2 - Distributed Computation Based Car-following Control Integrating Optimal System Performance For A Platoon Of Autonomous Vehicles

Siyuan Gong, PhD Candidate, Illinois Institute of Technology, 3201 South Dearborn Street, Chicago, IL, United States, sgong1@hawk.iit.edu, Jinglai Shen, Lili Du

This research develops car-following control algorithms for a platoon of autonomous vehicles on a straight highway. The platoon is modeled as an interconnected multi-agent dynamic system subject to physical and safety constraints. A constrained optimization based control algorithm is developed to improve transient traffic smoothness and asymptotic dynamic performance. Distributed algorithms are proposed to compute optimal solutions, and stability analysis is carried out for the linear dynamics. Simulations are conducted to illustrate the efficiency of the proposed algorithms.

3 - Demand Adaptive Paired-line Hybrid Transit System In Radial Transit Network

Yu Nie, Northwestern University, A328 Technological Institute, 2145 Sheridan Road, Evanston, IL, 60208, United States, y-nie@northwestern.edu, Peng Chen

This paper proposes and analyzes a hybrid transit system in the radial transit network with both circular and radial transit lines. The hybrid transit system integrates the traditional fixed-route service with a demand adaptive service (DAS). The optimal design problem is formulated and solved. Both numerical experiments and simulation experiments are conducted to compare the performance of the proposed system with the same kind of hybrid transit system in the grid transit network.

4 - Shared-use Mobility And Parking Provision

Zhengtian Xu, University of Florida, Gainesville, FL, United States, zhengtianxu@ufl.edu, Yafeng Yin, Liteng Zha

Shared-use mobility services become increasingly important in meeting travel needs in metropolitan areas. The cruising of ride-sharing vehicles for customers generates additional traffic demand that may worsen the traffic condition. This study develops a parsimonious framework to investigate the allocation of a certain portion of road space to on-street parking for vacant ride-sharing vehicles. Various market competition situations, business models, and vehicle technologies are considered.

Distributed Control of Multi-Agent Networks

Sponsored: Aviation Applications

Sponsored Session

Chair: Shaoshuai Mou, Purdue University, 701 W. Stadium Ave., West Lafayette, IN, 47907-2045, United States, mous@purdue.edu

1 - A Distributed Algorithm For Solving Linear Algebraic Equations

Shaoshuai Mou, Purdue University, mous@purdue.edu

Solving linear algebraic equations is perhaps one of the most fundamental problems in all fields. Besides allowing decomposing a large linear equations into smaller ones to be cooperatively solved by a mutli-agent network, distributed algorithms for solving large linear equations only require each agent to know part of the linear equation, and can only communicate with its nearby neighbors. The distributed algorithm to presented (1.) is applicable to all linear equations; (2) converges exponentially fast; (3) works for time-varying networks; (4) allows asynchronous operations; (5) does not involve any time-varying step size.

2 - Control And Coordination Of Quadrotors

Wenlong Zhang, Arizona State University, Wenlong.Zhang@asu.edu

Quadrotors have attracted a lot of attentions in recent years due to its low cost and wide range of applications in product delivery, mapping, and surveillance. This talk will cover the estimation and control techniques to enable smooth operation of individual quadrotors. Moreover, design and coordination algorithms of a multi-quadcopter team will be introduced for enhanced capabilities and resilience.

3 - Stochastic Scheduling Estimation Of Multiple Discrete-time Linear Time Invariant Systems

Chong Li, Staff Research Engineer, Qualcomm Research & Development, Bridgewater, NJ, United States, lichong0436213@gmail.com

We proposed a stochastic scheduling strategy for estimating the states of multiple discrete-time linear time invariant dynamic systems, where only one system can be observed by the sensor at each time instant due to practical resource constraints. The idea of our stochastic strategy is that a system is randomly selected for observation at each time instant according to a pre-assigned probability distribution. We find the optimal pre-assigned probability in order to minimize the maximal estimate error covariance among dynamic systems. Finally, for scheduling implementation, we propose centralized and distributed deterministic scheduling strategies based on the optimal stochastic solution.

1 - Community-aware Charging Station Network Design For Electrified Vehicles In Urban Areas: Improving Accessibility, Reducing Emissions, And Promoting Walking

Sina Faridimehr, Wayne State University, sina.faridimehr@wayne.edu, Saravanan Venkatachalam, Ratna Babu Chinnam

Advantages of electric vehicles (EVs) include reduction of greenhouse gas and other emissions, energy security, and fuel economy. The societal benefits of large-scale adoption of EVs cannot be realized without adequate deployment of publicly accessible charging stations. In our research, we develop stochastic programming models to determine optimal infrastructure of charging stations for a community considering the uncertainties in state of charge for vehicles, arrival data based on origin-destination pairs, and walkable range within a community. We conducted computational experiments using various publicly available data sources.

2 - Capacitated Hydrogen Refueling Station Location Problem With Traffic Deviations Over Multiple Time Periods

Burcu Keskin, The University of Alabama at Tuscaloosa, bkeskin@cba.ua.edu, Mohammad Miralinaghi, Yingyan Lou, Arash M. Roshandeh

Construction of refueling stations is a major step toward the promotion of hydrogen fuel vehicles. In this study, we consider the problem of locating hydrogen refueling stations in a traffic network for intra-city trips via mathematical programming. The central planner aims to minimize the total system travel cost, including construction costs, operational costs and total system travel time cost. It is formulated as a mixed-integer linear model which is solved using Lagrangian relaxation and branch-and-bound algorithms. Numerical results demonstrate that refueling station location pattern can change with considering multi-period travel demand.

3 - Transnational Infrastructure Planning For Natural Gas Trucking

Ismail Capar, Texas A&M University, capar@tamu.edu, Michael J Kuby, Jong-Geun Kim

The European Union relies on oil for over 90% of its transportation fuels and spends one billion Euros a day on imported oil. To reduce this dependency, the EU is developing an integrated market for compressed (CNG) and liquefied (LNG) natural gas as alternatives to diesel for long-haul trucking. Motivated by this objective, we use forecasted road freight data from EU TransTools, and introduce several new side constraints for the flow-refueling location model to produce a more equitable distribution of covered flows across EU members.

Chair: Jay Parsons, University of Nebraska-Lincoln, Lincoln, NE, United States, jparsons4@unl.edu

1 - Flexible Stocking Strategies In A Variable Climate: From Research To Reality

John Ritten, University of Wyoming, Laramie, WY, United States, john.ritten@uwyo.edu, Justin Derner, Christopher Bastian, John Tanaka, David Agustine, Lauren Porensky, Mark Eisele, Kendall Roberts

Livestock producers must make decisions in a rapidly changing world. Precipitation-induced variability on forage production often makes it difficult to effectively match animal demand with forage availability. Weather events interact with price cycle dynamics creating additional difficulty for producers to react optimally to changing conditions. Further complicating the process is carry-over effects such as residual forage and soil moisture that can impact production. Consideration needs to be given to minimizing degradation of range resources, while also ensuring long-term economic viability.

2 - A Network Comparison Of Competing Institutions For Managing Water Against Hydropower And Irrigation Demands

Patrick O’Reilly, PhD Candidate, Mineral and Energy Economics, Colorado School of Mines, Golden, CO, United States, poreilly@mines.edu

Using a variational inequality approach, this paper investigates transaction cost consequences of choosing between alternative water institutions in light of their respective network structure, uncertain supply, and competing demands. Network formulation can reflect spatial, precedence, and institutional features associated with the flow of water through rivers, hydropower stations, and irrigated farmland. Preliminary boundary case results reflect what transaction cost theory suggests: where water rights can be made sufficiently complete, a centrally-planned approach does not fare better than a decentralized market equilibrium.

Chair: Yi-Jen Ho, Pennsylvania State University, Pennsylvania State University, University Park, PA, 16801, United States, hoy1@uci.edu

1 - Mobile App Analytics: Impact Of Popularity, Quality And Rank on Click And Conversion Performance

Shengjun Mao, University of California - Irvine, shengjum@uci.edu

The explosion in number and variety of mobile apps makes finding desirable ones a challenge, which in turn brings the significance for apps distributers to effectively display the apps. To understand users’ response to the listings of posted apps, we study the role of apps’ quality, popularity and positions in handsets screens on users’ click and download decisions based on a panel date set from an app recommendation engine. We found that when users make decisions to click an app, there are positive quality and popularity effects and negative position effect. However, when users decide whether or not to download apps, quality and popularity effects disappear and position effects becomes positive.

2 - An Empirical Analysis Of Price Dispersion In Electronic Markets

Jin Sik Kim, University of California-Irvine, Irvine, CA, 92617, United States, jinsk6@uci.edu, Vijay C Gurbaxani

Theory predicts that the price of homogeneous products at online retailers will exhibit low price dispersion; yet, there is empirical evidence to the contrary. This paper investigates price dispersion in homogeneous product markets based on uncertainty theory. We examine two types of uncertainty: seller and product uncertainty. We collect data in three product categories: search, experience, and credence goods. Our results show higher product uncertainty is consistent with higher price dispersion. Sellers with stronger reputations can set higher prices in product markets with higher uncertainty, resulting in price dispersion, but not otherwise.

3 - Product Upgrades With Innovation Uncertainty

Yiwei Wang, University of California-Irvine, derekw7@uci.edu

Firms usually upgrade their products by introducing an innovative attribute. This article looks at how a profit-maximizing firm design and position such upgraded versions, when products with traditional attribute has been supplied in the market. We specifically study the quality design and configuration strategy in the presence of innovation uncertainty, based on a product line selection framework.

4 - The Impact Of Digitization On Optimal Content Pricing Strategy

Ran Zhang, University of California-Irvine, ranz2@uci.edu

The widespread adoption of the Internet and digital technologies has transformed the distribution and consumption of information goods. We develop a parsimonious model to study pricing strategies of a publisher who offers information good in dual medium and in bundled medium. We develop optimal pricing strategies and show that while offering bundle of mediums and digital medium only (partial mixed bundling) is optimal under a wider range of market conditions, offering digital medium only is optimal under other market conditions. Offering information good or content in physical medium and in digital medium is not optimal as long as the two mediums are partial substitutes.

1 - Wind Turbine Wake Effects: Characteristics And Impacts On Wind Power Generation

Hoon Hwangbo, Texas A&M University, Dept. of Industrial & Systems Engineering, 3131 TAMU, College Station, TX, 77843-3131, United States, hhwangbo@tamu.edu, Andrew L Johnson, Yu Ding

When a wind turbine operates, rotating blades not only consume energy available in wind but also generate some turbulence, both changing characteristics of downstream wind thereby affecting power generation of downstream wind turbines. This phenomenon is referred to as wind turbine wake, and its effect on power performance is known to be significant. In this study, we observe characteristics of the wake effects from actual wind turbine data and quantify the effects on power performance of wind turbines.

2 - Statistical Monitoring Of Data Attacjs In Smartgrids

George Michailidis, University of Florida, gmichail@ufl.edu

Data attacks on the distribution network in SmartGrids have the potential to destabilize the power network, as well as impact the consumption patterns of electricity consumers.In this work, we provide an overview of such attacks and develop a statistical framework for their detection. The developed methodology is illustrated on synthetic and real data traces.

3 - Opportunistic Condition Based Maintenance Optimization For Offshore Wind Farm

Sanling Song, Postdoc, Rutgers University, 33 Livingston Ave, Room 250, New Brunswick, NJ, 08901, United States, lamusesi38sanling@gmail.com, Frank A Felder, David W Coit

Operation and maintenance cost for offshore wind farm can be 5-10 times higher than the cost for on-land wind farm. In this paper, opportunistic condition-based maintenance optimization model is developed. Two objectives we are interested in are wind farm maintenance cost and wind turbine availability or uptime. Genetic algorithm considering uncertainty is conducted, which is especially challenging because life experience for each component in the wind turbine is uncertain. Probabilistic Pareto frontier rather than deterministic Pareto front is obtained.

4 - Robust Optimization Based Power System Restoration For Incorporating Large-scale Wind Farms

Amir Golshani, University of Central Florida, Orlando, FL, United States, amir.golshani@knights.ucf.edu, Wei Sun, Qipeng Zheng

This presentation provides a novel two-stage optimization model for a faster and reliable power system restoration. The robust optimization approach is employed to immunize the solution against all possible realizations of wind uncertainties. With mixed-integer optimization in the inner-level problem the KKT condition cannot be directly applied. Thus, we adopt the column-and-constraint generation (C&CG) algorithm to solve the two-stage robust optimization problem. The proposed strategy can assist system operators to accomplish the restoration tasks accurately and harness wind energy more efficiently.

1 - A Spatial Calibration Model For Quality Prediction

Kaibo Wang, Tsinghua University, kbwang@tsinghua.edu.cn

The anisotropy of a carbon nanotube (CNT) film, which is a spatially distributed quality index, is difficult to measure in practice due to metrology and cost constraints. However, the anisotropy is highly correlated with the height of the CNT array, which can be measured in a much easier and more cost-effective way. In this talk, we propose a spatial model for predicting the anisotropy using the height. The model takes the spatially distributed two-dimensional (2D) height as an input and provides a predicted anisotropy distribution in a 2D space. If the anisotropy measures are obtained, the model can provide a more accurate prediction.

2 - Estimating Clearing Functions For Production Resources Using Simulation Optimization

Reha Uzsoy, NC State University, ruzsoy@ncsu.edu, Baris Kacar

We implement the Simultaneous Perturbation Stochastic Approximation (SPSA) algorithm, to estimate clearing functions (CFs) that describe the expected output of a production resource as a function of its expected workload from empirical data. A simulation model of a scaled-down wafer fabrication facility is used to generate the data and evaluate the performance of the CFs obtained from the SPSA.

3 - A BDD-based Approach For Designing Maximally Permissive Deadlock Avoidance Policies For Complex Resource Allocation Systems

Spyros Reveliotis, Georgia Tech, Atlanta, GA, United States, spyros.reveliotis@isye.gatech.edu, Zhennan Fei, Sajed Miremadi, Knut Akesson

The maximally permissive deadlock avoidance policy (DAP) for complex resource allocation systems (RAS) can be implemented through the identification and storage of a set of critical states of the underlying RAS state-space, known as minimal boundary unsafe states. This paper presents a symbolic approach, based on binary decision diagrams (BDDs), for efficiently retrieving the (minimal) boundary unsafe states from the underlying RAS state- space. Numerical experimentation demonstrates that the proposed method enables the deployment of the maximally permissive DAP for RAS with complex structure and large state-spaces with limited time and memory requirements.

4 - A Dynamic Control Algorithm For Distributed Feedback Control For Manufacturing Production, Capacity, And Maintenance

Seokgi Lee, Assistant Professor, University of Miami, 1251 Memorial Drive 281, Coral Gables, FL, 33146, United States, sgl14@miami.edu, Vittaldas V. Prabhu

We propose a dynamic algorithm for distributed feedback control which unifies the functions of production and maintenance scheduling at the shop floor level, and machinery capacity control at the CNC level, which are usually considered in isolation in practice. A continuous-time control theoretic approach is used to model dynamics of these three functions in a unified manner, considering stochastic machine failures and a corresponding maintenance interval. Theories of nonlinear control and discontinuous differential equations are used to analytically predict the system dynamics including the resulting discontinuous dynamics.

1 - Predicting Community Structure In Dynamic Networks: A Case Of Online Educational Networks

Yi-Shan Sung, Penn State University, yqs5097@psu.edu, Soundar Kumara

Community structure points to structural patterns in a network and reflects functional associations between entities. However, it is challenging to obtain timely updates of communities in a dynamic network in which changes are frequently introduced over time. We develop a model to predict community structure by integrating link prediction with community detection algorithms. We test the model efficacy using the data from nanoHUB.org, which is an online educational platform for science and engineering in nanotechnology. Predicting community structure in nanoHUB networks will help in developing an efficient recommendation system for the nanoHUB users and optimizing the resource allocation.

2 - Detecting Changes In Complex Systems Via Network Inference

Hoang M Tran, Texas A&M University, College Station, TX, United States, tran@tamu.eud, Satish Bukkapatnam

We propose a network based method to do change detection in transient complex systems. This is based on our approach to infer spurious-link-free network structures from time series. A spectral graph based method is used to detect process changes from these networks.

3 - Graph Reconstruction From High-dimensional Systems Of Additive Differential Equations

Ali Shojaie, University of Washington, Seattle, WA, United States, ashojaie@uw.edu, Shizhe Chen, Daniela Witten

We consider the task of learning a dynamical system from high-dimensional time-course data. We model the dynamical system non-parametrically as a system of additive ordinary differential equations. Most existing methods for parameter estimation in ordinary differential equations estimate the derivatives from noisy observations. This is known to be challenging and inefficient. We propose a novel approach that does not involve derivative estimation. We show that the proposed method can consistently recover the true network structure even in high dimensions, and we demonstrate empirical improvement over competing approaches.

4 - Modeling And Change Detection Of Dynamic Network Data By A Network State Space Model

Na Zou, Texas A&M University, College Station, TX, 77845, United States, nzou1@tamu.edu, Jing Li

Dynamic network data widely exist in social, biological, and engineering domains. There are two types of variability in dynamic network data: variability of natural evolution and variability due to assignable causes. Accurate and timely change detection from dynamic network data is important. Change detection is a classic research area in Statistical Process Control (SPC) and various approaches have been developed for dynamic data in the form of univariate or multivariate time series, but not in the form of networks. We propose a Network State Space Model (NSSM) to characterize the natural evolution of dynamic networks and integrate the NSSM with SPC for change detection.

1 - A Note On Real Estate Pricing With Exogenous Variables

Hiroshi Ishijima, Professor, Chuo University, 1-18 Ichigaya-tamachi Shinjuku, Tokyo, 1628478, Japan, hiroshi.ishijima.jp@gmail.com, Akira Maeda

We develop a pricing model of real estate that incorporates conventional hedonic attribute variables of real estate as well as exogenous variables, namely financial asset prices; this model is based on a theoretical pricing model that we, fundamentally develop. Specifically, our model features a pricing kernel expressed as the product of a cash-flow pricing kernel (stochastic discount factor) and a hedonic pricing kernel. Furthermore, we conduct an empirical analysis to understand Japanese real estate prices comprehensively. Our analysis reveals that the financial asset prices and conventional hedonic variables serve as the major determinants of Japanese real estate prices.

2 - Ensemble Model For U. S. Stock Major Index Prediction Using Economic Factors With Interactive Visualization

Yao-Te Tsai, Post-Doctoral Fellow, Auburn University, Auburn, AL, 36849, United States, yzt0007@auburn.edu, Bin Weng, Fadel Megahed, James Barth

The accuracy of the stock market prediction has been an attractive topic for researchers and public. However, it has still been remaining one of the most challenging tasks due to the non-linearity and non-stationary of the time series data. Our objective is to discover information and trends from macroeconomic perspectives to provide a foundation for the future stock market predictive model development. we investigate how macroeconomic factors that drive the U.S. major stock market index by applying the ensemble model. We also determine if the index of each sector would be driven from different factors. The last task is to predict the stock market index based on our variable selection.

3 - Capital Growth With Recycling And The Environmental Kuznets Curve

Fouad El Ouardighi, Professor, ESSEC Business School, Avenue B Hirsch BP 105, Cergy Pontoise, 95021, France, elouardighi@essec.fr

We investigate how the relationship between capital growth and pollution accumulation is affected by the source of pollution, that is, either production or consumption. We are interested in polluting waste that cannot be naturally absorbed, but for which recycling efforts are made to avoid massive accumulation with harmful consequences in the long run. We distinguish the cases where recycling efforts are capital-improving or capital-neutral. Based on both environmental and social welfare perspectives, we determine how the influence of the pollution source on capital growth and polluting waste accumulation is affected by the fact that recycling is capital-improving or capital-neutral.

Transportation, Rail II

Contributed Session

Chair: Yalda Khashe, University of Southern California, 3230 Overland Ave. APT 312, Los Angeles, CA, 90034, United States, khashe@usc.edu

1 - Train Timetable Based Integer Programming Model For Passenger Assignment Problem In Congest Urban Rail Line

Si Ma, Associate Professor, Southwest Jiaotong University, Chengdu, China, masi@home.swjtu.edu.cn, Gongyuan Lu, Lin Wang

We optimized passenger assignment problem (PAP) considering passenger waiting time, platform and car capacity to maximize transportation capacity in congest urban rail line. Using passenger_flow-Train_path network to integrate passenger behavior and timetable based train movement in space and time dimension, the PAP is modeled as a maximum flow problem with multi-sources and multi-sinks. In the real-world case of Chengdu urban rail line 1, the integer programming model is solved efficiently by commercial solver.

2 - Face Recognition Based Ticket Checking Solution In Speeding Train

Kui Yang, PH.D. Candidate, Southwest Jiaotong University, Chendu, 610031, China, ykylw@my.swjtu.edu.cn, Gongyuan Lu, Haifeng Yan

It is a big challenge to check rail ticket in almost every passenger section, due to great workload and passenger inconvenience. Integrated with ticket section, a face recognition based ticket checking solution is presented for strict and efficient checking. This visual-aided solution can automatically identify checking candidate in different section, avoid missing or multiple checking in the whole journey.

3 - Critical Systems Management Issues Of Implementing The Positive Train Control Technology In A Regional Railroad

Yalda Khashe, University of Southern California, 3230 Overland Ave. Apt 312, Los Angeles, CA, 90034, United States, khashe@usc.edu

Positive Train Control (PTC) is a generic term referring to a range of fully integrated technologies that overlay existing safety systems to prevent train-to-train collision and improve worker safety. One of the challenges that railroad industry is facing for implementing PTC is the complications of introducing this new technology to an already existing system and its effect on the technological, organizational and human subsystems and their interactions.

1 - Optimal And Heuristic Models For School Bus Fleet Size Problem

Jiayuan Zhang, Stony Brook University, 24 malvern lane, stony brook, NY, 11790, United States, jiayuan.zhang01@gmail.com, Herbert F. Lewis, Thomas Raymond Sexton, Sreekanth Mallikarjun

We present a new algorithm to minimize the number of school buses that a district must own to serve morning and afternoon routes subject to constraints on school bell times and pickup and delivery time windows. We compare our results to those produced by known optimal and heuristic models. Our proposed heuristic algorithm produces very good solutions in reasonable time.

2 - Combined Maintenance And Routing Optimization For Large-scale Problems

John Fontecha-García, Instructor, Universidad de los Andes, Cra 1 Este No 19A - 40, Bogotá, Colombia, je.fontecha10@uniandes.edu.co, Raha Akhavan-Tabatabaei, Daniel Duque, Juan Pablo Rodríguez, Andres L Medaglia

We tackle the problem of planning and scheduling maintenance operations of a set of geographically distributed sites that are subject to non-deterministic failures. We extended a combined maintenance and routing optimization approach that is based on two components: a maintenance model that is used to determine the optimal time to serve a site; and an MIP-based split (route-first, cluster-second) procedure that routes the crews who conduct maintenance operations. We applied our method on a case study for the sewer system in the city of Bogotá.

4 - Simultaneous Production And Transportation Problem: A Case Of Additive Manufacturing

Gourav Dwivedi, Doctoral Student, Indian Institute of Management, Indian Institute of Management, IIM Road, Off Sitapur Road, Lucknow, 226013, India, fpm14013@iiml.ac.in, Yogesh K Agarwal, Rajiv K Srivastava

We present a new situation of simultaneous production and transportation problem arising in additive manufacturing (AM) application. A vehicle with AM machine produces parts while approaching the customers' location, saving the production time while transporting. Thus, delivery time depends on the travel time and the production completion time. This presents a unique operational decision problem to optimize delivery routes under different decision settings. A mixed-integer linear programming formulation is presented to decide the sequence of deliveries for the minimum total trip time. Tighter formulation is demonstrated through valid inequalities and their effect on lower bounds.

5 - Geometric Partitioning And Robust Ad-hoc Network Design

Mehdi Behroozi, University of Southern California, 3120 Bagley Ave, Apt 5, Los Angeles, CA, 90034-2930, United States, mehdi.behroozi@usc.edu, John Gunnar Carlsson, Xiang Li

We present fast approximation algorithms for the problem of dividing a given convex geographic region into smaller sub-regions so as to distribute the workloads of a set of vehicles. Our objective is to partition the region in such a fashion as to ensure that vehicles are capable of communicating with one another under limited communication radii. We consider variations of this problem in which sub-regions are constrained to have equal area or be convex, and as a side consequence, our approach yields a factor 1.99 approximation algorithm for the continuous k-centers problem on a convex polygon.

1 - How Do Countries' Direct Manufacturing Costs And Hidden Costs Affect Manufacturers' Performance? An Empirical Study

Zhexiong Tao, McGill University, 1001 Rue Sherbrooke O, Montreal, QC, H3A1G5, Canada, zhexiong.tao@mail.mcgill.ca

In this study, we attempt to investigate the relationship between countries' direct manufacturing costs and hidden costs and local manufacturers' performance. A research model is proposed and then tested by an international dataset.

