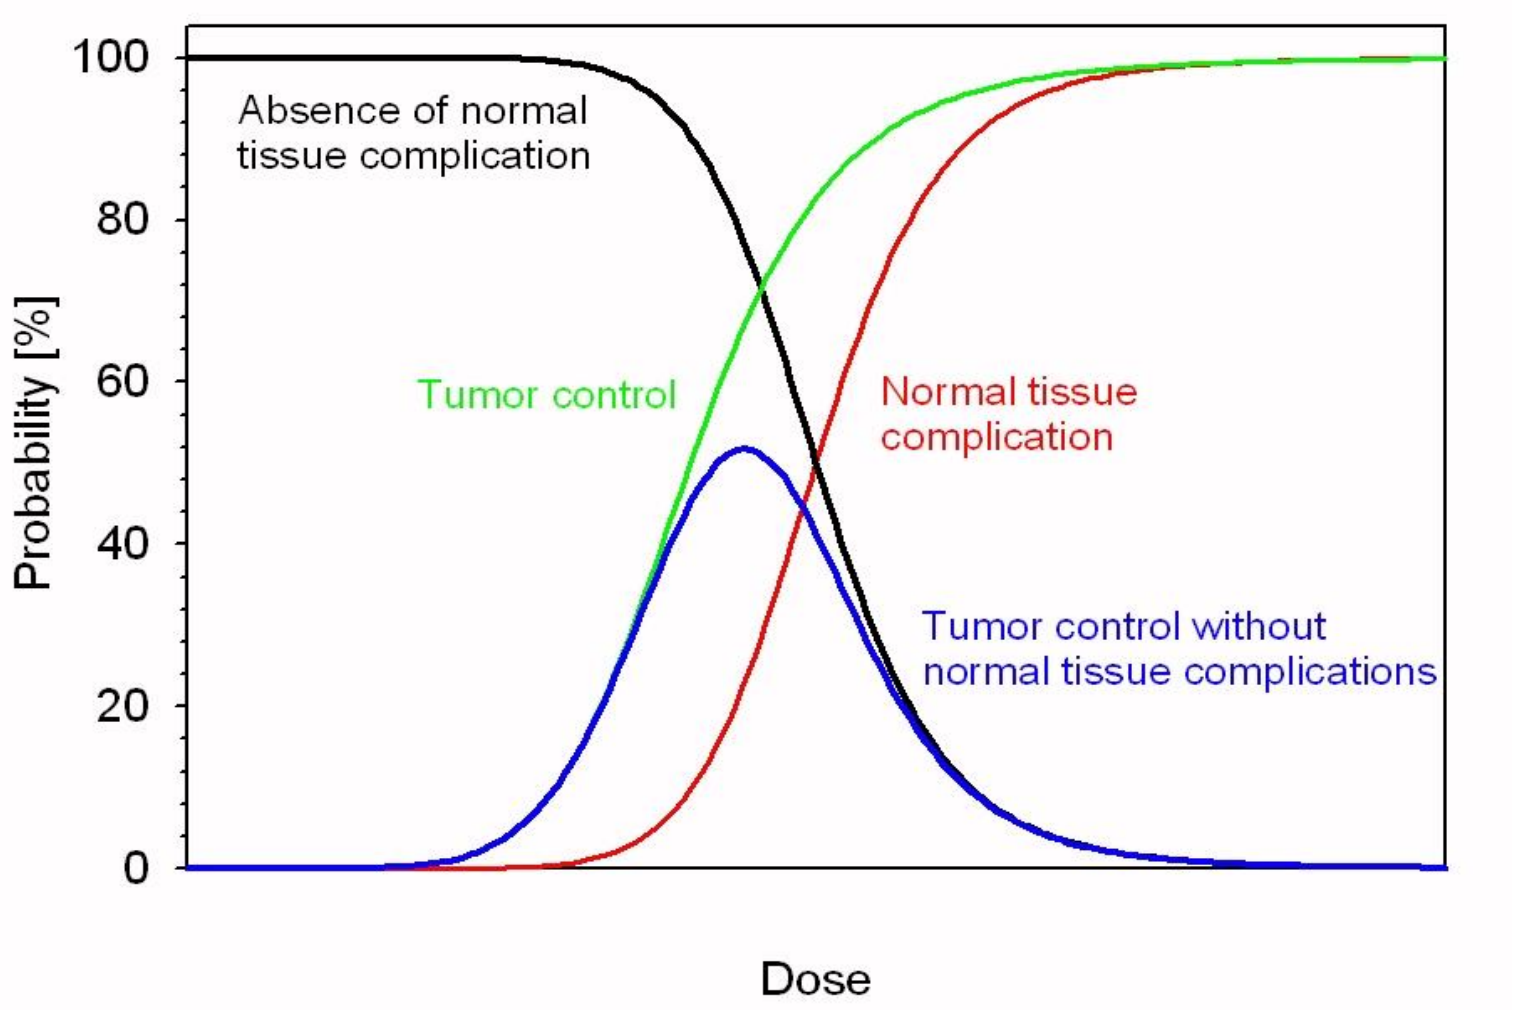
How do we target molecules ? antibodies and small molecules



The Therapeutic Window

Merck pipeline

Phase I

Tepotinib – c-Met kinase inhibitor
Solid tumors

M2698 – p70S6K & Akt inhibitor
Solid tumors

M3814 – DNA-PK inhibitor
Solid tumors

M9831 (VX-984) – DNA-PK inhibitor
Solid tumors

Beigene-283 – BRAF inhibitor
Solid tumors

M7583 – BTK inhibitor
Hematological malignancies

M66207[7] (VX-970) – ATR inhibitor
Solid tumors

M4344 (VX-803) – ATR inhibitor
Solid tumors

Avelumab – Anti-PD-L1 mAb
Solid tumors

Avelumab – Anti-PD-L1 mAb
Hematological malignancies

M9241 (NHS-IL12)
Cancer immunotherapy
Solid tumors

M7824 - Bifunctional immunotherapy
Solid tumors

M1095 (ALX-0761)
Anti-IL-17 A/F nanobody
Psoriasis

Phase II

Tepotinib
c-Met kinase inhibitor
Non-small cell lung cancer

Tepotinib
c-Met kinase inhibitor
Hepatocellular cancer

Avelumab – Anti-PD-L1 mAb
Merkel cell carcinoma 1L[1]

Sprifermin
Fibroblast growth factor 18
Osteoarthritis

Atacicept
Anti-Blys/anti-APRIL fusion protein
Systemic lupus erythematosus

M2951
BTK inhibitor
Rheumatoid arthritis

M2951
BTK inhibitor
Systemic lupus erythematosus

Abituzumab
anti-CD 51 mAb
Systemic sclerosis with interstitial lung disease

Phase III

Avelumab – Anti-PD-L1 mAb
Non-small cell lung cancer 1L[1]

Avelumab – Anti-PD-L1 mAb
Non-small cell lung cancer 2L[2]

Avelumab – Anti-PD-L1 mAb
Gastric cancer 1L[1]

Avelumab – Anti-PD-L1 mAb
Gastric cancer 3L[3]

Avelumab – Anti-PD-L1 mAb
Urothelial cancer 1L[1]

Avelumab – Anti-PD-L1 mAb
Ovarian cancer platinum resistant/refractory

Avelumab – Anti-PD-L1 mAb
Ovarian cancer 1L[1]

Avelumab - Anti-PD-L1 mAb
Renal cell cancer 1L[1]

Avelumab - Anti-PD-L1 mAb
Locally advanced head and neck cancer

MSB11022
Proposed biosimilar of Adalimumab
Chronic plaque psoriasis

Registration

Cladribine[4] Tablets –
Lymphocyte targeting agent
Relapsing-remitting multiple sclerosis

Avelumab[5] – Anti-PD-L1 mAb
Merkel cell carcinoma

Avelumab[6] – Anti-PD-L1 mAb
Urothelial cancer 2L[2]

- Neurodegenerative Diseases
- Oncology
- Immunology
- Immuno-Oncology
- Biosimilars

Pipeline as of March 1st, 2017
Pipeline products are under clinical investigation and have not been proven to be safe and effective.
There is no guarantee any product will be approved in the sought-after indication.

[1] 1st line treatment; [2] 2nd line treatment; [3] 3rd line treatment; [4] European Medicines Agency (EMA) accepted Merck's Marketing Authorization Application (MAA) in July 2016;
[5] EMA accepted Merck's MMA in July 2016 and the US Food and Drug Administration (FDA) has accepted for Priority Review the Biologics License Application (BLA);
[6] FDA accepted for Priority Review the BLA; [7] Includes expansion cohorts in non small cell lung cancer, small cell lung cancer and triple negative breast cancer

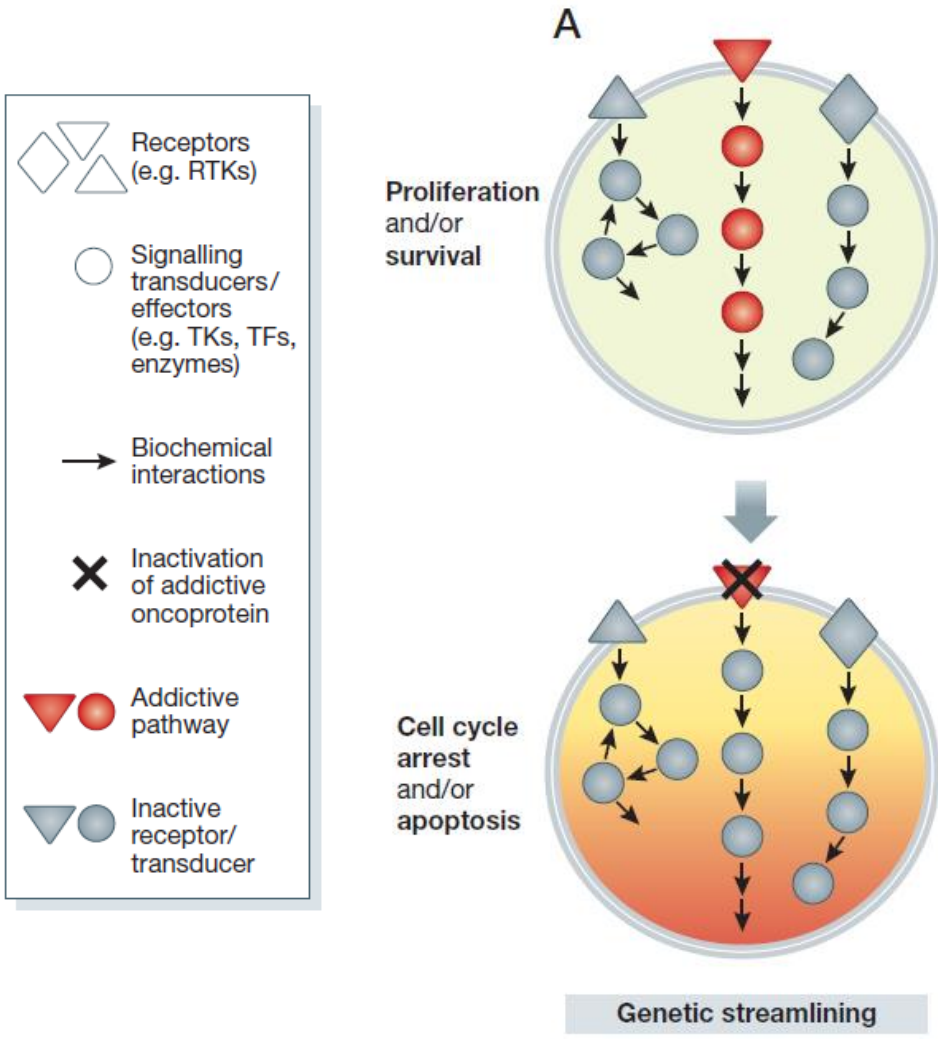
Oncogene Addiction: 2 models

a) genetic streamlining theory

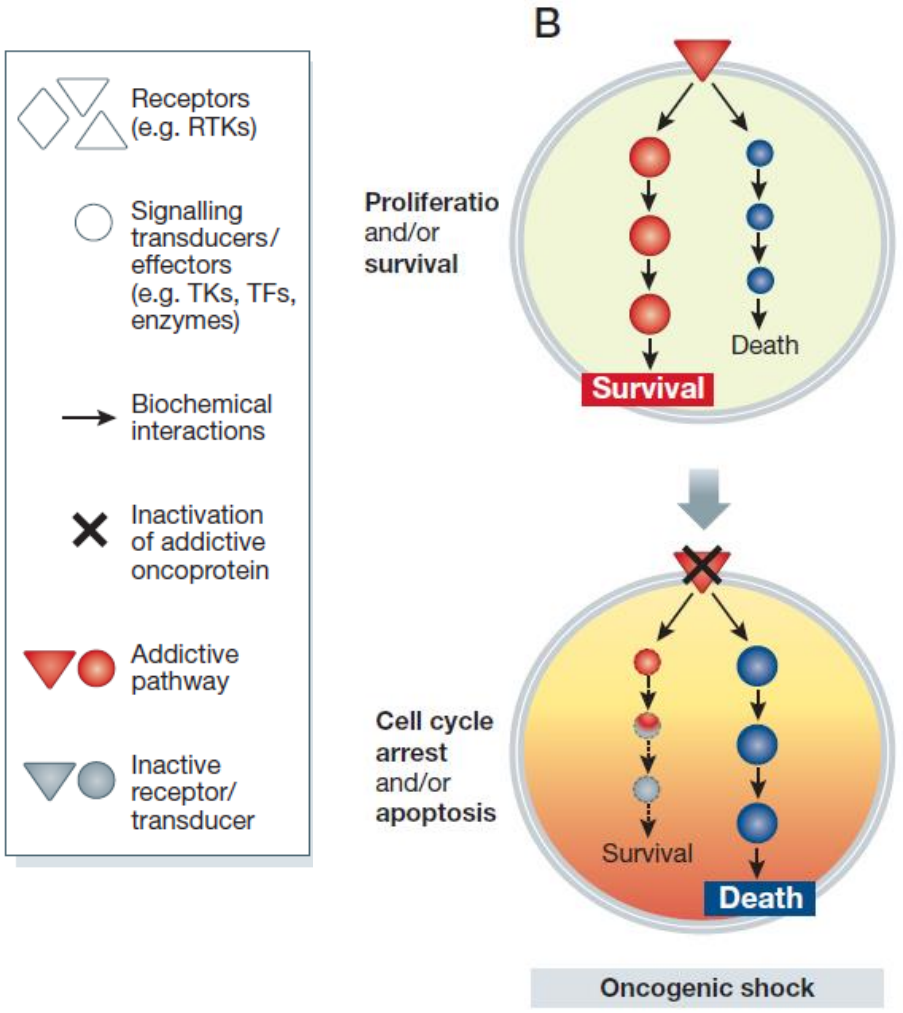


The 'genetic streamlining' theory postulates that non-essential pathways (top, light grey) are inactivated during tumour evolution, so that dominant, addictive pathways (red) are not surrogated by compensatory signals. Upon abrogation of dominant signals, there is a collapse in cellular fitness and cells experience cell-cycle arrest or apoptosis (bottom, red to yellow shading).

Torti and Trusolino, 2011

Oncogene Addiction: 2 models

b) oncogenic shock model



In the 'oncogenic shock' model, addictive oncoproteins (e.g. RTKs, red triangle) trigger at the same time pro-survival and pro-apoptotic signals (top, red and blue pathway, respectively). Under normal conditions, the pro-survival outputs dominate over the pro-apoptotic ones (top), but following blockade of the addictive receptor, the rapid decline in the activity of survival pathways (dashed lines, bottom) subverts this balance in favour of death-inducing signals, which tend to last longer and eventually lead to apoptotic death.

Relevant Questions::

Molecular evolution of resistance to treatment:

- Acquired during therapy?
- ➢ As a result of continuing mutagenesis?

- Already present in a clonal subpopulation within the tumours *prior* to the initiation of therapy?
- ➢ Is resistance therefore a fait accompli—the time to recurrence is simply the interval required for the subclone to repopulate the lesion.?
- ➢ Is the short time interval of recurrence due to the rapid expansion of the resistant subclone immediately following treatment initiation?
- ➢ Required:

Combination therapies targeting at least two different “processes” or “pathways”.

ESTRO School

Kinases in Oncology

- Kinases are involved in processes leading to cell proliferation and survival

- Kinases are popular targets
  - virtually every signal transduction process is wired through phosphotransfer cascade
  - despite high degree of conservation highly specific agents can be developed
  - inhibition of kinase in normal tissue can often be tolerated (therapeutic window)
  - to date approx. 80 inhibitors advanced to some stage of clincial evaluation

Chemical Structures of some clinically approved kinase inhibitors

Structure	Name	Known targets	Indication
	Imatinib (Gleevec; Novartis)	Bcr-Abl, c-Abl, PDGFR, c-KIT, DDR1	CML, GIST, HES
	Nilotinib (Tasigna; Novartis)	Bcr-Abl, c-Abl, PDGFR, c-KIT, DDR1	Imatinib-resistant CML
	Erlotinib (Tarceva; OSI Pharmaceuticals/ Genentech/Roche)	EGFR, ERBB2 (HER2)	NSCLC, pancreas cancer
	Gefitinib (Iressa; AstraZeneca)	EGFR, ERBB2, HER4	NSCLC

Mechanisms of small molecule action (TK-inhibitors) I

Initial concerns: well conserved ATP-binding sites in between the family of kinases: can we get specificity?

Using protein cristallography and NMR-spectroscopy sophisticated structure-based design of specific kinase-inhibitors are now feasible

Kinase inhibitors were developed with the goal of highest selectivity, however, several clinically approved kinases inhibitors are potent inhibitors of multiple kinases: reason for potency?

Potential to target multiple distinct processes (hallmarks) associated with tumor growth, but might be more toxic

Several preclinical studies demonstrate (supra-) additive effect by combined treatment modalities mAB plus TK-inhibitors (complementary effects)

Kinase inhibitor binding sites

- Type I inhibitors
  - constitutes majority of ATP-competitive inhibitors and recognizes the so called active conformation of the kinase
  - e.g. sorafenib, dasatinib, sutent
- Type II inhibitors
  - recognize the inactive conformation of the kinase
  - e.g. imatinib
- Allosteric Inhibitors
  - bind outside of ATP-binding site; at an allosteric site
  - exhibit highest degree of kinase selectivity
- Covalent inhibitors
  - require low concentrations
  - concern about potential toxicity by modification of unanticipated targets

Iressa - Gefitinib

The first selective inhibitor that targets the mutant proteins in malignant cells

Used to treat lung cancer

Only ~10% of non-small cell lung cancer patients response to Iressa

Toxicities include acne, diarrhea, nausea, vomiting and skin reactions

chemical class: quinazoline

orally bioavailable (compliance)

selective inhibitor of EGFR tyrosine kinase

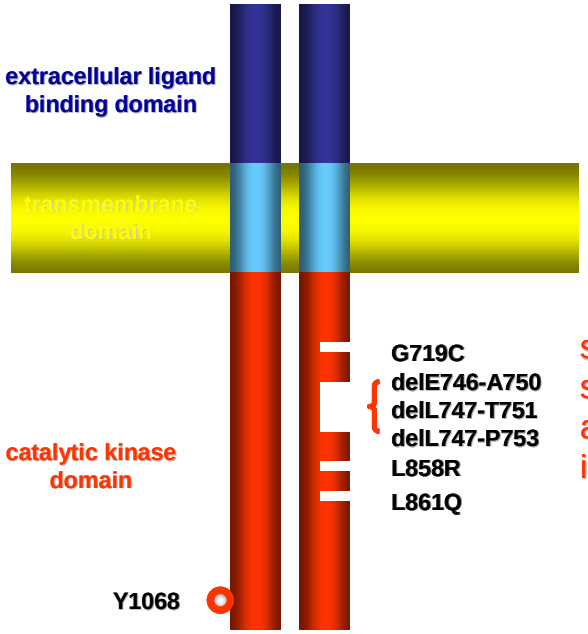
- EGFR IC50 = 0.023-0.079 μM
- erbB2 IC50 = 1.2-3.7 μM

competitive inhibitor of ATP-binding

inhibits ligand-induced cell growth

- IC50 = 0.08 μM

EGFR Mutation



specific mutations confer sensitivity of EGFR-TK activity to gefitinib/iressa in NSCLC patients !

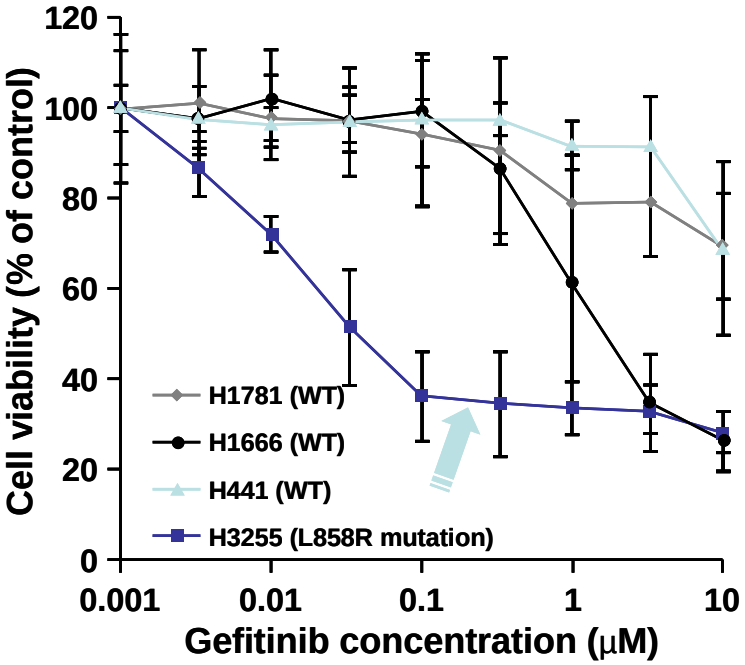


Table 1. The current state of knowledge of *EGFR* mutations in patients with NSCLC

Known	Unknown
EGFR mutations are associated with responses to gefitinib and erlotinib	The etiology of the *EGFR* mutations
EGFR mutations are somatic	The relative oncogenic properties of the different *EGFR* mutations
EGFR mutations are more common in women, nonsmokers, in adenocarcinomas, and East Asians	The outcome of patients with different *EGFR* mutation treated with different EGFR-TKIs
Secondary *EGFR* mutations are associated with resistance to gefitinib and erlotinib in patients and *in vitro*	The mechanisms of resistance to gefitinib and erlotinib in the patients who do not have the identified T790M secondary *EGFR* mutation

Acquired Resistance of Lung Adenocarcinomasto Gefitinib or Erlotinib Is Associated with a Second Mutation in the EGFR Kinase Domain

Patient 2.
This 55-y-old woman with a nine pack-year history of smoking underwent two surgical resections within 2 y (right lower and left upper lobectomies) for bronchioloalveolar carcinoma with focal invasion. Two years later, her disease recurred with bilateral pulmonary nodules and further progressed on systemic chemotherapy. Thereafter, the patient began erlotinib, 150 mg daily. A baseline CT scan of the chest demonstrated innumerable bilateral nodules (Figure S1B, left panel), which were markedly reduced in number and size 4 mo after treatment (Figure S1B, middle panel). After 14 mo of therapy, the patient's dose of erlotinib was decreased to 100 mg daily owing to fatigue. At 23 mo of treatment with erlotinib, a CT scan demonstrated an enlarging sclerotic lesion in the thoracic spine. The patient underwent CT-guided biopsy of this lesion and the erlotinib dose was increased to 150 mg daily. After 25 mo of treatment, she progressed within the lung (Figure S1B, right panel). Erlotinib was discontinued, and a fluoroscopically guided core needle biopsy was performed at a site of progressive disease in the lung.

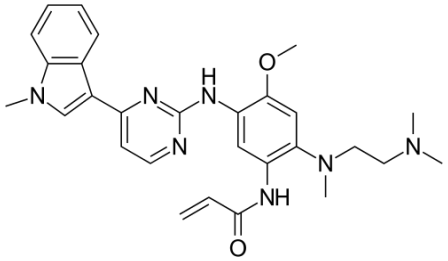
Kobayashi, PLoS Med, 2, e73

Sensitivity to Gefitinib Differs Among NSCLC Cell Lines Containing Various Mutations in *EGFR* or *KRAS*

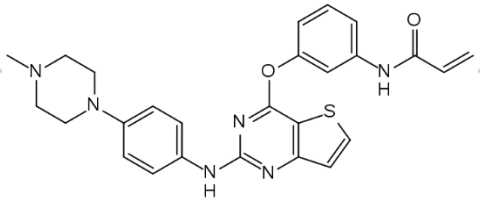
The three indicated NSCLC cell lines, H3255 (L858R mutation), H1975 (both T790M and L858R mutations), and H2030 (wild-type *EGFR,* mutant *KRAS*), were grown in increasing concentrations of gefitinib, and the density of live cells after 48 h of treatment was measured

Targeting EGFR T790M mutation in NSCLC: From biology to evaluation and treatment

Osimertinib (AstraZeneca) is a potent, irreversible EGFR tyrosine kinase inhibitor that is selective for EGFR tyrosine kinase inhibitor–sensitizing mutations and the T790M resistance mutation with an excellent therapeutic index because its activity is poor towards the wild-type EGFR



Olmutinib (HM 61713)(Boehringer Ingelheim) is an irreversible tyrosine-kinase inhibitor, selective for mutant EGFR. Its molecule structure contains a Michael acceptor that covalently binds a cysteine residue near the kinase domain of mutant EGFR



Resistances: Secondary and Downstream Mutations

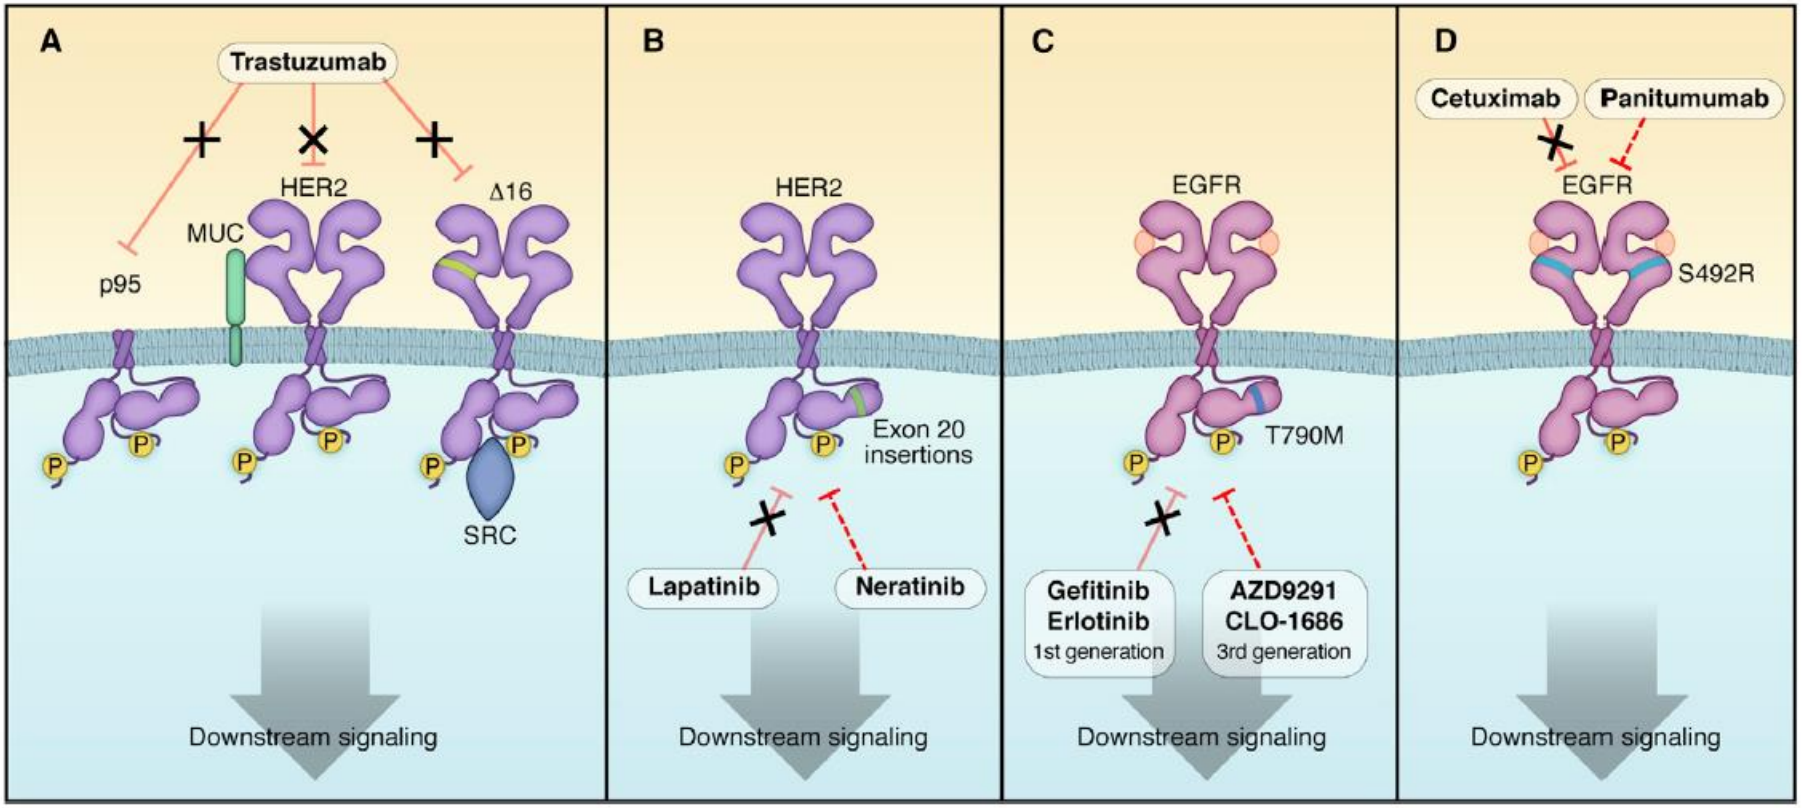


Figure 1. Schema Depicting Intragenic Alterations Leading to Resistance to HER2 and EGFR Inhibitors

(A) HER2 truncations (p95) and splice variants (Δ16) are not inhibited by trastuzumab. In addition, expression of specific mucin isoforms can prevent trastuzumab from binding HER2 (Price-Schiavi et al., 2002). Not shown in the figure, pertuzumab and T-DM1 cannot recognize p95 either.

(B) HER2s harboring exon 20 insertions are not inhibited by lapatinib, but may be sensitive to irreversible HER2 inhibitors afatinib and neratinib. They are also resistant to trastuzumab.

(C) The EGFR T790M gatekeeper mutation leads to acquired resistance to first generation EGFR inhibitors, but is effectively inhibited by third-generation EGFR inhibitors.

(D) An EGFR mutation in the extracellular domain is associated with acquired resistance to cetuximab, but may still be sensitive to another anti-EGFR antibody, panitumumab. Dashed lines indicate inhibition via alternative antibodies and inhibitors.

Arteaga, Cancer Cell, 25, 2015

Resistances: Secondary and Downstream Mutations

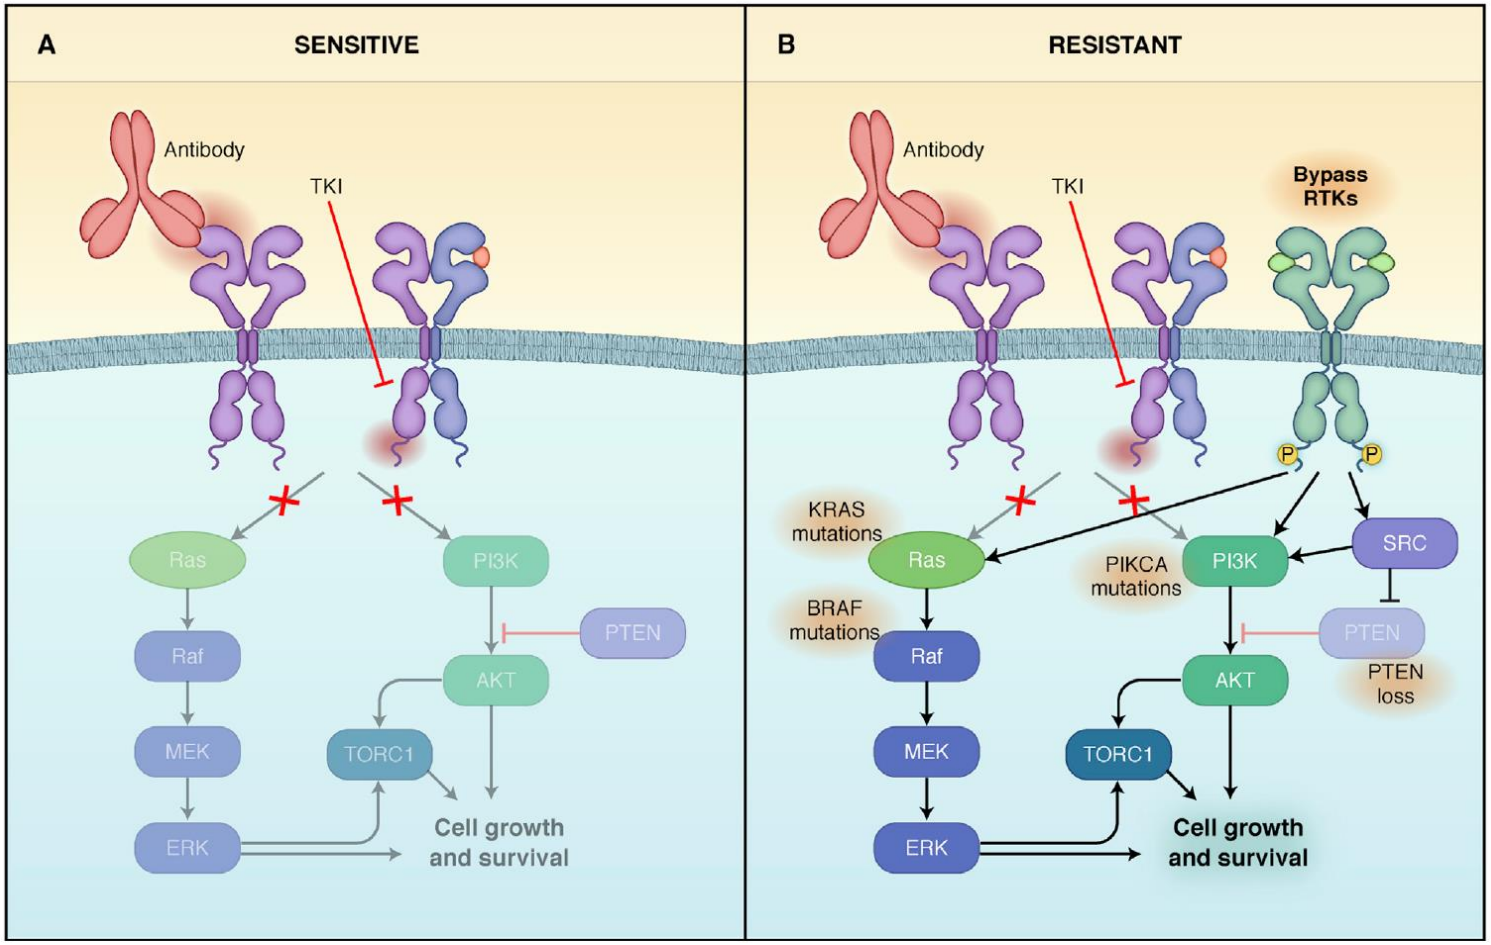

Figure 2. Schematic Depicting Resistance to EGFR and HER2 Inhibitors due to Activation of Bypass Track Signaling

(A) Model of a sensitive EGFR or HER2-addicted cancer treated with an ERBB small-molecule inhibitor or antibody resulting in suppression of downstream signaling. EGFR or HER2 homodimers and heterodimers are shown.

(B) Model of a EGFR mutant or *HER2*-amplified cancer with resistance due to maintenance of downstream signaling in the presence of the EGFR or HER2 inhibitors. Activation of signaling can be caused by activation of other RTKs or mutational activation of downstream signaling.

Key Points

Molecularly targeted agents are less toxic than cytotoxic agents (antibodies/small molecular

resistances

Molecularly targeted agents work by targeting the genetic changes(s) in cancer cells

- Chromosomal translocation
- Gene duplication
- Gene mutation

Risk for secondary mutations high

Risk for paraxodical activation of pro-tumorigenic wildtype-signal transduction cascade exists (Raf-inhibitors)

To improve cancer treatment, we need to better understand the differences between cancer and normal cells

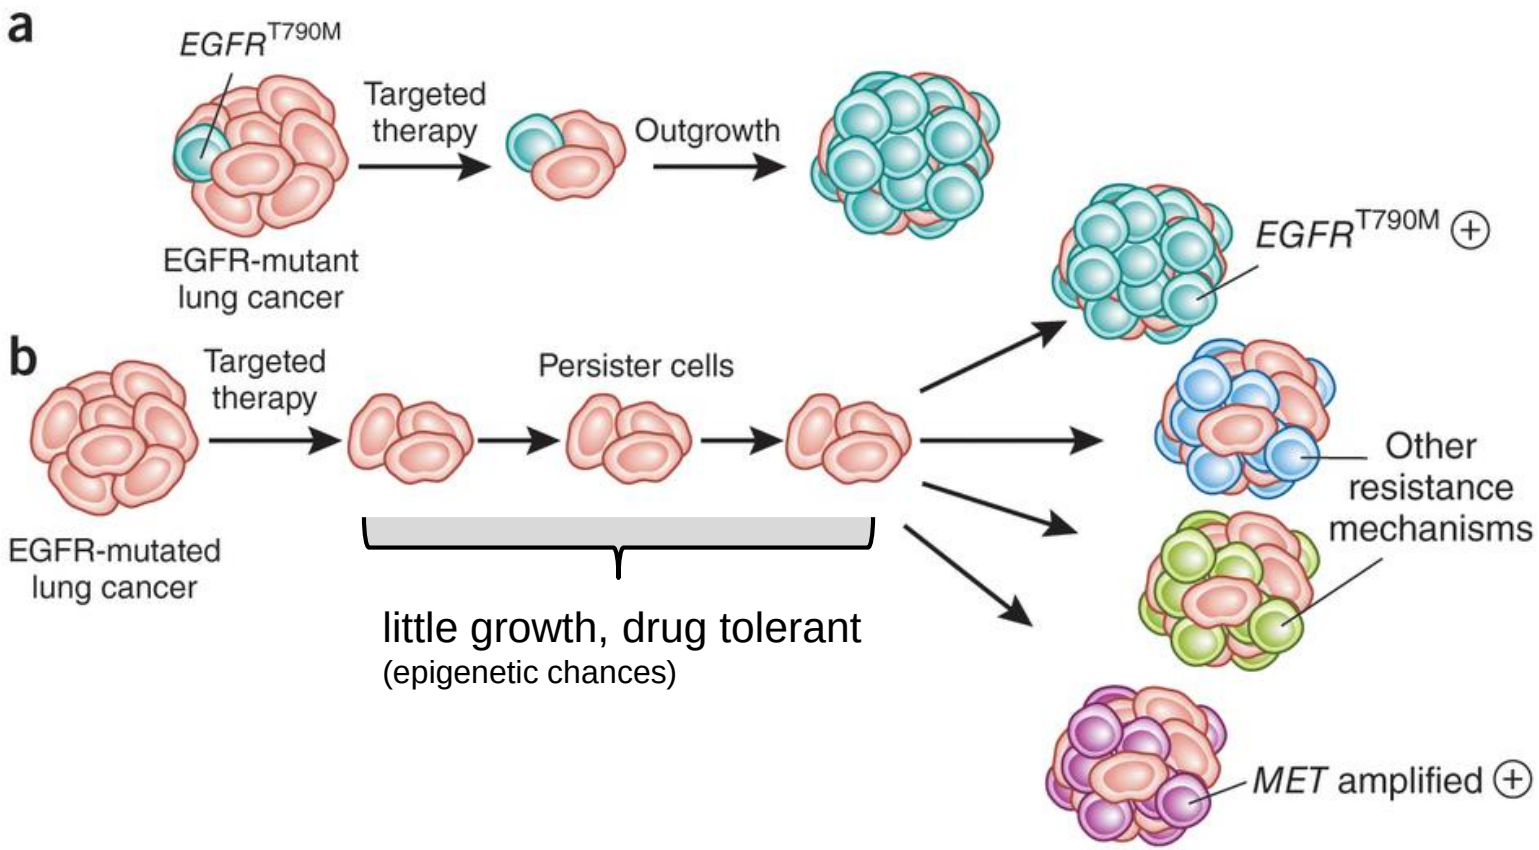
Major Callenges: Resistances

- de novo/ intrinsic resistance: do not exhibit an initial response

- acquired resistance: develops after an initial, often marked and durable clinical response

- same molecular mechanisms may cause both types of resistance

Cellular Origins of Drug Resistance in Cancer



a) Preexisting subclones

b) Induction of durable drug-tolerable state followed by aquisition of a variety of resistance mechanisms

Hata et al., Ramirez et al, 2016

ESTRO School

Relevant Questions:

- Molecular evolution of resistance to treatment:
  - acquired during therapy?
  - Already present in a clonal subpopulation within the tumours *prior* to the initiation of therapy?

- Is resistance is therefore a fait accompli—the time to recurrence is simply the interval required for the subclone to repopulate the lesion.?
- Is the short time interval of recurrence due to the rapid expansion of the resistant subclone immediately following treatment initiation?

- Required:

Combination therapies targeting at least two different pathways - processes.

Changing nature of early development trials

- Enrichment strategies: by subtype of by genomic alterations
- Novel dose escalation methods applied
- Research biopsies
- Driving go-no-go decisions based on their ability to provide proof of concept
- Trends in increase in the sample size of phase I trials
- Expanding cohorts being conducted for multiple purposes

Evidence-Based Medicine

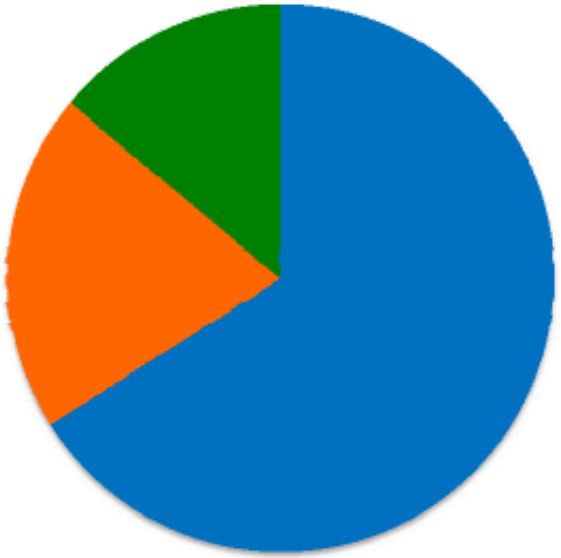
Cancer treatment is based on trials that were large, rigorous, and provided level I evidence.

Challenges to meaningful clinical trials in the ‘omic era:

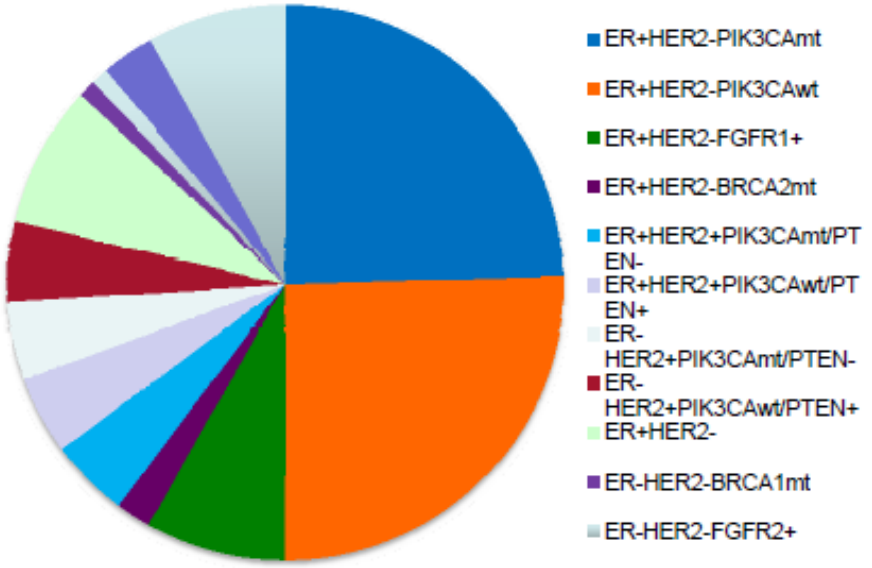
1. “Cancer” doesn’t exist, is now a fragmented group of biologically distinct entities.
2. Cancer outcomes are globally better (good for patients, bad for event rates)

Breast cancer as an orphan disease

Breast Cancer 2015

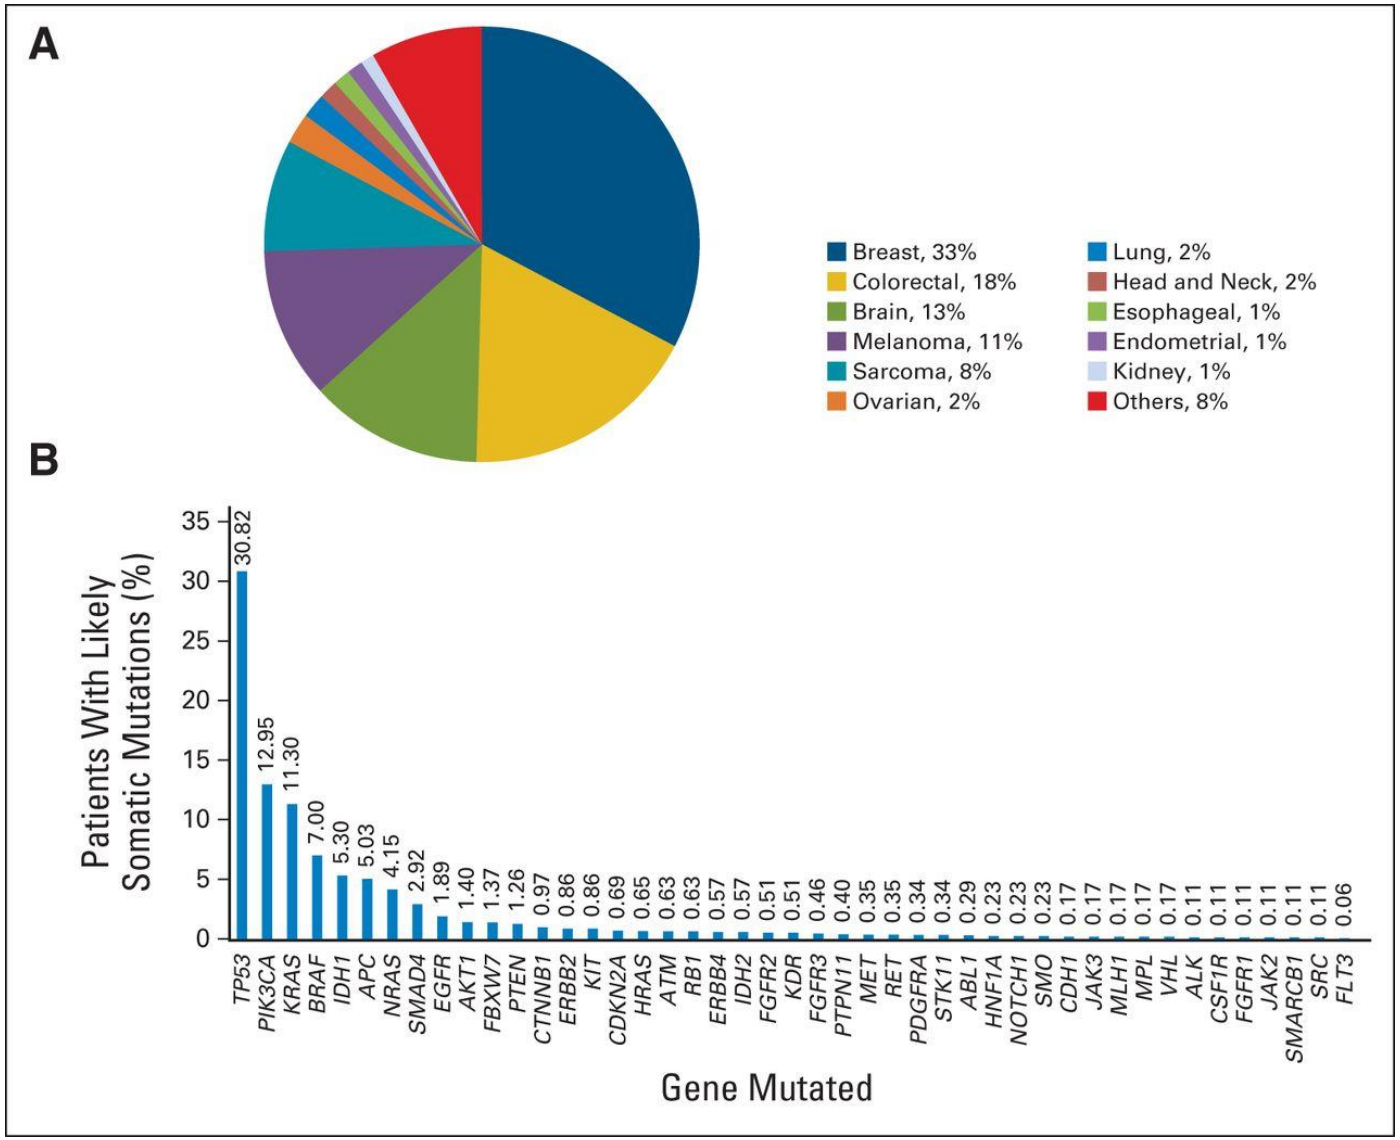


Breast Cancer 2023



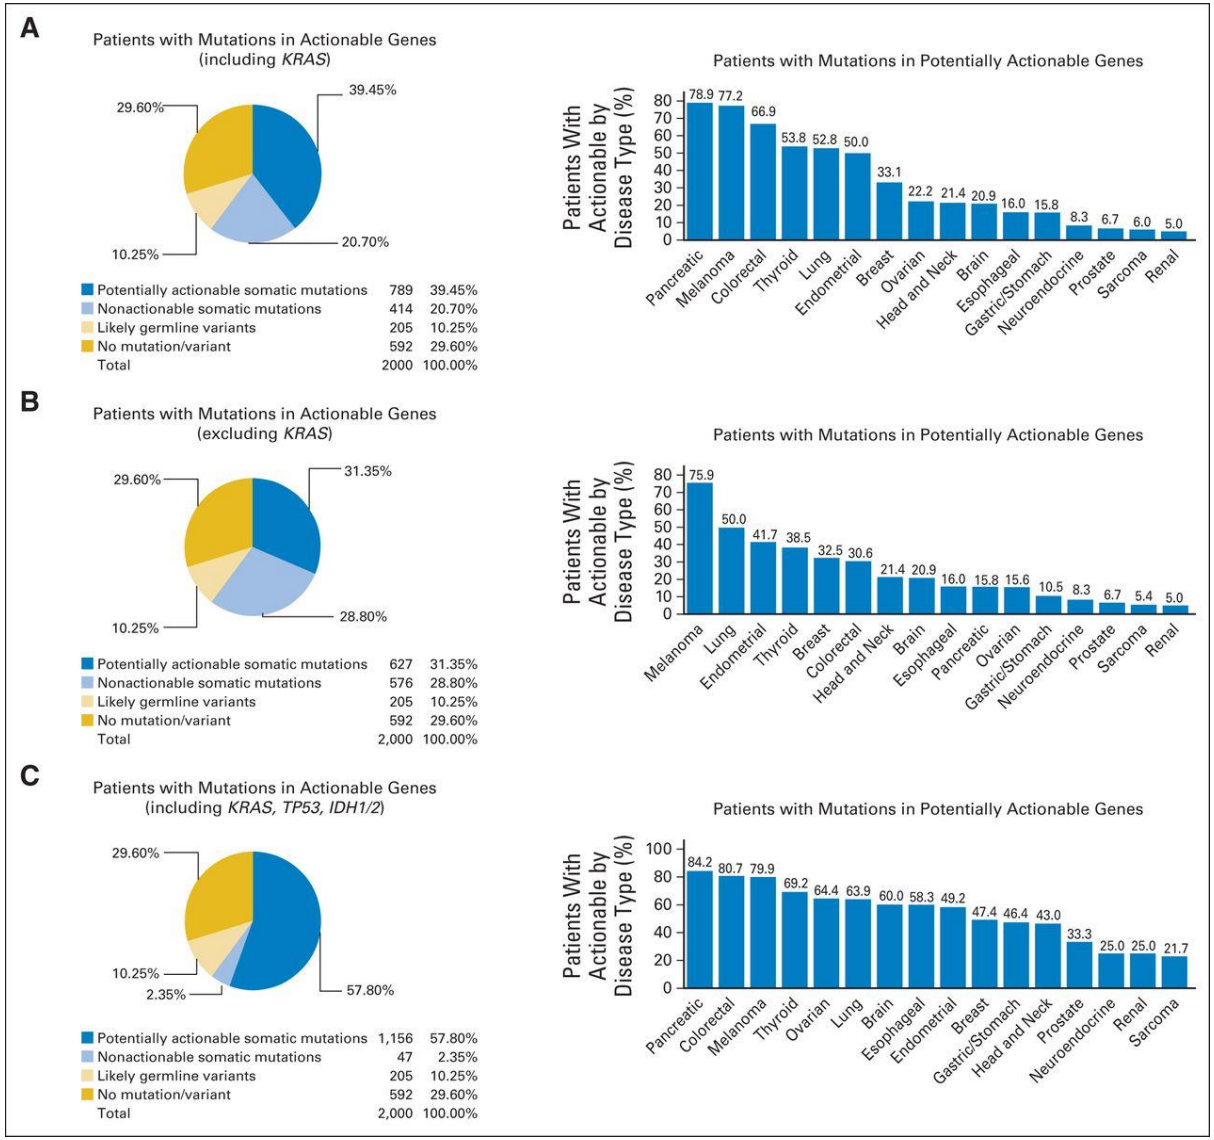
Each molecular segment is very rare
and presents a specific biological feature

The most common somatic mutations for patients who underwent genomic testing



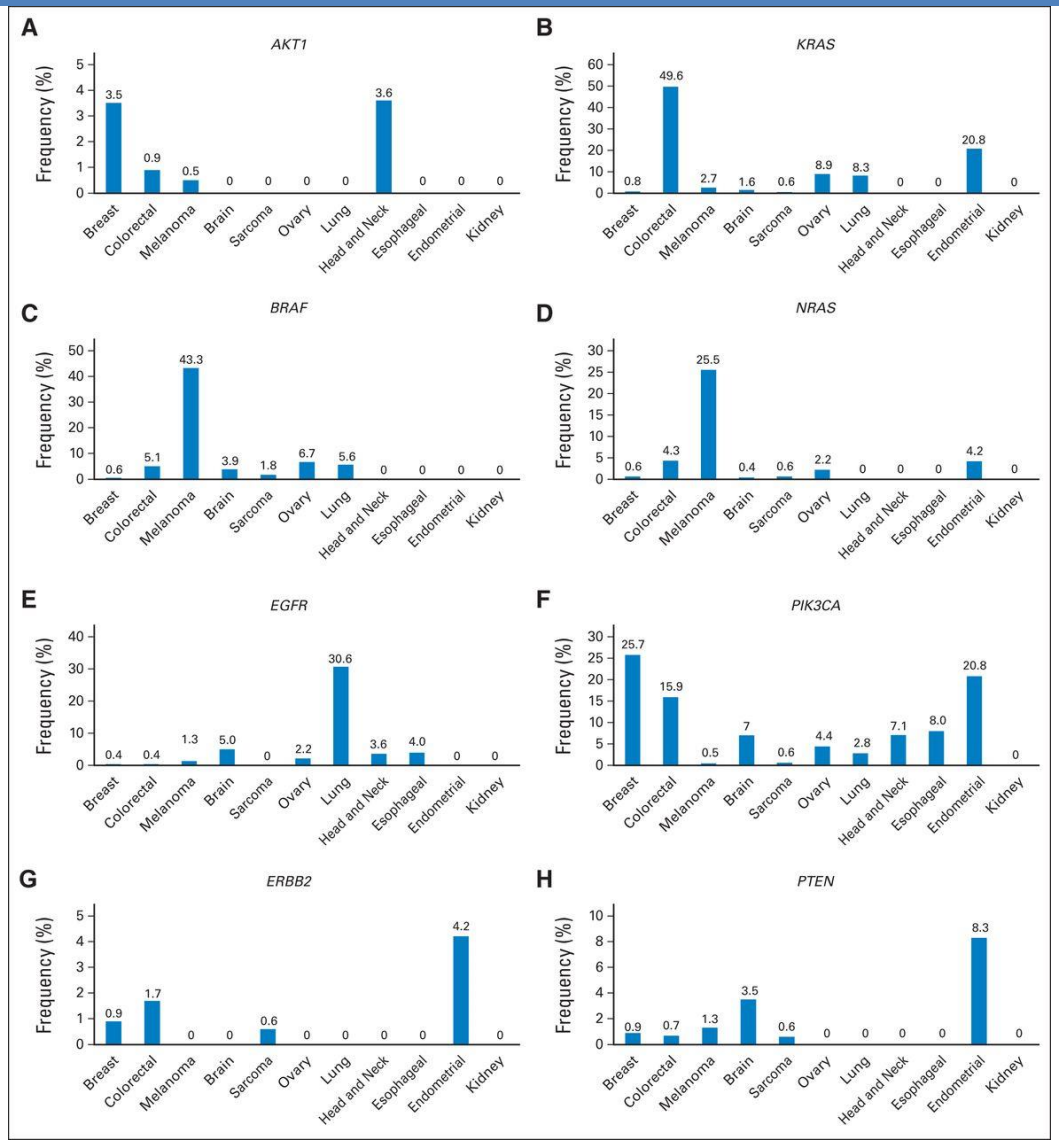
Funda Meric-Bernstam et al. JCO 2015;33:2753-2762

Frequency of actionable alterations



Funda Meric-Bernstam et al. JCO 2015;33:2753-2762

Frequency of selected alterations in different tumor types



Funda Meric-Bernstam et al. JCO 2015;33:2753-2762

Why drug development is changing?

- Knowledge of molecular biology is accumulating and technology is rapidly evolving
- Molecularly targeted agents and immuno-oncology agents are becoming important
- Patients and infrastructure resources are limited
- Accelerated drug approval is possible with compelling results
- Desire to accelerate drug development process to bring active compunds to the clinic and improve cancer cures have fueled these changes

The traditional drug development paradigm

Phase I	Phase II	Phase III
Safety	Efficacy in selected tumors	Meaningful benefit in a randomized setting against existing standard
Tolerability	ORR	OS
Pharmacokinetics	TTP	
Pharmacodynamics	PFS	
Preliminary antitumor activity		

The current drug development paradigm

Proof of mechanism	Proof of concept	
	Early	Late
Safety, tolerability, on target and off target effects	Predictive biomarkers explored	Predictive biomarkers confirmed
Preliminary antitumor activity	Antitumor activity seen using surrogate endpoints	Proof of concept using a validated clinical endpoint
Evidence of target engagement in valid pharmacodynamic biomarkers	ORR TTP PFS	OS

New trend in Oncology Drug development

Neoadjuvant Trials

Newly diagnosed pt
Tumor in place

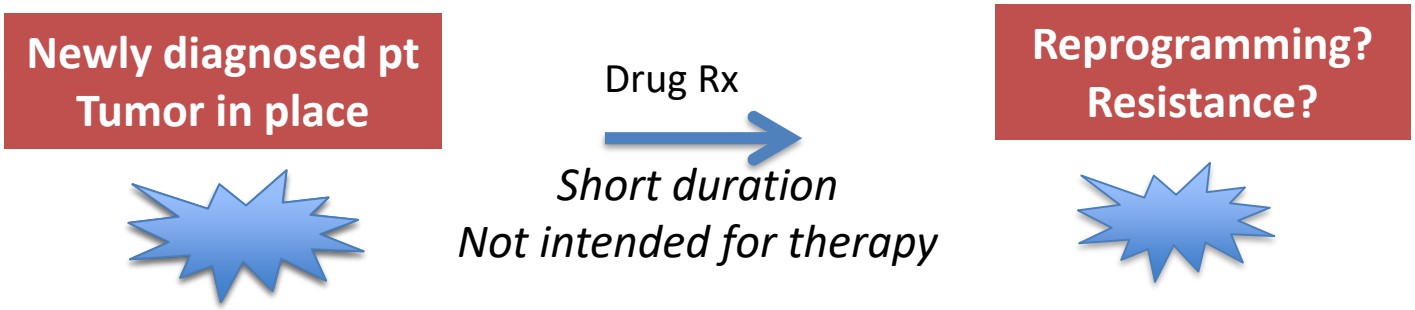
DRUG RX

Therapeutic intent and duration

Post-treatment clinical and correlative data

- Good ☺:
  - Small, fast
  - Pick-a-winner
  - pCR is a good surrogate endpoint (FDA registrational option)
  - DFS/OS can be collected in same cohort
- Bad ☹:
  - pCR only validated endpoint. Irrelevant in many (ER+)
  - Quantitative relationship pCR to DFS/OS not established
    - Trials underpowered for these endpoints
  - Macromet = micromet?
  - Drugs must be well known

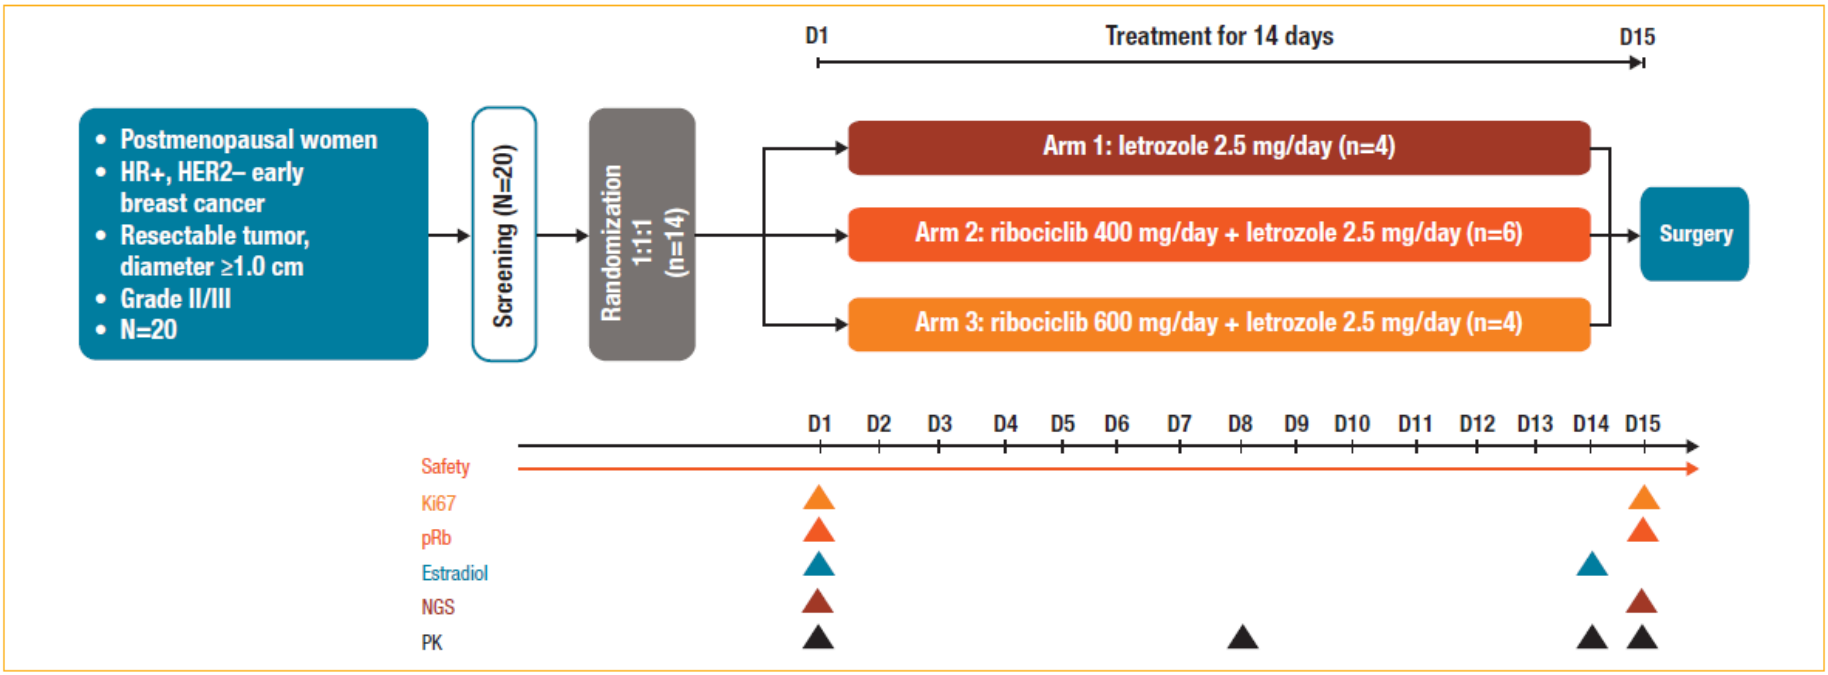
"Window of Opportunity" Trials



- Good for:
  - Discovery
  - Proof of principle (e.g. Johnson presentation)
- Bad for:
  - Unknown agents
  - ? Testing combinatorial strategies
    - Doses?
    - Toxicity issues

These contribute to scientific knowledge and therapeutic hypotheses, not clinical care

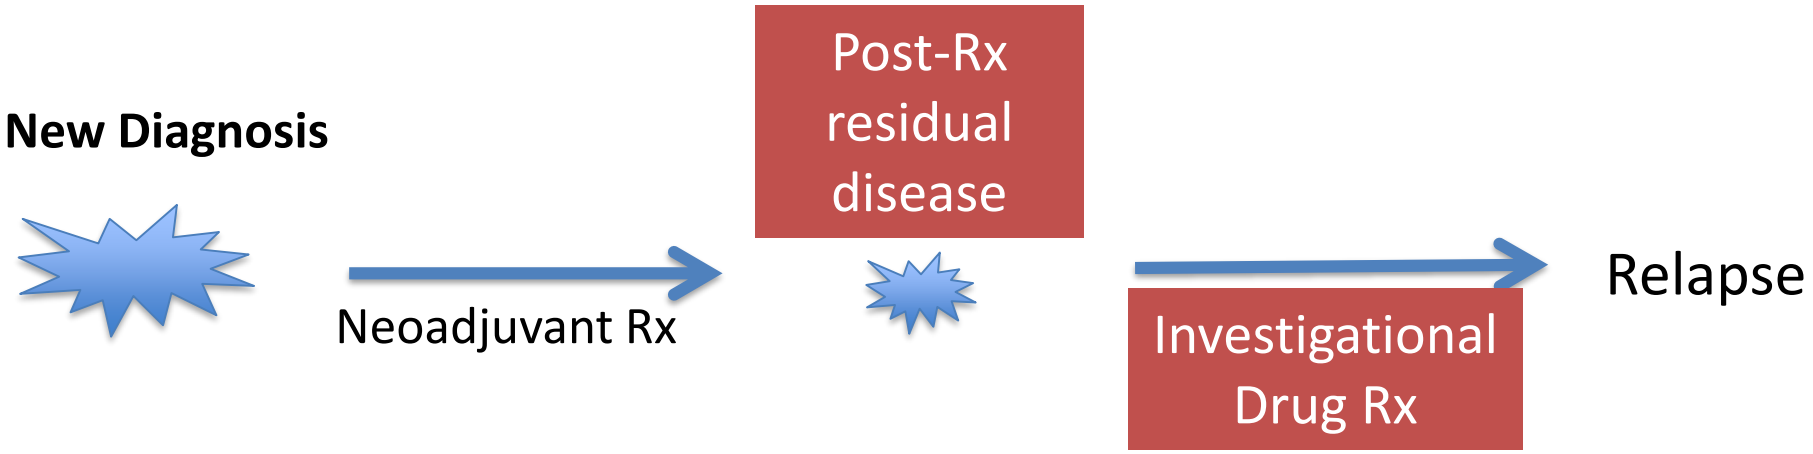
“Window of Opportunity” Trials: Monaleesa-1



D, Day; ER+, estrogen receptor-positive; HER2–, human epidermal growth factor receptor 2-negative; NGS, next-generation sequencing; PK, pharmacokinetics; pRb, phosphorylated Rb.

G. Curigliano et al. Submitted

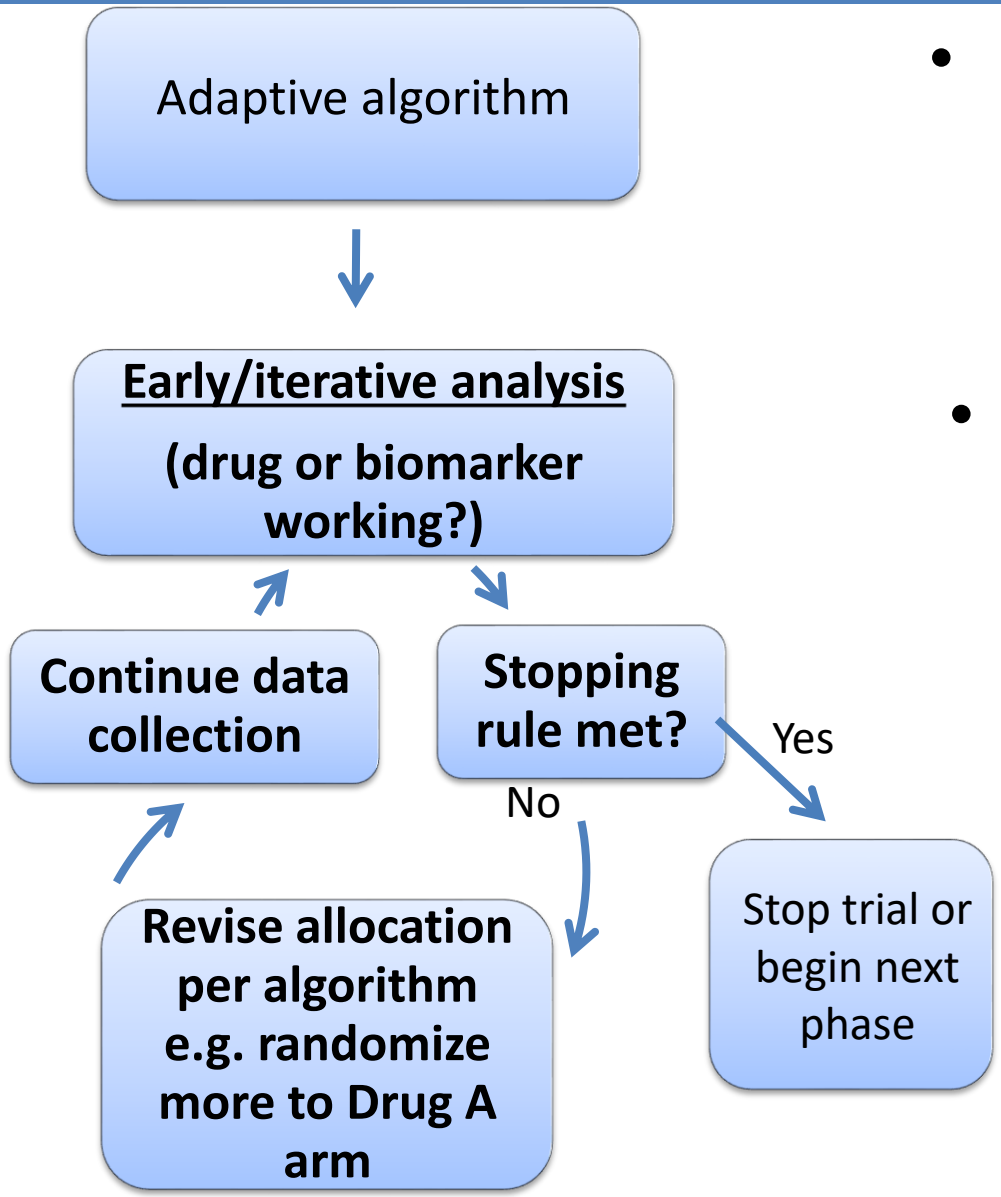
Residual Disease Trials



- Good ☺:
  - Tissue available
  - Resistant tumors
  - High risk population
- Bad ☺:
  - Adjuvant-size trial
  - Cannot assess response (event = relapse)

Example: PENELOPE – palbociclib in residual ER+ disease

Adaptive Trials

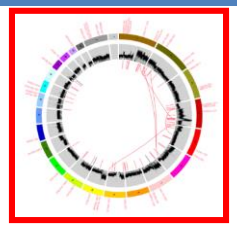


- Good ☺:
  - Pick-a-winner
  - Can adapt on drug or biomarker
  - Smaller, conserve resources
- Bad ☹:
  - Interim estimates= ↑error risk
  - Complicated! Continuously collecting response data
  - If biomarker-based
    - Must be validated.
    - Need real-time results
    - Cannot do discovery

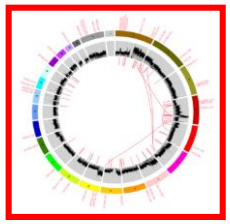
Example: ISPY2 - novel biologics in combination with chemotherapy

“Genome-Forward” Trials

2 baseline frozen cores
70%+ tumor cellularity
DNA extracted



Ki67 in surgical sample
Greater that 10% = Unfavorable



16 to 18 weeks of aromatase inhibition

2nd stage: n=16

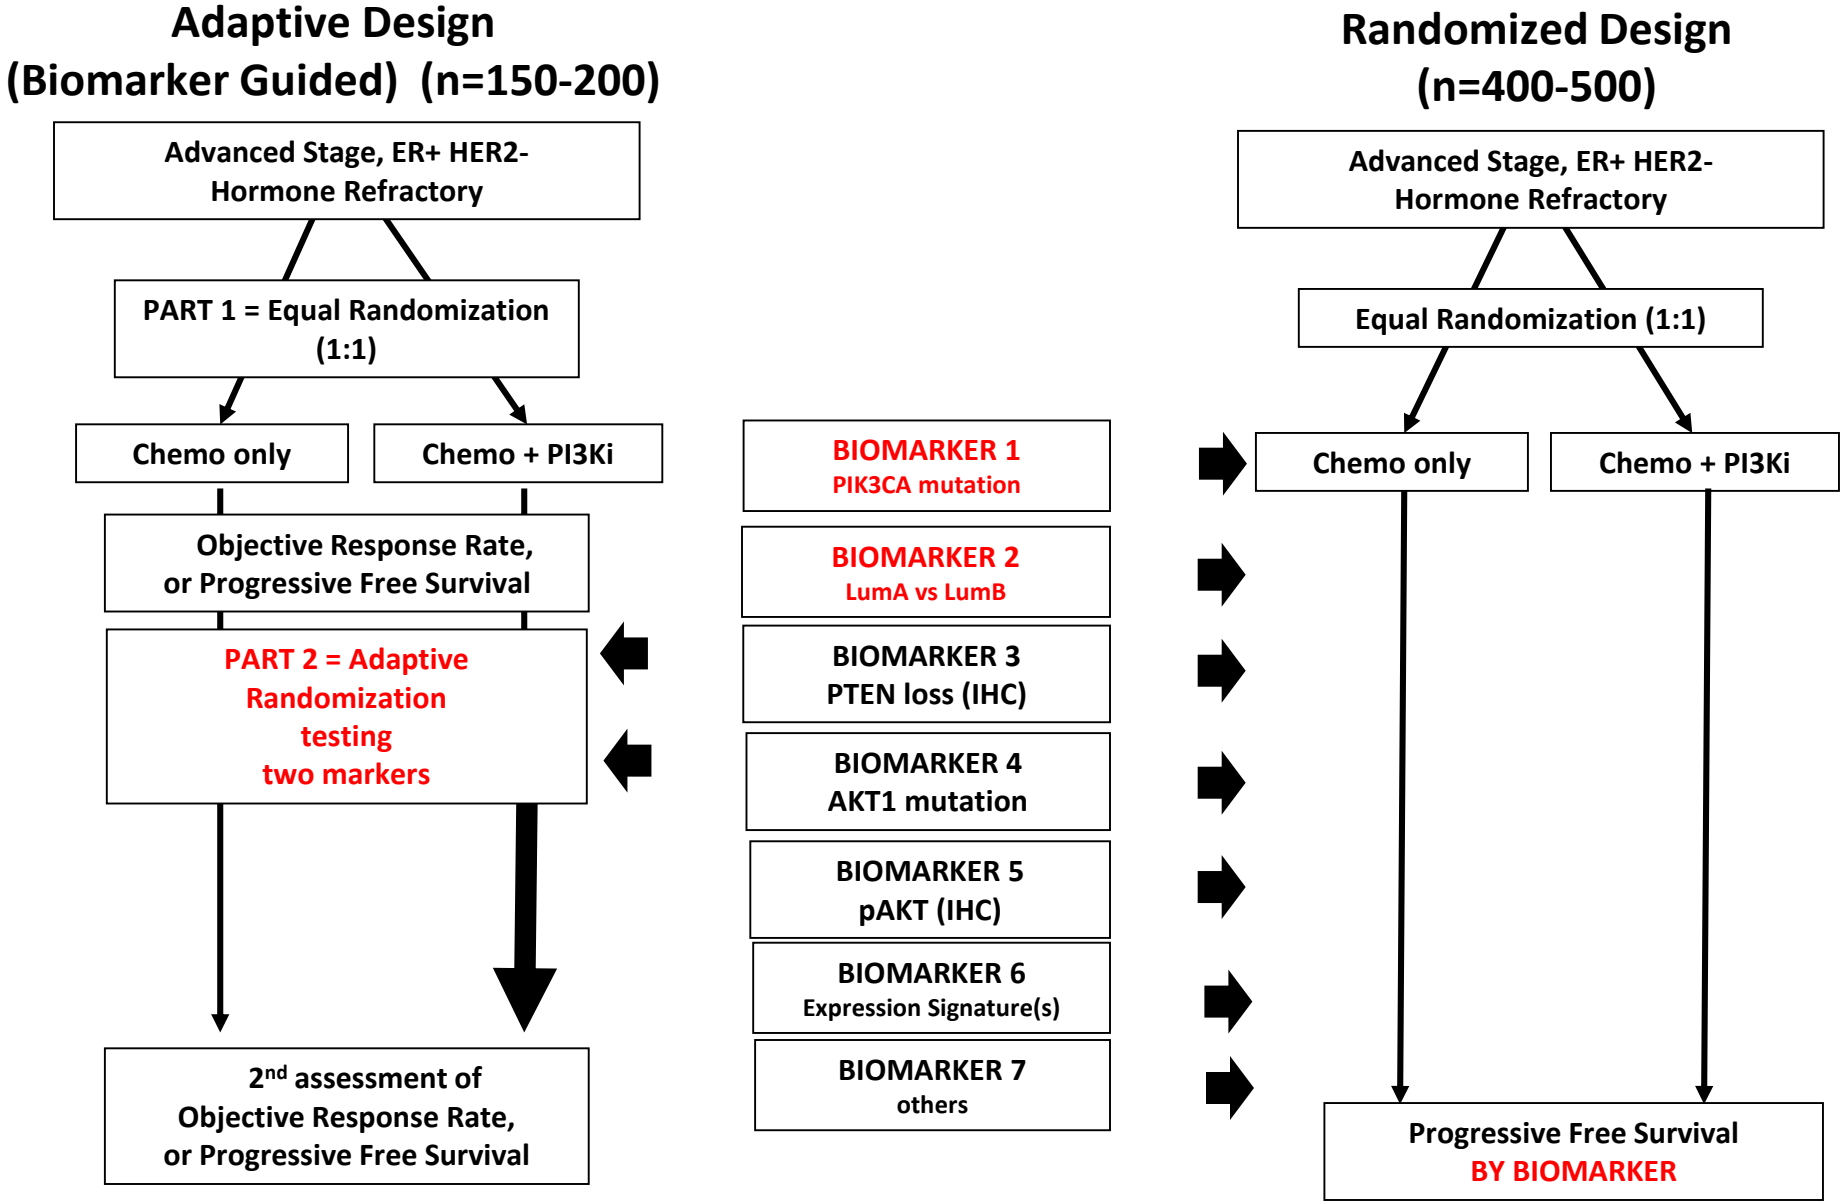
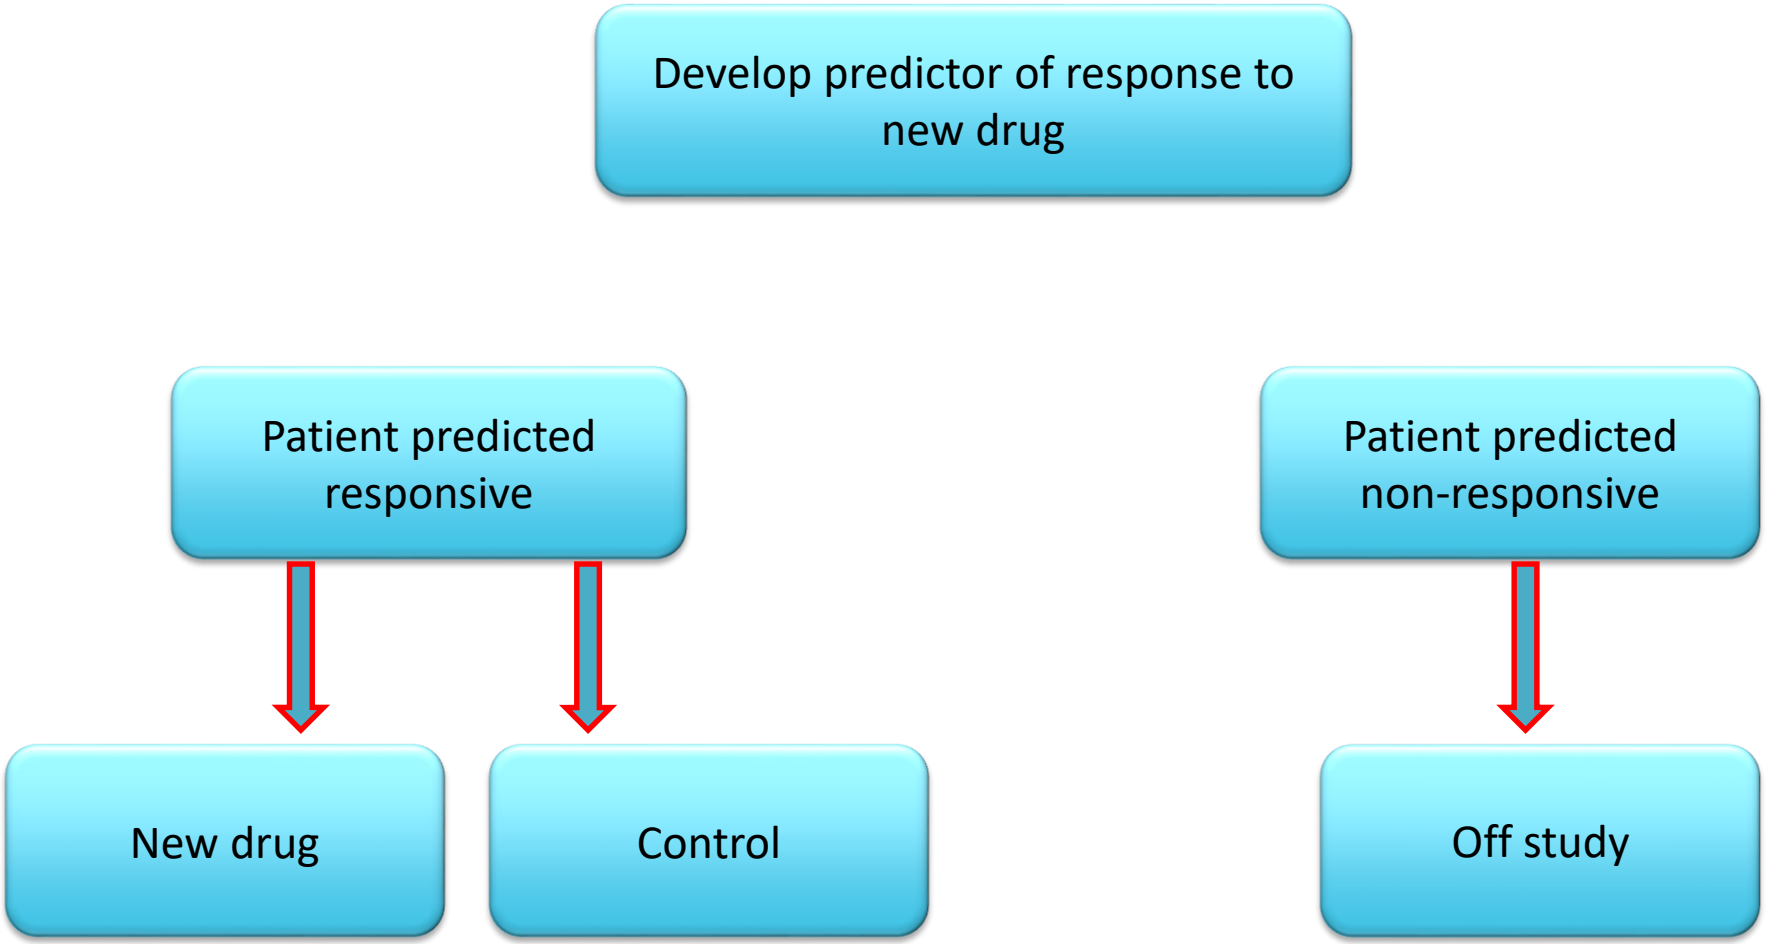
Testing A Predictive Biomarker?



Enrichment Design

- Restrict entry to the phase III trial based on the binary predictive classifier, i.e. targeted design

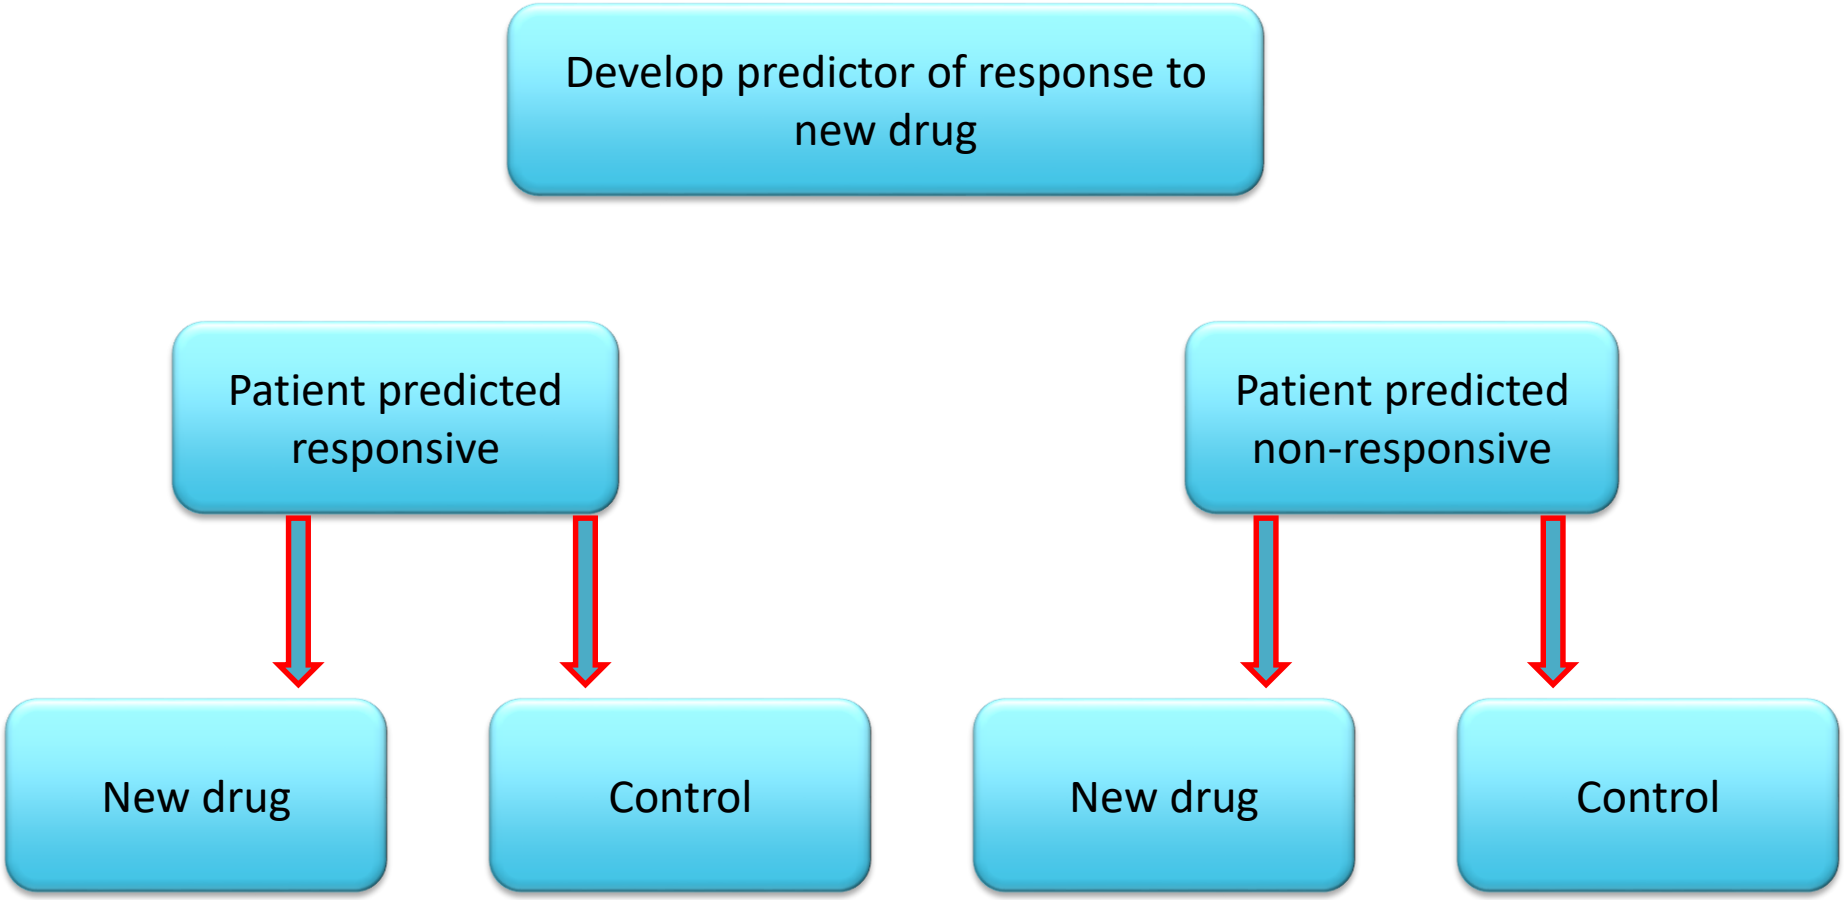
Enrichment Design



Enrichment Design

- Primarily for settings where the classifier is based on a single gene whose protein product is the target of the drug
  - eg trastuzumab
- Analytical validation, biological rationale and phase II data provide basis for regulatory approval of the test
- Phase III study focused on test + patients to provide data for approving the drug

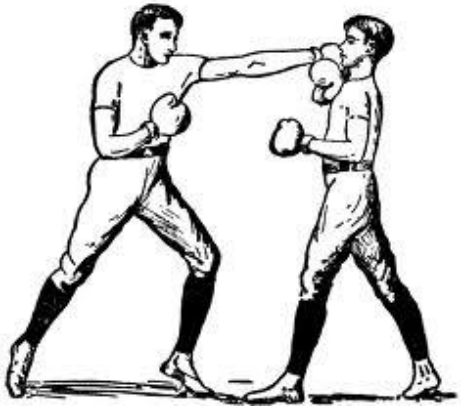
Stratification design



Stratification Design

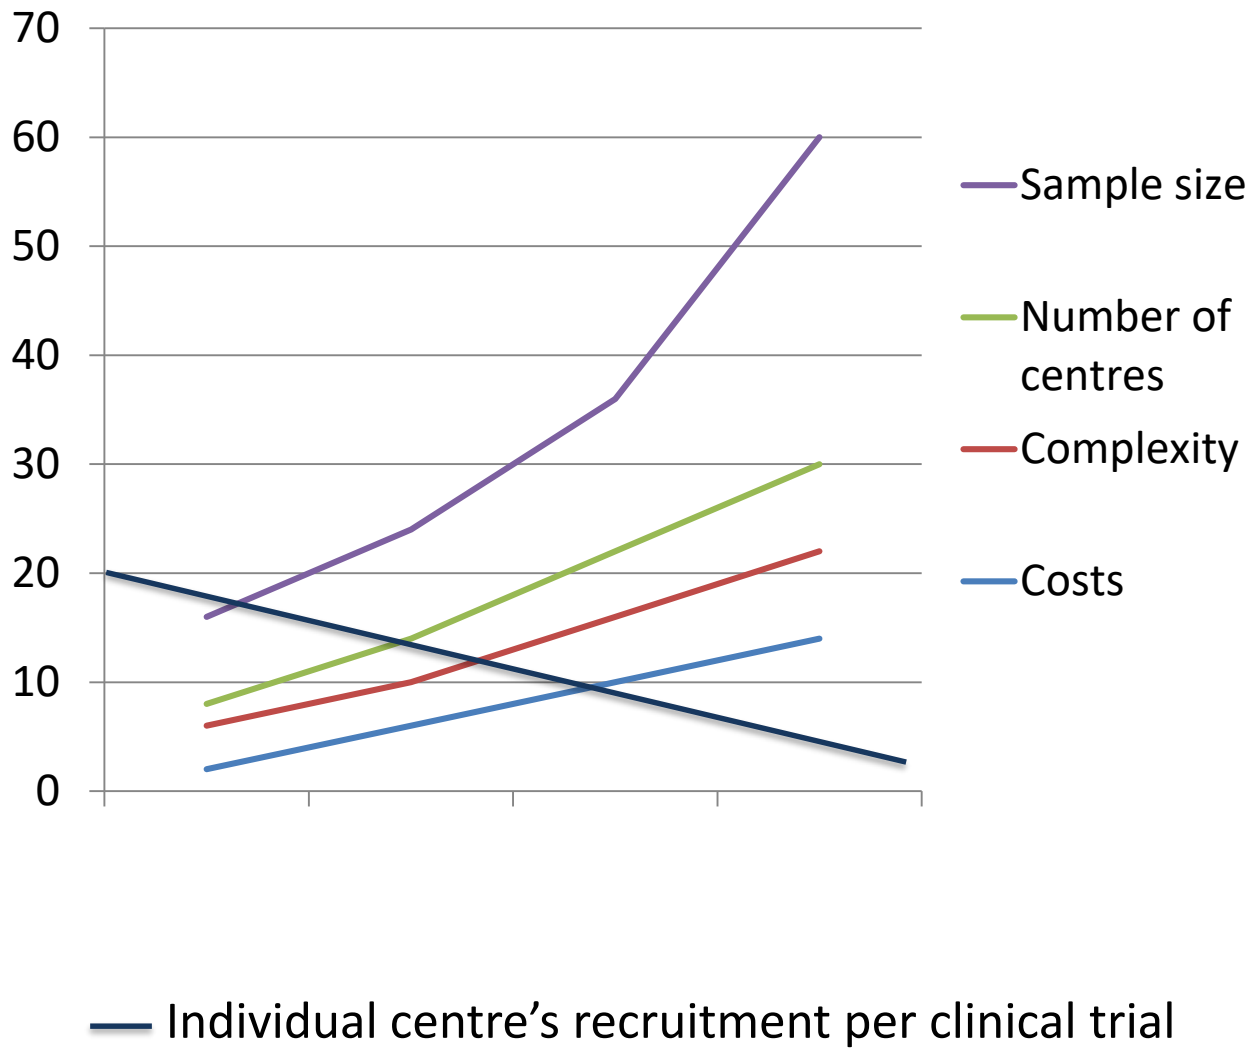
- Do not use the diagnostic to restrict eligibility, but to structure a prospective analysis plan
- Having a prospective analysis plan is essential
- "Stratifying" (balancing) the randomization is useful to ensure that all randomized patients have tissue available but is not a substitute for a prospective analysis plan
- The purpose of the study is to evaluate the new treatment overall and for the pre-defined subsets; not to modify or refine the classifier
- The purpose is not to demonstrate that repeating the classifier development process on independent data results in the same classifier

Later Stage Trials
Biomarkers: Enrich or Stratify?



- Enrich = “integral”
  - Certainty about biomarker
  - Certainty that you do not wish to test others
  - Assay clinically valid (FDA is watching you!)
- Stratify = “integrated”
  - Bigger than no-biomarker trial
  - Assay clinically valid (less scrutiny)

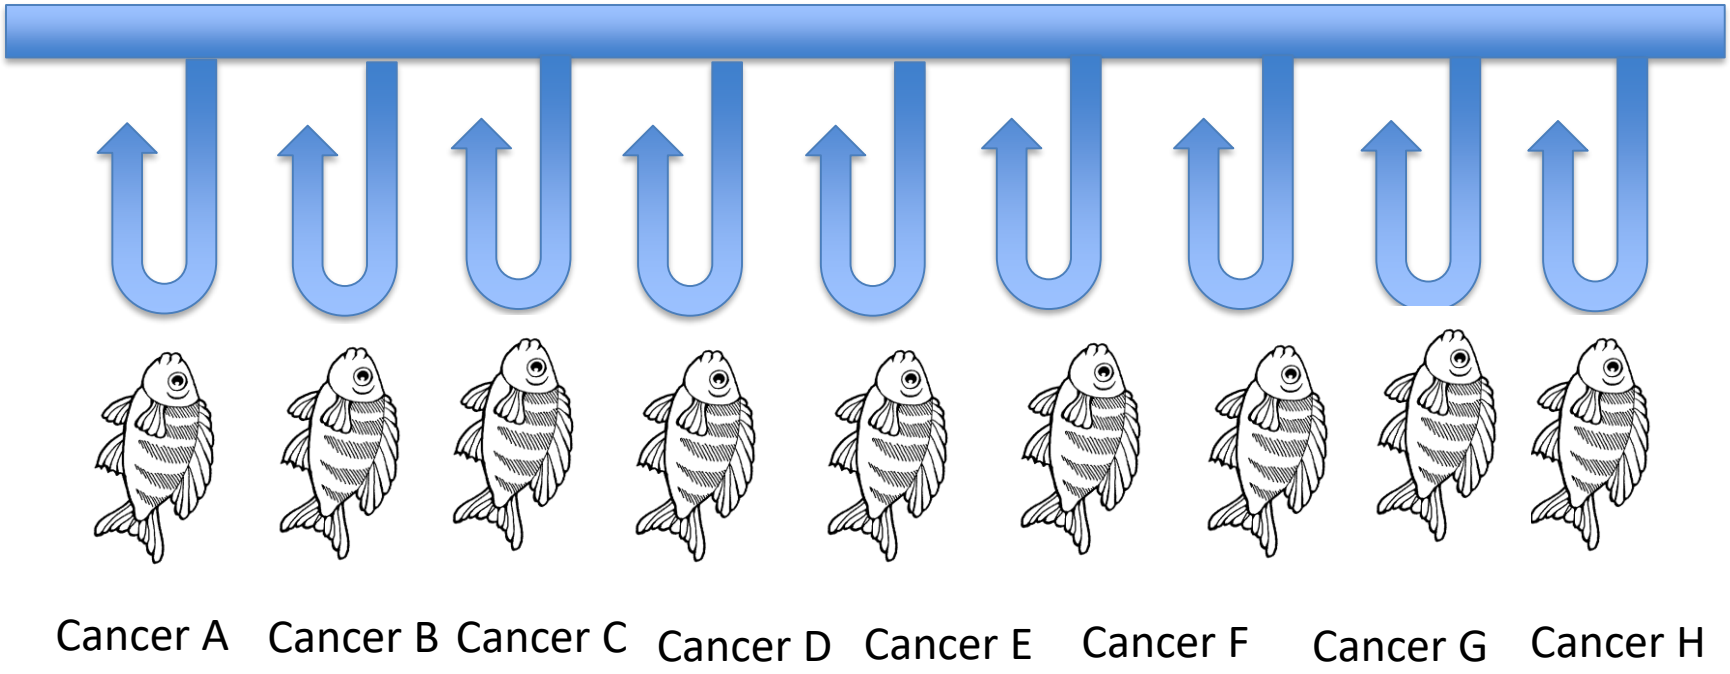
Economics and logistics of personalized medicine trials



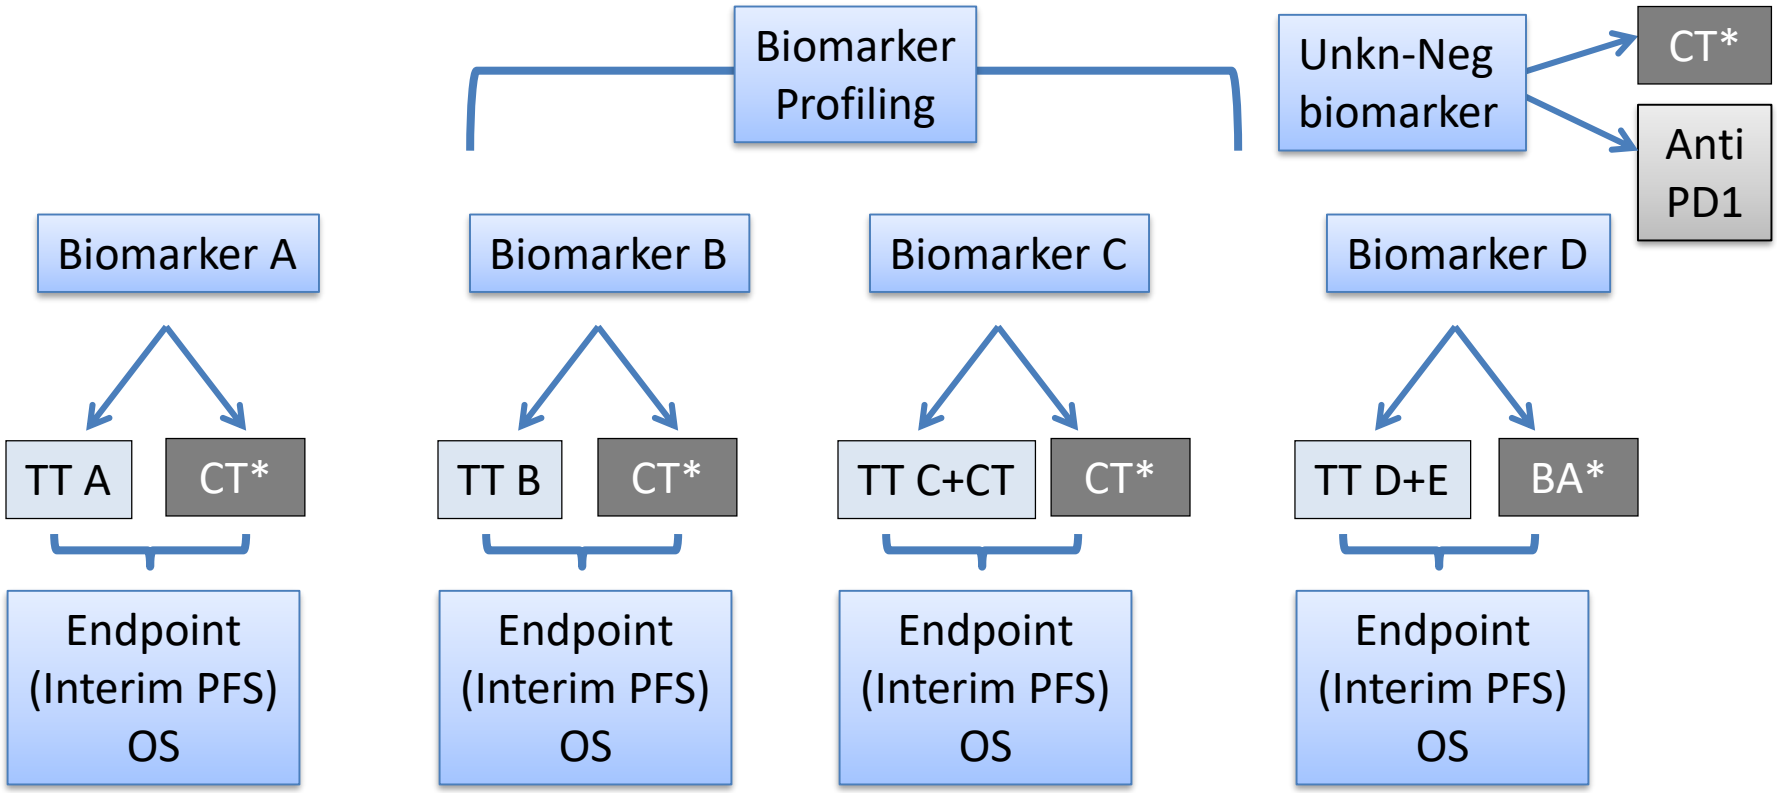
Economics and logistics of personalized medicine trials

- Each center needs to open multiple studies to be economically viable
- Greater regulatory burden (protocols emendments, SUSARs)
- Cost per case increased
- Limited experience accumulated per centre
- Collection of trial data by sponsor with sharing of toxicity data by grade and frequency on a regular basis throught protocol conduct

Single protocol: Multiple cohorts signal finding trials

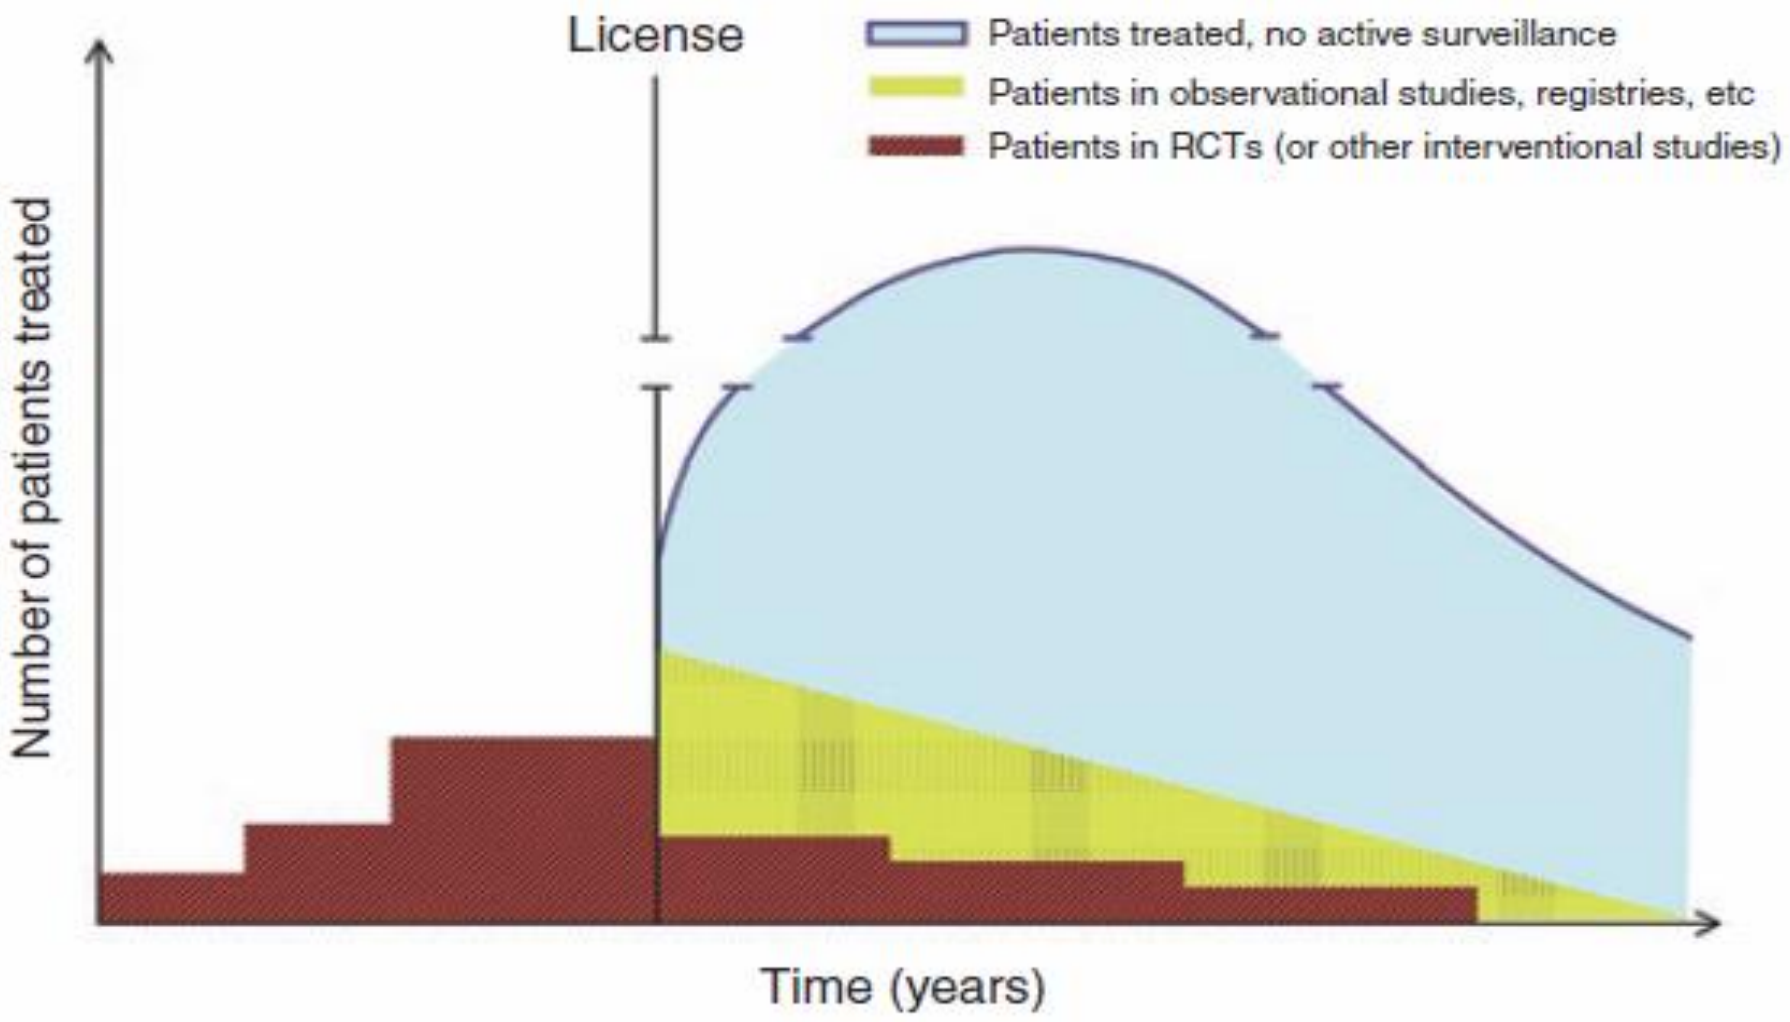


Master Protocol



TT=Targeted therapy, CT=chemotherapy; BA=Biological Agent

Observational data



Eichler H-G, et al: Clin. Pharm. Ther. Vol 91, 91:426–437, March, 2012

Unselected patients with expansion cohort in enriched population

Dose Escalation	Expansion cohort Pharmacodynamics Targeted tumors types

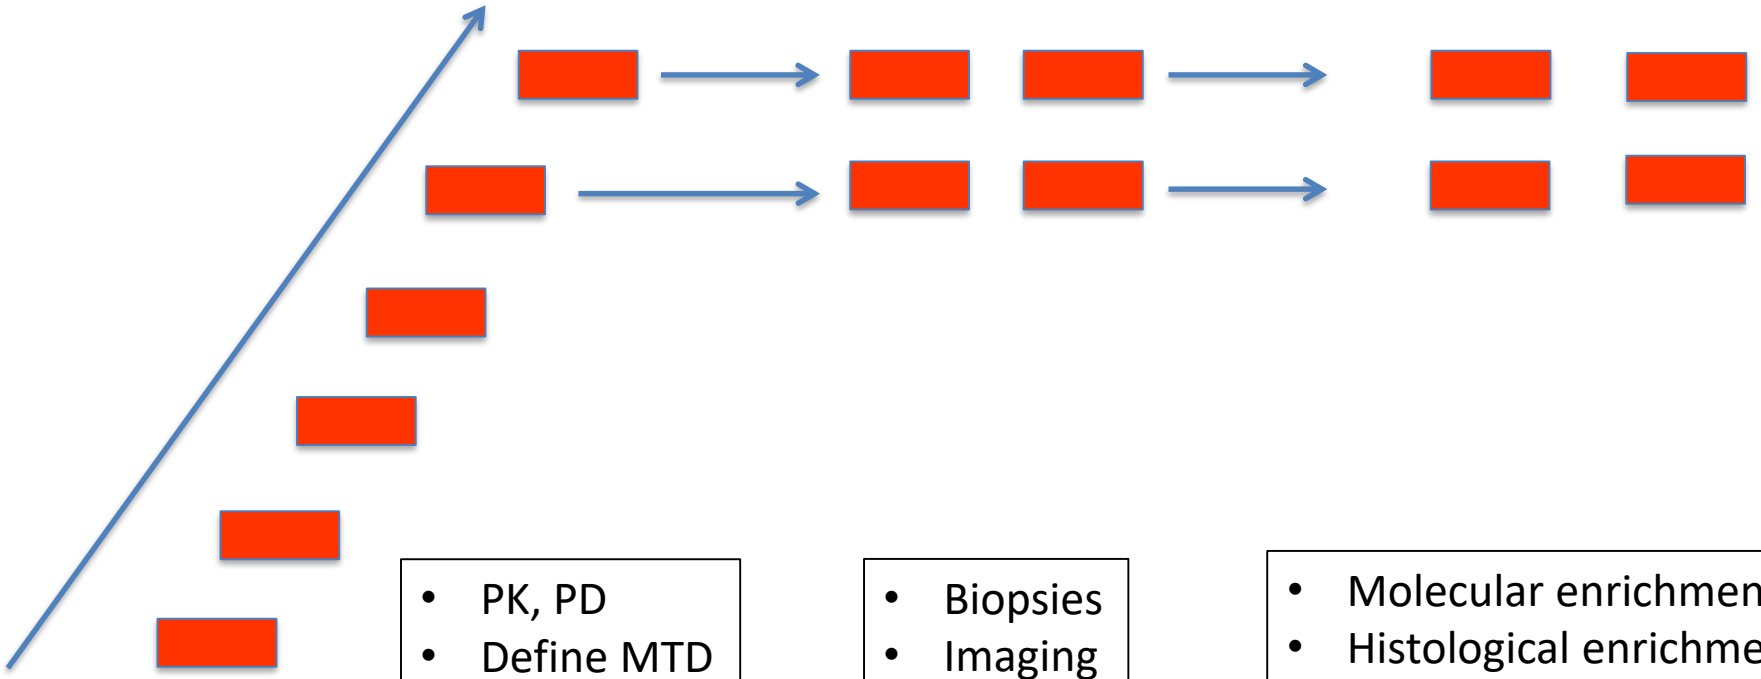
- Biopsies
- Imaging

- Molecular enrichment
- Histological enrichment

Molecular enriched population

Dose Escalation	Expansion cohort Pharmacodynamics Targeted tumors types

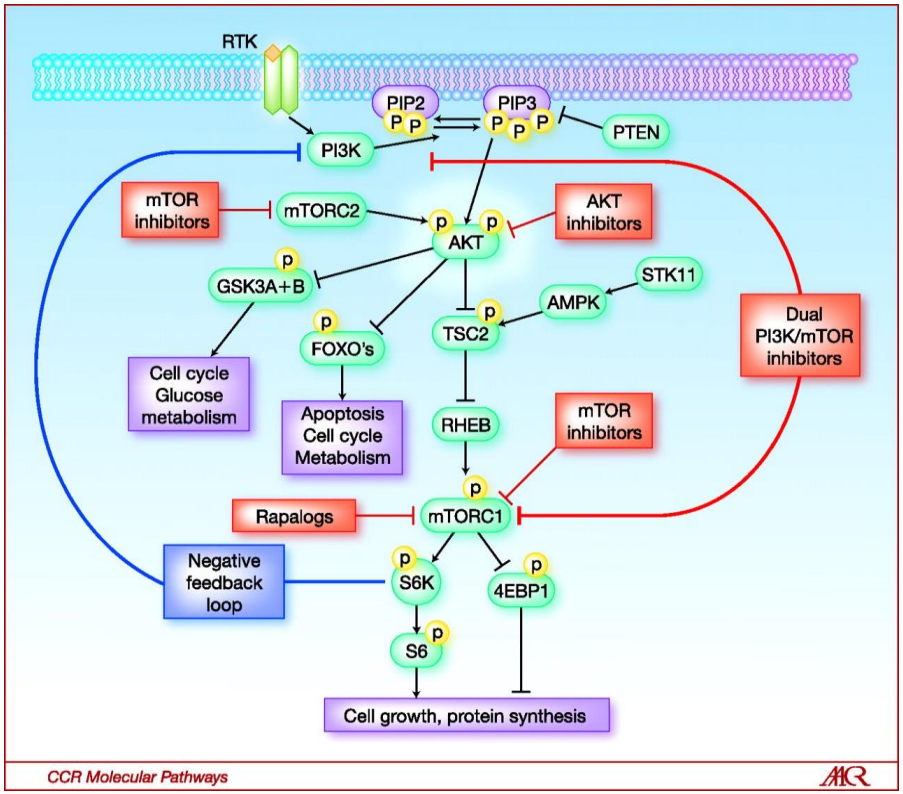


- PK, PD
- Define MTD

- Biopsies
- Imaging

- Molecular enrichment
- Histological enrichment

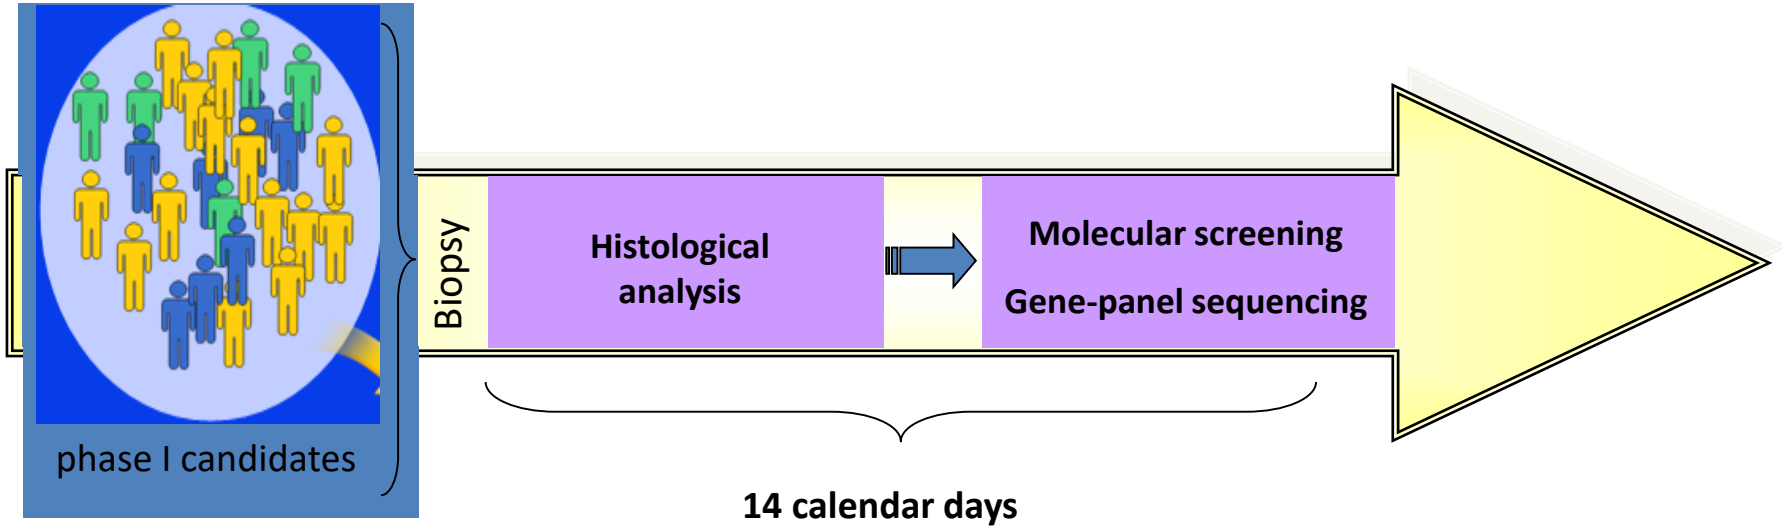
Examples



- Inclusion criteria

1. PIK3CA mutation or amplification
2. PTEN loss of function
3. cMET activation or HER2 amplification/IHC 3+
4. Endometrial cancer not selected for molecular status

Molecular enrichment



- Complex PK and PD, cardiokinetics
- Dedicated staff (research nurses, data managers, pathologists, interventional radiologists, MDs)
- Time to reaction

Biomarker-Driven Clinical Research

NNS = Number needed to screen

$$\frac{1}{\text{(fraction with biomarker X assay specificity X fraction trial-eligible X fraction giving informed consent)}}$$

Example: HER2+ in BC= 1/(0.25 X 0.9 X 0.5 X 0.5) = 17.8 patients screened/1 patient entered into trial

Example: ALKtx in NSCLC = 1/(0.05 X 0.9 X 0.5 X 0.5) = 88 patients screened/1 patient entered into trial

Example: PIK3CA mut in BC = 1/(**0.03** X 0.9 X 0.5 X 0.5) = 148 patients screened/ 1 patient entered into trial

Example: FGFR in BC = 1/(**0.08** X 0.9 X 0.5 X 0.5) = 55 patients screened/ 1 patient entered into trial

Enrichment and patient selection

Element	Challenges	Solutions
Molecular selection	Central screening • Archived tumor samples requested • Return of molecular information • Turnaround time variable Local screening • Local screening not reimbursed • Assay may not be validated in CLIA lab	Activate molecular screening programs national based or locally supported using validated multiplexed assays (funding remain an issue)
Identification of rare subset of patients	↑Screening costs while ↓ number of eligible patients with financial challenges to keep many trial open with less patients recruited	Support for screening Multiplexed screening Umbrella or basket protocols

The future drug development paradigm?

Histology and molecular selection	Proof of concept
Safety and tolerability	Substancially efficacy in selected patients uding innovative trial designs and endpoints
Functional target selection	Trial design accounting for interpatient and intratumor heterogeneity
Pharmacology	
Antitumor activity	

Summary

- What we can't do
  - 8000 pt trials in unselected breast cancer
- What we can do –
  - New continuum for genome-forward approaches
    - Representative model systems in parallel +
    - Small hypothesis-driven trials
  - New strategies for biomarker-driven clinical trials
    - Start broadly (relatively unselected) and learn
    - Be as critical about assays as you are of drugs
  - Novel strategies are good, but so are traditional endpoints – Overall survival
- Embrace your lab colleagues, molecular pathologists, and statisticians!

Thank you

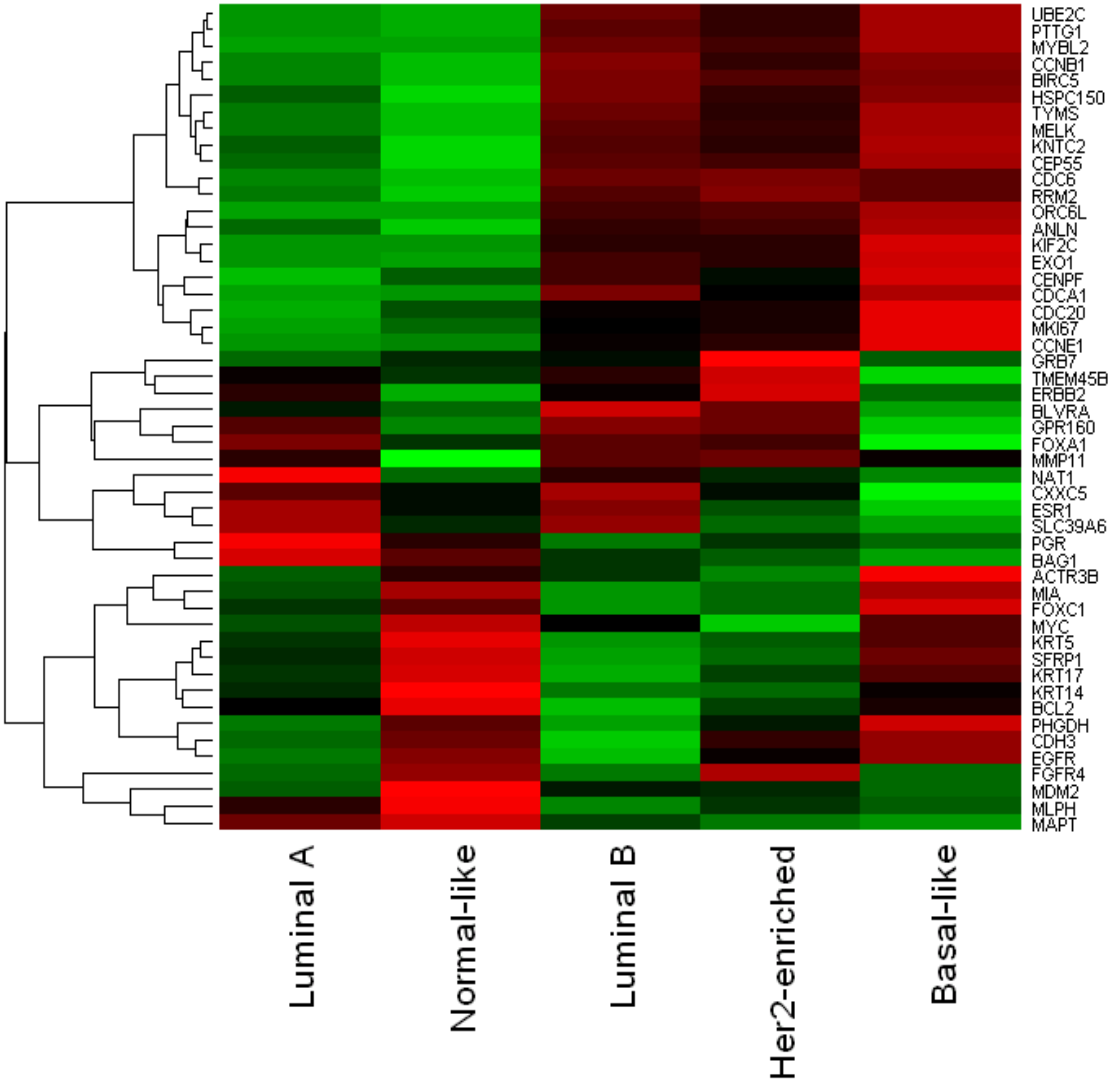
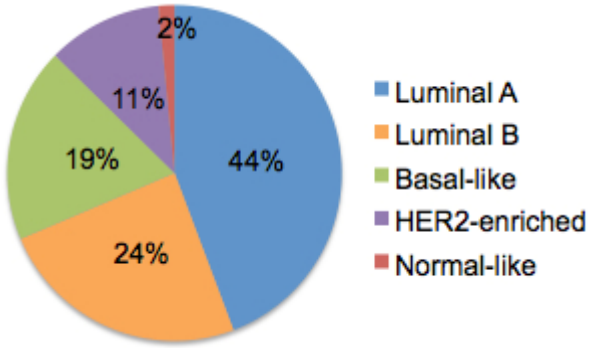
Molecular classification





Classification: St Gallen 2017

Clinical grouping	Notes*
Triple negative	Negative ER, PR and HER2
Hormone receptor-negative & HER2-positive	ASCO/CAP guidelines
Hormone receptor-positive & HER2-positive	ASCO/CAP guidelines
Hormone receptor-positive & HER2-negative :a spectrum	ER and/or PgR positive >= 1%
High receptor, low proliferation, low grade ("luminal A-like")	Multi-parameter molecular marker "good" if available. High ER/PR and clearly low Ki-67 or Grade.
Intermediate	Multi-parameter molecular marker "intermediate" if available. Uncertainty persists about degree of risk and responsiveness to endocrine and cytotoxic therapies.
Low receptor, high proliferation, high grade ("luminal B-like")	Multi-parameter molecular marker "bad" if available. Lower ER/PR with clearly high Ki-67, histological grade 3.

Subtypes

Classification and pathology assessment	Definition
Luminal tumors: ER positive/HER2 negative	
• **Luminal like-A: High ER, high PgR, low proliferative index and low grade**	Low risk tumors. No “genomic testing”
• **Luminal A/B like**	
• **A spectrum : low-intermediate expression of ER and PgR, intermediate grade, intermediate proliferative index**	Recommended use of “genomic testing”
• **Luminal B-like: low expression of ER and PgR, high grade, high proliferative index**	High risk

St Gallen 2017

Integrate pathology and biology

Histologic Grade		**Low (I of III)**	**Intermediate (II of III)**	**High (III of III)**
Biomarkers	ER expression	**+++**	**++ to +++**	**+ to ++**
	PR expression	**++ to +++**	**0 to +++**	**0 to ++**
	Proliferation (Ki-67 / S phase fraction)	**Low (<10%)**	**Intermediate (10-20%)**	**High (>20%)**
	HER2 Overexpression	**Never**	**Occasional**	**Occasional**
Genetic / Genomic / multipanel markers	21-gene recurrence score	**Low (< 18)**	**Intermediate (18-25)**	**High (>25)**
	Intrinsic subtype	**Luminal A**	**Luminal B**	
	Genomic Grade	**Lower**		**Higher**
	IHC4	**Lower**		**Higher risk**
	MammaPrint	**Low**		**High**
	Tumor DNA ploidy	**Mostly diploid**		**Mostly aneuploid**

St Gallen 2017

Medical treatment

Neoadjuvant therapy

Adjuvant therapy

Neoadjuvant therapy

We advice neoadjuvant therapy in:

- Locally advanced breast cancer
- Breast cancer with predictive factors of response to neoadjuvant chemotherapy or targeted therapy (triple negative or HER2 positive BC)

Neoadjuvant therapy

- Increasing rate of conservative surgery
- Increasing rate of radical surgery.
- In vivo monitoring of tumor response.

Neoadjuvant therapy

Newly diagnosed tumor

THERAPY

Curative intent

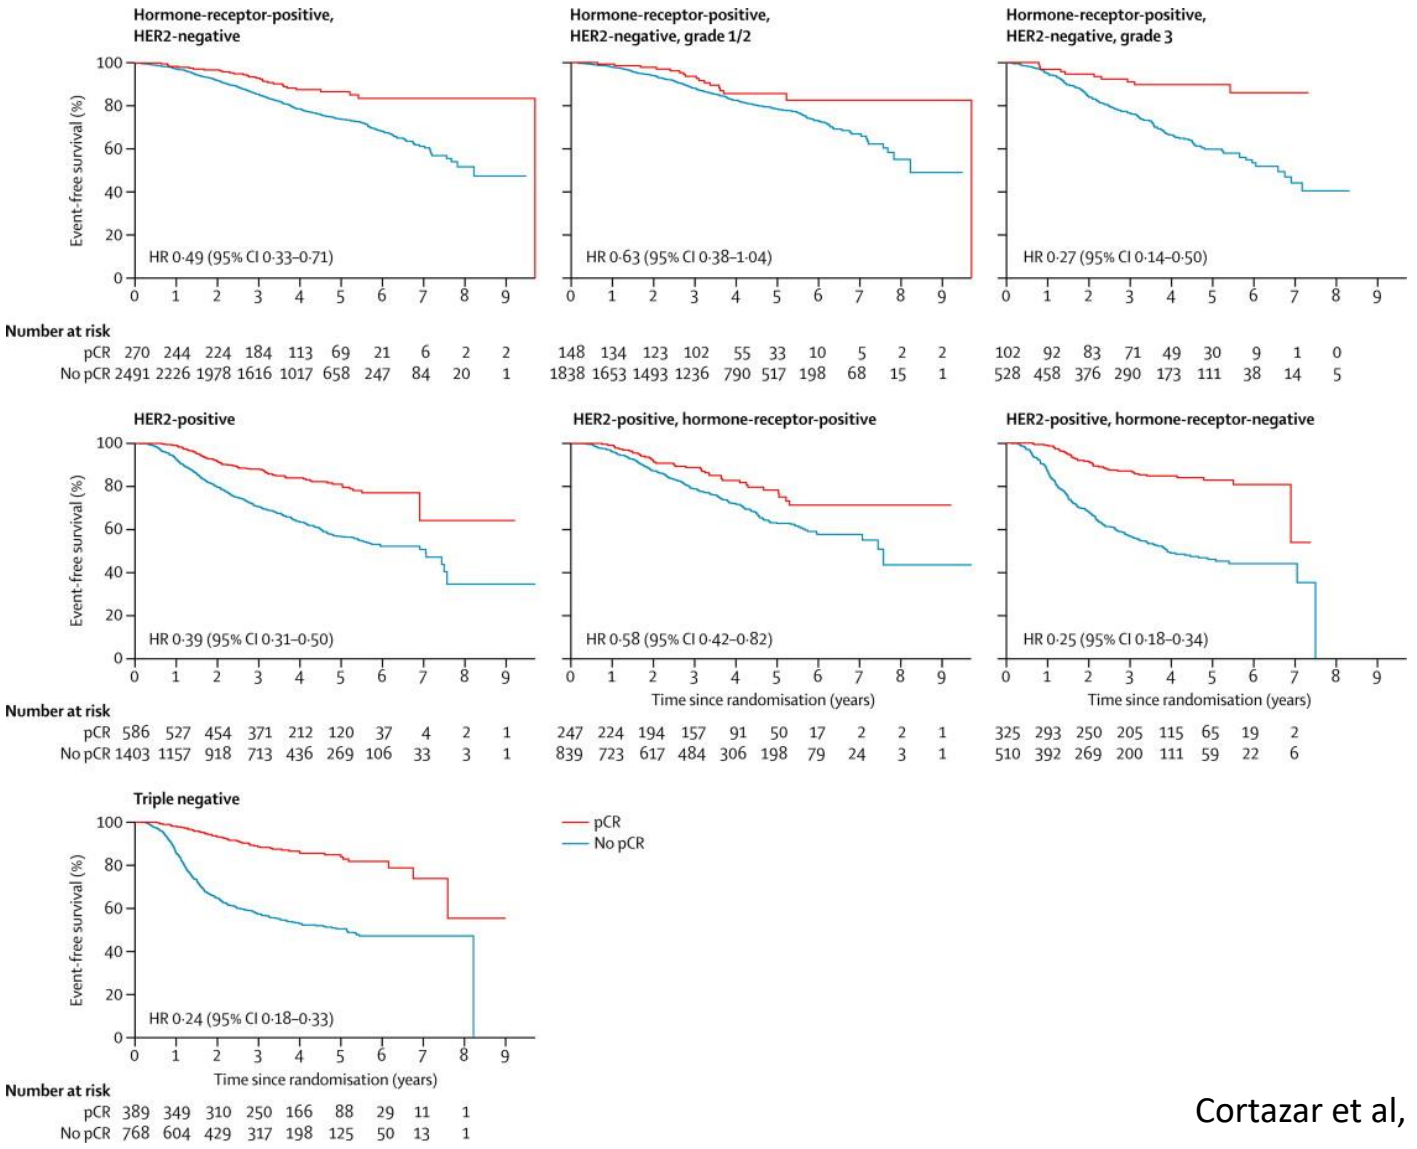
Residual tumor

- Pro:
  - Increasing rate of BCT
  - Pathological complete response
  - Drug develomment
- Contras:
  - Low rate of pCR (ER+)
  - Select subgroups
  - Implication for surgeons and radiation oncologists

Preferred option in some subtypes (triple negative ed HER2 positive)

pCR as surrogate for survival

(N=11,955)



Cortazar et al, Lancet 2014

Increase in pCR

74%

65%

48%

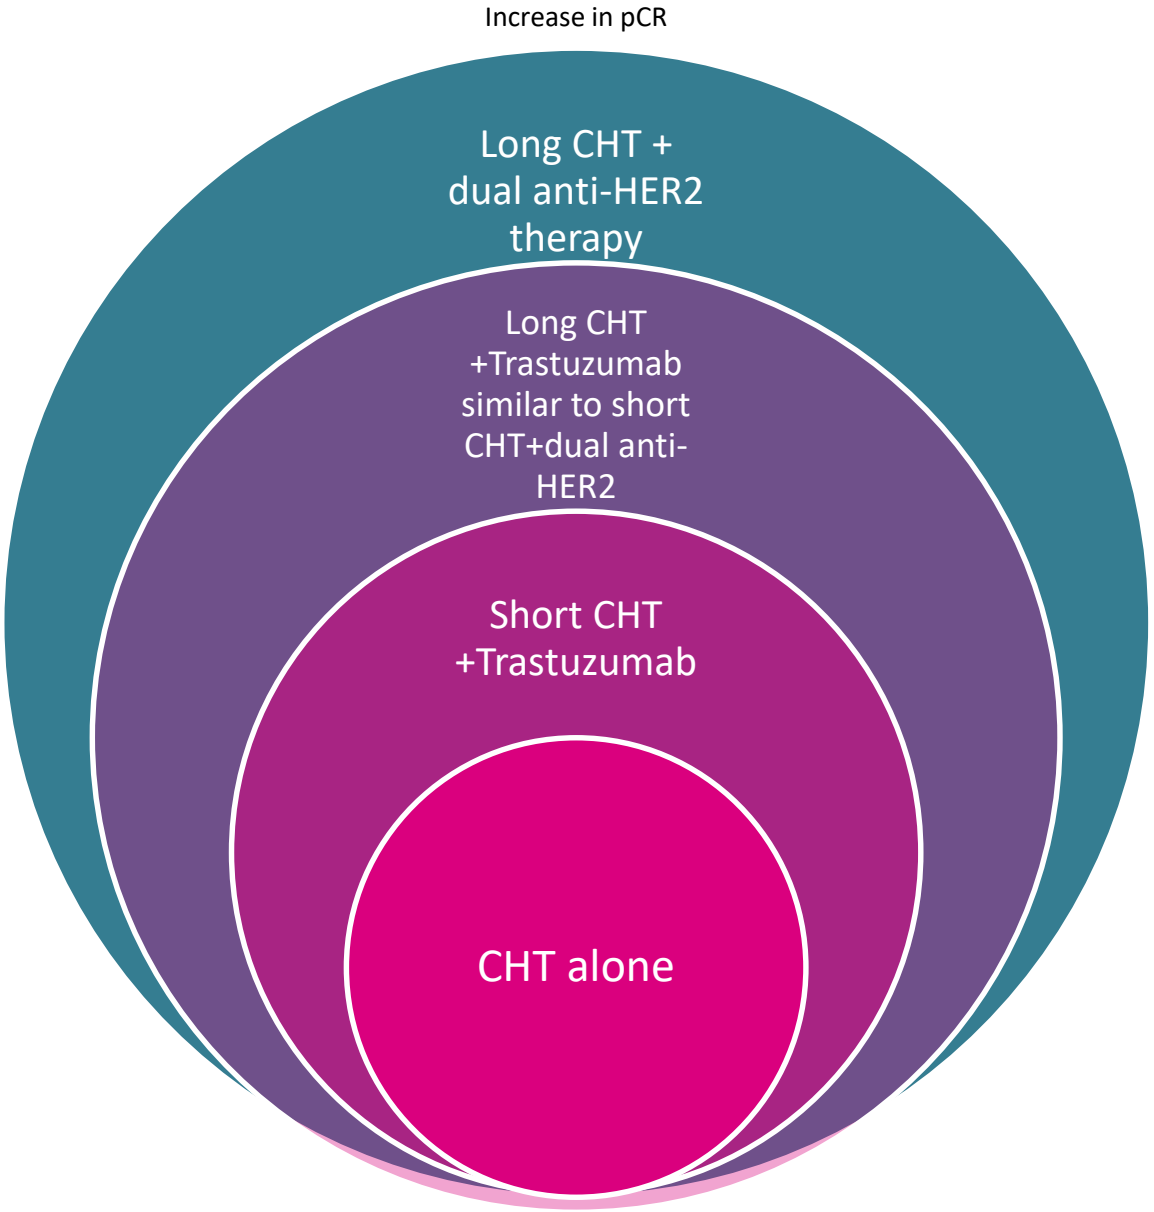
45%

38%

25%

20%

15%



Pathological complete response

- Absence of infiltrating carcinoma in breast and nodes

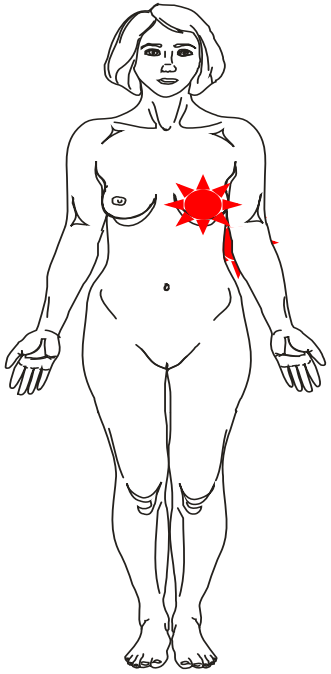
- Absence of infiltrating carcinoma (T and N) with residual *in situ* carcinoma.

Adjuvant therapy

- Reduce the risk of distant relapse.

- Adjuvant therapy (endocrine, chemotherapy or biology): duration and intensity to be decided according to stage and biological features of disease, balancing risk and benefits for the individual patient.

Adjuvant therapy

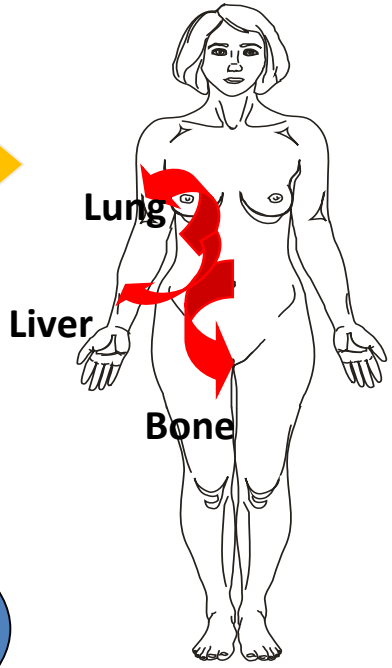


Early stage

Curable disease

Adjuvant therapy

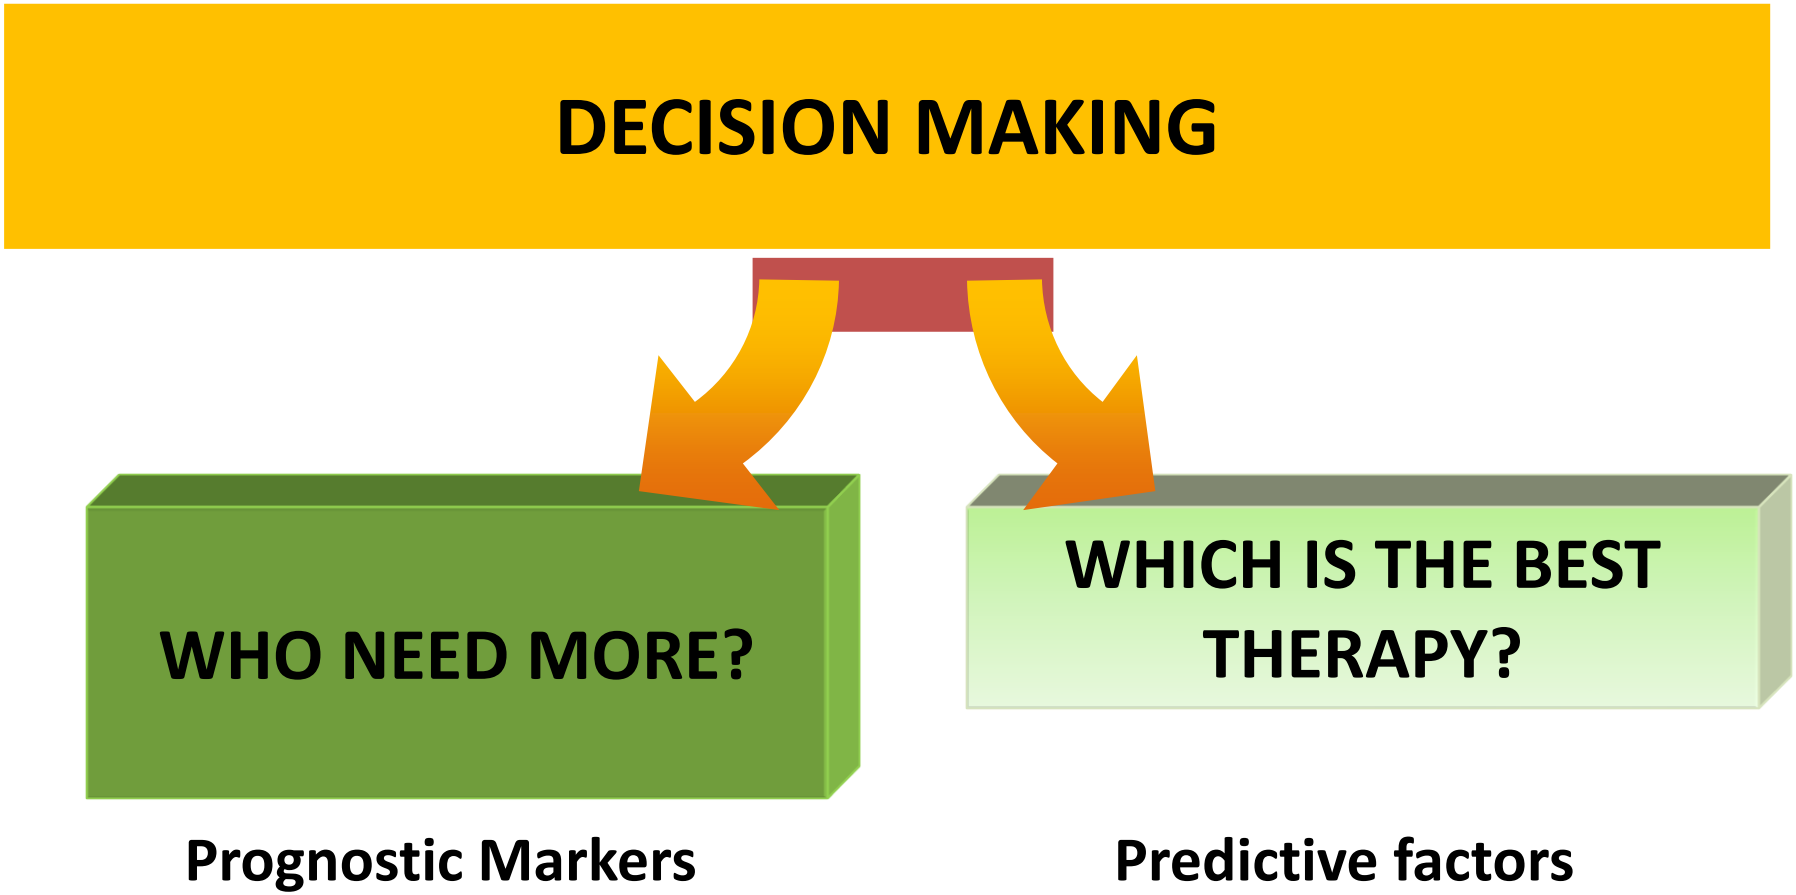
Risk of:
- Overtreatment
- Undertreatment
- Wrong treatment
- Suboptimal treatment



Mestatatic disease

Chronic disease

Adjuvant therapy



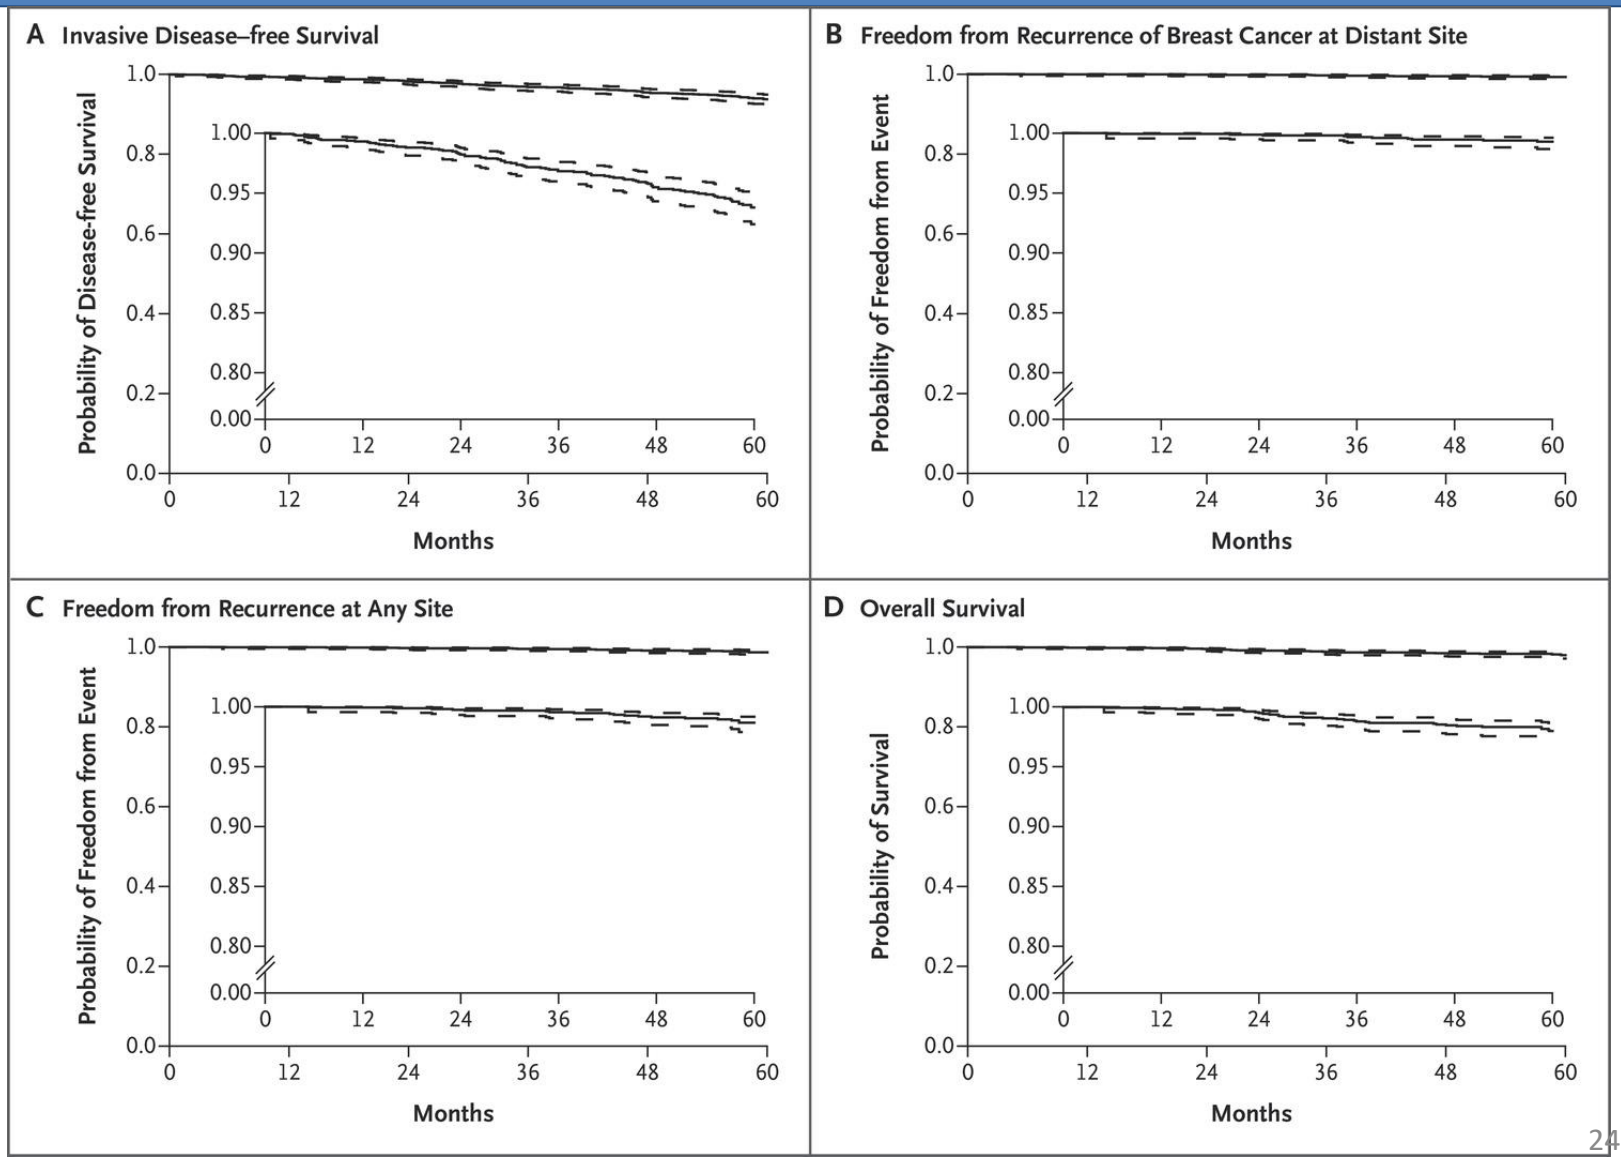
Adjuvant therapy

Relative Indications for chemotherapy in addition to endocrine therapy	Area of uncertainty for indication to chemotherapy in addition to endocrine therapy	Relative Indications for endocrine therapy alone
Histological Grade 3 **High or intermediate "genomic risk"**	Histological Grade 2 Intermediate "genomic risk"	Histological Grade 1 Low "genomic risk"
High proliferation[a]	Intermediate proliferation	Low proliferation
Lower ER and PgR level	High/Intermediate degree of ER and PgR expression	Higher ER and PgR level
Node positive (4 or more involved nodes)	Node positive (1-3 involved nodes)	Node negative
Presence of extensive peritumoral vascular invasion		Absence of extensive peritumoral vascular invasion
pT > 5 cm	pT 2.1 – 5 cm	pT ≤ 2cm

ER positive/HER2 negative

Subtypes according to clinical-pathological and genomic risk assessment	Treatment recommendation	De-escalation	Escalation
ER positive & HER2-negative			
High receptor, low tumour burden (pT1a, pT1b), no nodal involvement (pN0), low proliferation, low grade or low "genomic risk"	Endocrine therapy alone according to menopausal status		
Premenopausal	Tamoxifen 5 years	No role for extended adjuvant tamoxifen beyond 5 years No OFS	
Postmenopausal	Tamoxifen 5 year Consider AI as an option if tamoxifen is contraindicated or not tolerated	The majority of the panel recommended against extended adjuvant endocrine therapy beyond 5 years	

DFS and OS

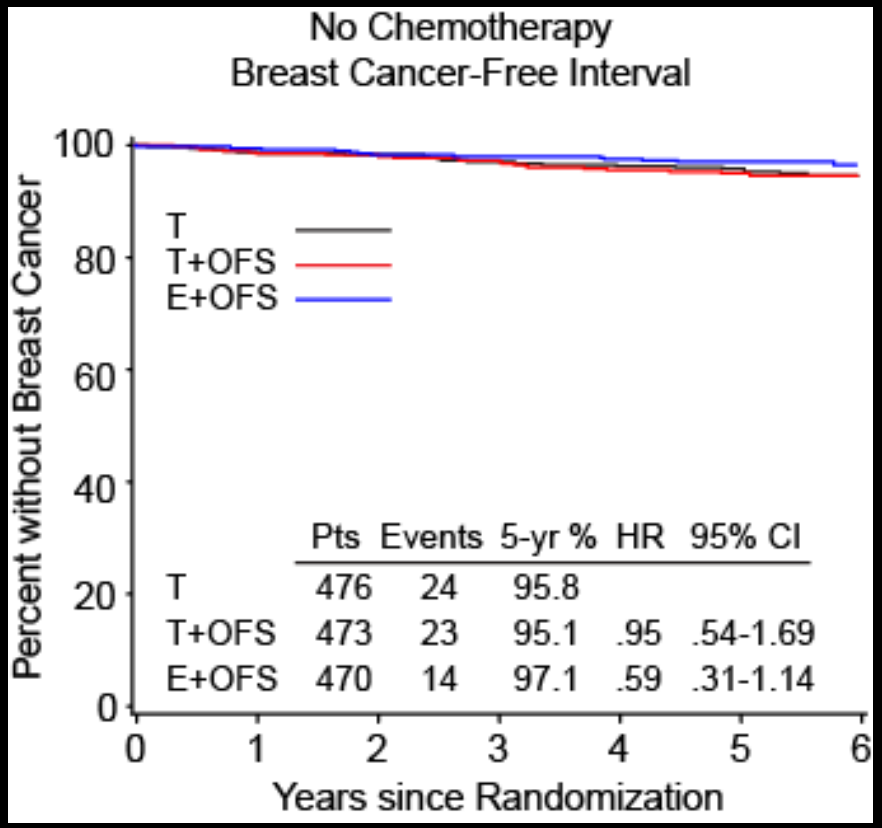


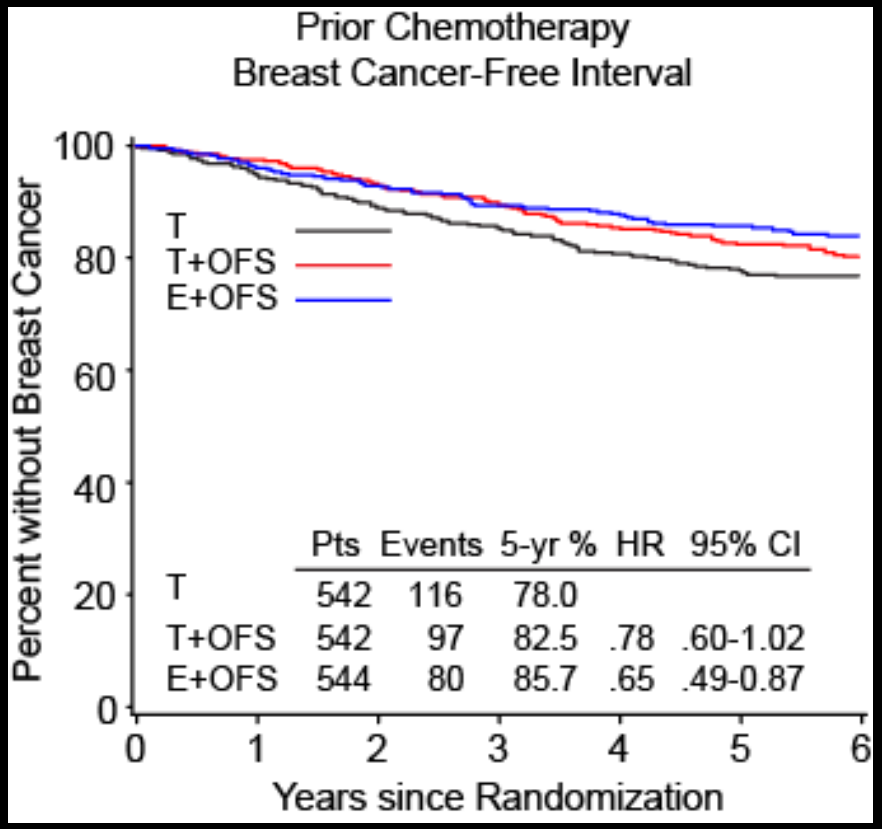
Sparano JA et al. N Engl J Med 2015;373:2005-2014.

