WELCOME AND INTRODUCTION

NEW

UPPER GI: TECHNICAL AND CLINICAL CHALLENGES FOR RADIATION ONCOLOGISTS

28 - 31 May 2016

Brussels, Belgium

ESTRO School

COURSE AIM

The aim of the course is to support an interactive educational environment by peer review of each step of radiation therapy practice (indication, prescription, delineation, planning, IGRT, outcome evaluation) according to the modern available technologies and knowledge and taking care of the clinician, physicist and RTT perspectives.

COURSE AIM

Specialists of different disciplines will support the radiation oncology audience in understanding the clinical needs, anatomic and pathologic details, and the therapeutic achievements needed to exploit the radiation technology at the best.

WELCOME AND INTRODUCTION

COURSE AIM

- Radiation Oncologists
Vincenzo Valentini (IT)
Marcel Verheij (NL)
Philippe Maingon (FR)

- Physicist,
Dirk Verellen (BE)

- RTT
Lisa Wiersema (NL)

- Delineation Administrator
Francesco CELLINI, RO (I)

- Surgeon,
William Allum (UK)

- Medical oncologist
Florian Lordick (DE)
Alain Hendlisz (BE)

- Radiologist
Angela Riddell (UK)

- Pathologist
Alexander Quaas (DE)

LEARNING OUTCOMES

By the end of this course, for each upper GI tumour site, participants should be able to practice:

- Proper indication for radiation therapy in a multidisciplinary perspective
- Prescription
- Tailored delineation according to tumour location and stage
- Dose distribution optimisation and comparison
- Optimal use of available IGRT technologies
- Proper monitoring of tumour response an control.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 1: Prescription

Participants will be invited to make their prescription on cases, that will be afterward delineated and planned in the following sessions, by a monkey questionnaire. Lectures on imaging based staging and state of art of treatment will help the final discussion.

COURSE CONTENT

Clinical cases

Esophageal

- Mid third
- GEJ

Gastric

- Partial gastrectomy
- Total gastrectomy

WELCOME AND INTRODUCTION

COURSE CONTENT

Esophageal cancer			
Session 1 Prescription	13.00-13.30	**Prescription interactive exercise**	All
	13.30-14.50	**Lecture (20'): Imaging based staging and response evaluation**	A.Riddell
		Lecture (20'): state of art of surgery in a combined treatment perspective	W.Allum
		Lecture (20'): state of art of radiation therapy in a combined treatment perspective	V.Valentini
		Lecture (20'): state of art of chemotherapy in a combined treatment perspective	A.Hendlisz
	14.50-15.30	**Prescription interactive exercise**	All teachers

WELCOME AND INTRODUCTION

COURSE CONTENT

30 May (Monday)			Speaker
Gastric cancer			
Session 7 Prescription	8.30-9.00	**Prescription interactive exercise**	All
	9.00-10.20	**Lecture (20'): Imaging based staging**	A.Riddell
		Lecture (20'): state of art of surgery in a combined treatment perspective	W.Allum
		Lecture (20'): state of art of radiation therapy in a combined treatment perspective	V. Valentini
		Lecture (20'): state of art of chemotherapy in a combined treatment perspective	F.Lordick
	10.20-11.00	**Prescription interactive exercise**	All teachers

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 2: Delineation (Falcon session)

The previously discussed cases will be available for a tutored small working group delineation exercise. A video on surgical procedure highlighing the key surgical steps to better understand local anatomy will be commented by a surgeon.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 2: Delineation (Falcon hands-on session)	16.00 – 16.45	**Hands-on: Group 1 delineation Middle Third**	Tutors: M.Verhej, F.Cellini, L.Wiersema
		Hands-on: Group 2 video on surgical procedure (highlight of key surgical steps)	W.Allum
	16.45 – 17.30	**Hands-on: Group 2 delineation Middle Third**	Tutors: M.Verhej, F.Cellini, L.Wiersema
		Hands-on: Group 2 video on surgical procedure (highlight of key surgical steps)	W.Allum

WELCOME AND INTRODUCTION

COURSE CONTENT

Anticipation Session 4	17.30-17.50	**Lecture (20'): Chemotherapy toxicity constraints**	A.Hendlisz

COURSE CONTENT

Session 3: Delineation

Lectures on primary tumour extension and nodal subsite involvement based on pathology evaluation and modern imaging will support the final recommendation for subsite delineation by stage and tumour position for the delineated cases.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 3: Delineation	8.30 – 10.30	**Lecture (15'): Primary tumor extension pathology evaluation**	A.Quaas
		Lecture (15'): Nodal subsite involvement for stage and tumor position	A.Quaas
		Lecture (30'): Imaging of primary and nodal subsite boundaries?	A.Riddell
		Lecture (20'): recommendation for subsite delineation by stage and tumor position	P.Maingon
		Discussion on delineation exercises (40')	All teachers

Session 9: Delineation	14.00 – 16.05	**Lecture (20'): Primary tumor extension and nodal subsite involvement**	A.Quaas
		Lecture (20'): Imaging of primary and nodal subsite boundaries?	A.Riddell
		Lecture (20'): incidence and location of local recurrences after combined treatment	W.Allum
		Lecture (20'): recommendation for subsite delineation by stage and tumor position	F.Cellini
		Discussion on delineation exercises (45')	All teachers

COURSE CONTENT

Session 4: In room imaging guided radiotherapy

The choice among competitive plans for the cases by interactive systems will be supported by lectures on dose issues for tumour control and constrains for organ at risk.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 4: Planning	11.00 – 12.40	**Lecture (20'): Dose issues in esophageal tumor control**	M. Verheij
		Lecture (20'): Dose constrains for organ at risk	P.Maingon
		Interactive lecture (60'): choice among competitive plans for early and locally advanced esophageal cancer	D.Verellen
Session 10: Planning	16.30 – 18.00	**Lecture (20'): Dose issues in gastric tumor control**	M. Verheij
		Lecture (20'): Dose constrains for organ at risk	P. Maingon
		Lecture (20'): Chemotherapy toxicity constraints	F.Lordick
		Interactive lecture (60'): choice among competitive plans for gastric cancer	D.Verellen

COURSE CONTENT

Session 5: Planning

Drill and practice exercise in small working groups on how to determine PTV margin, and IGRT by portal imaging and CT cone beam will favor discussion on the daily dose delivery issues.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 5: In room imaging guided radiotherapy	14.00 – 14.45	**Hands-on: Group 1 How to determine PTV margin**	D.Verellen
		Hands-on: Group 2 Tips and tricks on in room IGRT	M. Verheij, F.Cellini, L.Wiersema
	14.45 – 15.30	**Hands-on: Group 2 How to determine PTV margin**	D.Verellen
		Hands-on: Group 1 Tips and tricks on in room IGRT	P. Maingon, F.Cellini, L.Wiersema

COURSE CONTENT

Session 6: What we learn by failure analysis and future perspective

The challenge of tumour recurrence will be addressed by lectures on how to distinguish primary recurrence vs nodal recurrence by imaging, on incidence and location of local recurrences and on the new treatment perspectives.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 6: what we learn by failure analysis and future perspective	15.50 – 17.00	**Lecture (15'): how to distinguish primary recurrence vs nodal recurrence by imaging**	A.Riddell
		Lecture (15'): incidence and location of local recurrences after only surgery	W.Allum
		Lecture (15'): incidence and location of local recurrences after only radiotherapy	M. Verheij
		Discussion (10')	All teachers
		Lecture (15'): new perspectives in esophageal cancers	P. Maingon

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 12 : what we learn by failure analysis and future perspective	10.30 – 11.30	**Lecture (20'): how to distinguish recurrence by imaging**	A.Riddell
		Lecture (20'): new perspectives in gastric cancers	M. Verheij
		Discussion (20')	
Session 13 : end of the course	11.30 – 12.00	**Take home messages**	V. Valentini

ESTRO School

Imaging based staging and response evaluation in Esophageal Cancer

Dr Angela M Riddell

Royal Marsden, London. UK

ESTRO School

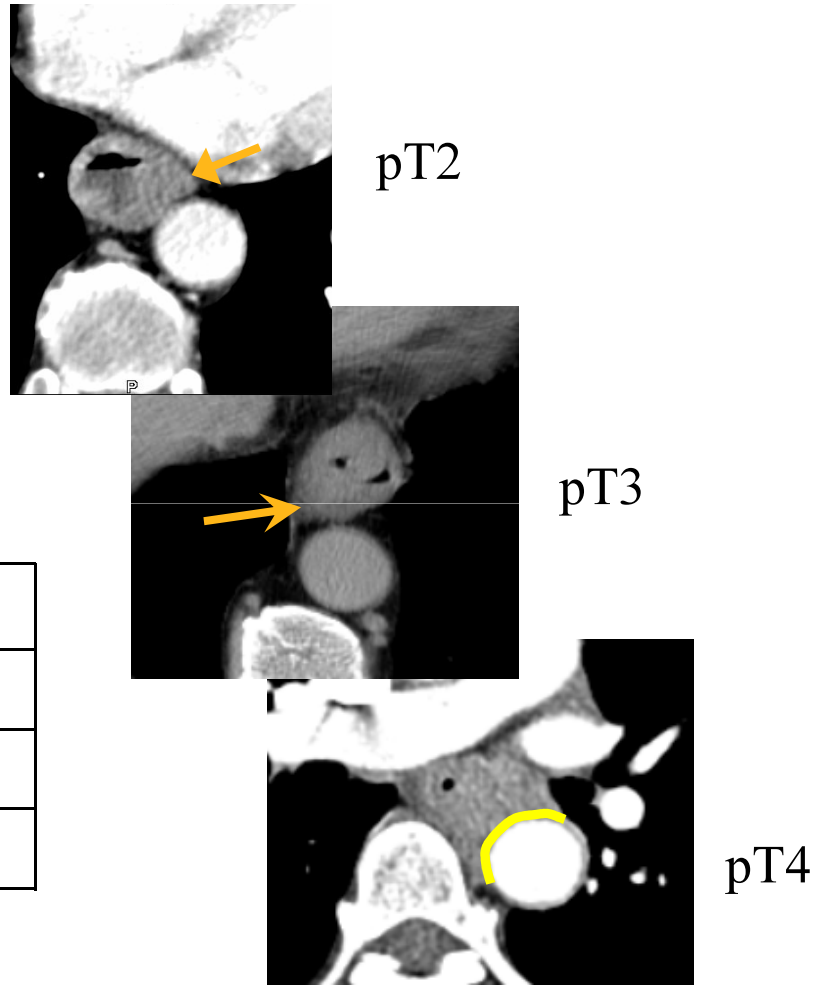
Esophageal Cancer - Current Staging Strategy

- Diagnosis – Endoscopic biopsy
- Initial Imaging:
  - MDCT
- Potentially curable disease:
  - EUS – Early disease, Proximal/ Distal Extent
  - PET/CT – exclude distant spread
  - Laparoscopy

T staging - MDCT

Initial Staging

- T stage - based on wall thickness and outline
- Limited soft tissue contrast
- Poor for early tumours



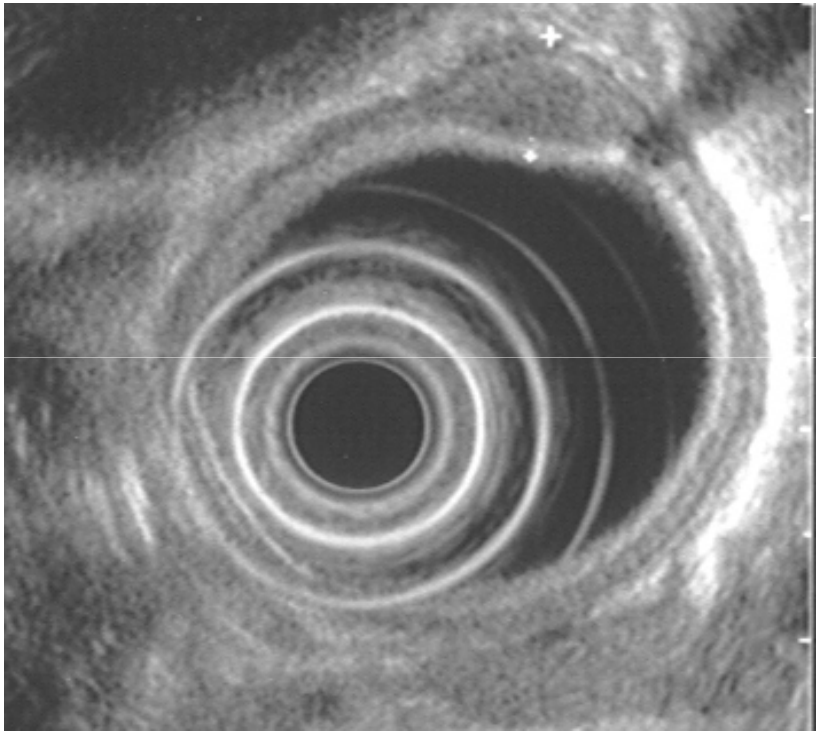
T Stage	Wall thickness	Wall Contour
T2	>3mm, <5mm	Smooth
T3	5-15mm	Irregular
T4	>15mm	Contact with adjacent structure

T Staging Accuracy - 74%*

* Davies, A. R., D. A. Deans, et al. (2006). Dis Esophagus **19**(6): 496-503

T staging - Endoscopic Ultrasound (EUS)

- Endoscopic Ultrasound is able to delineate the layers of the oesophageal wall
- More accurate staging of tumours confined within the wall (<T3)



pT1 tumour

Courtesy of Dr Martin Benson

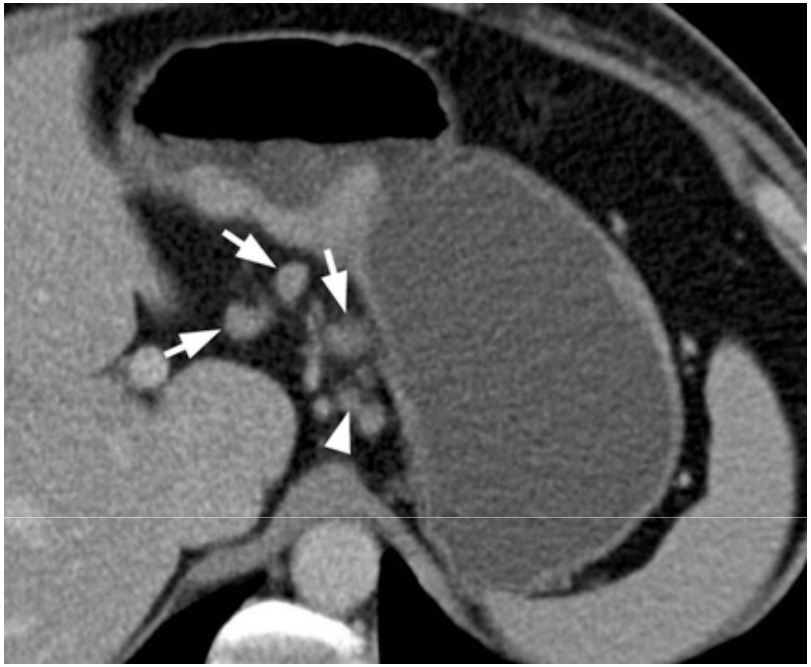
T Staging - EUS

- Limitation: stenotic tumours
- These tumours are likely to be locally advanced*
- Such patients should be offered neoadjuvant therapy

*Worrell, S. G., D. S. Oh, et al. (2014). J Gastrointest Surg **18**(2): 318-320.

N Staging - MDCT

- CT - high specificity, but low sensitivity
- Based on size criteria (short axis):
  - ≥6mm perigastric
  - ≥ 8mm extra perigastric
  - ≥10mm mediastinum



Accuracy of N staging	
Oesophageal Cancer	68%*
Gastric Cancer	67%†

Stage	No of Regional Nodes
N1	≤2
N2	3-6
N3	≥7

* Davies, A. R., D. A. Deans, et al. (2006). Dis Esophagus **19**(6): 496-503
†Hur, J., M. S. Park, et al. (2006). J Comput Assist Tomogr **30**(3): 372-7.

N Staging - MDCT

Tumour volume related to nodal burden*

Figure 1

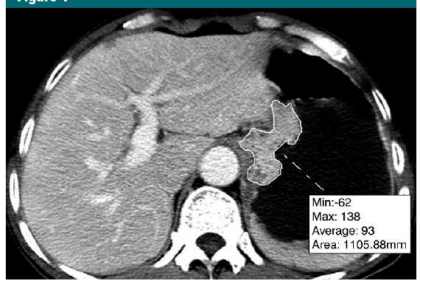


Figure 1: Transverse contrast-enhanced CT scan in 56-year-old man with AEG. Tumor area is manually drawn along margin of tumor, and value of this area (1105.88 mm) is automatically derived by software together with minimal, maximal, and average CT attenuation (in Hounsfield units).

Table 2

Gross Tumor Volume according to N Stage

N Stage	Stage T1–T3 (n = 216)	Stage T3 (n = 175)
N0	15.77 ± 6.95 (14.07, 17.48)	18.08 ± 10.00 (15.68, 20.49)
N1	27.01 ± 14.73 (23.11, 30.92)	28.83 ± 14.82 (24.62, 33.04)
N2	27.92 ± 14.49 (24.04, 31.85)	28.49 ± 14.15 (24.28, 32.69)
N3	38.62 ± 17.60 (32.83, 44.40)	38.82 ± 17.79 (32.89, 44.75)
N1–N2	27.46 ± 14.56 (24.74, 30.18)	28.66 ± 14.72 (25.74, 31.58)

Note.—Data are means ± standard deviations. Numbers in parentheses are 95% confidence intervals of the volume.

Table 3

ROC Analysis of Gross Tumor Volume in the Determination of N Stage

Gross Tumor Volume Cutoff	Comparison Groups	AUC	Sensitivity (%)	Specificity (%)	PPV (%)	NPV (%)	Accuracy (%)
Stage T1–T3 (n = 216)							
15.23 cm^3	N0 vs N1–N2	0.81	86 (96/112)	64 (42/66)	80 (96/120)	72 (42/58)	77 (138/178)
17.16 cm^3	N0 vs N1–N3	0.84	81 (122/150)	68 (45/66)	85 (122/143)	62 (45/73)	77 (167/216)
33.96 cm^3	N1–N2 vs N3	0.73	60 (23/38)	80 (90/112)	51 (23/45)	86 (90/105)	75 (113/150)
Stage T3 (n = 175)							
18.41 cm^3	N0 vs N1–N2	0.77	78 (78/100)	60 (23/38)	84 (78/93)	51 (23/45)	73 (101/138)
19.30 cm^3	N0 vs N1–N3	0.80	77 (105/137)	66 (25/38)	89 (105/118)	44 (25/57)	74 (130/175)
33.96 cm^3	N1–N2 vs N3	0.71	62 (23/37)	79 (79/100)	52 (23/44)	85 (79/93)	74 (102/137)

Note.—Numbers in parentheses are numbers of patients. AUC = area under the ROC curve, NPV = negative predictive value, PPV = positive predictive value.

ESTRO School

Response to chemotherapy / CRT

Methods used for assessing response:

- MDCT: Response Evaluation Criteria in Solid Tumours (RECIST)

^{18}FDG-PET/CT:

- Standardised Uptake Value (SUV mean / max)
- Metabolic tumour volume (MTV)
- Total lesion glycolysis (TLG)

MRI:

- Apparent Diffusion Coefficient (ADC)

Response to chemotherapy / CRT

Predict outcome for OG patients

- responders to neoadjuvant therapy benefit most post surgery
- non-responders to neoadjuvant therapy have a poorer prognosis post op than those who have primary surgery alone*β
- Individualise patient care

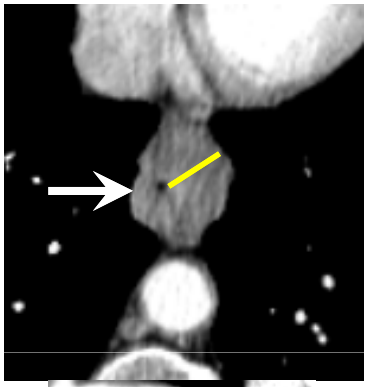
*Ancona E, Ruol A et al. 2001. Cancer; 91:2165-2174

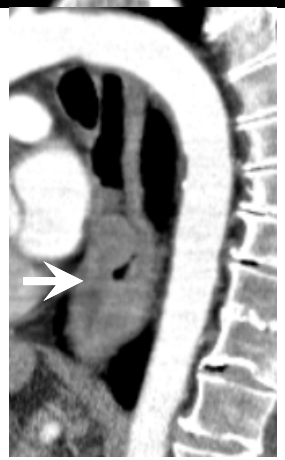
βLaw S, Fok M et al 1997. J Thorac Cardiovasc Surg; 14: 210-217

ESTRO School

Response to chemotherapy / CRT

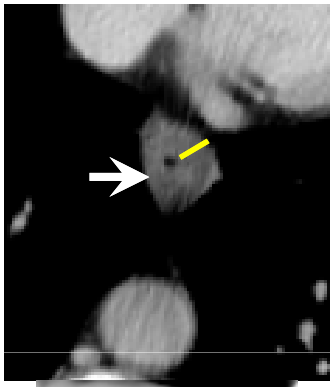
Multidetector Computed Tomography (MDCT)

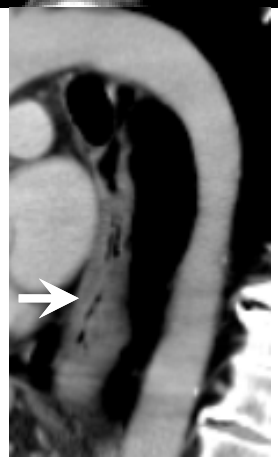




Sept 2012

3 cycles chemo



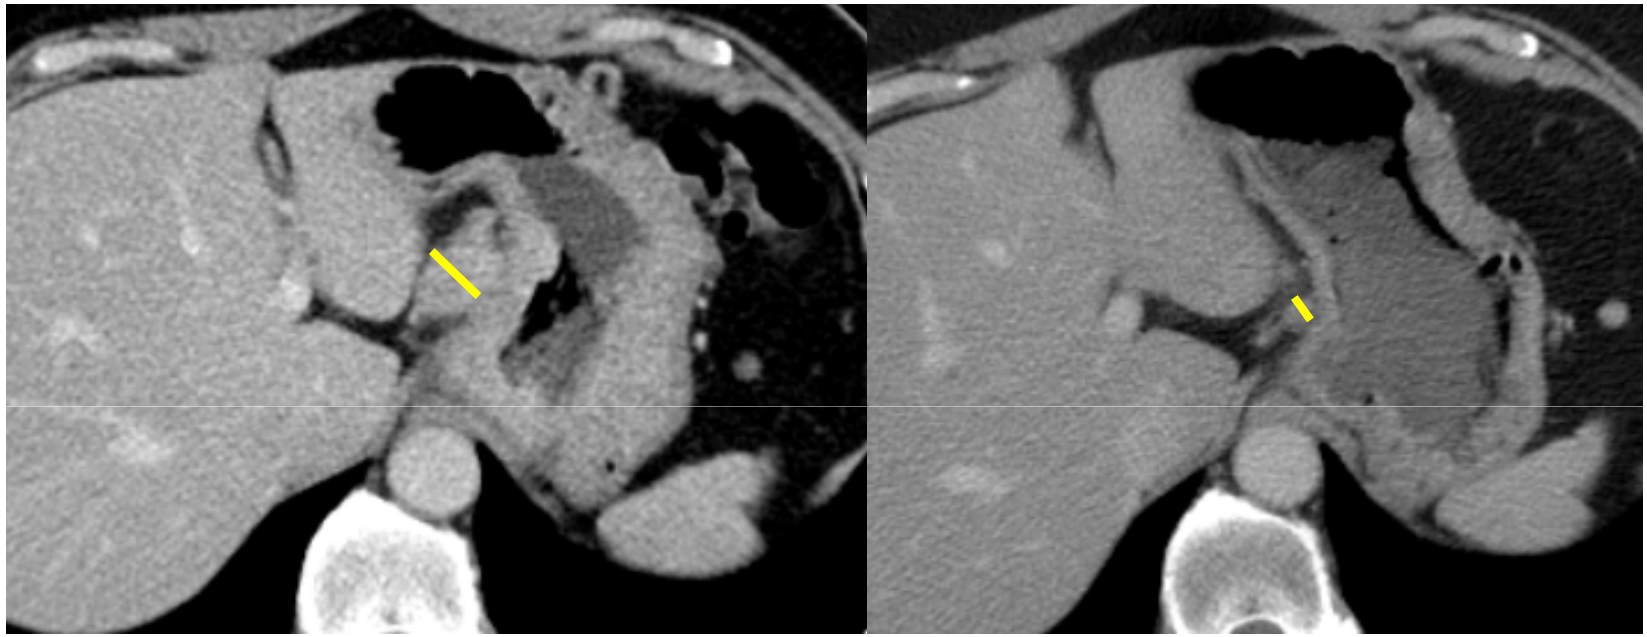


Dec 2012

Response by RECIST

ESTRO School

Response to chemotherapy / CRT



MDCT – measurement of lymph node size &/or metastases offer more consistent measures of response by RECIST

Response to chemotherapy / CRT

Challenges for MDCT

- Differences in luminal distension
- Lack of soft tissue contrast
- Unable to differentiate fibrosis & tumour

Detection of response by CT:

Sensitivity: 27 – 55%; Specificity: 50 – 91%*Ψ

*Cerfolio RJ, Bryant AS, Ohja B et al 2005. J Thorac Cardiovasc Surg; 129:1232-1241
ΨSwisher SG, Maish M, Erasmus JJ et al 2004. Ann Thorac Surg; 78: 1152 - 1160

MDCT - Restaging after neoadjuvant chemotherapy

- Predicted T stage correctly in 34 % (12/35)
- Overstaged 49 % (17/35)
- Understaged 17 % (6/35)*

- Accurate N stage was noted in 69 % (24/35)

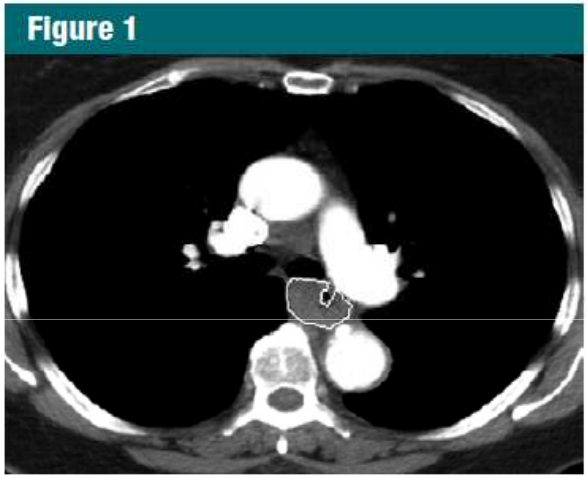
- Assessment of oesophageal tumour response should focus on combined morphologic and metabolic imaging

*Konieczny, A., P. Meyer, et al. (2013). Eur Radiol 23(9): 2492-2502.

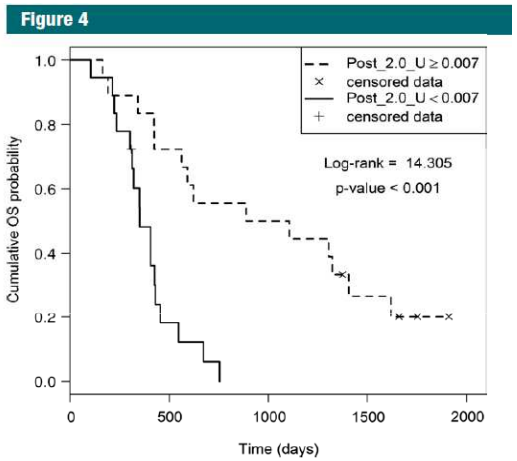
ESTRO School

Response to chemotherapy / CRT

CT Textural analysis §



ROI placed round the tumour



Kaplan-Meier survival analysis stratified by the uniformity of distribution of grey levels

Post treatment uniformity of 0.007 or higher is a positive prognostic indicator (median survival 33.2 months vs 11.7 months) §

§ Yip C, Landau B et al 2014. Radiology 270;1: 141-148

ESTRO School

Response to chemotherapy / CRT

EUS – assessment of treatment response

•50% reduction in cross-sectional area or tumour thickness*β:

- response to treatment
- improved survival

*Willis J, Cooper GS et al 2002. Gastrointest Endosc 55;655-661

βOta M, Murata Y et al 2005. Dig Endosc 17; 59-63

ESTRO School

EUS - Reassessment after neoadjuvant chemotherapy (NAC)

Challenges for EUS post neoadjuvant therapy

- Unable to differentiate fibrosis / inflammation from tumour *(resulting in over-staging)*
- Unable to detect microscopic of viable tumour *(resulting in under-staging)*
- T staging accuracy 29%
  - Overstaged 23/45 (51%)
  - Understaged 7/45 (16%)
- N staging accuracy 62%
- Conclusion: EUS is an unreliable tool for staging esophageal cancer after NAC*

*Heinzow, H. S., H. Seifert, et al. (2013). J Gastrointest Surg **17**(6): 1050-1057.

ESTRO School

^{18}FDG-PET/CT - Response to chemotherapy / CRT

- Metabolic response occurs early
  - Studies (eg MUNICON*) have used a reduction in the standardised uptake value (SUV) at 14 days

- SUV_{max} reduction of 35-60% have been shown to correlate with pathological response §

*Lordick F, Ott K et al. 2007 Lancet Oncol 8;9:797-805

§ Bruzzi J, Munden R et al. 2007. Radiographics 27;1635 - 1652

ESTRO School

^{18}FDG-PET/CT - Response to chemotherapy / CRT

^{18}FDG-PET/CT

Meta analysis >1500 patients*

- Conclusion: metabolic response on ^{18}FDG-PET is a significant predictor of long-term survival data

*Schollaert, P., R. Crott, et al. (2014). J Gastrointest Surg 18(5): 894-905

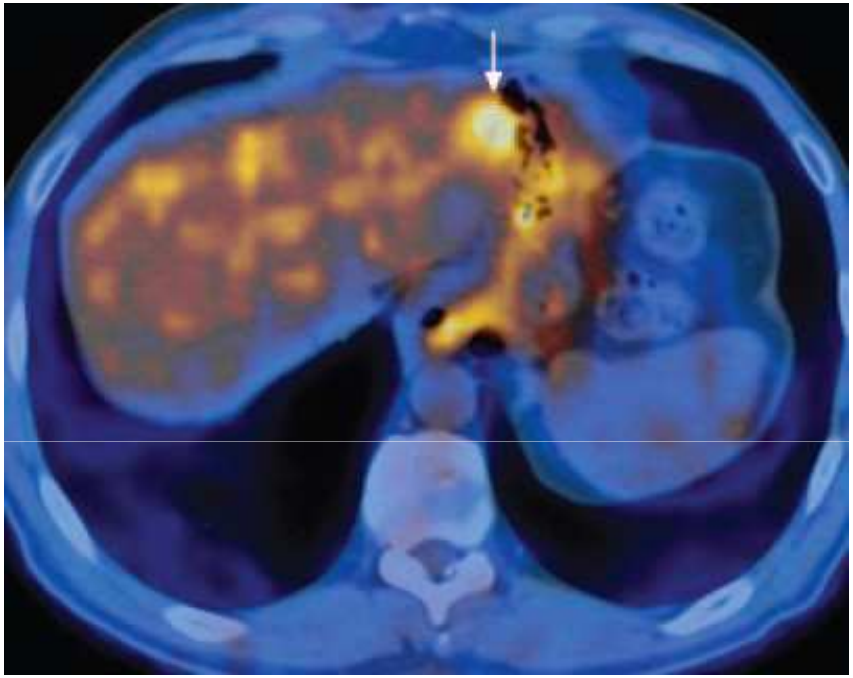
ESTRO School

Response to chemotherapy / CRT

Challenges for PET-CT

- False-positive interpretations
  - Post radiation therapy (due to inflammation/ulceration) – after 14/7 treatment
  - Change related to mucosal biopsy
  - Radiation damage to surrounding organs (eg liver)

Response to chemotherapy / CRT



Example of false positive PET-CT – area of increased FDG avidity in liver represents radiation induced necrosis/inflammation

Taken from: Bruzzi J, Munden R et al. 2007. Radiographics 27;1635 - 1652

ESTRO School

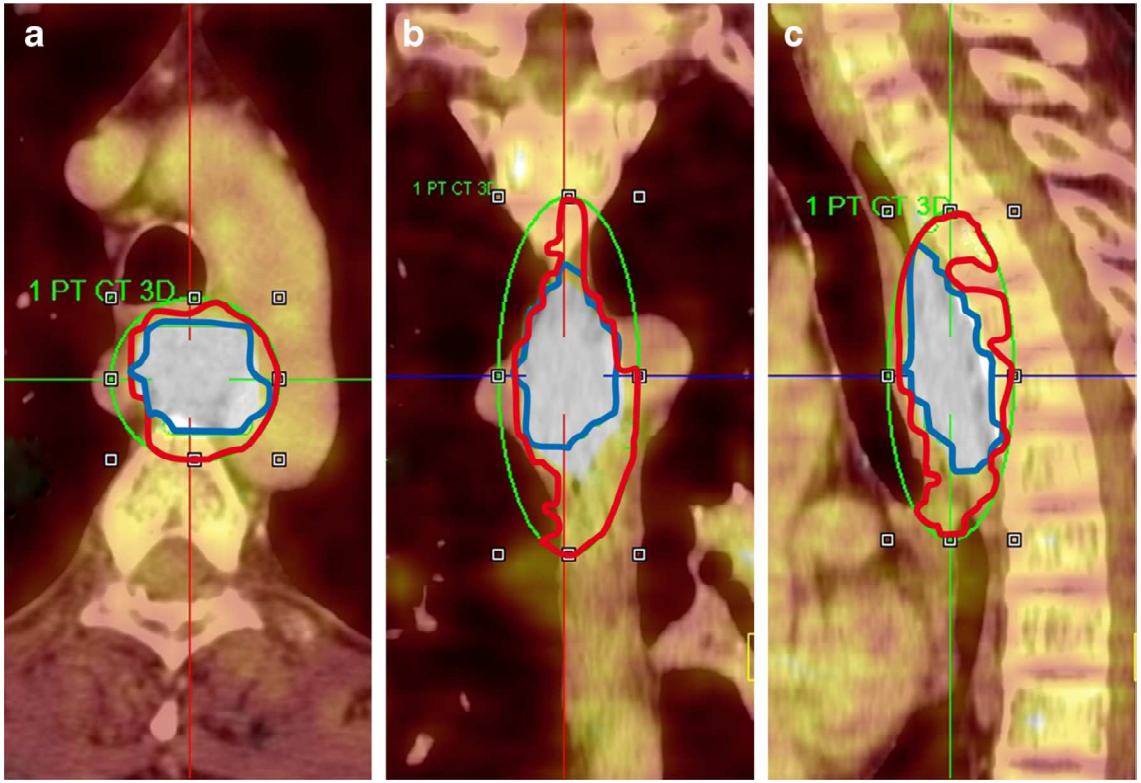
Response to chemotherapy / CRT

Current status for PET-CT

Recognised that PET SUV_{max} does not account for tumour heterogeneity

- Alternatives:
- Metabolic Tumour Volume (MTV)
  - Volume of tumour above a threshold of SUV_{max}
- Total Lesion Glycolysis (TLG)
  - MTV x SUV_{mean}

Response to chemotherapy / CRT



PET/CT images shown with delineation of MTV the SUV threshold of 40% SUV_{max} (Blue) and 25% SUV_{max} (red)

Tamandl D, Gore RM, Fueger B et al. 2015 Eur Radiol Jun 5 [Epub ahead of print]

ESTRO School

Response to chemotherapy / CRT

MTVratio & TLGratio shown to be independent predictors of OS following neoadjuvant chemoradiotherapy*

Table 2 Data are presented as medians with ranges in parentheses. *SUV* standard uptake value; *MTV* metabolic tumour volume; *TLG* total lesion glycolysis

Variable	Before chemotherapy	After chemotherapy	Ratio	*P* Value
CT volumetry (n=84)				
Tumour volume, mL	32.4 (4.6-278.3)	27.6 (0.0-210.6)	0.79 (0.0-2.65)	0.003
Maximum tumour thickness, mm	15 (6-29)	12 (5-27)	0.80 (0.38-1.85)	<0.001
PET metabolic parameters (SUV threshold 2.5, n=50)				
SUV_{mean}	5.2 (3.4-13.3)	3.5 (0.0-12.2)	0.65 (0.0-1.16)	<0.001
SUV_{max}	17.3 (6.2-63.8)	7.8 (0.0-56.4)	0.49 (0.0-1.93)	<0.001
MTV, mL	45.7 (4.0-242.3)	16.1 (0.0-358.7)	0.41 (0.0-7.65)	0.002
TLG, mL	272.5 (14.0-1491.6)	57.8 (0.0-1420.3)	0.31 (0.0-6.68)	<0.001
PET metabolic parameters (SUV threshold 4.0, n=50)				
SUV_{mean}	7.1 (4.6-17.7)	5.0 (0.0-16.3)	0.70 (0.0-1.22)	<0.001
SUV_{max}	18.6 (6.2-63.8)	8.2 (0.0-56.4)	0.49 (0.0-1.93)	<0.001
MTV, mL	22.0 (1.0-119.4)	4.1 (0.0-109.9)	0.20 (0.0-2.41)	<0.001
TLG, mL	171.8 (4.8-1177.2)	21.9 (0.0-654.9)	0.15 (0.0-2.68)	<0.001

Patients with a decrease in MTV of >50% or a decrease in TLG of >60% were shown to have superior overall survival

*Tamandl D, Gore RM, Fueger B et al. 2015 Eur Radiol Jun 5 [Epub ahead of print]

ESTRO School

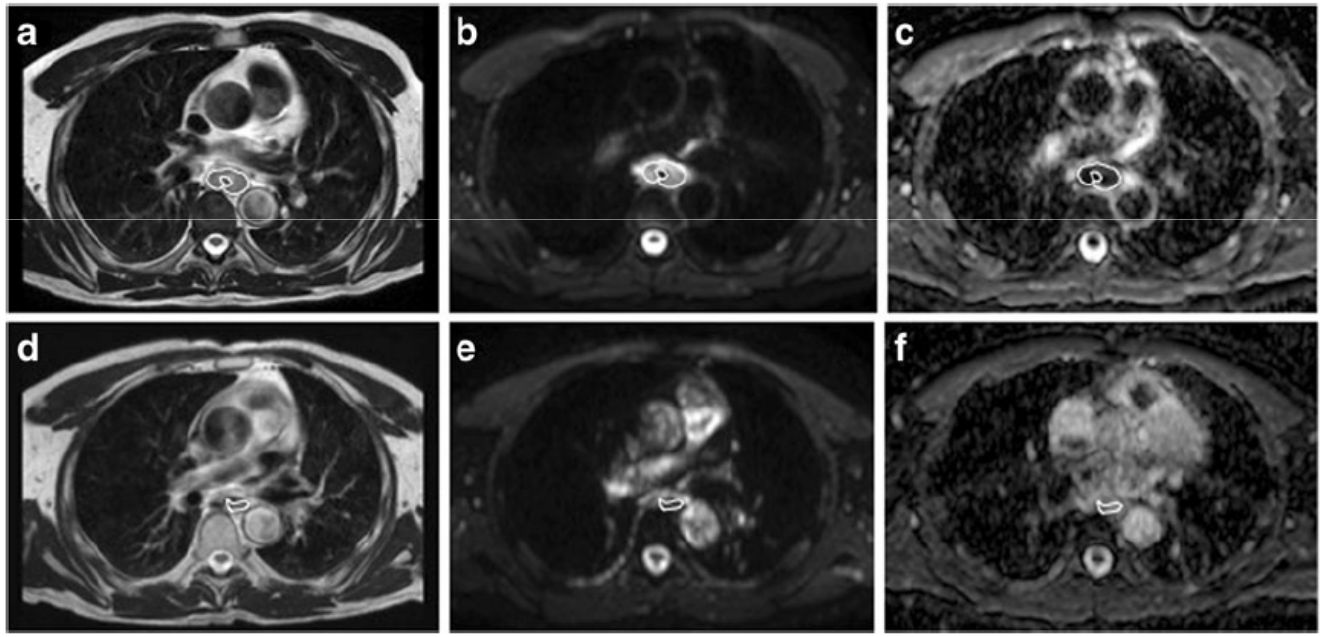
Response to chemotherapy / CRT

Current status for PET-CT

- Useful for response assessment, but consensus required for
  - timing of scan
  - optimised parameter to use to measure response (SUV_{max}, SUV_{mean} or MTV)
  - % change in the parameter that equates to response

Response to chemotherapy / CRT

Response assessment with Diffusion weighted MRI



Ax T2 DWI ADC

De Cobelli F, Giganti F et al 2013. Eur Radiol 23;2165-2174

ESTRO School

Response to chemotherapy / CRT

Responders

- Lower pre treatment ADC
- Higher post treatment ADC
- Change in ADC was inversely proportional to the pathology tumour regression grade

De Cobelli F, Giganti F et al 2013. Eur Radiol 23;2165-2174

ESTRO School

ADC as a prognostic biomarker

Limited small group studies

- Baseline ADC values ≤1.4 x$10^{-3}$$mm^2$/s were associated with poor prognosis

- ADC value correlated with tumour T stage[δ]

- Both for patients undergoing surgery alone & following neoadjuvant therapy*

*Giganti F, Salerno A, Ambrosi A et al. 2015 Radiol Med Sep 21 [Epub ahead of print]

[δ]Aoyagi T, Shuto K, Okazumi S et al. 2011 Dig Surg;28(4):252-7

ESTRO School

Summary

Initial Staging

- MDCT
- EUS
- ^{18}FDG-PET/CT

Provide

- TNM staging
- prognostic information

Individualise Patient care

Summary

Response Assessment

MDCT

•RECIST – relies on alteration in size; assumes reduction equates to response

PET-CT

•Useful for early response assessment

•Consensus required on technique & values used for response (SUV_{max}; MTV; TLG)

DW-MRI

•Potential to quantify response – further validation required to determine utility of ADC as a predictive biomarker

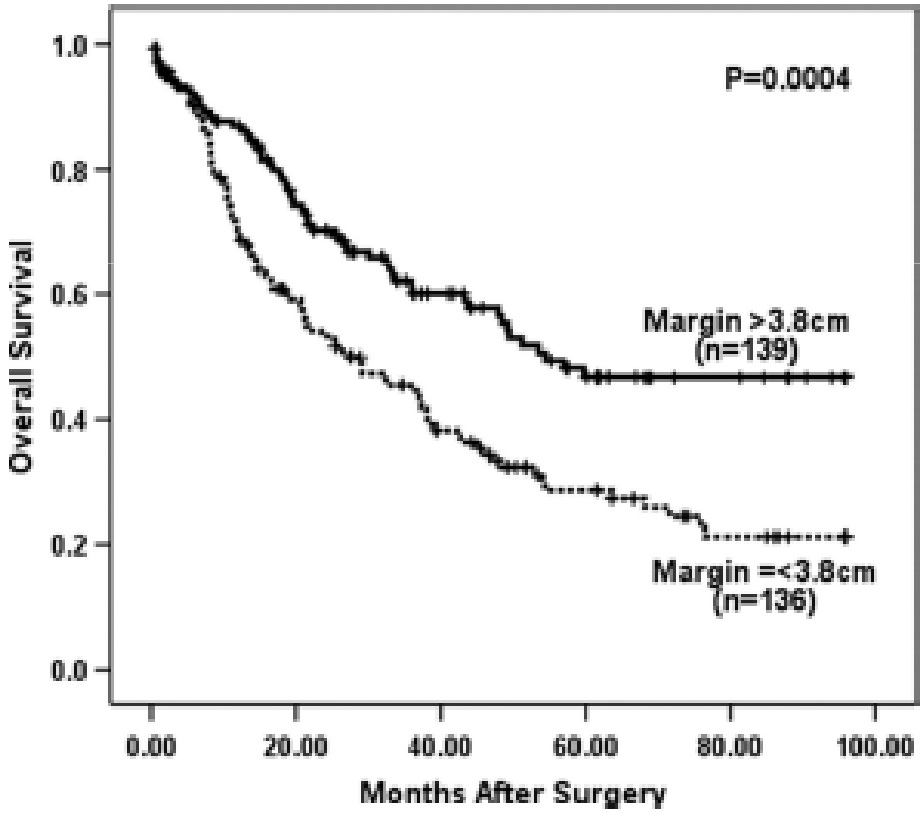
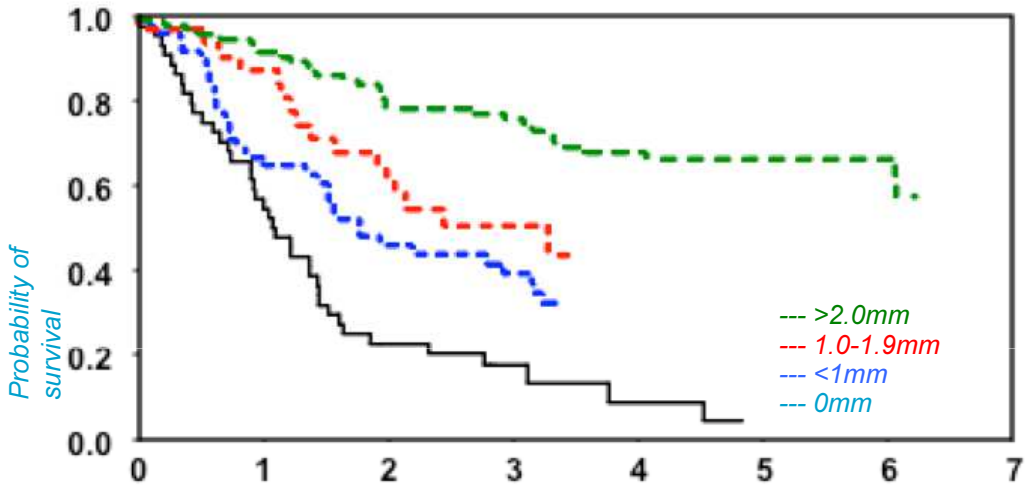
Resection Margin and Survival



Barbour et al. Ann Surg 246: 1-8

Circumferential resection margin (CRM) size correlates with overall survival

Prospective database, single institution study, N = 229

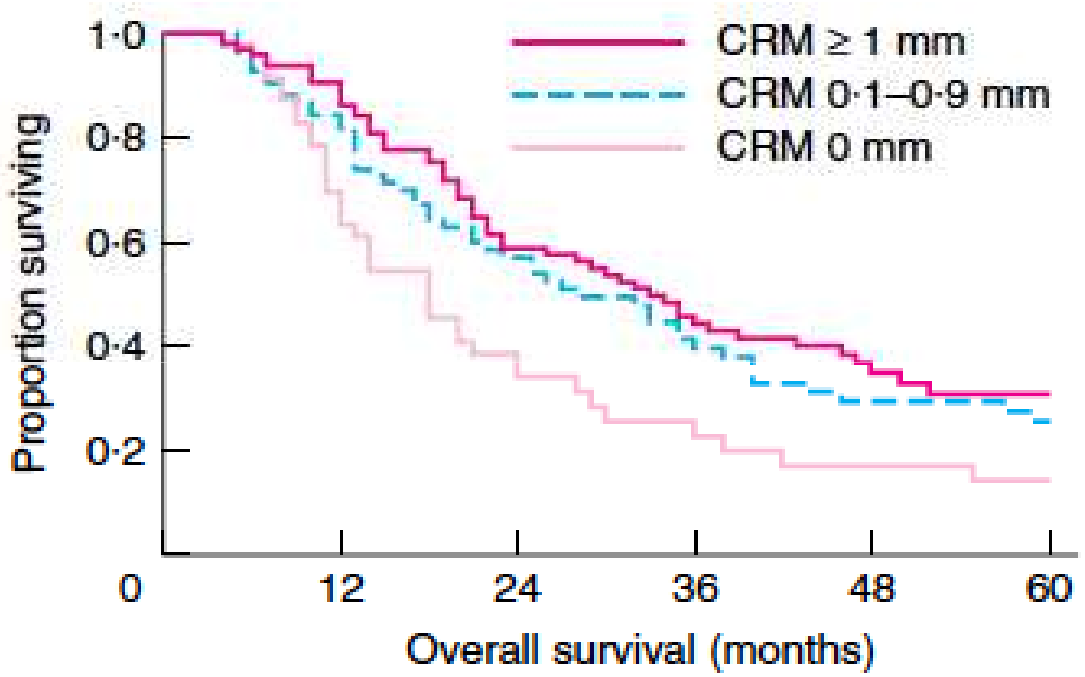


CRM	n	Median Survival (95% CI)
Positive	**45**	**1.2 yrs** (0.9-1.4)
<1mm	**48**	**1.9 yrs** (1.4-3.2)
1.0-1.9mm	**31**	**3.5 yrs** (2.0–no upper CI)
≥ 2.0mm	**105**	**Not reached**

- *CRM size is a significant prognostic factor for overall survival*
- *40.6% of patients in this study had a CRM <1mm*
- *Post operative chemoradiation did not alter survival in patients with CRM <1mm*
- *BUT smaller CRM may just reflect a larger tumour*

Landau et al., ESMO 2010 (Abstract 711PD)

Survival by CRM



No. at risk			
CRM ≥ 1 mm	96	42	13

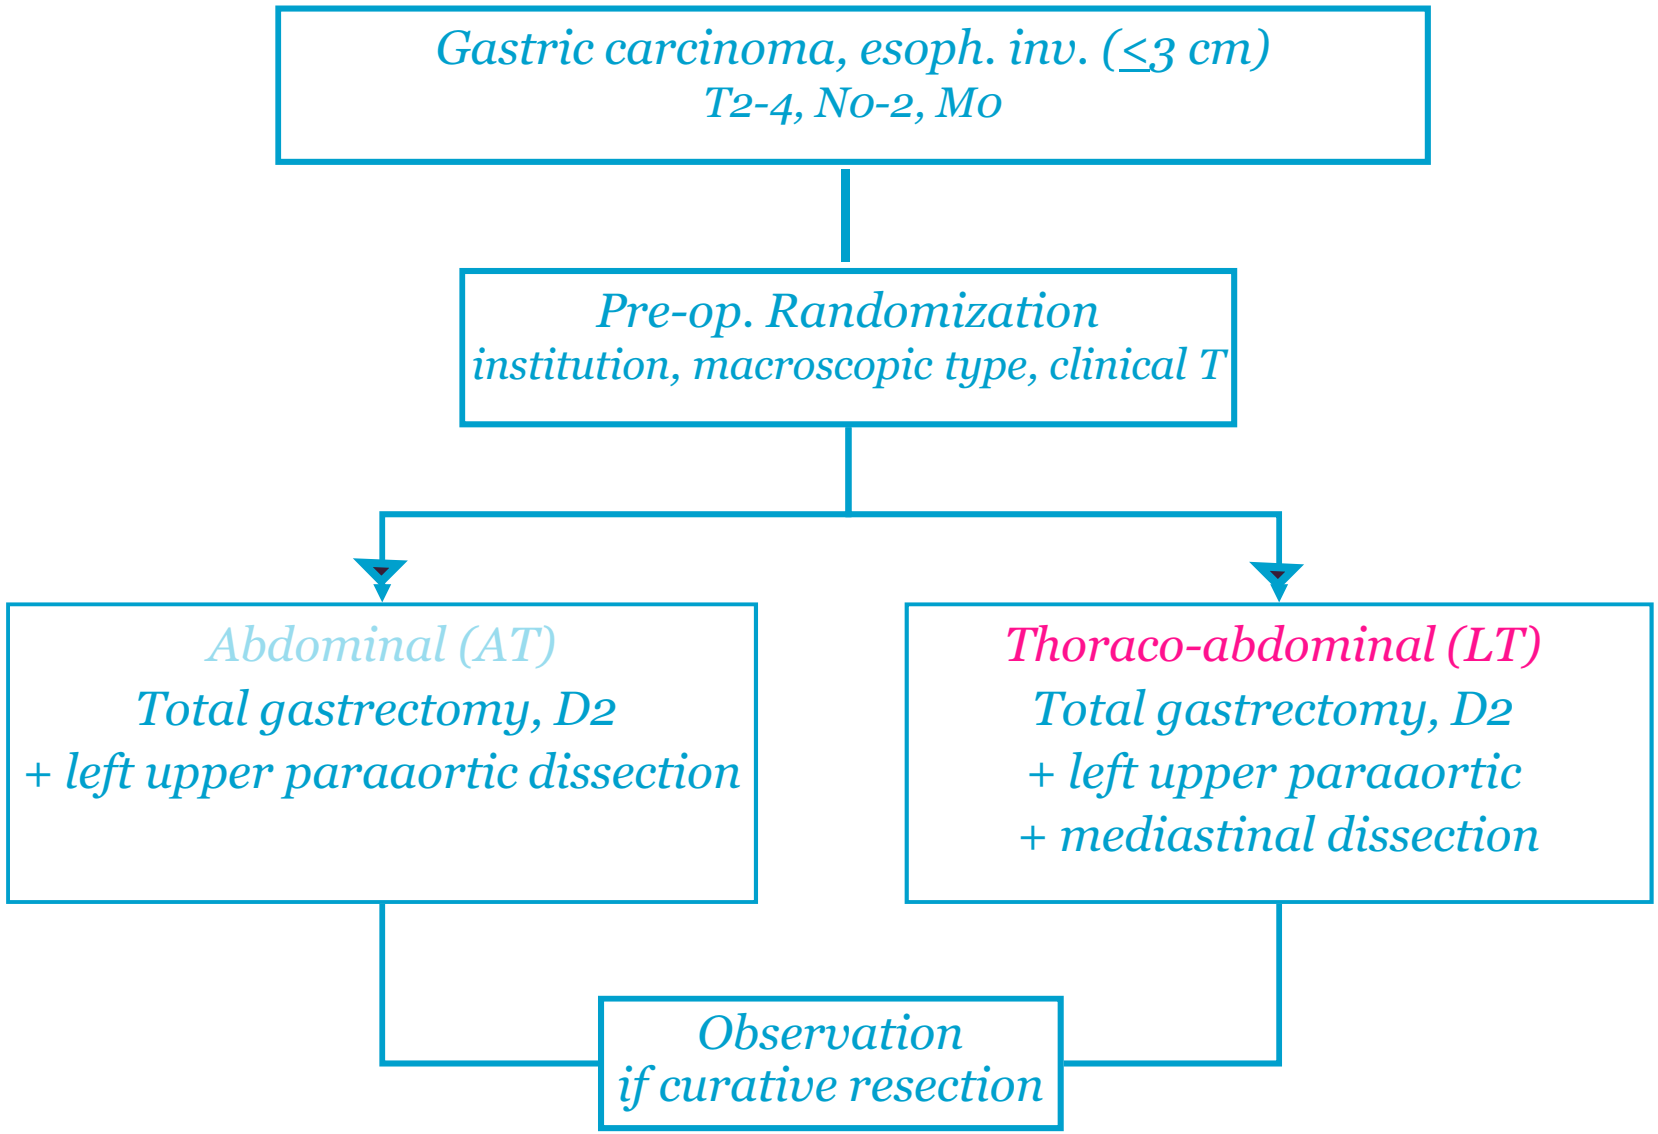
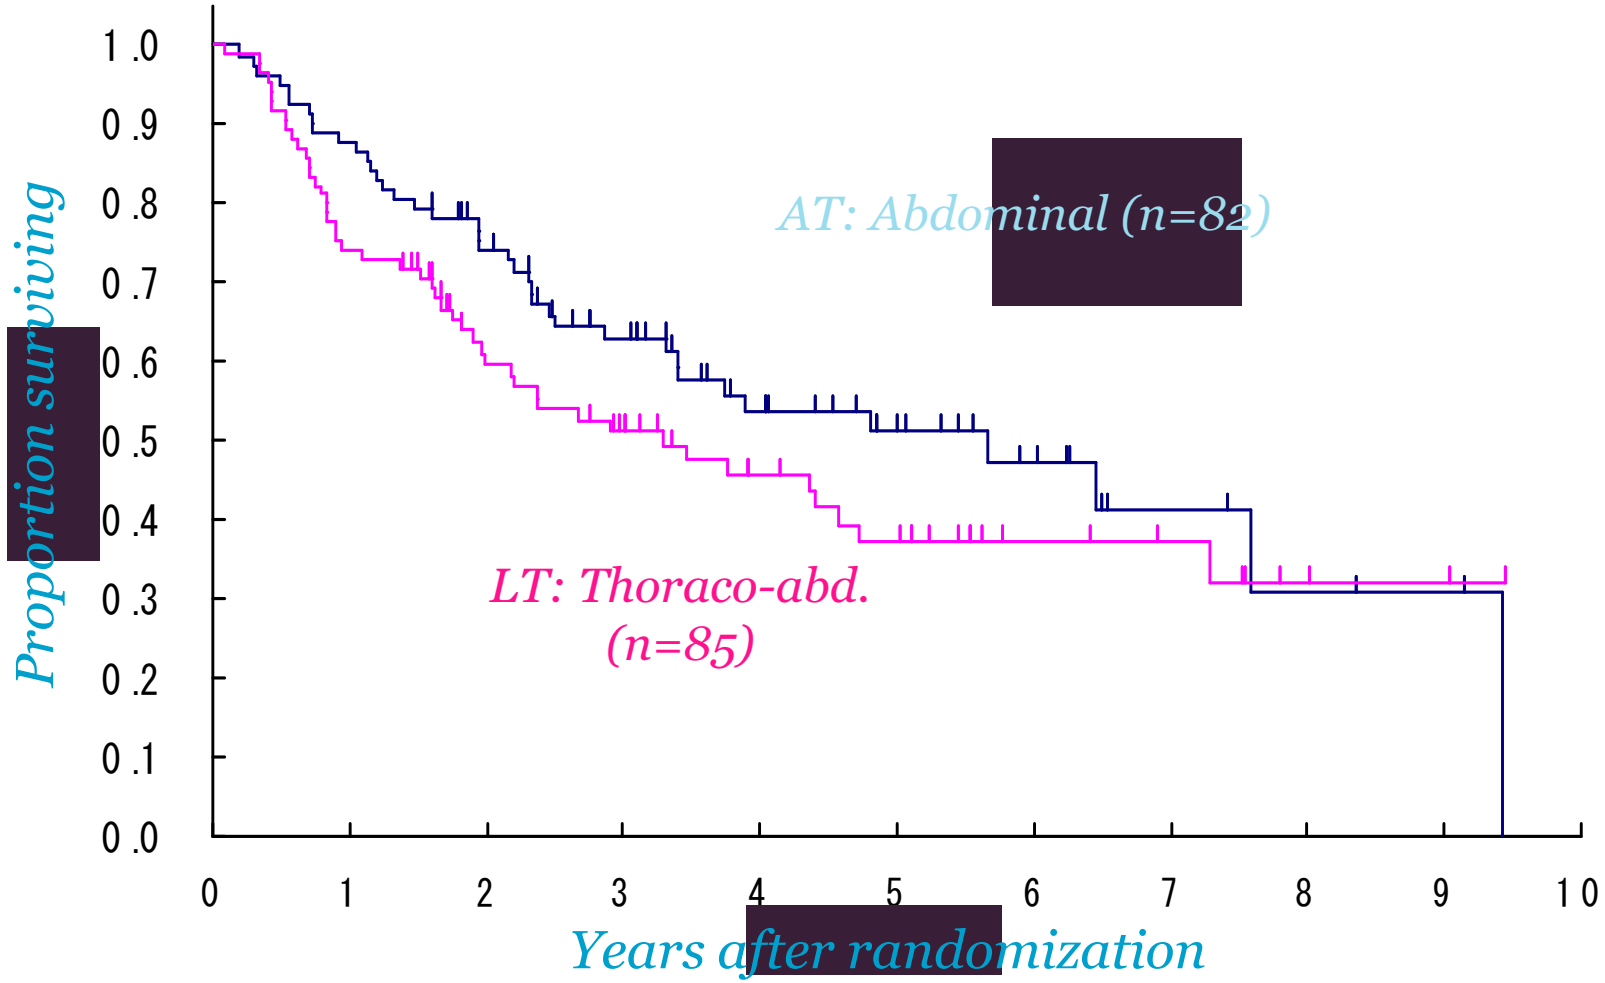
JCOG 9502: Scheme



Overall Survival



Sasako M. Lancet Oncol 2006

Conclusions of JCOG 9502

Thoraco-abdominal approach is *not* recommended for tumors of Siewert's type 2 and 3.

Health Related Quality of Life after Surgery for Junctional Cancer

63 patients
- 20 Ext TG
- 43 TTO

Better baseline scores for TTO – fitter group

6/12 HQRL lower scores after TTO
- Role and Social Function
- Global Quality of Life
- Fatigue

Barbour et al 2008, BJS 95: 80-4

Aim of Surgery for Junctional Cancer

R0 resection
Minimum 15 lymph nodes
5cm grossly normal in situ proximal oesophagus

Surgical Options According to Type

Siewert Type I	TTO / THO
Siewert Type II	TTO / THO / Ext TG
Siewert Type III	Ext TG

Resection Margin and Procedure

171 AEG Patients
- 16 Oesophagectomy
- 71 Left Thoraco-abdominal
- 84 Transhiatal

Margin: proximal limit of tumour above junction
- > 5cm – oesophagectomy
- 3 – 5cm – left thoraco-abdominal
- < 3cm - Transhiatal

Review

Survival benefit and additional value of preoperative chemoradiotherapy in resectable gastric and gastro-oesophageal junction cancer: A direct and adjusted indirect comparison meta-analysis

K. Kumagai [a,*], I. Rouvelas [a], J.A. Tsai [a], D. Mariosa [b], P.A. Lind [c,d], M. Lindblad [a], W. Ye [b], L. Lundell [a], C. Schuhmacher [e], M. Mauer [f], B.H. Burmeister [g], J.M. Thomas [g], M. Stahl [h], M. Nilsson [a]

Kumagai *et al*; EJSO 2015

✓ Is Preoperative Chemoradiation **detrimental for surgery?**

neoadjuvant CT plus S vs S alone

no evidence to suggest that neoadjuvantCT increased the risk of any type of postoperative complication.

neoadjuvant CRT plus S vs S alone

no evidence to suggest that neoadjuvant CRT increased the risk of any type of postoperative complication.

