

We study licensing decision of a brand-owning firm that sells its primary product to conspicuous customers, who value the brand exclusivity, and also licenses its brand name to a licensing firm. We compare fixed-fee and royalty contracts, and develop a mixed contract that improves the profit and coordinates the system.

Healthcare Operations

Sponsor: Manufacturing & Service Oper
Mgmt/Healthcare Operations
Sponsored Session

Chair: Van-Anh Truong, Columbia University, 500 West 120th St, New York, NY, 10027, United States of America, vt2196@columbia.edu

1 - Online Advance Admission Scheduling for Services, with Customer Preferences

Xinshang Wang, Columbia University, 500 West 120th St, New York, NY, 10027, United States of America, xw2230@columbia.edu, Van-Anh Truong

We study web and mobile applications that are used to schedule advance service, from medical appointments to restaurant reservations. We give the first online, data-driven algorithms with performance guarantees for these problems. We show that the average performance of our algorithms is bounded by 1/2 times that of an optimal algorithm. We test the empirical performance of our algorithms by using data from a department within a major academic hospital system in New York City.

2 - Service Encounters in Outpatient Clinics

Michele Samorani, Assistant Professor, University of Alberta, 3-20F Business Building,, University of Alberta, Edmonton, AB, T6G 2R6, Canada, samorani@ualberta.ca, Dan Zhang

The appointment scheduling literature typically focuses on "individual appointments" which may end with a no-show, a cancellation, or a patient arrival. However, cancellations and no-shows are often followed (possibly with some time lag) by rebooking another individual appointment, until the patient finally sees the doctor. We empirically study such sequences of individual appointments, which we call service encounters, and discuss the implications of our findings on capacity planning.

3 - Adaptive Robust Optimization of Surgery and Downstream Capacity Planning

Saba Neyshabouri, PhD Student, George Mason University,
SEOR Department, Engr Bldg, Rm 2100, MS, Fairfax, VA, 22030,
United States of America, sneyshab@gmu.edu, Bjorn Berg

We propose a novel robust optimization formulation to address the uncertainty in surgery duration and length-of-stay (LOS) in the downstream unit. The structure of the problem is analyzed in order to adapt a column-and-constraint generation method to find the optimal solution to the formulation. The methodology presented can be used in other important applications such as resource-constrained project scheduling under activity duration uncertainty and inventory management.

4 - Multi-class, Multi-resource Advance Scheduling with No-shows, Cancellations and Overbooking

Mahshid Parizi, University of Washington, Industrial & Systems
Engineering, University of Washington Box 352650, Seattle,
United States of America, msalemp@uw.edu, Archis Ghatge

We study a scheduling problem where arriving stochastic demand of heterogeneous job-types is booked into the booking horizon or is rejected. The effect of cancellations, no shows and overbooking is included. Scheduling decisions must respect multiple resource constraints. We formulate an MDP model and provide an approximate dynamic programming algorithm rooted in Lagrangian relaxation, value function approximation and constraint generation. The resulting policies are compared with a myopic one.

Innovative Pricing Strategies

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Pnina Feldman, UC Berkeley Haas School of Business, 2220
Piedmont Ave, Berkeley, CA, 94720, United States of America,
feldman@haas.berkeley.edu

1 - Unbundling of Ancillary Service: How Does Price Discrimination of Main Service Matter?

Yao Cui, Cornell University, 401N Sage Hall, Ithaca, United States
of America, yao.cui@cornell.edu, Izak Duenyas, Ozge Sahin

We consider a setting where the firm sells a main service (e.g., air travel) and an ancillary service (e.g., baggage delivery) to multiple consumer segments (e.g., business travelers and leisure travelers). We study how the firm's ability to charge discriminatory main service prices affects its decision of whether to unbundle the ancillary service from the main service and charge separate prices.

2 - Dynamic Pricing in the Presence of Social Learning and Strategic Consumers

Yiangos Papanastasiou, Haas School of Business, UC Berkeley,
Berkeley, CA, 94720, United States of America,
yiangos@haas.berkeley.edu, Nicos Savva

When a product of unknown quality is first introduced, consumers may choose to strategically delay their purchasing decisions in order to learn from the reviews of their peers (social learning). This paper investigates how the presence of social learning affects the strategic interaction between a dynamic-pricing monopolist and a forward-looking consumer population.

3 - Innovative Dynamic Pricing: The Potential Benefits of Early-purchase Reward Programs

Yossi Aviv, Professor, Washington University, 1 Brookings Drive,
St. Louis, MO, 63130, United States of America, aviv@wustl.edu,
Mike Wei

The management science literature has studied on the implications of strategic consumer behavior on the effectiveness of dynamic pricing strategies. Possible ways to mitigate the adverse effect of strategic consumer behavior include price commitment, inter-temporal price matching, and capacity rationing. In this work, we propose a scientific model to theoretically examine the optimal structure and effectiveness of an early-purchase reward program as a mechanism for mitigating strategic behavior.

4 - The Operational Advantages of Threshold Discounting Offers

Simone Marinesi, Wharton, 562 Jon M. Huntsman Hall, 3730
Walnut St, Philadelphia, PA, 19104, United States of America,
marinesi@wharton.upenn.edu

Inspired by Groupon, this study examines how Threshold-Discounting strategies—the idea to offer a discounted service to customers conditional on enough customers subscribing to the offer—can significantly boost operational performance and profit by improving capacity utilization. However, when offered through powerful intermediaries, such offers can be much less effective and even harmful. Surprisingly, in this context, we show that customer strategic behavior is beneficial to the firm.

Contemporary Challenges in Pricing and Revenue Management: Repetitive Purchases and Loss Aversion

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Necati Tereyagoglu, Assistant Professor of Operations
Management, Scheller College of Business, Georgia Institute of
Technology, 800 W Peachtree St NW, Suite 4424, Atlanta, GA, 30308,
United States of America, Necati.Tereyagoglu@scheller.gatech.edu

1 - Optimal Pricing of Access and Secondary Goods with Repeat Purchases: Evidence from Online Grocery

Ricard Gil, Associate Professor, ricard.gil@jhu.edu,
Evsen Korkmaz, Ozge Sahin

We investigate optimal pricing strategies for an online grocery retailer who derives its profits from delivery fees and grocery sales. We derive testable theoretical implications that we take to data using a unique dataset detailing transaction information from an online grocery retailer in a Western European country. We find that firms may increase profits by implementing alternative and simpler pricing strategies that combine second and third degree price discrimination schemes.

2 - Loss Aversion and the Uniform Pricing Puzzle for Vertically Differentiated Products

Javad Nasiry, Assistant Professor, Hong Kong University of
Science and Technology, ISOM, LSK Building, HKUST, Hong
Kong, Hong Kong - PRC, nasiry@ust.hk, Pascal Courty

The uniform pricing puzzle states that a monopolist sells high and low quality products at the same price despite the fact that quality is perfectly observable and that there are no significant costs of adjusting prices. We resolve the puzzle by accounting for consumer loss aversion in monetary and consumption utilities and by assuming that the reference point is endogenously set as part of a “personal equilibrium” and includes only past purchases of products of the same quality.

3 - Service Pricing with Loss Averse Customers

Liu Yang, Tsinghua University, School of Economics and
Management, Tsinghua university, Beijing, 100084, China,
yangliu@sem.tsinghua.edu.cn, Pengfei Guo, Yulan Wang

We consider a service system in which customers are loss averse towards both price and delay attributes. We first study customers' equilibrium queueing strategies. We find that, in contrast to the traditional case in which loss aversion is not considered, there could exist three equilibrium strategies. We then study the optimal pricing problem for a monopoly server. We show that loss aversion polarizes queues, making long queues even longer and short queues even shorter.

4 - Multi-Attribute Loss Aversion and Reference Dependence: Evidence from Performing Arts Industry

Necati Tereyagoglu, Assistant Professor of Operations
Management, Scheller College of Business, Georgia Institute of
Technology, 800 W Peachtree St. NW, Suite 4424,
Atlanta, GA, 30308, United States of America,
Necati.Tereyagoglu@scheller.gatech.edu, Peter Fader,
Senthil Veeraraghavan

We hypothesize that not only the price but also the observed sales for a seating area determines the utility of a customer from buying a ticket for a show in this industry. We test the reference effects for both prices and sales using customer level transaction data from an orchestra in the US, and show that patron decisions are driven by the position of the seating alternatives relative to price and sales expectations. We find that the revenue effects of referencing are significant.

Avenue, Shanghai, 201306, China, silu369@126.com

1 - Including Regeneration Possibilities to Increase Water Reuse in Scheduling Multipurpose Batch Plants

Renzo Akkerman, Technische Universität München, TUM School
of Management, Arcisstr 21, München, 80333, Germany,
renzo.akkerman@tum.de, Pulluru Sai Jishna

Scheduling of multipurpose batch process plants has recently started integrating water reuse objectives, also including water regeneration processes. Including regeneration possibilities significantly alters the flexibility of schedules that are

already constrained on the use of water. This study aims to examine the impact of including regeneration possibilities on the flexibility of scheduling procedures and focuses on trade-offs between cost-optimal and water-efficient production schedules.

2 - A Layer Analysis Framework to Investigate the CO2 Sinks in the U.S. Manufacturing Supply Chain Network

Gokhan Egilmez, University of New Haven, Mechanical and Industrial Engineering, East Haven, CT, 06512, United States of America, gegilmez@newhaven.edu, Mohammad Aslam

In this study, U.S. manufacturing industries and related supply chains are analyzed from life cycle perspective considering layers in the supply chain. The focus of the analysis is greenhouse gas (GHG) emissions which are represented with CO2 equivalent metric. Input output-based life cycle assessment models are developed and layer analysis is conducted for 6 supply chain layers: onsite, second, third, fourth, fifth tier suppliers and rest of the supply chain.

3 - Promoting Fair Trade Products

Seung Jae Park, Assistant Professor, Texas A&M University-Central Texas, 1001 Leadership Place, Killeen, TX, 76549, United States of America, s.park@tamuct.edu

The study considers how to promote fair trade products. We show that competition between firms increases the usage of fair trade certified raw materials. We also show that if a fair trade organization can decide the maximum margin from fair trade products, then it will increase the usage of fair trade certified raw materials and increase each manufacturer's total profit compared to those without consideration of the maximum margin decision.

4 - Effect of Carbon Emission Regulations on the Supply Chain with Two Substitutable Products

Xu Chang-yan, Shanghai Maritime University, 1550 Haigang Avenue, Shanghai, 201306, China, silu369@126.com, Wang Chuan-xu, Rongbing Huang

We examine a decision problem for one retailer and one manufacturer under the influence of carbon tax policy set by the government. The manufacturer produces two partially substitutable products with different carbon emissions. The two-stage game theoretical model under three different carbon tax policies is investigated. The impact of carbon tax and green subsidy on the profits of the manufacture, the retailer, and the supply chain is analyzed.

1 - Algorithms and Computational Results for the (CITI) Bike-sharing System

David Shmoys, Cornell University, School of ORIE, Rhodes Hall, Ithaca, NY, 14853, United States of America, david.shmoys@cornell.edu, Eoin O'Mahony, Ola Svensson, Shane Henderson

Bike-sharing systems are becoming increasingly prevalent in urban environments. Users imbalance the system by creating demand in an asymmetric pattern; this necessitates intervention to restore balance and facilitate future use. Pre-balancing the system in preparation for usage requires placement of the available bikes at stations to minimize the expected rush-hour outage minutes. We present algorithmic approaches for pre-balancing and both mid-rush hour and overnight rebalancing operations.

2 - The Implications of the Auto Manufacturer's Involvement in the Car Sharing Business

Ioannis Bellas, Assistant Professor, George Mason University-ISOM Area, Enterprise Hall, 4400 University Drive, MS 5F4, Fairfax, VA, 22030, United States of America, ibellos@gmu.edu, Mark Ferguson, Beril Toktay

We study the auto manufacturer's choice regarding whether to offer a car sharing business model in conjunction with the traditional sales channel. We determine the efficiency of the vehicles offered and we characterize the economic and environmental implications.

3 - Bike-share Systems: Empirical Models of Business Models

Karan Girotra, Associate Professor, INSEAD, Boulevard de Constance, Fontainebleau, 77300, France, Karan.Girotra@insead.edu, Ashish Kabra, Elena Belavina

This talk illustrates the use of big-data to capture consumer behavior in Bike-share systems. We then use the estimated patterns of customer to propose system improvements and redesigns.

1 - Impact of Certification Programs on Waste Recovery

Gokce Esenduran, esenduran.1@osu.edu, Yen-Ting Lin, Wenli Xiao

R2 and E-stewards are two main certification programs for recyclers. The latter is stricter and costlier to implement; however when customers are "green", it would also result in higher product returns. In order to understand which certification is more profitable to adopt under what conditions, we model the competition between recyclers considering the consumers' and collectors' decisions as well. We also identify the impact of certification's stringency on the total recycling amount.

2 - The Joint Impact of Public Awareness Campaigns and System Infrastructure on E-Waste Collection

Wenyi Chen, Postdoc, McGill University, 1001 Rue Sherbrooke Ouest, Montreal, QC, H3A 1G5, Canada, wenyi.chen@mail.mcgill.ca, Jianmai Shi, Vedat Verter

We present a dynamic formulation for the joint design of the collection center network and the campaign strategy for a monopolistic non-profit organization. We use a Nerlove-Arrow-type advertising model to capture the "carryover effect" in the consumers' environmental awareness and a continuous approach to incorporate the impact of the collection center locations. A case study based on the British Columbia Stewardship Program in Canada is presented.

3 - Impact Analysis of Recyclability and Reusability on Greenhouse Gas Emissions and Related Cost

Hailong Cui, University of Southern California, Marshall School of Business, Bridge Hall B5, Los Angeles, CA, 90089, United States of America, Hailong.Cui.2019@marshall.usc.edu, Greys Sosis

We build supply chain models to evaluate the impact of recyclability and reusability on the emissions through the products' life cycle and derive conditions that lead to reduction in the long-run average emissions. We then investigate the cost of recycling and emissions imposed on the supply chain and on the society to understand optimal decisions for centralized and decentralized cases. We compare outcomes obtained when recycling is run by the government and when it is done by the manufacturer.

Revenue Management Pricing I

Contributed Session

Chair: Fredrik Odegaard, Ivey Business School, Western University, 1255 Western Road, London, ON, N6G 0N1, Canada, fodegaard@ivey.uwo.ca

1 - Dynamic Pricing to Maximize Profits in Multiproduct and Multioutlet Channel Systems

Markus Bergmeier, Research Assistant, University of Passau / Chair of Marketing and Services, Innstr. 27, Passau, 94032, Germany, markus.bergmeier@uni-passau.de, Dirk Totzek

To date, operations research approaches have played a minor role in the field of managing multiple online and offline distribution channels. We develop an optimization model that captures heterogeneous customer characteristics over time and enables companies to choose profit-maximizing prices for each product, distribution channel, intermediary, consumer group, and period. We test this model using data from different industries and show that it leads to higher profits and optimal coordination.

2 - Dynamic Pricing with Bogo Promotion in Revenue Management

Sunggyun Park, Doctoral Program, KAIST, 291 Daehak-ro
Yuseong, Daejeon, Korea, Republic of, sunggyun@kaist.ac.kr,
Kyoung-kuk Kim, Chi Guhn Lee

We consider a dynamic pricing problem when a seller sells a single product in a finite horizon. We particularly focus on the widely adopted promotional schemes “buy one get one free” and “50% off” and study the optimal strategic choices of the seller. Analytical results together with numerical experiments are presented to help us obtain managerial insights. Additional numerical results for a generalized model are provided so as to examine the effectiveness of promotional schemes.

3 - Estimation from Competitor Data

Möge Tekin, Universitat Pompeu Fabra, Ramon Trias Fargas, 27,
Barcelona, Spain, muge.tekin@upf.edu, Kalyan Talluri

Competitor price information is available as a data stream in many industries. Also, in the hotel industry some providers reveal competitor occupancy rates. While this information is very closely monitored by hotel managers, it has not been fully exploited by revenue management systems. We exploit this marginal information to answer a question of great interest to pricing managers: How much should I price above (or below) the competitor's price?

4 - Revenue Bounds for Bundling Strategies under Dependent Valuations

Fredrik Odegaard, Ivey Business School, Western University,
1255 Western Road, London, ON, N6G 0N1, Canada,
fodegaard@ivey.uwo.ca, Mihai Banciu, Alia Stanciu

Digital goods such as radio streaming, television channels or e-journals are frequently bundled in packages of large sizes. Moreover, most of these bundles incorporate goods that have dependent valuations, which makes the associated revenue optimization problem hard to solve analytically. In this paper, we derive tight bounds for the seller's revenue function and show the existence of an optimal maximin pricing strategy.

Incentive and Compensation Schemes in Supply Chains

Sponsor: Manufacturing & Service Operations Management
Mgmt/Supply Chain
Sponsored Session

Chair: Sandra Transchel, Kuehne Logistics University, Grosse
Grasbrook 17, Hamburg, Germany, Sandra.Transchel@the-klu.org

1 - You Get What You Pay For: CEO Compensation and the Inventory Rhombus

Kristoph Ullrich, Köhne Logistics University - KLU,
Grosse Grasbrook 17, Hamburg, 22297, Germany,
Kristoph.Ullrich@the-klu.org

This article seeks and finds empirical evidence of a relationship between CEO compensation and inventory investments in multiple direct and indirect ways. I identify the dominant of the competing hypotheses that emerge from OM theory: CEOs whose compensation is more dependent on the stock price follow less risky strategies and invest less in inventories. CEOs whose compensation is more dependent on the stock price volatility follow more risky strategies and have higher inventory investments.

2 - Contract Design in Processing Trade under Information Asymmetry

Paolo Letizia, Assistant Professor of Business Analytics, University
of Tennessee, 223 Stokley Management Center, 916 Volunteer
Boulevard, Knoxville, TN, 37996, United States of America,
pletizia@utk.edu, Long Gao

Processing companies have repeatedly wrestled on the question whether they should control or delegate the quality of their products to foreign producers. We study this important question when there is a gap of expertise in the production processes between the processing company and its producer. We find that although quality delegation involves a control loss, it allows the producer to leverage on his superior expertise resulting in a flexibility gain.

3 - Salesforce Compensation under Inventory Rationing

Sandra Transchel, Kuehne Logistics University, Grosse Grasbrook
17, Hamburg, Germany, Sandra.Transchel@the-klu.org,
Kristoph Ullrich, Ruud Teunter, Jasper Veldman

We study sales quota-based compensation schemes of two sales agents who can exert effort to stochastically increase demand. Both agents satisfy demand from the same inventory, which is ordered by the firm before demand uncertainty is revealed. As actual demand and exerted sales effort are unobservable by the firm, both agents decide on their effort level based on sale quota bonus contract, inventory level, and allocation policy, which are designed by the firm to maximize the expected profit.

4 - Cultural Attitudes Towards Contract Design in Supply Chain Exchanges

Dina Ribbink, Assistant Professor, Western University,
1255 Western Rd, London, ON, Canada, dribbink@ivey.ca,
Yun Shin Lee, Stephanie Eckerd

The purpose of this study is to investigate the impact of national culture on the design and effectiveness of bonus and penalty incentive contracts. We conduct laboratory experiments in Canada, China, and the Republic of Korea, and evaluate buyers' contract design decisions and suppliers' responses.

Non-Profit Operations Management

Sponsor: Manufacturing & Service Operations Management
Sponsored Session

Chair: Sripad Devalkar, Assistant Professor, Indian School of Business,
Gachibowli, Hyderabad, 500032, India, sripad_devalkar@isb.edu

Co-Chair: Karthik V. Natarajan, Assistant Professor, University of
Minnesota, 321 19th Avenue South, 3-150, Minneapolis, MN,
United States of America, knataraj@umn.edu

1 - Understanding and Improving Global Health Supply Chains: An Analysis of Global Supply Chain D

Ananth Iyer, Susan Bulkeley Butler Chair In Operations
Management, Purdue University, Purdue University,
West Lafayette, IN, United States of America, aiyer@purdue.edu,
Gemma Berenguer

We focus on data from USAID which provides all shipments across the supply chain in 2011-2012. We built statistical and mathematical programming models to understand the logic of the flows, explore the impact of changes in mode mix and changes in supply chain structure and explore the impact of lead times, transshipment etc. Our goal is to enable an understanding of the cost and service level impact on the operation of the supply chain.

2 - Effect of Armed Conflicts on Humanitarian Operations

Alfonso Pedraza-Martinez, Assistant Professor, Indiana University,
1309 E 10th Street, Bloomington, IN, 47405, United States of
America, alpedraz@indiana.edu, Andres Jola-sanchez,
Kurt Bretthauer, Rodrigo Britto

We study an important but widely neglected topic in humanitarian operations: armed conflicts. Specifically, we analyze the effect of man-made disasters (armed conflicts) on the operational performance of rural hospitals and investigate what is the effect of conflicts on: (i) the efficiency of rural hospitals? (ii) the total factor productivity of rural hospitals? and (iii) patient satisfaction? We use panel data from 163 public rural hospitals in Colombia during the period 2007-2011.

3 - Payment for Results: Signaling Efficiency in Non-profit Operations

Milind Sohoni, Associate Professor Of Operations Management
And Sr. Associate Dean Of Programs, Indian School of Business,
Gachibowli, Indian School of Business, Gachibowli, Hyderabad,
PL, 500032, India, milind_sohoni@isb.edu, Sripad Devalkar

We consider the problem of a NPO raising funds for projects. Donors care about the end benefits but are uncertain about the NPO's efficiency. We compare the performance of traditional fund raising, where donors contribute before implementation, with an emerging form of ‘payment for results’ wherein the NPO implements a project and then seeks contribution. We highlight conditions when the ‘payment for results’ option dominates. Our results suggest important implications for regulators too.

4 - Dynamic Programming to Reduce Environmental Impacts of Food Waste at Campus Dining Services

Esma Birisci, Student, University Of Missouri, 246 Engineering
Building West, Columbia, MO, 65211, United States of America,
esmaibirisci@mail.missouri.edu, Ronald McGarvey,
Christine Costello

This research incorporates environmental impacts of food wastage into a cost-minimizing stochastic inventory model of campus dining service operations. We use Life Cycle Analysis estimates to account for broader environmental costs of wasted food, focusing on how optimal food production and ordering decisions can reduce storage losses and over preparation losses.

■ WC51

51-Room 106B, CC

Consolidation and Asymptotics in Inventory

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Stefanus Jasin, Stephen M. Ross School of Business, University of Michigan, Ann Arbor, United States of America, sjasin@umich.eduCo-Chair: Linwei Xin, Assistant Professor, University of Illinois at Urbana-Champaign, 104 S. Mathews Ave., Urbana, IL, 61801, United States of America, lxin@illinois.edu**1 - Centralized and Decentralized Warehouse Logistics Collaboration**Shiman Ding, UC Berkeley, IEOR Dept., Berkeley, CA, 94720-1777, United States of America, shiman@berkeley.edu, Philip Kaminsky

An emerging paradigm for logistics collaboration in the grocery industry centers on large third-party warehouses that multiple suppliers use as warehouses or mixing centers, and from which multiple retailers order mixed-product truckloads. We explore centralized and decentralized strategies for operating shared warehouses, and characterize the loss due to decentralized operation.

2 - Shipment Consolidation for Online RetailersLai Wei, Stephen M. Ross School of Business, 701 Tappen Ave, Ann Arbor, MI, 48109, United States of America, laiwei@umich.edu, Roman Kapuscinski, Stefanus Jasin

The online retailers have a significant flexibility how to satisfy multiple orders for customers. An existing order can be strategically delayed to combine with future orders, such that a single shipping cost can be incurred for multiple orders. But delaying the shipment increases the shipping cost itself, as shorter remaining time requires expedited shipping. We characterize the structure of the optimal policy and use such insights to construct easily implementable near-optimal heuristics.

3 - Asymptotic Optimality of Tailored Base-Surge Policies in Dual-Sourcing Inventory SystemsLinwei Xin, Assistant Professor, University of Illinois at Urbana-Champaign, 104 S. Mathews Ave., Urbana, IL, 61801, United States of America, lxin@illinois.edu, David Goldberg

Dual-sourcing inventory systems are notoriously difficult to optimize. Recently, so-called Tailored Base-Surge policies have been analyzed in Allon and Van Mieghem (2010) and Janakiraman et al. (2014). Although numerical results have suggested that such policies perform well as the lead time difference grows large, providing a theoretical foundation for this phenomenon has remained a major open problem. In this talk, we resolve this open problem by proving asymptotic optimality of such policies.

4 - Replenishment Policies in Assemble-to-order Inventory Systems with Non-identical Lead TimesMartin I Reiman, Bell Labs, 600 Mountain Ave., Murray Hill, NJ, 07974, United States of America, martyreiman@gmail.com, Haohua Wan, Qiong Wang

In Assemble-to-Order systems, the use of one component often depends on the availability of others. Thus ordering decisions for components with shorter lead times should be coordinated with decisions made at earlier times for those with longer lead times. The independent base stock policy does not have this feature and we will assess the impact of this deficiency on the inventory cost. We will also explore alternative policies that improve an asymptotic-optimality criterion.

Retail Management III

Contributed Session

Chair: Amir Ghiasi, PhD Student, University of South Florida, Department of Civil and Environmental Engineering, 4202 E. Fowler Avenue, Tampa FL 33620, United States of America, amirghiasi@mail.usf.edu**1 - The Prepack Optimization: A Case Study of a Korean Fashion Retailer**Shin Woong Sung, KAIST, 291 Daehak-ro, Yuseong-gu, Daejeon, Korea, Republic of, sw.sung@kaist.ac.kr, Young Jae Jang

This study considers a real-world inventory packing and distribution problem called "PrePack Optimization Problem (POP)" at the largest outdoor-fashion retailer in Korea, KOLON SPORT (K/S). We formulate a mathematical programming model for POP and propose a solution approach which can be efficiently utilized at K/S. The field experiments, conducted for two seasons, revealed that the approach remarkably improved the inventory stability.

2 - Socio-demographic Characteristic Associated with the Location of Organic and Local Food StoresAmir Ghiasi, PhD Student, University of South Florida, Department of Civil and Environmental Engineering, 4202 E. Fowler Avenue, Tampa, FL, 33620, United States of America, amirghiasi@mail.usf.edu, Guangqing Chi, Chuo Li, Xiaopeng Li

In this study, physical accessibility to organic and local food is examined relative to socio-demographic factors in New Orleans, LA. Linear and spatial regression models are adopted to investigate how the socio-demographic variables correlate with the distance of driving, biking, or walking to the stores. Results show that accessibility to organic food stores is more in denser areas and areas with more African-Americans, Hispanics and more educated people.

Behavioral Issues in Supply Chains Regarding Quality and Competition

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Yinghao Zhang, Assistant Professor, Salisbury University, 1101 Camden Avenue, Salisbury, MD, 21801, United States of America, YXZhang@salisbury.eduCo-Chair: Diana Wu, University of Kansas, Lawrence, United States of America, dianawu@ku.edu**1 - The Decision to Recall: A Behavioral Investigation in the Medical Device Industry**George Ball, PhD Candidate, University of Minnesota, 321 19th Ave. S, Minneapolis, MN, 55455, United States of America, ball0197@umn.edu, Karen Donohue, Rachna Shah

Using a unique managerial subject pool with significant experience in product recall decision-making, this study identifies factors that impel medical device industry managers to decide to recall. We then incorporate a well-established Cognitive Reflection Test (CRT) to highlight sources of individual heterogeneity among recall decision-makers. The results of this study inform decision-making literature and may be able to improve the product recall decision-making process.

2 - Should Suppliers Bear the Qualification Costs?**Theory and Experiments**Wei Chen, Assistant Professor, The University of Kansas, 1450 Jayhawk Blvd, Lawrence, KS, 66045, United States of America, wei.chen@ku.edu, Milind Dawande, Ganesh Janakiraman, Elena Katok

A firm needs to source from a fixed-size pool of yet-to-be qualified suppliers for an indivisible contract. The contract can only be awarded to a supplier who passes a costly qualification test. Using the theory of optimal auction design and lab experiments, we investigate the following questions: Should suppliers bear the qualification costs in mechanisms that are optimal for the buyer? If suppliers are asked to bear these costs, should the buyer reimburse them in any way?

3 - Social Comparison and Pull-to-Center in Newsvendor ContestsValery Pavlov, The University of Auckland, Private Bag 92019, Auckland, New Zealand, v.pavlov@auckland.ac.nz, Nagesh Gavirneni, Tony Lin

We study a game of two newsvendors competing for a fixed bonus. Its most prominent feature is that the game is non-transitive (similar to Rock-Paper-Scissors), and the best-response is almost always "to order a quantity a bit closer to the mean than the competitor's". We test our model predictions experimentally and (i) find that a pull-to-center dynamics can emerge due to social comparison, and, (ii) find that friendship may be ineffective in mitigating competitive effects of social comparison.

4 - Perceived Versus Actual Value of Product Substitution FlexibilityBrent Moritz, Assistant Professor, Supply Chain Management, Pennsylvania State University, 469 Business Bldg., University Park, PA, 16802, United States of America, bmoritz@psu.edu, Saurabh Bansal

Using behavioral decision-making experiments for inventory of substitutable products, we investigate how decision-makers perform when estimating the value of operational flexibility of product substitution. Subjects consistently overestimated the monetary value of product substitution, and this is related to behavioral biases when estimating the conjunctive probability of substitution. We demonstrate a probability decomposition-based approach to mitigate this overestimation.

Service Science I

Contributed Session

Chair: Oleg Pavlov, Associate Professor Of Economics And System Dynamics, WPI, SSPS, 100 Institute Rd., Worcester, MA, 01609, United States of America, opavlov@wpi.edu

1 - Demand Management and Optimal Workforce Scheduling in Professional Service Firms

Vincent Hargaden, University College Dublin, Engineering & Materials Science Centre, Belfield, Dublin 4, Ireland, vincent.hargaden@ucd.ie, Jennifer Ryan, Amir Azaron

We analyse the workforce planning process in professional services firms from a demand management perspective. Taking a project network approach, we develop a multi-objective optimization model, which minimizes both the total direct costs of project staff and the maximum delay from the scheduled durations across all projects. The result is a better utilization of the firm's workforce, while maintaining customer satisfaction.

2 - Strategies for Planning the ICT Convergence-based PSS Value Chain in Manufacturing Companies

Hosun Rhim, Professor Of Logistics, Service, And Operations Management, Korea University Business School, Anam-dong, Seongbuk-gu, 136-701, Seoul, Korea, Republic of, hrhim@korea.ac.kr, Yong Yoon

The ICT convergence-based Product Service Systems (PSS) is a migration strategy to be adopted for the manufacturers in the PSS business model planning stage. The structured process and the critical factors in that stage will be investigated. The analytic hierarchy process (AHP) has been implemented to organize and analyze a series of decisions.

3 - Exploiting Learning in Call Center Routing Decisions

Tom Robbins, Associate Professor, East Carolina University, College of Business, 3212 Bate Building, Greenville, NC, 27858, United States of America, robbinst@ecu.edu

We explore a call center environment where agents increase their productivity over time, but eventually quit. We consider a routing policy that attempts to exploit this situation and improve long-term call center performance. We examine policies where calls are routed to the most experienced agents when the call center is busy, to facilitate efficiency, and to the least experienced agent when the call center is slow, to facilitate learning.

4 - Education as a Service System

Oleg Pavlov, Associate Professor Of Economics And System Dynamics, WPI, SSPS, 100 Institute Rd., Worcester, MA, 01609, United States of America, opavlov@wpi.edu, Frank Hoy

Service science is an emerging discipline rooted in system science. Applied to education, the service science methodology views universities and academic programs as service systems that go through life-cycles. We study entrepreneurship education programs that are gaining in popularity, yet are notoriously difficult to build up and sustain. We describe them as educational service systems, review different program deployment models and identify factors that lead to their success or failure.

Decision Analysis II

Contributed Session

Chair: Yudhi Ahuja, Associate Professor, San Jose State University, One Washington Square, San Jose, CA, 95192, United States of America, yudhi.ahuja@sjsu.edu

1 - Social Norms and Identity Dependent Preferences

Daphne Chang, School of Information, University of Michigan, 105 S. State Street, 3336 North Quad, Ann Arbor, United States of America, daphnec@umich.edu, Erin Krupka, Roy Chen

In our paper, we test the impact of norms on social identity driven choice by using a 2 (identity prime) x 2 (frame) x 2 (choice or norms) experimental design to separately and directly elicit empirical measures of identity dependent norms for eleven different redistribution situations. We demonstrate that including identity dependent norms improves our ability to predict behavior. Further, we estimate a key structural parameter of the social identity model identity dependent norm sensitivity.

2 - Combining Forecast Quantiles – A Numerical Investigation

Chen (mavis) Wang, Assistant Professor, Tsinghua University, Shunde Bldg. S609, Beijing, 100084, China, chenwang@tsinghua.edu.cn, Shu Huang, Vicki Bier

We review statistical methods for combining forecast quantiles from multiple experts, including equal weighting aggregation (by finding the average quantile, average probability, median quantile, or median probability), and performance-based weighting aggregation. We also propose a Bayesian quantile regression model to estimate location and precision biases and a more flexible Bayesian nonparametric model. We compare them using both simulation and a large dataset on expert opinion by Cooke.

3 - Approximate Representation for Time Series and its Application to Efficient State Estimation

Jianjun Lu, Associate Professor, China Agricultural University, No. 17, Qinghuadong Road, Haidian Distri, Beijing, 100083, China, ljjun@cau.edu.cn

We propose an approximate representation of multivariate time series by using the representative time series called latent time series based on covariance structure analysis where correlation among observed time series is utilized. The dynamic factor analysis for multivariate time series is extended. To avoid the whole estimation of state variable to each nonlinear system, we apply Particle Filters only for latent time series, and for another observed time series we use these estimated states.

4 - Forecasting Trends of Immigration to United States of America

Yudhi Ahuja, Associate Professor, San Jose State University, One Washington Square, San Jose, CA, 95192, United States of America, yudhi.ahuja@sjsu.edu

This paper deals with immigration statistics to United States of America from all over the globe. The future trends of immigrants have been estimated and their distributions over various States worked out. The paper concludes with implications of immigration on the economy, employment, education and social benefits.

5 - Integrated Fuzzy Approach for Analyzing Risk Analysis in Product Recovery System

Dr Jitender Madaan, Professor, Dept Of Management Studies, Indian Institute of Technology Delhi, Hauz Khas, New Delhi, 110016, India, jmadaan@iitd@gmail.com, Divya Chaoudhry

Paper proposes a novel methodology based on fuzzy set theory and evidential reasoning algorithm for quantifying the risks to capture the uncertainties of recovery system operations. It has practical implications for the organizations involved in product recovery to guide strategy formulation for the pro-active mitigation of risks. Moreover, paper would provide insights to the managers for enhancing the robustness of recovery systems along with better management of disruptions.

Chair: Felix Papier, Associate Professor, ESSEC Business School, Avenue Bernard Hirsch, Cergy, 95021, France, papier@essec.edu

1 - Managing Product Variety through Developing Vanilla Boxes using Hierarchical Clustering

Pooya Daie, Concordia University, 1455 De Maisonneuve Blvd. W., Montreal, QC, H3G 1M8, Canada, Pooyadaie@gmail.com, Simon Li

This paper focuses on implementing mass customization through development of semi-finished vanilla boxes to reduce supply chain cost. The challenge is that the possible number of vanilla boxes grows dramatically with increase in number of product variants. In solution, the basic information of product variety is captured in a matrix format, specifying the component requirements for each product variant. Then, hierarchical clustering is applied over the components with the considerations of demands.

2 - Tailor Made: Make-to-order Decisions at the Bottom of the Apparel Supply Chain

Suri Gurumurthi, Visiting Asst. Professor, HKUST, Clearwater Bay, Kowloon, HK, Hong Kong - PRC, imsuri@ust.hk

I discuss make-to-order strategies considered by apparel component suppliers at the bottom of the supply chain. The prevalent models for make-to-order decisions focus on decision-makers at the upper tiers of supply chains. I discuss make-to-order decisions at lower tier decision-makers who are subject to extremes of demand variability, but that also compete with very slim margins.

3 - Optimal Assembly Planning to Manage Manufacturing and Supply Chain Complexity Due to Product Variety

Jeonghan Ko, University of Michigan and Ajou University,
1205 Beal Ave., Ann Arbor, MI, United States of America,
jeonghan@umich.edu, Heng Kuang, Ehsan Nazarian

The complexity due to product variety has been an important issue for manufacturing and supply chains. Assembly planning determines the manufacturing process sequence and logistics, and plays a crucial role in minimizing such complexity. We propose a new complexity measure of assembly plans, verify the index through manufacturing and supply chain models, and provide a strategy for improved assembly plans. Our result illustrates the advantages of delayed differentiation and balanced planning.

4 - How Much Efficiency Is Enough?

Mohammad Ali Asudegi, University of Tennessee, 525 John D.
Tickle Engineering Building., 851 Neyland Dr, Knoxville, TN,
37996, United States of America, aliasudegi@gmail.com,
Rupy Sawhney

For many years the focus of many companies has been on efficiency metrics while other metrics have been ignored to gain higher efficiency. To define an optimal level of efficiency in a facility the interaction between efficiency and all other metrics should be studied. In this study, a framework is offered to define optimal level of efficiency considering other financial and non financial metrics for a better use of available resources.

5 - Managing Electricity Peak Loads in Make-to-Stock Manufacturing Lines

Felix Papier, Associate Professor, ESSEC Business School, Avenue
Bernard Hirsch, Cergy, 95021, France, papier@essec.edu

Our research is motivated by new manufacturing systems that smoothen electricity consumption to avoid expensive and carbon-emission-intensive peak loads. We study the control of stochastic make-to-stock manufacturing lines in the presence of peak loads. We show that standard methods in manufacturing research are not effective in this setting and we develop a new control policy. We derive analytic properties of the control policy for 2 workstations and develop a heuristic for more workstations.

Power System Design and Optimization

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Amir Mousavian, Assistant Professor, Clarkson University, 8
Clarkson Avenue, Potsdam, NY, 13699-5790, United States of America,
amir@clarkson.edu

1 - Optimizing Primary Response in Preventive Security-constrained Optimal Power Flow

Hrvoje Pandzic, Faculty of Electrical Engineering and Computing
University of Zagreb, Unska 3, Zagreb, Croatia,
Hrvoje.Pandzic@fer.hr, Pierre Henneaux, Yuri Dvorkin,
Daniel Kirschen

Preventive Security-Constrained (PSC) Optimal Power Flow (OPF) dispatches controllable generators at minimum cost while ensuring that operating constraints on generation and transmission assets are respected during both the pre- and post-contingency states without relying on post-contingency redispatch. A new PSCOPF model that optimizes the droop coefficients of the synchronized generators will be described.

2 - Optimal Resilient Distribution Grid Design using a 3-phase Unbalanced AC Power Flow

Russell Bent, Los Alamos National Laboratory, P.O. Box 1663, Los
Alamos, NM, 87545, United States of America, rbent@lanl.gov,
Emre Yamangil, Harsha Nagarajan, Scott Backhaus

Modern society is critically dependent on the services provided by power systems. Here we discuss an optimal electrical distribution grid design problem that improves the resiliency of such systems. To improve tractability, we introduce two ways of approximating the 3-phase AC power flow equations and L-shaped infeasibility cuts. Our experiments show that, unless the network impedance profile is unrealistically modified, our algorithms remain tractable and the solutions provide good results.

3 - Dispatchability Maximized Energy and Reserve Dispatch

Wei Wei, Tsinghua University, 3-211, West Main Building,
Tsinghua Univ, Beijing, 100084, China,
wei-wei04@mails.tsinghua.edu.cn, Shengwei Mei, Jianhui Wang

The dispatchability of the affine policy based energy and reserve dispatch (AF-ERD) is shown to be a polytope. The mathematical model of AF-RED is proposed. An efficient SOCP based algorithm is developed to solve the proposed model. The

generalized Gauss inequality is adopted to evaluate the probability of infeasible real-time dispatch in the absence of the exact probability distribution of wind power.

4 - Optimal Energy Scheduling in a Microgrid Including Electric Vehicle Parking Lots

Ebrahim Mortaz, Auburn University, Auburn University, Auburn,
AL, 36849, United States of America, ezm0012@auburn.edu,
Jorge Valenzuela

Microgrids are small-scale versions of the current bulk power grids. Microgrids allow customers to participate in energy trading and demand response programs. In this presentation, we consider scheduling electric power in a microgrid that includes thermal generators, renewable energy, and a parking lot with electric vehicles. We propose a mathematical programming model that minimizes the total expected operation cost. Results confirm that the proposed energy scheduling reduces generation costs.

1 - Power Markets with Real and Reactive Power Based off a Sequential Linear Approximation to the ACOPF

Paula Lipka, Graduate Student Researcher, University of
California, Berkeley, 4141 Etcheverry Hall, Berkeley, CA, 94720,
United States of America, plipka@berkeley.edu, Shmuel Oren

This work shows how to use a successive linear program that solves the ACOPF to run a real-time power market. It discusses how to calculate load payments, generation rents, congestion rents, and flowgate prices and how these items are different from the DC terms due to voltage and reactive power. It compares market outcomes under these new settings to those from a DCOPF approach with several examples.

2 - Impact of ACOPF Constraints on Security-constrained Unit Commitment

Anya Castillo, Federal Energy Regulatory Commission,
888 1st Street NE, Washington DC, United States of America,
anya.castillo@ferc.gov, Richard O'Neill, Carl Laird,
Jean-Paul Watson, Cesar Silva Monroy

We propose a unit commitment formulation with alternating current optimal power flow (ACOPF) constraints and solve the problem as a mixed-integer sequential linear program. This approach accounts for voltage requirements and enables the commitment of units for reactive power compensation in addition to economically satisfying the real power balancing requirements. We compare our results to unit commitment approaches that either ignore network effects or approximate lossless power flows.

3 - First Order Loss Approximation for LMP Calculation

Brent Eldridge, Operations Research Analyst, Federal Energy

United States of America, breldridge@gmail.com, Richard O'Neill,
Any Castillo

The following paper discusses an improvement method for estimating line losses when solving a DC optimal power flow (DCOPF) with endogenous line loss estimation. We present a DCOPF model and propose a method called First Order Improvement of Losses, or FOIL, which uses only linear constraints and does not require additional solutions to AC power flow equations. We compare FOIL to the initial solution and to results using successive linearization.

4 - Robust Feasibility and Stability Analysis in Power Flow Problems

Krishnamurthy Dvijotham, California Institute of Technology,
Pasadena, CA, United States of America, dvij@caltech.edu

Recent research has shown that convex relaxations often find provably optimal solutions of ACOPF problems. However, they do not provide guarantees of feasibility and dynamic stability in the presence of uncertainty (contingencies, stochastic generation, load etc.). In this work, we develop efficient algorithms to certify stability and feasibility of power flow solutions under various forms of uncertainty. The certificates cover practical operating conditions for several test cases.

Strategy/Strategic Planning II

Contributed Session

Chair: Karim Farhat, Stanford University, 475 Via Ortega, Huang Engineering Center 245A, Stanford, CA, 94305, United States of America, kfarhat@stanford.edu

1 - Product Spacing and The Quest for Survival: Organizational Learning in New Markets

Josué Reynoso, PhD Student, Rensselaer Polytechnic Institute, 124 Ferry Street, Apt. 203, Troy, NY, 12180, United States of America, reynoj5@rpi.edu

In new product markets, entrants make choices about the characteristics of their products. Given the technological and market uncertainties, learning plays a key role on the success of product strategies. While product differentiation is related to faster learning, diffusion dynamics provide incentives to introduce products in the vicinity of what is already in the market. Product-level data is used to analyze this tension as well as pre-entry experience and order-of-entry effects.

2 - Is it Worth Trusting Your Manager?

Elena Kulchina, Assistant Professor, Duke University, Fuqua School of Business, 100 Fuqua Drive, Durham, NC, 27708, United States of America, Elena.Kulchina@duke.edu

Researchers have long been interested in the role of top managers in organizations. The research, however, has paid little attention to the social aspects of the relationships between managers and owners. We focus on one such social aspect: the asymmetry of trust between an owner and a manager. We demonstrate that under-trusted managers are associated with lower firm performance. Conversely, equal trust and over-trust have no negative association with the performance of firms with hired managers.

3 - A Theoretical Synthesis of Research on Strategy Implementation Effectiveness

Alex Tawse, PhD Candidate in Management, University of Houston - Bauer College of Business, 4800 Calhoun Road, Houston, TX, 77004, United States of America, awtawse@uh.edu, Pooya Tabesh

Strategy implementation (SI) is a critical component of organizational performance. Despite extensive efforts by researchers to define and develop factors that determine effective SI, a comprehensive framework of SI has yet to be developed. Through the synthesis of existing research, we propose a model that defines the process of SI, summarizes tools that promote SI effectiveness, and outlines three conditions for successful SI: coordination, commitment, and capability.

4 - Can Divestiture Foster Parent-firm's Innovation? Proactiveness, Experiences and Relative Size

Kyungsuk Lee, Seoul National University Business School, 599 Gwanak-ro, Gwanak-gu, Seoul, 151-916, Korea, Republic of, kxl5060@snu.ac.kr, Dong-kee Rhee, Taewoo Roh

We investigate the impact of post-divestitures on innovative activities at firm-level. This study integrated research on knowledge-based view and organizational inertia and encompassed the model of financial distress in order to evaluate firm's proactive-ness. Our findings contribute to understandings of how proactive divestiture can reinforce knowledge capacity, distant from previous studies that regarded divestiture as a reactive action vis-à-vis financial pressure.

5 - Quantifying Competitive Strategy: Decision Analytic Modeling of Five-forces Framework

Karim Farhat, Stanford University, 475 Via Ortega, Huang Engineering Center 245A, Stanford, CA, 94305, United States of America, kfarhat@stanford.edu

We present a decision-analysis model of Porter's Five-Forces framework, with a case-study in the solar PV industry. While capable of generating valuable insights, the Five-Forces have been mostly assessed qualitatively. This model quantifies the five competitive forces, and it accounts for market uncertainties as well as value-chain decisions. Thus, the model provides executives with a practical and robust methodology to evaluate future profitability and strategically position their business.

Flexible Manufacturing Systems

Contributed Session

Chair: Hakan Gultekin, TOBB University of Economics and Technology, Sogutozu Cad No:43 Sogutozu, Ankara, Turkey, hgultekin@etu.edu.tr

1 - The Optimization of Agile Multi-Product Production Systems through Markov Decision Process

Yuan Feng, Tsinghua University, Department of Automation, Tsinghua University, Beijing, 100084, China, fengyuan1216@gmail.com, Wenhui Fan

In order to optimize the work-in-process (WIP) level in multi-product production systems, Markov Decision Process is used to obtain the optimal workforce scheduling policy, which dynamically allocates the cross-trained workforce according to the system state. The results from simulation experiments show that the WIP level of the optimal policy based on MDP is significantly lower than the WIP levels under Longest Queue, Shortest Queue, Longest Time, Shortest Time and Cyclic Policies in any case.

2 - Modeling and Analysis of a Flexible Manufacturing Cell with Three Machines and a Robot

Mehmet Savsar, Professor, Kuwait University, College of Engineering, P.O. Box 5969, Safat, 13060, Kuwait, mehmet.savsar@ku.edu.kw

This paper presents a stochastic model for analysis of a Flexible Manufacturing Cell (FMC) consisting of three flexible machines, one robot, and a pallet. Batch of parts are conveyed into and out of the cell by the pallet, while the robot loads and unloads the parts. The stochastic model is used to determine system performance measures, including production rate of the cell and utilization of the system components under different operational conditions.

3 - Cell Formation in under Uncertain Demand and Processing Times: A Stochastic Genetic Algorithm (SGA)

Samrat Singh, Research Assistant, North Dakota State University, 1263 17th Avenue North, Unit 20 University Village, Fargo, ND, 58102, United States of America, samrat.singhnepal@gmail.com, Gokhan Egilmez

This study addresses the stochastic cell formation problem with a newly proposed stochastic genetic algorithm (SGA) approach considering stochastic demand and processing times, thus capacity requirements. Statistical analysis was employed to convert the uncertain demand and processing times into stochastic capacity requirements. The stochastic nonlinear mathematical model (SNMM) and the newly proposed SGA approaches are compared on 10, 20 and 30-product problems.

4 - Balancing Dual Gripper Robotic Cells

Hakan Gultekin, TOBB University of Economics and Technology, Sogutozu Cad No:43 Sogutozu, Ankara, Turkey, hgultekin@etu.edu.tr, Betul Coban, Vahid Eghbal Akhlahi

We consider a production line consisting of a number of machines and a dual-gripper robot. Each of the identical parts has a number of. The problem is to assign these operations to the machines satisfying the precedence constraints and to determine the robot activity sequence that jointly maximize the throughput rate. We develop both a mathematical programming formulation and a heuristic algorithm for this complex problem. The performance of the heuristic is tested through computational study.

5 - A Mathematical Model for Perishable Products with Price- and Displayed-stock-dependent Demand

Erhun Kundakcioglu, Ozyegin University, Faculty of Engineering, Istanbul, Turkey, erhun.kundakcioglu@ozyegin.edu.tr, Arda Yenipazarli, Mehmet Onal

In this study, we introduce a single store multi-product order quantity model incorporating product assortment, pricing and space-allocation decisions for perishable products. We assume that the demand rate of a product depends on the selling price and the on-display stock level of that item as well as other products in the assortment. A heuristic method is developed to solve this complex problem and the results are discussed with computational experiments to validate the proposed approach.

Optimization under Uncertainty: Integration of Intermittent and Demand Side Resources in Electric Power Systems

Sponsor: ENRE – Environment I – Environment and Sustainability
Sponsored Session

Chair: Lindsay Anderson, Assistant Professor, Cornell University,
316 Riley Robb Hall, Ithaca, NY, 14853, United States of America,
landerson@cornell.edu

1 - Chance-constrained Optimal Power Flow with Uncertain Reserves

Johanna Mathieu, Assistant Professor, University of Michigan,
1301 Beal Ave, Ann Arbor, MI, 48109, United States of America,
jlmath@umich.edu, Bowen Li, Siqian Shen, Yiling Zhang

Electric loads can be controlled to help the power grid balance supply and demand, but the amount of reserves available from these resources is uncertain. We investigate optimization methods to dispatch power systems with uncertain reserves. Specifically, we formulate a chance-constrained optimal power flow problem and solve it using various scenario-based and analytical methods. We run experimental studies and compare the performance and computational complexity across the cases.

2 - Strategic Price Bidding in Electricity Markets with Only Renewables

Josh Taylor, Assistant Professor, University of Toronto, 10 King's
College Rd., SF 1021C, Toronto, ON, M5S3G4, Canada,
josh.taylor@utoronto.ca, Johanna Mathieu

Renewables have low marginal-to-fixed costs ratios. In a power system with only renewables, the standard marginal-cost pricing mechanism would simply lead to all prices being equal to zero, which would be unsatisfactory. Motivated by other high-fixed, low-marginal cost industries like software and digital media, we analyze an extension of Bertrand-Edgeworth competition in which renewable producers with random capacities compete through a single, non-physical price to fulfill a random demand.

3 - Optimal Development of Wind Farm with Energy Storage in Micro-grid Community

Qing Li, PhD Candidate, Rutgers University, 96 Frelinghuysen
Road, CoRE Building, Room 201, Piscataway, NJ, 08854, United
States of America, ql78@scarletmail.rutgers.edu, Honggang Wang

Wind power has been widely used in micro-grids for local community energy consumptions. While it is clean, sustainable and low operational cost, wind power availability is highly fluctuant. A practical solution to maintain sufficiency is using energy storage. We develop computational models and optimization methods for optimal development and management of wind farm with energy storage. Two-stage optimization framework is proposed to seek and improve the optimal number and placement of turbines.

4 - Social Effects in the Diffusion of Solar Panels: A Dynamic Discrete Choice Approach

Sebastian Souyris, PhD Candidate, The University of Texas at
Austin, 2110 Speedway Stop B6500, Austin, TX, 78712, United
States of America, sebastian.souyris@utexas.edu, Jason A. Duan,
Anant Balakrishnan, Varun Rai

We study the diffusion of residential solar panels by assuming looking forward households. We propose a dynamic discrete choice model, where the households estimate the return on investment and are influenced by previous spatio-temporal distributed adopters. We project the dynamics of the market; thereby, giving insights about where the developers should focus their customer acquisition efforts and what schedule of incentives would be more efficient to stimulate adoption.

Distributed Energy Generation

Cluster: Energy Systems: Design, Operation, Reliability and Maintenance

Invited Session

Chair: Alexandra Newman, Professor, Colorado School of Mines,
Mechanical Engineering, Golden, CO, 80401, United States of America,
anewman@mines.edu

1 - Optimizing A Renewable, Hybrid Distributed Energy Generation System

Gavin Goodall, PhD Student, Colorado School of Mines,
Golden, CO, 80401, United States of America,
ggoodall@mymail.mines.edu

We formulate a mixed integer linear program to select renewable technologies such as wind and solar, and conventional technologies such as diesel generators and batteries, to minimize system costs subject to operational, load, and spinning reserve constraints. We use statistical models to generate realizations of load, solar irradiance and wind speed. Solutions from our optimization model prescribe both a procurement and a dispatch strategy for these realizations, with additional realistic data.

2 - Robust Unit Commitment Problem with Valid Inequalities and Computational Study

Wei Wang, PhD Student, University of South Florida, 4202
E.Fowler Ave. ENB, Tampa, FL, 33620, United States of America,
weiw@mail.usf.edu, Bo Zeng

In order to improve the computational performance of robust unit commitment problem, we study the polyhedron of unit commitment problem, derive some valid inequalities and incorporate them into robust formulation. Preliminary computational results will be presented to evaluate their impact.

3 - Integration of Demand Dynamics and Investment Decisions on Distributed Energy Resources

Farbod Farzan, Rutgers University, 96 Frelinghuysen Road,
Piscataway, Ne, 08901, United States of America,
farbod_farzan@yahoo.com, Farnaz Farzan, Mohsen Jafari

We coupled investment decisions on distributed generation(DG) with demand side management(DSM). An adaptive model is used for load calculations on a premise that expected dynamical effects due to DSM strategies cannot be captured by forecast models. To demonstrate the effect of coupling of DG investment decisions and DSM, three scenarios(S) are presented. SI is used for benchmarking. Load patterns for PEVs are introduced in SII. SIII is an extended version of SII, where smart devices are adopted

4 - Multi-objective Optimization of Grid-connected Decentralized Energy Systems

Ayşe Kocaman, Assistant Professor, Bilkent University, Bilkent
Universitesi, Endüstri Muhendisligi, Ankara, 06800, Turkey,
selin.kocaman@bilkent.edu.tr, Ozlem Karsu

Along with the transition from fossil fuel based centralized energy systems to decentralized renewable energy systems, decision makers will have to make a choice between using two types of electricity, one of which is less expensive but also associated with high CO2 emissions and the other is clean but more costly. Here, we develop a decision support system that decides on the scales of energy production facilities to be used in the process of moving towards decentralized energy systems.

America, aghoniem@isenberg.umass.edu

1 - Performance of Office-based Versus Home-based Call Center Agents: Evidence from Three Industries In

Hyojeong Kim, University of Oregon, 2050 Goodpasture Pl,
Heron Club Apartment 42, Eugene, OR, 97401, United States of
America, hyojeongkim.uoregon@gmail.com, Nagesh Murthy

We examine the performance of call center agents that work from office vis-à-vis those that work from home. The home-based workers achieve significantly higher call productivity without any loss of call service quality. These differences are accentuated by task complexity and call routing clarity perceived by the agents.

2 - The Research on Modularization Order-picking Policy Based on Combination Forecasting

Shuiyin Zhou, Associate Professor, Huazhong University of
Science and Technology, NO. 1037, Luoyu Road, Wuhan,
430074, China, abigale_lm@sina.com, Miao Li

Modularization order-picking policy was proposed to improve the response speed of orders and reduce the cost. The method of determining modules and the process of order-picking were described in detail and mathematic optimal model was established in the article, then algorithms were used to solve the problem. What is more, combination forecasting method was used to get the final module set. The results showed that the policy could improve the efficiency of order-picking effectively.

3 - Optimizing The Online Sellers' Shipping Strategy and Return Service Charge Jointly

Huijun Hou, University of Science and Technology of China,
No.96, Jinzhai Road, Hefei, 230026, China,
hjhou90@mail.ustc.edu.cn, Xiangyu Meng

Our work develops a theoretical model to optimize the sellers' shipping strategy of free shipping or not and return service charge jointly when no-reason return are admitted. The results imply that the sellers should adjust their shipping strategy and return service charge according to the market environment. Data experiments show that the joint optimal decisions could improve the sellers' profit and keep it more stable with the change of the price effectively.