ER positive/HER2 negative

Subtypes according to clinical-pathological and genomic risk assessment	Treatment recommendation	De-escalation	Escalation
ER positive & HER2-negative			
High/Intermediate degree of ER and PgR expression, intermediate tumour burden pT1c, pT2, pN0 or pN1 (1-3), intermediate or high proliferation or grade, and/or intermediate "genomic risk"	Endocrine therapy according to menopausal status plus adjuvant chemotherapy		
Premenopausal Uncertain "clinical risk" (node negative) "intermediate genomic risk"	OFS plus tamoxifen or OFS plus exemestane		Consider addition of chemotherapy in selected cases Extended adjuvant endocrine therapy with tamoxifen in some cases
Premenopausal intermediate/high "clinical risk" (node positive) "intermediate/high genomic risk"	OFS plus exemestane plus adjuvant chemotherapy in many cases		Chemotherapy Extended adjuvant endocrine therapy with tamoxifen
Post-menopausal Uncertain "clinical risk" (node negative) "intermediate genomic risk"	AI up front Chemotherapy in many cases		Bisphosphonates
Postmenopausal "intermediate/high genomic risk" and intermediate/high "clinical risk" (node positive)	Chemotherapy AI as first endocrine therapy for at least 3-5 years		Extended adjuvant AI according to risk and tolerability Bisphosphonates Denosumab has been shown to reduce bone-health related events in breast cancer patients

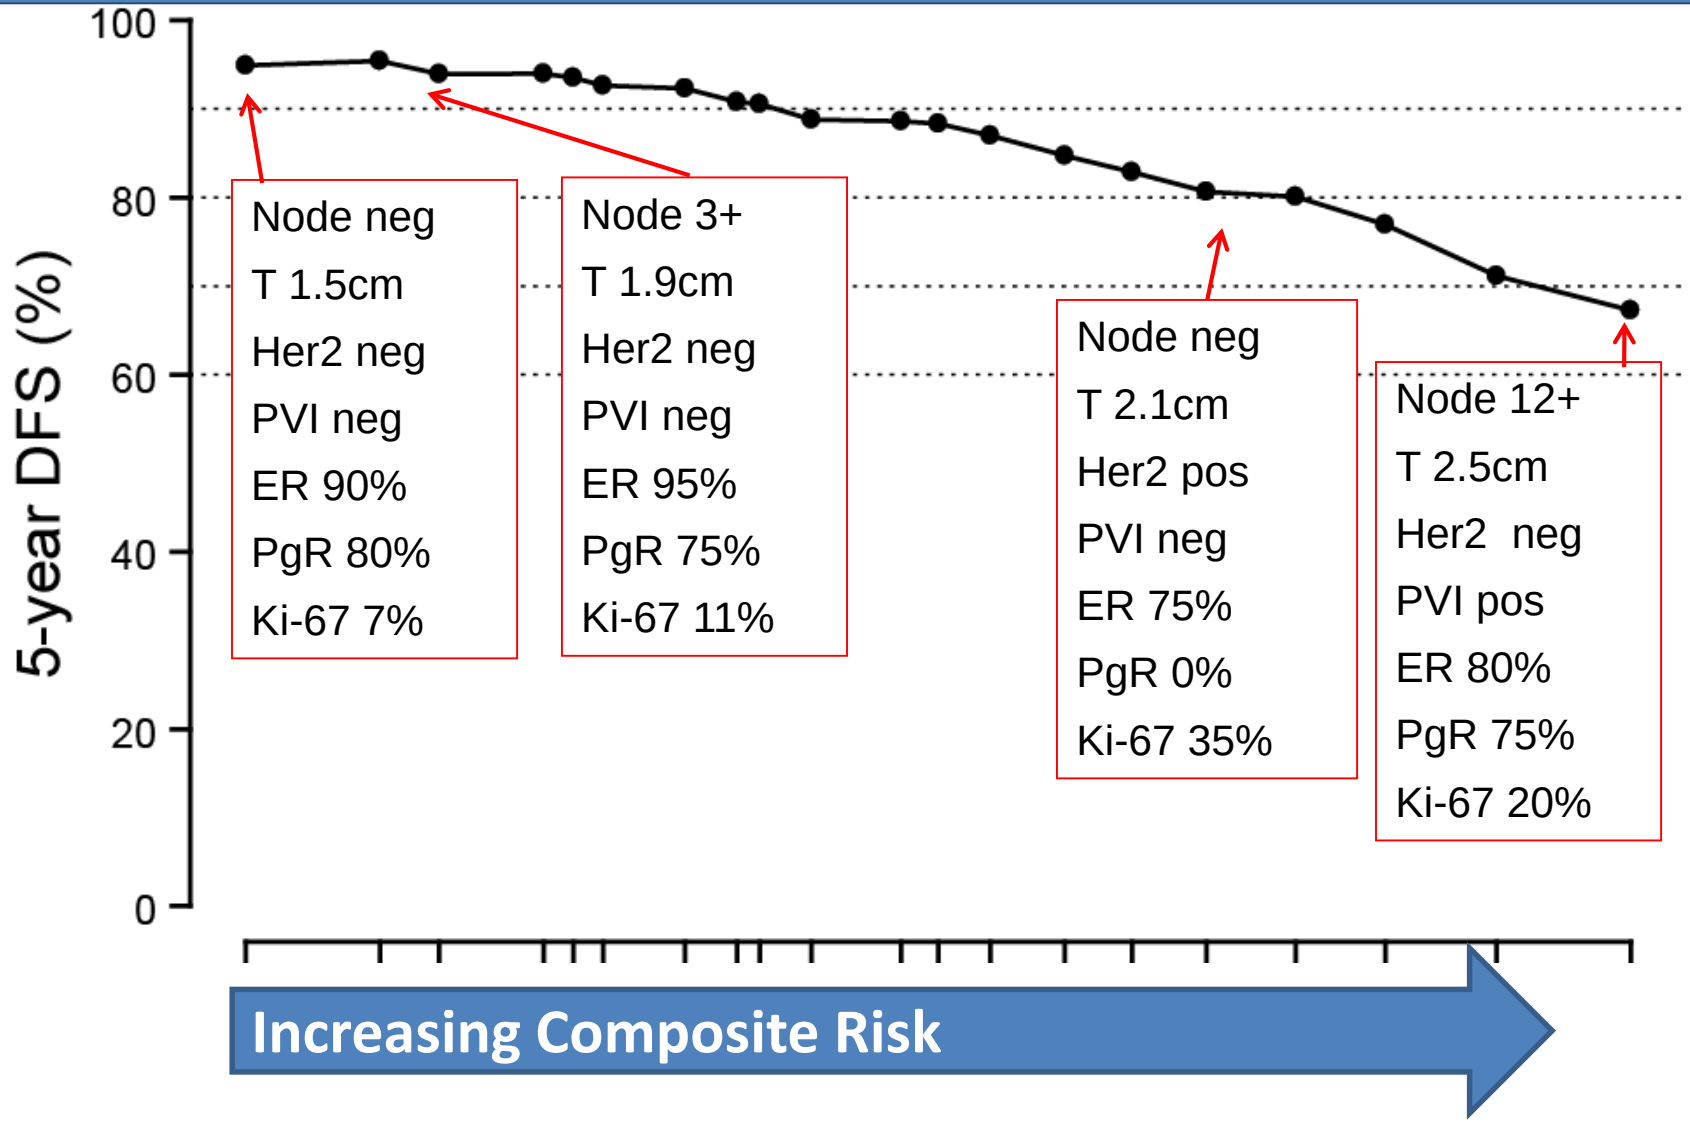
Premenopausal





Francis P, et al. NEJM 2015

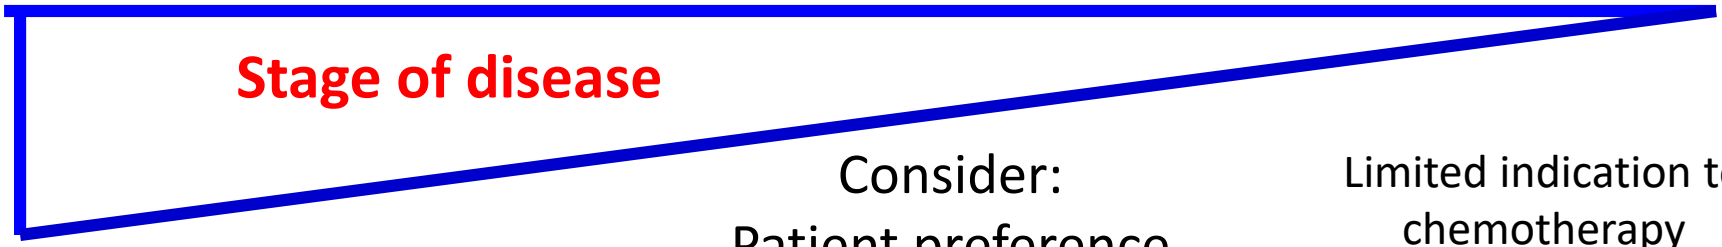
Post-menopausal



Viale G et al, JCO 2011

Chemotherapy

YES		NO
High grade	M A Y	Low grade
High Ki67		Low Ki67
Low ER and PR	B E	High ER e PR
High genomic risk		Low genomic risk
Luminal B like		Luminal A or surrogate
Risk of early recurrence		Risk of late recurrence



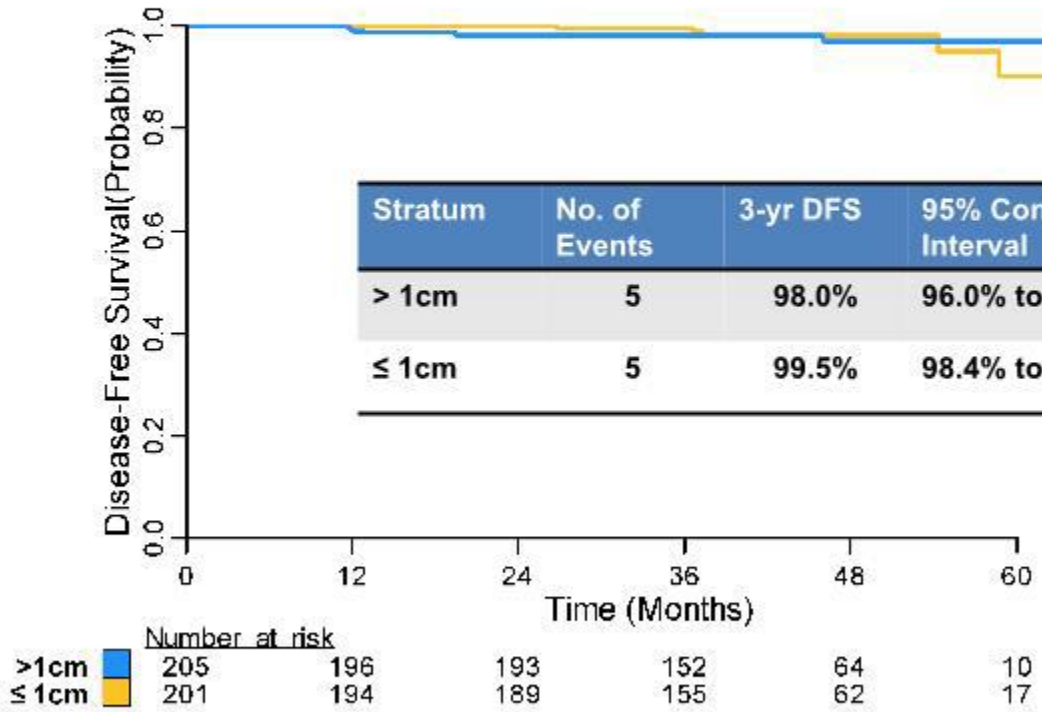
HER2 positive

Subtypes according to clinical-pathological and genomic risk assessment	Treatment recommendation	De-escalation	Escalation
ER negative & HER2-positive			
pT1a node negative	No systemic therapy	No systemic therapy	
pT1 b,c node negative	Chemotherapy plus trastuzumab	Consider paclitaxel plus one year trastuzumab without anthracyclines	Dual blockade with pertuzumab and trastuzumab improves outcome among patients who are at higher risk for relapse because of lymph-node involvement or hormone-receptor negativity [92]*
Higher T or N stage	Neoadjuvant therapy for stage II or III is the preferred initial treatment approach. Anthracycline followed by taxane with concurrent trastuzumab continued to 12 months	Patients may be treated with TCH regimen	Dual anti-HER2 therapy with pertuzumab and trastuzumab with chemotherapy as the preferred option in the neoadjuvant setting Dual blockade with pertuzumab and trastuzumab improves outcome among patients who are at higher risk for relapse because of lymph-node involvement or hormone-receptor negativity [92]*
ER positive & HER2-positive	As above plus endocrine therapy appropriate to menopausal status		Extended adjuvant therapy with neratinib after one year of trastuzumab may reduce recurrence in ER positive subgroup*.

Small HER2 positive

San Antonio Breast Cancer Symposium- Cancer Therapy and Research Center at UT Health Science Center- December 10-14, 2013

Disease-Free Survival by Tumor Size



Stratum	No. of Events	3-yr DFS	95% Conf. Interval
> 1cm	5	98.0%	96.0% to >99.9%
≤ 1cm	5	99.5%	98.4% to >99.9%

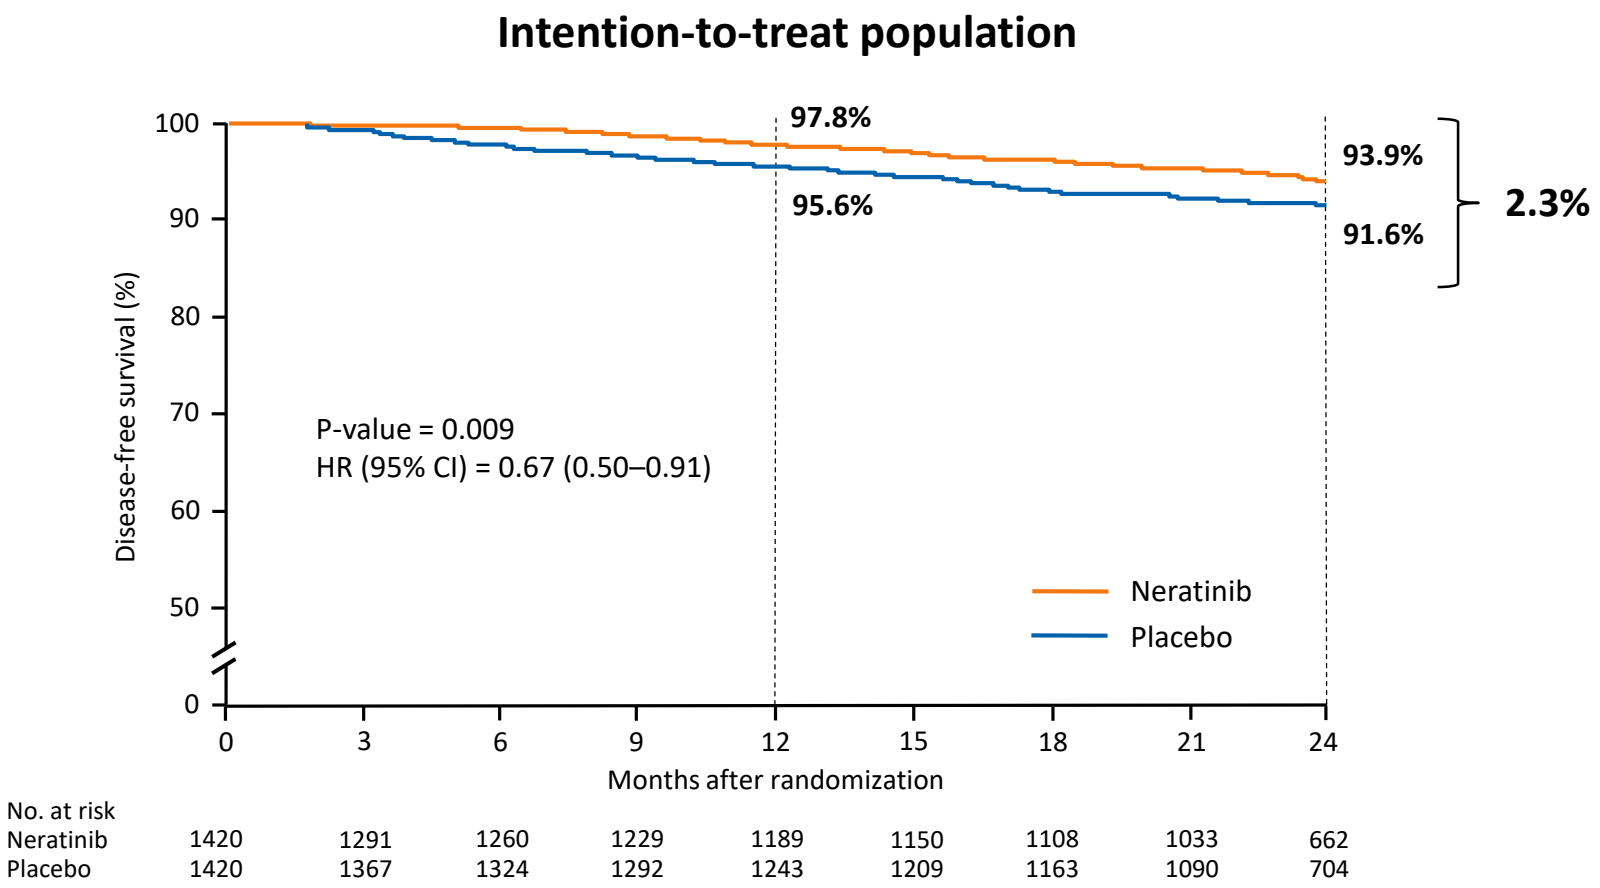
Extended adjuvant therapy



Chan et al. Lancet Oncol 2016

Triple negative

Subtypes according to clinical-pathological and genomic risk assessment	Treatment recommendation	De-escalation	Escalation
Ductal triple negative			
pT1a node negative		No routine adjuvant chemotherapy for stage pT1a pN0.	
Higher T and N stage	Neoadjuvant therapy for stage II or III is suggested as initial treatment approach. Chemotherapy should include anthracycline and taxanes	Dose-dense adjuvant chemotherapy preferred by only a minority of the consensus panel	No consensus on post-neoadjuvant treatment in case of residual disease. In BRCA1/2 associated cancers, the Panel was evenly split on whether to recommend (neo)-adjuvant platinum chemotherapy though agreed that such patients should receive alkylating chemotherapy.

Small triple negative

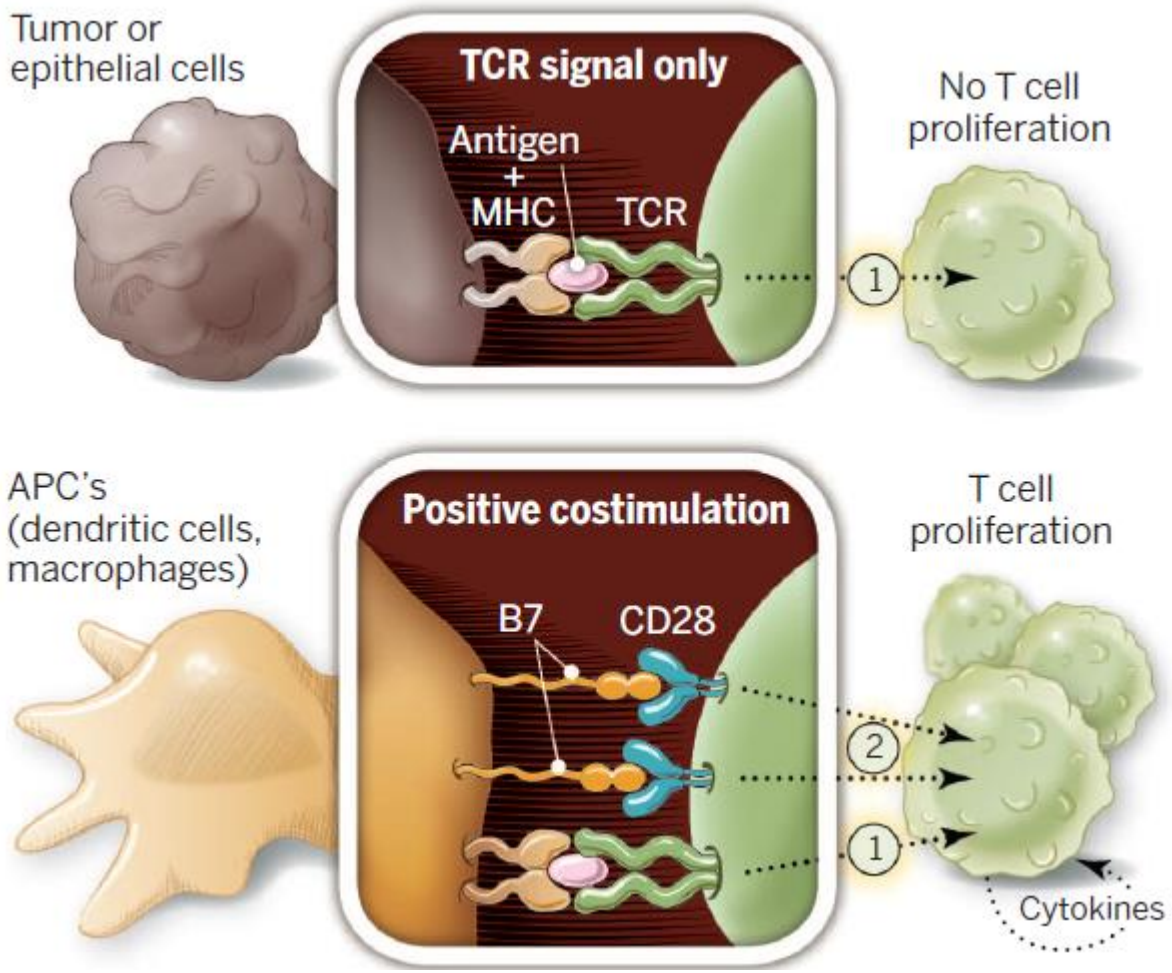
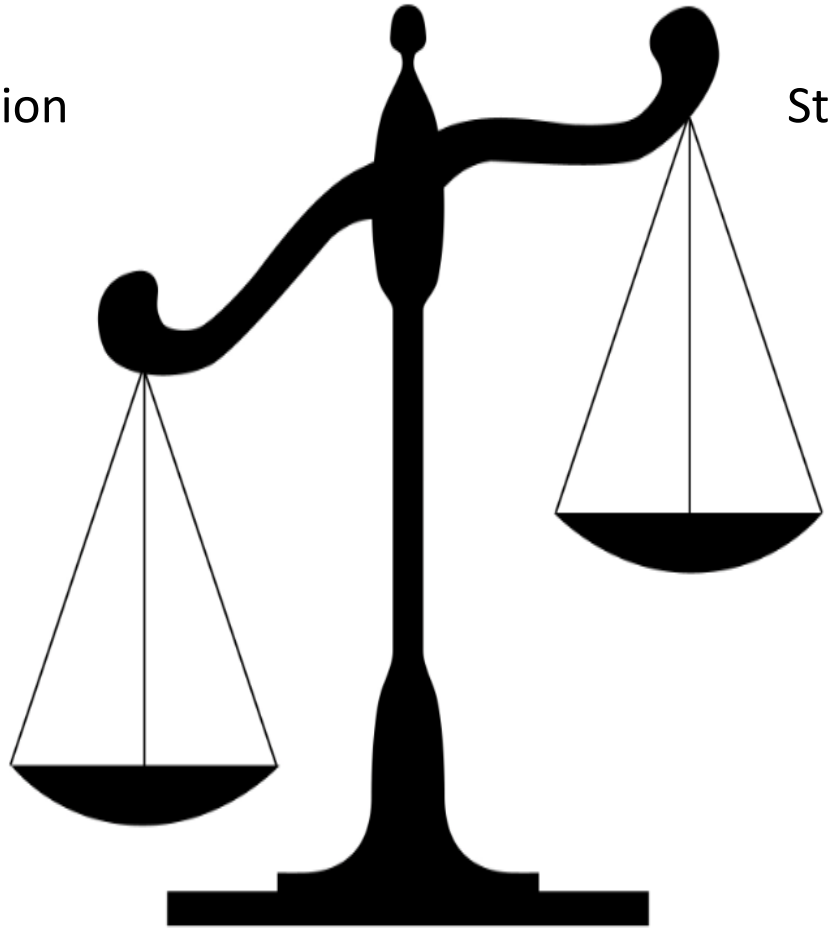
Activation of T cells requires two signals



Science 3 APRIL 2015 • VOL 348 ISSUE 6230

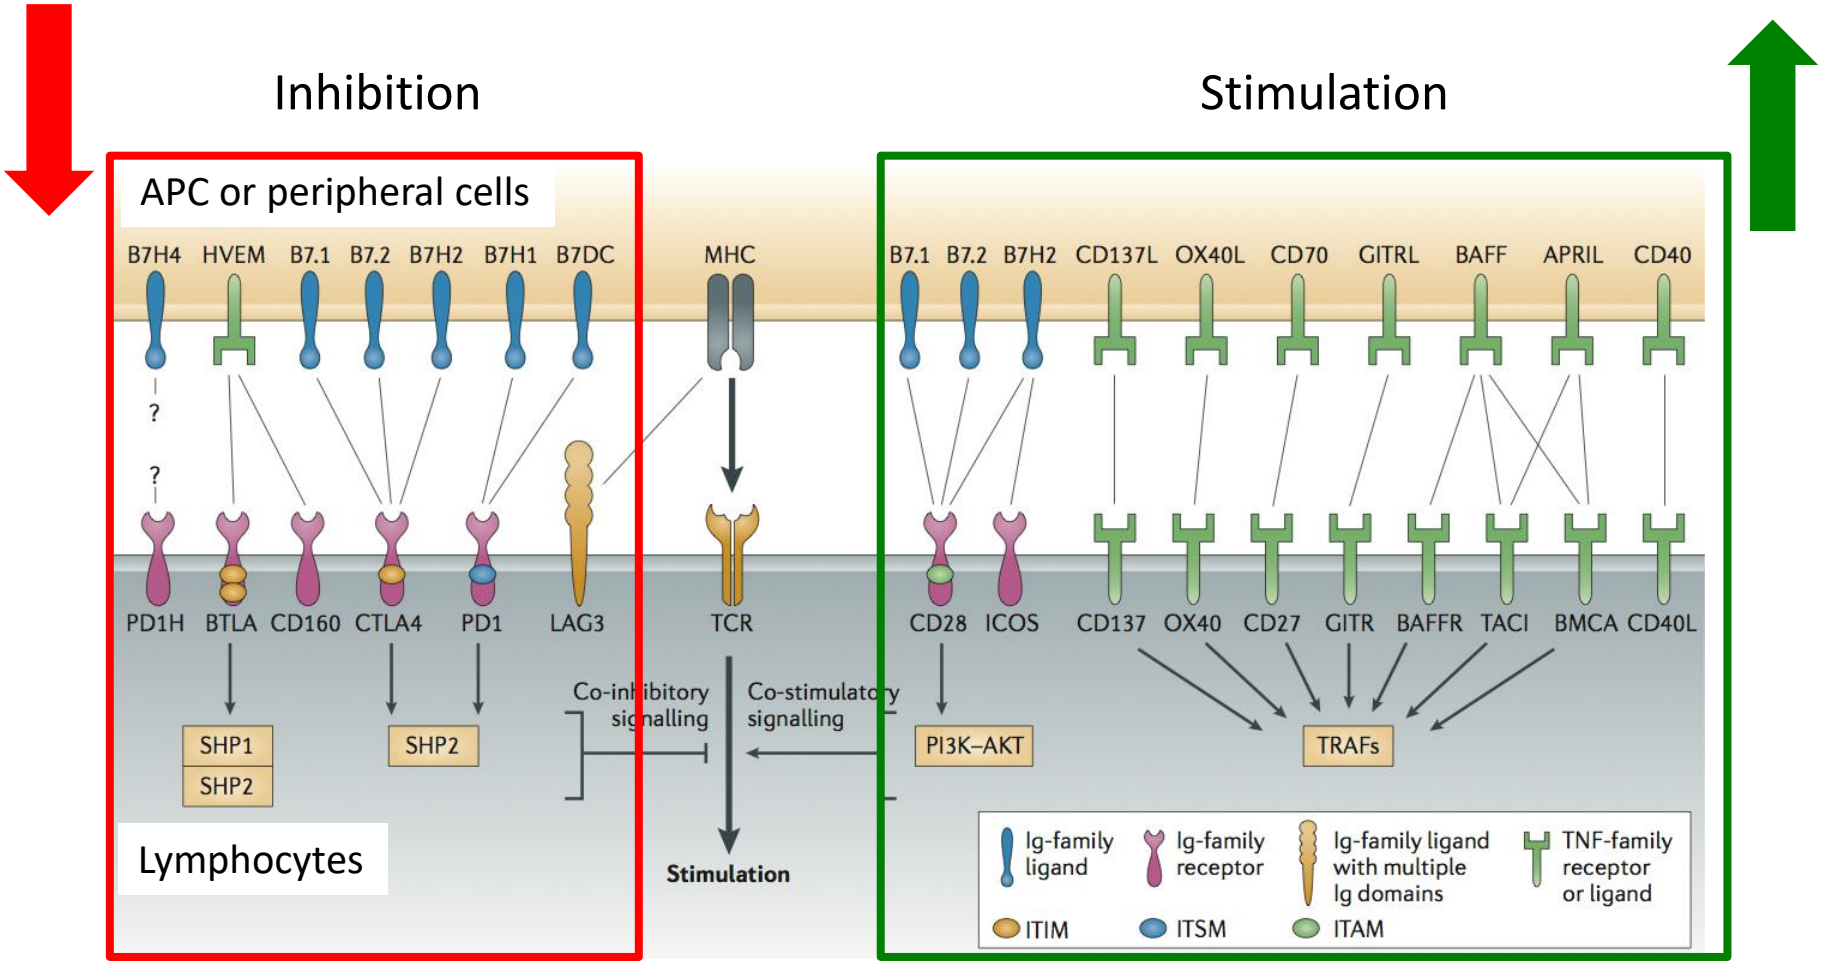
Finely tuning of the immune response

Inhibition



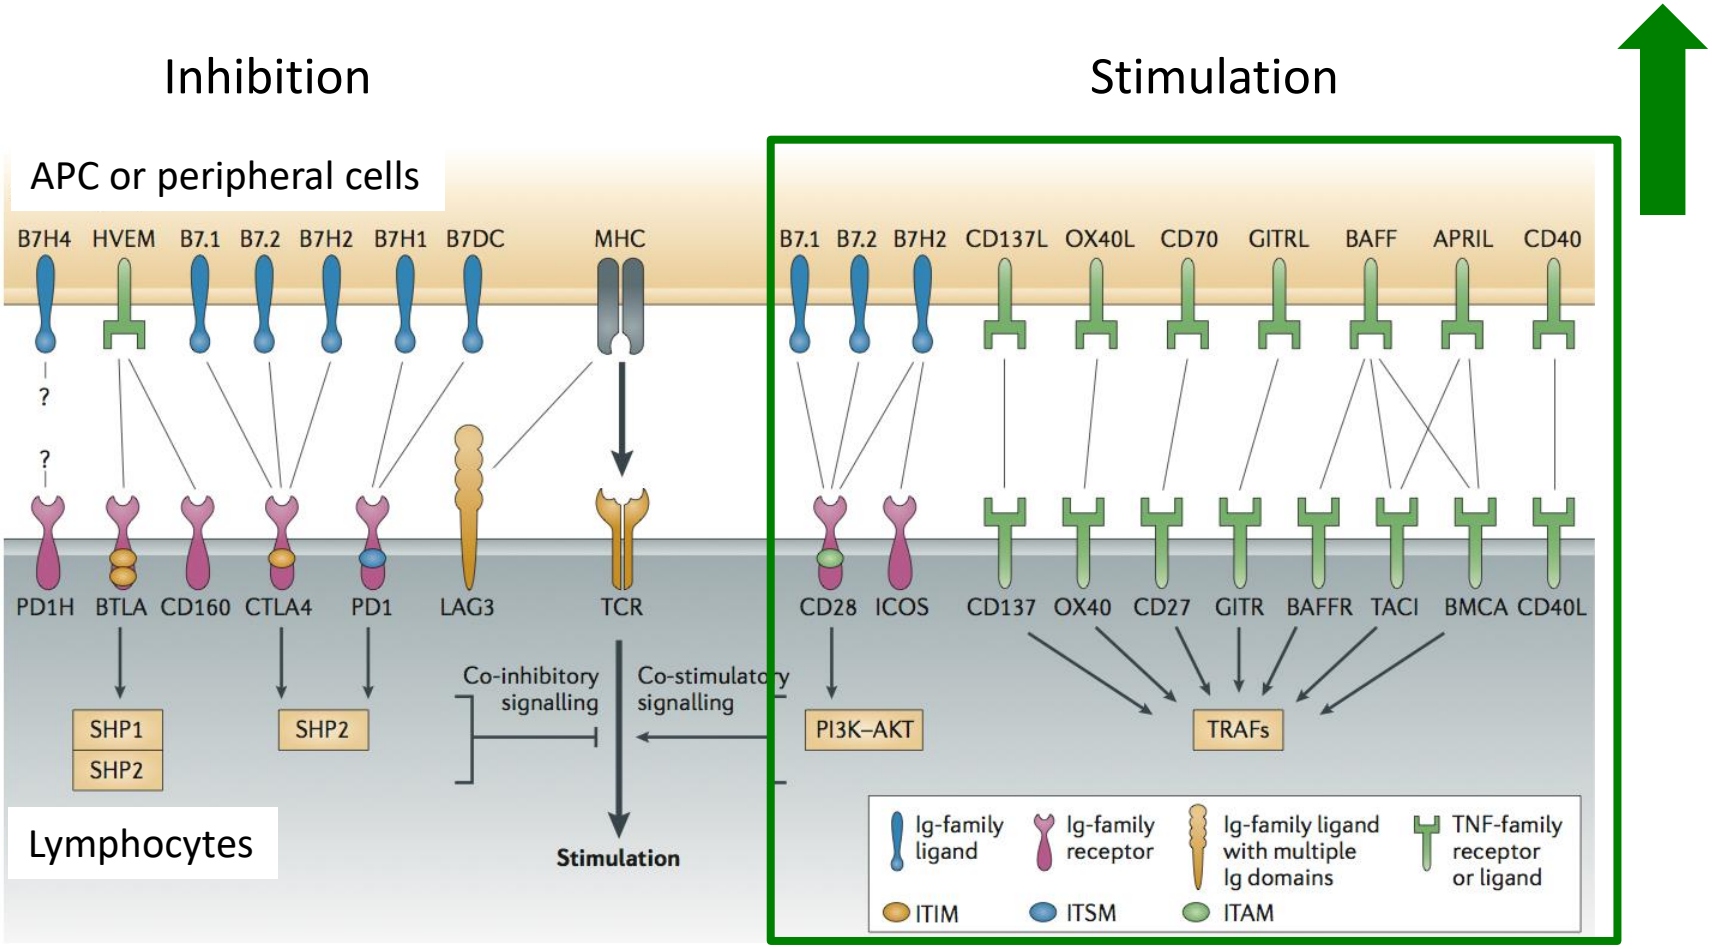
Stimulation

Finely tuning of the immune response
Immune checkpoints



Nature Reviews Drug Discovery 12, 130-146 (February 2013)

Finely tuning of the immune response
Immune checkpoints



Nature Reviews Drug Discovery 12, 130-146 (February 2013)

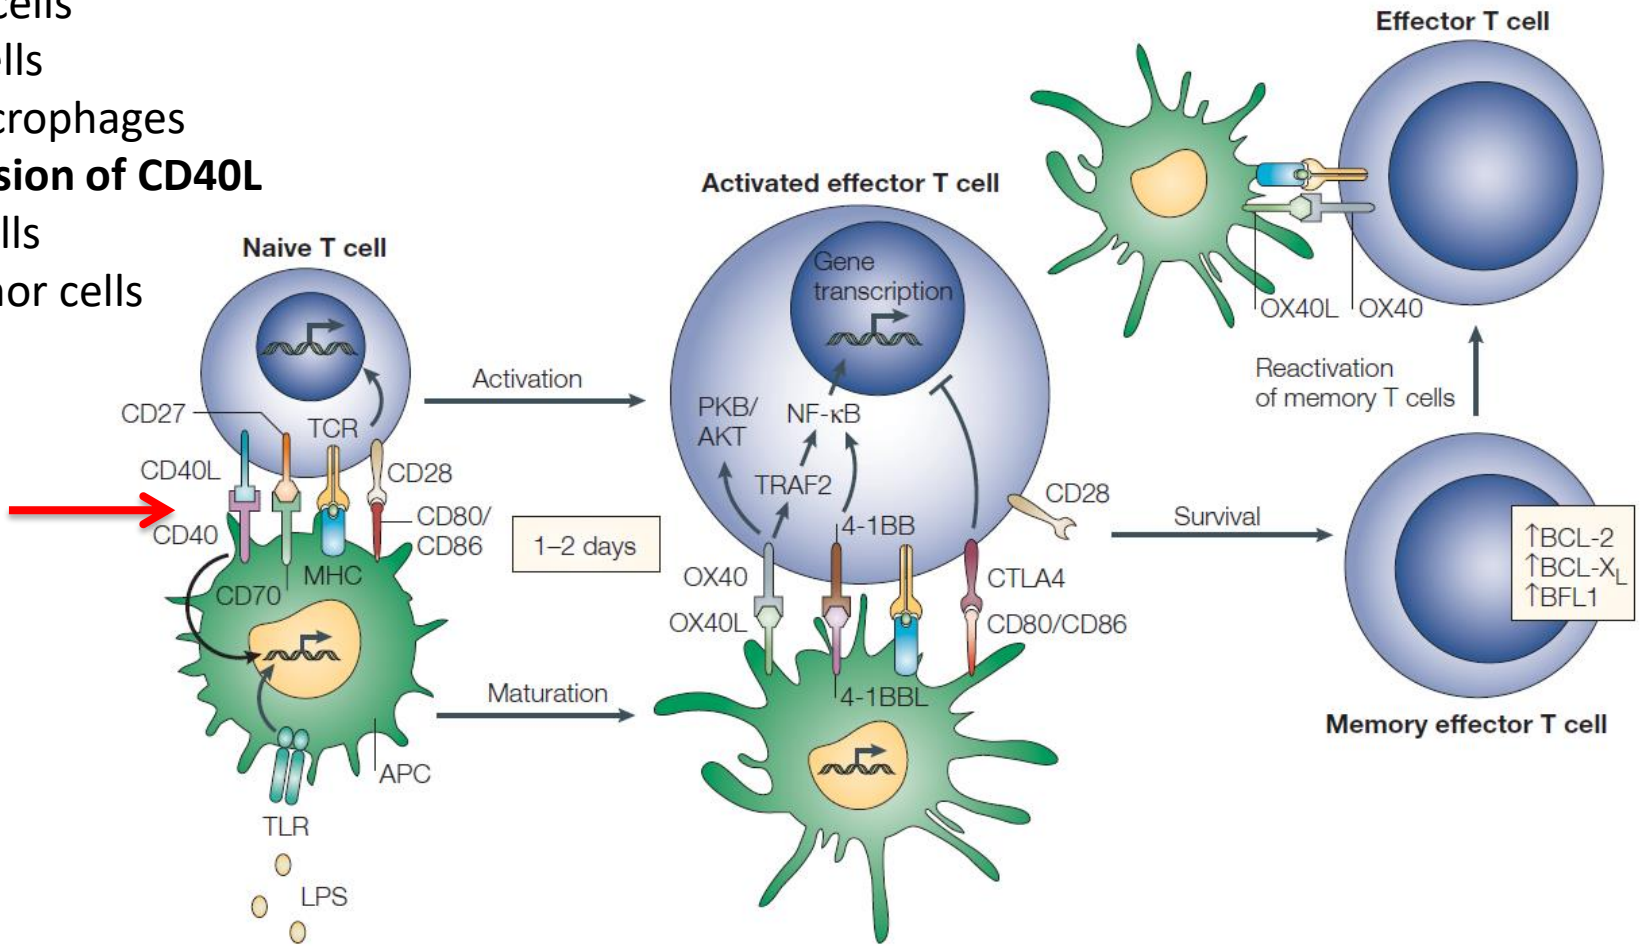
CD40/CD40L

Expression of CD40

- DC cells
- B cells
- Macrophages

Expression of CD40L

- T cells
- Tumor cells

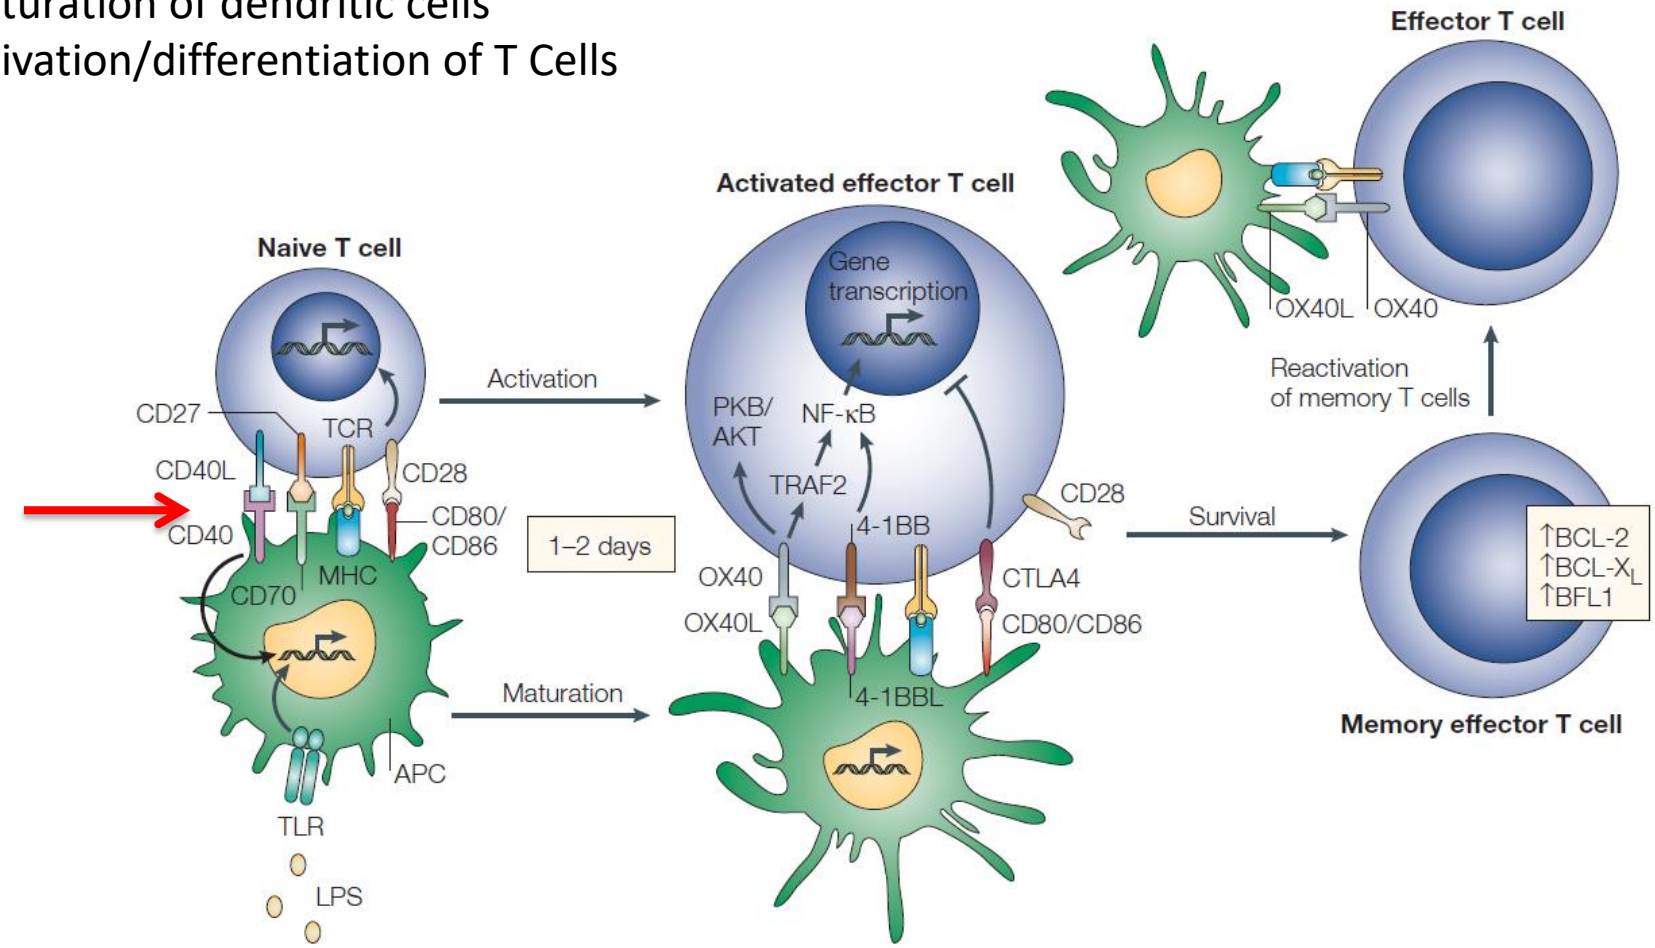


Nature Rev Immunol. 4:420 (2004)

CD40/CD40L

Function

- Maturation of dendritic cells
- Activation/differentiation of T Cells

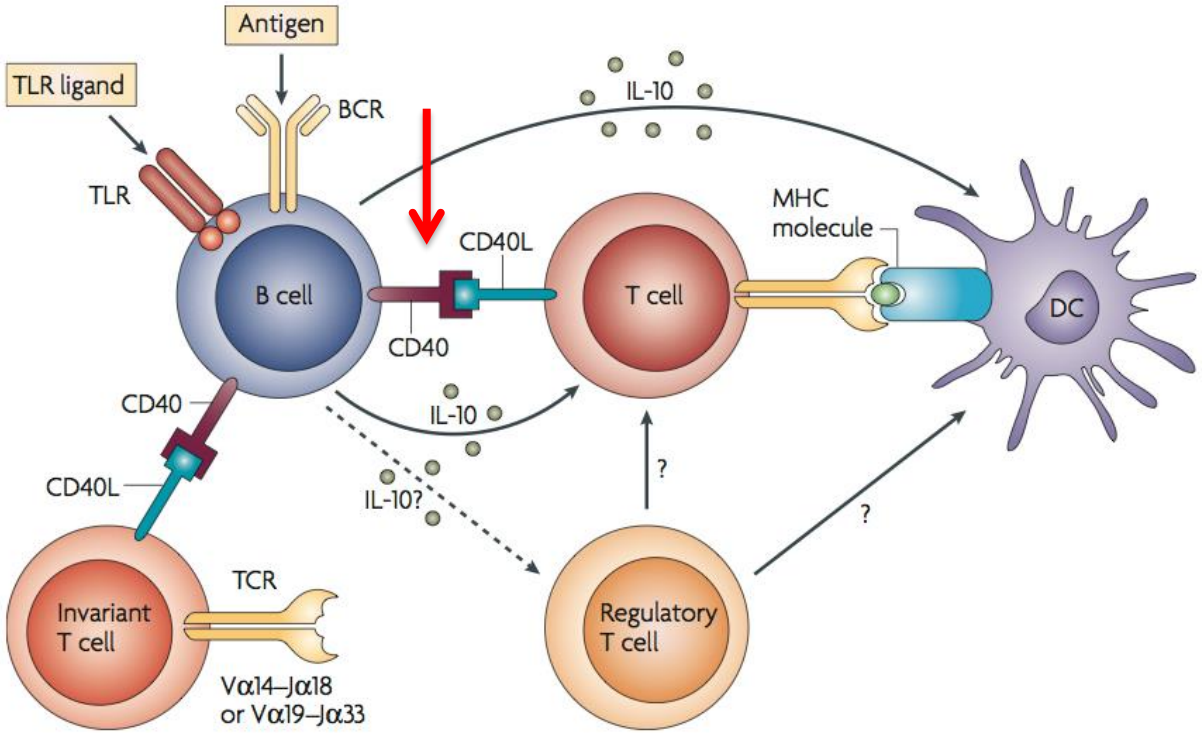


Nature Rev Immunol. 4:420 (2004)

CD40/CD40L

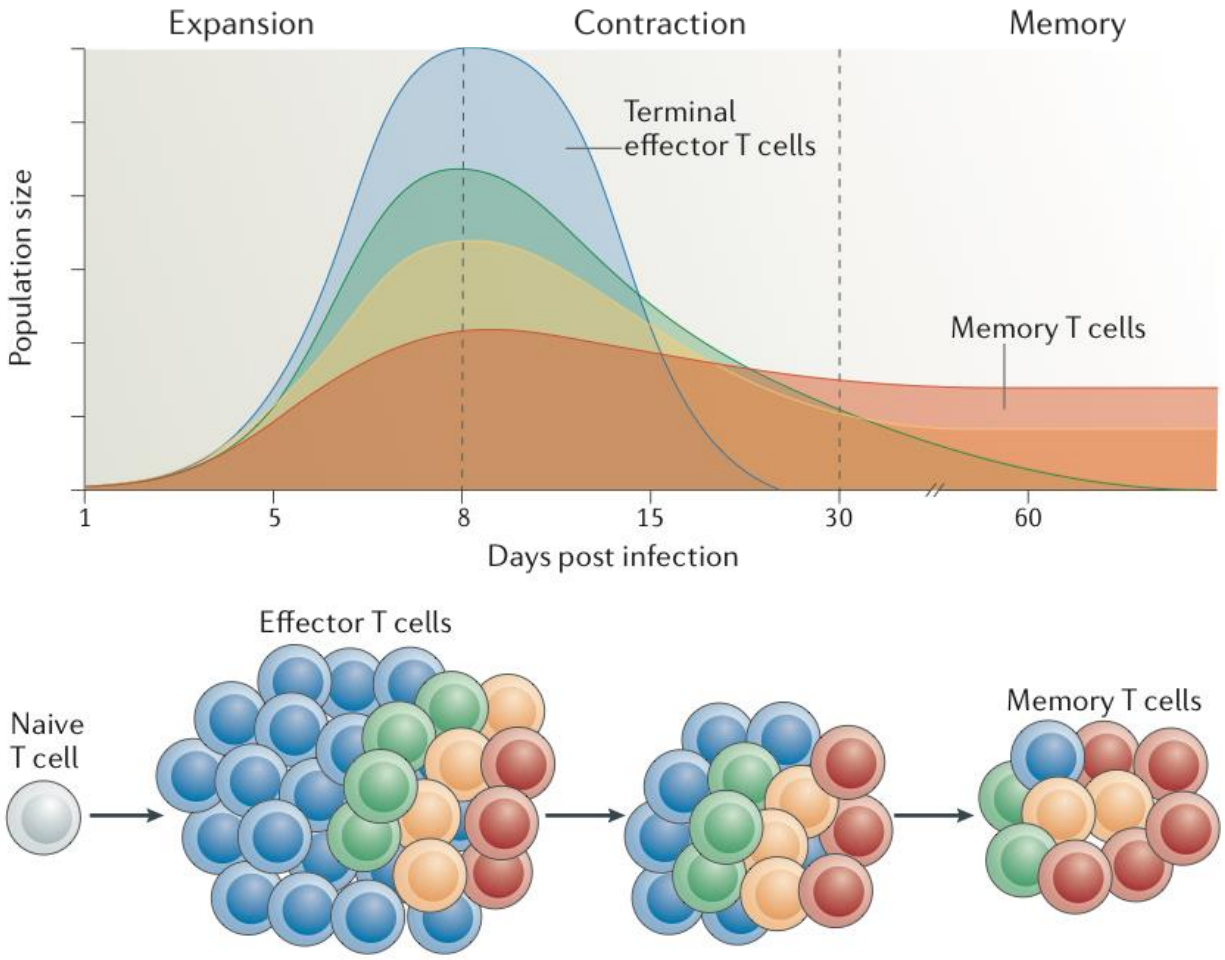
Function (B cells)

- Activation
  - immunoglobulin switching
  - antibody secretion
- Rescue from apoptosis
- Development of germinal centres
- Survival of memory B cells



Nature Reviews Immunology 8, 391-397 (May 2008)

OX40/OX40L:
three phases after antigen stimulation



Nature Reviews Immunology 12, 749-761 (November 2012)

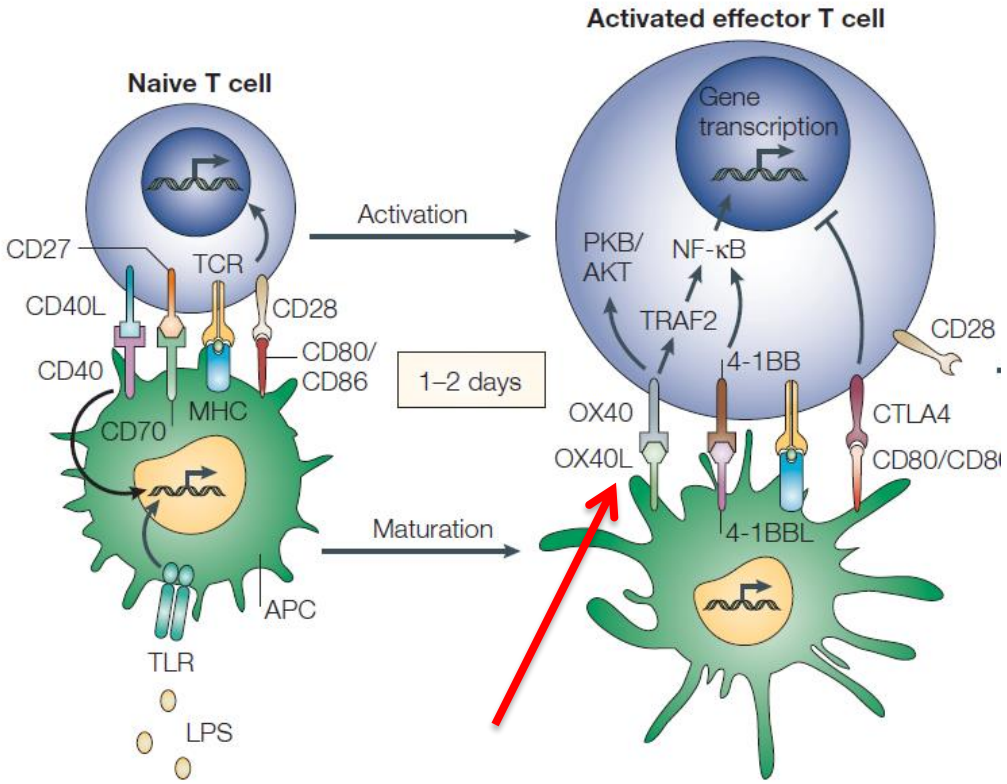
OX40/OX40L

Expression of OX40

- Following antigen stimulation on activated naïve CD4 and CD8 T cells
- Activated regulatory T cells, NKT cells, NK cells, and neutrophils

Expression of OX40L

- Following antigen stimulation on APCs
- Following recognition of antigen on T cells

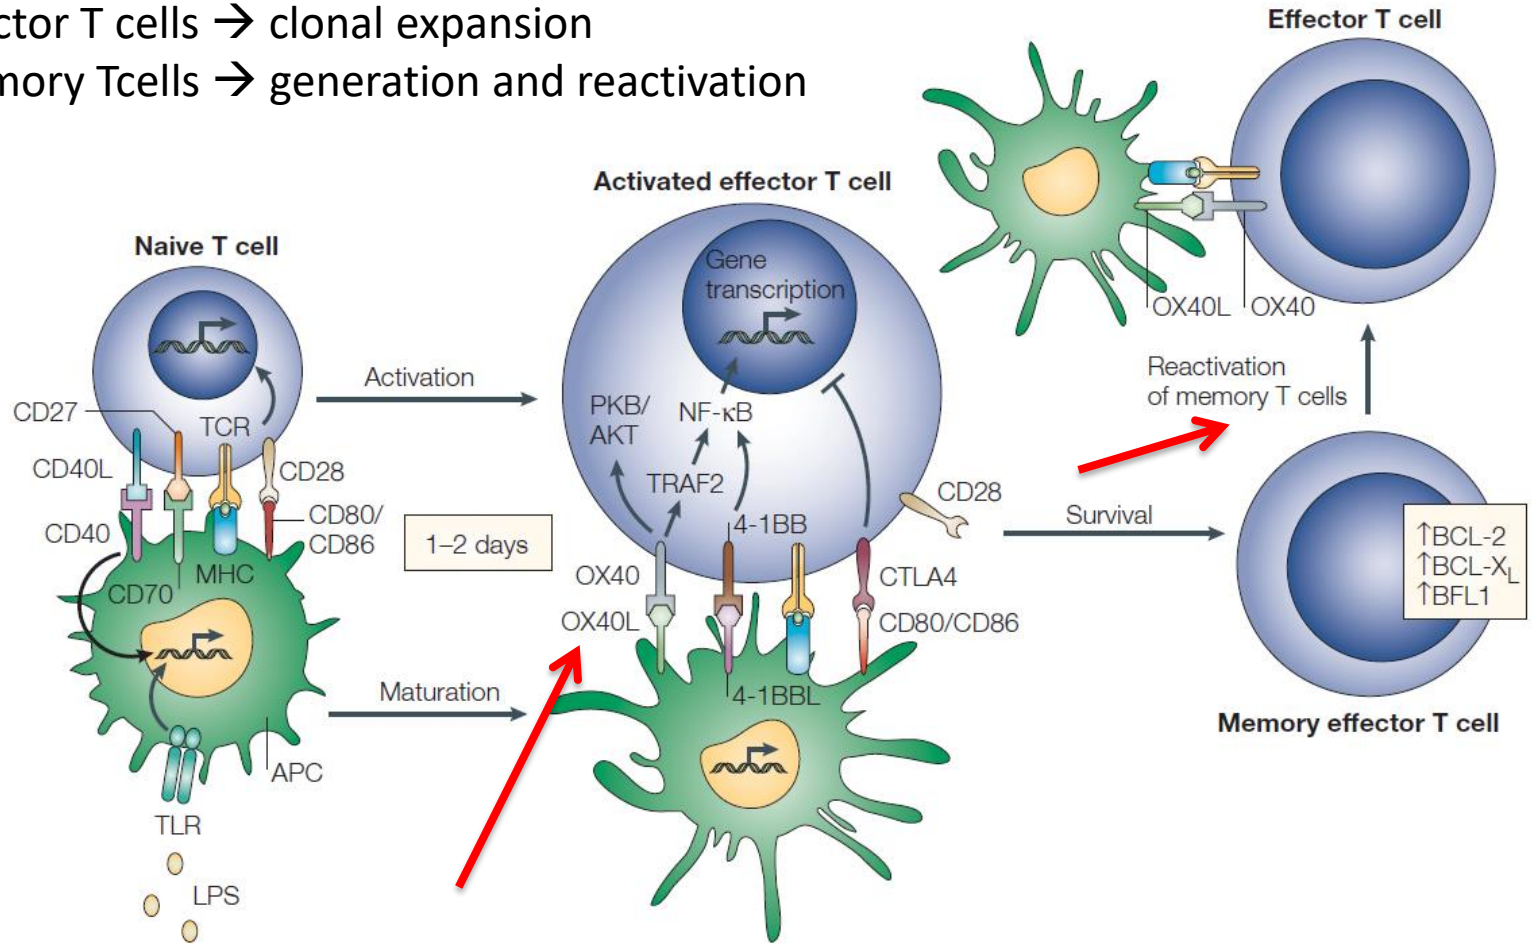


Nature Rev Immunol. 4:420 (2004)

OX40/OX40L
determine the size of effector and memory T cell pools

Function

- Effector T cells → clonal expansion
- Memory Tcells → generation and reactivation

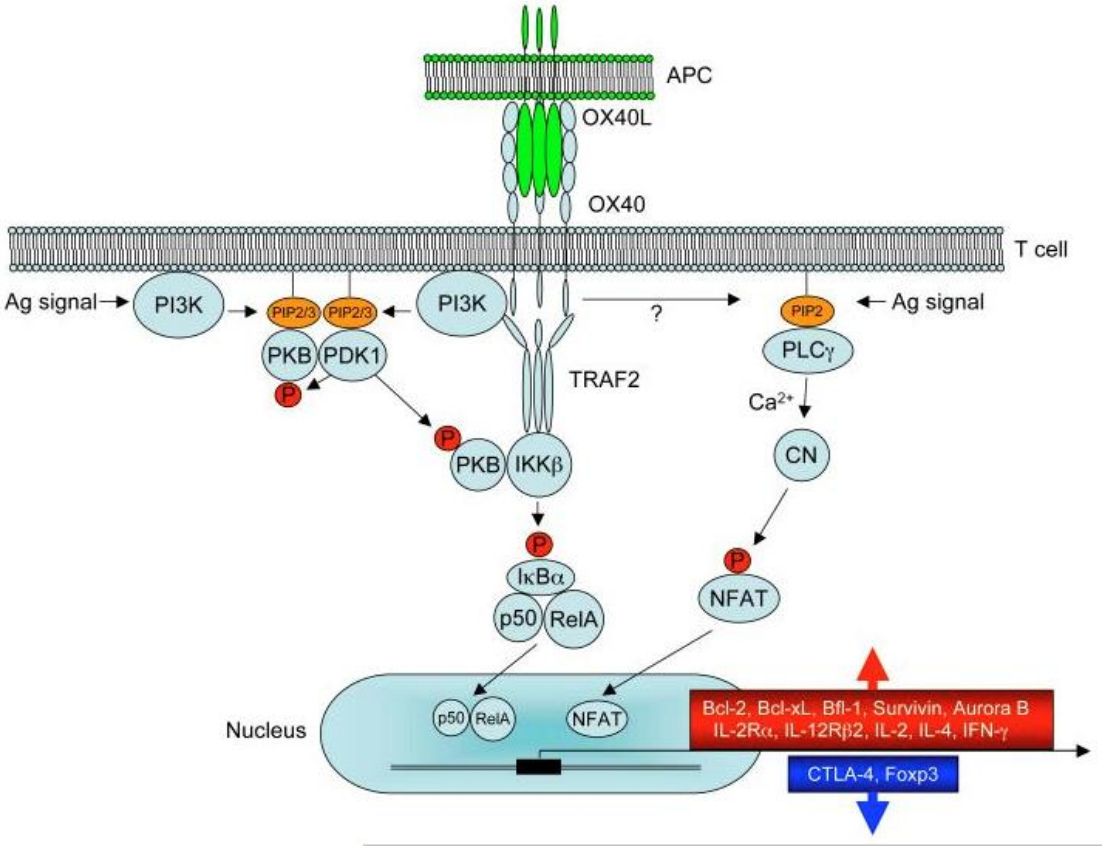


Nature Rev Immunol. 4:420 (2004)

OX40/OX40L

Function

- Effector T cells → clonal expansion
- Memory Tcells → generation and reactivation
- Regulatory T cells → inhibition by downregulation of CTLA4 and FoxP3



Immunol Rev. 2009 May; 229(1): 173–191

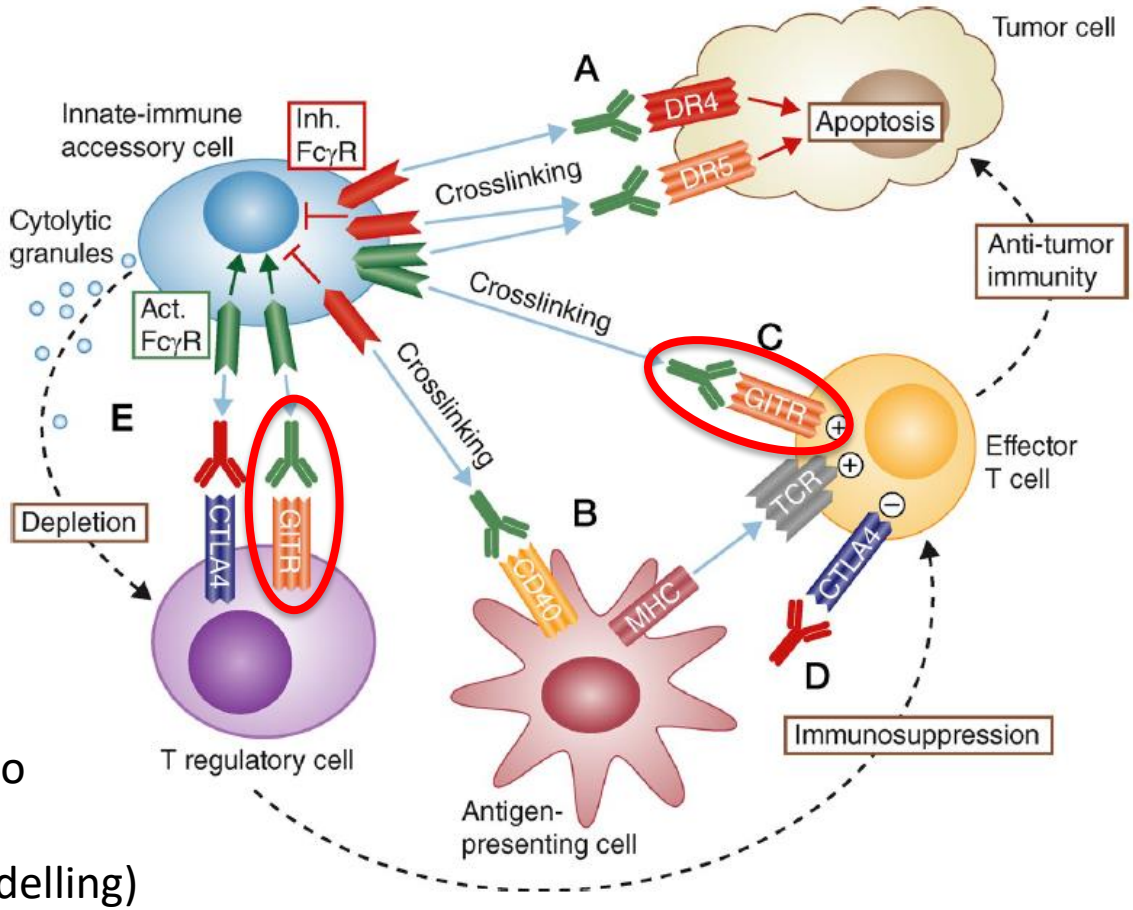
GITR

Expression of GITR

Cell type		
	Naïve	**Activated**
Regulatory T cells	High	Very high
T cells (CD4/CD8)	Intermediate	High
NK cells	Intermediate	High
Granulocytes	Intermediate	High
Mast cells	Intermediate	Intermediate
Eosinophils	Intermediate/low	
Basophils	Intermediate/low	
Monocytes	Low	Intermediate

GITR

Function:



On T regs:
Diverts the cells to Th9 phenotype (chromatin remodelling)

On T eff cells:
Increases survival (protection from activation-induced cell death (AICD) and function

Boosts the effect of CD4 helpers

CA009-002: for solid tumors alone or in combination with Nivolumab

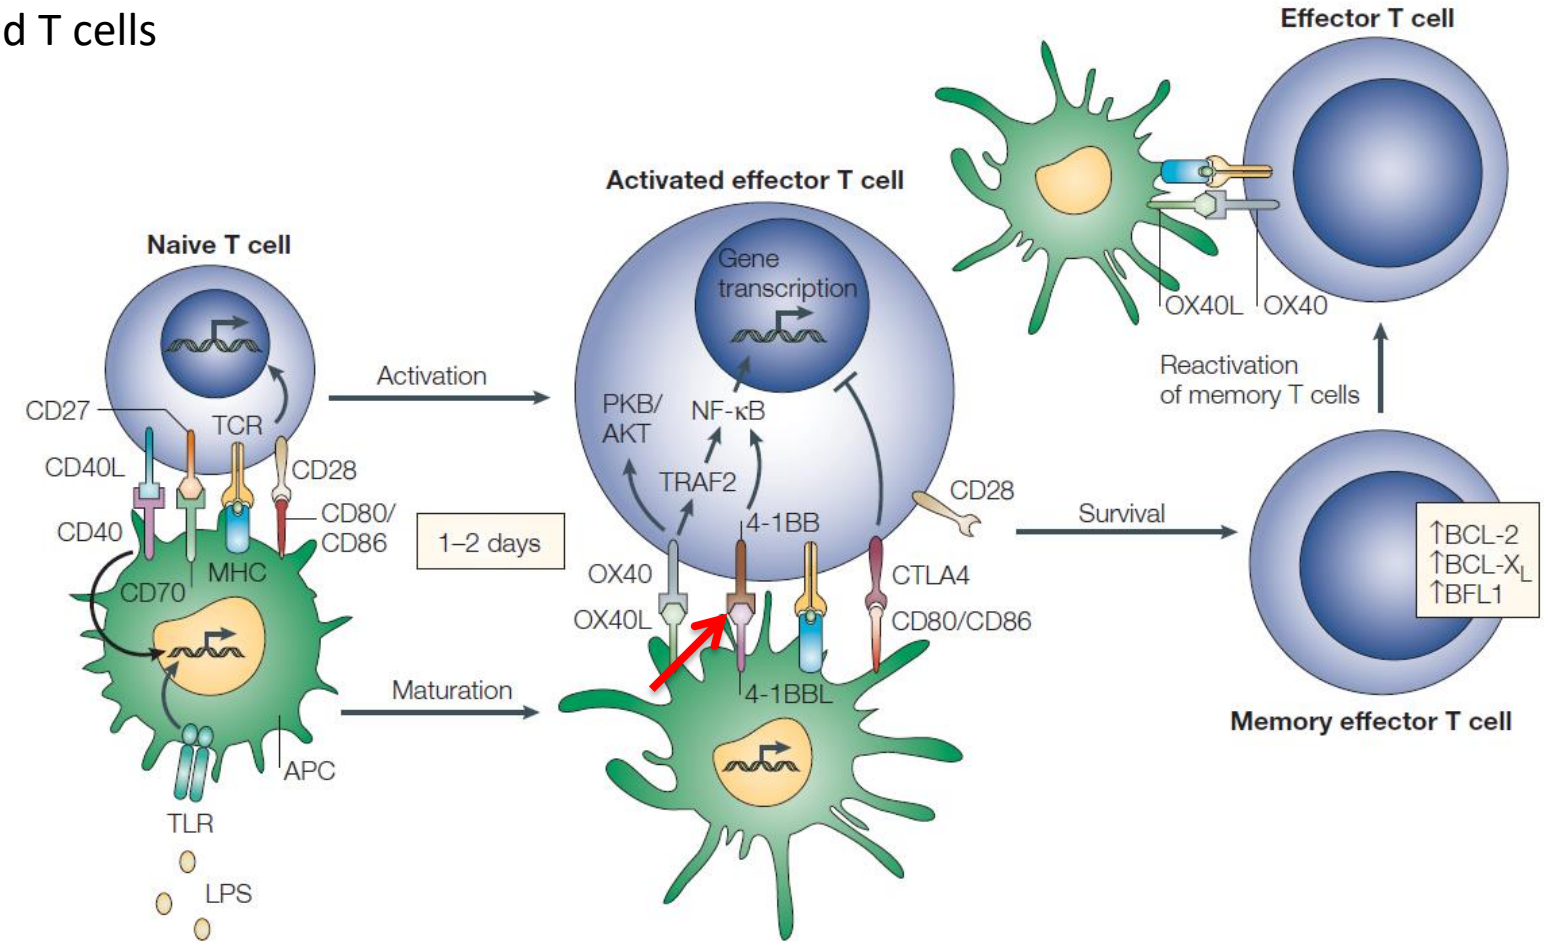
uncleal role

J Ex Med; 210(9), 1695–1710

CD137 (4-1BB): CD137 (4-1BB)L

Expression of CD137:

- stimulated T cells
- T regs
- DCs
- NK cells



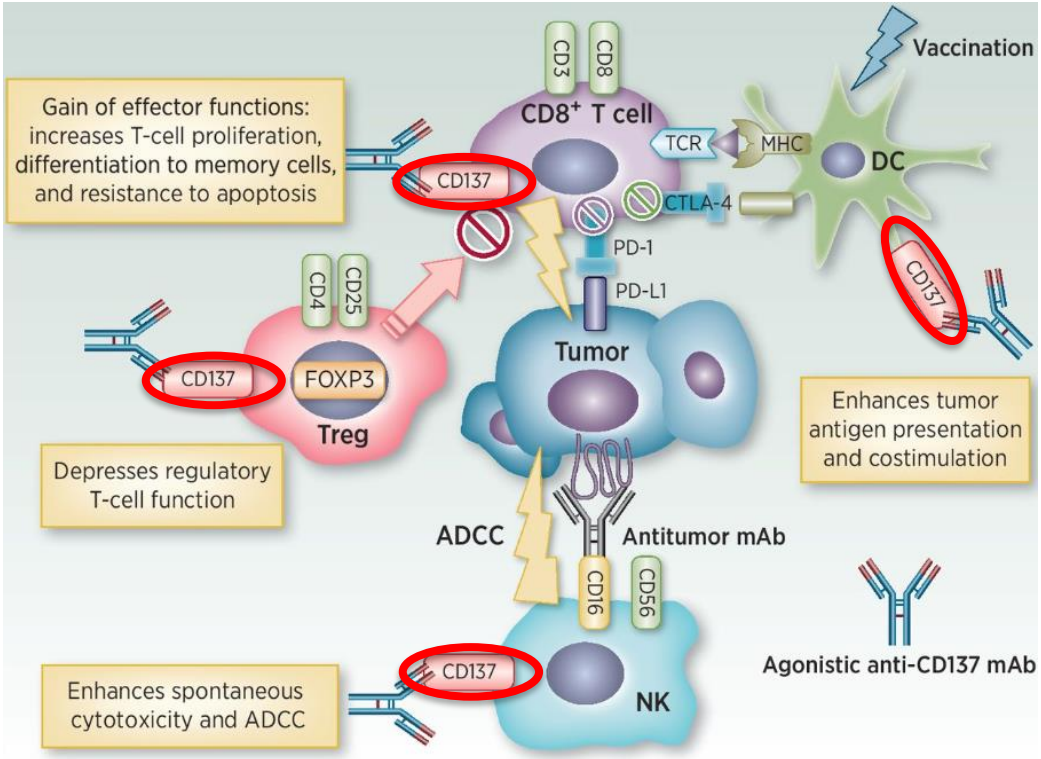
Nature Rev Immunol. 4:420 (2004)

CD137: CD137L

Function:

On T cells increasing:
proliferation, resistance to apoptosis, IFNγ secretion
→ increase in tumor-selective cytolytic T-cell activity

On T reg:
Reduction of T regs infiltration



On DC
Enhancing co-stimulation

On NK
Enhanced ADCC (antibody-dependent cell-mediated cytotoxicity)

Clin Cancer Research July 2015 Volume 21, Issue 14

Clinical trials with Abs targeting CD137

The experience with Urelumab

Phase I, NCT00309023:
- low grade fatigue
- grade 2+ neutropenia, leukopenia, thrombocytopenia, increased in AST and ALT

Phase II NCT00612664:
- terminated due to high incidence of Grade IV, potentially fatal, hepatitis

Ab	Trial number	Combination	Indication
Urelumab	NCT01471210		solid tumors and NHL
Urelumab	NCT02110082	Cetuximab	CRC and HN cancer
Urelumab	NCT01775621	Rituximab	Lymphoma
Urelumab	NCT02253992	Nivolumab	solid tumors and NHL
PF-05082566	NCT02179918	Pembrolizumab	solid tumors

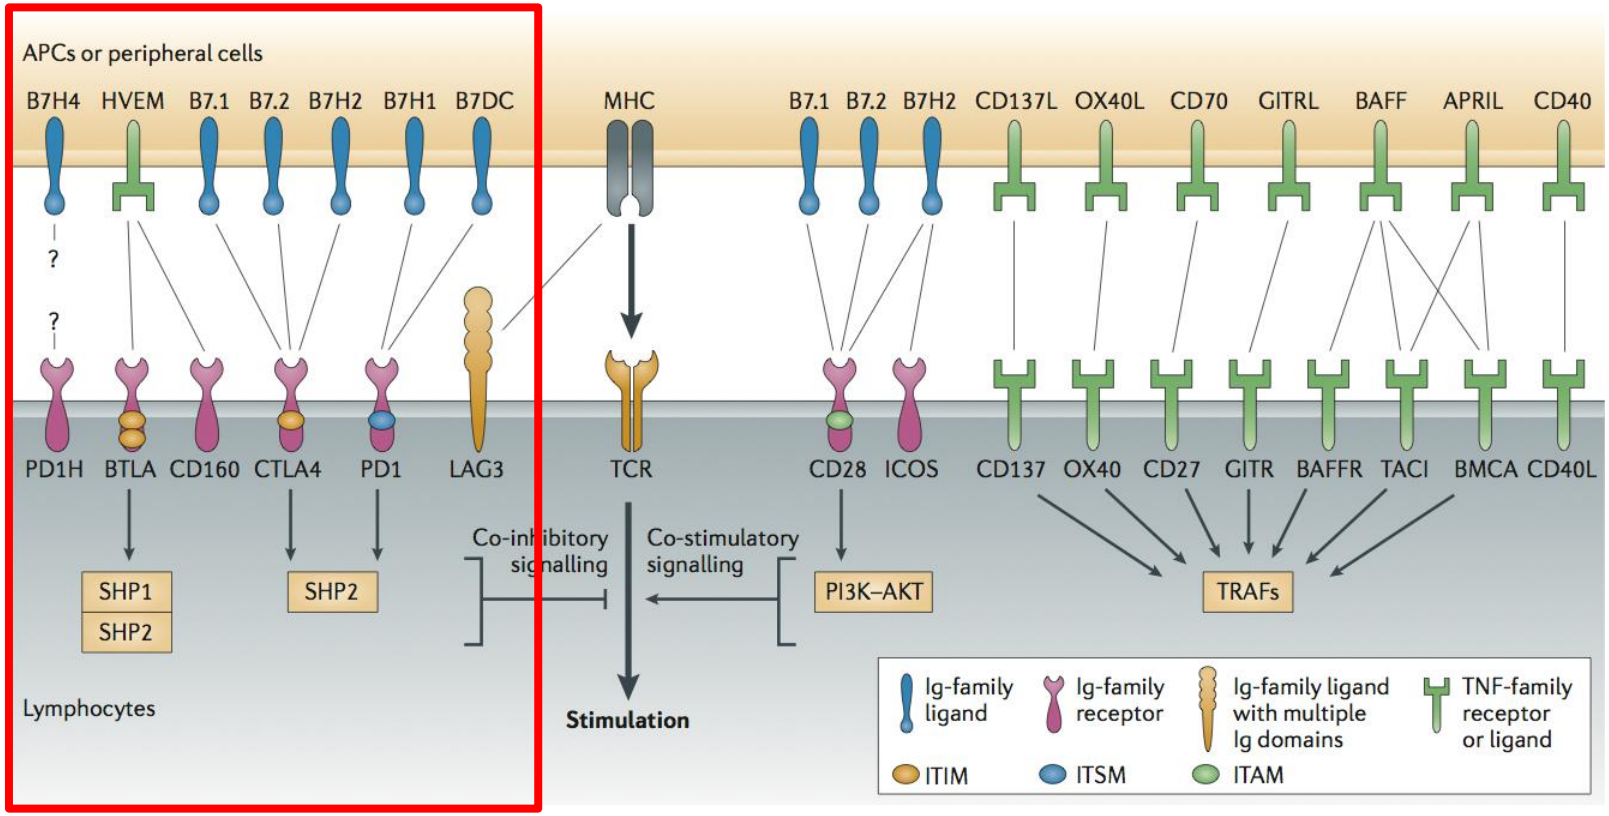
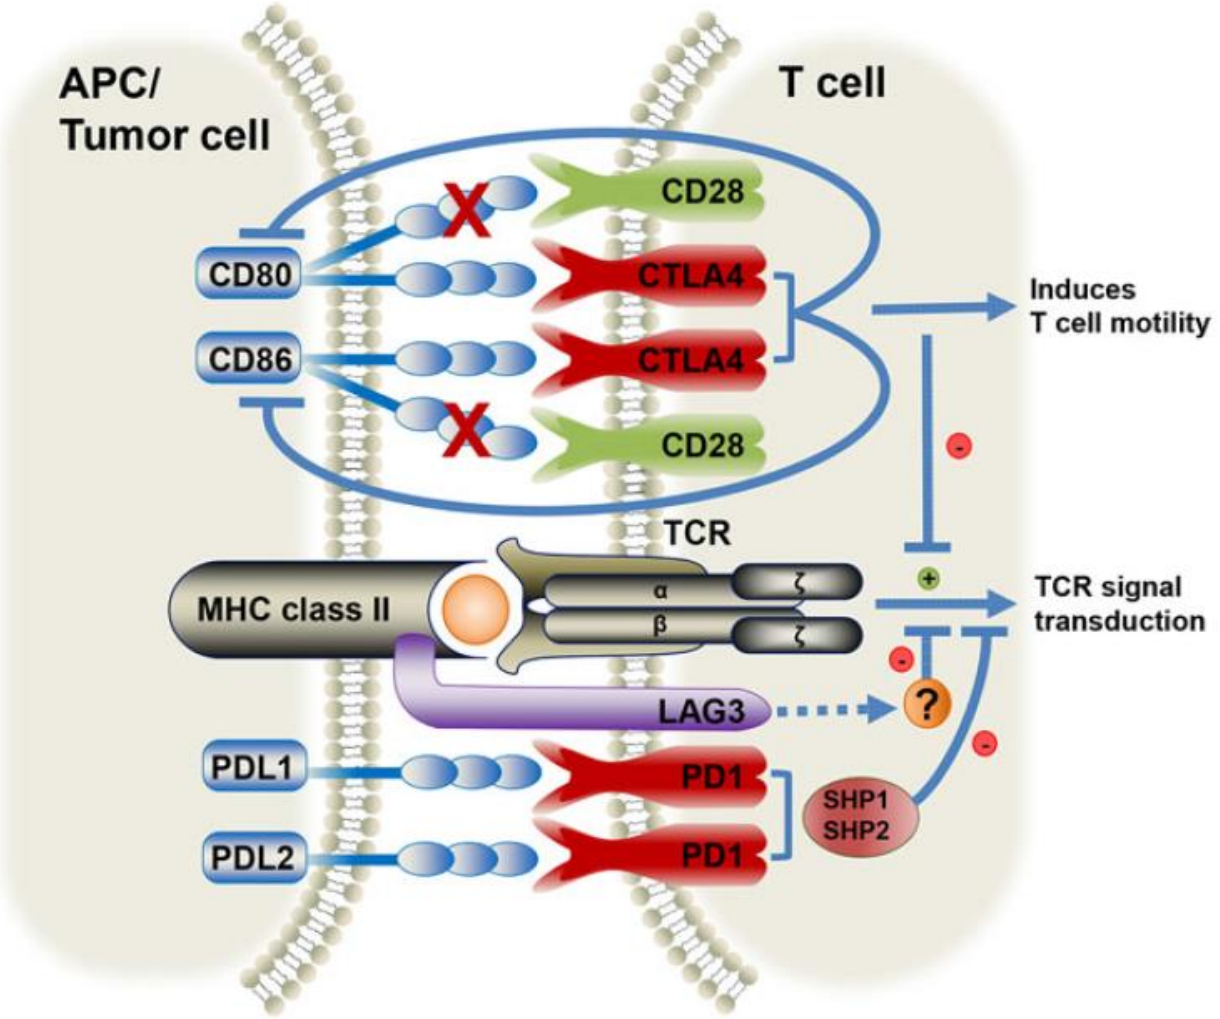
CD28:CD80/86	TAB08
CD27:CD70	Varilumab
CD40:CD40L	CP870, 893, ChiLob7/4
OX40:OX40L	MEDI0562, 6469, 6383, MOXR0916
GITR:GITRL	TRX518 GWN323 MEDI1873 INCAGN01876
CD137: CD137L	Urelumab, PF-05082566

Co-inhibition and co-stimulation determine the quality of the T cell response



Nature Reviews Drug Discovery 12, 130-146 (February 2013)

Co-inhibitory molecules

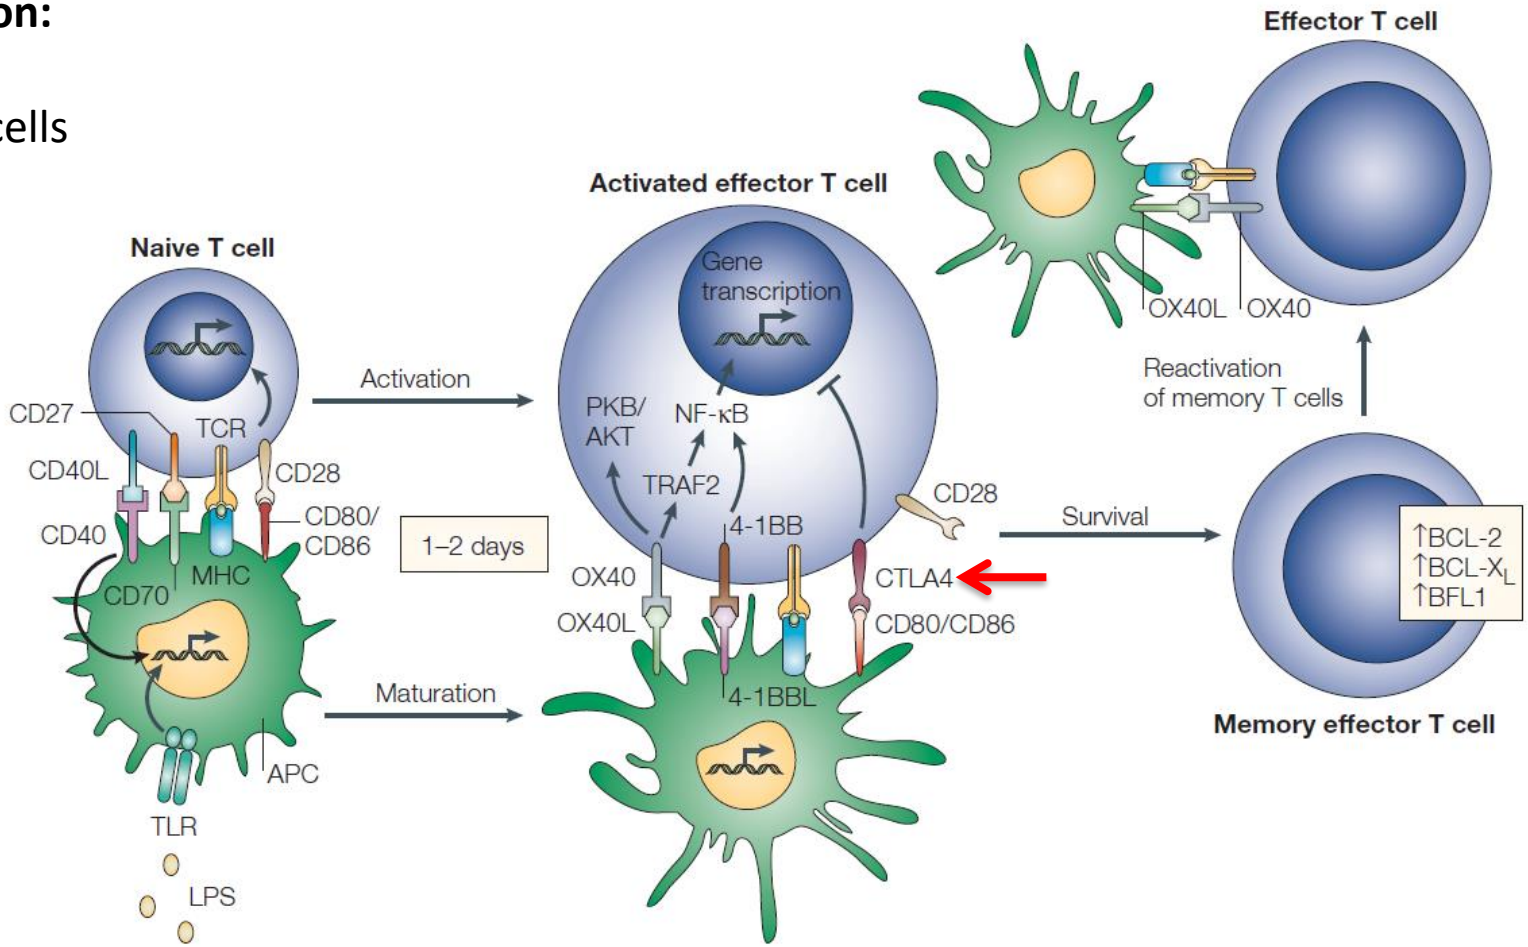


Eur. J. Immunol. 2015. 45: 1892–1905

CTLA4

Expression:

- T regs
- T eff cells

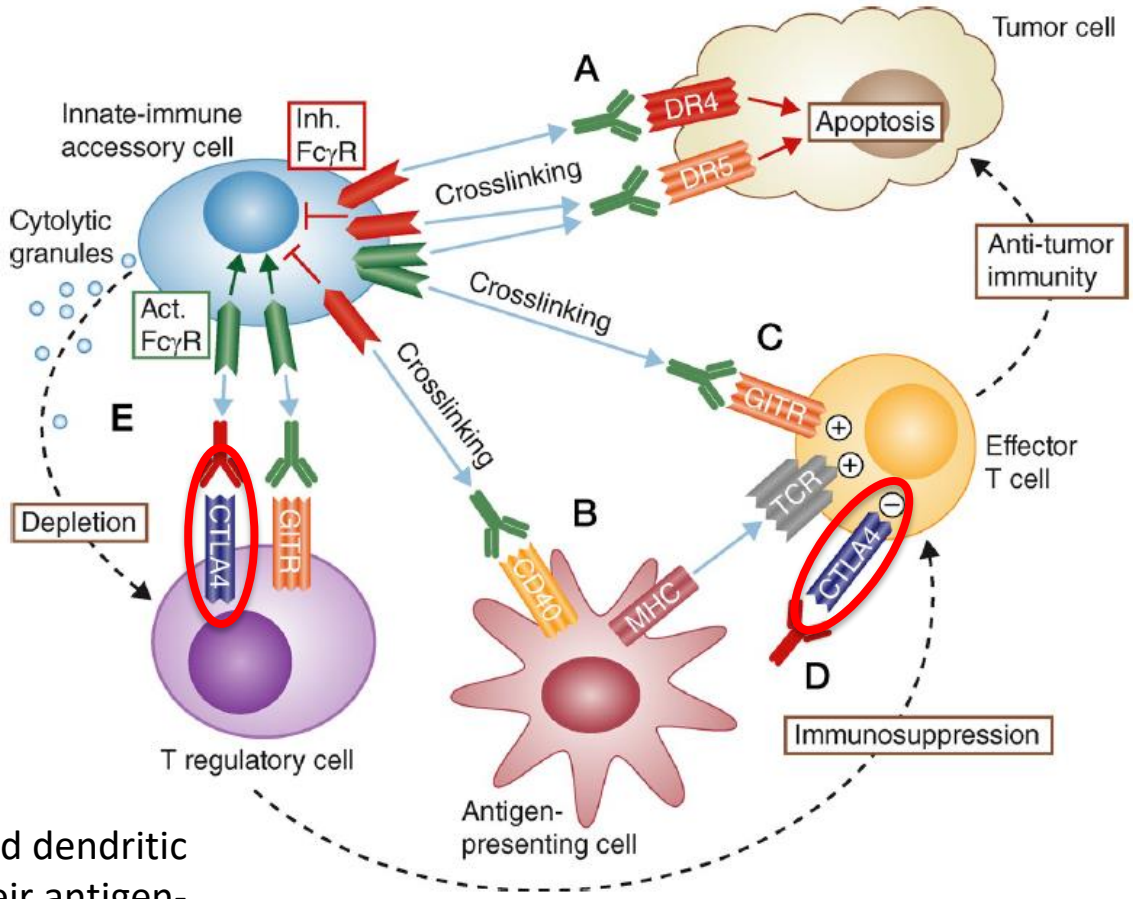


Activation of T cells → proliferation and functional differentiation
→ **inhibitory program → stop proliferation**

Nature Rev Immunol. 4:420 (2004)

CTLA4

Function:



On T eff cells:
as a negative feedback regulator

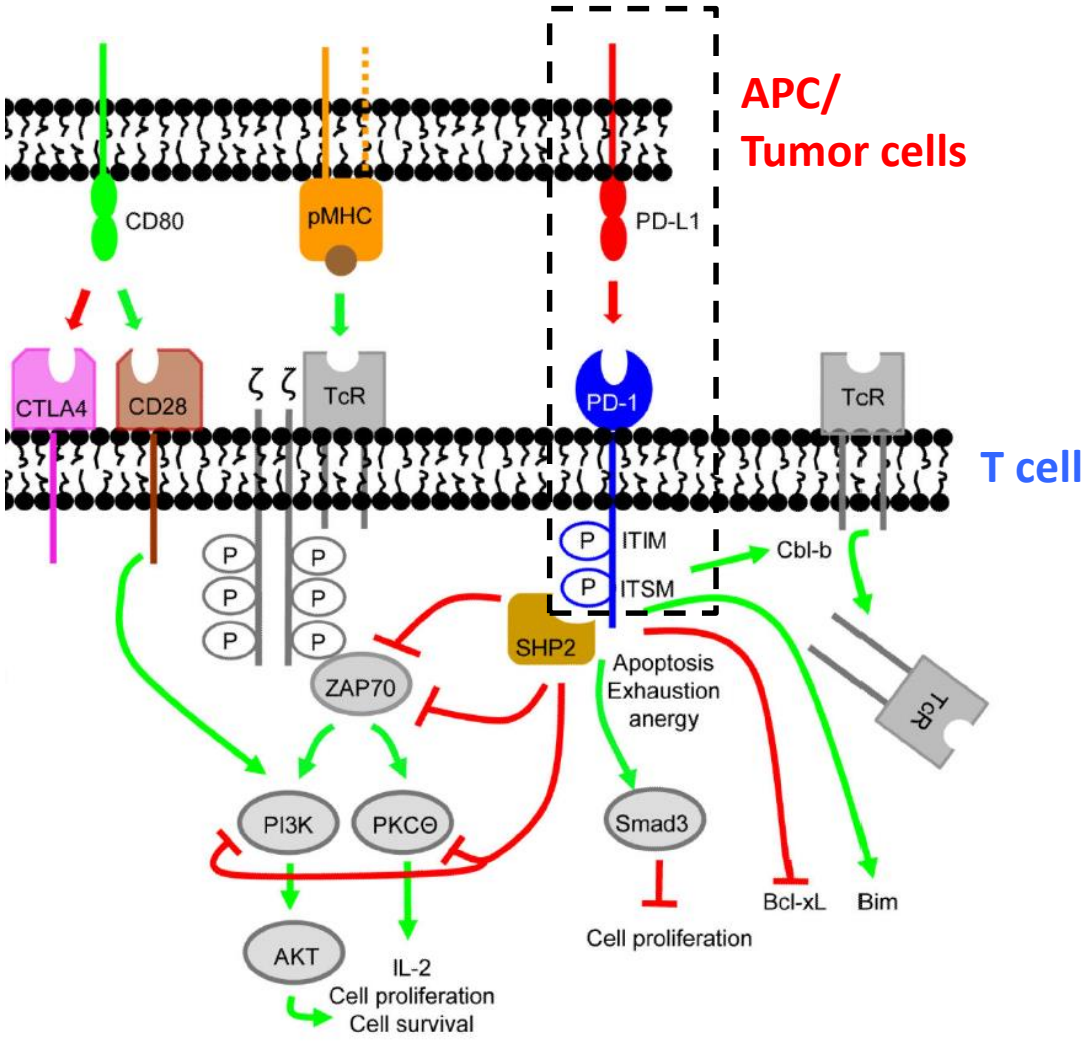
On T regs:
to aggregate around dendritic cells and inhibit their antigen-presenting activity

J Ex Med; 210(9), 1695–1710

The PD-L1/PD1 pathway leads to:

Function

- T cell death
- Down-regulation of activated T cells
- Reduction of T cells to kill tumor cells



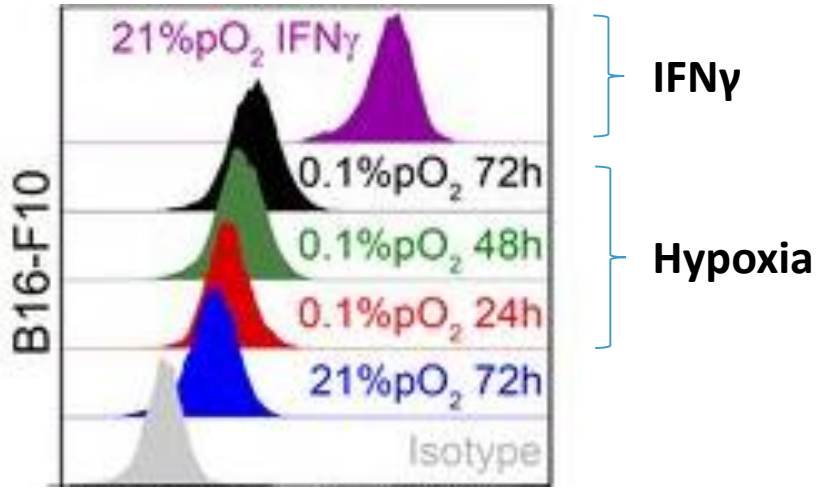
Adapted from J. Immunology 2014, 193(8): 3835–3841

The PD-L1 molecule

PD-L1 is expressed on:
Activated T cells, NK cells, macrophages, myeloid DCs, B cells, epithelial cells, vascular endothelial cells; tumor cells

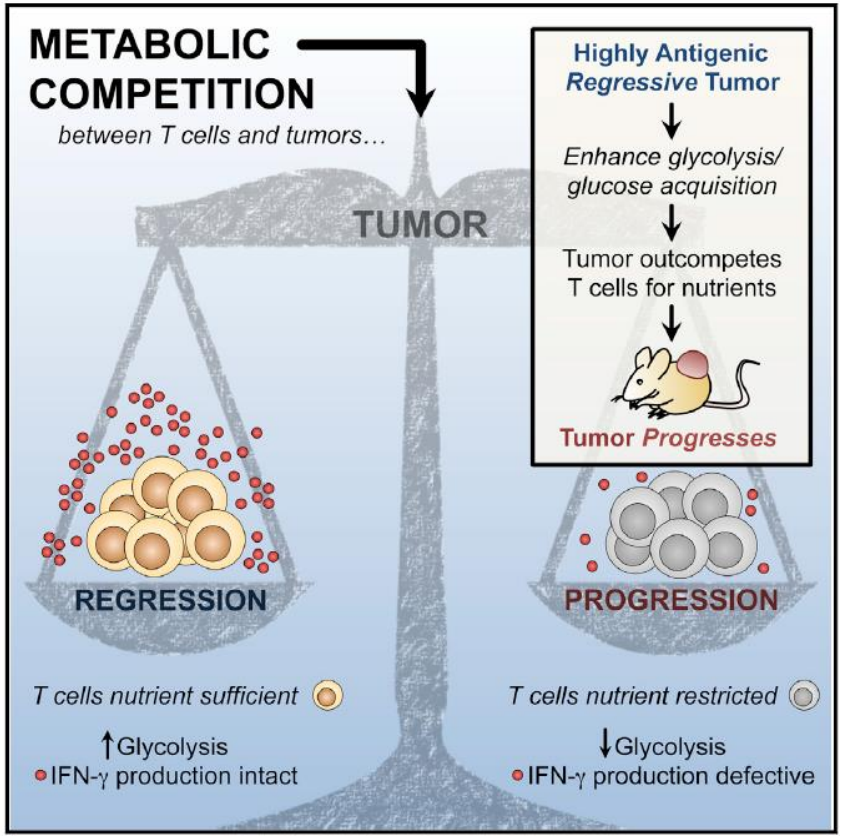
Expression of PD-L1 is induced by :
Type 1 and Type 2 IFNs, TNFα, LPS, GM-CSF, VEGF, IL-10, IL4

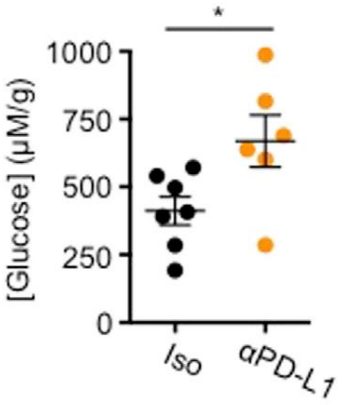
Expression of PD-L1 can be downregulated by:
downregulation of PI3K; ALK/STAT3 ; NF-kB; miRNA513;wtPTEN



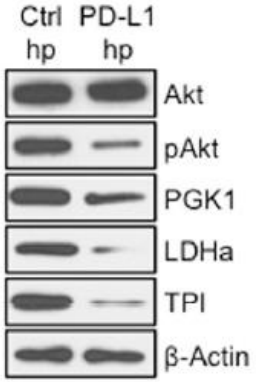
Adapted from J Exp Med 2014;211:781-790

PD-L1 has also a direct tumor activity





PD-L1 enhances tumor cell glycolysis and thus depletes glucose from immune cells in the tumor microenvironment



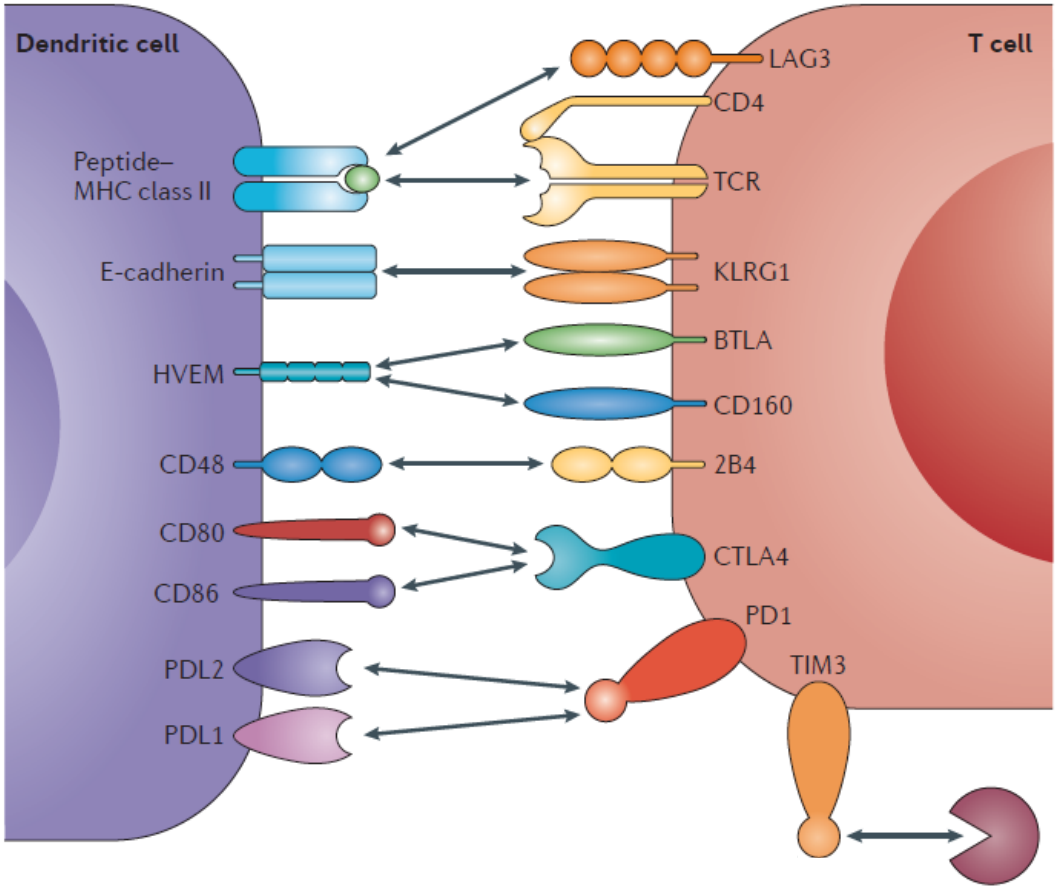
PD-L1 is important for Akt/mTOR signaling in tumors.

Cell 2015; 162: 1229–1241

LAG3: CD4 homologue, binding MHC II

Expression

- On exhausted T cells
- On TIL
- On T regs
- On NK



Function

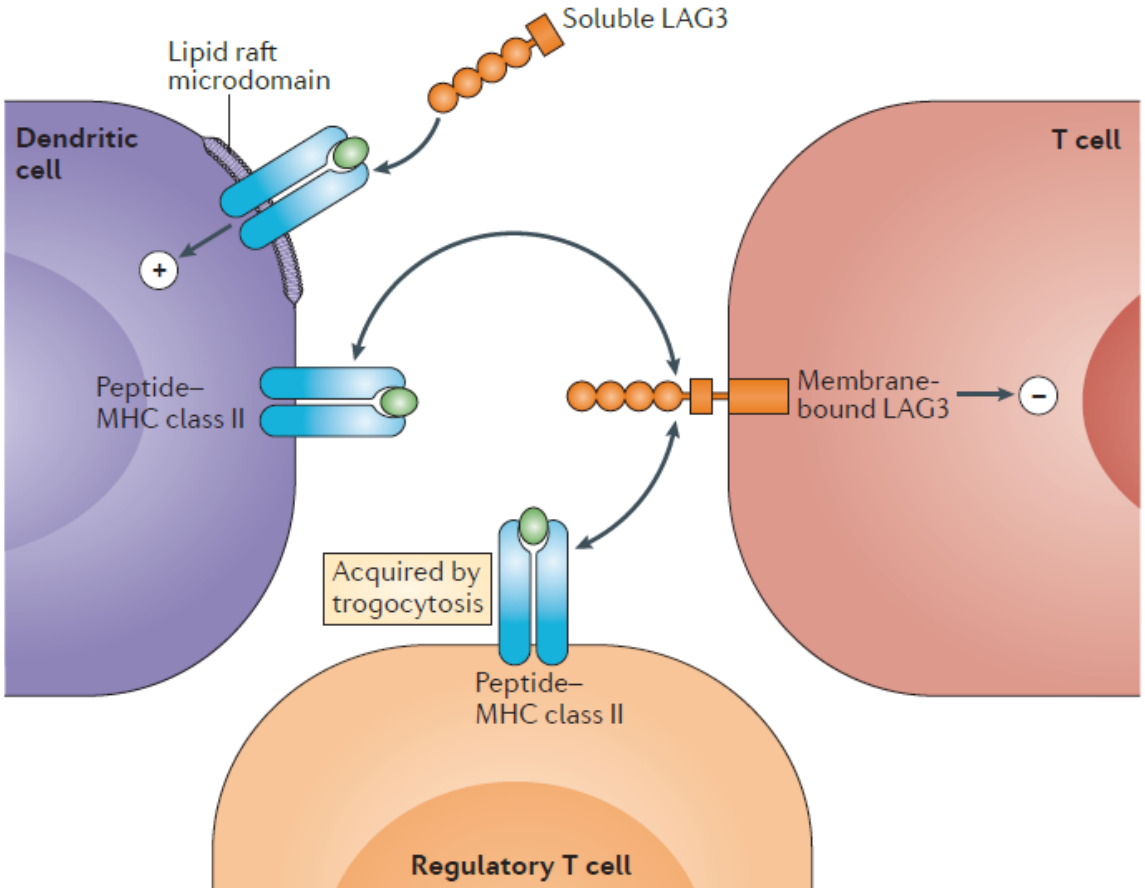
- Confers a Treg function on CD4 naïve T cells

LAG3 negatively regulates

- T-cell activation
- Proliferation
- Homeostatic expansion

Adapted from Nature Reviews Immunology 15; 2015: 45-56

Soluble LAG3 is an immunoadjuvant



Adapted from Nature Reviews Immunology 15; 2015: 45-56

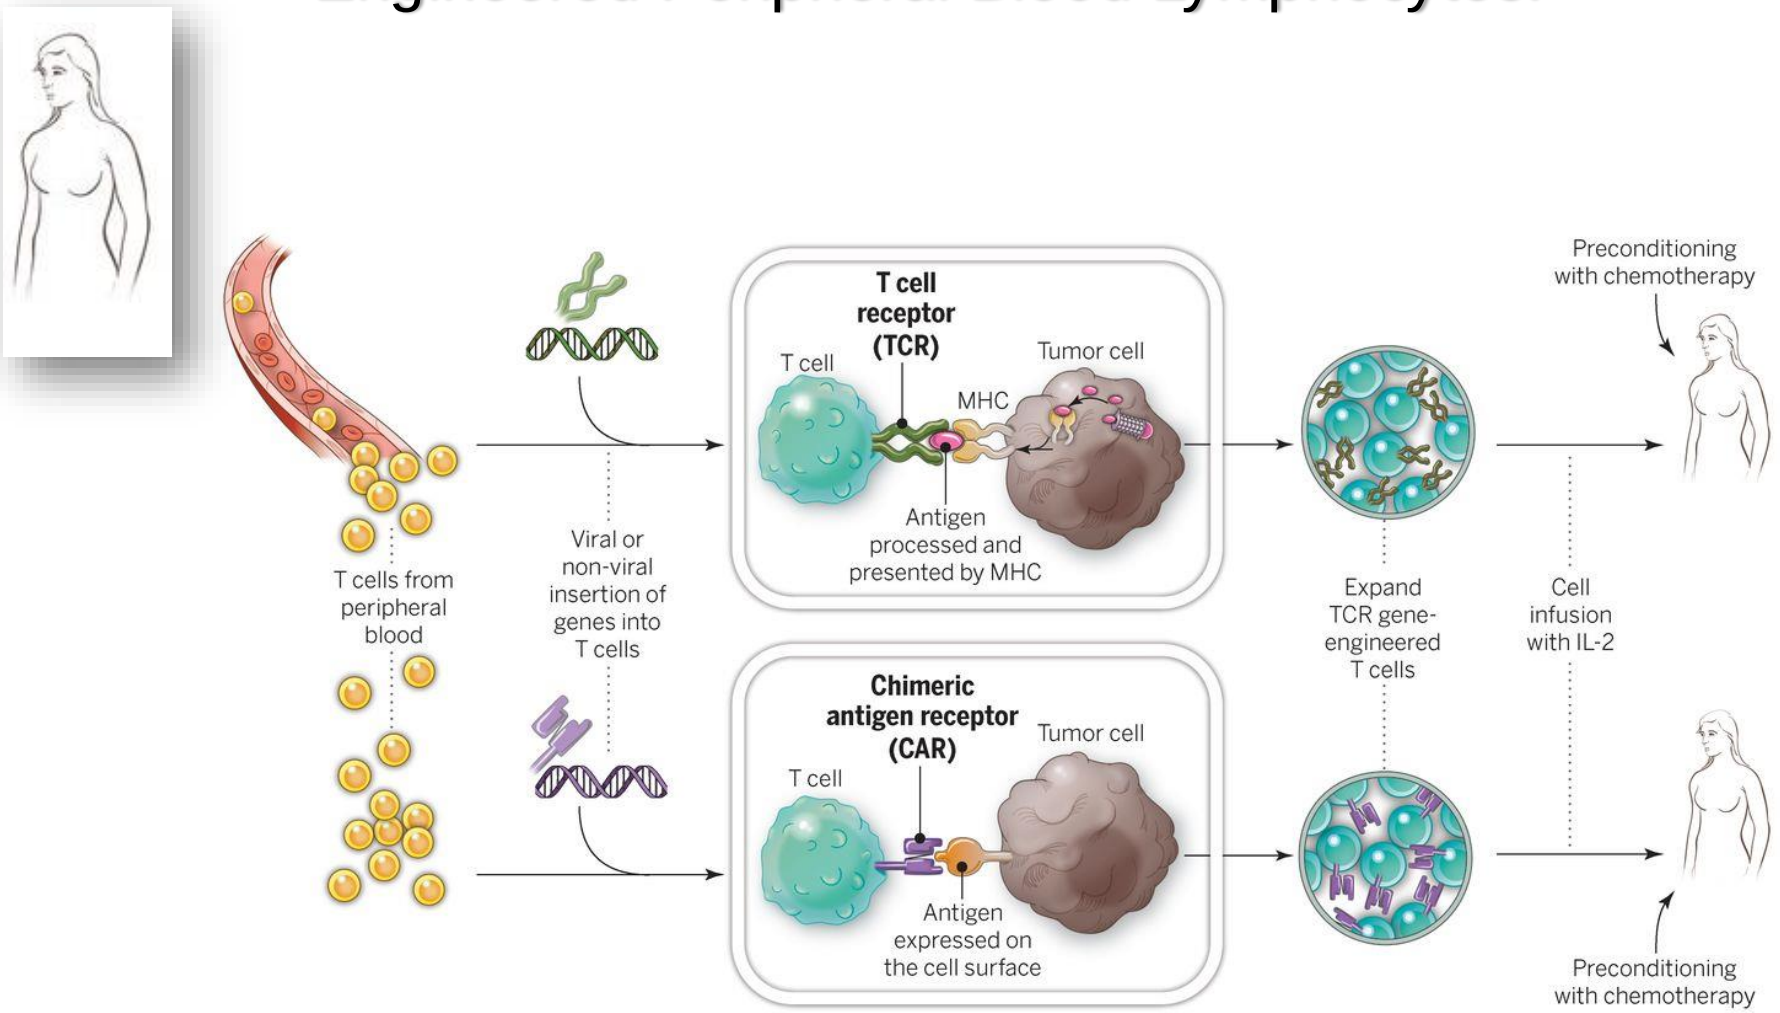
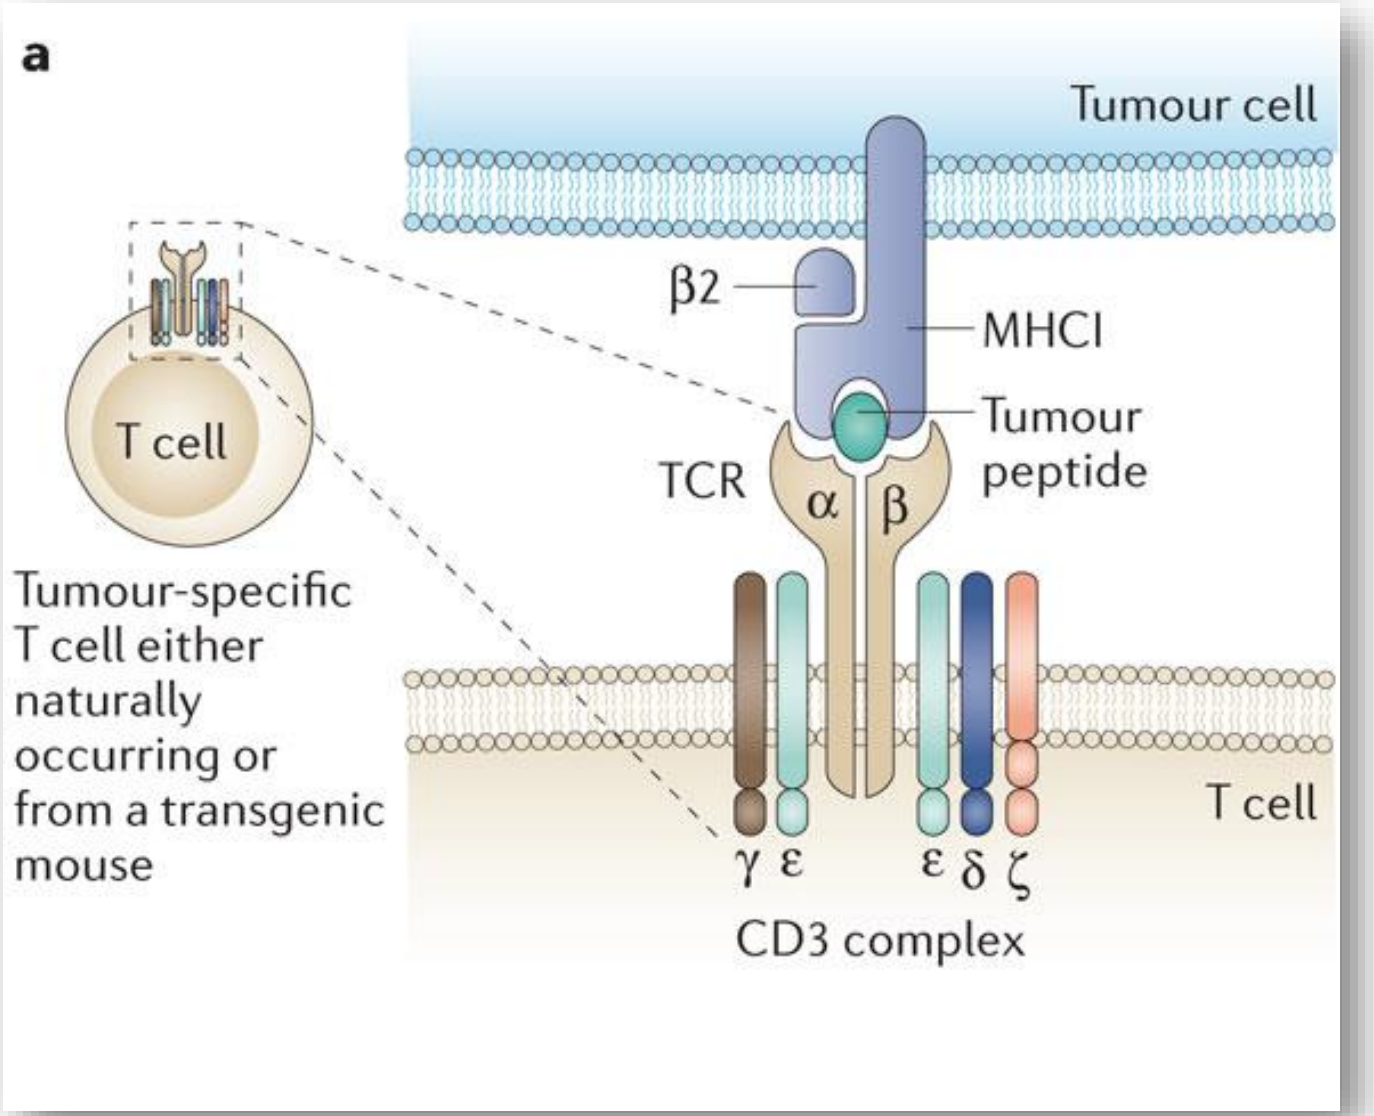
OPTION 2: Adoptive T cell Therapy with Genetically Engineered Peripheral Blood Lymphocytes.

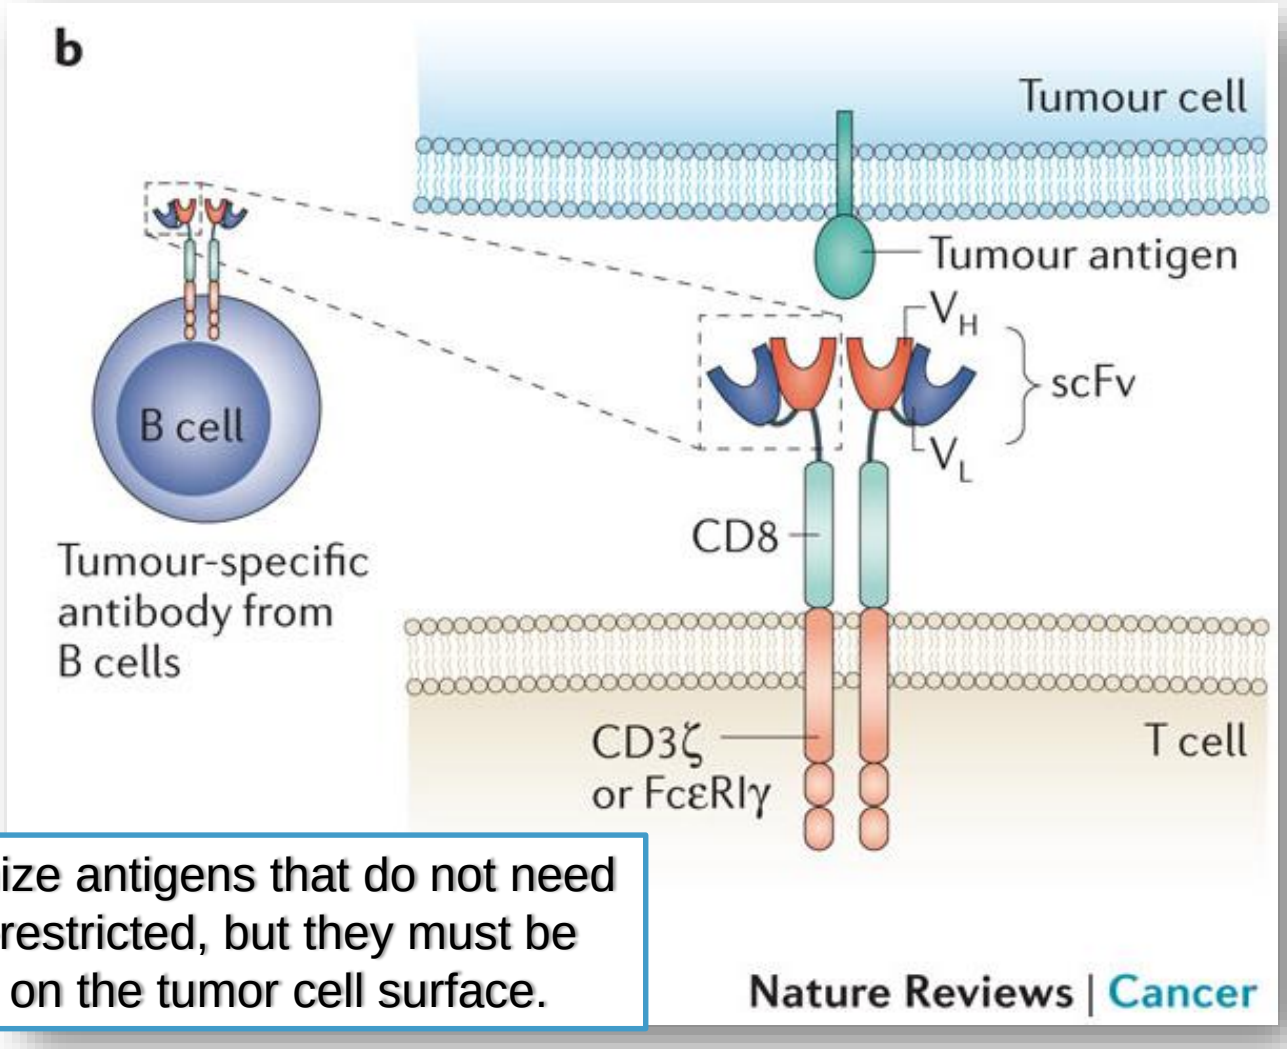


Steven A. Rosenberg, and Nicholas P. Restifo Science 2015;348:62-68

TCRs are composed of one α chain and one β chain, and they recognize antigens that have been processed and presented by one of the patient's own MHC molecules.

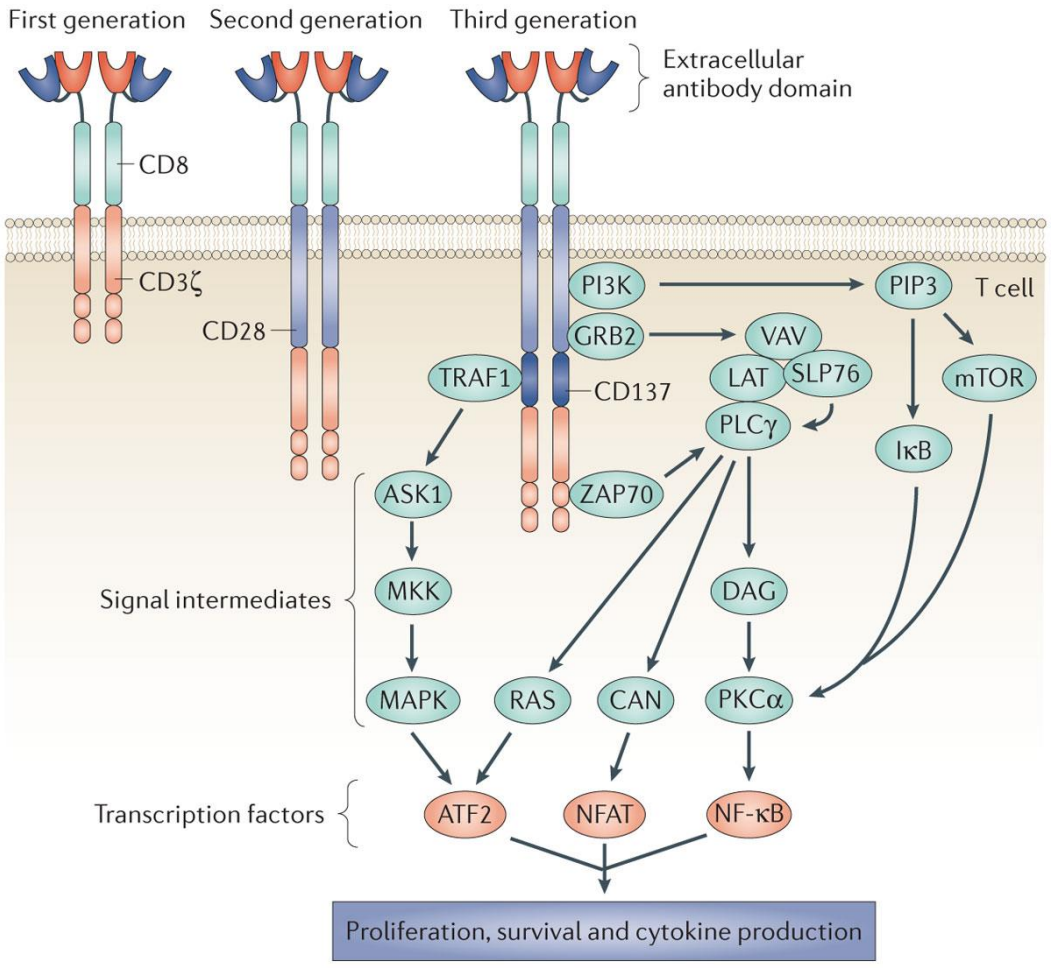


CARs are artificial receptors that can be constructed by linking the variable regions of the antibody heavy and light chains to intracellular signaling chains (such as CD3-zeta, CD28, 41BB) alone or in combination with other signaling moieties.



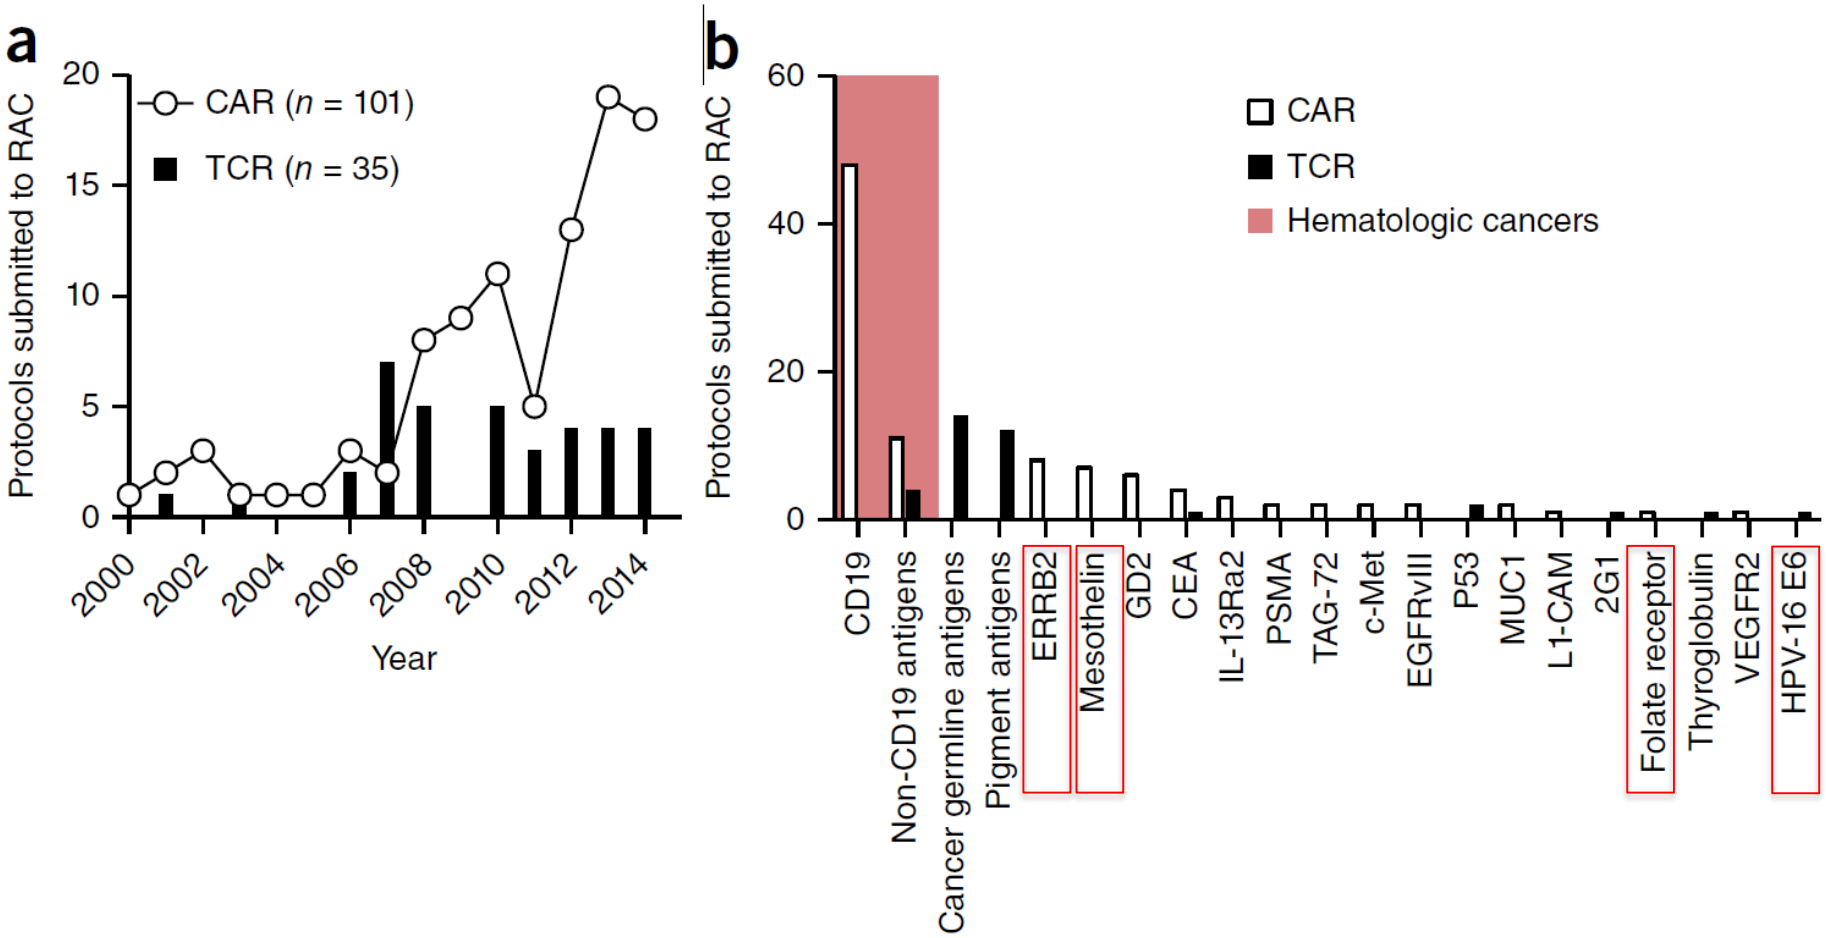
CARs recognize antigens that do not need to be MHC-restricted, but they must be presented on the tumor cell surface.

Generations of CARRs



Nature Reviews | Cancer

CAR and TCR Cancer Clinical Trials in the US 1994 - 2014



Klebanoff CA, Rosenberg SA, Restifo NP. Prospects for gene-engineered T cell immunotherapy for solid cancers. Nat Med. 2016 Jan;22(1):26-36

The CD19 CAR T Cell Success Story for relapsed ALL and CLL

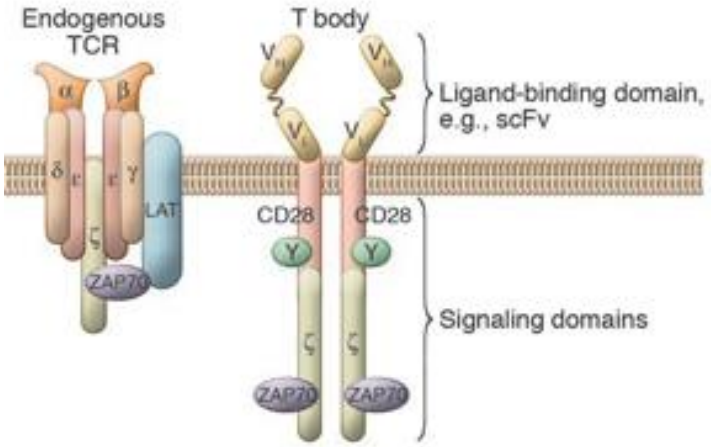
Emily Whitehead

- Complete remission and long-term responses in up to 90% of acute lymphoblastic leukemia (ALL) patients (both adult and pediatric)
- And in > 50% of chronic lymphocytic leukemia (CLL) patients.

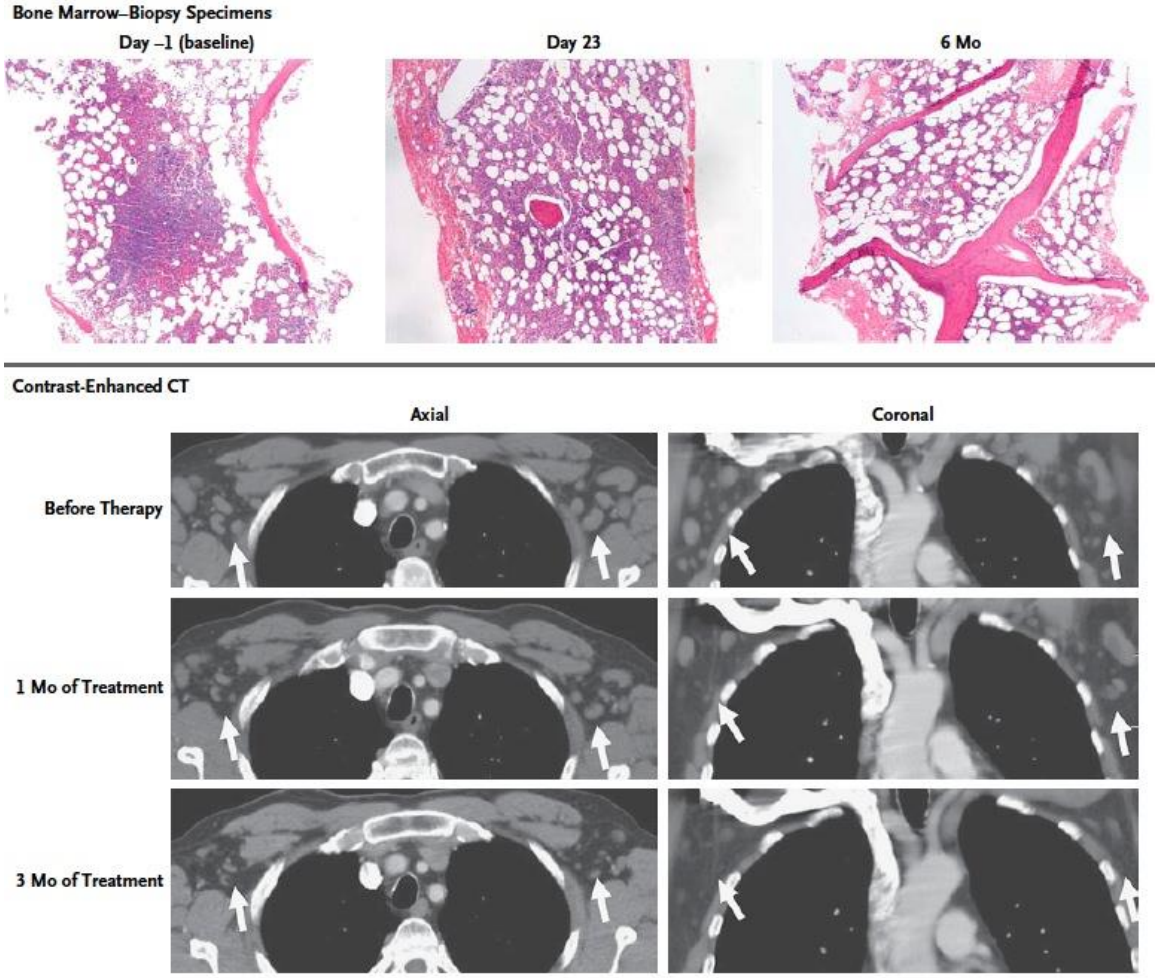
- On target side effects include B cell aplasia and cytokine release syndrome.

Maud et al, NEJM 2015 & Blood 201

Tumor Therapy with Engineered T Cells



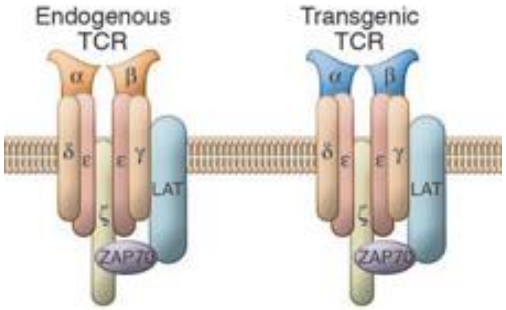
2017

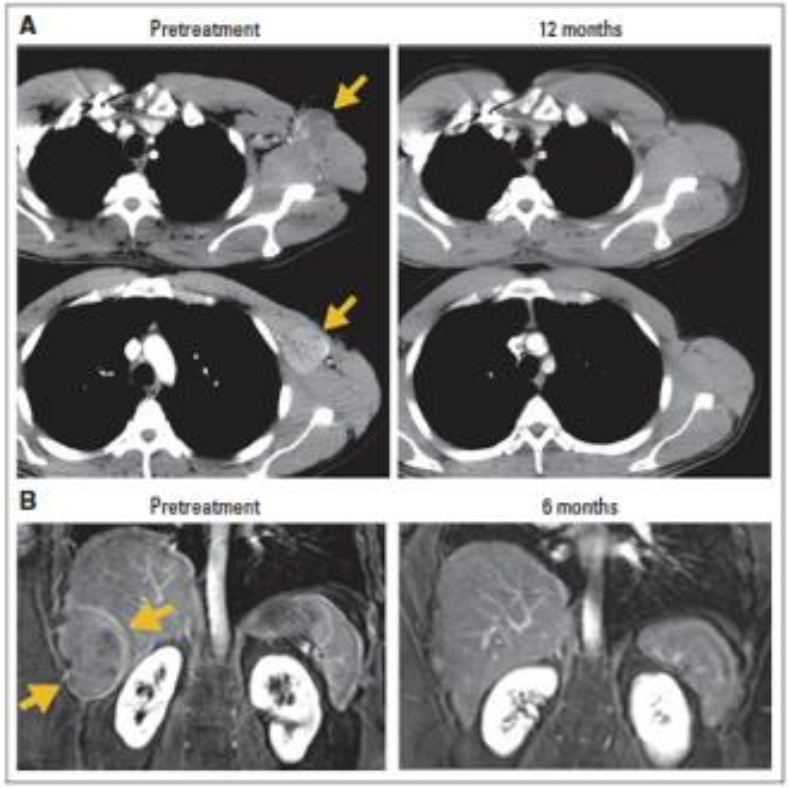


Porter *NEJM* 2011

Adoptive transfer of TCR-transferred T cells

NYESO-1 TCR
Sarcoma Patient





2017

Robbins *JCO* 2011

Challenges for CAR Therapy

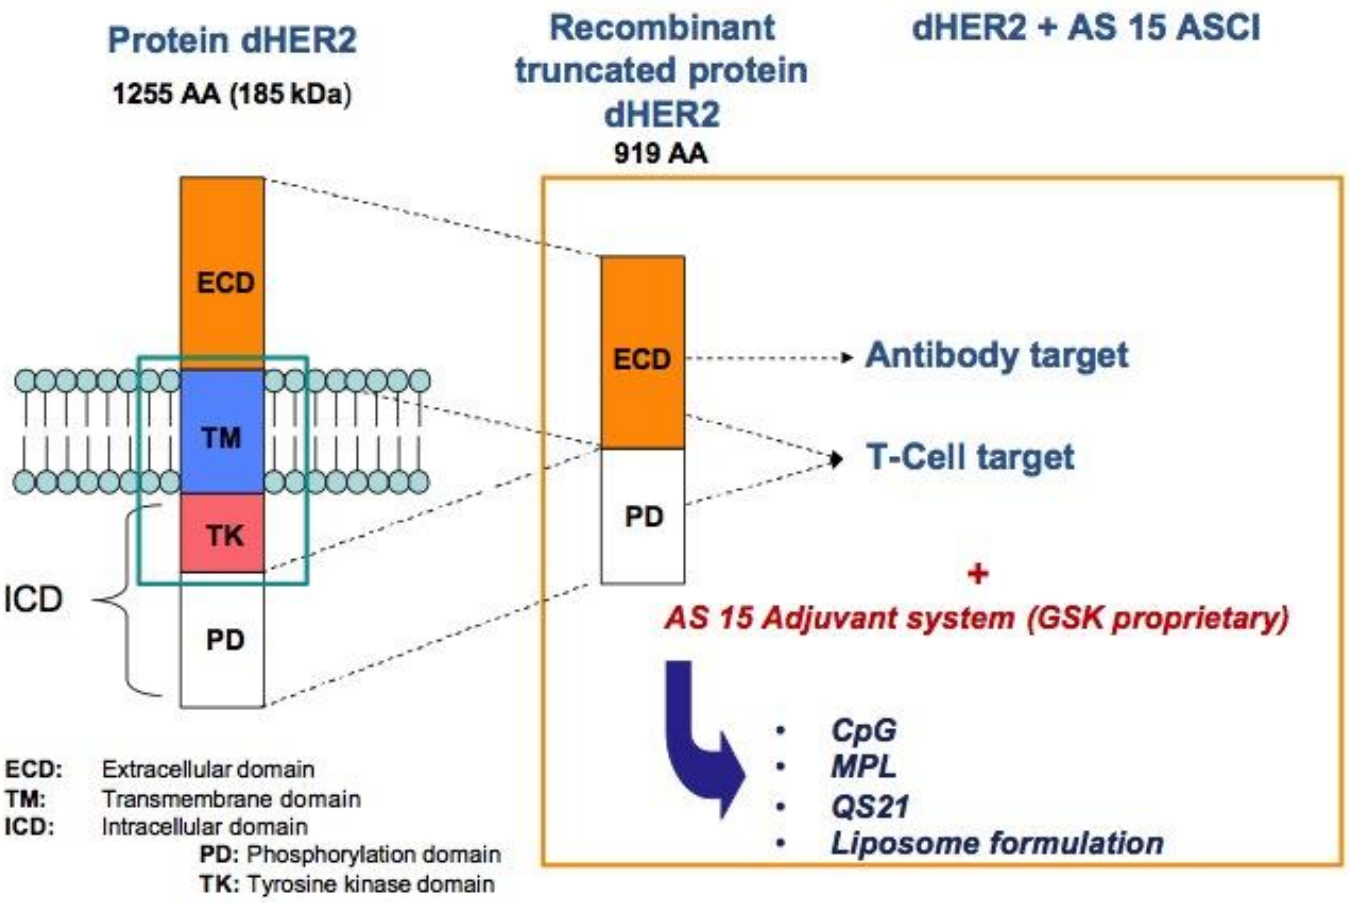
- Limitation: Antigen targets with surface expression are often not specific
- More specific targets are intracelullar (NYESO-1)
- Heterogenous expression of tumor antigen in solid tumors
- Suppressive tumor microenvironment factors
- Highly TOXIC
- Expensive (personalized) and infrastructure is required

Future Approaches

- Armored CARs
  - IL-12 secreting
- Combination Therapy
  - PD-1/PDL-1
- Suicide Switch : Abrogate CRS
- Finding cleaner Targets
  - To avoid on target toxicities

VACCINES

Phase I open-label dose-escalation vaccine trial of dHER2 protein with AS15 adjuvant in HER2-overexpressing patients with high-risk breast cancer



G. Curigliano et al. 2016

Endpoints

- Primary:

  Safety

- Secondary:

  Humoral immunogenicity

  Cell-mediated immunogenicity

  Impact of escalating doses of HER2

G. Curigliano et al. 2016

Study design

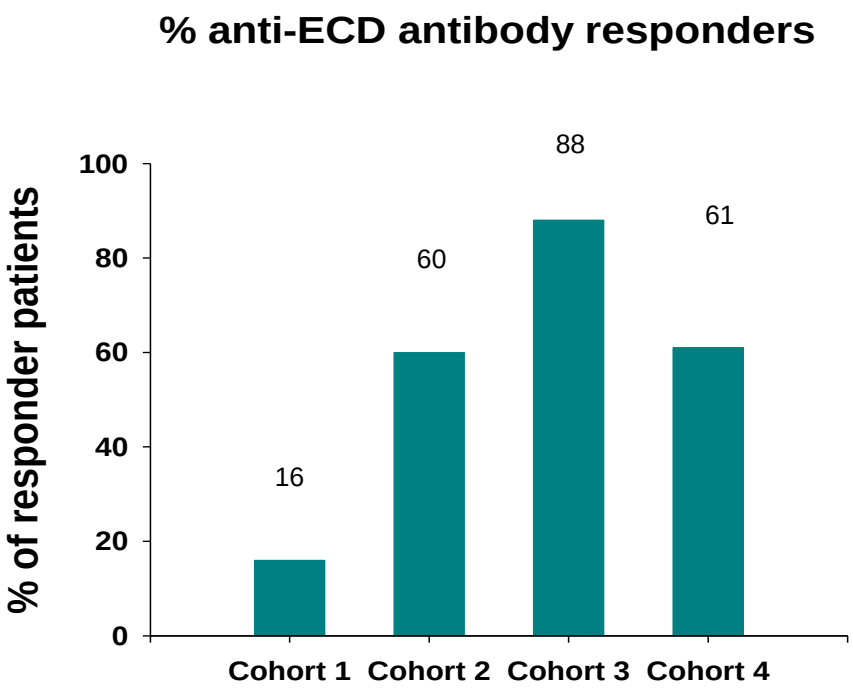
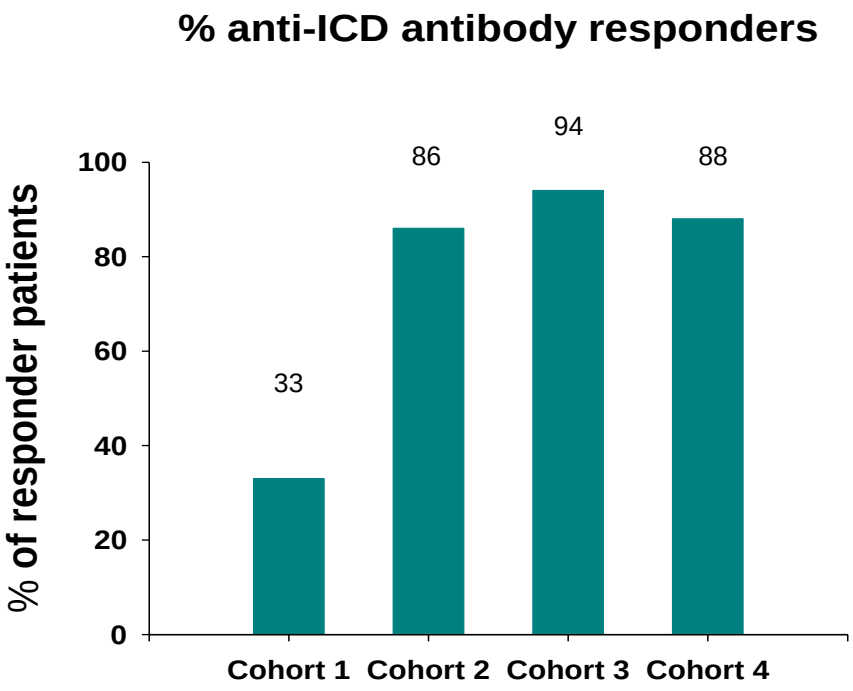
Responders anti ECD and anti ICD

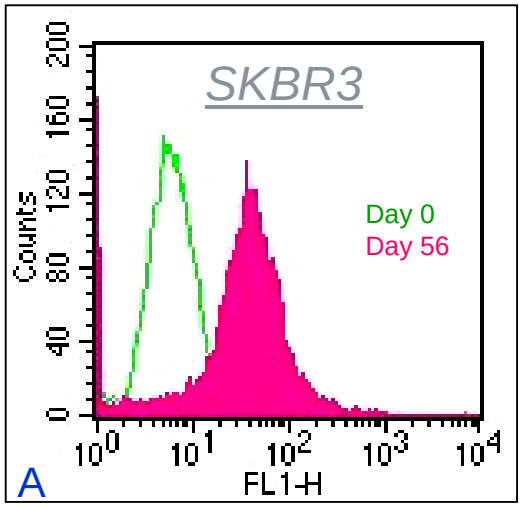


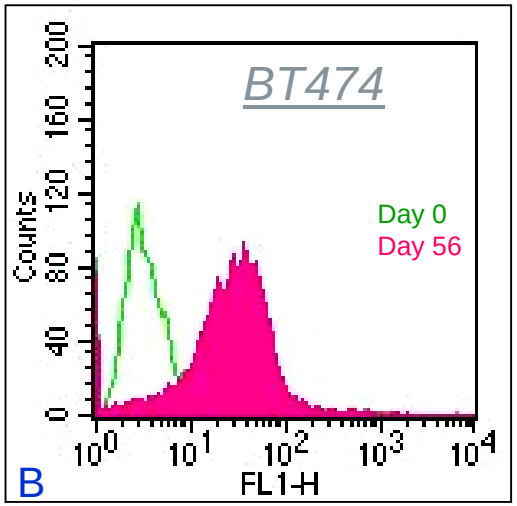


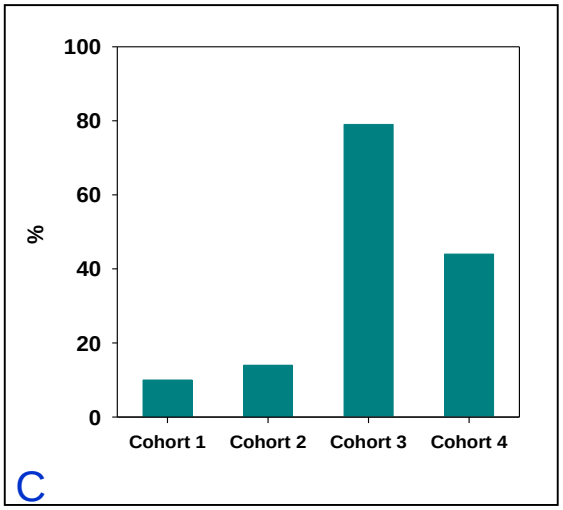
G. Curigliano et al. 2016

d-HER2 induces antibodies that specifically bind the native HER2 receptor

- The ECD binding ratio seems to increase with the dose of HER2 protein when assessed after the administration of four dHER2 + AS15 doses.







G. Curigliano et al. 2016

Thank you for your attention

Concomitant Chemoradiotherapy of esophageal carcinomas

C. Hennequin,
Hôpital Saint-Louis, Paris

Esophageal cancer

- Two main histological types:
  - Squamous cell carcinoma (SCC)
    - Tobacco, alcohool
    - Incidence decreasing
  - Adenocarcinoma (Adk)
    - Biliary and acid gastroesophageal reflux
    - Incidence dramatically increasing

Enzinger, NEJM, 2003: 349: 2241-52

Gastro-Oesophageal Junction (GOJ) adenocarcinoma

Siewert Classification

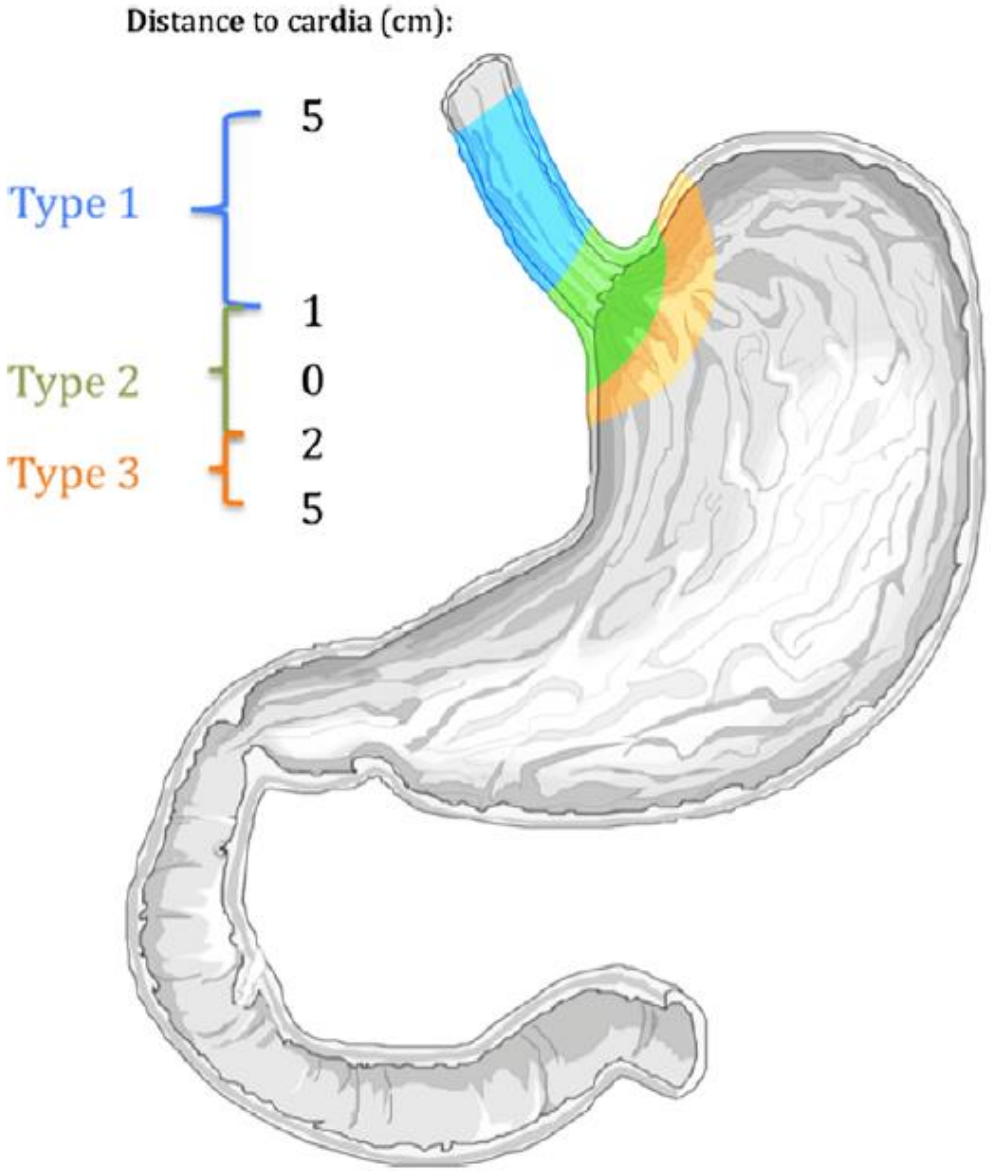


Figure 5–1. Classification of gastroesophageal junction tumors. (Adapted from Siewert JR, Stein HJ. Classification of adenocarcinoma of the oesophagogastric junction. Br J Surg 1998;85:1457–9.)

Outcome of esophageal cancer

	1976-1990	1991-1996	1996-2002
3 yr Survival (%)	6.8	10.4	7.2

Bouvier, Eur J Cancer, 2006, 42: 228-233

Historical approach:
Surgery is the cornerstone of the treatment
Modern questions

- Is a pre-or post-operative treatment useful? ?
- If yes, chemo or chemoradiotherapy?
- Must all the resectable patients be resected?
- What are the best modalities of CT-RT:
  - Doses
  - Volumes
  - Drugs

Esophageal wall

Oppedijk, JCO, 2014, 32: 385=91

Conclusion:
Pre-operative treatments for locally advanced oesophageal cancers (T3 and/or N+)

- SCC: RT-CT
  - Advantage well demonstrated
    - Meta-analysis, CROSS, etc…
- Adenocarcinomas of the Gastro-oesophageal junction
  - A neo-adjuvant treatment is required
  - CT or RT-CT ?
  - CT: MRC trial, MAGIC, FFCD trial, meta-analysis
  - RT-CT: CROSS, trial meta-analysis
    - Maybe better for large tumors
- Trial in progress: MAGIC vs CROSS study

Locally advanced oesophageal carcinomas

Definition: T3-T4 and/or N+

Results of surgery:

5-yr survival:10 - 30%

Could Chemoradiotherapy be used instead of surgery?

Locally advanced oesophageal carcinomas: Is surgery useful?

2 Randomized trials:

Stahl, JCO, 23: 2310-17, 2005

Bedenne, JCO, 25: 1160-68, 2007

Same design:

After concomitant chemo-radiotherapy

And a « good » response

Randomisation: Surg. or continuation of CT-RT

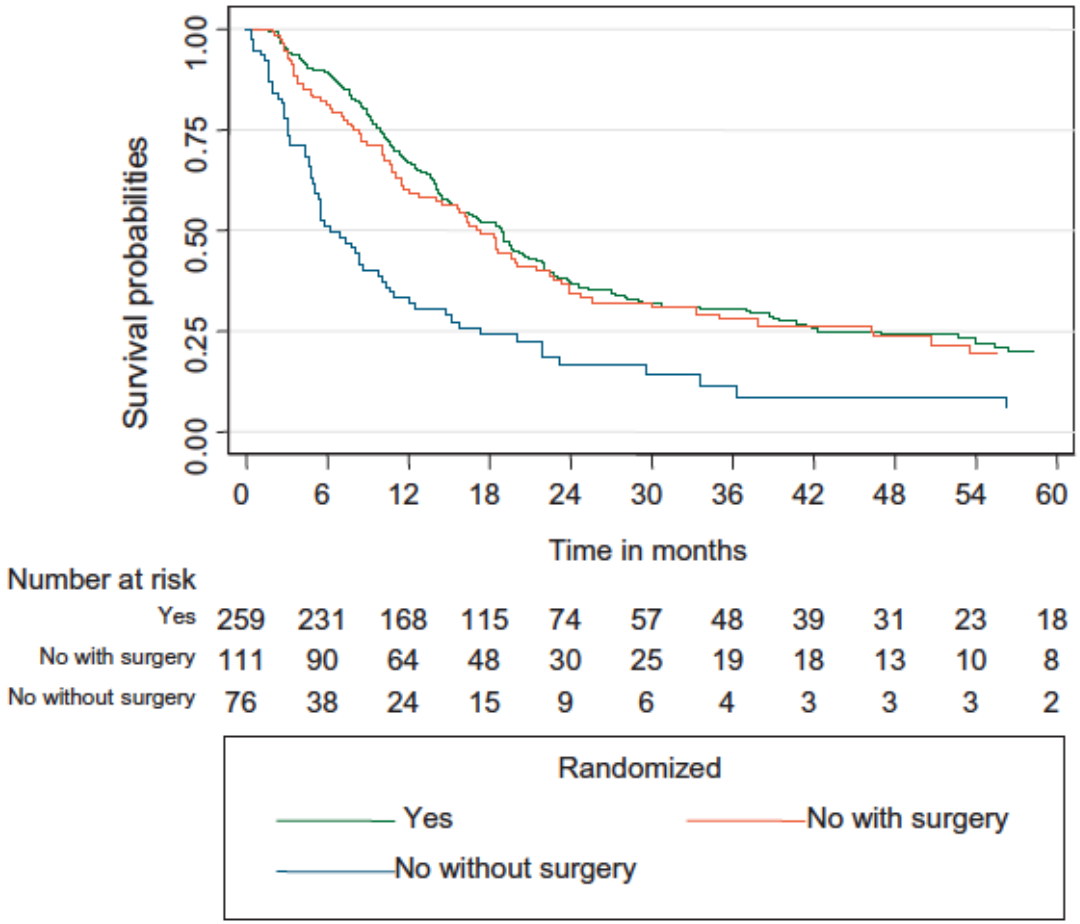
Surgery: a salvage modality?

FFCD trial: what happen to the non-randomized pts (non-responders, mainly) ?

- 451 pts registered
- 192 pts not randomized because of
  - A less than partial response
  - Contraindication for surgery
  - Patient's refusal
  - Death
- 112 pts underwent salvage surgery



Non-responders pts who are operated Have the same survival that randomized pts !

Vincent, EJC, 2015, 51:1683– 1693

Salvage Surgery

Large multicenter retrospective study

Salvage surgery vs Planned surgery

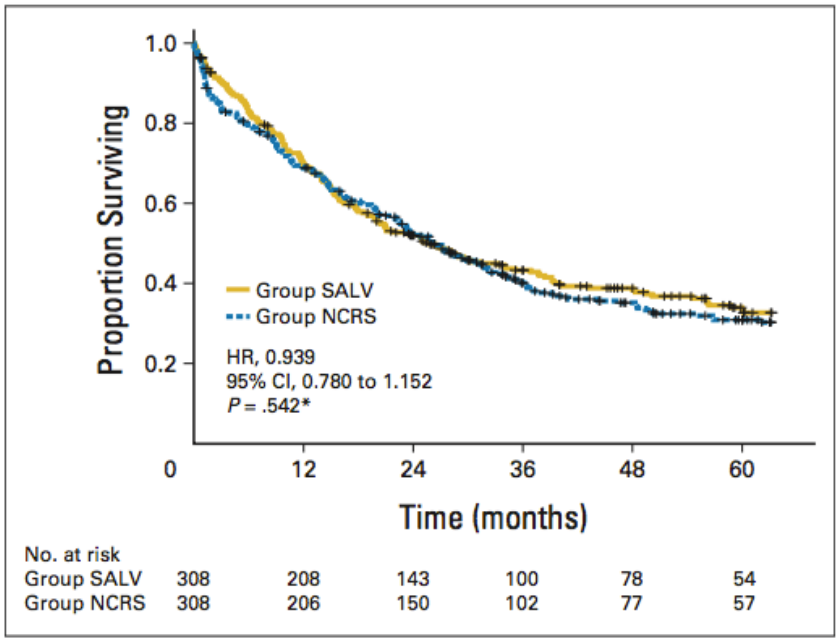


Fig 1. Comparison of overall survival in propensity-matched salvage esophagectomy after definitive chemoradiotherapy (SALV) and neoadjuvant chemoradiotherapy followed by planned esophagectomy (NCRS) groups. No. of patients at risk in each interval is shown in table at bottom of graph. HR, hazard ratio. (*) *P* value and HR calculated using Cox regression model for matched data set.

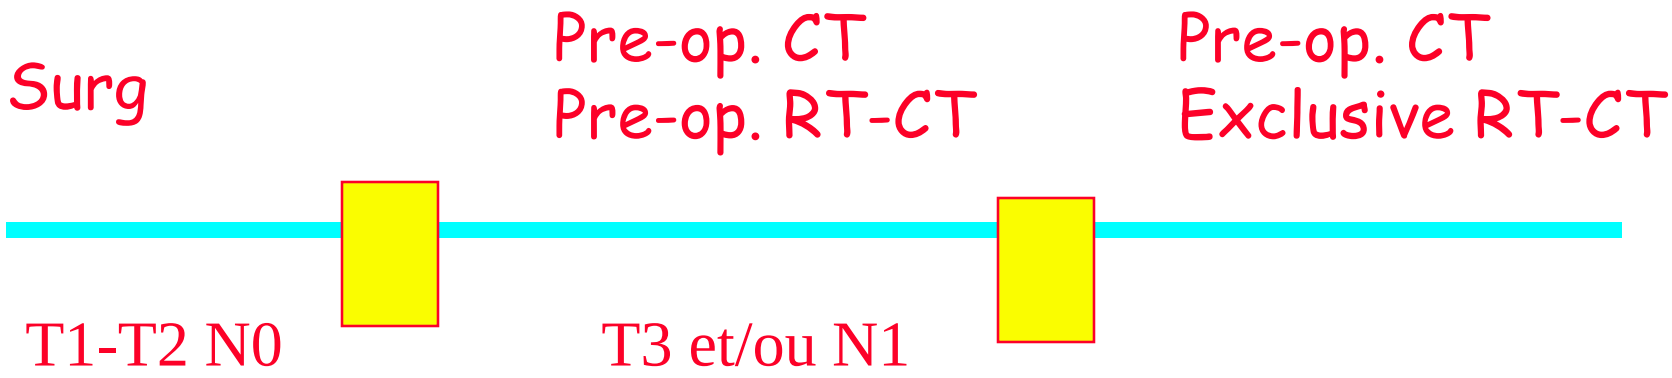
No difference
In long-term outcome

A viable option ?