SCC higher risk of total postoperative mortality and treatment-related mortality compared with surgery alone. No difference with ADK

Surgery according to location

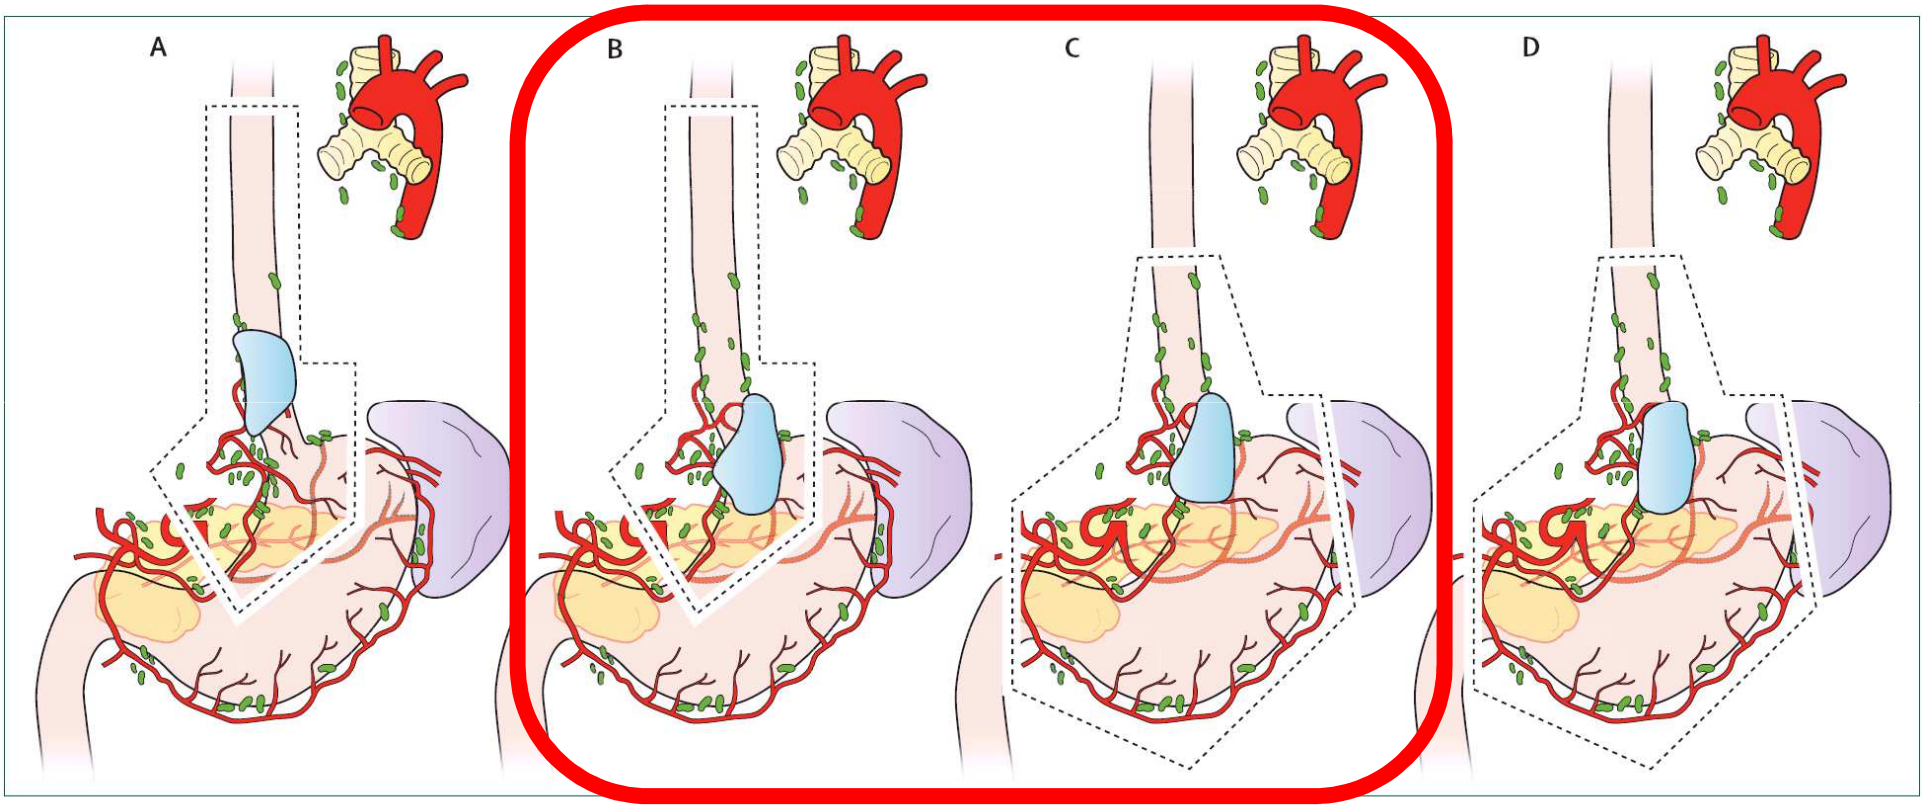

Figure 4: **Schematic representation of recommended extent of surgical resection for oesophagogastric junction adenocarcinomas**
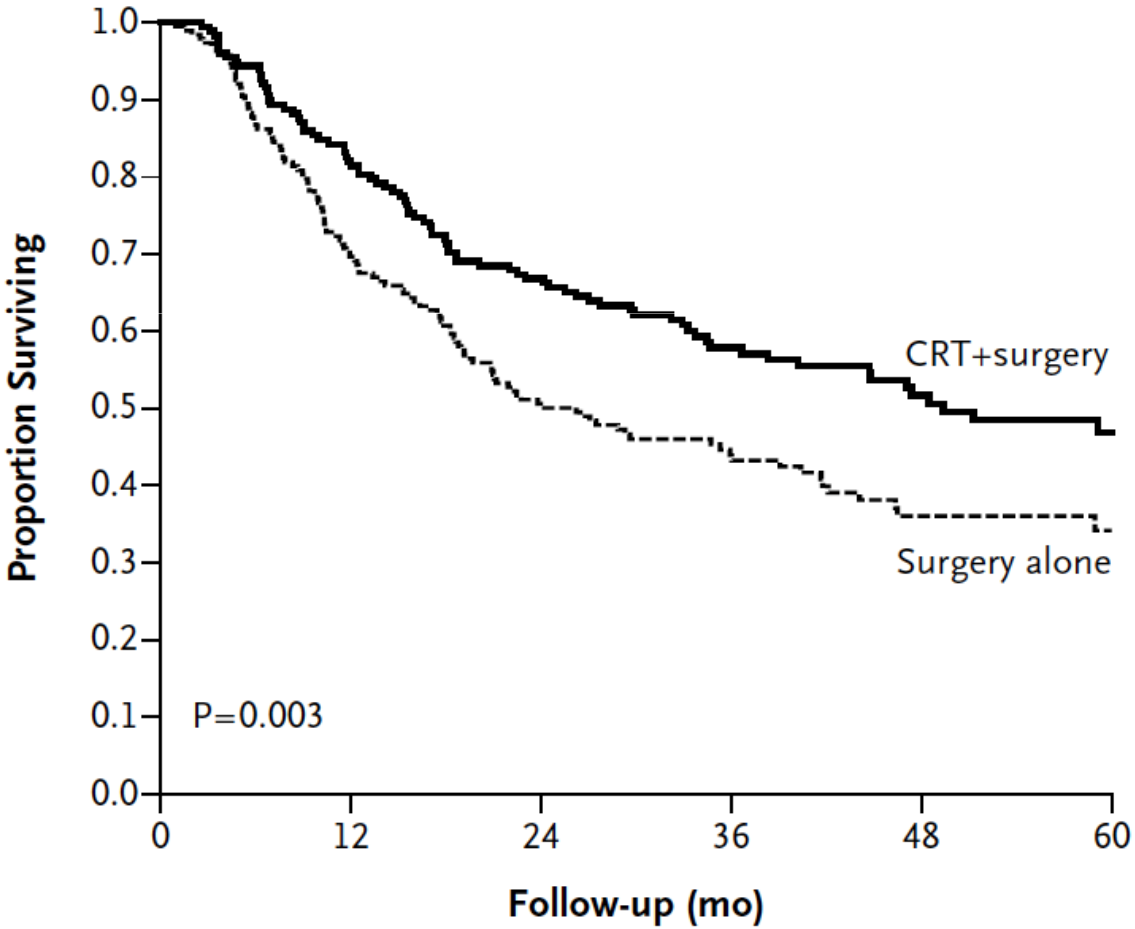
Type I (A; subtotal oesophagectomy with superior polar gastrectomy), type II (subtotal oesophagectomy with superior polar gastrectomy [B] or total gastrectomy with inferior oesophagectomy [C]), and type III (D; total gastrectomy). Blue region is tumour site.

Mariette et al Lancet Oncol 2011

Who should not receive preop treatment?

CROSS trial



368 patients

75% adenocarcinoma

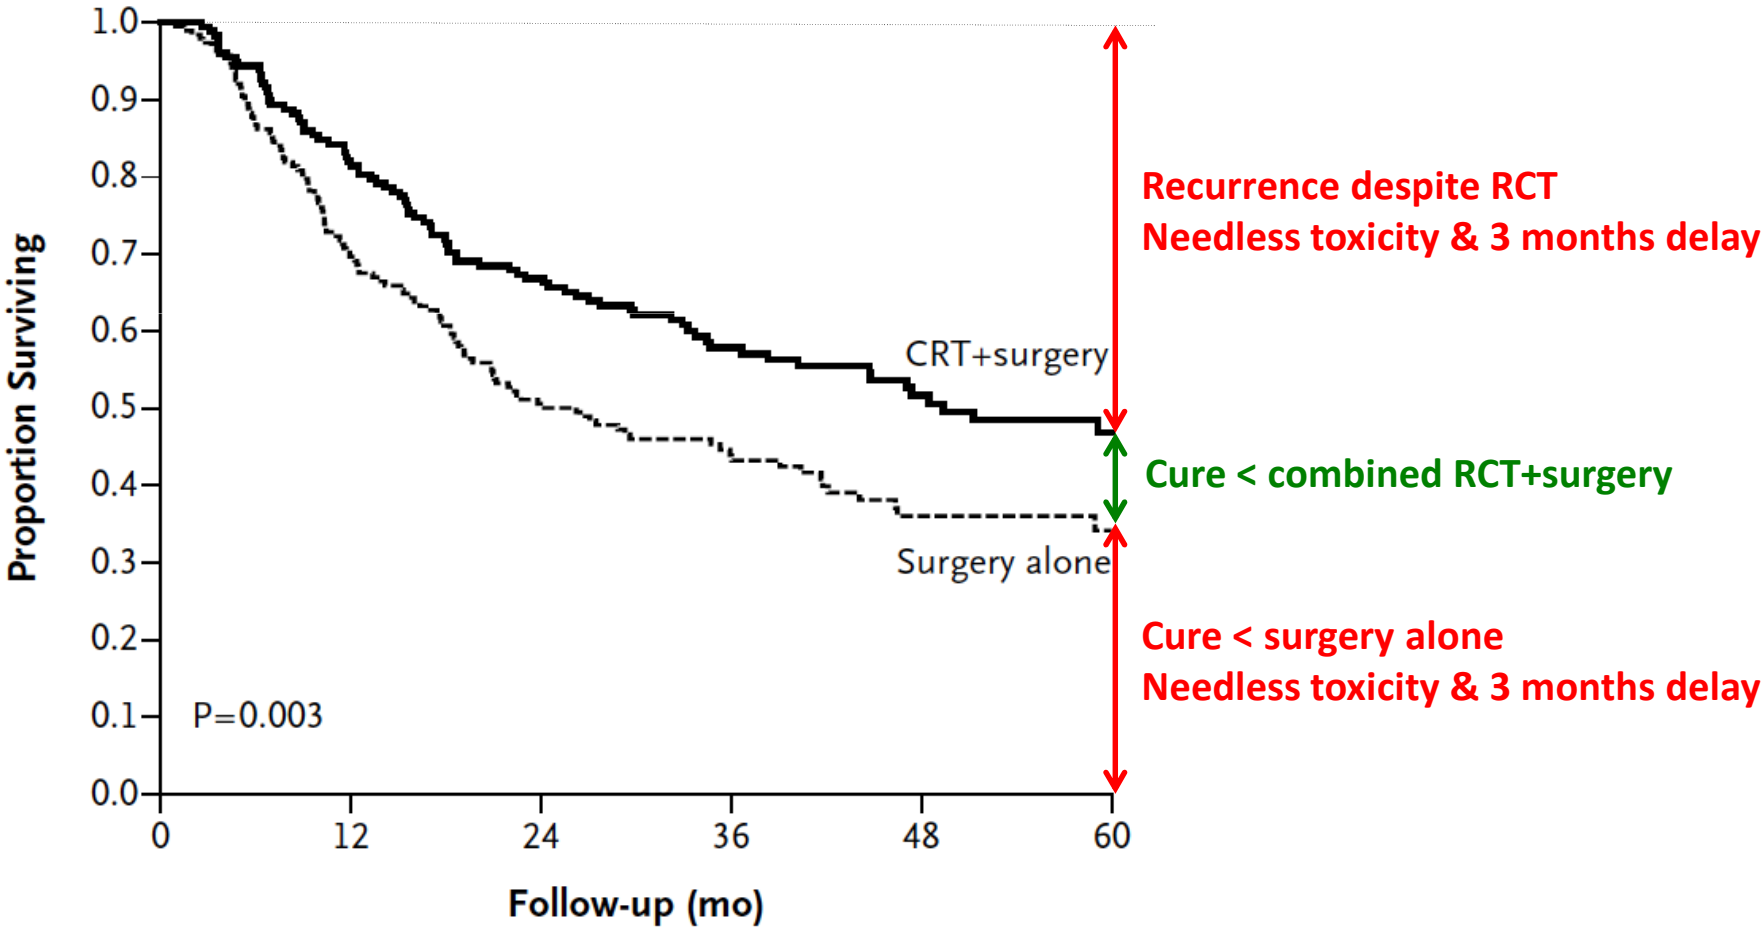
25% squamous cell C.

RTCT ↗ mOS **34%**

[HR 0.657; 95% CI 0.495-0.871; P=0.003]

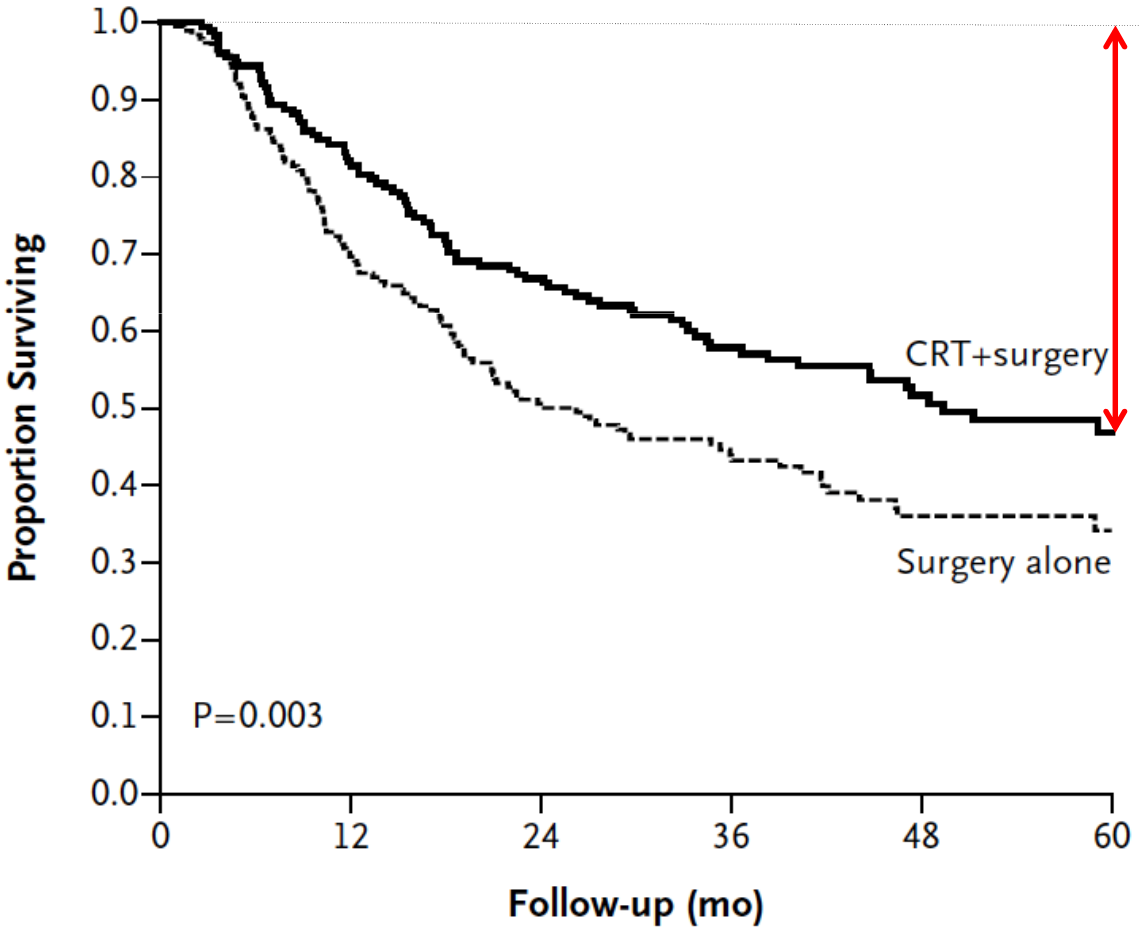
Van Hagen et al. NEJM 2012

The extent of benefit from preop treatment



Van Hagen et al. NEJM 2012

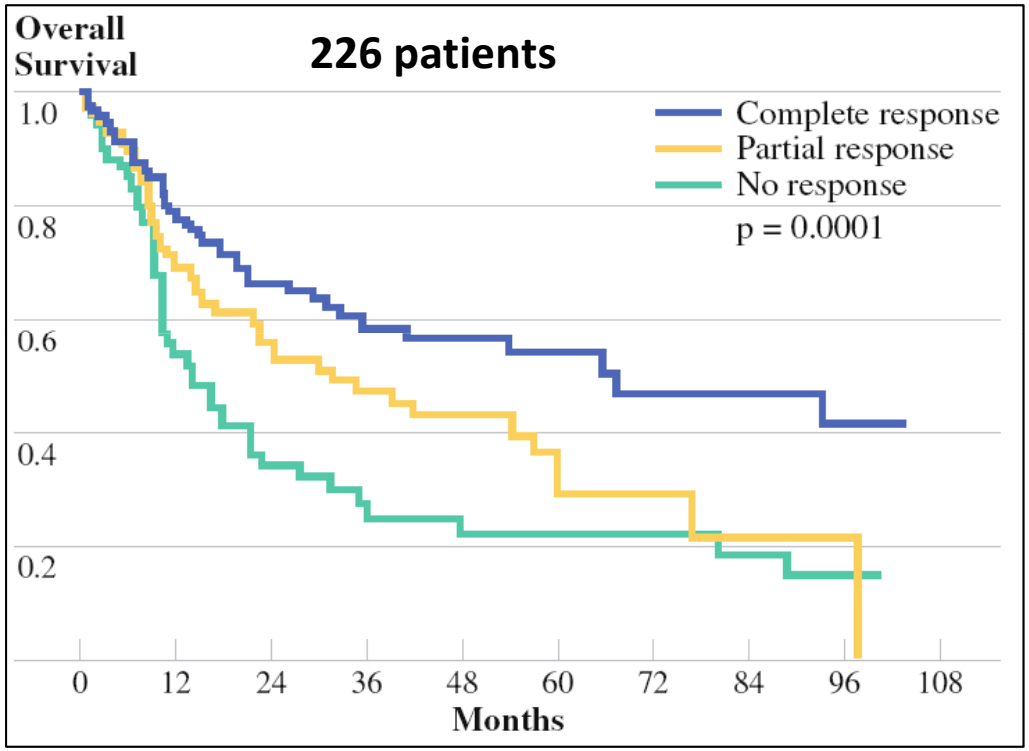
The extent of benefit from preop treatment



Recurrence despite RCT
Needless toxicity & 3 months delay

Van Hagen et al. NEJM 2012

Predictive biomarker for preop RCT: pCR

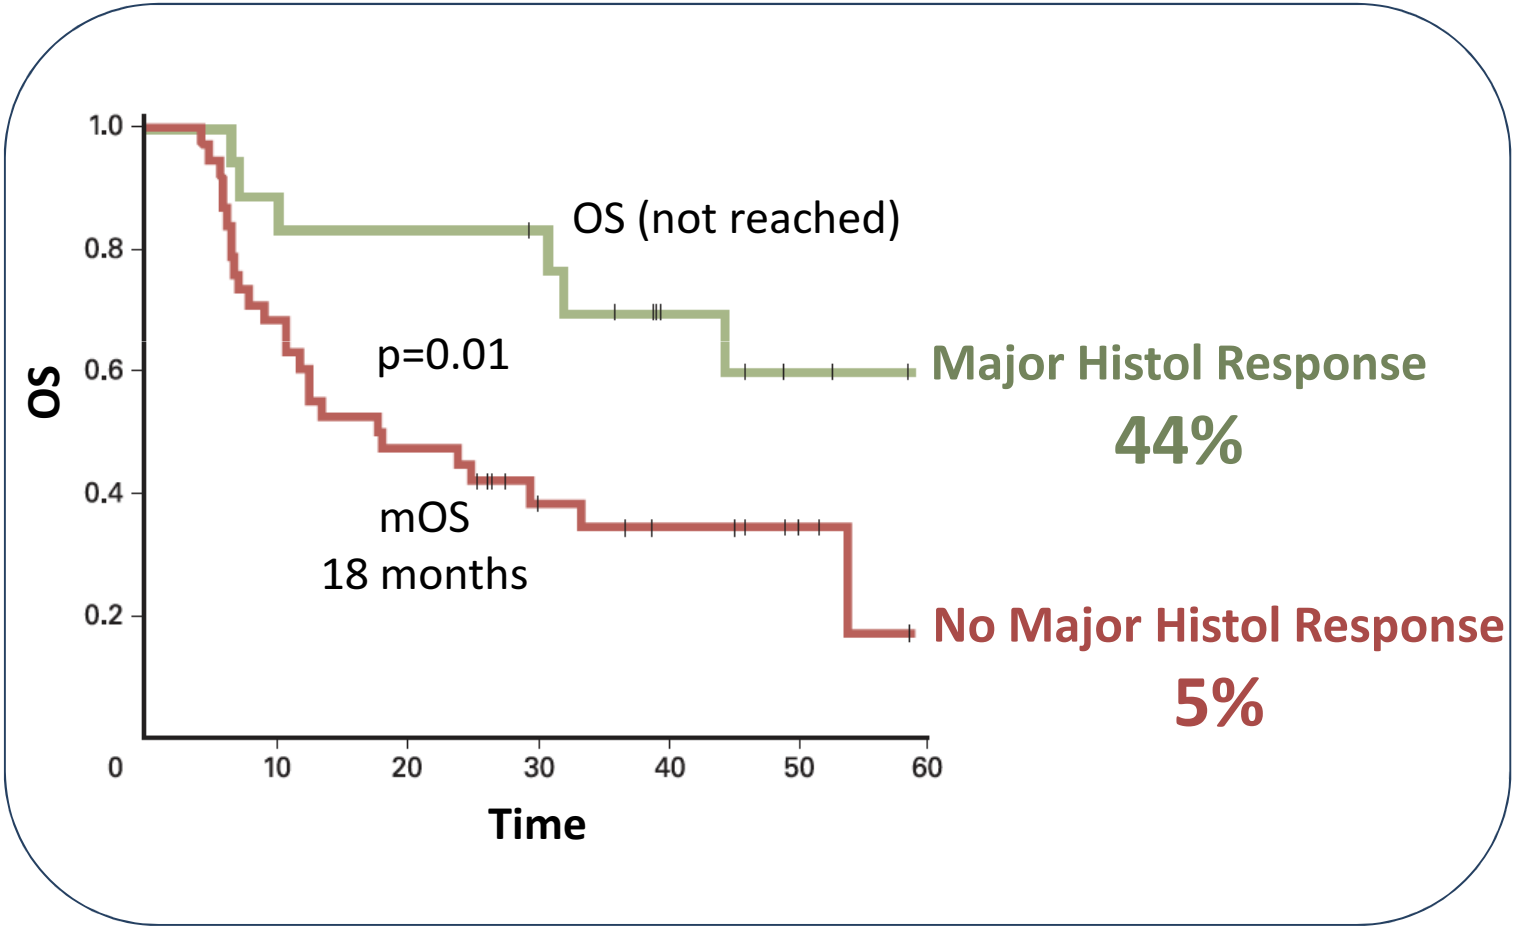


<u>Residual Question</u>: Is complete pathological response **predictive** or **prognostic**?

Meredith et al. Ann Surg Oncol 2010

Predictive biomarker for preop RCT: Metabolic Imaging

Metabolic Response after 1 course CT



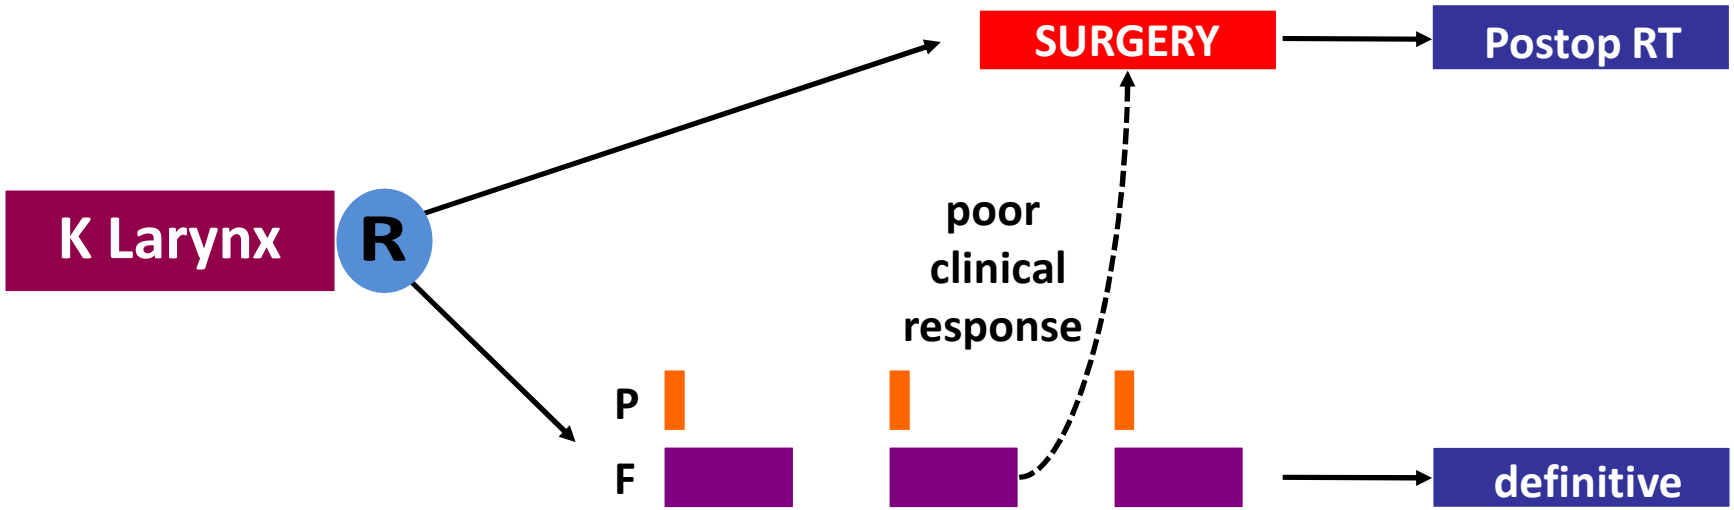
<u>Residual Question</u>: is Metabolic Response **predictive** or **pronostic**?

Ott et al. J Clin Oncol 2006

Pitfalls in Metabolic Assessment of Response

- Poorly studied **during** RCT (pro-inflammatory effect?)
- Poorly correlated with pathological response **after** RCT
- Needless **after** RCT (treatment already given)

Non-response to CT predict non-benefit RCT (H&N)



conservatrice approach (definitive RCT) less mutilating

Lefebvre et al. JNCI 1996

Department of Veterans Affairs Laryngeal Cancer Study Group NEJM 1991

MR CT biomarker for RTCT benefit?

SCC

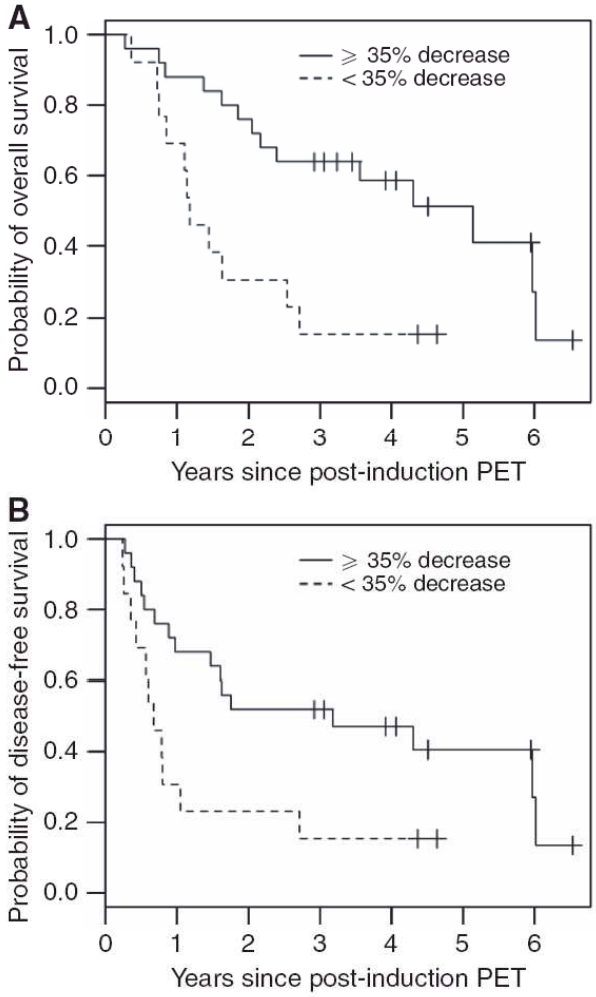


Figure 3. (**A**) OS by metabolic response status ($P = 0.004$). (**B**) DFS by metabolic response status ($P = 0.02$).

			surgery	-	188	-	24.0 (p=0.003)	-

Perspectives in RCT

- **PReoperative Chemoradiation (Paclitaxel-carboplatin or FOLFOX) for Resectable Esophageal and Junctional Cancer (PROTECT)**

  Preop RCT CBDCA/Taxol vs RCT FOLFOX

- **NCT01333033**

  Preop FOLFOX vs CBDCA then RCT (backbone CT according to early FDGPET response)

CONCLUSIONS

Surgery alone no longer standard of care

Adjuvant CT or RCT not efficient

Preop CT or RCT valuable options (RCT > CT?)

No obvious difference between drugs in terms on efficacy

Obvious differences between drugs in terms of safety

High medical need for predictive tools

Thanks for the attention

PACLITAXEL

Toxicities associated with CBDCA/paclitaxel

Study	Arms	RT	N	histol	severe GI toxicity	severe hematol tox
Van Hagen 2012	preop CBDCA/paclitaxel-RCT	41.4Gy (1.8Gy/f)	178	75%ADC 23%SCC	6%	2%
	surgery	-	188		-	-

R0 resection 92% RCT–surgery versus 69% surgery (P<0.001)
4% postoperative mortality (both groups)
8% no RT in RCT group

Combined Modality Toxicity is complex

depends on:

the patients' particular medical condition

the pattern of RT (dose,fraction, length, fields, dosimetry, …)

the drugs and schedule

the intent of treatment

But the whole team should take responsibility

CONCLUSIONS

Toxicity from combined RCT variable and difficult to assess

< **H**uge heterogeneity of CT and RT variables

Highly dependant on treatment modalities

Tailoring therapy allowed

RCT work in progress needing cross-talks between specialties

THANK YOU

WHO classification[a] of tumours of the oesophagus

Epithelial tumours	
Premalignant lesions	
Squamous	
Intraepithelial neoplasia (dysplasia), low grade	8077/0*
Intraepithelial neoplasia (dysplasia), high grade	8077/2
Glandular	
Dysplasia (intraepithelial neoplasia), low grade	8148/0*
Dysplasia (intraepithelial neoplasia), high grade	8148/2
Carcinoma	
Squamous cell carcinoma	8070/3
Adenocarcinoma	8140/3
Adenoid cystic carcinoma	8200/3
Adenosquamous carcinoma	8560/3
Basaloid squamous cell carcinoma	8083/3
Mucoepidermoid carcinoma	8430/3
Spindle cell (squamous) carcinoma	8074/3
Verrucous (squamous) carcinoma	8051/3
Undifferentiated carcinoma	8020/3
Neuroendocrine neoplasms[b]	
Neuroendocrine tumour (NET)	
NET G1 (carcinoid)	8240/3
NET G2	8249/3
Neuroendocrine carcinoma (NEC)	8246/3
Large cell NEC	8013/3
Small cell NEC	8041/3
Mixed adenoneuroendocrine carcinoma	8244/3

Mesenchymal tumours	
Granular cell tumour	9580/0
Haemangioma	9120/0
Leiomyoma	8890/0
Lipoma	8850/0
Gastrointestinal stromal tumour	8936/3
Kaposi sarcoma	9140/3
Leiomyosarcoma	8890/3
Melanoma	8720/3
Rhabdomyosarcoma	8900/3
Synovial sarcoma	9040/3
Lymphomas	
Secondary tumours	

[a] The morphology codes are from the International Classification of Diseases for Oncology (ICD-O) [904A]. Behaviour is coded /0 for benign tumours, /1 for unspecified, borderline or uncertain behaviour, /2 for carcinoma *in situ* and grade III intraepithelial neoplasia, and /3 for malignant tumours.
[b] The classification is modified from the previous (third) edition of the WHO histological classification of tumours [691] taking into account changes in our understanding of these lesions. In the case of neuroendocrine neoplasms, the classification has been simplified to be of more practical utility in morphological classification.
* These new codes were approved by the IARC/WHO Committee for ICD-O at its meeting in March 2010.

UNIKLINIK KÖLN

Anatomical subsites

1. Cervical oesophagus (C15.0)

begins: lower border of the cricoid cartilage

ends: thoracic inlet (suprasternal notch). 18 cm distal upper incisor teeth

2. Intrathoracic oesophagus (C15.3-5)

- Upper: begins: thoracic inlet (about 18 cm) ends: tracheal bifurcation (about 24 cm)
- Mid: begins: tracheal bifurcation (about 24 cm) ends: 32 cm distal upper incisor teeth
- Lower: About 8 cm long and includes abdominal oesophagus. Ends about 40 cm.

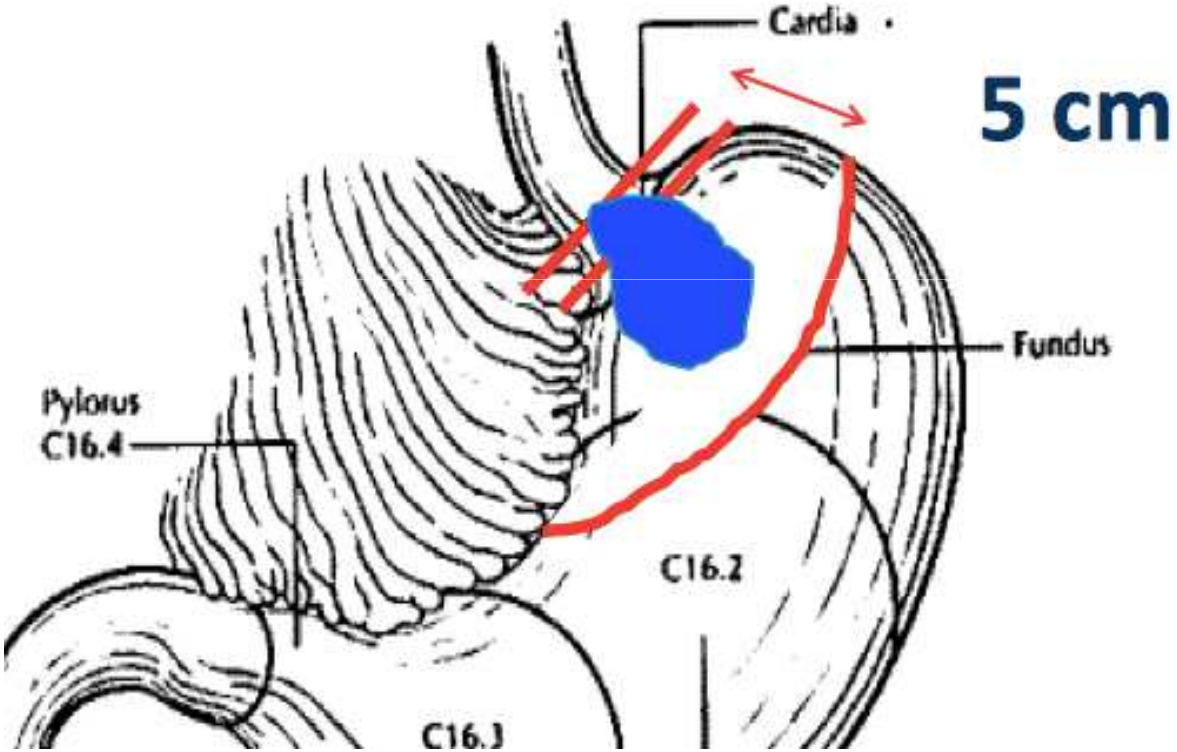
3. Oesophago-gastric junction (C16.0)

Definition of oesophago-gastric junction: There is no universally agreed definition!

For histologists: junction of squamous epithelial cells to cylindric epithelial cell of the stomach
For surgeons: passage through the diaphragm
For gastroenterologists: junction at the beginning of proximal gastric folds
In Japan: at the distal end of palisade venes

UNIKLINIK KÖLN

Definition oesophageal/gastric adenocarcinoma Definition changed 2010



A tumour of epicentre of which is within 5 cm of the oesophagogastric junction and also extends into the oesophagus is classified and staged using the oesophageal scheme. Tumours with an epicentre in the stomach greater than 5 cm from the oesophagogastric junction or those within 5 cm of the oesophagogastric junction without extension in the oesophagus are classified and staged using the gastric carcinoma

Modified from: Wittekind and Schmiegel

UNIKLINIK KÖLN

Staging: UICC

Oesophagus 7th edition

TNM definitions: AJCC = UICC

Tis	Carcinoma in situ /High-grade dysplasia
T1	lamina propria or submucosa
	T1a lamina propria or muscularis mucosae
	T1b submucosa
T2	muscularis propria
T3	adventitia
T4	adjacent structures
	T4a pleura, pericardium, diaphragm, or adjacent peritoneum
	T4b other adjacent structures, e.g. aorta, vertebral body, trachea

N0	No regional lymph node metastasis
N1	1 to 2 regional lymph nodes
N2	3 to 6
N3	>6

[N1 was site dependent]

M - Distant Metastasis

M1 Distant metastasis

[M1a,b were site dependent]

Changes from 6th edition

Union for International Cancer Control www.uicc.org

Applies to carcinoma (ICD-0 C15) and includes adenocarcinoma of the oesophagogastric junction (ICD-0 C16.0)

UNIKLINIK KÖLN

Staging: UICC

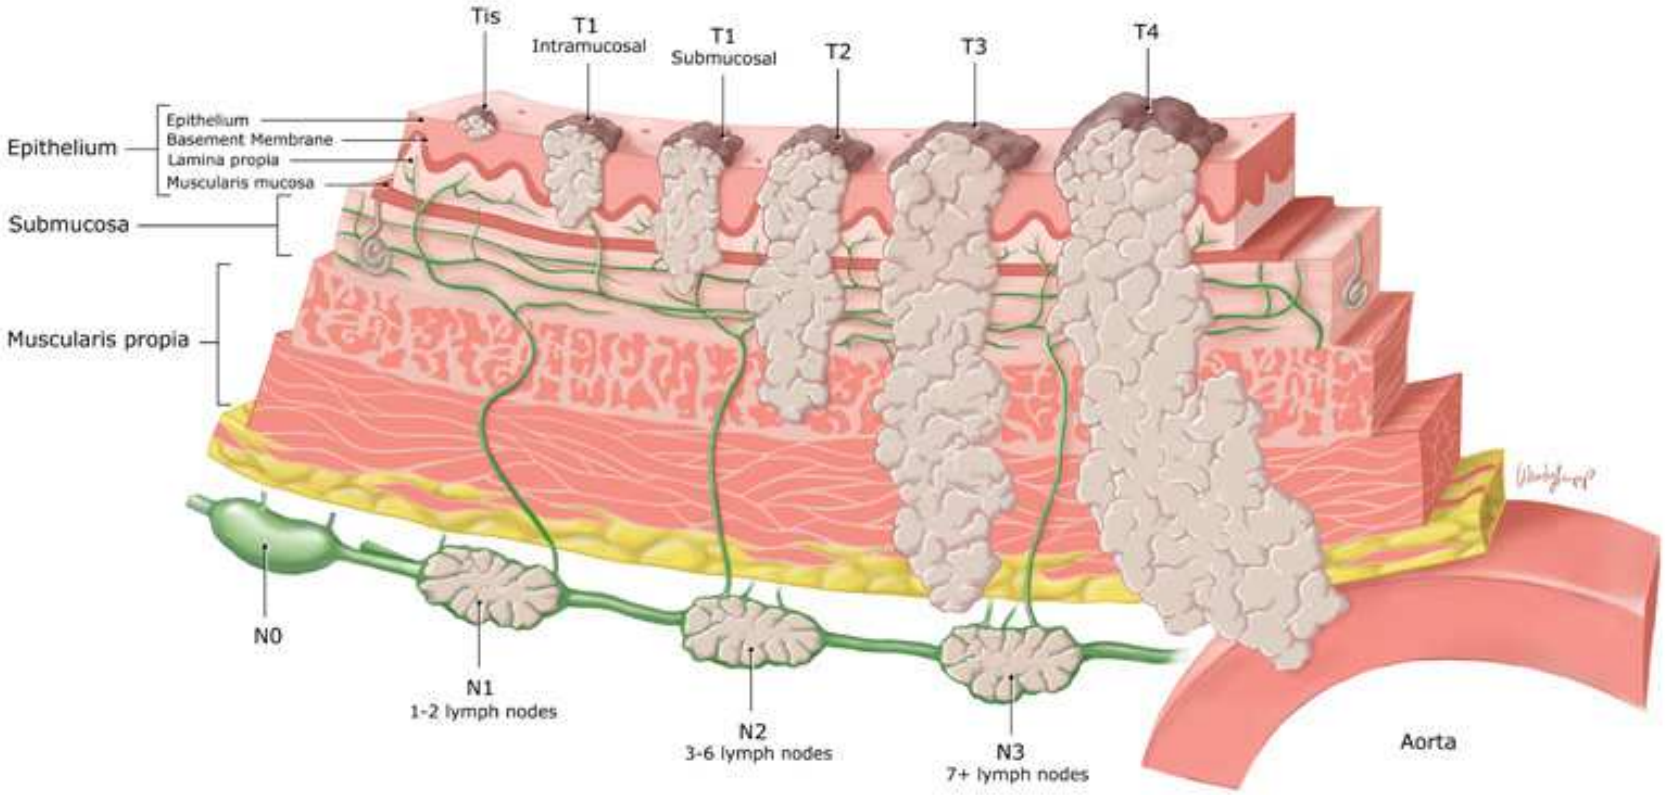
pT1a is sub-divided

- m1 - into the lamina propria
- m2 - into the superficial/inner muscularis mucosae
- m3 - into the space between the layers of the muscularis mucosae
- m4 - into the outer/true muscularis mucosae

T1b is sub-divided as SM1-3 as follows:

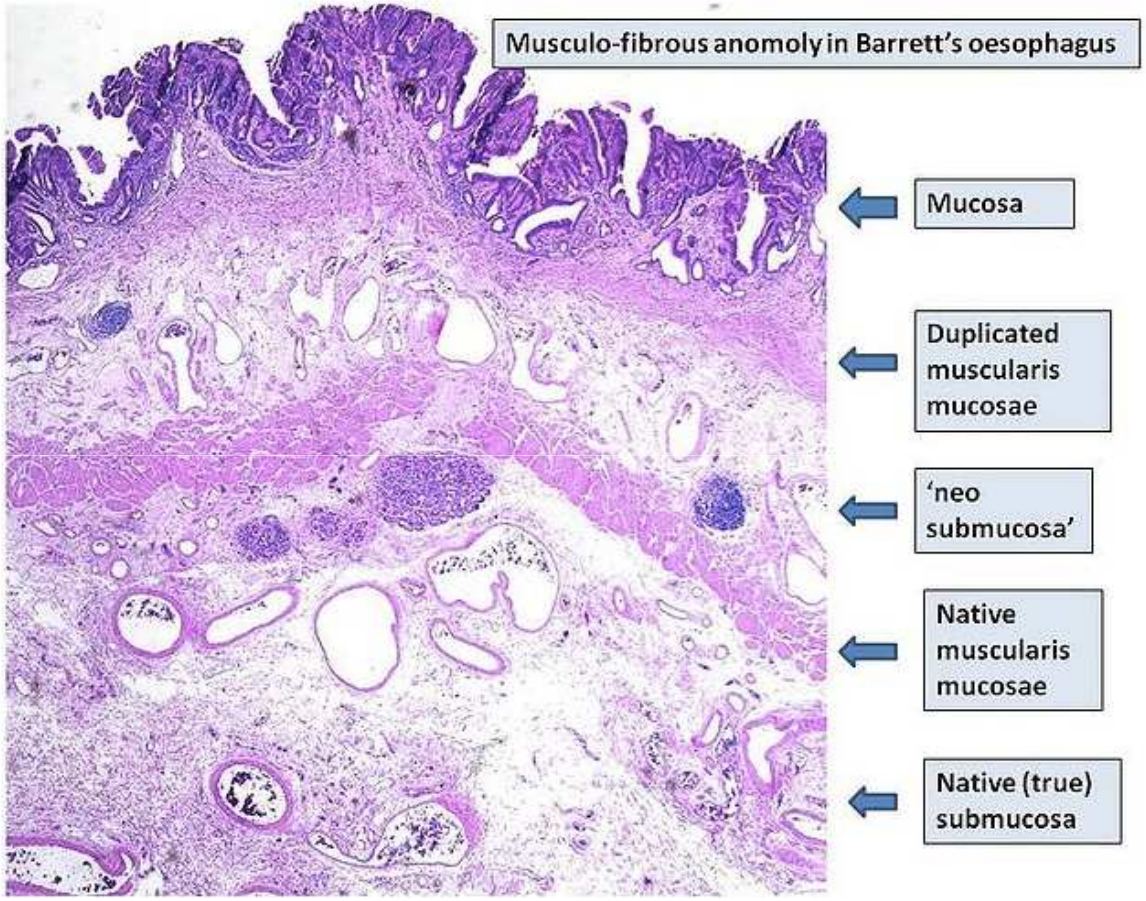
- sm1 – superficial 1/3 submucosa
- sm2 – intermediate one third of submucosa
- sm3 – outer one third of submucosa

Esophageal Cancer Staging



UNIKLINIK KÖLN

double layer of muscularis mucosae in Barrett (pT1a; m1-m4)



Bobryshev, Y, Brown, I, Clouston, A, Cancer Council Australia Barrett's Oesophagus Guidelines Working Party. What are the histological features of early adenocarcinoma of the oesophagus?

UNIKLINIK KÖLN

double layer of muscularis mucosae in Barrett (pT1a; m1-m4)

Stolte staging system (mucosa)

UNIKLINIK KÖLN

Prognostic factors

Univariable analysis of factors influencing survival

Variable	χ^2	DF	*P*-value
Age	48.020	41	0.210
Gender	1.039	1	0.308
Histological cell type	2.250	2	0.308
Histological tumour grade	10.260	2	0.006
Operative approach (TT *vs* TH)	0.795	1	0.373
Neoadjuvant therapy	0.627	1	0.429
T stage (same in TNM6 and TNM7)	21.514	3	<0.0001
N stage (TNM6)	21.499	1	<0.0001
N stage (TNM7)	37.509	3	<0.0001
Number of lymph node metastases	61.677	12	<0.0001
Stage groupings (TNM6)	36.587	4	<0.0001
Stage groupings (TNM7)	50.531	7	<0.0001
Prognostic groupings (TNM7)	47.147	7	<0.0001

Most important:

1) Depth of invasion (primary tumor extension)
2) Lymph node involvement
3) Stage/prognostic groupings

UNIKLINIK KÖLN

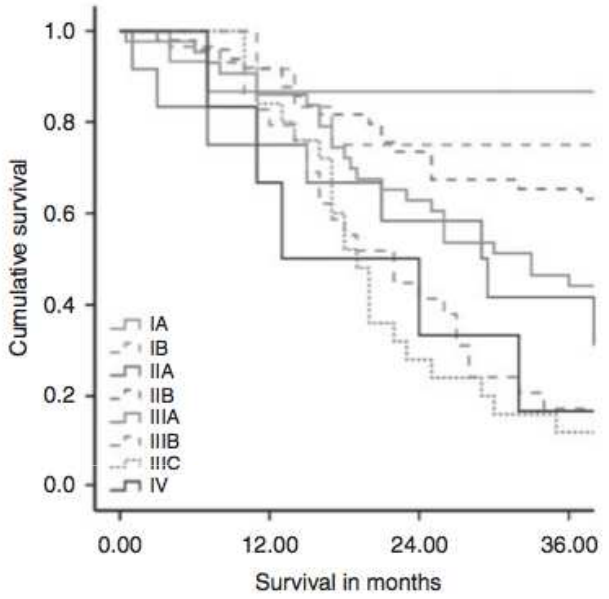
Prognostic grouping

Prognostic grouping: Squamous cell carcinoma

	T	N	M	Grade	Location*
Group 0	Tis	0	0	1	Any
Group IA	1	0	0	1, X	Any
Group IB	1	0	0	2, 3	Any
	2, 3	0	0	1, X	Lower, X
Group IIA	2, 3	0	0	1, X	Upper, middle
	2, 3	0	0	2, 3	Lower, X
Group IIB	2, 3	0	0	2, 3	Upper, middle
	1, 2	1	0	Any	Any
Group IIIA	1, 2	2	0	Any	Any
	3	1	0	Any	Any
	4a	0	0	Any	Any
Group IIIB	3	2	0	Any	Any
Group IIIC	4a	1, 2	0	Any	Any
	4b	Any	0	Any	Any
	Any	3	0	Any	Any
Group IV	Any	Any	1	Any	Any

Biggest problem in oesophageal carcinoma:

- Lymph nodes metastasis indicate poor prognosis
- Metastasizes early
- Often: locally advanced tumors



No. at risk	0 months	12 months	24 months	36 months
Stage IA	15	13	13	13
Stage IB	12	11	9	9
Stage IIA	12	9	7	4
Stage IIB	49	45	36	30
Stage IIIA	43	37	27	19
Stage IIIB	29	23	12	4
Stage IIIC	25	21	7	3
Stage IV	6	4	2	1

Figure 3 Oesophageal cancer survival related to TNM7 prognostic groups.

UNIKLINIK KÖLN

Prognostic factors – Lymph nodes metastasis indicate poor prognosis

Extensive interconnecting lymphatic channels
High risk of skip areas (high risk of local recurrence)
Drain into lymph nodes: paraoesophageal, paratraechael, dorsal mediastinum, lung hilum, inferior thyroid artery, left gastric artery (celiac axis), paraesophageal in the neck.

Risk to develop nodal mets: T1b: 20%
T2: 60%
T3: 90%
T4: 100%

Biggest problem in oesophageal carcinoma:
- Often: locally advanced tumors (85% in T2 or more)
- Metastasizes early

From: neoadjuvant.wikidot.com staging and krebsdaten.de (Robert-Koch-Institut)

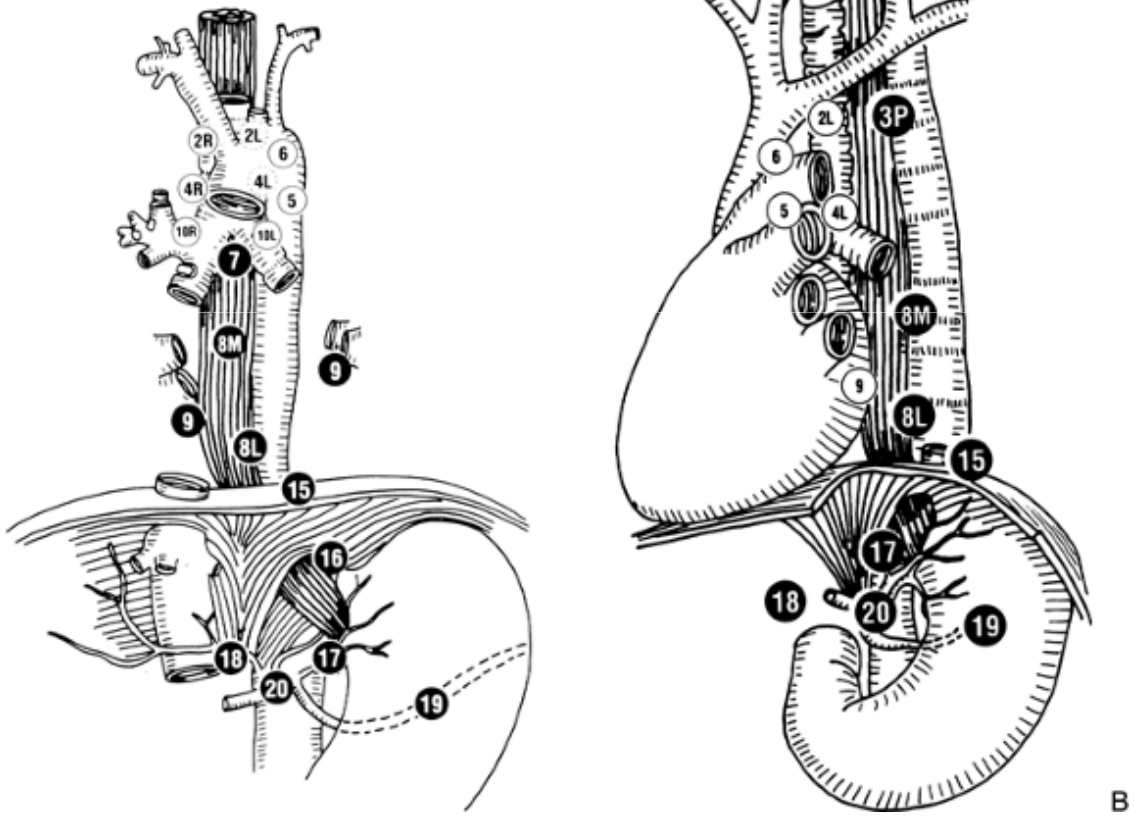
UNIKLINIK KÖLN

Regional Lymph Nodes

Localisation using TNM 7th edition:

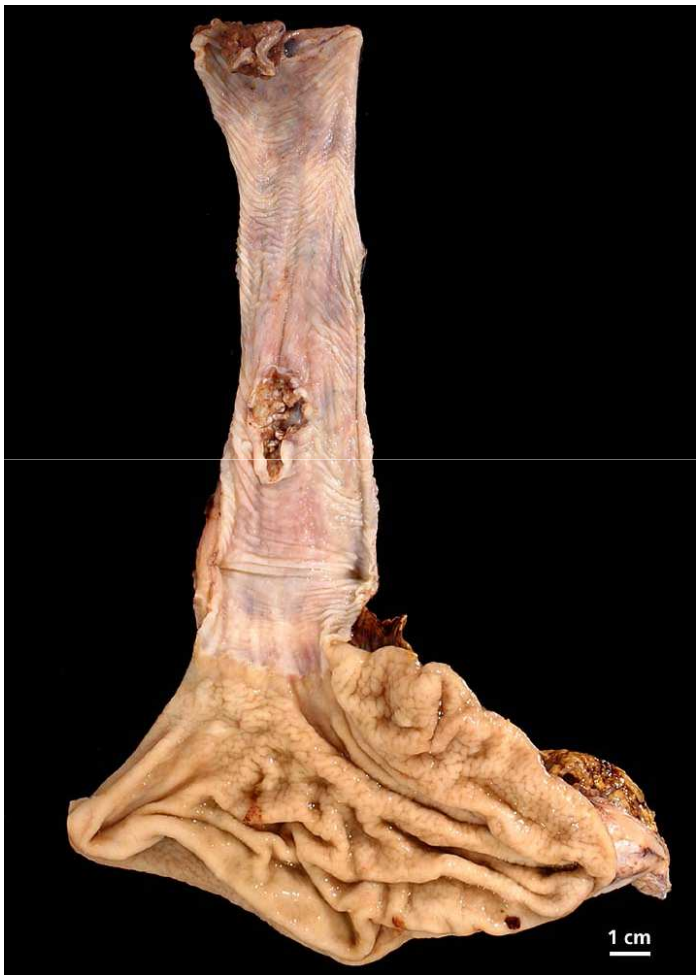
- Regional lymph nodes, irrespective of the site of the primary those in the oesophageal drainage – including:

paraoesophageal, paratraechael,
dorsal medistinum, lung hilum,
inferior thyroid artery,
left gastric artery (celiac axis)
paraesophageal in the neck.



How many we need:

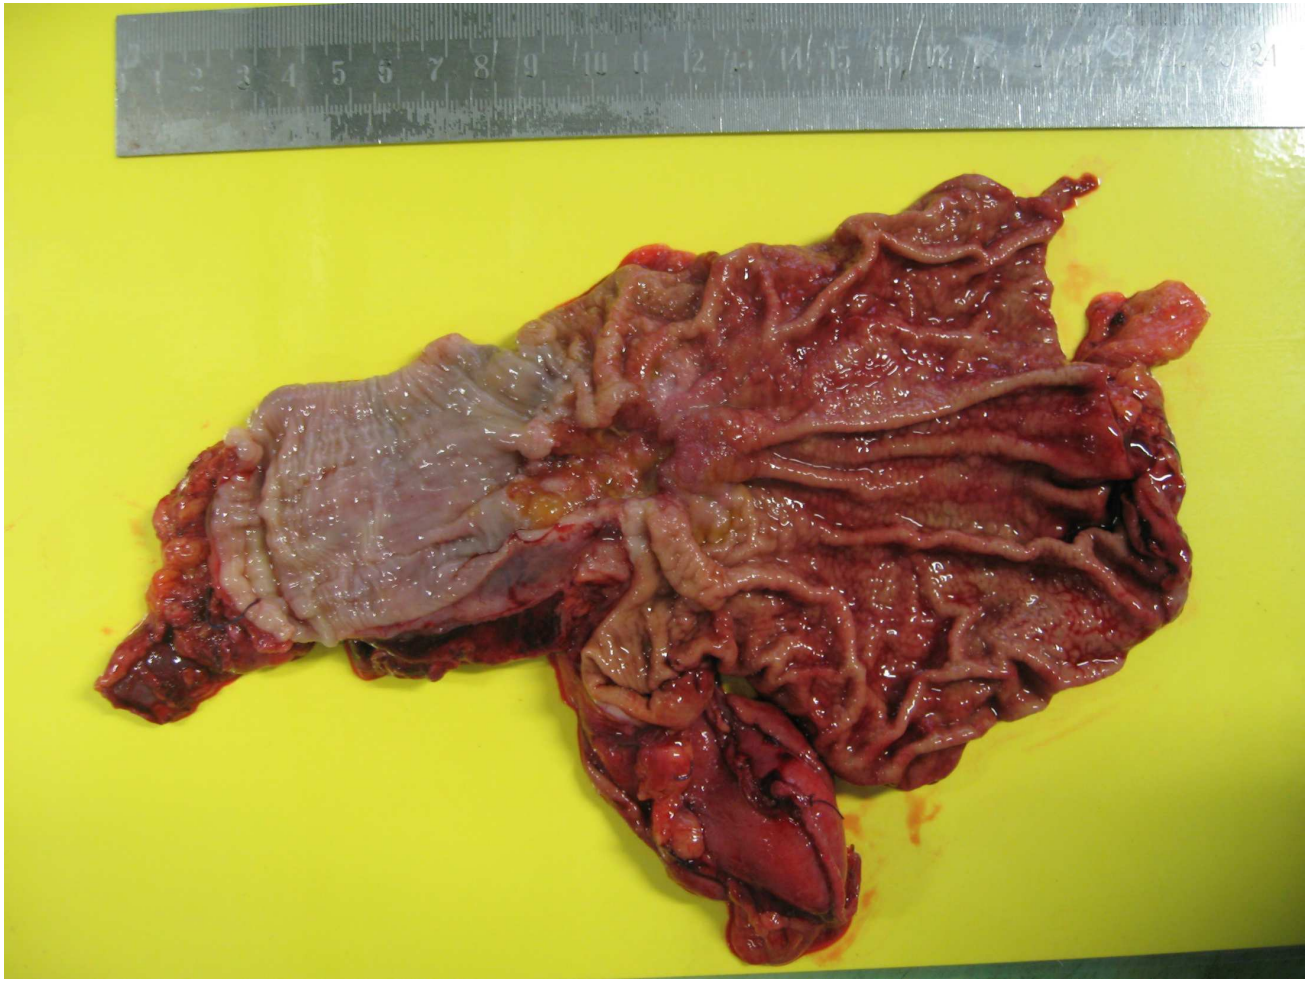
- >15 lymph nodes



Localisation: Whole oesophagus including distal parts; more often: middle third

UNIKLINIK KÖLN

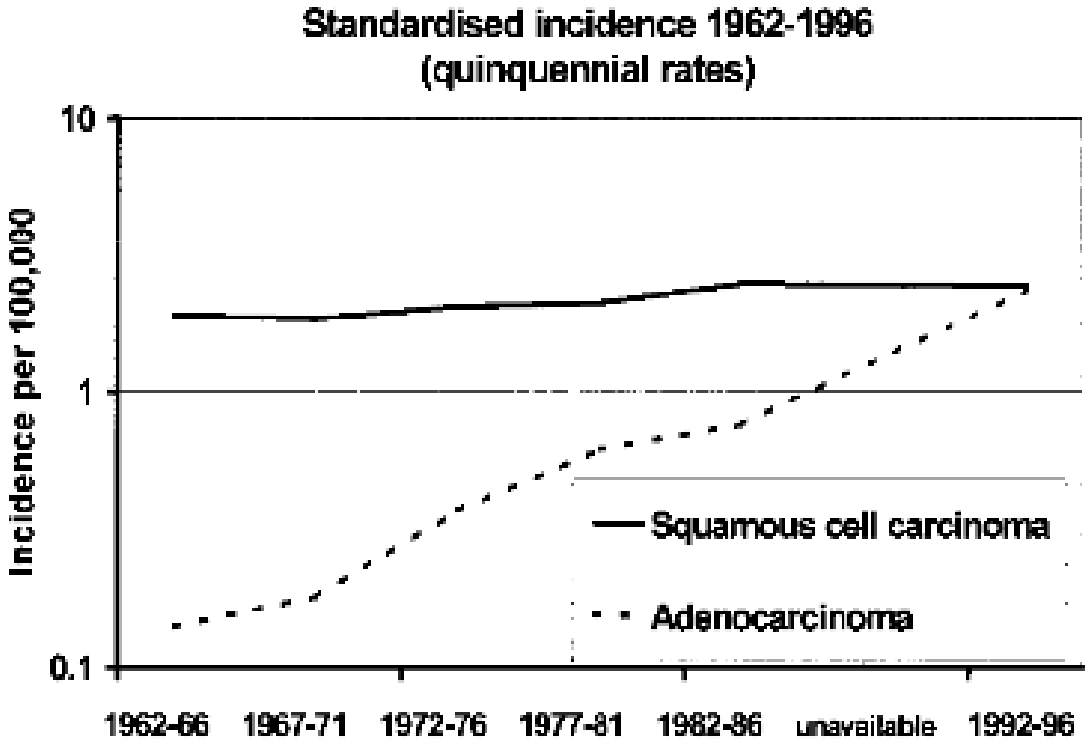
Adenocarcinoma



Localisation: distal parts of oesophagus/oesophgeal-gastric junction

UNIKLINIK KÖLN

Adenocarcinoma of eosophagus: Incidence continues to increase



From: Powell et al. Int J Cancer 2003

UNIKLINIK KÖLN

Regression-Scores after neoadjuvant therapy

According to Becker et al:

Morphological regressions signs:

- oedema
- foamy histiocytes
- necrosis
- fibrosis and hyalinosis

Grading of Histophathologic Regression in the Primary Tumor Bed	
Grade	**Description**
1a	No residual tumor / tumor bed
1b	< 10% residual tumor / tumor bed
2	10-50% residual tumor / tumor bed
3	> 50% residual tumor / tumor bed

From: Becker et al. Ann Surg 2011 or Becker et al. Cancer 2003

UNIKLINIK KÖLN

Regression-Scores

Response Classification System

Scheme	Characteristic
Class I	Minor histomorphologic regression
a	With lymph node metastases
b	Without lymph node metastases
Class II	Major histomorphologic regression
a	With lymph node metastases
b	Without lymph node metastases

Major responder
Minor responder
Cut-off: 10% vital tumour

Cologne Regression Classification System

- Grade I indicates minimal/no regression, with more than 50% vital tumor remaining;
- Grade II indicates partial regression, with less than 50% and more than 0% vital tumor remaining;
- Grade III indicates sub-total regression, with 0% vital tumor remaining;
- Grade IV indicates complete regression, with no vital tumor remaining.[22,23]

Response grades I and II are classified as 'minor response,' and grades III and IV as 'major response.'

UNIKLINIK KÖLN

Work-flow in Cologne

1) Photographic documentation of all surgical specimens

2) Macroscopically

- Tumor size (if possible in three dimension)
- Tumor localisation
- Tumor extension
- Distance to margins (oral, aboral, circumferential)
- Complete embedding of the tumor from oral to aboral (CRM is included and colourmarked)
- Lymph nodes are completely embedded

3) Reporting

- Histological types (adenocarcinoma, squamous cell carcinoma)
- UICC staging (y) pT pN (including ece+) L V Pn (=perineural invasion)
- Margins (free; distance; oral, aboral, circumferential)
- Grading (in case of neoadjuvant chemo-/radiotherapy: no grading)
- Regression grade (in case of neoadjuvant therapy using Becker and Cologne Score)

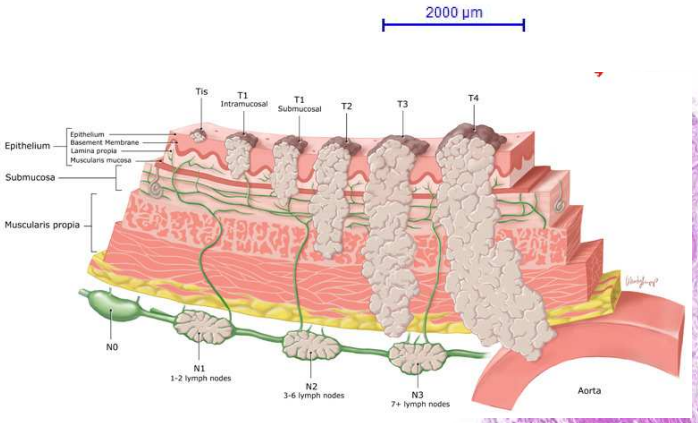
From three-dimensional surgical specimen to two-dimensional slides

Stainings: HE, PAS

UNIKLINIK KÖLN

SCC – pT?



