1 **AOAC SMPR 2016.XXX; Version 3**

2
3 **Method Name:** **Detection and Identification of *Variola Virus***

4
5 Approved Body: *AOAC Stakeholder Panel on Agent Detection Assays*

6 Approval Date:

7 Final version date:

8
9 **1. Intended Use:** Laboratory use by trained technicians.

10
11 **2. Applicability:** Detection of *Variola virus* DNA in collection buffers from aerosol collection
12 devices for DoD applications

13
14 Note: Method developers are advised to check the AOAC website for the most up to date version of
15 this SMPR before initiating a validation.

16
17 **3. Analytical Technique:** Polymerase Chain Reaction (PCR) Methods.

18
19 **4. Definitions:**

20
21 **Acceptable Minimum Detection Level (AMDL)**

22 The predetermined minimum level of an analyte, as specified by an expert committee that must
23 be detected by the candidate method at a specified probability of detection (POD). The AMDL is
24 dependent on the intended use. (Draft ISO 16140) ¹

25
26 **Exclusivity**

27 Study involving pure non-target strains, that are potentially cross-reactive, that shall not be
28 detected or enumerated by the tested method. (Draft ISO 16140)²

29
30 **Inclusivity**

31 Study involving pure target strains that shall be detected or enumerated by the alternative
32 method. (Draft ISO 16140)³

33
34 **Maximum Time-To-Assay Result**

35 Maximum time to complete an analysis starting from the collection buffer to assay result.

36
37 **Probability of Detection (POD)**

38 The proportion of positive analytical outcomes for a qualitative method for a given matrix at a
39 specified analyte level or concentration with a ≥ 0.95 confidence interval. ⁴ .

40
41 **System False-Negative Rate**

¹ Draft EN ISO/CD 16140-1: Microbiology of food and animal feeding stuffs - Method validation - Part 1:
Terminology of method validation, vs 17-03-2011

³ *Ibid.*

⁴ Appendix H: Probability of Detection (POD) as a Statistical Model for the Validation of Qualitative Methods,
Official Methods of Analysis of AOAC INTERNATIONAL, 19th edition, 2012.

Pre-decisional Draft, Do Not Distribute

42 Proportion of test results that are negative contained within a population of known positives.

43

44 **System False-Positive Rate**

45 Proportion of test results that are positive contained within a population of known negatives.

46

47 ***Variola virus***

48 A member of the genus *Orthopoxvirus* and the causative agent of smallpox.

49

50 **5. System suitability tests and/or analytical quality control:**

51 The controls listed in Annex I shall be embedded in assays as appropriate. Manufacturer must
52 provide written justification if controls are not embedded in the assay.

53

54 **6. Validation Guidance:**

55

- 56 • AOAC INTERNATIONAL Methods Committee Guidelines for Validation of Biological Threat
57 Agent Methods and/or Procedures (AOAC INTERNATIONAL Official Methods of Analysis,
58 2012, Appendix I).

64
65

7. Method Performance Requirements:

Parameter	Minimum Performance Requirement
Acceptable Minimal Detection Level (AMD L)	50,000 copies/ml of <i>Variola virus</i> target DNA in the candidate method sample collection buffer. Copies/ml refers to number of viral genomes or equivalent plasmid copies containing target viral gene or gene fragment.
Probability of Detection at AMD L within sample collection buffer	≥ 0.95
Probability of Detection at AMD L in an aerosol environmental matrix	≥ 0.95 (Annex V; part 1)
Inclusivity panel purified DNA	All inclusivity strains (Annex II) must test positive at 2x the AMD L [†]
Exclusivity panel purified DNA	All exclusivity strains (Annex III and Annex V; part 2) must test negative at 10x the AMD L [†]
System False-Negative Rate using spiked aerosol environmental matrix	≤ 5% (Annex V; Part 1)
System False-Positive Rate using aerosol environmental matrix	≤ 5% (Annex V; Part 1)
Maximum Time to Assay Result	≤ 4 hours
Notes: [†] 100% correct analyses are expected. All aberrations are to be re-tested following the AOAC Guidelines for Validation of Biological Threat Agent Methods and/or Procedures ⁵ . Some aberrations may be acceptable if the aberrations are investigated, and acceptable explanations can be determined and communicated to method users.