Markar, JCO, 33: 3866-73, 2015

Conclusion:
« Resectable » oesophageal carcinomas
Big heterogeneity



Stage
Resectability (surgeon)
Histology (+++)
Tumour volume
Patient (Age, comorbidities, …)

Role of surgery in locally advanced oesophageal carcinomas

Who benefit from surgery ?

Improving the results of concomitant Chemo-Radiotherapy

- Predictive factors of chemosensitivity
- Evaluation of response to chemo/radiotherapy
- "Neo-adjuvant" Chemotherapy
- New drugs for chemo-radiation schedules
- Endoluminal brachytherapy
- Altered fractionnation schedules
- Conformal radiotherapy

Predictive factors of chemo-radiosensitivity

- Apoptosis: p53, p21, Survivin, bcl2
- Tumour proliferation: NF-κB, COX-2, cyclins
- EGFR, HER-2
- DNA repair: ERCC1
- Tumour hypoxia
- Thymydylate synthase (5FU)
- Metallothionein, GST-Π, P-glycoprotein (cisplatin)
- Gene expression arrays
- SNPs for AKT, PTEN, …

Prognostic value of NF-κB

37 pts
Preoperative RT-CT
Then surgery
NF-κB evaluated by immunochemistry

pCR according to NF-kB

NF-kB +	NF-kB -
1/10 (10%)	13/27 (48%)

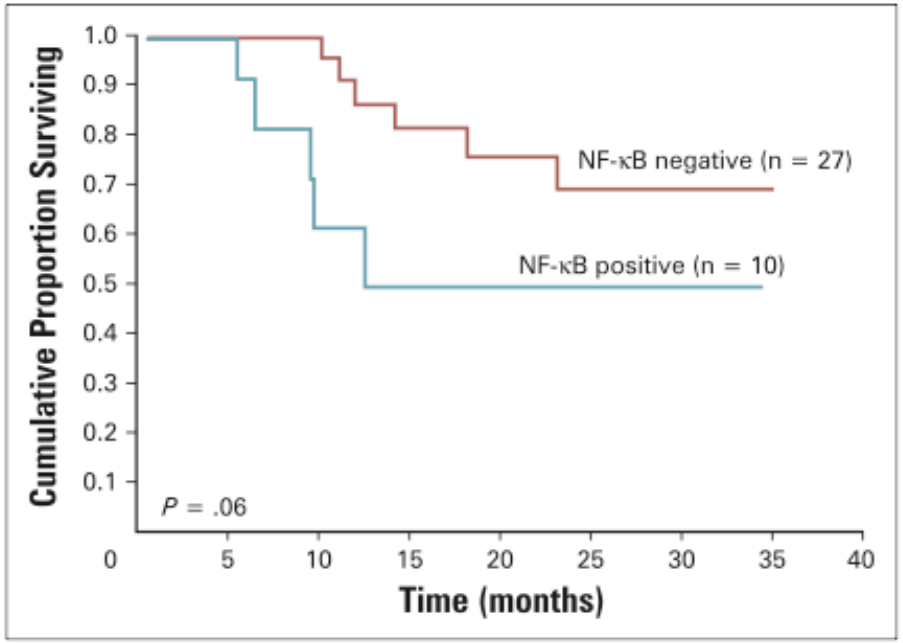


Fig 4. Kaplan-Meier curve and overall survival by pretreatment nuclear factor κB (NF-κB) expression status for esophageal cancer patients treated with preoperative chemoradiotherapy.

Izzo, JCO, 24:748-754, 2006

Impact of surgery in locally advanced oesophageal carcinomas

Population:

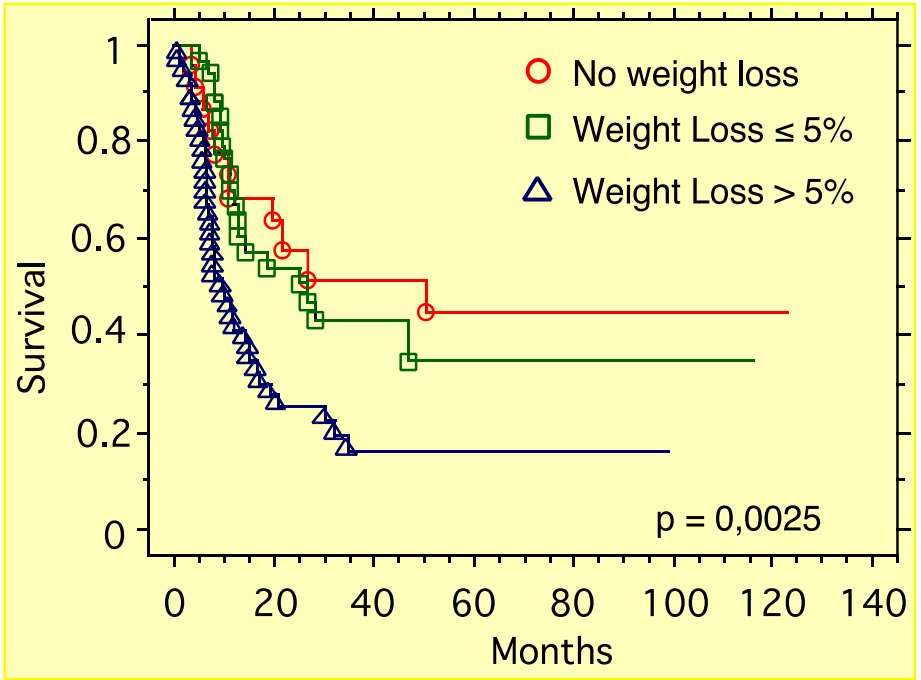
-112 patients with a T3 and/or N+ tumor

- Concomitant chemoradiotherapy
- 2 cycles of 5FU-CDDP then 40 Gy
- Reevaluation

-Then Surgery or continuation of RT-CT

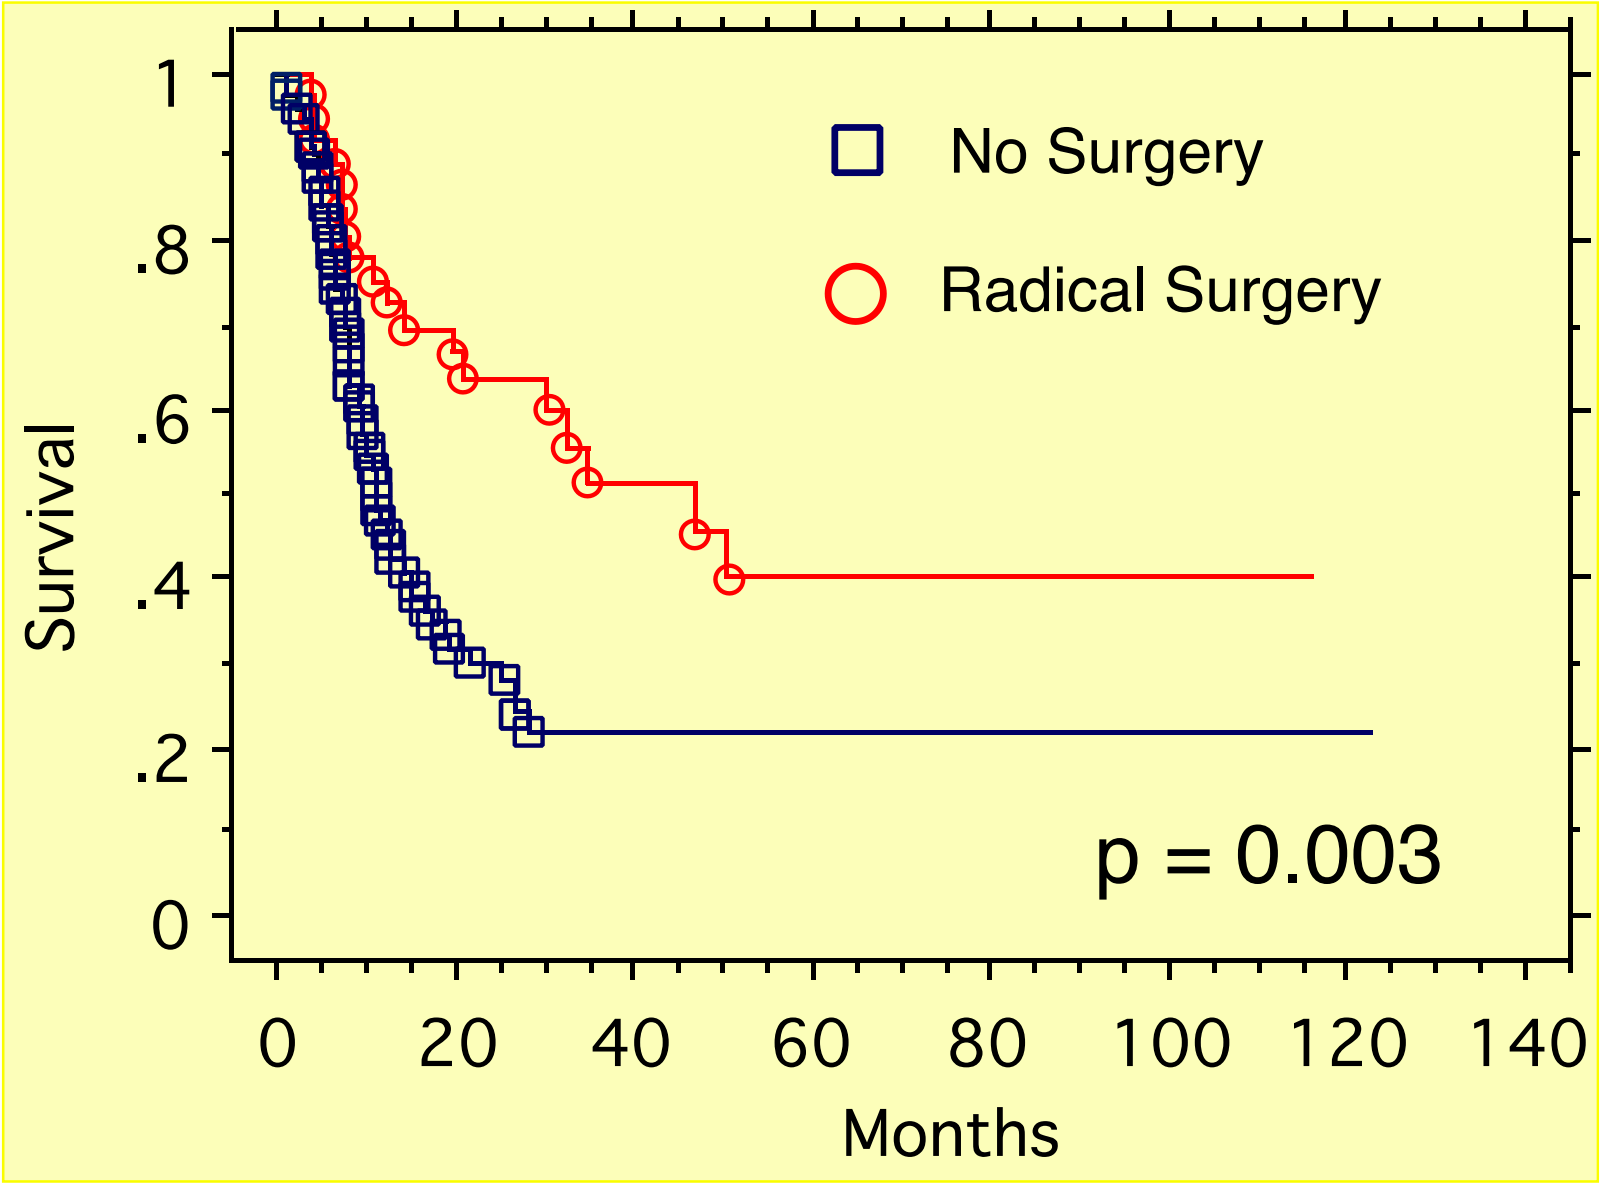
Prognostic factors (Univariate):

- Karnofsky index
- Weight loss
- Response to RT-CT
- Surgery



Hennequin et al, IJROBP, 2001

Survival according to Surgery



Five-year survival rate for the 78 responders according to surgery and clinical response

Clinical response	Esophagectomy	No surgery	P
Complete response, n (%)	7 (35.7%)	21 (42.2%)	NS
Partial response, n (%)	28 (49.1%)	22 (23.5%)	0.003

(%) : 5-year survival rates

Evaluation of response

- Endoscopy: could not assessed intra-parietal tumor residual

- Echo-endoscopy (Giovannini, Ital J Gastro, 1999)

Overestimation of residual tumour because of oedema

- CT –IV contrast (Griffith, Br J Radiol, 1999) +++

- PET-scan (Brucher, Ann Surg, 2001)
- Inflammation due to radiation

Prognostic value of metabolic response

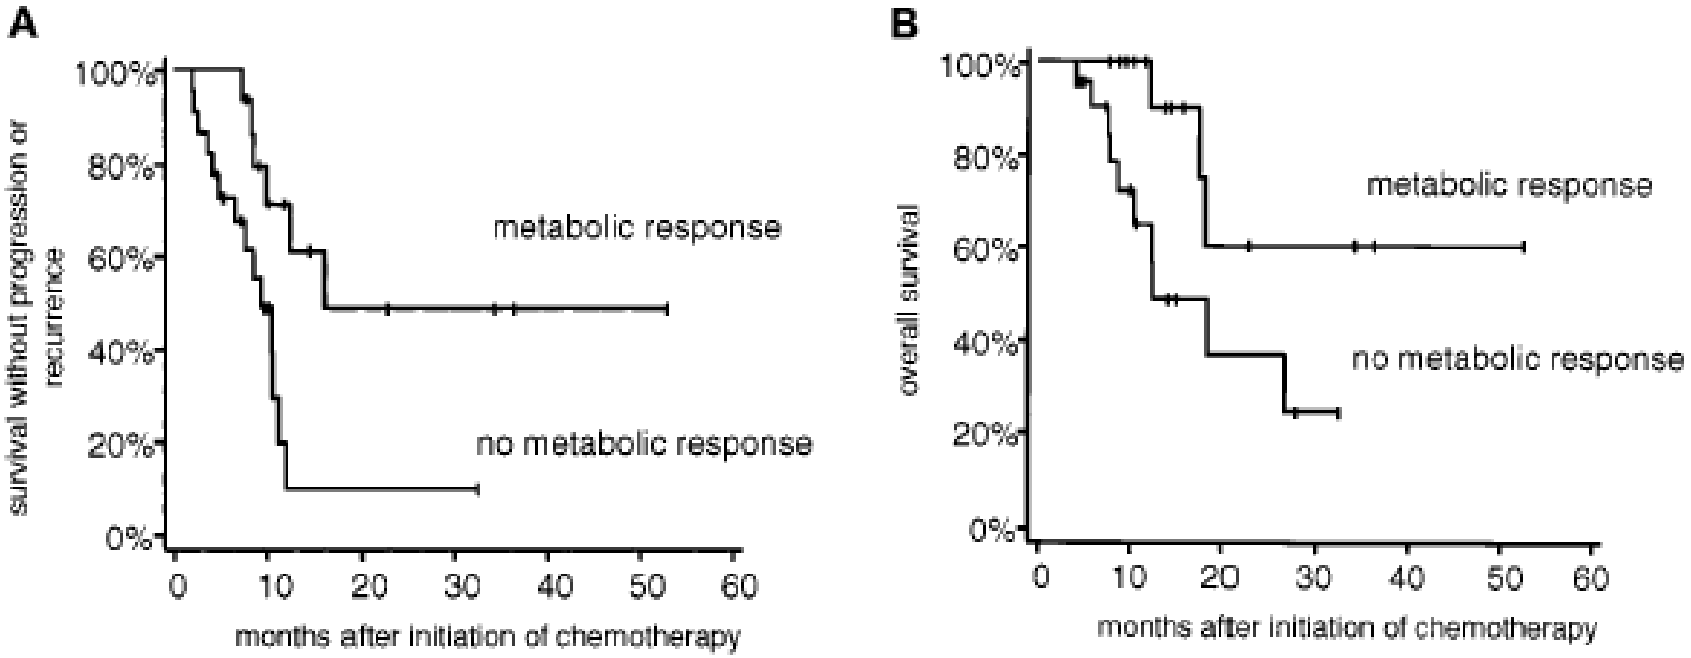


Fig 3. Kaplan-Meier plots showing (A) survival without disease progression or recurrence and (B) overall survival. For both parameters there is a statistically significant difference between patients with and without a metabolic response ($P = .01$ and $P = .04$, respectively).

Weber, JCO, 2001

Time Course of Tumor Metabolic Activity During Chemoradiotherapy of Esophageal Squamous Cell Carcinoma and Response to Treatment

Wieder, JCO, 22: 900-908, 2004

N =38 pts

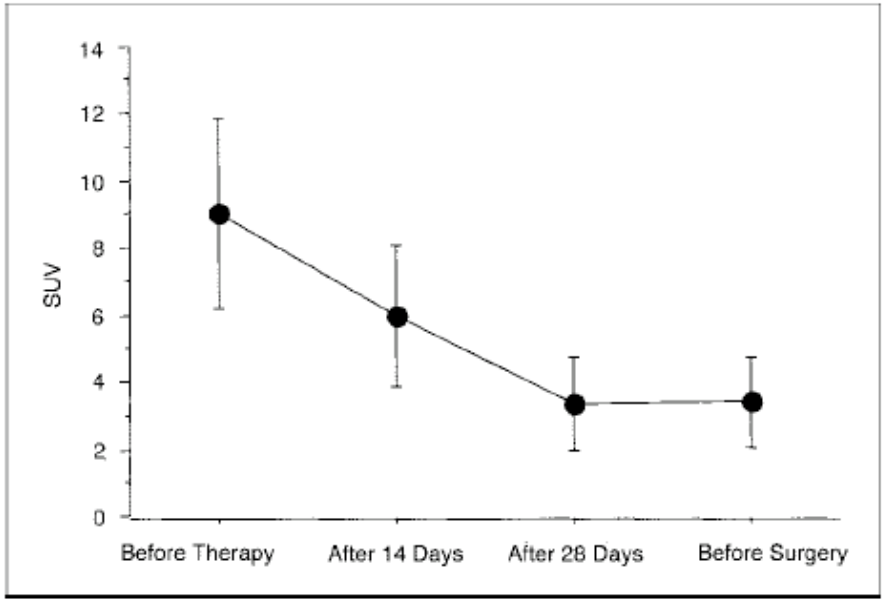

Fig 1. Time course of tumor fluorodeoxyglucose uptake during chemoradiotherapy. Error bars denote 1 standard deviation. SUV, standardized uptake value.

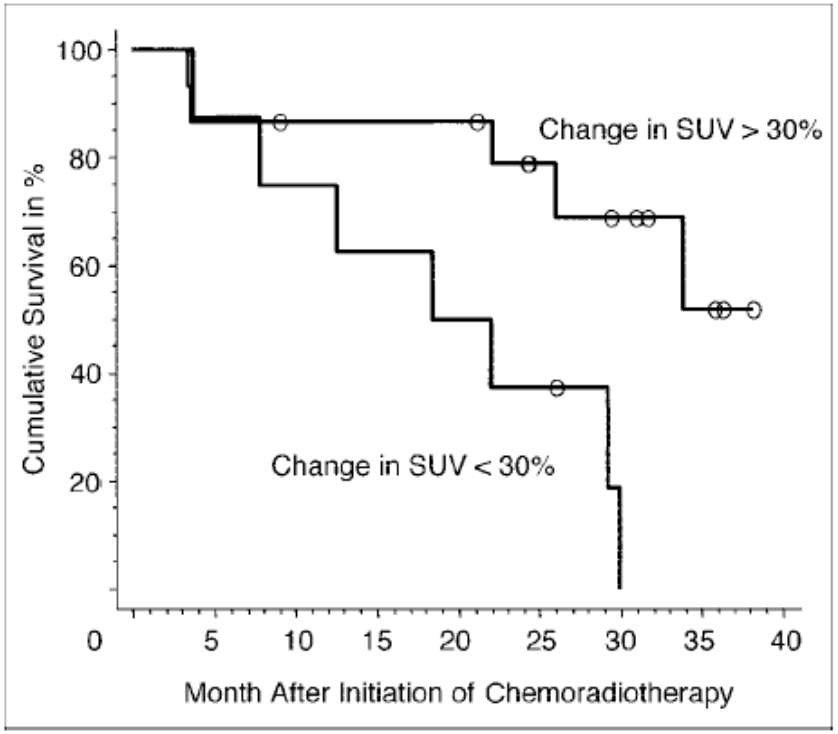

Fig 6. Reduction of tumor fluorodeoxyglucose uptake 14 days after initiation of chemoradiotherapy versus patient survival. SUV, standardized uptake value.

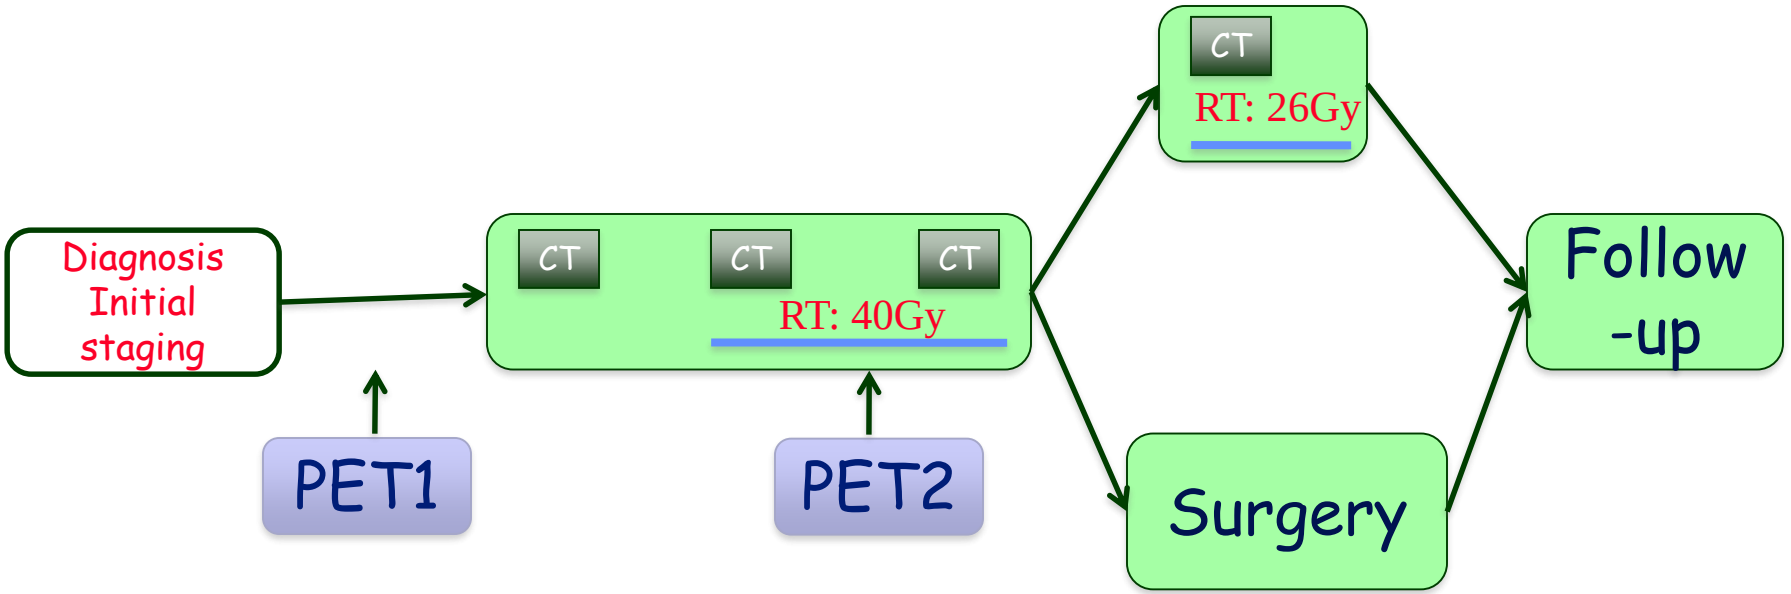
Evaluation of response to RT-CT by 18-FDG-PET-CT



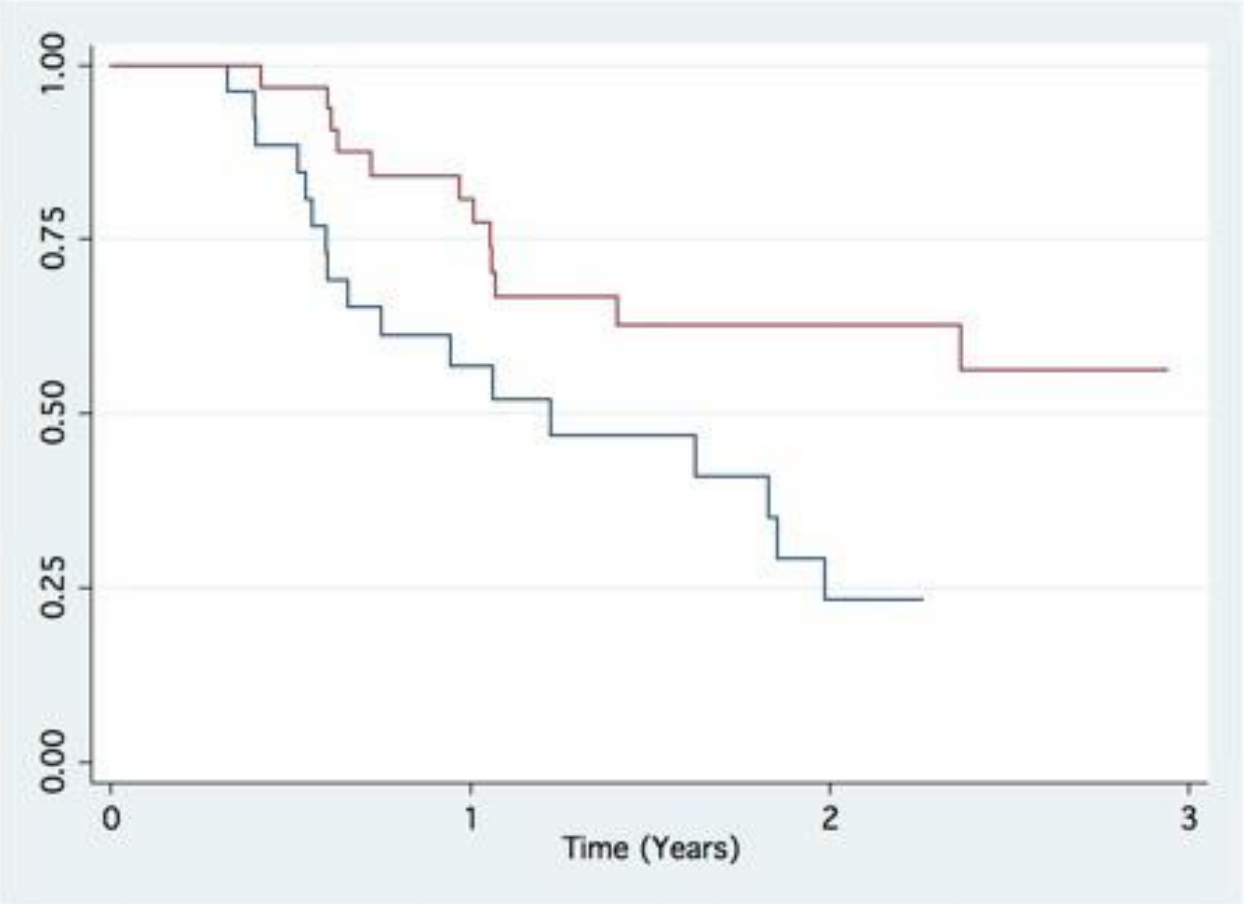
Included:
72 pts

Second PET-CT:
N=59 pts

No Second PET-CT:
n=13

Cuenca, Hennequin, …Eur J Nucl Med Mol Imaging. 2013 Apr;40(4):477-85

Evaluation of response to RT-CT by 18-FDG-PET-CT



Log-rank : p=0.016

Numbers of patients at risk:

Months	0	6	12	18	24	30	36
Good Response	33	32	25	16	12	8	5
Poor Response	26	23	13	8	4	2	_

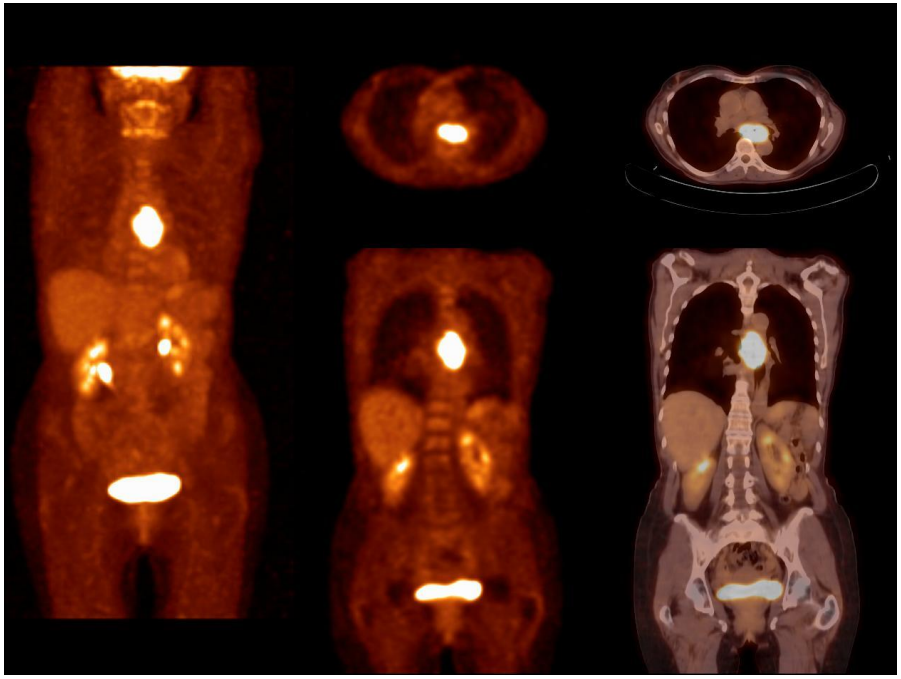
Overall survival according to metabolic response (>50% decline in SUV)

Cuenca, EJNM, 2013

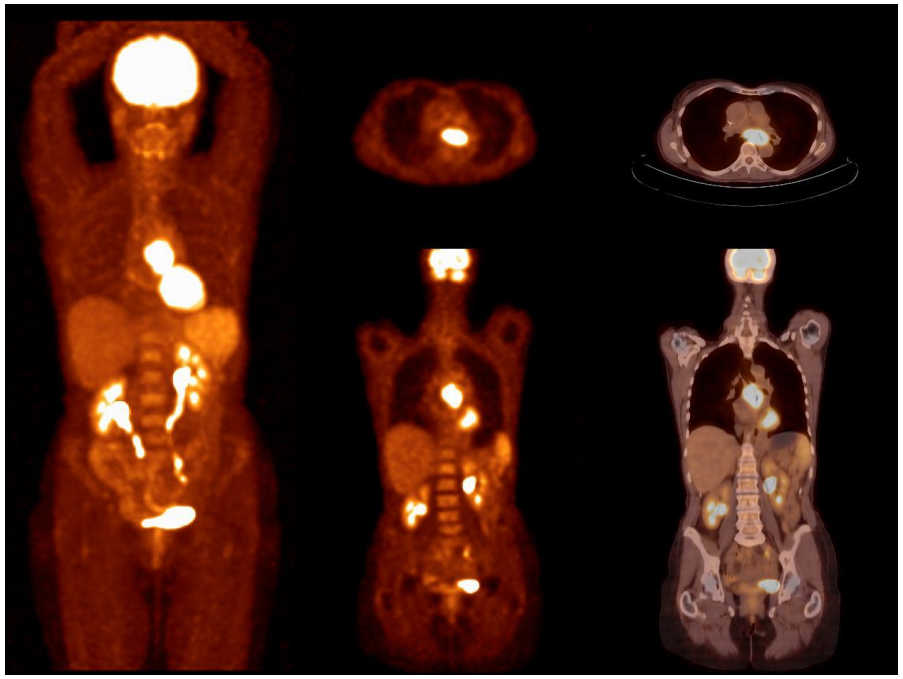
- Exemple N° 1

- 72 yr-old; T3N1 middle third of the oeso.

Primary TEP: SUVmax=14



TEP at 20 Gy: SUVmax=12



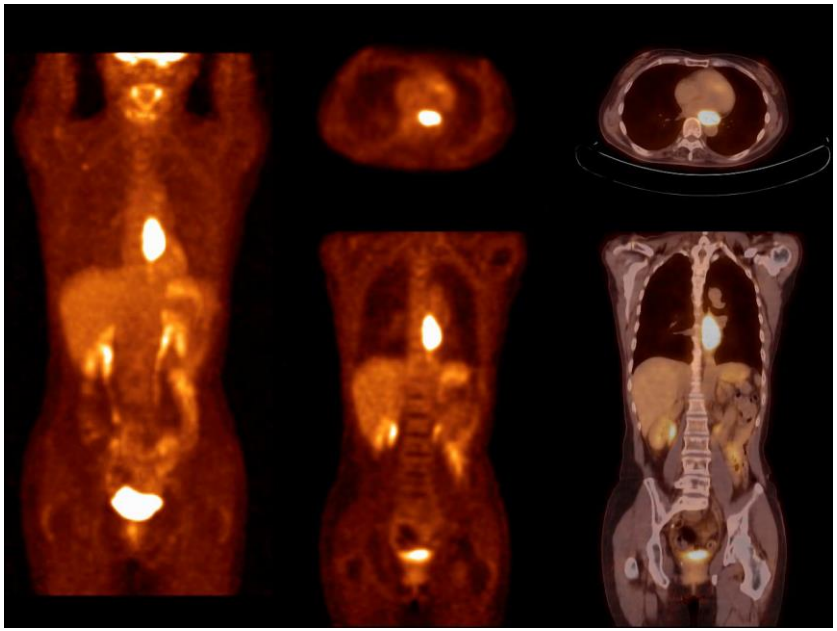
Conclusion: No metabolic response

Surgery : No tumour down staging
No sign of tumour regression

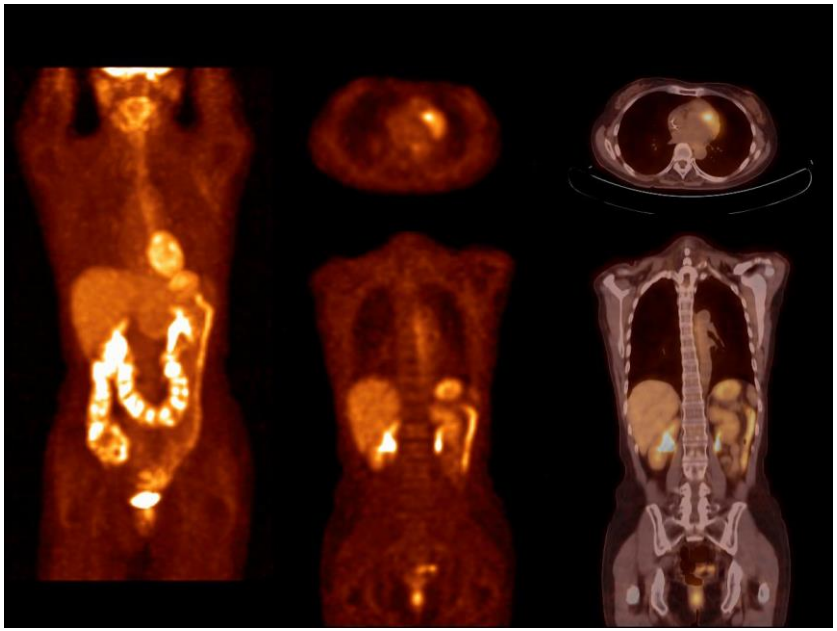
- Exemple N° 2

- 55 yrs old; SCC T3N0 lower third

First TEP : SUVmax=19.3



TEP à 20 Gy: SUVmax=2.3



Conclusion: Complete metabolic response

Surgery: pathologic metabolic response

New drugs

Taxanes: Taxol, Taxoter

Oxaliplatine

Targeted therapies

- EGFR inhibitors (cetuximab, panitunimab)
- Anti-angiogenic drugs
- HER2 inhibitors (for Her2 ADK tumours)

FolFox vs 5FU/CDDP

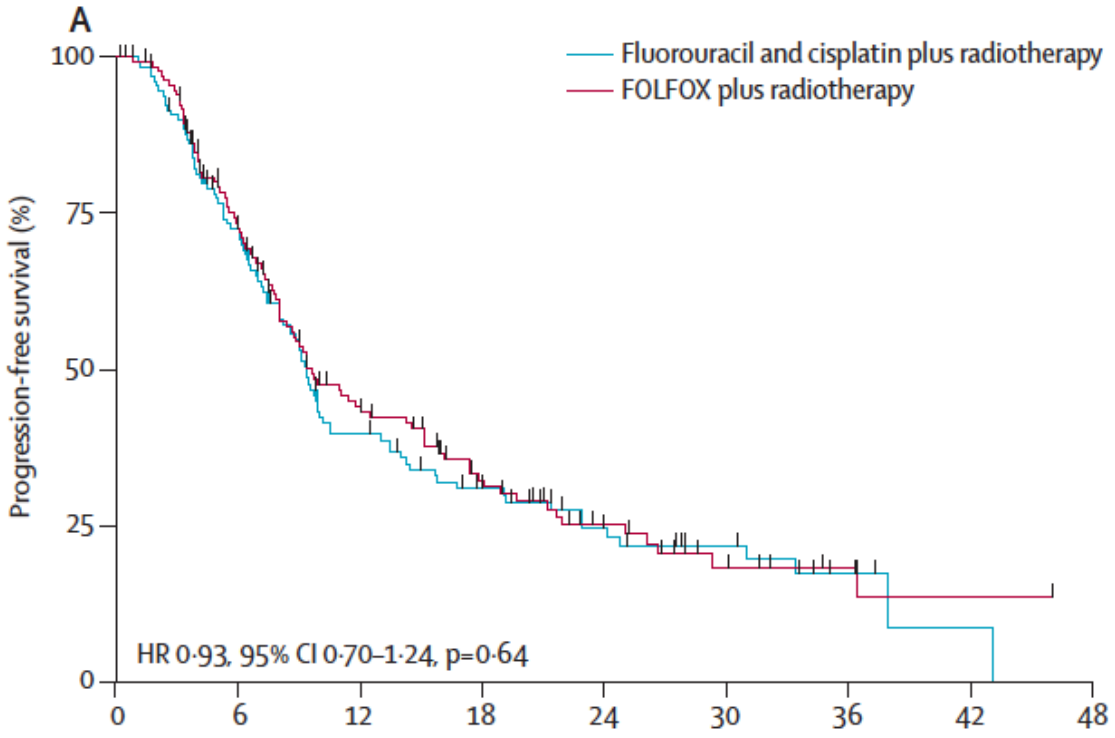
Phase III trial
267 pts – SCC: 85.8% - Stage III-IV: 61%

	FolFOx RT	5FU/CDDP/RT
Grade ¾ toxicities (%)	30.6	31.3
3-yr PFS (%)	18.2	17.4
OS (%)	20.2	17.5

No difference – better tolerated?

Conroy, T., Lancet Oncol. 2014 Mar;15(3):305-14

FolFox vs 5FU/CDDP



Number at risk									
Fluorouracil and cisplatin plus radiotherapy	133	89	44	29	18	11	5	1	0
FOLFOX plus radiotherapy	134	90	50	29	17	8	4	3	2

No difference

But this is not an non-inferiority trial

Conroy, T., Lancet Oncol. 2014 Mar;15(3):305-14

5FU/CDDP ± Cetuximab: SCOPE Trial

Phase II/III trial:

RT-CT: Cisplatin 60 mg/m2 D1+ capecitabine: 625mg/m2 twice daily
4 cycles – RT 50 Gy during cycles 3&4
± Cetuximab: 400 mg/m2 D1 then 250 mg/m2 weekly

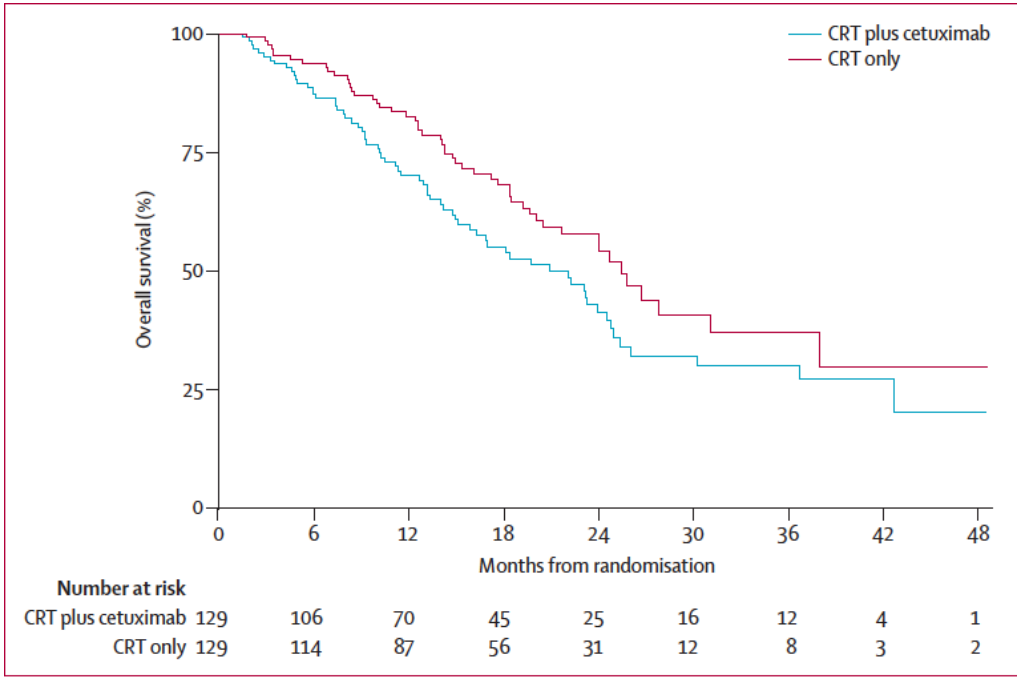


Figure 2: Kaplan-Meier curves of overall survival by treatment group

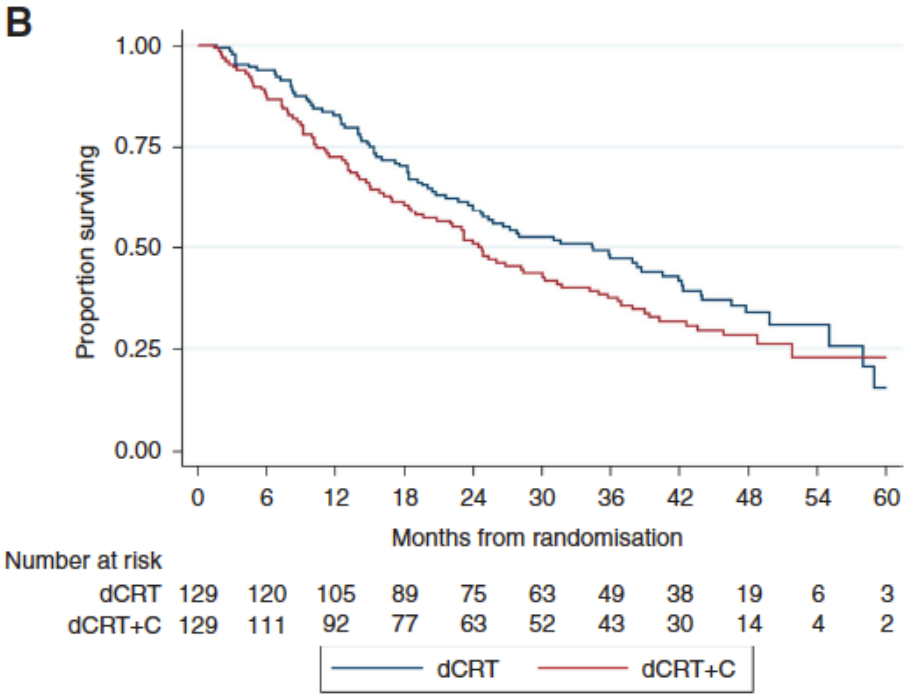
Crosby, Lancet Oncol 2013; 14: 627–37

Scope trial: update



Exclusive RT-CT
(contemporary series)
3-yr OS: 47.2%

Prognostic factors:
- Radiation dose
- Cisplatin intensity

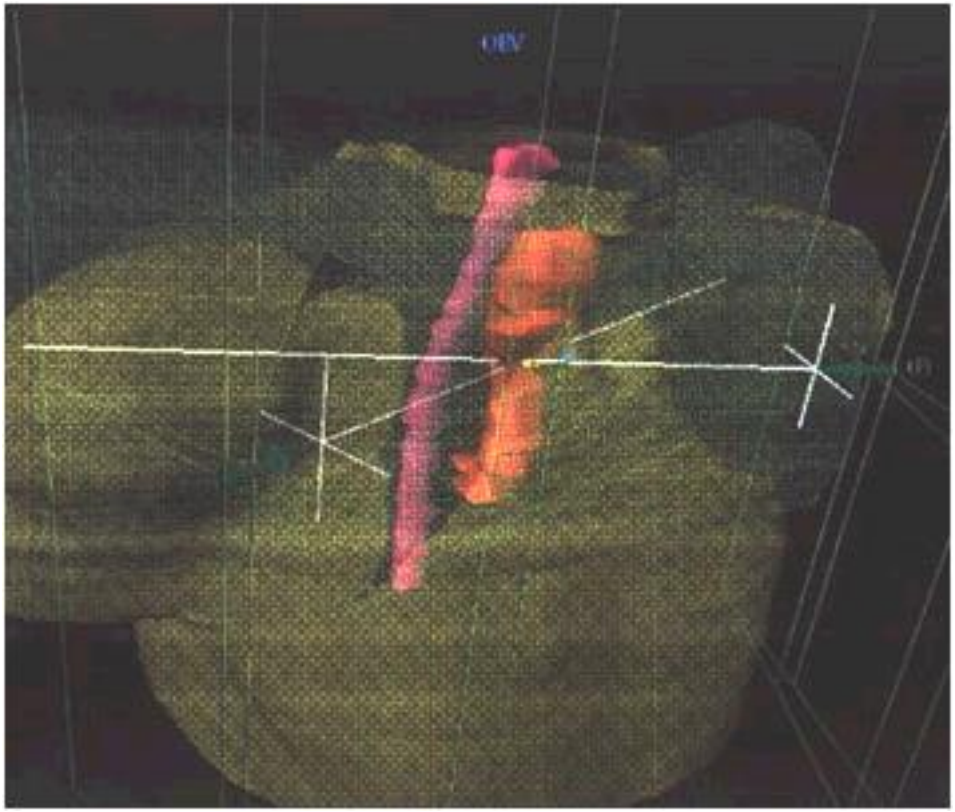
Crosby, BJC, 2017, 116: 709-716

Improving radiotherapy

- Conformal RT/IMRT

- Definition of target volumes: PET-scan

- Dose:
50 or 66 Gy ++++



PET-scan for staging

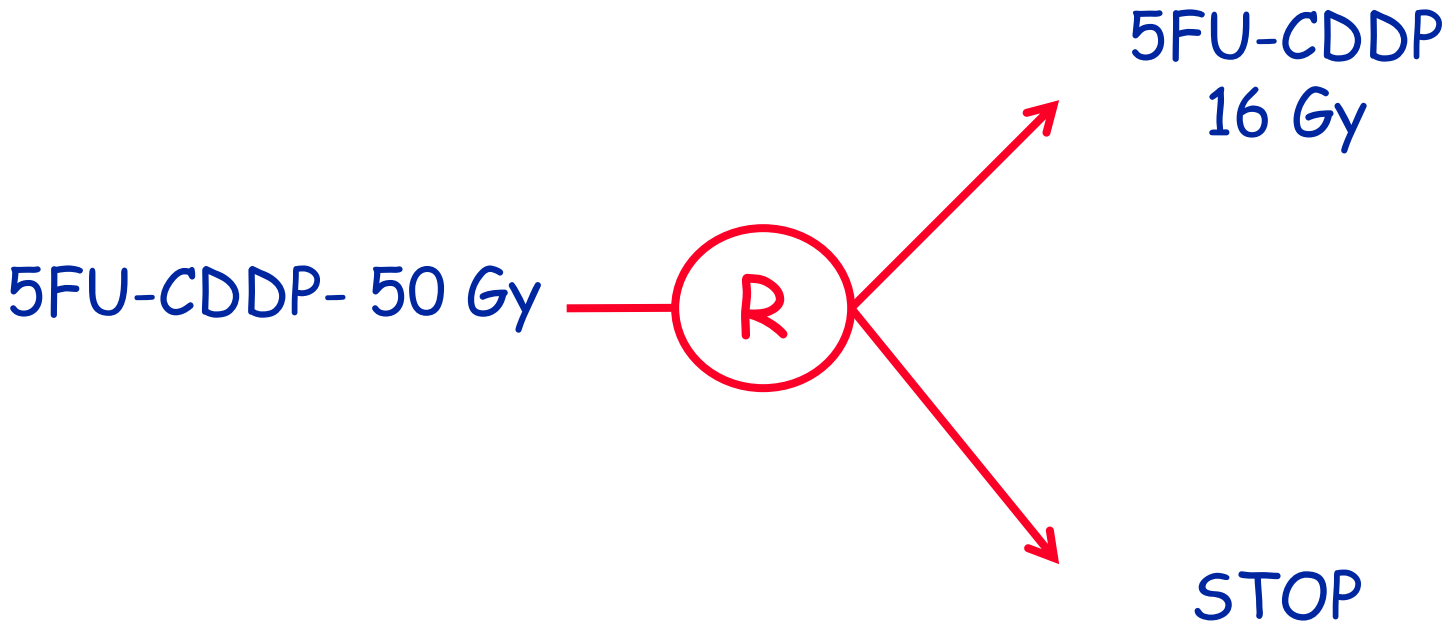
Treatment-related deaths	10%	2%
2-yr survival (%)	31%	40%

New french trial: CONCORDE



Chemo-radiotherapy in oesophageal carcinomas: Take-home messages

1. For T3-T4 or N1 tumours, pre-op RT-CT is required

2. For T3-T4 or N1 tumours, after pre-op RT-CT, the role of surgery is not well defined

3. For inoperable locally advanced tumours, RT-CT could cure #25% of the patients

4. The best chemotherapy regimen to be used with RT:
- 5FU-CDDP
- FolFox
- Taxol/carboplatine

What stage ?

1. T2 N0
2. T3 N0
3. T2 N1
4. T3 N1
5. T3 M1

What do you proposed ?

1. Front-line surgery
2. Chemotherapy then reevaluation for surgery
3. Chemoradiotherapy then reevaluation for surgery
4. Exclusive chemoradiation

Exclusive chemoradiotherapy

- Target-volumes:
  - First step: GTV
  - Then defining CTV1:
    - GTV + 5 cm below and behind GTV
    - Including peri-oesophageal spaces and lymph nodes stations
  - PTV1 = CTV1 + 0.5 cm
  - Eventually: CTV2: GTV + 2 cm longitudinal margins + circumferential margins: 5 mm

Target volumes in CROSS trial

- GTV: Primary T and positive nodes
- No CTV
- PTV:
  = 4 cm margins up and down
  = Circumferential margins: 1.5 cm

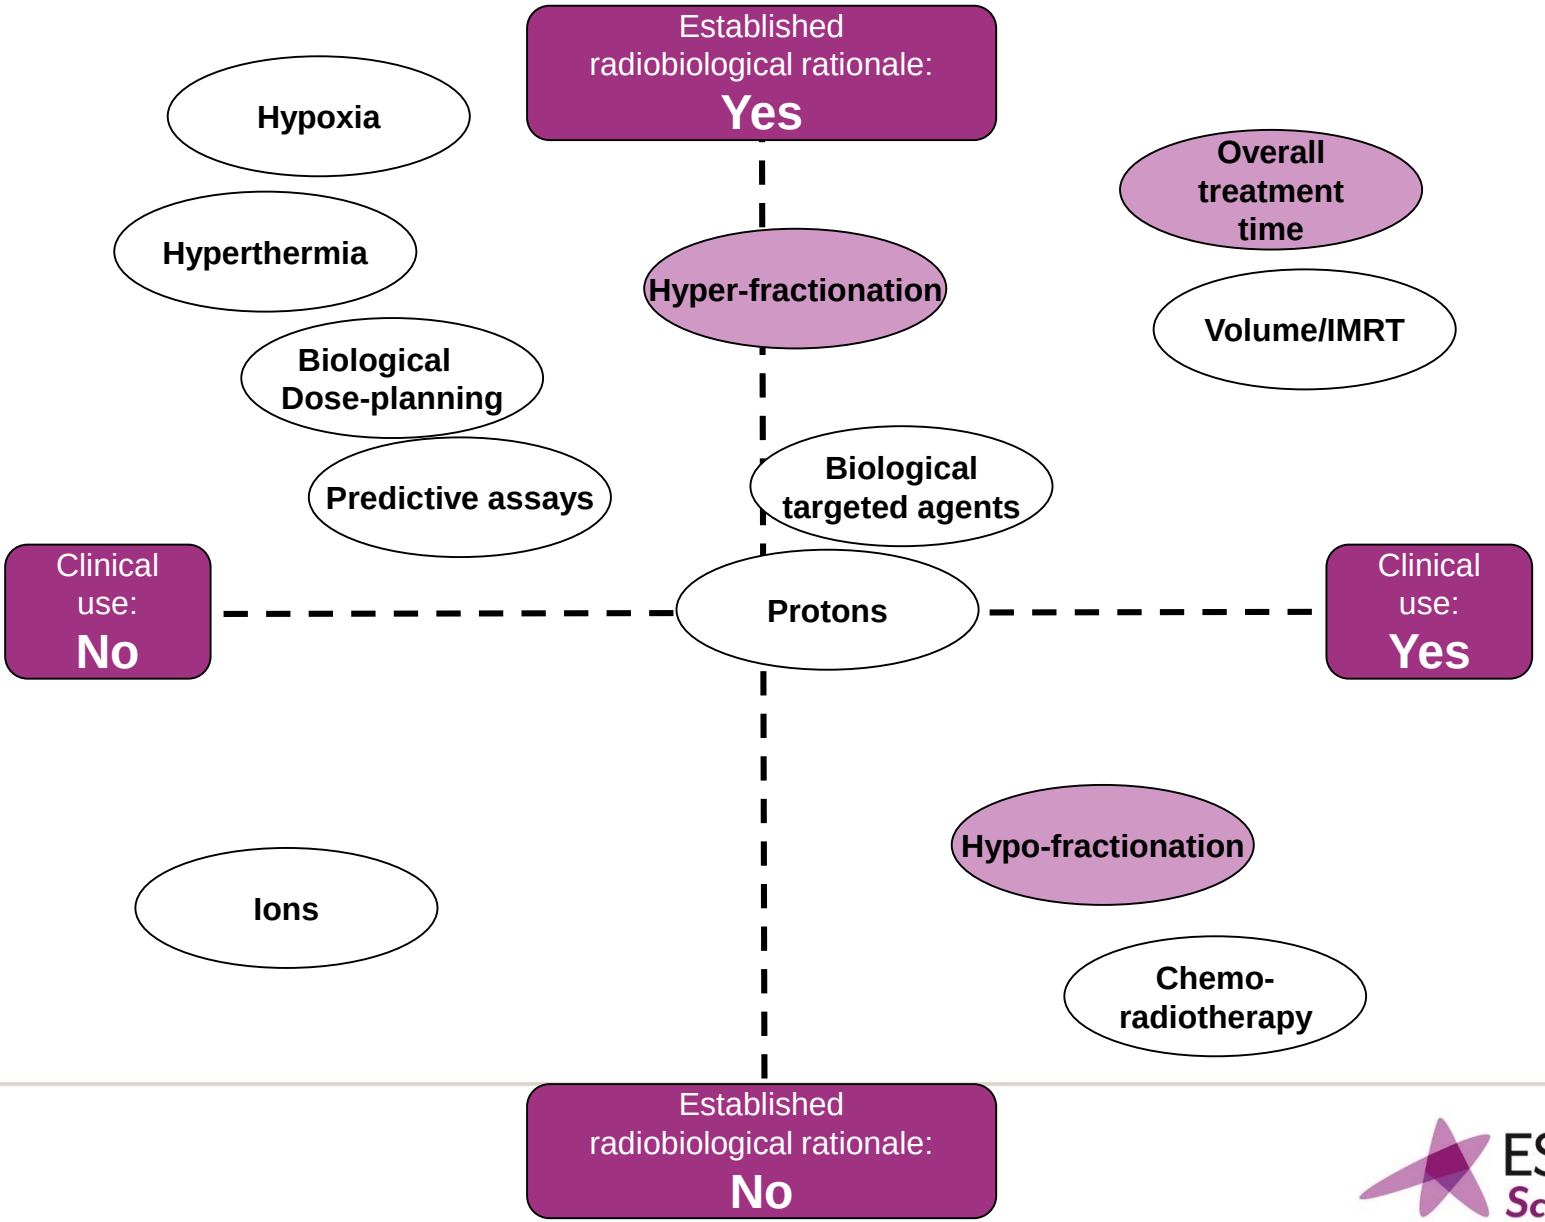
Type of morbidity
Volume and tissue
Other treatment
Genetic variation
Co-morbidity

Altered fractionation



Altered fractionation

Conventional fractionation: 1.8-2 Gy/fx - 5fx per week

Split-course fractionation: a break (weeks long) during treatment resulting in prolonged overall treatment time

Hyperfractionation: small doses per fraction (<1.8-2 Gy/fx)

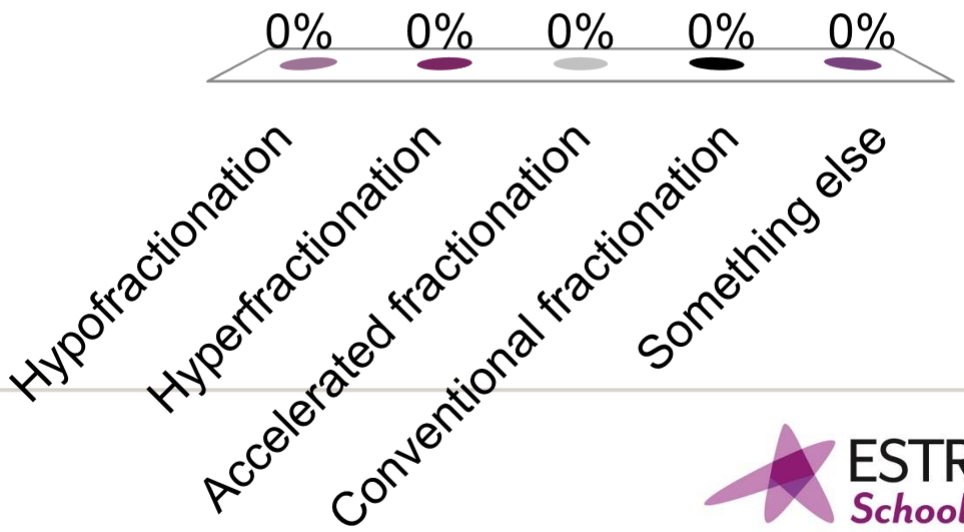
Hypofractionation: large doses per fraction (>2 Gy/fx)

Accelerated fractionation: reduced overall treatment time

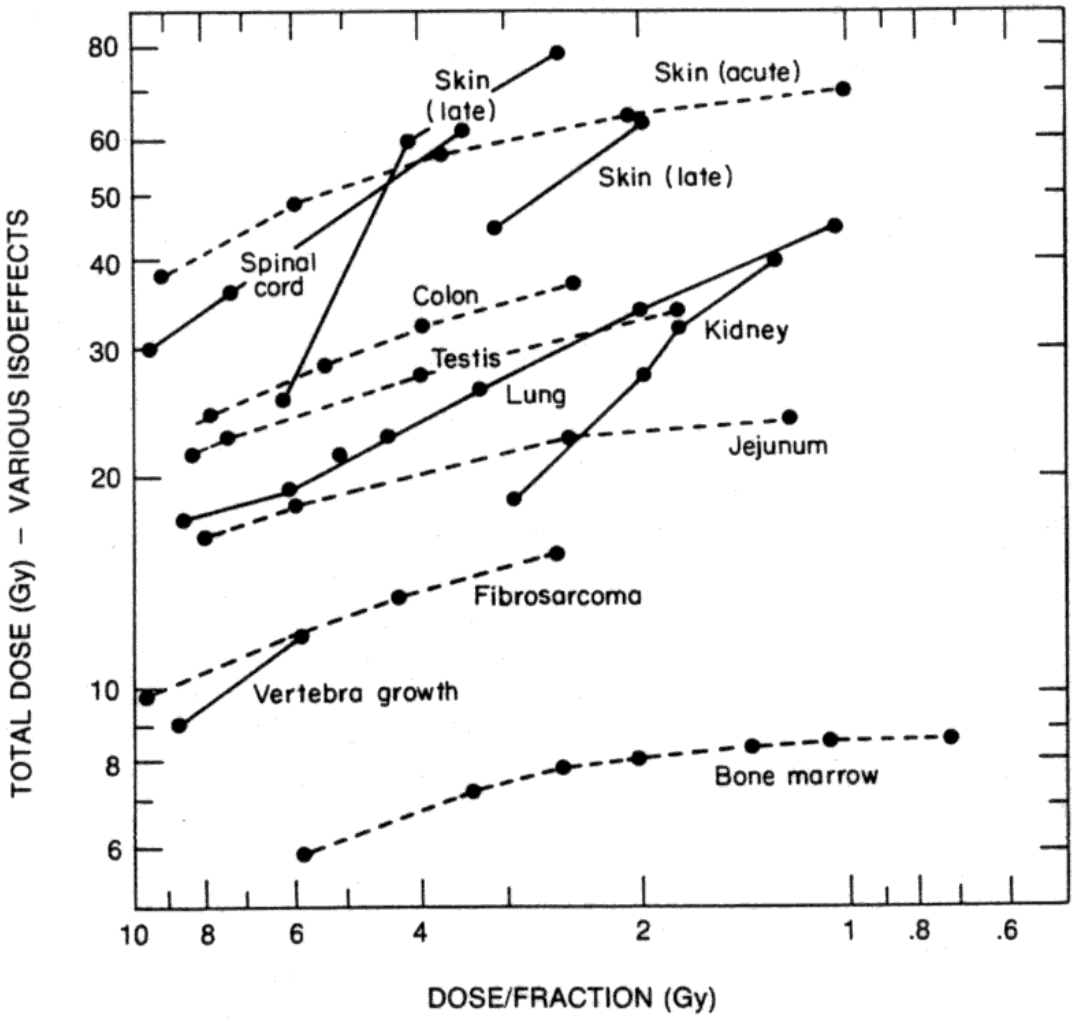
- and any combination of the different principles

For treatment of curative H&N cancer we *mainly* use:

A. Hypofractionation
B. Hyperfractionation
C. Accelerated fractionation
D. Conventional fractionation
E. Something else



Fractionation sensitivity - The spaghetti plot



Withers Cancer 1985

ESTRO School

Fractionation sensitivity

Early reacting normal tissues

- Low fractionation sensitivity
- Small increase in tolerance with decreasing dose per fraction
- High alpha-beta (8-30 Gy)
- Time factor (repopulation)

Late reacting normal tissues

- High fractionation sensitivity
- Large increase in tolerance with decreasing dose per fraction
- Low alpha-beta (2-4 Gy)
- No time factor

Hypofractionation: Palliative radiotherapy

PAIN RELIEF AFTER LOCAL RADIOTHERAPY

Randomized studies with > 100 patients

Study	Number of patients	Treatment #1	Treatment #2	Pain relief (CR+PR)
Tong 1982	146	4 Gy x 5	2.7 Gy x 15	90%/92%

ESTRO School

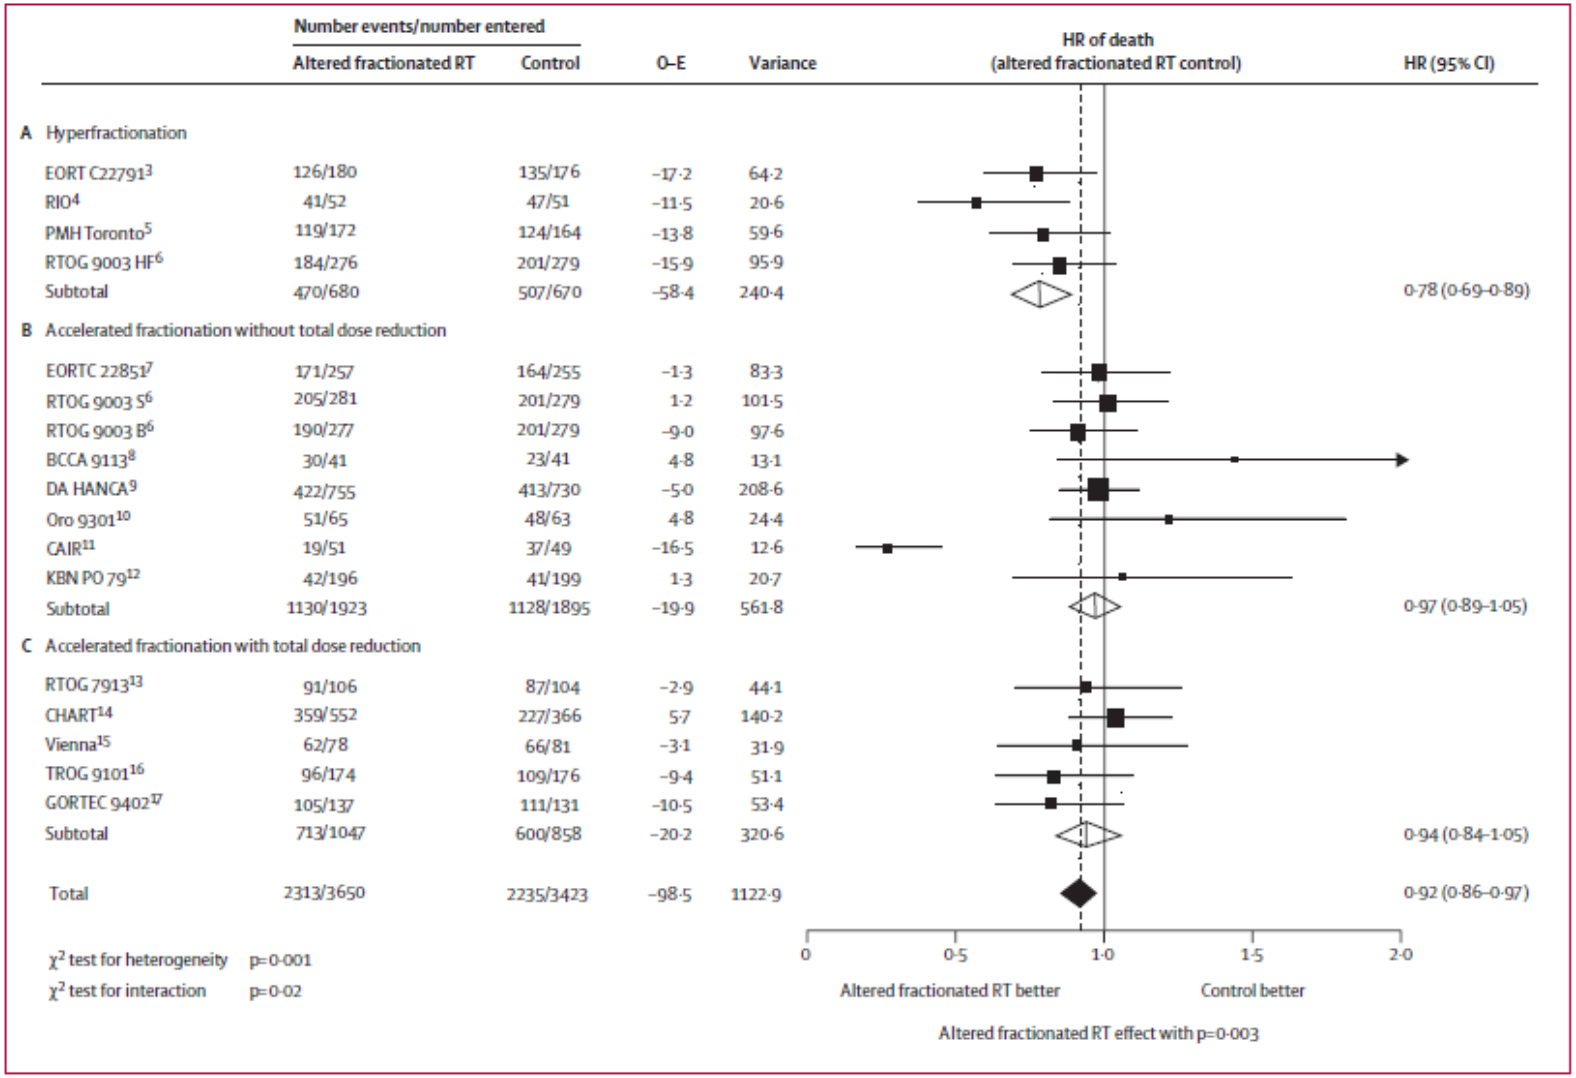
Meta-analysis: overall survival



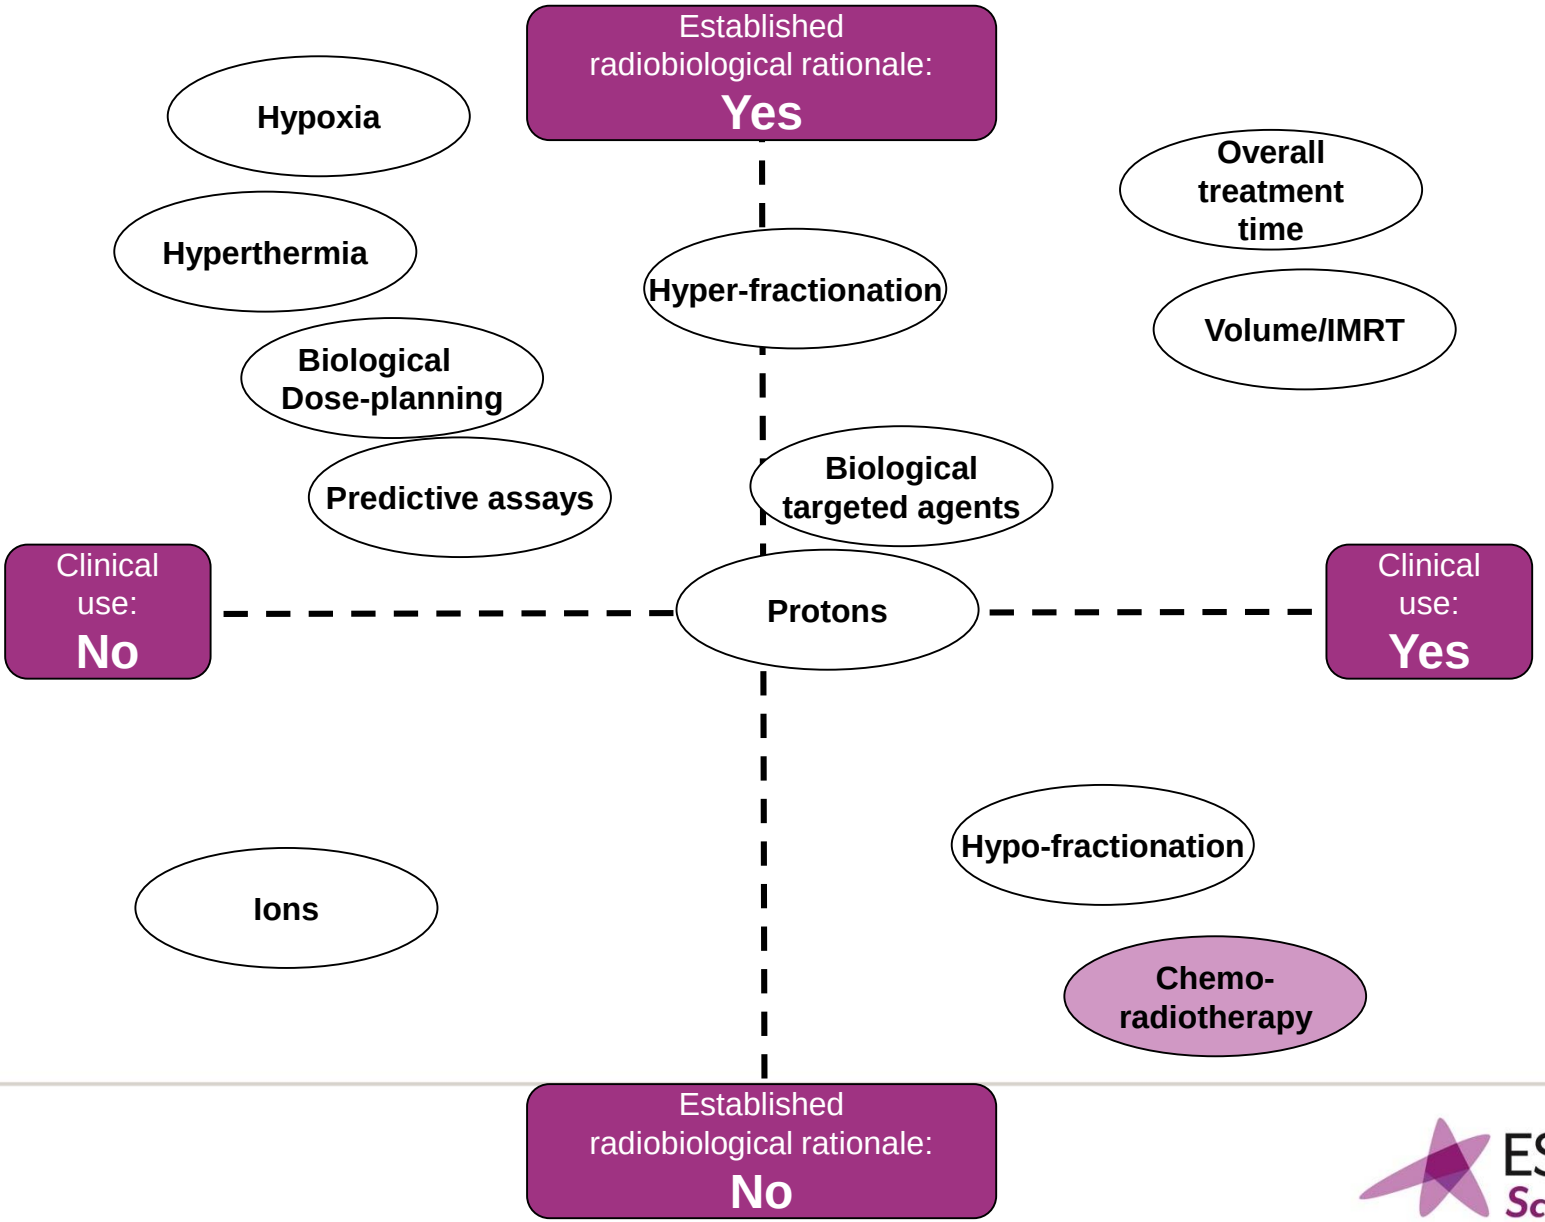
Lancet 2006; 368: 843–54

ESTRO School

Conclusion - fractionation

- Awareness of the fractionation sensitivity of tumors and normal tissues is critical
- Clinical studies and meta-analysis have shown that moderately accelerated radiotherapy improves loco-regional control
- Hyperfractionated RT improves loco-regional control and survival
- Altered fractionation is thus recommended for primary radiotherapy of head and neck cancer

The landscape of evidence and practice



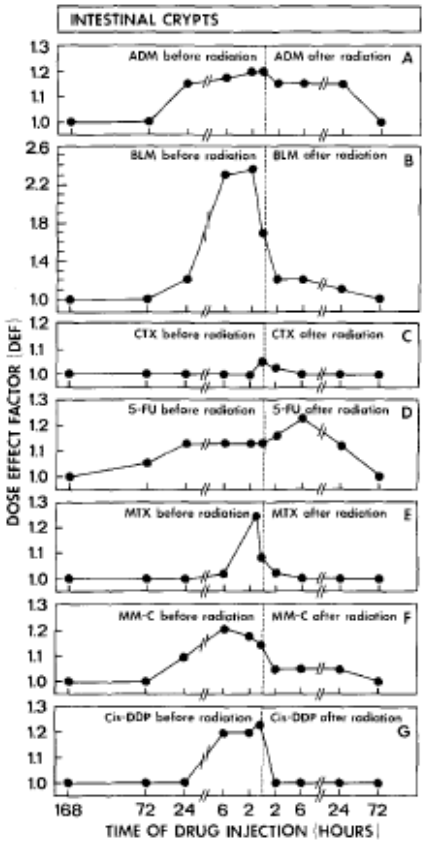
First clinical success with C-RT

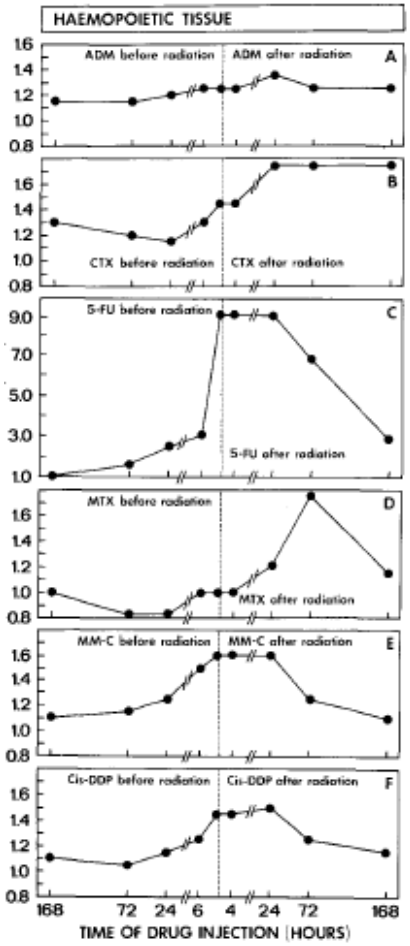
Sidney Farber,
Brigham and Women's hospital
Boston, 1958

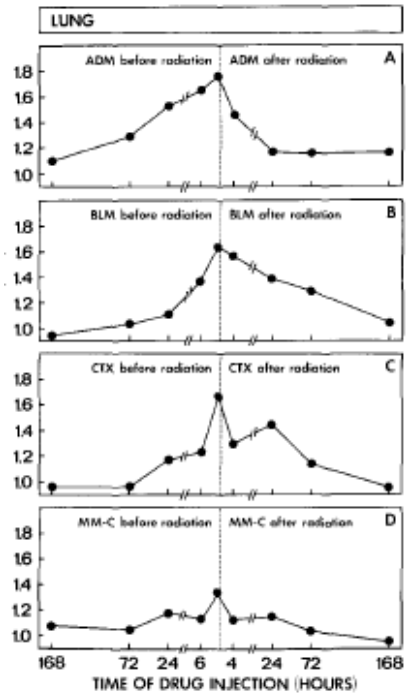
- Wilms' tumour
- Actinomycin D, RT,
- Followed by surgery
- DSS: 40%-85%

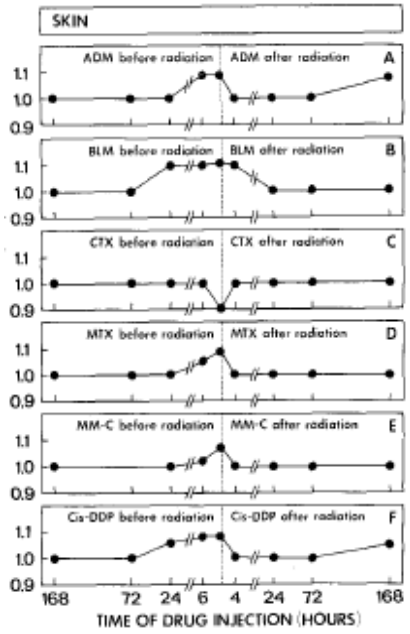
ESTRO School

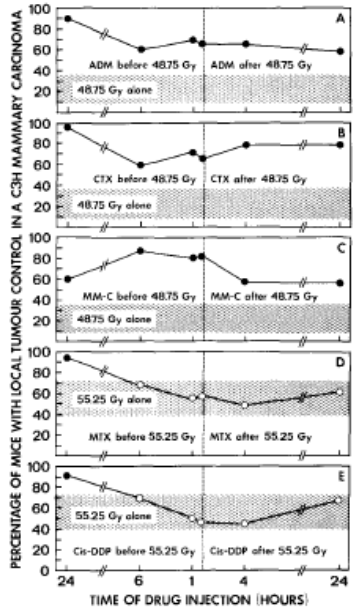
Preclinical data











vdMaase 1986

Why combine chemotherapy with radiotherapy?

Two purposes:

- To increase the effect of radiotherapy

- To remove micrometastases outside the RT-field

- But preferably without increase in morbidity

How to combine chemotherapy with radiotherapy?

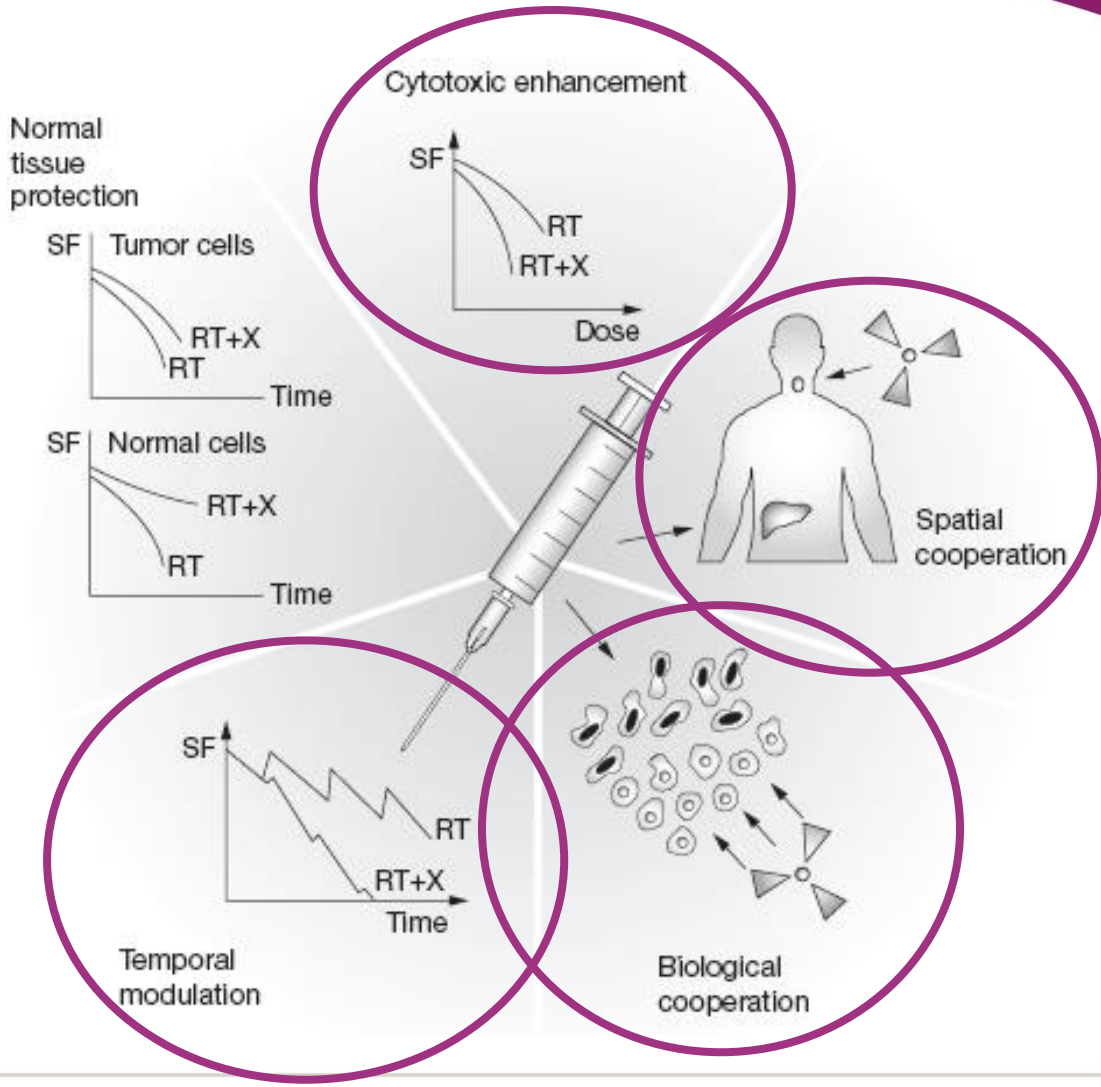
Spatial cooperation

Cytotoxic enhancement

Biological cooperation

Temporal modulation

Normal tissue protection



Bentzen SM 2007

Cisplatin

Barnett Rosenberg,
Michigan State University
1965

1890: Cisplatin discovered

1965: Inhibits bacteria cell division

1969: First cure of a solid tumour

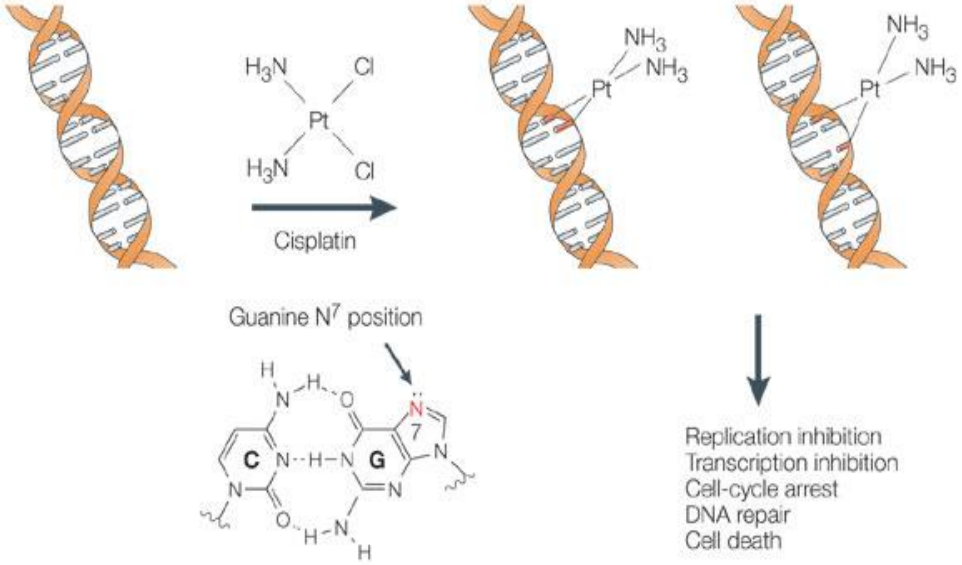
1976: First clinical trials

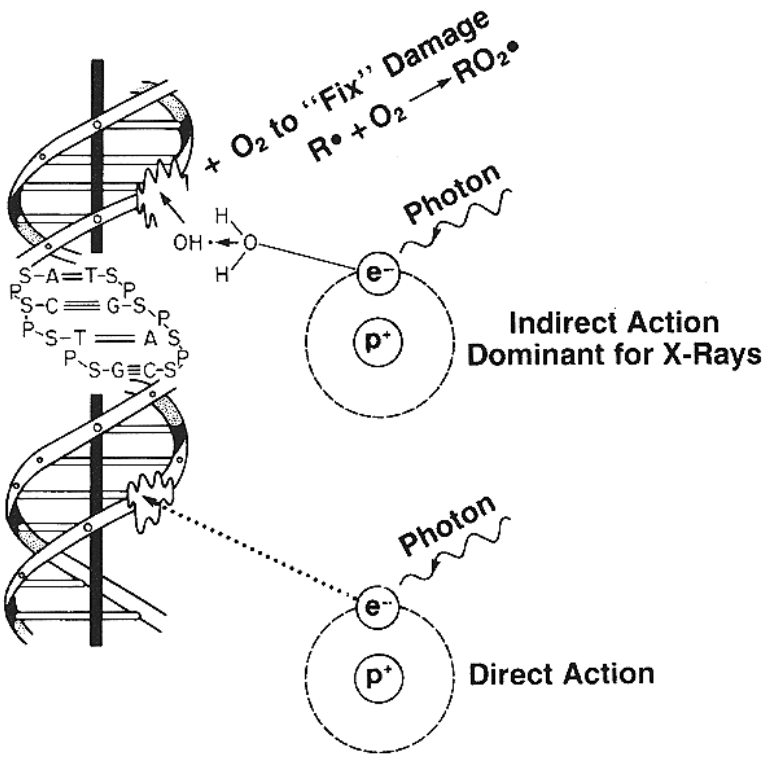
1978: FDA approval

1999: First data of C-RT

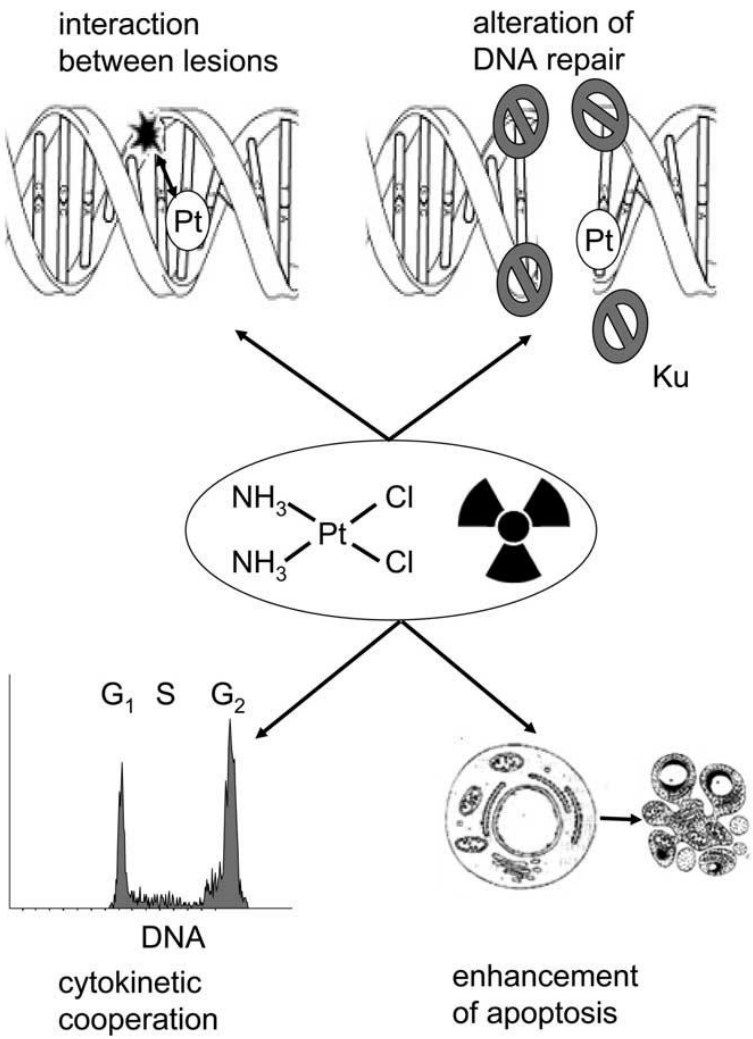
Cisplatin RT

- Intra/inter-strand crosslinks
- Cyklus uspecific





Cisplatin and RT

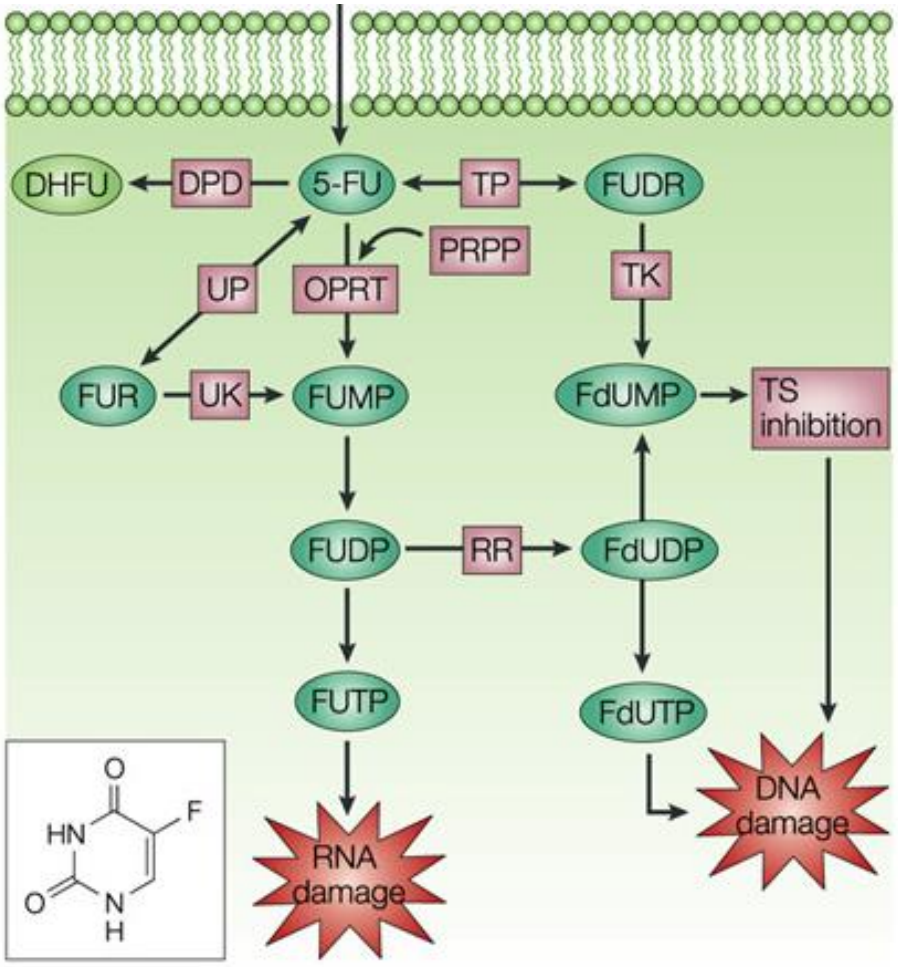


- Increase in toxic platin-derivatives
- Cisplatin blocks DNA-ends
- RT increase cellular uptake of cisplatin
- Stop cells in the G2-phase
- Impaired repair of DNA

Wilson GD 2006

ESTRO School

5-FU and RT

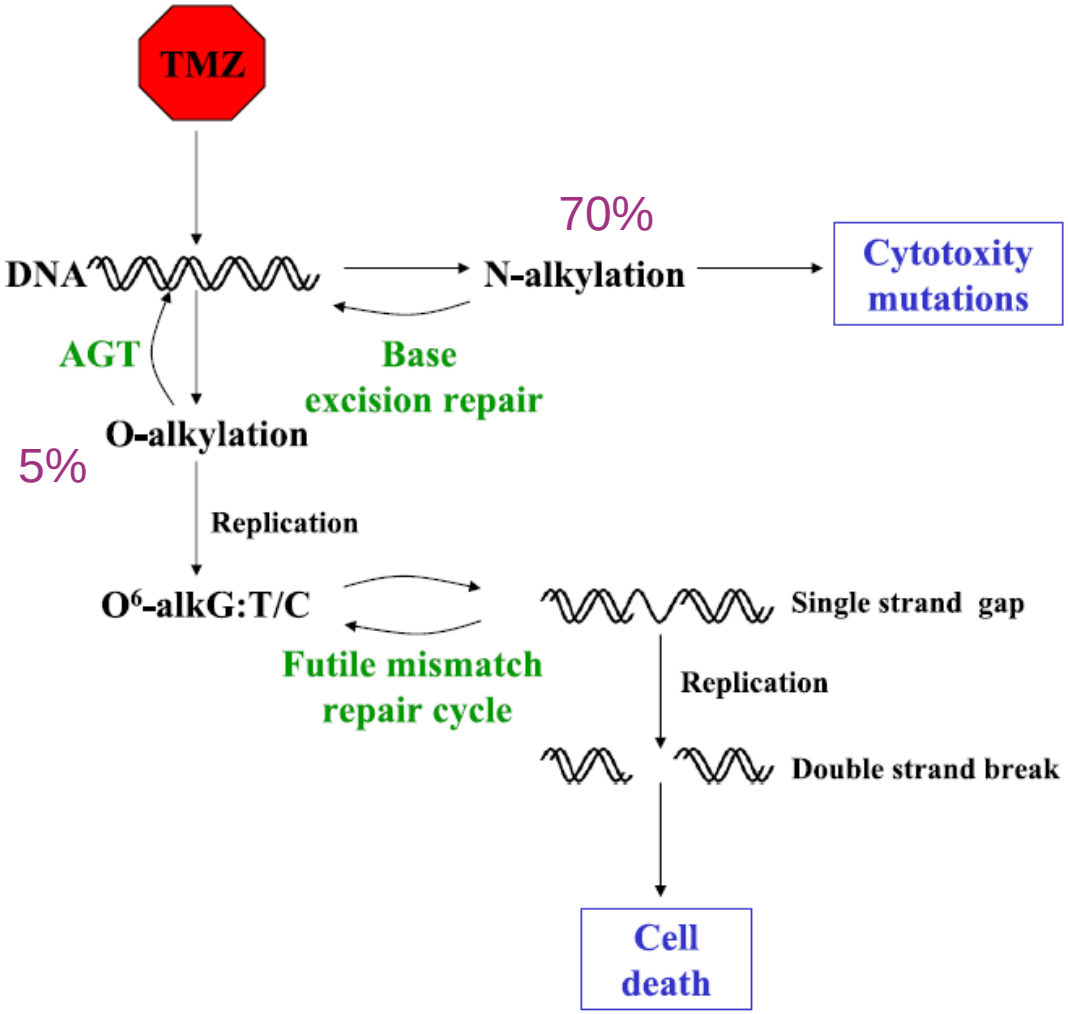


- Thymidin 5-tri-P analogue
- Inhibition of TS
- Deplete Thymidine 5 mono-P and Thymidine 5 tri-P
- Inhibition of DNA synthesis
- Interference with DNA repair.
- S-phase specific (RT-resistent)
- Inhibit S-phase entry

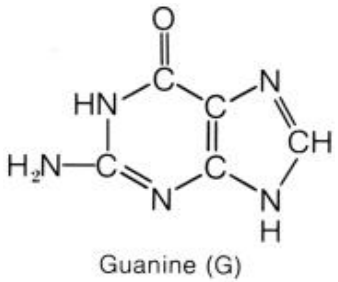
Longley DB 2003

ESTRO School

Temozolomide and RT



- Alkylating drug (Guanine)
- Ireversible
- AGT/MGMT



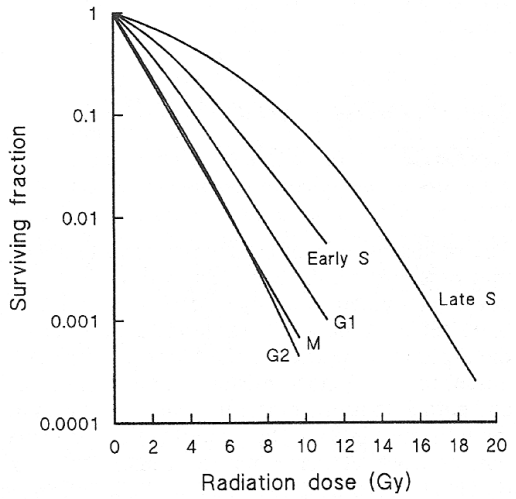
Guanine (G)

Zhang M 2006

”New drugs”

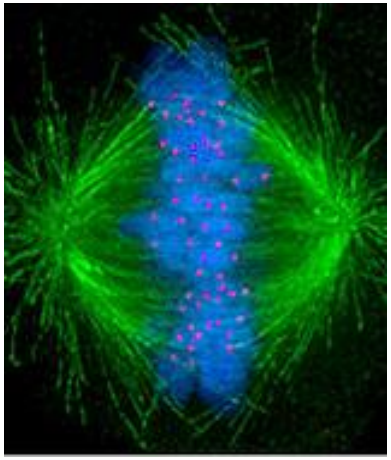
Gemcitabine:

- Pyrimidin-analogue - interferes with DNA and inhibits DNA synthesis and repair
- S-phase specific?

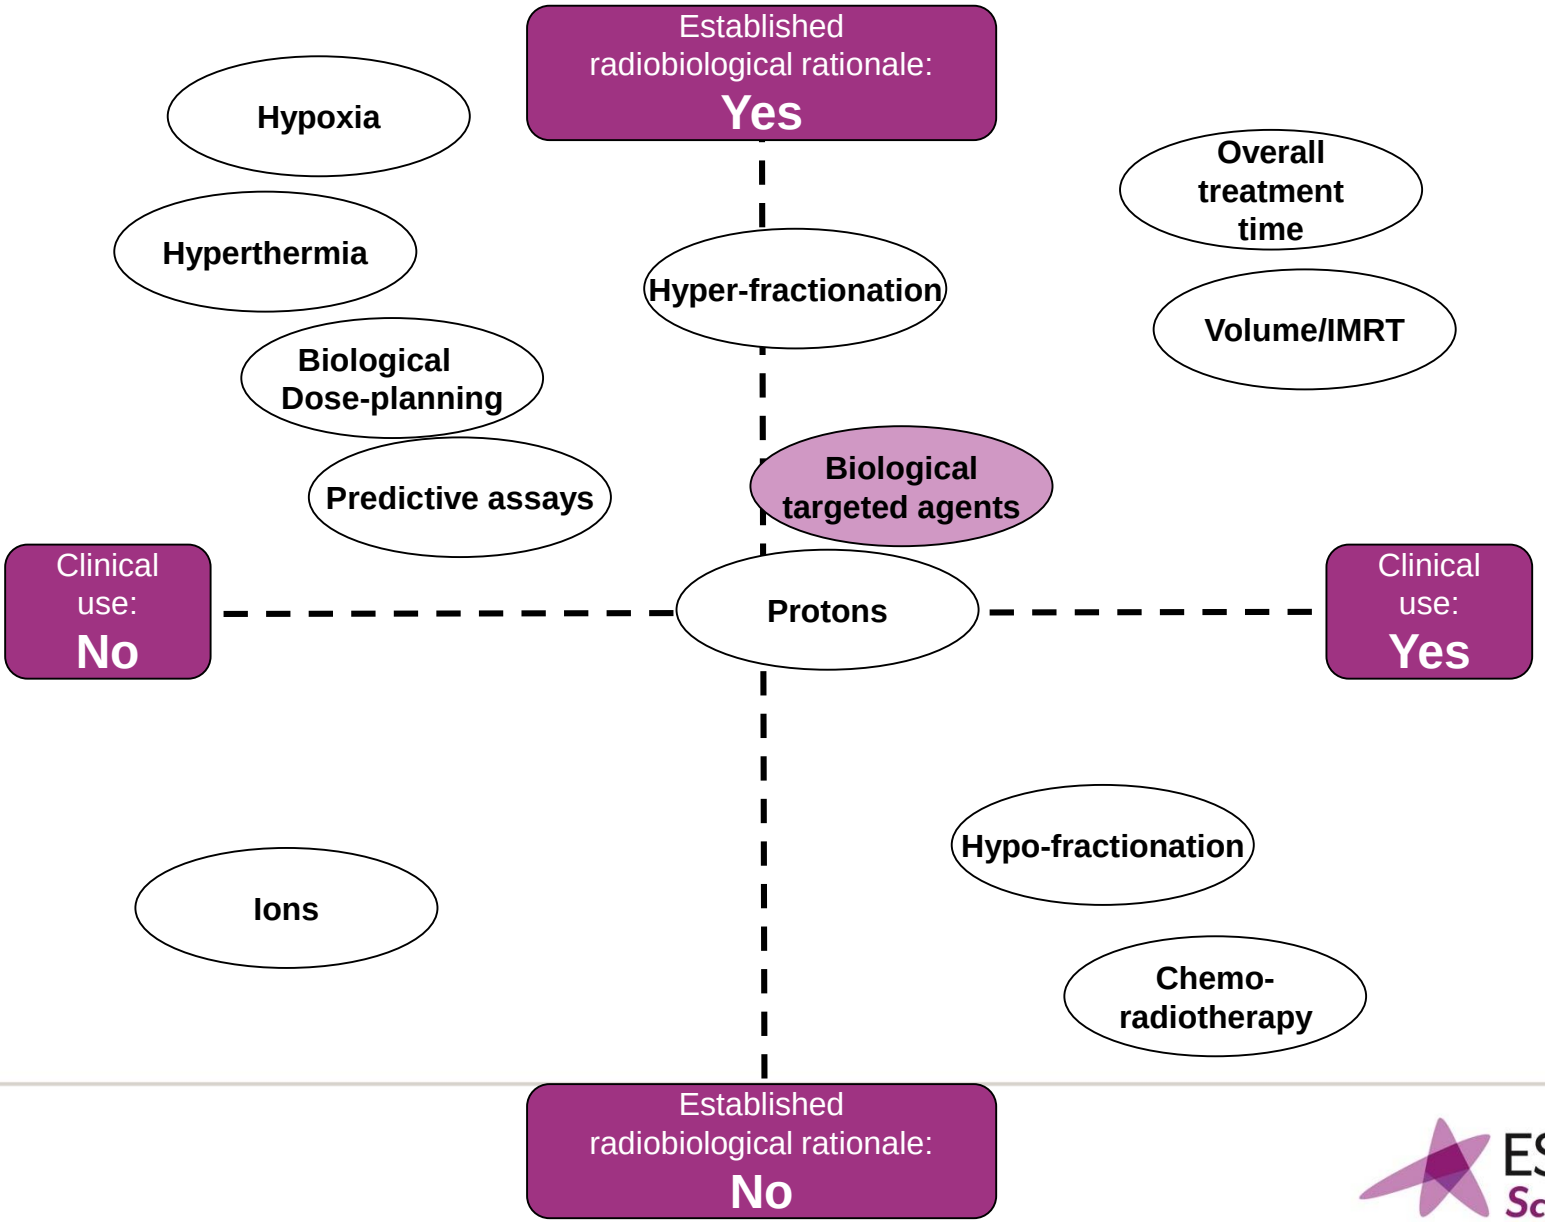


Taxanes:

- Interferes with microtubuli - cell cycle stops in G2/M-phase
- Synchronizing (only seen *in vitro*)
- Reoxygenation through tumour reduction?



The landscape of evidence and practice



The Ideal biological target

- Selective inhibition of a specific target
- Present in tumour cells
- Only present in tumour cells….or…..
- The function of the target is not essential for normal tissue
- Only one or a few activation pathways (little redundacy)
- Good preclinical models that shows tumour efficacy

After Grandis 2008

Epidermal Growth Factor Receptor

ESTRO School

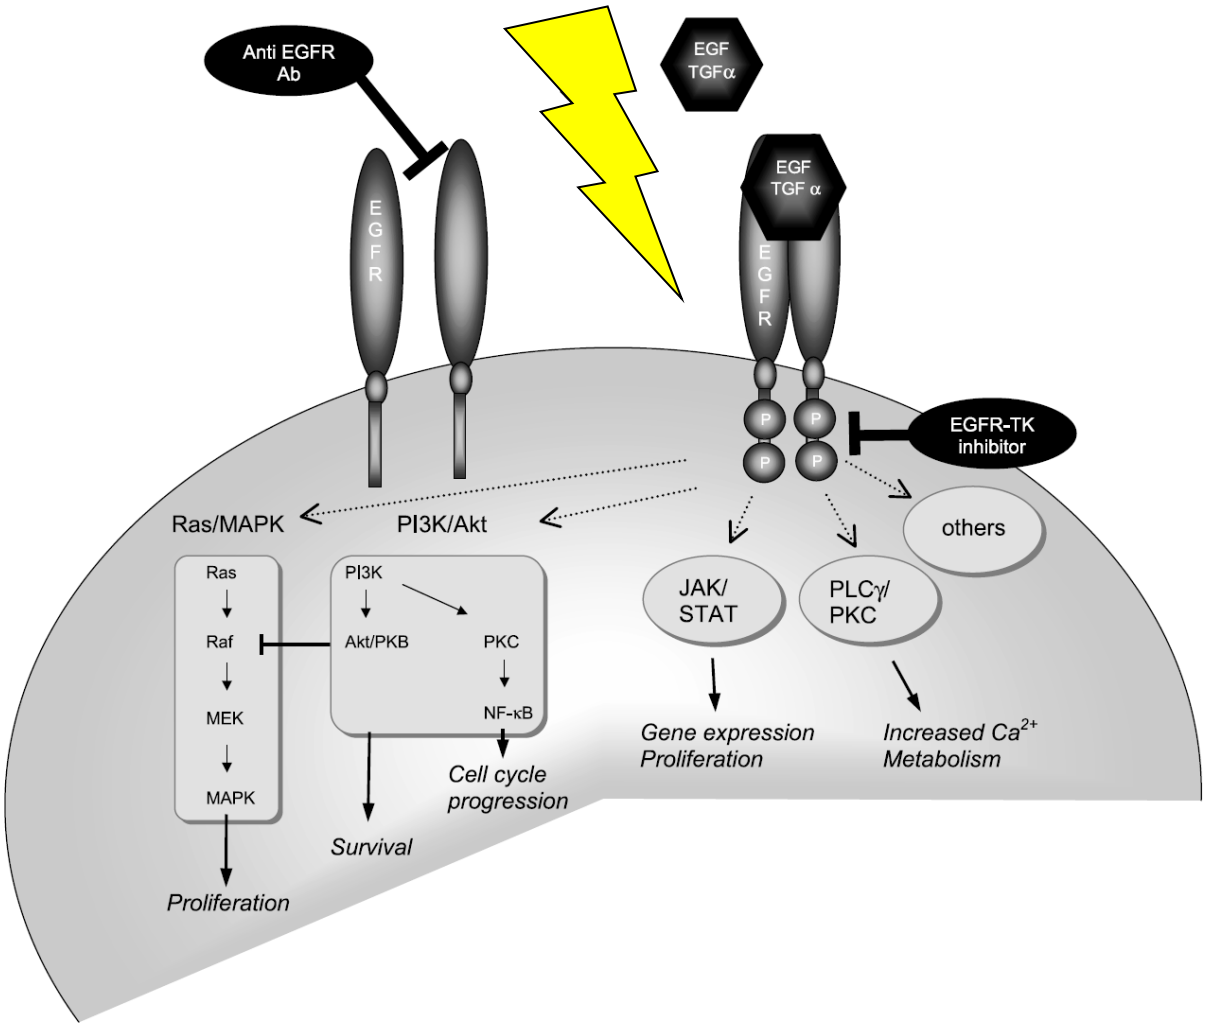
Synergy between EGFR and RT?



Baumann M 2004

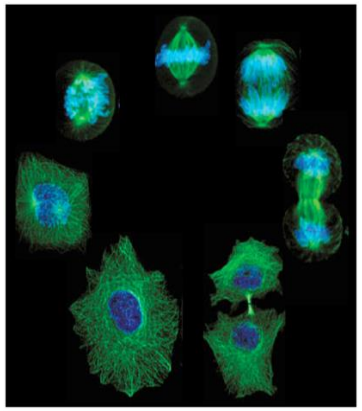
ESTRO School

Antiproliferation

Ionising radiation → G2/M-stop

EGFR-I → G1-stop

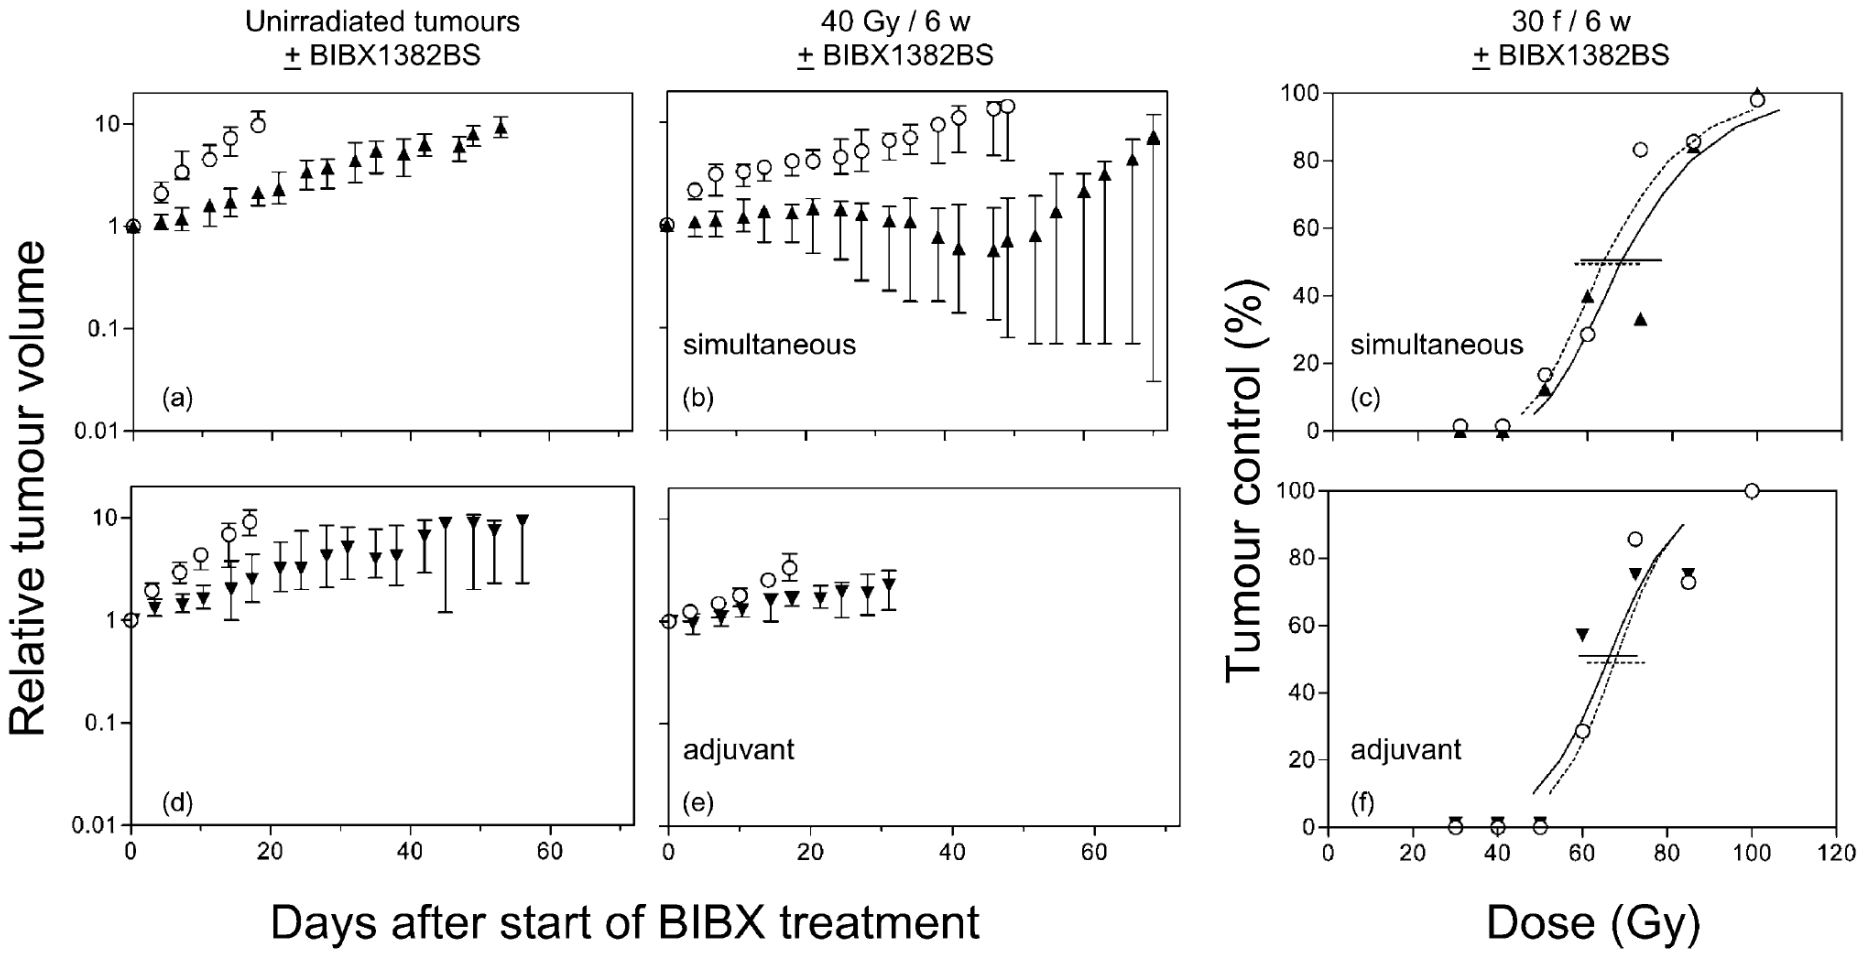
- Cell cycle checkpoint deregulation and apoptosis
- Fewer cells in the relatively radioresistent S-phase
- More cells in the relatively radiosensitive G1-phase



Huang SM 1999; Harari PM 2001;

Nyati MK 2004

Tumour volume vs. tumour control?

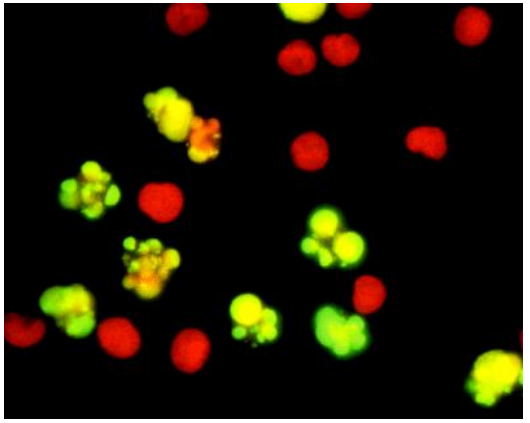


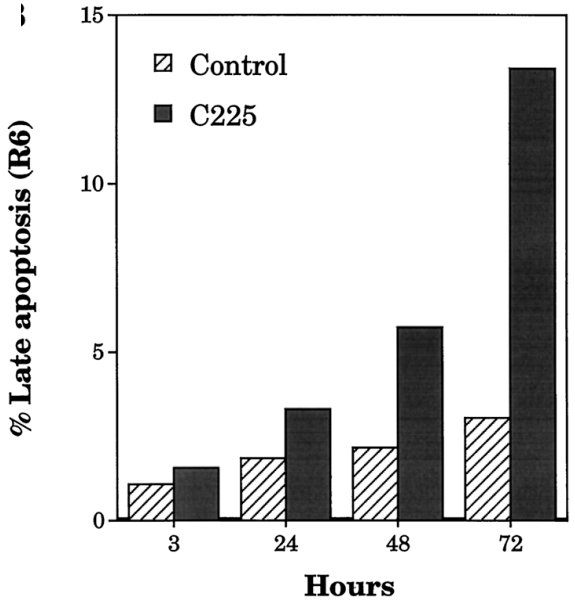
Baumann M 2004; Krause M 2009

ESTRO School

Apoptosis

- EGFr-I induce apoptosis (~ 2 fold)
- RT induce apoptosis (6 Gy – 2 fold)
- RT and EGFr-I induce (5-6 fold)



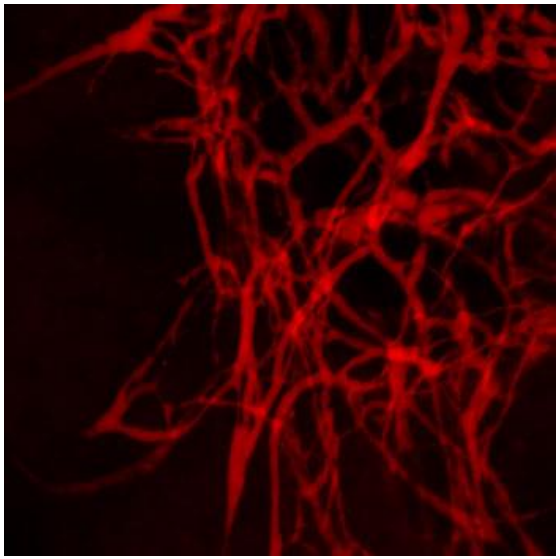


Huang SM 1999

Anti-angiogenesis

Ionising radiation → Increased VEGF

EGFr-I → Reduced VEGF



RT+EGFr-I

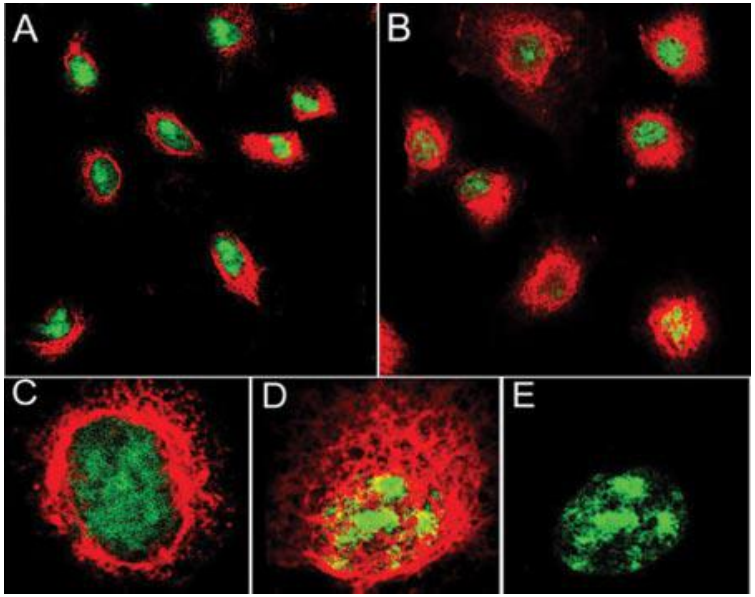
- Decreased vascular density
- More organised/better? flow
- Reoxygenation

Gorski DH 1999; Milas 2000; Krause M 2005

ESTRO School

DNA repair

- RT-induced cell damage activate repair
  - Increased PI3-K and DNA-PK
  - EGFR enters nucleus bound to KU70/80 and increases DNA-DNA-PK complex and repair



- EGFR-I inhibits EGFR enucleation
- Interaction between EGFR-I bound to EGFR and DNA-PK increases sequestration of DNA-PK

Lieber 1999; Dittmann K 2000 etc..

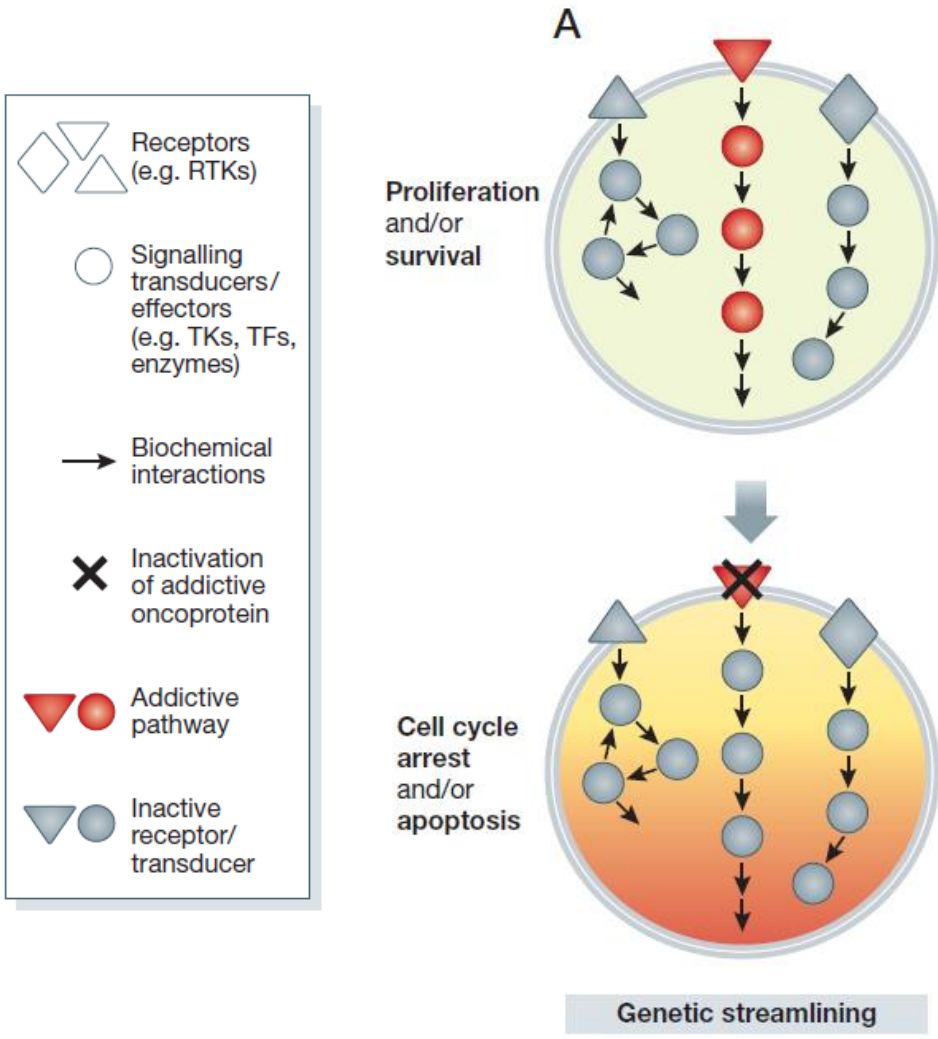
Oncogene Addiction: 2 models

a) genetic streamlining theory

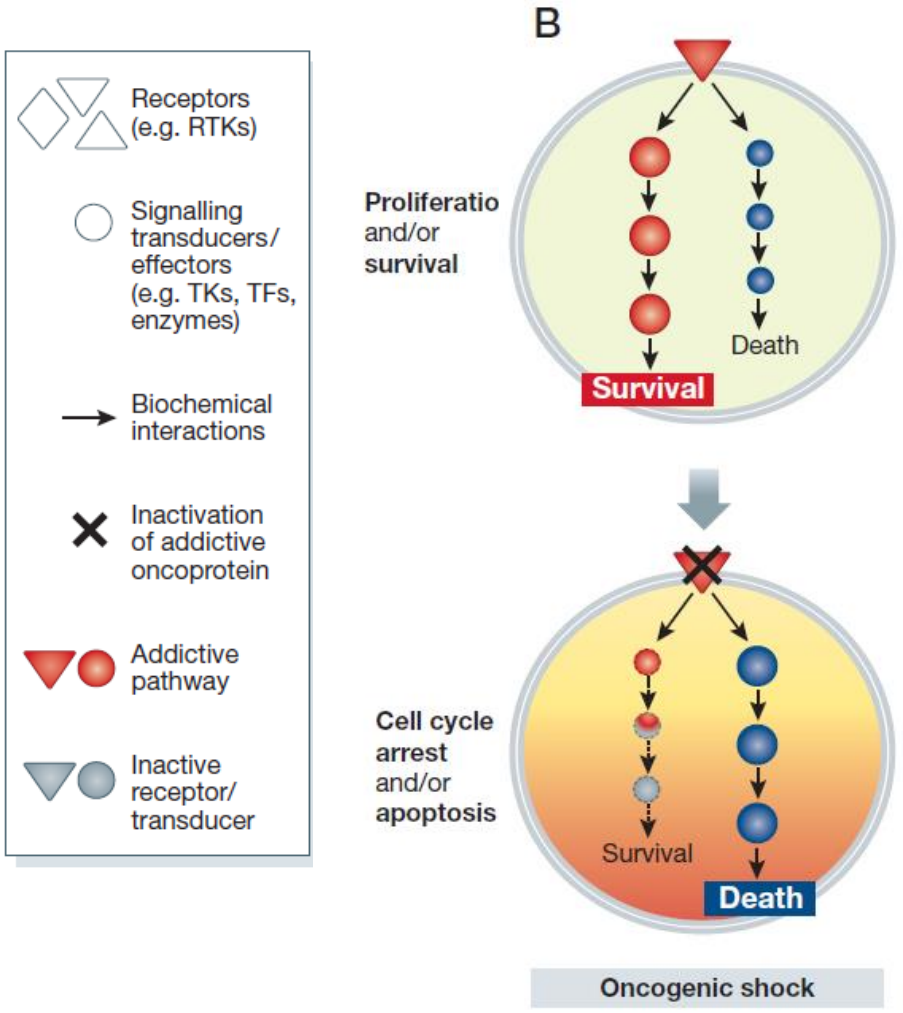


The 'genetic streamlining' theory postulates that non-essential pathways (top, light grey) are inactivated during tumour evolution, so that dominant, addictive pathways (red) are not surrogated by compensatory signals. Upon abrogation of dominant signals, there is a collapse in cellular fitness and cells experience cell-cycle arrest or apoptosis (bottom, red to yellow shading).

Torti and Trusolino, 2011

Oncogene Addiction: 2 models

b) oncogenic shock model



In the 'oncogenic shock' model, addictive oncoproteins (e.g. RTKs, red triangle) trigger at the same time pro-survival and pro-apoptotic signals (top, red and blue pathway, respectively). Under normal conditions, the pro-survival outputs dominate over the pro-apoptotic ones (top), but following blockade of the addictive receptor, the rapid decline in the activity of survival pathways (dashed lines, bottom) subverts this balance in favour of death-inducing signals, which tend to last longer and eventually lead to apoptotic death.

Relevant Questions::

Molecular evolution of resistance to treatment:

- Acquired during therapy?
- ➢ As a result of continuing mutagenesis?

- Already present in a clonal subpopulation within the tumours *prior* to the initiation of therapy?
- ➢ Is resistance therefore a fait accompli—the time to recurrence is simply the interval required for the subclone to repopulate the lesion.?
- ➢ Is the short time interval of recurrence due to the rapid expansion of the resistant subclone immediately following treatment initiation?
- ➢ Required:

Combination therapies targeting at least two different “processes” or “pathways”.

ESTRO School

Kinases in Oncology

- Kinases are involved in processes leading to cell proliferation and survival

- Kinases are popular targets
  - virtually every signal transduction process is wired through phosphotransfer cascade
  - despite high degree of conservation highly specific agents can be developed
  - inhibition of kinase in normal tissue can often be tolerated (therapeutic window)
  - to date approx. 80 inhibitors advanced to some stage of clincial evaluation

Regulation of Normal Tyrosine Kinase Activity I

Chemical Structures of some clinically approved kinase inhibitors

Structure	Name	Known targets	Indication
	Imatinib (Gleevec; Novartis)	Bcr-Abl, c-Abl, PDGFR, c-KIT, DDR1	CML, GIST, HES
	Nilotinib (Tasigna; Novartis)	Bcr-Abl, c-Abl, PDGFR, c-KIT, DDR1	Imatinib-resistant CML
	Erlotinib (Tarceva; OSI Pharmaceuticals/ Genentech/Roche)	EGFR, ERBB2 (HER2)	NSCLC, pancreas cancer
	Gefitinib (Iressa; AstraZeneca)	EGFR, ERBB2, HER4	NSCLC

Mechanisms of small molecule action (TK-inhibitors) I

Initial concerns: well conserved ATP-binding sites in between the family of kinases: can we get specificity?

Using protein cristallography and NMR-spectroscopy sophisticated structure-based design of specific kinase-inhibitors are now feasible

Kinase inhibitors were developed with the goal of highest selectivity, however, several clinically approved kinases inhibitors are potent inhibitors of multiple kinases: reason for potency?

Potential to target multiple distinct processes (hallmarks) associated with tumor growth, but might be more toxic

Several preclinical studies demonstrate (supra-) additive effect by combined treatment modalities mAB plus TK-inhibitors (complementary effects)

Kinase inhibitor binding sites

- Type I inhibitors
  - constitutes majority of ATP-competitive inhibitors and recognizes the so called active conformation of the kinase
  - e.g. sorafenib, dasatinib, sutent
- Type II inhibitors
  - recognize the inactive conformation of the kinase
  - e.g. imatinib
- Allosteric Inhibitors
  - bind outside of ATP-binding site; at an allosteric site
  - exhibit highest degree of kinase selectivity
- Covalent inhibitors
  - require low concentrations
  - concern about potential toxicity by modification of unanticipated targets

Iressa - Gefitinib

The first selective inhibitor that targets the mutant proteins in malignant cells

Used to treat lung cancer

Only ~10% of non-small cell lung cancer patients response to Iressa

Toxicities include acne, diarrhea, nausea, vomiting and skin reactions

chemical class: quinazoline

orally bioavailable (compliance)

selective inhibitor of EGFR tyrosine kinase

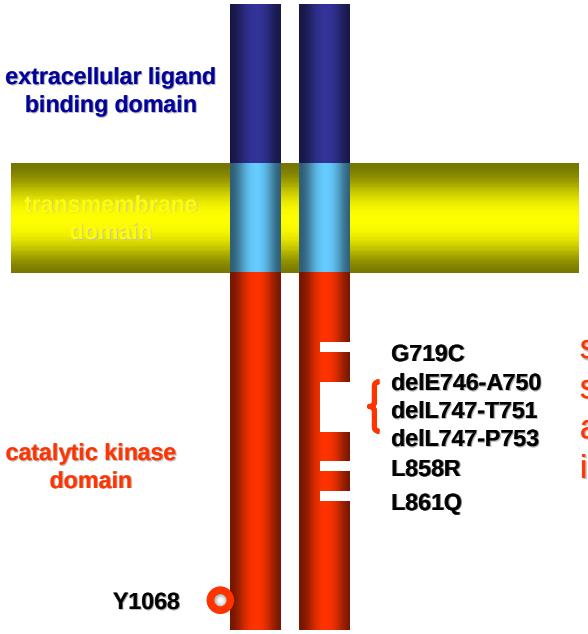
- EGFR IC50 = 0.023-0.079 μM
- erbB2 IC50 = 1.2-3.7 μM

competitive inhibitor of ATP-binding

inhibits ligand-induced cell growth

- IC50 = 0.08 μM

EGFR Mutation



specific mutations confer sensitivity of EGFR-TK activity to gefitinib/iressa in NSCLC patients !

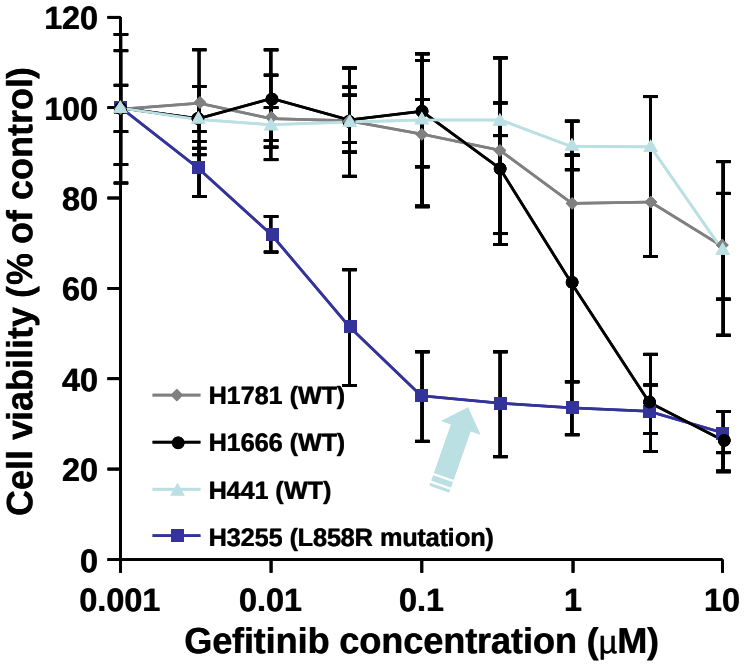


Table 1. The current state of knowledge of *EGFR* mutations in patients with NSCLC

Known	Unknown
EGFR mutations are associated with responses to gefitinib and erlotinib	The etiology of the *EGFR* mutations
EGFR mutations are somatic	The relative oncogenic properties of the different *EGFR* mutations
EGFR mutations are more common in women, nonsmokers, in adenocarcinomas, and East Asians	The outcome of patients with different *EGFR* mutation treated with different EGFR-TKIs
Secondary *EGFR* mutations are associated with resistance to gefitinib and erlotinib in patients and *in vitro*	The mechanisms of resistance to gefitinib and erlotinib in the patients who do not have the identified T790M secondary *EGFR* mutation

Acquired Resistance of Lung Adenocarcinomasto Gefitinib or Erlotinib Is Associated with a Second Mutation in the EGFR Kinase Domain

Patient 2.
This 55-y-old woman with a nine pack-year history of smoking underwent two surgical resections within 2 y (right lower and left upper lobectomies) for bronchioloalveolar carcinoma with focal invasion. Two years later, her disease recurred with bilateral pulmonary nodules and further progressed on systemic chemotherapy. Thereafter, the patient began erlotinib, 150 mg daily. A baseline CT scan of the chest demonstrated innumerable bilateral nodules (Figure S1B, left panel), which were markedly reduced in number and size 4 mo after treatment (Figure S1B, middle panel). After 14 mo of therapy, the patient's dose of erlotinib was decreased to 100 mg daily owing to fatigue. At 23 mo of treatment with erlotinib, a CT scan demonstrated an enlarging sclerotic lesion in the thoracic spine. The patient underwent CT-guided biopsy of this lesion and the erlotinib dose was increased to 150 mg daily. After 25 mo of treatment, she progressed within the lung (Figure S1B, right panel). Erlotinib was discontinued, and a fluoroscopically guided core needle biopsy was performed at a site of progressive disease in the lung.

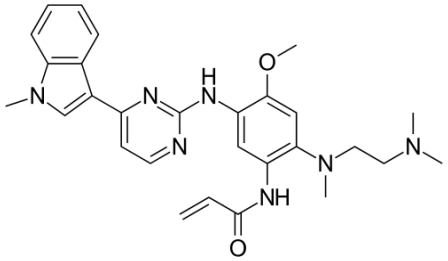
Kobayashi, PLoS Med, 2, e73

Sensitivity to Gefitinib Differs Among NSCLC Cell Lines Containing Various Mutations in *EGFR* or *KRAS*

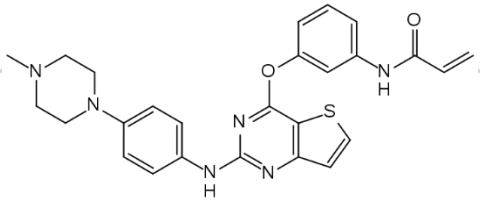
The three indicated NSCLC cell lines, H3255 (L858R mutation), H1975 (both T790M and L858R mutations), and H2030 (wild-type *EGFR,* mutant *KRAS*), were grown in increasing concentrations of gefitinib, and the density of live cells after 48 h of treatment was measured

Targeting EGFR T790M mutation in NSCLC: From biology to evaluation and treatment

Osimertinib (AstraZeneca) is a potent, irreversible EGFR tyrosine kinase inhibitor that is selective for EGFR tyrosine kinase inhibitor–sensitizing mutations and the T790M resistance mutation with an excellent therapeutic index because its activity is poor towards the wild-type EGFR



Olmutinib (HM 61713)(Boehringer Ingelheim) is an irreversible tyrosine-kinase inhibitor, selective for mutant EGFR. Its molecule structure contains a Michael acceptor that covalently binds a cysteine residue near the kinase domain of mutant EGFR



Resistances: Secondary and Downstream Mutations

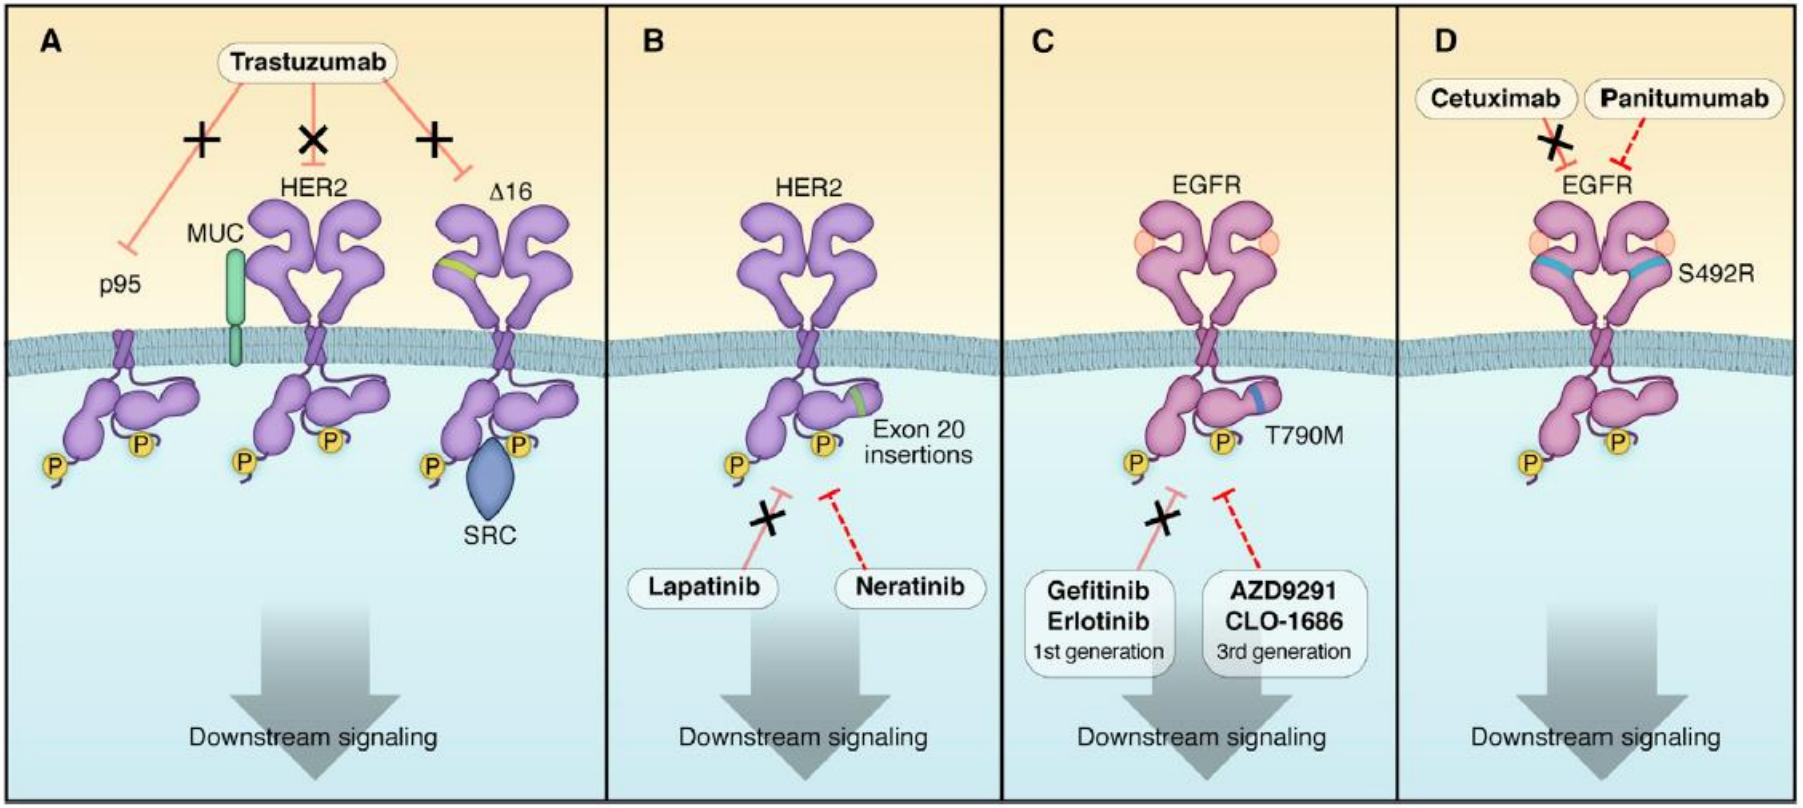


Figure 1. Schema Depicting Intragenic Alterations Leading to Resistance to HER2 and EGFR Inhibitors

(A) HER2 truncations (p95) and splice variants (Δ16) are not inhibited by trastuzumab. In addition, expression of specific mucin isoforms can prevent trastuzumab from binding HER2 (Price-Schiavi et al., 2002). Not shown in the figure, pertuzumab and T-DM1 cannot recognize p95 either.

(B) HER2s harboring exon 20 insertions are not inhibited by lapatinib, but may be sensitive to irreversible HER2 inhibitors afatinib and neratinib. They are also resistant to trastuzumab.

(C) The EGFR T790M gatekeeper mutation leads to acquired resistance to first generation EGFR inhibitors, but is effectively inhibited by third-generation EGFR inhibitors.

(D) An EGFR mutation in the extracellular domain is associated with acquired resistance to cetuximab, but may still be sensitive to another anti-EGFR antibody, panitumumab. Dashed lines indicate inhibition via alternative antibodies and inhibitors.

Arteaga, Cancer Cell, 25, 2015

Resistances: Secondary and Downstream Mutations

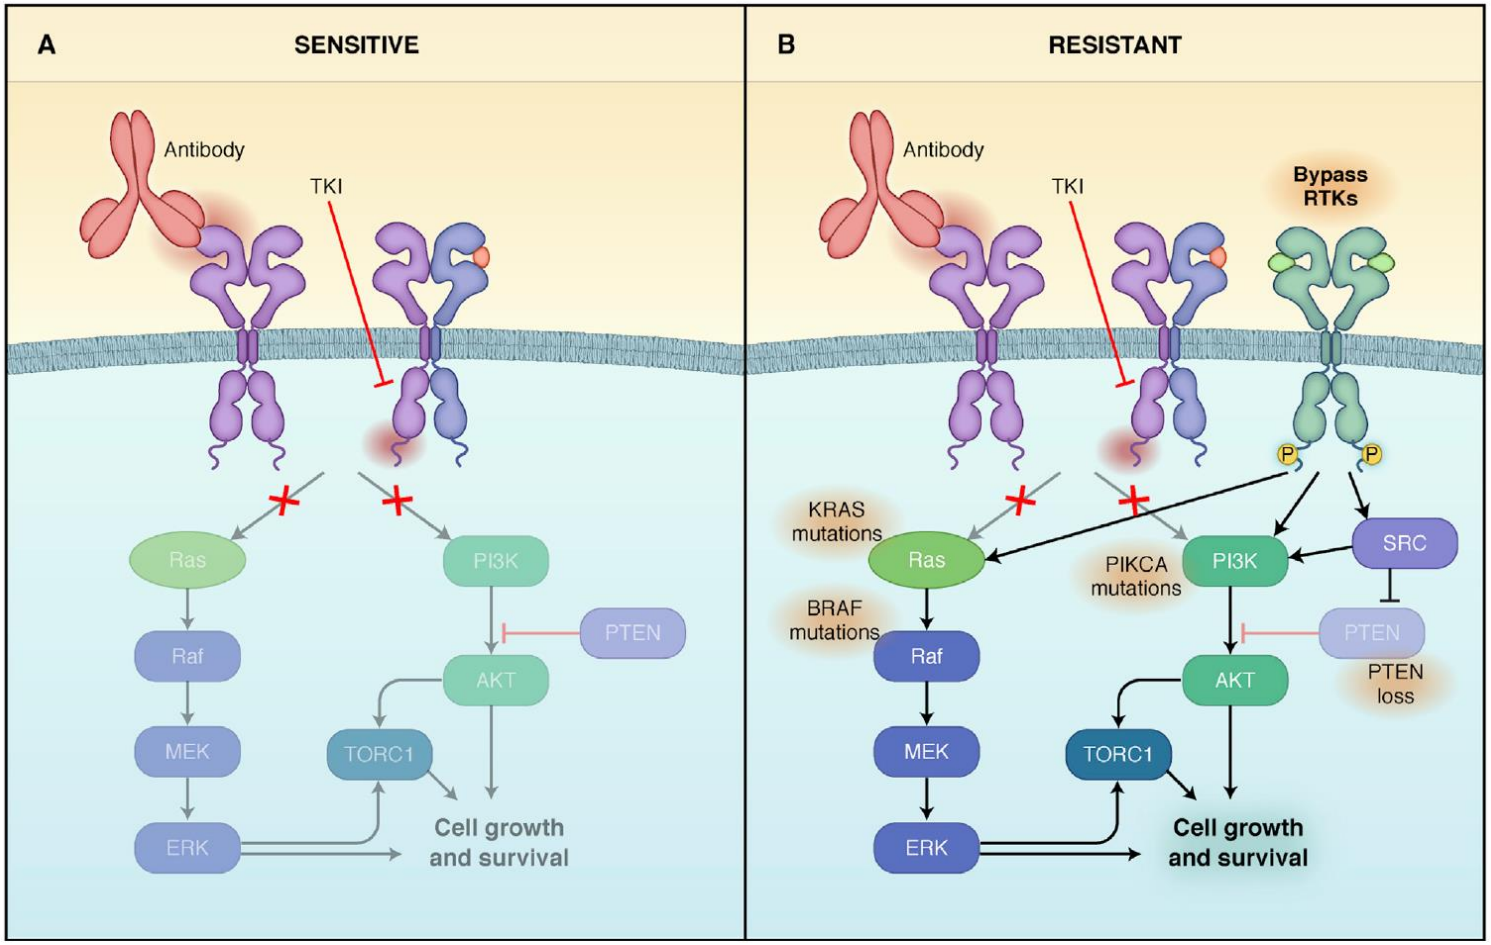

Figure 2. Schematic Depicting Resistance to EGFR and HER2 Inhibitors due to Activation of Bypass Track Signaling

(A) Model of a sensitive EGFR or HER2-addicted cancer treated with an ERBB small-molecule inhibitor or antibody resulting in suppression of downstream signaling. EGFR or HER2 homodimers and heterodimers are shown.

(B) Model of a EGFR mutant or *HER2*-amplified cancer with resistance due to maintenance of downstream signaling in the presence of the EGFR or HER2 inhibitors. Activation of signaling can be caused by activation of other RTKs or mutational activation of downstream signaling.

Key Points

Molecularly targeted agents are less toxic than cytotoxic agents (antibodies/small molecular

resistances

Molecularly targeted agents work by targeting the genetic changes(s) in cancer cells

- Chromosomal translocation
- Gene duplication
- Gene mutation

Risk for secondary mutations high

Risk for paraxodical activation of pro-tumorigenic wildtype-signal transduction cascade exists (Raf-inhibitors)

To improve cancer treatment, we need to better understand the differences between cancer and normal cells

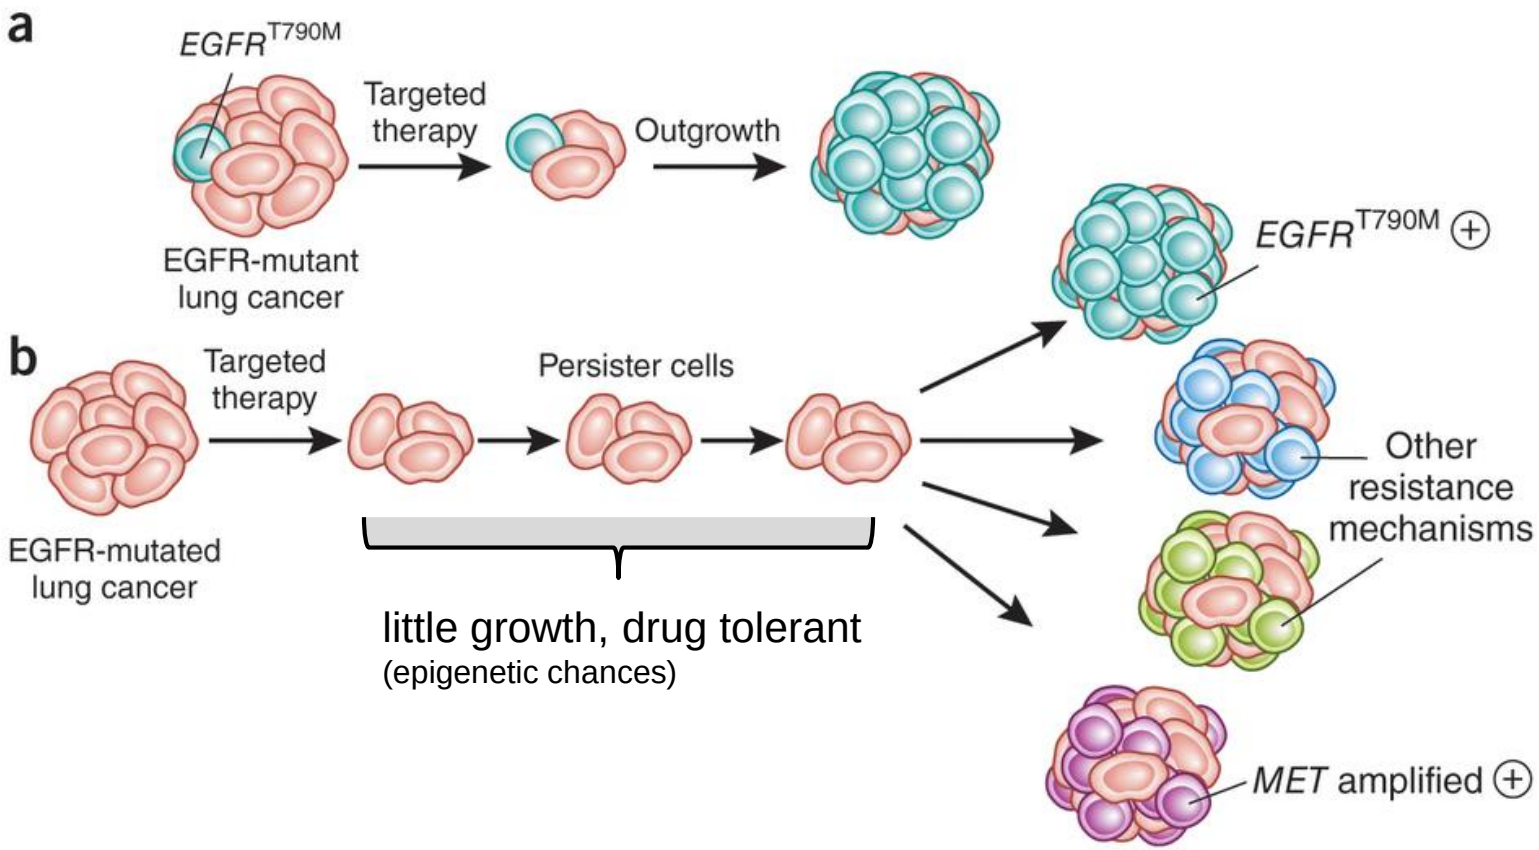
Major Callenges: Resistances

- de novo/ intrinsic resistance: do not exhibit an initial response

- acquired resistance: develops after an initial, often marked and durable clinical response

- same molecular mechanisms may cause both types of resistance

Cellular Origins of Drug Resistance in Cancer



a) Preexisting subclones

b) Induction of durable drug-tolerable state followed by aquisition of a variety of resistance mechanisms

Hata et al., Ramirez et al, 2016

Meta Analysis - Hypoxic modification of radiotherapy in HNSCC

* 95% CI.
** Numbers of patients Needed to Treat to achieve benefit in one patients.

Overgaard et al 2011

ESTRO School

Conclusive remarks

- Hypoxia can be modulated in HNSCC and CCU
- Influences LRC, DSS and OS
- But still “adored in lab, ignored in the clinic”.
- Success’es as well as dissapointments
- A few really ugly ones
- New trials of imidazoles in Asia, UK and EORTC
- Gene-test

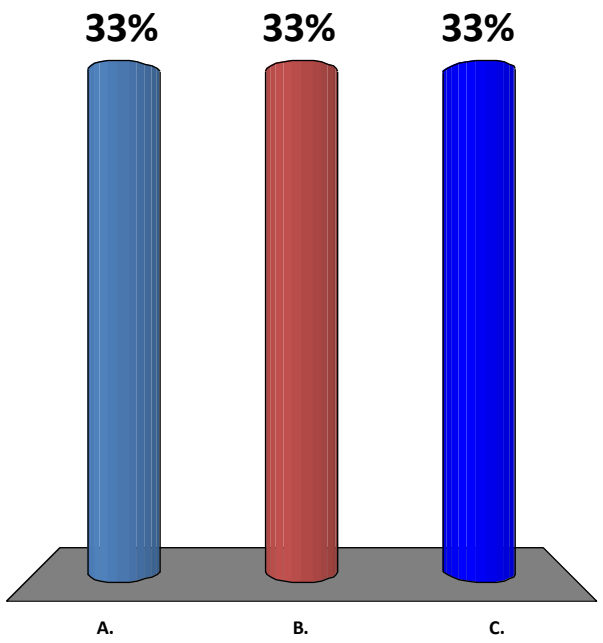
  - Questions
- Neoadjuvant chemotherapy
- Adjuvant chemotherapy
- Targeted agents
- Personalised medicine
- Clinical cases

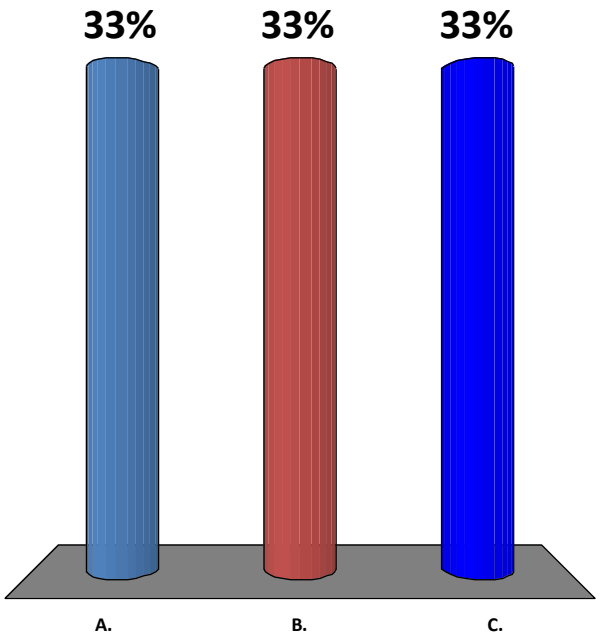
Is concomitant chemotherapy routinely given with radiotherapy for cervix cancer at your centre?

A. Yes
B. No



Which concomitant chemotherapy regimen is used at your centre?

A. Weekly cisplatin only
B. Weekly cisplatin and cisplatin-5FU
C. Both platinum and non-platinum regimens



Which FIGO stage would you treat with concomitant chemo-RT?