Coloured margin

UNIKLINIK KÖLN

Summary

1: incidence of adenocarcinoma is increasing (SCC to Adeno-Ca: 60/40)

2: overall prognosis is dismal (despite some advances)

mainly due to:

- locally advanced disease (we diagnose too late)
- early lymph nodes metastasis (intense network of lymph vessels)
- no well defined subtypes
- treatment options are still insufficient (personalized: Herceptin only)

3: >15 regional lymph nodes

4: standardized work flow in pathology
embedding of whole tumor bed

5: regression scores after neoadjuvant treatment

UNIKLINIK KÖLN

Questions

1: why do we have differences in responding to treatment (major and minor responder)?

2: can we find tumor sub-types (like in adenocarcinoma of lung or stomach)?

3: can liquid biopsies be helpful in detection recurrences?

UNIKLINIK KÖLN

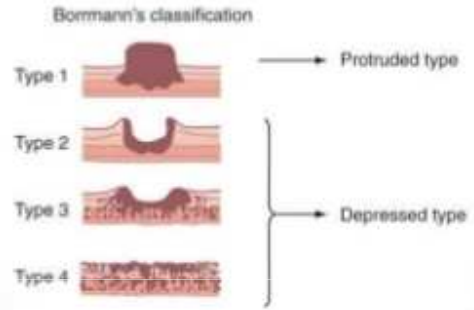
Traditional morphology based diagnostics

Classifications

- 1926-



- 1942- **Border**'s classification- degree of cellular differentiation.
- 1965- **Lauren**- Intestinal, Diffuse types.
- 1990- **WHO**- Adeno Ca., AdenoSq., SqCC, Small cell Ca., Undifferentiated Ca.

From: Dr. D. Guin, St. John's Medical College Hospital

UNIKLINIK KÖLN

Traditional morphology based diagnostics

Lauren's

INTESTINAL	DIFFUSE
Environmental	Familial
Gastric atrophy, intestinal metaplasia	Blood type A
Men >women	Women >men
Increasing incidence with age	Younger age group
Gland formation	Poorly differentiated, signet ring cells
Hematogenous spread	Transmural/lymphatic spread
Microsatellite instability *APC* gene mutations	Decreased E-cadherin
p53, p16 inactivation	*p53, p16* inactivation

- Differentiated — Undifferentiated

From: Dr. D. Guin, St. John's Medical College Hospital

UNIKLINIK KÖLN

Traditional morphology based diagnostics

Table 1 Gastric adenocarcinoma classification systems

WHO (2010)	Lauren (1965)
Papillary adenocarcinoma Tubular adenocarcinoma Mucinous adenocarcinoma	Intestinal type
Signet-ring cell carcinoma And other poorly cohesive carcinoma	Diffuse type
Mixed carcinoma	Indeterminate type
Adenosquamous carcinoma	
Squamous cell carcinoma	
Hepatoid adenocarcinoma	
Carcinoma with lymphoid stroma	
Choriocarcinoma	
Carcinosarcoma	
Parietal cell carcinoma	
Malignant rhabdoid tumor	
Mucoepidermoid carcinoma	
Paneth cell carcinoma	
Undifferentiated carcinoma	
Mixed adeno-neuroendocrine carcinoma	
Endodermal sinus tumor	
Embryonal carcinoma	
Pure gastric yolk sac tumor	
Oncocytic adenocarcinoma	

From: Bing Hu, Gastric cancer: Classification, histology and application of molecular pathology, J Gastrointest Oncol 2012;3(3):251-261

UNIKLINIK KÖLN

Molecular subtypes

1) Chromosomal instable 49,8%
2) Microsatellite-instable 21,7%
3) Genomic stable 19,6%
4) EBV-induced 8,9%

Microsatellite-instable carcinoma and EBV-positive carcinoma: more antigenes/highly inflammed: probably immunocheckpoint inhibition (and perhaps radiation) more effective

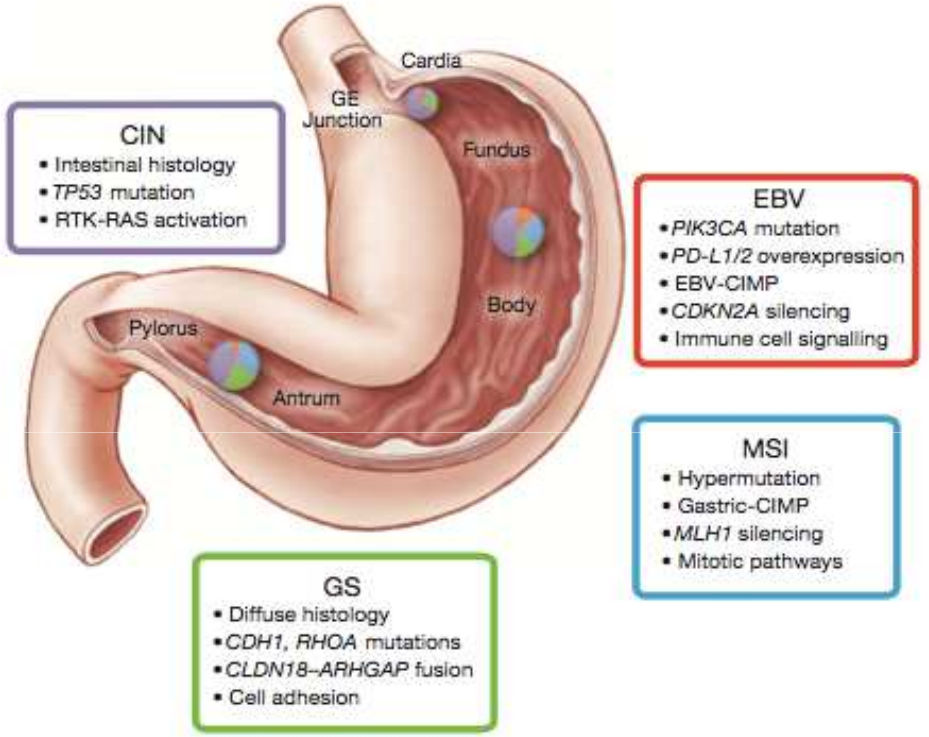


Figure 6 | Key features of gastric cancer subtypes. This schematic lists some of the salient features associated with each of the four molecular subtypes of gastric cancer. Distribution of molecular subtypes in tumours obtained from distinct regions of the stomach is represented by inset charts.

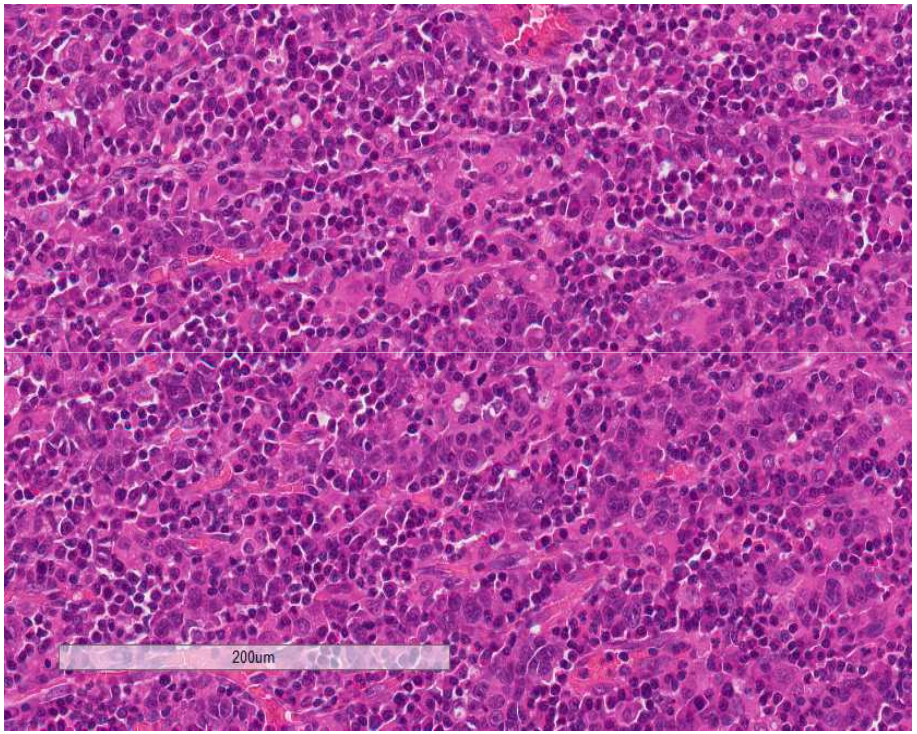
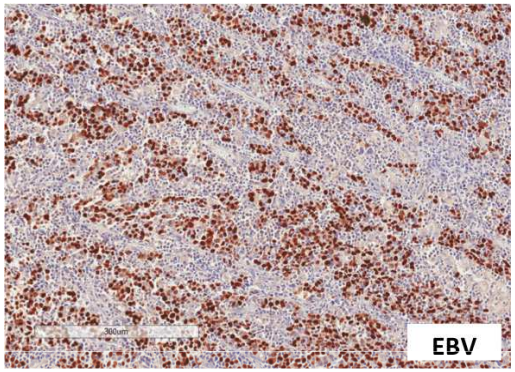
From: CancerGenomeAtlasResearchNetwork, „comprehensive molecular characterization of gastric adenocarcinoma“ Nature 2014

UNIKLINIK KÖLN

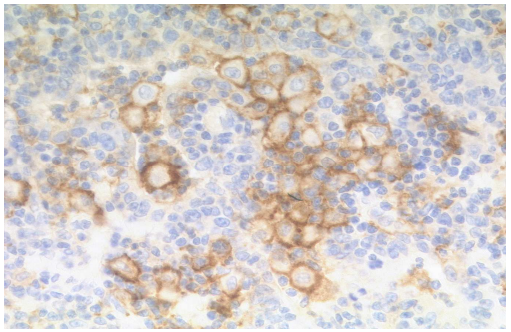
EBV+ gastric carcinoma



WHO: Gastric carcinoma with lymphoid stroma (medullary or lymphoepithelioma-like carcinoma)



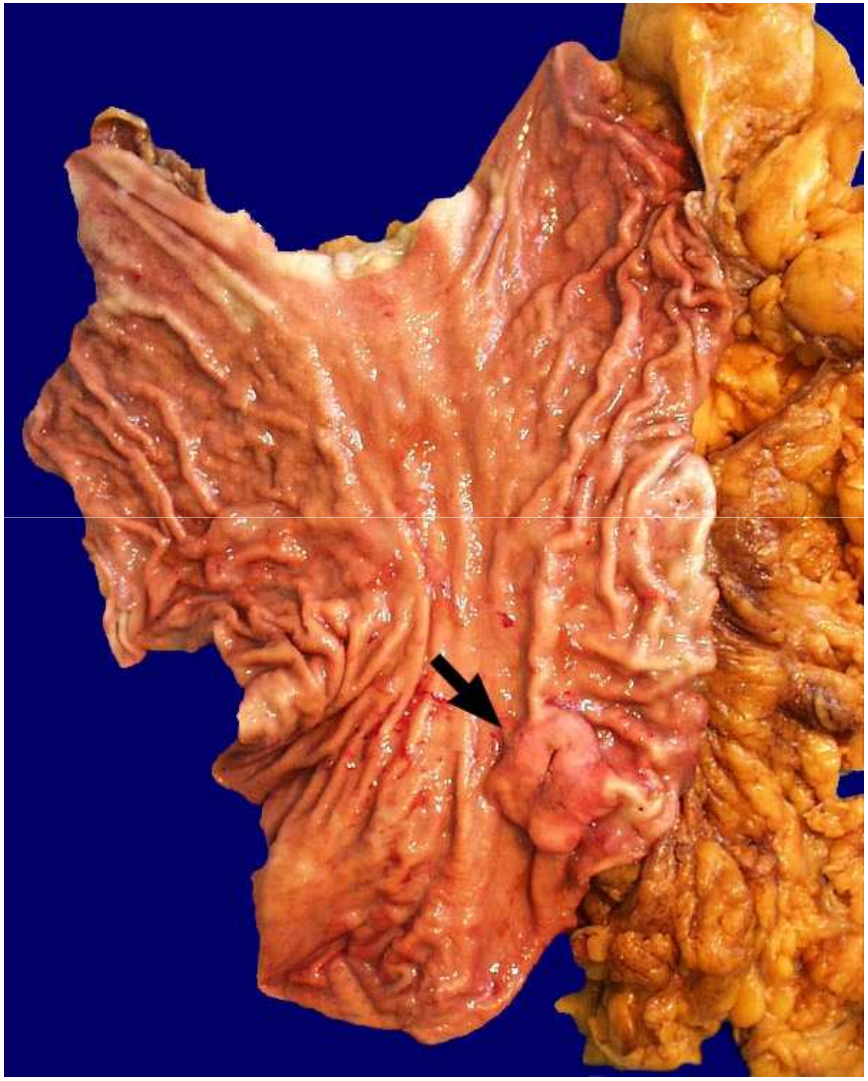
EBV-encoded RNA (EBER) in-situ hybridization (ISH)

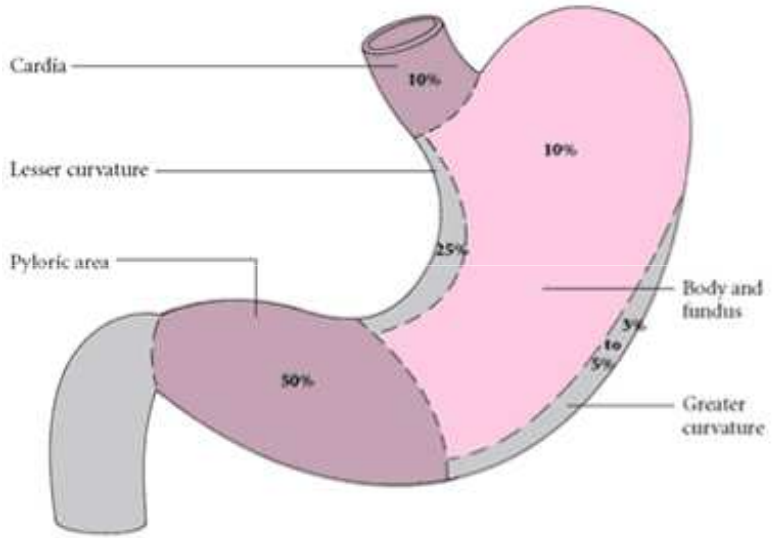


PD-L1 Immunohistochemistry, Dako-clone 28-8

UNIKLINIK KÖLN

Distribution





But: increased incidence of cardia carcinoma/GEJ carcinoma. More „intestinal type“ carcinoma, more often Her2/neu positive

UNIKLINIK KÖLN

TNM

Stage	Description
T Stage	
Tis	Carcinoma in situ; intraepithelial tumor without invasion of the lamina propria
T1	Tumor invades lamina propria, muscularis mucosa, or submucosa.
T1a	Tumor invades lamina propria or muscularis mucosa.
T1b	Tumor invades submucosa.
T2	Tumor invades the muscularis propria.
T3	Tumor penetrates subserosal connective tissue without invasion of visceral peritoneum or adjacent structures.
T4	Tumor invades serosa (visceral peritoneum) or adjacent structures.
T4a	Tumor invades serosa (visceral peritoneum).
T4b	Tumor invades adjacent structures.*
N Stage	
N0	No regional lymph node metastasis
N1	Metastasis in 1 to 6 regional nodes
N2	Metastasis in 7 to 15 regional nodes
N3	Metastasis in more than 15 regional nodes
M Stage	
M0	No distant metastasis
M1	Distant metastasis

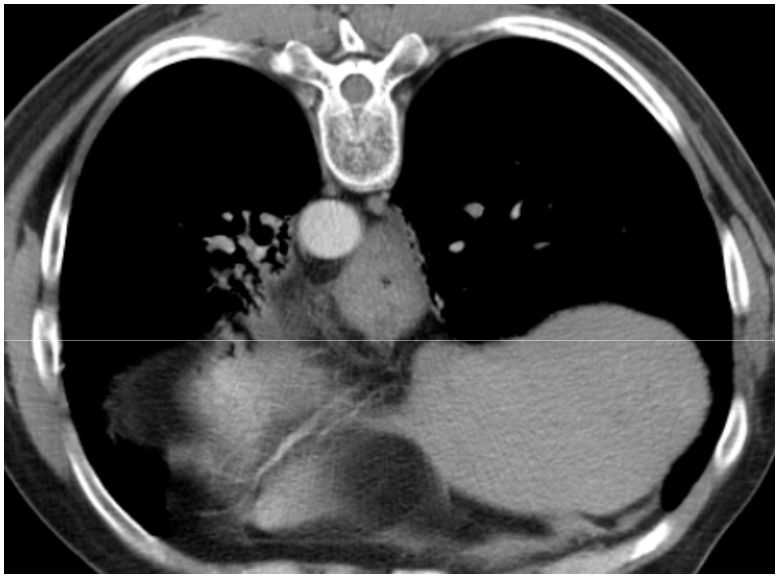
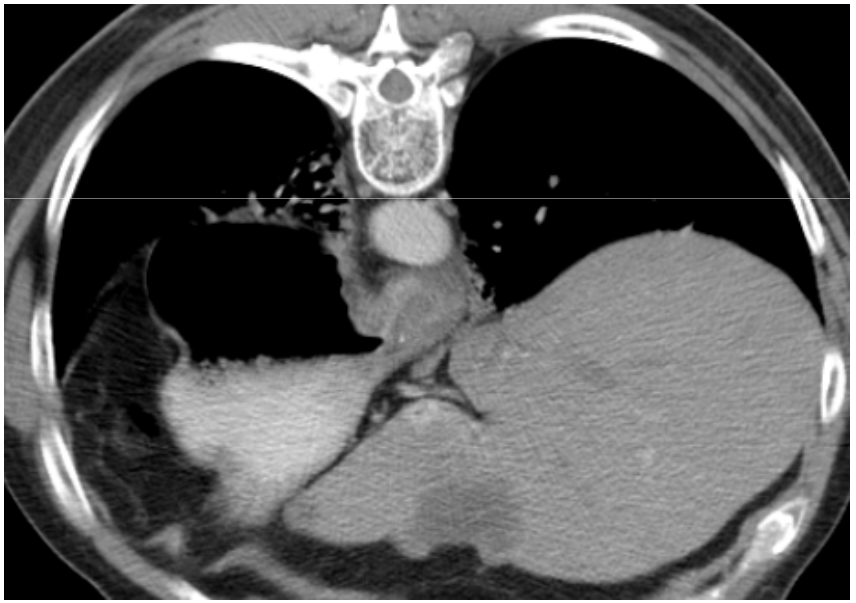
Prone imaging





Contact versus invasion of aorta

Staging the primary

Initial Staging

- T stage - based on wall thickness and outline
- Limited soft tissue contrast
- Poor for early tumours

pT2

pT3

pT4

T Stage	Wall thickness	Wall Contour
T2	>3mm, <5mm	Smooth
T3	5-15mm	Irregular
T4	>15mm	Contact with adjacent structure

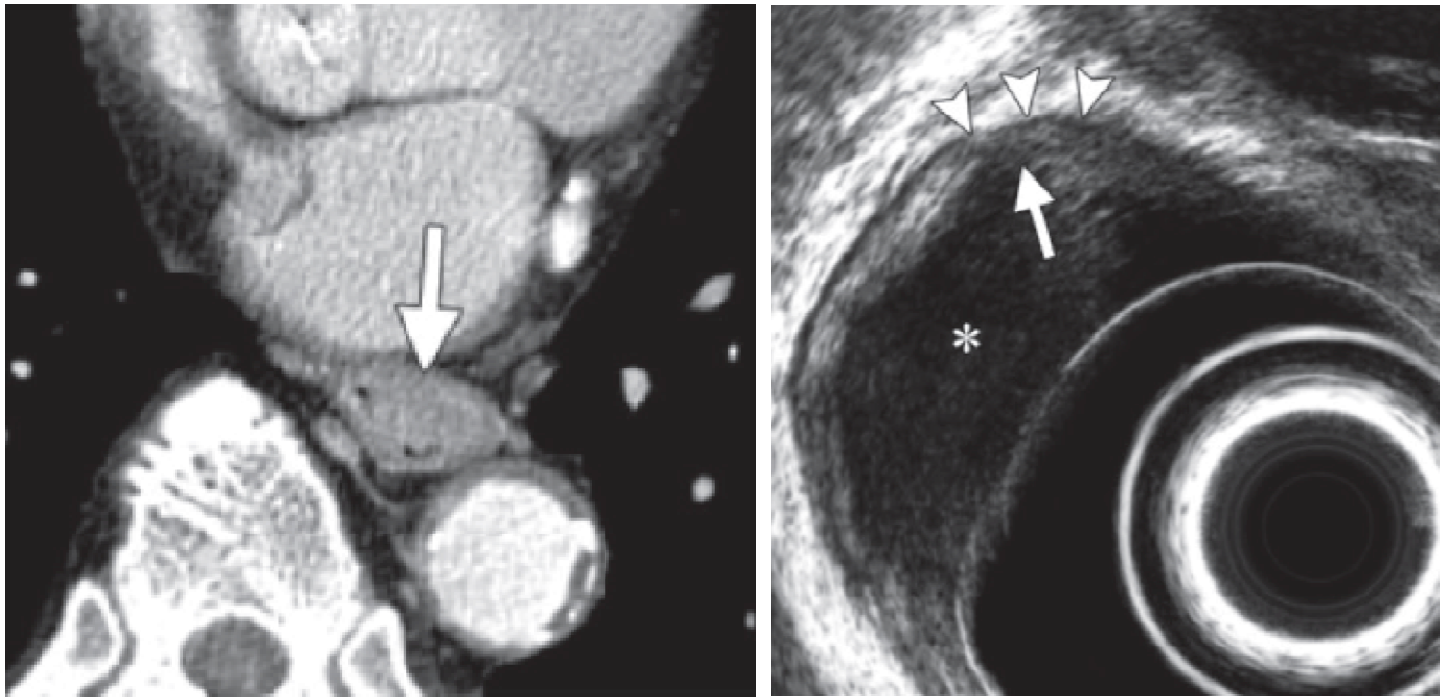
T Staging Accuracy - 74%*

* Davies, A. R., D. A. Deans, et al. (2006). Dis Esophagus **19**(6): 496-503

ESTRO School

Imaging the primary

- Endoscopic Ultrasound (EUS) delineates the layers of the oesophageal wall

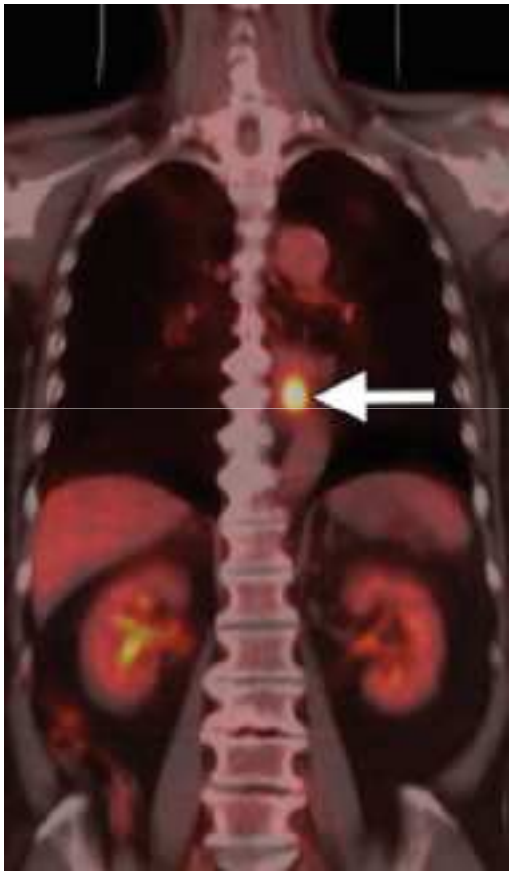


Hong SJ, Kim T J, Nam KB 2014. Radiographics; 34:1722-1740

ESTRO School

Imaging the primary – PET-CT

- 78-95% sensitivity for detecting primary tumour
- False positive due to oesophagitis & GORD
- T staging limited
- Provides information for tumour delineation
- Controversy remains over optimum segmentation method for determining target volume



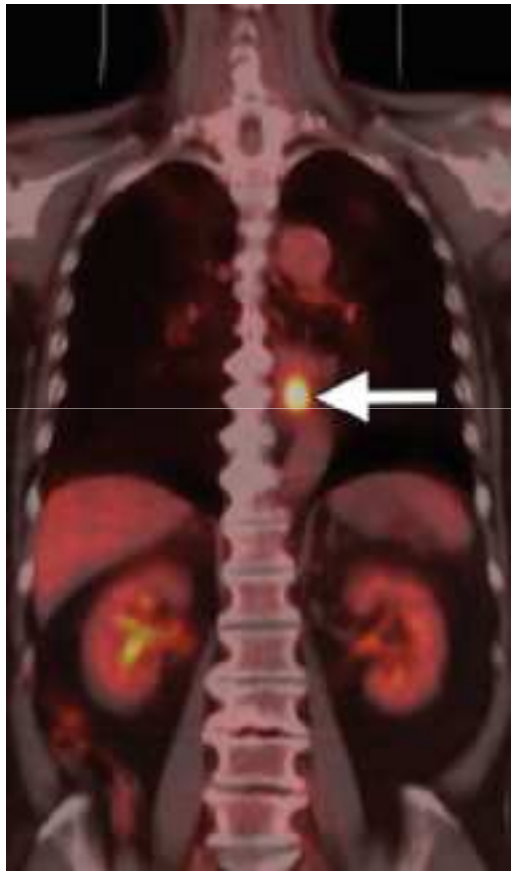
ESTRO School

Imaging the primary – PET-CT

Utility for Radiotherapy planning

Systematic review*:

- 3/50 studies demonstrated positive correlation of PET-CT length with path
- 1/50 showed improved inter & intra observer variability
- No studies demonstrated improved locoregional control



*Muijs CT, Beukema JC, Pruim J 2010. Radiother Oncol. Nov;97(2):165-71

ESTRO School

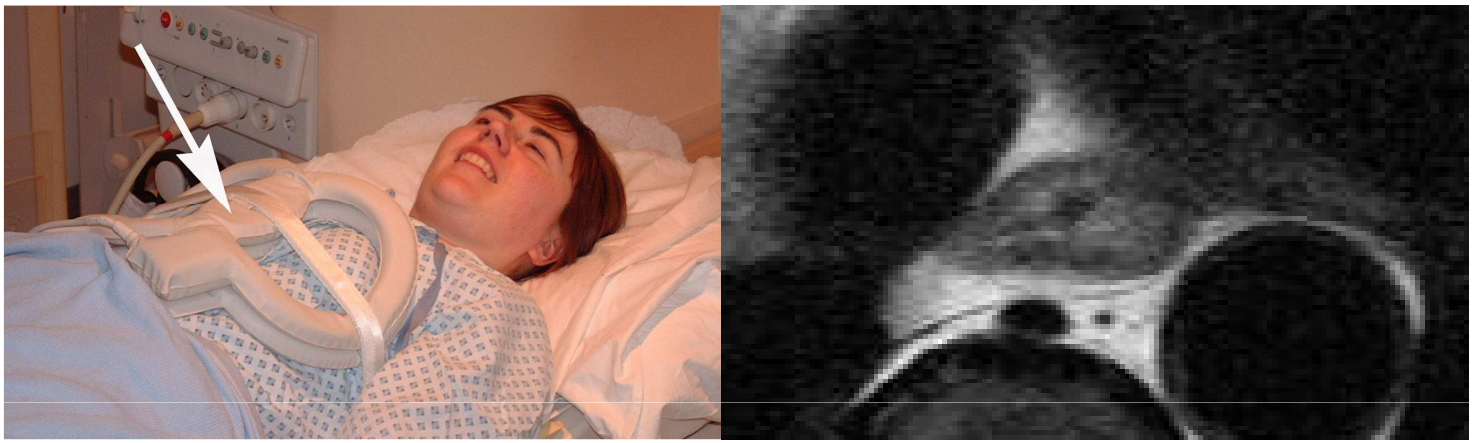
Imaging the primary: High Resolution MRI

- Advances in surface coil technology & fast imaging techniques
- Improved signal to noise
- Small field of view
- Thin slice imaging
- High Resolution Images = Voxel size 1-2mm^3

- Enables demonstration of the esophageal wall layers, allowing for local staging.

MRI Technique

External Surface coil MRI



Patient preparation

Starve for 2 hours

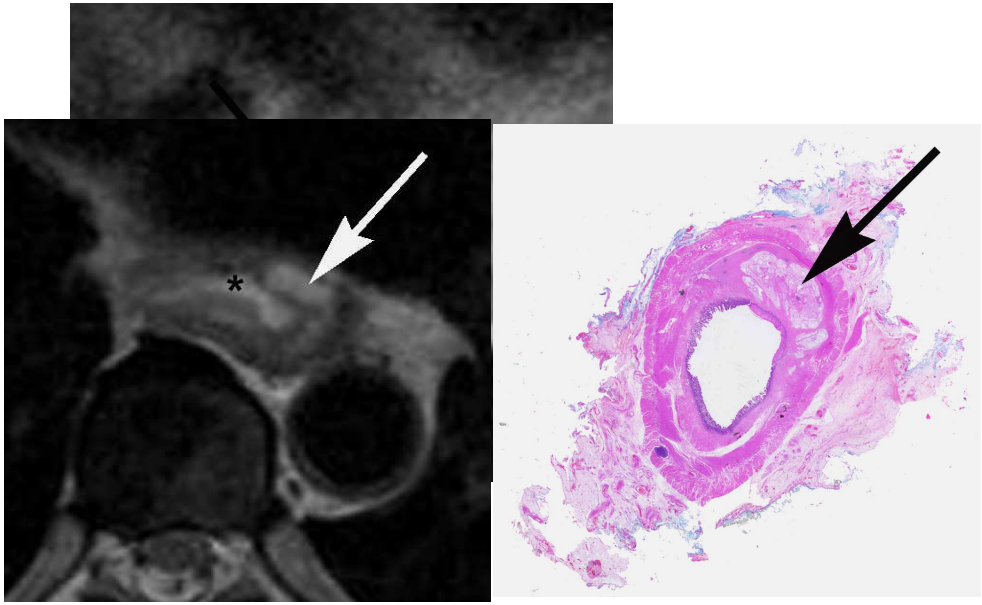
Antispasmodic

400mls water prior to scan

No requirement for IV contrast

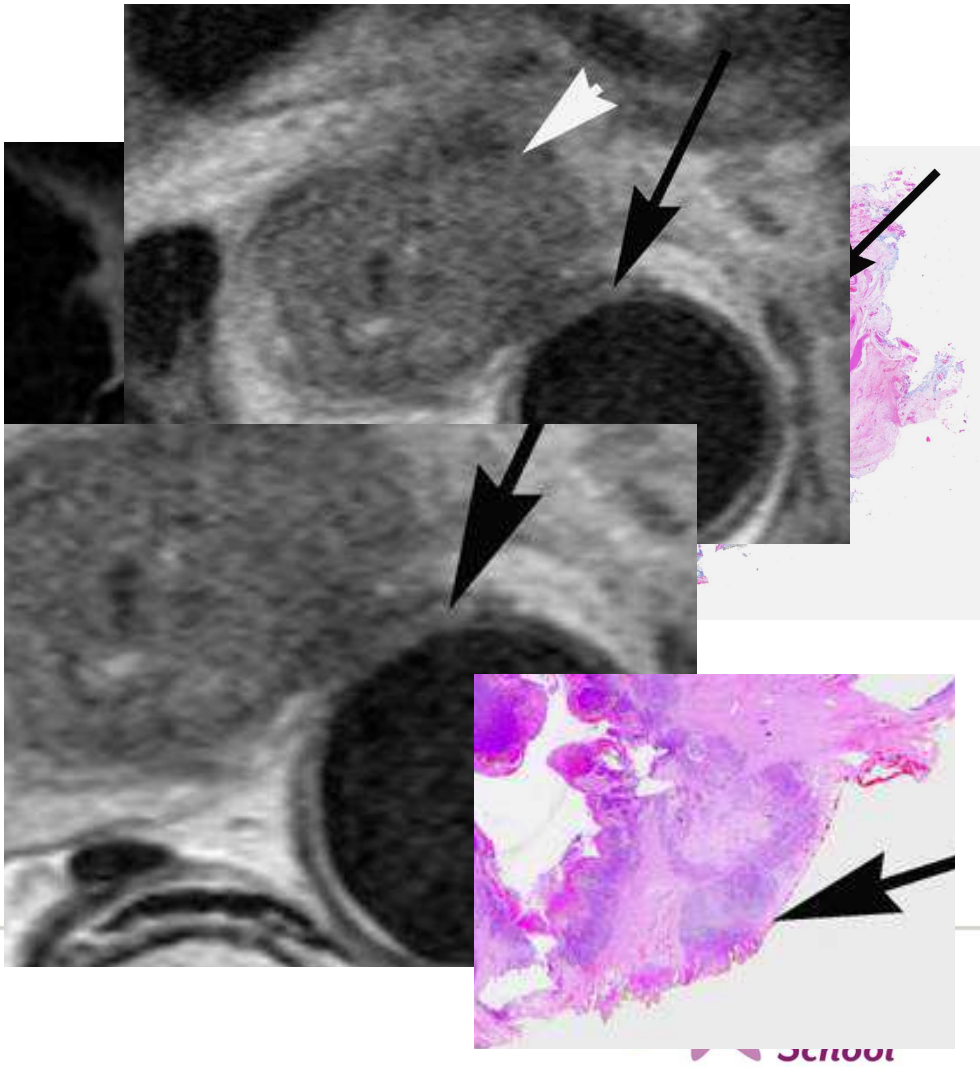
Potential advantages of MRI over MDCT

- Superior soft tissue contrast
  - Local staging
  - Tumour characterisation



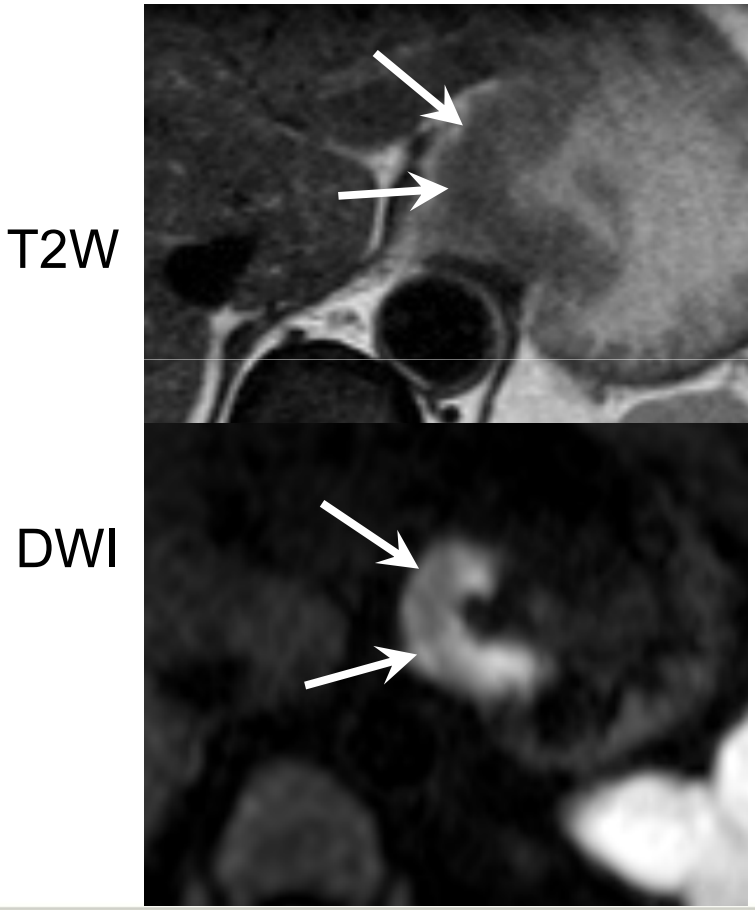
Potential advantages of MRI over MDCT

- Superior soft tissue contrast
  - Local staging
  - Tumour characterisation
- Improved assessment of the circumferential resection margin (CRM)

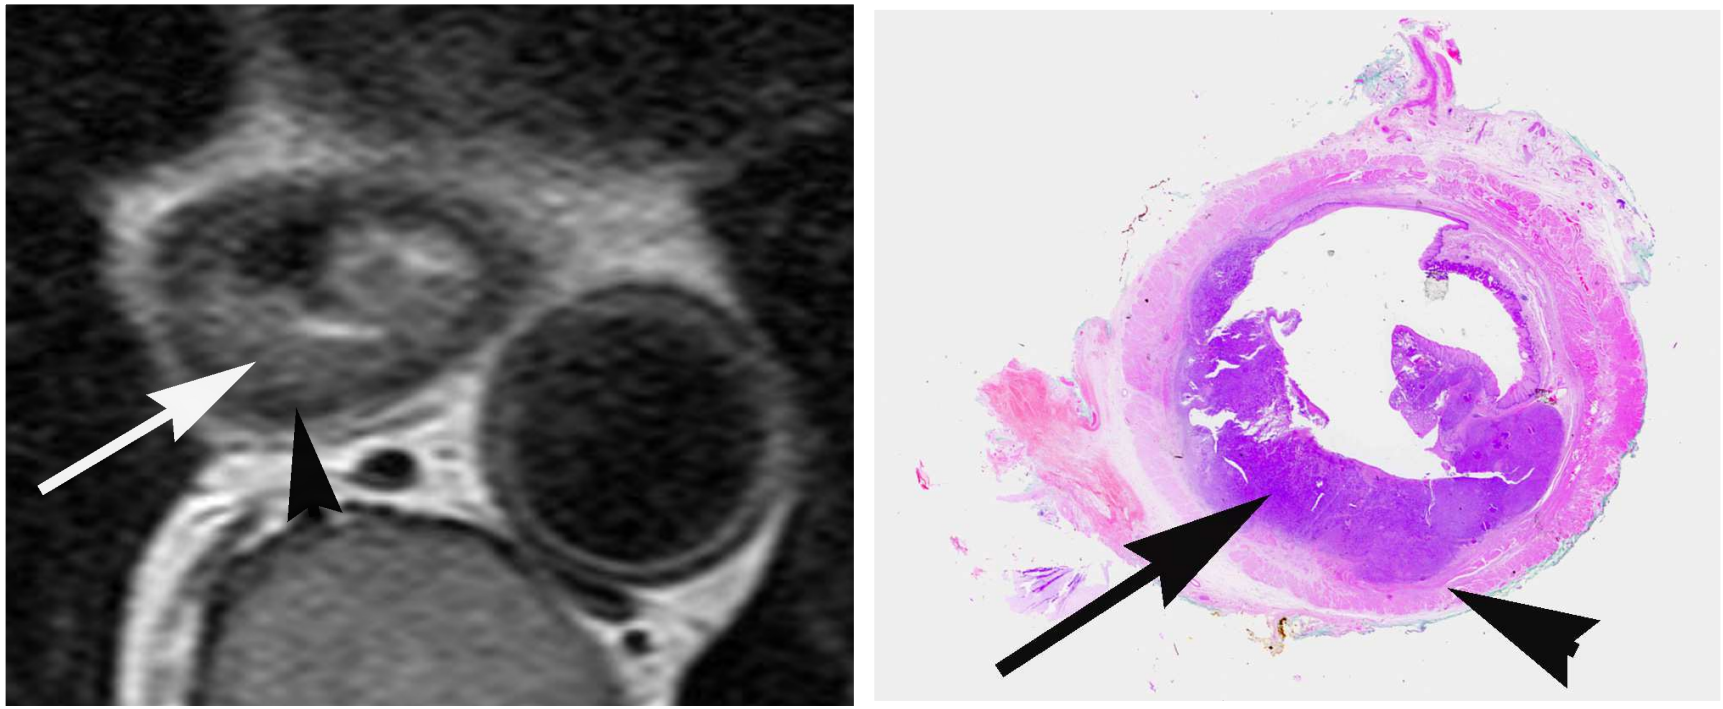


Potential advantages of MRI over MDCT

- Superior soft tissue contrast
  - Local staging
  - Tumour characterisation
- Improved assessment of the circumferential resection margin (CRM)
- Functional Information
  - Diffusion Weighted Imaging



High Resolution MRI



T2 tumour

Riddell A M, Allum W H, Thompson J N et al 2007. European Radiology: 17(2); 391-399

ESTRO School

MRI -T Staging

- Spatial resolution of MRI insufficient to accurately stage early tumours
- Good level of agreement with histology for ≤T2 vs ≥T3

	Path		
MRI	T= 0-2	T= 3-4	
T= 0-2	26	5	31 (44.3%)
T = 3-4	5	34	39 (55.7%)
	31 (44.3%)	39 (55.7%)	70

- Kappa for MRI 0.71
- Kappa for EUS 0.57 (post chemotherapy)

MRI - Prediction of Resectability

	Path Margin		
	Positive (no resection)	Negative	Total
MRI Positive	17(5)	5	22
Negative	9	44	53
Total	26	49	75

Correlation with Path for resected tumours:

Sensitivity	65%
Specificity	90%
PPV	77%
NPV	83%

Accuracy with MRI = 61/75, 81%

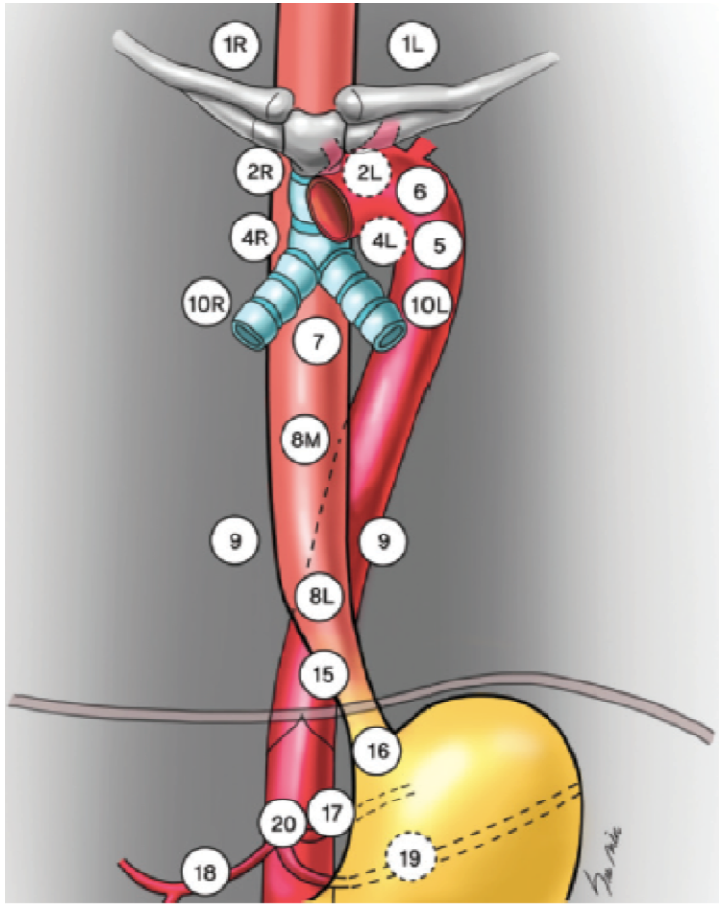
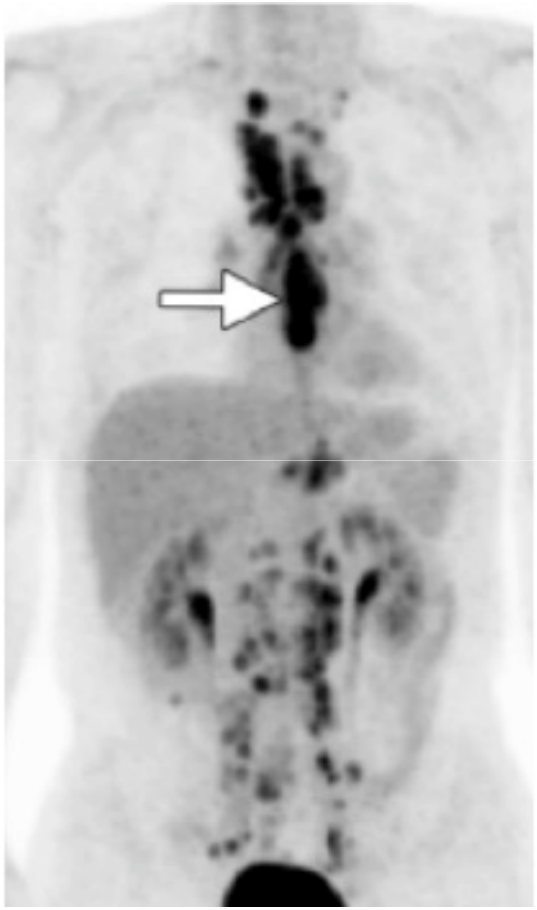
Anatomy: regional nodal stations – PET-CT





Hong SJ, Kim T J, Nam KB 2014. Radiographics; 34:1722-1740

ESTRO School

Regional Lymph nodes

Determining nodal involvement

Modality	Criteria	Comment	Sensitivity	Specificity
CT	Size	Intrathoracic & intra abdominal nodes >10mm & supraclavicular nodes >5mm are considered involved	63-87%	14-43%
EUS	Morphology	Malignant nodes: round; hypoechoic. Capability for FNA	85%	85%
PET-CT	SUV	Lower sensitivity due to reduced ability to detect nodes near the primary in some instances	51%	84%

Summary

Identification of anatomical landmarks

- Enables accurate location of primary & involved nodal stations

Multimodality approach to imaging

- MDCT
- EUS & PET-CT can refine identification and staging
- MRI likely to be used increasingly in the future

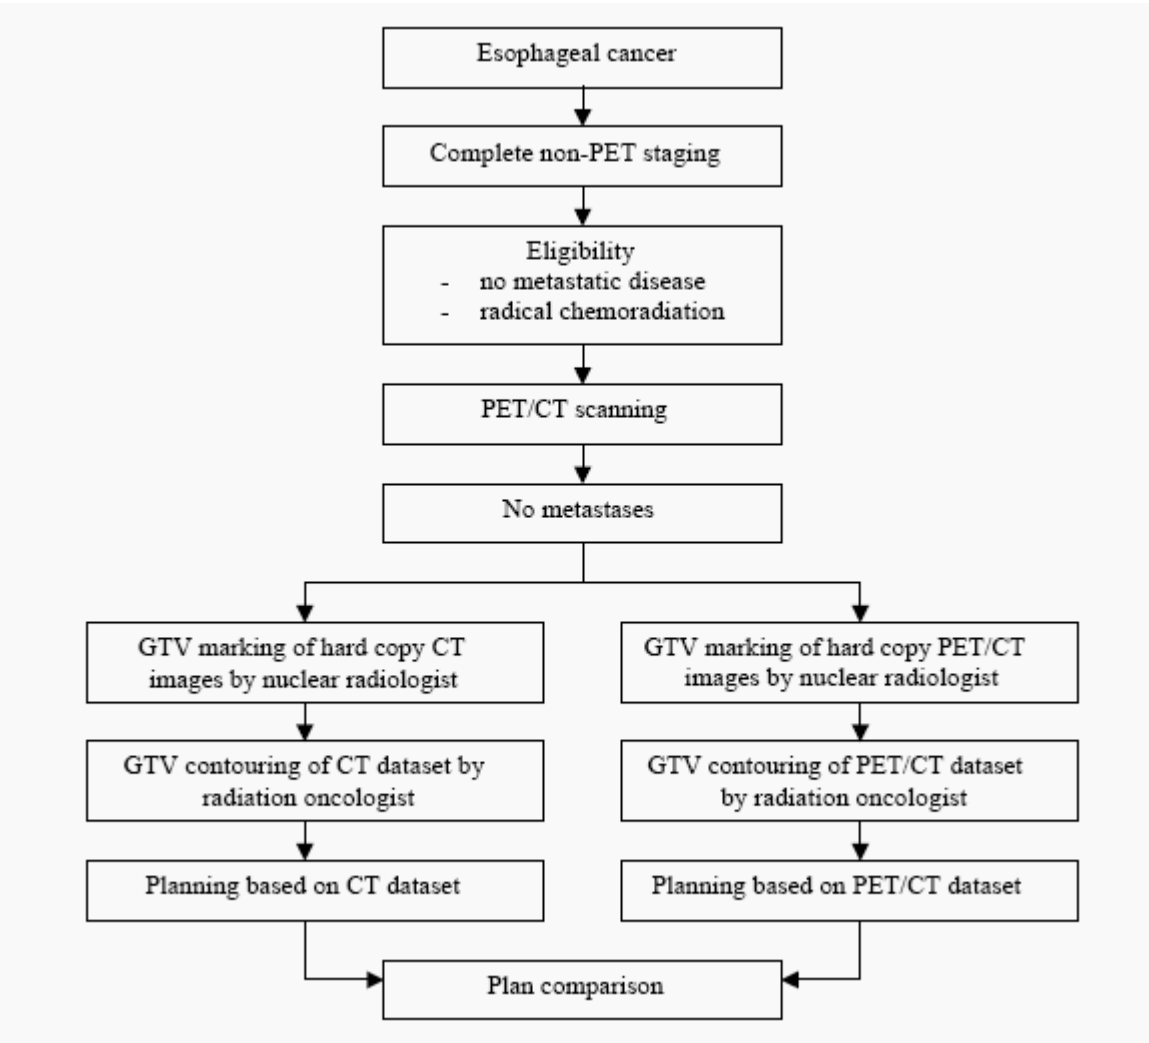
Impact of PET-CT on RT planning



Leong T. Radiother Oncol 2006;78:254-61

Impact of PET-CT on RT planning

- PET-avid disease was excluded from GTV in 68% if CT alone were used.
- Median percentage of volume of GTV-CT not included in GTV-PET was 38%.
- The median percentage of GTV-PET not included in the PTV-CT was 6% ….

Leong T. Radiother Oncol 2006;78:254-61

Esophageal cancers

- PET can improve the RT planning

  Duong Eur J Nucl Med Imaging 2006
- PET is more accurate for nodal assessment
- Distant lymph nodes and distant metastasis

  Van Westreneen JCO 2004
- PET shows the longitudinal extent better than CT
- PET may be the only way to visualize the lower border of the tumor

CTV DEFINITION

- On surgical specimens: n= 34 SCC/32ADK
- Microscopiques extensions

- **Lateral (mean value) =**
  - SCC : 10.5 ± 13.5 mm SUP et 10.6 ± 8.1 mm INF
  - ADK : 10.3 ± 7.2 mm SUP et 18.3 ± 16.3 mm INF

- **Supero-inferior (mean value) =**
  - 50mm = 100% in field
  - 30mm = 94% in field

ENI versus IFRT ? Lymph node metastasis and micrometastases

	Sensitivity		Specificity	
CT scan	0.50	*0.41-0.60*	0.83	*0.77-0.89*
EUS	0.80	*0.75-0.84*	0.70	*0.65-0.75*
FDG-PET	0.57	*0.43-0.70*	0.85	*0.76-0.95*

Van Viet Br J Cancer 2008

- Micrometastases do not influence the survival of pN0 patients
- Micrometastases is totally unpredictable
- Better OS after 3 field lymphadenectomy may suggest the benefit of ENI
- The number of positive lymph nodes is related to prognosis

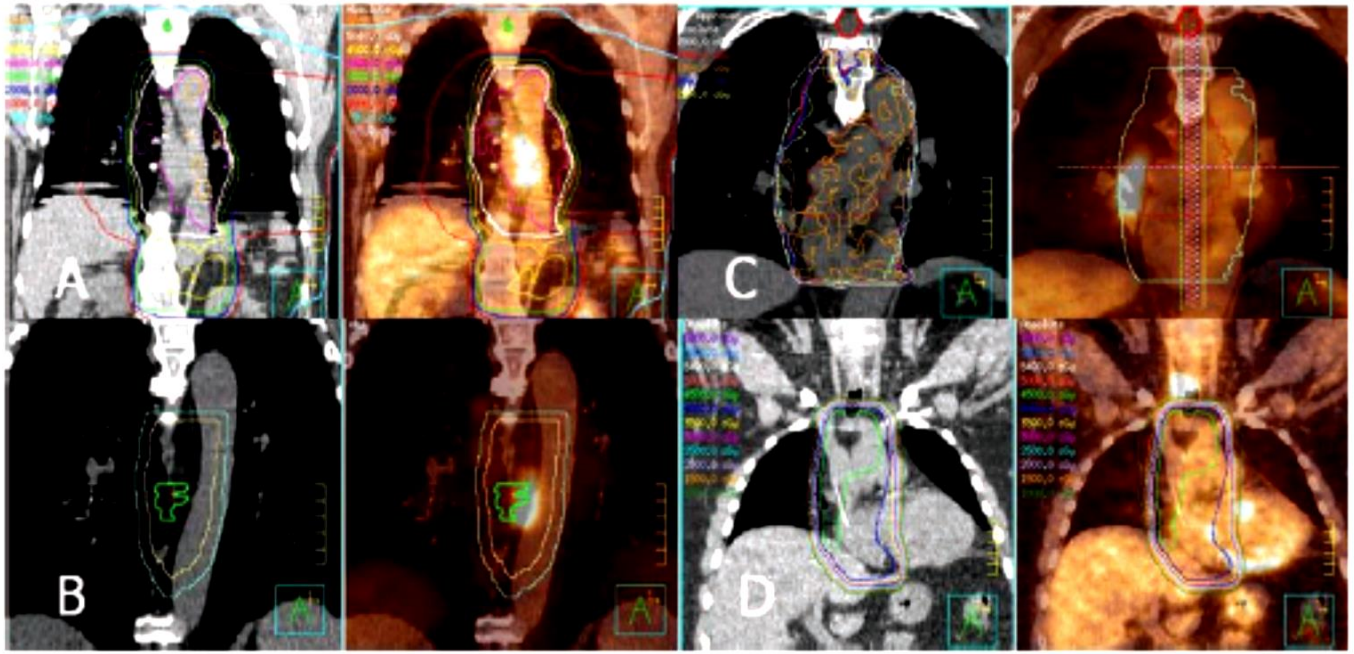
ENI versus IFRT ? Chemoradiotherapy and the incidence of regional failure

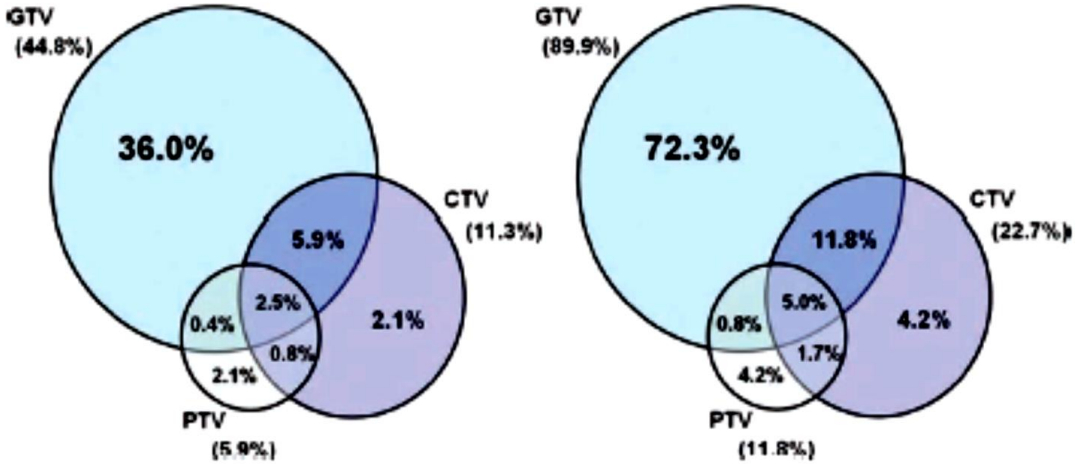
- Chemotherapy or CRT is able to reduce nodal metastases
- If tumor shows a major response, micromet are significantly reduced (nbre of nodes and nbre of positive nodes).
- The clinical relevance of micromets depend of tumor aggressiveness, the host immune status and the response to treatment
- Incidental irradiation is considerable using 3DCRT

ENI versus IFRT? Patterns of failure

	T1	T2-T3	T4
RR	90%	60-90%	57-88%
CR	88-97%	50-60%	17-39%

- The incidence of regional lymph node failure is low with or without ENI (1-6%)
- IFRT should be feasible for T1 stage EC
- Most of the failure occur in the GTV (85%)





Welsh J. Cancer 2012;118:2632-40

ESTRO School

ENI versus IFRT? Patterns of failure

- **Preoperative setting** Oppedijk JCO 2014

Table 3. Tumor Recurrences in Relation to Radiation Target Volumes in Patients Undergoing CRT Plus Surgery (n = 213)

Recurrence	Infield	Outfield	Borderline	Unknown	Total
LRR only	2	2	2	1	7
Distant only	0	43	0	1	44
LRR plus distant	9	11	3	0	23
Total	11	56	5	2	74

Abbreviations: CRT, chemoradiotherapy; LRR, locoregional recurrence.

- Even for CR after CRT, the primary and the distant organ rather than the regional lymph node were the prominent sites of recurrence.
- For early and advanced EC, the majority of the failures occurs in the GTV (the primary). Only few patients experienced solitary regional node failure.
- No clear recommendation regarding differenciation

Contents

Introduction

Treatment options

Radiotherapy: OAR, dose-constraints

Epidemiology of esophageal cancer

- 2012: Europe ~46,000 cases/year; ~39,500 deaths
- 6th leading cause of cancer-related mortality
- 8th most common cancer worldwide
- Worldwide >450,000 people are affected
- Incidence is increasing rapidly
- Overall 5-year survival 15-25%
- Diagnosis at advanced (metastatic) stages
- 30-40% present with resectable disease
- SCC is predominant type; in some western European countries adenocarcinoma exceeds SCC

Esophageal cancer: risk factors

Oesophageal SCC

- Tobacco use
- Alcohol consumption
- Mutations of enzymes that metabolise alcohol
- Achalasia
- Caustic injury
- History of thoracic radiation
- Low socioeconomic status
- Poor oral hygiene
- Nutritional deficiencies
- Non-epidermolytic palmoplantar keratoderma

Oesophageal adenocarcinoma

- Symptomatic gastro-oesophageal reflux disease
- Barrett's oesophagus
- Obesity
- Tobacco use
- History of thoracic radiation
- Diet low in vegetables and fruits
- Increased age
- Male sex
- Medications that relax the lower oesophageal sphincter
- Familial history (rare)

TNM esophageal cancer 7th edition

Treatment options

- Operable/resectable vs. Inoperable/irresectable
- Surgery vs. neoadjuvant chemotherapy + surgery
- Neoadjuvant chemoradiotherapy with surgical resection
- Surgery with adjuvant chemotherapy, radiotherapy, or chemoradiotherapy
- Definitive (chemo-) radiotherapy

Surgery vs. neoadjuvant chemotherapy + surgery

	Number of patients	Study treatments	Chemotherapy regimen	Histology	Median survival (months)	Overall survival (%)
Kelsen et al, 1998[91]	440	Surgery vs surgery and chemotherapy	Cisplatin+fluorouracil for three cycles before surgery	204 (46%) SCC, 236 (54%) adenocarinoma	14·9 vs 16·1	(3-year) 26% vs 23%
MRC, 2002[92] and Allum et al, 2009*	802	Surgery vs surgery and chemotherapy	Cisplatin+fluorouracil for two cycles before surgery	247 (31%) SCC, 533 (66%) adenocarcinoma, 24 (3%) undifferentiated or unknown	13·3 vs 16·8	(5-year) 17% vs 23%†
Cunningham et al, 2006[93]	503	Surgery vs surgery and chemotherapy	Epirubicin+cisplatin+ fluorouracil for three cycles before and after surgery	503 (100%) adenocarcinoma (372 [74%] gastric, 131 [26%] oesophageal)	NR	(5-year) 23% vs 36%†

SCC=squamous-cell carcinoma. MRC=Medical Research Council Oesophageal Cancer Working Group. NR=not reported. *Appendix p 7. †Significant difference in favour of the neoadjuvant chemotherapy group.

Table 2: **Results of randomised trials of neoadjuvant chemotherapy**

- Rationale: control early spread of systemic disease
- Conflicting results
- MAGIC study (Cunningham) may not be generalisable to all esophageal adenocarcinoma (26% EGJ/adeno oes)

ESTRO School

Survival after neoadjuvant chemotherapy or chemoradiotherapy for resectable oesophageal carcinoma: an updated meta-analysis

	Year started	Radiotherapy schedule	Chemotherapy schedule	Concurrent or sequential	Tumour type	Sample size	Median follow-up (months)*
Chemoradiotherapy *vs* surgery alone							
Nygaard[9]	1983	35 Gy, 1·75 Gy per fraction over 4 weeks	Two cycles: cisplatin 20 mg/m² days 1–5; bleomycin 5 mg/m² days 1–5	Sequential	SCC	78	18†
Apinop[39]	1986	40 Gy, 2 Gy per fraction over 4 weeks	Two cycles: cisplatin 100 mg/m² day 1; fluorouracil 1000 mg/m² days 1–4	Concurrent	SCC	69	12†
Mariette[41]‖	2000	45 Gy in 25 fractions over 5 weeks	Two cycles: cisplatin 75 mg/m² day 1 or 2; fluorouracil 800 mg/m² days 1–4	Concurrent	SCC and adenocarcinoma	195	68
van der Gaast[42]‖	2004	41·4 Gy, 1·8 Gy per fraction over 4·6 weeks	5 weeks concurrent chemotherapy: carboplatin area under curve=2 and paclitaxel 50 mg/m² on day 1 weekly	Concurrent	SCC and adenocarcinoma	364	32

Different neoadjuvant schedules:

- 20-50.5 Gy in 10-28 Fx
- 5FU/cis; bleo/cis; paclitaxel/cis; paclitaxel/carbo
- Sequential/concurrent

Sjoquist et al. Lancet Oncol 2011

Surgery vs. surgery + adjuvant chemotherapy, radiotherapy, CRT

	Number of patients	Study treatments	Regimen	Histology	Median survival (months)	Overall survival (%)
Macdonald et al, 2001[106]	556	Surgery vs surgery and adjuvant CRT	Sequential and concurrent CRT with fluorouracil	556 (100%) adenocarcinoma (445 [80%] stomach, 111 [20%] gastro-oesophageal junction)	27 vs 36	(3-year) 41% vs 50%*
Ando et al, 2003[105]	242	Surgery vs surgery and adjuvant chemotherapy	Fluorouracil+ cisplatin	242 (100%) SCC	NR	(5-year) 52% vs 61%†
Armanios et al, 2004[103]‡	55	Surgery and adjuvant chemotherapy	Cisplatin+ paclitaxel	55 (100%) adenocarcinoma	31·2	(3-year) 42%
Xiao et al, 2003§	495	Surgery vs surgery and adjuvant RT	50·0–60·0 Gy in 25–30 fractions	495 (100%) SCC	NR	(5-year) 31·7% vs 41·3%
Ténière et al, 1991§	221	Surgery vs surgery and adjuvant RT	45·0–55·0 Gy	221 (100%) SCC	18 vs 18	(5-year) 17·6% vs 18·6%
Fok et al, 1993§	130	Surgery vs surgery and adjuvant RT	49·0–52·5 Gy in 14 fractions	104 (80%) SCC, 26 (20%) adenocarcinoma	15·2 vs 8·7¶	NR
Zieren et al, 1995§	68	Surgery vs surgery and adjuvant RT	Up to 30·6 Gy	68 (100%) SCC	NR	(3-year) 20% vs 22%

CRT=chemoradiotherapy. RT=radiotherapy. SCC=squamous-cell carcinoma. NR=not reported. *Difference significant for overall survival. †Although overall survival did not differ (p=0·13), disease-free surival was improved with adjuvant chemotherapy (45% vs 55%, p=0·037). ‡Phase 2 non-randomised, non-controlled trial. §Appendix pp 7–8. ¶Difference significant for median survival.