4 - Optimal Routing for Multi-channel Call Centers with Idling Times during the Service Process

Oualid Jouini, Associate Professor, Ecole Centrale Paris, LGI,
Grande Voie des Vignes, Chateauf-Malabry, 92290, France,
oualid.jouini@ecp.fr, Ger Koole, Benjamin Legros

We consider a call center with inbound and outbound jobs. The inbound service is characterized by three successive stages where the second one is a break (idle time for the agent). This leads to a new opportunity to efficiently split the agent time between inbounds and outbounds. We focus on the optimization of the outbound job routing to agents. We prove for the optimal policy that all the time there is at least a systematic treatment of outbounds, either during the break, or between two calls.

5 - Lodging Capacity Analytics for the Qatar 2022 Fifa World Cup

Ahmed Ghoniem, Isenberg School of Management, UMass
Amherst, 121 Presidents Dr., Amherst, MA, 01002, United States
of America, aghoniem@isenberg.umass.edu, Agha Iqbal Ali

Capacity analytics is important for small countries, such as Qatar, that host the FIFA World Cup. We develop an Analytics-Optimization framework that assesses the lodging preparedness of the host country under an array of likely scenarios.

1 - Strategic Decisions for Bringing Innovation to Market in Presence of Spillover Risks

Yunke Mai, Duke University, Durham, NC,
United States of America, yunke.mai@duke.edu, Sasa Pecek

We study optimal sourcing strategies of a technology innovator facing a manufacturer who is also a competitor in the product end market. The competing manufacturer has its own inferior product which could be improved through technology spillover, should a contract with the innovator be secured. We characterize the equilibria and analyze comparative statics in several variants of this supply chain/innovation management game.

2 - Decision Analysis using Holistic Component as Opposed to Conventional Attribute Driven Methodology

Subhabrata Bapi Sen, Adjunct Faculty, Sillberman College of
Business, 32 Rolling Hill Dr, Chatham, NJ, 07928,
United States of America, bapi45@fdu.edu

The holistic approach - 5 stage skill acquisition model that differentiate "knowing how" from "knowing that" is better than multi-attribute decision analysis (MDA) supported by AI which uses decomposition. This truly reflect the decision making as an inscrutable business, a mysterious blending of careful analysis, intuition, and the wisdom and judgement distilled from experience that takes us away from limited rationality to a-rational domain which limit un mindful use of MDA in social policy.

3 - The Impact of Spillover in R and D Competition

Wenxin Xu, Illinois University, United States of
America, wxu9@illinois.edu, Jovan Grahovac, Dharma Kwon

Why are some firms willing to disclose their intellectual properties to their competitors while others are not? To answer this, we investigate a game theoretic duopoly model to examine the impact of spillover on R&D investment strategies when the R&D completion times are uncertain. We find that spillover may or may not hurt the more efficient firm. We identify the conditions under which the more efficient firm benefits from spillover.

4 - Investment in Shared Supplier under Spillover, Uncertainty, and Competition

Youngsoo Kim, University of Illinois at Urbana-Champaign,
Urbana, IL, United States of America, ykim180@illinois.edu,
Anupam Agrawal, Dharma Kwon, Suresh Muthulingam

We consider two competing buyers who can invest into their common supplier under spillover and uncertainty. One firm's investment could be spilled to the other through the shared supplier. Moreover, return on investment is unknown to the buyers though it can be learned based on the supplier's performance. Modeling as real option game, we find two equilibria, one of which has been rarely studied in literature, and we characterize the conditions under which the investment is hastened or delayed.

1 - Nonparametric, Heterogeneous Demand for Autonomous Electric Vehicles

Ricardo Daziano, Assistant Professor, Cornell University,
305 Hollister Hall, Ithaca, NY, 14853, United States of America,
daziano@cornell.edu

In this paper we use data about vehicle preferences, and automation awareness and attitudes. A sample of 1,260 respondents answered a discrete choice experiment especially designed for this study. Several models were estimated, including a semi-parametric random parameter logit (with assumption-free heterogeneity distributions that are a mixture of normals). Estimation of the Gaussian mixture model was implemented in R using the maximum simulated likelihood estimator with analytical gradients.

2 - Deployment and Utilization of Plug-in Electric Vehicles in Round-trip Carsharing Systems

Stephen Zoepf, MIT, 1039 Massachusetts Ave., #302, Cambridge,
MA, 02138, United States of America, szoepf@mac.com,
Alexandre Jacquillat

Plug-in Electric Vehicles (PEVs) can reduce gasoline consumption but are also constrained by range limitations and recharging requirements. We address the problem of PEV utilization in a round-trip carsharing system by optimizing and simulating the assignment of trips to vehicles. We use these results to inform the deployment of PEVs in the carsharing fleet. We find that PEV deployment and utilization can reduce gasoline consumption significantly and improve carsharing operators' profitability.

3 - Connected Vehicle V2i(vehicle-to-infrastructure) Based Microscopic Dynamic Merge Coordination System

Xiaowen Jiang, Ph.d Fellow, Rutgers, The State University of New
Jersey, #736 CORE Building Busch Campus, 96 Frelinghuysen
Rd, Piscataway, NJ, 08854, United States of America,
xiaowen.jiang@rutgers.edu, Peter J. Jin

This paper proposes a connected vehicle V2I (Vehicle-to-Infrastructure) based dynamic merge coordination system. The system assumes DSRC Road-side Unit (RSU) can obtain full vehicle trajectories through radar sensors and will coordinate all DSRC-equipped thru and ramp vehicles. Each ramp vehicle is paired and synchronized with a targeted gap on the through lane. The putative following (PF) vehicle of the gap will be advised to yield and maintain enough gap to allow smooth merging.

4 - Framework for Standalone Application Development for Traffic Management in Ad Hoc Networks

Sayyid Vaqar, KFUPM, P.O. Box 983, Dhahran, 312600,
Saudi Arabia, savaqar@kfupm.edu.sa

Road traffic condition awareness is an important tool in traffic management in intelligent transportation systems. We propose a framework to develop standalone application to be run on participating node in the network that can process information collected from neighboring nodes to predict driving condition down the road. The nodes can communicate with each other for gathering data but processing and decision making is done individually.

5 - On Processing and Evaluating GPS Based Traffic Data

Xiaoyun Zhao, PhD Student, Dalarna University, Sweden,
Högskolan Dalarna, 79188 Falun, Falun, 79188, Sweden,
xzh@du.se, Kenneth Carling, Johan Håkansson

This paper aims to evaluate the reliability of GPS based traffic data to reveal the neglected but susceptible measurement error. We assess the reliability of the data on geographical positioning, speed and altitude for three types of vehicles: bike, car and bus with a randomized experiment. We outline a general procedure for data processing considering no standard software packages or procedures are available in former studies.

Sponsored Session

Chair: Cheng-lung Wu, Senior Lecturer, UNSW Australia, School of Aviation, UNSW Australia, Kensington, NS, 2052, Australia, c.l.wu@unsw.edu.au

1 - Enhanced Delay Propagation Tree Model with Bayesian Network for Modelling Flight Delay Propagation

Cheng-lung Wu, Senior Lecturer, UNSW Australia, School of Aviation, UNSW Australia, Kensington, NS, 2052, Australia, c.l.wu@unsw.edu.au, Weiwei Wu

This paper developed an enhanced Delay Propagation Tree model with Bayesian Network (DPT-BN) to model delay propagation and interdependencies between flights. Results showed that flights have non-homogeneous delay propagation with non-IID delay profiles. The DPT-BN model was used to infer posterior delay profiles with different delay scenarios. We also demonstrated how robust airline scheduling methodologies can benefit from this probability-based delay model.

2 - Integer Programming Based Pairing Generation with Deviation Penalty in Airline Crew Recovery

Hyunsuk Lee, Ph.d Student, McCombs School of Business, The University of Texas at Austin, 2110 Speedway Stop B6500, CBA 5.202, Austin, TX, 78712, United States of America, hyunsuk.lee@utexas.edu, Douglas Fearing

In this paper, we will explore how to model airline scheduling problems (flight/crew scheduling and recovery), and apply IP based pairing generation technique to crew recovery with deviation penalty. In particular, we will control IP based pairing generator by restricting the number of different flights in new pairing. Such a study should hopefully give insights to minimizing deviations from original schedule.

3 - U.S. Commercial Aviation Demand Forecasting with a Panel Data: The Role of Individual Heterogeneity

Mei Liu, Economist, FAA, 6712 Tildenwood Lane, Rockville, MD, 20852, United States of America, chia-mei.liu@faa.gov, Dipasis Bhadra

Studies in aviation demand forecasting have long relied on time series approaches, ignoring the individual heterogeneity in a panel data. Heterogeneity is most evident in the U.S. aviation sector where network effect is prevalent. This paper identifies the route-specific effects from 2000 through 2010 and takes it forward to perform a 4-year-ahead forecasting. We evaluate whether the inclusion of individual heterogeneity reduces forecast errors.

Risk in Freight Transport and Logistics

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Choungryeol Lee, Purdue University, United States of America, lee1210@purdue.edu

1 - Downside Risk Analysis for Planning Intermodal Facility Investments

Irina Benedyk, United States of America, birina@purdue.edu, Hong Zheng, Yuntao Guo, Srinivas Peeta, Ananth Iyer

We apply Down Side Risk analysis to plan intermodal facility investment decisions. The model accounts for factors such as the future global commodity flow changes and demand uncertainty. Experiment results show that tighter downside risk constraints lead to the inland intermodal facilities being preferred for investment compared to the ports. They also suggest that low downside risk values increase the total cost but reduce its variation.

2 - Procuring and Transporting Commodities: Hedging against Price, Demand and Freight Rate Risk with Options

Arum Chockalingam, Assistant Professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612AZ, Netherlands, A.Chockalingam@tue.nl, Taimaz Soltani, Jan Fransoo

We consider a firm that procures and transports a commodity via ocean freight to its production plant where the commodity is converted to a final product to meet customer demand. Transportation of commodities via ocean freight has increased significantly in recent years leading to increasing volatility in the cost of freight transportation. We study how a firm can reduce its procurement and transportation costs using options on procuring the commodity and freight space in a newsvendor setting.

3 - Risk Management Strategies in Transportation Capacity Decisions: An Analytical Approach

Jiho Yoon, Michigan State University, N468 North Business Complex, Michigan State University, East Lansing, MI, 48824-1121, United States of America, yoon@broad.msu.edu, Hakan Yildiz, Sri Talluri

In recent years, access to freight transportation capacity has become a constant issue in the minds of logistics managers due to capacity shortages. In a buyer-seller relationship, reliable, timely, and cost-effective access to transportation is critical to the success of such partnerships. Given this, guaranteed capacity contracts with 3PLs may be appealing to shippers to increase their access to capacity and respond effectively to customer requirements. With this new opportunity, 3PLs must focus on approaches that can assist them in analyzing their options as they promise guaranteed capacity to shippers when faced with uncertain demand and related risks in transportation. In this paper, we analytically analyze three capacity-based risk mitigation strategies and the mixed use of these individual strategies using industry based data to provide insights on which strategy is preferable to the 3PL and under what conditions. We posit that the selection of a strategy is contingent on several conditions faced by both the shipper and the carrier. Although our approach is analytical in nature, it has a high degree of practical utility in that a 3PL can utilize our decision models to effectively analyze and visualize the trade-offs between the different strategies by considering appropriate cost and demand data.

4 - Freight Option-Based Mechanism for Multiple Carrier Collaborative Less-Than-Truckload Logistics

Choungryeol Lee, Purdue University, United States of America, lee1210@purdue.edu, Srinivas Peeta

We propose option-based mechanisms for LTL carrier-to-carrier collaboration to alleviate operational and financial risks resulting from stochastic demand in the operational horizon. It aims to enhance the utilization of fleet capacity and reduce the induced costs of handling demand variability. Numerical experiments illustrate the feasibility and provide useful insights of implementing option-based multiple carrier collaborative LTL logistics.

1 - Computationally Efficient Algorithms for the Calibration of High-resolution Stochastic Traffic Simulators

Chao Zhang, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States of America, chaoz@mit.edu, Carolina Osorio, Gunnar Flütterüd

This work formulates the calibration problem as a simulation-based optimization (SO) problem which is addressed by the metamodel approach. The metamodel combines information from both the simulator and an analytical traffic model that relates the calibration parameters to the simulation-based objective function. The performance of the proposed approach has been tested on a toy network and is currently being evaluated on a large-scale metropolitan network in Berlin, Germany.

2 - Decentralized Traffic Assignment for Multi-level Modeling

Ehsan Jafari, University of Texas at Austin, Austin, TX, United States of America, ejafari@utexas.edu, Stephen Boyles

Statewide planning model is used for planning projects that will have implications on transportation across the entire state. At the same time, medium-sized cities have their own planning model. The process of updating these models in a way that maintains consistency between them is laborious and time-consuming. In this research, a decentralized bi-level modeling approach, based on the concept of network contraction, is proposed to address these issues.

3 - A Simulation-based Optimization Algorithm for Traffic Responsive Control

Linsen Chong, Massachusetts Institute of Technology, Cambridge, MA, United States of America, linsenc@mit.edu, Carolina Osorio

We propose a simulation-based optimization (SO) framework to address generally constrained urban traffic responsive control problems. We develop a tractable dynamic traffic model that is inspired from traffic flow theory, transient queueing theory and is parameterized by time-dependent sensor data. We illustrate the performance of the proposed method through a large-scale urban traffic case study.

4 - Potential Effectiveness of Liability Rules and Automated Vehicles in Reducing Rear-ending Crashes

Indrajit Chatterjee, University of Minnesota, Twin Cities,
500 Pillsbury Drive SE, Minneapolis, MN, 55455,
United States of America, chat0123@umn.edu, Gary Davis

This research focuses on understanding the behavior of drivers involved in rear-ending crashes on congested freeways, and using this understanding to evaluate (a) the safety implications of changes in liability policies where individual drivers are penalized based on degree of causal contribution to the crash and (b) the safety implications of mixtures of human-operated and automated vehicles in the future traffic streams.

1 - Spatial-temporal Traffic Pattern Identification in a Large-Scale Urban Network

Zhenhua Zhang, The University at Buffalo, NY,
United States of America, zhenhuaz@buffalo.edu, Qing He,
Jizhan Gou, Xiaoling Li

We employ the dictionary-based compression method to identify the regional traffic pattern within a large-scale urban network and aim to quantify the traffic pattern fluctuations from different time and space perspectives. Studies unveil characteristics of the geographic pattern distribution, time-of-day pattern fluctuations and the day-to-day pattern differences etc. It can even quantify the influences of the large municipal works on its surrounding traffic.

2 - A Bayesian Mixture Model for Short-term Average Link Travel Time Estimation using Large-scale Limited Information Trip-based Data

Xianyuan Zhan, PhD Candidate, Purdue University, 550 Stadium Mall Drive, School of Civil Engineering, West Lafayette, IN, 47906, United States of America, zhanxianyuan@purdue.edu, Chao Yang, Satish V. Ukkusuri

This paper develops a Bayesian mixture model to estimate the urban link travel times utilizing large-scale limited trip-based data without trajectory information. The model estimates the mean and variance of the average link travel times. A transition model is also introduced as an informative prior to capture the temporal and spatial dependencies of link travel times. An efficient solution approach based on expectation-optimization (EM) algorithm is proposed to solve the problem. The model is tested using a large-scale taxi trip data from New York City.

3 - Exploring Behavior during Hurricane Sandy

Arif Mohaimin Sadri, Purdue University, 149 Arnold Drive,
Apt 12, West Lafayette, IN, 47906, United States of America,
asadri@purdue.edu, Satish V. Ukkusuri

Individuals, being subjected to different personal constraints and environments, may want to evacuate or not during a major hurricane. Evacuation decision can also be influenced by the social network partners. In this study, data has been obtained by interviewing individuals from high storm surge areas of New York and New Jersey. Individuals' social network information were obtained by using an ego-centric approach. A mixed logit model is developed to explain the effects of individual, household and social network characteristics on evacuation decision making.

4 - Temporal-Spatial Domain Trajectory Matching Algorithm

Ali Arian, Graduate Research Assistant, The University of Arizona, 1209 E. Second Street, Room 206A-1, Tucson, AZ, 85721, United States of America, arian@email.arizona.edu, Yi-Chang Chiu

This talk presents a Longest Common Sequence (LCS) based algorithm to compare and match two distinct trajectories for degree similarity based on temporal-spatial domain information matching. Applications of the presented algorithm in passive multi-person carpool matching and day-to-day route set building are presented.

Vehicle Routing II

Contributed Session

Chair: Jiahong Zhao, School of Business, Guangzhou University, NO.230, Guangzhou Daxuecheng Waihuanxilu, Guangzhou, China

1 - An Optimization-Based Heuristic for the School Bus Problems with Regret Minimization

Mehmet Ivgin, Lecturer, Turkish Military Academy,
Devlet Mahallesi Kara Harp Okulu Caddesi, Ankara, Turkey,
mivgin@kho.edu.tr, Elif Rabia Karadeniz

We present in this study an application of the School Bus problem in practice. Based on an integer programming formulation of the School Bus problem, we implemented a heuristic using column generation to solve a real-life instance provided by a public school in Ankara. Our results show that our approach yields a big improvement in terms of customer satisfaction when compared to the previously used scheduling approaches.

2 - A Simulated Annealing Approach to Solve Large-Scale VRP: An Application at GE Appliances & Lighting

Ehsan Khodabandeh, University of Louisville, Speed School of Engineering, Department of Industrial Engineering,
Louisville, KY, 40292, United States of America,
ehsan.khodabandeh@louisville.edu, Sunderesh Heragu,
Lihui Bai, Gerald Evans

A simulated annealing approach with a network shrinking heuristic is considered to solve a vehicle routing problem with time windows where routes have limited duration. The objective is to minimize traveled time and total number of vehicles required. Implementation of this algorithm for solving large-scale problems has positively impacted GE Appliances & Lighting's operation by reducing delivery time from three to two days and by reducing the number of required trucks by half in some instances.

3 - A Branch-and-Price-and-Cut Algorithm for the Generalized Vehicle Routing Problem

Mohammad Reihaneh, Isenberg school of management,
University of Massachusetts Amherst, 121 Presidents Dr.,
Amherst, MA, 01002, United States of America,
mreihaneh@som.umass.edu, Ahmed Ghoniem

We examine the Generalized Vehicle Routing Problem, a VRP variant where customers are partitioned into mutually exclusive clusters, each with a specific demand. We propose a branch-and-price-and-cut algorithm that takes advantage of the characteristics of the problem and treats a GVRP instance with n customers and m clusters nearly as a VRP instance with m customers. Our computational study reports encouraging results.

4 - Rail Freight Service Design with Consideration of Consolidation and Heterogenous Demand

Xiao Lin, PhD Candidate, Tsinghua University, Beijing, China,
lin-x12@mails.tsinghua.edu.cn, Tianhu Deng, Simin Huang

Rail carriers are forced to serve more time-sensitive customers in nowadays China. To serve the new market the China Railway Company need to provide faster transportation service and design differentiated service products. For a consolidation carrier like the rail, faster service means less stops, which further results in less consolidation of freight. This study provides a differentiated service design model that maximize revenue for consolidation carriers facing heterogeneous demand. In solving this problem, we proposed two heuristic methods which can solve the problem of real size and compared its performance with lagrangian relaxation method.

5 - A Multi-Depot Vehicle-Routing Model for the Explosive Waste Recycling

Jiahong Zhao, School of Business, Guangzhou University, No. 230 in Daxuecheng Waihuanxilu, Guangzhou, Guangdong, 510006, China, zhaojiahong1@126.com

The explosive waste recycling is a significant concern because it has immense impacts on economy and safety during its transportation among multiple depots. We develop a multi-depot vehicle-routing model with the minimizations of cost and risk. It is formulated through the two-commodity flow formulation, and characterized by simultaneously planning tours, vehicle acquisitions and return-trips. To solve this model, a modified lexicographic weighted Tchebycheff method is also proposed.

1 - Optimization of Area Traffic Control: A Binary Mixed Integer Linear Programming Approach

Zhao Zhang, Researcher Assistant, Tsinghua University,
Room 615, Shude Bbuilding, Beijing, 100084, China,
zzaxx@tsinghua.edu.cn

This paper proposes a model aims at optimizing area traffic control. We use network total delay as the objective in the model. In this research, cell transmission model is used to discretize research time into many intervals and signal coordination, lane settings, phase, start of green and green split can be optimized simultaneously. The model is linear in nature and can be solved by standard branch and bound algorithm.

2 - A Finite Sampling Approach for MPEC

Wenjing Song, Pennsylvania State University, 628B Oakwood
Ave, State College, PA, 16803, United States of America,
wus145@psu.edu, Terry Friesz, Hongcheng Liu, Tao Yao

We study mathematical program with equilibrium constraints (MPEC) from equilibrium network design problems. We consider the scenario where the equilibrium constraint has a non-closed-form operator, and propose a finite sampling approximation with a tunable error bound. Under some regularity conditions, the approach allows MPEC to be solvable by gradient-based local schemes to an approximate KKT solution with bounded infeasibility. The approach is applied to a congestion toll pricing problem.

3 - Travel Time Transmission Model for Network Loading at Merging, Diverging Segments, and Intersections

Peter J. Jin, Assistant Professor, Rutgers, The State University of
New Jersey, CoRE 613, 96 Frelinghuysen Rd, Piscataway, NJ,
08854, United States of America, peter.j.jin@rutgers.edu,
Stephen Boyles, Wangsu Hu

The research presents an enhanced travel time transmission model (TTM) based dynamic network loading (DNL) model for freeway merging, diverging segment and signalized intersections. The study further evaluates the capability of TTM in formulating node delay. A network adapted from field flow, signal and network data of the US-1 at Far West Interchange in Austin TX is used. The modeling results are compared with the output of a CTM (Cell Transmission Model) based DNL model.

4 - Vehicle (Lagrangian)-space Freeway Traffic State Estimation: A Lagrangian Kalman Filter Approach

Han Yang, PhD, Tongji University, Cao'an Road 4800, Shanghai,
China, yanghan900121@163.com, Peter J. Jin

Lagrangian coordinates has shown the potential numerical benefits in modeling mobile sensor data. A new Kalman filter based Lagrangian-space traffic state estimation model is proposed based on the Travel Time Transmission Model (TTM). The model is calibrated and evaluated by using a simulation model calibrated with field data on IH-894 in Milwaukee, Wisconsin and compared with a CTM-based Kalman filter estimator on space-time coordinates under different sampling rates of probe vehicles.

5 - Vehicle Routing for the Radiopharmaceutical Industry

Ioannis Akrotirianakis, Siemens Corporate Technology,
750 College Road, Princeton, NJ, United States of America,
ioannis.akrotirianakis@siemens.com, Amit Chakraborty

We develop a model for the distribution of radiopharmaceuticals. Our aim is to serve many medical imaging centers within a pre-specified time interval at minimum transportation cost. The model ensures all orders arrive at the centers before the patients enter the PET scanners. It also takes into consideration the availability and capacity of the transportation vehicles. The efficiency of the model is supported by computational results demonstrating substantial savings in transportation costs.

1 - Reliability Approximation for k-out-of-n Pairs:**G Balanced Systems**

Elsayed Elsayed, Rutgers University, 96 Frelinghuysen Road,
CoRE Building, Room 201, Piscataway, NJ, 08854, United States
of America, elsayed@rci.rutgers.edu, Dingguo Hua

Many applications can be modeled as k-out-of-n pairs: G Balanced systems. When there are a large number of units in such systems, it is very tedious and impossible to enumerate the complete set of successful events to obtain the exact function of its reliability. We provide an approach to obtain approximation for the reliability of such systems. We validate the approximation by comparing its results with systems with a small number of units and through the simulation of larger systems.

2 - A Wiener Process Model for Heterogeneous Degradations Based on Kriging

Nan Chen, National University of Singapore, isecn@nus.edu.sg,
Eunshin Byon

Wiener process plays a crucial role in degradation modeling and condition based maintenance for critical assets. This paper proposes a Wiener process model based on Kriging to provide a flexible way to account for heterogeneous degradation patterns commonly observed due to observable or unobservable factors. It includes conventional random effects model and covariate model as special cases, and offers efficient computation. Numerical studies have been conducted to demonstrate the performance.

3 - Condition-based Joint Maintenance Optimization for a Large-scale Homogeneous Population

Young Myoung Ko, Assistant Professor, Pohang University of
Science and Technology, 77, Cheongam-ro, Nam-Gu,
Pohang, Gyeongbuk, 790-784, Korea, Republic of,
youngko@postech.ac.kr, Eunshin Byon

We develop a cost-effective maintenance strategy for systems consisting of homogeneous units. When a large number of units operate in a system, translating the stochastic degradation processes of individual units into system-level information remains a significant challenge. We use the asymptotic distribution for characterizing the system-level condition and analytically derive the threshold values that trigger maintenance operations. The results are verified through numerical experiments.

4 - Uncertainty Analysis for Importance Sampling Estimators with Stochastic Simulations

Youngjun Choe, PhD Candidate, University of Michigan, 1205
Beal Avenue, Ann Arbor, MI, 48109, United States of America,
yjchoe@umich.edu, Eunshin Byon

Stochastic simulations are widely used to model real-world stochastic systems and to evaluate the system reliability. Yet, the reliability evaluation can take significant computational resources as the simulator becomes more realistic. To speed up the computer experiments, our prior study proposed new importance sampling estimators. This study establishes the central limit theorems for the estimators and constructs asymptotically valid confidence intervals.

Chair: Yin Shu, University of Houston, E206 Engineering Bldg.2, Houston, TX, 77204, United States of America, yinshulx@gmail.com

1 - Detecting Entropy Increase in Categorical Data using Maximum Entropy Distribution

Devashish Das, Research Assistant, University of Wisconsin, Madis, 124 North Breeze Terrace Apt. E, Madison, WI, 53726, United States of America, ddas3@wisc.edu, Shiyu Zhou

In work, we propose a statistical monitoring method to detect the increase of entropy in categorical data. First, we propose a distribution estimation method to approximate the probability distribution of the observed categorical data. Then we use this procedure to estimate the non-parametric, maximum entropy distribution of an observed data sample and use it for statistical monitoring.

2 - A Conditioned-Based Maintenance Policy for a Two-Component System

Ameneh Forouzandeh Shahraki, NDSU, 1220, 10th St. N, #101, Fargo, ND, United States of America, ameneh.forouzandehsh@ndsu.edu, Om Yadav

This paper proposes an optimal conditioned-based maintenance policy for a two-unit deteriorating system with economic dependency. Each unit is monitored by remaining useful life based-inspection policy and is maintained by corrective, perfect or imperfect maintenance actions. We propose a general maintenance decision framework to select optimal maintenance actions and to optimize the grouping of maintenance actions for both components at the same time.

3 - Optimal Decision Making for Systems with Multifunctional Components

Yiwen Xu, University of Arizona, RM111, 1127 E. James E. Rogers Way, Tucson, AZ, United States of America, yiwen.xu6@gmail.com, Haitao Liao

We studied systems with multifunctional components. The goal is to make an optimal decision to maximize the system reliability when a failure occurs. Properties and numerical studies are included.

4 - Non-Gaussian Ornstein-Uhlenbeck Processes in Degradation-based Reliability Analysis

Yin Shu, University of Houston, E206 Engineering Bldg.2, Houston, TX, 77204, United States of America, yinshulx@gmail.com, Qianmei Feng, Hao Liu, Edward Kao

We use non-Gaussian Ornstein-Uhlenbeck (OU) processes to model the evolution of degradation with random jumps. The superiority of our models stems from their flexibility in modeling stylized features of degradation data series such as nonlinearity, jumps fluctuation, asymmetry, and heavy tails. Based on Fokker-Planck equations, we derive explicit results for reliability characteristics represented by Levy measures. Our models are applicable for analyzing a great deal of degradation phenomenon.

5 - A Flexible Random Effects Zero-inflated Model for the Study of Copper Hillocks Growth

Guilin Li, National University of Singapore, #07-17 Blk E1, Engineering Drive 2, NUS, Singapore, 117576, Singapore, guilin_li@u.nus.edu, Szu Hui Ng, Daniel Chua, Royston Tan

An experiment was conducted to measure the metal layer shorts in integrated circuits caused by copper hillocks to improve the process. Two features of the collected short counts are identified: excessive zeros and multi-level variations. A zero-inflated model with flexible random effects was proposed. Statistical inference procedures are also developed.

1 - Exact Efficient Simulation of Stochastic Differential Equations

Apaar Sadhwani, PhD Student, Stanford University, 212L, Huang Engineering Center, 475 Via Ortega, Stanford, Ca, 94305, United States of America, apaars@stanford.edu, Kay Giesecke

We present practical techniques to improve the efficiency of exact simulation of SDEs. Our proposed acceptance-rejection algorithm is an order of magnitude faster than existing methods and alleviates the problem of sample paths hitting unreachable boundaries. To achieve this speedup, we develop a novel method for

simulating hitting time of Brownian Meander to a fixed boundary. Numerical experiments show that our method performs 10-15x faster than current methods.

2 - Modeling and Simulation of Automotive Assembly Line

Ahad Ali, Associate Professor, Lawrence Technological University, 21000 West Ten Mile Road, Canton, MI, 48188, United States of America, aali@ltu.edu, Don Reimer

This paper provides methods to create a valid representation of a automotive assembly using modeling and simulation. Various performance analysis are presented with statistical validation. The use of the mean steady state 90% confidence interval was used to measure job per hour for the simulation model to the current system. DOE and RSM will be used and analyzed.

3 - Promoting Loose Coupling in Simulation Models: The Service Broker Approach

Sunil Kothari, Researcher, Hewlett-Packard, 1501 Page Mill Road, Bldg 2U, Palo Alto, CA, 94304, United States of America, sunil.kothari@hp.com, Jun Zeng, Gary Dispoto, Francisco Oblea

Many simulation models are not designed for reuse since the development of reusable models can take significant investment in time and effort since they have to be abstracted over all possible use cases. We illustrate the service broker architecture in the context of industrial printing domain. The service broker architecture ensures that the resources are loosely coupled to demand. We highlight two case studies to show our approach.

4 - Maximal On-time Delivery by Soft-pegging in Wafer Fab under Consideration of Hierarchical Mes

Joon Young Lee, ASU ME, 850 S. McAllister Ave., Tempe, AZ, 85287, United States of America, joon.lee@asu.edu

Under given hierarchical production planning and control of the MES, assignment policy (soft-pegging) is considered in order to maximize customer service level in semiconductor wafer fabrication processes. A wafer fab is modeled and several input scenarios were experimented to see the effects of the policy. On-time delivery is maximized in equilibrium state at a diversification point by proper assignment policy.

5 - Knowledge Evolution in a Dynamic R&d Team from the Perspective of Task Performance

Ni Xia, Mr., School of Management, Huazhong University of Science and Technology, No.1037, LuoYu Road, Hongshan District, Wuhan, 430074, China, xntx128390@163.com

We leverage learning by doing to establish a model of knowledge evolution in a R&D team, and simulate the effects of strength of team dynamics, task load, task complexity. Simulation results indicate that dynamic strength has greater damage to group knowledge than individual knowledge. It not only destroys group knowledge, but also benefit knowledge recovery. We also find low task load benefits knowledge restore but harms knowledge increase, while task complexity cannot take significant effects.

1 - Price and Quantity Competition in Mixed Market with a Common Retailer

Jian Liu, Dr., Hohai University, Focheng West Road No.8, Business School, Hohai University, Nanjing, JS, 211100, China, liujane1124@126.com, Sun Li, Huimin Wang

This paper investigates the public supplier and the private supplier's equilibrium pricing and quantity decisions in mixed market. Through comparing these equilibrium results under different game, we find that under Cournot competition, the whole market is in prison's dilemma. Under Bertrand competition, the market equilibrium exists when the product differentiation is lower, where the public supplier is leader and the private one is follower.

2 - Real-time Demand Forecasting in a 3-stage Fast-fashion Retail Supply Chain

Sanchoy Das, Professor, New Jersey Institute of Technology, University Heights, Newark, NJ, 07102, United States of America, das@njit.edu, Jingran Zhang

Demand forecasting is a critical issue as a premise of supply positioning in a fast fashion supply chain. This paper is focused on a fast fashion retailer that sells a single product in a finite selling season, with demand uncertainty and stage switching. Products are sold in three sequential stages, regular, clearance and outlet. We derive the demand forecast by a modified exponential-weighted moving average.

3 - Organizational Structure of A Global Supply Chain in the Presence of a Gray Market

Bosung Kim, Ph.D Student, KAIST(Korea Advanced Institute of Science and Technology), 85 Hoegiro, Dongdaemun-Gu, Seoul, Korea, Republic of, kim-bs@business.kaist.ac.kr, Kun Soo Park

We consider the organizational structure of a multinational firm (MNF) that distributes its product to low-price and high-price markets. MNF competes with the gray marketer with parallel import. We analyze the impact of information asymmetry and consumers' valuation difference in the choice of organizational structure.

4 - Does Transshipment Benefit Newsvendors under Limited Supply?

Ziteng Wang, Department of Industrial and Systems Engineering, North Carolina State University, 111 Lampe Dr., Daniels 443, Raleigh, NC, 27695, United States of America, zzwang23@ncsu.edu, Shu-chen Fang

In a supply chain consisting of one supplier and two newsvendor-type retailers, inventory transshipment after demand realization can benefit both newsvendors. When the supply capacity is limited, however, we find that one of the newsvendors may be hurt. Insights are discussed and a coordinating mechanism is designed.

Auctions/Mechanism Design

Contributed Session

Chair: Su Xiu Xu, The University of Hong Kong, LG108, Composite Building, HKU, Hong Kong, 999077, Hong Kong - PRC, xusuxiu@gmail.com

1 - Pro-competitive Rationing in Multi-unit Auctions

Par Holmberg, Associate Professor, Research Institute of Industrial Organization, Box 55665, Stockholm, SE10215, Sweden, par.holmberg@ifn.se

In multi-unit auctions, rationing rules break ties between multiple marginal bids. The standard approach is to ration marginal bids proportionally. This paper shows how bidding can be made more competitive if the rationing rule depends on the clearing price and gives increasing priority to bidders with a small volume of marginal bids at clearing prices closer to the reservation price. This can have almost the same effect on the competitiveness of bids as a doubling of the number of bidders.

2 - Modeling Electricity Coalition Payoff Disaggregation: A Multi-Agent Framework

Abbas Ehsanfar, Stevens Institute of Technology, Babbio 516, 6th & River St., Stevens Institute of Tech., Hoboken, NJ, 07030, United States of America, aehsanfa@stevens.edu, Babak Heydari

We formulate the electricity consumer and producer coalition in the electricity market. The cooperation is formulated according to the functionality of electricity day-ahead and real-time wholesale markets and a mathematical model is proposed to disaggregate the cooperative payoff among consumers. A multi-agent approach is applied to create a competitive realistic environment for participants.

3 - An Empirical Study on Recyclers' Valuation of Plastic Bottle Recycling in Auctions in Japan

Kazuaki Okubo, Saitama University, 255 Shimo-Okubo, Sakura-ku, Saitama, Japan, okubo@dp.civil.saitama-u.ac.jp

In Japan, electronic bidding is conducted on contracts for recycling polyethylene terephthalate bottles in municipality-based auctions. Recyclers and municipalities are spatially distributed and recyclers can bid in certain municipalities. Predicted bottle amounts at auctions often differ from post-contract amounts. We use a structural model and data from these auctions to empirically examine the impact of recyclers' distance from municipalities, and of amount differences, on their valuations.

4 - Social Welfare in Repeated Task Allocation in Transportation

Qing Chuan Ye, Erasmus University Rotterdam, Burg. Oudlaan 50, Rotterdam, Netherlands, ye@ese.eur.nl, Yingqian Zhang

We investigate the social welfare and behaviour of agents in repeated task allocation problems in transportation by looking at social welfare throughout the system, and the role behaviour plays in the system and agents' willingness to participate. We make use of two task allocation mechanisms, one only considering optimality in terms of costs and the other considering optimality in terms of primarily fairness and secondarily costs. Fairness incentivizes agents to keep participating.

5 - Intermodal Transportation Auctions for B2b E-commerce Logistics with Transaction Costs

Su Xiu Xu, The University of Hong Kong, LG108, Composite Building, Hong Kong, 999077, Hong Kong - PRC, xusuxiu@gmail.com, Meng Cheng, George Q. Huang

We propose efficient intermodal transportation auctions for the B2B e-commerce logistics problem (ELP). This paper is the first to consider transaction costs into auctions. The shipper (a B2B e-commerce platform) bears transaction costs while goods sellers or buyers pay 3PLs' intermodal services. Total logistics chain cost is minimized. Incorporating transaction costs leads to considerable cost saving for the shipper and logistics chain, as well as higher profitability for the group of 3PLs.

1 - Medical Evacuation from The Battlefield under Uncertainty

Miguel Lejeune, Associate Professor, The George Washington University, 2201 G Street, NW, Fungar Hall, Suite 415, Washington, DC, 20052, United States of America, mlejeune@gwu.edu, Francois Margot

We propose stochastic optimization models that maximize the number of CAT A high-priority casualties transported to a medical center within one hour. Uncertainty stems from the difficulty to reach the casualty locations and the load of the air ambulances. We derive MINLP reformulations and propose algorithmic methods.

2 - Evaluating The Impact of Hospital Efficiency on Wellness in The Military Health System

Eric Swenson, Pennsylvania State University, University Park, PA, United States of America, es187@psu.edu, Nathaniel Bastian, Hyojung Kang, Lawrence Fulton, Paul Griffin

Like all healthcare delivery systems, the U.S. military health system strives to achieve top preventative care and population health outcomes for its members while operating at an efficient performance level. This work uses DEA, SFA, and panel regression to investigate the relationship between hospital efficiency and wellness over time within the military health system. Comparisons are made using 128 military hospitals and clinics in the Army, Navy and Air Force from 2011 - 2013.

3 - Optimizing Military Medevac Dispatching: A Multi-objective Markov Decision Process Model

Benjamin Grannan, Virginia Military Institute, Lexington, VA,
United States of America, grannanbc@vmi.edu, Nathaniel
Bastian, Lawrence Fulton, Mort Webster, Paul Griffin

We present an infinite horizon Multi-Objective Markov Decision Process model to optimize sequential resource allocation decision-making in the military medical evacuation of wartime casualties, which consists of identifying how many/which air assets to dispatch in response to a casualty event and which mobile hospital to transport the patients to. These sequential decisions are complicated due to uncertain casualty demand, distinguishable mobile hospitals, and multiple conflicting objectives.

4 - Stochastic Multi-objective Auto-optimization for Resource Allocation Decision-making

Nathaniel Bastian, Pennsylvania State University, 362 Leonhard
Building, University Park, PA, 16823, United States of America,
nathaniel.bastian@fulbrightmail.org, Lawrence Fulton, Benjamin
Grannan, Tahir Ekin, Hyojung Kang, Paul Griffin

The military health system is a large, centrally-funded and controlled health system that is challenged to provide healthcare delivery and health services at certain quality and workload levels with a fixed amount of input resources. We present a stochastic multi-objective auto-optimization model to help health system decision-makers automatically re-allocate input resources across hospitals for difference levels of resource uncertainty as to optimize overall system performance.

Scheduling IV

Contributed Session

Chair: Hossein Soroush, Professor, Kuwait University, Dept. of Stat. & Opns. Res., POB 5969, Safat, 13060, Kuwait, h.soroush@ku.edu.kw

1 - Heuristics for Scheduling Parallel Machines to Minimize Weighted Squared Tardiness

Jeffrey Schaller, Professor, Eastern Connecticut State University,
83 Windham St., Department of Business Administration,
Willimantic, CT, 06226, United States of America,
schallerj@easternct.edu, Jorge Valente

This paper considers a problem in which there is a set of jobs to be sequenced on identical parallel machines. Each job has a weight and the objective is to sequence the jobs to minimize total weighted squared tardiness. Several heuristics are presented and are tested on randomly generated problems of various numbers of jobs, numbers of machines, due date tightness and due date ranges. The results show that some heuristics find good solutions in a minimal amount of processing time.

2 - Investigation of Algorithms for No-Wait Flowshops

Ali Allahverdi, Professor, Kuwait University, P.O. Box 5969,
Safat, Kuwait, ali.allahverdi@ku.edu.kw

The m-machine no-wait flowshop scheduling problem of minimizing total completion time is addressed where makespan is constrained to be less than a certain value and where setup times are considered as separate from processing times. Several new algorithms are proposed and shown to be efficient.

3 - Synchronized Scheduling in Hybrid Flowshop with Dynamic Customer Order Arrivals

Jian Chen, The University of Hong Kong, LG 108,
Composite Building, Hong Kong, Hong Kong - PRC,
justinchenjian@gmail.com, George Q. Huang

We consider a synchronized scheduling of dynamic arriving customer orders in a hybrid flowshop. The objective is to achieve synchronized production that all products of a same order are simultaneously completed so that they are shipped in a batch. We decompose the dynamic problem into a series of periodic sub-problems. A mixed integer programming model is formulated for sub-problem which is solved by genetic algorithm. Numerical studies obtain several significant findings.

4 - Simulation Based Approximate Dynamic Programming for Stochastic Resource-constrained Project Scheduling

Yasin Gocgun, Assistant Professor, Istanbul Kemerburgaz
University, Mahmutbey Mah., Dilmelenler Cad.No: 26, Istanbul,
Turkey, yasin.gocgun@kemerburgaz.edu.tr, Archis Ghate,
Mahshid Parizi

We study dynamic stochastic resource-constrained project scheduling problems. We formulate these problems as Markov decision processes (MDPs). Since the state and actions spaces of the underlying MDP grow exponentially in parameters such as the number of project types and queue capacity, we pursue an approximate dynamic programming (ADP) approach. We compare the performance of the ADP technique against the myopic method.

5 - Scheduling with Convex Resource Allocation, Learning Effects, Job Deterioration, and Setup Times

Hossein Soroush, Professor, Kuwait University,
Dept. of Stat. & Opns. Res., POB 5969, Safat, 13060, Kuwait,
h.soroush@ku.edu.kw

We study single machine scheduling problems with convex resource dependent processing times, job learning and deterioration, and setup times. Polynomial time algorithms are proposed to find the optimal sequences and the optimal resource allocations that either minimize a composite function of some criteria subject to the constraint that the total resource cost does not exceed a given amount, or minimize the total resource cost such that the composite function does not surpass a specific limit.

Inventory Management for Supply Chains II

Contributed Session

Chair: Yang Bo, PhD, University of Texas at Dallas,
800 West Campbell Rd., Richardson, TX, United States of America,
yxb120630@utdallas.edu

1 - A Three-Level Supply Chain with Up and Down-Stream Trade Credit Periods Linked to Ordered Quantity

Roshanak Akram, university of Tennessee, Knoxville, 727 Front
Avenue, Apartment 9, Knoxville, TN, 37902, United States of
America, roshanak@utk.edu, Rupy Sawhney

An EPQ model from manufacturer perspective in a 3-echelon supply chain is developed to minimize total cost considering that a trade credit is offered to the manufacturer, if his order quantity is more than a predetermined value. Customers are permitted to pay off manufacturer in a same or contrary credit period. Defective items can be produced and all would become perfect after rework. Optimal solutions for production lot size and backlogged shortage are obtained based on convex optimization.

2 - A Note on Integrality in Deterministic and Stochastic Inventory Models

Yang Bo, PhD, University of Texas at Dallas, 800 West Campbell
Rd., Richardson, TX, United States of America,
yxb120630@utdallas.edu

The "integrality" question for dynamic optimization models of inventory control asks if there exists an integral optimal policy, given integral initial inventory levels, capacities and demand realizations. For single-product, stochastic-demand problems in multi-echelon assembly systems, the answer is yes (Chen et al. 2013). For single-product, multi-echelon distribution and assembly-distribution systems, integrality holds under deterministic demands, but fails to hold under stochastic demands.

3 - A Joint Replenishment Problem with Dissimilar Items

Linda Li, Student, University of Alabama, 1105 17th Street,
5102A, Tuscaloosa, AL, 35401, United States of America,
lczy1985@163.com, Charles Schmidt

We study a joint replenishment problem with dissimilar items and demand of Poisson process. A class of continuous review policies is considered. The class is defined by three characteristics. Finding the optimal policy out of the class is demonstrated to be a combinatorial optimization problem. The findings reveal that the joint inventory position (a vector) is actually a subordinated continuous time Markov Chain. A new methodology is developed to solve this type of model.

Business Applications II

Contributed Session

Chair: James Ang, Research Advisor, The Logistics Institute Asia Pacific,
National University of Singapore, #04-01 21 Heng Mui Keng Terrace,
Singapore, 119613, Singapore, bizangsk@nus.edu.sg

1 - A Framework for Customer Analytics on Massive Data Sets

Ming Xie, IBM, Diamond Bld, ZGC Software Park, Beijing, China,
xieming@cn.ibm.com, Changrui Ren, Tianzhi Zhao, Miao He,
Jian Xu, Zhen Huang, Yuhui Fu

With the rapid growth of the amount of data accumulated, companies are facing opportunities and challenges for efficiently analyzing these massive data to generate insights and help business. Here we present a framework that leverages big data foundation to provide efficient customer analytical models designed to support the key customer service scenarios in banks. This framework has been verified in real cases.

2 - Data Science Approach for Dealership Performance Analysis

Haidar Almohri, Wayne State University, Detroit, MI, 48243,
United States of America, almohri@wayne.edu, Mark Colosimo,
Ratna Babu Chinnam

Due to the dynamics and complexity of the automotive market, managing automotive dealership performance has always been a challenge for business owners. We present a novel, data science approach for managing, assessing, and enhancing dealership performance using data from dealerships across the United States by first clustering the dealers. Results suggest that this new approach surpasses the traditional approach employed by the industry.

3 - Overview of Supply Chain Risk Management and the Current Issues of Closed-loop Supply Chain in China

Qiang Qiang, Pennsylvania State University, 30 E. Swedesford Rd., Malvern, PA, 19335, United States of America, qzq10@psu.edu

The path toward sustainability to demonstrate environmental and social responsibility has led to an increasing attention to the lifecycle of a product with a focus on value-added recovery activities. However, besides the risks encountered in traditional supply chains (or, sometimes referred to as the forward supply chain), the CLSC bears additional layer of risks if the products are not properly recycled. In this talk, we will provide an overview of both supply chain and CLSC risks in China.

4 - Supply Chain Risk

James Ang, Research Advisor, The Logistics Institute Asia Pacific, National University of Singapore, #04-01 21 Heng Mui Keng Terrace, Singapore, 119613, Singapore, bizangsk@nus.edu.sg

Supply chain risk analysis involves risk identification assessment. For the former, the failure mode effect analysis is improved using fuzzy theory and grey system theory. For the latter, simulation models of supply chains are built to quantitatively assess impacts of risks in terms of production rate, inventory level, and lead-time.

The Social Impacts of Social Media Analysis

Cluster: Social Media Analytics

Invited Session

Chair: Les Servi, The MITRE Corporation, 202 Burlington Road, Bedford, MA, United States of America, lservi@mitre.org

1 - Modeling Human Behavior in the Context of Social Media During Extreme Events

Yulia Tyshchuk, Researcher, USMA, 5 Winding Brook Dr. Apt. 2J, Guilderland, NY, 12084, United States of America, yulia.tyshchuk@gmail.com

This research examines how social science theory, Theory of Planned Behavior, can explain human behavior in response to extreme events on social media. Validation of this theory enables emergency response officials to create strategies that facilitate public response to extreme events such as diffusion of critical actionable information, providing confirmations, and taking the prescribed action. Effective public response can save lives and reduce property damage.

2 - Social Media Whispers during IPO Quiet Period

Julie Zhang, Assistant Professor, University of Massachusetts Lowell, One University Ave., Lowell, MA, 01854, United States of America, juheng_zhang@uml.edu

We investigate social media news for companies during their quiet periods for IPO. In this study, we examine whether the stock price of a company on its IPO day is associated with the volume and valence of its social media coverage during quiet period. We demonstrate the relationship between a company's stock price PARK volatility in the first week of IPO and its social media coverage in the first week and quiet period.

3 - Simulating Twitter Ego Networks

Inbal Yahav, Bar Ilan University, Bar Ilan University, Ramat Gan, 5290002, Israel, yoavac@gmail.com, Yoav Achiam

The network on the 2-level (followers, and their followers) Twitter social ego-network is studied. A simulation based on A. Barabasi's model is generated. The collected data contains the followers' names and a count of their followers. We found that followers' distribution follows a combination of power law and exponential distributions. The distribution of followers per companies (having more than 1000 followers) is steady over time, with a constant rate of new followers and departing followers

Portfolio Analysis I

Contributed Session

Chair: Umit Saglam, Assistant Professor, East Tennessee State University, Department of Management and Marketing, College of Business and Technology, Johnson City, TN, 37614, United States of America, saglam@etsu.edu

1 - Understanding Behaviors of Robust Portfolios

Woo Chang Kim, Associate Professor, KAIST, 291 Daehak-Ro, Yuseong-Gu, Daejeon, Korea, Republic of, wkim@kaist.ac.kr

Robust portfolio optimization has been developed to resolve the high sensitivity to inputs of the Markowitz mean-variance model. Although much effort has been put into forming robust portfolios, there have not been many attempts to analyze the characteristics of portfolios formed from robust optimization. In this presentation, we discuss the recent findings on the qualitative characteristics of the robust portfolios such as higher moment controllability, factor tilting behaviors, and robustness.

2 - Computing Near-optimal Value-at-risk Portfolios using Integer Programming Techniques

Onur Babat, PhD Student, Lehigh University, 217 W. Packer Ave, Bethlehem, PA, 18015, United States of America, onur.babat@lehigh.edu, Juan Vera, Luis Zuluaga

VaR is a non-convex risk measure. It is well-known that the VaR portfolio problem can be formulated as an integer program (IP), which can be difficult to solve with current IP solvers for large-scale instances of the problem. To tackle this drawback, we present an algorithm to compute near-optimal VaR portfolios that takes advantage this IP formulation and provides a guarantee of the near-optimality of the solution. Numerical results will be presented.

3 - Portfolio Optimization with Probabilistic Ratio Constraints

Ran Ji, PhD Candidate, The George Washington University, 2201 G St, NW, Fungler 415H, Washington, DC, 20052, United States of America, jiran@gwmail.gwu.edu, Miguel Lejeune

We propose a class of stochastic portfolio optimization models with probabilistic ratio constraints. The proposed probabilistic reward-risk ratio measures regard the asset returns/losses as random variables to mitigate the estimation risk due to mean return vectors. Each model includes a chance constraint with random technology matrix. We expand a combinatorial modeling framework to represent the feasible set of the chance constraint as a set of mixed-integer linear inequalities.

4 - A Marginal Conditional Stochastic Dominance Based Model of Enhanced Index Tracking

Qian Li, Professor, Xi'an Jiaotong University, No.74 West Yanta Road, Xi'an, China, lqian@mail.xjtu.edu.cn, Liang Bao

Stochastic dominance and mean-variance are two criteria used in optimal portfolio selection. In this paper, we present an enhanced model for index tracking with Marginal Conditional Stochastic Dominance (MCSD) rules. The model is still in the optimization framework but combined with two levels of MCSD criteria. By adopting an immunity based multiple objective optimization algorithm, the solutions for the model are developed. The model is then applied to 8 major markets.

5 - Revealed Preferences for Portfolio Selection – Does Skewness Matter?

Umit Saglam, Assistant Professor, East Tennessee State University, Department of Management and Marketing, College of Business and Technology, Johnson City, TN, 37614, United States of America, saglam@etsu.edu, Merrill Liechty

In this study, we consider two competing descriptions of portfolio selection, the traditional mean variance efficient portfolio versus a generalization allowing for decision makers to consider skewness in their asset allocation. Our numerical experiments are conducted on portfolio drawn from 30 different stocks from the Dow Jones. Numerical results show that investors' preferences are better explained when skewness is taken into account.

Risk Analysis I

Contributed Session

Chair: John Guo, Head of Consumer Credit Risk Analytics and Modeling, Fifth Third Bank, 5001 Kingsley Drive, Cincinnati, OH, 45227, United States of America, john.guo@53.com

1 - A Total Systems Framework to Integrate Risk, Safety and Quality Management Models

Mehdi Dorri, Solico Food Inc., East Azerbaijan Ave.
No.103, Tehran, Iran, me.dorri@gmail.com

Organizations that pursue excellence in their performance require to focus on systematic quality and performance improvement of all the components of their system. Integrated and collaborative quality, safety and risk management strategies, including ISO and OHSAS standards, Lean and Six Sigma, enable organizations to develop a strategy to identify critical performance measures for all the components of the system.

2 - The Determinants of Property Damage: Evidence from Hurricane Sandy

Sisi Meng, Dept. of Economics, Florida International University,
University Park Campus, Miami, FL, United States of America,
smeng003@fiu.edu, Pallab Mozumder

This paper analyzes the determinants of property damage caused by hurricane Sandy. We have constructed a hurricane destruction index by using HAZUS-MH. The effectiveness of hurricane preparedness and housing characteristics have been incorporated in explaining variations in property damages. Our results suggest that hurricane intensity has a large negative impact on property damages while effective hurricane preparedness can potentially reduce damages.

3 - Analysis of the Unimodality of the Newsvendor Problem with Mean-variance Trade-off

Javier Rubio-Herrero, Rutgers University, Piscataway, NJ,
United States of America, javier.rubioherrero@rutgers.edu,
Melike Baykal-Görsoy

We introduce an analysis on the conditions needed for the unimodality of the single-period newsvendor problem with two decision variables, namely, price and quantity. The analysis is carried for two different price-dependent functions commonly known as additive and multiplicative. We add risk considerations to the discussion by introducing a mean-variance trade-off used to model risk-averse and risk-seeking situations.

4 - A Two-Stage Approach in Consumer PD Models

John Guo, Head of Consumer Credit Risk Analytics and Modeling, Fifth Third Bank, 5001 Kingsley Drive, Cincinnati, OH, 45227, United States of America, john.guo@53.com

5/3 consumer risk analytics and modeling team proposed a novel two-stage approach to address a major drawback in the legacy modeling framework to predict the probability of default in Expected Loss models by the means of injecting macroeconomic dynamics into loan-level risk characteristics. The innovative two-stage approach not only successfully enhanced 5/3 consumer PD model framework but also addressed a common challenge faced by DFAST and CCAR practitioners.

1 - Impact of Open Innovation on Academic Performance of Firms in Nanotechnology Industry

Arman Sadreddin, Graduate Student - M.sc, Concordia
University, Montreal, QC, H3H 2J8, Canada,
a_sadre@encs.concordia.ca, Andrea Schiffauerova

This research focuses on open business models in nanotechnology industry. Based on a statistical analysis on a data, which was gathered from online survey, and simulation result, the frequency of applying two main types of open innovation practices were identified. Also, the impact of applying these practices on academic performance of firms were studied. This research found that applying both types of practices at the same time will lead to have more academic outcomes.

2 - Collaboration Network of Nano-tech Firms:**Open Innovation Approach**

Ehsan Ghalamzan, Research Assistant, Concordia University,
1455 De Maisonneuve Blvd. W., Montreal, QC, H3G1M8,
Canada, ehsan.ghl@gmail.com, Arman Sadreddin,
Andrea Schiffauerova

A substantial body of literature has been concerned about the collaboration networks and their importance in production and distribution of scientific knowledge on one hand, and Open Innovation and its innovative power for firms on the other hand. But no one pays attention to the impact of Open Innovation practices on collaboration network properties of the firm. This article aims to study the relation between applying OI practices and how the company stands in the network of its collaborators.

3 - University Technology Transfer: A Cross-national Comparison

Alfonso Cruz, Professor, Catholic University of Chile, School of Engineering, Avenida Vicuña Mackenna 4860, Campus
San Joaquín, Macul, Santiago, 7820436, Chile, acruzn@uc.cl

This paper compares Spanish universities' technology transfer (TT) output and performance with similar universities in the United States. The study reveals that, for equivalent research & development expenditure, Spanish universities have lower levels of TT in spite of proportionally similar intellectual property protection activity. The most noticeable gaps found are the number of contracts licensed and licensing incomes, although startup creation shows comparable numbers in both countries.

4 - M&As as Substitutes or Stepping Stones to Innovation?**Examining the Impact of Financial Crisis**

Jiwon Hwang, Seoul National University, Ichondong
Yongsangu Kangchon Apt.101-807, Seoul, Korea, Republic of,
kyliehwang@gmail.com, Christine Choi

With the increase of knowledge intensive M&As, interest in the effect that M&A has on post-M&A innovation has been on the rise. This research strives to examine the strategic choice of whether M&As are used as substitutes or stepping stones to subsequent innovation efforts, by utilizing propensity score matching and DID methods. This paper further studies whether such choices differ between deals conducted during financial crisis and those conducted in non-financial crisis.

E-Business/Commerce II

Contributed Session

Chair: Shikui Wu, Assistant Professor, Ryerson University, 350 Victoria St., TRS 2-015, Toronto, Canada, shikui.wu@ryerson.ca

1 - The Impact of O2O Strategy Announcements on the Market Value of Firms in China

Yang Hu, Huazhong University of Science and Technology,
School of Management 310 Lab, Wuhan, China,
huyang_3648@hust.edu.cn, Jun Yang, Wei Lu

O2O (online to offline) e-commerce mode which combines offline business opportunities with the Internet is blooming in China. Based on 105 samples from 2013 to 2015, we use event study methodology to examine the stock market reaction to O2O announcements. Furthermore, hypotheses concerning factors such as industry type, platform type, product type and risk warning are developed and tested. The results provide useful implications for making decisions about O2O mode to maximize the business value.