2 - Joint Pricing And Production Decisions With Yield Uncertainty And Downconversion

Fen Lu, Huazhong University of Science and Technology, 1037 Luoyu Road,Hongshan District, Wuhan, China, Wuhan, 430074, China, lufen@hust.edu.cn

We consider a firm who supplies two types of products: high-end and low-end. Because of the uncertainty in the production process, the yield rate of the high-end product is uncertain.The substandard high-end products caused by the yield uncertainty can be transformed into the low-end product with a certain cost. We characterize the optimal pricing and production decisions and develop an algorithm to compute the optimal solution. We also investigate the impact of the yield uncertainty on the firm's performance, and how stability of market demand, emergent fulfillment costs and downconversion cost influence this effect.

3 - Supply Chain Strategies And International Tax Arbitrage

Hung Tuan Do, Assistant Professor, University of Vermont, 55 Colchester Avenue, Burlington, VT, 05405, United States, hdo@uvm.edu, Masha Shunko, Andy A Tsay

Our model and analysis demonstrate that the MNF's preferences regarding the operating structures are not necessarily an obvious ordering based on the amount of risk and decision authority transferred to the division. We derive and analyze threshold values of the performance parameters that describe the main tradeoffs involved.

4 - Dynamic Substitution Policy For Selling Multiple Products

Chengzhang Li, Purdue University, West Lafayette, IN, United States, li1392@purdue.edu, Qi Feng, J. George Shanthikumar

We study a firm selling multiple substitutable products over a selling horizon. In each period, when the random demands materializes, the firm may choose one product to meet the demand for another at a cost. We design an efficient algorithm that delivers close-to-optimal performance. We also show that restricting substitutions between products with adjacent characteristics can yield a benefit close to allowing full substitution among all products. Moreover, with an efficient dynamic substitution policy, the value of optimizing initial stock level becomes negligible.

5 - Shipment Consolidation Under Different Delivery Date Options For E-tailing

Tugce Vural, Smeal College of Business, Pennsylvania State University, Smeal College of Business Department of Supply Chain and Information Systems, 454 Business Building, University Park, PA, 16802, United States, tugcevural@psu.edu, Nesim K Erkip

We consider a shipment consolidation problem for an e-retailer that provides two types of services. In regular service, the e-retailer guarantees a maximum delivery time to its customers, whereas in premium service customers receive their items in negligible time. The consolidation operation is analyzed under deterministic demand structure. With the objective of maximizing average profit, a non-linear program with linear constraints is devised. Decision variables are durations for satisfying different service combinations. The structure of optimal policy is derived by using KKT conditions.

1 - Equilibria Of Decision Signalling Problem In A Time Sensitive Market

Sheng Zhao, NUS, 14-255D UTwon Residence South Tower, Singapore, 138600, Singapore, zhaosheng@u.nus.edu

A timely launch of new products is crucial for their success/failure.Time is a source of competitive advantage and time-based competition has been recognized as a key feature in different industries such as smartphones, video games, personal computers, automobiles etc. While releasing a product earlier is helpful from the marketing perspective because customers are usually time-sensitive, operational constraints, primarily due to limited production rate, imply that less inventory will be available for sale. We explore this trade-o both under monopoly and competition.

2 - Disruption Management For Outbound Baggage Handling With Worker Assignment

Christian Ruf, TU Muenchen, Arcisstr. 33, Munich, 80333, Germany, christian.ruf@tum.de

Outbound baggage is transferred to departing airplanes. Flights have to be assigned to handling facilities, the handling has to be scheduled and workers have to be staffed to the flights. We propose a model and a solution procedure to plan the outbound baggage handling rolling planning fashion which allows for considering disruptions and updates of problem parameters at each decision epoch. In a computational study we show that the procedure is capable of giving a good solution in a reasonable amount of time even under severe disruptions.

3 - Demand Learning And Agreement Delay In Technology Adoption

Wei Zhang, University of Hong Kong, Pokfulam Road, Hong Kong, China, zhangw.03@gmail.com

Delay of price agreement is common when new technologies are being adopted. Existing theories attribute agreement delay in bilateral negotiations to either asymmetric information or behavioral constraints. We discover that incentives to learn about the uncertain demand drive delay of agreements, even when information is symmetric. Contrary to most existing theories, costly delay can benefit both negotiators.

1 - Constraint Programming Models For The Irregular Cutting And Packing Problems

Luiz Henrique Cherri, University of São Paulo, São Carlos, 13566-590, Brazil, luizcherri@gmail.com,
Maria Antonia Carravilla, Cristina Ribeiro, Franklina M Toledo

We propose new constraint programming models for variants of the two-dimensional irregular cutting and packing problem. In the literature, several heuristics were proposed for some problem variants, however there is no exact method or mathematical model for many of them. Using the constraint programming models we can represent and solve the irregular cutting and packing variants by exact methods. Since the enforcement of the no overlap among the pieces are the core constraints of all the problem variants, the formulations are built around this basis.

2 - An Iterative Method For Biobjective Mixed Integer Linear Programming Models

Hadi Farhangi, Research Assistant, Missouri University of Science and Technology, 1870 Miner Circle, 236, Engineering Mgmt & Systems Eng, Rolla, MO, 65409, United States, hfrhc@mst.edu, Dincer Konur

In this study, we propose an iterative method to generate the complete set of Pareto efficient solutions for biobjective mixed integer linear programming models. The Pareto efficient set is obtained by sequentially solving mixed integer linear programming models and utilizing the properties of the feasible search space. A numerical study demonstrates the performance of the solution method.

3 - Ensuring Scalability And Re-Usability Of Spreadsheet Analytical And Optimization Models

Larry J LeBlanc, Professor, Vanderbilt University, Owen Graduate School of Mgmt, 401 21st Ave South, Nashville, TN, 37203, United States, larry.leblanc@owen.vanderbilt.edu, Thomas A Grossman

Spreadsheet optimization models are harder than their algebraic counterparts to scale up and down in size. We show how to overcome this spreadsheet scalability disadvantage—We show how to program an optimization model in a spreadsheet that can easily be scaled up or down in size and re-optimized using the Excel Solver as easily as algebraic models. We give examples involving supply chain optimization.

4 - A Novel Branching Rule For Branch And Bound Based on Mahalanobis Distance

Abdulaziz Saud Alkabaa, PhD Candidate, University of Tennesee, 1001 Cain Oak Place, Apt 1001, Knoxville, TN, 37909, United States, aalkabaa@vols.utk.edu, Alberto Garcia-Diaz

The critical rules affecting the Branch-and-Bound (B&B) algorithm's solution performances are mostly regarded to the selection strategies of the search trees' variables and nodes. These strategies can significantly impact on the algorithms' efficiency. The available branching strategies in the literature, however, are not reliable in large problems (Linear Integer problems). In this research, we propose a novel branching strategy that is based on the concept of Mahalanobis Distance. Our analytical and numerical results show that the purposed strategy can effectively improve the B&B solution performances and works capably in a range of problem sizes.

Behavioral Operations I

Contributed Session

Chair: Nazaré Rego, Escola de Economia e Gestão, Universidade do Minho, Braga, Portugal, nazare@eeg.uminho.pt

1 - Study Of Patient Satisfaction Perception Based On Medical Experience And Health Cognition

Jianjie Zhang, Beijing Institute of Technology, Beijing, China, zhjj_2013@163.com, Jinlin LI, Rong Zhang, Jian Xue

This paper examines patient experience and health cognition in outpatient from nine cities of China.By conducting discrete choice experiments,we identify discrepant patients in several attributes and the individual-difference about the health cognition that can explain such discrepancy.For the high degree of the health cognition patients,medical environment and waiting time affection is not significant.however,for the low degree of group,both two attributes affect significantly.In addition to providing the empirical description in China's healthcare market,our study offers patient behavioral optimization suggestions to improve patient satisfaction perception.

2 - Detecting Market Irrationality Using News Sentiment Transfer Entropy

Anqi Liu, PhD Candidate, Stevens Institute of Technology, Hoboken, NJ, 07030, United States, aliu@stevens.edu, Steve Y Yang

Studies in behavioral finance have shown that investors are not rational, and market sentiment and returns have complex interactions. In this study we explore the non-linear relationship between news sentiment and market returns according to the transfer entropy statistic which identifies the amount of directional information flow. We identify two market regimes: sentiment dominance and market dominance. Further analysis suggests that the sentiment dominance indicates more irrational market activities contributing to elevated mispricing and high volatility, while market dominance reflects informational market efficiency.

3 - The Dark Side Of The Singularity: Can OR/MS Help?

John D C Little, Institute Professor, Massachusetts Institute of Technology, M.I.T. Sloan School Of Management, Room E62-534, Cambridge, MA, 02142, United States, jlittle@mit.edu

The "Singularity" is the point in time when artificial intelligence (AI) exceeds human intelligence. This may occur by putting AI on computers, by biological creation, or by a mixture of both. Some of the people writing about this or developing advanced AI are Victor Vinge, Ray Kurzweil (the Singularity is Near), Tom Malone, Ben Goertzel and Hugo de Garis. The dark side is that most people in this room will be left far behind. Kurzweil notes that AI develops exponentially, whereas most of us extrapolate linearly.

4 - Performance Effects Of Diversity Of Experience In Fluid Teams

Antti Tenhiala, IE Business School, Madrid, Spain, antti.tenhiala@ie.edu, Constantin Alba, Fabrizio Salvador

Analyzing fluid teams in a software services setting, we study the performance effects of diversity of experience, partitioning the diversity construct into three dimensions: segmentation, disparity, and variety. We also explore how project complexity moderates the performance effect of each diversity dimension. The results show that depending on the dimension, diversity of experience may have either negative, positive, or inverted-U relationship with team performance and that project complexity may make the effect either more beneficial or more detrimental.

5 - A System Dynamics Analysis Of Cautious Materials Management In Hospitals

Nazaré Rego, Escola de Economia e Gestão, Universidade do Minho, Braga, Portugal, nazare@eeg.uminho.pt
Nazaré Rego, INESC TEC, Faculdade de Engenharia, Universidade do Porto, Porto, Portugal, nazare@eeg.uminho.pt, João Claro, Jorge Pinho de Sousa

The supply system of a hospital provides a wide variety of services and products through a network composed of central departments and relatively autonomous wards. This system has to assure a high service level, particularly at critical wards. In this context, a just-in-case approach to inventory control has been frequently observed and, when the inventory at the DC is insufficient to meet all requests, priority in its allocation may be given to critical wards. We use System Dynamics to analyze the effect of these practices on inventory levels and related service level of a hospital supply system. Our results indicate that they may have a negative impact on the desired materials management outcomes.

Decision Analysis

Contributed Session

Chair: Jordi Weiss, PhD Student, Unil, Lausanne, 1022, Switzerland, jordi.w@outlook.com

1 - Multi-modal Optimization Of WINTIME As A Game Performance Metric And Rankings Basis With An Application To College Football

Christopher Keller, Assistant Professor, East Carolina University, Department of Marketing & Supply Chain, College of Business, Greenville, NC, 27858-4353, United States, kellerc@ecu.edu

WINTIME is the elapsed clock time for the winning team's score to exceed the losing team's final score. WINTIMES can be used to generate a rating system and an estimated WINTIME. The resulting optimization problem is to minimize the errors between the observed and the estimated WINTIMEs. For college football, the model has 129 variables and is multi-modal. Excel Solver solutions are discussed. Accuracy is comparable to other systems with predictive accuracy above 70% and retrodictive accuracy above 85%. The system could also be applied to other sports like hockey or soccer.

2 - Should I Stay Or Should I Go? The Cognition Of Exploration And Exploitation

S.S. Levine, University of Texas, Dallas, TX, 75080, United States, sslevine@gmail.com, Charlotte Reypens

In many life situations, people choose sequentially between repeating a past action in expectation of a familiar outcome (exploitation), or choosing a novel action whose outcome is largely uncertain (exploration). For instance, in each quarter, a manager can budget advertising for an existing product, earning a predictable boost in sales. Or she can spend to develop a completely new product, whose prospects are more ambiguous. Using experiments in a lab and a labor market, we examine what affects these decisions. We investigate traits of the decision-makers, such as risk aversion, but also their history. We find that the past matters, greatly: What you experience counts as much as who you are.

3 - A POMDP Model For Personalized Depression Monitoring

Jue Gong, Graduate Student, University of Washington, Industrial & Systems Engineering, Box 352650, Seattle, WA, 98195, United States, gongjue@uw.edu, Shan Liu

Mitigating depression has become a national health priority as it affects 1 out of 10 American adults. We formulate a partially observable Markov decision process (POMDP) in order to find an optimal monitoring schedule for anindividual patient. The state of the POMDP combines the health state of the patient and the direction of health change. We estimated the transition and emission matrices by extending the Baum-Welch algorithm to include a mixture of multiple transition matrices. We solved the model using the Bellman Equation via dynamic programming algorithm.

4 - Remanufacturing Decisions In A Close-loop Supply Chain With Extended Warranty Options

Kunpeng Li, Utah State University, 767 Eagle View Dr., Providence, UT, 84332, United States, kunpeng.li@usu.edu, Yang Li

The study addresses the problem of choosing the appropriate reverse channel structure for collecting of used products. We consider a two-echelon supply chain with a single manufacturer and a single retailer. By comparing five different reverse channel formats, we intend to understand how close-loop supply chain structure influences the use-product collection. We also study the impact of extended warranty on the consumption of remanufactured products.

5 - Using Online Games To Develop Manager Intuition About Demand Randomness

Jordi Weiss, PhD Student, Unil, Lausanne, 1022, Switzerland, jordi.w@outlook.com, Michael Bean, Suzanne de Treville

Quantitative-finance methods applied to the supply chain dramatically improve incorporation of demand risk into supply-chain decisions. Use of these methods is hindered by managers lack of intuition about demand randomness. We use online games to allow managers to apply such methods in the face of randomness arriving from different forecast-evolution processes (instantaneous volatility or jump diffusion). We present the results from using these games at the policy level for three cantons in Switzerland, demonstrating how increased intuition about randomness helps decision makers to consider profitable options that are counterintuitive and non linear.

Chair: Ed Klotz, IBM, PO Box 4670, Incline Village, NV, 89450, United States, klotz@us.ibm.com

1 - Solving Large Scale Grid-based Location Problems

Noor E Alam, MD, Assistant Professor, Northeastern University, 334 SN, 360 Huntington Avenue, Boston, MA, 02115, United States, mnalam@neu.edu, John Doucette

This talk will present mathematical models for grid-based location problems (GBLPs) with two case studies. Apart from presenting computational difficulty of the GBLPs, it will also discuss two problem-specific integer linear program (ILP) based decomposition algorithms to solve large-scale instances.

2 - A Mixed-integer Programming Approach To Optimize Typing Method And Design Of Touchscreen Keyboards On Smartphones

Mohammad Ali Alamdar Yazdi, PhD Student, Auburn University, 354 W Glenn Ave, Auburn, AL, 36830, United States, mza0052@auburn.edu, Ashkan Negahban, Fadel Mounir Megahed

Millions of people use smartphones for different typing purposes. There are significant differences in the design of keyboards for smartphones. Optimization of typing method and improvements in the design of touchscreen keyboards on smartphones is expected to have a significant impact on the total typing time. A MIP model is developed to optimize typing zones for fingers in two-thumb typing with the objective to minimize the total typing time. Through extensive experimentation, different keyboard dimensions are also compared to find the optimal keyboard design. The results shows that the best keyboard design has square keys with minimum possible horizontal and vertical spaces between the keys.

3 - Solution Value Contingent Cuts For Solving Hard Generalized Assignment Problems

Robert M Nauss, Professor, University of Missouri - St Louis, 3816 Boca Pointe Dr., Sarasota, FL, 34238, United States, robert_nauss@umsl.edu, Jeremy William North

Define hard generalized assignment problems (GAP) to be those that take more than one hour CPU time to prove optimality. Tremendous strides have been made in the capability of "off the shelf" software, such as GUROBI, to solve general integer linear programs (ILP). However, some classes of ILPs remain difficult to solve to optimality in a reasonable amount of time. Certain instances of the GAP exhibit this behavior. While good feasible solutions are found relatively quickly, the issue remains in proving optimality. We introduce some novel cuts (and methods for deriving said cuts) that are applied with an "off the shelf" solver through the use of CALLBACK functions. Computational results are presented.

4 - Improved Analysis Of Infeasible Mixed-integer Linear And Quadratic Programs

Ed Klotz, IBM, P.O. Box 4670, Incline Village, NV, 89450, United States, klotz@us.ibm.com, John W Chinneck, Andrew Scherr

Analysis of infeasible MILPs and MIQPs is complicated by the integer restrictions (IRs). Current techniques return a minimal infeasible subset of the linear constraints and variable bounds by solving a series of MILPs. They do not find a minimal subset of the IRs, because of the significant additional computational cost. We develop efficient ways to find a minimal subset of the IRs and use this to speed the isolation of a true Irreducible Infeasible Subset for MILPs and MIQPs. This is helpful when a variable is accidentally specified as integer.

Opt, Network I

Contributed Session

Chair: Seyed Mohammad Nourbakhsh, Sabre, 3150 Sabre Drive, Southlake, TX, 76092, United States, seyed.nourbakhsh@sabre.com

1 - Enhanced Robust Operational Aircraft Routing

Seyed Mohammad Nourbakhsh, Sabre, 3150 Sabre Dr, Southlake, TX, 76092, United States, seyed.nourbakhsh@sabre.com, Dong Liang, Xiaodong Luo, Xiaoqing Sun, Sergey Shebalov

Enhanced Robust Operational Aircraft Routing (E-ROAR) serves as an airline planning decision support solution that is used as a post-process to the Fleet Assignment Model (FAM) to bridge the chasm between Airline Planning and Airline Operations. E-ROAR considers connections, and maintenance requirements; and provides fleet assignments and through connections feasible for Crew Planning, Maintenance Planning, and Airline Operations. The output from E-ROAR is given to Airline Operations, where tail assignments are made. We propose an advanced solution approach by combining heuristic and optimization methodologies. Computational results demonstrate significant improvement.

2 - Managing Demand Uncertainty in Collaboration Mechanism Design for Carrier Alliances

Yuhan Wang, University of California, Irvine, CA, wangyuhan1101@gmail.com, Luyi Gui, Ozlem Ergun

A carrier alliance refers to a cooperative among transportation companies that often collaborate via sharing service network capacities. In this paper, we consider a type of collaboration mechanism via capacity exchange prices that has been widely adopted in practice, and aim to provide a comprehensive analysis of its coordination effectiveness under demand uncertainty. In particular, we analyze the structure of service networks of sea cargo alliances in practice and develop a decomposition algorithm to not only much simplifies the problem but also enables a detailed analysis into the structure of a robust exchange prices and the capacity-demand properties of networks where such prices exist.

3 - Interdiction Learning-based Approaches To Combat Security Threats On Information Systems

Forough Enayaty Ahangar, University of Arkansas, Fayetteville, AR, United States, fenayaty@email.uark.edu, Chase Rainwater

We consider a information system connected across a network of servers. In part one of the talk, we solve an interdiction-based model to strategically determine how content is allocated amongst available servers so to minimize the impact of a denial of service attack. In part two of the talk, we provide an operational framework for identifying network threats across the chosen network structure via a learning-based framework. Roles of optimization within this framework are highlighted and the methodology is applied to network data taken from a national laboratories computer logs.

4 - Optimal Linepack Planning Models For Gas Transmission Network

Trung Hieu Tran, Postdoctoral Research Fellow, The University of Warwick, Coventry, CV4 7AL, United Kingdom, t.h.tran@warwick.ac.uk, Simon French, Rhys Ashman, Edward Kent, Mark Hamling, Ben Dickel

National Grid, the gas network operator in the UK, experiences challenges maintaining pressure and linepack (quantity of gas in network) limits due to the transient behaviour of customers in an open market. In this paper, 2 mixed-integer programming models are proposed for optimal linepack planning (i.e. considering the compressibility of natural gas in pipelines) to compensate for the fluctuation of gas flows. The first model minimizes total deviation between simulated & target linepack such that all demand is satisfied. The second model determines time and actions to minimize total cost for resolving linepack deficit. The efficiency of models has been validated in case studies at National Grid.

1 - Interaction Between Operational Efficiency And Doctor Incentives In Outpatient Services

Guoming Lai, UT Austin, 1 University Station, B6500, Austin, TX, 78712, United States, laiguoming@gmail.com, Xiaofang Wang

This paper studies the interaction between a doctor and a population of patients in a congested health service delivery system. The doctor's prescribing decisions depend on her diagnostic/treatment ability, level of altruism and the institutional framework. Some patients are strategic and decide to see this doctor based on perceived quality, congestion and monetary costs. Within such a setting, we study the socially optimal decisions and provide policy insights.

2 - Equitable Nurse Scheduling By Goal Programming

Esra Agca Aktunc, Assistant Professor, Kadir Has University, Kadir Has Caddesi Cibali, Istanbul, 34083, Turkey, esra.agca@khas.edu.tr

Hospitals have to provide continuous service by employing the shift system and workers, mainly doctors and nurses, are required to work efficiently to avoid errors. Quality of healthcare services can be improved significantly if the nurse shifts are scheduled according to nurses' preferences and by distributing the workload equitably. Schedules should also abide by hospital policies and workload requirements in each shift by assigning nurses with different skill sets. In this study, monthly nurse scheduling problem is modeled and solved by goal programming observing goals that represent nurse and patient satisfaction with fairness measures such as the number of night shifts and weekend shifts.

3 - An Approximate Solution Approach For Blood Management When There Are Multiple Independent Sources Of Supply

David C Novak, Associate Professor, University of Vermont, 310 Kalkin Hall, 55 Colchester Avenue, Burlington, VT, 05405-0157, United States, dnovak@bsad.uvm.edu, Marilyn T Lucas, S. Karti Puranam

We present an approximation method to solve the infinite horizon, fixed lifetime perishable, inventory model with a lifetime of $m > 2$ periods, where there are two independent sources of supply. One source is blood ordered by the blood bank. The other source is blood that is randomly transferred from smaller, lower-usage hospitals in a regional blood exchange network to blood bank. We formulate a DP to solve the multi-period cost minimization problem and test our solution approach both theoretically and empirically.

4 - Improve Service Levels And Reduce Labor Cost Using Different Float Nursing Level Strategies Under Staff Absences In Hospitals

Kamil Ciftci, Lehigh University, 200 West Packer Avenue, Bethlehem, PA, 18015, United States, kac208@lehigh.edu

Nurse shortage is one of major problems in Healthcare Systems. Float nurse strategy is an alternative solution method in hospitals to minimize nurse shortage issue. In this research, we investigate service level, staff absences and economic effects of nurse shortage to find a core regular unit nurse level with flexible float nursing strategy. Under different regular nurse core levels, optimal service and float nurse levels are determined. Performance of our model is also compared with different service level methods in literature. Case study results demonstrate our model provide higher service level and decrease labor cost comparing with current practice in a local hospital.

5 - Design Of Multi-stage Multi-provider Hybrid Appointment System For Patient Scheduling Under Uncertainty

Sharan Srinivas, PhD Candidate and Research Assistant, Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16802, United States, sus412@psu.edu, Arunachalam Ravindran

Recent research focuses on designing hybrid appointment systems (HAS) for patient scheduling by combining open access and pre-booking scheduling methods. However, the multi-stage nature of patient flow, patient availability and uncertainties in outpatient clinics are rarely integrated in the design. We propose a deterministic model, and scenario based Monte Carlo approach to address this gap. The proposed approach aims to improve patient satisfaction and resource utilization by determining the percentage of appointments reserved for pre-booking and open access. A case study with real data from a Family Medicine clinic is used to show the feasibility of the proposed approach.

1 - Investigating The Impact Of Social Influence On The Personalization-privacy Paradox: An Eye Tracking Study

Thomas Frick, PhD Student, Rotterdam School of Management, Burgemeester Oudlaan 50, Rotterdam, 3062PA, Netherlands, frick@rsm.nl, Ting Li, Paul Pavlou

Using consumers' personal information to personalize ads does not only increase perceived ad relevance but also triggers consumer privacy concerns. To study this personalization-privacy paradox, we use eye-tracking technology and investigate how social influence affects consumers' perceived ad relevance and privacy concerns. By objectively measuring visual attention, we obtain a rich understanding of how users affectively and cognitively process information and assess ads. Our results provide insights into the mediating role of attention within the personalization-privacy paradox.

2 - Non-contractual Customer Retention In Multichannel Settings

Chun-Wei Chang, Assistant Professor, Governors State University, 1 University Parkway, University Park, IL, 60484-0975, United States, cchang@govst.edu

We present a framework for estimating multichannel customer relationship dynamics in a non-contractual setting that flexibly allows for relationship revival and investigates the effects of different channel experiences and marketing communication on retention and profitability. We use a multi-segment, multivariate hidden Markov modeling framework to model three managerially relevant customer behaviors: purchase amount, purchase incidence, and channel choice. We uncover two latent relationship states that customers migrate to and from - an active state and an inactive state characterized by different levels of purchase frequency, responsiveness to marketing, and profitability.