Table 4: **Results of trials of adjuvant chemotherapy, radiotherapy, and chemoradiotherapy** *Pennathur et al, Lancet 2013*

- Rationale: may be beneficial for specific subgroups (node-positive disease; positive margins)
- No consistent benefits

A Randomized Trial of Dose Escalation in definitive Chemoradiotherapy for patients with Oesophageal cancer

Primary objective

To improve the local tumor control rate by escalating the RT dose in definitive CRT for patients with locally irresectable or medically inoperable carcinoma of the esophagus or gastric junction

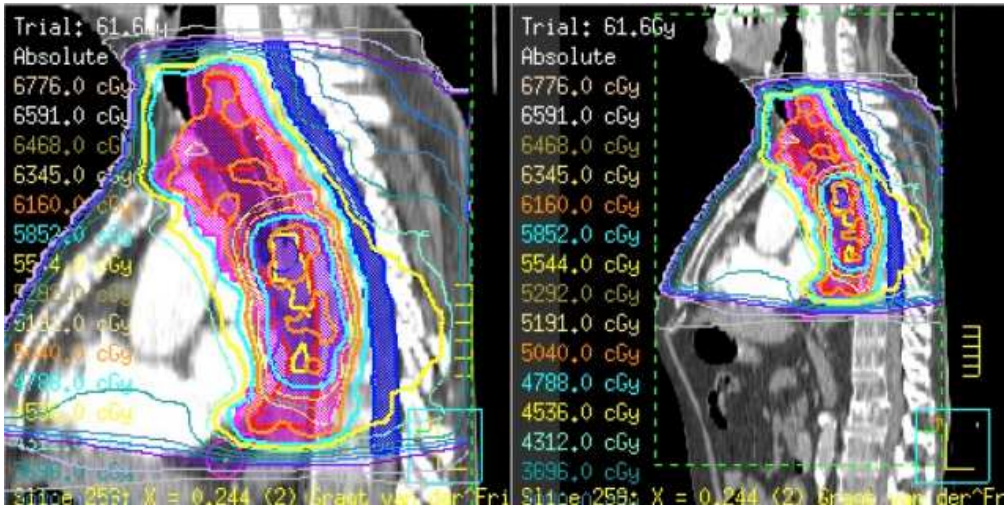
Dutch dose escalation trial definitive CRT

ART-DECO

R

Standard: 50.4 Gy/28 fr + weekly carbo/paclitaxel

Experimental: 61.6 Gy/28 fr (SIB boost GTVoes) + C/P



ESTRO School

Critical structures and dose constraints

- Lungs: EQD2 $D_{mean} \leq 16$ Gy ($\alpha/\beta=3$)
- Heart: 3/3 <40 Gy; 2/3 <50 Gy; 1/3 < 66 Gy
  (<30% cardiac silhouette may receive 40 Gy)
- Spinal cord: EQD2 $D_{max} \leq 50$ Gy ($\alpha/\beta=2$)

Conclusions

- *Incidence of esophageal cancer is increasing*
- *Prognosis is poor due to advanced stages at diagnosis*
- *Treatment is challenging and requires multidisciplinary approach*
- *Largest gain is obtained in neo-adjuvant setting (CRT>CT?)*
- *Whether there is room for RT dose escalation remains unanswered (subgroups? Better/safer RT techniques?)*

CONCLUSIONS

- IMRT should be favored in the treatment of esophageal cancer.
- The inverse treatment planning is asking for contraints to the tumor as well as for organs at risk.
- The constraints to OARs should minimize the dose delivered to critical structures which could be associated to acute toxicities and poor compliance.
- The ALARA principle should be applied to all thoracic irradiated organs.

“Competitive” plans

Universitair Ziekenhuis Brussel

Vrije Universiteit Brussel

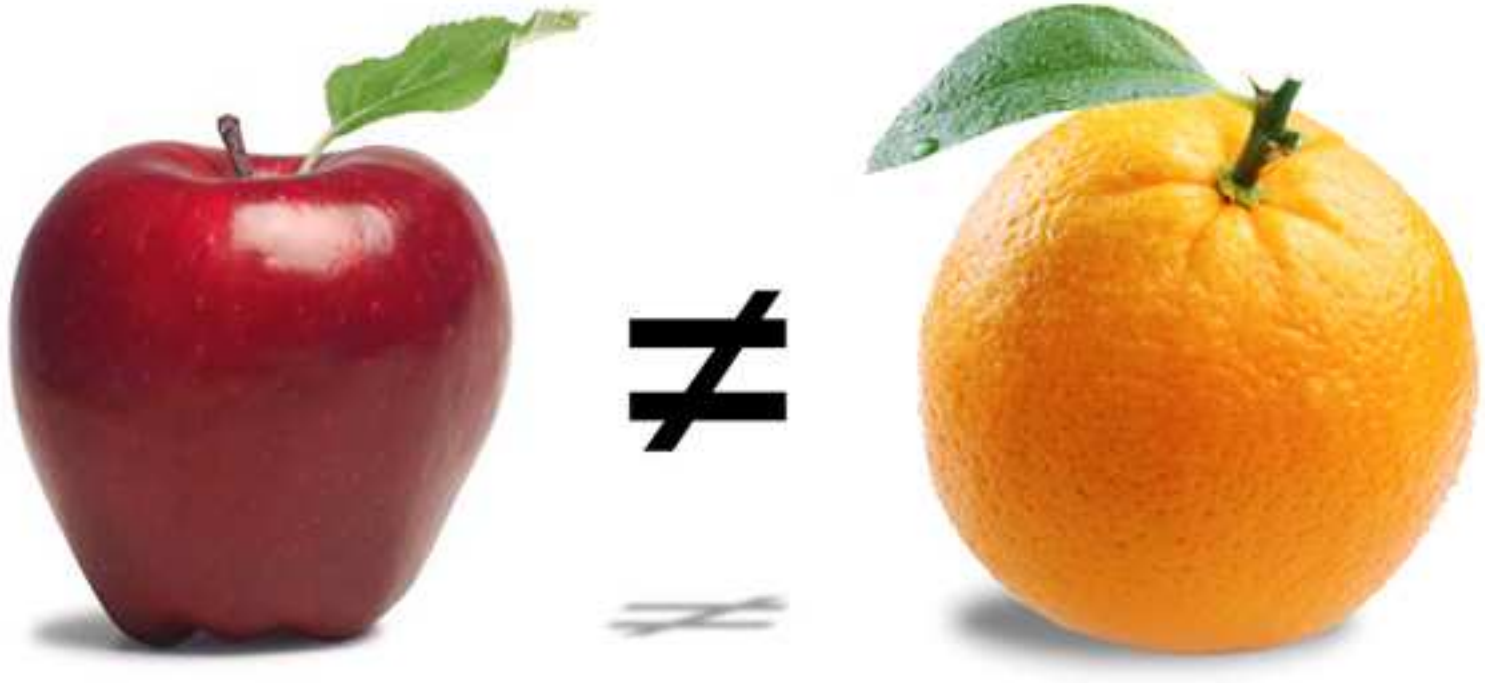
Dirk Verellen

DV is involved in an on-going scientific collaboration with BrainLAB AG, RaySearch, MIM software Inc.

ESTRO School

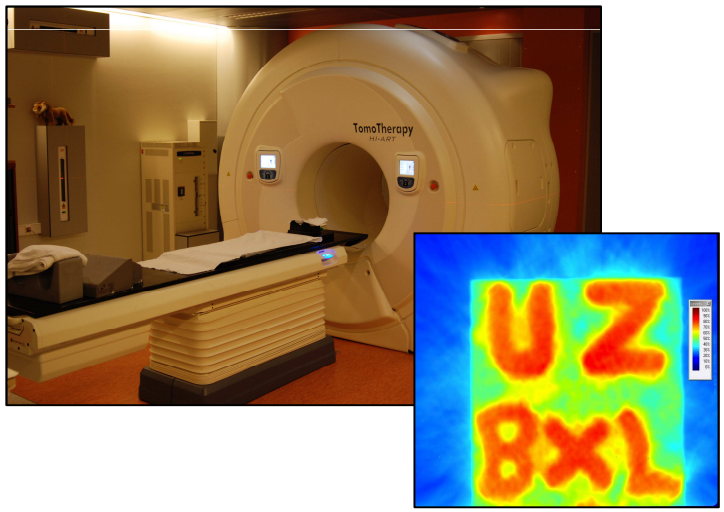
Outline

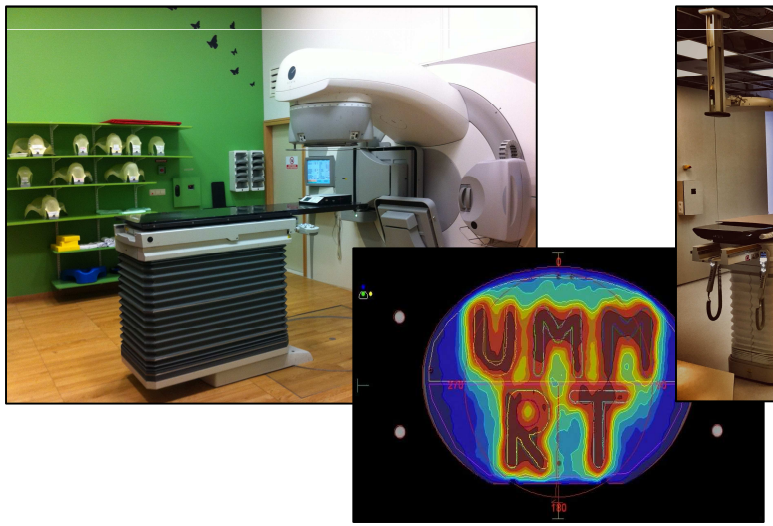
- How to compare plans?
- Oesophagus: 3D-CRT versus VMAT
- Oesophagus: 3D-CRT versus Helical TomoTherapy
- Partial gastrectomy: 3D-CRT versus Helical TomoTherapy

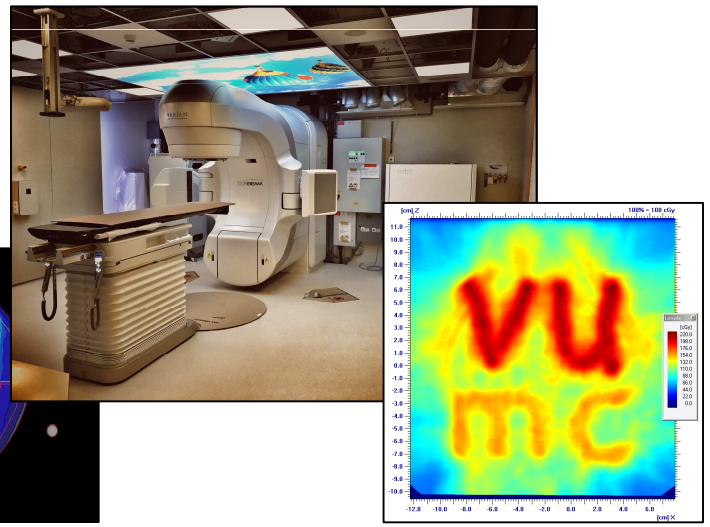


A few disclaimers

- Unlike the title suggests, this exercise is not trying to show superiority of a technology







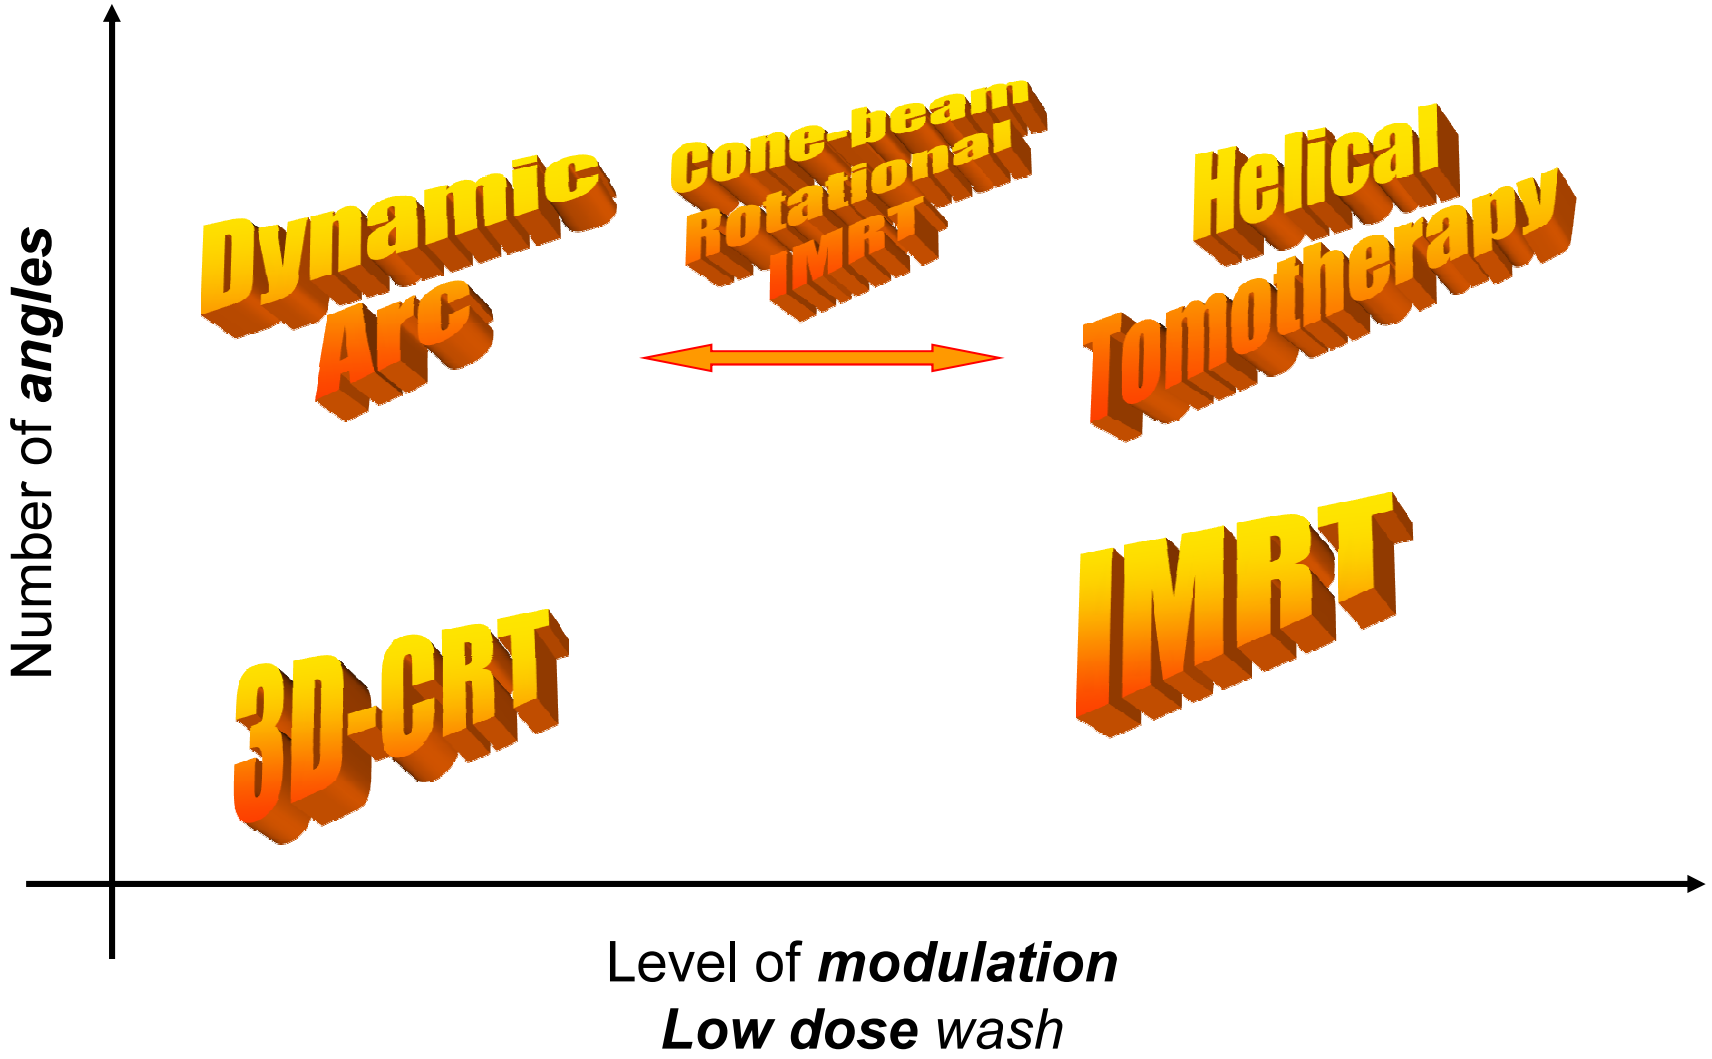
- The plans shown in this presentation are typical plans as they would be performed in clinic, generated by a dosimetrist.
  - eg focus on a certain constraint in the optimizer could drive the IMRT plan to outperform another on that particular variable … bias, selectivity ….
  - The acceptance criteria, were: “the plan being clinically acceptable, presenting a good compromise.”

A few disclaimers

- We're limiting ourselves to photon treatment
  - … for obvious reasons

- From 3D-CRT to IMRT to rotational IMRT: "**re-distribution of dose**"
  - Simplistic: "if you want more conformality, you'll sacrifice on homogeneity and *vice versa*."
  - The clinical choice is: "delivering more dose to *some* normal tissues and sparing *others* completely" versus "distributing low dose values uniformly within large volumes of normal tissues (***low dose wash***)."

You get what you pay for

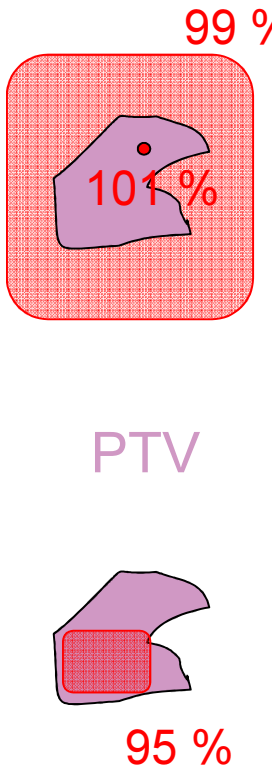


Dose homogeneity & Conformity

Tumor dose inhomogeneity, $TDI = (D_{max} - D_{min})/D_{median}$

Conformity Index, $CI_{95} = V_{NonTargetTissue}/V_{CTV}$

Technique	TDI	CI
Tomotherapy	**0.38**	**0.35**
IMRT opposing	**0.26**	**2.33**
IMRT non opposing	**0.25**	**0.33**
Dynamic Arc	**0.26**	**0.51**
IMRS opposing	**0.30**	**0.43**
IMRS non opposing	**0.26**	**0.29**



TDI ++

CI ++

Dose homogeneity & Conformity

- Paddick Conformity Index:

  - simultaneously takes into account irradiation of the target volume and irradiation of the healthy tissue

$$\frac{TV_{PI}}{PIV} \times \frac{TV_{PI}}{TV}$$

  - TV_{PI} is the target volume (TV) within the prescribed isodose volume (PIV)
  - **Part 1**: Healthy tissue receiving dose > PI (ideally ➔ 1)
  - **Part 2**: Quality of target coverage (ideally ➔ 1)
  - Ideally, **should be close to 1**.

Dose homogeneity & Conformity

- Homogeneity Index:

$$HI = \frac{D_2 - D_{98}}{D_P}$$

- D_2: represents maximum dose, dose to 2% of the PTV
- D_{98}: represents minimum dose, dose to 98% of the PTV
- D_p: prescription dose
- **Lower values indicate more homogeneity**.

Dose homogeneity & Conformity

- Gradient Index:
  - A measure for dose fall-off

$$GI = \frac{PIV_{50}}{PIV}$$

  - PIV: Prescription isodose volume, in this case PIV_{95}
  - PIV_{50}: Volume that receives half of prescription dose
  - **The lower the better** (eg for SRS a GI less than 3 is suggested).

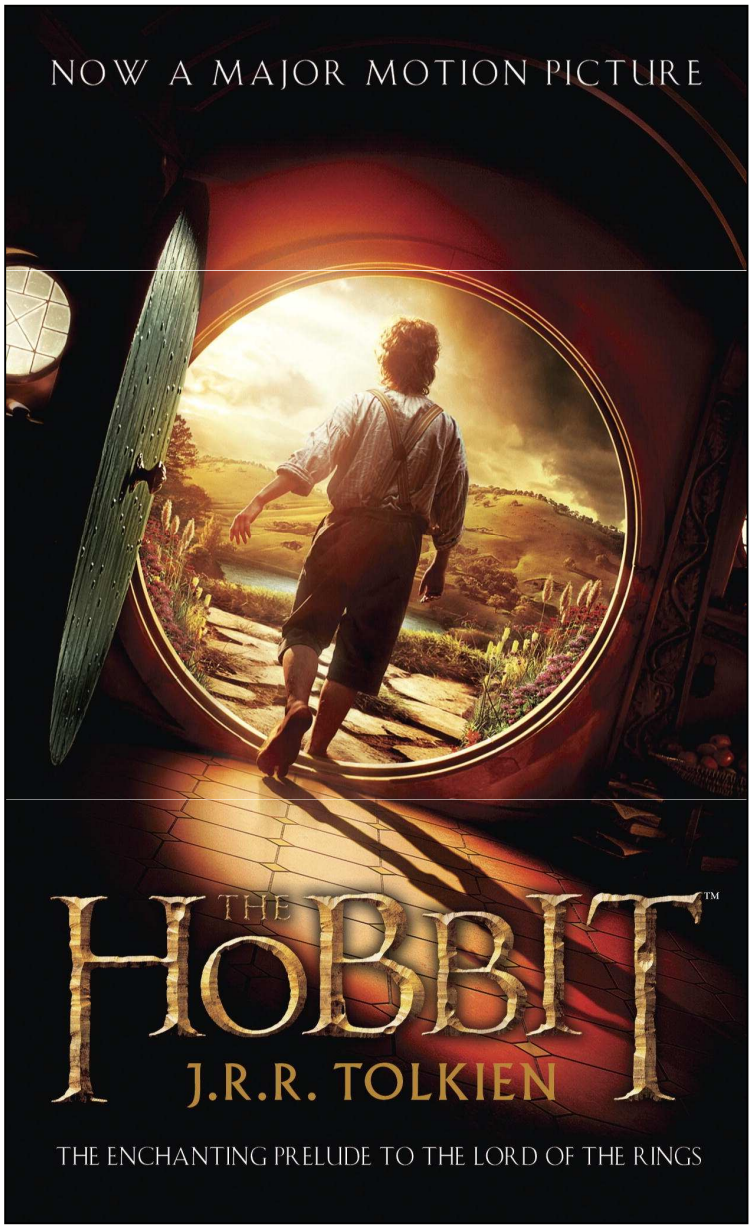
The PTV

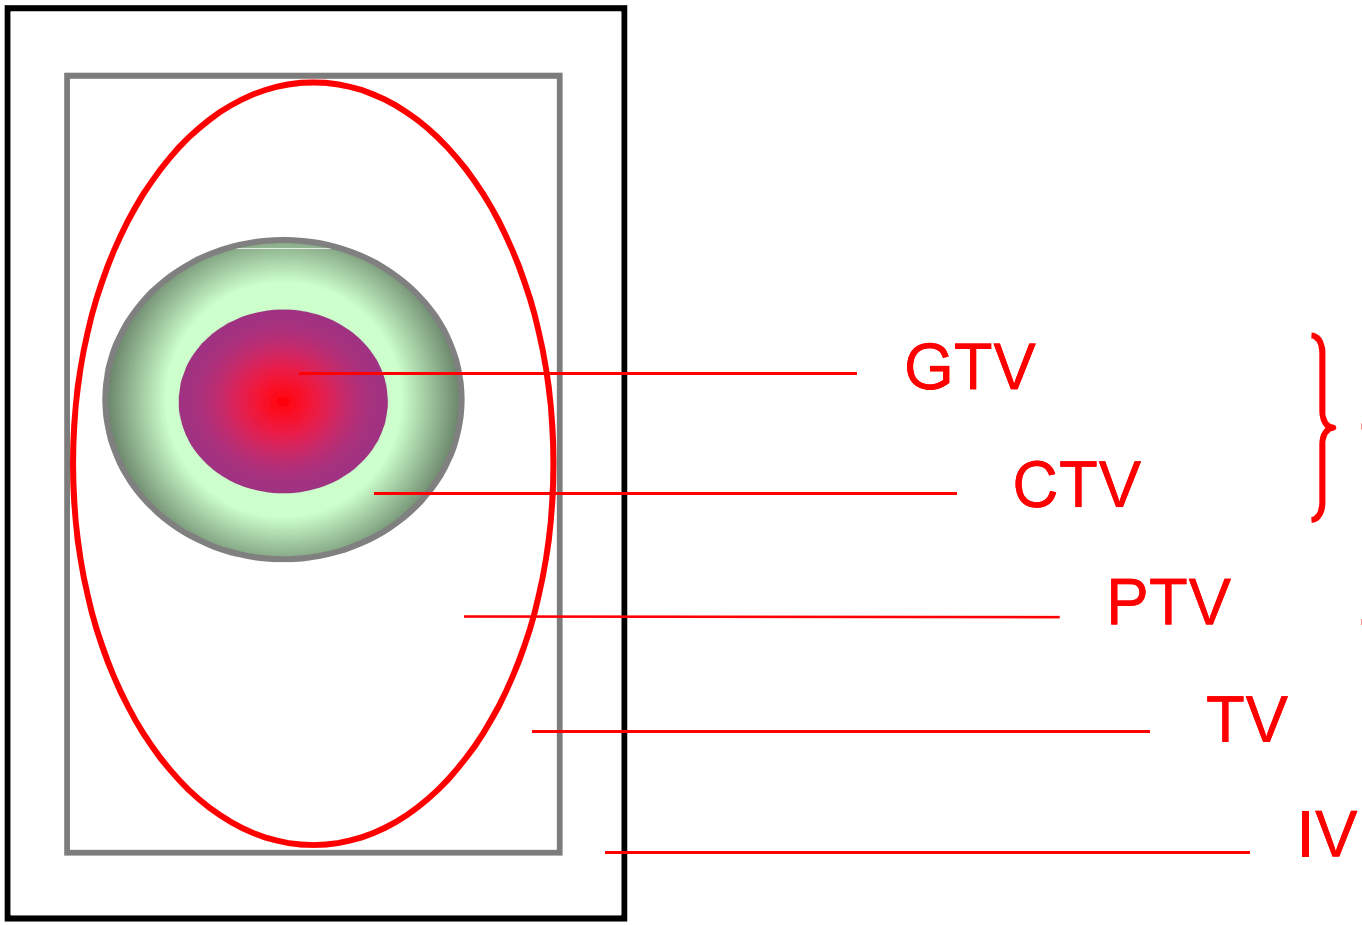
- There and back again



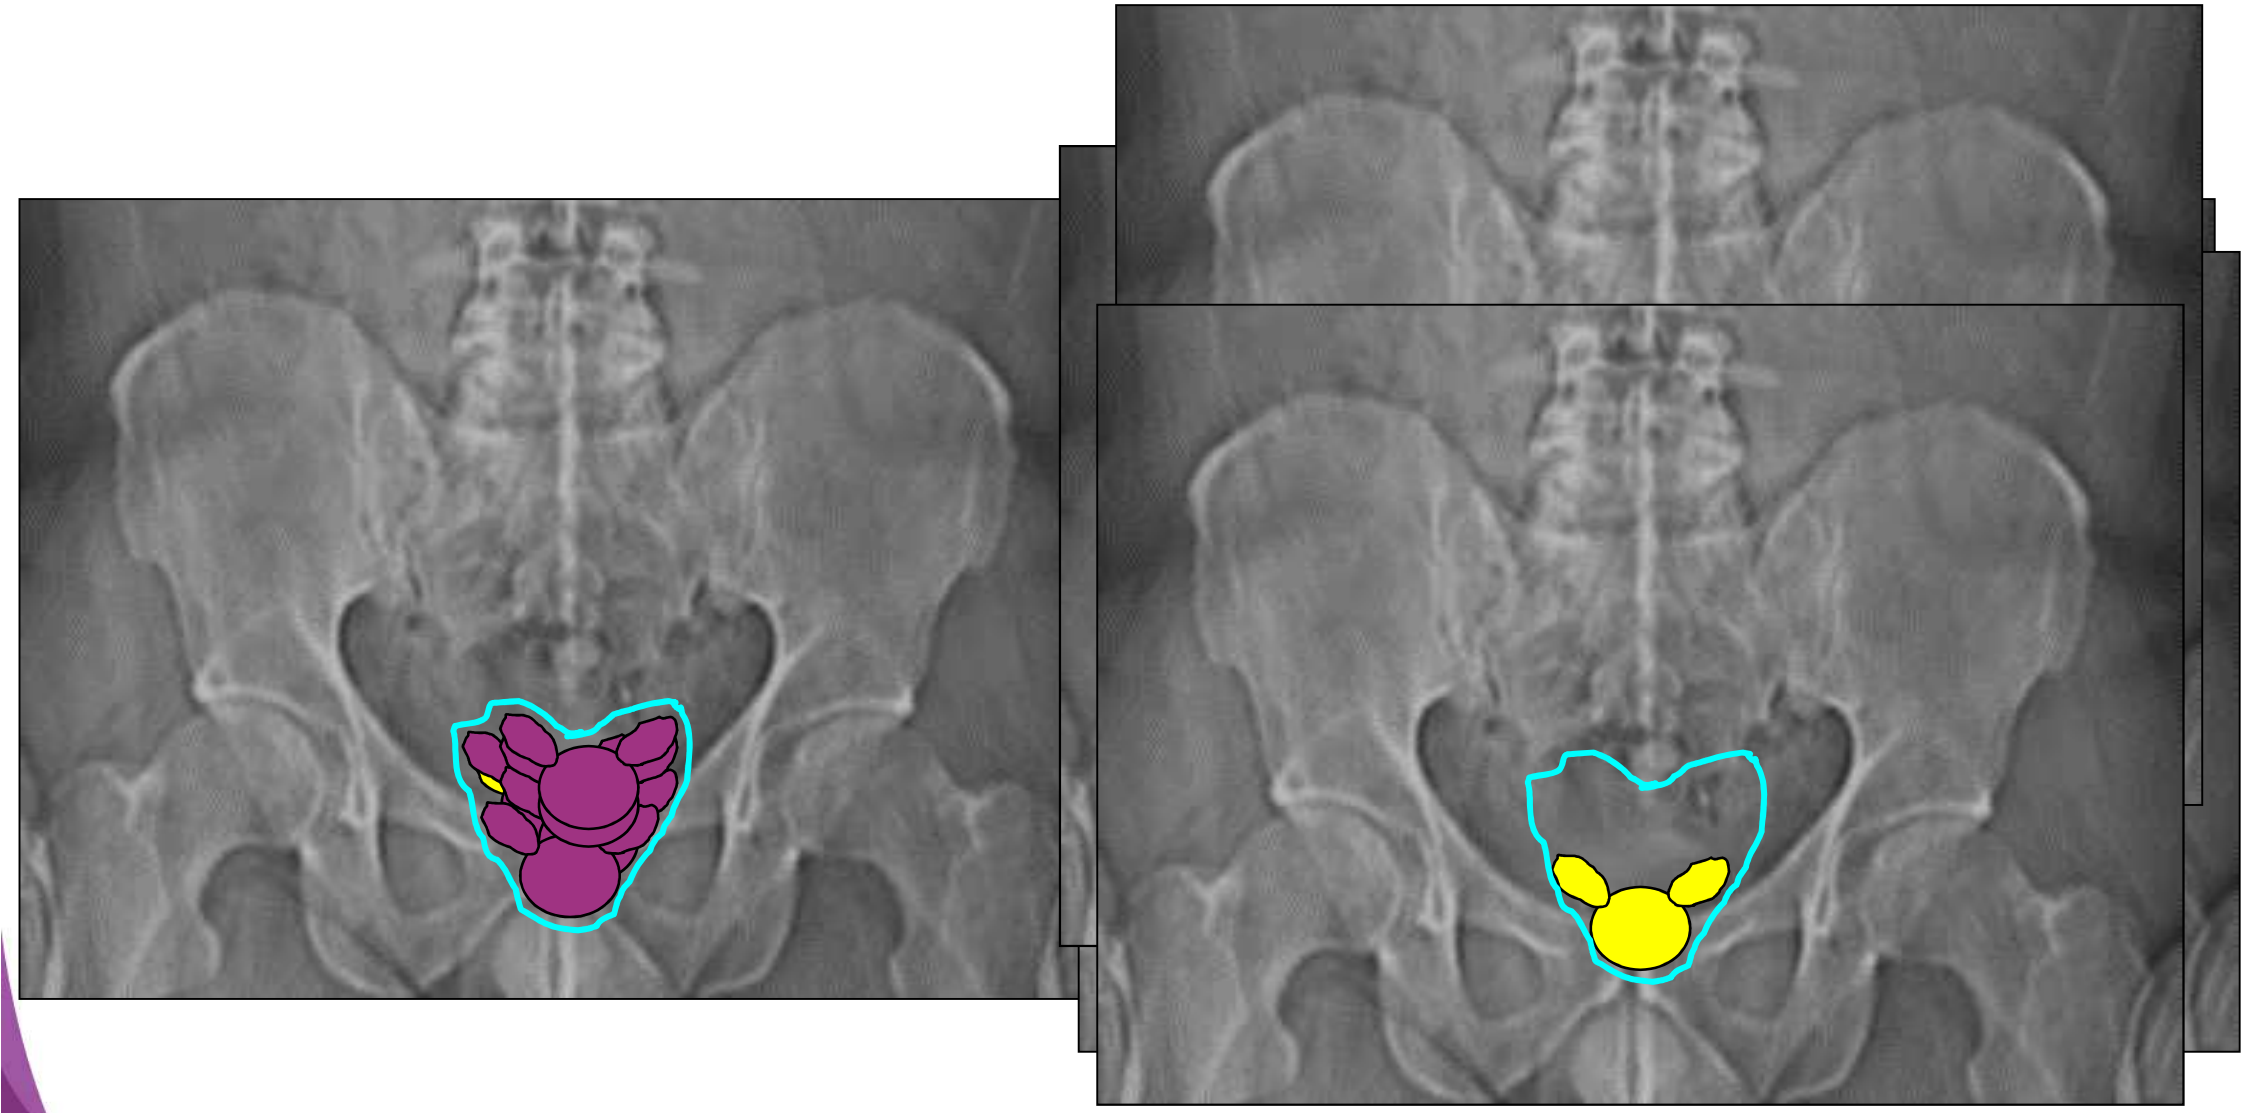
Outline

- PTV as a pragmatic solution
- Is there still room for the concept PTV when we evolve to BCRT, ART, … particle therapy?

Let's start with the definition

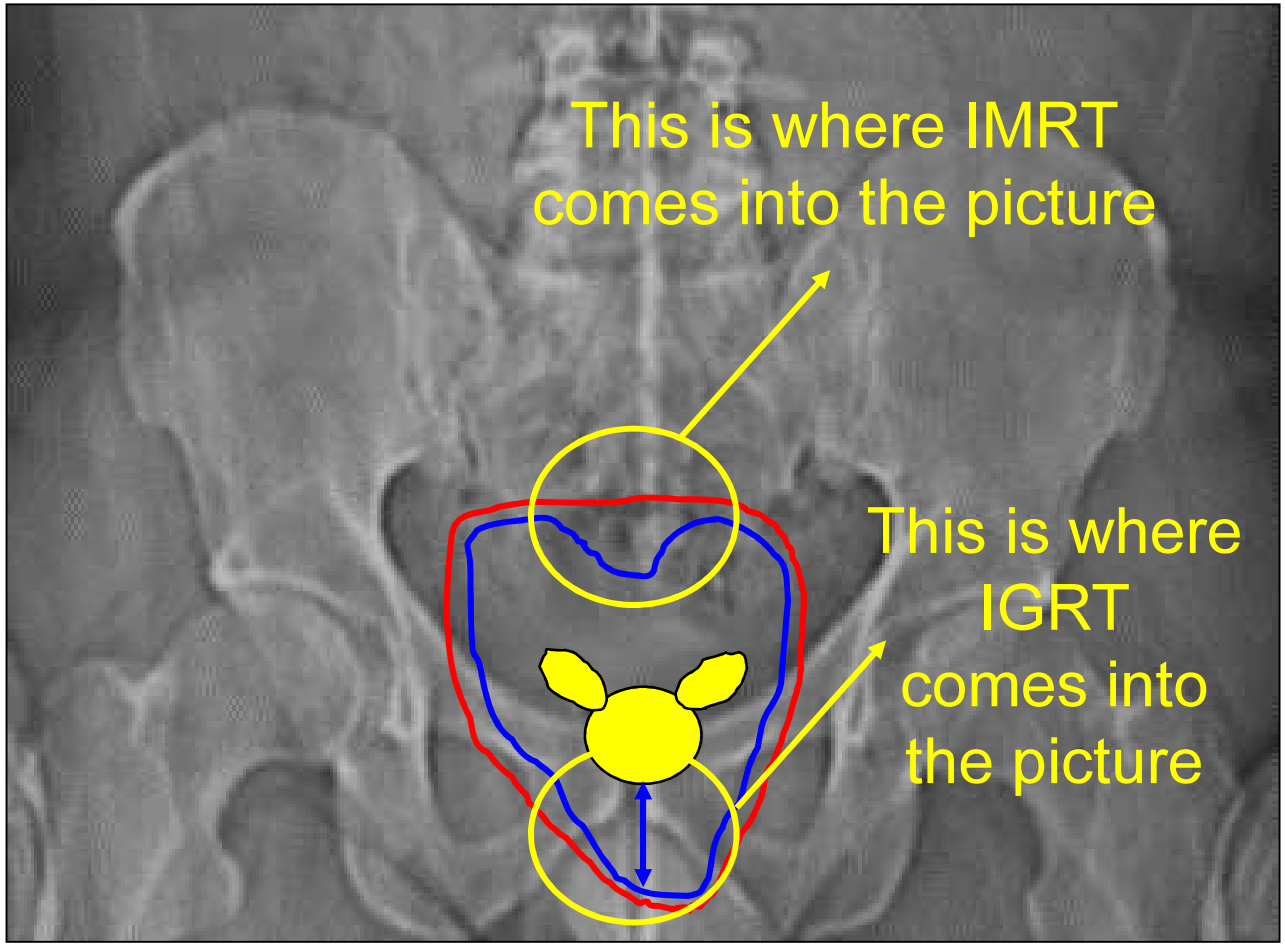


Let's start with the definition



"The dancing prostate"

Let's start with the definition



Set up Margin

+

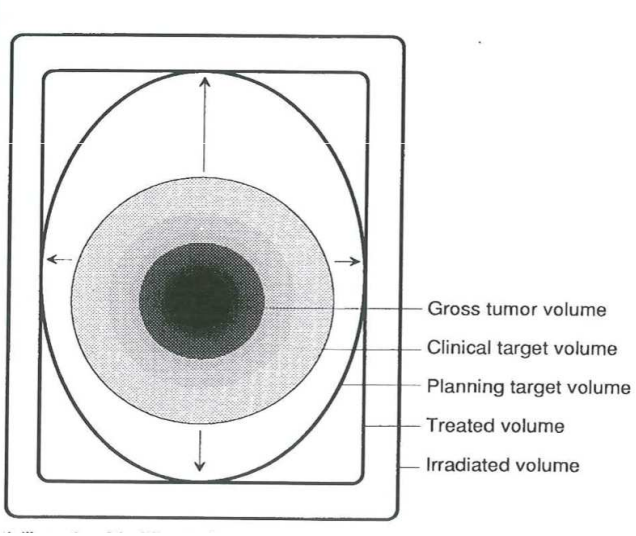
Internal Margin

Irradiated Volume

"The dancing prostate"

Let's start with the definition

- ICRU 50



- ICRU 62

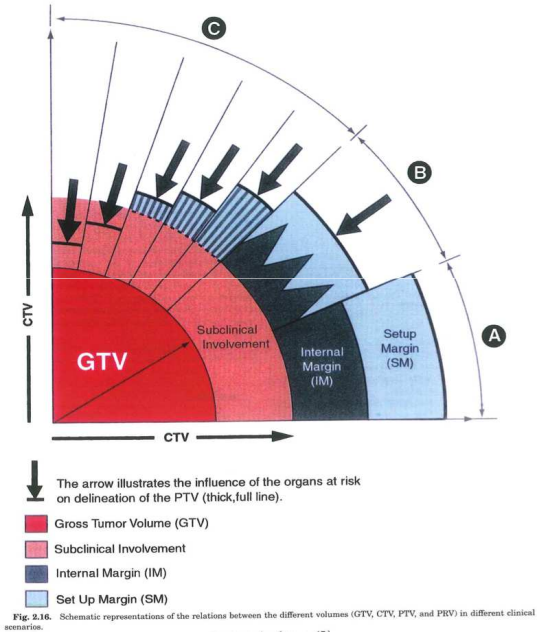


Fig. 2.16. Schematic representations of the relations between the different volumes (GTV, CTV, PTV, and PRV) in different clinical scenarios.

- … ICRU 83 …

Let's start with the definition

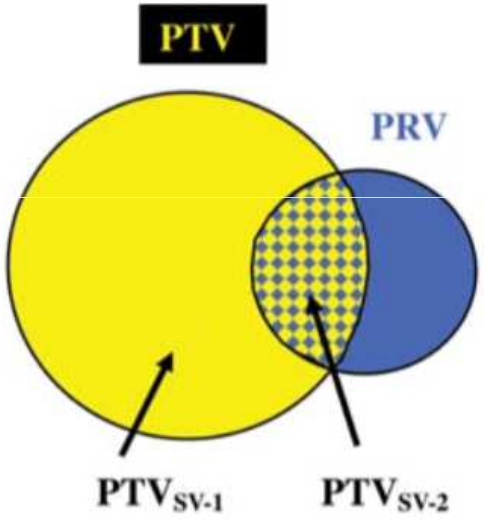
- **ICRU 83**:
  - The PTV is **A GEOMETRICAL CONCEPT** introduced for treatment planning and evaluation. **It is the recommended tool to shape absorbed-dose distributions to ensure that the prescribed absorbed dose will actually be delivered to all parts of the CTV with a clinically acceptable probability**, despite geometrical uncertainties such as organ motion and setup variations
  - It surrounds the representation of the CTV with a margin such that the planned absorbed dose is delivered to the CTV
  - This margin takes into account both the **internal** and the **setup** uncertainties
  - **Although the delineation of the GTV and the CTV is independent of the irradiation technique, the delineation of the PTV is dependent on the technique and is part of the treatment prescription**.
  - A margin must be added to the CTV taking into account uncertainties and variations in (1) position, size, and shape of the CTV (internal variations), and (2) patient and beam positioning (external variations)

Let's start with the definition

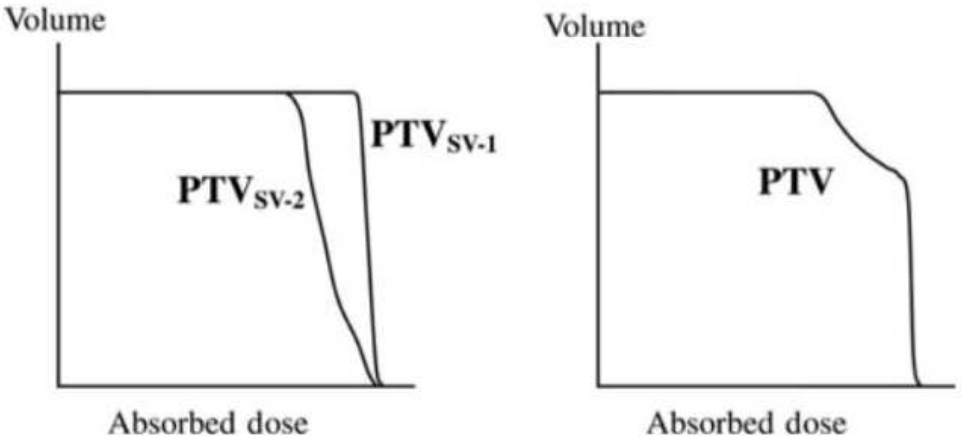
- **ICRU 83**:
  - In earlier ICRU documents, the possibility of **compromising** the margins of the PTV if they encroached on **OAR** was suggested (ICRU, 1999; 2004; 2007), but is **no longer recommended**. To reduce the CTV-to-PTV margin has always been a temptation. As an example, the CTV-to-PTV margin between the prostate and rectum is often 1 cm, except in the anterior – posterior direction for which it is reduced to spare the rectum
  - To ensure accurate reporting of absorbed dose to the PTV in cases for which the PTV encroaches or overlaps another PTV, OAR, or PRV, it is now recommended that the delineation of the primary PTV margins should not be compromised. Developments in treatment-planning software now make it possible to achieve sufficient dose sparing of the OAR by **using priority rules in optimizer** planning systems (see Section 2). Alternatively, subdivision of the PTV into regions with different prescribed absorbed doses (so-called **PTV-subvolumes**, PTVSV) may be used.

Let's start with the definition

- **ICRU 83**:

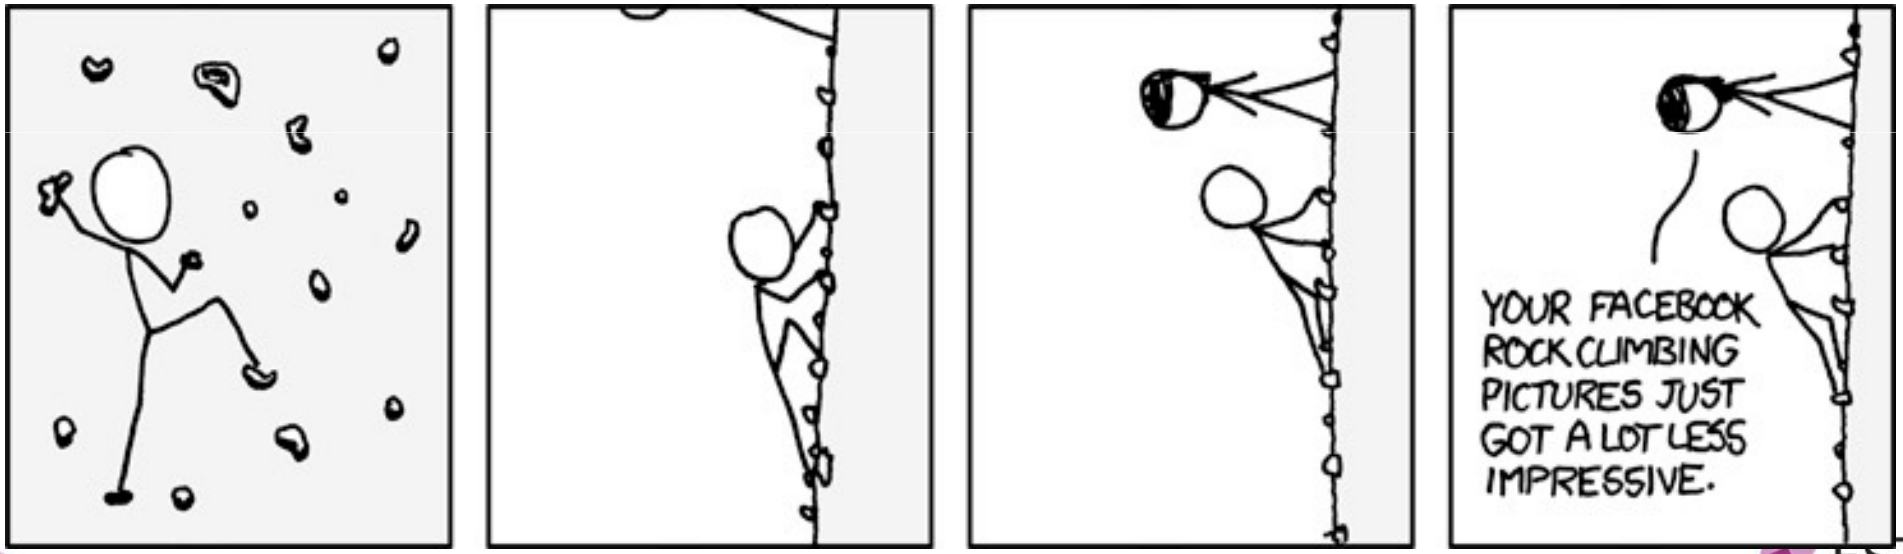


$$PTV = PTV_{SV-1} + PTV_{SV-2}$$



That was easy …

- What about clinical practice?
  - Requiring 100 % confidence for adequately treating the CTV would result in unreasonably large margins.
  - To quote ICRU 83, case number B3. Adenocarcinoma of the Prostate: "*The PTV-T was defined by adding an anisotropic margin to the CTV. This margin was 7 mm posteriorly, and 10 mm in all other directions …*"
- **But where does the 7 mm come from**??????



PTV in literature

PRESCRIBING, RECORDING, AND REPORTING PHOTON-BEAM IMRT

Table 4.4. Summary of various published recommendations for margins around target volumes (CTV) and OAR (modified from van Herk, 2004).

Author	Region	Recipe	Comments
Bel *et al.* (1996)	PTV	0.7σ	Statistical uncertainties only (linear approximation)—Monte Carlo.
Antolak and Rosen (1999)	PTV	1.65σ	Statistical uncertainties only, block margin?
Stroom *et al.* (1999a)	PTV	$2\,\Sigma + 0.7\sigma$	95 % absorbed dose to on average 99 % of CTV tested in realistic plans.
van Herk *et al.* (2000)	PTV	$2.5\,\Sigma + 0.7\,\sigma$ (or more correctly): $2.5\Sigma + 1.64\,(\sigma - \sigma_e)$	Minimum absorbed dose to CTV is 95 % for 90% of patients. Analytical solution for perfect conformation.
McKenzie (2000)	PTV	$2.5\,\Sigma + \beta + (\sigma - \sigma_e)$	Extension of van Herk *et al.* (2000) for fringe dose due to limited number of beams. The factor β depends on the beam organization.
Parker *et al.* (2002)	PTV	$\Sigma + \sqrt{(\sigma^2 + \Sigma^2)}$	95 % minimum absorbed dose and 100 % absorbed dose for 95 % of volume. Probability levels not specified.
van Herk *et al.* (2002)	PTV	$2.5 + \Sigma + 0.7\sigma + 3$ mm (or more correctly): $\sqrt{2.7^2\Sigma^2 + 1.6^2\sigma^2} - 2.8$ mm	Monte Carlo based test of 1 % TCP loss due to geometrical errors for prostate patients, fitted for various σ and Σ.
Ten Haken *et al.* (1997), Engelsman *et al.* (2001a, 2001b)	PRV (liver and lung)	0	No margin for respiration, but compensation by absorbed-dose escalation to iso-NTCP, reducing target-dose homogeneity constraints.
McKenzie *et al.* (2000)	PRV	A	Margin for respiration on top of other margins when respiration dominates other uncertainties.
van Herk *et al.* (2003)	PRV (lung)	$0.25\,A$ (caudally); $0.45\,A$ (cranially)	Margin for (random) respiration combined with random setup error of 3 mm SD, when respiration dominates other uncertainties ($A > 1$ cm).
McKenzie *et al.* (2002)	PRV	$1.3\,\Sigma \pm 0.5\,\sigma$	Margins for small and/or serial organs at risk in low (+) or high (−) absorbed-dose region.

Symbols: Σ, standard deviation of systematic uncertainties; σ, standard deviation of statistical (random) uncertainties; σ_e, describes width of beam penumbra fitted with a Gaussian function; A, peak-to-peak amplitude of respiration.

PTV in practice?

- … Use **coverage probabilities** to derive margins …
- … This idea is limited to effects expressed in terms of physical dose, biological response parameters are not included …
  - Stroom *et al.*: 99% of target volume receives 95% of the prescribed dose or more
  - Van Herk *et al.*: 90% of patients in the population receives a minimum cumulative CTV dose of at least 95 % of the prescribed dose.
- … Not all patients will be treated to 100% of the prescription dose in all fractions!!!

THE PROBABILITY OF CORRECT TARGET DOSAGE: DOSE-POPULATION HISTOGRAMS FOR DERIVING TREATMENT MARGINS IN RADIOTHERAPY

MARCEL VAN HERK, PH.D., PETER REMEIJER, PH.D., COEN RASCH, M.D, AND JOOS V. LEBESQUE, M.D., PH.D.

Radiotherapy Department, The Netherlands Cancer Institute/Antoni van Leeuwenhoek Huis, Amsterdam, The Netherlands

Margins and the “van Herk recipe”

- A short refreshment on the “philosophy”
  - “**Blur**” the planned dose distribution using ***all execution (random) errors*** (i.e. set-up, inter/intra fraction motion, penumbra, …) to estimate the cumulative dose distribution: **σ**
  - **Shift** the blurred dose with the ***preparation*** error (***systemetic error***): **Σ**
  - Use a probability distribution of preparation errors to compute the fraction of patients that receive a certain dose to the CTV:
  - For a given dose level:
    - Find the region of space where the cumulative dose exceeds the given dose level.
    - Compute the ***probability*** that the CTV is in that region
  - … this gives you the required margin.

$$\mathbf{M}_{ptv} = \alpha\sqrt{(\boldsymbol{\Sigma}^2{}_i + \boldsymbol{\Sigma}^2{}_e)} + \beta\sqrt{(\boldsymbol{\sigma}^2{}_i + \boldsymbol{\sigma}^2{}_e + \boldsymbol{\sigma}^2{}_p)} - \beta\boldsymbol{\sigma}_p, \quad (13)$$

Margins and the “van Herk recipe”

- So, don’t use

Simplified PTV margin recipe for dose - probability

To cover the CTV for 90% of the patients with the 95% isodose (analytical solution) :

PTV margin = 2.5 Σ + 0.7 σ

Σ = quadratic sum of SD of all preparation (systematic) errors
σ = quadratic sum of SD of all execution (random) errors

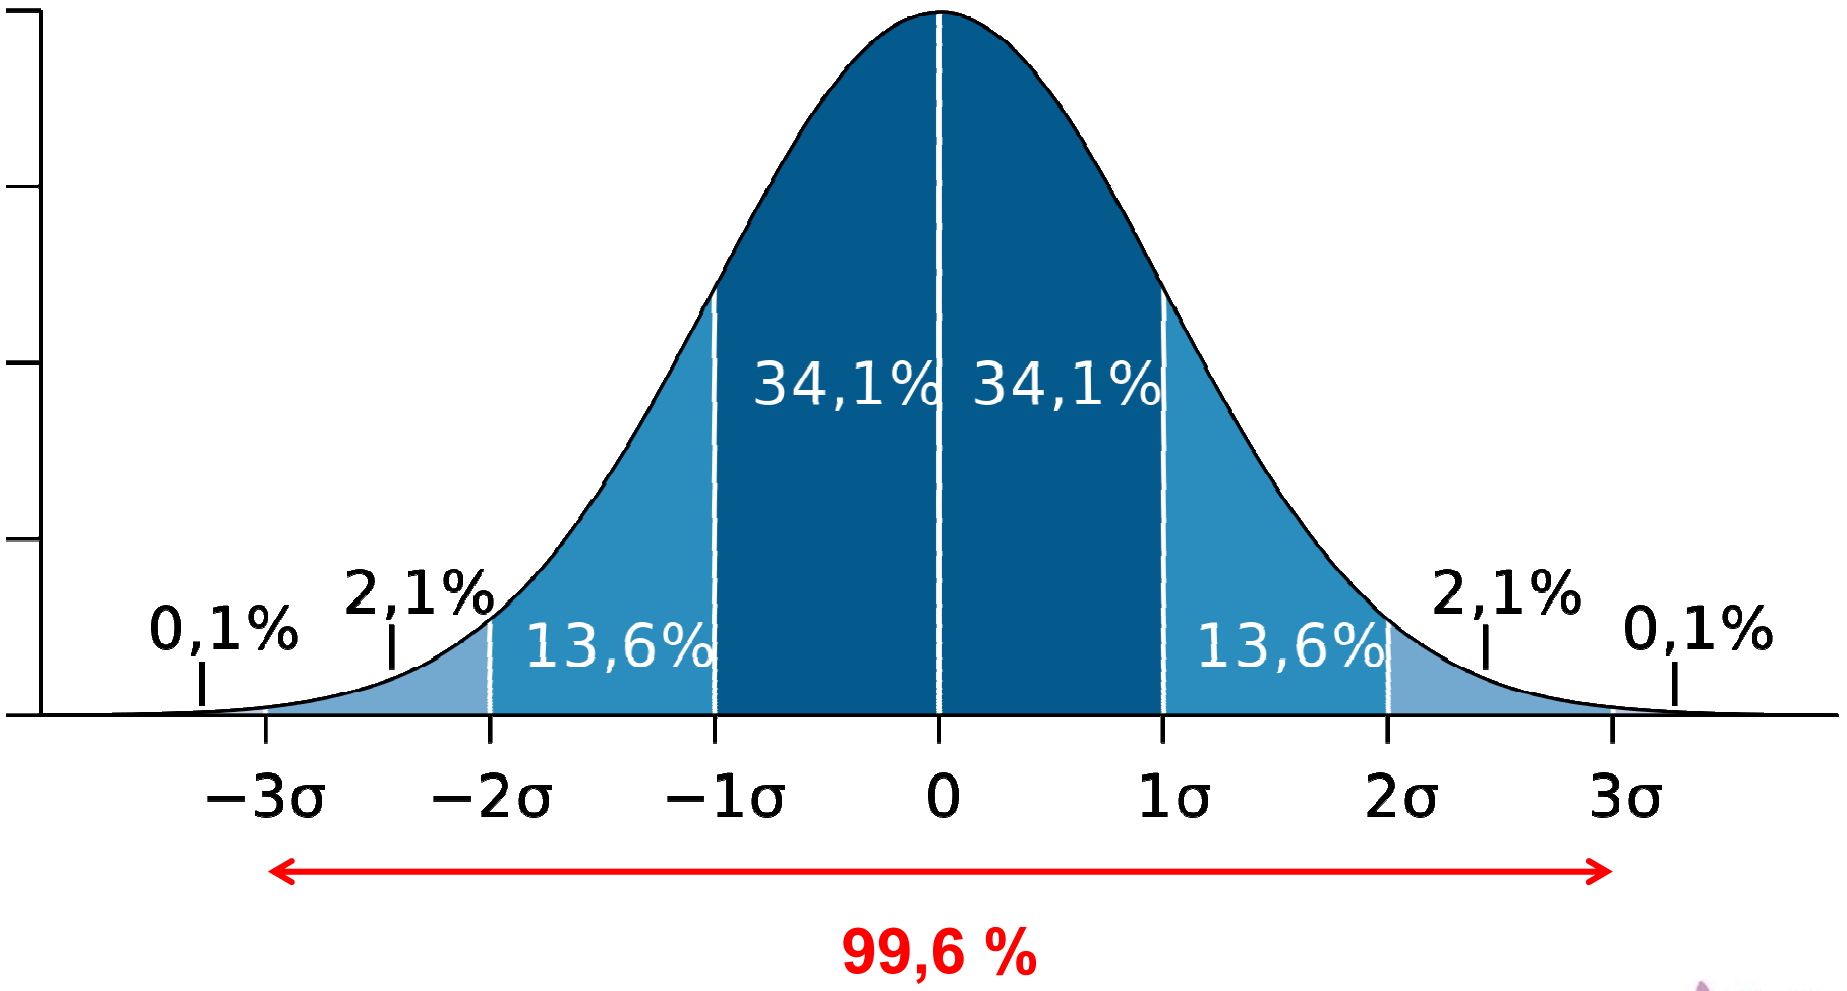
(van Herk et al, IJROBP 47: 1121-1135, 2000)

*For a big CTV with smooth shape, penumbra 5 mm

- Without knowing what it’s about

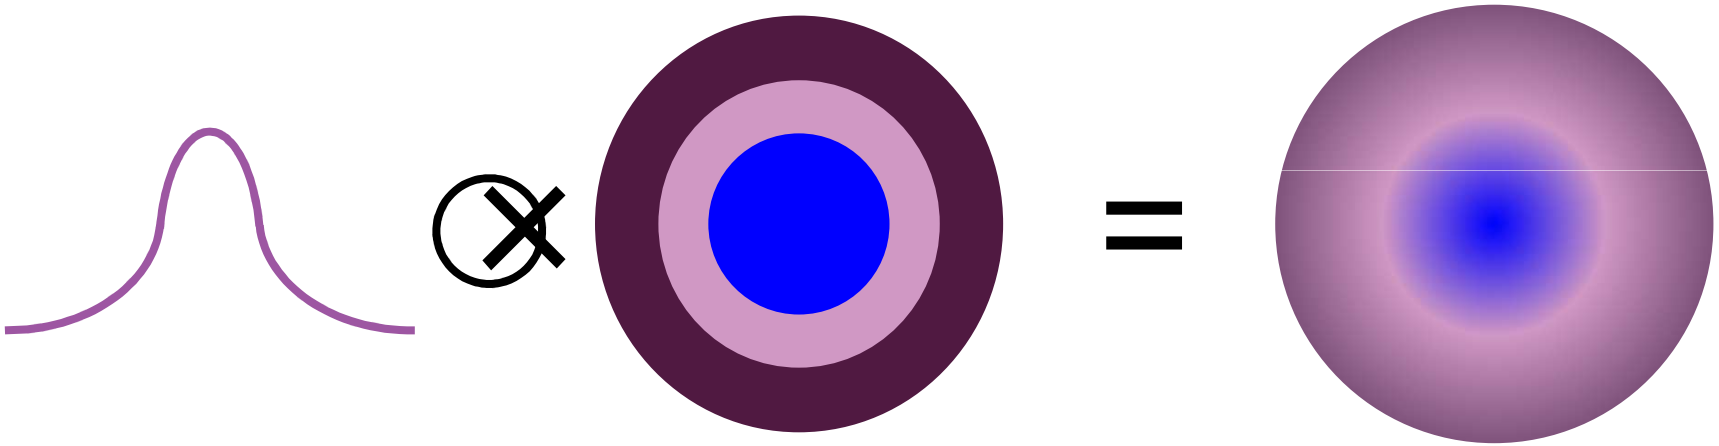
It's all about probabilities

- This idea assumes Normal Distributions!