2 - When are Online Reviews Most Helpful? The Review Significance Index

Anupama Dash, Graduate Student, University of Maryland,
Baltimore County, 1000 Hilltop Circle, Baltimore, MD, 21250,
United States of America, adash1@umbc.edu, Nazrul Shaikh,
Margaret Ricciuti

Our research looks into the interplay between the product and review characteristics with the aim of (a) determining when reviews are most helpful, (b) indexing products on the basis a review significance index (RSI) that brand teams could use for planning their reputation management efforts.

3 - The Effect of Benefit and Cost on Mobile Coupon Sharing in Social Network Sites: The Role of Social Capital

Han Lubin, Master Student, Huazhong University of Science and Technology, 1037 Luoyu Road, Wuhan, 430074, China,
hhanlubin@163.com, Zhao Xuefeng

This study investigates the influence of long benefit (i.e., reciprocity and social reward), short benefit (i.e., economic reward), long cost (i.e., privacy concern) and short cost (i.e., effort) on mobile coupon sharing by users in social network sites (SNSs). Moreover, this study examines how social capital moderates the relationship between benefit-cost and mobile coupon sharing in SNSs. A field survey with 377 subjects in China is conducted to test the research model.

4 - Managing Cross-border E-commerce: A Multichannel Integration Approach

Shikui Wu, Assistant Professor, Ryerson University, 350 Victoria St., TRS 2-015, Toronto, Canada, shikui.wu@ryerson.ca, Yuan Yuan Wu

This study adopts a multichannel integration approach to analyze and optimize online and offline business strategies and operations for cross-border e-commerce, including: pricing and inventory control; sales, deliveries and returns; and, online and in-store customer service. It helps cross-border businesses in adapting their strategies to market environment, streamlining their business processes, reducing operational costs, mitigating market uncertainty, and improving customer satisfaction.

Chair: Carlos Eduardo De Andrade, Senior Inventive Scientist, AT&T Labs Research, 200 Laurel Avenue South, A5-1E33, Middletown, NJ, 07748, United States of America, cea@research.att.com

1 - Cardinality Constrained Portfolio Optimization via Mixed Integer Linear Programming

Nasim Dehghan Hardoroudi, Aalto University School of Business, Runeberginkatu 22-24, Helsinki, N/, 00100, Finland, nasim.dehghan@gmail.com, Abolfazl Keshvari

Controlling the number of active assets (cardinality of the portfolio) in a mean-variance portfolio problem is practically important but computationally difficult. Such task is commonly presented as a mixed integer quadratic programming (MIQP) problem. We propose a novel approach to reformulate such problem as a MILP problem. Our proposed formulation can be solved by standard MILP solvers much faster than the MIQP problem.

2 - On Linear Conic Relaxation of Discrete Quadratic Programming

Tiantian Nie, North Carolina State University, Department of Industrial and Systems, Engineering, Raleigh, NC, 27695, United States of America, tn timer@ncsu.edu, Shu-chen Fang, Qi An

Discrete quadratic programming problems (DQP) appear widely in real-life applications, but they are hard to solve. We proposed an RLT-based linear conic relaxation of DQP. When the proposed relaxation problem has an optimal solution with rank one or two, optimal solutions to the original DQP problem can be explicitly generated. Numerical results indicate that the proposed relaxation with a primal ADM procedure is capable of efficiently providing high-quality lower bounds for DQP.

3 - Location Problem of Electric Vehicles' Charge Stations under Uncertainty

Rui Chen, IE Department of Tsinghua University, ShunDe Building in Tsinghua University, Beijing, China, chenruiest@163.com

The location of charging stations spreads adoption of electric vehicles by consumer and it simultaneously affects the cost and revenue. This paper presents a location problem for electric vehicles' charge stations under fluctuation of electricity price. An integer programming model is proposed to solve this problem with uncertainty of demand. Then a hybrid algorithm is applied to and numerically verified by an actual example.

4 - A Learning Framework for Feasibility Pump

Carlos Eduardo De Andrade, Senior Inventive Scientist, AT&T Labs Research, 200 Laurel Avenue South, A5-1E33, Middletown, NJ, 07748, United States of America, cea@research.att.com, Shabbir Ahmed, Yufen Shao, George L. Nemhauser

We present a framework for finding feasible solutions for mixed integer programs. We use the feasibility pump heuristic (FP) coupled with a learning framework which is able to build a pool of projections and combine them using information of previous projections. Preliminary results shows that this approach is able to find feasible solutions for instances where the original FP fails.

Optimization Stochastic IV

Contributed Session

Chair: Jeremy Castaing, University of Michigan, IOE 1205 Beal Ave., Ann Arbor, MI, United States of America, jctg@umich.edu

1 - Application of Two-stage Risk-averse Optimization to Real-time Interday Portfolio Management

Sitki Gulten, Assistant Professor, Stockton University, 101 Vera King Farris Drive, Galloway, NJ, United States of America, sitki.gulten@stockton.edu, Andrzej Ruszczyński

We describe a study of application of risk-averse optimization techniques to daily portfolio management. First, we develop clustering methods for scenario tree construction. Then, we construct a two-stage stochastic programming problem with conditional measures of risk, which is used to re-balance the portfolio on a rolling horizon basis, with transaction costs included. Finally, we present an extensive simulation study on both intraday and interday real-world data of the methodology.

2 - Stochastic Mixed Integer and Gradient Search Methods for Constrained Problems

Larry Fenn, Hunter College, CUNY, 695 Park Avenue, New York, NY, 10021, United States of America, larry.fenn@gmail.com, Felisa Vazquez-abad

An ordinal variable b denotes resources. For each b , there is a control variable u that yields a convex cost $C(b, u)$. We seek minimal cost satisfying a constraint of the form $P(b, u) < a$. Both functions are steady state averages of a stationary complex process: function evaluations are very costly. We combine Fibonacci search in b with gradient search in u to find the optimal solution and propose sequential sampling for minimal computation. We analyze convergence and discuss parallel computation.

3 - Optimally Scheduling Satellite Communications under Uncertainty

Jeremy Castaing, University of Michigan, IOE 1205 Beal Ave., Ann Arbor, MI, United States of America, jctg@umich.edu, Amy Cohn, James Cutler

We consider the problem of scheduling and managing the download of data from collecting satellites to receiving ground stations under uncertainty of their availability. We design models and heuristics to compute download schedules over the planning horizon while addressing dynamics of collecting, storing, using, and spilling both data and energy.

Chair: Guzin Bayraksan, Associate Professor, The Ohio State University, Integrated Systems Engineering, Columbus, OH, 43209, United States of America, bayraksan.1@osu.edu

1 - Regularized Decomposition of High-dimensional Multistage Stochastic Programs with Markov Uncertainty

Tsvetan Asamov, Princeton University, Sherrerd Hall, Charlton Street, Princeton, NJ, 08544, United States of America, tasamov@princeton.edu, Warren Powell

We develop a quadratic regularization approach for the solution of high-dimensional multistage stochastic optimization problems. The resulting algorithms are shown to converge to an optimal policy after a finite number of iterations. Computational experiments are conducted using the setting of optimizing energy storage over a large transmission grid. The numerical results indicate that the proposed methods exhibit significantly faster convergence than their classical counterparts.

2 - Multistage Stochastic Optimization with Application in Energy Storage Control

Harsha Gangammanavar, University of Southern California, 3715, McClintock Avenue, GER 240, Los Angeles, CA, 90089, United States of America, gangamma@usc.edu, Suvrajeet Sen

In this talk we will present Time-staged Stochastic Decomposition, a sequential sampling algorithm which is applicable to multistage stochastic linear programs, in general, and control of distributed storage devices, in particular. The method is focused on stage independent uncertainty and its special cases, including autoregressive processes. We will present convergence properties of this algorithm, and computational results comparing it with algorithms like approximate dynamic programming.

3 - Dynamic Allocations for Cooperative Games under Uncertainty with Risk-averse Players

Nelson Uhan, Assistant Professor, United States Naval Academy, Mathematics Department, Chauvenet Hall, Annapolis, MD, 21402, United States of America, uhan@usna.edu, Alejandro Toriello

We consider a class of cooperative games in which the costs of cooperation are uncertain and evolve over time, and the players are risk averse. These games generalize the classic linear production game, and as a result, model a variety of cooperative settings. We give sufficient conditions for the existence of an allocation in the strong sequential core - the set of allocations that distribute costs as they are incurred and are stable against coalitional defections at any point in time.

4 - Ambiguous Stochastic Programs with Variation Distance

Hamed Rahimian, PhD Student, The Ohio State University, Integrated Systems Engineering, Columbus, OH, 43210, United States of America, rahimian.1@osu.edu, Guzin Bayraksan, Tito Homem-de-mello

Ambiguous stochastic programs relax the assumption of known distributions in stochastic programming and instead use an ambiguity set of distributions. We focus on the variation distance to form the ambiguity set, examine the resulting model properties, and propose a decomposition-based algorithm to solve it. We characterize a minimal scenario tree, where the presence of every scenario is critical in determining the optimal objective function.

Sponsored Session

Chair: Michael Kim, University of Toronto, 5 King's College Road, Toronto, Canada, mikekim@mie.utoronto.ca

1 - Robust Optimization with Learning

Andrew Lim, National University of Singapore/Department of Decision Sciences, Mochtar Riady Building, BIZ1 08-69, 15 Kent Ridge Drive, Singapore, Singapore, andrewlim@nus.edu.sg, Michael Kim

We consider a robust optimization problem with learning in the setting of a Bayesian mixture model and show how it is a natural framework for modeling customer heterogeneity in business analytics applications. Asymptotic equivalence to a mean-variance problem is established. More generally, we illustrate how robust Bayesian models are a natural framework for combining concerns for robustness and learning about uncertainty sets.

2 - Coordinating Pricing and Inventory Replenishment with Nonparametric Demand Learning

Boxiao (Beryl) Chen, University of Michigan-Ann Arbor, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, boxchen@umich.edu, Xiuli Chao, Hyun-Soo Ahn

We consider a finite horizon problem of dynamic pricing and inventory control for a nonperishable product. We develop a data-driven policy that does not require explicit information about the demand distribution and show that it is asymptotically optimal and converges at the fastest possible speed.

3 - Data-driven Assortment Optimization

Velibor Misić, Massachusetts Institute of Technology, 77 Massachusetts Avenue, E40-147, Cambridge, MA, 02139, United States of America, vvmisic@mit.edu, Dimitris Bertsimas

We present a practical method for transforming limited historical transaction data into effective assortment decisions. Our method consists of estimating a choice model from the data by efficiently solving a large-scale linear program, and finding the optimal assortment by solving a tractable mixed-integer program. Our method leads to assortments that achieve near-optimal revenues and significantly outperform assortments derived from other parametric and nonparametric approaches.

4 - Geo-demand Estimation and Inventory Allocation in Online Retailing

Long He, University of California, Berkeley, 1117 Etcheverry Hall, Berkeley, CA, 94720, United States of America, longhe@berkeley.edu, Zhiwei (Tony) Qin

For existing items, we first formulate the multi-dimensional geo-demand distribution estimation problem for existing items as a robust low-rank tensor recovery problem in a convex optimization framework. We also propose a tailored algorithm based on the alternating direction augmented Lagrangian method. For new items, we develop the estimation based on nested logit model and discuss the inventory allocation policy in practice.

1 - Globally Solving Non-Convex Quadratic Programming Problems via Linear Integer Programming Techniques

Wei Xia, Lehigh University, 312 Brodhead Ave., Bethlehem, PA, 18015, United States of America, wex213@lehigh.edu, Luis Zuluaga, Juan Vera

Quadratic programming (QP) problems are NP-hard optimization problems. We propose an alternative way of globally solving nonconvex QPs by exploiting the Karush-Kuhn-Tucker conditions to linearize its objective. Then we reformulate the problem as a mixed integer linear problem with binary variables to model the KKT complementary constraints. We compare the performance of this solution approach with the benchmark global QP solver QuadprogBB on a variety of test QP instances.

2 - An Engie Novel Approach to the Solution of Thermal Unit Commitment Problem with Coupling Constraints

Melodie Mouffe, ENGIE, Avenue Einstein, 2A, NewTech Center, Louvain-la-Neuve, 1348, Belgium, melodie.mouffe@engie.com, Dimitri Tomanos

Engie developed PoweredPegase to optimize the commitment of its large number of plants on a medium term horizon, while taking into account supply delivery, storage and ancillary services. Getting to find a solution using a fine time granularity is difficult to achieve, specifically when dealing with global constraints. We propose a novel approach to find an accurate solution in a reasonable amount of time, without performing any model approximation, implementing a "smart" time decomposition.

3 - Poweredpegase : Engie's Next-gen Software for Joint Gas and Power Portfolio MT Optimization

David Valembois, Head Of Business Development, ENGIE, Avenue Einstein, 2a, Louvain-la-Neuve, 1300, Belgium, david.valembois@external.engie.com

PoweredPegase is ENGIE's next-gen software for joint gas & power portfolio MT optimization. PP delivers reliable and accurate solutions in remarkable short time thanks to disruptive "smart time" approach. PP open "working modules" allow modifying models by integrating your specific context. If flexibility and accuracy really matter, PoweredPegase is the answer. ENGIE (GDF-Suez) is the No. 1 Independent Energy Producer in the World. Winter is Coming—Optimize Your Energy with PoweredPegase.

1 - Strategic Delay in Networked Bargaining

Thanh Nguyen, Krannert School of Management, Purdue University, West Lafayette, IN, United States of America, nguyet161@purdue.edu, Vijay Subramanian, Randall Berry

We study decentralized markets involving producers and consumers that are facilitated by middlemen. We do this by analyzing a non-cooperative networked bargaining game. We show that sunk cost problems and a heterogeneous network can give rise to delay or failure in negotiation, and therefore, reduce the total trade capacity of the network. In the limiting regime of extremely patient agents, we provide a sharp characterization of the trade pattern and the segmentation of these markets.

2 - A Joint Work on Knowledge Management and Operations Management: How to Keep Firm-Specific Knowledge

Kai Luo, Assistant Professor, KEDGE Business School, 450 Avenue François Arago CS 90262, La Garde, France, luokailk@sohu.com, Salomee Ruel, Sajjad Jasimuddin

Firm-specific knowledge (FSK) acquisition and maintenance is essential for a firm to fill knowledge gaps and enhance its competitive advantage. We start with qualitative research that identifies the existence and important features of the FSK problem, followed by quantitative research formulated as a principal-agent problem, providing closed-form solutions. We used our model to compare French and American firm styles via 40 numerical examples and develop managerial insights.

3 - Pooling Principals by a Repair Agent

Shuo Zeng, University of Arizona, McClelland Hall 430, 1130 E. Helen Street, Tucson, AZ, 85721, United States of America, shuozeng@email.arizona.edu, Moshe Dror

The literature on principal-agent interplay has its focus on the principal. We focus on the agent. For performance based service contracts it is known that the principal extracts all the surplus and the agent breaks even. But this is not the case for an agent contracting with multiple principals. We show that agent who contracts with a collection of principals with interdependent failure characteristics realizes a profit rate that is convexly increasing in the number of principals.

4 - A Game Theoretic Study on Fake Goods Issue in C2c E-commerce

Fen Ding, Huazhong University of Science and Technology, School of Management, 1037 Luoyu Road, Wuhan, China, ivyours319@163.com

This paper mainly researches the fake goods issue of C2C e-commerce sites by analysis on suppliers, buyers and sellers based on game theory. Supplier's credit problem leads to the spread of fake goods, which effect seller's credit and arouse fraud, caused by the imperfect credit management. Based on that, we build a game model, and then we make an improvement by regulating the suppliers.

5 - How Personality Type Changes the Impact of Recommendation on Investment Decisions

Jun-Yuan Chen, Frontier High School, 1601 East Debbie Ln, Apt. 1301, Mansfield, United States of America, piky1223@gmail.com

We study how personality types, measured by the Myer-Briggs Type Indicator (MBTI) survey, affect the impact of recommendations on investment choices. The MBTI measures personality types in multiple dimensions including how individual processes information, and react to stimulus. We manipulated the presence of a recommendation between two investment choices. We found the impact of this manipulation is mediated by the results of the personality type survey.

Networks and Graphs I

Contributed Session

Chair: Boris Brimkov, Rice University, 6100 Main MS-134, Houston, TX, 77005, United States of America, bb19@rice.edu

1 - Micro to Macro Community Scaling in Human and Bacterial Societies

Irina Cazan, Carnegie Mellon University, Electrical and Computer Engineering, 2134 Hamerschlag Hall, Pittsburgh, PA, United States of America, icazan@andrew.cmu.edu, Connor Walsh, Radu Marculescu

This decade has seen broad research in the social behavior of microbes, with parallels drawn to human behavior to explain core network formation processes. This work explores static and dynamic properties of microbial and human social networks to identify the role of such processes in forecasting community evolution. Using the human microbiome and startup networks, similarities are identified in static features and reaction to disruptions, and contrasts in dynamic evolution.

2 - Graph Based Approaches for Managing Cyber-physical Systems

Fabian Runge, Research Assistant, Jade University, Friedrich-Paffrath-Strasse 101, Wilhelmshaven, 26389, Germany, fabian.runge@jade-hs.de, Sabine Baumann, Oliver Eulenstein

Common solutions for controlling cyber-physical systems focus on linear approaches. However, the system consists of self-referential, but connected and interacting systems and thus high complexity. Given the growing amount of related (sensor) data and the interdependencies of the systems, graph based solutions, like neural networks, seems to be more suitable for controlling the production. This paper describes current graph related methods to handle the growing complexity.

3 - On the Statistical Monitoring of Communication Networks

Marcus Perry, University of Alabama, 305 Alston Hall, 361 Stadium Drive, Tuscaloosa, AL, 35487, United States of America, mperry@cba.ua.edu, Ketong Wang, Xuwen Zhu

Often, decision-makers need to be aware of significant organizational changes in advance to avoid or mitigate potential crisis. Communication networks often serve as a proxy for assessing organizational structure. In this talk, we discuss application of statistical process control methods to efficiently detect changes in macro organizational structure within communication networks. We apply our approach to a time series of daily email networks from the Enron email corpus during crisis time.

4 - Efficient Computation of Chromatic and Flow Polynomials

Boris Brimkov, Rice University, 6100 Main MS-134, Houston, TX, 77005, United States of America, bb19@rice.edu, Illya Hicks

The chromatic and flow polynomials of a graph count the number of ways to color and assign flow to the graph. We present closed formulas and polynomial-time algorithms for computing the chromatic polynomials of novel generalizations of trees, cliques, and cycles. We also use graph duality to compute the flow polynomials of outerplanar graphs and generalized wheel graphs.

Optimization Robust II

Contributed Session

Chair: Svenja Lagershausen, Leibniz Universität Hannover, Wirtschaftswissenschaftliche Fakultät, Königsworther Platz 1, Hannover, 30167, Germany, svenja.lagershausen@prod.uni-hannover.de

1 - Robust Pessimistic Bi-level Optimization

Ihsan Yanikoglu, Özyegin University, Nisantepe Cekmeköy, Istanbul, Turkey, ihsan.yanikoglu@ozyegin.edu.tr, Daniel Kuhn

This paper proposes a robust optimization approach for a class of pessimistic bilevel optimization problems with uncertain data. The associated optimization problem consists of binary "here and now" decisions that are made before data reveals itself; continuous "wait and see" decisions that are adjustable according to the revealed portion of the data. We propose conservative and progressive approximations of such bilevel optimization problems.

2 - Investor Avoidance from Risk as Uniform Portfolio Becomes Optimal

Ahmed Burak Paç, PhD Candidate, Bilkent University, Department of Industrial Engineering, Ankara, 06800, Turkey, burakpac@gmail.com

In a market of N risky assets, asset returns follow a multivariate distribution involving distributional uncertainty in a ball around a known nominal distribution. As the radius of uncertainty increases, optimal investment converges to the uniform portfolio with equal $1/N$ wealth on each asset. In this study, the tendency of the investor to respond to increasing uncertainty by avoiding risk, i.e., the uniform portfolio, is investigated, introducing a riskless asset.

3 - Robust Optimization of Process Industries under Price Uncertainty

Jens Bengtsson, Associate Professor, School of Economics and Business, Norwegian University of Life Sciences, P.O. Box 5003, Aas, 1432, Norway, jens.bengtsson@nmbu.no, Mikael Ronnqvist, Patrik Flisberg

Several studies indicate relationships between changes in input prices and output prices in process industries, e.g. oil refinery. It is of interest to analyze how such relationships can be incorporated in uncertainty constraints which then is used in robust optimization of decisions in the supply chain. Then it also of interest to analyze how different uncertainty constraints will affect the planning of the supply chain, risk exposures and the cost of robustness.

4 - Robust Harvesting Planning in Lumber Supply Chains with Random Supply and Demand

Omid Sanei Bajgiran, PhD Candidate, Concordia University, 1455 De Maisonneuve Blvd. W., Montreal, QC, Canada, o_sane@encs.concordia.ca, Mustapha Nourelfath, Masoumeh Kazemi Zanjani

We propose a robust harvesting planning model under log supply and demand uncertainty that affect the right hand side, constraints, and the objective function coefficients. The proposed robust optimization model which has been formulated based on "price of robustness" provides some insights into the adjustment of the level of robustness of the harvesting plan over the planning horizon and protection against uncertainty.

5 - Dynamic Multi-product Lot-sizing Problem under Uncertainty

Svenja Lagershausen, Leibniz Universität Hannover, Wirtschaftswissenschaftliche Fakultät, Königsworther Platz 1, Hannover, 30167, Germany, svenja.lagershausen@prod.uni-hannover.de

We present a stochastic single-level, multi-product dynamic lot-sizing problem subject to a strict production capacity constraint. The production schedule is determined such that the expected costs are minimized. The backlog is limited using a d-service-level constraint. This leads to a non-linear model that is approximated by a linearization model.

Core Algorithms and Techniques for Computational Optimization

Sponsor: Computing Society

Sponsored Session

Chair: Atharv Bhosekar, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, Pa, 15213, United States of America, abhoseka@andrew.cmu.edu

1 - Update Algorithms for the Roundoff-error-free LU and Cholesky Factorizations

Adolfo Escobedo, PhD Candidate, Texas A&M, 3131, TAMU, College Station, TX, 77843, United States of America, adolfoescobedo@tamu.edu, Erick Moreno-centeno

We introduce efficient update algorithms for the Roundoff-error-free (REF) LU and Cholesky factorizations. The updates are addition, deletion, and replacement of rows and columns of a basis. Combined with REF substitution, the featured algorithms provide a complete framework for solving LPs exactly and efficiently. A significant advantage of the REF LP framework is that the length of any coefficient calculated via its algorithms is bounded polynomially without having to use gcd operations.

2 - Status Update on GCG, a Generic Branch-price-and-cut Solver

Marco Luebbeke, Aachen University, Germany, marco.luebbeke@rwth-aachen.de, Jonas Witt, Michael Bastubbe, Christian Puchert

GCG is a source-open extension to SCIP to solve mixed-integer programs (MIPs) via branch-price-and-cut without any user interaction. It is meant as a research vehicle and “another trick in the bag” to solve MIPs. For specially structured MIPs, GCG (not surprisingly) outperforms standard MIP solvers by far while it (also not surprisingly) colossally fails on other instances. We report on the project's status, recent novelties, future plans, and potential benefits for a general audience.

3 - Integer Programming as Projection

John Hooker, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, jh38@andrew.cmu.edu, H. P. Williams

We develop an alternative theory of integer programming (IP) based on projection. We define valid inequalities that are analogous to Chvatal-Gomory cuts but based on congruences rather than rounding and have bounded rank. We show how to solve a general IP by branching solely on finite-domain auxiliary variables. We define an IP dual as a value function that is obtained by nested rounding of bounded depth and becomes shift periodic for large perturbations.

4 - Computational Experience with the Bam Global Optimization Algorithm for Derivative-Free Optimization

Atharv Bhosekar, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, abhoseka@andrew.cmu.edu, Luis Miguel Rios, Nikolaos Sahinidis

Branch-and-model (BAM) is a derivative-free optimization (DFO) algorithm that builds a model around each evaluated point using the surrounding evaluated points. The algorithm performs a dense search and employs a local search algorithm to identify local optima. We present extensive computational experience with the algorithm and comparisons with other DFO algorithms.

Operations Research Methodologies to Improve Healthcare Operations

Sponsor: Health Applications

Sponsored Session

Chair: Nazanin Esmaili, PhD Candidate, University of Pittsburgh, 1048 Benedum Hall, Pittsburgh, PA, United States of America, nae22@pitt.edu

1 - Impact of Care Discontinuity on Patients' Length of Stay

Kimia Ghobadi, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, United States of America, kimiag@mit.edu, Retsef Levi, Ana Cecilia Zenteno Langle, Andrew Johnston

The Department of Medicine in Massachusetts General Hospital serves a wide variety of patients with various care levels. This functional heterogeneity has led to distributed care models which combined with consistent growth in demand has resulted in a congested system. In this talk, we explore contributors to clinically unnecessary delays in patient progression through the hospital, and more

specifically, the impact of care discontinuity during team handovers on patients' total length of stay.

2 - Appointment Scheduling Based Upon Continuously and Periodically Reported Data

Zlatana Nenova, University of Pittsburgh, 241 Mervis Hall, Roberto Clemente Drive, Pittsburgh, PA, 15260, United States of America, zdn3@pitt.edu, Jerrold H. May

We discuss an approach to determining the optimal timing of appointments for diabetic patients, based upon their blood glucose, blood pressure, and cholesterol readings. Blood pressure and cholesterol are reported periodically; blood glucose is reported multiple times per day. The approach is illustrated using examples from the VA Health System.

3 - Simulation of a Phlebotomy Station in an Outpatient Chemotherapy Infusion Clinic

Matthew Rouhana, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, United States of America, mrouhana@umich.edu, Amy Cohn, Pamela Martinez Villarreal, Marian Grace Boxer, Carolina Tpyaldos

We study the organization and operation of a phlebotomy station at the University of Michigan Comprehensive Cancer Center. By developing a simulation of the patient and work flow through the station, we evaluate alternative methods to reduce patient wait time and improve full-day patient experiences. For educational purposes, we create a simplified table-top version to demonstrate the underlying probability theory for hospital leadership.

4 - Hospital Nurse Staffing Improvements through Better Prediction of Surgical Case Volume

Nazanin Zinouri, Clemson University, 130 Freeman Hall, Clemson, SC, United States of America, nzinour@g.clemson.edu, Kevin Taaffe

Accurate approximations of final surgical case volume are difficult due to the high surgical demand variations. Staffing adjustments a few days prior to the day of surgery are difficult and inefficient. Having accurate demand prediction weeks in advance would help improve staff scheduling and decrease nurse workload pressure by allowing more flexibility in the schedule. We have studied current staff scheduling and workload prediction methods at a hospital to identify areas for improvement.

5 - Hybrid Inventory Policies for Hospitals with Shelf Space Restriction

Nazanin Esmaili, PhD Candidate, University of Pittsburgh, 1048 Benedum Hall, Pittsburgh, PA, United States of America, nae22@pitt.edu, Bryan Norman, Jayant Rajgopal

We address the management of inventory for multiple non-perishable routine use items in a healthcare setting. We present a mixed-integer programming model for selecting the best inventory control system for each item and the best shelf configuration considering space, shelf, and inventory control policy constraints. The objective is to minimize the total average effort to monitor, manage and replenish items. We illustrate the model with data from a hospital.

Stochastic Processes I

Contributed Session

Chair: Toshikazu Aiyama, Professor, Tokyo Metropolitan University, 1-1 MinamiOhsawa, HachiOhji, Japan, tyaiyama@yahoo.com

1 - A Multi-Resolution Stochastic Graphene Growth Kinetics Model

Sobambo Sosina, Harvard University, 1 Oxford Street, 7th Floor Science Center, Cambridge, MA, 02138, United States of America, sosina@fas.harvard.edu, Tirthankar Dasgupta, Qiang Huang

Graphene has many important properties and has been identified as key component in many industrial applications. It is thus crucial that its growth process and the kinetics behind that process be thoroughly understood. Extending work done by collaborators, we derive a stochastic model for multi-resolution observations, which correctly quantifies uncertainty in the kinetics.

2 - Queueing Network Approximations with MAP(3)s

Sunkyo Kim, Professor, Ajou University, 206 World Cup Road, Youngtong Gu, Suwon, 16499, Korea, Republic of, sunkyo@ajou.ac.kr

We propose a minimal representation of MAP(3)s and present an exact moment matching method. The marginal and joint LST of stationary intervals of the MAP(3) is given in terms of nine parameters. As for queueing network applications, arrival and departure processes are approximated as a MAP(3) based on nine moments. We show that the MAP(3) approximation performs better than MAP(2) especially under moderate traffic intensities.

3 - A Storage Grid as a Network of “Internet of Things”

Ehsan Shirazi, West Virginia University, Morgantown, WV, 26505,
United States of America, ehshirazi@mix.wvu.edu

This work focuses on a high-density storage system in which each grid works as an agent. Combining the decentralized, agent-based control with supervisory oversight provides a higher level of efficiency of product movement within the storage grid. Metrics in the research focus on variations from theoretical number of movements.

4 - Framework of Multiple Stochastic Decision Process in a System

Toshikazu Aiyama, Professor, Tokyo Metropolitan University,
1-1 Minami Ohsawa, Hachiohji, Japan, tyaiyama@yahoo.com

Consider multiple stochastic decision process operating in a system. A system is open to its environment; thus allowing external variability. We will concentrate on a two-process system on this research. First we will present various types. Next we will analyze some characteristics of each types. Some elementary numerical results are presented to illustrate the implication of more than one process in a system.

Queueing Approximation and Simulation

Sponsor: Applied Probability

Sponsored Session

Chair: John Hasenbein, Mechanical Engineering, University of Texas at Austin, Austin, TX, United States of America, jhas@mail.utexas.edu

1 - Exact Simulation of Non-stationary Queues

Mohammad Mousavi, Assistant Professor, University of
Pittsburgh, 1048 Benedum Hall, Pittsburgh, PA, 15212,
United States of America, mousavi@pitt.edu

We discuss the challenges that arise in the planning simulations of systems with time dependent arrival and service rates. Estimating how far back in time a simulation must be initialized is an essential problem in planning simulations. We propound using reflected Brownian motion (RBM) with time-dependent drift and volatility as a guide for estimating this initialization time. We develop an exact simulation method for RBM with time-dependent drift and volatility.

2 - Heavy-traffic Limits for a Fork-join Network in the Halfin – Whitt Regime

Hognyuan Lu, Penn State University, 355 Leonhard Bldg,
University Park, PA, 16802, United States of America,
hzl142@psu.edu, Guodong Pang

We study a multi-server fork-join network with non-exchangeable synchronization (NES), where all parallel service stations are operating in the Halfin-Whitt regime under the non-idling FCFS discipline. The NES requires that completed tasks are only synchronized if they are associated with the same job. We prove FWLLN and FCLT for the number of tasks in each waiting buffer for synchronization, jointly with the number of tasks in each parallel service station and the number of synchronized jobs.

3 - Optimal Stock Allocation for Production-inventory Systems with Multiple Impatient Customer Classes

Yasar Levent Kocaga, Assistant Professor Of Operations
Management, Yeshiva University, 500 West 185th Street, New
York, NY, 10033, United States of America, kocaga@yu.edu,
Yen-Ming Lee

We address the production and inventory control of a make-to-stock system with multiple impatient customer classes. We assume Poisson demand and exponential production times. Demand not satisfied immediately is backordered; but waits only up to an exponentially distributed amount of time, and is cancelled if not satisfied within this time. We show that the threshold inventory rationing policy is still optimal under certain conditions including a requirement on the order of abandonment rates.

4 - Routing and Scheduling in Fluid Gurovich Networks

John Hasenbein, Mechanical Engineering, University of Texas at
Austin, Austin, TX, United States of America,
jhas@mail.utexas.edu, Arda Sisbot

We examine a class of networks in which fluids may be routed to different classes at the same server. Extending previous work on single-station systems, we show that optimal policies in tandem Gurovich networks can exhibit interesting counter-intuitive behavior.

1 - Active Learning for Relevance Vector Machine Regression

Youngdoo Son, PhD Candidate, Seoul National University,
1 Gwankak-ro, Gwanak-gu, Seoul, Korea, Republic of,
hand02@snu.ac.kr, Jaewook Lee

In this paper, we propose a novel active learning procedure for relevance vector machine regression. First, we propose the transductive relevance vector machine which uses both labeled and unlabeled data points to construct the model. Then, we suggest three simple querying strategies which exploit the characteristic of relevance vector machine regression. The proposed method showed significantly better performance than the benchmark, random selections, with both of artificial and real data sets.

2 - Rethinking Principal Component Analysis in EEG Classification

Xiaoxia Li, North Dakota State University, 124 East Bison Court,
Fargo, ND, 58102, United States of America, xiaoxia.li@ndsu.edu

Principal Component Analysis (PCA) is considered to be a powerful tool in dimension reduction. However, it is worth thinking of the suitability of application for EEG signal data. Two EEG datasets collected from alcoholic and control groups were used to test the prediction accuracy before and after PCA transformation with SVM and KNN methods. Based on the classification results, we found that PCA is not valid in EEG signal processing. We also concern that other factors might be confounding.

3 - Regret Transfer and Parameter Optimization

Noam Brown, Carnegie Mellon University, 5000 Forbes Ave,
Pittsburgh, PA, 15213, United States of America,
noamb@andrew.cmu.edu

Regret matching is a widely-used algorithm for learning how to act. We begin by proving that regrets on actions in one game can be transferred and discounted to warm start the regrets for solving a different game with same structure but different payoffs that are a function of parameters. This provides, to our knowledge, the first principled warm-starting method for no-regret learning. We then leverage this warm starting to optimize a parameter vector for a player in a two-player zero-sum game.

4 - Dynamic Programming Approximations for Stochastic Resource Planning under Partial Observation

Stanislaus Solomon, Assistant Professor Of Supply Chain
Management, Sam Houston State University, 236S SHB,
Department of Management and Marketing, Huntsville, TX,
77340, United States of America, solomon@shsu.edu,
Cipriano Santos, Haitao Li, Keith Womer

Assigning heterogeneous resources to jobs in a stochastic environment requires a sequential decision process. This research focuses on developing an approximate dynamic programming algorithm to address the problem scenario, where the information required to make decisions at each epoch is only partially observable. Hewlett-Packard's resource planning problem will be studied as an application.

1 - Heuristic Search in Dual Space for Constrained Stochastic Shortest Path Problems

Sylvie Thiebaux, ANU & NICTA, 7, London Circuit, Canberra,
Australia, Sylvie.Thiebaux@anu.edu.au, Felipe Trevizan,
Pedro Santana, Brian Williams

Constrained Stochastic Shortest Path Problems are a natural model for planning under uncertainty for resource-bounded agents with multiple competing objectives. We present i-dual, a heuristic search algorithm that generates optimal stochastic policies for these problems. It incrementally generates and explores promising regions of the 'dual' space of policy occupation measures, guided by a lower bound on the value function. Our experiments show significant run-time improvements over LP methods.

2 - Mixed-integer Programming Formulations for Partial-order Plans

Buser Say, Student, University of Toronto, 5 King's College Rd.,
ON M5S 3G8, Toronto, ON, M5S 3G8, Canada,
buser.say@mail.utoronto.ca, Andre Augusto Cire, Chris Beck

A partial-order plan (POP) is a set of actions associated with precedence constraints for which a goal is achieved in any total ordering of actions that respects the precedence constraints. POPs are more flexible than sequential plans since agents can dynamically commit to the ordering of certain actions at execution time. We investigate novel mixed-integer linear formulations to produce valid POPs from sequential plans, and compare their performance to state-of-the-art MaxSAT models.

3 - Fast Optimal Chance-constrained Scheduling under Uncertainty

Brian Williams, Professor of Aeronautics and Astronautics, MIT
CSAIL, 32 Vassar St, Cambridge, MA, 02139, United States of
America, williams@csail.mit.edu, Cheng Fang, Andrew Wang

Temporal uncertainty in large-scale logistics requires balancing lost efficiency through slack and costly replanning when deadlines are missed. This motivates a computational framework to quantify and bound the risk of violating schedule requirements. In this work, we decompose the problem into two subproblems: 1) optimal risk allocation; and 2) enforcing schedule requirements. This allows us to minimize conservatism while leveraging specialized solvers for each subproblem for fast solutions.

4 - Linear Optimization for Operator Counting in Automated Planning

Florian Pommerening, University of Basel, Spiegelgasse 5,
Basel, 4051, Switzerland, florian.pommerening@unibas.ch

Automated planning is the search for paths in factored state spaces. The recently suggested operator-counting framework uses LP/IP optimization to unify, combine and explain connections between state-of-the-art planning techniques. We present an easily accessible introduction to planning and operator counting. LP/IP methods are a hot topic in planning with significant potential for research collaborations between OR and AI researchers.

Optimization Nonlinear Programming I

Contributed Session

Chair: Dongdong Ge, Shanghai University of Finance and Economics,
100 Wudong Road, Shanghai, 200433, China, gedong78@163.com

1 - An Extended Cutting Plane Approach with PWL Approximation for Generalized Geometric Programming

Yiduo Zhan, PhD Student, University of Central Florida,
12800 Pegasus Drive, P.O. Box 162993, Orlando, FL, 32816,
United States of America, yzhan@knights.ucf.edu,
Chung-Li Tseng, Qipeng Zheng

We employ an extended cutting plane (ECP) approach combining with piecewise-linear (PWL) approximation to provide the global solution of GGP. In this approach, the constraints are separated by positive and negative terms. The negative terms are converted to mixed-integer linear constraints through PWL approximation. The partially linearized GGP becomes a mixed-integer nonlinear problem (MINLP). This MINLP is solved using ECP method. Numerical problems are tested and results are discussed.

2 - Solving Non-separable Quadratic Binary Programs using Projection and Surrogation

Jaehwan Jeong, Assistant Professor, Radford University,
Department of Management, P.O. Box 6954, Radford, VA, 24142,
United States of America, jjeong5@radford.edu, Chanaka
Edirisinghe

A new approach is developed to solve non-separable quadratic programs with binary variables. First, separability is induced using a projection technique and non-convex relaxation of the binary variables. Then, using constraint surrogation, an iterative sequence of nonconvex separable quadratic knapsack programs are solved efficiently using our previous algorithms. Preliminary computations are provided.

3 - Stochastic PDE-constrained Optimization of Vibrations of a Plate under a Piecewise-linear Current

Dmitry Chernikov, University of Iowa, 1010 W Benton St. #208F,
Iowa City, IA, 52246, United States of America, dmitry-
chernikov@uiowa.edu, Pavlo Krokhmal, Olesya Zhupanska

In this work a two-stage stochastic PDE-constrained optimization framework is applied to the problem of vibration control of a thin composite plate in the presence of electromagnetic field. The electric current is assumed to be of a piecewise-linear form. We compute the gradient of the objective function using adjoint numerical differentiation method. The value of the objective function is calculated by solving the governing PDEs, and a black-box approach is used for the minimization problem.

4 - Optimizing Blending Operations at the World's Largest Coal Export Port

Fabian Rigterink, The University of Newcastle, Australia,
University Drive, Callaghan NSW, 2308, Australia,
fabian.rigterink@newcastle.edu.au, Natasha Boland,
Thomas Kalinowski

The port of Newcastle, Australia, is the world's largest coal export port. We model the supply chain's medium- and long-term planning of blending operations as a time-expanded pooling problem. Using new multi-commodity flow formulations, we study the trade-off between continuous and discretized variables (NLP and MINLP). We evaluate the performance of unary, log unary and binary variable discretizations in an extensive computational study that concludes the talk.

5 - On the Complexity and Algorithms of Regularized Least Square Problems

Dongdong Ge, Shanghai University of Finance and Economics,
100 Wudong Road, Shanghai, 200433, China,
gedong78@163.com, Yinyu Ye, Zizhuo Wang, Hao Yin

We show that finding a global optimal solution for the regularized least square problem is strong NP-Hard as long as the nonlinear penalty function is concave and non-decreasing. This result clarifies the complexity for a large class of regularized optimization problems studied in the recent statistics literature.

tianqin.shi@sjsu.edu

1 - Group Decision Making: A Flexible Methodology

Pascale Zaraté, Professor, Toulouse 1 Capitole University - IRIT, 2
rue du Doyen Gabriel Marty, Toulouse Cedex 9, 31042, France,
pascale.zarate@irit.fr

The specific benefice of a collective decision process mainly rests upon the possibility for the participants to confront their respective points of views. To this end, they must have cognitive and technical tools that ease the sharing their own preferences, while allowing keeping some information and feelings for their own. The paper presents the basis of such a flexible, cooperative decision making methodology. This methodology has been implemented in a GDSS called GRoUp Support.

2 - Identifying Patients at Risk using Fuzzy Logic

John Zaleski, Chief Informatics Officer, Nuvo, Inc., 4801 S.
Broad Street, Suite 120, Philadelphia, PA, 19112,
United States of America, jzaleski@nuvo.com

The use of "big data" for decision making has been a growing area of investigation and usage in healthcare enterprises. This paper shows how fuzzy rules can be used to operate on data obtained from the point of care to assist in clinical decision making, with application to real-time data collection in medical surgical units.

3 - The Effects of Patent Extension and Pharmaceutical Stewardship Program on Green Pharmacy

Tianqin Shi, San Jose State University, One Washington Square,
Business Tower 450, San Jose, CA, 95192, United States of
America, tianqin.shi@sjsu.edu, Dilip Chhajed, Nicholas Petrucci

The eco-toxicity arising from unused pharmaceuticals has drawn considerable attention. In this paper, an innovative pharmaceutical company faces price-dependent demand and decides whether to adopt green pharmacy in response to the regulatory policy as well as the competition from a generic company. A pharmaceutical company incurs a fixed cost to choose green pharmacy. We examine the impacts of two regulatory policies, patent extension and take-back regulation, on the choice of green pharmacy.

Tung Cu, Louisiana State University, 2200 Business Education Complex, Nicholson Extension, Baton Rouge, LA, 70803, United States of America, tcu1@lsu.edu, Helmut Schneider, James Van Scott

The study explores the role of user-generated content (UGC) during the diffusion process of digital artifacts. Data collection is conducted on 260 new digital products and more than 105 thousand social network nodes. The overall finding shows that Volume of Post and UGC Sentiment have a dynamic impact on diffusion of digital products. But, the relationships among them depend on certain situations. The study sheds light on the crowding power and the long-tail effect in online social networks.

2 - How Much to Open, How Fast to Fix? Effects of Making the Software Open Source

Rakesh Mallipeddi, PhD Student, Texas A&M University, 320 Wehner, 4217 TAMU, College Station, TX, 77843-4217, United States of America, rmallipeddi@mays.tamu.edu, Subodha Kumar, Ram Gopal, Emre Demirezen

We develop empirical and analytical models to examine the effects of making software open on the overall quality of software systems and behavior of software vendor. We derive and develop optimal strategies for software vendor to allocate resources for maintenance of existing software while developing new software.

3 - Towards a Theoretical Framework of IT-enabled Operations Strategy

Yeming Gong, Associate Professor, EMLYON Business School, 12 Rue Dunoir, Lyon, France, Gong@em-lyon.com, Hongyi Mao, Ryad Titah, Oliver Yao

By an integrated analysis of quantitative data from more than 100 organizations in Europe, Asia and North America and qualitative data from 56 cases, this paper presents a theoretical framework of IT-enabled operations strategy with the objective of investigating "How does information technology leverage resources and processes for operational agility?"

4 - Timing, Diffusion, and Substitution of Generations of Technological Innovations

Miaomiao Lu, Huazhong University of Science and Technology, Room403, South Student Hostel, The Huazh, Wuhan, China, 1207170339@qq.com

Diffusion processes across generations and over time have become increasingly complex and multifaceted in recent years. We discuss efforts to model simultaneously the substitution of successive generation of a durable technological innovation, and the diffusion of the technology. Empirical and normative implications of the proposed model are explored for four generations on Microsoft Windows operating system: win Vista; win xp; win 7; win 8.

Data Mining in Medical and Sociological Decision Making

Sponsor: Data Mining

Sponsored Session

Chair: Chitta Ranjan, Georgia Institute of Technology, Ferst Drive NW, Atlanta, GA, United States of America, nk.chitta.ranjan@gatech.edu

Co-Chair: Kamran Paynabar, School of Industrial and Systems Engineering, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, kpaynabar3@gatech.edu

1 - Online, Semi-Parametric Estimation of Treatment Allocations for the Control of Emerging Epidemics

Eric Laber, 211 Devonhall Lane, Cary, NC, 27518, United States of America, eblaber@ncsu.edu

A key component in controlling the spread of an epidemic across a network of individuals is deciding where, when, and to whom to apply an intervention. An allocation strategy formalizes this process as a sequence of functions that map up-to-date information on the epidemic to a subset of nodes targeted for treatment.

We derive estimating equations for the optimal allocation strategy that do not require a model the system dynamics and that scale to very large problems.

2 - A Novel Sequence Kernel Graph Transform for Clustering and Visualization

Chitta Ranjan, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, United States of America, nk.chitta.ranjan@gatech.edu, Samaneh Ebrahimi, Kamran Paynabar

We propose a novel sequence kernel graph (SKG) transform for non-parametric feature extraction on sequence data. The proposed method is accurate, faster than existing methods and parallelizable. The SKG transform can be used for finding similarity between sequences, and hence, alignment-free clustering. It can be extended to perform bi-clustering, and graph visualization of sequences; with application on various behavioral data (clickstream, purchase pattern), protein and gene sequences, etc.

3 - A Transfer Learning Approach for Predictive Modeling of Degenerate Biological Systems

Jing Li, Arizona State University, Tempe, AZ, United States of America, jinglz@asu.edu, Na Zou

Transfer learning, as a statistical modeling approach, refers to methods that integrate knowledge of old domains and data of a new domain, in order to develop a model for the new domain that is better than using the data of the new domain alone. We propose a transfer learning method for predictive modeling and apply it to degenerate biological systems. Theoretical results and findings from real-data analysis will also be presented.

4 - Bayesian Learning Without Recall: A Naive Social Learning Model

Mohammad Amin Rahimian, Graduate Research Fellow, University of Pennsylvania, Levine 4F, University of Pennsylvania, 3330 Walnut Street, Philadelphia, PA, 19104, United States of America, mohar@seas.upenn.edu, Ali Jadbabaie

We analyze a model of learning and belief formation in networks in which agents follow Bayes rule yet they do not recall their history of past observations and cannot reason about how other agents are making their decisions. This model avoids the complexities of fully rational inference and also provides a behavioral foundation for non-Bayesian updating. We present the implications of the choice of signal and action structures for such agents leading to familiar update forms.

Data Mining and Optimization

Contributed Session

Chair: Fatma Yerlikaya Ozkurt, Middle East Technical University, Institute of Applied Mathematics, Ankara, Turkey, fatmayerlikaya@gmail.com

1 - Data Classification via Cluster Covering

Zhengyu Ma, Korea University, Room 551, Engineering Building, Seoul, 136-713, Korea, Republic of, mazhengyu@hotmail.com, Kwangsoo Kim, Hong Ryoo

For data classification, a homogeneous cluster containing only one type of data can easily be identified via neighborhood measure. Using clusters for patterns in LAD, one can obtain a set of homogeneous clusters and next optimize their interplay to discover a decision theory. This new framework of supervised data analytics inherits the major advantage of LAD while it avoids redundant data binarization and also the difficult stages of support feature selection and pattern generation in LAD.

2 - Wastewater Sewerage Treatment Plant Aeration Process Optimization: A Data-driven Approach

Anoop Verma, Research Associate, Wayne State University, 4815 4th St, Detroit, MI, 48201, United States of America, anoop.verma@wayne.edu, Kai Yang, Ali Asadi

Being water quality oriented, large-scale industries such as wastewater treatment plants tend to overlook potential savings in energy consumption. Wastewater treatment process includes energy intensive equipment such as pumps and blowers to move and treat wastewater. Presently, a data-driven approach has been applied for aeration process modeling and optimization of one large scale wastewater in Midwest. A great deal of saving in energy can be made while keeping the water quality within limit.

3 - Optimal Experimental System Design

Alireza Mohseni, Oregon State University, 204 Rogers, Corvallis, OR, 97331, United States of America, mohseni.s.alireza@gmail.com, David Kim

This research examines how the design of a factorial experiment can be modeled as a cost and time constrained discrete optimization problem. Initial results with respect to creating a statistical model for an experiment will be presented.

4 - A Hybrid Computational Method based on Convex Optimization for Outlier Problems

Fatma Yerlikaya Ozkurt, Middle East Technical University,
Institute of Applied Mathematics, Ankara, Turkey,
fatmayerlikaya@gmail.com, Aysegul Askan,
Gerhard Wilhelm Weber

Statistical modeling plays a central role for any prediction problem of interest. However, predictive models may give misleading results when the data contain outliers. In many applications, it is important to identify and treat the outliers without direct elimination. To handle such issues, a hybrid computational method based on conic quadratic programming is introduced and employed on earthquake ground motion data set. Results are compared against widely-used ground motion prediction models.

Chair: Feifan Wang, Zhejiang University, No.38, Zheda Road, Hangzhou, China, wangfeifan@zju.edu.cn

1 - A Framework of Social Recommender System Combining Social Network and Sentiment Analysis

Donghui Yang, Southeast University, Sipailou 2#, Nanjing, China, dhyang@seu.edu.cn

In this contribution, we propose a new framework for a social recommender system based on both network structure analysis and social context mining. Exponential random graph models and sentiment similarities are used to make the social recommender system much more precise and to satisfy users' psychological preferences. The recommendation results of diabetes accounts of Sina Weibo show that our method outperforms other social recommender systems.

2 - Decision Tree Based Method for Prediction of Preventable Readmissions in Acute Myocardial Infarction

Andres Garcia-Arce, University of South Florida, 4202 E. Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, andresg@mail.usf.edu, Jose L. Zayas-Castro, Florentino Rico, Shuai Huang

Preventable readmissions are recognized as a target for quality improvement. The US government implemented economic penalties to decrease the preventable readmissions, which leads stakeholders to improve to avoid penalties. The literature show several statistical models that help hospitals understand readmissions risk in their institutions, however, these models usually fail to achieve a good discriminatory power. A random forest-based predictive model is studied, achieving an AUC=0.7494.

3 - Assess Care Coordination by Multi-criteria Ranking

Wei Liu, Purdue University, Industrial Engineering, West Lafayette, IN, United States of America, liu317@purdue.edu, Ping Huang, Steven Landry

Care coordination reflects the quality of care and impacts the patient outcome. It remains a challenge to quantify the interactions among providers from various services as well as the relationships among patients and providers. We use a novel method of multi-criteria ranking to assess the care coordination under consideration. It may aid decision makers to identify appropriate interventions to improve care.

4 - Performance of Different Generalized Propensity Methods in Evaluating Multi-arm Nonrandomized Study

Feifan Wang, Zhejiang University, No.38, Zheda Road, Hangzhou, China, wangfeifan@zju.edu.cn, Haomiao Jin, Zhengxiao Wang

Generalized propensity score (GPS) is a widely used approach to adjust the inherent bias existed in multi-arm nonrandomized study. A simulation study is conducted to assess the performance of four GPS methods: regression adjustment, matching, stratification, and inverse probability weighting. Practical implications are discussed and a case is provided.

Chair: Alfonso Pedraza-Martinez, Assistant Professor, Indiana University, 1309 E 10th Street, Bloomington, IN, 47405, United States of America, alpedraz@indiana.edu

1 - Fast and Frugal Disaster Response? Decisions in Typhoon Haiyan

Tina Comes, University of Agder, Postboks 509, Grimstad, 4898, Norway, tina.comes@uia.no, Bartel Van De Walle

In the response to sudden-onset disasters, humanitarian organisations operate under trying conditions in which response targets evolve as information on the actual impact becomes available. The pressing humanitarian needs require fast decision making, including decisions on warehouse locations and the allocation of relief items, yet with little time for more than frugal analyses. In this presentation, we study the response to Typhoon Haiyan which struck the Philippines in November 2013.

2 - Estimating and Incorporating Deprivation Costs into Humanitarian Logistic Models for Relief Response

Victor Cantillo, Associated Professor, Universidad del Norte, Km 5 via Puerto Colombia, Barranquilla, Colombia, vcantill@uninorte.edu.co, Nathalie Cotes, Luis Macea, Ivan Serrano

This research allows mathematical formulations using discrete choice modelling to quantify externalities associated to the lack of access to critical commodities in the aftermath of a disaster. Thus the estimated deprivation cost function is explicitly incorporated into the objective function of facility location models for prepositioning supplies, which attempt to minimize the total social costs, as determined by both operational and social considerations. The models are applied to a real case.

3 - Assembling High Quality and Timely Information for Humanitarian Organizations from Social Media

Eunae Yoo, Arizona State University, P.O. Box 874706, Tempe, AZ, 85287, United States of America, Eunae.Yoo@asu.edu, Mahyar Eftekhari, Elliot Rabinovich, Bin Gu

To support operational decision making, humanitarian organizations require high quality and timely data. We investigate how such information can be extracted from social media using automated data mining mechanisms that rapidly process data. The effectiveness of data mining mechanisms are tested using a sample of Twitter data. Our results help shed light on what constitutes high quality information for humanitarian organizations and how it can be speedily obtained from social media.

4 - Humanitarian Funding in a Multi-donor Market with Donation Uncertainty

Alfonso Pedraza-Martinez, Assistant Professor, Indiana University, 1309 E 10th Street, Bloomington, IN, 47405, United States of America, alpedraz@indiana.edu, Arian Aflaki

We analyze the trade-off between earmarked funding and operational performance. If a Humanitarian Organization (HO) allows donors to earmark their donations, HO's expected funding increases but its operational efficiency decreases. We use the Scarf's minimax approach and the newsvendor framework, and calibrate our model using data from 15 disasters.

Health Care Strategy and Policy II

Contributed Session

Chair: Neil Desnoyers, Instructor, Saint Joseph's University, 133 Green Valley Rd, Upper Darby, PA, 19082, United States of America, ntidesnoyers@gmail.com

1 - Revenue-based Booking Policy for Clinic Appointment with Overbooking Considering Patient No-shows

Jiafu Tang, Chair Professor, Dean, Dongbei University of Finance and Economics, School of Management Science, and Engineering, Dalian, 116025, China, jftang@mail.neu.edu.cn, Pingping Cao, Xuanzhu Fan

In this paper, an advanced clinic access system is designed. We formulate a Markov Decision Process model with its extension considering regular patients' no-shows and patient choice to improve clinic revenue by overbooking same-day patients, and then to improve patient satisfaction by allowing patients to choose either a same-day or a scheduled future appointment. Numerical experiments and analysis are made finally.

2 - What Can Merger and Acquisition (M&A) do for Healthcare Services?

Yujiun Tsai, Texas A&M University, 3131 TAMU, College Station, TX, United States of America, yjt2009@tamu.edu

We would like to explore the rationalization of hospitals using M&A to differentiate themselves through services, quality measures, and customer satisfaction.

3 - The Impact of Knowledge Sharing on Healthcare Risk Management Performance

Mecit Can Emre Simsekler, Research Associate, UCL School of Management, UCL, Gower Street, London, WC1E 6BT, United Kingdom, e.simsekler@ucl.ac.uk, Bilal Gokpinar

Considering two key components of knowledge sharing among healthcare personnel, (i) codified in the form of written documents and (ii) tacit with behaviors and daily practices, we examine how knowledge sharing capabilities in healthcare settings translate into risk management performance. We employ a unique dataset from the NHS acute trusts in England to investigate our hypotheses.

4 - Infectious Disease Outbreak Response Strategies for Ebola

Neil Desnoyers, Instructor, Saint Joseph's University, 133 Green Valley Rd, Upper Darby, PA, 19082, United States of America, ntidesnoyers@gmail.com

High viral-load Ebola patients cause an outsize proportion of all transmissions. Outbreak response strategy should include the construction and/or use of permanent, temporary, and/or mobile healthcare facilities, simultaneously. I investigate the use of information on the requirements of high vs. low viral-load Ebola patients. I discuss optimal healthcare facility use to inform Ebola outbreak response and facility deployment strategies, thereby achieving maximum benefit at minimum cost.

1 - The J-set and Successive McCormick Relaxations for Polynomial Programming Problems

Evrin Dalkiran, Wayne State University, 4815 4th St. MEB # 2149, Detroit, MI, 48202, United States of America, evrind@wayne.edu

We analyze the relative strength and tractability of the two linear programming relaxations obtained by the J-set of constraints constructed for the original polynomial formulations and the McCormick relaxations constructed for equivalent quadratic formulations via successive quadratification scheme. We propose a hybrid algorithm that judiciously selects among the J-set relaxation and the McCormick inequalities based on the problem's structural characteristics.

