WELCOME ESTRO Teaching Course

Image-guided radiotherapy & chemotherapy in gynaecological cancer - with a special focus on adaptive brachytherapy

Madrid 2.-6. September 2018

Richard Pötter Kari Tanderup

Image-guided cervix radiotherapy – with a special focus on adaptive brachytherapy In the ESTRO school for 14 years

- 1st edition Vienna 08 2004: 80 participants
- 2nd edition Paris 08 2005: 100 participants
- 3rd edition Vienna 08 2006: 130 participants
- 4th edition Copenhagen 08 2007: 106 participants
- 5th edition London 08 2008: 158 participants
- 6th edition (1st intern.) Manila 01 2009: 160 participants ESTRO-SEAROG
- 7th edition Amsterdam 09 2009: 120 participants
- 8th edition Warsaw 08 2010: 110 participants
- 9th edition Chandigarh (2nd intern.) 03 2011: 102 particip. AROI-ESTRO
- 10th edition Izmir 09 2011: 104 participants
- 11th edition Beijing (3rd intern.) 03 2012: 128 participants ESTRO-CSRO
- 12th edition Budapest 10 2012: 102 participants
- 13th edition Moscow (4th intern.) 06 2013: 180 participants
- 14th edition Barcelona 09 2013: 90 participants
- 15th edition Florence 10 2014: 99 participants
- 16th edition Utrecht 11 2015: 82 participants
- 17th edition Toronto (5th intern.) 04 2016: 110 particip. ESTRO-CARO
- 18th edition Bangalore (6th intern.): 80 participants AROI-ESTRO
- 19th edition Prague 10 2017: 101 participants
- 20th edition Luchnow (7th intern.) 03 2018: 80 participants AROI-ESTRO
- 21th edition Madrid 09 2018: 83 participants

In total >2300 participants

Faculty

Course directors

- Richard Pötter, Rad Onc, Medical University of Vienna (AUT)
- Kari Tanderup, Physicist, Aarhus University Hospital, Århus (DEN)

Faculty:

- Daniel Berger, Medical Physicist, University Hospital, Vienna (AT)
- Umesh Mahantshetty, Radiation Oncologist, Tata Memorial Hospital, Mumbai (IN)
- Primoz Petric, Radiation Oncologist, Århus University Hospital, Århus (DK)
- Remi Nout, Radiation Oncologist, Leiden University Medical Center, Leiden (NL)
- Jamema Swamidas, Physicist, Tata Memorial Hospital (IN)
- Li Tee Tan, Radiation Oncologist, Addenbrooke's Hospital, Cambridge (UK)
- Simon Duke, Clinical Oncologist, Cambridge University Hospitals, Cambridge (UK)

Guest Faculty:

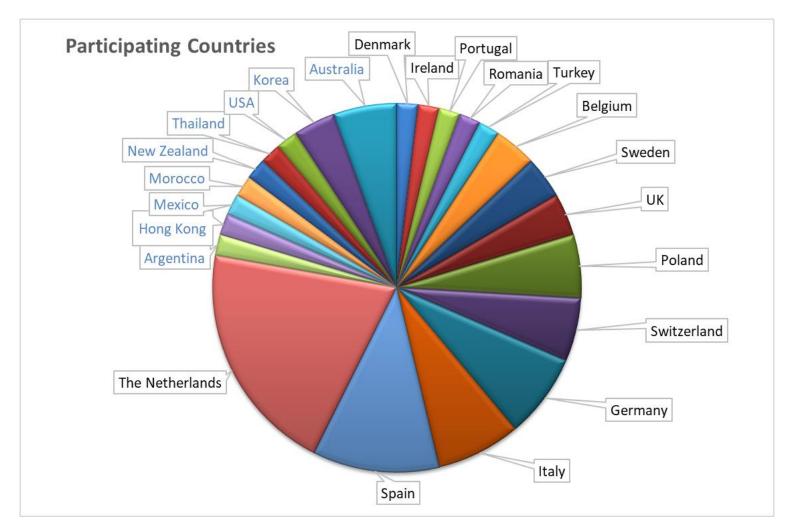

Elena Villafranca, Radiation Oncologist, Hospital of Navarra, Pamplona (ES)

ESTRO Faculty "at home":

- Ina Jürgenliemk-Schulz, RO, University Medical Center Utrecht (NL)
- Nicole Nesvacil, Physicist, Medical University of Vienna (AUT)

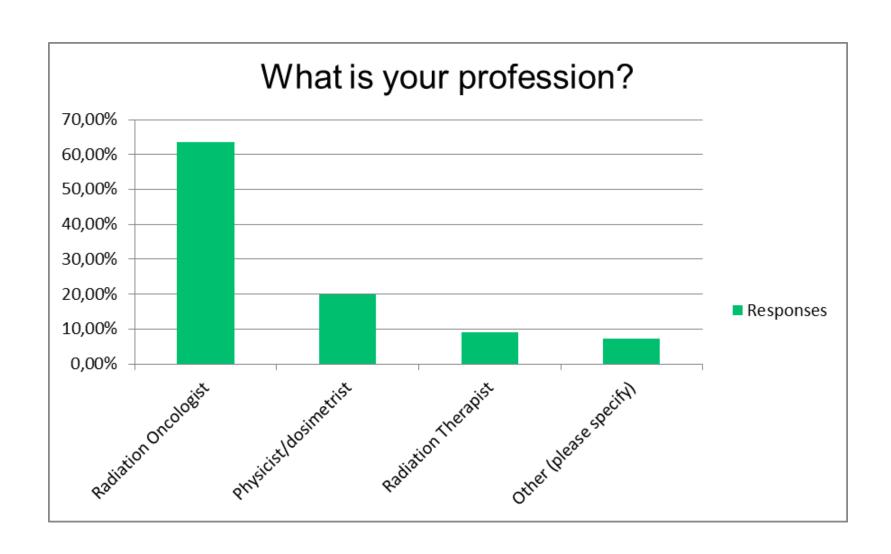

About you...

83 participants from 23 countries

4

Multidisciplinary audience

From knowledge to skills and practice...

Your expectations:

To improve my knowledge and skills in gynae radiotherapy by learning from experts, and will try to implement more up to date practices in my own department.

A good overview of the treatment modalites of gynaecological cancer.

Constraints for OAR for BT especially intestines compromising target doses .CTV PTV margins for definitive RTadjuvant treatment in uterine ca.

Increase my knowledge in treating postoperative Endometrim cancer patients and Primary or postop. Cervix cancer patients.

TO IMPLEMENT MRI IN HDR BRT PLANNING AND IGBT

to get updated guidelines and to know expert european colleagues in the field

We are just about to get an MRI in the department, and we are hoping to get the confidence and Tools to treat all our patients with MRI based BT (instead of CT which is our current practice).

To start to change tecnics

Refresh and know new concepts of EBRT and BT in Gyn Cancer. I had and excelent training in BT during the especiality in Ramon y Cajal Hospital (Madrid) with Alfredo Polo, and in AMC Hospital of A Voluming guidelines for conformal techniques - in particular ITV expansions to take into account the potential movement of the cervix, parametrium and uterus with variations in bowel and bladder filling improving imrt applicator in place contouring improve anatomical knowlegdeunderstanding how it's work with needkes and how to settle il in my departementchek my practice get confident on MRI based planning, Vienna Applicator

learn more about the BT for gynaecological cancer, especially the cervix BT with applicator and interstitial needles and the image guidance used for the EBRT improvement in coutrouingadaptive EBRT with MRI in cervixbetter understanding of QA

I would like to have a overall knowledge of the process. In addition to knowing the aplicator reconstruction techniques and the most suitable IMR adquisition series

I've just started as a new consultant and I want to gain confidence in both EBRT and brachy. I'm also keen to evaluate different protocols to make sure I'm happy with our current approach. It will also have likely structures on different type of images. Explore new treatment techniques in treating gynaecological cancer.

Evidence based treatments cervix cancer, endometrial cancer, vaginal cancer. Discus differences in brachytherapy. Image based target defining GTV, HRCTV/LRCTV, PTV. Learn more about MRI guided RT.

To learn to insert the applicators corectly Why I must to use point A if optimization is done in CTV- HR?

- I would like to learn more about interstitial/intracavitary brachytherapy in advanced cervical Cancer- I would like to learn how to plan brachytherapy MRI-based (so far we use only CT-planning in brach Contouring technique, knowing basic concept about interstitial techniqueHow to due with some of the difficult case, like vaginal relapse after surgery of corpus cancer

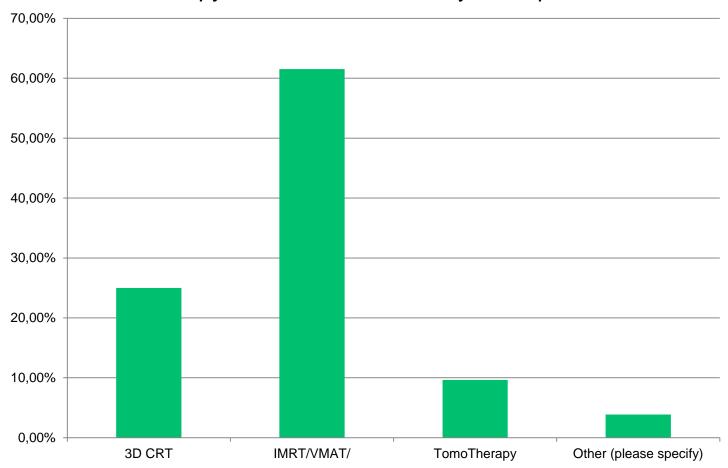

I hope this will be an excelent preparation for my training in gynecologic oncology and brachytherapy in particular. I will start treatment of patients with gynecologic oncology in november 2018 as part of MRI based brachytherapy. Techniques used in different centres.

Hot Topic: Indications neoadjuvant Chemotherapie and indications for Radiochemotherapy After neoadjuvant Chemotherapie+Operation

I would like to get a good overview of the Image Guided Radiotherapy (External+Brachy) and get some experience with These Kind of Treatments in order to slowly bring it into our clinic.

Your practice

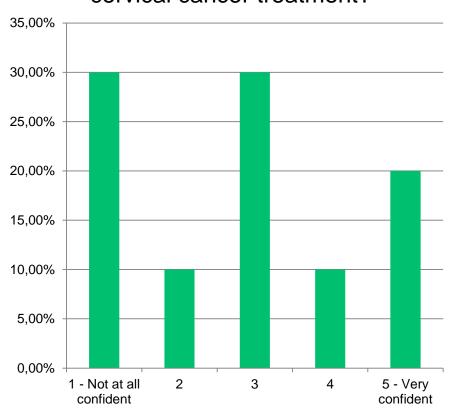

What is the standard EBRT technique for definitive radiotherapy for cervical cancer in your department?

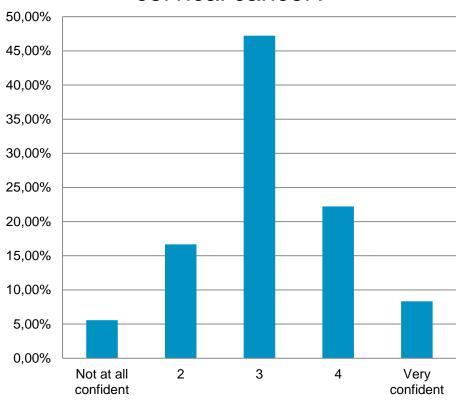

7

Your confidence

How confident are you at optimising IMRT plans for cervical cancer treatment?

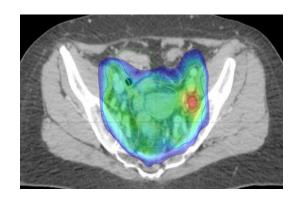

How confident are you at evaluating IMRT plans for cervical cancer?

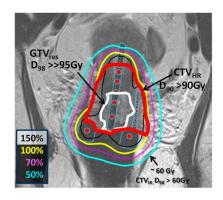

Our vision...

This course provides understanding of the rationale for advanced image guided external beam and brachytherapy techniques in gynaecological cancer

With this course you will learn tools to update and change clinical practice in your institution

Role of clinical gynaecological examination

Staging

Umesh Mahantshetty,
Professor, Radiation Oncology,
Tata Memorial Hospital, India

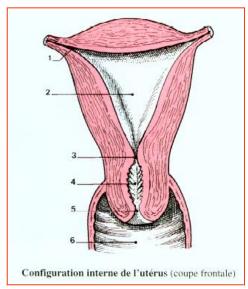

C. Haie-Meder,
Brachytherapy Unit, Gustave Roussy, France

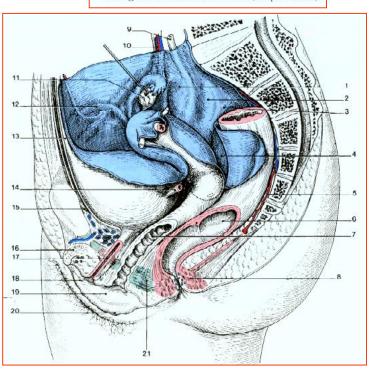

Cervical cancer: General

- 500,000 new cervical cancer cases each year
- 80% of the new cases in developing countries
- 3rd most common cause of female cancer mortality
- 274,000 deaths each year
- Human papillomavirus is responsible for virtually all cases of

cervical cancer

- HPV 16 & 18: most prevalent of the Oncogenic types
- Cure Rates high: Depending on the Stage

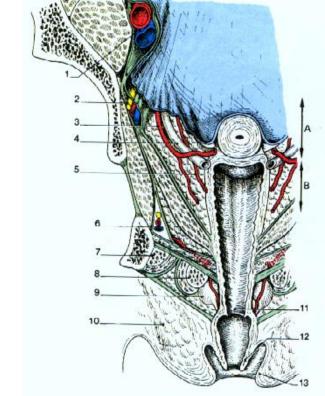

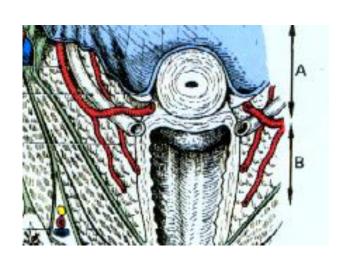

Cervix

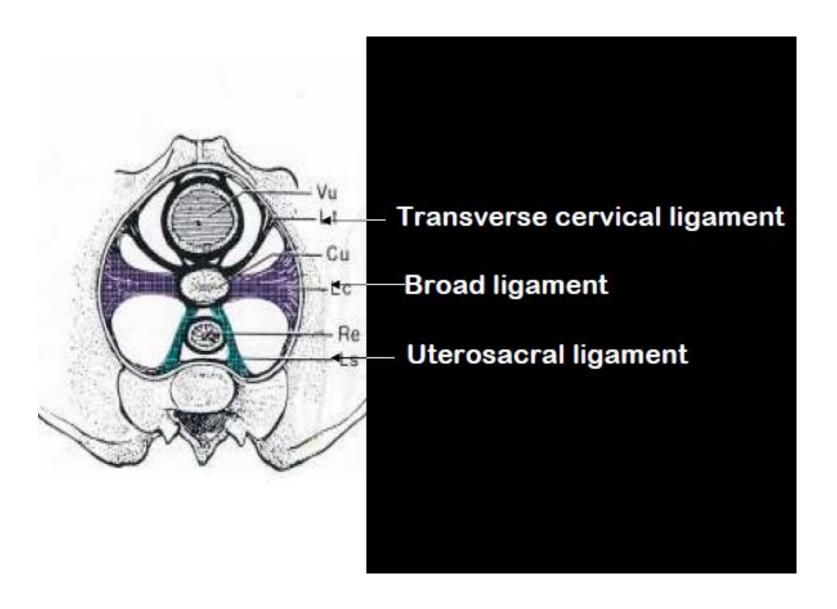

- Approx measures 3x3 cm and is predominantly fibro-muscular organ
- Divided to supra-vaginal and the vaginal portion
- Supra-vaginal part (endo cervix)
- Bladder and rectum faces covered with peritoneum
- Vaginal part (ecto cervix)
- Separated from the vagina by vaginal fornices

- Vascularization : <u>uterine artery</u>
 arising from <u>internal iliac artery</u>
- 3 segments: parietal, parametrial and mesometrial
- Parametrial segment is anteriorly crossed by the ureter
- Located 20 mm laterally from the isthmus
 +/- 15 mm from the vaginal fornix

Point A

Parametrial Limits:

Ventral: bladder

Dorsal: perirectal/ mesorectal

fascia

Medial: cervical rim/tumor

Lateral: pelvic wall

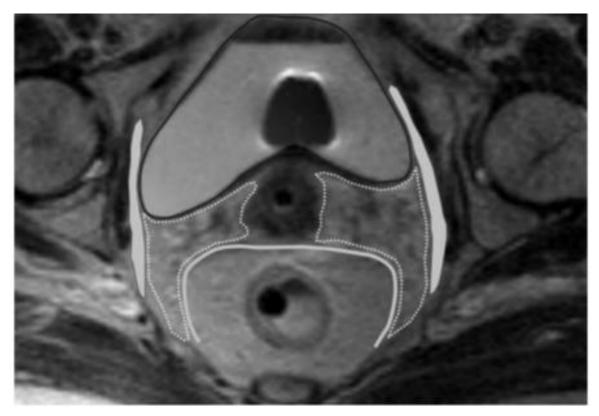

Fig. 2. Definition of parametria according to visible and reproducible radiologic criteria at its borders: ventral = bladder, dorsal = perirectal fascia, medial = tumor/cervical rim, lateral = pelvic wall (PW). At the PW, the space that contains vessels and lymph nodes is particularly indicated. For measurements between tumor and PW, the internal obturator muscle was taken because of its superior visibility.

Classification of radical hysterectomy

Denis Querleu, C Paul Morrow

Lancet Oncol 2008; 9: 297-303

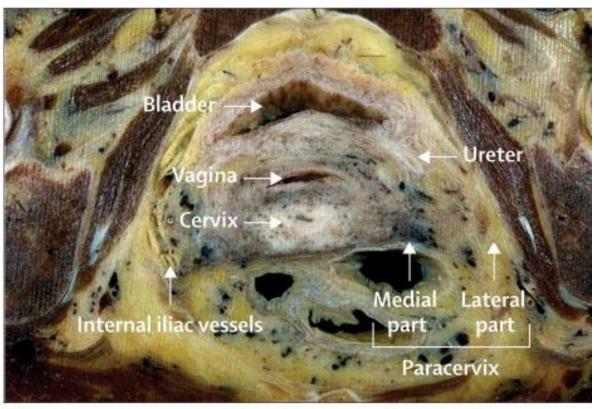

Figure 1
Transverse section of pelvis

Classification of radical hysterectomy

Table 3. Querleu-Morrow classification⁵

| Type of radical hysterectomy | Paracervix or lateral parametrium | Ventral parametrium | Dorsal parametrium |
|---------------------------------|--|--|--|
| Type A | Halfway between the cervix and ureter (medial to the ureter-ureter identified but not mobilized) | Minimal excision | Minimal excision |
| Type B1 | At the ureter (at the level of the ureteral bed-ureter mobilized from the cervix and lateral parametrium) | Partial excision of the vesicouterine ligament | Partial resection of the rectouterine-rectovaginal ligament and uterosacral peritoneal fold |
| Type B2 | Identical to B1 plus paracervical lymphadenectomy without resection of vascular/nerve structures | Partial excision of the vesicouterine ligament | Partial resection of the rectouterine-rectovaginal ligament and uterosacral fold |
| Type C1 | At the iliac vessels transversally, caudal part is preserved | Excision of the vesicouterine ligament (cranial to the ureter) at the bladder. Proximal part of the vesicovaginal ligament (bladder nerves are dissected and spared) | At the rectum (hypogastric nerve is dissected and spared) |
| Type C2 | At the level of the medial aspect of iliac vessels completely (including the caudal part) | At the bladder (bladder nerves are sacrificed) | At the sacrum (hypogastric nerve is sacrificed) |
| Type D | At the pelvic wall, including resection of the internal iliac vessels and/or components of the pelvic sidewall | At the bladder. Not applicable if part of exenteration | At the sacrum. Not applicable if part of exenteration |

Classification of radical hysterectomy

Type C2 radical hysterectomy

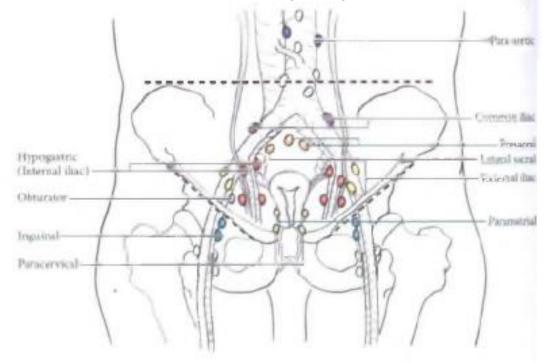

Same anatomical preparation as shown in figure 1 . Border shows area of resection.

Lymphatic drainage

Lymphatic drainage

- Parametrial
- Obturator
- Internal iliac (hypogastric)
- External iliac
- Sacral
- Presacral
- Common iliac
- Para-aortic

Fig. 52.1 Regional lymph nodes for the cervix uteri

- Lower vaginal Involvement: Inguinal Lymph nodes
- PA region to mediastinal / Left SC nodes

ESTRO School

Role of clinical examination

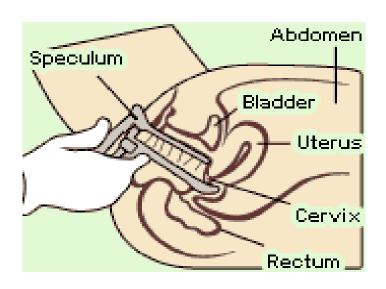

- Accurate tumor characteristics :
 - type: proliferative / infiltrative / vascular / necrotic
- Staging
- General condition and fitness for radical treatment

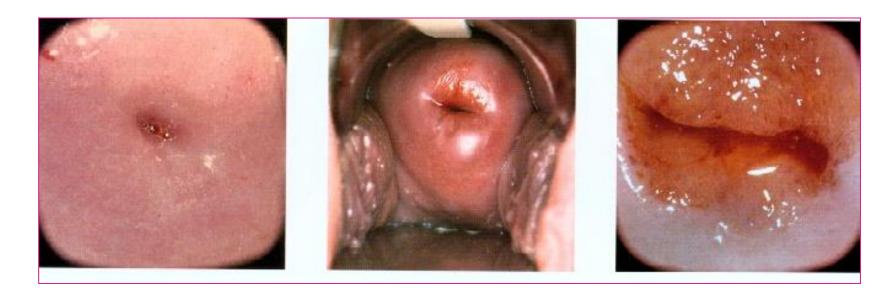

Clinical Examination

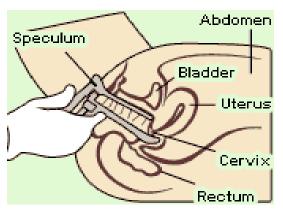

- Patient Counseling
- Parts clean and preferably prepared
- General Examination: Anemia / Lymphadenopathy incl SC nodes
- Pelvic Examination:
 - Inspection of external genitalia
 - Per Speculum Examination
 - Palpation

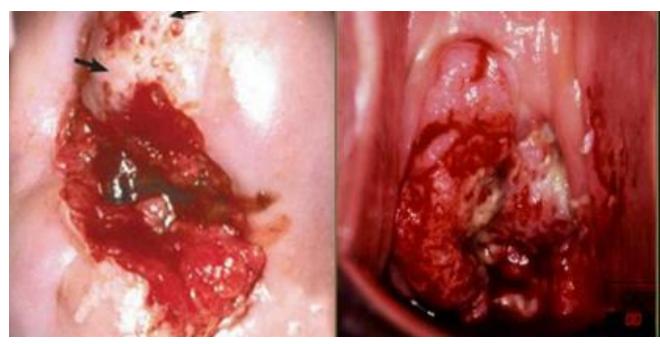

Per Speculum Examination

Per Speculum Examination

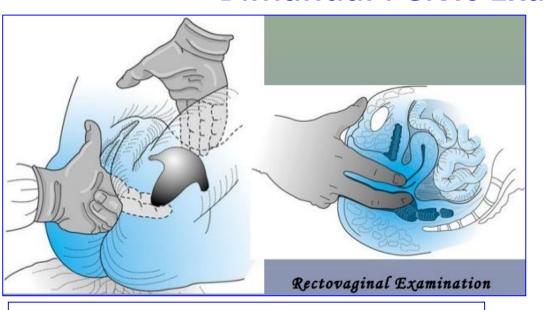

Bimanual Pelvic Examination

Local Disease Spread

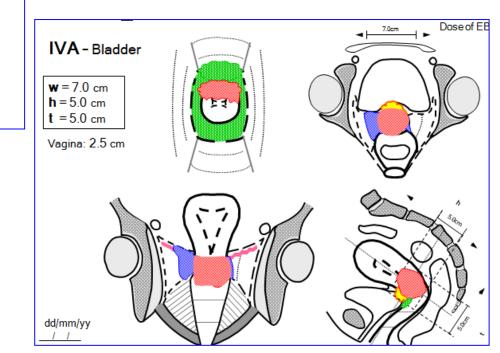

- Cervix
- Vagina
- Parametrium
- Lower uterus

Tumor measurement Tumor extension:

- vagina (vaginal impression)
- parametrium

ESGO ESTRO ESP Guidelines 2017

Local clinical and radiological diagnostic work-up

- Pelvic examination and biopsy +/- colposcopy are mandatory components to diagnose cervical cancer.
- Mandatory initial work-up for assessment of pelvic tumour extent and to guide treatment options is pelvic magnetic resonance imaging (MRI).
- Endovaginal/transrectal ultrasound is an option if performed by a properly trained sonographer.
- Cystoscopy or rectoscopy may be considered to provide a biopsy if suspicious lesions in the urinary bladder or rectum are documented on MRI or ultrasound.

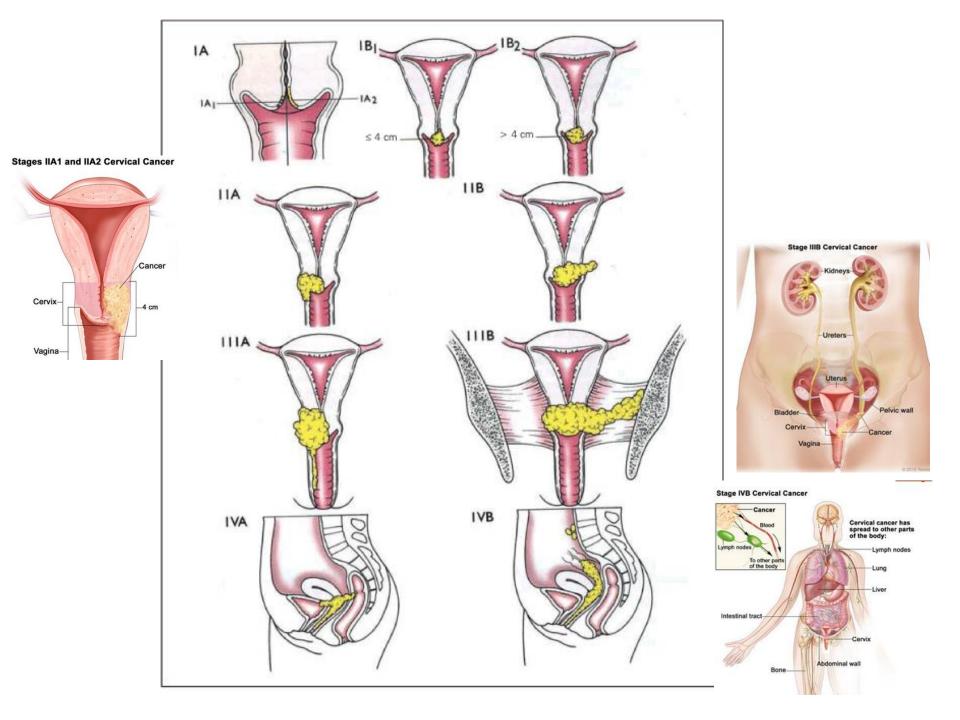

FIGO staging 2008

- Stage I: confined to cervix
 - la1: minimal microscopic invasion
 - Ia2: invasion ≤ 5mm depth and ≤ 7mm horizontally
 - Ib1: greater than Ia, clinically visible, confined to the cervix, ≤ 4 cm size
 - Ib2: > 4 cm size

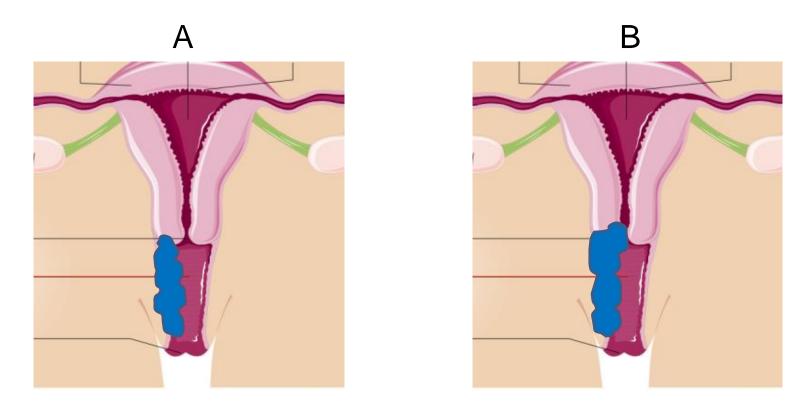

5-year survival : 75.7%

- Stage II: invades beyond cervix but not to side wall or lower third of vagina
 - IIa: tumour without parametrial invasion
 - Ila1: ≤ 4 cm size
 - Ila2: > 4 cm size
 - IIb: tumour with parametrial invasion
- Stage III: tumour extends to pelvic sidewall and/or lower third of vagina or causes hydronephrosis or non-functioning kidney
 - IIIa: lower third of vagina, no pelvic side wall extension
 - IIIb: involving pelvic side wall or causing hydronephrosis
- Stage IV: tumour invades mucosa of bladder or rectum and/or extends beyond true pelvis

5-year survival: 89.1%

FIGO classification

According to FIGO staging rules, tumors in the vagina should be classified as:

'cervical' if the cervical os is involved (even if most of the tumor is in the vagina)

ESGO ESTRO ESP Guidelines 2017

UICC TNM: 8th Edition (2016)

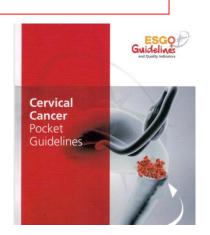

STAGING

POCKET GUIDELINES CERVICAL CANCER

based on

ESGO-ESTRO-ESP Guidelines for the Management of Patients with Cervical Cancer

FIGO staging and TNM classification

- Patients with cervical cancer should be staged according to the TNM classification. Clinical staging (FIGO) should also be documented (*Table 1*).
- TNM should be based on a correlation of various modalities (integrating physical examination, imaging and pathology) after discussion in a multidisciplinary forum.
- The method used to determine tumour status (T), lymph node status (N) and systemic status (M) i.e. clinical (c), imaging (i) and/or pathological (p) should be recorded.
- Lymph node metastases should be classified according to the TNM classification (see Principles of pathological evaluation).

FIGO staging / TNM classification [UICC 8th Ed.(2016)]

Regional Lymph Nodes (N)

| TNM CATEGORIES | FIGO STAGES | |
|-------------------|----------------|--|
| NX | | Regional lymph nodes cannot be assessed |
| NO | | No regional lymph node metastasis |
| N1 | IIIB | Regional lymph node metastasis |

Distant Metastasis (M)

| Distai | ic Mier | astasis (IVI) |
|------------|---------|----------------------------|
| TNM | FIGO | |
| CATEGORIES | STAGES | |
| MO | | No distant metastasis |
| M1 | IVB | Distant metastasis |
| | | (including peritoneal |
| | | spread, involvement |
| | | of supraclavicular, |
| | | mediastinal, or paraaortic |
| | | lymph nodes, lung, |
| | | liver, or bone) |

| ANATOMIC STAGE/PROGNOSTIC GROUPS (FIGO 2008) | | | | | | |
|--|-------|-------|----|--|--|--|
| Stage 0* | Tis | N0 | M0 | | | |
| Stage I | T1 | N0 | M0 | | | |
| Stage IA | T1a | N0 | M0 | | | |
| Stage IA1 | T1a1 | N0 | M0 | | | |
| Stage IA2 | T1a2 | N0 | M0 | | | |
| Stage IB | T1b | N0 | M0 | | | |
| Stage IB1 | T1b1 | N0 | M0 | | | |
| Stage IB2 | T1b2 | N0 | M0 | | | |
| Stage II | T2 | N0 | M0 | | | |
| Stage IIA | T2a | N0 | M0 | | | |
| Stage IIA1 | T2a1 | N0 | M0 | | | |
| Stage IIA2 | T2a2 | N0 | M0 | | | |

| Stage III | T3 | N0 | M0 | | | |
| Stage IIIA | T3a | N0 | M0 | | | |
| Stage IIIB | T3b | Any N | M0 | | | |
| | T1-3 | N1 | M0 | | | |
| Stage IVA | T4 | Any N | M0 | | | |
| Stage IVB | Any T | Any N | M1 | | | |

AJCC 8TH Edition 2017

| T Category | FIGO Stage | T Criteria |
|------------|------------|---|
| TX | | Primary tumor cannot be assessed |
| TO | | No evidence of primary tumor |
| TI | 1 | Cervical carcinoma confined to the uterus (extension to corpus should be disregarded) |
| Tla | IA | Invasive carcinoma diagnosed only by microscopy. Stromal invasion with a maximum depth of 5.0 mm measured from the base of the epithelium and a horizontal spread of 7.0 mm or less. Vascular space involvement, venous or lymphatic, does not affect classification. |
| Tlal | IAI | Measured stromal invasion of 3.0 mm or less in depth and 7.0 mm or less in horizontal spread |
| T1a2 | IA2 | Measured stromal invasion of more than 3.0 mm and not more than 5.0 mm, with a horizontal spread of 7.0 mm or less |
| Tlb | IB | Clinically visible lesion confined to the cervix or microscopic lesion greater than T1a/IA2. Includes all macroscopically visible lesions, even those with superficial invasion. |

| T Category | FIGO Stage | T Criteria |
|------------|------------|---|
| T161 | IBI | Clinically visible lesion 4.0 cm or less in greatest dimension |
| T1b2 | IB2 | Clinically visible lesion more than 4.0 cm in greatest dimension |
| T2 | H | Cervical carcinoma invading beyond the uterus but not to the pelvic wall or to lower third of the vagina |
| T2a | HA | Tumor without parametrial invasion |
| T2a1 | HAL | Clinically visible lesion 4.0 cm or less in greatest dimension |
| T2a2 | IIA2 | Clinically visible lesion more than 4.0 cm in greatest dimension |
| T2b | 11B | Tumor with parametrial invasion |
| Т3 | III | Tumor extending to the pelvic sidewall* and/or involving the lower third of the vagina and/or causing hydronephrosis or nonfunctioning kidney |
| ТЗа | IIIA | Tumor involving the lower third of the vagina but not extending to the pelvic wall |
| Т3Ь | IIIB | Tumor extending to the pelvic wall and/ or causing hydronephrosis or nonfunctioning kidney |
| T4 | IVA | Tumor invading the mucosa of the bladder or rectum and/or extending beyond the true pelvis (bullous edema is not sufficient to classify a tumor as T4) |

^{*}The pelvic sidewall is defined as the muscle, fascia, neurovascular structures, and skeletal portions of the bony pelvis. On rectal examination, there is no cancer-free space between the tumor and pelvic sidewall.

Definition of Regional Lymph Node (N)

| N Category | FIGO Stage | N Criteria |
|------------|------------|---|
| NX | | Regional lymph nodes cannot be assessed |
| NO | | No regional lymph node metastasis |
| N0(i+) | | Isolated tumor cells in regional lymph node(s) no greater than 0.2 mm |
| NI | | Regional lymph node metastasis |

Definition of Distant Metastasis (M)

| M Category | FIGO Stage | M Criteria |
|------------|------------|--|
| M0 | | No distant metastasis |
| MI | IVB | Distant metastasis (including peritoneal spread or involvement of the supraclavicular, mediastinal, or distant lymph nodes; lung; liver; or bone) |

AJCC 8TH Edition 2017

Para-aortic Lymph nodes : As regional nodes

Para-aortic Lymph nodal Mets: N1

Other sites: M1

Regional Lymph Nodes

The cervix is drained by parametrial, cardinal, and uterosacral ligament routes into the following regional lymph nodes (Fig. 52.1):

- Parametrial
- · Obturator
- · Internal iliac (hypogastric)
- · External iliac
- Sacral
- Presacral.
- Common iliae
- Para-aortic

Definition of Regional Lymph Node (N)

| N Category | FIGO Stage | N Criteria |
|------------|------------|--|
| NX | | Regional lymph nodes cannot be assessed |
| NO | | No regional lymph node metastasis |
| N0(i+) | | Isolated tumor cells in regional lymph node(s) no greater than 0.2 mm |
| NI | | Regional lymph node metastasis |

Definition of Distant Metastasis (M)

| M Category | FIGO Stage | M Criteria |
|------------|------------|--|
| M0 | | No distant metastasis |
| MI | IVB | Distant metastasis (including peritoneal spread or involvement of the supraclavicular, mediastinal, or distant lymph nodes; lung; liver; or bone) |

Proposed Revision in FIGO Staging for Cervical Cancer

Stage I

<u>Stage IA</u> Invasive carcinoma that can be diagnosed only by microscopy with measured deepest invasion <5 mm

Stage IA1 Stromal invasion < 3.0 mm

Stage IA2 Stromal invasion > 3.0 mm < 5.0 mm

<u>Stage IB</u> Invasive <u>carcinoma</u> <u>with</u> measured deepest invasion ≥ 5 mm and size measured by maximum tumor diameter

Stage IB1 Invasive carcinoma ≥ 5.0 mm ≤ 2 cm

Stage IB2 Invasive carcinoma > 2 cm < 4 cm

Stage IB3 Invasive carcinoma > 4 cm

Stage III

Add Stage IIIC to reflect positive lymph node metastasis to pelvic and/or paraaortic lymph nodes, adding notation of r (imaging) and p (pathology) to indicate the findings that are used to allocate to stage IIIC.

Stage IIIC Pelvic and/or paragortic lymph node metastasis

Stage IIIC1 Pelvic lymph node metastasis only

Stage IIIC2 Paraaortic lymph node metastasis

Notation of r = imaging and p = pathology, e.g., imaging indicating pelvic lymph node metastasis would be Stage IIIC1r and pelvic lymph node metastasis by pathological findings would be Stage IIIC1p.

FIGO Meeting at Dubai - April 2018

Stage IA & B

Stage III to include PA nodal disease

Conclusion

- Natrual histroy of Cervical Cancer
- Knowledge of lymphatic drainage
- Importance of Clinical examination
 - Per speculum & bimanual pelvic examination
- Staging : Clinical + Radiological
 - TNM & FIGO Systems

3D image based pathologic anatomy at time of diagnosis

Radiation Oncologist's perspective

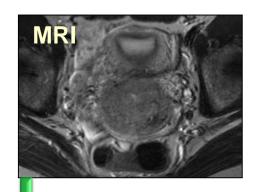

Primoz Petric Peter Petrow

Overview

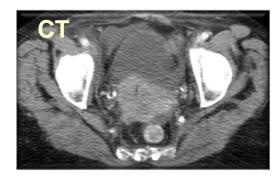

- T: Primary tumor assessment
 - Modality of choice
 - Normal anatomy of central pelvis
 - Recommendations for MRI
 - Tumor assessment
- N: Detection of nodal disease
- M: Detection of nodal metastases

Imaging modality of choice for primary tumor assessment in cervix cancer

Choice of imaging modality: primary tumor

- Superior soft tissue depiction quality
 - normal anatomy
 - tumor
- Major information available from T2w without i.v. contrast
- Multi planar imaging
- Clinico-pathological studies: ↑ staging accuracy
- No radiation
- Gyn GEC ESTRO Recommendations published
- Functional imaging

Lee SI, et al. JNM 2015;56(3). Boss EA et al. Obstet Gynecol 1995 Mitchell DG et al. J Clin Oncol 2006 Oszarlak O et al. Radiol 2003 Jung DC et al. Cancer 2008, 44(11): 1524-1528 Hricak H, et al. Radiology 2007;243(1):28-53 Yu KK, et al. Radiology 1997;202(3):697-702 Yu KK, et al. Radiology 1999;213(2):481-488 Sala E, et al. Radiology 2006;238(3):929-937 Dimopoulos J. IJROBP 2006 Dimopoulos et al. Radiother Oncol 2011

Role of PET CT

- Detection / Confirmation of primary tumor
- No information on soft tissue details (i.e. PM invasion)
- Important for detection of lymphadenopathy

The choice of primary therapy best achieved when

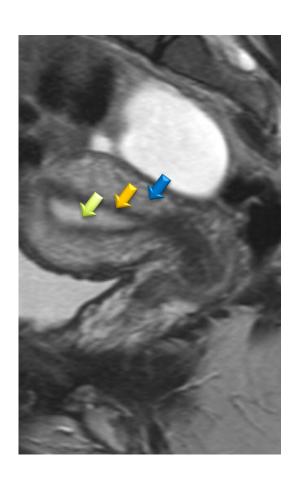

MRI + ¹⁸FDG PET/CT are included in workup

MRI normal anatomy and primary tumor appearance

Unenhanced MRI – Normal anatomy

Uterus

T2 w MRI

Endometrium: Hyperintense

Inner myometrium=
Junctional zone:
Low signal intensity

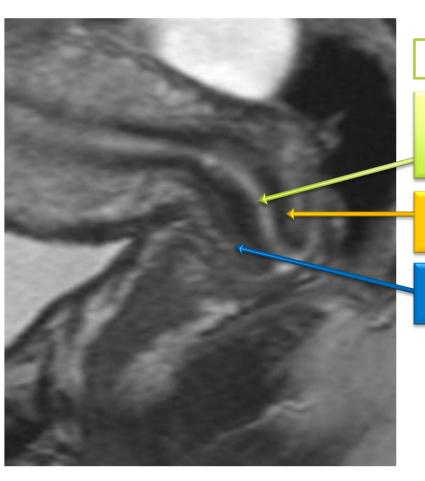

Outer myometrium: High signal intensity

Signal intensity decreases with age

Unenhanced MRI – Normal anatomy

Cervix

T2 w MRI

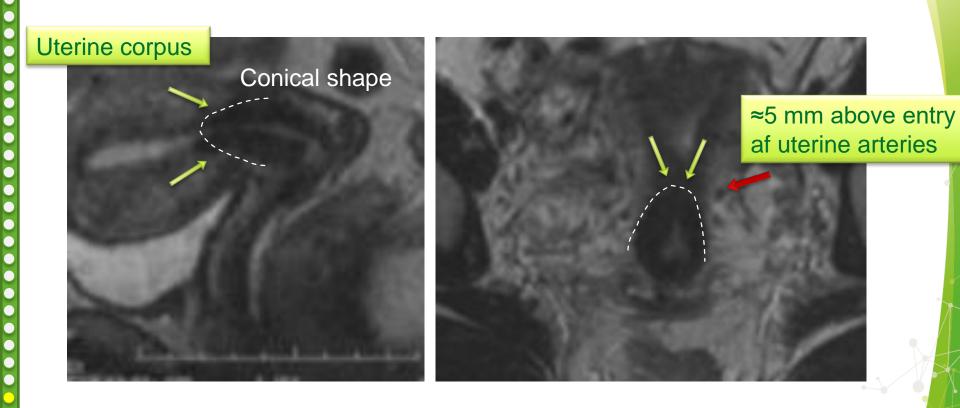

Endocervical mucosal glands:
High signal intensity

Cervical stroma: Low signal intensity

Smooth muscle: Intermediate signal

Unenhanced MRI – Normal anatomy

Cervix – cranial limit

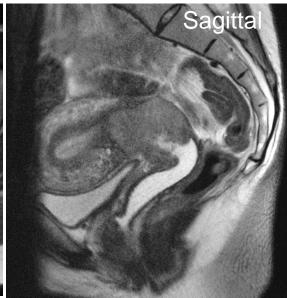

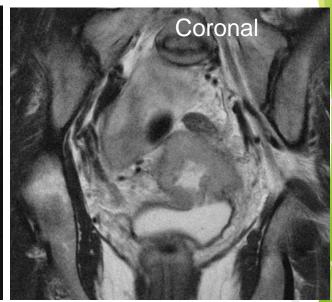

Unenhanced MRI – Pathology

Appearance of tumour tissue

T2w No contrast

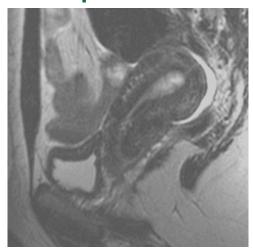

Contrast-enhanced MRI

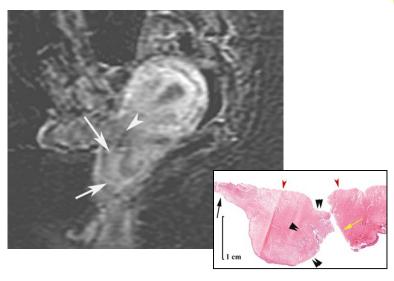

Indications

Small or non-visible tumor on T2

Example:

33 years old patient Endocervical Tumor

| Superior | Top of fallopian tube/ broad ligament. Depending on degree of uterus flexion, this may also form the anterior boundary of parametrial tissue. | Isthmus of uterus (= level where uterine artery drains into) *Contouring would stop at the level where bowel loops are seen | |

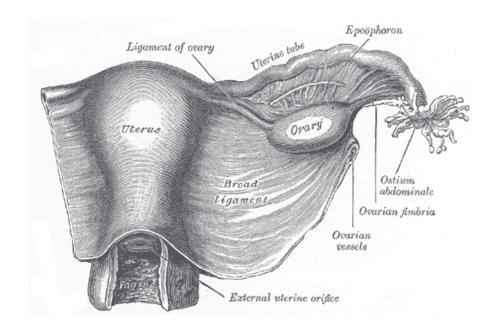

Uterine Cervix

The entire cervix, if not already included within the GTV contour, is to be contoured (13). The cranial margin is defined at the level at which the uterine arteries enter the uterus (same level of the superior border of the parametrium CTV).

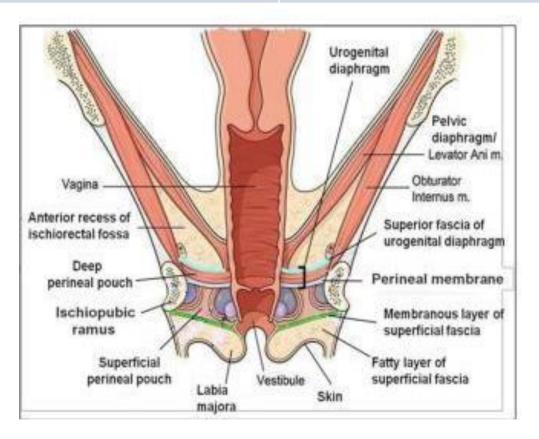

The broad ligaments, round ligaments and ovarian ligaments do not need to be included.

Parametrium - definition

 The parametrium is a band of fibrous tissue that separates the supravaginal portion of the cervix from the bladder. It extends on to its sides and laterally between the layers of the broad ligaments.

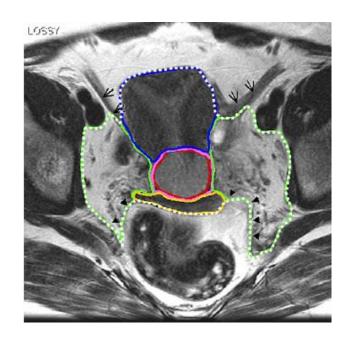

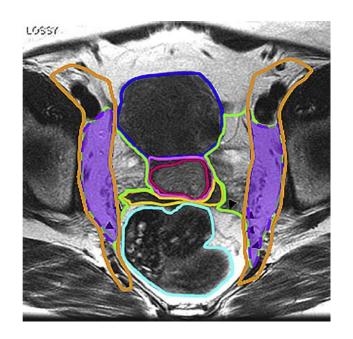

| | GYN IMRT consortium | Japanese consortium | | |

 Lateral border = medial edge of internal iliac and obturator vessels

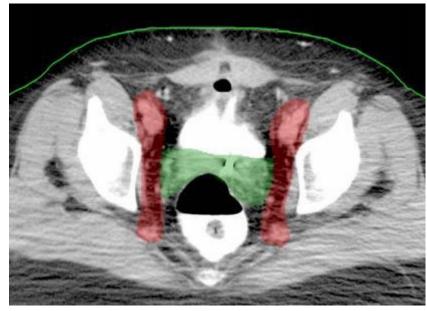

IIIB disease

 Lateral border = medial edge of internal iliac and obturator vessels

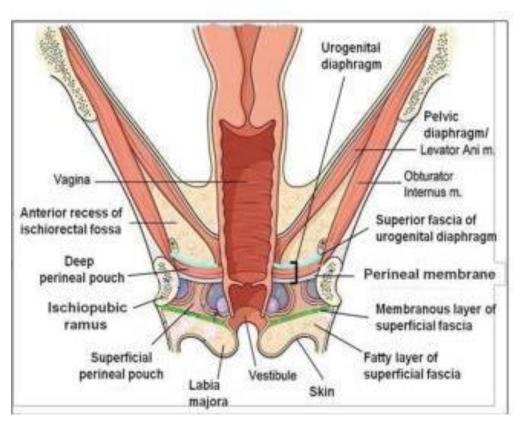

RTOG post-op

Vagina – inferior margin

- GYN IMRT + Japanese consortiums
 - Minimal or no vaginal extension: upper half
 - Upper vaginal involvement: upper two-thirds
 - Extensive vaginal involvement: entire vagina
- EMBRACE-II
 - 20 mm margin of uninvolved vagina measured from the most inferior position of the CTV-T HR

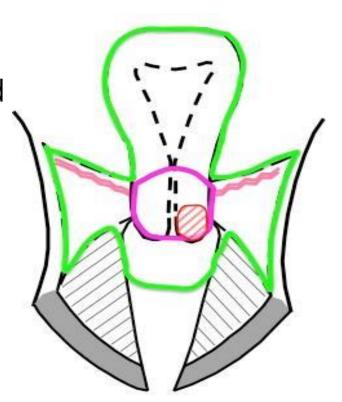

Issue

 Inferior margin of vagina CTV may be superior to urogenital diaphragm/levator ani

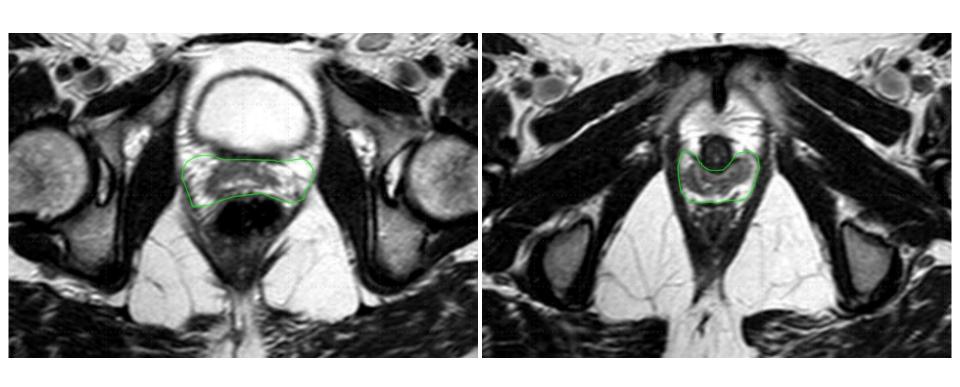

Vagina – lateral margin

- GYN IMRT consortium
 - No mention
- Japanese consortium
 - Paravaginal tissue would be included
- EMBRACE-II
 - No mention

Courtesy of Remi Nout

Margin round involved organ

- GYN IMRT consortium
 - Include entire mesorectum if uterosacral ligament involved
- EMBRACE-II
 - In case of involvement of the pelvic wall, sacro-uterine ligaments, mesorectum or other involved structures a 20 mm margin around the initial HR CTV-T will be extended into these structures

Ovaries

GYN IMRT consortium

Parametrium Entire parametrium, including ovaries;

Japanese consortium

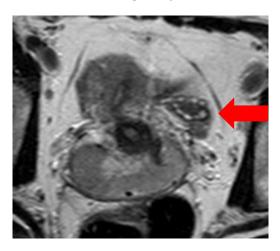

OVARY

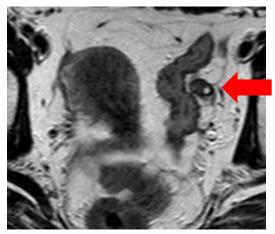

Ovaries visible on the CT/MRI would be included.

A consensus was not reached regarding the possibility of excluding the ovaries in selected cases (i.e. non-bulky Stage I or II cases with squamous cell carcinoma).

Ovaries

- Overall risk of ovarian metastases is small. Increased risk reported for
 - Adeno/adenosquamous
 - High grade and LVSI
 - Extension into the uterine corpus
- Ovaries can be highly mobile!

 In case of excessive uterine/ligamentum latum infiltration, consider to include ovaries into CTV-T LR_{initial}

Nodal targets

- GTV-N = involved node
- CTV-N
 - Margin round involved node
- CTV-E = uninvolved nodes
 - Pelvic
 - Para-aortic

Nodal targets

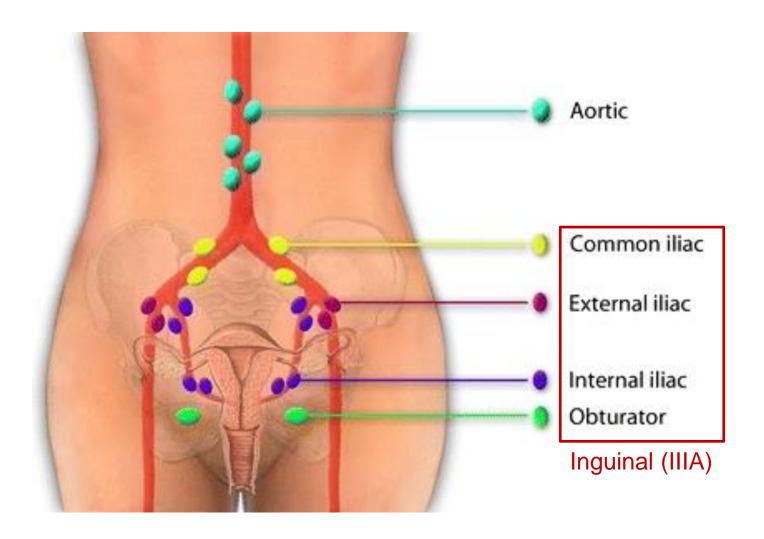

CTV margins

- CTV margin for CTV-N is for extracapsular spread
 - EMBRACE-II recommends 0-3 mm
- CTV margin for CTV-E is for variation in location of nodes

| | 3D margin around vessels (mm) | | | | |
|----------------|-------------------------------|------|------|------|------|
| | 3 | 5 | 7 | 10 | 15 |
| Nodal coverage | 56 % | 76 % | 88 % | 94 % | 99 % |

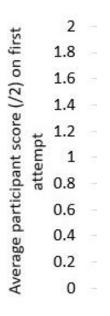

7 mm margin with minor adjustments: 99% coverage of lymph nodes

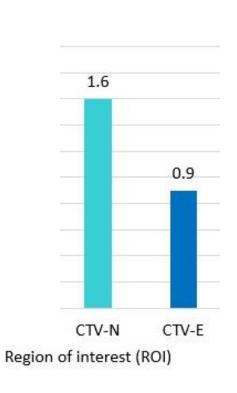

CTV-E

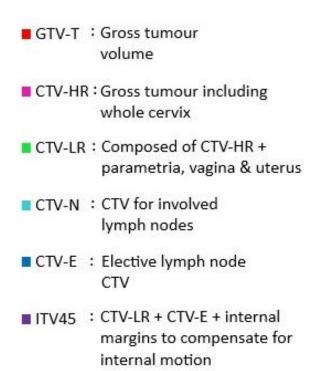

Taylor A, et al. IJROBP, 2005;63:1604–12 Small W, et al. IJROBP 2008;71:428-434 (RTOG)

EMBRACE-II accreditation

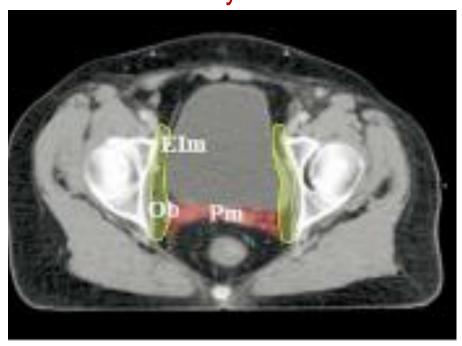

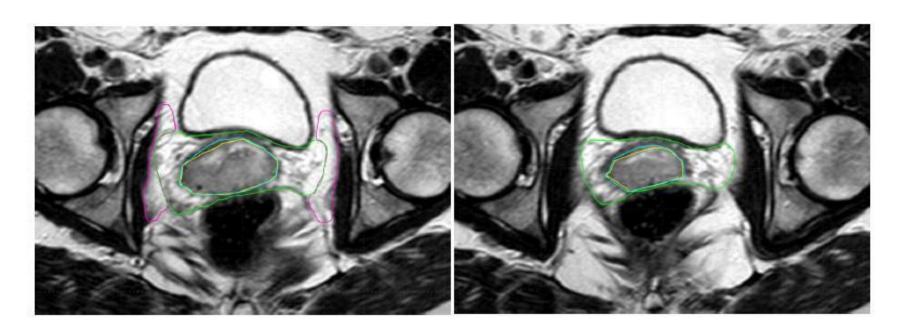

Obturator – inferior limit

Taylor

 Where internal iliac vessels enter or leave the true pelvis (usually at the upper part of the obturator foramen, below femoral head)

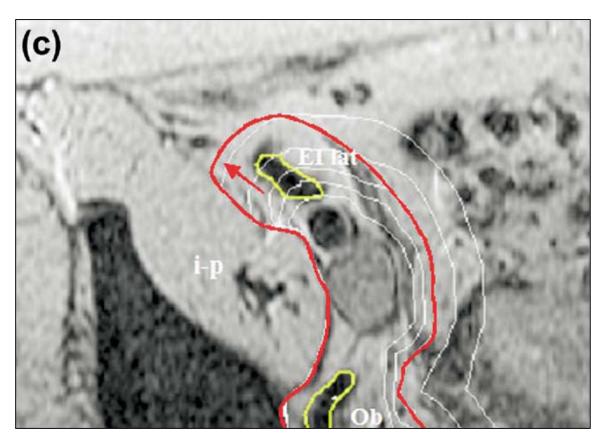

External iliac – anterior limit

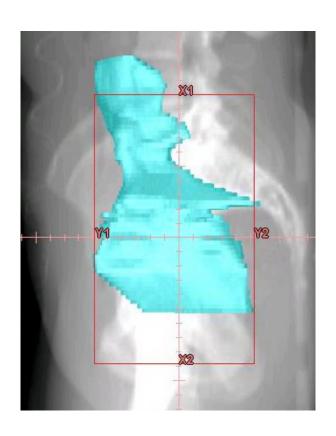

Taylor

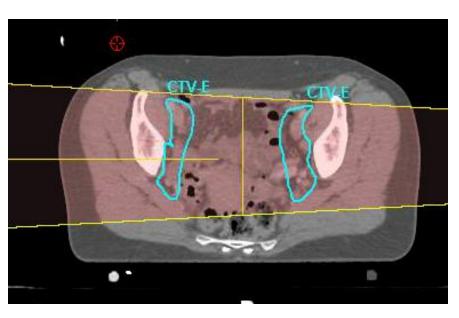

Extend 10 mm in front of external iliac vessels along iliopsoas muscle

Tip

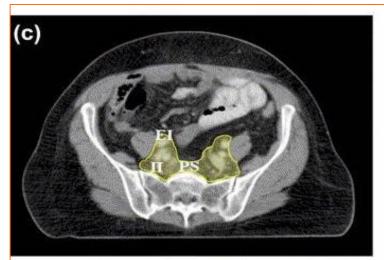

Use traditional box as guide

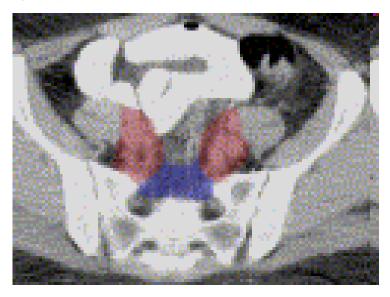

Pre-sacral – inferior limit

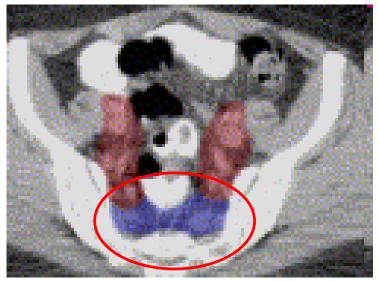

Taylor

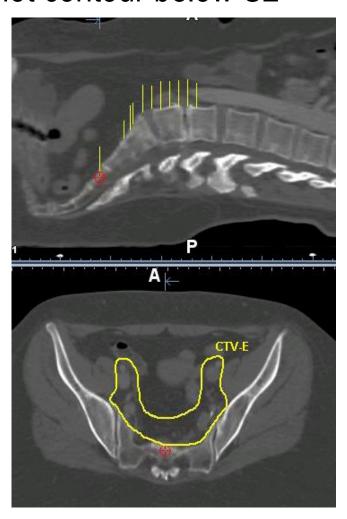

Small

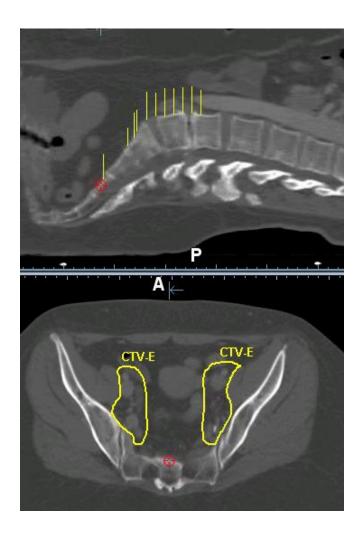

Tip

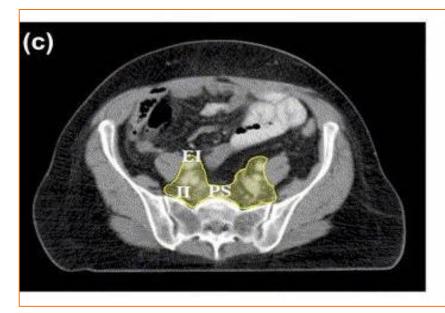

• Do not contour below S2

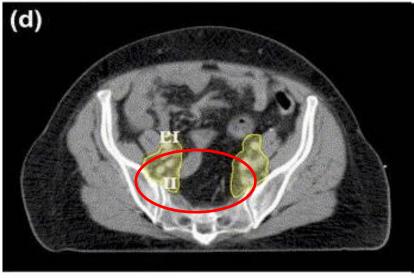

Taylor

 To cover the presacral region, connect the volumes on each side of the pelvis with a 10-mm strip over the anterior sacrum (S1 and S2)

Common iliac – lateral limit

- Taylor
 - Extend posterior and lateral borders to psoas and vertebral body

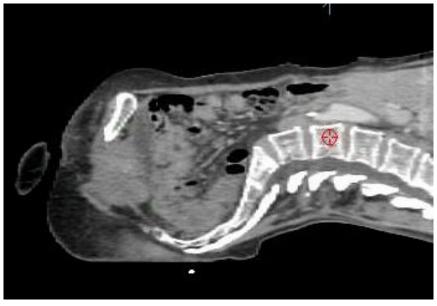

Common iliac – superior limit

- Taylor
 - Bifurcation of aorta
- Small
 - From 7 mm below L4/5 interspace to bifurcation of common iliac arteries

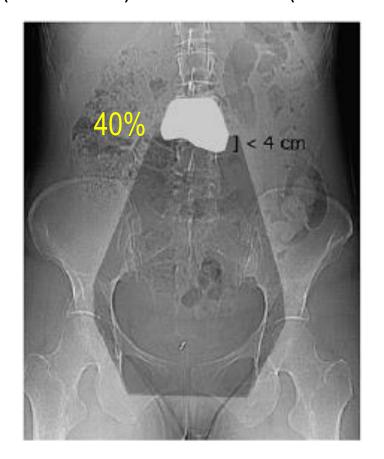

Common iliac – superior limit

Patterns of regional failure

- MD Anderson 1980-2000 (1894 patients)
 - 198 regional (no central) recurrences (33% distant mets)

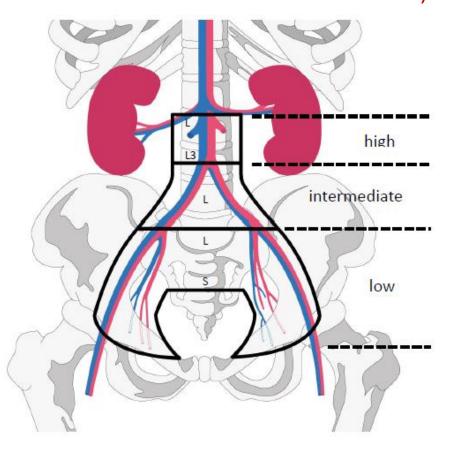

Beadle BM, et al. Int J Radiat Oncol Biol Phys. 2010;76(5):1396-403

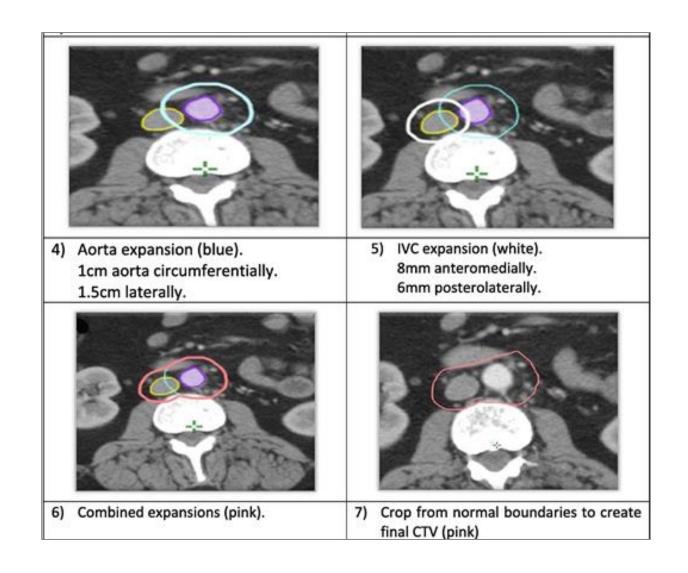

EMBRACE II EBRT CTV

Treat to renal vein (PA nodes above renal vessels incurable)

| Risk Group LN | Definition |
|------------------------------|---|
| Low Risk (LR LN) | Tumour size ≤4cm AND stage IA/IB1/IIA1 AND NO AND squamous cell carcinoma AND no uterine invasion |
| Intermediate Risk (IR LN) | Not low risk No high risk features |
| High Risk (HR LN) | Based on nodal pathology • ≥ 1 pathologic node at common iliac or above • OR ≥ 3 pathologic nodes |

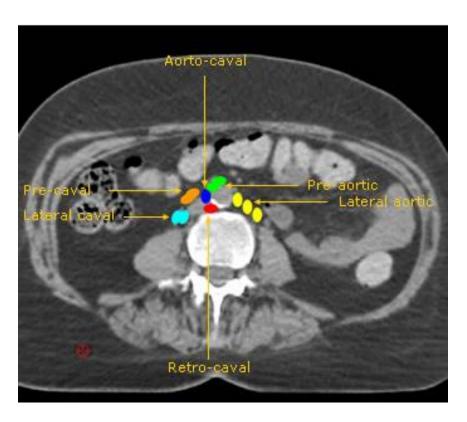

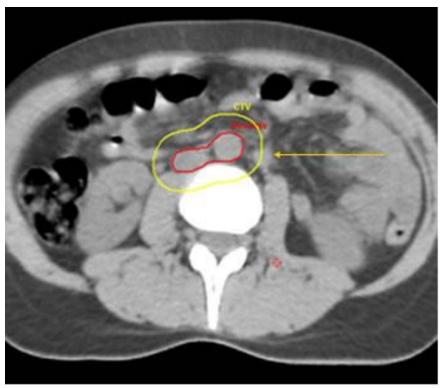

Paraaortic atlas

Keenan, Lorna G. et al. Radiother Oncol. 2018 Mar 6. [Epub ahead of print]

Paraortic nodes

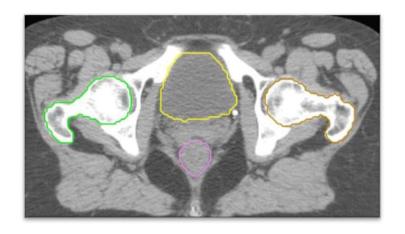

Organs at risk

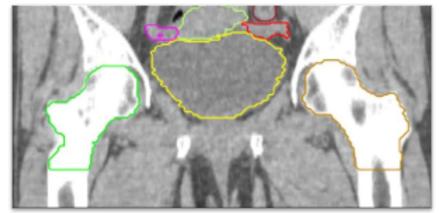

EMBRACE-II

- The outer contour of the following organs should be delineated:
 - Bladder Whole organ including the bladder neck
 - Rectum From the ano-rectal sphincter to the recto-sigmoid junction
 - Sigmoid From the recto-sigmoid junction to the left iliac fossa
 - Bowel Outer contour of bowel loops including the mesenterium

EMBRACE-II

- Femoral heads
 - Both femoral head and neck to the level of the trochanter minor

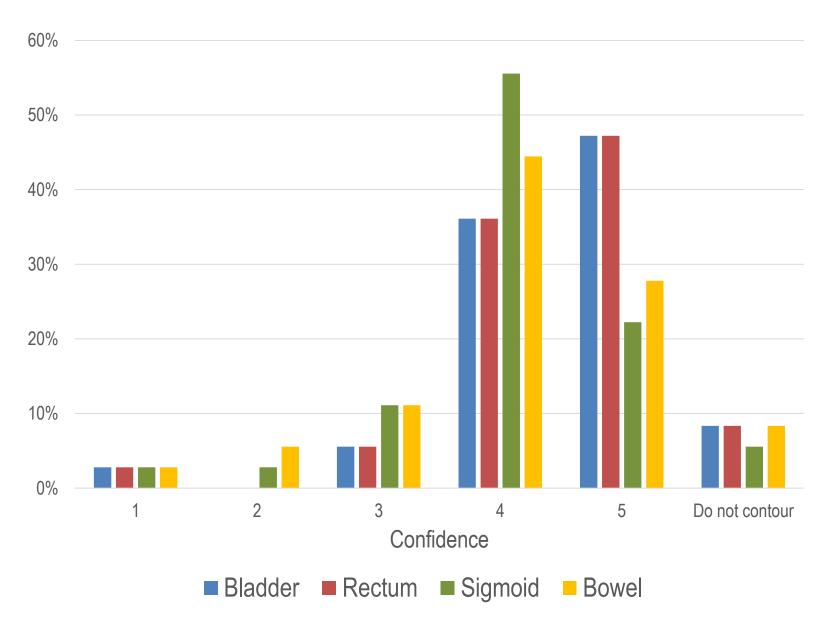

EMBRACE-II

- For para-aortic irradiation
 - Kidneys Outer contour excluding renal pelvis
 - Spinal cord Outer contour
- If para-aortic RT above L1 is applied
 - Duodenum Whole organ
- In case of ovarian transposition
 - Ovary Outer contour

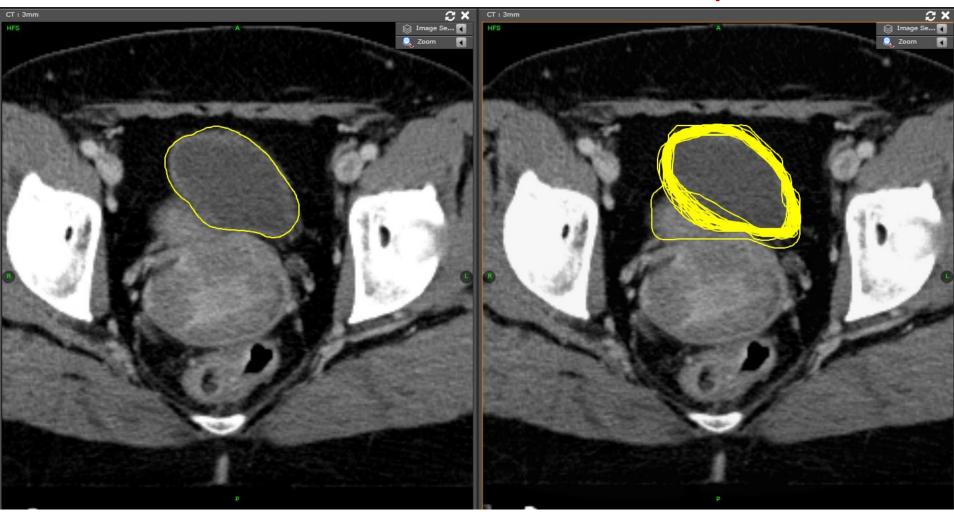

OAR

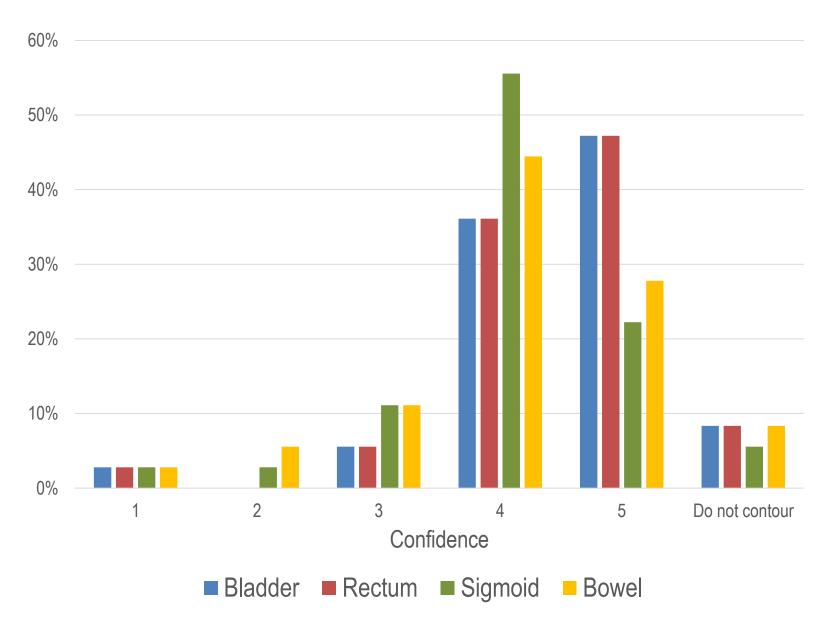

OAR contouring exercise – bladder

Reference

Participants

OAR

Varying definitions of rectum in RT studies and practice

Superior

- Rectosigmoid junction
- 12 cm from the anus
- Top of acetabula
- At the level of \approx S3
- Inferior level of sacroiliac joints
- 1 cm above the PTV

Inferior

- Anal verge
- Ano-rectal junction
- 1 cm below PTV
- Ischial tuberosities
- Ischial tuberosities + 2cm

Circumferential

- Rectum + contents
- Rectal wall

Varying definition of rectosigmoid junction

Anatomy

 Cessation of the mesocolon, cessation of the colonic haustra and a blending of the lateral and anti-mesenteric taenia to form a flat anterior muscular band.

Endoscopy

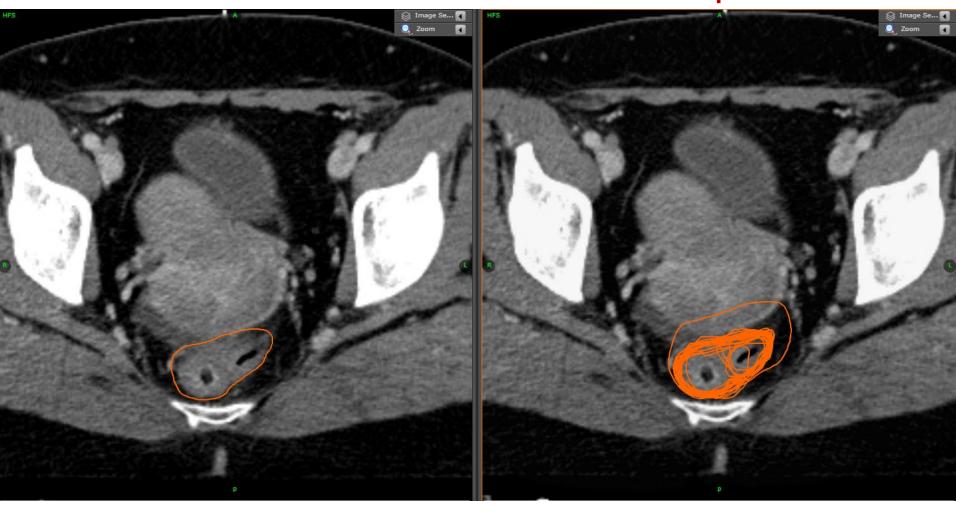

Narrow sharply angulated segment.

Radiology

- Anatomists S3
- Surgeons sacral promontory

ITV-T LR

+ 5=10 mm

Uterus MRI

ITV for nodes?

- "The CTV is an anatomical-clinical concept"
- Taylor CTV-E obturator nodes
 - Create a strip medial to the pelvic sidewall that should be at least 18 mm wide.

Conclusion

Summary

- Contouring of targets (tumour + nodal) and OARs for IMRT cervix is complex
- Some inconsistencies in guidelines
- Need to use clinical judgement
 - Understand principles and rationale
- Priority avoid geographical miss

Image guidance, organ motion and ITV/PTV

ESTRO Teaching Course

Image-guided radiotherapy & chemotherapy in gynaecological cancer - with a special focus on adaptive brachytherapy

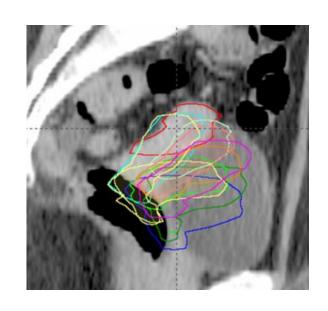

Madrid 2018

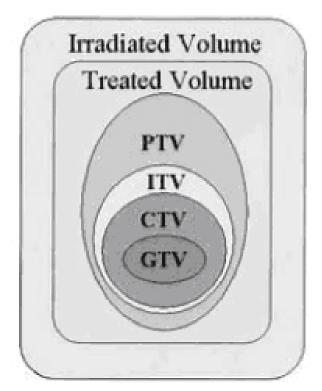

Kari Tanderup Richard Pötter

ITV and PTV

- ITV: Internal variations
 - Position, size and shape of CTV
 - Tumour shrinkage
 - Organ movement
 - Organ deformation

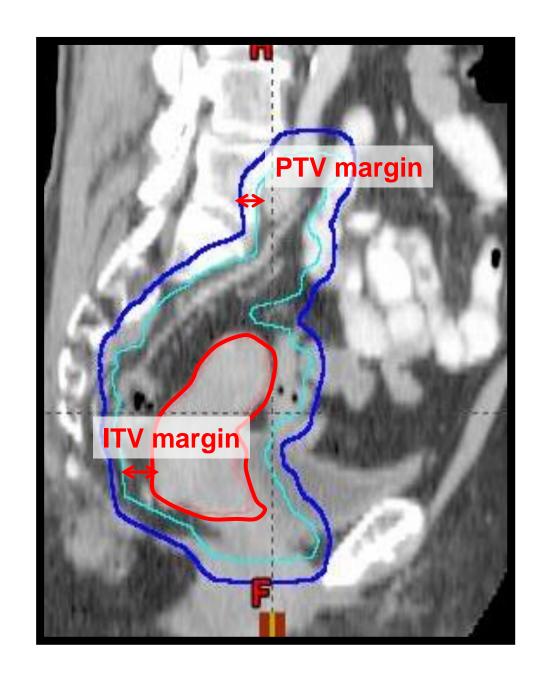

- PTV: External variations
 - Beam positioning
 - Patient set-up (e.g. uncertainties when setting up according to skin marks)

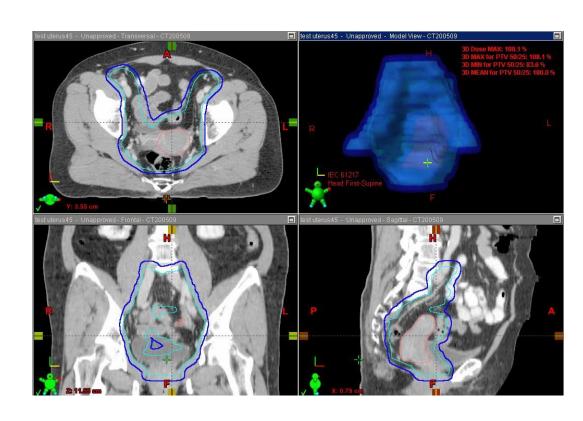

Margins in cervix cancer

- Elective CTV
 - PTV margin
- Pathologic nodes
 - PTV margin
- Primary CTV
 - ITV margin
 - PTV margin

PTV elective lymph node target volume

- Assumption:
 - Lymph nodes are in a fixed relation to bony anatomy
 - Bony registration aligns elective lymph node target
- Image fusion:
 - CBCT/EPID/kV

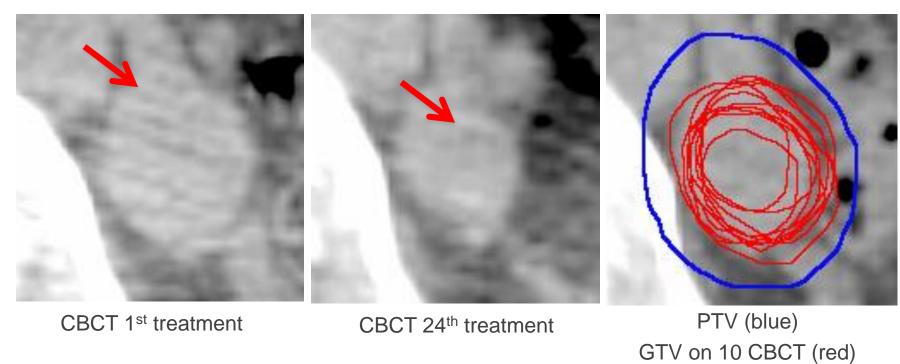

PTV pathological lymph nodes

Assumption:

- Lymph nodes are in a relatively fixed relation to bony anatomy
- Bony registration aligns pathological lymph node target

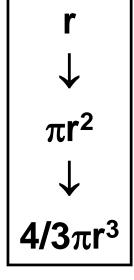

Most often pathological lymph nodes shrink during RT

Anne Ramlov, Radiother Oncol. 2017 Apr;123(1):158-163

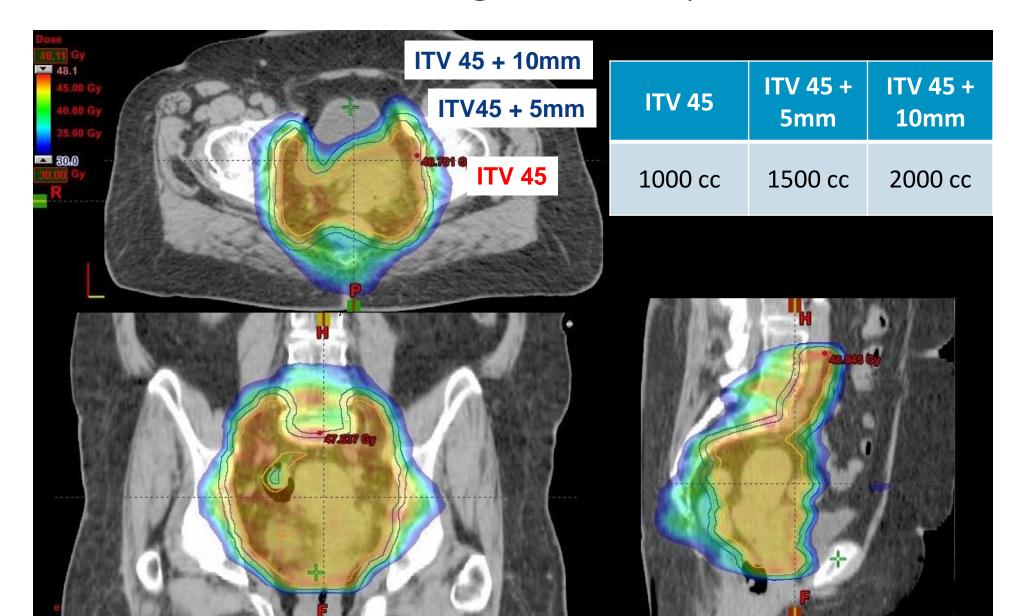

Why does the margin matter?

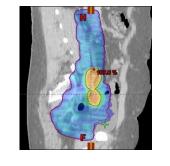

D. Verellen et al., Nature Reviews Cancer 2007

Let's take a look at the orange and the peel...

EMBRACE I, EMBRACE II: EBRT volume (V43Gy)

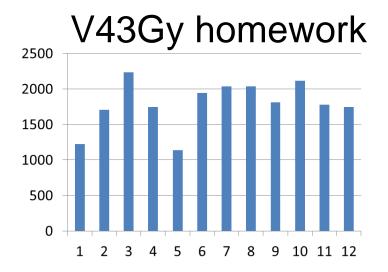

| | Pelvic | Para-aortic | |
|-------------------------|------------------------|------------------------|--|
| CTV vol (cc) | ~ 1000 cm ³ | ~ 1500 cm ³ | |
| PTV vol (cc) 5mm margin | ~ 1500 cm ³ | ~ 2000 cm ³ | |
| V43Gy (cc) EMBRACE I | ~ 2500 cm ³ | ~ 3000 cm ³ | |
| V43Gy (cc) EMBRACE II | ~ 1500 cm ³ | ~ 2000 cm ³ | |

CRT - IMRT: 500cm³ (V43)

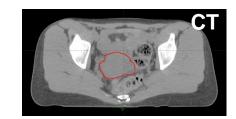

50Gy - 45Gy: 400cm³ (V43)

 $xmm \implies 5mm : \sum x cm^3 (V43)$

Skin marks versus daily bony registration

- <u>Daily</u> image guidance with bony fusion
 - Initial set-up according to skin marks
 - Image fusion according to bone
 - Verification of fusion
 - Couch correction
 - Typically 5mm PTV margin

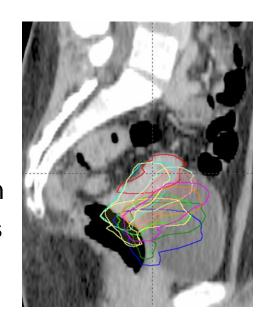

- Set-up on skin marks (no daily image guidance):
 - Imaging at first RT or e.g. weekly
 - Typically 7-10mm PTV margin

Which total dose (EBRT+BT) do you think this patient received to the non-involved uterus?

Patient case:

- 45/25fx EBRT
- 40Gy EQD2 BT
- 1.5cm CTV-PTV margin
- 50% of fractions: uterus outside PTV

EBRT dose: 38Gy

BT dose: 6Gy

EBRT+BT dose: 44Gy

(Normally patients receive >5-10Gy to the uterus from BT)

Sapru et al, Radither Oncol 107 (2013) 93–98

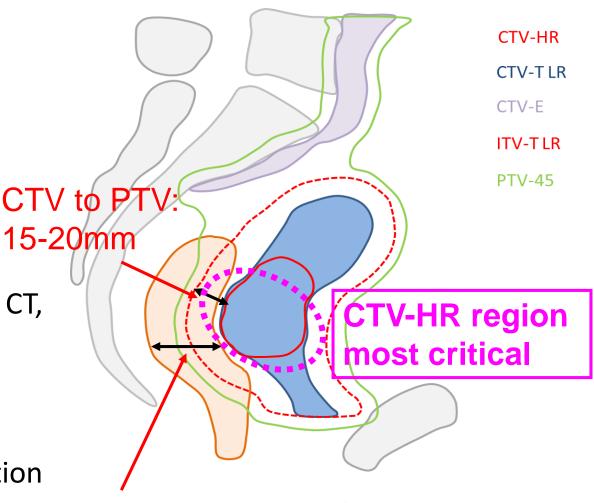

ITV-T LR and PTV-T LR

Standard:

- 10-15mm ITV margin
- 5mm PTV margin
- Total 15-20mm margin

Individualised approach:

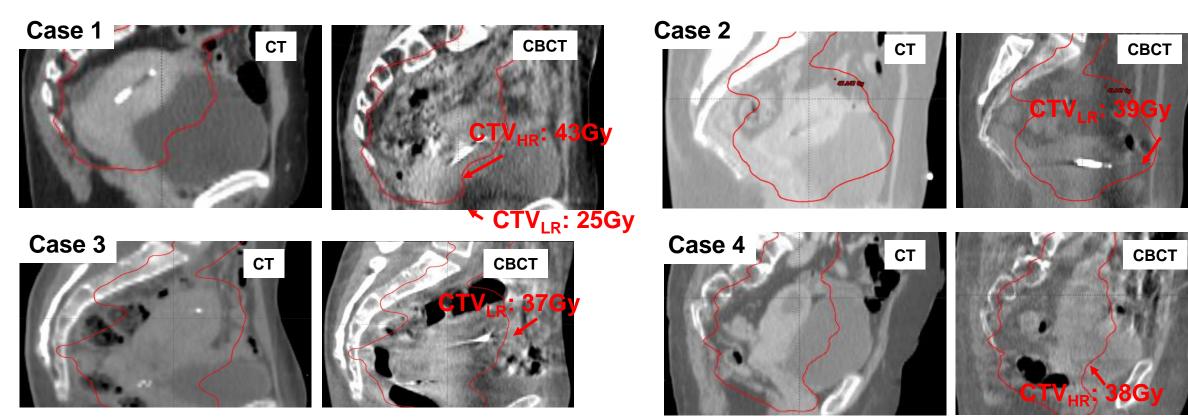

- Several treatment planning images: MRI, CT, full bladder, empty bladder
- Review anatomy on treatment planning images
- Apply margin according to predicted motion
- Monitor on daily CBCT

Maximum rectal filling at treatment planning scan: 40mm

Experience with CBCT monitoring from AUH

- Full and empty bladder planning CT + MRI -> Individualised ITV margin: median 1.2cm, range [1.0-3.5cm]
- Target coverage can be evaluated in 90% of CBCTs
- Prescribed EBRT: 45Gy in 25 fx
- 15% of cases could benefit from re-planning

Bladder filling and bowel volume

- Full bladder versus empty bladder decreases volume of bowel irradiated to a significant dose
- Avoid very large filling (>300ml)*
- Example drinking protocol:
 - 450-500ml 1 hour prior to planning CT scan and to each treatment
- Reproducibility of bladder filling?
 - Significant variation
 - Main purpose is to push bowel away!

*Eminowicz et al, Understanding the impact of pelvic organ motion on dose delivered to target volumes during IMRT for cervical cancer. Radiother Oncol 2017;122:116–21

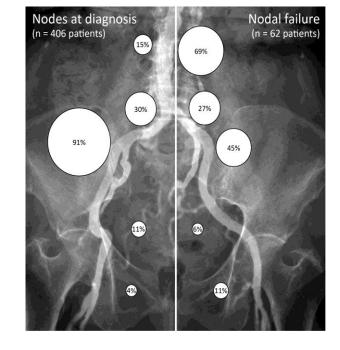

Take home message: nodal CTV

Margins add to considerable irradiation of normal tissue

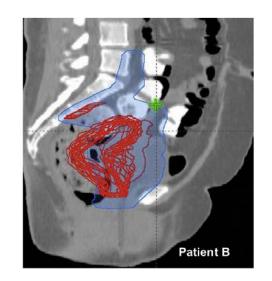

- PTV margin for elective target volume:
 - 7-10mm margin without daily image guidance
 - 5mm margin with daily image guidance and bony fusion

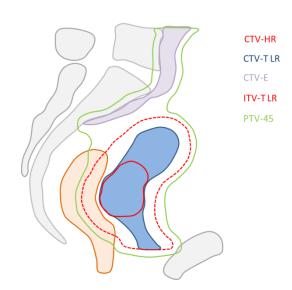

• Potential in pelvic elective radiotherapy to reduce irradiated volume by 40% with IMRT and daily IGRT (2500cc \rightarrow 1500cc)

Take home message: primary CTV

- Secure CTV-HR coverage macroscopic tumour burden
- Uninvolved uterus is NOT the most critical target microscopic disease
- Clinical practise:
 - ~15-20mm is common for CTV-T LR to PTV margin
 - Be aware of rectal filling at time of treatment planning! E.g. threshold of 40mm diameter of filling.