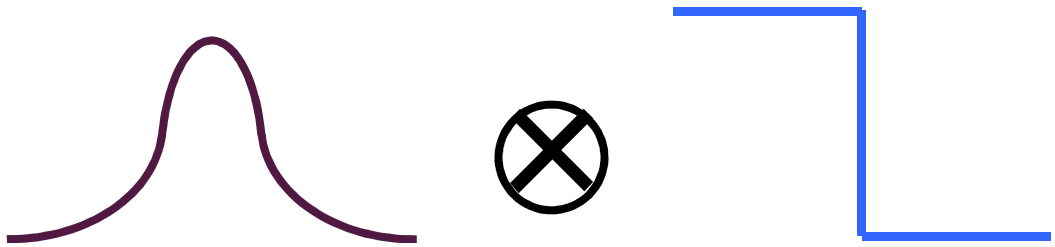


The “blurring” part: random

- “Daily” random variations in alignment of dose distribution with CTV cause a blurring effect of the delivered dose distribution.
- This blurring can be described by convolving a random distribution (normal) with the planned dose distribution



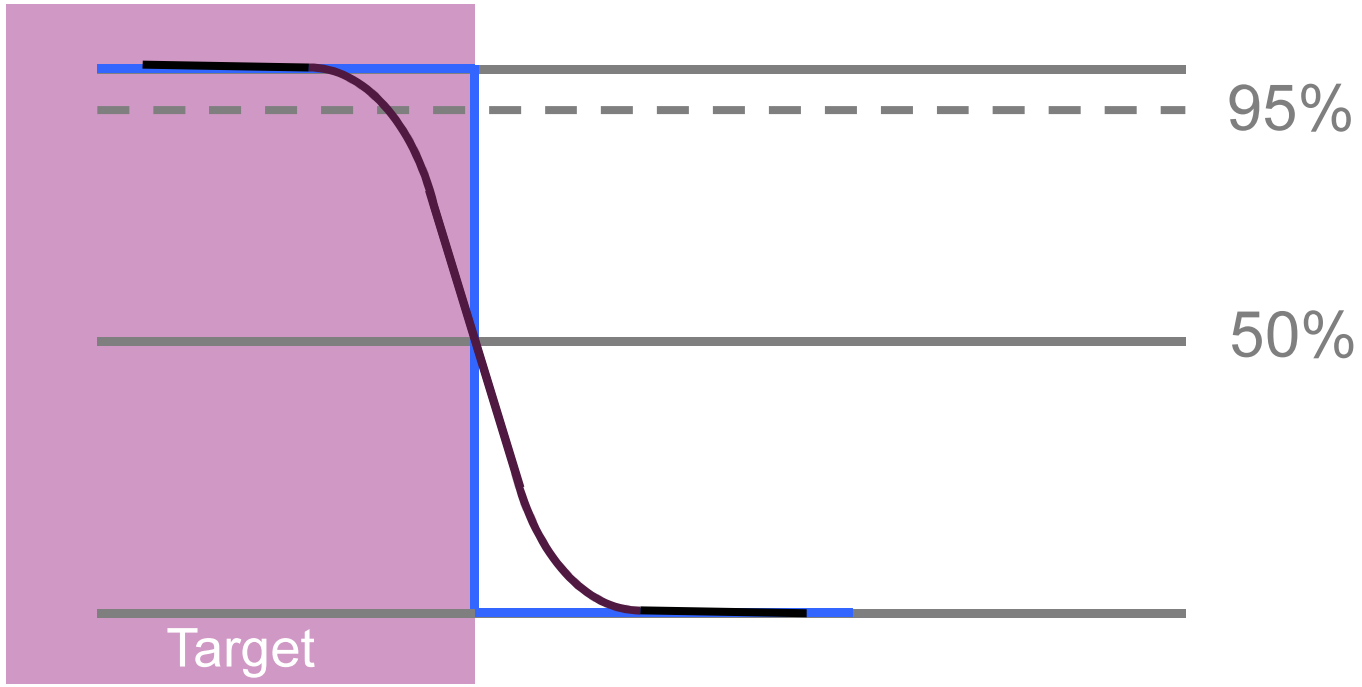
The “blurring” part: random



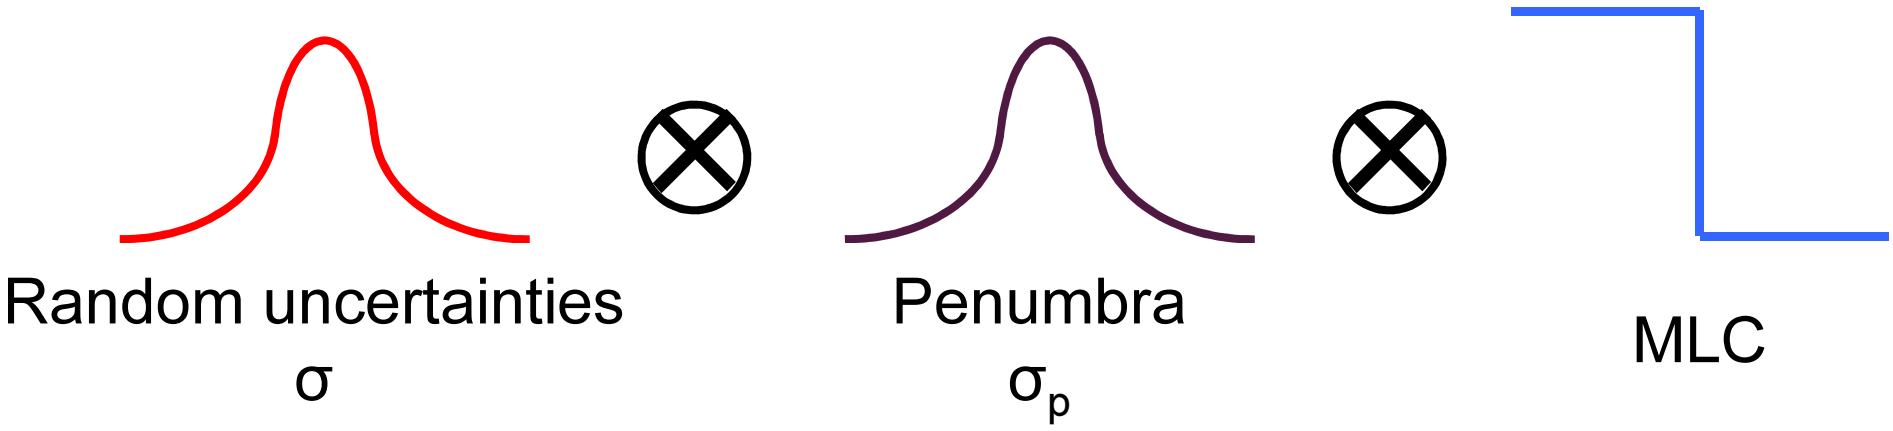
Penumbra

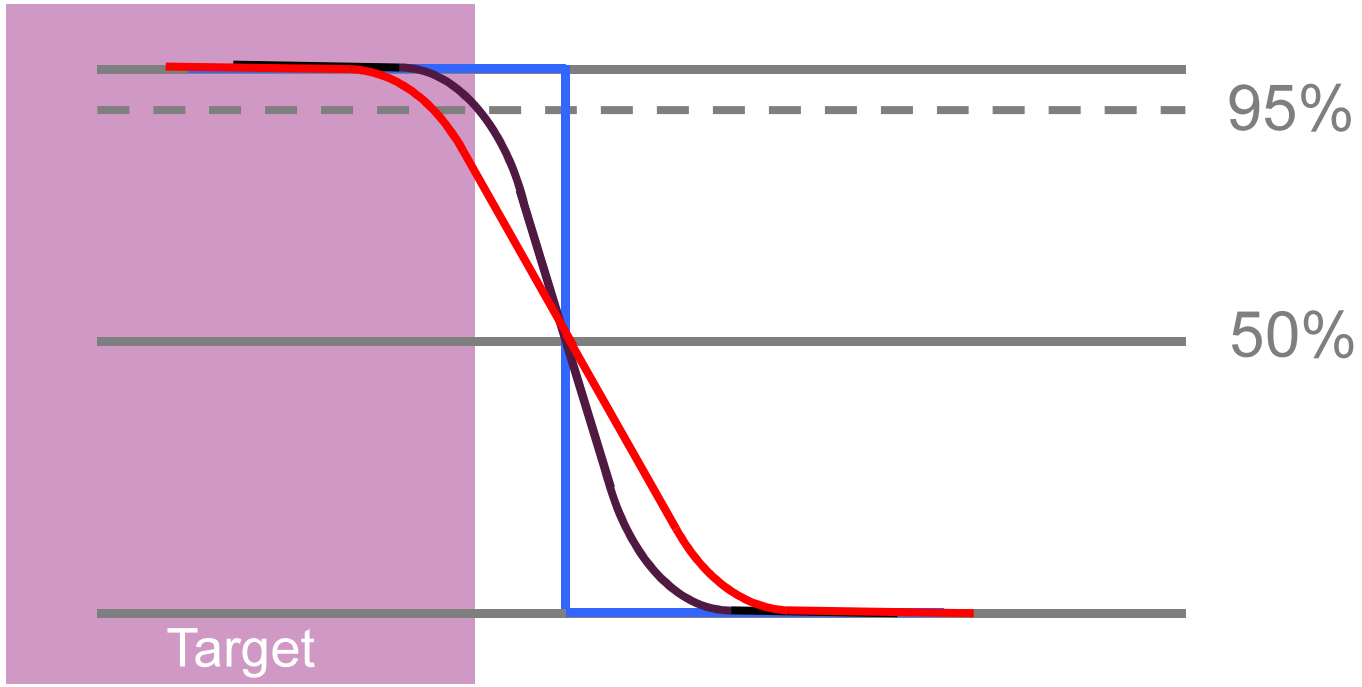
σ_p

MLC



The “blurring” part: random



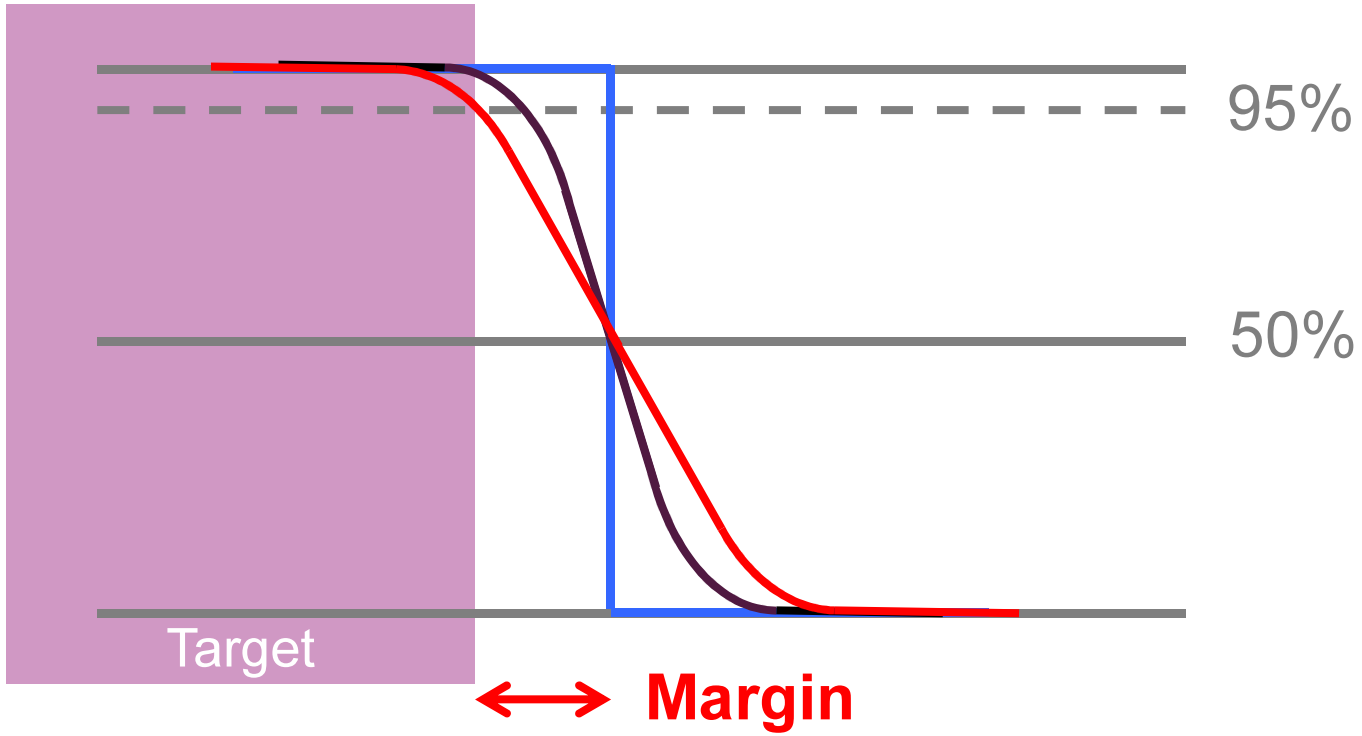


The “blurring” part: random

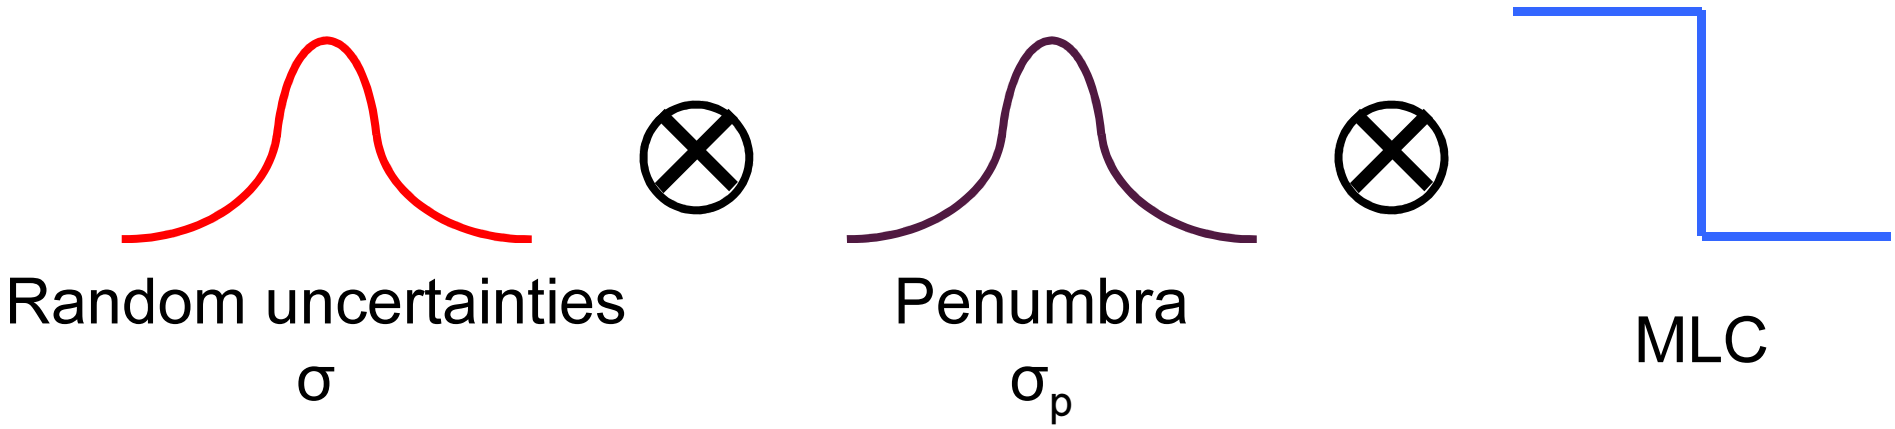
Random uncertainties
σ

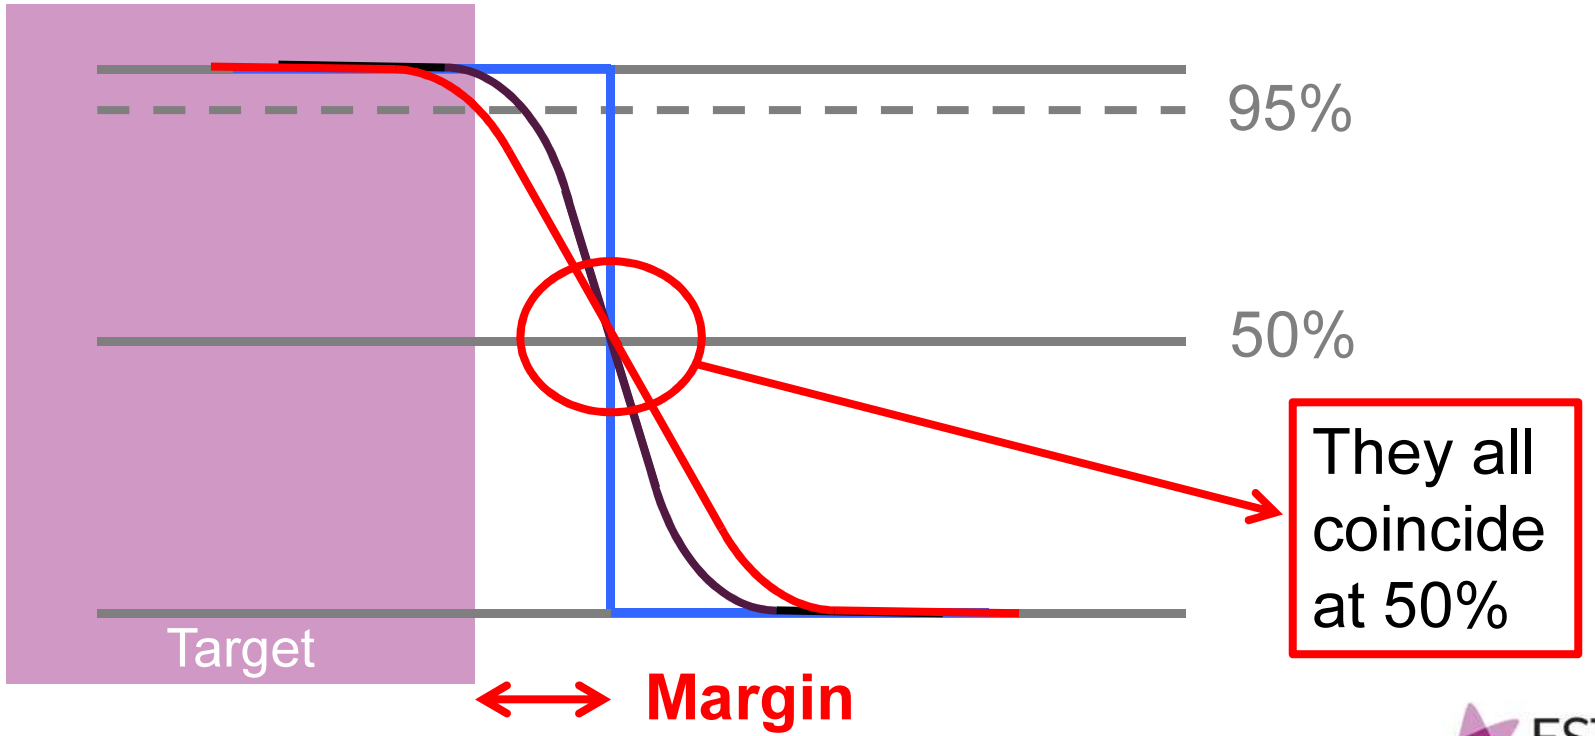
Penumbra
σ_p

MLC



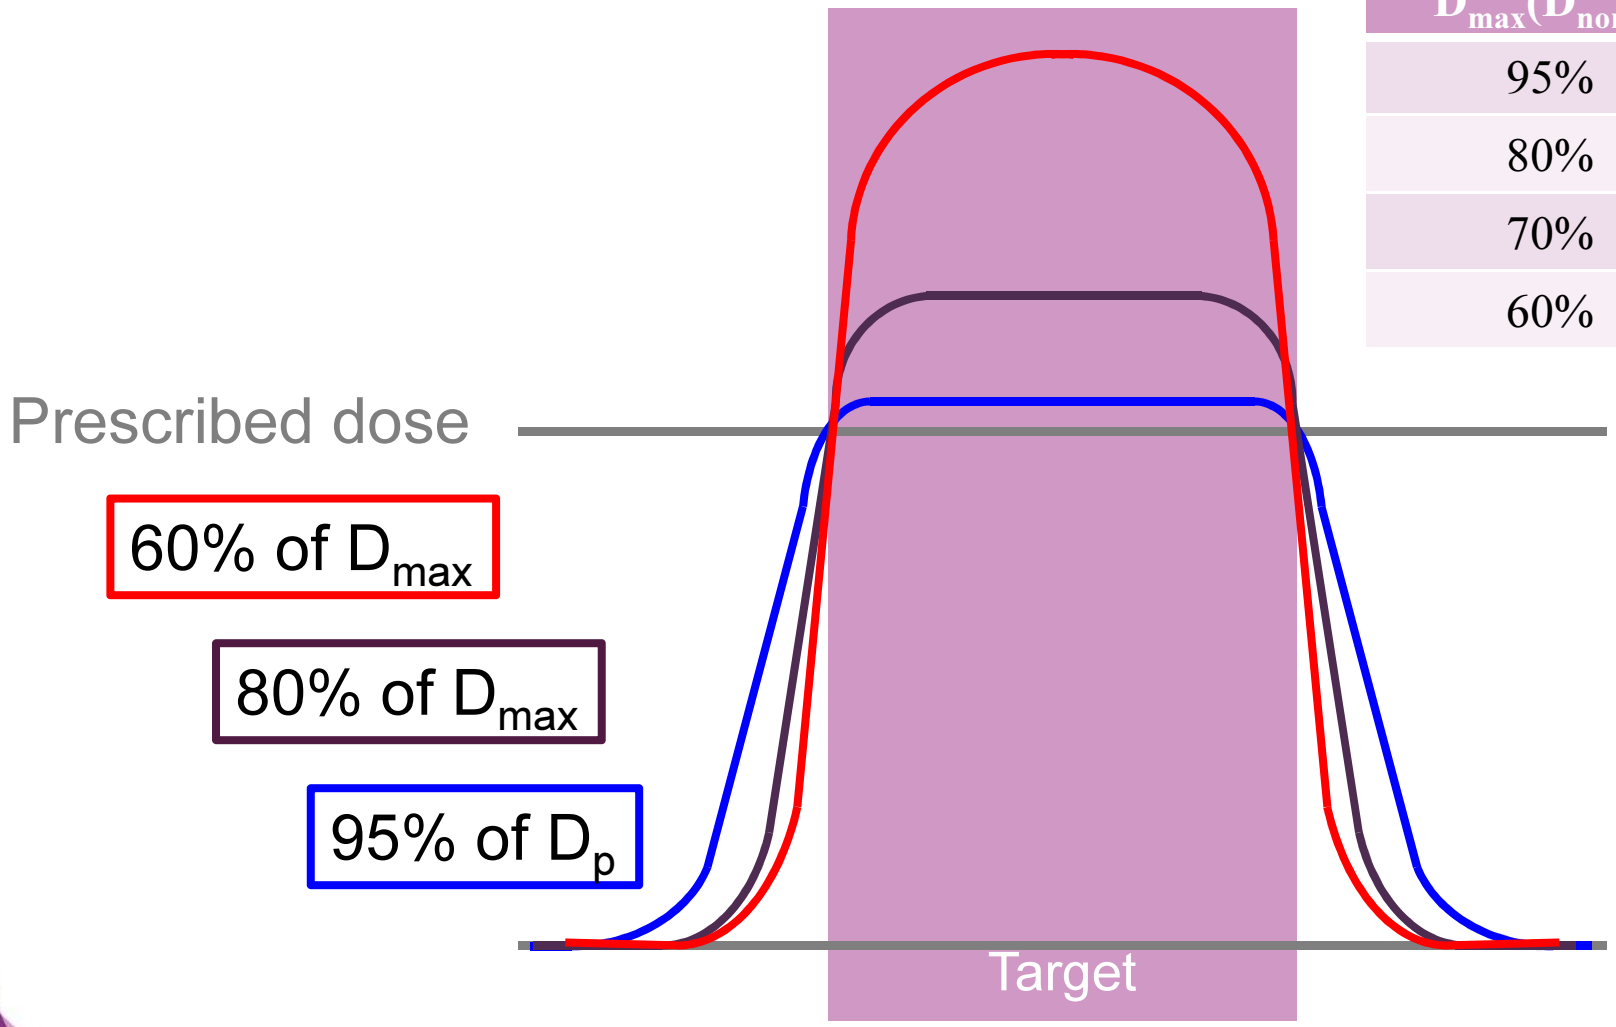
Dose prescription and margins





Dose prescription and margins

% of $D_{max}(D_{norm})$	β
95%	1.64
80%	0.84
70%	0.52
60%	0.25



The “blurring” part: random

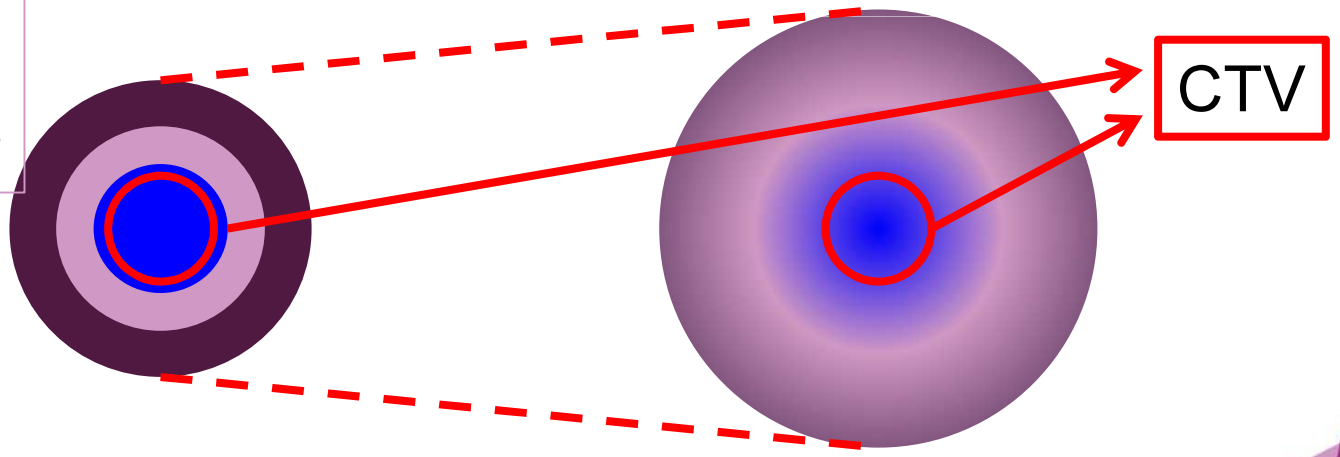
- Cumulative minimum dose to CTV ≥ 95% of prescription dose

	σ_p
Water	3.2
Lung	6.4

$$M_r = \beta\sqrt{\sigma^2 + \sigma_p^2} - \beta\sigma_p$$

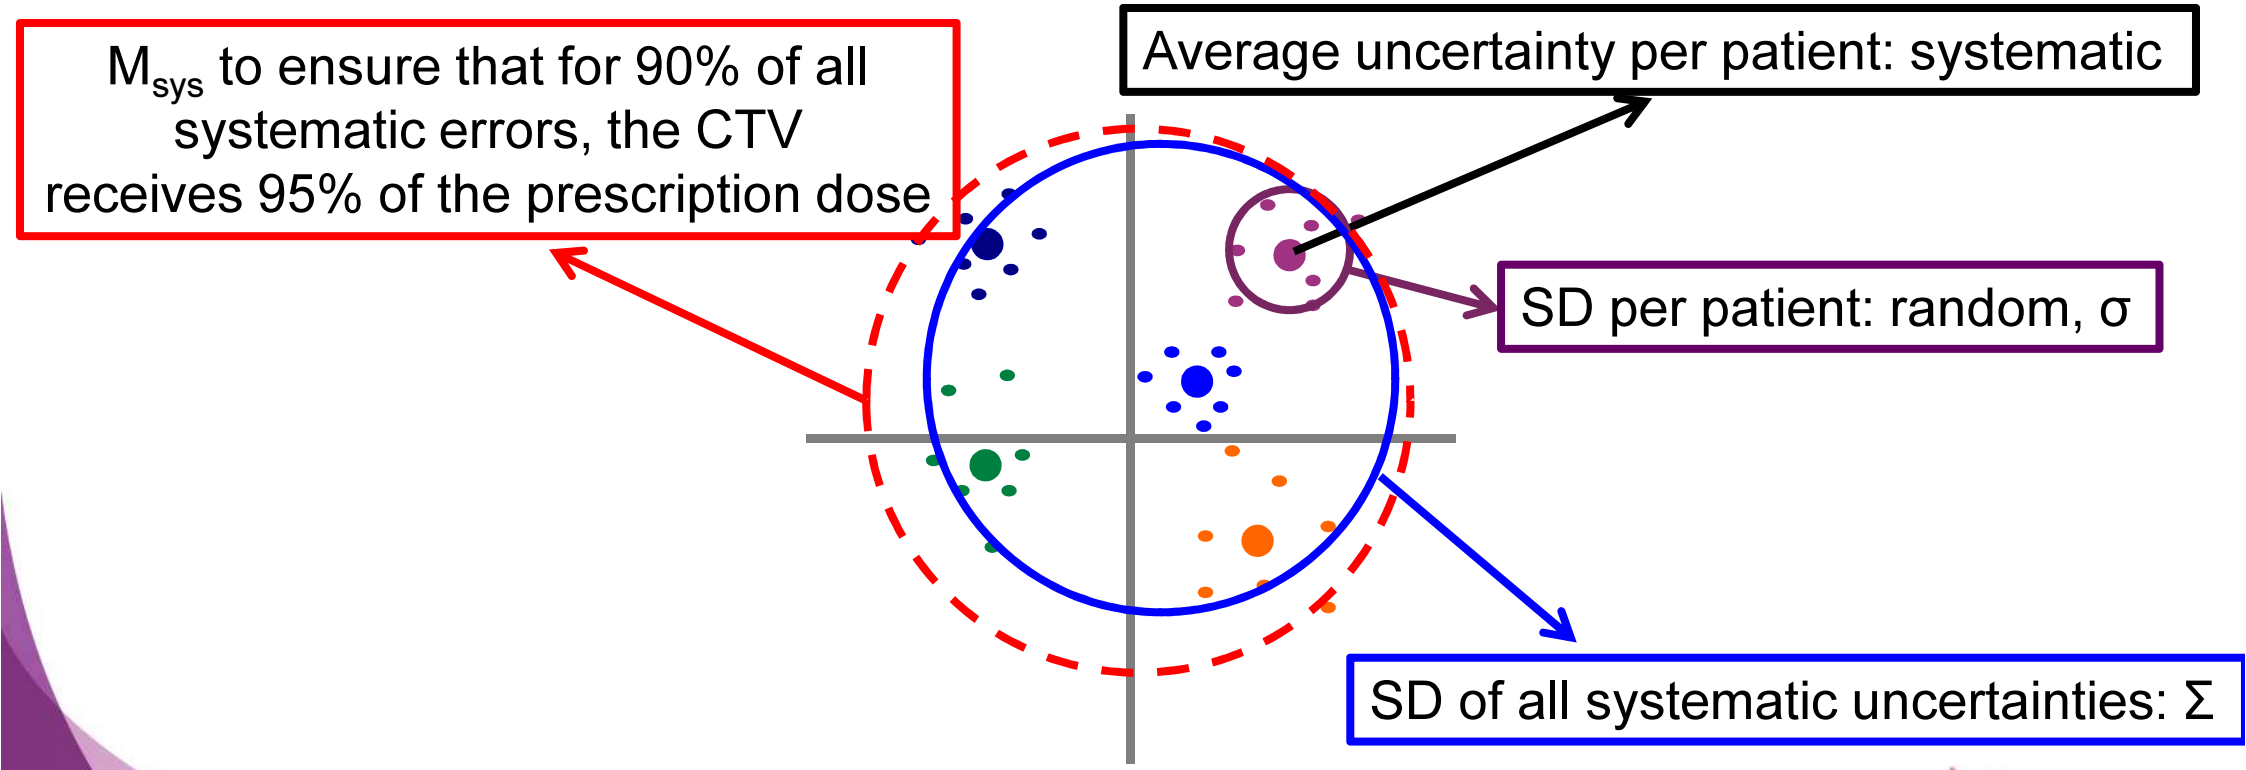
% of D_{norm}	β
95%	1.64
80%	0.84
70%	0.52
60%	0.25

But, what about:
IMRT, VMAT,
Helical TomoTherapy?



The “shift” part: systematic

- Systematic uncertainties (typically preparation errors) cause a **shift** of the (blurred) dose distribution.
- Again, we assume the systematic uncertainties within a certain population of patients to be described by a normal distribution



The “shift” part: systematic

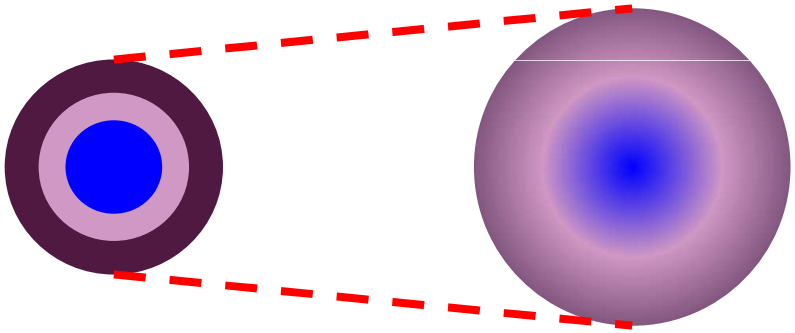
- Assuming a “spherical” target

$$\int_0^{M_{sys}} p(\Sigma)\,dr = 0.9 \quad \Rightarrow \quad M_{sys} = 2.5\Sigma$$

confidence	α
80%	2.16
90%	2.50
95%	2.79
99%	3.36

Margins and the “van Herk recipe”

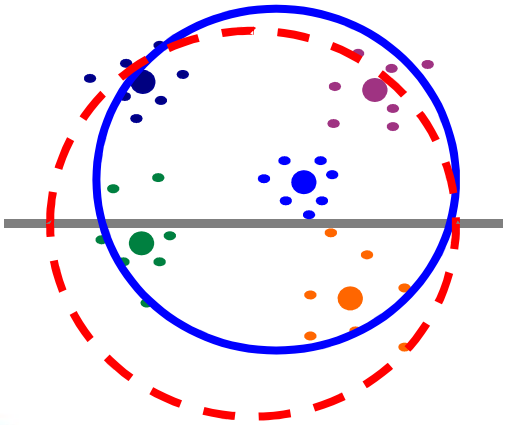
- “Blurring” part: cumulative minimum dose ≥ 95% of D_p



$$M_r = \beta\sqrt{\sigma^2 + \sigma_p^2} - \beta\sigma_p$$

$$\beta = 1.64$$

- “Shifting part: ≥90% of population receives a cumulative CTV dose ≥ 95% of D_p



$$M = \alpha\Sigma + M_r$$

$$\alpha = 2.5$$

Total systematic and random uncertainties

- Why "quadratic sum"?

  - For a simple criterion such as probability level of minimum dose, random and systematic uncertainties could be added linearly.

$$M = M_{sys} + M_r$$

  - For the separate systematic and random uncertainties a **quadratic sum** is required:

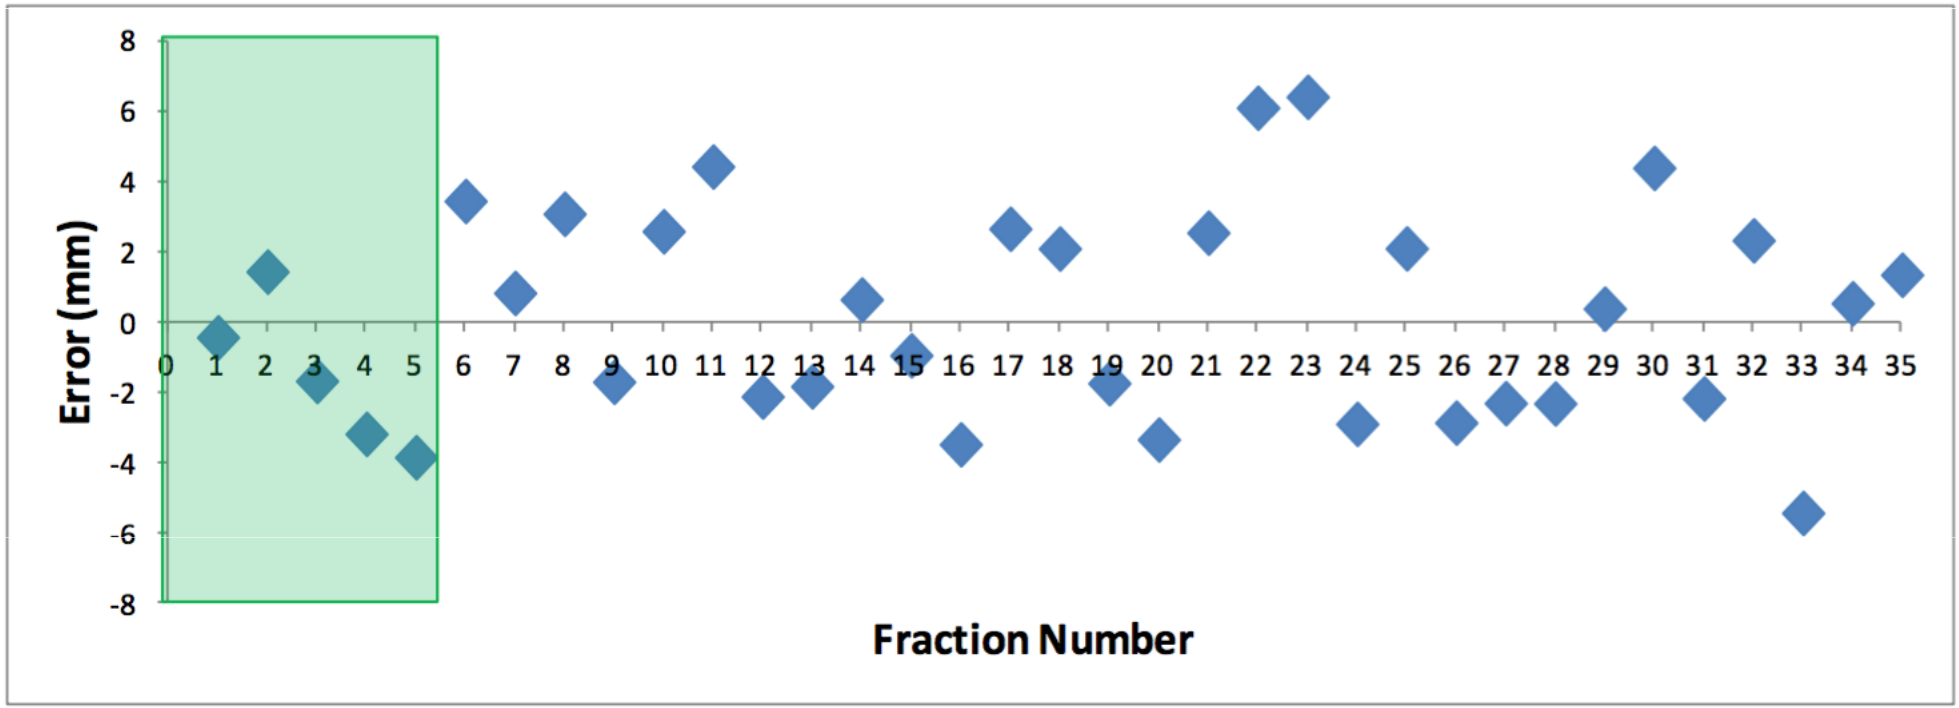
$$\Sigma = \sqrt{\Sigma_a^2 + \Sigma_b^2 + \Sigma_c^2}$$

$$\Sigma = \sqrt{10^2 + 3^2 + 3^2} = 10.9$$

  - **It emphasizes the large uncertainties**!!! (see example)

Margins and number of fractions

- If the number of fractions decreases (eg HYPOFRACTIONATION) the “random” component becomes more “systematic” (ie a “shift”)



- Uncertainty after 35 fractions: 0.1mm
- Uncertainty after 5 fractions: -1.6mm

Margins and number of fractions

- If the number of fractions decreases (eg HYPOFRACTIONATION) the "random" component becomes more "systematic" (ie a "shift")

- Effective systematic uncertainty (shift)

$$\Sigma_{eff} = \sqrt{\Sigma^2 + \frac{1}{N}\sigma^2}$$

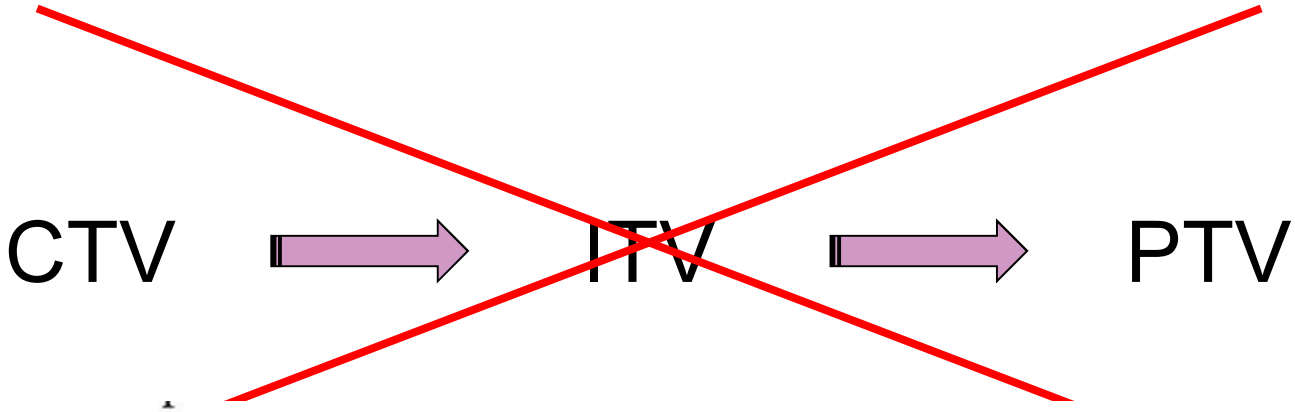
- Effective random uncertainty (blur)

$$\sigma_{eff} = \sqrt{\left(1 - \frac{1}{N}\right)\sigma^2}$$

$N \to 1$

… and motion management

- Based on the previous, it is obvious that



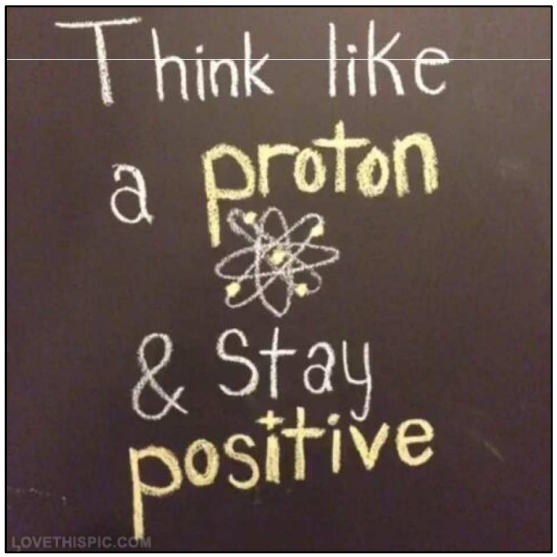
$$\mathbf{M}_{ptv} = \alpha\sqrt{(\boldsymbol{\Sigma}^2{}_i + \boldsymbol{\Sigma}^2{}_e)} + \beta\sqrt{(\boldsymbol{\sigma}^2{}_i + \boldsymbol{\sigma}^2{}_e + \boldsymbol{\sigma}^2{}_p)} - \beta\boldsymbol{\sigma}_p, \quad (13)$$

- For more details: see ESTRO course

  “Clinical Practice & Implementation of Image-Guided Stereotactic Body Radiotherapy”

… and particle therapy

- Don’t even think of using a PTV!!



- Halperin’s rule:
  - Most tumours are radioresistent if you miss them …
  - Proton therapy offers many new and expensive ways of missing the tumour.

Validity of the margin recipe

- Assumes **homogeneous patient population** (identical SD)
- Assumes **many fractions**
- Assumes **spherical symmetry**
  - More or less OK if CTV >> σ
- Assumes **"ideal" conformation**
  - ie preparation errors have the same impact in all directions
- **Rotations and shape variations** have been ignored
- Uncertainties were assumed to be isotropic
  - The concept can be generalized to 3D by separating x, y, and z directions.
- The different sources of uncertainties are assumed to be **statistically independent**
  - As most of the uncertainties are introduces at different stages of the treatment, this assumption seems OK
- And again: **normal probability distributions** are assumed.

PTV in practice: oesophagus

- In this exercise we will work out the antero-posterior margin only, the latero-lateral and cranio-caudal margins can be deduced in a similar way.
- 3D (isotropic) margins assume a ball rolling along the 3D CTV … sounds easier than it is.

- **As this is an example based on a particular patient population using a particular IGRT workflow, this data is NOT TO BE USED in an other setting.**

PTV in practice: oesophagus

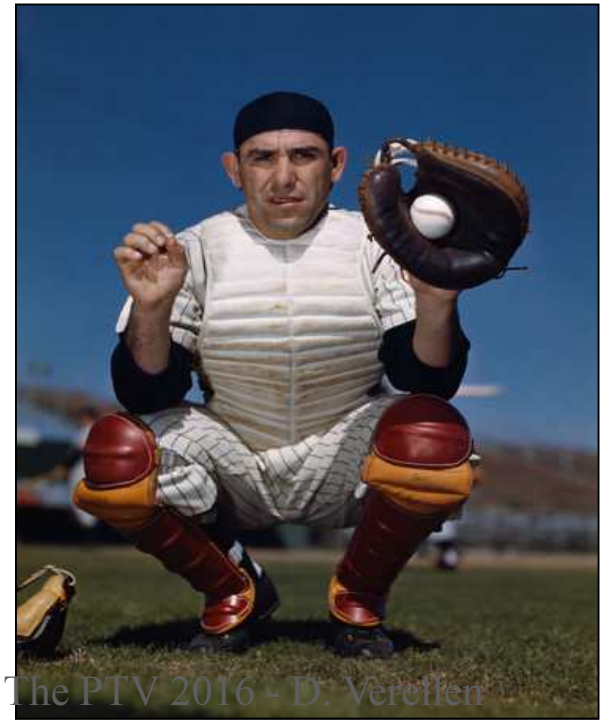
- These probabilistic approaches, require some prior knowledge of patient motion and tumor mobility, and assume a ‘reasonable’ reproducible, predictive breathing pattern

Let's start with some Yogi wisdom …

- Quoting the famous Yogi Berra:
  - "If you don't know where you're going, you might not get there."

Let's start with some Yogi wisdom …

- … he also said:
  - "I knew the record would stand until it was broken."
- … free translated, by yours truly:
  - "**I knew the PTV would remain in use until it became useless.**"



Esophageal Cancer: How to distinguish primary from nodal recurrence by imaging

Dr Angela M Riddell

Royal Marsden, London. UK

ESTRO School

Patterns of relapse in Esophageal Cancer

- 47-58% patients treated with neoadjuvant/peroperative chemotherapy & surgery develop recurrence
- Recurrence occurs within 2-3 years of surgery
- Distant failure is more common than locoregional recurrence

Oppedijk V, van der Gaast A, van Lanschot J et al. 2014 JCO doi:10.1200/JCO.2013.51.2186
Moorcraft S, Fontana E, Cunningham D et al 2016 BMC Cancer 16:112

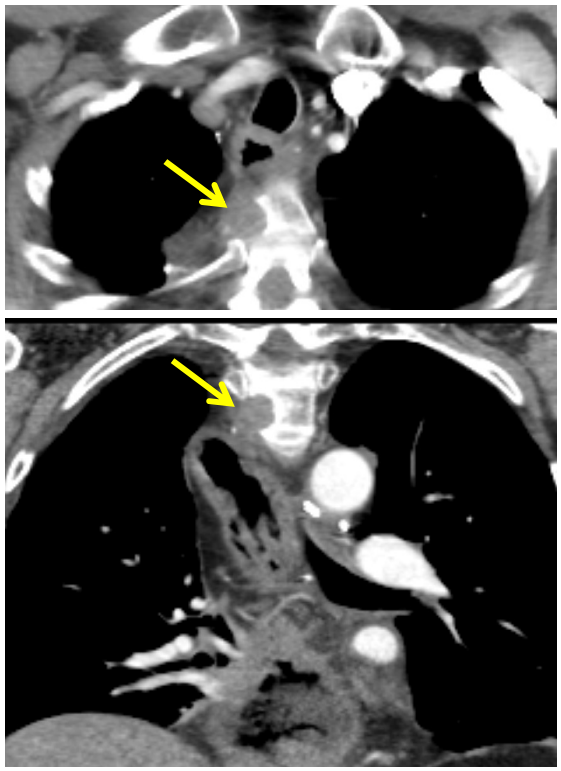
74 year old male patient underwent Ivor Lewis oesophagectomy following perioperative chemotherapy. 1 year post op he developed back pain.

30.05.2014

Baseline

08.10.2014

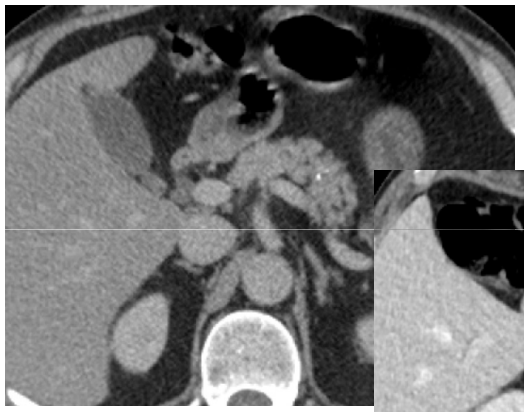


Bone involvement due to direct extension from LRR, not haematogenous spread

ESTRO School

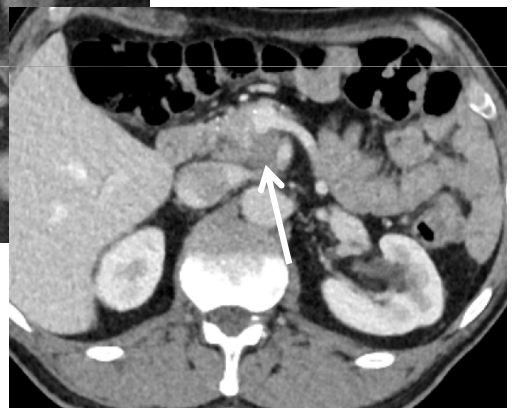
60 year old male patient. Underwent preoperative ECX x4 followed by surgery for pT3N2M0 R0 TRG4 GOJ tumour. Post op he had 54Gy in 30♯ completed Feb 2015. Presented with rectal bleeding

10.02.2014



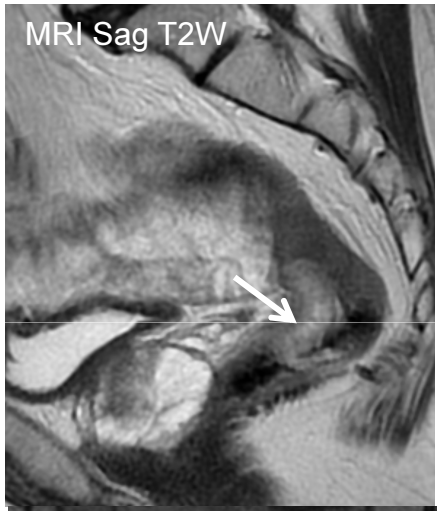
Baseline

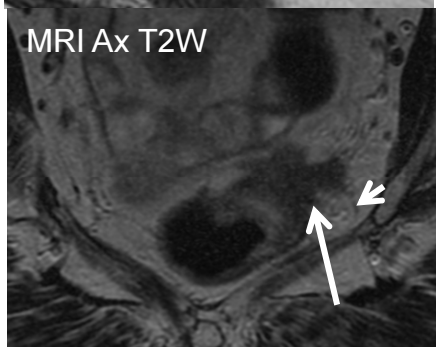
13.04.2016



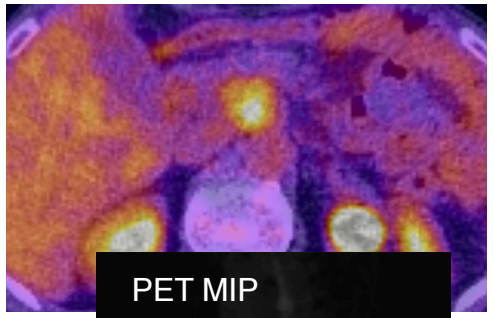
SMA Nodal relapse

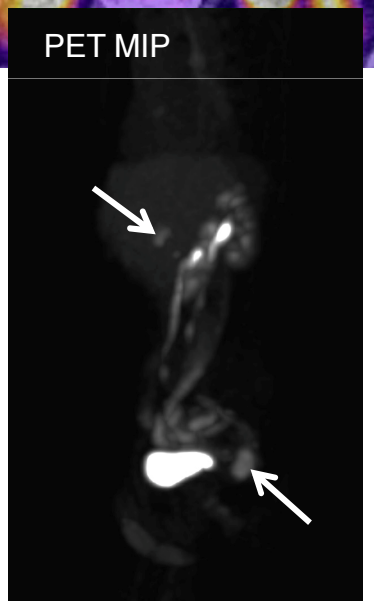
13.04.2016





24.05.2016





Biopsy showed adenocarcinoma with immunohistochemistry profile consistent with an oesophageal primary similar to original primary

ESTRO School

Primary versus nodal relapse

Summary

- Nodal relapse may be adjacent to the anastomosis or separate
- When separate from primary, can readily confirm nodal relapse.
- Multiple imaging investigations can identify regional lymph node involvement.
- When relapse is adjacent to the anastomosis determine the epicentre of the soft tissue
- Local relapse centred on the wall
- Nodal relapse often eccentric
- It may not be possible to differentiate primary from nodal relapse
- The two may co-exist

Thank you

Sex (male *v* female)	33 *v* 34	12 *v* 20	1.12	0.67 to 1.87	NA	
Treatment arm (S *v* CRT + S)	27	14	**0.37**	**0.23 to 0.59**	**0.50**	**0.29 to 0.86**
pCR after CRT (no *v* yes)*	NA	7 *v* 17	0.36	0.13 to 1.05	NA	

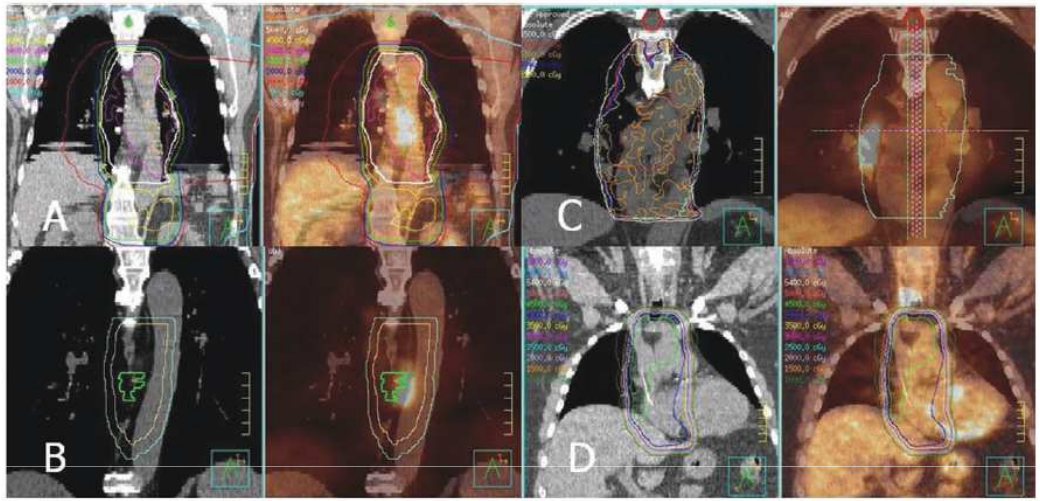
NOTE. Bold font indicates significance.

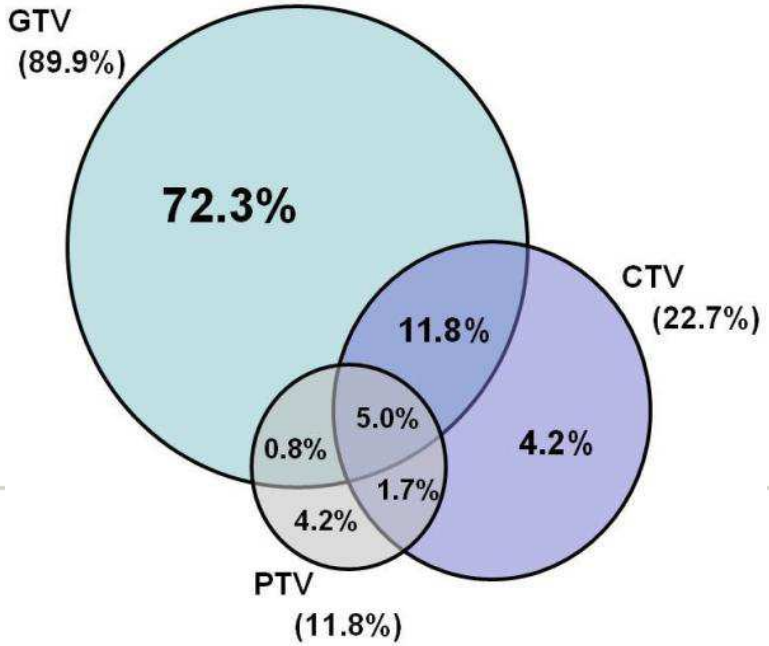
Abbreviations: AC, adenocarcinoma; CRT, chemoradiotherapy; HR, hazard ratio; LRR, locoregional recurrence; NA, not applicable; pCR, pathologic complete response; S, surgery; SCC, squamous cell carcinoma; THE, transhiatal esophagectomy; TTE, transthoracic esophagectomy.

*Factor only available in the CRT + S arm and therefore not suitable for multivariable analysis.

Failure patterns in patients with esophageal cancer treated with definitive chemoradiation

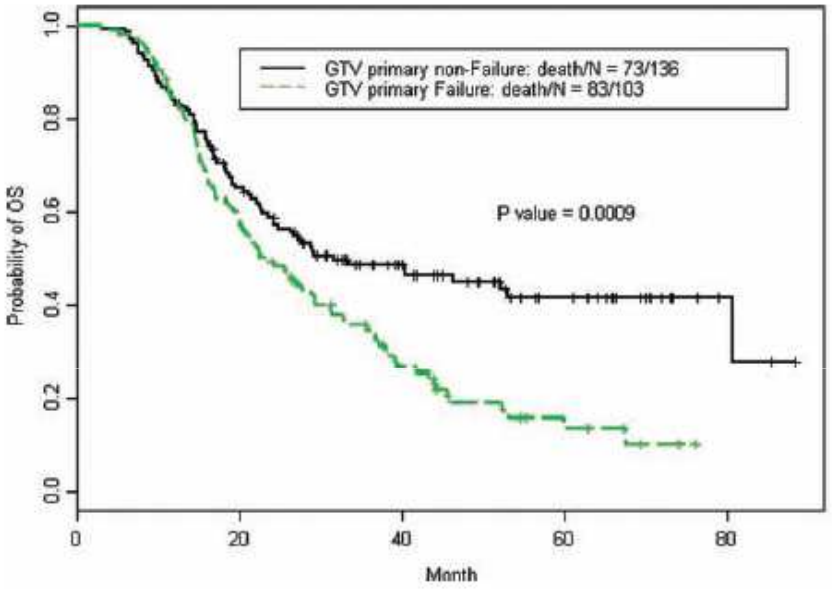
- 239 patients dCRT
  - 87% T3/T4
  - 50.4Gy/28 fr + 5FU
- median FU 52.6 months
  - 50% (n=119) local failure
  - 48% (n=114) distant failure
  - 31% (n= 74) NED
  - Local failure (n=119)
    - 90% GTV failure(107/119)
    - 23% CTV failure (27/119)
    - 12% PTV failure (14/119)

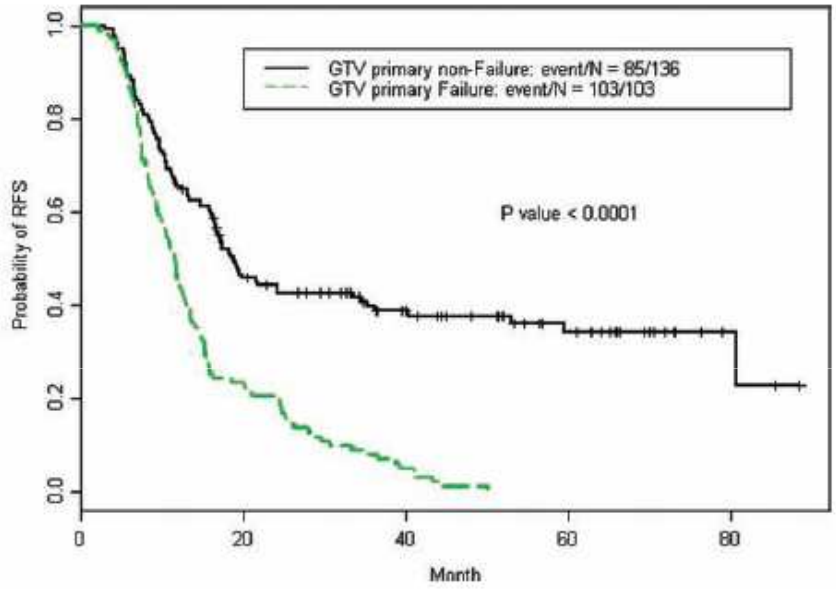




Welsh, Cancer 2012

Failure patterns in patients with esophageal cancer treated with definitive chemoradiation





Welsh, Cancer 2012

ESTRO School

Summary

- Patters of failure after nCRT:
- Distant metastases: 36% ➔ 29%
- Locoregional failure: 36% ➔ 13%
- Recurrence within the radiation target volume occurred in only 5%, mostly combined with outfield failures.

- Patterns of failure after dCRT:
- Distant metastases: 50%
- Locoregional failure: 50%
- Most failures at site of macroscopic tumor

patient selection. The 2012 annual report of the UK National Oesophago-gastric Cancer Audit[38] has showed an improvement in outcomes for patients undergoing surgery, with 45% of patients surviving for 3 years. Both of these areas have scope for further development, namely the incorporation of CT-PET more directly into radiotherapy planning and assessment of caseload, with outcomes in specialist non-surgical services.

We believe, however, that by using newer radiotherapy techniques, such as intensity-modulated and image-guided radiotherapy, we can now safely deliver a higher

colleagues' trial.[1] As Crosby and
radiation doses of 60 Gy or higher
safe to deliver to patients with thes
cause significant morbidity. A succe
radiotherapy and a targeted therapy
advance against this disease and wel

1.8 Gy are regarded as standard treatment of definitive radiotherapy in the United States. Increased radiation doses up to 60 Gy in fractions of 1.8–2.0 Gy are recommended in parts of Europe and Japan for definitive chemoradiotherapy. This is due to an obvious dose–response correlation of radiotherapy in oesophageal cancer and the positive experience with these radiation doses in prospective multi-centre trials [16, 17] (Figure 1).

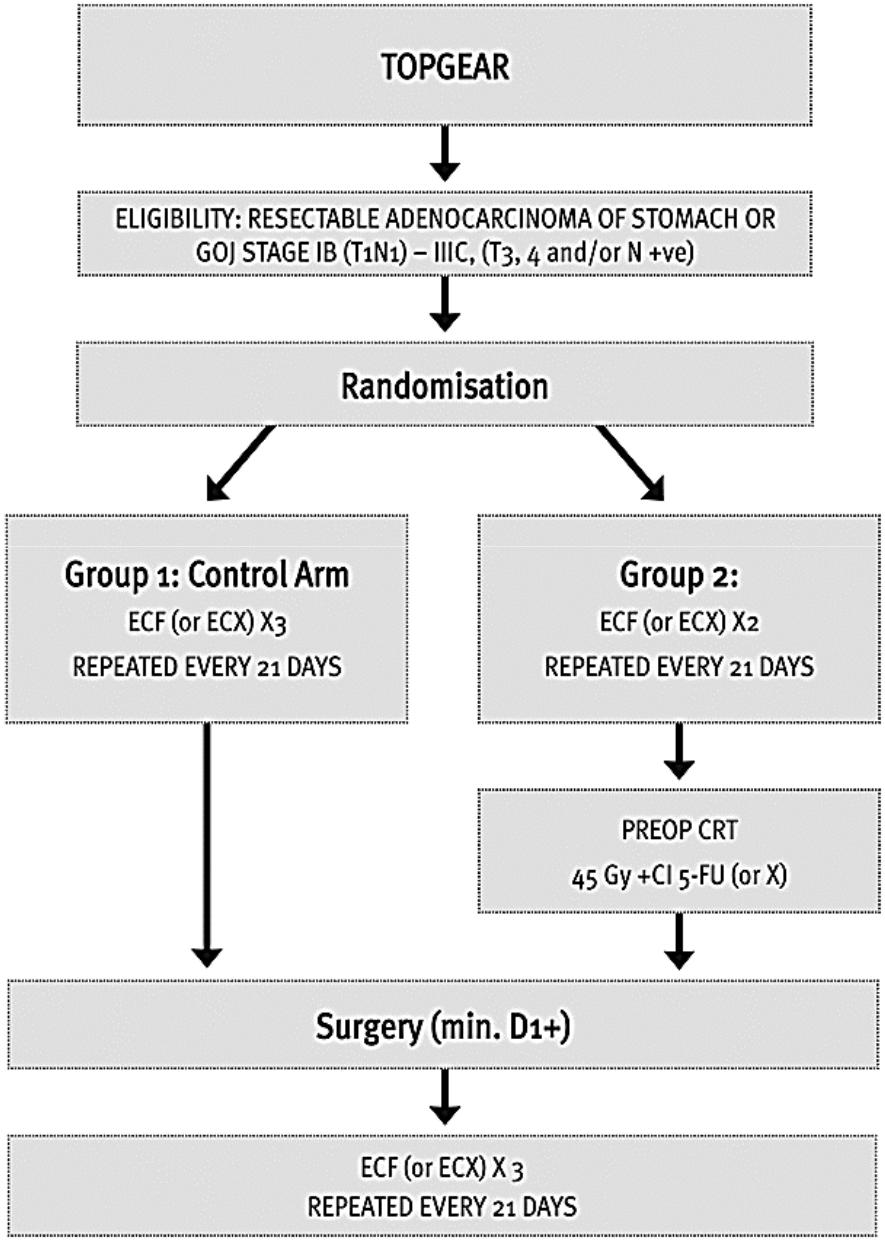
22114 - 40111: Study schema



ESTRO School

22114 - 40111: Study endpoints

- **Part 1 (Phase II component)**
  - Primary: Pathological complete response rate
  - Secondary:
    - Toxicity (including surgical morbidity and mortality)
    - Feasibility of preoperative chemoradiation (compliance)
    - Accrual

- **Part 2 (Phase III component)**
  - Primary: Overall survival
  - Secondary:
    - Disease free survival
    - Toxicity
    - Pathological response rate
    - Surgical R0 resection rate

Traveling to a High-volume Center …

- Traveling to a high-volume center is associated with improved survival for patients with esophageal cancer.
- 4679 patients with T1-3 N1 M0 in the National Cancer Data Base from 2006-211
  - Travel patients were more likely to undergo esophagectomy (68% vs 43%) and had significantly better 5-year survival (40% vs 21%)
- Strategy that support patient travel for treatment at high-volume centers may improve esophageal cancer outcomes.