2 - Symmetry: What LP Can Learn from MIP

Roland Wunderling, IBM, Annenstrasse 9, Graz, Austria, roland.wunderling@at.ibm.com, Jean-francois Puget

Symmetry has long been exploited in the solution of mixed integer programs. While LP does not suffer from the same combinatorial explosion of the search space due to symmetry as MIP does, symmetries can be identified and exploited for LP as well. We will evaluate the effect of doing so.

3 - Profit-oriented Ring Arboriculture Problems

Alessandro Hill, Hamburg University of Technology, Schwarzenbergstrasse 95 D, Hamburg, Germany, alessandro.hill@tuhh.de, Roberto Baldacci, Edna Hoshino

In this work we study three new problems in extended network design. Two types of customer nodes and Steiner nodes can be used in a two-level network. Type two customers have to be in circuits that intersect in a depot. Type one customers may also be used in arborescences that extend this ring core. Objectives take into account the arc costs, customer-dependent profits or both. We present MIP models, valid inequalities, corresponding exact algorithms, heuristics and computational results.

4 - Testing Algorithm for Large P-median Problems in Heterogeneous Road Networks

Pascal Rebreyend, Senior Lecturer, Högskolan Dalarna, Rödavägen, Falun, 79188, Sweden, prb@du.se, Laurent Lemarchand

This paper presents and compares different algorithms on large scale p-median problems, up to 2000 candidate nodes. Our main focus is instances where the demand is asymmetric distributed. We use as real data the Swedish road network including distances and as demand points the location of Swedish citizens as our

experimental context. Tested methods simulated annealing, volume algorithm and Cplex. Our new hybrid genetic approach outperforms other existing approaches on large instances.

5 - Conic Least Squares Problem

Yu Xia, Assistant Professor, Lakehead University, 955 Oliver Rd, Thunder Bay, ON, P7B 5E1, Canada, yxia@lakeheadu.ca

I give two reformulations of the dual of the constrained least squares problem over convex cones. The conic least squares problem is then solved by applying modified Nesterov's excessive gap method or Nesterov's smooth method. Numerical experiments comparing this approach with interior-point method based state-of-art software are given.

Marketing/Operations Management

Cluster: Operations/Marketing Interface

Invited Session

Chair: Rachel Chen, University of California, Davis, CA, United States of America, Associate Professor, rachen@ucdavis.edu

Co-Chair: Cuihong Li, University of Connecticut, 2100 Hillside Rd, Storrs, CT, United States of America, Cuihong.Li@business.uconn.edu

1 - Retailer Adoption of Innovative Products

Jane Gu, Assistant Professor, University of Connecticut, 2100 Hillside Road, Storrs, CT, United States of America, jane.gu@business.uconn.edu, Yunchuan Liu

We consider a research context where innovators with new product development expertise lack direct-selling capabilities and big retailers control the access to the consumer market. We examine how a retailer decides whether to carry an innovator's product based on its private information regarding the market acceptance to the innovative product. Our investigation reveals the interesting impact of vertical and the horizontal channel structures on the retailer's innovation adoption decision.

2 - Product Line Design: Variety and Responsiveness

Cuihong Li, University of Connecticut, 2100 Hillside Rd, Storrs, CT, 06269, United States of America, Cuihong.Li@business.uconn.edu, Laurens Debo

A larger product variety allows a firm to better satisfy the needs of heterogeneous customers, but, in a make-to-order environment, it increases the job completion time, leading to longer waiting of customers. We study the trade-off between product variety and responsiveness to align product line design and operations system design.

3 - Why and Where to Have Outlet Stores?

Shuya Yin, University of California, Irvine, Merage School of Business, Irvine, CA, United States of America, shuya.yin@uci.edu, Jiarui Bai, Haresh Gurnani

Outlet stores have been both complementary to and competing with the main stores. In this project, our goal is to understand the tradeoffs involved in offering outlet stores. In particular, we study how much product differentiation and physical distance should be kept between the main and outlet stores.

4 - Open Or Closed? Technology Strategy, Supplier Investment, and Competition

Bin Hu, Assistant Professor, UNC Kenan-Flagler Business School, CB#3490 McColl Bldg, University of North Carolina, Chapel Hill, NC, 27519, United States of America, Bin_Hu@kenan-flagler.unc.edu, Ming Hu, Yi Yang

We analyze a model where each of two manufacturers decides whether to open its technology to the competitor, and a supplier subsequently decides what technologies to invest in. We find that open technology incentivizes supplier investment, and also leads to a technology-risk-pooling benefit. The manufacturers may also be faced with the prisoner's dilemma. Finally, we show that manufacturers may close their technologies to force the supplier to make a technology investment.

5 - Money-back Guarantees When Physical and On-line Retailers Compete

Hang Ren, University College London, London, United Kingdom, hang.ren.13@ucl.ac.uk, Tingliang Huang, Chris Tang, Ying-ju Chen

We study the pricing and product return policies when physical and on-line stores compete. We find that the on-line store offers money-back guarantees when its salvage advantage outweighs total return hassle. Interestingly, better service quality may hurt the on-line store. When consumers can showroom, i.e. buying online after trying the product offline, we show that the on-line store should offer hassle-free money-back guarantees.

Operations Management/Marketing Interface III

Contributed Session

Chair: Ashkan Negahban, Auburn University, 3301 Shelby Center, Auburn, AL, 36849, United States of America, anegahban@auburn.edu

1 - Fulfillment Service in Online Marketplaces

Wenjing Shen, Drexel University, 3220 Market Street, Philadelphia, PA, 19104, United States of America, ws84@drexel.edu, Gangshu Cai, Xiangfeng Chen

Dominant online retailers, such as Amazon.com and Sears.com, allow small retailers to sell on their online marketplaces and offer fulfillment service to handle the order fulfillment activities for small retailers. In exchange, small retailers pay a fulfillment fee per unit of sales. In this paper, we investigate the benefit of such fulfillment programs and study the optimal fulfillment fees for the dominant retailer.

2 - Try Before You Buy Pricing: Should Rental Fees Apply to Purchases?

Monire Jalili, University of Oregon, 1208 University of Oregon, Eugene, OR, United States of America, mjalili@uoregon.edu, Michael Pangburn

When a product has uncertain value or is used repeatedly over time, customers may opt to rent before purchase. Some sellers entice purchase conversions by offering part of a paid rental price as a subsequent discount. Other sellers offer no such credit. We analyze the optimal pricing and discount policy for a monopolist selling to a market of consumers facing uncertain product value, and derive the conditions under which sellers should optimally apply some of the rental price towards a purchase.

3 - Responding to Forecasting Errors for New Products: An Agent-based Simulation Approach

Ashkan Negahban, Auburn University, 3301 Shelby Center, Auburn, AL, 36849, United States of America, anegahban@auburn.edu, Jeffrey S. Smith

Many real-world examples show that even companies with significant experience in successful product launches have faced huge financial losses due to incorrect demand forecasts for their new products. We consider the case where the demand for the new product grows beyond expectations and use agent-based simulation to evaluate different after-the-fact reactive strategies including capacity expansion, viral marketing, and sales control to reduce potential losses under different market dynamics.

Scheduling in Healthcare Operations

Sponsor: Manufacturing & Service Operations
Mgmt/Healthcare Operations
Sponsored Session

Chair: Shrutivandana Sharma, Singapore University of Technology and Design, 8 Somapah Road, Singapore, 487372, Singapore, shrutivandana@sutd.edu.sg

Co-Chair: Hossein Abouee Mehri, University of Waterloo, 200 University Avenue West, Department of Management Sciences, Waterloo, ON, N2L 3G1, Canada, habouee@uwaterloo.ca

1 - Long Term Surgery Planning and Scheduling

Maya Bam, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, mbam@umich.edu, Brian Denton, Mark Van Oyen

Scheduling surgeries in a timely manner is a challenge due to competing criteria, such as patient wait time and the availability and utilization of multiple resources (i.e., operating room, surgical service block time). Based on collaboration with a local hospital, we present a mixed integer programming planning model that strives to achieve high resource utilization and provide timely access.

2 - Data-driven Patient Scheduling in Emergency Departments

Meilin Zhang, PhD Candidate, NUS Business School, BIZ 2 Building, 1 Business Link, Singapore 117592, Singapore, Si, 117592, Singapore, 214101@gmail.com, Shuangchi He, Melvyn Sim

We focus on the dynamic scheduling of Emergency Department (ED) patients aiming to mitigate the ED crowding and consequential delays. We propose a novel modeling framework for this patient flow control based on robust optimization approach which is of high fidelity to real ED operations. Our

numerical study is inspired from empirical data and the proposed policy well retains the computation tractability and yields promising benefits on achieving ED targets comparing to other common policies.

3 - Combined Advance and Appointment Scheduling

Mehmet Begen, Ivey Business School - Western University, 1255 Western Road, London, ON, N6G0N1, Canada, mbegen@ivey.uwo.ca, Jonathan Patrick, Antoine Sauré

Appointment scheduling and advance scheduling have generally been addressed as two separate problems despite being highly dependent on each other. We attempt to develop a framework that combines the two problems and present our findings.

4 - Determining Non-clinical Predictors of Hospital Ward Length-of-stay

Taylor Corcoran, PhD Student, UCLA Anderson School of Management, 110 Westwood Plaza, Los Angeles, CA, 90095, United States of America, taylor.corcoran.1@anderson.ucla.edu, Ira Hofer, Nirav Kamdar, Elisa Long

Post-surgical hospital length-of-stay is influenced by patient acuity and surgery procedure, and other factors including patient demographics, ward assignment, surgeon, census levels, discharge day and location. We design an econometric model to identify non-clinical predictors of length-of-stay using 24 months of data from the Ronald Reagan UCLA Medical Center, which regularly experiences occupancy near 100%. Reduced ward length-of-stay could alleviate congestion and improve on-time surgeries.

Pricing & Revenue Management with New Ingredients

Sponsor: Revenue Management and Pricing
Sponsored Session

Chair: Xin Geng, Xin.Geng@sauder.ubc.ca

1 - Threshold Discounts Comparison: Across-the-board or Partial?

Thunyarat Amornpetchkul, Faculty Member, NIDA Business School, 118 Seri-Thai Road, Bangkok, Boonchana-Atthakorn Bldg. 8th Fl., Bangkok, 10240, Thailand, thunyarat.a@nida.ac.th

An increasingly ubiquitous discount format that is taking over traditional price cuts is "threshold discount," under which a price reduction is awarded to a purchase that meets a minimum quantity or minimum spending requirement. We consider the use of two popular discount schemes: all-unit and incremental discount, in a retail setting. Our focus is to investigate when it is more profitable for the retailer to offer an all-unit discount or an incremental discount.

2 - In Parallel to Ongoing Efforts to Deoptimal Contract Designs for Carbon Capture and Storage Systems

Wenbo Selina Cai, Assistant Professor, New Jersey Institute of Technology, Newark, NJ, cai@njit.edu, Dashi Singham

In parallel to ongoing efforts to develop improved CCS technology, we model the decision processes of CCS participants who face uncertainty in both costs and emissions, and optimize incentives to encourage storage operators to provide the service of transportation and storage of CO₂ from emitters who have heterogeneous emissions profiles. We also evaluate the impact of the cap-and-trade carbon policy on CCS participants' sequestration efforts and storage operators' performance.

3 - Consumer Subsidies in Developing Economies: Advance Selling and Self-control

Qiao-Chu He, PhD Candidate, University of California, Berkeley, 1117 Etcheverry Hall, Berkeley, CA, United States of America, heqc0425@berkeley.edu, Zuo-jun Max Shen, Ying-jun Chen

We present an explanation to the product adoption puzzle in developing economies via consumers' lack of self-control due to their present-bias. We explore the roles of advance selling and consumer subsidy in resolving this puzzle.

4 - Advance Selling to Strategic Consumers: Preorder Contingent Pricing or Preorder Contingent Production

Mike Wei, Assistant Professor, University at Buffalo, 326C Jacobs Management Center, Buffalo, 14260, United States of America, mcwei@buffalo.edu, Fuqiang Zhang

Motivated by emerging industry practices, this paper studies the effectiveness of two new advance selling strategies in counteracting strategic consumer behavior: the preorder contingent production (PCP) strategy and the preorder contingent pricing (PCP) strategy, where the seller's preorder production and price are a function of the preorder quantities respectively.

Revenue Management and Pricing in Social Networks

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Amir Ajorlou, Postdoctoral Fellow, Massachusetts Institute of Technology, E32-D569, 32 Vassar Street, Cambridge, MA, 02139, United States of America, ajorlou@mit.edu

1 - Ergodic Social Learning

Alireza Tahbaz-Salehi, Columbia Business School, 3022 Broadway, Uris Hall 418, New York, NY, 10023, United States of America, alirezat@columbia.edu, Ali Jadbabaie, Pooya Molavi

This paper examines how the structure of a social network and the quality of information available to different agents determine the speed of social learning. In a variant of the DeGroot learning model, we show that the rate of learning has a simple analytical characterization in terms of the relative entropy of agents' signal structures and their eigenvector centralities.

2 - Cournot Competition in Networked Markets

Shayan Ehsani, Stanford University, 450 Serra Mall, Stanford, CA, 94305, United States of America, shayane@stanford.edu, Kostas Bimpikis

The paper considers competition among firms that produce a homogeneous good in a networked environment. A bipartite graph determines which subset of markets a firm can supply to. We characterize equilibrium supply quantities, prices, and profits, and provide several insights regarding entering a new market or two firms merging.

3 - Maximizing Stochastic Monotone Submodular Functions

Arash Asadpour, Assistant Professor, New York University, 44 West 4th Street, Suite 8-60, New York, NY, 10012, United States of America, aasadpou@stern.nyu.edu, Hamid Nazerzadeh

We study the problem of maximizing a stochastic monotone submodular function with respect to a matroid constraint. We show that the adaptivity gap ϕ the ratio between the values of optimal adaptive and optimal non-adaptive policies ϕ is bounded and is equal to $e/(e-1)$. We propose a polynomial-time non-adaptive policy that achieves this bound. We also present an adaptive myopic policy that obtains at least half of the optimal value.

4 - Dynamic Pricing in Social Networks: The Word of Mouth Effect

Amir Ajorlou, Postdoctoral Fellow, Massachusetts Institute of Technology, E32-D569, 32 Vassar Street, Cambridge, MA, 02139, United States of America, ajorlou@mit.edu, Ali Jadbabaie, Ali Kakhbod

We study the problem of optimal dynamic pricing for a monopolist selling a product to consumers in a social network. The only means of spread of information about the product is via Word of Mouth communication. We show that, in line with the real world evidence from smartphone applications, the optimal dynamic pricing policy for durable products drops the price to zero infinitely often, giving away the immediate profit in full to expand the informed network in order to exploit it in future.

1 - Understanding Spatio-temporal Diffusion of New Durable Products: The Toyota Prius Hybrid Vehicle

David Keith, Assistant Professor, MIT Sloan School of Management, 100 Main St, Room E62-441, Cambridge, MA, 02138, United States of America, dkeith@mit.edu, Jeroen Struben, John D. Sterman

We propose an analytical framework in which spatio-temporal diffusion is explained by social influence between adopters and potential adopters at different geographic scales, for which data are more readily observable. We analyze Prius sales in 4 US cities selected to capture variation in conduciveness and observed adoption. We find that variation in Prius adoption is primarily explained by social contagion within each ZIP code, amplifying underlying market heterogeneities.

2 - Sustainability Consciousness in Engineering Education

Qiong Wang, National University of Singapore, #12-207C, North Tower, University Town, Singapore, 138601, Singapore, qiong.wang@u.nus.edu

University sustainability education programs in several European countries and the US have been compared to find common characteristics of the curricula in environmental science and engineering programs. This study investigates differences in the world's top universities for engineering and technology with the QS World University Rankings and Times Higher Education World University Rankings by Faculty in the academic year 2014-15.

3 - Sustainability Trends in Service Sectors: A Text Mining Approach

Youqin Pan, Assistant Professor, Salem State University, 352 Lafayette Street, Salem, MA, 01970, United States of America, youqinpan@my.unt.edu, Xiaocun Sun

In this paper, sustainability reports of major companies in the service sectors are obtained and used. To extract useful information or uncover hidden patterns from these reports, text mining is applied. The higher the frequency of a certain term, the greater is the emphasis that companies place on them and hence the more important they are to the companies.

4 - Financial Sustainability of Operator Assisted E-government Kiosks in Emerging Economies

Rajesh Sharma, Research Scholar, Indian Institute of Management, Prabandh Shikhar, Rau, Indore, MP, 453556, India, f12rajeshs@iimdr.ac.in, Rajhans Mishra

The paper addresses the issue of financial sustainability of operator assisted kiosks which are deployed in emerging economies to overcome the handicap of low education, PC penetration and lack of Internet connectivity.

5 - Feasibility Study of Grid Defection with PV and Battery

Rajab Khalilpour, Dr, University of Sydney, School of Chemical and Biomolecular Eng, University of Sydney, University of Sydney, 2006, Australia, rajab.khalilpour@sydney.edu.au, Anthony Vassallo

We have developed a mixed-integer decision support tool for rigorous assessment of the feasibility of leaving the grid. Numerous sensitivity analyses are carried out over critical parameters such as technology costs, system size, load, and feed-in-tariff. The results show that leaving-the-grid is not the best economic option and it might be more beneficial to keep the connection with the grid, but minimize the electricity purchase by installation of an optimal size of a PV-battery system.

Sponsored Session

Chair: Ryan Buell, Harvard Business School, Morgan Hall 429, Boston, MA, 02163, United States of America, rbuell@hbs.edu

1 - Strategically Giving Service: Information Visibility and Driver Behavior in E-hailing Services

Antonio Moreno-Garcia, Northwestern University, 2001 Sheridan Rd, Evanston, IL, 60208, United States of America, a-morenogarcia@kellogg.northwestern.edu, Can Ozkan

Using data from a leading eHailing platform, we study how drivers react to the existence of detailed information about the location of their competitors, and we analyze how this phenomenon affects operational efficiency.

2 - Increasing Sales by Managing Congestion in Self-service Environments: Evidence from A Field Experiment

Saravanan Kesavan, Associate Professor, University of North Carolina at Chapel Hill, Kenan-Flagler Business School, Chapel Hill, NC, 27514, United States of America, Saravanan_Kesavan@kenan-flagler.unc.edu, Hyun Seok Lee, Vinayak Deshpande

We examine the impact of congestion in fitting-room on store performance. We demonstrate an inverted-U relationship between fitting-room traffic and sales. We find that co-production is more effective: increasing fitting-room labor by one person through field experiment increases sales per hour by 15.77%. Our solution was adopted with around 100 stores. Finally, we tease out two mechanisms of congestion effect by closely observing other retail store: 1) Waiting time and 2) Phantom stock-out.

3 - The Performance Benefits of Not Working

Bradley Staats, Associate Professor, UNC-Chapel Hill, NC,
United States of America, Bradley_Staats@kenan-flagler.unc.edu

Using lab and field experiments we examine how performance may be improved by doing less and thinking more.

4 - The Persistence of Customer Incompatibility: Evidence from a Retail Bank Acquisition

Ryan Buell, Harvard Business School, Morgan Hall 429,
Boston, MA, 02163, United States of America, rbuell@hbs.edu,
Dennis Campbell

When a firm acquires a customer whose needs and preferences are misaligned with its operating system, will the customer's preferences conform over time? Will the customer defect? Or, will the misalignment persist? We leverage a natural experiment created when one nationwide retail bank acquired another to answer these questions.

Strategic Planning for the Closed Loop Supply Chain

Sponsor: Manufacturing & Service Oper
Mgmt/Sustainable Operations
Sponsored Session

Chair: Daniel Steeneck, Post Doctoral Associate, MIT Center for Transportation and Logistics, 1 Amherst St., E40-211, Cambridge, MA, 02142, United States of America, steeneck@mit.edu

1 - To Remarket Now or Save for Warranty Claims

Cerag Pince, Kuehne Logistics University, Grosser Grasbrook 17,
Hamburg, Germany, Cerag.Pince@the-klu.org, Beril Toktay,
Mark Ferguson

Consumer returns constitute a substantial fraction of sales in the consumer electronics industry and often cannot be re-sold as new due to litigation concerns. Therefore, identifying the best joint pricing and disposition strategy is a challenging but important decision for consumer electronics OEMs. This paper investigates how an OEM should price new and refurbished products while allocating consumer returns between remarketing and warranty coverage options over the product's short life cycle.

2 - Optimal Product Design in a Remanufacturing Setting

Serkan M. Akturk, PhD Candidate, Texas A&M University, 4217
TAMU Wehner 320 M, College Station, TX, United States of
America, makturk@mays.tamu.edu, James Abbey, Neil Geismar,
V. Daniel R. Guide, Jr.

This study analytically investigates how remanufacturing firms should choose among varying design philosophies ranging from integral to modular to part-based designs. Firms believe that increasing the level of remanufacturability would also increase the profitability by lowering remanufacturing costs. However, several factors such as industry clockspeed and time-to-market complicate this decision.

3 - The Effect of Channel Structure on End-of-Life Product Collection Strategies

Elizabeth J. Durango-Cohen, Associate Professor, Illinois Institute
of Technology, 10 W. 35th Street, Chicao, IL, 60616,
United States of America, durango-cohen@iit.edu, Chia-hang Li

In this talk, we address the coordination issue of deciding on the proper reverse channel strategy to collect End-of-Life products in a three-echelon closed-loop supply chain, under the presence of a strategic recycler. We find that the manufacturer is always better-off by outsourcing product collection activities either to the retailer or the recycler. We discuss the impact of a strategic recycler, whether a price taker or price maker, on equilibrium prices, profits, and collection rates.

4 - End-of-life Option and Product Design

Daniel Steeneck, Post Doctoral Associate, MIT Center for Transportation and Logistics, 1 Amherst St., E40-211, Cambridge, MA, 02142, United States of America, steeneck@mit.edu,
Subhash C. Sarin

The characteristics of a product and its parts determine its optimal End-of-Life (EOL) option. However, a product's design plays a large role in determining the characteristics of a product. Insights relating product design to optimal EOL option are presented.

Revenue Management Pricing II

Contributed Session

Chair: John Wilson, Ivey School of Business, 1255 Western Road,
London, ON, N6G 0N1, Canada, jwilson@ivey.ca

1 - Optimal Subscription Pricing for Free Delivery Services

Chinmoy Mohapatra, PhD Candidate, University of Texas at Austin, 3500 Greystone Drive, Apt. 126, Austin, TX, 78731, United States of America, chinmoym@utexas.edu, Anant Balakrishnan, Shankar Sundaresan

We study the subscription pricing problem of a retailer that offers its consumers two delivery choices: a pay-per-delivery option and a subscription option with free delivery. The retailer balances the "loss" incurred in covering the shipping costs of subscribers against the increase in revenue from the "lift" in their order quantity. Considering a model with a general utility framework, heterogeneous consumers, and an outside option, we characterize the retailer's optimal subscription price.

2 - Budget Constrained Markdown Optimization

Emrah Zarifoglu, Team Leader - Optimization And Modeling, IBM, 1001 Hillsdale Blvd. Ste 400, Foster City, CA, United States of America, emrah.zarifoglu@utexas.edu, Xiao Chun Li, Jun Lei Chen

Markdown is a schedule of known price reductions taken over short time with the purpose of managing a product out the assortment gracefully and cost-effectively. Markdown budget is an important constraint when retailers run a markdown recommendation for a plan. It is crucial to limit total markdown dollars under budget. We provide a method to ensure markdown dollar to be limited to markdown budget and avoid the performance issue when considering the total budget across all store-products level.

3 - Dynamic Nonlinear Pricing of Inventories Over Finite Sales Horizons

Yan Liu, University of Science and Technology of China, No.96, Jin Zhai Road Baohe District, Hefei, China, terenceliuyan@gmail.com, Guillermo Gallego, Michael Li

We present three dynamic pricing models in a setting where customers can be incentivized to purchase multiple units. The dynamic linear pricing (DLP) model charges a uniform price that depends on the time-to-go and the remaining capacity. The dynamic package pricing (DPP) model allows complete freedom in pricing different bundle sizes. We also study dynamic block pricing (DBP) as an intermediate scheme where prices are linear within each block.

4 - Dynamic Pricing for a Single Perishable Product Based on Customer Inertia

Yusheng Hu, Student, School of Management and Economics, Beijing Institute of Technology, No. 5 South Zhong Guan Cun Street, Beijing, 100081, China, huyusheng1981@163.com, Jinlin Li

This paper investigates a dynamic pricing problem for a single perishable product in the presence of customer inertia. Dynamic pricing model about customer inertia is established using the dynamic programming method, and structural properties of the optimal price are given. The results show that customer inertia produces negative effect on the optimal price, which is monotonically decreasing in inertia depth and inertia breadth.

5 - Optimising Name-your-own-price Auctions Over Different Channels and Number of Bids

John Wilson, Ivey School of Business, 1255 Western Road, London, ON, N6G 0N1, Canada, jwilson@ivey.ca

Optimality results for designing Name-Your-Own-Price Auctions with other distribution channels will be presented. For the case of just a Name-Your-Own-Price Auction, the optimality results regarding allowing one or more bids will be presented.

Facility Location I

Contributed Session

Chair: Kenneth Carling, Professor, Dalarna University, Sweden, Högskolan Dalarna, Falun, 79188, Sweden, kca@du.se

1 - Locating and Sizing Storage Units in a Drainage System using a Simulated Annealing Approach

Maria Cunha, Professor, University of Coimbra, DEC Polo II da Universidade, Coimbra, 3030-165, Portugal, mccunha@dec.uc.pt, Nuno Simies, Joao Zeferino

Urban stormwater drainage systems are very important assets to sustainable development. Attention must be paid to the effects of the rapid process of urbanization and climate change with extreme weather and heavy rains occurring more frequently. A pioneering tool will be presented, comprising interlinked modules (including an optimization model for locating and sizing units to store excess flows taking into account climate change) to redesign sustainable urban stormwater drainage systems.

2 - Developing a Transportation Network for UAVs Delivery

Amirali Ghahari, University of Arkansas, 891 W. Melmar Dr., Apt #83, Fayetteville, AR, 72703, United States of America, aghahari@uark.edu, Edward Pohl

Recently, the use of Unmanned Ariel Vehicle (UAV) for package delivery has become an interesting topic for giant corporations. In our research, we develop a strategic model that constructs a transportation and support network which enables the UAVs to fly long distances and make deliveries to a variety of demand points. Since the developed models cannot be solved optimally for large representative problems using exact methods, a heuristic algorithm is developed to solve real world examples.

3 - Cold Supply Chain Design with Environmental Considerations: A Simulation-optimization Approach

Ahmed Saif, University of Waterloo, 200 University Avenue, Waterloo, Canada, asaif@uwaterloo.ca, Samir Elhedhli

Cold supply chains have high levels of greenhouse gas emissions due to the high energy consumption and refrigerant gas leakages. We model the cold supply chain design problem as a mixed-integer concave minimization problem with dual objectives of minimizing the total cost and the global warming impact. A novel hybrid simulation-optimization approach is proposed to solve the problem.

4 - On Administrative Borders and Accessibility to Public Services

Kenneth Carling, Professor, Dalarna University, Sweden, Högskolan Dalarna, Falun, 79188, Sweden, kca@du.se, Pascal Rebreyend, Xiangli Meng, Johan Håkansson

Do the Europeans suffer from a poor accessibility to public services due to internal borders? We address this question by studying the effect of administrative borders within Sweden on the population's spatial accessibility to hospital service. We have elaborated several scenarios ranging from strongly confining regional borders to no confinements of borders as well as long-term population redistribution. Our findings imply that the borders are only marginally worsening the accessibility.

1 - Shipment Policies for Perishable Products in Two-tier Supply Chains

Arzum Akkas, Boston University, 595 Commonwealth Avenue, Boston, MA, United States of America, arzumakkas@gmail.com, Vishal Gaur, David Simchi-levi, Roy Welsch

Product expiration is an important problem in the consumer packaged goods industry with substantial impact on the environment and profits of firms. We found that shelf life erosion is one of the drivers of expiration. In this study, we establish shipment policies for manufacturers to address the shelf life erosion problem.

2 - Online Fresh Grocery Retail: A La Carte Or Buffet?

Elena Belavina, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, United States of America, elena.belavina@chicagobooth.edu

Grocery delivery is a market that many try to conquer. Appropriate pricing is key for success. There is little consensus among different players (at times even within one firm operating in different locations) on what is the best pricing scheme. For example, Amazon Fresh in Seattle is using per order pricing while in San Francisco - subscription fee. We provide recommendation for the preferred pricing scheme based on various characteristics (delivery logistics, demand variability etc.).

3 - Customer Behavior in Bike-share Systems

Karan Girotra, Associate Professor, INSEAD, Boulevard de Constance, Fontainebleau, 77300, France, Karan.Girotra@insead.edu

Using a large high-frequency dataset, we identify the impact of the accessibility of bike-share stations and the associated service-levels on the usage of these systems. We illustrate the use of our estimates to support operational decisions such as station network reorganization and system investments.

4 - Service Region Design for Urban Electric Vehicle Sharing Systems

Ho-Yin Mak, Associate Professor, Saad Business School, University of Oxford, Park End Street, Oxford, United Kingdom, Ho-Yin.Mak@sbs.ox.ac.uk, Ying Rong, Long He, Zuo-Jun Max Shen

We consider the service region design problem for electric vehicle sharing systems. We then develop a model that incorporates both customer adoption behavior and fleet operations under spatially-imbalanced and time-varying travel patterns. To address the uncertainty in adoption patterns, we employ a distributionally-robust optimization framework. Applying this approach to the case of Car2Go's service in San Diego, CA, with real operations data, we address a number of planning questions.

Strategic Behavior and Decision Making within Supply Chains

Sponsor: Manufacturing & Service Operations Management
Sponsored Session

Chair: Pelin Pekgun, Assistant Professor, University of South Carolina, 1014 Greene Street, Columbia, SC, 29208, United States of America, pelin.pekgun@moore.sc.edu

1 - The Effects of Product Recalls on Promotions and Sales

Yan Dong, Moore School of Business, University of South Carolina, 1014 Greene St, Columbia, SC, 29201, United States of America, Yan.Dong@moore.sc.edu, Chen Zhou, Rafael Becerril, Tony Haitao Cui

This study investigates firm decisions in response to a major product recall, which has a direct effect to the recalled brand and an indirect effect to the market and the competitors. In the wake of the recall, firms may adopt different strategies to take advantage of the recall, by promoting their own products more aggressively, for example, to increase sales. Analyzing a dataset of recalls in the automobile industry, this study shows how the competitors can proactively react to a major recall.

2 - Mitigating Supplier Risks via Diversification Versus Improvement: An Experimental Evaluation

Basak Kalkanci, Georgia Institute of Technology, 800 W Peachtree St, NW, Atlanta, GA, United States of America, Basak.Kalkanci@scheller.gatech.edu

Using economic experiments, we evaluate the performance of supplier diversification versus improvement to mitigate supply chain risks of a buyer facing suppliers with different costs and risk profiles. We show that the buyers diversify their orders more than theory and the orders are artificially inflated to benefit from quantity hedging. We also demonstrate that sourcing commitment hurts a buyer by reducing the subsequent supplier improvement effort, contrary to theory.

2 - Analytical Stochastic Link Transmission Model Suitable for Large-scale Analysis

Jing Lu, Massachusetts Institute of Technology, Cambridge, MA,
United States of America, luj@mit.edu, Carolina Osorio

We formulate a model that builds upon the previously formulated analytical stochastic network loading model of Osorio and Flötterod (2013). The proposed model has a complexity that is linear, rather than cubic, in the space capacity of the links in the network. It is a scalable approach suitable for large-scale network analysis. The model is validated versus stochastic simulation results, and is then used to analyze a network with intricate network dynamics.

3 - A Graph-based Approach to Measure the Efficiency of Urban Taxi Service System

Xianyuan Zhan, PhD Candidate, Purdue University, 550 Stadium
Mall Drive, School of Civil Engineering, West Lafayette, IN,
47906, United States of America, zhanxianyuan@purdue.edu,
Xinwu Qian, Satish V. Ukkusuri

This study investigates the efficiency level of the taxi service system using real world large-scale taxi trip data from New York City. Two large-scale optimization problems are formulated and transformed into equivalent graph problems to find the theoretical optimal strategy that minimizes the cost of vacant trips, and results in minimum number of taxis required to satisfy all observed trips. Huge performance gap is observed between current system and the optimal system, which suggests the potential gain by sharing system-wide information among taxi drivers and passengers.

4 - Combining Data-driven and Model-driven Approaches for Traffic Simulator Calibration Problems

Kevin Zhang, Massachusetts Institute of Technology, Cambridge
MA, United States of America, kzhang81@mit.edu

In this presentation, we approach the problem of parameter calibration of stochastic traffic simulators through the use of Kalman filtering. We build upon an established Kalman filtering approach by incorporating network-specific structural information supplied by an analytical queueing model. The approach is benchmarked versus other traditional calibration methods. Results on low-dimensional calibration problems are presented.

1 - Psychological Benefits of Real-Time Travel Information on Route Choice Behavior – Analysis of Interactive Driving Simulator Experiment Data

Dong Yoon Song, Purdue University, West Lafayette, IN,
United States of America, song50@purdue.edu, Srinivas Peeta

This study proposes a comprehensive framework to understand the psychological mechanisms associated with real-time travel information provided. A structural equation model with latent variables is presented to address the driver's psychological processes associated with real-time information based on revealed preference data from interactive driving simulator experiments and the associated survey data. Insights from the interactive driving simulator experiments will also be discussed.

2 - Determining Optimal Toll Gantry Locations on Tollway

Ruoyu Liu, CDM Smith, 8140 Walnut Hill Ln # 1000, Dallas, TX,
United States of America, happylyr@gmail.com,
Worapong Hirunyanitiwattana

Toll Gantry Locations can affect traffic flow and toll revenue on tollway. The model maximizes toll revenue and also minimizes the travel cost. Genetic algorithm is used to search the optimal solution based on result from a traffic assignment model.

3 - Real-Time Lane-Based Traffic State Estimation and Prediction

Kerem Demirtas, Arizona State University, Tucson, AZ,
United States of America, kerem.demirtas@asu.edu,
Pitu Mirchandani, Xuesong Zhou

Given new lane-based ITS applications such as speed controls and managed lanes, one needs to estimate and predict the state of the traffic in each lane of a highway. Based on Newell's 1993 Simplified Kinematic Wave Model, and the p-detector interpretation of Daganzo, we have an approach to estimate past trajectories from Lagrangian flow-density measurements and subsequently predict short-term trajectories using simplified behavior models. Analysis using real and simulated data is discussed.

4 - Desirability Measures and Discovery Analysis for Multi-Modal Services Based on Daily Trajectory Pattern Data

Yi-Chang Chiu, University of Arizona, Tucson, AZ,
United States of America, chiu@email.arizona.edu, Ali Arian

This talk focuses on presenting a computational method to estimate the desirability measures for various transportation modes available to a traveler based on known multi-day daily GPS trajectory pattern data. Algorithmic details and case studies are presented.

WD70

Vehicle Routing III

Contributed Session

Chair: Alexander Düge, TU München, Arcisstr. 21, München, Germany,
alexander.doege@tum.de

1 - Appointment Scheduling with Multiple Providers and Stochastic Service Times

Mohamad Soltani, University of Alberta, PhD Office, Business
Building, Edmonton, AB, T6G 2R3, Canada, soltani@ualberta.ca,
Michele Samorani, Bora Kolfal

We consider a multi-server appointment scheduling problem in which patients may not show up, and those who show up require stochastic service times. We model this problem to evaluate each candidate solution. We statistically find some properties for the optimal or near optimal solutions, and design a simulation optimization approach using these properties. We also propose a heuristic algorithm, and validate its performance by comparing its result with our simulation optimization approach.

2 - Exact Optimization Frameworks for Time-consistent Routing

Anirudh Subramanyam, Graduate Student, Carnegie Mellon
University, DH3122, 5000 Forbes Ave, Pittsburgh, PA, 15213,
United States of America, asubramanyam@cmu.edu,
Chrysanthos Gounaris

We present exact approaches for the Consistent Traveling Salesman Problem, wherein arrival-time consistency across multiple periods is enforced for each customer. Our first approach is based on branch-and-cut. We compare alternative formulations and propose new valid inequalities. Our second approach is based on decomposition into single-period TSPTWs, where consistency is enforced by tightening the windows during the search. We compare our approaches on benchmark instances derived from TSPLIB.

3 - Rollout Algorithm for The Dynamic Vehicle Routing Problem In City Logistics

Gitae Kim, Assistant Professor, Hanbat National University, N4 -
207, 125 Dongseo-daero, Yuseong-gu, Daejeon, 305-719, Korea,
Republic of, gitae.kim@gmail.com, Yew Soon Ong,
Taesu Cheong

This paper suggests a dynamic vehicle routing problem (DVRP) model in city logistics. Depending on the traffic conditions, the travel time between two nodes, particularly in a city, changes both dynamically and stochastically over time. In this paper, we propose a Markov decision process (MDP) model for the DVRP with the travel time dynamics under traffic congestion in the city area and adopt the rollout algorithm to solve the problem.

4 - Vehicle Routing with Flexible Delivery Locations

Alexander Düge, TU München, Arcisstr. 21, München, Germany,
alexander.doege@tum.de, Daniel Gartner, Markus M. Frey

We present a new extension of the vehicle routing problem (VRP): The VRP with flexible delivery locations and time points (VRPFLTP). In the VRPFLTP, a customer not only corresponds to exactly one location but has to be served at one out of a set of possible capacitated locations. We develop an adaptive large neighborhood search which demonstrates high quality solutions within short computation times. In our economic analysis, we trade off location flexibility on a variety of performance metrics.

Transportation Operations III

Contributed Session

Chair: Sara Saberi, PhD Candidate, University of Massachusetts Amherst, Department of Operations and Information, Isenberg School of Management, Amherst, MA, 01003, United States of America, ssaberi@som.umass.edu

1 - Vehicle Routing for Urban Drainage Operations: A VRP with Stochastic On-site Durations

Hamid Zaman, Graduate Student, University of Alberta, 9105 116 Street NW, Edmonton, AB, Canada, hzaman@ualberta.ca,
Mohamed Al-hussein, Ahmed Bouferguene

Operational preventive maintenance of urban drainage network involves various short-duration flushing/cleaning activities performed at selected locations across the city, which results in large amount of travel. Moreover, the stochastic nature of the on-site activity durations can lead to unused time at the end of work shifts. This study thus formulates drainage operations scheduling as a combinatorial optimization problem which minimizes the aforementioned travel and unused times.

2 - Operational Flexibility in the Truckload Trucking Industry

Hossein Zolfagharinia, Wilfrid Laurier University, 125 Lincoln Road, Waterloo, ON, N2J2N9, Canada, hzolfagharinia@wlu.ca,
Michael Haughton

Inspired by a real-life operating carrier, this study addresses a dynamic pickup and delivery problem with full truckload (DDPFL) for local operators. The main purpose of this work is to investigate the impact of potential factors on the carriers' operational efficiency. These factors, which are usually under the managerial influence, are diversion capability, re-optimization interval, and advance load information (ALI).

3 - An Integrated Multi-Ship Crane Allocation in a Transshipment Container Terminal

Nabil Nehme, Assistant Professor, Lebanese American University, Byblos, Lebanon, nabil.nehme01@lau.edu.lb, Bacer Maddah,
Isam Kaysi

This research investigates the integration between the quay and yard sides for multiple berthing ships with transshipment containers. An integer linear programming model is formulated to minimize the total number of cranes used in both quay and yard sides for all berthing ships unloading at the same time horizon. The number of containers unloaded is determined for each crane used, quay location and for the storage location of containers on the yard per berthing ship.

4 - A Continuous Approximation Model for Logistic Distribution System Delivered by Trucks and Drones

Li Yu Shan, PhD, Tsinghua University, Beijing Haidian Tsinghua University, Shuenn-Der Building, 615 South, Beijing, 100084, China, lyslys_1990@126.com

This paper presents a continuous approximation model to evaluate cost of Logistics distribution model. The problem is a realistic variant of vehicle routing problem, in which expresses are delivered by trucks and drones. With Amazon's Prime Air UAVs project, many companies pay attention to deliver goods with UAVs. Aim to evaluate economy of drones and build routing costs model with CA method. Analyze parameters of model and provide some insights for managers with ensuing decision-making reference.

5 - Supply Chain Network Competition in Price and Quality with Multiple Manufacturers and Carriers

Sara Saberi, PhD Candidate, University of Massachusetts Amherst, Department of Operations and Information, Isenberg School of Management, Amherst, MA, 01003, United States of America, ssaberi@som.umass.edu, Anna Nagurney, Shivani Shukla,
Jonas Floden

We develop multitiered static and dynamic supply chain network models with manufacturers and freight service providers (carrier) with multiple modes of shipment competing on price and quality. They maximize their utilities while considering the consequences of the competitors' prices and quality levels. An algorithm tracking the evolution of the strategic variables over time through discrete-time adjustment is presented. The framework is illustrated numerically and its practicality demonstrated.

Image and Functional Data Analysis: Methods and Applications

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Kamran Paynabar, Georgia Institute of Technology, 755 Ferst Drive, Atlanta, GA, 30332, United States of America, kamran.paynabar@isye.gatech.edu

1 - Porosity Detection in Additive Manufacturing using Spatial Statistical Model

Zhenyu Kong, Associate Professor, Virginia Tech University, 123 Durham Hall (MC 0118) 1145 Perry Str, Blacksburg, VA, 24061, United States of America, zkong@vt.edu, Jia (peter) Liu,
Pralhad Rao

In order to realize nondestructive quality monitoring for additive manufacturing (AM), we propose a nonparametric spatial statistical model to monitor porosity in AM products. We use sliced images acquired by Micro CT to estimate the spatial distribution of porosity by employing Dirichlet process model, which can effectively handle the nonstationarity of the spatial distribution.

2 - Calibrating Functional Parameters in Computer Models, A Case Study

Matthew Plumlee, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, mplumlee@umich.edu

The output from a computational model depends on a set of parameters which are unknown, but a modeler can estimate them by collecting physical data. In the described study of the ion channels of ventricular myocytes, our parameter of interest is a function as opposed to a scalar or a set of scalars. New methods are devised to address this unique situation.

3 - A Degradation-based Prognostic Model using Image Data

Xiaolei Fang, Georgia Tech, 1546 Woodlake Dr. NE, Apt. E, Atlanta, GA, 30329, United States of America, xfang33@gatech.edu, Kamran Paynabar, Nagi Gebraeel

Due to the rapid development of sensing technology, it is possible to capture the degradation process of engineering systems using sequential image data. In this talk, we present a novel prognostic model utilizing degradation-based image data.

Chair: Kai He, University of Pittsburgh, 1048 Benedum Hall, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States of America, kah167@pitt.edu

1 - Competitive and Cooperative Game-theoretic Models for Usage-based Lease Contracts

Maryam Hamidi, PhD Candidate, University of Arizona, 1127 E. James E. Rogers Way, Room 111, P.O. Box 210020, Tucson, AZ, 85721, United States of America, mhamidi@email.arizona.edu, Haitao Liao

We develop competitive and cooperative game-theoretic models for lease contracts based on Nash equilibrium and total maximum profit, respectively. Under the contracts, the owner (lessor) rents an equipment which deteriorates with both age and usage to a user (lessee). The lessee determines the optimal lease period and usage rate, and the lessor develops a preventive maintenance policy. Our results illustrate that cooperation can significantly increase the profit, under certain conditions.

2 - On The Benefits of Condition-based Maintenance over Time-based Maintenance

Bram De Jonge, University of Groningen, P.O. Box 800, 9700 AV, Groningen, Netherlands, b.de.jonge@rug.nl, Ruud Teunter,
Tiedo Tinga

Developments in condition monitoring technology have led to an ongoing shift from time-based maintenance (TBM) to condition-based maintenance (CBM). Although CBM allows for more effectively planned maintenance, its performance strongly depends on the behavior of the deterioration process, severity of failures, required setup time, accuracy of the condition measurements, and amount of randomness in the failure level. This study points out how the relative benefit of CBM depends on these factors.

3 - Estimation of Servers Utilization in an Unreliable Queueing System with Stacked Servers

Maboubeh Madadi, University of Arkansas, Fayetteville, AR, United States of America, mmadadi@uark.edu, Richard Cassidy, Shengfan Zhang, Lisa Maillart

We consider a queueing system comprised of a set of identical servers that are stored in a stack when not in use. In such cases, customers may find it more convenient to select the server that is on top of the stack. We develop a continuous-time Markov chain model to compute the cumulative, transient utilization and age of each server based on the number of servers in the system, the server's initial position in the stack, the arrival rate and the service rate.

4 - Optimal Preventive Maintenance Planning in Anticipation of Imperfect Implementation

Kai He, University of Pittsburgh, 1048 Benedum Hall 3700 O'Hara Street, Pittsburgh, PA, 15261, United States of America, kah167@pitt.edu, Oleg Prokopyev, Lisa Maillart

Maintenance planners usually assume perfect implementation of their prescribed preventive maintenance (PM) policies. However, the maintenance workers often deviate from the intended PM policy resulting in imperfectly timed PM actions. We formulate cost rate-minimizing models to investigate the impact of such deviations, assuming that the actual PM time differs from the scheduled PM time in a probabilistic manner. We establish results for age replacement with and without minimal repair policies.

Reliability III

Contributed Session

Chair: Faranak Fathi Aghdam, The University of Arizona, 3125 E. Bellevue Street, Tucson, AZ, 85716, United States of America, faranakf@email.arizona.edu

1 - A Reliability Model for Multi-State Systems with Multi-State Components with Different Failures

Carlos Solorio, Assistant Professor, CETYS Universidad, Calzada S/N, Mexicali, Mexico, carlos.solorio@cetys.mx

A general model that evaluates the reliability of complex engineering systems that suffer soft failures due to common degradation of physical systems and catastrophic failures due to sudden shocks that provoke powerful stresses is presented. The general reliability model considers multi-state systems with multi-state components, where system reliability is evaluated based on the states of the components. Performance measures are presented that help us decide which system is better.

2 - Optimal CBM Policies under the Gamma Degradation Process

David Han, University of Texas, One UTSA Circle, San Antonio, TX, United States of America, David.Han@utsa.edu

CBM is an effective method to reduce unexpected failures as well as the O&M costs. This talk discusses the CBM policy with optimal inspection points under the gamma degradation process. A random effect parameter is used to account for population heterogeneities and its distribution is continuously updated at each inspection epoch. The observed degradation level along with the system age is utilized for making the optimal maintenance decision, and the structure of the optimal policy is examined.

3 - An Opportunistic Condition-Based Maintenance Policy with Two Degradation Thresholds

Joeri Poppe, KU Leuven, Naamsestraat 69, Leuven, 3000, Belgium, joeri.poppe@kuleuven.be, Robert Boute, Marc Lambrecht

Condition-based maintenance (CBM) is a maintenance strategy that makes use of the actual condition of the component. We introduce CBM in combination with preventive and corrective maintenance. We propose a CBM policy that relies on two thresholds of the degradation level, which can initiate a maintenance action on the monitored component. We find that major reductions in both maintenance cost and system unavailability can be realised, compared to the established maintenance policies.

4 - Reliability Study of High-k Bi-layer Dielectrics with Non-weibullian Failure Time Distribution

Faranak Fathi Aghdam, The University of Arizona, 3125 E. Bellevue Street, Tucson, AZ, 85716, United States of America, faranakf@email.arizona.edu, Haitao Liao

As electronic devices get smaller, reliability issues pose new challenges due to unknown underlying physics of failure. This necessitates new reliability analysis approaches related to nano-scale devices. The time-dependent breakdown of dielectric films is one of the most important reliability issues. In this research, we study two new approaches for modeling the time to breakdown of high-k bi-layer dielectrics.

Simulation and Optimization

Contributed Session

Chair: Siyang Gao, Assistant Professor, City University of Hong Kong, Tat Chee Avenue, P6605, AC1, Kowloon, Hong Kong - PRC, siyangao@cityu.edu.hk

1 - A Simulation Based Traffic Control Policy for Hazardous Materials Transportation

Sara Masoud, The University of Arizona, A214, 1300 E. Fort Lowell Rd., Tucson, AZ, 85719, United States of America, saramasoud@email.arizona.edu, Sojung Kim, Young-jun Son

A simulation-based traffic control policy for hazardous materials (hazmat) vehicles is devised to enhance public safety without sacrificing traffic efficiency, by considering two traffic control policies simultaneously: 1) Network Design which restricts hazmat vehicles from freeways; and 2) Dual Toll Pricing which levies toll on both hazmat vehicles and regular vehicles in tollways. The proposed approach is demonstrated via AnyLogic/Æ ABS software with a real traffic data of San Antonio, Texas.

2 - General-Purpose Ranking and Selection

Soonhui Lee, UNIST, UNIST-gil 50, Ulsan, Korea, Republic of, shlee@unist.ac.kr, Barry Nelson

In this study we take a step toward general-purpose Ranking & Selection procedures that work for many types of performance measures and output distributions, including situations in which different simulated alternatives have entirely different output distribution families. To obtain the required PCS we exploit intense computation via bootstrapping, and establish the asymptotic PCS of these procedures.

3 - Convex Risk Measures: Efficient Computations via Monte Carlo

Zhaolin Hu, Associate Professor, Tongji University, School of Economics and Management, Shanghai, China, huzhaolin@gmail.com

In this paper, we study an important class of convex risk measures called utility-based shortfall risk (SR). We develop efficient Monte Carlo methods for estimation of SR, sensitivity analysis of SR, and optimization of SR. Numerical experiments are studied extensively, which further demonstrate the effectiveness of our methods.

4 - Territory Design under Uncertainty

Peter Verderame, Air Products and Chemicals, Inc., 7201 Hamilton Boulevard, Allentown, PA, United States of America, verderpm@airproducts.com, Subhajit Ghoshal, Erdem Arslan, Pratik Misra

Territory design looks to maximize the efficiency of a company's resources through intelligent, objective placement and allocation of assets. Balancing workload across territories is a critical factor for successful deployment; however, projected workload is often uncertain which in turn greatly impacts design robustness. We developed a sophisticated optimization-and-simulation-based framework which explicitly considers the parametric or nonparametric uncertainty surrounding workload forecasts.

5 - Efficient Feasibility Determination with Multiple Performance Measure Constraints

Siyang Gao, Assistant Professor, City University of Hong Kong, T at Chee Avenue, P6605, AC1, Kowloon, Hong Kong - PRC, siyangao@cityu.edu.hk, Weiwei Chen

Feasibility determination has emerged as a widely applied problem in simulation optimization. It seeks to provide all the feasible designs from a finite set of design alternatives. In this paper, we consider this problem in presence of multiple performance measure constraints. The optimal solution to maximize the probability of correct selection is derived under asymptotic approximation. The numerical testing shows that our approach can enhance the simulation efficiency significantly.

Supply Chain Competition II

Contributed Session

Chair: Masoud Narenji, Doctor, Iran University of Science and Technology, Narmak, Tehran, 1894119493, Iran, mnarenji@iust.ac.ir

1 - Volume Guarantees in Global Health Procurement

Alexander Rothkopf, Julius-Maximilians-University
Wuerzburg, Stephanstraße 1, Wuerzburg, Germany,
alexander.rothkopf@uni-wuerzburg.de, Eirini Spiliotopoulou

Recently global health buyers granted volume guarantees to pharma manufacturers in an effort to reduce prices through competition and higher economies of scale. However, guaranteeing volumes affect market competition and new supplier entry in the future. Our analysis lends insights to policy makers how to optimally structure a volume guarantee.

2 - Information Asymmetry and Competitive Implications for Horizontal Outsourcing

Seung Hwan Jung, Washington University in St. Louis, Olin
Business School, Campus Box 1133, 1 Brookings Drive,
St. Louis, MO, 63130, United States of America,
seunghwan.jung@wustl.edu, Panos Kouvelis

We investigate the role of information asymmetry in business relationship between competing firms. We consider a two-echelon supply chain in which a vertically integrated (VI) firm sells a component to a component outsourcing (CO) firm. The VI firm has its own brand which competes with the CO firm's product. Under this circumstance, we characterize firms' sourcing and pricing decisions. This work highlights the role of information asymmetry in competing firms' operational strategy.

3 - Impact of Channel Power and Fairness Concern on Supplier's Market Entry Decision

Jie Zhang, Associate Professor, Guangdong University of Finance
and Economics, 21 Luntou Road, Haizhu District, Guangzhou,
510320, China, jiezhang@gdufe.edu.cn, Baozhuang Niu

We consider a two-stage supply chain with a supplier and a retailer, and incorporate the concepts of channel power and fairness concern to analyze the supplier's decision on its online direct channel. We show that a direct channel leads to the decline of online product's quality and its price. Furthermore, the retailer's order shifting strategy results in a lose-lose situation for the two firms. We also find that the supplier's fairness concern may make it less likely to open an online channel.

4 - Integrated Bioenergy Supply Chain Optimization under Crop Competition and Uncertainties

Yuanzhe Li, PhD Student, University of California, Davis,
Dept. of Civil & Environmental Engineer, Ghausi Hall,
One Shields Avenue, Davis, CA, 95616, United States of America,
rgli@ucdavis.edu, Yueyue Fan

An integrated optimization program was developed to model the bioenergy production system where dedicated energy crop is competing with incumbent agricultural crops as feedstock. The model addresses crop adoption decisions under competition and infrastructure deployment strategies under supply and demand uncertainties simultaneously. A case study for the U.S. Pacific Northwest region is conducted to obtain practical insights for the industry.

5 - Competition of Supply Chains and Their Internal Elements in a Market with Two Classes of Customers

Masoud Narenji, Doctor, Iran University of Science and
Technology, Narmak, Tehran, 1894119493, Iran,
mnarenji@iust.ac.ir, Mohammad Fathia

We follow competition and coordination strategies between two chains. Each supply chain has a manufacturer and a distributor. There are two types of customers with different sensitivity to price and delivery time. Each member of a chain can choose their own individual policy (dedicated or shared capacity) with respect to importance of the customers. The evolutionary game approach was followed to illustrate the best combination of strategy-policy, and heuristic methods was used to solve them.

Analytic Hierarchy Process

Contributed Session

Chair: Luis Vargas, Professor, Business Analytics and Operations, Joseph M. Katz Graduate School of Business, University of Pittsburgh, 356 Mervis Hall, Pittsburgh, PA, 15260, United States of America, lgvargas@pitt.edu

1 - Impact of NPD-SCM Alignment on Competitiveness of Indian Automotive Industry

Bimal Nepal, Associate Professor, Texas A&M University,
3367 TAMU, College Station, TX, 77843, United States of
America, nepal@tamu.edu, Ankur Pareek, Ajay P.S. Rathore,
Rakesh Jain

This paper attempts to measure NPD-SCM Alignment and evaluate its impact on Competitive Advantage in comparison to some established competitive priorities such as Cost, Quality, Delivery, Flexibility, and Innovation. A large scale survey data from Indian automobile industry has been collected and analyzed using ANP to capture the effect of inter-dependence among variables. Findings have been validated through three longitudinal in-depth case studies.

2 - From Actors' Analysis to Multicriteria Decision Aiding: A Mixed Method Approach

Valentina Ferretti, Politecnico di Torino, Corso Castellidardo
30/A, Torino, Italy, valentina.ferretti@polito.it

This paper proposes a methodological approach based on the combined use of different tools for designing complex urban regeneration processes. The purpose of the paper is to investigate synergies between the Social Network Analysis of actors and stakeholders and the Analytic Network Process in order to support the design of urban regeneration strategies. The framework has been tested on a real case study concerning the requalification for abandoned military barracks in Turin (Italy).

3 - Voting with Intensity of Preferences

Luis Vargas, Professor, Business Analytics and Operations, Joseph
M. Katz Graduate School of Business, University of Pittsburgh,
356 Mervis Hall, Pittsburgh, PA, 15260, United States of America,
lgvargas@pitt.edu

In this paper we develop a method based on the idea of pairwise voting to rank projects or candidates and incorporate in the ranking process how strongly the referees/voters feel about the comparisons they make. Voting is a modified form of ranking and all the votes are equally important. However, there are situations similar to voting in which the votes are not just ordinal but each voter expresses an intensity of preference for the different candidates, e.g., ranking projects for funding.

Scheduling, Workload and Complexity

Sponsor: Military Applications

Sponsored Session

Chair: Thomas Willemain, TomW@smartcorp.com

1 - A Simulation Optimization Approach for a Task Process to Balance Mental Workload

Cansu Kandemir, Old Dominion University, 5115 Hampton Blvd.,
Norfolk, VA, 23529, United States of America,
ckand002@odu.edu, Holly A. H. Handley

This research employs a human performance modeling simulation tool with meta-heuristic methods in order to assign personnel to tasks based on credentials, while still maintaining a workload balance among them. An initial simulation-optimization application on the task process of "Air Interdiction Mission Planning" will be presented.