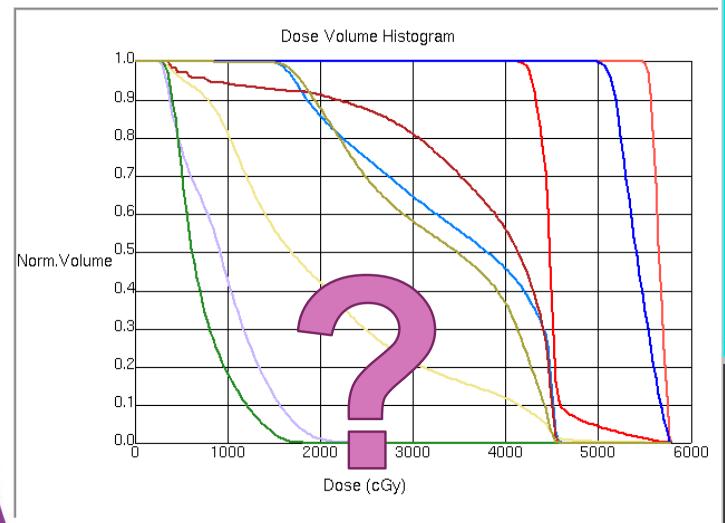

Medical aspects of dose constraints including DVH parameters for EBRT planning

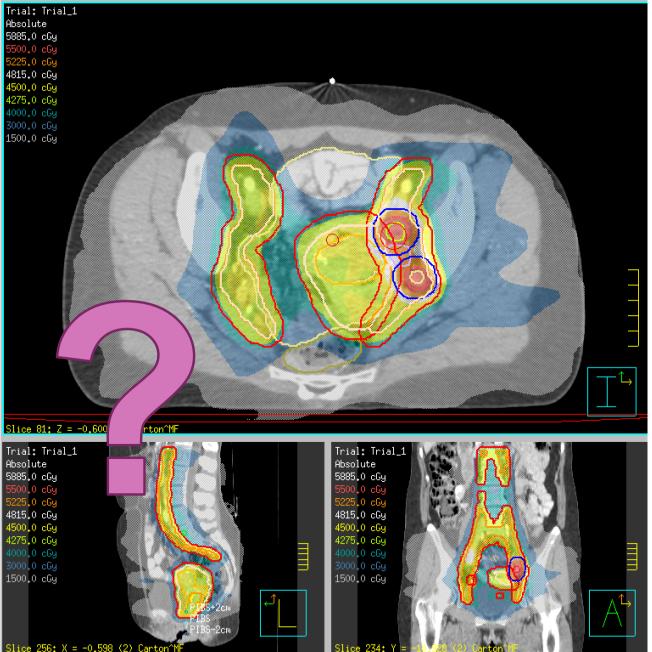

ESTRO GYN TEACHING COURSE Madrid 2018

Ina Jürgenliemk-Schulz Umesh Mahantshetty Kari Tanderup Remi Nout

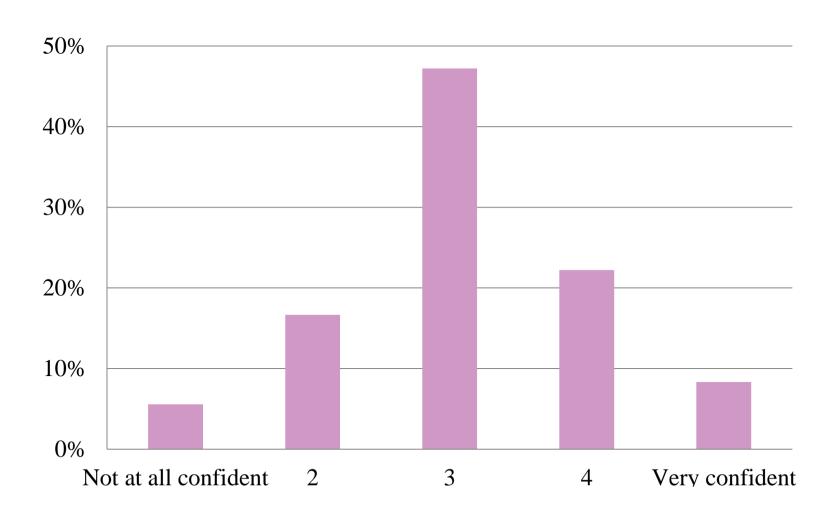

Learning objectives

How confident are you at evaluating IMRT plans for cervical cancer?

Learning objectives

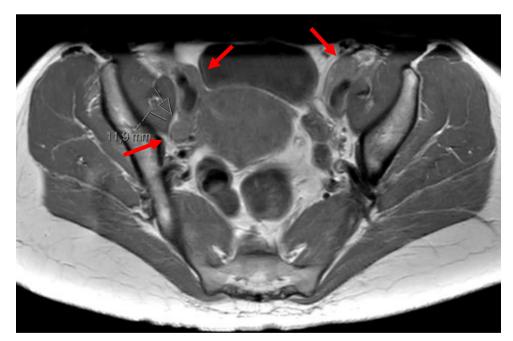

- Evidence for EBRT dose constraints and DVH parameters
- Evidence for dosimetric and clinical gain IMRT
- Importance of DVH parameters for EBRT treatment planning

• Brachy part not included!

EBRT for gynecological cancer treatment

- Elective dose including draining lymphatic system (postoperative EBRT)
- Boost to regional pathologic nodes
- Boost to primary / recurrent tumor if brachytherapy is not feasible

Dose in tumor versus organs at risk

- Which dose is required for <u>tumor control</u>?
 - Microscopic disease
 - Macroscopic tumor
 - Radiosensitizer?
- OAR, which dose is tolerated?
 - Severe morbidity
 - Long term Quality of Life
- Dose constraints and DVH parameters help to <u>balance</u> between tumor dose and OAR dose

Evidence for dose to control elective region

Elective regions need dose

 Effective elective dose in endometrial, vulvar and cervical cancer is 46-50 Gy in 1.8-2.0 Gy per fraction

Summary

In the largest series examining extended field intensity modulated radiation therapy for node-positive cervical cancer, we observed a low para-aortic recurrence rate of 2.5% in patients with pelviconly positive lymph nodes (negative para-aortic lymph nodes by positron emission tomography/computed tomography) without surgical staging, suggesting efficacy of this approach in addressing the 20% to 25% risk of microscopic paraaortic nodal disease. A simultaneous integrated boost of 55 Gy in 25 fractions effectively eradicated disease in involved pelvic and para-aortic lymph nodes, with acceptable risks of late adverse events.

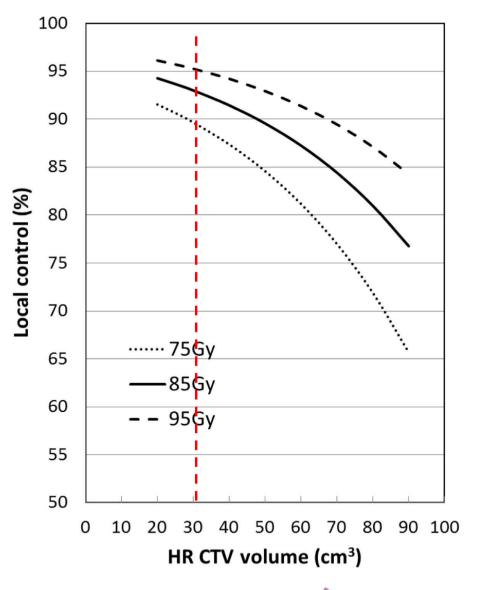

Evidence for dose needed to control primary tumor

Bigger tumors need more dose

Local control depends on applied <u>dose</u> in a certain <u>volume</u>

Tanderup 2016

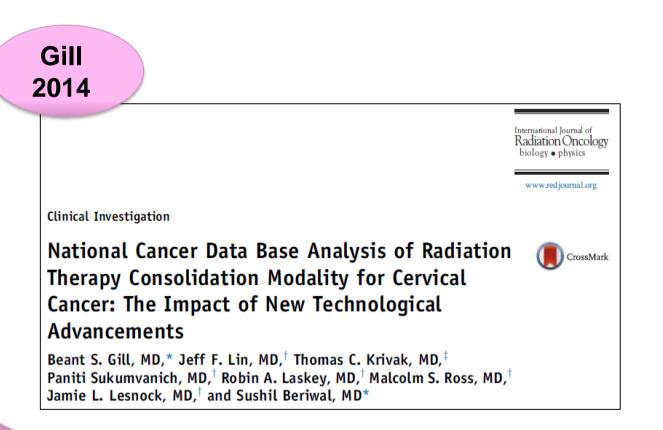

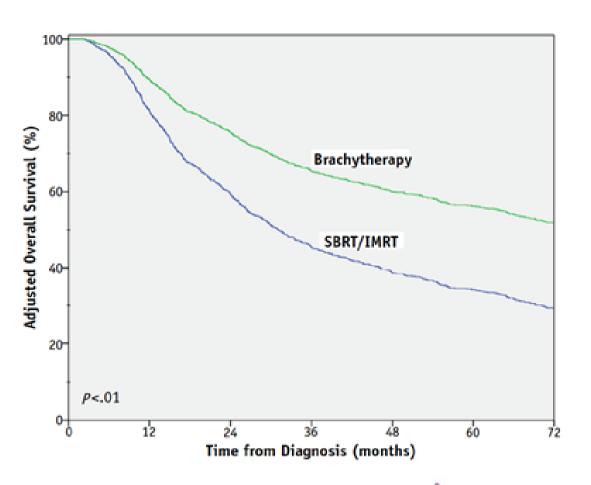

Evidence for dose needed to control primary tumor

Primary gyn tumors need dose (EBRT + BT)

- Local control depends on applied dose
- For cervix brachy contribution essential

Evidence for dose needed to control primary tumor

Preliminary results with SBRT, no brachy

 Different gyn tumors, primary tumors, recurrences, lymph node metastases

Mendez 2016

Abstrac

Aims: To summarise and evaluate the current literature in gynaecological tumours treated with stereotactic ablative body radiotherapy (SABR) through a systematic review using the Preferred Reported Items for Systematic Reviews and Meta-analysis (PRISMA) guideline.

Department of Radiation Oncology, Sunnybrook Health Science Centre, University of Toronto, Toronto, Ontario. Canada

Materials and methods: A literature search through Medline, EMBASE and Cochrane databases resulted in 22 pertinent manuscripts. Selected studies evaluated the locoregional role of SABR in gynaecological tumours, regardless of SABR clinical indication. Data on local control, toxicity and SABR dose and technique were extracted by at least two investigators.

Results: In total, 330 patients received locoregional SABR for gynaecological tumour and had measurable clinical outcomes. Six different clinical scenarios were identified: (i) boost to external beam radiotherapy (EBRT) for cervical cancer as radical treatment; (ii) boost to EBRT for non-operable endometrial cancer; (iii) treatment for pelvic and/or para-aortic node metastases; (iv) adjuvant treatment after surgery in uterine/cervix cancers; (v) salvage of non-nodal pelvic recurrences and (vi) vulvar or vaginal malignancies. Except for SABR as a boost for non-operable endometrial cancer, local control over 80% was found in a range of median follow-up of 4—132 months. Local control in non-operable endometrial tumours receiving SABR was 53%. In salvage treatments for non-nodal pelvic relapses, SABR was associated with about a 20% grade 3—4 gastrointestinal toxicity.

Conclusion: There is no clear consensus or evidence on the defined role of SABR in gynaecological tumours. Local control and toxicity associated with SABR seems reasonable for most clinical indications found by this review with a short median follow-up. When used for salvage of non-nodal pelvic recurrences, SABR may be associated with high rates of grade 3–4 late gastrointestinal toxicity.

- Small numbers, different local control rates

Tumors need dose

Microscopic disease: 45-50Gy

Pathologic lymph nodes: 55-60Gy

Primary / recurrent tumors: ->Brachytherapy

-If BT not feasible aim 70Gy

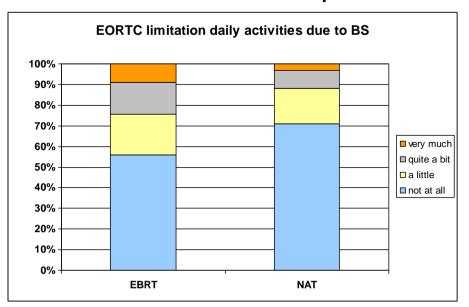

-SBRT dose no consensus

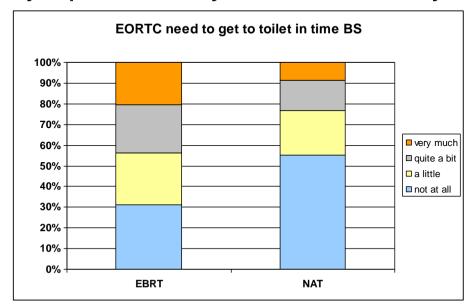

As high as intended and reasonably achievable

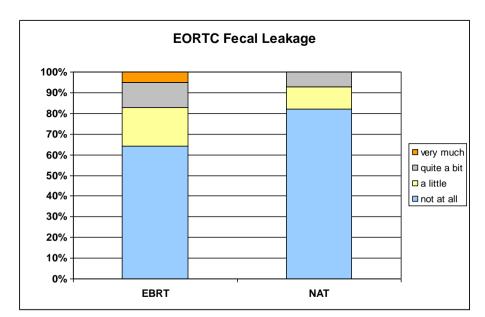

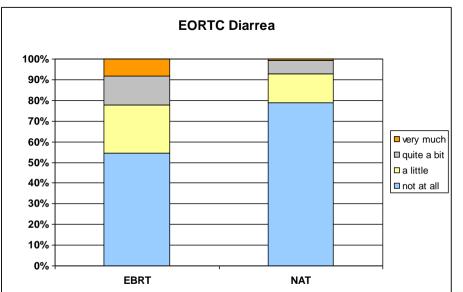

Evidence that OAR do not like dose

PORTEC-1: Patient reported bowel symptoms 15-years after 46Gy

Evidence that OAR do not like dose

Surrounding organs do not like dose; example bowel

- 90% of patients develop permanent change in bowel habits after radiotherapy
- 50% report impact on QoL
- 10-20% develop serious complications within 10-20 years after treatment

Andreyev 2007 Clinical Oncology (2007) 19: 790-799 doi:10.1016/j.clon.2007.08.011

Overview

Gastrointestinal Problems after Pelvic Radiotherapy: the Past, the Present and the Future

H. J. N. Andreyev

Department of Medicine, Royal Marsden Hospital, Fulham Road, London, UK

ARSTRACT.

Up to 300 000 patients per year undergo pelvic radiotherapy worldwide. Nine out of 10 will develop a permanent change in their bowel habit as a result. Five out of 10 of all patients will say that this change in their bowel habit affects quality of life and two to three out of 10 will say that this effect on quality of life is moderate or severe. Between one in 10 and one in 20 patients will develop very serious complications within the first 10 years after treatment. This number will increase to two out of 10 by 20 years from the end of treatment. Although research carried out into the basic molecular, cytokine and physiological changes underlying radiation-induced bowel symptoms and the optimal treatment that should be provided to symptomatic patients is scant, it does seem probable that a significant proportion of these patients can be cured or improved by specialist gastroenterological intervention. However, most patients never get referred to a specialist gastroenterologist and research into late radiation bowel damage has not been considered a priority. With the advent of more effective cancer therapies leading to greater numbers of affected long-term survivors, much more emphasis is urgently required to provide better information to patients at the start and after treatment, developing techniques that might reduce the frequency of significant bowel toxicity and researching better ways of measuring and treating late-onset side-effects. Key words: Chronic gastrointestinal toxicity, pelvic radiotherapy, quality of life

The development of bowel toxicity is not entirely dose, volume and fractionation schedule related. It also depends on a complex interaction of physical, patient-related and genetic factors, but these have been poorly characterised

Practical aspects

Treatment plan evaluation is based on DVH parameters and assessment of spatial dose distribution

To consider beyond dose constraints and DVH parameters

- Cooperation of radiation oncologist, clinical physicist and RTT essential
- Understand why an individual plan is not further improving
- Important to realize that treatment planning reflects anatomical situation at one moment in time
- Current CTV-ITV-PTV margins take into account anatomical changes of targets but not OAR
- Adaptive IGRT (e.g. library plans) accounts for these changes in a structured way and may further help to improve balance between tumor and OAR dose
- Our knowledge on dose constraints and DVH parameters is constantly improving

Literature data dose constraints rectum and bladder

Vagina

Also vagina does not like EBRT dose

 Significantly higher chance on G≥2 vaginal stenosis when EBRT dose exceeds 45 Gy

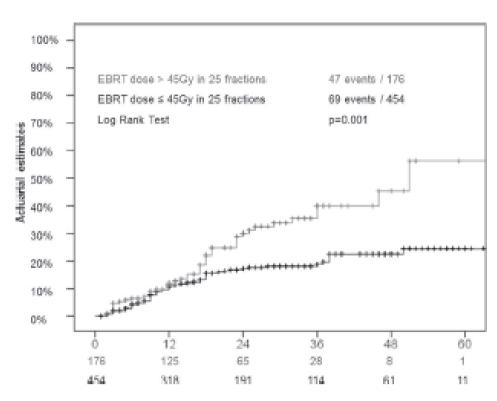

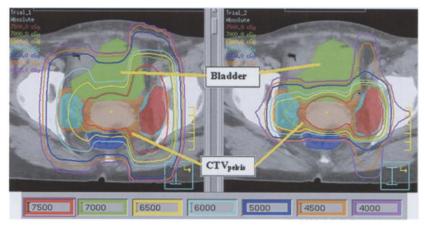

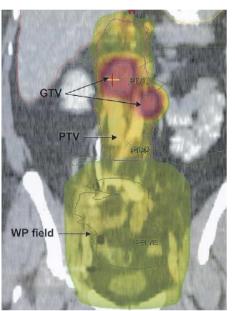

Fig. 3. Actuarial estimates for vaginal stenosis $G \ge 2$ in patients according to the EBRT dose.

Summary IMRT dosimetric gain

- Numerous studies including a metaanalysis
- Dosimetric gain by reducing in high dose volumes for OAR's
- Dosimetric gain by more dose to tumor, simultaneous boosts
- Extended field radiation easier achievable

EBRT treatment Techniques

Jamema Swamidas Kari Tanderup

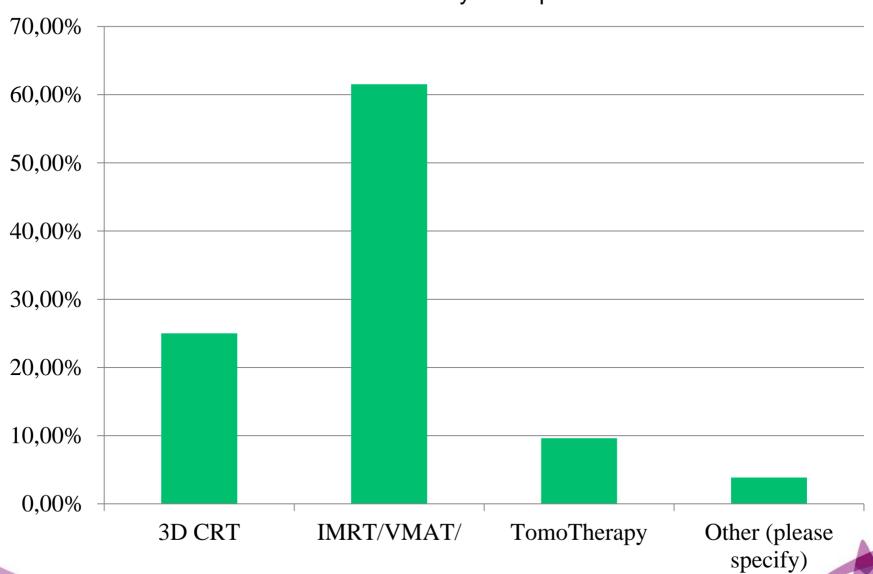

Learning Objectives

- Review of IMRT/VMAT planning tools for creating optimal plans.
- Familiarization of EMBRACE II protocol
- Examine the plan quality according to EMBRACE II protocol

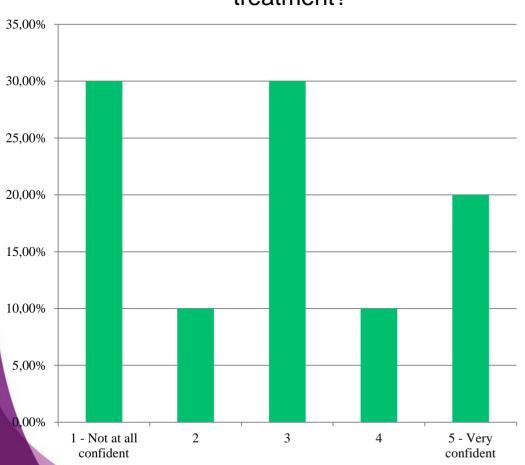

Your practice

What is the standard EBRT technique for definitive radiotherapy for cervical cancer in your department?

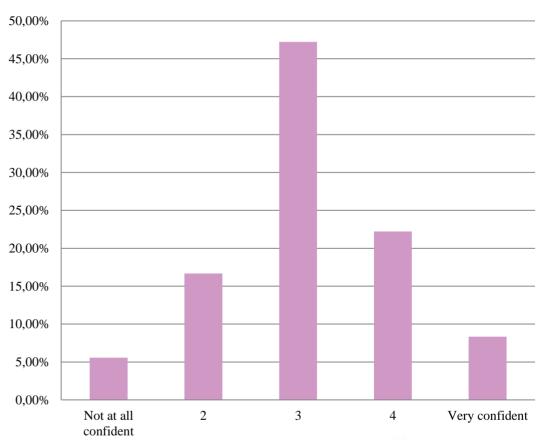

Your confidence

How confident are you at optimising IMRT plans for cervical cancer treatment?

How confident are you at evaluating IMRT plans for cervical cancer?

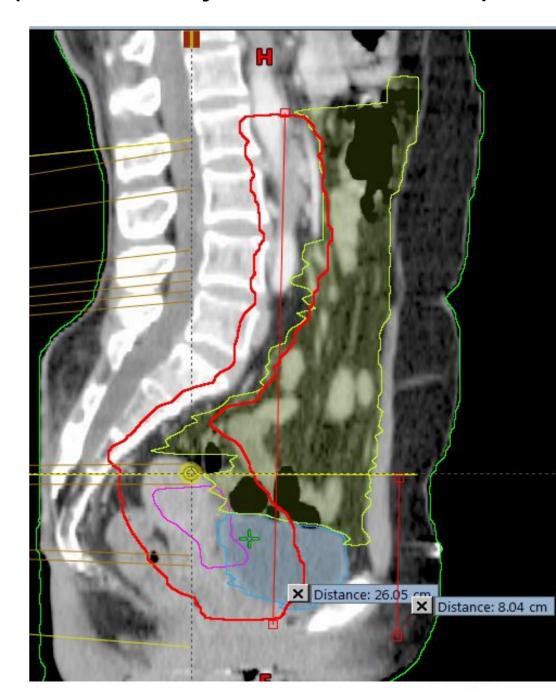

EMBRACE – II Study

- Aim: Optimize EBRT dose to minimize OAR
- Inverse optimization: IMRT / VMAT / HT mandatory
 - Choice of Beam energy: 6/10MV
 - Position of Isocentre
 - Number of arcs: 2-3
 - Dose calculation algorithm
 - Plan Objectives
 - Optimization volumes
 - Plan evaluation

Placement of Isocentre (limited by CBCT FOV)

- Length of PTV > 20cm, Isocentre has to be offcentered
- Limitation of CBCT –
 16cm
- To visualize full bladder, and Fundus of the uterus

Planning Objectives for target e.g – EMBRACE II

Primary Target

- PTV 45: V95% > 95% (Hard constraint)
- ITV 45 D99.9 > 95% (42.8Gy) (Hard Constraint)

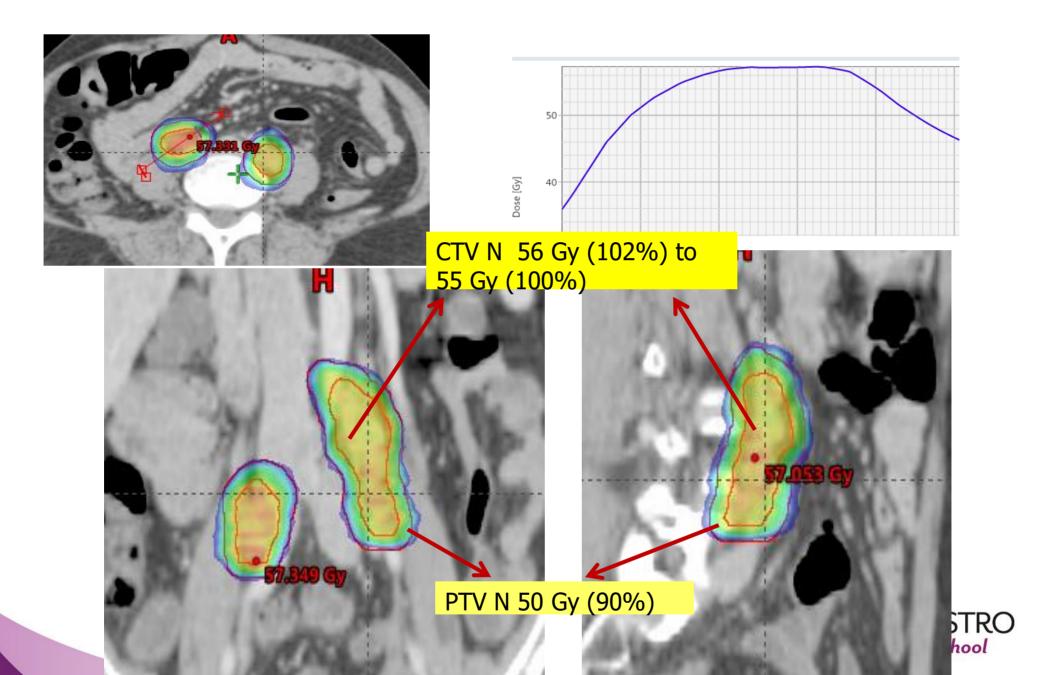

Nodes

- CTV-(N#) D98 >100% of prescribed dose (Hard constraint)
- If possible ITV-(N#) D50% > 102% of prescribed dose
- PTV-(N#) D98 > 90% of prescribed dose (Hard constraint)

PTV margins: 5mm isotropic for both ITV45 and ITV-(N#)

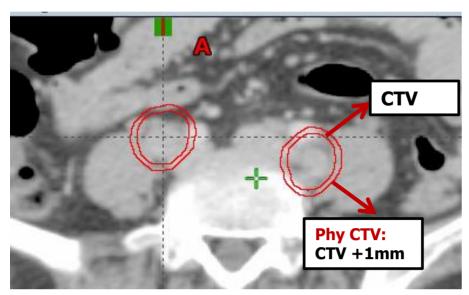

Coverage Probability Principle - Nodal SIB boost

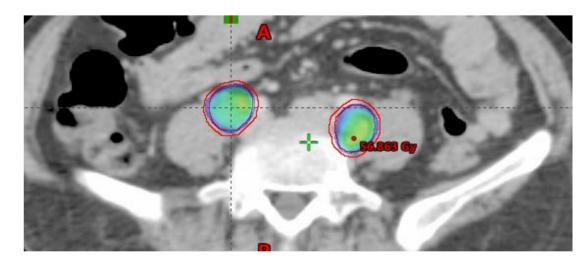

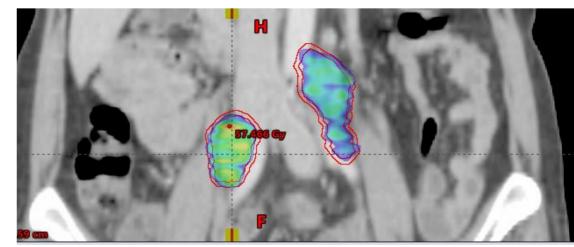

Optimization Volume - CTV Node

- Planning Aim: 55-57.5 Gy /25 fr (SIB)
 - D98% > 100% of LN Dose (Hard constraint)
 - Dmean > 102% of LN dose(Soft constraint)

Phy CTV: CTV + 1 mm

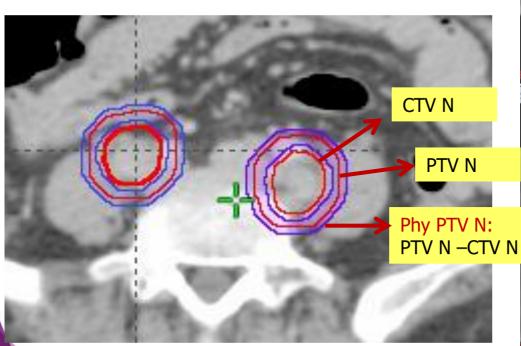

Optimization Volume - PTV node

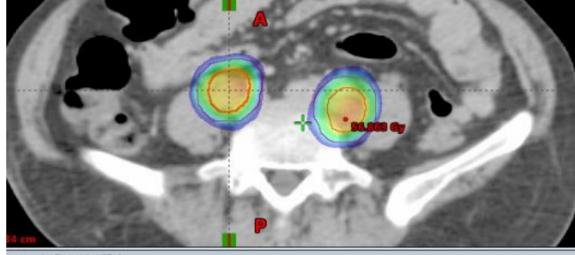

Phy PTV N : PTV N - CTV N

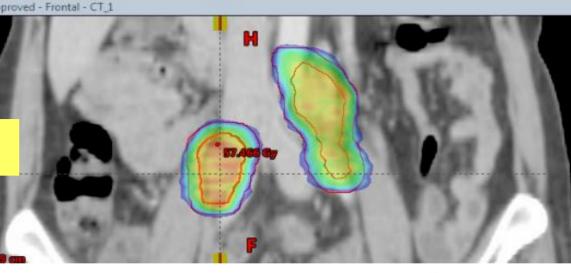

PTV dose constraints

D98% > 90% of LN dose

Dmax < 107% of LN dose

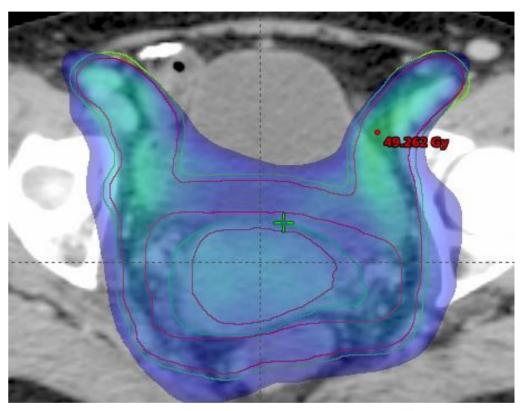

Optimization Volume - ITV 45

- D99.9 > 95% of prescribed dose, 42.8 Gy (Hard constraint)
- Optimization volume (Phy ITV): ITV 45+1mm

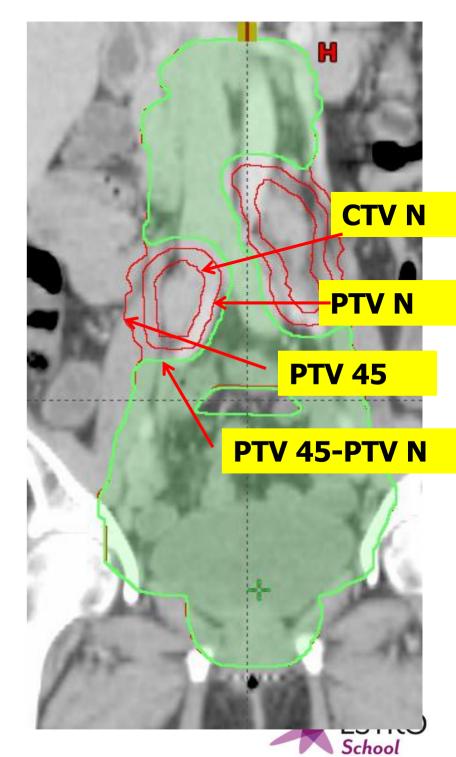

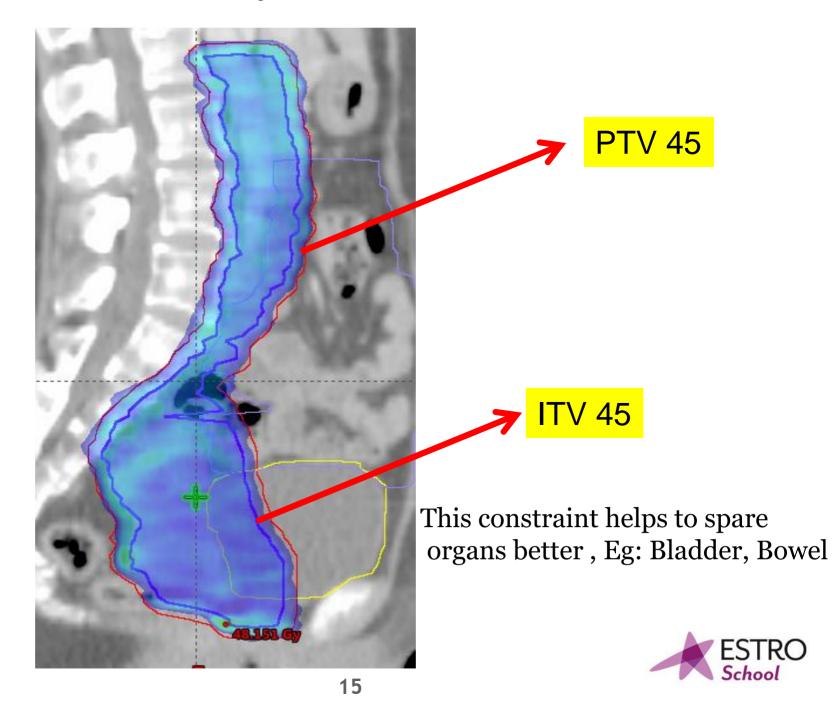

Optimization volume - PTV 45

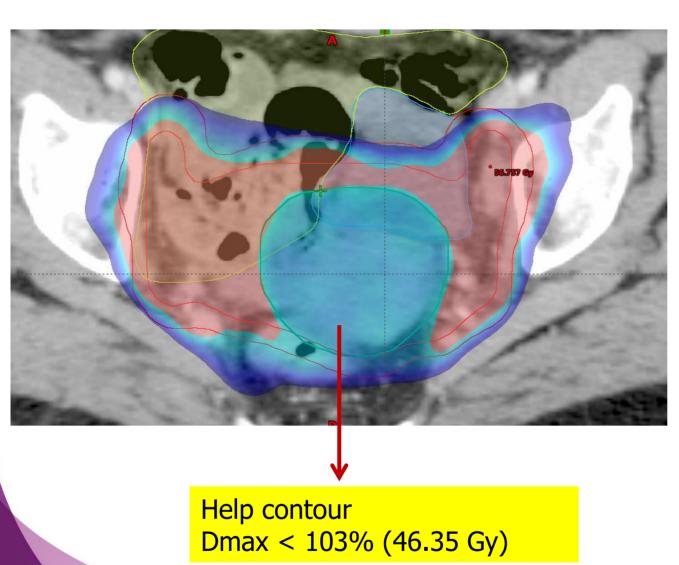

- V95% > 95%
- Dmax <107% (when Lymph nodes are not boosted)
- Optimization volume (Phy PTV 45:
 - > PTV 45-PTV N (crop by 3mm)

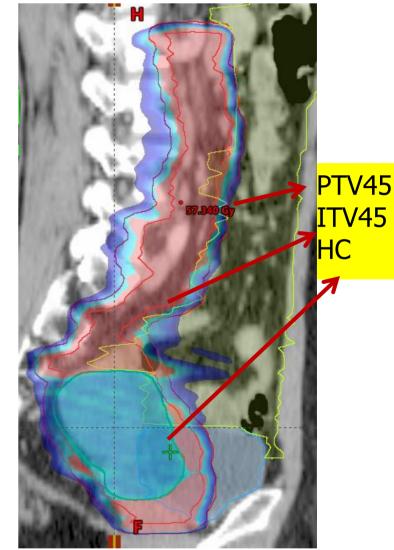

PTV 45 - 42.8 Gy Isodose Volume

BT region during IMRT - Helper Contour — Avoid hot spots (D0.1>103% of 45Gy — Soft constraint)

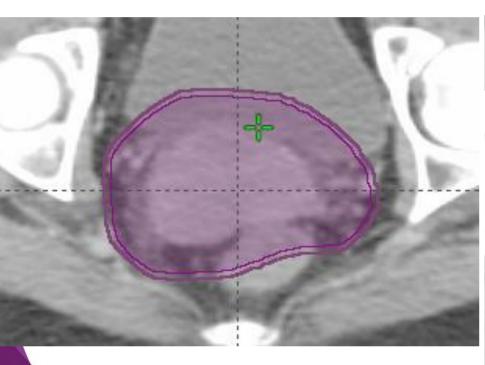

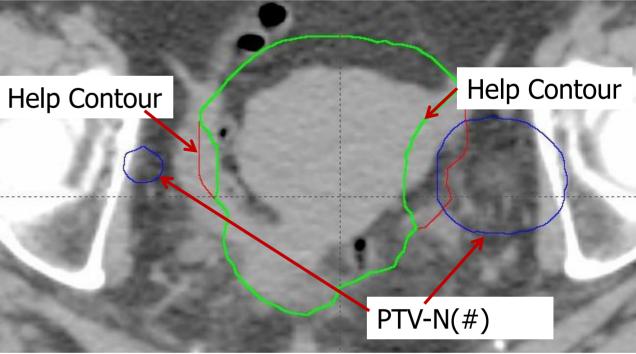

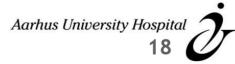

Optimization volume - Help Contour

Help contour = HR-CTV plus 1cm (the brachy area) Help Contour cropped with 1 cm to PTV-N(#).

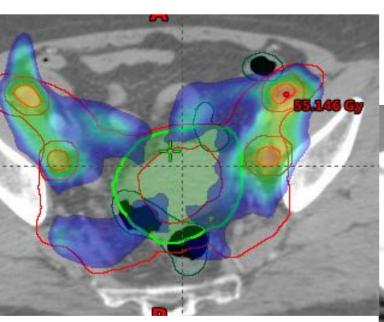

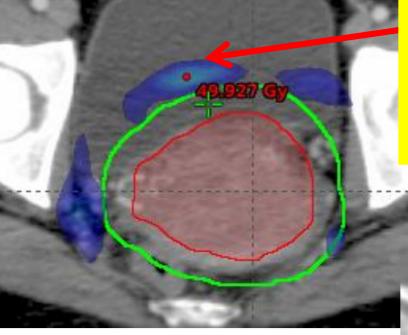

Help contour examples - 46.35Gy Isodose

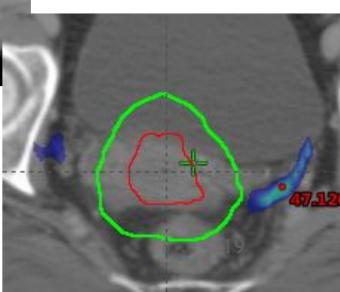

SIB – Multiple nodes

SIB with one node

To avoid: Potential high dose from BT

Imp: Spatial location of high dose in the OAR

Planning Objectives for OAR e.g – EMBRACE II (ALARA)

| Bowel | Dmax < 105% | V40Gy < 250cm³* V30Gy < 500cm³* | Dmax < 105% in regions outside 10-15mm from PTV-N | When no para-aortic irradiation: V40Gy < 250cm ³ * V30Gy < 500cm ³ * For para-aortic irradiation: V40Gy < 300cm ³ * V30Gy < 650cm ³ * |
|--------------------------|-------------------------|------------------------------------|--|--|
| Sigmoid | Dmax < 105% | | Dmax < 105% in regions outside 10-15mm from PTV-N | |
| DI-14 | 2 | V40Gy < 60%* | Dmax < 105% | V40Gy < 60%* |
| Bladder | Dmax < 105% | V30Gy < 80%* | in regions outside 10-15mm from PTV-N | V30Gy < 80%* |
| Destune | D < 10E0/ | V40Gy < 75%* | Dmax < 105% | V40Gy < 75%* |
| Rectum | Dmax < 105% | V30Gy < 95%* | in regions outside 10-15mm from PTV-N | V30Gy < 95%* |

| Femoral heads | Dmax < 50Gy | | Dmax < 50Gy | |
| Kidney | Dmean < 15Gy | Dmean < 10Gy | Dmean < 15Gy | Dmean < 10Gy |
| Body | Dmax < 107% | | Dmax < 107% | |
| Douy | Dillax < 10770 | | in regions outside 10-15mm from PTV-N | |
| Vagina (if not involved) | | D _{PIBS-2cm} < 5Gy | | D _{PIBS-2cm} < 5Gy |
| Conformality | | 1.10 (V42.75Gy/Volume of PTV) | | 1.10 (V42.75Gy/Volume of PTV |
| Conformality | | 1.55 (V36Gy/Volume of PTV) | | 1.55 (V36Gy/Volume of PTV) |
| | | | | |
| Transposed ovaries | Dmean < 8 Gy | Dmean < 5 Gy | Dmean < 8 Gy | Dmean < 5 Gy |
| Duodenum | V55 < 15cm ³ | | V55 < 15cm ³ | |

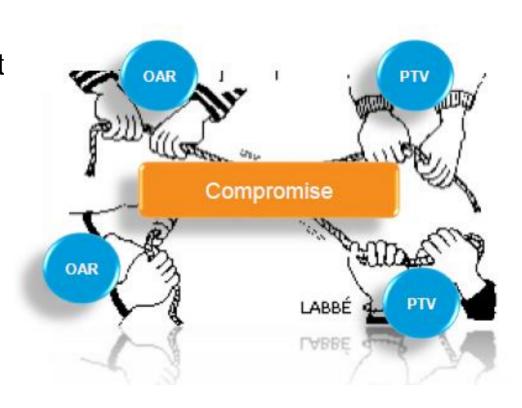

Percentages of 45 Gy unless stated otherwise for nodes Dmax and Dmin for MC plans based on D99.9 and D0.01

^{*} Soft constraints which can be used as optimisation constraints as they are not based on clinical evidence. The constraints are not supposed to be fulfilled by all patients, but rather by ~70-80% of the patients.

Monaco – Constrained optimization

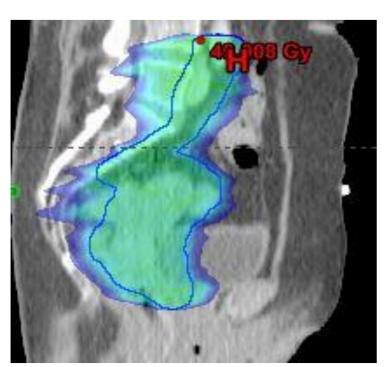

- In traditional systems, we create a plan to achieve target coverage then lower doses to OARs as a secondary process until the target coverage is compromised.
- With Monaco, the OAR doses (dose limiting cost functions) are prioritized and will be achieved before dose to targets (objective functions) are met.
- Only when the OAR doses are achieved will Monaco prioritize target objectives.

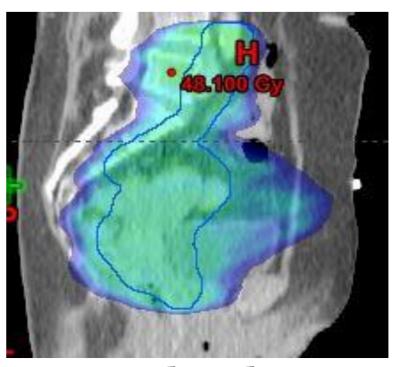

Slide Courtesy: Elekta Medical systems

Bowel, Bladder and Sigmoid 36 Gy isodosecurves

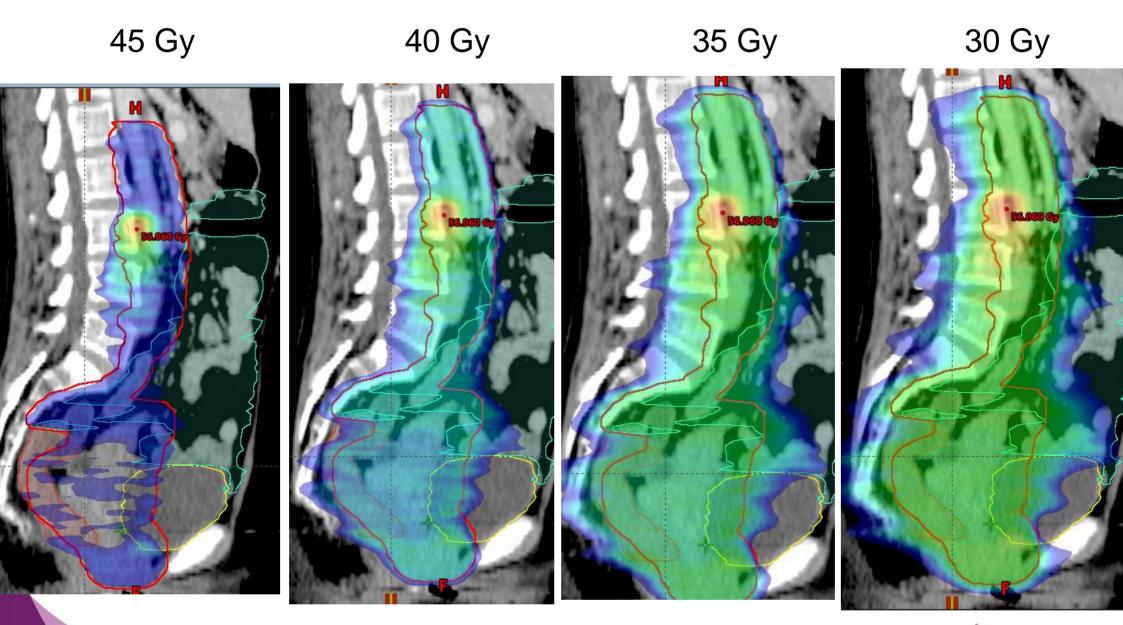

It is important to pay attention to lowdose area. OAR can be spared from a lot of dose!

Specially the bowel and the body V43Gy pays for the very good coverage.

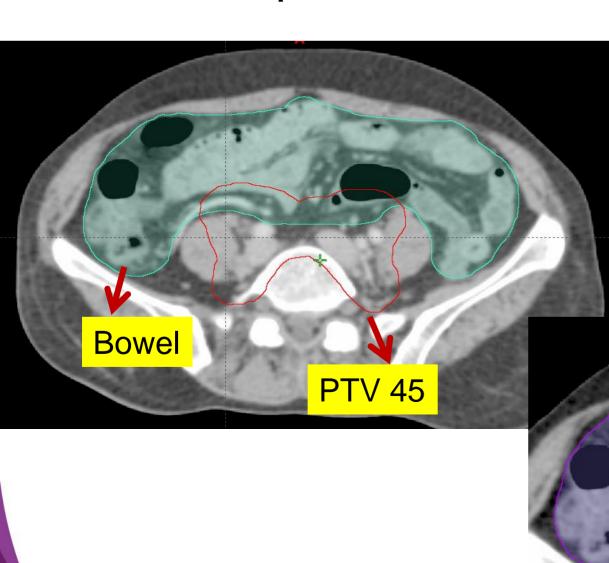

Dose fall – off

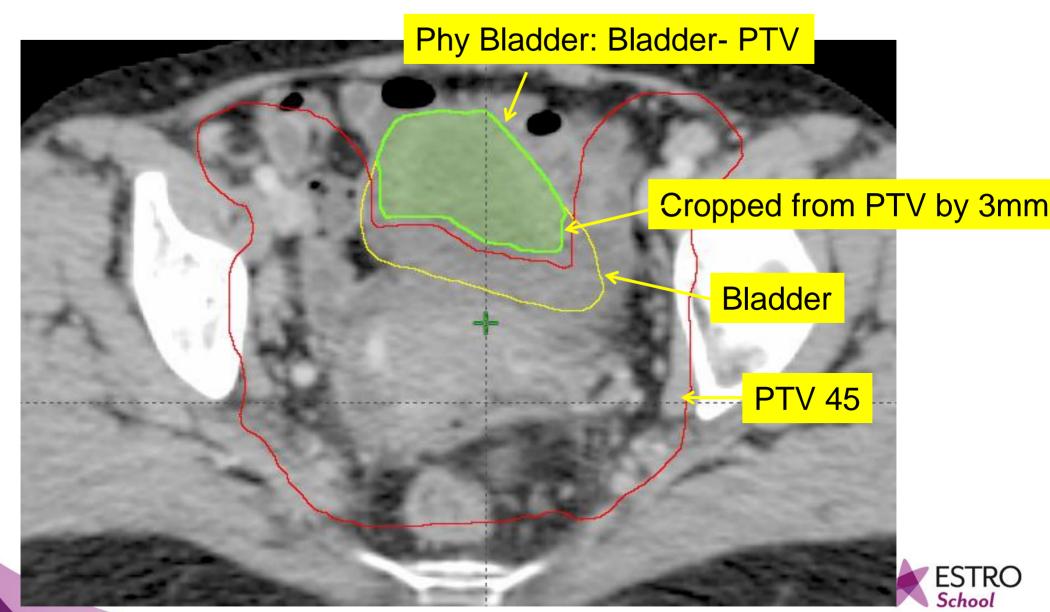

Optimization volumes - Bowel

Cropped from PTV by 3 mm

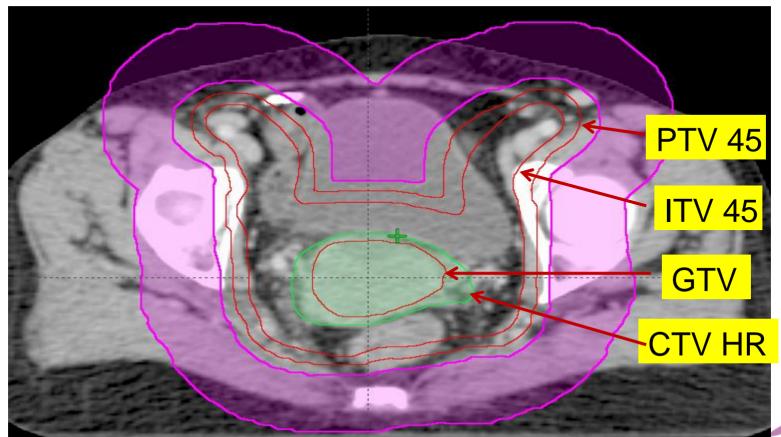

Optimization volume - Bladder

Optimization Volume – Shell

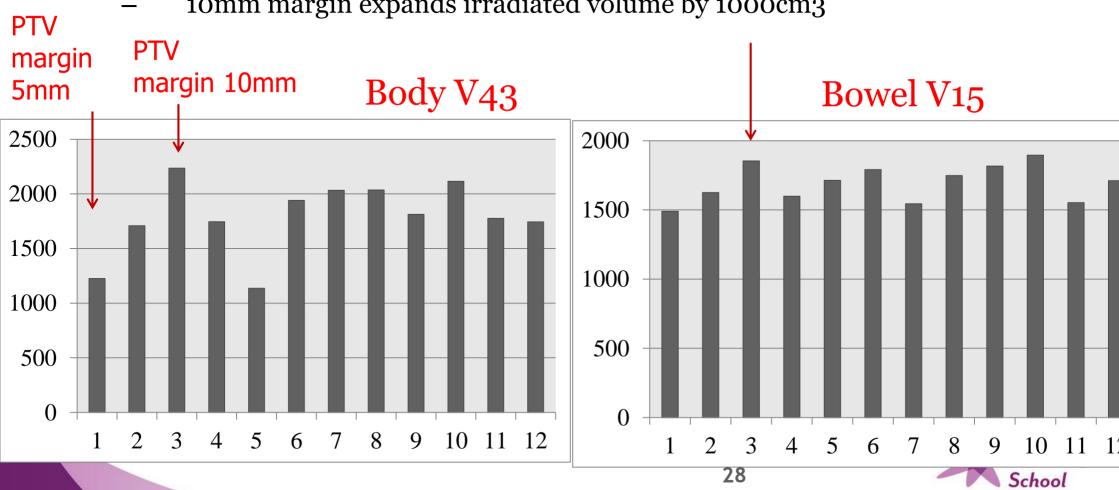

- To control the spillage of the high dose
- To control the lower dose, and improve conformity
- V43 Gy / Volume of PTV = 1.1
- V36 Gy / Volume of PTV = 1.55

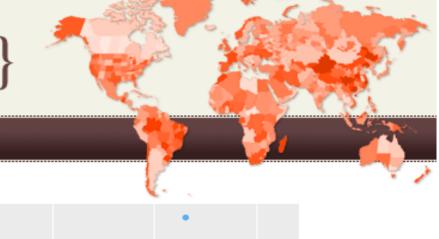

Irradiation of normal tissue – prague Home work

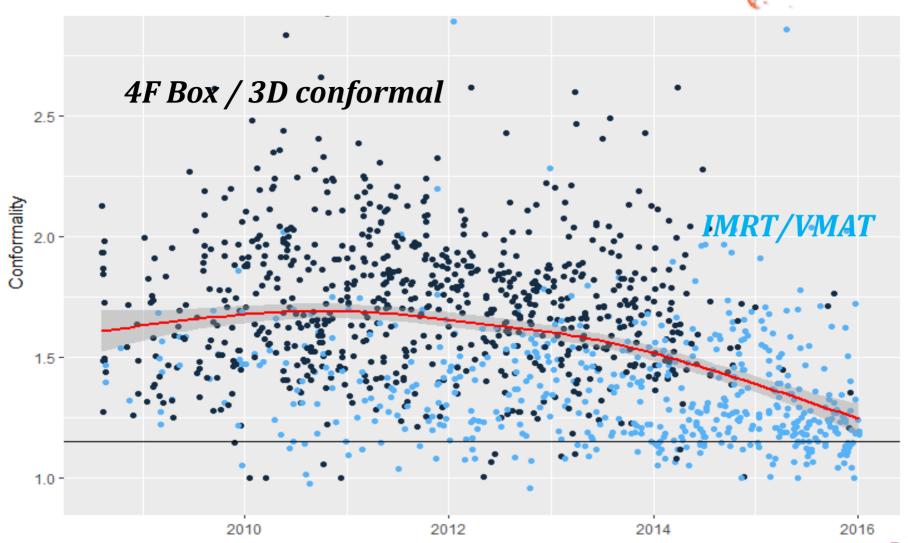

- Difference in irradiated body volume of 1000cm3
- **Question of PTV margin**
 - 5mm margin expands irradiated volume by 500cm3
 - 10mm margin expands irradiated volume by 1000cm3

Advances in EBRT treatment planning

- gEUD / Biological Optimization
- Knowledge based plan
- Multi Criteria Optimization
- Plan of the day?
- Online Adaptive
- ML / AI

How a gEUD objective works

Weights of virtual dose-volume objectives

$$gEUD = \left(\sum_{i} v_{i} D_{i}^{a}\right)^{1/a}$$

- The parameter a is organ specific. It is related to the parameter n, describing the volume effect in the Lyman Kutcher Burman NTCP model as n = 1/a.
- $a = +\infty$ (high a values): gEUD tends to the max dose-serial organs
- a = 1 gEUD equals the mean dose for parallel organs
- a = -∞ (negative a values): gEUD tends to the min dose- target min dose

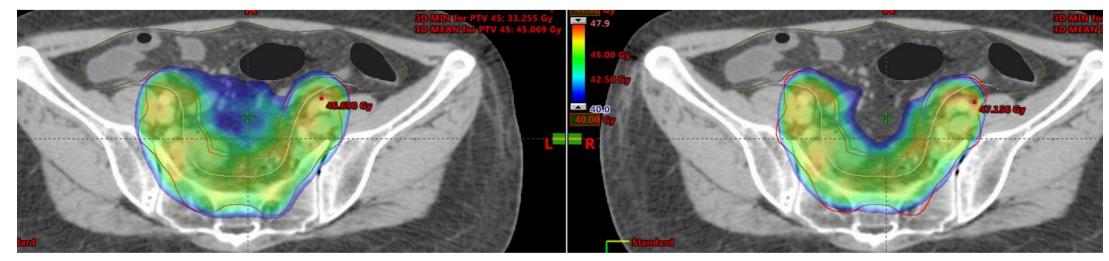

Comparison of DVH parameters Physical objectives vs gEUD plan

| DVH Parameter | | Physical Objectives plan | gEUD plan | Diff (cc) |
|--------------------------|-------|--------------------------------|-----------|-----------|
| Bowel (cm ₃) | V15Gy | y 1412 138 | | 24 |
| Bowel (cm ₃) | V3oGy | 1043 | 983 | 60 |
| Bowel (cm ₃) | V40Gy | 598 | 494 | 104 |
| Bladder (%) | V3oGy | 82 | 76 | 6 |
| Bladder (%) | V40Gy | 60 | 51 | 9 |
| Body (cm3)* | V43Gy | 1585 | 1440 | 145 |

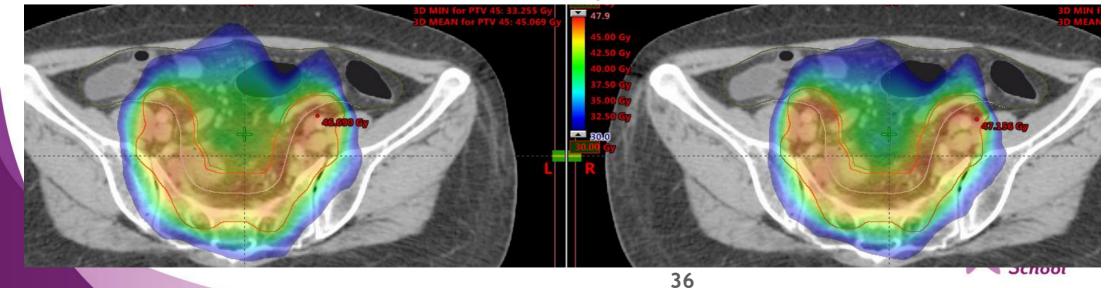

Bowel - Physical Objectives Vs gEUD

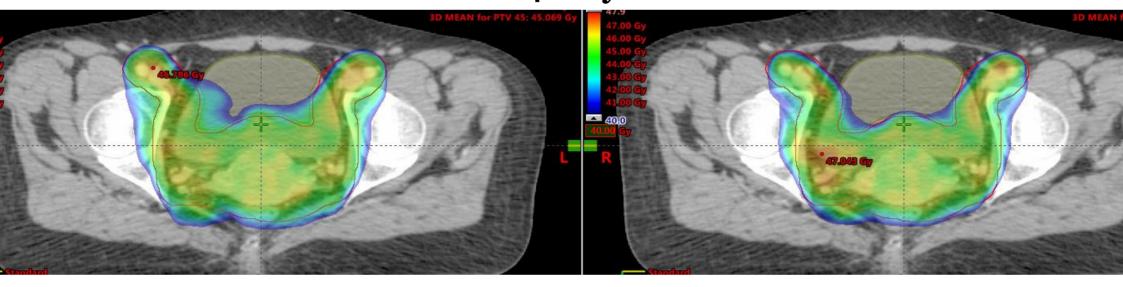

V40Gy

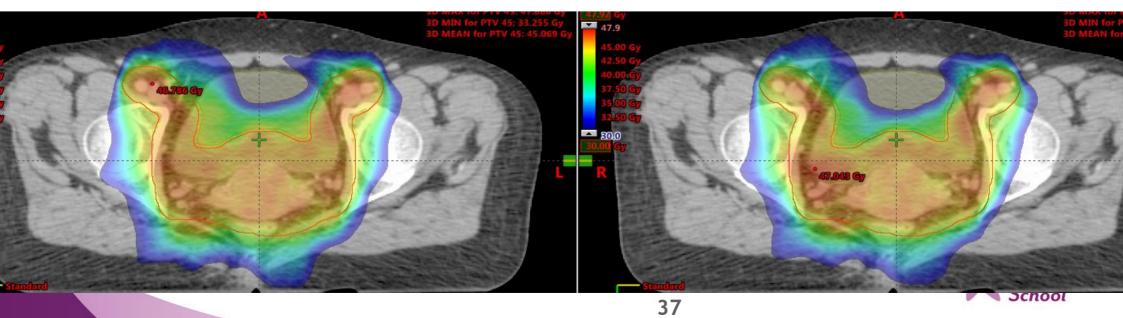

V3oGy

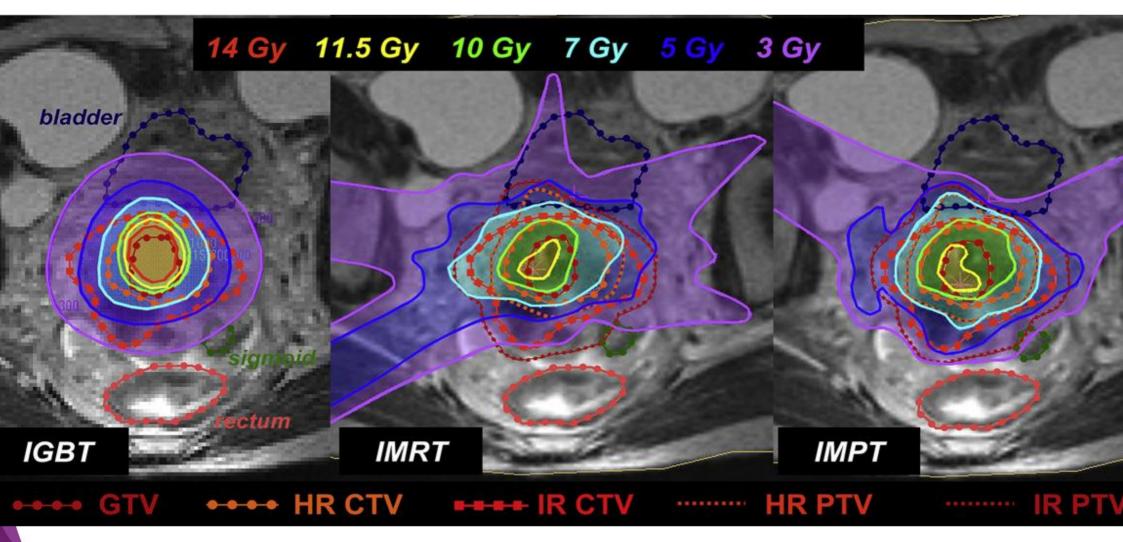

Bladder - Physical Objectives Vs gEUD V40Gy

V3oGy

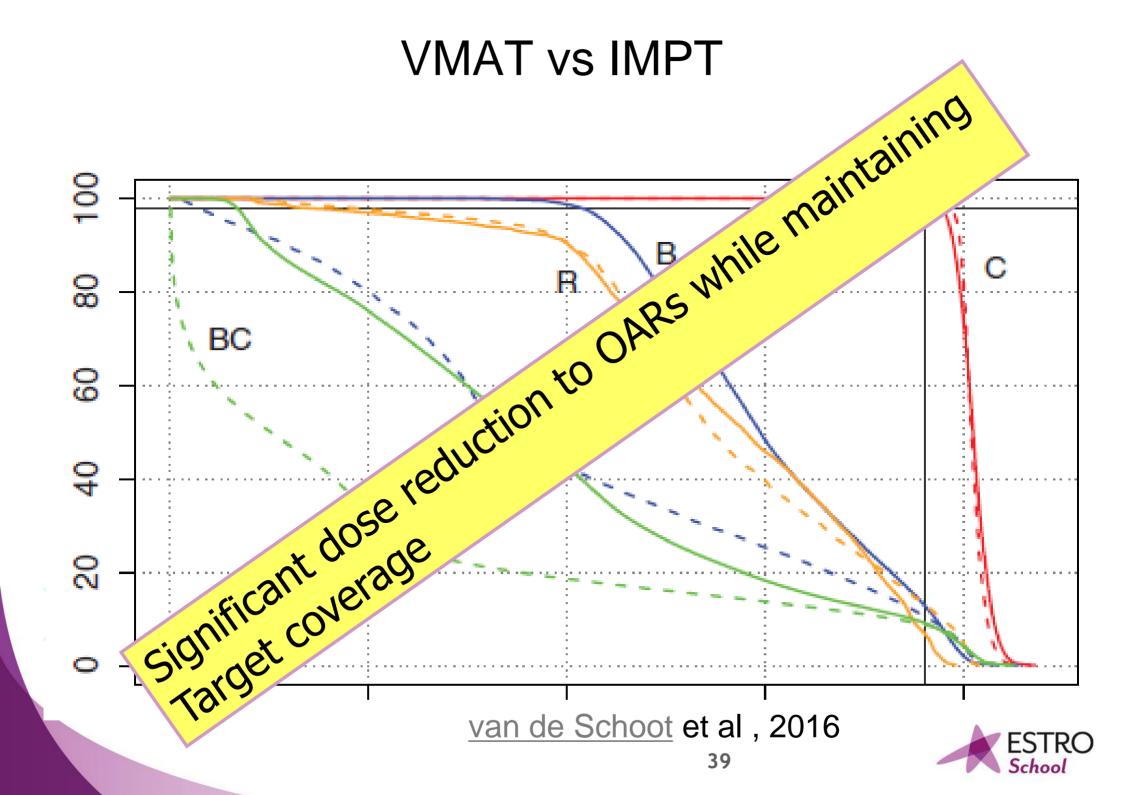

IMRT vs IGBT vs IMPT

George et al, 2008

IMRT VS IGBT

- For IMRT CTV-PTV margins is needed, i.e. a larger volume, compared to brachytherapy, has to be treated .
- D90 for IMRT was lower compared to BT for most of the patients.
- The volumes receiving intermediate doses (>60Gy) are much larger for IMRT.
- The importance of very high central doses are most likely of major importance for the excellent local control obtained with brachytherapy

Advanced BT is superior to IMRT

Conclusion

- · Tools of how to arrive at an optimal plan in a short time.
- EMBRACE protocol constraints Achievable for Targets,
 OAR(some times not achievable especially for bowel).
- IMRT / VMAT produces significant bowel and bladder sparing and hence improved conformity.
- Future tools Knowledge based planning, MCO!
- Use of gEUD / constraint optimization works well for OARs.
- Advanced IGBT is superior to IMPT

Dose calculation algorithm

AAA (C/S) vs Acuros (MC)

- Dose in the buildup region (Ca Breast)
- Dose in highly in-homogeneous region (Ca Lung)
- Dose in Interface Region(Bone-Tissue, Bone-Lung) Eg: Ca Breast
- In Pelvic IMRT, no marked difference between these two algorithms for dose calculation

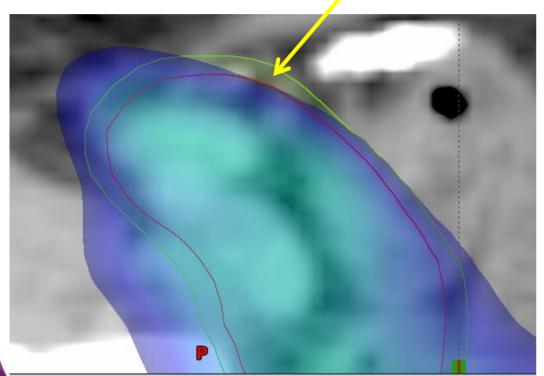

ITV Dmin vs ITV D99

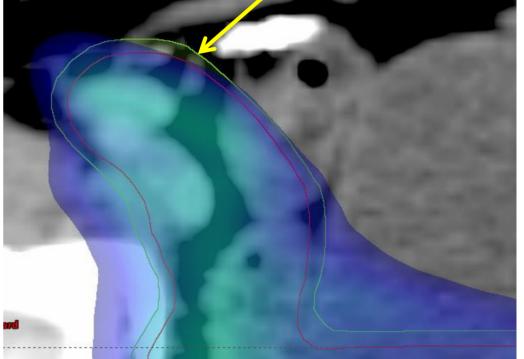

Dose Grid 2.5mm

Dmin 42.1 Gy

Dose Grid 1.0mm

Dmin 42.8 Gy

Varian Eclipse, Siemens Prowess – DAO, Philips Pinnacle (DMPO)

- Delivery constraints are included directly into the optimization.
- Oncentra VMAT developed by Ray Search Laboratories.

RaySearch also developed the SA module for Pinnacle (Underlying VMAT planning engine is very similar)

Elekta VMAT

- Anatomy based Inverse optimization ERGO ++
- Monaco (Biology based IMRT Optimization, Sweeping leaf sequencer)

Which of the following statement is **incorrect** regarding dose to OAR in EMBRACE II protocol

- 1. ALARA principle to be used
- 2. Bowel constraints : V40 < 250 cc, V 30 < 500 cc
- 3. Constrained Optimization / gEUD helps in achieving optimal OAR doses
- 4. None of the above

Inverse Planning - Beam Modeling

• Dosimetric accuracy of the IMRT plan delivery depends on the accurate representation of

- ✓ Beam Penumbra MLC / collimator jaws.
- ✓ transmission and scattering properties of MLC leaves.
- ✓ Output factor for small field size.
- ✓ Accuracy of dose calculation algorithm.
- ✓ Approximations of leaf sequence generation algorithm.
- ✓ Leaf positioning accuracy.

Applying adequate D to N+

Technique

Timing

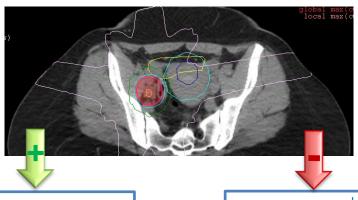

Dose

Technique of Nodal Boost: AP/PA or 3D CRT

- ↓D to central pelvis
- Excessive D along beam entry
 - Large V at high Dose
- Typical timing: Sequential

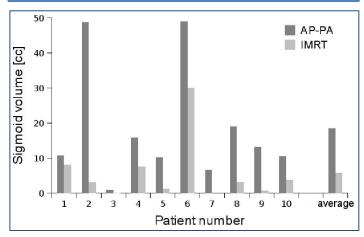

Technique of Nodal Boost: IMRT / VMAT

High D conformity

Smaller V at high D

- ↑ D to PTV-N (control)
- ↓ D to OAR (morbidity)

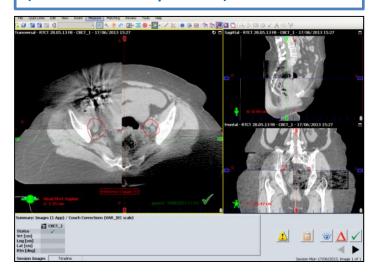

L. Dijkstra, E.Kerkhof

Larger V at ↓ D

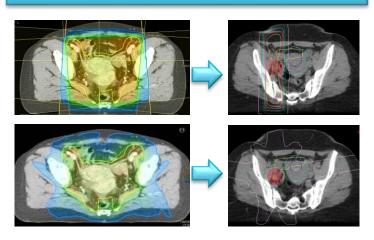

• Implications?

Uncertainties due to movements (need for daily CBCT)

Timing of Nodal Boost

Sequential Boost

i.e.:

PTV-E: 45 Gy in 25 fx

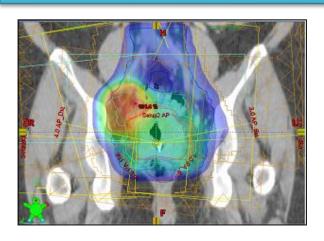

PTV-N: 16 Gy in 8 fx

↑ Totally delivered D ("waste D")

Simultaneous Integrated Boost

i.e.: (EMBRACE 2 Study protocol)

PTV-E: 45 Gy in 25 fx

PTV-N: 55 Gy in 25 fx (True pelvis)

57.5 Gy in 25 fx (Outside True p.)

Overall Treatment Time

Classical radiation dose-control data

| Size of Tumor | Control of Tumor Achieved with 6000 rads | Control of Tumor Achieved with Cisplatin and 6000 rads |
|------------------|--|--|
| 2 cm | 90% | 94% |
| 2–4 cm | 75% | 85% |
| 4–6 cm | 65% | 80% |
| 6 cm | 55% | 74% |

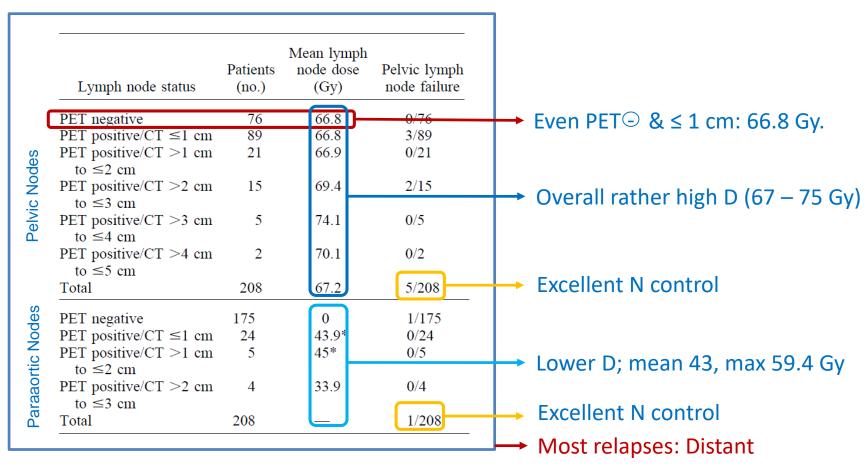

LYMPH NODE CONTROL IN CERVICAL CANCER

Perry W. Grigsby, M.D.,* $^{\dagger \S}$ Anurag K. Singh, M.D.,* § Barry A. Siegel, M.D., $^{\dagger \S}$ Farrokh Dehdashti, M.D., $^{\dagger \S}$ Janet Rader, M.D., $^{\ddagger \S}$ and Imran Zoberi, M.D.* §

n=208, all stages

N status: CT and PET

Grigsby PW, et al Int J Radiat Oncol Biol Phys 2004;59(3):706-12.

139 patients

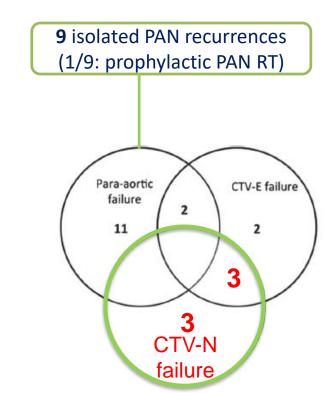

PET CT, MRI

209 N+ in 75 pts. $SUV_{max} = 5 (2-21)$

Boost D (EQD2): **D98=62 (53-69) Gy**

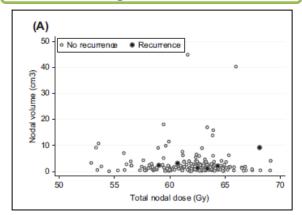

21 (15 %) pts.: N relapse

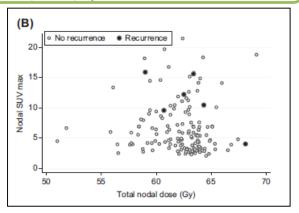

Conclusions:

- Current boost practice: ↑ control of involved N
- \uparrow SUV_{max} \rightarrow negative prognostic factor
- Attention: Chemotherapy & Paraaortic RT

D & V: No significant correlation

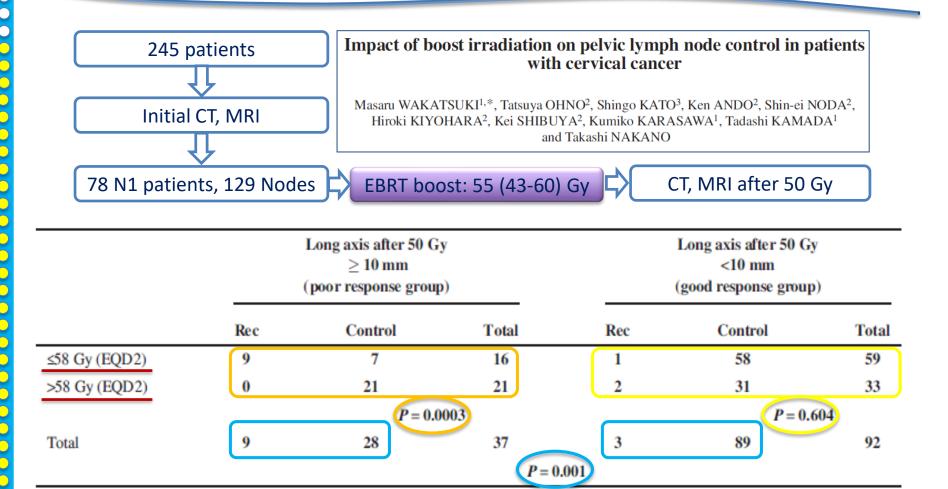

Initial SUV_{max} (recurrent N): 11 (4-16); p=0.002

More failures when < 5 cycles of ChT (p<0.001)

Ramlov A, et al. Acta Oncologica 2015

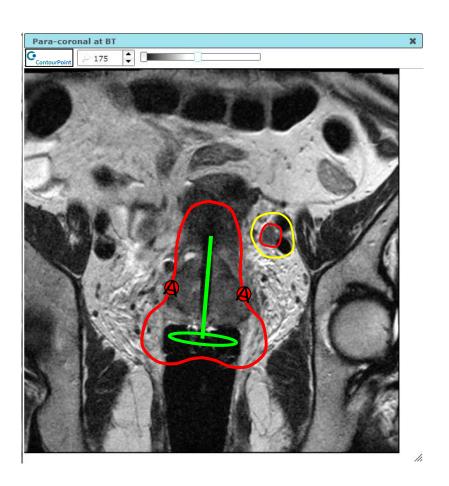

Conclusions:

- 1. Response after RT was more significant predictor for recurrence than initial N size
- 2. Poor responding nodes require >58 Gy

Summary

- Evidence suggests: 55 60 Gy
- "Elective" dose: 45 50 Gy + boost 10 to 20 Gy
- It's not only a matter of dose!
 - Initial SUV and SUV regression during EBRT
 - Volume or diameter regression during EBRT
- Don't forget BT dose contribution

Contribution of Brachytherapy to Nodal Dose

Width: 2.5 cm

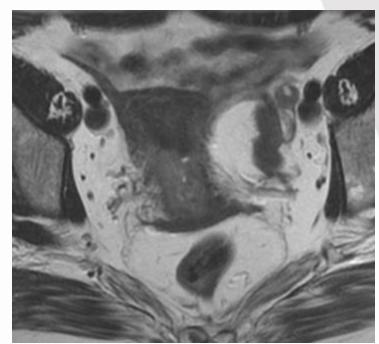

Thickness: 2.5 cm

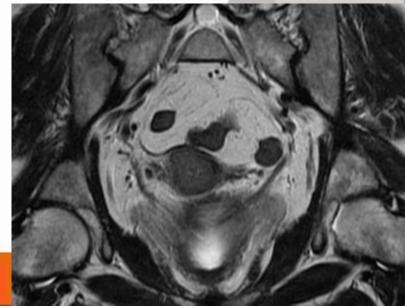

Height: 3 cm

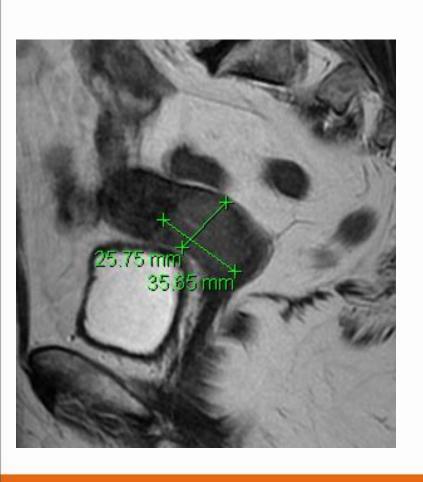

Tumoral assessment

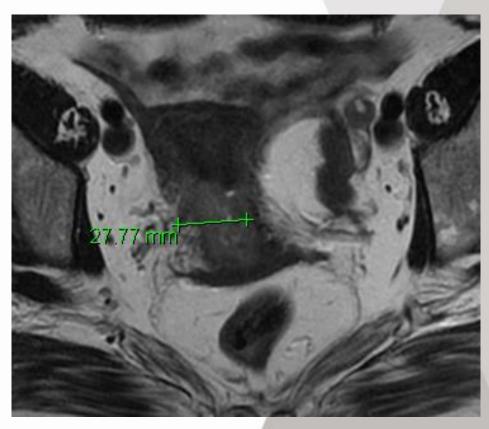

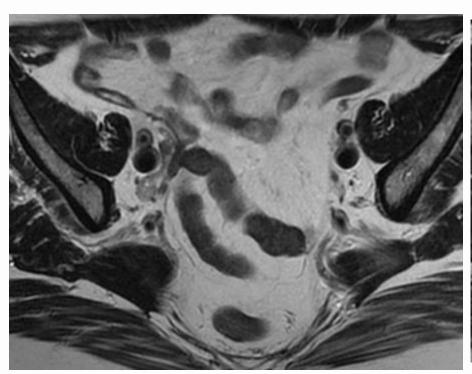

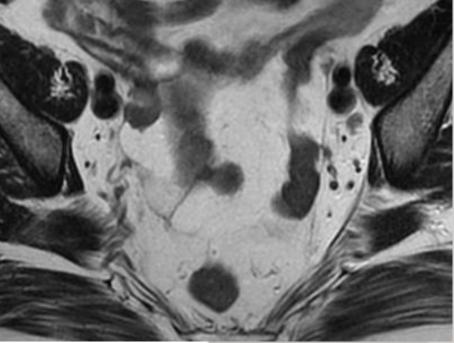

Tumoral assessment

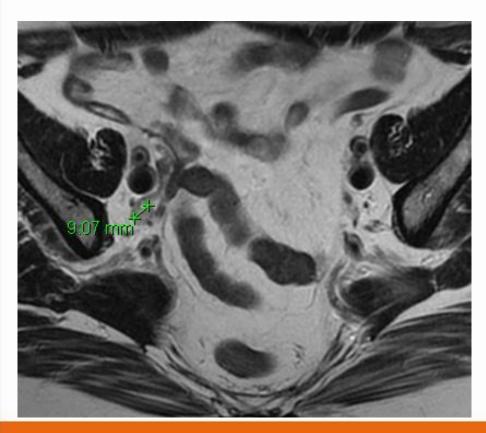

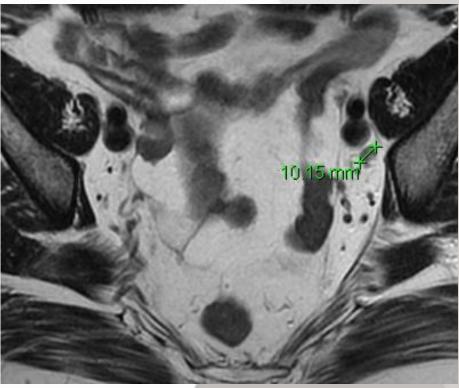

Nodal assessment

Nodal assessment

FIGO staging?
Complementary exams?
Can nodal status be better assessed?
Treatment?

TASK: EACH GROUP to come up with a consensus in 3-4 SLIDES

Clinical example: endometrial cancer

Case description

65 years old patient

WHO = 0; BMI = 33

Post-menopausal bleeding

Clinical investigation:

No pathological findings

Vaginal ultrasound:

≈50% myometrium invaded no cervical infiltration

Curettage:

G1 endometrial adenocarcinoma

no signs of cervical infiltration

Chest x-ray:

No pathological findings

Primary treatment: surgery

- Laparoscopic hysterectomy & bilateral salphingo oophorectomy
- Complete removal, no lymphadenectomy, no suspicious nodes

Histopathological findings:

- G2 endometroid adenocarcinoma (1.8 cm, dorsal wall)
- No lymph vascular space invasion (LVSI)
- Infiltration > ½ myometrium
- No infiltration into cervical stroma, serosa or adnexa
- → FIGO stage IB grade 2 endometrial cancer

Postoperative management

- 1. Lymphadenectomy (complete staging)?
- 2. Radiotherapy?
 - if yes: EBRT, BT, both?
- 3. Systemic treatment?
- 4. What if there was LVSI present?

Postoperative management

FIGO IB grade 2 endometrioid

- 1. Lymphadenectomy (complete staging)?
- 2. Radiotherapy?
 - if yes: EBRT, BT, both?
- 3. Systemic treatment?
- 4. What if there was LVSI present?

Lymph node metastasis (GOG)

Risk of microscopic pelvic metastases for stage 1 without extrauterine disease:

• low risk (<5%)

- grade 1 < 2/3,
- gr 2-3, no invasion

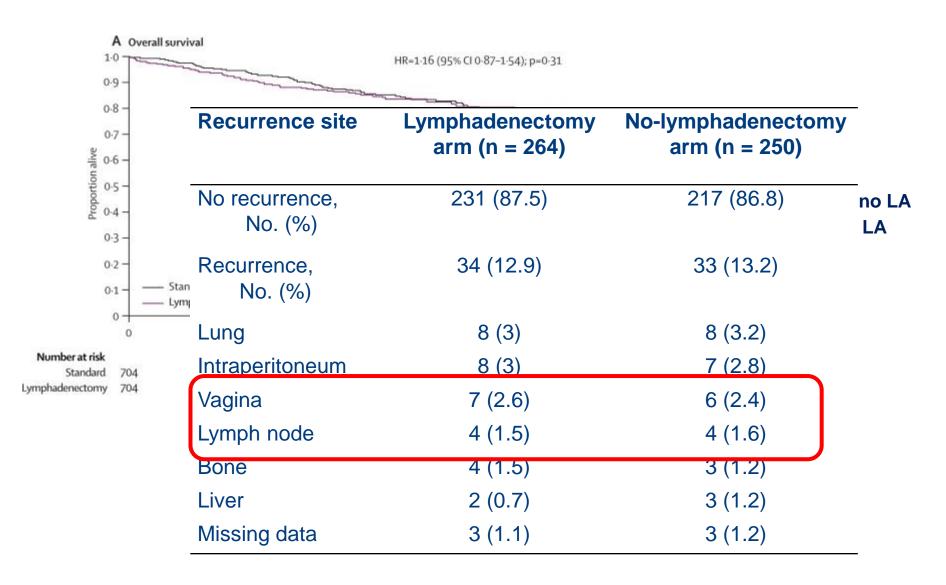

• *intermediate* (5-10%)

all others

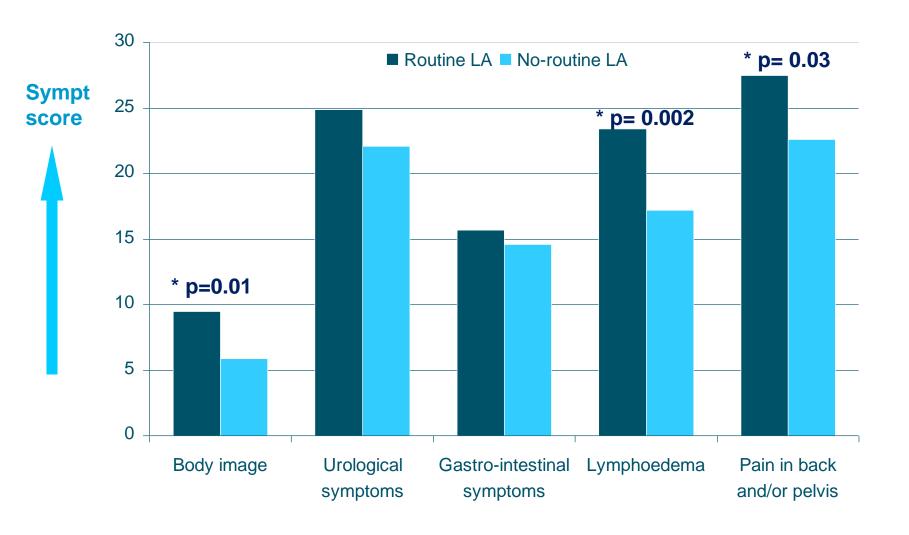

high risk (>10%)

gr 3, >2/3 invasion

Lymphadenectomy trials

Lymphadenectomy Quality of Life

Lymphadenectomy indications ESMO-ESGO-ESTRO

Recommendation 5.5: Patients with <u>low-risk</u> endometrioid carcinoma (grade 1 or 2 and superficial myometrial invasion <50%) have a low risk of lymph node involvement, and two RCTs did not show a survival benefit. Therefore, lymphadenectomy is not recommended for these patients

Level of evidence: II

Strength of recommendation: A

Consensus: 100% yes (37 voters)

Recommendation 5.6: For patients with <u>intermediate risk</u> (deep myometrial invasion >50% or grade 3 superficial myometrial invasion <50%), data have not shown a survival benefit. Lymphadenectomy can be considered for staging purposes in

these patients

Level of evidence: II

Insufficient evidence for efficacy or benefit does not outweigh the risk or the disadvantages (adverse events, costs, ...), optional

Strength of recommendation: C Consensus: 100% yes (37 voters)

Recommendation 5.7: For patients with high risk (grade 3 with deep myometrial invasion >50%), lymphadenectomy should be recommended

Level of evidence: IV

Strength of recommendation: B

LND to complete staging?

Recommendation 5.8: Lymphadenectomy to complete staging could be considered in previously incompletely operated high-risk patients to tailor adjuvant therapy

Level of evidence: V

Strength of recommendation: C

Consensus: 100% yes (37 voters)

6 Insert > Header & footer 10-Sep-18

Sentinel Node?