3 - An Analysis Of Menus Of Multi-part Tariffs

Ryan Choi, Assistant Professor of Marketing and SCM, Eastern Michigan University, 300 W. Michigan Ave., College of Business, Eastern Michigan University, Ypsilanti, MI, 48197, United States, jchoi20@emich.edu, Taewan Kim

We study which characteristics of three-part tariffs (3PTs) generate greater profit than two-part tariffs and examine the optimal values of 3PTs. Under an assumption of consumer heterogeneity and a full extraction of low type segment's surplus, the seller can extract more of high type surpluses. Literatures argue that offering high type contracts only may be more profitable than keeping the low type paying high information rent. Since the firm can charge greater rent from the high type, offering 3PTs contracts to both high and low segments will be more profitable even though the taste parameter is extremely low, regardless of the proportion of the low type.

Award Session

Chair: Robin Qiu, Penn State University, 30 E. Swedesford Road, Malvern, PA, 19355, United States, robinqiu@psu.edu

1 - Bike-share Systems: Accessibility And Availability

Ashish Kabra, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, ashish.kabra@insead.edu, Elena Belavina, Karan Girotra

This paper estimates the relationship between ridership of a bike-share system and its design aspects— station accessibility and bike-availability. Our analysis is based on a structural demand model that considers the random-utility maximizing choices of spatially distributed users, and it is estimated using high-frequency system-use data from the bike-share system in Paris and highly granular data on sources of bike-share demand. A novel model separates the long-term and short-term effects of higher bike-availability. Because the scale of our data render traditional numerical estimation techniques infeasible, we develop a novel transformation of our estimation problem.

2 - Queues With Redundancy: Is Waiting In Multiple Lines Fair?

Leela Aarthy Nageswaran, Carnegie Mellon University, 308 GSIA, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, leelaaarthy@gmail.com, Alan Scheller-Wolf

We study the performance of two queues serving two classes of customers, one of which is redundant: a redundant customer joins both queues simultaneously and is "served" when any one of her copies completes service. Applications of redundancy range from supermarkets with multiple checkout lines to multiple listing for kidney transplants. By analyzing different policies that a non-redundant customer may use to join a queue when faced with different levels of system information, our model provides fundamental insights on optimal queue-joining policies and on fairness in such systems.

3 - Online Decision-making With High-dimensional Covariates

Hamsa Sridhar Bastani, Stanford University, 10 Comstock Circle, Apt 304, Stanford, CA, 94305, United States, hsridhar@stanford.edu, Mohsen Bayati

Big data has enabled decision-makers to personalize choices based on an individual's observed characteristics. We formulate this problem as a multi-armed bandit with high-dimensional covariates, and present a new efficient algorithm that provably achieves near-optimal performance. The key step in our analysis is proving convergence of the LASSO estimator despite non-iid data induced by the bandit policy. We evaluate our algorithm using a real patient dataset on warfarin dosing; here, a patient's optimal dosage depends on her genetic profile and medical records. Our algorithm outperforms existing bandit methods as well as physicians to correctly dose a majority of patients.

4 - An Efficient Algorithm For Dynamic Pricing Using A Graphical Representation

Swati Gupta, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States, swatig@mit.edu, Maxime Cohen, Jeremy Kalas, Georgia Perakis

We study a multi-period, multi-item pricing problem: maximize the total profit by choosing feasible prices that satisfy various business rules. We develop a graphical model that can solve the problem for small memory. We make no assumption on the structure of the demand. For large memory, we show NP-hardness and approximate general demand functions using the reference price model. We give an approximation to solve the latter, extend it to handle cross-item effects among multiple items using the notion of a virtual reference price. We cluster items into blocks and incorporate global business constraints, and finally validate our results on demand models calibrated by real supermarket data.

5 - Evaluating The First-mover's Advantage In Announcing Real-time Delay Information

Siddharth Prakash Singh, PhD Candidate, Tepper School of Business, Carnegie Mellon University, Tepper School of Business, 5000 Fobes Avenue, Pittsburgh, PA, 15213, United States, sps1@andrew.cmu.edu, Mohammad Delasay, Alan Scheller-Wolf

We study queueing models of two comparable service providers competing for market share. The announcer (A) voluntarily provides real-time delay information, for example on a website. For the non-announcer (N), customers are only aware of a periodically updated long-term average delay. Customers make patronage decisions based on available delay information. We investigate how A, as the first-mover in announcing real-time delay information, influences market shares and customer delays. We find that when A is not the higher-capacity provider, she benefits on both market share and delay. However, when A is the higher-capacity provider, announcing may result in lower market share or longer delays.

1 - A Kalman Filter Approach For Dynamic Calibrationof a Simplified Lower-Order Car Following Model

Kerem Demirtas, Arizona State University, 699 S. Mill Ave. Tempe, Brickyard Engineering 553, Tempe, AZ, 85281, United States, kdemirta@asu.edu, Pitu Mirchandani, Xuesong Zhou

In this study, we are interested in dynamic calibration of car following parameters in order to explore both inter-driver and intra-driver heterogeneity. Specifically, we offer an augmented state space system for a lower order linear spacing car following model developed by Newell and implement a modified Kalman filter algorithm in order to track the leader-follower pairs and simultaneously predict and estimate the parameters related with the behavior of the following drivers. The algorithm is tested on the trajectories from NGSIM data and show satisfactory results. Interpretation of the results and promising future research directions are given.

2 - Efficient Supply Calibration Of Large-ScaleTraffic Simulators

Kevin Zhang, Massachusetts Institute of Technology, Cambridge, MA, United States, kzhang81@mit.edu

In this presentation, we propose a simulation-based optimization algorithm for the supply calibration of stochastic traffic simulators. We present a metamodel that combines information from the simulator with a problem-specific analytical network model. This metamodel is embedded within a derivative-free trust region algorithm. With this method, we aim to identify transportation-relevant solutions with improved performance within a strict computational budget. The approach is validated on a real traffic network; results are presented

3 - System Optimal Transit Assignment With Flow-dependent Dwell Times

Alireza Khani, University of Minnesota, 136 Civil Engineering Building, 500 Pillsbury Drive S.E., Minneapolis, MN, 55455, United States, akhani@umn.edu

Travel time of transit vehicles between stops is constant with respect to passenger flow. However, dwell time at stops changes by more boarding and alighting of passengers. This makes the transit assignment an asymmetric problem. To model this phenomenon, an optimization problem is developed and its mathematical properties are investigated.

1 - Modeling AS/RS Travel In Order Picking Applications

Jingming Liu, Research Assistant, 1986, 920 N Leverett, Apt 824, Fayatteville, AR, 72701, United States, jl011@uark.edu, John A White

An order picking operation is modeled as an M|G|1 queueing problem, with the S/R machine being the server and order picking stations being customers. Service time is the time required for an automated storage and retrieval machine to travel from an order picking station to a random storage location and, then, to an order picking station. To obtain the variance for service time, the density function is derived. Because the two travel times are statistically dependent random variables, results obtained previously for S/R travel do not apply. Random demands for replenishment of order picking stations and Chebyshev travel by the S/R machine are assumed.

2 - Stochastic Quasi-newton Methods For Non-strongly Convex Problems: Convergence And Rate Analysis

Farzad Yousefian, Assistant Professor, Oklahoma State Univeristy, 317D Engineering North, School of Industrial Engineering & Management, Stillwater, OK, 74074, United States, farzad.yousefian@okstate.edu, Angelia Nedich, Uday Shanbhag

Motivated by applications in machine learning, we consider stochastic quasi-Newton (SQN) methods. Traditionally, the convergence of SQN schemes relies on strong convexity. To our knowledge, no rate statements exist in the absence of this assumption. We consider merely convex problems and develop an SQN scheme where both the gradient mapping and the Hessian approximation are regularized and updated in a cyclic manner. Under suitable assumptions on the stepsize and regularization parameters, the convergence is shown in both almost sure and mean senses and the rate of convergence is derived in terms of function value. The empirical results on a binary classification problem are promising.

3 - Optimization With Reference-based Almost Stochastic Dominance

Jian Hu, Assistant Professor, University of Michigan - Dearborn, 4901 Evergreen Rd., Dept. of IMSE,, Dearborn, MI, 48128, United States, jianhu@umich.edu

Stochastic dominance is a preference relation of uncertain prospect defined over a class of utility functions. While this utility class represents basic properties of risk aversion, it includes some extreme utility functions rarely characterizing a rational decision maker's preference. We introduce reference-based almost stochastic dominance (RSD) rules which well balance the general representation of risk aversion and the individualization of the decision maker's risk preference. We also propose RSD constrained stochastic optimization model and develop an approximation algorithm based on Bernstein polynomials.

4 - Balancing Flexibility And Inventory In Workforce Planning With Learning And Uncertain Demand

Silviya Valeva, University of Iowa, 710 Carriage Hill, Apt 5, Iowa City, IA, 52246, United States, silviya-valeva@uiowa.edu, Barrett Thomas, Mike Hewitt

Explicitly modeling human learning in task assignment problems offers opportunities for better decision making that can result in both increased revenue and decreased lost sales. We present an assignment model incorporating both individual learning and uncertainty in demand and compare its performance to several myopic models. Our results demonstrate that cross training the workforce can be a successful way to hedge against uncertain demand. We further explore the use of practice assignments and inventory building as ways of creating capacity and preparing to meet future demand.

5 - Approximation Algorithms For Capacitated Perishable Inventory Systems With Positive Lead Times

Xiting Gong, Assistant Professor, The Chinese University of Hong Kong, Room 506, William M. W. Mong Engineering Building, Shatin N.T., Hong Kong, xtgong@se.cuhk.edu.hk, Xiuli Chao, Cong Shi, Chaolin Yang, Huanan Zhang, Sean Zhou

Perishable inventory system with positive lead time and finite ordering capacity is an important but notoriously difficult class of problems in both analysis and computation. Its optimal control policy is extremely complicated, and no effective heuristic policy has been proposed in the existing literature. In this paper, we develop an easy-to-compute approximation policy for this class of problems and show that it admits a theoretical constant-factor worst-case performance guarantee under most demand models of practical interest. Our numerical study shows that the proposed policy performs consistently well.

Technology Tutorial: Frontline/ SAS-GAP/EDU

Technology Tutorial

1 - Frontline: AnalyticSolver.com: Data Mining, Simulation And Optimization In Your Web Browser

Daniel Fylstra, Frontline Systems, Inc., Incline Village, NV, Daniel@solver.com

AnalyticSolver.com is the new, simple, point-and-click way to create and run analytic models using only your web browser - that also works interchangeably with your spreadsheet. Whether you need forecasting, data mining and text mining, Monte Carlo simulation and risk analysis, and conventional and stochastic optimization, you can "do it all" in the cloud. We'll show how you can upload and download Excel workbooks, pull data from SQL Server databases and Apache Spark Big Data clusters, solve large-scale models, and visualize results - without leaving your browser. If you're more comfortable working on your own laptop or server, we'll show how you can do that, too.

2 - SAS: Analysis Of a Presidential Debate Using SAS Text Analytics

André de Waal, Global Academic Program, Cary, NC, 27513, United States

During the last year of a presidential term in the United States of America, the race to the White House has everybody excited. News channels and newspapers provide "expert" analysis of day to day events. However, many of the expert opinions are biased and reflect a commentator's political viewpoint or affiliation. Can text mining be used to look at the data objectively and cut through the political rhetoric? In this talk, a script of one of the 2016 presidential debates is analyzed with SAS Text Miner. An attempt is made to look at the data "objectively" and to let the data speak. Words are counted and stemmed, documents are grouped into clusters, topics are identified and candidates are analyzed while trying to determine what separates one candidate from the rest of the field. Although it is impossible to predict using text mining alone who will win the presidential election, text mining could provide some insight into the election process (of which the debates are an integral part) that is not generally available to the general populace and might influence their choice of presidential candidate.

Big Data and Big Decisions

Plenary Session

Chair: Shabbir Ahmed, Georgia Tech, shabbir.ahmed@isye.gatech.edu

1 - Big Data And Big Decisions

Suvrajeet Sen, University of Southern California, 3715 McClintock Ave, Los Angeles, CA, 90089, United States, s.sen@usc.edu, Suvrajeet Sen

Over the past decade, the world of Statistical and Machine Learning have made dramatic in-roads into some of the more challenging AI problems ranging from speech recognition and natural language processing, to bio and health informatics. Both supervised and unsupervised learning methods have exploded in daily use for applications covering business analytics, e-commerce, educational/tutoring systems, and others. In many cases, new models and algorithms have been developed so that the results of learning are also easier to interpret (for a human decision maker). The partnership between AI and human cognition is not new, but its widespread success in recent years has transformed the way we do business today. The combination of modern informatics and high dimensional statistics has often been credited with this transformation. This lecture will not only highlight some successes of Big Data, but also explore settings where human cognition may not provide the best test of decision quality. This new class of problems involves not only Big Data, but also Big Decisions. This lecture will explore the continuum between Big Data and Big Decisions.

Clustering Methods in Data Mining

Sponsored: Data Mining

Sponsored Session

Chair: Majeed Simaan, RPI, 231 Congress Street, Troy, NY, 12180, United States, simaam@rpi.edu

1 - Parable: A Parallel Random Partition Based Hierarchical Clustering Algorithm For The Mapreduce Framework

Haimonti Dutta, University at Buffalo, 325P Jacobs Management Center, Buffalo, NY, 14260, United States, haimonti@buffalo.edu

Large datasets, of the order of peta and tera bytes, are prevalent in many scientific domains. To effectively store, query and analyze these gigantic repositories, parallel and distributed architectures are popular. Apache Hadoop is one such parallel framework for supporting data-intensive applications. In this paper, we present a PArallel, RAndom-partition Based hierarchicaL clustEring algorithm for the MapReduce framework on Hadoop. It proceeds in two steps - local hierarchical clustering on nodes and integration of results by a novel dendrogram alignment technique. Empirical results indicate that significant scalability benefits can be obtained while maintaining good cluster quality.

2 - Clustering The Traffic Data Errors Using K-mean Clustering Method

Amin Ariannezhad, Graduate Research Assistant, University of Arizona, 1209 E. 2nd Street, Tucson, AZ, 85719, United States, ariannezhad@email.arizona.edu, Yao-Jan Wu

This study aims to identify the meaningful patterns of errors observed in traffic data collected from dual loop detectors in Phoenix, Arizona. A set of data quality control criteria was implemented to calculate the percentage of different types of errors observed during each day of data for each loop detector. K-mean clustering method was then utilized to cluster the 15 possible error categories in the data detected in each loop detector on daily basis. Seven significant patterns were found in these errors based on the relationship between them. Findings from the field visit revealed that the clustering method could successfully find different meaningful patterns in data errors.

3 - A New Optimization Model For Supervised Biclustering Problem In Biomedical Dataset Classification

Cem Iyigun, Associate Professor, Middle East Technical University, Inonu Blvd, Endustri Muhendisligi, Ankara, 06800, Turkey, iyigun@ie.metu.edu.tr, Saziye Deniz Oguz Arikan

Biclustering groups samples and features simultaneously in the given set of data. We focus on a supervised biclustering problem leading to unsupervised feature selection for binary class and multi-class problems. For this problem, we have proposed a new supervised biclustering optimization model which aims to maximize classification accuracy by selecting almost all features.

4 - Large Scale Spectral Partitioning By Simulated Mixing

Shahzad Bhatti, University of Illinois at Urbana Champaign, 104 S Mathews Ave,, Urbana, IL, 61801, United States, bhatti2@illinois.edu, Carolyn Beck, Angelia Nedich

Several problems can be cast as a spectral partitioning problem such as data clustering, graph partitioning, community detection, image segmentation etc. However, computational complexity of eigenvalue decompositions has handicapped application of spectral partitioning to large scale problems. Several algorithms in the recent past focus on accelerating spectral partitioning, however they sacrifice its accuracy to achieve faster speed. Our algorithm on the other hand does not require eigenvalue decomposition, rather it recursively bi-partitions the data by finding an approximate linear combination of eigenvectors of the normalized adjacency matrix of the underlying graph.

Methods for Analysis of Next-Generation Sequencing Data

Sponsored: Data Mining

Sponsored Session

Chair: Paul Brooks, Virginia Commonwealth Univ, Richmond, VA, United States, jpbrooks@vcu.edu

1 - Quality Control For Microbiome Experiments

David Edwards, Virginia Commonwealth University, Richmond, VA, United States, dedwards7@vcu.edu, Paul Brooks

Microbiome studies aim to understand the role of the bacterial communities in physiology and disease. The primary goal of the Vaginal Microbiome Consortium is to develop methods to facilitate the discovery of patterns in 16S rRNA data and extensive clinical and demographic data as it relates to women's health. Maintaining internal consistency and understanding measurement variation in microbiome experiments is key to identifying and avoiding batch effects. In this talk, we discuss and illustrate how statistical quality control techniques (and related visualizations) are useful for assessing data consistency across time via positive and negative controls.

2 - Characterizing The Vaginal Microbiome Based On A Large Observational Study

Victoria Pokhilko, Virginia Commonwealth University, Richmond, VA, United States, pokhilkovv@vcu.edu, Paul Brooks, David Edwards

We conducted an analysis of 16S rRNA surveys of the vaginal microbiome based on samples from over 6,000 women. Vaginal microbiome profiles are typically dominated by a single bacterium, leading to a classification of samples into groups that we call vagitypes. Vagitype classifications facilitate the discovery of relationships between microbiome profile and clinical data. The presence or absence of Lactobacillus species and a diagnosis of bacterial vaginosis have been shown to play an important role in the reproductive health of a woman. Our analysis provides information about these patterns and suggests roles for other bacteria in health and dysbiosis.

3 - Longitudinal Data Analysis Techniques For Analyzing Microbiome Data

Eugenie Jackson, University of Wyoming, ejacks20@uwyo.edu

Microbiome data is characterized by a high degree of sparseness, a number of observations much smaller than the number of taxa, and often a small set of taxa that dominates the data. Goals of analysis include identifying and characterizing microbiome profiles, discovering relationships between microbial populations and health states, and understanding interdependencies among taxa. Changes in human microbial communities and their respective hosts across time is of fundamental interest. We present an overview of recent longitudinal analysis techniques for microbiome data. We discuss their respective strengths and uses, open problems, and directions for future work.

4 - Changes In Community State Types Reflect Major Shifts In The Human Microbiome

Paul Brooks, Virginia Commonwealth Univ, jpbrooks@vcu.edu

The human microbiome consists of the micro-organisms that reside in various body habitats. We present a re-analysis of five sequencing-based surveys of the vaginal microbiome with repeated measures. Our goal is to understand the expected persistence in a state, the rate of state changes, our ability to predict an upcoming change, and predictors of upcoming changes. Our results provide insight into microbiome dynamics.

Marketing Strategies of Entertainment Products

Invited: Entertainment Analytics

Invited Session

Chair: Yong Liu, University of Arizona, 1130 E Helen Street, Tucson, AZ, 85721, United States, yoliu@eller.arizona.edu

1 - Pre-launch Analysis Of Competitive Dynamics

Natasha Zhang, University of Virginia, ynf8a@comm.virginia.edu, Fang Wu, Vithala R Rao

The market structure literature has focused on mature products and post-launch competition. Yet many industries such as entertainment see frequent product introductions with short lifecycles; and need to identify dynamic market structure pre-launch to guide marketing mix decisions largely made pre-launch. However, such identification is almost impossible because of lack of sales data and dynamic competition resulting from entries, exits, and changes in preannounced release timing. The authors thus propose a dynamic market structure model to capture the evolution of competitive sets and brand positioning, calibrated on a film prediction market.

2 - The Choice And Effects Of Movie Previews In Video-on-Demand Services

Yong Liu, University of Arizona, Tucson, AZ, United States, yoliu@eller.arizona.edu, Zhen Chen, Madhu Viswanathan, Hongtao Pan, Pei Huang

A key strategy that the Video-on-demand (VOD) providers use to help consumers choose among numerous programs is the provision of program reviews. In this paper we investigate when consumers choose to watch previews and how preview watching may influence movie choice. Our research context are the on-demand movies in the Internet Protocol TV (IPTV) systems from a large Chinese VOD service provider. We find that the movie attributes, household characteristics, and time of the week significantly affect consumer choice for previews. At the same time, the ratio of preview watching time to the length of the preview program has a significant impact on the subsequent movie choice.

Developing Country Electricity Systems

Sponsored: Energy, Natural Res & the Environment, Energy I Electricity

Sponsored Session

Chair: Valerie Thomas, Georgia Tech, 765 Ferst Drive, Atlanta, GA, 30332, United States, vthomas@isye.gatech.edu

1 - Electricity Development In Africa - A Multi-objective Optimization Approach

Amelia Musselman, Georgia Institute of Technology, Atlanta, GA, United States, amusselman@gatech.edu, Dima Nazzal, Valerie Thomas

Many people across Africa are without sufficient access to electricity. The unavailability and unreliability of energy resources in Africa contribute to developmental challenges in many areas including business, education, and healthcare. We develop a mixed integer optimization model for power generation and transmission system expansion planning in Africa. In addition to solving the least cost optimization, we consider optimal use of a fixed electrification budget when demand cannot fully be met. We test our model on the Democratic Republic of Congo, Uganda, Tanzania, Rwanda, and Burundi.

2 - Can Developing Countries Leapfrog The Centralized Electrification Paradigm?

Todd Levin, Argonne National Laboratory, tlevin@anl.gov

Due to the decreasing costs of decentralized technologies, centralized power systems are no longer a necessary condition of universal electricity access. Developing countries with less developed infrastructures may be able to adopt these new technologies more quickly. We determine the electricity consumption levels at which the costs of centralized and decentralized electrification are equivalent in three African regions. We then calculate capital costs necessary for distributed technologies to cost-effectively provide each of five tiers of energy access, as defined by the UN SE4All Framework.

3 - Analysis of a Wind-Hydro Storage System in Kenya

Maureen Murage, Cornell University, Ithaca, NY, Contact: mwm88@cornell.edu

Kenya has set a target of increasing the wind power capacity from 1% to nearly 15% of total generation capacity. The Lake Turkana Wind Power (LTWP) wind farm will be the largest installation, contributing to half of this total. In this presentation, we will discuss the reliability impact of LTWP project on the Kenyan Power system. The results indicate that the addition of wind power into the system only marginally improves the reliability of the power system, though other implementation strategies may improve this outcome.

Optimal Power Flow

Sponsored: Energy, Natural Res & the Environment, Energy I Electricity

Sponsored Session

Chair: Andy Sun, Georgia Institute of Technology, Atlanta, GA, United States, andy.sun@isye.gatech.edu

1 - Visualizing The Feasible Spaces Of Optimal Power Flow Problems And Their Convex Relaxations

Daniel K Molzahn, Argonne National Laboratory, dan.molzahn@gmail.com

Optimal power flow (OPF) problems can have non-convex feasible spaces. Visualizing these feasible spaces can aid in understanding these non-convexities. Work towards developing such visualizations uses the Numerical Polynomial Homotopy Continuation (NPHC) algorithm, which is guaranteed to find all power flow solutions. By discretizing the inequality constraints, repeated power flow solutions using NPHC enables calculation of the feasible spaces for small OPF problems. This presentation illustrates the feasible spaces of several challenging OPF problems and various convex relaxations.

2 - Global Optimization Techniques For The Optimal Power Flow Problem

Burak Kocuk, Carnegie Mellon University, Pittsburgh, PA, United States, bkocuk@andrew.cmu.edu, Santanu S. Dey, Andy Sun

In this study, we aim to solve the Optimal Power Flow problem using global optimization techniques. Our analysis starts with an equivalent SDP formulation of the problem with additional nonconvex minor constraints. We propose several convexification approaches to deal with these nonconvexities via cutting planes and envelopes. We make efficient use of bound tightening to stregthen the convex relaxations. We also develop an SOCP-based spatial branch-and-cut algorithm. Our approach is successful in proving small optimality gaps for challenging power systems instances from the literature.

3 - Convex Cuts For Optimal Power Flow

Hassan Hijazi, Australian National University, Canberra, Australia, hassan.hijazi@anu.edu.au, Carleton Coffrin, Pascal Van Hentenryck

Global optimality and feasibility guarantees are highly desirable outcomes for problems arising in application areas with critical infrastructures. These include energy, transportation, telecommunication and cyber-security systems. A global approach is necessary to prove that the underlying model is infeasible or that the provided solution is optimal. Unfortunately, off-the-shelf global optimization tools are unable to scale up to real-world size problems. This presentation will cover recent results on the generation of valid convex cuts for nonconvex quadratically constrained programs, focusing on key application problems such as the Optimal Power Flow.