2 - Addressing Complexity of Hurricane Sandy with Innovative Kingdon's Model

Eliot Evans, Lt Col & Graduate Student, George Mason University
School of Public Policy, Government, & International Affairs,
12308 Cicero Drive, Alpharetta, GA, 30022,
United States of America, eliotevans11@gmail.com

Losses due to the impact of Hurricane Sandy in 2012 raise the concern of the effectiveness of disaster management and its operations. FEMA's Hurricane Sandy After-Action Report revealed three significant problems 1) lack of collaboration 2) inadequate survivors' needs met, 3) shortage of an agile, professional emergency management workforce. This research aims to analyze the complexity of Hurricane Sandy and its problems, to propose an agenda and alternatives, and to recommend public policies.

3 - throughput Analysis of Reserve Component Mobilization Training Capacity

Katharina Best, Associate Operations Researcher, The RAND Corporation, 1200 S. Hayes St, Arlington, VA, 22202,
United States of America, kbest@rand.org, Jeremy Eckhause, Igor Mikolic-torreira, Michael Linick

Army Reserve Component units require administrative processing and varying amounts of high-quality training at specialized installations before deploying to contingency locations. Capacity at such facilities is limited and opening bases quickly can be problematic. We present a mixed-integer programming model that optimizes training schedules under different assumptions about training time, facilities ramp-up, unit type prioritization, demand timing, and Active/Reserve Component force mix.

4 - Optimal Multi-stage Allocation via Approximate Dynamic Programming

Darryl Ahner, Asst Professor, Air Force Institute of Technology,
2950 Hobson Way, Wright-Patterson AFB, OH, 45433-7765,
United States of America, darryl.ahner@afit.edu, Carl Parson

We consider the optimal allocation of resources over multiple stages to a collection of tasks with the objective of maximizing the reward for completing tasks where the task arrivals follow a known distribution, namely stochastic weapon-target assignment. Simulation and mathematical programming are used within a dynamic programming framework to update functional approximations representing future rewards using subgradient information and thereby determine allocation strategies.

Scheduling V

Contributed Session

Chair: Majid Algwaiz, Engineering Specialist, Saudi Aramco Oil Company, P.O. Box 19422, Dhahran, 31311, Saudi Arabia, majid.gwaiz@gmail.com

1 - A Genetic Algorithm for the Resource Leveling Problem with Generalized Precedence Relations

Hongbo Li, Shanghai University, School of Management, Shangda Road 99, Shanghai, 200444, China, ishongboli@gmail.com,
Yinbin Liu, Li Xiong

We present a bi-chromosome based genetic algorithm (BGA) for the resource leveling problem with generalized precedence relations. In the BGA, a solution is represented by a bi-chromosome that consists of two parts: a random key vector and a percentage based shift vector. To demonstrate the effectiveness of our BGA, we conduct extensive computational experiments on a set of benchmarks with up to 500 activities and compare the BGA with two best metaheuristics in the literature.

2 - Results on throughput Maximization with Limited Advance Information

Ishwar Murthy, Professor, Indian Institute of Management Bangalore, Bannerghatta Road, Bangalore, 560076, India, ishwar@iimb.ernet.in

We consider throughput maximization, given limited advance information. For problems where job lengths are equal, we propose an on-line algorithm whose competitive ratio improves as the duration of the advance information increases. Further, the performance of this on-line algorithm asymptotically approaches that of the off-line algorithm. More importantly, we help to identify the structure of the worst case instances – those that correspond to the competitive ratios.

3 - A Lower Bound Analysis for the Flowshop Scheduling Problem with Makespan Minimization

Carlos Ernani Fries, Professor, Federal University of Santa Catarina, Caixa Postal 5185, Florianopolis, SC, 88040-970, Brazil, carlos.fries@ufsc.br, Bruno De Souza Alves

This paper deals with a lower bound (LB) analysis for makespan measure of FSP. The LB measures are compared with solutions obtained with exact models and

the popular CDS heuristic. Simulations varying the number of jobs, machines and processing times show that solutions discrepancies tend to increase until N less than M and decrease for N greater than M , with largest discrepancy observed for N equal M . The divergences tend to be larger when greater variability on processing times is considered.

4 - Stochastic Patient Scheduling by Chance Constraint Programming

Bulent Erenay, PhD Candidate, Wilkes University,
5667 Barney Lane, Columbus, OH, 43235,
United States of America, be977209@ohio.edu

A stochastic patient scheduling problem is studied by using chance constraint programming. The time patient stays at the hospital is considered as probabilistic.

5 - Optimizing Ship Loading Schedules for Oil and Gas Terminals

Majid Algwaiz, Engineering Specialist, Saudi Aramco Oil Company, P.O.Box 19422, Dhahran, 31311, Saudi Arabia, majid.gwaiz@gmail.com, Abdulaziz Nutaifi

We consider in this paper an oil and gas firm that owns its entire hydrocarbon supply chain with many production facilities and ship loading terminals. Customers make purchases a month in advance but only provide a four day notice on the specific pickup times and the requested products and quantities. We present a MILP formulation to manage the hydrocarbon network and assign ships to berths on an hourly basis. Our objective is to minimize the ship waiting times along with the demurrage fees.

03-Room 303, Marriott

Inventory Management - Inventory Policies

Contributed Session

Chair: Jim Shi, Assistant Professor, New Jersey Institute of Technology, University Heights, Newark, NJ, 07102, United States of America, jshi@njit.edu

1 - Stochastic Integrated Location-inventory Up-to-S Model in Distribution System

Maxim Bushuev, Assistant Professor, Kent State University - Geauga, 1835 Beacon Hill Cir #21, Cuyahoga Falls, OH, 44221, United States of America, mbushuev@kent.edu

A stochastic integrated location-inventory problem with up-to-S policy is discussed. Simple proportional allocation rule is proposed which allows defining and solving the problem as convex optimization. This is the first stochastic model in the area of integrated location-inventory problems.

2 - An Extension of the Stochastic Dynamic Lot-Size Model of Vargus to a Model with Uncertain Production

Hendrik Vermuyten, PhD Student, KU Leuven, Warmoesberg 26, Brussel, 1000, Belgium, hendrik.vermuyten@kuleuven.be

We derive the optimal solution for the production planning for a single product for every period in the planning horizon, when demand is stochastic and non-stationary and the achievable production per period is stochastic as well. The model is an adaption of the stochastic dynamic lot-size model of Vargus without production restrictions. Simulation studies show a significant improvement in expected costs for this model compared to the model of Vargus in case of uncertain production capacity.

3 - Extended MIP Formulations for the Stochastic Lot-sizing Problem

Huseyin Tunc, Hacettepe University, Institute of Population Studies, Sıhhiye, Ankara, Turkey, huseyin.tunc@hacettepe.edu.tr

We revisit the certainty equivalent mixed integer programming formulations of the stochastic lot-sizing problem under the static-dynamic uncertainty strategy, and develop extended formulations thereof. The extended formulations are far more time-efficient than the existing formulations in the literature. Also, instead of working with a pre-determined piece-wise linear approximation of the cost function, they can find a minimum cost solution by means of a novel dynamic cut generation procedure.

4 - Stockout Risk Control of a Continuous Production-inventory System

Jim Shi, Assistant Professor, New Jersey Institute of Technology, University Heights, Newark, NJ, 07102, United States of America, Jshi@njit.edu

This paper studies the stockout control problem pertaining to a single-product continuous-time production-inventory system with a constant replenishment rate. Our objective is to optimize the expected system cost subject to a predetermined stockout acceptance level.

Inventory Management - Stochastic Demand

Contributed Session

Chair: Nicholas Leifker, St. John Fisher College, 3690 East Ave., Rochester, NY, 14618, United States of America, nleifker@sjfc.edu

1 - Managing Inventory for a Stochastic and a Deterministic Demand Stream

Rob Basten, Eindhoven University of Technology, P.O. Box 513, Eindhoven, 5600MB, Netherlands, r.j.i.basten@tue.nl, Jennifer Ryan

We consider a stock point for an item that observes two streams of demands. Our motivating example is the maintenance of capital assets. The low priority demand is observed before parts need to be ordered and thus exhibits perfect advance demand information (e.g., preventive maintenance), while the high priority demand is observed afterwards (e.g., corrective maintenance). We characterize the structure of the optimal inventory control policy and we propose a myopic heuristic policy.

2 - Percentile Threshold Policies for Inventory Problems with Partially Observed Markovian Demands

Parisa Mansourifard, PhD Candidate, University of Southern California, 1820 E Del Mar Blvd., Pasadena, CA, 91107, United States of America, parisama@usc.edu, Tara Javidi, Bhaskar Krishnamachari

We consider the case of partially observed demand in the context of a multi-period inventory problem with lost sales. We present an interesting class of policies with a percentile threshold (PT) structure which outperforms the myopic policy and performs close to the optimal policy. We derive the performance guarantee of PT policies and present the optimal PT policy with a reasonable performance guarantee.

3 - A One-Warehouse Multi-Retailer Inventory System with Non-Homogeneous Poisson Demand

Christian Bohner, Technische Universität München, Arcisstr. 21, Munich, Germany, christian.bohner@tum.de, Stefan Minner

Product lifecycles and demand seasonality are important characteristics of inventory systems. We extend the continuous review one-warehouse multi-retailer inventory problem to non-homogeneous Poisson demand. Using the unit-tracking approach, we find optimal time-dependent parameters for base-stock policies both for the warehouse and the retailers. A numerical study shows that the exact dynamic solution clearly outperforms the solution obtained from time decomposition.

4 - Inventory Control of Intermittent Demand Combined with Economic Indicators

Meng Yang, Tsinghua University, 519 Shunde Building, Beijing, 100084, China, yangm0628@gmail.com, Wanshan Zhu

The inventory cost can be very high for expensive service parts of many companies, e.g., Caterpillar Inc., because their demand is highly unpredictable due to its intermittency. One way to reduce the cost is to make use of economic indicators that have a leading effect on the demand. We develop a Markov decision model to incorporate the economic indicator information for better controlling the inventory and quantify the value of this information.

5 - An Integrated Method of Optimization of the Final Order of Spare Parts

Nicholas Leifker, St. John Fisher College, 3690 East Ave., Rochester, NY, 14618, United States of America, nleifker@sjfc.edu, Timothy Lowe, Philip Jones

At the end of a product's life cycle, companies may place a final order of spare parts to satisfy all future demand for the part. Determining the optimal policy can be complicated when products contain multiple types of parts in which the failure rates of the parts and products are not independent; in such cases, the optimal final order quantities for all part types must be determined simultaneously. We explore the concavity properties of this optimization problem, and present a solution method.

Portfolio Analysis II

Contributed Session

Chair: Dhanya Jothimani, Doctoral Student, Indian Institute of Technology Delhi, Department of Management Studies, New Delhi, India, dhanyajothimani@gmail.com

1 - The Robust Merton Problem of an Ambiguity Averse Investor

Mustafa C. Pinar, Bilkent University, Faculty of Engineering, Ankara, Turkey, mustafap@bilkent.edu.tr, Sara Biagini

We derive a closed form portfolio optimization rule for an CRRA investor diffident about mean return and volatility estimates. Confidence is represented by ellipsoidal uncertainty sets for the drift, given a volatility realization. The optimal policy is shaped by a rescaled market Sharpe ratio, computed under the worst case volatility. The result is based on a max-min HJB-Isaacs PDE, which extends the classical Merton problem and reverts to it for an ambiguity-neutral investor.

2 - An Orthogonal Genetic Algorithm for Indexing Tracking Problem

Liang Bao, Professor, Xidian University, No. 2 South Taibai Road, Xi'an, China, baoliang@mail.xidian.edu.cn

In this paper, we propose an orthogonal genetic algorithm for index tracking problem. Its significant feature is to incorporate an orthogonal design method into the initial population generation process and crossover operation. Our algorithm is more robust and can search the solution space in a statistically sound manner. We executed our algorithm to 5 datasets drawn from major world markets. The results compared with other published results show that our method has superior performance.

3 - Embedded Options in Institutional Investors' Asset Allocation Problems

Changle Lin, Princeton University, 10 Lawrence Drive, Apt 505, Princeton, NJ, 08540, United States of America, changlel@princeton.edu, John Mulvey

Various options are embedded in institutional investors' asset allocation problems. Pension funds are shorting a put option on the fund itself by requiring sponsors to contribute if underfunded. Sovereign wealth funds and family offices, have transfers from state or family businesses. The transfers depend on businesses' performances and generate embedded options. We model the options and their implications on asset allocation with real option theory, stochastic control and dynamic programming.

4 - Modeling Uncertainties in Mean Variance Framework using Robust Optimization

Dhanya Jothimani, Doctoral Student, Indian Institute of Technology Delhi, Department of Management Studies, New Delhi, India, dhanyajothimani@gmail.com, Ravi Shankar, Surendra Singh Yadav

The classical mean variance (MV) framework ignores the uncertainties associated with the estimates of the expected returns; hence, the classical portfolio optimization problem is often called as error maximizer. In order to model the data uncertainty in MV framework, this study uses robust optimization technique to select the portfolios. The excess returns of portfolios obtained using robust estimators were found to be favorable compared to those obtained using classical estimators.

Risk Analysis II

Contributed Session

Chair: Maryam Tabibzadeh, California State University, Northridge, 1157 W., 30th St., Los Angeles, CA, United States of America, m.tabibzadeh@gmail.com

1 - Modular Production Capacity Expansion: An Examination of Collateral Risk

Martin Wortman, Professor, Texas A&M University, Dept of ISEN, College Station, TX, 77843-3131, United States of America, wortman@atmu.edu, Cesar Malave

Modular production operations are gaining considerable attention within electric power generation, chemical products, and bio-pharmaceutical industries. Modular capacity expansion can greatly reduce the financial risk associated with capitalizing production operations. However, modularized operations can also present collateral risk that can be greatly exacerbated. We offer an analytical explanation of this circumstance.

2 - Optimal Portfolio of Supply Chain Risk Mitigating Plans

Sayan Mukherjee, Doctoral Candidate, XLRI, Jamshedpur,
XLRI Campus, CH Area East, Jamshedpur, India,
sayan.mukherjee@astra.xlri.ac.in, Rajiv Misra,
Tas Vijayaraghavan

Frequency of occurrence, time for which a risk occurs/ has an effect, Rate of loss and detectability of the risks are taken as random variables to model the distribution of the losses due to the supply chain risks. Bayesian Belief Network has been used as a modeling tool. The effect of a mitigation plan is judged by the expected loss reduction due to the plans. Then a multi-objective non-linear programming formulation is done for optimal portfolio selection of mitigation plans for the risks.

3 - An Exploration and Comparison of Resilience Metrics

Daniel Romero, Student, USF/ UAC, 4411 Shady Terrace Ln,
Tampa, FL, 33613, United States of America,
danielromero@mail.usf.edu, Weimar Ardila, Alex Savachkin,
Alvaro Sierra

A comparison of quantitative resilience metrics in different areas for the identification of key elements and approaches in order to get an accurate estimation of system resilience. Common factors in the resilience of physical systems are tested for predicted resilience measurements.

4 - Proactive Risk Assessment Framework to Address Safety-critical Issues of Offshore Drilling

Maryam Tabibzadeh, California State University, Northridge,
1157 W., 30th St., Los Angeles, CA, United States of America,
m.tabibzadeh@gmail.com

Although accident investigation frameworks are used to analyze the contributing causes of previous incidents in different complex technological and high-risk industries, they provide a retrospective point of view. They however can be incorporated into a proactive risk assessment system. This study proposes a series of safety leading indicators and integrate them with a developed AcciMap framework to address and assess the safety of offshore drilling, as part of a proactive total-system analysis.

Yingzi Xiong, Professor, School of Management, Xiamen
University, 422 Siming South Road, Xiamen, China,
xyingzi@xmu.edu.cn, Shaoqin Ye

This paper chooses online shopping as background, two generations in China as objectives, tests the process of the consumer socialization influenced on elderly generation by the younger generation, shows the mechanism and form of reverse generational influence, understands the reverse generation influence on elderly generation's online shopping intent and other factors that might result in online shopping.

2 - Evaluating Determinants of Satisfaction of Intermediary in Delivery of E-government Services

Rajesh Sharma, Research Scholar, Indian Institute of
Management, Prabhakar Shikhar, Rau, Indore, MP, 453556, India,
f12rajeshs@iimdr.ac.in, Rajhans Mishra

This research is grounded in the Stakeholder Theory (Freeman 1984) and deals with an important stakeholders in the delivery process in India, namely, the Village Level Entrepreneur (VLE). The study aims at identifying the determinants of satisfaction of VLEs who are running assisted kiosks in rural parts where the computer literacy and computer penetration is rather low. We propose a generic model of satisfaction consisting of institutional, interface, social and economic support.

3 - Consumers' Usage Behavior of M-coupons: The Moderating Role of Regulatory Focus

Huili Zhang, Huazhong University of Science and Technology,
1037 Luoyu Road, Hongshan District, Wuhan, China,
zhanghuili@hust.edu.cn, Xuefeng Zhao

Given the important role of consumers' personal traits in accelerating the usage of M-coupons, this paper aims to explore the moderating effects of regulatory focus on the relationship between perceived benefits or costs and consumers' attitude as well as the impact of perceived benefits and costs on consumers' behavioral intention based on the Valence Framework. A total amount of 325 valid questionnaires from different areas in China are recruited to examine the measurement model we developed.

4 - A Trust Transitivity Model of Agriculture and Local Products in WeChat Marketing

Jin Yin, Dalian University of Technology, No.2 Linggong Road,
Ganjingzi District, Dalian City, Liaoning Province, P.R.C., Dalian,
China, yinjin@mail.dlut.edu.cn, Qingkai Ji, Hu Xiangpei

Business of agriculture and local products is emerging in WeChat marketing. The challenge is how to establish consumer's trust because the serious food security problem in China. We establish trust transitivity model to forecast consumers' trust in Wechat. The model measures factors based on complex networks analysis, combines the psychology of trust, Subjective Logistics and multi-attribute decision making method to compute trust degree through transitivity and consensus process.

5 - The Use of Mobile Applications for Travel-related Needs

Ozay Ozaydin, Assistant Professor, Dogus University, Zeamet Cad
No: 21 Acibadem, Istanbul, 34722, Turkey,
oozaydin@dogus.edu.tr

With m-commerce still in its infancy, there have been relatively few attempts to systematically explore the opportunities and challenges posed by m-commerce. This study is an early attempt aims to provide empirical data on consumer perception of mobile applications. This paper first examines the value proposition of mobility, then investigates operation modes and potential consumer-based applications. Results provide useful insights into m-commerce applications and their commercial potentials.

1 - An Empirical Research on the Choice of R&D Patterns based on Enterprise Knowledge Base

Yanlan Yang, Huazhong University of Science and Technology,
1037 Luoyu Road, Hongshan District, Wuhan, China,
1040689355@qq.com

This article studies the impact of enterprise knowledge base on the choice of R&D patterns by using data collected from 437 firms with technology center in Hubei Province. The results show that the breadth of enterprise knowledge base positive influence enterprise' choice of internal R&D pattern; the relationship between the enterprise knowledge depth and the choice of internal R&D pattern there is inverted u-shaped, in contrast, knowledge depth and the choice of external R&D pattern is u-shaped.

2 - A Comparison of National Innovation Systems Efficiency between the OECD and BRIC

Jing Liu, PhD, Peking University, Guanghua School of
Management, Peking Univ, No.5 Yiheyuan Road Haidian District,
Beijing, 100871, China, liujingokay@163.com, Tao Huang,
Zhuojun Li

Although there are plenty of descriptions of national innovation system (NIS), a systematic comparison between different countries and classification have not been made so far. This paper measures the innovation efficiency of NIS in a systematic framework and makes comparison between the OECD and BRIC.

3 - When The Well Runs Dry: Predicting Observed Grace Satellite Groundwater Storage Trends

Roshanak Nateghi, Assistant Professor, Purdue University, 412
Ava Way NE, Washington, DC, 20017, United States of America,
roshanak.nateghi@gmail.com, C. Bayan Bruss

Groundwater is an essential component of global access to fresh water. It has an impact on political stability, health, economic growth and well-being. Identifying trends in groundwater storage using GRACE satellite observations is a promising new line of research. We have conducted extensive data analyses to find the best predictors of the observed trends using agricultural, climate, demographic, land-use and economic variables in 81 countries.

4 - Text Mining Techniques in Classified Websites: Spam Filtering and Information Organization

Tian Sun, Shanghai Kijiji Information Technology Co., Ltd.,
55 Guangyuan West Road, Xuhui District, Shanghai, China,
suntian@baixing.com, Shi Lin, Zhe Liang

Millions of advertisements have been posted on the classified websites every day. Those advertisements attract viewers who are in need of the services provided by ad posters. In order to operate a successful classified website, two major issues have to be solved: safety and classification. Text mining techniques are applied to detect spam and ensure correct information classification.

Marketing in E-Business/Commerce

Contributed Session

Chair: Pei-hua Chen, National Chiao Tung University, 1001 University Rd, 16C, HsinChu, 300, Taiwan - ROC, peihuamail@gmail.com

1 - Investigation of How Social Relationships Contribute to M-commerce Continuance Intentions

Chao Wen, Eastern Illinois University, 600 Lincoln Avenue, Charleston, IL, 61920, United States of America, cwen@eiu.edu

The purpose of this study is to provide a better understanding of how social relationships influence mobile commerce continuance intentions. An integrated research model was developed based on the theory and literature review. A questionnaire was designed and distributed through Amazon Mechanical Turk for data collection. Survey data from 298 m-commerce customers allowed testing the research hypotheses, and structural equation modeling allowed validation of the research framework.

2 - Temporally Pricing Low or Spotlighting Your App?: An Empirical Study on Amazon Free App of The Day

Kevin Lachaud, Duquesne University, Palumbo-Donahue School of Business, 600 Forbes Avenue, Pittsburgh, PA, 15282, United States of America, lachaudk@duq.edu, Wenqi Zhou

This research examines the effect of visibility and pricing, and their interaction effect, on apps' market performance. In particular, we empirically study Amazon's Free App of the Day, which puts a single app daily in the spotlight at a zero price. We test how high visibility and temporally free pricing resulted from this promotion strategy affect online user-generated conversations and sales rank on Amazon, which in turn affects apps' sales and revenues on the Android app market.

3 - The Impact of User-generated Vs Firm-generated Content on Purchase Intention of High/Low Involvement Product

Huma Amir, Chairperson Marketing Dept.; Assistant Professor, Institute of Business Administration, 218 Fauji Foundation, University Enclave, Gulshan-e-Iqbal, Karachi, 75400, Pakistan, huma.amir@hotmail.co.uk

Effects of user-generated content (UGC) and firm-generated content of Facebook official brand pages on attitudes towards the brands and consumer purchase intentions are examined for low-involvement (LI) and high-involvement products (HI). Findings show positive correlation between attitudes towards HI for both UGC and FGC. FGC showed higher correlation with attitude towards a brand as compared to UGC, and positive impact on attitudes towards HI. LI do not exhibit any significant correlations.

4 - The Effects of Service Convenience, Trust and Perceived Risks on Third-party Payment Usage Intention

Pei-Hua Chen, National Chiao Tung University, 1001 University Rd, 16C, HsinChu, 300, Taiwan - ROC, peihuamail@gmail.com, Chia-Yi Chen

This study investigated the relationships of service convenience, trust and perceived risks to consumers' intention to use third-party payment in Taiwan. A web-based questionnaire was created and sent to 300 participants with online shopping experiences. The results showed that service convenience, perceived risk and trust all have positive effects on usage intention for third-party payment.

Optimization Integer Programming IV

Contributed Session

Chair: Ayse Bayrak, TUBITAK, Tunus Caddesi No:80, Ankara, Turkey, aysebayrak.tubitak@gmail.com

1 - Integrated Batching and Lot Streaming with Variable Sublots and Sequence-dependent Setup

Shasha Wang, Clemson University, Freeman Hall, Clemson, SC, 29634, United States of America, shashaw@g.clemson.edu, Scott Mason, Cole Smith

Customers order multiple products belonging to some job family that can be batched together for manufacturing. Each product can be split into several sublots so that overlapping production is possible in a two-stage hybrid flow shop. We model this practically-motivated integrated batching and lot streaming problem with variable sublots and incompatible job families in the presence of sequence-dependent setup times to minimize total weighted completion time and present promising results.

2 - An Integer Programming Approach for Patrol Police Assignment in the Philippines

Rhoda Namoco, Mindanao University of Science and Technology, Lapasan, Cagayan De Oro City, 9000, Philippines, rhodaagdeppanamoco@gmail.com, Eleajen Lago

In this study, an integer programming model is developed to solve the Police Assignment Problem (PAM) which consists of assigning policemen to beat areas to ensure optimum police visibility in the central business district (CBD) of Cagayan de Oro City, Philippines. Results of the study show that the proposed model provides better police visibility than the current police assignment around the CBD of the city.

3 - Branching Rule in the Branch and Bound Algorithm: An Approach Based in Polyhedral Information

Ivan Derpich, Doctor, Universidad de Santiago de Chile, Ave. Ecuador 3769 Santiago, Santiago, Chile, ivan.derpich@usach.cl

This work presents a new variable branching rule for the B&B algorithm, the hybrid rule. It is based in a combination of the flatness rule and the pseudocosts rule. The result of this work showed that the number of nodes generated using the hybrid rule yielded to these test problems, a 80% less node than the produced when using the pseudocost rule.

4 - Valid Inequalities for Economic Lot-sizing Problems with Remanufacturing: Joint Setups Case

Sharifah Aishah Syed Ali, PhD Researcher, Dept. of Management Science, University of Strathclyde, Graham Hills Building, RM 858, 40 George Street, Glasgow, G1 1QE, United Kingdom, sharifah-aishah-binti-syed-ali@strath.ac.uk, Kerem Akartunali, Mahdi Doostmohammadi, Robert Van Der Meer

In this talk, we study the polyhedral structure of a mixed integer set arising from the feasible set of economic lot-sizing problems with remanufacturing and joint setups. First, we present the basic properties and some general results about trivial facet-defining inequalities. Then, we derive new families of valid inequalities and identify cases where they define facets. Finally, some preliminary computational results are presented to test the effectiveness of these inequalities.

5 - Pharmaceutical Industry Waste Management

Ayşe Bayrak, TUBITAK, Tunus Caddesi No:80, Ankara, Turkey, aysebayrak.tubitak@gmail.com, Bahar Ozyoruk

The measures taken for Environmental Pollution has made significant efforts in waste management. In this study, in Turkey, the waste of pharmaceutical industry will be discussed. Pharmaceutical waste will appear, the pharmaceutical industry waste management will be modeled. In this context, a mathematical model will be developed for recycling and disposal of waste and solutions related methods will be investigated.

Robust/Stochastic Optimization

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Tahir Ekin, Assistant Professor, Texas State University, 601 University Dr. McCoy Hall 411, San Marcos, TX, 78666, United States of America, t_e18@txstate.edu

1 - Simulation Based Approaches for Stochastic Optimization with Endogenous Uncertainty

Tahir Ekin, Assistant Professor, Texas State University, 601 University Dr. McCoy Hall 411, San Marcos, TX, 78666, United States of America, t_e18@txstate.edu, Nicholas Polson, Refik Soyer

We present two simulation based approaches to solve stochastic programs with decision dependent (endogenous) uncertainty. We develop an augmented probability model where the decision variable is treated as random and sampling from the marginal decision variable results with the optimal decision. Markov chain Monte Carlo simulation and nested sampling algorithms are utilized. We illustrate the methodology on a two stage news-vendor problem with stock-dependent uncertain demand.

2 - Novel Sampling Technique for High Dimensional Stochastic Optimization Problem

Nishant Dige, Graduate Student Industrial Engineering,
University of Illinois at Chicago, 1200 W Harrison Street,
Chicago, IL, 60607, United States of America, ndige2@uic.edu,
Urmila Diwekar

Computational speed is critical in optimizing large scale stochastic problems and the major bottleneck is the computational intensity of samples. For sampling randomness is important but uniformity governs its accuracy. This paper presents a novel sampling approach; combining LHS & Sobol Sampling for better uniformity in single as well as multi dimensions & also to avoid clustering effect for higher dimensions. We have implemented this technique on stochastic supply chain network design problem.

3 - Inventory Management Based on Target-oriented Robust Optimization

Yun Fong Lim, Associate Professor, Singapore Management
University, 50 Stamford Road, #04-01, Singapore, 178899,
Singapore, yflim@smu.edu.sg, Chen Wang

We propose a target-oriented robust optimization approach to solve a multi-product, multi-period inventory problem subject to capacity constraints. The product demands are characterized by uncertainty sets. We find an ordering policy that maximizes the uncertainty sets such that all demand realizations from the sets result in a cost lower than a pre-specified target. We prove that a static policy is optimal and it can achieve a balance between the expected cost and the associated cost variance.

4 - Optimal Learning of Demand for The Nested Lagged Commitment Problem

Nana Aboagye, PhD Candidate, Princeton University,
Sherrerd Hall, Charlton Street, Princeton, NJ, 08544,
United States of America, aboagye@princeton.edu,
Warren Powell

We address the problem of making lagged commitments to resources in order to maximize revenue over time while sequentially making decisions. The motivating application is hotel resource management and a separate dimension involves learning how the market will respond to price. We consider two cases: where demand is unknown but static and where demand is unknown and dynamic. We use the optimization algorithm called the Knowledge gradient to learn the optimal demand function.

5 - Continuity of Robust Optimization Problems with Respect to the Uncertainty Set

Philip Allen Mar, Dept. of MIE, University of Toronto,
5 King's College Road, Toronto, ON, M5S 3G8, Canada,
philip.mar@mail.utoronto.ca, Timothy Chan

We discuss the stability properties of robust problems satisfying the Strong Slater condition, with respect to their uncertainty sets. We show, by way of results in Linear Semi-Infinite Optimization, that the optimal values of the robust optimization problem are Lipschitz continuous with respect to the Hausdorff distance between their respective uncertainty sets. We also present implications for measuring a price of robustness and approximating robust optimization with complex uncertainty sets.

Risk-Aware Decision Making under Uncertainty

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Ruiwei Jiang, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, ruiwei@umich.edu

1 - A Composite Risk Measure Framework for Decision Making under Uncertainty

Pengyu Qian, Columbia University, Columbia Business School c/o
PhD Office, 3022 Broadway, 311 Uris Hall, New York, NY, 10027,
United States of America, qianpengyu@pku.edu.cn, Zaiwen Wen,
Zizhuo Wang

In this talk, we present a unified framework for decision making under uncertainty. Our framework is based on the composite of two risk measures accounting for parametric (given distribution) and distributional uncertainty respectively. The framework generalizes many existing models. We also propose new models within this framework whose solutions have probabilistic guarantees and are less conservative comparing to traditional models. Numerical experiments demonstrate the strength of our models.

2 - Risk-averse Two-stage Stochastic Program with Distributional Ambiguity

Ruiwei Jiang, University of Michigan, 1205 Beal Ave., Ann Arbor,
MI, 48109, United States of America, ruiwei@umich.edu, Y
ongpei Guan

We develop a risk-averse two-stage stochastic program (RTSP) taking into account the distributional ambiguity. We derive an equivalent reformulation for RTSP that applies to both discrete and continuous distributions. Also, the reformulation reflects its linkage with a full spectrum of coherent risk measures under varying data availability.

3 - Risk Sharing in Classification Problems

Constantine Vitt, PhD Candidate, Rutgers University,
1 Washington Park, Newark, NJ, 07102,
United States of America, constantine.vitt@rutgers.edu,
Darinka Dentcheva, Hui Xiong

We develop a new approach to solving classification problems based on the theory of coherent measures of risk and risk sharing. We view labeled training data as random samples from populations with unknown distributions, subject to change. The key idea of the proposed methodology is to associate individual measures of risk with the misclassification of each class. We analyze the problem theoretically and propose a numerical method to identify the proper risk sharing among the classes.

Optimization Methodology II

Contributed Session

Chair: Vahid Nourbakhsh, PhD Student, UC Irvine, The Paul Merage School of Business, The Paul Merage School of Business, University of California-Irvine, Irvine, CA, 92697, United States of America, vahidn@uci.edu

1 - Reliability Optimization for Multi-components System in the Design Phase

Qianru Ge, PhD Candidate, Technology University of Eindhoven,
Paviljoen E.03, IE&IS, Eindhoven, 5612 AZ, Netherlands,
q.ge@tue.nl

We develop an optimization model to determine the optimal failure rate of critical components in a system. Since the system is under a service contract, a penalty cost should be paid by the OEM when the total system down time exceeds a predetermined level, which complicates the evaluation of the life cycle costs. Furthermore, in the design phase for each critical component, the failure rate can be chosen from a certain range.

2 - Multistage News Vendor Problem with Targets

Vishwakant Malladi, Doctoral Student, UT Austin, Austin, TX,
78703, United States of America,
Vishwakant.Malladi@phd.mcombs.utexas.edu

We analyze the optimal control policy of a multi-stage new vendor problem with targets. The results show a tractable and intuitive control policy for each stage.

3 - Efficient Methodology to Maximizing Total Noise Reduction and Minimize Total Cost in Traffic Design

Golshan Madraki, PhD Candidate, Ohio University,
15 Station St. Apt F, Athens, Oh, 45701,
United States of America, g.madraki@gmail.com

Three crucial variables that affect the efficiency of a Traffic noise barrier are: the distance from receivers, height of the barrier and the material of the barrier. A novel combination of methodologies is proposed to maximize the efficiency of the barrier with minimum cost. An example model of the barriers are simulated by TNM2.5 software used to perform Factorial design of experiment to fit a meta-model. LP-metric method is applied to solve the multi-objective math-model.

4 - On Solving Bi-level Programming Problem with Fuzzy Random Variable Coefficients

Vishnu Pratap Singh, Research Scholar, Indian Institute of
Technology Kharagpur, Department of Mathematics, Kharagpur,
721302, India, vishnupratapsingh56@gmail.com,
Debjani Chakraborty

This paper represents the bi-level linear programming problem in an imprecise and uncertain mixed environment. The aim of this paper is to introduce leader and the follower's demand as fuzzy random variable. To determine the optimal value of the leader and follower's objectives a new methodology is developed for bi-level linear programming model in presence of fuzzy random variable. A numerical example is solved to demonstrate the methodology.

5 - Generalizing Shifting Quadratic Envelopes for Solving Non-convex Routing Problem

Vahid Nourbakhsh, PhD Student, UC Irvine, The Paul Merage School of Business, The Paul Merage School of Business, Irvine, CA, 92697, United States of America, vahidn@uci.edu, John Turner

We will study routing of jobs to service centers. Jobs arrive to job nodes each node with different arrival rate and there can be more than one server at a service center. The service time depends on the job node to which the job arrives and the service center. The objective is maximizing the total number of jobs that are served without any delay upon arrival. We analyze the convexity of this problem and propose an outer-approximation method to solve the problem.

Optimization Large Scale I

Contributed Session

Chair: Sam Davanloo Tajbakhsh, Visiting Assistant Professor, Virginia Tech, 412 Hutcheson, Blacksburg, VA, 24060, United States of America, sdt144@vt.edu

1 - Communication-efficient Distributed Optimization of Self-concordant Empirical Loss

Yuchen Zhang, PhD Student, University of California, Berkeley, 495 Soda Hall, Berkeley, CA, 94709, United States of America, zhangyuc@gmail.com

We consider distributed convex optimization where each machine has access to a local loss function constructed with i.i.d. data. We propose a communication-efficient distributed algorithm to minimize the overall loss function. We show that in a standard setting for supervised learning, the required number of communication rounds of the algorithm does not increase with the sample size, and only grows slowly with the number of machines.

2 - Formulation of a New Complex Fleet Modernization Problem for the Capability Portfolio Analysis Tool

Frank Muldoon, Sandia National Laboratories, P.O. Box 5800 MS 1188, Albuquerque, NM, 87185-1188, United States of America, fmmuldo@sandia.gov, Matthew Hoffman, Stephen Henry

The Capability Portfolio Analysis Tool (CPAT) (2015 Edelman Finalist) is currently being used to model the fleet of logistics and support systems under the U.S. Army PEO Combat Support & Combat Service Support to provide analytical capability in support of modernization and investment decisions. Initially, this MILP modeled the Army's Ground Combat Systems but the formulation has since evolved to meet the challenges posed by the CS&CSS fleet such as system age, recapitalization, and its large size

3 - A Provable Two-Stage Algorithm for Fitting Gaussian Process Models

Sam Davanloo Tajbakhsh, Visiting Assistant Professor, Virginia Tech, 412 Hutcheson, Blacksburg, VA, 24060, United States of America, sdt144@vt.edu, Enrique Del Castillo, Necdet Serhat Aybat

Fitting Gaussian Process models and finding the Maximum Likelihood Estimate (MLE) of the parameters requires a nonconvex optimization. The problem is aggravated in big data settings since the computational complexity of the MLE is $O(n^3)$ where n is the number of distinct locations at which the process is observed. We proposed a theoretically provable two-stage algorithm which solves a semidefinite program in the first stage and a least square problem in the second stage.

4 - A Framework of Asynchronous Parallel Algorithms for Monotone Inclusions and Optimization

Ming Yan, Assistant Professor, Michigan State University, 220 Trowbridge Rd, East Lansing, MI, 48824, United States of America, yanm@math.ucla.edu, Wotao Yin, Zhimin Peng, Yangyang Xu

We propose a framework of async-parallel algorithms for finding a fixed point to a nonexpansive operator by multiple uncoordinated agents (e.g., nodes, CPUs, GPU cores). Each time, an agent updates a random (block) coordinate of the variables. There is no global timing or memory locking. Its sequence converges to a fixed point almost surely. Special-case async-parallel algorithms are proposed for linear equations and distributed convex optimization problems.

Networks and Graphs II

Contributed Session

Chair: Ian Herszterg, Pontifícia Universidade Católica do Rio de Janeiro, Rua Marquês de São Vicente, 225, Gávea, Rio de Janeiro RJ 22451-900, Brazil, iherzterg@inf.puc-rio.br

1 - Heuristic Procedures for K-Chinese Postman Problem with Workload Balancing

Yasemin Limon, Middle East Technical University, Industrial Engineering Department, Ankara, Turkey, yaseminlimon@gmail.com, Meral Azizoglu

This study considers the k-Chinese Postman Problem. The problem can be defined as the assignment of each postman to a set of arcs so as to cover all arcs at least once and guarantee feasible routes that start and terminate at the depot. Our aim is to assign the arcs to the postman so as to balance their workloads as much as possible. We define heuristic procedures that involve construction and improvement mechanisms. We find that our procedures find high quality solutions in reasonable times.

2 - The Dynamics of Stochastic Opinions

Luis Castro, PhD Student - Research Assistant, University of Miami, Department of Industrial Engineering, 268 McArthur Engineering Building, Coral Gables, FL, 33146, United States of America, l.castro6@umiami.edu, Nazrul Shaikh

We model the dynamics of stochastic opinions and derive a set of conditions for global and local consensus. Our results suggest that new opinions are more likely to be adopted if they belong to the intersection set of consensus distributions between groups.

3 - Multigroup Multicast Routing for High-quality Interactive Multimedia

Pavel Troubil, PhD Student, Masaryk University, Faculty of Informatics, Botanická 68a, Brno, 60200, Czech Republic, pavel@troubil.cz

In tight runtime limits, we solve multigroup multicast routing problem for interactive collaboration over high-quality multimedia: with on-the-fly recompression of video for per-user adaptation of content quality, and under uncertain network topology and capacity. We react dynamically to network events and request changes, and minimize path perturbation. Our ant colony optimization heuristic is applied for sign-language interpretation in university education or live broadcasts of sport events.

4 - Phase Unwrapping: Attacking the Problem with Operations Research

Ian Herszterg, Pontifícia Universidade Católica do Rio de Janeiro, Rua Marquês de São Vicente, 225, Gávea, Rio de Janeiro, RJ, 22451-900, Brazil, iherzterg@inf.puc-rio.br, Marcus Poggi, Thibaut Vidal

We propose a new model for L0-norm 2D Phase Unwrapping (2DPU). We associate the discontinuities of the wrapped phase image (residues) to a graph, where the vertices have different polarities (+1/-1), and seek a minimum cost balanced spanning forest where the sum of polarities is equal to zero in each tree. We propose a branch-and-cut algorithm and a population metaheuristic to address the problem, leading to an efficient approach for L0-norm 2DPU, viewed as "highly desirable" but intractable.

Optimization Linear Programming

Contributed Session

Chair: Fariborz Partovi, Professor, Drexel University, 33rd Chestnut Street, Department of Decision Sciences, Philadelphia, PA, 19003, United States of America, Partovi@Drexel.edu

1 - O.R. Optimization Methods as Used for Protecting Statistical Data

Paul Massell, Mathematical Statistician, U.S. Census Bureau, 4600 Silver Hill Road, Room 6H130F, Washington, DC, 20233, United States of America, paul.b.massell@census.gov

Magnitude data tables are used by agencies for displaying economic data. These tables are additive; i.e., for each set of rows, a sum row is also given (same for columns). Sensitive cells are determined based on a dominance rule; such cells are suppressed. To prevent values of sensitive cells from being recovered, secondary suppressions are found using a L.P. model. This LP is a heuristic for the true I.P. model. We also discuss ways to protect cells using noise.

2 - Transportation Optimizer System as Applied to Rail Car Assignment Problem

Ilya Buzytsky, BIAS Intelligence, 7741 37th Ave NE, Seattle, WA, 98115, United States of America, ilya@biasintelligence.com

BIAS Optimizer System was developed to address problems frequently encountered in many transportation and distribution logistics applications. Its objective is to find optimal solution to problems that can be formulated in terms of supply/cost/demand configuration across large matrix representing a multi-node network: The solution helps find an assignment that would meet the demand supported by available supply across all nodes and satisfy all business rules and constraints at the minimum cost.

3 - Diet Problem Revisited

Fariborz Partovi, Professor, Drexel University, 33rd Chestnut Street, Department of Decision Sciences, Philadelphia, PA, 19003, United States of America, Partovi@Drexel.edu

It has been close to seventy years since the Diet problem was introduced by Stigler (Stigler 1945). However the problem with the classical Diet models is based on lack of proper presentation of food preferences. For many people, especially when they are eating outside their home, the content of the food as far as nutrition is concern may be not as important as the taste of the food. In this article we modify Diet problem using extensions of linear programming to consider the above issues

Computational Optimization with Risk and Uncertainty

Sponsor: Computing Society

Sponsored Session

Chair: John Sirola, Sandia National Laboratories, P.O. Box 5800, MS 1326, Albuquerque, NM, 87185-1326, United States of America, jdsirola@sandia.gov

1 - Multistage Power Generation Capacity Expansion Models with Different Risk Measures

Shu Tu, Lehigh University, H.S. Mohler Laboratory, 200 West Packer, Bethlehem, PA, 18015, United States of America, sht213@lehigh.edu, Boris Defourny

We investigate different stochastic optimization formulations for the multistage power generation capacity expansion problem. In particular, we focus on risk measures whose parameters can be calibrated from market data.

2 - Exploiting Inter-scenario Information to Accelerate Progressive Hedging

John Sirola, Sandia National Laboratories, P.O. Box 5800, MS 1326, Albuquerque, NM, 87185-1326, United States of America, jdsirola@sandia.gov, Jean-paul Watson, David Woodruff

Progressive Hedging (PH) is a scalable and effective approach for solving large stochastic programming problems through scenario-based decomposition. However, PH is sensitive to key tuning parameters (notably ρ) and for many problems can exhibit slow convergence. In this work we present new approaches for accelerating convergence and improved tuning by propagating key information among scenarios.

3 - Production Planning under Uncertainty and Service Level Constraints

Suleyman Karabuk, Associate Professor, University of Oklahoma, School of Industrial and Sys Engineering, 202 W. Boyd St., Room 124, Norman, OK, 73019, United States of America, karabuk@ou.edu

Consider a production planning problem with machine changeover and inventory carrying costs, and service level constraints, where demand for products is probabilistic. We formulate the problem as a multistage stochastic programming model with recourse. The resulting model is very large scale even for trivially small size instances. We develop an effective decomposition algorithm where individual product sub problems are solved by a novel probabilistic dynamic programming model.

Mathematical Modeling of HIV at the Cellular, Individual, and Population Level

Sponsor: Health Applications

Sponsored Session

Chair: Eva Enns, Assistant Professor, University of Minnesota, 420 Delaware St. SE, Minneapolis, MN, 55408, United States of America, eenns@umn.edu

1 - Mathematical Modeling of HIV Viral Dynamics and Immune Response During Treatment Interruptions

Nargesalsadat Dorratoltaj, Virginia Tech, Room 392, Vet Med Phase II., Blacksburg, VA, 24060, United States of America, nargesd@vt.edu, Josep Bassaganya-riera, Stanca Ciupe, Stephen Eubank, Margaret O'dell, Hazhir Rahmandad, Kaja Abbas

The objective of this study is to understand and predict HIV viral and immune dynamics at the individual level during treatment interruption and low adherence in developing AIDS. We use ordinary differential equations to build immune-viral dynamics of HIV/AIDS during treatment interruption. The results of the simulation show that the time that patients start treatment and for how long they stay on treatment before interruption are unique predictor for time to progress to AIDS.

2 - A Data-driven Approach to Understanding HIV Care Trajectories and Retention in Care Challenges

Eva Enns, Assistant Professor, University of Minnesota, 420 Delaware St. SE, Minneapolis, MN, 55408, United States of America, eenns@umn.edu

Sub-optimal retention in HIV primary care is associated with increased risks of mortality, detectable viral loads, and other complications compared to regular, ongoing care; however, the standard dichotomous measures of retention (e.g., in/out of care) ignore the diversity and complexity of individual care trajectories. In this talk, I describe a data-driven approach to understanding HIV care patterns and how to incorporate complex care behaviors into mathematical models of HIV interventions.

3 - Modeling a Bi-layer Contact Network of Injection Drug Users and The Spread of Blood-borne Infections

Rui Fu, Stanford University, 74 Barnes CT, Stanford, CA, 94305, United States of America, ruifu@stanford.edu, Alexander Gutfraind, Margaret L. Brandeau

Blood-borne infections can spread among injection drug users (IDUs) via risky sexual and needle-sharing contacts. To accurately model the spread of such contagions among IDUs, we build a bi-layer network that captures both types of risky contacts. We present methodology for inferring important model parameters. Such a model can be used to evaluate the efficacy of various programs that aim to combat drug addiction and contain blood-borne diseases among IDUs.

4 - Measuring the Potential Impact of Combination Prevention in Sub-Saharan Africa

Amin Khademi, Assistant Professor, Clemson University, 130-D Freeman Hall, Clemson, SC, 29634, United States of America, khademi@clemson.edu, Sunanth Anand

A public health approach to combination HIV prevention is advocated to contain the epidemic in Sub-Saharan Africa. We explore the implications of universal access to treatment along with HIV education scale-up in the region. We develop an HIV transmission model, calibrate it with data from South Africa and simulate the impacts of universal access to treatment along with HIV education scale-up on HIV trends.

Stochastic Processes II

Contributed Session

Chair: Vincent Slaugh, Visiting Assistant Professor, Smeal College of Business, Penn State University, 465 Business Bldg, University Park, PA, 16802, United States of America, vws102@psu.edu

1 - Solving Strategic Refinery Planning and Financial Risk Problems via Pyomo

Ariel Uribe, Ecopetrol S.A., Km 7 Via Piedecuesta, Piedecuesta, Colombia, ariel.uribe@ecopetrol.com.co, Wilson Briceño

In this work we reformulate the problem proposed by Bagajewicz & Lakkhanawat (2008), in which is solved a refinery planning problem taking into account financial risk management issues and the pricing effect on the planning decisions. As a first step, we compare from a computational point of view the performance of the deterministic and stochastic solutions between gams and pyomo. Finally, we explore pyomo in a parallel environment.

2 - Valuation and Operation of Three Types of Power Plants using Continuous Time Stochastic Control

Rune Ramsdal Ernsten, University of Copenhagen, Finsensvej 42, 4.tv, Frederiksberg, 2000, Denmark, rre@math.ku.dk

With the increasing focus on renewable energy in the deregulated energy markets, it is to be expected that the energy mix will change and along with it the dynamics of the energy prices. This will change the values of the existing and new power plants, and thus change the investment incentives. My research is based on valuation and operation of three different types of power plants in a new electricity market: a renewable power plant, a conventional power plant and a storage power plant.

3 - Reservation Admission Control in Rental Systems

Vincent Slaugh, Visiting Assistant Professor, Smeal College of Business, Penn State University, 465 Business Bldg, University Park, PA, 16802, United States of America, vws102@psu.edu, Alan Scheller-wolf, Sridhar Tayur

Using a multiserver queueing model, we study the problem of whether a rental firm should accept reservation requests during a rental season. We discuss performance bounds and the structure of the optimal policy for admitting reservations, and propose an easy-to-implement newsvendor-style heuristic for accepting reservations. We show that the heuristic performs well in test cases, and also observe that the system's profit is decreasing in the reservation notice time.

New Directions in Applied Probability

Sponsor: Applied Probability

Sponsored Session

Chair: David Goldberg, Assistant Professor, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, dgoldberg9@isye.gatech.edu

1 - Data-driven Dynamic Pricing and Inventory Control with Limited Price Changes

Boxiao (beryl) Chen, University of Michigan-Ann Arbor, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, boxchen@umich.edu, Xiuli Chao

We consider periodic review joint pricing and inventory control problem. Demand is random and price sensitive, and the firm has limited prior knowledge about its distribution. The firm learns the demand to maximize profit, but is faced with the business constraint that prevents it from conducting extensive price experimentations. We develop data-driven algorithms for pricing and inventory decisions and prove they converge to the optimal decision at the fastest possible speed.

2 - Rare Events in a Single Server Queue

Harsha Honnappa, Purdue University, West Lafayette, IN, United States of America, honnappa@purdue.edu, Peter Glynn

We characterize the rare event paths of the workload process in a FIFO single server queue that offers general service. The arrival times of a large, but finite, population of jobs are modeled as ordered statistics of i.i.d. random variables. We prove a large deviations principle (LDP) that shows that unlike a random walk, the most likely paths to hit a high level are not linear. We also extend this analysis to periodic traffic patterns, and develop an LDP for this setting as well.

3 - Efficient Monte Carlo Simulation using A Representation for Viscosity Solutions of Hamilton Jacobi Equations

Pierre Nyquist, Brown University, 182 George Street, Providence, RI, 02912, United States of America, pierre_nyquist@brown.edu, Henrik Hult, Boualem Djehiche

The design of efficient Monte Carlo methods is intimately connected to (sub)solutions of certain Hamilton-Jacobi (HJ) equations. However, such subsolutions can be hard to construct for a given problem. We discuss a min-max representation for viscosity solutions of HJ equations and its applications to rare-event simulation. To illustrate the result we focus on a specific setting: The use of importance sampling to estimate rare-event probabilities in a Markovian intensity model for credit risk.

Artificial Intelligence II

Contributed Session

Chair: Alexandra Diamond, Hunter College CUNY, 695 Park Avenue, New York, NY, 10021, United States of America, alexandradiamond@yahoo.com

1 - Role-assignment for Game-theoretic Cooperation

Catherine Moon, Duke University, 213 Social Sciences, Box 90097, Durham, NC, 27705, United States of America, csm17@duke.edu, Vincent Conitzer

In multiagent systems, a team of agents may work on multiple projects together. Here, we focus on the game-theoretic aspect that needs to be considered: when the agents are self-interested, careful role assignment is necessary to make cooperation the repeated game's equilibrium. We formalize this problem and find an easy-to-check necessary and sufficient condition for a given role assignment to induce cooperation. We also show that finding whether such assignment exists is in general NP-hard.

2 - Discretization of Continuous Action Spaces in Extensive-form Games

Christian Kroer, PhD Student, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, ckroer@cs.cmu.edu, Tuomas Sandholm

Most equilibrium-finding algorithms for sequential games require discrete, finite games, whereas applications often have continuity. Leveraging recent results on abstraction solution quality, we develop the first framework for providing bounds on solution quality for discretization of continuous action spaces in extensive-form games. Based on this framework, we develop algorithms for finding bound-minimizing abstractions under various structural assumptions.

3 - A New Fuzzy Kernel-free Support Vector Machine Model

Jian Luo, Assistant Professor, Dongbei University of Finance and Economics, 217 Jianshan Street, Shahekou District, Dalian, 116025, China, luojian546@hotmail.com, Zhibin Deng, Xingkai Yang, Huixiang Su, Chang Liu

A new kernel-free fuzzy support vector machine model is proposed using the concept of Fisher discriminant analysis and a new fuzzy membership function. A decomposition algorithm is designed to solve this proposed model. Computational results indicate that the proposed model outperforms well-known fuzzy support vector machine models with kernels.

4 - Stochastic Approximation for Optimal Self-driven Sensor-guided Rescue Robots under Uncertainty

Alexandra Diamond, Hunter College CUNY, 695 Park Avenue, New York, NY, 10021, United States of America, alexandradiamond@yahoo.com, Felisa Vazquez-abad

A robot must locate and retrieve an artifact that has a limited battery for sending signals. We compare two scenarios. (1) All calculations are done in the cloud using signals from the artifact to estimate position. The robot is then sent to the rescue. (2) The robot has computational and sensing capabilities and it performs the optimization in real time as it moves towards the object. The "risk" is associated with the probability of missing the target by a certain amount. We discuss convergence

Chair: Fang Xie, PhD Student, Beihang University, 37 Xueyuan Road, Haidian District, Beijing, 100191, China, xiefangmm@163.com

1 - Estimation of Resource Allocation Patterns in a Portfolio of Engineering Projects

Vishwanath Hegde, California State University East Bay, 25800 Carlos Bee Blvd, Hayward, CA, 94542, United States of America, vish.hegde@csueastbay.edu, Zinovy Radovitsky

Using historic resource loading data in a multi-project setting, we show that resource distribution patterns can be captured by parametric regression models, which can forecast resource distribution during project lifetime using project due date and other attributes.

2 - Improved Design of CMS by Considering Operators Primary and Backup Decision-making Styles

Mohammad Rezaei-Malek, University of Tehran, No. 3, Ganji Alley, North Khosh Street, Tehran, 1457813353, Iran, m.rezaeimalek@ut.ac.ir, Reza Tavakkoli-Moghaddam, Nima Salehi Sadghiani

This paper considers decision-making style (as an index of operator's personal characteristics) in CFP to design an operator-consistent CMS. Decision-making style not only influences the interaction of two operators, but also affects the work that operator does on a machine, and these interactions both need to observe consistency. Hence, this paper presents a mathematical model for CFP that considers consistency between each two operators and consistency between operator and assigned task.

3 - Reactive Project Scheduling with a Cash Flow Balanced Objective

Minjing Ning, Xi'an Jiaotong University, No.28, Xianning West Road, Xi'an, China, ningminjing@stu.xjtu.edu.cn, Zhengwen He

This paper investigates reactive project scheduling which may be used to repair project schedules that suffer from multiple activity duration disruptions during project execution. The objective is to minimize the cumulative cash flow gap of the contractor in the real executing process of the project.

4 - Robust Scheduling of the Resource-constrained DTCTP with Uncertain Activity Costs

Fang Xie, PhD Student, Beihang University, 37 Xueyuan Road, Haidian District, Beijing, 100191, China, xiefangmm@163.com, Zhe Xu

We investigate the resource-constrained discrete time/cost trade-off problem in which the activity costs are stochastic and the objective is to construct a robust baseline schedule that maximizes the probability of completing the project within the given budget. Two algorithms for solving this problem are presented. We compare the two algorithms and analyze the impact of different factors through conducting experiments on a set of instances generated from the PSPLIB.

5 - Project Management And Quality Data Challenges for IoT Systems

Michael Chuang, SUNY - New Paltz, 1 Hawk Dr, New Paltz, United States of America, chuangm@newpaltz.edu, Kuan-Tsae Huang

Internet of Things (IoT) has shown its potentials to be employed to scenarios of Industry 4.0. Caterpillar installs sensors and telematics in its products. AzTron uses embedded sensors to allow for bidirectional communication over production lines. Collected data enable remote repair and service to make appropriate decisions, resulting in increased manufacturing uptime and improved customer service. How to apply project management to manage IoT becomes an important but uncharted topic.

Chair: Gang Wang, Assistant Professor, UMass Dartmouth, 285 Westport Road, Room 214, CCB, North Dartmouth, MA, 02747, United States of America, gwangl@umassd.edu

1 - A Game Theoretic Approach to Energy Policy Making with Multiple Objectives

Busra Keles, University of Miami, 1251 Memorial Drive, Department of Industrial Engineering, Coral Gables, FL, 33146, United States of America, bxk96@miami.edu, Murat Erkoc, Nurcin Celik, Mahide Kucuk, Yalcin Kucuk

We develop a two-stage decision making model on how a governmental agency can build and incentivize its energy policy across service providers. The agency, as the Stackelberg leader, has multiple objectives related to economic concerns, environment, and energy surety. The agency sets penalties and limits to which the power companies respond by choosing their investment and production strategies. We develop a model that integrates the Successive Weighted Sum method into the policy making game.