Gastric Cancer – Staging & Imaging of primary & nodal subsite boundaries

Dr Angela M Riddell
Royal Marsden, London. UK

30/05/2016

STOMACH 7TH EDITION - AJCC

Primary Tumor		Regional Lymph Nodes	
TX	Primary tumour cannot be assessed	NX	Lymph nodes cannot be assessed
T0	No evidence of primary tumour	N0	No regional lymph node metastasis
Tis	Carcinoma in situ	N1	1 to 2 regional lymph nodes
T1	Lamina propria or submucosa	N2	3 to 6 nodes (was N1)
– T1a	Lamina propria or muscularis mucosae	N3	≥ 7 nodes
– T1b	Submucosa	– N3a	7 to 15 nodes (was N2)
T2	Muscularis propria *(was T2a)*	– N3b	≥16 nodes (was N3)
T3	Subserosa *(was T2b)*	**Distant Metastasis**	
T4	Adjacent structures	M0	No distant metastasis
– T4a	Perforates serosa *(was T3)*	M1	Distant metastasis
– T4b	Other adjacent structures *(was T4)*		

Staging of Gastric Cancer

Two main categories:

Early gastric cancer

Malignant invasion confined to the mucosa & submucosa

Advanced gastric cancer

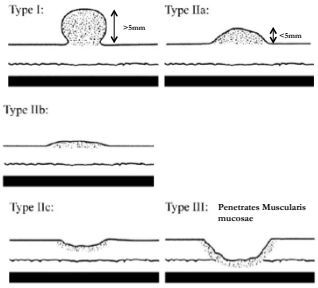
Malignant invasion into the muscularis propria

Early Gastric cancer

Elevated

Flat

Depressed



Adapted from: Ba-Ssalamah A, Prokop M et al. Radiographics 2003; 23:625-644

Gastric Cancer Staging

Diagnosis – Endoscopic biopsy

Initial Imaging:

MDCT

Potentially operable disease:

PET/CT – exclude distant spread

Laparoscopy

EUS – Early disease, Proximal/ Distal Extent

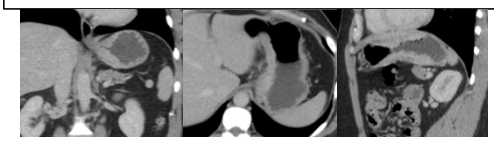
MRI

MDCT - Patient preparation

- Fasted for 6hrs
- Gastric distension
  - Anti spasmodic –Buscopan®
  - Oral contrast – water
- Position
  - Supine
  - Prone
  - Oblique angle to improve regional gastric distension

MDCT - Scan Technique

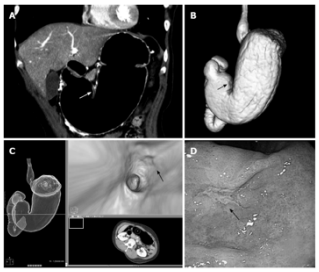
Portal venous phase imaging (70 second delay)
Thorax, abdomen & pelvis



Scan parameters aim to achieve resolution that can enable MPR postprocessing using isotropic voxels

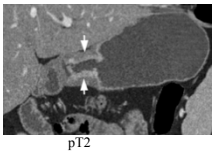
MDCT - Scan Technique

Virtual gastroscopy

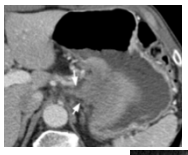


03/01/13

MDCT - T Staging



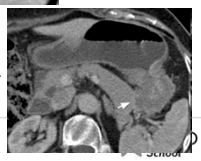
pT2
Smooth outer wall



pT3
Irregular outer wall due to infiltration into perigastric fat.

Parameter	Percentage range
Accuracy	77 - 89%
Sensitivity	83-100%
Specificity	80 -97%

pT4
Direct infiltration of the pancreas



Choi J, Joo I, Lee, J 2014 WJG 20;16: 4546 - 4557

MDCT - N Staging

Lymphatic spread is found in 74%–88% of patients
N staging depends on the number of lymph nodes involved
CT - high specificity, but low sensitivity
Based on size criteria (short axis):
≥6mm perigastric
≥ 8mm extra perigastric

Parameter	Percentage range
Sensitivity	62.5 - 91.9%
Specificity	50 - 87.9%

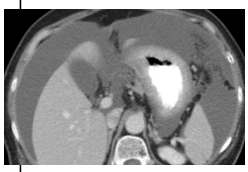
Stage	No of Regional Nodes
N1	≤2
N2	3-6
N3	≥7

Kwee RM, Kwee TC. 2009 Gastric cancer; 12: 6-22

MDCT – M staging

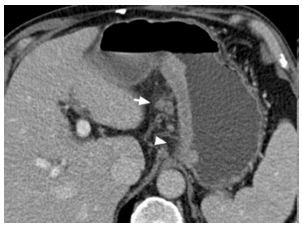
- Detection of hepatic mets: sens 88%, spec 99%*.
- Detection of peritoneal disease
  No ascites: sens 30%†
  In presence of ascites:
  Sens 51%, Spec 97%*

Laparoscopy for potentially operable patients



*Yajima, K., T. Kanda, et al. (2006). Am J Surg **192**(2): 185-90.
†D'Elia, F., A. Zingarelli, et al. (2000). Eur Radiol **10**(12): 1877-85.

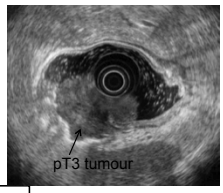
Gastric Cancer staging



CT Report:
- Length
- Location
- T Stage
- N & M Stage

EUS - T Staging

5-20mHz probes
- High spatial resolution enables visualization of individual wall layers
- EUS T staging more accurate than MDCT



Wide variation in accuracy in literature (65-92%)
Overstaging early tumours

Image from: Bohle W et al. 2011 J Gastrointestin Liver Dis; Vol. 20 No 2, 135-139

EUS - N Staging

Provides morpholgical information
- Malignant nodes: round, hypoechoic, lose echogenic hilum
- Fine needle aspiration (FNA) possible

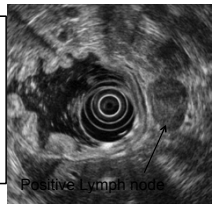


Image from: Bohle W et al. 2011 J Gastrointestin Liver Dis; Vol. 20 No 2, 135-139

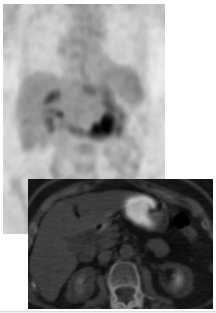
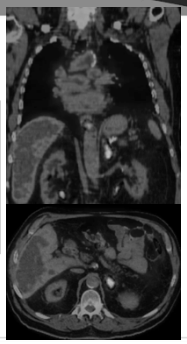
^{18}FDG-PET/CT

Gastric Cancer
- Variable ^{18}FDG avidity dependent upon tumour subtype
- Intestinal-type have greater FDG avidity
- Limited uptake in diffuse-type ~30% tumours not visualised
- ^{18}FDG-PET/CT not currently advocated for gastric cancer staging



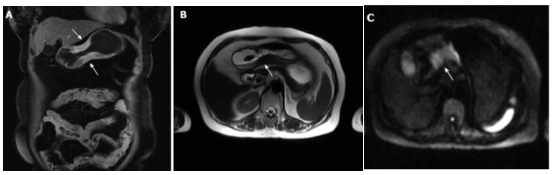
^{18}FDG-PET/CT

Main advantage
Identification of occult metastatic disease*



*Kinkel K, Ying L et al (2002) Radiology 224:748–756

Gastric Cancer Staging - MRI



Limited studies
- In vitro studies – demonstrate individual layers of the oesophageal wall. High level of accuracy for staging all tumours
- In vivo studies – T & N staging similar to MDCT

Choi J, Joo I, Lee, J 2014 WJG 20;16: 4546 - 4557

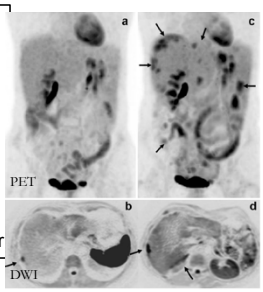
M Staging – Peritoneal disease

MDCT

Accuracy 25-90% dependent on site, size & morphology of disease

Functional imaging

PET-CT & Diffusion Weighted MRI (DW-MRI) have similar improved accuracy, but falls for foci <1cm*



*Soussan M, Des Guetz G et al. (2012) Eur Radiol 22:1479 - 1487

Summary

Staging
- MDCT – exclude metastatic disease
- PET-CT – refine staging & localise tumour

- EUS – defining prox / distal extent
- MRI – research

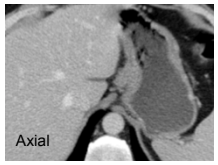
Metastatic nodes

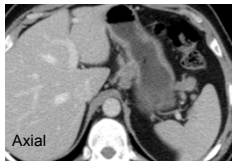
Case 1

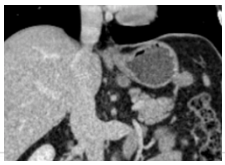
Case 1

- 65yr old male presented with abdominal pain and weight loss

Case 1



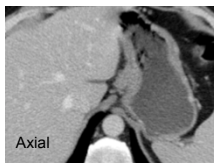


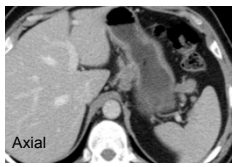


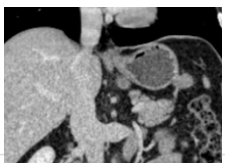
Case 1

- Stage the tumour
- If there are nodes involved; state which nodal stations

Case 1







Case 1

Case 1

Tumour stage:

T3N2M1

Nodal Stations

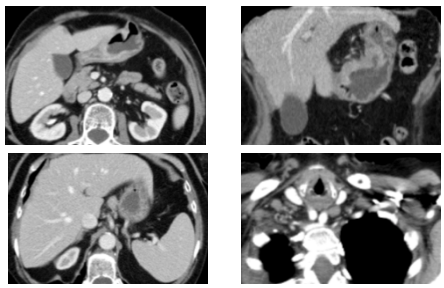
Left gastric artery – 7

Splenic hilum - 10

Case 2

72 year old female with weight loss and anaemia

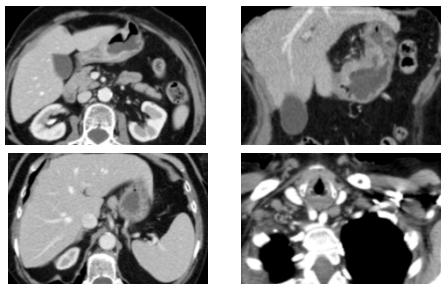
Case 2



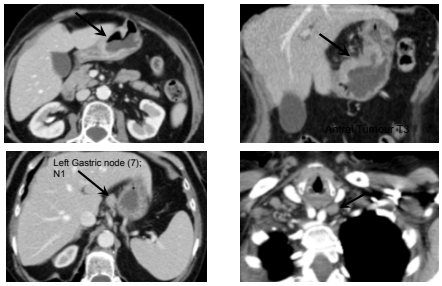
Case 2

- Describe the location of the tumour
- Stage the tumour
- Identify any nodal stations involved

Case 2



Case 2



T3N1 ?? M1 – Supraclavicular node…

ESTRO School

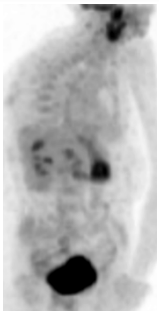
Case 2

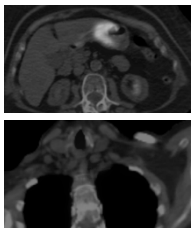
What to do next?

- Consider supraclavicular node positive based on size (9mm)?
- Arrange a PET-CT scan
- Arrange an U/S +/- FNA

ESTRO School

Case 2





Moderate FDG avidity in node 'equivocal' on PET-CT

ESTRO School

Case 2

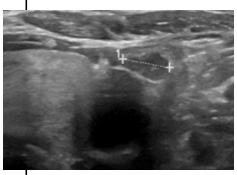
What to do next?

- Consider supraclavicular node positive based on PET-CT findings
- Arrange an U/S +/- FNA
- Consider PET-CT findings as negative in the node & proceed with neoadjuvant therapy followed by surgery

ESTRO School

Case 2

- An U/S with FNA was arranged
- Sonographic appearance in keeping with a reactive node.
- Cytology – C1



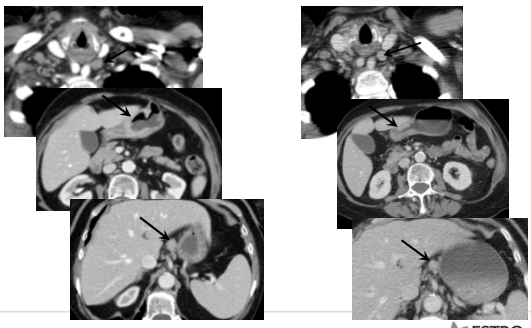
ESTRO School

Case 2

The patient was given neoadjuvant therapy

ESTRO School

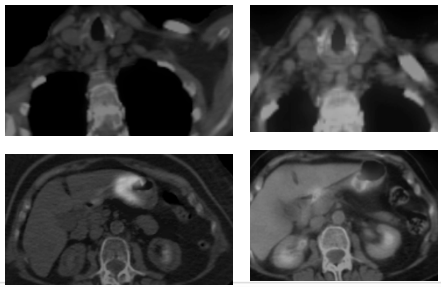
Case 2



Post x2 Chemo cycles - PR

ESTRO School

Case 2



Post x2 Chemo cycles - PR

ESTRO School

Case 2

- Had second laparoscopy – no metastases
- Went on to have total gastrectomy in Dec 2009.
- Well with no recurrence
- Patient opted for no further treatment post op.

ESTRO School

Thank you

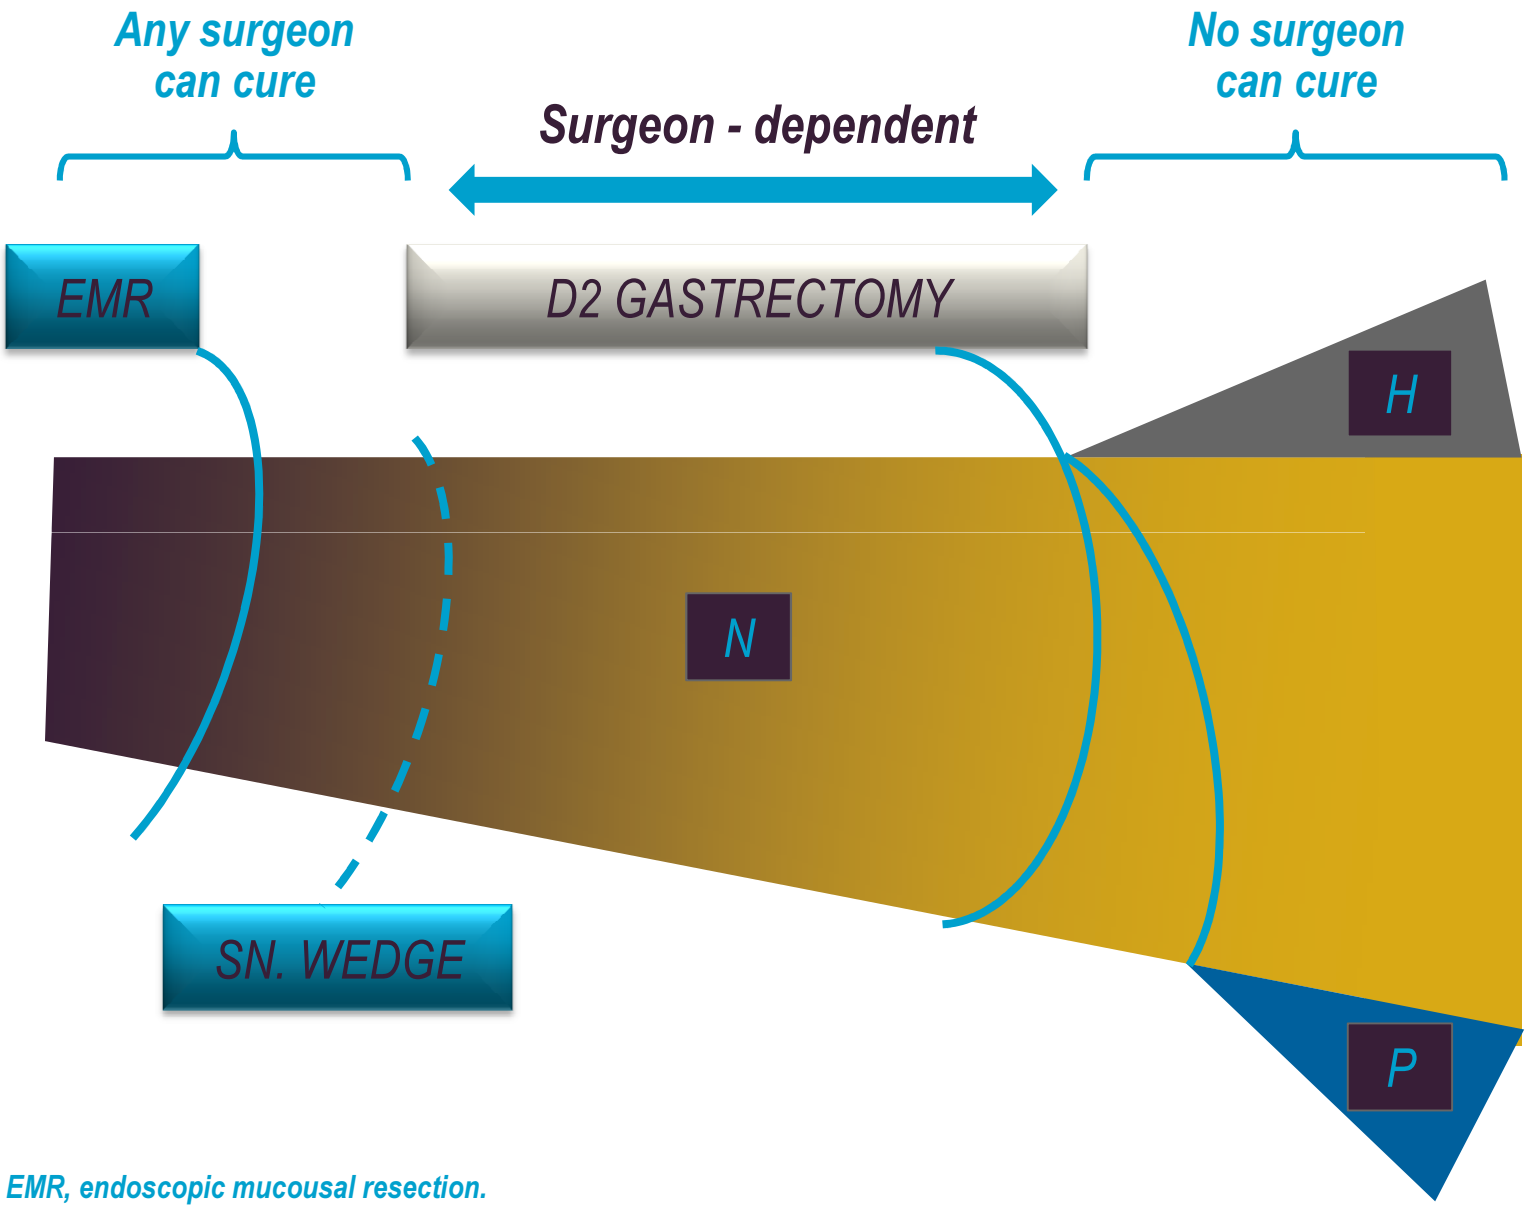
State of Art of Surgery in a Combined Treatment Perspective: Gastric Cancer

William Allum
Consultant Surgeon
Royal Marsden NHS Foundation Trust
London, UK

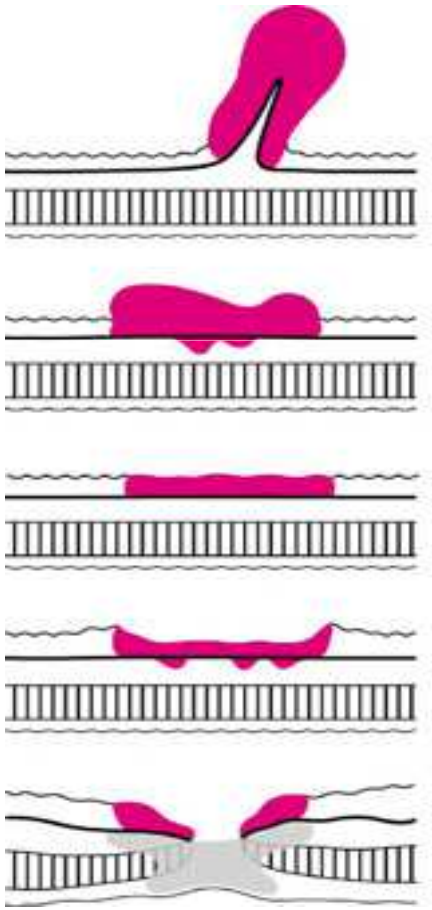
NHS



EMR, endoscopic mucousal resection.

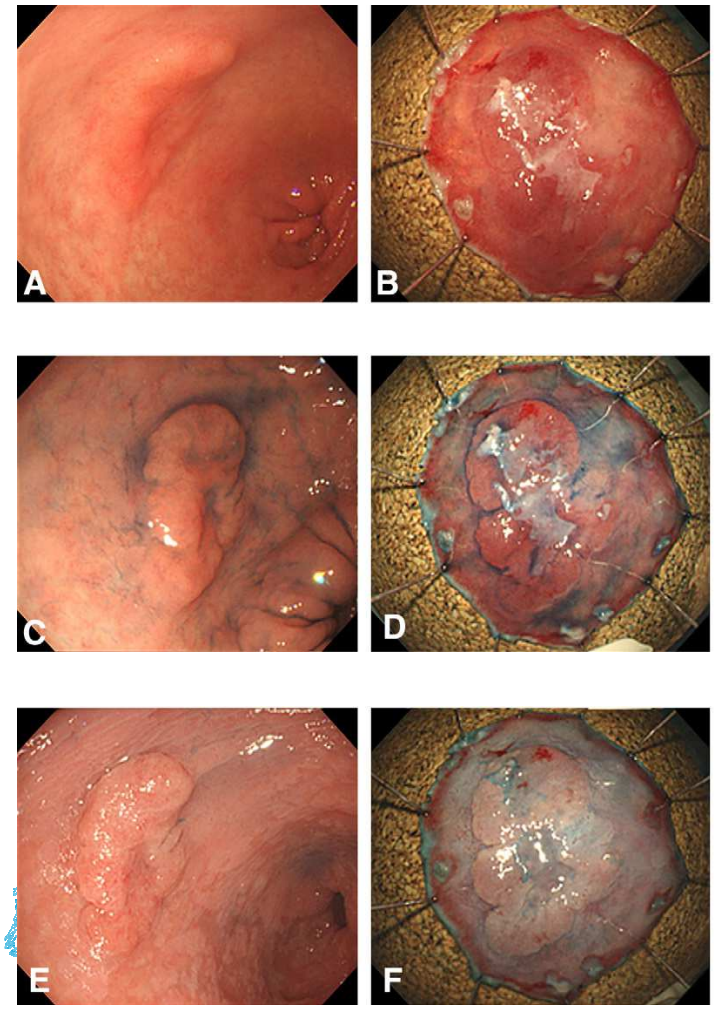
Multipurpose device

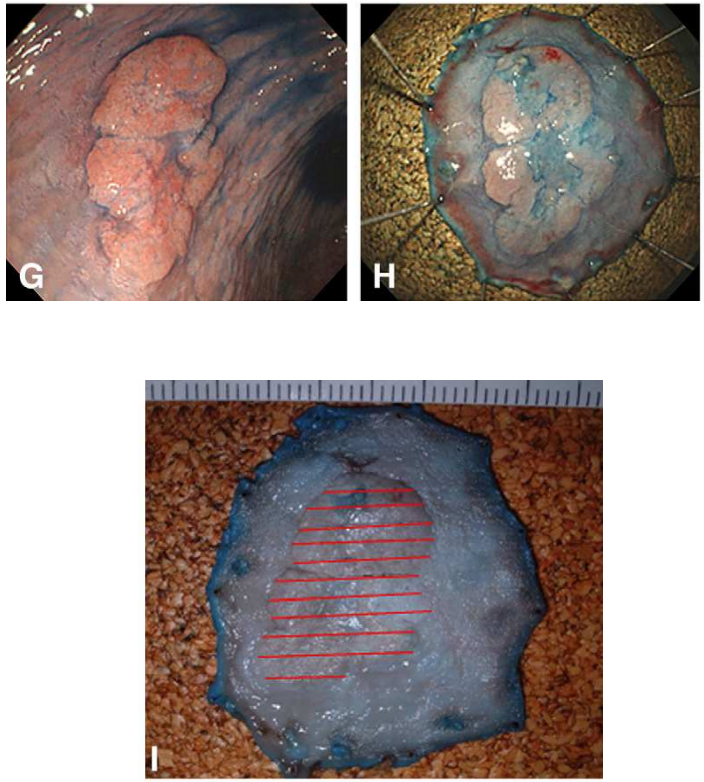
T1 TUMOURS



- Protruding
- Superficial Elevated
- Superficial Flat
- Superficial Ulcerated
- Excavated

Endoscopic Diagnosis
Indigo carmine + Acetic Acid





Sakai et al, GIE 2008

ENDOSCOPIC RESECTION

well differentiated adenocarcinoma
no lymphatic or venous invasion
intramucosal cancer regardless of size without ulceration
intramucosal cancer <30mm with ulceration
minute submucosal penetration (sm1) and <30mm

LN Metastasis from EGC

About 10% of EGC

3% of M cancer

20% of SM cancer

5% of SM has N2

Multiple sections of the primary tumor detect SM

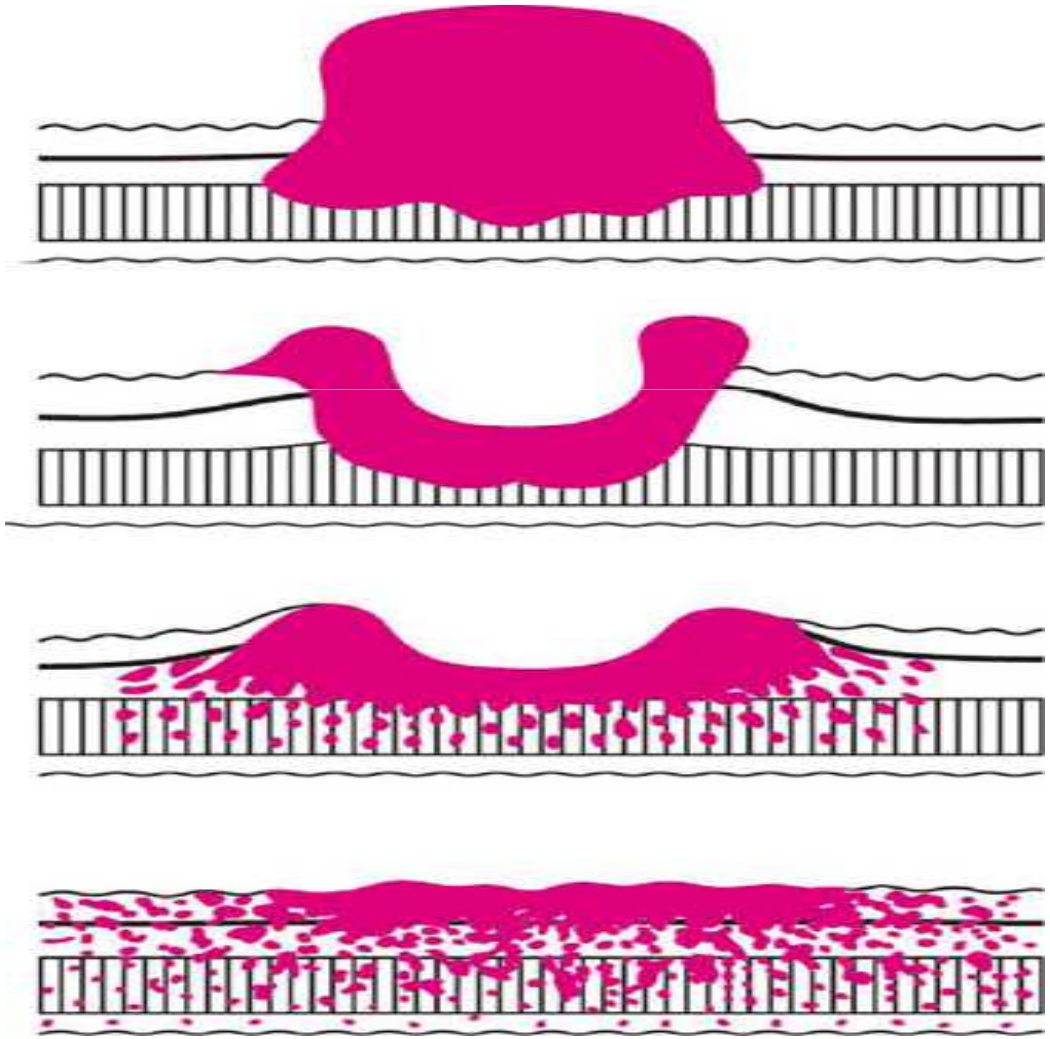
Multiple sections of LN detects metastasis

SURGERY FOR EARLY GASTRIC CANCER

T1 m	D1 alpha (Stations 7 & 8)
T1 sm	D1 beta (D1 alpha + station 9 & 11p)

Function preserving gastrectomy

LOCALLY ADVANCED GASTRIC CANCER



Mass

Ulcerative

Infiltrative, ulcerative

Infiltrative, diffuse

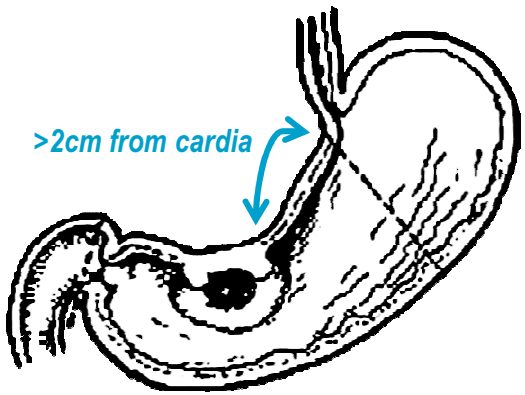
R0 Resection

A surgical procedure in which there is no evidence of macroscopic residual tumour in the tumour bed, lymph nodes and/or distant sites with microscopic negative resection margins

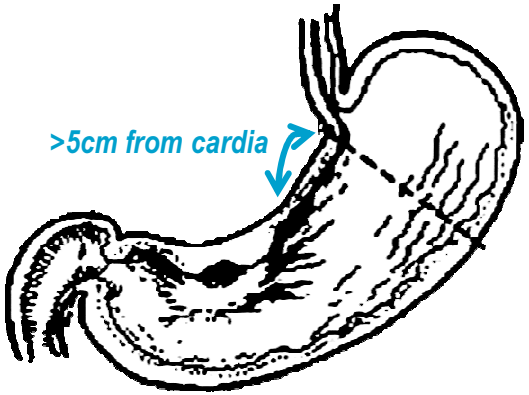
Hermanek P, Wittekind C. Pathol Res Pract. 1994;190(2):115-123.

Indication and Division Lines for Distal Subtotal and Total Gastrectomy

Distal subtotal gastrectomy

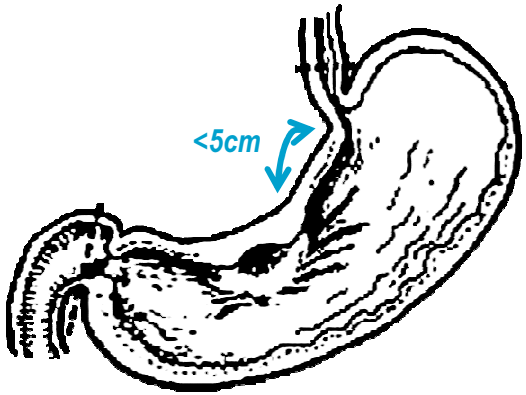


Early cancer or well-circumscribed advanced cancer

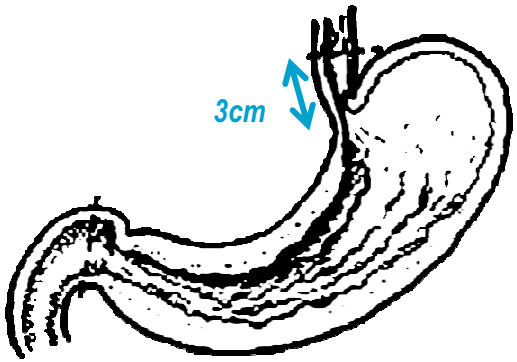


Infiltrative advanced cancer

Total gastrectomy

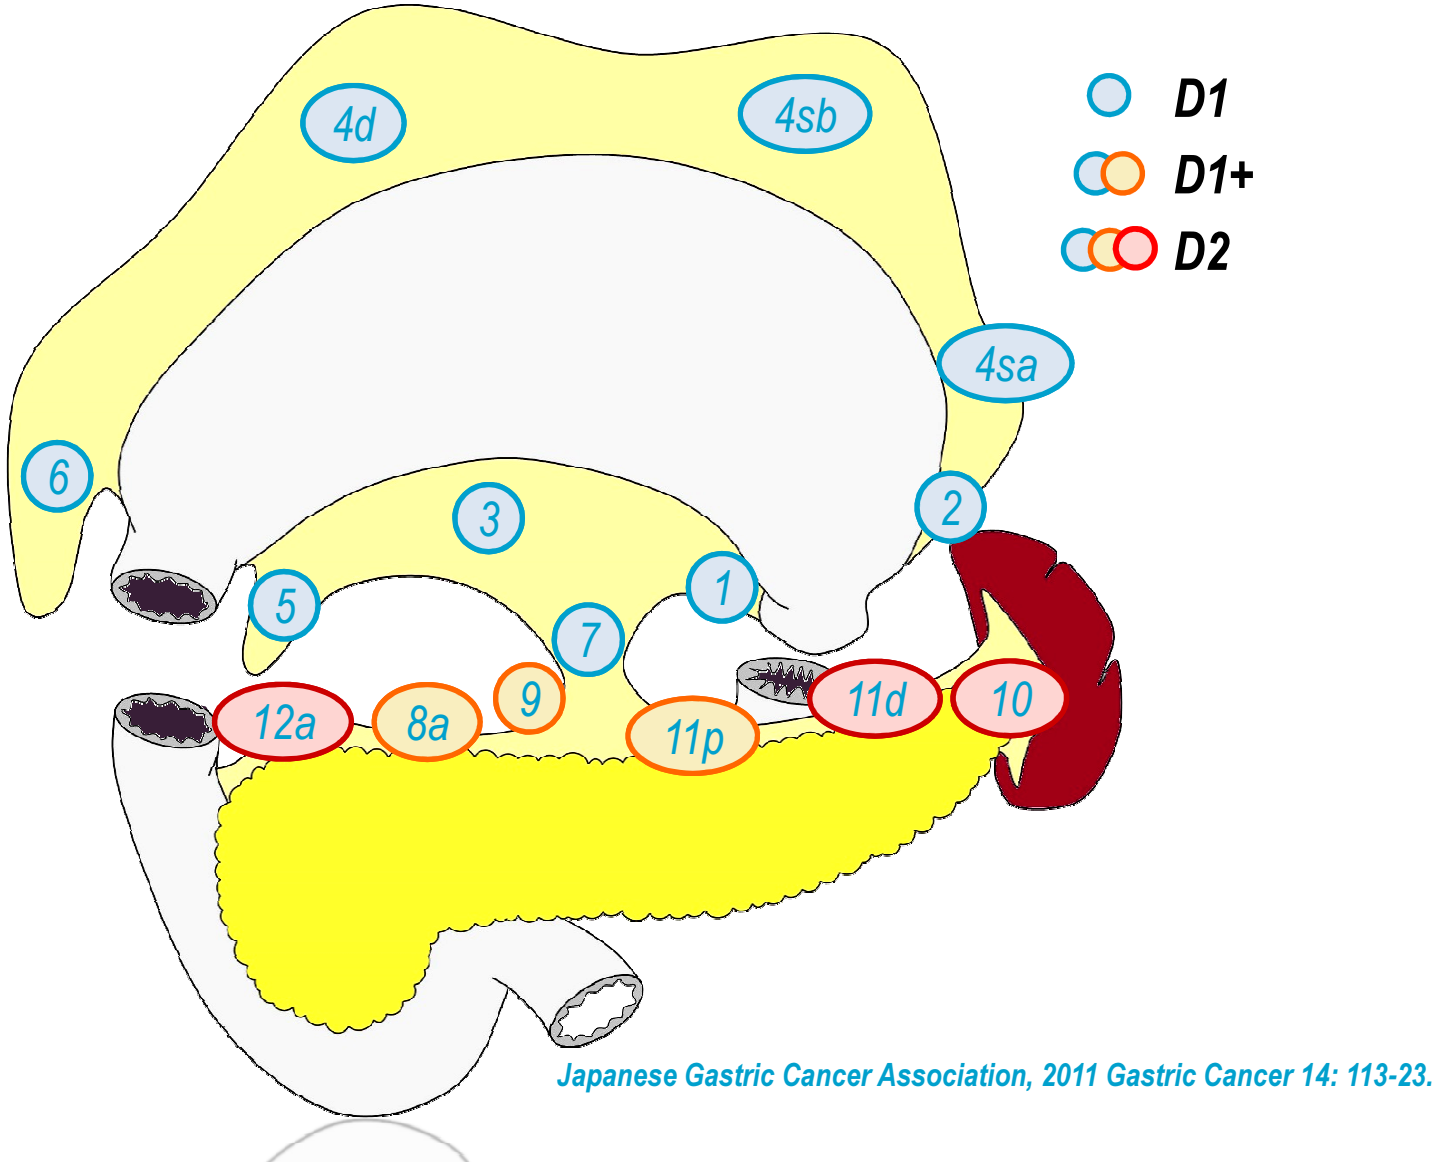


When the proximal distance from the cardia is less than the required length, total gastrectomy is indicated



Total gastrectomy is always indicated in diffuse carcinoma (Borrmann type 4) regardless of its size

Total Gastrectomy and Lymph Node Dissection



Japanese Gastric Cancer Association, 2011 Gastric Cancer 14: 113-23.

Distal Gastrectomy and Lymph Node Dissection

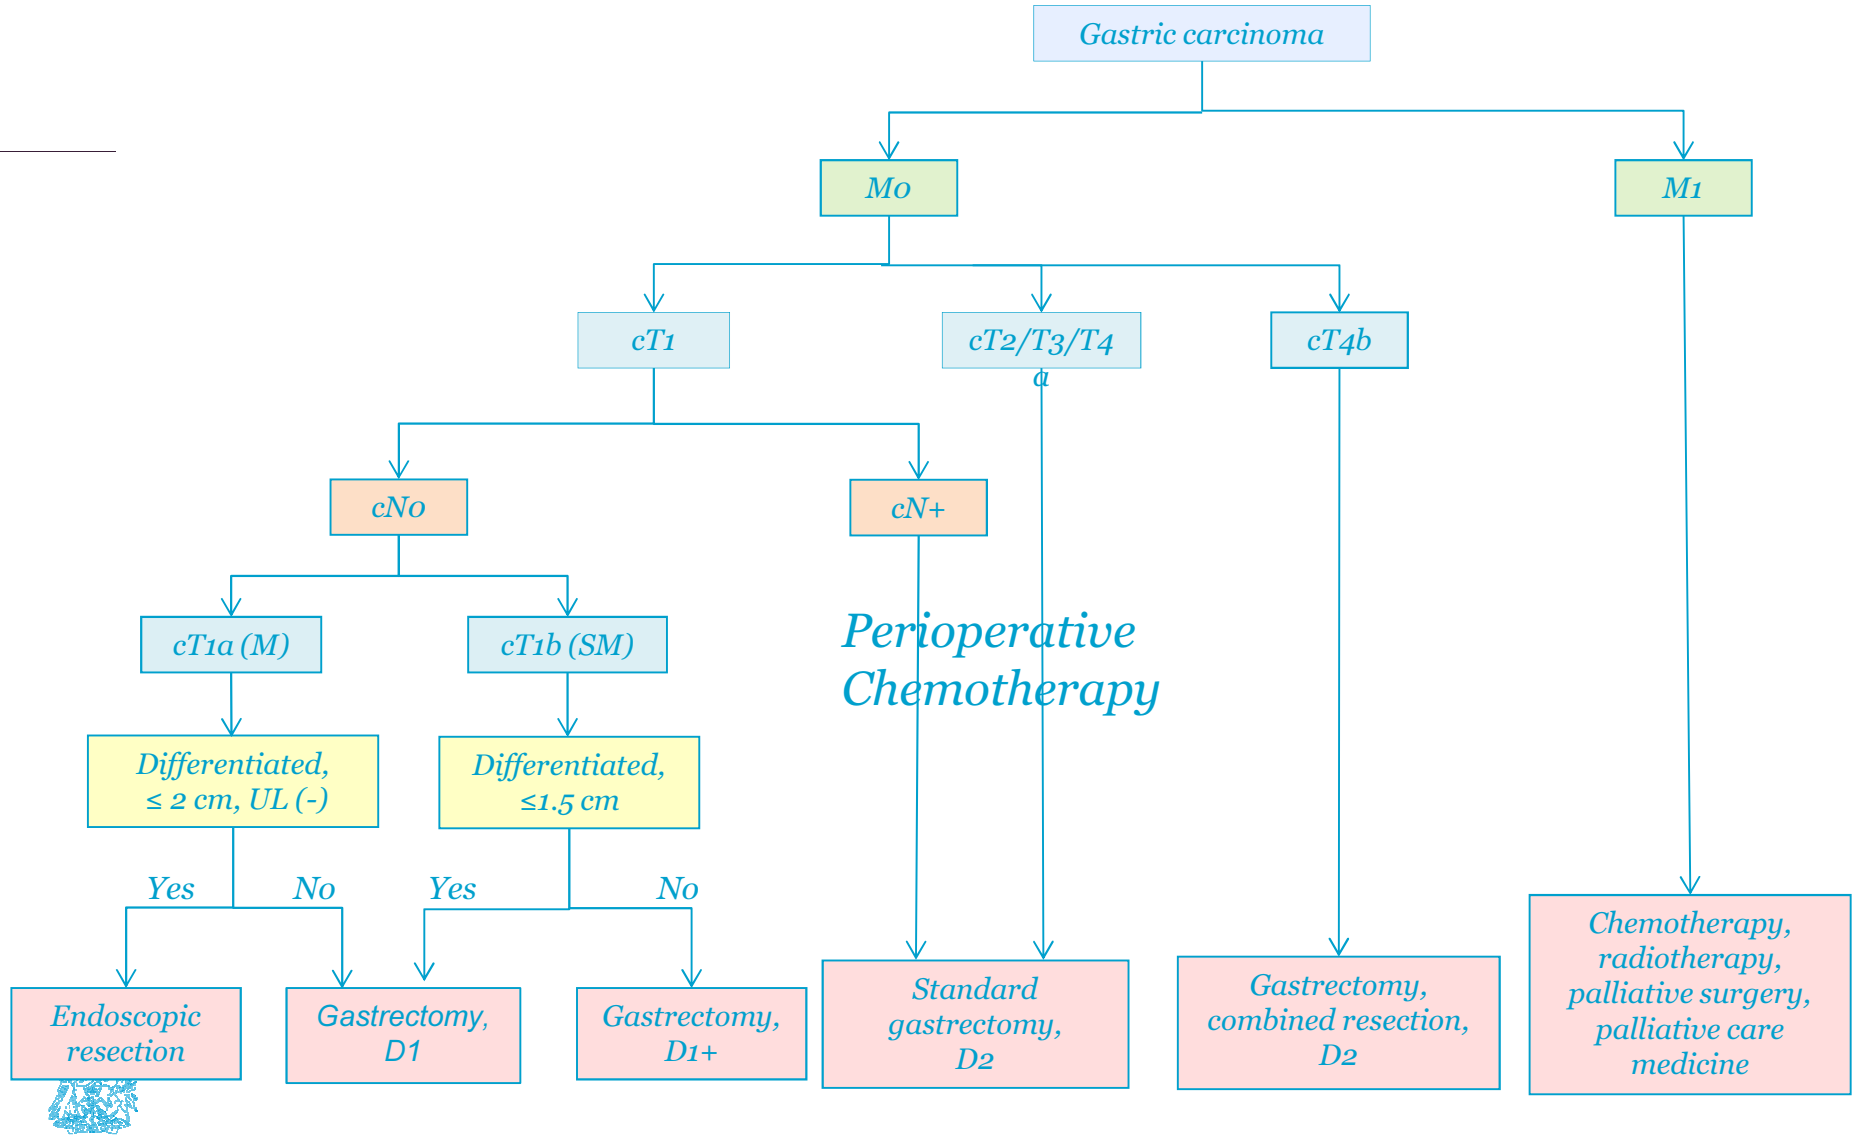
Algorithm of Standard Treatment



Surgery

	CSC		S	
	N	**%**	**N**	**%**
Proceeded to surgery	219	88%	240	95%
Resection outcome:				
'Curative' operation	169	-	166	-
Palliative operation	44	-	70	-
Laparotomy but no resection	1	-	0	-
Resection performed but outcome unknown	5	-	4	-
Never had surgery	15	6%	6	2%
Incomplete surgical data	16	6%	4	2%
Median time to surgery	99 days		14 days	

In patients who proceeded to resection with known outcome, a significantly higher proportion of patients in the CSC arm (79% vs 70%; p=0.029, χ^2 test) had resections which were deemed curative by the surgeon.

Postoperative morbidity/mortality

	CSC	S
Postoperative deaths	6% (14/219)	6% (15/240)
Postoperative complications	46%	46%
Median duration of post-operative hospital stay	13 days	13 days

Pathology staging following surgery

	CSC	S	p-value
Maximum tumour diameter			
Median (IQR)	3.cm (2.0-5.0)	5.0cm (3.5-7.5)	<0.001, Mann-Whitney U test
Extent of tumour (gastric only)			
T1/T2	52%	38%	0.009, χ^2 test (trend)
T3/T4	48%	62%	
Nodal status (gastric only)			
N0/N1	84%	76%	0.01, χ^2 test (trend)
N2/N3	16%	29%

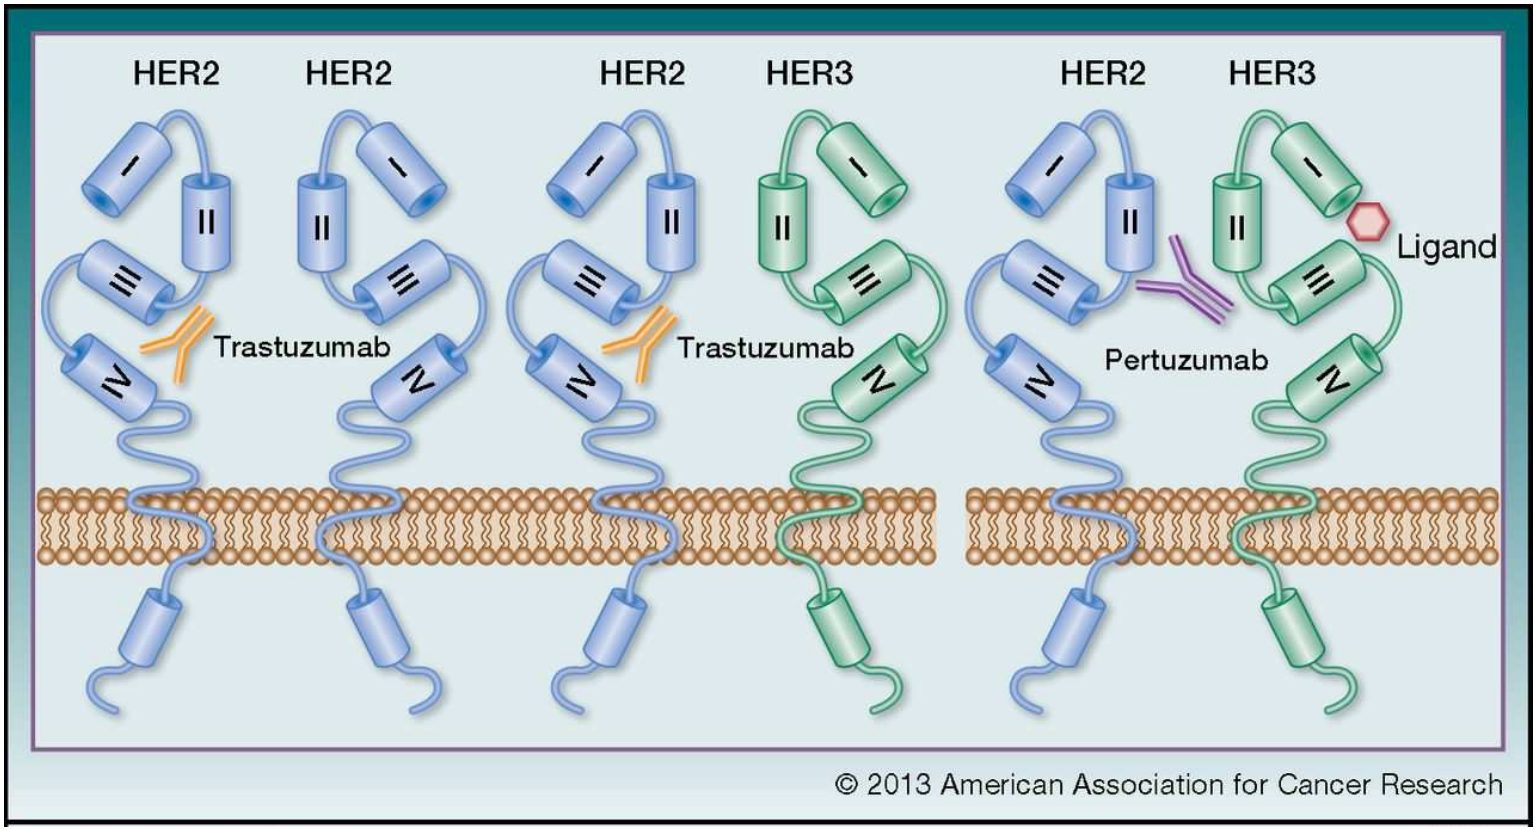
Anti-HER2 – Trastuzumab and Pertuzumab



The mechanism of action of pertuzumab and trastuzumab. Trastuzumab binds to the ECD IV of the HER2 receptor, preventing the spontaneous formation of homodimers (HER2–HER2) and ligand-independent heterodimers (HER2–HER3 and also HER2–HER1 and HER2–HER4). Pertuzumab binds to the dimerization domain of the HER2 receptor (ECD II), preventing the formation of ligand-induced HER2 heterodimers.

Postoperative CTx intensification did not improve outcomes in EU

ESTRO School

Summary

- Perioperative chemotherapy is the EU standard of care fo T3-4 and/or N+
- Perioperative CTx is based on platinum and a fluoropyrimidine
- Studies on integration of RTx and comparative studies areeongoing
- Taxanes may improve chemotherapy response and survival
- Anti-angiogenic treatment is not effective
- Anti-HER2-directed treatment: under investigation
- Adjuvant chemotherapy marginally effective
- Intensification of adjuvant / postoperative chemotherapy has thus far not improved survival outcomes

Welcome

Dear Participants of the International Gastric Cancer Congress 2019,

With great pleasure we announce the **2019 International Gastric Cancer Congress to be held in Prague**. Gastric Cancer continues to be a major health problem in Europe, in the Asian-Pacific Region, in America, Middle East and Africa. From a worldwide perspective, almost 1 Mio patients are diagnosed with gastric cancer / year and 750.000 die from this aggressive cancer.

Gastric tumors: Pathology evaluation

Alexander Quaas
Institute of Pathology
University of Cologne

UNIKLINIK KÖLN

Road map

- Facts – gastric carcinoma in Germany
- Morphology based and molecular based diagnostics
- Tumor extension evaluation – using UICC- TNM 7th edition (since 2010)
- Lymph nodes stations (D1-D4)
- Patho-anatomical basics and reportings

UNIKLINIK KÖLN

Facts

- Germany 2016: 9.200 men /6.400 women
- 60-70% will die carcinoma-releated in following years
- In metastasis/recurrence: dismal prognosis (8 months median survival)

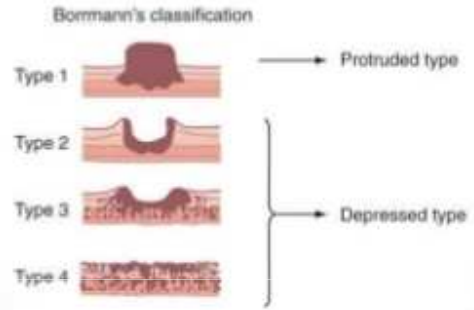
From: gekid.de (Gesellschaft der epidemiologischen Krebsregister in Deutschland e.V.) and krebsdaten.de (Robert-Koch-Institut)

UNIKLINIK KÖLN

Traditional morphology based diagnostics

Classifications

- 1926-



- 1942- **Border**'s classification- degree of cellular differentiation.
- 1965- **Lauren**- Intestinal, Diffuse types.
- 1990- **WHO**- Adeno Ca., AdenoSq., SqCC, Small cell Ca., Undifferentiated Ca.

From: Dr. D. Guin, St. John's Medical College Hospital

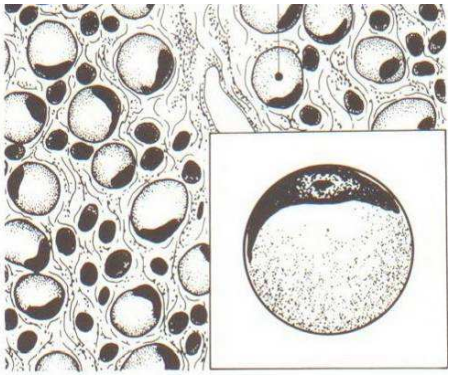
UNIKLINIK KÖLN

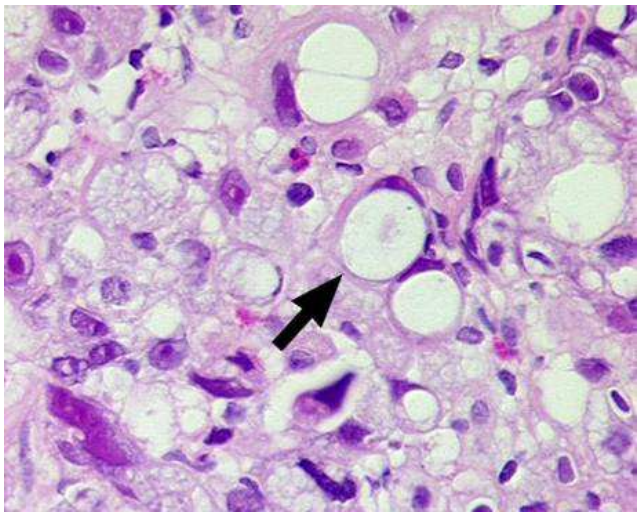
Traditional morphology based diagnostics

Table 1 Gastric adenocarcinoma classification systems

WHO (2010)	Lauren (1965)
Papillary adenocarcinoma Tubular adenocarcinoma Mucinous adenocarcinoma	Intestinal type
Signet-ring cell carcinoma And other poorly cohesive carcinoma	Diffuse type
Mixed carcinoma	Indeterminate type
Adenosquamous carcinoma	
Squamous cell carcinoma	
Hepatoid adenocarcinoma	
Carcinoma with lymphoid stroma	
Choriocarcinoma	
Carcinosarcoma	
Parietal cell carcinoma	
Malignant rhabdoid tumor	
Mucoepidermoid carcinoma	
Paneth cell carcinoma	
Undifferentiated carcinoma	
Mixed adeno-neuroendocrine carcinoma	
Endodermal sinus tumor	
Embryonal carcinoma	
Pure gastric yolk sac tumor	
Oncocytic adenocarcinoma	

"Carcinomas of the stomach are a heterogeneous group of lesions in terms of architecture, pattern of growth, cell differentiation, and histogenesis..."





From: Bing Hu, Gastric cancer: Classification, histology and application of molecular pathology, J Gastrointest Oncol 2012;3(3):251-261
Hye Seung Han and Gregory Y. Lauwers, Connection 2010

UNIKLINIK KÖLN

Molecular subtypes

1) Chromosomal instable 49,8%
2) Microsatellite-instable 21,7%
3) Genomic stable 19,6%
4) EBV-induced 8,9%

Microsatellite-instable carcinoma and EBV-positive carcinoma: more antigenes/highly inflammed: probably immunocheckpoint inhibition (and perhaps radiation) more effective

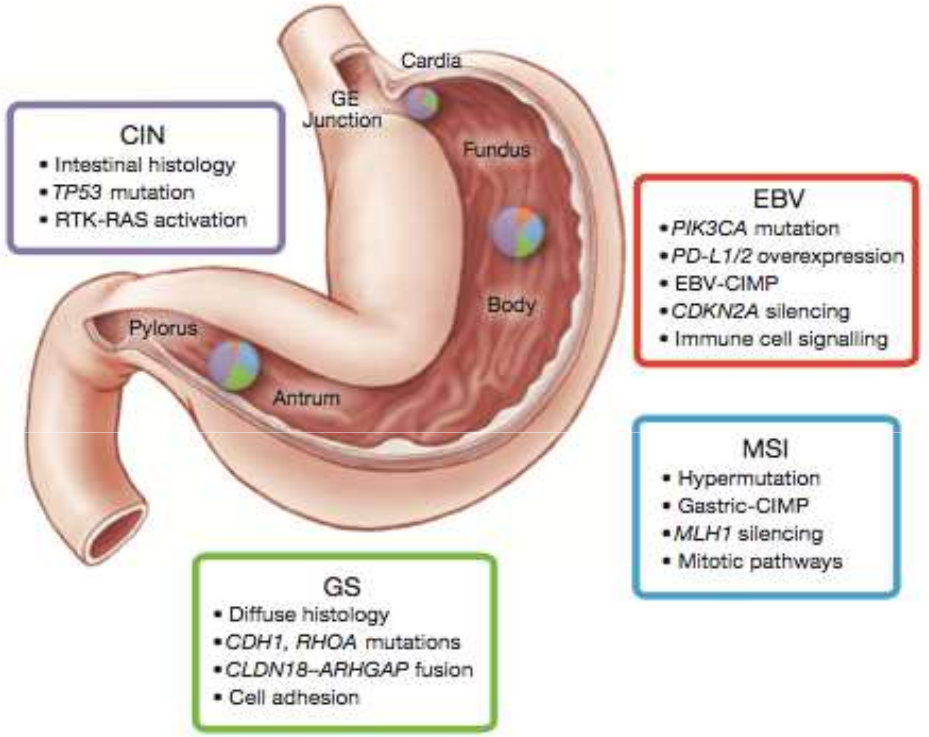


Figure 6 | Key features of gastric cancer subtypes. This schematic lists some of the salient features associated with each of the four molecular subtypes of gastric cancer. Distribution of molecular subtypes in tumours obtained from distinct regions of the stomach is represented by inset charts.

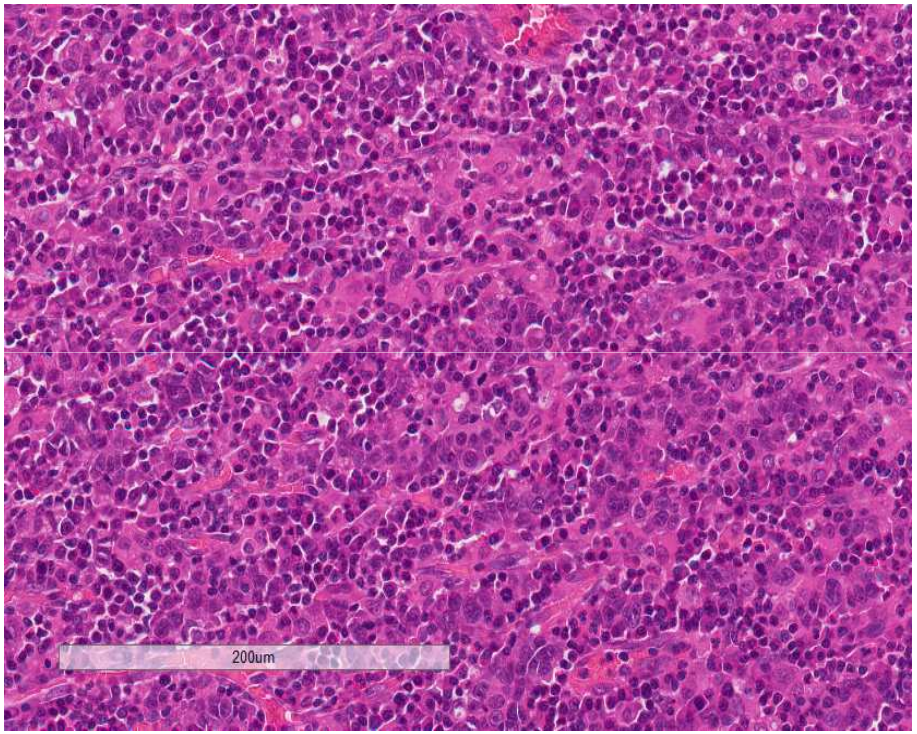
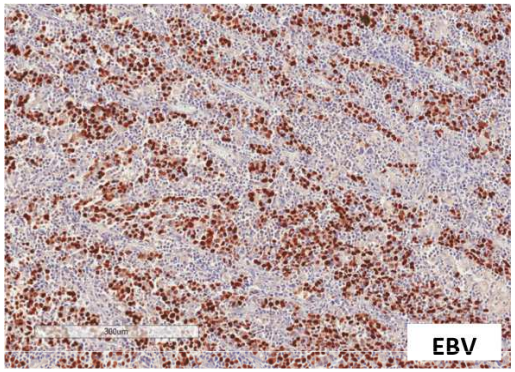
From: CancerGenomeAtlasResearchNetwork, „comprehensive molecular characterization of gastric adenocarcinoma“ Nature 2014

UNIKLINIK KÖLN

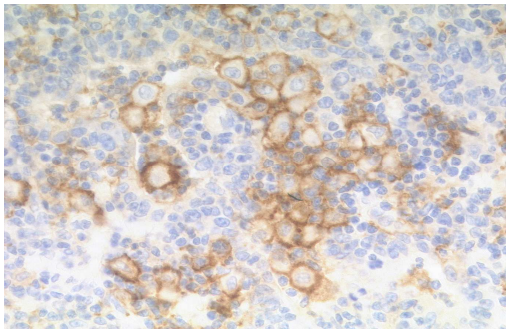
EBV+ gastric carcinoma



WHO: Gastric carcinoma with lymphoid stroma (medullary or lymphoepithelioma-like carcinoma)



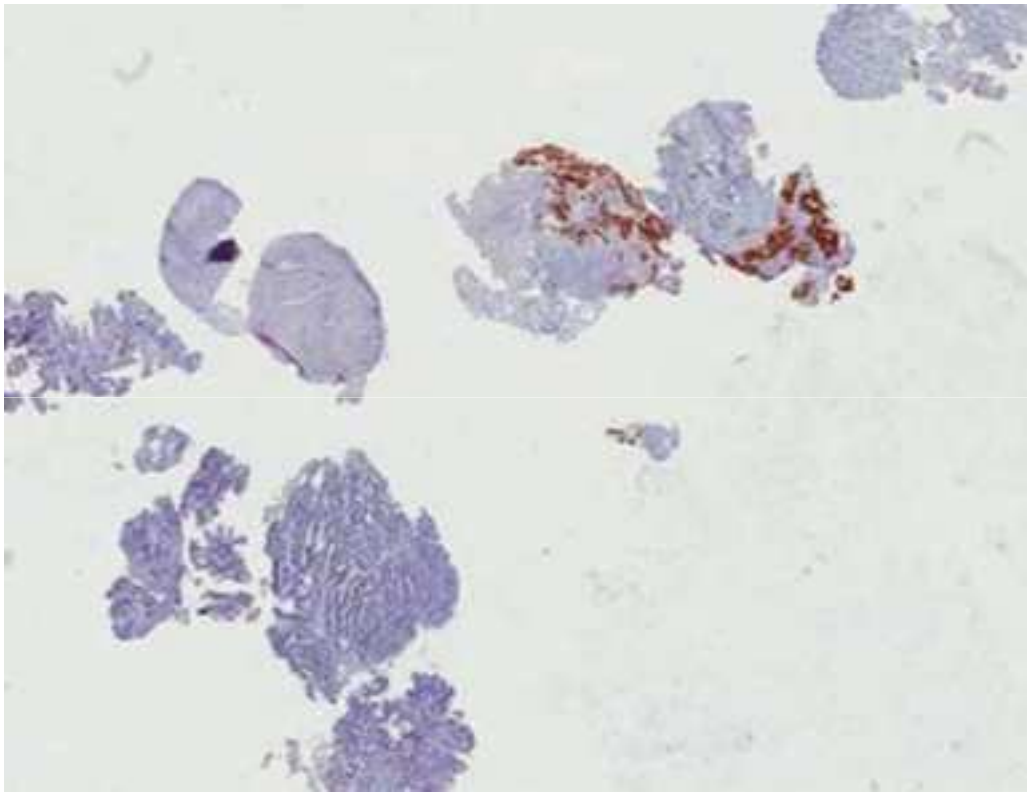
EBV-encoded RNA (EBER) in-situ hybridization (ISH)

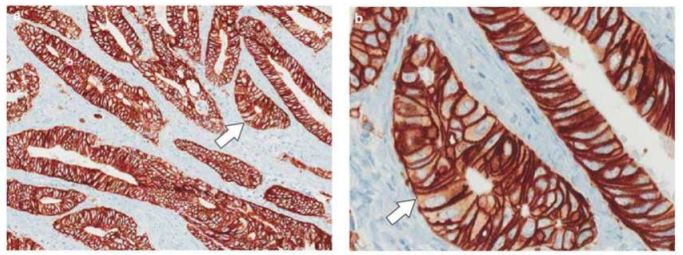


PD-L1 Immunohistochemistry, Dako-clone 28-8

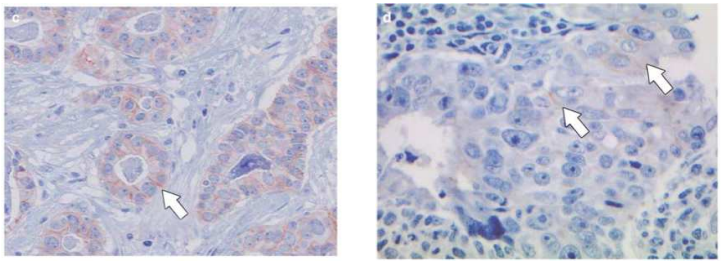
UNIKLINIK KÖLN

Her2+ gastric carcinoma





Magnification rule: 2,5-5X easy to see: 3+

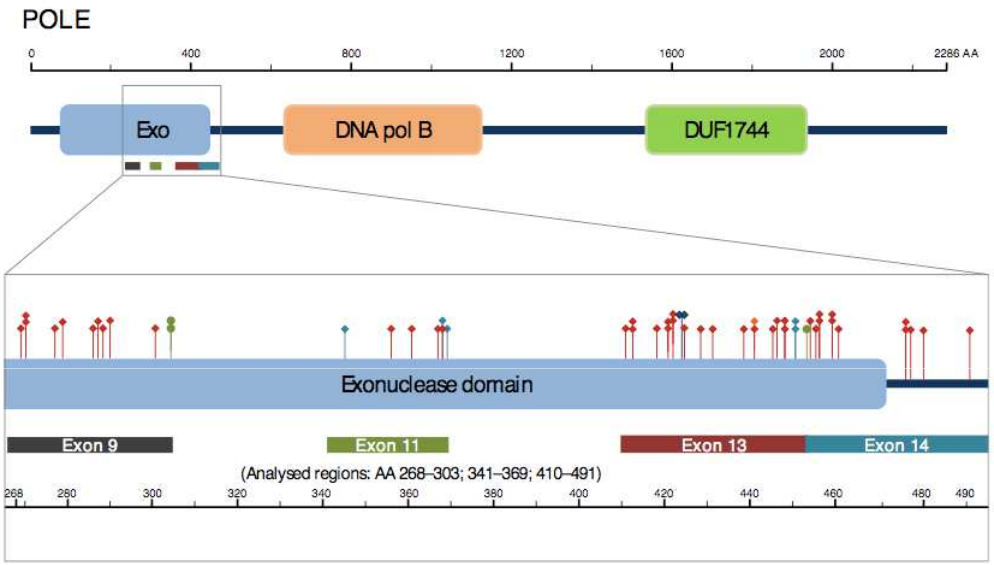


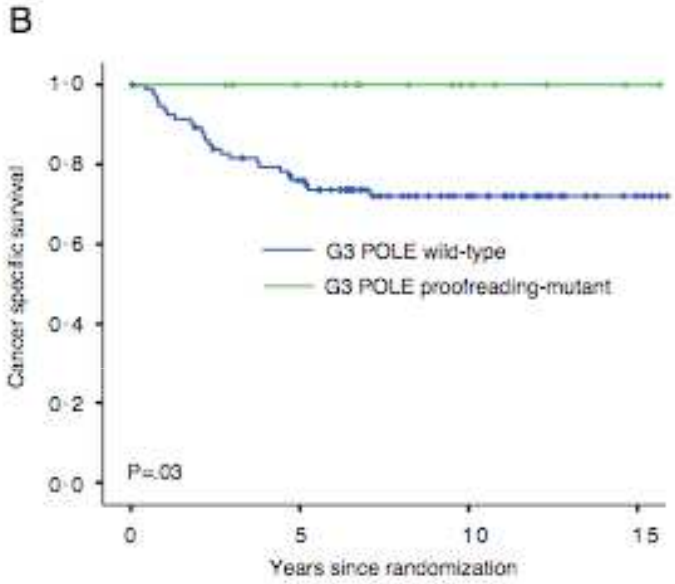
Magnification rule: 20x : 2+ - (F) ISH and 1+ is negative

Positivity: baso-lateral or circumferential staining
Highly heterogenous distribution
Use other staining protocols: breast/gastric

UNIKLINIK KÖLN

POLE-mutated gastric carcinoma?