A. All stages
B. Not Ib1 patients
C. Not IIIb or IVa patients

*J Clin Oncol. 2008;**26**:5802-12*

Conclusion 3

- No difference in the size of benefit by
  - Radiotherapy dose
  - Chemotherapy dose
  - Chemotherapy scheduling

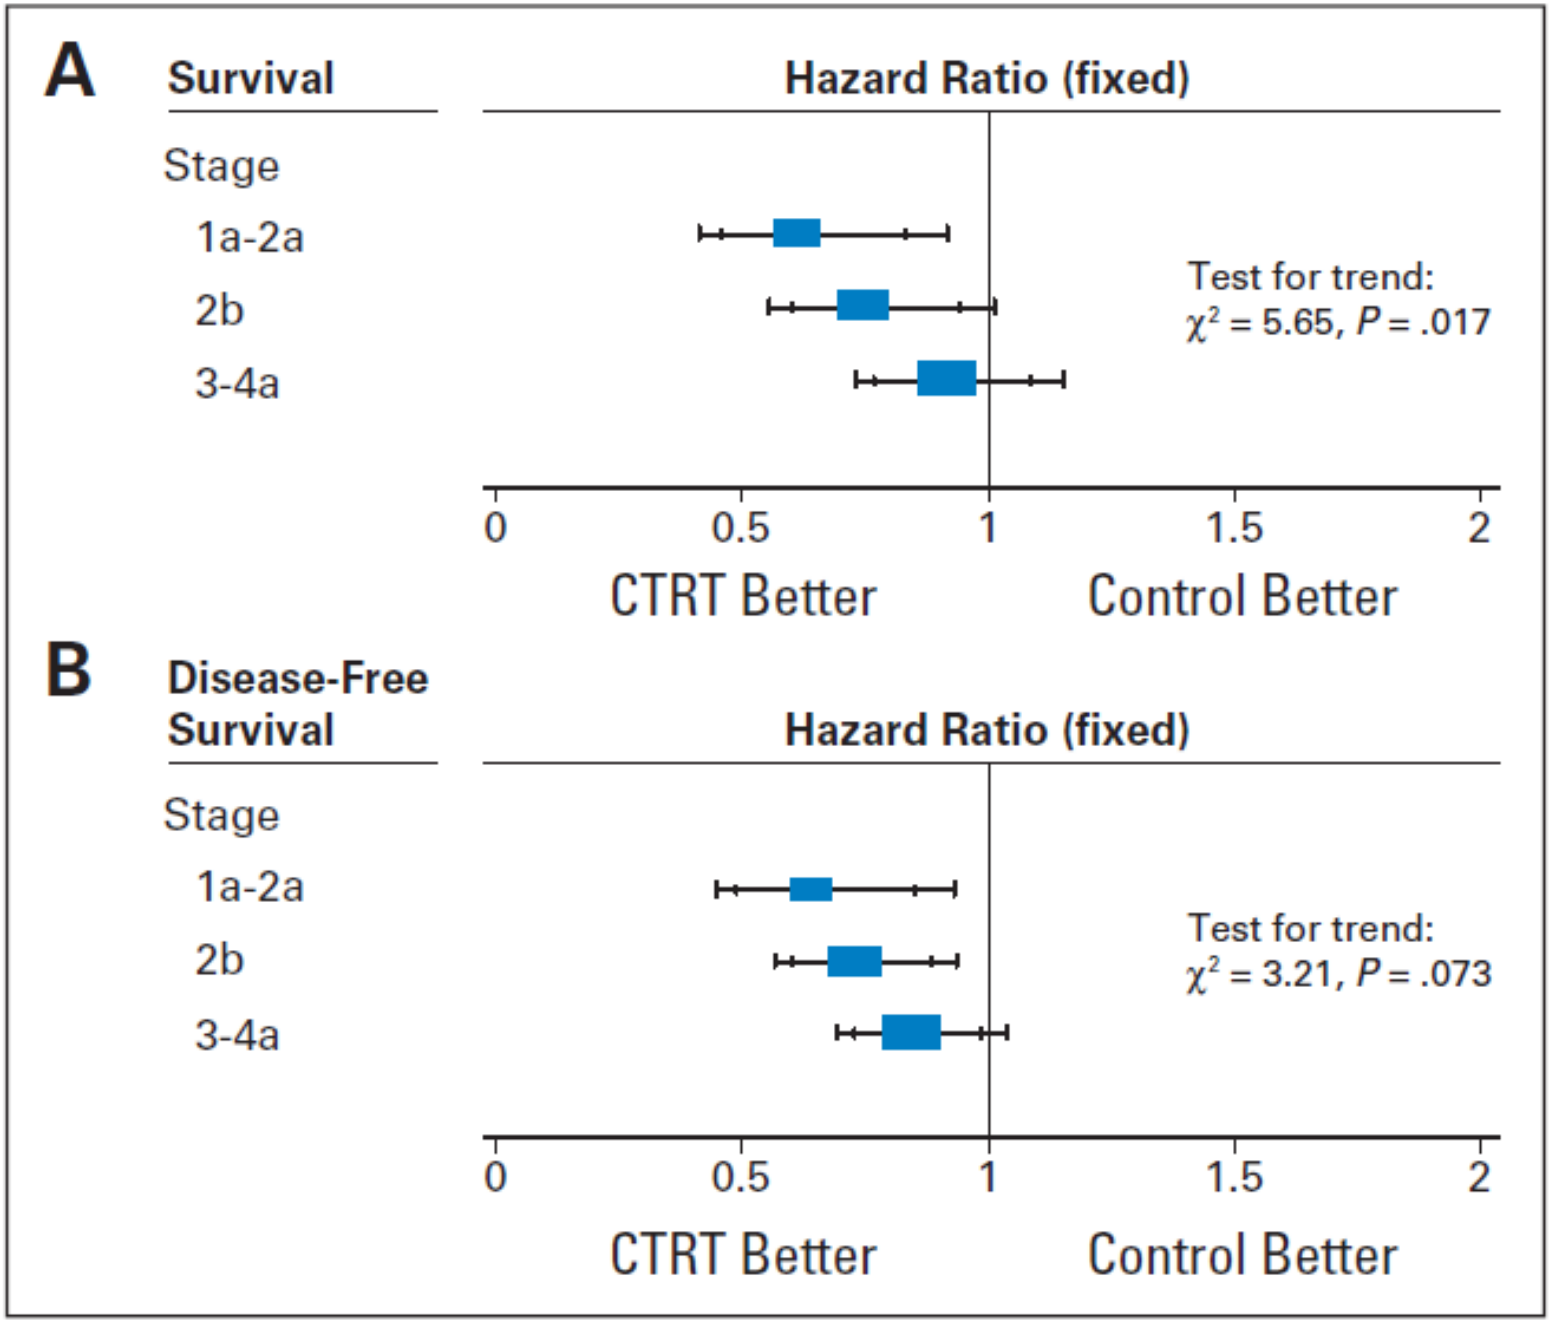
Variable	Main Analysis (13 trials)		
	HR	95% CI	Interaction *P*
Planned radiotherapy dose			
≥ 45 Gy + BRT	0.78	0.68 to 0.89	
< 45 Gy + BRT	0.93	0.70 to 1.24	.26
Planned radiotherapy duration, weeks			
≤ 8	0.83	0.72 to 0.96	
> 8	0.73	0.57 to 0.93	.35
Planned chemotherapy cycle length, weeks*			
≤ 1	0.74	0.60 to 0.92	
> 1	0.95	0.72 to 1.25	.16
Planned cisplatin dose-intensity, mg/m^2/wk*			
≤ 25	0.93	0.70 to 1.24	
> 25	0.76	0.62 to 0.96	.25
Cisplatin regimen*			
Single agent	0.76	0.62 to 0.93	
Combination	0.93	0.70 to 1.24	.25
Chemotherapy regimen			
Single agent	0.75	0.63 to 0.88	
Combination	0.86	0.71 to 1.04	.29

*J Clin Oncol. 2008;**26**:5802-12*

Conclusion 4

- Suggestion of difference in size of benefit with tumour stage

*J Clin Oncol. 2008;**26**:5802-12*

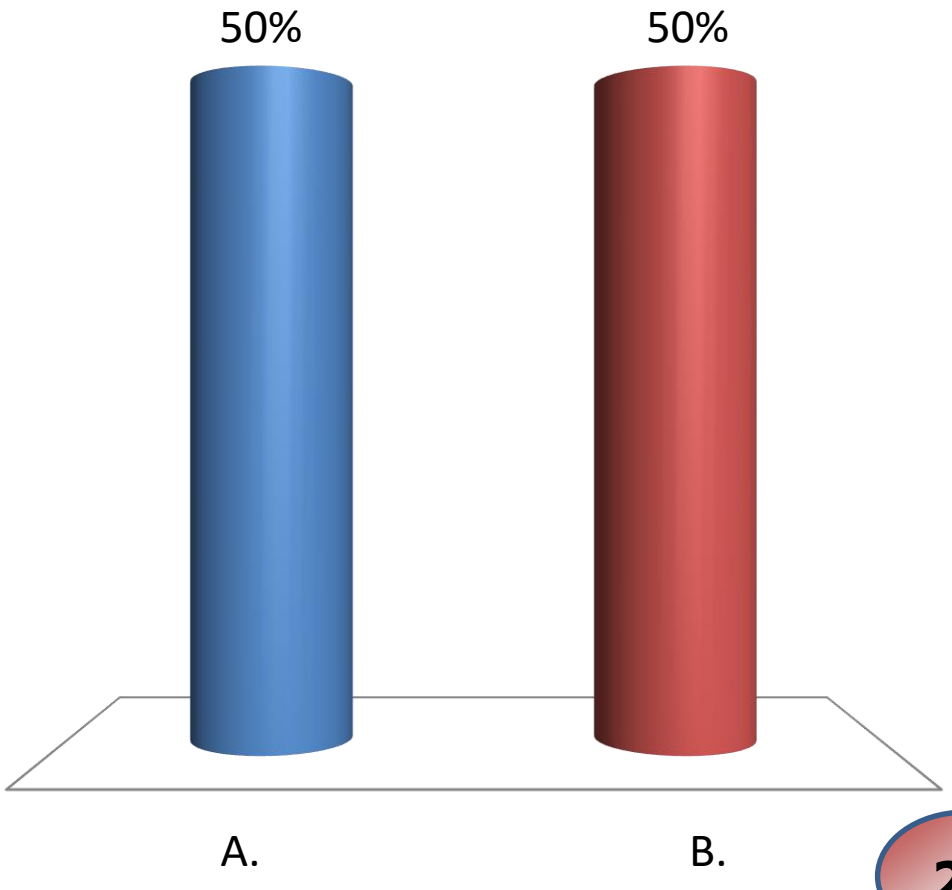


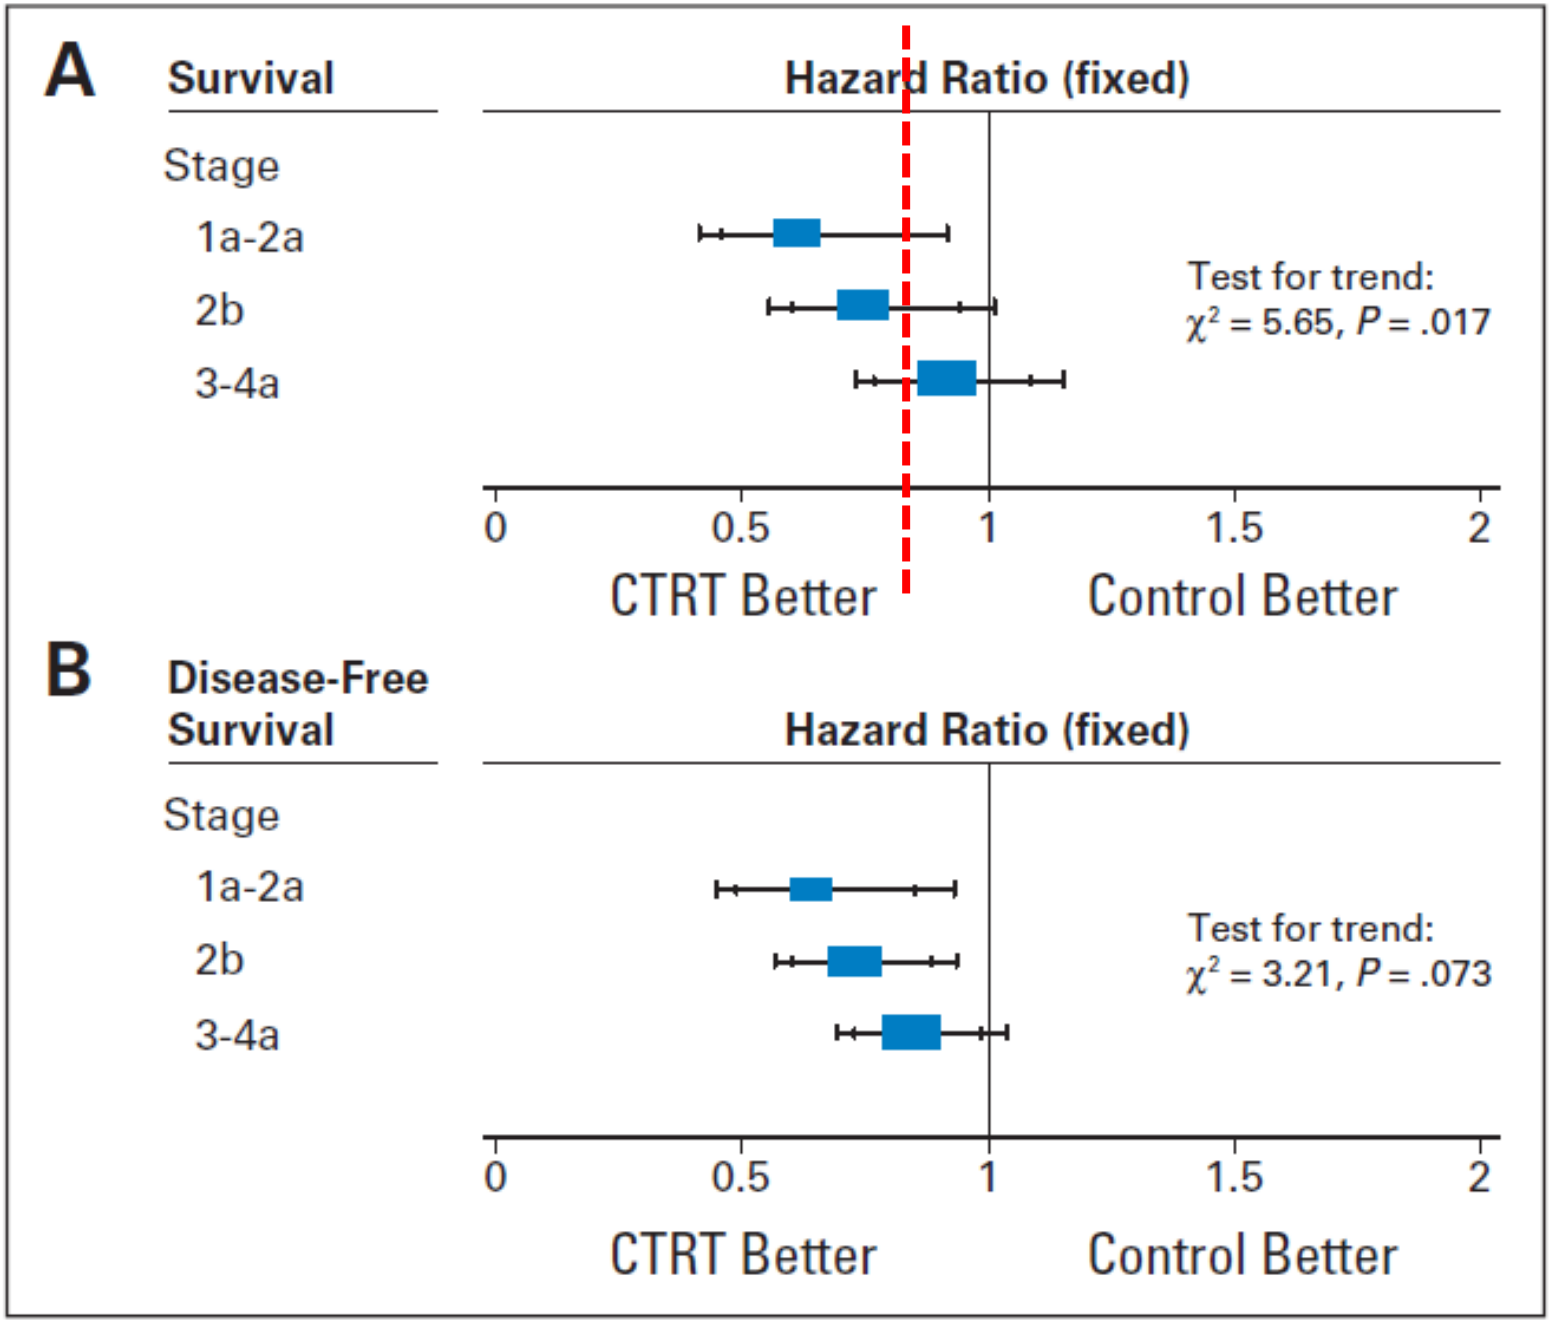
*J Clin Oncol. 2008;**26**:5802-12*

Would you stop offering concomitant chemo Stage III and IVa patients based on these results?

A. Yes

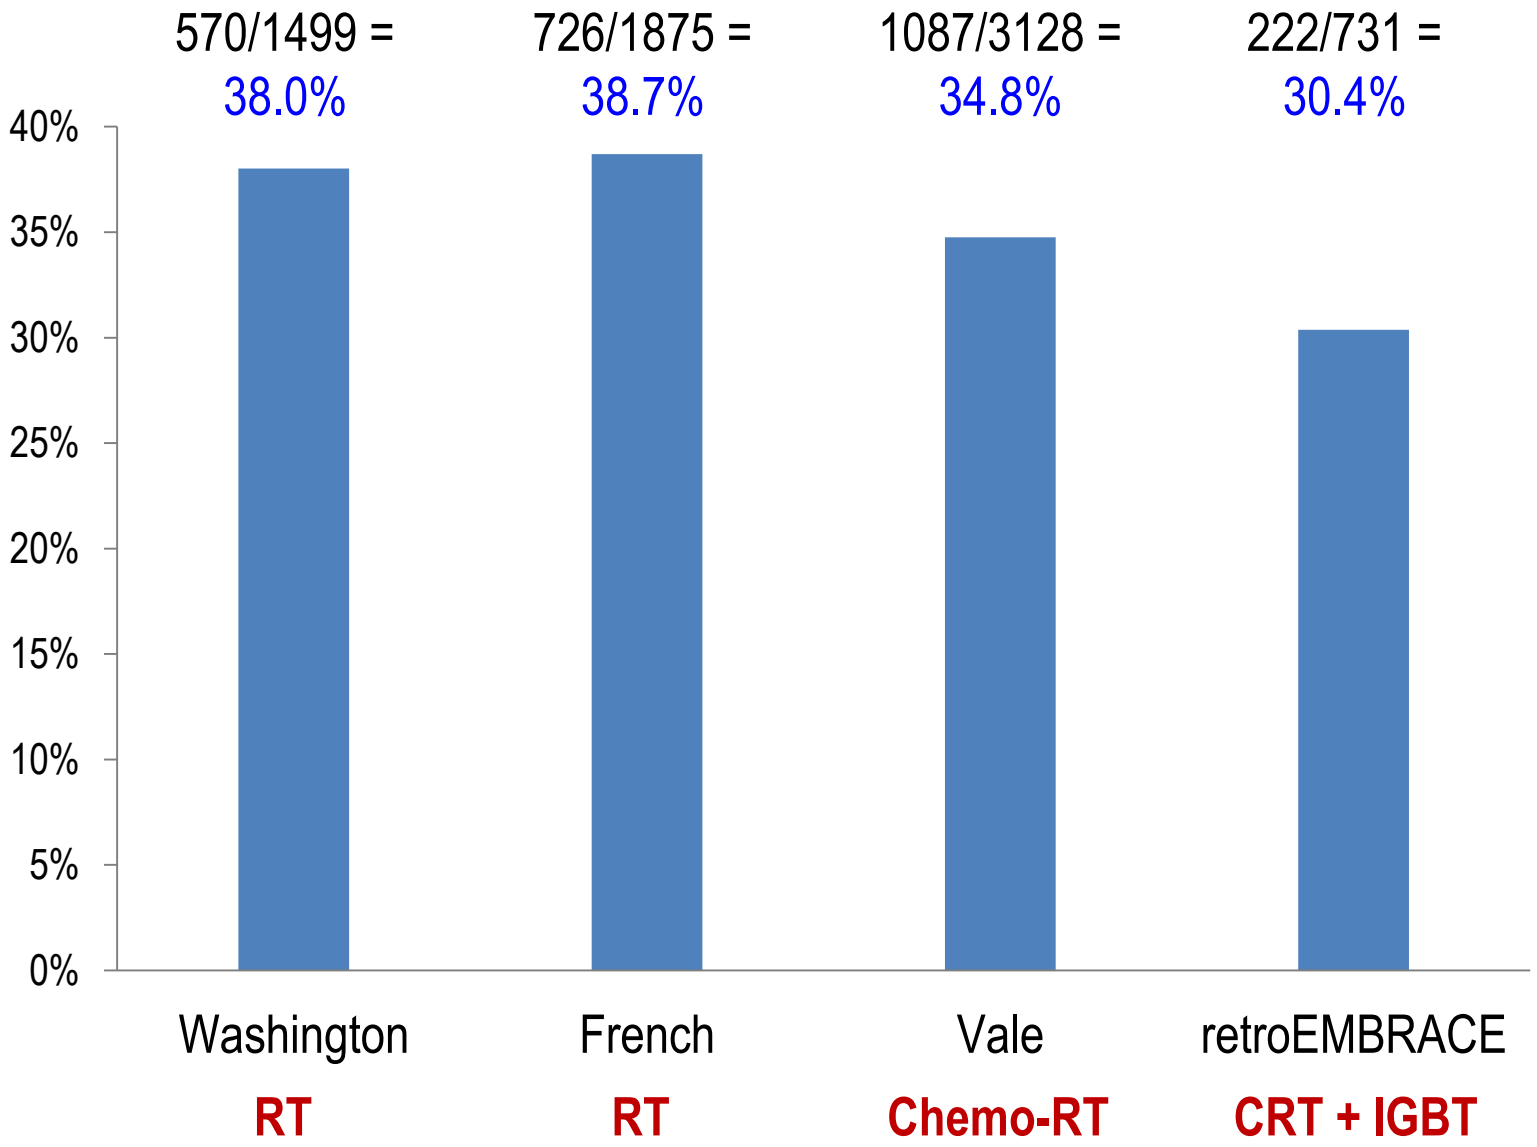
B. No



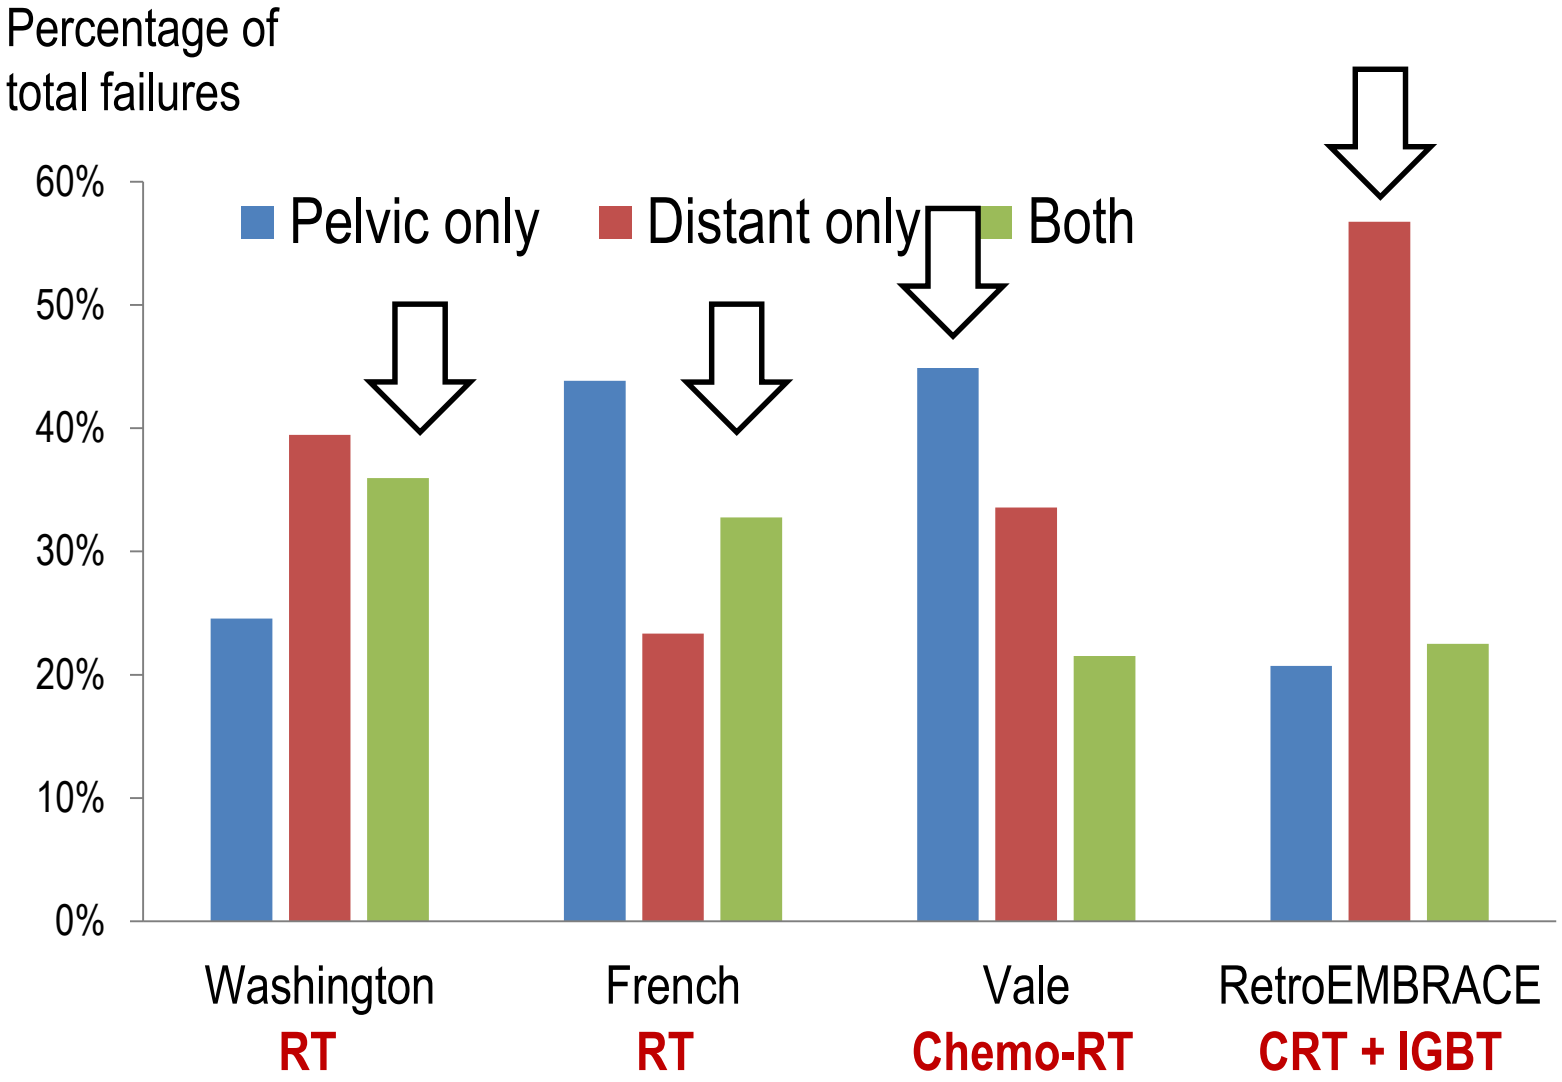


*J Clin Oncol. 2008;**26**:5802-12*

Total failures



Patterns of spread



Toxicity

- Acute toxicity
  - Serious haematologic toxicity increased by ~2 to 10-fold in individual trials
  - Significant increase in serious GI toxicity

Toxicity

- Late toxicity
  - Not recorded in majority of trials
    - Rectal 7 trials
    - Bladder 5 trials
    - Intestinal/vaginal 4 trials
  - Substantial missing data within these trials

- Clinical cases

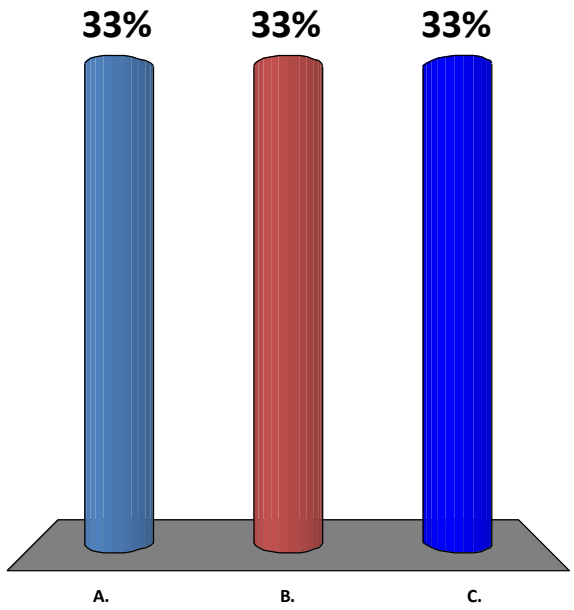
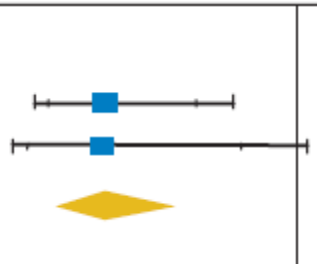
Do you give adjuvant chemotherapy after radiotherapy for cervix cancer?

A. Yes
B. Sometimes
C. No



2008 meta-analysis

Trial ID	CTRT events	CTRT pts.	Control events	Control pts.	O-E	Variance
Trials of CTRT + adjuvant chemotherapy *v* radiotherapy						
SWOG8797[8,46] (CDDP FU)	28	135	54	133	-15.61	20.36
Kantardzic[45] (CDDP BLM)	15	40	25	40	-7.74	9.74
Sub-total	43	175	79	173	-23.35	30.10



= absolute benefit of 19% at 5 years

*J Clin Oncol. 2008;**26**:5802-12*

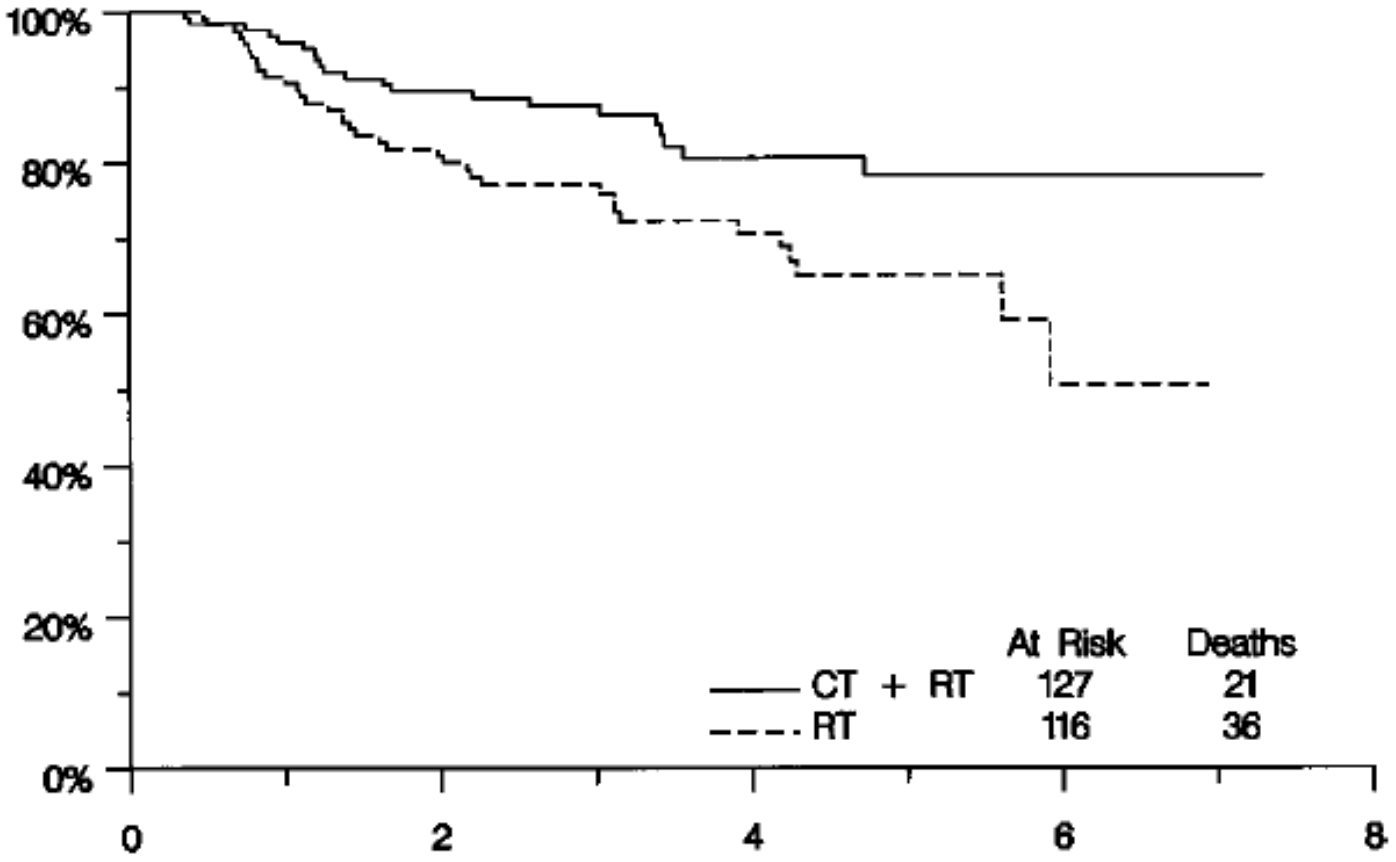
SWOG 7897

- 268 patients - IA2, IB, IIA
- Radical hysterectomy + PLND
- RT to pelvis (49.3 Gy in 29#) for
  - Positive LN
  - Positive margins
  - Parametrial disease
- 4 cycles of cisplatin 70 mg/m^2 + 5-FU 1000 mg/m^2/d x 4 days

Peters, et al. JCO 2000; ***18****:1606-13*

SWOG 7897

- 4-year survival
  - 81% for CT + RT vs 71% for RT only (p = 0.007)



SWOG 7897

- Acute toxicity
  - 21 G4 toxicity for CT + RT vs 4 for RT alone

- Late toxicity not reported

SWOG 7897

No. of Cycles Received	Patients (n = 127) No.	%
0 (refused)	10	8
1	8	6
2	19	15
3	14	11
4	76	60

Dueñas-González 2011

- 515 patients - IIB - IVA
- Treatment
  - RT to pelvis (50.4 Gy in 28#) + BT 30 Gy to point A
  - Standard 4-field box or opposed fields
  - Weekly cisplatin 40 mg/m^2 + gemcitabine 125 mg/m^2
  - 2 cycles cisplatin 80 mg/m^2 + gemcitabine 1000 mg/m^2 (d1 + d8) q21

*J Clin Oncol. 2011;**29**:1678-85*

Dueñas-González 2011

- 9% improvement in 3-year PFS (p = 0.03)
- OS not analysed
- No difference in local failure - 11% and 16%

Toxicity

- Acute
  - G3-4 haematological toxicity 72% vs 24%
  - More G3-4 non-haematological toxicity (p = 0.002)
  - 3 deaths within 60 days
  - 30 patients hospitalised vs 11 (p = 0.003)
- Late
  - G3-4 toxicity 4.1% vs 1.4%
  - Data for 1 year only (median FU 47 months)
  - 15% missing

Table 6 — Comparison of rates of serious morbidity in published reports

Reference	Patients	Treatment	Morbidity
Clatterbridge [13]	223	Radiotherapy alone	5.0%
Cookridge, Leeds [14]	371	Radiotherapy alone	19.0%
Bristol [15]	270	Radiotherapy alone	32.5%
French Co-operative Study [16]	1383	Radiotherapy alone	27.6%
Washington University [17]	970	Radiotherapy alone	18.4%
Addenbrooke's	71	Chemoradiotherapy	18.3%
Birmingham [9]	79	Chemoradiotherapy	12.7%
China Medical University, Taiwan [10]	70	Chemoradiotherapy	14.3%
Albert Einstein College of Medicine, New York [11]	77	Chemoradiotherapy	6.0%
RTOG 90-01 [7]	191	Chemoradiotherapy	12.6%
GOG 120* [6]	215	Chemoradiotherapy	2.8%

Tan LT, et al. Clin Oncol (R Coll Radiol). 2008.

ANZGOG OUTBACK

- Pelvic RT 45-50.4 Gy in 25-28#
- Weekly cisplatin 40 mg/m^2
- 4 cycles of carboplatin AUC5 + paclitaxel 155 mg/m^2
- 780 patients over 3 years to detect 10% improvement in OS
- IGBT not allowed

Outline

- Concomitant chemotherapy
- Neoadjuvant chemotherapy
- Adjuvant chemotherapy
- **Targeted treatments**
- Personalised medicine
- Clinical cases

Targeted treatments

- Anti-angiogenesis
  - **Bevacizumab**
- Tyrosine kinase inhibitors
  - Sunitinib, sorafenib, imatinib, pazopanib, cediranib
- EGFR inhibitors
  - Gefitinib, erlotinib, cetuximab, lapatinib, trastuzumab, panitumumab
- Ribonucleotide reductase inhibitor
  - Triapine
- Immunotherapy
  - Adoptive T-cell therapy
  - **ADXS11-001 (axamilogene)**

ADXS11-001 immunotherapy

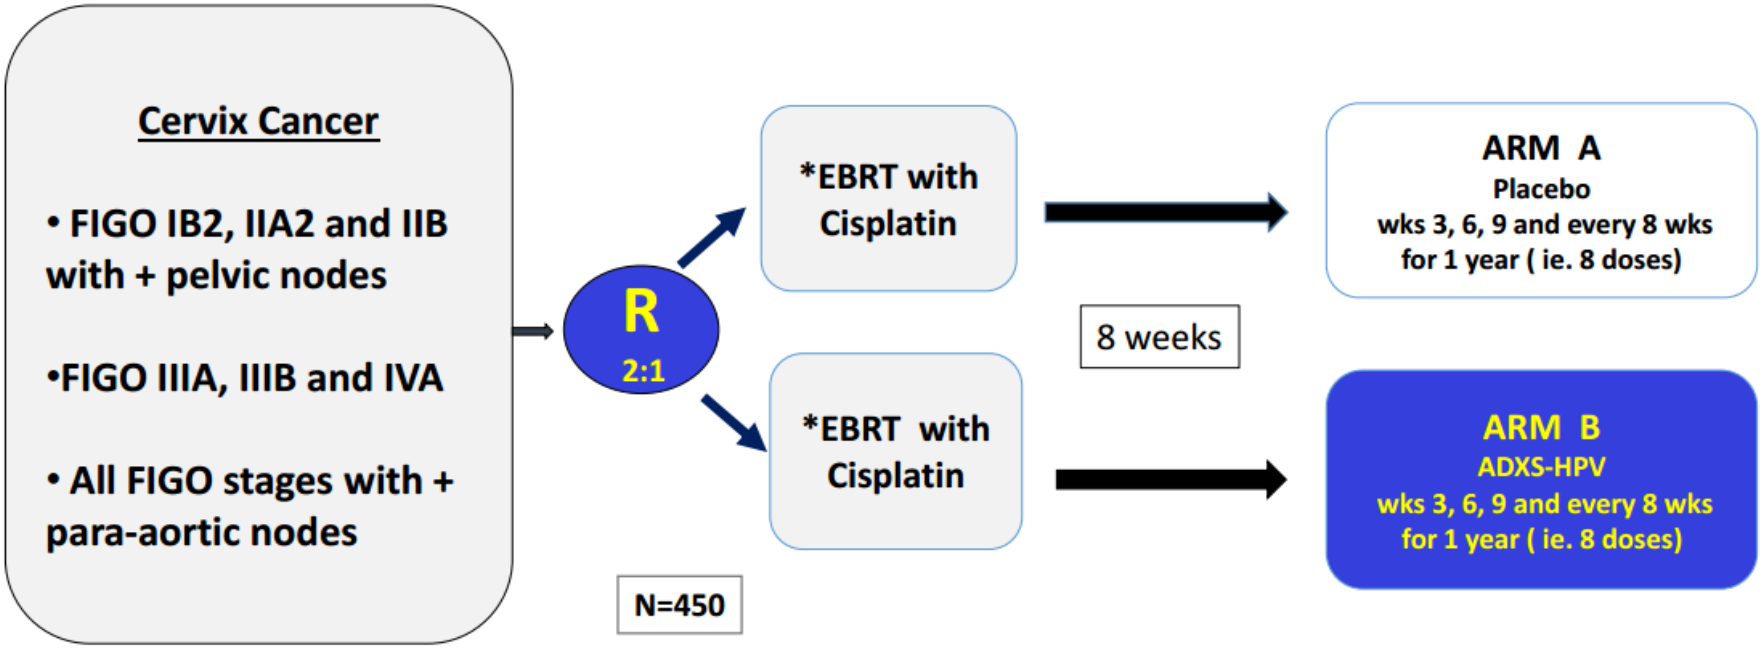
- Utilizes listeria monocytogenes (gram positive bacteria) which selectively infects antigen presenting cells
- Targets HPV-transformed cells, inducing antitumor T-cell immunity
- Activity observed across all HPV types

GOG 0265

- Phase II study
  - Persistent or recurrent cervical Ca
  - One prior line of systemic therapy
  - 3 doses of ADXS

- 12-month OS = 38.5% in 26 patients

AIM2CERV



1° endpoint: Progression Free Survival
2° endpoint: Overall Survival

*Concurrent chemo radiation therapy administered with curative intent according to national/institutional guidelines

Outline

- Concomitant chemotherapy
- Neoadjuvant chemotherapy
- Adjuvant chemotherapy
- Targeted agents

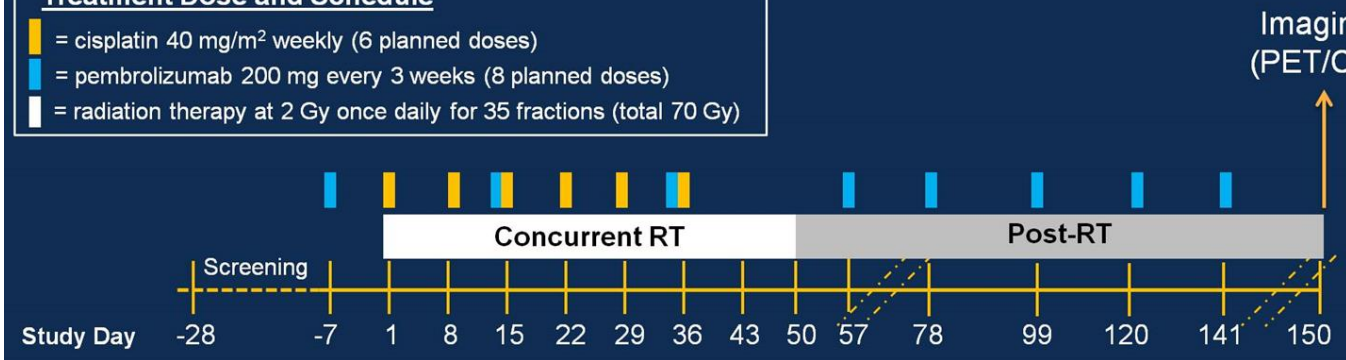
PRESENTED AT: ASCO ANNUAL MEETING '17 | #ASCO17

Treatment Dose and Schedule

- = cisplatin 40 mg/m² weekly (6 planned doses)
- = pembrolizumab 200 mg every 3 weeks (8 planned doses)
- = radiation therapy at 2 Gy once daily for 35 fractions (total 70 Gy)



Primary end points:

- Safety - dose-limiting adverse events (AEs) and immune-related AEs (irAEs)
- Efficacy - complete response (CR) rate on imaging or salvage surgery at day 150

Secondary end points: PFS, OS, locoregional control, distant metastasis rate, quality-of-life (FACT H&N)

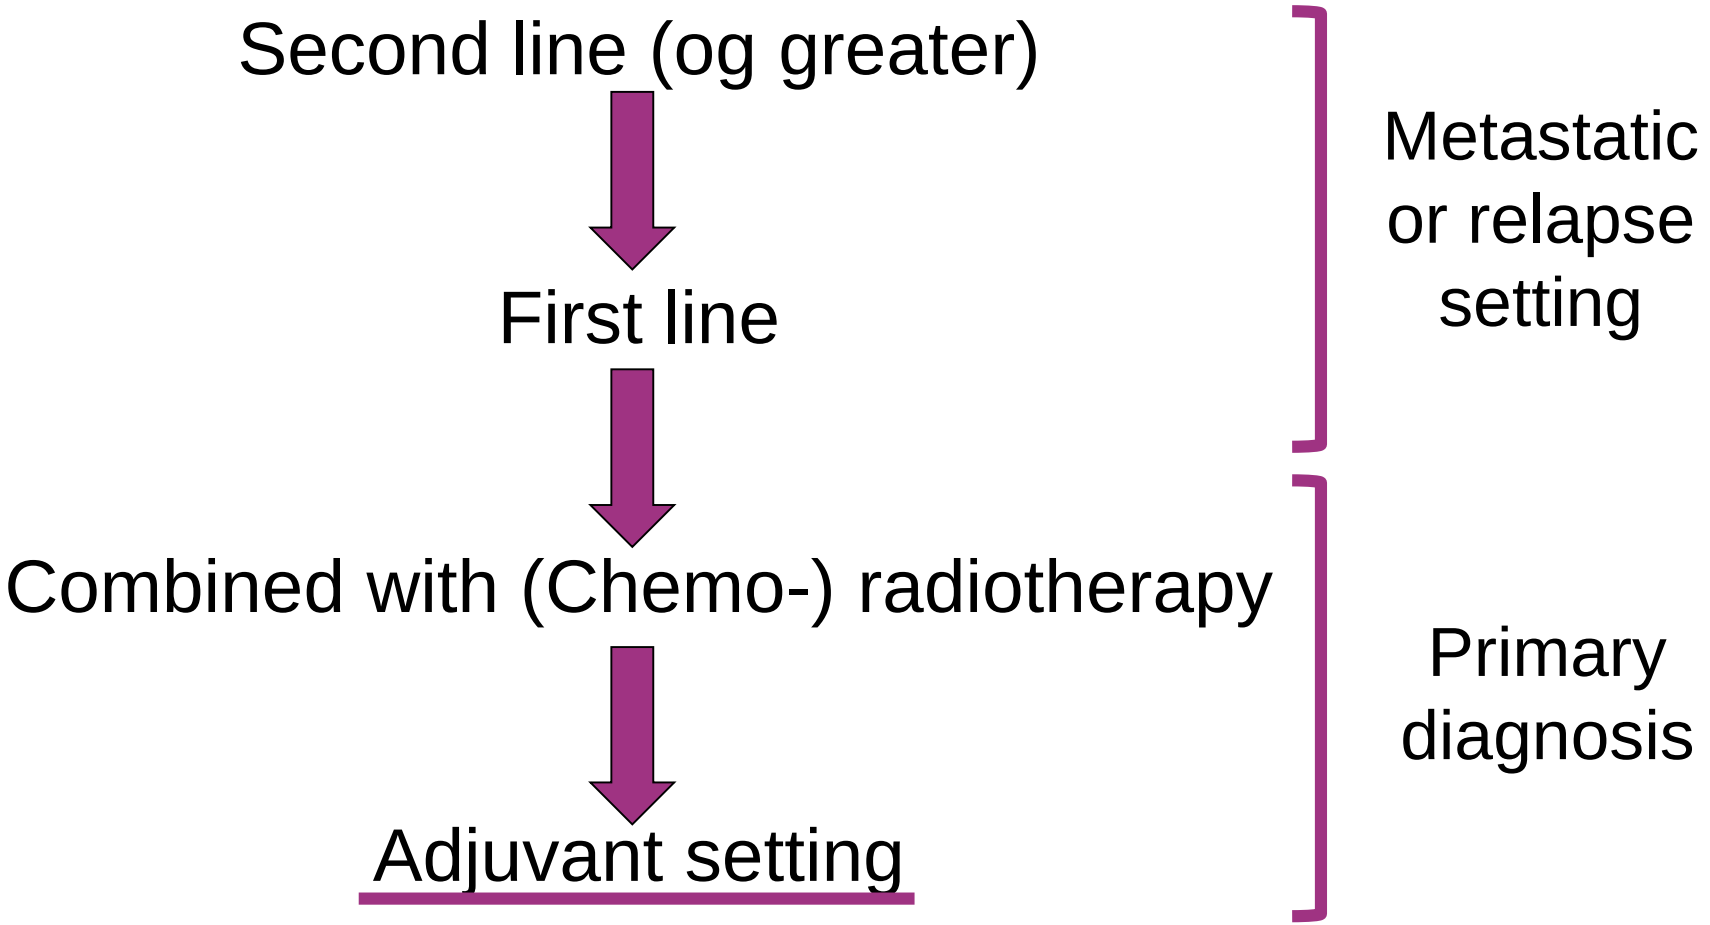
The landscape of treatment development

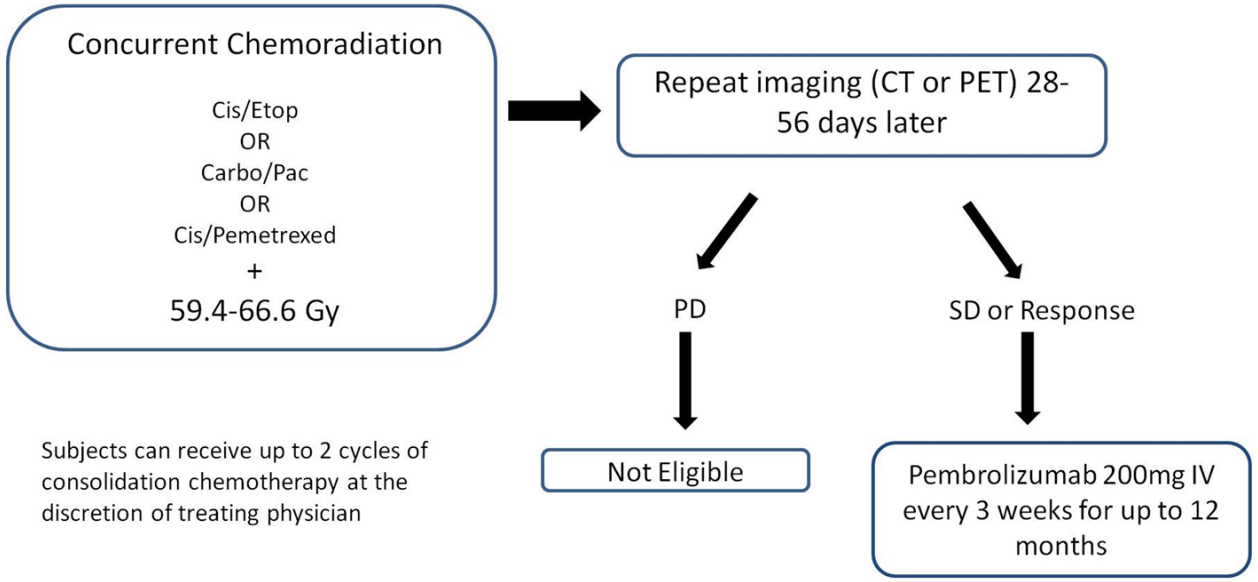


Adjuvant Pembrolizumab after C-RT to st. III NSCLC

Safety and Feasibility of Consolidation Pembrolizumab following Concurrent Chemoradiation for Unresectable Stage III Non-Small Cell Lung Cancer: Hoosier Cancer Research Network LUN14-179

Greg Durm, Cynthia Calley, Shadia Jalal, Ahad Sadiq, Salma Jabbour, Robin Zon, Goetz Kloecker, Karen Reckamp, William Fisher, and Nasser Hanna

SCHOOL OF MEDICINE



Adjuvant Pembrolizumab after C-RT to st. III NSCLC

Feasibility of Receiving 4 Cycles of Pembrolizumab Consolidation

- 76/93 (81.7%) eligible patients were able to receive 4 cycles of therapy
- Reasons for dropout or withdrawal:
  - Adverse events-7 (pneumonitis (4), recurrent colitis, pulmonary embolus, pneumothorax)
  - Disease progression- 4
  - Patient withdrawal- 3
  - Death- 2
  - Unknown-1

Conclusion

- Biological basis for combining RT with check-point inhibitors
- In mice models there seems to be synergy
- Different toxicity profile
- Apparently not synergy re. side effects
- Trials are ongoing
- No immuno-RT treatments can be considered standard – everything should be done in controlled trials

DIFFERENT MEDICINES SAME TARGET

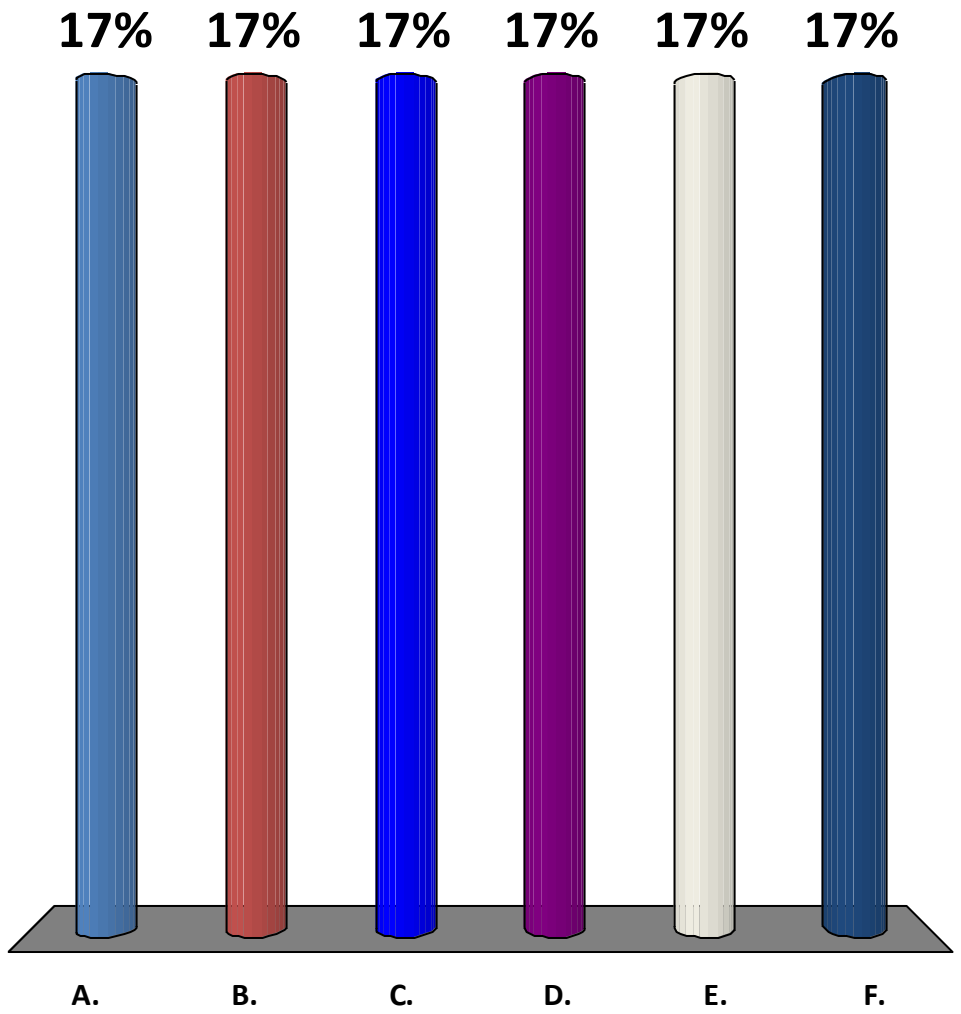
Decision-making in oncology

Dr Li Tee Tan

Cambridge University Hospitals NHS
NHS Foundation Trust

Do you find decision-making in your clinical practice difficult?

A. Consultant - often
B. Consultant - sometimes
C. Consultant - rarely
D. Trainee - often
E. Trainee - sometimes
F. Trainee - rarely



What is decision-making?

- Decision-making is the act of choosing between two or more courses of action.

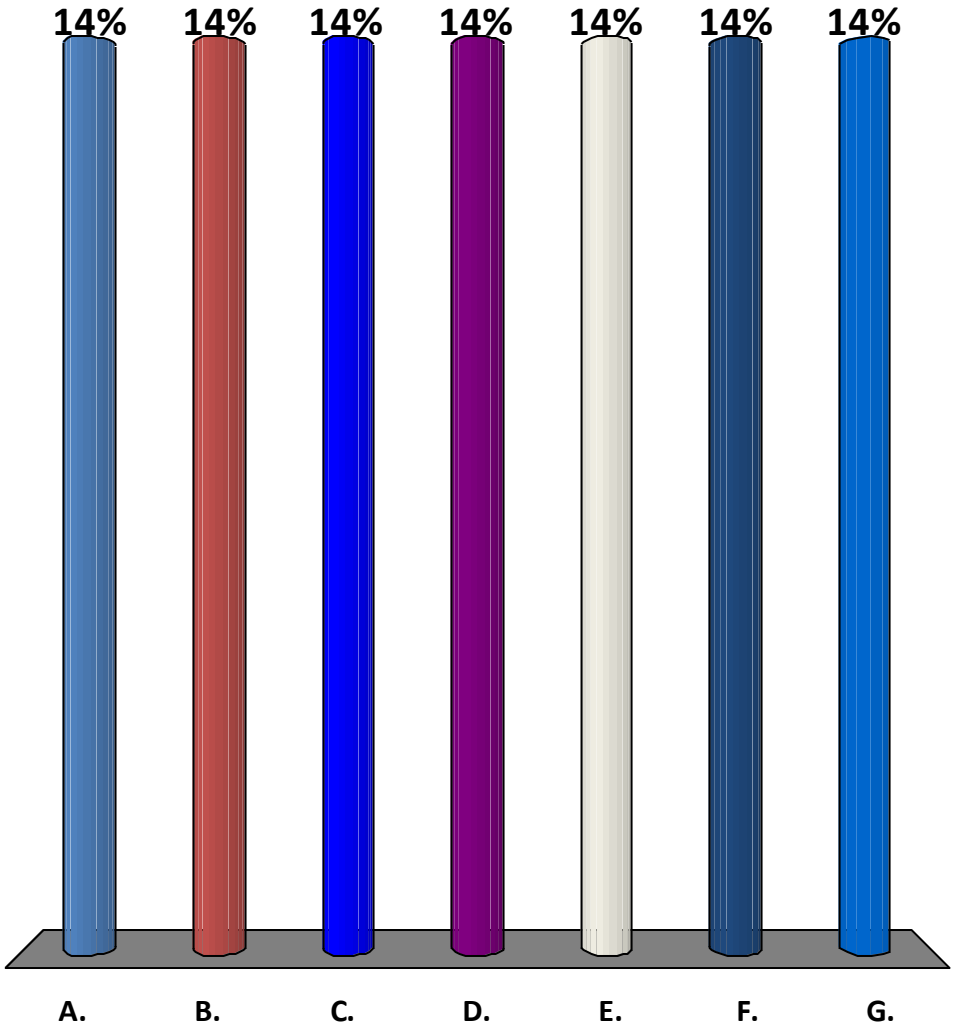
https://www.skillsyouneed.com/ips/decision-making.html

Decision-making in oncology

- To decide on the best treatment for the **individual** patient

What do you find challenging in oncology decision-making? (Select one or more)

A. Knowing the latest evidence
B. Applying the evidence to the individual patient
C. Presence of conflicting or little evidence
D. Deciding on treatment intent
E. Modifying treatment plan according to tumour and patient factors
F. Helping patients to make a choice
G. Giving consistent and unbiased advice to different patients



What can prevent effective decision-making?

- Not enough information
- Too much information
- Too many people
- Vested interests
- Emotional attachments
- No emotional attachment

- Some people put off making decisions by endlessly searching for more information or getting other people to offer their recommendations.
- Others resort to decision-making by taking a vote, sticking a pin in a list or tossing a coin.

https://www.skillsyouneed.com/ips/decision-making.html

What can prevent effective decision-making?

- Not enough information
- Too much information
- Too many people
- Vested interests
- Emotional attachments
- No emotional attachment

"Many of these issues can be overcome by using a structured decision-making process."

https://www.skillsyouneed.com/ips/decision-making.html

How are decisions made?

- Decisions can be made through either an intuitive or reasoned process, or a combination of the two.
- Intuition is using your ‘gut feeling’ about possible courses of action.
- Reasoning is using the facts and figures in front of you to make decisions.

https://www.skillsyouneed.com/ips/decision-making.html

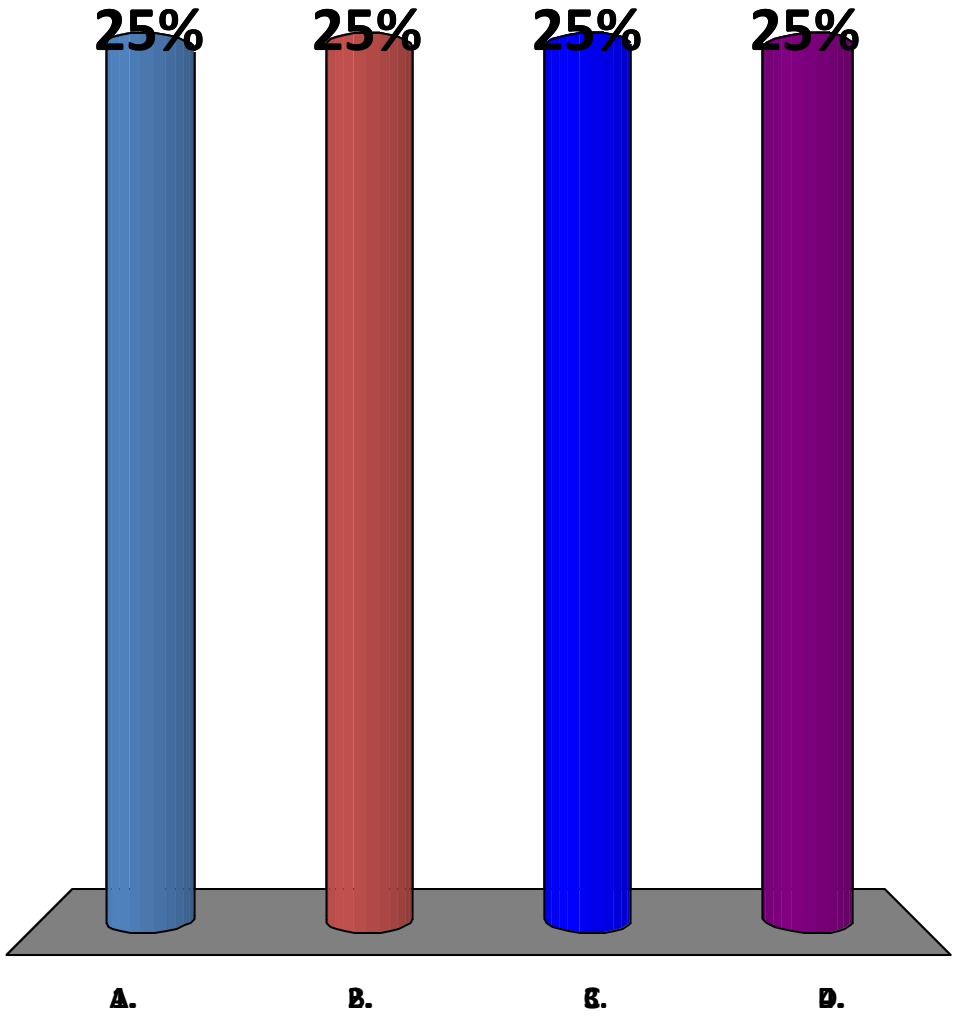
Intuition

- Intuition is a combination of past experience and your personal values.
- It is worth taking your intuition into account, because it reflects your learning about life.
- In oncology, intuition can be considered the same as clinical judgement.

https://www.skillsyouneed.com/ips/decision-making.html

Evidence-based medicine has replaced the need for clinical judgement.

A. Consultant - agree
B. Consultant - disagree
C. Trainee - agree
D. Trainee - disagree



Intuition

- Intuition is a combination of past experience and your personal values.
- It is worth taking your intuition into account, because it reflects your learning about life.
- It is not always based on reality, only your perceptions, many of which may have started in childhood and may not be very mature as a result.
- It is worth examining your gut feeling closely, especially if you have a very strong feeling against a particular course of action, to see if you can work out why, and whether the feeling is justified.

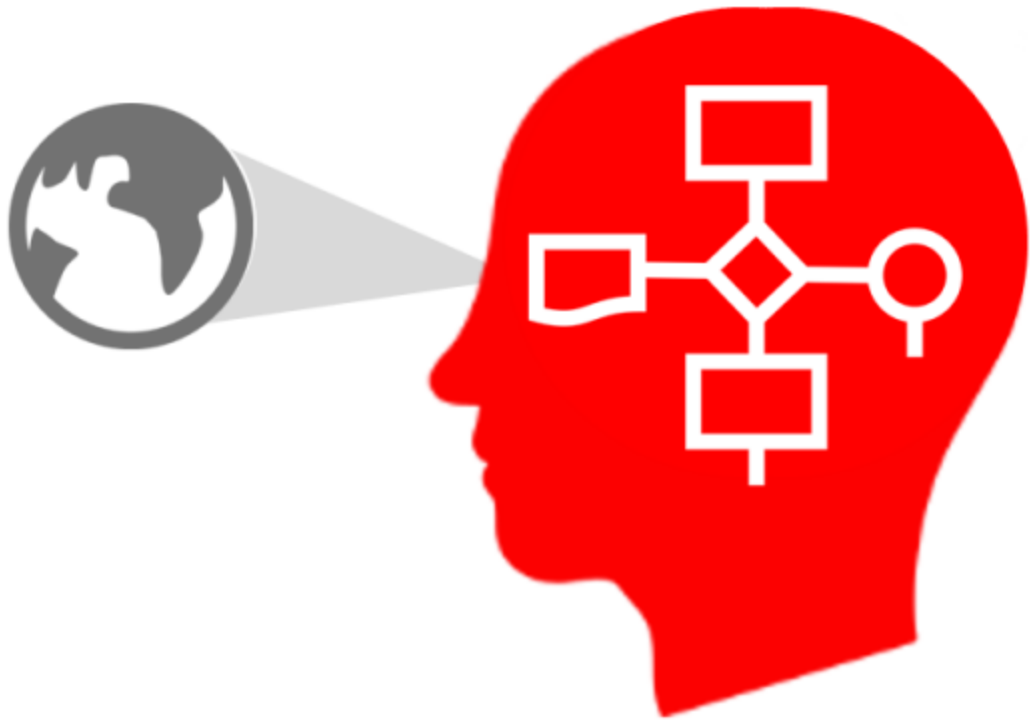
https://www.skillsyouneed.com/ips/decision-making.html

RE-FRAMING

A **mental model** is:

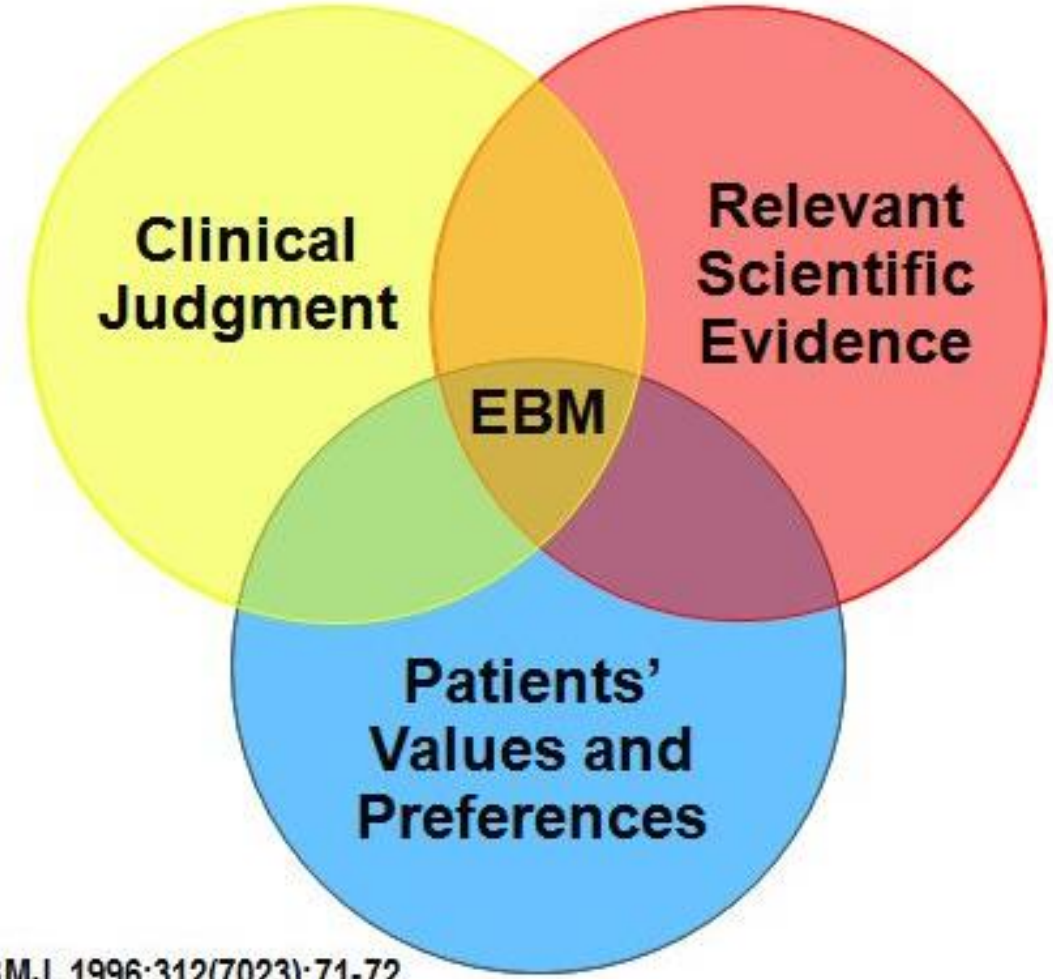
‘an explanation of someone's thought process about how something works in the real world’.

Wikipedia



STRATEGY PitStop

Evidence-based medicine



Sackett DL, et al. BMJ. 1996;312(7023):71-72.

Outline

- Treatment intent
- Decision-making process
- Patient values

Aim of treatment

- Maximise therapeutic index

$$\frac{\text{Benefit}}{\text{Side-effects}}$$

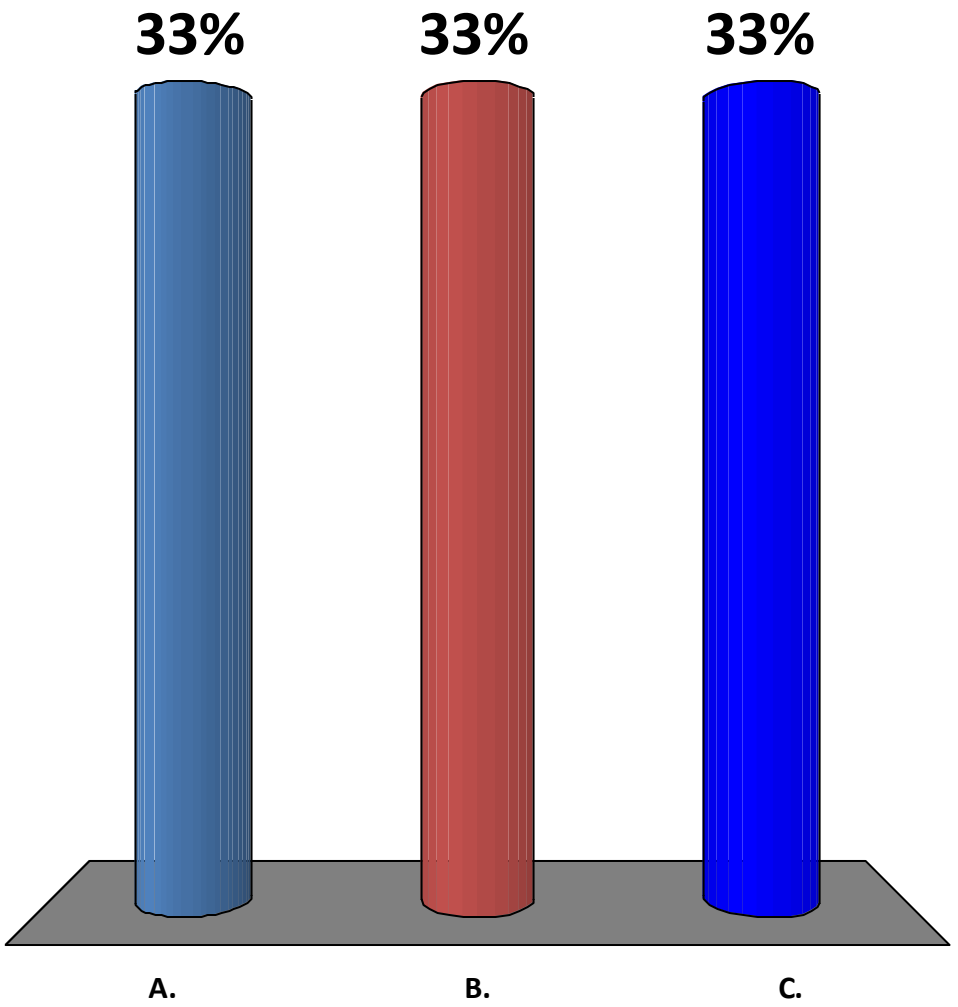
Terminology

- Radical
- Adjuvant
- Palliative

- Curative
- Non-curative
- Neo-adjuvant
- Concomitant
- Concurrent
- Synchronous
- Disease modification
- Terminal

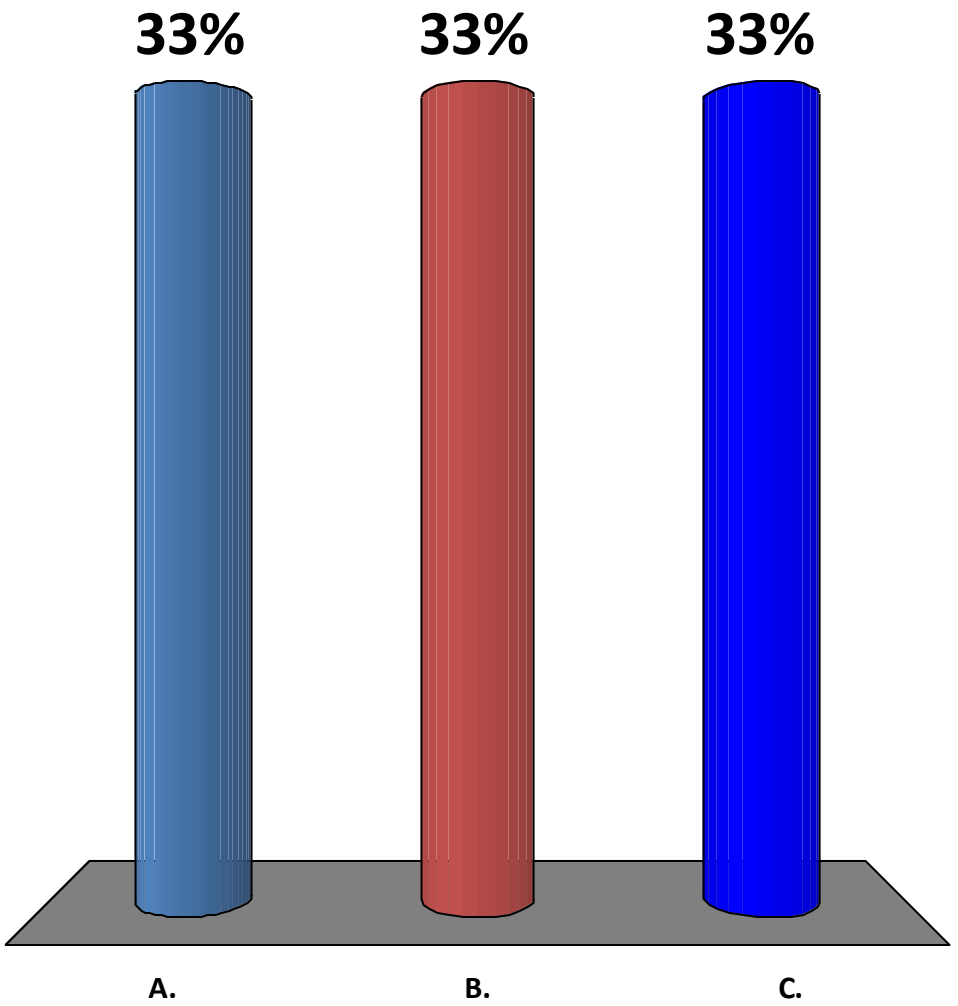
Cure means that the disease will never return.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



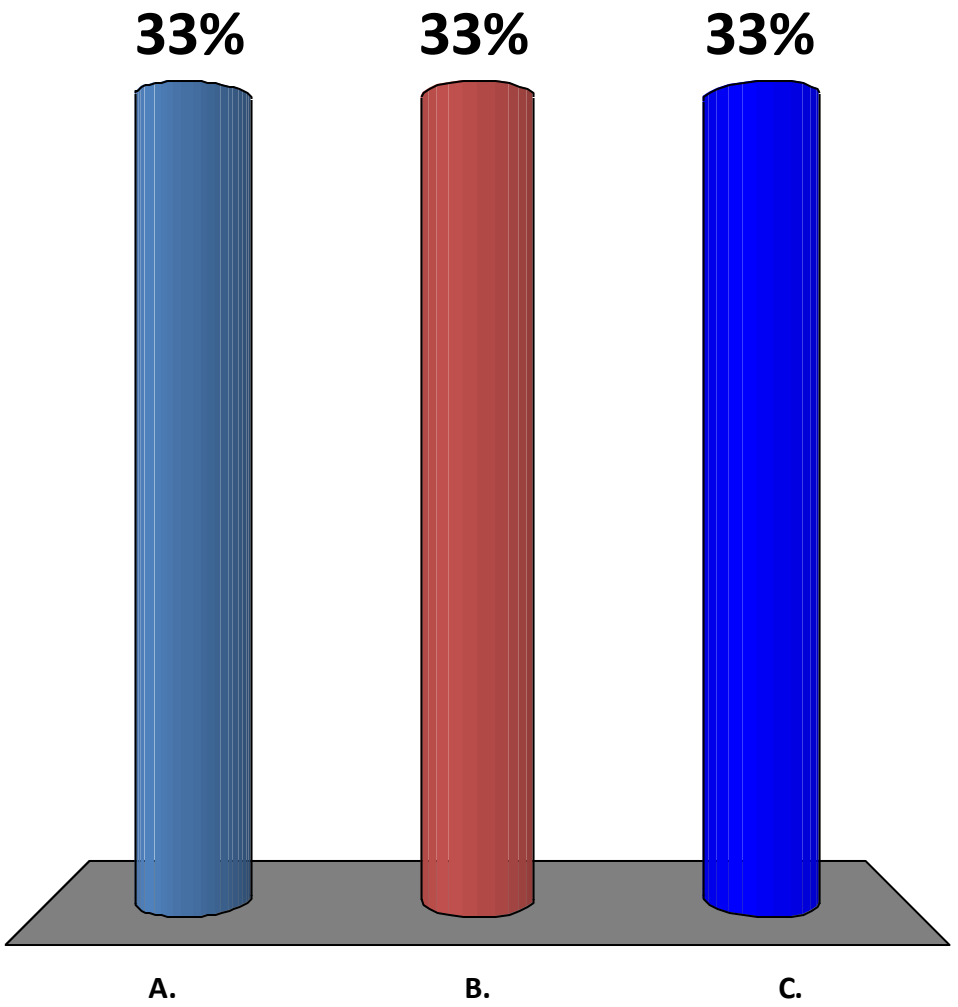
M0 disease should be regarded as curable.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



M1 disease should be regarded as incurable.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree

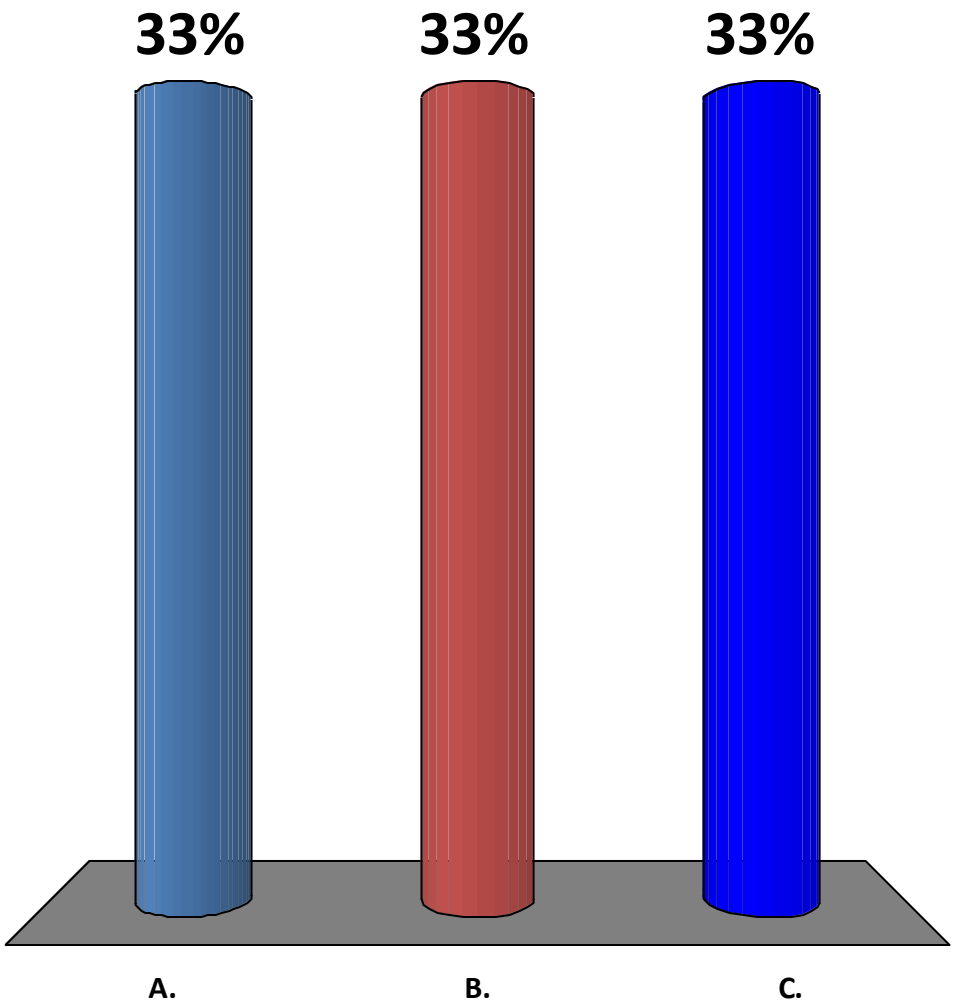


Norms vs exceptions

- Liver metastases in colorectal cancer are potentially curable.
- Liver metastases in breast cancer are potentially curable.
- Blood supply to liver from bowel is via portal circulation.
- Should liver metastases in breast cancer be resected?

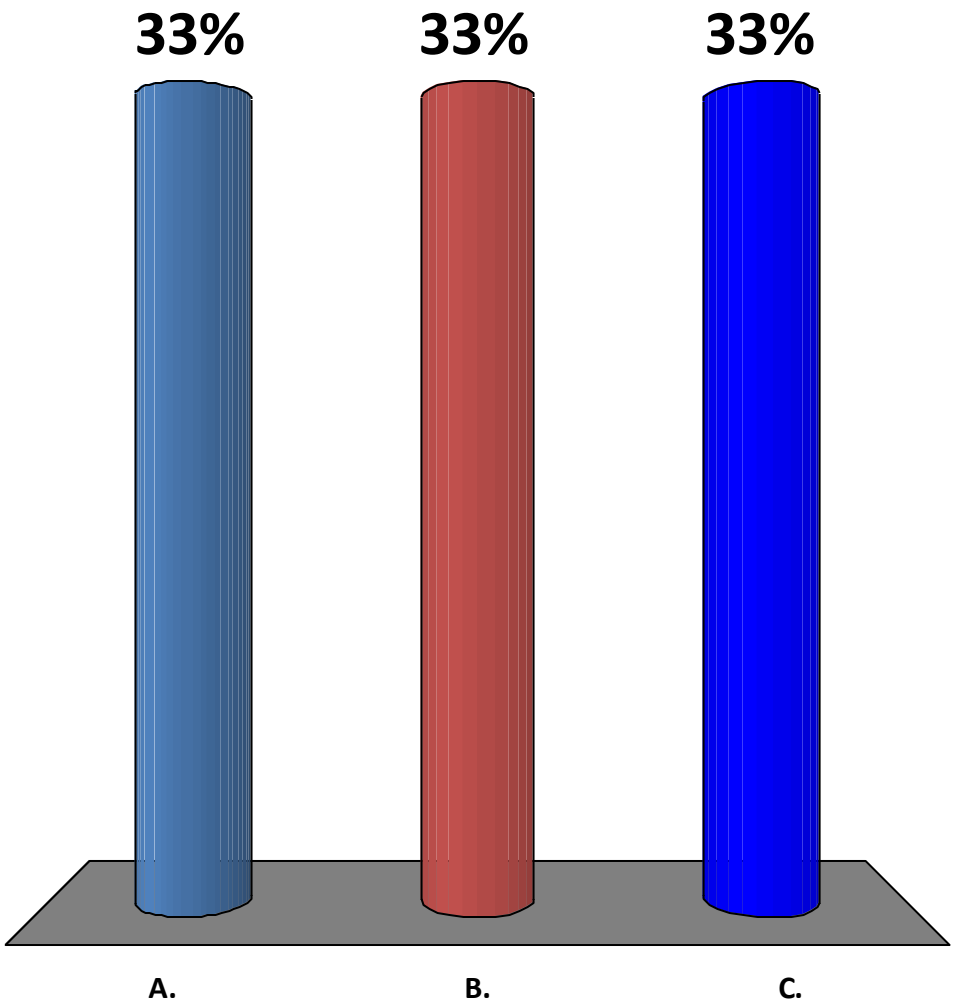
Adjuvant treatment on its own can be curative.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



Neo-adjuvant treatment on its own can be curative if there is complete remission at the end of treatment.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



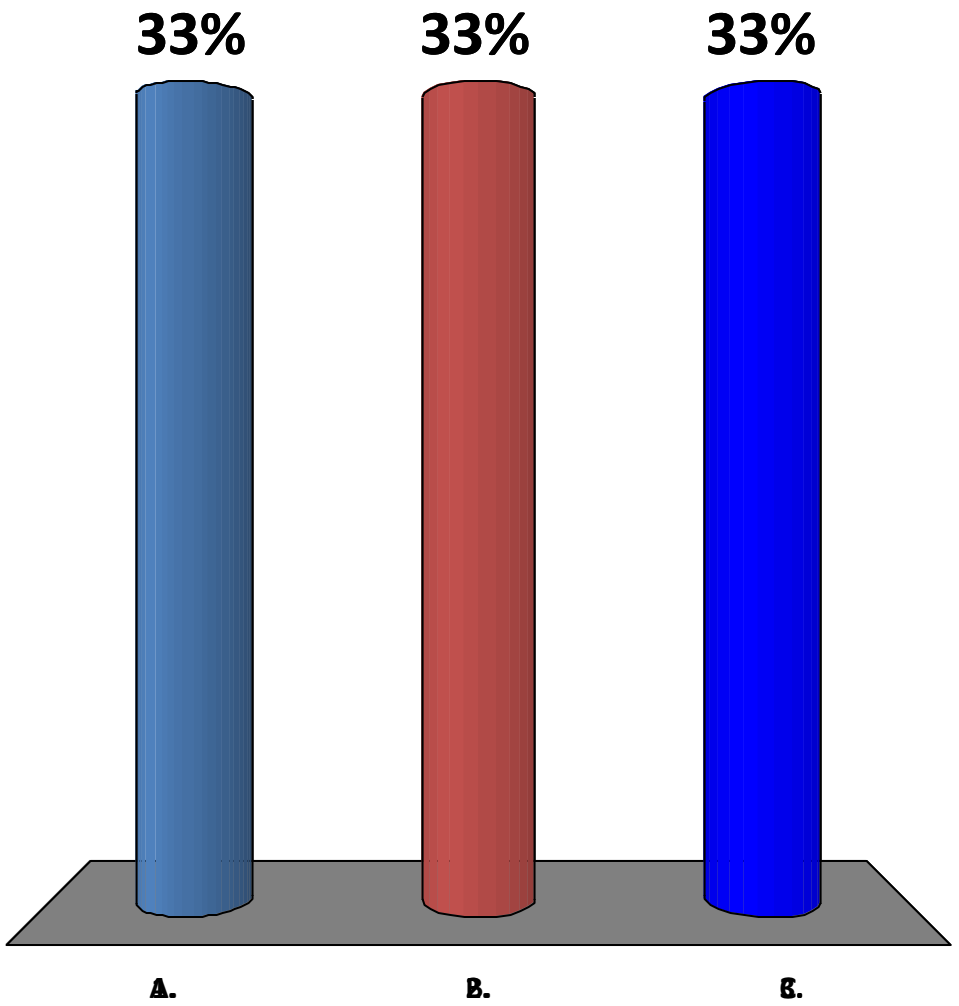
Response is not necessarily an indicator of prognosis

- Examples
  - Small cell carcinoma of lung
  - Ovarian carcinoma

Be wary of switching strategy halfway through treatment based on response.

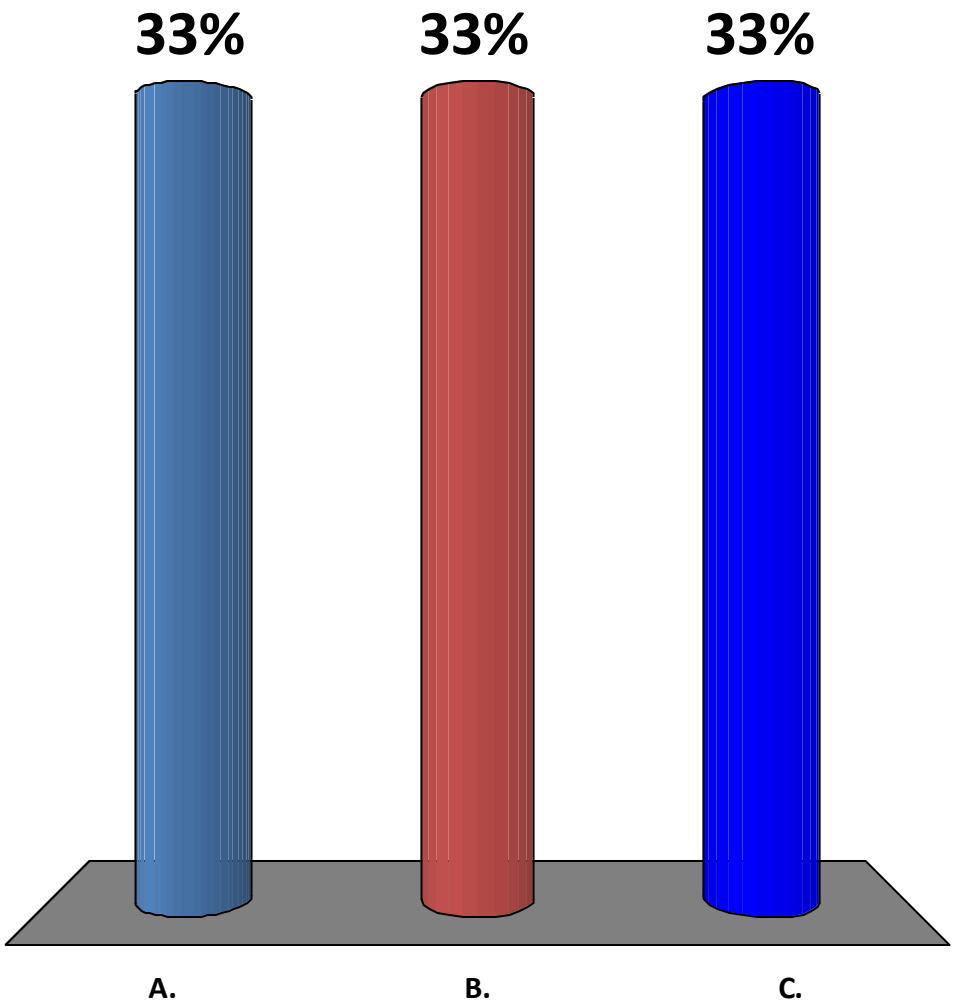
The term palliative is the same as incurable.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



Radical treatment should only be offered for curable disease.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree

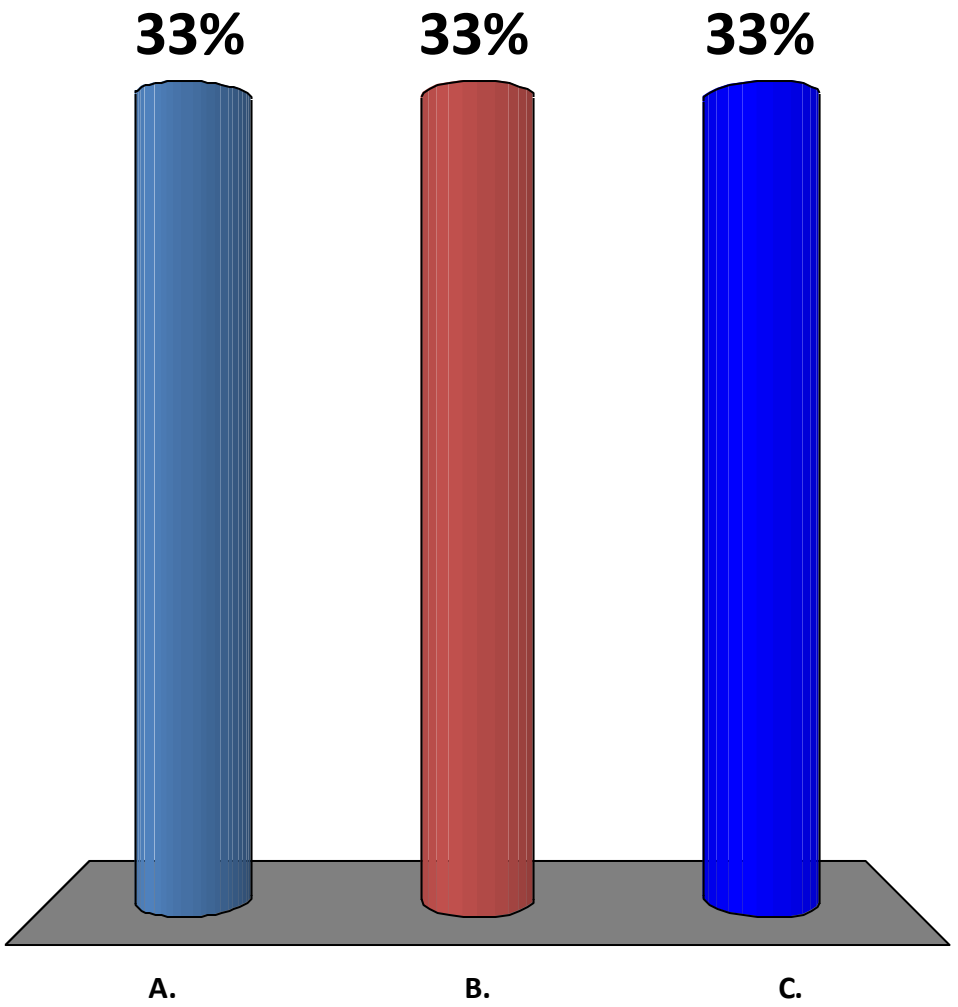


Intent vs. treatment

- “Radical with palliative intent”
- “Radical dose with palliative intent”

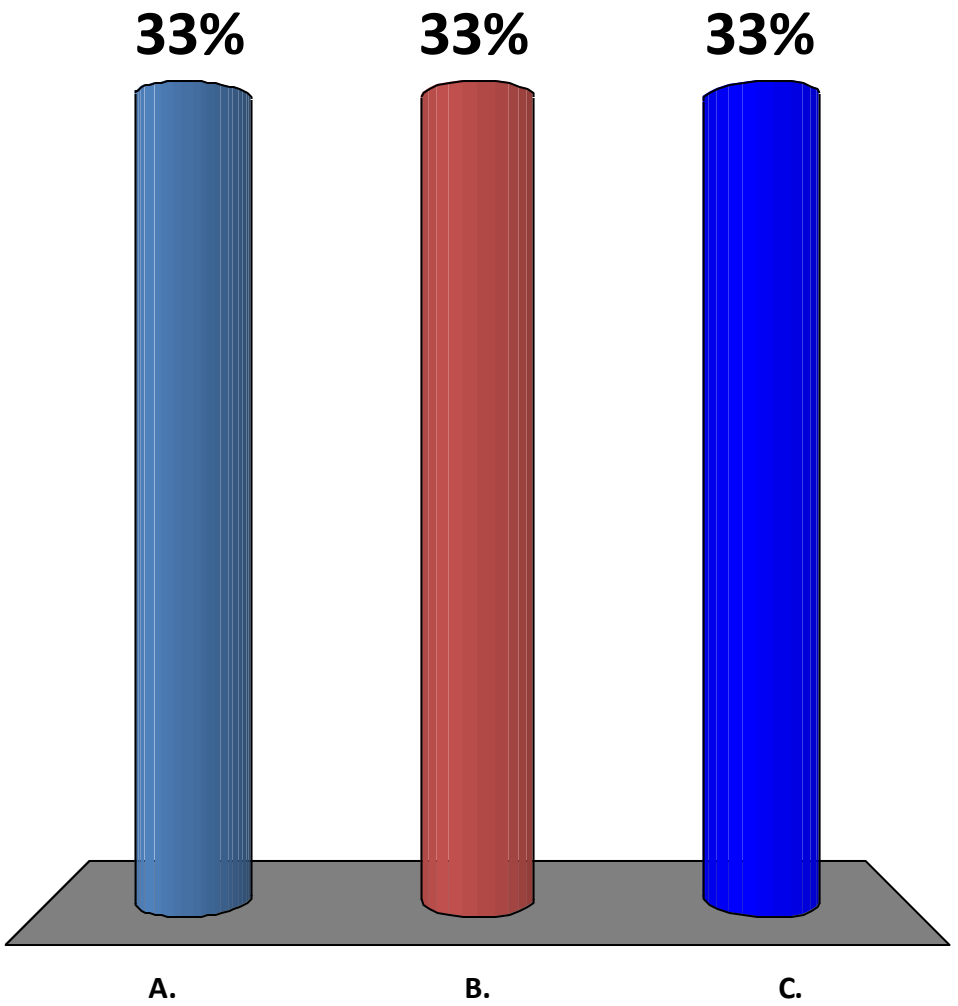
The treatment intent can be changed during the course of treatment.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



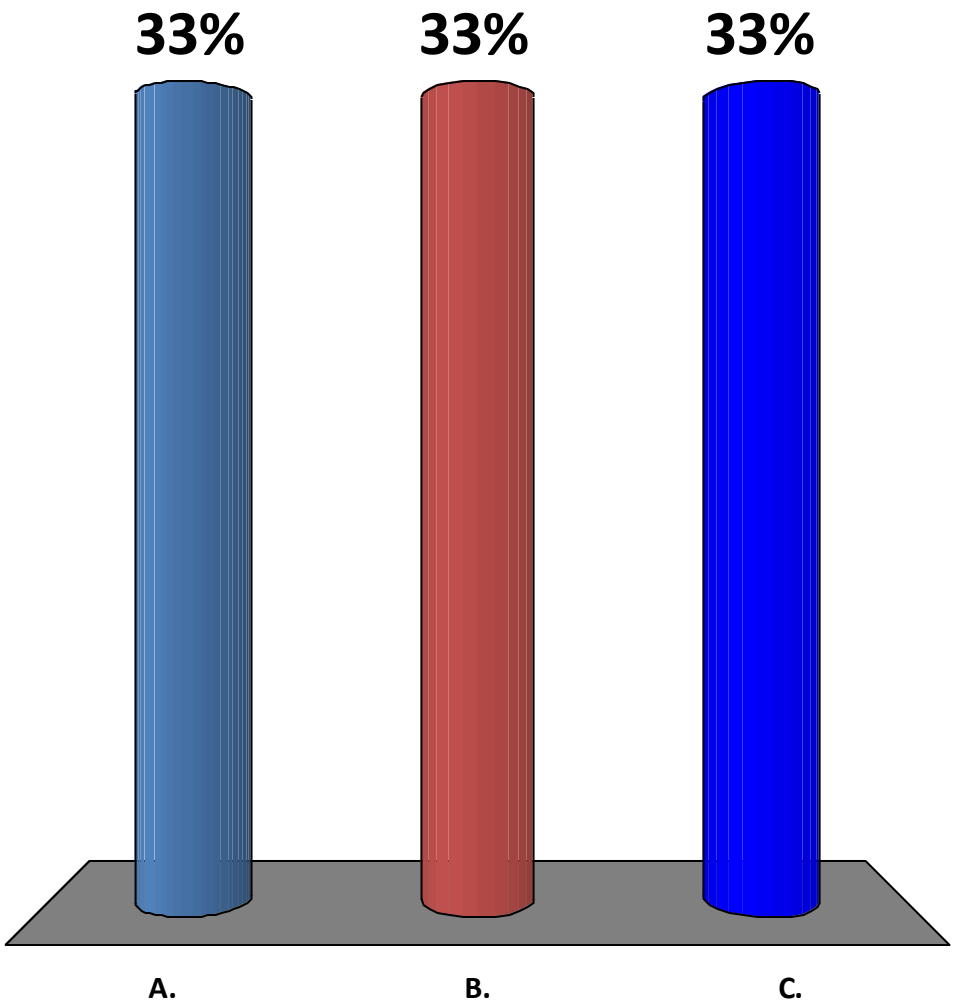
The treatment intent can be changed from curative to palliative during treatment.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



The treatment intent can be changed palliative to curative during treatment.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



Treatment intent - tips

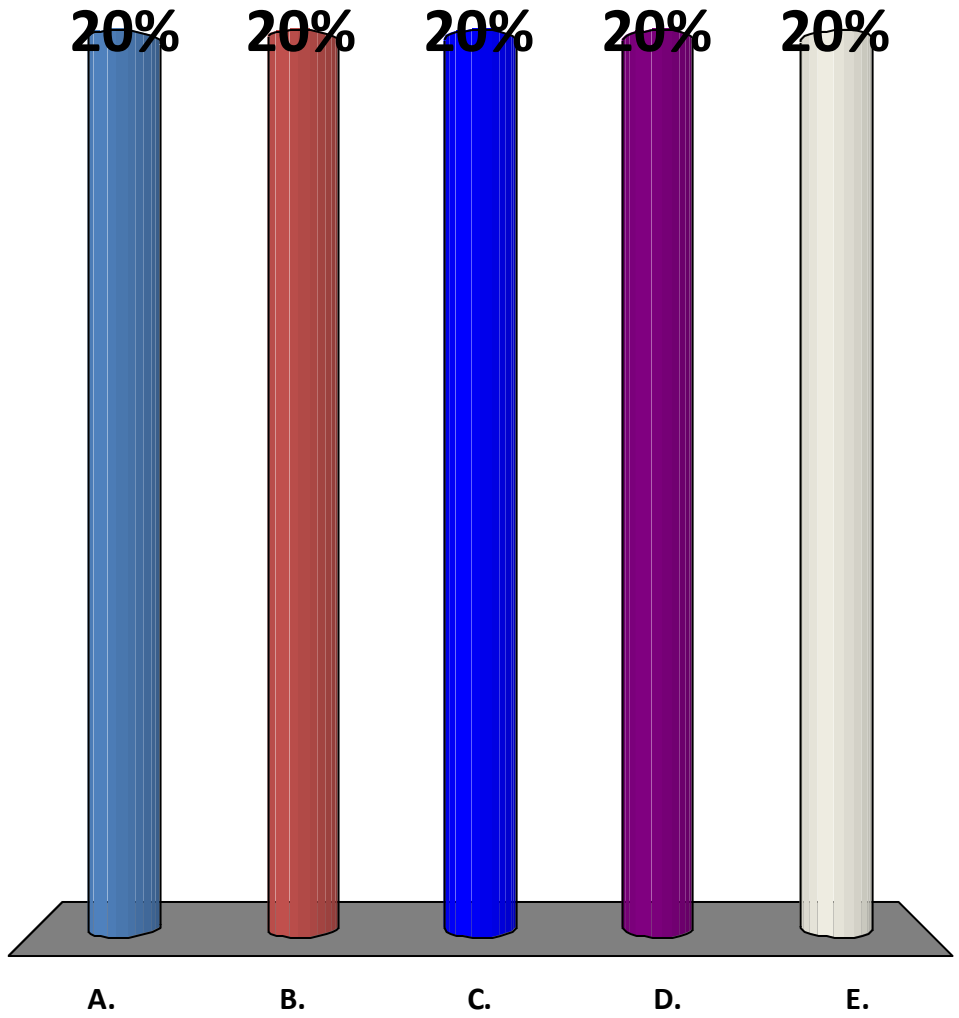
- Decide on treatment intent at the start of treatment
  - Possible to switch from curative to palliative (e.g. if metastatic disease develops or patient unable to tolerate curative treatment)
  - Not possible to switch from palliative to curative
- Think of the norms rather than exceptions

Outline

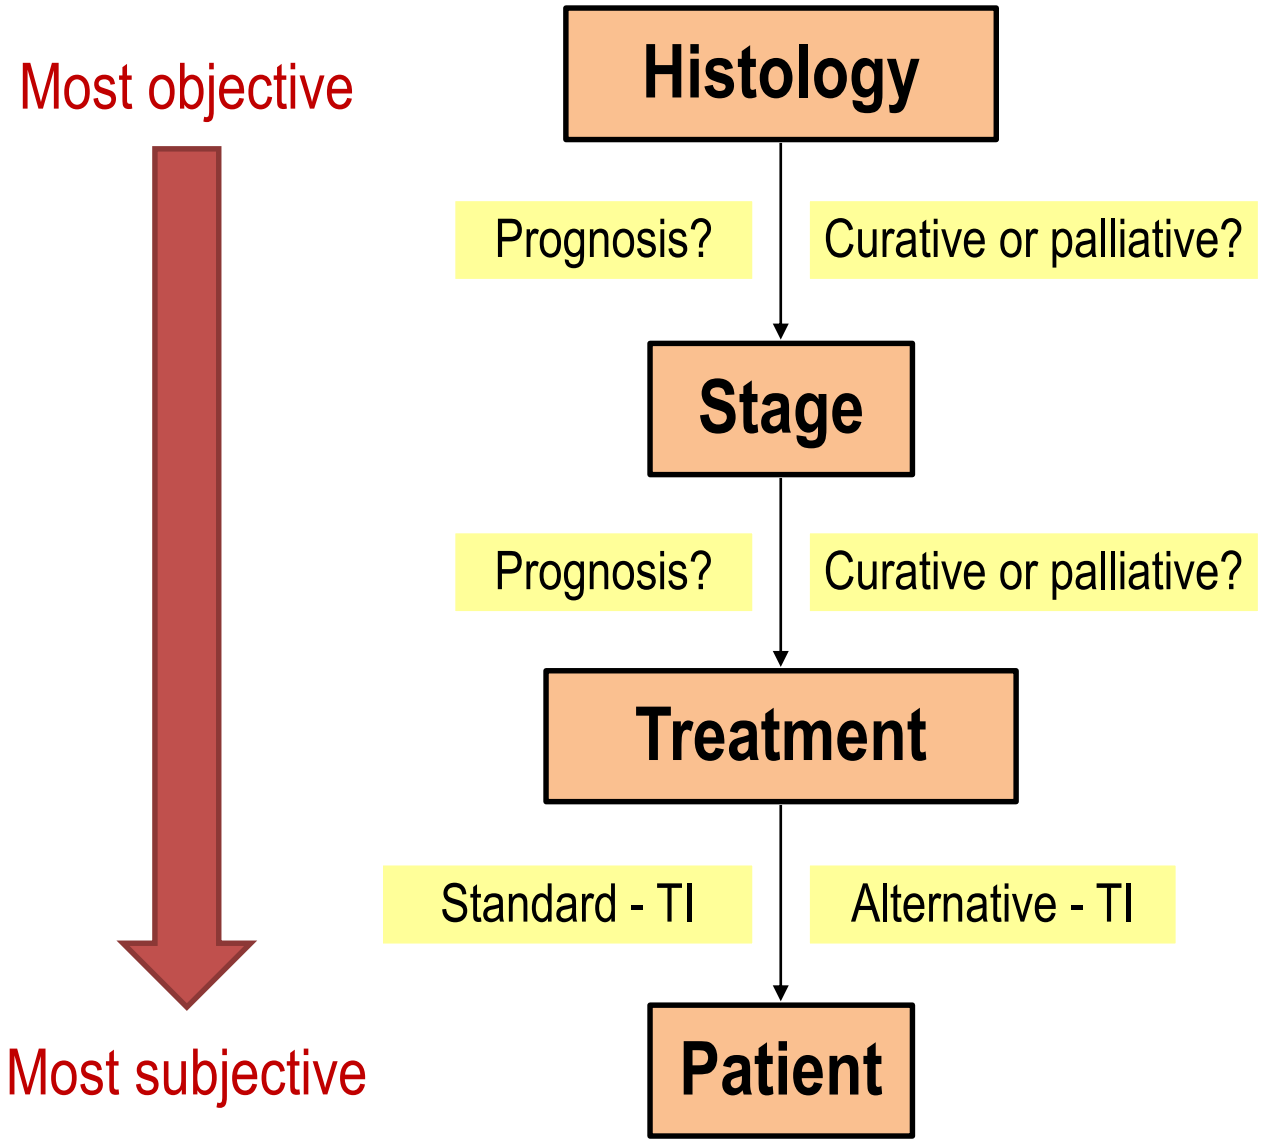
- Treatment intent
- Decision-making process
- Patient values and expectations

When deciding how to treat a patient, what do you consider first?

A. Economic factors
B. Patient factors – age, co-morbidity
C. Treatment factors – options, benefits, side-effects
D. Tumour factors – histology, stage
E. It depends

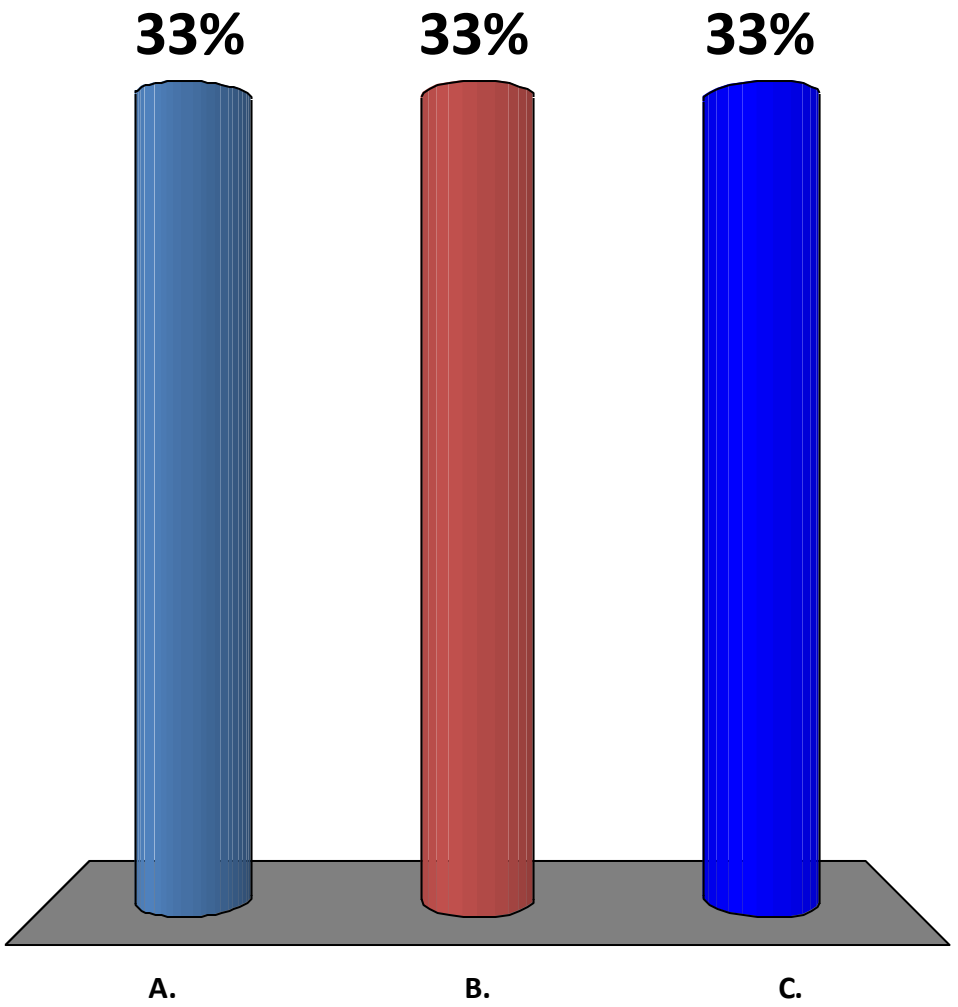


Decision-making - curative



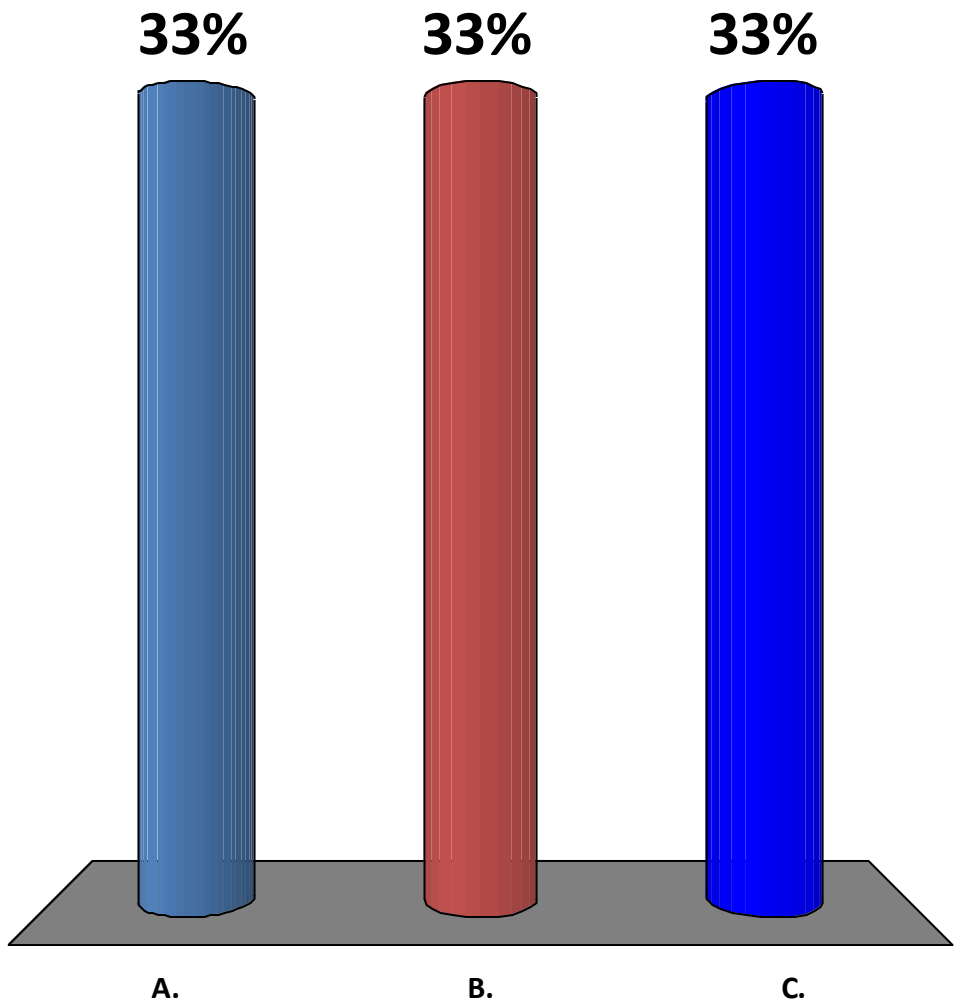
AdenoCa of cervix has worse prognosis than squamous cell Ca cervix

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree

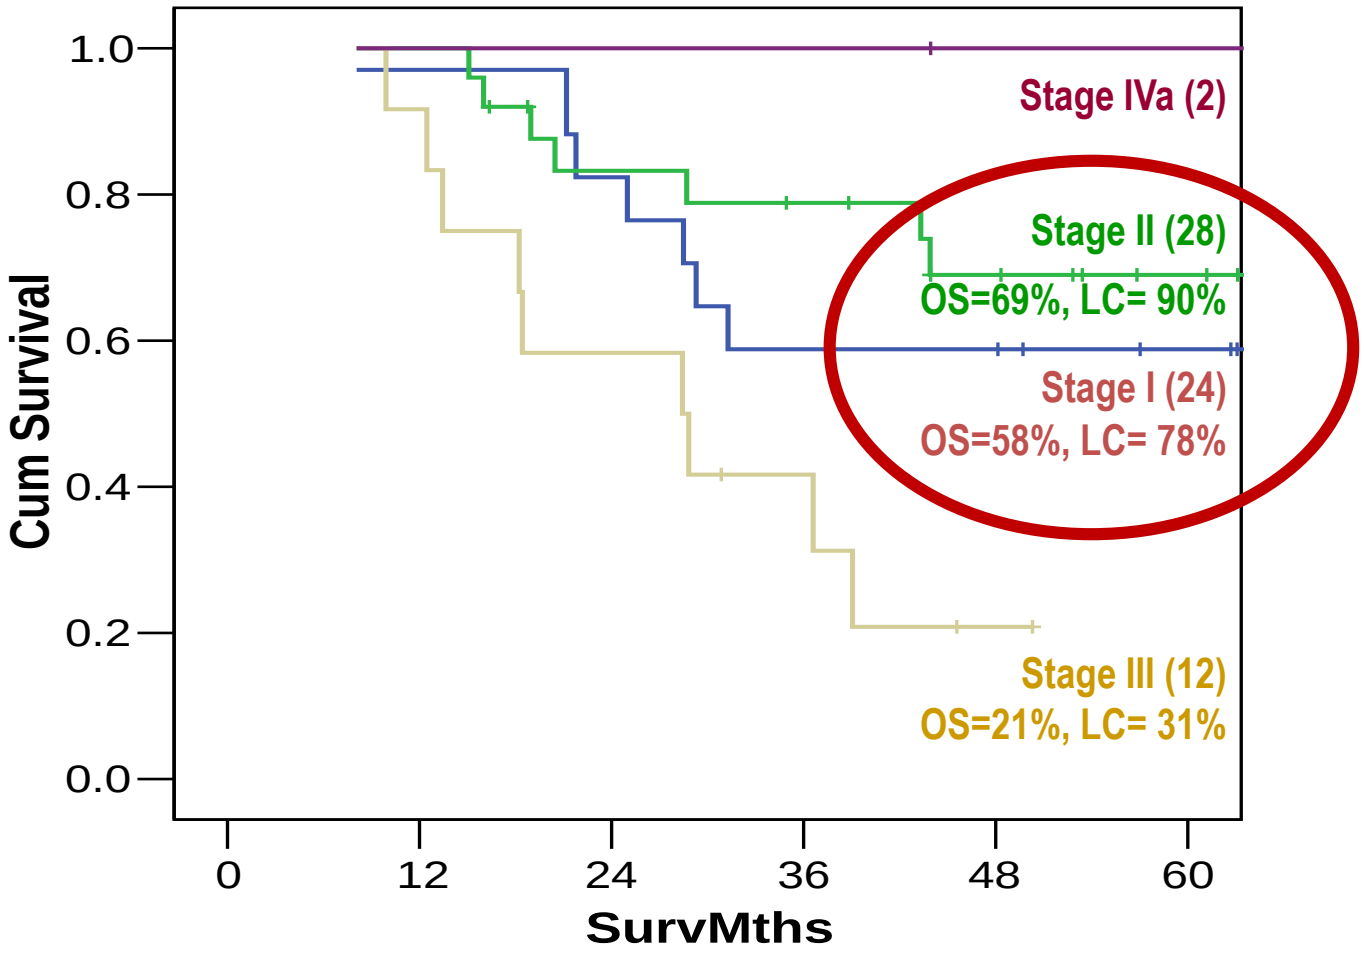


Stage Ib2 adenoCa cervix has worse prognosis than Stage IIb squamous cell Ca cervix.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



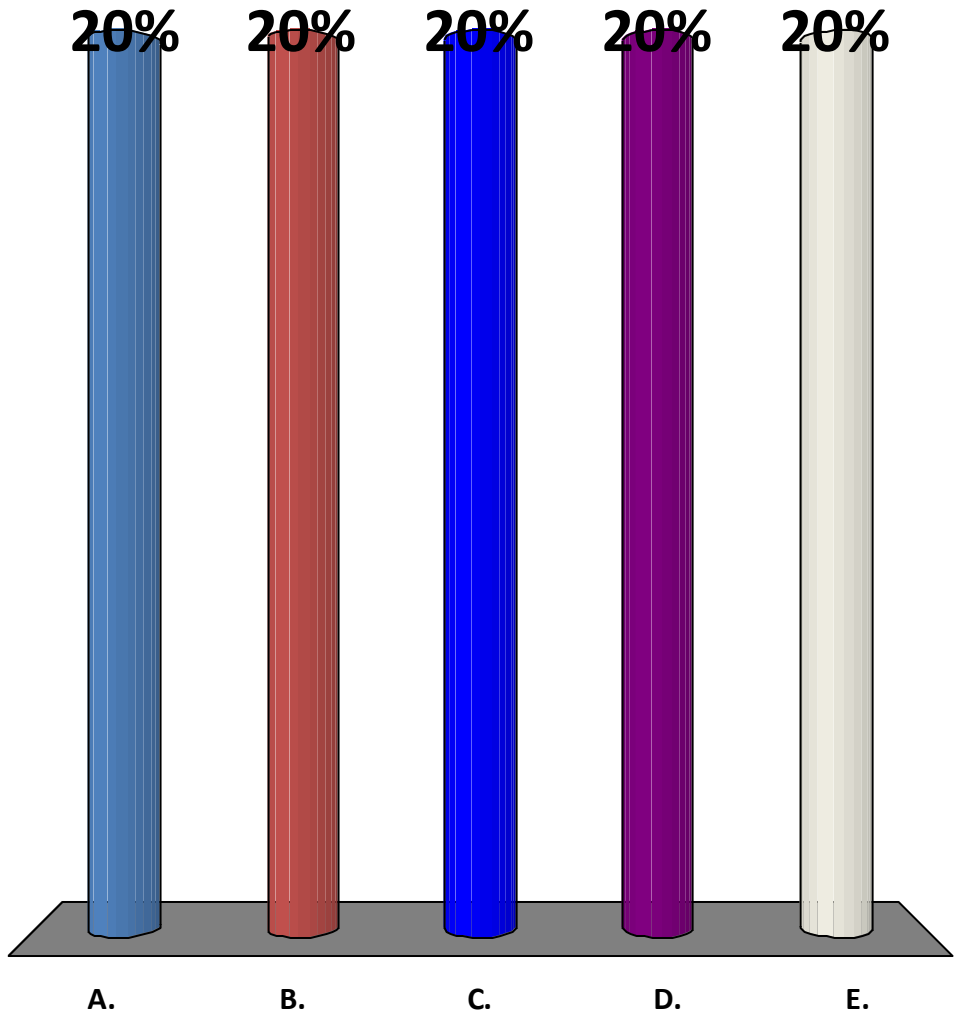
Addenbrooke's 1999–2003



Tan LT, Zahra M. Clin Oncol (R Coll Radiol) 2008;20(5):358-64

What is the standard treatment for a 5 cm Stage Ib2 adenoCa cervix?

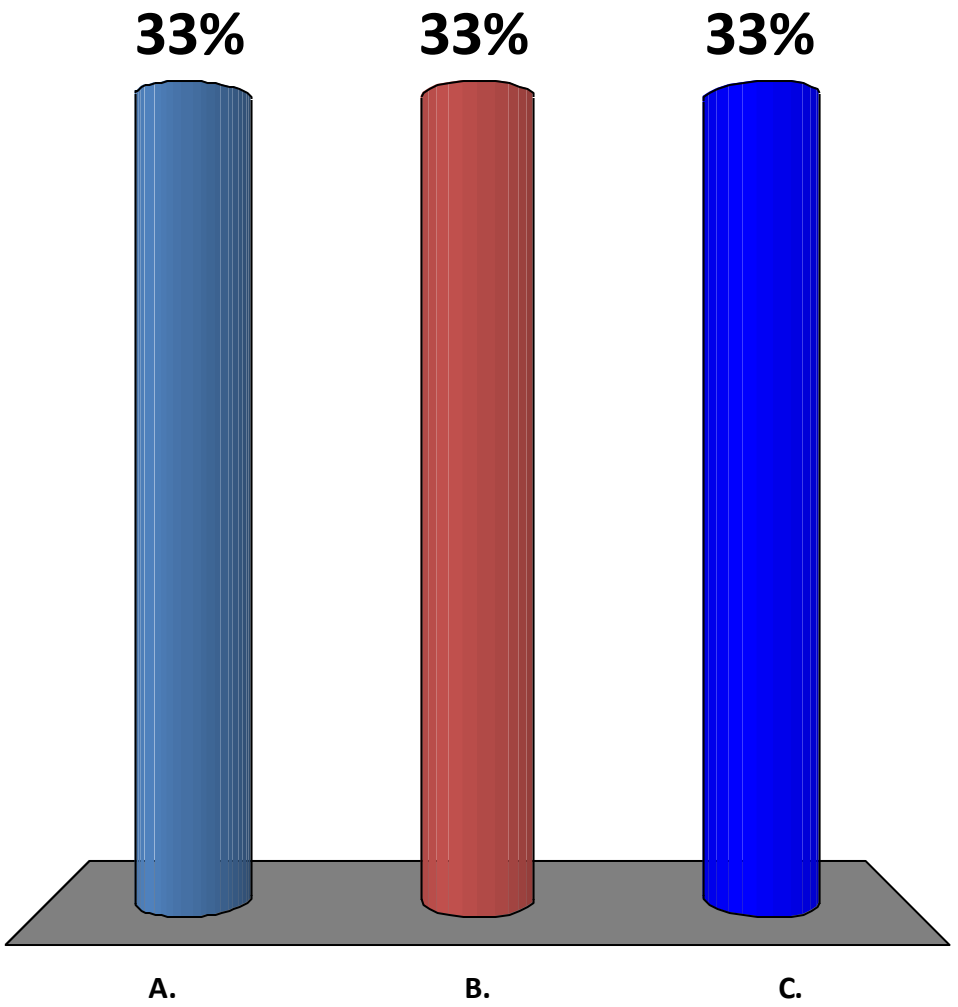
A. Radical surgery
B. Chemo-RT
C. Neoadjuvant chemo + chemo-RT
D. Neoadjuvant chemo + surgery
E. Chemo-RT + surgery



What is standard treatment?

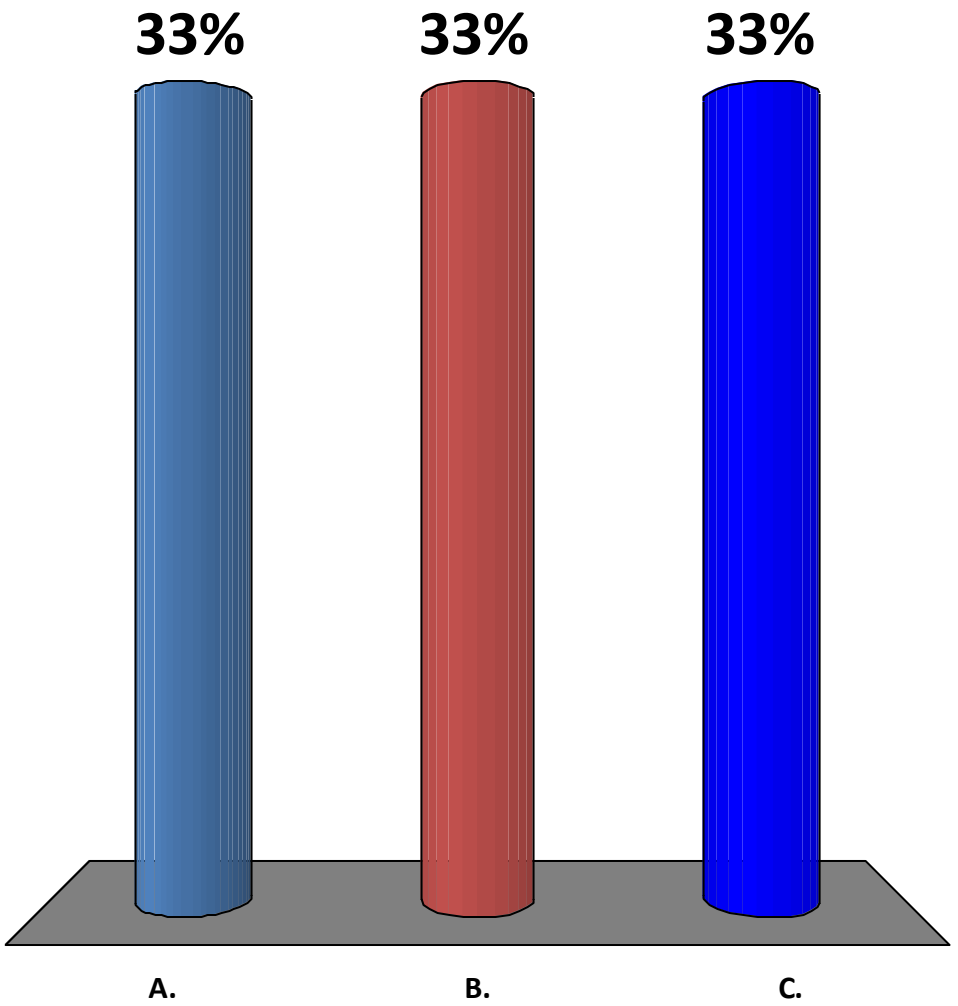
It is the treatment most commonly given to a group of patients with the same tumour and patient factors.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



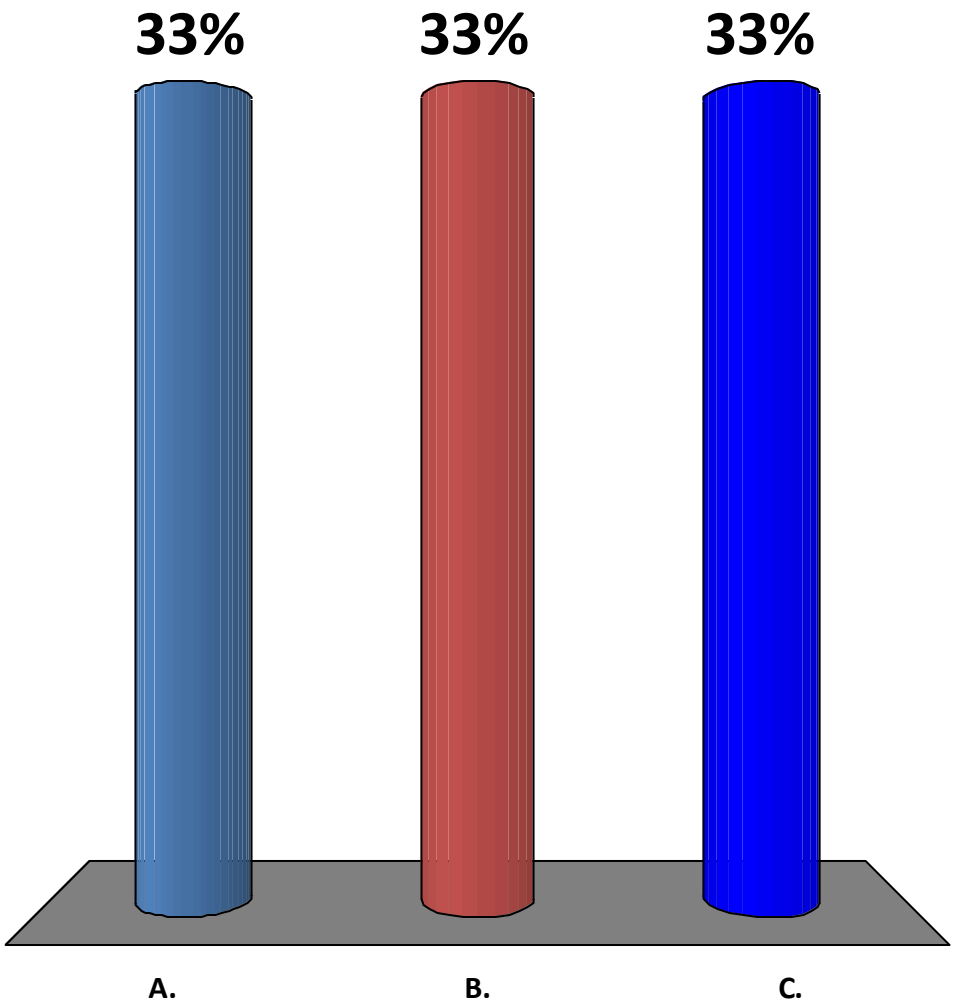
It is the most appropriate treatment for an individual patient.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



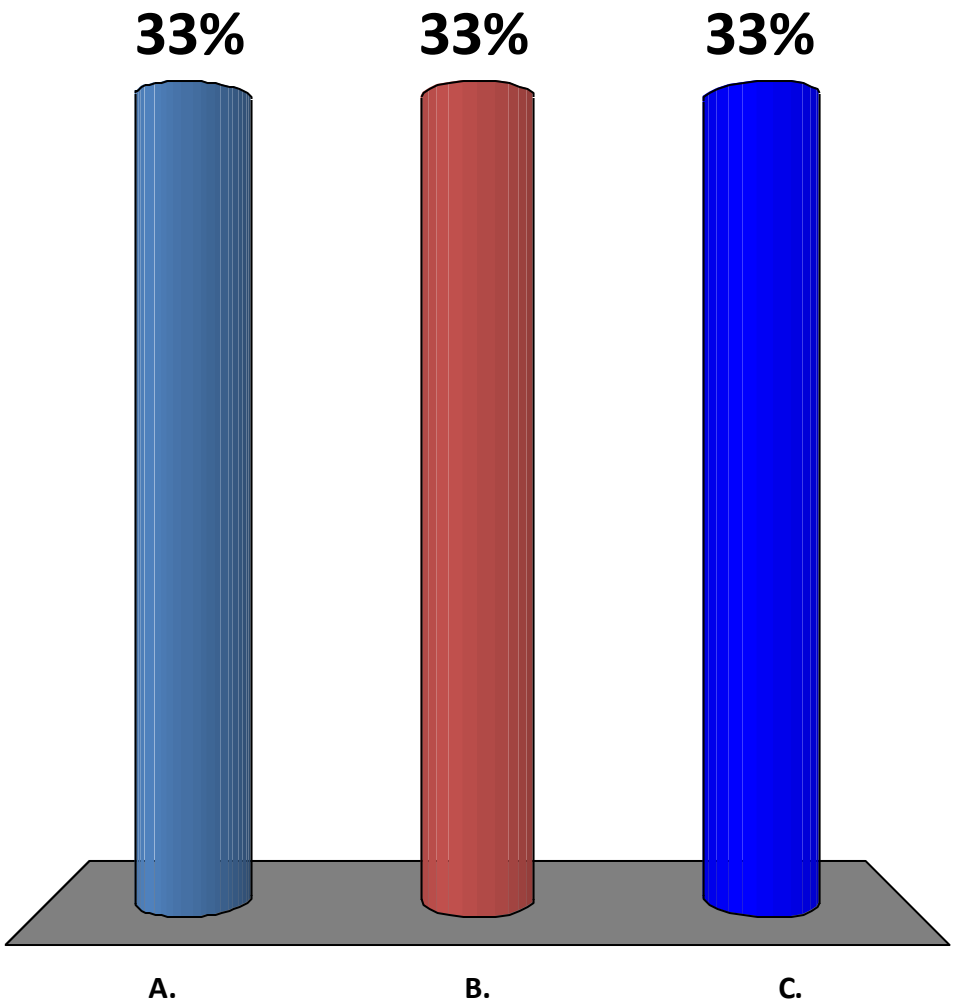
It is the treatment that gives the best chance of cure.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



It must be accepted by the majority of experts.

A. Mostly agree
B. Neither agree nor disagree
C. Mostly disagree



Guidelines may recommend alternative treatments instead of standard treatment for patients with the same characteristics.

Cervical Cancer Treatment (PDQ®)–Health Prof Version

Go to Patient Version

Stages IB and IIA Cervical Cancer Treatment

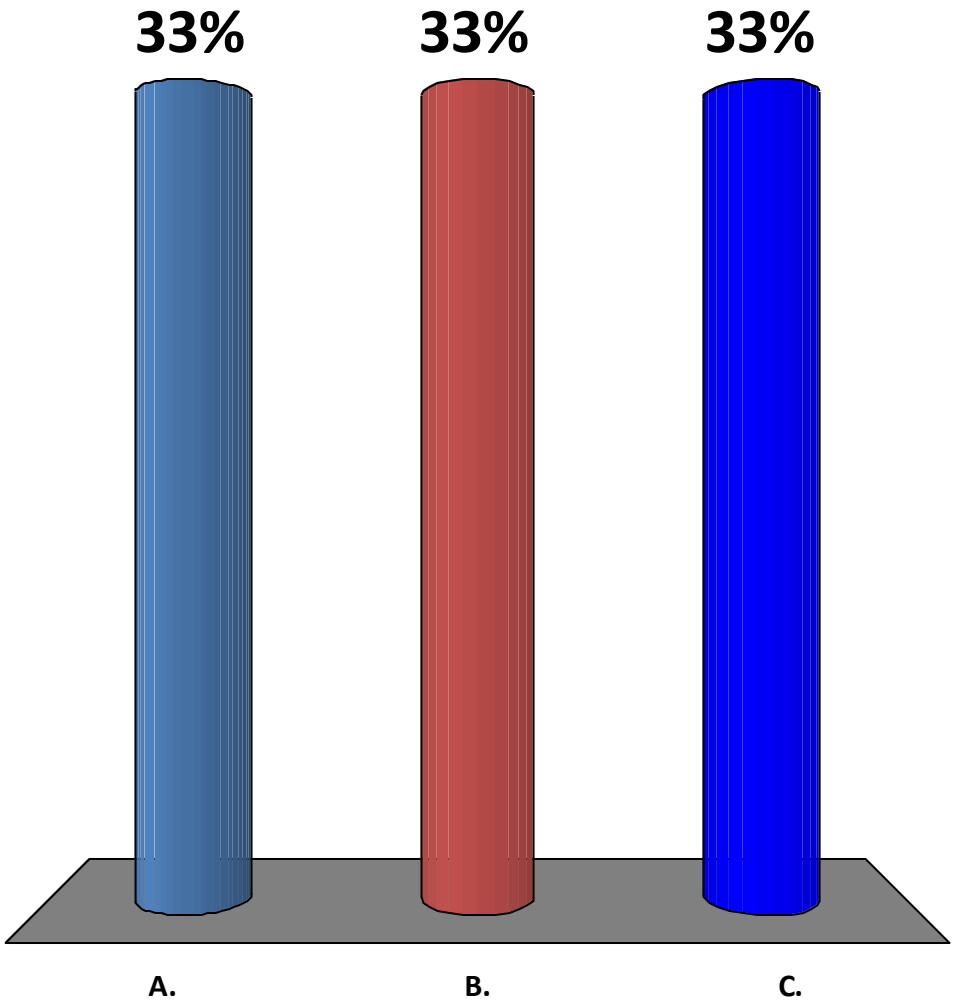
- Standard Treatment Options for Stages IB and IIA Cervical Cancer
  - Radiation therapy with concomitant chemotherapy
  - Radical hysterectomy and bilateral pelvic lymphadenectomy with or without total pelvic radiation therapy plus chemotherapy
- Other Treatment Options
  - Radical trachelectomy
  - Neoadjuvant chemotherapy
  - Radiation therapy alone
  - IMRT

Which of the following statements about the therapeutic index (benefit over toxicity) of the alternative treatment is true?

A. The therapeutic index of the alternative treatment is usually larger than that of the standard treatment.

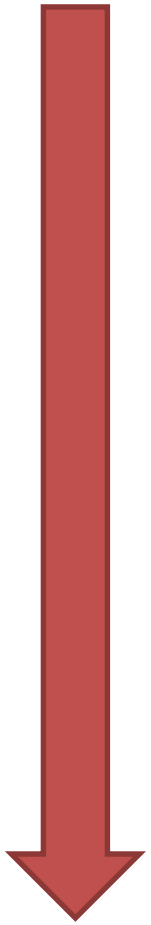
B. The therapeutic index of the alternative treatment is usually similar to that of the standard treatment.

C. The therapeutic index of the alternative treatment is usually smaller than that of the standard treatment.

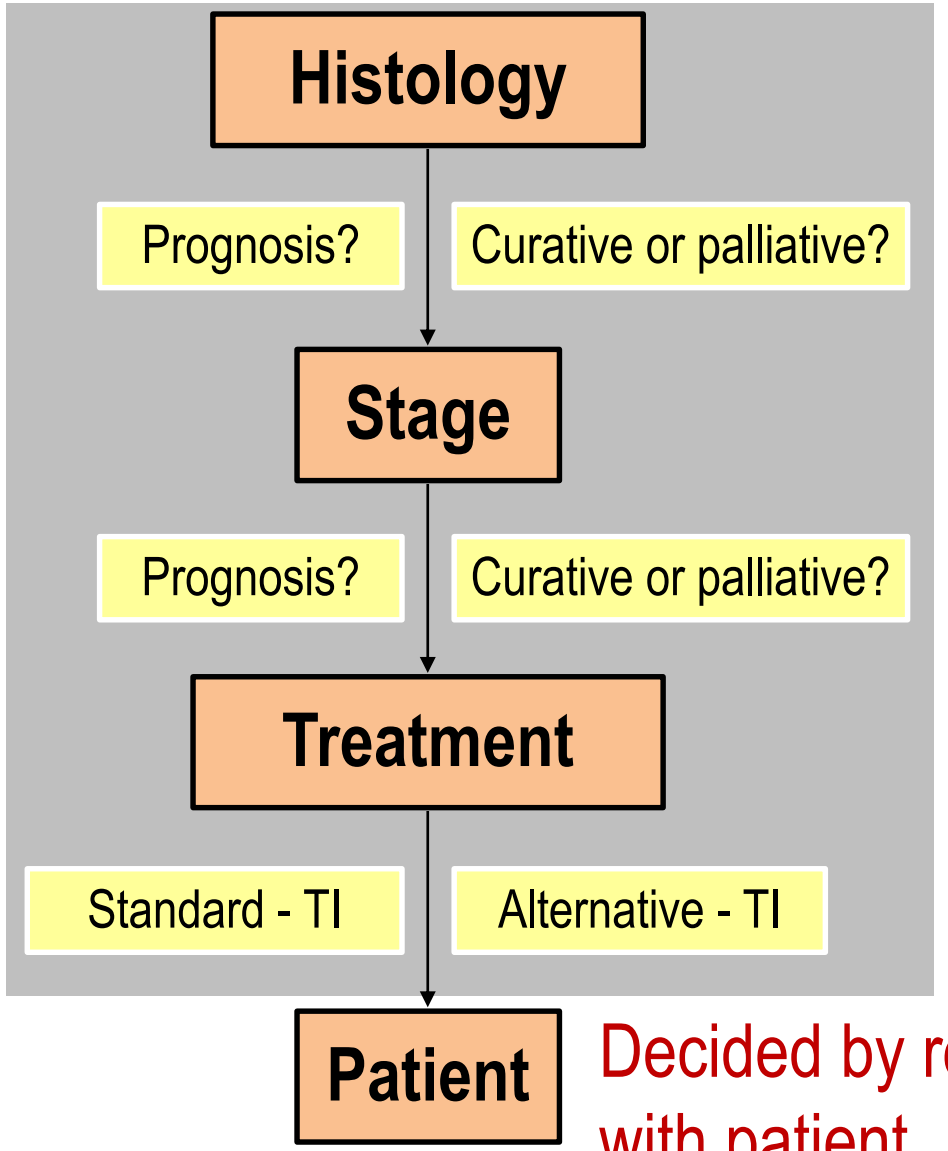


Decision-making - curative

Most objective



Most subjective



Decided by MDT

Decided by responsible clinician with patient

Decision-making for cure - tips

- Standard treatments have the largest therapeutic index.
- Alternative treatments have similar or smaller therapeutic index compared to standard treatment.

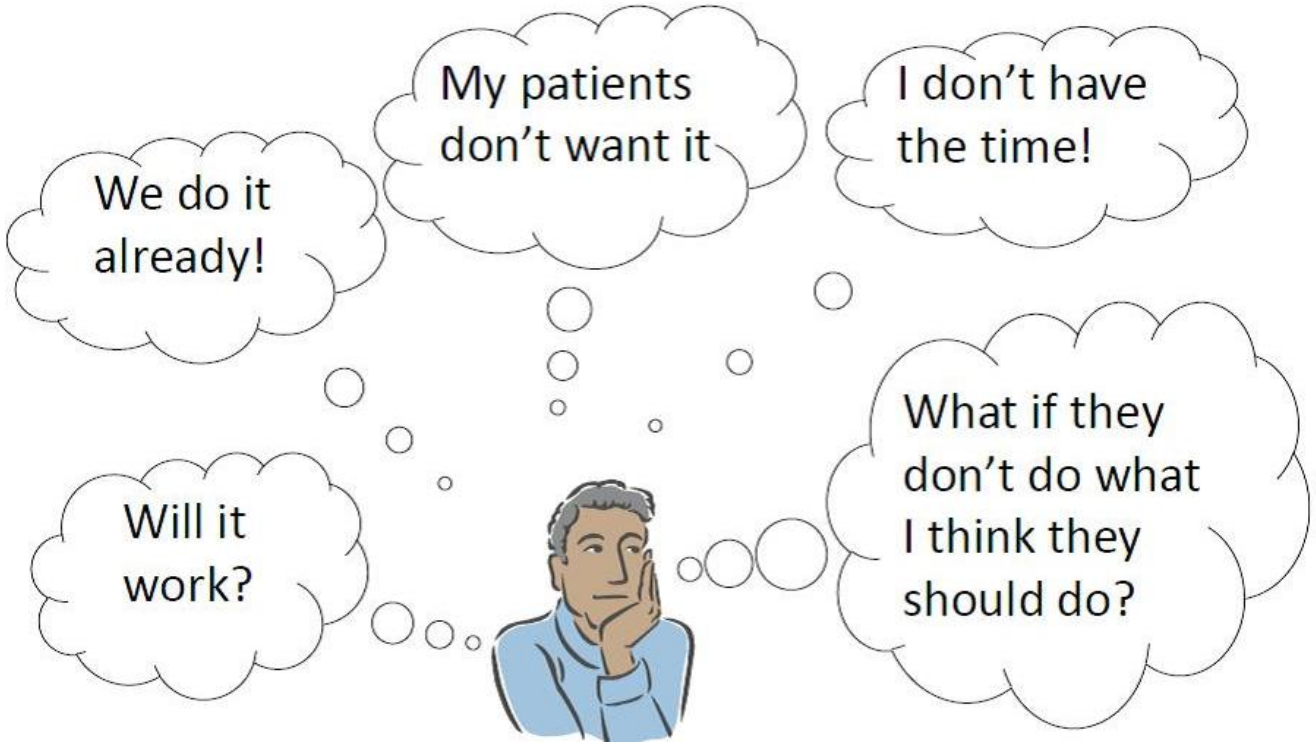
Be wary of recommending "more" than standard treatment.

Outline

- Treatment intent
- Decision-making process
- **Patient values**

Shared decision making cancer

- 23320 publications



Attitudes to chemotherapy

Mild

- Slight nausea/vomiting
- No hair loss
- Occasional use of needles/drips
- Some tiredness/weakness
- Hospital admission 1/month

Intensive

- Severe nausea/vomiting
- Hair loss
- Frequent needles/drips
- Frequent tiredness/weakness
- Admission 3-4/month
- Possible infertility

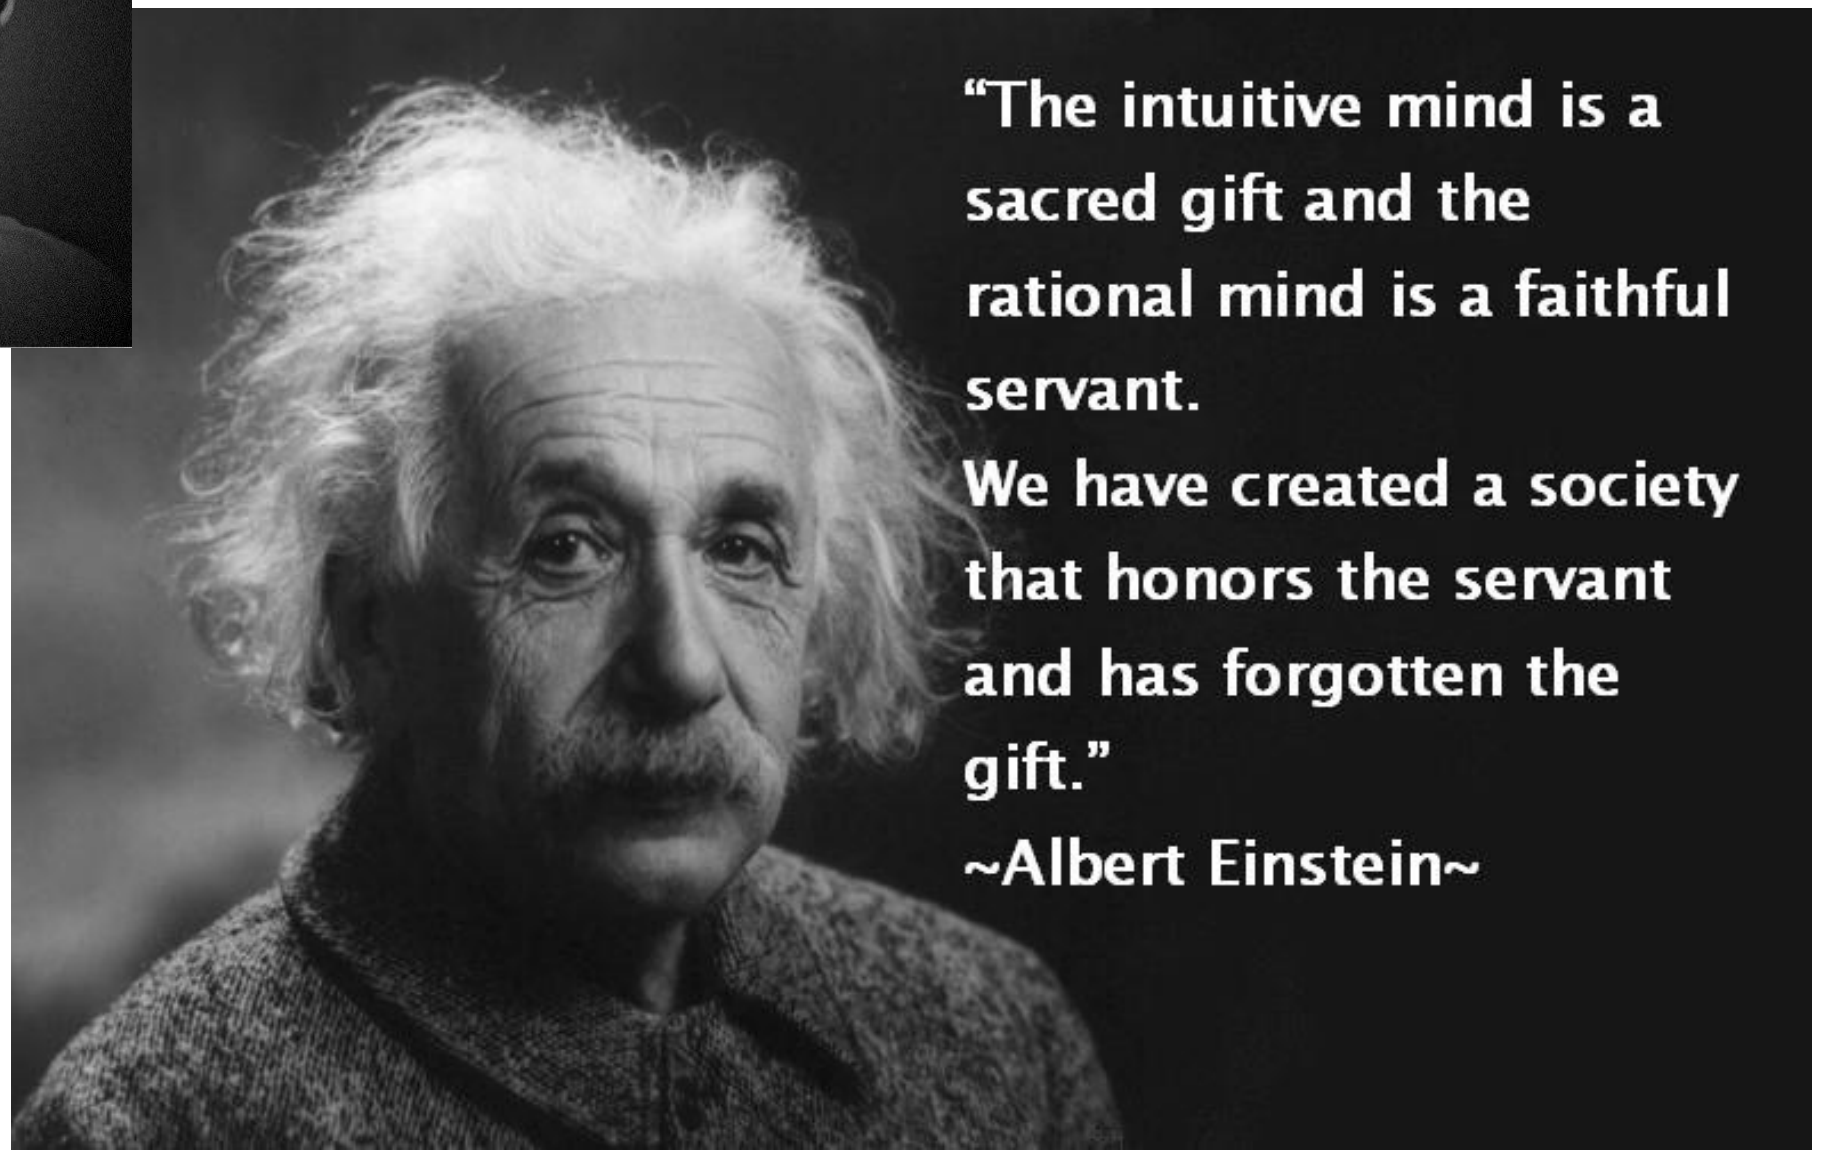
Decisional regret

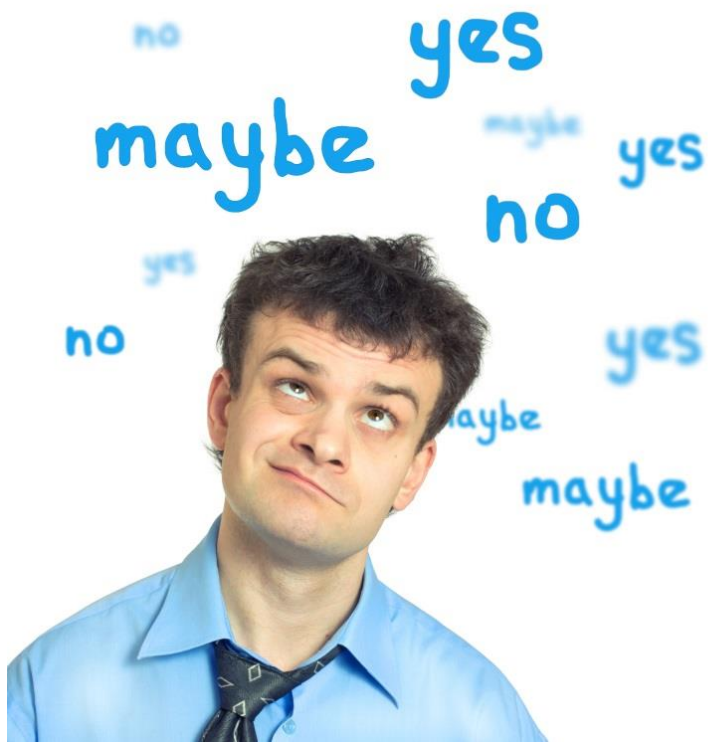
- Factors most frequently associated with decision regret in multivariate analyses included
  - Higher decisional conflict
  - Lower satisfaction with the decision
  - Adverse physical health outcomes
  - Greater anxiety levels
- If we measure that success of decision-making in terms of conflict and regret, we may favour easy decisions over rational ones.



“The intuitive mind is a sacred gift and the rational mind is a faithful servant.
We have created a society that honors the servant and has forgotten the gift.”
~Albert Einstein~

Tips for decision-making

- Begin with objective factors
- Be clear about treatment intent
- If evidence is lacking, have plausible explanations



State of the art multimodal treatment of anal cancer

ESTRO Chemoradiation Course
Bruxelles, June 2017

Rob Glynne-Jones
Mount Vernon Centre for Cancer Treatment

Disclosures: last 5 years

- **Speaker:** Roche, Merck Serono, Sanofi Aventis, Pfizer
- **Advisory Boards:** Roche, Merck Serono, Sanofi Aventis, Astra Zeneca, BMS
- **Funding to attend meetings**: Roche, Merck Serono, Sanofi Aventis,
- **Research funding**: Roche, Merck Serono, Sanofi Aventis

Incidence and risk factors

- Rare disease
  - Annual incidence: 1-2/100 000 (USA)
  - Incidence is increasing over the last 25 years

- 5 year survival: +/- 60%

- Risk factors:
  - HPV (in 90% of the patients), HIV, (HSV)
  - Immune suppression (transplant recipients)
  - Cigarette smoking
  - Previous malignancies (gynaecological, lymphoma, leukemia)

Squamous carcinoma of anus

- HPV heavily implicated
- ?as in HNSCCC modified by smoking

HPV-Prevalence in Anal SCC

Author	HPV total (%)	HPV16 (%)
Koerber	83.3	76.6
Mai	67.9	n.a.
Rödel	95.8	78.9
Serup-Hansen	87.5	79.8
Baricevic	95	89

Koerber S, Radiother Oncol 2014; Mai S, Int J Radiat Oncol Biol Phys 2015; Rödel F, Int J Cancer 2015; Baricevic I, Eur J Canc 2015; Serup-Hansen E, J Clin Oncol 2014

Squamous carcinoma of anus

- HPV heavily implicated ?as in HNSCCC modified by smoking
- Usually loco-regional disease at presentation
- 30% -40% will have nodal spread at diagnosis
- Primary T stage based mainly on size

TNM Staging of anal canal cancer

- Tx cannot assess primary
- T0 no evidence of tumour
- Tis Carcinoma in situ
- T1 <2cm
- T2 2-5cm
- T3 >5cm
- T4 adjacent organ invasion
- M0 no distant metastases
- M1 distant metastases

- Nx cannot be assessed
- N1 perirectal nodes
- N2 unilateral internal iliac/inguinal nodes
- N3 perirectal and inguinal or bilateral internal iliac and/or inguinal nodes

Site of relapse after CRT from ACT II (940 patients)

Primary Inguinal/pelvic nodes Metastases/oligometastases	Number	% total relapses
Pelvic - no metastases	133	64%
Pelvic - with metastases	30	14%
Distant metastases only	46	22%
Total crude pelvic failure (with or without metastases)	163	78%
Total relapses	209	

Data from ACT II – Sebag-Montefiore D et al ASCO 2012

Prognostic factors
ACT I validated against ACT II

- Prognostic for LRF and OS
- Clinically palpable nodes
- Male sex

- Prognostic for ACD and OS
- Haemoglobin

Glynne-Jones R et al., Cancer 2013 Feb 15;119(4):748-55.

$P16^{INK4A}$

- In UK 90% patients mod/strongly + for $p16^{INK4A}$ (Gilbert 2013)

- p16+ 37/137(27%) relapsed
- P16 - 10/16 (63%) relapsed (Gilbert 2013) p=0.0076

Prognostic relevance of TILs

Author	Patients (n)	Results
Grabenbauer	38	CD3/CD4: decreased 3 years NED
Rubio	277	CD3/CD8: increased 15 years survival
Hu	40	intratumoral CD8: increased DFS peritumoral CD8: increased OS
Gilbert	153	increased relapse-free survival

High levels of TILs, especially CD8(+) cells, are associated with a favourable clinical response and survival

Squamous cell carcinoma of the Anus

- The standard of care is chemoradiation with 5FU and MMC
- Standard of care for radiation is IMRT

Diagnosis and staging

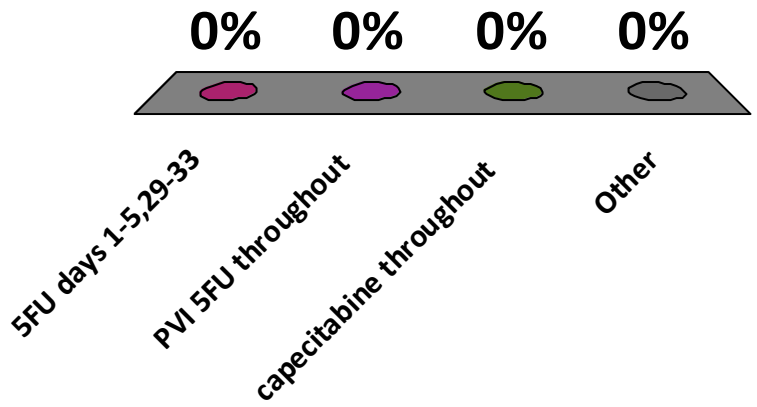
- A 48 years old male with a 4cm anal mass.
- Biopsy: Squamous cell carcinoma.
- Positive HPV 16 and HPV 53. HIV test:Negative
- MRI: mass 3.6 cm. No involvement of external sphincter. No enlarged inguinal or pelvic lymph nodes detected.
- CT scan/PET scan: No metastases.

Squamous cell carcinoma of the anal canal
cT2 cN0M0. Stage II.

What to do next?

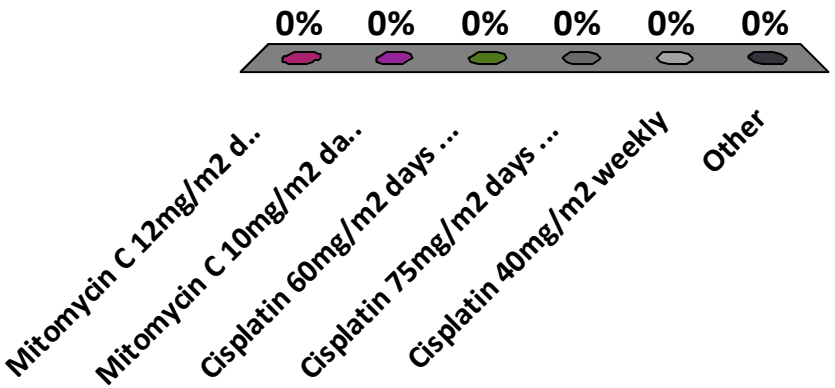
Chemoradiation- what fluoropyrimidine?

A. 5FU days 1-5,29-33
B. PVI 5FU throughout
C. capecitabine throughout
D. Other



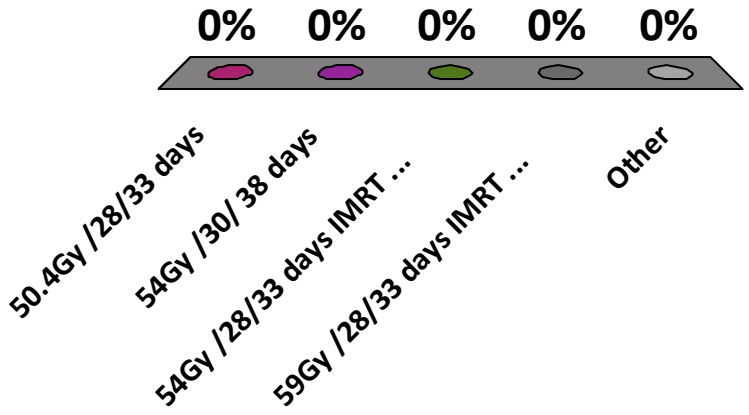
Chemoradiation- what partner?