2 - A Heuristic Based on Qualitative Information for Territorial Partitioning Problems

Salem Chakhar, Dr, Portsmouth Business School, Portland Building, Portland Street, Portsmouth, PO1 3AH, United Kingdom, salem.chakhar@port.ac.uk, Maria Barbati, Carmela Piccolo, Giuseppe Bruno

This presentation proposes a heuristic to solve territorial partitioning problems. It uses as input a tree data structure, previously constructed based on qualitative information. This qualitative evaluation is grounded on several criteria and takes the form of a qualitative scale with a finite set of evaluation levels. The heuristic is illustrated using real-world data relative to Ile-de-France region in France.

3 - A Bi-Level Decentralized Programming for Setting Differential Subsidy Rate of Taiwan's Waste Printer

Jiun-Yu Yang, Master Student, Tamkang University, 151 Yingzhuang Rd., New Taipei, 25137, Taiwan - ROC, jiunyu.yang@gmail.com, Hsu-shih Shih

This study uses bi-level decentralized programming for setting differential subsidies on the recycling plants in Taiwan. The case of waste printers is illustrated. The results show that the differential subsidies on recycling plants can achieve a higher recycling rate.

4 - Markov Method for Assessing Utility Functions

Baback Vaziri, Purdue University, 315 N. Grant St., West Lafayette, IN, United States of America, bvaziri@purdue.edu, Yuehwen Yih, Tom Morin, Mark Lehto

Multiatribute value functions are a useful tool for decision makers. Many methods directly obtain information from the decision maker regarding the preferences of attributes. We propose an alternative approach, which will reverse engineer the weights of the value function. We use the results of the preferences of alternatives in conjunction with a Markov-based ranking method to develop a rating vector of attributes.

5 - Operations Scheduling in Reverse Supply Chains: Delivery Deadlines and Identical Demand

Gang Wang, Assistant Professor, UMass Dartmouth, 285 Westport Road, Room 214, CCB, North Dartmouth, MA, 02747, United States of America, gwangl@umassd.edu, Angappa Gunasekaran

This study addresses an integrated operations scheduling problem of reverse supply chains with delivery deadlines. The problem is to determine shipping quantities from collectors to the manufacturer and the assignment of demand points, subject to the capacity constraints of both the collectors and the manufacturer.

Big Data: Inference and Prediction

Sponsor: Analytics

Sponsored Session

Chair: Rob Lantz, Senior Manager Of Operations Analysis, Novetta Solutions, 8618 Westwood Center Drive, Suite 315, Vienna, VA, 22182, United States of America, rlantz@novetta.com

1 - Detecting Unknown Threats through Social Network Analysis

Matt Teschke, Senior Quantitative Consultant, Novetta, 7921 Jones Branch Drive, 5th Floor, McLean, VA, 22102, United States of America, mteschke@novetta.com, Jennifer Stave

A common impediment to the analysis of networks is the determination of risk relative to particular actors within the network. Using insights from the field of SNA in addition to an understanding of the challenges faced by the analyst, entities can be prioritized for investigation. This network-centric approach assigns risk based on an assessment of an entity's characteristics and activity using an eigenvector centrality algorithm, of which Google's PageRank algorithm is one application.

2 - Use the Whole Buffalo: Binary Classification which Encounters Diverse Data Types

David Elkind, National Security Consultant & Statistical Modeler, Novetta Solutions, 1320 N Veitch St, Arlington, VA, 22201, United States of America, delkind@novetta.com

Contemporary data collection gathers many different data formats, yet conventional analysis views data from a flat perspective in which an observation is a single unit type. This perspective leaves some data types unexploited when they cannot be made to fit a single paradigm. We propose to use model stacking to make predictions informed by all available data types. We accomplish this by using several SVMs, each of which has a kernel function appropriate to the subset of features it is learning.

3 - Big Data and Causality

Xuan Wang, Graduate Student, Louisiana State University - ISDS Department, 2200 Business Education Complex, Nicholson Extension, Baton Rouge, LA, 70803, United States of America, xwang35@lsu.edu, Helmut Schneider

In the past decade, Big Data Analytics has mainly focused on data mining to make better predictions. This research explores analytical techniques to discover causal relationships and focuses on challenges of interpreting correlational relationships in big data and discusses methods that help to distinguish between correlational and potential causal effects.

Chair: Shalini Wunnava, Assistant Professor, SUNY Potsdam, 44 Pierrepont Avenue, 209 Dunn Hall, Potsdam, NY, 13676, United States of America, wunnavss@potsdam.edu

1 - Crowdsourcing and Project Management

Michael Chuang, SUNY, 1 Hawk Dr, New Paltz, NY, United States of America, mikeychuang@gmail.com

Crowdsourcing has been increasingly employed in today's projects, and has become a phenomenon. Issues of crowdsourcing also demonstrate in various facets, such as innovation and technology. However, there lacks a comprehensive understanding of crowdsourcing's potentials for projects. To bridge the gap, this research aims at conducting a systematic review of literature, in hopes of better understanding crowdsourcing for project management.

2 - The Effect of Project Artifacts, Ambidexterity, and Social Network on Open Source Project Success

Ram Kumar, Professor, UNC-Charlotte, 203B Friday Building, 9201 University City Boulevard, Charlotte, NC, 28223, United States of America, rlkumar@unccl.edu, Orcun Temizkan

Open Source Software (OSS) development is a rapidly emerging, yet poorly understood type of software development with extremely high project failure rates. We present a model of OSS project success by integrating multiple theories from social networking, innovation, and organizational theory. Our results illustrate that ambidexterity along with artifact development success and social network characteristics influences project success and highlight the bridging role of ambidextrous developers

3 - Leveraging On-demand Markets to Manage a Hybrid Workforce for IT Service Delivery

Su Dong, Assistant Professor, Fayetteville State University, School of Business and Economics, 1200 Murchison Road, Fayetteville, NC, 28311, United States of America, sdong@uncfsu.edu, Monica Johar, Ram Kumar

Organizations increasingly have access to temporary workers through markets for on-demand workers. We present a model of a hybrid workforce in which organizations effectively assign tasks to a mix of full-time and on-demand workers. Full-time workers have to perform assigned tasks. Temporary (on-demand) workers bid for tasks that are beneficial to them. Issues relating to pricing, task allocation and knowledge management are explored.

4 - Designing Quality Control Tools for Enhanced Cyber-security in Manufacturing

Ahmed Elhabashy, Graduate Student, Virginia Tech, 114 Durham Hall, 1145 Perry Street, Blacksburg, VA, 24061, United States of America, habashy@vt.edu, William Woodall, Lee Wells, Jaime Camelio

Manufacturing relies heavily upon the use of Quality Control tools to detect quality losses and to ensure high quality parts production. However, current tools are not designed to detect the effects of cyber-attacks, as they are based on assumptions (sustained shifts, rational sub-grouping, etc.) that may no longer be valid under the presence of an attack. The goal of this research is to design/adapt current Quality Control tools by adopting principles from the Information Technology domain.

5 - Biometrics: Adoption and Attitudes

Shalini Wunnava, Assistant Professor, SUNY Potsdam, 44 Pierrepont Avenue, 209 Dunn Hall, Potsdam, NY, 13676, United States of America, wunnavss@potsdam.edu

Biometrics has become ubiquitous on present day digital devices; although the usage is not very widespread currently, it is expected to see exponential growth in the near future. What attitudes are fueling the adoption of biometrics? This research question will be examined using the lenses of protection motivation theory and technology acceptance model.

Statistical Roles in Stochastic Decision-Making

Sponsor: Data Mining

Sponsored Session

Chair: Victoria Chen, The University of Texas at Arlington, Dept. of Ind., Manuf., & Sys. Engr., Campus Box 19017, Arlington, TX, 76019, United States of America, vchen@uta.edu

1 - A Data-driven Optimization of Price, Promotion, Display, and Feature at Product Category Level

Durai Sundaramoorthi, Lecturer In Management, Washington University in St. Louis, One Brookings Drive, Olin Business School, St. Louis, MO, 63131, United States of America, sundaramoorthi@wustl.edu, Seethu Seetharaman

Data Mining can be broadly classified into two groups: supervised learning and unsupervised learning. Supervised learning is the subject of interest in this research as we deal with predicting the units of category-level products sold in stores of a grocery chain. The goal of this research is two-fold. First, prediction models are developed to predict demand. Second, optimum vector X is determined to maximize the profit made by the chain.

2 - High-dimensional Adaptive Dynamic Programming with Mixed Integer Linear Programming

Zirun Zhang, University of Texas, Arlington, 500 West First Street, Arlington, TX, 76019, United States of America, zhang.zirun@gmail.com, Victoria Chen, Jay Rosenberger

This study addresses the optimization of a real world, complex, dynamic system. The objective is to control the environmental impact of aircraft deicing activities at the Dallas-Fort Worth International Airport. To overcome the complexities such as nonlinear transitions, non-convex objective function, and high-dimensional decision space, an ADP method is introduced using treed regression and MILP. The proposed ADP approach is also compared with a reinforcement learning approach.

3 - Efficient Simulation-based Sampling for Approximate Dynamic Programming

Danilo Macció, National Research Council of Italy (CNR-ISSIA), Via De Marini 6, Genova, 16153, Italy, ddmach@ge.issia.cnr.it, Victoria Chen, Cristiano Cervellera

We propose a method to generate efficient state sample points for the solution of continuous-state finite-horizon approximate dynamic programming problems. The method is based on the notion on F-discrepancy, which measures how closely a set of points follows a given distribution. The proposed algorithm can be used as an alternative to uniform random sampling when it is difficult to define a priori the state boundaries. Simulation results confirm in practice the effectiveness of the method.

4 - Continuous-state Adaptive Dynamic Programming

Prashant Tarun, Associate Professor, Missouri Western State University, Craig School of Business, 4525 Downs Drive, St. Joseph, MO, 64507, United States of America, ptarun@missouriwestern.edu, Victoria Chen, Huiyuan Fan

We present a sequential state space exploration (SSSE) approach to adaptively adjust the state space ranges for the experimental design while also sampling useful data for the statistical model. The SSSE approach is coupled with an adaptive value function approximation (AVFA) algorithm that gradually grows the complexity of the statistical model as more data are observed.

Chair: Weihong Guo, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48105, United States of America, graceguo@umich.edu

1 - Deterioration Monitoring of Ultrasonic Welding Tools Based on High-order Decomposition

Yaser Zerehsaz, PhD Student, University of Michigan, Ann Arbor, MI, 48105, United States of America, yzereh@umich.edu,
Chenhui Shao, Jionghua (Judy) Jin

Ultrasonic welding has been used for joining lithium-ion battery cells in electric vehicles. The geometric change of tool surfaces severely affects the weld quality. A new monitoring scheme based on a high-order decomposition method is suggested for the purpose of detecting the tool wear. A classification approach is used to determine the wear level of tools, which is helpful in finding the assignable causes of the extraordinary tool wear.

2 - Predictive Analytics of Semiconductor Chip Quality under Data Imbalance Situations

Jin Soo Park, Mr., Korea University, Anam-Dong, Seongbuk-Gu Korea University, Innovation Hall #816, Seoul, 136-713, Korea, Republic of, pjs0078@gmail.com, Seoung Bum Kim

The quality prediction of the semiconductor industry has been widely recognized as important and critical for quality improvement. The main objective of this paper is to predict the final quality of semiconductor chips by solving data imbalance problems. Our proposed method is generating more synthetic data near the decision boundary in order to specify the minority class region. We demonstrate the usefulness and applicability of the proposed method using real data from a semiconductor industry.

3 - Identifying Key Factors Affecting Knowledge Absorptive Capacity of Automobile Industry

Guohua Qiu, School of Economics and Management, Tongji University, No.1239 Siping Road, Shanghai, China, 2298900836@qq.com, Yixi Xue, Jianxin You

Knowledge absorptive capacity is essential for the R&D of automobile firms. Thus, identifying key factors affecting this capacity is important which, however, is ignored by much research. This paper firstly builds a two-level factor framework which contains four dimensions in the first level and 16 factors in the second level. Interval valued intuitionistic fuzzy and DEMATEL model are then constructed to identify key factors based on expert interview. Finally, some suggestions are proposed.

4 - Decision Support Information System Based on Rough Set to Telecom Churn Management

Mihrimah Özmen, University of Erciyes, Muhendislik Fakultesi Endustri Muh Bolum, Kayseri, 38039, Turkey, mihrimah@erciyes.edu.tr, Emel Kizilkaya Aydogan

In this study a rough set based heuristic algorithm is developed enabling data selection, filtering and aggregation. And then, in order to identify the customers with churning tendency, a relatively novel and popular algorithm is proposed. This cost-based particle swarm optimization algorithm is particularly efficient in analyzing high dimensional data aggregate stacks with high accuracy.

5 - Multi-stream Profile Monitoring and Fault Diagnosis via Sensor Fusion

Weihong Guo, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48105, United States of America, graceguo@umich.edu, Jionghua (Judy) Jin, S. Jack Hu

When multiple signals are acquired from different sources, sensor fusion and data dimension reduction are two major issues to achieve a better comprehension of the process. A method for analyzing multi-stream profiles based on uncorrelated multilinear discriminant analysis and ensemble learning is proposed in this research for the purpose of profile monitoring, fault detection, and fault diagnosis. The proposed method is compared with other solutions with both simulated and real data.

Scheduling in Residency Rotational Medical Programs

Sponsor: Health Applications

Sponsored Session

Chair: Ruben Proano, Associate Professor, Rochester Institute of Technology, 81 Lomb Memorial Drive, Rochester, NY, 14623, United States of America, rpmeie@rit.edu

1 - Constructing Annual Block Schedules for Family Medicine Residents

Jonathan Bard, Professor, University of Texas, 204 E. Dean Keeton St., C2200, Austin, TX, 78712, United States of America, jbard@mail.utexas.edu, Zhichao Shu, Douglas Morrice, Ramin Poursani, Luci Leykum

This paper presents a mathematical model that can be used to help construct annual block schedules for Family Medicine programs. Starting with the current rotation templates our goal was to redesign them to concurrently (i) balance the number of outpatients that can be seen in the clinic during each half-day session, and (ii) minimize the changes to the current template assignments. Computations are illustrated with data provided by the University of Texas School of Medicine in San Antonio.

2 - Decision Support for Duty- and Workstation Rostering Subject to Fairness and Preferences

Jens Brunner, University of Augsburg, Universitätsstraße 16, Universität Augsburg, WiWi, Augsburg, De, 86159, Germany, jens.brunner@unikat.uni-augsburg.de, Andreas Fögener

We consider a practical physician scheduling problem at hospitals. We formulate two mixed integer linear programming models for duty- and workstation assignments. The duty-roster model assigns physicians to 24h- and late-duties whereas the workstations-roster model assigns physicians to actual workstations for each regular working day. To promote for job satisfaction we take into account fairness and preferences. We present the status of the software development and an evaluation of our models.

3 - A Multi-objective Optimization Approach to the Resident Rotation Scheduling Problem

Akshit Agarwal, Rochester Institute of Technology, 81 Lomb Memorial Drive, Rochester, NY, 14623, United States of America, aa9425@rit.edu, Ruben Proano

Resident rotation scheduling is a complex process, which makes it challenging for schedulers to develop yearlong rotation schedules that not only adhere to the various managerial and legal restrictions but also balance resident workload and the quality of their education experience. We propose a multi-objective mixed integer programming approach and evaluate its performance on a multi-criteria scorecard based on AHP.

4 - Models and Approaches for Residents' Annual Rotation Schedules

William Pozehl, Research Specialist, University of Michigan, 1075 Beal Avenue, Suite 3246, Ann Arbor, MI, 48109, United States of America, pozewil@umich.edu, Amy Cohn, Ed O'Brien

Building annual resident rotation schedules requires not only meeting resident education and service coverage requirements, but also fulfilling a variety of requests to improve training quality and resident satisfaction. Priorities and constraint complexity vary by program, but the underlying models and scheduling approaches share fundamental similarities. We present our experiences in building pediatric and surgical rotation schedules.

Chair: Gina Dumkrieger, ASU, 1151 S. Forest Avenue, Tempe, AZ, 85281, United States of America, gina.dumkrieger@asu.edu

1 - Rapid Vaccination Response to a Deadly Disease Outbreak

Rebecca Scott, University of North Carolina Wilmington, 601 S. College Road, Wilmington, NC, 28403, United States of America, scottra@uncw.edu, Gayle Prybutok, Victor Prybutok

Rapid vaccination response is developed for Ebola using a contextualized newsvendor model. A network model that allows evaluating the importance of decision making factors is both posited and tested. Implications are reported that provide insights for increasing the ability to respond in a populated urban area.

2 - Effect of Meat Price on Health Outcomes

Allison Pitt, Graduate Student, Stanford University, 475 Via Ortega, 212I, Stanford, CA, 94305, United States of America, alpitt@stanford.edu, Eran Bendavid

We simulate the changes in obesity prevalence, mortality, and quality of life of adults in the United States from a sustained shift in meat price such as those that may result from volatility in global food markets or from policies. We highlight the differential impact across subpopulations defined according to race and gender.

3 - Fear as Contagion: The Ebola Crisis and Public Fear Networks a System Dynamics Approach

Nasser Sharareh, Binghamton University, 99 Schubert, Binghamton, NY, 13905, United States of America, nsharar1@binghamton.edu, Nasim Sabounchi

The most important problems during a period of crisis in any country is how to respond to the public's fear. There has been a lot of research investigating epidemic diseases. However, a few of these have employed a system dynamics (SD) approach to demonstrate the relationships between pandemics and the public response to fear, and the public perception of epidemic. In this study, an SD model has been developed to study the hidden relations that spread the disease.

4 - Is it a Solution? Findings from HIMMS Data

Liuliu Fu, PhD Candidate, Old Dominion University, 5413 Walton Avenue, Norfolk, VA, 23508, United States of America, luna.foe@gmail.com, Ling Li, Li Xu

Our research uses the HIMSS 2014 analytics database to identify the implementation of IT on US hospitals as well as the impact of IT on these hospitals. SEM models are constructed. Research questions: 1) What are the influential factors of hospital performance? 2) Whether Information System plays a role to improve hospital performance? If so, what's the mechanism that IS influence the performance? And 3) For different type of hospitals, whether IS affects the performance differently? If so, Why?

5 - Blood Inventory Performance Improvement via Substitution Order Optimization

Gina Dumkrieger, ASU, 1151 S. Forest Avenue, Tempe, AZ, 85281, United States of America, gina.dumkrieger@asu.edu

When allocating limited resources of a substitutable, perishable good, such as blood, substitution order is important. Research shows that by optimizing the blood type substitution order arrival of the first unserved patient can be delayed.

Optimization in Cyber and Physical Systems

Sponsor: Public Sector OR

Sponsored Session

Chair: Justin Yates, Professor, Francis Marion University, 4822 E Palmetto St, Florence, SC, United States of America, jyates@fmarion.edu

1 - Network Models for Nuclear Facility Security

Justin Yates, Professor, Francis Marion University, 4822 E Palmetto St, Florence, SC, United States of America, jyates@fmarion.edu, Sambridhi Bhandari, Sergiy Butenko

Security practices are based on traditional risk equations relying heavily on expert opinion and estimation. The proposed model measures the strength rating of a facility based on current and available detection and delay components to effectively allocate/improve security resources. Testing is conducted on a various facility models that mimic real-world structure.

2 - Data Fusion Methods for Emergency Logistics

Robert Pavur, Professor, University of North Texas, 1307 West Highland Street, College of Business, Denton, TX, 76201, United States of America, Robert.Pavur@unt.edu, Huguette Tran

Data fusion methods, based on Shannon's Entropy, are often employed in emergency logistics. Implementation of these techniques to estimate casualties or survivors has to be carefully considered. These methods may yield results equivalent to standard statistical estimators. Shannon's entropy, invariant to permutations of values of discrete variables, makes the formulation of the estimator inefficient if enough categories are not selected. We compare traditional and entropy-based procedures.

3 - Proactive Cost-effective Risk Mitigation in a Supply Chain using Fault-tree Analysis

Michael Sherwin, Mississippi State University, 1767 Independence Way, Valencia, PA, 16059, United States of America, mdsherwin@gmail.com, Hugh Medal, Steven Lapp

Fault-tree analysis (FTA) is a well-accepted methodology in reliability engineering for analyzing risks within a system. In this paper we present an approach for constructing a fault-tree to assess risk within a supply chain. The top-level event of interest is the delay in delivering a product to a customer and lower-level events represent the causes and associated probabilities of disruptions within the supply-chain for the product being studied.

4 - A Computational Approach to Determine Damage in Infrastructure Systems from Outage Reports

Huy Nguyen, Research Assistant, Rensselaer Polytechnic Institute, 110 8th Street, Troy, NY, 12180, United States of America, nguyeh7@rpi.edu, Thomas Sharkey

We consider the problem of determining damaged components in an infrastructure system given outage reports from customers. This is important in the context of cyber attacks on the information/control systems of the infrastructures since these attacks can induce incorrect information about the status of components. We develop an integer programming approach that iteratively determines a set of components to inspect whose damage would best replicate the outage report.

5 - Blastoff: A Stochastic MILP Approach to Satellite Orbital Maneuvers to Collect Forest Fire Data

Aaron Hoskins, PhD Student, Mississippi State University, Industrial & Systems Engineering, Starkville, MS, United States of America, abh318@msstate.edu, Hugh Medal

Forest fires cause considerable loss of life and property each year, but more data being available to fire crews can help to mitigate the loss. Satellite data is a data source that is under utilized due to the fact that the satellite's orbit can preclude it from collecting the most valuable data. This research applies a MILP approach to the altering of satellite trajectories to improve the data collected by a satellite of a forest fire.

Health Care Strategy and Policy III

Contributed Session

Chair: Jessye Bemley, North Carolina A&T State University, 1601 East Market St., McNair Hall 419, Greensboro, NC, 27409, United States of America, jlbemley@gmail.com

1 - Risk Adjustment and Low Income Subsidy Distortions in Medicare Part D

Daniel Miller, Assistant Professor, Clemson University, Dept. Economics, 228 Sirrine Hall, Clemson, SC, 29670, United States of America, dmille7@g.clemson.edu

This paper reveals distortions in the largest health exchange, Medicare Part D, related to the design of the Low Income Subsidy program and the three "Rs" of Part D's risk adjustment sharing mechanism (risk adjustments, risk corridors, reinsurance). I document price distortions, biases in risk adjustments, and evidence of insurers and drug suppliers price discriminating to exploit these biases. In conclusion, I discuss policy considerations for designing health exchanges.

2 - Causes and Consequences of Telemedicine Adoption in Clinics with Clinical Decision Support System

Xiaojin Liu, University of Minnesota, 321 19th Ave S, Minneapolis, MN, 55455, United States of America, liux1591@umn.edu, Susan Goldstein, Karen Soderberg, Kingshuk Sinha

Telemedicine, the technology-enabled remote delivery of clinical care, is one potential means to improve patient access to health care services. Yet, little is known on antecedents and consequences of current adoption. We investigate how geographical, socioeconomic and organizational characteristics determine the adoption, and examine how telemedicine impacts clinical care effectiveness.

3 - For-profit Vs. Nonprofit: Strategies for Competition and Collaboration in Continuing Care

Chengcheng Fan, Stanford University, 44 Olmsted Rd, #408, Stanford, CA, 94305, United States of America, fanc@stanford.edu

For-profit organizations have risen as a new form of entrepreneurship in healthcare industry. In this paper, I first examine the impact of ownership status on occupancy rate, price, and resident satisfaction in continuing care industry through an empirical study in California. Second, I set up a two-sided market framework to model the competition between for-profit and nonprofit CCRCs. The results provide new insights to understand the increase of for-profits' market share in healthcare.

4 - Modeling Individual Consumer Food Contamination Progression

Jessye Bemley, North Carolina A&T State University,
1601 East Market St., McNair Hall 419, Greensboro, NC, 27409,
United States of America, jlbemley@gmail.com, Lauren Davis

Food-borne illness affects nearly 48 million individuals a year resulting in hospitalizations and deaths. United States public health departments reported that 1,527 food outbreaks occurred between 2009 and 2010 of which 7.8% resulted in deaths. The purpose of this research is to develop models that will help to quantify consumer morbidity, consider the impact of various characteristics on the consumer, spread of contamination and consider interventions.

38-Room 415, Marriott

Optimization Combinatorial IV

Contributed Session

Chair: Mohsen Momeni Tabar, K.N.Toosi University of Technology, Tehran, Iran, mohsenmt40@gmail.com

1 - Semidefinite and Copositive Relaxation of Polynomial Optimization by using Symmetric Tensors

Xiaolong Kuang, Lehigh University, 14 Duh Drive, Apt. 324,
Bethlehem, PA, 18015, United States of America,
kuangxiaolong0731@gmail.com

We study relaxation of general polynomial optimization problem over the cone of positive semidefinite and completely positive tensors, which are natural extensions of the cones of positive semidefinite and completely positive matrices. Then we characterize the relationship between Lagrangian bounds, semidefinite bounds and copositive bounds of polynomial optimization.

2 - A Three-Operator Splitting Scheme and its Optimization Applications

Damek Davis, Graduate Student, University of California, Los Angeles, Department of Mathematics, Los Angeles, CA,
90095-1555, United States of America, damek@math.ucla.edu,
Wotao Yin

In this talk, we introduce a new splitting scheme that extends the Douglas-Rachford and forward-backward splitting schemes to monotone inclusions with three operators, one of which is cocoercive. We discuss why this algorithm works, derive several special cases, including a simple three-block ADMM algorithm, and introduce an acceleration that achieves the optimal rate of convergence for strongly monotone inclusions. Finally, we discuss several applications and future research directions.

3 - Moment Problem and its Applications to Risk Assessment

Ruilin Tian, Associate Professor Of Finance, North Dakota State University, 244 Richard H. Barry Hall, NDSU Dept 2410, Fargo, ND, 58108-6050, United States of America,
ruilin.tian@gmail.com, Samuel Cox, Luis Zuluaga

We discuss how to solve univariate moment problems with different function forms for risk assessment through three methods; namely, the semidefinite programming method, the moment-matching method, and a linear approximation method. We show that for practical purposes, these methods provide numerically equivalent results. Also, we propose a simpler formulation for the unimodal bounds on $E[L(x \leq K)]$ compared to existing formulations of the moment problem in the literature.

4 - Calculating the Number of Optimal Server in Queue M/M/s/K

Mohsen Momeni Tabar, K.N.Toosi University of Technology, Tehran, Iran, mohsenmt40@gmail.com, Zhila Dehdari Ebrahimi, Mahyar Ejlaei

Nowadays, economical systems play an important role in reducing costs. In this paper, mathematical modeling and calculation of optimal server queue $M / M / s / K$ have been investigated and numerical analysis method was used. The goal of this paper, base on two criteria to minimize costs and maximize the level of service is built. Finally, analyzed this paper done by maple 12 software.

39-Room 100, CC

Supply Disruption, Price Competition, and Quality

Cluster: Operations/Marketing Interface

Invited Session

Chair: Chao Liang, Assistant Professor, Cheung Kong Graduate School of Business, Main Campus, Oriental Plaza, E2, 1 East Chang An Ave, Beijing, China, cliang@ckgsb.edu.cn

1 - Impact of Variety Seeking Behavior on Service Competition under Price Commitment

Ying Wei, Associate Professor, Jinan University, Rm 722, Huiquan Building, Huangpu Avenue West 601#, Tianhe Dist., Guangzhou, 510632, China, yingwei@jnu.edu.cn, Liyang Xiong, Yulan Wang

Variety seeking is modeled as a decrease in the willingness to pay for the product purchased on the previous purchase occasion. With a two-stage Hotelling-type model, we show that under symmetric competition, the presence of variety seeking induces centralization effect, meaning firms tend to make the same price and service levels; while under asymmetric competition, the presence of variety seeking induces polarization effect meaning firms' price and service decisions tend to be different.

2 - Uniform Pricing in Service Systems as an Efficient Way of Improving Quality

Xin Geng, Sauder School of Business, University of British Columbia, Vancouver, BC, Canada Xin.Geng@sauder.ubc.ca

We look at a firm with heterogeneous servers who provide quality-differentiated services, where quality can be improved based on servers' experience. The commonly used pricing scheme that posts a price on each server suffers from a pitfall that the low quality servers usually improve slowly, impeding the future revenue increase. To resolve this issue, we propose another pricing scheme, which is essentially probabilistic selling, and analytically establish its superiority in long-run revenue.

3 - Does Traceability Help Product Quality?

Chao Liang, Assistant Professor, Cheung Kong Graduate School of Business, Main Campus, Oriental Plaza, E2, 1 East Chang An Ave, Beijing, China, cliang@ckgsb.edu.cn

In a supply chain with one manufacturer and one supplier, we study how traceability impacts the manufacturer and the supplier's incentive to improve product quality. Interestingly, we find that traceability may reduce the final product's quality.

WE40

40- Room 101, CC

Operations Management/Marketing Interface IV

Contributed Session

Chair: Sung Wook Yun, Yonsei University, Sinchon-dong, Seodaemun-gu, Seoul, Korea, Republic of, giantguard@naver.com

1 - Product Differentiation under Uncertain Market Conditions

Xingxing Chen, Washington University in St. Louis, Campus Box 1133, St. Louis, MO, 63130, United States of America, xingxing.chen@wustl.edu

We study a competition model between two firms facing uncertain market conditions where they engage in a product design competition with these uncertainties and then engage in a price competition after uncertainties are resolved. We try to characterize price and product design equilibrium and see how uncertainties in the market affect the equilibrium outcome.

2 - The Antecedents and Consequences of Automotive Recall Decision Making

Chelsey Hill-Esler, Drexel University, 730 Gerri LeBow Hall, 3220 Market Street, Philadelphia, PA, 19104, United States of America, chh35@drexel.edu, Chaojiang Wu

In the automotive industry, when a safety defect or noncompliance issue is discovered, automakers must make many important decisions. This research considers two decisions: action and initiation. Using primary and secondary recall data between 2004-2014, the authors utilize a two-stage modeling approach investigating the factors influencing recalls and the effect of recall decisions on market share.

3 - Institutional Logics Change and Firm Attention: Sustainability Logic in the Apparel Industry

Yoojung Ahn, University of Massachusetts Amherst, MA,
121 Presidents Drive, Amherst, MA, 01003,
United States of America, yoojung@som.umass.edu

This paper explores how change in institutional logics impacts firm attention to this logic to create self-regulatory institutions. I examine the “sustainability logic” in the apparel industry to understand the different ways firms attend to this logic, and whether attention patterns contribute differently to participating in a self-regulatory institution. I deploy content analysis and event history analysis methods.

4 - Development of Predictive Model for Moviegoers using Multi Regression Analysis and Movie Scheduling

Sung Wook Yun, Yonsei University, Sinchon-dong,
Seodaemun-gu, Seoul, Korea, Republic of,
giantguard@naver.com

This paper is about a practical decision-making approach to a film screening in a multiplex movie theater. Our ultimate objective in this paper is to maximize the number of moviegoers by allocating movies to a limited number of screens that have different number of seats. We specifically devised a movie schedule model that determine which movies will be played on which screens with the consideration of an exchange screening and a double booking based on the Movie forecasting.

Pricing and Inventory Control

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Izak Duenyas, John Psarouthakis Professor, University of Michigan, Ross School of Business, Ann Arbor, MI, 48109, United States of America, duenyas@umich.edu

1 - Dual-metric Segmentation for Creating Airline Forecast Groups

Wei Wang, Scientist, PROS, Inc., 3100 Main Street, Suite #900,
Houston, Tx, 77002, United States of America,
weiwang@pros.com

For airlines, forecast groups created based on various flight attributes can improve forecast accuracy and provide sponsorship (especially to new markets), however frequently the segmentation uses load factor (LF) as the only metric. We present a two-metric and two-step approach where the segmentation is guided by both revenue and LF.

2 - Analysis of Self-adjusting Controls for Dynamic Pricing with Unknown Demand Parameters

George Chen, Stephen M. Ross School of Business, University of Michigan, 701 Tappan Ave, Ann Arbor, MI, United States of America, georgeqc@umich.edu, Izak Duenyas, Stefanus Jasini

We study the network-RM pricing problem with unknown demand function parameter. We develop a joint learning and dynamic pricing heuristic that combines MLE and self-adjusting price control and show that the best attainable revenue loss rate in the general setting can be achieved without re-optimization. A much sharper rate can also be achieved when demand are well-separated using the proposed self-adjusting heuristic.

3 - Data-driven Algorithms for Nonparametric Multi-product Inventory Systems

Weidong Chen, University of Michigan, Industrial and Operations Engineering, Ann Arbor, MI, 48109, United States of America, aschenwd@umich.edu, Cong Shi, Izak Duenyas

We propose a data-driven algorithm for the management of stochastic multi-product inventory systems with limited storage as well as production cost uncertainty. The demand distribution is not known a priori and the manager only has access to past sales data. We measure performance of our proposed policy through regret and characterize the rate of convergence guarantee of our algorithm.

4 - Dynamic Pricing and Inventory Management under Network Externalities

Renyu Zhang, Doctoral Student, Olin Business School, Washington University in St. Louis, Campus Box 1133,
1 Brookings Drive, St. Louis, MO, 63130,
United States of America, renyu.zhang@wustl.edu, Nan Yang

We study a periodic-review joint pricing and inventory management model with network externalities. The product is a network product so that the customers' willingness-to-pay and, thus, the potential demand of the product are increasing in the network size. We characterize the optimal policy and analyze the impact of network externalities upon the optimal price and inventory decisions. We also propose effective strategies to exploit network externalities.

New Approaches in Dynamic Pricing and Revenue Management

Sponsor: Revenue Management and Pricing

Sponsored Session

Chair: Yonatan Gur, Stanford GSB, 655 Knight Way, Stanford, CA, 94305, United States of America, ygur@stanford.edu

1 - Randomized Markdowns and Online Monitoring

Ken Moon, PhD Candidate, Stanford GSB, 655 Knight Way,
Stanford, CA, 94305, United States of America,
kenmoon@stanford.edu, Kostas Bimpikis, Haim Mendelson

Using data tracking customers of a North American retailer, we present empirical evidence that consumers are forward-looking and that monitoring products online associates with successfully obtaining discounts. Developing a structural model relating consumers' dynamic behavior to their monitoring costs, we find substantial heterogeneity, with opportunity costs for an online visit ranging from \$2 to \$25 in inverse relation to price elasticities. We show implications for retail operations.

2 - Agent Behavior in the Sharing Economy: Evidence from Airbnb

Antonio Moreno-Garcia, Northwestern University,
2001 Sheridan Rd, Evanston, IL, 60208, United States of America,
a-morenogarcia@kellogg.northwestern.edu, Jun Li, Dennis Zhang

Using data from Airbnb, we study the behavior of non-professional agents in two-sided platforms.

3 - Implications of Choice Paralysis on Operational Decision Making

Rene Caldentey, NYU, 44 W 4th St, New York, NY, 10012,
United States of America, rcaldent@stern.nyu.edu,
Srikanth Jagabathula, Anisha Patel

We empirically investigate the notion of choice paralysis (i.e., too many options can paralyze a consumer and make them more prone to not purchasing) and study its implications on assortment and inventory decisions. We propose a modification to the nested logit model to incorporate the choice paralysis effect.

4 - Doing While Learning and Adapting to a Changing Environment

Yonatan Gur, Stanford GSB, 655 Knight Way, Stanford, CA,
94305, United States of America, ygur@stanford.edu,
Omar Besbes, Assaf Zeevi

Multi Armed Bandit (MAB) problems are building blocks of many RM&P problems. We study a MAB formulation that allows for a broad range of temporal uncertainties in the rewards. We characterize the complexity of this class of problems, mapping the “budget” of allowable variation to the minimal achievable regret relative to a dynamic oracle. We study the price of universality: the additional complexity associated with not knowing variation budget, over the one embedded in a known budget.

■ WE45

45-Room 103C, CC

Reducing the Carbon Footprint

Contributed Session

Chair: Emre Berk, Bilkent University, Management Faculty, 06800 Bilkent, Ankara, Turkey, eberk@bilkent.edu.tr

1 - Real Options Portfolio Strategies for Cloud Infrastructure Expansion

Yunpeng Pan, Assistant Professor, South Dakota State University,
Mathematics&Statistics, Box 2220, Brookings, SD, 57007,
United States of America, yunpeng.pan@sdstate.edu

Cloud services are powered by capital-intensive, energy-hungry data centers. The temporal and spatial choices of data center deployment must be made judiciously to best satisfy customer needs while keeping economic and environmental costs in check. To this end, we propose a real options framework for evaluating the desirability of candidate sites under the complex dynamics of electricity rate, customer demand, etc.; we develop strategies for portfolio selection and option exercise.

2 - Design of Financial Incentive Programs to Promote Net Zero Energy Buildings

Alireza Ghalebani, Doctoral Candidate, University of South Florida, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, Alireza@mail.usf.edu, Tapas K. Das

Promoting net zero energy buildings (NZE) is among key carbon emissions reduction approaches in the U.S. and in the EU countries. We present a mixed integer programming (MIP) model to aid determining the minimum thresholds of financial incentives that would spur growth in NZEBs. The results indicate the threshold values of the incentive program parameters, and show that these thresholds are highly influenced by the leveled cost of electricity from RE and are independent of load profiles.

3 - Environmental Consequences of Inventory Stockout Decisions

Hongyan Liang, Kent State University, 800 E Summit Street, Kent, OH, 44240, United States of America, hliang@kent.edu, Alfred Guiffreda, Eddy Patuwo

The literature on sustainable inventory management has focused on the carbon footprint with inventory management decisions. Emergence orders are issued to correct a stockout occurrence. The majority of emergency orders involve transportation by motor carriers, which impacts the environment through the carbon footprint. Models for examining the decision to backorder do not address environmental concerns, hence a research opportunity exists to reexamine the decision to backorder or stockout.

4 - A Multi-modal Inventory System with Lead Time Dependent Demands

Emre Berk, Bilkent University, Management Faculty, 06800 Bilkent, Ankara, Turkey, eberk@bilkent.edu.tr, Ozgur Toy, Onurcan Ayas

We consider an inventory system facing slow moving demand with multi-modal transport opportunities. Customers have waiting time tolerances in cases of stockouts and societal-impact considerations (e.g., carbon emission sensitivities) for the units they purchase. We investigate mode selection and service contract design. We provide some structural results and numerical examples.

5 - On Variability of Global Annual Mean Temperature

Xiaoyue Jiang, Tulane University, Department of Computer Science, New Orleans, LA, 70118, United States of America, xjiang@tulane.edu, Brent Venable, Leiwen Jiang

A “model-free” analysis of global annual mean temperature anomalies (HadCRUT4, from 1850-2014) is developed. By capturing the maximum variability across all time scales covered by the dataset, this envelope-based characterization confirms some widely accepted, in the meantime, strongly disputed understandings and offers new and objective insights and interpretation to future climate change trajectory.

Studies in Customer Queuing Behavior

Sponsor: Manufacturing & Service Oper Mgmt/Service Operations
Sponsored Session

Chair: Robert Batt, Asst. Professor, Wisconsin School of Business, UW-Madison, 975 University Ave., Grainger Hall, 5279, Madison, WI, 53706, United States of America, rbatt@bus.wisc.edu

Co-Chair: Laurens Debo, Associate Professor, Dartmouth College, 100 Tuck Hall, Hanover, NH, 03755, United States of America, laurens.g.debo@tuck.dartmouth.edu

1 - Managing Customer Expectations and Priorities with Delay Announcements

Gad Allon, Professor, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, g-allon@kellogg.northwestern.edu, Achal Bassamboo, Qiuping Yu

We study in a service environment, how to manage customers' expectations and to prioritize customers appropriately to maximize the firm's profits. Specifically, we focus on a setting where the firm uses only delay announcements and study the opportunities and limitations of this mechanism. We are particularly interested in when and how the customers can be influenced by delay announcements.

2 - Searching for Better Quality and a Shorter Wait

Luyi Yang, Doctoral Student, University of Chicago Booth School of Business, Chicago, IL, United States of America, luyi.yang@chicagobooth.edu, Laurens Debo, Varun Gupta

We consider a many-server queueing system in which servers have different qualities. The customer does not know either the quality of the server or its queue length in advance, and is thus engaged in a costly sequential search. We characterize the equilibrium search behavior. We find that reducing the search cost may increase the expected waiting time while increasing the arrival rate may decrease it.

3 - Observational Learning in Congested Environments with Multiple Choice Options

Chen Jin, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, chenjin2011@u.northwestern.edu, Laurens Debo, Mirko Kremer, Seyed Iravani

We study human choice behavior in a congested multi-location system with quality variation among locations and information asymmetry among sequentially arrived customers, i.e. some customers are informed and know the quality of all locations while others don't (uninformed). Customers all observe the queue length at each location upon arrival. We specify conditions under which uninformed customers join longest queue and join shortest non-empty queue. We also test the results in the laboratory.

Consumer Returns Management in Retailing

Sponsor: Manufacturing & Service Oper Mgmt/Sustainable Operations

Sponsored Session

Chair: Guangzhi Shang, Assistant Professor, Florida State University, College of Business, RBB354, Tallahassee, FL, 32306, United States of America, gshang@business.fsu.edu

1 - Does a Better Customer Experience Reduce Consumer Returns? An Empirical Study using Data Analytics

Necati Ertekin, Texas A&M University, Mays Business School, College Station, TX, 77840, United States of America, nerteikin@mays.tamu.edu, Michael Ketzenberg, Gregory Heim

This study contributes to the understanding of consumer return behavior by examining the association between in-store customer experience (i.e. product quality, service quality, and customer satisfaction) during a purchase and a subsequent return. Our analysis reveals surprising findings for retailers. For instance, we demonstrate that retail efforts such as increasing salespeople competence and improving store environment that are so long believed to prevent returns may indeed induce returns.

2 - Intertemporal Pricing and Return Policies in the Presence of Strategic Consumers

Wenbo Selina Cai, Assistant Professor, New Jersey Institute of Technology, cai@njit.edu, Ying-ju Chen

Pricing and return policies are crucial decisions that affect online retailers' profitability when dealing with strategic consumers. We develop a model that considers heterogeneous consumer valuations, valuation uncertainties, and strategic purchasing behaviors, and derive the optimal joint pricing and return policy for a retailer in a dynamic pricing framework. We discuss the implications of a generous return policy, and show that returns can help retailers facilitate market segmentation.

3 - An Empirical Investigation of Return Drivers: Reducing Consumer Returns in the Era of Generous Refunds

Guangzhi Shang, Assistant Professor, Florida State University, College of Business, RBB354, Tallahassee, FL, 32306, United States of America, gshang@business.fsu.edu, Mark Ferguson, Michael Galbreth

We empirically study drivers of whether and when to return. Our results informs retailers' return management along two dimensions: 1) how to target buyer assistance, and 2) how to customize return time window.

Facility Location II

Contributed Session

Chair: Utku Kunter, Research Assistant, Middle East Technical University, ODTU Kampusu Endüstri Mühendisliği Bolum, Oda 325 Cankaya, Ankara, 06801, Turkey, kunter@metu.edu.tr

1 - Identifying Stadium Locations for the Qatar 2022 Fifa World Cup

Agha Iqbal Ali, Professor And Chairman, University of Massachusetts-Amherst, Isenberg School of Management, 121 Presidents Dr., Amherst, MA, United States of America, aiali@isenberg.umass.edu, Ahmed Ghoniem

The number of venues for the twenty FIFA World Cups since 1930 has ranged from 3 to 20 and the number of participating teams has grown from 13 to 32. Due to the compactness of Qatar, the logistical impacts of different numbers and locations of venues can be significant for the Qatar 2022 FIFA World Cup. These impacts are studied in a scenario analysis using mathematical programming.

2 - Modeling Transportation Cost Uncertainty in City Logistics Systems

Utku Kunter, Research Assistant, Middle East Technical University, ODTU Kampusu Endüstri Mühendisliği Bolum, Oda 325 Cankaya, Ankara, 06801, Turkey, kunter@metu.edu.tr, Cem Iyigun, Haldun Sural

City Logistics (CL) deals with freight transportation in urban areas. We consider the fixed charge facility location problem under transportation cost uncertainty in a CL setting. The optimization problem has been framed as a two-stage stochastic MIP. Locations are chosen in the first stage; capacity allocations are made in the second. We propose an evolutionary solution algorithm with local search. The algorithm performs well when compared with exact solution methods in the literature.

3 - Optimizing Hospital Closures

H A Eiselt, University of New Brunswick, Fredericton, NB, Canada, haeiselt@unb.ca, Joyendu Bhadury, Mark L. Burkey, Hunkar Toyoglu

We examine the effects of hospital closures on some major indicators concerning service level, including the average access time and the proportion of potential patients who are able to access a health care facility within 30 minutes driving time. Results of extensive computations are provided and discussed.

Empirical Studies in Supply Chain Risk Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Jun Li, Assistant Professor, Ross School of Business, University of Michigan, 701 Tappan St, Ann Arbor, 48103, United States of America, junwli@umich.edu

1 - Supply Chain Network Structure and Firm Returns

Wu Jing, University of Chicago Booth School of Business, 5050 S Lake Shore Dr 3417S, Chicago, IL, United States of America, wujing@chicagobooth.edu, John Birge

Using data on the relationships of public US firms, we investigate the effects of supply chain connections on firm performance, as reflected in stock returns, at two interaction levels, first-order from direct connections and second-order from systemic exposures through the network.

2 - An Empirical Model of Inventory Rationing Game

Robert Bray, Northwestern University, Evanston, IL, United States of America, robertlbray@gmail.com, Oliver Yao, Achal Bassamboo

We study inventory rationing in a one-DC, 80-retailer supply chain. We model the stores' inventory policies as a dynamic discreet choice game. We estimate whether the stores increase or decrease their order quantities when the threat of DC stock out increases. Increasing order quantities indicate inventory gaming—stores squabbling over upstream inventories—whereas decreasing order quantities indicate supply chain coordination—stores preserving upstream inventories for those most in need.

3 - A Structural Estimation of the Bullwhip Effect using Supply Network Data

Vishal Gaur, Cornell University, 321 Sage Hall, Ithaca, NY, 14850, United States of America, vg77@cornell.edu, Maximiliano Udenio, Jan Fransoo

We estimate a two-stage structural model of inventory decisions using financial data for 6,040 unique supplier-customer dyads for the years 1984-2013 to investigate downstream inventory adjustments and their influence on upstream firms. Our results show that inventory cost ratios are dynamic, and a significant cause of the bullwhip effect in supply chains.

Facilities Planning and Design

Contributed Session

Chair: Begün Efeoglu, Research Assistant, Middle East Technical University, ODTÜ Kampüsü Endüstri Mühendisliği, Oda 324 Çankaya, Ankara, 06800, Turkey, beguneefeoglu@gmail.com

1 - A Markov Decision Process Model for the Dynamic Block Stacking Problem

Hueon Lee, PhD Student, University of Arkansas, Dept. of IE, 4207 Bell Engineering Center, 1 University of Arkansas, Fayetteville, AR, 72701, United States of America, hueonlee@uark.edu, John A. White, Shengfan Zhang

The block stacking problem involves determining the depth of a storage row for unit loads that minimizes the sum of space and travel cost. A conventional block stacking problem assumes static row depths and deterministic demand. We allow row depths to change (by relocating product) and demand to be random. The problem is formulated as a Markov decision process and the optimal lane depth is determined for each inventory level. Results obtained provide useful insights for designers.

2 - A Heuristic Method for Storage Location Assignment Problem for a Distribution Center

Zeynep Turgay, Solution Architect, Migros IT, Atasehir, Istanbul, 34758, Turkey, zeynept@migros.com.tr, Necati Aras

Storage location assignment of products is an important research topic in warehouse design. We solve storage location assignment problem for a distribution center providing day-to-day service for a retail chain. Ordered items and quantities are random. Order pickers collect the products ordered by the stores from their addresses and deliver to the order shipment area. The objective is to optimize the total effort spent by the order pickers in terms of the total traveling distance.

3 - Impact of Demand Stochasticity on Distributed Layouts

Begün Efeoglu, Research Assistant, Middle East Technical University, ODTÜ Kampüsü Endüstri Mühendisliği, Oda 324 Çankaya, Ankara, 06800, Turkey, beguneefeoglu@gmail.com, Haldun Sural, Melih Celik

The facility layout problem is to assign departments to locations. Recent studies show that functional layout configurations do not meet the needs of multiproduct enterprises. We investigate the effect of the stochastic demand and the layout cost on the choice of a layout type in a dynamic environment. Using a two-stage stochastic integer programming, we simulate its results in order to study system trade-off and present our experimental results.

1 - Two Sides of the Same Coin: A Meta-analysis of Cohesion in Organizational Contexts

Angelo Solarino, City Univeristy of Hong Kong, Chee Avenue, Kowloon, Hong Kong, Hong Kong - PRC, mgangelo@cityu.edu.hk, Frederik Von Briel

Cohesion is one of the most important determinants of group performance; it is reflected through a socio-emotional (i.e., group members' liking for one another) and a task-oriented (i.e., group members' shared task commitment) dimension. Exclusively focusing on organizational contexts we conduct a meta-analysis of the cohesion-performance relationship to clarify the effect of individual dimensions, thereby identifying group type and country as contingencies that moderate the relationship.

2 - Foreign Cuisine or Local Delicacies? A Study on Overseas and Domestic M&A by Chinese Listed Firms

Daitian Li, PhD Candidate, Bocconi University, Via Roentgen, 1, Milan, 20136, Italy, daitian.li@phd.unibocconi.it

This paper explores how sectoral difference and firm heterogeneity affect the link between mergers and acquisitions (M&A) and productivity. I hypothesize that overseas M&A tend to increase firms' productivity in high-tech sectors, while domestic M&A tend to increase firms' productivity in low-tech sectors. Above relationships are affected by firm heterogeneity in terms of prior productivity levels. The hypotheses are tested with data on M&A conducted by Chinese listed firms in 2000-2011.

3 - Joint Price Differentiation and Inventory Decisions for a Risk-tolerant Firm with Demand Leakage

Syed Asif Raza, Assistant Professor, Qatar University, College of Business and Economics, Qatar University, Doha, QC, 2713, Qatar, syedar@qu.edu.qa, Mohd. Nishat Faisal

We present a model for an optimal joint price differentiation and inventory decisions for risk-tolerant firm. It is assumed that the firm divides its market demand into two segments using a differentiation price and sell almost the same or slightly distinguished products. However, this differentiation leads an imperfect segmentation causing a demand leakage from the full price market segment to the discounted price segment. We assess the impact of risk-aversion on a firm profitability.

4 - A New Statistical Approach to Multi-Channel Inventory Allocation

Misuk Lee, Assistant Professor, Salisbury University, Perdue School of Business, Salisbury, MD, 21804, United States of America, mxlee@salisbury.edu

All revenues in different channels are not created equal with different distribution costs and different market prices. We develop a new statistical model to find a more profitable, yet achievable channel mix. By estimating multivariate normal demand, we capture correlations of demand among channels and compute the expected channel mix. We incorporate the estimation process with demand seasonality identified through clustering, which results in more business-reasonable allocation.

1 - The Impact of Changing Discharge Standards on the Wastewater Treatment Process

Bingxiong Lu, Tsinghua University, South 615A Shunde Building, Beijing, China, lubx13@mails.tsinghua.edu.cn, Simin Huang, Xiangyuan Du

We used derivative-free optimization to optimize the wastewater treatment process at different discharge standards, and obtained the 'optimal treatment scenarios' with minimal treatment cost. The life cycle impact of 'optimal treatment scenarios' were calculated using life cycle assessment. The results show that the life cycle impact increases with increasingly stringent discharge standard, and the marginal life cycle impact varies with different categories of water pollutant.

2 - Export Restrictions or Boundary Adjustments? A Technology Choice and Social Welfare Based

Sam Aflaki, HEC Paris, 1 Rue de la Liberation, Jouy en Josas, 78350, France, aflaki@hec.fr

In this paper, we study the legislations concerning e-waste export restrictions such as Basel convention and compare them with alternative schemes such as boundary adjustment methods involving taxation. We characterize the Nash equilibrium of a Stackelberg game between a regulator and a monopolistic firm and analyze the influence of these schemes on the technology choice for recycling, remanufacturing quantity and social welfare.

3 - Industrial Emissions: Corporate Social Liability and Responsibility

John J Liu, Professor, City U of Hong Kong, Tat Chee Avenue, Kowloon, Hong Kong - PRC, johnliu@cityu.edu.hk, Hao Leo Li

We theorize that industrial emissions represent an unavoidable social liability that has not been unaccounted for in the POM research, and develop an emission transduction model of production energy dissipation to characterize and measure individual industrial emissions as liable "bads" (bad output) inevitably transduced together with the "goods" produced by a production system. The model is validated with empirical tests.

1 - Value Co-creation and Resource Consumption: Towards an Operational Model of SD Logic

Christoph Heitz, Zurich University of Appl. Sciences, Postfach, Winterthur, 8401, Switzerland, christoph.heitz@zhaw.ch

We study a service system with two actors (e.g. service provider and customers) which may integrate their resources for mutual value creation. We derive a formal model that takes into account not only the value creation but also the resource consumption of both actors. We assume that both actors have limited resources, and the choices of how to use these resources determine their behavior in the service relationship. The model leads to general insights on the behavioral options of the actors.

2 - NSF Funding Opportunities for Human-centered Smart Service Systems

Alexandra Medina-Borja, Program Director, National Science Foundation/ UPRM, 2507 Fowler St, Falls Church, VA, 22046, United States of America, amedinab@nsf.gov

NSF program directors will discuss funding opportunities at the intersection of behavioral Sciences/ Human Factors and mathematical modeling. This research work is expected to enable smart service systems of the future. Requirements and recommendations will be discussed

3 - Task Variety in Professional Service Work: When it Helps and When it Hurts

Emmanouil Avgerinos, PhD Candidate, University College London, Gower Street, London, WC1E6BT, United Kingdom, emmanouil.avgerinos.10@ucl.ac.uk, Bilal Gokpinar

In many professional service firms, individuals perform a variety of tasks with significant opportunities for learning but also tend to enjoy more discretion in managing when and how they perform their tasks. In light of these observations, we investigate task allocation strategies that may enhance or inhibit individual learning. Using a dataset of 3,275 coronary artery bypass surgeries we examine the effect of concurrent and non-concurrent exposure to task variety on individual productivity.

4 - Barriers to Productizing Services

Sukruth Suresh, Rensselaer Polytechnic Institute, Troy, NY, 12180, United States of America, suress@rpi.edu, T. Ravichandran

We extend the existing product service systems classification, to include productized service offerings. These are a well-defined, well-packaged bundle of distinct services with a defined scope, delivered to address a specific set of needs. We posit that firm status; maturity and extent of modularity of the offering and, market size influence the propensity of firms productizing their offerings. These are mobility barriers rather than entry barriers as the transition is within the industry.

5 - Waiting Time and Customer Satisfaction Improvement in Emergency Departments

Sina Ansari, Northwestern University, 2145 Sheridan Road Room C210, Evanston, IL, 60208, United States of America, sina.ansari@u.northwestern.edu, Seyed Iravani, Laurens Debo

Excessive wait time is the most common reason patients become unsatisfied and leave the emergency department before being treated. In this study, we aim to determine the possibilities of improvement in patient's waiting times (both actual and perceived) in Northwestern Memorial Hospital ED and consequently help ED managers to achieve higher patient satisfaction.

1 - Performance Improvement of Average Access Time and Cache Memory Access Time

Mohammad Shamsu Alam, Assistant Engineer, ADN Telecom, 17, Red Crescent Concord, Tower, Mohakh, 121/1&2, Tejkon Para, Tejgaon, Dhaka, 1215, Bangladesh, shiblyshamsul@gmail.com, Mirza Moazzem Hossain, Jamal Uddin Ahmed

The cache is a small amount of high speed memory. Cache is placed between the CPU and main memory. In this view, we consider in this paper to optimize the cache memory access time which eventually optimizing the average access time and also if the cache memory size doubled then the cache memory access time should also double but cache memory access time will only increase 10% from the previous value.

2 - The Thermal Contact Resistance Testing Method Study of Thin Film Materials

Xiaogang Li, BUAA, Rm 318, Weimin Building, 37 Xueyuan Rd., Haidian Dist., Beijing, China, lxxg@buaa.edu.cn

As there are many factors affecting the thermal contact resistance, In engineering application, the thermal contact resistance of the solid interfaces is usually obtained by testing. In this paper, the method of measuring the thermal contact resistance of the thin film materials is presented. According to this method, we use copper heat flux meter, graphite columnar specimens and graphite thin film sample to measure the thermal contact resistance between the graphite thin film material

3 - Data-enhanced Prediction of Marketing Strategies: Does Product Repairability Play a Role?

Mostafa Sabbaghi, Graduate Research Assistant, University at Buffalo, SUNY, 437 Bell Hall, Buffalo, NY, 14260-2000, United States of America, mostafas@buffalo.edu, Sara Behdad

The existing manufacturers' policies in making products difficult and expensive to repair and not adequately share the repairing information with end-users and independent repair businesses make repair a challenging process. This paper aims to characterize the product sales rate and post purchase usage behavior to investigate the impact of product reparability on consumers' future purchase decisions and the long-term profitability of manufactures.