Recommendation 5.3: SLND is still experimental, but large series suggest that it is feasible. SLND increases the detection of lymph nodes with small metastases and isolated tumour cells; however, the importance of these findings is unclear

Level of evidence: IV

Strength of recommendation: D Consensus: 100% yes (37 voters)

STATEC trial in High Risk EC sub study for sentinel node

Intermediate Risk – Randomised trials

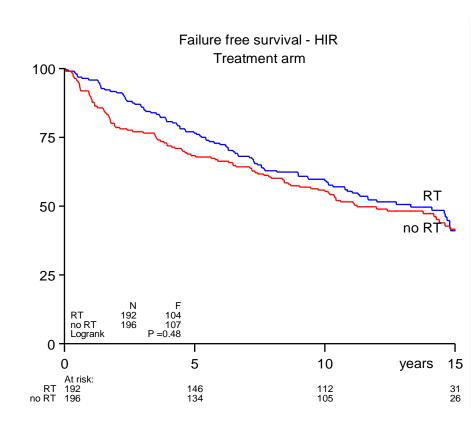

| Trial | No. patients eligibility | Surgery | Randomization | Locoregional recurrence | Survival | Severe complications |
|------------------------|---|-------------------------------------|--|-------------------------------------|-------------------------------------|------------------------------------|
| Norwegian 1968-1974 | 540 Stage I | TAH-BSO | Brachytherapy vs. brachy and pelvic RT | 7% vs. 2% at 5 years p<0.01 | 89% vs. 91% at 5 years p=NS | NA |
| PORTEC 1990-1997 | 714 IB grade 2-3 IC grade 1-2 | TAH-BSO | NAT vs. pelvic RT | 14% vs. 4% at 5 years p<0.001 | 85% vs. 81% at 5 years p=0.31 | 3% GI at 5 years (actuarial) |
| GOG-99 1987-1995 | 392 St IB, IC St II (occult) | TAH-BSO and lymph- adenectomy | NAT vs. pelvic RT | 12% vs. 3% at 2 years p<0.01 | 86% vs.92% at 4 years p=0.56 | 8% GI at 2 years (crude) |
| ASTEC/EN5 1996-2005 | 905 St IAB g3, IC, St II, serous/cc | TAH-BSO +/- lymph- adenectomy | NAT vs. pelvic RT | 7% vs. 4% at 5 years p=0.038 | 84% vs.84% at 5 years p=0.98 | 3 vs 7% gr 3/4 |

PORTEC-1: 15-year outcomes for HIR patients

Locoregional Recurrence

Locoregional relapse - HIR Treatment arm 30 no RT P <.001 Logrank no RT 20 75% vaginal RT recurrences 5 10 15 years At risk: 147 113 31 136 106

Failure Free Survival

Summary high-intermediate risk

- Brachytherapy effective in preventing vaginal recurrence: 2.9% at 8 years
- More pelvic recurrences after brachytherapy, most with simultaneous distant metastases (isolated pelvic failure 1.5% vs 0.5%)
- No difference in distant metastases and survival
- VBT better QoL/functioning

Lymph vascular space invasion LVSI

- LVSI independent prognostic factor for relapse (p<0.001)
- Both in node positive and negative disease
- LVSI positive: 5-fold risk for N+ (p=0.001)
- Node negative: LVSI significant prognostic factor for relapse and survival

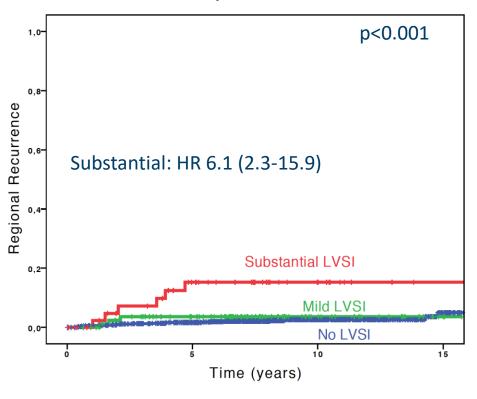

Quatification of LVSI in PORTEC-1 and 2

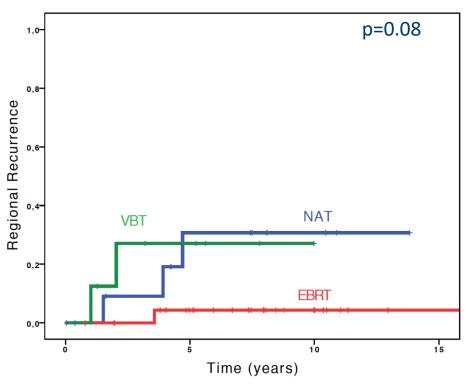

Pelvic nodal recurrence

All 954 patients

Substantial LVSI: 46 patients

5%

Q1: Current best definition of risk groups?

| Risk Group | Description (FIGO 2009) No R | E |
|------------------------|---|-------------|
| Low | Stage IA Endometrioid + grade 1-2 + LVSI negative | 1 |
| Intermediate | Stage IB Endometrioid + grade 1-2 + LVSI negative | 1 |
| High Intermediate | Stage IA Endometrioid + grade 3, regardless of LVS Stage I Endometrioid + grade 1-2 + LVSI unequivocally positive regardless of depth of invasion Pelvic IMRT | 1 |
| High | Stage IB Endometrioid + grade 3, regardless of LVSI status Stage II & stage III with no residual disease Non endometrioid (serous, clear cell, undifferentiated carcinoma, carcinosarcoma, mixed >10%) | 1 1 1 |
| Advanced Metastatic | Stage III with residual disease & IVAStage IVB | 1 1 |

Chemotherapy in the treatment of Cervical Cancers

Umesh Mahantshetty

Professor,

Department of Radiation Oncology

8

GYN Disease Management Group Member Tata Memorial Hospital, Mumbai, India

Objectives

 To understand the role of chemotherapy in the management of locally advanced cervical cancer

 To learn from the most important clinical series the real benefit of chmeotherapy

Chemotherapy Schemes

- Neo adjuvant Chemotherapy:
 - NACT followed by RT Vs RT
 - NACT followed by Sx Vs RT
 - NACT followed by Sx Vs Sx
 - NACT followed by Sx Vs Chemo-RT
- Concomitant Chemo-radiation (Radiosensitizing CT)
- Adjuvant CT / Neo-adjuvant CT followed by CTRT
- Palliative Chemotherapy including targetted therapy in recent era

www.ejconline.com

Neoadjuvant chemotherapy for locally advanced cervical cancer: a systematic review and meta-analysis of individual patient data from 21 randomised trials

Neoadjuvant Chemotherapy for Cervical Cancer Meta-analysis Collaboration*,1

- Individual patient data from 23 trials
- Two comparisons:

PERGAMON

- Comparison 1 NACT followed by RT Vs RT alone
- Comparison 2 NACT followed by Sx Vs RT

Comparison 1

NACT followed by RT Vs RT

- 18 trials
- N = 2074
- 92% of patients from all eligible trials
- Survival data available from all trials
- Median FU 5.7 years
- 70% pts had stage II or III disease
- Lymph node status unknown in 60%

Comparison 1 NACT followed by RT Vs RT

| Table 3 All endpoints in comparison 1 | | | | |
|--|----------------------------------|---|--------------------------|--|
| Endpoint | Number of events/patients | Hazard ratio (95% CI), P value | Heterogeneity P value | |
| Survival Disease-free survival | 1084/2074 | 1.05 (0.94–1.19), 0.393 | 0.0003 0.001 | |
| Loco-regional disease-free survival Metastases-free survival | 938/1724 911/1724 899/1724 | 1.00 (0.88–1.14), 1.000 1.03 (0.90–1.17), 0.654 1.00 (0.88–1.14), 1.000 | 0.001 0.0002 0.002 | |

- Significant heterogeneity among the trials
- It may be inappropriate to combine the trials
- Trials divided in two ways:
 - Cycle interval (> 14 d Vs ≤ 14 d)
 - Cisplatin dose intensity (< 25 Vs ≥ 25 mg/m2/wk)

Overall survival (OS) by frequency of chemotherapy and cisplatin dose intensity in comparison 1 [6]

| Variable | Trials | HR (95% CI) | p value | Heterogeneity <i>p</i> value | 5-year OS |
|-----------------------------|----------|------------------|---------|------------------------------|-----------------|
| Frequency of | chemot | herapy | | | |
| >14 days | 11 | 1.25 (1.07-1.46) | 0.005 | 0.23 | ↓8% |
| ≤14 days | 6 | 0.76 (0.62–0.92) | 0.005 | 0.19 | [†] 7% |
| Cisplatin dos | e intens | ity | | | |
| $<25 \text{ mg/m}^2$ | 7 | 1.35 (1.11-1.64) | 0.002 | 0.74 | ↓11% |
| \geq 25 mg/m ² | 11 | 0.91 (0.78-1.05) | 0.2 | 0.001 | ↑3% |

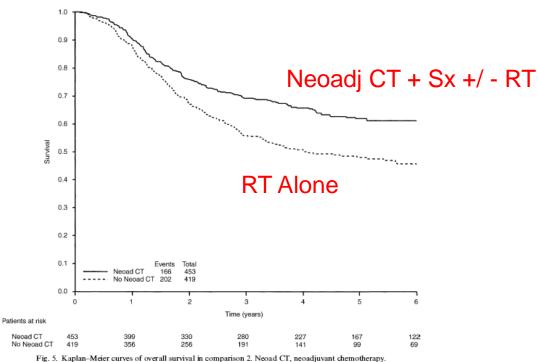

- Chemotherapy may select radio-resistant clones due to cross resistance
- Longer cycle duration may lead to accelerated re-growth between cycles
- Dose dense and intensity: better outcome

Comparison 2

NACT followed by Sx Vs RT

- 5 trials
- N = 872
- Planned cycle interval = 10 21 days
- Cumulative cisplatin dose = 100 300 mg/m²
- RT similar across trials (EBRT 45-60 Gy & ICRT 25-40 Gy)
- One third pts had stage IB & 1/3rd stage II

NACCCM A Collaboration | European Journal of Cancer 39 (2003) 2470-2486

Caveats

- No of pts/events (872/368):small
- A large fraction of pts in the surgical group received RT
- The RT dose was suboptimal by current standards
- Chemo regimens were not 'modern'
- There was lack of concurrent chemo in the RT group

NeoAdj CT + Sx Vs Sx alone

[Intervention Review]

Neoadjuvant chemotherapy plus surgery versus surgery for cervical cancer

Larysa Rydzewska¹, Jayne Tierney¹, Claire L Vale¹, Paul R Symonds²

¹Meta-analysis Group, MRC Clinical Trials Unit, London, UK. ²Department of Oncology, Leicester Royal Infirmary, Leicester, UK

Contact address: Larysa Rydzewska, Meta-analysis Group, MRC Clinical Trials Unit, 222 Euston Road, London, NW1 2DA, UK. lhr@ctu.mrc.ac.uk.

Copyright © 2010 The Cochrane Collaboration.

- 6 trials, 1072 pts
- PFS available in all trials (1036)
- OS, resection rates, path response available in 5 trials (909-938 pts)

Cochrane – NACT + Sx Vs Sx

- Use of post-op RT was balanced in the two arms
- 3 trials used high cisplatin dose intensity and 3 used lower intensity
- Chemotherapy drugs
 - Cisplatin
 - Bleomycin
 - Vincristine
 - 5-FU
 - Mitomycin

Cochrane – NACT + Sx Vs Sx

 NACT favorably impacted (or trended in that direction) on many outcome measures like resection rates, pathological characteristics and PFS

There was a lack of convincing benefit in OS

Chemotherapy may add benefit to surgery!

Neoadjuvant Chemotherapy + Surgery versus Concurrent Chemoradiation Therapy in Stage IB2 / IIB Squamous Carcinoma of Cervix

Neo-adjuvant Chemotherapy + Surgery

Versus

Concurrent Chemo-radiation (STD)

in Stage IB2 / IIB Squamous Carcinoma of Cervix

EORTC – 55994 STUDY

TMH NACT STUDY

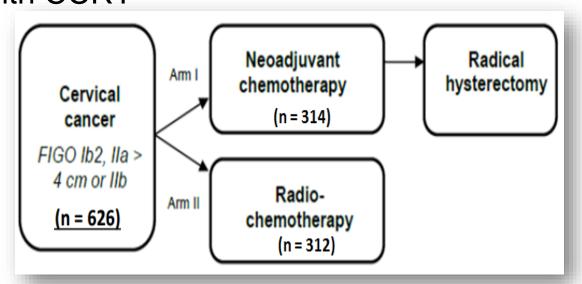

EORTC Trial # 55994:

Randomized phase III study of neoadjuvant chemotherapy followed by surgery vs. concomitant radiotherapy and chemotherapy in FIGO lb2, lla > 4 cm or llb cervical cancer.

 Largest multi-centric randomized trial in cervical cancer comparing NACT followed by radical hysterectomy directly with CCRT

Primary endpoint:

Overall survival at five years

Secondary endpoints:

- Overall survival
- Progression free survival
- Toxicity
- Quality of life

Completed recruitment in June 2014

Final Analysis: 2019

Short term toxicity & preliminary data on the surgical arm are out.

Results:

- 238 (76%) patients underwent surgery in NACT arm.
- 54 patients didn't undergo surgery after NACT due to
 - 23 patients (7.3%)- Treatment-related toxicity
 - 17 patients (5.4%)- Progressive disease
 - 14 patients (4.5%)- insufficient response to chemotherapy
- Pathological examination showed: parametrial invasion in 49 (20.6%), vascular invasion in 57 (23.9%), positive surgical margins in 32 (13.4%), peri-nodal spread in 19 (8.0%), pelvic lymph node metastases in 66 (27.7%), metastatic common iliac lymph nodes in 22 (9.2%) and para-aortic nodes in 7 (2,6%) patients.
- Pathological complete response was found in 53 patients (22.3%).

Ongoing Trials – status update

GYNECOLOGIC CANCER INTERGROUP An Organization of International Cooperative Groups for Cheical Think in Gynecologic Cancers

EORTC GCG 55994

Randomized phase III study of neoadjuvant CT followed by surgery vs. concomitant RTX+CT in FIGO stage Ib2, IIa > 4 cm or IIb cervical cancer.

Conclusions from preliminary data

- This is the largest randomized trial in cervical cancer comparing NACT followed by radical hysterectomy with CCRT
- Short term safety is acceptable, mainly due to CT in both arms
- Discontinuation of protocol is high (20-30%)
- Pathological complete/ optimal response in NACT arm = 37%
- Complete response based on imaging in arm 2 = 49%
- Adjuvant therapy in arm 1 for patients who underwent surgery = 27%
- Survival data will follow mid 2019

Abstract No. 3395 / 9280_PR

Neoadjuvant chemotherapy followed by surgery versus concomitant cisplatin and radiation therapy in patients with stage IB2, IIA or IIB squamous carcinoma of cervix: A randomized controlled trial

ESMO PLENARY PRESENTATION - 2017

Gupta et al; JCO Feb 2018

ESMO PLENARY PRESENTATION – 2017 TMH NACT STUDY

Study Design > Squamous carcinoma > Stage IB2, IIA, or IIB N=317 EXPERIMENTAL NACT X 3 cycles

An absolute increase of 10% in 5-year DFS in NACT-Surgery arm, assuming a 65% 5-year DFS in the CTRT arm with a 2-sided alpha level of 0.05 and power of 80%.

hematological & renal function

N = 318 CTRT

- · Neoadjuvant chemotherapy
 - Paclitaxel (175 mg/m2) + Carboplatin: (AUC 5-6) every 3 weeks X 3 cycles
- Concomitant chemotherapy
 Cisplatin (40/m2/week) X 5 weeks
- Radiotherapy

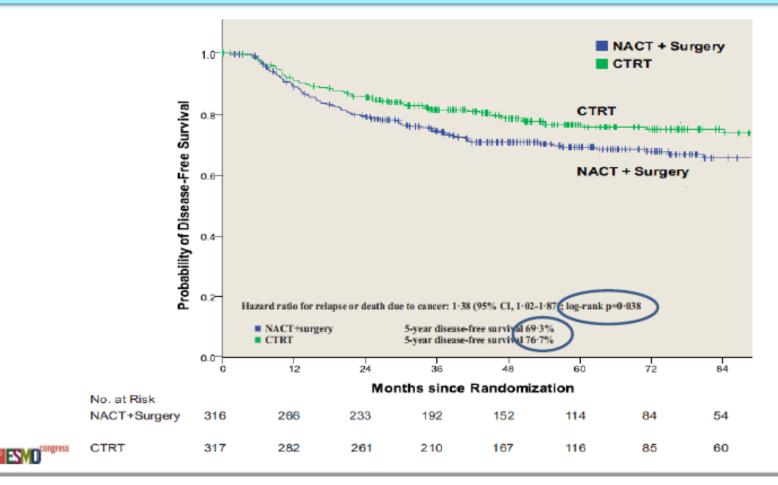

EBRT: 40 Gy/20 fr/5 weeks + BRT (HDR 7Gy/5 appl or LDR 30 Gy/2 appl)

ESMO PLENARY PRESENTATION – 2017 TMH NACT STUDY

Disease-free survival in intention-to-treat population

ESMO PLENARY PRESENTATION – 2017 TMH NACT STUDY

CONCLUSIONS

- Our hypothesis of improved outcomes with NACT-surgery was not proven.
- Concomitant chemoradiation with weekly cisplatin resulted in significantly higher DFS compared with neoadjuvant chemotherapy followed by radical surgery in patients with locally advanced squamous cervical cancer.
 - ✓ The main benefit of CTRT was in stage IIB patients

ESMO PLENARY PRESENTATION – 2017 NACT STUDY - TMH

CONCLUSIONS...

Neoadjuvant chemotherapy and surgery should not be routinely practiced.

Concomitant chemoradiation should be the standard of care in locally advanced cervical cancer.

Rationale for chemo-radiation

1. Additive effects

- Enhanced cell death through cytotoxic DNA cross-links

2. Synergistic effects

- Inhibition of repair of radiation induced damage
- Promote synchronization of cells into a radiosensitive phase
- Initiating proliferation in non-proliferating cells
- Hypoxic cell sensitization and reducing fraction of hypoxic cells

3. Independent effect

- CT may independently increase the rate of death of tumour cells

RATIONALE FOR CONCURRENT CHEMO-RADIATION

 Increased tumor cell kill without delaying the course of RT or protracting the overall treatment time

- Synergistic action with RT
 - potentiates the sub-lethal damage
 - inhibits the DNA damage repair induced by RT

RADIOSENSITIZING CT AGENTS

- HYDROXYUREA
- 5 FLUROURACIL
- CISPLATIN
- CARBOPLATIN

- VINCRISTINE
- ETOPOSIDE
- BLEOMYCIN
- PACLITAXEL
- MITOMYCIN

New Generation CT agents: Gemcitabine, Capecitabine, Targetted therapy etc.

Cisplatin: CT in a dose of 40 - 50 mg/m2 or 50 - 70 mg/m2 three weekly

Phase III trials with concurrent chemo-radiotherapy in stage IB2-IVa CERVICAL CANCER:

Dose of Cisplatin/m2

• GOG 85 : Cisplatin 50 mg day 1, 29 + FU infusion

• GOG 120 : Cisplatin 50 mg day 1, 29 + FU infusion +HU

• GOG 120 : Cisplatin 40 mg weekly

• GOG 123 : Cisplatin 40 mg weekly

• SWOG8797/GOG 109 : Cisplatin 70 mg day 1, 22 + FU infusion

• RTOG 9001 : Cisplatin 70 mg day 1, 22 + FU infusion

• NCIC : Cisplatin 40 mg, weekly

RCT on Chemoradiation

| | Study group | No. of Pts | Overall survival (% | ⁶⁾ P-value | Follow-up |
|---|---------------|---------------|---------------------|-----------------------|-----------|
| | GOG 85 | 388 | 65 vs 51 (5y) | 0.018 | 104mo |
| | GOG 120 | 526 | 66 vs 50 (3y) | 0.004 | 35mo |
| | J | | 67 vs 50 (3y) | 0.002 | |
| | GOG 123 | 369 | 83 vs 74 (3y) | 0.008 | 36mo |
| | SWOG 8797 | 268 | 81 vs 71 (4y) | 0.007 | 42mo |
| | RTOG 9001 | 388 | 73 vs 52 (5y) | < 0.001 | 43mo |
| * | NCIC | 253 | 62 vs 58 (5y) | 0.53 | 82mo |

(Whiteney et al, JCO, 1999. Rose et al, NEJM, 1999. Keys et al, NEJM, 1999. Peters et al, JCO, 2000. Morris et al, NEJM, 1999. Pearcy et al, JCO 2002)

NATIONAL CANCER INSTITUTE CLINICAL ANNOUNCEMENT

'CONCURRENT CHEMO-RADIATION FOR CERVICAL CANCER'

in February 1999

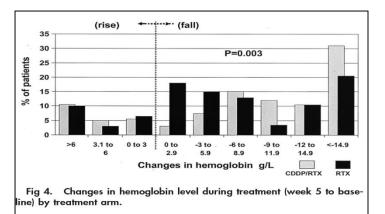

"Five major randomized phase III trials show that platinum based chemo when given concurrently with RT prolongs survival in women with locally advanced cervical cancer stages Ib2 - IVa as well as in women with stage I / IIa found to have metastatic pelvic lymph nodes, positive parametrial disease and positive surgical margins at the time of primary surgery"

NCIC Trial: 6th RCT

Median follow-up: 82 months

| Stage IB2 and IIA (5 cm in diameter), IIB, IIIB, IIIA, and IVA | | | | | | | |
|--|--------------|----------|--|--|--|--|--|
| (< 5cm if LN + ve) | | | | | | | |
| Randomization | CT+RT (CDDP) | RT alone | | | | | |
| 127 pts 126 pts | | | | | | | |

| | 127 pts | 126 pts |
|----------|----------------------------|---------|
| OS 3 yrs | 69% | 66% |
| 5 yrs | 62% | 58% |
| HR | 1.13 (95% CI 0.77 to 1.67) | P=0.42 |

Conclusions:

The best results are certainly achieved by careful attention to RT details, including dose and overall delivery time, the use of ICBT whenever possible, and probably the addition of concurrent CDDP CRT

Approximately 53% of patients on the CRT regimen had decreases in their hemoglobin levels of 9 g/L or more.

STUDY DESIGN

Open label phase randomized III Trial

INCLUSION CRITERIA

- ✓ FIGO Stage IIIB
- ✓ SQ CA histology
- √ Age > 18 years & < 65 years
 </p>
- ✓ WHO perf. Status: 0 or 1
- √ Hemoglobin > 10 gm %
- ✓ Normal blood counts
- ✓ Normal renal functions

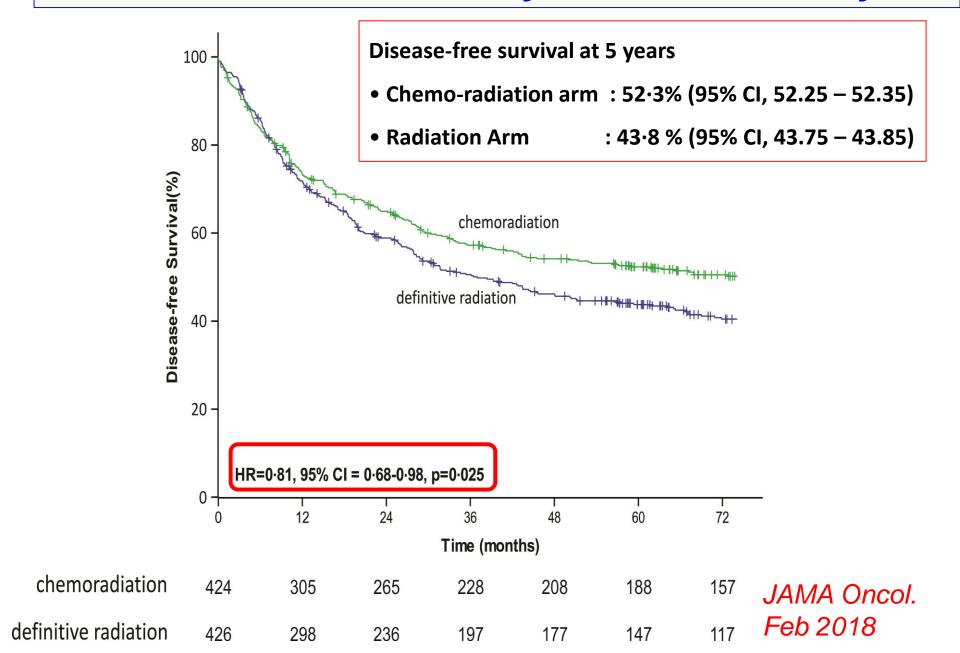

Definitive Radiation:

- External Beam: 50 Gy / 25 # (MLB at 40 Gy when ever feasible)
- Brachytherapy: LDR (25-30 Gy to point 'A' 1#) or HDR (7 Gy to point 'A' x 3# once weekly)
- Total RT (Physical) Doses: 76 Gy 81 Gy (LDR Equivalent) to Point 'A' *

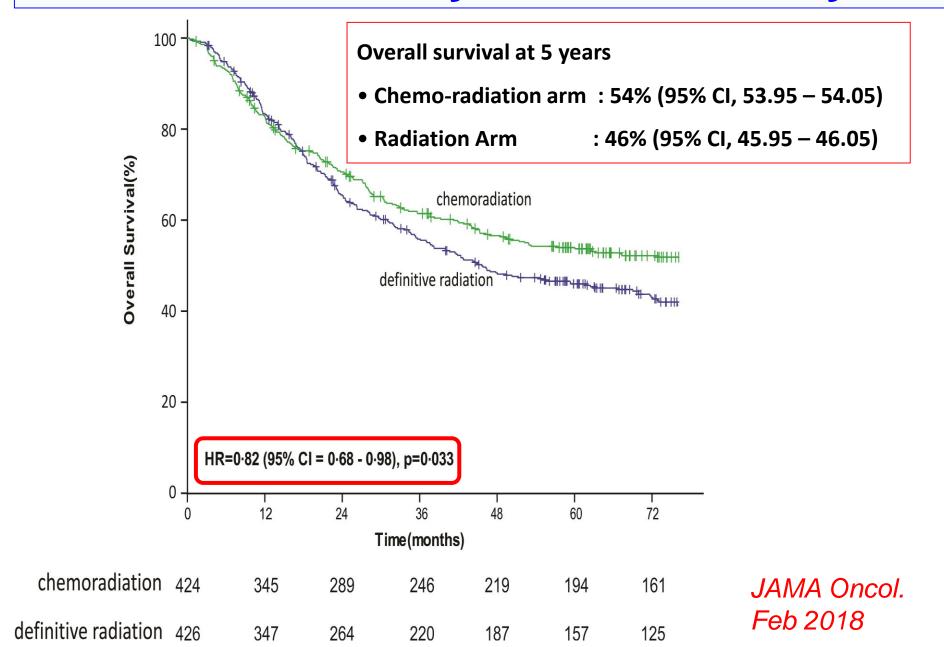

STUDY END POINTS

- Primary Endpoint: Disease free Survival (DFS)
- Definition of Event: Cervical cancer recurrence (any) or death whichever was earlier
- > Secondary End Points:
 - Overall Survival and Toxicities

Disease free Survival by Arms: ITT Analysis

Overall Survival by Arms: ITT Analysis

PATTERNS OF FIRST FAILURE BY TWO ARMS

| | Chemo-radiation ARM (N = 424) | Radiation Alone ARM $(N = 426)$ |
|-------------------------------|-------------------------------|---------------------------------|
| Overall Loco-regional | 90 (21·2%) | 94 (22·1%) |
| Local Only | 66 | 68 |
| Regional Only | 16 | 18 |
| Loco-regional | 08 | 08 |

CONCLUSIONS

- Our hypothesis of benefit of cisplatin based concomitant chemo-radiation in FIGO Stage IIIB is proven
- Concomitant cisplatin based chemo-radiation resulted in signficantly improved disease free & overall survivals with an absolute benefit of 8.5 % and 8% respectively in FIGO

Stage III B (Squmaous cell carcinoma) Cervical Cancer

JAMA Oncol. Feb 2018

CONCLUSIONS contd...

Our study is the largest trial in a homogenous group of advanced stage (IIIB) cervical cancer to prove the benefit of relatively simple and well tolerated concomitant cisplatin chemotherapy regimen over adequately delivered radiation therapy.

Our study confirms that concomitant weekly ciplatin based chemoradiation should be the standard of care in FIGO Stage IIIB Squamous Cell Cervical Cancer

Concomitant Chemobrachytherapy

NCT01561586: A Phase III Randomized Trial Korean GOG study

(Tri-weekly Administration of Cisplatin in LOcally Advanced Cervical Cancer)

• Secondary end-points: PFS, Toxicity,

Compliance to radiation protocol, QOL.

Actual Study Start Date : March 2012
Estimated Primary Completion Date : March 2020

Estimated Study Completion Date: March 2023

CARBOPLATIN

Higgins et al. Gynecol Oncol 2003

- Fewer GI, renal and neuropathy than Cisplatin
- Phase I/II studies different schedules; wkly AUC 2 safe & active
- Not compared in a phase III study with Cisplatin

• PACLITAXEL

Lee et al. Gynecol Oncol 2007

- Phase II trial of paclitaxel / carbo with concurrent RT 33 stage IB to IVB patients
- RT + P (135 mg/m2) + Carboplatin (AUC 4.5) X 2/3 cycles, 4 wkly.

| | Stage I-IIA | IIB | Ш | IV |
|----------|-------------|-----|-----|-----|
| 3 yr DFS | 67% | 91% | 88% | 50% |
| 3 yr OS | 89% | 91% | 88% | 50% |

CAPECITABINE

CAPECITABINE + RT Phase II results

TREATMENT SCHEDULE

- RADIOTHERAPY 45Gy and HDR 25 Gy VBT: 8 weeks
- CAPECITABINE(C) 825mg/m2; Monday-Friday, weeks1-8 + *Adjuvant CT (C) x 6

cycles1000mg/m2 bid D1-14

* In patients achieving response or stable disease after Chemo-radiotherapy

- N=60 Patients were treated (Median Follow/up: 18.3 months)
- Stage at diagnoses IIB: 58%;IIIA: 2%;IIIB: 40%
- Overall Responses Rates: 88.3% (95% CI:77.4-95.2)
 - Complete Response: 80%
 - Partial Response: 8.3%
- Percentage of patients without progression was:
 - 86% (95% CI:77-95) at 12 months
 - 76% (95% CI:65-88) at 23 months

Topotecan

- sabotage repair of sublethal cell injury
- prevent HIF-regulated hypoxic cell survival.
- Dunton and coworkers (2002) maximal tolerance dose (MTD) with RT
 - 1 mg/m² daily for 5 days on days 1–5 and 22–26 concomitantly
 - Grade III anemia in one case
 - Grade II leukopenia in two cases
 - Dose limiting toxicity was not reached.
- Bell and associates (2001) Brachy with topiotecan
 - 0.5 mg/m².
- Ongoing: Weekly IV Topotecan and Cisplatin With Radiation in Cervical Carcinoma NCT00257816
 - University of california
 - 2004-9

GEMCITABINE

Phase I study: 19 patients. MTD not determined.

Low toxicity profile and highly active (90% CR +PR)

(ASCO 2005, abstr 5142)

- Randomized phase II: 65 patients stage IIB-IIIB
 - RT and weekly cisplatin 35 mg/m2 or weekly gemcitabine 150 mg/m2.
 - Similar overall response rate and toxicity
 - Higher CR rate with gemcitabine

(ASCO 2007, abstr 16012)

• prompted for further trials especially with concurrent and adjuvant gemcitabine.

Adjuvant / Neoadjuvnat Chemotherapy after Chemoradiation

- Disease progression after radical radio-chemotherapy:35%
- Distant relapses are major in locally advanced cervical cancer after radical Rx
- Adjuvant CT was part of few trials of Chemo-radiation
- No proper large study evaluating Adj. CT

Phase III, Open-Label, Randomized Study Comparing Concurrent Gemcitabine Plus Cisplatin and Radiation Followed by Adjuvant Gemcitabine and Cisplatin Versus Concurrent Cisplatin and Radiation in Patients With Stage IIB to IVA Carcinoma of the Cervix

Alfonso Dueñas-González, Juan J. Zarbá, Firuza Patel, Juan C. Alcedo, Semir Beslija, Luis Casanova,

Women with Ca Cervix IIB – IV A with KPS >70% with no evidence of PA LN

Arm A (n= 259 pts)

CCRT + Brachytherapy + Adj. CT

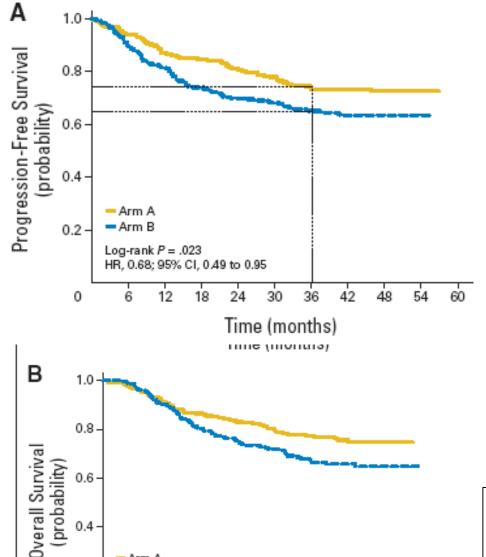

Concurrent Chemo - Weekly Cis 40 mg/m2
+ Gemcitabine 125mg/m2
Adjuvant chemo -2 weeks after brachy
Cisplatin and Gemcitabine 2 cycles

ARM B (n= 256 pts)

CCRT+ BRT
with
Weekly Cis 40mg/m2

Adverse Effects

- Arm A More Grade 3-4 toxicities (p<0.001)
- Haematologic Toxicity
 - Grade 3-4 ; 71.9% Vs 23.9 %
- Non haematologic toxicities
 - Vomiting & diarrhea more in arm A (p=0.002)
- Hospitalization during treatment
 - Arm A -30 pts & Arm B -11 pts (p=0.02)
 - 3 deaths in arm A 2 due to sepsis and bowel perforation & 1 due to acute encephalopathy
- Late toxicities slightly higher in Arm A
 - Grade 4 GI : 2.3 % Vs 0%

0.6 -

0.2 -

- Arm A

— Arm B

Log-rank P = .022

HR, 0.68; 95% CI, 0.49 to 0.95

Time (months)

Results

- 3 Y PFS 74.4% Vs 69% (p=0.029)
- Median PFS- HR 0.68
- Statistically significant improvement in median PFS

Conclusion: Gemcitabine + cisplatin CRT followed by Brachy & adjuvant gem/cis CT improved survival outcomes with increased but clinically manageable toxicity compared to standard Rx

Concurrent CTRT + Adjuvant CT

Challenges

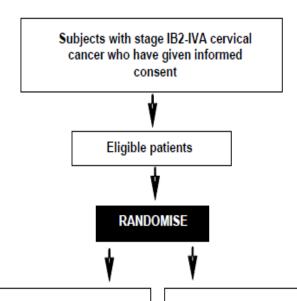

- Acute and chronic toxicity
 - Mainly
 - Hematological Toxicity
 - GI toxicity

Options

- Non overlapping toxicity drugs
- Targeted agents
- Improved radiotherapy techniques to avoid synergistic toxicity

OUTBACK TRIAL MULTICENTRIC PHASE III STUDY

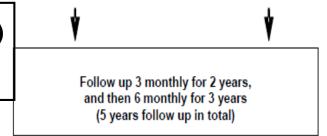

| Primary Objectives: | To determine if the addition of adjuvant chemotherapy to standard cisplatin- based chemo-radiation improves progression-free survival. |
|-------------------------|---|
| Secondary objectives | To determine: overall survival rates, acute and long-term toxicities, patterns of dise recurrence, the association between radiation protocol compliance and outcomes patient quality of life, including psycho-sexual health. |
| # patients | 780 |
| Planned duration | 4 years recruitment and a maximum of 5 years follow-up |
| Statistics | A sample size of 780 provides 80% power to detect an increase in the proportions who are both alive and progression free at 3 years from 55% in the control arm to 65.5% in the experimental arm with a 2-sided type 1 error of 5%. |

Arm A – Control Arm Concurrent chemoradiation Arm B – Intervention Arm Concurrent chemoradiation followed by adjuvant chemotherapy

Cisplatin based concurrent chemo-radiation (STD)

Vs CCRT followed by Pacli + Carbo x 3 cycles

Recruited: 600 pts approx.

Induction Chemotherapy followed by Concomitant Chemo-Radiation

in Advanced Stage Carcinoma Cervix:

A Phase III Randomized Trial (INTERLACE Study - NCT01566240)

Carcinoma Cervix Stage FIGO Ib2-IVA

Based on Phase II Study which evaluated the feasibility of delivering dose dense & dose intense CT (Pacli + Carbo weekly)

385 patients

Concomitant chemo radiotherapy weekly Cisplatin (40 mg/m2 x 4 - 5 #)

385 patients

Induction chemotherapy with weekly x 6weeks
Paclitaxel (80 mg/m2) + Carboplatin (AUC2)

Concomitant chemoradiotherapy
weekly Cisplatin (40 mg/m2 x 4 - 5 #) &

Outcomes:

Primary: Overall Survival

Secondary: Progression free Survival

Acute toxicities

Late Toxicities

Initiated in 2012

Accrual period: 4 years

Completion: 2021

CRT AND BIOLOGIC AGENTS

VEGF IN CERVICAL CANCER

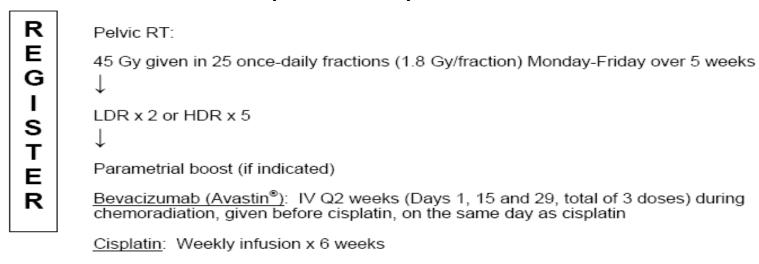

- Intratumoral protein levels of VEGF are increased in patients with cervical cancer when compared to normal cervical tissue (1)
- Increasing intratumoral levels of VEGF correlated with (1):
 - higher stage
 - increased risk of LVI
 - increased risk of lymph nodes metastasis
- Higher VEGF expression was an independent prognostic factor for poor diseasefree and overall survival (2)

(1)Cheng et al. Obstet Gynecol 2000;96:721-6

(2)Loncaster et al. Br J Cancer 2000;83(5):620-5

BIOLOGIC AGENTS - BEVACIZUMAB

Phase II study of Bevacizumab in combination with definitive radiotherapy and cisplatin in locally advanced cervical carcinoma (RTOG 0417)

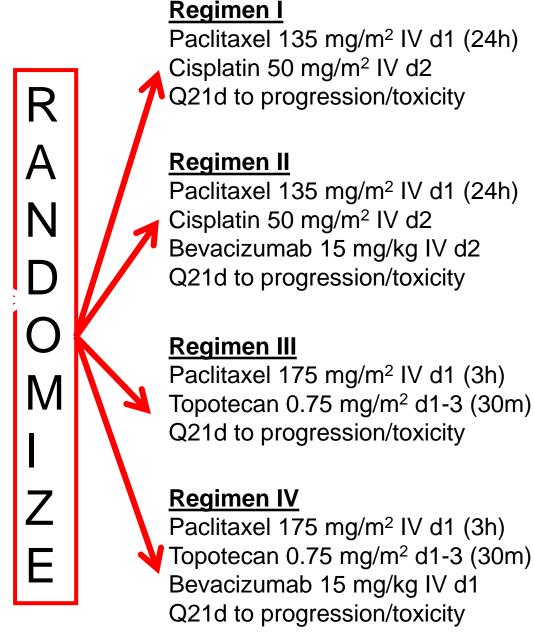

- 60 patients from 25 institutions were enrolled between 2006 and 2009
- 49 patients evaluable.
- Median follow-up of 10 months (Mostly IIB 63%, squamous-80%) no treatment-related SAEs.
- There were 15 (31%) protocol specified treatment-related AEs, most common were hematologic (12/15 =80%)

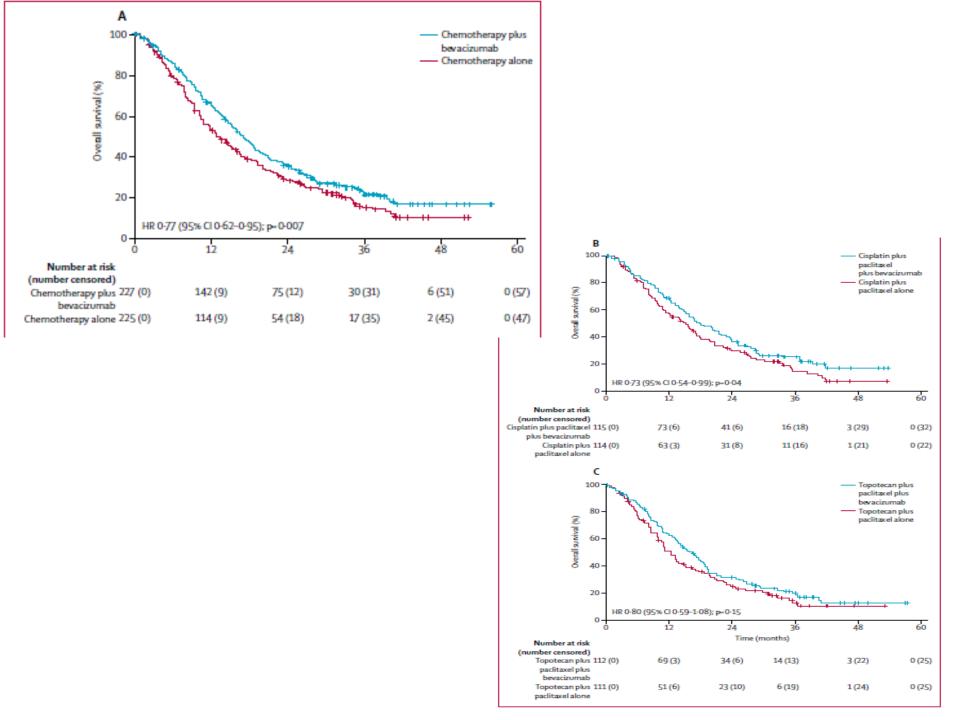

2010 ASCO Annual Meeting: J Clin Oncol 28:15s, 2010 (suppl; abstr 5006)

GOG 240 Schema

Eligibility:

- 1. Primary stage IVB or Recurrent/persistent carcinoma of the cervix
- 2. Measureable disease
- 3. GOG PS 0-1

Increase in AE's

- -GU Gr 2-3 fistula
 - Hyertension
 - -- Neutropenia
- Vascular events : Bleed / Thrombosis

GOG 240: Conclusions

- Bevacizumab plus chemotherapy significantly improves OS in stage IVB, recurrent or persistent cervical carcinoma
 - Nearly 4-month improvement in OS is clinically significant
 - Increase in median PFS and ORR are also demonstrated
 - Cisplatin + paclitaxel arm is current standard of care and did not underperform
 - Benefit seen even when recurrent disease is in irradiated pelvis
- Bevacizumab treatment is associated with a higher rate of AEs
 - 3–8% rate of known bevacizumab-related AEs
- The improvement in OS with bevacizumab treatment was not accompanied by a decrease in HRQoL
- First targeted agent to improve OS in a gynecologic cancer

SUMMARY Chemotherapy IN Cervical Cancers

- Neo adjuvant Chemotherapy:
 - NACT followed by RT Vs RT: No Benefit
 - NACT followed by Sx Vs RT: Some Benefit but has major limitations
 - NACT followed by Sx Vs Sx: CR better but no survival benefit
 - NACT followed by Sx Vs Chemo-RT: Chemo-radiation STD of Care
- Concomitant Chemotherapy: STD of Care
- Concomitant followed Adjuvant CT: Still Investigational
- Palliative CT in recent era: Bevacizumab some benefit

THANK YOU

Endometrial Cancer

Techniques and clinical evidence for post-operative radiotherapy, results of clinical trials in intermediate-risk patients

Remi Nout

Dept of Radiation - Oncology

Leiden University Medical Centre, The Netherlands

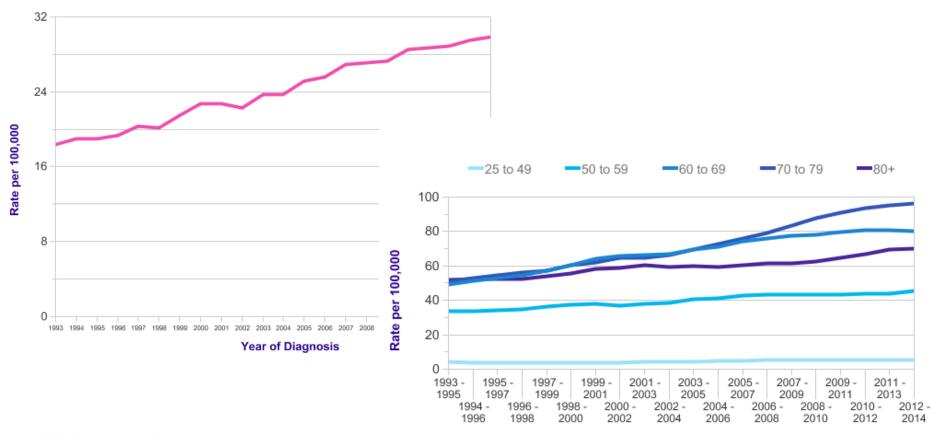

Learning objectives

- Prognostic factors & risk stratification for adjuvant treatment
- Clinical trials which form the basis for current treatment
- How different radiotherapy techniques impact on morbidity and quality of life
- Upcoming (molecular) prognostic factors and ongoing trials, discussed in next presentation

Incidence

Uterine Cancer (C54-C55): 1993-2014

European Age-Standardised Incidence Rates per 100,000 Population, Females, UK

Year of Diagnosis

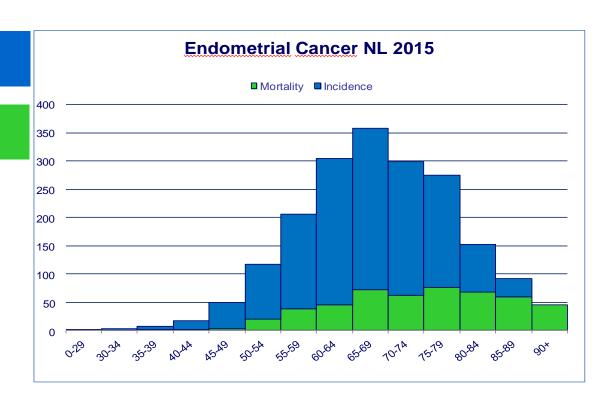

Endometrial Carcinoma

Incidence 22 / 100.000

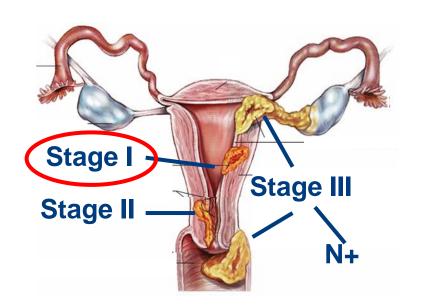

Mortality 5.5 / 100.000

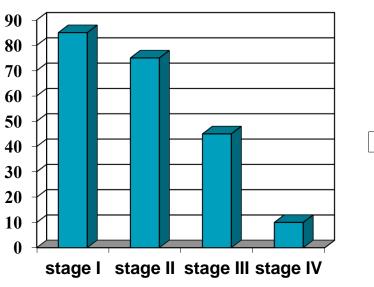

Histology

other carcinosarcoma clear cell serous endometrioid

Stage and histologic subtype

■5-yr surv.

Histological type (5 yr OS)

endometrioid carcinoma: 80-85%

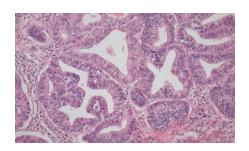

serous carcinoma: 50-55%

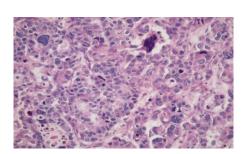

clear cell carcinoma: 60-65%

Major prognostic factors

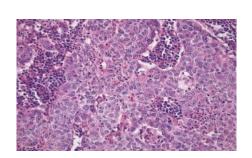

- Age
- Stage
 - Depth of myometrial invasion
- Histology
 - Histological type
 - Grade

Lymph-vascular space invasion

Molecular factors discussed in high risk presentation

Lymph node metastasis (GOG)

Risk of microscopic pelvic metastases for stage 1 without extrauterine disease:

• low risk (<5%)

- grade 1 < 2/3,
- gr 2-3, no invasion

intermediate (5-10%)

all others

high risk (>10%)

gr 3, >2/3 invasion

Historic Risk Groups

Low risk:

stage I grade 1-3 no invasion stage I grade 1 <50% invasion

• Intermediate risk:

stage I grade 2-3 <50% invasion stage I grade 1-2 ≥50% invasion

• High risk:

stage I grade 3 ≥50% invasion; stage II / III / IV

NEEC: serous, clear-cell carcinoma, carcinosarcoma

Low risk endometrial cancer

Surgery alone

- TLH-BSO
- no lymphadenectomy, no RT
- 95% relapse-free survival

No vaginal brachytherapy:

Randomized trial, vaginal recurrence rate:

- Vaginal brachytherapy: 0-2%
- No additional therapy: 2-5%

Intermediate Risk – Randomised trials

| Trial | No. patients eligibility | Surgery | Randomization | Locoregional recurrence | Survival | Severe complications |
|------------------------|---|-------------------------------------|--|-------------------------------------|-------------------------------------|------------------------------------|
| Norwegian 1968-1974 | 540 Stage I | TAH-BSO | Brachytherapy vs. brachy and pelvic RT | 7% vs. 2% at 5 years p<0.01 | 89% vs. 91% at 5 years p=NS | NA |
| PORTEC 1990-1997 | 714 IB grade 2-3 IC grade 1-2 | TAH-BSO | NAT vs. pelvic RT | 14% vs. 4% at 5 years p<0.001 | 85% vs. 81% at 5 years p=0.31 | 3% GI at 5 years (actuarial) |
| GOG-99 1987-1995 | 392 St IB, IC St II (occult) | TAH-BSO and lymph- adenectomy | NAT vs. pelvic RT | 12% vs. 3% at 2 years p<0.01 | 86% vs.92% at 4 years p=0.56 | 8% GI at 2 years (crude) |
| ASTEC/EN5 1996-2005 | 905 St IAB g3, IC, St II, serous/cc | TAH-BSO +/- lymph- adenectomy | NAT vs. pelvic RT | 7% vs. 4% at 5 years p=0.038 | 84% vs.84% at 5 years p=0.98 | 3 vs 7% gr 3/4 |

PORTEC-1 trial (1990-1997)

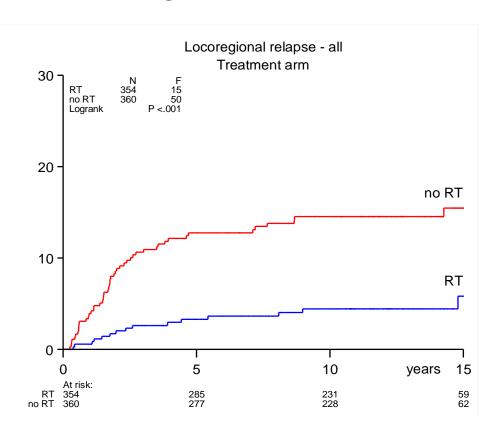

Stage I intermediate risk (n=714):

- grade 1 or 2 with ≥50% invasion
- grade 2 or 3 with <50% invasion
- TAH-BSO without lymphadenectomy

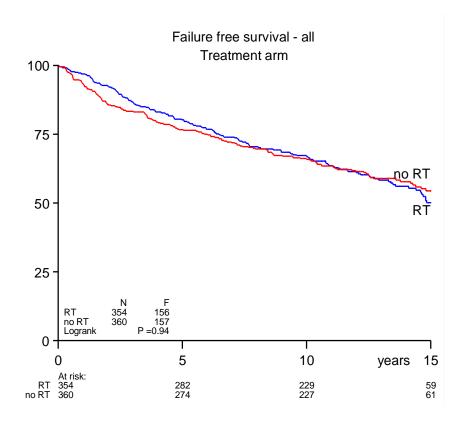

15-year outcomes PORTEC-1

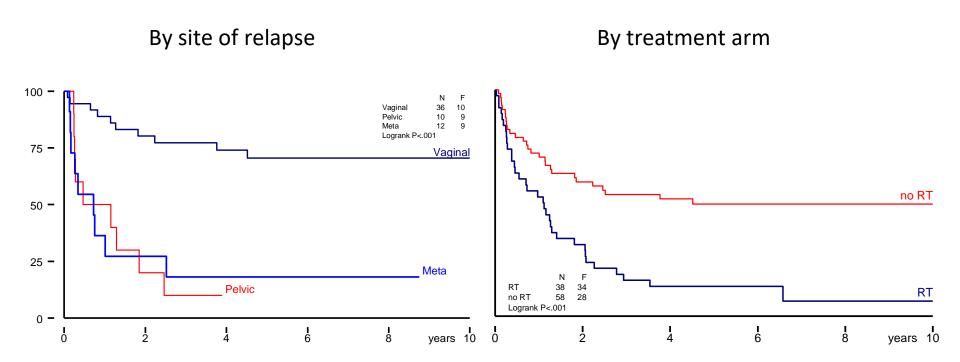

Locoregional Recurrence

Failure Free Survival

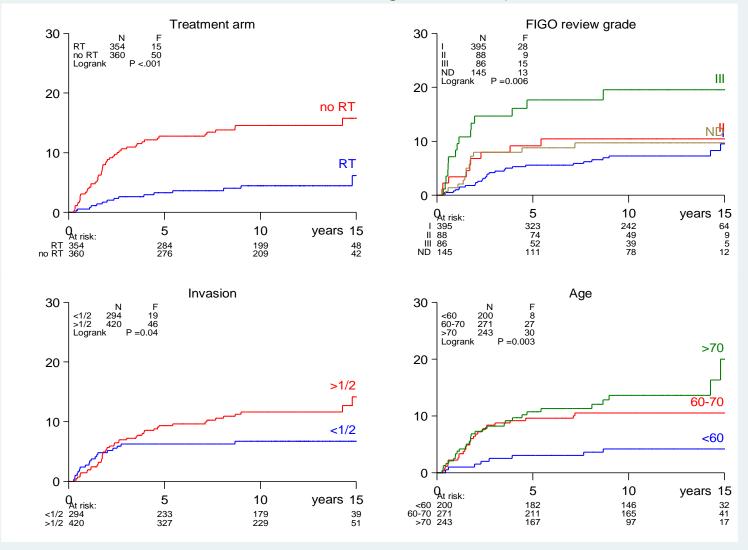

Survival after relapse in PORTEC-1

Vaginal brachytherapy?

PORTEC-1: risk factors for locoregional relapse

PORTEC-1: high-intermediate risk

3 major risk factors:

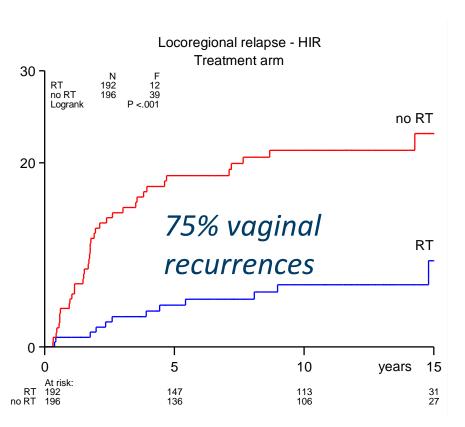

- grade 3
- outer 50% invasion
- age \geq 60 years

RT indication only if 2 or more risk factors

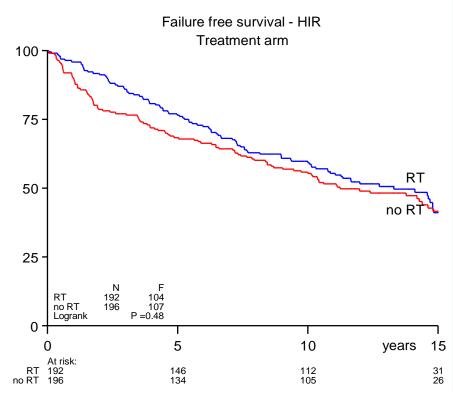

Reduction of RT-indication by 50%

PORTEC-1: 15-year outcomes for HIR patients

Locoregional Recurrence

27% vs. 13% (RR 0.48)

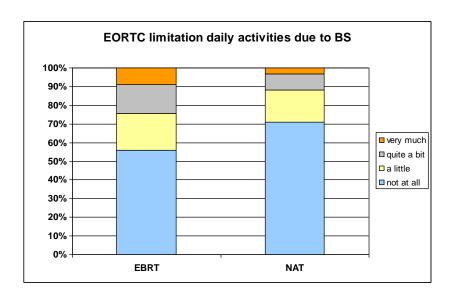

13% vs. 5% (RR 0.38)

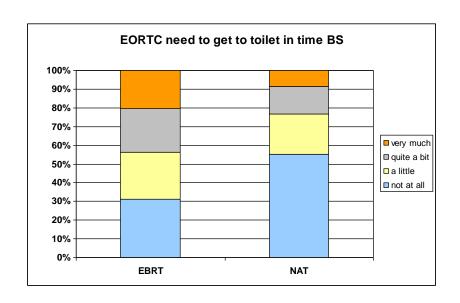

4 yr local relapse

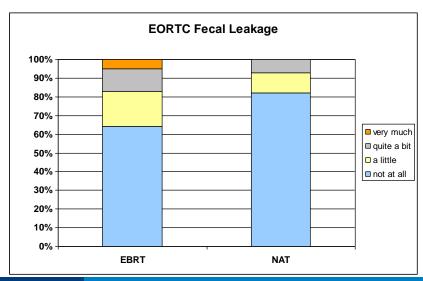

PORTEC-1: morbidity

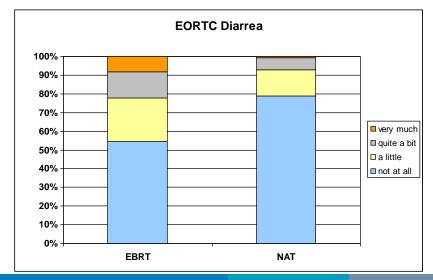

- 5-year actuarial grade 1-4:
 - Overall EBRT 26% versus NAT 4%
 - Grade 1: EBRT 17% versus NAT 4%
 - Majority gastrointestinal tract
- Grade 3-4 after EBRT 3%
- > 4-field box technique less late complications
 - 30% treated with parallel opposing fields
- GOG#99 extended surgery + EBRT 13% grade 3-4

Bowel symptoms

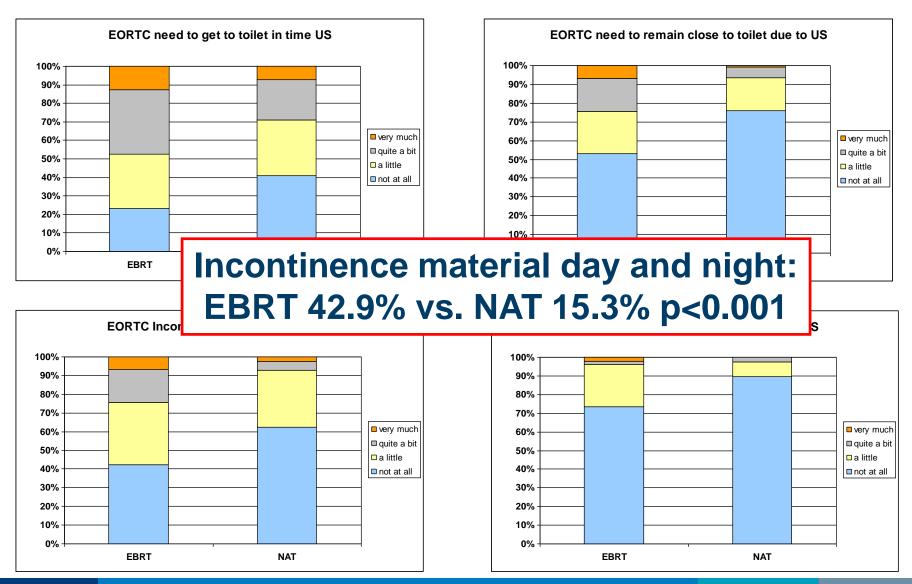

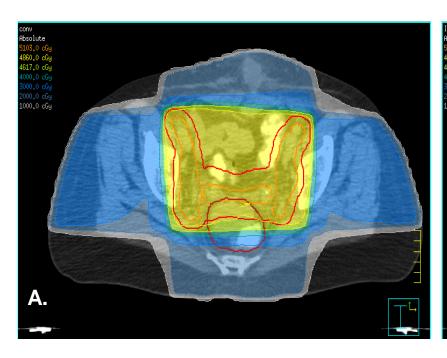

Urinary symptoms

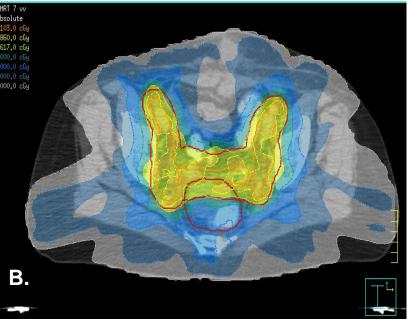

Improvement of EBRT techniques

PORTEC-1: 30% AP-PA
70% 3-4 fields with shielding

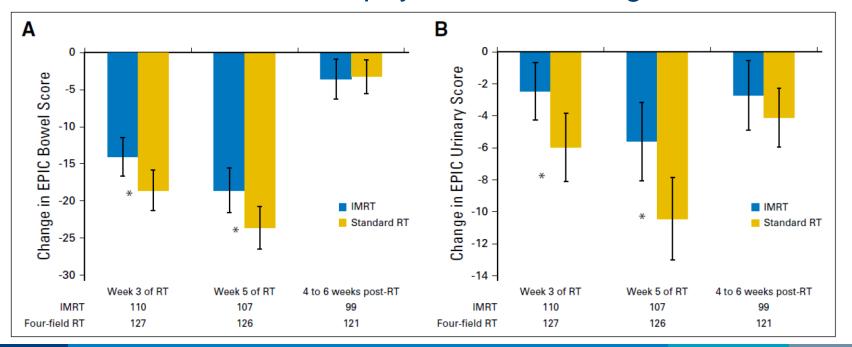

IMRT

Pelvic IMRT: reduced toxicity

- NRG RTOG Time C randomized trial
 - IMRT vs 4-field pelvic radiotherapy
 - Endometrial / Cervix postoperative
- IMRT: less acute GI and GU toxicity at 5 wks
 - Less use of medications during treatment
 - IMRT: better QOL physical functioning

Summary – intermediate risk

15 year PORTEC-1 results

- LRR risk reduction with EBRT 67%
- no survival advantage

EBRT has long-term impact on quality of life

- higher levels of bladder & bowel symptoms
- lower physical functioning, more role limitation

EBRT to be avoided in intermediate risk cases

- HIR criteria for treatment selection
- vaginal brachytherapy

PORTEC-2 trial (2002-2006)

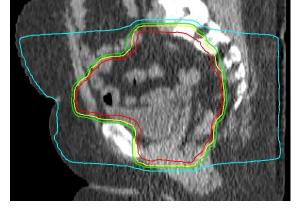

Stage I high-intermediate risk (n = 427)

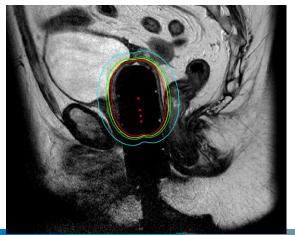

- age ≥ 60 and ≥50% invasion grd 1-2 or <50% invasion grd 3
- FIGO 1988 stage 2A
- TAH-BSO without lymphadenectomy

pelvic radiotherapy 46 Gy / 23# / 5 wks

vaginal brachytherapy
21 Gy / 3# / 2 wks

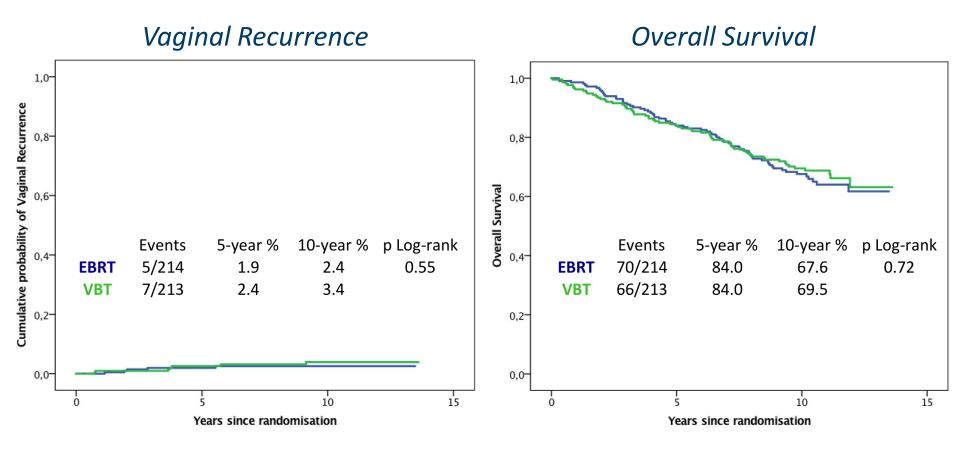

Vaginal Recurrence & Overall Survival

Median follow-up 10.5 years

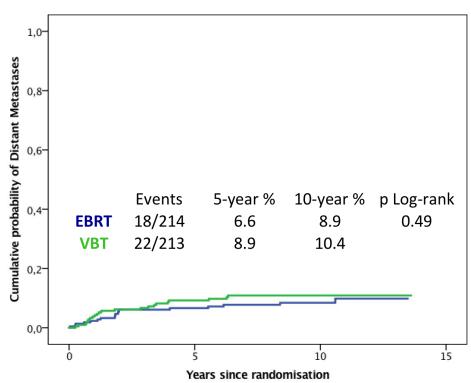

Vaginal Recurrence & Overall Survival

Median follow-up 10.5 years

Distant Metastases

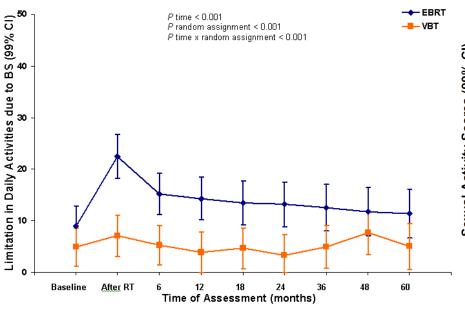

Quality of Life – bowel symptoms

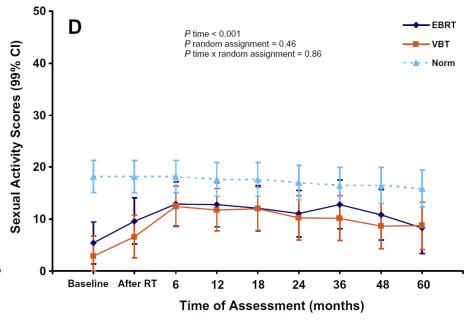

Quality of Life – bowel symptoms

Sexual activity

Swedish randomised trial (1997-2008)

Stage I 'medium risk ' (n=527)

| | | VBT | EBRT+VBT |
|---------------------------------|--------------|------|----------|
| Vaginal recurre | ence (erude) | 2.7% | 1.9% |
| Vaginal recurre Locoregional | | 5.0% | 1.5% |
| Overall Survival | | 90% | 89% |
| | | | |
| Toxicity Gr 3: | Gl | 0% | 2% |
| | vagina | 0.8% | 0% |

Similar QoL results favoring VBT alone

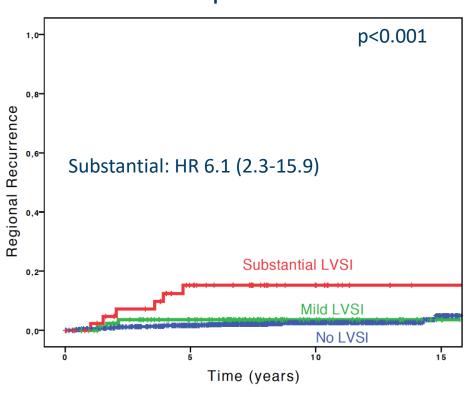

Quatification of LVSI in PORTEC-1 and 2

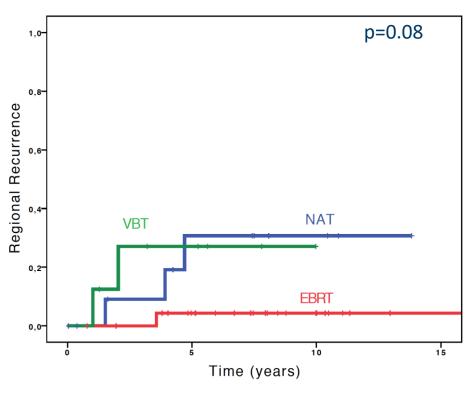

Pelvic nodal recurrence

All 954 patients

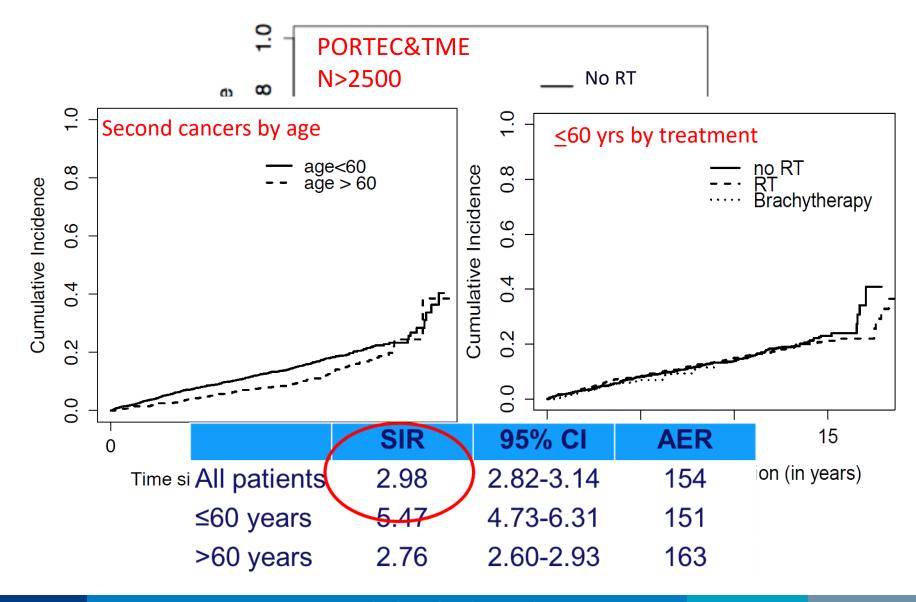

Substantial LVSI: 46 patients

5%

Risk of second cancers

Summary high-intermediate risk

- Brachytherapy effective in preventing vaginal recurrence: 2.9% at 8 years
- More pelvic recurrences after brachytherapy, most with simultaneous distant metastases (isolated pelvic failure 1.5% vs 0.5%)
- No difference in distant metastases and survival
- VBT better QoL/functioning
- Substantial LVSI: consider IMRT
- No increased risk of second cancers

Q1: Current best definition of risk groups?

| Risk Group | Description (FIGO 2009) No R | TE |
|------------------------|---|-------------|
| Low | Stage IA Endometrioid + grade 1-2 + LVSI negative | 1 |
| Intermediate | Stage IB Endometrioid + grade 1-2 + LVSI negative | 1 |
| High Intermediate | Stage IA Endometrioid + grade 3, regardless of LVS Stage I Endometrioid + grade 1-2 + LVSI unequivocally positive regardless of depth of invasion Pelvic IMR | |
| High | Stage IB Endometrioid + grade 3, regardless of LVSI status Stage II & stage III with no residual disease Non endometrioid (serous, clear cell, undifferentiated carcinoma, carcinosarcoma, mixed >10%) | 1 1 1 |
| Advanced Metastatic | Stage III with residual disease & IVAStage IVB | 1 1 |

Endometrial Cancer

Role of chemo / chemo-radiation in high risk endometrial cancer

Remi Nout
Radiation Oncology, Leiden University Medical Centre, The Netherlands

ESMO-ESGO-ESTRO consensus: risk groups

| Risk Group | Description (FIGO 2009) |
|------------------------|--|
| Low | Stage IA Endometrioid + grade 1-2 + LVSI negative |
| Intermediate | Stage IB Endometrioid + grade 1-2 + LVSI negative VBT |
| High Intermediate | Stage IA Endometrioid + grade 3, regardless of LVSI status Stage I Endometrioid + grade 1-2 + LVSI unequivocally positive, regardless of depth of invasion Pelvic IMRT |
| High 15% | Stage IB Endometrioid + grade 3, regardless of LVSI status Stage II & stage III with no residual disease Non endometrioid (serous, clear cell, undifferentiated carcin carcinosarcoma, mixed >10%) Both? |
| Advanced Metastatic | Stage III with residual disease & IVA Stage IVB |

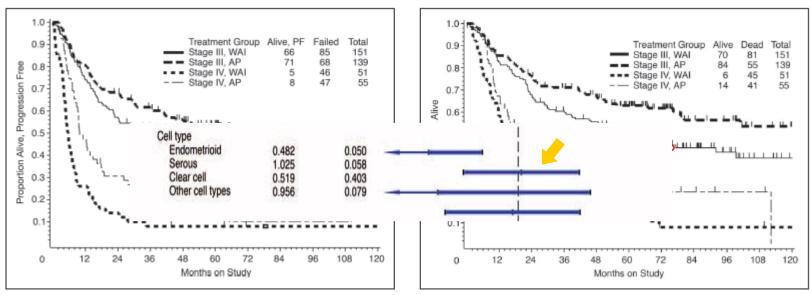

Fig 3. Progression-free survival by treatment and stage. AP, doxorubicin and cisplatin; WAI, whole-abdominal irradiation; PF, progression free.

Fig 4. Survival by treatment and stage. AP, doxorubicin and cisplatin; WAI, whole-abdominal irradiation.

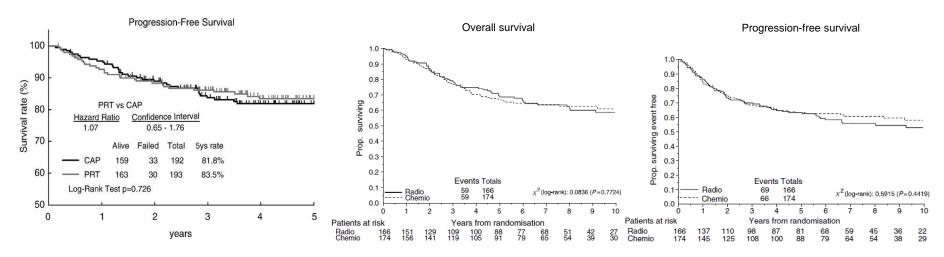

Progression-free Survival

Overall Survival

Radiotherapy vs Chemotherapy

JGOG - 385 pts RT vs chemo* x3

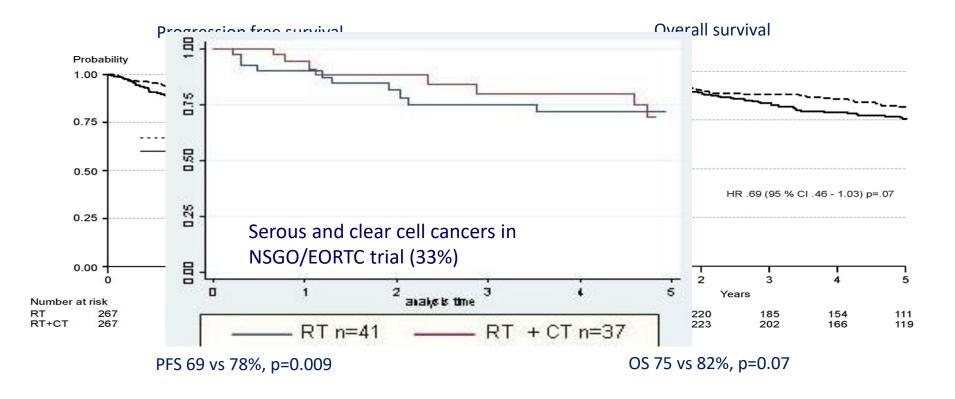

Italian trial - 345 pts RT vs chemo* x5

^{*} cyclophosphamide – doxorubicin - cisplatin

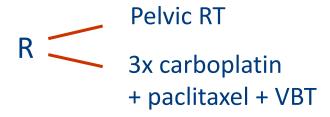

Radiotherapy delays local recurrence, chemotherapy delays distant metastasis

Pooled randomised NSGO-EORTC/Iliade trials Radiotherapy vs RT plus platinum-based chemotherapy x4

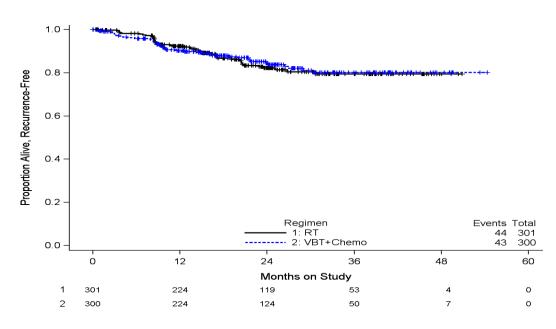

First GOG#249 results

- Stage I-II HIR factors
- Stage I-II serous / cc

Completed accrual 2012 N=601, primary endpoint PFS 89% underwent lymphadenectomy 15% serous, 5% clear cell, 74% stage I

Update, median FU 53 months
No difference RFS and Overall Survival

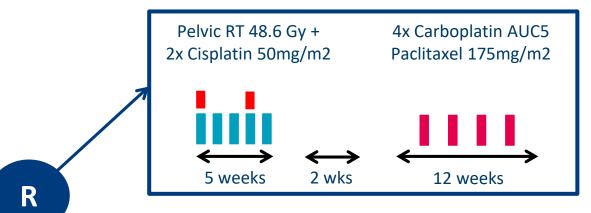

First GOG#249 results

| Site of Recurrence | Pelvic RT (N=301) | VBT/Chemo (N=300) |
|--------------------|-------------------|-------------------|
| Vaginal | 5 (1.6%) | 3 (1%) |
| Pelvic | 2 (0.6%) | 19 (6.3%) |
| Para-aortic | 2 (0.6%) | 3 (1%) |
| Distant | 32 (10.6%) | 24 (8%) |

- More acute ≥G3 toxicity with VBT/Chemo N=187 vs 32
- No difference in late ≥G3 toxicity N=37 vs 35
- ➤ No superiority of 3 cycles chemo + VBT over EBRT alone

PORTEC-3 trial design

686 stage I High risk, stage II/III Endometrial Cancer

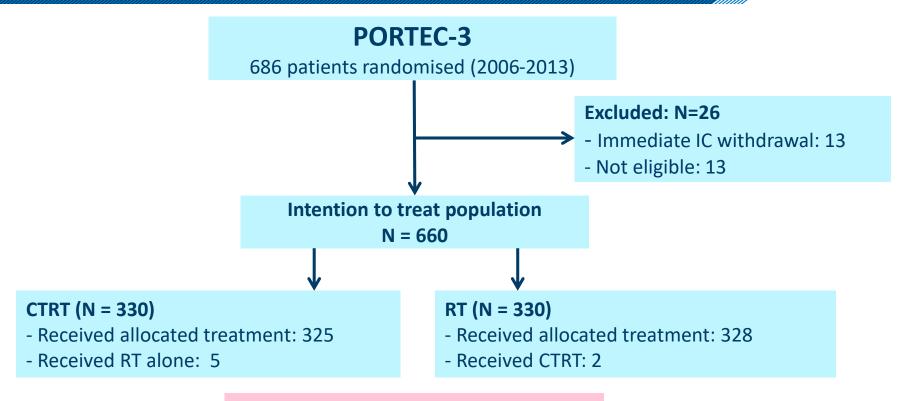

- uniform treatment schedule
- upfront pathology review
- quality of life analysis

CONSORT diagram

Patients with Stage III EC

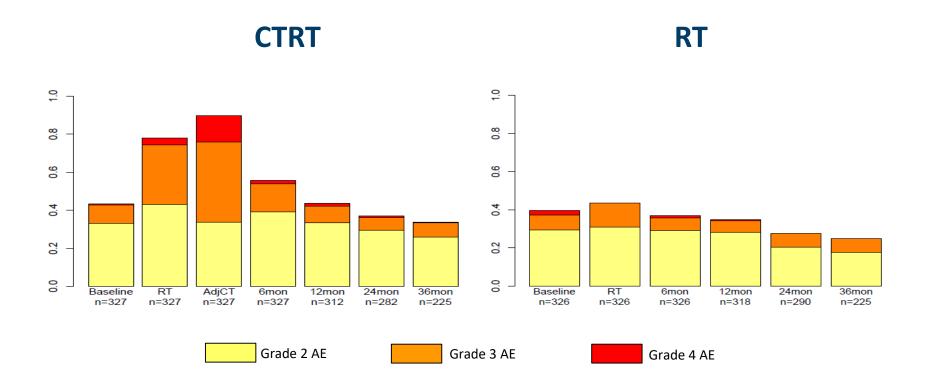

Forest plot of multivariable analysis (treatment covariate)

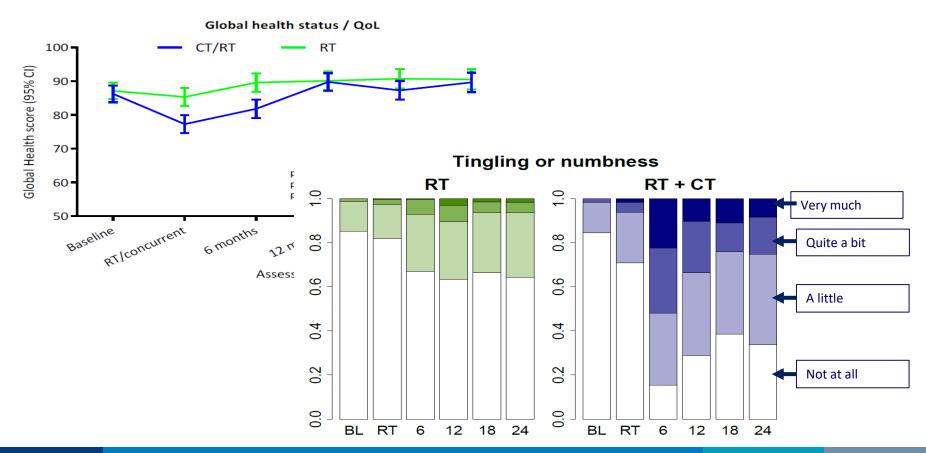

Survival by histology

Adverse events (CTCAE v 3.0)

Quality of life

Conclusions

CTRT vs RT for high-risk endometrial cancer:

- Improved 5-year FFS, no overall survival benefit
 - All patients 7% FFS benefit with CTRT
 - Stage III: 11% FFS benefit with CTRT
- Significantly more toxicity with CTRT in the first 12 months
- OS analysis may need longer follow-up

GOG-258 design

- N= 813 patients
- 18% serous cancer
- Median FUP 47 months

TAH/BSO, Pelvic and para-aortic lymph node sampling optional

Eligibility:

Surgical Stage III or IVA EC (FIGO 2009)
Stage I or II clear cell or serous EC + cytology
GOG Performance Status of 0-2
Adequate organ function

Ineligible Patients

Carcinosarcoma
Recurrent EC
Residual tumor after surgery > 2 cm

Regimen 1: C-RT (n=407)

Cisplatin 50 mg/m² IV Days 1 and 29 plus **Volume-directed radiation therapy (45Gy+/- brachytherapy)** followed by

Carboplatin AUC 5* plus Paclitaxel 175 mg/m² q 21 days for 4 cycles with G-CSF support

Regimen 2: CT (N=406)

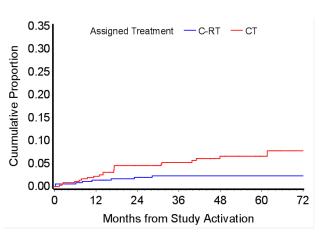

Carboplatin AUC 6 plus Paclitaxel 175 mg/m² q 21 days for 6 cycles

Stratification:

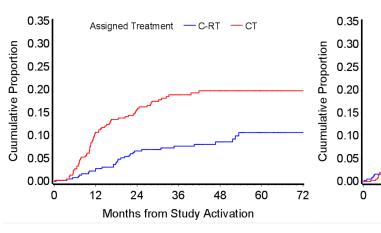

Age >/< 65 Gross residual disease

First GOG-258 results

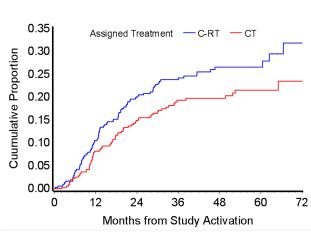

Vaginal Recurrence

Pelvic and PA Recurrence

Distant Recurrence

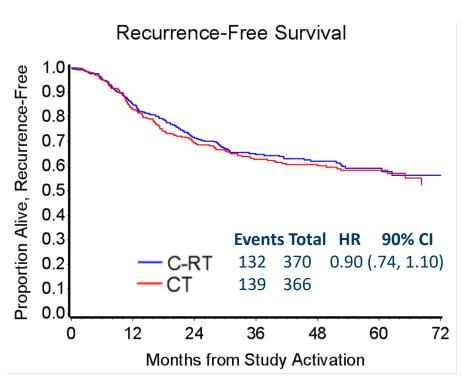

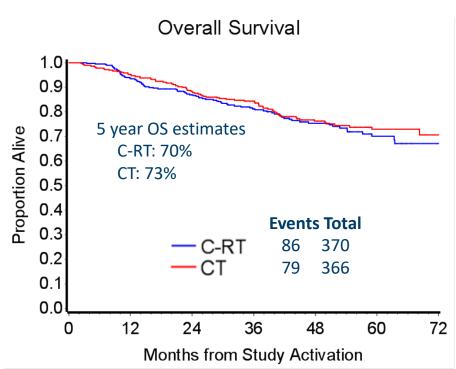

C-RT vs. CT: HR=0.36 (CI: 0.16-0.82)

HR=0.43 (CI: 0.28-0.66)

HR=1.36 (CI: 1.00-1.86)

First GOG-258 results

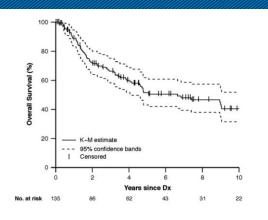

Data cut-off 03/09/2017 Data not mature for final analysis

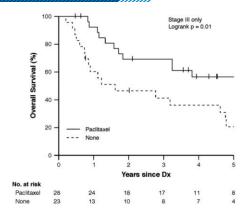

Conclusion High Risk: CT+RT vs RT

- NSGO-EORTC/Iliade: significant PFS benefit (9%); trend for OS (7%)
- PORTEC-3: trend for improved FFS (7%) with CT+RT
- Does benefit outweigh the added toxicity, without OS benefit?
- Good pelvic control with RT alone (PORTEC-3 and GOG-249)
- CT+RT schedule cannot be recommended as standard for stage I-II
 - Translational studies will hopefully identify those who benefit
- Stage III disease largest FFS improvement with both CT+RT and CT
 - PORTEC-3 significant 11% FFS benefit for stage III with CT+RT
 - GOG-258 better local control with CT+RT

Serous and clear cell

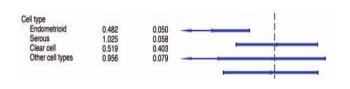

Largest retrospective analysis suggest benefit of chemotherapy

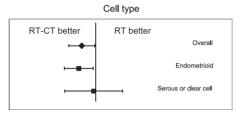

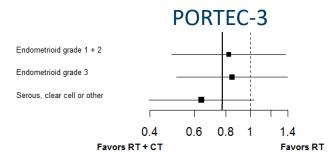

> Subgroups in randomized trials, no clear benefit:

GOG-122

NSGO-EORTC/Iliade

Serous and clear cell

- Stage I serous and clear cell
 - 103 patients: 26% non-invasive; 58% <50% invasion
 - 34% received adjuvant chemotherapy
 - 5-year isolated pelvic recurrence rate 4%, locoregional recurrence 7%
 - 5-year OS 84%

Vaginal brachytherapy alone sufficient in stage IA

Stage II

SUMMARY – EXAMPLE T2W MRI at BT from Rad. Onc. Perspective

- 1. No free FLuid
- 2. No **O**rgan **P**erforation (or uterine perforation)

- 8 cm³ (ellipsoid formula)
- Regression to Proportional V: PV = 20 % initial V
- **2.** <u>T</u>opography: unfavourable due to right parametrial extension.
- 3. Adequate insertion geometry.
- **4. G**rey zones correspond to initial infiltrative tumor: proximal third of right parametrium, dorsally.
- 5. "**E**xtra" findings:
 - Collaboration with radiologist recommended.

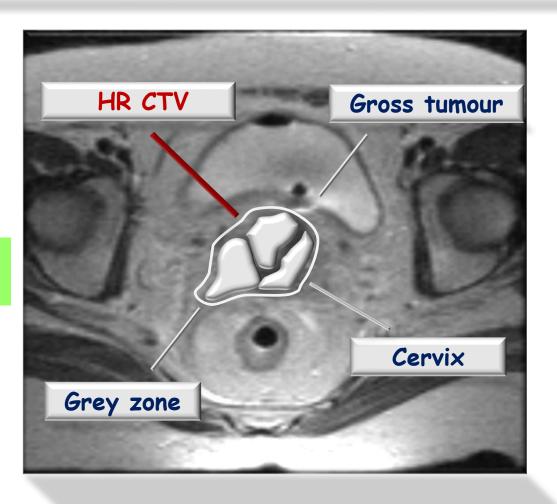

CT for IGABT?

Imaging protocols MRI and CT Key issues when using MRI for IGABT

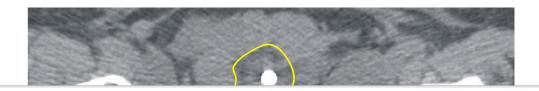

Target / Patho-anatomical structures / GTV, HR-CTV contouring on MRI

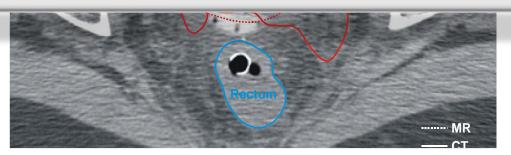

LONGS UNDER CONTOURING

Imaging protocols MRI and CT Key issues when using CT for IGABT

Target / Patho-anatomical structures / GTV, HR-CTV contouring on CT

GTV-contouring as it is done on MRI is not possible on CT!

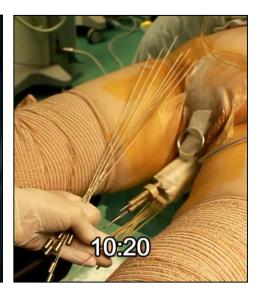

CT for IGABT?

Preparation for contouring starts prior to imaging

Adapt your application technique!

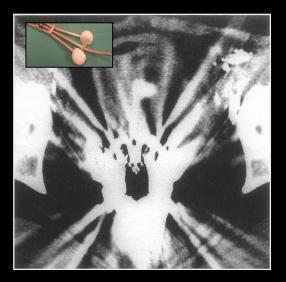

Avoid thick stainless steel applicators / accessories

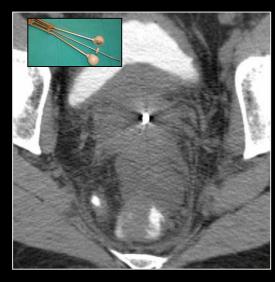

Use CT compatible equipment

Avoid non-diluted contrast (packing, Foley ballon, bladder...)

Consider marking vaginal extension (i.e. radio-opaque suture)

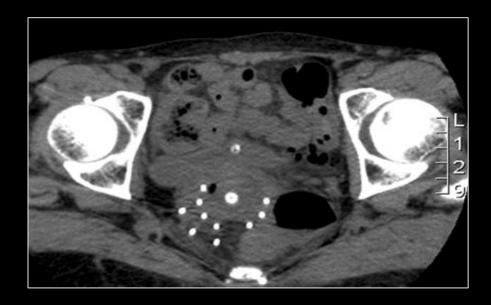

Use CT compatible applicators

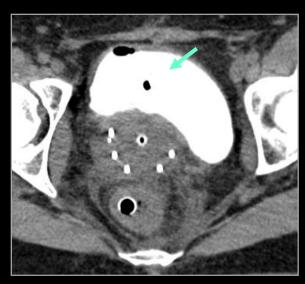

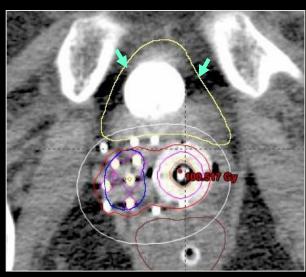

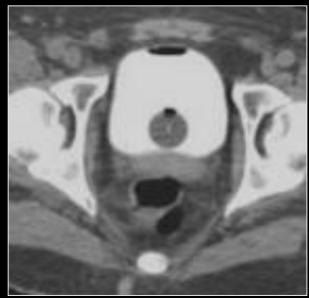

Bladder / Foley contrast dilution

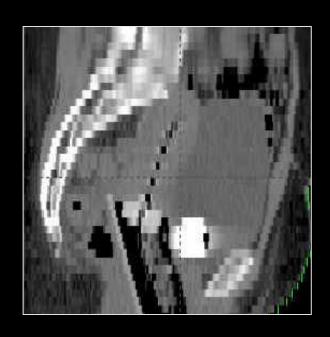

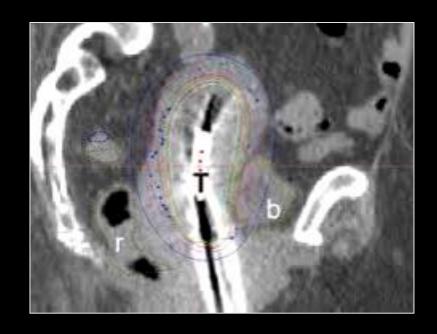

i.v. contrast

Use thin slices over the areas of interest

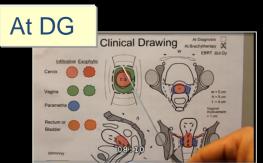

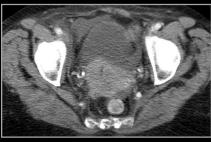

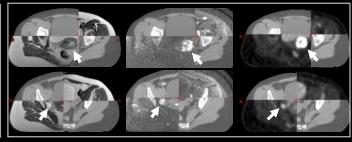

Sometimes there is little we can do...

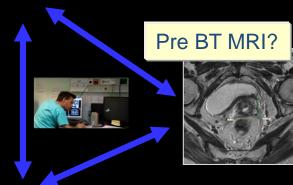

Combine all clinical and radiological information

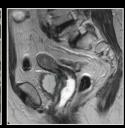

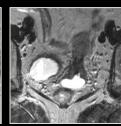

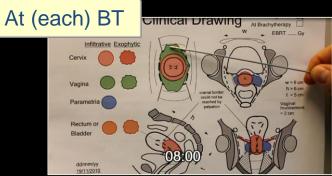

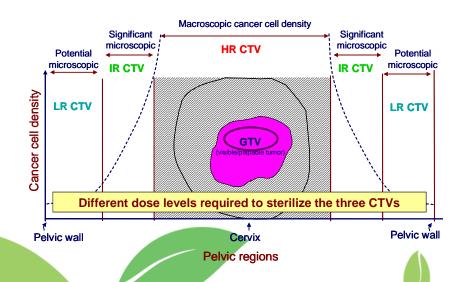

CT for IGABT?