4 - Convexification Of The Power System State Estimation Problem

Yu Zhang, University of California, Berkeley, Berkeley, CA, United States, yuzhang49@berkeley.edu, Ramtin Madani, Javad Lavaei

This presentation deals with the power flow (PF) and power system state estimation (PSSE) problems. The PF problem is cast as an optimization problem by adding a well-designed quadratic objective. It is shown that with a suitable set of measurements and under mild angle conditions, the semidefinite programming (SDP) relaxation can recover the true solution. Capitalizing on this result, a penalized SDP using the weighted least absolute value data fitting cost is tailored for the PSSE. The optimal SDP solution has a dominant rank-one component formed by lifting the true state. An upper bound on the estimation error is also derived, which depends on the noise power.

Solving Hard Optimization Problems in Machine Learning

Sponsored: Data Mining

Sponsored Session

Chair: Yan Xu, SAS Institute, Inc., 100 SAS Campus Drive, Cary, NC, 27513-2414, United States, yan.xu@sas.com

1 - Strategies For Maintaining Sparse Dual Solutions In Large-scale Nonlinear SVM

Alireza Yektamaram, Lehigh University, Bethlehem, PA, sey212@lehigh.edu, Joshua Griffin

This talk will focus on distributed methods for solving large-scale nonlinear SVM problems. It is easy to show that the global solution for such problems may be dense, resulting in large impractical models returned to the user. Further, the accuracy of such models typically is poor compared to sparser approximate solutions. This talk focuses on practical methods that can be used to directly and efficiently seek out accurate sparse solutions regardless of whether or not the global solution is dense.

2 - A Hessian Free Method With Warm-starts For Deep Learning Problems

Wenwen Zhou, SAS Institute Inc, 100 SAS campus drive, Cary, NC, 27513, United States, Wenwen.Zhou@sas.com, Joshua Griffin

This talk will focus on solving deep learning problems with Krylov-based iterative methods where effective preconditioning matrices are unavailable. For such problems, convergence of the outer iterations can degrade when the iterative solver repeatedly exits on maximum Hessian-vector products rather than relative residual error . To address this issue, a new warm start strategy is proposed to accelerate an existing modified conjugate gradient approach while maintain important convergence properties. Numerical experience and addition to convergence results will be provided.

3 - An Accelerated Power Method For The Best Rank-1 Approximation To A Matrix

Jun Liu, SAS Institute Inc., Cary, NC, United States, Jun.Liu@sas.com, Ruiwen Zhang, Yan Xu

The best rank-1 approximation to a matrix is a fundamental tool in linear algebra and many machine learning applications. The power method is one of the most well-known approaches for computing the best rank-1 approximation to a matrix. In this paper, we propose to accelerate the power method for the best rank-1 approximation of a matrix by imposing an additional refinement step. The refinement step combines the current approximate solution and the previous one to obtain an optimally refined point that is used as an input to the next step of the power method. Empirical results on synthetic and real data sets demonstrate the effectiveness of the proposed method.

4 - Local Search Optimization For Hyper-parameter Tuning

Yan Xu, SAS Institute, Inc., yan.xu@sas.com

Many machine learning algorithms are sensitive to their hyper-parameter settings. In this talk we discuss the use of black-box local search optimization (LSO) for machine learning hyper-parameter tuning. Viewed as a black-box objective function of hyper-parameters, machine learning algorithms create a difficult class of optimization problems. The corresponding objective functions involved tend to be nonsmooth, discontinuous, unpredictably computationally expensive. We apply a parallel hybrid derivative-free optimization algorithm that can make progress despite these difficulties providing significantly improved results over default settings with minimal user interaction.

Networks and Data Analytics in Finance

Sponsored: Data Mining

Sponsored Session

Chair: Shawn Mankad, Cornell University, 401H Sage Hall, Ithaca, NY, 14853-6201, United States, spm263@cornell.edu

1 - A System-wide Approach To Measure Connectivity In The Financial Sector

Sumanta Basu, Cornell University, sumbose@berkeley.edu, Sreyoshi Das, George Michailidis, Amiyatosh Purnanandam

We develop and estimate a system-wide measure of network connectivity for a sample of very large financial institutions of the U.S. Our approach is in sharp contrast with extant measures of systemic risk that, either explicitly or implicitly, estimate such connections using pair-wise relationships between institutions. We show that such a pair-wise approach may result in improper classification of banks as systemically important. Our system-wide approach, based on a recently developed Lasso penalized Vector Auto-Regression (LVAR) model, allows us to detect important systemic events and identify systemically important institutions in a statistically principled manner.

2 - The Topology Of Overlapping Portfolio Networks

Andreea Minca, Cornell University, acm299@cornell.edu

This paper analyzes the topology of the network of common asset holdings, where nodes represent managed portfolios and edge weights capture the impact of liquidations. We consider the degree centrality as the degree in the subnetwork of weak links, where weak links are those that lead to significant liquidations. We show that the degree centrality is correlated with excess returns, and is significant after we control for the Carhart four factors.The network of weak links has a scale free structure, similar to financial networks of balance sheet exposures. Moreover, a small number of clusters, densely linked, concentrate a significant proportion of the portfolios.

3 - Network Concentration And Systemic Losses

Agostino Capponi, Columbia University, ac3827@columbia.edu

We develop a majorization-based tool to compare financial networks with a focus on the implications of liability concentration. Specifically, we quantify liability concentration by applying the majorization order to the liability matrix that captures the interconnectedness of banks in a financial network. We develop notions of balancing and unbalancing networks to bring out the qualitatively different implications of liability concentration on the system's loss profile. An empirical analysis of the network formed by the banking sectors of eight representative European countries suggests that the system is either unbalancing or close to it, persistently over time.

4 - The Multilayer Structure Of The Financial System

Dror Kenett, US Office of Financial Research, dror.kenett@ofr.treasury.gov

We introduce a new multilayer map to identify, quantify, and understand interconnections that can spread a stress event across the financial system. The network map has three layers showing the flow of assets, short-term funding, and collateral that circulate among market participants. As we move from one layer to the next layer, risk is transformed and spreads. For example, a price shock to one type of securities in the asset layer may move through the network to become a funding risk in the funding layer, then emerge as a counterparty or credit risk in the collateral layer. We also discuss data gaps that must be filled to map the full scope of interconnections in a multilayer financial system.

Business Model Innovation

Invited: Business Model Innovation

Invited Session

Chair: Serguei Netessine, INSEAD, Singapore, Singapore, serguei.netessine@insead.edu

1 - Sustainable Distribution Models At The Bottom Of The Pyramid

Bhavani Shanker Uppari, INSEAD Business School, shanker4uu@gmail.com, Ioana Popescu, Serguei Netessine

Although several products are invented to improve the lives of poor (e.g., efficient cook stoves, solar lights), they do not necessarily reach the poor because these people live in villages which are located beyond most multinationals' distribution networks. Lack of infrastructure and illiteracy only aggravate this problem. Therefore, several firms rely on door-to-door (D2D) distribution networks to sell their products. We investigate the strategic issues that arise in D2D models, such as when is it appropriate to create a proprietary D2D network or share it with a partner, what type of partner (for-profit vs. for-impact) is suitable, and how to align the incentives of partners in a shared D2D model.

2 - Pay-as-you-go Business Models In Developing Economies

Jose A Guajardo, University of California-Berkeley, jguajardo@berkeley.edu

Pay-As-You-Go business models have become widely adopted for the diffusion of off-grid energy products in developing economies. In this research we provide an empirical analysis of central aspects of this type of business models.

3 - Business Model Innovation Feature Extraction And Application To The Lean Startup Framework

Christophe Pennetier, Insead, Christophe.pennetier@insead.edu

Using a new curated dataset with more than half a million startups, we use state-of-the-art text mining and machine learning techniques to identify business model innovations and study their effects on startups' success.

4 - Division Of Labor: Managing A Portfolio Of Self-scheduling Workers

Kaitlin Daniels, Assistant Professor, Olin Business School, Washington University in St. Louis, St. Louis, MO, United States, k.daniels@wustl.edu

Self-scheduling workers value their ability to decide for themselves how much they work. However, the flexibility of self-scheduling creates costly uncertainty in the service capacity of a firm coordinating a network of self-scheduling workers. We study a system of heterogeneous workers who decide to work in response to incentives offered by a firm. The firm balances the cost of convincing some workers to work reliably with the benefit of reducing capacity uncertainty. We study how the mix of reliable and "flexible" workers changes as workers make costly demands of the firm (e.g. expense reimbursement, overtime pay, minimum wages), like those made by Uber drivers in recent lawsuits.

Information and Market Structure

Sponsored: Applied Probability

Sponsored Session

Chair: Yash Kanoria, ykanoria@columbia.edu

1 - Designing Information Disclosure Policies

Kostas Bimpikis, Stanford, Stanford, CA, United States, kostasb@stanford.edu, Mohamed Mostagir

Participants race towards completing a project and learn about its feasibility from their own efforts and their competitors' gradual progress. Information about the status of competition can alleviate some of the uncertainty inherent in the contest, but it can also adversely affect effort provision from the laggards. This paper explores the problem of designing the information disclosure policy of a contest in a dynamic framework and provides a number of guidelines for maximizing the designer's expected payoff.

2 - Shared Information Sources In Exchanges

Mariann Ollar, University of Pennsylvania, omariann@gmail.com

In financial and commodity exchanges, shared information sources, such as common forecasting methodologies or targeted advertisement, induce common biases in forecast errors. I show here in a linear normal model, that shared information sources qualitatively affect information aggregation and trade stability. First, they hinder perfect aggregation of information even on large markets with fundamental values and they necessitate learning from price even with independent trader values, since price is then informative about the common bias. Importantly, source restrictions can resolve market collapse, especially in exchanges with strong common values.

3 - Stable Matchings Are Easy To Find

Yash Kanoria, Columbia Business School, ykanoria@columbia.edu, Itai Ashlagi, Mark Braverman, Peng Shi

Matching markets include dating markets, school/college admissions, and labor markets. We analyze two-sided markets with tiers and study how much search effort is needed to find a stable matching. We find a "small" amount of search effort suffices, if each agent reaches out to his most desirable potential matches among those who have slightly less market power than his own. Interestingly, agents should wait for dream matches to reach out to them.

1 - Evaluating Risks Of Maritime Transportation And Countries Of Import Source For LNG

Ayumi Sekimori, Chuo University, Tokyo, Japan, a11.eceh@g.chuo-u.ac.jp, Shigeki Toriumi, Ryuta Takashima

The use of natural gas has increased due to the influence of Fukushima accident. Thus it becomes more important to choose source countries for LNG import. In this work we analyze an import policy for LNG taking into account risks of maritime transportation and countries of import source. Especially the transportation risk includes maritime accidents and a dependence on chokepoints. The import source countries for LNG are decided by minimizing both risks under constraint of transportation cost.

2 - A Simulation Model For Comparing The Robustness Of Alternative Liquefied Natural Gas Annual Delivery Programs

Fatih Mutlu, Qatar University, fatihmutlu@qu.edu.qa

Annual delivery program (ADP) is an integrated production, inventory, and delivery plan prepared by liquefied natural gas (LNG) suppliers to fulfill their contractual requirements. Traditionally, ADPs are prepared with the aim of minimizing the operational and contractual penalty coss. However, the implementation of an ADP is subject to many random disturbances, e.g., travel time delays. We develop a discrete-event based systems simulation model to simulate the implementation of an ADP by incorporating travel times uncertainty. Our model includes several contingency plans in case of delays. We compare the robustness of alternative ADPs using the simulation model.

3 - The North American Natural Gas Model: Analysis Of Long Term Natural Gas Exhaustion

Sauleh Ahmad Siddiqui, Johns Hopkins University, 3400 N Charles Street, Baltimore, MD, 21218, United States, siddiqui@jhu.edu, Felipe A Feijoo

The U.S. shale boom and new power plant regulations recently announced by the U.S. Environmental Protection Agency have stimulated substantial academic debate and numerical simulation exercises to understand the future role of natural gas in North America. Furthermore, the U.S. is expected to become a significant net exporter of natural gas over the next years. We use the North American Natural Gas Model (NANGAM) to better understand the new developments in infrastructure needed in North America to address increasing global demand. An analysis of resources being exhausted due to increased exports is also performed.

Optimization in Network Reliability, Security, and Interdiction

Sponsored: Optimization, Network Optimization

Sponsored Session

Chair: Yongjia Song, Virginia Commonwealth University, Richmond, VA, United States, ysong3@vcu.edu

1 - Multi-layered Interdependent Network Flow Problem

Negin Enayaty, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, nenayaty@email.uark.edu, Kelly Sullivan, Sarah G Nurre, Matthew Jd Robbins, Brian J Lunday

We propose a generalization of the minimum cost multi-commodity flow problem in which the flow of each commodity is dependent on the flow of other commodities. We present computational results for an interdependent infrastructure data set and analyze the cost of layer interdependence in this problem. We develop model reduction strategies and investigate their effect on reducing computation times.

2 - Vulnerability Analysis Of Interdependent Networks Via Integer Programming Approaches

Shanshan Hou, The University of Arizona, shanshanh@email.arizona.edu

Due to the mutual support from the other one, the interdependent network shows increasing vulnerability to failures. In this talk, we proposed integer programming formulations to identify the most vulnerable components in the network, and also the solution approaches. To validate and test the model and algorithm, we perform the numerical experiments on power grid and its supporting communication control network. The potential application of this research is to redesign or defense many networks, especially the infrastructure networks.

3 - Stochastic Network Interdiction With Incomplete Preference

Babak Saleck Pay, Virginia Commonwealth University, saleckpayb@mymail.vcu.edu

We study two different cases of the stochastic shortest path interdiction problem with incomplete preferences. In the first case, the defender makes an interdiction decision, random network costs are realized, and then the attacker chooses his path. In the second case, the decisions of both players are made before the realization of randomness. We consider the situation where the underlying utility functions of the decision makers are ambiguous. We use a minimax formulation for the defender to minimize the attacker's worst-case utility. We present numerical results based on randomly generated instances to show the performance of the models.

4 - Approximation Algorithms For Expected-value Maximum Multiple Coverage Problem And Its Variants

Kay Zheng, University of Wisconsin-Madison, kay.zheng@wisc.edu, Laura Albert McLay, James Luedtke

Motivated by cyber-security planning application, we develop an optimization framework based on maximum coverage problem addressing multiple coverage, concave objective function, group budget constraints, and random coverage failure etc. Polynomial time approximation algorithms with constant performance guarantees are formulated to solve the integer programming models. Computational results are presented to demonstrate the efficiency and accuracy of the algorithms.

New Models and Approximation Results in Stochastic and Combinatorial Optimization

Sponsored: Optimization, Integer and Discrete Optimization

Sponsored Session

Chair: Qie He, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States, qhe@umn.edu

1 - Approximation Algorithms For Chance-constrained Problems

Shabbir Ahmed, Georgia Institute of Technology, shabbir.ahmed@isye.gatech.edu, Weijun Xie

Chance constrained problems (CCPs) are NP-hard. We propose bicriteria approximation algorithms for CCPs by scaling and rounding optimal solutions to certain relaxations proposed in the literature. We explore the tractability of the relaxations under different probability distributions. For a CCP with discrete support, this approximation algorithm can be reduced to a single criterion one, and the approximation ratio turns out to be tight.

2 - Valid Inequalities For Separable Concave Constraints With Indicator Variables

James Luedtke, University of Wisconsin-Madison, Madison, WI, United States, jim.luedtke@wisc.edu, Cong Han Lim, Jeff Linderoth

We study valid inequalities for optimization models that contain both binary indicator variables and separable concave constraints. We propose a technique to obtain valid inequalities that are based on both the MILP constraints and the concave constraints. We demonstrate how valid inequalities for the single node flow set and for the lot-sizing polyhedron can be to “tilted” to give valid inequalities that also account for separable concave functions of the arc flows. We present promising computational results demonstrating the utility of the new inequalities for nonlinear transportation problems and for lot-sizing problems with concave costs.

3 - Strong Reductions For Linear And Semidefinite Programs

Sebastian Pokutta, Georgia Institute of Technology, sebastian.pokutta@isye.gatech.edu, Gabor Braun, Aurko Roy

Linear and semidefinite programming are two core optimization paradigms with many important applications. However, the expressive power of these modeling paradigms is only partially understood so far and extended formulations are a powerful and natural tool to analyze the possibilities and limitations of linear and semidefinite programming formulations. We will present a strong reduction mechanism both for LPs and SDPs, which allows to establish strong inapproximability results for various problems, including e.g., vertex cover, bounded-degree matching, and sparsest cut. Moreover, the reduction mechanism induces an ordering of relative hardness of the underlying problems.

4 - A Matrix Selection Problem

Zeyang Wu, University of Minnesota, wuxx1164@umn.edu, Qie He

Consider a discrete-time dynamic system xk+1 = Mkxk for k = 0,1,2, T. The matrix Mk can be chosen as one of the given two matrices A or B. The matrix selection problem is defined as follows: given an initial vector x0, select matrices M1, ..., MT such that a linear function over the states x1,... xT is minimized. This problem is motivated by an application in cancer treatment planning. We formulate this problem as a mixed-integer linear program, and derive several families of facet-defining inequalities for the resulting formulation.

Recent Advances in Stochastic Integer Programs

Sponsored: Optimization, Integer and Discrete Optimization

Sponsored Session

Chair: Yongjia Song, Virginia Commonwealth University, Richmond, VA, United States, ysong3@vcu.edu

1 - A Scalable Bounding Approach For Multistage Stochastic Programs

Osman Yalin Ozaltin, North Carolina State University, Raleigh, NC, 27695, United States, oyozalti@ncsu.edu

Despite being a flexible modeling framework, multistage stochastic programs are not widely adopted in practice, mostly due to their unbearable size. Moreover, incorporating integer variables renders multistage stochastic programs even less tractable. We propose a bounding approach, which does not assume convexity but it rather relies on scenario decomposition and is inherently parallelizable. Our results demonstrate that the proposed method scales nicely with problem size and produces high quality solutions.

2 - Adaptive Partition-based Level Decomposition For Stochastic Programs

Yongjia Song, Virginia Commonwealth University, Richmond, VA, ysong3@vcu.edu, Wim van Ackooij, Welington de Oliveira

We present a computational study of several strategies to solve two-stage stochastic programs by integrating the adaptive partition-based approach with level decomposition. A partition-based formulation is a relaxation of the original stochastic program, obtained by aggregating variables and constraints according to a scenario partition. Partition refinements are guided by the optimal second-stage dual vectors computed at certain first-stage solutions. The proposed approaches rely on the level decomposition with on-demand accuracy to dynamically adjust partitions until an optimal solution is found. Numerical results are presented.

3 - A Class Of Sequential Discrete Decision Problems With Stochastic Disruptions

Haoxiang Yang, Northwestern University, Evanston, IL, United States, HaoxiangYang2019@u.northwestern.edu, David Morton

We consider a sequential decision problem under uncertainty, where the uncertainty consists of a small number of disruptions and where both the magnitude and the timing of the disruption can be random. We first formulate a stochastic linear programming model and an algorithm to solve it. Furthermore, we extend the model to handle integer decision variables, investigate methods to solve this multi-stage stochastic integer program and evaluate the computational performance of our approach.

Revenue Mgt, Pricing

Contributed Session

Chair: Chuangyin Dang, Professor, City University of Hong Kong, Dept of Systems Eng & Eng Mgmt, 83 Tat Chee Avenue, Kowloon, Hong Kong, mecdang@cityu.edu.hk

1 - When Is It Optimal To Offer Free Allowance?

Hemant K Bhargava, University of California, Gh-3108, Graduate School of Management, Davis, CA, 95616, United States, hemantb@ucdavis.edu, Manish Gangwar

In contrast to Two-Part Tariff (2PT), Three Part Tariff (3PT) offers an additional free allowance. We find that despite free allowance optimal 3PT generates the same profits as optimal 2PT. However, the free allowance in 3PT can improve firm’s profit under two conditions, when consumers are uncertain about their usage or when the market demand involves a multi modal mixture distribution.

2 - Dynamic Stochastic Knapsack Problem With Adaptive Interaction

Kyle Maclean, Ivey Business School, London, ON, Canada, k.d.maclean@gmail.com, Fredrik Odegaard

Motivated by group seating requirements in entertainment venues, we formulate and study an extension to the Dynamic Stochastic Knapsack Problem. We add a stochastic interaction between the offered set of open compartments and the item placement, generalizing previously deterministic problems and making the problem relevant to revenue management customer choice models. Then, using a specific interaction function inspired by the entertainment industry, we provide an algorithm to determine the optimal solution. Using this algorithm we obtain insights into the structural properties of the problem.

3 - Product Planning With Sensory Customer Requirements: A Plain Yogurt Case

Leman Esra Dolgun, Anadolu University, Iki Eylÿl Kampusu, Endustri Muhendisligi Bolumu, Eskisehir, Turkey, ledolgun@gmail.com, Gulser Koksal, Elcin Kartal Koc

Customers use vague terms to describe their requirements and perceptions of sensory products such as yogurt, which makes prioritizing improvements and setting targets for them difficult. In this study, we propose an improved use of Quality Function Deployment and Kansei Engineering to overcome such difficulties, and demonstrate it in a plain yogurt case. Customer needs and perceptions are assessed by special surveys based on semantic scales. Survey data are analyzed using hypothesis tests and building logistic regression models. Targets are suggested by optimizing these models.

4 - A Reformulation-based Interior-point Path-following Method For Determining Proper Equilibria

Chuangyin Dang, Professor, City University of Hong Kong, Dept of Systems Eng & Eng Mgmt, 83 Tat Chee Avenue, Kowloon, Hong Kong, mecdang@cityu.edu.hk, Yin Chen

This paper extends an equivalent reformulation of Nash equilibrium to a specifically defined perturbed game that deforms continuously with an extra variable. As a result of this extension, we develop an interior-point path-following method for determining a proper equilibrium. The method numerically follows a smooth path that starts from any given point in the Euclidean space and ends at a proper equilibrium. Numerical results further confirm the effectiveness of the method.

Information in Optimization

Sponsored: Optimization, Optimization Under Uncertainty

Sponsored Session

Chair: Eugene Perevalov, Lehigh University, 1, Bethlehem, PA, 18015, United States, eup2@lehigh.edu

1 - Outpatient Clinic Scheduling With Heterogeneous Patient Preference And Resource Uncertainty

Deepak Agrawal, Pennsylvania State University, University Park, PA, United States, agrawal.deepankur@gmail.com, Guodong Pang, Priyantha Devapriya, Soundar Kumara

Reasons of No-shows and how to stop them, has been focus of the research since more than a decade. No-show adds up to the increases healthcare waste. Therefore motivated by this we aim to develop advanced scheduling models which can reduce No-shows by scheduling appointments at patients' preferred day and time with their preferred physicians. Researchers have acknowledged that each patient may have different priority. Our model considers patient segments with different priorities to design an efficient yet profitable scheduling system.

2 - Mutual Information Minimization For Evaluating The Causal Impact Of Home Care Services On Patient Discharge Disposition

Alexander Nikolaev, University at Buffalo, anikolae@buffalo.edu, Yuan Zhou, Sabrina Casucci, Lei Sun, Li Lin

Recent developments in observational causal inference employ subset selection algorithms that balance the covariate distributions in the compared groups of treated and untreated units under study. We present a subset selection approach that works by minimizing the mutual information (MI) between the covariates and the treatment variable. This becomes possible thanks to the derived optimality conditions that tackle the non-linearity of a sample-based MI function. The resulting algorithm runs in polynomial (close to linear) time, allowing for treatment effect estimation with large datasets. We proceed to draw causal insights from hospital readmission data of the UB HOMEBASE project.

3 - Information Acquisition Process: The Quantitative Aspect

Eugene Perevalov, Lehigh University, eup2@lehigh.edu

The classical Information Theory was able to facilitate significant advances in information transmission by finding a way of properly describing the quantity of the form of information existence - the various symbols. On the other hand, to make similar advances in the process of information acquisition, one would need to properly understand and describe the quantities associated with the information itself - its content. We take a step in that direction.

Stochastic Sequential Assignment and Planning

Sponsored: Optimization, Optimization Under Uncertainty

Sponsored Session

Chair: Olga Raskina, Juno Therapeutics, Seattle, WA, United States, olga.raskina@junotherapeutics.com

1 - Stochastic Production Scheduling For Personalized Cancer Therapy Manufacturing

Olga Raskina, Juno Therapeutics, olga.raskina@junotherapeutics.com, Jon Gunther

Juno Therapeutics is a clinical-stage company developing novel cellular immunotherapies. To manufacture our therapeutic T cell product candidates, we harvest blood cells from a cancer patient, separate or enrich for the appropriate T cells, activate the cell, insert the gene sequence for the CAR or TCR construct into the cell's DNA, and grow these modified T cells to the desired dose level. The modified T cells can then be infused into the patient or frozen and stored for later infusion. We are investing substantially in a process that we believe is commercially scalable for both CARs and TCRs.