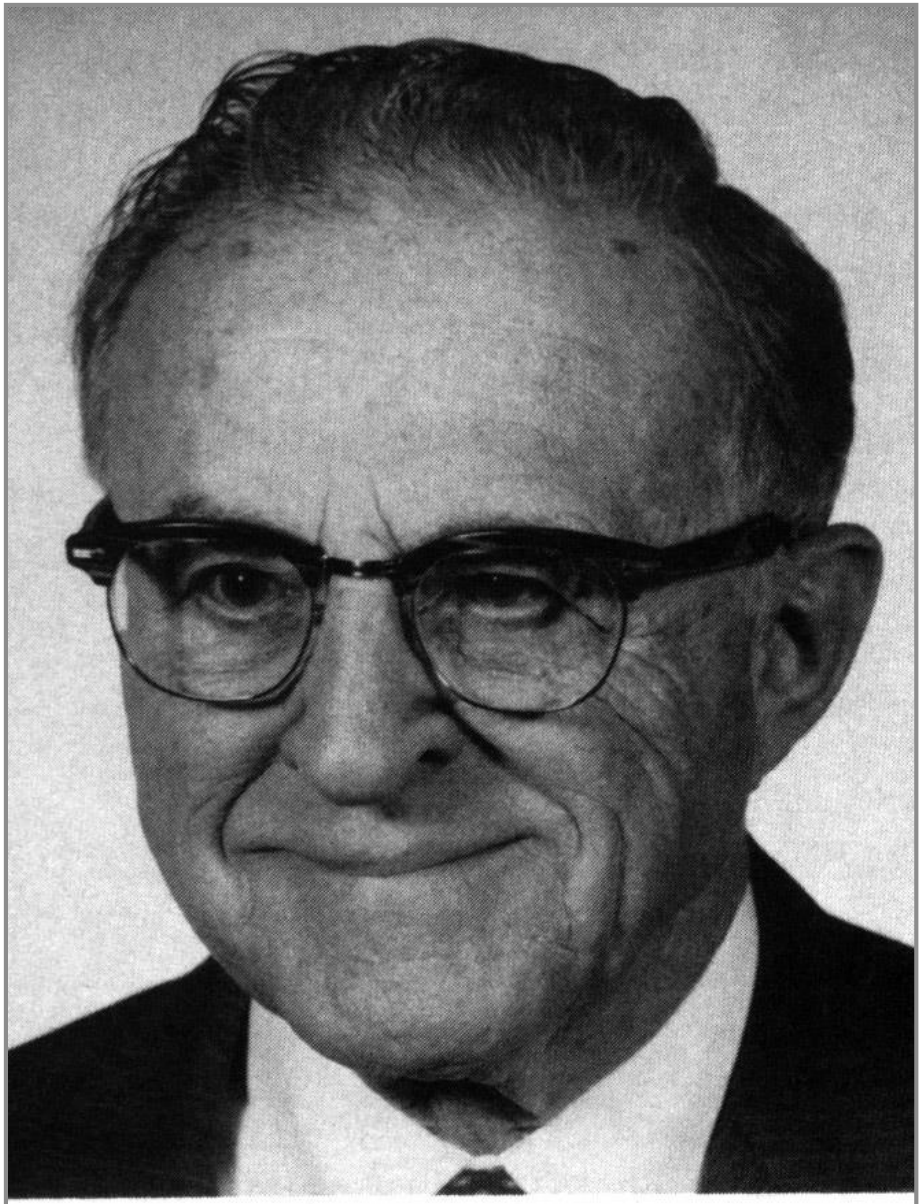
A. Mitomycin C 12mg/m2 day 1 only
B. Mitomycin C 10mg/m2 days 1 and 29
C. Cisplatin 60mg/m2 days 1 and 29
D. Cisplatin 75mg/m2 days 1 and 29
E. Cisplatin 40mg/m2 weekly
F. Other



Chemoradiation- what dose to primary PTV?

A. 50.4Gy /28/33 days
B. 54Gy /30/ 38 days
C. 54Gy /28/33 days IMRT /VMAT simultaneous integrated boost
D. 59Gy /28/33 days IMRT /VMAT simultaneous integrated boost
E. Other





Nigro suggested that CTRT

- Low doses of RT - 30Gy could achieve path CR in tumours 5cm or less
- Response is sustained
- Failure to respond is usually associated with rapid systemic relapse

Results: Nigro et al.,1983

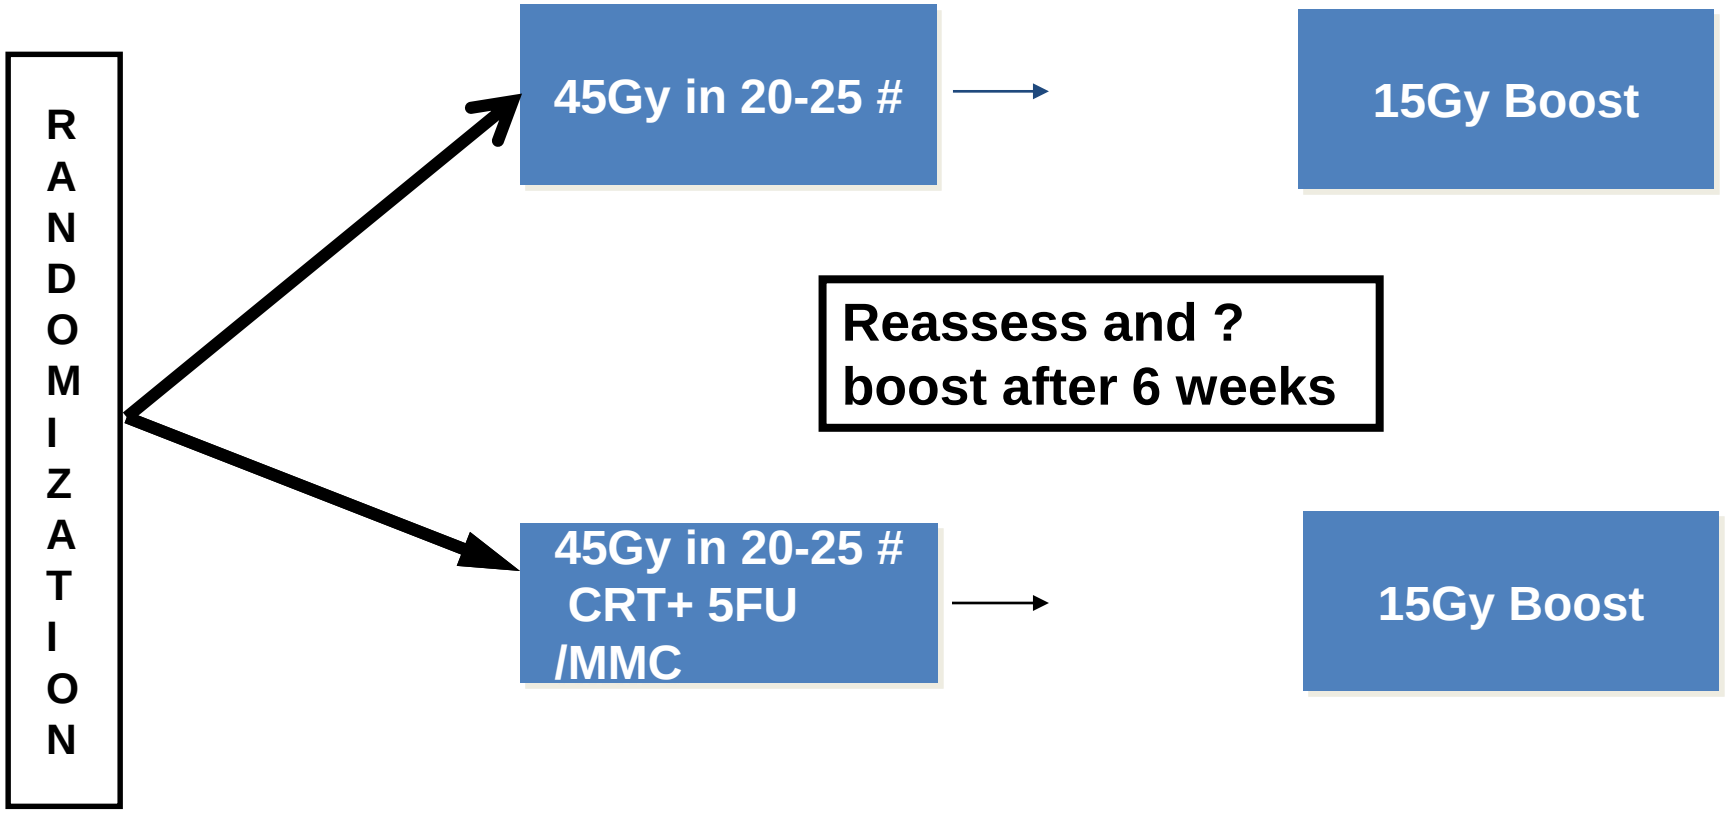
- 28 patients 4 persistent tumour
  24 clinical CR

12 had APER (7/12 path CR)
14 excision of scar (100% path CR)
2 refused surgery
Failure to control 5/9 tumours of 6cm

Anal canal squamous cell carcinoma should not be treated by the same procedure as adenocarcinoma of the lower rectum, because both these diseases differ markedly.

ACT I Trial

N = 585 patients



Squamous carcinoma of anus

- **Three phase III trials 1987– 1994**
  - **UKCCCR ACT 1 n=585**
  - **EORTC 22861 n=110**
  - **RTOG 87-04/ECOG 1289 n=310**

- **Three phase III trials 1998– 2008**
  - **UKCCCR ACT II n=940**
  - **RTOG 9811 n=644**
  - **ACCORD-03 n=307**

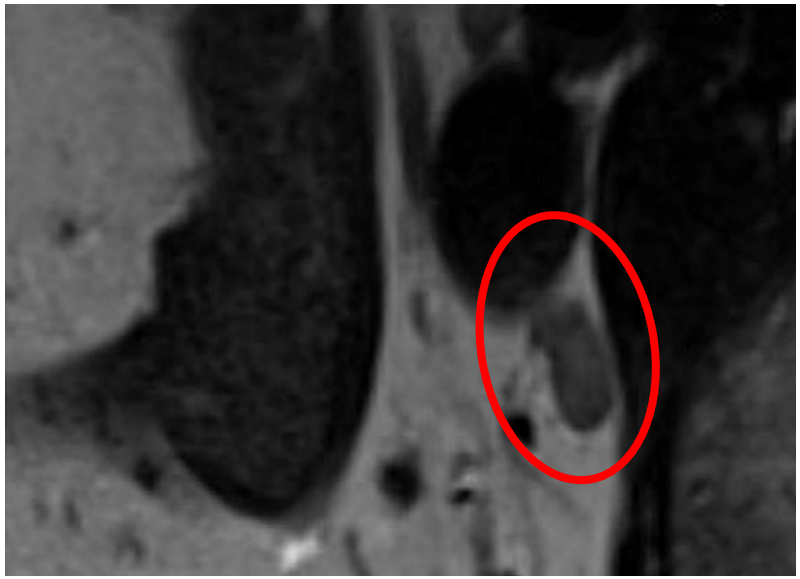
Work-up and diagnosis

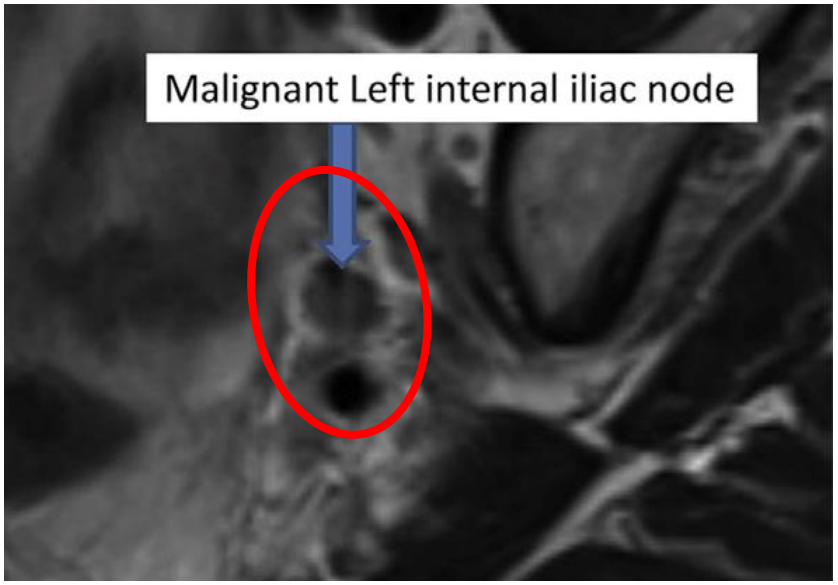
- Standard work up includes proctoscopy
- Examination under anaesthetic (EUA) is necessary on occasions in anal cancer to inspect and obtain biopsy
- Pelvic MRI mandatory for loco-regional staging
- TRUS if MRI not available but difficult in advanced anal lesions
- Whole body CT to determine if metastatic disease
- Positron emission tomography (PET/CT) scan

Anal cancer pelvic nodes

- Size not accurate because > 50% LN+ smaller than 5 mm

→ overestimation of node positivity in large nodes





Ciombor et al. Surg Oncol Clin N Am 2017

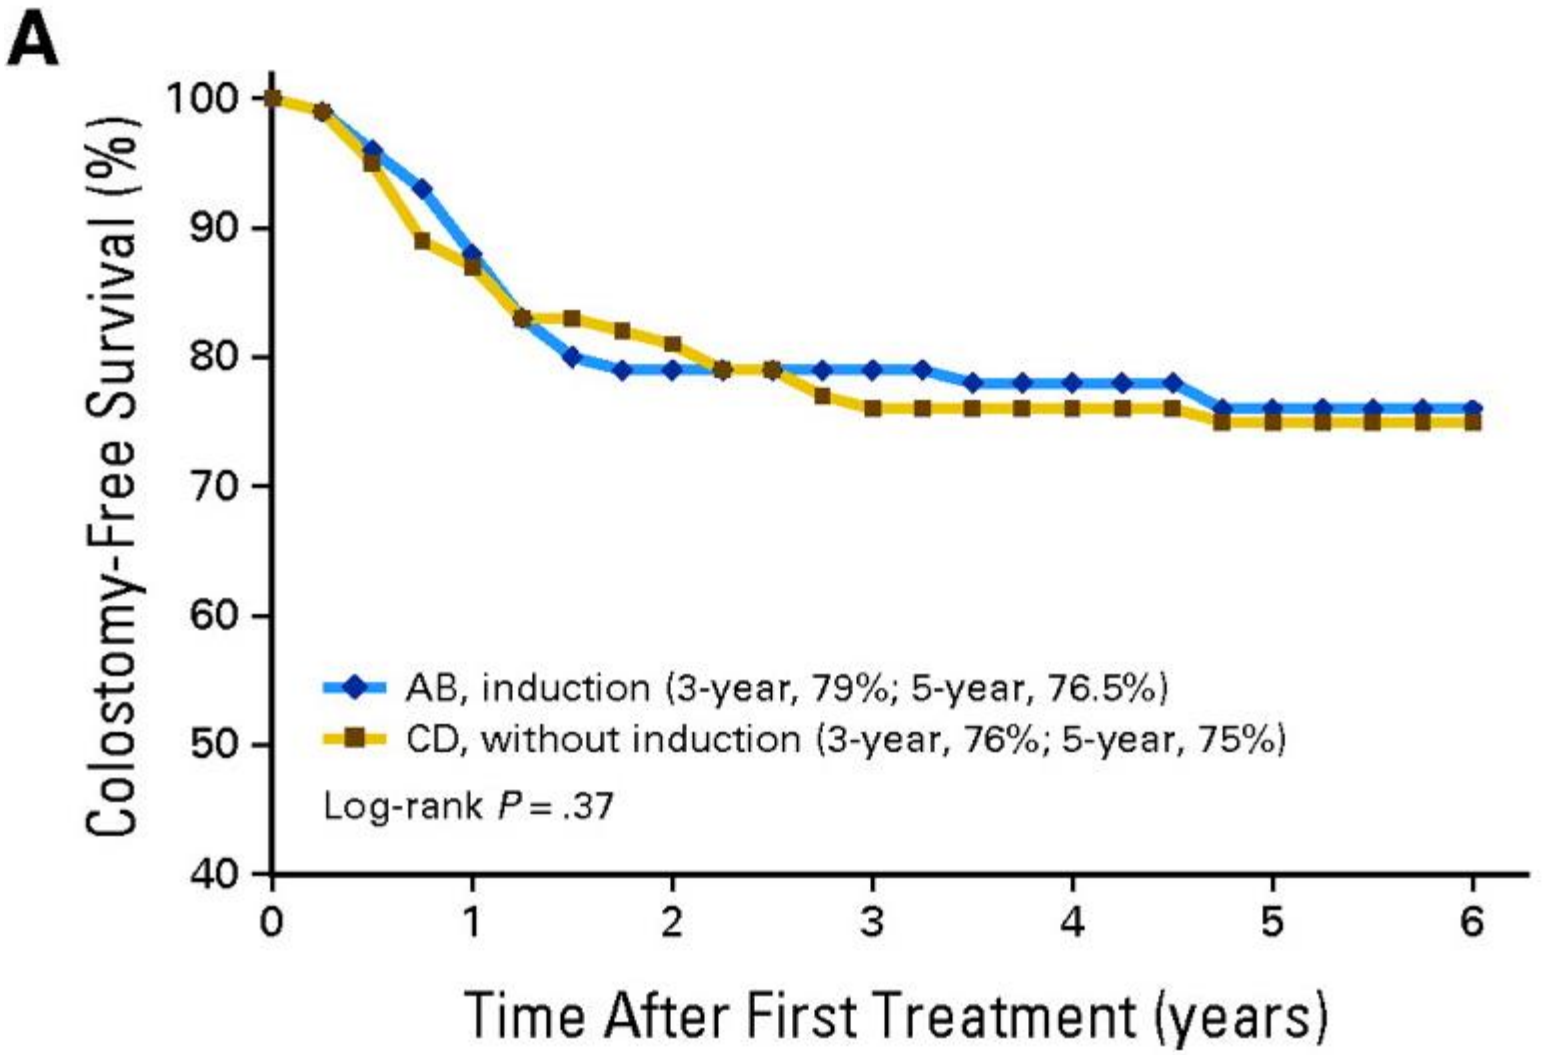
ACCORD- 03

- Therapeutic intensification
  - **Induction chemotherapy (CRT cisplatin)**
  - **High dose radiotherapy (CRT cisplatin)**
- Primary endpoint: colostomy-free-survival(CFS).

ACCORD CFS : induction versus no induction



2 Trials

- No advantage to induction chemotherapy prior to CRT

  (actually worse in RTOG 9811)

Why has induction chemotherapy not worked?

Any initial beneficial response to chemo may be lost owing to

- More proliferation prior to start of CRT.
- Acute toxicity causing delay to CRT
- ? Impacted on compliance to CRT
- Development of resistance mechanisms.
- Creating inherent bias in terms of smaller dose/field size

- De Ruysschers Principle of SER

(the interval between the start of treatment and the end of radiotherapy should be as short as possible)

De Ruysscher D, et al., Time between the first day of chemotherapy and the last day of chest radiation is the most important predictor of survival in limited-disease small-cell lung cancer. **J Clin Oncol 2006;24(7):1053-63**

	Cisp 60mg/m2	Cisp 60mg/m2	Cisp 120mg/m2

MMC - Comparison 1 versus 2 doses

no difference

- PFS (HR 0.85, 95% CI 0.37–1.92),
- CFS (HR 0.91, 95% CI 0.31–2.67) between the MMC1 and MMC2 groups.
- Acute grade ⩾2 toxicities were worse in the MMC2 group.
- 3 treatment-related deaths, all in the MMC2 group

- **White et al Chemoradiotherapy for squamous cell carcinoma of the anal canal: Comparison of one versus two cycles mitomycin-C. Radiother Oncol 2015;117 (2):240–245**

Question 1

- Do you need 2 doses of MMC?
- ie 10mg/m2 X 2
- Or 12mg/m2 X 1 (max 20mg)

Question 2

60 mg/m2 X **2**

compared with **100 mg/m2**
used commonly in head and neck cancer
(Where it is important to ensure 3rd dose is applied)

Other options for concurrent CRT

- Cisplatin versus MMC
- 5FU/MMC versus Cisplatin/MMC (EORTC)
- 2 drugs versus 3 drugs (ACT II pilot)

- Carboplatin/taxol

- EGFR inhibition

Capecitabine integrated into CRT in anal cancer

Study	RT	MMC	Capecitabine
Glynne-Jones 2008	50.4 Gy in 28 fractions in 2 phases	Single dose of MMC 12mg/m2 max 20mg	825 mg/m^2 b.i.d on radiation days
Deenen 2013	59.4 Gy in 33 fractions with SIB-IMRT	Single dose of MMC 10mg/m2 max 15mg	825 mg/m^2 b.i.d on radiation days

Abstract

Go to:

Background

Safety and efficacy of pembrolizumab, a humanized programmed death 1 monoclonal antibody, was assessed in KEYNOTE-028, a multicohort, phase Ib trial for patients with programmed death ligand 1 (PD-L1)-positive advanced solid tumors. We report results for the cohort of patients with advanced anal carcinoma.

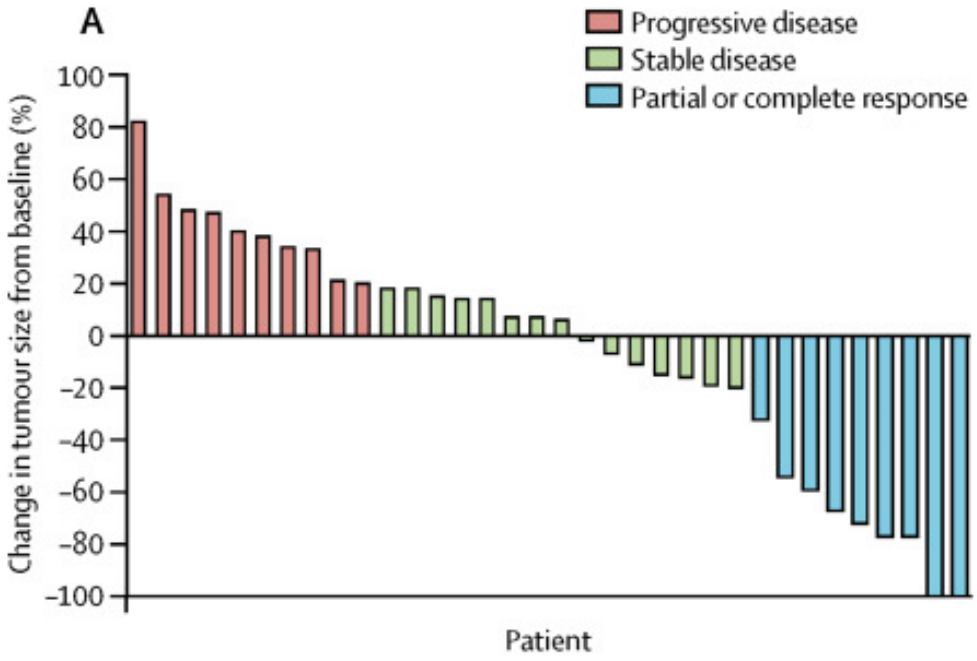
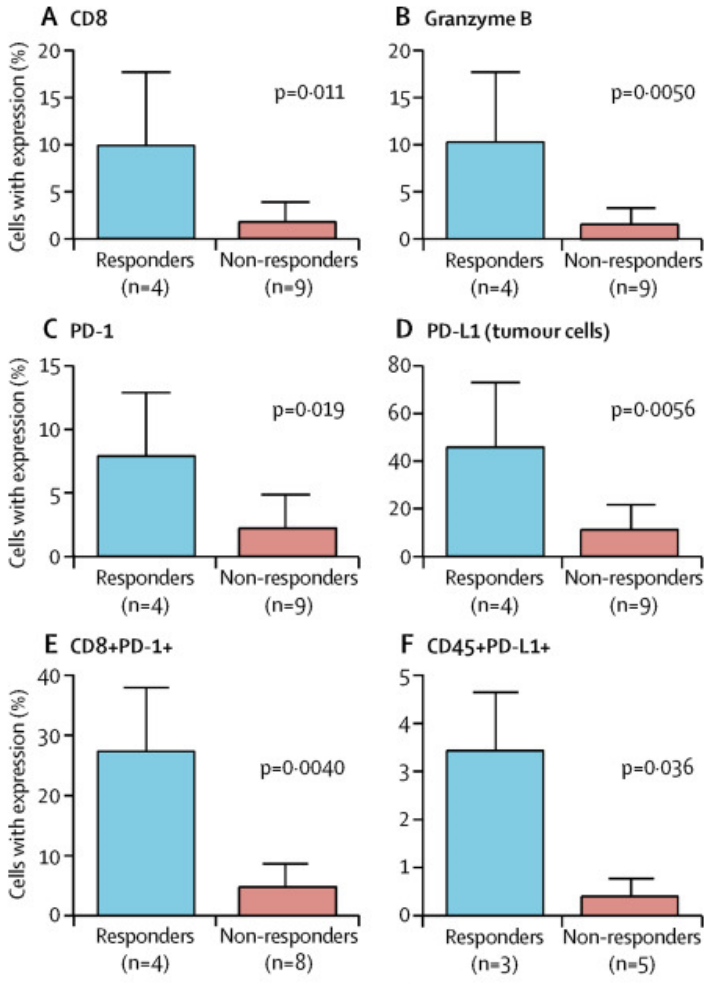
Nivolumab for previously treated unresectable metastatic anal cancer



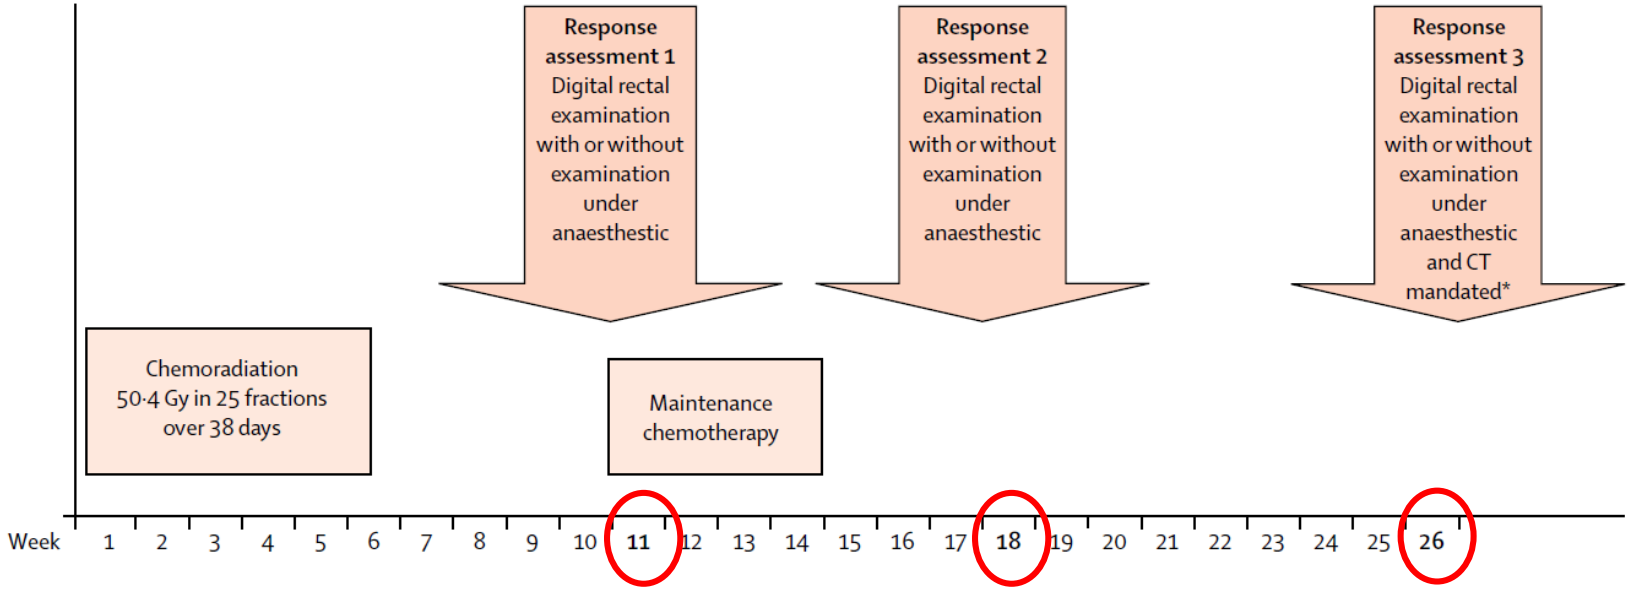


Higher immunogenicity → Better response

ACT II –how long is it safe to wait ? Conclusions

- Excellent CR rate at 6 months - 83% v 84%
- 151/209 (72%) patients not in cCR at Assessment 1 (11 weeks) achieved cCR at 18 or 26 weeks.
- Assessment safe at 26 weeks

Best time to assess complete clinical response (cCR) after CRT in Anal-Ca: ACTII data



- n=691 attended all three assessments
- cCR: 64%, 80% and 85% at assessments 1, 2 and 3, respectively
- 72%: no cCR at assessment 1; cCR by assessment 3
- 5-year OS (at assessment 3): cCR=87%; non-cCR=48%

- **Can the classical 5Rs of Radiobiology explain the delayed tumor response over a period of weeks?**

ADXS11-001 immunotherapy

- live attenuated Listeria monocytogenes (Lm)
- bioengineered to secrete a HPV-16-E7 fusion protein targeting HPV transformed cells.

- Anal cancer cells infected with HPV have the tumour associated antigen HPV E7.

- So ADXS11-001 causes antigen presenting cells to be stimulated to facilitate immune cells to attach to cancer cells expressing HPV E7

Phase II trial

Phase II/III trial

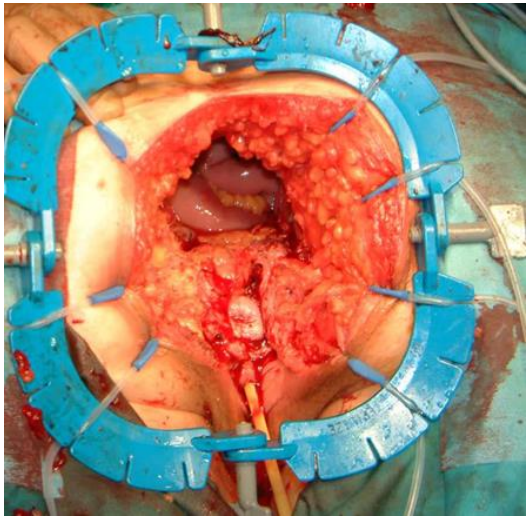
Conclusions

- Ideally patients should be treated in specialist units
- Imaging with CT and MRI ? PET
- Advice re smoking
- Limited local excisions
- CRT with 5FU and MMC
- IMRT better for toxicity and compliance
- RT dose open
- Can assess CCR up to 6 months
- Need to explore immunotherapy
- Surveillance an open question

Thank you for listening

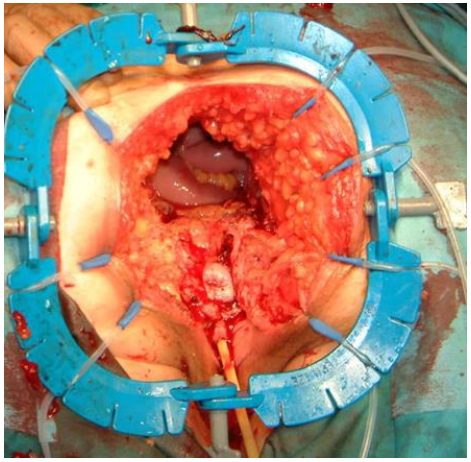
Surgical Salvage

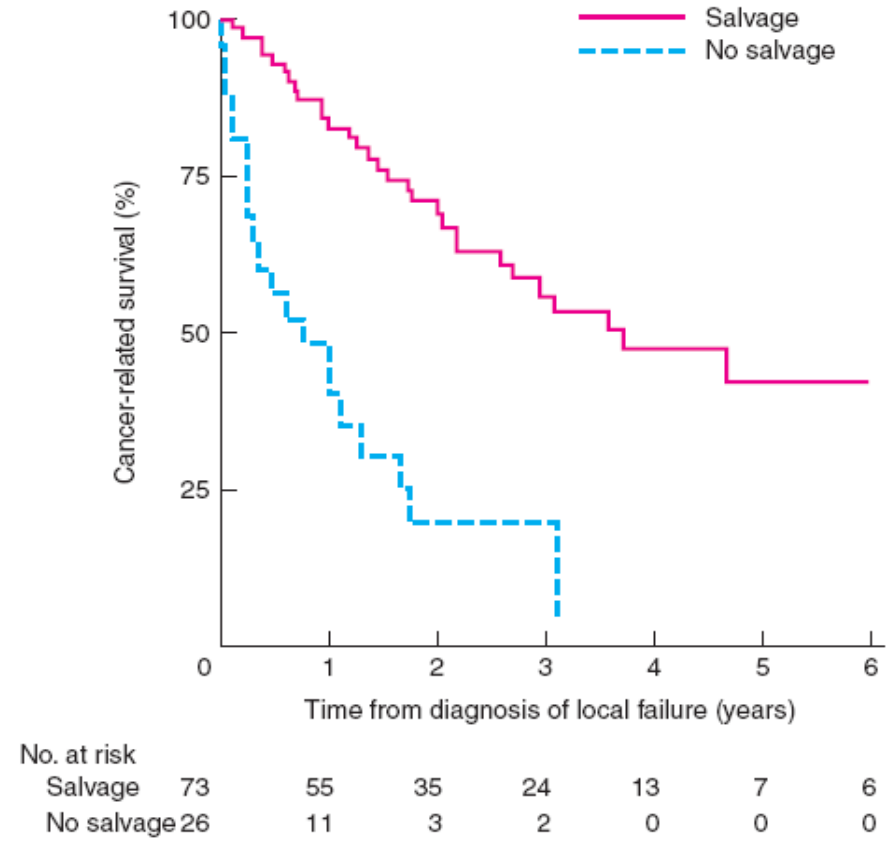
- Not the same as APER in rectal cancer
- Often late effects of radiotherapy
- En bloc resection of adjacent viscera more common
- Need for reconstruction
- R0 important for survival



Surgical Salvage: Prognosis

- Post salvage
  - 40-60% at 5years
- No salvage
  - 5% at 3 years

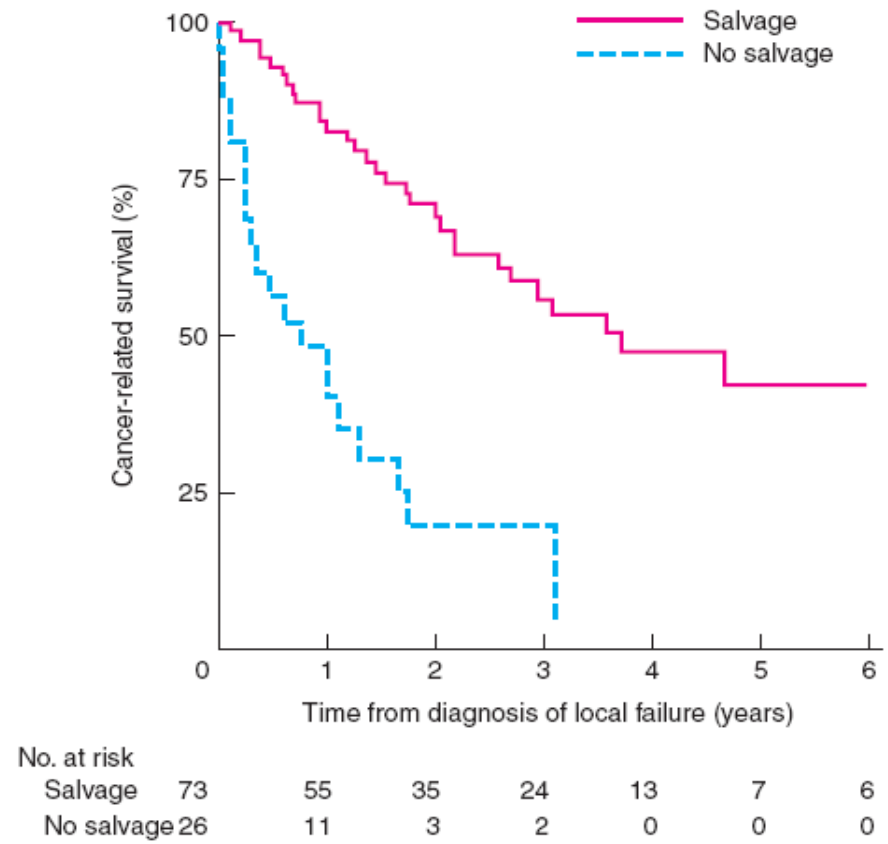




Renehan et al. BJS 2005

Prognosis

- Post salvage
  - 40-60% at 5years
- No salvage
  - 5% at 3 years



Renehan et al. BJS 2005

Summary of IMRT

- Dosimetric studies and clinical trials have shown reduced dosing and toxicity to normal structures with the use of IMRT.
- No decreases in treatment effectiveness or local control rates have been detected.
- Limited sample sizes and duration of follow-up minimize the ability to detect small variations in local control rates.

ESTRO School

Temozolomide chemotherapy versus radiotherapy in high-risk low-grade glioma (EORTC 22033-26033): a randomised, open-label, phase 3 intergroup study

RT vs TMZ in HR LGG: EORTC 22033
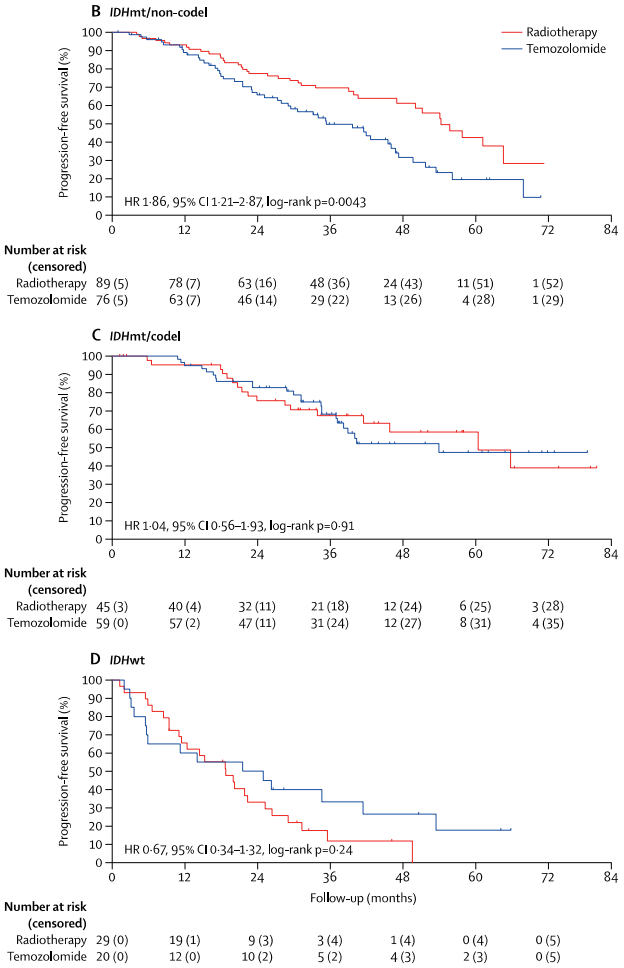
(molecular analysis)



IDHmut/1_p19_q intact

- Median PFS:
  - ❑ RT 55.4 months
  - ❑ TMZ 36 months

p = 0.0043

IDHmut/1_p19_q codel

- Median PFS:
  - ❑ RT 61.6 months
  - ❑ TMZ 55 months

p = n.s.

IDHwt

- Median PFS:
  - ❑ RT 19.1 months
  - ❑ TMZ 23.7 months

p = n.s.

CONCLUSION

Our results might support the option of initial TMZ alone in good-prognosis tumors (IDHmut/1_p19_q codel), in order to minimize the potential risk of late toxicity by postponing RT (if TMZ could be used instead) in a patient population who might live for more than 10–20 years.

ESTRO School

Health-related quality of life in patients with high-risk low-grade glioma (EORTC 22033-26033): a randomised, open-label, phase 3 intergroup study

QoL → 50.4 Gy RT vs TMZ: EORTC 22033

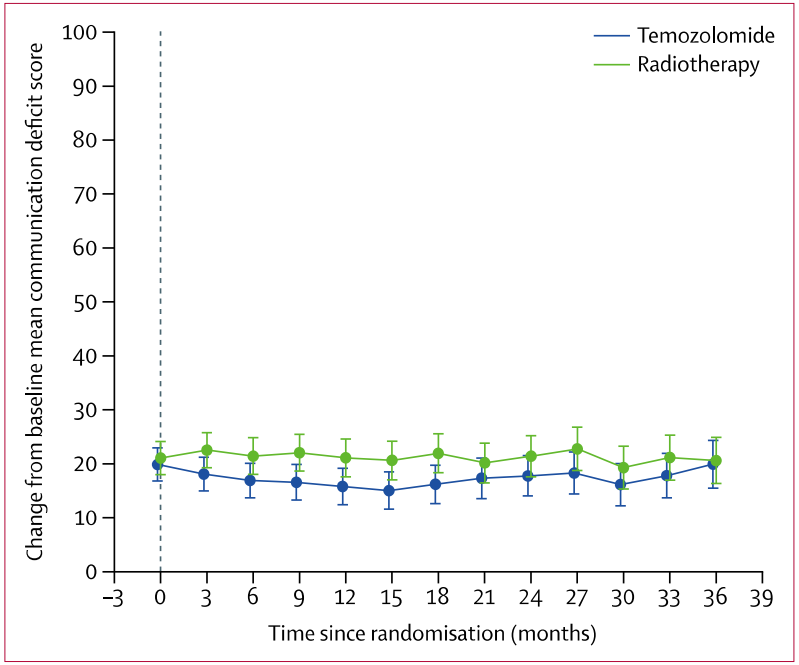


Figure 2: **Changes from baseline in communication deficit scores**
Error bars are SDs. 0 months is the baseline. A higher communication deficit score means more symptoms.

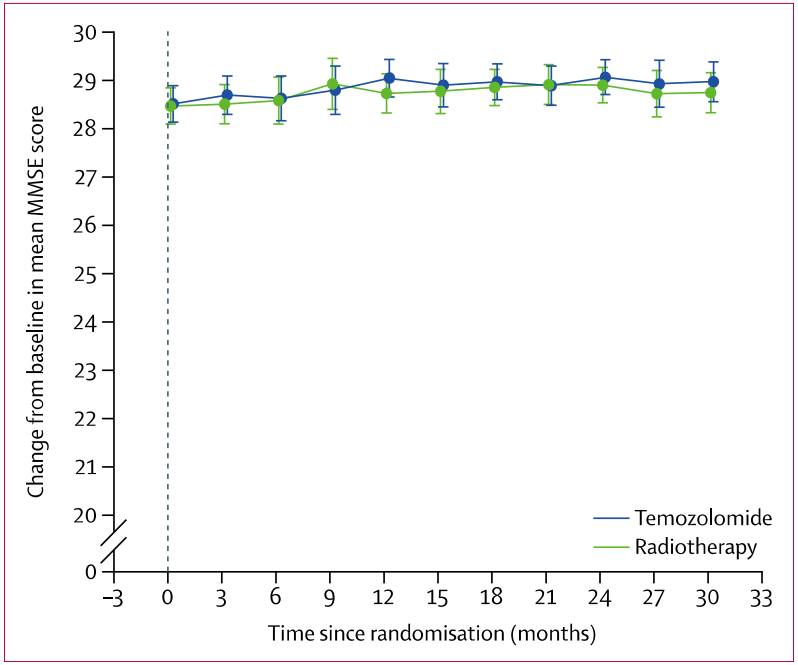

Figure 3: **Changes from baseline in MMSE scores**
Error bars are 99% CIs. No significant difference was found between radiotherapy and temozolomide in the longitudinal and overall analysis or at any timepoint (p=0·47). 0 months is the baseline. MMSE=Mini-Mental State Examination.

QoL or global cognitive funtioning did not differ between RT or TMZ in patients with LGG.
Our results do not support the choice of TMZ alone over RT alone in patients with "high-risk" LGG.

Take Home Message (Anaplastic gliomas)

A) 1p/19q CODELETED TUMORS

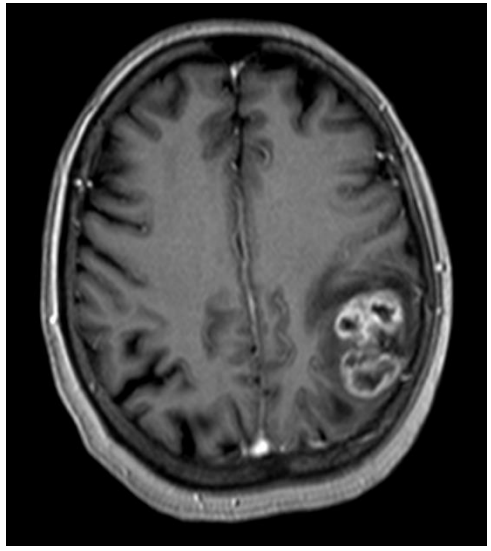
- ❑ Median survival >10 years
- ❑ Benefit from “upfront” sequential RT and CT (PCV regimen)
- ❑ RT→PCV or PCV→RT are both feasible options
- ❑ TMZ instead of PCV? No final answer so far (waiting for results from CODEL trial)

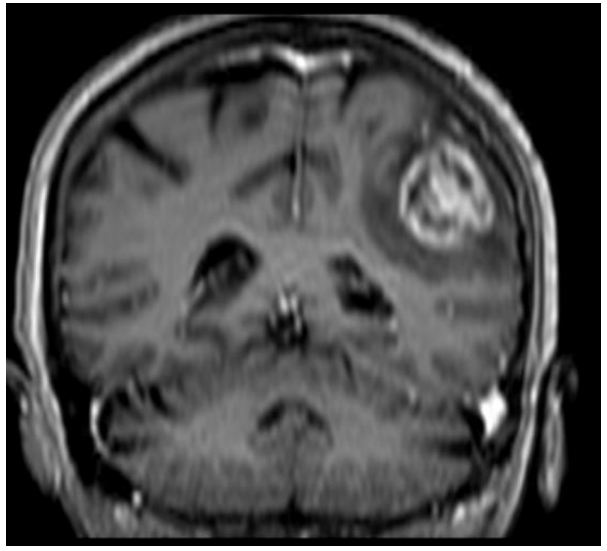
B) NON-CODELETED TUMORS

- ❑ Median survival 2-7 years
- ❑ RT as current standard for newly diagnosed cases.
- ❑ Benefit from adjuvant TMZ (CATNON trial)

CLINICAL CASE #3 – GLIOBLASTOMA

- F.E. woman, aged 52
- Seizures, for 3 months
- Craniotomy – debulking of the lesione in the left parietal lobe
- Histology – glioblastoma, Ki67 30%





- Post-operative KPS: 90
- Post-op MR: nearly GTR

ESTRO School

How would you treat this patient ?

A. **RT alone 60 Gy/30 fractions**

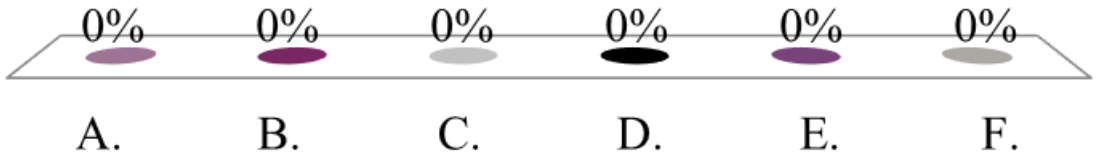
B. **RT (60 Gy/30 fractions) + concomitant TMZ followed by adjuvant TMZ x 6**

C. **RT (60 Gy/30 fractions) + concomitant TMZ**

D. **RT (60 Gy/30 fractions) + adjuvant TMZ x 6**

E. **Hypofractionated RT alone (40-42 Gy)**

F. **TMZ alone**



ESTRO School

What if the same patient was 74 years old ?

A. **RT 60 Gy/30 fractions alone**

B. **Hypofractionated RT alone (40-42 Gy)**

C. **RT 60 Gy/30 fractions + concomitant TMZ followed by adiuvant TMZ x 6**

D. **TMZ alone**

E. **Hypofractionated RT (40-42 Gy) + concomitant TMZ followed by adjuvant TMZ**

- **Median OS = 12 months (arm RT + BCNU)**

Cancer

survival of 8%. The study also demonstrated that a modified histologic classification of anaplastic astrocytoma *versus* glioblastoma provided better prognostic information than the astrocytoma grading system of Kernohan. Patients with anaplastic astrocytoma had a median survival of 27 months as compared to 8 months for patients with glioblastoma. In further evaluation of any beneficial effect of chemotherapy, it was identified that only among the 40–60-year-old groups, BCNU treated patients appeared to have significantly increased survival than patients in the control groups ($P = 0.01$, one-sided). Similarly, methyl-CCNU + DTIC was suggestively better than the control ($P = 0.08$, one-sided).

ESTRO School

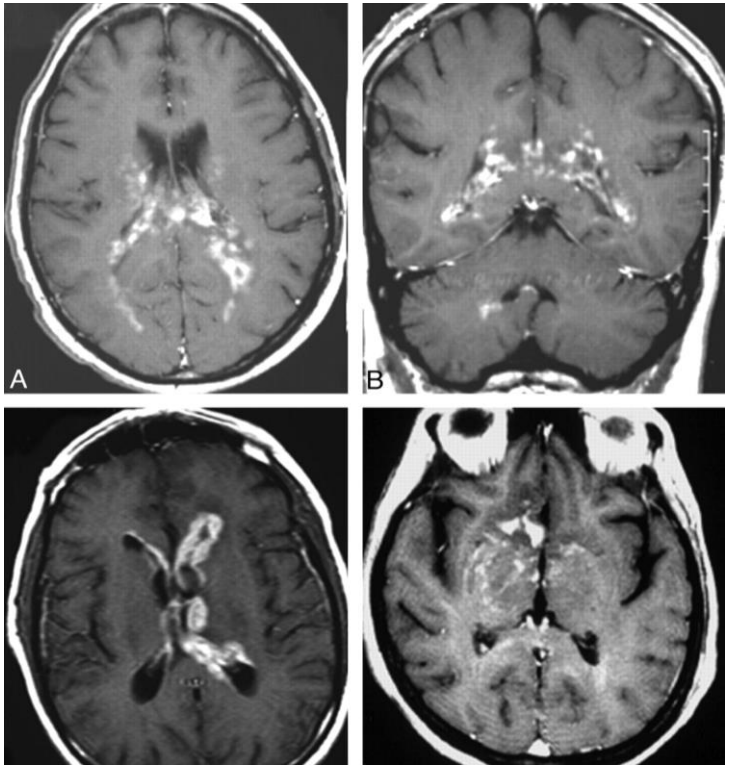
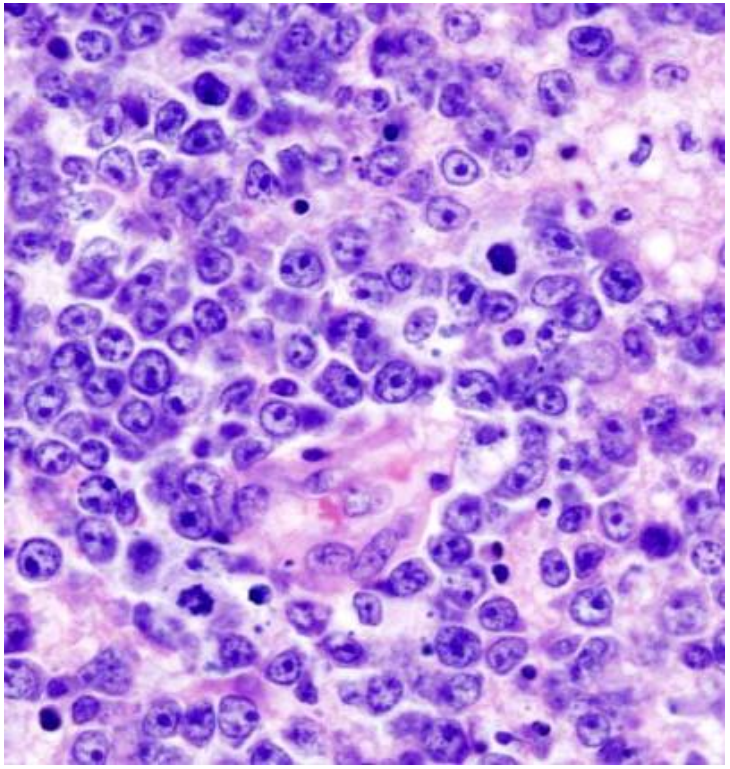
Primary CNS lymphoma (PCNSL)



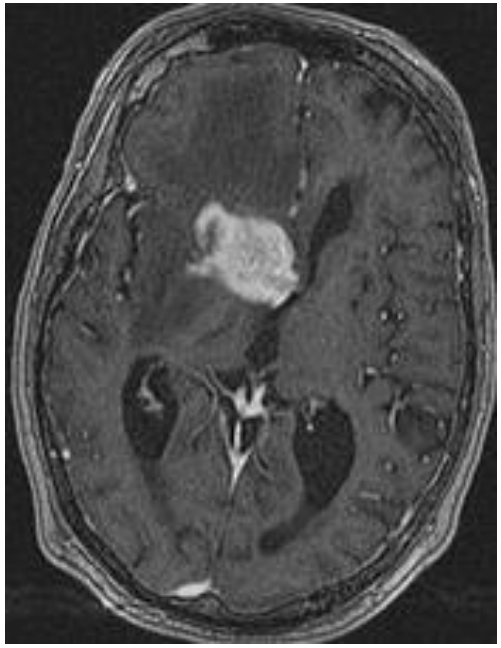


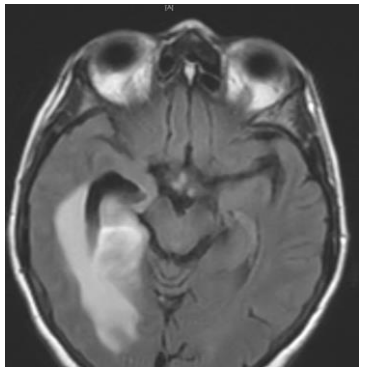
- Rare (but progressively increasing incidence), aggressive brain tumor
- 4-6% of all extranodal NHLs
- 90-95% DLBCL

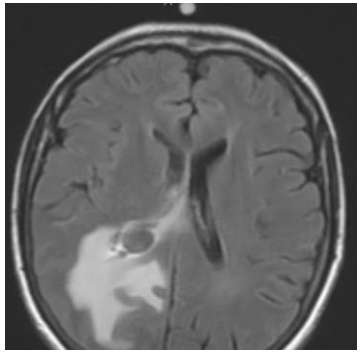
ESTRO School

Clinical features

- **Sites of presentation**
  - Brain
  - Leptomeninges
  - Eye (PIOL)
  - Spinal cord
- **Mean age = 60**
- **Gender**: M/F = 1:1
- 23% ocular involvement
- 17% positive CSF cytology
- **Symptoms**
  - 51% behavioral/personality
  - 28% hemiparesis
  - 13% seizure





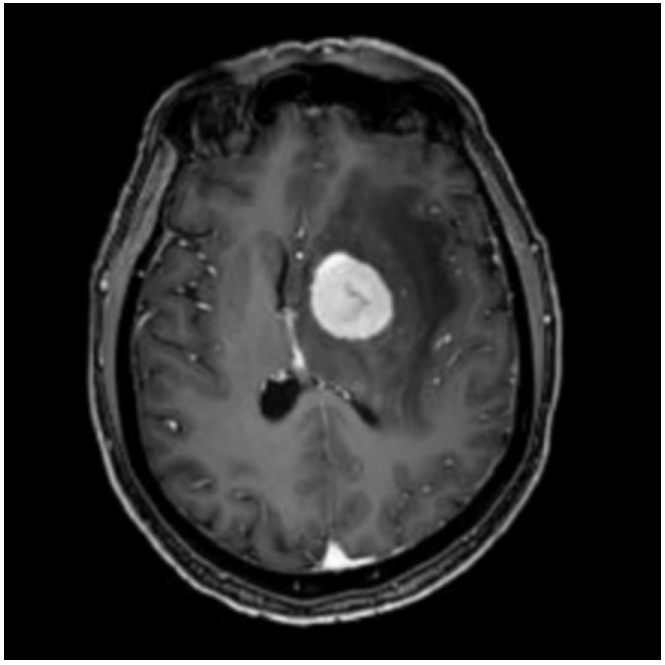


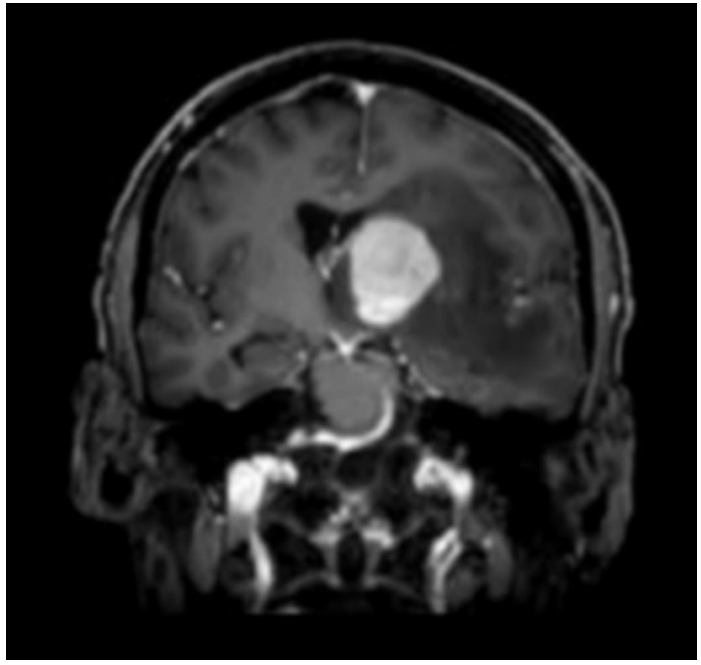
- **Chemo-radiotherapy is the most commonly used strategy**
- Efficacy of chemo: limited by special functional and micro-environmental characteristics of the CNS (BBB)
- Consolidation after chemotherapy represents the best role for radiotherapy (whole brain RT due to infiltrative nature of PCNSL)

ESTRO School

CLINICAL CASE #4 – PRIMARY CNS LYMPHOMA

- R.V. 59 years
- Headache and neurocognitive decline
- MRI: suspicion for PCNSL
- Stereotactic biopsy: confirmed PCNSL, DLBCL, CD20+, Ki67 80%
- PET-CT and Bone Marrow biopsy: no evidence of extracranial dissemination of lymphoma
- KPS: 70





ESTRO School

How would you treat this patients ?

A. **High dose Methotrexate**

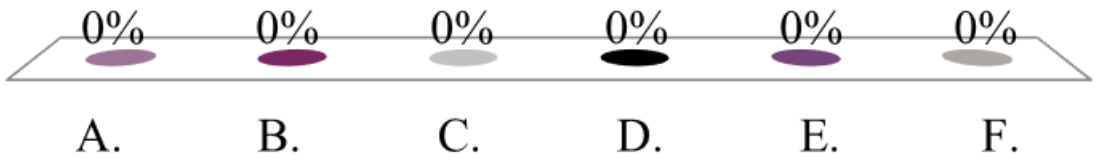
B. **High dose Methotrexate + ARA-C**

C. **Rituximab + High dose Methotrexate + ARA-C + Thiotepa**

D. **Rituximab + High dose Methotrexate + Procarbazine + Vincristine + ARA-C**

E. **R-CHOP**

F. **Upfront Whole Brain RT**



ESTRO School

- The patient was treated according to the MATRix regimen x 4 (**M**ethotrexate + **A**RA-C + **T**hiotepa + **Ri**tu**x**imab)

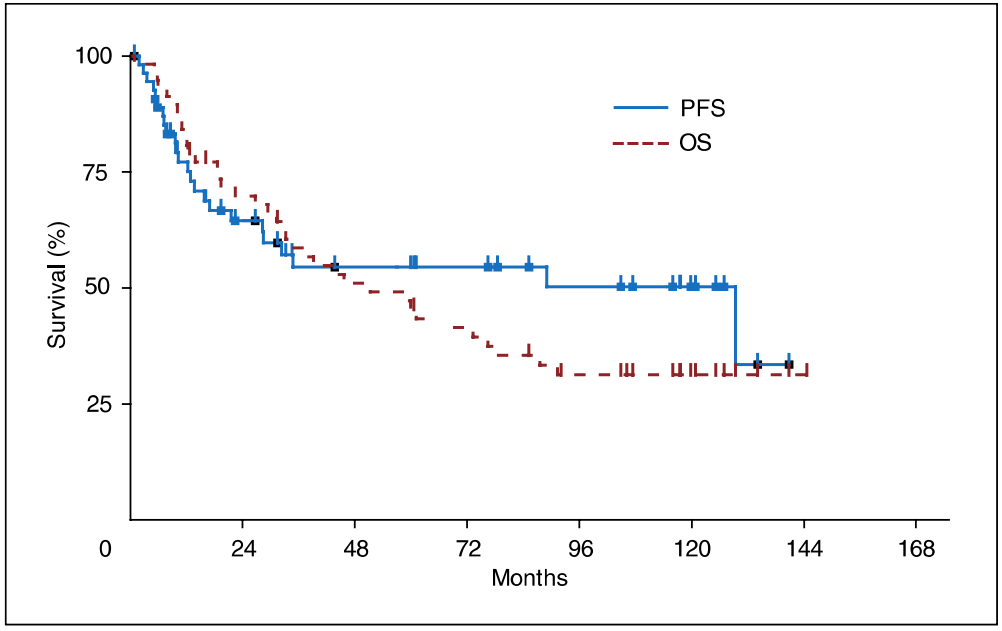
JOURNAL OF CLINICAL ONCOLOGY ORIGINAL REPORT

Long-Term Follow-Up of High-Dose Methotrexate-Based Therapy With and Without Whole Brain Irradiation for Newly Diagnosed Primary CNS Lymphoma

Igor T. Gavrilovic, Adília Hormigo, Joachim Yahalom, Lisa M. DeAngelis, and Lauren E. Abrey

Overall population



- **TREATMENT:**
  1. **HD-MTX + Procarbazine + Ara-C**
  2. **Eventual WBI: 45 Gy**
- 30% of patients developed treatment-related neurotoxicity after WBI.
  1. Pts >60 years: 75% (9/12).
  2. Pts <60 years: 26% (5/19).
- Only one patient developed neurotoxicity after chemotherapy alone; this patient had an initial KPS of 40 with poor recovery of function and possible MTX- induced leukoencephalopathy.
- The median survival from diagnosis of neurotoxicity was 23 months.

N.B. formal neuropsychological testing was not performed

ESTRO School

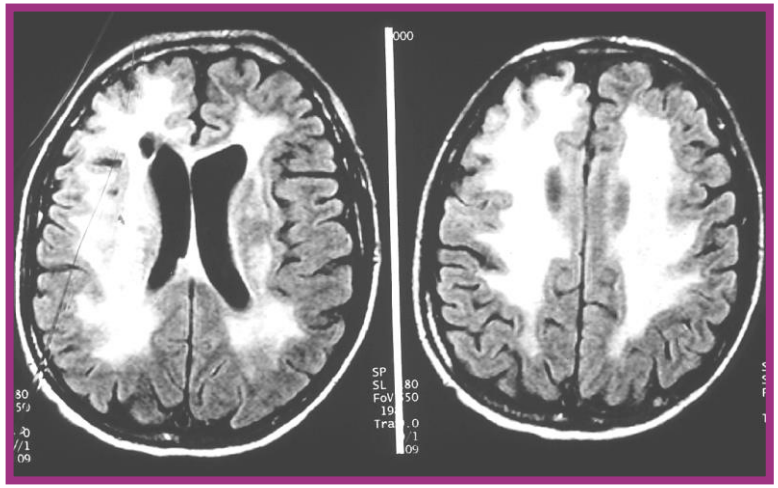
Cognitive functions in primary central nervous system lymphoma: literature review and assessment guidelines

D. D. Correa[1]*, L. Maron[2], H. Harder[3], M. Klein[4], C. L. Armstrong[5], P. Calabrese[6], J. E. C. Bromberg[3], L. E. Abrey[1], T. T. Batchelor[7] & D. Schiff[8]

Annals Oncol. 2007;18

Neurotoxicity: the big problem…

- **WBRT ± chemotherapy is associated with more pronounced cognitive impairment than chemotherapy alone**
- Long term impairment in the areas of attention, executive function, memory and psychomotor speed



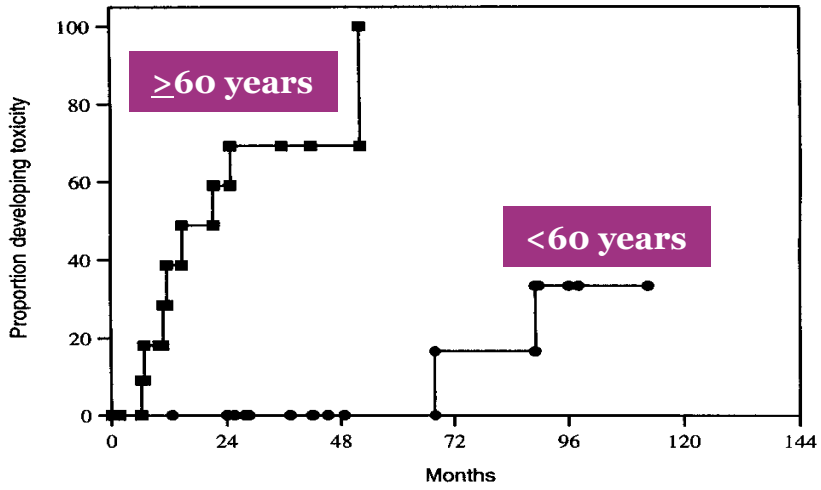


Fig 1. Proportion of patients who developed neurotoxicity with increasing duration of follow-up. Patients less than 60 years of age (circles) are compared with patients aged more than 60 years (squares); $P < .0001$ (Mantel-Cox method).

- High incidence of neurotoxicity particulary in patients > 60 years

ESTRO School

The Million Dollar Question…

Can we reduce RT-induced neuropsychological impairment, without compromising the clinical outcome ?

Reducing RT-related neurotoxicity
(moving points)

- To optimize (dose and volume) consolidative RT
- To avoid consolidative RT
- To replace RT with other strategies

CONSOLIDATION RADIOTHERAPY IN PRIMARY CENTRAL NERVOUS SYSTEM LYMPHOMAS: IMPACT ON OUTCOME OF DIFFERENT FIELDS AND DOSES IN PATIENTS IN COMPLETE REMISSION AFTER UPFRONT CHEMOTHERAPY

Whole-brain radiotherapy in primary CNS lymphoma

Andrés J M Ferreri*, Lisa DeAngelis, Gerald Illerhaus, Brian P O'Neill, Michele Reni, Carole Soussain, Joachim Yahalom

The study did not meet many standards… in design, undertaking, and interpretation.

- **Poor protocol adherence** (318/551 = 57.7%)
- **Low statistical power** because of exclusion of patients with protocol violations from the denominator in various analyses (PP vs ITT analyses)
- **Long accrual period** (2000-2009, 75 centers)
- **Involvement of many centers with little experience in PCNSL** (high rates of erroneous response assessment, patients lost to follow-up, and toxic deaths).
- **Inconsistent data for iatrogenic neurotoxicity** (exclusively assessed by MRI)

The G-PCNSL-SG-1 trial is compromised by several flaws and failed to prove its primary hypothesis.

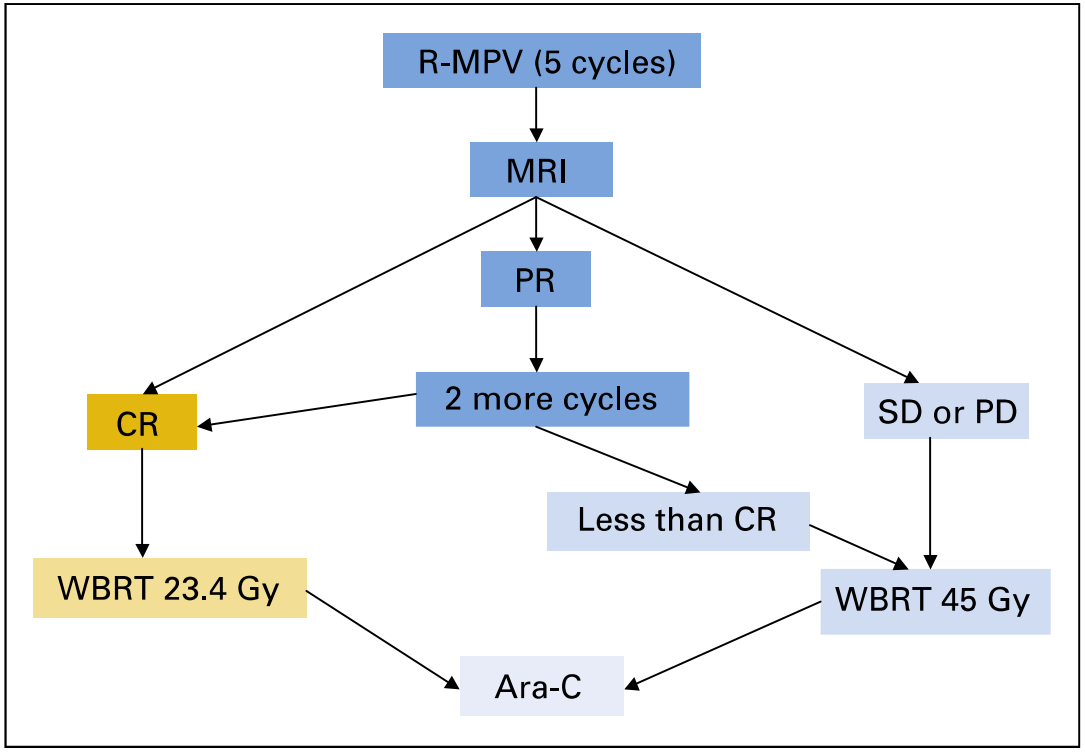
JOURNAL OF CLINICAL ONCOLOGY

Combined Immunochemotherapy With Reduced Whole-Brain Radiotherapy for Newly Diagnosed Primary CNS Lymphoma

Feasibility of ”reduced dose” WBRT



The primary end points were:

a) 2-year progression-free survival (PFS)
57% in the entire population
79% in the patients who received rdWBRT

b) acute treatment-related toxicity.
No evidence of neurocognitive decline within the 12-month post-**rdWBRT** follow-up period. One case of grade 4 neutropenia

Shah et al. JCO 2007;25

ESTRO School

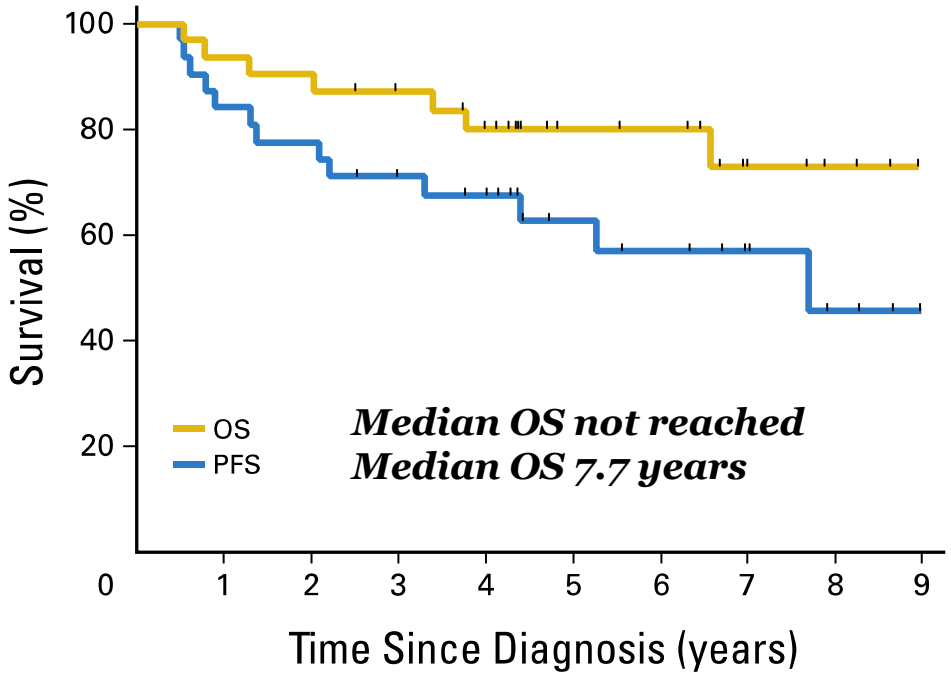
Rituximab, Methotrexate, Procarbazine, and Vincristine Followed by Consolidation Reduced-Dose Whole-Brain Radiotherapy and Cytarabine in Newly Diagnosed Primary CNS Lymphoma: Final Results and Long-Term Outcome

Feasibility of ”reduced dose” WBRT

- **Chemotherapy schedule R-MVP x 5-7 cycles**
  - Rituximab
  - Methotrexate
  - Vincristine
  - Procarbazine
- **WBRT**
  - rdWBRT (23.4 Gy/13 fr) in patients who achieved CR
  - Standard WBI (45 Gy/25 fr) in patients with PR-SD-PD
- **Consolidative CT**
  - High dose ARA-Cx 2 cycles

CR rate: 47%
ORR rate: 95%

Outcomes of patients receiving rdWBRT



Morris PG et. al JCO 2013;31

ESTRO School

Rituximab, Methotrexate, Procarbazine, and Vincristine Followed by Consolidation Reduced-Dose Whole-Brain Radiotherapy and Cytarabine in Newly Diagnosed Primary CNS Lymphoma: Final Results and Long-Term Outcome

Toxicity profile of ”reduced dose” WBRT

- **Prospective comprehensive neuropsychological evaluations were conducted:**
  - At baseline
  - After induction chemotherapy (before rdWBRT)
  - At 6-month intervals after completion of rdWBRT (up to 48 months)

- **Three cognitive domains were evaluated:**
  - Executive (Trail Making Test; Brief Test of Attention)
  - Verbal memory (Hopkins Verbal Learning Test)
  - Motor speed (Grooved Pegboard Test)

- **RESULTS**
  - At baseline, cognitive impairment was present in several domains.
  - After CT, there was a significant improvement in executive ($P<0.01$) and verbal memory ($P<0.05$)
  - There was ***no evidence of significant cognitive decline***, except for motor speed ($P<0.05$).
  - Self-reported ***quality of life remained stable*** during the follow-up period

Rituximab, Methotrexate, Procarbazine, and Vincristine Followed by Consolidation Reduced-Dose Whole-Brain Radiotherapy and Cytarabine in Newly Diagnosed Primary CNS Lymphoma: Final Results and Long-Term Outcome

Toxicity profile of ”reduced dose” WBRT

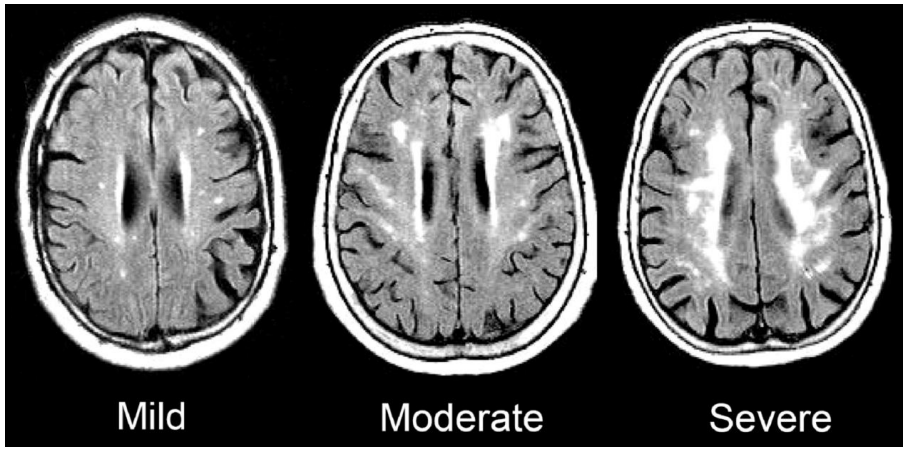
WHITE MATTER CHANGES (Fazekas scale)

Table 2. White Matter Changes in Patients Undergoing Neuropsychological Evaluation After Receiving Reduced-Dose Whole-Brain Radiotherapy (Fazekas Scale; n = 12)[20]

Grade	Baseline	Post R-MPV (prior to rdWBRT)	1 Year	2 Years	3 Years	4 Years
0	2	0	0	0	0	0
1	5	11	8	8	5	5
2	3	1	3	3	5	5
3	2	0	1	1	2	2
4	0	0	0	0	0	0
5	0	0	0	0	0	0

NOTE. Grades are defined as follows: grade 0, no white matter change; grade 1, minimal patchy white matter foci; grade 2, start of confluence of white matter disease; grade 3, large confluent areas; grade 4, confluence of white matter changes with cortical and subcortical involvement; grade 5, leukoencephalopathy.

Abbreviations: rdWBRT, reduced-dose whole-brain radiotherapy; R-MPV, rituximab, methotrexate, procarbazine, and vincristine.



- At baseline, five of 12 patients had grade ≥ 2 white matter disease, which decreased to one of 12 after chemotherapy.
- At the 4-year evaluation, the proportion of patients with white matter changes increased:
  - G2 changes → 5 patients
  - G3 changes → 3 patients
  - G4-G5 changes → 0 patients

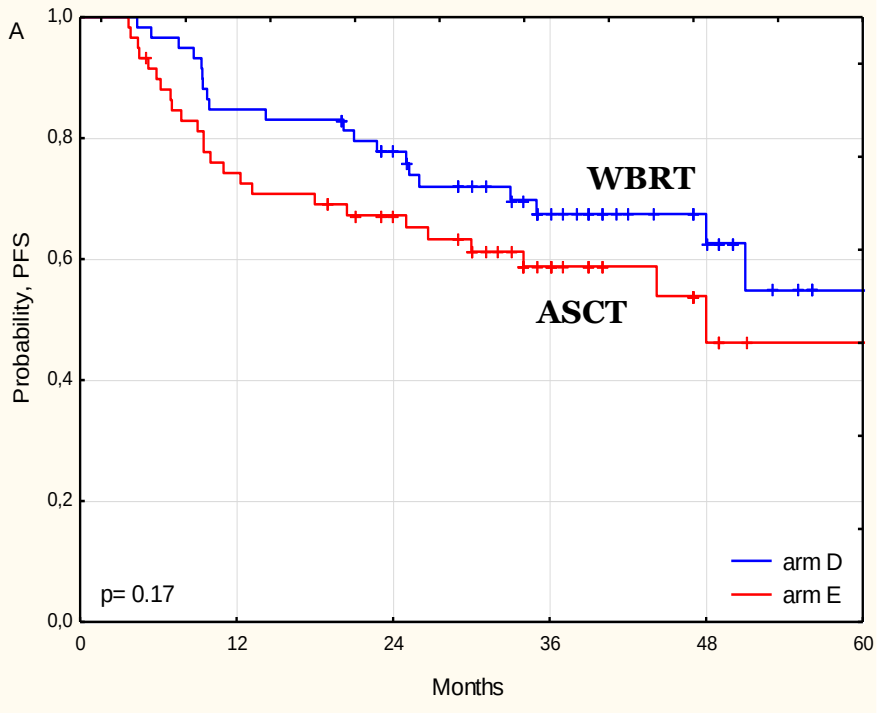
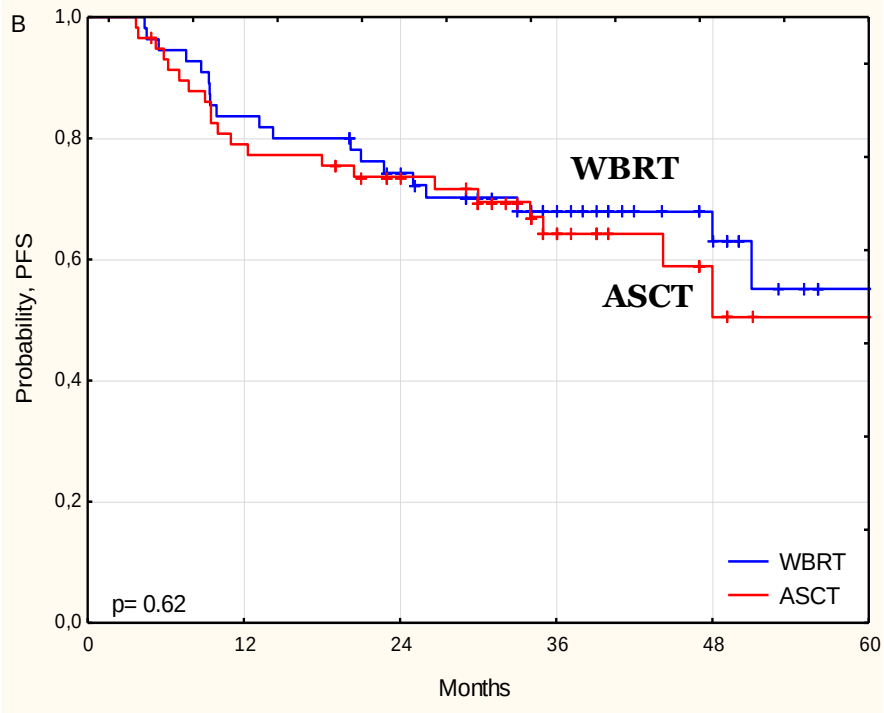
Effects on Survival and Neurocognitive Functions of Whole-Brain Radiotherapy (WBRT) and Autologous Stem Cell Transplantation (ASCT) as Consolidation Options After High-Dose Methotrexate-Based Chemoimmunotherapy in Patients with Newly Diagnosed Primary CNS Lymphoma (PCNSL): Results of the Second Randomization of the IELSG32 Trial

PFS – Intention to treat



PFS – Per protocol



Ferreri AJM. et al. Blood; abstract book ASH 2016

Neuropsycological tests

WBRT

ASCT

- ***A significant impairment of some attention/executive functions among patients treated with WBRT was recorded****, while results of tests addressing language and memory were stable after this therapy.*
- Patients treated with ASCT exhibited improved functions at most of the performed test, and both consolidation therapies were associated with improved QoL figures.
- **BUT… 2 toxic deaths (out of 40 patients, 5%) in the arm of Consolidative ASCT.**

ESTRO School

Ferreri AJM. et al. Blood; abstract book ASH 2016

Conclusions – PCNSL

- **MTX + Rituximab containing regimen** is significantly more active and effective than the other combinations leading to high rates of CR (≃50%) and ORR (85-90%), and should be considered the new standard induction for PCNSL

- **A Consolidative therapy is strongly recommended** after induction chemotherapy for PCNSL

- **WBRT and ASCT are both active and effective**, as consolidation therapies after high-dose-methotrexate-based chemoimmunotherapy with a 95% CR rate, and 75-80% progression-free survivors at 2 years

- **The best consolidative approach** should be selected “case by case” and tailored to the patients within a multidisciplinary tumor board, taking into account the toxicity profile of each strategy.

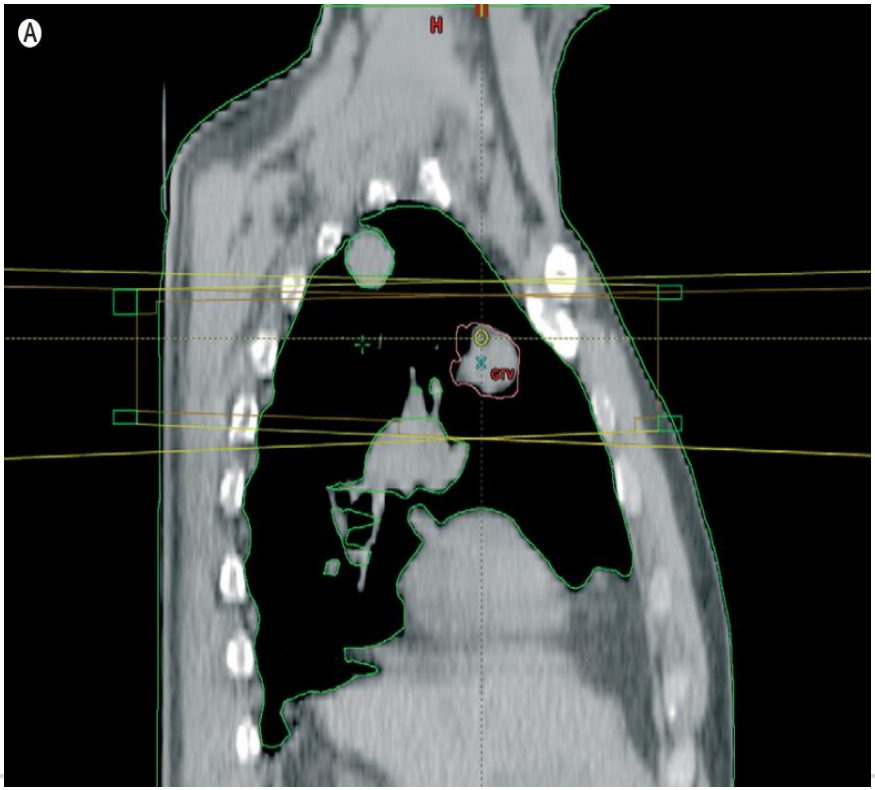
- Clinical situation
- Immunogenic cell death
- Preclinical examples

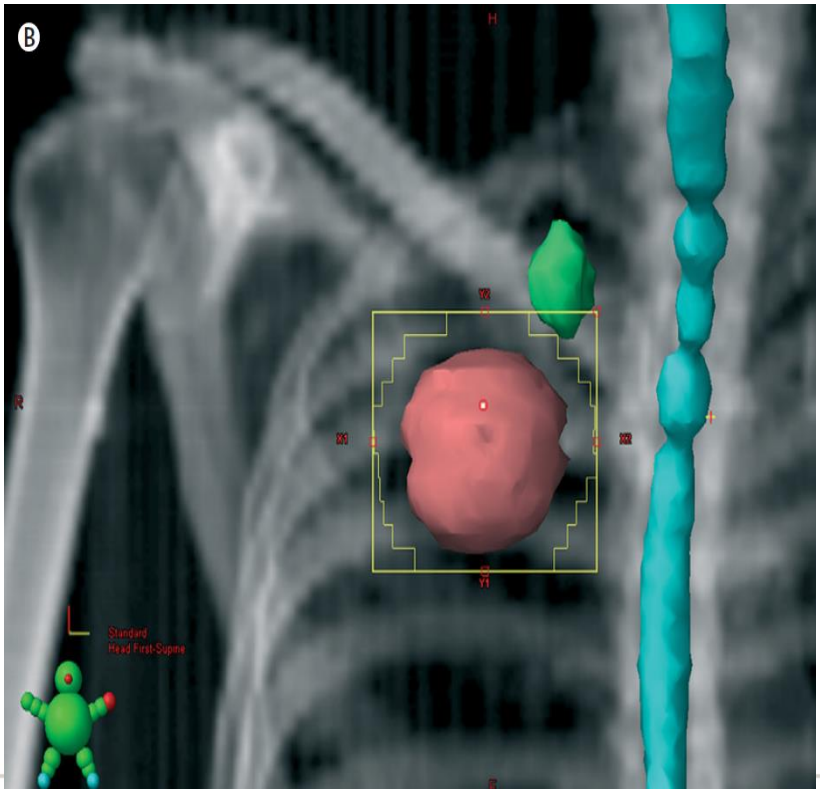
- Radiotherapy and immune checkpoint inhibitors
- Resistance mechanisms

Systemic effects of local radiotherapy

Silvia C Formenti, Sandra Demaria Lancet Oncol 2009; 10: 718–26

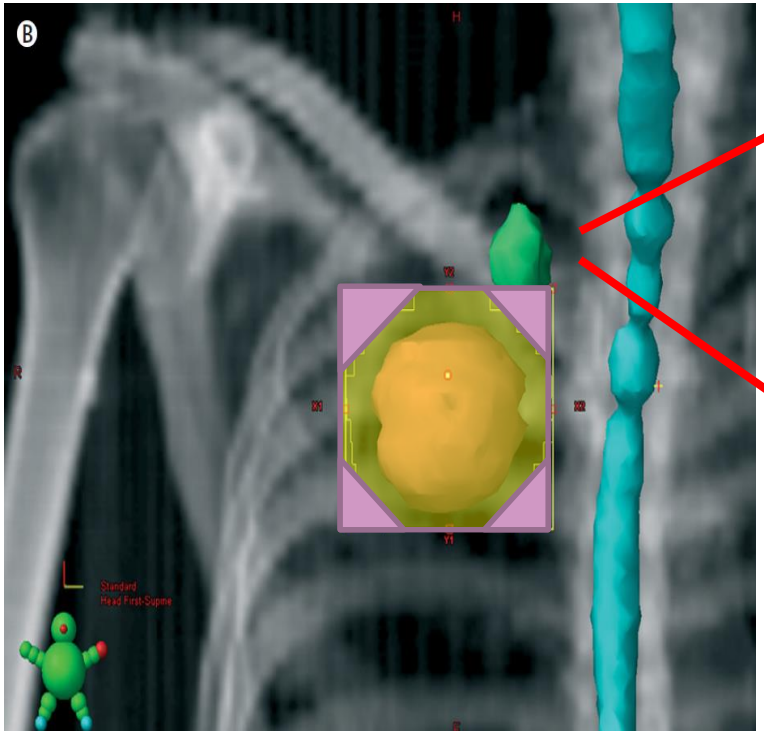
- Patient with thymic carcinoma
- 2 lung lesions, one irradiated, one not irradiated

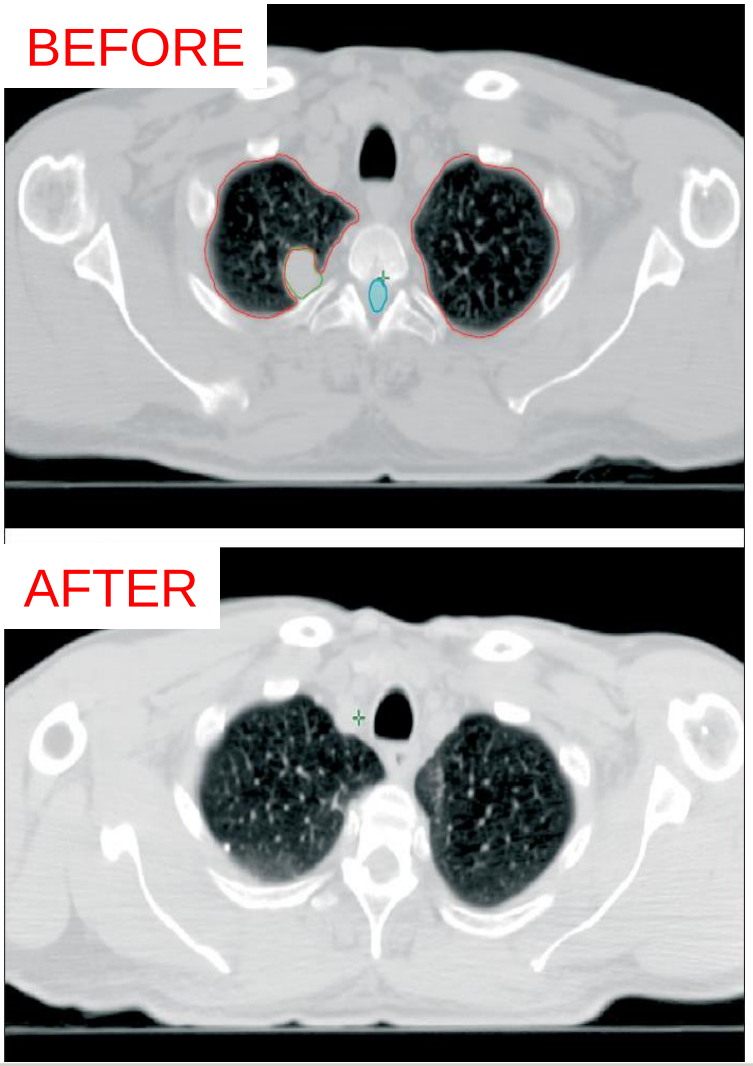




ESTRO School

Tumor regression in non-irradiated, distant tumor sites





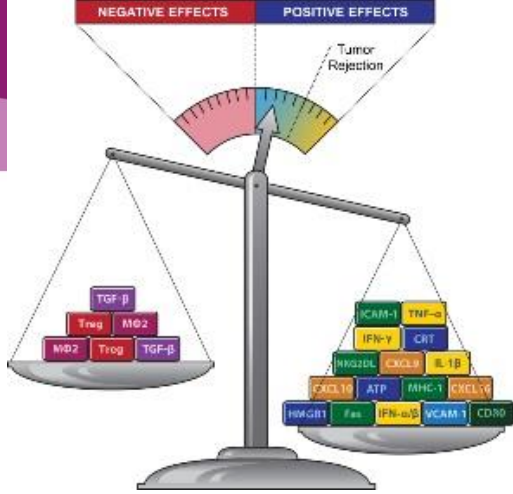
Abscopal response in unirradiated lesion
Ab = away from Scopus = the target

First described in 1953: Mole R; Br. J. Radiol, 26:234-241)

Reported clinical cases (1960-2014):51 patients (23 case reports after RT alone)

ESTRO School

Radiotherapy and Immune Response



- Radiation is cytotoxic through the induction of non-repairable, double-stranded DNA breaks.

- It has long been believed that radiation is immunosuppressive. (normal hematopoietic cells and hematologic malignancies appear to be very sensitive to low radiation; release of immunosuppressive factors)

- However, the effects of RT are multifaceted and may serve as an immune stimulus: primary tumor site; abscopal site

Radiotherapy and Abscopal Effect

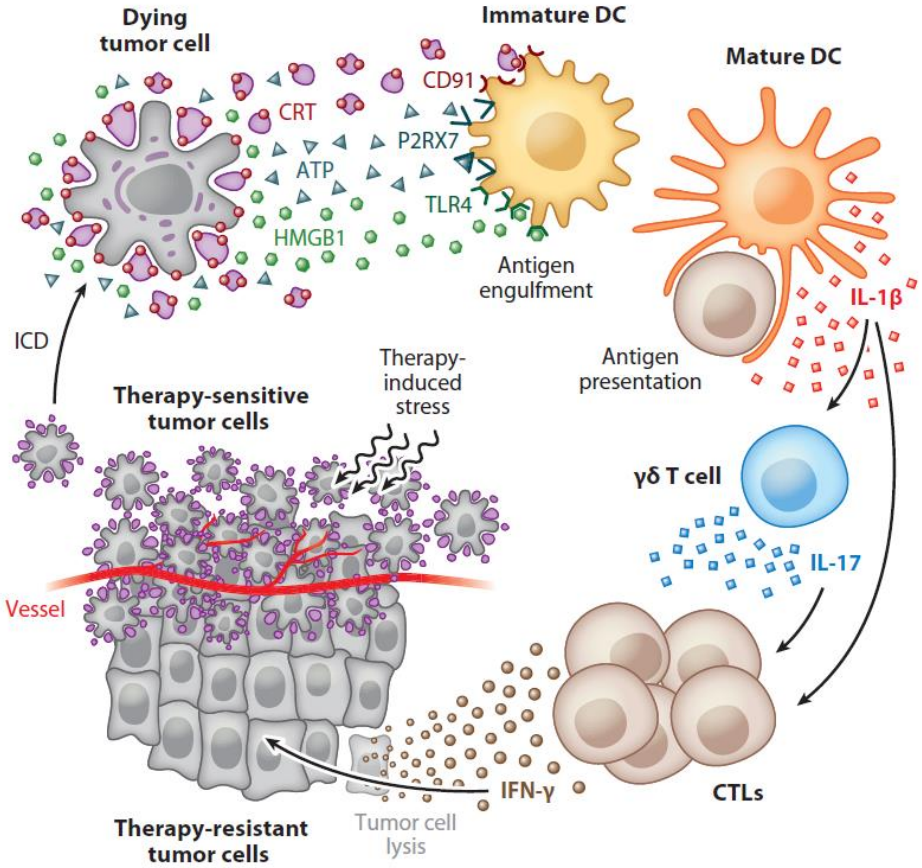
- «True» abscopal effect does not include the effect of systemic therapies
- Preclinical research fails to consistently reproduce abscopal effects by RT *alone*

➢ Is abscopal effect coincidental representation of spontaneous regression?

- New enhanced systemic responses after RT described in patients progressing through immunotherapy

➢ We need more controlled (pre-)clinical studies

Radiotherapy meets Immunology: Immunogenic Cell Death induced by RT



Properties of Immunogenic Cell Death:

a) Exposure of calreticulin, secretion of ATP, release of HMGB1

b) Recruitment of dendritic cells into tumor bed, optimal antigen presentation to T cells

c) Followed by potent immune-response

Relevance of Immune System for Treatment Response

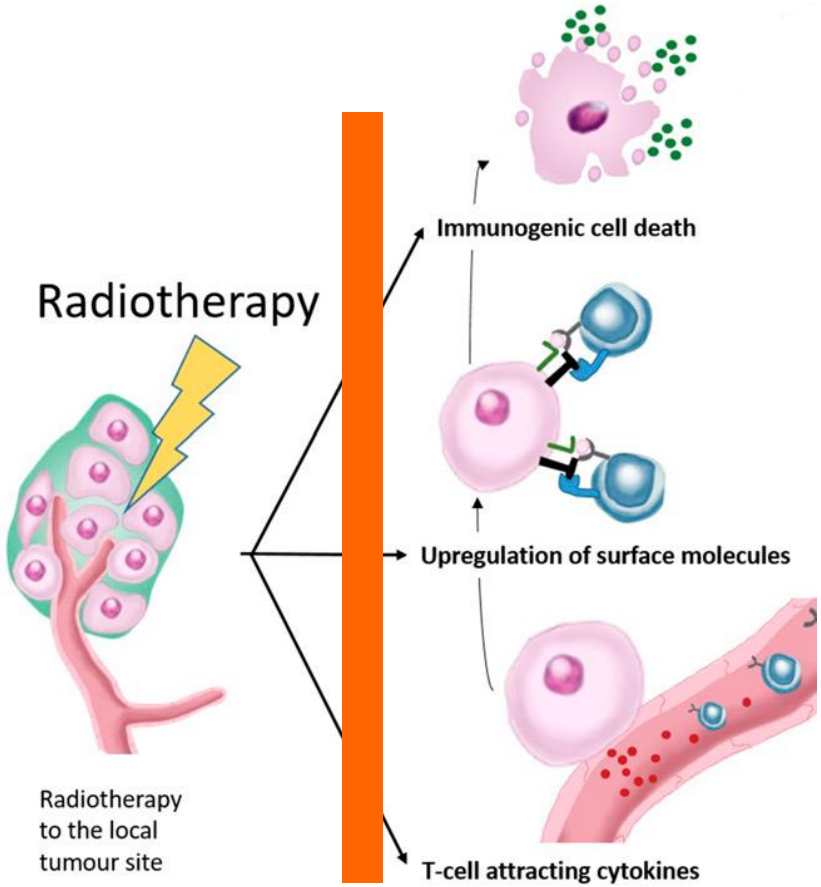
adapted from Wennerberg et al., 2017

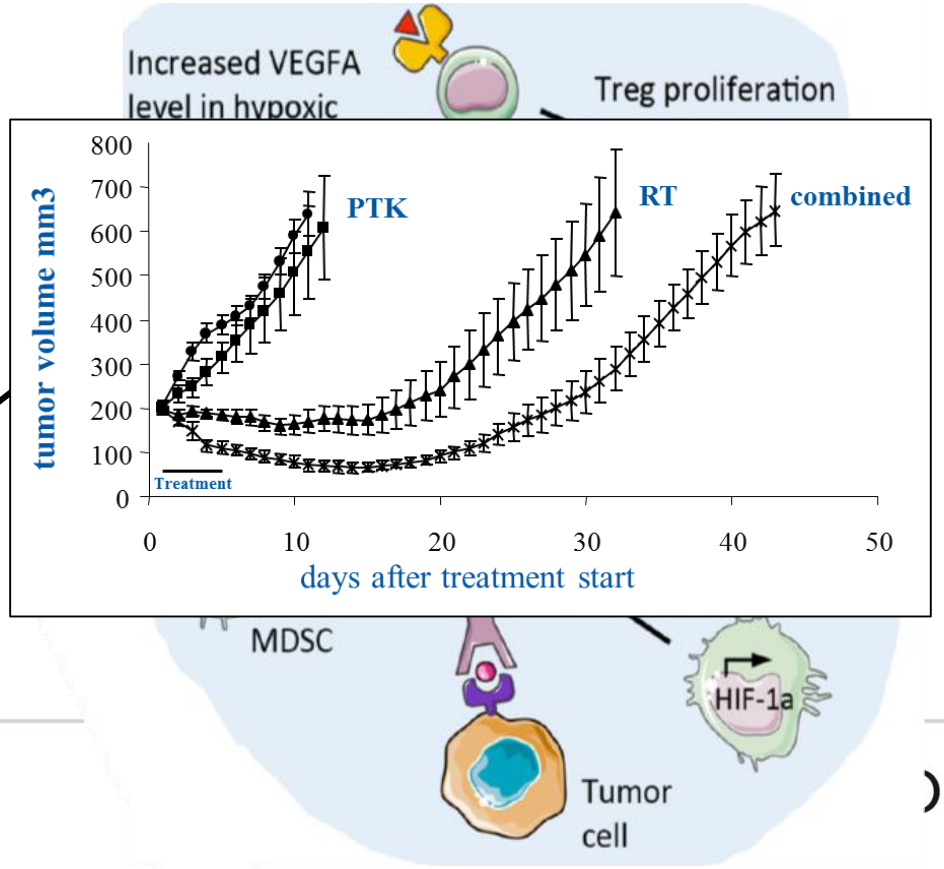
Immunosuppressive Pathways enhanced by RT

- Hypoxia-induced PDL-1-expression
- Hypoxia fine-tuned M2-phenotype tumor-associated Macrophages

- Hypoxia-induced VEGF-secretion

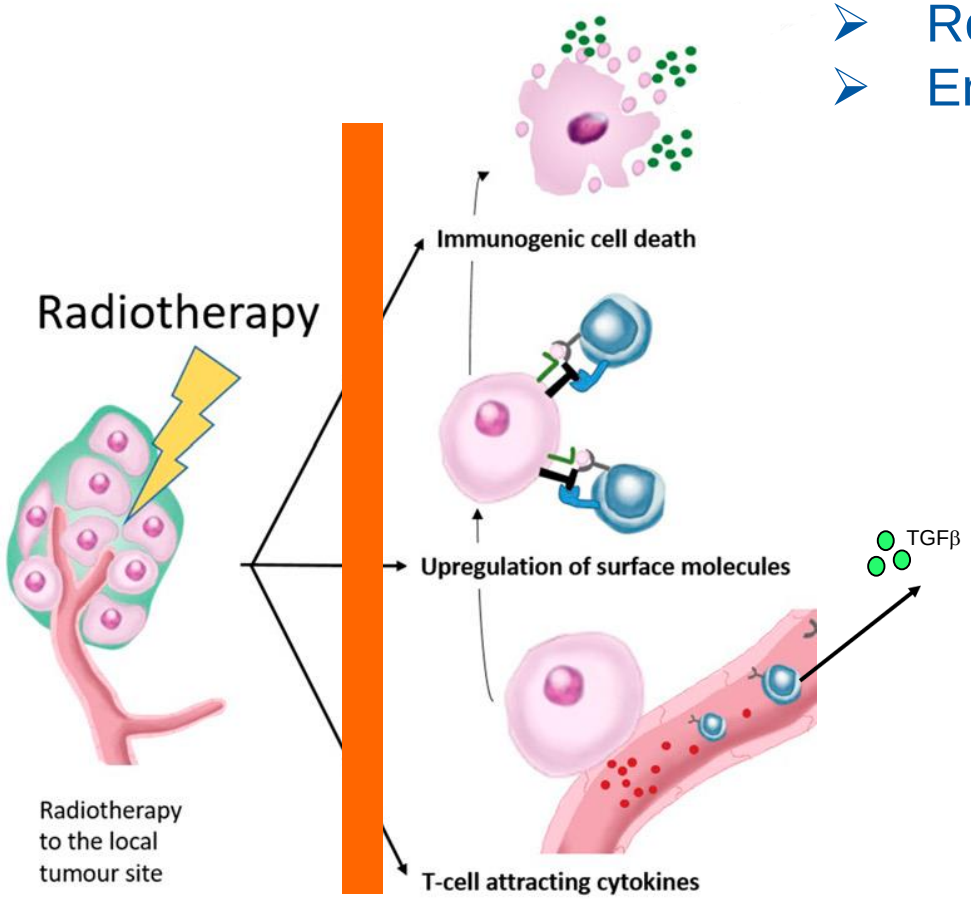
➢ VEGF-mediated Treg proliferation

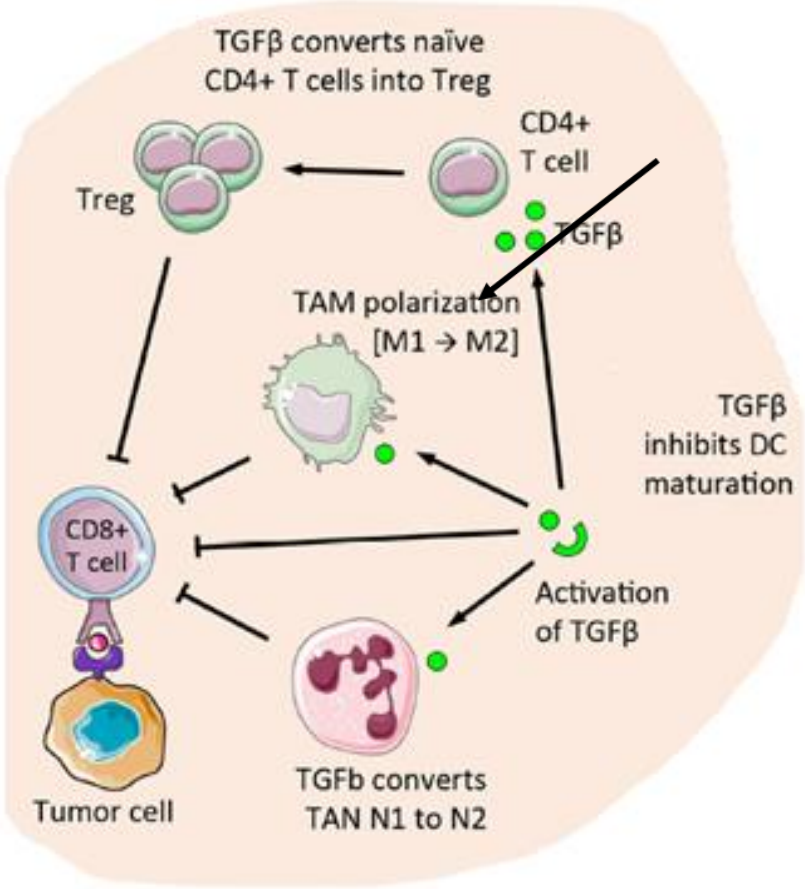




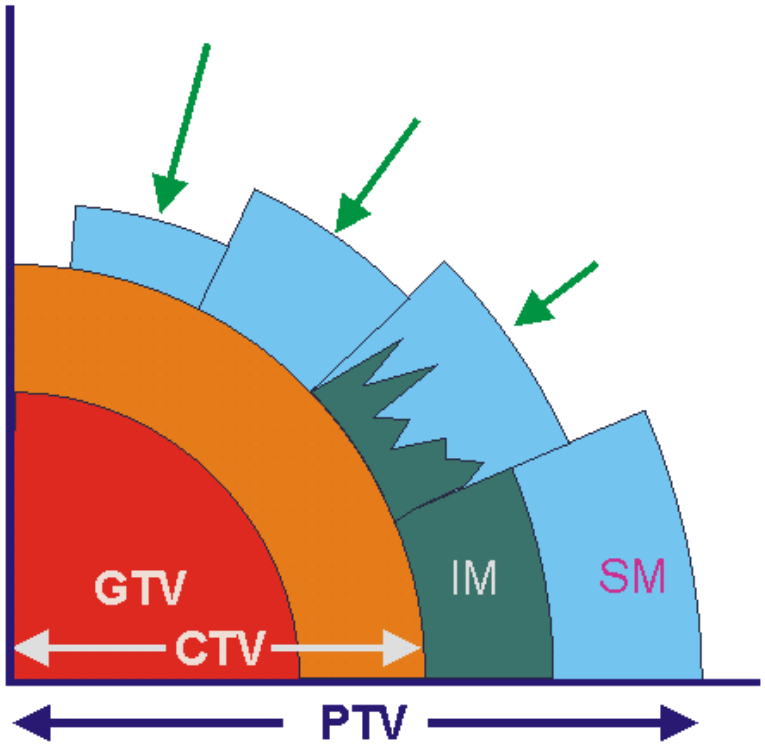
Immunosuppressive Pathways enhanced by RT

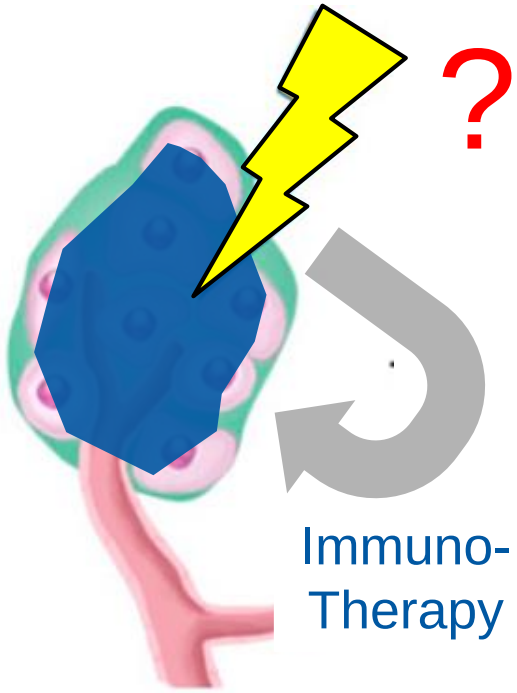
- RT-induced TGFβ-release and activation
  - Reduced $CD8^+$ T cell differentiation
  - Enhanced Treg population





In an Ideal World: Exploting IR-Induced ICD and Immunotherapy at the Site of the Primary Tumor





Radiotherapy to the local tumour site

Reduced Normal Tissue Toxicity ?

Reduced Requirement for Conformal Radiotherapy ?

Summary

True RT-induced abscopal effects exist, are rare, are immune-mediated (irradiated tumor as immunogenic hub)

- Novel immunomodulatory agents have the potential to maximise RT-induced anti-tumor immune responses
- Radiotherapy can enhance antitumor immune response

Multiple questions exist:

Relation between dose/fraction and the immune effects of radiation; additional resistance mechanisms

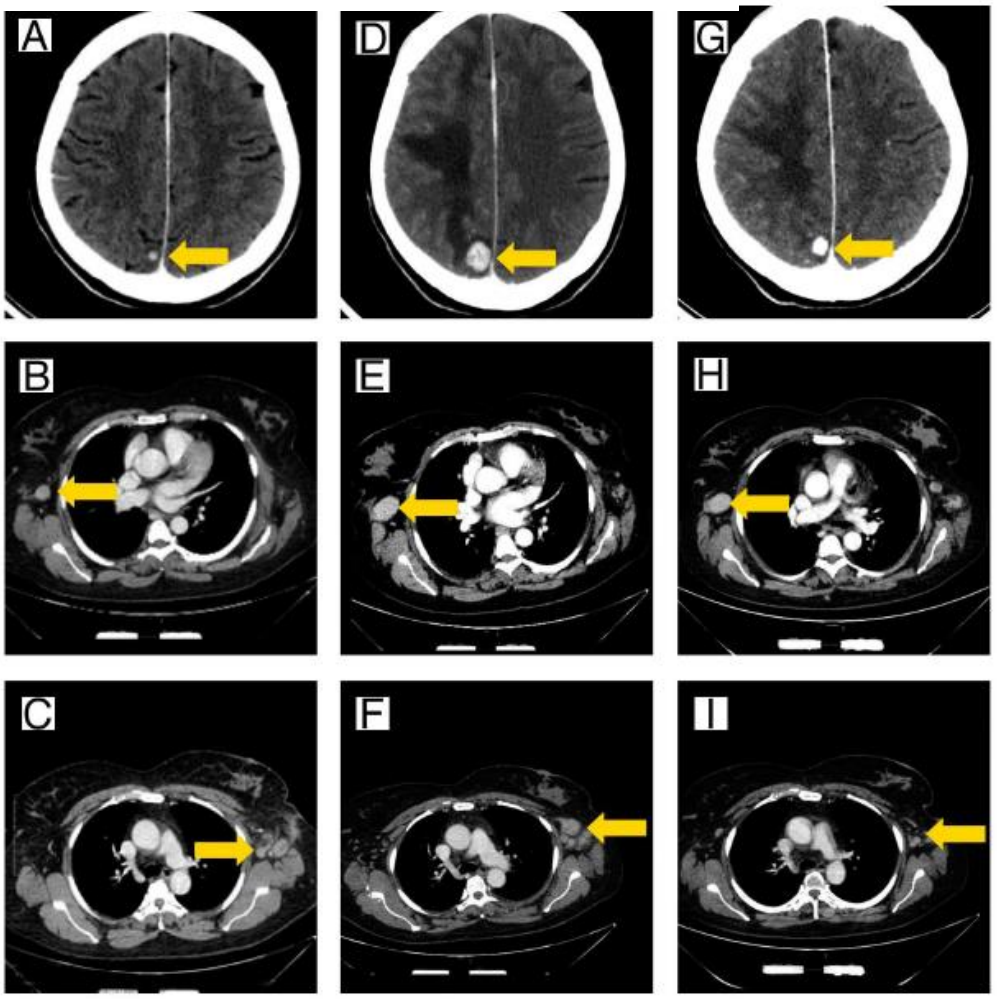
Timing of immune therapy with radiotherapy is crucial

Is Rejection of neoplastic lesions by immune system a novel «R»?

Abscopal effect and brain metastases

Figure 3. Patient Case 2. (**A–I**) A 52-y-old female patient received 4 cycles of ipilimumab 3 mg/kg (May to August 2012) followed by palliative whole-brain radiotherapy (WBRT) in August to September 2012 for symptomatic brain metastases. Whole body 128-slice CT scans (1 mm thickness) were performed at baseline, post-ipilimumab and post-RT. (**A–C**) Baseline, pre-ipilimumab scans from May 2012. (**D–F**) Post-ipilimumab scans from August 2012 showing representative brain metastasis (**D**) and lymphnodal (**E–F**) metastases. (**G–I**) Post-RT follow-up scan from september 2012 showing a local response (**G**) and reduction of lymphnodal (**H–I**) metastases indicative of abscopal response.

Does RT «just» enhance Ipilimumab-effect ?



Baseline | Post-ipilimumab | Post-RT

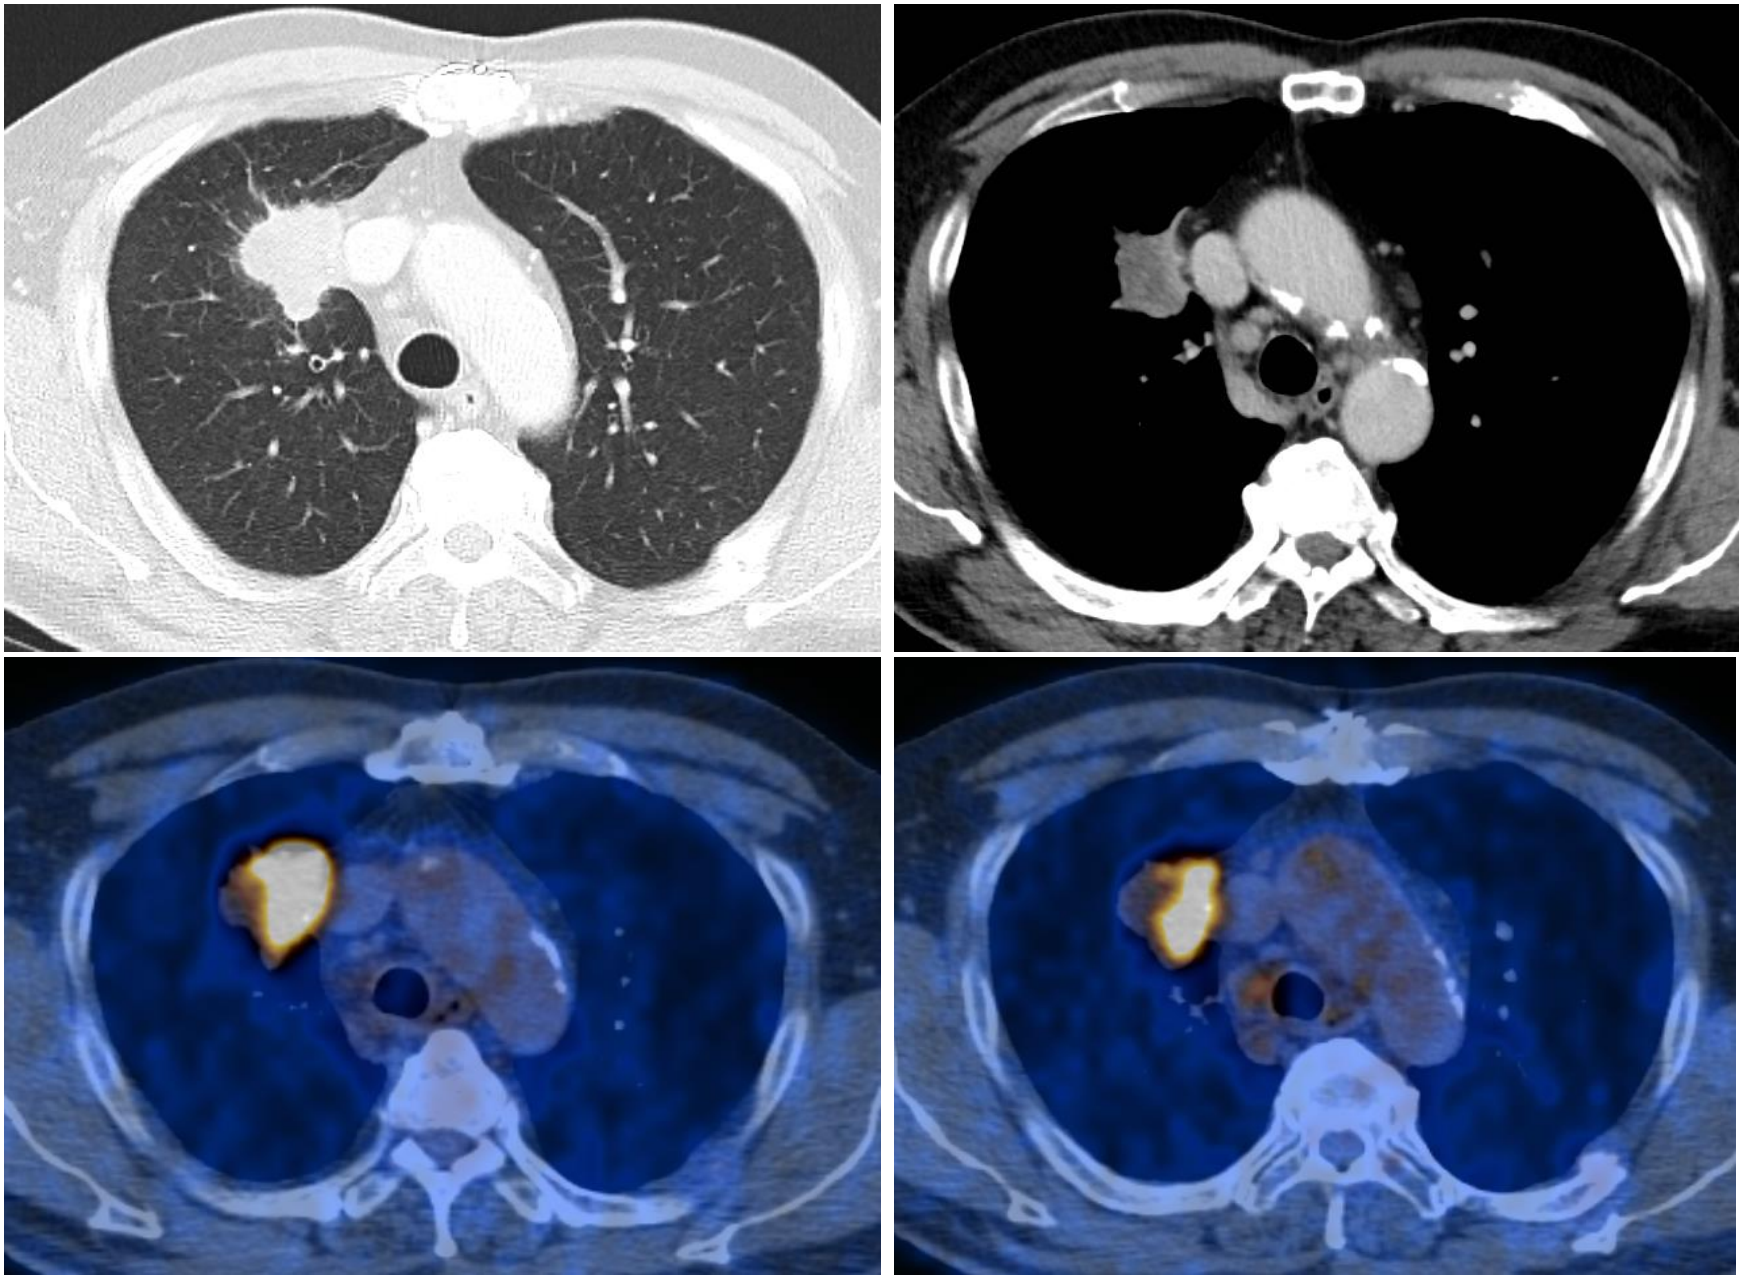
CLINICAL CASE #1 – Locally advanced NSCLC

- **A 55-year-old, otherwise healthy man (ECOG PS = 0)**
- Former smoker (quit 10 years ago)
- Suspicious 5-cm mass in right upper lobe (RUL) at the chest X-ray
- Chest **CT scan**: 5x4-cm spiculated lesion in RUL and suspicious 1.7-cm mediastinal lymph node (LN) at the 4R region
- **PET-CT**: 5-cm fluorodeoxyglucose (FDG) avid mass in RUL (mSUV 16.4), right hilum, 4R node (SUV4)

- Bronchoscopy and Endobronchial Ultrasound (EBUS):
  Biopsy of lung lesion and 4R LN; both show adenocarcinoma (CK7+, CK20-TTF1+)

ESTRO School



Additional Evaluations:

- ❑ Adequate pulmonary function tests (PFTs) and cardiac function, results from laboratory tests are normal
- ❑ Brain MRI: Negative
- ❑ Molecular Analysis (biopsy of the Lung Tumor): ***EGFR* mutation (deletion 19)**

Clinical Stage: **T2bN2M0 (IIIA-N2)**

Patient was presented and discussed at a multidisciplinary thoracic tumor board

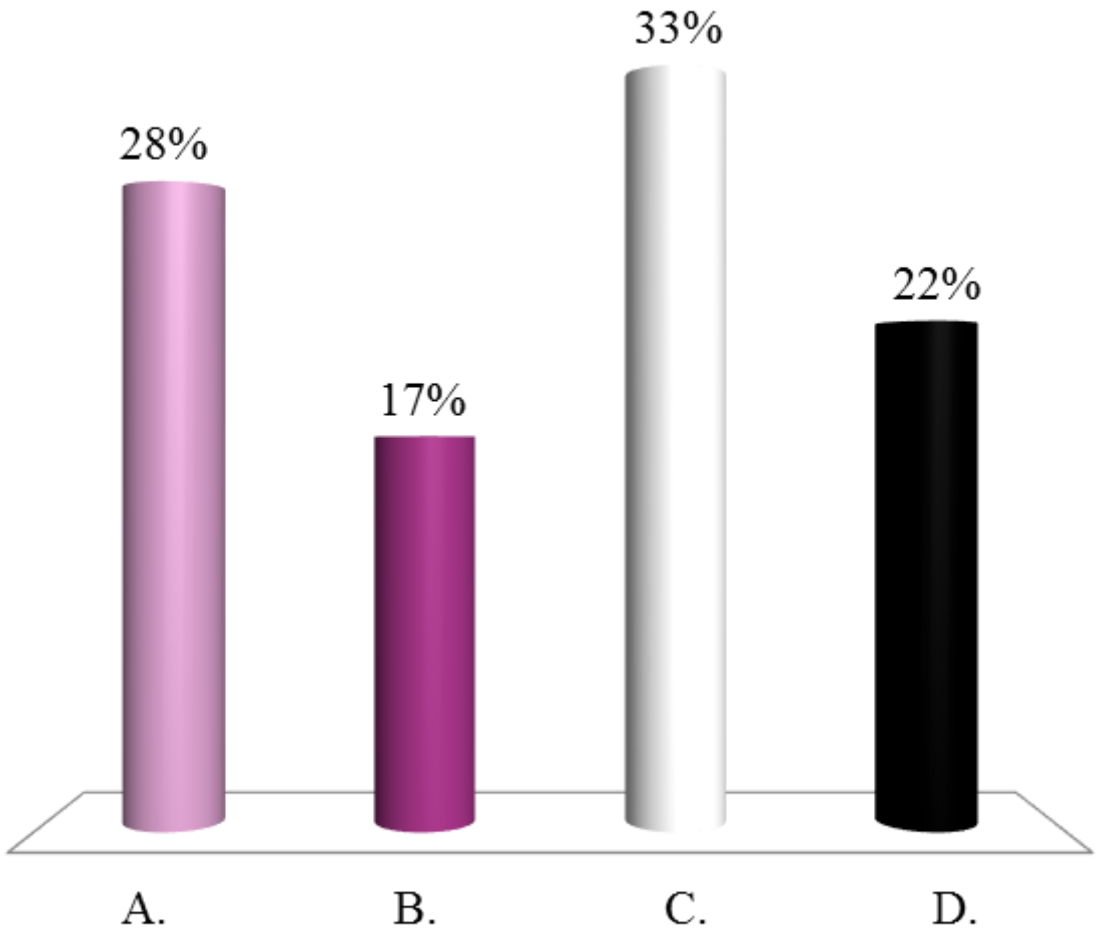
What treatment approach would you suggest for this patient with clinical stage IIIA-N2 (single node 1.7-cm) NSCLC?

A. Surgical resection with mediastinal LN dissection → chemotherapy +/- radiotherapy

B. Neoadjuvant systemic therapy → surgery if no progression

C. Induction chemoradiotherapy (CRT) → surgery if no progression

D. Definitive concurrent CRT



ESTRO School

Which Patients Are Candidates for Surgery?

Early and locally advanced non-small-cell lung cancer (NSCLC): ESMO Clinical Practice Guidelines for diagnosis, treatment and follow-up†

- The preferred treatment of **unresectable LA-NSCLC is definitive concurrent chemotherapy and radiotherapy** [I, A].
- Definitive **thoracic radiotherapy should be no less than** the biological equivalent of **60 Gy in 2.0 Gy fractions** [I, A].
- In patients who are **unfit to receive concurrent** chemotherapy and radiotherapy, the **sequential approach** should be offered as an **alternative treatment with curative intent** [I, A].

Comparison of Concurrent Use of Thoracic Radiation With Either Carboplatin-Paclitaxel or Cisplatin-Etoposide for Patients With Stage III Non–Small-Cell Lung Cancer

A Systematic Review

Table 3. Patient Characteristics

Characteristic	% Cisplatin and Etoposide (n = 3090)	% Carboplatin and Paclitaxel (n = 3728)
Median age, y	61	63
Sex		
Men	65	65
Women	35	35
Histology		
Adenocarcinomas	36	37
Squamous	40	40
Stage IIIA/IIIB	45/54	46/54
Performance status (0/1)	49/49	48.5/51.5
Median radiation dose	63 Gy	64.6 Gy
Median chemotherapy dose	Cisplatin: 50 mg/m^2 Etoposide: 50 mg/m^2	Carboplatin: AUC 2 Paclitaxel: 50 mg/m^2
Induction therapy	3	51
Consolidation therapy	46	39

Abbreviation: AUC, area under the curve.

Table 4. Clinical Outcomes and Toxic Effects in 6818 Patients

Outcome	% Cisplatin and Etoposide (n = 3090)	% Carboplatin and Paclitaxel (n = 3728)	*P* Value
ORR	58	56	.26
OS (weighted median)	19.6 m	18.4m	.40
1-Year survival	65	65	.80
3-Year survival	30	25	.50
PFS (weighted median)	12 m	9.3m	.24
Locoregional relapse	38	37	.63
Distant metastasis	44	46	.50
Pneumonitis	12	9	.12
Esophagitis	23	21	.27
Nausea and/or vomiting	20	11	.03
Anemia	14	9	.15
Thrombocytopenia	14	8	<.001
Neutropenia	54	23	<.001

Abbreviations: ORR, overall response rate; OS, overall survival; PFS, progression-free survival.

ESTRO School

Steuer CE. et al. JAMA 2016;4280

Conclusions

- **No significant differences** were seen in efficacy between Cisplatin-Etoposide (CE) and Carboplatin-Paclitaxel (CP)
- There was no difference in pneumonitis or esophagitis rates between CE and CP. However, **hematologic toxicities and N/V were significantly higher in the CE arm**
- Both **CE and CP with XRT are acceptable standards of care** to treat stage III NSCLC, and prospective data is needed to determine the optimum regimen

Phase III Study Comparing Cisplatin Plus Gemcitabine With Cisplatin Plus Pemetrexed in Chemotherapy-Naive Patients With Advanced-Stage Non–Small-Cell Lung Cancer

Cisplatin/Pemetrexed:

a valuable option for Stage IIIB/IV NON-squamous NSCLC

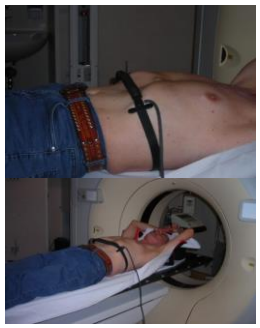
Radiotherapy for Locally Advanced NSCLC

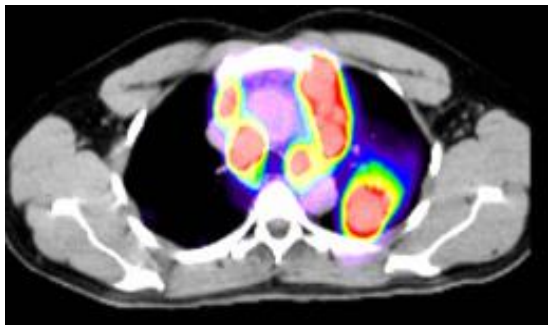
- ***Objectives of XRT for lung cancer***
  - Optimize local control
  - Reduce toxicity

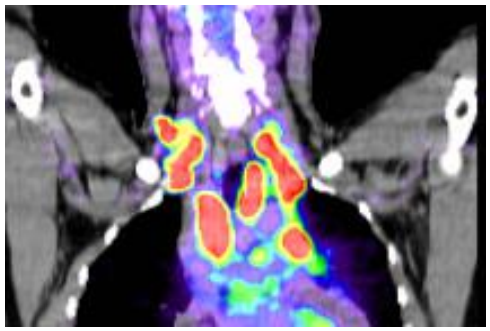
- ***Technical advances that improve UTCP (uncomplicated tumor control probability) rates***
  - Incorporate **PET-CT** into radiation planning
  - **4D-CT** to account for tumor motion (ITV)
  - Advanced planning solutions (**IMRT**)
  - **IGRT** to limit PTV margins

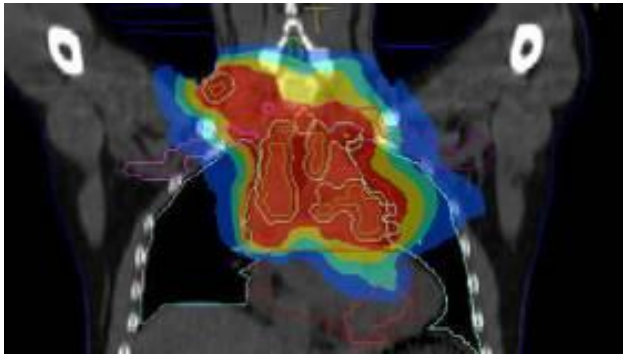
Cutting edge Radiotherapy in Lung Cancer

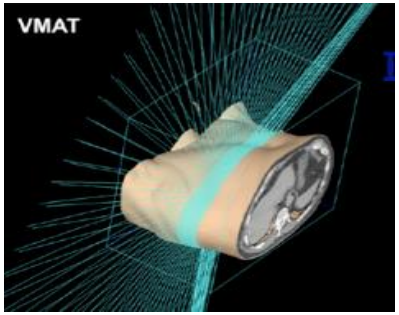
1. **Use of 4D-CT**: accounting for tumor motion during breathing
2. **GTV-Definition**: minimization based on functional Imaging (PET-CT) and shift to smaller CTV volumes

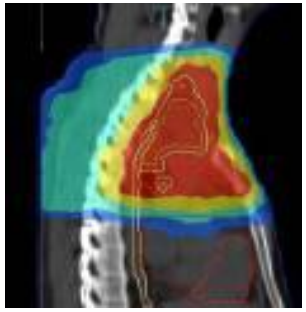




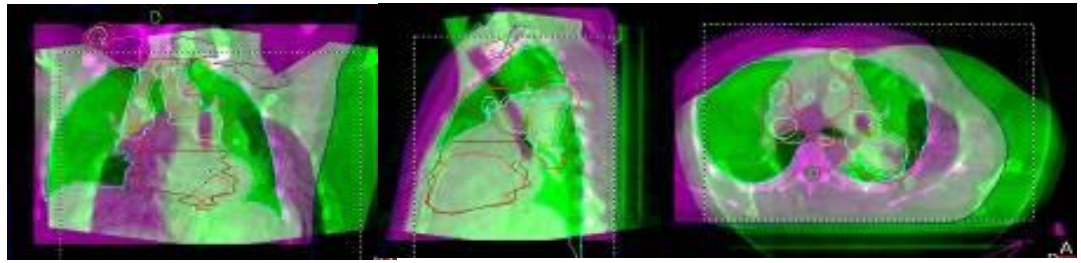




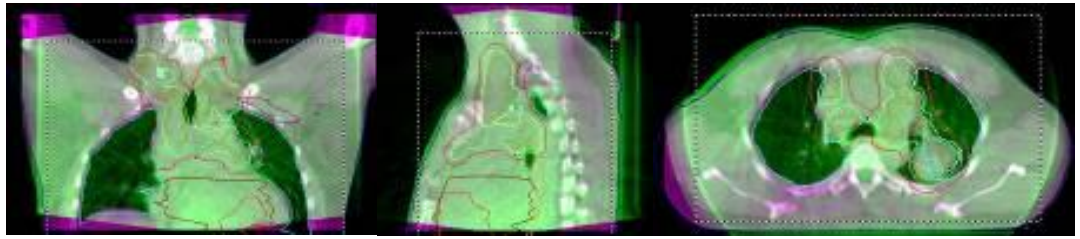




2. Treatment Planning: IMRT based on Monte-Carlo Dose calculation (dose-painting)



Suboptimal Positioning



Optimal Positioning

3. Image Guided Radiotherapy Treatment with Cone-Beam-CT at Linac for margins reduction

ESTRO School

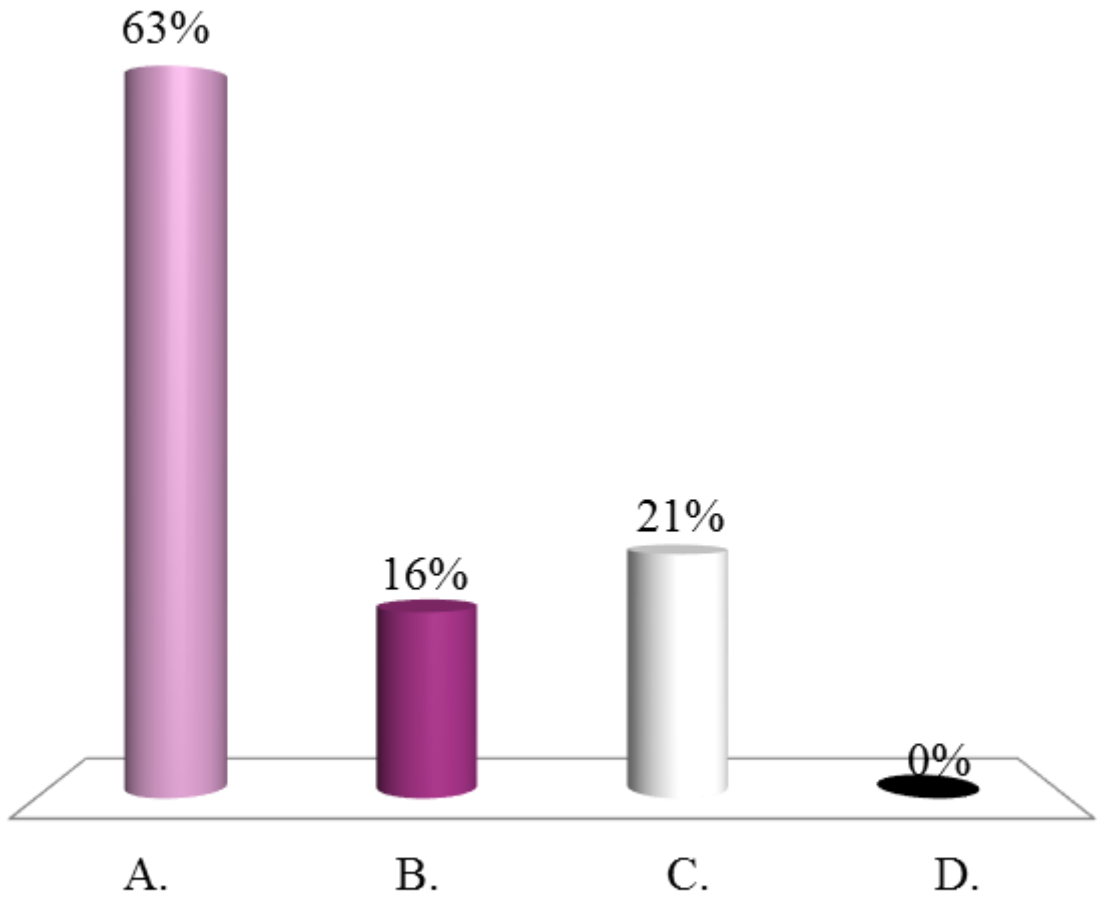
Let's Move back for a while to our patient… He obtained a partial response after Carboplatin/Paclitaxel chemotherapy. Which is now the best RT schedule in a sequential approach ?

A. Thoracic RT 60 Gy/30 fractions

B. Thoracic RT 74 Gy/37 fractions

C. Hypofractionated RT 66 Gy/24 fractions (2.75 Gy/day)

D. Hyperfractionated accelerated RT 60 Gy/40 fractions/tid (4.5 Gy/day in 3 fractions)

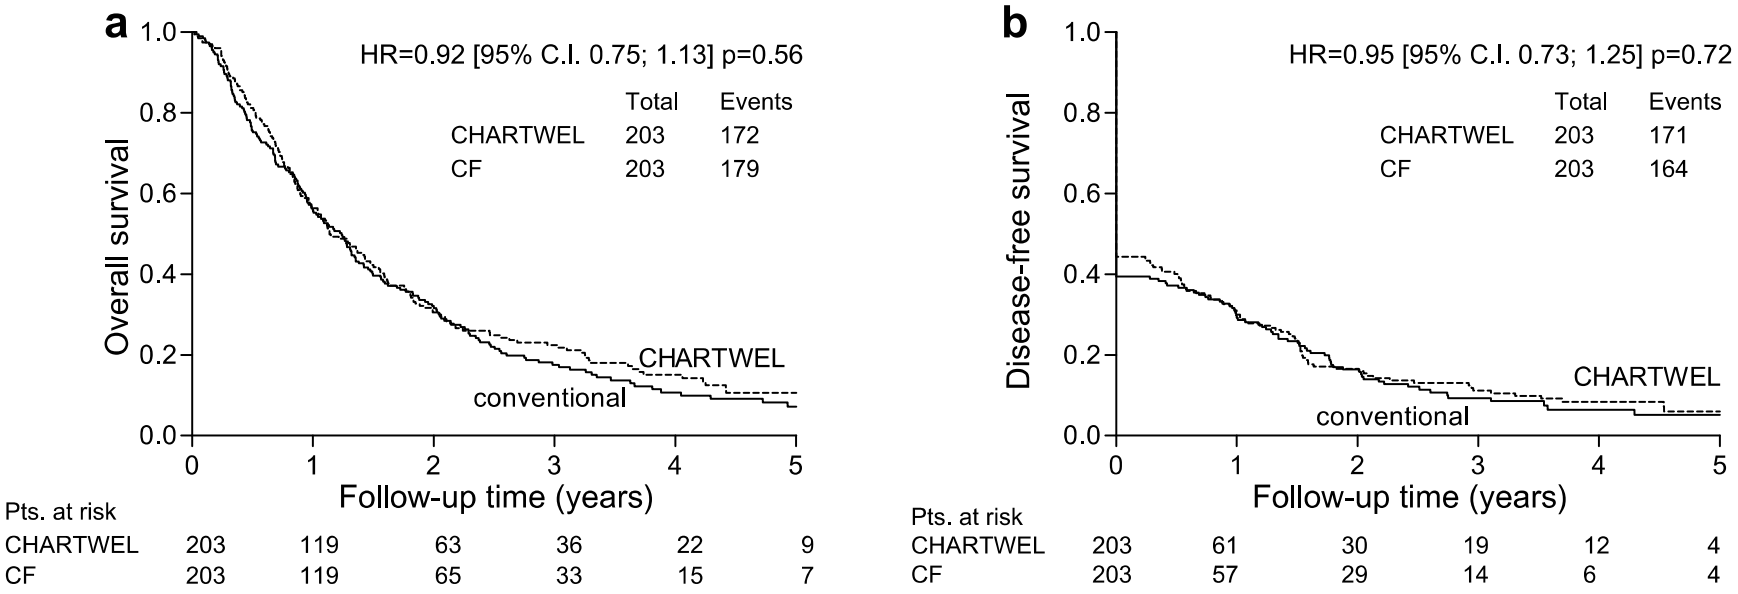


ESTRO School

Phase III randomised trial

Final results of the randomized phase III CHARTWEL-trial (ARO 97-1) comparing hyperfractionated-accelerated versus conventionally fractionated radiotherapy in non-small cell lung cancer (NSCLC)

Hyperfractionated-accelerated RT



- Standard arm: 66 Gy/33 fr.
- Experimental arm: 60 Gy/40 fractions, 3 fractions per day (weekend-less)
- N.B. not all patients received neoadjuvant chemotherapy before RT

- ***"Outcome after CHARTWEL or conventional fractionation was not different"***

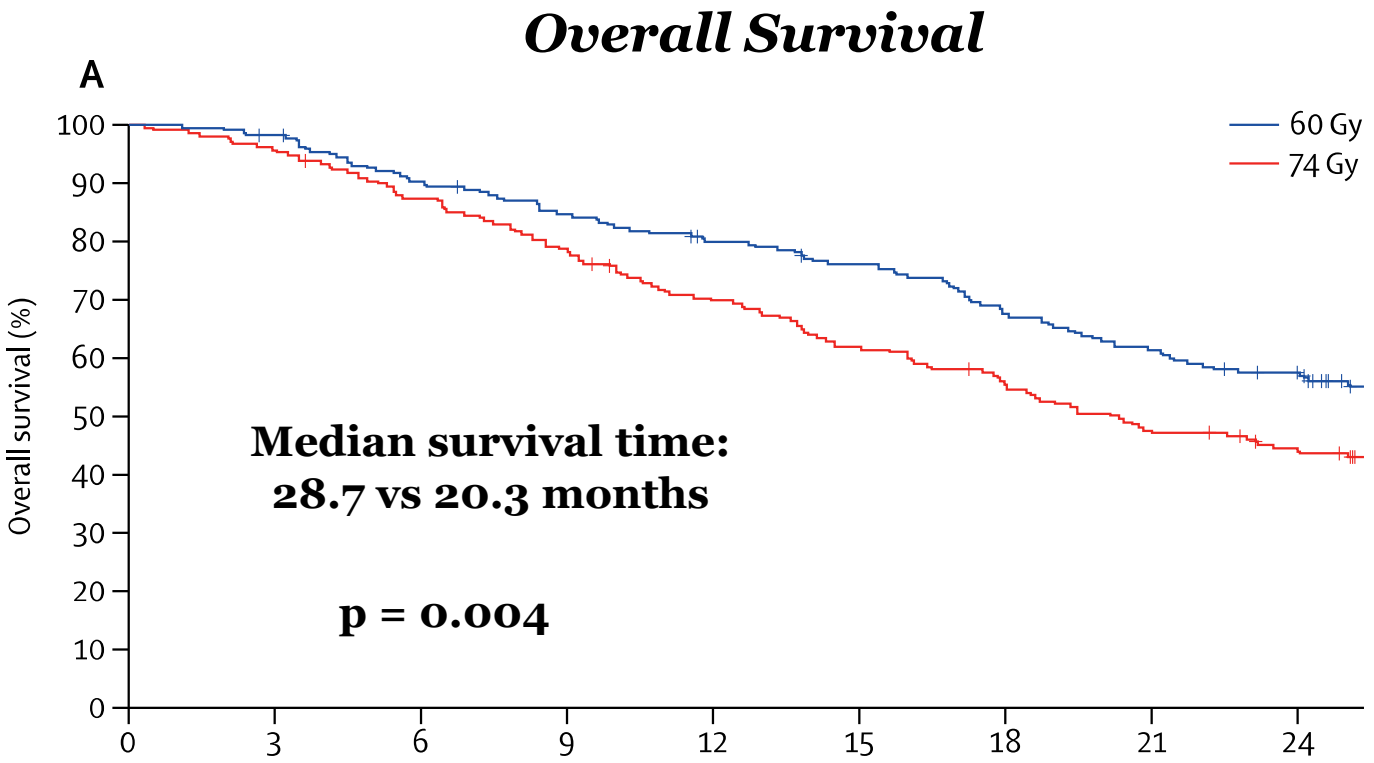
THE LANCET Oncology

Standard-dose versus high-dose conformal radiotherapy with concurrent and consolidation carboplatin plus paclitaxel with or without cetuximab for patients with stage IIIA or IIIB non-small-cell lung cancer (RTOG 0617): a randomised, two-by-two factorial phase 3 study

RTOG 0617 Trial



- **N.B. Local failure rates at 18 months:**
  - 25.1% in standard arm (60 Gy)
  - 34.3% in high dose arm (74 Gy)

→ **p < 0.05**

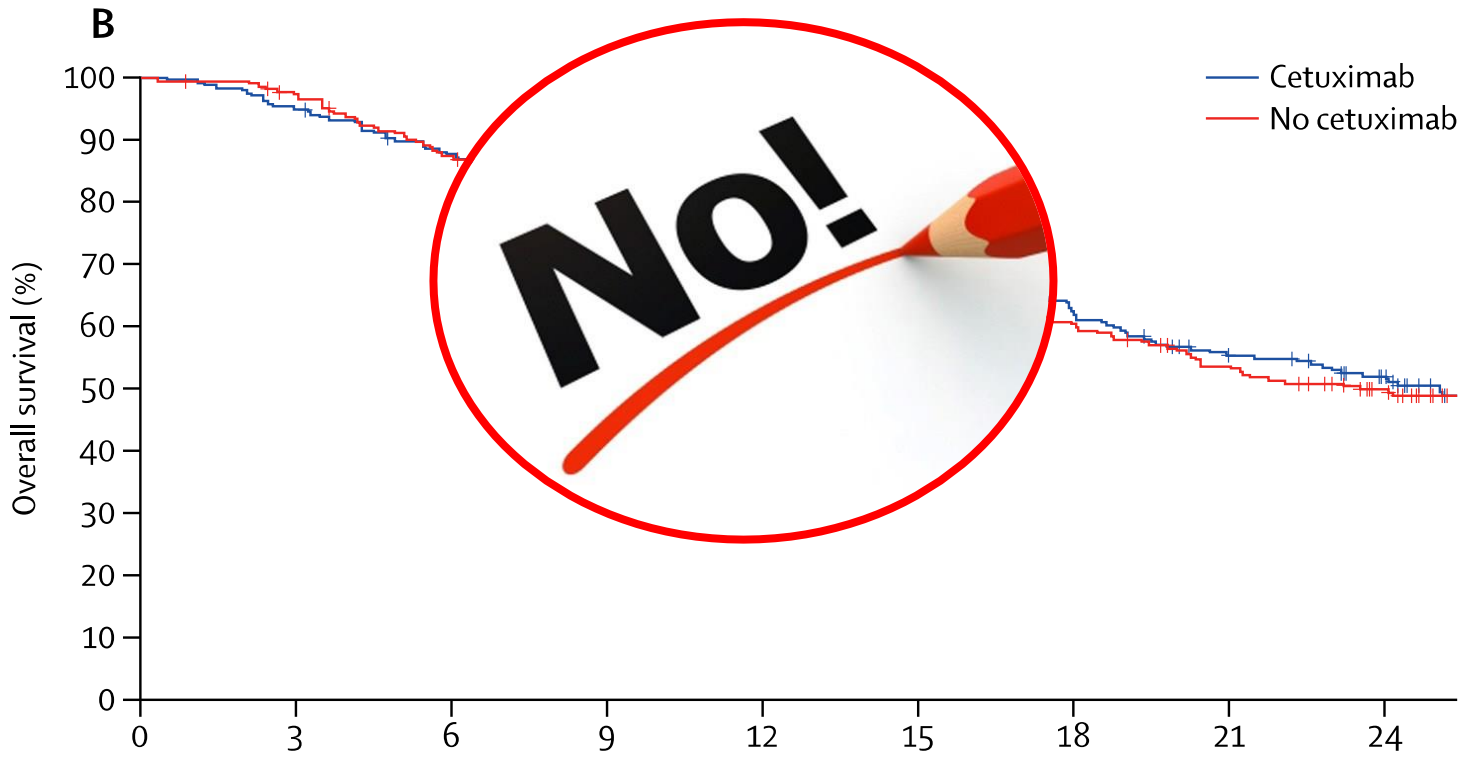
Bradley JD. et al. Lancet Oncol 2015;16

ESTRO School

THE LANCET
Oncology

Standard-dose versus high-dose conformal radiotherapy with concurrent and consolidation carboplatin plus paclitaxel with or without cetuximab for patients with stage IIIA or IIIB non-small-cell lung cancer (RTOG 0617): a randomised, two-by-two factorial phase 3 study

RTOG 0617 Trial – Any role for Cetuximab ?



Bradley JD. et al. Lancet Oncol 2015;16

ESTRO School

RTOG 0617 – Conclusions

- **"Positive" of RTOG 0617**
  - Excellent median survival of 28.7 months in the 60-Gy study arms when compared with prior cooperative group studies in stage III NSCLC.
  - May reflect PET scan use for staging (used in ~ 90% of pts)

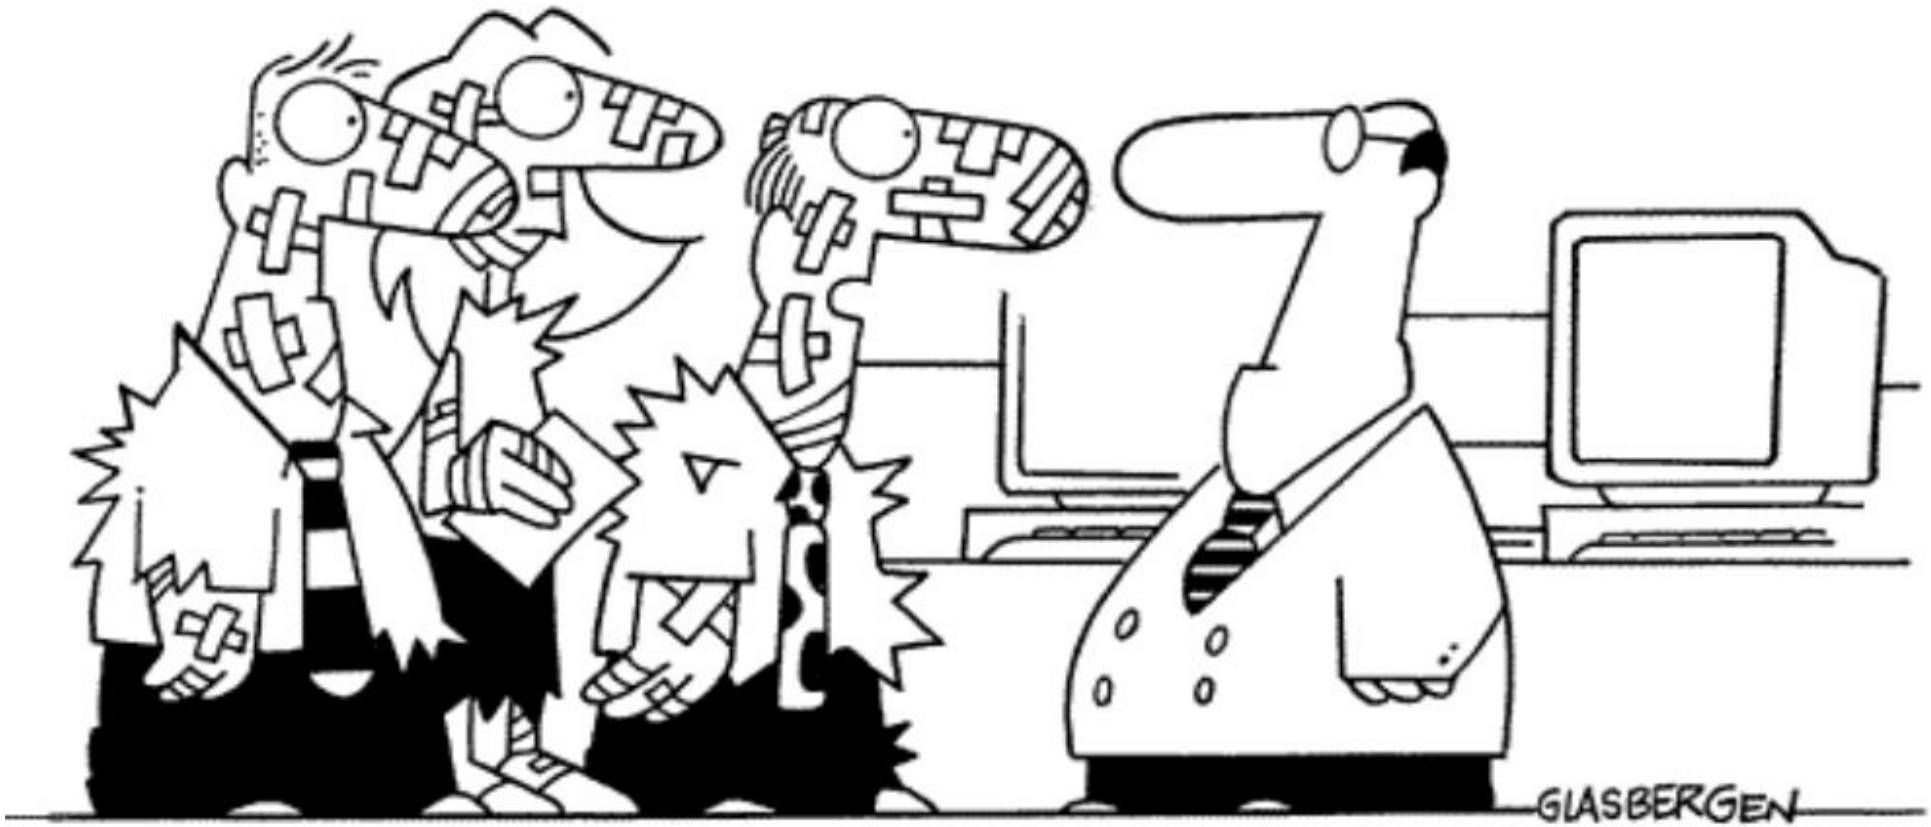
- **"Negative" of RTOG 0617**
  - 74 Gy radiation with concurrent CT was not better than 60 Gy for patients with stage III NSCLC, and might be potentially harmful.
  - Addition of Cetuximab to concurrent CR-RT and consolidation treatment provided no benefit in OS for these patients, but increased overall grade 3-5 toxicity (85% vs 69%, $p < 0.0001$)

RTOG 0617…

Why results poor in higher RT dose arm? NOT YET KNOWN

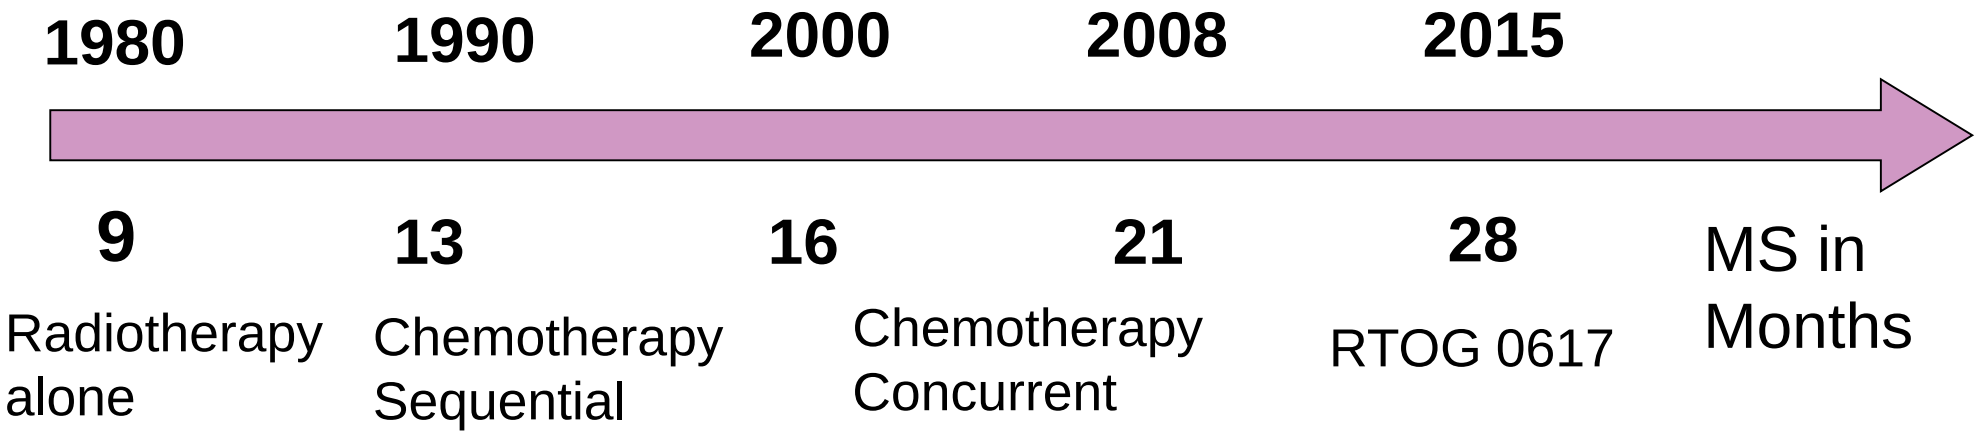
- Higher rate of treatment-related deaths?
- Higher dose of radiation to the heart (V_{40})?
- Unreported side effects?
- Higher dose scheduled compromising overall treatment time?
- RT delivery?

ESTRO School



“Frankly sir, we’re tired of being on the cutting edge of technology.”