4 - Response Surface Modeling Approaches for Multi-response Design Parameter Optimization Problems

Gölsen Güğayaz, Research Assistant, Middle East Technical University, Industrial Engineering Department, Ankara, Turkey, ggulten@metu.edu.tr, Gulser Koksall

Performances of response surface modeling approaches such as Ordinary Least Squares, Weighted Least Squares, Generalized Least Squares, Multivariate Regression, and Seemingly Unrelated Regression are analyzed for multiple-response design parameter optimization problems. Weaknesses are discussed and improvements are suggested.

5 - Maximum Entropy Utility Function Assessment using Renyi Entropy

Jayash Koshal, Bloomberg LP, 425 Washington Blvd, Jersey City, NJ, 07310, United States of America, jayashkoshal@gmail.com, Vijitashwa Pandey

Maximum entropy methods, used to assess probability distributions, can also be used for assessing utility. When utility values are known for discrete values of the attributes, a problem arises of fitting a curve to these points. We use Renyi entropy instead of Shannon's entropy to allow different weighting of different regions of utility functions. We show how Maximum Renyi Entropy formulation can be used for utility functions and compare the results with Maximum Shannon Entropy functions.

1 - A Spatiotemporal Outlier Detection Framework for Diagnostic Quality Monitoring of Image Sequences

Mohammad Abed Motasemi, UTSA, 6685 UTSA Blvd., San Antonio, TX, 78249, United States of America, abed.motasemi@gmail.com, Adel Alaeddini

Statistical quality monitoring has mainly remained with less attention in images and high dimensional data application. We propose a novel spatiotemporal outlier detection framework for monitoring the quality of image sequences. Extensive analysis based on a real application in a manufacturing facility is conducted to demonstrate the performance of our proposed methodology in detecting various types of outliers.

2 - The Cause and Effect of Material Handling Systems on Operational Performance

Yunjung Suh, PhD Candidate, Kyungpook National University, 102-1001 Maechunro 2Gil, 19, Bukgu, Daegu, 702-793, Korea, Republic of, yunjusuh@knu.ac.kr, Jaewoo Chung

This study investigates the causal relationships among actual firm's motives, degrees of material handling automation systems(MHS) and operational performance based on surveys in Korea. The study classifies and measures the usage of MHS and identifies actual firms' motives to introduce MHS with a fit to the firm's business strategy. The result presents that there is an associative relationship among firm's strategy, MHS and operational performance with the mediating effect of MHS.

3 - Shifting Bottleneck Heuristic for Stochastic Job Shop Scheduling Problems

Hossein Badri, PhD Student, Wayne State University, Industrial and Systems Engineering Dep, Detroit, MI, 48201, United States of America, hossein.badri@wayne.edu, Milad Zafarnezhad, Kai Yang

Job shop scheduling problems are among the hardest known combinatorial optimization problems. In this research a shifting bottleneck heuristic algorithm is developed for stochastic job shop scheduling problems. To evaluate the performance of the developed algorithm, the heuristic is tested with randomly generated instances. The results indicate that the developed heuristics performs very well for minimizing makespan in stochastic job shop problems.

Stochastic Methods Applied to Power System Operations

Sponsor: ENRE – Energy I – Electricity

Sponsored Session

Chair: Zhi Zhou, Argonne National Laboratory, 9700 South Cass Ave. Bldg 221, Lemont, IL, 60437, United States of America, zzhou@anl.gov

1 - Two-stage Robust SCUC with Mixed-integer Recourse

Lei Wu, Clarkson University, 8 Clarkson Ave, Potsdam, United States of America, lwu@clarkson.edu

This talk presents a two-stage robust SCUC approach to adaptively and securely respond to continuous load/wind uncertainty intervals and discrete N-K contingency security criteria. Corrective capabilities of both non-quick-start and quick-start units are formulated. The proposed model is solved by the combination of modified BD method and C&CG algorithm. Case studies illustrate the effectiveness of the proposed robust SCUC approach.

2 - Flexible Operation of Batteries in Power System Scheduling with Renewable Energy

Audun Botterud, Argonne National Laboratory, 9700 S Cass Ave, Lemont, IL, United States of America, abotterud@anl.gov, Nan Li, Emil Constantinescu, Canan Uckun, John Birge, Kory Hedman

We present a two-step framework to evaluate the value of energy storage in power systems with renewable generation. First, we formulate a stochastic unit commitment model with wind power forecast uncertainty and energy storage. Second, we derive a flexible schedule for energy storage in economic dispatch with limited look-ahead horizon. A case study demonstrates the benefits of battery storage in systems with renewable resources and the effectiveness of the proposed operational strategy.

3 - Optimal Coordination of Power Generation Scheduling with an EV Support Service System

Yuping Huang, 12800 Pegasus Dr. RM 320, Orlando, FL, 32817,
United States of America, ypnghuang@gmail.com, Qipeng Zheng

As electric vehicles become more mainstream, the capacitated electric vehicles can be connected to the local electric grids and employed to reduce the variability of renewable energy by scheduling electric vehicles charging/discharging. We develop a price-based unit commitment model in support of the hourly operations of a personal transit system. A two-stage stochastic mixed integer programming model is formulated to optimize the coordinated operations of power generation and electric vehicles.

4 - Stochastic Optimization for Unit Commitment and Electricity Market Operation: A Review

Zhi Zhou, Argonne National Laboratory, 9700 South Cass Ave.
Bldg 221, Lemont, IL, 60437, United States of America,
zzhou@anl.gov

We present a comprehensive review of the application of stochastic programming to the UC problem and associated electricity market operations. The review discusses different characteristics of stochastic UC formulations. Moreover, we compare the performance of stochastic and deterministic UC models reported in the literature. Finally, the review summarizes the current status and prospects for industrial adaptation of stochastic methods in electricity market operations.

Bi- and Multi-Level Optimization in Energy Systems

Sponsor: ENRE – Energy II – Other (e.g., Policy, Natural Gas, Climate Change)

Sponsored Session

Chair: Qipeng Zheng, Assistant Professor, University of Central Florida,
12800 Pegasus Dr., P.O. Box 162993, Orlando, FL, 32817,
United States of America, Qipeng.Zheng@ucf.edu

1 - Boundedly Rational User Equilibrium Models for Electricity Consumer Market Studies in Smart Grid

Guanxiang Yun, PhD Student, University of Central Florida, 8112
Pamlico St, Orlando, FL, 32817, United States of America,
ygx8822@gmail.com, Qipeng Zheng

We proposed a boundedly rational model for the user's consumption of energy schedule with the smart grid. Under this principle, the total cost of the system can vary between a lower and upper bound. In order to decrease the upper bound we introduce perturbations for the unit price of the energy to control the user's behavior. We use multiple methods to calculate. And it is interesting to find that the result of lagrangian method have strong duality even in the non-convex feasible region.

2 - Renewable-based Generation Expansion under A Green Certificate Market

Salvador Pineda, Associate Professor, Department of
Mathematical Sciences, University of Copenhagen,
Universitetsparken 5, Copenhagen, 2100, Denmark,
spinedamorente@gmail.com, Andreas Bock

Green energy certificates represent a policy instrument to incentive renewable-based electricity generation. In this talk we present a family of generation expansion problems (GEP) to determine the optimal capacity of renewable generation including both an electricity and a certificate market. The GEP is first formulated as a complementarity problem assuming perfect competition. If producers compete a la Cournot, the GEP is reformulated as a mathematical problem with equilibrium constraints.

3 - An Integrated Economic Equilibrium Model for Electricity Markets

Lihui Bai, University of Louisville, Speed School of Engineering,
Louisville, 40292, United States of America,
lihui.bai@louisville.edu, Swapna Sri Pothabathu,
Qipeng Zheng, Andrew Liu

We consider an integrated economic equilibrium model for an electricity market system consisting of electricity consumers, power generators, grid owners, coal producers, natural gas producers and pipeline owners. In this equilibrium model, each individual player optimizes its own subsystem while market-clearance conditions are satisfied wherever players interact with each other. This model can assist decision making and planning for energy policies. Numerical results will be reported.

4 - A Bi-level Decision Dependent Stochastic Programming Model for Facility Investment Planning

Yiduo Zhan, PhD Student, University of Central Florida, 12800
Pegasus Drive, P.O. Box 162993, Orlando, FL, 32816, United
States of America, yzhan@knights.ucf.edu, Qipeng Zheng

A two-stage bilevel decision dependent stochastic model is proposed to tackle the facility investment planning problems. This model addresses both exogenous and endogenous uncertainties. The upper-level focuses on a long-term generation planning problem. The lower-level represents an electricity pricing problem that addresses the market clearing consideration with local transmission network.

johnson@villanova.edu

1 - Equilibrium Structure of Fixed-cost-reducing Alliances in New Technology Development

Hiroki Sano, Student, McCombs School of Business, The
University of Texas at Austin, 2110 Speedway Stop B6500,
Austin, TX, 78712-1277, United States of America,
hiroki.sano@phd.mcombs.utexas.edu, Edward Anderson

Motivated by alliance formation between semiconductor manufacturers in new technology development, we study how competing firms' cooperative decisions in a new market entry opportunity can be stabilized from a game-theoretic perspective. We discuss the equilibrium alliance structure when firms can be asymmetric in their individual cost efficiency and relative market power. We also address social efficiency of alliance formation assuming that an alliance incurs an additional cost of cooperation.

2 - Product Architecture and Trade-ins for Managing Sequential Innovation

Houcai Shen, Nanjing University, No 22 Hankou Road,
Nanjing, China, hcshen@nju.edu.cn, Zican Luo

Science and technology advances drive firms to continually enhance their product's performance and launch sequentially improving offerings. In this paper, we study the product design issue for the durable product when it is sequentially improved and the tradein policy is used, i.e. the integral architecture or the modular architecture?

3 - Putting the Genie to Work: Positioning Firms in the Value Chain to Profit from 3D Printing

Anshuman Tripathy, Indian Institute of Management Bangalore,
Bannerghatta Road, Bangalore, India, atripathy@iimb.ernet.in,
Harsh Ketkar, Onkar Kulkarni

We posit that 3D printing makes radical innovation at the product level more feasible. Additionally, it makes manufacturing more knowledge-intensive and customer-oriented. Firms can profit from this technology by deploying non-imitable complementary assets and developing unique capabilities. Through our detailed study of a 3D Printing firm, we provide definitive frameworks for analysing business models in 3D printing and finding a niche in which a firm may enter so as to profit from 3D printing.

4 - A Structural Equation Model of the Analytics Investment Decision

Bruce Pollack-Johnson, Villanova University, 800 Lancaster
Avenue, Villanova, PA, 19085, United States of America,
bruce.pollack-johnson@villanova.edu, Matthew Liberatore,
Suzanne Clain

The purpose of this research is to model the relationships between the progression for the development of a firm's analytics capabilities, firm size, organizational slack, and industry competitiveness as they affect the decision to invest in analytics. Structural equation modeling is used to investigate the relationships. This study draws on data obtained from firms that participated in a series of intensive workshops held by IBM.

1 - Targeted Advertising and Privacy Concerns in Online Advertising Markets

Nabita Penmetsa, Assistant Professor, University of Utah, Eccles School of Business, Salt Lake City, UT, 84112, United States of America, nabita@business.utah.edu

We analyze the nature of competition between online advertising platforms in order to understand how privacy concerns of users influence the competitive outcome. The presence of heterogeneity in the user and the advertiser populations leads to differentiation between the platforms in the level of privacy protection that they offer to users and in the targeting capabilities that they offer to advertisers. This differentiation leads to segmentation of both the user and the advertiser markets.

2 - Asymmetric Trade Liberalization, Comparative Advantage and Heterogeneous Firms

Wenxing Nie, Tongji University, 1239 Siping Road, Shanghai, P.R. China, Shanghai, China, nienwenxing@tongji.edu.cn, Yingzhe Gu

Asymmetric trade liberalization occurs when a country suddenly slashes or soars its trade barriers. When this happens, the country which takes initiative in reducing trade barriers would suffer from net job destructions but enjoy better welfare and higher factor rewards. The country which remains the same trade barriers would benefit from net job creations but have lower welfare and factor rewards. The comparative advantage industries have relatively higher factor rewards and job destructions.

3 - Consumer Unions: Blessing or Curse?

Cigdem Gizem Korpeoglu, PhD Candidate, Carnegie Mellon University Tepper School of Business, 5700 Bunkerhill Street Apt 804, Pittsburgh, PA, 15206, United States of America, cpala@andrew.cmu.edu

We study whether coalitions of consumers are beneficial to consumers when producers have market power. We refer to coalitions of consumers as consumer unions and the number of consumers in a union as union size. We establish that consumer welfare decreases with union size when the union size is above a threshold. We also prove that consumer unions discourage producers' investments, which may have repercussions for long-term consumer welfare.

Operations/Economics Interface II

Contributed Session

Chair: Yunbin Shen, PhD Student, Tongji University, 1239th Siping Road, Shanghai, China, sybfamily@163.com

1 - Judgment Error in Lottery Play: When the Hot-hand Meets the Gambler's Fallacy

Qingxia Kong, Universidad Adolfo Ibáñez, Santiago, Santiago, Chile, q.kong@uai.cl

We demonstrate that lottery markets can exhibit the "hot-hand" phenomenon, where past winning numbers tend to have greater share of the betting proportion in future draws, even though past and the future events are independent. We use two sets of lottery game data to show that both the gambler's fallacy and hot-hand fallacy can prevail under different gaming environments, contingent on the design (e.g., prize structures) of the lottery games.

2 - Oligopoly Pricing with Reference-price Effects

Paola Labrecciosa, Monash University, Wellington Road, Clayton Campus, Melbourne, Australia, paola.labrecciosa@monash.edu, Luca Colombo

We propose an infinite-horizon continuous-time model of oligopolistic competition with differentiated products and reference-price effects. We derive open-loop and closed-loop pricing strategies. We show that: (i) reference-price effects are pro-competitive; (ii) the equilibrium price can be either increasing or decreasing over time; (iii) when the speed of adjustment of the reference price becomes instantaneous, the stationary equilibrium price converges to the marginal cost.

3 - The Effect of Industry-Specific Exchange Rate Movements on the Manufacturing Productivity in China

Yunbin Shen, PhD Student, Tongji University, 1239th Siping Road, Shanghai, China, sybfamily@163.com, Yingzhe Gu, Yulin Fu

The industry-specific real effective exchange rate (IREER) is more useful than the aggregate exchange rate on analyzing the effect of exchange rate movements on the total factor productivity (TFP). We use the product-level China customs data to calculate the IREER of 30 industries. The results of quantile regression shows that IREER has a significant impact on the TFP and many industries exhibit a downward sloping quantile regression curve, which means the selection effect and scale effect exist.

Resilience in Power Systems

Cluster: Energy Systems: Design, Operation, Reliability and Maintenance

Invited Session

Chair: Feng Qiu, Argonne National Laboratory, 9700 S. Cass Ave., Argonne, IL, 60439, United States of America, fqiu@anl.gov

1 - Enhancing Resilience of Power Systems with Renewables Integration

Yunhe Hou, Assistant Professor, The University of Hong Kong, Room 522, CYC Building, Hong Kong, Hong Kong - PRC, yhhou@eee.hku.hk, Zhijun Qin

Resilience is well identified as one of the key functionalities of the future energy delivery systems. The overall functionality requirements for a resilient power grid will be discussed first. The systematic solution to improve the self-healing capability, the key function of resilience, will be discussed in detail. Especially, the method to involve the contribution of renewables during self-healing process will be discussed.

2 - Electric Distribution Resilience – Asset vs. System Resilience to Extreme Weather Events

Julia Phillips, Argonne National Laboratory, 9700 S Cass Ave, Argonne, IL, United States of America, phillipsj@anl.gov

With the increase in awareness and concern surrounding extreme weather events due to climate change, resilience of the Nation's critical lifeline infrastructure is paramount. Capturing resilience of a single asset can be complicated, while resilience for the system increases complexity dramatically. We focus on capturing system resilience of electric distribution infrastructure to extreme weather events, to include intangible resilience activities, such as planning, training and exercising.

3 - Assessing and Improving the Operational Resilience of Interdependent Energy Infrastructure Systems

David Alderson, Associate Professor, Naval Postgraduate School, 1411 Cunningham Rd, Monterey, CA, 93943, United States of America, dlalders@nps.edu, W. Matthew Carlyle, Michael Dickenson

We formulate and solve a model of interdependent fuel and electric power infrastructure systems that includes the fuel required to run electric power generators and the power required to pump fuel. Our model determines a set of fuel and power flows that yield minimum operating cost of both systems. We contrast solutions for individual system operation with a global solution for the combined system, and consider both worst-case disruptions and best possible mitigations to the combined system.

4 - Accident Risk Assessment in Fossil Energy Chains using a Bayesian Model Averaging Approach

Matteo Spada, Senior Researcher, Paul Scherrer Institut, OHSA/D19, Villigen PSI, AG, 5232, Switzerland, matteo.spada@psi.ch, Peter Burgherr

This study analyzed the risk, and its uncertainty, for fatal accidents within full fossil energy chains, collected in the Energy-related Severe Accident Database (ENSAD), through the application of a Bayesian Model Averaging. The proposed approach provides a unified framework that comprehensively covers accident risks in energy chains, and allows calculating specific risk indicators, including their uncertainties, to be used in a holistic evaluation of energy technologies.

1 - A Change-of-Variables Approach to Simulating Conditional Expectations

Guiyun Feng, University of Minnesota, 1006 27th Avenue SE,, Minneapolis, MN, 55414, United States of America, fengx421@umn.edu, Guangwu Liu

We introduce a change-of-variables approach to simulating conditional expectations. A key of the proposed approach is the construction of a one-to-one mapping such that a conditional expectation can be represented as an ordinary expectation by using change-of-variables technique. This new representation leads to an efficient estimator of the conditional expectation. Application to Greek estimation for financial options will be discussed.

2 - Optimal Procurement, Pricing, and Hedging under Cost and Demand Uncertainty

Max Friedrich Schoene, WHU - Otto Beisheim School of Management, Burgplatz 2, Vallendar, 56179, Germany, max.schoene@whu.edu, Stefan Spinler, John Birge

Commodity price volatility is an important factor to consider in corporate risk management. In this article, we study the joint pricing, inventory control, and hedging problem of a risk-averse industrial firm, facing uncertain commodity prices and stochastic demand. We solve the firm's decision problem under realistic commodity price dynamics using regression-based Monte Carlo methods. Our findings show that optimal pricing, procurement, and hedging decisions are interconnected.

3 - Lead-Time Reduction, Capital Structure, and Optimal Investment Policies

Isik Bicer, Post Doctoral Researcher, Ecole Polytechnique Fédérale de Lausanne, Lausanne, Vaud, 1015, Switzerland, isik.bicer@epfl.ch, Ralf W. Seifert

We consider a manufacturing firm that places a production order in the face of demand uncertainty. It also has an option to raise capital and invest in reducing lead times. We analyze the optimal investment policy and derive closed-form expressions that quantify the impact of lead time on the firm value, the optimal leverage ratio, and the cost of capital. We show that firms can significantly increase their profits by using external funds and capitalizing on the value of lead-time reduction.

4 - Inventory, Random Capacity, and Firm Valuation by the Financial Market

Bo Li, Doctoral Candidate, Texas A&M University, 4217 TAMU, College Station, TX, 77843, United States of America, bli@mays.tamu.edu, Antonio Arreola-Risa

Companies want to maximize their value on the financial market; however, their inventory decisions may dis-serve this goal. We consider a firm that purchases from a supplier with random available capacity, faces a newsvendor-type decision and aims to maximize its own value. Employing the Capital Asset Pricing Model, we explore how randomness in both customer demand and supplier capacity impacts the optimal inventory decision and firm value.

1 - Measuring Discounting Without Measuring Utility

Han Bleichrodt, Erasmus University, P.O. Box 1738, Rotterdam, 3000DR, Netherlands, bleichrodt@ese.eur.nl, Peter P. Wakker, Arthur E. Attema, Zhenxing Huang, Yu Gao

We introduce a new method for measuring the temporal discounting of money. Unlike preceding methods, our method requires neither knowledge nor measurement of utility. It is easier to implement and clearer to subjects, and requires fewer measurements than preceding methods did.

2 - Do We Discount Time As We Discount Money?

Cédric Gutierrez, HEC Paris, 1 Rue de la Libération, Jouy en Josas, 78351, France, cedric.gutierrez-moreno@hec.edu, Mohammed Abdellaoui, Emmanuel Kemel

While intertemporal choice of money has been studied extensively, very few studies have analyzed the way people discount time, despite the fact that it is a scarce and valuable resource. We investigate this issue in a laboratory experiment where consequences are measured in units of money or time. We report significant differences between discounting of time and of money. For instance, there is a higher heterogeneity in discounting behaviors and a stronger present-bias for time than for money.

3 - Multiperson Utility Without The Appearance of Dictatorship

Manel Baucells, Darden School of Business, P.O. Box 6550, Charlottesville, VA, 22906-6500, United States of America, BaucellsM@darden.virginia.edu, Lloyd Shapley, Dov Samet

We take the multiperson utility setup (coalitions are endowed with incomplete VNM preferences satisfying the extended Pareto rule) and assume a mild condition on individual preferences (avoiding the appearance of dictatorship). We prove that whenever certain smaller but overlapping coalitions have complete preferences, then the group necessarily has complete preferences. The smaller coalitions are not restricted to be pairs, thus generalizing previous results.

Rail Transportation

Contributed Session

Chair: Bahar Zarin, PhD Candidate, University of Maryland, College Park, MD, United States of America, bzarin@umd.edu

1 - Integration of Passenger and Freight Rail Scheduling with Minimal Tardiness

Liang Liu, University of Southern California, Los Angeles, CA, United States of America, liangliu@usc.edu, Maged Dessouky

We present a methodology to integrate passenger and freight train scheduling to reduce train tardiness when they travel on the same trackage. The research highlights the control policy of resource allocation in a complex railway network. We develop a dual objective optimization model which minimizes the freight train flow time and passenger train tardiness. Simulation of the railway system is conducted given the control policy from the optimization model solution.

2 - A Multi-Period Multi-Class High Speed Rail Passenger Revenue Management Problem

Ying Qin, Doctoral Student, Tongji University, No. 1239, Siping Road, Shanghai, 200092, China, qinying915@139.com, Zhe Liang

We study a multi-period multi-class rail passenger revenue management problem in which the unsatisfied demand can be recaptured by the alternative product. To formulate the problem, we first propose a basic model (BM), but it suffers from the intractable computation complexity. Therefore, we propose a two-stage heuristic by solving a restricted BM based on the solutions of a leg-based decomposition model and the heuristic provides nearer optimal solutions than the BM in much shorter time.

3 - Capacity Allocation in Vertically Integrated Railway Systems: A Sequential Bargaining Game Approach

Bo Zou, University of Illinois at Chicago, 2095 Engineering Research Facility, 842 W. Taylor Street (M/C 246), Chicago, IL, 60607-7023, United States of America, bzou@uic.edu, Ahmadrza Talebian

We propose a game-theoretic approach to model the bargaining process for rail line capacity allocation. A public passenger rail agency negotiates on schedule and price with a host freight railroad to obtain train paths. Each side alternately offers schedule/price and decides whether to accept or reject the other side's offer. Both perfect and incomplete information cases are investigated analytically with numerical analysis offering further insights.

4 - Investigating the Trade-off Between Level of Service and Capacity Parameters in Train Scheduling

Hamed Pouryousof, Michigan Technical University, 819 Dow, CEE Dept., 1400 Townsend DR, Houghton, MI, 49931, United States of America, hpouryou@mtu.edu, Pasi Lautala

Maximizing the capacity utilization while maintaining adequate level of service (LOS) are important for any railroad. This research investigates the use of an analytic model called "hybrid optimization of train schedules" (HOTS) for train rescheduling and for evaluating its impact on train stop patterns and maximum and total dwell times. One research finding revealed that changes in max dwell time (especially within the spectrum of 6-15 min) have high impact on other LOS and capacity parameters.

5 - Movement Planner Algorithm for Dispatching Trains

Bahar Zarin, PhD Candidate, University of Maryland, College Park, MD, United States of America, bzarin@umd.edu, Seshadri Srinivasa Raghavan, Golnush Amoli, Arezoo Samimi, Ali Asadabadi

Train Dispatching Problem (TDP) is an important and crucial optimization problem in the railway industry. The objective of our study is to develop a new optimization formulation to solve the problem more efficiently with less computational time. A Genetic Algorithm (GA) based heuristic is also developed to solve the formulated problem and the performance of the algorithm is evaluated using a TOY problem data set.

1 - Dynamic Channel Control in Revenue Management

Weidi Wang, Tongji University, No.1239 Siping Road Yangpu District, Shanghai, 200092, China, wangweidi.dunelm@gmail.com

In the study of revenue management, channel effect is always ignored in inventory control. However in the reality, selling the same flight ticket in different channels will make different profits for airline company. In our study, we develop a DP model which integrated inventory control and channel control in single leg.

2 - Robust Solution Method for Single-leg Choice-based Revenue Management

Dirk Sierag, CWI, Science Park 123 1098 XG, Amsterdam, Netherlands, dirk@cwi.nl

This talk provides a robust solution method for revenue management models with general choice-models. The robust solution method optimises the worst-case scenario, providing a trade-off between risk and average reward. The uncertain parameters of a choice model (e.g., from estimation errors) are modelled using f-divergence uncertainty sets. Numerical results for a single-leg problem show that the robust solution method outperforms the nominal solution by up to 2% when using estimated parameters.

Topics in Transport II

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Mohammad Ghane-Ezabadi, Oregon State University, Corvallis, WA, United States of America, United States of America, ghanezm@onid.oregonstate.edu

1 - A 3D Container Loading Problem for Very Large Tires

John Ye, JDA, John.Ye@jda.com, Phillippe Grangier, Louis-Martin Rousseau, Michel Gendreau, Fabian Le Huede

Tire manufacturers are currently spending a lot of time and effort on manually planning the load of delivery trucks. The problem we are dealing with is a 3D container loading problem for agricultural tires. Such tires are much bigger and heavier than tires for passenger cars. As such, there exist many rules to ensure that the loading will remain stable. We have developed a approach that relies on a custom algorithm to locate those tires.

2 - The Load Planning Problem for Double Stacked Intermodal Trains

Nitish Umang, GE Global Research, Schenectady, NY, United States of America, nitishumang86@gmail.com, Emma Frejinger, Teodor Gabriel Crainic

In this research, we study the load planning problem considering several new constraints including dimensional restrictions, technical constraints, weight capacities and center of gravity restrictions for double stacked platforms. We propose an ILP formulation with the objective to minimize the number of cars required to load a given set of containers. The results based on a set of artificial instances inspired from real data suggest that the proposed methodology can lead to significant savings in the operating cost of loading trains.

3 - Integrated Intermodal Transportation Network Design using a Decomposition Approach

Mohammad Ghane-Ezabadi, Oregon State University, Corvallis, WA, United States of America, United States of America, ghanezm@onid.oregonstate.edu, Hector A. Vergara

The expected growth of intermodal transportation demand increases the importance of strategically designing intermodal logistics networks. In this research, load route and transportation mode selection problems are integrated with the hub location problem in a mathematical formulation. A composite variable formulation was developed in which the complete route for a load from origin to destination was considered as a single composite variable. A decomposition approach was applied to find solution for the proposed mathematical formulation. Computational experiments were completed to evaluate the performance of the proposed mathematical model and solution approach.

4 - Distribution, Routing and Fleet Design Strategy for an E-commerce Provider in Santiago Chile

Cristian Cortés, Universidad de Chile, Associate Professor, Department of Civil, Chile, ccortes@ing.uchile.cl, Jaime Miranda, Pablo Rey, Pablo Saintard

A simulation approach is proposed to analyze and quantify the cost of different configurations and operational schemes of a e-commerce provider in the city of Santiago, Chile. Strategies involve delivery of products within promised time windows and a potential implementation of a new depot location. A routing strategy is also proposed to simulate new strategies of unobserved distribution policies.

1 - A Dynamic Load-dependent Vehicle Routing Schedule for Minimizing Risk in Medical Waste Collection

Masoumeh Taslimi, University at Buffalo (SUNY), 342 Bell Hall, Buffalo, NY, United States of America, masoumeh@buffalo.edu, Rajan Batta, Changhyun Kwon

Medical waste service companies aim to create safe, responsible, and customized programs to collect medical waste from medical centers. Thus, the companies and customers agree on a schedule for collection services. In order to find a mutually less risky and more beneficial schedule, we propose a dynamic load-dependent capacitated vehicle routing problem that captures minimization of both occupational and transportation risks. A column generation heuristic approach is developed to handle the computational difficulties in solving real world problems.

2 - A Probabilistic Model for Vehicle Scheduling based on Stochastic Trip Times

Yindong Shen, Professor, School of Automation, Huazhong University of Science and Technology, 1037 Luoyu Road, Wuhan, 430074, China, yindong@hust.edu.cn

We study the vehicle scheduling problem in public transport based on stochastic trip times instead of fixed ones. A novel probabilistic model and its enhanced model featuring delay propagation are proposed, while a solution method is developed. Experiments show the models can considerably enhance the on-time performance of resulting schedules.

3 - Same-Day Delivery for Online Purchases

Stacy Voccia, FedEx Express, 3610 Hacks Cross Rd, Bldg. H, 2nd Floor, Memphis, United States of America, stacy.voccia@fedex.com, Barrett Thomas, Ann Campbell

Same-day delivery for online purchases is a recent trend in online retail. We introduce a dynamic pick-up and delivery problem with time windows that incorporates key features associated with same-day delivery logistics. In order to make better-informed decisions, our solution approach incorporates information about future orders into routing decisions. We present results that demonstrate the value of the approach.

4 - Decomposition Method for Revenue Management Problem of Multi-period Multi-class High Speed Rail

Hasan Manzour, Industrial & Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98195-2650, United States of America, hmanzour@uw.edu, Zhe Liang, Ying Qin, W. Art Chaovalitwongse

We study a multi-period multi-class rail passenger revenue management (MPMC-RPRM) problem in which the unsatisfied demand from a previous period can be recaptured by the later periods. The original MIP model is hard to solve. Therefore, we present a Benders decomposition solution approach incorporating some heuristics. In addition, Benders cuts are strengthened to facilitate faster convergence and improved computational efficiency. We perform the analysis on a real case study.

Intelligent Traffic Signal Control

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: K. Larry Head, University of Arizona, Tucson, AZ, United States of America, larry@sie.arizona.edu

1 - Smart Signal Systems for Urban Road Networks

Stephen F. Smith, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, sfs@cs.cmu.edu, Gregory J. Barlow, Zachary B. Rubinstein, Isaac Isukapati, Xiao-Feng Xie

Traffic optimization in urban environments presents special challenges, due to issues of scale, uncertainty, and competing, time-varying dominant flows. We formulate and analyze a decentralized approach to signal control in this setting, where each intersection optimizes locally sensed traffic in real-time and exchanges plans with neighbors to achieve coordinated behavior.

2 - Intelligent Traffic Control in a Connected Vehicle Environment

Yiheng Feng, University of Arizona, Tucson, AZ, yihengfeng@email.arizona.edu, Mehdi Zamanipour, Shayan Khoshmashgham, K. Larry Head

An intelligent traffic control framework in a connected vehicle environment is proposed. A phase allocation algorithm optimizes the signal timing based on different objectives considering both mobility (delay) and safety (dilemma zone protection). Additional constraints from signal priority are integrated into the same framework.

3 - Unified Section Level Priority and Intelligent Traffic Signal Control

Byunho Beak, University of Arizona, Tucson, AZ, United States of America, beak@email.arizona.edu, Mehdi Zamanipour, K. Larry Head, Yiheng Feng, Shayan Khoshmashgham

An integrated priority control and adaptive signal control model is developed that can intelligently consider connected vehicles and priority eligible vehicles at both intersection level and section level. The model coordinates optimal priority strategies between two or more consecutive intersections and also guarantees connected vehicles progression within the intersections.

4 - Solving Simultaneous Route Guidance and Traffic Signal Optimization Problem using Space-time-phase Hypernetwork

Pengfei Li, Xuesong Zhou, Pitu Mirchandani

This talk addresses the simultaneous route guidance and traffic signal optimization problem. A space-time-phase hypernetwork is used to explicitly represent the traffic signal control mechanism and time-dependent paths. We develop a Lagrangian-relaxation-based problem decomposition framework, and the subproblems are solved using finite-horizon dynamic programming algorithms.

1 - A Fast Algorithm for Solving the Static Rebalancing Problem in Bike Sharing Systems

Aritra Pal, Doctoral Student, University of South Florida, Tampa, Tampa, FL, 33612, United States of America, aritra1@mail.usf.edu, Yu Zhang

We present a hybrid nested large neighborhood search with variable neighborhood descent algorithm for solving the Static Rebalancing Problem in

Bike Sharing Systems. Computational experiments on a set of benchmark instances previously used in the literature, demonstrate that the presented algorithm is both more effective and more efficient than a tabu search algorithm and highly competitive with exact algorithms previously reported in the literature.

2 - Trip Generation Models for Medellin Metropolitan Area

Ivan Sarmiento, Associate Professor, Universidad Nacional de Colombia at Medellin, Calle 65 No.78 - 28, M1-201, Medellin, Colombia, irsarmie@unal.edu.co, Ivan Sanchez-Diaz, Jose Holguin-Veras, Carlos A. Gonzalez-Calderon

A freight survey with a sample of 2,984 commercial establishments in Medellin, Colombia was conducted in 2012 to characterize the cargo movements and patterns in the city. Based on the survey, a series of trip generation models are estimated. A complete analysis of the variables and their influence on trip generation are considered along with the characteristics of the freight movements in the area

3 - Continuum Approximation Modeling of Freight Distribution Systems

Mahour Rahimi, Assistant Professor, University of Massachusetts, Amherst, Department of Civil & Environmental Eng., 130 Natural Resources Road, Amherst, MA, 01003, United States of America, gonzales@umass.edu, Eric Gonzales

This study presents a continuous approximation model for truck deliveries which relate the operating parameters to the characteristics of the service and network, service area, and demand rate. The objective of this study is to minimize the total cost of distributing multicommodity freight from an origin to randomly distributed points, with or without transshipments, and within a limited amount of time. Two different distribution methods are considered: peddling, and peddling with transshipment.

4 - Tabu Search Heuristic for the Heterogeneous Vehicle Routing Problem on a Multigraph

Ozgun C. Demirag, Penn State Erie, Black School of Business, Erie, PA, United States of America, ozcl@psu.edu, Janny Leung, David S.w. Lai

We study a time-constrained heterogeneous vehicle routing problem on a multigraph. We formulate the problem as a mixed-integer linear programming model and develop a tabu search heuristic that efficiently addresses computational challenges due to parallel arcs. Numerical experiments show that the heuristic is highly effective.

1 - Bus Bunching Modeling for Mixed Traffic in Delhi

Hemant Suman, Research Scholar, IIT Delhi, Hauz Khas, New Delhi, 110016, India, hemantmn@gmail.com, Nomesh Bolia

In Delhi the buses often arrive at bus-stops in clusters that causes long waiting time as well as more variations in headways. Due to clustering of buses, the average waiting time for public bus users in Delhi is often more than 30 minutes. Due to this high and uncertain waiting time, bus commuters are face issues with punctuality. This work addresses the problem of lack of punctuality associated with the existing bus system by reduced bus bunching in the mixed traffic conditions of Delhi. The approach, if used, can provide significant benefits in the mean as well as variability of travel time.

2 - Dynamic Transit Service Network Design under Capacitated User Equilibrium Conditions

Jiangtao Liu, Arizona State University, Ira A. Fulton Schools of Engineering, Tempe, AZ, United States of America, jliu215@asu.edu, Xuesong Zhou

This talk will discuss how to address emerging modeling issues in transit service network design such as time-dependent capacitated user equilibrium, system-wide impact of dynamic service line scheduling under equilibrium conditions. We will develop a single level model with a Lagrangian relaxation based approximation method to rapidly find close-to-optimal solution subject to budgetary, UE and capacity constraints.

3 - Use of Analytics to Investigate Crash Related Risk Factors

Dursun Delen, Oklahoma State University,
408 Business Building, Stillwater, OK, United States of America,
Dursun.Delen@okstate.edu

Investigation of the risk factors that contribute to the injury severity in motor vehicle accidents has proved to be an interesting and challenging problem. In this study, employing a data-driven predictive analytics methodology along with information fusion-based sensitivity analyses, we identified the relative importance of the crash related risk factors as they relate to varying levels of injury severity.

4 - Real-time Schedule Recovery in Liner Shipping with Regular Uncertainties and Disruption Event

Chen Li, Dr. Hong Kong University of Science and Technology,
Dept of IELM, Clear Water Bay, Hong Kong, Hong Kong - PRC,
cliad@connect.ust.hk, Dongping Song, Xiangtong Qi

We study real-time schedule recovery policies for liner shipping under regular uncertainties and the emerging disruption. One important contribution is to distinguish two types of uncertainties, and propose different strategies to handle them. For regular uncertainties, we address the problem as a stochastic control problem, and develop the structural results; then we show how an emerging disruption changes the control policies. Numerical studies demonstrate the advantages of control policies.

5 - Cyber Physical Allocation to Make Efficient Bike Sharing Programs

Subasish Das, Research Associate, University of Louisiana at
Lafayette, P.O. Box- 44886, Lafayette, LA, 70504,
United States of America, subasishsn@gmail.com

Real-time allocation helps making the bike sharing programs efficient and productive. Cyber physical network of any bike sharing program will provide real-time status of the bike kiosks and user location. The bike sharing program can turn these information into real-time data product app. Users can use the app for the real-time info and make plan accordingly. This paper develops simulation tool to verify the research findings.

1 - Partial Aliasing Relations in Mixed Two- and Three-Level Designs

Arman Sabbaghi, Assistant Professor Of Statistics, Purdue
University, Department of Statistics, 150 N. University Street,
West Lafayette, IN, 47907, United States of America,
sabbaghi@purdue.edu

Indicator functions are constructed under the orthogonal polynomial parameterization of contrasts, and applied to the study of partial aliasing, for mixed two- and three-level designs. The algebra behind calculation of indicator function coefficients is proven to be a product of individual algebraic operations for the different types of factors. Conditions for estimable interactions in mixed-level designs are established by means of this equivalence.

2 - Local Calibration of Computer Models

Arash Pourhabib, Assistant Professor, Oklahoma State University,
322 Engineering North, Stillwater, OK, 74078, United States of
America, arash.pourhabib@okstate.edu, Rui Tuo, Jianhua Huang,
Yu Ding

We propose a framework for the local calibration of parameters when a computer model is used to approximate a physical process. The proposed framework, non-parametric local calibration, acknowledges the functional dependency of parameters on control variables. We present the model in terms of a regularized optimization problem and solve it using a representer's theorem. We also prove the consistency of the estimator obtained via this approach.

3 - Maximum Projection Designs for Computer Experiments

Evren Gul, PhD Student, Georgia Institute of Technology,
251 10th Street NW, THB 504, Atlanta, GA, 30318,
United States of America, egul3@gatech.edu

Space-filling properties are important in computer experiments. Maximin and minimax distance designs consider only space-filling in the full-dimensional space; this can result in poor projections onto lower-dimensional spaces, which is undesirable when only a few factors are active. Latin hypercubes can improve one-dimensional projections but cannot guarantee good space-filling in larger subspaces. We propose maximum projection designs that maximize space-filling properties in all subspaces.

4 - Smoothing The Bumps: Sigmoidal Versus Localized Basis Functions in Gaussian Process Modeling

Daniel Apley, Professor, Northwestern University,
2145 Sheridan Road, Evanston, IL, 60208,
United States of America, apley@northwestern.edu

In Gaussian process (GP) modeling of computer simulation data, common covariance models have localized basis functions, which can result in a bumpy fitted response surface. We propose a new class of covariance models that can be viewed as incorporating an integrator into any stationary GP (akin to the integrator in an ARIMA model), thereby resulting in sigmoidally-shaped basis functions. We contrast local versus sigmoidal basis functions and argue the advantages of the latter in GP modeling.

1 - Algorithms for Optimal Allocation of Resources in Reliability Growth Testing

Kelly Sullivan, Assistant Professor, University of Arkansas,
Fayetteville, AR, 72701, ksullivan@uark.edu,
Mohammadhossein Heydari

Reliability growth testing seeks to identify and remove failure modes in order to improve the reliability of a product entering the market. We develop and test a suite of exact and heuristic algorithms for allocating limited testing resources within a series-parallel system in order to maximize the resulting system's reliability.

2 - Application of Markov Decision Processes for Optimization of Reliability Growth

Tom Talafuse, Graduate Student, University of Arkansas,
Fayetteville, AR, 72701, United States of America,
tom.talafuse@gmail.com, Shengfan Zhang, Edward Pohl

Reliability growth occurs when failure modes are identified and corrective actions taken to improve system reliability. Planning methods allow construction of idealized growth curves to estimate the time and resources needed to reach a desired level of reliability. Since developmental testing results often deviate from this idealized curve, we propose a Markov Decision Processes approach to optimally allocate resources to improvement efforts to minimize deviation from idealized growth.

1 - Optimal Condition-based Imperfect Maintenance Policy for Systems Subject to Multiple Competing Risks

Sara Ghorbani, American Express, 33 Hudson Street, Jersey City,
NJ, 07302, United States of America, saraghorbani21@gmail.com,
Elsayed A. Elsayed, Hoang Pham

We develop a generalized threshold-type condition-based maintenance (CBM) policy for a system subject to multiple competing risks including degradation process and sudden failure. This model extends the existing research by considering imperfect maintenance. Furthermore, a special case of a system subject to two independent competing risks, degradation and sudden failure is studied and the numerical optimization analyses are presented.

2 - Simulation-based Reliability Evaluation of Multi-stage Multi-state Manufacturing Systems

Seyed Niknam, Western New England University,
1215 Wilbraham, Springfield, MA, 01119, United States of
America, seyed.niknam@wne.edu, Rogerio Peruchi

This research investigates the reliability analysis of a multi-stage multi-state manufacturing system. The proposed model provides a sensible measure to assess the system situation against the best-case scenario of a production line. The proposed model incorporates not only failures that stop production but also deals with partial failures where the system continues to operate at reduced performance rates. A simulation model is developed to define the possible states in the system.

3 - Optimal Maintenance Policy with Repair Time under Warranty

Minjae Park, Hongik University, 72-1 Sangsu-Dong,
Mapo-Gu, Business School, Seoul, 121-791, Korea, Republic of,
mjpark@hongik.ac.kr

This study formulates a warranty cost model for the repairable products when an age replacement policy is adopted in cooperation with the renewing minimal repair-replacement warranty and studies the optimal choice of the preventive replacement age. Under the renewing minimal repair-replacement warranty, either minimal repair or replacement is performed depending on the length of repair time when the product failures occur during the warranty period.

1 - Mathematical Analysis for Tomato Spotted Wilt Virus Transmission

Yan Kuang, Kansas State University, Manhattan, KS, 66502, United States of America, ykuang@ksu.edu, Songinan Zhao, David Ben-ariel, Chih-hang Wu

Tomato spotted wilt virus (TSWV) is a plant infecting virus and impacts many food and ornamental crops in both quantity and quality aspects, resulting in crop disease epidemics of worldwide economic significance. TSWV is transmitted particularly by thrips, the most efficient of which is West Flower Thrip (WFT). This research is aimed to use mathematical models to study the disease transmission effects. Through the preliminary results, we discuss the impacts of potential mitigation strategies.

2 - A Farmers Markets Location Allocation Framework for Enhanced Public Health

Hoyoung Na, University of Arizona, 8131 N Midnight Way, Tucson, AZ, 85741, United States of America, nh4201@email.arizona.edu, Sojung Kim, Young-jun Son, Langelier Brent

The goal of this study is to propose a new location allocation framework of farmers markets (FMs) to enhance public health, by introducing FMs into food deserts which have a limited access to healthy food resources. The proposed framework adopts the theory of planned behavior (TPB) under an agent-based simulation (ABS) platform for food choice behavior modeling of individuals. The framework is demonstrated via AnyLogic/ABS software with the 2007 Food Attitudes and Behaviors Survey dataset.

3 - A Network Size-Reduction Methodology for Stochastic Prediction of Wildfire Propagation

Mohammad Hajian, PhD, Northeastern University, Dept. of Mechanical and Industrial Eng., 360 Huntington Avenue, Boston, MA, 02115, United States of America, mhajian@coe.neu.edu, Peter Kubat, Emanuel Melachrinoudis

Each year, thousands of wildfire events throughout the US threaten life and property. In a fire event, it is important to make the most effective decision under time pressure. This requires a fast and accurate prediction of the fire propagation, taking into account uncertain factors such as wind. In this research, we model the wildfire propagation as stochastic shortest path and present a network reduction methodology to effectively predict the wildfire traversal time.

4 - An Enhanced Global Optimization Method for a PV-Diesel-Battery Hybrid Power System

Siew Fang Woon, Universiti Utara Malaysia, 06010 Sintok, Kedah, Malaysia, woonsiewfang@yahoo.com, Sie Long Kek, Muhammad Nazri Abu Bakar

Non-linear constrained discrete-valued optimal control problems are known to have multiple local optima that require global optimization methods to find the best solution. We developed a global optimization method by embedding an improved discrete filled function technique into a computational optimal control algorithm. This proposed method improves the computational efficiency in determining a near global optimal solution for the operating cost of a PV-diesel-battery hybrid power system.

5 - Multi-agent Learning Approach for Online Calibration of Real-time Traffic Network Management System

Hossein Hashemi, Graduate Research Assistant, Southern Methodist University, 3101 Dyer Street, Dallas, TX, 75205, United States of America, shashemi@smu.edu, Khaled Abdelghany

The paper introduces a novel formulation and a solution methodology for the problem of online calibration of simulation-based Dynamic Traffic Assignment (DTA) models. The methodology calibrates the model considering multiple inconsistency sources including the time-dependent demand pattern and the traffic flow propagation models. It adopts a reinforcement learning approach to determine an efficient activation schedule for the different model adjustment modules.

1 - The Nexus between GDP, Population Growth/fuel Prices in the United States

Fesseha Gebremikael, PhD Student, UGPTI, P.Box 6050, Fargo, ND, 58102, United States of America, fesseha.gebremikael@ndsu.edu, Joseph Zmerekovsky, Karen Froelich, En Sue Lee

The linkage between GDP and VMT, population growth, and fuel prices, has been strong for quite some time, irrespective of the ups and downs of the national economics of the developed societies, particularly the United States. Linear regression model will be used to test empirically the nexus between VMT and the related variables. Data will be collected from the World Bank, BEA, EIA and other relevant sources /compiled to gauge the change over time.

2 - An Integrated Model of Location and Safety Stock Placement

Liwen Cui, PhD Candidate, Tsinghua University, Room 615, Shunde Building, Beijing, 100084, China, cui-liwen0512@126.com, Zuo-jun Max Shen

We study the integrated location and safety stock placement problem, and design an efficient dynamic programming algorithm to solve the problem. From analytical analysis and numerical studies on real supply chain data, we obtain some interesting managerial insights.

3 - Performance Outcomes and Success Factors of Healthcare Industrial Vending Solutions

John Kros, Professor Of Marketing And Supply Chain Management, East Carolina University, 3205 Harold Bate Building, Greenville, NC, 28590, United States of America, krosj@ecu.edu

Healthcare firms face considerable pressure to efficiently and effectively manage their inventory. Industrial vending machine solutions, a specific form of VMI, are one solution. IVM includes automated drug distribution systems and medical supply dispensing systems (e.g., Pyxis). Two-hundred nine healthcare supply chain managers were used to test the theoretical model. Results show complex interactions of the enablers with one another and in their relationship with perceived success.

4 - Ordering Problems with Demand Forecast Updating and Supply Constraints

Meimei Zheng, Nanyang Technological University, 50 Nanyang Avenue, Singapore, 639798, Singapore, meimeizheng2009@gmail.com, Kan Wu

This paper investigates an extension of the newsvendor model with demand forecast updating under supply constraints. The retailer prefers to postpone the order for improved demand accuracy. However, the postponement is associated with a price to the supplier and thus is limited. In this situation, we investigate the optimal ordering decisions based on demand forecast updating, increased purchasing cost, and restrictions on the ordering time and quantity.

5 - Product Complexity and Supply Chain Design

Robert Inman, General Motors, MC 480-106-RE1, 3 0500 Mound Road, Warren, MI, 48090, United States of America, robert.inman@gm.com, Dennis Blumenfeld

Assembling a product requires each and every part. Compared to assemblers of simple products, manufacturers of complex products are much more sensitive to supply chain delays. This heightened vulnerability to supply chain disruptions should lead complex product assemblers to design less risky supply chains. This paper models how product complexity drives the likelihood of production disruption and provides insights for supply chain design.

New Product Development

Contributed Session

Chair: Semco Jahanbin, University of Bath, School of Management, Claverton Down, Bath, BA27AY, United Kingdom, Semco.jahanbin@gmail.com

1 - Continuous Development of Multiple Game Series in a Video Game Company

Hossein Jahandideh, PhD Student, UCLA Anderson School of Management, 3759 Vinton Ave APT 2, Los Angeles, CA, 90034, United States of America, hossein.jahandideh.1@anderson.ucla.edu

We often see that video game companies produce a number of game series and focus mainly on developing sequels in the existing series rather than introducing new series. We propose a restless bandit dynamic programming model to manage the development of sequels in a video game company with limited resources.

2 - Improving the Front End Innovation – Systems Engineering Approach

Hesham Maghrabie, Graduate Student, Concordia University, 30 rue Berlioz, Verdun, H3E1L3, Canada, hesham.maghrabie@gmail.com, Andrea Schiffauerova, Yvan Beauregard

The aim of this research is to achieve a sustainable innovation performance through establishing a framework for the early stage activities within the innovation process (i.e. “Front End Innovation” or “Fuzzy Front End”). The framework should support the choice of knowledge sourcing strategy (e.g. exploration, exploitation, or hybrid) by adopting a dynamic multi-dimensional perspective.

3 - Collaboration Strategies to Design New Products

Fatima Zahra Barrane, Postdoctoral Researcher, Qatar University, E232, College of Business and Economics, Doha, 2713, Qatar, fzahra@qu.edu.qa, Egide Karuranga, Diane Poulin

Managing collaboration with multiple stakeholders is a significant challenge for companies today. In this empirical study, the question is: How can an organization manage collaboration with multiple stakeholders in the new product design process? We first reviewed the literature to come up with a series of research propositions. We then conducted 15 semi-structured interviews with managers whose companies engage in 2nd and 3rd -stage wood processing in Quebec.

4 - How Change in Consumer Preferences Can Influence New Product Sales Forecasting Methods

Semco Jahanbin, University of Bath, School of Management, Claverton Down, Bath, BA27AY, United Kingdom, Semco.jahanbin@gmail.com, Joao Quariguasi Frota Neto, Paul Goodwin, Sheik Meeran

Customer preferences are not stable, especially where a consumer needs to make a complex or unfamiliar decision. This is, to some extent connected with the theory of bounded rationality, which asserts that decision-makers have a limited capability to process information. In this research, the instability of consumer preferences and its influence on choice based conjoint analysis as a new product sales forecasting method are examined.