67
68

ANNEX I: Controls

Control	Description	Implementation
Positive Control	<p>This control is designed to demonstrate an appropriate test response. The positive control should be included at a low but easily detectable concentration, and should monitor the performance of the entire assay. The purpose of using a low concentration of positive control is to demonstrate that the assay sensitivity is performing at a previously determined level of sensitivity. It is recommended that a technique (ie unique distinguishable signature) is used to confirm whether the positive control is the cause of a positive signal generated by a sample.</p>	<p>Single use per sample (or sample set) run</p>
Negative Control	<p>This control is designed to demonstrate that the assay itself does not produce a detection in the absence of the target organism. The purpose of this control is to rule-out causes of false positives, such as contamination in the assay or test.</p>	<p>Single use per sample (or sample set) run</p>
Inhibition Control	<p>This control is designed to specifically address the impact of a sample or sample matrix on the assay's ability to detect the target organism.</p>	<p>Single use per sample run</p>

Pre-decisional Draft, Do Not Distribute

Annex II: Inclusivity Panel

The inclusivity panel shall include:

- Sequences from at least two representative strains, one strain from each major clade of *Variola virus* (Li, et. al. *On the origin of smallpox: correlating variola phylogenics with historical smallpox records*. *PNAS* (2007) Oct. 2;104 (40):15787-15792.)
- Any other strain with differences in the assay primer and/or probe target sequences based on bioinformatic analysis. See Annex IV.

Note: The World Health Organization (WHO) restricts access to *Variola virus* genomic material; use of any genomic sequences greater than 500 bp requires written permission/approval from the WHO. Insertion of *Variola virus* DNA into other *Orthopoxviruses* is prohibited.

More details can be found at:

102 **Annex III: Exclusivity Panel (near-neighbor)**

103

104 The exclusivity panel shall include:

105

- 106 • All poxvirus strains listed in the table below (Note: See AOAC Website for the
107 most recent list.)
- 108 • Any additional strains determined through the bioinformatics analysis,
109 performed in accordance with Annex IV, with greater similarity to the assay's
110 target region(s) than the strains listed in the table below.

111

112

113 **CORE EXCLUSIVITY PANEL**

114

Annex IV: Bioinformatics Analyses of Signature Sequences underlying *Variola Virus* Assays

In silico screening will be performed on signature sequences (eg: oligo primers) to demonstrate specificity to *Variola virus* and inclusivity across all sequenced *Variola virus* strains.

In silico results are suggestive of potential performance issues, so will guide necessary additions to the wet screening panels. *In silico* identification of potential cross-reactions (false positives) or non-verifications (false negatives) would require the affected strains be included in the exclusivity or inclusivity panels, respectively, if available.

A vendor-selected tool to carry out the bioinformatics evaluation should be able to predict hybridization events between signature components and a sequence in a database including available genomic sequence data, using public genbank nt [<http://www.ncbi.nlm.nih.gov/genbank/>]. The selected tool should be able to identify predicted hybridization events based on platform annealing temperatures, thus ensuring an accurate degree of allowed mismatch is incorporated in predictions. The program should detect possible amplicons from any selected database of sequence.

Potential tools for *in silico* screening of real-time PCR signatures include:

- <http://sourceforge.net/projects/simulatepcr/files/?source=navbar>
 - [This program will find all possible amplicons and real time fluorescing events from any selected database of sequence.](#)
- [NCBI tools](#)

The vendor submission should include:

- Description of sequence databases used in the *in silico* analysis
- Description of conditions used for *in silico* analysis
 - Stringency of *in silico* analysis must match bench hybridization conditions
- Description of tool used for bioinformatics evaluation
 - Data demonstrating the selected tool successfully predicts specificity that has been confirmed by wet-lab testing on designated isolates
 - These data can be generated retrospectively using published assays
- List of additional strains to be added to the inclusivity (Annex II) or exclusivity (Annex III) panels based on the bioinformatics evaluation

Pre-decisional Draft, Do Not Distribute

154 **Annex V: Environmental Factors For Validating Biological Threat Agent Detection Assays**

155

156 [Adapted from the Environmental Factors Panel approved by SPADA on June 10, 2010.]

157

158 The Environmental Factors Studies supplement the biological threat agent near-neighbor exclusivity
159 testing panel. It is critical to understand the performance of the method in the presence of these
160 environmental factors. This panel is used to characterize assay performance in the presence of these
161 factors. There are three parts to Environmental Factors studies: part 1 - environmental matrix
162 samples; part 2 - the environmental organisms study; and part 3 - the potential interferents
163 applicable to Department of Defense applications.⁶

164

165

166 **Part 1:**

167

168 **Environmental Matrix Samples - Aerosol Environmental Matrices**

169

170 Method developers shall obtain environmental matrix samples that are representative and consistent
171 with the collection method that is anticipated to ultimately be used in the field. This includes
172 considerations that may be encountered when the collection system is deployed operationally such
173 as collection medium, duration of collection, diversity of geographical areas that will be sampled,
174 climatic/environmental conditions that may be encountered and seasonal changes in the regions of
175 deployment.

176

177 Justifications for the selected conditions that were used to generate the environmental matrix and
178 limitations of the validation based on those criteria must be documented.

179

- 180 • Method developers shall test the environmental matrix samples for interference using samples
181 inoculated with a target biological threat agent sufficient to achieve 95% probability of detection.
- 182 • Cross-reactivity testing will include sufficient samples and replicates to ensure each
183 environmental condition is adequately represented.

184

185

⁶ Added in June 2015 for the Department of Defense project.

Pre-decisional Draft, Do Not Distribute

186

187

Part 2: Environmental Panel Organisms - This list is comprised of identified organisms from the environment.