Survival of Stage III NSCLC:



1. Stage Migration
2. Concurrent Chemo-radiation Therapy
3. Improved Radiation Technology

clinical practice guidelines

Annals of Oncology 24 (Supplement 6): vi89–vi98, 2013
doi:10.1093/annonc/mdt241
Published online 16 July 2013

Early and locally advanced non-small-cell lung cancer (NSCLC): ESMO Clinical Practice Guidelines for diagnosis, treatment and follow-up†

- Stage III NSCLC: the **gap** between an **ideal patient** from the guidelines and the **average patient** from clinical practice is especially wide

ESTRO School

Vansteenkiste J, et al. Ann Oncol. 2013;24

- **Locally advanced NSCLC (IIIA-IIIB)**
- **Oligometastatic NSCLC**

Categories of Oncology Care and Historical Outcomes

1) Local (limited to the site of origin)

- Highest cure rates (especially with more extensive surgery)
- Non-surgical treatments woefully inadequate
- Relapse is predominantly distant

2) Local-regional (spread to lymph nodes and adjacent organs)

- Mediocre cure rates, 30-50%
- Concurrent chemo added to improve radiotherapy
- Most patients will relapse either locally or distant

3) Metastatic (spread to distant sites)

- Dismal cure rates, <5%
- Surgery only helpful in small percentage
- Most patients first relapse in original sites of disease burden

ESTRO School

Moving Forward……

1) **Local**
   - Need an effective NON-SURGICAL treatment option
2) **Local-regional**
   - Need to “break the stalemate” of concurrent chemoradiotherapy by finding a potent local therapy
3) **Metastatic**
   - Even “targeted” systemic therapies fail first in sites of initial gross disease
   - Need to add a potent but tolerable local therapy

The Oligometastatic State

In a 1995 JCO Editorial, clinical evidence led Hellmann and Weichselbaum to coin the term "oligometastases"

It was a proposal for a new clinical concept :

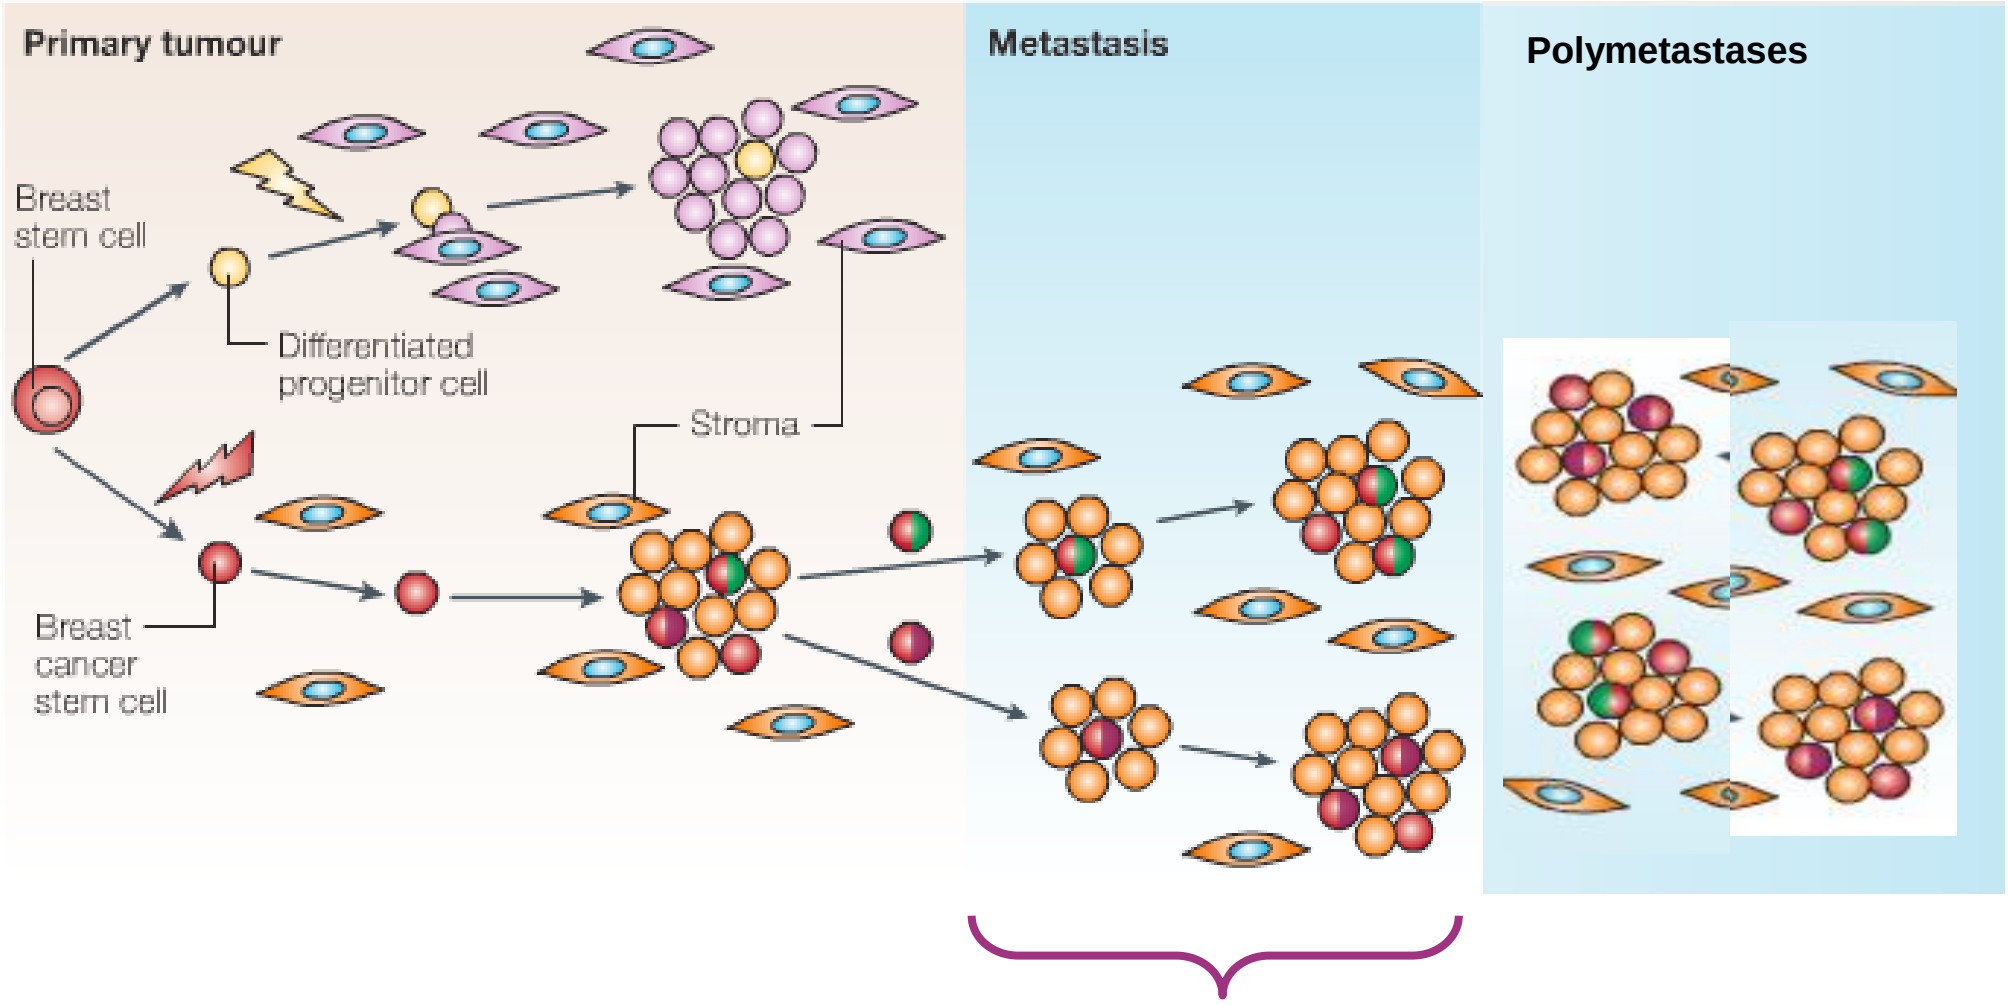
- **Intermediate** biologic state of restricted metastatic capacity between truly locoregionally-confined and widely –metastatic cancer
- **Limited** number and organ sites of metastases
- **Transitional** state to dissemination (not yet achieved a widespread dissemination)

*Oligometastatic state (by "arbitrary definition"): limited number of metastases (**usually ≤ 5**), all amenable to radical local therapies*

Weichselbaum & Hellmann. J Clin Oncol 1995;13
Weichselbaum & Hellmann. Nat Rev Clin Oncol 2011;8

ESTRO School

Terminology and definition

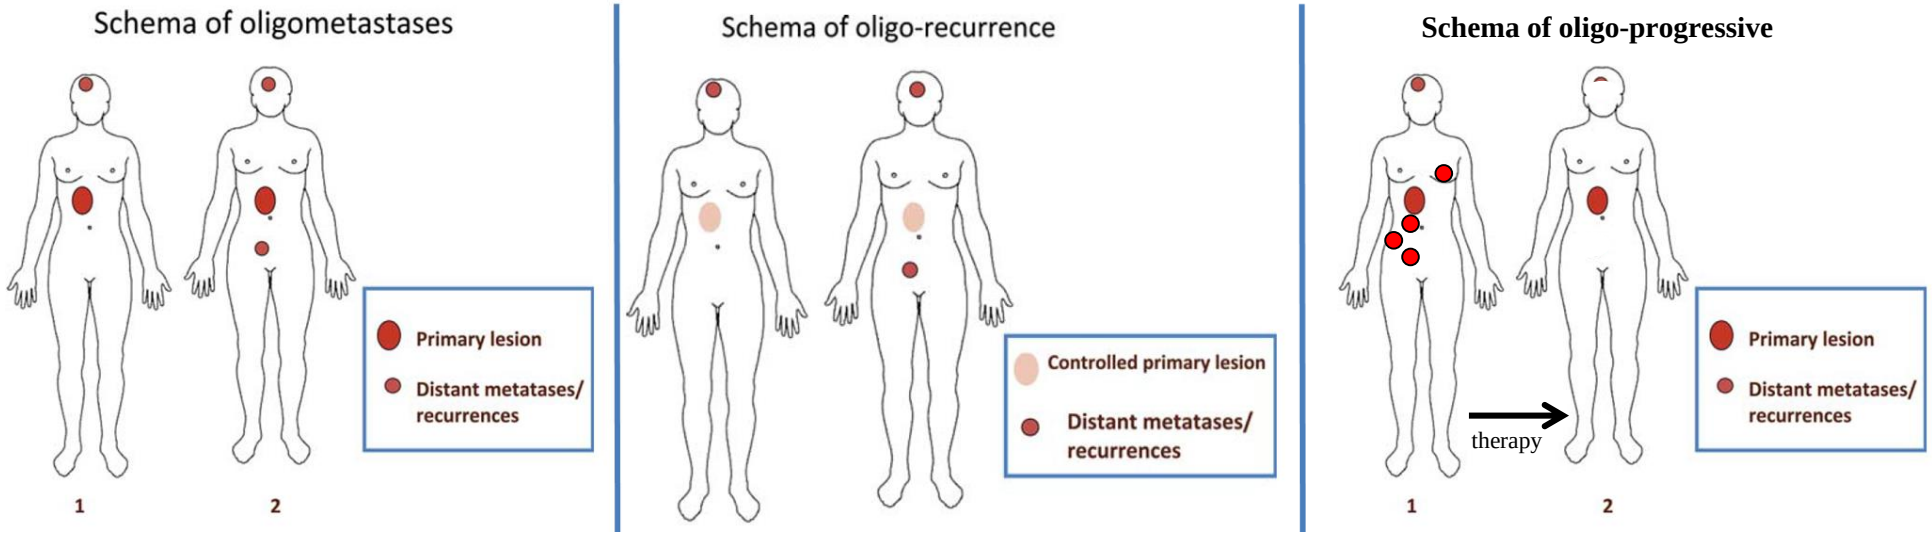


Oligometastases → *Patients with **one to five metastases** may be at a continuum between truly local disease and widely disseminated cancer*

ESTRO School

Distinct cohorts of oligometastatic disease

‘**oligometastases**’ = diagnosed with oligometastatic disease
‘**oligorecurrence**’ = relapsed oligometastatic disease
‘oligoprogressive’ = status after cytoreductive therapy



❑ ***These cohorts have probably different prognoses***

ESTRO School

The Oligometastatic State

- In such a state of limited disease burden (≤ 5 mts), the **eradication of all sites** of metastatic disease with a **local therapy** (either surgery or radiotherapy) could result in **long-term survival** or even **cure** in a subgroup of pts
- This hypothesis is **based on long-term survival following** surgical **resection** of limited lung and liver metastases in some tumors
- Extracranial oligometastases are **different from intracranial oligometastases**, which represent an **established clinical entity** where surgery, radiotherapy, radiosurgery have defined roles supported by phase III RCT and detailed outcome analyses

An Individual Patient Data Metaanalysis of Outcomes and Prognostic Factors After Treatment of Oligometastatic Non–Small-Cell Lung Cancer

RPA OVERALL SURVIVAL

- 757 oligometastatic patients
- Training and validation cohorts
- Surgery to primary tumors: 83.9%
- Surgery to metastatic patients: 62.3%

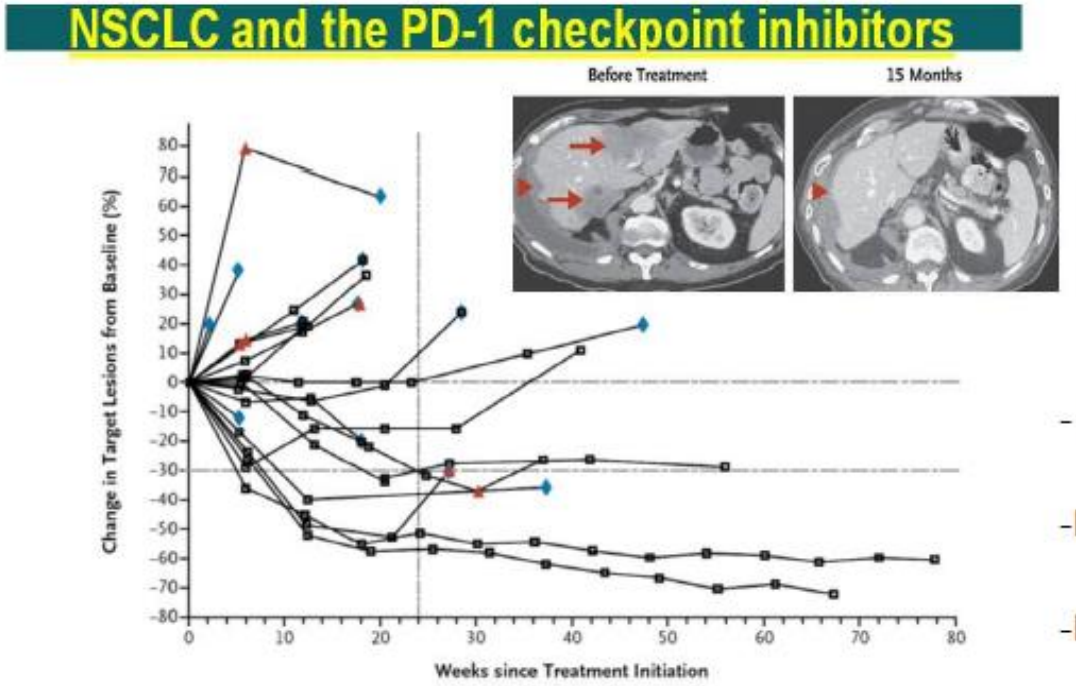
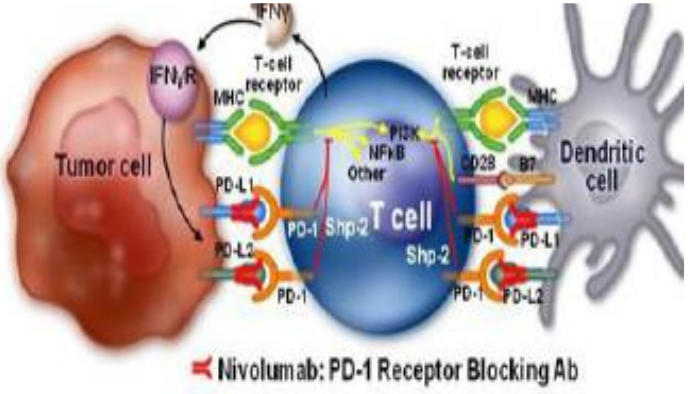
Immunotherapy: a less toxic approach
To increase treatment success rates in NSCLC



Topalian, S et.al. NEJM 2012, Brahmer J et al. NEJM 2012



- Biomarker?

-Role in first line?

-Role as adjuvant treatment?

- Combination with chemo?

- Combination with anti-CTLA4?

-Combination with radiotherapy ?

PD-1 inhibitors and RT

- **PD-L1** expression is a **prognostic factor** in resected NSCLC and a **predictive factor for efficacy** of therapies targeting PD-1 and PD-L1 in metastatic NSCLC.
- The **prognostic value of PD-L1** expression in patients with NSCLC treated with radiotherapy **(RT) and** chemotherapy **(CT)** has **not been explored**.
- Tumor **immune microenvironment is involved** in mechanisms underlying **efficacy of RT and CT**, suggesting that PD-L1 expression may modulate response to these treatments.

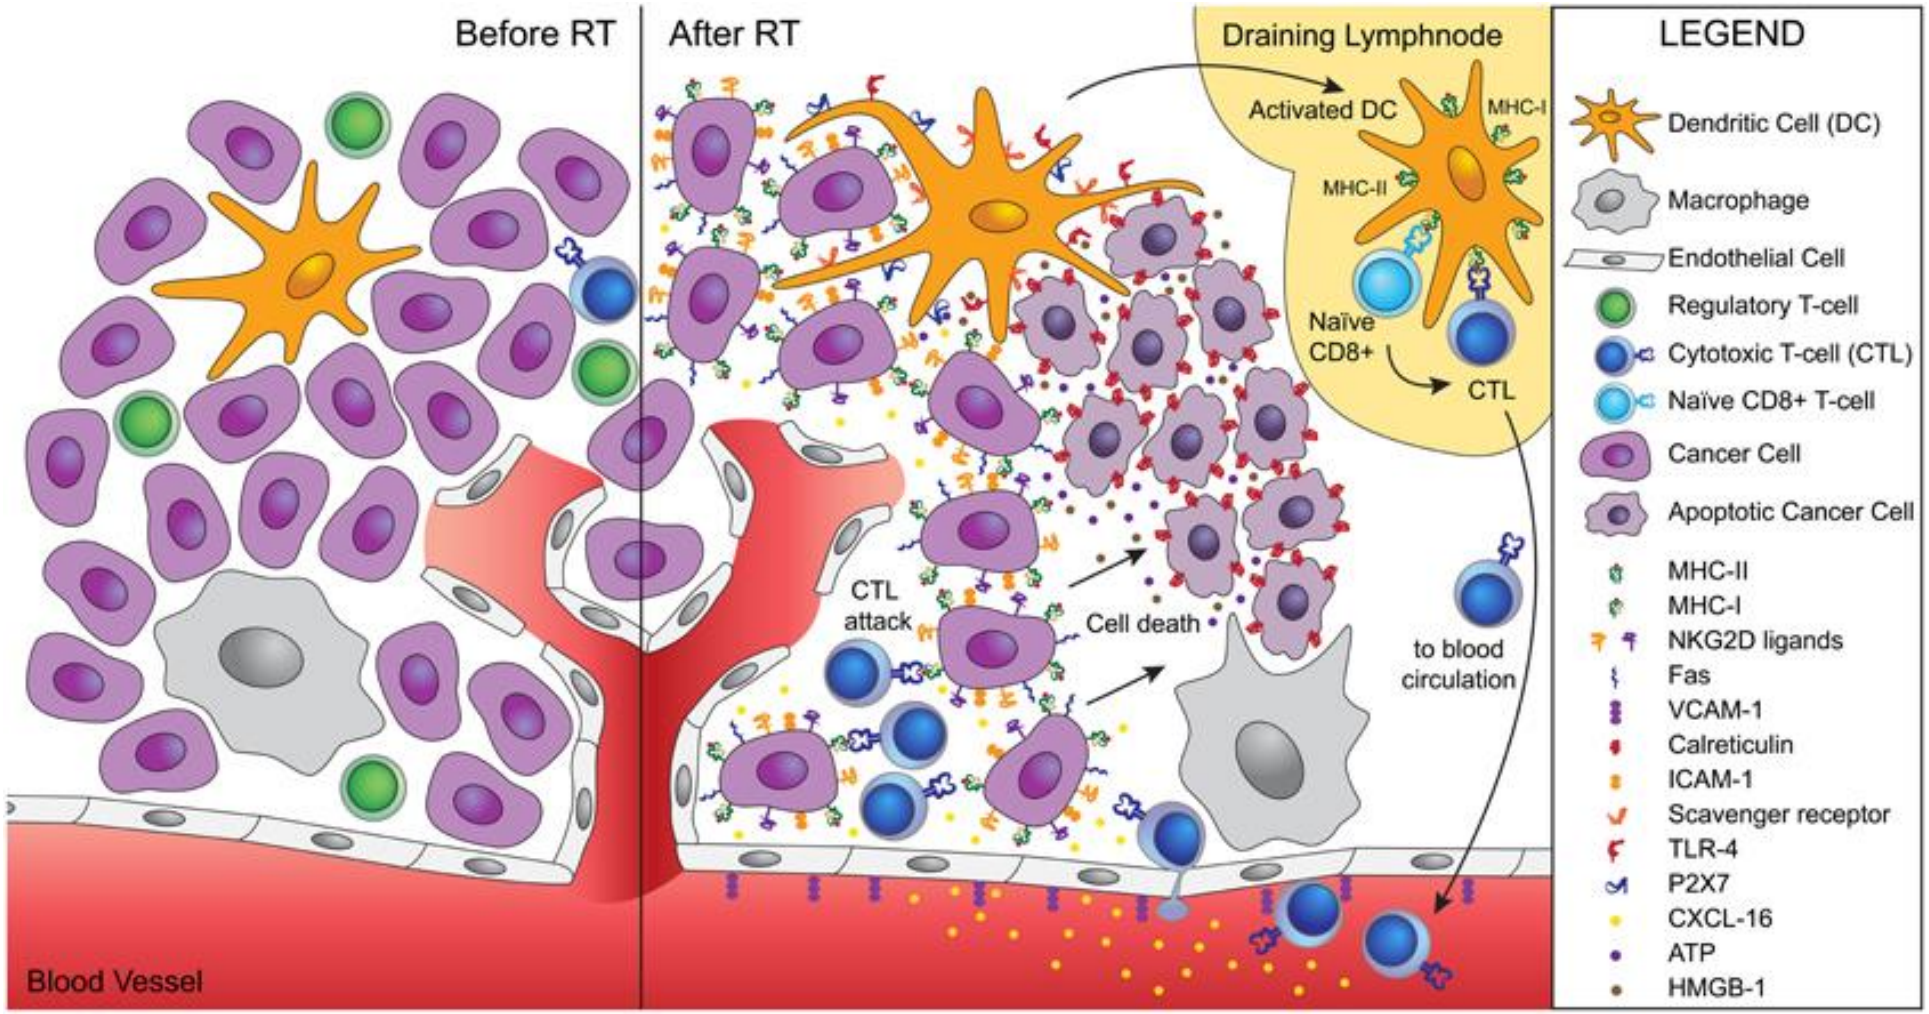
Randomized data needed due to lack of historical baseline and recent stage migration

Rationale for combining RT and immunotherapy

- **Mechanism: spatial and biologic cooperation , temporal modulation**

  - RT induced release of tumor antigens leading to activation of the immune system
  - RT induced expression of PDL1
  - RT induced bystander (abscopal) effect
  - RT+IT increases CD8+ T cells

Ionizing radiation acts as a modifier of the tumor microenvironment converting the tumor into an "*in situ* vaccine".



De Maria & Formenti, Front Oncol 2012

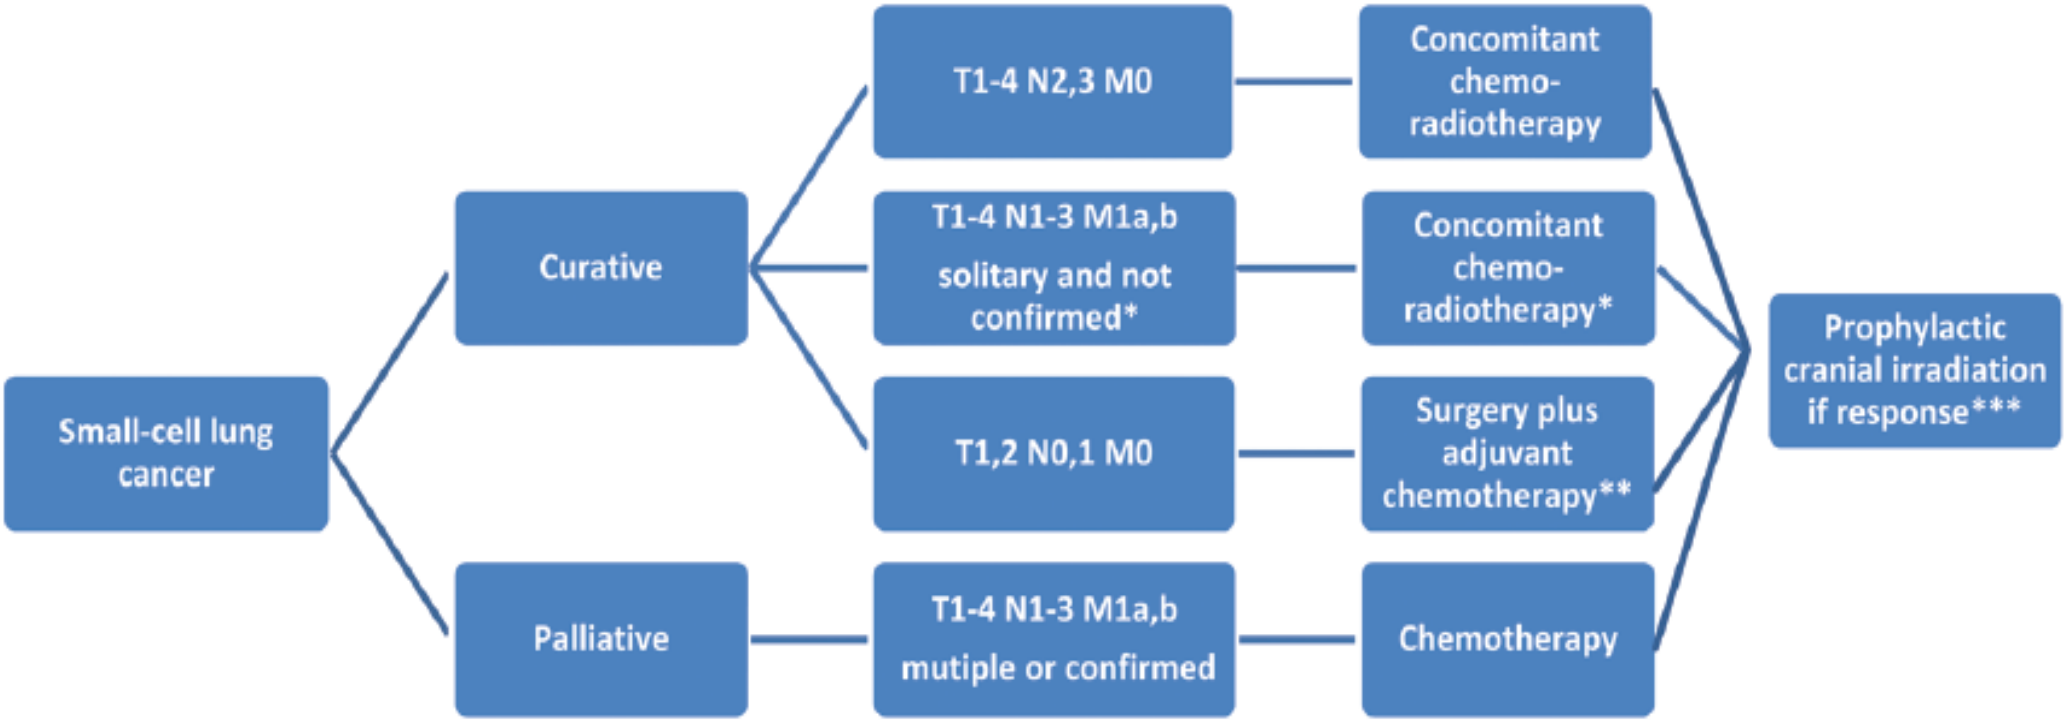
Small-cell lung cancer (SCLC): ESMO Clinical Practice Guidelines for diagnosis, treatment and follow-up†

M. Früh[1], D. De Ruysscher[2], S. Popat[3], L. Crinò[4], S. Peters[5] & E. Felip[6], on behalf of the ESMO Guidelines Working Group*

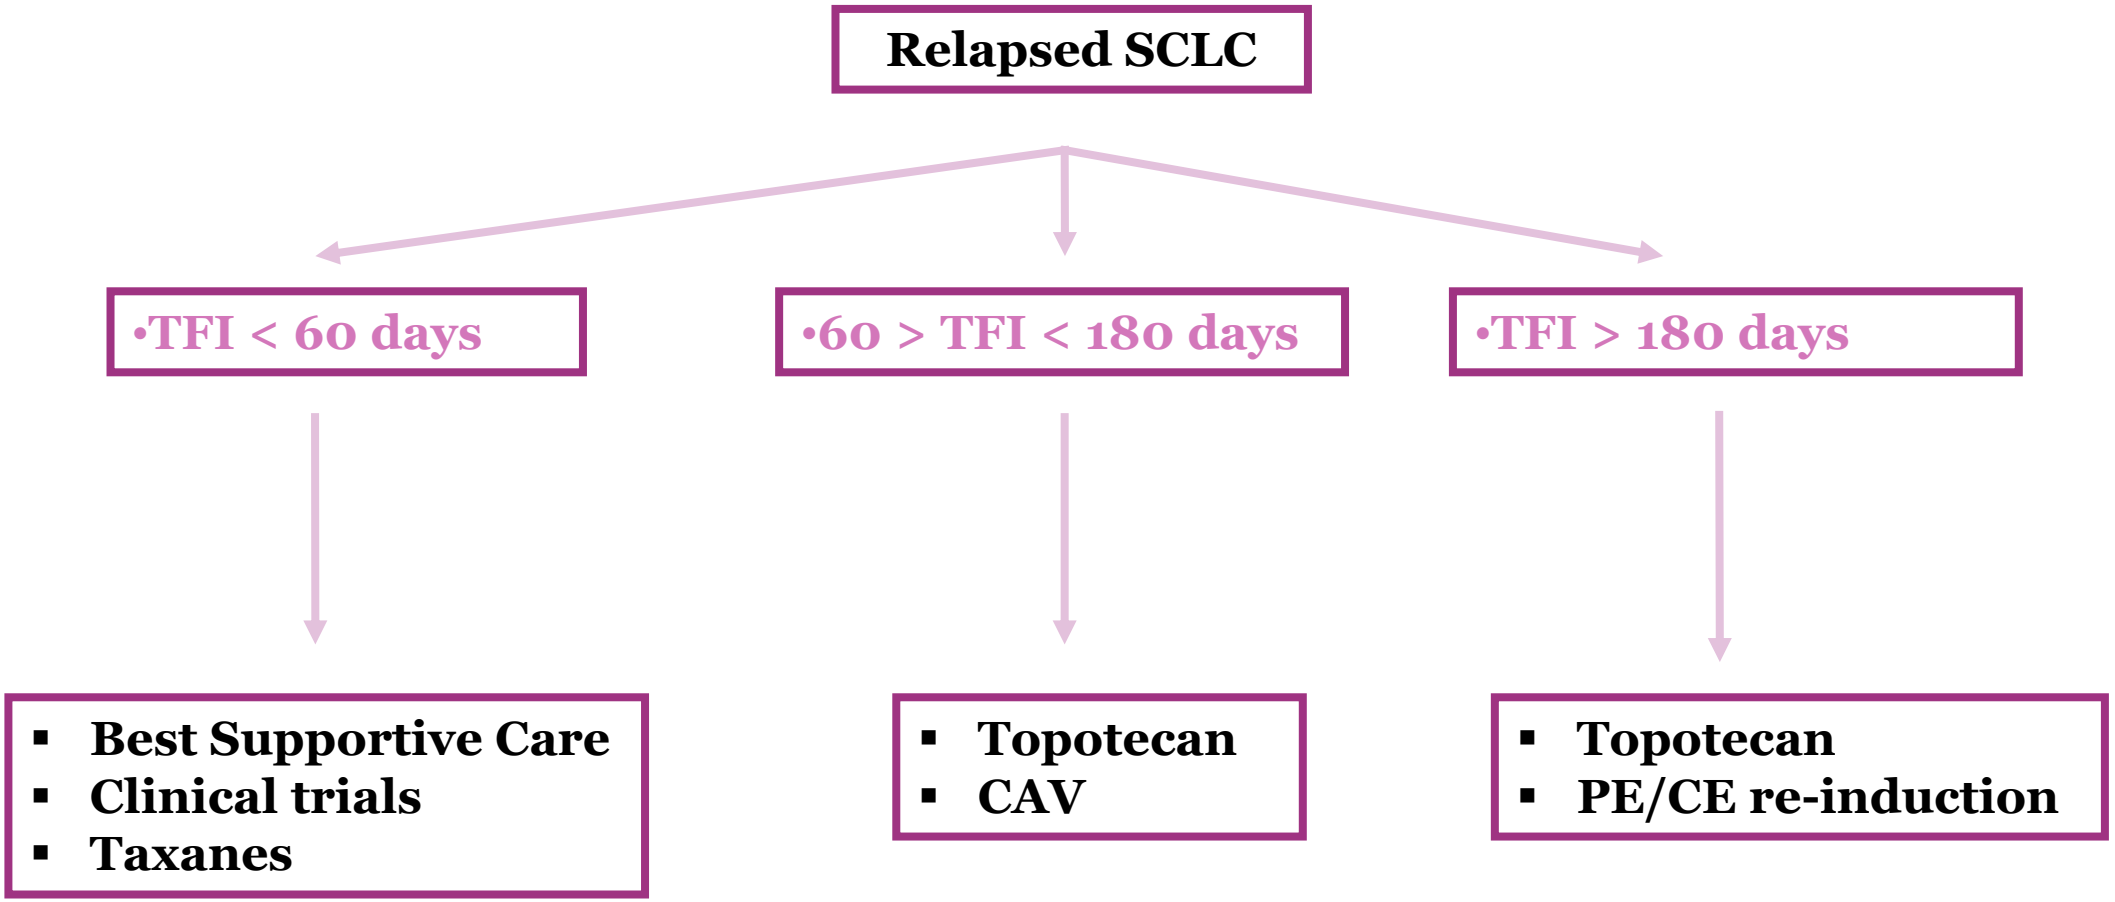


***if no confirmation of solitary metastasis is obtained, radiotherapy may be added after first response evaluation and is omitted in case of obvious metastatic involvement**

**** concomitant chemoradiotherapy as an alternative option**

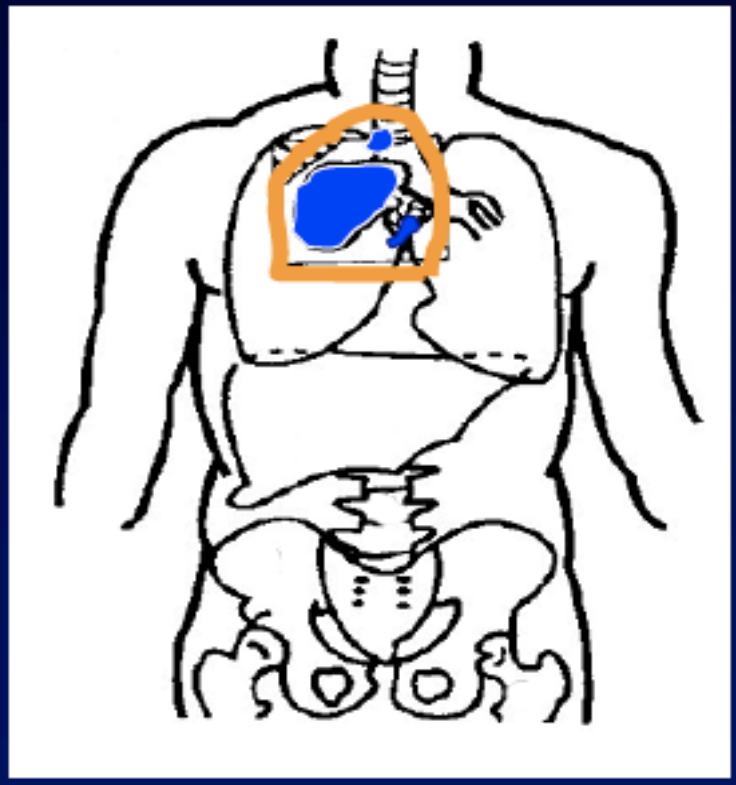
***** or stable disease in case of localised disease**

Standard treatment of relapsed SCLC

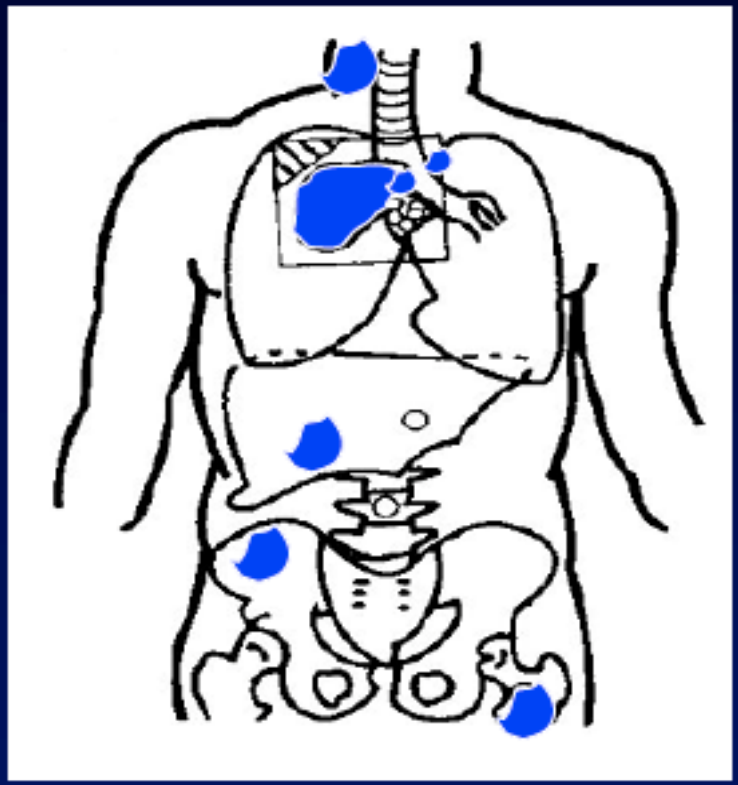


ESTRO School

SCLC: staging



Limited disease (LD)



Extensive disease (ED)

ESTRO School

SCLC and radiation therapy

- **LIMITED DISEASE:** disease limited to the chest and capable of inclusion with a reasonable radiotherapeutic portal

- **EXTENDED DISEASE:** disease outside the chest or not capable of inclusion with a reasonable radiotherapeutic portal

LIMITED DISEASE

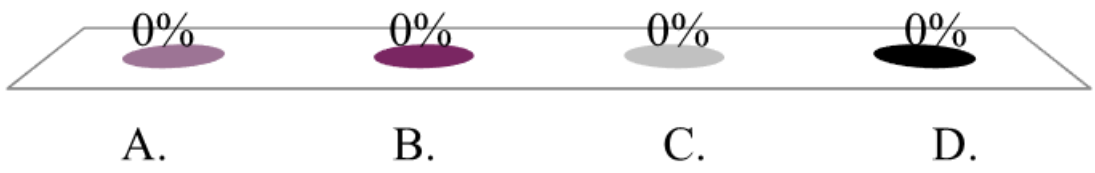
A colleague has referred to you a 62 year old male patient in excellent clinical conditions (ECOG PS 0) affected with LD-SCLC.
No comorbities. Which is the best treatment strategy for this patient ?

A. **Chemotherapy alone (Cisplatin + Etoposide x 4-6 cycles)**

B. **Chemotherapy (Cisplatin + Etoposide) + thoracic RT (60 Gy)**

C. **Chemotherapy (Cisplatin + Etoposide x 4 cycles) + thoracic RT (60 Gy) + Prophylactic cranial irradiation if patients responds to CMT.**

D. **Chemotherapy (Cisplatin + Paclitaxel x 4 cycles) + thoracic RT (60 Gy) + Prophylactic cranial irradiation if patients responds to CMT.**

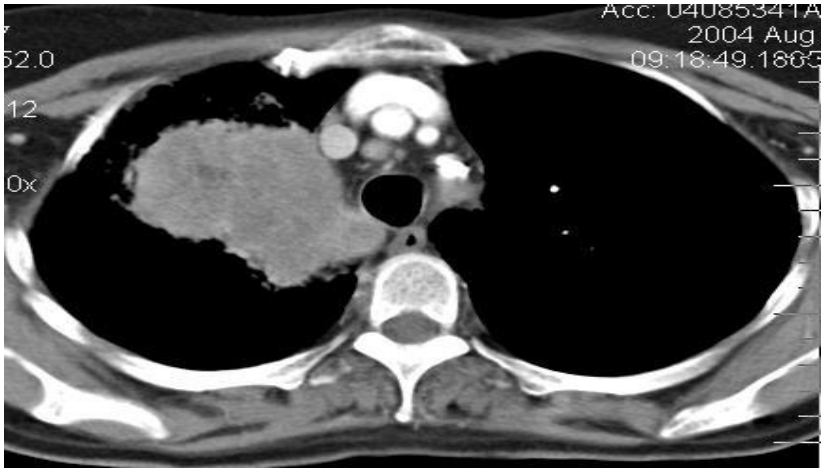


ESTRO School

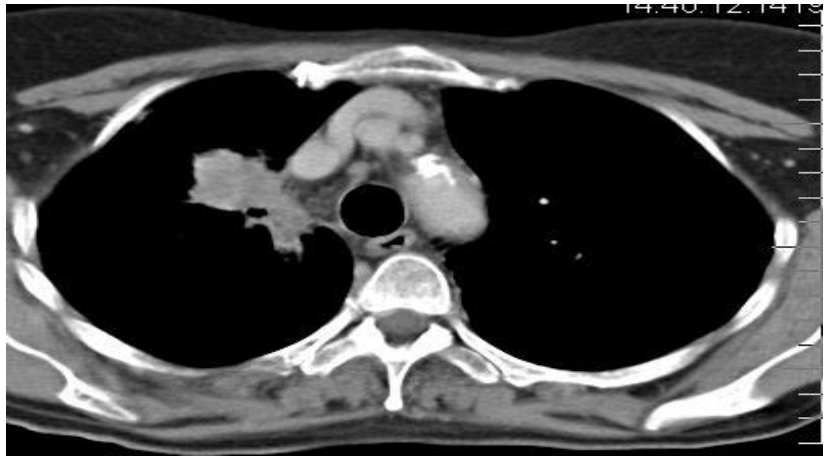
LD-SCLC

- The disease is “limited” in 20% of patients (TNM IASLC classification probably better)
- Is a systemic disease
- Surgery has a limited role
- CT is the mainstay of treatment and RT is the most important local therapy

Before treatment
(Chemo-radiotherapy)



After treatment
(Chemo-radiotherapy)



ESTRO School

Chemotherapy Regimens

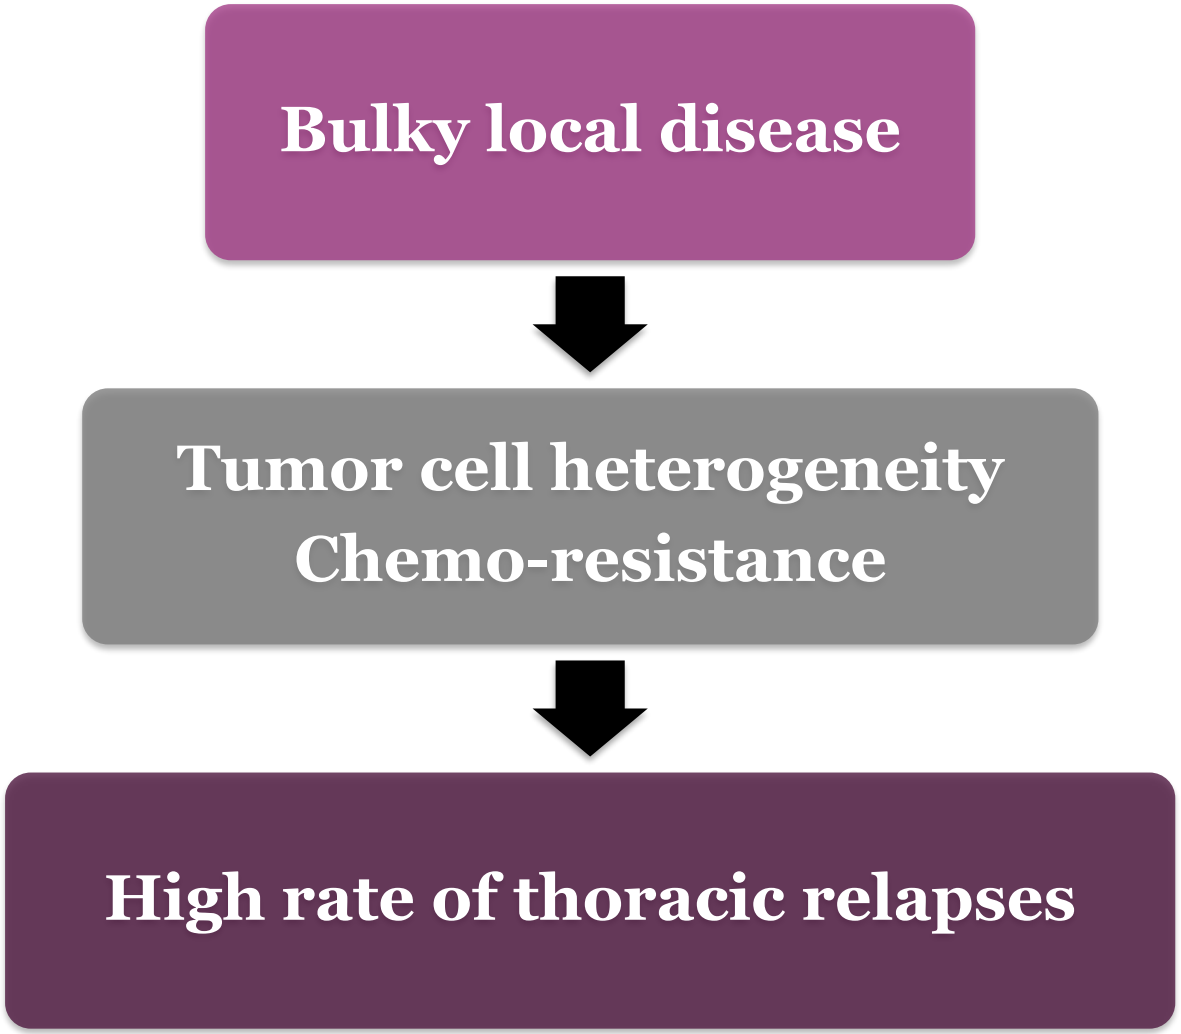
- **EP** (Etoposide Cisplatin)
- **CAV** (Cyclophosphamide/Doxorubicin/Vincristine)
- **IP** (Irinotecan/Cisplatin)

All these regimens are considered standard therapies, but EP is largely preferred because can easily be integrated with TRT

Small cell lung cancer: treatment outcomes

	LD	ED
Response rate (CR + PR)	80-90%	70-80%
Complete response	50-60%	20-30%
Median survival	12-16 mos.	8-10 mos.
Long-term survival	5-10%	<1%

LD-SCLC: rationale for thoracic irradiation (TRT)



ESTRO School

Metanalysis of 13 studies on the role of thoracic RT in LD-SCLC

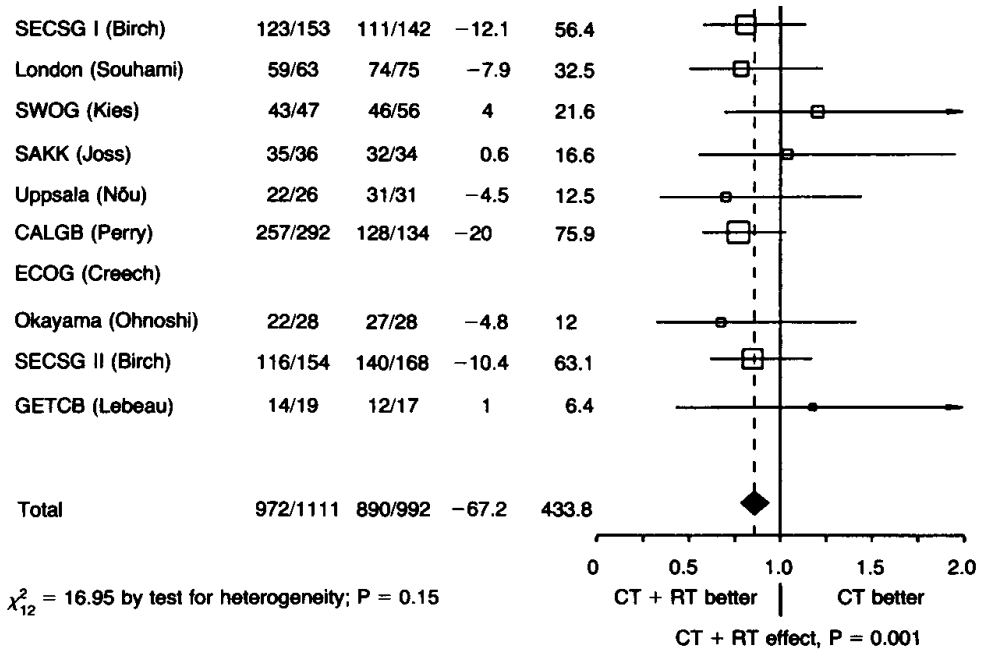


Figure 1. Relative Risk of Death among Patients Receiving Both Chemotherapy and Radiotherapy (CT + RT) as Compared with Patients Receiving Chemotherapy Alone (CT).

Each open square represents the relative risk for the trial, and each horizontal line its 99 percent confidence interval; the area of each square is proportional to the amount of information from the corresponding trial. The broken line and the solid diamond represent the pooled relative risk and its 95 percent confidence interval (see the Statistical Analysis section for details). The percentage reduction in the pooled relative risk

5.4% gain in OS @ 3 years (14.3% vs 8.9%)

p = 0.001

Pignon JP et al. NEJM 1992;327

Approaches to increase the efficacy of Thoracic RT

1) **Early administration**
2) **Increasing total dose**
3) **Altered fractionation schedules**
4) **Optimal radiation volumes**

1) “Early” irradiation in LD-SCLC: arguments for and against

FOR:

- ❑ Earlier tumor regression
- ❑ Decreased risk of resistant clones appearance

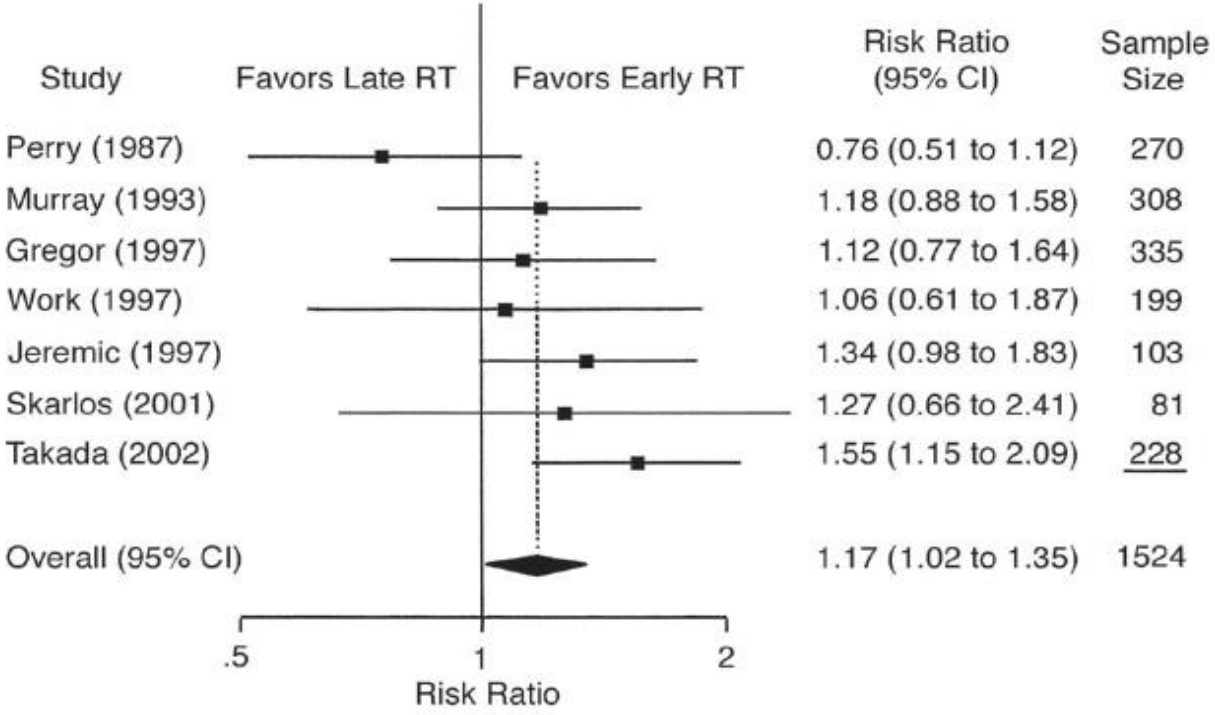
AGAINST:

- ❑ No selection of patients
- ❑ Increased toxicity
- ❑ Larger irradiated volumes

ESTRO School

1) “Early” vs. “Late” thoracic RT in LD-SCLC

Overall Survival @ 2 years



- **Early RT** = beginning of RT **within 9 weeks** after the initiation of chemotherapy and **before the third cycle** of chemotherapy

- **Late RT** = beginning of RT **9 weeks or more** after the initiation of chemotherapy or **after** the beginning of **the third cycle** of chemotherapy

Fried DB et al, JCO 2004;22

ESTRO School

The concept of SER in LD-SCLC (Start of any treatment to the End of Radiotherapy)

Time Between the First Day of Chemotherapy and the Last Day of Chest Radiation Is the Most Important Predictor of Survival in Limited-Disease Small-Cell Lung Cancer

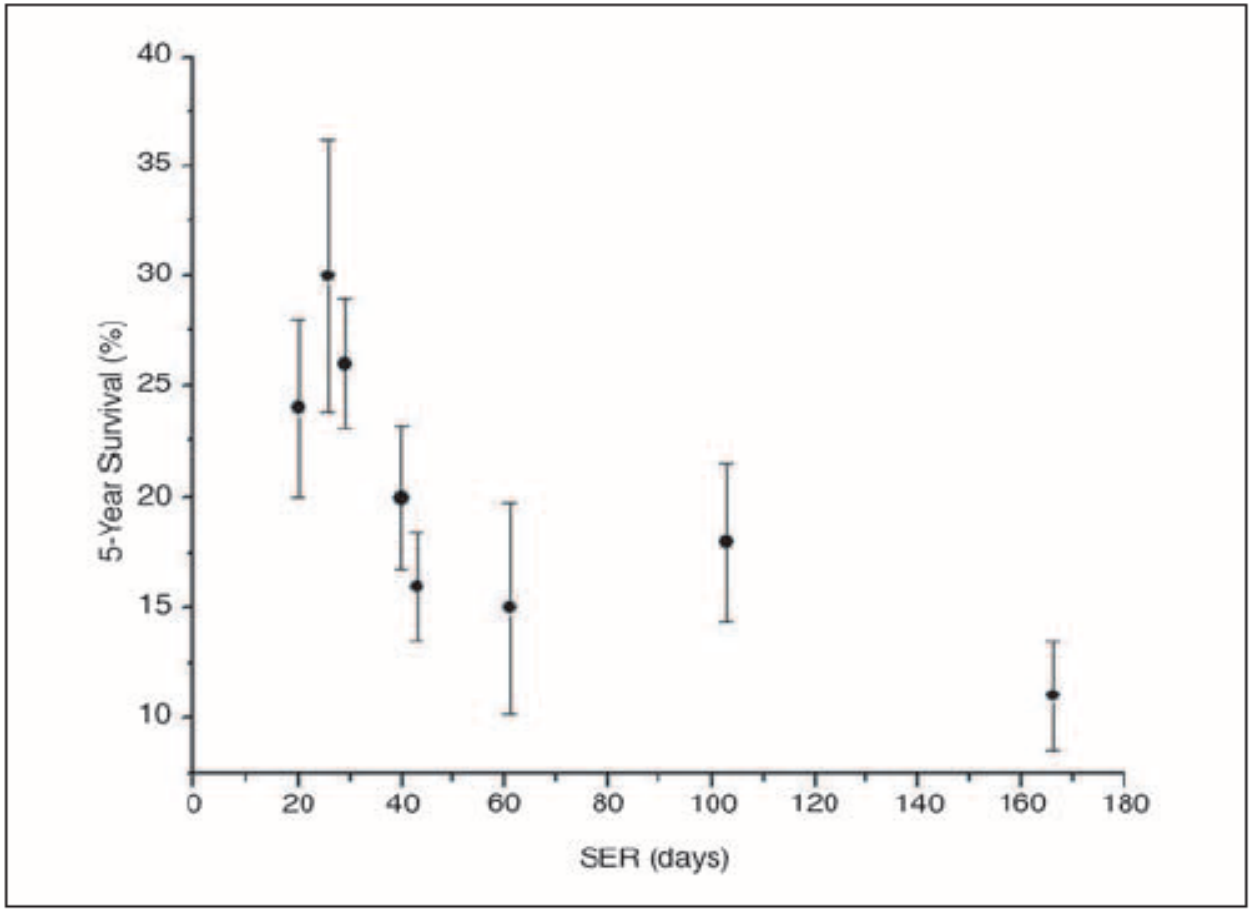


Fig 5. The survival at 5 years as a function of the time from the start of any treatment and the end of radiotherapy (SER). Each dot represents a single trial ± SE.

De Ruysscher D. et al JCO 2006;24

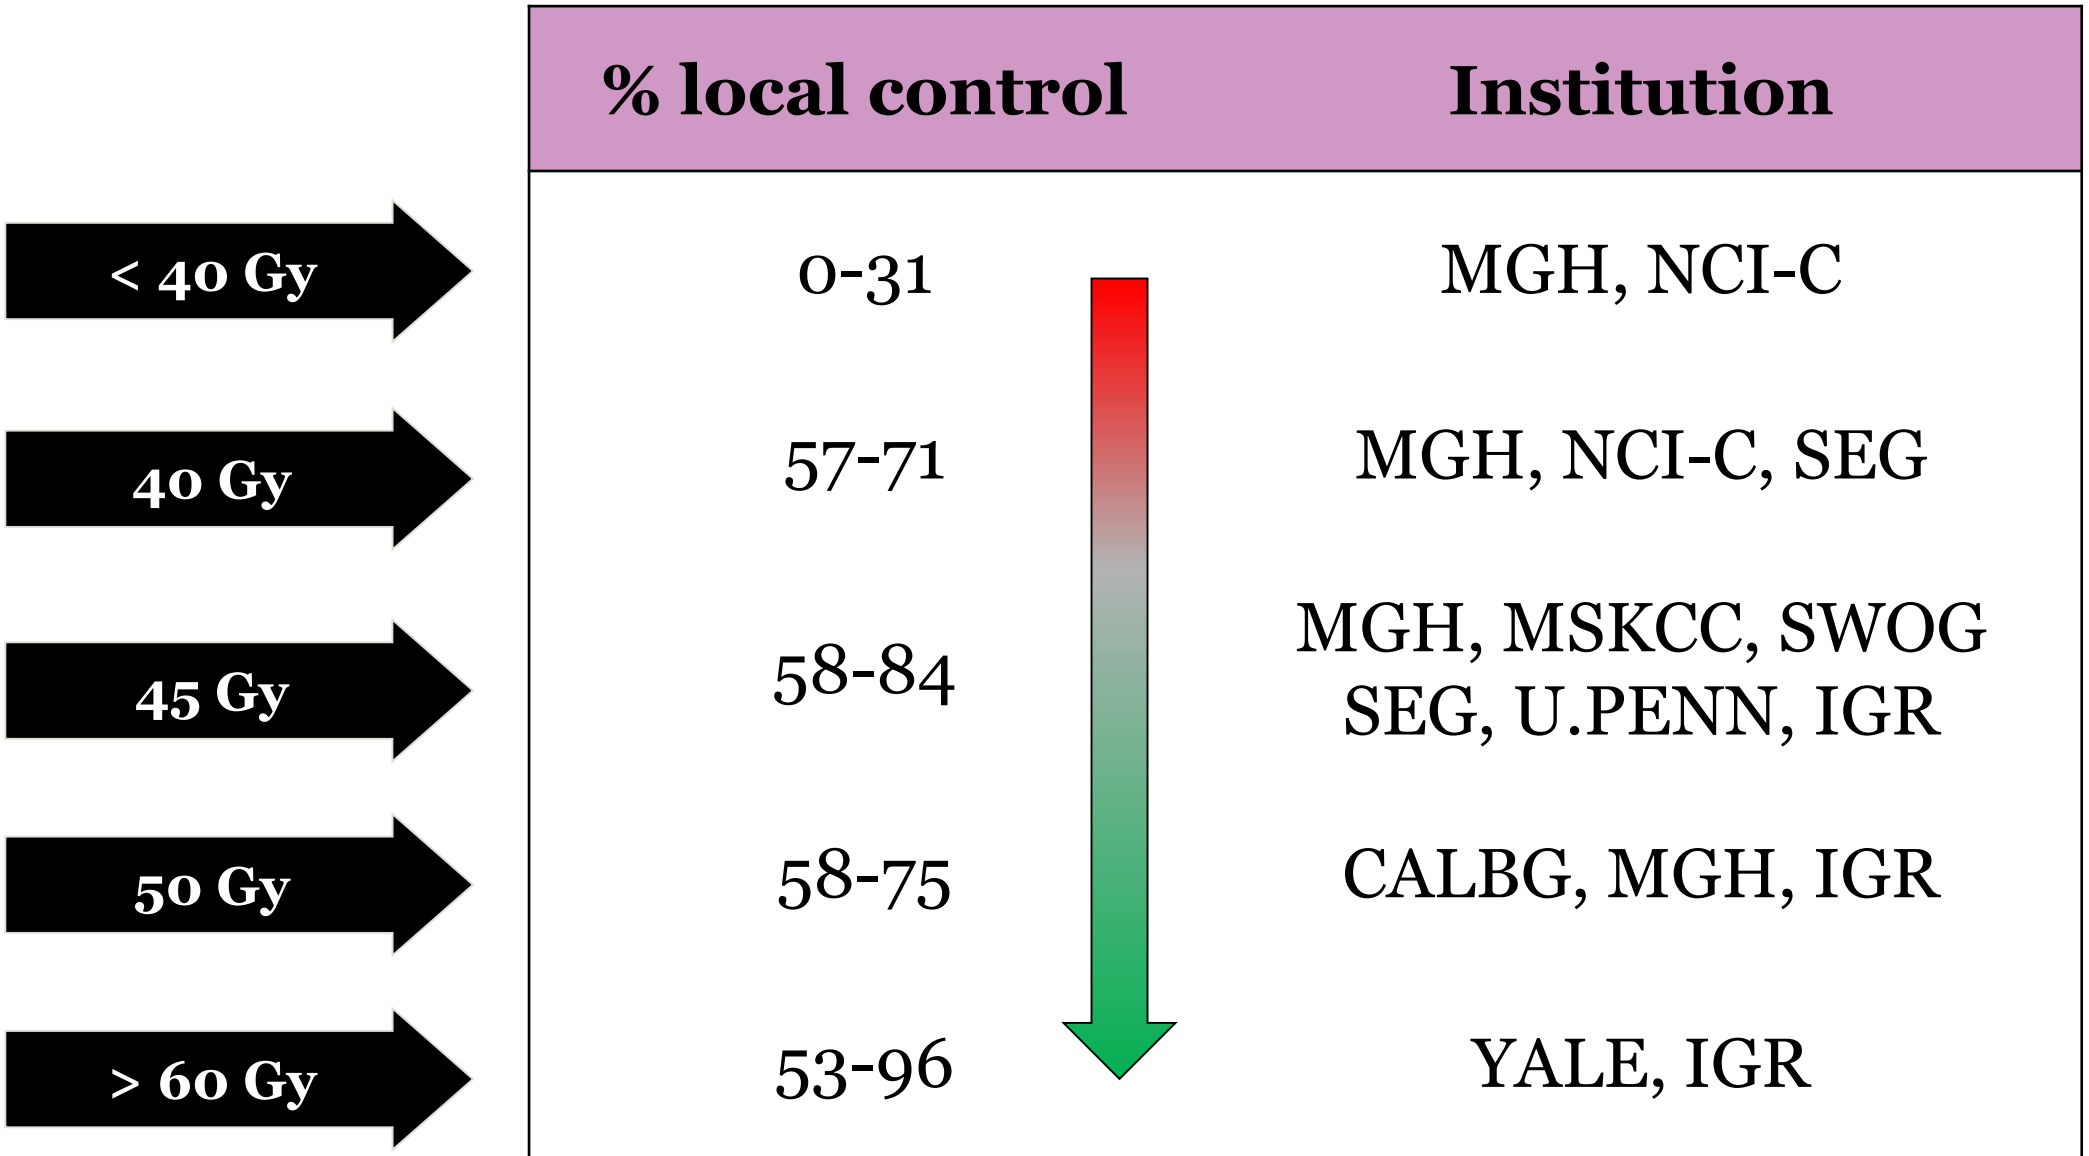
ESTRO School

2) Rationale for RT dose escalation in LD-SCLC

- Better **local control** with **higher RT doses** in some retrospective series
- Trend towards **better survival** with **higher RT doses** in some retrospective series
- Possibility of **dose-escalation** with **modern radiotherapy**

ESTRO School

Local control as a function of RT dose

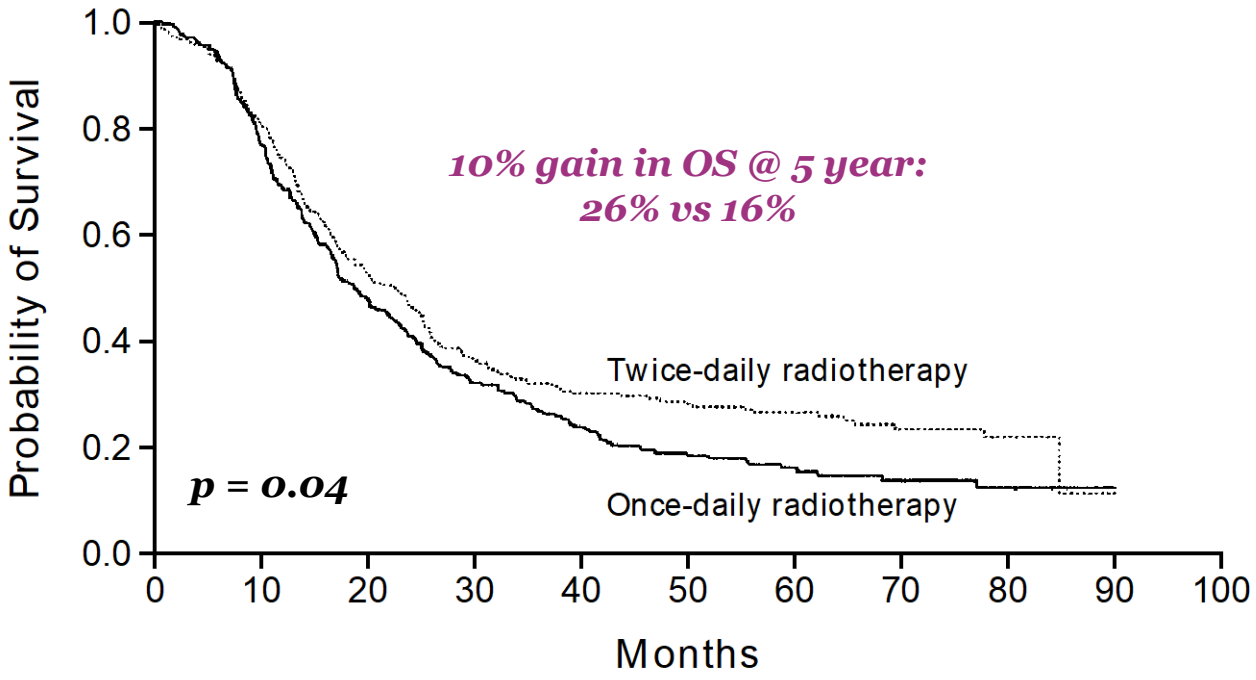


ESTRO School

TWICE-DAILY COMPARED WITH ONCE-DAILY THORACIC RADIOTHERAPY IN LIMITED SMALL-CELL LUNG CANCER TREATED CONCURRENTLY WITH CISPLATIN AND ETOPOSIDE

3) Altered fractionation - Intergroup trial 0096:
the current standard in LD-SCLC?

Overall Survival



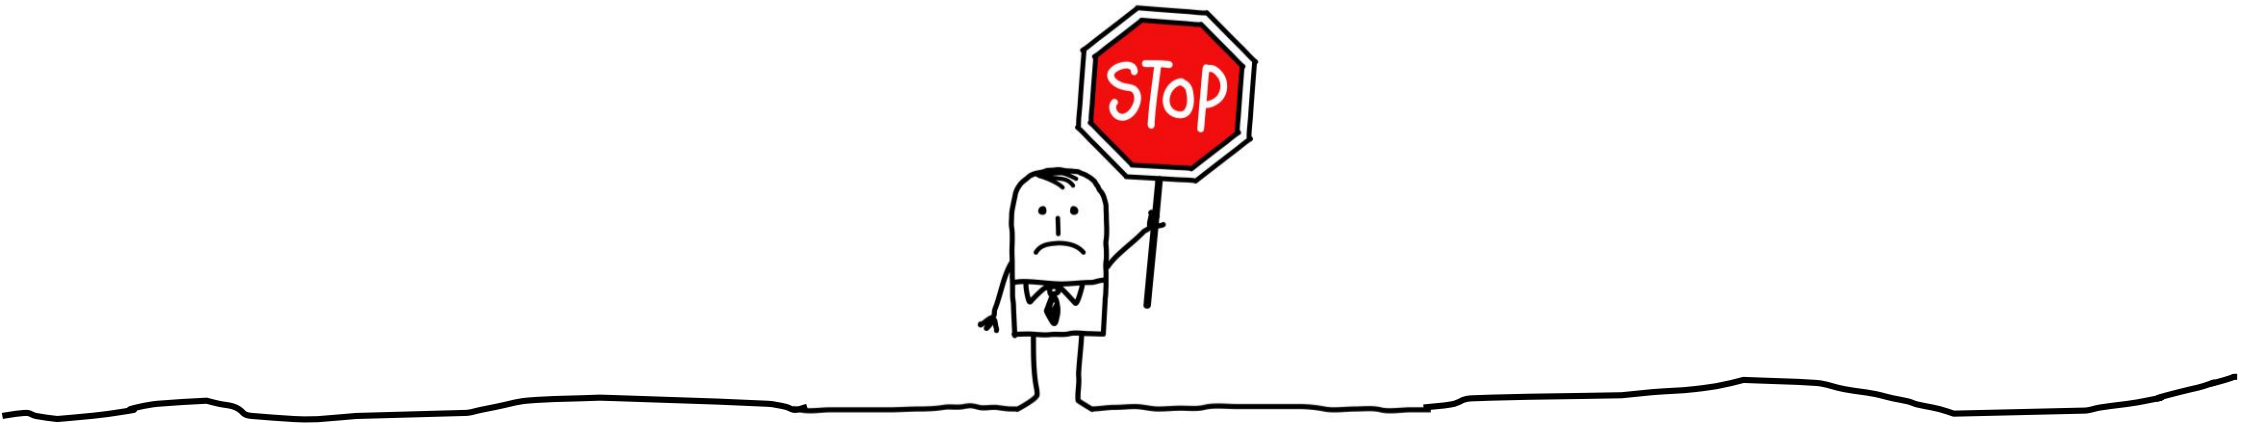
- 417 Patients
- All patients received 4 x Cis+Etoposide
- Randomly assigned to receive either 45 Gy twice daily (1.5 Gy/bid) or once daily (1.8 Gy/die)
- Higher rates of G3+ esophageal toxicity in the accelerated arm

The schedules were not biologically equivalent!

Turrisi AT et al NEJM 1999;340

ESTRO School

Why 45 Gy BID failed to adopt ?

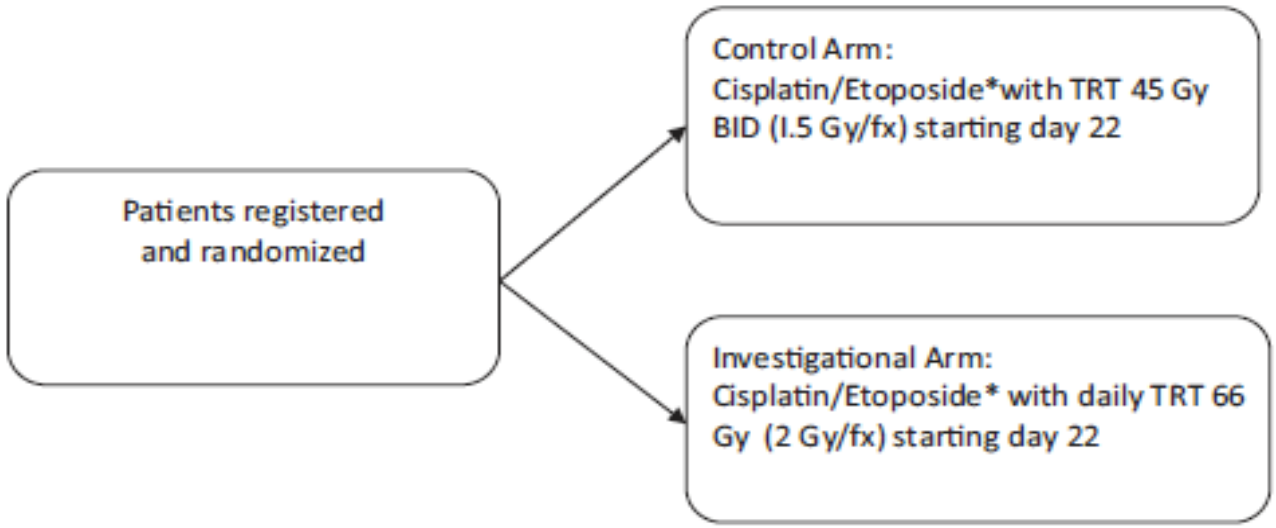


- Inconvenience of twice daily treatment
- Increased rate of esophagitis
- Suboptimal control arm in “Turrisi” trial
- **Lack of phase III trial comparing hyperfractionation with “high-dose” conventionally fractionated treatment**

BMJ Open

Protocol for the CONVERT trial––Concurrent ONce-daily VErsus twice-daily RadioTherapy: an international 2-arm randomised controlled trial of concurrent chemoradiotherapy comparing twice-daily and once-daily radiotherapy schedules in patients with limited stage small cell lung cancer (LS-SCLC) and good performance status

3) Ongoing study on the role of altered fractionation: the CONVERT trial



- Phase III randomized trial
- 447 patients enrolled, accrual closed, results expected very soon.
- The **results will be crucial** in determining the best standard regimen for LD-SCLC
- **Higher dose of radiation** in the "once-daily" arm, compared to the hyperfractionated one (66 Gy vs 45)
- Primary endpoint: OS

ESTRO School

Faivre-Finn C. et al. BMJ 2016;6

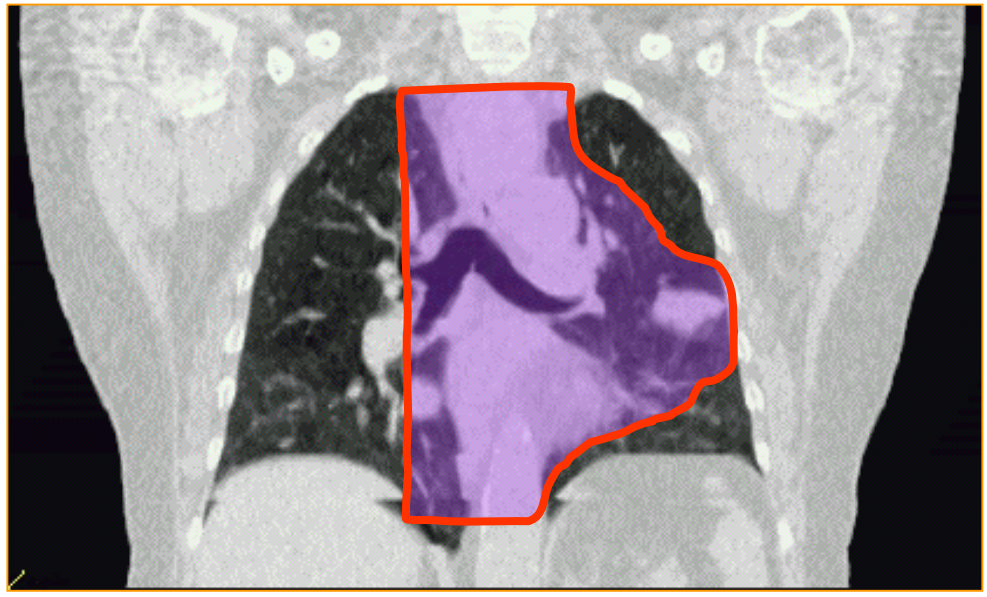
4) Radiation Therapy Volume in LD-SCLC

- Defining the radiotherapy target in limited stage SCLC is evolving
- In NSCLC selective nodal irradiation widely replaced elective nodal irradiation
- In SCLC the role of ENI is still controversial

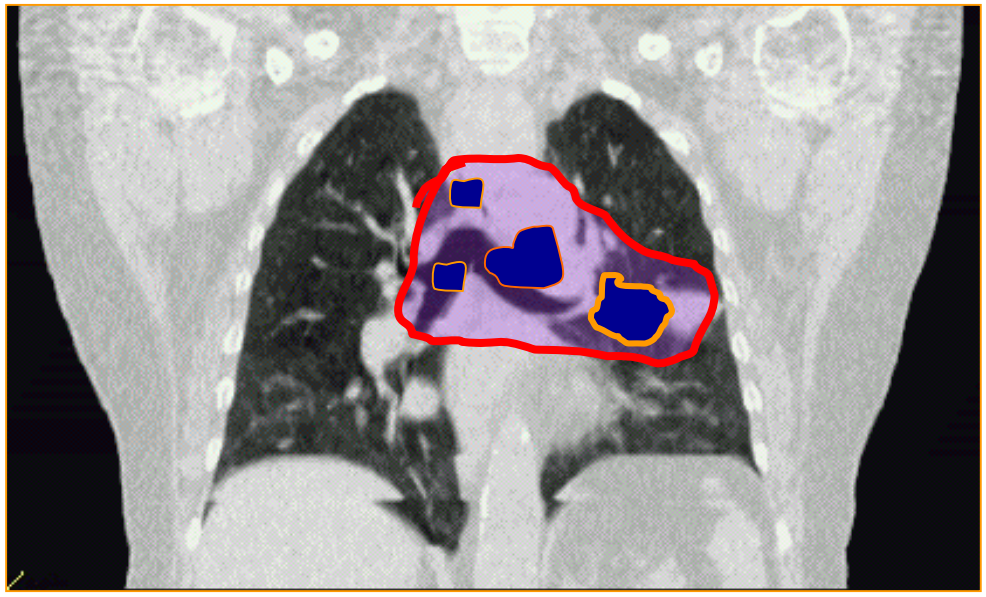
4) Changes in radiotherapy fields:

From Elective Nodal Irradiation (ENI) to Involved Field Irradiation

Elective nodal RT



Involved-field RT



ESTRO School

4) Radiation Therapy Volume in LD-SCLC

- **Elective Fields**: classical management, used in most studies
  - Advantage: inclusion of potential micromets
  - Disadvantage: increased toxicity

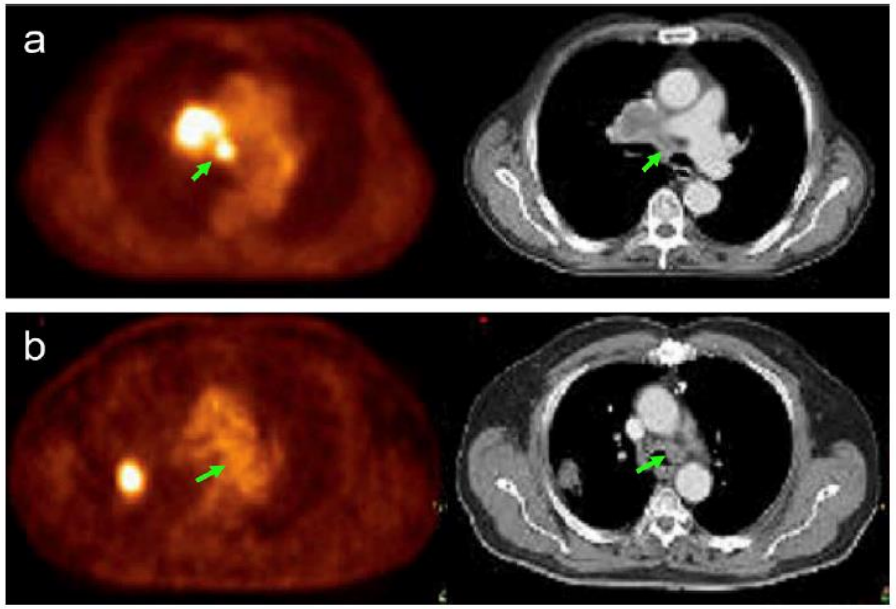
- **Involved Fields**: omission of ENI
  - Advantage: dose-escalation
  - Disadvantage: increased risk of regional nodal relapse

Involved Field RT: phase II studies

Author	Pts	CT	RT dose	RT timing	Local/Regional relapse	Distant relapse
Baas et al	37	CPE	45/25	2-3 cycle	6 (16%)	19
Lievens et al	34	EP	50/25	2 cycle	2 (6%)	NR
De Ruysscher et al	27	EC	45/50 BID	1-2 cycle	7 (33%) + 2 supraclav LN	11

PET-guided nodal contouring definitely supports the use of Involved Fields RT

Recurrence	Patients (n)
None	**21 (35)**
Local	**9 (15)**
In field	3 (5.0)
Out of field	4 (6.7)
Both in field and out of field	2 (3.3)
Isolated local	2 (3.3)
Local and distant/nodal	7 (11.7)
Nodal	**20 (33.3)**
In field	8 (13.3)
Out of field	7 (11.7)
Both in field and out of field	5 (8.0)
Isolated nodal	2 (3.3)
Nodal and distant/local	18 (30.0)
Distant	**34 (56.7)**
Isolated distant	19 (31.7)
Distant and local/nodal	15 (25.0)
Isolated brain	9 (15.0)



3% of isolated nodal relapse in PET-staged SCLC patients receiving IF-RT

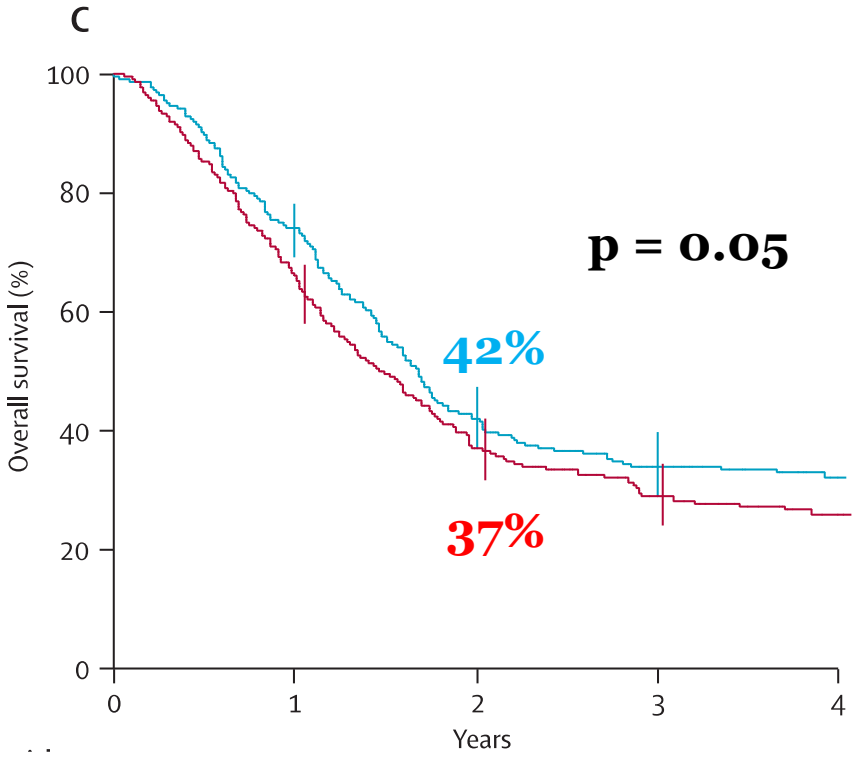
Overall survival



Le Pechoux C. et al. Lancet Oncol 2009;10

Standard-dose versus higher-dose prophylactic cranial irradiation (PCI) in patients with limited-stage small-cell lung cancer in complete remission after chemotherapy and thoracic radiotherapy (PCI 99-01, EORTC 22003-08004, RTOG 0212, and IFCT 99-01): a randomised clinical trial

Standard vs High-Dose PCI: CONCLUSION

- **No significant reduction in the total incidence of brain metastases was observed after higher-dose PCI, but there was a significant increase in mortality.**
- **PCI at 25 Gy should remain the standard of care in limited-stage SCLC.**

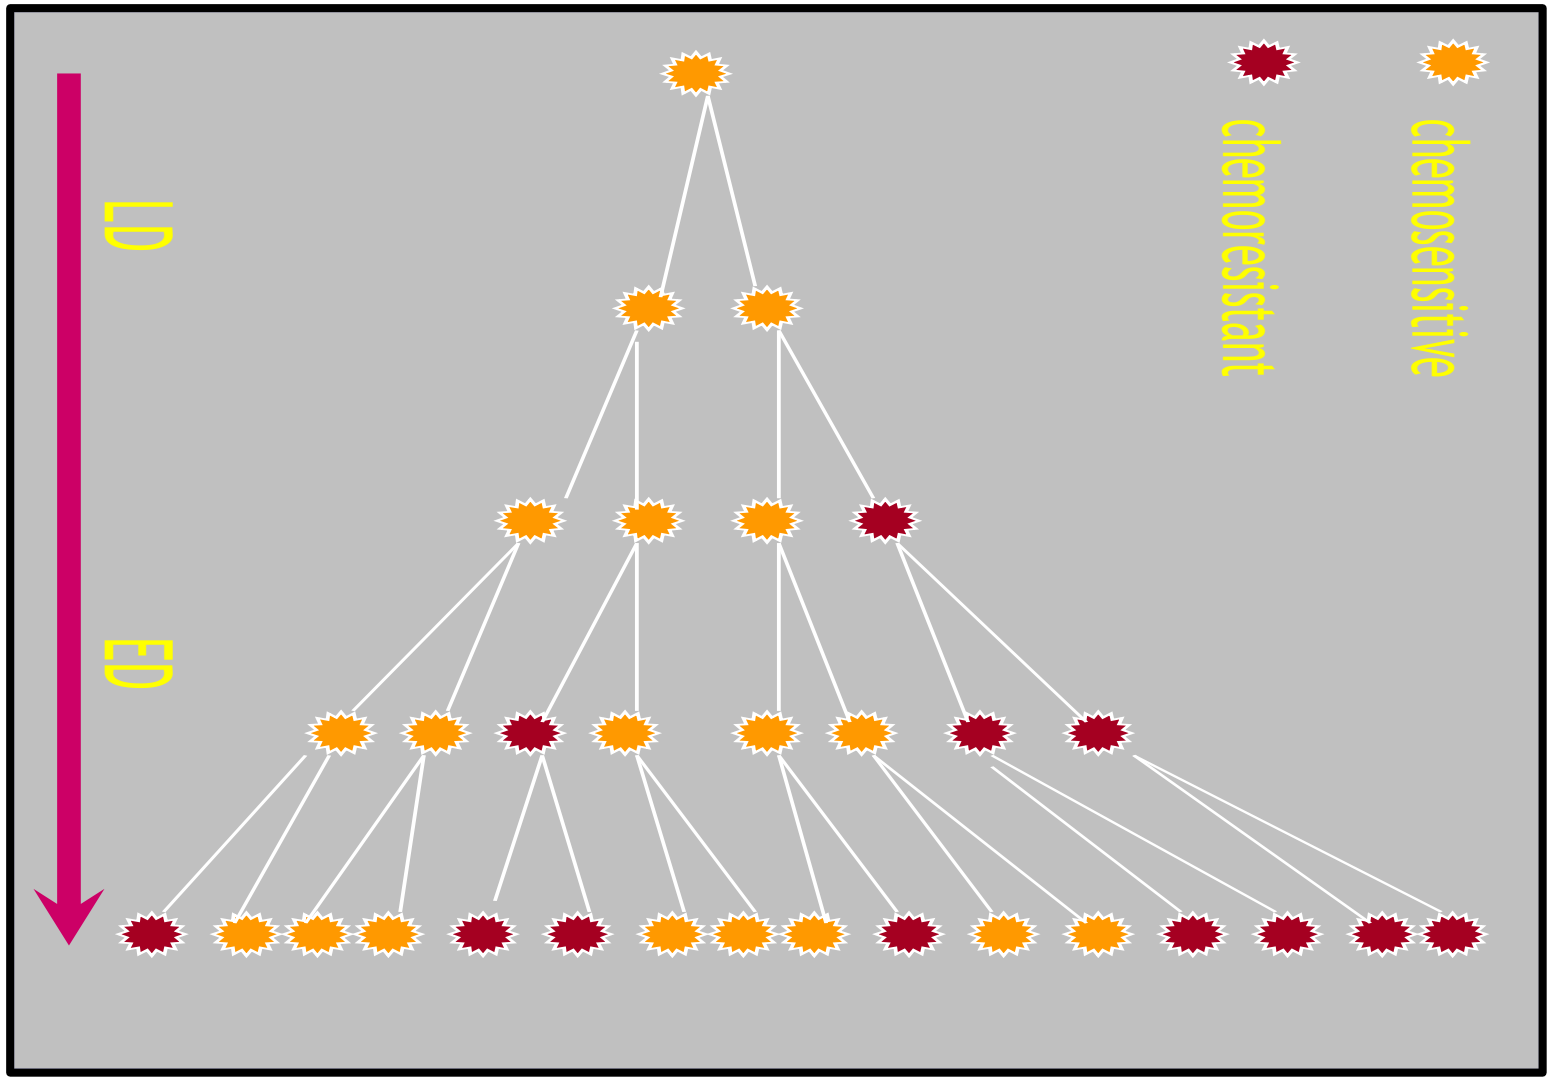
EXTENDED DISEASE

“Chemoresistance” raises with growing extension of the disease



ESTRO School

A 59 years old female patient affected with ED-SCLC has obtained a PR after 6 cycles of Cisplatin-Etoposide. Would you consider this patient for further therapies?

A. NO

B. Yes, she deserves 2 more cycles of chemotherapy

C. Yes, I would consider her for PCI (if no evidence of brain mets at least at the CT scan), followed by thoracic RT (30 Gy/10 fractions)

D. Yes, I would consider her for PCI (if no evidence of brain mets at least at the CT scan)

E. I would refer the patient for WBI in case of brain mets at MRI. No PCI if brain mets are excluded at the MRI

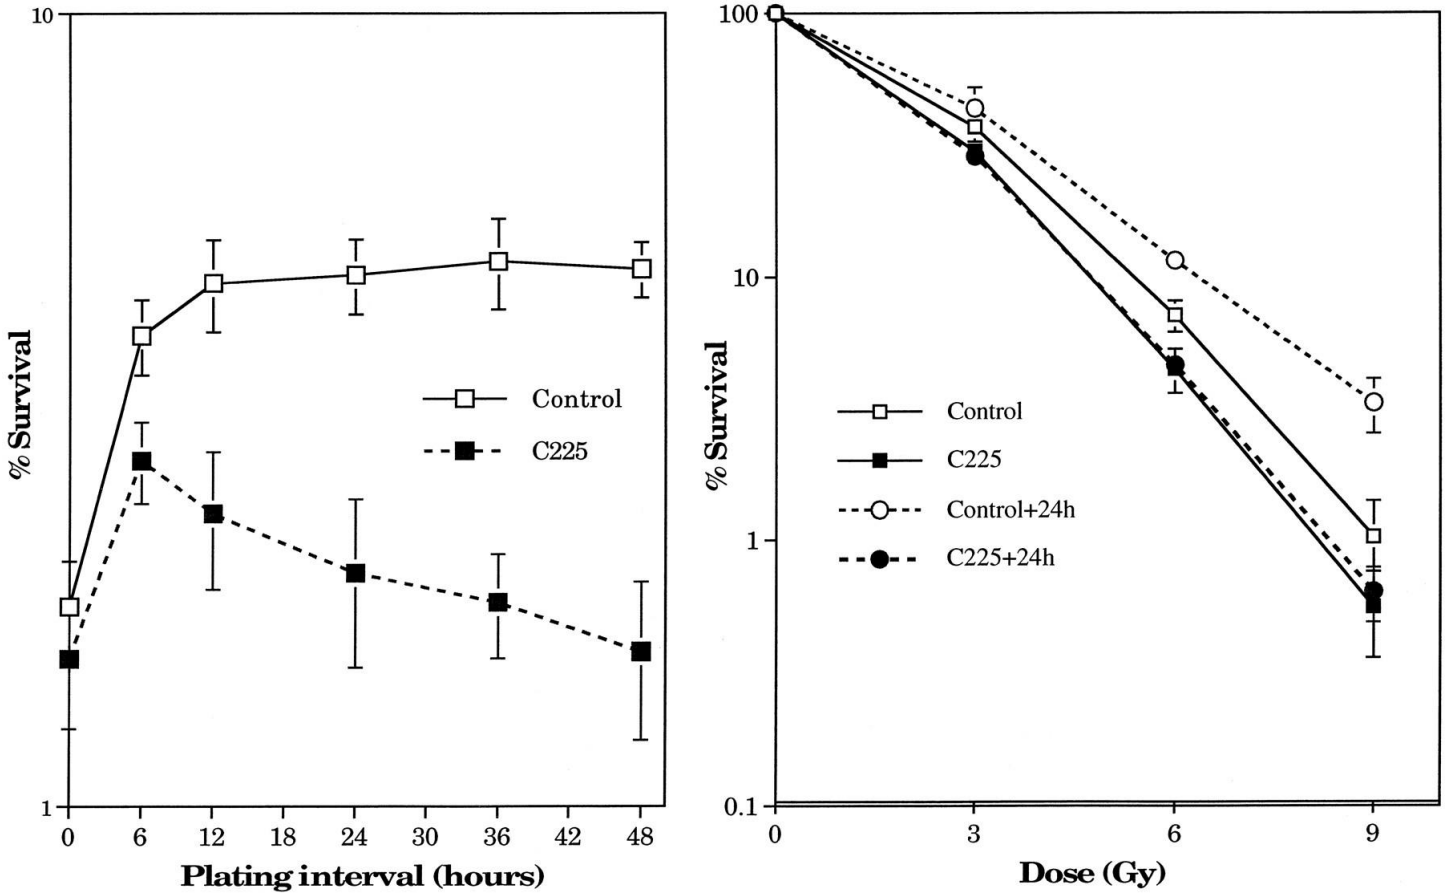
Summary

- Inhibition of EGFR in combination with RT
  - multiple mechanisms contribute to enhanced radiosensitivity
  - From DDR to Repopulation
- Secretome is as mediator of treatment resistance
- AXL is a promising target for combined radiochemotherapy
- Differential secretome analysis is a promising approach to identify predictive markers and novel targets for radiosensitization.
- Novel ADAM17 inhibitors are promising agents to improve the radiotherapy outcome of NSCLC.

Cetuximab compromises the capacity of SCCs to accomplish effective repair after radiation-induced damage



PLDR was examined using single-dose irradiation of **confluent** cultures. Irradiation, cells were either immediately subcultured for colony formation (0 h) or were returned to the incubator for delayed plating at specified time intervals.

Head and neck cancer

ABSTRACT

Background: Our previous individual patient data (IPD) meta-analysis showed that chemotherapy improved survival in patients curatively treated for non-metastatic head and neck squamous cell carcinoma (HNSCC), with a higher benefit with concomitant chemotherapy. However the heterogeneity of the results limited the conclusions and prompted us to confirm the results on a more complete database by adding the randomised trials conducted between 1994 and 2000.
Methods: The updated IPD meta-analysis included trials comparing loco-regional treatment to loco-regional treatment + chemotherapy in HNSCC patients and conducted between 1965 and 2000. The log-rank-test, stratified by trial, was used to compare treatments. The hazard ratios of death were calculated.
Results: Twenty-four new trials, most of them of concomitant chemotherapy, were included with a total of 87 trials and 16,485 patients. The hazard ratio of death was 0.88 ($p < 0.0001$) with an absolute benefit for chemotherapy of 4.5% at 5 years, and a significant interaction ($p < 0.0001$) between chemotherapy timing (adjuvant, induction or concomitant) and treatment. Both direct (6 trials) and indirect comparisons showed a more pronounced benefit of the concomitant chemotherapy as compared to induction chemotherapy. For the 50 concomitant trials, the hazard ratio was 0.81 ($p < 0.0001$) and the absolute benefit 6.5% at 5 years. There was a decreasing effect of chemotherapy with age ($p = 0.003$, test for trend).
Conclusion: The benefit of concomitant chemotherapy was confirmed and was greater than the benefit of induction chemotherapy.

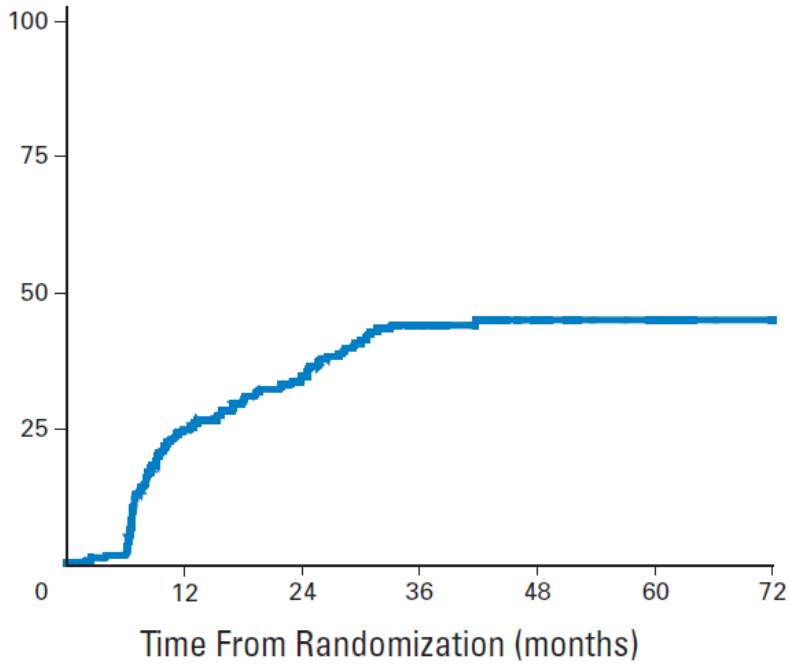
Late morbidity



Analysis of 3 RTOG trial with C-RT

(RTOG 91-11, 97-03, and 99-14)

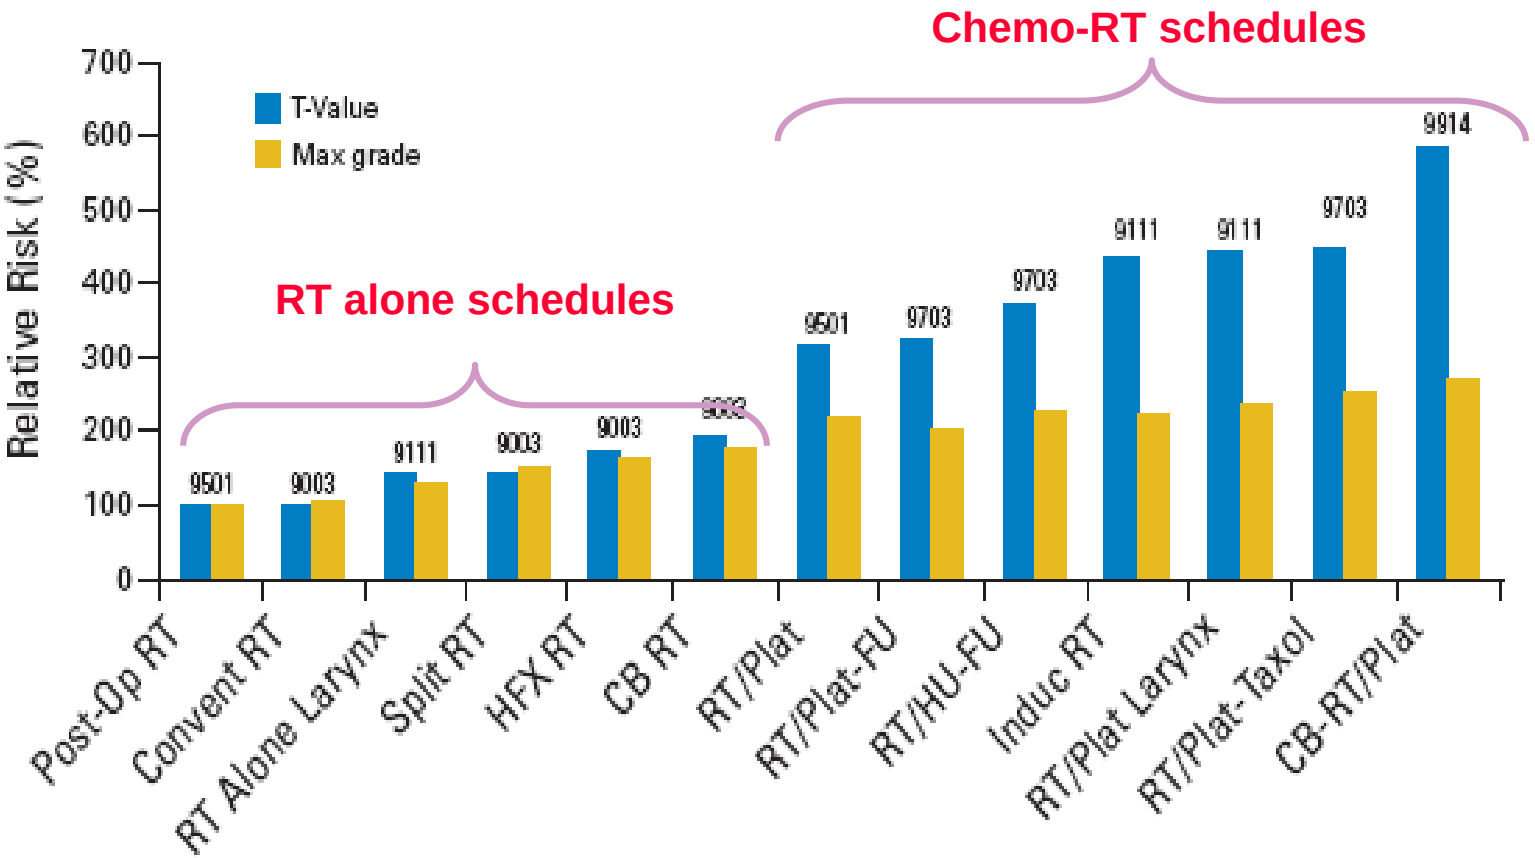
In total 230 patients

- 43% severe late morbidity
- 40% larynx/pharynx dysfunction
- 13% tube feeding >2 Y after C-RT

Machtay M 2008

ESTRO School

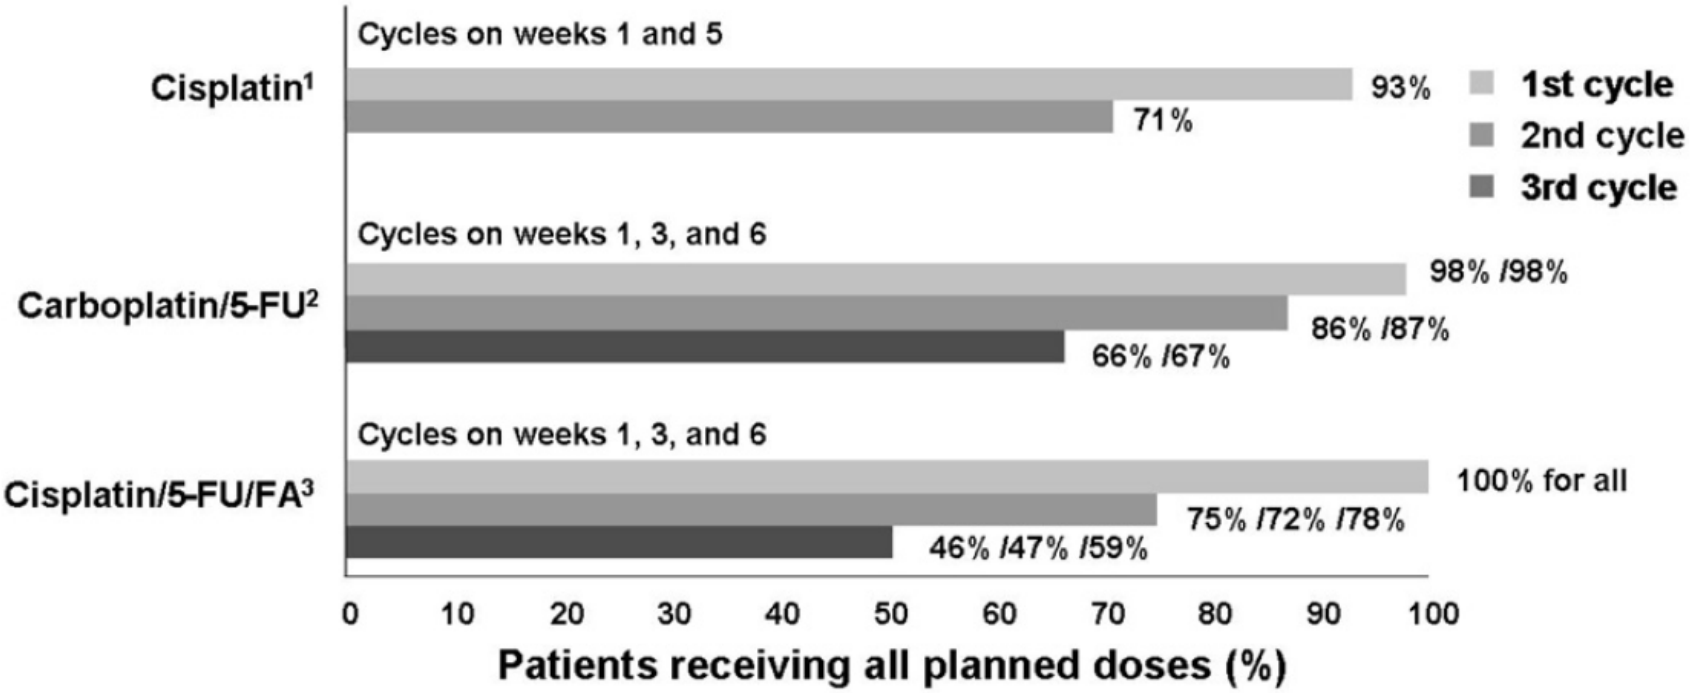
Chemo-radiation enhance late morbidity



Trotti 2007; Bentzen and Trotti 2007

ESTRO School

Compliance to concurrent C-RT



- 1/3 of pts. in trials do not receive the planned number of cisplatin cycles
- Compliance decreases over time
- C-RT regimens are affected by longer overall treatment times
- More frequent treatment interruptions than radiotherapy alone

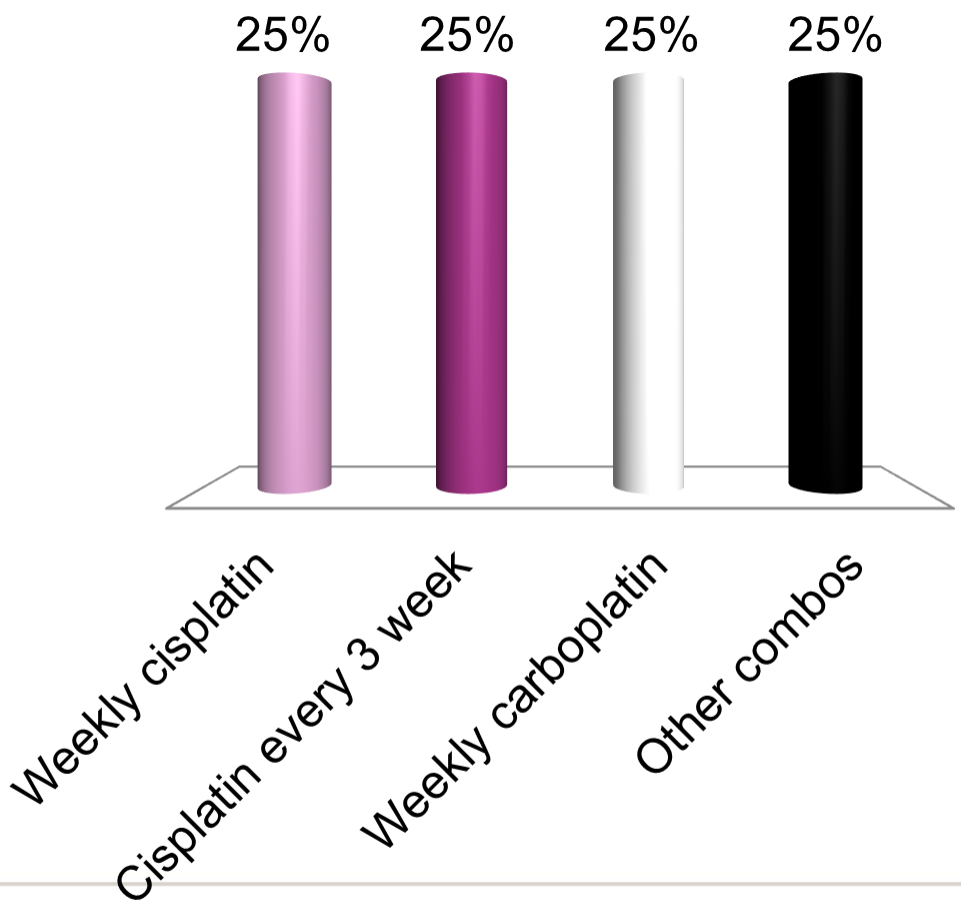
Bernier J 2009

ESTRO School

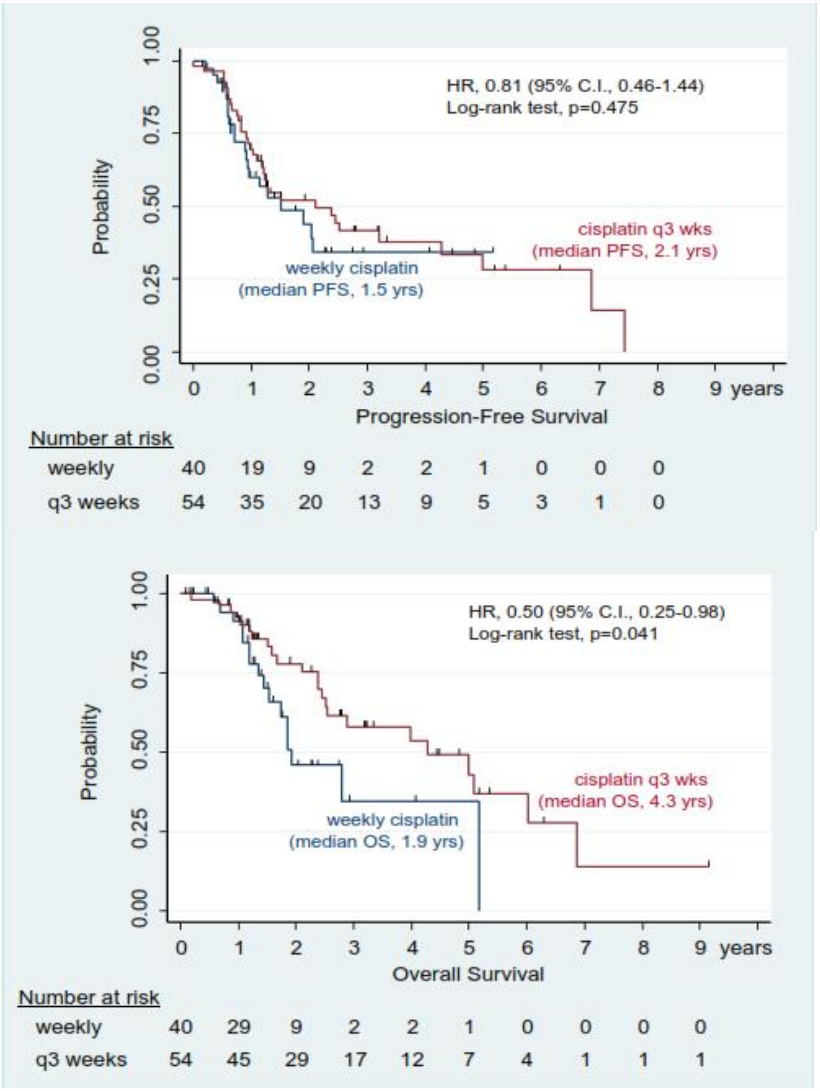
How much and how often?

How much and how often?

A. Weekly cisplatin
B. Cisplatin every 3 week
C. Weekly carboplatin
D. Other combos



Low-dose weekly or high-dose every 3 weeks?



- Retrospective
- N=94
- 40 vs. 100 mg/m^2

Cisplatin – LD weekly or HD every 3rd week

W3W

Phase III randomized trial comparing weekly versus 3-weekly (W3W) cisplatin in patients receiving chemoradiation for locally advanced head and neck cancer

Vanita Noronha, MD DM
On behalf of Medical Oncology Department
Head and Neck Disease Management Group
Tata Memorial Hospital, Mumbai, India

PRESENTED AT: ASCO ANNUAL MEETING '17 | #ASCO17

Trial Design-W3W

ELIGIBILITY CRITERIA

- Age ≤ 70 yrs
- SCC of oral cavity/ pharynx/ larynx/ cervical lymphadenopathy of unknown primary
- Stage III / IV, no distant mets
- Adjuvant or definitive CRT
- If postop: high-risk features: ECE, close or + margins, T4 primary, > 2 LNs +
- No induction chemotherapy
- Adequate organ function

Stratify

- **T-group** (T0,1,2 vs T3,4)
- **N-group** (N0,1 vs N2,3)
- **Therapy intent** (adjuvant vs definitive)

Randomized 1:1 Open Label

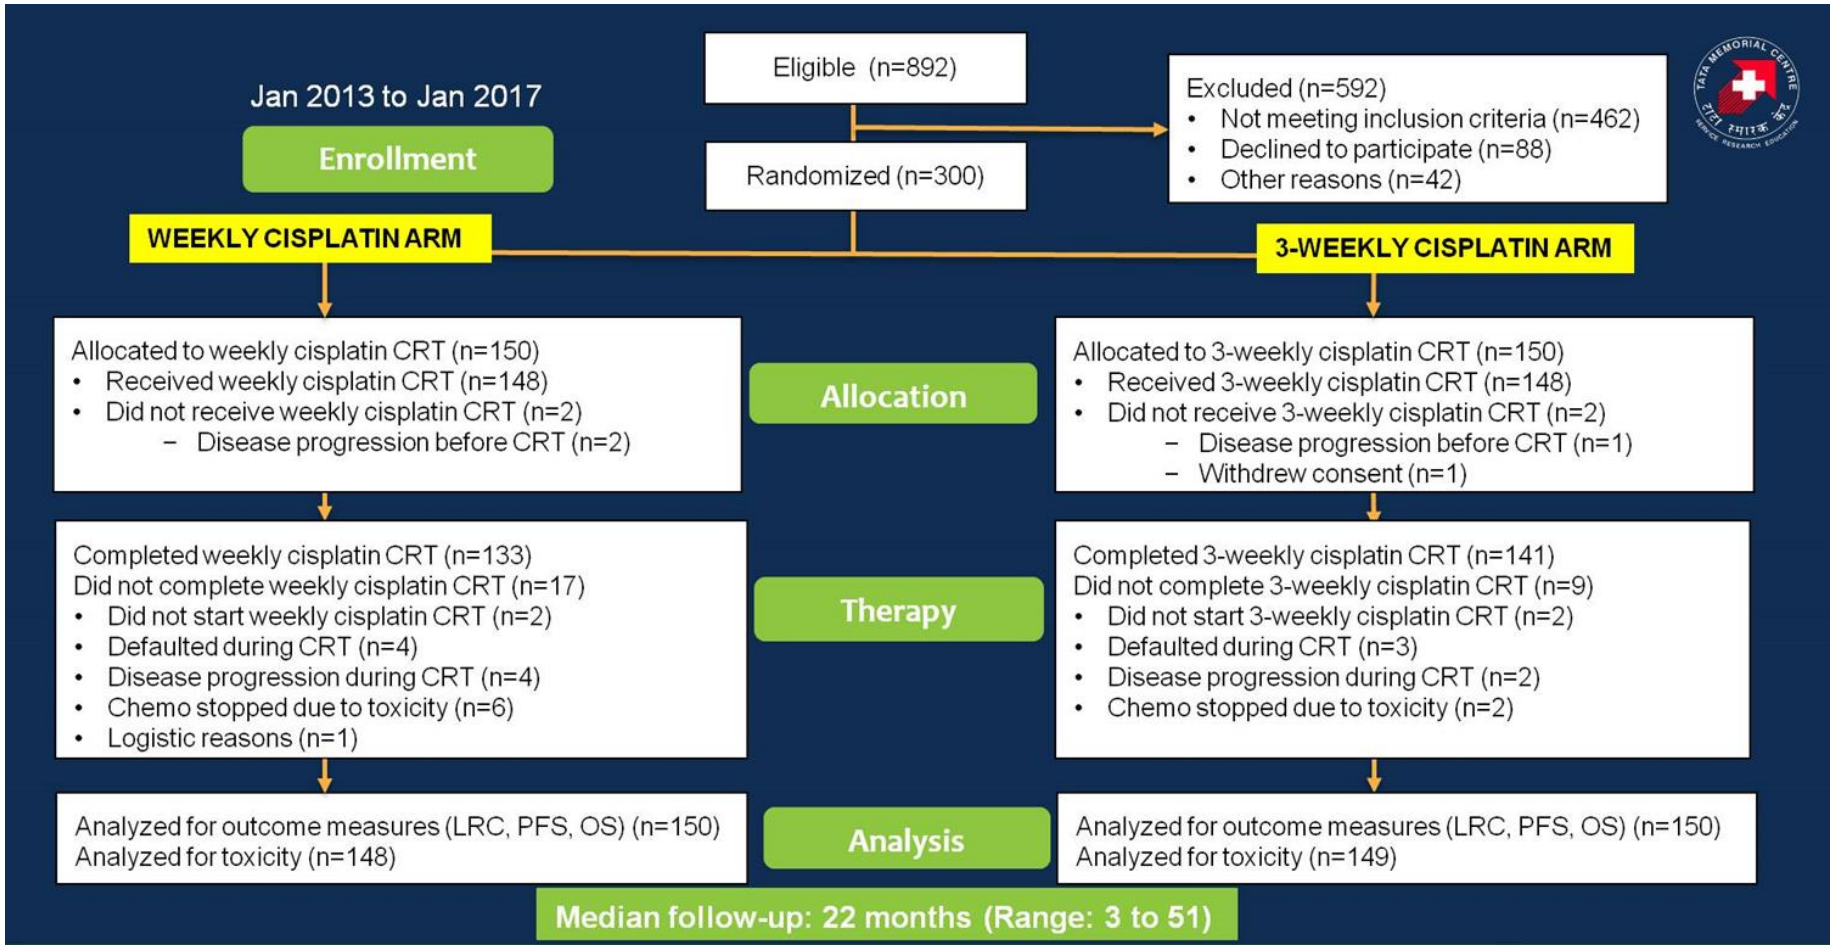
n=150 → **3-weekly cisplatin 100mg/m² D1,22,43 of RT**

n=150 → **Weekly cisplatin 30mg/m² with RT**

RT: 60 Gy/30 fr/6 wks (adj)
70 Gy/35 fr/7 weeks-(def)

Follow-up: Weekly during CRT, then Q3 mths x 2 yrs, then Q6 mths

Cisplatin – LD weekly or HD every 3rd week



Cisplatin – LD weekly or HD every 3rd week

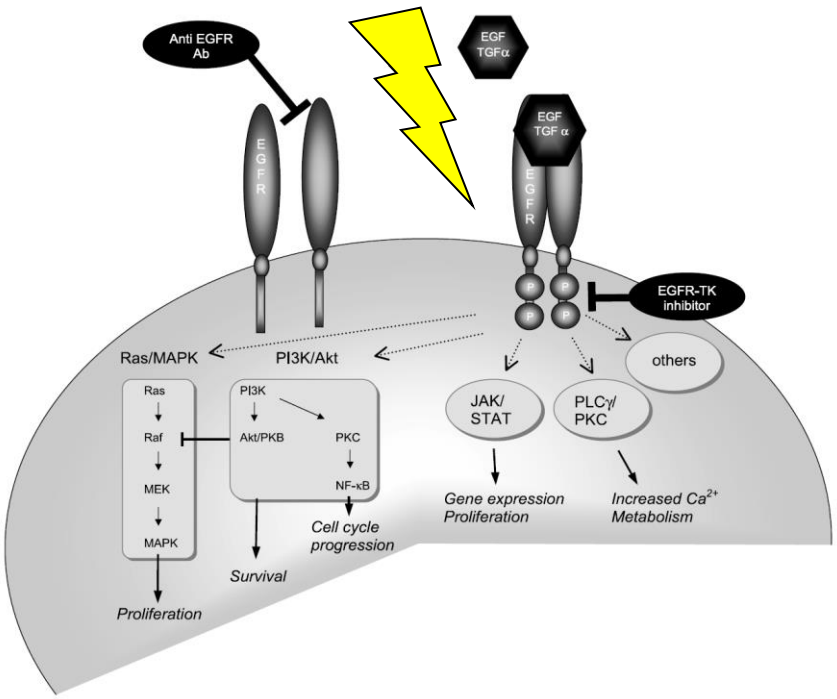
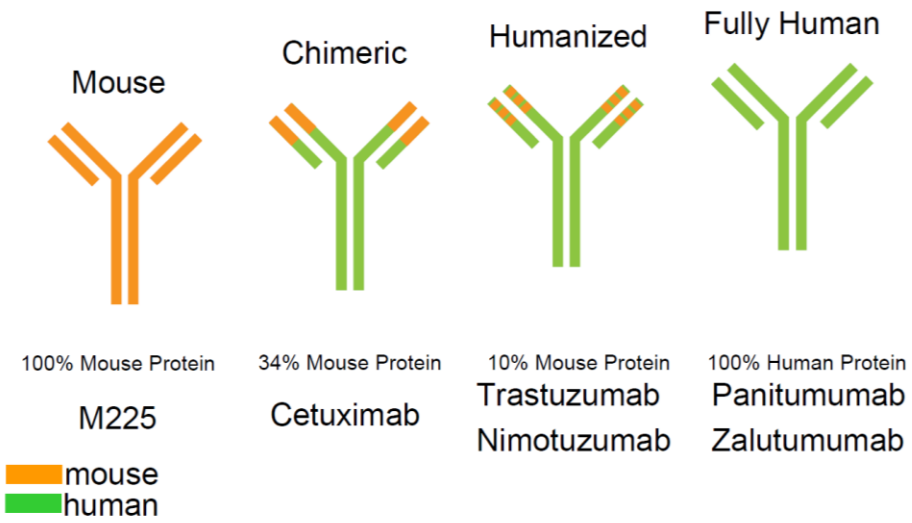
C-RT for the 70+ ???

Does the tumour sense that it is placed in an old body?

Bio-radiotherapy





The Ideal biological target

- Selective inhibition of a specific target
- Present in tumour cells
- Only present in tumour cells….or…..
- The function of the target is not essential for normal tissue
- Only one or a few activation pathways (little redundacy)
- Good preclinical models that shows tumour efficacy

After Grandis 2008

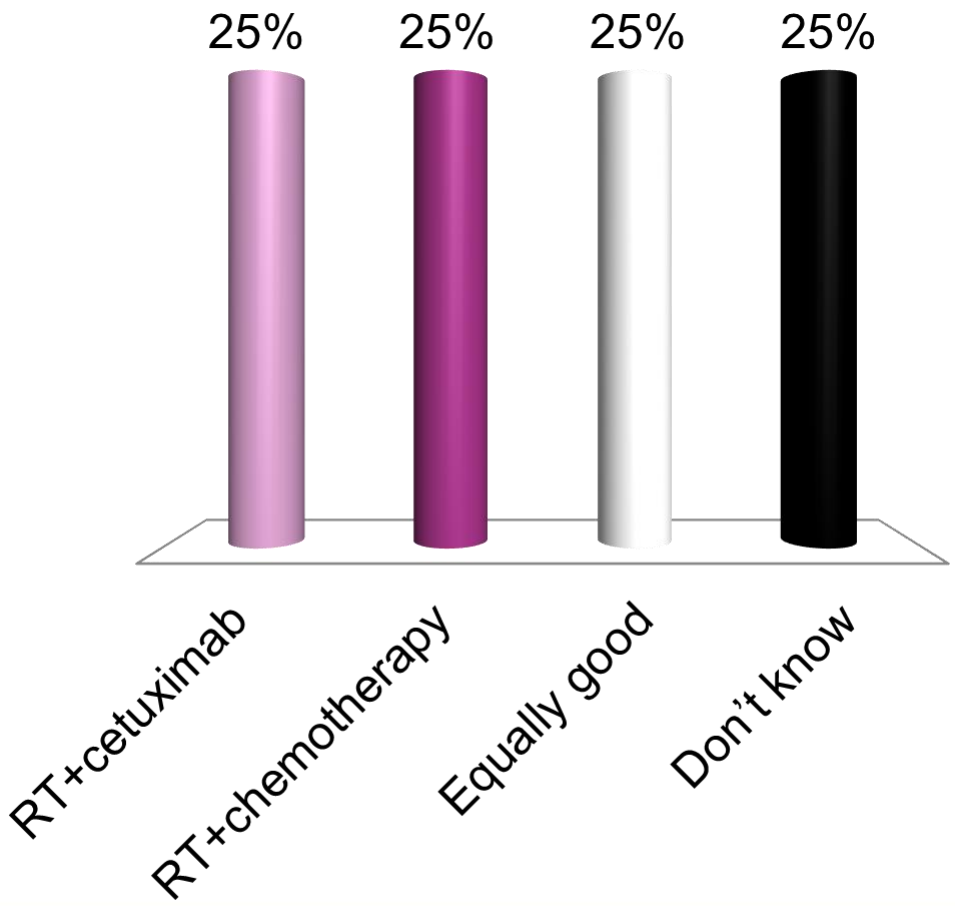
Long-time effects?

What is best? B-RT or C-RT ?

A. RT+cetuximab
B. RT+chemotherapy
C. Equally good
D. Don’t know



ESTRO School

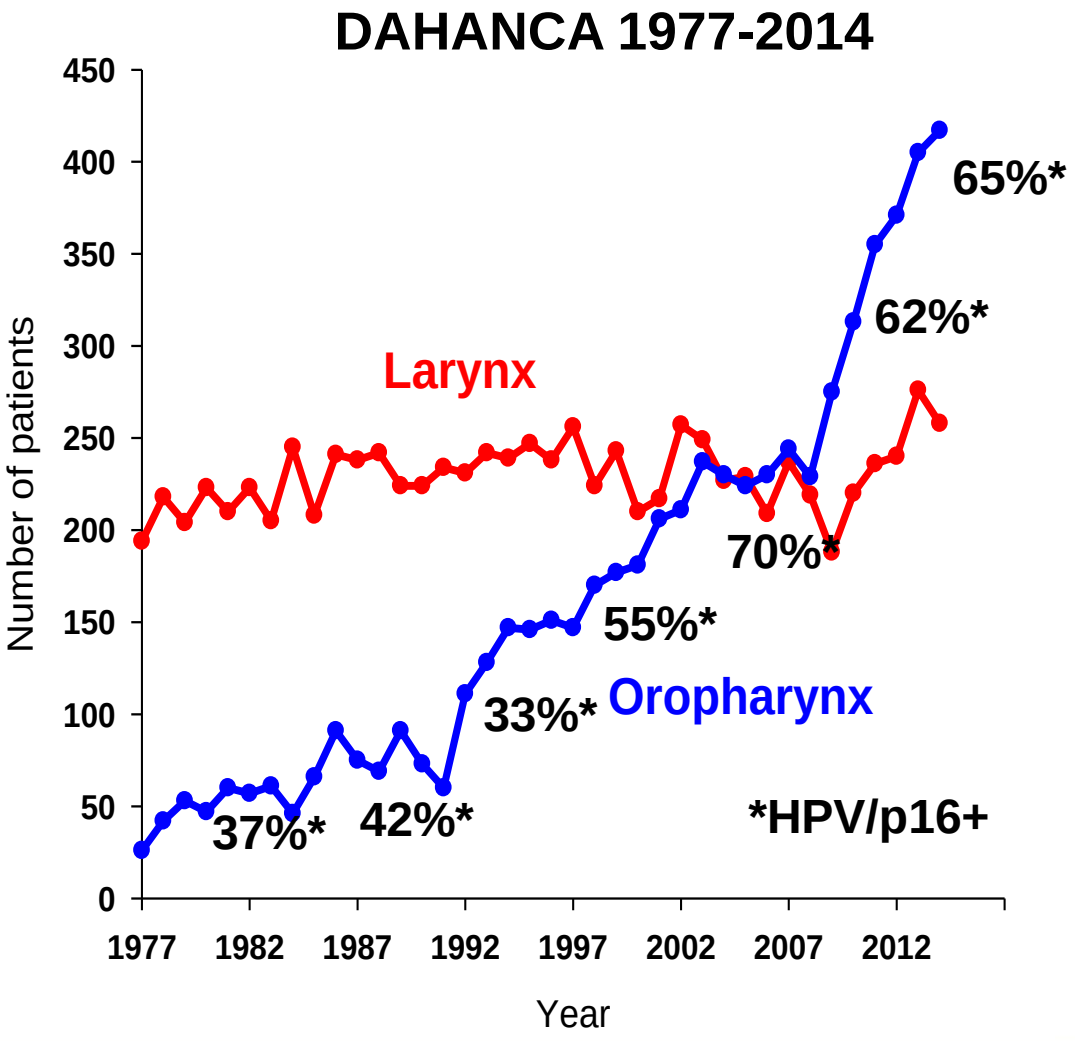
HNSCC is a disease in transition…….

HPV/p16 and HNSCC in the oropharynx

- Oropharynx cancer
- Increasing incidence

- Non-keratinizing SCC
- p16 expression, p53wt

- Younger age/more fit
- Less smoking
- Less alcohol
- N+ (advanced disease)
- Improved prognosis



Updated from Lassen 2010

Head and Neck patient case

Jesper Grau Eriksen

Dept. Of Oncology
Odense Universityhospital, Denmark

jesper@oncology.dk

Patient history

- 60-year old man.
- 3 week history of nodal swelling, left side of the neck. No pain or dysphagia. No weight loss.
- No co-morbidity except from back pain.
- Ceased smoking in 1990, 16 pack-years.
- 1-2 glasses of alcohol a day.

Clinical examination

- Good performance (WHO PS 0).
- Base of tongue/vallecula area a 3x2x2 cm large tumour is seen. Proximal border of the tumour seems to be close to the lower pole of the left tonsil.
- Otherwise normal fiber optic examination.
- Palpable node in region II, left side.
- Contra-lateral side normal.

Fiber optic examination

Pathology

- Moderate differentiated squamous cell carcinoma (G2)
- p16 positive

HEAD AND NECK CANCER – AUSTRALIAN EDITION

07-21 December, 2015

TARGET GROUP
These online delineation workshops are aimed at junior clinical or radiation oncologists who want to improve their contouring skills or at more senior specialists who want to refresh and validate their knowledge and skills in this field.
The workshop is limited to 30 people. Places are given on a first-come-first-serve basis.

FACULTY
Workshop Director
Jesper Eriksen

Cancer Specialist
Vincent Gregoire

WORKSHOP SESSIONS
7 December, 2015 - 18.00-19.00 AEDT (Australian Eastern Daylight Time)
14 December, 2015 - 18.00-20.00 AEDT (Australian Eastern Daylight Time)
21 December, 2015 - 18.00-19.30 AEDT (Australian Eastern Daylight Time)

COURSE AIM
The workshops will be conducted through 3 interactive web conference sessions that offer the opportunity to compare delineations from participants and experts and discuss the interobserver variability and the available guidelines.

Rectal and Anal cancer: use of clinical endpoints

Rob Glynne-Jones
Mount Vernon Cancer Centre

My Disclosures: last 5 years

- **Speaker:** Roche, Merck Serono, Sanofi Aventis, Pfizer, AIS
- **Advisory Boards:** Roche, Merck Serono, Sanofi Aventis, Astra Zeneca, BMS
- **Funding to attend meetings**: Roche, Merck Serono, Sanofi Aventis,
- **Research funding**: Roche, Merck Serono, Sanofi Aventis

Time-to-events endpoints (38)

As you can see there are many different time to event endpoints, with very subtle differences and different papers may even use different names for the same outcome:

	Results from systematic review of RCTs of systemic therapy for EBC				
	DFS	**RFS**	**EFS**	**TTR**	**Total**
LR + DR + CLB + NBSP + Death	**7**	**0**	**2**	**0**	**9**
LR + DR + CLB + DCIS + Death	**1**	**0**	**0**	**0**	**1**
LR + DR + CLB + DCIS + BC Death	**0**	**0**	**0**	**1**	**1**
LR + DR + CLB + Death	**3**	**0**	**0**	**0**	**3**
LR + DR + CLB + NBSP	**1**	**0**	**0**	**0**	**1**
LR + DR + CLB	**2**	**3**	**0**	**1**	**6**
LR + DR + Death	**6**	**1**	**1**	**1**	**9**
LR + DR	**3**	**3**	**0**	**1**	**7**
LR + DR + BC Death	**0**	**1**	**0**	**0**	**1**

Table: Lucy S Kilburn
Clinical Trials & Statistics Unit (ICR-CTSU),
The Institute of Cancer Research, London, UK

LR = local recurrence, DR =distant recurrence, CLB= contralateral breast, NBSP =National Breast Screening Programme

Starting points in breast cancer trials

Time from	DFS	RFS	EFS	TTR	Total
Randomisation	11	1	0	2	14
Surgery	3	3	0	0	6
Study entry	2	0	0	0	2
diagnosis	0	0	1	0	1
Treatment start	0	1	0	0	1
Undefined	7	3	2	2	14

Problems

- Huge variations in which endpoints are used
- and how they are defined
- And variable starting points (not always defined)

Imprecision/heterogeneity makes it difficult if not impossible to compare results among studies

The current randomised trials are slow – require decades!

? we need to drive them faster!

? We need….Early Clinical Endpoints

TRIAL	No	Median FU	Primary endpoint	Secondary endpoints
ACT 1 (UKCCR 1996)	585	42 months	Local treatment failure (composite of local failure and colostomy)	Overall survival
EORTC 22861 (Bartelink 1997)	110	42 months	Local failure	Event-free survival
RTOG 87-04/ECOG (Flam 1996)	291	3 years	Disease-free survival.	Overall survival Colostomy-free survival, Loco-regional control etc..
RTOG 98-11 (Ajani 2008)	644	2.51 years	Disease-free survival.	Overall Survival Cumulative incidence of Colostomy
ACCORD-03 (Conroy 2009)	307	43 months	Colostomy-free survival	Overall survival Cancer-specific survival Local control etc..
ACT II (CRUK) (James 2013)	940	61 months	**Complete response** Acute Toxicity Recurrence-free survival	Overall survival Cancer-specific survival Colostomy rate

Definition of composite disease-related endpoints used in Anal Cancer Trials

Trial	Endpoint	Loco-regional disease	Pelvic disease	Distant mets	Death	New tumour	Colostomy
ACT I[1]	Local Treatment Failure	✓	✓	✓	✓		✓
ACT II[6]	Progression -Free Survival*	✓	✓	✓	✓		✓
EORTC[7]	Event-Free Survival	✓			✓	✓	
ACCORD 03[5]	Event-Free Survival	✓		✓	✓		
RTOG 8704[8]	Disease-Free Survival	✓		✓	✓		
RTOG 9811[4]	Disease-Free Survival	✓		✓	✓		

Most meaningful clinical end points

Depend on

1. The disease stage

- primary only,
- adjuvant ie primary removed
- or advanced/metastatic

2. The individual tumour site
3. The natural history of that disease site
4. The target patient population
5. The type of treatment employed

Endpoints based on tumour assessments

- Overall response rate (ORR)
- Time to progression (TTP)
- Progression free survival (PS)
- Disease free survival (DFS)
- Time to treatment failure (TTF)

All time to event endpoints

Primary disease:Recurrence related endpoints

Most used recurrence endpoints

- Loco-regional failure–free survival
- Disease free survival
- Recurrence free survival
- Colostomy-free survival
- Event free survival
- Time to recurrence

Composite of the following events

- Local Recurrence (LR)
- Colostomy
- Distant recurrence (DR)
- Second primary (same disease site)
- Second primary (different disease site)
- Cancer specific survival
- Overall survival

Composite of the following events

- Local Recurrence (LR)
- Colostomy
- Distant recurrence (DR)
- Second primary (same disease site)
- Second primary (different disease site)
- Cancer specific survival
- Overall survival

What do you think is most appropriate?
Discuss for anal cancer

Local primary site

- Particular issues if chemoradiation rather than surgery is the standard of care

ACT I - Local tumour failure

defined as evidence of

- persistent local disease,
- local regrowth or local recurrence in the primary tumour after protocol therapy.
- Patients who never attained local control (after chemoradiotherapy) were counted as treatment failures at the first assessment post-treatment at 6 weeks.
- Requirement for colostomy

Discuss

- Higher RT doses give rise to higher risk of 2nd malignancy?
- Higher RT doses give rise to more likelihood of colostomy?
- Should there be an internationally agreed consensus?

RTOG-8704

Local failure-free-survival

patients who had

- a colostomy,
- local excision,
- abdominoperineal resection,
- or exenteration for any reason were considered treatment failures on the day of surgery – even if subsequent long-term local control was achieved

Second malignancies common in SCCA

In ACT II 20 patients died of other cancers - in total 6 who received mitomycin C (MMC) based CRT and 14 who received cisplatinum either as CRT or maintenance

Metastatic /advanced

- Few options in practice (OS or PFS)

Main primary endpoints used in advanced or metastatic various types of cancers

	Phase II	Phase III
Non-small cell lung cancer	response rate, progression free survival	overall survival, progression free survival
Small-cell lung cancer	response rate, progression free survival	overall survival, progression free survival
Mesothelioma	response rate	overall survival
Breast cancer	response rate, progression free survival	overall survival, progression free survival
Nasopharyngeal carcinoma	response rate, time to progression	overall survival, progression free survival
Thyroid cancer	response rate	progression free survival
Esophageal cancer	response rate	overall survival, progression free survival
Gastric cancer	response rate	overall survival
Colon rectal cancer	response rate, progression free survival	overall survival, progression free survival
Pancreatic cancer	response rate, progression free survival, overall survival	overall survival
Hepatocellular carcinoma	response rate, progression free survival	overall survival, time to progression
Biliary tract Cancer	response rate, progression free survival	overall survival
Cervical cancer	response rate	overall survival, progression free survival
Endometrial Cancer	response rate, progression free survival	overall survival, recurrence free survival
Ovarian cancer	response rate, progression free survival	overall survival, progression free survival
Prostate Cancer	time to PSA progression, progression free survival	overall survival, progression free survival
Renal cell carcinoma	response rate, progression free survival	overall survival, progression free survival
Glioblastoma	response rate, progression free survival	overall survival, progression free survival
Melanoma	response rate, relapse free survival, disease stabilization rate	overall survival, progression free survival

Kiba, J Cancer Sci Ther 2011, 3:7

Metastatic /advanced

- Few options in practice (OS or PFS)
- TFS: Time to Failure of Strategy
- TTP: Time To Progression
- TTTF: time to treatment failure (includes toxicity)

Progression free survival

- Do you think PFS is meaningful or simply measurable?

- Extending PFS does not always lead to longer overall survival

Please discuss

Convenience/Feasibility

size of a trial is determined by the number of "events"

- since recurrence/progression of cancer usually occurs before death
- PFS or DFS can be evaluated earlier and require less patients

Progression free survival

- Defining Disease Progression (when and how?)
- What does PFS mean for patients?
- Why do treatments that increase PFS fail to improve survival?
- Post-progression therapy debate (do you continue biologicals?)

Whose endpoint is it anyway?

- Important, relevant and meaningful to

- Pharma
- Investigators/clinicians
- Patients
- The FDA

Guidance for industry Clinical trials Endpoints for the approval of cancer drugs FDA, May 2007

“Overall survival is considered the most reliable cancer endpoint, and when studies can be conducted to adequately assess survival, it is usually the preferred endpoint.”

Endpoints in Drug Development

Early phase

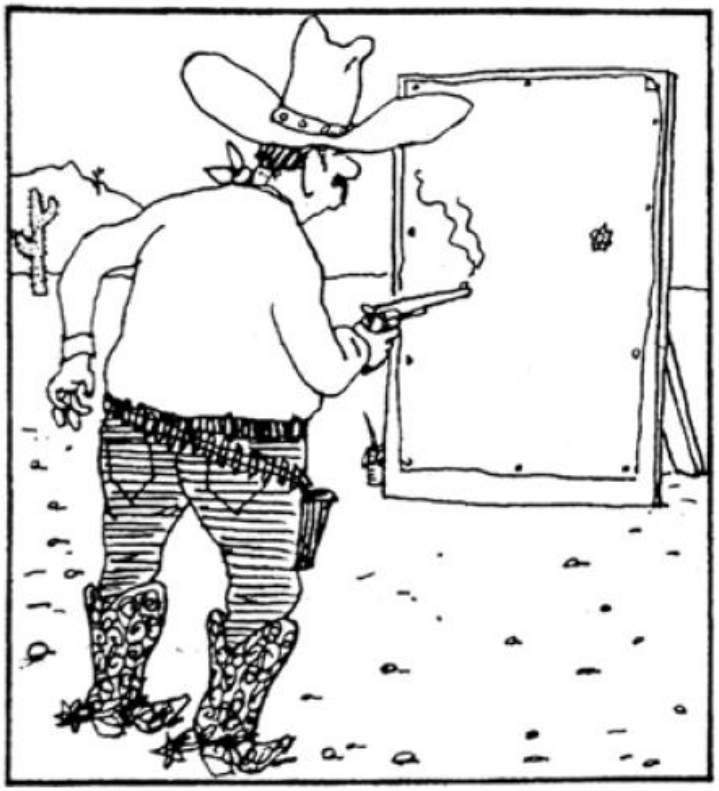
- Safety
- Evidence of activity
- Identifying potential indications

Late phase

- To confirm clinical benefit

The Texas sharpshooter

SHOOTS FIRST…



With thanks to Søren Laurberg

Outcomes

- Those that matter to HCPs/statisticians
- Those that matter to patients

"I won't mince words, Mrs. Horton, concerning your husband, we've had a negative patient-care outcome."

Outcomes can be positive or negative

- So should we poll patients to ask them to choose the most relevant endpoints?

Clinical Benefit

- Live longer (overall survival)
- Live longer without cancer (progression free siurvival)
- Live better (QOL)

- Safer
- Cheaper

Overall Survival (the "gold" standard for showing clinical benefit)

Definition	Time from randomisation to death from any cause (in ITT population)
Pros	• Measure of direct benefit • Easy to measure (unbiased) • Reliable and precise • Blinding not required
Cons	• May require large population and long follow-up • Includes deaths unrelated to cancer • Can be affected by crossover and subsequent treatment (eg checkpoint inhibitors) • Other endpoints may have intrinsic value
Censor	Last date subject was seen alive

Progression Free Survival

Definition	Time from randomisation to recurrence (in ITT population)
Pros	• Smaller population and shorter follow-up • Not affected by crossover or subsequent treatment (eg checkpoint inhibitors)
Cons	• ? Measure of direct benefit • Subject to assessment bias • Unreliable and imprecise • Blinding required • Need to balance radiological assessments
Censor	bias – if imbalanced withdrawal of patients who are censored prior to relapse or progression

Limitation of Progression free survival

- Focusses on a single line of treatment
- All that happens later is just ignored or considered as confounding factor

Disease Free Survival

Definition	Time from randomisation to recurrence (in ITT population)
Pros	• Smaller population and shorter follow-up • Not affected by crossover or subsequent treatment (eg checkpoint inhibitors)
Cons	• ? Measure of direct benefit • Subject to assessment bias • Unreliable and imprecise timing • Need to balance radiological assessments ie need standardized follow-up protocols
Censor	bias – if imbalanced withdrawal of patients who are censored prior to relapse or progression

Colostomy-free survival

- Primary outcome measure of the ACCORD-03 trial
- Secondary endpoint in ACT II and RTOG 9811

Colostomy-free survival

Definition	Time from randomisation to colostomy formation (in ITT population)
Pros	• Easy to define • Not affected by crossover or subsequent treatment (eg checkpoint inhibitors)
Cons	• ? Measure of direct benefit • Initial colostomy can be reversed but often not reversed • Colostomy can be formed both for recurrence and late effects
Censor	bias – if imbalanced withdrawal of patients who are censored prior to colostomy

Survival may depend on

- differences in risk factor prevalence
- adjustment for stage and other clinical factors
- adjustment for comorbidities, socioeconomic disadvantage and remoteness
- Adjustments for region
- Further treatments after progression
- Alternative medicines taken by large tranches of population (eg aspirin) -we don’t know about

Options for Survival

- Survival from all causes (masks the outcomes for cancer per se)

- Disease-specific /cancer specific survival (may be vulnerable to censoring bias)

  Unreliable information on cause of death.

  (Death certificates inaccurate).

- Relative survival

Relative Survival

<u>overall survival after diagnosis</u>

survival in a similar population (not diagnosed with that disease).

(A similar population is composed of individuals with at least age and gender similar to those diagnosed with the disease.)

Relative Survival

<u>overall survival after diagnosis</u>

survival in a similar population (not diagnosed with that disease).

(A similar population is composed of individuals with at least age and gender similar to those diagnosed with the disease.)

But requires credible life tables.

Options for Survival

- Survival from all causes (masks the outcomes for cancer per se)

- But if a treatment is toxic……and could cause deaths

Which do you think is the best option for Survival endpoint?

1. Survival from all causes (masks the outcomes for cancer per se)

2. Disease-specific survival (may be vulnerable to censoring bias)

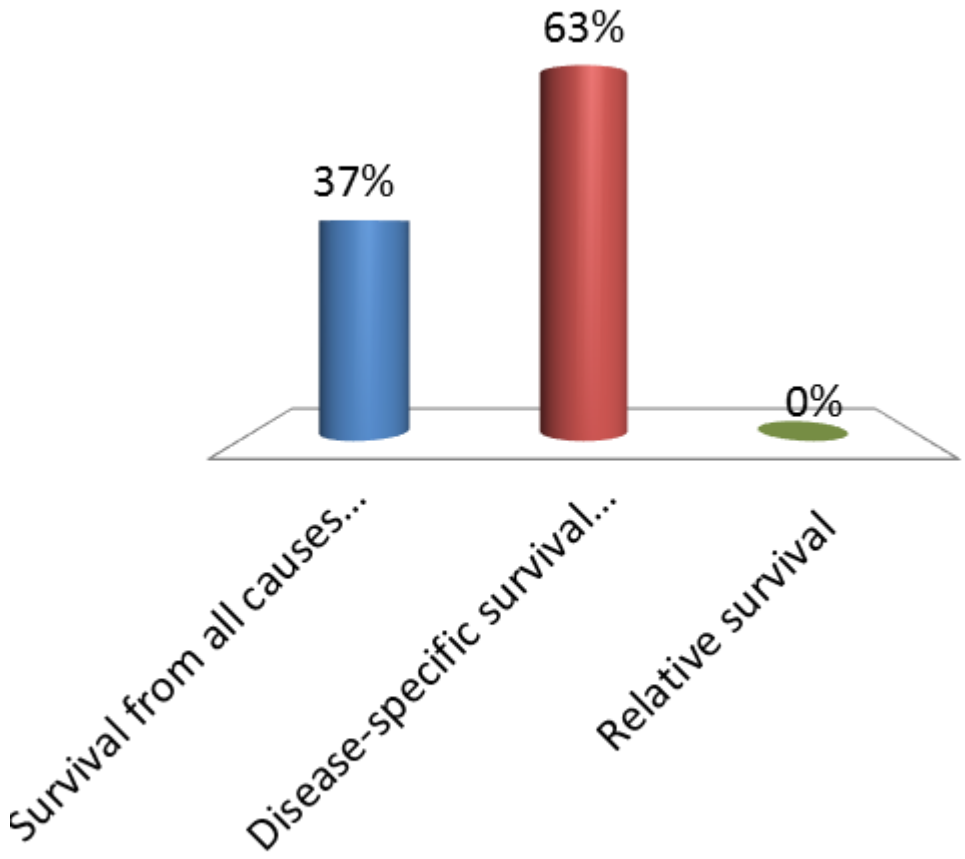
3. Relative survival

Which do you think is the best option for Survival endpoint?

A. Survival from all causes (masks the outcomes for cancer per se)

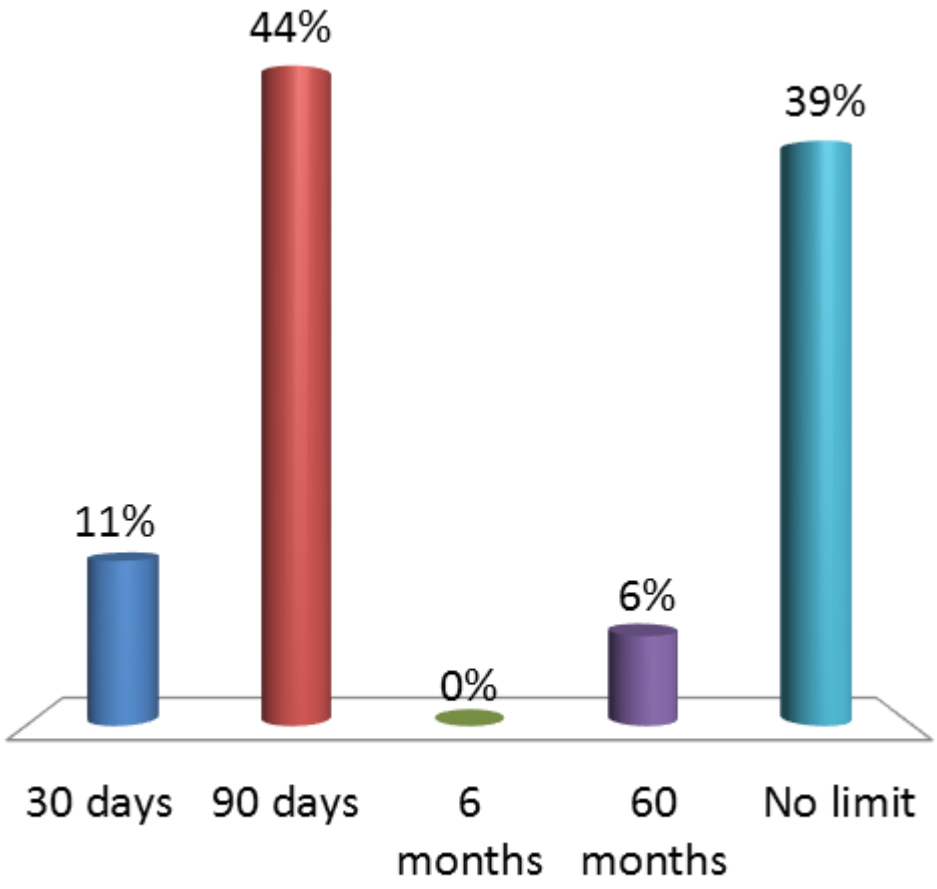
B. Disease-specific survival (may be vulnerable to censoring bias)

C. Relative survival



Should you have a time limit for death due to treatment after CRT?

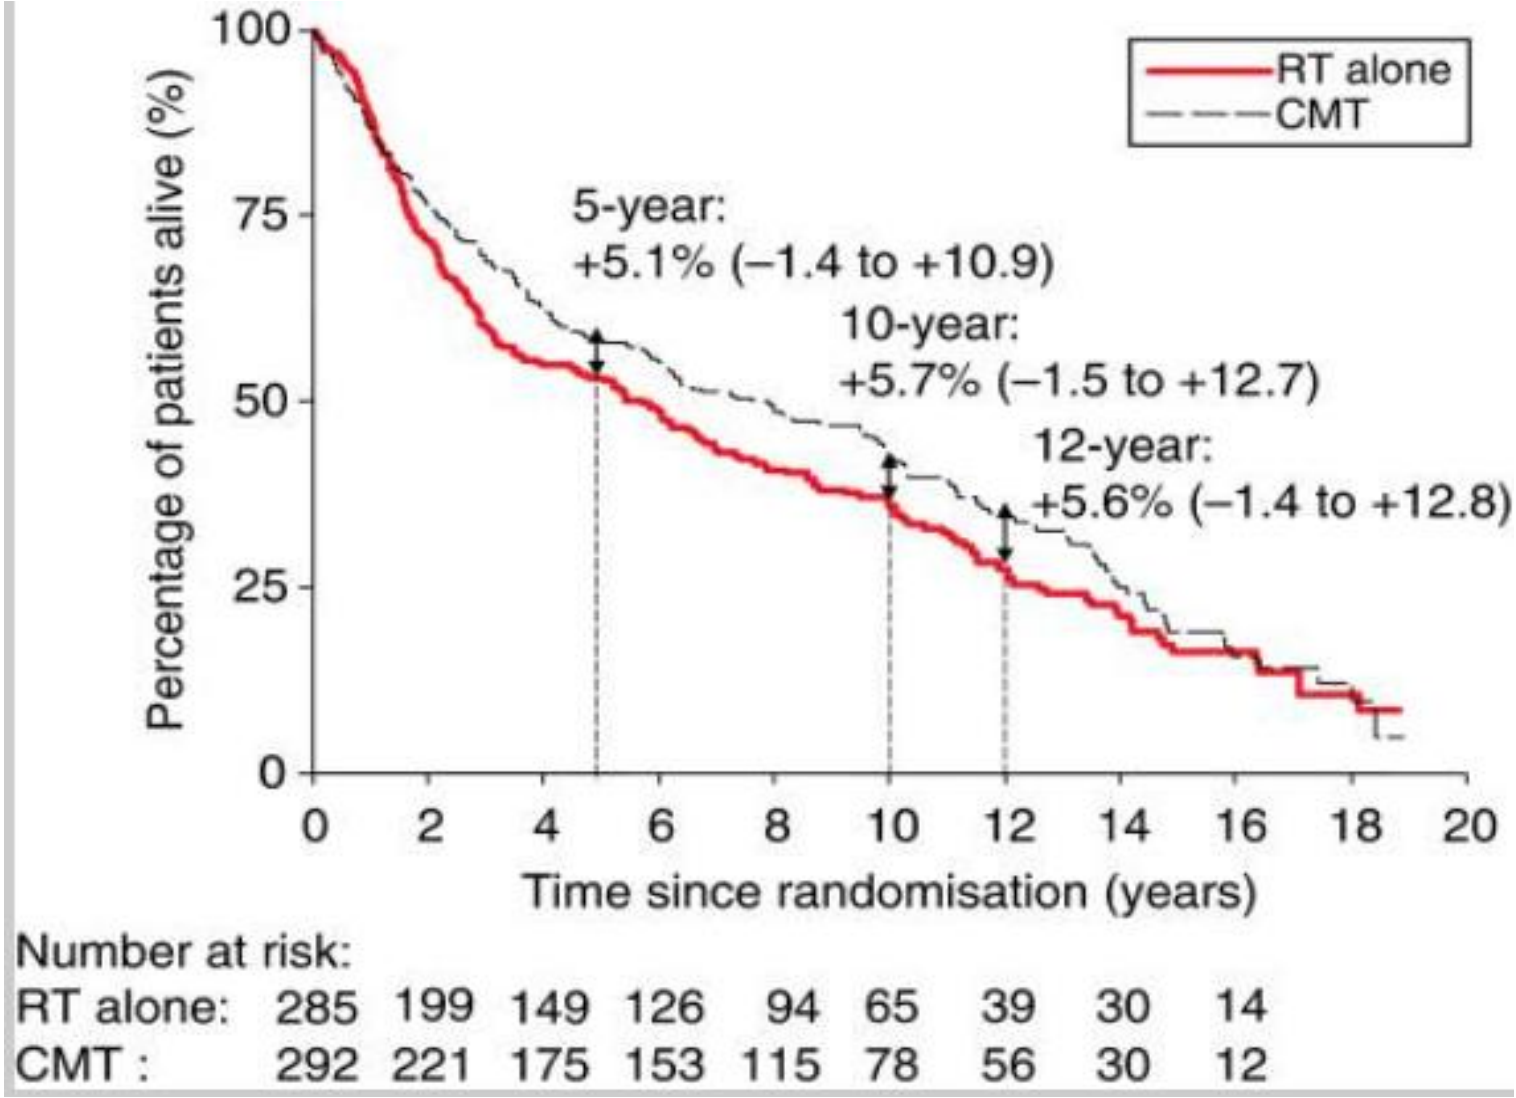
A. 30 days
B. 90 days
C. 6 months
D. 60 months
E. No limit



Options for Survival

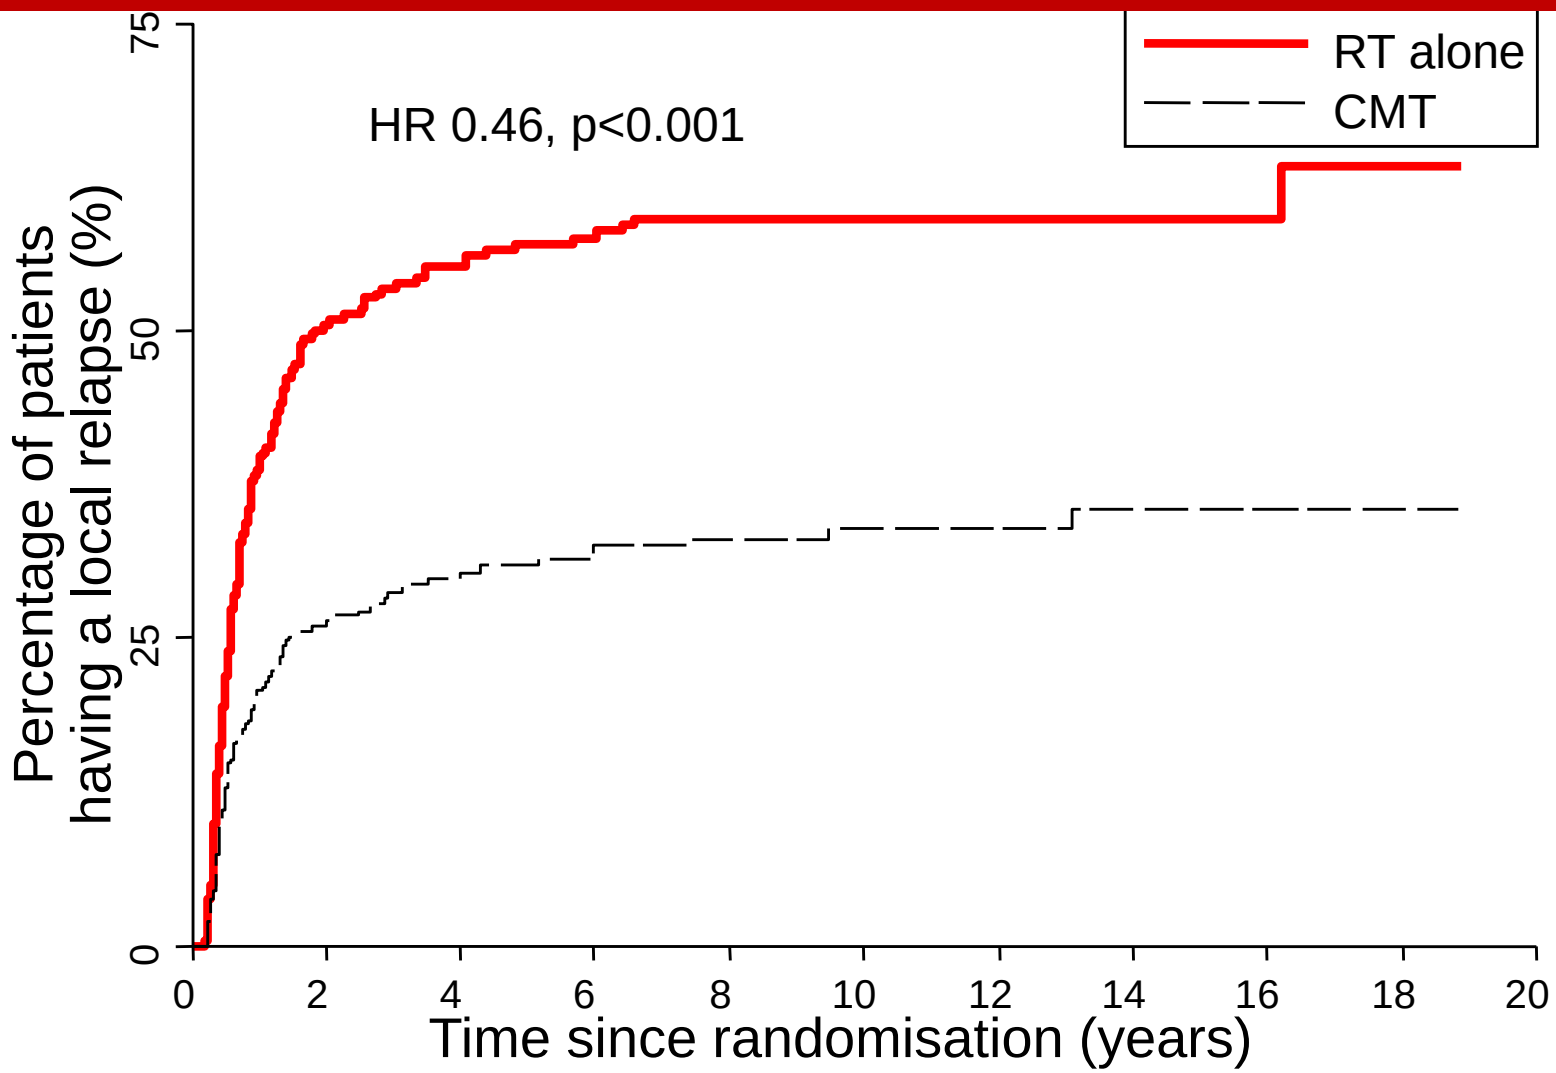
- Survival from all causes (masks the outcomes for cancer per se)
- Disease-specific survival (may be vulnerable to censoring bias)
- Relative survival

ACT I : Overall survival



Northover J et al Br J Cancer 2010;102(7):1123–8

ACT I :Time to first local relapse



Northover J et al Br J Cancer 2010;102(7):1123–8

- variable use of salvage treatments among centers or countries may have uncontrollable effects on overall survival benefits.