2 - Dynamic Path Assignment For Robotic Bees Under Collision Control

Felisa Vázquez-Abad, Hunter College, felisav@hunter.cuny.edu

We study the problem of dynamic routing of robotic bees towards the hive. Due to uncertainty in position measurements, the stochastic problem cannot ensure collision-free paths. We study the effects that the algorithm parameters have in reducing the computational complexity and expected number of collisions. We explore via experimentation a parallel algorithm for cloud computing as well as crowd sourcing for estimation. In this manner we seek a faster completion time reducing collisions and computational complexity.

3 - Multidimensional Birth And Death Models For Biochemical Modeling With A View To Personalized Medicine

Alexey Nikolaev, CUNY, Hunter College and Graduate Center, New York, NY, 11232, United States, anikolaev@gradcenter.cuny.edu, Felisa J Vázquez-Abad, Jon Gunther

Chemical reactions can be modeled either using ordinary differential equations, or continuous time Markov chains. The ODE describes the dynamics of the concentration of proteins. The multidimensional Birth and Death process describes the dynamics of the number of particles of proteins. We study an activator/repressor model that regulates circadian cycles in cells. We show that the ODE is an exact expectation for the B&D process, under some regimes. For other regimes we apply a novel technique of Taboo kernels. This methodology has potential to predict malfunctions and to identify treatment.

Finance, Portfolio II

Contributed Session

Chair: Jonathan Liu, Stony Brook University, 61-40 163rd Street, Flushing, NY, 11365, United States, Jonathan.m.liu@stonybrook.edu

1 - Portfolio Selection With The Probabilistic Ordered Weighted Average

Jose M. Merigo, Full Professor, University of Chile, Av. Diagonal Paraguay 257, Santiago, 8330015, Chile, jmerigo@fen.uchile.cl, Sigifredo Laengle, Gino Loyola

This article presents a generalization of Markowitz's mean-variance portfolio selection approach by using the probabilistic ordered weighted average. The main advantage is that it can under or overestimate the information provided in the classical portfolio approach according to the attitudinal character of the decision maker. Moreover, it includes the classical Markowitz model as a particular case when the attitudinal character is not needed, by using only the expected value which is a particular case of the probabilistic ordered weighted average. The work considers a wide range of scenarios in financial decision making problems.

2 - Structural Approach To Portfolio Analysis With Diversification Constraints

Kyungchan Park, PhD Candidate, Yonsei University, Seodaemun-gu Yonsei-ro 50, School of Business (Bld.#212) Rm.#411, Seoul, 03722, Korea, Republic of, hippogras@gmail.com, Hongseon Kim, Seongmoon Kim

The maximum weight of single stock in mutual fund is limited by regulations to enforce diversification. Under incomplete information with added constraints on portfolio weights, enhanced performance had been reported in previous researches. We use a structural approach to analyze the effects of additional constraints on the portfolio's performance by computing the Euclidean distance from the tangency portfolio, as opposed to analyzing ex-post return only. We find that the diversification-constrained portfolios generally have a smaller distance than the unconstrained portfolios.

3 - Monetary Policy And Real Estate Price Fluctuation: An Analysis On Regional Heterogeneity From China

Charl Chan, Tongji University, Siping Road 1500, Room 1211, Shanghai, 200092, China, charlc@yeah.net, Jiangang Shi

This paper analyzes empirically the relationship among monetary policy, real estate price and policy aims using PVAR model. The results show that not all areas of real estate market as a carrier can play a normal function in the process of transmission from the policy tools to the ultimate goal. Extended McCallum rule executed against the regional real estate price bubble will affect the normal supply of the basic currency to other area. And Extended Taylor rule executed will exacerbate deflation in the areas which real estate market is ineffective as a carrier, while it can bring negative effects to other area economic fundamentals.

4 - Efficient Allocation Of Tarp Funds To U.s. Banks

Jonathan Liu, Stony Brook University, 61-40 163rd Street, Flushing, NY, 11365, United States, Jonathan.m.liu@stonybrook.edu, Herbert F Lewis, Dmytro Holod

In 2008 the government allocated hundreds of billions of dollars to banks all across the United States under the Troubled Asset Relief Program (TARP). The main purpose of TARP was to encourage bank lending during the financial crisis. In this paper, we apply data envelopment analysis (DEA) as part of a two-step process to measure the efficiency of the distribution of funds. DEA is a linear programming-based methodology for measuring relative efficiency of decision making units (DMU). A reallocation model is used to show how funds could have been assigned in a more efficient manner and how additional lending could have been achieved. Finally, we find common characteristics among the inefficient banks.

Computational Methods for Healthcare Applications

Sponsored: Computing

Sponsored Session

Chair: Burak Eksioglu, Clemson University, Clemson University, Clemson, SC, 29634, United States, burak@clemson.edu

1 - Optimal Compromises Between Efficiency And Practicality

Andrew C Trapp, Worcester Polytechnic Institute, atrapp@wpi.edu

In many real-world contexts, the output of an optimization model may be impractical to implement directly due to a variety of factors. For example, an optimized medical personnel schedule may specify such a large deviation from the (non-optimized) status quo, that it might only be possible to roll out over time. We discuss our methodology, TOpS (Transition toward the Optimal Solution), that creates optimal deployment plans for binary integer programs. TOpS illuminates the most improving steps within a specified deviation from the status quo. We implement TOpS in two popular modeling environments, and demonstrate how it can find the best improving steps while managing change from present conditions.

2 - Two-stage Stochastic Programming For Vaccine Vial Replenishment

Zahra Azadi, Clemson University, zazadi@clemson.edu, Harsha Gangammnavar, Sandra D Eksioglu

Multi-dose vaccine vials must be utilized within a short time if not protected in appropriate temperature. The remaining doses are discarded. Single-dose vials do not contribute to Open Vial Wastage (OVW), but have higher purchase and inventory holding costs per dose than multi-dose vaccine vials. This study presents a two-stage stochastic programming model that aids health care practitioners identify inventory replenishment and vial opening policies which minimize costs and OVW. We compare the performance of optimal with myopic policies in the presence of random demand.

3 - Optimal Quarantining Policy For Ebola Epidemic

Ceyda Yaba, Clemson University, cyaba@clemson.edu, Burak Eksioglu, Amin Khademi

The actions taken during a deadly epidemic can be crucial in order to eradicate the disease. We model a Markov decision model for an Ebola epidemic in two districts with the objective of minimizing incidence while quarantining infectious people. However, as the capacities of the quarantine facilities are limited, we need to find a decision rule for quarantining infectious population so that the incidence is minimized in both of the districts.

Robust Multiobjective Optimization for Decision Making under Uncertainty and Conflict

Tutorial Session

Chair: Margaret M Wiecek, Clemson University, Mathematical Sciences Dept, Clemson, SC, 29634-1907, United States, wmalgor@clemson.edu

1 - Robust Multiobjective Optimization For Decision Making Under Uncertainty And Conflict

Margaret M Wiecek, Clemson University, Mathematical Sciences Dept, Clemson, SC, 29634-1907, United States, wmalgor@clemson.edu, Garrett M Dranichak

Many real-life problems in engineering, business, and management are characterized by multiple, conflicting objectives, as well as the presence of uncertainty. The conflicting criteria originate from various ways to assess system performance and the multiplicity of decision makers, while uncertainty results from inaccurate or unknown data due to imperfect models and measurements, lack of knowledge, and volatility of the global environment. In this tutorial, the deterministic approaches to uncertainty that are integrated with multiobjective optimization to address decision making under uncertainty and conflict are discussed. The approaches are based on robust optimization and parametric optimization, both developed for single-objective settings. Six sources of uncertainty are presented, and each type of uncertainty is placed in the multiobjective optimization problem (MOP), yielding several types of uncertain MOPs (UMOPs). Some of the sources are adopted from earlier studies in (single-objective) engineering optimization, while the others result from the multiobjective optimization modus operandi. The UMOP models are classified first according to the location of the uncertainty in their formulation, second with respect to the undertaken optimization approach, and third on the basis of the proposed definition of robust efficient solutions. The models are presented along with the accompanying results on solution concepts, properties, methods, and applications that are specific to each case. It is expected that the topics selected in this tutorial and their organization may help beginners to become familiar with the area of robust multiobjective optimization while serving as a reference to researchers.

1 - The Impact Of Delay Announcements On Hospital Network Coordination

Jing Dong, Northwestern University, jing.dong@northwestern.edu, Elad Yom-Tov

We investigate the impact of delay announcements on the coordination within hospital networks using a combination of empirical observations and numerical experiments. We provide empirical evidence that patients may take delay information into account when choosing emergency service providers and that such information can help increase coordination in the network. We analyze different factors that may affect the level of coordination that can be achieved. In particular, we show that delay estimators that are based on historical average may cause extra oscillation in the system when patients are sensitive to delay.

2 - Proactive Inpatient Bed Allocation For Emergency Department Patients Using Predictive Analytics

Seung Yup Lee, Wayne State University, Detroit, MI, United States, seung.lee@wayne.edu, Ratna Babu Chinnam, Evrim Dalkiran

One of the main factors driving Emergency Department (ED) crowding is boarding delay, where admitted patients are held in ED while waiting for an inpatient bed to be identified and prepared. We propose a queueing network model that allows for the development of 'proactive' coordination strategies. In particular, under the proposed setting, the inpatient bed allocation process precedes ED patient disposition. Model also accounts for the performance of the predictive analytics model in predicting disposition decisions. We present analytical results and insights through experiments motivated by a large Midwest healthcare facility.

3 - Care Coordination Models Based On Longitudinal Encounter Data

Michael Rossi, Univ of Massachusetts - Amherst, Amherst, MA, United States, mrossi09@gmail.com, Hari Balasubramanian

We discuss a framework for analyzing data concerning healthcare encounters at the individual level. These encounters can be of various types - outpatient, emergency room, inpatient, pharmaceutical etc., each corresponding to one or more diagnoses. We provide examples where such data could be used and discuss the stochastic methods that are best suited for generating insights.

4 - Coordinating Clinic And Surgery Appointments To Meet Access Service Levels For Elective Surgery

Pooyan Kazemian, Harvard Medical School, Boston, MA, United States, pooyan.kazemian@mgh.harvard.edu, Mustafa Y Sir, Mark P Van Oyen, David Larson, Kalyan Pasupathy

Providing timely access to surgery is crucial for patients with high acuity diseases like cancer. We present a methodological framework to coordinate clinic and surgery appointments so that patient classes with different acuity levels can see a surgeon in the clinic and obtain surgery (if found to be needed) within a maximum wait time target. We evaluate six heuristic scheduling policies that exploit information on the need for surgery obtained from the clinic visit. Colorectal surgery at Mayo Clinic is discussed as a case study. Numerical results suggest dramatic improvements in access for urgent patients.

1 - Risk Aversion In Gatekeeping Systems: An Empirical Study Of Admission Errors In Emergency Departments

Stefan Scholtes, University of Cambridge, Judge Business School, Cambridge, United Kingdom, s.scholtes@jbs.cam.ac.uk, Michael Freeman

In a study of over 450,000 emergency department attendances, we explore the impact of gatekeeper risk-aversion and the level of diagnostic uncertainty on referral errors. While gatekeepers normally make binary decisions to refer or not, we demonstrate the value of a third decision alternative, akin to a second opinion, that can be used when the gatekeeper lacks confidence to commit. The error reduction is particularly pronounced for more risk-averse gatekeepers, for customers with a high level of diagnostic uncertainty, and when the unit is busy.

2 - Learning From Many: Partner Diversity And Team Familiarity In Fluid Teams

Jonas Jonasson, London Business School, jjonasson@london.edu, Zeynep Aksin Karaesmen, Sarang Deo, Kamalini Ramdas

We use data from London Ambulance Service to study the impact of partner diversity of new paramedics on their operational performance. We find that the greater diversity in prior partners directly improves performance for an unstandardized process. For a more standardized process, this effect is moderated by a new recruit's total experience. We explore the implications of our results for team formation strategies by balancing the benefits of partner diversity with those of team familiarity.

3 - Patient Portals In Primary Care: Impacts On Visit Frequency And Patient Health

Hessam Bavafa, University of Wisconsin, hessam.bavafa@wisc.edu

Interest in innovative healthcare delivery models has increased due to measures such as the Affordable Care Act, which is designed to expand insurance coverage and contain healthcare costs. One innovation that has been forwarded as a low-cost alternative to physician office visits is "e-visits," or secure messaging between patients and physicians. We evaluate the effect of e-visit adoption on patient health and physician productivity using a panel dataset from a primary care provider in the US.

4 - Discharge Decision In Emergency Departments: Impact Of Operational Measures And Pay-for-Performance Incentives

Eric Park, University of Hong Kong, Hong Kong, g, ericpark@hku.hk, Yichuan Ding

We study how operational measures in the emergency department such as number of patients waiting to be seen and physician's patient load affect patient discharge decisions. We also analyze the impact of a provincial hospital level pay-for-performance incentive scheme on discharge decisions. We study several major hospitals in the metro Vancouver, Canada area.

Models in Medical Decision Making

Sponsored: Health Applications

Sponsored Session

Chair: Zlatana Dobrilova Nenova, University of Pittsburgh, 282 Mervis Hall, Pittsburgh, PA, 15260, United States, zdn3@pitt.edu

1 - Chronic Kidney Disease: A Simulation Study

Zlatana Nenova, University of Pittsburgh, zdn3@pitt.edu, Jerrold H May

We developed a case-based reasoning simulation model to predict the one-year disease progression of chronic kidney disease patients. The model bases its projections on an analysis of the patient's historical lab values (eGFR, albumin, phosphate, and potassium) and vital signs (systolic and diastolic blood pressure, and weight), together with the history of disease comorbidities and complications (diabetes, heart failure, dialysis, PVD/CVD, and cirrhosis).

2 - Decision-making Models In Kidney Transplantation

Eric Chow, Johns Hopkins University, Baltimore, MD, 21231, United States, echow8@jhmi.edu

Clinical decision-making in kidney transplantation is a constant challenge for patients: will you benefit from a given organ being offered or are you better off waiting on dialysis for a better organ? The field is thus in need of mathematical models designed to help patients make these decisions. Fortunately, there are rich sources of big data in transplantation to support the design of these models, including a national registry of every patient on the waiting list, every organ offer made, and post-transplant outcomes. This presentation will review these data sources and their integration into several existing models.

3 - Challenges In Markov Modeling Of Cancer Treatment

Jiaru Bai, University of California, Irvine, Irvine, CA, United States, jiarub@uci.edu, Cristina del Campo, L Robin Keller

We present a way to build a Markov decision tree to model cancer progression and cost-effectiveness analysis for two or more cancer treatments. We propose several problems researchers can encounter in this kind of research and provide possible solutions.

4 - A Continuous Time Stochastic Model To Optimize Blood Pressure Treatment Decisions

Anthony Bonifonte, Georgia Institute of Technology, ABonifon@gatech.edu, Turgay Ayer, Ben Haaland, Peter Wilson

Antihypertensive drug treatment can control elevated blood pressure and reduce the risk of future cardiovascular outcomes. We develop a data-driven stochastic model of blood pressure progression that generalizes Brownian motion by modeling the change in blood pressure per unit time as a Gaussian mixture distribution. This model addresses the question of what thresholds at which to initiate antihypertensive treatment and the optimal intensity. Our main finding is initiation and intensity decisions depend jointly on systolic and diastolic pressure. The methods are generalizable to other chronic diseases with continuous valued measurements.

5 - Designing Effective Vaccine Administration Practices

Gizem Sultan Nemutlu, PhD Candidate, University of Waterloo, Faculty of Engineering University of Waterloo, Carl A. Pollock Hall 3654 200 University Avenue West, Waterloo, ON, N2L 3G1, Canada, gsnemutlu@uwaterloo.ca, Fatih Safa Erenay, Osman Yalin Ozaltin

Childhood vaccine wastage due to limited shelf-life of opened vials is still high in developing countries. Our research shows that open vial wastage can be significantly reduced by keeping vaccine stocks in different size vials, and dynamically deciding what size of vial to use next and/or when to terminate daily vaccination services. We develop a discrete-time MDP model maximizing demand coverage. We analyze the structural properties of the optimal strategies and show that the proposed model can help decision makers in determining the best vial-size combinations and optimal inventory levels.

Analytics in Evidence-Based Practice (EBP)

Sponsored: Health Applications

Sponsored Session

Chair: John Zaleski, Bernoulli Health, 4801 S. Board Street, Suite 120, Philadelphia, PA, 19112, United States, jzaleski@bernoullihealth.com

1 - Clinical Applications Of Data Analytics: A Survey

Amy Harris, Middle Tennessee State University, amy.harris@mtsu.edu

Increasing volumes and varieties of clinical data and growing interest in analytics has created opportunities for healthcare organizations to study and address clinical problems. Experience gained is often employed to improve care and, where successful, results are published in academic journals. This presentation surveys the literature and explores which types of analytics are most popular and how healthcare organizations use data analytics to inform clinical practice.

2 - The Use Of Kalman Filtering In Alarm Management Studies

John Zaleski, Bernoulli Enterprise Inc, jzaleski@bernoullihealth.com

Vitals signs monitoring in high acuity environments are often the source of alarms and notifications to care providers. In this presentation, the author demonstrates the use of a Kalman filtering technique that has been used in the identification of alarm limit thresholds for capnography monitoring of patients in the medical surgical environment post-operatively.

3 - The State Of Digital Marketing In The Healthcare Industry

Brian Harris, Lima Consulting, bharris@limaconsulting.com

Digital marketing technologies and web analytics have opened new opportunities to provide actionable analysis to decision makers. However, many analysts struggle with inconsistent or questionable data due to failed or sub optimal deployments of these technologies. This study examines two million pages across websites of hundreds of the world's largest healthcare companies to provide insights on the relative health of digital marketing and web analytics across multiple sectors. It also provides practical advice for analysts seeking to improve the quality and veracity of their web analytics data.

4 - Consistent Staffing For Long-term Care Through On-call Pools

Vincent W. Slaugh, Assistant Professor, Cornell University, Ithaca, NY, 14850, United States, vslaugh@cornell.edu, Alan Scheller-Wolf, Sridhar R Tayur

Nursing home managers have increasingly emphasized consistency of care — i.e., minimizing the number of different nurse aides who care for each resident — but have struggled with this goal due to nurse aide absences before the start of each shift. We provide structural and numerical results for the relationship between the number of aides in an on-call pool, on-call pool rules, staffing costs, and consistency level. We also demonstrate that using part-time aides can actually improve consistency of care if their on-call pool participation rate is sufficiently high.

Scheduling and Contracts

Invited: Project Management and Scheduling

Invited Session

Chair: Nicholas G Hall, Ohio State University, Columbus, OH, United States, hall.33@osu.edu

1 - Multitasking Via Alternate And Shared Processing: Algorithms And Complexity

Chung-Lun Li, The Hong Kong Polytechnic University, chung-lun.li@polyu.edu.hk, Nicholas G Hall, Joseph Leung

This work is motivated by disruptions that occur when jobs are processed by humans, rather than by machines. E.g., humans may become tired, bored, or distracted. We present two scheduling models with multitasking features, which aim to mitigate the loss of productivity in such situations. The first model applies "alternate period processing" and aims either to allow workers to take breaks or to increase workers' job variety. The second model applies "shared processing" and aims to allow workers to share a fixed portion of their processing capacities between their primary tasks and routine activities. For each model, we consider several widely studied and practical classical scheduling objectives.

2 - Scheduling To Minimize Energy Cost

Marc Posner, The Ohio State University, posner.1@osu.edu, Nicholas G Hall

While scheduling is an effective way to improve energy efficiency in manufacturing, optimal scheduling becomes more complicated when energy costs vary. Our machine has discretely variable speeds, and increased energy usage is incurred at faster machine speeds. Three alternative scenarios about the time at which the machine can change speed are considered. In each scenario, we study the problem of minimizing total energy cost, subject to the completion of work by a given date. We describe efficient algorithms for these problems where possible, and also identify limits to their solvability.

3 - Analysis Of A Procurement Game With Option Contracts

Bo Chen, University of Warwick, Coventry, United Kingdom, b.chen@warwick.ac.uk, Edward James Anderson, Lusheng Shao

When a firm faces an uncertain demand, it is common to procure supply using some type of option in addition to spot purchases. A typical version of this problem involves capacity being purchased in advance, with a separate payment made that applies only to the part of the capacity that is needed. We address such a problem by formulating it as a procurement game, in which competing suppliers choose a reservation price and an execution price for blocks of capacity, and the buyer, facing known distributions of demand and spot price, needs to decide which blocks to reserve.

4 - Scheduling Crash Tests At Ford With Sequencing Restrictions And Capacity Constraints

Yuhui Shi, University of Michigan, 2212 Glencoe Hills Drive, Apt 11, Ann Arbor, MI, 48108, United States, yuhuishi@umich.edu, Amy Cohn, Marina Alex Epelman

We present the problem of scheduling crash tests at Ford Motor for new vehicle model development. In this problem, we assume performing crash tests requires prototype vehicles as well as other limited supporting resources such as testing facilities and engineers. We show how to solve the problem subject to these resource constraints by using various decomposition methods.

Combinatorial Auction Pricing

Invited: Auctions

Invited Session

Chair: Benjamin Lubin, Boston University, Boston, MA, United States, blubin@bu.edu

1 - Adaptive-price Combinatorial Auctions

Benjamin Lubin, Boston University, blubin@bu.edu

This work introduces and implements an iterative combinatorial auction that aims to achieve both high efficiency and fast convergence without prior restrictions on the valuation domain. Our auction uses polynomial prices, which price combinations of items beyond just single items, and gradually extends price expressivity as the rounds progress. We also propose a heuristic approach to winner determination to ensure the auction scales. An experimental evaluation shows that our auction is competitive with bundle-price auctions in regimes where these excel, namely multi-minded valuations, but also performs well in regimes favorable to linear prices, such as valuations with pairwise synergy.

2 - New Core-Selecting Payment Rules With Better Fairness And Incentive Properties

Benedikt Buenz, Stanford, buenz@stanford.edu

Most of the recent large-scale combinatorial auctions, e.g. for spectrum rights, have used core-selecting payment rules. Such rules ensure that no subset of players is willing to outbid the total payments charged the winning players. However, while the particular rule used in practice, the Quadratic rule, is a core-selecting rule, there are many alternatives. We examine several hundred alternative core-selecting rules in Bayes-Nash equilibrium via a novel numerical solver to identify better rules. We show that Quadratic is not the optimal rule in terms of efficiency, incentives, revenue or fairness, and that we can design rules that outperform Quadratic in all of these dimensions simultaneously.

3 - Linear Item Pricing In Combinatorial Auctions

Robert Day, University of Connecticut, Storrs, CT, Bob.Day@business.uconn.edu

I will present new results regarding the use of linear item prices in combinatorial auctions. Prices for items form a solution to an altered dual of WDP, are core-selecting, and constitute a combinatorial winning-level equilibrium.

Social Networks and Learning

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Elena Belavina, University of Chicago Booth School of Business, Chicago, IL, United States, elena.belavina@chicagobooth.edu

1 - The Use And Value Of Social Network Information In Selective Selling

Ruslan Momot, INSEAD, Fontainebleau, France, Ruslan.Momot@insead.edu, Elena Belavina, Karan Girotra

We consider the use and value of social network information in selectively selling goods and services whose value derives from exclusive ownership among network connections. Our model accommodates customers who are heterogeneous in their number of friends (degree) and proclivity for social comparisons (conspicuity). We show how the firm with information on either (or both) of these traits can use it to increase profits making a product selectively available to the firm's best targets - high-conspicuity customers within intermediate-degree segments. We find that information about degree is more valuable than information about conspicuity and that the two are substitutes.

2 - The Sharing Newsboys

Ming Hu, Rotman School at University of Toronto, Ming.Hu@Rotman.Utoronto.Ca

We study resource sharing or demand referral behavior among a network of connected newsboys. Each newsboy only locally knows the number of his neighbors but does not know the number of his neighbor's neighbors. Our focus is to investigate the change of the degree distribution on the newsboy decisions and social welfare. Surprisingly, we show that more connections may not lead to a higher social welfare.

3 - Information Externalities In Crowdfunding Projects

Senthil Veeraraghavan, Wharton School, senthilv@wharton.upenn.edu, Jiding Zhang

We study the information externalities associated with crowdfunding projects. Crowdfunding projects suffer from the tragedy of the commons. To raise capital for successful funds requires overcoming the "startup problem". We study and compare mechanisms to improve the project success — lotteries, seeking altruistic investments, up-front payments and quick dissemination of information.

4 - Managing Service Systems In Presence Of Social Networks

Gad Allon, Wharton School, Philadelphia, PA, 19010, United States, gadallon@wharton.upenn.edu, Dennis Zhang

We study a service system with the presence of a social network. In our model, firms can differentiate resource allocations among customers, and customers learn the service qualities from the social network. We study the interplay among network structure, customer characteristics, and information structure, and characterize the optimal policy. We further calibrate our model with data from Yelp.com and quantify the value of social network knowledge empirically.