Zhu, Mengping WA75	Zhuo, Daisy TB11	Zolfagharinia, Hossein WD71	WD06, WD15, WE38
Zhu, Ning SC19	Zhuo, Yueran MD02, PS-T, WB34	Zou, Bin SA06	Zuo, Yi TA09
Zhu, Qiong WA02	Zhupanska, Olesya PS-T, WD27	Zou, Bo PS-M, MD68, WE65	Zuo, Zhiya SB24
Zhu, Stuart X. WA75	Ziemba, William T. PS-M	Zou, Han MB67	Zur, Emanuel WB04
Zhu, Suning SC05	Zink, Daniel MC11	Zou, James SD28	Zussblatt, Niels SD64
Zhu, Wanshan WB78, WE04	Zink, Rich PS-M	Zou, Jikai MB61	Zvilichovsky, David WB09
Zhu, Weiming MA48, TA48	Zinouri, Nazanin WD21	Zou, Jingjing SB22	Zwart, Bert TA32
Zhu, Wendong TA78	Zipkin, Paul WB49	Zou, Na WD31	Zweier, Kevin WA67
Zhu, Xuwen WD17	Ziya, Serhan TB46, WB42	Zou, Xiang TA66, TB62	
Zhu, Yada SD31	Zmerekovsky, Joseph WE77	Zoumpoulis, Spyros TB43	

SESSION INDEX

Sunday, 8:00am -9:00am

SA01	Modeling and Combating Terrorism
SA02	Interdiction and Fortification Models:Applications
SA03	Scheduling and Optimization in Logistics, Energy, Manufacturing Industries
SA04	JFIG Paper Competition I
SA05	Scalable Business Analytics in Social Media
SA06	Financial Engineering
SA07	Quantitative Financial Risk Management
SA08	Node Location, Node Disruption and Routing
SA09	Global Value Chains and New Organizational Architectures
SA10	Mobile and Location-Based Services
SA11	Polynomial and Nonconvex Optimization
SA12	Surrogate-Based and Derivative-Free Optimization I
SA13	Nonconvex Statistical Optimization
SA14	Stochastic Optimization with Discrete Moments
SA15	Nonlinear Optimization in Energy Systems
SA16	Topics in Optimization
SA17	Social Network Modeling and Optimization
SA18	Recent Advances on Support Vector Machines Research
SA19	High-performace Computation for Optimization
SA20	Big Data in the Clouds
SA21	Stochastic Models for Medical Decision Making and Healthcare Delivery
SA22	Matching Markets
SA23	Queueing Models
SA24	Data Mining for Decision Making
SA25	Business Analytics and Innovation
SA26	Biotechnology and Bioinformatics
SA27	Multi-objective Combinatorial Problems
SA28	Combinatorial Auctions
SA29	Analytics
SA30	Research from 2015 Richard E. Rosenthal Early Career Connection Program Participants
SA31	Mathematical Optimization Models for Data Science
SA32	Data Mining in Medical and Brain Informatics
SA33	Health Policy/ Public Health
SA34	Health-care Decision Making
SA35	Joint Session HAS/MSOM-Healthcare: Health Care Operations
SA36	Humanitarian Applications I
SA37	Health Care Modeling and Optimization I
SA38	Big Data I
SA39	Game Theoretic Models in Operations and Marketing interface
SA40	Organization Theory I
SA41	Joint Session MSOM-Health/HAS/Analytics: Data-driven Modeling in Healthcare I
SA42	Joint Session HAS/MSOM-Health-Practice: Operations Management of Emergency Services I
SA43	Revenue Management and Learning I
SA44	Pricing and Consumer Behavior
SA45	Networks: Games and Control
SA46	Empirical Research in Services and Retail
SA47	Emerging Topics in Healthcare Operations
SA48	Sustainable Operations Management and the Environment
SA49	Frontiers of Supply Chain Research
SA50	Emerging Issues and Recent Trends in Sourcing
SA51	Service Operations
SA52	Models of Service Systems
SA53	Experiments in Supply Chains
SA54	Data-Driven Stochastic Programming using Phi-Divergences
SA55	Airline Economics: Competition and Collaboration
SA56	Hub Location
SA57	Real Options in the Energy Sector
SA58	Multi-Agent Decision-Making for Smart Grids Operation I
SA59	Open Pit Mining
SA60	Evaluating Student Learning
SA61	Electricity Markets and Renewable Power
SA62	Optimization Models for Bioenergy Production and Delivery

SA63	Nicholson Student Paper Competition
SA64	Experts & Algorithms
SA65	Joint Session DAS/ENRE: Panel Discussion: Climate Assessment and Decision Analysis
SA66	Airlines Network Planning and Scheduling Applications
SA67	City Logistics and Sustainable Urban Freight Systems - I
SA68	Geospatial Analysis in Transportation and Logistics
SA69	Facility Location and Inventory Routing
SA70	Railway Applications Section Student Paper Award
SA71	Transportation Network Analysis and Optimization
SA72	Predictive Modeling and Control for Additive Manufacturing
SA73	Data Analytics for Reliability Evaluation and Maintenance Optimization I
SA74	IEEE T-ASE Invited Session: Manufacturing Systems Automation
SA75	Digital Manufacturing
SA76	Sustainable Infrastructure
SA77	Supply Chain Management I
SA78	Managing Supply Chain Disruptions
SA79	Software Demonstration – Microsoft Power BI

Sunday, 11:00am-12:30pm

SB01	Network Mapping
SB02	INFORMS 2015 Data Mining Best Student Paper Award
SB03	Improving Efficiency and Effectiveness of Supply Chains
SB04	JFIG Paper Competition II
SB05	Bridging Business and Analytics
SB06	Stochastic Systems in Finance
SB07	Networks and Contagion Risk
SB08	Cooperation and Integration Approaches to Modern Telecommunication Networks Problematics
SB09	Panel Discussion: Research Opportunities in Entrepreneurship, Innovation and Operations Management
SB10	Healthcare and Population Health in the Digital Economy
SB11	Combinatorial Network Optimization
SB13	Recent Advances in Stochastic Integer Programming
SB14	Sampling and Learning Methods in Stochastic Optimization
SB15	Recent Advances on First Order Methods
SB16	Recent Advances in Linear and Conic Optimization
SB17	Networks Robustness and Vulnerability Analysis
SB18	Joint Session Modeling Methodologies/Big Data: Large-Scale Data Analytics and Applications
SB19	Computational Optimization for Applied Problems I
SB20	Cloud Resource Management and Pricing
SB21	Healthcare Data Analytics
SB22	Experiment Design and A-B Testing
SB23	Reflected Diffusions and Stochastic Networks
SB24	Data Mining and Network Inference for Social and Health Application I
SB25	Mobile and Social Data Analytics
SB26	INFORMS Undergraduate Operations Research Prize I
SB27	Multi-objective Choice Problems
SB28	Contingent Mechanisms
SB29	A Collection of State of the Art Analytics Models and Methods
SB30	Model Building like a Boss
SB31	Predictive Analytics for Health Care Decision Making
SB32	Advances in Community Detection and Influence Analysis in Social Networks
SB33	Applications of Markov Models to Medical Decision Making Problems
SB34	Smart Medical Prognosis and Decision Making via Data Mining
SB35	Joint Session HAS/Analytics: Predictive Models for Clinical and Public Health Decision Making
SB36	Humanitarian Applications II
SB37	Health Care Modeling and Optimization II
SB38	Big Data II
SB39	Interdisciplinary Focus on Problem Solving
SB40	Organization Theory II

SB41	Optimization Methods in Healthcare Scheduling	SC17	Network Optimization
SB42	Healthcare Operations Modeling and Optimization	SC18	Data Mining for Healthcare
SB43	New Directions in Revenue Management	SC19	Application in Transportation Systems
SB44	Models of Customer Behavior	SC20	Resource Allocation and Pricing in Cloud Computing
SB45	Retail Pricing	SC21	Applied Operations in Health Services: Research by Bonder Scholars
SB46	Drivers of Employee Productivity in Service Settings	SC22	Adaptive Sampling and Selection in Simulation, Medicine and Machine Learning
SB47	The Sharing Economy	SC23	Solutions for Large Markov Chains
SB48	Quality and Compliance Enforcement in the Supply Chain	SC24	Fashion, Innovation and Technology
SB49	Understanding and Managing Risk in Extended Supply Chains	SC25	E-Commerce and Digital Marketing
SB50	Designing Dynamic Markets	SC26	INFORMS Undergraduate Operations Research Prize II
SB51	Retail Operations	SC27	MCDM Methods and Applications
SB52	Uncertainty and Performance of Service Processes	SC28	Market Design
SB53	From Behavioral/Experimental Economics to Behavioral Operations: Opportunities and Challenges	SC29	Joint Session Analytics/CPMS: Panel Discussion on OR vs Analytics: Experts Weigh in on the Case for Change
SB54	Pricing Inspired by Data and Practice	SC30	Creating and Sustaining an Analytics Advantage
SB55	Airline Revenue Management and Customer Choice	SC31	Interactions Between Learning and Decision Making
SB56	Location Applications	SC32	Special Topics in Supervised Learning: Variable Selections and Dimension Reductions
SB57	Electricity Market Models	SC33	Statistics and Optimization Methods for Pain Management
SB58	Smart Grids and Demand Response	SC34	Design and Analysis of Adaptive Health Interventions
SB59	Underground Mining	SC35	OR and Homeland Security: Social and Organizational Concerns
SB60	Case Competition I	SC36	Threats to Life and Limb
SB61	Dimensionality Reduction Techniques for Generation Capacity Expansion Problems with Intermittent Resources	SC37	Health Care Modeling and Optimization III
SB62	Modeling, Analysis, and Management of Water-Centric Systems	SC38	Panel Discussion: Relevant OM / MS Research: Why? What? How?
SB63	Doing Good with Good OR I	SC39	New Directions in Marketing - Operations Interface
SB64	Applications of Decision Analysis & Large-Scale Data Analytics	SC40	Behavioral Operations I
SB65	Quantifying Uncertainty in Decision Analysis Practice	SC41	Joint Session MSOM-Health/HAS/Practice: Operations Management of Emergency Services II
SB66	Aviation Applications Section: Best Student Presentation Competition I	SC42	Joint Session MSOM-Health/HAS: Healthcare Analytics and Optimization
SB67	Working Towards the Physical Internet	SC43	Joint Session RMP/PPSN: Socially Responsible Revenue Models
SB68	Joint Session TSL/Public Sector: Transportation Issues in Emergency Response	SC44	Revenue Optimization and Related Methodologies
SB69	Routing Problems with Uncertainty I	SC45	Revenue Management in Online Advertising
SB70	RAS Problem Solving Competition 2015	SC46	Managing Professional Services
SB71	Traffic State Estimation Methods and Data	SC47	Incentives and Investment in Renewable Energy and Energy Efficiency
SB72	QSR Student Introduction and Interaction and Best Student Poster Competition	SC48	Energy and Commodity Merchant Operations
SB73	Data Analytics for Quality Control and Improvement II	SC49	Operations Management and Marketing
SB74	QSR Refereed Research Session	SC50	Procurement and Management of Complex Goods and Services
SB75	Advanced Manufacturing I	SC51	MSOM Student Paper Competition Finalists - I
SB76	Efficient Learning in Stochastic Optimization	SC52	Social Network Analysis
SB77	Supply Chain Management II	SC53	Bounded Rationality, Social Preferences, and Risk Management in Behavioral Operations
SB78	Supply Chain Practice and Empirics	SC54	Uncertainty in Demand Response? Identification, Estimation, and Learning
SB79	Software Demonstration – Simia/Forio Simulation	SC55	Applications of DEA

Sunday, 1:30pm- 3:00pm

SC01	Military O.R. and Applications I	SC56	New Directions in Locational Analysis
SC02	Cyber-Physical Protection Models and Analysis.	SC57	Energy Technology, Climate Change, and Uncertainty
SC03	Contemporary Scheduling	SC58	Resiliency and Reliability Optimization of Electric Power Systems
SC04	Gender Inspired Research	SC59	Just the Facts: Empirical Patterns in Strategy
SC05	Extracting Business Value from Social Media Analytics: Techniques and Applications	SC60	Case Competition II
SC06	Computational Methods in Options Pricing and Portfolio Selection	SC61	Optimal Power Flow in Electric Power Systems I
SC07	Big Risks, Big Data	SC62	Biofuel Supply Chain and Market Analysis
SC08	Topics in Telecommunications	SC63	Doing Good with Good OR II
SC09	Managing Innovation: Products, Services, Employee Attributes and Organizational Performance	SC64	Joint Session DAS/ENRE: Decision Analysis Applications in Oil and Gas
SC10	Online Consumer Conversion and Developer Strategy	SC65	Systems Engineering and Decision Analysis
SC11	Joint Session OPT/OPT Under Uncertainty: IP Methods for Stochastic Optimization	SC66	Aviation Applications Section: Best Student Presentation Competition 2
SC12	Mixed Integer Programming and Location Routing Problem	SC67	Advances in Network Design
SC13	Multi-armed Bandits and Online Optimization	SC68	Joint Session TSL/Public Sector: Transportation Disruption Management
SC14	New Developments in Robust and Adaptive Optimization	SC69	Facility Logistics I
SC15	Nonlinear Optimization Methods with Stochastic and Second Order Information	SC70	RAS Roundtable: Part I Railroad Operations Efficiency
SC16	Efficient Algorithms for Large-Scale Convex Games		

and Recovery
 SC71 Public Transportation Modeling
 SC72 Panel Discussion: IoT-enabled Data Analytics:
 Opportunities, Challenges and Applications
 SC73 Quality Engineering
 SC74 IEEE Intelligent Systems Invited Panel Discussion on
 Healthcare Intelligence
 SC75 Advanced Manufacturing Systems and Planning
 SC76 Design of Experiments and Statistical Analysis for Simulation
 SC77 Supply Chain Management III
 SC78 Supply Chain Risk Management I
 SC79 Software Demonstration – Provalis Research/
 SAS Education Practice

Sunday, 4:30pm-6:00pm

SD01 Military O.R. and Applications II
 SD02 OR and Homeland Security 1: Data Driven Decisions
 SD03 Application of Scheduling Theory
 SD04 Special Panel on 20th Year Anniversary of WORMS:
 Strategies for Advancing Women in OR/MS
 SD05 Tutorial: Collecting and Analyzing Twitter Data with Python
 SD06 Asset Returns and Portfolio Management
 SD07 Systemic Risk in Financial Networks
 SD08 Surveillance
 SD09 Joint Session TIME/NPD: Meet The Editors
 SD10 Digital Platform and New Economy
 SD11 Recent Theoretical and Computational Advances in
 Mixed Integer Programming
 SD12 Strong Relaxations and Computations for Mixed
 Integer Nonlinear Programs
 SD13 Uncertainty in Energy and Natural Resource Systems
 SD14 Topics in Dynamic Programming
 SD15 Nonlinear Optimization Algorithms
 SD16 New Optimization Modeling and Effective Techniques
 SD17 Transportation Network Modeling and Optimization
 SD18 Theory and Applications of Coordinate Descent and
 Alternating Direction Methods
 SD19 Computational Data Analytics
 SD20 Queueing with Redundancy for Cloud Computing
 SD21 Natural History Modeling for Medical Decision Making
 SD23 Queues in Heavy-Traffic: Approximations and Control
 SD24 Meet the Editors
 SD25 Online Search, Social Network and Advertisement
 SD26 Industry Job Search Panel
 SD27 MCDM in Agriculture
 SD28 Advances in Auction Theory
 SD29 Baseball Analytics
 SD30 “Speed Networking” Coordination of Subdivisions’ Interests
 SD31 Data Analytics and Statistical Learning
 SD32 Computational and Statistical Challenges in Big Data Genomics
 SD33 Operations Research/Management for Women’s Health
 SD34 Medical Decision Making
 SD35 OR in Public Policy: From Healthcare to Food Banks
 SD36 Public and Nonprofit Sector Applications
 SD37 Health Care Modeling and Optimization IV
 SD38 Big Data III
 SD39 Pricing and Consumer Behavior in Retail and
 Service Operations
 SD40 Behavioral Operations II
 SD41 Healthcare Capacity and Patient Flow Analytics
 SD42 Patient Scheduling under Resource Constraints
 SD43 Data-Driven Revenue Management
 SD44 Algorithmic Revenue Management with Strategic Customers
 SD45 Pricing — Examples of Collaboration Between Academia
 and Industry
 SD46 Empirical Operations Management: Services
 SD47 Topics in Remanufacturing and Consumer Product Returns

SD48 Empirical Topics on OM/Finance Interface
 SD49 Service Process Design
 SD50 Retail Operations
 SD51 MSOM Student Paper Competition Finalists II
 SD52 Designing Services: Marketing and Operations
 Inter-related Issues I
 SD53 2015 INFORMS BOM Section Best Working Paper Awards
 SD54 Robust Optimization, Risk Ambiguity
 SD55 Analysis of Infrastructure using DEA
 SD56 Location Models
 SD57 Joint Session with all ENRE Clusters: The Energy, Natural
 Resources, and Environment Awards Session
 SD58 Funding Opportunities within CMMI
 SD59 Small Firms, Mobility, and Entrepreneurial Spawning
 SD60 Publications in Education
 SD61 Decision Analysis IV
 SD62 Transportation
 SD63 Nicholson Student Paper Competition II
 SD64 Value of Information
 SD65 Decision Analysis in Procurements and Procurement Auctions
 SD66 Aviation Applications Section: Award Finalists
 SD67 Container-based Logistics
 SD68 Electric Vehicles I
 SD69 Facility Logistics II
 SD70 RAS Roundtable: Part II Railroad Operations Efficiency
 and Recovery
 SD71 Alternative Fuel Vehicles and Sustainable Transportation I
 SD72 IIE Transactions
 SD73 Multicriteria and Multiobjective Models in Risk, Reliability
 and Maintenance
 SD74 Panel Discussion: Funding Opportunities
 SD75 Software Demo – IBM
 SD76 Emerging Development in Simulation and Optimization
 SD77 Supply Chain Management IV
 SD78 Supply Chain Risk Management II
 SD79 Software Demonstration – Artelys/Grms Development Corp.

Monday, 8:00am-9:30am

MA01 Military O.R. and Applications III
 MA02 Game Theory in Practice for Homeland Security
 MA03 Teaching Modern Project Management
 MA05 Applying Advanced Analytics to Social Media Data
 MA06 Financial Engineering
 MA07 Systemic Risk Measurement: Data and Algorithmic Aspects
 MA08 Topics in Innovative and Entrepreneurial Operations
 MA09 Understanding Knowledge Sources and Politics in
 Technology Management
 MA10 Economics of Digital Channels
 MA11 Convexification Techniques in Mixed-Integer Programming
 MA13 Distributionally Robust Optimization
 MA14 Stochastic Optimization Applications to Renewable
 Energy Integration
 MA15 Radiation Therapy Optimization
 MA16 Conic Convex Optimization: New Algorithms and Results
 MA17 Network Optimization under Uncertainties
 MA18 The Reborn of Traditional OR Methods in the Era of Big Data
 MA19 Distributed and Parallel Optimization
 MA20 Resource Allocation in Cloud Computing
 MA21 Public Health and Health System Modeling
 MA22 New Advances in Stochastic Networks
 MA23 Queues: Approximations and Control
 MA24 Social Media Analytics and Big Network Data
 MA25 Examining the Social Crowd
 MA26 2015 INFORMS Special Session for JIPE and IJOR
 MA27 Theory and Applications of the Analytic Network Process
 MA28 Matching Markets and Their Applications
 MA29 Applied Analytics Across Industries

MA30	2015 Edelman Finalists Reprise	MB10	Economics of Digital Goods and Services
MA31	Retail Analytics	MB11	Discrete Decision Making and Computation
MA32	George B. Dantzig Dissertation	MB12	Recent Algorithmic Developments in Deterministic Global Optimization
MA33	Polycymaking in Public Health	MB13	Distributed Stochastic Optimization for Large-Scale Machine Learning
MA34	Managing Healthcare Services	MB14	Statistical Optimization
MA35	Health Policy	MB15	Unconstrained and Bound-Constrained Optimization
MA36	Resilient Public Health Supply Chains	MB16	Trends in Optimization
MA37	Health Care Modeling and Optimization VI	MB17	Cliques and Clique Relaxations
MA38	Applied Probability I	MB18	Big Data Analytics: Methodology and Applications
MA39	Topics in Mental Accounting, Newsvendor and Pricing	MB19	OR and AI
MA40	Investigating Mobility Dynamics within Markets and Organizations	MB20	Decision Analytics in Cloud
MA41	Joint Session MSOM-Health/HAS: Data-Driven Modeling in Healthcare II	MB21	Re-Designing the (US) Healthcare System
MA42	Modeling Healthcare Provider and Processes Interaction	MB22	Learning and Random Graphs
MA43	Game Theoretic Models in Revenue Management I	MB23	Role of Information in Large-scale Stochastic Resource Allocation Problems
MA44	Data Driven Pricing	MB24	Data Mining and Network Inference for Social and Health Application II
MA45	RM in Practice	MB26	Data Analytics Applications for Smart Industries
MA46	Healthcare Operations	MB27	Advances in Multiobjective Programming
MA47	MSOM Sustainability and Energy	MB28	Economic Models of Auctions
MA48	Supply Chain Finance and Risk Management	MB29	Joint Session Analytics/MIF/HAS: Healthcare Analytics
MA49	Energy Operations and Sustainability	MB30	Practice Presentations by INFORMS Roundtable Companies I
MA50	The Role of Behavioral Modeling Features in Revenue Management	MB31	Data Mining and Predictive Analytics in Health Care
MA51	Models for Fashion Operations Management	MB32	Big Data Analytics in Genomics
MA52	Designing Services: Marketing and Operations Inter-related Issues II	MB33	Joint Session HAS/MSOM-Healthcare: Health Care Operations
MA53	Behavioral Issues in Coordination and Pricing	MB34	Supply Chain Analytics: Public Food Safety Applications
MA54	A Practical Guide to Ranking and Selection Methods	MB35	Relief Distribution Management
MA55	Innovative Uses of DEA	MB36	Community-Based Operations Research I
MA56	Facility Location and Supply Chain Network Design	MB37	Health Care Modeling and Optimization V
MA57	Optimization for Wind Energy	MB38	Applied Probability II
MA58	Analytics in the Petrochemical and Petroleum Industries I	MB39	Contracts, Quality, and Pricing for OM-Marketing
MA59	Strategy, Innovation, and Entry	MB40	Nonmarket Strategy
MA60	Enabling Business Students to Use OR	MB41	New Development in Health Care Operations
MA61	Transmission and Generation Expansion Planning	MB42	Joint Session MSOM-Health/HAS: Designing Healthcare Systems to Improve Patient and Provider Experience
MA62	OR Models for Ocean and River Energy	MB43	Innovation, Technology Management and Networks
MA63	Daniel H. Wagner Prize Competition I	MB44	Joint Session RMP/HAS: Health Care Pricing
MA64	Joint Session DAS/HAS: Dependencies in Pharmaceutical Portfolio Management: Challenges and Pragmatic Approaches	MB45	Dynamic Pricing: Learning, Personalization, Equilibrium, and Consumer Benefit
MA65	From Value of Information to Sensitivity Analysis	MB46	The Economics and Operation of Vehicle Sharing
MA66	Air Traffic Management and Airline Operations	MB47	Environmentally Responsible Operations
MA67	City Logistics and Sustainable Urban Freight Systems - II	MB48	Operations and Finance Interface
MA68	Electric Vehicles II	MB49	Sustainability in Supply Chains
MA69	Facility Logistics III	MB50	Supply Chain Risk Management Strategies
MA70	Rail Safety and Risk Analysis	MB51	Behavior-driven Operations Management
MA71	Alternative Fuel Vehicles and Sustainable Transportation II	MB52	Best Paper Award
MA72	2015 QSR Best Student Paper Competition	MB53	Social Media, Sales and Pricing
MA73	IEEE T-ASE Invited Session: Healthcare and Service Systems Automation	MB54	Markov Decision Processes
MA74	Data Analytics for Quality Control and Improvement I	MB55	Applications of DEA II
MA75	New Research Topics on Innovation	MB56	Recent Advances in Location Analysis
MA76	Simulation Optimization and Ranking and Selection	MB57	Optimization of Power Systems Planning and Operation
MA77	Supply Chain Management V	MB58	Analytics in the Petrochemical and Petroleum Industries II
MA78	Supply Chain Risk Management III	MB59	Panel Discussion: The Impact of the Value-Based Approach on the Field of Strategy
MA79	Software Demonstration - SAS JMP Division/AnyLogic	MB60	Cases in the Undergraduate OR Curriculum
		MB61	Stochastic and Robust Optimization Models in Electric Power Systems
		MB62	Optimization Approaches for Invasive Species and Pest Management
		MB63	Daniel H. Wagner Prize Competition II
		MB64	Joint Session DAS/ENRE: Environmental Decision Analysis: Theory and Applications
		MB65	Risk Attitudes in Decision Analysis
		MB66	Air Traffic Management Decision Support: Learning from History
		MB67	The Role of Information in Transportation Models
		MB68	Green Vehicle Routing
		MB69	Facility Logistics IV

Monday, 11:00am-12:30pm

MB01	Military O.R. and Applications IV	MB62	Optimization Approaches for Invasive Species and Pest Management
MB02	MAS Tutorial: A Brief Introduction To Predictive Analytics	MB63	Daniel H. Wagner Prize Competition II
MB03	Supply Chain Scheduling	MB64	Joint Session DAS/ENRE: Environmental Decision Analysis: Theory and Applications
MB04	Panel: Topics for PhD students	MB65	Risk Attitudes in Decision Analysis
MB05	Tutorial: Analyzing Social Media with LIWC	MB66	Air Traffic Management Decision Support: Learning from History
MB06	Tutorial in Financial Services	MB67	The Role of Information in Transportation Models
MB07	Assessing Systemic Risk	MB68	Green Vehicle Routing
MB08	Green Business Models	MB69	Facility Logistics IV
MB09	Best Dissertation Award Finalists – Technology, Innovation Management and Entrepreneurship Section		

MB70	Joint Session RAS/TSL/AAS: Real-Time Decision Support Practice
MB71	Mobility Choices in Urban Transportation
MB72	Journal of Quality Technology (JQT) Invited Session
MB73	Game-theoretical Models in Maintenance and Reliability
MB74	Sustainable Operations in the Manufacturing Industry
MB75	Managing Search and Problem Solving in Innovation Settings
MB76	Simulation Optimization and Input Uncertainty
MB77	Supply Chain Management VI
MB78	Shipping and Transportation for Supply Chains
MB79	Software Demonstration – AMPL/Gurobi Optimization

Monday, 12:30pm - 2:30pm

Poster Session

Monday, 1:30pm-3:00pm

MC01	Military O.R. and Applications V
MC02	Logistics and Transportation Security
MC03	Innovative Scheduling Applications
MC04	Joint Session JFIG/MIF: Department Chair Panel Discussion on Tenure and Promotion
MC05	Predictive Models of Human Behavior in Social Media
MC06	INFORMS Section on Finance Student Paper Competition
MC07	Modeling and Quantification of Risk
MC08	Empirical Perspectives on Business Model Innovation
MC09	Collaborative Innovation
MC10	Social Media and E-Commerce
MC11	Symmetry and Extended Formulations in Integer Programming
MC12	Global Optimization: Algorithms and Applications
MC13	Robustness in Optimization, Complementarity, and Queueing Systems
MC14	Optimization Award Session
MC15	Theory and Applications of Convex Optimization
MC16	Advances in Infinite-Dimensional Linear Programming
MC17	Network Flows and Combinatorial Optimization
MC18	Optimization Metaheuristics
MC19	Tools for Optimization Modeling
MC20	Modeling and Optimization of Big Data Systems
MC21	Pierskalla Award Finalists
MC22	Message Passing for Inference
MC23	Optimal Control of Stochastic Systems
MC24	Network Modeling and Analysis
MC25	Data-Driven Research on Economics of Digitization
MC26	Academic Job Search Panel
MC27	Multi-objective Design Problems
MC28	Auctions and Trading Agents
MC29	Joint Session Analytics/CPMS: Panel Session: Extending the Reach of Certification: The New Associate Certified Analytics Professional
MC30	Practice Presentations by INFORMS Roundtable Companies II
MC31	Data Mining in Healthcare
MC32	Statistical Innovations in Computational Biology and Genomics
MC33	Topics in Health Systems
MC34	Joint Session HAS/MSOM-Managing Healthcare Operations
MC35	Practice-Based Research in Humanitarian Operations Management
MC36	Community-Based Operations Research II
MC37	Health Care Modeling and Optimization VII
MC38	Dynamic Programming and Control I
MC39	Branding and Bundling
MC40	Micro-Underpinnings of Mobility, Knowledge, and Performance in Groups and Organizations
MC41	Joint Session MSOM-Health/HAS/Analytics: Data-Driven Modeling in Healthcare III
MC42	Joint Session MSOM-Health/HAS/Analytics: Healthcare Analytics

MC43	Game Theoretic Models in Revenue Management II
MC44	Empirical and Data-Driven Research in Revenue Management and Pricing
MC45	From Store to Omni-Channel: Choice-Driven Pricing Models
MC46	Pricing and Strategic Behavior in Queueing Systems
MC47	Energy Operations and Energy Efficiency
MC49	Emerging Topics in Supply Chain Management
MC50	Retail Supply Chain: From Demand Forecast to Order Fulfillment
MC51	Dynamic Contracts in Operations Management
MC52	Analytics for IT Services
MC53	Opportunities and New Directions for Behavioral OM
MC54	Equilibrium Routing and its Paradoxes
MC55	Efficiency in the Higher Education and Banking Sectors
MC56	Location Analytics
MC57	Policy Issues in Energy Markets
MC58	Analytics in the Petrochemical and Petroleum Industries III
MC59	Strategy and Geography
MC60	Project Based Learning
MC61	Nonconvex and Stochastic Electricity Pricing
MC62	Operations Management with Carbon Restrictions: Environmental Concerns
MC63	Advanced Manufacturing II
MC64	Behavioral Decision Analysis
MC65	Joint Session DAS/MAS:Game Theory, Decision Analysis, and Homeland Security, Part A
MC66	Ongoing Challenges in Airline Operations Planning
MC67	Integrated Vehicle Routing Problems I
MC68	Logistics and Supply Chain under Disruption and Disasters
MC69	Facility Logistics V
MC70	International Rail Freight
MC71	Shared Mobility Analysis and Optimization
MC72	Panel Discussion on "Publishing in Quality and Reliability: The Editor's Perspective"
MC73	Modeling and Analysis of Data with Quantitative and Qualitative Variables
MC74	Modern Monitoring Applications
MC75	Innovations in Healthcare Products and Services
MC76	Accounting for Input Uncertainty in Stochastic Simulations
MC77	Supply Chain Management VII
MC78	Integer Programming Applications in Energy
MC79	Software Demonstration – AIMMS/MOSEK ApS

Monday, 4:30pm-6:00pm

MD01	Military Applications Society Awards
MD02	Cyber Security
MD03	Scheduling with Applications
MD04	Panel Discussion: International Academia Career Opportunities
MD05	Predicting Customer Behavior using Facebook Data
MD06	Finance and Risk Management
MD07	Quantitative Methods for Financial Applications
MD08	Mobile-Based Business Model Innovations
MD09	TIMES Distinguished Speaker
MD10	IT-Enabled Competitive Strategies
MD11	Convex Relaxations for Structured Integer Programs
MD12	Surrogate-Based and Derivative-Free Optimization II
MD13	Stochastic Integer Programming
MD14	Robust Optimization in Radiation Therapy Planning
MD15	Distributed Convex Optimization
MD16	Application of Linear and Conic Programs with Complementarity Constraints
MD17	Modeling Social Influence in Networks
MD18	Methodologies in Text Mining for Big Data
MD19	Application of Nonlinear Optimization using Sequential Linear Programming Techniques with Xpress
MD20	Stochastic Models and Analysis for Cloud Computing
MD21	Stochastic Models in Healthcare
MD22	Joint Session Prize/CPMS: 2015 Informs Prize Winner

MD23 Markov Lecture
MD24 Latent Variable Models in Biomedical Informatics
MD25 Economics of IS & OM
MD26 Analytics Maturity Model
MD27 Spatial Multi-Criteria Decision Analysis
MD28 Auctions for Spectrum
MD29 Joint Session Analytics/CPMS: 2015 Innovative Applications
in Analytics Award Winner Reprise
MD30 Practice Presentations by INFORMS Roundtable Companies III
MD32 Big Biological Data: Computational and Analytical Challenges
MD33 Radiation Therapy Optimization: Algorithms and
Biological Effects
MD34 Decision Models for Women's and Children's Health
MD35 Joint Session PPSN/Analytics: Pro Bono Analytics
Panel Discussion
MD36 Modeling Broader Policy Impacts at the Local Scale
MD37 Health Care Modeling and Optimization VIII
MD38 Dynamic Programming and Control II
MD39 Innovative Strategies in the Interface of Operations
and Marketing
MD40 Gender, Leadership, and Governance
MD41 High-dimensional Data Models for Cost-effective Healthcare
MD42 Joint Session MSOM-Health/HAS:
Operations Research/Management for Public Health:
Data-Driven and Dynamic Decision-Making
MD43 Empirical Revenue Management
MD44 Pricing and Information in Innovative Business Models
MD45 Revenue Management and Learning II
MD46 Equilibrium Models and Pricing of Queues
MD47 Sustainability and Transportation
MD48 Operations/Corporate Finance Interface
MD49 Supply Chain Operations
MD50 Procurement, Auction, and Pricing
MD51 Applications of Operations Management to Pharmaceutical
and Healthcare Industry
MD53 Behavioral Studies in Supply Chains and
Revenue Management
MD54 Computational Optimization and Statistical Methods for
Big Data Analytics: Applications in Neuroimaging
MD55 Environmental Application and Computational Aspects
of Efficiency and Productivity Analysis
MD56 Spatial Analysis
MD57 Planning Models in Electric Power Systems
MD58 Multi-Agent Decision-Making for Smart Grids Operation II
MD59 Forest & Timber Management
MD60 Panel Discussion: Encouraging Professionalism
in the Classroom
MD61 Multilevel Optimization Problems in Energy
MD62 Spatial Optimization and Conservation Reserve Design
MD63 Daniel H. Wagner Prize Competition III
MD64 Decision Analysis Society Awards Session
MD65 Freight Transportation
MD66 Aviation Applications Section: Keynote Presentation
MD67 Integrated Vehicle Routing Problems II
MD68 Joint Session TSL/Public Sector: Resilience in
Transportation Infrastructure Systems
MD69 Arc Routing Problems and Applications
MD70 Railway Analytics
MD71 Transportation Network Modeling and Design
MD72 Panel Discussion on Big Data Science - Opportunities
and Challenges
MD73 Data Analytics in Manufacturing and Service Industries
MD74 Advanced Maintenance Modeling
MD75 Deep Dive on Open Innovation - Papers and Discussants
MD76 Simulation in Healthcare
MD77 Supply Chain Management VIII
MD78 Optimization under Uncertainty with Energy Applications
MD79 Software Demonstration – LINDO Systems Inc./Do Analytics

Tuesday, 8:00am-9:30am

TA01 Military Manpower and Force Management
TA02 Optimization Applications in Homeland Security
TA03 Scheduling in Practice
TA04 Panel Discussion: Journal Publication Tips
TA05 Social Media and Networks in Business
TA06 Systemic Risk
TA07 Pricing and Risk Modeling in Financial Engineering,
Operations Research
TA08 e-Business Models
TA09 Using Big Data Analytics for Technology Intelligence:
Methods and Cases to Gather Intelligence on
Technological Innovations
TA10 Contextual Factors Affecting eBusiness Initiatives
TA11 Online Optimization with Integer Applications
TA12 Convexification-based Algorithms for Solving Quadratic
and Polynomial Programs
TA13 Optimizing Sharing Service/Economy Under Uncertainty
TA14 Data-driven Optimization
TA15 Patient Scheduling in Health Care
TA16 Disjunctive Conic and Optimization Problems
TA17 Network Resilience and Applications
TA18 Scientometric Data Analytics
TA19 Computational Integer Optimization
TA20 Cloud Services and Applications
TA21 Medical Decision Making in Cancer Care
TA22 Two-Sided Matching Markets
TA23 Asymptotic Optimality in Processing Networks
TA24 Intelligent Heuristics and Systems
TA25 Online Information Intermediaries
TA26 Optimal Sourcing, Procurement Design, and Eco-label System
in Supply Chain Management
TA27 Application-motivated Theories and Methods for
Multiobjective Optimization
TA28 Auctions for Ad Space
TA29 Applications of Analytics I
TA30 Sports and Entertainment
TA31 Financial Applications of Data Mining and Machine
Learning Techniques
TA32 Principles in Applied Probability
TA33 Medical Decision Making in Chronic Disease Screening
and Treatment
TA34 Operations in Emergency Medicine
TA35 Panel Discussion: Infusing Learning from Hospitality and
Service Design to Healthcare: A Panel Discussion
TA36 Innovations on Disaster Response Logistics
TA37 Health Care Modeling and Optimization IX
TA39 Supply Chain Management and Marketing Interface
TA40 Behavioral Operations III
TA41 Studies in Healthcare Productivity
TA42 Operational Decision Making in Healthcare
TA43 Measurement and Optimization in Online Advertising
TA44 Pricing Issues in Revenue Management
TA45 Social Learning and Revenue Management
TA46 Empirical Research in Supply Chains and Service Management
TA47 Sustainability in Food Supply Chains
TA48 Managing Contracts and Financial Flow in Supply Chain
TA49 Uncertainty in Sourcing and Procurement
TA50 Operations Management and Marketing Interface
TA51 Economics of Innovation in Supply Chains
TA52 Consumer-driven Management Science
TA53 Behavior in Operational Contexts
TA54 Applying Machine Learning in Online Revenue Management
TA55 Extensions of DEA
TA56 Execution Mode Choices for NPD
TA57 Applications of Stochastic and Dynamic Programming
in Energy
TA58 Topics in Oil, Natural Gas, and Alternative Fuels
TA59 Fire Management I: Suppression

TA60	Education I
TA61	Sustainability in Energy Sector: Policy Analysis and Technology Assessment
TA62	Reliability and Random Factors in Power Systems
TA63	KINFORMS Sponsored Session
TA64	The Journey to Organizational Decision Quality (ODQ)
TA65	Recent Findings and Experiences in Probability Elicitation
TA66	Airline/Airport Operations Management
TA67	Advanced Routing Models
TA68	Joint Session TSL/Public Sector: Resilience in Interdependent Infrastructure System
TA69	Maritime Logistics
TA70	Advanced Analytics in Tactical Decision Making
TA71	Managing Uncertainties and Outages in the Aviation System: Models and Methods
TA72	DDDAS for Industrial and System Engineering Applications I
TA73	Functional Data Analysis
TA74	System and Process Informatics in Additive Manufacturing (I)
TA75	IBM Research Best Student Paper Award I
TA76	Advances in Simulation-based Optimization I
TA77	Green Supply Chain Management
TA78	Big Data and Energy
TA79	Software Demonstration – Sigma LX/Mathworks

Tuesday, 11:00am-12:30pm

TB01	Cyber and Logistics Applications
TB02	Homeland Security Decision Making
TB03	New Topics in Scheduling
TB04	The Business of Music and Emotion in Social Media
TB05	Social Media in Business
TB06	Engineering Approaches in Finance
TB07	Quantitative Risk Measurement and Modeling
TB08	Sharing Economy and Peer-to-Peer Marketplaces
TB09	Ecosystem Analytics & Visualization
TB10	Frontiers in IS Research
TB11	Machine Learning under a Modern Optimization Lens
TB12	Nonlinear Programming in Stochastic and Multilevel Problems
TB13	Stochastic Approximation
TB14	Joint Session OPT/ICS: Stochastic Programming: Progressive Hedging and Related Methods
TB15	Recent Advances in Nonlinear Programming
TB16	Various Aspects of Mixed Integer Conic Optimization
TB17	Network Modeling and Design
TB18	Data Mining for Different Type of Big Data
TB21	Bundled Payment Systems
TB22	Learning High-dimensional/Sparse Models
TB23	New Advances in Production Planning and Scheduling
TB24	Urban Data Analytics and Mining
TB25	Software-Driven Innovation and Business Strategies
TB26	Retailer Pricing
TB27	Multiple Criteria Decision Aiding
TB28	Empirical Market Design
TB29	Applications of Analytics II
TB30	Intelligent Agents and Systems
TB31	Connected Vehicle Analytics
TB32	Business Analytics in Higher Education Industry
TB33	Joint Session HAS/MSOM-Healthcare: Modeling Applications for Emergency Departments
TB34	Data-driven Modeling and Analysis of Health Care Systems
TB35	Using Technology to Enhance Guest Experiences and Performance in Hospitality Management
TB36	Disaster Relief and Humanitarian Logistics
TB37	Health Care Modeling and Optimization X
TB38	Queueing Models I
TB39	Risks Management in Operations/Marketing
TB40	Operations/Sustainability
TB41	ED Operations Management

TB42	Joint Session MSOM-Health/HAS: Global Health Delivery
TB43	Choice Modeling and Assortment Optimization
TB44	Machine Learning in Operations
TB45	Revenue Management for Marketing
TB46	Service Models in MSOM
TB47	Supply Chain Social Responsibility
TB48	Operational Issues in Agriculture
TB49	Retail Operations
TB50	Value Chain Innovations in Developing Economies
TB51	Procurement Mechanisms
TB52	Marketing and Optimal Control
TB53	Behavioral Issues in the OM / Marketing Interface
TB54	Approximations of Queueing Performance for Rapid Systems Design
TB55	Stochastic Methods in Efficiency Analysis
TB56	Multiple Stakeholders in NPD
TB57	Assorted Topics in Renewable Energy
TB58	Topics in Nuclear Energy
TB59	Fire Management 2: Landscape & Modeling
TB60	Education II
TB61	Economics of Reverse Logistics and Sustainable Operations
TB62	Aviation Applications
TB64	Panel Discussion: A Heated Discussion on Decision Analysis and Systems Engineering
TB65	Modeling in Decision Analysis
TB66	Delay Propagation and Robust Airline Operations
TB67	Advances in Vehicle Routing Problem and its Variants
TB68	TSL Invited Cluster Keynote Address
TB69	Joint Session TSL/Public Sector: Health-care, Education, and Emergency Applications of Logistics
TB70	Yard and Terminal Simulation
TB72	DDDAS for Industrial and System Engineering Applications II
TB73	Joint Session QSR/Energy: Data Analytics in Energy Systems
TB74	System and Process Informatics in Additive Manufacturing (II)
TB75	IBM Research Best Student Paper Award II
TB76	Advances in Simulation-based Optimization II
TB77	Logistics I
TB78	Planning and Scheduling in Energy Applications
TB79	Software Demonstration – Statistics.com/River Logic

Tuesday, 12:30pm - 2:30pm

Poster Session

Tuesday, 1:30pm-3:00pm

TC01	Logistics and Operations Research
TC02	Network Applications in Homeland Security
TC03	Inventory Management I
TC04	Social Media Analytics Best Papers Finalist Competition
TC05	Social Media Impact
TC06	Dynamics and Information in Commodity Markets
TC07	Systemic Risk: Methods and Models
TC08	Different Facets of Innovation: Product, Technology and Business Models
TC09	Crowd Innovation
TC10	e-Media and Health Care Practices
TC11	Advances in Discrete Optimization
TC12	Optimization Integer Programming I
TC13	Stochastic Combinatorial Optimization
TC14	Stochastic Financial Optimization
TC15	Optimization Models in Radiotherapy Treatment Planning
TC16	Game Theory I
TC17	Network Analysis I
TC19	Modeling and Optimization for Sustainable Cloud Computing
TC20	Financial Engineering and Optimization
TC21	Innovations in Healthcare Operations
TC22	Analysis and Control of Queues

TC23	Stochastic Modeling and Control of Production Systems
TC24	Search Across Disciplines: Artificial Intelligence and Operations Research
TC25	Online Crowds: Crowdfunding and Social Media
TC26	Gray Market, Sustainability, Competition, and Diffusion
TC27	Evolutionary Bilevel Optimization
TC28	New Frontiers in Market Design
TC29	Joint Session Analytics/HAS: Analytics Innovations in Healthcare and Medicine
TC30	Decision Support Systems I
TC31	Joint Session DM/QSR: Quality and Statistical Decision Making in Health Care Applications
TC32	Decision Support Systems for Data Mining
TC33	Appointment Scheduling in Healthcare
TC34	Optimal Cancer Therapy
TC35	Disaster and Emergency Management I
TC36	Humanitarian Applications III
TC37	Kidney Allocation and Exchange
TC38	Queueing Models II
TC39	Distribution Channel Management
TC40	Marketing I
TC41	Joint Session MSOM-Health/HAS: Healthcare Operations
TC42	Joint Session MSOM-Health/HAS: Workarounds, Errors and Interruptions in Healthcare
TC43	Joint Session RMP/MSOM: Choice Models: Estimation and Optimization
TC44	Pricing in Online Markets
TC45	Behavioral Issues in RM
TC46	Issues Related to Supply Chain Management
TC47	Topics in Remanufacturing and Recycling
TC48	Managing Finances and Risk in Supply Chains
TC49	Multi-Echelon Inventory Modeling
TC50	Operations Economics
TC51	Online Retailing
TC52	Machine Learning Applications in Marketing
TC53	Grab Bag of Behavioral Papers
TC54	Discrete Optimization Models for Homeland Security and Disaster Management
TC55	Outsourcing I
TC56	Commercialization of New Technologies
TC57	Long-Term Electric Power System Planning Models
TC58	Electricity and System Resilience
TC59	Impacts of Climate Change
TC60	Disruption Management
TC61	Sustainable and Responsible Supply Chain Management
TC62	Optimization in Bio-energy
TC63	Operations Management I
TC64	Panel Discussion: Analytics and Decision Analysis
TC65	Joint Session DAS/MAS:Game Theory, Decision Analysis, and Homeland Security, Part B
TC66	Managing Airport Arrival Flows
TC67	Consolidation in Transport
TC68	TSL Prize Session
TC69	Multimodal Traffic Signal Control in a Connected Vehicle Environment
TC70	Predictive Analytics in Railway - Practice
TC71	Transportation Planning I
TC72	DDAS for Industrial and System Engineering Applications III
TC73	Quality Monitoring and Analysis in Complex Manufacturing Processes
TC74	Innovative Methods for System Informatics
TC75	IBM Research Best Student Paper Award III
TC76	Advances in Stochastic Simulation
TC77	Logistics II
TC78	Optimization of Energy Systems
TC79	Software Demonstration – Snycopation Software/ Frontline Systems, Inc.

Tuesday, 4:30pm-6:00pm

TD01	Optimizing Decisions in Conflict, Deterrence, and Peace
TD02	Military Applications
TD03	Inventory Management II
TD04	Economics I
TD05	Social Media Engagement
TD06	Quantitative Finance and Risk Management
TD07	Topics in Optimal Investment
TD08	Tutorial in Financial Services
TD09	Collaborative R&D
TD10	Platform-Based Markets in the Digital Era
TD12	MAS Tutorial: The State of Operations Research in the US Military: A 75th Anniversary Perspective
TD14	Optimization in Energy and Resources Production and Management
TD15	Capacity Management in Healthcare Operations
TD16	Inverse Optimization
TD17	Routing and Multidimensional Assignment Applications
TD18	Recent Advances in First Order Methods for Large-Scale Optimization
TD19	Network Inference
TD20	Banking and Insurance
TD21	Disease Modeling in OR
TD22	Contact Centers
TD23	Markov Decision Models and Approximations for Manufacturing
TD24	Social Network Analytics
TD25	Economic Models and Analysis of Networks and Platforms
TD26	Production and Scheduling I
TD27	Applications of Multi-objective Optimization
TD28	Dynamic Matching Markets
TD29	Joint Session Analytics/HAS:The Emerging Role of Health Systems Engineering and its Impact on Clinical Informatics and Analytics
TD30	Decision Support Systems II
TD31	Time Series Data Mining
TD32	Data Mining
TD33	Decision and Prediction Models in Healthcare
TD34	Joint Session HAS/MSOM-Healthcare: Operational Issues and Information Sharing in Healthcare
TD35	Disaster and Emergency Management II
TD36	Fire and Emergency Medical Services
TD37	Therapy and Treatment
TD38	Probability
TD39	Product brand differentiation and pricing decisions
TD40	Marketing II
TD41	Healthcare Supply Chain Decision Making
TD42	Patients and Practice: Using the Right Resources to Deliver Care
TD43	Revenue Management with Consumer Choice Models
TD44	Recent Trends in Retailing
TD45	Topics in Dynamic Pricing and Revenue Management
TD46	Service Operations
TD47	Sustainable Operations Management
TD48	New Directions at the Interface of Finance, Operations, and Risk Management
TD49	Demand Driven Supply Chains
TD50	Supply Network Management: Collaboration and Competition
TD51	Innovative and Entrepreneurial OM
TD52	Social Media and Internet Marketing
TD53	Inventory and Information Sharing
TD54	Meta-algorithms: From Algorithm Tuning and Configuration to Algorithm Portfolios
TD55	Data Envelopment Analysis (DEA)
TD56	Project Selection, Evaluation and Collaboration
TD57	Modeling the Economics of Low-Carbon Power Systems
TD58	New Insights on Electricity Markets with Uncertain Supply
TD59	Optimal Design and Operation of Smart Electrical Grids
TD60	Performance Measurement

TD61	Environmentally Responsible Operations Management
TD62	Optimization on Power Grid Application
TD63	Operations Management II
TD64	Optimization and Utility Theory
TD65	Near Miss and Threshold Events and Their Influence on Risk Perception and Behavior
TD66	Air Cargo
TD67	Topics in Transport I
TD68	Resilience in Electricity Infrastructure Systems
TD69	Connected and Autonomous Vehicles I
TD70	Tutorial: Railroad Predictive Analytics
TD71	Transportation Planning II
TD72	Design and Analysis of Data with Complex Structure
TD73	Recent Advances in Analyzing Experiments
TD74	Bayesian Applications in Industrial Statistics
TD75	IBM Research Best Student Paper Award IV
TD76	Rare Event Simulation and Network Applications
TD77	Supply Chain Optimization
TD78	Electricity Markets and Utilities
TD79	Software Demonstration – SAS/Responsive Learning Tech

Wednesday, 8:00am-9:30am

WA01	Acquisition and Logistics
WA02	Scheduling I
WA03	Logistics and Inventory Management
WA04	Economics II
WA05	Identifying Sentiment Change and Geographic Location in Social Media
WA06	Modeling and Computations in Financial Engineering
WA07	Risk Management Approaches in Engineering Applications
WA09	Innovation and Technology Management
WA11	Optimization Large Scale II
WA12	Optimization Stochastic I
WA13	Stochastic Integer Programming Methods and Applications
WA14	Advances in Information Modeling
WA15	Monitoring and Prevention of Hospital Acquired Infections
WA16	Game Theory II
WA17	Network Analysis II
WA18	Optimization Combinatorial I
WA19	Computational Optimization for Applied Problems II
WA21	Health Care Operations
WA23	Stochastic Modeling and Analysis with Applications
WA24	Robustness and Approximation in Markov Decision Processes
WA25	Managing Sustained Participation in Online Communities
WA26	Production and Scheduling II
WA27	Multi-objective Optimization and Applications
WA28	Bidding Mechanisms
WA29	Applied Analytics
WA30	Information Systems for E-Business/Commerce
WA31	Data Mining for Environmental and Natural Hazard Applications
WA32	Data Mining with Marketing Applications
WA33	Data-driven Healthcare Operations
WA34	Real World Problems, Innovative Approaches and Implementations at Geisinger Health System
WA36	Joint Session PPSN/TSL: Network Infrastructure Recovery and Resilience
WA38	Bayesian Approach I
WA39	Supply Chain Management with Marketing Considerations
WA40	Marketing III
WA41	Healthcare Operations Management
WA43	Choice Modeling Applications in Revenue Management
WA44	Dynamic Pricing
WA45	Topics in Revenue Management
WA46	Empirical Studies in Public Services: Health Care and Education
WA47	Promoting and Developing Markets for Recycling & Reuse
WA48	Supply Chain Risk Management
WA49	Inventory Problems in Online Retail
WA50	New Models and Algorithms for Exploration and Exploitation

WA51	Tradeoff Optimization
WA52	Analyzing and Managing Incentives
WA53	Retail Management I
WA54	Behavioral Models in Operations Management
WA55	Resource Allocation
WA56	Forecasting
WA57	Operations Management VII
WA58	Electric Transportation Systems Modelling
WA59	Renewables Integration: Market Clearing, Optimal Siting and Energy Storage
WA60	Joint Session ENRE & Integer and Discrete Optimization: Emerging Operational Approaches in Electric Power Systems — Transmission Switching
WA61	Electricity Access in Developing Countries
WA62	Research in Environmentally Sustainable and Socially Responsible Operations
WA63	Energy and Supply Chain Management
WA64	Operations Management III
WA65	Risk-Based Decision Making in Interdependent Systems
WA66	Decision Analysis Applications in Operations Management
WA67	Reducing Impact of Delay through Improved Airport Operations and Recovery Procedures
WA68	Freight Logistics
WA69	Inference and Control in Dynamic Routing
WA70	Connected and Autonomous Vehicles II
WA71	Recent Academic Research in Railway Applications
WA72	Traffic Management
WA73	Design and Analysis of Computer Experiments
WA74	Reliability Analysis of Complex Engineering Systems
WA75	Decision Analysis Approaches and Predictive Modeling to Managing Uncertainty in Manufacturing and Service Systems Design & Operations
WA76	Supply Chain Management IX
WA77	Simulation I
WA78	Supply Chain Closed Loop I
WA79	Energy Applications
WA80	Software Demonstration – Optimization Direct/Maximal Software Inc.

Wednesday, 11:00am-12:30pm

WB01	MAS Tutorial: A Logistics Planning System For Military Contingency Missions
WB02	Scheduling II
WB03	Newsvendor Model and Extensions
WB04	Economics III
WB05	Better Business using Social Media Analytics
WB06	Real Options
WB07	Large-scale Portfolio Risk
WB08	Optimization Nonlinear Programming II
WB09	Venture Capital Funding, Crowd Sourcing, New Product Development, and Supply Chain Transparency
WB10	Openness and IT
WB11	Planning
WB12	Optimization Stochastic II
WB13	Robust Optimization: Theory and Applications
WB14	Risk-Averse Control of Markov Systems
WB15	Healthcare Informatics
WB16	Game Theory III
WB17	Network Optimization and its Applications
WB18	Optimization Combinatorial II
WB19	Retail Analytics and Optimization
WB20	Operations Research Applications in Vaccine Pricing and Distribution
WB21	Queueing Models for Manufacturing and Service Systems
WB22	Modern Market Microstructure: Stochastic Models of Limit Order Books
WB23	Joint Session AI/ICS: Decision Diagrams for Optimization and Artificial Intelligence
WB24	Economics of Information Systems
WB25	

WB26 Production and Scheduling III
 WB27 Applications and Methodological issues on MCDM
 WB28 Economics of Auctions
 WB29 Data Analytics in Pricing and Revenue Management
 WB30 Information Systems I
 WB31 Data Analytics for Manufacturing and Healthcare Enterprise System
 WB32 Data Mining in Health Care
 WB33 Methods and Applications in Disease Detection and Treatment
 WB34 Medical Decision Making
 WB35 Urban Planning
 WB36 Humanitarian Applications IV
 WB37 Modeling and Optimization of Health Care Processes
 WB38 Bayesian Approach II
 WB39 Channel Management and Pricing
 WB40 Operations Management/Marketing Interface I
 WB41 Joint Session MSOM-Health/HAS: Incentives in Healthcare Value Chain for Drugs and Consumables
 WB42 Stochastic Models for Healthcare Applications
 WB43 Revenue Management Problems with Consumer Choice Behaviors
 WB44 Assortment Optimization
 WB45 Sustainability I
 WB46 Role of Information in Service Systems
 WB47 Sustainable Supply Chain
 WB48 Information-Related Issues in Supply Chain Management
 WB49 Supermodularity and Its Applications in Operations Management
 WB50 New Topics in Behavioral Operations
 WB51 Supply Chain Outsourcing
 WB52 Retail Management II
 WB53 Frontiers of Behavioral Operations Research
 WB55 Decision Analysis I
 WB57 Advances in Sustainable Energy and Economic Systems Analysis
 WB58 Non-Convex Equilibrium Problems
 WB59 Strategy/Strategic Planning I
 WB60 Green Manufacturing
 WB61 Integrated Biofuels Supply Chain Design
 WB62 Computational Advances in Power System Modeling
 WB63 Operations Management IV
 WB64 Teaching Methods for Decision Analysis
 WB65 Decision Making: Tradeoffs, Risk Processing and Altruism
 WB66 Aviation Day of Operations and Air Traffic Optimization
 WB67 Ocean Container Transport Logistics
 WB68 Production and Distribution Systems
 WB69 ITS in Public Transportation
 WB70 Vehicle Routing I
 WB71 Transportation Operations I
 WB72 Omni-channel Commerce and Analytics
 WB73 Bayesian Data Analytics for Quality and Reliability Assurance
 WB74 Reliability I
 WB76 Simulation II
 WB77 Supply Chain Closed Loop II
 WB78 Natural Resources
 WB79 Software Demonstration – FICO/IBM Academic Initiative Group

Wednesday, 12:45pm-2:15pm

WC01 Military Cognitive Analysis, Value based Acquisition and Military Recruiting Prediction Models
 WC02 Scheduling III
 WC03 Inventory Management for Supply Chains I
 WC04 Business Applications I
 WC05 Capitalizing on Social Media
 WC06 Financial Institutions
 WC07 Risk Management and Financial Regulation
 WC08 Finance Theory and Empirics
 WC09 Innovation and Entrepreneurship I
 WC10 E-Business/Commerce I
 WC11 Optimization Integer Programming II
 WC12 Optimization Stochastic III
 WC13 Data Driven Optimization and Applications II
 WC16 Game Theory IV
 WC17 Optimization Network
 WC18 Optimization Robust I
 WC19 Heuristics
 WC21 Healthcare Capacity Planning Models
 WC22 Learning and Queues
 WC23 Control of Queues
 WC24 Constraint and Mixed Integer Programming
 WC26 Project Management I
 WC27 Multicriteria Decision Making I
 WC28 Optimization Stochastic V
 WC29 Decision Analytics Applications in the Media Industry
 WC30 Information Systems II
 WC31 Data-driven Operations Management of Energy Systems
 WC32 Data Mining Methodology
 WC33 Health Care Operations Management
 WC34 Joint Session HAS/Analytics: Unleashing the Potential of Big Data using Visualization in Health Care Delivery
 WC35 Global Issues I
 WC36 Modeling Disease Transmissions Using Contact Networks
 WC37 Health Care Strategy and Policy I
 WC38 Optimization Heuristic Programming
 WC39 Operations Management and Marketing Interface
 WC40 Operations Management/Marketing Interface II
 WC41 Healthcare Operations
 WC43 Innovative Pricing Strategies
 WC44 Contemporary Challenges in Pricing and Revenue Management: Repetitive Purchases and Loss Aversion
 WC45 Sustainability II
 WC46 Sustainability and New Business Models
 WC47 Incentive Issues in Sustainable Operations
 WC48 Revenue Management Pricing I
 WC49 Incentive and Compensation Schemes in Supply Chains

Welcome to Philadelphia!

Home of Independence Hall, Rocky, the Liberty Bell, cheesesteaks... and

SIAM®

Since its inception in 1952, the Society for Industrial and Applied Mathematics (SIAM) has been headquartered in Philadelphia and today serves more than 14,000 members worldwide. We invite you to visit the SIAM Booth (#8) to browse new books in the MOS-SIAM Series on Optimization, as well as other bestselling titles. While you're there, be sure to pick up free copies of SIAM journals (including SIOPT and SIGCOMP) and SIAM News and learn more about all that SIAM membership offers.

Electrical Transmission System Cascades and Vulnerability: An Operations Research Viewpoint

Daniel Bienstock

MOS-SIAM Series on Optimization 22

Power grid robustness is a complex problem for two reasons: the underlying physics is mathematically complex, and modeling is complicated by lack of accurate data. This book sheds light on this complex problem by introducing the engineering details of power grid operations from the basic to the detailed and describing how to use optimization and stochastic modeling, with special focus on the modeling of cascading failures and robustness.

Arc Routing: Problems, Methods and Applications

Ángel Corberán and Gilbert Laporte, Editors

MOS-SIAM Series on Optimization 20

This thorough and up-to-date discussion of arc routing by world-renowned researchers is organized by problem type and offers a rigorous treatment of complexity issues, models, algorithms, and applications. It opens with a historical perspective of the field and is followed by three sections that cover complexity and the Chinese Postman and the Rural Postman problems; the Capacitated Arc Routing Problem and routing problems with min-max and profit maximization objectives; and important applications, including meter reading, snow removal, and waste collection.

Introduction to Nonlinear Optimization: Theory, Algorithms, and Applications with MATLAB

Amir Beck

MOS-SIAM Series on Optimization 19

Readers will find more than 170 theoretical, algorithmic, and numerical exercises that deepen and enhance their understanding of nonlinear optimization. The author includes several subjects not typically found in optimization books—for example, optimality conditions in sparsity-constrained optimization, hidden convexity, and total least squares. The book also offers a large number of applications discussed theoretically and algorithmically.

Evaluating Gas Network Capacities

Thorsten Koch, Benjamin Hiller, Marc E. Pfetsch, Lars Schewe, Editors

MOS-SIAM Series on Optimization 21

This book provides an introduction to the field of gas transportation planning and discusses in detail the advantages and disadvantages of several mathematical models that address gas transport within the context of the technical and regulatory framework. It shows how to solve the models using sophisticated mathematical optimization algorithms and includes examples of large-scale applications of mathematical optimization to this real-world industrial problem.

List \$99.00 • MOS/SIAM Member \$69.30 • Attendee \$79.20 • MO21

Vehicle Routing: Problems, Methods, and Applications, Second Edition

Paolo Toth and Daniele Vigo, Editors

MOS-SIAM Series on Optimization 18

The text of this new edition is either completely new or significantly revised and provides extensive and complete state-of-the-art coverage of vehicle routing by those who have done most of the innovative research in the area. It emphasizes methodology related to specific classes of vehicle routing problems and, since vehicle routing is used as a benchmark for all new solution techniques, contains a complete overview of current solutions to combinatorial optimization problems.

2014 • xviii + 463 pages • Softcover • 978-1-611973-58-7
List \$119.00 • MOS/SIAM Member \$83.30 • Attendee \$95.20 • MO18