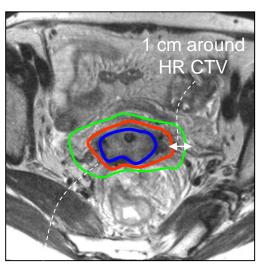

Understanding MRI concepts: precondition for CT based contouring

Incorporation of clinical information

High-risk clinical target volume delineation in CT-guided cervical cancer brachytherapy: Impact of information from FIGO stage with or without systematic inclusion of 3D documentation of clinical gynecological examination

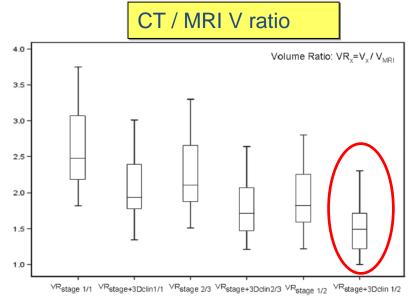

NEAMAT HEGAZY^{1,2}, RICHARD PÖTTER^{1,3}, CHRISTIAN KIRISITS^{1,3}, DANIEL BERGER¹, MARIO FEDERICO¹, ALINA STURDZA¹ & NICOLE NESVACIL¹

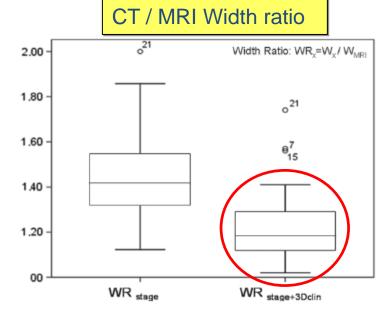

¹Department of Radiotherapy, Comprehensive Cancer Centre Vienna, Medical University of Vienna, Vienna, Austria, ²Department of Clinical Oncology, Medical University of Alexandria, Egypt and ³Christian Doppler Laboratory for Medical Radiation Research for Radiation Oncology, Medical University Vienna, Austria

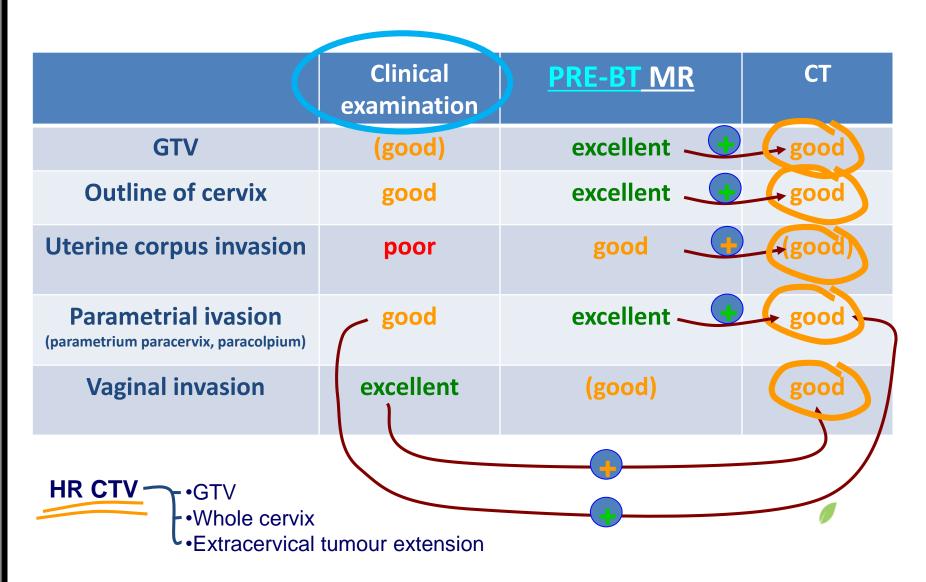

Incorporation of clinical information

High-risk clinical target volume delineation in CT-guided cervical cancer brachytherapy: Impact of information from FIGO stage with or without systematic inclusion of 3D documentation of clinical gynecological examination

Conclusion. CT-based HR CTV contouring based on FIGO stage alone leads to large overestimation of width and volume. Target delineation accuracy can systematically improve through incorporation of additional information from comprehensive 3D documentation of repetitive gynecological examination in the contouring protocol, and thus help to improve the accuracy of dose optimization in settings with limited access to imaging facilities at the time of brachytherapy. If CT information is only available, minimum 2/3 of uterine height may be a good surrogate for the height of HR CTV.

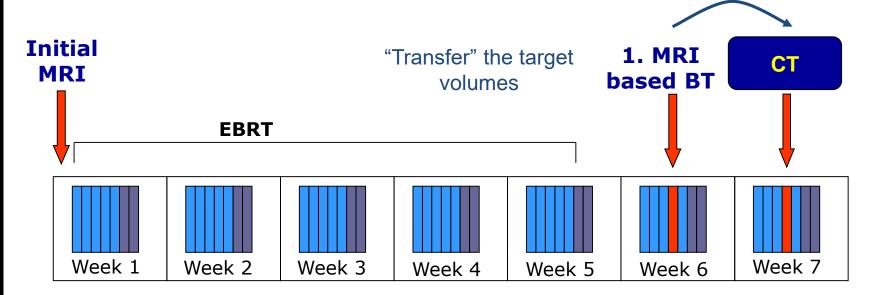

IR CTV: in principle HR CTV + margins

Incorporation of pre-BT MRI information

Adaptive image guided brachytherapy for cervical cancer: A combined MRI-/CT-planning technique with MRI only at first fraction

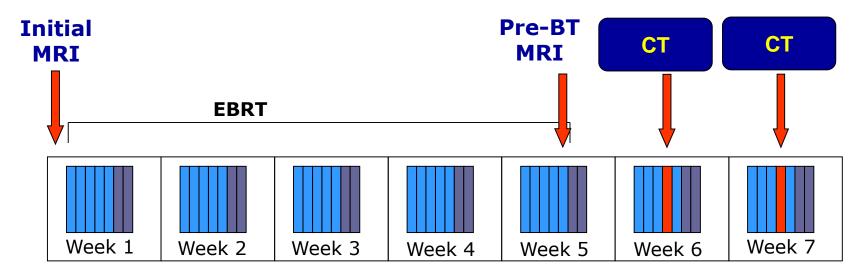

Nicole Nesvacil^{a,*}, Richard Pötter^b, Alina Sturdza^a, Neamat Hegazy^a, Mario Federico^a, Christian Kirisits^b

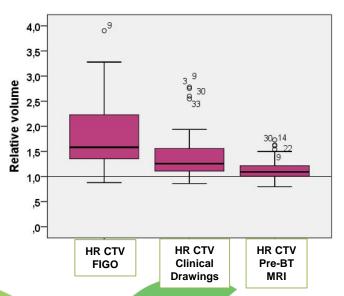

^a Department of Radiotherapy, Comprehensive Cancer Center, Medical University of Vienna; ^b Department of Radiotherapy, Comprehensive Cancer Center & Christian Doppler Laboratory for Medical Radiation Research for Radiation Oncology, Medical University of Vienna

Conclusions: A combination of MRI for first fraction and subsequent CT based planning is feasible and easy when automatic applicator-based image registration and target transfer are technically available. The results show striking similarity to fully MRI-based planning in cases of small tumours and intracavitary applications, both in terms of HR CTV coverage and respecting of OAR dose limits. For larger tumours and complex applications, as well as situations with unfavourable OAR topography, especially for the sigmoid, MRI based adaptive BT planning remains the superior method.

Incorporation of pre-BT MRI information

Pre-BT MRI improves the ability to contour on CT!

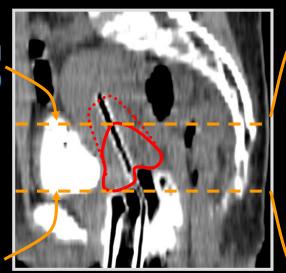

HR CTV contouring on CT: tips

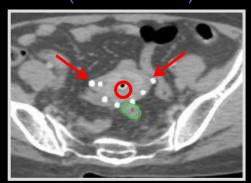

Inferior and superior extent ≅ cervical borders

Uppermost contour

Uterine vessels abutting (i. v. contrast)

Superior: Where uterus indents, contour the next 1 cm - pointed shape (cone)

Inferior: ring / ovoids level

Cervical length: 2.5 – 3 cm

Vaginal involvement: add vaginal tissue involved clinically at BT.

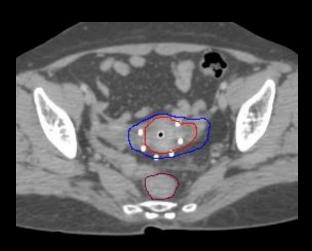

Uterine involvement: more challenging. Clinical / radiological information into account

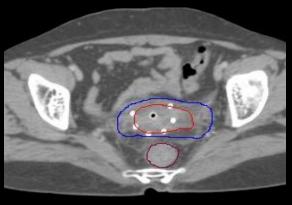

HR CTV contouring on CT: tips

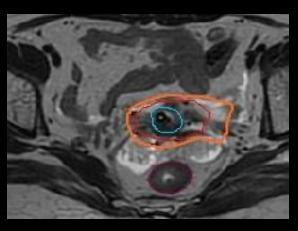

Lateral borders of HR-CTV: Clinical examination & imaging

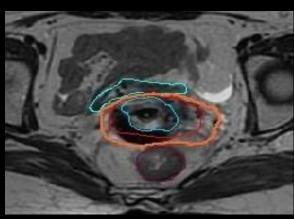

No parametrial invasion: lateral cervical borders

Parametrial invasion: grey structures in parametria (density of cervix)

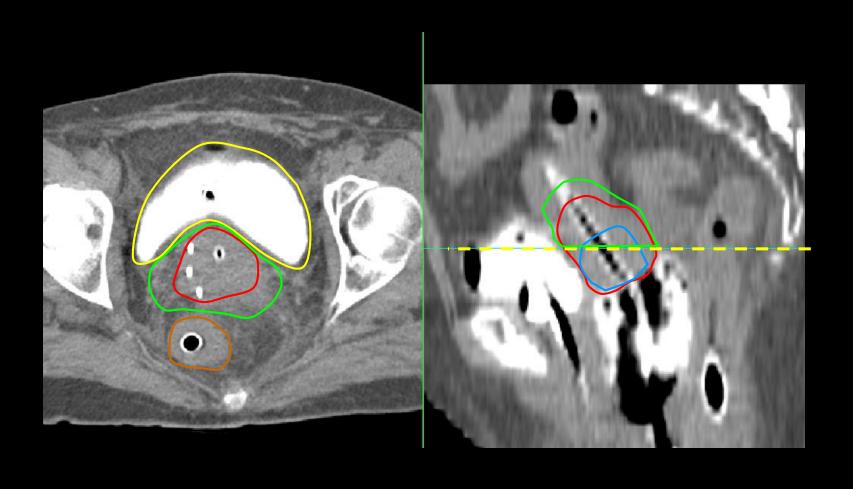

IR CTV contouring on CT: tips

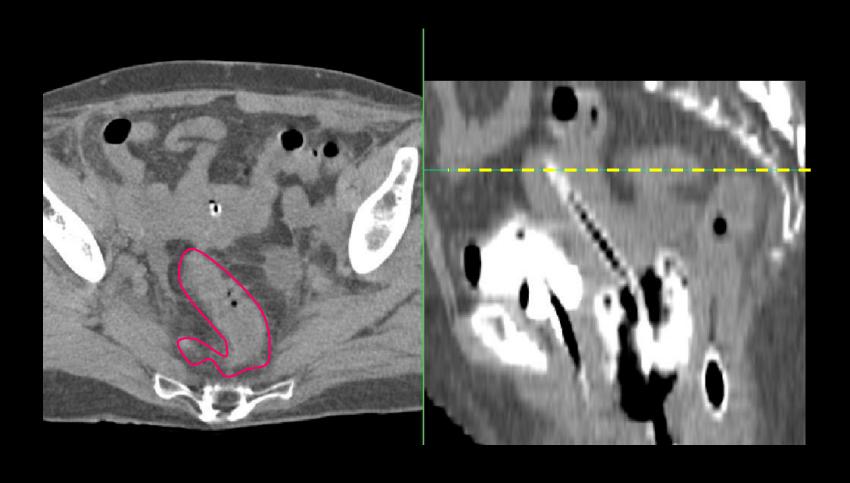

IR CTV ≅ **HR CTV** with a margin

Respect GEC ESTRO Recommendations for MRI-based contouring

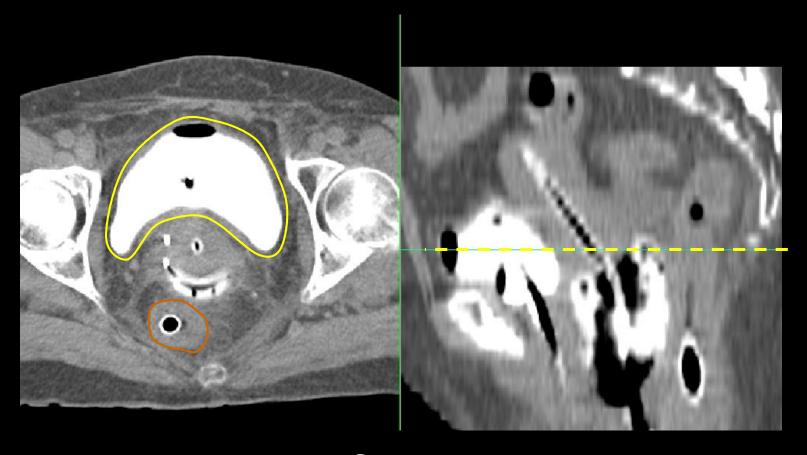

OAR contouring on CT

Sigmoid colon

OAR contouring on CT

Rectum and bladder

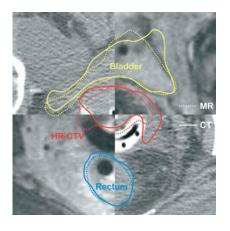

Summary:

CT and MRI <u>useful</u> for delineation of outer organ boundaries. However, MRI is superior.

MRI- vs. CT-based contouring: results

COMPUTED TOMOGRAPHY VERSUS MAGNETIC RESONANCE IMAGING-BASED CONTOURING IN CERVICAL CANCER BRACHYTHERAPY: RESULTS OF A PROSPECTIVE TRIAL AND PRELIMINARY GUIDELINES FOR STANDARDIZED CONTOURS

AKILA N. VISWANATHAN, M.D., M.P.H.,* JOHANNES DIMOPOULOS, M.D.,† CHRISTIAN KIRISITS, Sc.D.,†
DANIEL BERGER, M.Sc.,† AND RICHARD PÖTTER, M.D.,†

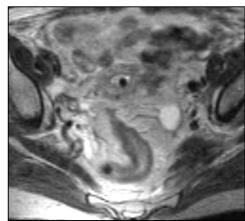

Conclusion: Computed tomography-based or MRI-based scans at brachytherapy are adequate for OAR DVH analysis. However, CT tumor contours can significantly overestimate the tumor width, resulting in significant differences in the D_{90} , D_{100} , and volume treated to the prescription dose or greater for the HR-CTV compared with that using MRI. MRI remains the standard for CTV definition. © 2007 Elsevier Inc.

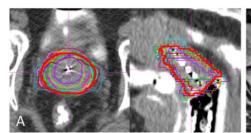

Common interpretation:

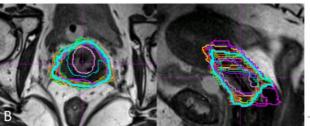

CT is OK for OAR, but suboptimal for HR CTV and IR CTV

...oversimplification for the OAR?

MRI should be considered the gold standard for contouring!

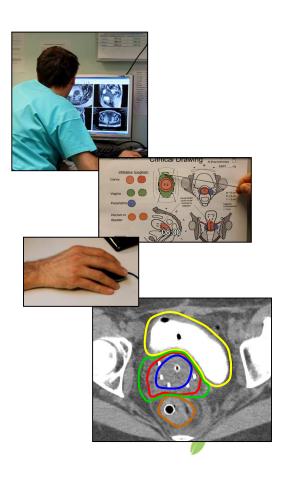

Oncology Ljubljana, Ljubljana, Slovenia, ****Department of Radiation Oncology, National Center for Cancer Care and Research, Doha, Qatar, ****University of Miami Miller School of Medicine, Miami,

CONCLUSION: In a comparison of MR-contoured with CT-contoured CTV volumes, the higher level of agreement on CT may be due to the more distinct contrast medium visible on the images at the time of brachytherapy. MR at the time of brachytherapy may be of greatest benefit in patients with large tumors with parametrial extension that have a partial or complete response to external beam. On the basis of these results, a 95% consensus volume was generated for CT and for MR. Online contouring atlases are available for instruction at

SUMMARY & CONCLUSIONS

- MRI-based approach: Gold Standard
- CT-based approach: feasible, provided:
 - Experience with MRI-Based Approach
 - Pre-therapy MRI available
 - Standardized CT protocol used
 - Clinical findings incorporated
 - Pre BT MRI facilitates CT contouring

Tumor and target volume definitions for the primary tumor

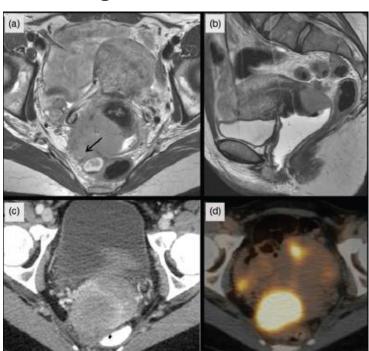

- GTV for the primary tumor (GTV-T)
- CTV for the primary tumor (CTV-T)
- Residual GTV-T (GTV-T_{res})
- Adaptive CTV-T (CTV-T_{adapt})
- High-Risk CTV-T (CTV-T_{HR})
- Intermediate-Risk CTV-T (CTV-T_{IR})
- Low-Risk CTV-T (CTV-T_{IR})
- Planning Target Volume (PTV-T)

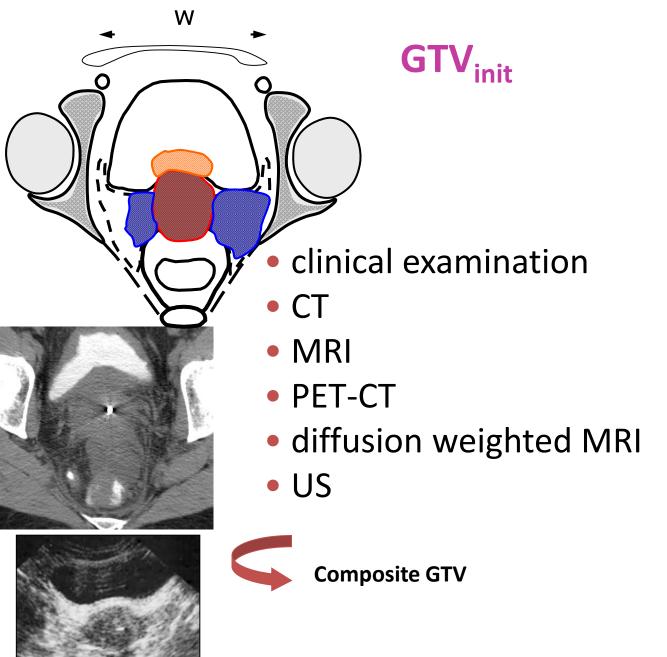

GTV for the primary tumor (GTV-T)

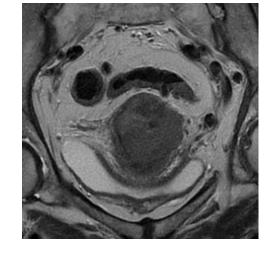

- basis for treatment prescription and planning
- clinical, imaging, and/or pathology investigations assessment
- represents macroscopic demonstrable disease for the primary tumor according to the UICC TNM classification
- composite GTV-T
- context of adaptive radiotherapy : GTV-T_{init} to distinguish this from the

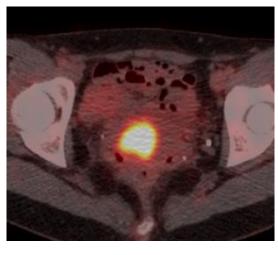

GTV-T_{res}

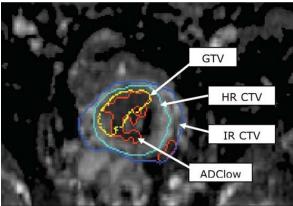

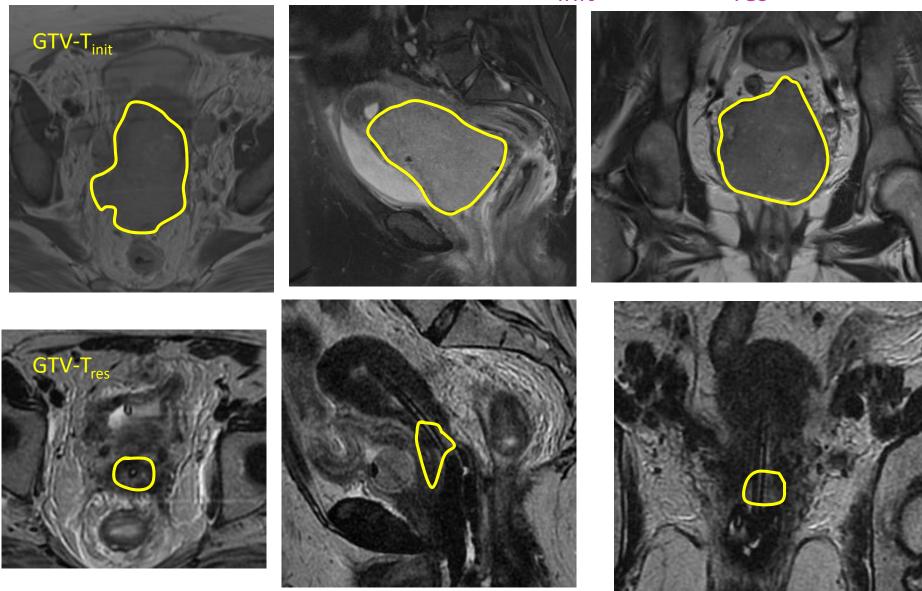

GTV for the primary tumor Example stage IIIB : GTV-T_{init} / GTV-T_{res}

CTV for the primary tumor (CTV-T)

- GTV and assumed sub-clinical malignant disease
- CTV-T encompasses the microscopic tumor spread at the boundary of the primary tumor GTV

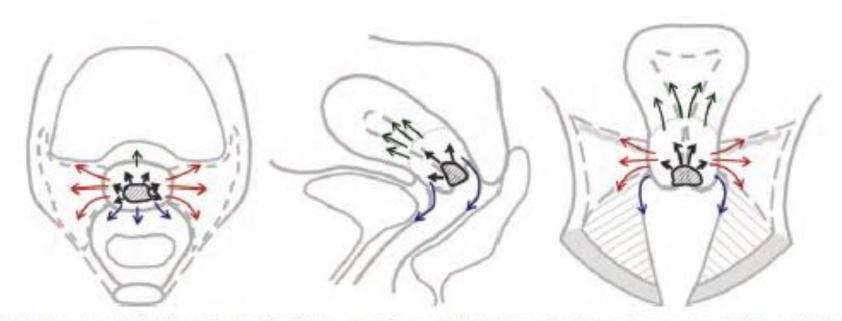

Figure 5.5. Schematic axial (left) mid-sagittal (middle) and mid-coronal (right) views of typical cervix cancer growth in—and outside—the cervix with extra-cervical infiltration into adjacent structures such as parametria, uterine corpus, vagina [see also electronic appendix Gyn GEC ESTRO Rec II (Lim et al., 2011; Pötter et al., 2006)].

CTV for the primary tumor (CTV-T)

Three different CTV-Ts have been defined in the GEC-ESTRO recommendations: "High Risk CTV," "Intermediate Risk CTV," and "Low risk CTV"

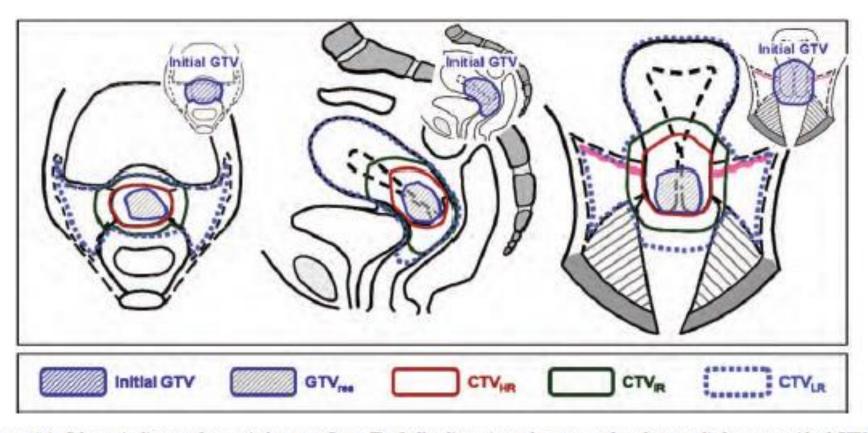

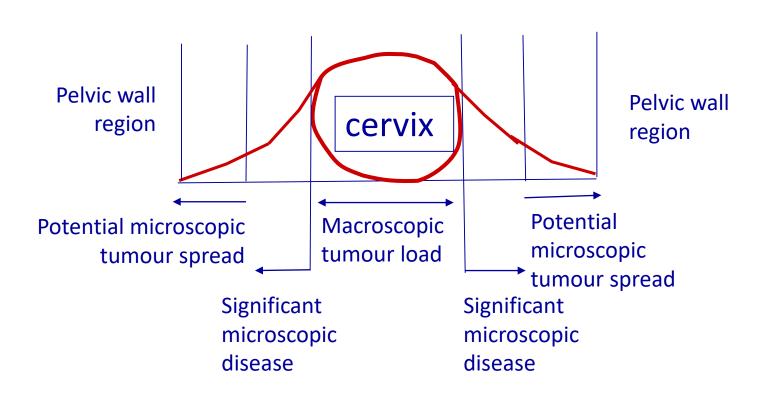

Figure 5.9. Schematic diagram for cervical cancer, Stage IB₂ (bulky disease), good response after chemo-radiotherapy: residual GTV-T (GTV-T_{res}), adaptive CTV-T (CTV-T_{HR}), initial GTV-T (GTV-T_{tres}), intermediate risk CTV-T (CTV-T_{IR}) (GTV-T_{tres} plus margins around the CTV-T_{HR}), and CTV-T_{LR} for adaptive brachytherapy: coronal, transversal, and sagittal view (see also Appendix Example 2 and 9).

CTVs concepts

Cancer cell density in 3 different target volumes

CTV for the primary tumor (CTV-T)

CTV-T_{LR} for cervix cancer (for external irradiation):

- whole uterus
- whole parametria
- upper vaginal third (if the vagina is not involved)

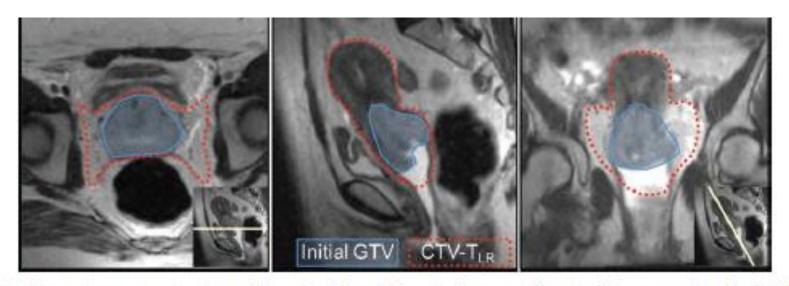

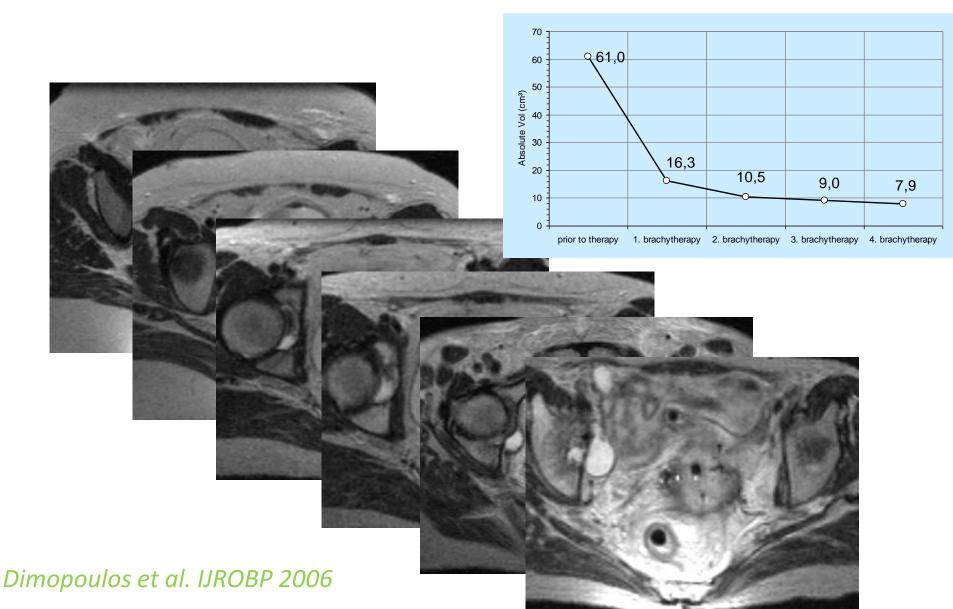

Figure 5.7. Magnetic resonance imaging at diagnosis of Stage IIB cervical cancer infiltrating both parametria with GTV-T_{init} and CTV-T_{LR}(CTV-T₃) including both parametria, uterine corpus, and upper vagina, contoured for treatment planning of EBRT.

Adaptive MRI based planning concept

CTV for the primary tumor (CTV-T): adaptive CTV-T concept

The CTV-T determination for the brachytherapy boost at the end of external therapy takes changes into account by applying the adaptive CTV-T concept with:

- CTV-T_{HR}
- CTV-T_{IR}

CTV for the primary tumor (CTV-T)

HR CTV:

- GTV at the time of BT
- CTV if complete response : limited to cervix
- CTV if uncomplete response : cervix plus adjacent

structures with presumed residual disease - assessed

by both clinical examination and imaging (~30-60

- cc) including grey zones
- No safety margins
- Intent: 85 to 90 + Gy total dose to CTV in definitive radiotherapy in advanced disease
- Dose comparable with dose to point A

CTV for the primary tumor (CTV-T)

IR CTV:

- Integrates GTV at the time of diagnosis
- Always includes HR-CTV
- In case of major response: includes safety margins with regard to initial size GTV
- Intent: 60 + Gy total dose to CTV in definitive radiotherapy in advanced disease
- Dose comparable with dose to the 60Gy isodose (ICRU recommendations)

CTV for the primary tumor (CTV-T)

Intermediate Risk CTV:

GTV at time of diagnosis

In all cases includes:

- HR-CTV
- integrates initial CTV

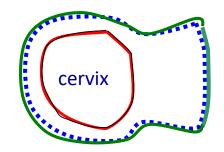

SAFETY MARGINS:

1-1.5 cm cranially0.5 cm antero-posteriorly1cm laterally

AIM: TO STERILIZE MICROSCOPIC TUMOUR

Patient n°4

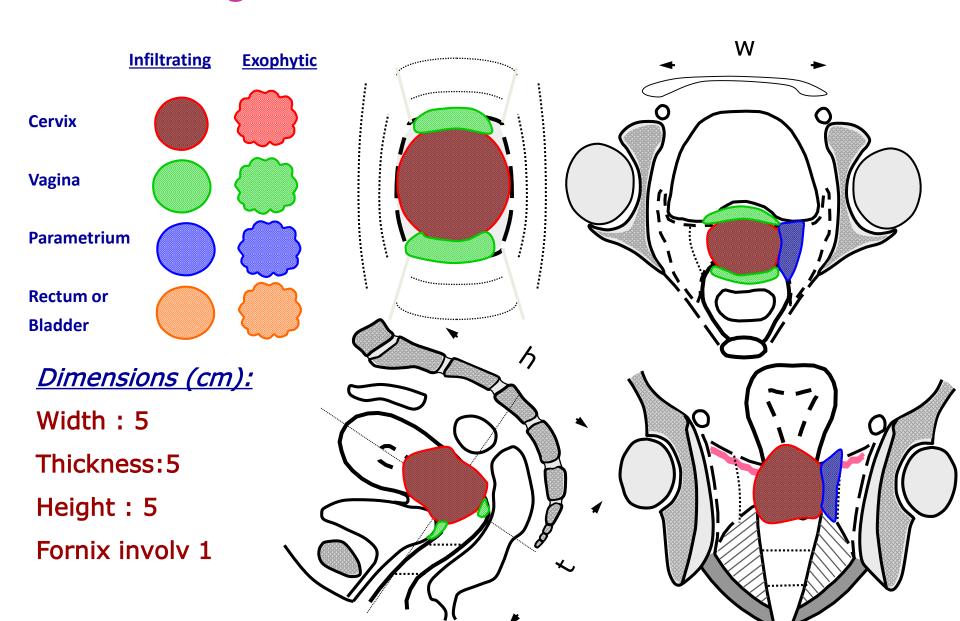

Mrs BOR... 46 year-old WHO=0, 72 kg, 1m67

Vaginal bleeding

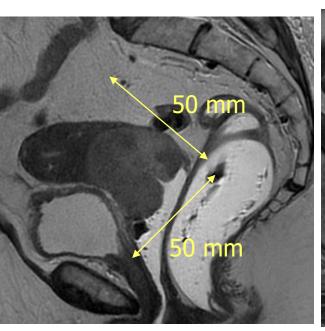

Biopsy: moderately differentiated adenocarcinoma

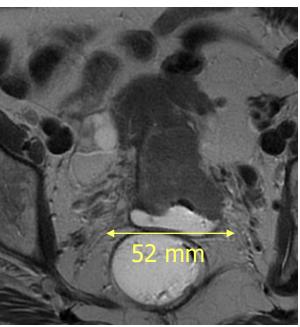

At clinical examination: cervical tumor + infiltration of the anterior and posterior fornices + infiltration of the proximal part of the left parametrium

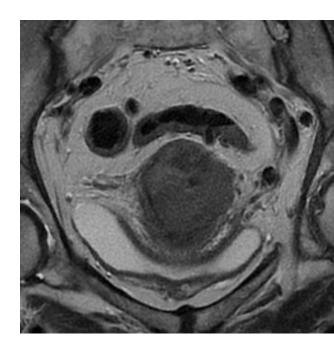

Stage IIB: initial clinical examination

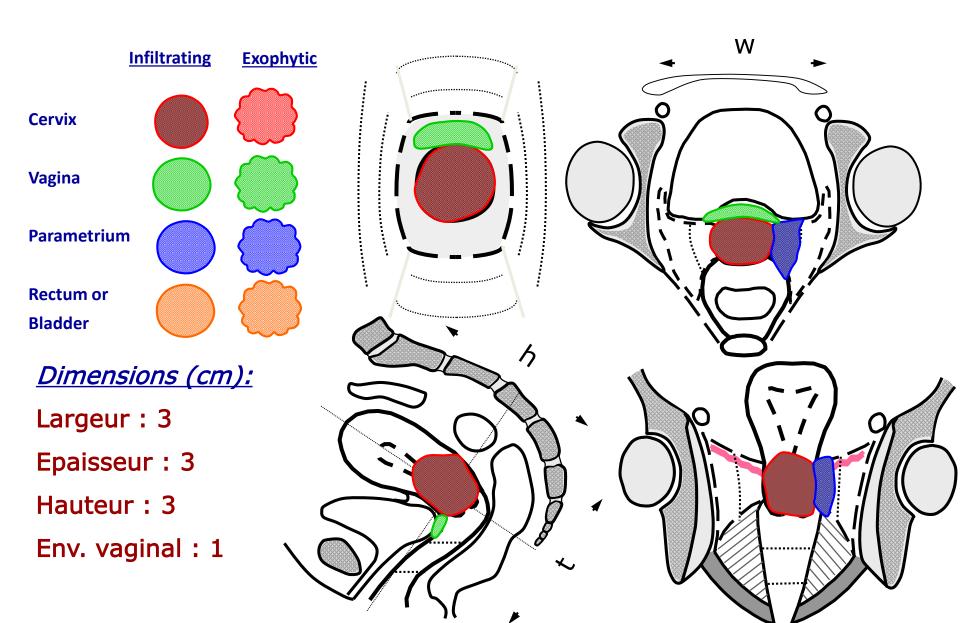

Stage IIB: initial MRI

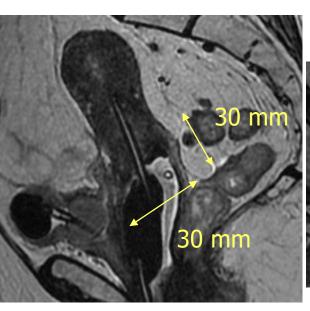

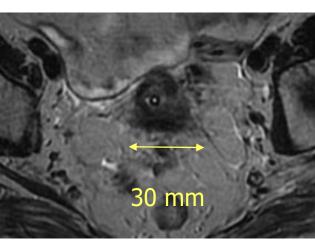

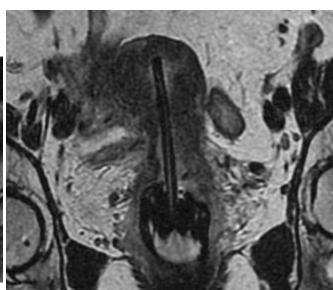

Stage IIB: at the time of brachytherapy

Stage IIB: MRI at the time of brachytherapy

Target volume concepts

High Risk CTV:

GTV at time of brachytherapy In all cases includes:

- GTV + whole cervix
- Presumed tumour extension in adjacent tissues
 - Clinical assessment
 - Residual grey zones on MRI

NO SAFETY MARGINS

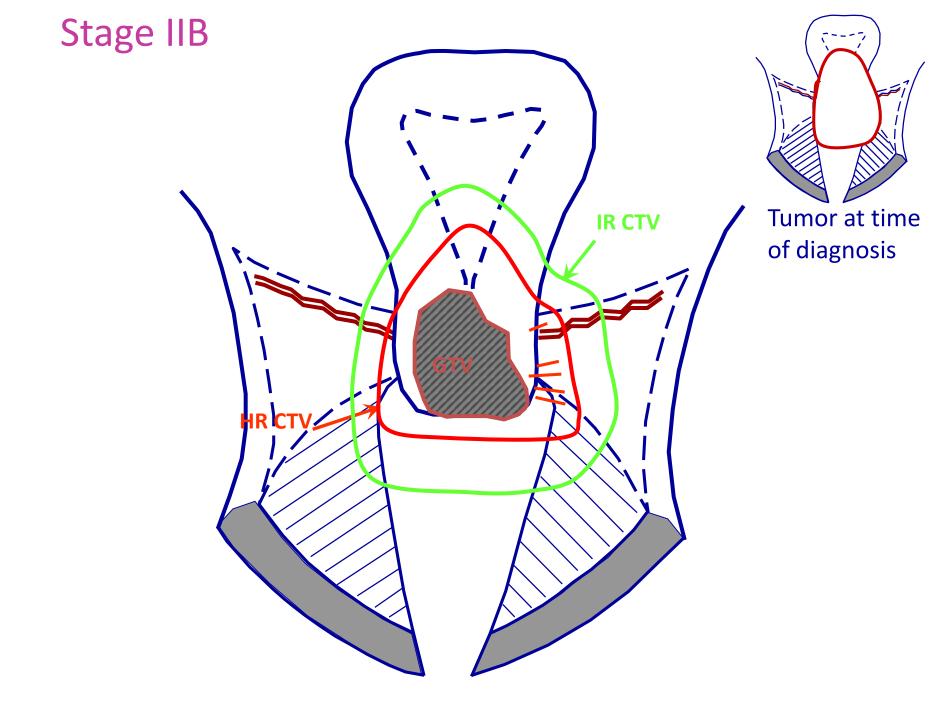

Intermediate Risk CTV:

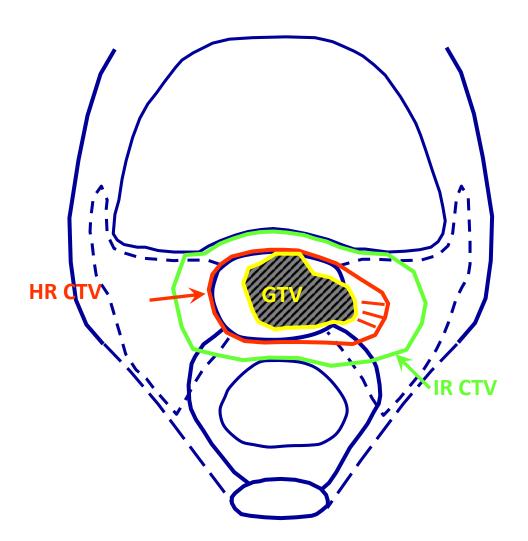

GTV at time of diagnosis In all cases includes:

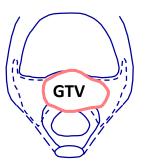

- HR-CTV
- integrates initial CTV

SAFETY MARGINS:

1-1.5 cm cranially0.5cm antero-posteriorly1cm laterally

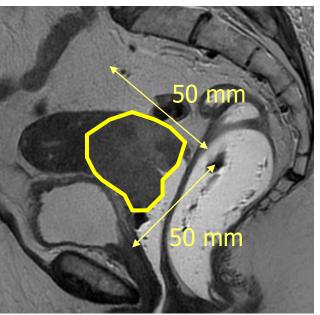

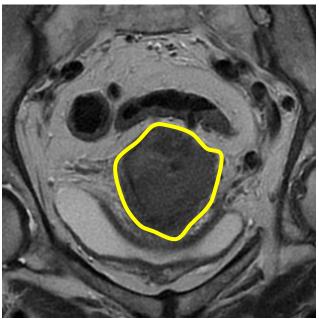

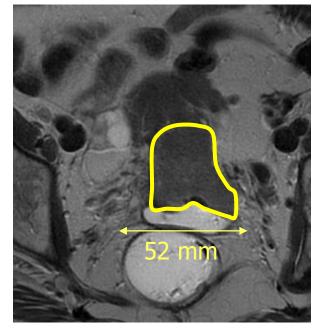

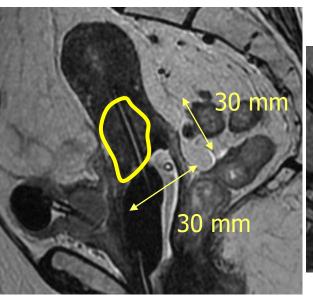

Tumor at time of diagnosis.

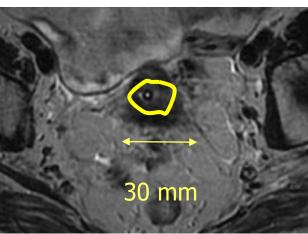

Stage IIB

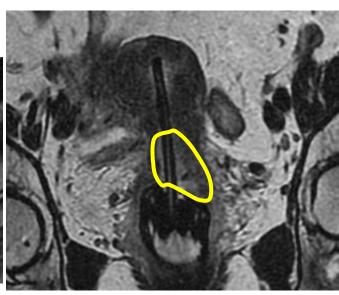

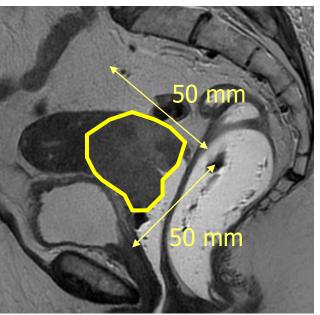

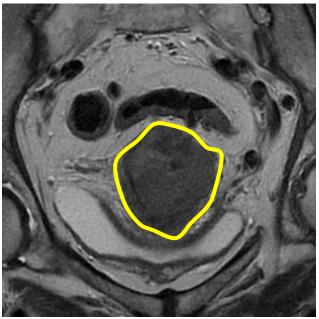

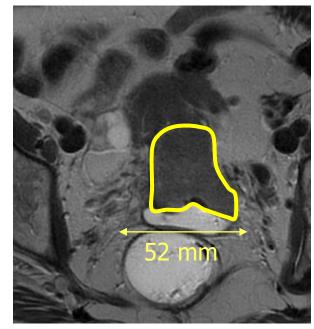

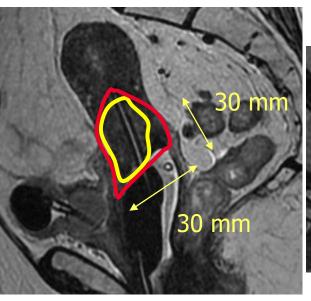

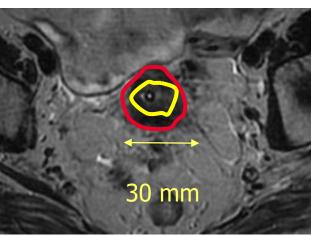

Stage IIB

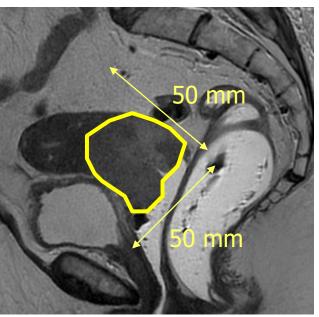

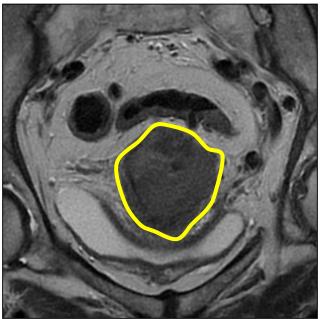

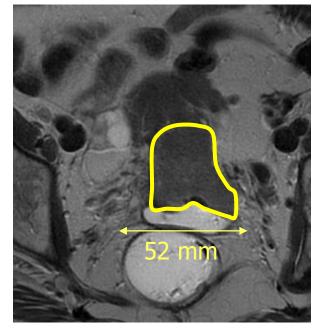

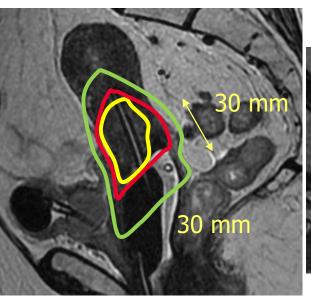

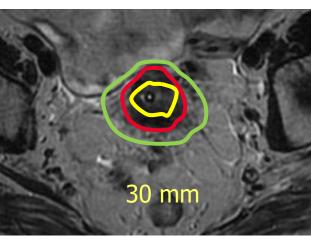

Stage IIB

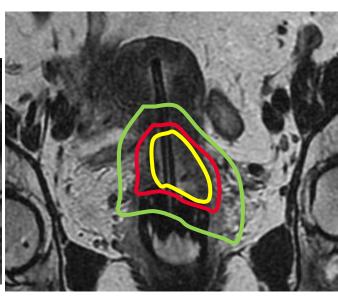

Patient n° 7

Mrs Claudine BAR... 62 year-old

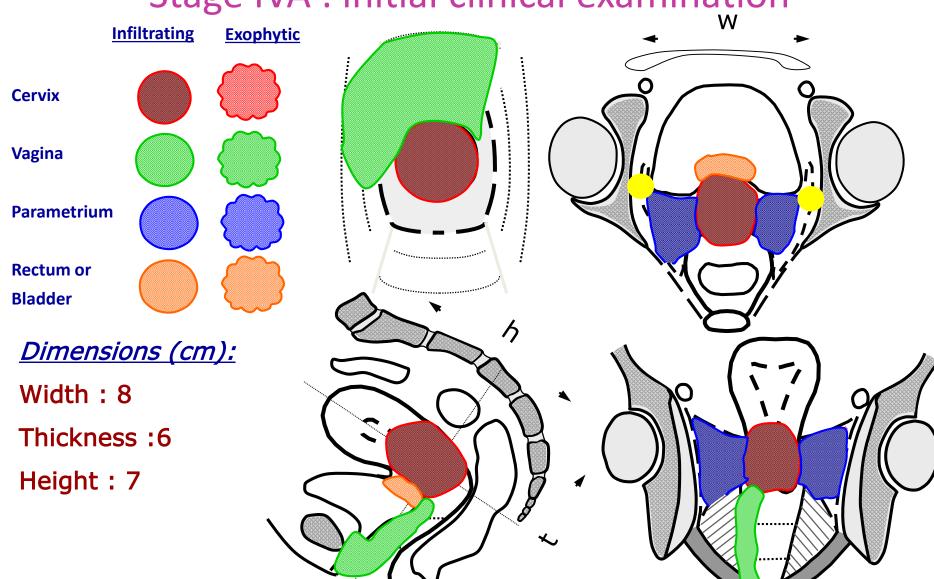

Vaginal bleeding for > 1 year, urinary retention

Biopsy: well differentiated squamous cell carcinoma

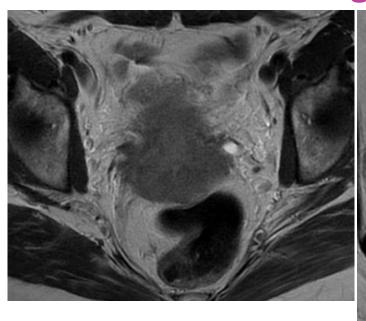

At clinical examination: cervical tumor + infiltration of the whole anterior and right vaginal wall + infiltration of the right parametrium to the pelvic wall + infiltration of the left distal parametrium

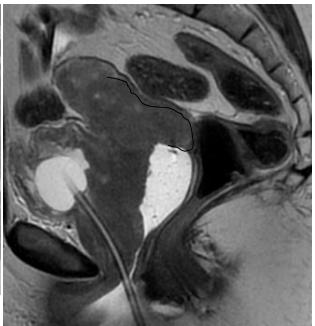

Cystoscopy: involvement of the trigonal area, + biopsy

Stage IVA: initial clinical examination

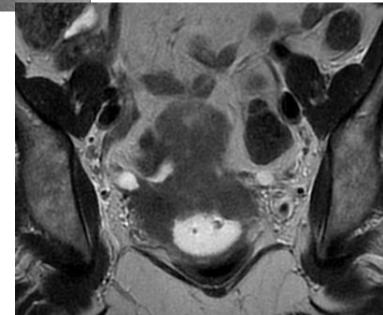

Stage IVA: initial MRI

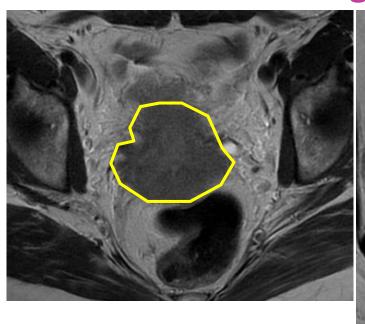

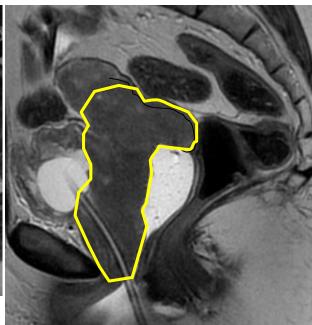

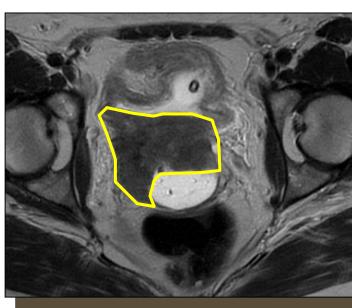

Stage IVA: initial MRI

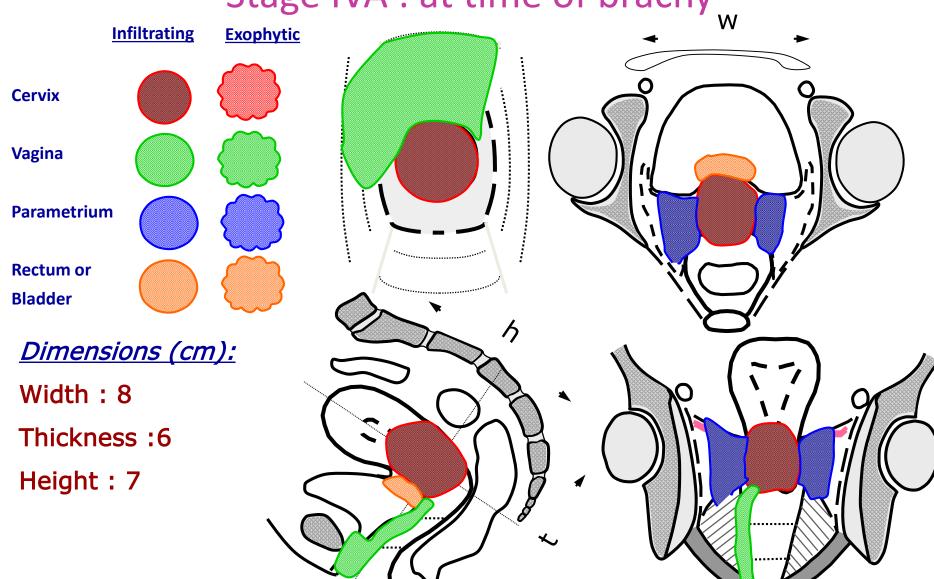

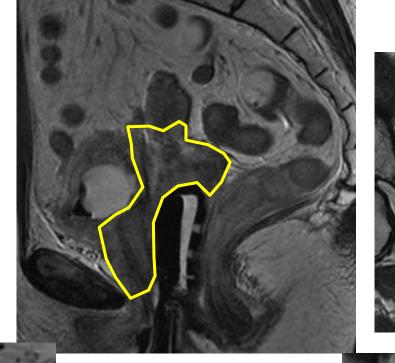

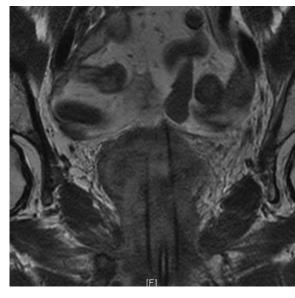

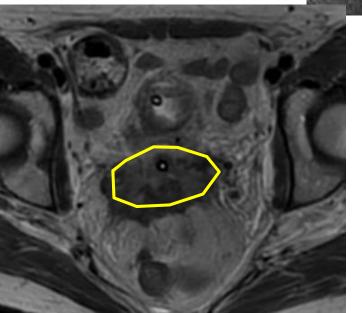

Stage IVA: at time of brachy

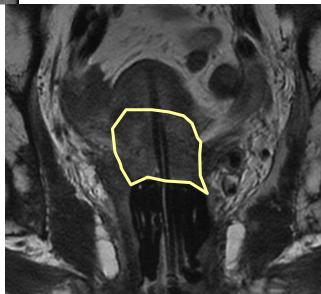

Stage IVA: at time of brachytherapy

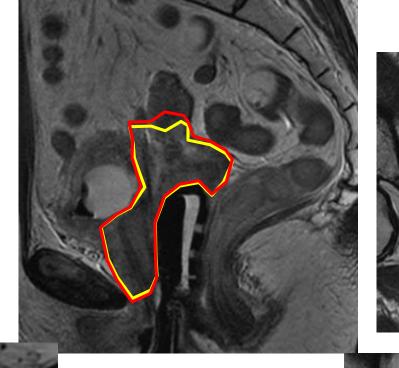

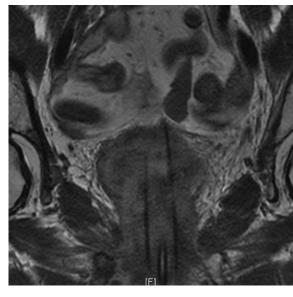

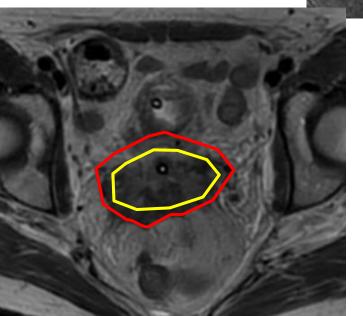

Stage IVA: at time of brachytherapy

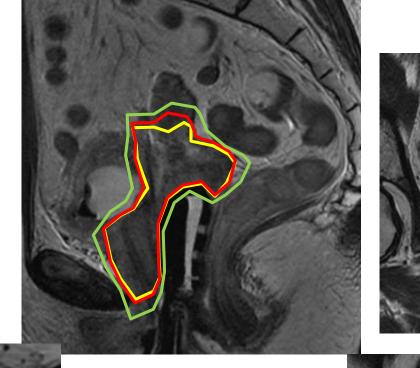

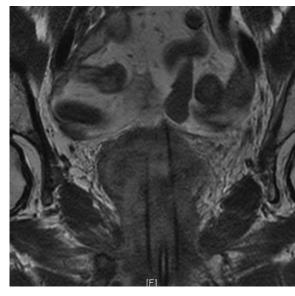

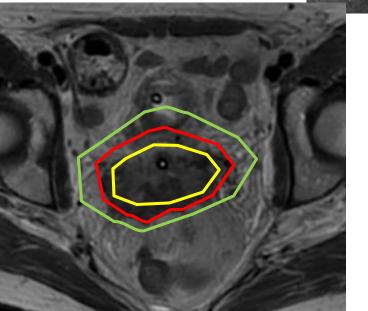

Stage IVA: at time of brachytherapy

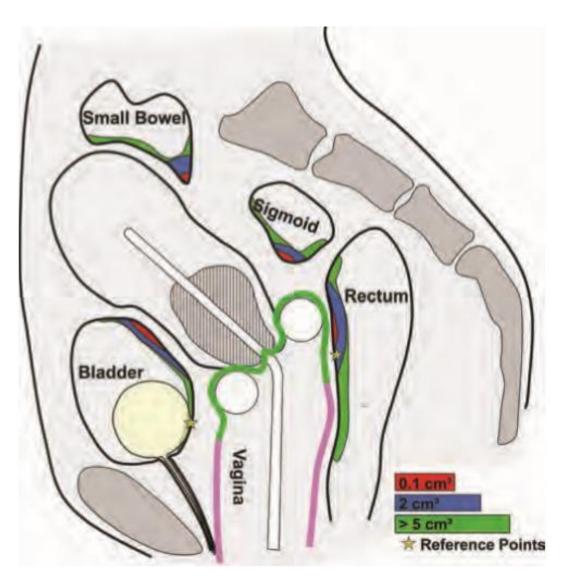

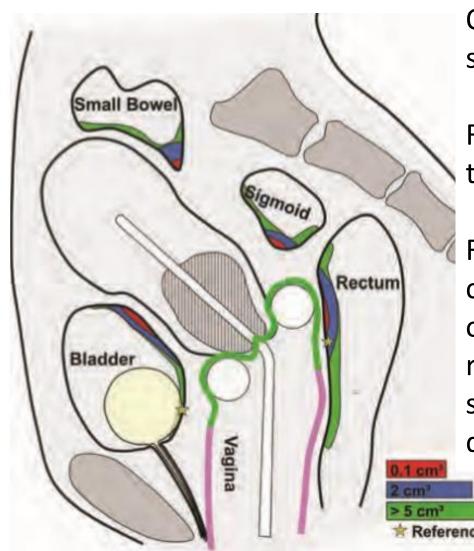

Organs at risk

Organs at risk

Small organ-wall volumes up to 2 cm³–3cm³ represent typical targets for brachytherapy-related morbidity

Organs at risk

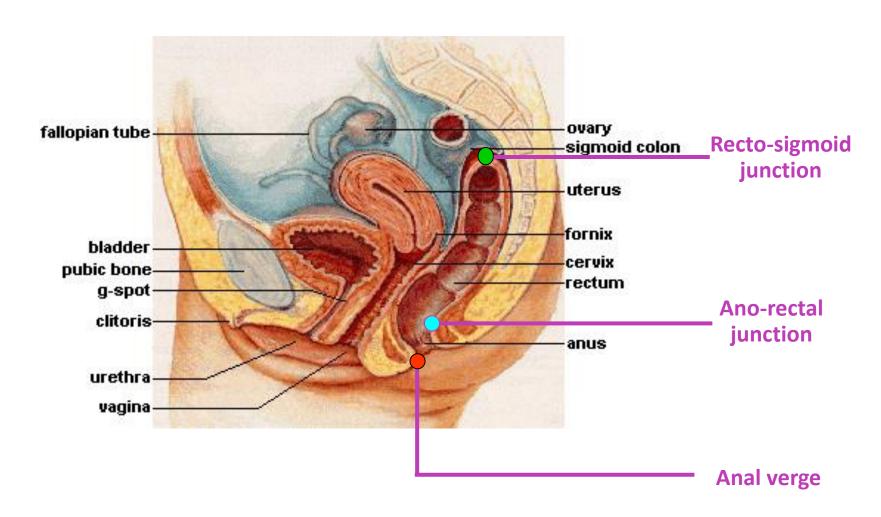

OAR-specific or OAR-sub-volume specific types of morbidity

Rectal and sigmoidal bleeding = telangiectasia even in small volumes

Rectal urgency/ continence = consequence of damage to the overall recto-anal wall, with the relevant muscle and nerve plexus structures regulating the recto-anal discharge

Anorectum

Anatomy

Anorectum

Perspectives

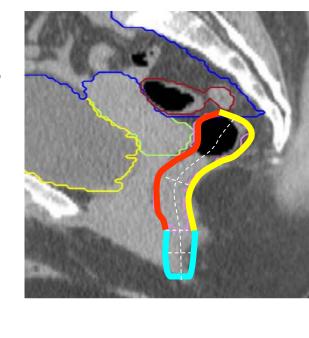

Separate delineation of ano-rectal regions

Separate assessment of DVH to different regions

Separate scoring & modelling of different endpoints

Determination of relevant structures for

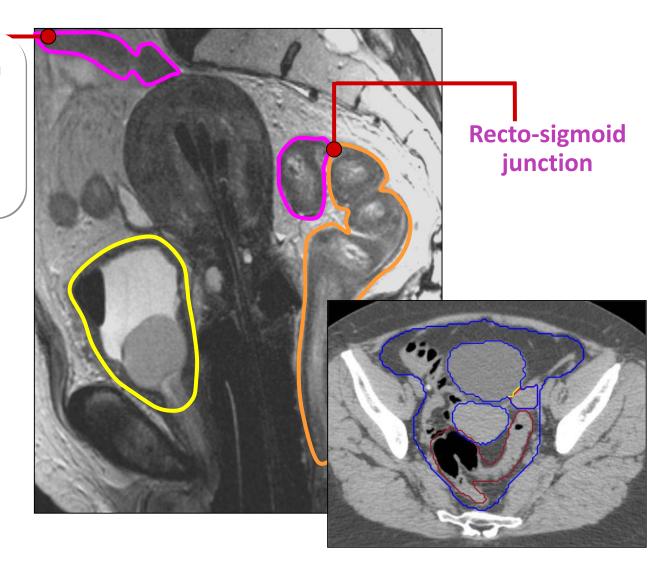

different endpoints

High D regions

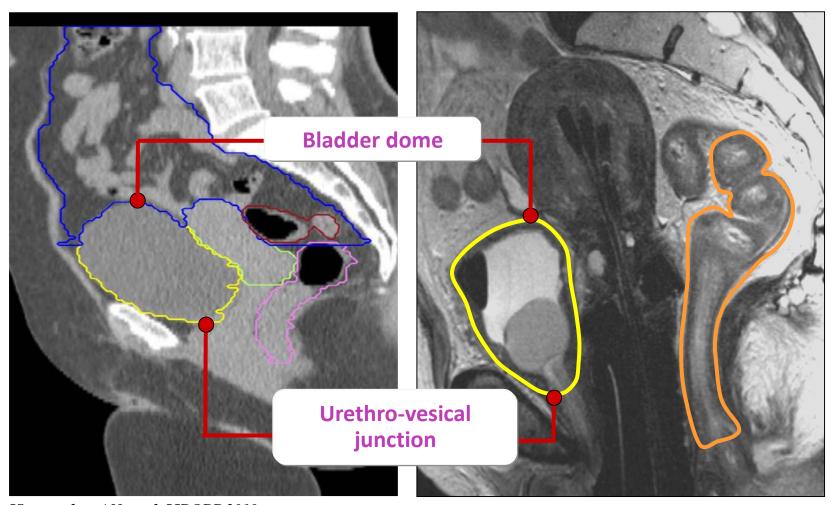

Sigmoid colon

Junction with descending colon (above high dose region)

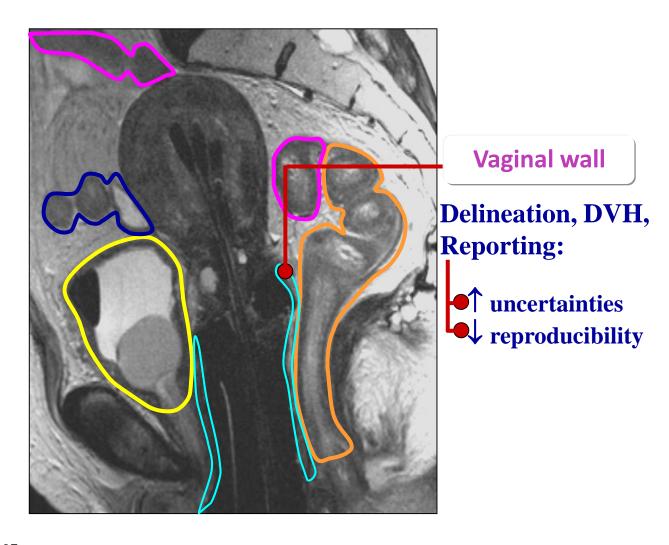

Bladder

What to delineate?

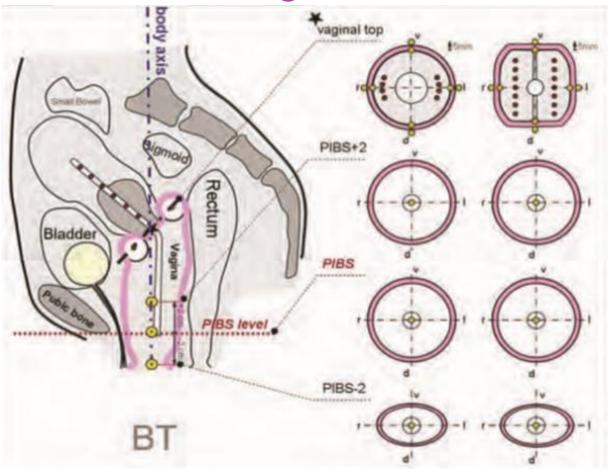

Viswanathan AN, et al. IJROBP 2010

Vagina

Vagina

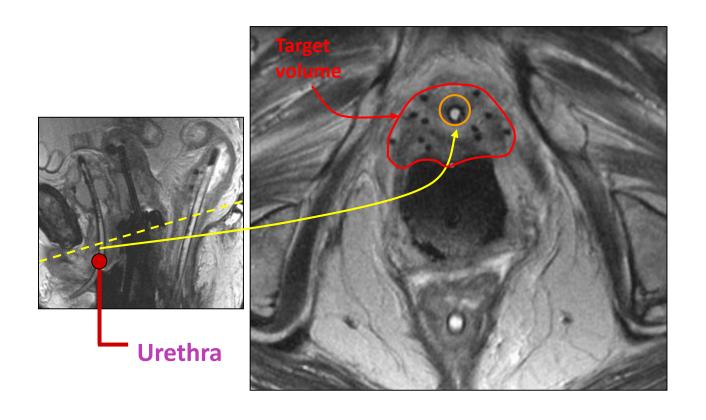

PIBS vaginal-dose point definition: 2 cm posterior from the posterior-inferior border of the pubic symphysis at the point of this line where it crosses the applicator tandem

2 additional points : 2 cm up and down along the vaginal axis PIBS+2 = the mid of the vagina and PIBS-2 = the introitus level

Other organs?

Urethra

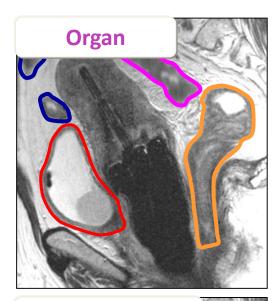

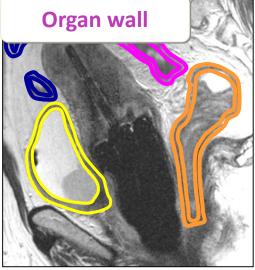

Delineate Organ or Organ wall?

Situation in Brachytherapy

Can we contour <u>organs</u> instead of <u>organ walls</u>?

- Wall: More correct
- Demanding & time consuming
- Prone to uncertainties

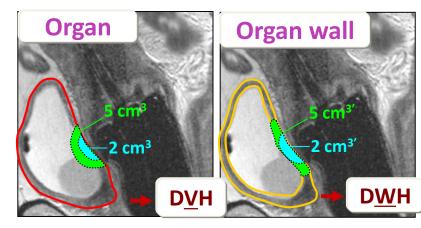

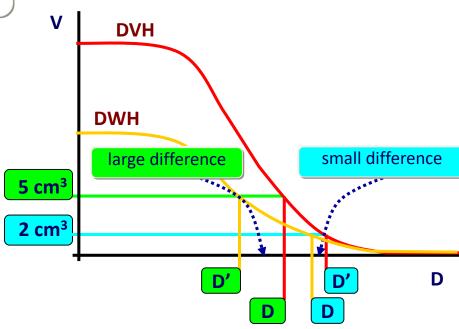

Delineate Organ or Organ wall?

Situation in Brachytherapy

Can we contour <u>organs</u> instead of <u>organ walls</u>?

Yes, if doses up to 2 cm³ are evaluated

Conclusion

- Importance of GTV and CTV for the primary tumor
- Residual GTV-T (GTV-T_{res})
- Adaptive CTV-T (CTV-T_{adapt})
- High-Risk CTV-T (CTV-THR)
- Intermediate-Risk CTV-T (CTV-TIR)
- OAR delineation

Static shielding

From: Gifford KA, et al. Int J Radiat Oncol Biol Phys 2005

Reduced bladder & rectal D

Limited imaging possibilities!

- Artifacts on CT
- Lack of MRI compatibility

Uncertainty: target shielding?

Static shielding: CT compatible, MRI conditional

Static shielding: Direction-modulated BT (DMBT)

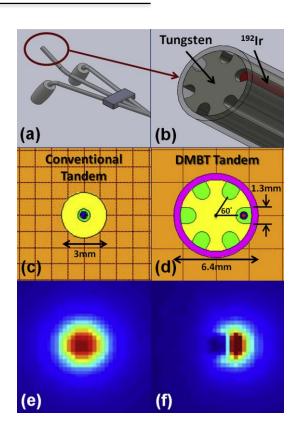

Physics Contribution

Direction-Modulated Brachytherapy for High-Dose-Rate Treatment of Cervical Cancer. I: Theoretical Design

International Journal of Radiation Oncology biology • physics

Dae Yup Han, MSc,*', Matthew J. Webster, MSc,*', Daniel J. Scanderbeg, PhD,* Catheryn Yashar, MD,* Dongju Choi, PhD,* Bongyong Song, PhD,* Slobodan Devic, PhD, Ananth Ravi, PhD, and William Y. Song, PhD*,

- MRI compatible tandem design
- 75 plans compared: DMBT vs. standard
- ↓ D2cc for OAR, ≈ D90 for HR CTV

Static shielding: Direction-modulated BT (DMBT)

Special considerations

Low- and High-Dose Volumes, TRAK

Methods:

The clinically relevant parameters (22), such as D0.1 cc and D2cc for OARs, and V100, V150, V200, and D90 for HRCTV, were calculated thereafter.

Results:

2.38 Gy (40.07%), and 1.26 Gy (27.5%), respectively. The total dwell times, normalized to air kerma strength of 40.25 kU (10 Ci) source, increased on average by 27.1% (from 6.3 ± 1.9 to 8.1 ± 2.6 minutes) for the DMBT plans. This

CAUTION

- TRAK increased
- V150, V200 not reported

<u>Static</u> shielding: Direction-modulated BT (DMBT)

Special considerations

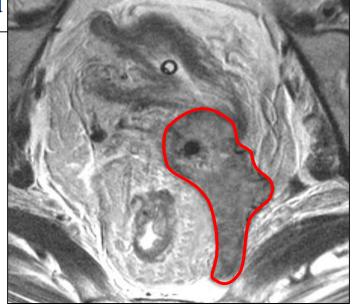

Clinical value / Limitations of DMBT!

Discussion:

out that at least some of the advanced clinical cases in which interstitial needles are necessary (eg, parametrial or utero-sacral extensions) (15) can be replaced with the

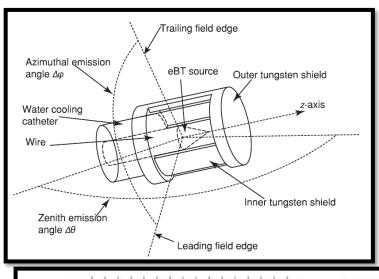

DMBT applicator. For this study, the selected

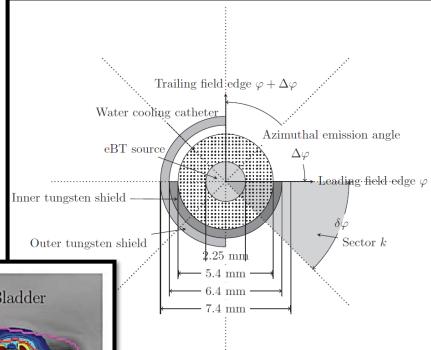

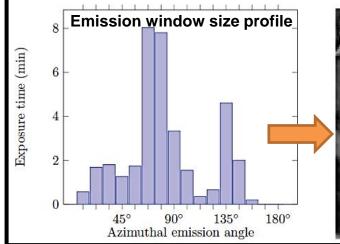

Dynamic Rotating Shield Brachytherapy - D-RSBT

- Electronic brachytherapy source
- Radiation shield capable of changing emission angles

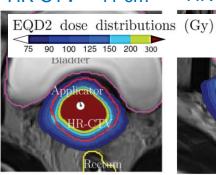

Dynamic Rotating Shield Brachytherapy - D-RSBT

 $HR CTV = 41 cm^3$

 $HR CTV = 45 cm^3$

 $HR CTV = 77 cm^3$

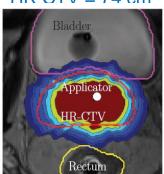

HR CTV = 98 cm^3 HR CTV = 74 cm^3

Plans of 5 cases compared:

- <u>D-RSBT</u> vs. <u>Interstitial + Intracav. BT</u>
- With 30 additional min. for D-RSBT:
 - D90 improved for 20 Gy (EQD2)
 - OAR doses +/- unchanged

CONCLUSIONS

Patients who need to be treated with HDR-BT may benefit from the D-RSBT technique. Compared to the existing interstitial BT methods such as IS + ICBT, D-RSBT can generate less invasive plans with a better dose distribution at the expense of longer delivery times. D-RSBT is also likely to yield

e cases where S-RSBT may have difficulty e between dose quality and delivery time.

CAUTION...

- IS-IC BT technique not described in this work...
- Extensive Favourable experience with IC-IS BT!
- D-RSBT: Dose emitted from single channel
 - High-D volume increased by 15 50 %!
 - D heterogeneity!
 - TRAK?
- Clinical implications?

Liu Y, Flynn RT, Kim Y, Yang W, Wu X.. Med Phys 2013;40(12):12703 Liu Y, Flynn RT, Kim Y, Wu X. Med Phys 2014;41(11):111709 Yang W, Kim Y, Wu X, et al.. Phys Med Biol 2013;58(11):3931-41. Liu Y, et al.. Med Phys 2013;40(5):051720 Adams QE, Xu J, Breitbach EK, et al. Med Phys 2014;41(5):051703

CONCLUSIONS

- Modern intracavitary applicators
 - Same concept as historical systems; main differences:
 - CT, MRI compatibility, materials
 - Fixed, adjustable components
 - Smaller channel diameters
- Main types of intracavitary applicators:
 - Tandem & ring (Stockholm style)
 - Tandem & ovoids (Manchester or Fletcher style)
 - Mould technique
- Intracavitary technique alone:
 - limited possibility for D adaptation
- Interstitial boost recommended for unfavourable topography

* All patient undergo CT based planning mandatory for first #

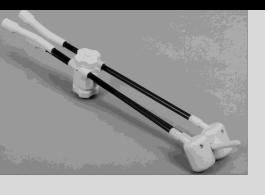

OUTLINE

- Limitations of STD Intracavitary Applicators
- Conventional Interstitial Techniques
- Modern Intracavitary + Interstitial Techniques
- Optimizing Applicator placement by Image guidance
- Principles of Selection of Appropriate Technique

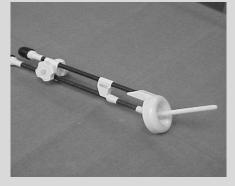

Limitations of pure intracavitary techniques

- middle/distal parametrial tumor extension
- unfavourable topography/unfavourable relation to the applicator (e.g. asymmetrical tumors)
 (depending on applicator position)
- 2-3 cm distal intravaginal tumor growth
- para-vaginal tumor growth
- unfavourable topography of organs at risk
 (not predictable correction within the frame of subsequent applications)

264 patients

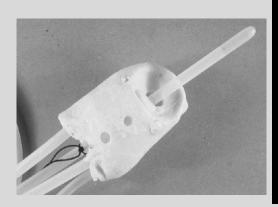

Modern Manchester Applicator

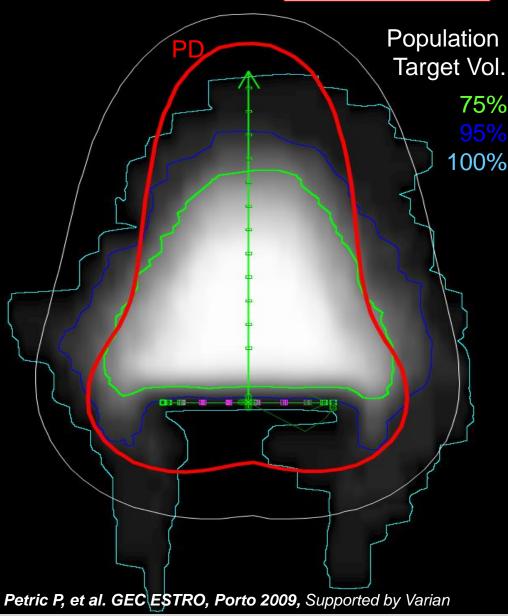

Modern Stockholm Applicator

Ring applicator

Mould Applicator

Indications for combined intracavitary/interstitial

- middle/distal parametrial tumor extension
- unfavourable topography/unfavourable relation to the applicator (e.g. asymmetrical tumors)
 (depending on applicator position)
- distal intravaginal tumor growth
- para-vaginal tumor growth
- unfavourable topography of organs at risk
 (not predictable correction within the frame of subsequent applications)

INTERSTITIAL TECHNIQUES AIMS IN LOCALLY ADVANCED DISEASE

- accurate and reproducible placement of needles
- tailor positions of needles to the target
- tailor dose distribution to target and OAR
 - adequate target coverage
 - Optimal sparing of OAR

CLASSICAL INTERSTITIAL TECHNIQUES FREEHAND PLACEMENT

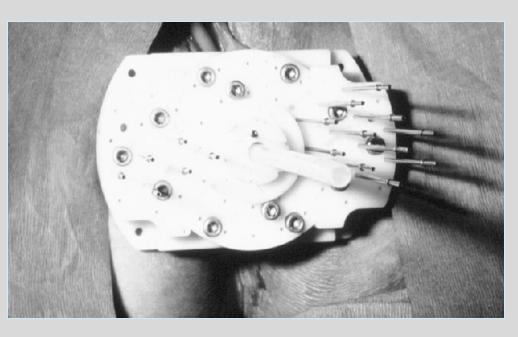

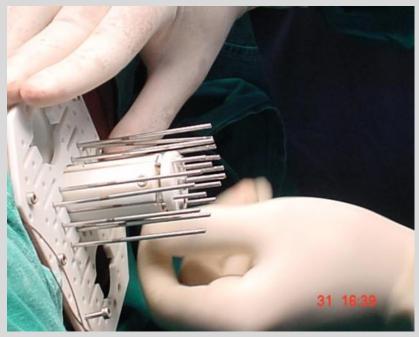

CLASSICAL INTERSTITIAL TECHNIQUES PERINEAL TEMPLATES

SYED

MUPIT

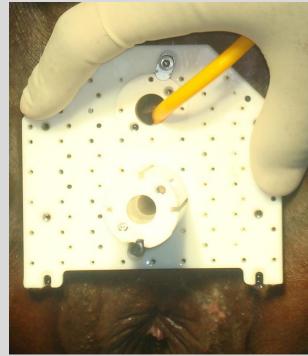

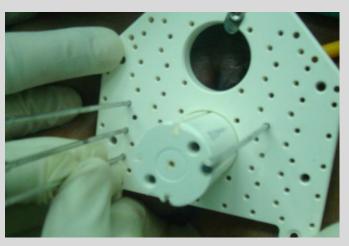

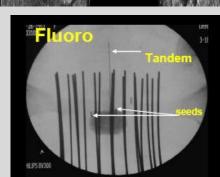

PRINICPLES OF MUPIT PROCEDURE

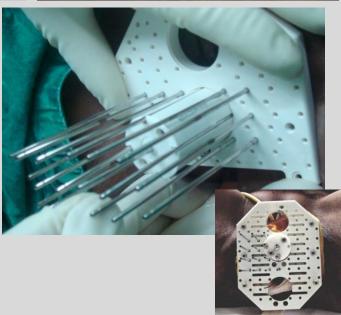

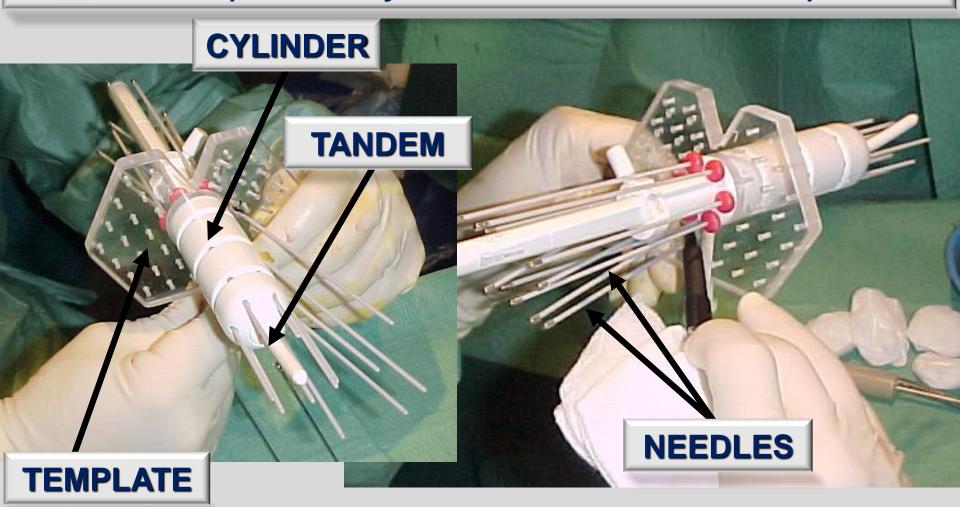

MODIFIED CLASSICAL INTERSTITIAL TECHNIQUES

MRI-compatible cylinder + tandem + template

CLASSICAL & MODIFIED INTERSTITIAL TECHNIQUES

DRAWBACKS

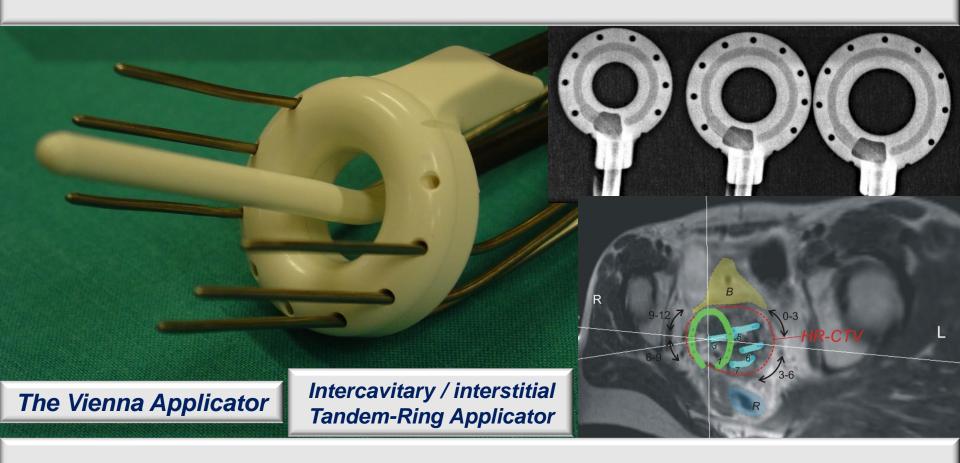

- Accurate freehand implantation is difficult
 - positioning often inaccurate
 - loss of parallelism
 - not reproducible
- Perineal templates (Syed, MUPIT, others)
 - high number of needles used
 - long distances between template and target (loss of parallelism, inaccurate positioning)
 - impediment for general acceptance: considerable risk of serious acute/late complications

INTRACAVITARY + INTERSTITIAL TECHNIQUES

TASKS

- improve control over the placement of needles: short distance between template and the target (accurate and reproducible insertion)
- lesser number of needles to achieve an adequate target coverage
- to be combined with individualised MRI based treatment planning to tailor the dose distribution (improve local control without increasing side effects)

MODERN INTERSTITIAL TECHNIQUES

Modified Applicator: drilled holes into ring to insert needles parallel to the Tandem

Kirisits et al. IJROBP 2006 (technical note)
Dimopoulos et al. IJROBP 2006 (clinical results)

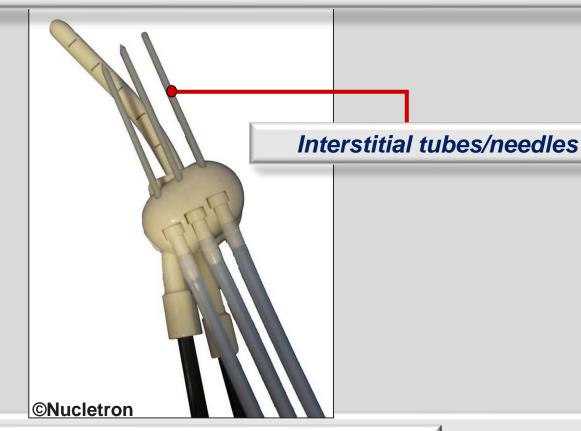

MODERN INTERSTITIAL TECHNIQUES

Applicators – special situations

Cervical cancer with moderate lateral expansion: modified principles of treatment

The Utrecht Applicator

Intracavitary / interstitial Fletcher Applicator

Schulz I, et al. Radiother Oncol., with permission

COMBINED INTRACAVITARY & INTERSTITIAL TECHNIQUES SELECTION OF APPLICATION TECHNIQUE

Based on clinical examination and sectional imaging:

At the time of diagnosis

- Initial tumor extension

During EBRT

-Quantitative and qualitative tumor regression

At the time of brachytherapy

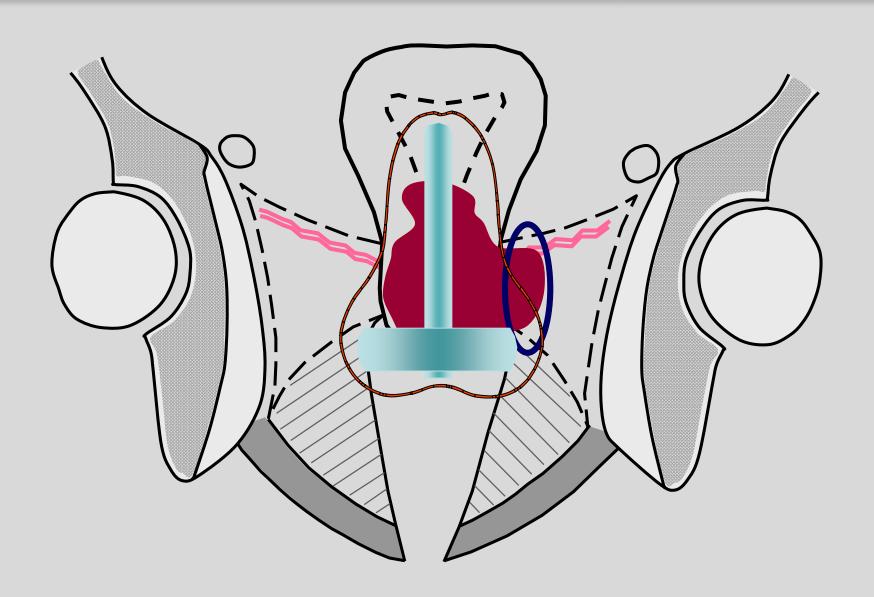

-Topography of residual tumor in relation to the applicator

Selection of Brachytherapy Technique

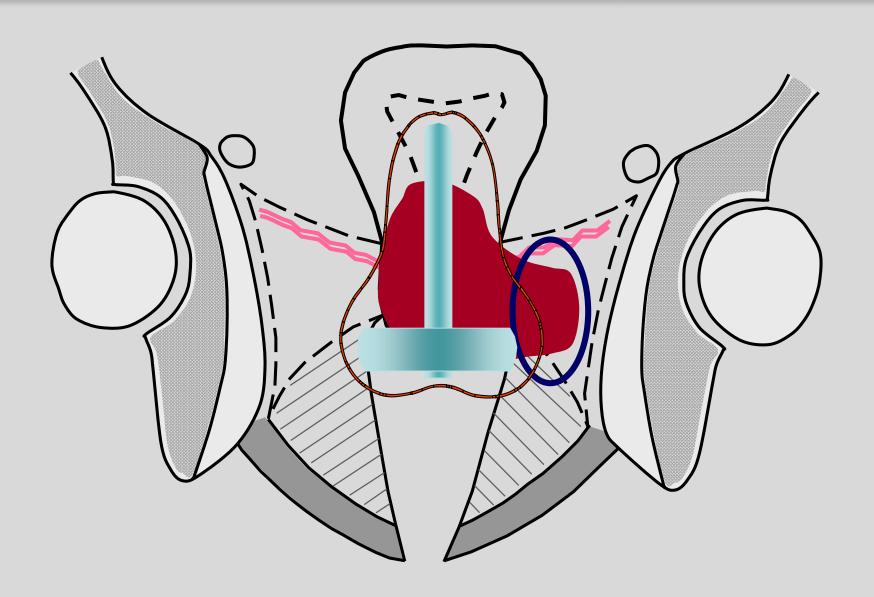

In General: depending on residual disease at brachytherapy

- Disease confined to cervix and medial third parametrium and favourable topography: IC alone unfavouable topography: combined IC + IS
- Extensions beyond medial third parametrium: IC + IS combination
- Extensive vaginal disease at BT: vaginal cylinders + IC + IS
- Extensions beyond medial third parametrium: IC + IS combination
- Extensive disease not amenable to standard situations: IC + IS +...
- Applications my be modified in subsequent fractions (esp. HDR)

Mini-Contour exercises

Instructions — "Mini-Contour"

1) Go to estro.org and log in. Click on the moodle button

- 2) Go to the course website (where the modules are listed)
 - Scroll to the bottom (section 5) and complete the consent form
 - Click the 'Mini-Contour' exercise link
 - If you have technical problems please let us know
- 3) After completing the exercises, feedback would be very useful if possible, we would like you to give feedback on each hotspot using the 'comment' link

Thank you very much for your patience and participation!

ARCHIVED

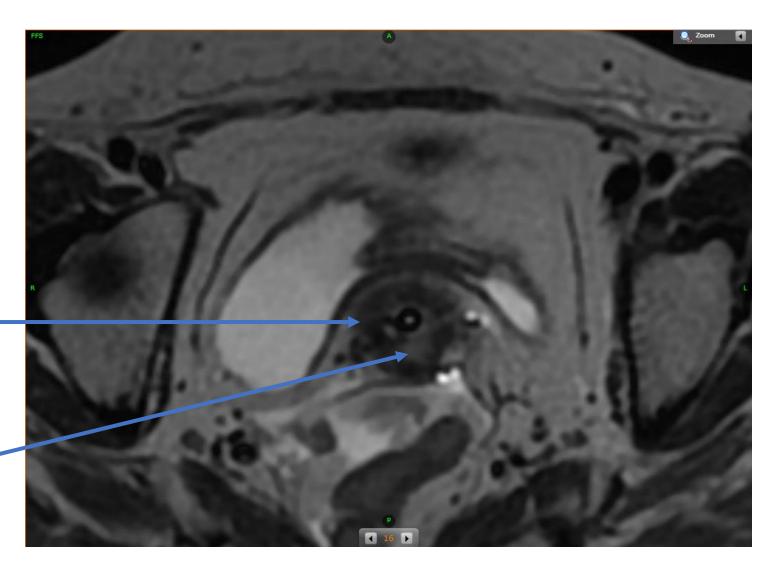

Homework – GTV (2)

Tip:

Identify cervix

Look for outer rim of low signal

Identify where disrupted

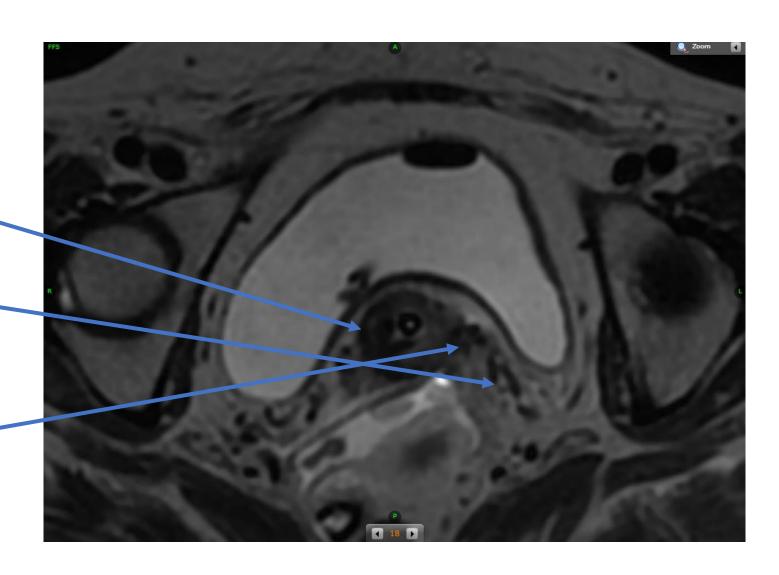

Homework – High Risk CTV

Tip:

Identify dark (low T2) outer rim of cervix

Identify bright (high T2) parametrial fat

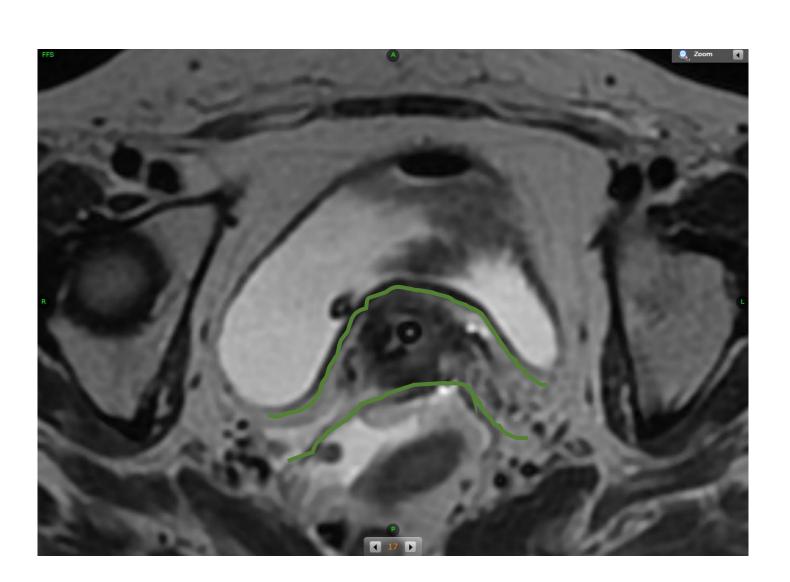

Look for intermediate signal zones in between

Homework – Intermediate Risk CTV (2)

Tips:

- 1) Outline mesorectum and bladder borders
- (if no bladder / mesoretal involvement at diagnosis)
- 2) Put on expansion from HR-CTV, edited for those lines
- 3) Decide on extent along parametrial axis based on initial tumour extent

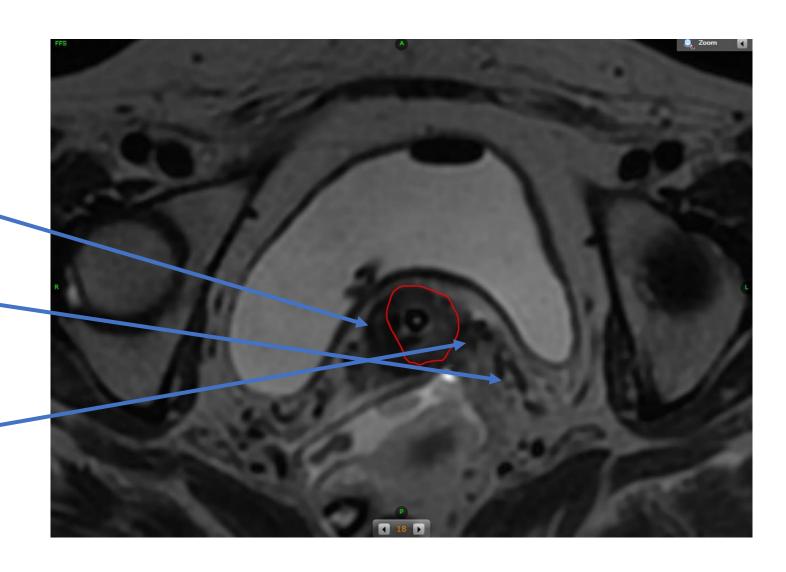

Homework – High Risk CTV (2)

Tip:

Identify dark (low T2) outer rim of cervix

Identify bright (high T2) parametrial fat

Look for intermediate signal zones in between

Basic Physics and dose planning principles

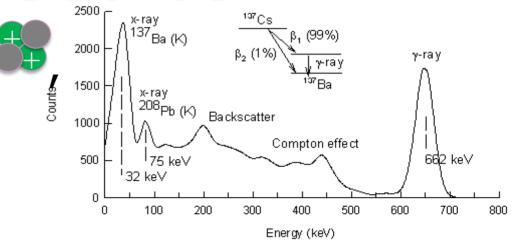

presented by Daniel Berger

General Hospital of Vienna, City of Vienna, Medical University of Vienna, Department of Radiotherapy

Spectrum of a Source

• The source can emit alfabeta and/or gamma radiation

 Sealed sources: the alfa- and beta radiation will be absorbed in the wall of the source

 The type and the energy of the radiation is unique for each **nuclide** and is called the spectrum of the source

Largely replaced Ra-226 in the mid 1970s.