188

189

190

Inclusion of all environmental panel organisms is not a requirement if a method developer provides appropriate justification that the intended use of the assay permits the exclusion of specific panel organisms. Justification for exclusion of any environmental panel organism(s) must be documented and submitted.

191

192

193

194

195

Organisms and cell lines may be tested as isolated DNA, or as pools of isolated DNA. Isolated DNA may be combined into pools of up to 10 panel organisms, with each panel organism represented at 10 times the AMDL, where possible. The combined DNA pools are tested in the presence (at 2 times the AMDL) and absence of the target gene or gene fragment. If an unexpected result occurs, each of the individual environmental organisms from a failed pool must be individually re-tested at 10 times the AMDL with and without the target gene or gene fragment at 2x the AMDL in the candidate method DNA elution buffer.

196

197

198

199

200

201

202

203

DNA in this list that already appear in the inclusivity or exclusivity panel do not need to be tested again as part of the environmental factors panel.

Part 3: Potential Interferents Study

The Potential Interferents Study supplements the Environmental Factors Study, and is applicable to all biological threat agent detection assays for Department of Defense applications. Table 1a provides a list of potential interferents that are likely to be encountered in various Department of Defense applications.

Method developers and evaluators shall determine the most appropriate potential interferents for their application. Interferents shall be spiked at a final test concentration of 1 µg/ml directly into the sample collection buffer. Sample collection buffers spiked with potential interferents shall be inoculated at 2 times the AMDL (or AMIL) with one of the target biological threat agents.

Spiked / inoculated sample collection buffers shall be tested using the procedure specified by the candidate method. A candidate method that fails at the 1 microgram per ml level may be reevaluated at lower concentrations until the inhibition level is determined.

It is expected that all samples are correctly identified as positive.

337
338

Table 5a: Potential Interferents

Compounds		Potential Theaters of Operation
group 1: petroleum-based	JP-8 ¹	airfield
	JP-5 ²	naval

339
340
341
342

Table 1a is offered for guidance and there are no mandatory minimum requirements for the number of potential interferents to be tested.

¹ **JP-8.** Air Force formulation jet fuel.

Pre-decisional Draft, Do Not Distribute

² **JP-5.** A yellow kerosene-based jet fuel with a lower flash point developed for use in aircraft stationed aboard aircraft carriers, where the risk from fire is particularly great. JP-5 is a complex mixture of hydrocarbons, containing alkanes, naphthenes, and aromatic hydrocarbons.

³ **Burning rubber** (tire smoke). Gaseous C1-C5 hydrocarbons: methane; ethane; isopropene; butadiene; propane. Polycyclic aromatic hydrocarbons (58-6800 ng/m³): parabenzo(a)pyrene; polychlorinated dibenzo-p-dioxins (PCDD); polychlorinated dibenzofurans (PCDF). Metals (0.7 - 8 mg/m³): zinc; lead; cadmium.

⁴ **Terephthalic acid.** Used in the AN/M83 hand grenade currently used by US military.

⁵ **Zinc chloride smoke.** Also known as “zinc chloride smoke” and “HC smoke”. Was used in the M8 grenade and still used in 155mm artillery shells. HC smoke is composed of 45% hexachloroethane, 45% zinc oxide, and 10% aluminum.

⁶ **Solvent yellow 33** [IUPAC name: 2-(2-quinoly)-1,3-indandione] is a new formulation being developed for the M18 grenade.

⁷ **Brake fluid.** DOT 4 is the most common brake fluid, primarily composed of glycol and borate esters. DOT 5 is silicone-based brake fluid. The main difference is that DOT 4 is hydroscopic whereas DOT 5 is hydrophobic. DOT 5 is often used in military vehicles because it is more stable over time requires less maintenance

⁸ **Brake dust.** Fe particles caused by abrasion of the cast iron brake rotor by the pad and secondly fibers from the semi metallic elements of the brake pad. The remainder of the dust residue is carbon content within the brake pad.

⁹ **MIL-L-63460**, "Military Specification, Lubricant, Cleaner and Preservative for Weapons and Weapons Systems"; trade name “Break-Free CLP”. Hyperlink: [Midway USA](#).

Pre-decisional Draft, Do Not Distribute

¹⁰ **High explosives.** The M795 155mm projectile is the US Army / Marine Corp's current standard projectile containing 10.8 kg of TNT. The M795 projectile replaced the M107 projectile that contained Composition B which is a 60/40 mixture of RDX/TNT. RDX is cyclotrimethylene trinitramine. Suggestion: test RDX/TNT together.

¹¹ **Artillery propellant.** Modern gun propellants are divided into three classes: single-base propellants which are mainly or entirely nitrocellulose based, double-base propellants composed of a combination of nitrocellulose and nitroglycerin, and triple base composed of a combination of nitrocellulose and nitroglycerin and nitroguanidine. Suggestion: test total nitrocellulose/ nitroglycerin nitroguanidine together.