Why? competing risks

Needs to be adjusted

- for age,
- sex,
- year of diagnosis,
- Socio-economic status
- Remoteness
- Availability of surgical salvage/quality of hospitals

- Punt CJ et al., **Endpoints in adjuvant treatment trials: a systematic review of the literature in colon cancer and proposed definitions for future trials.** J Natl Cancer Inst. 2007 Jul 4;99(13):998-1003

Adjuvant treatment

- with the increasing number of effective salvage treatments available in many types of cancer,
- much longer follow-up is required to demonstrate that adjuvant treatments improve overall survival compared with other clinical endpoints

Adjuvant trials should include

- DFS
- RFS
- TTR
- TTF
- Cancer specific survival
- Overall survival

Punt CJ, **Endpoints in adjuvant treatment trials: a systematic review of the literature in colon cancer and proposed definitions for future trials**
J Natl Cancer Inst. 2007 Jul 4;99(13):998-1003

DFS

- Serves both as a surrogate endpoint
- and as an endpoint in itself

DFS

- Defined as the time from randomization to any event, (irrespective of cause)
- is the most informative endpoint for assessing the effect of treatment and therefore the most relevant to clinical practice.
- Accepted surrogate for OS in colon cancer adjuvant trials

- Not yet accepted in rectal cancer trials of CRT

DFS after CRT

DFS often counts the following as an event:

- non-complete response (nCR) (timed 4-18 weeks following CRT)
- New radiological local, nodal, pelvic or distant disease following a post CRT CR
- or death from any cause.

- ***Is this a meaningful endpoint for patients who have slow or no response, but are salvaged by surgery and thereafter have no clinical disease?***

Primary tumour

Surgery to recurrence is straightforward –tumour is removed - so definitely no tumour and first new evidence is event

Chemoradiation (CRT)

- Tumour disappears at some point
- Some never free from disease –so treatment failure - assume event occurs at randomisation
- Some disappears and then reappears

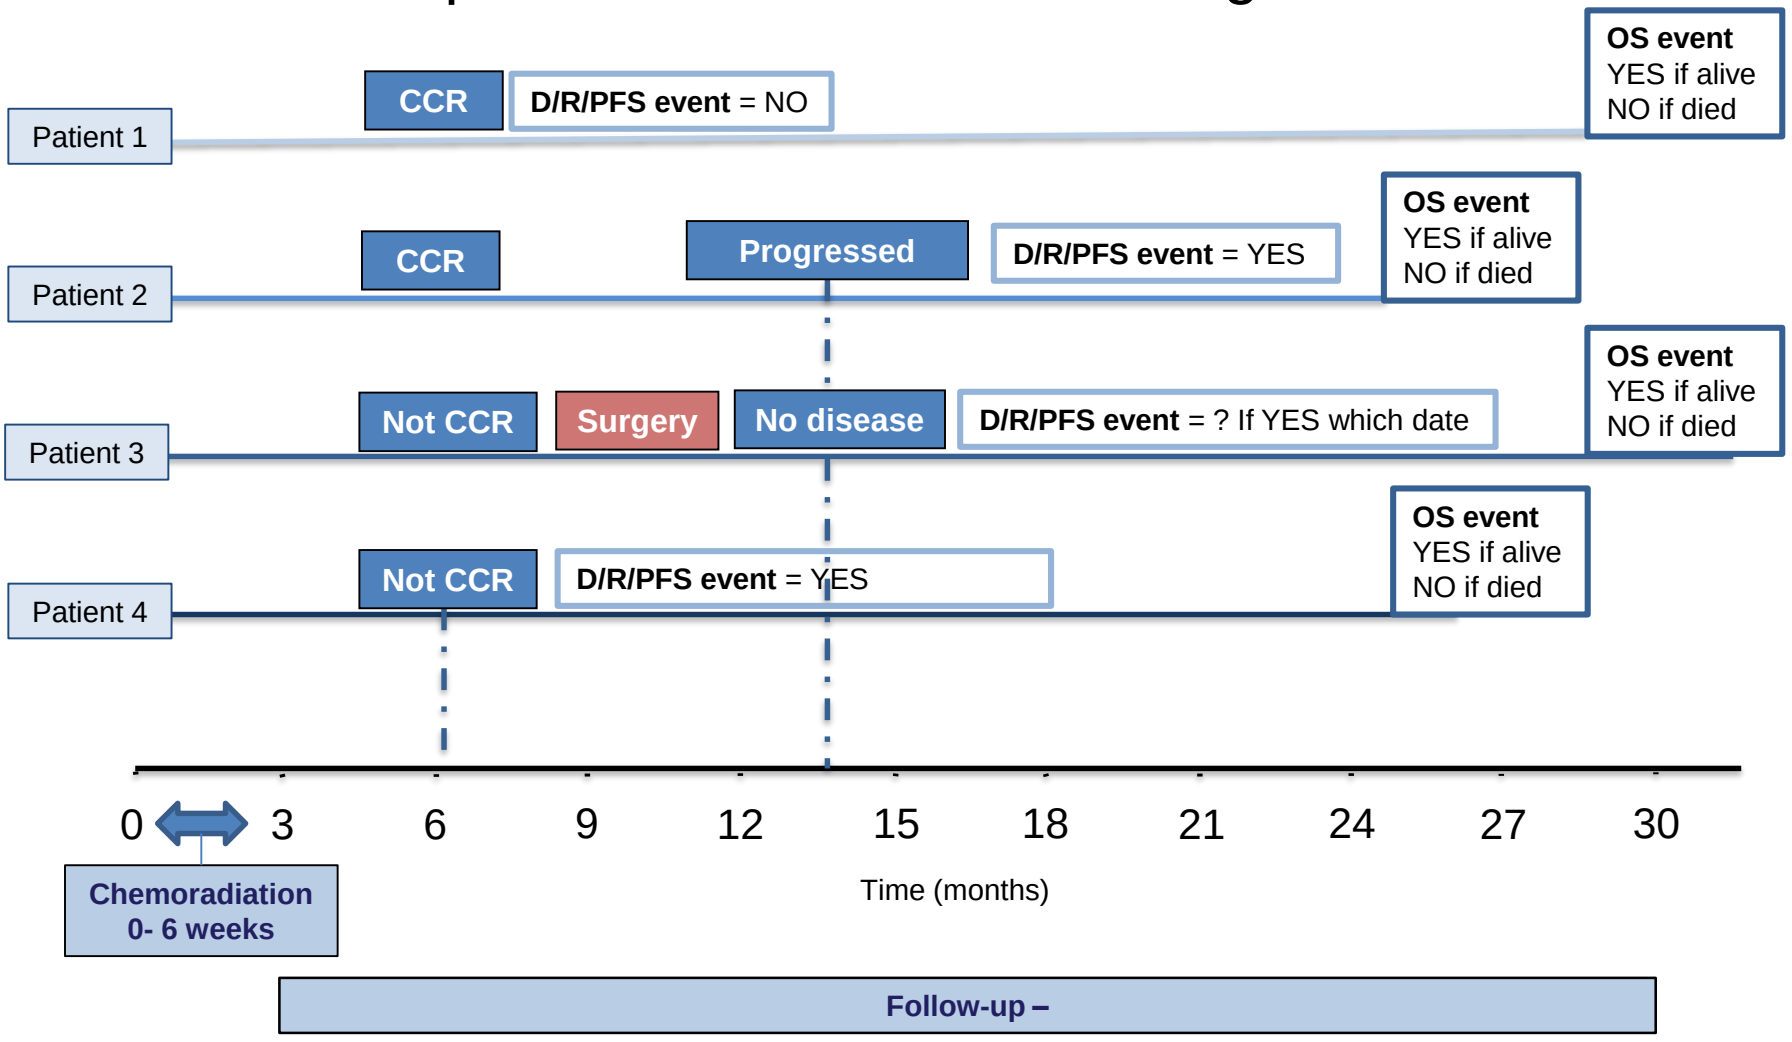
ie both an early and late pattern to loco-regional relapse /failure

DFS

- A positive biopsy may define the endpoint conclusively
- but a premature positive biopsy may indicate active tumour, which is actually destined to disappear if the tumour is observed for a longer period.

Glynne-Jones R et al. Lancet Oncology 2017; Mar;18(3):347-356.

Figure 1. Time-to-event outcomes in SCCA - possible outcomes for patients with SCCA following chemoradiation.



Surrogate endpoints

- Alternative early endpoint if validated
- Allows inference on the effect of an intervention on the long-term endpoint (survival)
- Rely on early response or growth of tumour (pCR etc..)

Prentice Criteria

- The treatment has an effect on survival time.
- The treatment has an effect on the surrogate.
- The surrogate is associated with survival time.
- The treatment effect on survival is captured by the surrogate.

ie a patient with a longer PFS/DFS will have a longer OS (correlation is insufficient)

PCR

- is almost immediately observable event, which dramatically reduces the time required until trial completion.

- An increase in the pCR rate objectively demonstrates efficacy of the agent against the primary tumour.

PCR

- The Radiation Therapy Oncology Group (RTOG) 0247 (A Randomized, Phase 2 Study of Neoadjuvant Radiation Therapy Plus Concurrent Capecitabine and Irinotecan or Capecitabine and Oxaliplatin for Patients With Locally Advanced Rectal Cancer)

PCR

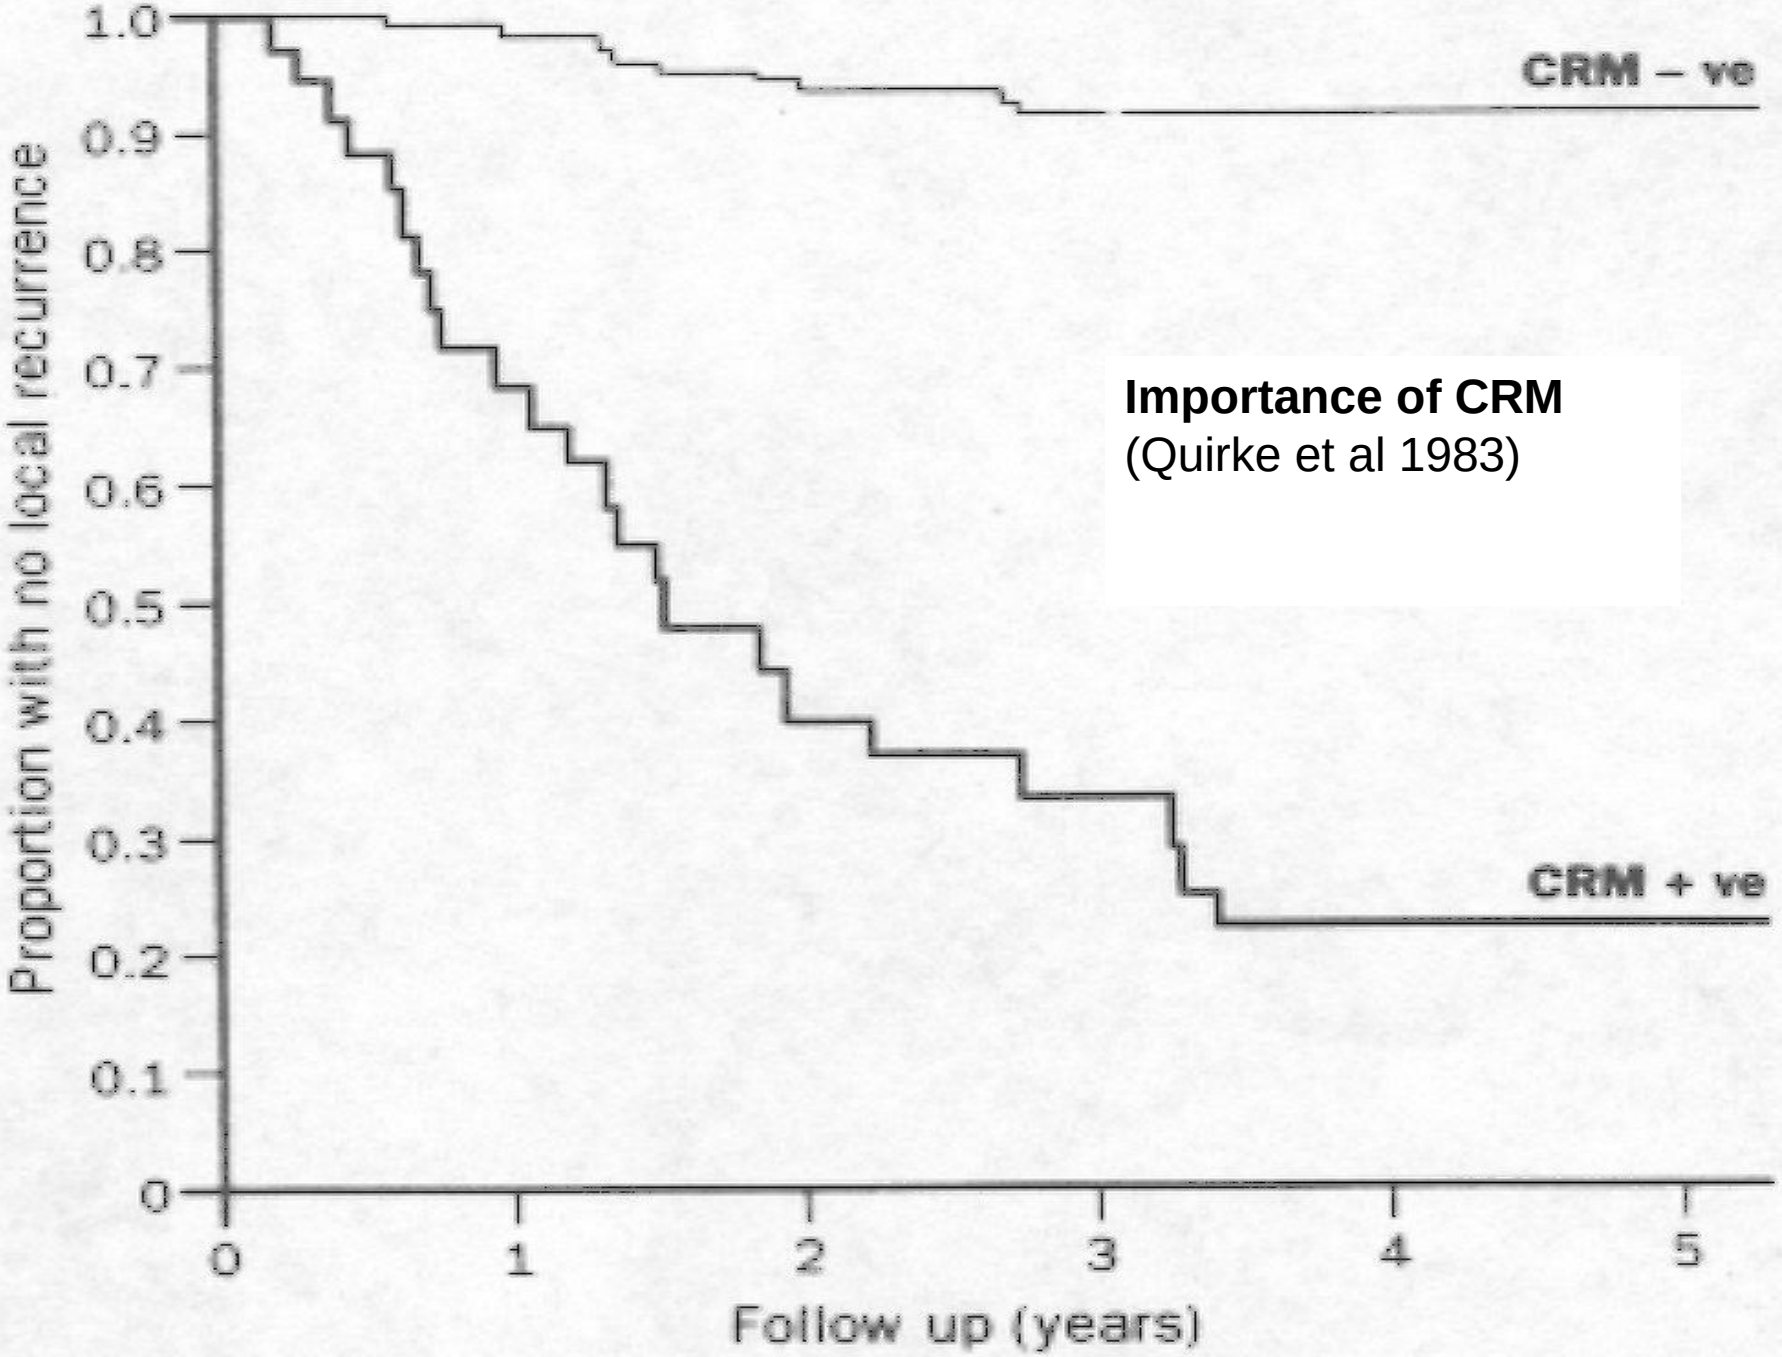
Capecitabine/oxaliplatin pCR = 21% (10/48)
capecitabine/irinotecan pCR = 10% (5/48)

so the irinotecan arm was rejected

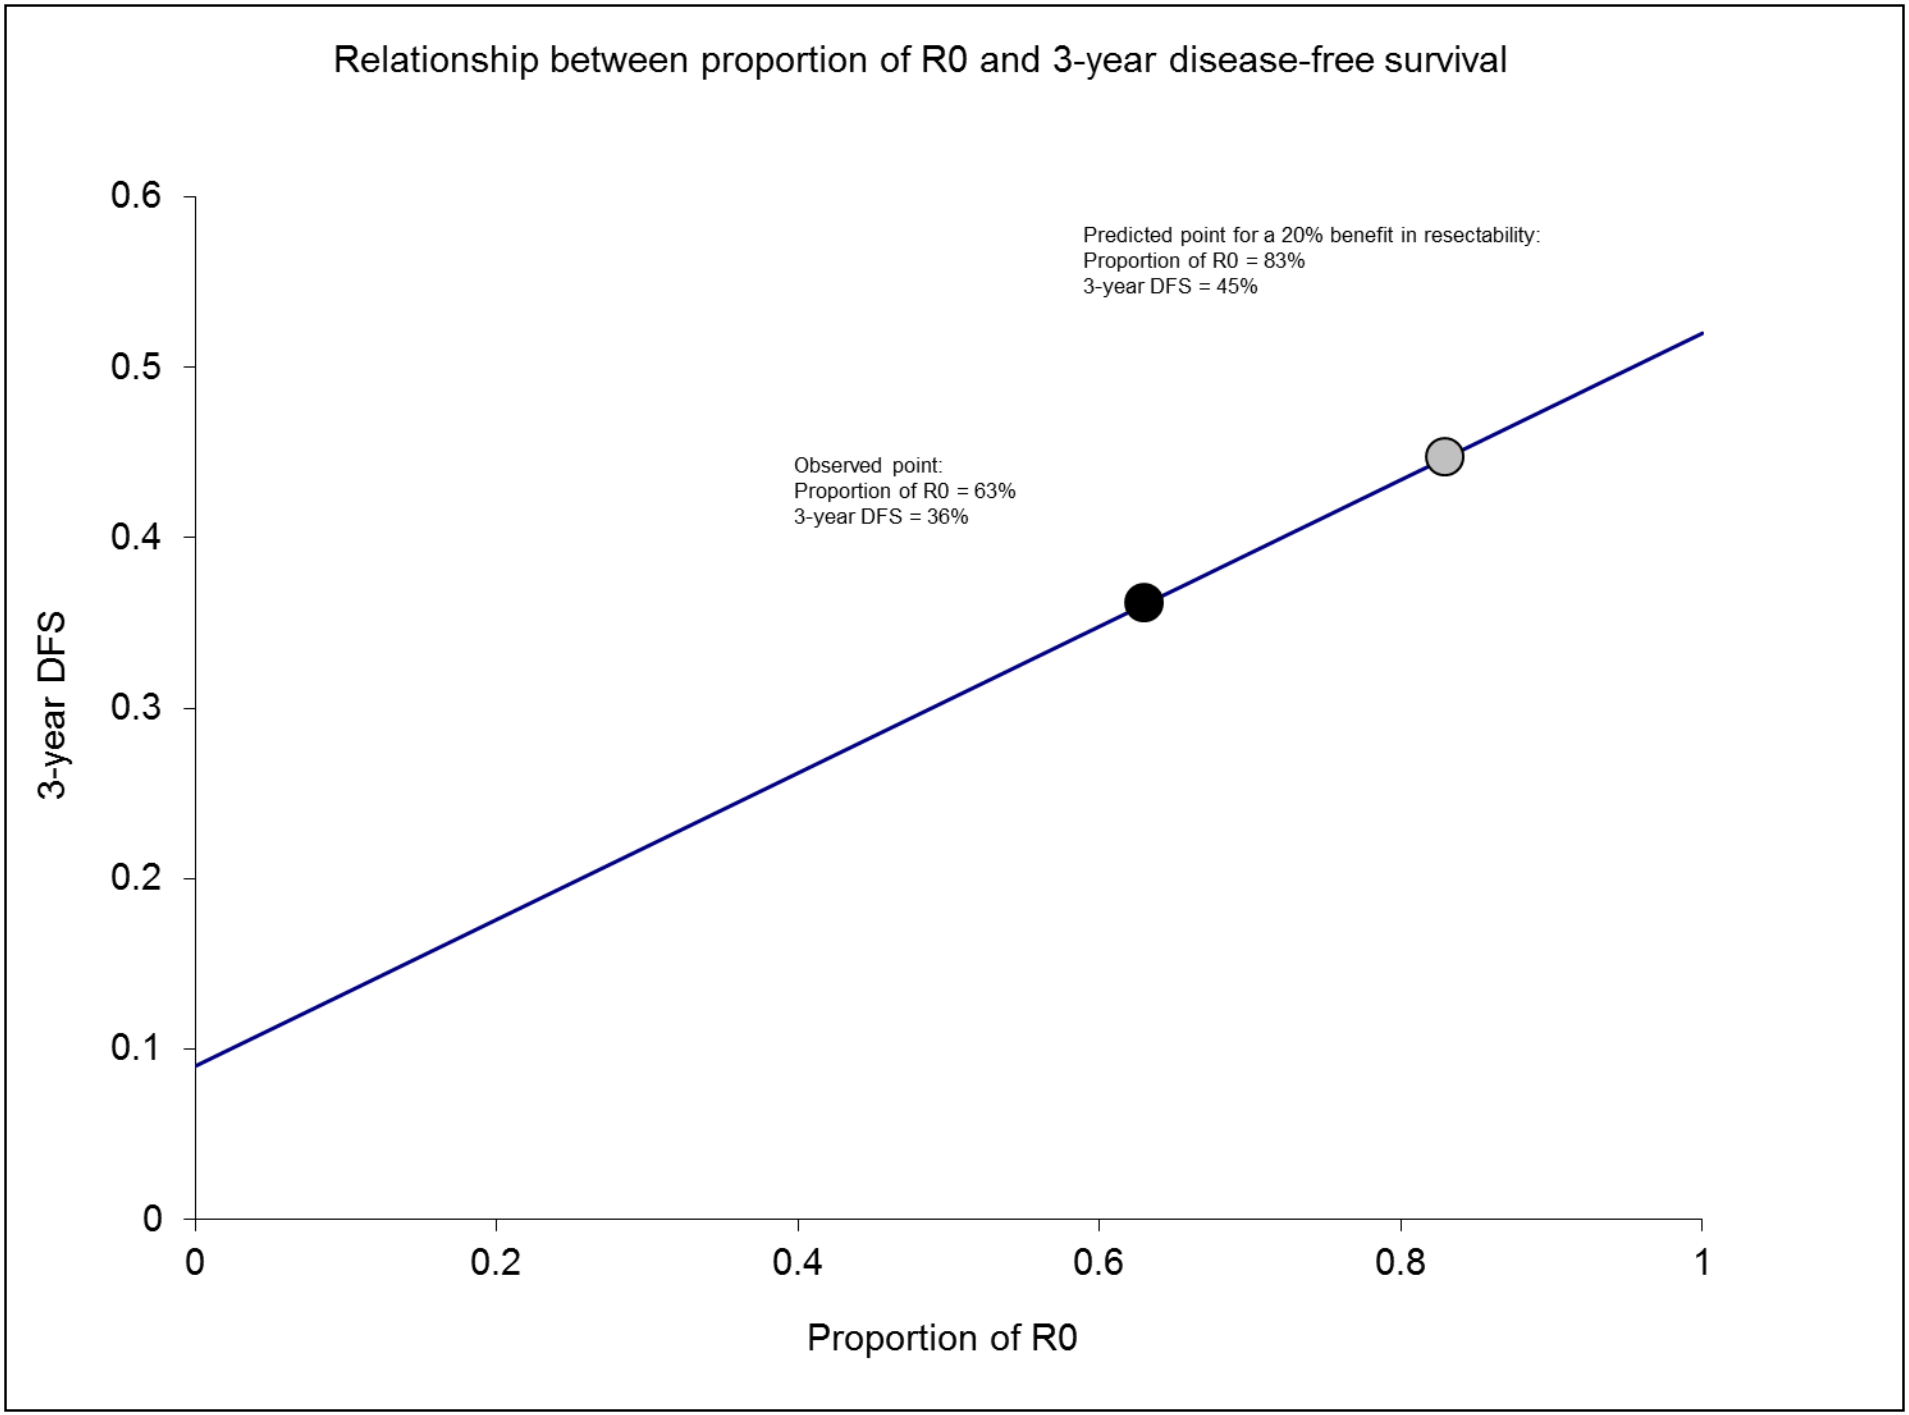
But long-term follow-up showed

- Numerically superior survival (4-year OS: 85% v 75%; P > .05)
- The 4-year DFS 68% versus 62%.

Wong SJ et al. IJROBP 2015; 91(1):116-123



Importance of CRM
(Quirke et al 1983)



Relationship between proportion of R0 and 3-year disease-free survival
Predicted point for a 20% benefit in resectability:
Proportion of R0 = 83%
3-year DFS = 45%
Observed point:
Proportion of R0 = 63%
3-year DFS = 36%

Time since randomisation (in years)
Time to pelvic failure (PF)
Time to distant metastases (DM)
Progression-free survival (PFS)
Cause-specific survival (CS)
Overall survival (OS)

Conclusion

- The ideal objective for gauging success in future SCCA phase III trials should be anal dysfunction-free survival.

Conclusions /Recommendations

- Be wary of variations in named endpoints and what events they include
- Need a future consensus
- Editors of journals/clinicians/groups need to agree

Thank you for listening

RTOG 9811 defined event free survival (EFS)

- time from date of registration to the date of death from any cause,
- first evidence of disease progression, evaluated as non-complete response (nCR) at the second evaluation after CR,
- undergoing colostomy
- or first evidence of second primary cancer,

whichever happens first.

- Axel Grothey No66c- bevacizumab trial continuing Bev post progression
- Criticized by Kopetz

Ondansetron not continued (n = 95)
HR = 0.65
P = .02

HAZARD RATIOS

- OS, DFS and PFS report difference between experimental/control curves as Hazard Ratio (HR).

i.e. ratio between events occurring in any given time interval with experimental compared to control treatment is constant

- HR may not be meaningful if survival curves are not of similar shape
- If HR <1 and the 95% confidence interval excludes 1, there is a statistically significant effect of the experimental treatment as compared to control.

Modern RT in lymphoma

- Radiation therapy has **changed dramatically** over the last few decades in terms of both irradiated volumes and dose

- **Smaller** treatment volumes, **lower** radiation dose and **advanced** conformal radiotherapy can certainly allow a safer radiation delivery, when/if needed (!!!)

Modern RT in Lymphoma: Volume delineation

- **Advances** in imaging, treatment planning, treatment delivery, have made it possible to better define and further **decrease RT volumes** in many situations

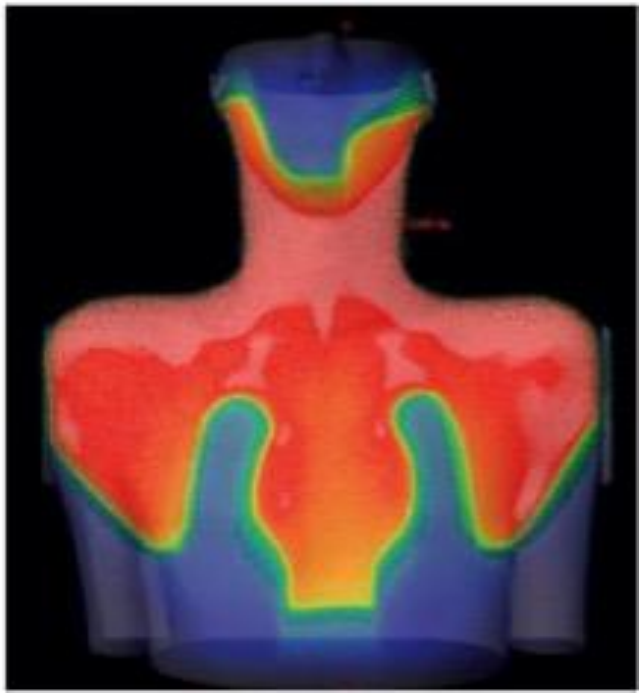
- The current **guidelines for involved field RT** based on **anatomic landmarks** and encompassing adjacent uninvolved lymph nodes **are no longer appropriate** for modern and more "targeted" RT delivery aimed at reducing normal tissue exposure

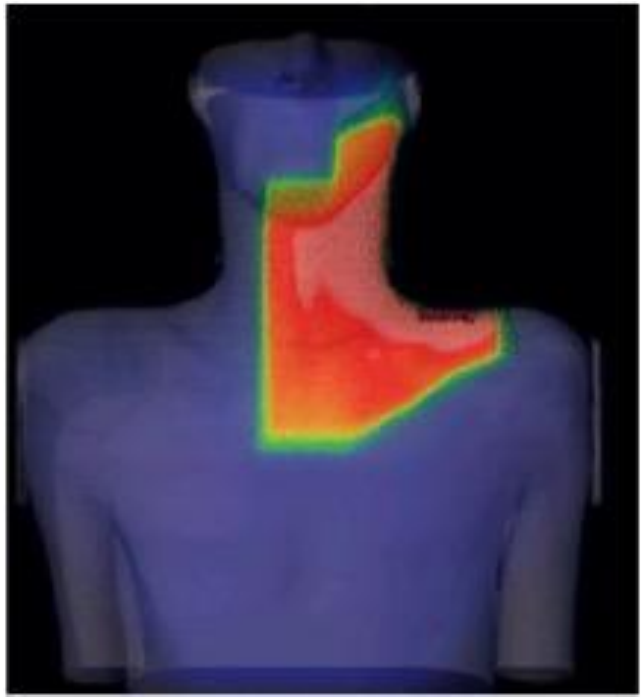
Radiotherapy Volumes for Lymphoma Patients

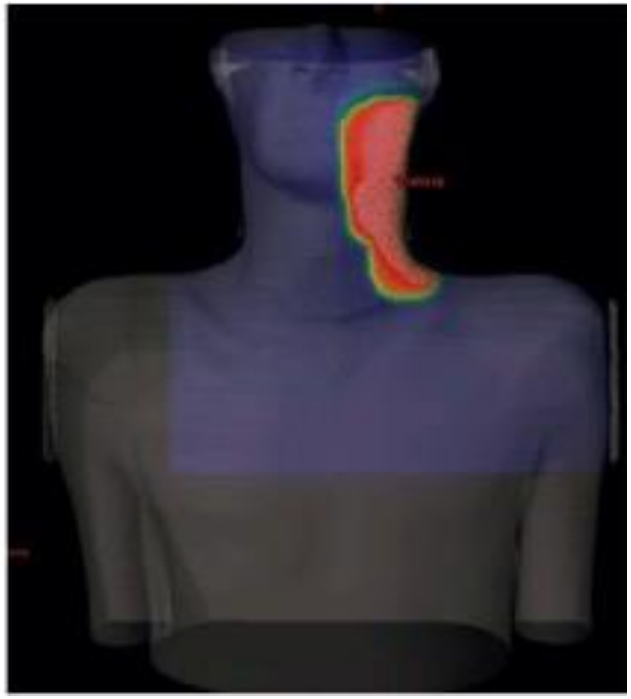
Mantle field

Involved field

Involved site
Involved node





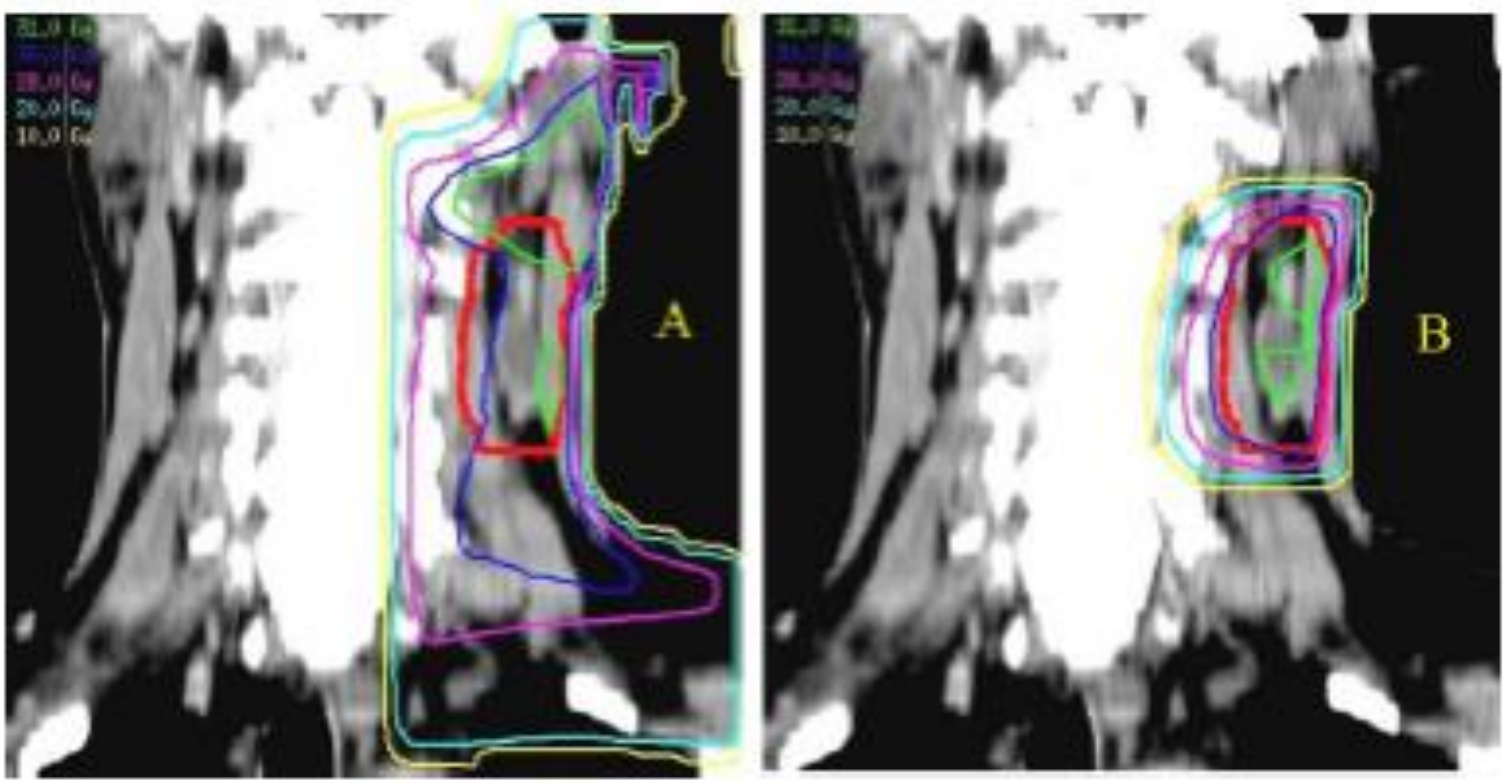


Volume treated on the basis of anatomical borders

Targets of treatment are only lymph nodes and/or extranodal sites involved at baseline

ESTRO School

From IFRT to INRT or ISRT



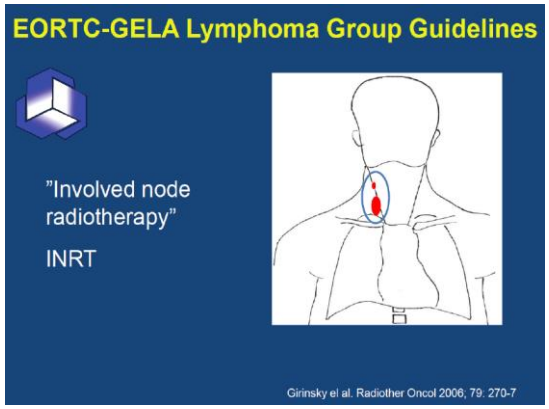
- The concept of **IF-RT** which included the whole initially involved lymph node region can now be replaced by the concept of **involved-node RT**, which only includes the initially involved lymph node(s)

ESTRO School

The concepts of INRT and ISRT

❑ Involved Node Radiotherapy (INRT)

- Good pre-chemo imaging with PET-CT in treatment position
- Image fusion with post-chemo planning CT
- Contouring target volume of tissue which contained lymphoma at presentation



❑ Involved Site Radiotherapy (ISRT)

- Detailed pre-chemo imaging is not always optimal (not in treatment position) in standard clinical practice
- Compared to INRT slightly larger volumes needed to ensure irradiation of all initially involved tissue volumes, but the same principles apply
- In most situations, ISRT includes significantly smaller volumes than IFRT

ILROG
INTERNATIONAL LYMPHOMA RADIATION ONCOLOGY GROUP

ESTRO School

The “Clinical” Role of the Radiation Oncologist

- ***Defining CTV relies upon:***

1. the quality and accuracy of imaging;

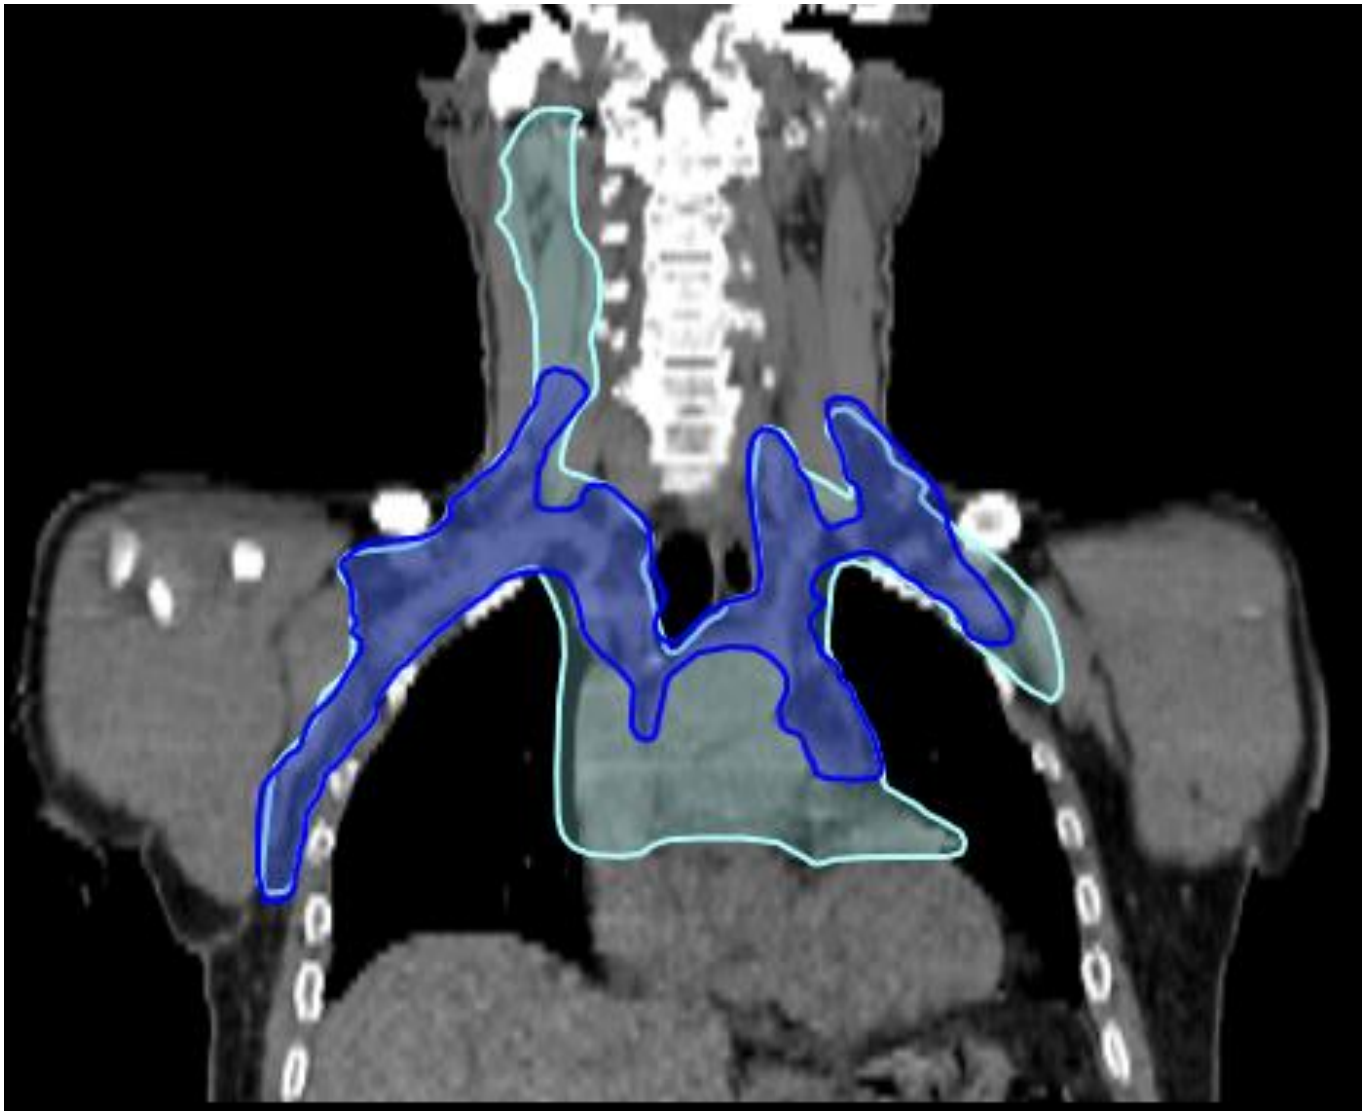
2. knowledge of the spread patterns of the disease, as well as potential subclinical extent of involvement, and adjacent organ at risk constraints

↓

All of which depend on clinical judgment and experience

ESTRO School

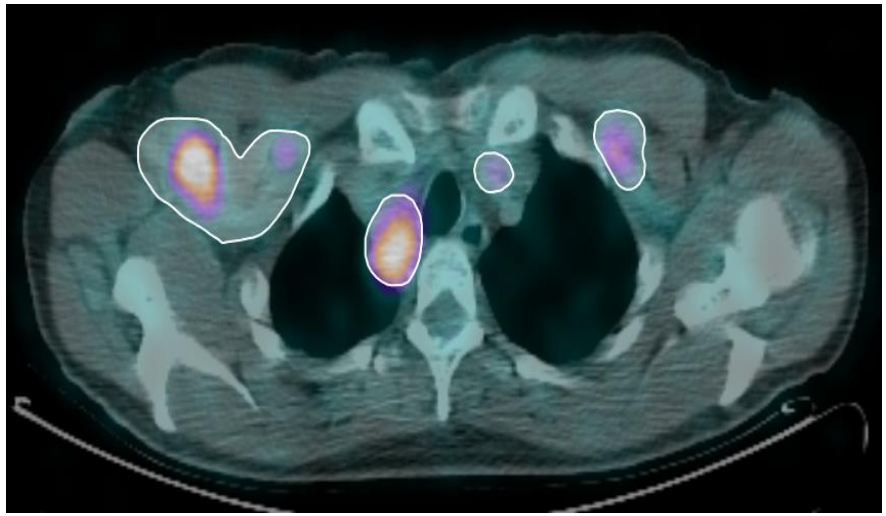
From IFRT to ISRT

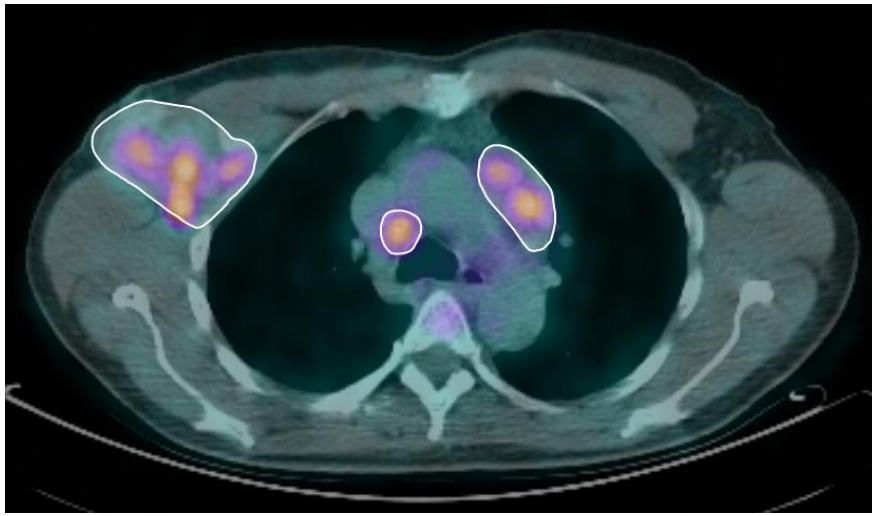


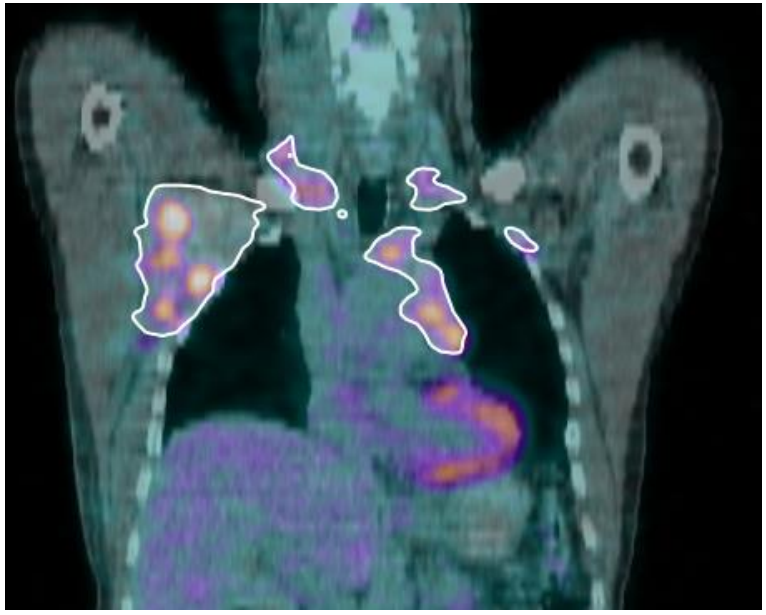
“In most situations, ISRT will include significantly smaller volumes than IFRT"

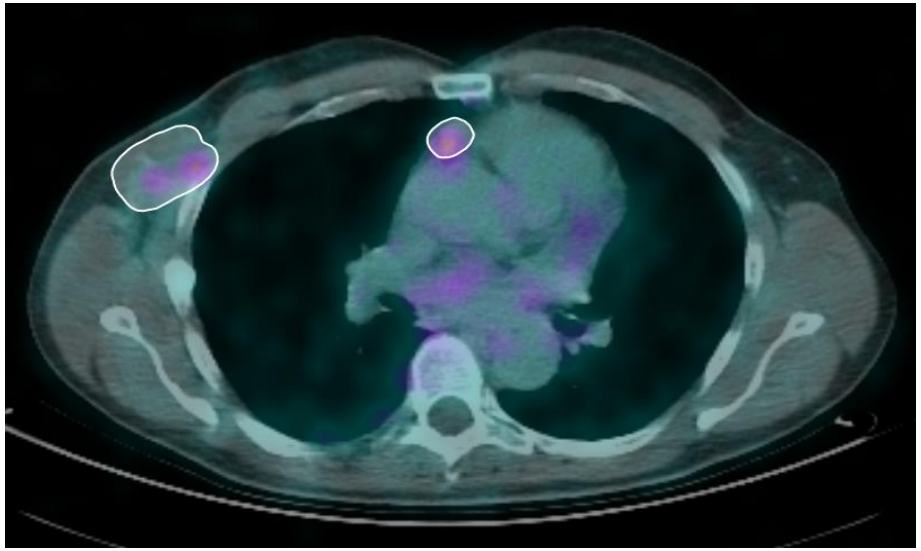
ESTRO School

GTV on pre-chemotherapy PET



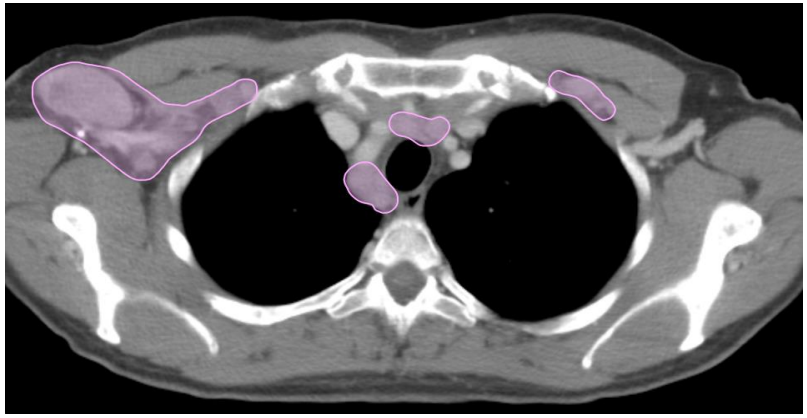


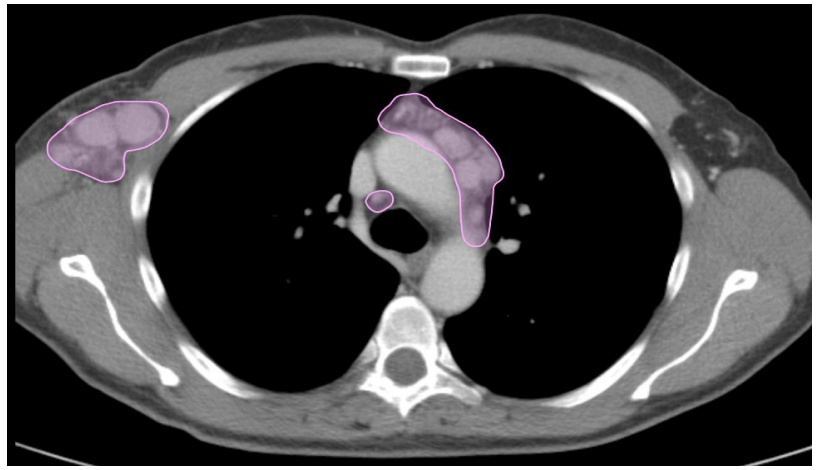


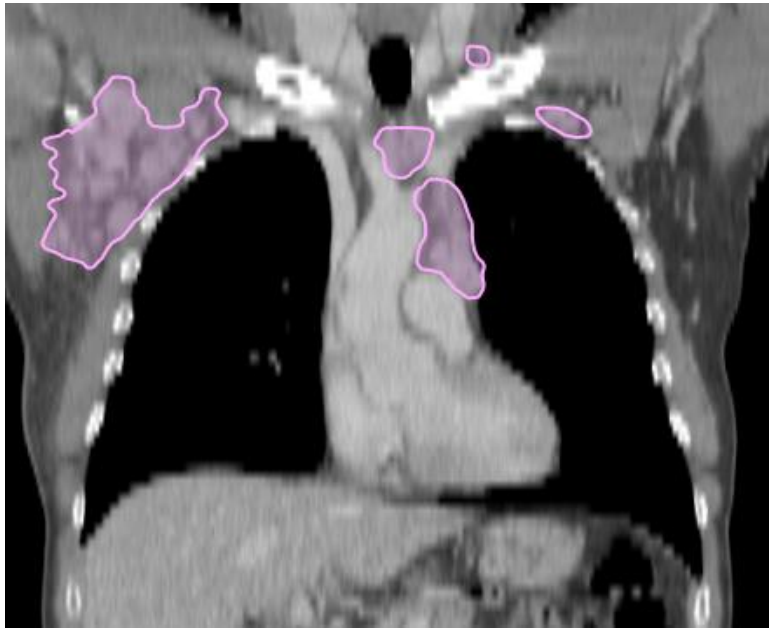


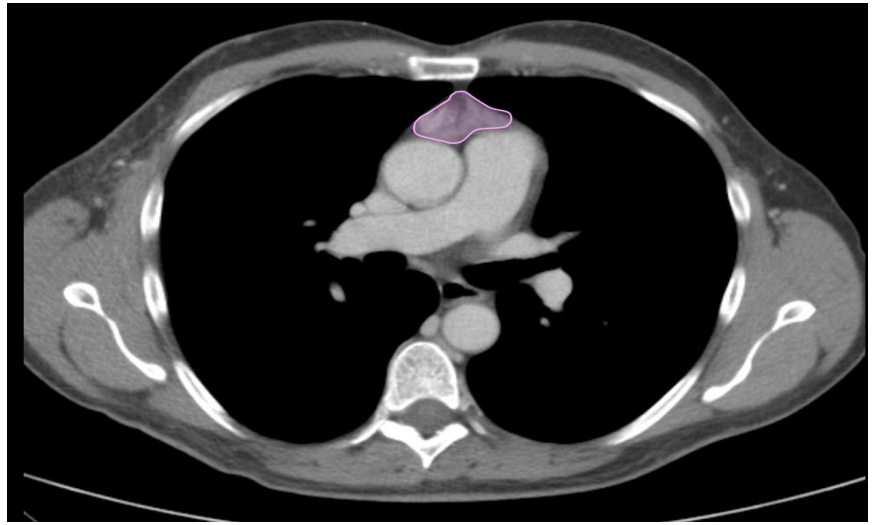
ESTRO School

GTV on pre-chemotherapy CT scan



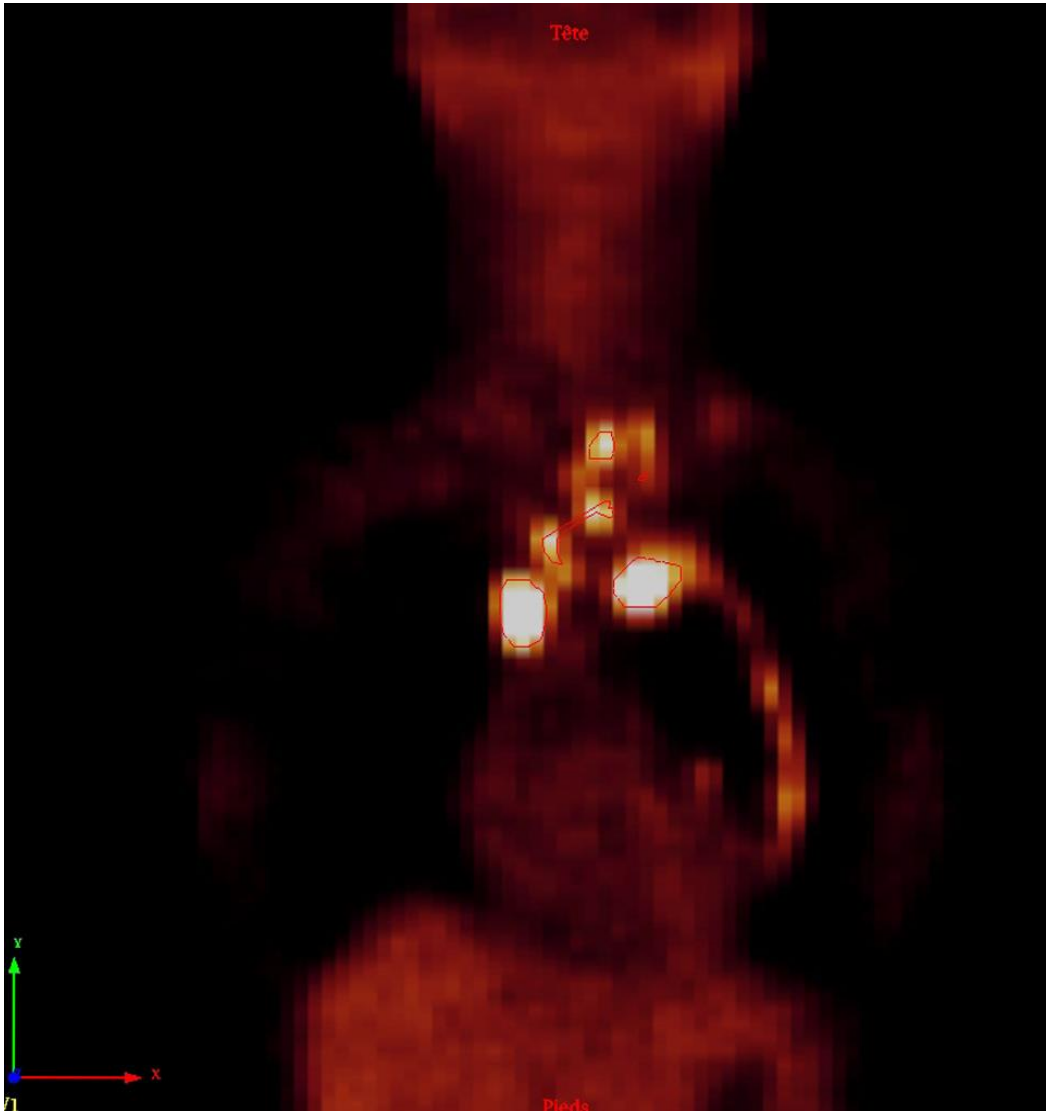


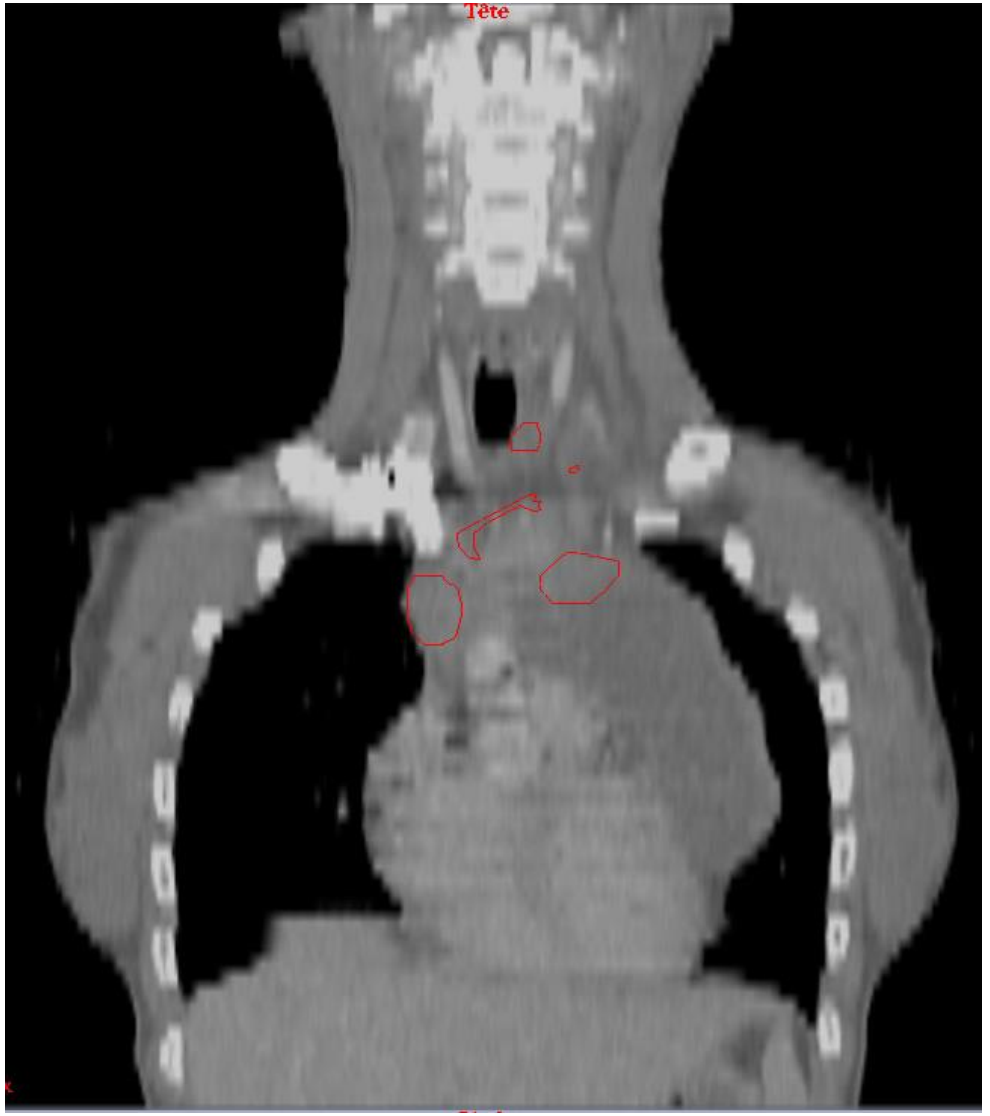




ESTRO School

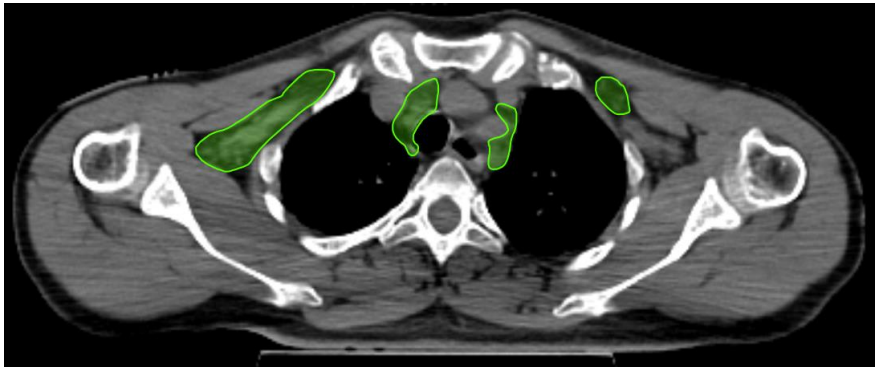
PET avidity often heterogeneous

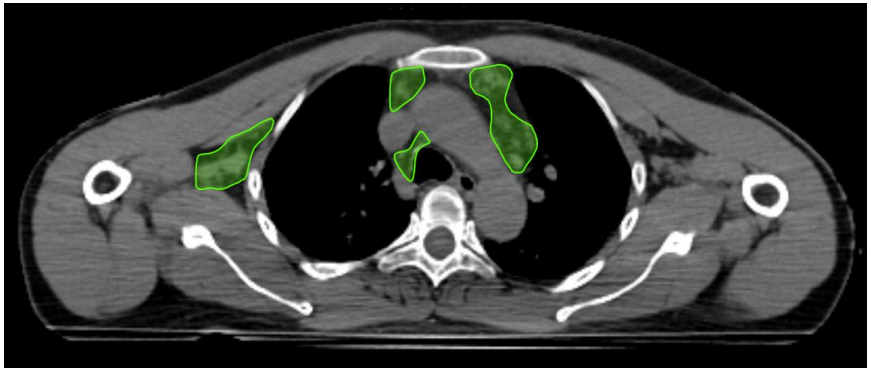


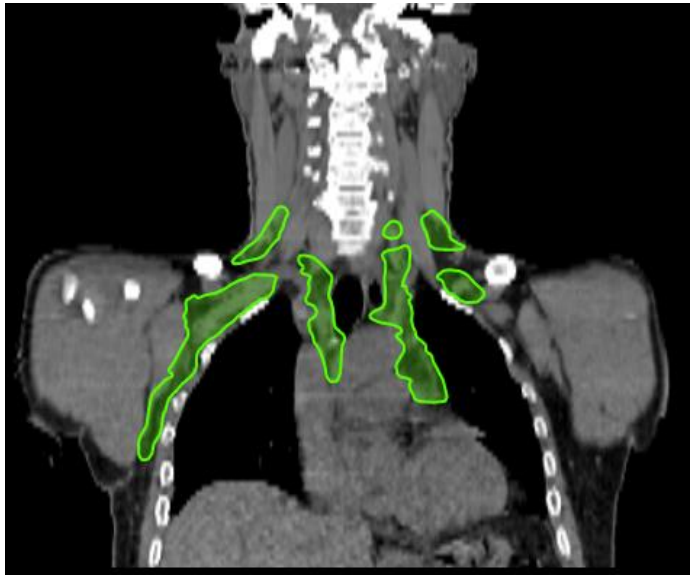


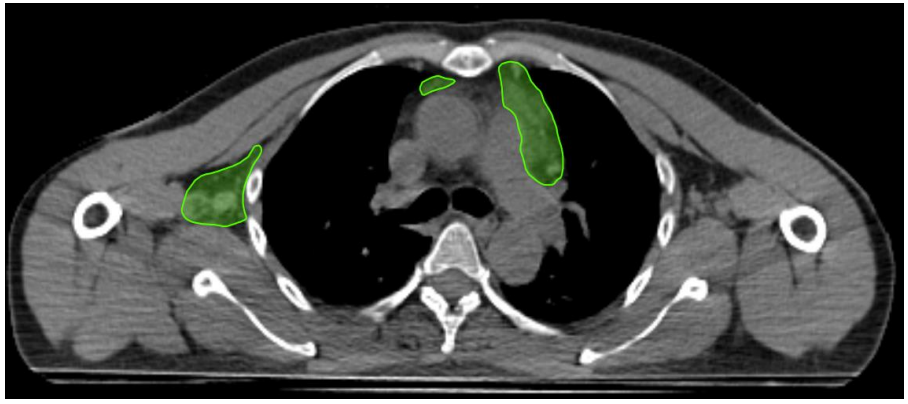
ESTRO School

- GTV_{CT} and GTV_{PET} import on planning CT→
- CTV definition by modifying GTVs according to response and normal tissues displacement → INRT and ISRT









ESTRO School

3DCRT vs IMRT/VMAT
which technique is preferable ?

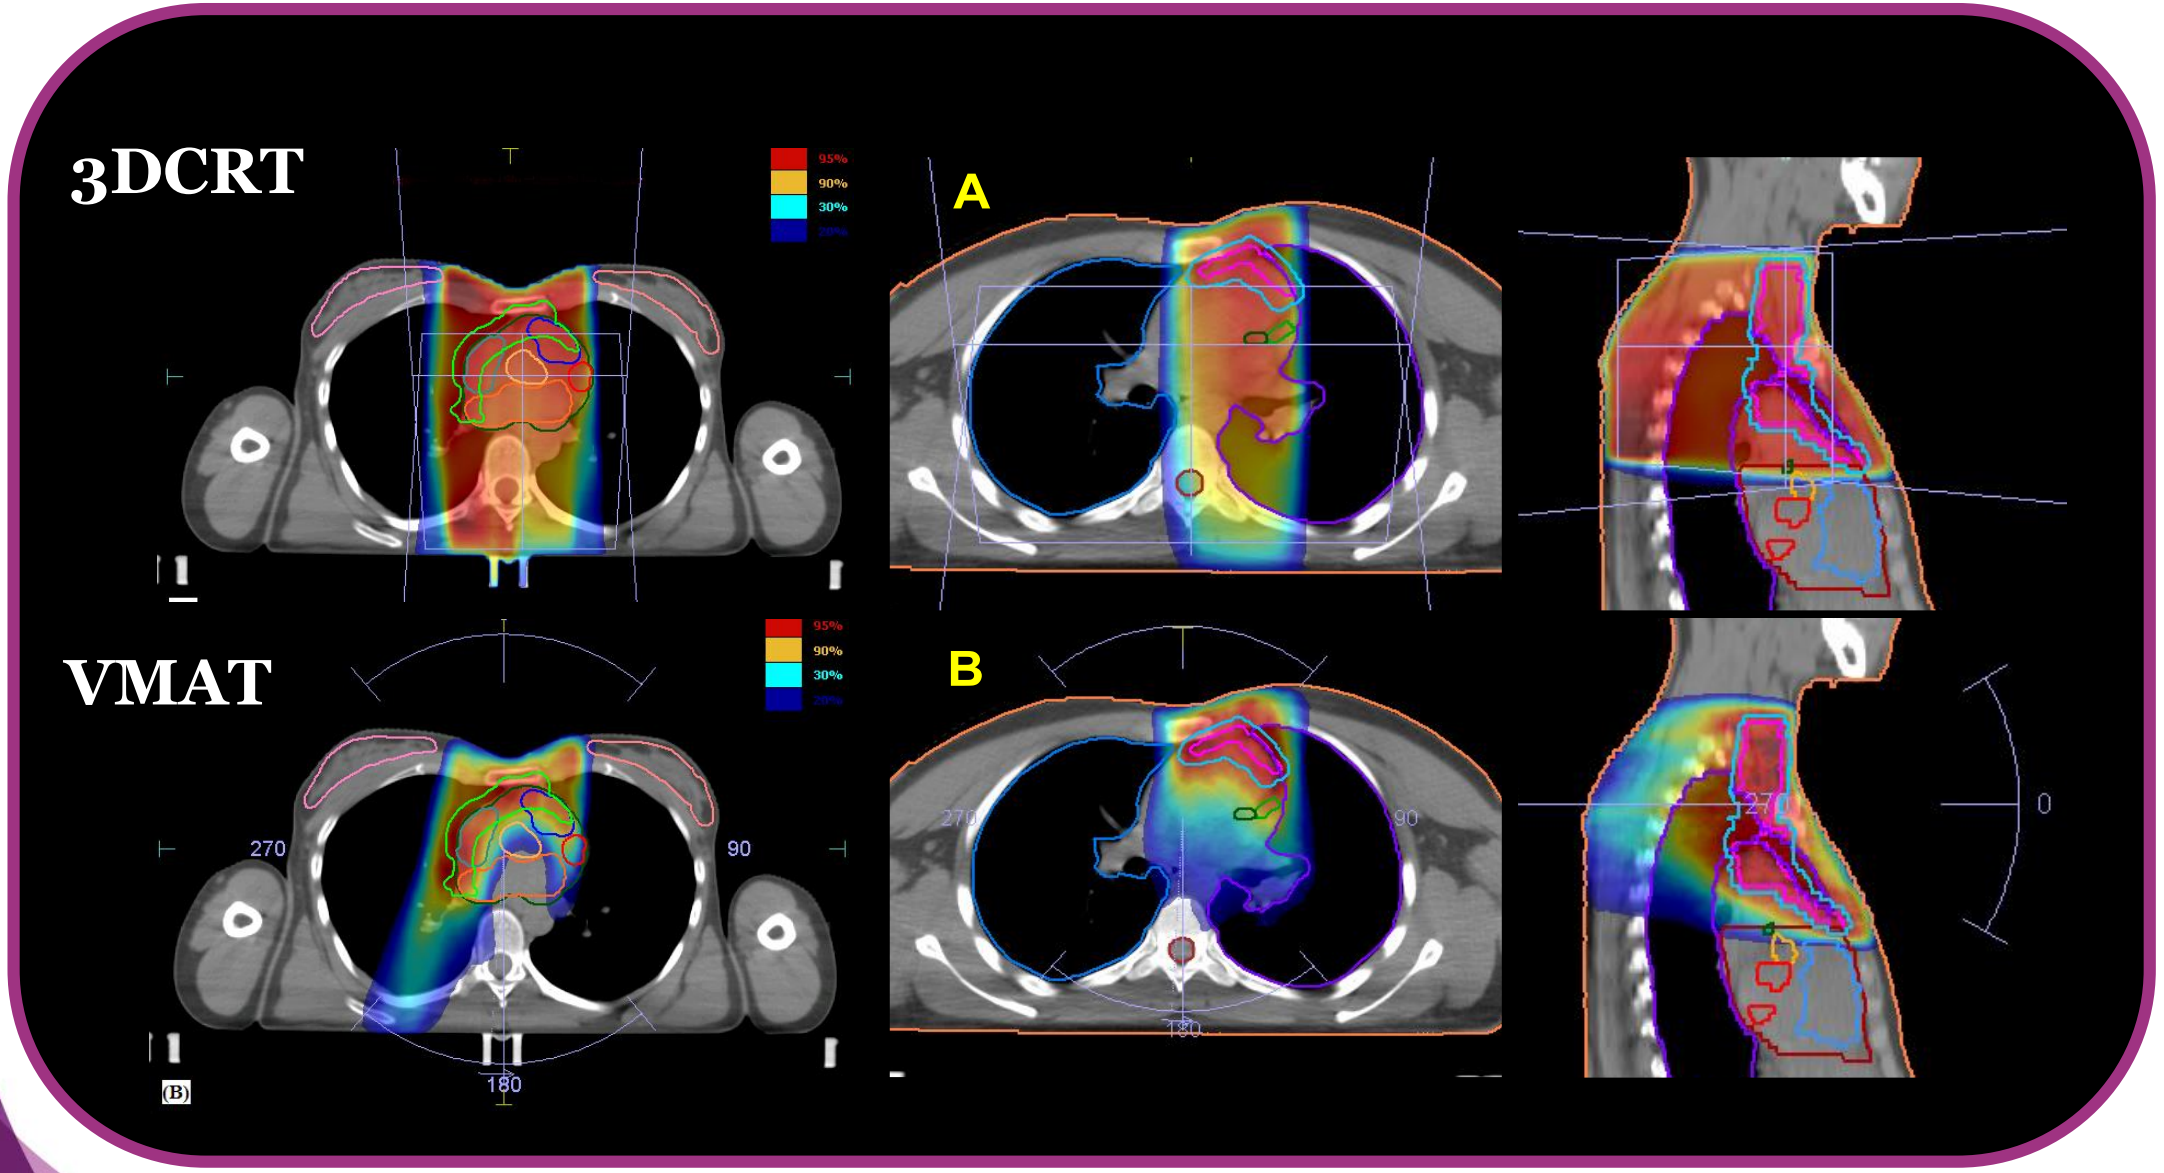
- ***There is no single proven best planning and delivery RT technique***

- No two lymphomas are the same with regard to localization and extent of disease

- ***The decision should be made at the individual patient level*** (i.e., what appears the optimal treatment plan for one patient may not be acceptable for another patient)

ESTRO School

IMRT is probably better in mediastinal lymphomas



Take Home Message (Early Stage HL)

- ***Combined modality therapy still represents a standard*** for patients affected with early stage HL. Chemotherapy alone can be considered in some patients, after a discussion with a Radiation Oncologist to hear about PROs/CONs in his/her particular case

- Interim-PET studies confirmed that ***even PET-negative patients are more likely to fail without RT*** and modification of the treatment schedule according to PET-scan is experimental

- ***Radiation oncologists should be aware of the opportunity to minimize the risks*** of late toxicity by using smaller fields and most recent technological improvements in radiation planning and delivery.

- ***A balanced multi-disciplinary evaluation*** of individual patients should be ***encouraged*** for the proper selection of ***the best strategy*** according to age, disease extension, secondary cancer and heart diseases risk profile.

ESTRO School

❑Early stage HL

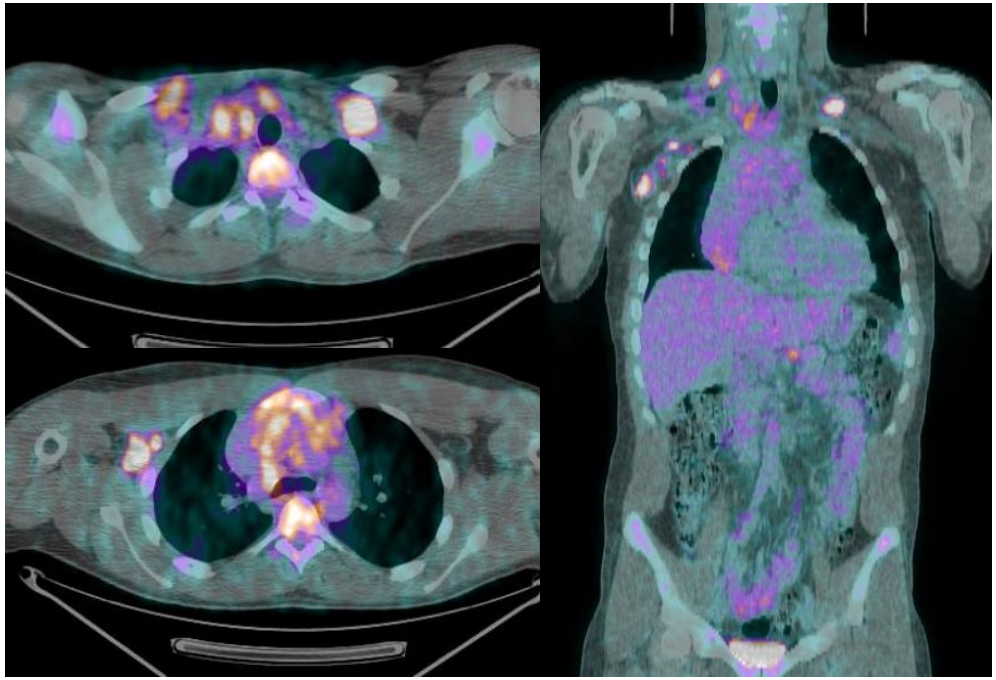
- Without risk factors (Favourable)
- With risk factors (Unfavourable or Intermediate)

❑Advanced stage HL

❑Non Hodgkin Lymphoma

CLINICAL CASE #2 – Advanced stage HL

- G.R., 28 years old, male.
- April 2016: night sweats, fever (>38°C), left supraclavicular lymph node.
- Supraclavicular FNA: cHL scleronodular
- CT and PET-CT scans (May 2016): right neck, bilateral supraclavicular and left axillary involvement. **Mediastinal bulky lesion**, para-aortic abdominal adenopathy.
- **stage IIIBX.**



ESTRO School

How to treat this patient ?

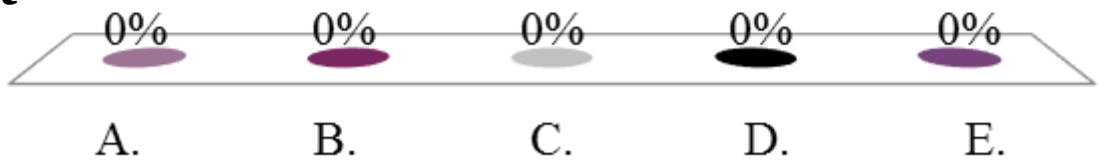
A. **ABVD x 6 alone**

B. **BEACOPPescalated x 6 alone**

C. **ABVD x 6 followed by consolidative ISRT 30 Gy to the bulky lesion**

D. **BEACOPPescalated x 6 + consolidative ISRT 30 Gy to PET+ residual disease after chemotherapy**

E. **ABVD x 6 or BEACOPPescalated alone; in case of PET+ residual disease, patient shifted to high dose chemo + ASCT**



ESTRO School

- Chemotherapy schedule: ABVD x 6
- PET2: complete metabolic response → Continued ABVD x 6
- PET6: confirmed complete metabolic response

- Treatments completed with consolidative RT to bulky lesion: 30 Gy/15 fractions

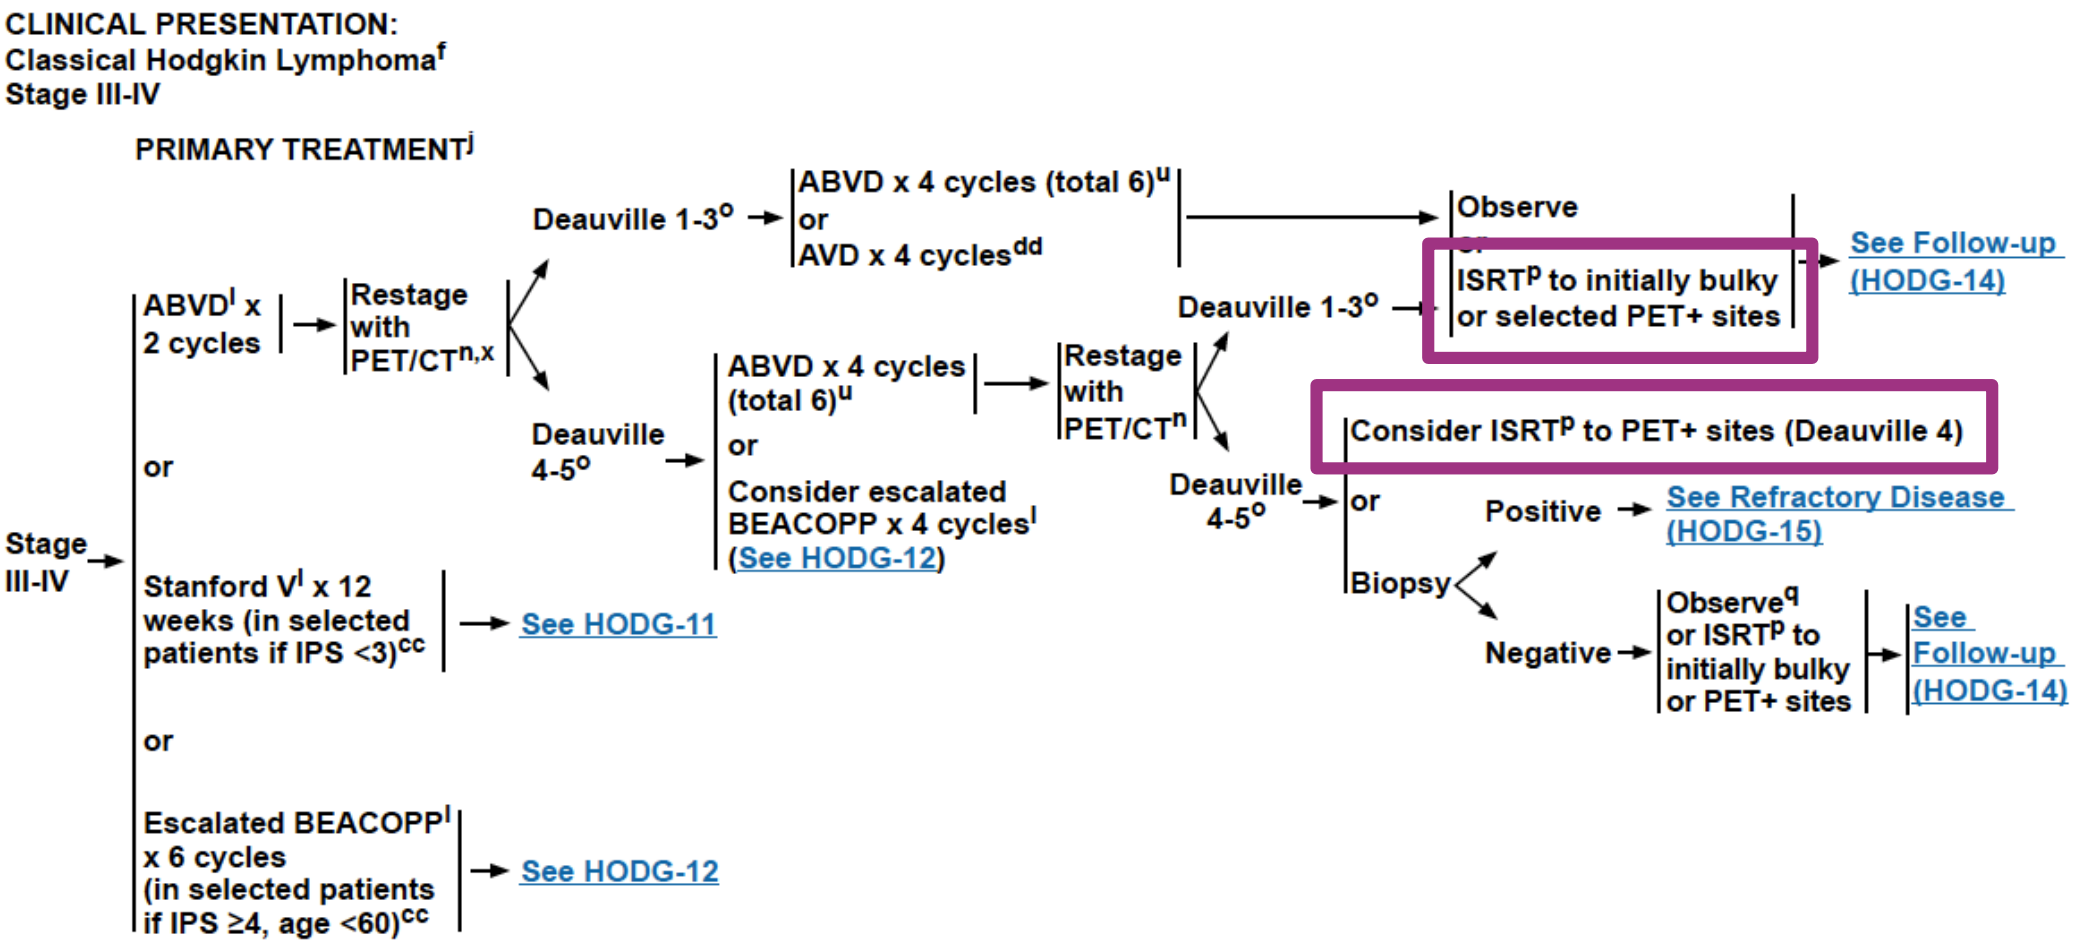
ROLE OF RADIATION THERAPY FOR ADVANCED STAGE HODGKIN LYMPHOMA



RADIATION ONCOLOGIST AND HEMATOLOGIST…
Different perspectives on the same story?!?

ESTRO School

Role of RT in Advanced stage HL

- The role of ***consolidative RT on bulky lesions*** for advanced stage Hodgkin disease is ***controversial***.

- Several studies have shown the ***beneficial role of consolidative RT*** in term of PFS (but not in term of OS). However these results were obtained with ***outdated RT*** (dose, fields and techniques) ***and CT*** (MOPP, Stanford V…) schedules.

- ***Nowadays*** consolidative **RT on bulky** lesions **is related** to the chemotherapy regimen and to the PET status at the end of it.

- Consolidative ***RT*** was not established, but ***left to the discretion*** of the treating physicians (bulky lesions or residual disease at the end of chemotherapy), by many ***recent randomized studies*** that tested the effect of ABVD regimen (e.g. RATHL study)

Engert et al. Lancet 2012

Beacoppescalated Followed By Radiotherapy of Initial Bulk or Residual Disease in Advanced Stage Hodgkin Lymphoma: Long-Term Follow up of the HD9 and HD12 Trials of the German Hodgkin Study Group

Stefanie Kreissl, Bastian von Tresckow, Helen Goergen, Heinz Haverkamp, Stephanie Sasse, Volker Diehl, Andreas Engert and Peter Borchmann

Blood 2016 128:923;

Regarding the HD12 trial:

Amongst the patients with bulk

- **PFS in favor of RT arm** @ 10 years (88.6% vs 83.5%), HR 1.47
- **OS marginally in favor of RT arm** @ 10 years (93% vs 90.2%)

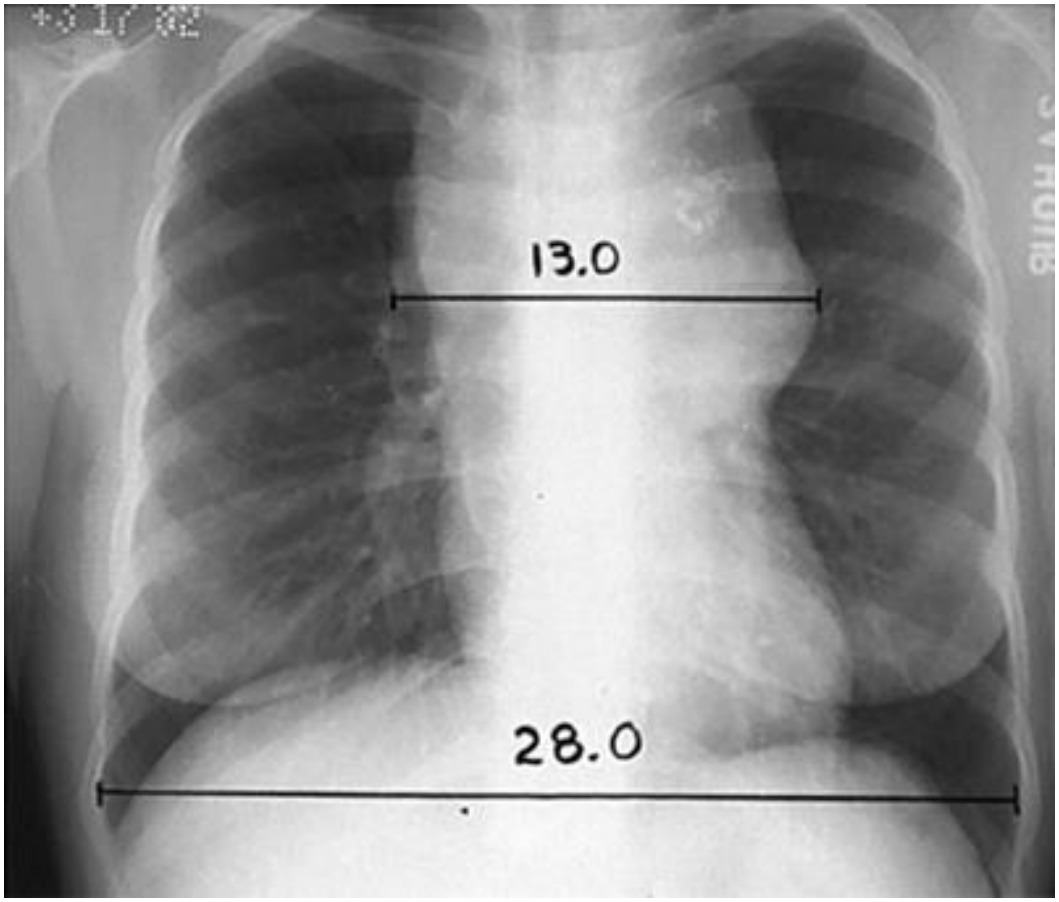
Amongst the patients with residual disease

- **PFS in favor of RT arm** @ 10 years (89.3% vs 83.4%)
- **OS in favor of RT arm** @ 10 years (94.4% vs 88.4%)

No significant difference in terms of second cancer @ 10 years (9.7% vs 6.4%)

ESTRO School

BULKY LESION DEFINITION

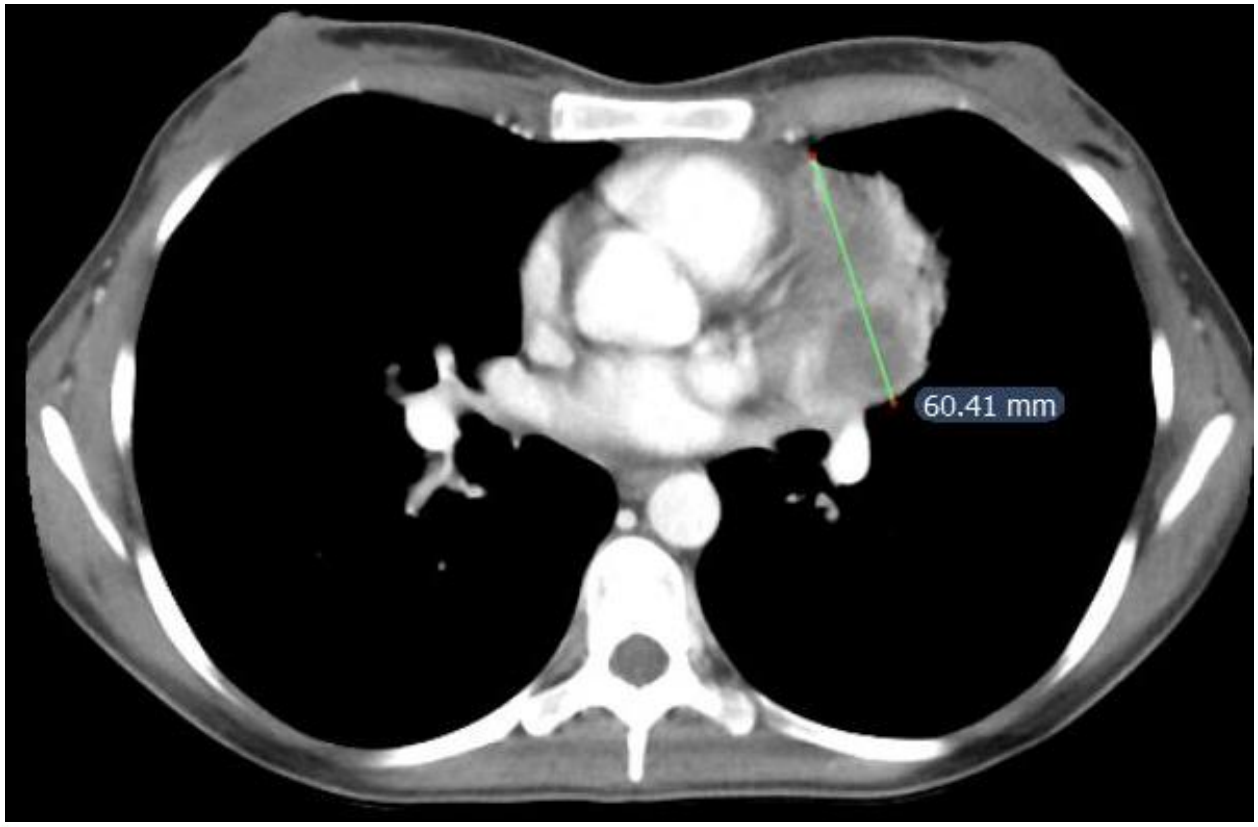


The definition of bulk has evolved as imaging modalities have changed.
The most common one is based on results of a chest X-ray, and bulky disease is defined based on the ratio of the maximum width of the mediastinal mass and the maximum intrathoracic diameter on standing posterior-anterior X-ray (mediastinal mass ratio [MMR] > 0.33)

ESTRO School

CLINICAL CASE #3 – Bulky definition

- E.F. 24 years old, female.
- Chest X-ray: mediastinal enlargement
- CT scan and PET-CT: mediastinal lesion. Maximum axial diameter: 6 cm.
- Mediastinal biopsy: cHL, CD30+.



ESTRO School

Is this a mediastinal “bulky” lesion ?

A. YES

B. NO

C. Maybe…!

Take Home Message (DLBCL)

- The development of tailored therapy according to the relapse risk is warranted, rather than uniform treatment of all early-stage DLCL (bulky disease, PET-oriented treatment)

- Therapeutic burden: R-CHOP x 3 cycles followed by 30 Gy IF-RT probably better than R-CHOP x 6 cycles (less toxic and probably higher survival rates)

- Consolidative RT is strongly recommended, even after 6 R-CHOP and in advanced stage DLBCL, for patients with bulky lesions or skeletal involvement

”There is no doubt that radiation remains the most effective single agent in the treatment of most types of lymphoma”

James O. Armitage

“Combined modality treatment consisting of a fixed combination of a restricted number of ABVD courses followed by small-field radiotherapy remains the gold standard for early stage HL”

Andreas Engert & John Raemaekers

Levels of evidence

IA	Meta-analysis of randomized controlled trials
IB	At least one randomized controlled trial
IIA	At least one controlled study without randomization
IIB	At least one quasi-experimental study
III	Non-experimental descriptive studies (comparative studies, correlation studies, case-control studies)
IV	Expert opinions

Grades of recommendation

A	Directly based on Level I evidence
B	Directly based on Level II evidence or extrapolated recommendations from Level I evidence
C	Directly based on Level III evidence or extrapolated recommendations from Level I or II evidence
D	Directly based on Level IV evidence or extrapolated recommendations from Level I, II, or III evidence

Levels of evidence

Levels of scientific evidence	
1++	High-quality meta-analyses, high-quality systematic reviews of clinical trials with very little risk of bias.
1+	Well-conducted meta-analyses, systematic review of clinical trials or well-conducted clinical trials with low risk of bias.
1-	Meta-analyses, systematic reviews of clinical trials or clinical trials with high risk of bias.
2++	High-quality systematic reviews of cohort or case and control studies; cohort or case and control studies with very low risk of bias and high probability of establishing a causal relationship.
2+	Well-conducted cohort or case and control studies with low risk of bias and moderate probability of establishing a causal relationship.
2-	Cohort or case and control studies with high risk of bias and significant risk that the relationship is not causal.
3	Non-analytical studies, such as case reports and case series.
4	Expert opinion.

Grades of recommendation

Grades of recommendations	
A	At least one meta-analysis, systematic review or clinical trial classified as 1++ and directly applicable to the target population of the guideline, or a volume of scientific evidence comprising studies classified as 1+ and which are highly consistent with each other.
B	A body of scientific evidence comprising studies classified as 2++, directly applicable to the target population of the guideline and highly consistent with each other, or scientific evidence extrapolated from studies classified as 1++ or 1+.
C	A body of scientific evidence comprising studies classified as 2+, directly applicable to the target population of the guideline and highly consistent with each other, or scientific evidence extrapolated from studies classified as 2++.
D	Level 3 or 4 scientific evidence, or scientific evidence extrapolated from studies classified as 2+.

Due to their high risk of bias, studies classified as 1- or 2- should not be used in compiling recommendations

Good Clinical Practice

√[1]	Practice recommended on the basis of clinical experience and consensus by the drafting team

Outline

- Endometrial cancer
- Vulva cancer
- Uterine sarcomas

Endometrial cancer

- Most common gynae cancer in western countries
- Confined to the uterus in 75%
  - High risk features in 30%
  - Occult metastatic disease in 15%
- Treatment of choice = surgery

Adjuvant treatment

- Radiotherapy
  - Who to treat?
  - How to treat?
- Role of chemotherapy?
- Future agents?

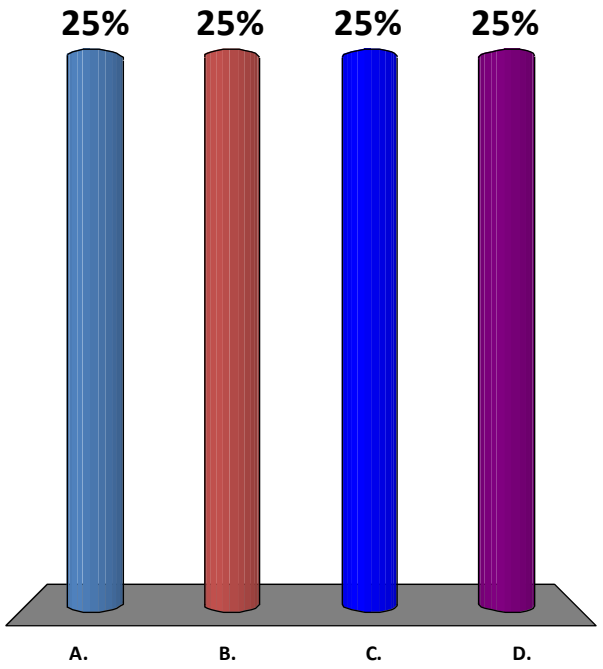
Patient

- Age 55
- LAVH + BSO (no LND) for IbG2 endometrioid ca
- Tumour invades into outer half of myometrium to within 3 mm of serosal surface
- No LVSI

What adjuvant RT would you recommend?

A. None
B. Vault BT
C. Pelvic RT
D. Don't know

- Age 55
- Stage IbG2 (no LND)
- No LVSI



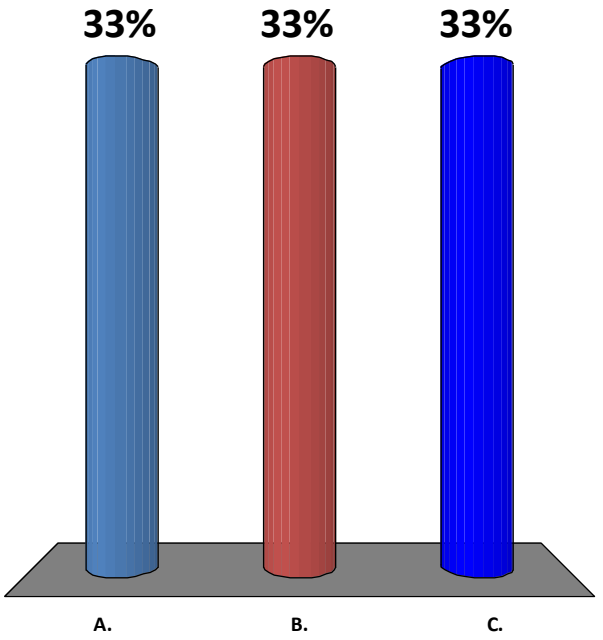
Would your recommendation be different if she was 65 instead of 55?

A. No

B. Yes – recommend more intensive RT

C. Yes – recommend less intensive RT

- Age **65**
- Stage IbG2 (no LND)
- No LVSI



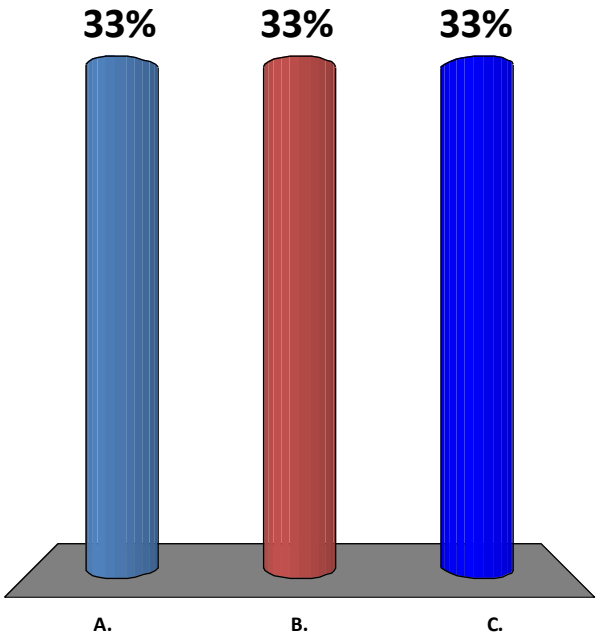
Would your recommendation be different if tumour was G3 instead of G2?

A. No

B. Yes – recommend more intensive RT

C. Yes – recommend less intensive RT

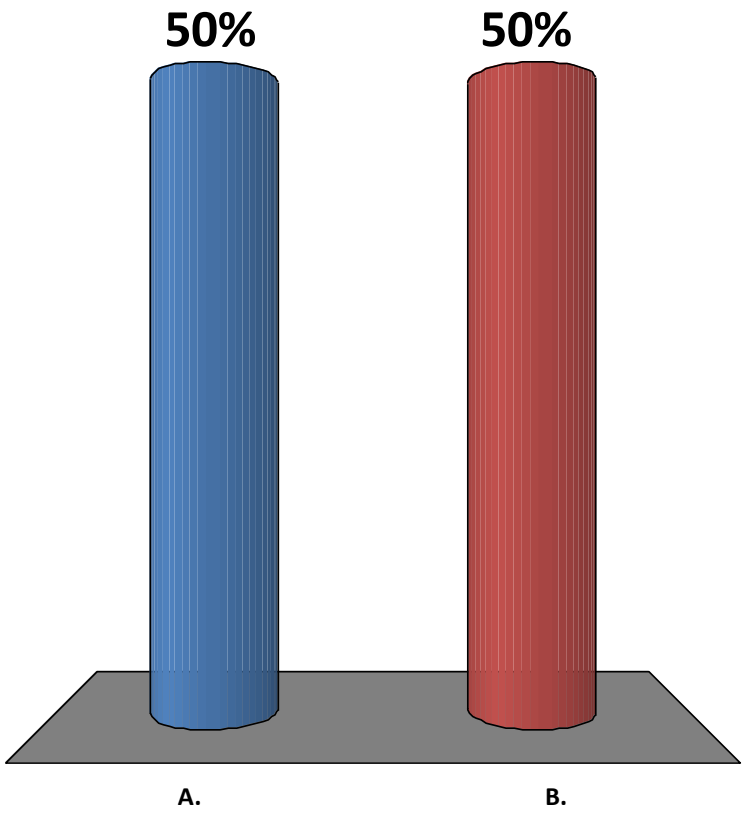
- Age 55
- Stage Ib**G3** (no LND)
- No LVSI



Would your recommendation be different if there was focal LVSI?

A. Yes
B. No

- Age 55
- Stage IbG2 (no LND)
- **Focal** LVSI



Adjuvant treatment

- Radiotherapy
  - **Who to treat?**
  - How to treat?
- Role of chemotherapy?

PORTEC-1

- Role of RT in Stage I disease (no LND)
- Whole pelvis RT vs. observation
- Inclusion criteria
  - G1, deep (≥50%) invasion (2009 Ib)
  - G2, superficial or deep invasion (2009 Ia + Ib)
  - G3, superficial (<50%) invasion (2009 Ia)

Creutzberg CL, et al. Lancet. 2000 22;355(9213):1404-11

PORTEC-1 results

	RT	Control	*p* value
Local recurrence	4%	14%	<0.001

RT recommended only if two adverse features present: age ≥ 60, deep myometrial invasion, G3.

Other RCTs

Trial	No of pts.	Surgery	Randomization	Local recurrence	Survival
Portec 1	714	TAH-BSO	Obs	14%	85%
2000	Stage IB, G2-3		EBRT	4%	81%
	Stage IC, G1-2			(p<.001)	(n.s.)
GOG-99	392	TAH-BSO &	Obs	12%	86%
2004	Stage IB, IC, IIA	LA	EBRT	3%	92%
				(p<.01)	(n.s.)
ASTEC/EN.5	789	TAH-BSO	Obs	6% (BT50%)	84%
2009	Stage IAB G3	LA optional	EBRT	3% (BT50%)	84%
	Stage IC	(30%)		(p<0.02)	(n.s.)

Adjuvant treatment

- Radiotherapy
  - Who to treat?
  - **How to treat?**
- Role of chemotherapy?

PORTEC-2

- Type of RT
- Vaginal BT vs. whole pelvis RT
- Inclusion criteria
  - 1C (deep invasion), G1 or 2, age ≥ 60 (Ib)
  - 1B (superficial invasion), G3 and age ≥ 60 (Ib)
  - 2A, any age, G1 or 2, deep or superficial invasion (Ia + Ib)
  - 2A, any age, G3, superficial invasion (Ia)

Nout RA, et al. Lancet. 2010 6;375(9717):816-23

PORTEC-2 results

	VBT	EBRT	*p* value
Vaginal recurrence	1.8%	1.6%	0.74
Pelvic recurrence	5.1%	2.1%	0.17
Acute GI toxicity	12.6%	53.8%	

VBT is adjuvant treatment of choice for patients with "high-intermediate risk" endometrial Ca

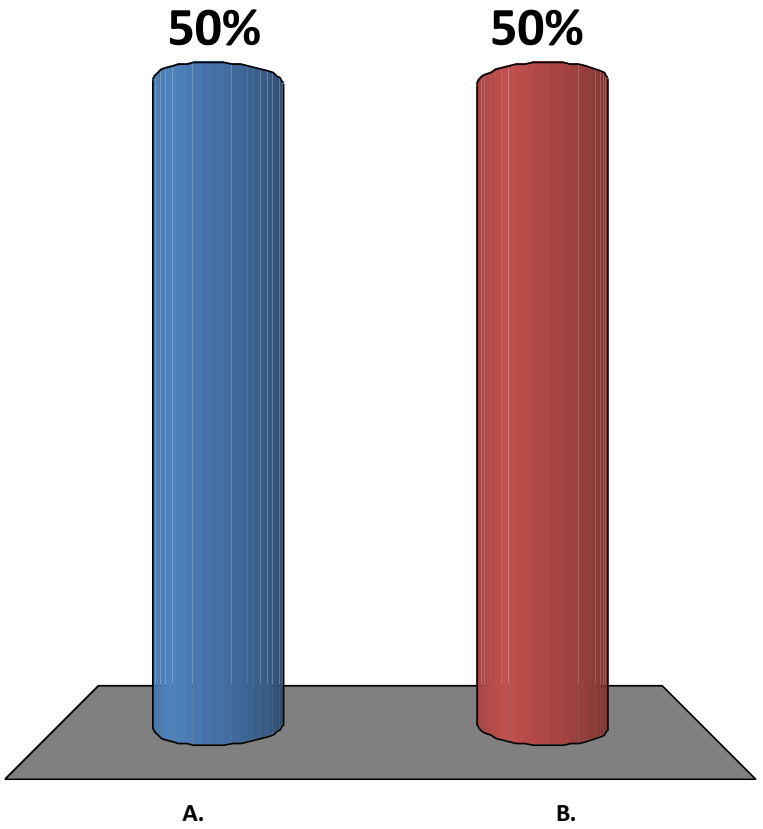
Adjuvant treatment

- Radiotherapy
  - Who to treat?
  - How to treat?
- **Role of chemotherapy?**

Do you offer adjuvant chemotherapy after radiotherapy for endometrial cancer patients outside clinical trials?

A. Yes

B. No



Adjuvant chemo studies

Study	Pats	Adv stage	Treatment	5-yr OS
NSGO-EORTC Hogberg 2007	382 Stage I-III	2%	RT RT+ A/P/T	74% 82%

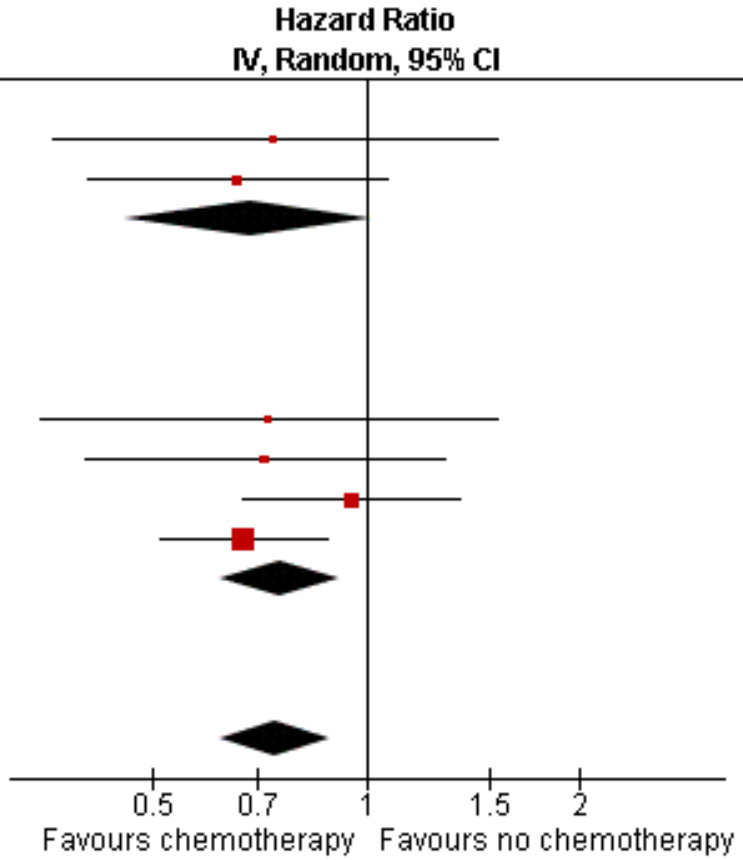
Test for subgroup differences: Chi² = 0.20, df = 1 (P = 0.65), I² = 0%				



Cochrane Database of Systematic Reviews 2011

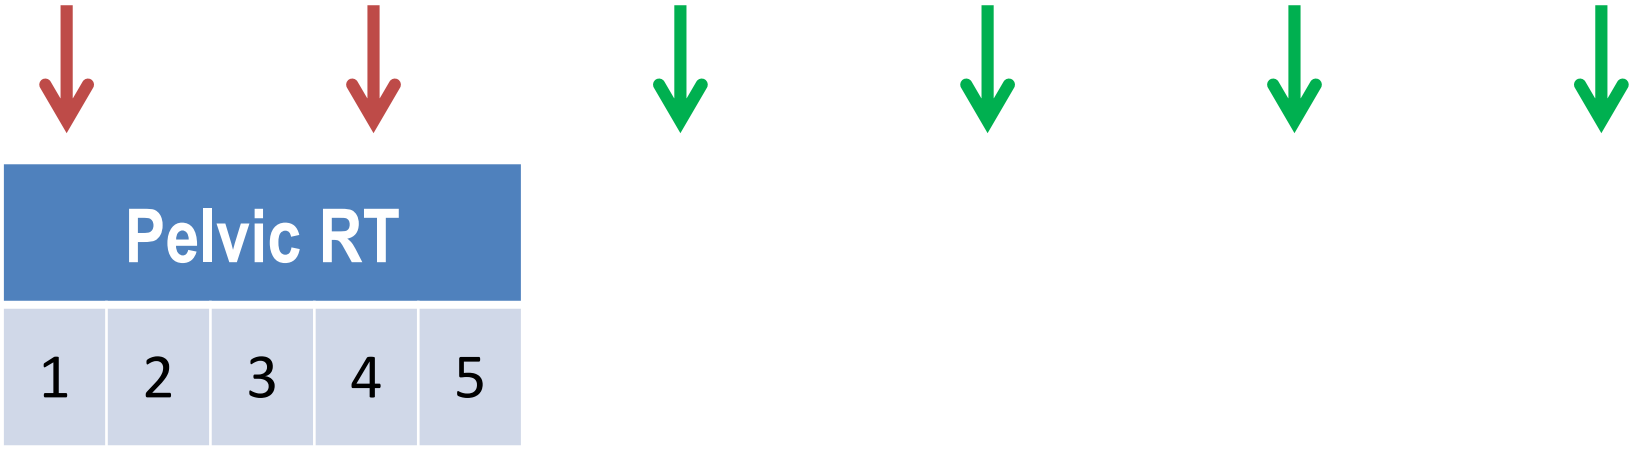
Meta-analysis - conclusions

- Post-op platinum-based chemotherapy is associated with small benefit in PFS and OS irrespective of RT.
  - Reduces risk of developing metastases
  - Could be alternative to RT
  - Has added value when used with RT

Cochrane Database of Systematic Reviews 2011

PORTEC-3

- EBRT ± 2# cisplatin (50 mg/m^2)
  4# carboplatin (AUC5) + Taxol 175 mg/m^2



PORTEC-3

- Criteria
  - IB G3 with LVSI
  - IC or IIA G3
  - IIB
  - IIIA* or IIIC (**IIIA on cytology alone must be G3)*
  - IB, IC, II or III with serous or clear cell histology
- Increase in 5-year OS of 12.5% (expected OS for RT: 50%). Target accrual = 500 over 5 years

Phase III Stage III + IVA EC

- Experimental arm

  RT + cisplatin 50 mg/m2 IV Days 1 and 29

  + Carboplatin AUC 5/6 + Paclitaxel 175 mg/m2 x 4 cycles

- “Active Comparator”

  Carboplatin AUC 6 + Paclitaxel 175 mg/m2 x 3 cycles

  + RT

  + Carboplatin AUC 5 or 6 + Paclitaxel 175 mg/m2 x 3 cycles

Phase III Stage III + IVA EC

- Primary endpoint
  - Recurrence-free survival
- Secondary endpoint
  - Overall survival
- Target accrual = 450
  - Study start March 2015
  - Study end date March 2023

GOG-0249

- Phase III study of pelvic RT vs. vaginal BT + 3# carbo-Taxol chemotherapy
- High-intermediate risk factors (GOG-99) - G2 or 3, LVSI, deep myometrial invasion:
  - Stage I, age ≥ 70, 1 risk factor
  - Stage I, age ≥ 50, 2 risk factors
  - Stage I, age ≥ 18, 3 risk factors
  - Stage II disease with or without risk factors
- Target accrual = 562

Preliminary results SGO 2014

- 601 patients randomized

	Pelvic RT	VBT + chemo
Vaginal recurrence	5	2
Pelvic recurrence	2	19
Distant failure	32	24
DFS	82%	84%
OS	93%	92%

- Acute toxicity more common with VBT + chemo

McMeekin, DS. SGO 2014 Abstract

ESMO-ESGO-ESTRO recommendations 2015

4 risk groups

Risk group	Histology	Adjuvant treatment
Low	Ia, G1-2, LVSI -ve	None

Colombo N. Radiother Oncol. 2015;117(3):559-81

ESMO-ESGO-ESTRO recommendations 2015

4 risk groups

Risk group	Histology	Adjuvant treatment
Low	Ia, G1-2, LVSI -ve	None
Intermediate	Ib, G1-2, LVSI -ve	BT or none if <60

Colombo N. Radiother Oncol. 2015;117(3):559-81

ESMO-ESGO-ESTRO recommendations 2015

4 risk groups

Risk group	Histology	Adjuvant treatment	
Low	Ia, G1-2, LVSI -ve	None	
Intermediate	Ib, G1-2, LVSI -ve	BT or none if <60	
		With LND	No LND
High-intermediate	Ib, G1-2, LVSI +ve Ia, G3	BT or none	BT if G3 and LVSI - EBRT if LVSI+

LVSI must be unequivocally positive (not focal)

Colombo N. Radiother Oncol. 2015;117(3):559-81

ESMO-ESGO-ESTRO recommendations 2015

4 risk groups

Risk group	Histology	Adjuvant treatment	
		With LND	No LND
High	Ib G3	EBRT or BT	EBRT (+ chemo)
	II G1-2, LVSI -ve II G3 or LVSI +ve	BT EBRT	EBRT EBRT (+ chemo)
	III	EBRT (+ chemo)	

Colombo N. Radiother Oncol. 2015;117(3):559-81

Take-home messages

- Younger patients have better prognosis.
- LVSI must be unequivocally positive (not focal) for RT

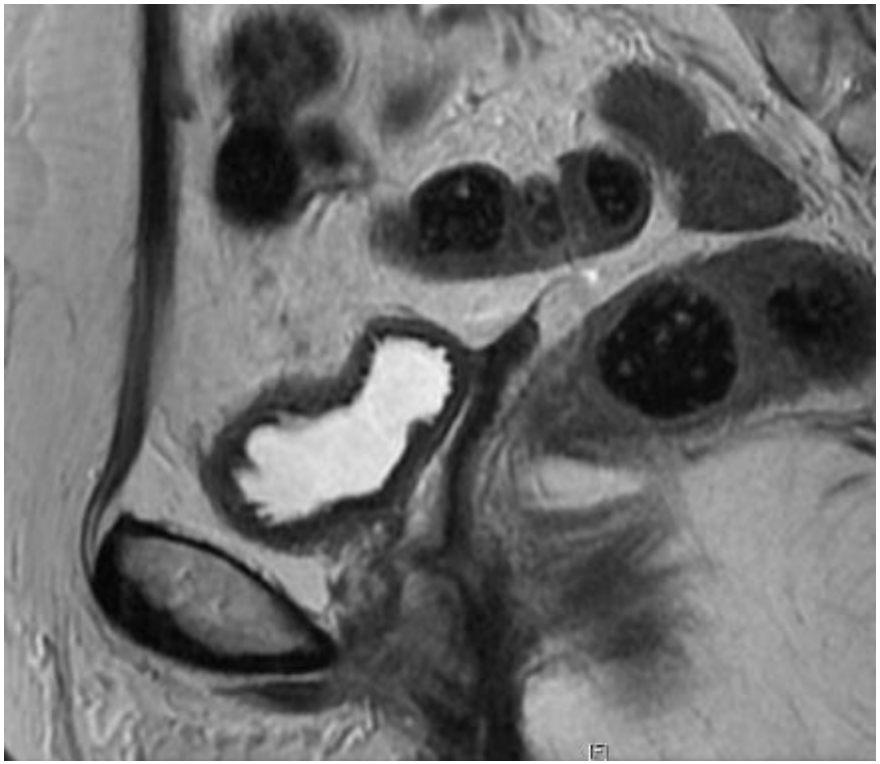
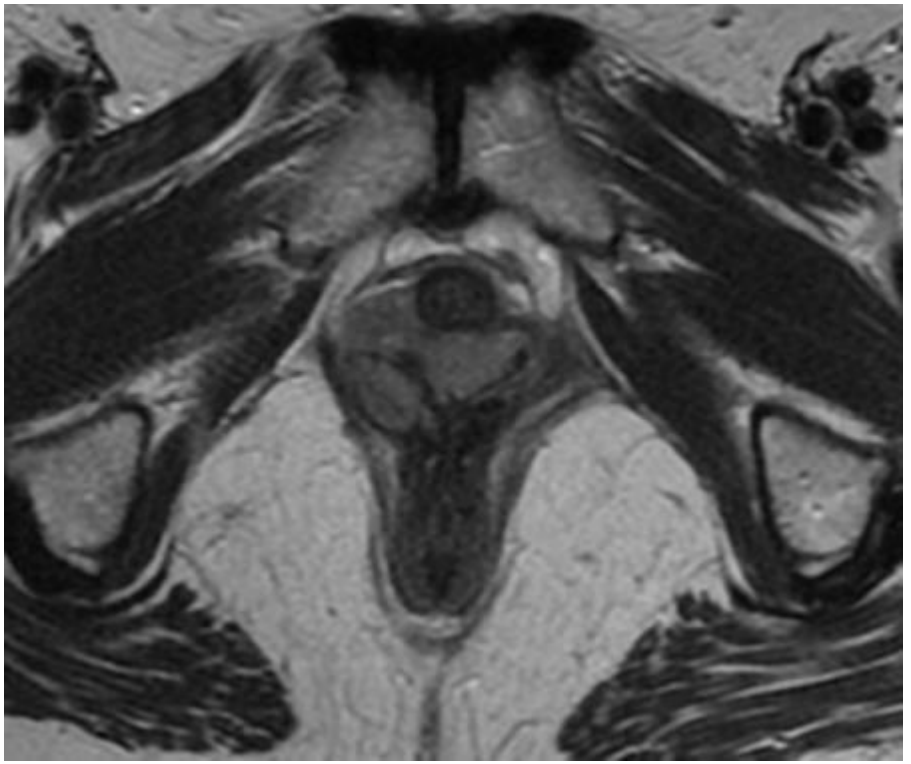
Patient

- Age 55
- LAVH + BSO for IbG2 endometrioid ca
  - Tumour invades into outer half of myometrium to within 3 mm of serosal surface
  - No LVSI
- No post-operative RT
- Isolated vaginal recurrence at 12 months

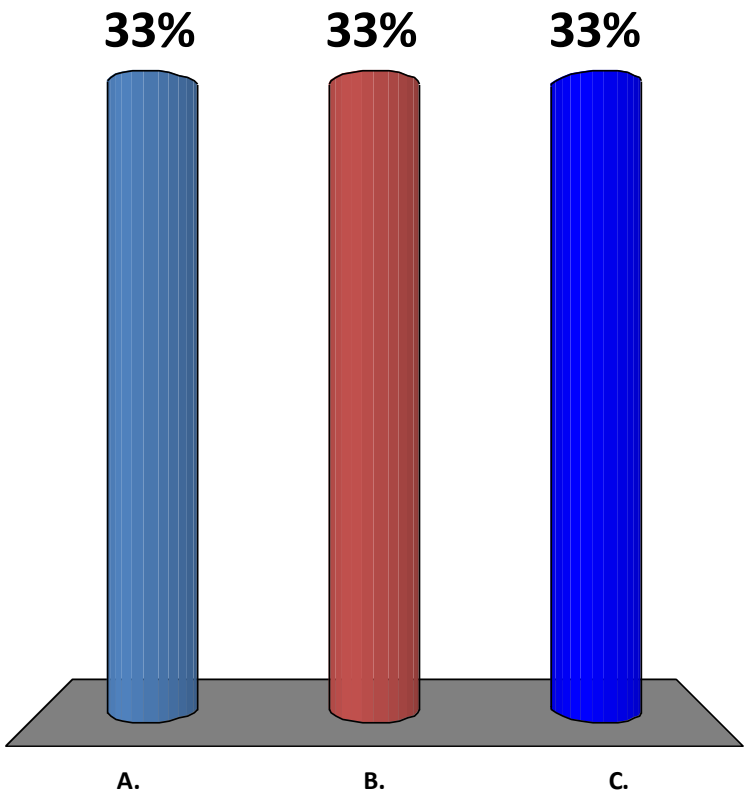
Patient





What treatment would you recommend for recurrence?

A. Surgery
B. Radiotherapy
C. Chemotherapy



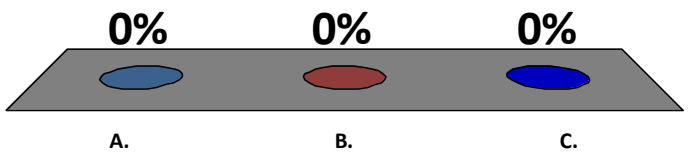
- Age 55
- Stage IbG2
- No LVSI
- No post-op RT

What local control rate would you expect after salvage RT for vault recurrence?

A. 20%

B. 50%

C. 80%

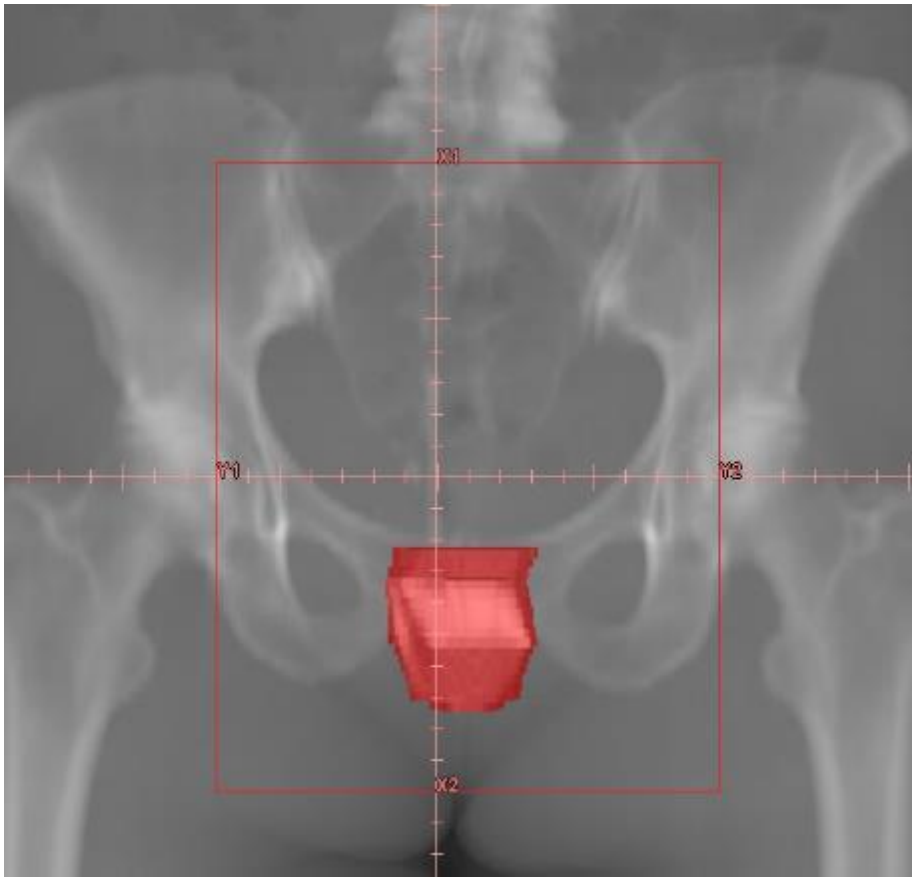


Vault recurrence

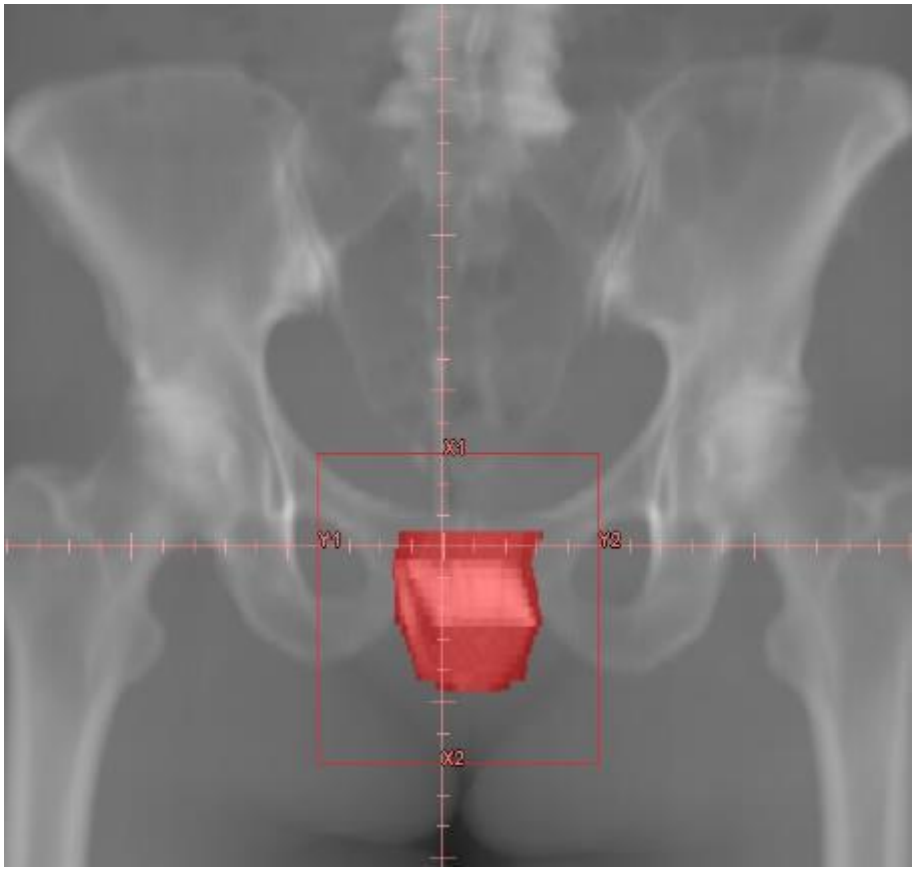
- Danish Endometrial Cancer Study
  - 1166 patients, surgery alone
  - Vaginal recurrence: low risk 6.3%, intermediate risk 22%
  - **Curative treatment: 100% CR, 74% cured**
- Must give sufficient dose (>65 Gy)
  - EBRT boost
  - Interstitial boost
  - IMRT

Ørtoft G, et al. Int J Gynecol Cancer. 2013; 23(8):1429-37

Patient

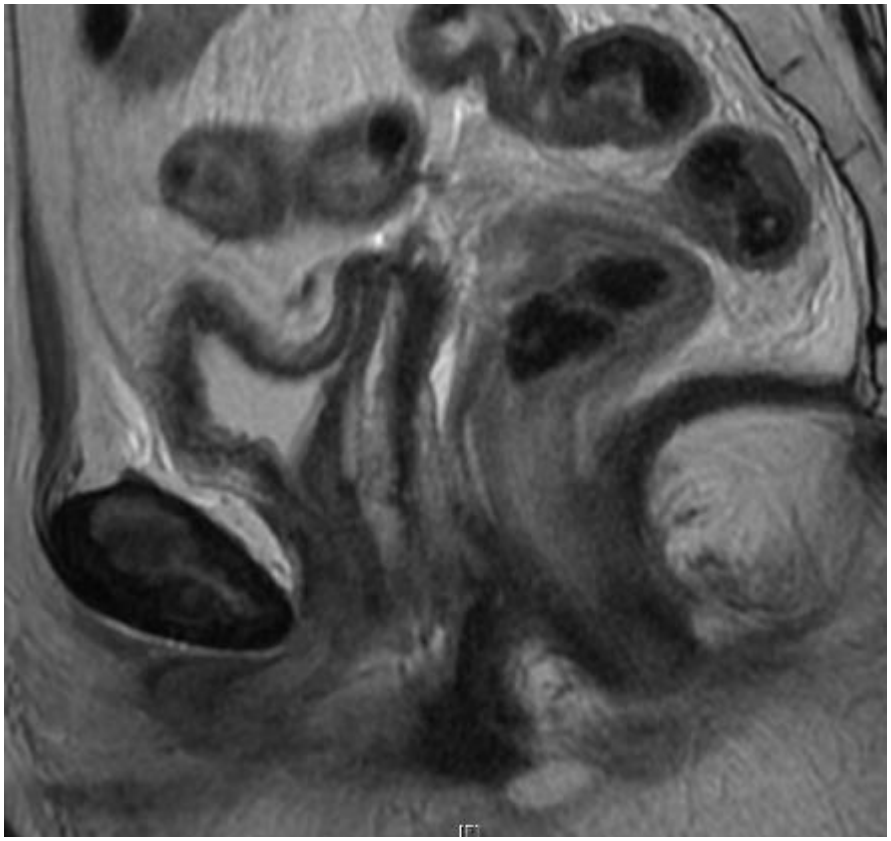


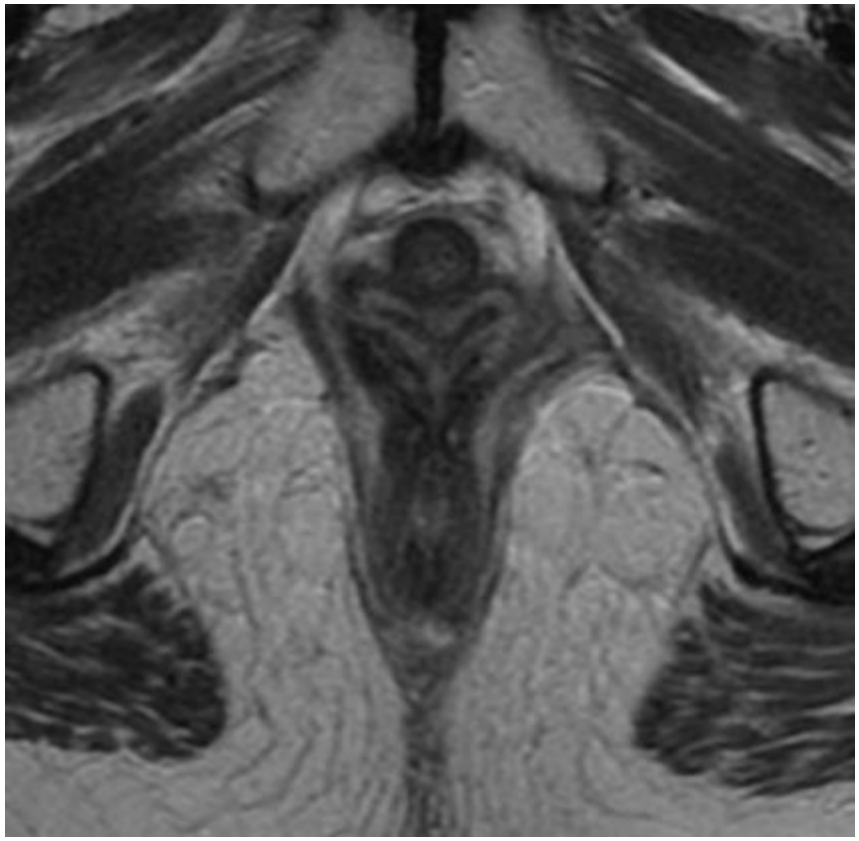
45Gy in 25#



20Gy in 10#

Patient





ESMO-ESGO-ESTRO recommendations 2015

- RT with curative intent is indicated in patients with isolated vaginal relapse after surgery.
- Use of systemic therapy or surgery before RT for vaginal or pelvic node recurrence could be considered in certain patients with more bulky disease.

Colombo N. Radiother Oncol. 2015;117(3):559-81

Outline

- Endometrial cancer
- **Vulva cancer**
- Uterine sarcomas

Epidemiology

- Rare - 3-5% of gynae cancers
- Squamous cell carcinoma in 85-90%
- Elderly patients
- Treatment of choice = surgery

Adjuvant treatments

- Post-operative
- Pre-operative

Post-operative radiotherapy

- Aims
  - Reduce local recurrence
  - Reduce regional recurrence
  - Improve survival
- Questions
  - Does it work?
  - Can it replace groin surgery?
  - Does adding chemotherapy help?

Reduce local recurrence

- 135 patients (observational study)
  - Stage I-II = 110
  - Stage III-IV = 25

Table 14–6. CORRELATION OF SURGICAL MARGIN WITH LOCAL RECURRENCE FOLLOWING SURGICAL THERAPY OF VULVAR CANCER

	Surgical Margin < 8 mm (N = 44)	Surgical Margin ≥ 8 mm (N = 91)
Local recurrence	21/44 (48%)	0/91

Heaps JM, et al. Gynecol Oncol. 1990;38(3):309-14

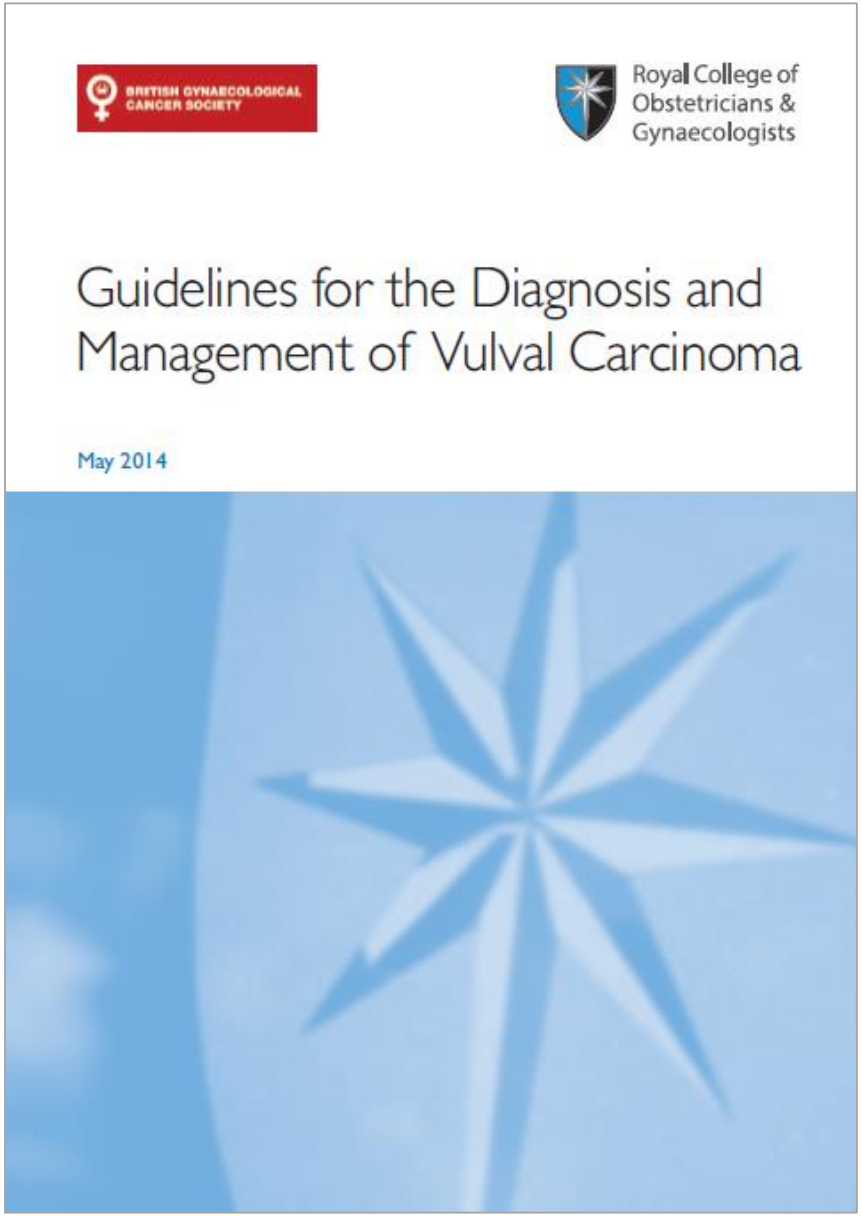
Would you offer post-op RT if margin is <8mm and further excision is not possible?

A. Yes

B. No

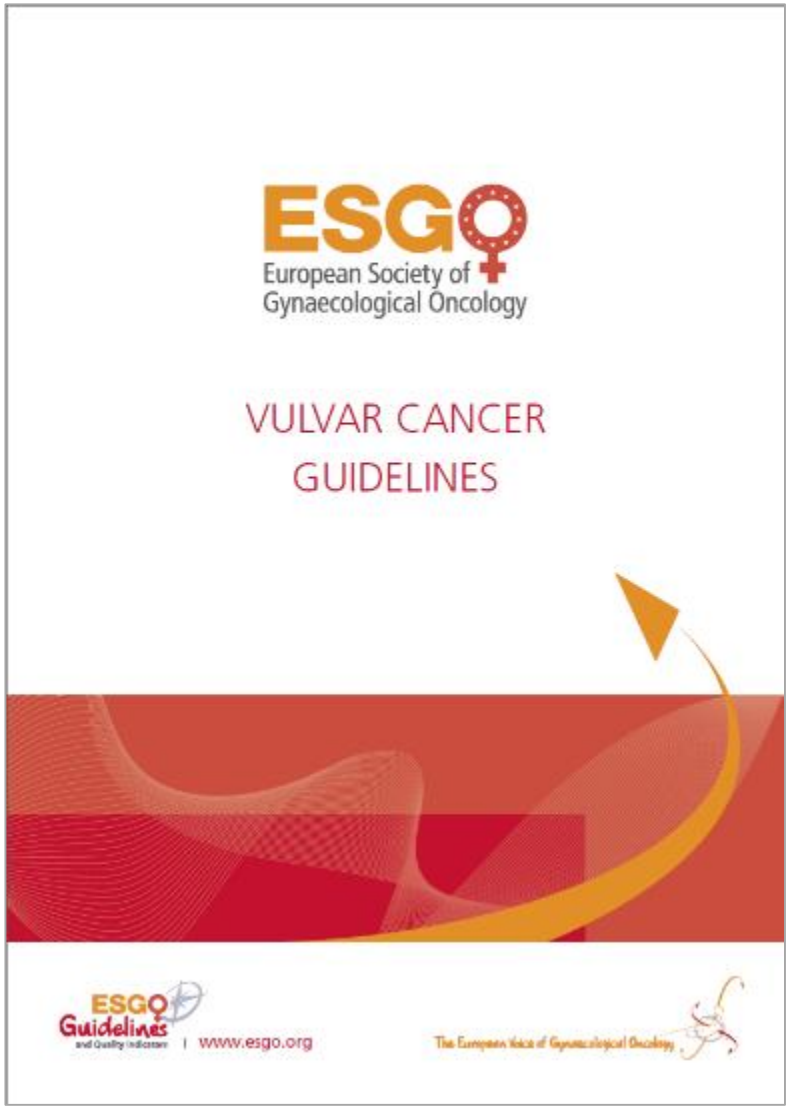
BGCS/RCOG guidelines 2014

"There is not enough evidence to recommend adjuvant local therapy routinely in patients with close surgical margins."



ESGO 2016

- In case of close but clear pathological margins, postoperative vulvar radiotherapy may be considered to reduce the frequency of local recurrences. There is no consensus for the threshold of pathological margin distance below which adjuvant radiotherapy should be advised.



Expert opinion

Reduce regional recurrence
Improve survival

- GOG-37 (RCT)
  - 114 patients
  - Positive inguinal nodes
- Pelvic node dissection vs pelvic RT

	Surgery	Radiotherapy
Regional recurrence	24%	5%
Survival	54%	68%

$p = 0.03$

Homesley HD, et al. Obstet Gynecol. 1986;68(6):733-40

Indications for post-operative RT

- 2 or more microscopic nodes
- 1 or more macroscopic node
- Extracapsular disease

Replace groin surgery

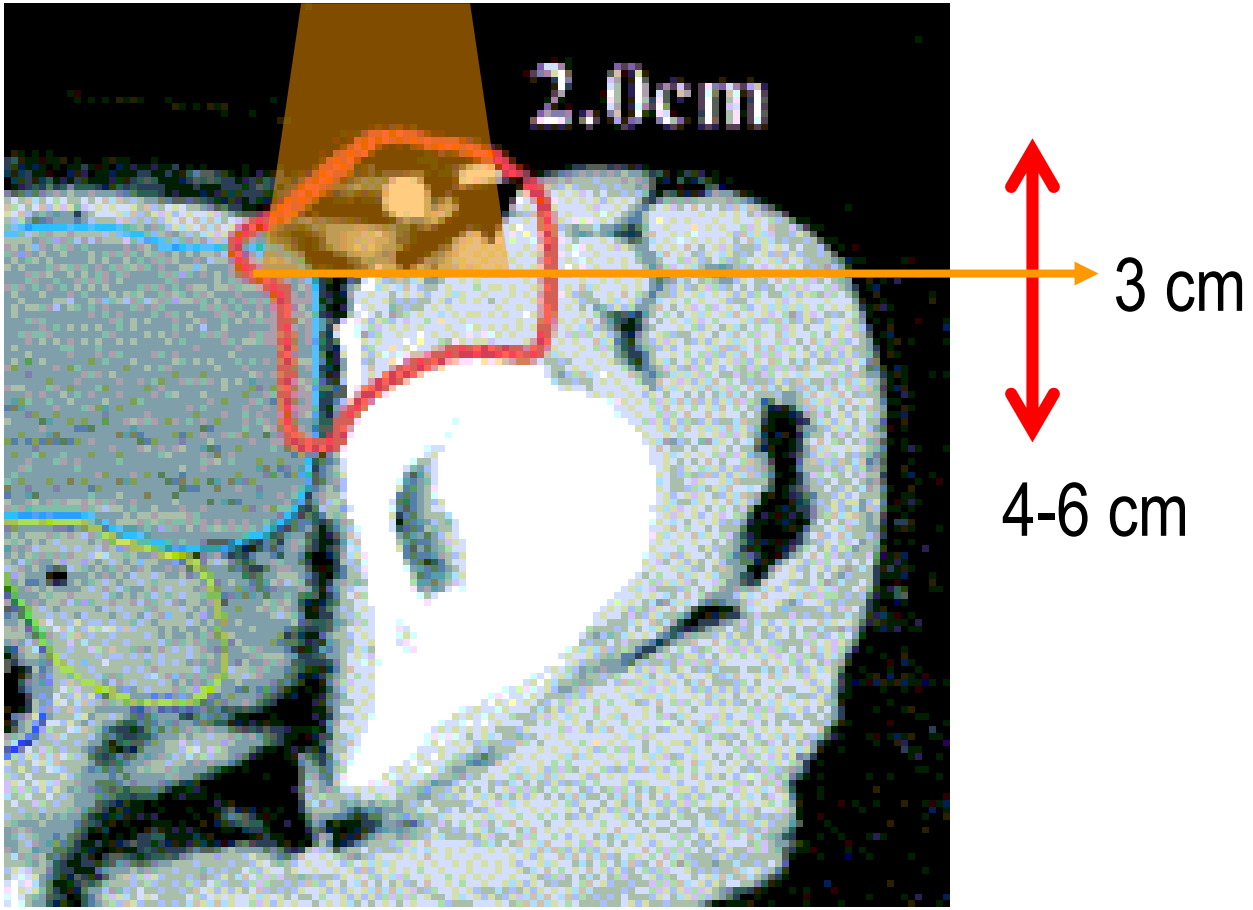
- GOG 88
  - RT vs inguinal node dissection
  - 58 patients
  - T1-3, N0-1, M0

	Surgery	Radiotherapy
Groin relapse	0%	18.5%

Stehman FB, et al. IJROBP 1992. 24:389-396

RT vs nodal dissection

- 50 Gy at 3 cm depth

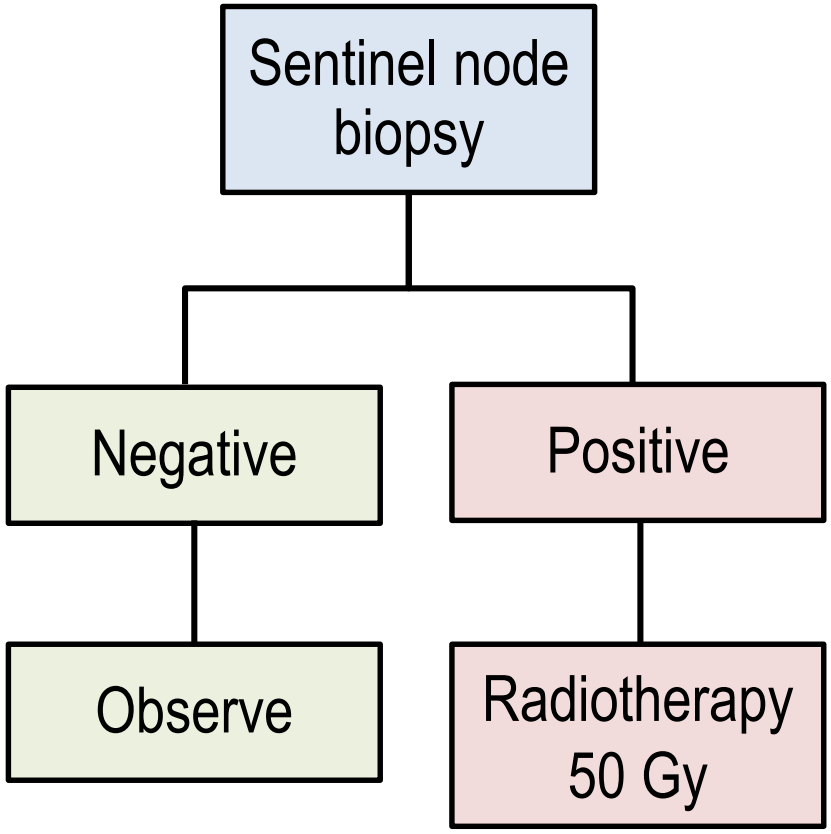


RCOG 2014

- Surgery is the cornerstone of therapy for the groin nodes in women with vulval cancer.
- Individual women who are not fit enough to withstand surgery, even when performed under regional anaesthesia, can be treated with primary radiotherapy.

GROINSS-V II

- Observational study
  - T1-T2 < 4 cm
  - No clinical/radiological involved nodes

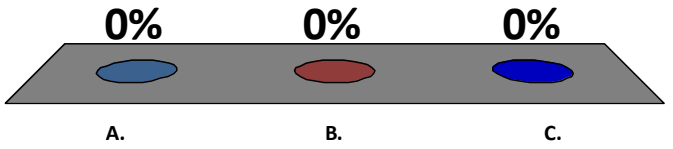


Do you offer concomitant chemotherapy with adjuvant radiotherapy for vulvar cancer?

A. Usually

B. Sometimes

C. No



GYNECOLOGIC CANCER INTERGROUP

An Organization of International Cooperative Groups for Clinical Trials in Gynecologic Cancers

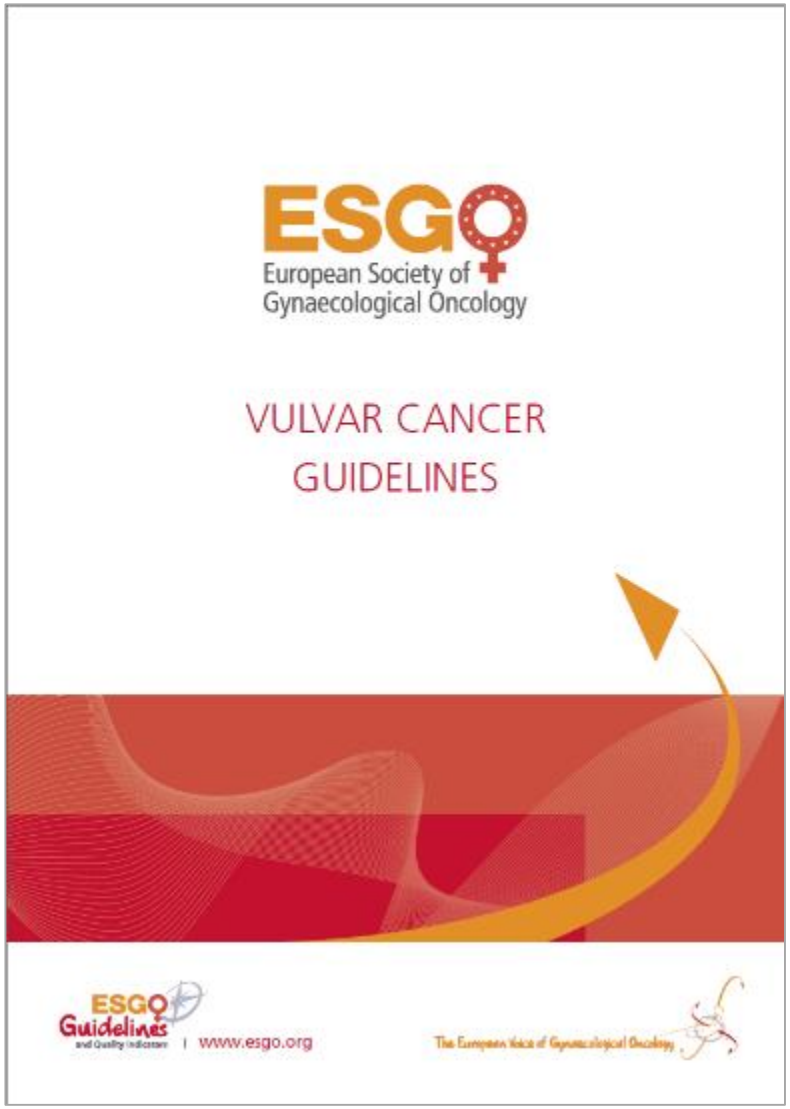
Patterns of Care for Radiotherapy in Vulvar Cancer: A Gynecologic Cancer Intergroup Study

- Use of concomitant chemotherapy
  - No = 50%
  - Yes = 50%
- Regimens
  - Cisplatin 70%
  - Cis + 5FU 20%
  - 5FU + MMC 10%

Gaffney DK, et al. Int J Gynecol Cancer. 2009;19:163-7

ESGO 2016

- Based on evidence from other squamous cell cancers such as cervical, head & neck, and anal cancer, the addition of concomitant, radiosensitising chemotherapy to adjuvant radiotherapy should be considered.



Grade C: Extrapolated evidence from studies rated as 2++

Adjuvant treatments

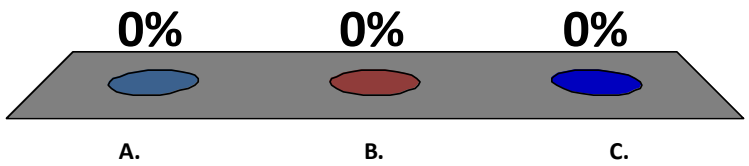
- Post-operative
- **Pre-operative**

Pre-operative

- Aims
  - Downstage disease
  - Avoid mutilating surgery
- Questions
  - Benefit of adding chemotherapy?
  - Avoid all surgery?

Do you offer neoadjuvant chemo-RT for vulvar cancer?

A. Usually
B. Sometimes
C. No



GYNECOLOGIC CANCER INTERGROUP
An Organization of International Cooperative Groups for Clinical Trials in Gynecologic Cancers

Patterns of Care for Radiotherapy in Vulvar Cancer: A Gynecologic Cancer Intergroup Study

- Use of concomitant chemotherapy
  - No = 19%
  - Yes = 81%
- Regimens
  - Cisplatin 55%
  - Cis + 5FU 31%
  - 5FU + MMC 5%
  - Other 9%

Gaffney DK, et al. Int J Gynecol Cancer. 2009;19:163-7

Concomitant chemotherapy

- RCT of neoadjuvant chemoRT vs. surgery
  - 68 patients
  - **Operable cancer**, FIGO Stage II-IV
  - Reported in abstract only (IJGC 2003; Vol. 13 Suppl 1:6)
  - No difference in 5-year survival or morbidity

Maneo A, et al. Cochrane Database of Systematic Reviews 2011

Avoid surgery

- Phase II studies
  - Operability achieved in 63-92% of cases with platinum-based regimens
  - Effective for both primary and nodes

Outcome

- 27-85% of patients died due to treatment-related causes or disease
- Toxicity substantial
  - Severe skin reactions
  - Avascular necrosis
- Different from cervical and anal cancers
  - Less responsive
  - Worse skin reaction c.f. anal Ca - vulva dystrophy?

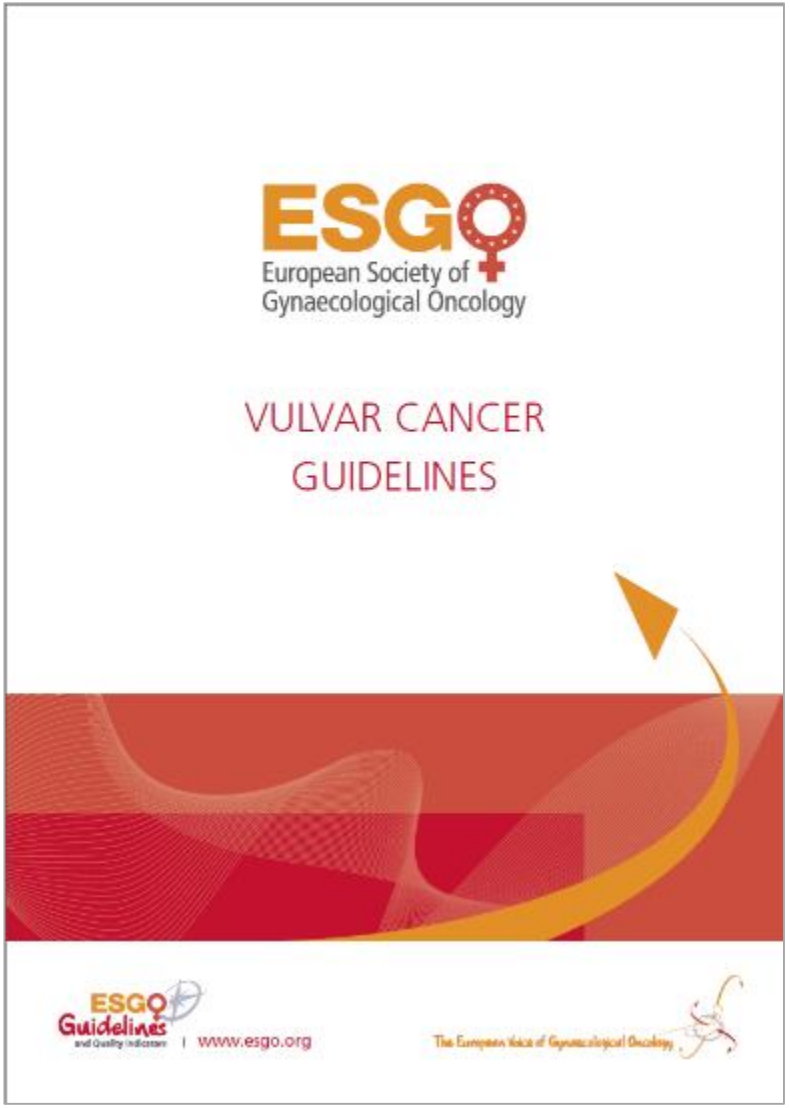
ESGO 2016

- Definitive chemoradiation (with radiation dose e[illegible]tion) is the treat[illegible]hoice in patient[illegible]ith unresectable disease.

Chemo?

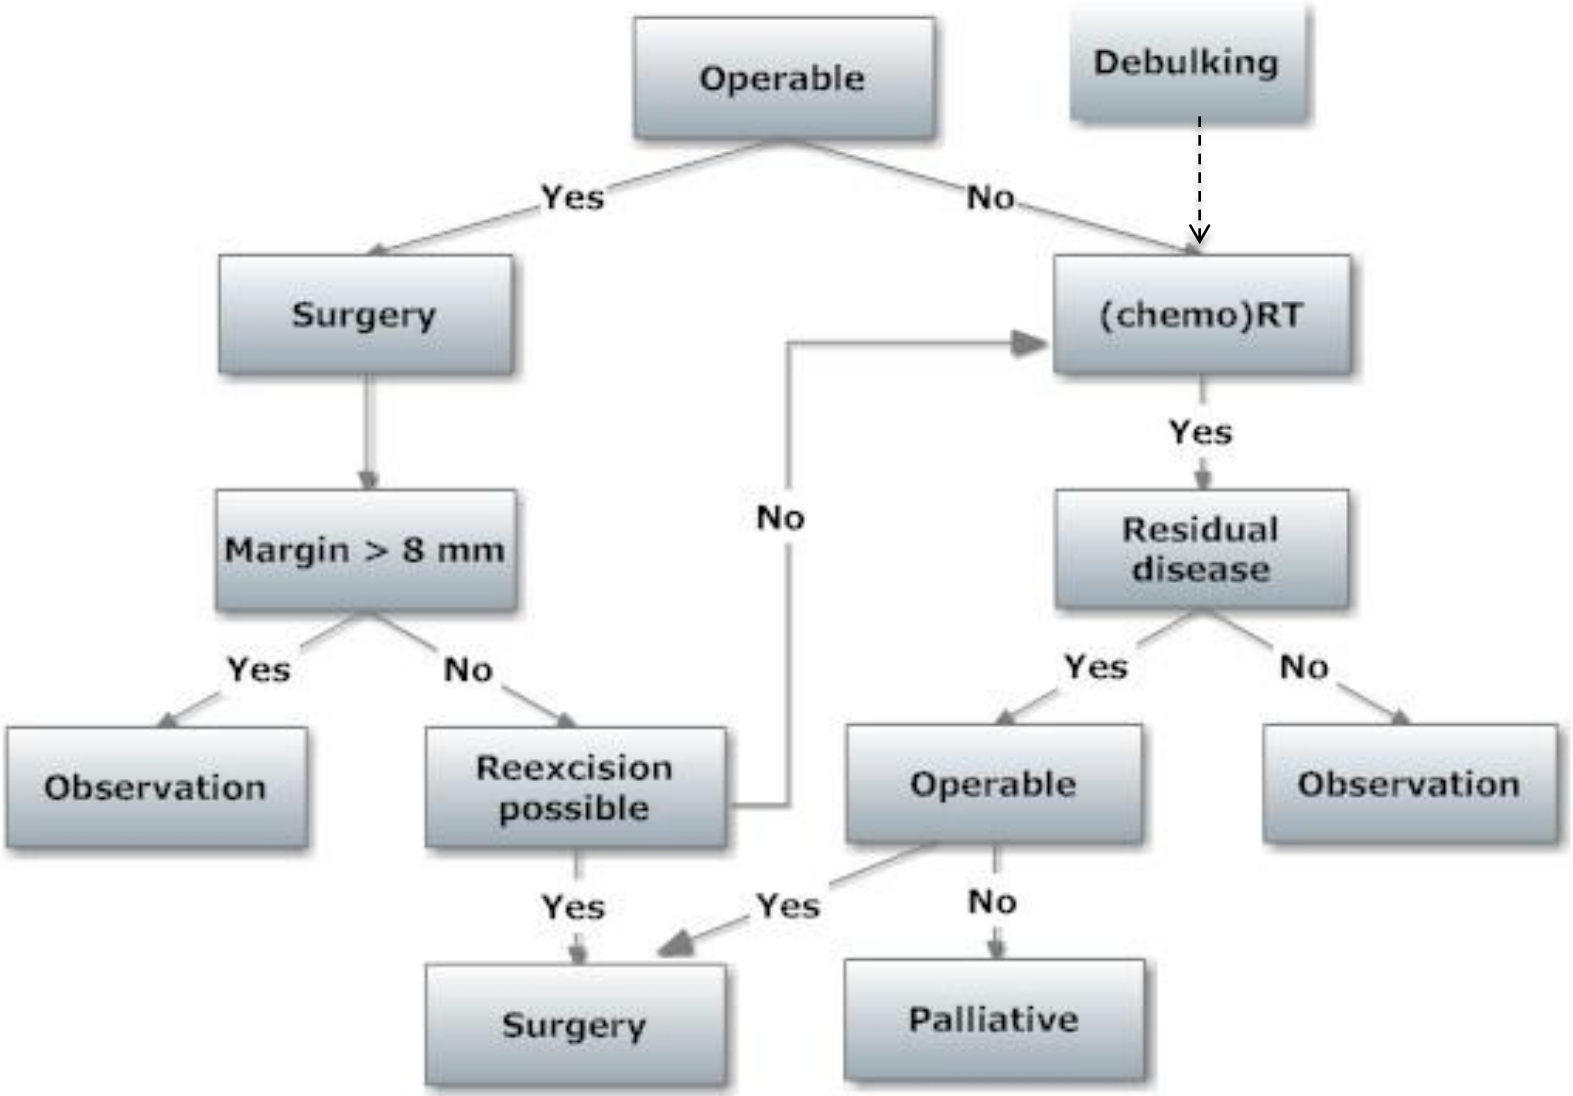
- In advanced [illegible] s[illegible] in order to [illegible]erative surgery.