Caesium-137 is widely used in LDR brachytherpy and is available in several forms needles, tubes, pellets. Formed as one of the more common fission products by the nuclear fission of uranium-235

Availability of sources suitable for remote afterloading devices has declined the use of ¹³⁷Cs as a LDR BT source.

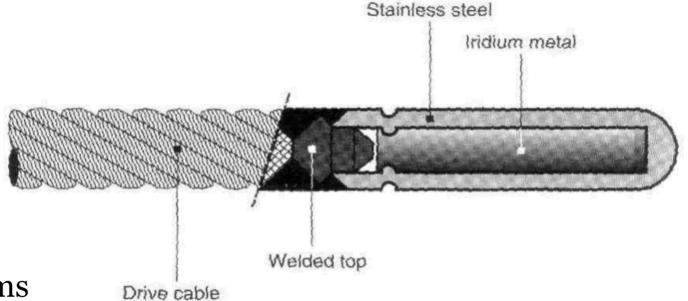

Sources in GYNaecological BrachyTherapy

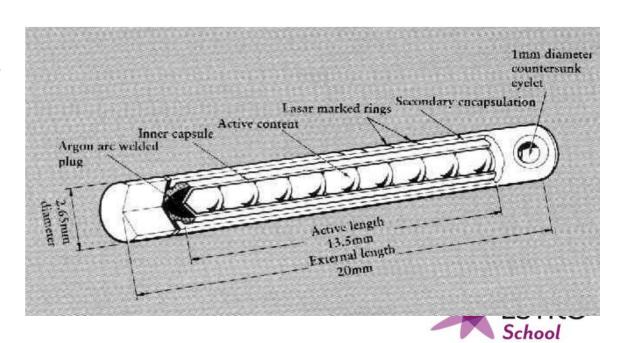

Source types

sealed sources!!

different physical forms

Dose calculation accorging to AAPM TG - 43

$$D(r,\Theta) = S_k \cdot \lambda \cdot T \cdot \frac{G(r,\Theta)}{G(r_0,\Theta_0)} \cdot g(r) \cdot F(r,\Theta)$$

 S_k ... Air kerma strength

λ ... Dose rate constant

T ... Total time

 $\frac{G(r,\Theta)}{G(r_0,\Theta_0)}$... Geometry factor

g(r) ... Radial dose function

 $F(r,\Theta)$... Anisotropy function

Inverse square law

Dose calculation accorging to AAPM TG - 43

$$D(r,\Theta) = S_k \cdot \lambda \cdot T \cdot \frac{G(r,\Theta)}{G(r_0,\Theta_0)} \cdot g(r) \cdot F(r,\Theta)$$

 S_k ... Air kerma strength

 λ ... Dose rate constant

T ... Total time

 $\frac{G(r,\Theta)}{G(r_0,\Theta_0)}$... Geometry factor

g(r) ... Radial dose function

 $F(r,\Theta)$... Anisotropy function

Simple approximation with most varying factors:

$$D \approx T \cdot \frac{1}{r^2}$$

TG43 FORMALISM

$$D(r,\theta) = S_k \Lambda t \frac{G(r,\theta)}{G(r_0,\theta_0)} g(r) F(r,\theta)$$

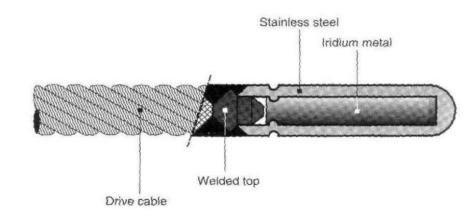

The **Dose Rate Constant,** A, has to be given for each source model specifically, in order to include the effects of source geometry, encapsulation, and self-filtration within the source and scattering in water surrounding the source. Its relation with classical formalism is:

$$\Lambda = \left[\frac{\mu_{en}}{\rho}\right]_{air}^{m} \varphi(r_0)G(r_0, \theta_0)$$

Lasar marked rings

being $\frac{\mu_{en}}{\rho}_{air}$ the ratio of average mass attenuation coefficients in m (medium) and air, and $\varphi(r)$ the function that take into account the attenuation of primary photons and the effect of scattered photons in the

medium.

$$D(r,\theta) = S_k \Lambda t \frac{G(r,\theta)}{G(r_0,\theta_0)} g(r)F(r,\theta)$$

$$G_L(r,\theta) = \begin{cases} \frac{\beta}{L \cdot r \cdot \sin \theta} & \text{if} \quad \theta \neq 0, \pi \\ \frac{1}{r^2 - \frac{L^2}{4}} & \text{if} \quad \theta = 0, \pi \end{cases}$$
 geometry function
$$\mathbb{P}(\mathbb{F}_0, \mathbb{G})$$

$$\mathbb{P}(\mathbb{F}_0, \mathbb{G}_0)$$

TG43 FORMALISM

$$D(r,\theta) = S_k \Lambda t \frac{G(r,\theta)}{G(r_0,\theta_0)} g(r) F(r,\theta)$$

The **Radial Dose Function**, **g**(**r**), describes the dose fall-off along the transverse axis of the source accounting for the <u>effects of absorption and</u> scatter in water. It is defined as:

$$g(r) = \frac{\dot{D}(r, \theta_0)G(r_0, \theta_0)}{\dot{D}(r_0, \theta_0)G(r, \theta_0)} \qquad G_L(r, \theta) = \begin{cases} \frac{\beta}{L \cdot r \cdot \sin \theta} & \text{if} \quad \theta \neq 0, \pi \\ \frac{1}{r^2 - \frac{L^2}{4}} & \text{if} \quad \theta = 0, \pi \end{cases}$$

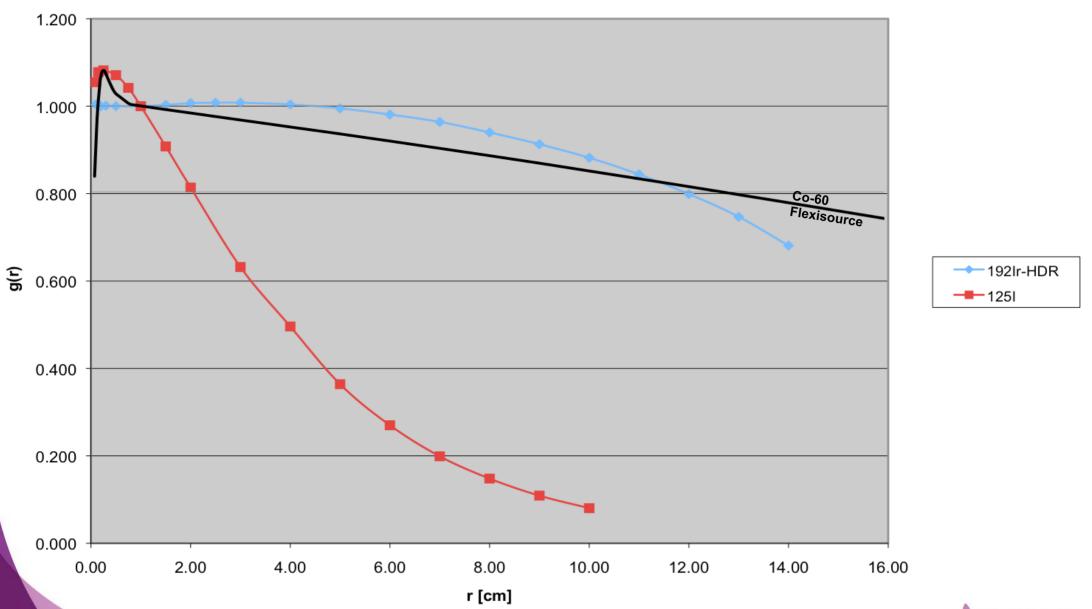

It can also be influenced by filtration of photons by the encapsulation and source materials. Its relation with the classical formalism is the tissue attenuation and scatter function normalized at 1 cm distance:

$$g(r) = \frac{\varphi(r)}{\varphi(r_0)}$$

$$D(r,\theta) = S_k \Lambda t \frac{G(r,\theta)}{G(r_0,\theta_0)} g(r) F(r,\theta)$$

Radial Dose Function

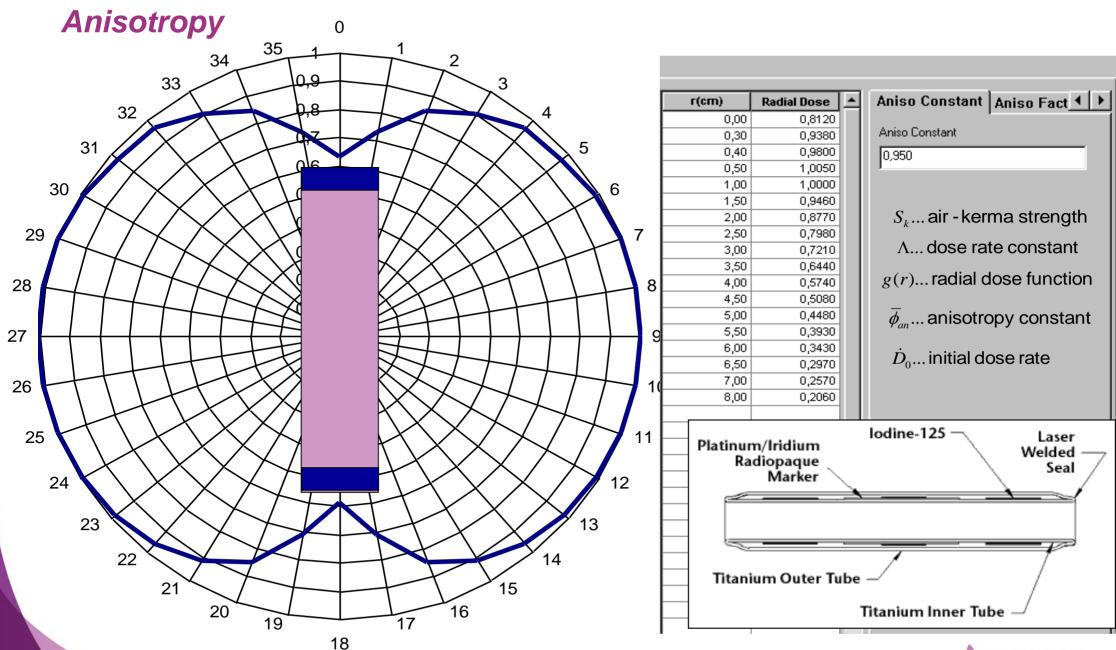

$$D(r,\theta) = S_k \Lambda t \frac{G(r,\theta)}{G(r_0,\theta_0)} g(r) F(r,\theta)$$

TG43 FORMALISM

The **Anisotropy Function**, $F(r,\theta)$, accounts for the anisotropy of dose distribution around the source, including the effects of absorption and scatter in the source construction and water. It gives the angular variation of dose rate around the source at each distance due to self-filtration, oblique filtration of primary photons through the encapsulating material, and scattering of photons in water. It is defined as:

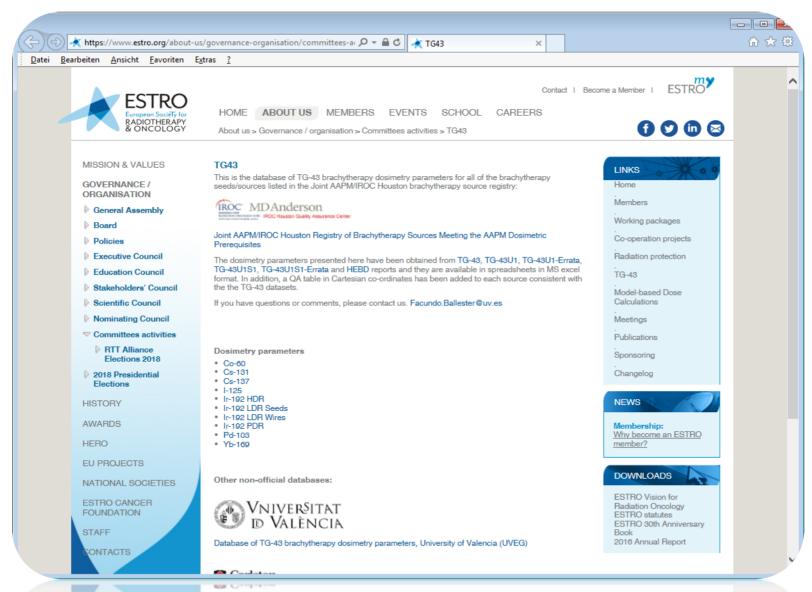

$$F(r,\theta) = \frac{\dot{D}(r,\theta)G(r,\theta_0)}{\dot{D}(r,\theta_0)G(r,\theta)}$$

TG43 tables found at

https://www.estro.org/about-us/governanceorganisation/committees-activities/tg43

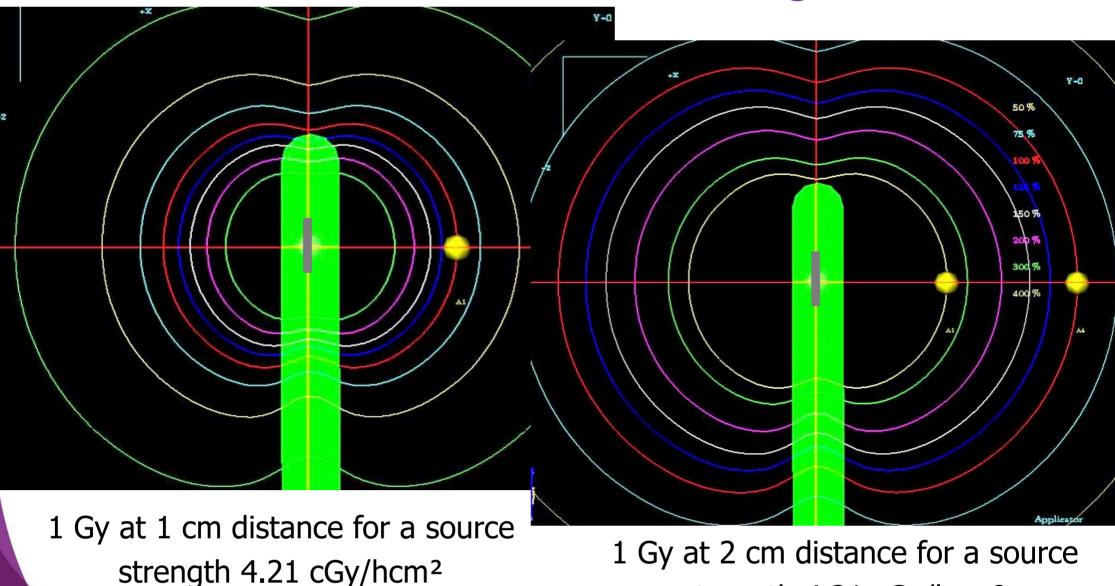

- TG43 algorithm is based on water calculation and can be done on CT, MRI and US
- Model based algorithms take tissue into account (based on CT), but has limited impact for GYN-Brachytherapy

MR-based treatment planning will work well for GYN with ¹⁹²Ir or ¹³⁷Cs sources, since density correction is not important

Applicator commissioning, reconstruction, geometry and fusion

Jamema Swamidas
Taran P Hellebust
Daniel Berger

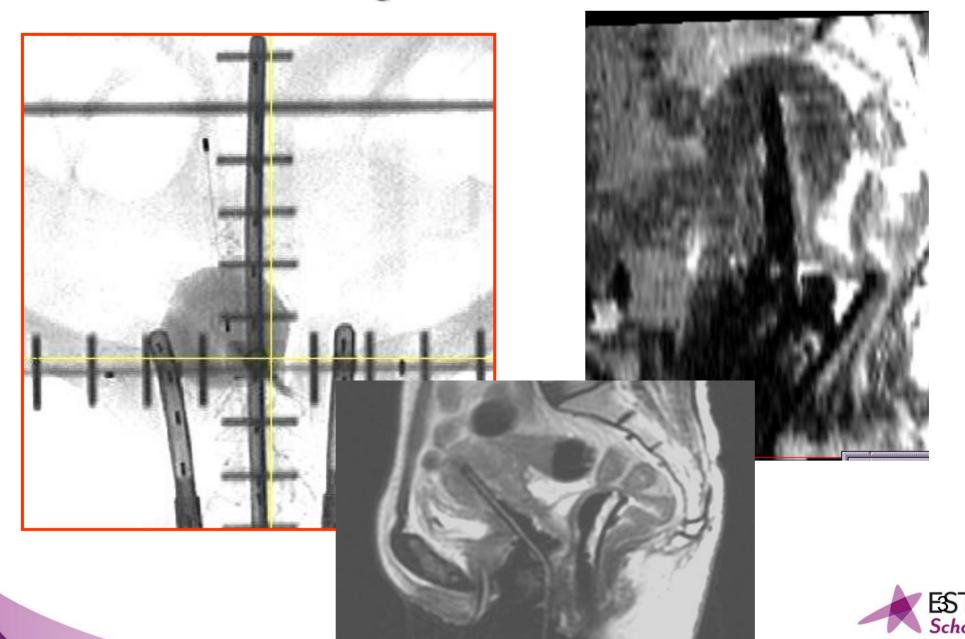

Commissioning

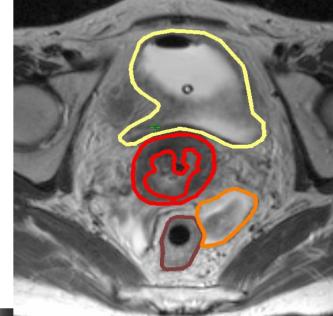

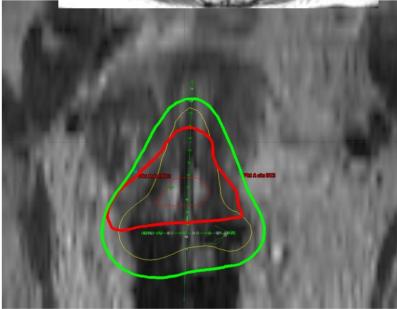

Why so much fuss about Applicator commissioning / reconstruction in 3D BT

Clinical consequences

- •10 intracavitary cervical cancer patients
- •MR scan with ring applicator in situ
- •Contouring on transversal T2 images:
 - > HR-CTV
 - **Bladder**
 - > Rectum
 - Sigmoid
- •Manual 3D dose optimisation
- •DVH parameters:
 - > D100, D90 for HR-CTV
 - \triangleright D_{2cc} for bladder, rectum, sigmoid

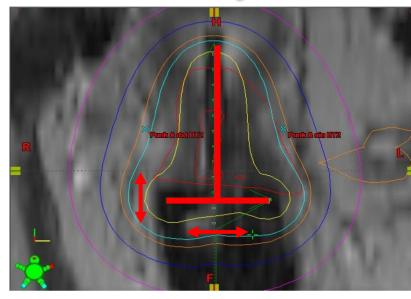

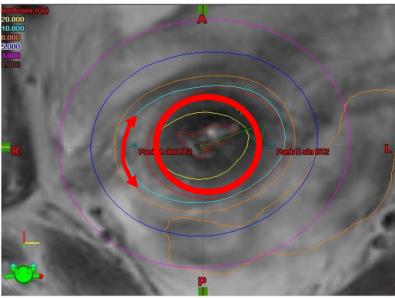

Simulation of un-certainty

- •Displacement in directions:
 - Longitudinal (along tandem):
 - $=\pm$ 3 mm, \pm 5 mm
 - > Lateral:
 - ± 3 mm
 - > Ant-post
 - ± 3 mm
- •Rotation of ring:
 - \rightarrow ± 15 dgr (4 mm)

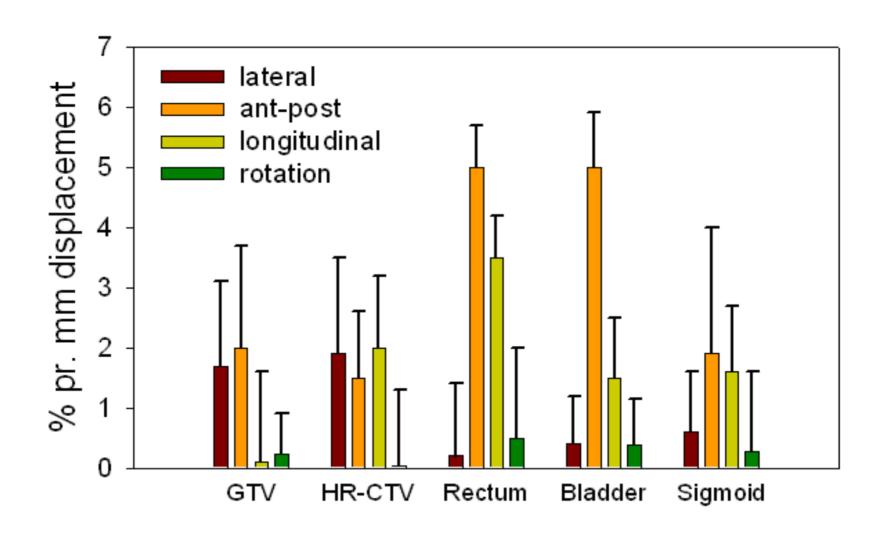

Tanderup et al, R&O 2008

GEC-ESTRO Recommendations

Recommendations from Gynaecological (GYN) GEC-ESTRO Working Group: Considerations and pitfalls in commissioning and applicator reconstruction in 3D image-based treatment planning of cervix cancer brachytherapy

Taran Paulsen Hellebust ^{a,*}, Christian Kirisits ^b, Daniel Berger ^b, José Pérez-Calatayud ^c, Marisol De Brabandere ^d, Astrid De Leeuw ^e, Isabelle Dumas ^f, Robert Hudej ^g, Gerry Lowe ^h, Rachel Wills ^h, Kari Tanderup ⁱ

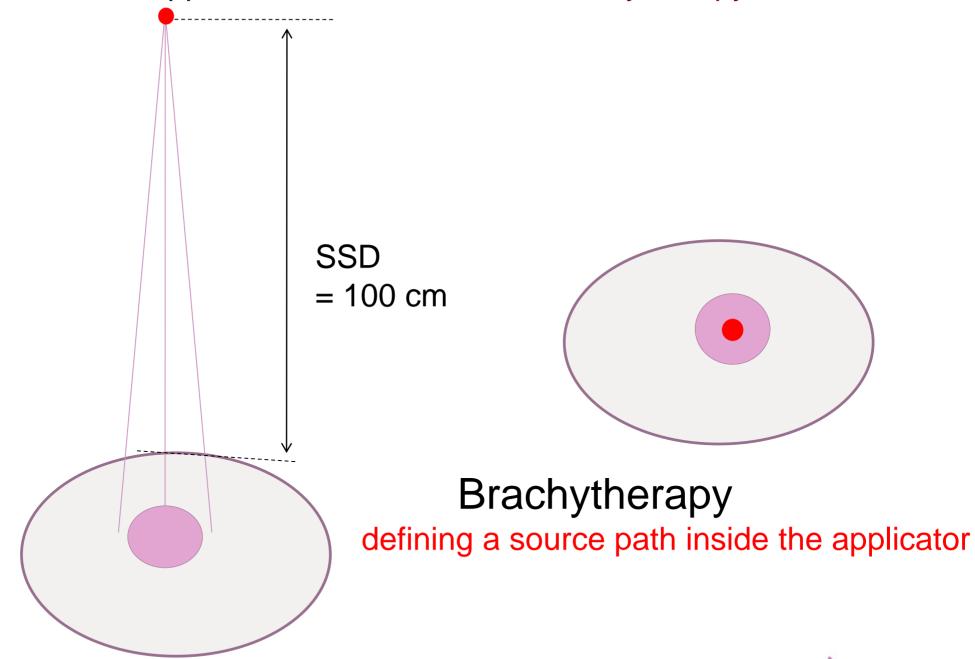

Radiotherapy and Oncology 96 (2010) 153-160

Inaccuracy in applicator reconstruction can lead to geometrical uncertainties and thus uncertainties in the definition of source positions which influence the accuracy of the delivered dose to both target volumes and organs at risk.

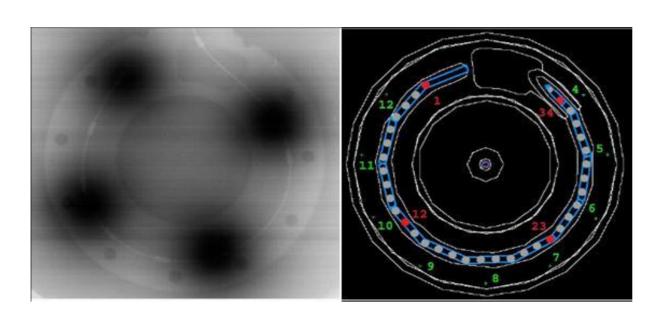

What is Applicator reconstruction in Brachytherapy?

External therapy

Commissioning of applicator

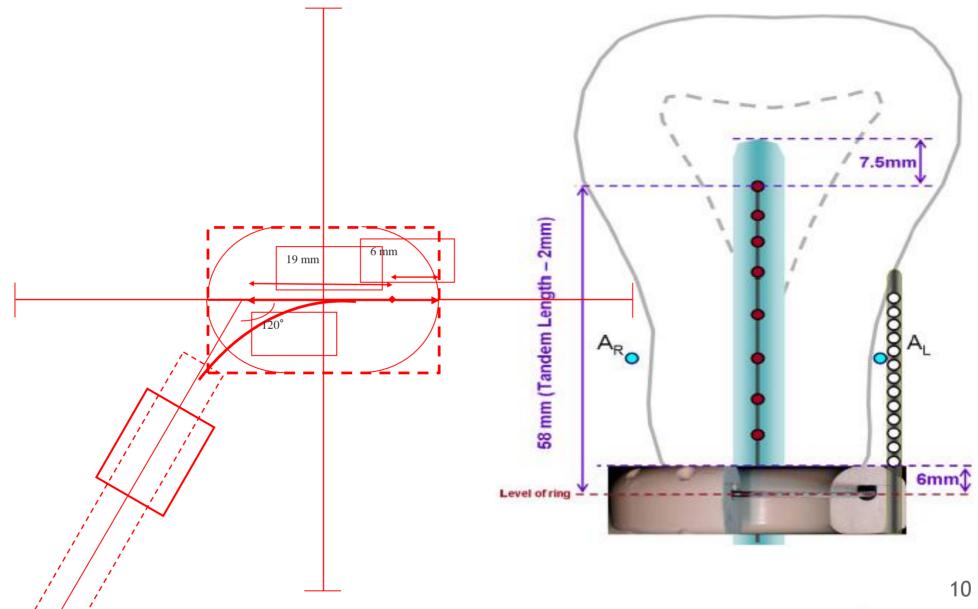

Ack: Hellebust TP

The location of dwell positions is found in relation to one another or in relation to reference points in the applicator,

 e.g., the distance from the tip of the tandem applicator to the first dwell position.

Step 1/5: Understand the geometry

Step 1/5: Understand the geometry

Photos of a plastic needles cut in two

More plastic in the tip in sharp needles

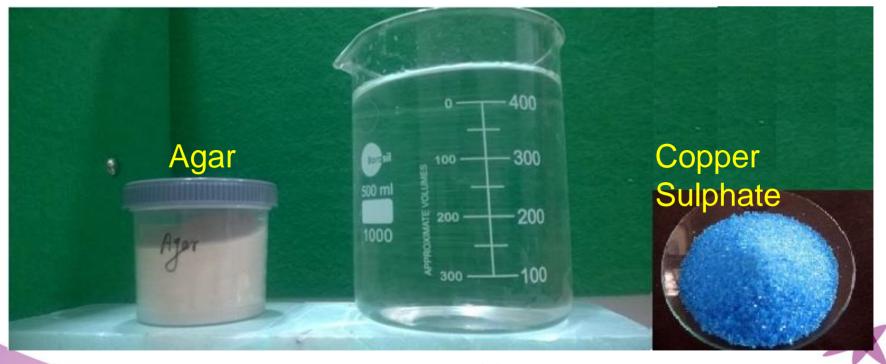

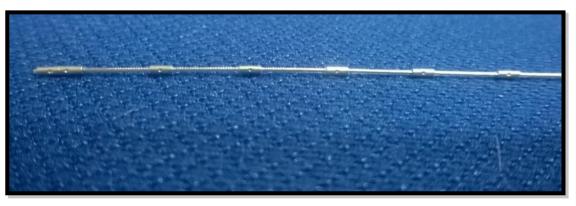

Pictures provided by Taran Hellebust, Oslo

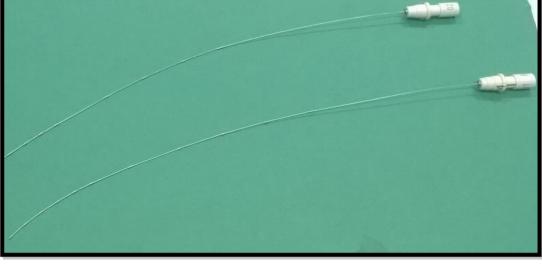

Medium Recipe:

- Preferable if it resembles human tissue imaging qualities.
- Ideal for CT/ MR applicator is Agarose gel (3%) with CuSO4
 (1 g/L)

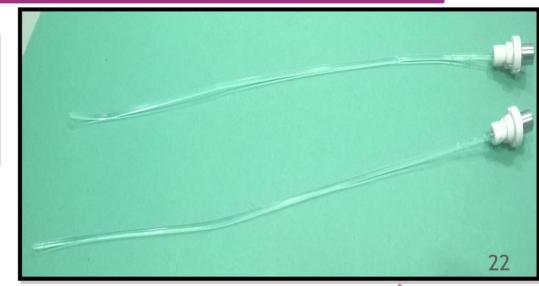

X-ray markers for CT/MR applicator.

DO NOT USE X-RAY MARKER DURING MRI.

MR markers for CT/MR applicator.

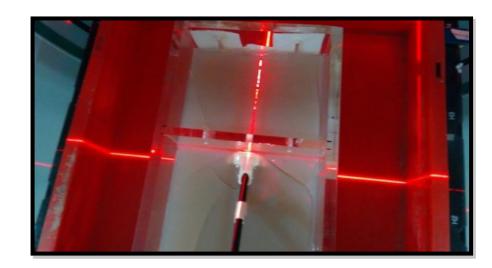

They are filled with water. CuSO₄ can also be used.

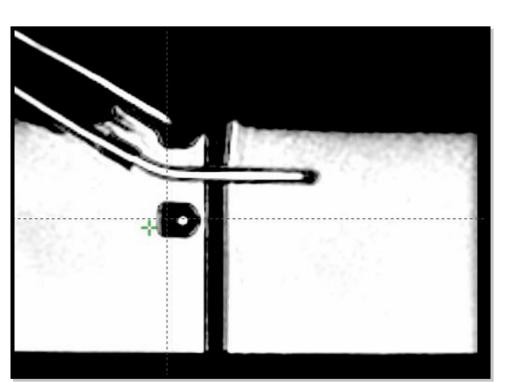

Imaging

- Setup according to the external markers.
- Align the axis of the applicator along the saggital Laser.
- Imaging Series
 - CT <1 mm slice thickness
 - MRI T1, T2 para-axial, para-saggital and para- coronal. 2-3 mm slice thickness.
 - Zero overlap
 - Other sequences of relevent.

Dwell position 24

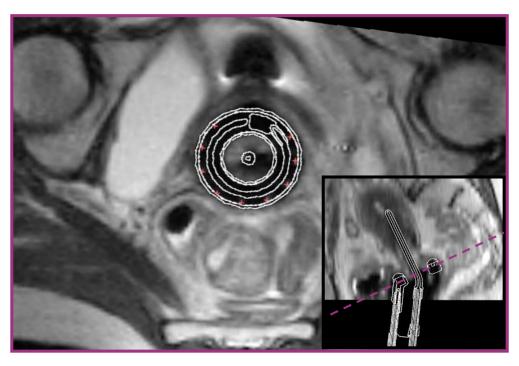

Applicator reconstruction in 3D

1. manual in-direct source path recor2. software integrated applicator recon.

 $5 - 10 \, \text{min}$

less than 5 min

If the relation between applicator shape and the source path is defined once, the reconstruction process can be performed by directly placing the applicator in the MRI dataset.

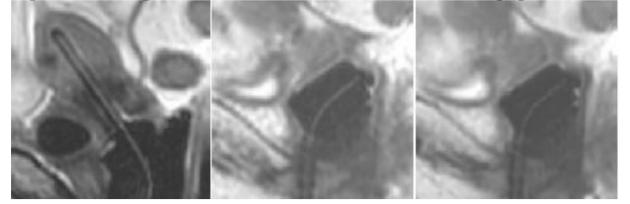

Direct Reconstruction

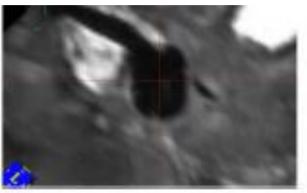

Clear visualization of the source channels in a single plane.

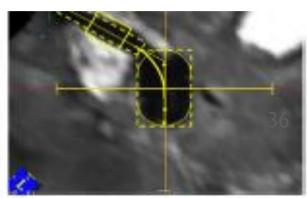

Check the geometry of the applicator verified during commissioning.

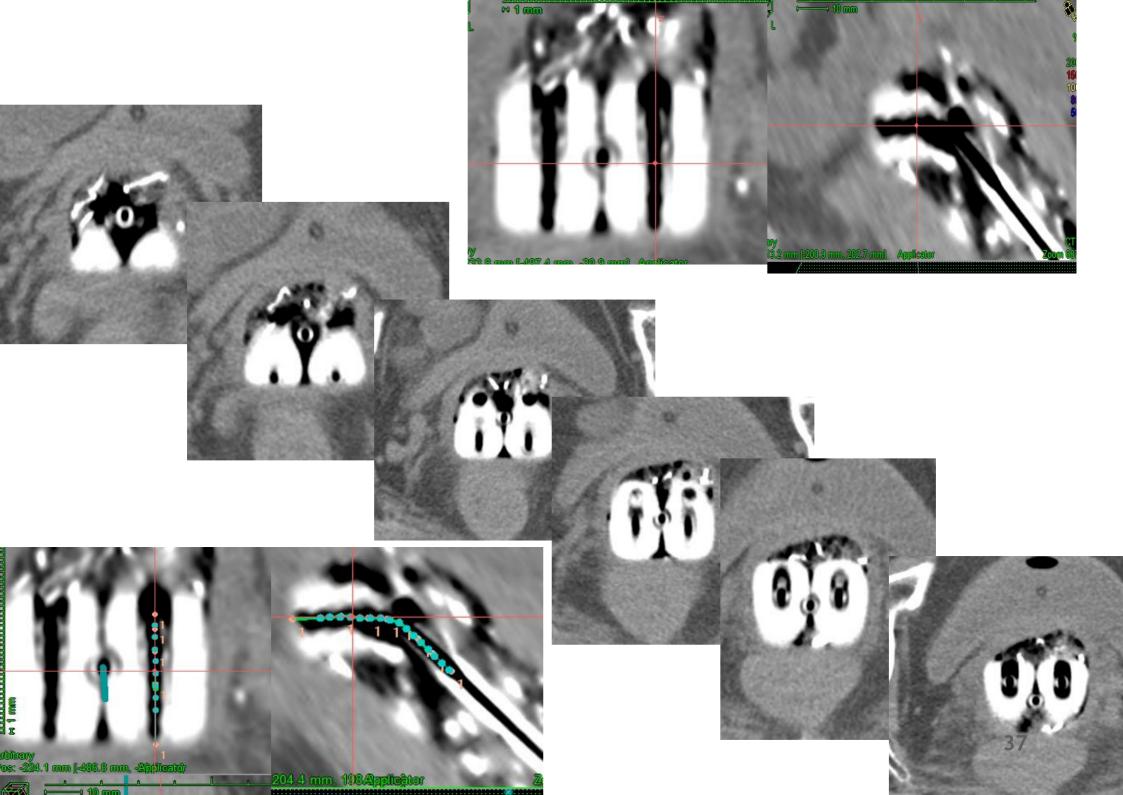

Especially useful for curved applicators (ovoid/ring)

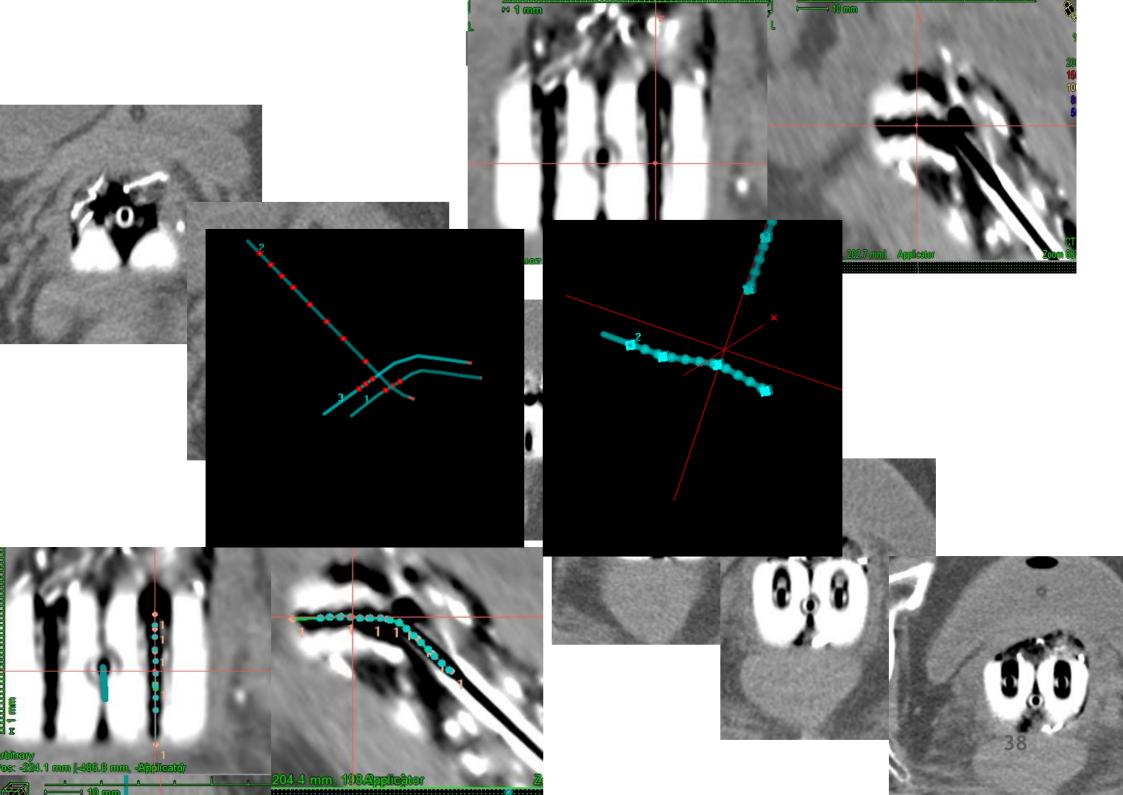

Leeuw et al, RO,2009

- Different dose/fractionation & prescription
- Treated lengths range proximal 1/3 1/2 (3-5cm)
- All seem effective

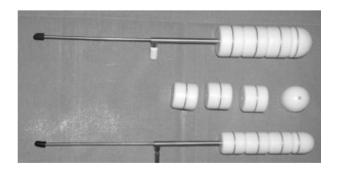

Summary literature "radiograph-era"

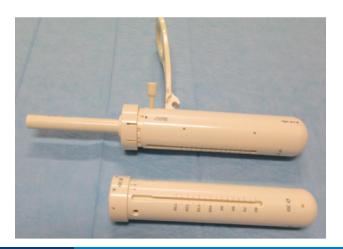

- Approximately 2/3 of recurrences at vault
- Effectiveness of ovoid, ring
- Higher dose and treating more length increases morbidity
- Suggests that proximal 1/3 is long enough (3-4cm)
- PORTEC-2 & Swedish trial:
 - Vaginal recurrence 2-3%
 - Low rates of morbidity

Applicators

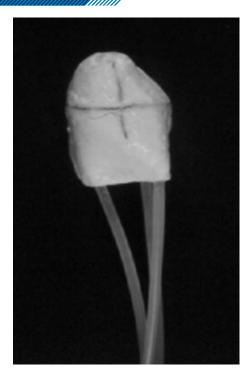

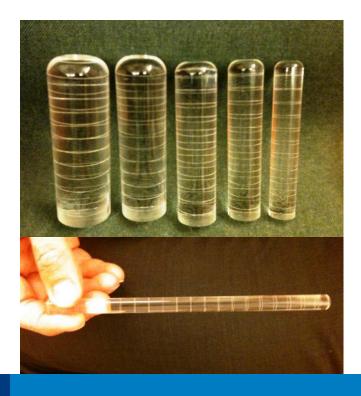

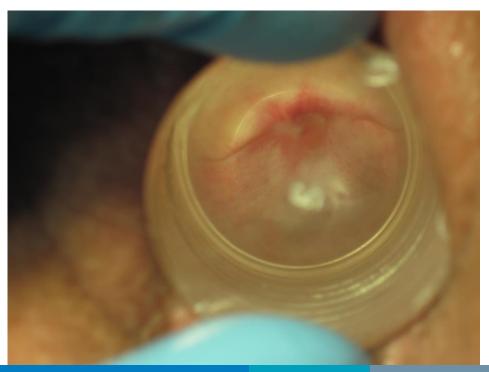

Practical points

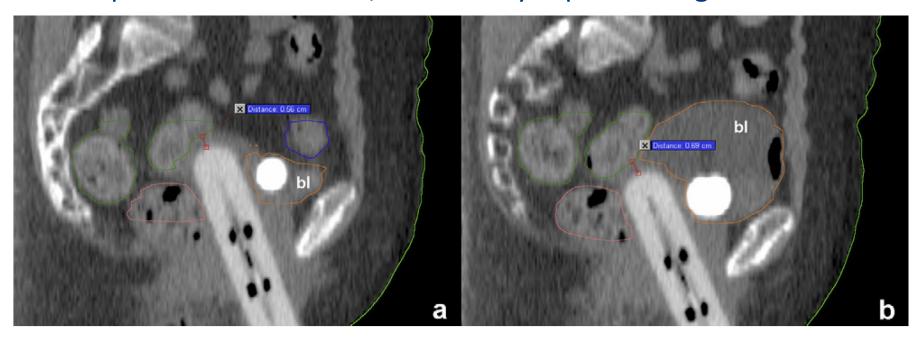

- Lubricant
- Pay attention to angle of vagina
- Make sure patient and pelvic floor muscles relax
- Measurement cylinders (plexi-glass) in different diameters
- Scale (cm) on the surface with magnifying effect

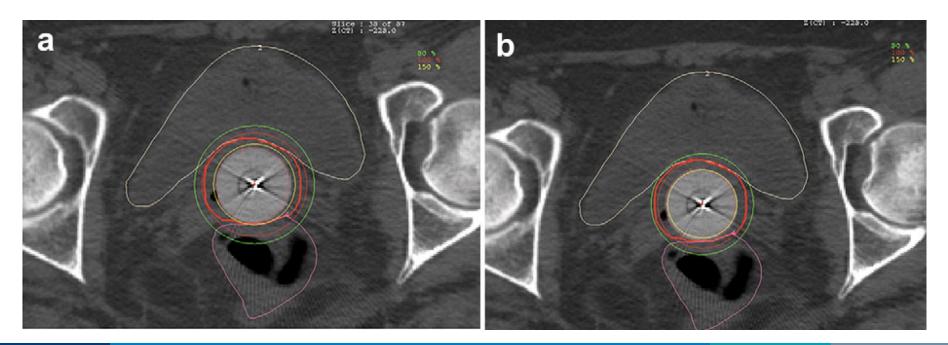

CT-based findings

- Only first fraction CT is necessary: small within patient variaton
- Bladder filling: increased dose to bladder, decreased dose to small bowel
- Applictor angle: horizontal reduces bowel dose
- Airpockets: most distal, reduced by repositioning

CT: target volume

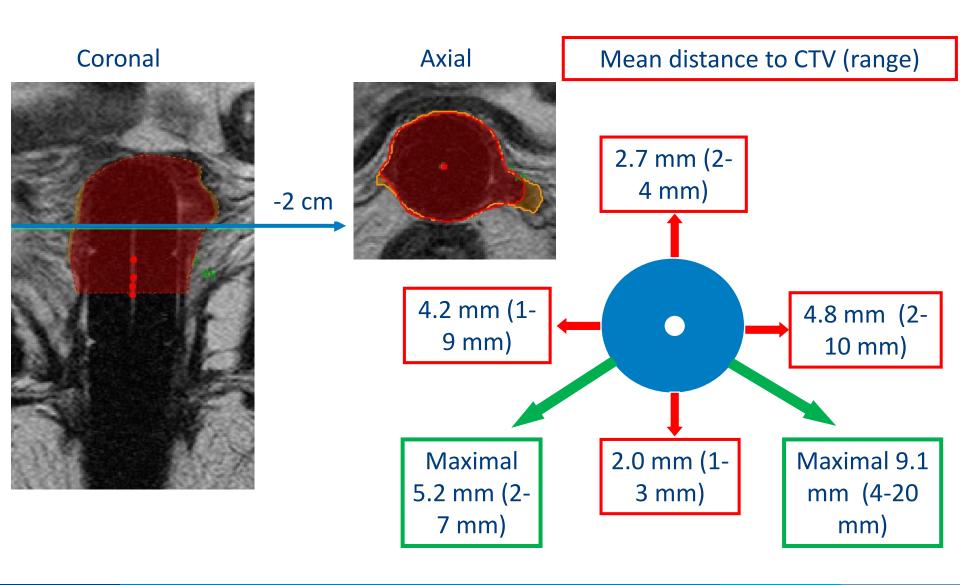

- > CTV (Kim et al.):
- 0.5cm expansion of proximal 2.5cm of cylinder
- Editing to exclude bladder and rectum
- Superiorly edit based on 'soft tissue seen'

MRI

- Superior soft tissue resolution:
- Visualization of the vaginal wall, thickness
- Surgical scar ligaments
- Organs at risk

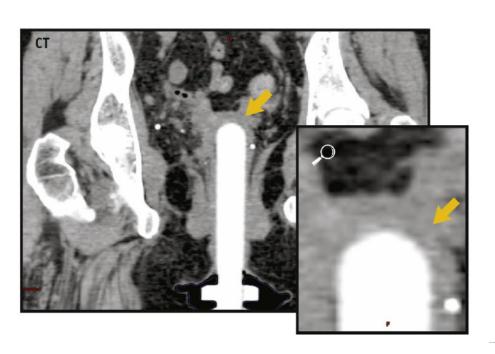

- Largest variation cranial and lateral in 'folds' and ligament structures
- ➤ Pathology study shows that 95% of lymph vessels are located in superficial 3 mm of vaginal tissue.

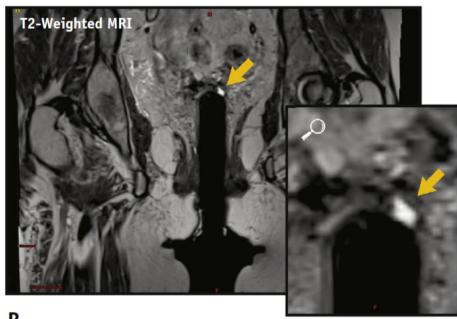

Consensus for study:

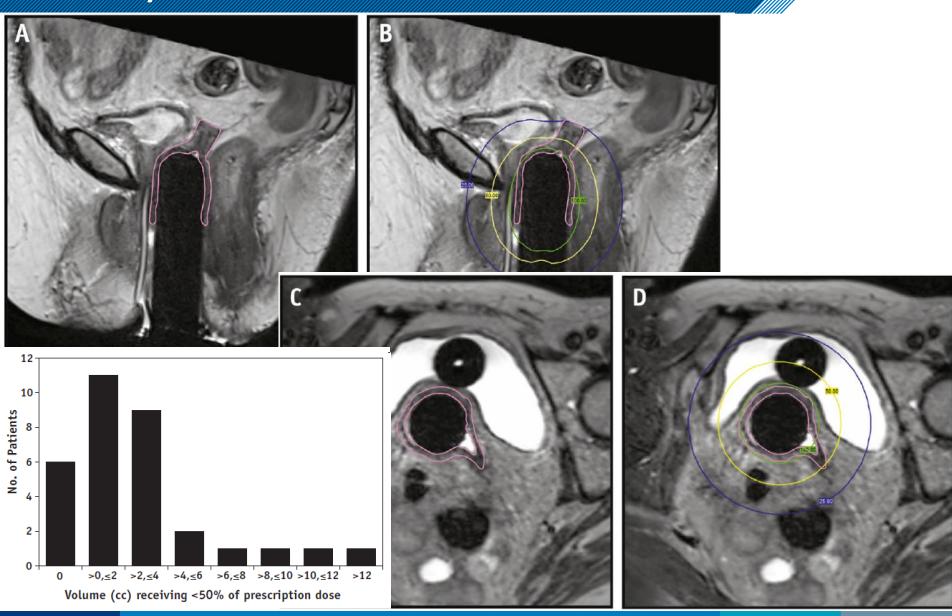

- Cylinder 3 mm 'ring' expansion, where necessary further expansion
- Include 'vaginal folds' to document dose in folds
- Exclude: ligament structures cranially; air, fluid

MRI-Based Evaluation of the Vaginal Cuff in Brachytherapy Planning: Are We Missing the Target?

Christina Hunter Chapman, MD,* Joann I. Prisciandaro, PhD,*
Katherine E. Maturen, MD,† Yue Cao, PhD,*,† James M. Balter, PhD,*,‡
Karen McLean, MD, PhD,§ and Shruti Jolly, MD*

Hunter Chapman et al. IJROBP 2015

Summary CT-MRI

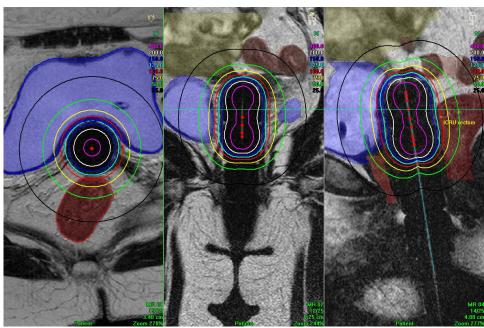

- More information on dose to OAR:
- Moderate bladder filling; horizontal angle
- MRI, visualization of vaginal wall:
- 0.3cm thick wall / ring, expand and include folds
- "Dog ears" potential under dosage
- Clinical relevance? (good clinical results)
- Aim: ensure optimal contact between applicator surface and vaginal wall, consider:
- Applicator: size cylinder, ovoid, ring, mould
- Position verification: X-ray, CT (MRI), marker

Treatment planning (other presentation)

- Traditional standard treatment planning
- Orthogonal radiographs
- based on applicator dimensions, prescription depth and length

- 3D image guided treatment planning
- Based on target volumes and organs at risk

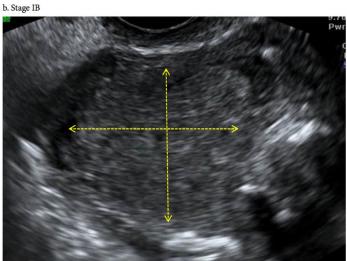

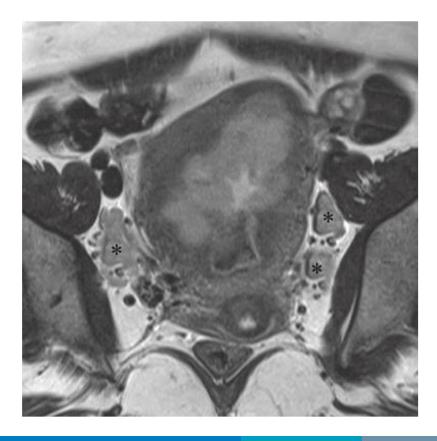

Endometrial cancer: imaging

Ultrasound

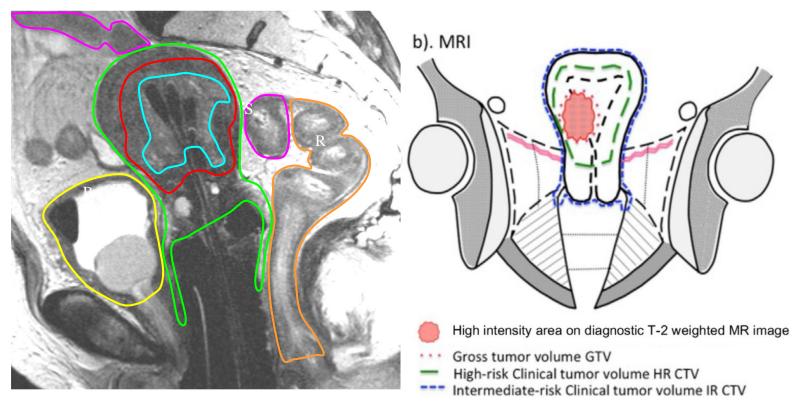

- MRI: gold standard
- Superior to US/CT
- Staging accuracy 85-93%

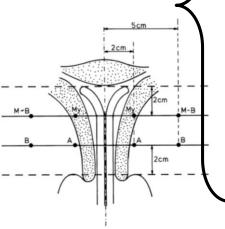

Target concept endometrium

- CTV: whole uterus, cervix and upper 1/3 of vagina
 - Take all information into account (colposcopy, imaging) to delineate GTV
 - Depending of pattern of spread parametrial and paravaginal tissue may be included

Inoperable endometrial cancer: Review

Radiograph-era HDR: 955 patients Local control 70%-90%

| Author | Patient No. | Applicators | Dose prescription | Total dose in EQD2 $(\alpha/\beta = 10)$ | Local control rates | Severe late complication rates (Grade 3–4) (%) | |

3D-HDR: 31 patients Local control 90%-100%

Applicators

Intracavitary techniques

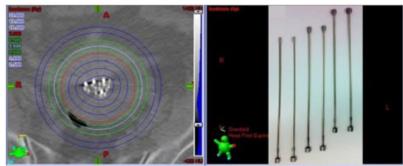

Individualised packing methods:

- Modified Heymann Packing
- Umbrella Technique

Standard applicators:

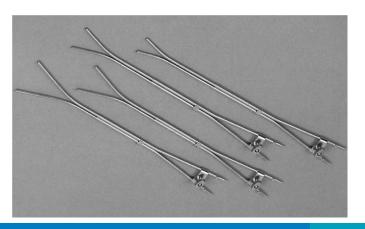

- Two or three channel applicator
- One channel applicator

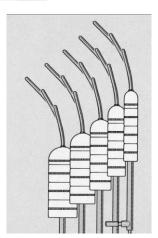

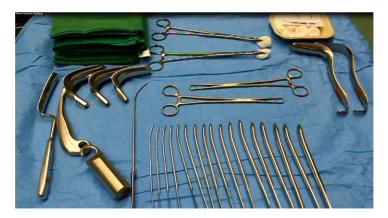

Practical points

- Collaboration anaesthesiologist; consider local anaesthesia
- Co-morbidity & feasibility

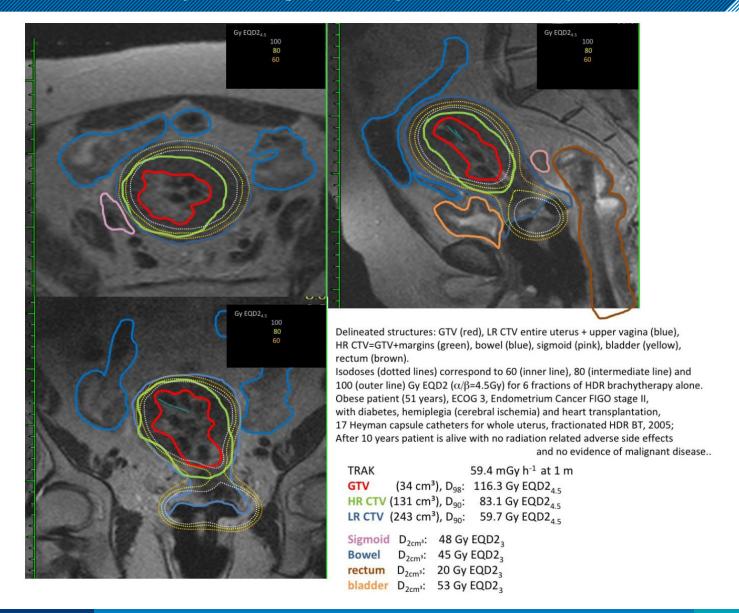

Treatment planning (other presentation)

Vaginal recurrence (other presentation)

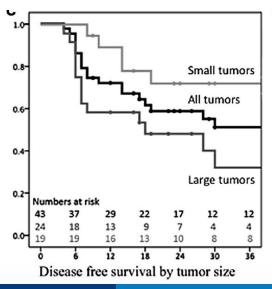

Toward four-dimensional image-guided adaptive brachytherapy in locally recurrent endometrial cancer

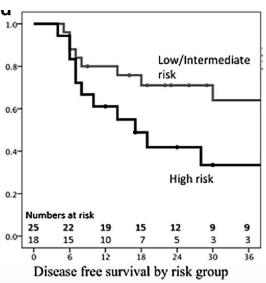

Lars Fokdal^{1,*}, Gitte Ørtoft², Estrid S. Hansen³, Lisbeth Røhl⁴, Erik Morre Pedersen⁴, Brachytherapy 2013 Kari Tanderup^{1,5}, Jacob Christian Lindegaard¹

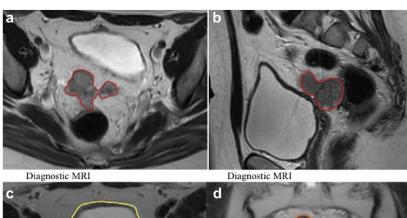

Aarhus 2006-2013 N=43; PDR; median follow-up 30 months

24 interstitial – 19 intracavitary

Late grade 3 morbidity 12%

MRI for brachytherapy

MRI for brachytherapy

Conclusions

- Postoperative brachytherapy:
- Upper 1/3, ensure optimal contact with applicator
- 3D imaging: position verification
- 3D individualised optimization: for boost or recurrent disease
- Definitive treatment:
- Medical inoperable, rare (obesity)
- MRI gold standard
- Move towards 3D image guided approaches

Learning Objectives

- Understand the concepts and learn the terms
 of dose volume and dose point parameters
 for planning, prescribing, recording and reporting
 the GTV and the CTV doses for 3D IGABT;
- Understand the concepts and learn the terms
 of dose volume and dose point parameters
 for planning, prescribing, recording and reporting
 the OAR doses for 3D IGABT;
- Be able to use brachytherapy related
 dose volume and dose point parameters
 for planning aims and dose prescription
 for GTV, CTV, and the relevant OARs in IGABT.

Level 3

Level 2

Level 1

Research oriented:

New concepts; to be established

Advanced standard:

†comprehensive exchange of information

Minimum standard:

All centres, for all patients

Level 1: Minimum standard for reporting

Volumetric imaging approximation

- Comprehensive clinical gynecologic examination
- Volumetric imaging (MR, CT, US, PET-CT) at the time of diagnosis and brachytherapy

FIGO/TNM stage

Baseline morbidity and QoL assessment

Schematic 3D documentation on a clinical diagram indicating dimensions (width, thickness, height) and volumes for:

- GTV_{init} (the GTV at diagnosis)
- GTV_{res} (the GTV at brachytherapy)
- CTV_{HR} [the GTV_{res} (if present) plus residua] (if present) plus whole cervix]
- (CTV_{IR}: area of GTV_{init} and/or CTV_{HR} plus s used for prescription)

Dose reporting:

- TRAK
- · Point A dose
- · Recto-vaginal reference-point dose
- $D_{0.1 \text{cm}^3}$ and $D_{2 \text{cm}^3}$ for the bladder and rectun

Dose delivery pattern:

- Absorbed-dose rate/dose per fraction
- Number of fractions
- · Time between fractions
- (Pulse number, size, time, if PDR)
- · Overall treatment time
- · Total EQD2 dose

Source and dose calculation:

- · Radionuclide and source model
- Source strength
- · Dose-calculation algorithm

Radiographic approximation

- · Comprehensive clinical gynecologic examination
- Radiographic imaging (plus additional volumetric 3D imaging)

FIGO/TNM stage

Baseline morbidity and QoL assessment

Schematic 3D documentation on a clinical diagram indicating dimensions [width, thickness, (height)] and volumes for:

- · GTV_{init} (the GTV at diagnosis)
- GTV_{res} (the GTV at brachytherapy)

Emphasis on Volumetric imaging approximation

Level 2: Advanced standard for reporting; All from L1 plus:

Volumetric imaging approximation

- 3D delineation of volumes (on volumetric images with applicator):
- GTV
- CTV_{HR}
- (CTV_{IR} if used for prescription)
- With maximum width, height, thickness, and with volume

Radiographic approximation

Topography for volumes (on isodose plan with applicator/on radiographs with applicator)

- GTV_{res}
- CTV_{HR}
- CTV_{IR} (if used for prescription)
- · With maximum width, thickness, standard height, and with

Dose reporting for defined volumes:

- \bullet $D_{98\,\%}, D_{90\,\%}, D_{50\,\%}$ for the CTV_{HR}
- $(D_{98\,\%}, D_{90\,\%}$ for the CTV_{IR} if used for prescription
- D_{98 %} for GTV_{res}
- $D_{98\%}$ for pathological lymph nodes

Dose reporting OARs:

- Bladder reference point dose
- D_{0.1cm³}, D_{2cm³} for sigmoid^a
- D_{2cm³} bowel
- Intermediate- and low-dose parameters in bladder 60 Gy EQD2 volume
- $(e.g., V_{15~{
 m Gy}}, V_{25~{
 m Gy}}, V_{35~{
 m Gy}}, V_{45~{
 m Gy}} \, {
 m or} \, D_{98~\%}, D_{50~\%}, D_{98~\%}, D_{50~\%}, D_$ Vaginal point doses at level of sources (lateral at 5
- Lower- and mid-vagina doses (PIBS, PIBS + 2 cm)

Level 3: Research-oriented reporting; All from L1 & L2 plus:

Radiographic approximation Volumetric imaging approximation

- (1) GTV, CTV_{HR} sub-volumes based on functional imaging (diagnosis,
- during treatment, and at brachytherapy)

Isodose surface volumes: For example

- 85 Gv EQD2 volume

Dose reporting for tumor:

- (1) $D_{98\,\%}$ and $D_{90\,\%}$ for the CTV_{IR} even if not used for prescription
- (2) $D_{90\%}$ for the GTV_{res}
- (3) DVH parameters for the PTV
- (4) $D_{50\%}$ for pathological lymph nodes
- (5) DVH parameters for non-involved nodes (ext/int iliac, common iliac)

OAR volumes and points:

- (1) Additional bladder and rectum reference points
- (2) OAR sub-volumes (e.g., trigonum or bladder neck, sphincter muscles)
- (3) Vagina (upper, middle, lower)
- (4) Anal canal (sphincter)
- (5) Vulva (labia, clitoris)
- (6) Other volumes/sub-volumes of interest (e.g., ureter)

Dose-volume reporting for OAR:

- (1) Dose-volume and dose-surface histogram parameters for additional OARs and sub-volumes
- (2) Vaginal dose profiles, dose-volume, and dose-surface histograms (3) Length of treated vagina

Isodose surface volumes: For example

- 85 Gy EQD2 volume
- 60 Gv EQD2 volume

OAR volumes, points:

- (1) Additional bladder and rectum points
- (2) Sigmoid point
- (3) Anal-canal point (e.g., low vagina point)
- (4) Vulva point (e.g., low vagina point)
- (5) Other points of interest
- OAR dose reporting:
- Length of treated vagina

ICRU/GEC ESTRO Report 89. 2016. pp 161-3.

Level 1: Minimum standard for reporting

Level 3: Research-oriented reporting; All from L1 & L2 plus:

Volumetric imaging approximation

- (1) GTV, CTV_{HR} sub-volumes based on functional imaging (diagnosis, during treatment, and at brachytherapy)

Isodose surface volumes: For example

- 85 Gv EQD2 volume

Dose reporting for tumor:

- (1) $D_{98\,\%}$ and $D_{90\,\%}$ for the CTV_{IR} even if not used for prescription (2) $D_{90\%}$ for the GTV_{res}
- (3) DVH parameters for the PTV
- (4) $D_{50\%}$ for pathological lymph nodes
- (5) DVH parameters for non-involved nodes (ext/int iliac, common iliac)

OAR volumes and points:

- (1) Additional bladder and rectum reference points
- (2) OAR sub-volumes (e.g., trigonum or bladder neck, sphincter muscles)
- (3) Vagina (upper, middle, lower)
- (4) Anal canal (sphincter)
- (5) Vulva (labia, clitoris)
- (6) Other volumes/sub-volumes of interest (e.g., ureter)
- Dose-volume reporting for OAR:
- (1) Dose-volume and dose-surface histogram parameters for additional OARs and sub-volumes
- (2) Vaginal dose profiles, dose-volume, and dose-surface histograms
- (3) Length of treated vagina

Radiographic approximation

Isodose surface volumes: For example

- 85 Gy EQD2 volume
- 60 Gv EQD2 volume

OAR volumes, points:

- (1) Additional bladder and rectum points
- (2) Sigmoid point
- (3) Anal-canal point (e.g., low vagina point)
- (4) Vulva point (e.g., low vagina point)
- (5) Other points of interest
- OAR dose reporting:
- Length of treated vagina

Prescribing, Recording & Reporting of D & V

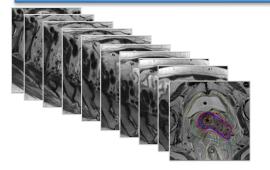

ICRU Report 89. 2016, page 106:

organs are not sufficient.

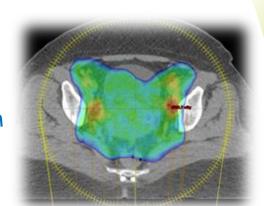

The overall aim of dose prescription and reporting is to describe the dose distribution related to target volumes and to OARs as completely and precisely as possible. The typical heterogeneity of the brachytherapy absorbed-dose distribution complicates achieve-

4D BT

Daniel Berger

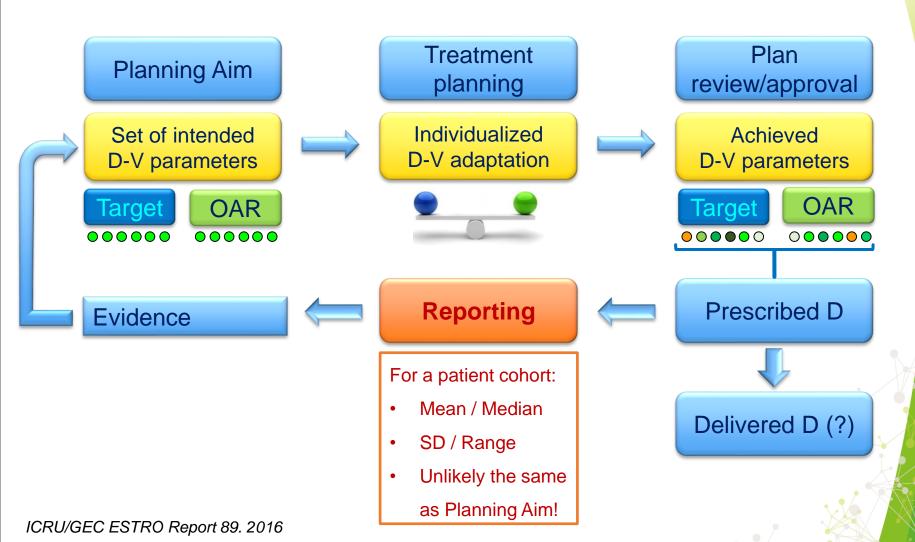

From treatment planning to dose prescription

From Planning Aim to D Prescription

ICRU 89: process from planning aim to prescription is defined

Prescribing, Recording & Reporting of D & V

Q: Centre X uses "BT schedule of 4x7 Gy to CTV HR".

What is prescribed dose / fraction to CTV HR in their patients?

- A: A. 10 Gy, according to Linear Quadratic model
 - B. 7 Gy
 - C. 28 Gy
 - D. I can't tell, but all of the above answers are likely wrong.

...the term "4 x 7 schedule" doesn't tell us much...

Planning aims – desired D_V and V_D parameters $\xrightarrow{I.~e.}$ D90 > 10 Gy EQD2

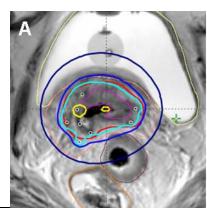

Prescription – achieved D_V and V_D parameters after planning — i. e. → D90 = 10.4 +/- 0.6 Gy EQD2

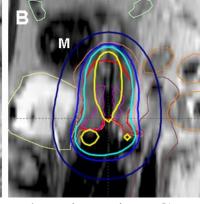

Delivered treatment $-D_V$ and V_D parameters delivered $\xrightarrow{\text{i. e.}}$???

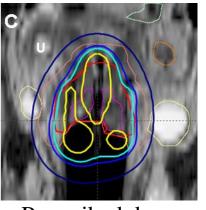

Planning aim and prescription dose

- Planning aim: what you want to obtain
- Prescribed dose: what you decide to treat

Case 6
Appendix,
ICRU 89

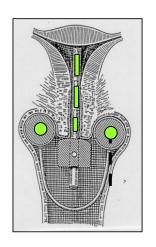

| Structure | Dose-volume parameter | Planning aim, Gy | Prescribed dose Gy |
|-------------------------------------|------------------------------------|------------------|-----------------------|
| $\overline{\text{CTV}_{\text{HR}}}$ | EQD2 ₁₀ D ₉₀ | ≥ 85 | 88.9 |
| Bladder | $EQD2_3 D_{2cm}^3$ | ≤ 90 | 71.1 |
| Rectum | $EQD2_3 D_{2cm}^3$ | ≤ 70 | 65.6 |
| Sigmoid | $EQD2_3 D_{2cm}^3$ | ≤ 70 | 57.4 |
| Bowel | $EQD2_3 D_{2cm}^{3}$ | ≤ 70 | 53.3 |

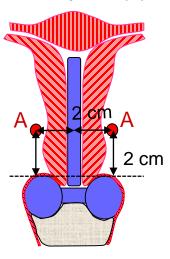

Reporting Parameters for the Target

Pötter R, et al. Radiother Oncol 2006 Haie Meder et al. Radiother Oncol 2007 ICRU report 89, 2016

Amount of Radiation

Total Reference Air Kerma (TRAK)

Source strength

KERMA:

Kinetic Energy Released per unit MAss

1 m

At 1 m: Reference Air Kerma Rate [Gy/s]

x Dwell Time [s]

 Σ All positions

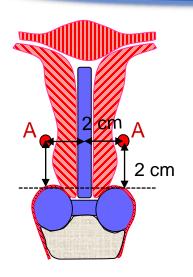

TRAK [Gy]

- Corresponds to historical quantity "mg·h of Radium"
 - $1 \text{mg} \cdot \text{h} = 7.2 \, \mu \text{Gy} \, @ \, 1 \text{m}$
- Physical parameter (not directly associated with effects)
- Extensive experience
- Comparison of treatments
 - within & between institutions

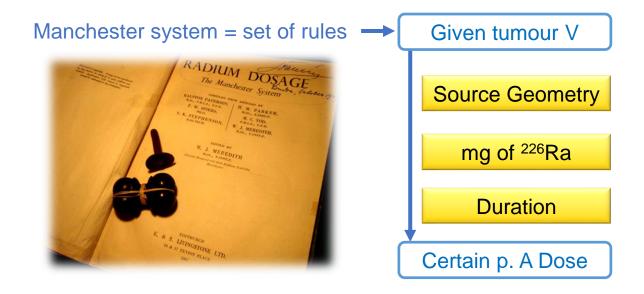

Level:

Level 2

Level 1

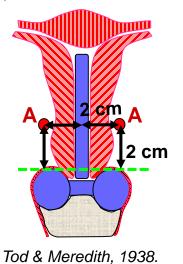

- Introduced in the 1930's (Tod & Meredith)
- Surrogate for mgh or TRAK (amount of radiation)
- p. A: ≈ Crossing of uterine artery and ureters

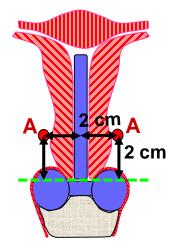

Point A is an applicator point, defined in relation to tandem and colpostats...

Upper surface of ovoids

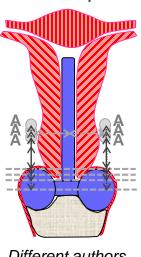

Bottom of tandem / Os

Tod & Meredith, 1953.

Various interpretations

Different authors

Variation of point A location

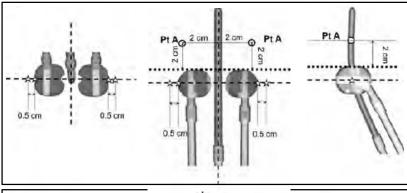

Large Variation of reported D

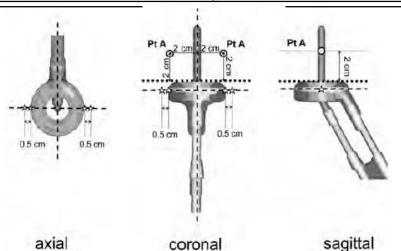

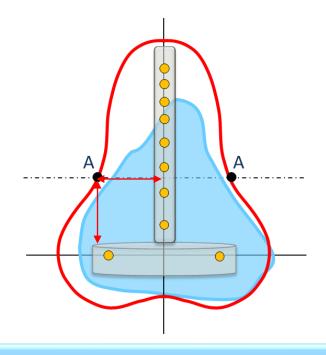

ICRU 89 & ABS definition:

Follows original Manchester definition

Point A related to the applicator

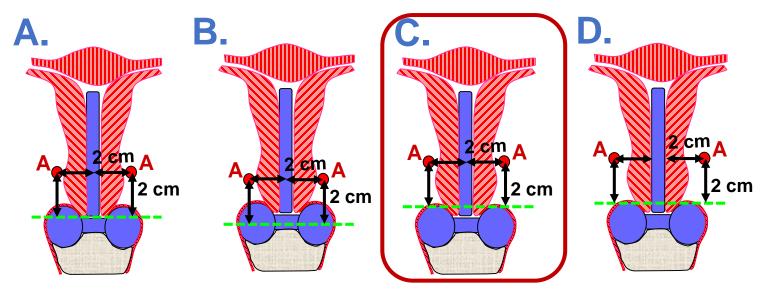

Provides information on D distribution only if source-pattern rules are described!

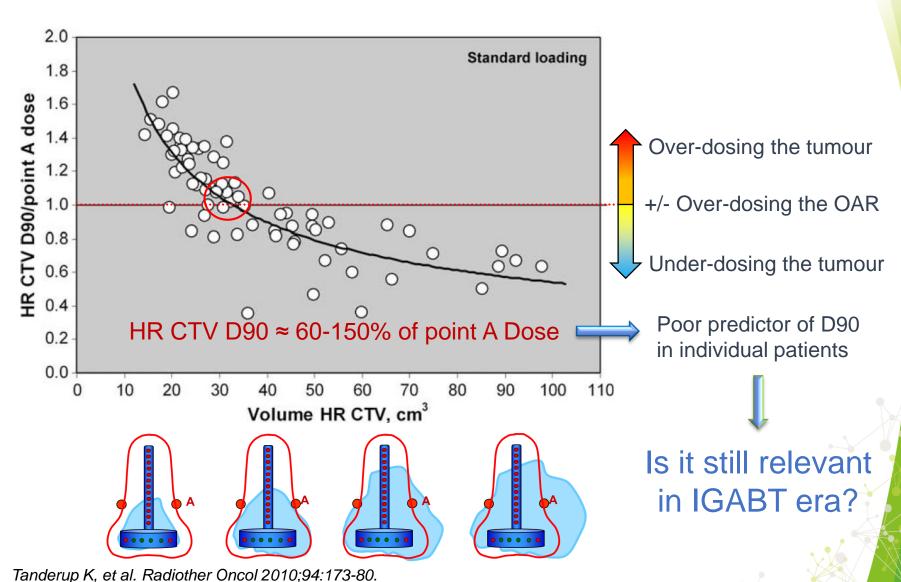

Q:

How do you define point A at your Institution?

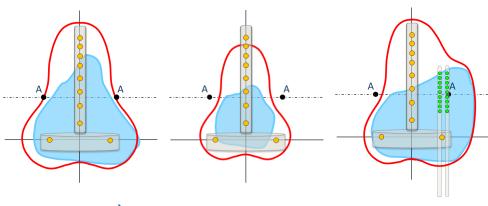

ICRU/GEC ESTRO Report 89. 2016

Point A Dose in the context of Image Guided Adaptive BT

Point A Dose in the context of Image Guided Adaptive BT

Extensive clinical experience

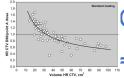

Link to tradition ("safety" measure)

Independent of contouring

Can be associated with effects

Comparison btw. patients & centres with different D schedules / rates

CTV_{HR} D90

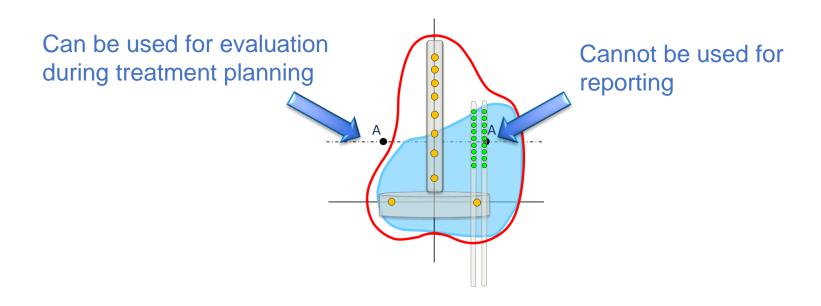

≈ 60–150% of p.A D

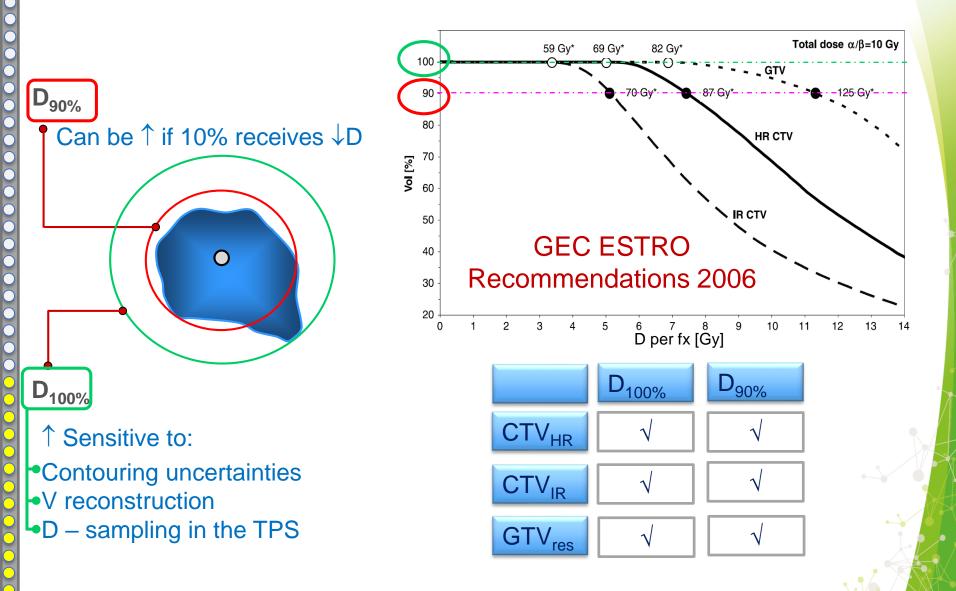

≈ Measure for mean D90 of population

Vaginal dose reporting - Summary

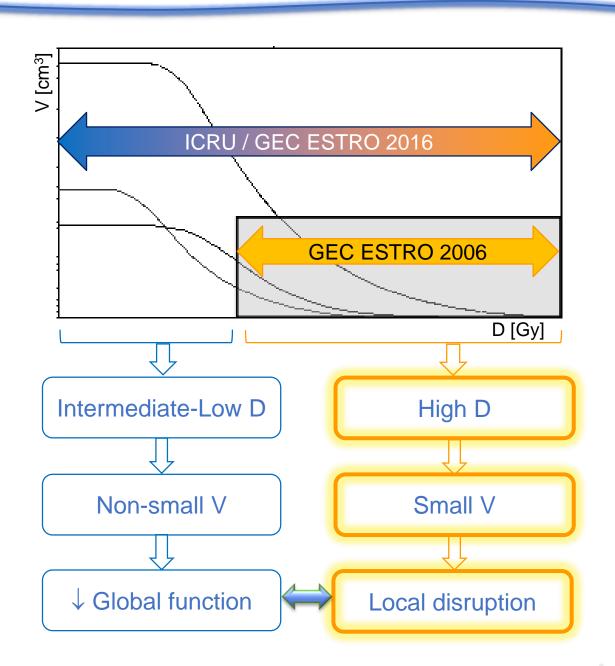

Organs at Risk: Doses to Volumes

Organs at Risk: Doses to Volumes

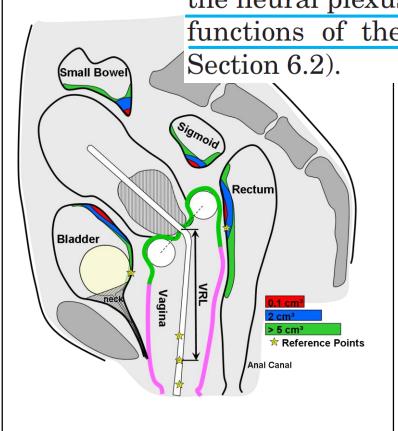

Doses to Organs at Risk

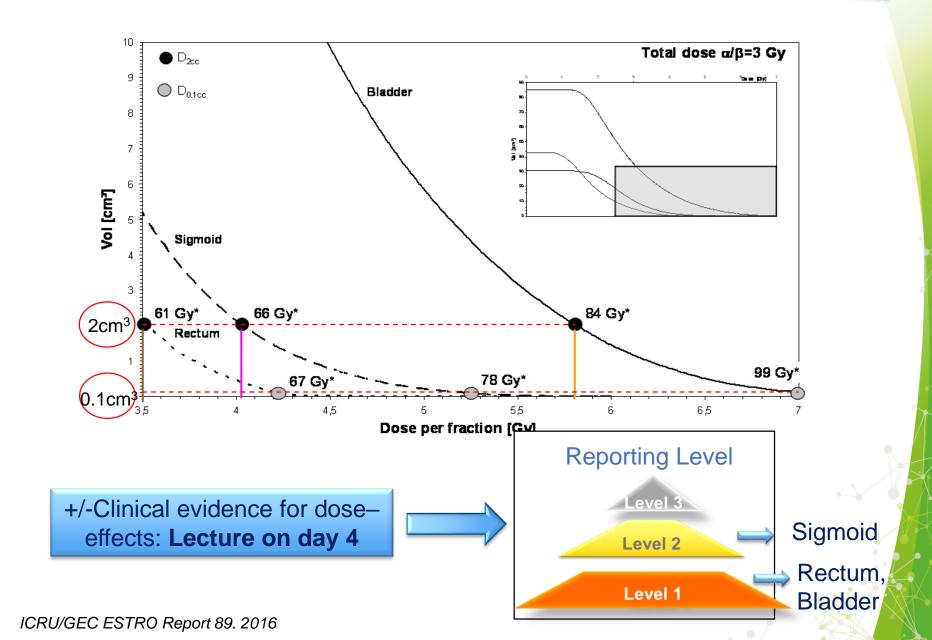

High Doses to Small V

and incontinence. The <u>biological targets</u> are small normal-tissue sub-volumes located mainly in the mucosa and sub-mucosa of the organ walls, and in the neural plexus and muscles that regulate specific functions of the bladder, rectum, and anus (see Section 6.2).

High Doses to Small V: Bladder, Rectum, Sigmoid Colon, Bowel

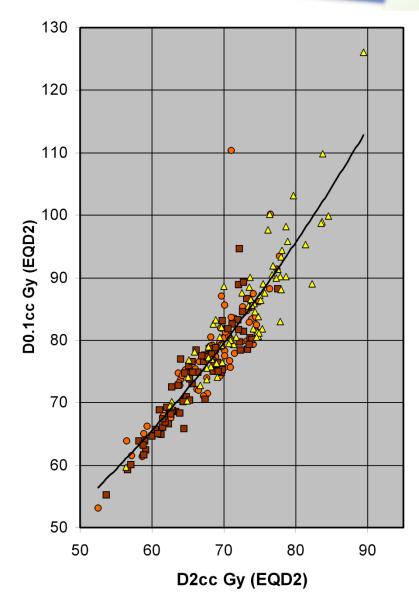

High Doses to Small V: Bladder, Rectum, Sigmoid Colon, Bowel

D2cc and D0.1cc

| | D2cc Gy EQD2 | D0.1cc Gy EQD2 |
|---------|-----------------|-------------------|
| Bladder | 71 ± 7 | 81 ± 13 |
| Rectum | 65 ± 6 | 72 ± 8 |
| Sigmoid | 67 ± 6 | 74 ± 12 |

 $D_{0.1cc}/D_{2cc}$: 134% ± 9% (Physical doses)

Aarhus University Hospital: PDR BT

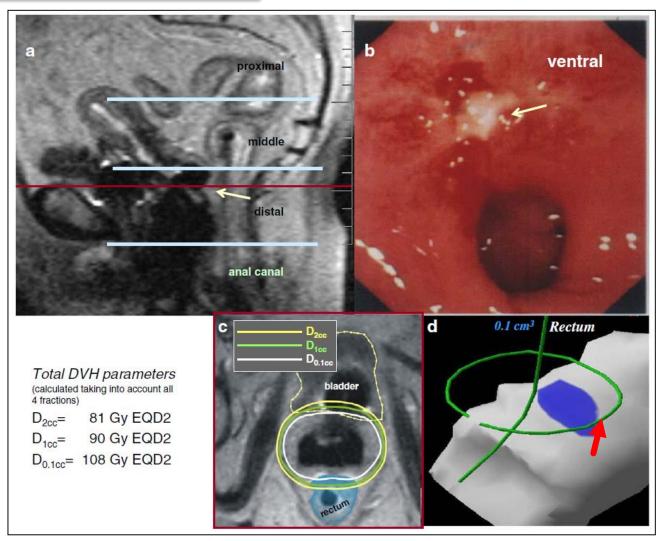

High Doses to Small V

Example: Teleangiectasia / Bleeding

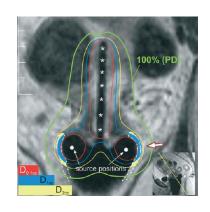

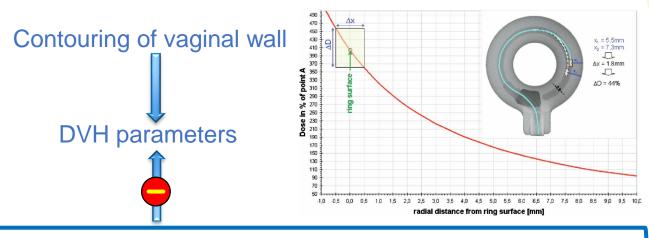

High Doses to Small V

Example: Ulcer / Fistula / Necrosis

High Doses to Small V: Vagina

Resolution of imaging

Contouring variation

Applicator reconstruction

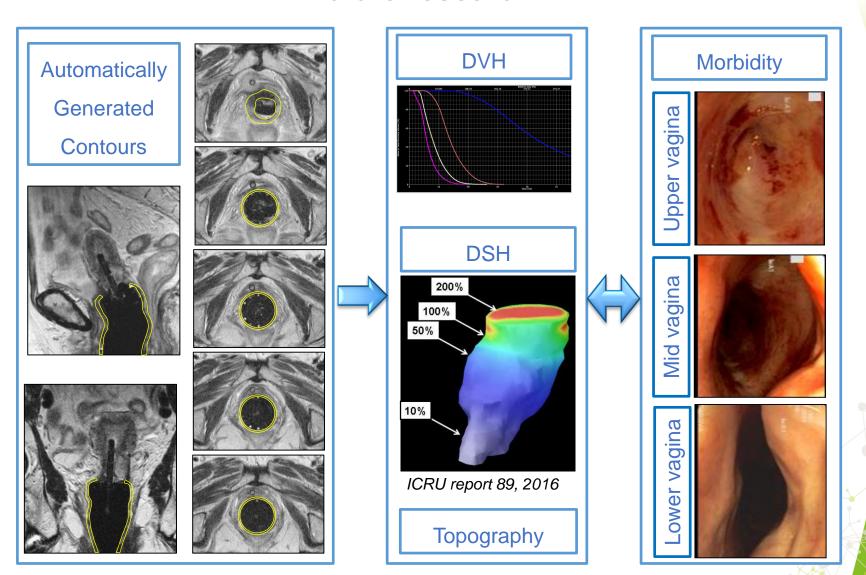

DVH parameters have HIGH uncertainty for representative vaginal dose estimation

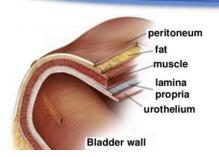

High Doses to Small V: Vagina

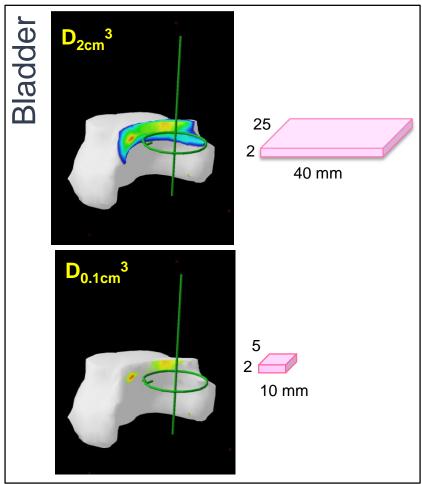

Future research

 D_{2cm}^3 and $D_{0.1cm}^3$:

Not spherical V

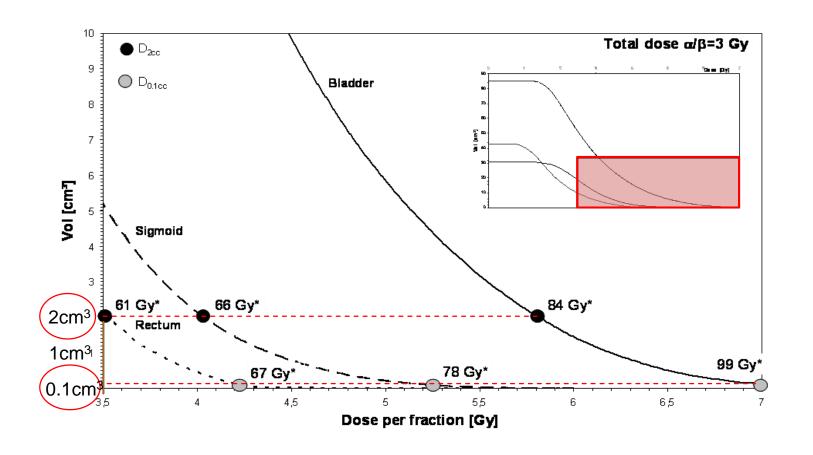

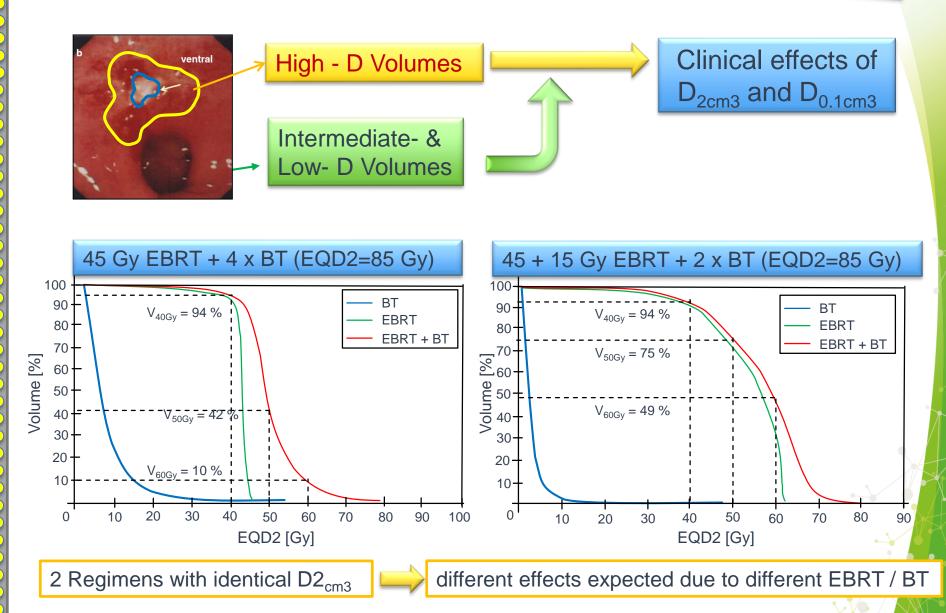

D_{1cm}³: reporting not recommended (can be interpolated)

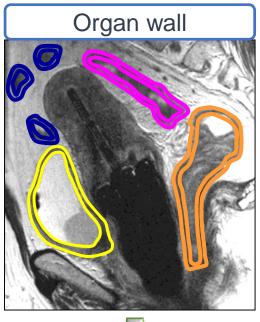

Reporting of D_{2cm3} and $D_{0.1cm3}$ describes only the high dose part of the dose distribution

Example from ICRU 89 Report, p. 113.