Incentives Issues in Sustainable Operations

Sponsored: Manufacturing & Service Oper Mgmt, Sustainable Operations

Sponsored Session

Chair: Luyi Gui, The Paul Merage School of Business, UC - Irvine, Irvine, CA, United States, luyig@uci.edu

1 - Green Sourcing-the Role Of Premium Sharing And Consulting Services

Xi Chen, University of Michigan - Dearborn, xichenxi@umich.edu

Certified sustainable products often times enjoy a significant green premium in the retail market. In this paper, we study a retailer's use of a sourcing contract as a tool of incentivizing suppliers to exert greening efforts which improves the chances of receiving certification, and in turn capturing the green premium. We also explore the rationale for retailer to involve in suppliers' greening efforts.

2 - Inducing Prompt Disclosure In The Presence Of Evasive Effort

Shouqiang Wang, The University of Texas at Dallas, Richardson, TX, United States, Shouqiang.Wang@utdallas.edu, Peng Sun, Francis E De Vericourt

In supply chains, firms are typically exposed to negative impacts resulting from random adverse events that occur at and are privately observable to their suppliers. The firm can use fiscal instrument as well as inspections to uncover the adverse event. The supplier, however, prefers to conceal and even deliberately hide such adverse event so as to evade its responsibility. The goal of this paper is to devise optimal strategies for firms to induce the supplier's prompt disclosure in the presence of such evasive behavior.

3 - The Adoption Of Smart Home Appliance For Energy Shifting

Wenbin Wang, Shanghai University of Finance and Economics, Shanghai, China, wang.wenbin@shufe.edu.cn, Yannan Jin

Smart home appliances can shift energy consumption in response to energy price and thus hold great potential for reducing the energy cost. This paper uses a game theoretical approach to analyze the consumers' decisions on adopting smart home appliances. We study how the adoption decisions are affected by the pricing decisions of the appliance manufacturer and the utility company, as well as the government subsidy. We find the appliance manufacturer or the utility company alone may offer sufficient incentives to adopt smart home appliances. However, to increase the social welfare the government may need to interfere with these incentive programs.

4 - Incentives For Joint Product And Process Improvement Under Collective Extended Producer Responsibility

Luyi Gui, UC Irvine, luyig@uci.edu

Extended producer responsibility legislation mandates producers' financial responsibility of proper post-use treatment of their products. This study investigates how the widely-adopted collective implementation of EPR legislation can promote more environmentally friendly product design and more efficient recycling technology. In particular, we analyze the impact of cost allocation choices on the joint design-technology advancement.

Predictive Modeling in Healthcare

Sponsored: Manufacturing & Service Oper Mgmt, Healthcare Operations

Sponsored Session

Chair: Anita L Tucker, Brandeis, 415 South Street, MS 032, Waltham, MA, 02453-2728, United States, atucker@brandeis.edu

Co-Chair: Hummy Song, Harvard University, Soldiers Field, Boston, MA, 02163, United States, hsong@hbs.edu

1 - Accurate Emergency Department Wait Time Prediction

Mohsen Bayati, Stanford University, bayati@stanford.edu, Erjie Ang, Sara Kwasnick, Erica Plambeck, Michael Aratow

In this talk we discuss Q-Lasso method for wait time prediction, which combines statistical learning with fluid model estimators. In historical data from four remarkably different hospitals, Q-Lasso predicts the emergency department (ED) wait time for low-acuity patients with greater accuracy than existing methods. Q-Lasso achieves greater accuracy largely by correcting errors of underestimation in which a patient waits for longer than predicted. Implemented on the external website and in the triage room of the San Mateo Medical Center (SMMC), Q-Lasso achieves over 30% lower mean squared prediction error than would occur with the best rolling average method.

2 - Disease Trend Prediction And Resource Allocation for Optimal Containment

Eva Lee, Georgia Tech, evakylee@isye.gatech.edu, Kevin Liu

This work is joint with CDC. This work focuses on a computational decision modeling framework that integrates a biological disease spread predictive model, a dynamic network-based social-behavior model that captures human behavior and interaction, and a stochastic queueing model that describes treatment characteristics, day-to-day hospital and homecare processes, and resource usage (labor, time, and equipment). The computational platform includes an optimization engine that determines the minimum resource requirements needed to contain the epidemic. Results of its usage for Ebola control in West Africa will be presented.

3 - An Examination Of Early Transfers To The ICU Based On A Physiologic Risk Score

Wenqi Hu, Columbia Business School, New York, NY, United States, wh2274@columbia.edu, Carri Chan, Jose Zubizarreta, Gabriel J. Escobar

Unplanned transfers of patients from the ward to the Intensive Care Unit (ICU) can occur due to rapid deterioration and may increase the patients' risk of death and lengths of stay in hospital. A new predictive model, the EDIP2, was developed with the intent to identify patients at risk for deterioration, which in some cases could trigger a proactive transfer to the ICU. This work examines the potential costs and benefits of preventive ICU admissions based on this new dynamic warning system. We find that preventive ICU admissions have the potential to improve patient outcomes, and physicians' fears of needlessly clogging the ICU may not be as dire as initially feared.

4 - Approaches To Manage Demand Variability In An Academic Medical Center

Ryan M. Graue, Sr. Project Manager, Process Improvement, Beth Israel Deaconess Medical Center, Boston, MA, United States, rgraue@bidmc.harvard.edu, Sarah Moravick, Julius Yang

Hospitals struggle to manage variability in patient demand. For one, their physical supply (e.g., bed capacity and number of exam rooms) to accommodate patients is essentially fixed, while the daily inpatient census and number of appointments in each clinic fluctuate. In addition, minimal flexibility is built into staffing models, leading to wide day-to-day swings in staff productivity. Our work focuses firstly on approaches to reduce demand variability, and secondly on developing a newsvendor staffing model formulation that evaluates the required staff-to-patient ratios in different clinical areas and aims to minimize the costs of overstaffing and understaffing.

Topics in Operations and Finance Interface

Sponsored: Manufacturing & Service Oper Mgmt, iFORM

Sponsored Session

Chair: S. Alex Yang, London Business School, Regent's Park, Sussex Pl, London, NW1 4SA, United Kingdom, sayang@london.edu

1 - The Dual Objectives Of Reward-based Crowdfunding

Rachel Rong Chen, University of California-Davis, rachen@ucdavis.edu, Esther Gal-Or, Paolo Roma

Reward-based crowdfunding can provide entrepreneurs information regarding future demand for their products. Such information is valuable, especially for entrepreneurs who need additional funding from a Venture Capitalist (VC), because a successful crowdfunding campaign can help convince the VC to finance the project. This paper examines the optimal campaign design when the crowdfunding campaign serves the dual objectives of raising capital and acquiring market information.

2 - Optimal Pricing And Efficiency In Group Buying: Theory And Evidence

Liu Ming, PhD Candidate, Unversity of Maryland, College Park, MD, 20742, United States, liu.ming@rhsmith.umd.edu, Tunay Tunca

We study demand risk mitigation by utilization of group buying in retail sales. We model a frequently employed group buying mechanism and derive the dynamic consumer behavior and optimal seller pricing. Utilizing data from a major retail platform, we structurally estimate the model and calculate the efficiency gains employed by the mechanism.

3 - Pass-through Contracts Volatile Inputs And Frictions

Danko Turcic, Washington Univ. in St. Louis, turcic@wustl.edu, Panos Kouvelis, Wenhui Zhao

This paper examines puts forth a risk-management framework for a supply chain exposed to both demand and input cost risks. In the setting that we consider, the supply chain participants interact via index contracts that allow for re-distribution of price risks. We identify conditions under which firms find it optimal to re-distribute risk and conditions under which firms want to both re-distribute and hedge.

Revenue Mgt, Pricing III

Contributed Session

Chair: Fouad H Mirzaei, Santa Clara University, Unit 3, 559 Alviso St, Santa Clara, CA, 95050, United States, fhm.phd@ivey.ca

1 - Pricing In Remanufacturing Operations

Akshay Mutha, Pennsylvania State University, Smeal College of Business, 454 Business Building, University Park, PA, 16802, United States, axm536@psu.edu, Saurabh Bansal, V Daniel R Guide

We consider a firm that can remanufacture products after the demand is realized. We analyze the effect of postponing remanufacturing operations on the pricing decisions of a firm. We show the application of our model using industry data.

2 - Airline Price-sensitive Demand Forecasting And Optimization

Sylvia Zhu, Sabre Airline Solution, 3150 Sabre Dr., Southlake, TX, 76092, United States, sylvia.zhu@sabre.com

Traditional revenue management models assume the demand is independent. In recent years, there has been more attempt to handle scenarios in which the customer looks for the lowest available fare. It means that the demand for specific product depends on availability of other products. In order for us to make a recommendation on the capacity and connectivity that an airline will need to achieve higher revenue, we will need to provide reliable dependent demand forecasting and optimization methodologies. We will describe major features of the forecasting and optimization models for dependent demand revenue management and share experiments of their performance.

3 - An Analysis Of B2B Negotiations In The Context Of Data Products

Jyotishka Ray, Student, University of Texas-Dallas, Naveen Jindal School of Management, Richardson, TX, 75083, United States, jxr114030@utdallas.edu, Syam Menon, Vijay S Mookerjee

The explosive growth of eBusiness has allowed many companies to accumulate a repertoire of rich and unique data sets that can provide substantial value to other firms. We analyze how to monetize proprietary data products through negotiation. We consider whether the seller should make presentations to the buyer before the negotiation when the buyer is underestimating the value. We extend our study to understand the impact of a consultant (hired by the buyer to analyze the data) on the negotiation process. We adapt the generalization of the Nash bargaining problem to analyze this three-player negotiation. We find that the presence of a consultant reduces the possibility of a viable presentation.

4 - Managing Change Revenue With Presence Of Time Uncertain Customers

Fouad H Mirzaei, Santa Clara University, Unit 3, 559 Alviso St, Santa Clara, CA, 95050, United States, fhm.phd@ivey.ca, Fredrik Odegaard, Xinghao Yan

In this study, we focus on the dynamics between a firm charging a change fee and customers who are uncertain about their future travel plans. While the firm maximizes its revenue by imposing optimal change fees, customers consider their travel plan uncertainties and maximize their utilities by responding strategically to these fares. Without imposing any distributional assumptions, we analytically derive each market player's best reaction to the other to prescribe the characteristics of the firm/customer interaction equilibrium. We also investigate how the optimal monopolistic price should be set with the presence of a change fee.

Queueing Models I

Contributed Session

Chair: Yao Yu, North Carolina State University, 4335-3 Avent Ferry Road, Raleigh, NC, 27606, United States, yyu15@ncsu.edu

1 - Can The Way Customers Are Assigned To Servers Affect The Unscheduled Within-day Work Breaks In A Service System?

Xu Sun, Columbia University, 363 W 123rd St, Apt 4R, New York, NY, 10027, United States, xs2235@columbia.edu, Ward Whitt

We apply many-server heavy-traffic analysis to study the impact of alternative routing rules, such as longest-idle-server-first (LISF) and randomized routing (RR), on the pattern of server idleness in a service system. We show that LISF provides more regular breaks than RR when the staffing is adequate to allow non-negligible idleness.

2 - Decoupling Job Size And Server Slowdown In Modeling Redundancy

Kristen Gardner, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States, ksgardne@cs.cmu.edu, Mor Harchol-Balter, Alan Scheller-Wolf

Redundancy is an increasingly common technique for reducing response time in multi-server queueing systems. In a system with redundancy, jobs replicate themselves and wait in multiple queues; a job is complete as soon as any one copy completes service. Much of the existing theoretical work on analyzing systems with redundancy makes the unrealistic assumption that a job's service times are independent across different servers. This assumption can lead to results that are at odds with implementation results. We introduce a new, more realistic model of redundancy and design a new dispatching policy that is both analytically tractable within our model and has provably excellent performance.

3 - Gated Queues With Impatience Customers

George Mytalas, NJIT, Newark,NJ, NJ, United States, mytalas@aueb.gr

We analyze an M/M/1 queueing model with gated service discipline. In this discipline there is a waiting room and a service queue. Each time the service queue becomes empty all customers in the waiting room are instantaneously put in the service queue. Customers in waiting room can be impatient after waiting a random amount (or a certain) of time and abandon the system. We derive the joint distribution of the number of customers in waiting room and service queue, and obtain various quality of service measures.

4 - Appointment Systems Under Service Level Constraints

Rui Chen, University of Toronto, 105 St George St, Toronto, ON, M5S 3E6, Canada, rui.chen@rotman.utoronto.ca, Rowan Wang, Zhenzhen Yan, Saif Benjaafar, Oualid Jouini

We consider a new model of appointment scheduling where customers are given the earliest possible appointment times under the service level constraint that the expected waiting time of each individual customer cannot exceed a given threshold. We apply the theory of majorization to analytically characterize the structure of the optimal appointment schedule. We show that, the optimal inter-appointment times increase with the order of arrivals. We prove that, when customer service times follow an exponential distribution, our system converges asymptotically to the D/M/1 queueing system as the number of arrivals approaches infinity. We also extend our analysis to systems with multiple servers.

5 - Approximations For Heavily-loaded G/ Gi/n+ Gi Queues

Yao Yu, North Carolina State University, 4335-3 Avent Ferry Road, Raleigh, NC, 27606, United States, yyu15@ncsu.edu, Yunan Liu, Ward Whitt

Motivated by applications to service systems, we develop convenient engineering approximation formulas for the steady-state performance of heavily-loaded G/GI/n+GI multi-server queues. Based on established Gaussian many-server heavy-traffic limits in the efficiency-driven regime, however, the approximations also apply to systems in the quality-and-efficiency-driven regime where traffic intensity is close to 1 from above. Simulation experiments show that the proposed approximations are effective for large-scale queueing systems for a significant range of the traffic intensity and the abandonment rate.

Scheduling and Workload Assignment in Healthcare

Sponsored: Manufacturing & Service Oper Mgmt, Healthcare Operations

Sponsored Session

Chair: Retsef Levi, MIT, 100 Main Street, Building E62-562, Cambridge, MA, 02142, United States, retsef@mit.edu

Co-Chair: Cecilia Zenteno, Massachusetts General Hospital, 55 Fruit Street, White 400, Boston, MA, 02114, United States, azentenolangle@mgh.harvard.edu

1 - Integrated Scheduling And Capacity Planning With Considerations For Patients' Length-of-stay

Nan Liu, Columbia University, New York, NY, United States, nl2320@columbia.edu, Van-Anh Truong, Xinshang Wang, Brett Anderson

Motivated by the shortcoming of current hospital scheduling and capacity planning methods which often model different units in isolation, we introduce the first dynamic multi-day scheduling model that integrates information about capacity usage at more than one location in a hospital. In particular, we analyze the first dynamic model that accounts for patients' length-of-stay and downstream census in scheduling decisions. Through numerical experiments on real data, we show that there is substantial value in making integrated scheduling decisions. In contrast, localized decision rules that only focus on a single location of a hospital can result in up to a three-fold increase in total expenses.

2 - An Approximate Dynamic Programming Approach To Online Capacity Planning For Rehabilitation Treatment

Ingeborg A. Bikker, University of Twente, Enschede, Netherlands, i.a.bikker@utwente.nl
Ingeborg A. Bikker, Sint Maartenskliniek, Nijmegen, Netherlands, i.a.bikker@utwente.nl, Martijn Mes, Richard J Boucherie

We study an online capacity planning problem in which rehabilitation patients require a series of appointments with several disciplines, within a certain access time. In practice, appointments are typically planned in the first available time slots, leaving no space for urgent patients. In our research, we plan capacity for the appointment series of a patient at the moment of his/her arrival, in such a way that the total number of requests planned within their required access time is maximized. We formulate this problem as a Markov decision process, that takes into account predicted future arrivals. An approximate dynamic programming approach is used to obtain approximate solutions.

3 - Real-time Assignment Of Inpatients To Care Teams And Beds

Aleida Braaksma, Massachusetts Institute of Technology, 100 Main Street, E62-389, Cambridge, MA, 02142, United States, braaksma@mit.edu, Elizabeth Ugarph, Rhodes Berube, Cecilia Zenteno, Walter O'Donnell, Retsef Levi

The Department of Medicine at Massachusetts General Hospital has undergone a major care team and inpatient units redesign. In this work, we exploit the potential of the redesign to develop algorithms for real-time assignment of patients to care teams and to beds, aiming at shortening patient wait times, and decreasing the load of Medicine patients boarding in the Emergency Department. We use data-driven simulation to assess the effectiveness of the algorithms as well as to evaluate several other interventions aimed at optimizing patient flow.

Managing Service Systems with Strategic Servers

Sponsored: Manufacturing & Service Oper Mgmt, Service Operations

Sponsored Session

Chair: Philipp Afeche, University of Toronto, Rotman School of Management, Toronto, ON, M5S 3E6, Canada, afeche@rotman.utoronto.ca

1 - Product Support Forums: Customers As Partners In The Service Delivery

Stouras Konstantinos, INSEAD, konstantinos.stouras@insead.edu, Serguei Netessine, Karan Girotra

Online product support forums where customers can post complaints and questions, or report issues about a product or service of a firm abound. A large number of companies choose to crowdsource their product and service support back to their customers, employing a few dedicated service operators. We characterize the equilibrium behavior of such a novel business model for service and compare it with a call center model.

2 - Incentive Based Service System Design: Staffing And Compensation To Trade Off Speed And Quality

Amy Ward, USC Marshall School of Business, Los Angeles, CA, United States, amyward@marshall.usc.edu, Dongyuan Zhan

In many service systems, there is a trade-off between service speed and quality, and employees are paid based on both. We assume that the employees each selfishly choose their own service speed in order to maximize their own expected utility, which can have both a monetary and a non-monetary component. We show that a simple linear staffing and compensation policy is a first best solution in a large system limit. We further show the conditions under which a critically loaded, efficiency-driven, quality-driven, or mixed regime - in which there is simultaneous customer abandonment and server idling - emerges under a first-best linear policy.

3 - Managing Workplace Flexibility: The Case Of Agents With Task Preferences

Vasiliki Kostami, London Business School, vkostami@london.edu, Rouba Ibrahim

In many workplaces, employees are expected to excel in different skills as part of their job and are usually heterogeneous in their preferences to perform certain tasks. They might be willing to give up a grain of their salary to avoid working on the unlikable ones or prioritize the preferred ones. The manager, in turn, gains extra freedom in his decision to allocate tasks by charging his servers for this task discretion. We study how the choices change in equilibrium and we also derive the optimal flexibility fee under two innovative flexibility schemes and different heterogeneity scenarios.

4 - Pricing In A Two-sided Market With Time-sensitive Customers And Suppliers

Mustafa Akan, Tepper School of Business, Carnegie Mellon University, Pittsburgh, PA, United States, akan@andrew.cmu.edu, Philipp Afeche

We consider a firm that matches stochastically arriving and time-sensitive customers and suppliers. We characterize the structure and performance of the profit-maximizing and socially optimal pricing policies.

Pricing and Supply Chain Management in Healthcare Industry

Sponsored: Manufacturing & Service Oper Mgmt, Supply Chain

Sponsored Session

Chair: Mehmet Sekip Altug, George Washington University, maltug@gwu.edu

1 - Contracts For Referral Healthcare Services

Fernanda Bravo, Assistant Professor, UCLA, Los Angeles, CA, United States, fernanda.bravo@anderson.ucla.edu, Elodie Adida

This work focuses on the B2B interaction between a service requester and a service provider in a healthcare environment. The requester is responsible for managing the health of a population of patients, and refers the patient to a provider for advanced care needs. The requester may exert effort to reduce the volume of referrals and the provider may exert effort to reduce the chance of treatment failure. We analyze a variety of payment systems between the two firms and study how to coordinate the effort decisions with either the system optimum or the social optimum.

2 - Drug Pricing For Competing Pharmaceutical Manufacturers Distributing Through A Common PBM

Nan Yang, University of Miami, Coral Gables, FL, United States, yangn@wustl.edu, Panos Kouvelis, Yixuan Xiao

We study the price competition among multiple branded drug manufacturers when their drugs are distributed through a common Pharmacy Benefit Manager (PBM). We characterize the downstream PBM's optimal copayment and pricing decisions, and establish conditions for the equilibrium analysis of the price competition among the branded drug manufacturers. In particular, we provide a sufficient condition for the uniqueness of the equilibrium, and characterize the unique equilibrium in closed form. We apply our model to study the strategic implications of vertical integration between a branded drug manufacturer and the PBM.

3 - Policy And Product Launch Implications Of Parallel Imports In Pharmaceutical Industry

Mehmet Altug, George Washington University, maltug@gwu.edu, Ozge Sahin

While it may be socially optimal to introduce a new drug all over the world at the same time, doing so may have adverse implications for drug developers, such as the emergence of parallel imports. We study a pharmaceutical firm that already introduced a pioneering drug in its home country, where the product is protected by patent rules. The firm has to decide whether to launch in a second country in the same region, where parallel import between these two countries is feasible and if so how to price it. We characterize the joint equilibrium pricing and product launch decision of the firm. We discuss how these decisions are a ected by various parameters, including insurance, patient populations and negotiation.

Sustainability Issues in Supply Chains II

Sponsored: Manufacturing & Service Oper Mgmt, Sustainable Operations

Sponsored Session

Chair: Karthik Natarajan, University of Minnesota, University of Minnesota, Edina, MN, Please fill in, United States, knataraj@umn.edu

1 - Optimal Contracts For Recycling And Refurbishment In The Reverse Supply Chain

Aditya Vedantam, State University of New York at Buffalo, Buffalo, NY, United States, adityave@buffalo.edu, Ananth Iyer

Several companies contract with third parties to dispose end-of use electronics involving recycling and refurbishment with subsequent resale. We present examples of contracts currently used in the IT Asset Disposition industry, provide insights on the profit and environmental impact and show how a customer can optimally set contract parameters under uncertainty in condition of incoming units. We parameterize our model to data from a third party e-waste recycler.

2 - Environmental Benefits Of Internet-enabled C2c Surplus Chains

Suvrat Dhanorkar, Pennsylvania State University, 120 Kenley Court, State College, PA, United States, ssd14@psu.edu

Recently, online matching platforms (e.g. Craigslist, FreeCycle, Gumtree) have enabled consumers to directly connect with each other to buy/sell surplus consumer goods (electronics, furniture etc.), which would have otherwise ended up in the waste stream. Such matching platforms can facilitate the creation of C2C "surplus chains" for used goods, which can enhance product reuse and limit reliance on recycling and disposal alternatives. We estimate the environmental benefits of internet-enabled surplus chains.

3 - The Implications Of Eliminating Grading In Food Supply Chains

Karthik Murali, University of Alabama, kmurali@cba.ua.edu, Isil Alev

Aside from imprudent consumer behavior, food grading based on aesthetics is the biggest contributor to food waste in the U.S. This study explores the implications of eliminating food grading in the agri-supply chain by considering the introduction of differentiated produce at the retail level and its impact on profitability, waste, and farmed acreage when consumers are heterogeneous and produce quality is uncertain.

4 - Investigating The Impact Of Supply-chain Factors on Counterfeit Parts

Vidya Mani, Pennsylvania State University, State College, PA, United States, vmani@psu.edu, Jayashankar Swaminathan

In this paper we investigate the relationship between supply chain factors and risk of counterfeit parts. We quantify the effectiveness of inventory positioning, distribution network, and information sharing through an empirical study of counterfeit parts in the electronic parts supply chain.

Reliability I

Contributed Session

Chair: Hui Wang, Florida State University, Tallahassee, FL, United States, hw11b@my.fsu.edu

1 - Dynamic Reliability Modeling Of Software Errors

John G Wilson, Professor, Ivey School of Business, London, ON, N6G ON1, United States, jwilson@ivey.ca, Dov Te'eni

New errors can be dynamically introduced as new devices are produced and are found to be incompatible with software that is perfectly good for other devices. We provide a procedure for finding maximum likelihood estimators of key parameters where the number of errors and the number of users can change. This methodology is particularly apt for big data applications.

2 - Condition-Based Maintenance Policies Under The Gamma Degradation Process

David Han, University of Texas at San Antonio, One UTSA Circle, San Antonio, TX, 78249-0632, United States, david.han@utsa.edu

Condition-based maintenance is an effective method to reduce unexpected failures as well as the O&M costs. This talk discusses the condition-based maintenance policy with optimal inspection points under the gamma degradation process. A random effect parameter is used to account for population heterogeneities and its distribution is continuously updated at each inspection epoch. The observed degradation level along with the system age is utilized for making the optimal maintenance decision, and the structure of the optimal policy is examined.

3 - A Combined Repair-replacement Warranty Policy Considering Heterogeneous Usage Rate And Customer Error

Guozhen Xiong, graduate Student, Tsinghua University, Department of Industrial Engineering, Tsinghua University, Beijing, China, Beijing, 100084, China, xgz14@mails.tsinghua.edu.cn

Warranty has been widely used as a means of sales promotion. However, the warranty services usually result in considerable cost and hurt a company's profitability. It is not uncommon that some failures within warranty period are caused by customers' improper use, which should not be covered by the warranty service. Therefore, in order to minimize the total cost, this research studies the integration of maintenance strategies with appropriate testing strategies to identify failures that are out of warranty. Heterogeneous usage rate is also considered. Numerical experiments are conducted to illustrate the influence of different combinations of testing and maintenance strategies on warranty cost.