Chemo?
Surgery with plastics + positive margins

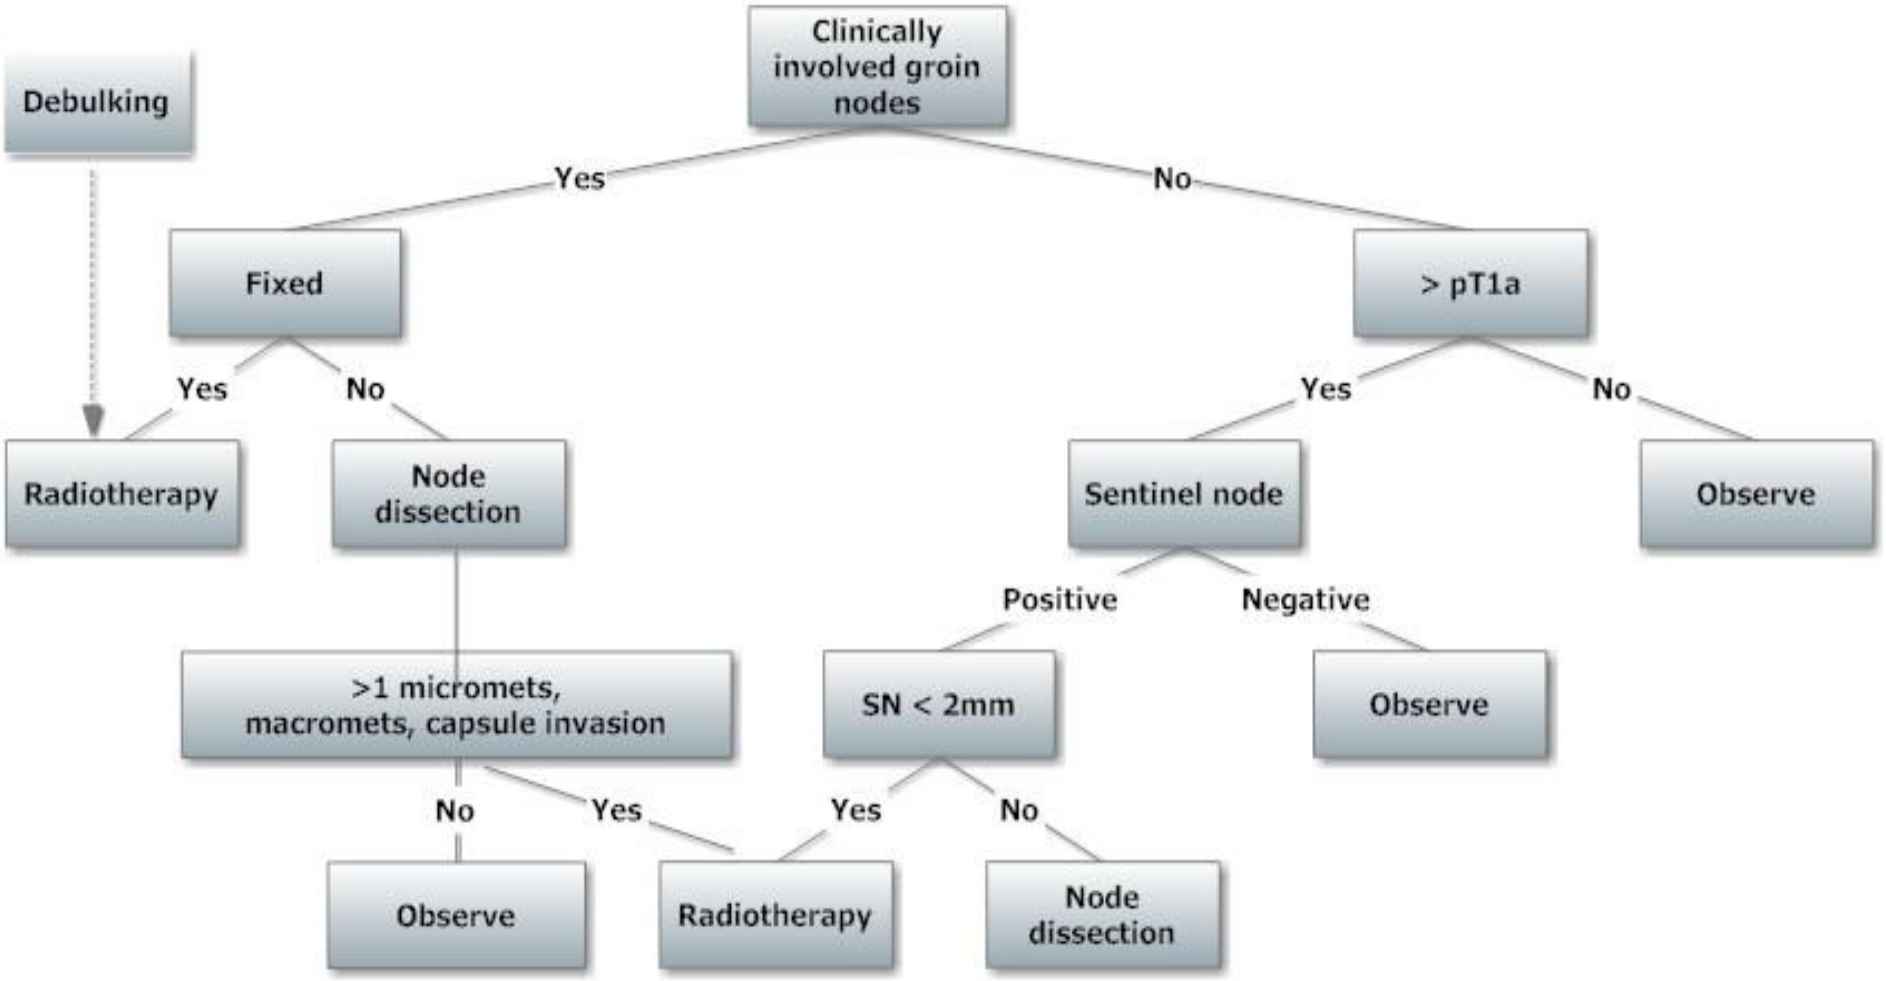


Grade C

Decision tree - vulva



Decision tree - groins



Outline

- Endometrial cancer
- Vulva cancer
- **Uterine sarcomas**

Epidemiology

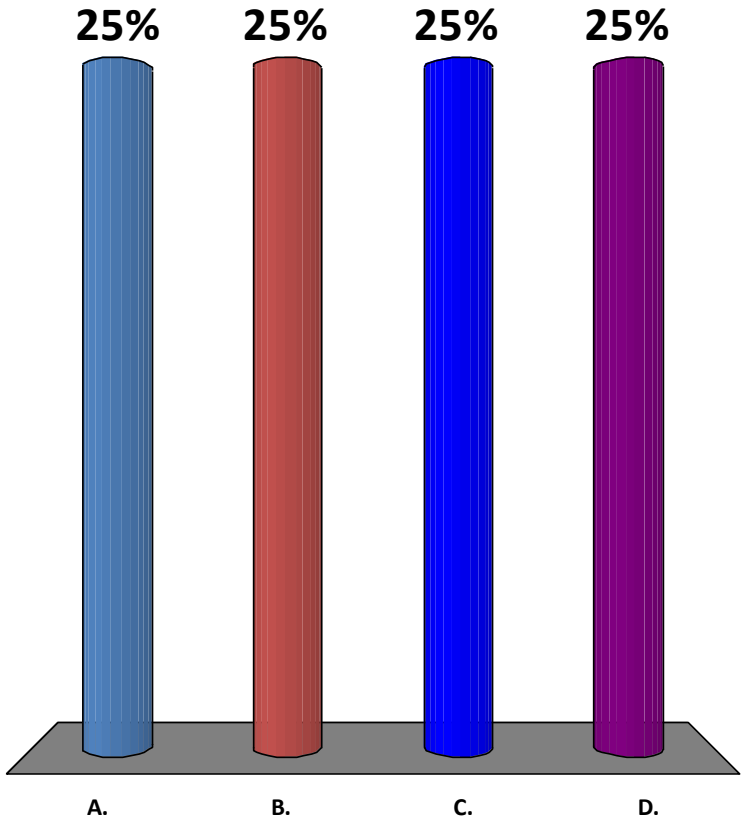
- Rare - ~4% of gynae cancers
- Histology
  - Stromal cell sarcoma
  - Leiomyosarcoma LG
  - Leiomyosarcoma HG
  - MMMT
- Low grade - local
- High grade - local and systemic problems

Adjuvant treatments

- Role of radiotherapy?
- Role of chemotherapy?

Do you offer adjuvant radiotherapy after surgery for patients with uterine sarcoma?

A. Yes - MMMT and LMS
B. Yes - MMMT only
C. Yes - LMS only
D. No



Role of RT - EORTC 55874

- 224 patients with HG uterine sarcoma
  - Stage I-II
  - Leiomyosarcoma 46%
  - MMMT 41%
  - Endometrial stromal sarcoma 13%
- Pelvic RT 50.4 Gy/28# vs. observation

Reed NS, et al. Eur J Cancer. 2008;44(6):808-18

EORTC 55874 - results

- Fewer local recurrences with RT - 3% vs. 18% (p = 0.0013)

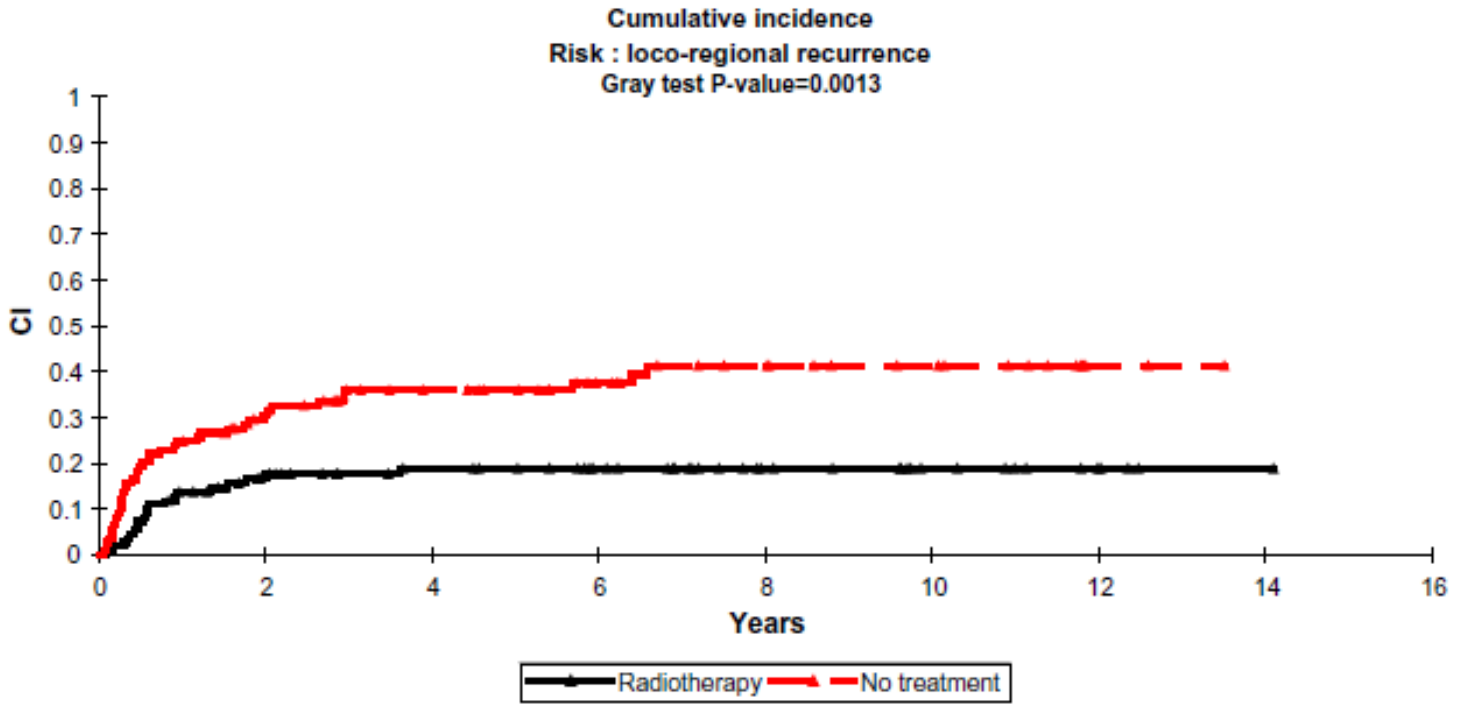


Fig. 3 – Cumulative incidence of local recurrence.

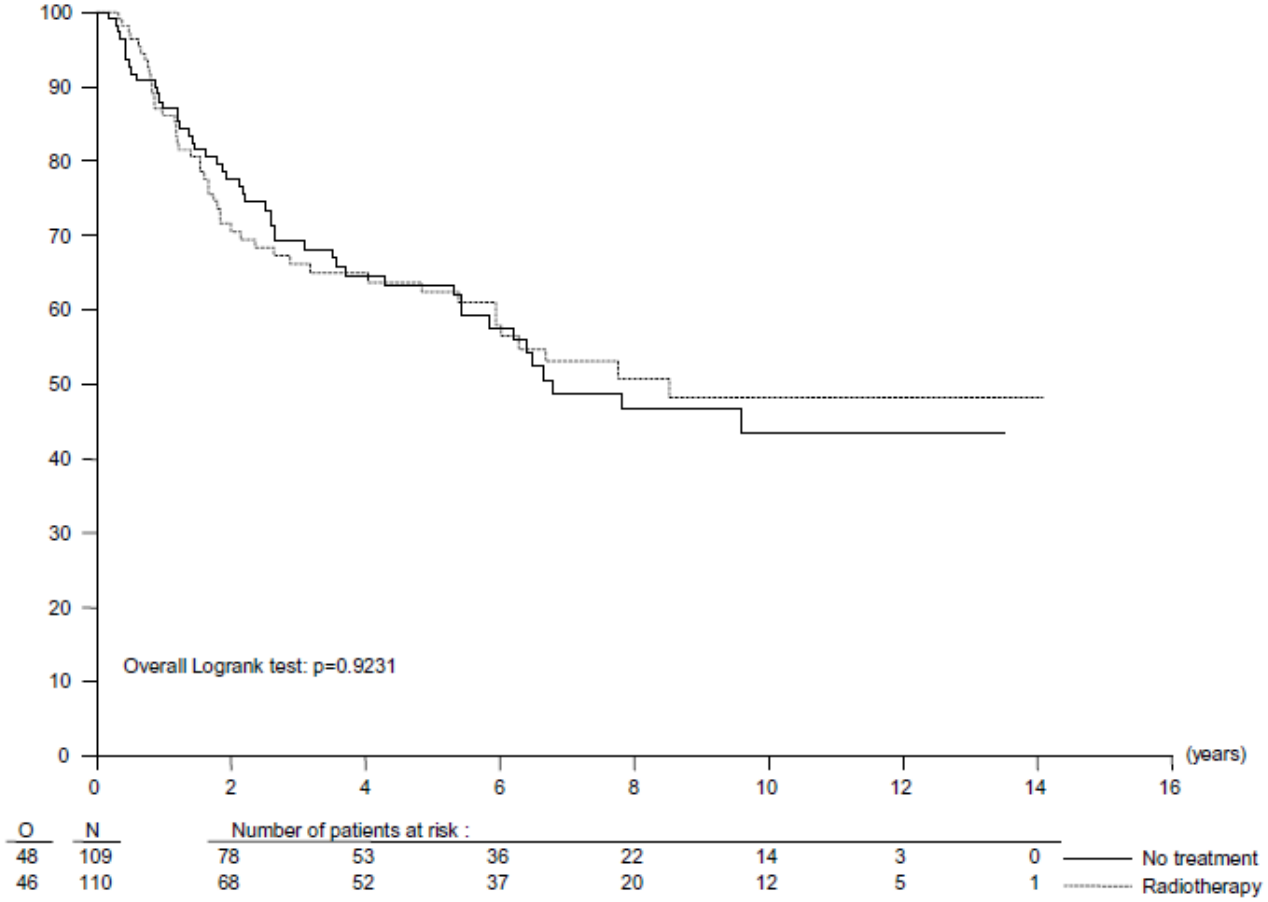
Reed NS, et al. Eur J Cancer. 2008;44(6):808-18

EORTC 55874 - results

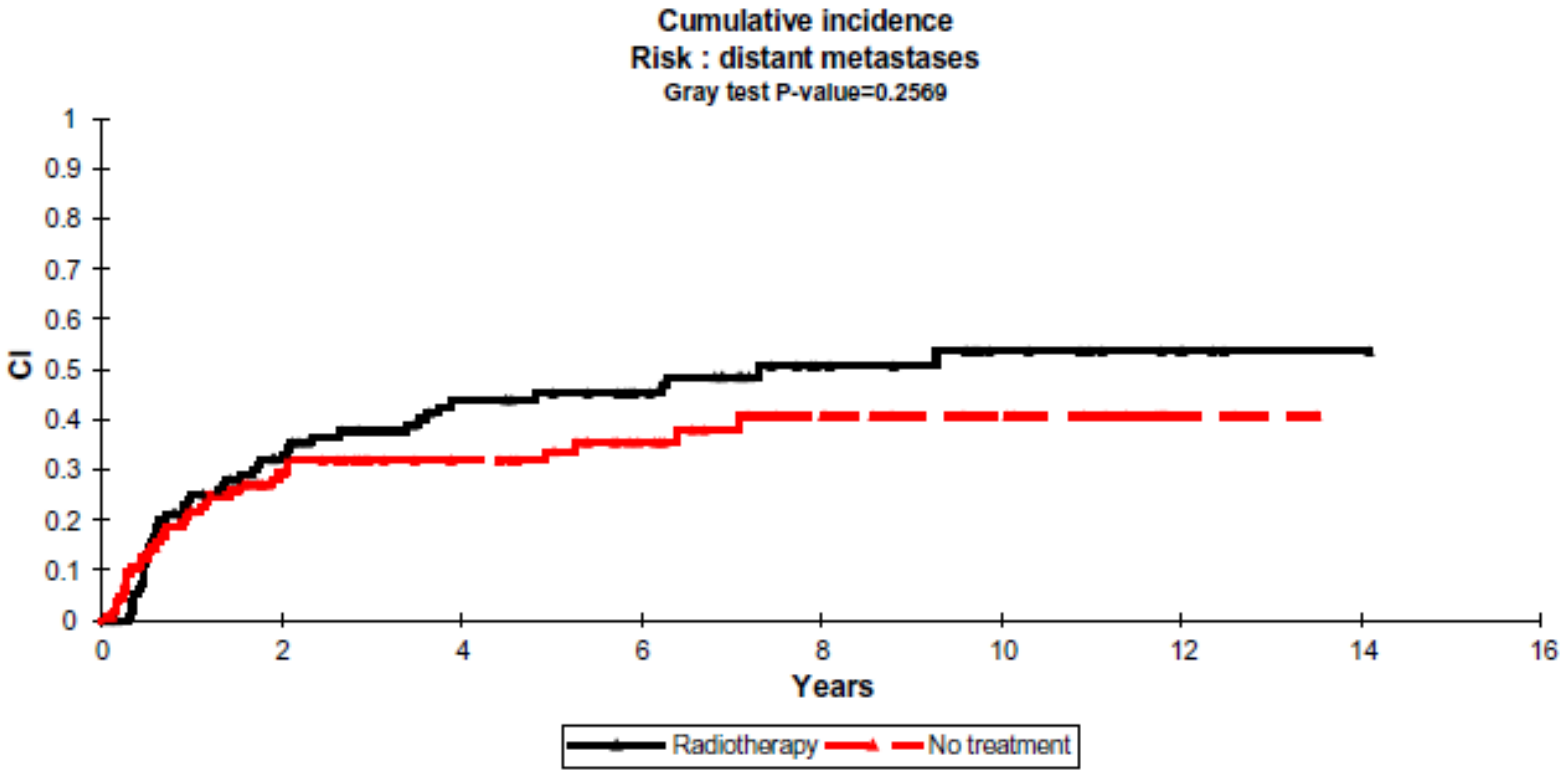
- No impact on PFS or OS



Reed NS, et al. Eur J Cancer. 2008;44(6):808-18

EORTC 55874 - results

- More metastases with RT - 25% vs. 10%



Reed NS, et al. Eur J Cancer. 2008;44(6):808-18

EORTC 55874

	MMMT n = 91		LMS n = 99	
	RT n = 46	Obs n = 45	RT n = 50	Obs n = 49
Local recurrence	24%	47%	20%	24%
Distant metastases	35%	29%	54%	33%

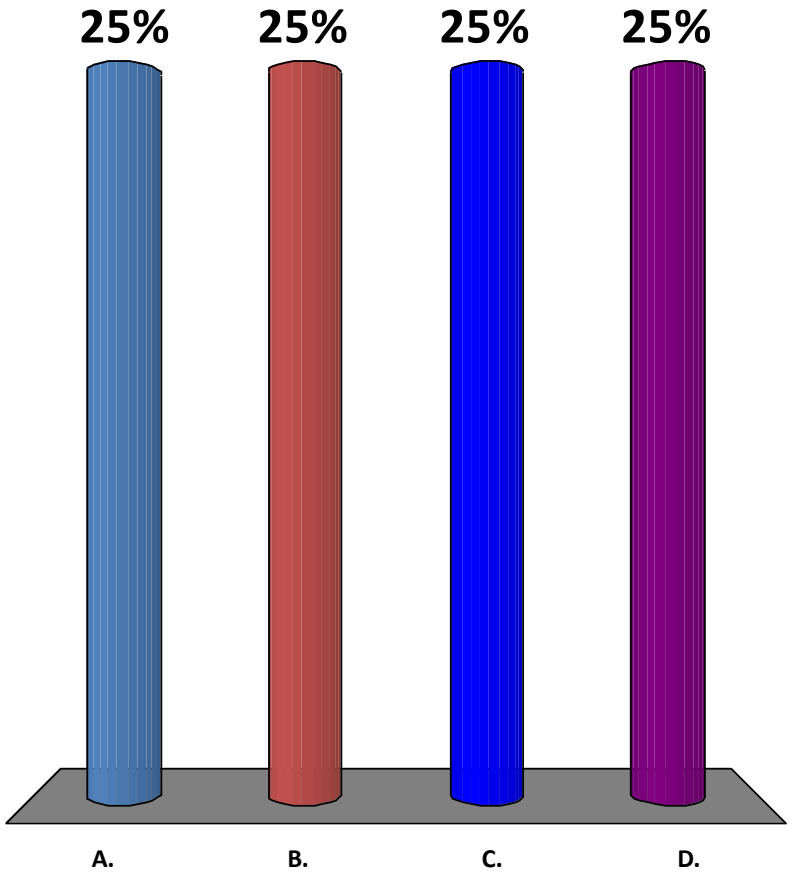
Reed NS, et al. Eur J Cancer. 2008;44(6):808-18

EORTC 55874 - conclusions

- No role for adjuvant RT in LMS
- ? Role in MMMT - reserve for salvage?

Do you offer adjuvant chemotherapy after surgery for patients with uterine sarcoma?

A. Yes - MMMT and LMS
B. Yes - MMMT only
C. Yes - LMS only
D. No



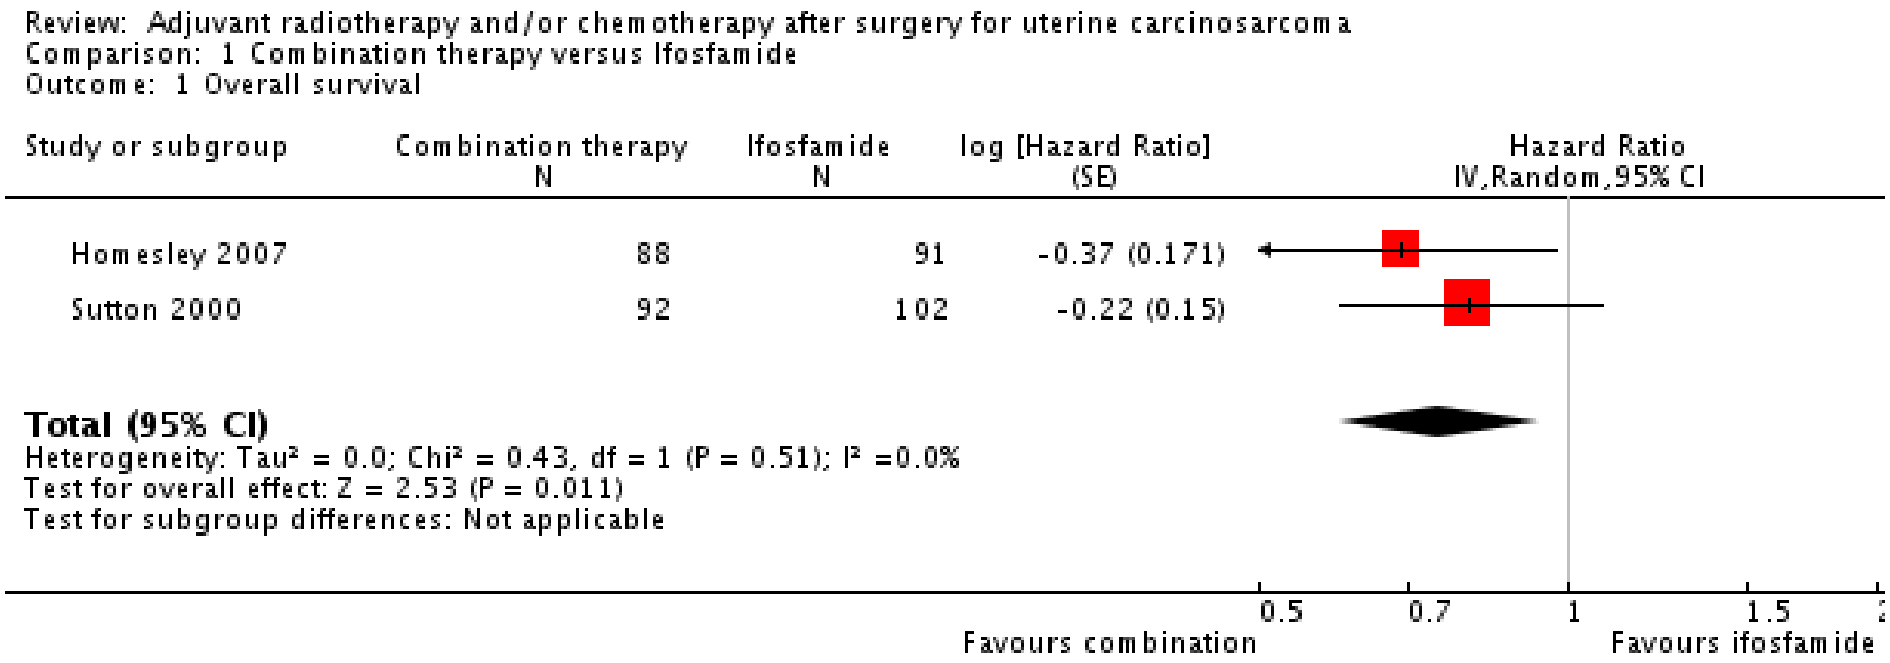
Chemo studies

3 randomised studies in MMMT

- 2 compared combination vs. single agent chemo
  - GOG 150 ifos + cisplatin vs. ifos
  - GOG 150 ifos + Taxol vs. ifos
- 1 compared chemo (ifos + cisplatin) vs. WART

Cochrane Database of Systematic Reviews 2013

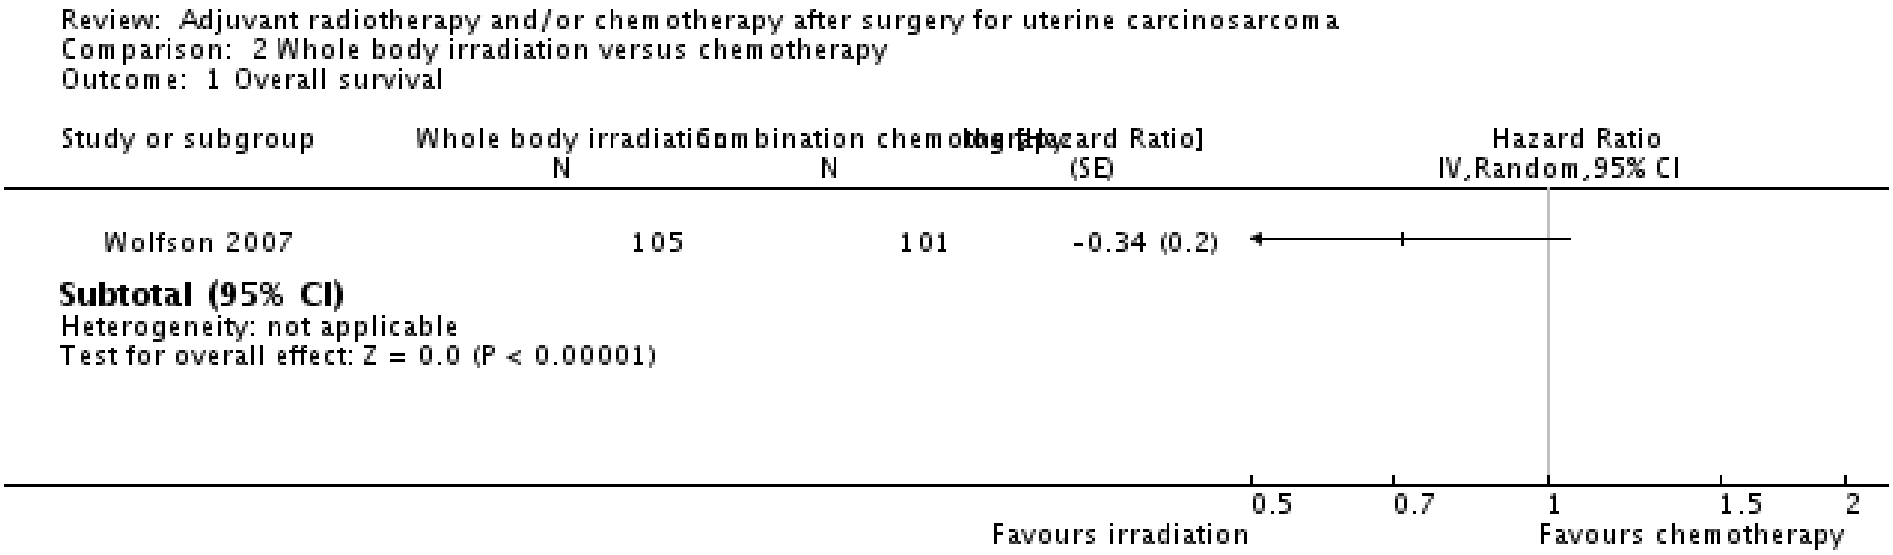
Combination vs. single agent



More toxicity with combination chemo

Cochrane Database of Systematic Reviews 2013

WART vs. chemo



More toxicity with combination chemo

Cochrane Database of Systematic Reviews 2013

Cochrane conclusions

- In advanced stage metastatic uterine carcinosarcoma as well as recurrent disease, adjuvant combination chemotherapy with ifosfamide should be considered.
- Combination chemotherapy with ifosfamide and paclitaxel is associated with lower risk of death compared with ifosfamide alone.
- In addition, radiotherapy to the abdomen is not associated with improved survival.

Cochrane Database of Systematic Reviews 2013

EORTC 62931

- 351 patients
- All macroscopically resected soft tissue sarcomas, including uterine
- Randomised to ifosfamide-doxorubicin vs. no chemo
- 73% received radiotherapy (equal in both arms)

Woll PJ, et al. Lancet Oncol. 2012;13(10):1045-54

EORTC 62931

- Results
  - No difference in 5-year OS (chemo 66·5%, control 67·8%)

- Conclusions

  "Future studies should focus on patients with larger, grade III, and extremity sarcomas"

Woll PJ, et al. Lancet Oncol. 2012;13(10):1045-54

Summary

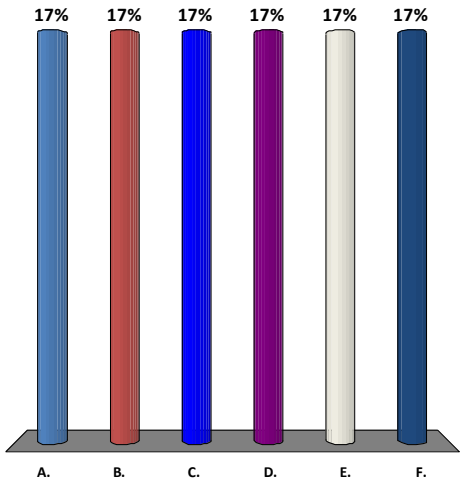
What if there is no evidence?

Patient

- Age 74
- 2 cm lump on vulva
- WLE
  - Mammary-type ductal carcinoma in situ with invasive component, strongly ER positive, margins >10mm
- Sentinel node biopsy
  - 3 nodes +ve on right, LVSI present

How would you manage this patient?

A. Bilat groin node dissection, no RT
B. Rt groin node dissection, no RT
C. Bilat groin node dissection + RT
D. Rt groin node dissection + RT
E. RT alone to bilat groins
F. RT alone to rt groin

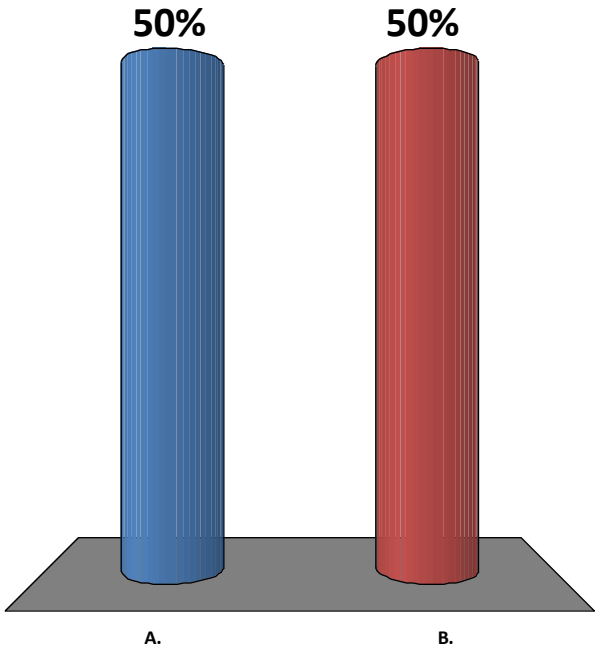


- Age 74
- 2 cm extra-mammary adenoCa
- ER +ve
- 3 right SN, LVSI +ve

Would you offer adjuvant tamoxifen?

A. No

B. Yes

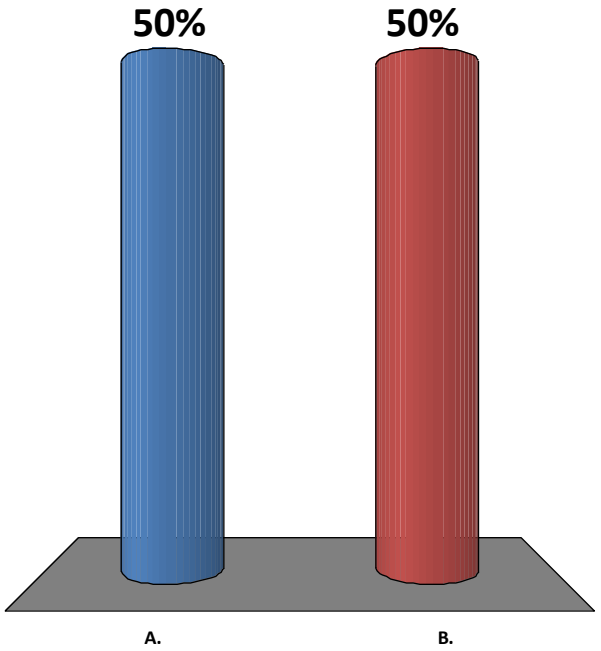


- Age 74
- 2 cm extra-mammary adenoCa
- ER +ve
- 3 right SN, LVSI +ve

If tumour was Her-2 +ve, would you offer Herceptin?

A. No

B. Yes



- Age 74
- 2 cm extra-mammary adenoCa
- ER +ve
- 3 right SN, LVSI +ve

Decision-making process

- Which site to extrapolate from?
- Breast or vulva or both?

Radiotherapy

- Indication – extrapolate from histology
  - Adjuvant RT given for adenoCa
- RT technique - extrapolate from location of tumour
  - Vulva
    - RT for close margins
    - SNB N+ - RT to both groins (even after LND)
  - Breast
    - RT regardless of margin
    - SNB N+ - RT to unilateral axilla (but not after LND)

Lymph node management

A. Bilateral groin node dissection, no RT
B. Right groin node dissection, no RT
C. Bilateral groin node dissection + RT
D. Right groin node dissection + RT
E. RT alone to both groins
F. RT alone to right groin

Systemic treatment

- Indication – extrapolate from histology (breast adenoCa)
  - N+, LVSI+ - in breast Ca, would offer systemic treatment
- What systemic treatment?
  - Consider therapeutic indices AND economic cost
  - ER positive - give tamoxifen (benefit U/K, toxicity low, cost low)
  - HER-2 positive – do not give Herceptin (benefit U/K, toxicity high, cost very high)
  - Chemo - ??? (benefit U/K, toxicity high, cost high)

Summary

- Indications for treatment – extrapolate from histology
- RT technique – extrapolate from location (lymphatic spread)
- For both, consider therapeutic index
  - Benefit unknown
  - Toxicity known
  - Cost known

ESTRO School

Do you treat?

Low risk Dukes B colon cancer patients with adjuvant chemo?

High Risk Dukes C colon cancer with adjuvant chemo?

FOLFOX or XELOX?

When do you want to start?

The European Society for Medical Oncology rectal cancer guidelines 2013 state

"Standard preoperative chemoradiotherapy means a dose of 45-50.4 Gy, 1.8 Gy/fraction, or alternatively 50 Gy, 2 Gy/fraction together with a fluoropyrimidine"

ESMO Guidelines

"An important aim is to treat so that the risk of residual disease in the pelvis, frequently causing a disabling local recurrence, is very low. This risk should preferably be less than about 5% in the population in whom curative treatment is intended"

Bengt Glimelius

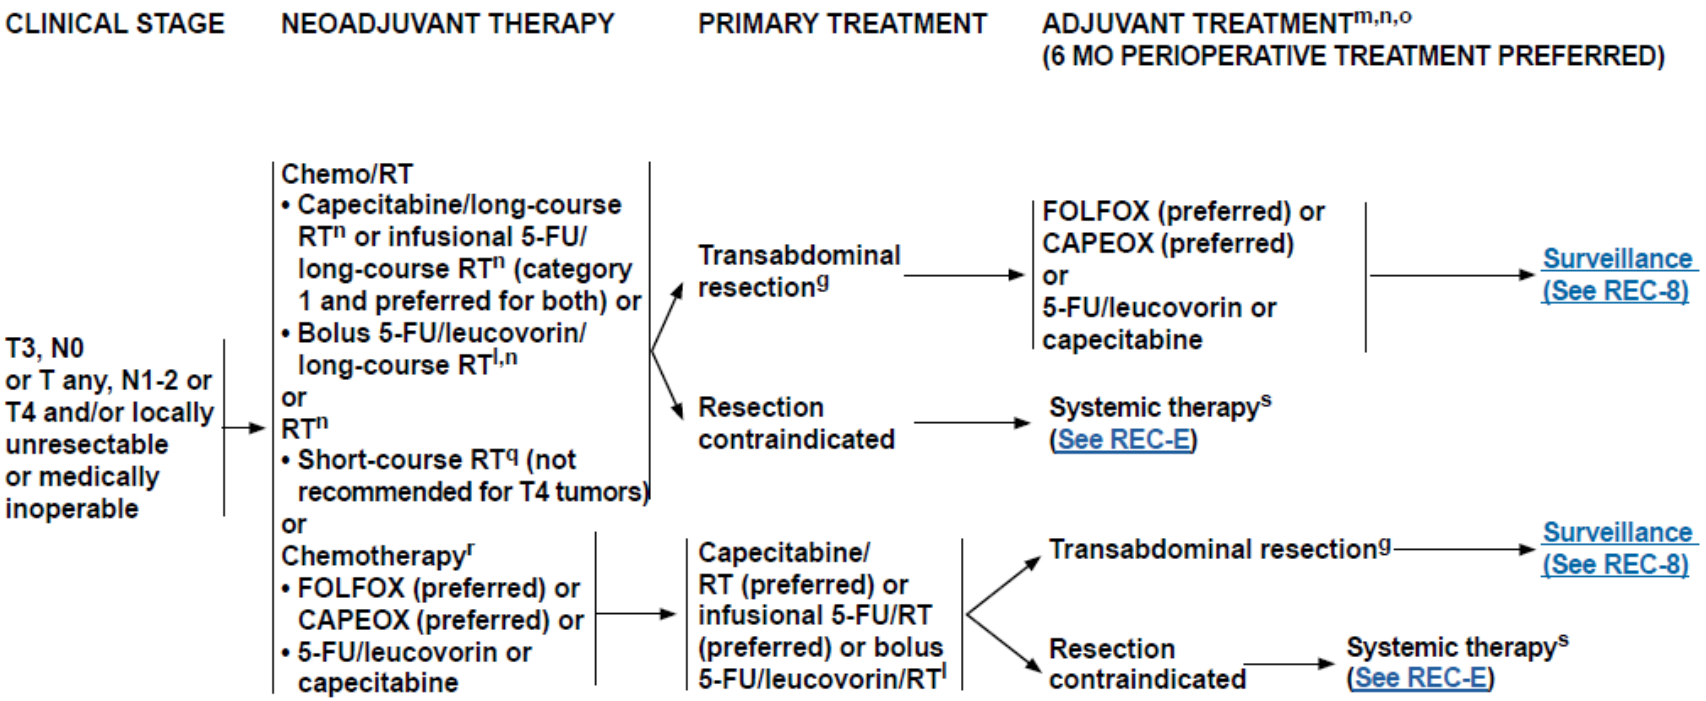
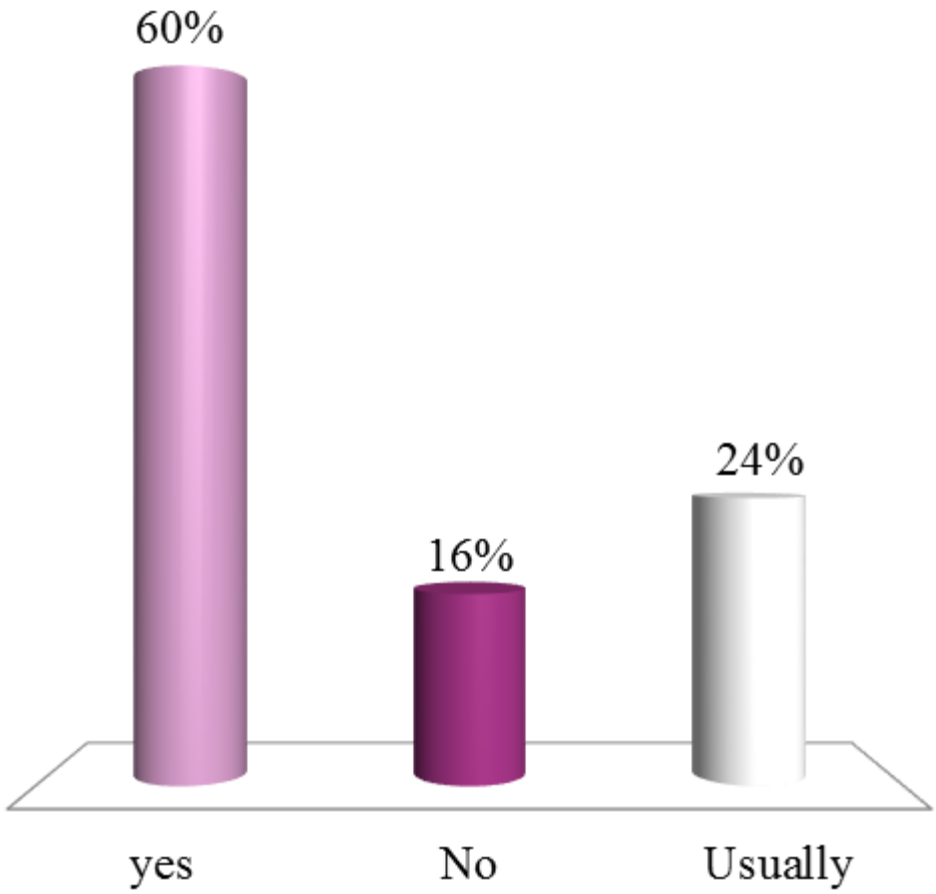
Discussion



[g] See Principles of Surgery (REC-B).
[l] Bolus 5-FU/leucovorin/RT is an option for patients not able to tolerate capecitabine or infusional 5-FU.
[m] See Principles of Adjuvant Therapy (REC-C).
[n] See Principles of Radiation Therapy (REC-D).
[o] Imaging (Chest/Abdomen/Pelvic CT with contrast) to be performed prior to adjuvant treatment to assess response to primary therapy or resection.
[q] Evaluation for short-course RT should be in a multidisciplinary setting, with a discussion of the need for down-staging and the possibility of long-term toxicity.
[r] Fernandez-Martos C, Pericay C, Aparicio J, et al: Phase II, randomized study of concomitant chemoradiotherapy followed by surgery and adjuvant capecitabine plus oxaliplatin (CAPOX) compared with induction CAPOX followed by concomitant chemoradiotherapy and surgery in magnetic resonance imaging-defined, locally advanced rectal cancer: Grupo cancer de recto 3 study. J Clin Oncol 2010;28:859-865.
Cercek A, Goodman KA, Hajj C, et al. Neoadjuvant chemotherapy first, followed by chemoradiation and then surgery, in the management of locally advanced rectal cancer. J Natl Compr Canc Netw 2014;12:513-519.
[s] FOLFOXIRI is not recommended in this setting.

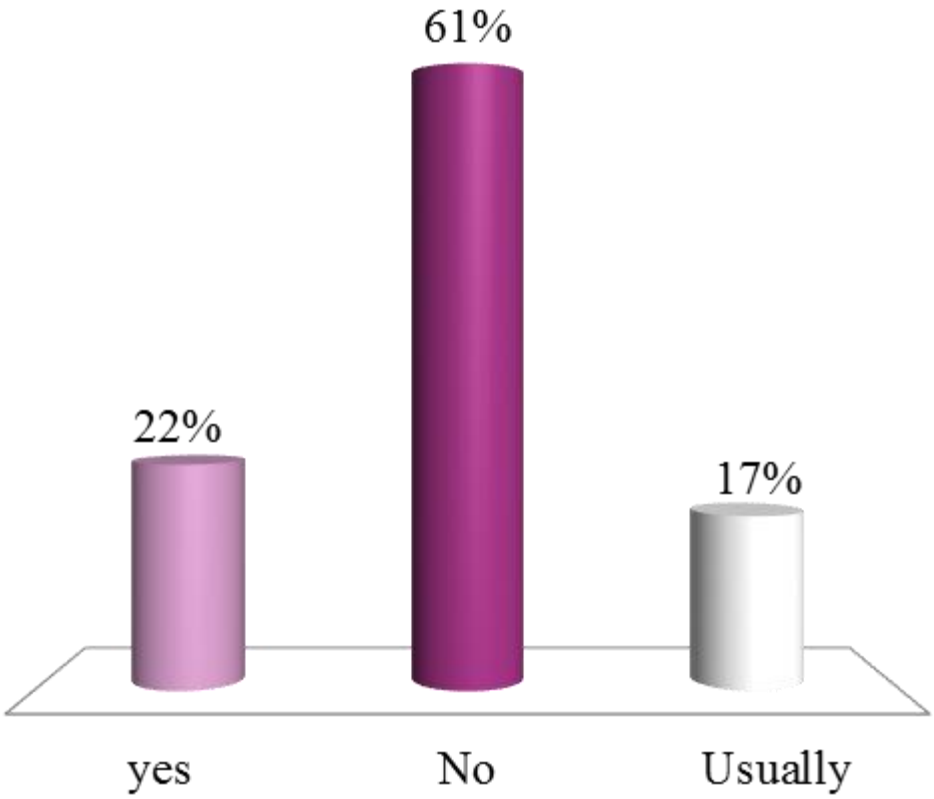
So do you treat all cT3cN1 with 5FU-based CRT?

A. yes
B. No
C. Usually



So do you treat all cT3cN1 with FOLFOX?

A. yes
B. No
C. Usually



I thought we had signed up to individualisation of treatment?

“Consistency is the last refuge of the unimaginative”

Oscar Wilde (1854-1900)

Preoperative Options to influence outcomes in rectal cancer

Chemoradiation (with fluoropyrimidine)

Radiotherapy (5 x 5Gy)

Neoadjuvant chemotherapy +/- Biologicals (Immunotherapy)

Different combinations and sequences of the above (4 x 3 x 2 x 1= 24)

Transcriptomic classification of four consensus molecular subtypes (CMS)

CMS1, called MSI-like, contains most microsatellite instable (MSI) tumors and enriched for tumors with a CpG-island methylator phenotype (CIMP) and mutations in the BRAF oncogene **(14%).**

CMS2, called canonical, with high chromosomal instability (CIN) and activation of the Wnt and MYC pathways **(37%).**

CMS3, called metabolic - enriched in *KRAS* mutations and shows a disruption of metabolic pathways **(13%).**

CMS4, called mesenchymal/stemlike, has a mesenchymal phenotype and frequent CIMP phenotype **(23%)**

stratifies CRC into intrinsic subtypes with different prognosis

CD3 infiltration - immunoscore

The ypTNM downstaging and TRG were used as endpoints to evaluate response to pCRT

72% of the biopsies with high infiltration of $CD3^+$ cells responders to CRT (complete or partial response)

63% of the biopsies with a low infiltration of $CD3^+$ cells were non-responders to CRT

($P = 0.015$).

4 Options for radiotherapy in locally advanced rectal cancer

1. Preoperative short course radiotherapy SCPRT (5 X 5 Gy) immediate surgery
2. Preoperative short course radiotherapy SCPRT (5 X 5 Gy) delayed surgery
3. Preoperative long course chemoradiotherapy CRT (25-28 X 1.8Gy Gy)

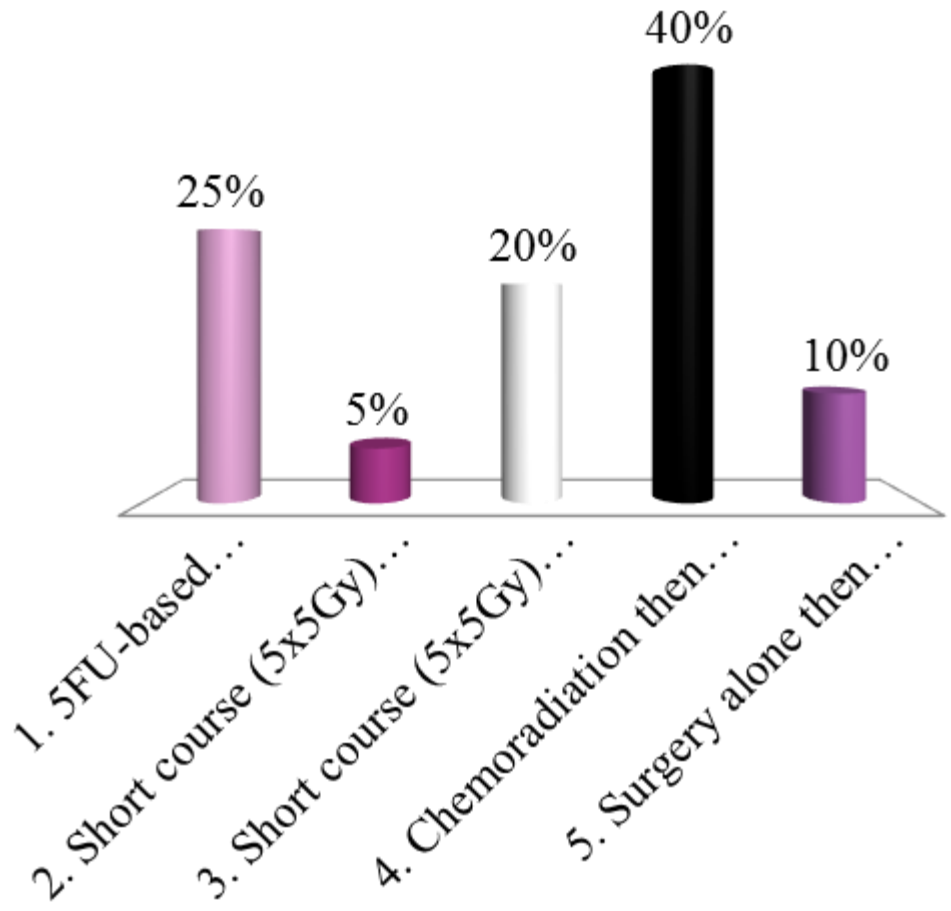
4. (Post-op CRT as adjuvant)

ESTRO School

What are you going to recommend?

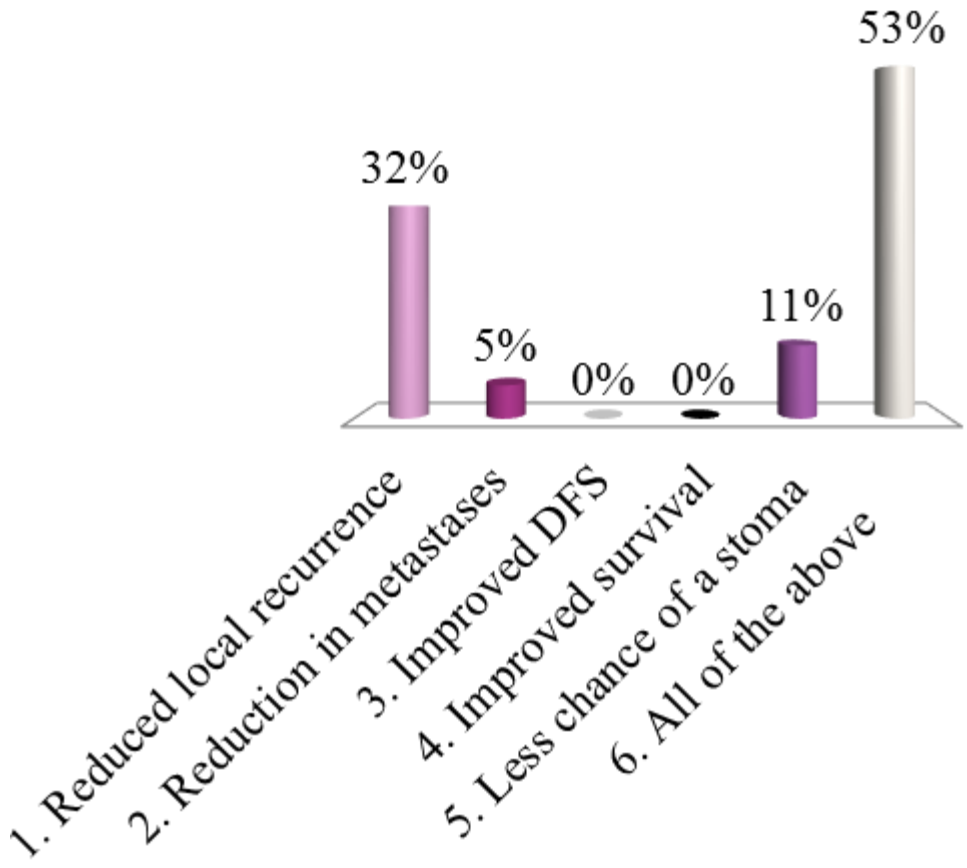
Turning point- How do you manage this patient?

1. 5FU-based Chemoradiation then surgery
2. Short course (5x5Gy) then surgery then chemo
3. Short course (5x5Gy) then chemo then surgery
4. Chemoradiation then surgery then chemo
5. Surgery alone then chemotherapy if node positive (stage III)



What are the advantages for this patient of RT/CRT?

1. Reduced local recurrence
2. Reduction in metastases
3. Improved DFS
4. Improved survival
5. Less chance of a stoma
6. All of the above



ESTRO School

3 Questions re use of chemotherapy

1. Do you simply want to reduce the risk of local recurrence (SCPRT or CRT needed)
2. Do you need to shrink the cancer to ensure an Ro resection?

(you can ignore data re irinotecan and biologicals on postop adjuvant)

3. Or do you want to reduce micro-metastases?*(you cant ignore data on postop adjuvant)*

What are the advantages for this patient of oxaliplatin based chemo?

1. Reduced local recurrence
2. Reduction in metastases
3. Improved DFS
4. Improved survival
5. Less chance of a stoma
6. All of the above

Locally advanced Rectal Cancer (LARC) 1:

- Low doses of RT are administered
- Chemoradiation and SCPRT are potentially curative treatments for locally advanced rectal adenocarcinoma.
- Not usually intended to be curative ‘per se’ (unless brachytherapy/Papillon boost)

What is the mechanism of the effect of preoperative CRT in preventing local recurrence?

1. by treating microscopic areas not seen (discontinuous deposits) and so not routinely removed by surgeon ?
2. by treating areas not routinely removed by surgeon (external iliac nodes/obturator nodes etc..) ?
3. by countering spillage ie rendering cells non-viable with RT?
4. by countering spillage growing ie tumour bed effect?
5. by compensating for poor surgical technique?
6. by damaging tumour /vasculature and causing immune effects/loss of tolerance etc..?

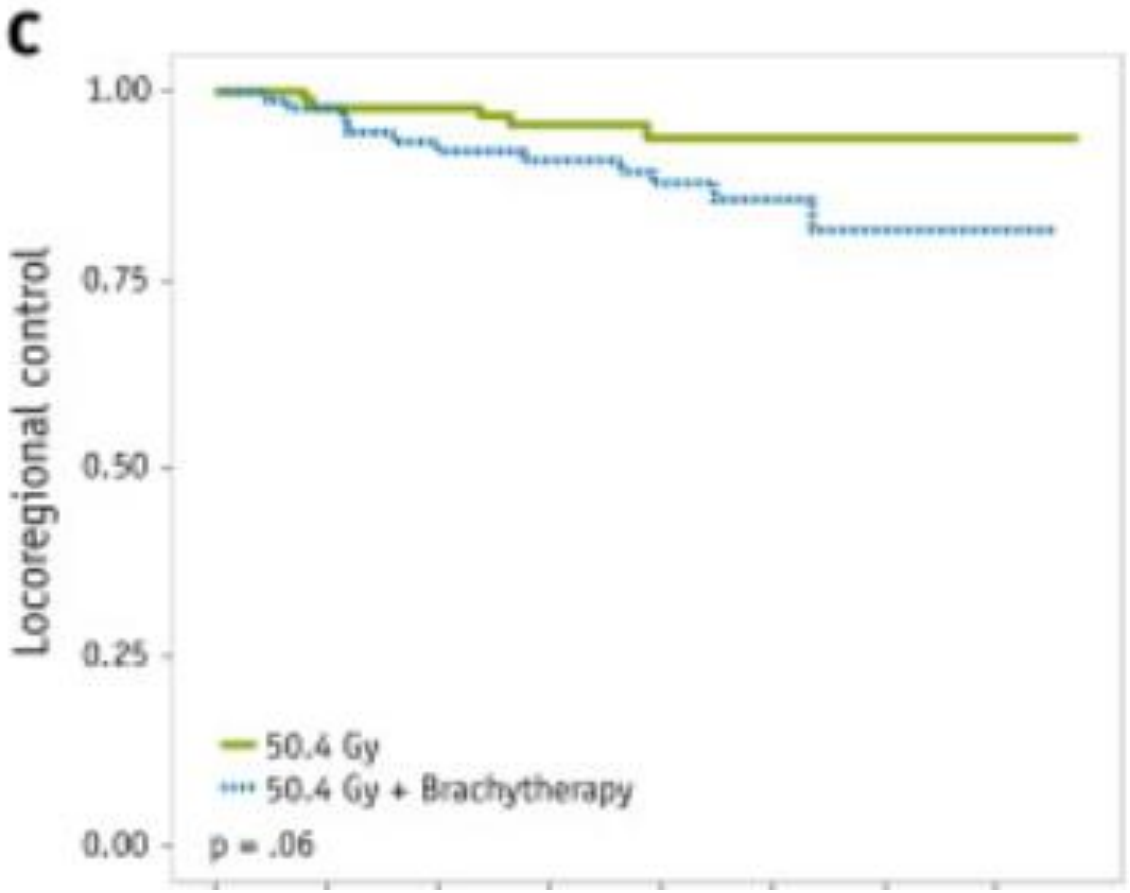
Chemoradiation

What about increasing the dose of RT with brachytherapy?

Jakobsen A 2012: endpoints

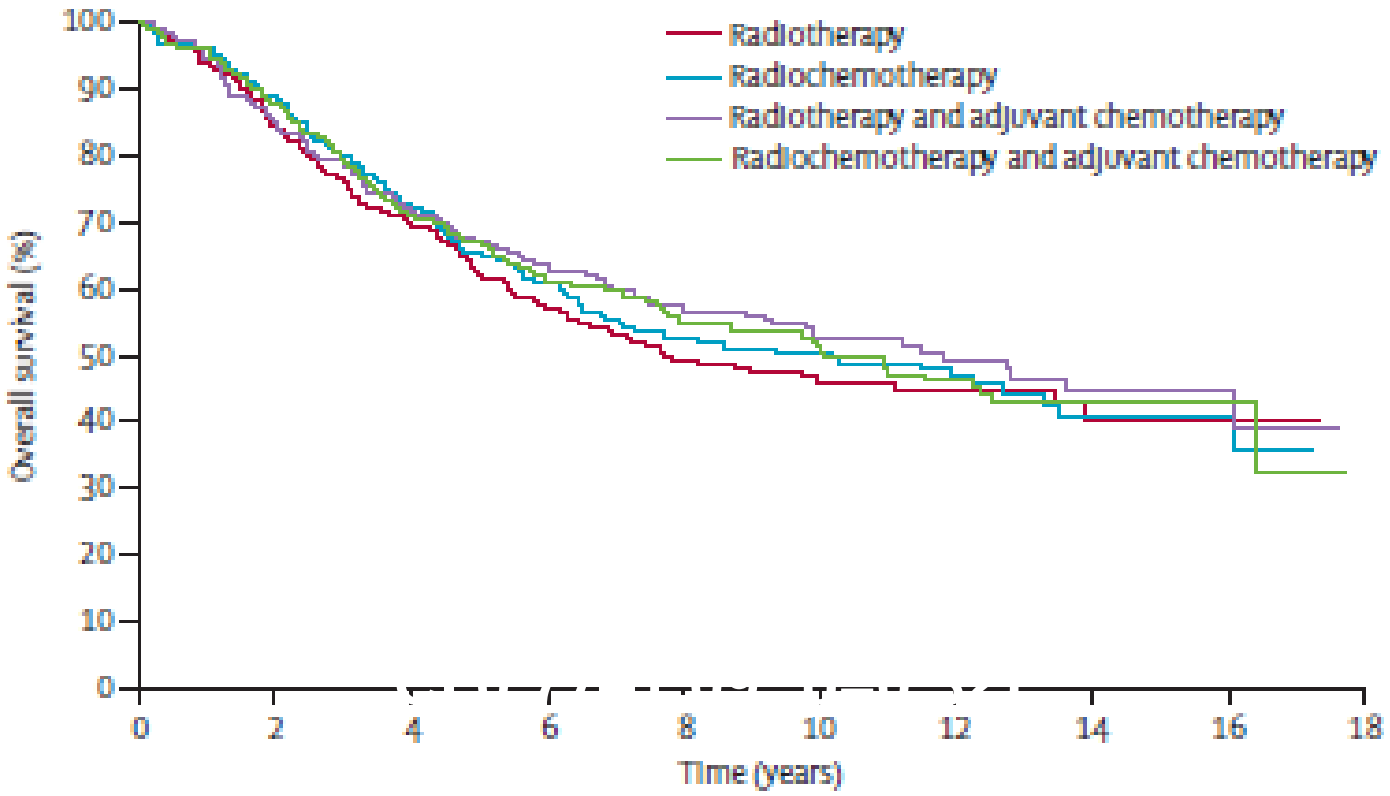
Endpoint	CRT +brachytherapy boost n=90	Standard CRT n= 92	P value
pCR	18%	18%	NS
R0 Resection	99%	90%	P= 0.03
Major response TRG 1 and 2	44% (35/80)	28% (23/82)	P= 0.04

Loco-regional control Appelt 2014



- Which begs the question regarding the mechanism of action for preventing local recurrence?

EORTC 22921 – Overall Survival



Number at risk									
Radiotherapy	252	208	165	129	98	62	32	15	5

Gunderson, L. L. et al. J Clin Oncol; 22:1785-1796 2004

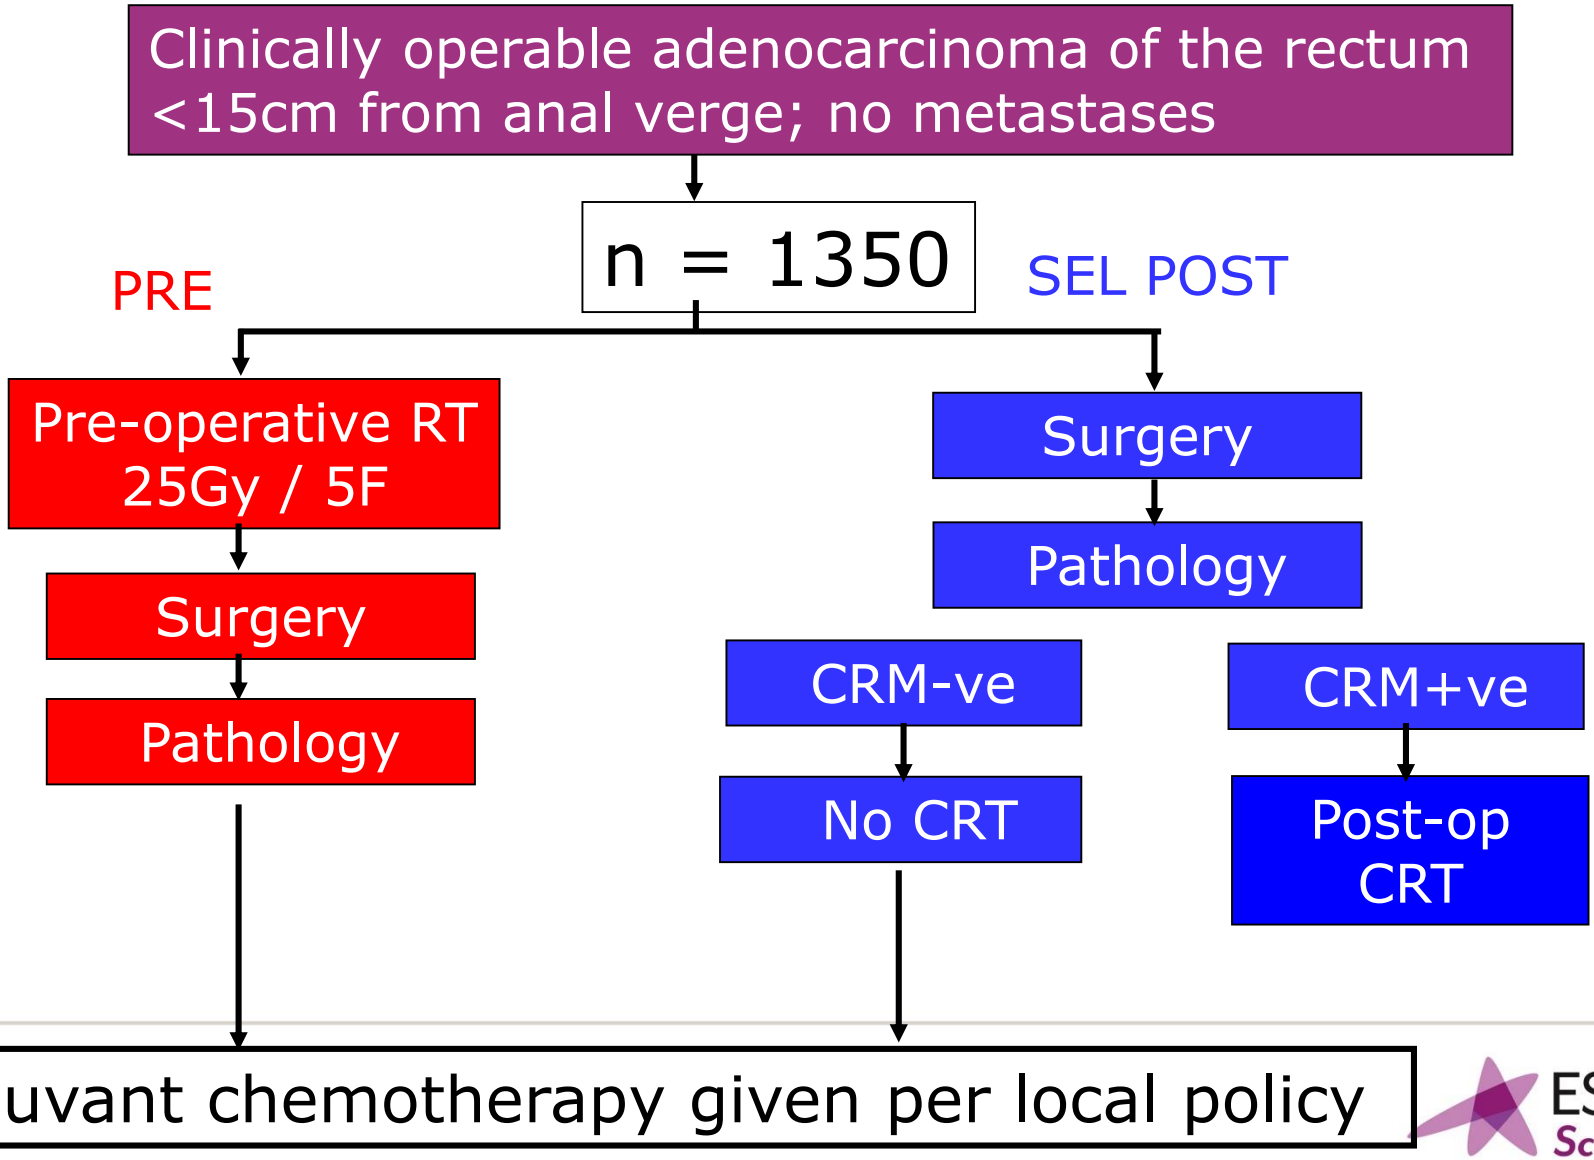
Current Wisdom

- Preoperative CRT better than postop
- Improves Local recurrence but not DFS or OS
- If CRM threatened on MRI needs response so CRT
- Low rectal cancers (below the levators) almost always have threat to CRM
- T1/T2N0 mid/upper rectum don't usually need RT or CRT unless to avoid radical surgery
- CRT helps preserve sphincters

Quality of surgery is the biggest factor in Local recurrence –not whether or not you have radiotherapy

Quality of surgery can be viewed and scored

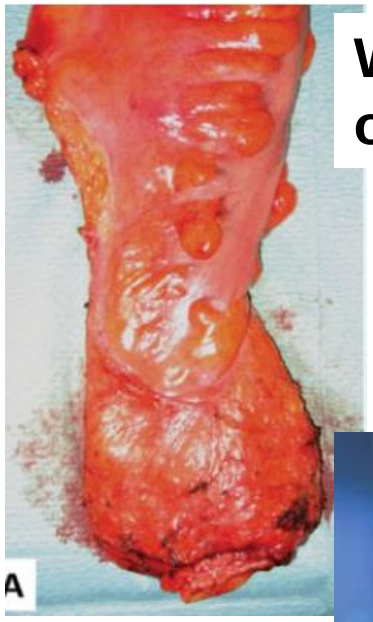
MRC CR07 NCIC C016 trial

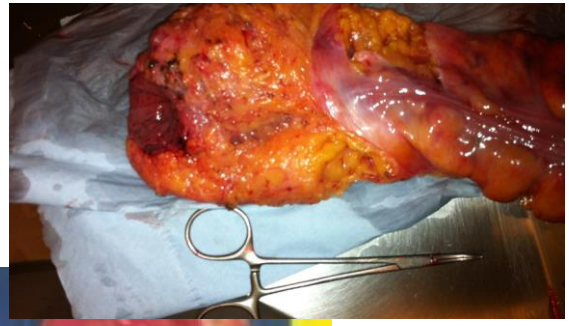


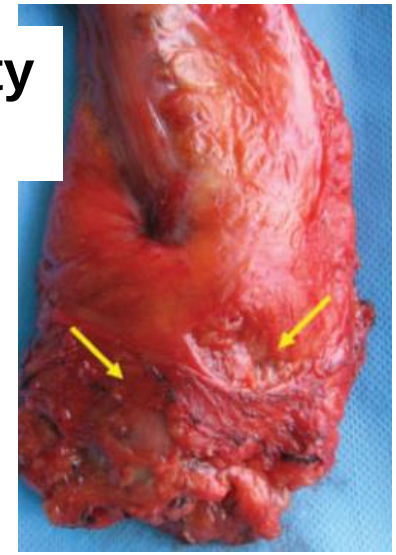
Scoring the Quality of the

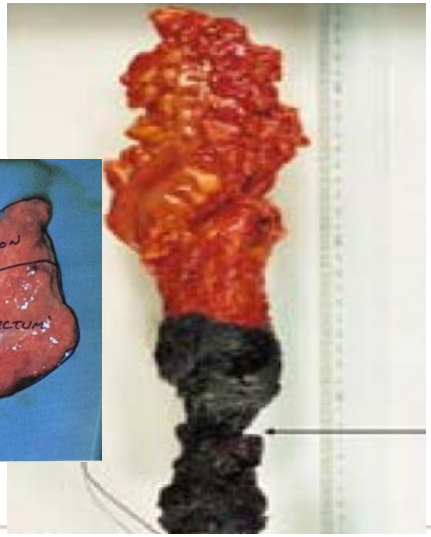
	Mesorectum	Defects	Coning	MRF
Complete	Intact, smooth	Not deeper than 5 mm	None	Smooth, regular
Nearly complete	Moderate bulk, irregular	No visible muscularis propria	Moderate	Irregular
Incomplete	Little bulk	Down to muscularis propria	Moderate–marked	Irregular

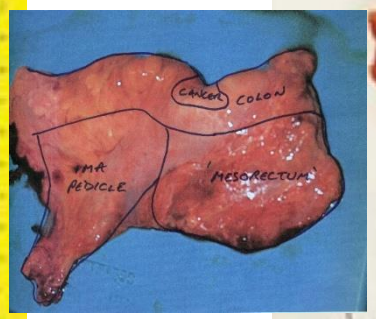
We can judge the quality of the Surgery





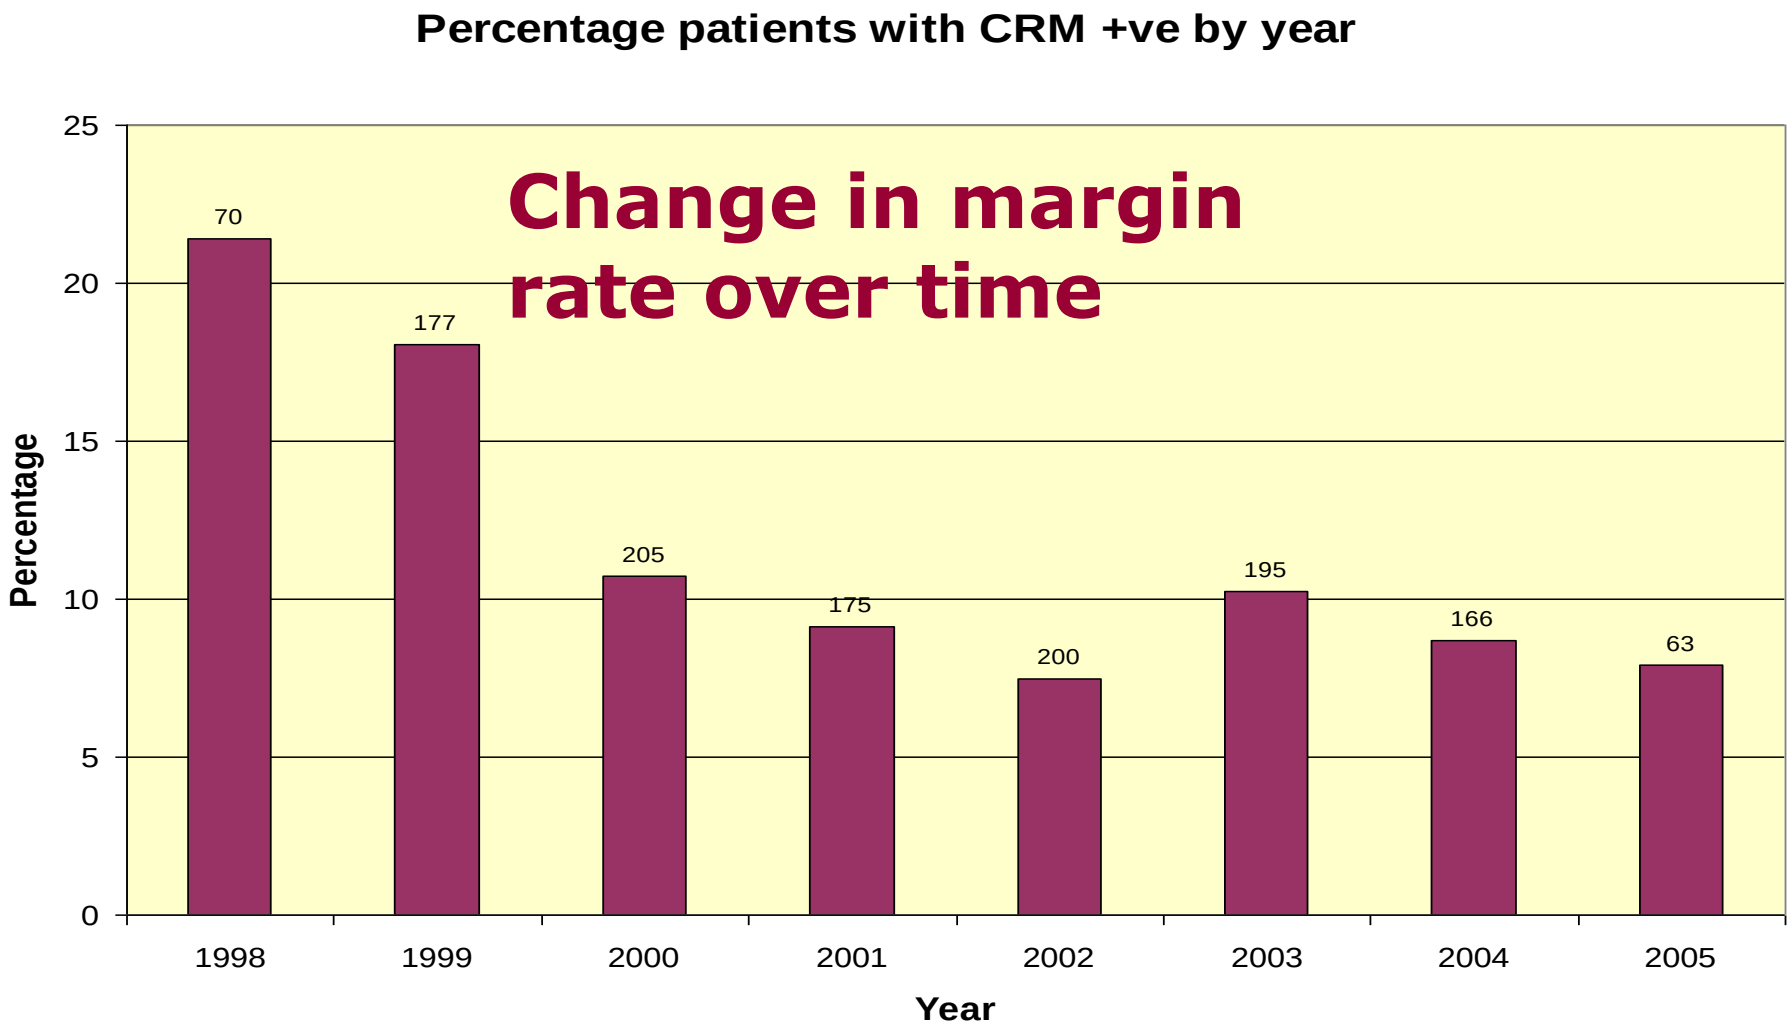






CR07

Percentage of patients with + CRM over time



CRM associations with plane of surgery

Pathologically defined Lymph nodes only affect your local recurrence rate if you leave them inside the patient!

Lymph nodes on MRI (unless extracapsular spread – ie irregular borders) mean you are simply seeing LN enlarged

– it may actually say the host immune system is working

So - What about?

- Oxaliplatin
- Irinotecan
- Biologicals

So - What about?

- Oxaliplatin
- Irinotecan
- ~~Biologicals~~

Currently - Different Philosophies

Medical Oncology trials EXPERT, EXPERT C, SPANISH (Fernandez-Martos)/ RAPIDO use systemically active chemotherapy outside chemoradiation

Radiation Oncology trials ACCORD 12, STAR-01, CAO/ARO/AIO-04, NSABP R04 use oxaliplatin as radiosensitizer (non systemic doses)

Primary end-point [n=515]

R0 resection rates (surgery performed & pathologic R0 status):

77% for SCPRT with 3 cycles of chemotherapy

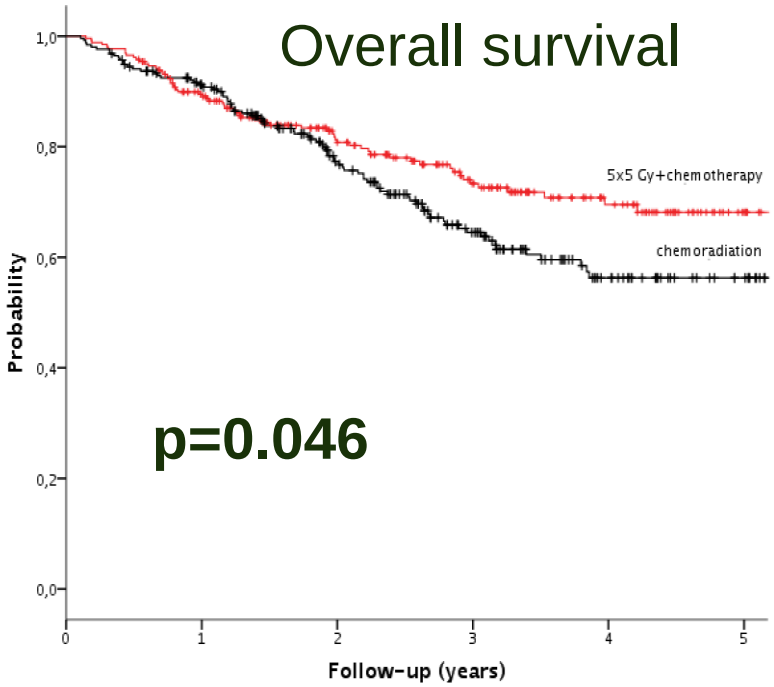
71% for CRT (control arm)

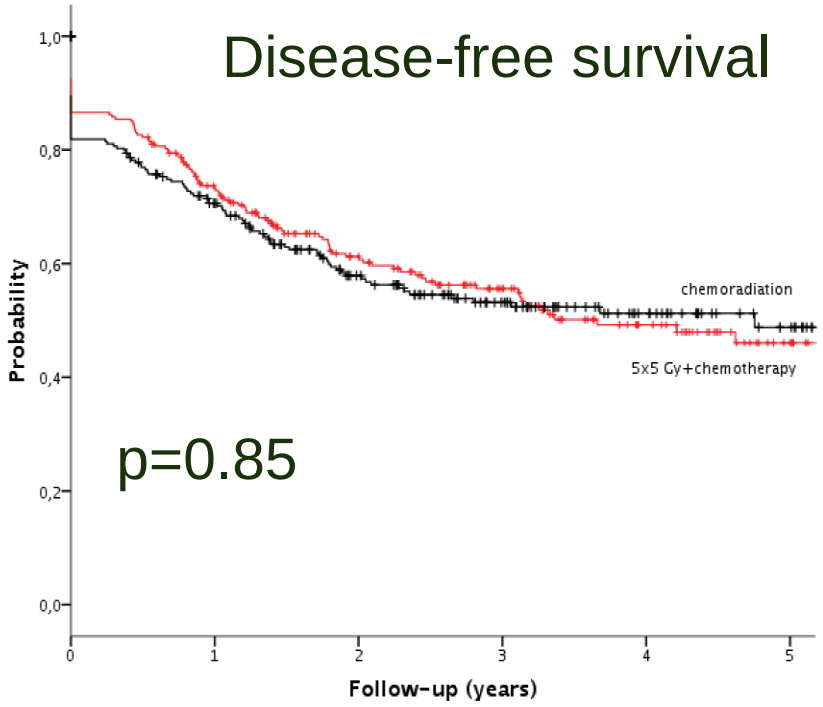
(p=0.081)

Secondary end-points

	SCRTx + FOLFOX4	CRTx	P value
Overall acute toxicity	**75%**	**83%**	**p= 0.006**
Grade III/IV toxicities	23%	21%	NS
pCR rate	16%	12%	p= 0.17

Polish-2: Secondary end-points





chemoradiation

short-course radiotherapy with consolidating chemotherapy

[median follow-up: 36 months]

ESTRO School

Conclusions

1. SCPRT = CRT in resectable cancer
2. cN+ probably inaccurate - most patients pN0
3. Radio-sensitizing 5FU-based CRT with sub therapeutic oxaliplatin ?
4. But minimal benefit for T3N0 on mets
5. Immunotherapy is coming

Thank you for listening

Chemo-radiotherapy in rectal cancer

Rob Glynne-Jones
Mount Vernon Cancer Centre

My Disclosures: last 5 years

Speaker: Roche, Merck Serono, Sanofi Aventis, Pfizer, AIS

Advisory Boards: Roche, Merck Serono, Sanofi Aventis, Astra Zeneca, Servier, BMS

Funding to attend meetings: Roche, Merck Serono, Sanofi Aventis,

Research funding: Roche, Merck Serono, Sanofi Aventis

My Inherent Bias

De Ruysschers Principle of SER

(the interval between the start of treatment and the end of radiotherapy should be as short as possible)

De Ruysscher D, et al., Time between the first day of chemotherapy and the last day of chest radiation is the most important predictor of survival in limited-disease small-cell lung cancer. **J Clin Oncol 2006;24(7):1053-63**

Preoperative Options to influence outcomes in rectal cancer

Radiotherapy (5 x 5Gy)

Chemoradiation (with fluoropyrimidine)

Neoadjuvant chemotherapy +/- Biologicals (Immunotherapy)

Different combinations and sequences of the above (4 x 3 x 2 x 1= 24)

In different countries

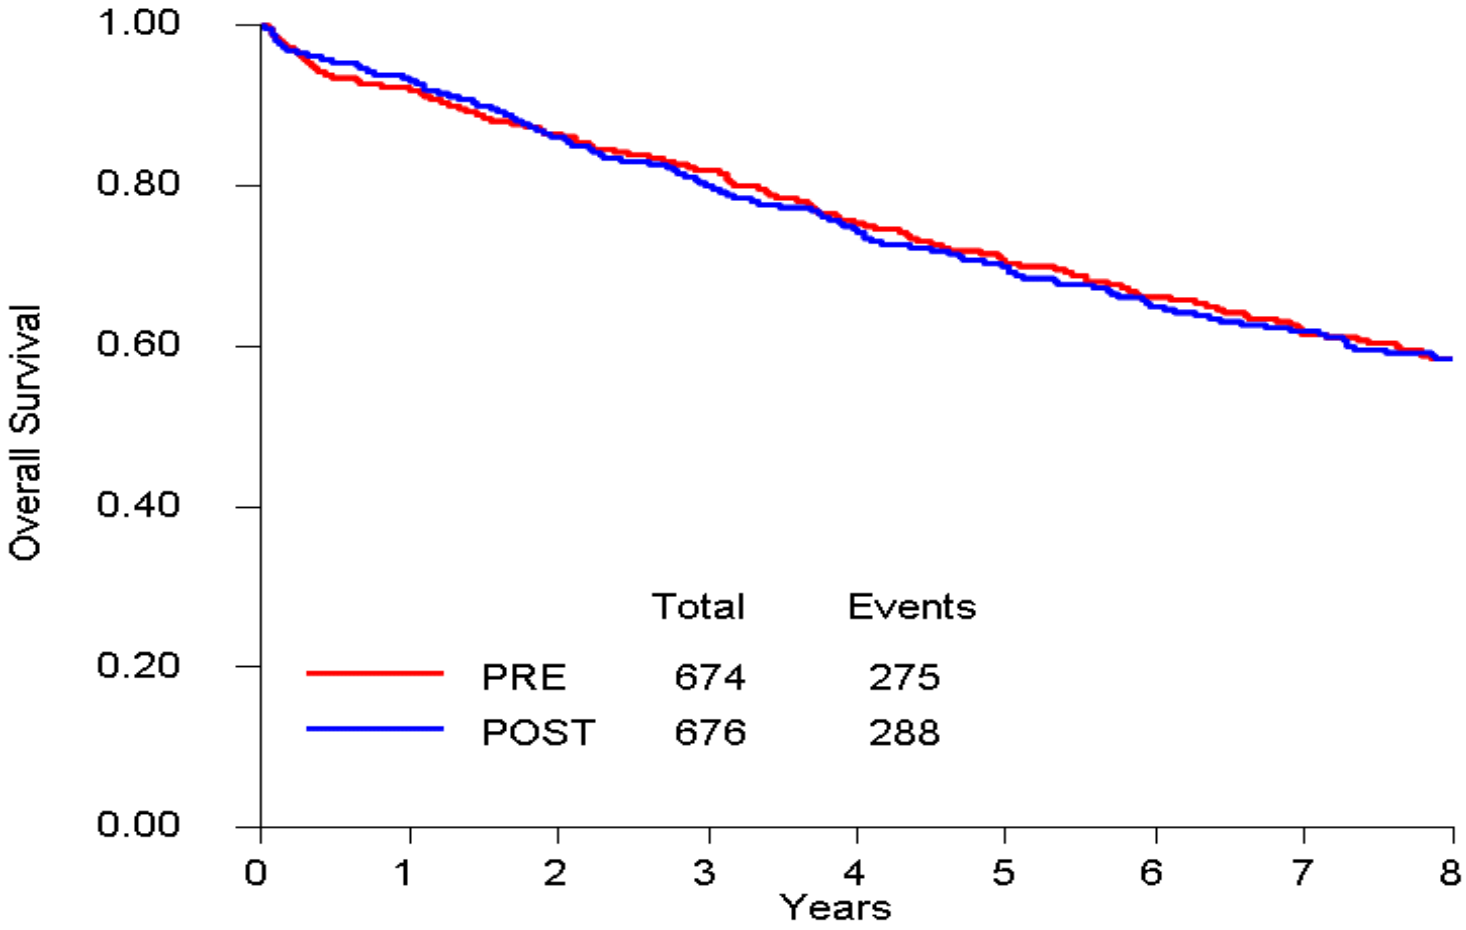
CR07 Overall Survival



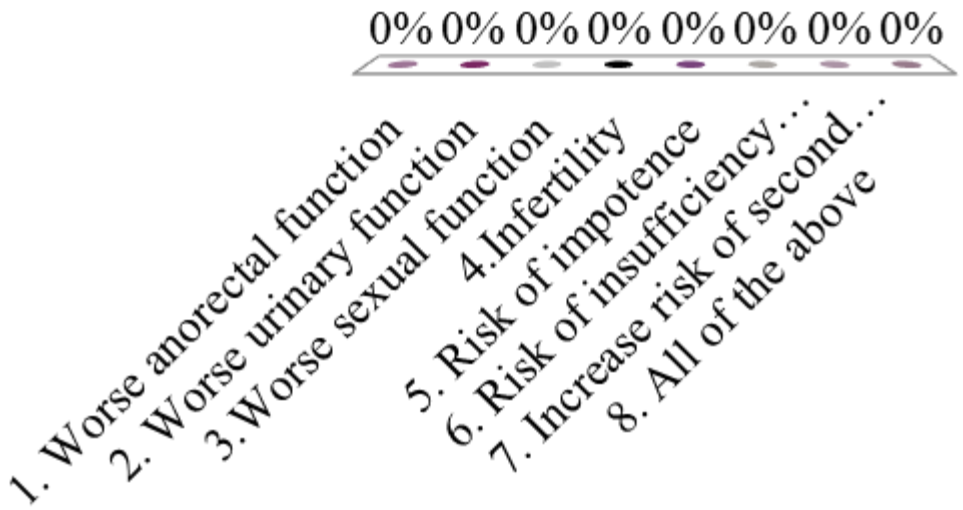
Number at risk

PRE	674	611	571	539	490	445	359	271	204
POST	676	624	577	530	487	434	356	274	208

ESTRO School

What are the dis-advantages for this patient?

1. Worse anorectal function
2. Worse urinary function
3. Worse sexual function
4. Infertility
5. Risk of impotence
6. Risk of insufficiency fractures
7. Increase risk of second malignancy
8. All of the above



Current Wisdom

- Preoperative CRT better than postop
- Improves Local recurrence but not DFS or OS
- If CRM threatened on MRI needs response so CRT
- Low rectal cancers (below the levators) almost always have threat to CRM
- T1/T2N0 mid/upper rectum don't usually need RT or CRT unless to avoid radical surgery
- CRT helps preserve sphincters

Do you treat?

Low risk Dukes B colon cancer patients with adjuvant chemo?

High Risk Dukes C colon cancer with adjuvant chemo?

FOLFOX or XELOX?

When do you want to start?

Historical staging

ESTRO School

No difference in Survival

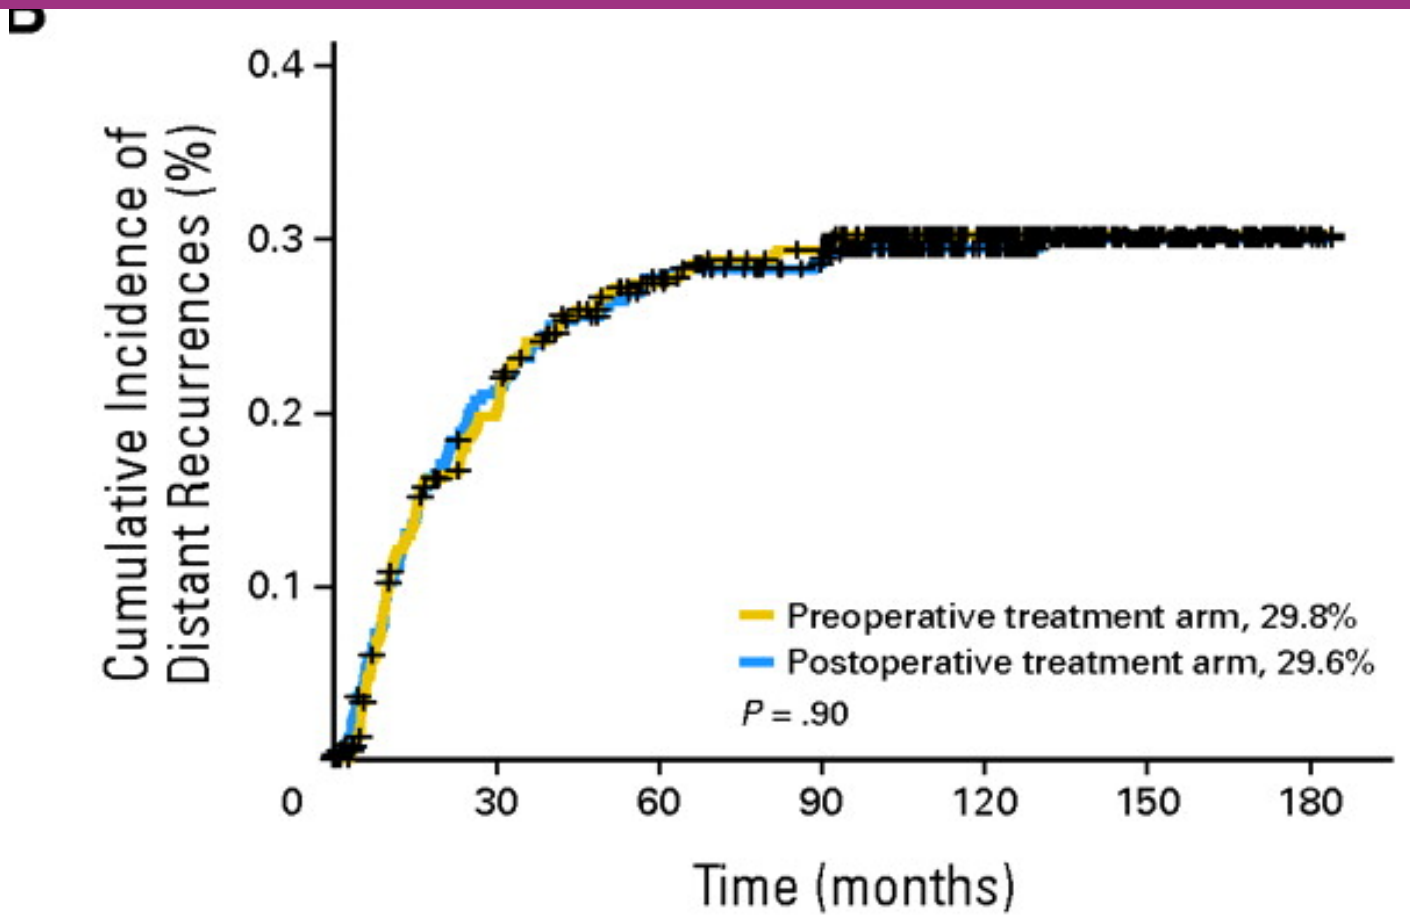
Pre versus post-op CRT

SCPRT versus CRT

RT versus CRT

SCPRT versus selective postop CRT

Pre- vs post-operative chemoradiation CAO/ARO/AIO-94



No. at risk							
Preop. CRT	393	295	262	241	158	60	5
Postop. CRT	396	310	267	246	162	63	6

So why have post-op CRT studies shown an improvement in survival

whereas preop CRT has not?

Possible reasons

Pathological stratification means we were comparing like with like

Selection of more advanced tumours (68% N+ in NCCTG) with more risk

Better surgery nowadays (TME)

Control arm is more active

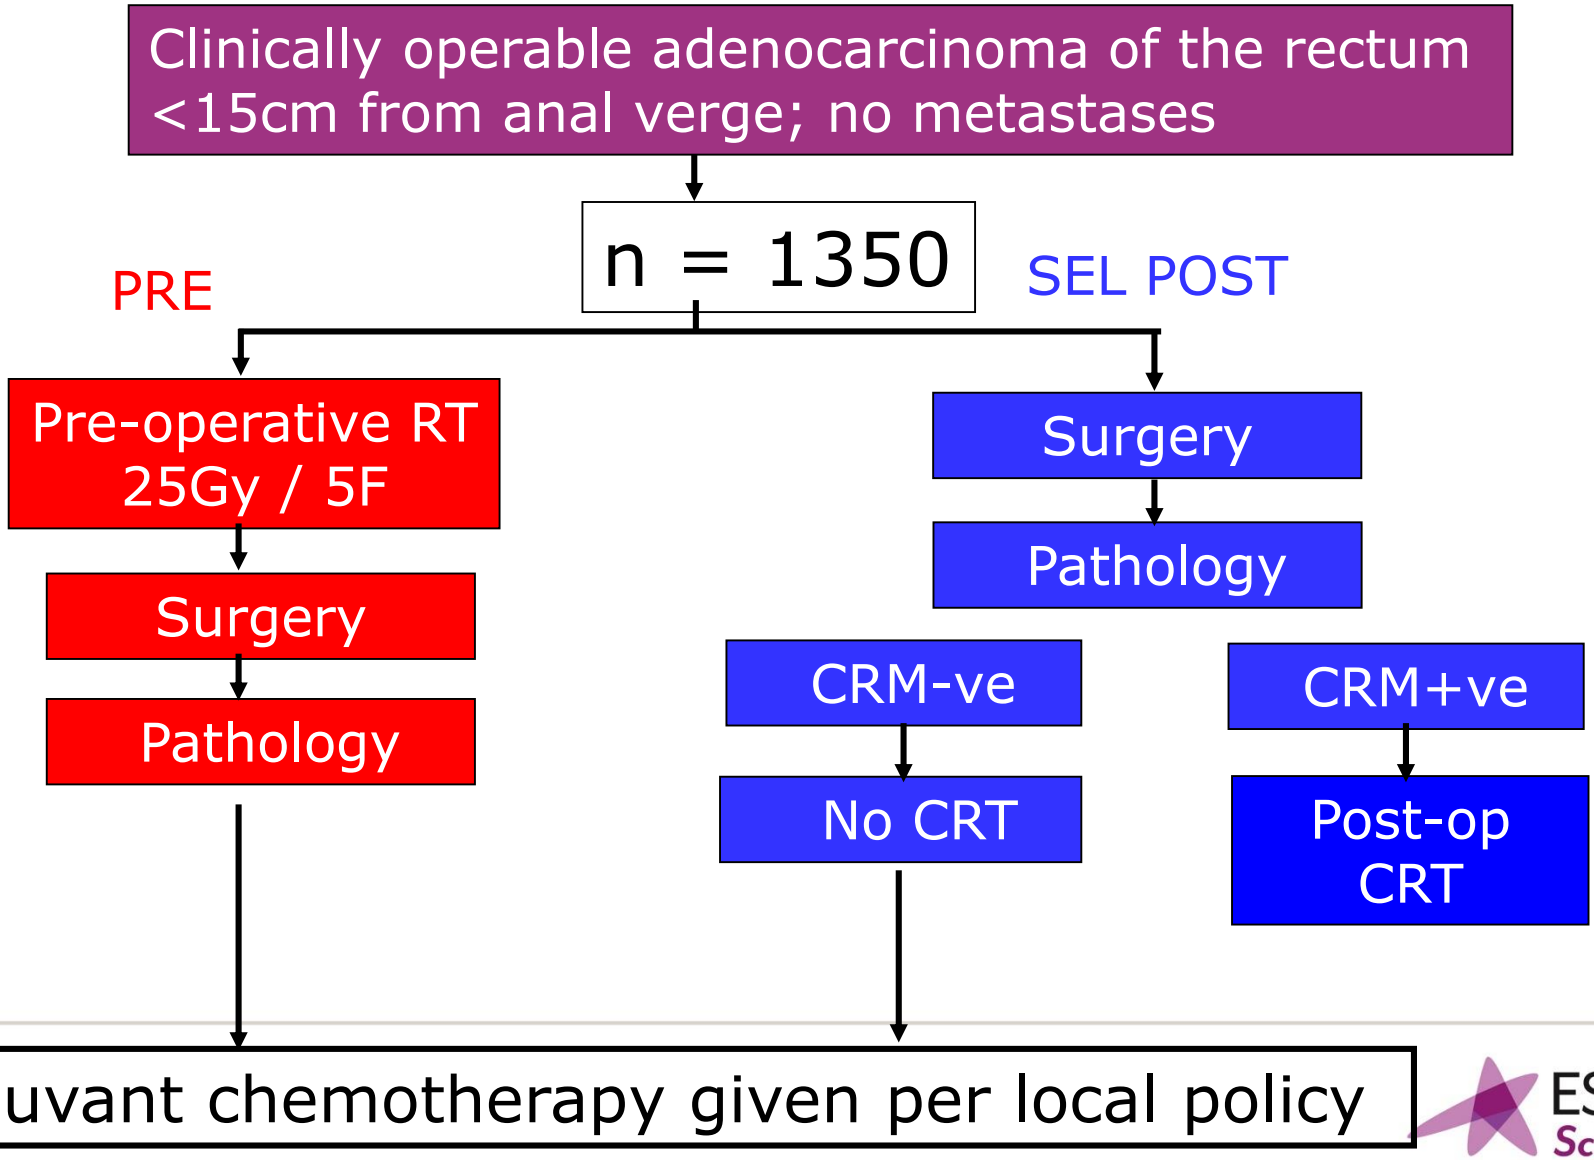
Rectal cancer is a heterogenous/ complex entity – outcomes may depend on

- Upper/middle/lower
- Anterior/ posterior
- Male/female
- Resectability/CRM
- T stage
- N stage
- EMVI/LVI/PNI
- Extranodal deposits

Quality of surgery is the biggest factor in Local recurrence –not whether or not you have radiotherapy

Quality of surgery can be viewed and scored

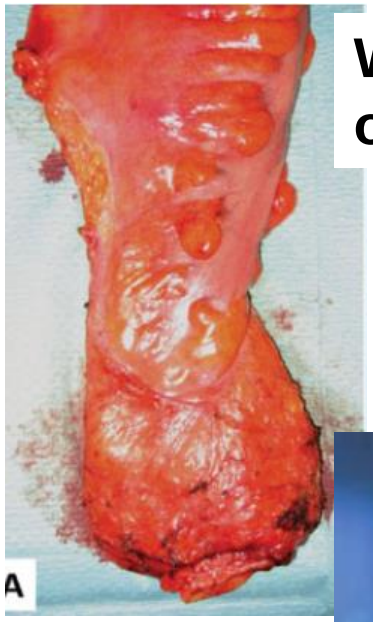
MRC CR07 NCIC C016 trial

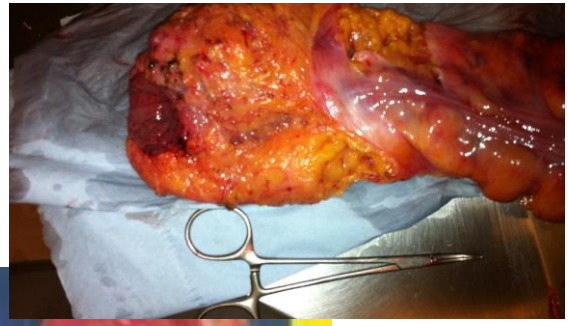


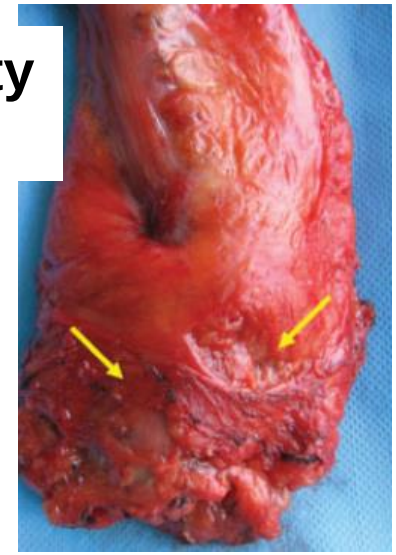
Scoring the Quality of the

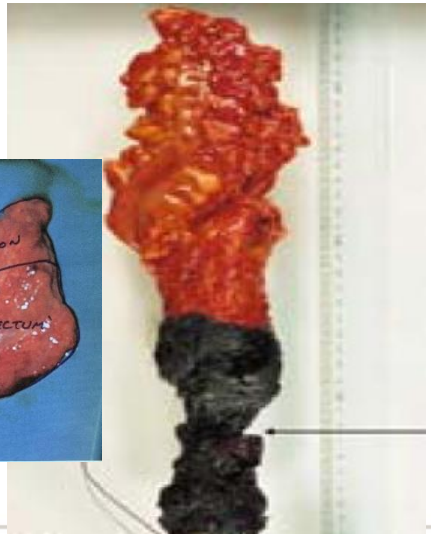
	Mesorectum	Defects	Coning	MRF
Complete	Intact, smooth	Not deeper than 5 mm	None	Smooth, regular
Nearly complete	Moderate bulk, irregular	No visible muscularis propria	Moderate	Irregular
Incomplete	Little bulk	Down to muscularis propria	Moderate–marked	Irregular

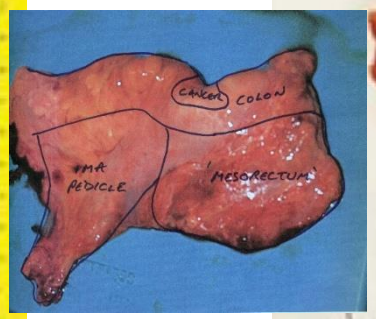
We can judge the quality of the Surgery











Margin at risk disease

CR07

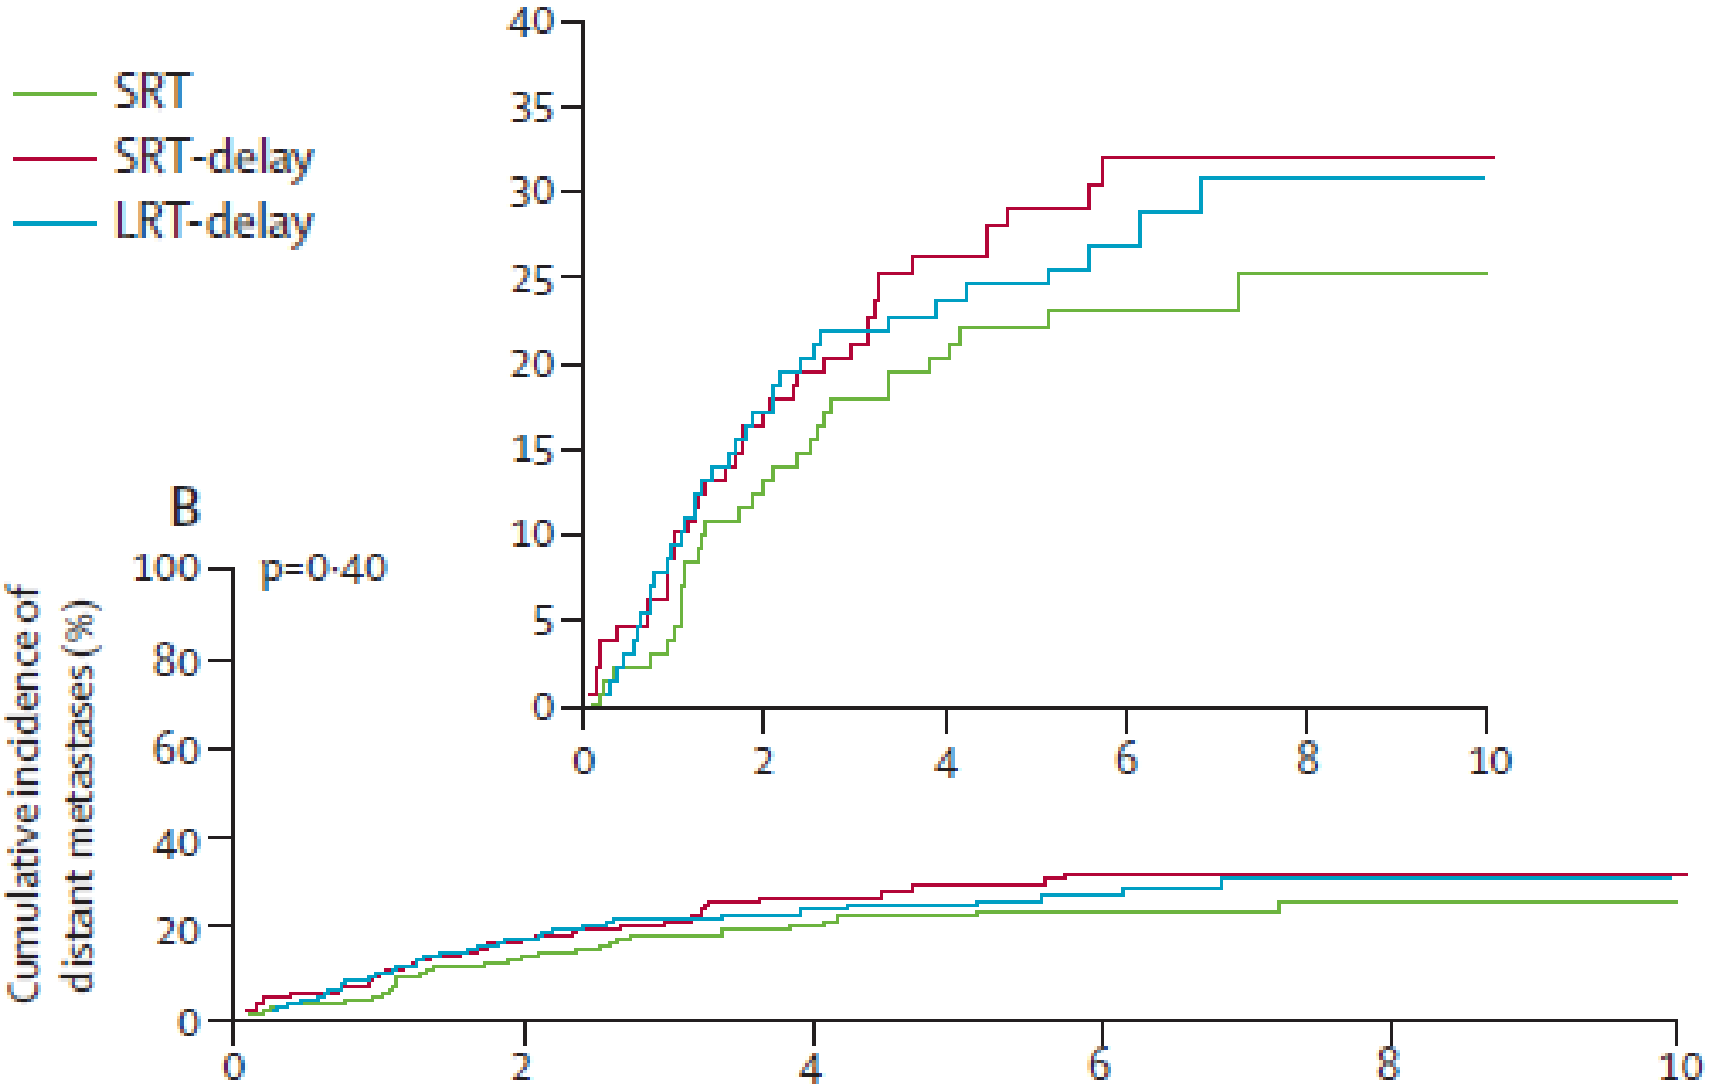
Stockholm III trial : incidence of metastases



So - What about?

- Oxaliplatin
- Irinotecan
- Biologicals

Currently - Different Philosophies

Medical Oncology trials EXPERT, EXPERT C, SPANISH (Fernandez-Martos)/ RAPIDO use systemically active chemotherapy outside chemoradiation

Radiation Oncology trials ACCORD 12, STAR-01, CAO/ARO/AIO-04, NSABP R04 use oxaliplatin as radiosensitizer (non systemic doses)

Questions

Does oxaliplatin add anything as a radiosensitizer to preop CRT?

Does postoperative adjuvant oxaliplatin add anything to preop CRT as adjuvant chemotherapy to reduce metastases?

So what have the trials shown us?

All 5 Oxaliplatain trials used low dose oxaliplatin as a radiosensitizer with CRT

2 trials mandated oxaliplatin also as postoperative adjuvant (so if benefit which component?)

Some of the 5 trials did not mandate TME

Phase III: CAO/ARO/AIO-04

Best arm of CAO/ARO/AIO-94:

RT 50.4 Gy + 5-FU
1000 mg/m² days 1-5 + 29-33
623 patients

From Phase I/II Studies:

RT 50.4 Gy + 5-FU/OX
Ox: 50 mg/m² d 1, 8, 22, 29
5-FU: 250 mg/m² d 1-14 + 22-35

Note: Chemo gap 3rd week of RT !

613 patients

T M E

5-FU
500 mg/m² d 1-5, q29
4 cycles (4 months)

mFOLFOX6
Oxaliplatin: 100 mg/m² d1,q15
Folinic Acid: 400 mg/m² d1
5-FU: 2400 mg/m² d1-2
8 cycles (4 months)

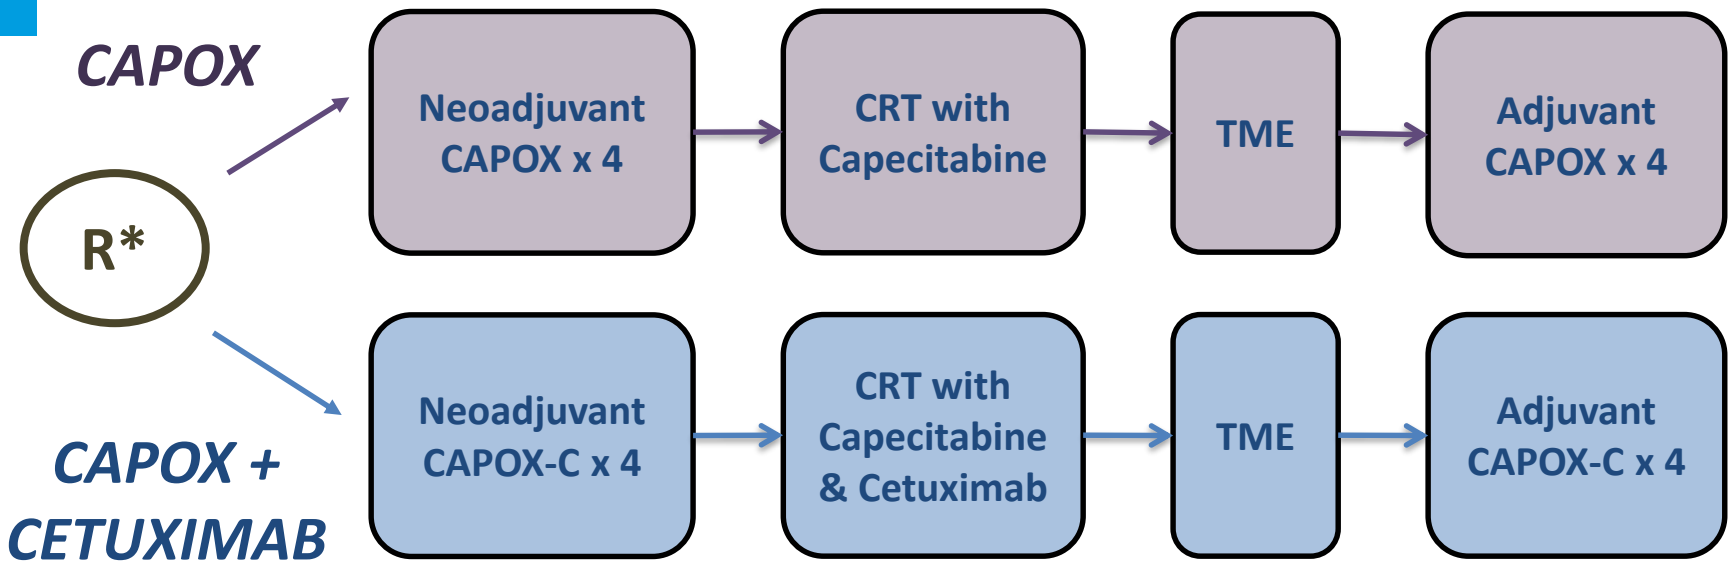
No residual tumour	1/10 (10%)	11/19 (58%)	7/52 (13.5%)	9/46 (20%)

ESTRO School

The EXPERT-C trial – Design



**Patients recruited from 15 European Centres 2005-2008*

Key inclusion criteria:

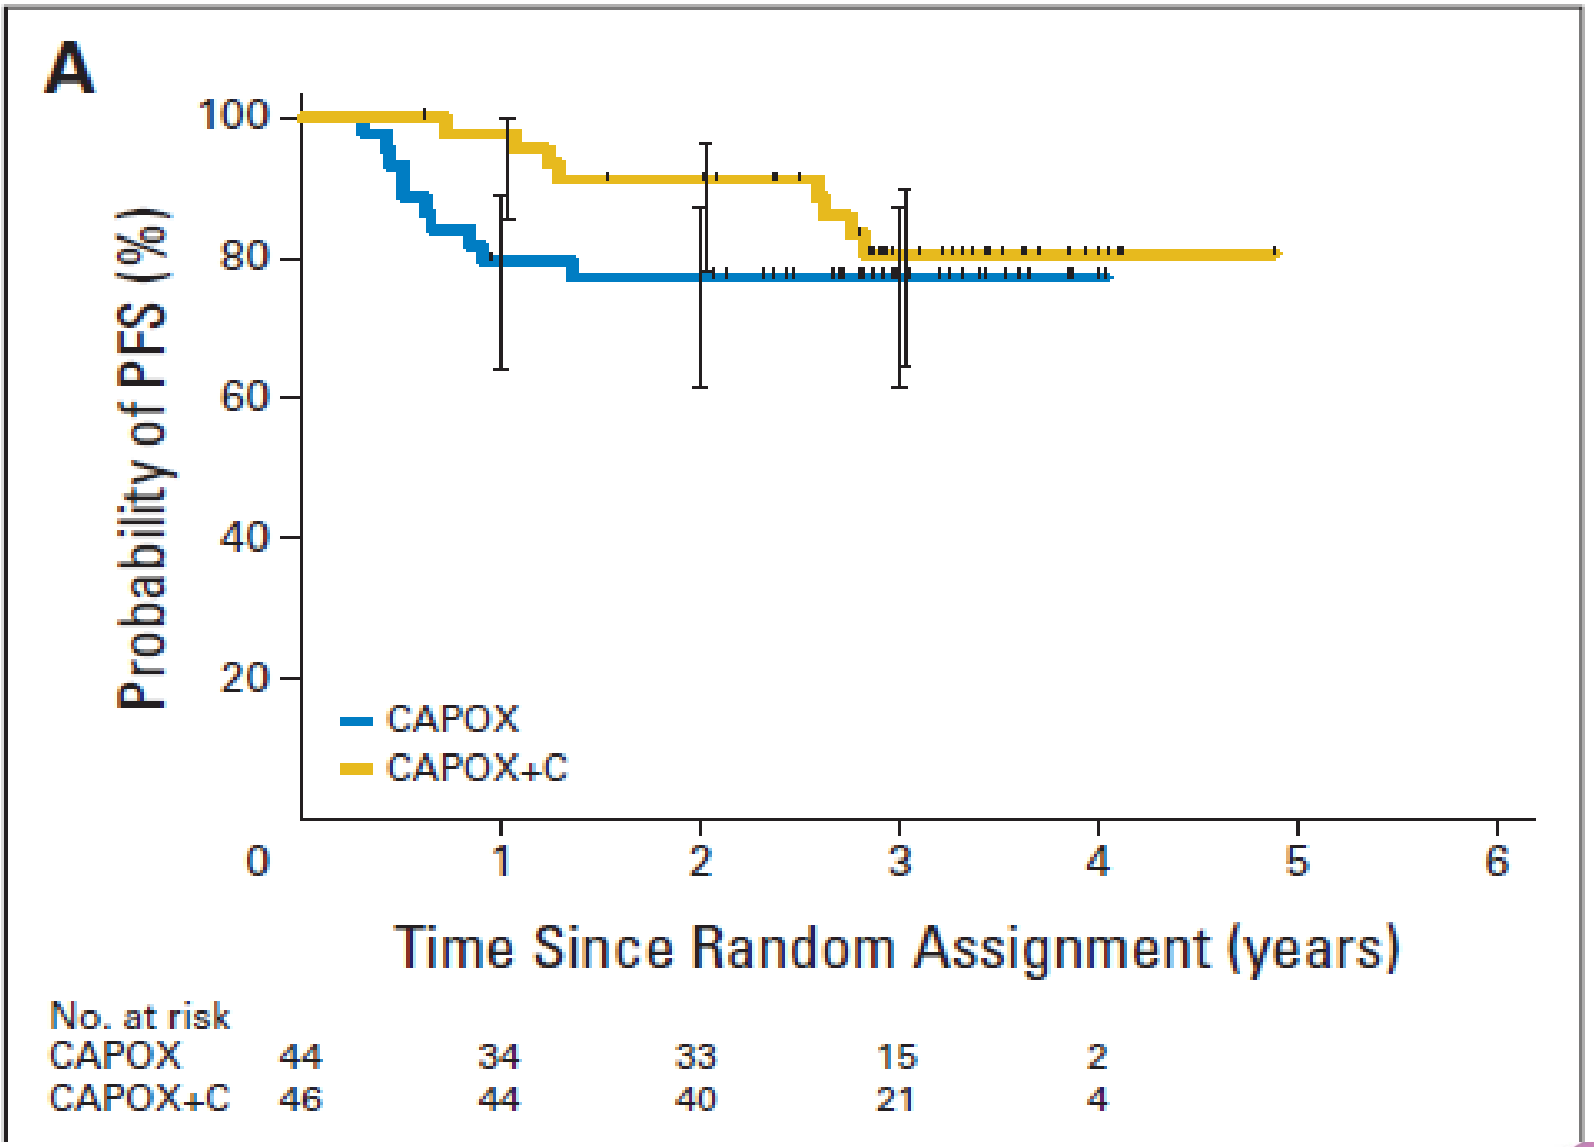
- Tumours within 1mm of mesorectal fascia
- Tumours extending ≥5mm into peri-rectal fat
- T4 tumours
- Presence of extramural vascular invasion
- T3 tumours at/below levators

Endpoints

- Primary endpoint:
  CR in *KRAS/BRAF* WT patients
- Secondary endpoints:
  RR, PFS, OS, safety and QoL

Dewdney, J Clin Oncol 2012

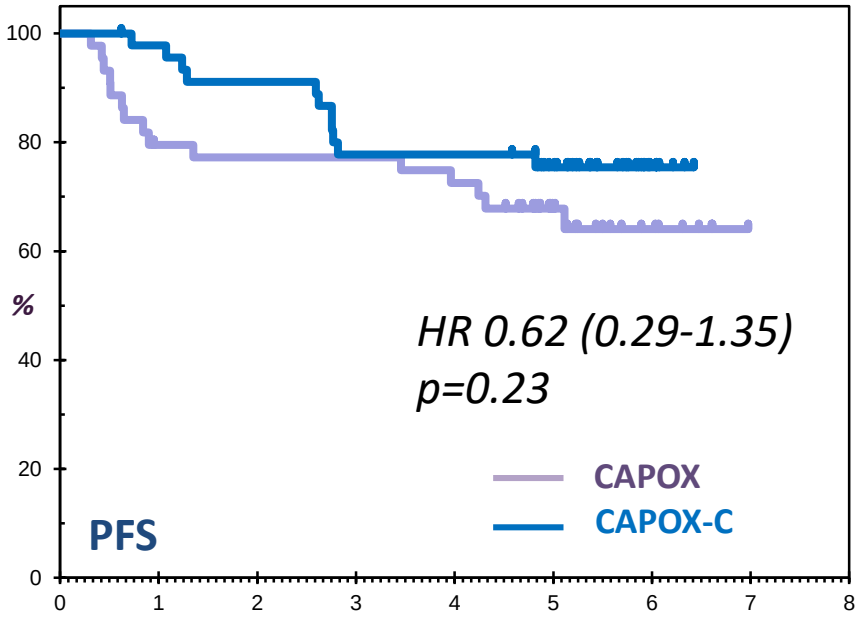
EXPERT-C KRAS WT PFS (Dewdney 2012)

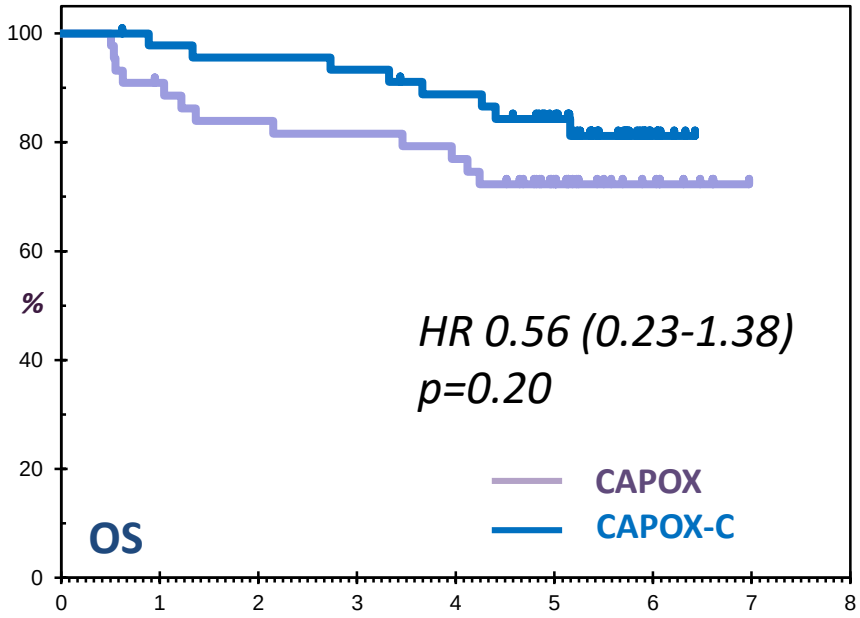


ESTRO School

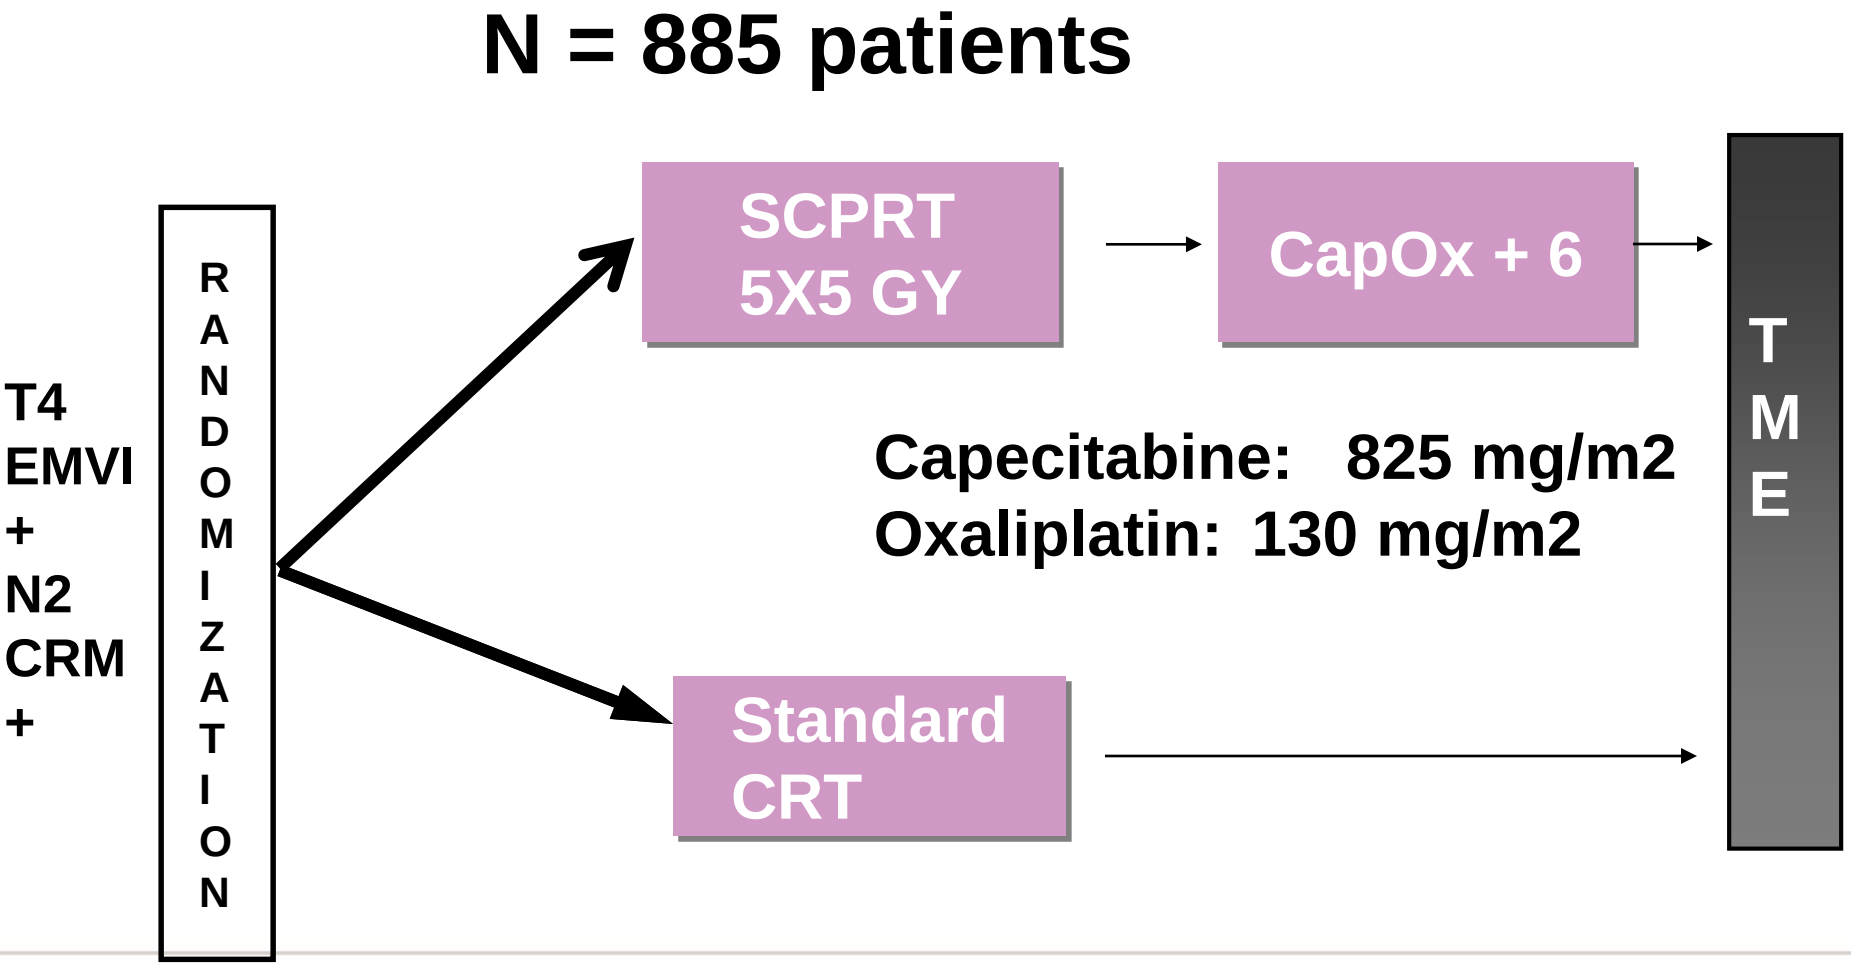
The EXPERT-C trial – Results

- No significant improvement in PFS and OS in the *KRAS/BRAF* WT group (median follow-up 63.8 months)





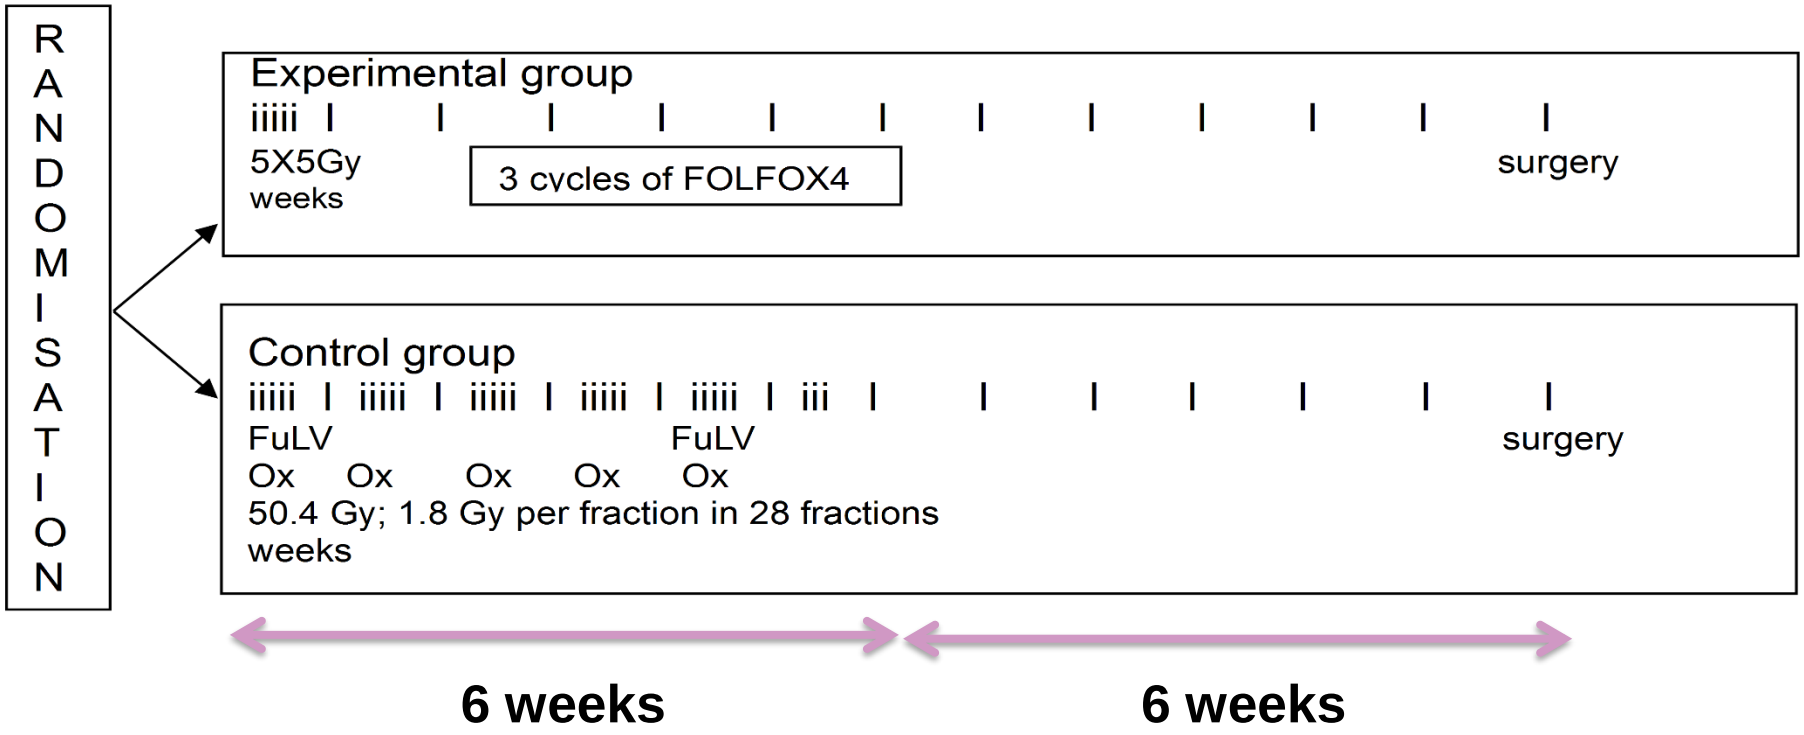
RAPIDO Trial



Primary endpoint 3 year DFS

ESTRO School

Polish-2: study design



N = 540, randomized 1:1

cT4 or fixed at DRE cT3

M0

ECOG 0-2

Treatment length and total oxaliplatin dose were balanced.

ESTRO School

Primary end-point [n=515]

R0 resection rates (surgery performed & pathologic R0 status):

77% for SCPRT with 3 cycles of chemotherapy

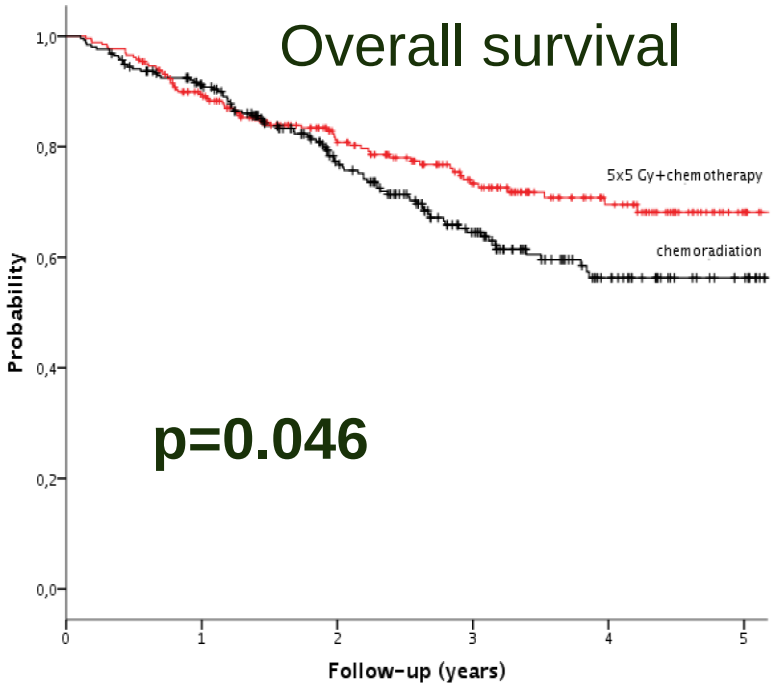
71% for CRT (control arm)

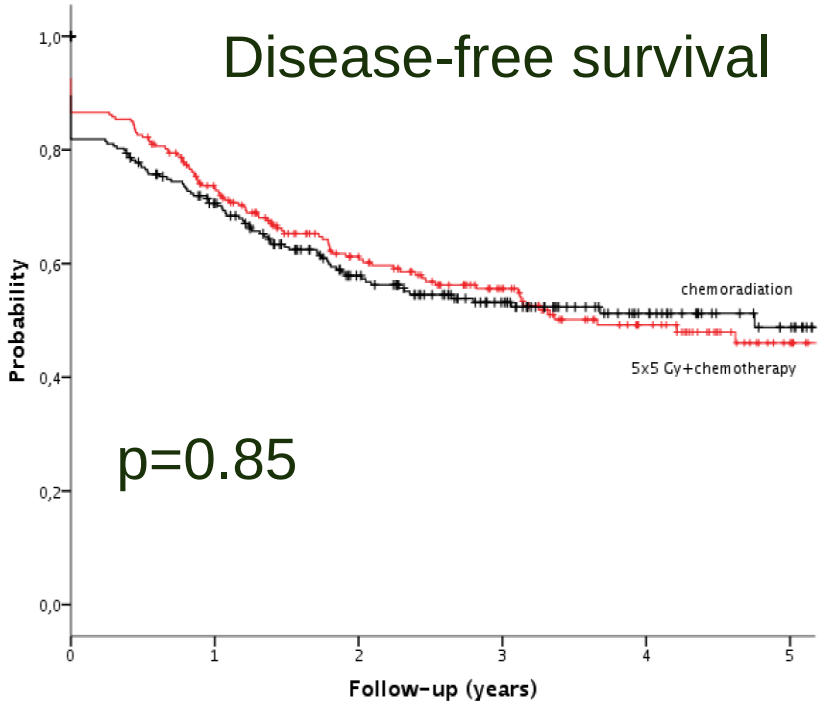
(p=0.081)

Secondary end-points

	SCRTx + FOLFOX4	CRTx	P value
Overall acute toxicity	**75%**	**83%**	**p= 0.006**
Grade III/IV toxicities	23%	21%	NS
pCR rate	16%	12%	p= 0.17

Polish-2: Secondary end-points





chemoradiation

short-course radiotherapy with consolidating chemotherapy

[median follow-up: 36 months]

ESTRO School

Conclusions

1. 5FU-based CRT more effective (downsizing) than RT but no improvement in SpS, DFS or OS
2. SCPRT = CRT in resectable cancer
3. Radio-sensitizing 5FU-based CRT with sub therapeutic oxaliplatin ?
4. But minimal benefit for T3N0 on mets
5. Biologicals have not yet delivered
6. Immunotherapy is coming

Thank you for listening

COMBINED DRUG + RT

1. RT + CHT
2. RT+ HT
3. RT+ target therapy
4. RT+ immunotherapy

RT + CHT

Advanced and large tumors

RT+CHT: one of the strongest impacts on current cancer radiation therapy practice

In particular concurrent approach

Superior to radiation therapy alone in

controlling locoregional disease and in improving patient survival

IEO
Istituto Europeo
di Oncologia

RATIONALE RT+CHT: increase therapeutic ratio

- Spatial cooperation
- Independent toxicity
- Enhancement of tumor response
- Protection of normal tissue

Steel and Peckham 1979

MECHANISMS (1)

- Increasing initial radiation damage
- Inhibition of cellular repair
- Cell cycle distribution
- Counteracting hypoxia-associated tumor resistance

MECHANISMS (2)

- Inhibition of tumor cell repopulation
- Molecular signaling pathways responsible for radioresistance
- Targeting tumor microenviroment
- Targeting tumor stem cells (radioresistance)

Mechanisms of radiosenstitization

Platinum-based compounds	Inhibition of DNA synthesis Inhibition of transcription elongation by DNA interstrand cross-links Inhibition of repair of radiation-induced DNA damage
Taxanes	Cellular arrest in the G_2M phase of the cell cycle Induction of apoptosis Reoxygenation of tumor cells
Topoisomerase I inhibitors	Inhibition of repair of radiation-induced DNA strand breaks Redistribution into G_2 phase of the cell cycle Conversion of radiation-induced single-strand breaks into double-strand breaks
Hypoxic cell cytotoxins	Complementary cytotoxicity with radiation on euoxic and hypoxic tumor cells
Antimetabolites	Nucleotide pool perturbation Lowering apoptotic threshold Cell cycle redistribution Tumor cell reoxygenation
Temozolomide	DNA repair inhibition (radiosensitization effect may be subject to MGMT status)

Perez Brady's 2013

We know how to combine

Strategy	Advantages	Disadvantages
Sequential chemoradiation	• Least toxic • Maximizes systemic therapy • Smaller radiation fields if induction shrinks tumor	• Increased treatment time • Lack of local synergy
Concurrent chemoradiation	• Shorter treatment time • Radiation enhancement	• Compromised systemic therapy • Increased toxicity • No cytoreduction of tumor
Concurrent chemoradiation and adjuvant chemotherapy	• Maximizes systemic therapy • Radiation enhancement • Both local and distant therapy delivered up front	• Increased toxicity • Increased treatment time • Difficult to complete chemotherapy after chemoradiation
Induction chemotherapy and concurrent chemoradiation	• Maximizes systemic therapy • Radiation enhancement	• Increased toxicity • Increased treatment time • Difficult to complete chemoradiation after induction therapy

Perez Brady's 2013

Perez Brady's 2013

We know who benefits

Disease Site	Commonly Used Chemotherapeutic Agents	Sequencing and Intent of Therapy	Benefit of Combined-Modality Approach
Locally advanced head and neck cancer	Cisplatin, 5-FU, hydroxyurea, carboplatin, cetuximab	• Definitive concurrent • Postoperative concurrent	Definitive: Organ preservation/survival benefit Postoperative: DFS/LRC benefit; overall survival benefit in subset of patients
Glioblastoma multiforme	Temozolomide	• Postoperative concurrent • Definitive concurrent in unresectable cases	Overall survival
Locally advanced/unresectable non–small cell lung cancer	Cisplatin, carboplatin, paclitaxel, cisplatin, etoposide, vinblastine	• Definitive concurrent • Sequential	Overall survival
Limited-stage small cell lung cancer	Cisplatin/etoposide	• Definitive concurrent	Overall survival
Esophageal cancer	Cisplatin/5-FU	• Preoperative concurrent • Definitive concurrent	Local control, overall survival
Gastric cancer	5-FU, leucovorin	• Postoperative concurrent	Overall survival
Pancreatic cancer	5-FU, gemcitabine	• Postoperative concurrent • Definitive concurrent in unresectable patients	Locoregional control, possibly survival
Locally advanced rectal cancer	5-FU, Xeloda	• Preoperative concurrent	Improved sphincter preservation, improved DFS
Anal cancer	5-FU, mitomycin-C	• Definitive concurrent	Improved colostomy-free survival
Cervical cancer	Cisplatin, 5-FU, hydroxyurea	• Definitive concurrent	Overall survival benefit
Bladder cancer	Cisplatin, 5-FU, mitomycin-C	• Definitive concurrent	Bladder preservation

Level 1 evidence

Primary	Systemic agent	Advantage of combined treatment compared with radiation alone
Glioblastoma (brain)	Temozolomide	Improved OS
Head and neck	Cisplatin, cetuximab	Improved OS
Lung	Cisplatin	Improved OS
Esophagus	5FU + cisplatin	Improved OS
Stomach	5FU + leucovorin	Improved OS compared with no treatment
Rectum	5FU	Improved OS
Anus	5FU + mitomycin	Improved local control
Cervix	Cisplatin	Improved OS
Prostate	Androgen deprivation therapy	Improved OS
Bladder	5FU + mitomycin	Improved local control

CHEMORADIATION HAS STILL VERY NARROW THERAPEUTIC INDEX

Fu, M.D., for the Radiation Therapy Oncology Group 9501/Intergroup

ABSTRACT

The NEW ENGLAND JOURNAL of MEDICINE

ORIGINAL ARTICLE

Postoperative Irradiation with or without Concomitant Chemotherapy for Locally Advanced Head and Neck Cancer

Jacques Bernier, M.D., Ph.D., Christian Domenge, M.D., Mahmut Ozsahin, M.D., Ph.D., Katarzyna Matuszewska, M.D., Jean-Louis Lefèbvre, M.D., Richard H. Greiner, M.D., Jordi Giralt, M.D., Philippe Maingon, M.D., Frédéric Rolland, M.D., Michel Bolla, M.D., Francesco Cognetti, M.D., Jean Bourhis, M.D., Anne Kirkpatrick, M.Sc., and Martine van Glabbeke, Jr., M.Sc., for the European Organization for Research and Treatment of Cancer Trial 22931

ABSTRACT

Study	RT	CHT-RT
RTOG	34%	77%
EORTC	21%	41%

- **Toxic deaths: 2%**

Combined toxicity

Agent	Toxicity	Mechanism
Bleomycin	Pneumonitis/pulmonary fibrosis	Undefined but related to total drug dose and effects on pulmonary macrophages, type I and II alveolar cells; effects/lethality exacerbated by the administration of radiation.
Actinomycin D	Hepatopathy	Altered liver function postradiation leads to decreased metabolism of agents, including actinomycin, which in turn worsens the hepatopathy.
Doxorubicin	Cardiomyopathy	There is an additive interaction between doxorubicin and radiation with recall of radiation effects occurring. Primary radiation effect is on the endothelial cell, whereas doxorubicin affects the connective tissue stroma of the myocardium.
Methotrexate	Leukoencephalopathy	Methotrexate may cause this syndrome on its own. Radiation effects on the blood–brain barrier and the choroid plexus can alter methotrexate clearance, leading to higher levels in the brain. Effects are increased when both modalities are used.
Cisplatin	Sensorineural hearing loss	While cisplatinum alone can cause this, reports suggests radiation therapy concurrently with cisplatin may contribute to sensorineural hearing loss.

Perez Brady's 2013

COMBINED DRUG + RT

1. RT + CHT
2. RT+ HT
3. RT+ target therapy
4. RT+ immunotherapy

TARGET THERAPY
AND
HIGH PRECISION RADIOTHERAPY

SBRT and drugs

Mechanisms

1. Reversal of hypoxia (normalisation of tumor flow)
2. Reduction of tumor size (direct and indirect)
3. Facilitation of apoptosis
4. Prevention of SBRT re-vascularisation
5. Improvement of immune response (microenvironment)

EVIDENCE?

Very few new drug–radiotherapy combinations are registered

IEO
Istituto Europeo
di Oncologia

EVIDENCE?

There are no guidelines on the

RT+new agents evaluation.

Almost all data are retrospective

NEW DRUGS AND RT: WHAT IS KNOWN?

SBRT and drugs

- Combined modality mainly studied in:

•brain metastases
•or recurrent glioblastoma

- Less data is available for extra-cranial SRT.

TOXICITY OF TARGET THERAPY AND RADIOTHERAPY

IEO
Istituto Europeo
di Oncologia

Toxicity of concurrent SRT and antibody therapy

Anti-VEGF (bevacizumab)

- additional risk of concurrent cranial SRT and bevacizumab is small (neurological toxicity)
- possibly protective to the development of radionecrosis.
- combination of bevacizumab and extra-cranial SBRT: scarce data
- concurrent abdominal SRT and bevacizumab should be practised with caution.

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

Toxicity of concurrent SRT and antibody therapy

Anti-EGF-R (cetuximab)

- Cetuximab + SRT studied only in recurrent HNC (re-RT)
- Considerable risk of severe toxicity (re-RT)
- Not clear to which extent concurrent cetuximab adds to the toxicity.

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

Toxicity of concurrent SRT and antibody therapy

Anti-Her2 (trastuzumab)

- Very limited available data **does not indicate increased toxicity** of cranial SRT combined with trastuzumab.

- Data on trastuzumab and extra-cranial SRT is lacking.

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

Toxicity of concurrent SRT and immune checkpoint inhibition

Anti-CTLA-4 (ipilimumab)

- **Concurrent cranial SRT with ipilimumab is safe.**

- **Limited data on the use ipilimumab concurrent with extra-cranial SRT.**

Toxicity of concurrent SRT and immune checkpoint inhibition

Anti-PD-1/PD-L1 (nivolumab, pembrolizumab)

- Data on combined SRT and nivolumab is **insufficient** for conclusions, both for cranial and extra-cranial SRT.

- Data about the combination of pembrolizumab with SRT is **not available.**

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

Toxicity of concurrent SRT and tyrosine kinase inhibitors (TKIs)

Multi receptor TKIs (sorafenib, sunitinib)

- Cranial SRT **+ sorafenib or sunitinib: safe** but one grade 5 toxicity has been observed for sunitinib.
- For extra-cranial SRT, liver SRT combined with **sorafenib is associated with severe toxicity**
- No radiation induced toxicity sunitinib and extra-cranial SRT.

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

Toxicity of concurrent SRT and tyrosine kinase inhibitors (TKIs)

EGF-R-inhibitors (gefitinib, erlotinib, lapatinib)

- Concurrent EGF-R-targeting TKIs and extra-cranial SRT: **increased toxicity within the irradiated volume** in the treatment of abdominal and thoracic metastases

- No increased toxicity in cranial SRT

- Data on lapatinib+SRT is not available.

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

Toxicity of concurrent SRT and ALK-inhibitors

crizotinib, ceritinib, alectinib

available data **does not allow for a robust conclusion** on safety of combined crizotinib, ceritinib, alectinib and SRT.

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

Toxicity of concurrent SRT and BRAF-inhibitors

vemurafenib, dabrafenib

- Conflicting data on CNS toxicity after cranial SRT and BRAF-inhibitors
- **High rates of toxicity warrant caution.**
- No data on BRAF inhibitors and extra-cranial SRT.

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

Toxicity of concurrent SRT and MEK-inhibitors

MEK-inhibitors (trametinib)

Very small number of patients

No data

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

Safety: SBRT and drugs

- Safety data is available for SRT combined with

- Bevacizumab
- Ipilimumab
- EGFR-targeting TKIs.

❑ Bevacizumab may possible even prevent SRT-induced radionecrosis

Kroeze S et al. Cancer Treatment Reviews 53 (2017) 25–37

IEO Istituto Europeo di Oncologia

RT + new drugs

1. Combination strategies not universally associated with increased risks

2. All combinations need to be evaluated individually

3. Different half-life of targeted therapy (range 24 h – 50d)

Sharma RA et al. Nature Reviews Clin Oncol 2016;13:627-

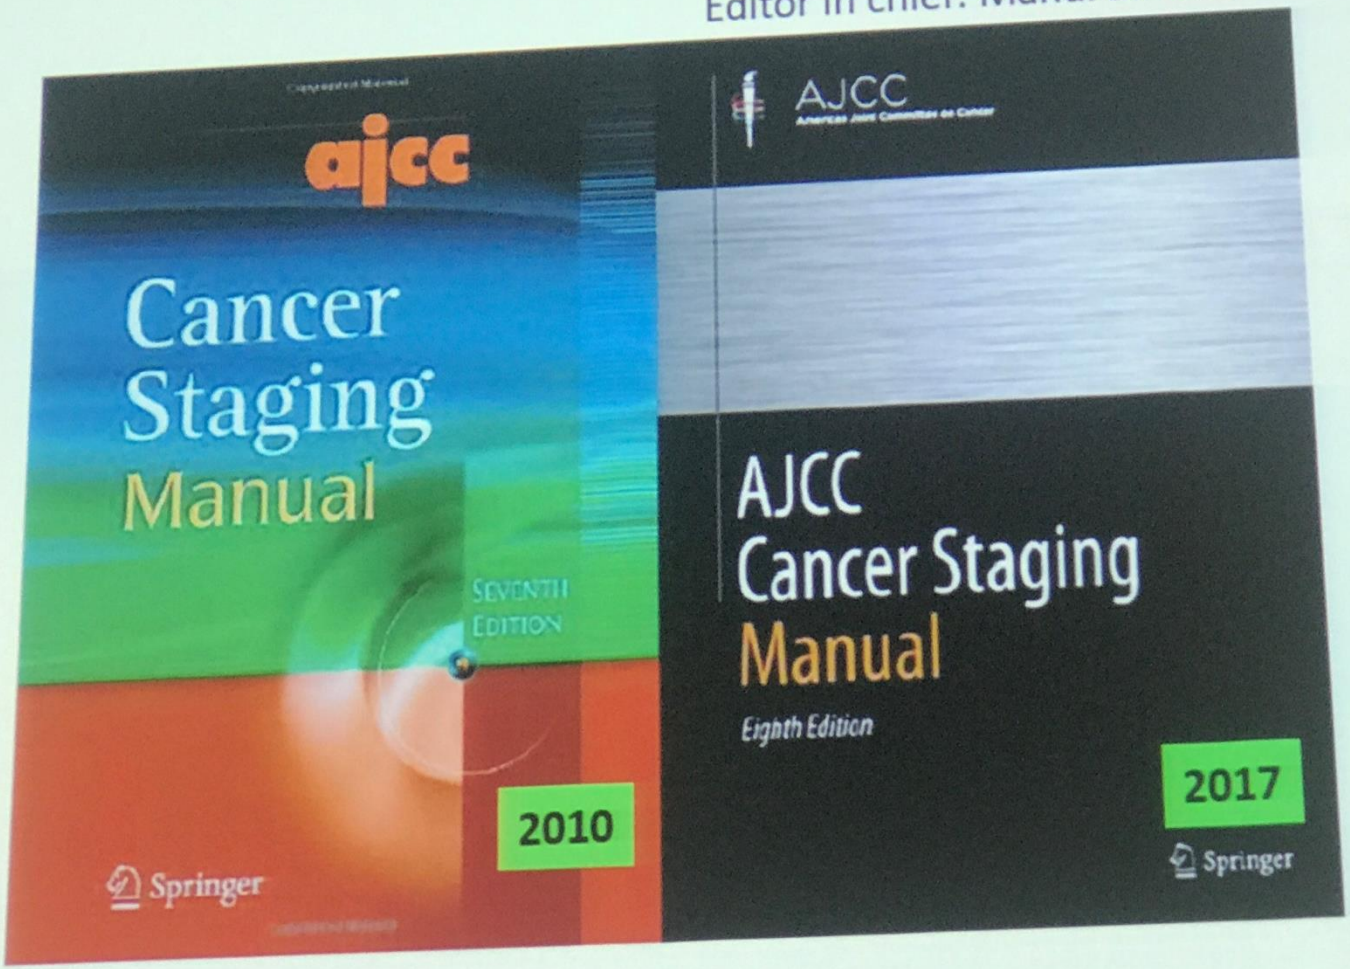
CHALLENGES

- 3% of all patients in the USA are included in the trials
- Linking genetic-clinical data re missing
- Even conventional prognostic factors are changing (TNM)
- Who should pay?

Editor in chief: Mahul B. Amin

1



"In order to ensure that the cancer care community has the necessary infrastructure in place for documenting 8th Edition stage, the **AJCC** Executive Committee, in dialogue with the National Cancer Institute **(NCI-SEER)**, Centers for Disease Control and Prevention **(CDC)**, the College of American Pathologists **(CAP)**, the National Comprehensive Cancer Network **(NCCN)**, the National Cancer Data Base **(NCDB)**, and the Commission on Cancer **(CoC)**, made the **decision to delay the implementation of the 8th Edition Cancer Staging System to January 1, 2018.**
All newly diagnosed cases through December 31, 2017 should be staged with the 7th edition." (From the AJCC website)

CHALLENGES

- 3% of all patients in the USA are included in the trials
- Linking genetic-clinical data re missing
- Even conventional prognostic factors are changing (TNM)
- Who should pay? Ryainair

CHALLENGES