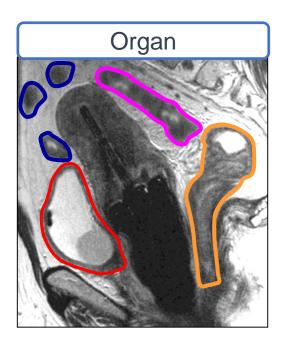

Effects: due to Dose in the Organ wall, not Lumen

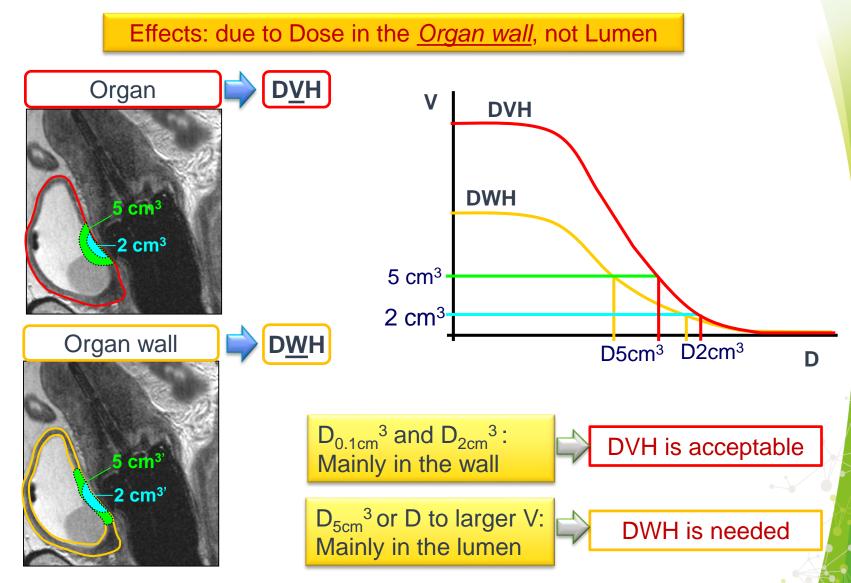

More correct, but:

- Time consuming
- Prone to uncertainties

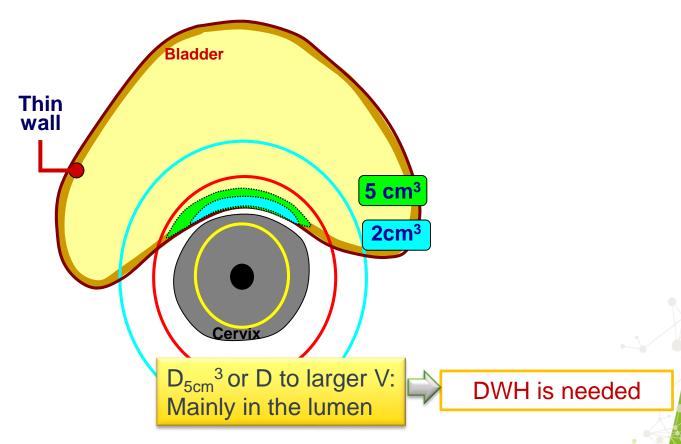

Can we contour <u>organs</u> instead of <u>organ walls</u>?

Olszewska AM. Radiother Oncol 2001;61:83-85 Wachter-Gerstner et al. 2003

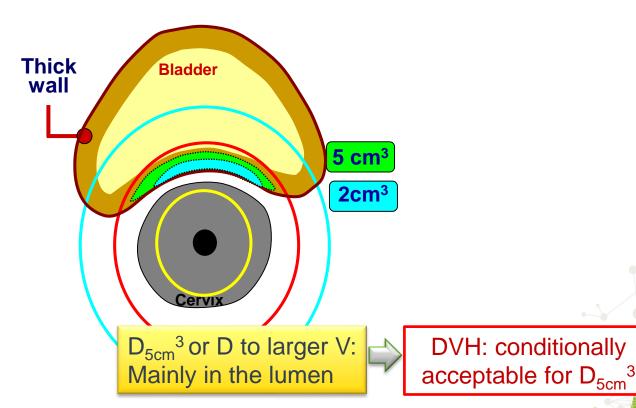

Effects: due to Dose in the Organ wall, not Lumen

Impact of wall thickness

Effects: due to Dose in the Organ wall, not Lumen

Impact of wall thickness

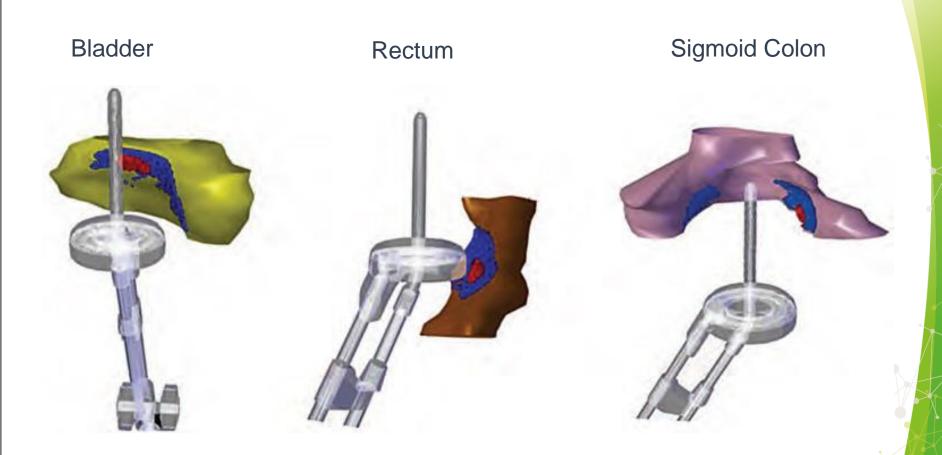

DVH: conditionally

General and image guided adaptive treatment strategies and BT techniques for Vaginal Cancer

Vaginal and Vulvar cancer: frequency

Estimated new cancer cases and deaths, United States, 2008

| | Estimated new cases | Estimated deaths |
|----------------------------|---------------------|------------------|
| Genital system (female) | 78490 | 28490 |
| Uterine cervix | 11070 | 3870 |
| Uterine corpus | 40100 | 7470 |
| Ovary | 21650 | 15520 |
| Vulva | 3460 | 870 |

Rare gynaecological tumours

Vagina: 1% - 2% female reproductive tract cancers

Vaginal cancer

Primary vaginal cancer:

- Cervix and the vulva without history of cervix or vulvar cancer within 5 years
- 80% postmenopausal women
- Mean age : 60-65 years
- Exception: clear cell adenocarcinoma, young patients
 (mothers diethylstilbestrol (DES) during their pregnancies)

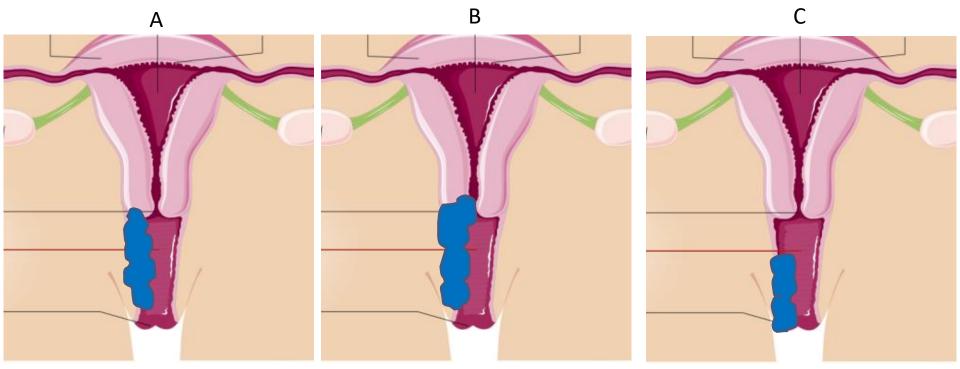

Vaginal cancer: natural history and pattern of spread

- 50% of vaginal cancers : upper third of the vagina even distribution on anterior/posterior/lateral walls
- 40-50% are multifocal
- Lower third of the vagina lymphatics communicate with those of the vulva
- Drainage:
 - either to the pelvic nodes or
 - to the inguino-femoral lymph nodes.

Vaginal cancer: initial work-up

- Clinical examination +++
 - Topography
 - Macroscopic characteristics
 - Drawings +++ / vaginal impression
- Transvaginal and/or transrectal sonography :
 - tumour thickness: assists in BT technique
- MRI: tumour dimension, site, extension (bladder, rectum) enlarged pelvic and para-aortic nodes
- FDG-PET nodal disease twice as often as CT
- Depending on tumoral extension : anuscopy/rectoscopy / urethrocystoscopy

FIGO classification

According to FIGO staging rules, tumors in the vagina should be classified as:

- 'cervical' if the cervical os is involved (even if most of the tumor is in the vagina)
- 'vulval' if any portion of the vulva is involved

Vaginal cancer: FIGO classification

- O Carcinoma in situ, intraepithelial carcinoma
- I Carcinoma limited to the vaginal wall
- II Paravaginal tissue extension, without reaching pelvic wall
- III Pelvic wall extension
- IV Extension beyond the true pelvis or bladder/rectum mucosa
- IVA Adjacent organs and/or direct extension beyond the true pelvis
- IVB Distant organs spread

Vaginal cancer: treatment

- Rarity of primary carcinoma of the vagina
- No randomized trial to assess :
 - the respective role of surgery and irradiation
 - to explore the value of concomitant chemoradiation
- Role +++ of brachytherapy

Vaginal cancer: treatment of VAIN

Surgery alone (80%) young patients,
 ovarian function preservation

Irradiation (5%-10): exclusive BT

Chemotherapy (4%-5%)

Results: brachytherapy VAIN

| Patients characteristics | | n=21 |
|--------------------------|-----------------------|------------|
| Age at diagnosis | Median (range) | 53 (29-78) |
| Age at brachytherapy | Median (range) | 66 (38-80) |
| History of | Cervical carcinoma | 2 |
| | endometrial carcinoma | 1 |
| | CIN | 20 |
| Multifocal | Yes | 2 |
| | No | 19 |
| Microinvasive carcinoma | Yes | 2 |
| | No | 14 |
| | NA | 5 |

Median Follow-up: 79 months

Results: Brachytherapy VAIN

| BT characteristics | | |
|---|-------------|--|
| Volume 60 Gy isodose (cm ³) | 82 (18-121) | |
| Vaginal volume treated | | |
| upper half | 14 | |
| upper two-third | 4 | |
| whole vagina | 3 | |
| ICRU Bladder Dose (Gy) | 47 (8-74) | |
| ICRU Rectum Dose (Gy) | 69 (32-109) | |
| Application duration (days) | 4.5 (3-6) | |
| Intraoperative Lugol staining (%) | 18 (82) | |
| Intraoperative fiducial placement (%) | 6 (27) | |

Brachytherapy: outcome

- Follow-up: 79 months
- 1 vulvar relapse (out of field)
- 1 « in field » relapse in a heavily pretreated patient
 - previous surgery, radiotherapy, chemotherapy and brachytherapy for cervical carcinoma
 - unsuccessful interferon and laser therapy for VAIN
- 19 cured patients

Vaginal cancer: treatment of invasive tumours

- External beam radiotherapy (ERT) and brachytherapy (BT)
- Limited stage I : exclusive BT
- 45 Gy to the pelvis/prophylactic inguinal ERT if lower third tumoral extension
- Concomitant chemoradiation

No recommendations for CTVs

- CTV_{HR} and CTV_{IR} concepts for cervix
- Transfer and adaptation to vaginal cancer

Target delineation recommendations of the GYN GEC-ESTRO Group for image-guided adaptive brachytherapy in primary vaginal cancer

GTV_{init}: macroscopic tumor at the time of diagnosis

 GTV_{res} : macroscopic residual tumor at the time of brachytherapy

Clinical examination: This is the remaining visible and palpable residual macroscopic tumor at gynae examination

Imaging: T2-weighted MRI remaining mass with hyperintense to isointense signal intensity, within the initial tumor extension at diagnosis, GTV_{init}

 CTV_{HR} : includes the GTV_{res} and areas at high risk for significant residual disease

Clinical: GTV_{res} and any abnormal thickened or irregular vaginal wall within the initial tumor extension (GTV_{init})

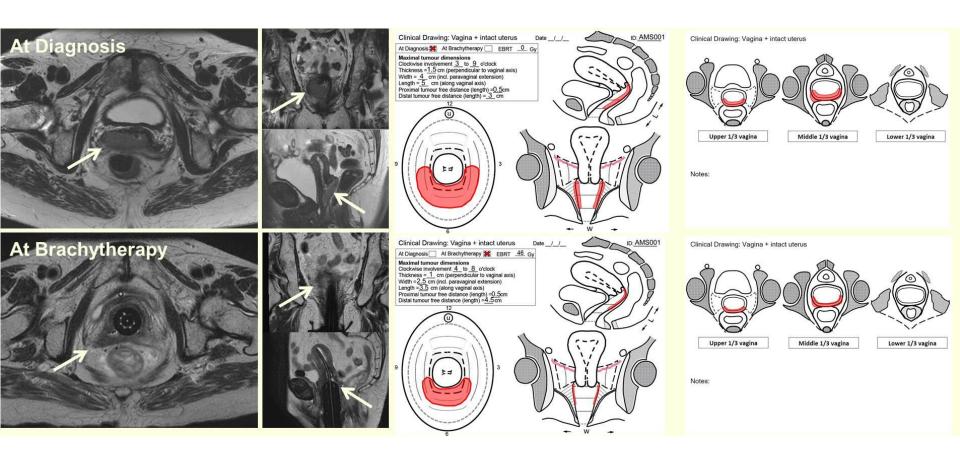

Imaging: includes the GTV_{res} and any abnormal thickened or deformed vaginal wall within the initial tumor extension (GTV_{init})

In case of tumors infiltrating the paravaginal or parametrial space at diagnosis, so called "grey zones" are included in the CTV_{HR}

 CTV_{IR} : safety margin for presumed adjacent significant microscopic disease Integrates initial tumor extension at diagnosis (GTV_{init})

Includes the CTV_{HR} plus an isotropic margin of **minimal 5 mm** limited by previously unaffected anatomical borders/compartments: pubic bone, pelvic wall, pelvic floor musculature, bladder, urethra, mesorectal fascia, rectum, anal sphincter

In case of infitration of hollow organs (rectum, urinary bladder) before radiochemotherapy only the organ wall without the lumen should be included

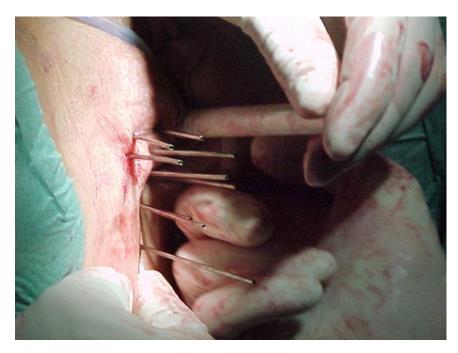

Vaginal cancer: brachytherapy

- Endocavitary
- Interstitial
- Endocavitary and interstitial combination
- Total dose: 80Gy to the GTV

Techniques

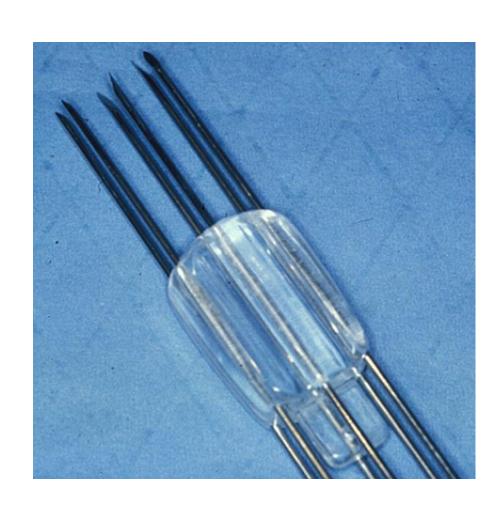

- Freehand placement
- Intra-vaginal templates
- Transperineal templates :
 - Syed- Neblett applicator
 - MUPIT...
- (Guide gutter)
- Plastic tube
- Steel plastic titanium needles

Techniques - Freehand placement

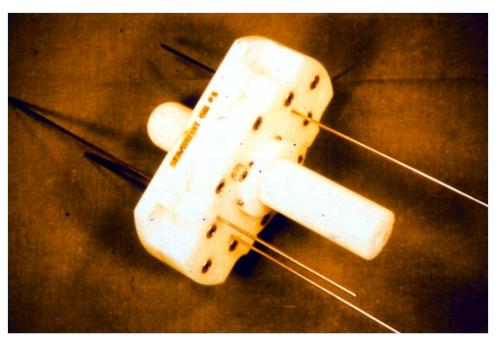

Techniques – Intravaginal template

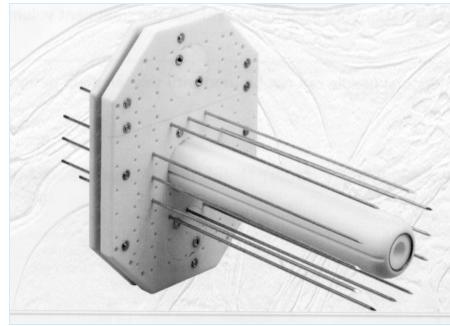

Techniques – Perineal templates

Syed

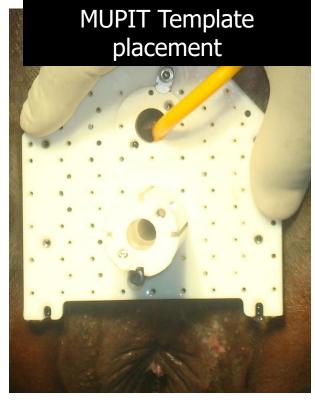

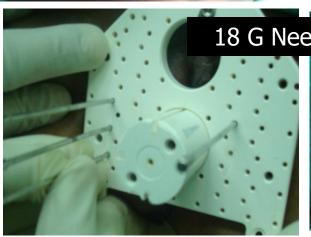

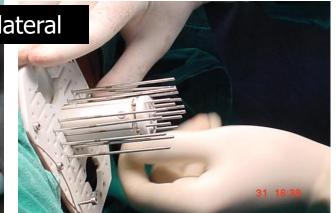

MUPIT Technique

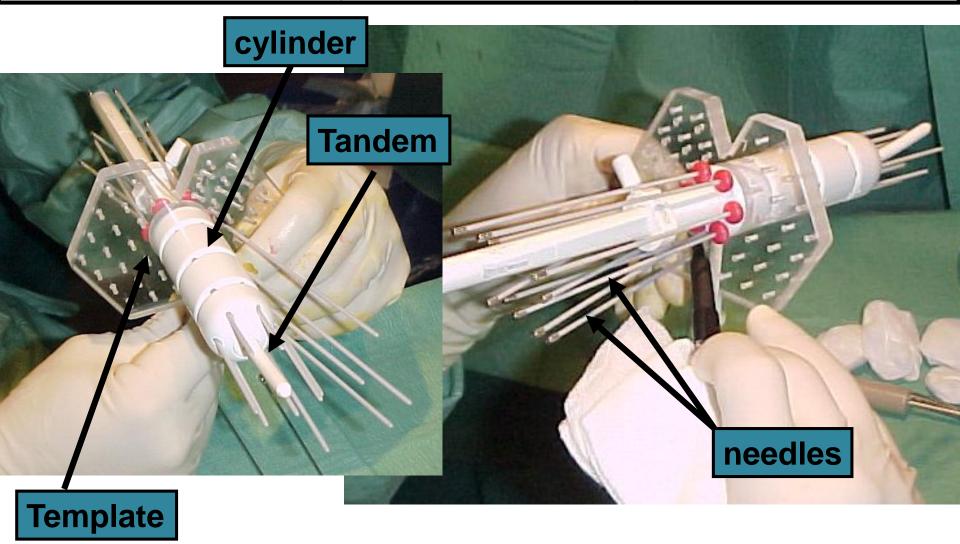

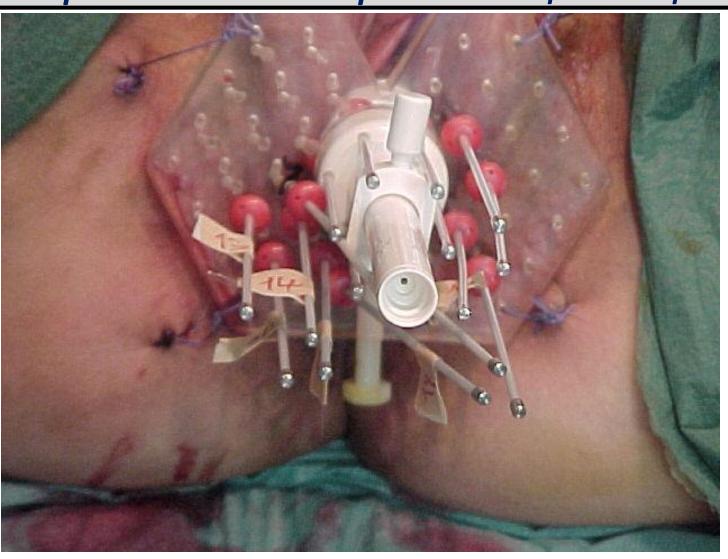

Under digital rectal guidance / Trans-ultrasound Guided

Techniques – Perineal templates

Techniques – Perineal templates – Completed implant

Attempts to improve needle placement

Needle placement accuracy

- Fluoroscopy
- Computed tomography
- MRI: open MRI
- Laparotomy ____ guided implants
- Laparoscopy-
- Transabdominal ultrasonography
- Transrectal ultrasonography

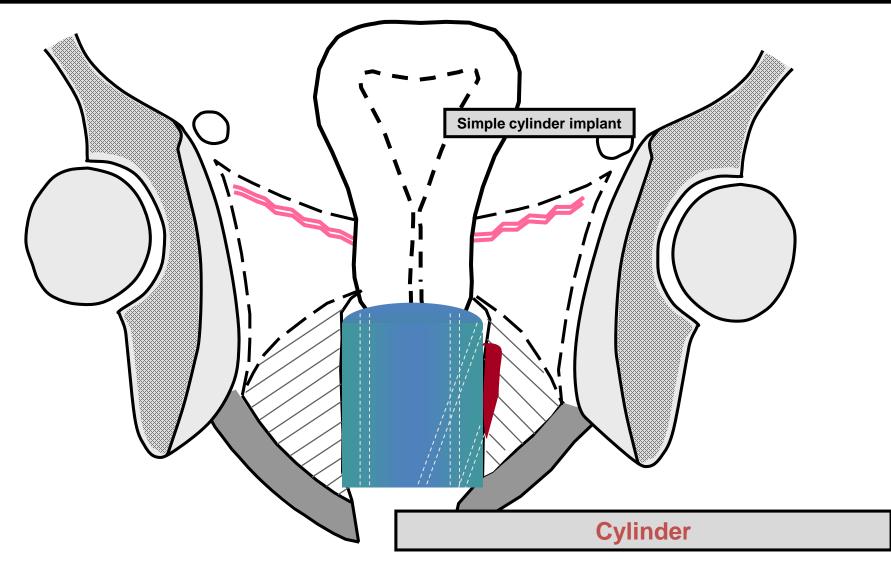

Published results include studies with diverse GYN tumors

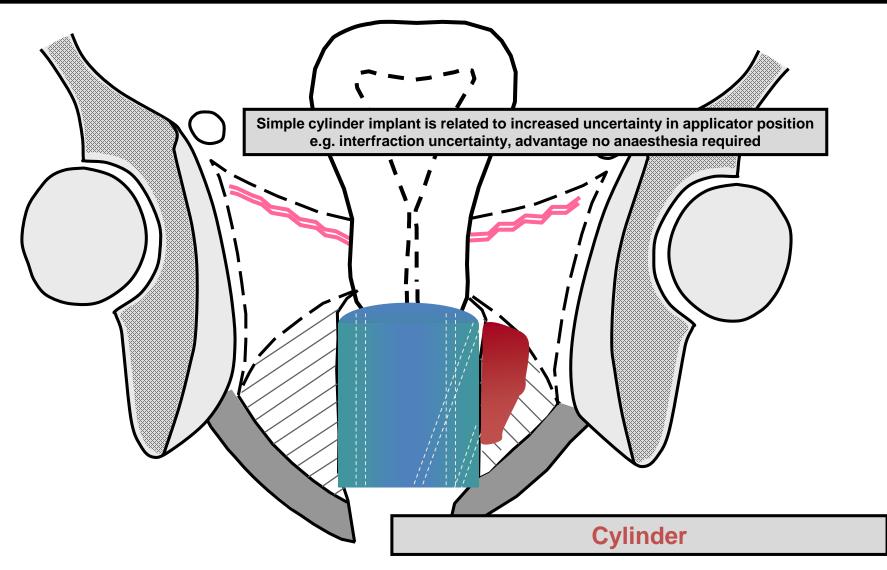

Selection of application technique

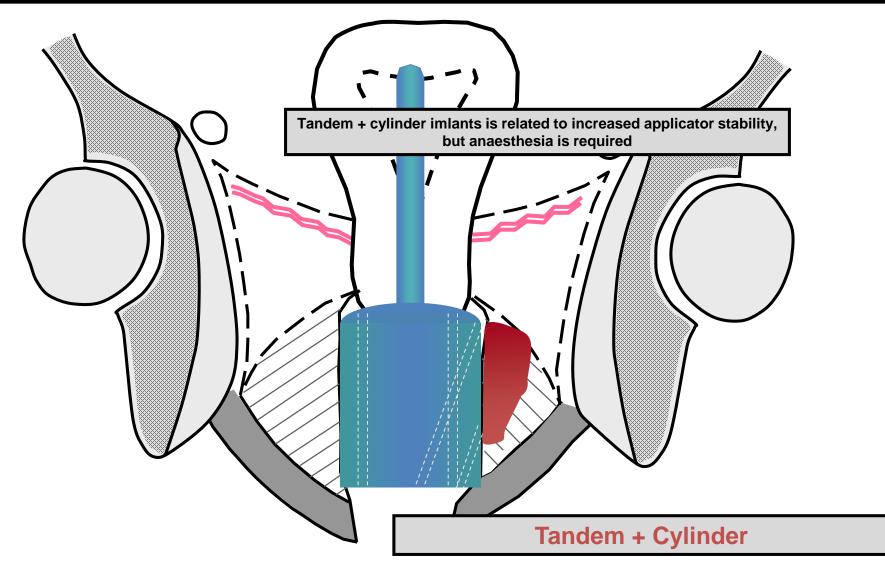

Based on clinical examination and sectional imaging:

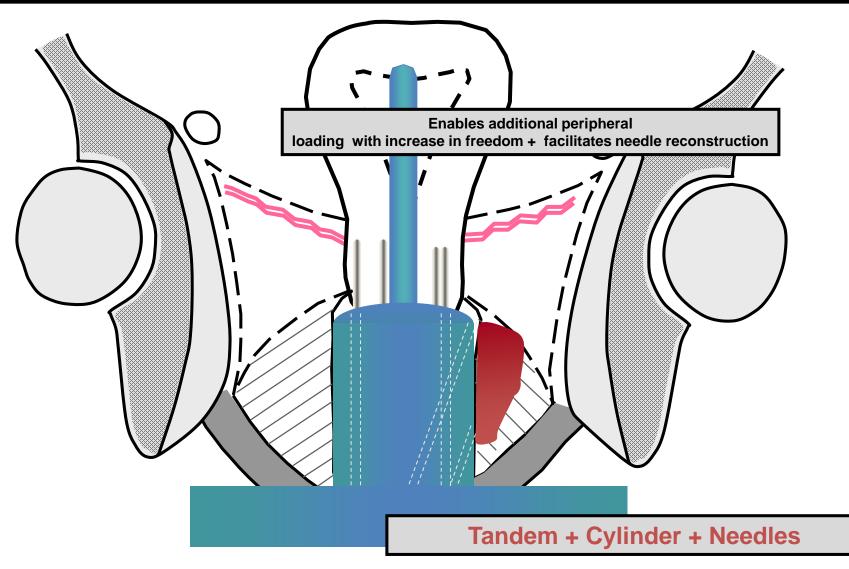

- At the time of diagnosis
 - -initial tumor extension
- During EBRT
 - -Quantitative and qualitative tumor regression
- At the time of brachytherapy
 - -Topography of tumor in relation to the applicator

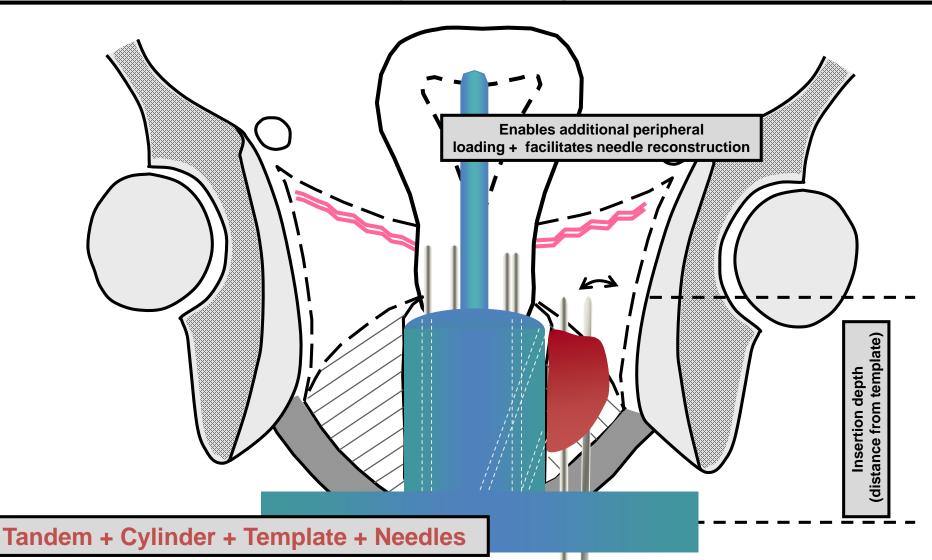

Published results include studies with diverse GYN tumors

Brachy 2011; IJROBP 2011

Conclusions

- Interstitial techniques when inappropriate coverage (topographic and dosimetric) with pure intracavitary techniques
- Several approaches (applicators, guidance) available
- Several pre-conditions for implementation (equipment, experience specialized centres)
- Adaptation of the application technique to the topography at the time of brachytherapy
- A good portion of cases can be treated with simple techniques
- Tasks: control over placement / few needles / MRI Based Treatment Planning
- Larger clinical data with Image Based Approach: essential

Vulval Cancer General Treatment Strategies & Interstitial BT Techniques

Umesh Mahantshetty
Richard Pötter
Christine Haie-Meder

Vulvar cancer

- Post-menopausal women
- Squamous cell carcinoma: 90 95%
- Human papilloma virus not reported as often as in cervical cancer
- Lichen sclerosis

Vulvar cancer: natural history and pattern of spread

- Diagnosis delay
- Pattern of dissemination : lymphogenic
- Inguino-femoral lymph node metastases
- Lateralized tumours usually drain to the ipsilateral groin
- Median tumours (or less than 1cm of the midline) drain to either groin side
- Clitoris tumours : possible direct drainage to pelvic nodes

Vulvar cancer: natural history and pattern of spread

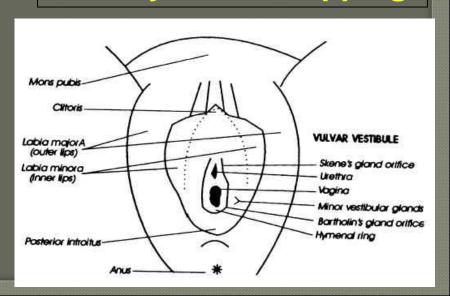

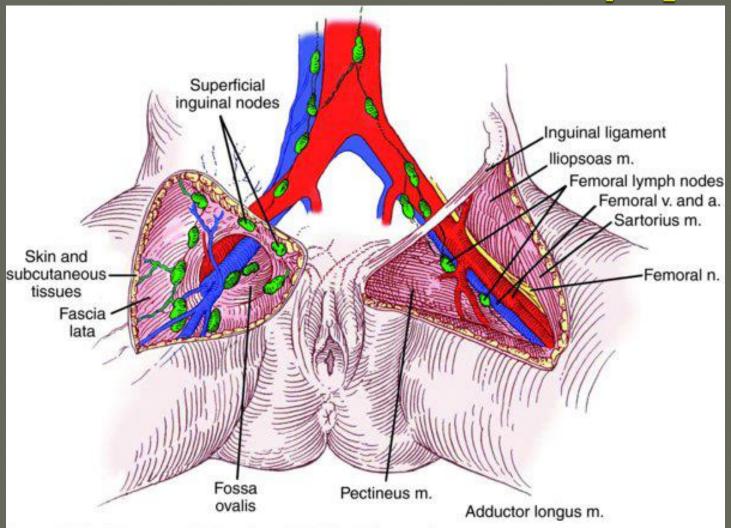

Vulvar cancer: initial work-up

- Vulvar tumours : easily accessible to clinical examination
- Tumour pain ———— examination under general anaesthesia
- Potential extension into the vagina
- Urethro-cystoscopy / anuscopy
- Imaging: CT/ MR depending on Stage (essentially for nodes)

Primary tumor mapping

Vulvar cancer: lymph node

Vulvar cancer: FIGO classification 2009

Takes nodal status into account

- Stage 0: in situ tumour without nodal metastasis
- Stage IA: tumour
 < 2cm confined to the vulva
 or perineum and with stromal invasion
 < 1mm,
 no nodal metastasis
- Stage IB: tumour > 2cm or with stromal invasion > 1mm, confined to the vulva or perineum, with negative nodes
- Stage II: tumour of any size with extension to adjacent perineal structures (1/3 lower urethra, 1/3 lower vagina, anus) with negative nodes

Vulvar cancer: FIGO classification 2009

- Stage III: tumour of any size with or without extension to adjacent perineal structures (1/3 lower urethra, 1/3 lower vagina, anus) with positive inguino-femoral lymph nodes
 - IIIA: with 1 lymph node metastasis (> 5mm), or
 1-2 lymph node metastasis(es) (< 5mm)
 - IIIB: with 2 or more lymph node metastases (> 5mm), or 3 or more lymph node metastases (< 5mm)
 - IIIC: with positive nodes with extracapsular spread

Vulvar cancer: FIGO classification 2009

- Stage IV: tumour invades other regional (2/3 upper urethra, 2/3 upper vagina), or distant structures
 - IVA: tumour invades any of the following:
 - upper urethral and/or vaginal mucosa, bladder mucosa, rectal mucosa, or fixed to pelvic bone, or
 - fixed or ulcerated inguino-femoral lymph nodes
 - IVB: any distant metastasis including pelvic lymph nodes

Vulvar cancer: treatment modalities

Standard treatment = surgery

ERT, BT or chemotherapy:

- adjuvant treatment options
- or exclusive treatment options in advanced disease
- Pre operative radiation in locally advanced tuomrs

Vulvar cancer: surgery Primary tumor

- Standard surgery used to be :
 - Radical vulvectomy with "en bloc"
 bilateral inguinofemoral and pelvic lymphadenectomy
- Alternative nowadays:
 - wide excision if free microscopic margins of at least 8mm and preferably 20mm can be achieved

Vulvar cancer: surgery

Nodal treatment

- If inguinofemoral nodes free : metastatic pelvic lymph node exceptional
- No pelvic lymphadenectomy in inguinal node negative pts
- Rarity of contralateral inguinofemoral lymph nodes (3%-4%)
 if lateralized tumours: unilateral inguinofemoral
 lymphadenectomy
- Bilateral inguinofemoral lymphadenectomy standard if midline located tumour

Vulvar cancer: surgery

Nodal treatment

- Recent development of sentinel node evaluation
- Mapping has been recently developed
 - isosulfan blue injection
 - combination of either isosulfan blue dye or technetium-99 and lymphoscintigraphy
- Predictive value of 99% out of 12 series collecting 353 pts

Vulvar cancer: irradiation Indications for Adjuvant therapy for primary tumor

- After wide local excision : positive margins or with margins
 < 3mm if re-excision is not possible
- Total dose of 45Gy-50Gy in 25-28 fractions to control potential micro-metastases
- EBRT Technique: electrons and photons combination
- Interstitial BT can be combined to external irradiation depending upon tumour location

Vulvar cancer: ERT Indications for definitive radiation

- Contra-indication to surgery or advanced tumours
- Total dose of 45 Gy to the pelvis ERT
- Interstitial BT total dose of 60 Gy-85 Gy
- Concurrent chemo-radiation (cisplatinum or carboplatinum used alone or in combination with fluorouracil)
- high response-rate (even in the absence of randomized trials)

Indications of nodal irradiation

bilateral inguinal femoral lymph node dissection

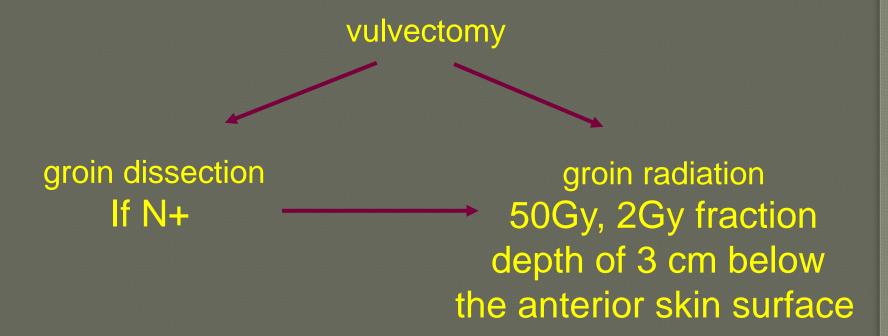

or

• external radiation to the groin ?

Stehman et al. Groin dissection versus groin radiation in carcinoma of the vulva: a Gynecologic Oncology Group study Int J Radiat Oncol Biol Phys 24:389–96;1992

Vulvar cancer: ERT GOG 88

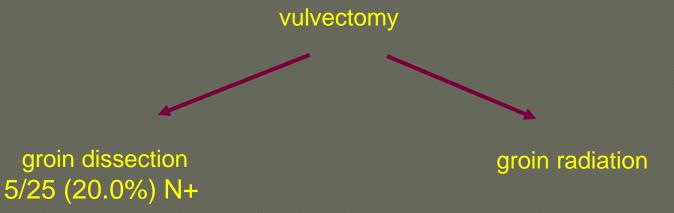

Vulvar SCC and nonsuspicious (N0-1) inguinal nodes

Stehman et al. Int J Radiat Oncol Biol Phys 24:389-96;1992

Study closed after interim analysis of 58 patients

Vulvar SCC and nonsuspicious (N0-1) inguinal nodes

Relapse:

0/25

5/27 (18.7%)

Stehman et al. Int J Radiat Oncol Biol Phys 24:389–96;1992

Femoral vessel depth and the implications for groin node radiation

CT of 50 patients with gynaecological cancer

Distance of each femoral vessel beneath the overlying skin surface

Individual femoral vessel depths ranged from 2.0 to 18.5 cm Mean average depth: 6.1 cm

Koh WJ et al. Int J Radiat Oncol Biol Phys 27:969-74;1993

Nodal irradiation vs nodal dissection

- Review of 3 series
- No evidence for a better control with external irradiation compared to dissection

van der Velven J. Primary groin irradiation versus primary groin surgery for early vulvar cancer (Cochrane Review). In : The Cochrane library, issue 1. Oxford : Update Sofware (2002)

Indications of post-operative nodal irradiation

- > 1 involved inguino-femoral lymph node (Stage IIIB)
- Extracapsular extension (Stage IIIC)
- Gross residual nodal disease (Stage IIIC with R + resection)

Vulvar cancer: ER Tog 37

Pelvic irradiation if involved inguinal nodes?

Pelvic node dissection

Postoperative radiotherapy
Bilateral pelvic and inguinal irradiation
45-50Gy
Anterior and posterior opposing fields

Homesley HD et al. Obstet Gynecol 68:733-40;1986

survival:

5%

p=0.02

68%

p = 0.03

Homesley HD et al. Obstet Gynecol 68:733-40;1986

A phase II trial of radiation therapy and weekly cisplatin chemotherapy for the treatment of locally-advanced squamous cell carcinoma of the vulva: a gynecologic oncology group study.

Moore, et al Gyn Onc 2012

- T3 or T4 vulvar lesions
- Treatment:
 - Radiation 1.8 Gy x 32 fx = 57.6 Gy
 - Weekly cisplatin 40 mg/m²
 - 4-6 wks. later biopsy or surgical resection
- Results:
 - 58 evaluable patients
 - 37 (63.8%) clinical CR
 - 29 (50%) pathological CR

Treatment results of vulvar cancer

- 5-year survival pelvic control rates:
 - stage I: 90% 97%
 - stage II: 70% 86%
 - stage III: 40% 65%
 - stage IV: 10% 27%
- 50% of the failures are local recurrences
- Groin recurrences: 6%-30% of recurrences occur sooner than local relapses

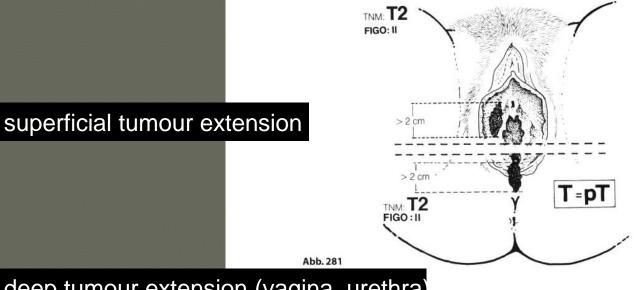

Prognostic factors of vulvar cancer

- Prognostic factors for local recurrence :
 - Positive or close margins
 - Presence of capillary space involvement
 - Large invasion depth and large primary size
- Main prognostic factor for survival :
 - Inguinofemoral lymph node status

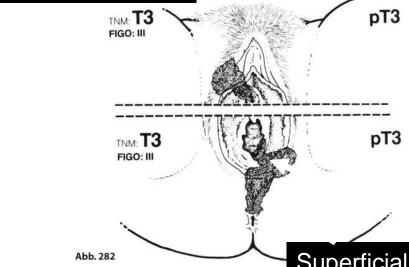

Principles of Brachytherapy for Vulval cancers

- Objective evaluation and Mapping of Disease at Diagnosis and Brachytherapy
- Natural tumor spread and appropriate techniques
- Adopt some Image Based Brachy principles in terms of Imaging, Dose painting, DVH parameters......
- Clinical Outcome: Local Control rates and Toxicities

Tata Memorial Hospital Experience Period: 2000 - 2010

Mahantshetty et al ; Brachytherapy 2017

| | Radical Brachy (n=6) | EBRT + Brachy (n=11) |
|--|---------------------------|--------------------------|
| Brachy Dose | Median 38Gy | Median 20Gy |
| EBRT dose | NA | Median 50Gy |
| HDR Brachy (2#/day) | 3.4 - 4 Gy/# for 8 - 12 # | 3.4 - 4 Gy/# for 4 - 5 # |
| Median OS (mnths) | 62 (12 – 102 mths) | 33 (10 – 122 mths) |
| Median age : 59 years (Range: 33 to 77) | | |

- Brachytherapy techniques:
 - Needle + plastic tube : 8 pts [Median tubes: 8 (4 12)]
 - Template Based : 7 pts [Median tubes:13 (11 20)]
- 4 Patients received treatment after radical surgery
- Status at last follow up: 2 pts necrotic ulcer at post. fouchette (disease)
 - 1 pt expired
 - 3 patients alive with disease (status of others not known)

Conclusions - I

- Staging and Mulitdisciplinary Approach
- Radiation : Adjuvant / Definitive / BT
- Disease mapping (Pre Rx & Post XRT) and Pre-planning
- Choice of technique dependent on tumour location & knowledge of local tumor spread
- Combined techniques for tailoring dose distribution
- Adequate fixation & tailor made templates: Important
- Improved needle positioning by guidance (applicable only for deep tumours)

Conclusions - II

- Target volume concept may be extrapolated
- Target volumes: guided predominantly by clincial exam / MR
- Adjustment of needle distribution to target as delineated
- Brachytherapy : PDR / HDR
- No established guidelines and DVH parameters available
- Posterior fouchette: Dose limiting structure for brachy
- Brachythearpy Team work: Learning Curve

COMMITTEES

The Board of ESTRO creates and determines the mission of standing and ad-hoc committees as required to conduct the business of the Society. The committees report to the Council to which their purpose is linked.

Current standing committees reporting to the Scientific Council:

- Advisory Committee on Radiation Oncology Practice ACROP
- Clinical Committee
- Education & Training Committee
- GEC-ESTRO Brachytherapy Committee
- Physics Committee
- Radiobiology Committee
- RTT Committee
- Young ESTRO Committee

NATIONAL SOCIETIES

GEC-ESTRO BRACHYTHERAPY COMMITTEE

Over the years, GEC-ESTRO has substantially increased its work, initiating new activities such as organrelated working groups, an executive committee, teaching courses and publications and it is now an integral part of ESTRO. Further information on these activities can be found here.

Working groups

There are six brachytherapy working groups. Please click on the links below or on the right hand side of this page for further information about the activities of the group.

GEC-ESTRO Breast - Chair: Vratislav Strnad

GEC-ESTRO Head and Neck - Chair: György Kovacs

GEC-ESTRO Urology - Chair: Peter Hoskin

GEC-ESTRO Gynaecology - Chair: Kari Tanderup

GEC-ESTRO BRAPHYQS - Chair: Frank-André Sieber

GEC-ESTRO Anal - Chair: Arthur Sun Mvint

Brachytherapy publications

GEC ESTRO Handbook of Brachytherapy

The GEC ESTRO Handbook of Brachytherapy is aimed at clinicians, physicists and radiotherapy technologists worldwide, this textbook covers the basics of brachytherapy, including the physics and radiobiology and also describes in detail all aspects of clinical practice.

First published in 2002, this valuable handbook is currently under review. The new version of the GEC ESTRO Handbook of brachytherapy will be included in DOVE, the current version of the book can be found here.

Guidelines and recommendations

Brachytherapy guidelines and recommedations issued by ESTRO and other organisations can be found through the search portal. These comprehensive books present a full review of the state of the art of brachytherapy and clinical radiobiology and are widely regarded as essential reading for all those involved in the delivery of radiation oncology therapies.

GEC ESTRO gyn working group and network

Working group and network chairs:

2000-2005 (Working group): Christine Haie-Meder

2005-2007: Richard Pötter and Christian Kirisits

2007-ongoing: Kari Tanderup and Richard Pötter

GEC ESTRO gyn network core institutions:

Participation and contact:

The GEC ESTRO gyn network is an open network, and we welcome all colleagues who have specific interest in gyneacological brachytherapy. Please email Kari Tanderup (karitand@rm.dk) if you are interested in joining the network.

EMBRACE II design

- Prospective interventional and observational study
- Multiple endpoints
- Multicenter: >25 centers
 - ~ 15 current EMBRACE centers and ~20 new centers
- 1000 patients in 4 years and follow up for 5 years
- 245 patients accrued since 2016
- Substudies on
 - Vaginal morbidity
 - Imaging
 - Translational research

- Increased use of IC/IS technique in BT:
 - HR CTV >30cm3: utilisation of IC/IS of >70% patients and CTV_{HR}>85Gy in 80% of patients (63% in EMBRACE I))
- Reduction of vaginal source loading
- Systematic utilisation of IMRT
- Utilisation of daily IGRT (set-up according to bony structures)
- EBRT target concept related to the primary tumour; concepts for OAR contouring
- EBRT dose prescription (45Gy/25fx) and reporting
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence
- Systematic application of simultaneous chemotherapy
- Reduction of overall treatment time

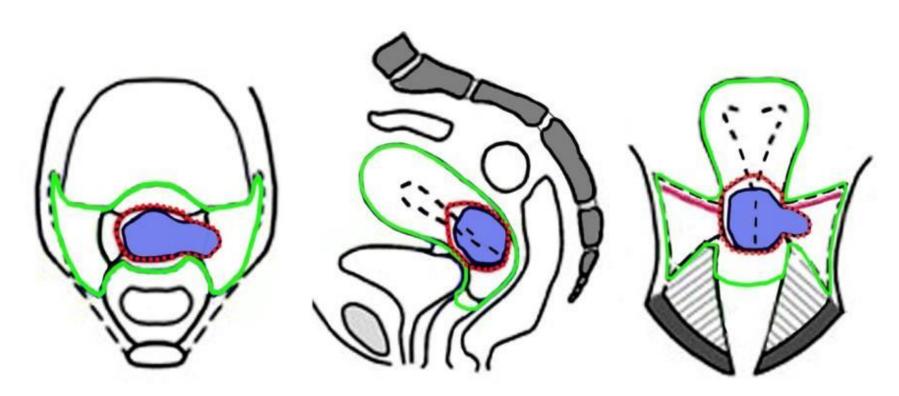

- Increased use of IC/IS technique in BT
- Reduction of vaginal source loading: <33% of total loading (51% in EMBRACE I)
- Systematic utilisation of IMRT
- Utilisation of daily IGRT (set-up according to bony structures)
- EBRT target concept related to the primary tumour; concepts for OAR contouring
- EBRT dose prescription (45Gy/25fx) and reporting
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence
- Systematic application of simultaneous chemotherapy
- Reduction of overall treatment time

- Increased use of IC/IS technique in BT
- Reduction of vaginal source loading
- Systematic utilisation of IMRT + Utilisation of daily IGRT (reduction of V43Gy by 1000cm3 (from 2500cm3 to 1500cm3 pelvis)
- EBRT target concept related to the primary tumour; concepts for OAR contouring
- EBRT dose prescription (45Gy/25fx) and reporting
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence
- Systematic application of simultaneous chemotherapy
- Reduction of overall treatment time

- Increased use of IC/IS technique in BT
- Reduction of vaginal source loading
- Systematic utilisation of IMRT
- Utilisation of daily IGRT (set-up according to bony structures)
- EBRT target concept related to the primary tumour (adapted to risk) and concepts for OAR contouring
- EBRT dose prescription (45Gy/25fx) and reporting
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence
- Systematic application of simultaneous chemotherapy
- Reduction of overall treatment time

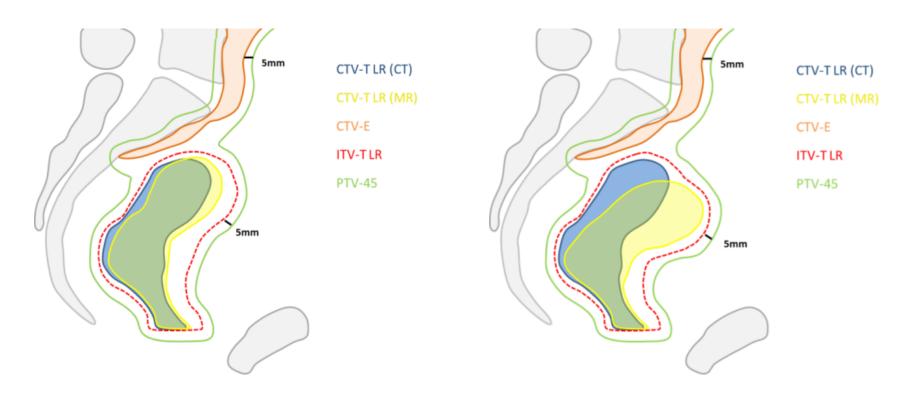

Target concept related to primary tumour

- Initial GTV (blue)
- Initial HR CTV-T (red): GTV+cervix
- LR CTV-T (green): HR CTV + uterus + parametria + vagina

Internal target volume

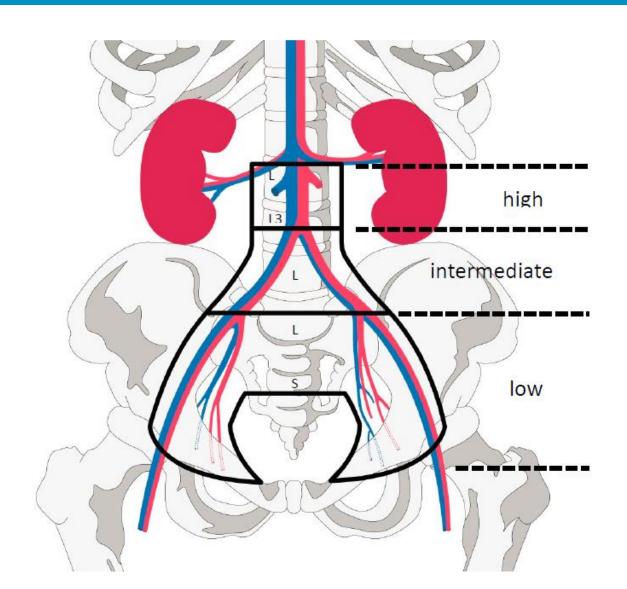

- Combined appearance on CT and MRI
- Taking organ motion into account

- Increased use of IC/IS technique in BT
- Reduction of vaginal source loading
- Systematic utilisation of IMRT
- Utilisation of daily IGRT (set-up according to bony structures)
- EBRT target concept related to the primary tumour; concepts for OAR contouring
- EBRT dose prescription and reporting (45Gy/25 fx in all fractions (30% patients with >45Gy in EMBRACE I)
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence
- Systematic application of simultaneous chemotherapy
- Reduction of overall treatment time

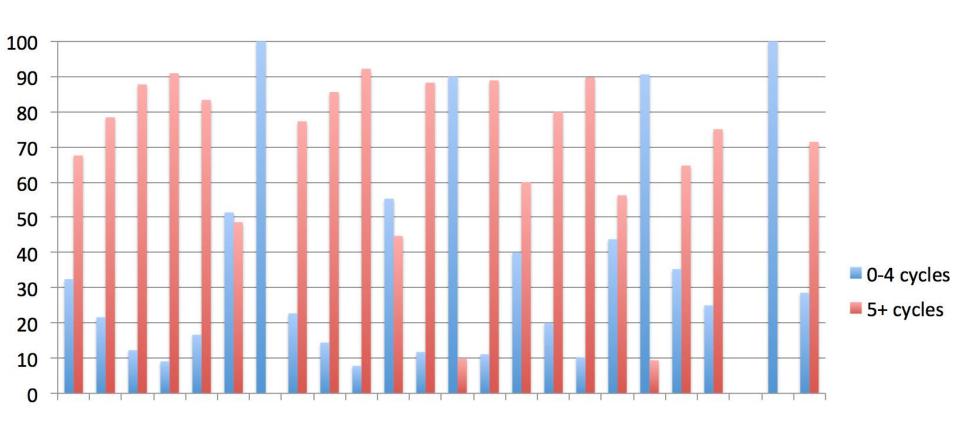

- Increased use of IC/IS technique in BT
- Reduction of vaginal source loading
- Systematic utilisation of IMRT
- Utilisation of daily IGRT (set-up according to bony structures)
- EBRT target concept related to the primary tumour; concepts for OAR contouring
- EBRT dose prescription (45Gy/25fx) and reporting
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence: application of PAN irradiation in 55% of N+ patients (25% in EMBRACE I)
- Systematic application of simultaneous chemotherapy
- Reduction of overall treatment time

Target concept related to elective lymph nodes

- Increased use of IC/IS technique in BT
- Reduction of vaginal source loading
- Systematic utilisation of IMRT
- Utilisation of daily IGRT (set-up according to bony structures)
- EBRT target concept related to the primary tumour; concepts for OAR contouring
- EBRT dose prescription (45Gy/25fx) and reporting
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence
- Systematic application of simultaneous chemotherapy (administration of 5 cycles in 80% of patients (69% in EMBRACE I)
- Reduction of overall treatment time

Administration of chemotherapy in EMBRACE I

- Increased use of IC/IS technique in BT
- Reduction of vaginal source loading
- Systematic utilisation of IMRT
- Utilisation of daily IGRT (set-up according to bony structures)
- EBRT target concept related to the primary tumour; concepts for OAR contouring
- EBRT dose prescription (45Gy/25fx) and reporting
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence
- Systematic application of simultaneous chemotherapy
- Reduction of overall treatment time (OTT<50 days in 80% of patients)

Accreditation and dummy run for new centers

- Documentation of compliance (web based)
 - Treatment of >10 pts per year qualifying for accrual to EMBRACE II
 - Both EBRT and BT performed in the center
 - Routine use of IMRT or VMAT
 - Routine use of daily IGRT with bony fusion
 - Routine use of MRI guided IGABT
 - Routine use of combined IC/IS (>20-50% of pts)

Accreditation and dummy run for new centers

Dummy run

- Contouring training for EBRT and BT (selfassessment)
- EBRT planning exercise (self assessment)
- Registration of 5 patient in registration database
- Submission of EBRT and BT contours
- Submission of EBRT and BT treatment plan

EMBRACE consortium

- EMBRACE II
 - 16 EMBRACE I centers
 - Accreditation of ~35 new centers

- EMBRACE registration study
 - Under development
 - Possibility to register patient and treatment characteristics as well as treatment outcome
 - Possibility to receive feedback on practice and outcome

Carcinoma Cervix IIIB (FIGO)

Initial findings

Patient & Tumour

Patient:

41 years old, Pre menopausal

No comorbidities

Tumour:

Histological type: SCC

FIGO Stage: III B, N1

Initial clinical findings:

Portio:

7x5 cm Large endophytic growth

Vagina: Upper 1cm

Fornices: Right and posterior

involved

Parametria:

Right: up to LPW

Left: Medial half

Cystoscopy: Normal

MRI Pelvis:

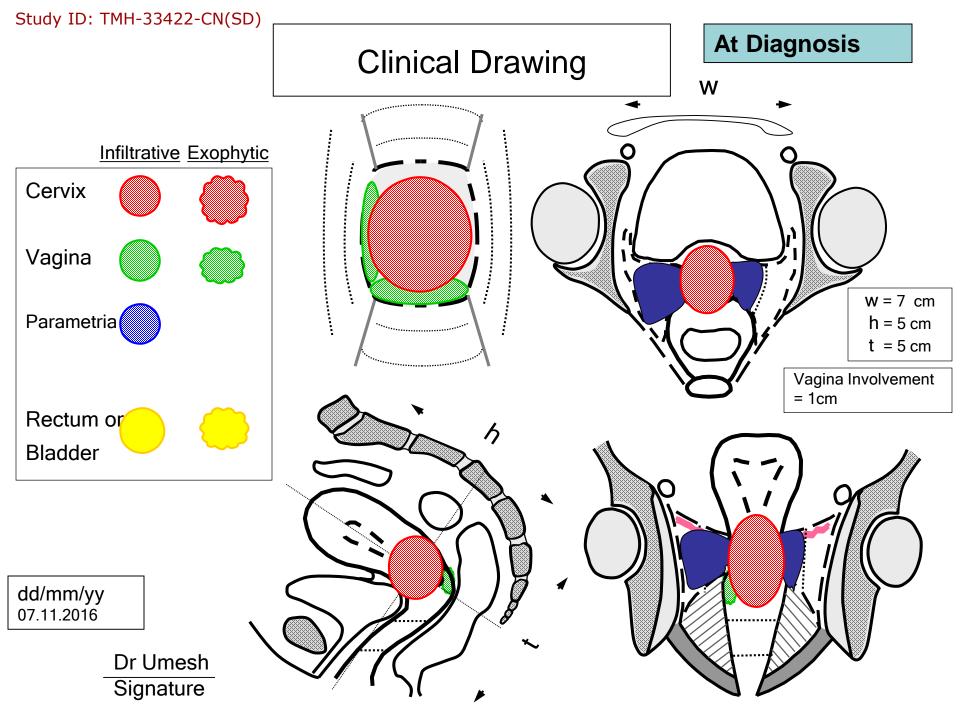

Cervical mass lesion extending into vaginal cavity and lower uterine body.

Bilateral parametria involved.

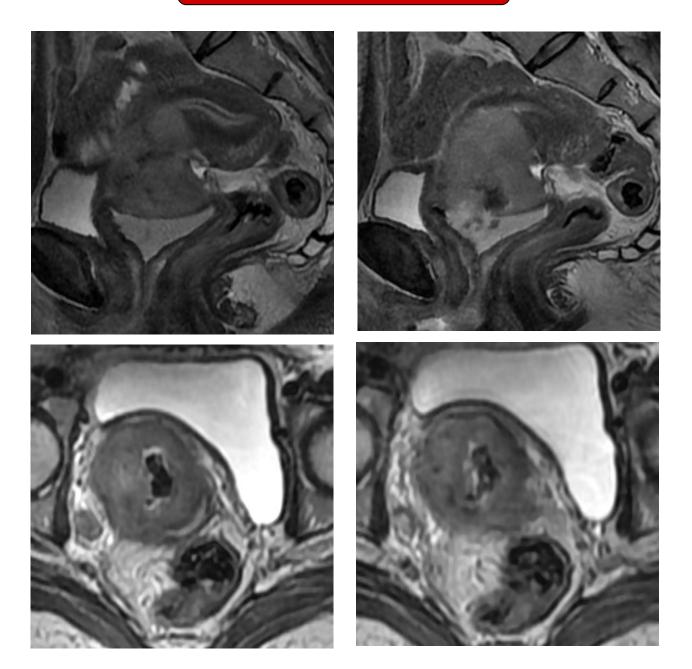

Enlarged right obturator node (10mm)

(Images in subsequent slides)

Details: see Initial Clinical Drawings (next slide)

Initial

EBRT, Chemotherapy

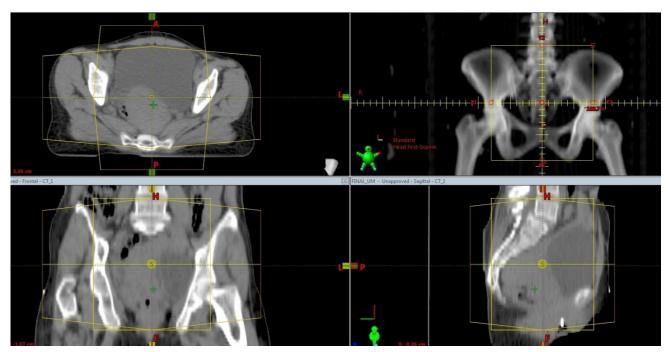

EBRT & Chemotherapy

EBRT Technique: Conventional - Box fields

TD: 50 Gy

Dose per fraction: 2 Gy

Boost: no

Concomitant chemotherapy: Cisplatin 40 mg/m2 weekly, 4 cycles

Findings at brachytherapy (immediately following EBRT)

Clinical findings at BT

Portio:

Residual endophytic growth eroding both lips of cervix

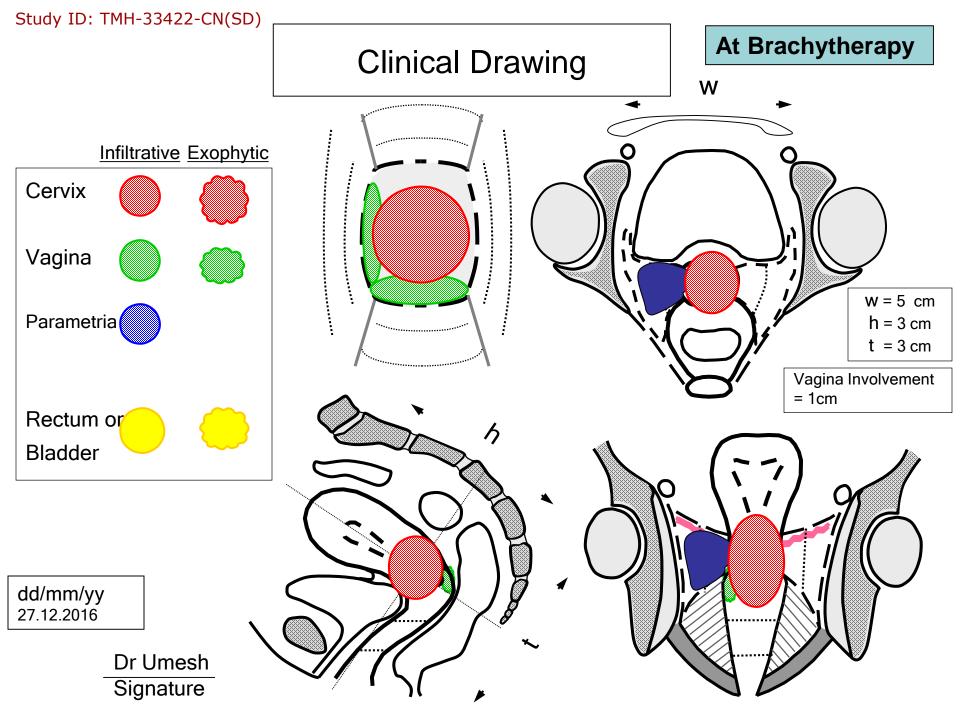

Vagina:

Right and posterior fornices involved.

Parametria:

Rt para involved up to LPW, Lt para supple.

Details: see *Clinical Drawings at BT* (next slide)

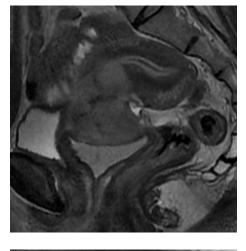

Insertion & imaging

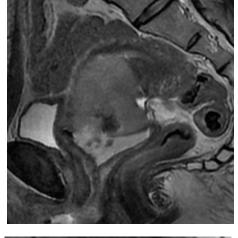

Inject 20cc saline in bladder

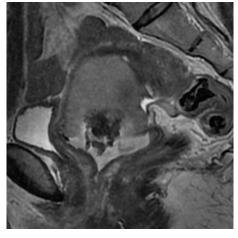

Anaesthesia: General **Application:** Intracavitary component: Tandem length: 60 mm Tandem angle: 45° Ring diameter: 26 mm Material: plastic Comments: Water-filled plastic tube inside ring & tandem. Interstitial component: N° of needles: 6 (3 straight + 3 divergent) in Rt parametrium Insertion depth: 5 cm Material: Titanium Vaginal packing: Gauze impregnated with betadine **Imaging:** MRI field strength: 1.5 T MRI configuration: closed Sequence(s): T2-weighted Imaging planes: transverse, sagittal, coronal Comments: Before imaging- Empty the bladder using Asepto syringe

Radiobiological Models to combine dose from External Beam and Brachytherapy (HDR,PDR)

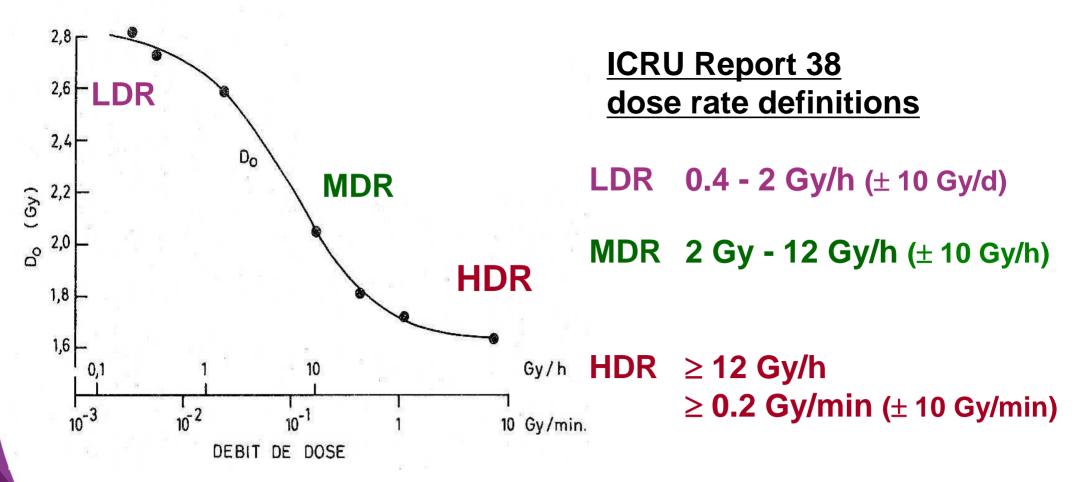

presented by Daniel Berger

General Hospital of Vienna, City of Vienna, Medical University of Vienna, Department of Radiotherapy

Dose Rates in Brachytherapy

Doses are only comparable for a specified dose rate

Different Fractionation Schedules

Conventional Therapy (EBRT):

2Gy/day

Continuous Low Dose Rate BT:

15Gy in 60 hours

High Dose Rate BT:

7Gy/fraction

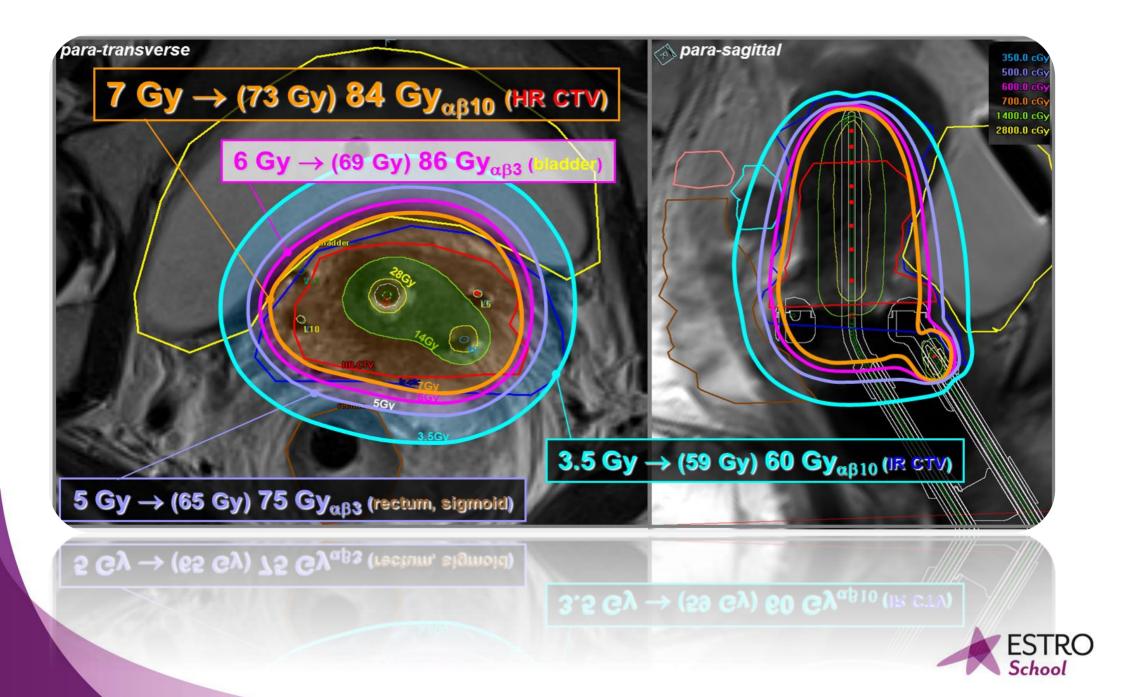

Pulsed Dose Rate BT:

0.5 Gy every hour

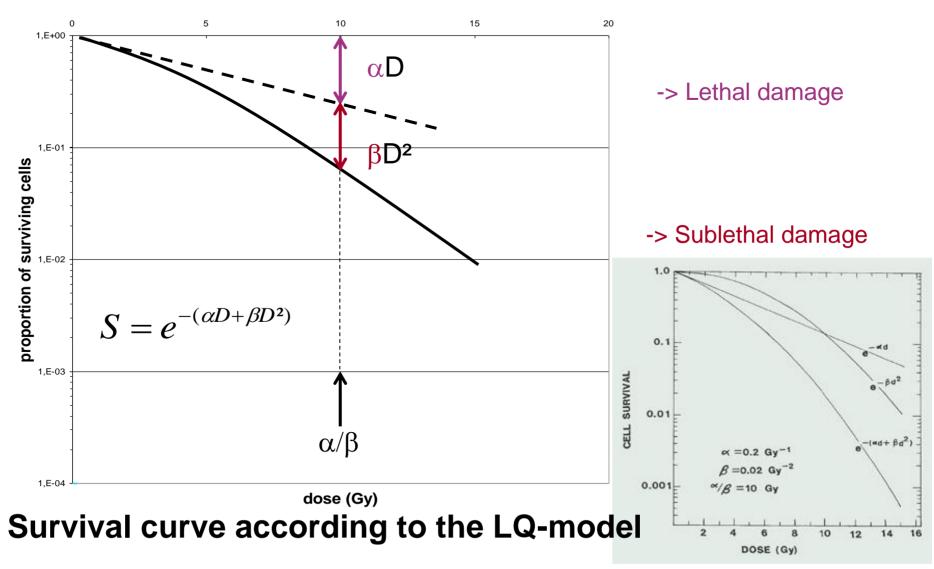

See what you will get

4 R's of radiobiology

- Repair
 - > Repair of sub-lethal DNA damage
- Redistribution
 - ➤ Radiosensitivity depends on phase in the cell cycle → redistribution changes radiosensitivity
- Repopulation
 - > Cell divide during a radiotherapy treatment
- Reoxygenation
 - > Radiosensitivity changes due to change in oxygenation

Linear-Quadratic Model

remember survival curve by Puck and Marcus 1956

Values of biological parameters

• Tumour and early reacting normal tissue:

 $\alpha/\beta \sim 10 \text{ Gy}$

7 – 20 Gy for most tumours

9 - 10 Gy for cervix carcinoma

 $T_{1/2} \sim 1.5 \text{ hours}$

0.5 - 1.5 hours

• Late reacting normal tissue:

 α/β ~ 3 Gy

0.5 - 6 Gy

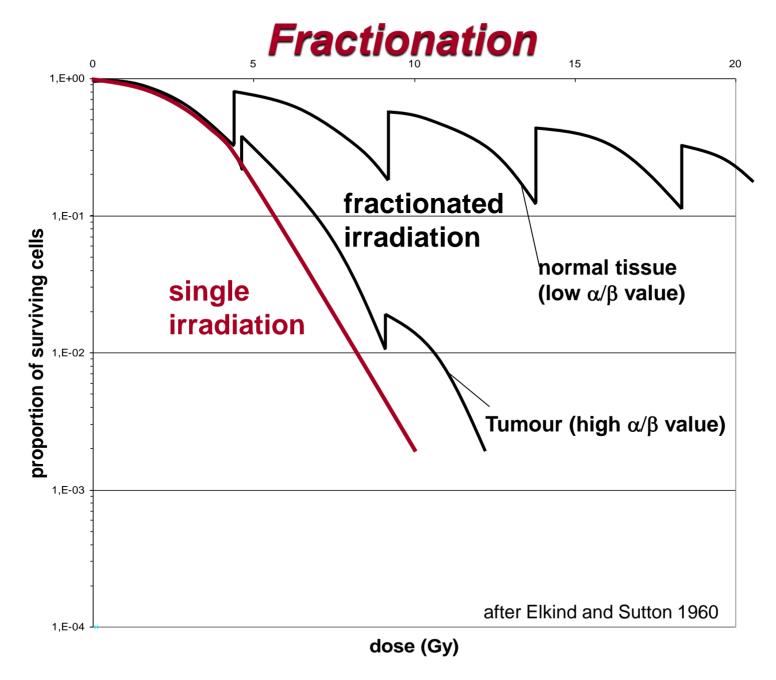

3 – 4 Gy for bladder, rectum, sigmoid

T_{1/2} ~ 1.5 hours

1 – 2 hours

Clinical and experimental experience

Limitation 4 Rs of Radiobiology

Recovery or Repair (half-time ~1hour)

Redistribution

Considered in the mathematical description ("equation")

Repopulation (< 1 day)

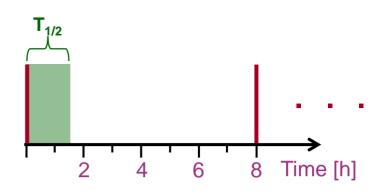

Reoxygenation

Mathematical Description / Repair Function

> External beam radiotherapy and HDR brachytherapy :

no repair during irradiation (min) repair function g = 1

> LDR, MDR brachytherapy :

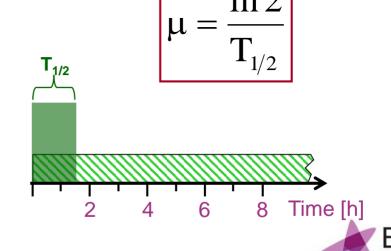

repair during irradiation (hours - days) is significant

$$g(LDR, MDR) = \frac{2}{\mu t} \left[1 - \frac{1 - e^{-\mu t}}{\mu t} \right]$$

μ... repair rate

 $T_{1/2}$... half time for repair

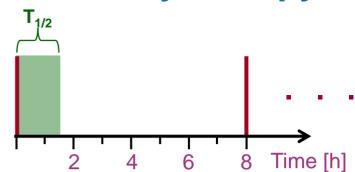

t ... irradiation time

Mathematical Description / Repair Function

> External Beam RadioTherapy and HDR BrachyTherapy :

no repair during irradiation (min) repair function q = 1

> PDR BrachyTherapy:

repair between successive pulses (hours) and during the

whole fraction (hours - days) is significant

$$g(PDR) = \frac{2}{\mu t} \left[1 - \frac{ny - sy^2}{n\mu t} \right]$$

$$g(PDR) = \frac{2}{\mu t} \left[1 - \frac{ny - sy^2}{n\mu t} \right] \qquad s = \frac{nk - k - nk^2 e^{-\mu t} + k^{n+1} e^{-\mu nt}}{\left(1 - ke^{-\mu t} \right)^2}$$

$$k = e^{-\mu x}$$

$$\mu = \frac{\ln 2}{T_{1/2}}$$

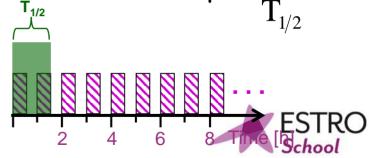

repair rate

T_{1/2} ... half time for repair

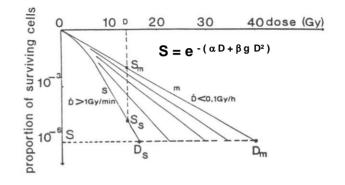

t ... irradiation time for each pulse

time between pulses without irradiation

number of equal pulses

- Biologically Effective Dose:
- 1) BED = nd [1 + g d / (α/β)]

The Role of Dose Rate in Brachytherapy (J. Dutreix) In: A Practical Manual of Brachytherapy (Pierquin / Marinello, Medical Physics Publishing)

BED ... <u>virtual dose value</u> that produces the same biological effect as the physical dose with an infinite low dose rate

Calculated BED values are normalized to (2) conventional EBRT with 2 Gy / fraction (reference schedule): "isoeffective dose" = "equivalent dose in 2 Gy fractions"

BED =
$$D_{lsoE} [1 + 2/(\alpha/\beta)]$$

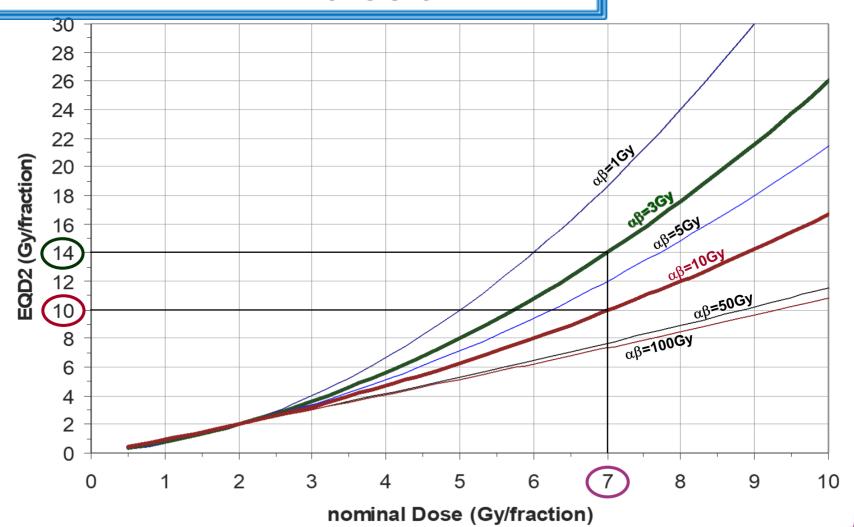

g=1 HDR or EBRT

$$D_{isoE} = \frac{nd \cdot (1 + \frac{g d}{(\alpha/\beta)})}{1 + \frac{2}{(\alpha/\beta)}}$$

$$D_{isoE} = \frac{nd \cdot (1 + \frac{d}{(\alpha/\beta)})}{1 + \frac{2}{(\alpha/\beta)}}$$

From physical dose to EQD2 dose

Limitation 4 Rs of Radiobiology

Recovery or Repair (half-time ~1hour)

Redistribution

Repopulation (< 1 day)

Reoxygenation

Repopulation

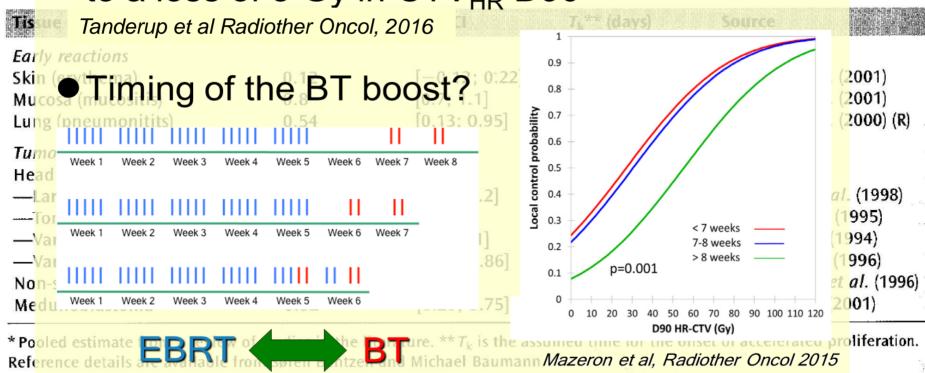

- changing the overall treatment time -

Influencing the local control rate

$$EQD_{2,T} = EQD_{2,t} - (T - t)D_{prolif}$$

Increasing OTT by one week is equivalent

table 13 to a loss of 5 Gy in CTV_{HR} D90

Repopulation – changing the overall treatment time -

Per day delay in overall treatment time will results in ~1% loss of local control

Therefore try to *stay within 50 days* (OTT) or compensate by increasing the dose

"Clinical experience is more important"!

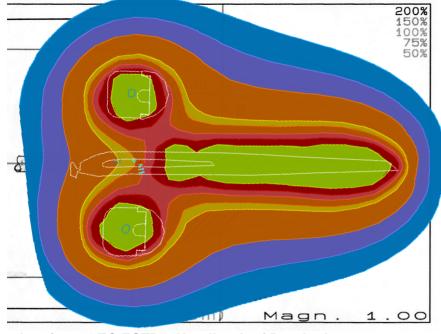

Mea

^{*} Poolea estimate from a review of studies in the literature. ** T_k is the assumed time for the onset of accelerated puliferation. Reference details are available from Søren Bentzen and Michael Baumann.

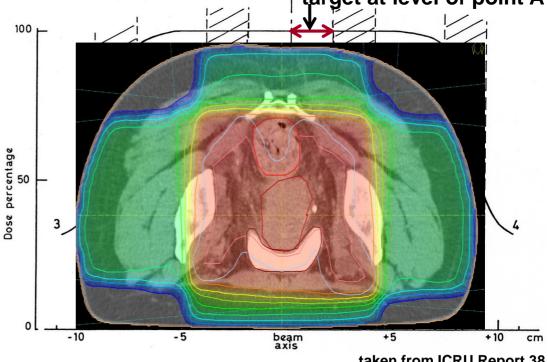

Volume Effect of Intracavitary Brachytherapy

With intracavitary brachytherapy a very heterogenous dose is applied to target and organs at risk (steep dose gradient)

significant change in dose within a few millimeters

taken from GEC ESTRO Handbook of Brachytherapy

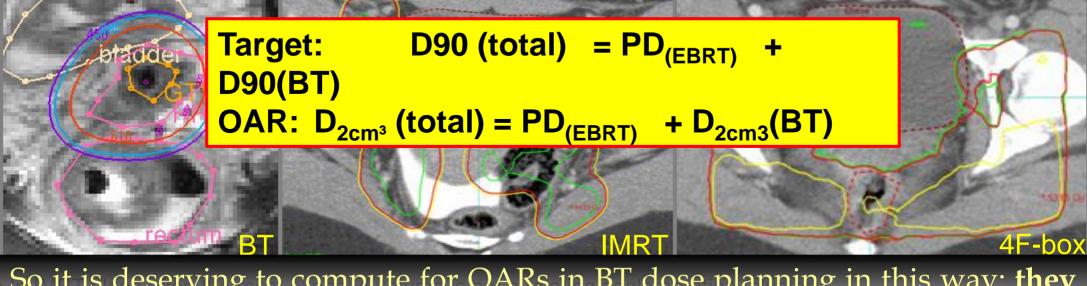

taken from ICRU Report 38

Standard dose distribution with a tandem- Variation of dose along the lateral axis of ring applicator

EBRT (full line) vs. intracavitary BT (dotted line)

Compare the Position of the Most Exposed D_{xcc} Areas in EBRT and BT

So it is deserving to compute for OARs in BT dose planning in this way: they had received approximately the PD of the external beam treatment.