4 - Data Analysis And Experimental Design For Accelerated Life Testing With Heterogeneous Group Effects

Kangwon Seo, PhD Candidate, Arizona State University, 699 S Mill Ave., Tempe, AZ, 85281, United States, kseo7@asu.edu, Rong Pan

In accelerated life tests (ALTs), complete randomization is hardly achieved because of economic or engineering constraints. Typical experimental protocols such as subsampling or random blocks in ALT result in a grouped structure of test units, which leads to correlated lifetime observations. In this talk, generalized linear mixed model (GLMM) approach is proposed to analyze ALT data and find the optimal ALT design with consideration of heterogeneous group e ffects. First, we will demonstrate how the random group effects of ALT affect the life-stress relationship. Second, D-optimal ALT test plan will be derived when we run experiments with multiple test chambers.

Applied Probability and Simulation I

Sponsored: Applied Probability

Sponsored Session

Chair: Henry Lam, University of Michigan, 500 S. State Street, Ann Arbor, MI, 48109, United States, khlam@umich.edu

1 - Rare Event Estimation For Gaussian Random Vectors

Ton Dieker, Columbia University, dieker@columbia.edu, Richard Gabriel Birge

We present a new technique for estimating the probability P(g(X)>x), where X is a Gaussian random vector and g is a function for which the probability becomes a rare event probability. In this setting, direct Monte Carlo is computationally expensive. We establish quantitative properties on the performance of our technique and illustrate them through numerical examples.

2 - On Adaptive Recursion For Integral Optimization

Raghu Pasupathy, Purdue University, pasupath@purdue.edu

We consider \emph{integral optimization problems}, that is, high-dimensional optimization problems where the objective function is expressed as an integral that can only be approximated using numerical quadrature. For efficient optimization, we propose an adaptive line-search recursion that dynamically determines the extent of work to be exerted during numerical quadrature. Assuming a general quadrature error-rate, we prove consistency and sample complexity results. The achieved rate in all cases is \emph{optimal} in a certain sense that we make clear.

3 - Three Asymptotic Regimes For Ranking And Selection With General Sample Distribution

Yi Zhu, Northwestern University, yizhu2020@u.northwestern.edu

In this paper, we study three asymptotic regimes that can be applied to ranking and selection (R&S) problems with general sample distributions. These asymptotic regimes are constructed by sending problem parameters (probability of incorrect selection, difference between the best and second best system) to zero. We establish asymptotic validity of the corresponding R&S procedures under each regime. We also analyze the connection among different asymptotic regimes and compare their pre-limit performances.

Markov Decision Processes: Theory

Sponsored: Applied Probability

Sponsored Session

Chair: Matthew J. Sobel, Emeritus Professor, Case Western Reserve University, 10900 Euclid Ave., Cleveland, OH, 44106-7235, United States, matthew.sobel@case.edu

Co-Chair: Jie Ning, Case Western Reserve University, 10900 Euclid Ave., Cleveland, OH, 44106-7235, United States, jie.ning@case.edu

1 - Atomless Discounted Markov Decision Processes With Multiple Criteria

Eugene A Feinberg, Stony Brook University, eugene.feinberg@stonybrook.edu, Aleksey Piunovskiy

A Markov Decision Process (MDP) is called atomless if the initial distribution and transition probabilities are atomless. We show that, for an atomless MDP with multiple cost functions, for an arbitrary policy there is a nonrandomized stationary policy with the same vector of the total expected discounted costs. We also discuss the relevance of this result to Lyapunov's convexity theorem, to the classic results by Dvoretzky, Wald, and Wolfowitz on sufficiency of nonrandomized policies for atomless decision problems, and to our previous results on sufficiency of nonrandomized Markov policies for atomless MDPs.

2 - Optimal Policies In Decentralized Stochastic Control: Existence And Approximations

Serdar Yuksel, Queen's University, Kingston, ON, K7L 3N6, Canada, yuksel@queensu.ca

We will study optimal solutions in decentralized stochastic control. First, strategic measures will be introduced; these are probability measures induced by admissible policies. Properties such as convexity and compactness will be studied leading to existence of and structural results for optimal policies. Finally, asymptotic optimality of finite model representations will be established. These lead to asymptotic optimality of quantized control policies, so that one can construct a sequence of finite models obtained through the quantization of measurement and action spaces whose solutions converge to the optimal cost. Witsenhausen's counterexample will be a running case study.

3 - Easy Affine Mdps: Theory

Matthew J. Sobel, Case Western Reserve University, matthew.sobel@case.edu, Jie Ning

An MDP with continuous state and action vectors is shown to have an extremal optimal policy if it has affine immediate rewards and dynamics, decomposable constraints on the actions, and maximizes the expected present value of the rewards. Identifying an optimal policy and computing its value function reduces to solving a small system of auxiliary equations. This exorcises the curse of dimensionality. The same structure in a sequential game yields the existence and simple characterization of an extremal Nash equilibrium. A companion paper with algorithms and applications is in another session.

Learning, Estimation, and Experimentation in RM and Pricing

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Stefanus Jasin, University of Michigan, Ann Arbor, MI, United States, sjasin@umich.edu

1 - Demand Forecasting In The Presence Of Unobserved Lost Sales

Shivaram Subramanian, IBM, subshiva@us.ibm.com, Pavithra Harsha

We present an effective mixed-integer programming (MIP) based optimization approach to calibrating attraction demand models for pricing and revenue management applications using censored historical sales data. This single-step approach helps overcome some of the limitations present in prior approaches (e.g., the EM method). We discuss its practical viability by reviewing a recent commercial implementation for a large retail chain. We also comment on interesting extensions.

2 - Learning Valuation Distributions From Bundle Sales

Will Ma, ORC, MIT, willma353@gmail.com, David Simchi-Levi

Bundling has been widely studied in the literature as a form of price discrimination. We show that it can also be used as a form of price experimentation - a mixed bundling scheme allows the firm to quickly learn the customer valuation distributions without having to change any prices. We present an iterative algorithm to reverse-engineer the valuations based on bundle sales, with theoretical convergence guarantees for Uniform distributions. For other two-parameter families of distributions, our extensive numerical experiments demonstrate that optimizing over the learned parameters still extracts close to 100% of the optimal profit obtainable had we known the exact parameters.

3 - Less Can Be More In Price Experimentation

Georgia Perakis, MIT, georgiap@mit.edu, Divya Singhvi

We consider a dynamic pricing problem where a monopolist is selling a single product but has no knowledge of the demand curve. Further, there is a cost on price experimentation, as for every price the monopolist incurs a fixed operational cost. The monopolist seeks to efficiently learn the demand curve and keep the cost of price experimentation low. We propose an approach for price experimenting and learning the demand for the problem and provide bounds on the number of price experimentations needed to achieve a threshold revenue level for both parametric and non-parametric demand functions. We show that with few price experimentations (aka 4) we can be within 18% of the optimal.

4 - A Nonparametric Self-adjusting Control For Multi-product Pricing With Limited Resources

Qi (George) Chen, Ross School of Business, University of Michigan, Ann Arbor, MI, United States, georgeqc@umich.edu, Stefanus Jasin, Izak Duenyas

We study a multi-period network revenue management problem where the underlying demand function is unknown (in the nonparametric sense) to the seller who uses dynamic pricing to minimize expected revenue loss. It is known that the asymptotic revenue loss of any feasible pricing policy is O(k^{1/2}) (k indicates the size of the problem), but there is a considerable gap between this theoretical lower bound and the performance bound of all existing heuristics. We propose a Nonparametric Self-adjusting Control and show that it guarantees a revenue loss of O(k^{1/2+epsilon} log k) for any arbitrarily small epsilon>0, provided that the underlying demand function is sufficiently smooth.

Sponsored Session

Chair: Jeffrey M Keisler, University of Massachusetts - Boston, 100 Morrissey Boulevard, Boston, MA, 02125, United States, jeff.keisler@umb.edu

1 - Decision Circuits For Decision Analysis

Debarun Bhattacharjya, IBM T. J. Watson Research Center, Yorktown Heights, NY, United States, debarunb@us.ibm.com, Ross D Shachter

A decision circuit is a graphical representation that is syntactic, i.e. depicts summation, multiplication and maximization operations required to solve a decision problem. Decision circuits can be viewed as a representation of decision analysis computations and therefore generalize decision trees as well as other well-known graphical forms. In this talk, I will present advances in our research on the formulation and analysis of decision analysis problems using decision circuits.

2 - On Computing Probabilities Of Dismissal Of 10b-5 Security Class-action Cases

Sumanta Singha, PhD Student, University of Kansas, 1654 Naismith Dr, Lawrence, KS, 66045, United States, sumanta.singha@ku.edu, Steve Hillmer, Prakash P Shenoy

The main goal of this paper is to propose a probability model for computing probabilities of dismissal of 10b-5 securities class-action cases filed in U.S. Federal district courts. By dismissal, we mean dismissal with prejudice in response to the motion to dismiss filed by the defendants, and not eventual dismissal after the discovery process. The proposed probability model is a hybrid of two widely-used methods: logistic regression (LR), and naïve Bayes (NB). Using a dataset of 925 10b-5 securities class-action cases, we show that the proposed hybrid model has the potential of computing better probabilities than either LR or NB models. By better, we mean lower RMSE of probabilities of dismissal.

3 - Observing Reporting And Deciding In Networks

Jeffrey Keisler, University of Massachusetts Boston, jeff.keisler@umb.edu, H Jerome Keisler

In observation networks, agents make observations, make new inferences, and report to neighbors to ultimately identify correct alternatives. Report plans ensure that this happens reliably. Junction tree algorithms applied to Bayes networks constitute report plans. General conditions for existence of report plans suggest other modeling possibilities.

Parallel Simulation Optimization

Sponsored: Simulation

Sponsored Session

Chair: Jie Xu, George Mason University, 4400 University Dr., MSN 4A6, Fairfax, VA, 22030, United States, jxu13@gmu.edu

1 - Implementing A Ranking And Selection Procedure In The Cloud

Sijia Ma, Cornell University, Ithaca, NY, United States, sm2462@cornell.edu, Shane Henderson

The goal of ranking and selection (R&S) procedures is to identify the stochastic system with largest mean from among a finite set of competing alternatives. We are implementing a R&S algorithm within a commercial simulation software product that runs in the cloud. A cloud-computing implementation requires estimating the wall-clock running time as a function of the number of cores used. To estimate the running time we develop a sampling and estimation method to learn about the ordered means. This methodology allows us to predict the residual running time more and more accurately as the R&S algorithm proceeds, and may prove useful when estimating the running times of other R&S procedures.

2 - Speeding Up Sequential Selection-of-the-best Procedures For Large-scale Problems

Jeff Hong, City University of Hong Kong, jeffhong@cityu.edu.hk, Jun Luo, Ying Zhong

Classical sequential ranking-and-selection (R&S) procedures require all pairwise comparisons after collecting one additional observation from each surviving system, which is typically an O(k^2) operation where k is the number of systems. When k is large (e.g., millions), these comparisons can be very costly and may significantly slow down the R&S procedures. In this paper we revise KN procedure slightly and show that one may reduce the computational complexity of all pairwise comparisons to an O(k) operation, thus significantly reducing the computational burden. Numerical experiments show that the computational time reduces by orders of magnitude.

3 - Multi-objective Optimization Via Simulation On Integer-ordered Spaces

Kalyani S Nagaraj, Purdue University, West Lafayette, IN, United States, kalyanin@purdue.edu, Kyle Cooper, Susan R Hunter

Consider the context of multi-objective optimization via simulation when the search space is integer-ordered. We propose a framework to efficiently identify the Pareto set that solves a sequence of stochastically constrained problems (via the epsilon-constraint method) and is designed for deployment on a parallel computing platform. We discuss the design principles that make our framework efficient.

4 - Parallel Empirical Stochastic Branch And Bound

Jie Xu, George Mason University, 4400 University Dr., MS4A6, Fairfax, VA, 22030, United States, jxu13@gmu.edu, Scott L. Rosen, Peter Salemi, Sajjad Taghiyeh

In this talk, we show how the Empirical Stochastic Branch and Bound (ESSB) algorithm, which is an effective globally convergent random search algorithm for discrete optimization via simulation, can be adapted to a high-performance computing environment to effectively utilize the power of massive parallelism. We propose a master-worker structure driven by MITRE’s Goal-Directed Grid-Enabled Simulation Experimentation Environment. We present numerical experiments with a benchmark test function and a real-life simulator to test the scalability of parallel empirical stochastic branch and bound.

Choice Modeling and Assortment Optimization

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Huseyin Topaloglu, Cornell Tech, 111 8th Avenue, Suite 302, Ithaca, New York, NY, 10011, United States, ht88@cornell.edu

1 - Assortment Optimization Under General Choice

Srikanth Jagabathula, NYU Stern School of Business, sjagabat@stern.nyu.edu

We consider the static assortment optimization problem where the objective is to determine the profit/revenue maximizing subset of products from a large universe of products. The product prices are exogenously fixed and the demand follows a general choice model. The problem in general is NP-hard and the greedy algorithm has been found to have good practical performance. We study the performance of a local search heuristic and show that it reaches the optimal solution for the MNL model and derive approximation guarantees for the random parameters logit (RPL) and the nested logit (NL) models. Numerically, we show that the algorithm outperforms existing heuristics in a wide-range of settings.

2 - Robust Assortment Optimization Under The Markov Chain Model

Antoine Desir, Columbia University, ad2918@columbia.edu, Vineet Goyal, Bo Jiang, Huseyin Topaloglu, Tian Xie, Jiawei Zhang

In this paper, we consider a robust assortment optimization problem under the Markov Chain model. In that setting, the true parameters of the model are unknown and belong to some uncertainty set. The goal is to select an assortment that maximizes the worst-case expected revenue over all parameter values. We present an efficient algorithm to compute the optimal robust assortment when the uncertainty set is row-wise. That is naturally the case in many settings. Our algorithm provides interesting operational insights regarding addressing uncertainty in the Markov chain model.

3 - On The Structure Of Cardinality-constrained Assortment Optimization Problems

Louis L Chen, Massachusetts Institute of Technology-ORC, llchen@mit.edu, David Simchi-Levi

Cardinality-Constrained assortment optimization, the problem of offering an assortment of items of constrained size that will maximize expected revenue, is generally regarded as a challenging problem. We provide a new perspective to the structural analysis, one that illuminates the optimality of “greedy solutions.” The approach reinterprets some known results for standard choice models but also provides some new ones as well.

4 - Competitive Pricing Under The Markov Chain Choice Model

Huseyin Topaloglu, Cornell Tech, New York, NY, 10011, United States, ht88@cornell.edu, James Dong

We consider competitive pricing problems under the Markov chain choice model. In this choice model, the customer transitions between the products according to a transition probability matrix. Based on the price of the product she visits, she decides to purchase the product or not. In our competitive setting, the prices of the different products visited by the customers are controlled by different firms. Each firm wants to maximize its own expected revenue. We show that a Nash equilibrium exists and the equilibrium prices are lower than those charged by a central planner.

Pricing, Promotions and Bundling for Revenue Management

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Pelin Pekgun, University of South Carolina, 1014 Greene Street, Columbia, SC, 29208, United States, pelin.pekgun@moore.sc.edu

1 - A Pricing Model To Optimize The Promotions Period In Airlines

Daniel Felipe Otero Leon, Lecturer, Universidad de los Andes, Bogota, 1111, Colombia, df.otero128@uniandes.edu.co, Cristina Lopez, Mariana Escallon, Raha Akhavan-Tabatabaei

Promotions help increment the demand for a flight. Several decisions have to be made to offer a promotion such as its price and duration. We propose a method to estimate the behavior of customer inter-arrival time distribution, his buying probability distribution, and the dilution effect from data and develop a stochastic dynamic model to maximize the revenue, evaluating the decision of whether or not to offer the promotion. Finally we study the structural properties of the model and draw conclusions.

2 - Dynamic Pricing For Hotel Rooms When Customers Request Multiple-day Stays

Yun Fong Lim, Singapore Management University, yflim@smu.edu.sg, Selvaprabu Nadarajah, Qing Ding

We study the dynamic pricing problem faced by a hotel that maximizes expected revenue from a single type of rooms. Demand for the rooms is stochastic and non-stationary. Our Markov decision process formulation of this problem determines the optimal booking price of rooms (resources) for each individual day, while considering the availability of room capacity throughout the multiple-day stays (products) requested by customers. To offer attractive average daily prices, the hotel should not only substantially raise the booking prices for some high-demand days, but also significantly lower the booking prices for the low-demand days that are immediately adjacent to these high-demand days.

3 - On The Benefit (or Cost) Of Large-scale Bundling

Tarek Abdallah, New York University, tabdalla@stern.nyu.edu

We study the effectiveness of a simple bundling mechanism in extracting the consumer surplus in the presence of non-negative marginal costs and correlated valuations. We develop simple robust analytics that identify the main drivers for the effectiveness of the pure bundling mechanism and allow the sellers to easily quantify the potential profits of a large-scale bundling mechanism relative to more complicated selling mechanisms. Our numerical simulations show that these analytics provide high predictive power for the true performance of the bundling mechanism and are robust to different parametric assumptions even for relatively small bundles.

4 - How Perceptions Of User Reviews Impact Price Competition

Pelin Pekgun, University of South Carolina, Columbia, SC, 29208, United States, Pelin.Pekgun@moore.sc.edu, Michael Galbreth, Bikram Ghosh

We analyze the interaction of user reviews and experience uncertainty, where negative and positive reviews may be weighted differently in a consumer’s assessment of the valence of the posted reviews. We find that the competitive impact of this unequal weighting may not be intuitive in terms of pricing and profits. In particular, if consumer awareness is higher for the lower quality product, it can charge higher prices and realize higher profits in equilibrium than its higher quality competitor when consumers are strongly influenced by negative reviews.

Co-Chair: Dimitri Papadimitriou, Bell Labs, Copernicuslaan 50, Antwerp, 2018, Belgium, dimitri.papadimitriou@nokia.com

1 - Statistical Learning Approaches For Stochastic Optimization (SLASO)

Suvrajeet Sen, USC, s.sen@usc.edu, Yunxiao Deng

SLASO is a new distribution-free concept for Integrative Analytics, bringing together both Predictive and Prescriptive Analytics. We will illustrate the power of this concept by demonstrating how multiple activities, such as sales, marketing, and production planning can all work from the same data sources, thus helping to coordinate decisions from a variety of groups within an organization. The SLASO framework helps cross-fertilize members of an analytics team so that tools such as regression (Statistics), linear programming (Optimization), variance reduction (Simulation) and others can be viewed from an integrative perspective, rather than the current lens of disciplinary stove-pipes.

2 - Time Series Applications Of SLASO

Yunxiao Deng, USC, yunxiaod@usc.edu

We will introduce how SLASO can be used for Time Series Applications by studying a single echelon inventory model in which the demand data are time dependent and stochastic. To minimize the expected cost of holding inventory plus lost sales, we formulate a Stochastic Linear Programming model which combines statistics as well as optimization by adopting SLASO framework. With other two methods (Newsvendor and Demand Forecasting), this approach performs better in both Back-Testing and Stress-Testing during validation analysis.

3 - Bayes-optimal Entropy Minimization For Active Learning In Conjoint Analysis

Stephen N Pallone, Cornell University, 290 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States, snp32@cornell.edu, Peter Frazier, Shane Henderson

Choice-based conjoint analysis is a method for preference elicitation where the user is offered a set of alternatives and chooses the preferred option. The rate at which we learn depends on the alternatives offered. We model the user's preferences through a linear classifier. Under certain noise assumptions, we prove a linear lower bound on the posterior entropy of this linear classifier, and show entropy pursuit can attain the bound when alternatives can be fabricated. Further, we explore an information theoretic variant of the knowledge gradient policy that selects comparative questions to greedily minimize interaction information, and numerically compare this policy with entropy pursuit.

4 - Learning Uncertainty Sets And Automation Of Robust Formulation

Dimitri Papadimitriou, Bell Labs, dimitri.papadimitriou@nokia.com

Machine learning shares deep connections with robust optimization as they both perform by adding uncertainty in the model, formulating the optimization problem, and exploiting mathematical programming. Machine learning applies to i) model uncertainty by automating processing of noisy or aleatory data to produce perturbation sets, ii) automatically derive robust formulation but also adapt decision rules associated to adjustable variables, and iii) learn about the behavior of resolution algorithm(s) and tune its execution to improve its performance. We illustrate them on three network optimization problems, the multi-commodity network flow, facility location and hub location problem.

Educational Research in OR/MS

Sponsored: Education (INFORMED)

Sponsored Session

Chair: Susan Wright Palocsay, James Madison University, Harrisonburg, VA, United States, palocssw@jmu.edu

1 - Batching In Higher Education

Jan Riezebos, University of Groningen, Nettelbosje 2, P.O. Box 800, Groningen, 9700 AV, Netherlands, j.riezebos@rug.nl, Iris F Vis

Models for optimal batch sizes in industrial context, such as economic lot sizing, cannot directly be applied to the context of higher education. However, in higher education, batching is even more important than in industrial contexts, as it is not just the economical impact that has to be considered, but also various effects on learning. We explore possible ways to extend OR models for batching in higher education.

2 - Effective Teaching For Mastery Of Boolean Constraints

Scott Stevens, Professor, CIS & Business Analytics, James Madison University, James Madison University, MSC 202, Harrisonburg, VA, 22807, United States, stevensp@jmu.edu, Susan Wright Palocsay

Mixed integer optimization problems often include constraints involving Boolean variables—variables that can equal only 0 or 1—representing the truth values of some logical propositions. The pure compound propositions of either "all Ai are true" or "at least one Ai is true" for some collection of Boolean variables Ai are easy to represent as linear expressions, but students frequently find propositions of the form (pure compound 1) implies (pure compound 2) to be baffling. We introduce a technique that allows any such proposition to be written as one or more linear constraints by applying three simple rules: decomposition, translation, and compression, and then provide evidence of efficacy.

3 - A Review Of The Literature For Operations Management Education

Susan Wright Palocsay, James Madison University, Harrisonburg, VA, United States, palocssw@jmu.edu, Michael Busing

Operations management (OM) has maintained a close association with OR/MS as its scope has broadened from manufacturing to service processes. In response, OM curricula have undergone significant revision with a corresponding increase in OM pedagogical studies. We will present a summary of OM educational publications and discuss OM teaching trends.

Matchings and Assignments with Societal Impact

Sponsored: Public Sector OR

Sponsored Session

Chair: Tina Rezvanian, Northeastern University, 360 Huntington Avenue, Boston, MA, 02115, United States, rezvanian.t@husky.neu.edu

Co-Chair: Ozlem Ergun, Northeastern University, 453 Meserve, 360 Huntington Avenue, 360 Huntington Avenue, MA, 02115, United States, o.ergun@neu.edu

1 - Two-sided Stable Matching In Markets With Multiple Periods

Tina Rezvanian, Northeastern University, Boston, MA, United States, rezvanian.t@husky.neu.edu, Ozlem Ergun

Many industries demand mechanisms for job assignments that are sustainable over multiple periods of time. It is a well-known fact that the core stays the same under any stable matching algorithm and therefore no such matching can guarantee sustainability and perfectness as a dominant strategy for participants as same participants stay unsatisfied. We introduce a popularity measure that identifies a connection between stability of the match and fairness for those unsatisfied. We use this trade off to employ negotiation schemes in our proposed algorithm. By analyzing network structures of the large-scale markets we are able to acquire near-optimal solutions.

2 - Human Interaction With Recommendation Systems: On Bias And Exploration

Sven Schmit, Stanford University, Stanford, CA, United States, schmit@stanford.edu, Ramesh Johari, Vijay Kamble, Carlos Riquelme

More and more, recommendation systems assist users decision making. These systems rely on historical data to provide suggestions. Little attention has been paid to the interaction of humans and learning algorithms. We propose an explicit model for the interaction between users and recommendations provided by a platform. First, we show that this interaction leads to a bias in naive estimators due to selection effects. This bias leads to suboptimal outcomes. Second, agents' heterogeneous preferences lead to sufficient exploration of alternatives. Both observations lead to new insights and practical advice.

3 - Uncertainty In Dynamic Matching With Application To Organ Exchange

John Dickerson, Carnegie Mellon University, Pittsburgh, PA, United States, dickerson@cs.cmu.edu
John Dickerson, University of Maryland, College Park, MD, United States, dickerson@cs.cmu.edu, Tuomas W Sandholm

We address dynamic kidney exchange, an organized market where patients with end-stage renal failure swap willing but incompatible living donors. Specifically, we focus on two types of uncertainty found in dynamic matching applications like kidney exchange: probabilistic existence of edges in the current matching graph, and determining the "best" way to match now given uncertainty over the future. We discuss recent theoretical results and optimization methods to tackle this uncertainty, and provide experimental results from applying these methods to real-world data from the UNOS US-wide kidney exchange.