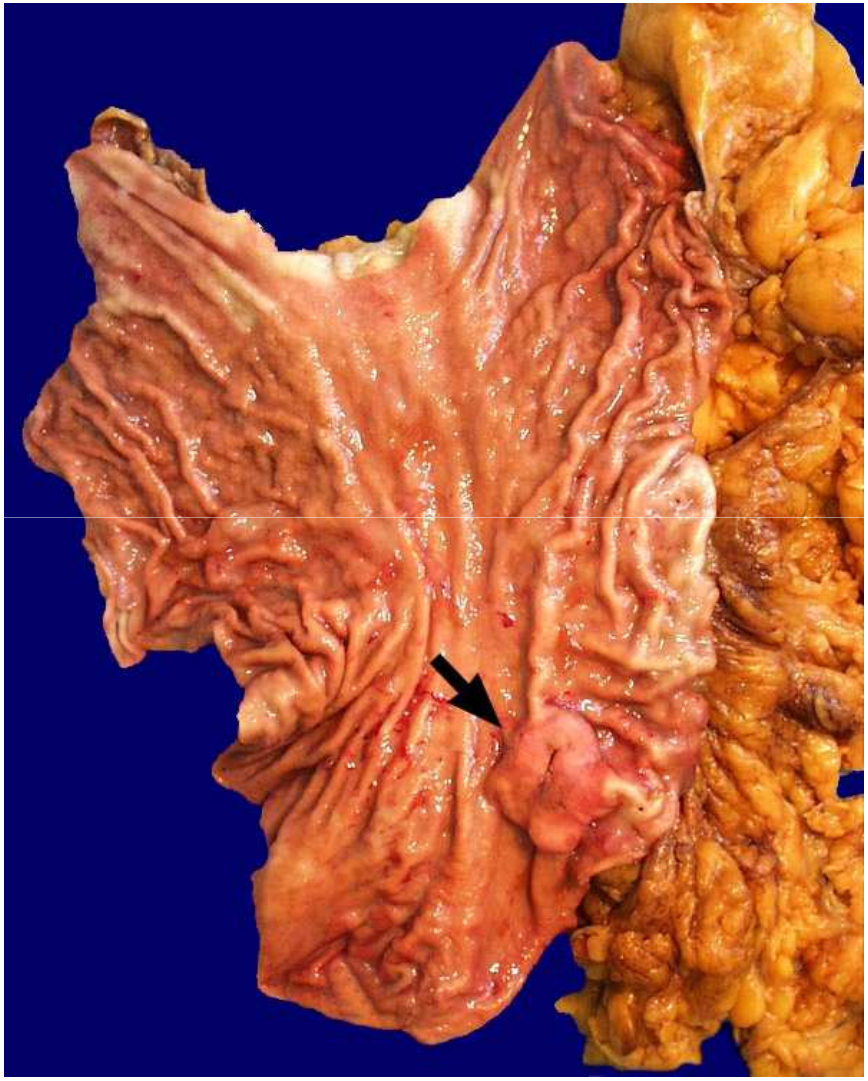


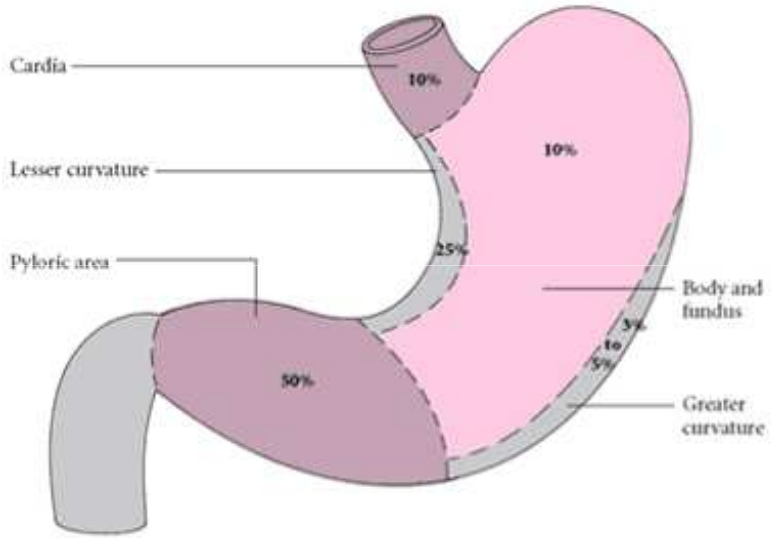
- G3 morphology?
- Good prognosis?
- Highly sensitive to chemotherapy?

From: Church, DN Prognostic significance of POLE proofreading mutations in endometrial cancer, J Natl Cancer Inst 2015
Stenzinger A Mutations in POLE and survival of colorectal cancer patients – link to disease stage and treatment, Cancer Med. 2014

UNIKLINIK KÖLN

Distribution





But: increased incidence of cardia carcinoma/GEJ Carcinoma. „Intestinal type“ carcinoma, more often Her2/neu positive

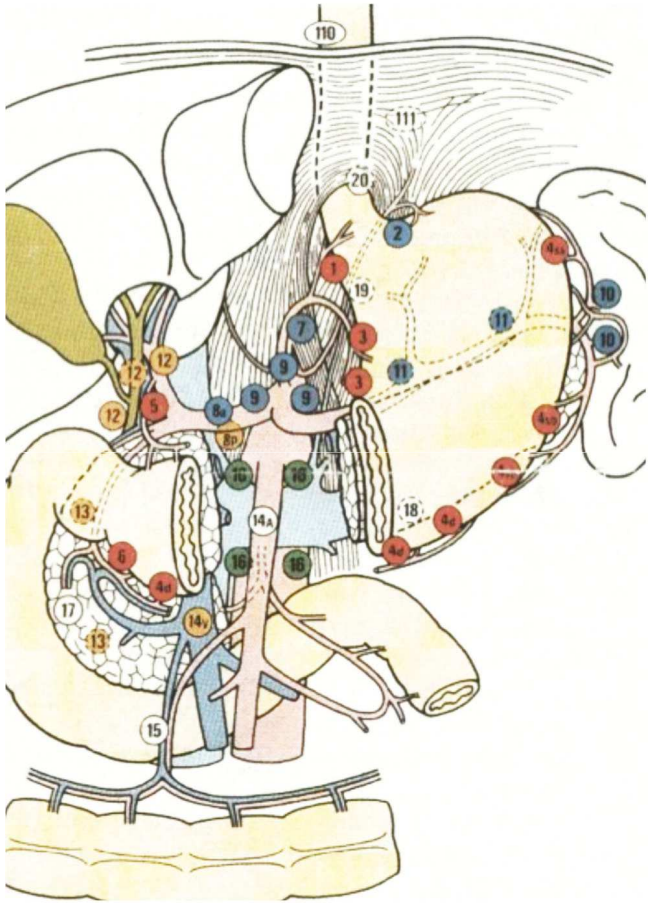
Lymphnodes stations

16 different LN stations surround the stomach (D1-D4)



D1 dissections:
LN stations 1-6; N1 level
1 Right cardia
2 Left cardia
3 along lesser curvatur
4 along right curvatur
5 suprapyloric
6 infrapyloric

D2 dissections:
LN stations 7-11; N2 level
7 left gastric artery
8 common hepatic artery
9 celiac trunk
10 splenic hilus
11 splenic artery

D3 dissections:
LN stations 12-14; N3 level
12 hepatoduodenal ligament
13 posterior surface of pancreas head
14 root of the mesentery/ artery/vein

D4 dissections:
LN stations 15-16; N4 level
15 paraaortic
16 paracolic

Advances in Surgery, Vol. 35, 2001 pp 203-223; S3-Leitlinie Magenkarzinom; Springer Science, Business Media ; Siewert et al Praxis der Viszeralchirurgie. Onkologische Chirurgie – 3.Auflage2010(541): Abb.40.12.

UNIKLINIK KÖLN

Regression-Scores after neoadjuvant therapy

According to Becker et al:

Morphological regressions signs:

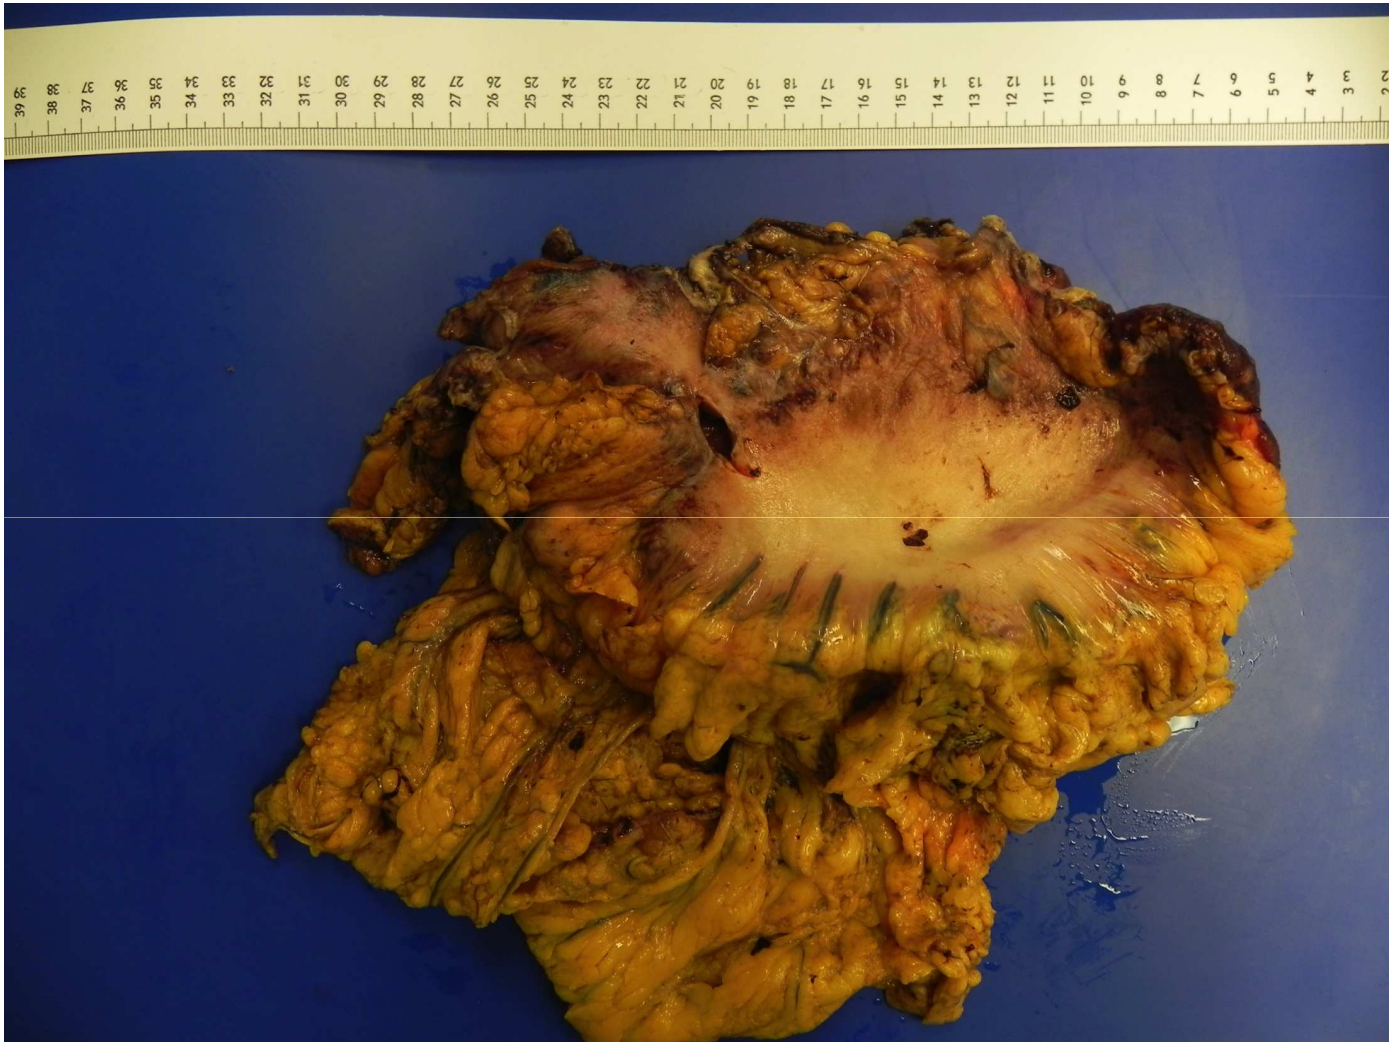
- oedema
- foamy histiocytes
- necrosis
- fibrosis and hyalinosis

Grading of Histophathologic Regression in the Primary Tumor Bed	
Grade	**Description**
1a	No residual tumor / tumor bed
1b	< 10% residual tumor / tumor bed
2	10-50% residual tumor / tumor bed
3	> 50% residual tumor / tumor bed

From: Becker et al. Ann Surg 2011 or Becker et al. Cancer 2003

UNIKLINIK KÖLN

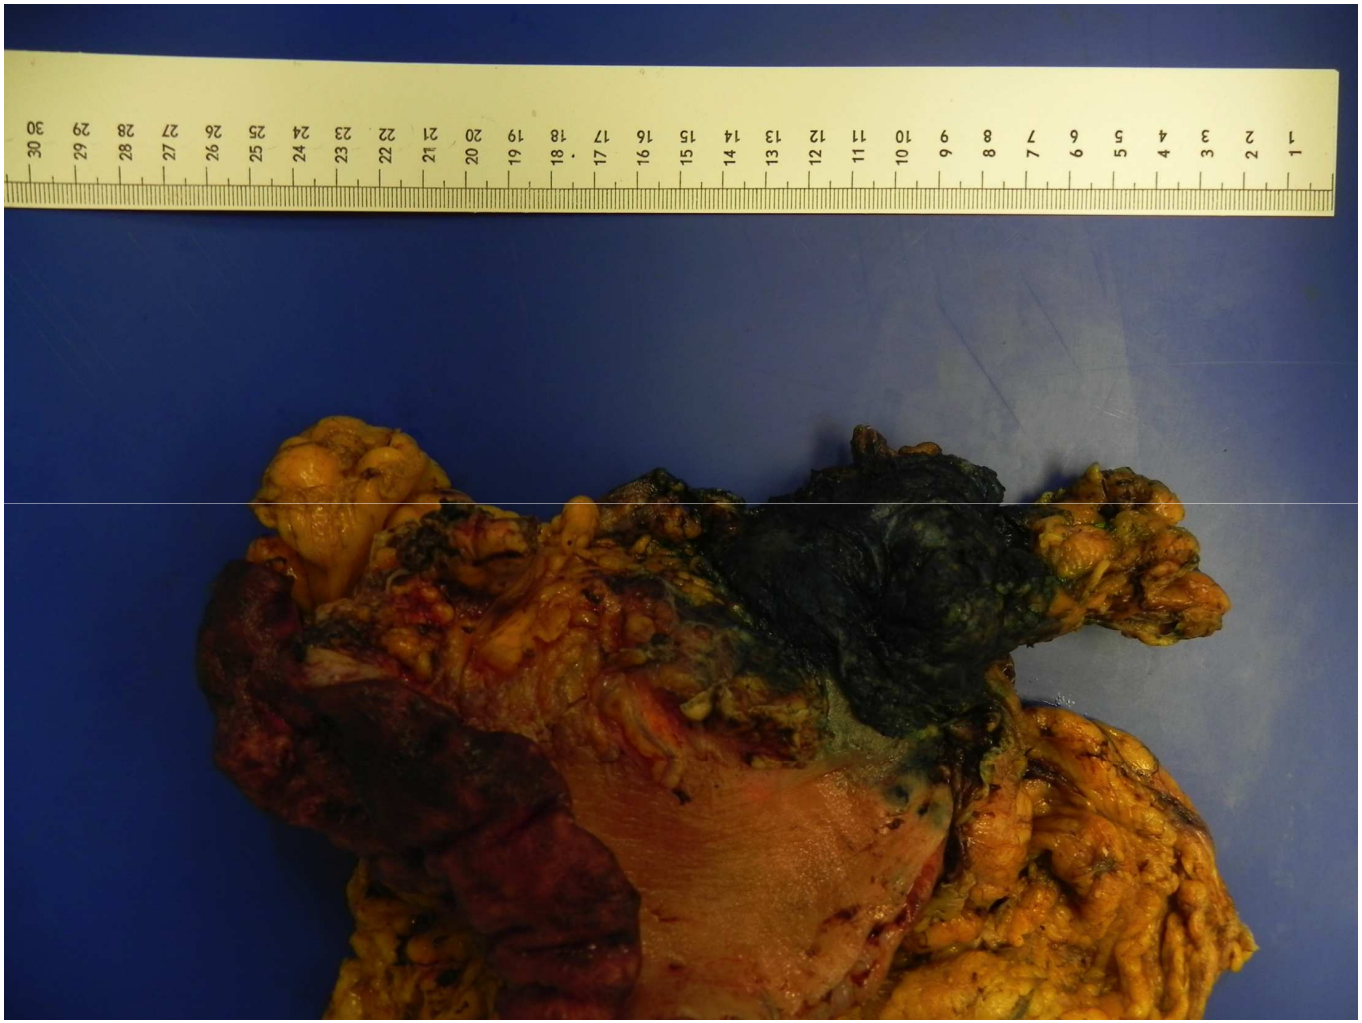
Surgical specimens



Gastrectomy

UNIKLINIK KÖLN

Surgical specimens



Colour-marked serosa

UNIKLINIK KÖLN

Surgical specimens

Ulcerated tumor

UNIKLINIK KÖLN

Surgical specimens

Probably already lymph nodes metastasis

UNIKLINIK KÖLN

Surgical specimens

Tumor in close contact to serosa – probably pT4a

UNIKLINIK KÖLN

Summary

1) two main types: intestinal and diffuse adenocarcinoma (according to Lauren)

1) Many (and rare) special types according to WHO

3) some progress in molecular subtyping
(MSI and EBV related: checkpoint inhibition effective?)
(Which tumor-subgroup/patients are particulary therapy sensitively?)

4) >16 regional lymph nodes

5) regression scores after neoadjuvant treatment (e.g. Becker et.al)

Early Microscope

Gastric Cancer – Staging & Imaging of primary & nodal subsite boundaries

Dr Angela M Riddell

Royal Marsden, London. UK

ESTRO School

STOMACH 7TH EDITION - AJCC

Primary Tumor

- TX Primary tumour cannot be assessed
- T0 No evidence of primary tumour
- Tis Carcinoma in situ
- T1 Lamina propria or submucosa
  - T1a Lamina propria or muscularis mucosae
  - T1b Submucosa
- T2 Muscularis propria *(was T2a)*
- T3 Subserosa *(was T2b)*
- T4 Adjacent structures
  - T4a Perforates serosa *(was T3)*
  - T4b Other adjacent structures *(was T4)*

Regional Lymph Nodes

- NX Lymph nodes cannot be assessed
- N0 No regional lymph node metastasis
- N1 1 to 2 regional lymph nodes
- N2 3 to 6 nodes (was N1)
- N3 ≥ 7 nodes
  - N3a 7 to 15 nodes (was N2)
  - N3b ≥16 nodes (was N3)

Distant Metastasis

- M0 No distant metastasis
- M1 Distant metastasis

ESTRO School

Staging of Gastric Cancer

Two main categories:

Early gastric cancer

Malignant invasion confined to the mucosa & submucosa

Advanced gastric cancer

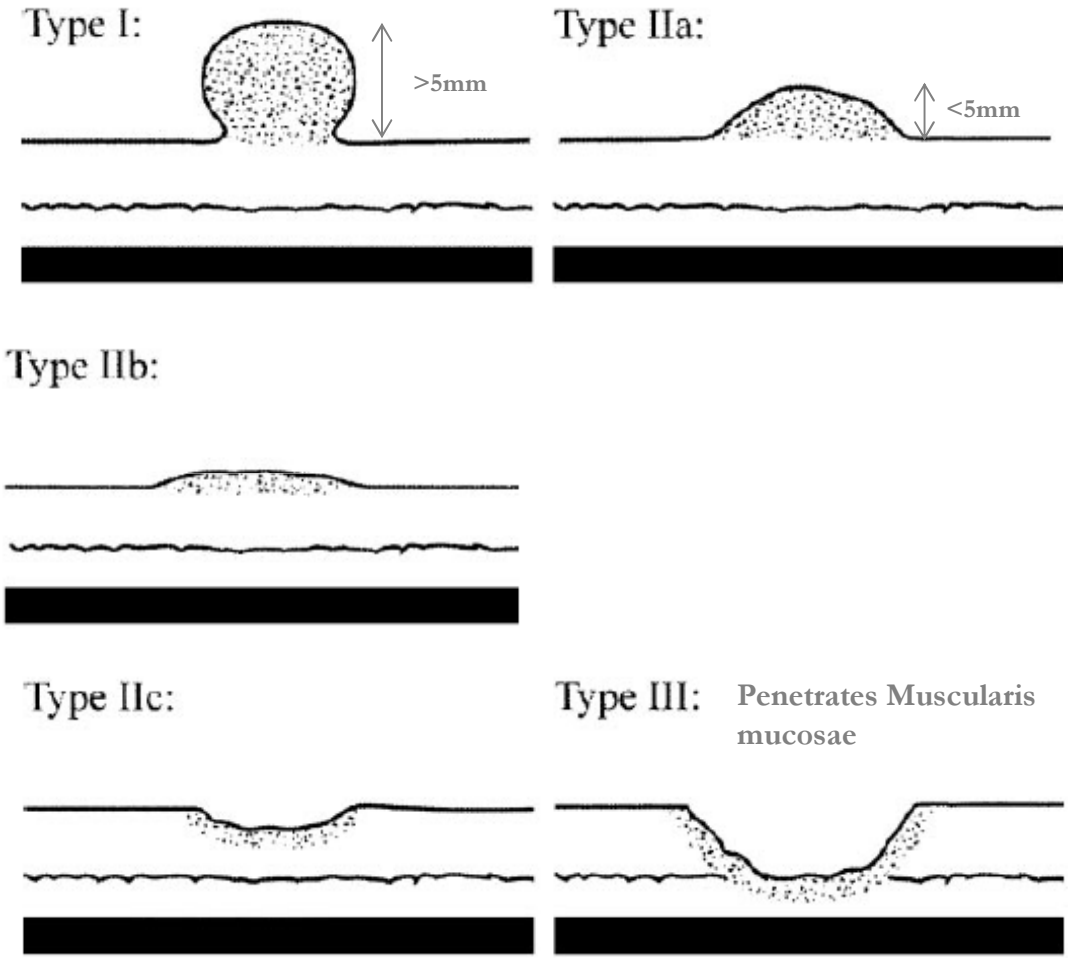
Malignant invasion into the muscularis propria

Early Gastric cancer

Elevated

Flat

Depressed



Adapted from: Ba-Ssalamah A, Prokop M et al. Radiographics 2003; 23:625-644

ESTRO School

Gastric Cancer Staging

Diagnosis – Endoscopic biopsy

Initial Imaging:

- MDCT

Potentially operable disease:

- PET/CT – exclude distant spread
- Laparoscopy

- EUS – Early disease, Proximal/ Distal Extent
- MRI

MDCT - Patient preparation

- Fasted for 6hrs
- Gastric distension
  - Anti spasmodic –Buscopan®
  - Oral contrast – water
- Position
  - Supine
  - Prone
  - Oblique angle to improve regional gastric distension

MDCT - Scan Technique

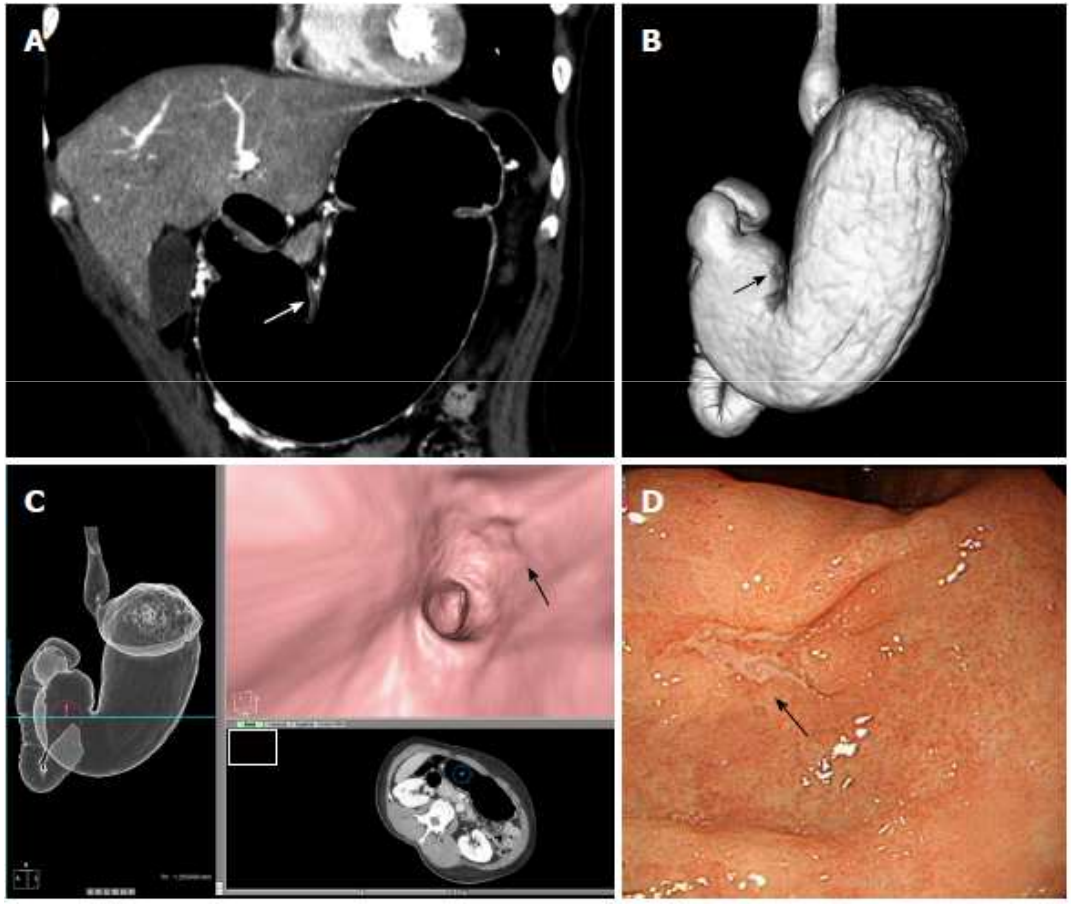
Portal venous phase imaging (70 second delay)

Thorax, abdomen & pelvis

Scan parameters aim to achieve resolution that can enable MPR postprocessing using isotropic voxels

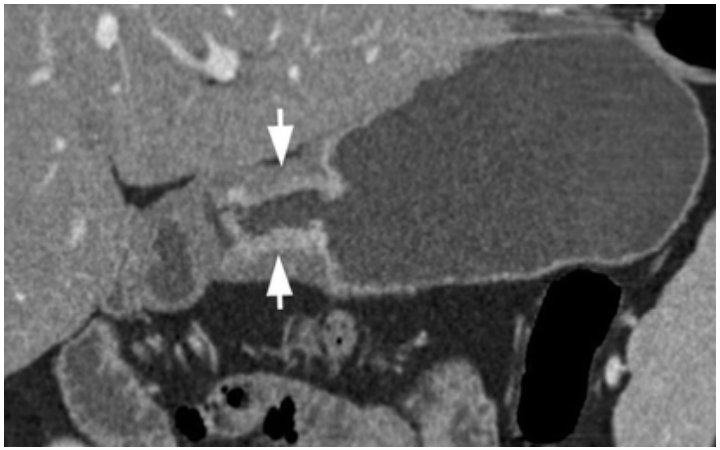
MDCT - Scan Technique

Virtual gastroscopy

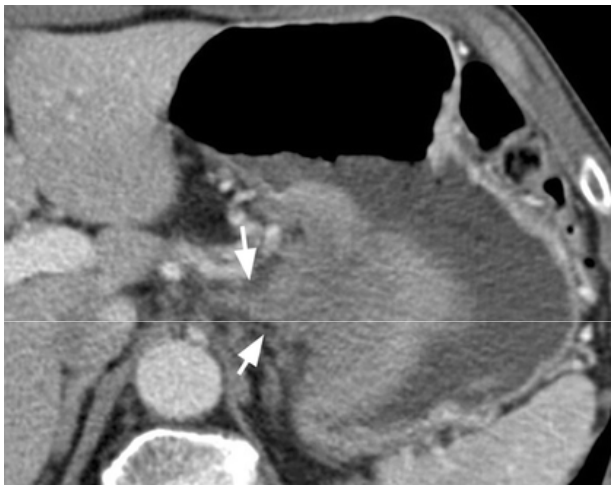


ESTRO School

MDCT - T Staging



pT2



pT3

Parameter	Percentage range
Accuracy	77 - 89%
Sensitivity	83-100%
Specificity	80 -97%

pT4

Choi J, Joo I, Lee, J 2014 WJG 20;16: 4546 - 4557

MDCT - N Staging

Lymphatic spread is found in 74%–88% of patients

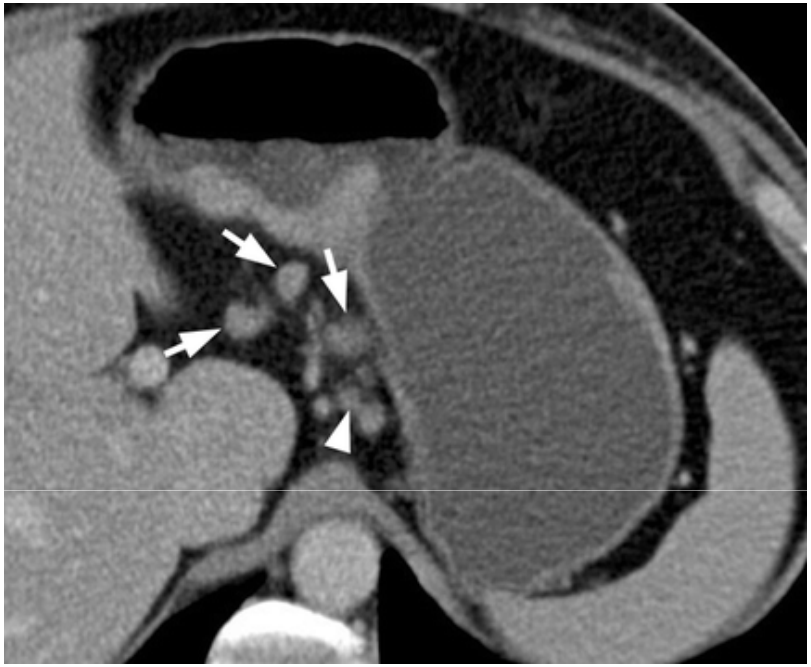
N staging depends on the number of lymph nodes involved

CT - high specificity, but low sensitivity

Based on size criteria (short axis):

≥6mm perigastric

≥ 8mm extra perigastric



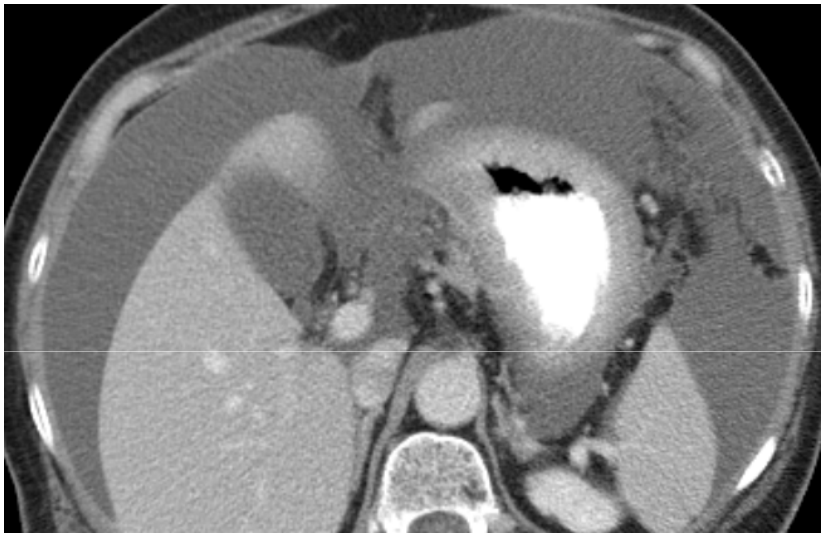
Parameter	Percentage range
Sensitivity	62.5 - 91.9%
Specificity	50 - 87.9%

Stage	No of Regional Nodes
N1	≤2
N2	3-6
N3	≥7

Kwee RM, Kwee TC. 2009 Gastric cancer; 12: 6-22

MDCT – M staging

- Detection of hepatic mets:
  sens 88%, spec 99%*.
- Detection of peritoneal disease
  No ascites: sens 30%†
  In presence of ascites:
  Sens 51%, Spec 97%*

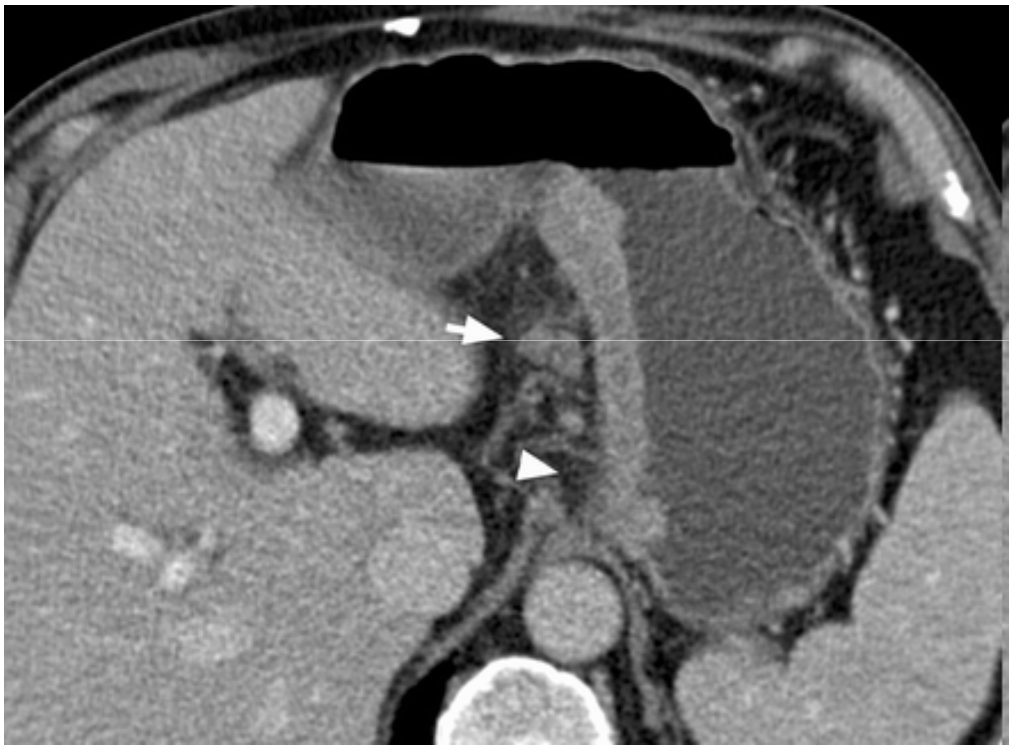


Laparoscopy for potentially operable patients

*Yajima, K., T. Kanda, et al. (2006). Am J Surg **192**(2): 185-90.
†D'Elia, F., A. Zingarelli, et al. (2000). Eur Radiol **10**(12): 1877-85.

ESTRO School

Gastric Cancer staging



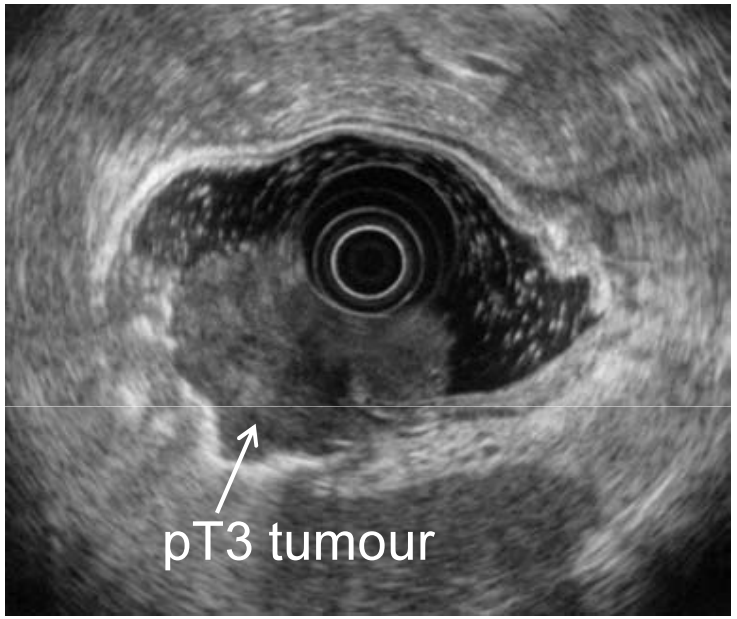
CT Report:

- Length
- Location
- T Stage
- N & M Stage

EUS - T Staging

5-20mHz probes

- High spatial resolution enables visualization of individual wall layers
- EUS T staging more accurate than MDCT



Wide variation in accuracy in literature (65-92%)

Overstaging early tumours

Image from: Bohle W et al. 2011 J Gastrointestin Liver Dis; Vol. 20 No 2, 135-139

ESTRO School

EUS - N Staging

Provides morpholgical information

- Malignant nodes: round, hypoechoic, lose echogenic hilum
- Fine needle aspiration (FNA) possible

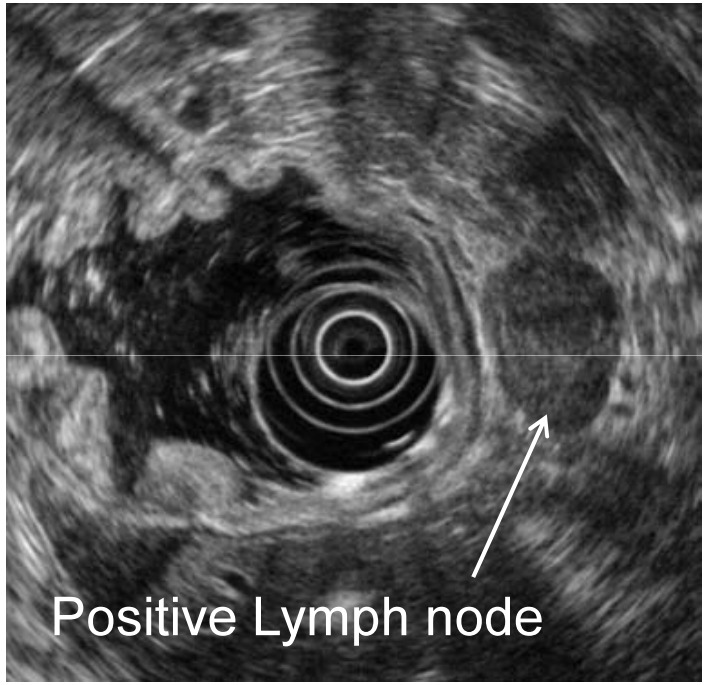


Image from: Bohle W et al. 2011 J Gastrointestin Liver Dis; Vol. 20 No 2, 135-139

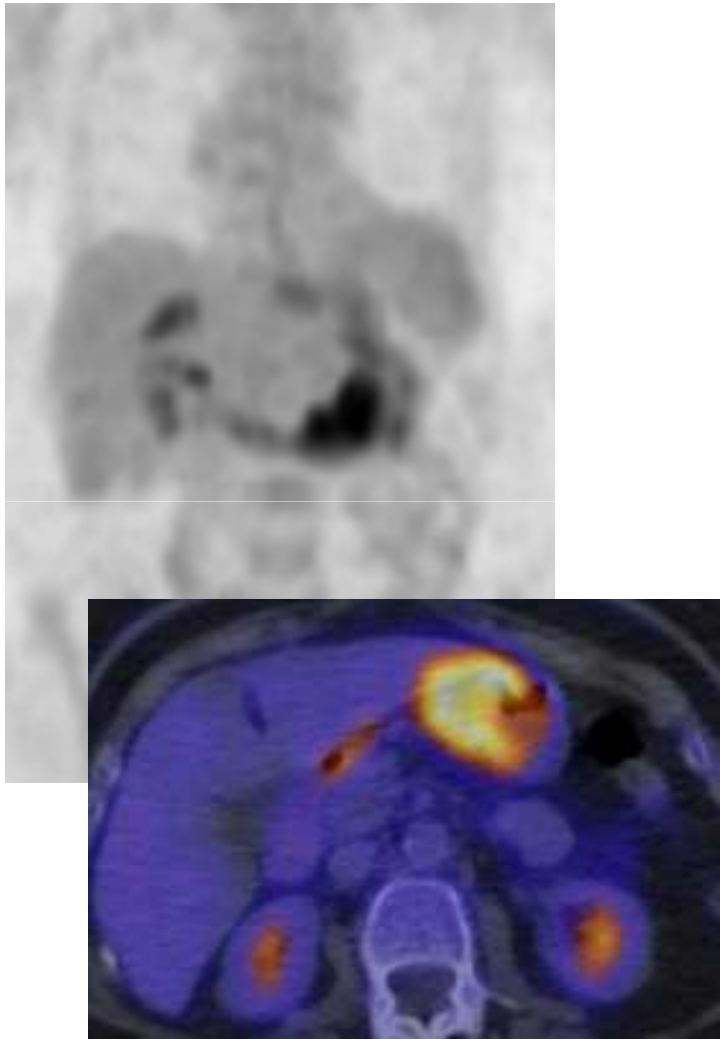
^{18}FDG-PET/CT

Gastric Cancer

- Variable ^{18}FDG avidity dependent upon tumour subtype
- Intestinal-type have greater FDG avidity
- Limited uptake in diffuse-type

  ~30% tumours not visualised

- ^{18}FDG-PET/CT not currently advocated for gastric cancer staging

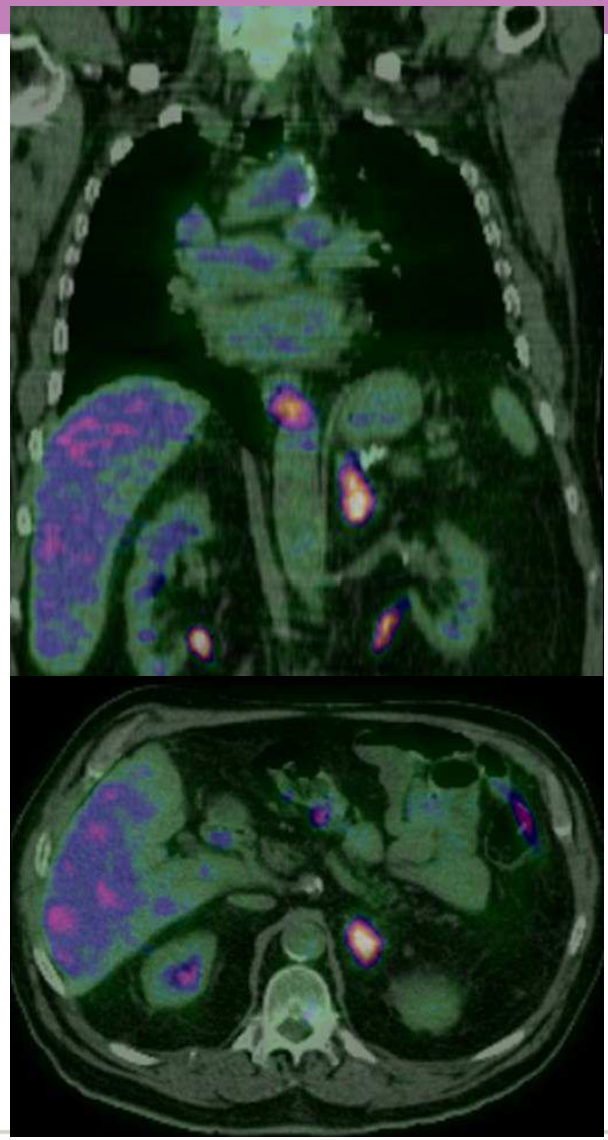


ESTRO School

^{18}FDG-PET/CT

Main advantage

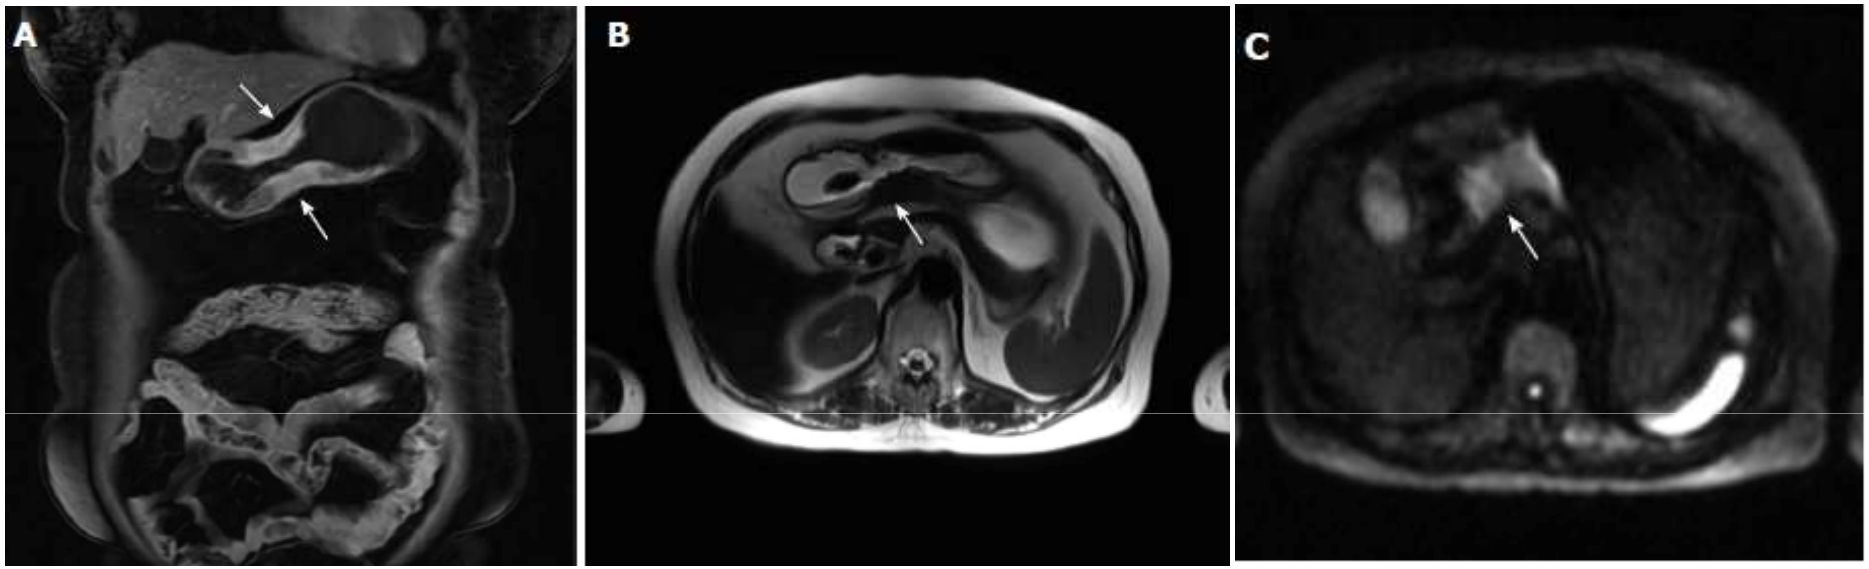
Identification of occult metastatic disease*



*Kinkel K, Ying L et al (2002) Radiology 224:748–756

ESTRO School

Gastric Cancer Staging - MRI



Limited studies

- In vitro studies – demonstrate individual layers of the oesophageal wall. High level of accuracy for staging all tumours
- In vivo studies – T & N staging similar to MDCT

Choi J, Joo I, Lee, J 2014 WJG 20;16: 4546 - 4557

ESTRO School

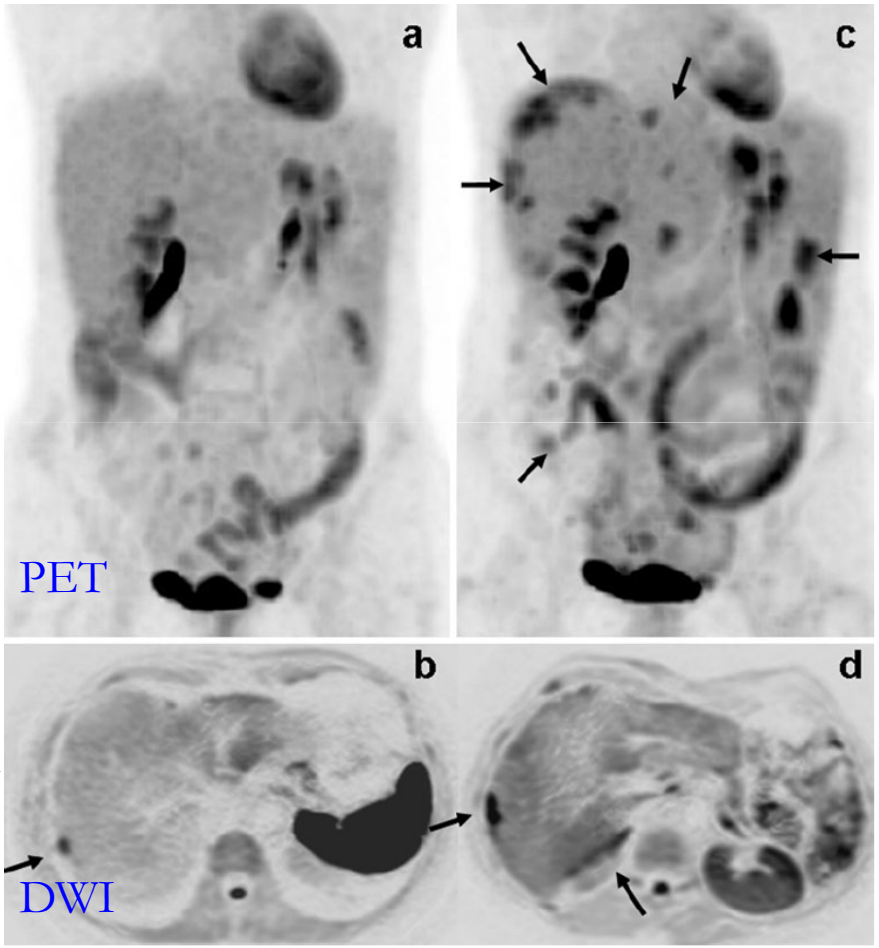
M Staging – Peritoneal disease

MDCT

Accuracy 25-90% dependent on site, size & morphology of disease

Functional imaging

PET-CT & Diffusion Weighted MRI (DW-MRI) have similar improved accuracy, but falls for foci <1cm*



*Soussan M, Des Guetz G et al. (2012) Eur Radiol 22:1479 - 1487

ESTRO School

Summary

Staging

- MDCT – exclude metastatic disease
- PET-CT – refine staging & localise tumour

- EUS – defining prox / distal extent
- MRI – research

Primary & Nodal subsite boundaries

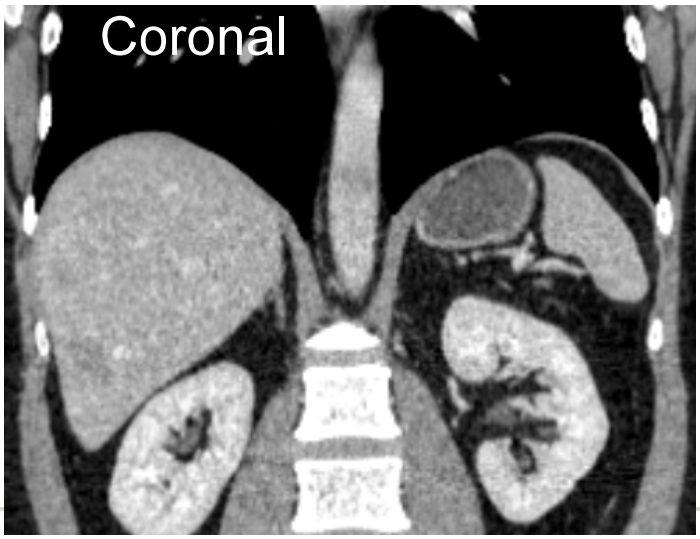
Case 1

Case 1

- 65yr old male presented with abdominal pain and weight loss

Case 1

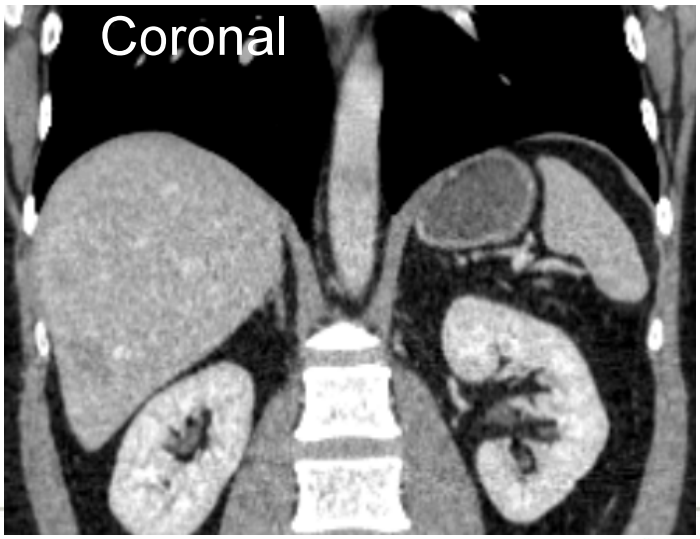


ESTRO School

Case 1

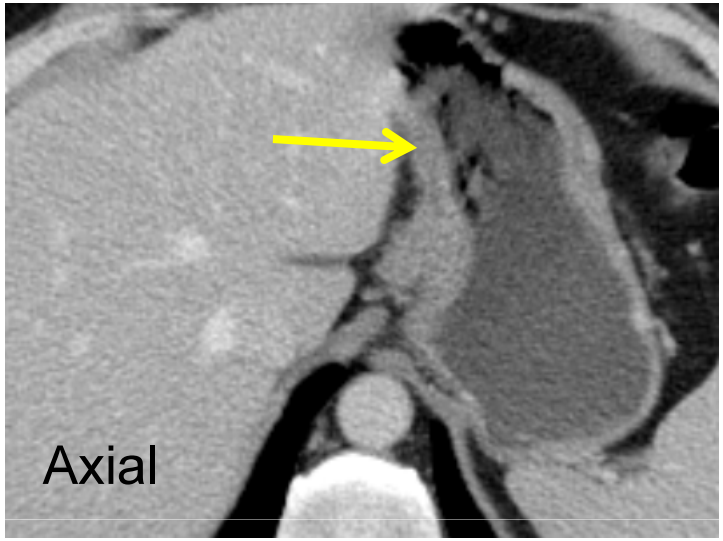
- Stage the tumour
- If there are nodes involved; state which nodal stations

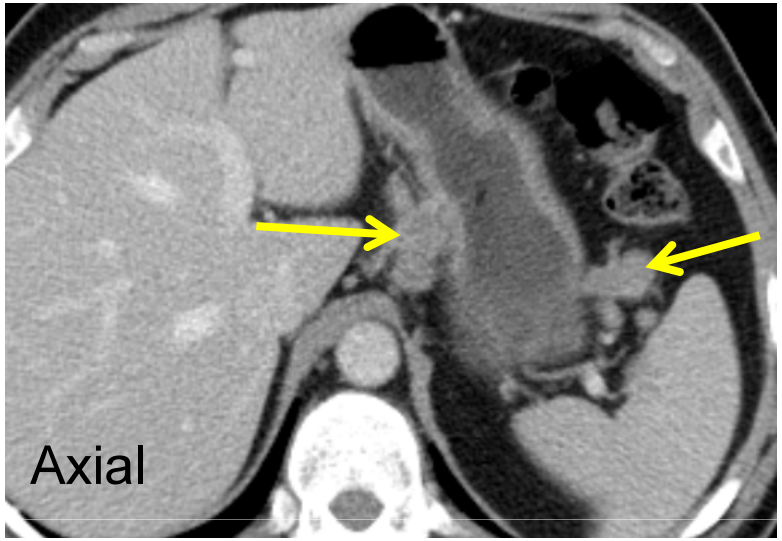
Case 1

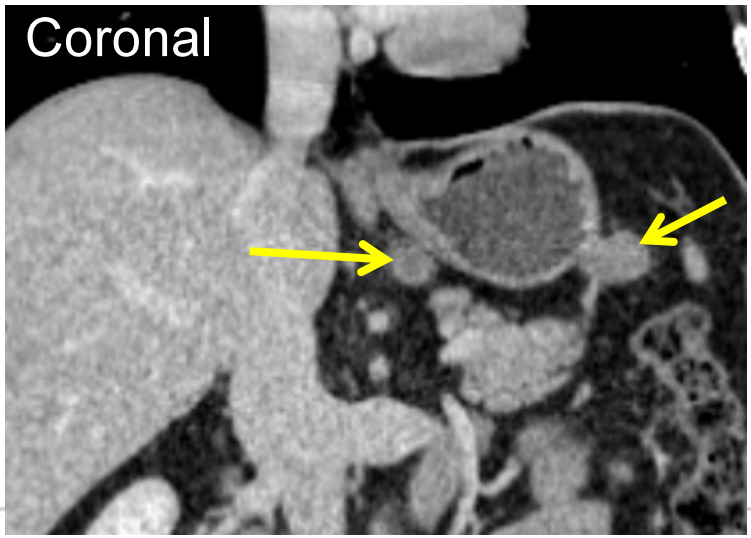


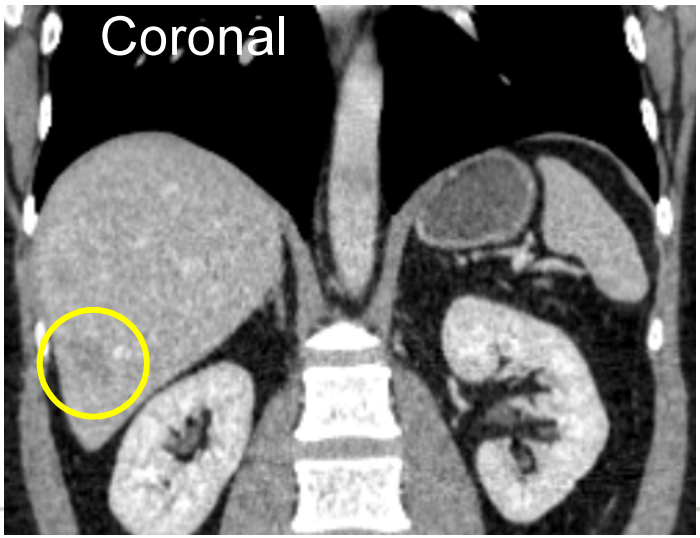
ESTRO School

Case 1









ESTRO School

Case 1

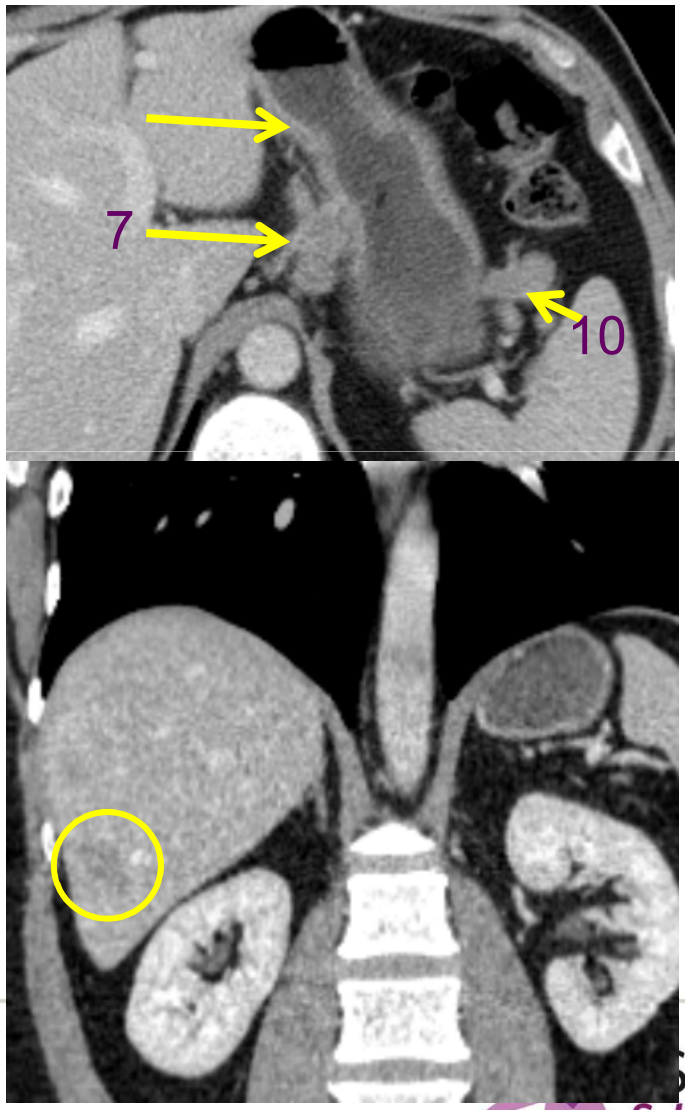
Tumour stage:

T3N2M1

Nodal Stations

Left gastric artery – 7

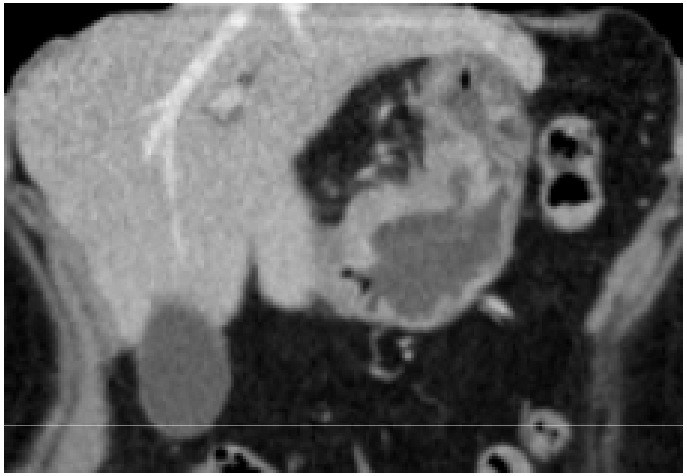
Splenic hilum - 10

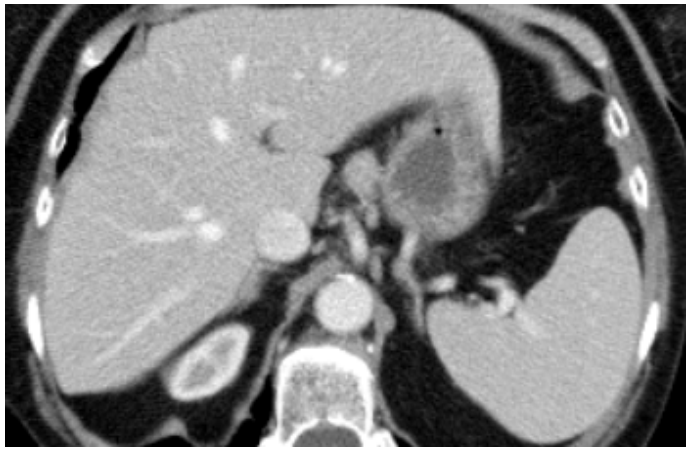


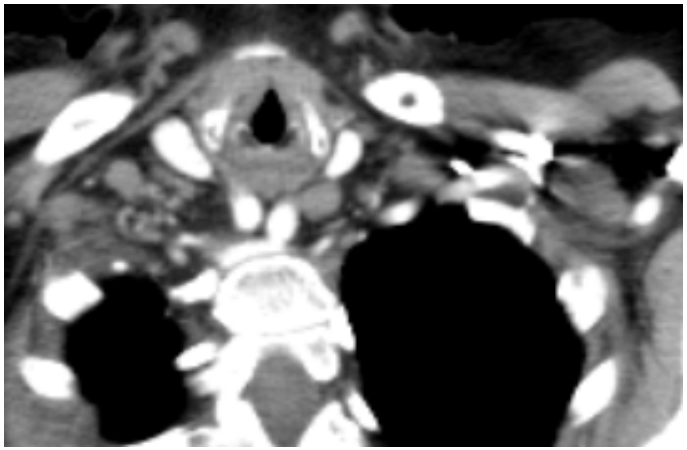
Case 2

72 year old female with weight loss and anaemia

Case 2





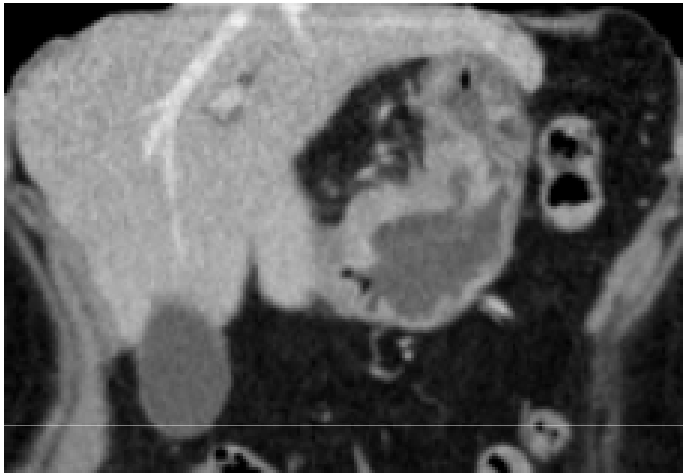


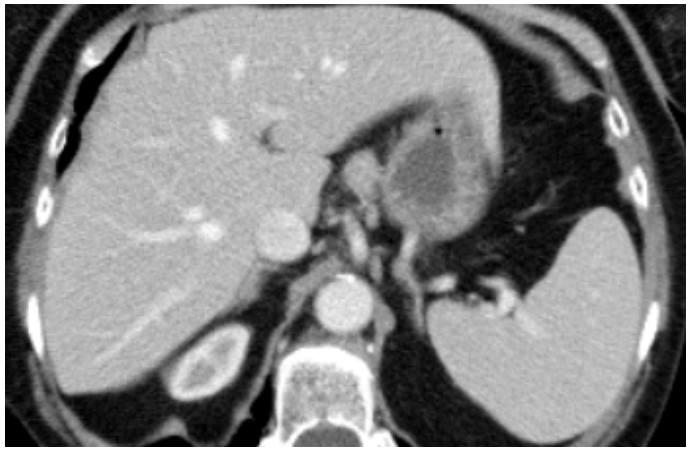
ESTRO School

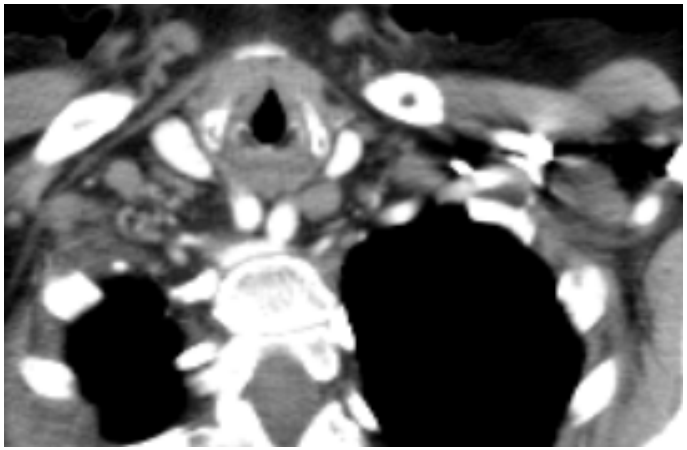
Case 2

- Describe the location of the tumour
- Stage the tumour
- Identify any nodal stations involved

Case 2

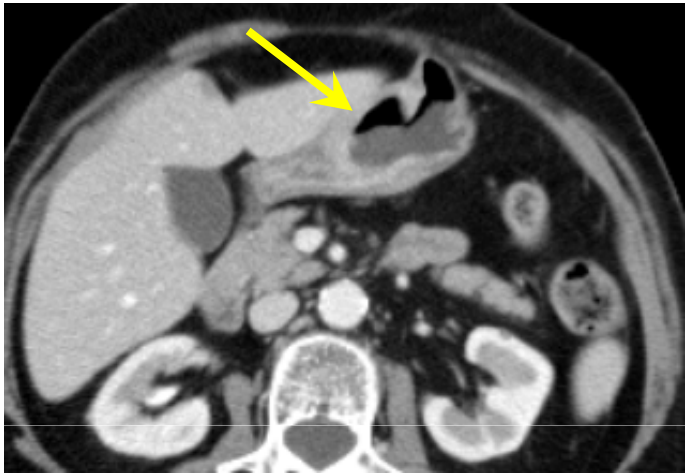


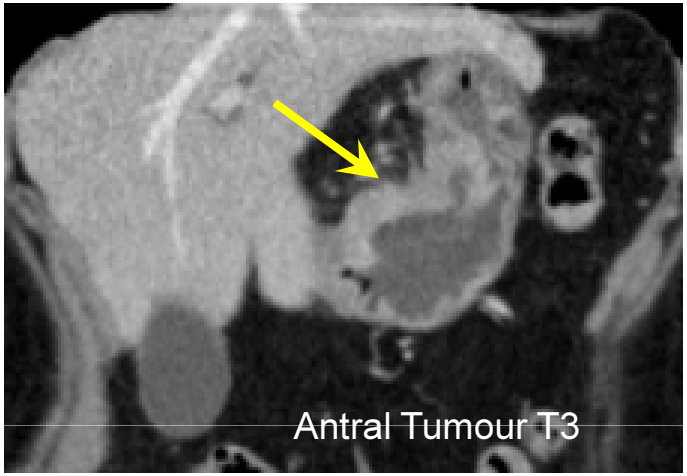


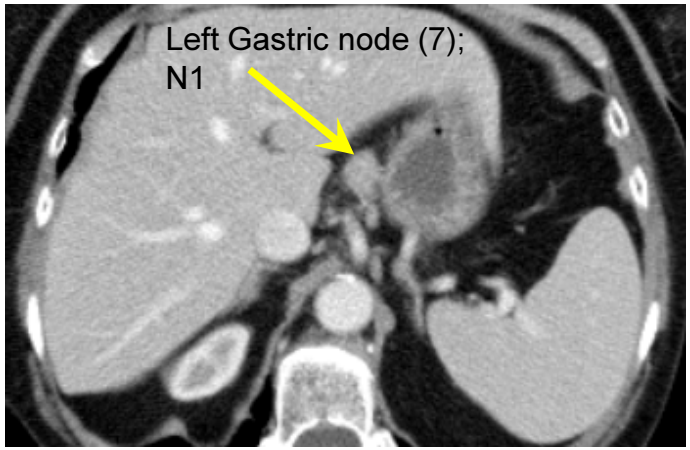


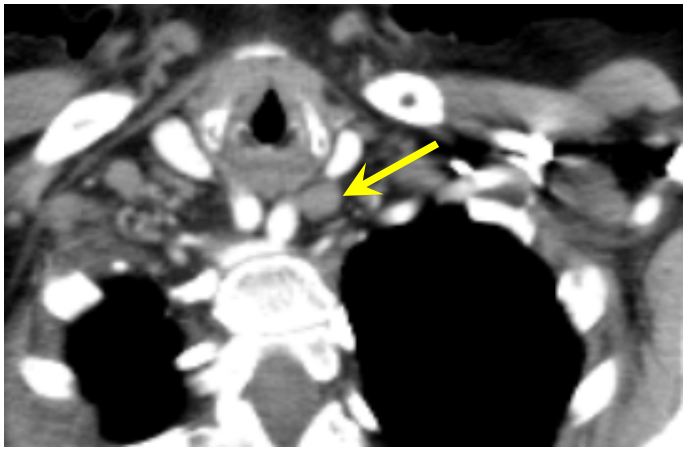
ESTRO School

Case 2









T3N1 ?? M1 – Supraclavicular node…

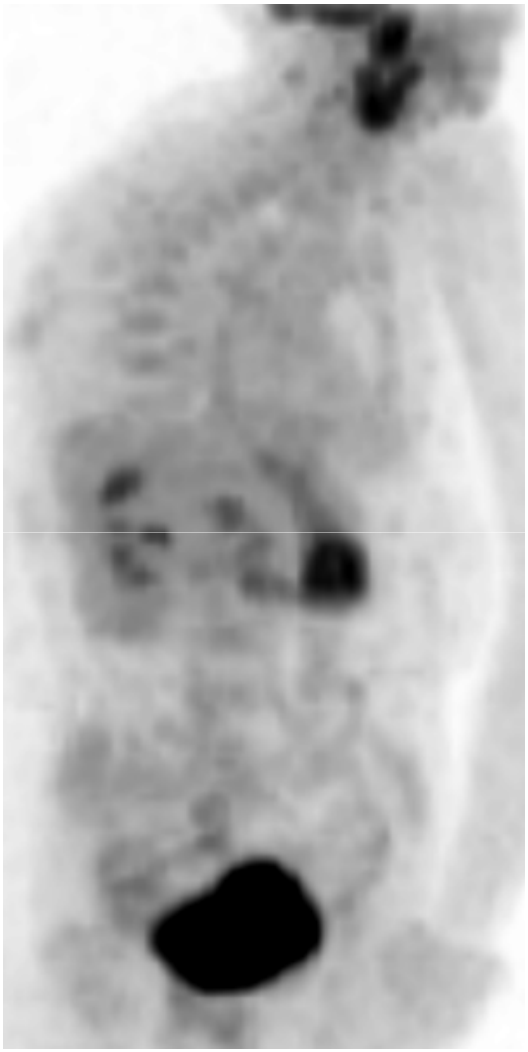
ESTRO School

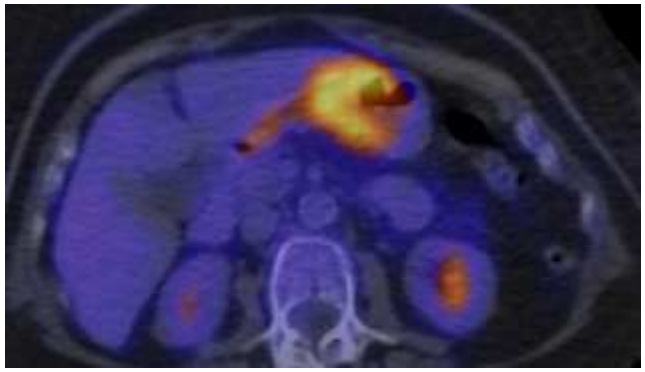
Case 2

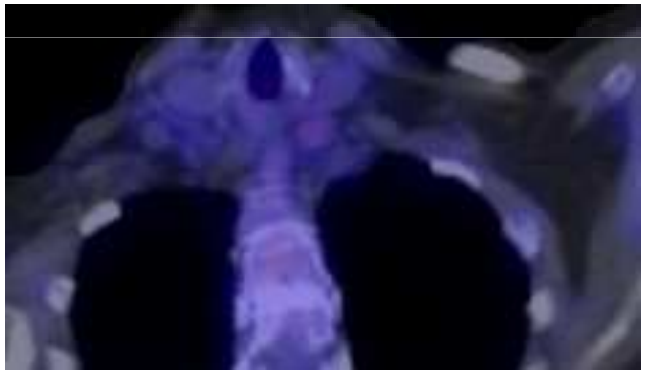
What to do next?

- Consider supraclavicular node positive based on size (9mm)?
- Arrange a PET-CT scan
- Arrange an U/S +/- FNA

Case 2







Moderate FDG avidity in node ‘equivocal’ on PET-CT

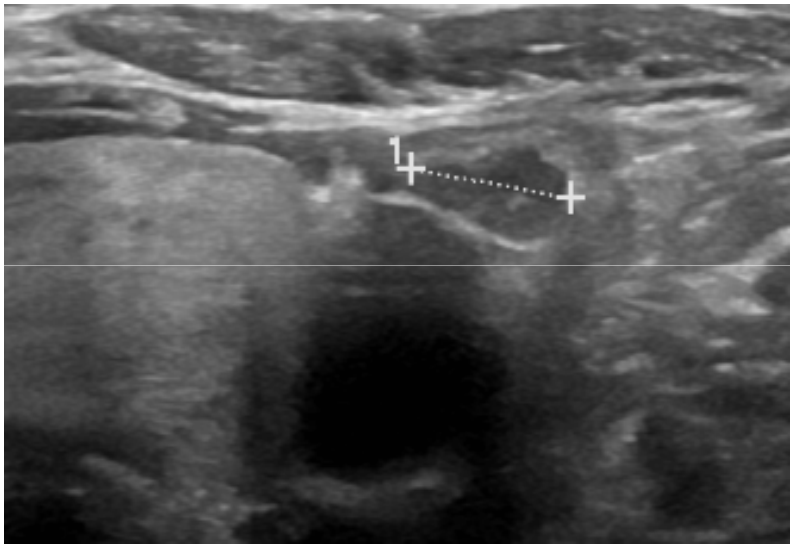
Case 2

What to do next?

- Consider supraclavicular node positive based on PET-CT findings
- Arrange an U/S +/- FNA
- Consider PET-CT findings as negative in the node & proceed with neoadjuvant therapy followed by surgery

Case 2

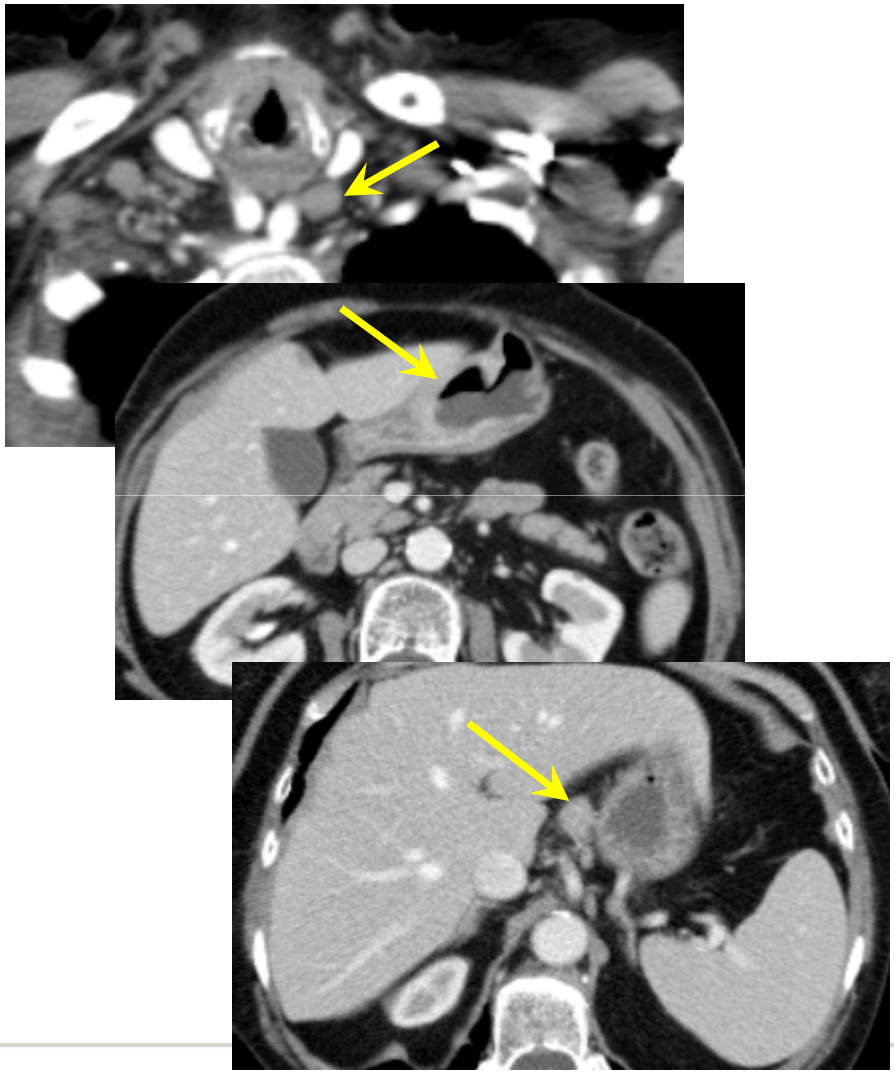
- An U/S with FNA was arranged
- Sonographic appearance in keeping with a reactive node.
- Cytology – C1

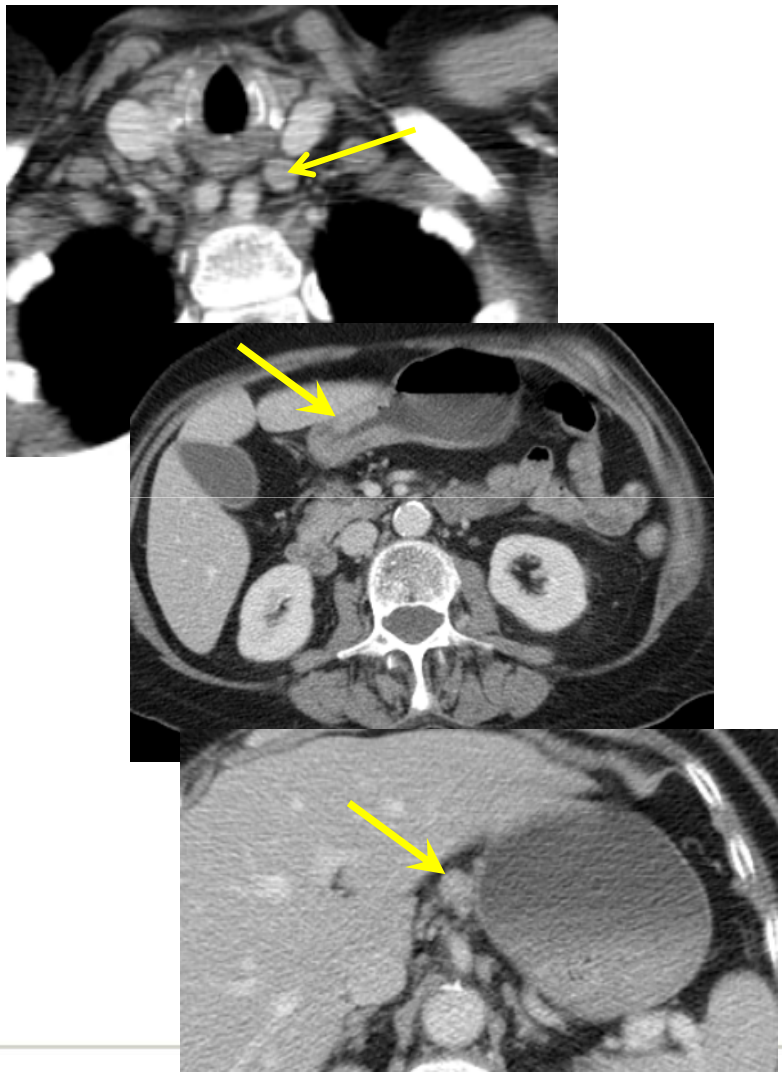


Case 2

The patient was given neoadjuvant therapy

Case 2

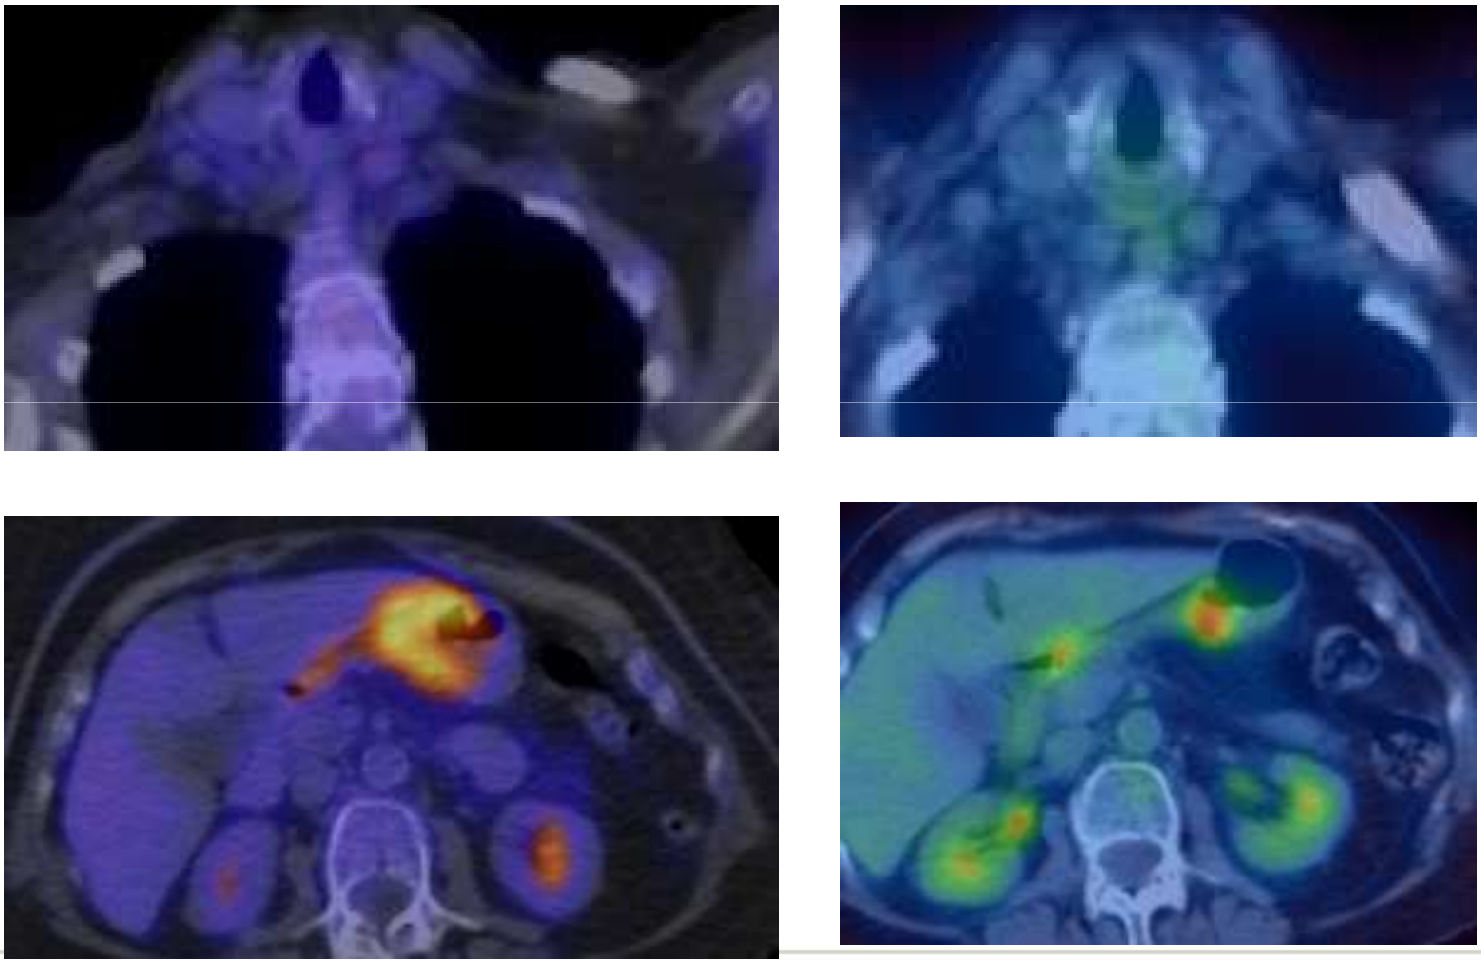




Post x2 Chemo cycles - PR

ESTRO School

Case 2



Post x2 Chemo cycles - PR

ESTRO School

Case 2

- Had second laparoscopy – no metastases
- Went on to have total gastrectomy in Dec 2009.
- Well with no recurrence
- Patient opted for no further treatment post op.

Thank you

Gastric Cancer: How to distinguish recurrence by imaging

Dr Angela M Riddell

Royal Marsden, London. UK

ESTRO School

Patterns of relapse

Retrospective review

- 1985 -2000
- 1172 patients; R0 resection
- 492 (42%) recurrence
- Locoregional recurrence – surgical bed; upper abdominal retroperitoneal lymph nodes; anastomotic recurrence

Location of recurrence	Number
Locoregional	199 (54%)
Distant	188 (51%)
peritoneal	108 (29%

79% recurred within 2 years

D'Angelica M, Gonen M, Brennan M et al 2004 Ann of Surg; 240:808-816

ESTRO School

Role of imaging for detection of relapse

Surveillance imaging may be:

- Directed within a clinical trial protocol
- Local protocols
- Response to development of clinical symptoms
- Response to rising tumour markers

Primary versus nodal relapse

- Challenging!
- Extremely difficult sometimes to identify relapse
- Much more difficult to determine nodal from anatomotic recurrence
- Mobile tissues, follow up difficult
- No specific rules….

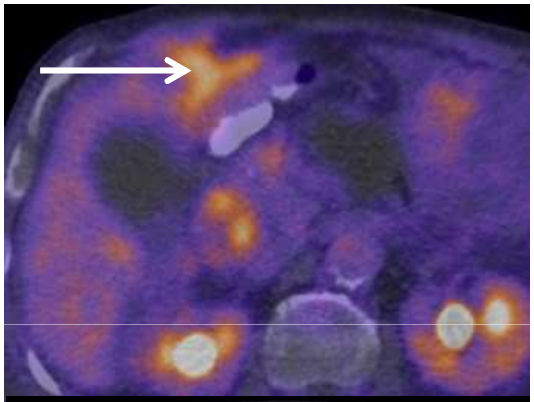
Gastric cancer patterns of disease relapse

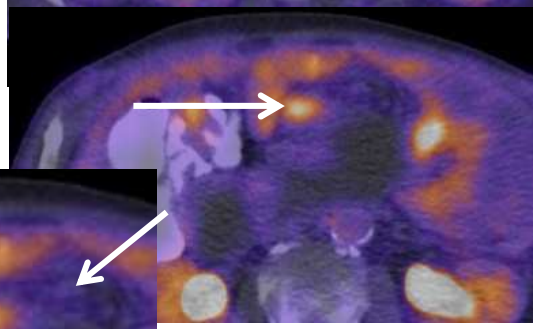
Male patient underwent a total gastrectomy on 09.09.2014 post neoadjuvant chemotherapy. The path staging was pT3bN1 R0 (3/40 nodes positive).

29.10.2014

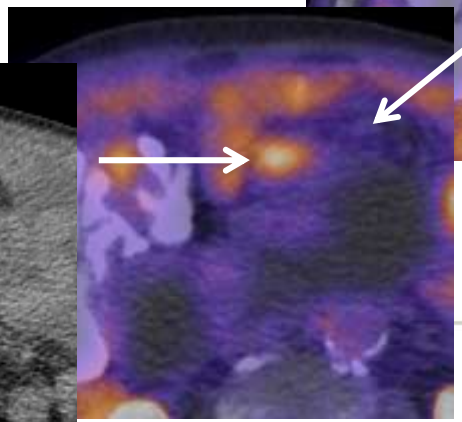
12.02.2015

06.03.2015





Baseline

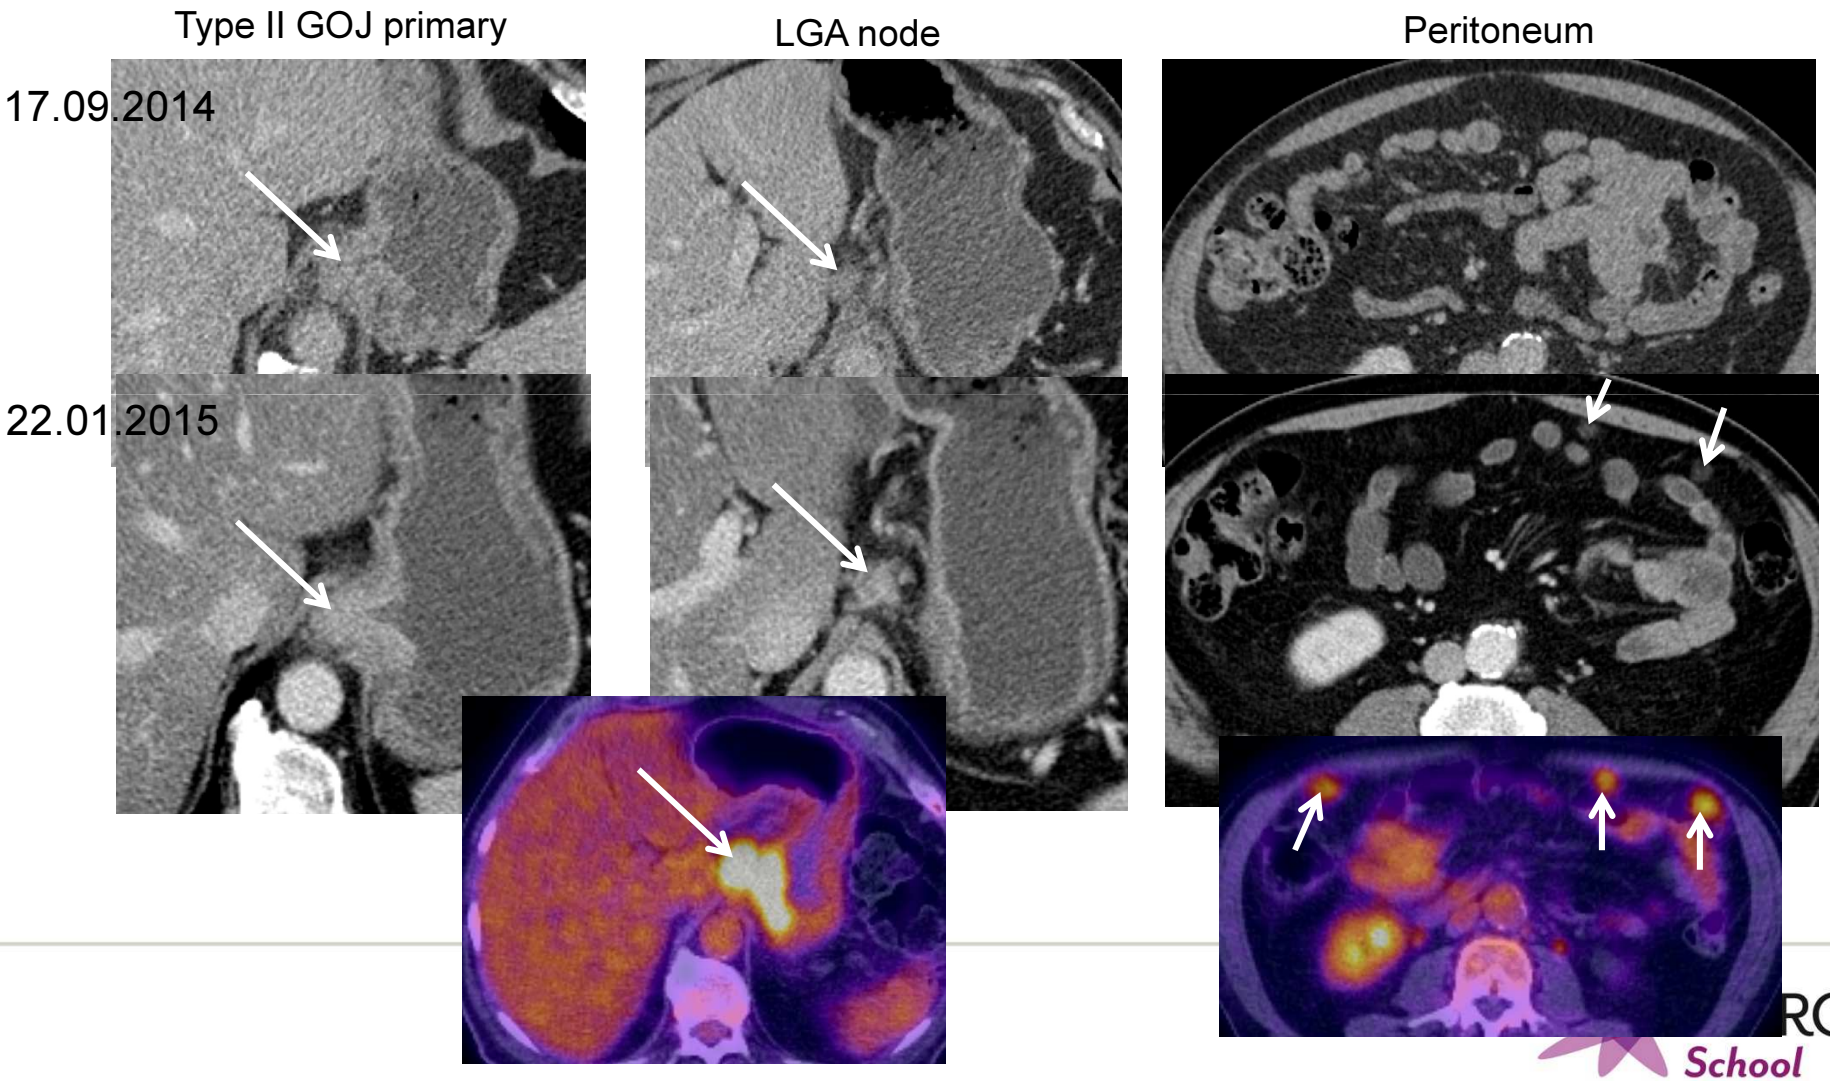


Serosal disease causing small bowel obstruction

ESTRO School

Primary versus nodal relapse

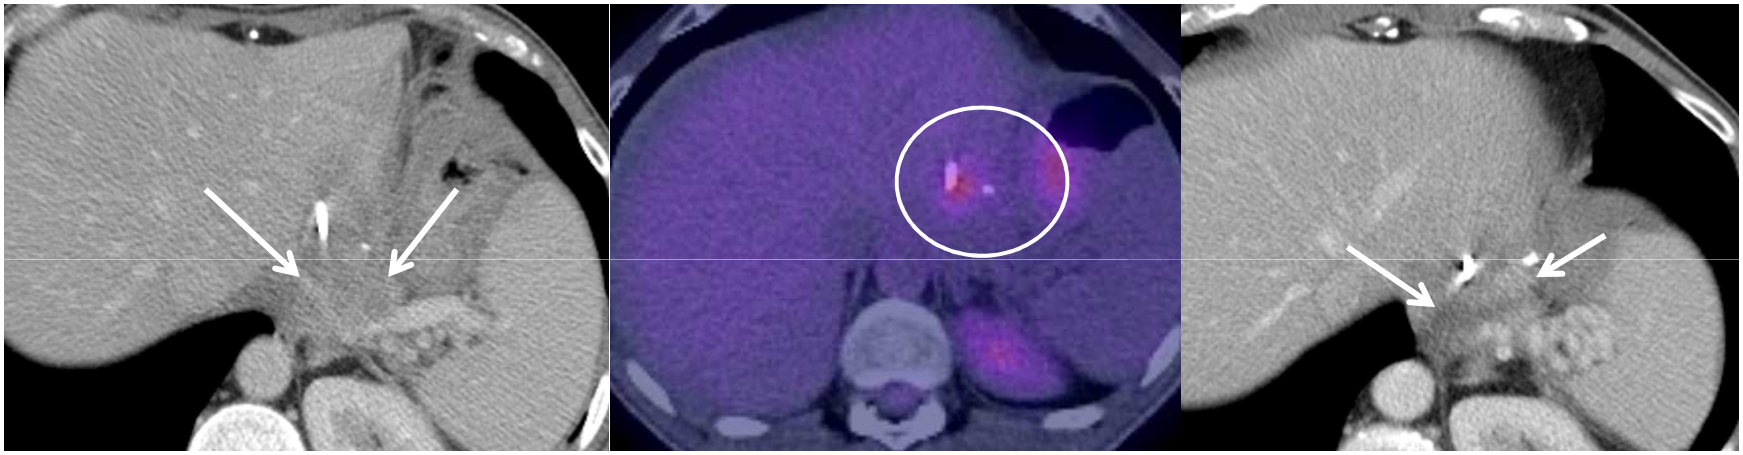
Type II GOJ tumour staged as T3N2. Commenced chemo. Progressive symptoms of dysphagia.



Primary versus nodal relapse

44 year old male with familial E-cadherin CDH1 gene +ve; poorly differentiated signet ring cell gastric carcinoma. Total gastrectomy 27.04.2010. pT3N1 (1/31 nodes)

10.12.2014 | 10.12.2014 | 19.03.2015



Loco-regional relapse ?nodal?primary…….

Partial response post chemotherapy

Summary

Detecting relapse following gastric surgery is challenging

- Unfamiliar anatomy
- Lack of intra abdominal fat
- False negative CT
- PET-CT may assist in detection of relapse
- Advise follow up if symptoms persist & imaging is negative

Thank you

UNIVERSITÀ CATTOLICA del Sacro Cuore

ESTRO School

CTV DELINEATION: Postoperative Setting

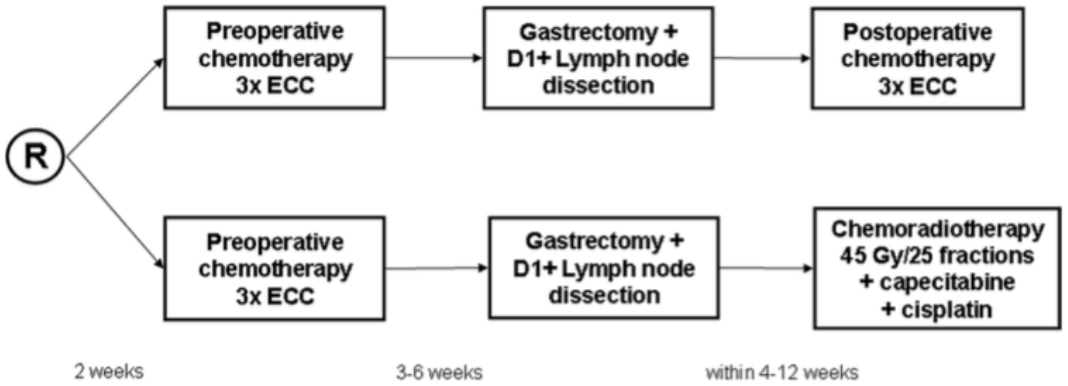
CTV consists of 3 parts:

1. Anastomoses
2. Gastric Bed/Remnant
3. Lymphnodes



CTV DELINEATION: Postoperative Setting

1. Anastomoses

- duodenal stump has to be treated in tumors of the distal stomach

- for tumors of the proximal stomach or GE- junction, the oesophagojejunal anastomosis has to be treated

- for GE-junction tumors a margin of 4cm of oesophagus (paraoesophageal nodes) has to be included in the CTV

CTV DELINEATION: Postoperative Setting

2. Gastric Bed/Remnant

- GEJ and proximal tumors at least 2/3-3/4 of the left medial hemidiaphragm
- T1-2 tumors tumor bed not necessarily
- Hepatogastric ligament (i.e. part of lesser omentum between liver and lesser curvature, which contains peri-gastric nodes)
- Anterior abdominal wall: only in T3-4 tumors with invasion or a close relationship with the anterior abdominal wall on pre-operative imaging or when described by the surgeon during surgery

CTV DELINEATION: Postoperative Setting

3. Lymphnodes

- **GE-Junction/ Cardia/proximal 1/3**: para-oesophageal, perigastric, hepatogastro lig, perigastric, ,celiac (left gastric artery, celiac axis), splenic hilum, suprapancreatic, porta hepatis, pancreaticoduodenal **[Stations 1-4;7,9-13]**

- **Corpus/middle 1/3:** perigastric, suprapyloric, infrapyloric, celiac (left gastric artery, common hepatic artery and celiac axis), splenic hilum, suprapancreatic, porta hepatis, pancreaticoduodenal **[Stations 3-13]**

- **Antrum/distal 1/3:** perigastric, suprapyloric, infrapyloric, splenic artery, pancreaticoduodenal, porta hepatis, celiac (left gastric artery, common hepatic artery and celiac axis), suprapancreatic **[Stations 3-9;11-13]**

CTV DELINEATION: Postoperative Setting

CTV DELINEATION: Guidelines

National Comprehensive Cancer Network®

NCCN Guidelines Version 1.2016
Gastric Cancer

Proximal One-Third/Cardia/Esophagogastric Junction Primaries

- Preoperative and Postoperative
  - With proximal gastric lesions or lesions at the esophagogastric junction (EGJ), a 3- to 5-cm margin of distal esophagus and nodal areas at risk should be included. Nodal areas at risk include: perigastric, celiac, splenic hilar, porta hepatic, and lymph nodes. Coverage of nodal areas may be modified based on clinical circumstances and the risks of toxicity.

Middle One-Third/Body Primaries

- Preoperative and Postoperative
  - Nodal areas at risk include: perigastric, suprapancreatic, celiac, splenic hilar, porta hepatic, and pancreaticoduodenal lymph nodes.

Distal One-Third/Antrum/Pylorus Primaries

- Preoperative
  - First and second part of duodenum should be included if the gross lesion extended to the gastroduodenal junction. Nodal areas at risk include: perigastric, suprapancreatic, celiac, porta hepatic, and pancreaticoduodenal lymph nodes.
- Postoperative
  - A 3- to 5-cm margin of duodenal stump should be included if the gross lesion extended to the gastroduodenal junction. Nodal areas at risk include: perigastric, suprapancreatic, celiac, porta hepatic, and pancreaticoduodenal lymph nodes.

CTV DELINEATION: CONCLUSION

- Main setting of Target delineation is defined but still some issues remaining
- Refer to available Consensus recommendations
- Refer to Atlas to identify normal structures and target
- Refer to Surgeon and Radiologist into Multidisciplinar frame

Summary (1)

- *Gastric cancer has a poor outcome*

- *Despite adequate surgery (D2; ≥15 ln), local-regional recurrence rates remain high*

- *Evidence-based strategies to improve surgical results are:*

  - *post-operative chemoradiation (SWOG/US)*
  - *peri-operative chemotherapy (MAGIC/EU)*
  - *adjuvant chemotherapy (ARTIST, CLASSIC/Asia)*

- *CRITICS compares peri-operative chemotherapy with pre-operative chemotherapy and post-operative chemoradiation after adequate surgery*

Ohri et al. IJROBP 2013

ESTRO School

Adjuvant chemoradiotherapy vs. surgery

SWOG-Intergroup 0116 Trial: comments

Suboptimal surgery:

- only 10% underwent the advised D2 dissection; 54% < D1

Suboptimal radiotherapy:

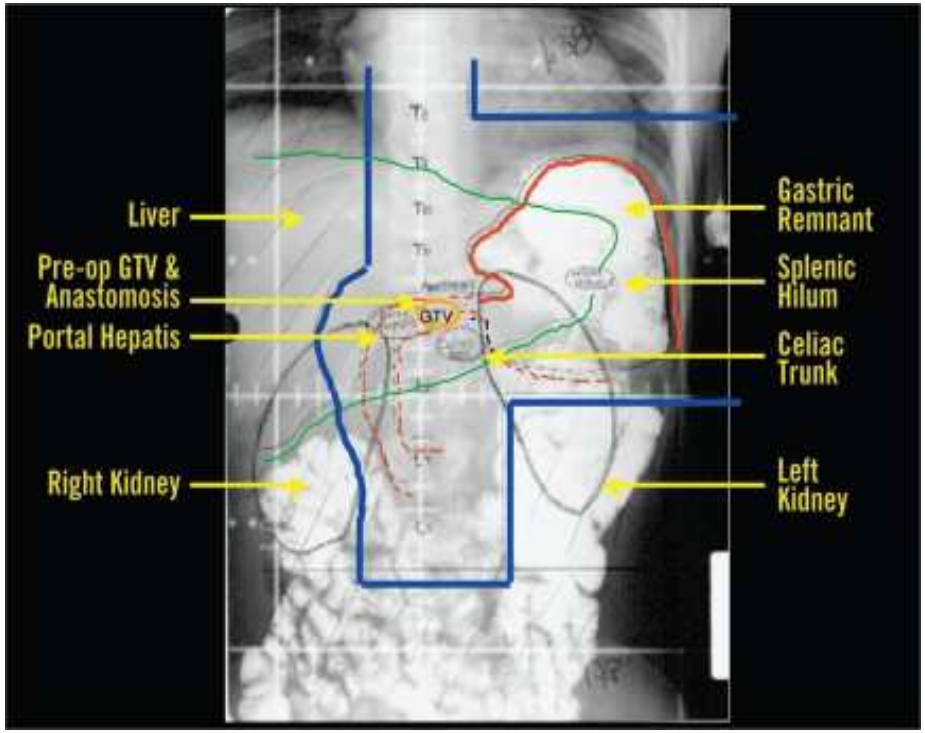
- 34% had major radiation treatment plan deviation
- outdated radiation techniques; no data on late toxicity (kidney)

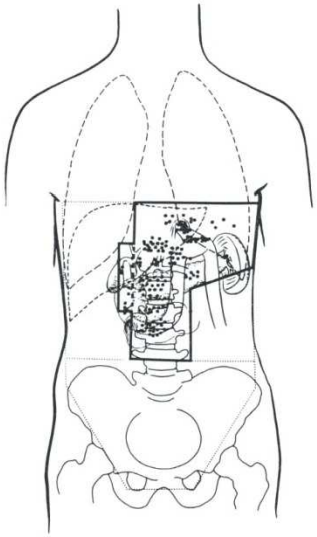
Suboptimal chemotherapy:

- according to present standard, chemotherapy was suboptimal and the interaction with radiation limited

Radiotherapy-technique according to the SWOG protocol (2001)

2D AP-PA





ESTRO School

Critical structures and dose constraints

- Kidneys: at least 2/3 of the volume of 1 (right) normally functioning kidney should receive less than 18 Gy (i.e. 40% of the prescribed physical dose)
- Liver: EQD2 D_{mean} < 30 Gy (α/β=3)
- Heart: 3/3 <40 Gy; 2/3 <50 Gy; 1/3 < 66 Gy (<30% cardiac silhouette may receive 40 Gy)
- Spinal cord: EQD2 D_{max} ≤ 50 Gy (α/β=2)
- Spleen: ?

GASTRIC TUMORS: Dose constraints for Organs at Risk

Prof. Philippe MAINGON

- The patient should be instructed to avoid intake of a heavy meal for 3 hours before simulation and treatment. When clinically appropriate, use of IV and/or oral contrast for CT simulation may be used to aid in target localization.
- Use of an immobilization device is strongly recommended for reproducibility of daily set-up.
- All patients should be simulated and treated in the supine position.
- The uncertainties arising from variations in stomach filling and respiratory motion should also be taken into consideration.

QUANTEC: dose-volume effects in the stomach and small bowel

- **Testicular cancer irradiation:**
  - Ulceration rate = Dose < 50 Gy : 4% Dose > 50 Gy : 16%
  - Perforation rate = 2% versus 14%

  Brich Arch Int Med 1955
- No evidence that adding chemotherapy adds some toxicity

- **Hodgkin disease**:
  - Cosset; 516 patients receiving close to 40 Gy
    - Ulcer = 25 4.8%
    - Severe gastritis = 9 1.7%
    - Obstruction = 2 0.4%
    - Dose per fraction dependant

  Cosset JM, Radiother Oncol 1988

ESTRO School

Nausea and Emesis

Committee I (1/5): The Four Emetic Risk Groups

HIGH	Risk in nearly all patients (> 90%)
MODERATE	Risk in 30% to 90% of patients
LOW	Risk in 10% to 30% of patients
MINIMAL	Fewer than 10% at risk

Nausea and Emesis

Committee I (2/5): Emetic Risk Groups – Adults – Single IV Agents

HIGH	Anthracycline/cyclophosphamide combination* Carmustine Cisplatin Cyclophosphamide ≥ 1500 mg/m² Dacarbazine Mechlorethamine Streptozocin		
MODERATE	Alemtuzumab Azacitidine Bendamustine Carboplatin Clofarabine Cyclophosphamide < 1500 mg/m² Cytarabine > 1000 mg/m²	Daunorubicin Doxorubicin Epirubicin Idarubicin Ifosfamide Irinotecan	Oxaliplatin Romidepsin Temozolomide** Thiotepa Trabectedin

* The combination of an anthracycline and cyclophosphamide in patients with breast cancer should be considered highly emetogenic.
** No direct evidence found for temozolomide IV. Classification is based on oral temozolomide, since all sources indicate a similar safety profile.

ESTRO School

Nausea and Emesis

Committee I (3/5): Emetic Risk Groups – Adults – Single IV Agents

LOW	Aflibercept	Eribulin	Panitumumab
	Belinostat	Etoposide	Pemetrexed
	Blinatumomab	5-Fluorouracil	Pegylated liposomal doxorubicin
	Bortezomib	Gemcitabine	Pertuzumab
	Brentuximab	Ipilimumab	Temsirolimus
	Cabazitaxel	Ixabepilone	Topotecan
	Carfilzomib	Methotrexate	Trastuzumab-emtansine
	Catumaxumab	Mitomycin	Vinflunine
	Cetuximab	Mitoxantrone	
	Cytarabine ≤ 1000 mg/m²	Nab- paclitaxel	
	Docetaxel	Paclitaxel

Nausea and Emesis

ACUTE Nausea and Vomiting: SUMMARY

EMETIC RISK GROUP	ANTIEMETICS
High Non-AC	5-HT_3 + DEX + NK_1
High AC	5-HT_3 + DEX + NK_1
Carboplatin	5-HT_3 + DEX + NK_1
Moderate (other than carboplatin)	5-HT_3 + DEX
Low	5-HT_3 or DEX or DOP
Minimal	No routine prophylaxis

5-HT_3 = serotonin$_3$ receptor antagonist	DEX = DEXAMETHASONE	NK_1 = neurokinin$_1$ receptor antagonist such as APREPITANT or FOSAPREPITANT or ROLAPITANT or NEPA (combination of netupitant and palonosetron)	DOP = dopamine receptor antagonist

NOTE: If the NK_1 receptor antagonist is not available for AC chemotherapy, palonosetron is the preferred 5-HT_3 receptor antagonist.

ESTRO School

Nausea and Emesis

DELAYED Nausea and Vomiting: SUMMARY

EMETIC RISK GROUP	ANTIEMETICS
High Non-AC	**DEX** or (if APR 125mg for acute: (**MCP** + **DEX**) or **APR**)
High AC	None or (if APR 125mg for acute: **DEX** or **APR**)
Carboplatin	None or (if APR 125mg for acute: **APR**)
Oxaliplatin, or anthracycline, or cyclophosphamide	**DEX** can be considered
Moderate (other)	No routine prophylaxis
Low and Minimal	No routine prophylaxis

DEX = DEXAMETHASONE | MCP = METOCLOPRAMIDE | **APR** = APREPITANT

A B S T R A C T

Purpose

To update the 2006 American Society of Clinical Oncology guideline on the use of hematopoietic colony-stimulating factors (CSFs).

Smith TJ et al., *J Clin Oncol* 2015, 33:3199-212

ESTRO School

Hematotoxicity

Key Points

- Primary prophylaxis with a CSF starting with the first cycle and continuing through subsequent cycles of chemotherapy is recommended in patients who have an approximately 20% or higher risk for febrile neutropenia based on patient-, disease- and treatment-related factors. Primary CSF prophylaxis should also be administered in patients receiving dose-dense chemotherapy when considered appropriate. Consideration should be given to alternative, equally effective, and safe chemotherapy regimens not requiring CSF support when available. (Type: evidence based, benefits outweigh harms. Evidence quality: high. Strength of recommendation: strong.)

- Secondary prophylaxis with a CSF is recommended for patients who experienced a neutropenic complication from a prior cycle of chemotherapy (for which primary prophylaxis was not received), in which a reduced dose or treatment delay may compromise disease-free or overall survival or treatment outcome. In many clinical situations, dose reduction or delay may be a reasonable alternative. (Type: evidence based, benefits outweigh harms. Evidence quality: high. Strength of recommendation: strong.)

- CSFs should not be routinely used for patients with neutropenia who are afebrile. (Type: evidence based, benefits outweigh harms. Evidence quality: high. Strength of recommendation: strong.)

- CSFs should not be routinely used as adjunctive treatment with antibiotic therapy for patients with fever and neutropenia. However, CSFs should be considered in patients with fever and neutropenia who are at high risk for infection-associated complications or who have prognostic factors predictive of poor clinical outcomes. (Type: evidence based, benefits outweigh harms. Evidence quality: high. Strength of recommendation: strong.)

ESTRO School

Hematotoxicity

Table 1. Patient Risk Factors for Febrile Neutropenia

Risk Factor
In addition to chemotherapy regimen and type of malignancy, consider the following factors when estimating patient's overall risk of febrile neutropenia[23-25]:
Age ≥ 65 years
Advanced disease
Previous chemotherapy or radiation therapy
Preexisting neutropenia or bone marrow involvement with tumor
Infection
Open wounds or recent surgery
Poor performance status or poor nutritional status
Poor renal function
Liver dysfunction, most notably elevated bilirubin
Cardiovascular disease
Multiple comorbid conditions
HIV infection

Smith TJ et al., *J Clin Oncol* 2015, 33:3199-212

ESTRO School

Hematotoxicity

Table 2. Patient Risk Factors for Poor Clinical Outcomes Resulting From Febrile Neutropenia or Infection[28]

Risk Factor
Sepsis syndrome
Age $>$ 65 years
Profound neutropenia (absolute neutrophil count $< 0.1 \times 10^9$/L)
Neutropenia expected to last $>$ 10 days
Pneumonia
Invasive fungal infection
Other clinically documented infections
Hospitalization at time of fever
Prior episode of febrile neutropenia

Welcome

Dear Participants of the International Gastric Cancer Congress 2019,

With great pleasure we announce the **2019 International Gastric Cancer Congress to be held in Prague**. Gastric Cancer continues to be a major health problem in Europe, in the Asian-Pacific Region, in America, Middle East and Africa. From a worldwide perspective, almost 1 Mio patients are diagnosed with gastric cancer / year and 750.000 die from this aggressive cancer.

New perspectives in gastric cancer

Improving surgical quality

The effect of centralization

National data obtained from cancer registries or clinical audits in the Netherlands, Sweden, Denmark and England. Between 2004 and 2009, 10 854 oesophagectomies and 9010 gastrectomies were registered

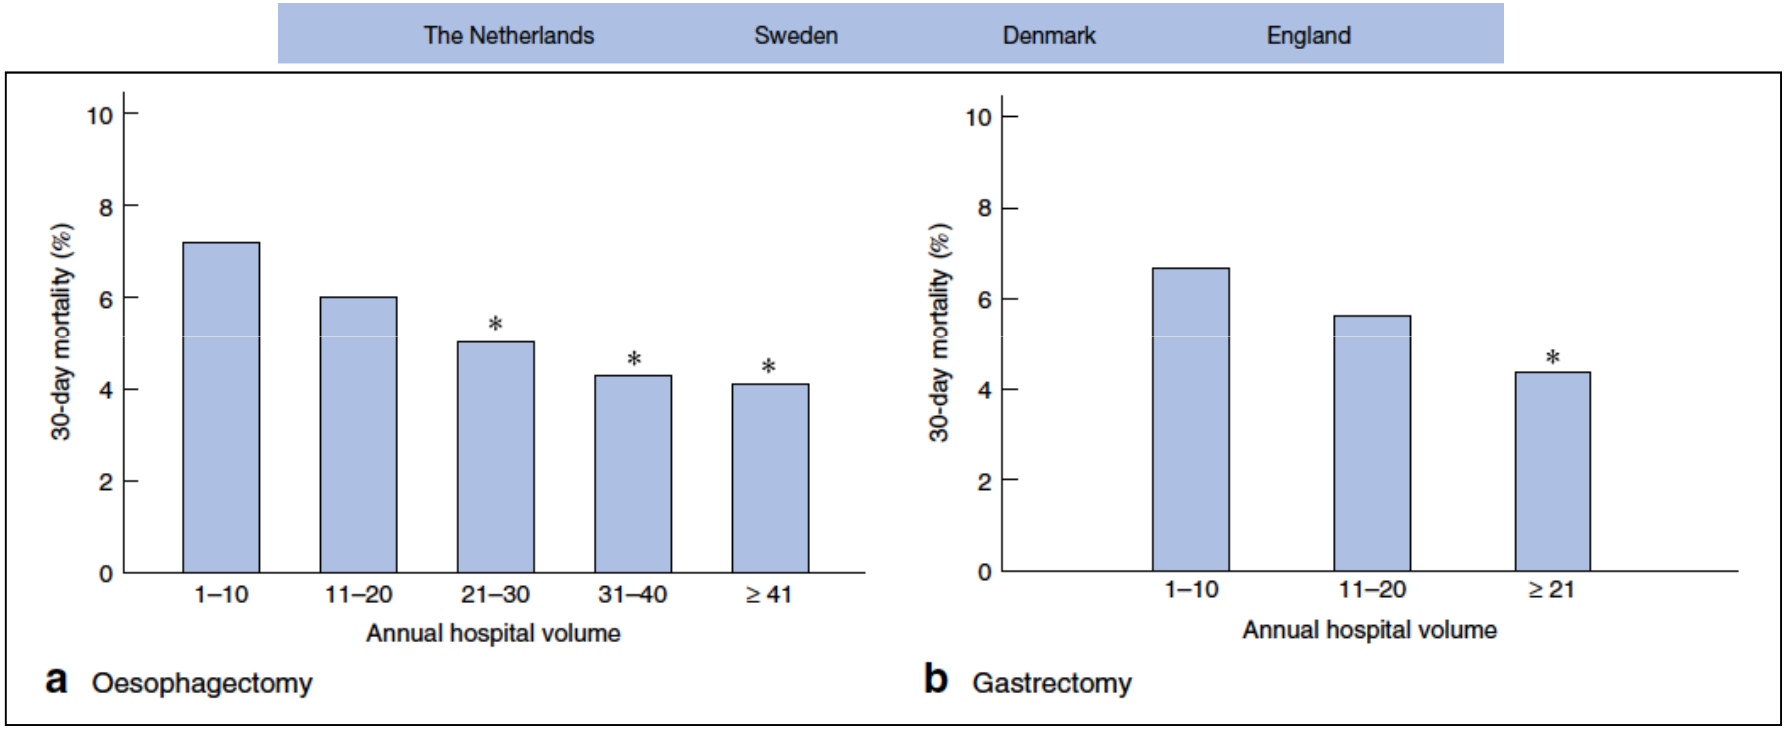

Fig. 4 Postoperative 30-day mortality after a oesophagectomy and b gastrectomy, adjusted for sex, age, and histology, by annual hospital volume (procedures per year). *$P < 0{\cdot}050$ *versus* 1–10 (generalized estimated equations)

Pre-operative chemoradiotherapy is an attractive approach

Advantages

- Smaller treatment volume by more accurate target definition
- Downstaging/-sizing; higher chance of radical R0 surgery
- Good compliance (CROSS)
- Early indication of treatment sensitivity

Disadvantages

- No information on histology, lymph node status
- Toxicity may delay definitive surgery

Pre-operative chemoradiotherapy: phase I-II studies

Authors	Patients	RT	Chemotherapy	Surgery	Outcome
Allal et al. IJROBP 2005; Ann Oncol 2003	N=19 T3-4 or N+	Median dose 38.4 Gy (hyperfx)	2 cycles of Cisplatin (100 mg/m^2) d1; 5FU (800 mg/m^2) d1-4; leucovorin (60 mg bid) d1-4 Second cycle during RT	D2 with (sub) total gastric resection	R0 resection 100% pCR+pPR 47% 2yr OS 71%

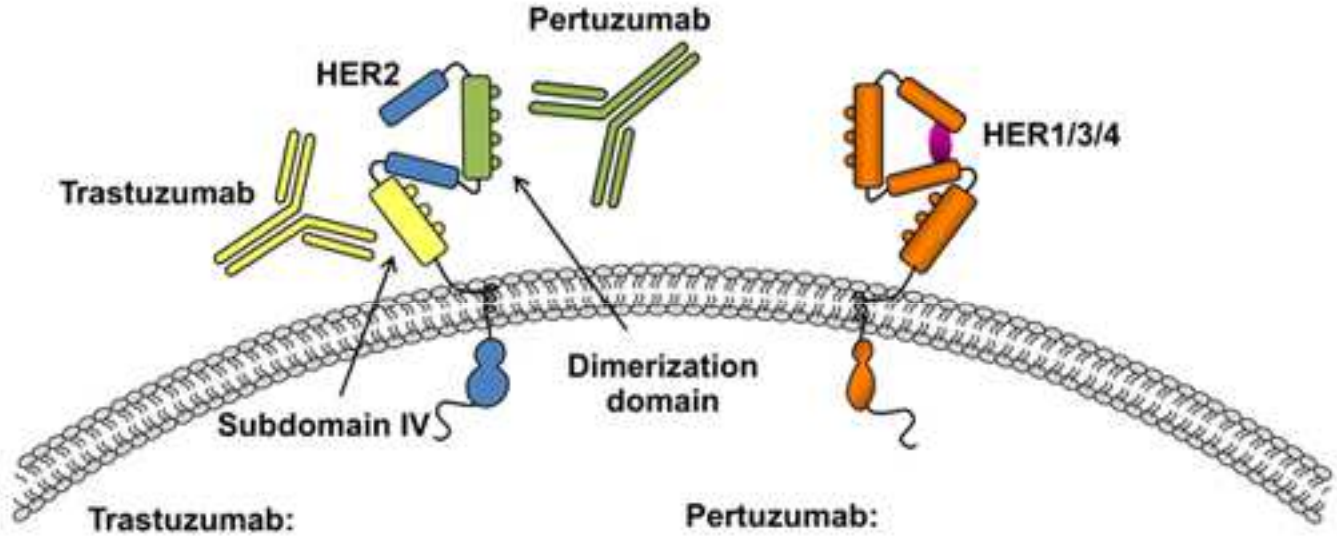
HER2 positive primary GC:

Pertuzumab and Trastuzumab
Complementary Mechanisms of Action



Trastuzumab:

- Inhibits ligand-independent HER2 signaling
- Activates ADCC
- Prevents HER2 ECD shedding

Pertuzumab:

- Inhibits ligand-dependent HER2 dimerization and signaling
- Activates ADCC