- bladder: not the same volume receives the highest dose in IMRT than in 4F-box treatments
- rectum: sometimes the close same division
- sigmoid: always the close same

| OAR | IMRT | 4F | р |
|---------|------|-----|--------|
| bladder | -1.6 | 1.4 | 0.03 |
| rectum | 2.9 | 2.6 | >0.05 |
| sigmoid | 5.2 | 0.0 | 0.0001 |

The dose of **BT** in the most exposed 2 ccm in **IMRT** and **4F** plans [D_{EBRT-BT} (% - PD)

Provided by G. Fröhlich, Budapest, Hungary

Application of Biological Model to Clinical Situation

- > Assumptions:
- ➤ Time between fractions is long enough to enable full sublethal damage repair (min. ~ 8 - 12 hours)
- > All investigated points and volumes from BT receive full EBRT dose
- ➤ In fractionated treatments the investigated points or volumes represent the same anatomical position throughout the whole treatment (worst case assumption)
- The same absorbed dose and time dose pattern of EBRT and BT produces the same biological effect
 - **ATTENTION:** dose and dose rate inhomogeneity within BT volume

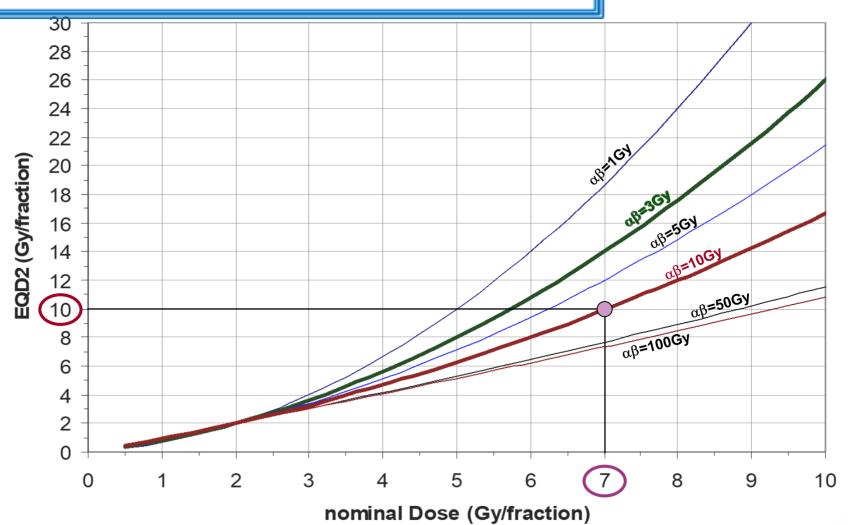

Limitations of the EQD2 model for BT

- > Chemotherapy is not taken into account
- Uncertainty increases for single fraction dose values >10Gy
- Only cell repair is considered
- $\geq \alpha/\beta$ values and $T_{1/2}$ are under discussion (E.g. tumour type prostate, OAR etc.)
- dose and dose rate inhomogeneity within BT volume is not considered
- ➤ Overall uncertainty of the biological dose calculation (values) in the range of ~10% -> Reasonable rounding of values

$$D_{isoE} = \frac{nd \cdot (1 + \frac{d}{(\alpha/\beta)})}{1 + \frac{2}{(\alpha/\beta)}}$$

From physical dose to EQD2 dose

Medical aspects of treatment planning and dose constraints: focus on BT Clinical evidence for dose-effects

Optimization type: Graphical

Total treatment time (sec.): 338.5

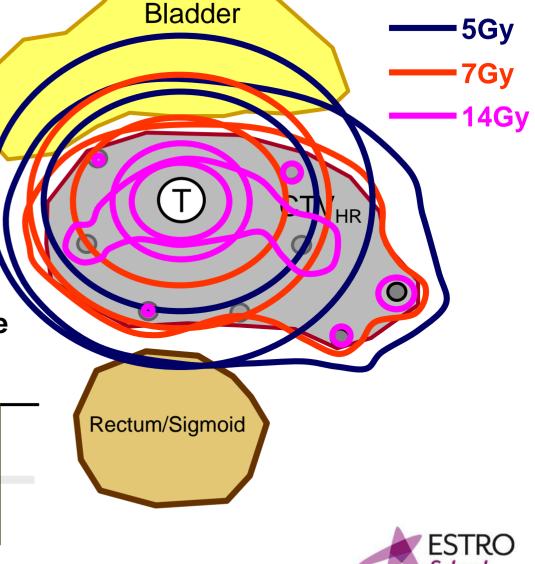

Keep in mind - Daniel's 3 easy steps in manual Treatment Planning Optimization

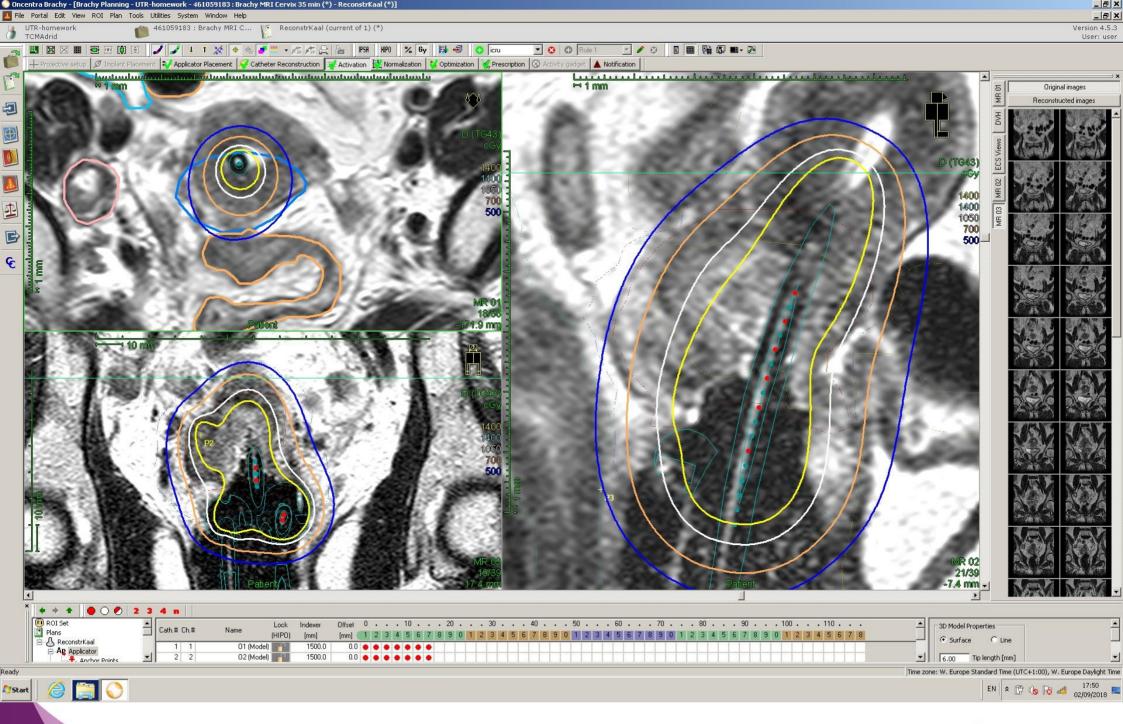

1: Apply (institutional) Standard Loading Pattern and normalize to Point A

2: Optimize the Intracavitary applicator (T/R, T/O) based on OARs (~10-20% of the dose limit)

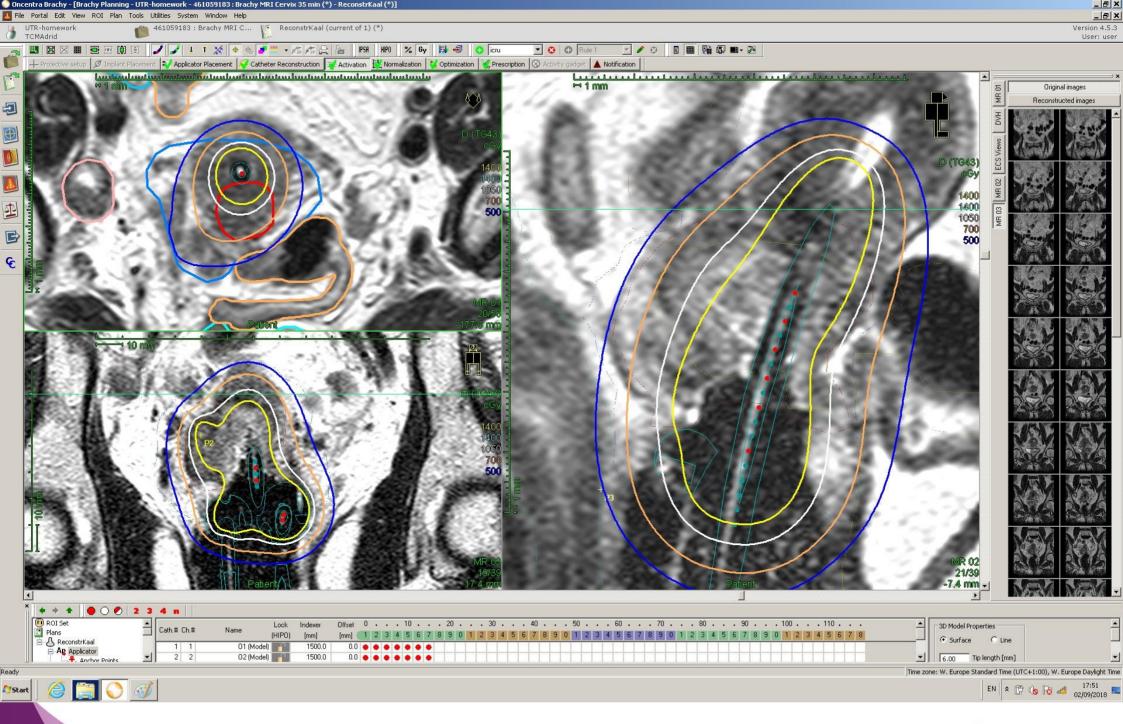

3: Add the <u>interstitial</u> components (Needles) to increase the target coverage

<Dwell-time is 10-20% of Intracavitary>

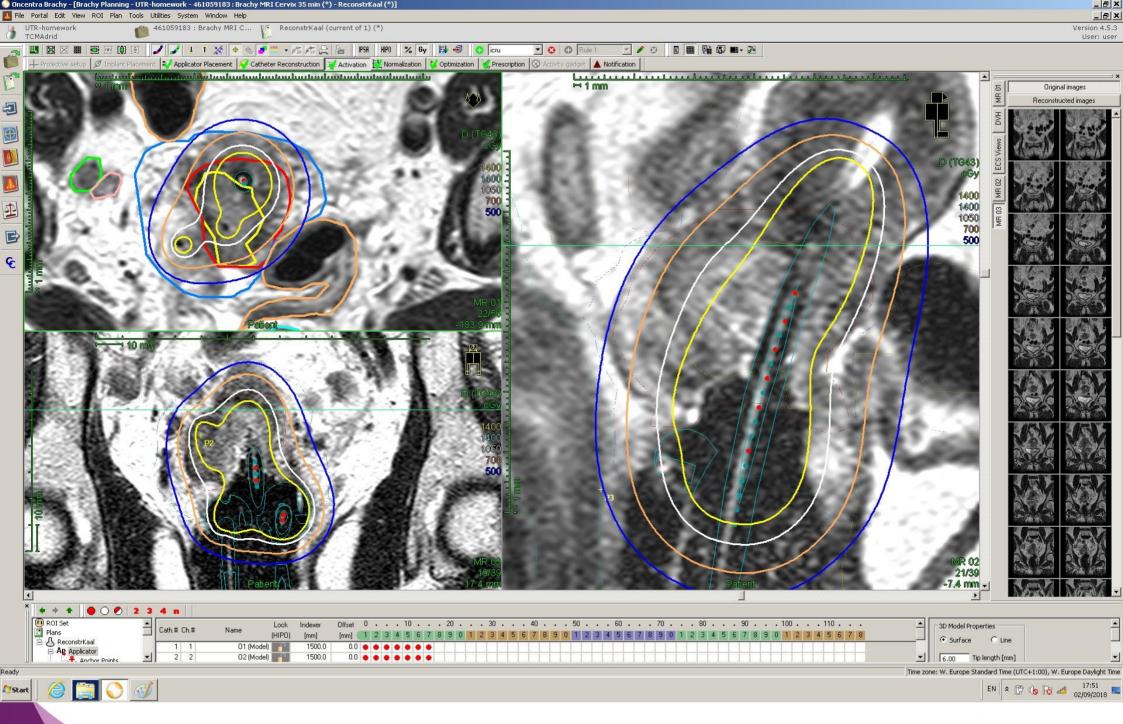

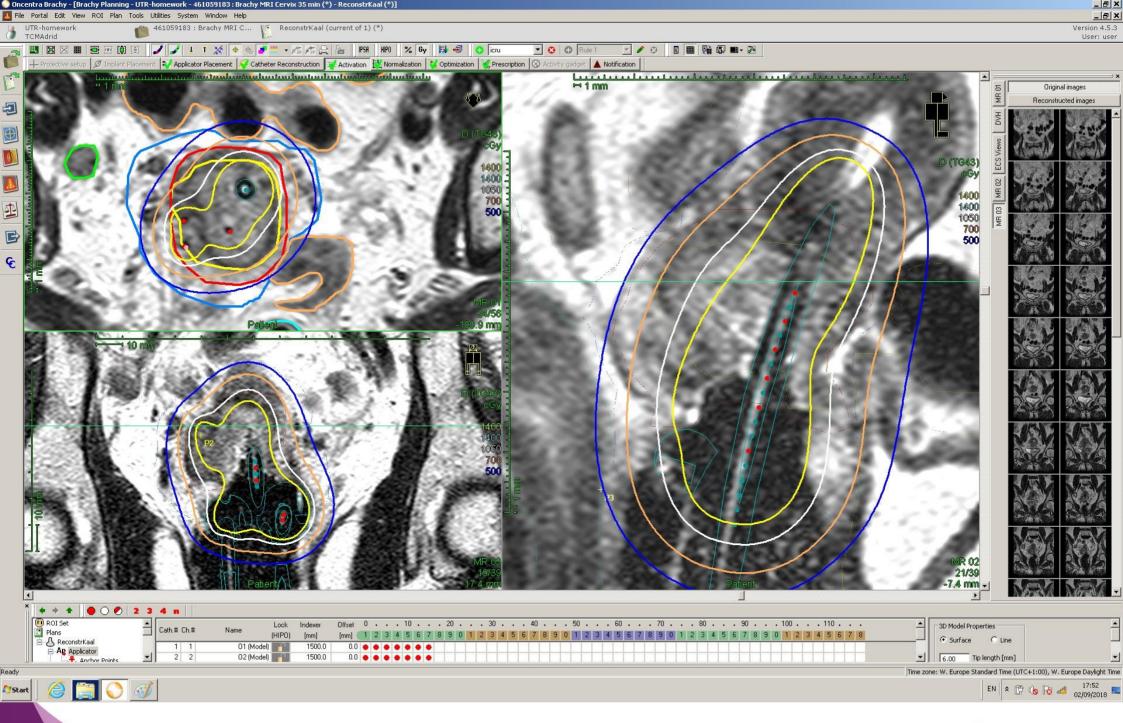

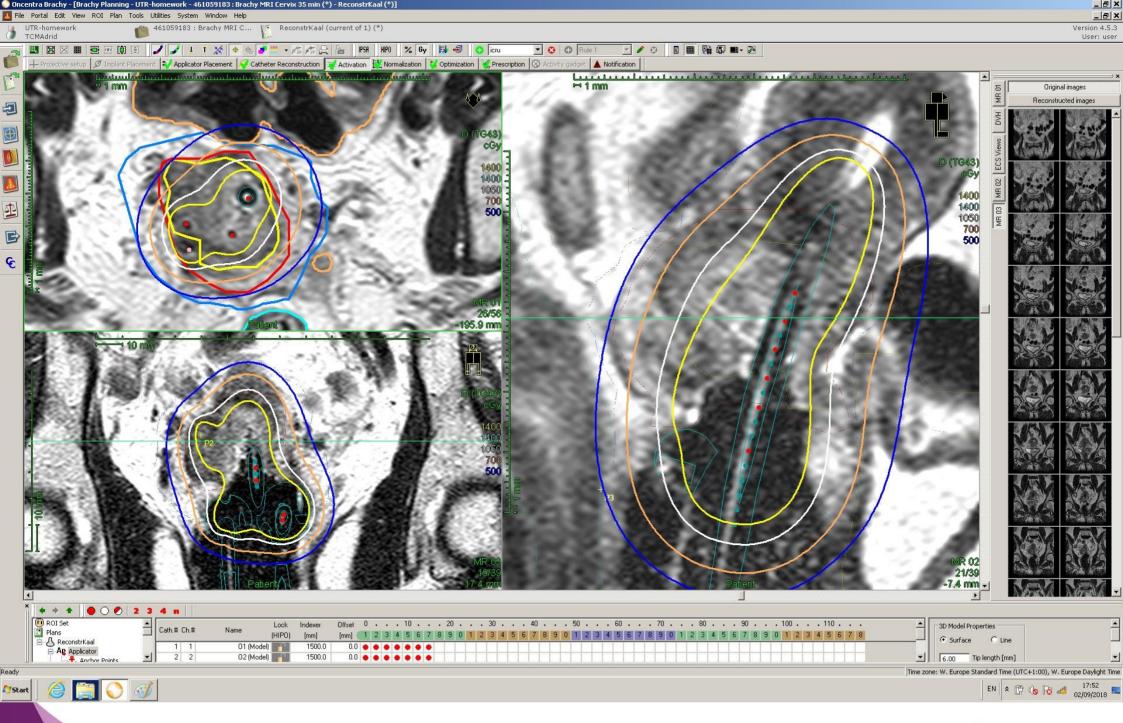

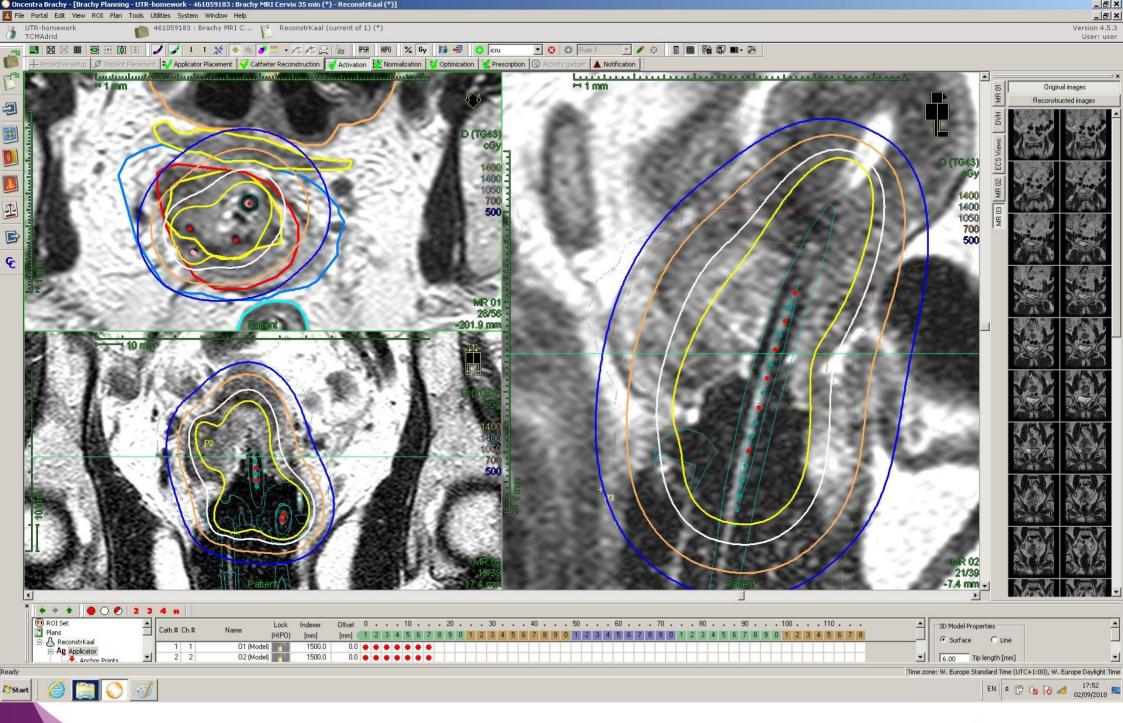

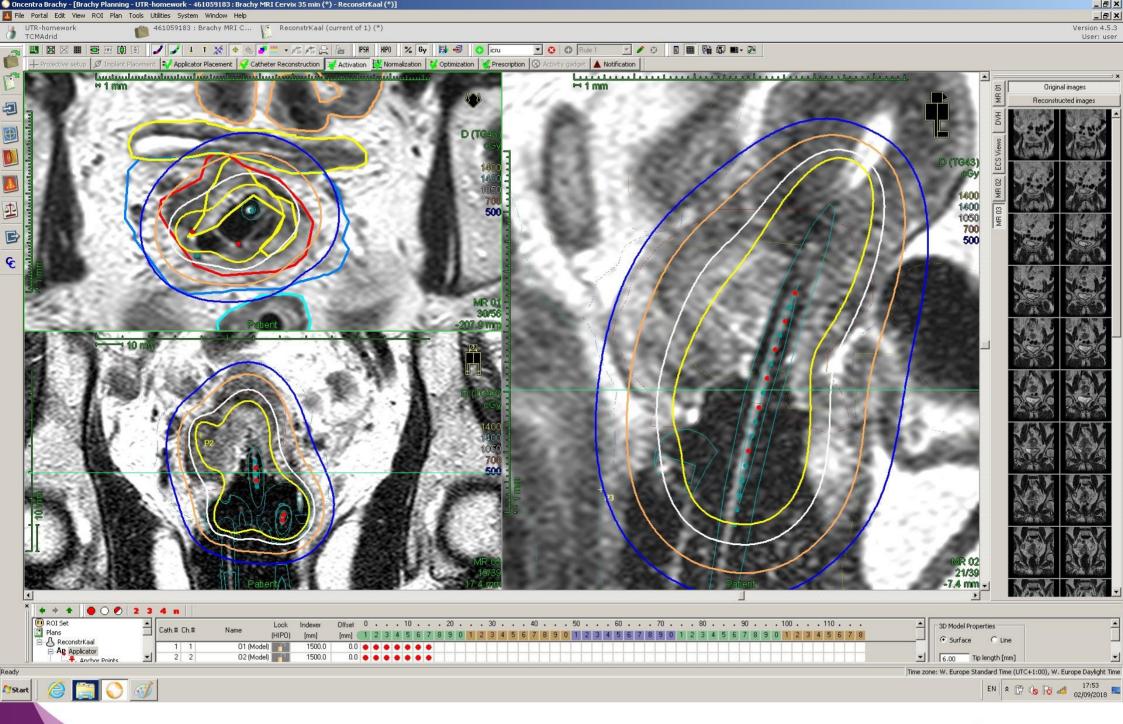

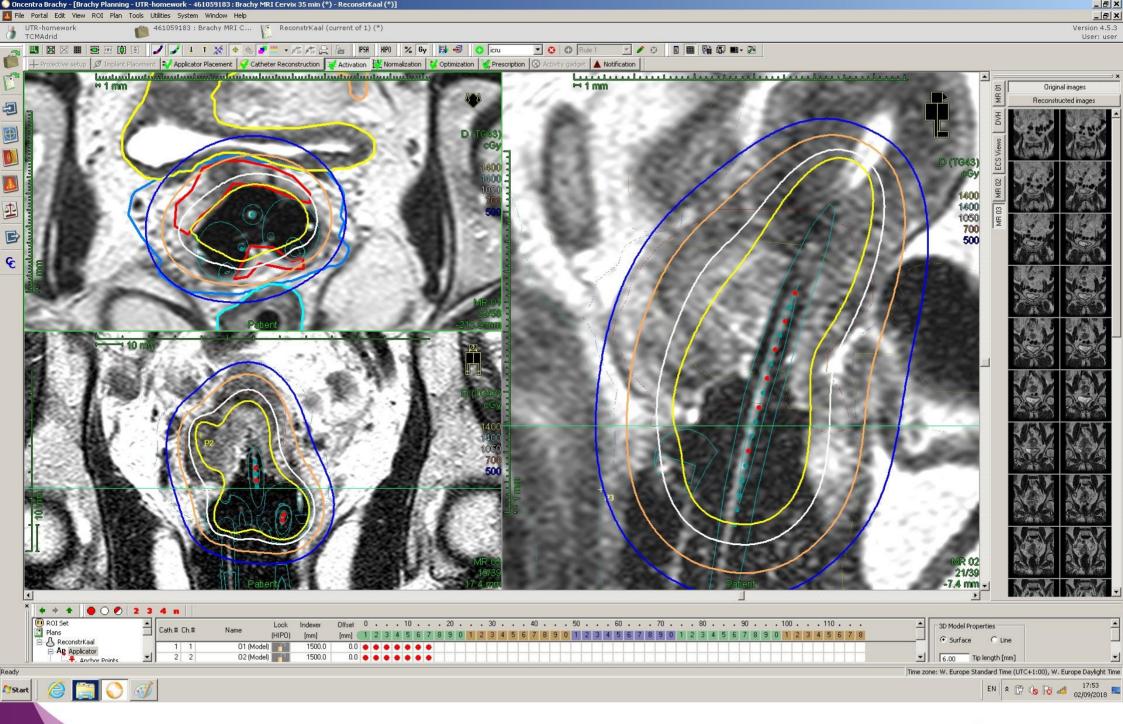

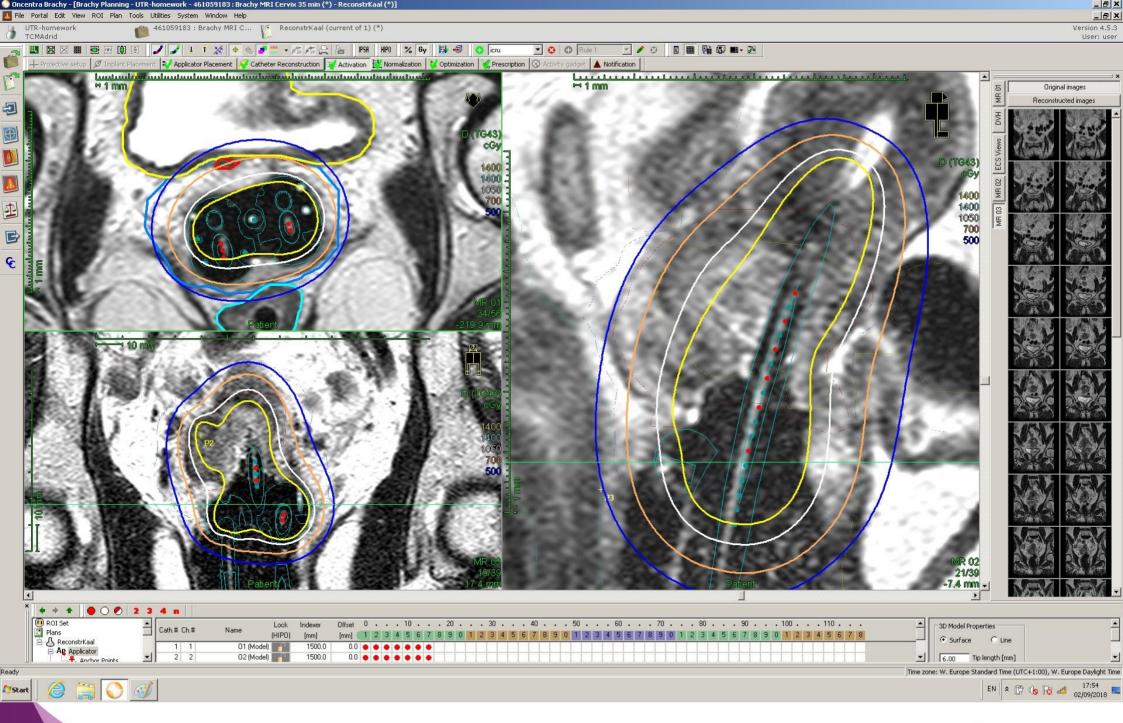

Physics aspects of treatment planning intracavitary +/- interstitial techniques in cervix cancer

Kari Tanderup, PhD

Paradox of standard point A dose prescription

Tools for dose optimisation

Manual dose optimisation

Graphical optimization / Dose shaper

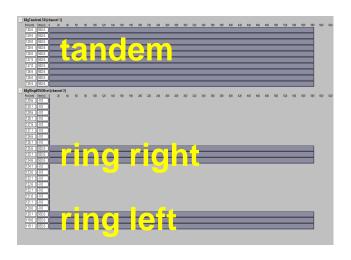

Inverse planning

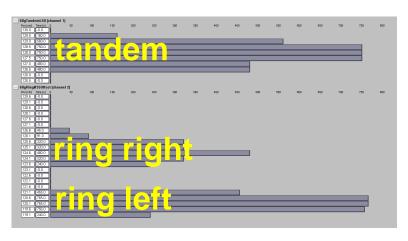

Manual optimisation

Standard

Manually optimised

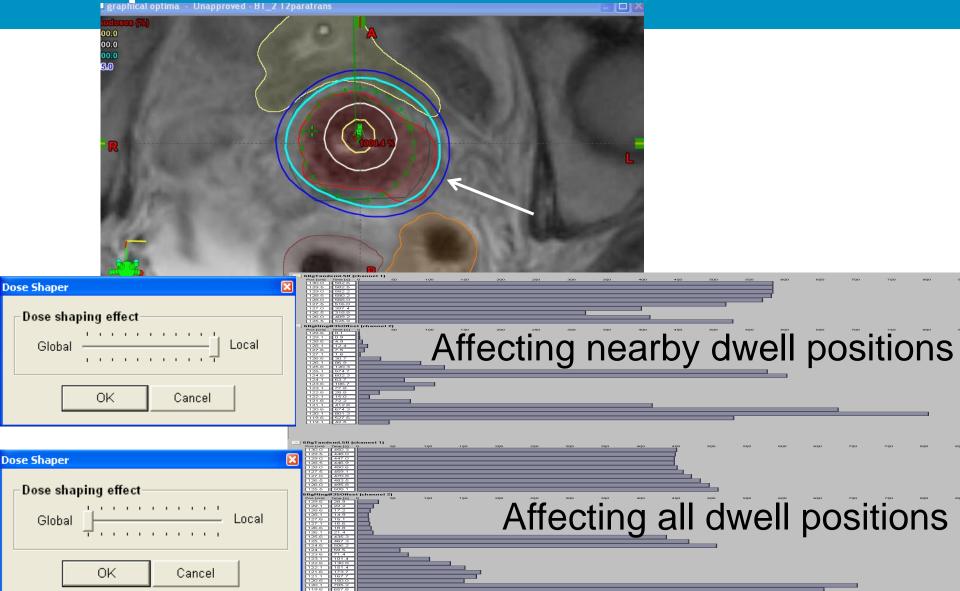

Dwell times

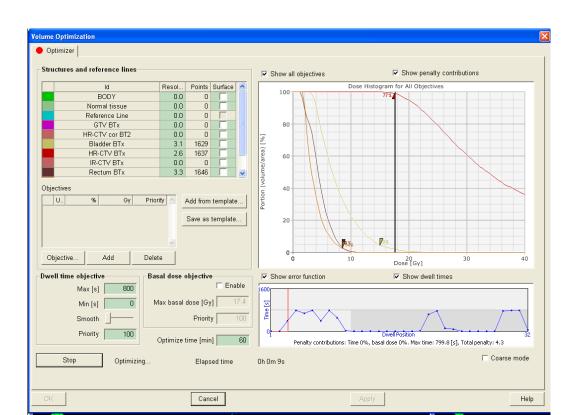

4

Graphical dose optimisation – "drag and drop"

Inverse dose optimisation

- Controlled by DVH constraints
- Weighting factors for different structures

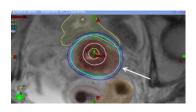

6

Which type do you prefer?

1. From scratch: manual

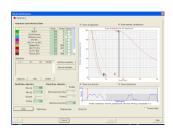

2. Elegant: drag and drop

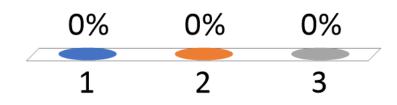

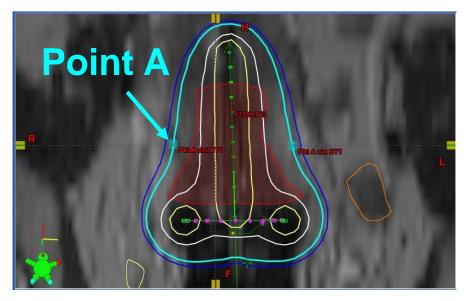

3. Fast and furious: inverse

- A. 1
- B. 2
- **C**. 3

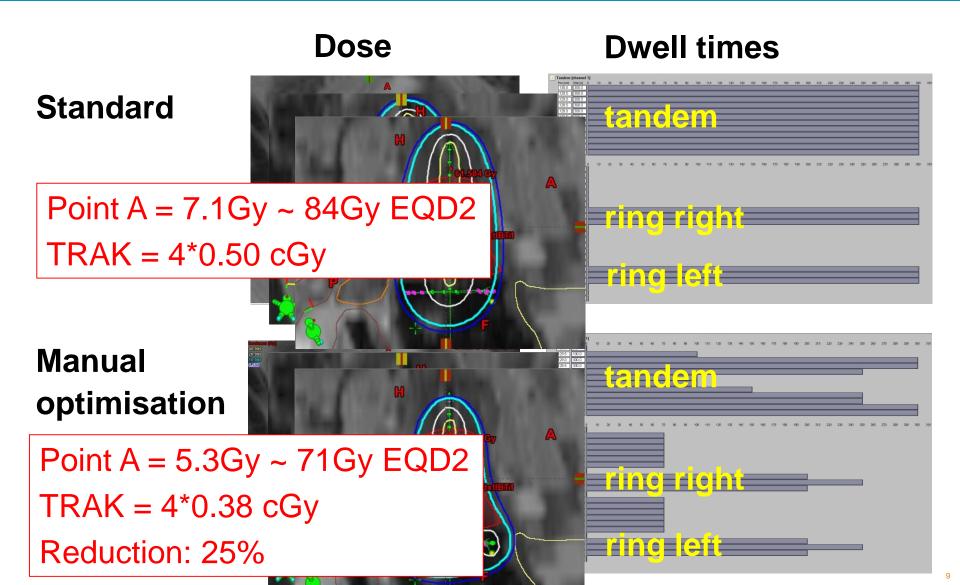

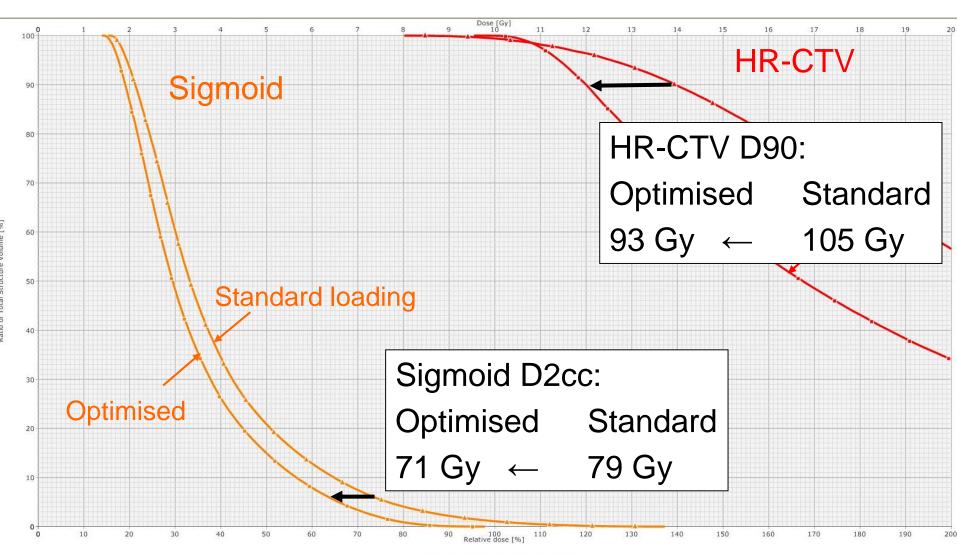

Always start optimisation with Standard loading pattern Standard prescription

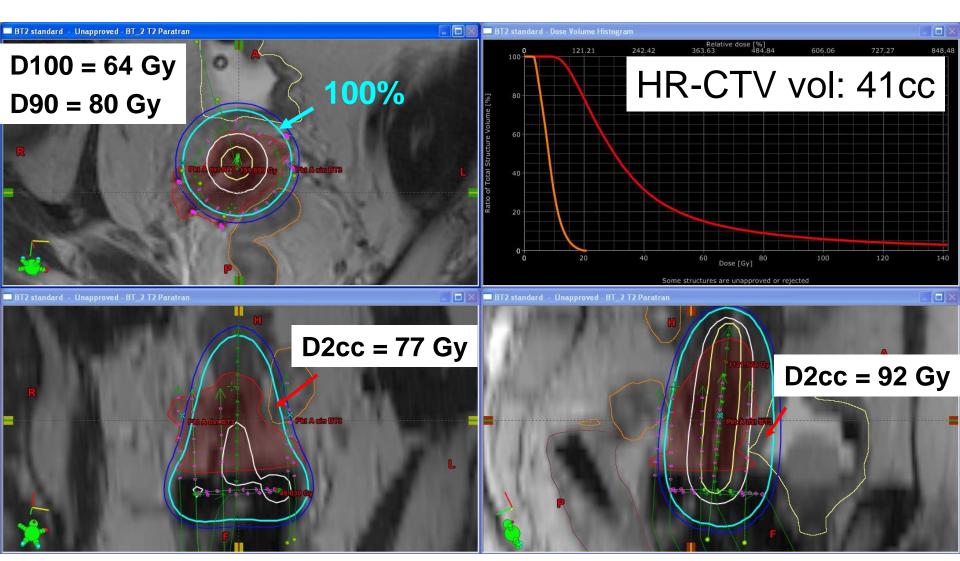

Example 1 Manual dose optimisation

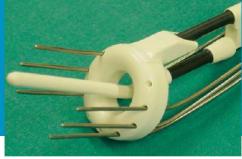

Example 1, DVH

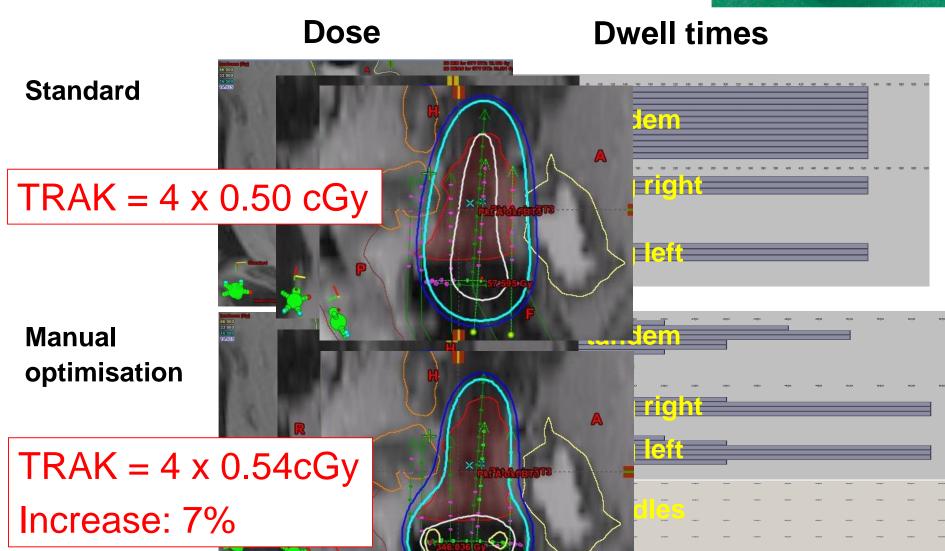

Example 2, Stage IIIB Standard dose plan

Example 2 Manually optimised plan

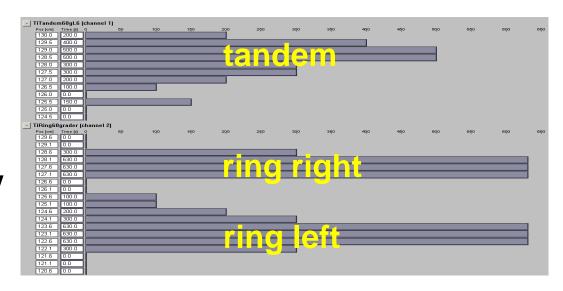

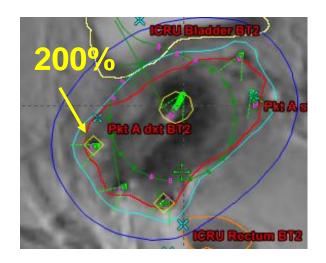

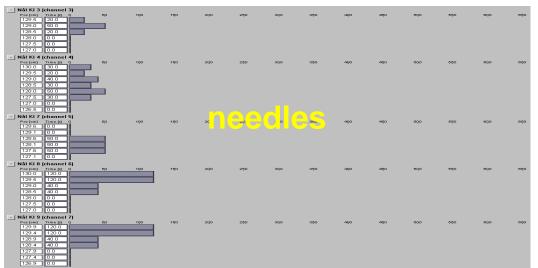

Loading of needles: dwell times and isodoses

Dwell times needles: 10-20% of dwell time in tandem/ring

May be >20% if needle is placed directly in the GTV

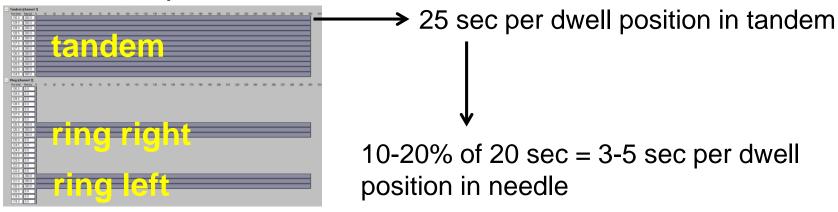

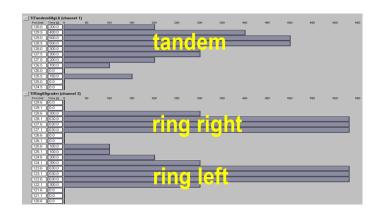

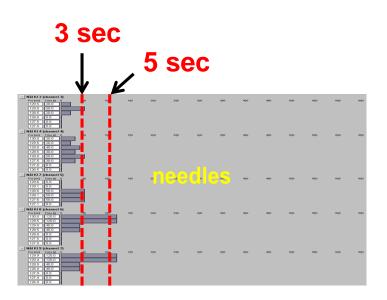

Dwell time threshold for needle loading

Standard plan

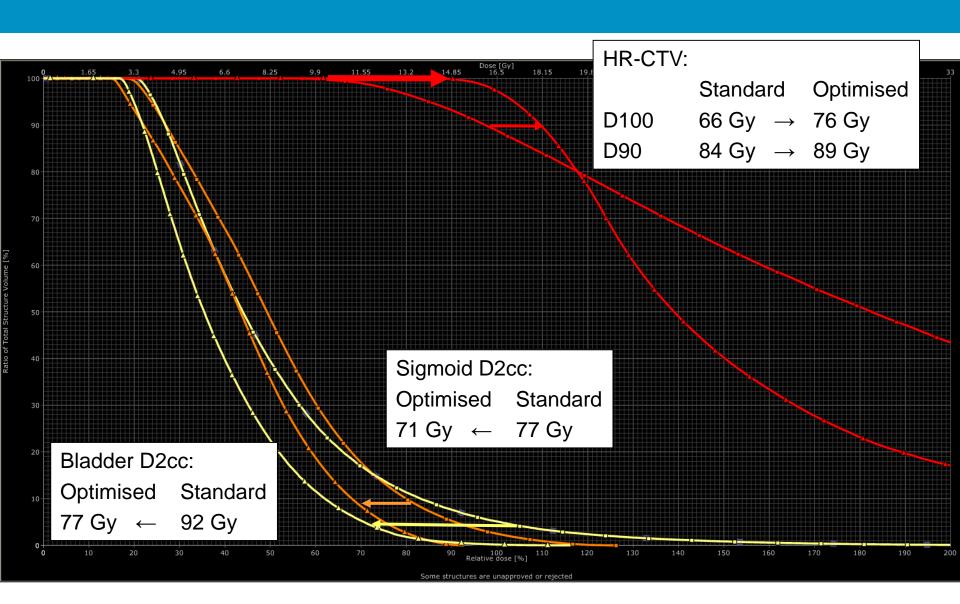

Optimised plan

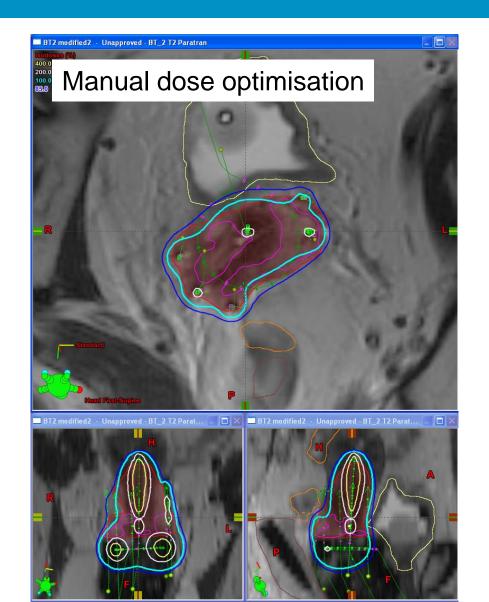

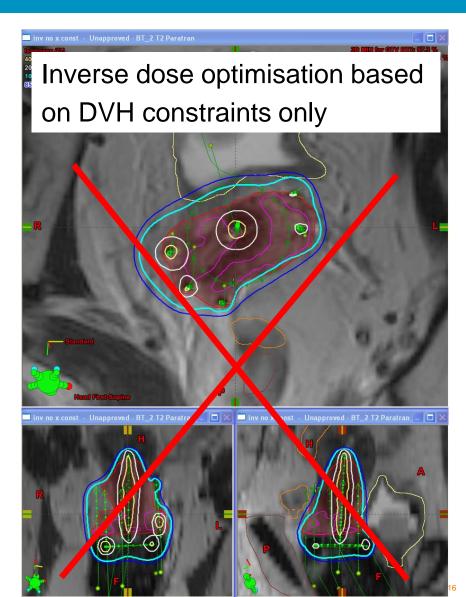

Example 2, DVH

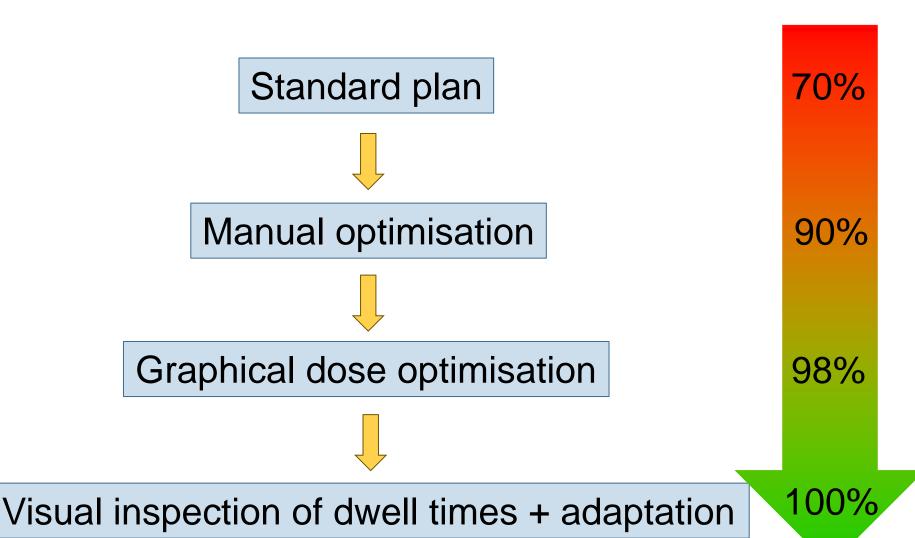

Example 2, inverse planning

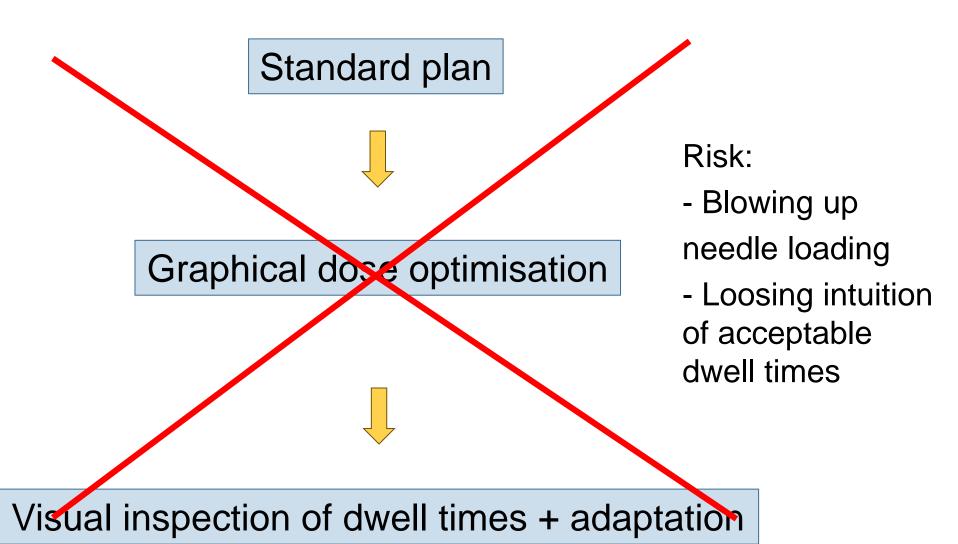

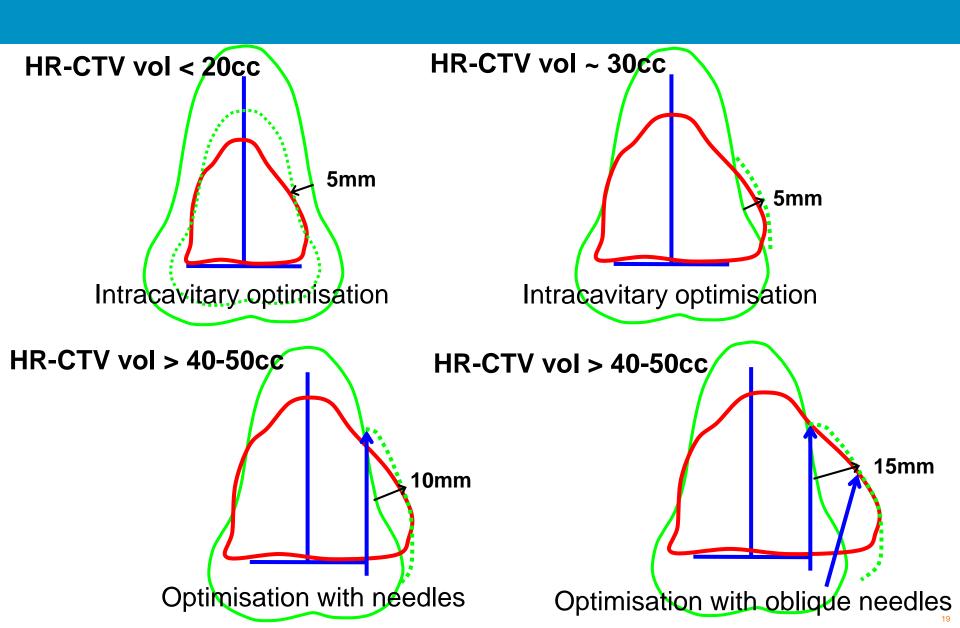

When to use graphical dose optimisation (dose shaper)?

When to use graphical dose optimisation (dose shaper)?

Typical scenarios of dose optimisation

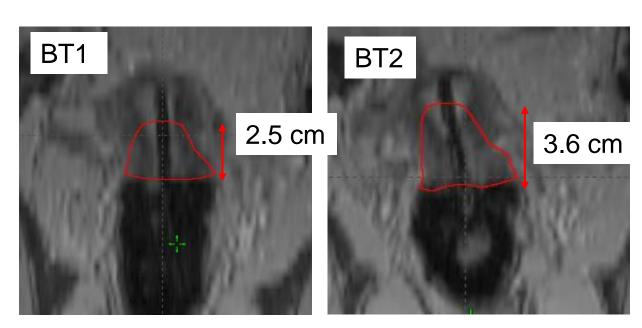

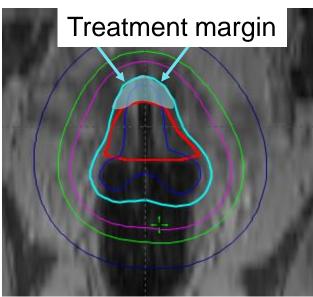

Conclusion – optimisation techniques

| Manual | Conservative and "safe" Iterative procedure Dependent on experience of dose planner |
|-----------|---|
| Graphical | Fast for small adaptations and fine tuning after manual opt Beware of: -dwell times -deviations from standard loading |
| | Fast Requires extra contouring + manual adaptations |
| Inverse | Beware of: -dwell times -high dose regions |
| | -dose to non-contoured tissue -deviations from standard loading |

PTV??? Example contouring uncertainty

- Variation in cranial border of HR-CTV
- Intra-observer variation!
- Load the tandem above the CTV_{HR} when feasible

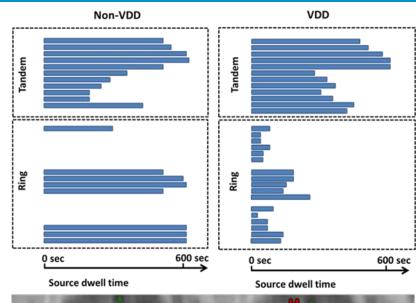

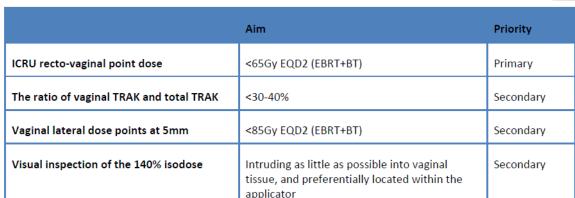

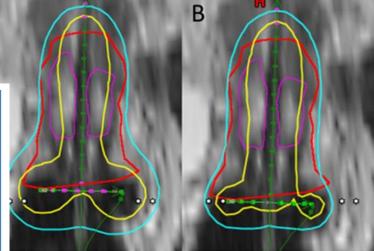

Vaginal dose de-escalation

Change of loading pattern:

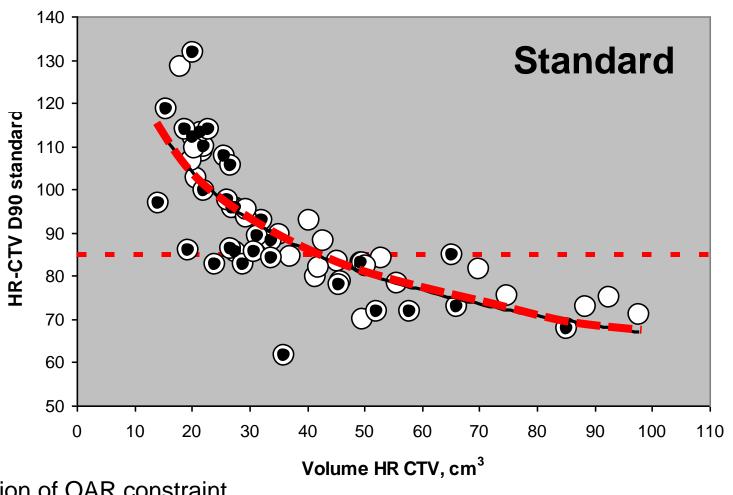

- Shift of dwell time from vaginal sources to tandem/needles
- Aim for 140% isodose out of vaginal mucosa
- Aim for <30-40% loading in ring/ovoids

From standard to...

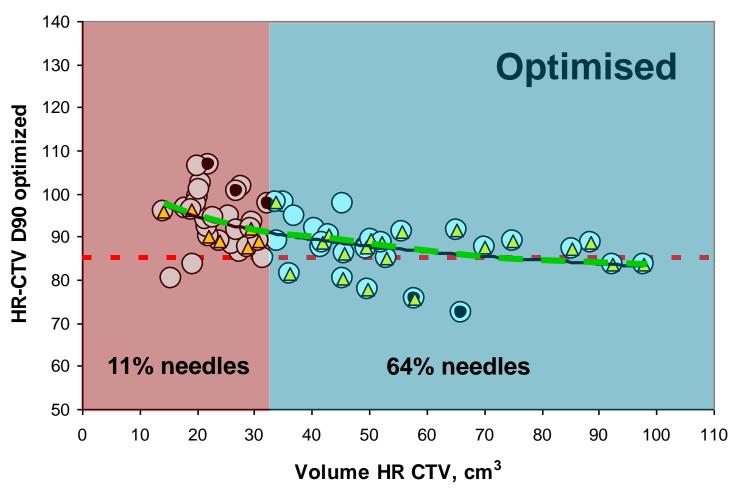

From beach-boys to...

From standard to optimised

K Tanderup et al, Radiother Oncol 2010

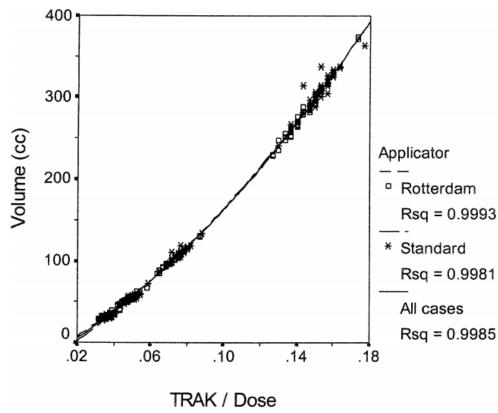

From beach-boys to bar-boys

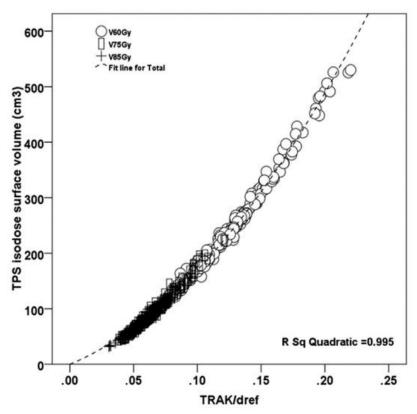

Keep track of your TRAK! Total Reference Air Kerma

TRAK = $\sum t_i$ * RAKR RAKR = 4.07 cGy/s (10Ci Ir-192)

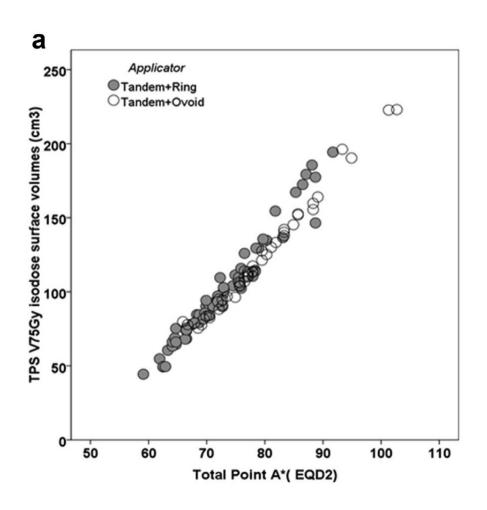

Datta et al, Brachytherapy 2:91–97, 2013

$$Vref = 4965 \left(\frac{TRAK}{d_{ref}}\right)^{3/2} + \left(\frac{TRAK}{d_{ref}}\right) - 1.5$$

Nkiwane et al, Brachytherapy 16(6):1184-1191, 2017

Why is point A still important in 3D image based brachytherapy?

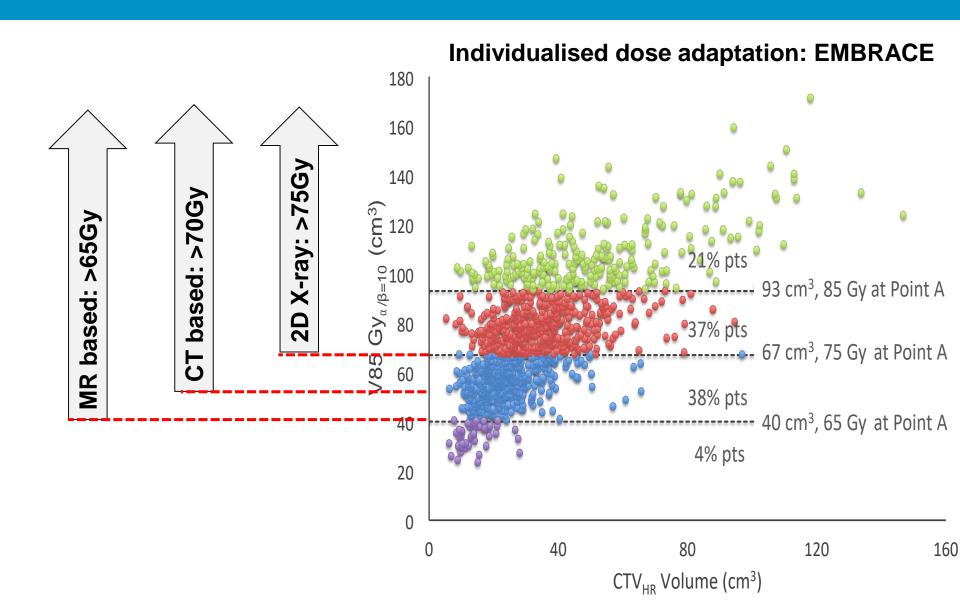

Point A dose is a surrogate of irradiated volume

Point A* = 14*TRAK (can be used for IC/IS)

Nkiwane KS et al. Total reference air kerma can accurately predict isodose surface volumes in cervix cancer brachytherapy. A multicenter study. Brachytherapy. 2017; 16(6):1184-1191

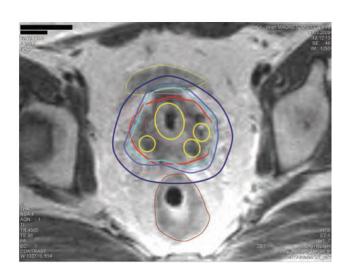

Volumes treated to 85Gy Be Careful:Thresholds of point A dose

Example IIB (ICRU89)

N7 dorsal N5 N4 N4 right ventral

- CTV_{HR} volume 43cm³
- 45Gy EBRT + 4 fx BT
- TRAK 0.43cGy (x4)
- V85Gy = 85cm³

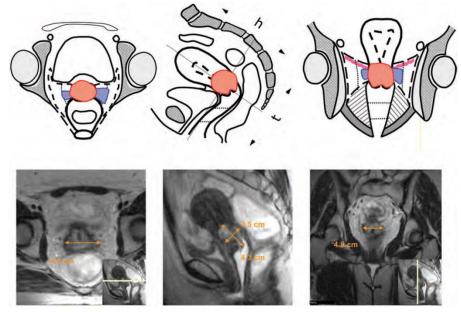

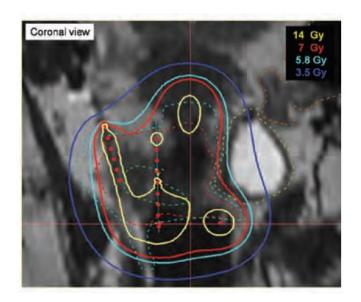

Figure A.5.4. Residual GTV and residual pathological tissue at the time of first brachytherapy: clinical drawings (upper) and corresponding MRI images (lower) at the time of first brachytherapy without applicator in place.

Example IIIB (ICRU89)

- CTV_{HR} volume 66cm³
- 45Gy EBRT + 4 fx BT
- TRAK 0.50cGy (x4)
- V85Gy = 70cm³

Ring: 26 mm diameter

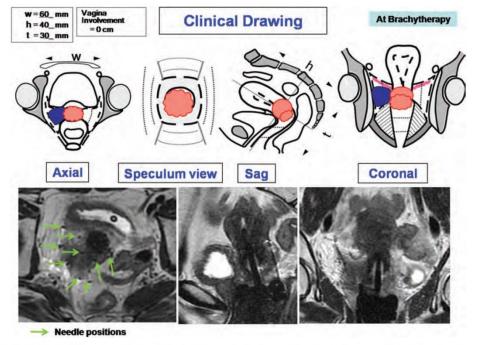

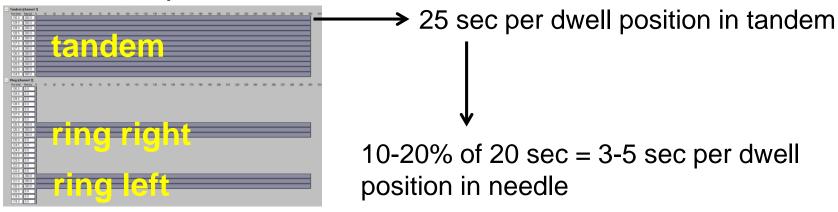

Figure A.8.4. Residual GTV and residual pathological tissue at the time of first brachytherapy: Clinical drawings (upper) and corresponding MRI images (lower) at the time of brachytherapy with applicator in place.

Take home message – dose optimisation

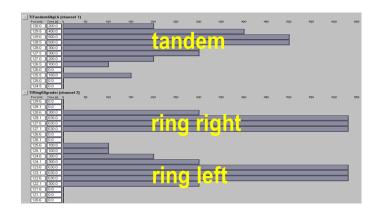

- Always start dose optimisation with standard loading pattern
- Use manual dose optimisation for major changes
- Use graphical optimisation for minor adaptation
- Needle loading: start with 10-20% per dwell position
- Application of combined intracavitary-interstitial applicator: increased therapeutic window by ~10Gy

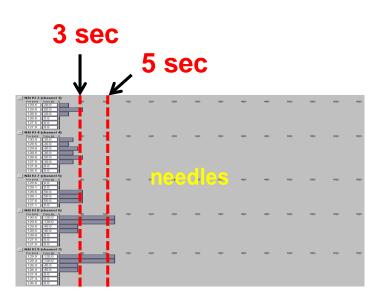

Dwell time threshold for needle loading

Standard plan

Optimised plan

Physics aspects of treatment planning in endometrium cancer

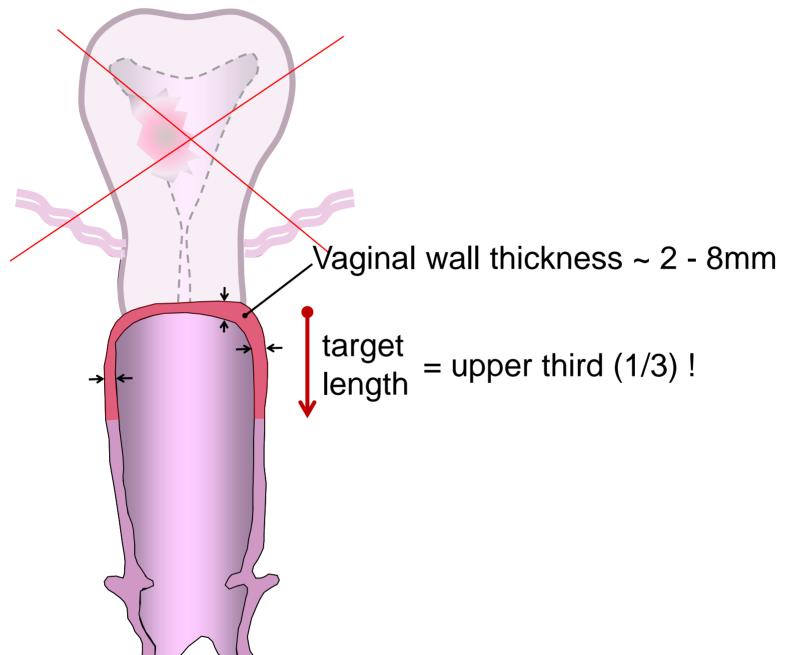

presented by Daniel Berger

General Hospital of Vienna, City of Vienna, Medical University of Vienna, Department of Radiotherapy

1) post-hysterectomy 2) patient unfit for hysterectomy 3) recurrence

Clinical Target Volume (CTV)

Clinical Target Volume (CTV)

Reference Depth 5 mm or individualized depth for dose prescription

Length to be treated (AL)

Applicator Diameter (Ø)

Vaginal wall thickness ~ 2 - 8mm

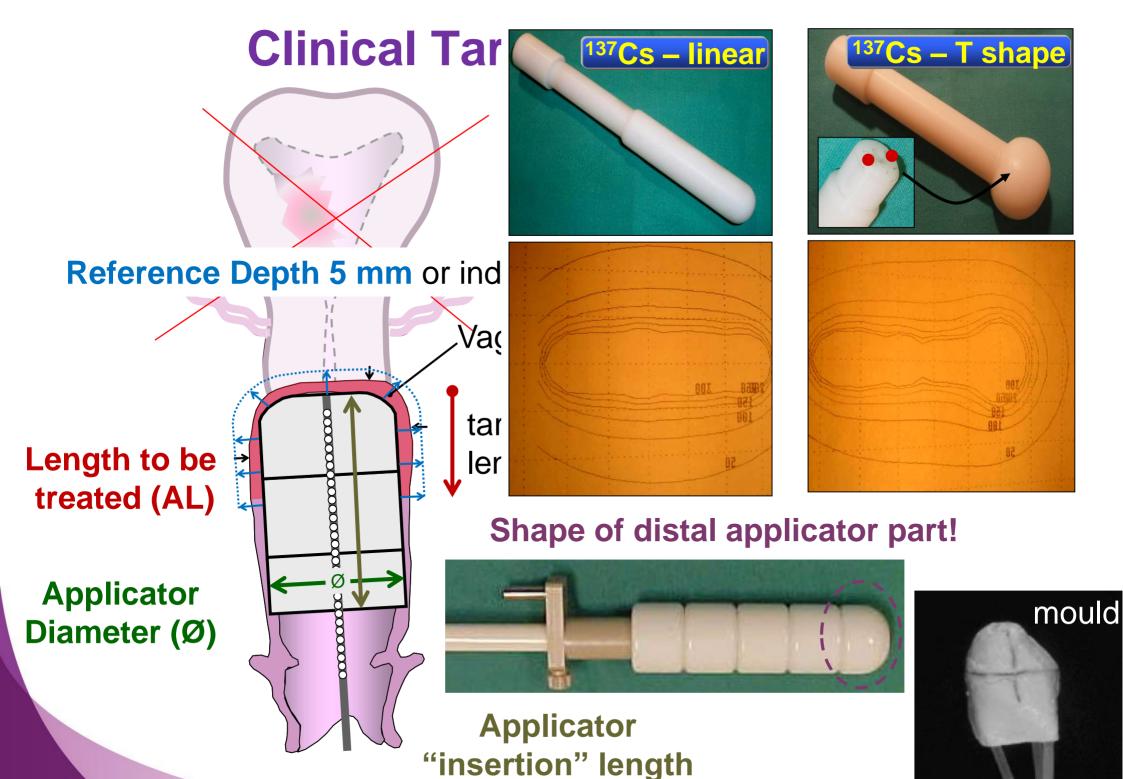

target length = upper third (1/3)!

Shape of distal applicator part!

Applicator "insertion" length

Dose prescription and reporting recommendations for vaginal vault brachytherapy

CONVENTIONAL CLINICAL PRESCRIPTION BASED ON DOSE POINTS; DOSE REPORTING IS IDENTICAL TO PRESCRIPTION

| Points at 5 mm from the applicator surface | |
|---|------|
| Prescription point: at the mid-point of active source length | 100% |
| Cylinder: Central apical point | >90% |
| Ovoids: apex 5mm from ovoid surface | |
| Additional points at other positions along the applicator | 100% |
| (may be used for dose optimization avoiding the Havanna cigar effect) | |

Clinical reporting

Applicator diameter

Treated length

Treatment time

Optional: vaginal length

Dose to prescription point

In case prescription defined above is not used, the reference dose

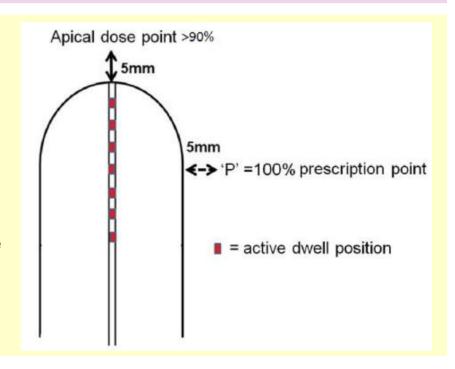

at 5 mm from the surface

Surface dose at prescription point

Optional: doses at other points

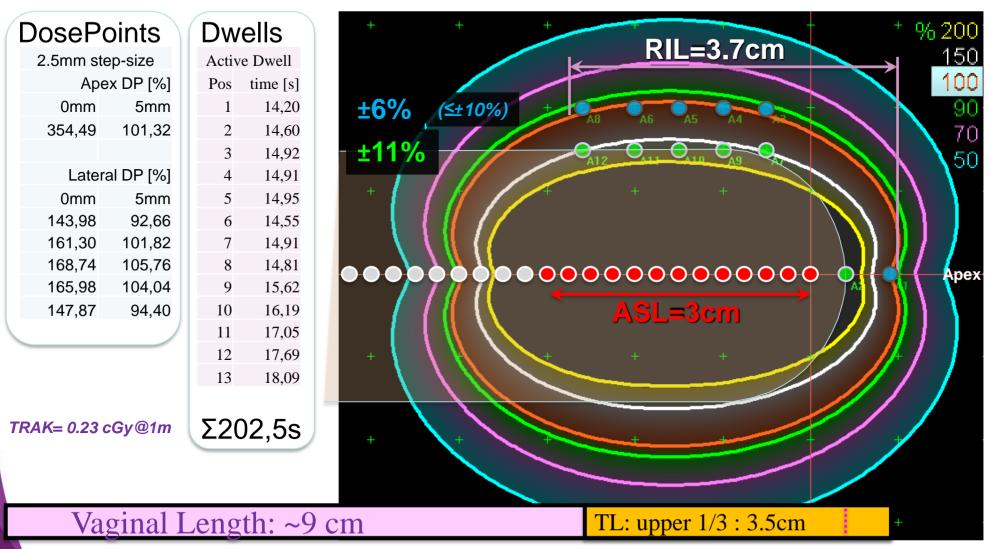

Dose to rectum (ICRU point or D2cc)

Dose to bladder (ICRU point or D2cc)

In addition the physics parameters (e.g. type of source, source activity, dose rate, AI system) have to be reported

Example: VagCyl.Ø30mm, VL=10cm TL=35cm, 2.5 mm step-size

- 🔪 Inactive 🎐 🗣 Active source pos.
- Lat. dose points on applicator surface: 158% ±11%
- Lat. dose points in 5mm tissue depth: 100% ±6%

Apex surface : 355% 20

Apex 5mm : 101%

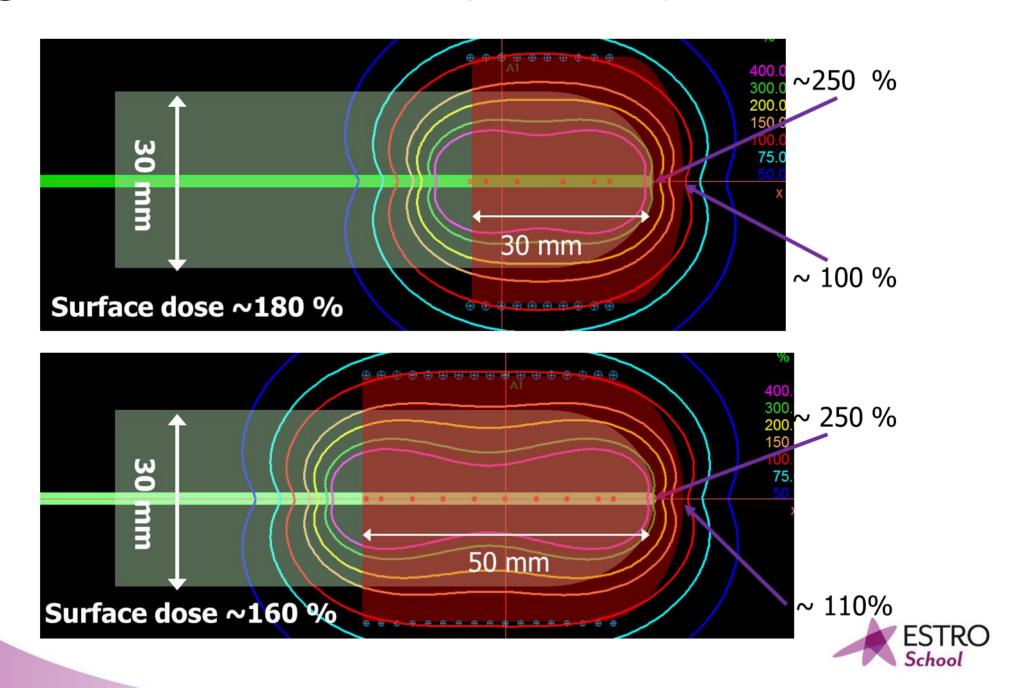

The dose distribution in CTV will depend on

- Length to be treated
- Applicator diameter
- Prescription depth
- Distal part of the applicator

 distance from the first dwell position to the tip of the applicator (→ applicator reconstruction lecture)

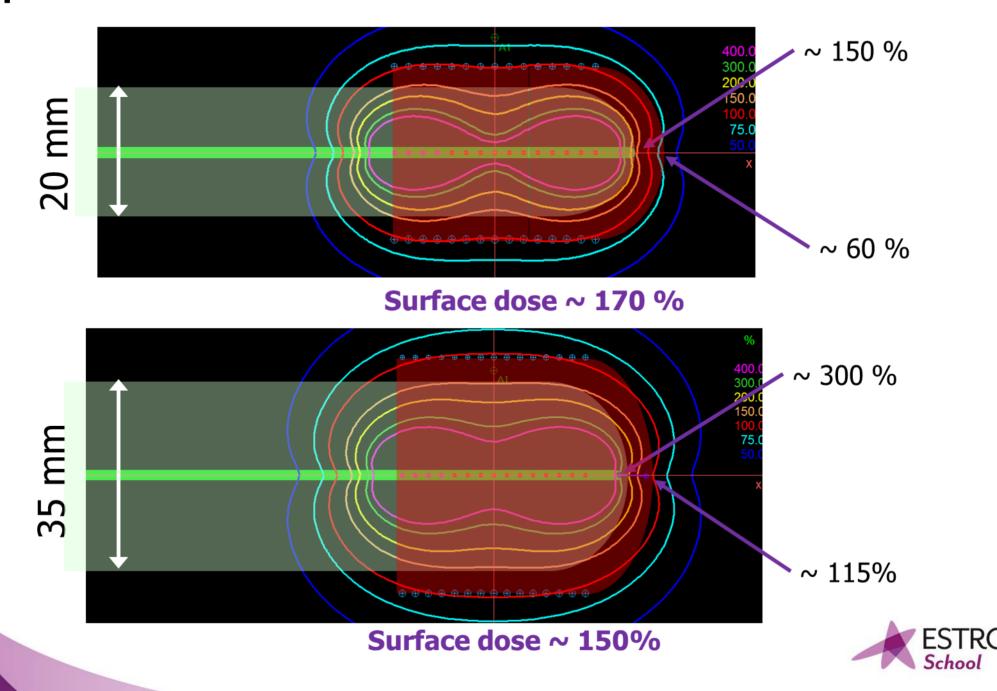

length to be treated (3-5 cm)

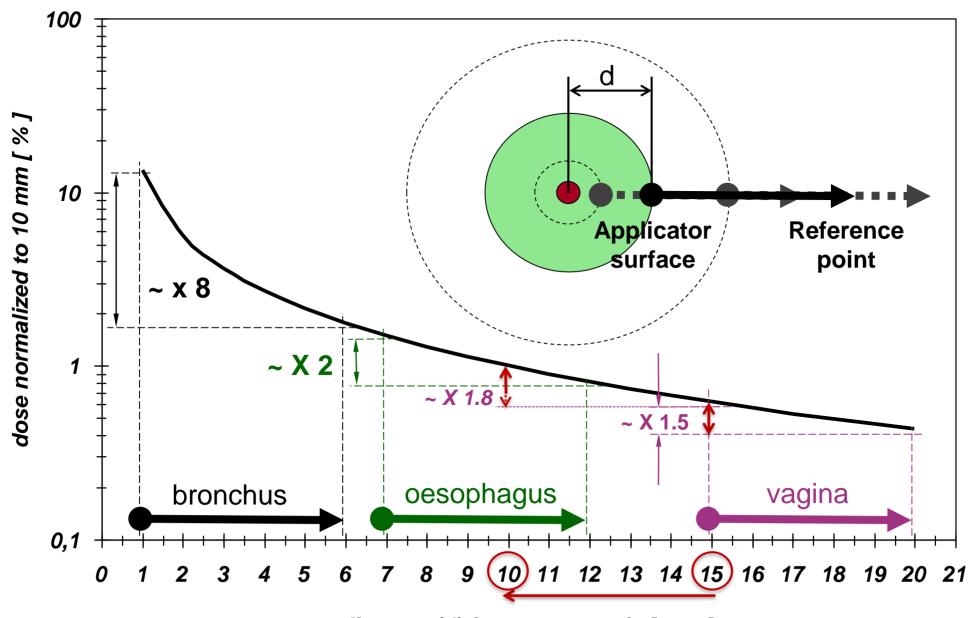

Select the length of the vaginal cylinder to fit into the vagina

Applicator diameter

Dose on Applicator Surface and at Reference Depth!

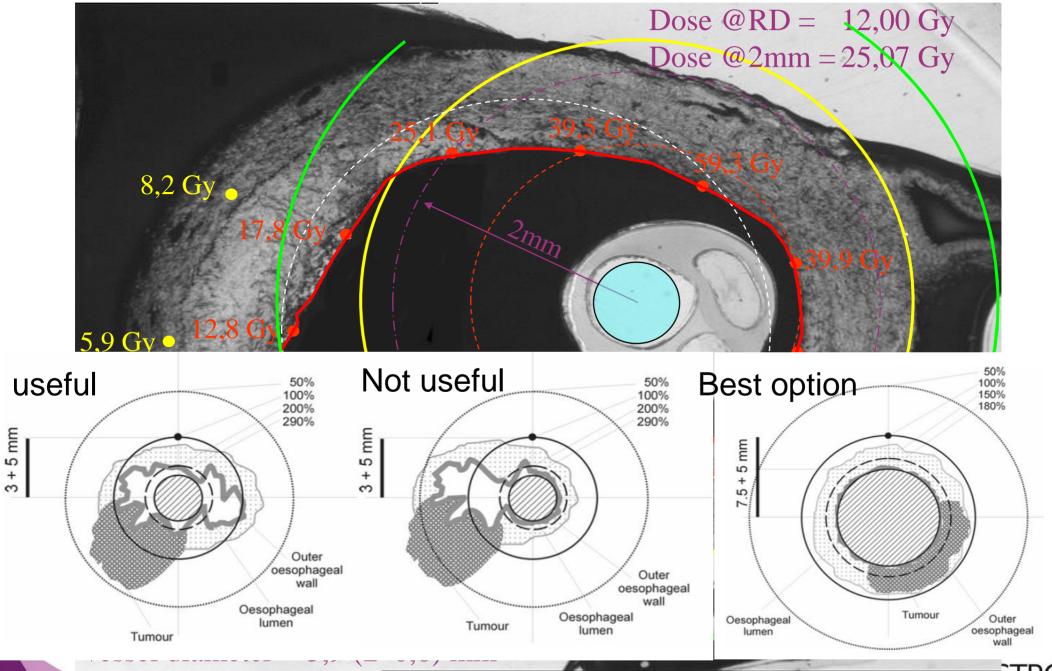

5 mm

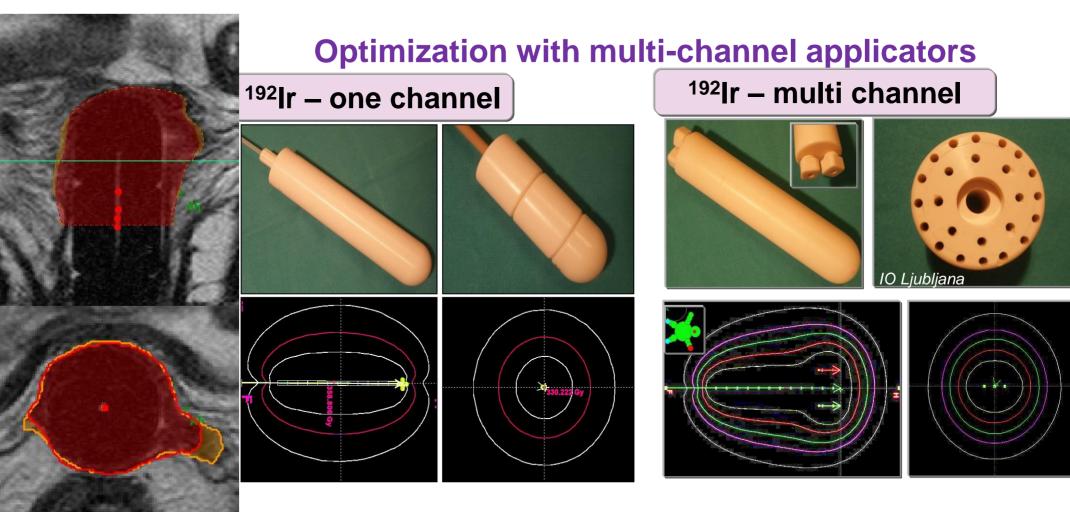

The right size of the brachytherapy applicator!

tissue with non-centera Engoluminar Source

Distal part of the applicator

Physics aspects of treatment planning for interstitial techniques in vagina and vulva cancer

Jamema Swamidas Daniel Berger

Learning Objectives

- Review of Treatment planning aspects of Vaginal and Vulval applications
 - > Intracavitary
 - Intracavitary and interstitial
 - > Interstitial
- Reconstruction, Source activation, Dose points, normalization/optimization.
- Clinical examples of each type

Vaginal and Vulval applications

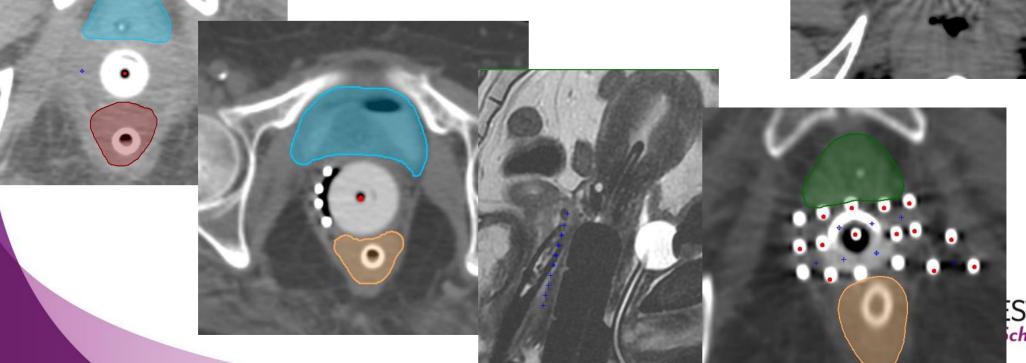

Vagina

- Cylinder
- Cylinder + Needles
- Cylinder + Tandem + Needles
- MUPIT

Vulva

Free Hand Implant

Vaginal and Vulval implants

| | Cylinder | Cylinder + N | Cylinder+T+N | MUPIT | Free Hand Vulval Implant |
|---------------------|---|--|------------------------|--|--|
| Implant Type | IC | IC+IS | | IS | |
| Reconstruction | | Central Tandem, Needles (offset), numbering of needles is important. | | | Plastic Catheters, Crowded, color code the catheters |
| Source activation | MRI - CTV is delineated, CT - Markers as surrogates / Clinical Examination | | | | |
| Dose points | Catheter based points from the applicator surface | | Basal points | | |
| Optimization | Dose Point Optimization | | Geometric Optimization | | |
| Evaluation | Uniformity not an issue, Caution: Hyper dose sleeve should be within the cylinder, and just around the needles, not compromising the target coverage. | | DHI > 0.75-0.8 | | |
| Tips | | | | Template – Geometry not an issue | Free Hand, Geometry will be an issue. Caution. |

« Intracavitary » versus Interstitial treatment planning <u>approach</u>

<u>achieved</u> by Weighting/dwell times (and Normalization point) <u>determined</u> by location and target

Normalization/Reference point(s)

High dose region

The Paris system defines the high dose region (hyper dose sleeve) as the volume of tissue immediately surrounding the source which receives a dose equal or greater than twice the reference dose (see for example Fig 2.6 and Fig 2.14).

The clinical experience of those who developed the Paris system indicates that complications (e.g., necrosis) occur when the diameter of this region exceeds 8 - 10 mm (Pierquin et. al. (31)). This constraint will limit the separation between sources.

Taken from the GEC ESTRO Handbook

¹-------⁻

Dominant weighting in catheter 3

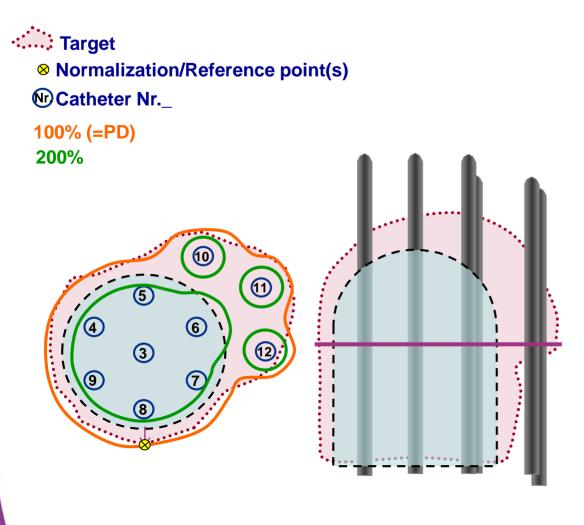

Dose normalized to Reference point

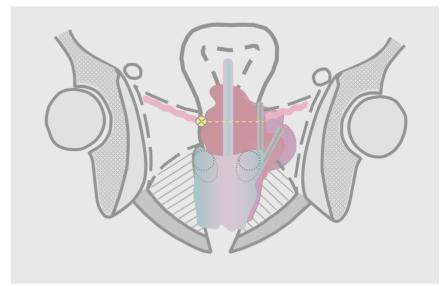

("reference" distance from applicator surface)

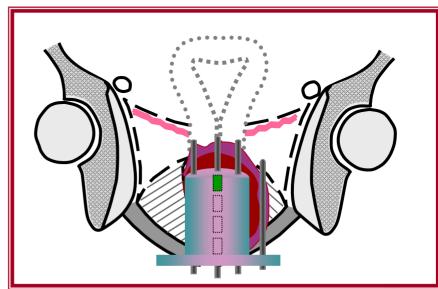

Balanced weighting between catheters 1-12 Dose normalized to ~85% basal dose (MCD)

Normalization Point – where to define the Reference point?

Intracavitary

☐ Interstitial

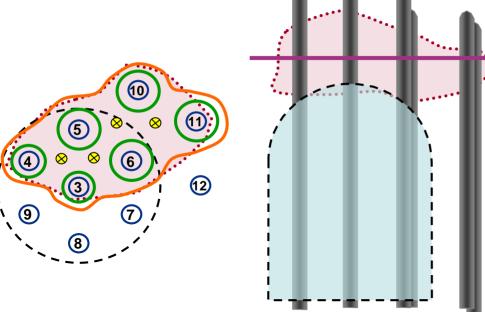

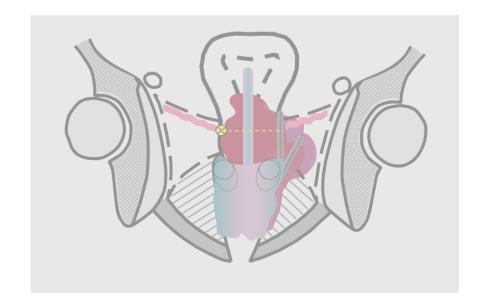

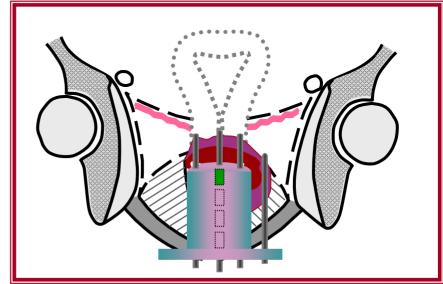

- Normalization/Reference point(s)
- **Nr** Catheter Nr._

100% (=PD)

200%

☐ Intracavitary

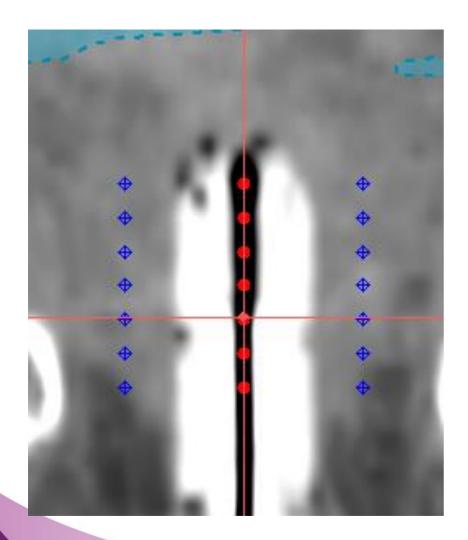

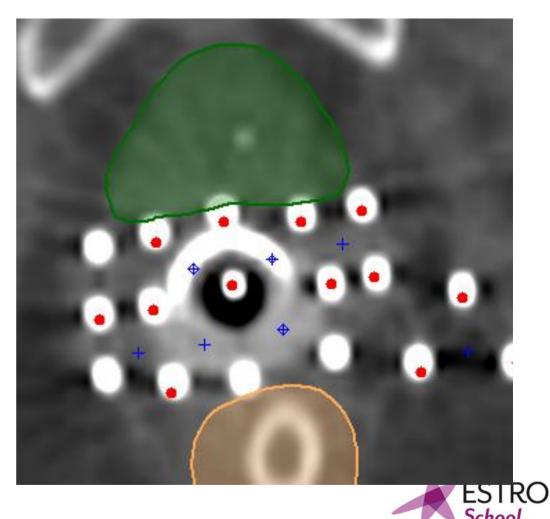

Dose Point vs Geometric Optimization

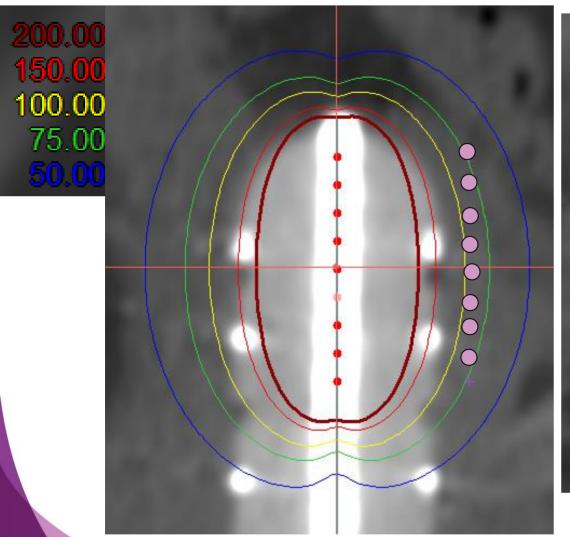

Desired dose at a number of dose points at a certain distance from the catheter are defined

The dwell locations themselves act as dose points. Aims for dose uniformity between the sources.

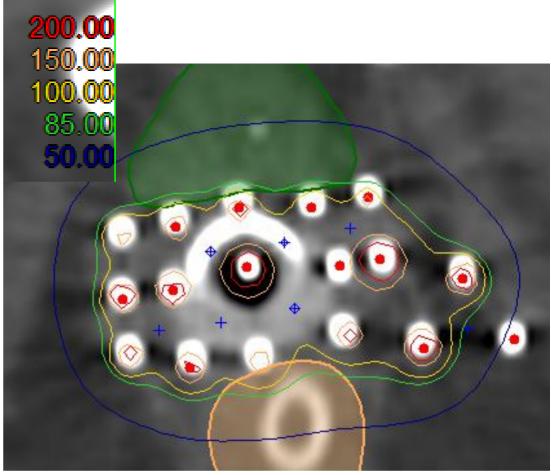

Dose Point vs Geometric Optimization

Eg: STS, Surface mould

Eg: APBI, HN

DVH Analysis

Coverage Index $CI = \frac{CTV(100\%)}{V(CTV)}$

Homogeneity index HI = CTV(100%)-CTV(150%)
(>0.75)
CTV(100%)

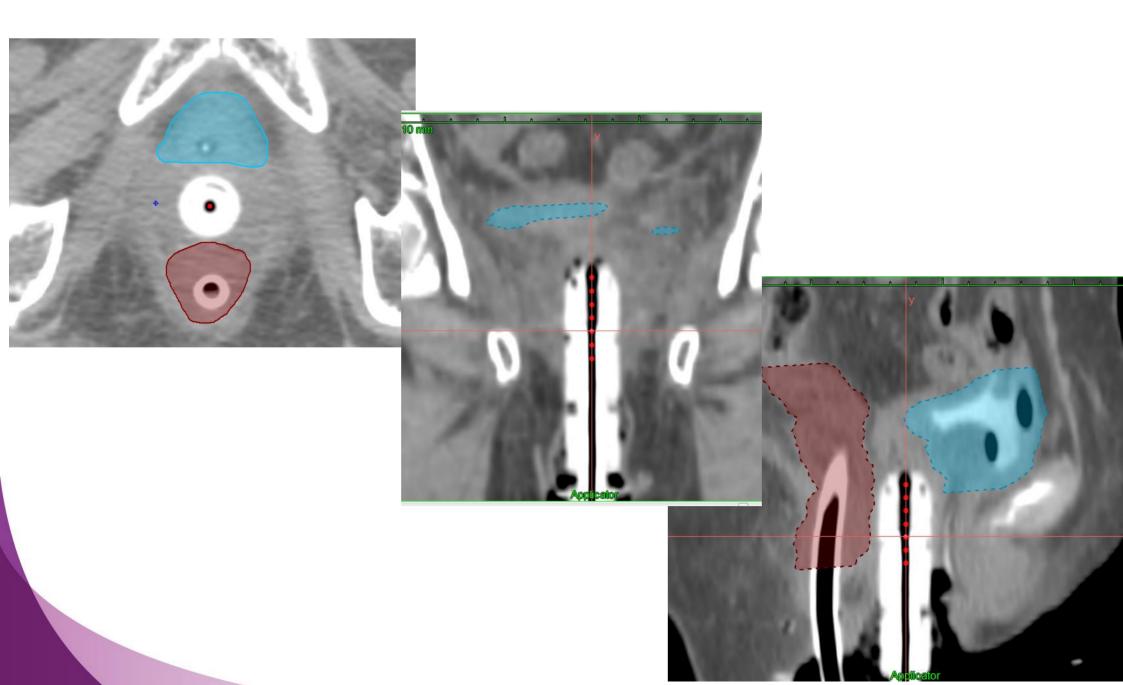

Over dose volume Index OI = CTV(200%)

V(CTV)

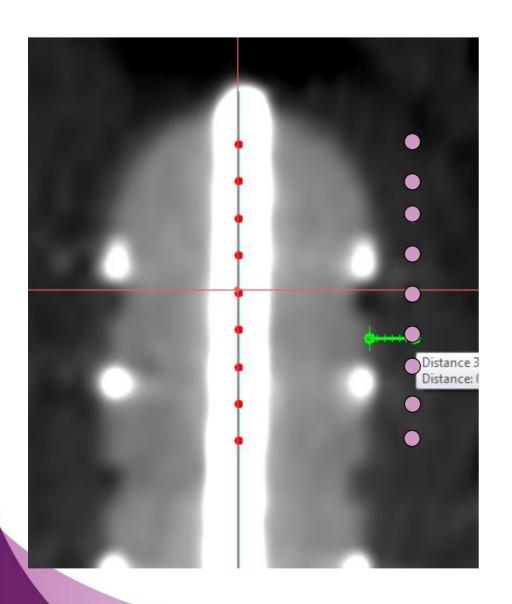

External volume Index EI = NTV(100%) - CTV(100%) V(CTV)

Example 1: Vaginal Cylinder

Vaginal cylinder – Dose points

5-8 mm from the applicator surface, which represent the dose to the vaginal mucosa

Dose to the OAR such as rectum and bladder to be considered while choosing the dose points

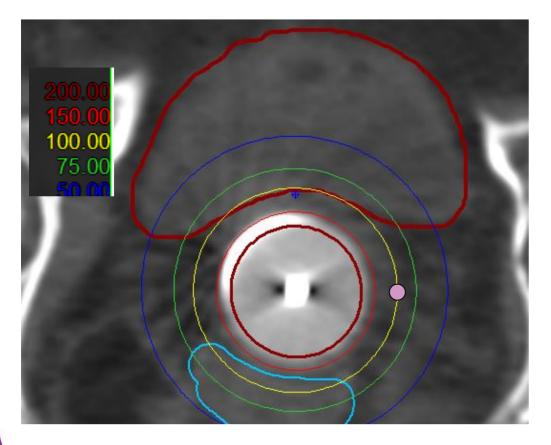

Dose: 50 Gy EBRT + 6 Gy x2

Total EQD2 dose = 67 Gy

Vaginal cylinder

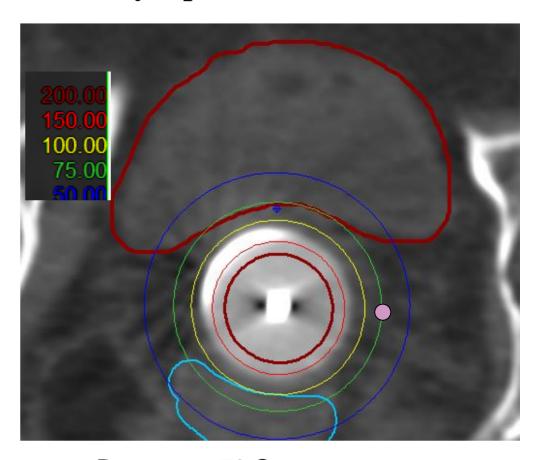

Normalized to Dose points

Rectum = 102 GyBladder = 90 Gy

 - > automatic: image volumes with reconstructed applicators (3D models) in place

Inter-/intra-fraction variations

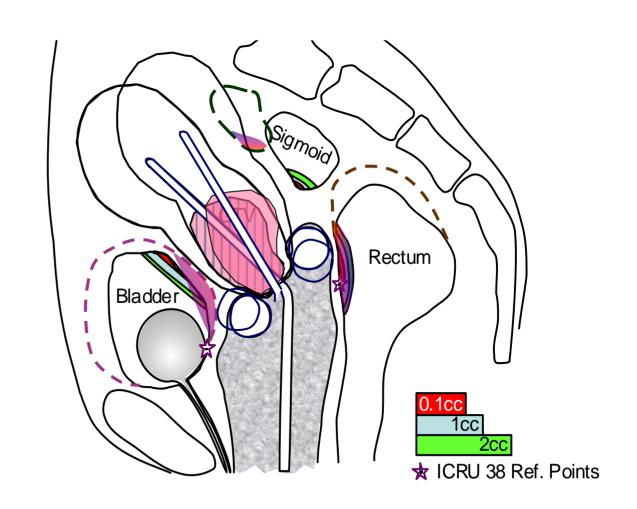

Target fixed to applicator

Rectum:

change of position or filling with gas

Bladder: change of filling (use of bladder filling protocol)

Sigmoid: might change its location

Applicator-based

Applicator-based registration (tandem-ring)

manual: landmark definition based on applicator points automatic: volumetric images with reconstructed applicators (3D models)

Image set A Image set B Image set A+B

If we know where the applicator is, we can define reproducible image registration points using the <u>applicator</u> as a reference <u>coordinate system</u> in all kinds of images!

Example of manual method: Align coordinate system according to applicator model and digitize 3 defined points

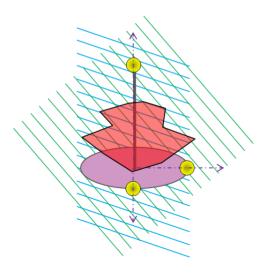

Applicator-based

Applicator-based registration (tandem-ring)

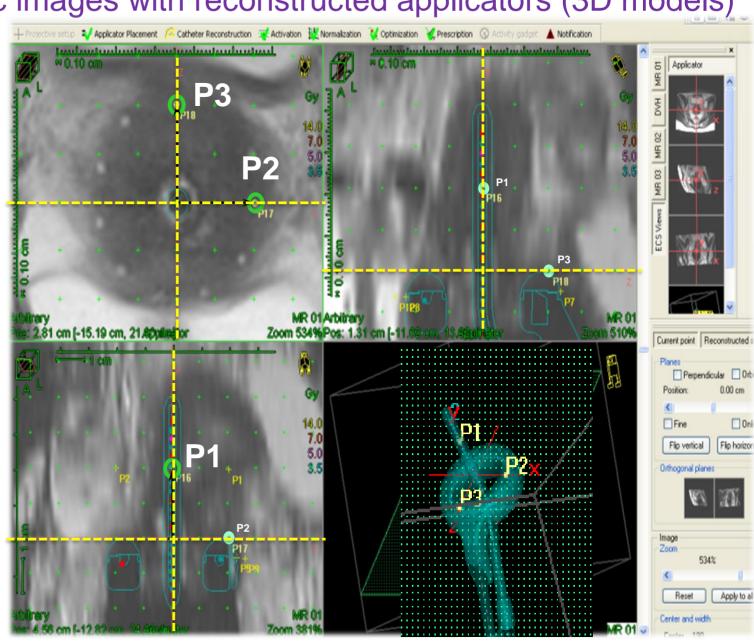

manual: landmark definition based on applicator points

automatic: volumetric images with reconstructed applicators (3D models)

Example of manual method: Align the coordinate system according to applicator model and digitize 3 defined points

If we know where the applicator is, we can define reproducible image registration points using the <u>applicator</u> as a reference coordinate system in all kinds of images!

Solutions for 3D image guided adaptive planning

Is access to MRI with applicator in place available?

Yes, for each fraction/application

MRI for each HDR fraction
MRI for each application, CT before each fraction for OAR verification,...

Yes, but only for first application

MRI for first application, CT for subsequent fractions (re-using MRI target from first fraction): software-based target transfer to avoid interobserver contouring uncertainties

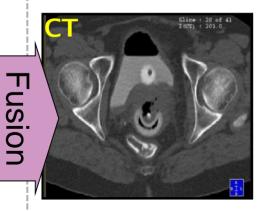

No, not at all

pre-BT MRI for target delineation on CT with applicator in situ at BT

or even: volumetric US scan after applicator insertion for target definition, and CT scan for OAR delineation (registration via applicator)

Results of a multicentre study between 6 centres with different treatment/ application techniques (Nesvacil et al. 2013, Radiother Oncol 107 and references therein):

De Leeuw et al.; Hellebust et al.; Anderson et al.; Mohamed et al.; Lang et al.; Jamema et al.

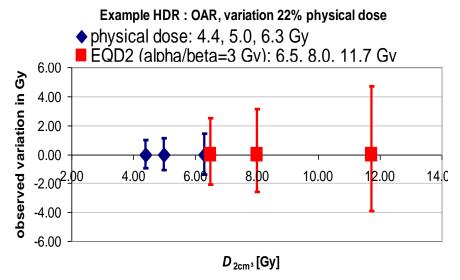

| | | Bladder SD D2cc | | Rectum SD D2cc | | | Sigmoid SD D2cc | | HR CTV SD D90 | | | |
|------------------|-----|--------------------|-------|-------------------|-----|-------|--------------------|------|------------------|------|------|-------|
| total | 2.7 | 1.5 | 20.3% | 4.5 | 4.1 | 22.0% | 1.6 | -0.9 | 26.8% | -1.1 | -1.7 | 13.1% |
| Intraaplication | 1.3 | 1.5 | 17.7 | 3.8 | 2.3 | 20.5 | -2.3 | -3.7 | 23.5 | -2.5 | -4.3 | 10.8 |
| interapplication | 3.9 | 0.0 | 22.3 | 5.8 | 5.2 | 23.2 | 6.8 | 3.7 | 30.2 | 0.4 | -0.8 | 15.1 |

Note: Changes correspond to physical dose change between 2 time points during course of BT. Effect on total EQD2 (EBRT+BT) depends on fractionation schedule (PDR, HDR, ...)

Translating random uncertainties to EQD2: single fraction dose

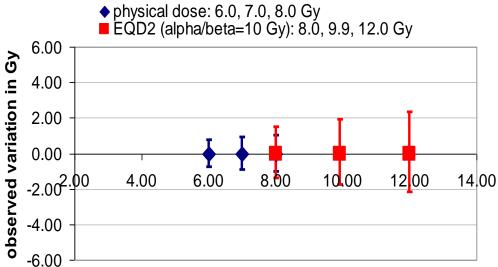

At higher EQD2 doses error bars become asymmetrical!

HR CTV (SD 13%)

OAR (SD 22%)

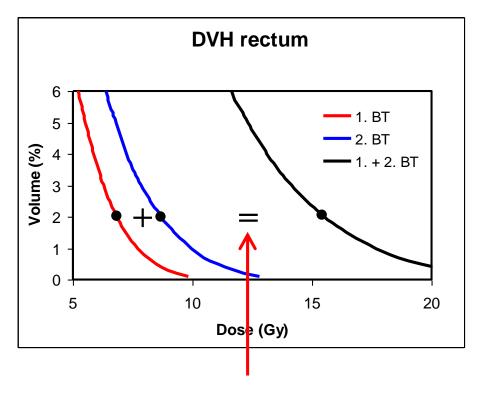

Example HDR: HR CTV, variation 13% physical dose

The impact of uncertainty on the total treatment dose depends on the fractionation scheme!

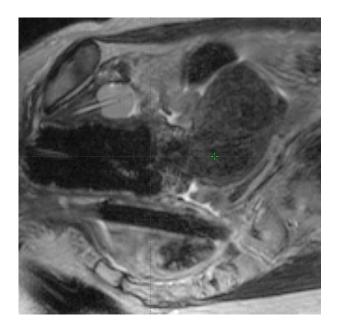

"Worst case assumption" Calculation of DVH for several fractions

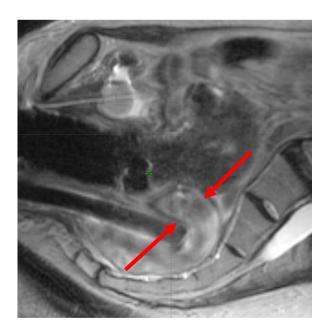

Approximation "Worst case assumption" or DVH addition

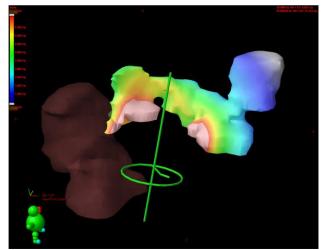

Different location of hotspots

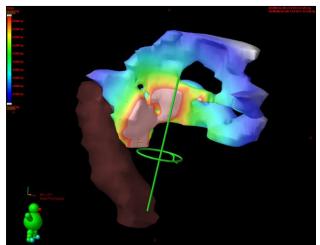

1. BT

2. BT

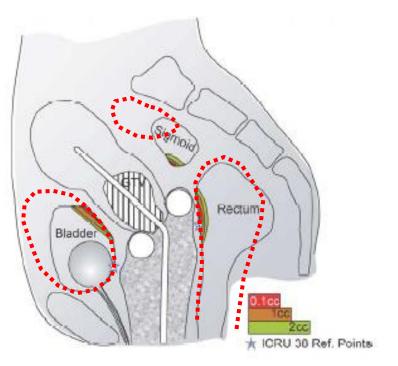

Influence of organ deformation

- Sigmoid
 - Highly mobile
 - DVH calculation conservative

- Rectum and bladder
 - Less mobile

Table 2 Summary of results of spatial location of $D_{2\text{cm}^3}$ hot spot region for each of the OAR.

| Categories | Rectum (<i>n</i> = 27) | Bladder (n = 27) | Sigmoid (<i>n</i> = 27) |
|---|-------------------------|---------------------|-----------------------------|
| Overlapping region >50% Overlapping region 10-50% | 16 7 | 8 14 | 3 |
| 3. Overlapping region <10%/no overlap | 4 | 5 | 15 |

DVH addition

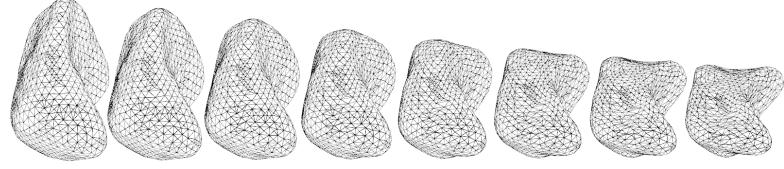

Bladder and rectum dose:

$$BT_{total} = BT1 + BT2 + BT3 + BT4$$

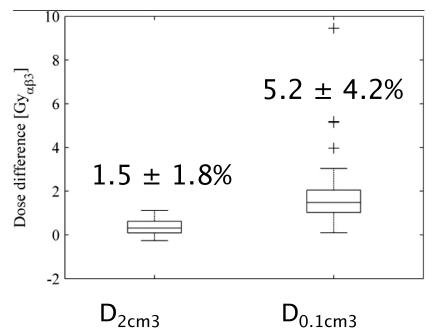

Sigmoid dose potential over–estimation of dose:

$$BT_{total} < BT1 + BT2 + BT3 + BT4$$

Bladder dose accumulation with deformable registration (biomechanical)

Difference between DVH addition and 3D dose accumulation:

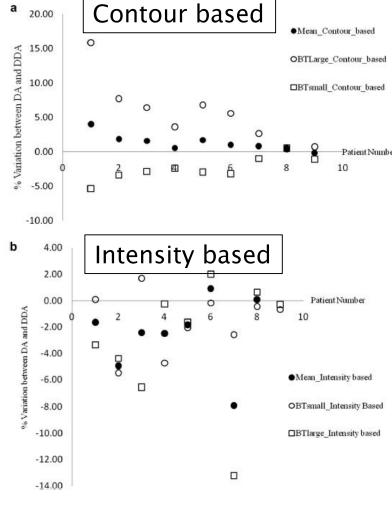

Pitfalls DIR based dose accumulation: Consistency of results

 Dose accumulation with intensity based DIR may not be consistent

 In-consistent DIR may systematically underestimate dose

-> DIR has currently very high, unknown uncertainties.

Clinically not advised to use it for decision making!!!!

The total uncertainty budget

- Radiotherapy and Oncology vol 107(1), 2013
- 19 papers on brachytherapy and mainly on uncertainties

Table 1
Uncertainty budget (SD) for one intracavitary brachytherapy fraction. The overall uncertainty for the entire treatment course is depending on the fractionation schedule and level of verification.

| | Target (HR CTV D90) | OARs (D _{2cm3}) |
|--|---------------------|---------------------------|
| Source strength | 2% | 2% |
| Dose and DVH calculation | 3% | 3% |
| Dwell position uncertainty (reconstruction and source positioning) | 4% | 4% |
| DVH addition across fractions (previously called "worst case assumption") | NA | 1% ^a -?% |
| Contouring (inter-observer) | 9% | 5-11% |
| Intra- and inter-fraction (intra-application) uncertainties ^b (5) | 11% | 20-25% |
| Total ^c | 12% | 21–26% |

^a For the bladder and likely rectum, whereas it has not been evaluated for sigmoid.

^b Per se including intra-and inter-observer contouring variations.

^c Contouring uncertainties included through intra- and inter-fraction uncertainties.

Examples total dose and uncertainty

• HR CTV: D90 =
$$90 \pm 4$$
Gy

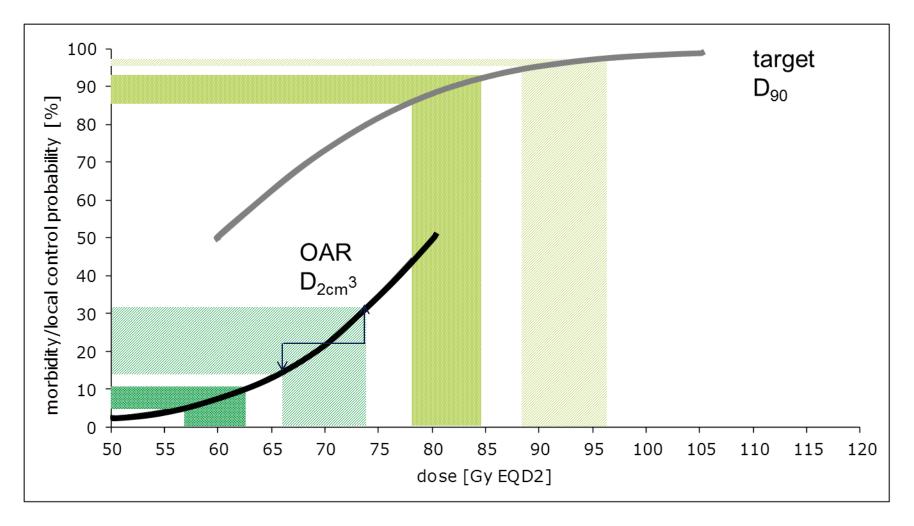

• Bladder:
$$D_{2cm3} = 85 \pm 7Gy$$

• Rectum:
$$D_{2cm3} = 70 \pm 4Gy$$

• Sigmoid:
$$D_{2cm3} = 70 \pm 7Gy$$

Dosimetric uncertainties and dose-response relationships

Schematic illustration of the effect of dosimetric uncertainties of prescribed vs. delivered dose on response probabilities.

Summary, Conclusion, Take Home Message

- Systematic uncertainties can be minimized by refining our clinical protocols for
 - Applicator reconstruction,
 - organ filling,
 - image acquisition (optimal image quality for applicator reconstruction and delineation at the same time)

• Random inter-/intra-fraction uncertainties are a dominant factor for the total uncertainty budget in gyn BT. They can be large and can be monitored by use of repetitive imaging workflows.

Involvement with tumour: No

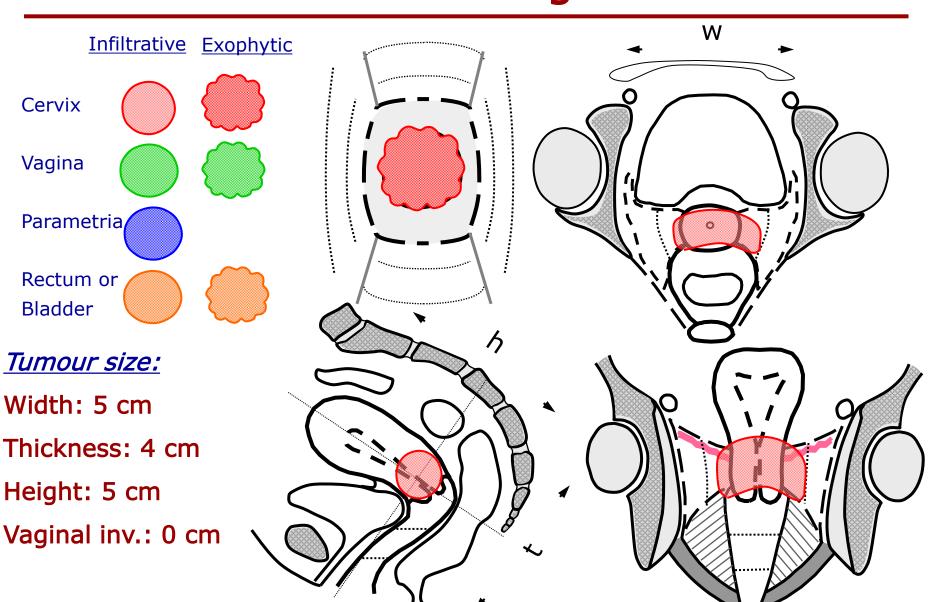

Parametria:

Right: Proximal residuum

Left: Distal residuum

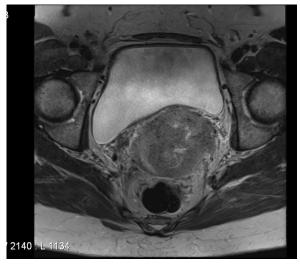

Details: see Clinical Drawings at BT (next slide)

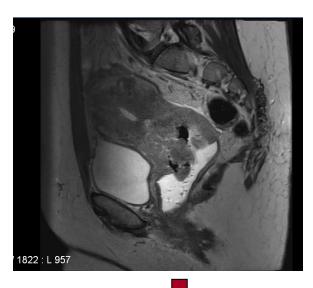

Clinical drawings at BT

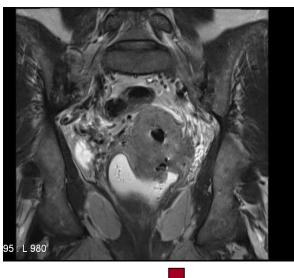

MRI findings

Diagnosis

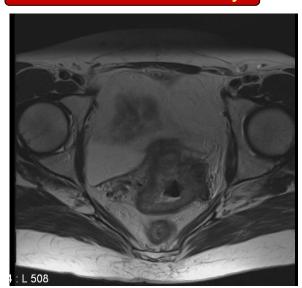

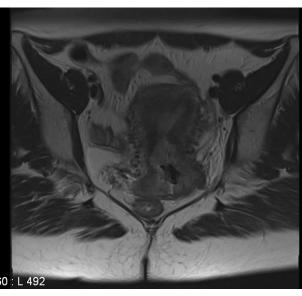

Before BT EBRT Dose 34.2Gy

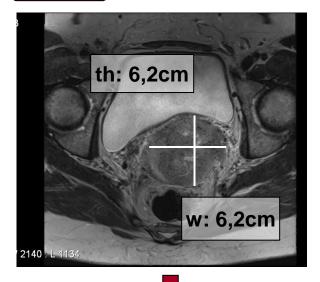

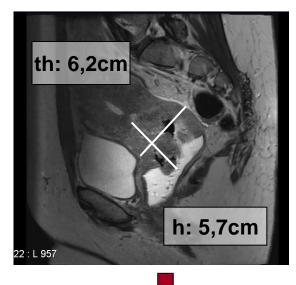

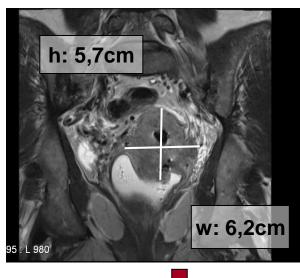

MRI findings

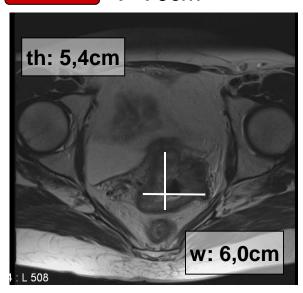

Diagnosis V=110cm³

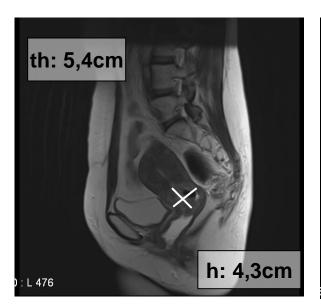

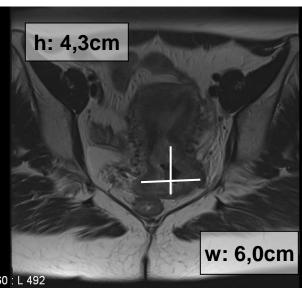

patient ID: VIE003

Insertion & imaging

Anaesthesia: epidural

Application:

Intracavitary component:

Tandem length: 60 mm

Tandem angle: 60°

Ring diameter: 34 mm

Material: plastic

Comments: Vienna II.

Interstitial component:

N° of needles:7+5

Insertion depth:

Material: Titanium

Vaginal packing:

Gauze impregnated with gadolinium

Imaging:

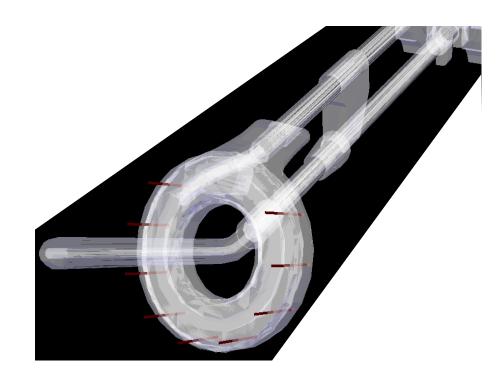

MRI field strength: 1.5 T

MRI configuration:

Sequence(s): T2-weighted

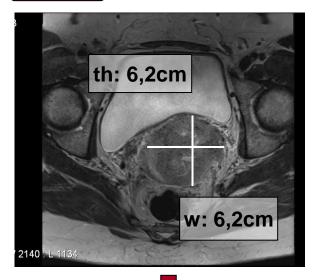

Imaging planes: para-transverse, para-sagittal, para coronal

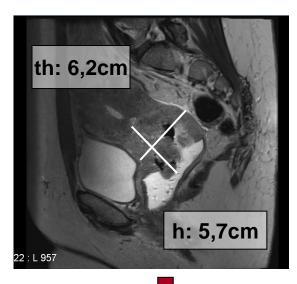

Comments regarding protocol: No contrast; Foley catheter open

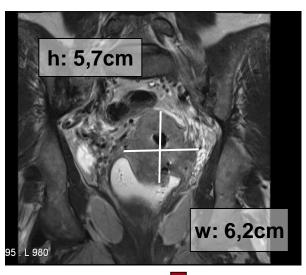

MRI findings

Diagnosis V=110cm³

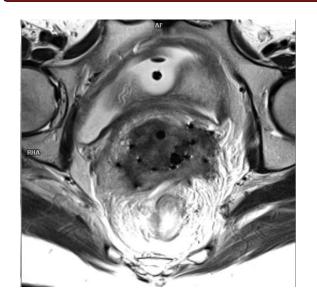

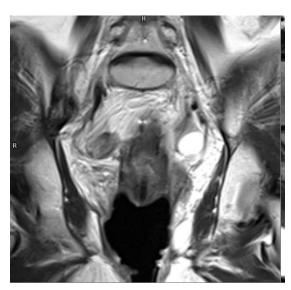

At BT (last week of EBRT dose 39.6Gy

V=30cm³

Time dose fractionation for EBRT + HDR BT

ESTRO Teaching Course Image-guided radiotherapy & chemotherapy in gynaecological cancer - with a special focus on adaptive brachytherapy

Madrid 2018

Kari Tanderup Richard Pötter

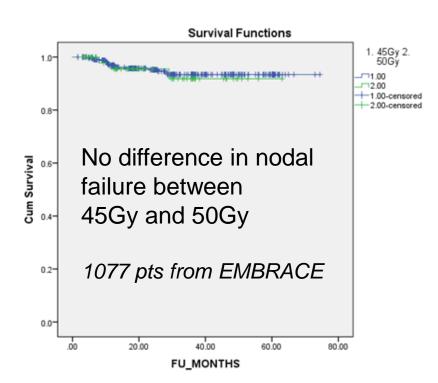

Combination of EBRT and BT

- EBRT dose and fractionation
- BT dose and fractionation
- Timing of BT boost
- Overall treatment time

2

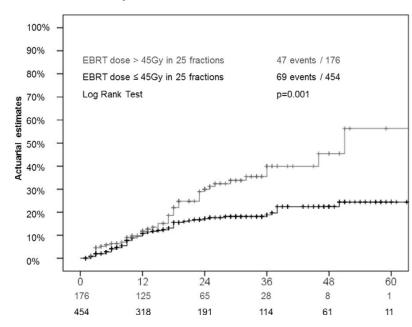

What do we know about dose to the elective target volume?

Do we need 45Gy or 50Gy for control of microscopic disease in lymph nodes with chemoradiation?

Difference in morbidity between 45Gy and 50Gy?

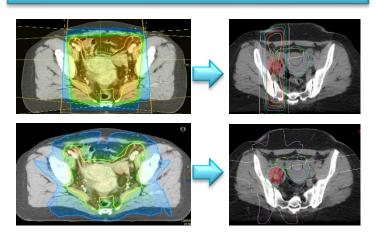

Vaginal stenosis
630 pts from EMBRACE

Kirchheiner et al. RO 118 160-166, 2016

Timing of Nodal Boost

Sequential Boost

i.e.:

PTV-E: 45 Gy in 25 fx

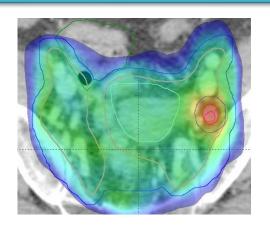

PTV-N: 16 Gy in 8 fx

Simultaneous Integrated Boost

i.e.: (EMBRACE 2 Study protocol)

PTV-E: 45 Gy in 25 fx

PTV-N: 55 Gy in 25 fx (True pelvis)

57.5 Gy in 25 fx (Outside True p.)

Overall Treatment Time

Totally administered D

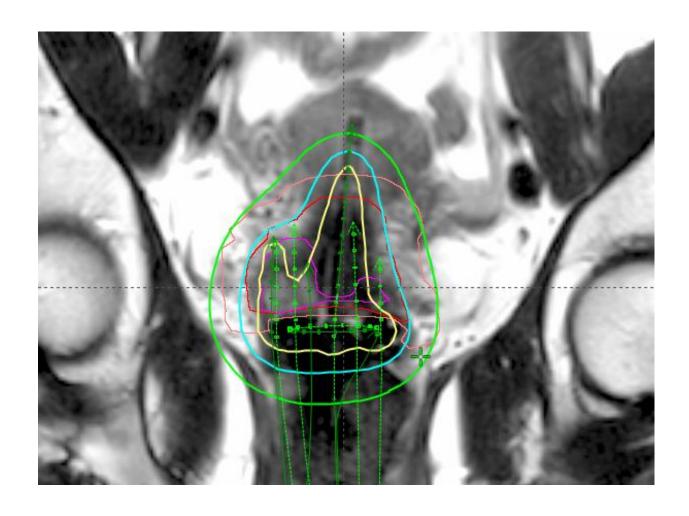

CTV-T & CTV-N move differently

Nodes shrink- Replanning

Courtesy Primoz Petric

Time, dose and fractionation primary tumour

7

EQD2 for some common schedules

| EBRT dose | EBRT #fx | BT fraction dose | BT fractions | Total EQD2 |
|--------------|----------|------------------|-----------------|------------|
| 50Gy | 25 fx | 7Gy | 3 fx | 80Gy |
| 50Gy | 25 fx | 8Gy | 3 fx | 86Gy |
| 50Gy | 25 fx | 9Gy | 2 fx | 79Gy |
| 45Gy | 25 fx | 7Gy | 4 fx | 85Gy |

8

What do we know about dose and local control for CTV_{HR}?

Effect of dose, volume and time:

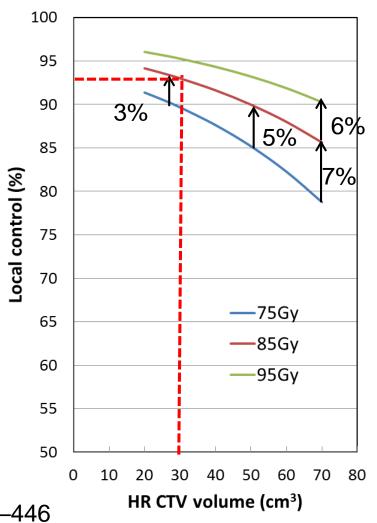

Dose: $10Gy \rightarrow 5\% LC$

Time: 7 days ~ 5Gy

Volume 10cm³ ~ 5Gy

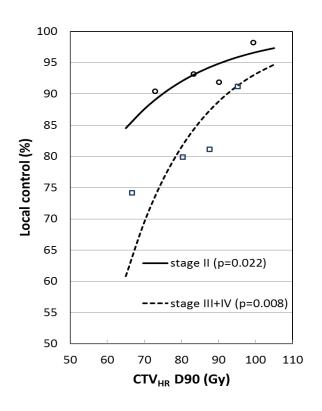

85Gy for 30cm³ CTV_{HR}: 93% LC

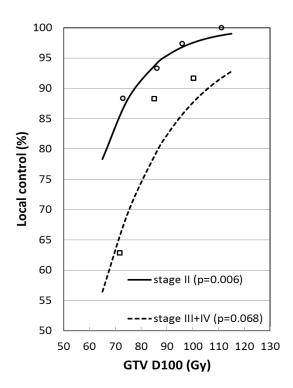

Local control at 3 years

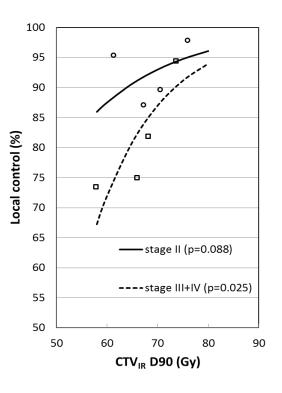

Dose effect GTV, CTV_{HR} and CTV_{IR}

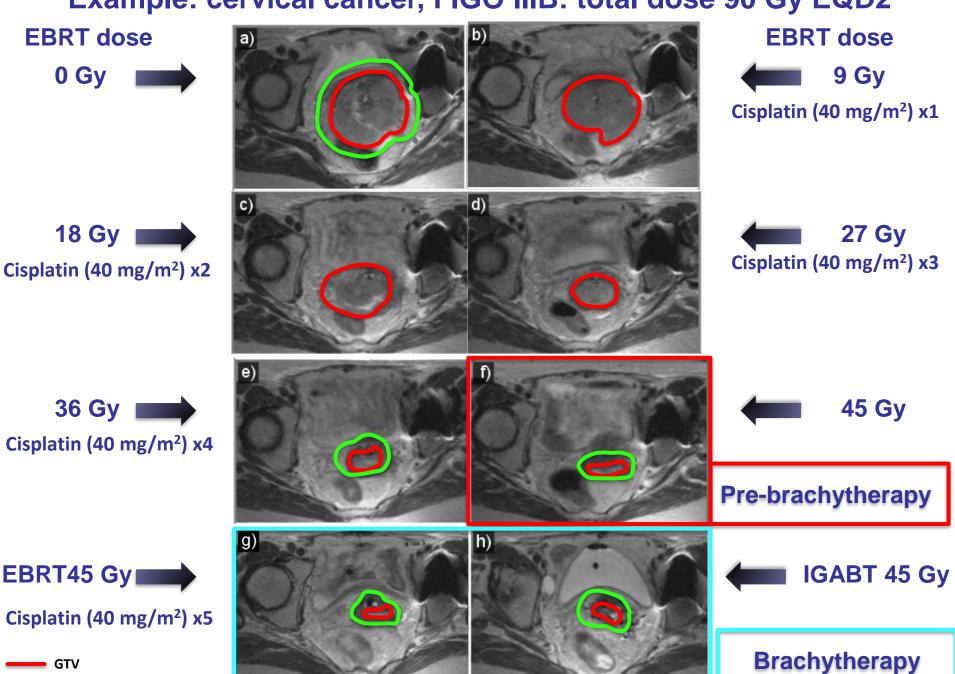

Analysis according to stage

Example: cervical cancer, FIGO IIIB: total dose 90 Gy EQD2

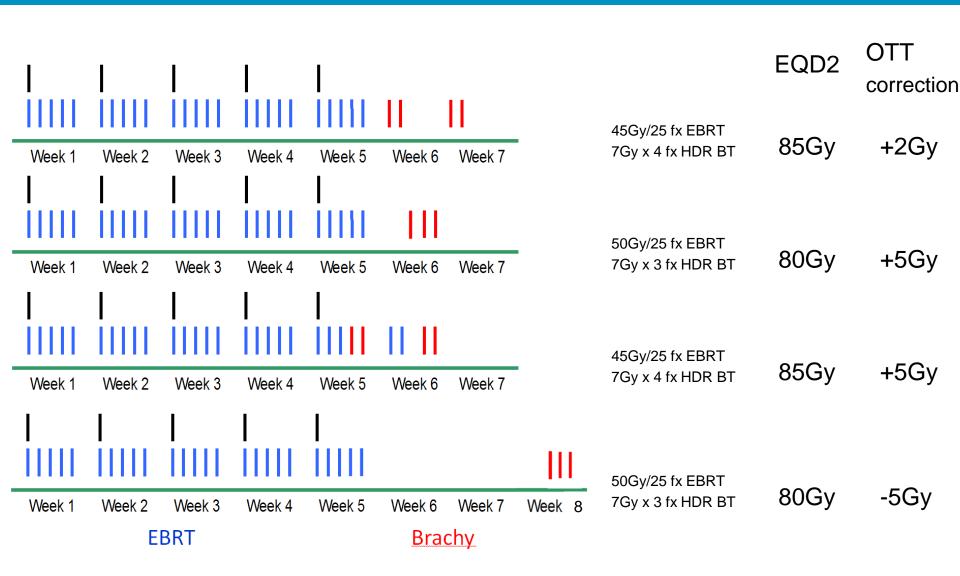

CTV

Impact of overall treatment time

- 1 week extra OTT ~ 5Gy less to CTV_{HR}
- 1 week extra OTT ~ loss of 2.5% local control

- How to keep overall treatment time limited?
- Primary tumour:
 - Start BT towards the end of EBRT or immediately after end of EBRT
 - With the help of IC/IS it is not necessary to wait further for tumour shrinkage
- Pathological lymph nodes
 - Simultaneously integrated boost

Equieffective dose and impact of overall treatment time

Take home messages

- Elective lymph node target: 45-50Gy EBRT
 - Perspective of reducing morbidity with 45Gy
- Pathological lymph nodes: 55-60Gy EBRT
 - Balance between tumour control and morbidity
- Primary tumour (CTV_{HR}): >85-90Gy EBRT+BT
 - Balance between EBRT and BT
 - With more IC/IS BT it is possible to reduce EBRT dose to 45Gy
- Overall treatment time: <50 days</p>

Common dose planning aims for target structures

| | EBRT dose | BT dose EQD2 | Total EQD2 EBRT+BT |
|--|-----------|-----------------|-----------------------|
| Elective lymph node target: CTV-E | 45-50Gy | - | 45-50Gy |
| Pathological lymph nodes | 55-60Gy | 0-4Gy | 60Gy |
| Intermediate Risk CTV: CTV _{IR} | 45-50Gy | 15-20Gy | 60-70Gy |
| High Risk CTV: CTV _{HR} | 45-50Gy | 35-45Gy | 85-90Gy |
| GTV | 45-50Gy | 50-55Gy | 95-100Gy |
| Point A | 45-50Gy | 25-40Gy | 70-85Gy |

Morbidity and QoL after IGABT for cervical cancer: Rectum, Sigmiod, Bladder, Vagina

ESTRO GYN teaching course, Madrid 2018

Remi Nout Leiden University Medical Center

Learning Objectives

- Late morbidity patterns for rectum, bladder, bowel and vagina
- Mid & long-term impairments in quality of life (functional aspects in daily life and patient reported symptoms)
- Differential value of physician assessed morbidity and patient reported outcomes (symptoms and QoL).

Morbidity assessment in clinical trials

medical intervention

decision /

clinical

objective

Analytic outcomes (lab / imaging)

Physician assessed objective symptoms

Patient reported objective symptoms

Patient reported subjective symptoms

Patient reported impact of symptoms on ADL

Patient reported complex multidimensional concepts Anemia defined as reduction in the amount of hemoglobin in 100 ml of blood Atrophy of the vaginal mucosa,

ulceration, necrosis, fistula

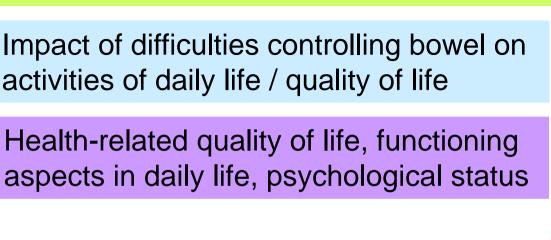

Number of stools / day, consistency of stool

Fatigue, pain, sexual functioning problems

activities of daily life / quality of life

Health-related quality of life, functioning aspects in daily life, psychological status

subjective

Physician assessed morbidity Common Toxicity Criteria of AE

medical intervention

decision /

clinical

objective

Analytic outcomes (lab / imaging)

Physician assessed objective symptoms

Patient reported objective symptoms

Patient reported subjective symptoms

Patient reported impact of symptoms on ADL

Patient reported complex multidimensional concepts

Combined information is translated by physician into medical terms and grades

Symptoms e.g., rectal discomfort, passing blood or mucus; medical intervention indicated; limiting instrumental activities of daily life

Depends on the interpretation of the physician Translation problems may be assumed!

subjective

Inter-rater reliability of CTCAE morbidity assessment

Atkinson et al. Qual Life Res 2012

N=393 patients, mixed cancer type

CTCAE assessed by 2 independent physicians within ~1h

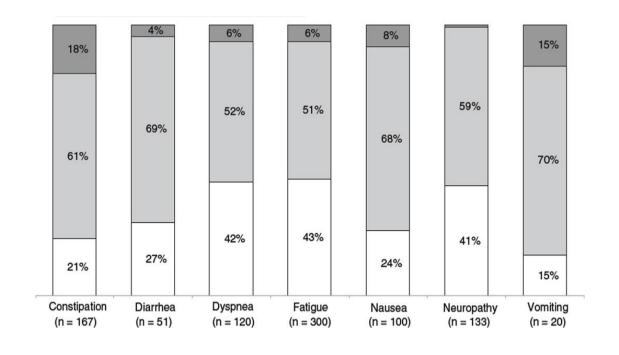

Results in symptomatic patients

15-43% agreement

51-70% 1 grade differences

1-18% 2 grades differences

CTCAE agreement between 2 physicians is moderate at best!

The lower the CTCAE grading, the more variation between physicians is observed. Disagreement mainly between G0/G1/G2.

Patient Reported Outcomes (PRO)

objective

Analytic outcomes (lab / imaging)

Physician assessed objective symptoms

Patient reported objective symptoms

Patient reported subjective symptoms

Patient reported impact of symptoms on ADL

Patient reported complex multidimensional concepts

PRO considered as Gold standard

FDA PRO Guidance, Dec 2009

"...any report of the status of a patient's health condition that comes directly from the patient, without interpretation of the patient's response by a clinician or anyone else." Final

Objectifying the subjective experience by questionnaires with predefined response categories and robust psychometric properties

subjective

| insomnia | 53 | 26 |
| hot flashes | 73 | 19 |
| vaginal dryness* | 22 | 11 |
| vaginal stenosis* | 24 | 11 |
| N=223 patients at 3 months FUP | In total 360 substantial problems reported | 159 (44%) of substantial problems not recognized by physician assessed CTCAE |

Possible explanations

Patients

- >tendency to "please the doctor", based on gratitude
- >certain symptoms too embarrassing to report
- ➤ level of distress caused by the symptoms is rated (highly subjective)
- psychological coping strategies(dissimulating / aggravating symptoms)

Physicians

- more emphasis on identifying severe G3/G4 morbidity than milder morbidity
- ➤ limited time to fully explore symptoms (general questions about any symptoms vs. systematical assessment of each symptom)
- continuum of severity along which a patient is put into context

Summary I

- Technical developments in RT → less severe G3/G4 morbidity
 Focus to milder and moderate G1/G2 morbidity and impact on QoL, PRO are especially sensitive
- Physician assessed CTCAE morbidity has a wide range of interpretation and therefore a low inter-rater reliability (especially in mild to moderate morbidity)
- Low associations between physician assessed and patient reported morbidity are consistently described in literature
- Both provide valuable information → combined reports or a collaborative approach provide a more accurate understanding of morbidity

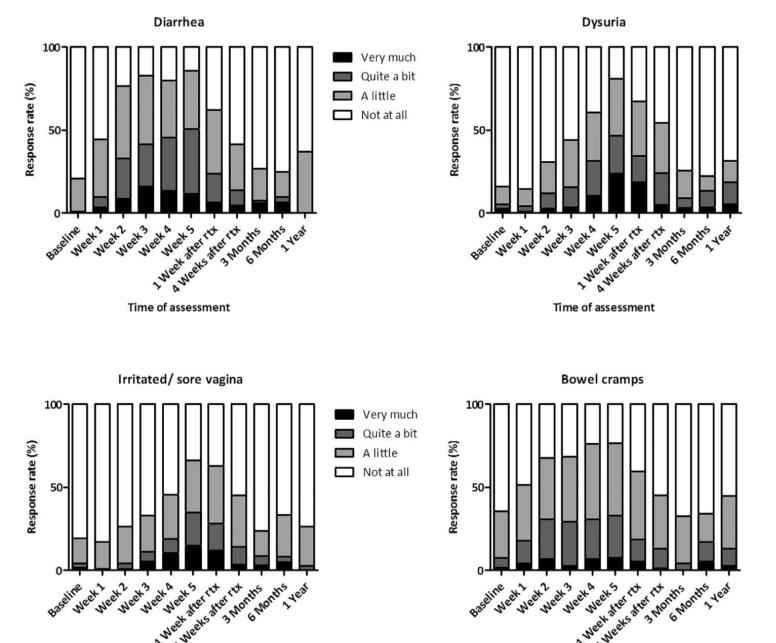

Learning Objectives

- Late morbidity patterns for rectum, bladder, bowel and vagina
- Mid & long-term impairments in quality of life (functional aspects in daily life and patient reported symptoms)
- Differential value of physician assessed morbidity and patient reported outcomes (symptoms and QoL).

Most frequently reported symptoms during and shortly after treatment

and Richard Pötter, MD, PhD*,†

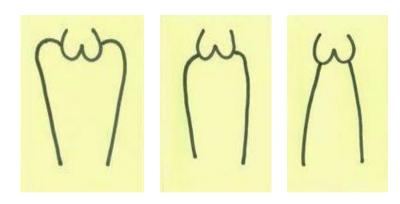

| EMBRACE I. CTCAE v3 |
|----------------------------|
| Vaginal dryness |
| Vaginal stenosis/length |
| Vaginal mucositis |
| Bleeding (hemorrhage GU) |
| Fistula (Vagina cont.) |
| Vaginal other |
| Hormonal therapy |
| Regular vaginal dilatation |

Vaginal stenosis

Flattening of the fornices → "conical appearance"

Impact on sexuality:

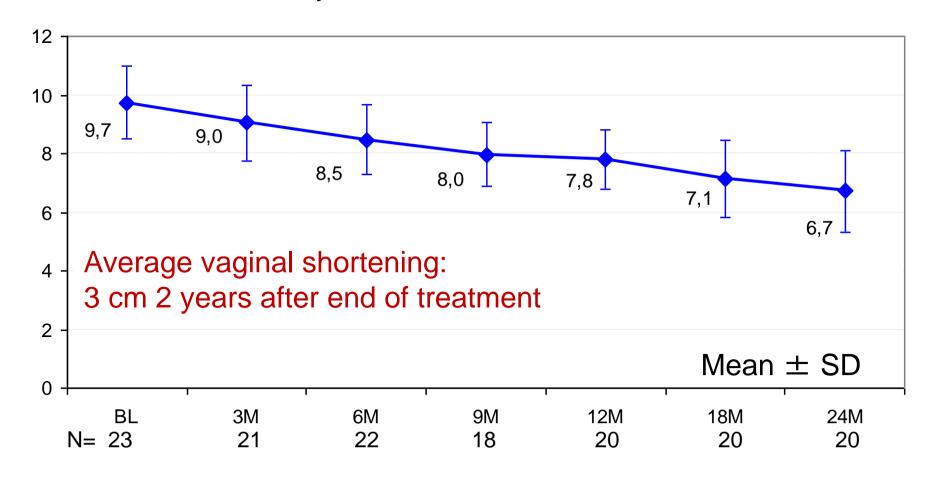

Feeling of vaginal shortening

Feeling of vaginal tightening, esp. at the introitus

→ Pain during intercourse (dyspareunia)

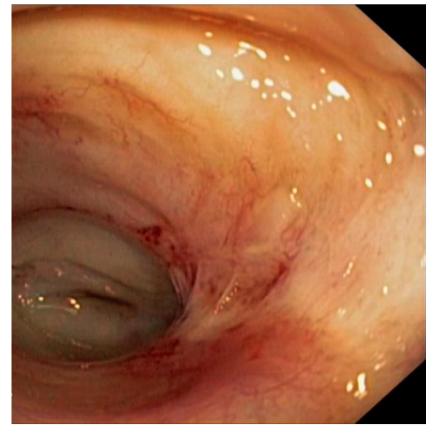

Vaginal length reduction

Fibrosis, loss of elasticity

Telangiectasia

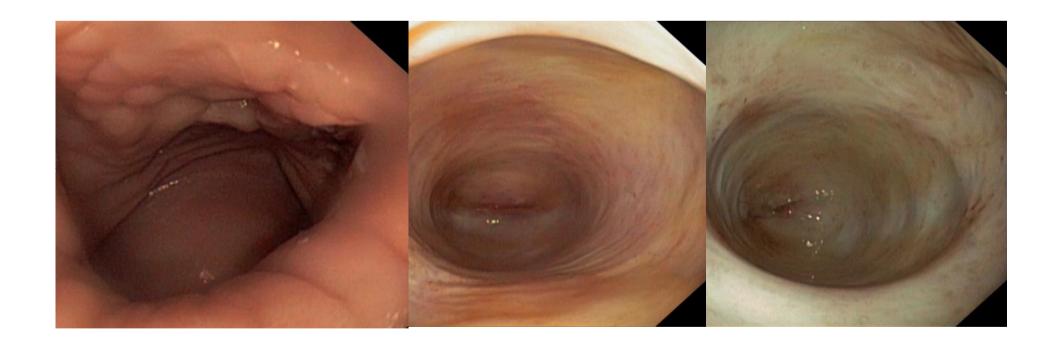

Impact on sexuality:

Contact bleeding during or after intercourse (causes fear of recurrence)

Atrophy of the mucosa

Impact on sexuality

Reduced lubrication despite sexual arrousal

→ painful friction and irritation of the mucosa,

Feeling of soreness, itching, burning

Adhesions

Resolvement during examination often painful

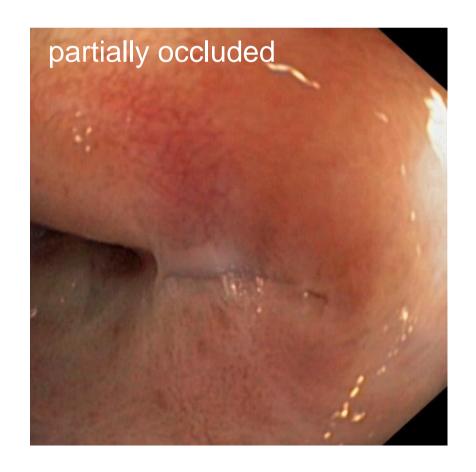

Impact on sexuality:

Rupture of adhesion during intercourse causes pain and bleeding

Vaginal occlusion

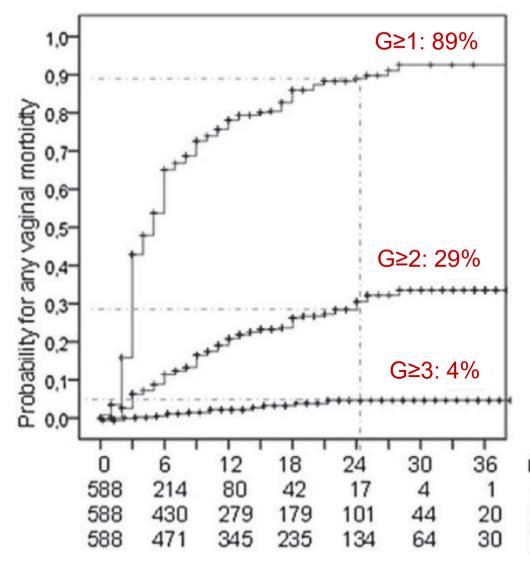

Prevention:
Regular dilation
and / or intercourse

Vaginal morbidity overview

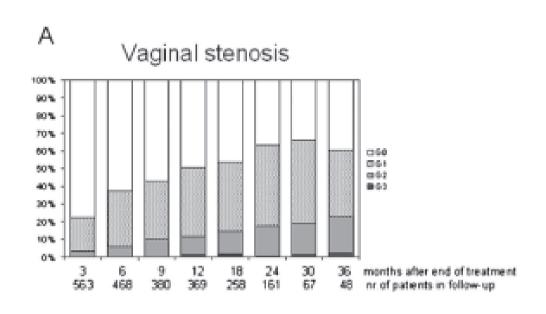

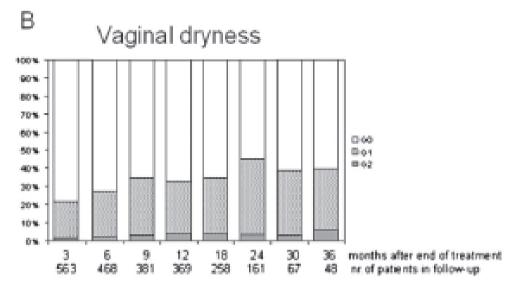

- N=588 LACC within EMBRACE study
- Prospective assessment of morbidity (CTCAE 3) at baseline and regular follow-ups (median 15 months)
- Endpoints: vaginal stenosis, dryness, mucositis, bleeding, fistula

| G3 | 5 (1%) | N.A. | 3 | 1 | 4 (1%) | 4 (1%) | 12 (2%) |
| G4 | N.A. | N.A. | 1 | 0 | 0 | 0 | 1 |
| G5 | N.A. | N.A. | 0 | 0 | 0 | 0 | 0 |

Abbreviation: N.A. = not applicable.

Summary

Crude incidence, rates for single vaginal endpoints

At two years, actuarial probability of severe vaginal morbidity (G≥3) was 3.6%.

However, mild and moderate vaginal symptoms were still pronounced (G≥1: 89%, G≥2: 29%), of which the majority developed within 6 months.

Stenosis was most frequently observed, followed by vaginal dryness. Vaginal bleeding and mucositis was mainly mild and infrequently reported.

Brachytherapy

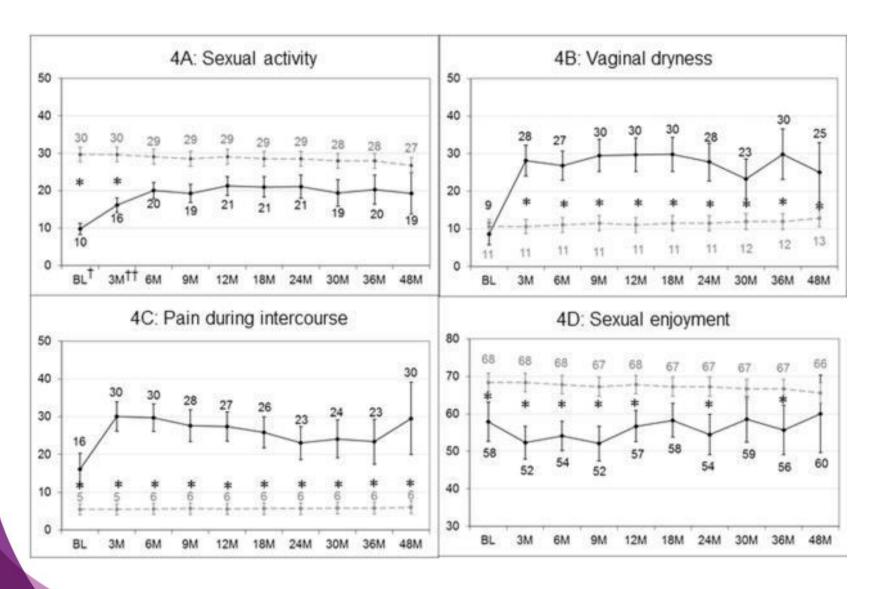

Dose-effect relationship and risk factors for vaginal stenosis after definitive radio(chemo)therapy with image-guided brachytherapy for locally advanced cervical cancer in the EMBRACE study

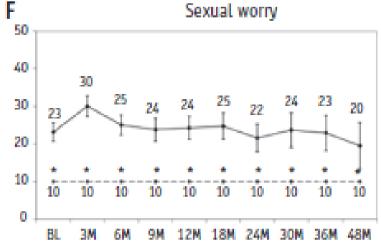

Kathrin Kirchheiner ^{a,*}, Remi A. Nout ^b, Jacob C. Lindegaard ^c, Christine Haie-Meder ^d, Umesh Mahantshetty ^e, Barbara Segedin ^f, Ina M. Jürgenliemk-Schulz ^g, Peter J. Hoskin ^h, Bhavana Rai ⁱ, Wolfgang Dörr ^{a,j}, Christian Kirisits ^a, Søren M. Bentzen ^k, Richard Pötter ^{a,j}, Kari Tanderup ^c, the EMBRACE Collaborative Group ¹

Impact on sexuality

• Comparison with age-matched, female normative reference population (dotted line).

Stenosis: ICRU rectovaginal reference point

With increasing dose to the recto-vaginal reference point, the probability of vaginal stenosis $G \ge 2$ increases significantly (p=0.003).

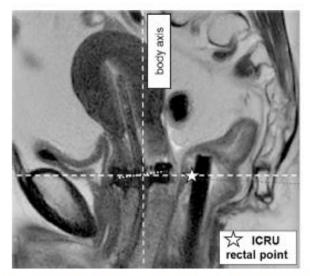

Fig. 1. ICRU rectal point depicted on sagittal T2 MRI, positioned at the intersection level between tandem and the source positions in the ring and 5 mm dorsal of the posterior yazinal wall on the axis perpendicular to the body axis.

Based on the model curve, the risk was 20% at 65Gy, 27% at 75Gy and 34% at 85Gy (rectovaginal reference point dose).

Keeping the EBRT dose at 45Gy/25fractions and decreasing the dose contribution of brachytherapy to the vagina decrease the risk of stenosis.

A <u>planning aim of ≤65Gy EQD2</u> (EBRT+brachytherapy dose) to the recto-vaginal reference point is therefore proposed.

LONG-TERM QUALITY OF LIFE

- 744, multi-institutional LACC patients (EMBRACE study)
- Prospective QoL assessment with EORTC-QLQ-C30+CX24
- Median follow-up 21 months
- Higher score represent better functioning and QoL
- Comparison with agematched, female normative reference population (dotted line).

Reported severe morbidity IGABT

RetroEMBRACE: Late toxicity recorded in 610/731 patients.

Actuarial rates of severe (G3-G5) at 5 years were:

- •Bladder 5%
- •GI-tract 7%
- •Vagina 5%

Monocentric series MRI guided IGABT >100 patients (Vienna, Aarhus, Paris) report: 5.6% - 7% severe (G3-G5) morbidity

Summary II

- Retrospectively reported severe late morbidity 5-7% with MRI guided IGABT. However, mild and moderate are more frequent and may negatively affect QoL.
- ➤ EMBRACE prospective analysis confirms ~5% severe late morbidity
- > QoL analysis provides valuable information on impact of mild morbidity
- Most frequently reported symptoms include:
- Bladder: frequency, incontinence
- Rectum: proctitis
- Bowel: diarrea, bowel cramps
- Vaginal: stenosis, dryness
- Other: hot flushes

Thank you!

Dose

Tanderup et al., RetroEMBRACE, 2016, RadiothOncol

Dose

- CTV-HR dose ≥85 Gy (D90) delivered in 7 weeks provide 3 year LC rates of
 - ->94% in limited size (20 cc)
 - ->93% in intermediate size (30 cc)
 - ->86% in large size (70 cc)
- Doses of 90–95 Gy add 1–4% to local control, depending on tumour volume.
- Increased CTV-HR volume by 10 cc requires additional 5
 Gy for equivalent local control.

Dose

- Similar levels of local control obtained with
 - GTV_{res} doses ≥95 Gy (D98)
 - CTV-IR doses of ≥60 Gy (D98)

ALEXANDRA TAYLOR, F.R.C.R.,‡‡ WALTER BOSCH, Ph.D.,§§§ ISSAM EL NAQA, Ph.D.,§§§
AND ANTHONY FYLES, M.D. * FOR THE GYN IMRT CONSORTIUM.

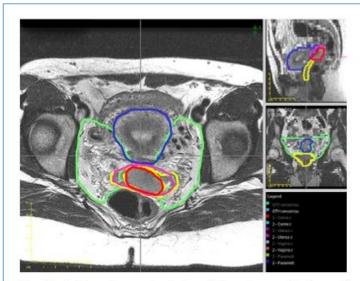

Fig. 2. Axial and reconstructed sagittal and coronal views of T₂-weighted MR images from a clinical contouring case showing 95% agreement contours for GTV (red), cervix (pink), vagina (yellow), parametria (green), and uterus (blue).

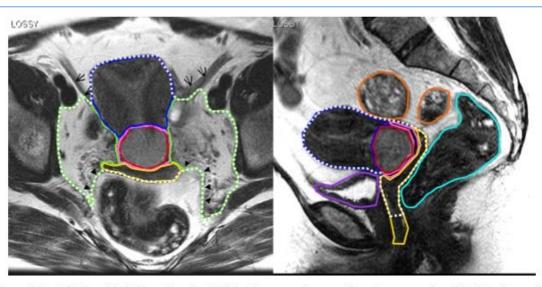

Fig. 3. T₂-weighted MR axial (left) and sagittal (right) images of one patient demonstrating GTV (red), cervix (pink), uterus (blue), vagina (yellow), parametrium (green), bladder (purple), rectum (light blue), and sigmoid (orange). Arrow heads refer to uterosacral ligaments and mesorectal fascia. Arrows refer to the broad ligament and top of the fallopian tube. Dashed white lines represent the CTV.

Table 2. CTV components

| GTV | Entire GTV; intermediate/high signal seen on T ₂ -weighted MR images |
|-------------|---|
| Cervix | Entire cervix; if not already included within GTV contour |
| Uterus | Entire uterus |
| Parametrium | Entire parametrium, including ovaries; include entire mesorectum if uterosacral ligament involved |
| Vagina | Minimal or no vaginal extension: upper half of the vagina |
| | Upper vaginal involvement: upper two-thirds of the vagina |
| | Extensive vaginal involvement: entire vagina |

Table 3. Anatomical boundaries of parametria

| Location | Anatomic structures |
|-------------|---|
| Anteriorly | Posterior wall of bladder or posterior border of external iliac vessel |
| Posteriorly | Uterosacral ligaments and mesorectal fascia |
| Laterally | Medial edge of internal obturator muscle/ ischial ramus bilaterally |
| Superiorly | Top of fallopian tube/ broad ligament. Depending on degree of uterus flexion, this may also form the anterior boundary of parametrial tissue. |
| Inferiorly | Urogenital diaphragm |

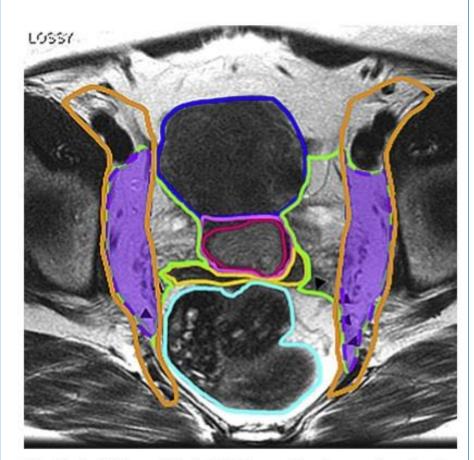

Fig. 6. Axial T₂-weighted MR image showing overlap (purpleshaded region) between nodal clinical target volume (orange contour) and lateral portion of parametrial volume (green contour).

Nodal CTV

The nodal CTV must include involved nodes and relevant draining nodal groups (common, internal, and external iliac and obturator and presacral lymph nodes). Inclusion of para-aortic lymph nodes will depend on the extent of disease and results of staging investigations. Details of nodal CTV delineation will not be addressed in this document as a number of guidelines already exist (9, 30, 31).

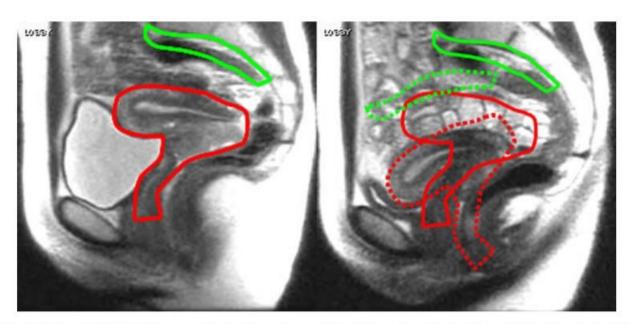

Fig. 7. Sagittal T₂-weighted MR images obtained 1 week apart from the same patient, demonstrating the marked difference between uterus and cervix positions, with altered bladder filling. Primary tumor CTV (red contour) and nodal CTV (green) contours overlaid. Solid lines represent targets at week 1, dashed lines represent the targets at week 2 if a direct translational shift is made to compensate for the change in the primary tumor CTV position. Nodal CTV and portions of tumor CTV in week 2 are missed.

PTV margins and image guidance

The survey of patterns of practice indicated that PTV margins varied among Consortium members, largely as a function of data available for organ motion for this site. A number of groups have published CTV-PTV margin recommendations which have ranged from 0.6 to 4 cm, depending on their methodology for assessing organ motion (11, 12, 14, 18, 32, 33). The combination of unpredictable organ motion and substantial tumor regression resulted in conservative margin recommendations by the Consortium. Margins of 1.5 to 2 cm around the CTV were recommended if good quality daily soft tissue verification was available during treatment. A PTV margin of 7 mm around the nodal CTV was agreed upon in line with previous recommendations in the postoperative cervix cancer setting (e.g., RTOG protocol 0418). If bone matching alone was being used, more generous margins would be necessary, due to the uncertainty of tumor CTV position in relation to nodal CTV position. The use of IMRT without any form of daily soft tissue verification risks geographical target miss and should be approached with caution. Even the use of fiducial markers is not always reliable as they may shift over the course of treatment.

Recommendations from Gynaecological (GYN) GEC-ESTRO Working Group* (I): concepts and terms in 3D image based 3D treatment planning in cervix cancer brachytherapy with emphasis on MRI assessment of GTV and CTV

ESTRO project

Recommendations from gynaecological (GYN) GEC ESTRO working group (II): Concepts and terms in 3D image-based treatment planning in cervix cancer brachytherapy—3D dose volume parameters and aspects of 3D image-based anatomy, radiation physics, radiobiology

Richard Pötter^{a,*}, Christine Haie-Meder^b, Erik Van Limbergen^c, Isabelle Barillot^d, Marisol De Brabandere^c, Johannes Dimopoulos^a, Isabelle Dumas^b, Beth Erickson^e, Stefan Lang^a, An Nulens^c, Peter Petrow^f, Jason Rownd^e, Christian Kirisits^a

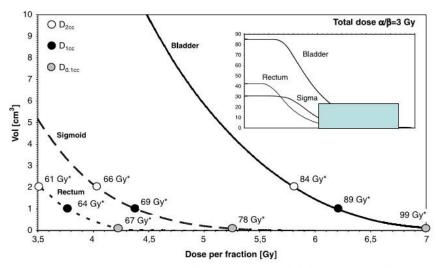

Fig. 5. Cumulative dose volume histograms of bladder, rectum and sigmoid (patient, Figs. 1, 3, 4 and 6) based on organ contouring indicating the minimum dose in the most irradiated tissue volume adjacent to the applicator ($D_{0.1cc}$, D_{1cc} , D_{2cc} for 0.1, 1, and 2 cm³). Total EQD2 dose values for these OAR are given assuming four identical HDR fractions with an α/β of 3 Gy. Treatment planning, for this example, was based on dose constraints for D_{2cc} (bladder: 90 Gy_{EQD2}; rectum, sigma: 70 Gy_{EQD2}). 90 Gy_{EQD2} is reached with four HDR fractions of 6.3 Gy (25.2 Gy), which is corresponding to 48 PDR pulses with 77 cGy/puls, 1 puls/h (37 Gy) and to LDR with 77 cGy/h in 48 h (37 Gy). For 70 Gy_{EQD2} the dose per HDR fraction is 4.5 Gy (18 Gy). The same dose is reached with 48 PDR pulses with 54 cGy/puls, 1 puls/h (26 Gy), and LDR with 54 cGy/h in 48 h (26 Gy).

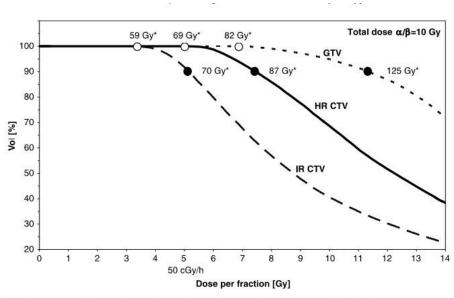

Fig. 4. Dose volume histograms of GTV, HR CTV, and IR CTV for one fraction of HDR intracavitary brachytherapy (patients Figs. 1, 3, 5 and 6). Prescribed dose is 25×1.8 Gy external beam therapy to ICRU point plus $40 \text{ Gy}_{\text{EQD2}}$ ($4 \times 7 \text{ Gy}$) brachytherapy to HR CTV, which gives a total of 84 Gy_{EQD2} ($\alpha/\beta = 10 \text{ Gy}$). *Total EQD2 values are given based on four identical fractions. In general, similar DVH curves are obtained for LDR or PDR treatments, but with different total EQD2 doses, e.g. 48 h LDR treatment with 50 cGy/h for D90 of IR CTV gives 69 Gy_{EQD2}, but 83 Gy_{EQD2} (74 cGy/h) for D90 of HR CTV and 110 Gy_{EQD2} (113 cGy/h) for D90 of GTV.

Image-guided brachytherapy in cervical cancer: experience in the Complejo Hospitalario de Navarra

Elena Villafranca¹, Paola Navarrete¹, Amaya Sola¹, Juan Carlos Muruzabal², Sara Aguirre², Santiago Ostiz³, Carmen Sanchez³, Rosa Guarch⁴, Nuria Lainez⁵, Marta Barrado¹.

Department of Radiation Oncology¹, Gynaecology², Radiology³, Pathological Anatomy⁴ and Medical Oncology⁵

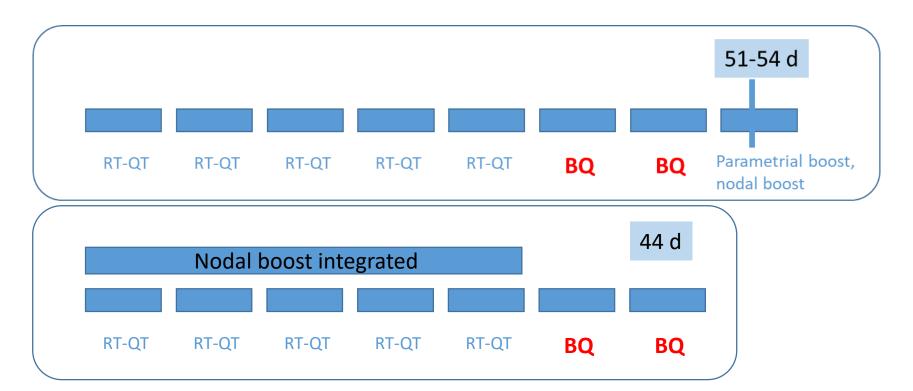

Complejo Hospitalario de Navarra

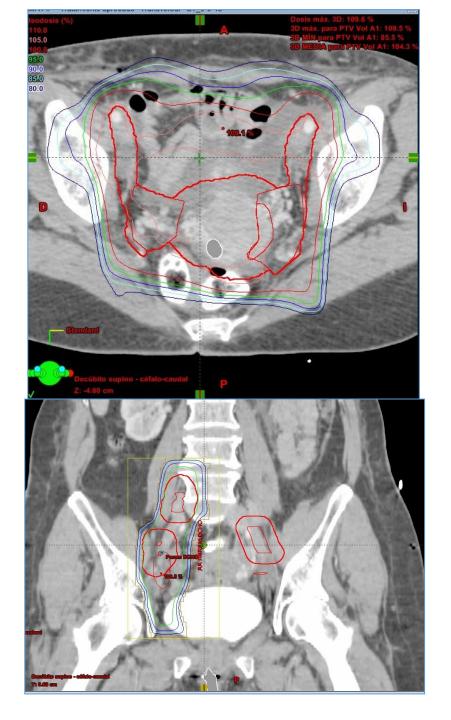

Pamplona. Spain

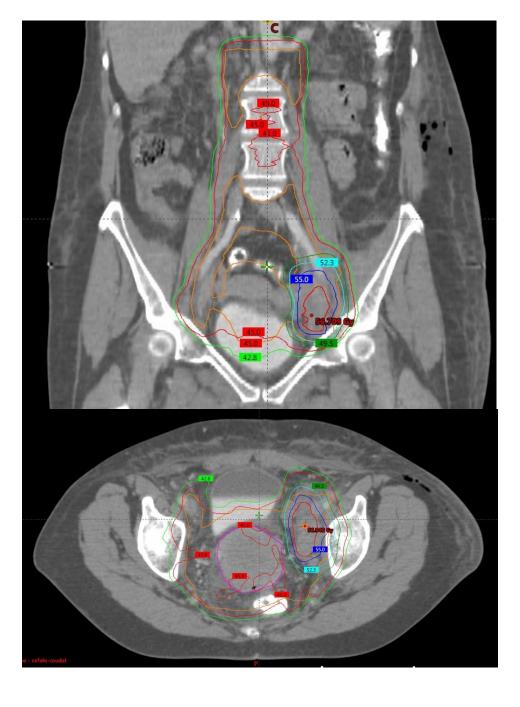

Material and Methods

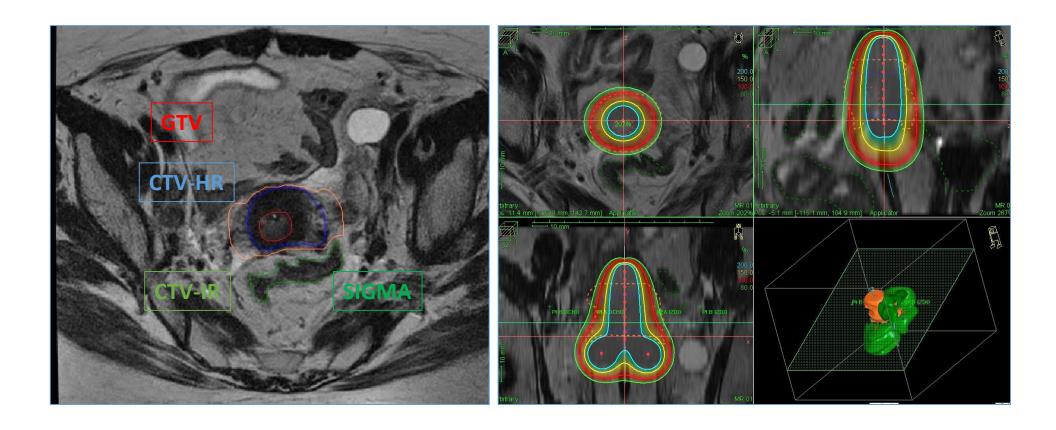

- Evaluation: All cases with locally advanced cervical tumours are evaluated by the Committee of Gynaecological Tumours. Patients undergo computerized tomography (CT), MRI and, in some cases, positron emission tomography-CT (PET-CT) studies, and pelvic-paraaortic lymphadenectomy is performed for staging.
- Chemotherapy involved the use of cisplatin 40 mg/m2, 1 day/week during 5 weeks.

- External beam radiotherapy (EBRT) was initially 3D but since 2011 IMRT is performed. All the cases received 45 Gy over 5 weeks.
 - In cases with lymph node remanents following lymphadenectomy or findings of extracapsular extension in some lymph nodes, a lymph node boost to 56-60 Gy was carried out after brachytherapy. Patients included in the EMBRACE II study received an integrated boost at a dose of 55-57 Gy according to the pelvic or paraaortic localization, respectively.
 - Before the availability of combined intracavitary-interstitial applicators, patients with macroscopic residual parametrial disease received a parametrial dose to achieve 60 Gy after brachytherapy, taking into account the parametrial doses of the brachytherapy.

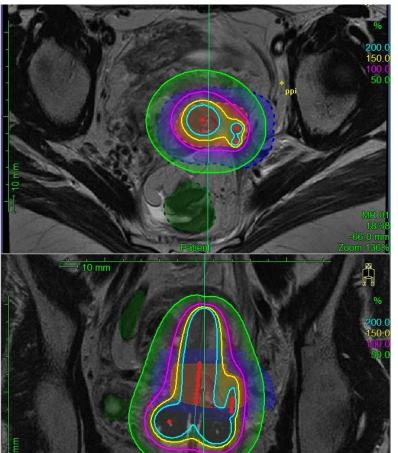

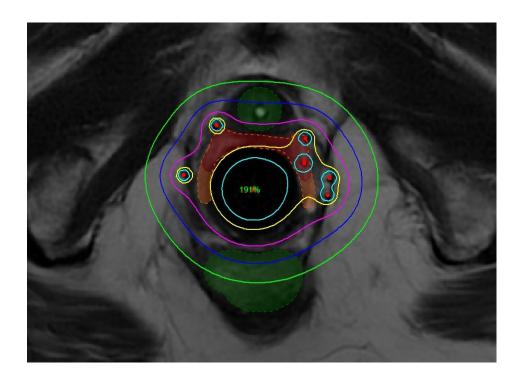

- At week 5 of EBRT, all patients underwent MRI to evaluate response and to choose the applicator for brachytherapy. Brachytherapy was then done at weeks 6 and 7; first with 5 fractions of 6 Gy in 2 implants, and then with 4 fractions of 7 Gy after entry in the EMBRACE study in 2011. In both protocols MRI was performed after each implant for treatment planning. The objective was to carry out all the treatment in less than 55 days.
- The GEC-ESTRO guidelines were followed for the delimitation of volumes in MRI-GBT. Taking into account the dose of EBRT, the dosimetric objectives were to achieve D90 HR-CTV > 100% of the prescription dose, D90 IR-CTV > 60 Gy EQD2, D2cc rectum and sigma < 75 Gy EQD2 and D2cc < 85 Gy EQD2.

Doses recomendations

- D90 CTV-HR > 85 -90 Gy
- D98 GTV> 95 Gy
- D90 CTV-IR > 60 Gy

- Rectum: D2cc < 75 Gy less fistula, D2cc < 65 Gy less proctitis
- Vagina: Punto Recto-vaginal < 75 Gy.
- Vejiga: D2cc < 80-85 Gy.
- Sigma: D2cc <70-75 Gy

- Follow-up: The patients were followed every 3 months during the first two years. The follow-up study always included physical examination, cytology every 6 months, MR every 6 months and CT annually. From years 3 to 5 the consultations were made every 6 months, with MR every year. After year 5 the follow-ups were carried out annually. The visits were alternated between the Gynaecology Department and the Brachytherapy Unit.
- Statistical analysis: General digestive, urinary and rectal toxicity were reported according to the Common Terminology Criteria for Adverse Events (CTCAE) v4 scale. T de Student was used to compare median of doses between groups of toxicity grade 0-1 versus grade 2-3. Kaplan-Meier test was used to calculate survival curves. Log rank test was used to compare prediction factors in survival

Toxicity

Acute grade 2-3 toxicity was: rectal 15.7%, intestinal 15.7% and vesical 15.5%.

No patient presented grade 4 toxicity, but late grade 2-3 toxicity was observed: rectal 8.6%, intestinal 8.6%, and vesical 15.5%. The latter type of toxicity was due to an increase in frequency in 6 cases; 2 for hydronephrosis and 1 vesicovaginal fistula in 1 patient after rescue surgery for suspicion of tumour persistence.

Late rectal and urinary morbidity in relation to the dosimetric parameters: appearance of late toxicity grade 2-3 according to the EBRT received with the following results: rectal: 15% 3D vs. 10.5% IMRT (p: ns X2 Pearson), urinary: 22% 3D, 21% IMRT (p: ns). According to the bracthytherapy:

| Cronic toxicity | | D2cc (Gy) | p (T Student) |
|------------------|------|-----------|---------------|
| Rectal toxicity | G0-1 | 67,7 | ns |
| | G2-3 | 72,4 | |
| Urinary toxicity | G0-1 | 83,2 | ns |
| | G2-3 | 80,4 | |

| Cronic toxicity | D2cc (Gy) | | p (X² Pearson) |
|------------------|-----------|-------|----------------|
| Rectal toxicity | < 75 Gy | 10% | ns |
| | > 75 Gy | 14% | |
| Urinary toxicity | < 85 Gy | 13,7% | ns |
| | > 85 GY | 26,7% | |

CONCLUSION

- In the present study the results obtained with the use of MRI-GBT in all the women with cervical cancer are comparable to those of the most important multicentre studies reported to date, with scarce, albeit manageable, late toxicity.
- The future is leading in the direction of the EMBRACE II study which is aimed at reducing toxicity in women showing good response after radiochemotherapy and intensification of brachytherapy treatment, especially with interstitial brachytherapy in order to improve local control and survival in patients with advanced tumours and poor initial response.

Results of the spanish cuestionary. Pamplona 2015

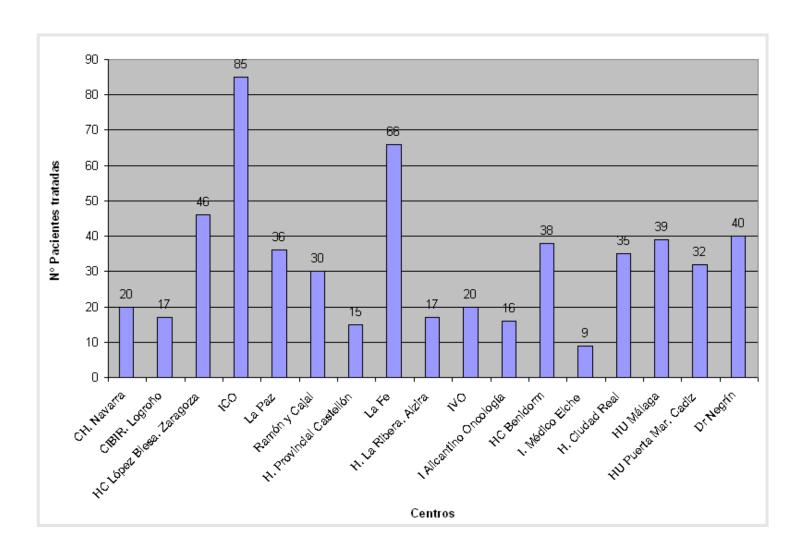

Dra. Amaya Sola Galarza.

Médico Adjunto Svo Oncología RT.

Complejo Hospitalario de Navarra

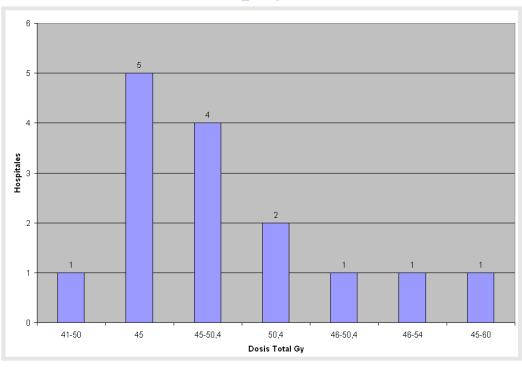

- GEB: started in1999.
- 128 doctors of 54 Hospitals.
- 17 have answered the cuestionary: 31.48 %

• Median patients treated between 2013-2014: 33 p

External radiotherapy

- •Technic: 81.25 % have the 3 (IMRT, IGRT, 3D). 68.75 % IMRT and IGRT
- Most centers (68.75%): 45-50.4 Gy
- Dose per fration: 1.8-2 Gy, 25-28.
- •QT (87.5% centers 14/16) : CDDP 40 mg/m2/weekly.

Dosimetric criteria

• PTV: D95>95 % DP

• Rectum: V 45 <50%, V50 < 50%.

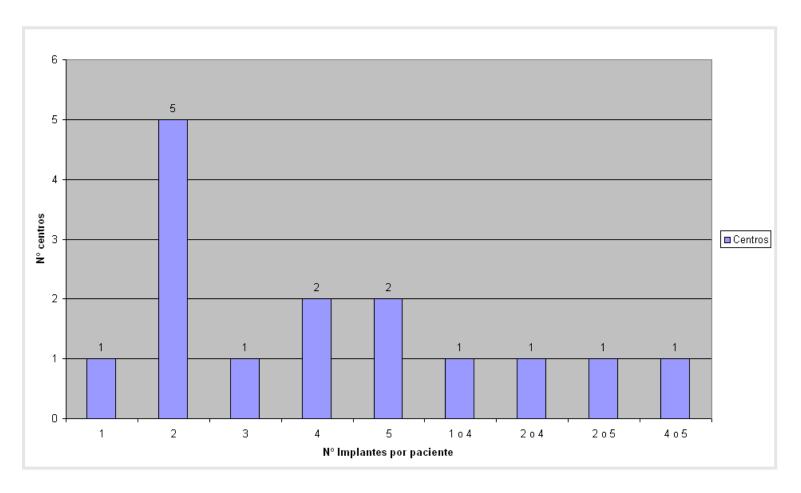

• Bladder: V45 < 60%, V50 < 50%.

• Sigmoid: V60 < 30%

• Bowell: V 45 < 195 cc, V 40 < 150cc

• Femur heads: V 45 < 5% V 50 < 5-10%.

Brachytherapy

- 16 centers
- Unique implant (PDR: 2 h), 33 % 2 implants, 13 % 4 implants, 13% 5 implants, others

Interstitial brachytherapy for locally advanced cancer

- 7 centers don't have aplicattors.
- 10 centers: only 7 hospitals do interstitial brachytherapy regulary.

OBJETIVOS DOCENTES

- Conocer recomendaciones de braquiterapia guiada por imagen de resonancia de GEC-ESTRO, GEB y GBFM, ICRU 89.
- 2. Reconocer beneficios de braquiterapia intersticial en tumores avanzados.
- Facilitar la formación in situ con aplicadores intersticiales y planificación con casos clínicos.

MARTES 5 CÁNCER DE PRÓSTATA / CÁNCER DE MAMA

MIÉRCOLES 6 TUMORES CEREBRALES / BRAQUITERAPIA

JUEVES 7 CABEZA Y CUELLO / TUMORES GINECOLÓGICOS

VIERNES 8 TUMORES DIGESTIVOS / CÁNCER DE PULMÓN

ORGANIZAN

OBJETIVOS DOCENTES

- 1. Conocer recomendaciones de braquiterapia guiada por imagen de resonancia de GEC-ESTRO, GEB y GBFM, ICRU 89.
- 2. Reconocer beneficios de braquiterapia intersticial en tumores avanzados.
- 3. Facilitar la formación in situ con aplicadores intersticiales y planificación con casos clínicos.

PROFESORES

Silvia Rodríguez. Oncóloga Radioterápica. Clínica Benidorm.

José Pérez Calatayud. Físico médico. Hospital La Fe Valencia.

Inés Álvarez de Eulate. Radióloga. CHN.

Santiago Pellejero. Físico médico. CHN.

Elena Villafranca. Oncóloga Radioterápica. CHN.

Acreditación docente: 1.41 créditos

Inscripción: contactar con Elekta: elekta.spain@elekta.com

Colaboración:

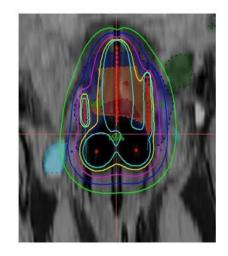

"I Workshop en Braquiterapia intersticial en el cáncer de cérvix"

Directores del Curso: Elena Villafranca. Santiago Pellejero

Destinado: Especialistas en Oncología radioterápica y <u>Radiofísica</u>, con Unidad de Braquiterapia.

Fecha: 15 y 16 de Junio de 2018.

Lugar: Complejo Hospitalario de Navarra. Edificio de Radioterapia. Pabellón J.

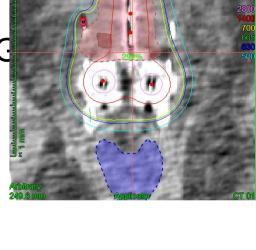

NEW ITEMS, (no so new......;;;;;;)

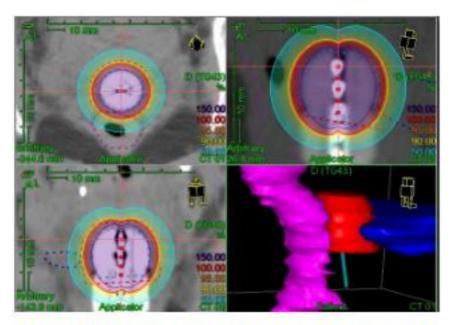

EMBRACE II:

- New Dose specificactions: D90, D98 (HRCTV and Q
- Keep in mind vaginal dose and toxicity
- New dose tolerance: planning aims and limits for prescribed dose for OAR
- TRAK

EMBRACE registration study: REGISTER MY PATIENTS AND TREATMET CHARACTERISTICS, AND TREATMENT OTCOME

XVIII REUNION DE CONSENSO EN BRAQUITERAPIA VAGINAL POSTOPERATORIA.

Salón de Actos.

Hospital Universitario Rey Juan Carlos

Dirección: Calle Gladiolo, s/n, 28933 Móstoles, Madrid

Comité Organizador

Dra. Pilar Samper Ots y Dr. Ramón Polo del Hospital Universitario Rey Juan Carlos. Móstoles.

Dra. Angels Rovirosa Casino y Dr. Antonio Herreros del Hospital Clinic de Barcelona.

Working Schedule Brachytherapy of Cervix Cancer **Preparation** 15'**l Patient** Surgical-nurse /Physician med.tech. Documents RTT DVH pre-planning Physician and Physicist **Anaesthesia** 45' Spinal/Epidural or Anaesthetist General / Anaesthesia-nurse Application IC±IS (TRUS) Physician / surg.-nurse/RT **Post Intervention Imaging** Multidisciplinary MR / CT RTT (diagnostic) supervision + discussion Team approach Physician and Physicist **Contouring** Organs at Risk RTT / Physician Target Volume Physician **Treatment Planning** Total 45 Reconstruction / Constraints RTT / Physicist Time Discussion and Validation Physicist and Physician 3h 45min Radiation Treatment RTT

Check list

PRE-REQUISITES

- Dummy run
- Workflow and various processes
- Applicators
- Treatment planning principles
- Analgesics
- Removal of application
- Manage the bleeding after removal
- Do not use sharp needles
- Optimization tools
- Learning Curve

Preconditions - Management

- Peri-operative Management (bowel preparation, measurements against thrombosis and infection, iv. hydration)
- Pain management anaesthesia (spinal / epidural / general)
- Sectional imaging (CT / MRI)
 - -at diagnosis and before brachytherapy (alternative 1)
 - -at diagnosis and at first brachytherapy (alternative 2)
 - -at diagnosis and at every brachytherapy (alternative 3)
- Equipment (appropriate set of applicators)
- Learning curve