4 - Assortment Planning In School Choice

Peng Shi, Massachusetts Institute of Technology (MIT), Cambridge, MA, pengshi@mit.edu

School choice systems assign students to schools by giving each student a menu of options and eliciting their relative preferences among the options. Many such systems uses the Gale-Shapely Deferred Acceptance (DA) algorithm, which also take into account students' priorities at each school. In previous literature, the menus and priorities are considered to be given. In this paper, we study how the school board can optimize the menus and priorities in order to maximum students' expected utilities subject to a budget for school busing. We apply this to real data from Boston Public Schools.

1 - A Vehicle Routing Problem For CNG Trucks With Fueling Stations

Yihuan (Ethan) Shao, University of Southern California, Los Angeles, CA, United States, yihuansh@usc.edu, Maged M Dessouky

In this research, we consider a Vehicle Routing Problem (VRP) for Compressed Natural Gas (CNG). Due to the limited number of available fueling stations and small fuel tank capacity, CNG trucks call for special concerns with the refueling problem. We introduce a new Mixed Integer Programming (MIP) model with preprocessing and valid inequalities to solve the problem optimally, as well as a new hybrid heuristic method to solve the problem in large scale. Numerical experiments show the efficiency of our preprocessing and valid inequalities. We also draw some insights from the experiments.

2 - The Truck Line Vehicle Routing Problem Of A Hub-and-spoke Structure Based Parcel Carrier

Jaesang Park, Postech, Pohang, Korea, Republic of, rose7@postech.ac.kr, Byung-In Kim, Ho-mahn Kwak, Hyunjoon Kim, Jeongbin Kim

We handle a combined problem of trunk line vehicle routing and hub capacity planning for a real-word parcel carrier, which uses a hub-and-spoke structure of about 300 spokes and 11 hubs. Because of limited sorting capability, only ten category groups can be classified at a spoke. The classified groups then are delivered to an eligible hub, are sorted and delivered to appropriate spokes. It handles about four million parcels daily and delivers them within two days using 4500 eleven tones trucks. A solution approach minimizing the total transportation and hub operating cost is developed.

3 - Dynamic Bus Routing For Evacuation

Xiaohang Zhu, University at Buffalo, 2514 Deer Lakes Dr, Amherst, NY, 14228, United States, xzhu8@buffalo.edu, Jee Eun Kang

Bus-based evacuation serves carless population and helps reduce congestion during evacuations. This research develops a single level dynamic bus routing problem, that determines the optimal bus routing with respect to dynamics of traffic and congestion, that minimizes the total evacuation time experienced by all evacuees. The proposed model is built upon the linear programming formulation of the Cell Transmission Model (CTM).

1 - Impact Of Forecasting Accuracy On Sharing Forecasts In Supply Chains

Hyoduk Shin, University of California - San Diego, hdshin@ucsd.edu

We investigate the role of accuracy information of demand forecasts on sharing forecasts within the supply chain between the downstream retailer and the upstream supplier. We demonstrate how the uncertainty on the forecast accuracy can help or hurt the ability to share demand forecasts.

2 - Supply Chain Contracts With Boundedly Rational Retailers

Behrooz Pourghannad, University of Minnesota, Minneapolis, MN, United States, behrooz.pourghannad@gmail.com, Guangwen Kong, Tony H Cui

We study supply chain contracts with consideration of information sharing and bounded rationality. We examine a dyadic supply chain where a supplier with more accurate demand information sells products to a bounded rational retailer. The research suggests that the supplier can be better-off by using a linear pricing contract than adopting a buy-back contract.

3 - Milking The Quality Test: Improving The Milk Supply Chain Under Competing Collection Intermediaries

Liying Mu, University of Delaware, muliying@udel.edu, Milind Dawande, Xianjun Geng, Vijay Mookerjee

We examine operational and incentive issues that conspire to reduce the quality of milk — via deliberate adulteration by milk farmers — under competing collection stations in developing countries. Two recommendations are provided to reduce the milk adulteration using minimal testing. Both solutions achieve a socially-beneficial equilibrium outcome: All the farmers provide high-quality milk and each competing station only conducts one mixed test and no individual testing.

4 - 3d Printing Vs. Traditional Flexible Technology: Implication On Manufacturing Strategies

Duo Shi, Washington University in Saint Louis, KH 401, Olin Business School, 1 Brookings Drive, St. Louis, MO, 63130, United States, dshi@wustl.edu, Lingxiu Dong, Fuqiang Zhang

In this paper, we study a firm's manufacturing strategies under two types of flexible technologies: traditional flexible technology and 3D printing. The firm adopts dedicated technology and one type of flexible technology, either the traditional one or 3D printing. It has to choose an assortment from a potential set of variants, assigns each variant to a production technology, and finally invests in resource capacities. We find that traditional flexible technology and 3D printing can have distinct technology assignment structures. Contrary to common wisdom, the adoption of traditional flexible technology can reduce product variety. 3D printing, however, always enhances product variety.

Chair: Qiang Qiang, Penn State University, 30 E. Swedesford Road, Malvern, PA, 19355, United States, qzq10@psu.edu

1 - Big Data Based Modeling And Optimizing Of The First Aid Services In Shanghai Songjiang District

Wei Yang, Tongji University, Shanghai, China, yangvmail@163.com, Qiang Su

To guarantee the emergency demand can be responded in time, the government is obliged to implement an effective EMS plan. Most studies failure to consider adequately the effect of the spatio-temporal uncertain demand since it is difficult to quantitatively describe. As a result, the location plan is not efficient enough. In this study, Gaussian Mixture Model clustering is innovatively utilized to quantitatively describe the spatial uncertain demand. Then the chance-constraint programming model for location planning is developed. The data of Songjiang District is used to validate the method proposed. The experimental results demonstrate that the delay time can be significantly decreased.

2 - The Impact Of Linguistic Persuasiveness On The Success Rate Of Crowdfunding Services: Evidence From Kickstarter

Hongwei Wang, Tongji University, Shanghai, China, hwwang@tongji.edu.cn, Wei Wang, Wei Chen, Kevin Zhu

Fund-seekers tend to use various linguistic styles to change investors' perception on project prospects, thus leading to different persuasiveness on investment intentions. Based on Hovland's persuasion model and Aristotle's rhetorical persuasion triples, the linguistic styles are grouped into resorting to credibility, to sentiment, to logic, to reward, and to exaggeration. We then extract the keywords for these categories by text mining. An econometric model is formulated with 128345 campaigns from Kickstarter to estimate the impact of linguistic styles on successful campaigns. The results guide fund-seekers to come up the most effective linguistic styles on describing their projects.

2 - Cooperation In Spare Parts Systems With Expedited Deliveries

Ulas Ozen, Ozyegin University, Cekmekoy Campus, Nisantepe District, Orman Street, Istanbul, 34794, Turkey, ulas.ozen@ozyegin.edu.tr

We study cooperation between a group of companies, who need spare parts to maintain their expensive equipment, by pooling their spare parts inventory. To address the cost allocation problem, we borrow concepts from cooperative game theory and examine the core of the resulting cooperative games. We study three cooperation scenarios: (i) cooperation by inventory pooling, (ii) cooperation under optimal inventory investment, and (iii) cooperation under service level constraint. For many of these games, we show that the cores are non-empty by identifying a PMAS. For the games with empty cores, we present examples.

3 - Multi Period Production Planning With Uniformly Perishable Inventories

Mehdi Karimi-Nasab, PostDoc, Institute for Operations Research, University of Hamburg, Von-Melle-Park 5, Hamburg, 20146, Germany, mehdi.karimi-nasab@uni-hamburg.de

A number of products should be produced over a number of periods. After a product is produced, it is subject to perishability. Assume that product i is produced in period t0. Then life time of product i can be divided into two parts: till a certain time limit after production, tl(i), we can be sure that item i is usable in the warehouse (i.e. till the end of period t0+tl(i) we are sure that it is not perished), but it may be considered unusable during the next periods located in the interval t0+tl(i)+1, . . ., t0+tu(i) with equal chance. In other words, we can be sure that by probability of 1 it is absolutely out of use afterwards. The problem is formulated and mathematical properties of the model are studied.

4 - Operational Responses To A Demand Surge

Apurva Jain, University of Washington, Foster School of Business, Box 353226, Seattle, WA, 98195-3226, United States, apurva@u.washington.edu

We develop and analyze a model where a firm observes the evolution of a demand-surge over a short time-period. The firm's decisions about inventory, quality and delivery influence the evolution of the demand surge over short-term and have impact on the level of long-term demand it may experience. The firm must determine the time and quantity for ordering inventory to meet the surge and must choose between sources that differ in their quality-levels and delivery-times.

1 - Effect Of Consumption Flexibility On Usage

Sreekumar Bhaskaran, Southern Methodist University, sbhaskar@smu.edu, Rajiv Mukherjee, Sanjiv Erat

In this research, we examine the effect of flexibility related to consumption of services on the extent of usage of a service. Impact of consumer behavior on capacity and pricing are also considered.

2 - How Strategic Crowdfunding Design Decisions And Financial Slack Affect Funding And Post-funding Outcomes

Daniel Zantedeschi, The Ohio State University, Columbus, OH, United States, zantedeschi.1@osu.edu, Onochie Fan-Osuala, Wolfgang Jank

Based on the marketing-operations interface model, we conjecture that strategic crowdfunding campaign design decisions can impact both funding and post-funding outcomes. We show that these strategic decisions have differential effects on the both phases (fundraising and post-funding) of crowdfunding. That is, decisions that positively impact funding success may negatively impact the time to shipment of crowdfunded products. Further, and contrary to speculations, we find that overfunding (a fundraising phase outcome) provides financial slack and is associated with lower delays in product shipment. Finally, we provide implications of these findings.

3 - "Co-opetition" In The Over-The-Top (OTT) Services

Antino Kim, Indiana University, Bloomington, IN, United States, antino@iu.edu, Debabrata Dey, Atanu Lahiri

Often, an infrastructure service provider (ISP) allows an "over-the-top" service provider (OTTSP) to use its infrastructure to offer services that end up competing with the services provided by the ISP itself. Such presence of competition and collaboration at the same time leads to an interesting relationship between the ISP and OTTSP. In this research, we examine this intricate relationship to analyze the pricing strategies for both parties.

4 - Product Support And Uncertainty: Effect On Two Competing Online Retailers

Vashkar Ghosh, University of Florida, 355A Stuzin Hall, Department of ISOM, Gainesville, FL, 32611, United States, vashkar.ghosh@warrington.ufl.edu, Kyung Sung Jung, Young Kwark, Janice Carrrillo

We analyze the effect of uncertainty about the product and retailer support between two competing online retailers selling the same product. The retailers differ in both their product support and fit. We consider the impact of online reviews, and investigate the problem under wholesale and agency pricing schemes.

Managing Decentralized Processes

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Enno Siemsen, University of Wisconsin, Madison, WI, United States, esiemsen@wisc.edu

1 - Production Process Moves

Pettis Kent, University of Minnesota, kentx143@umn.edu

To study the growing trend of multinational firms moving production processes within and between countries to address strategy needs, we develop a behavioral experiment where production teams build small devices for multiple rounds, with “template use” and “product/process change” as the individual variables of interest, and with cost (learning rate) as the dependent variable. Our research objective is to better understand how firms can effectively manage process knowledge during a production move.

2 - Ideation Execution Transition In Product Development

Evgeny Kagan, University of Michigan, ekagan@umich.edu, Stephen Leider, William Lovejoy

We show experimentally that design performance is significantly worse when designers decide for themselves how to schedule the development process. We demonstrate several remedies for situations when external allocation of time to development phases is not possible. Managers can improve performance by “nudging” individuals towards early physical build, or by requiring them to commit to a transition time beforehand. However, the most effective way to improve performance is contingent transition - a requirement to present a prototype that exceeds a minimum performance hurdle

3 - An Experimental Investigation Of Transshipment And Local Decision Making

Shan Li, Baruch College, City University of New York, New York, NY, 10601, United States, shan.li@baruch.cuny.edu, Kay-Yut Chen

When a retailer has surplus stock and another retailer has inventory shortage, it may be desirable to transfer surplus stock from the former to the latter. We experimentally examine how the possibility of such transshipment between two independent retailers affects each retailer’s local decisions of inventory and study the formation of transfer prices under different price setting processes.

4 - Inventory Sharing Behavior

Enno Siemsen, University of Wisconsin - Madison, Madison, WI, esiemsen@wisc.edu, Hui Zhao, Liang Xu

Inventory sharing systems are essential for decentralized decision makers to benefit from aggregation. We use behavioral laboratory experiments to examine inventory sharing behavior in the laboratory. Results from our experiments show that the transfer price - which is a common tool to coordinate inventory sharing systems - fails to influence our subjects initial order quantities, and thus does not lead to a coordinated system. Further, we show that subjects are reluctant to ask their supply chain partners for an adequate amount of information, and that the potential to request inventory from other players leads to a general reduction in initial order quantities.

1 - Integrated Generated Expansion Planning By Considering Wind Intermittency

Ahmet Akgun, Wichita State University, 3540 N Inwood Street, Apt # 11305, Wichita, KS, 67226, United States, ahmetie@yahoo.com

A multiperiod mathematical programming model for integration of electricity generation and transmission expansion planning and natural gas network problem is proposed. The proposed model is formulated as a linear optimization problem and it optimizes the operation, transmission and investment costs for both systems at the same time. This paper aims to determine what kind of generation units to be built, where to build those generation units, and when to build. The mathematical model also includes the decision for new transmission line for both natural gas and electricity. The proposed model is tested on a real scale network to analyze the impact of the natural gas cost on the new investment decisions.

2 - Energy-dependent Scheduling Of Non-identical Parallel Machines

Farnaz Ghazi Nezami, Assistant Professor, Kettering University, 5336 Timberwood Point Drive, Flint, MI, 48532, United States, fghazinezami@kettering.edu, Mojtaba Heydar

In this study, we analyze the problem of job scheduling in non-identical parallel machine production system with machine dependent processing durations to minimize total completion time and energy costs. The energy costs in this study include energy demand and consumption charges. We present a mixed integer linear programming model to formulate the problem. The model is solved for optimality using an exact approach and the performance is evaluated through numerical experiments.

Innovations in Transporation Network Pricing

Sponsored: Transportation Science & Logistics

Sponsored Session

Chair: Roger Lloret-Batlle, University of California, CA, United States, rlloretb@uci.edu

1 - A Vulnerable Options-based Reservation Scheme For Highway Facilities Subject To Degradation: Reservation Options On Truck-only Lanes

Choungryeol Lee, Perdue University, West Lafayette, IN, United States, lee1210@purdue.edu, Srinivas Peeta

A vulnerable options-based reservation scheme is proposed for truck-only lanes. The model incorporates risks for assuring a threshold traffic condition by estimating the expected potential loss. A case study of reservation options on truck-only lanes is used to estimate the loss and price reservations from the risk-neutral perspective of rational users.

2 - Efficient Envy-free Pricing In Transportation Systems

Roger Lloret-Batlle, University of California, CA, United States, rlloretb@uci.edu, R Jayakrishnan

We explore the envy-free pricing concept in multiple transportation contexts: (1) in min-cost flow networks such as in P2P ride-sharing problems, where its implementability as an ascending auction is examined, (2) in dynamic queue-jumping highway operations, and (3) in traffic signal control, for fair compensating payments in priced exchanges

3 - Dynamic Pricing And Reservation For Intelligent Urban Parking Management

Chao Lei, University of Illinois at Urbana - Champaign, 2063 S. Orchard St. Apt A, Urbana, IL, 61801, United States, lei8785@gmail.com, Yanfeng Ouyang

We study a real-time parking pricing and online reservation problem for the intelligent parking system in busy urban neighborhoods. A dynamic non-cooperative bi-level model and a non-myopic ADP solution approach are developed to enable the agency to decide the spatial and temporal parking price while considering the drivers’ competition for limited parking spaces at equilibrium parking prices. The numerical results reveal that the ADP-based pricing policy outperforms the myopic one in achieving greater performance of the parking system.

Moving People and Goods More Efficiently in Traffic Networks: Models and Algorithms

Sponsored: TSL, Urban Transportation

Sponsored Session

Chair: Trilce Marie Encarnacion, Rensselaer Polytechnic Institute, Rensselaer Polytechnic Institute, Troy, NY, 00000, United States, encart@rpi.edu

1 - Design Of Multi-period Tradable Credit Scheme For Vehicular Emission Reduction

Mohammad Miralinaghi, Purdue University, smiralin@purdue.edu, Srinivas Peeta

Credit-based congestion pricing is a strategy to manage traffic congestion and emissions by creating artificial markets for mobility credits. We design a multi-period tradable credit scheme to reduce vehicular emissions in a traffic network by factoring interest rates over a long-term planning horizon. It is formulated as a bi-level model where the credit allocation and link charging schemes are determined at the upper level and the lower level describes credit usage and the travel decision-making process of travelers

2 - Fast Computation Techniques For The Stochastic On-time Arrival Problem

Samitha Samaranayake, Cornell University, samitha@cornell.edu

We present a new technique for solving the path-based stochastic on-time arrival (SOTA) problem. Our approach uses the solution to the policy-based SOTA problem - which is of pseudo-polynomial-time complexity in the time budget of the journey - as an efficient search heuristic for the optimal path. We also demonstrate how path preprocessing techniques can be used for further speedups. To the best of our knowledge, these techniques provide the most efficient computation strategy for the path-based SOTA problem for general probability distributions, both with and without preprocessing.

3 - Urban Freight Microsimulation: Evaluating Freight Parking Behavior In New York City

Trilce Marie Encarnacion, Rensselaer Polytechnic Institute, encart@rpi.edu, Jose Holguin-Veras, Johanna Amaya

As urban centers continue having increased demand for consumer goods and services, the amount of freight trafficc and the associated negative externalities increase. Previous studies have shown that carriers have to either cruise until they find a parking space or illegally park in order to make their deliveries. Using data collected from in-depth interviews of carriers as well as current traffic conditions, a discrete simulation framework was developed to replicate the parking behavior of trucks making deliveries to a case study area in Midtown Manhattan. The goal is to provide insight into optimal freight parking policies to improve freight systems performance in dense urban areas.

4 - Dynamic Pricing In One-way Car Sharing Networks: A Distributional Fluid Approximation Approach

Ling Zhang, North Carolina State University, Raleigh, NC, United States, lzhang42@ncsu.edu, Yunan Liu, Yang Liu, Shuangchi He

Balancing supply and demand across different areas is a critical issue in one-way car sharing networks. We study dynamic pricing in order to maximize the profit of a car sharing network. Since the stochastic network model is analytically intractable, we propose a fluid approximation to represent the supply and demand of vehicles. In contrast to conventional transportation fluid models that assume deterministic processing times, general rental time distributions are built into our fluid model. Moreover, our model allows for time-varying demand rates and rental time distributions. Under this formulation, dynamic pricing is reduced to a convex optimization problem that is efficiently solvable.

Online Delivery Routing

Sponsored: TSL, Freight Transportation & Logistics

Sponsored Session

Chair: Jan Fabian Ehmke, Freie Universität Berlin, Garystr. 21, Berlin, 14195, Germany, janfabian.ehmke@fu-berlin.de

1 - Taking Advantage Of In-store Customers To Deliver Online Orders

Iman Dayarian, Georgia Institute of Technology, 765 Ferst Dr NW, Atlanta, GA, 30318, United States, iman.dayarian@isye.gatech.edu, Martin W P Savelsbergh

Same-day delivery of online orders is becoming an indispensable service for large retailers. We explore a novel environment in which in-store customers may take over the task of delivering online orders on their way back home. Additionally, a fleet of company-employed drivers is available to cover any unserved online orders. This context represents a highly dynamic and stochastic environment for which we explore and compare two rolling horizon approaches: one that ignores any information about future arrivals of online orders and in-store customers, and one that incorporates such information by means of sampled scenarios. Our results demonstrate the superiority of scenario-based planning.

2 - An Online Cost Allocation Model For Horizontal Supply Chains

Han Zou, University of Southern California, Los Angeles, CA, United States, hanzou@usc.edu, Maged M Dessouky, John Gunnar Carlsson

This research addresses the cost allocation problem in a real-time cost sharing transportation system, which results from horizontal cooperation among multiple suppliers. We formulate the cost allocation problem for the dynamic vehicle routing environment, where only part of the customers are known in advance, and the rest become known in real time. We propose an online cost-sharing mechanism coupled with a look-ahead dynamic vehicle routing framework that explicitly forecasts future customer requests.

3 - A Branch-and-price Approach For The Vehicle Routing Problem With Roaming Delivery Locations

Gizem Ozbaygin, Bilkent University, Ankara, Turkey, ozbaygin@bilkent.edu.tr, Martin W P Savelsbergh, Hande Yaman, Oya Ekin Karasan

We study the vehicle routing problem with roaming delivery locations in which each customer is associated with multiple locations and time windows. Exactly one location per customer should be included in the delivery plan respecting the time windows. We devise a branch-and-price algorithm to solve the problem and perform a computational analysis.

4 - E-fulfillment For Attended Last-mile Delivery Services In Metropolitan Areas

Jan Fabian Ehmke, Freie Universität Berlin, Garystr. 21, Berlin, 14195, Germany, janfabian.ehmke@fu-berlin.de, Catherine Cleophas, Charlotte Köhler, Magdalena Lang

We consider service time windows as a scarce resource and combine concepts of revenue management and vehicle routing to improve e-fulfillment of last-mile delivery services. As the customer has to be present for attended deliveries such as groceries, a service time window has to be agreed upon already when the order is accepted. We will focus on the factors impacting the success for e-fulfillment in metropolitan areas, considering uncertain demand and traffic conditions. To this end, we analyse historical order data and extend time-dependent vehicle routing techniques.

Data Mining and Optimization for Improved Airport Operations

Sponsored: Aviation Applications

Sponsored Session

Chair: Heng Chen, University of Nebraska–Lincoln, Supply Chain Management and Analytics, Lincoln, NE, 68588, United States, heng@unl.edu

1 - Airport Capacity Estimation For Decision Support

Sreeta Gorripaty, University of California Berkeley, gorripaty@berkeley.edu, Mark M Hansen

Capacity is a critical component of airport performance and air traffic decision-making. Capacity of an airport is the throughput observed at sufficiently high demand and is thus demand censored. The demand that is observed at the airport is a result of strategic and tactical decisions made to avoid buildups of unmet demand, thus making it challenging to estimate the capacity of an airport. We demonstrate that Random Survival Forest (RSF) model can be used to capture the censored nature of capacity data and model hourly capacity. The RSF capacity model is further used in decision support algorithms to represent airport capacity.

2 - Parameter Fixing Method For Improving The Rate Of Convergence Of A Hybrid Particle Swarm Optimization

Giuseppe Sirigu, Georgia Institute of Technology, giuseppe.sirigu@aerospace.gatech.edu

A new solution is proposed to perform just in time taxi operations using autonomous electric towbarless tractors, thereby to minimize the overall cost and the environmental impact of the ground operations. An algorithm for a tool that provides conflict-free schedules for the tractor autopilots was developed, which is based on a hybrid particle swarm optimization (HPSO), hybridized with a hill climbing meta-heuristic. In order to improve the rate of convergence of the algorithm, we developed a parameter fixing method.

3 - Machine Learning Techniques For Airport Passenger Flow Management

Xiaojia Guo, University College London, London, United Kingdom, x.guo.11@ucl.ac.uk, Yael S Grushka-Cockayne, Casey Lichtendahl, Frederick Tasker, Neville Coss, Tom Garside, Bert De Reyck

Passengers missing their connection at an airport can have a major impact on passenger satisfaction and airline delays. We develop a predictive model of passengers' connecting time using machine learning techniques, and provide both point forecasts and probabilistic forecasts using historical and real-time data. Based on these forecasts, we are developing a dynamic planning tool for London's Heathrow Airport to support airport operations.

Deterministic Network Design

Sponsored: TSL, Freight Transportation & Logistics

Sponsored Session

Chair: Mike Hewitt, Loyola University Chicago, NA, Chicago, IL, 60611, United States, mhewitt3@luc.edu

1 - Barge Scheduled Service Network Design With Resource And Revenue Management

Teodor Gabriel Crainic, Universite du Quebec a Montreal, TeodorGabriel.Crainic@cirrelt.net, Ioana Bilegan, Yunfei Wang

We study the incorporation of revenue management (RM) considerations, usually tackled at the operational-planning level, into tactical planning models for consolidation-based freight transportation carriers, and the impact of this integration on the selection of customer to service and on the structure of the service network, e.g., should the carrier increase the offer of service through more departures or larger vessels in order to later be able to capture spot demand? We present a service network design model with resource and RM considerations, a meta-heuristic, and the experimental results and insights obtained in the context of intermodal barge transportation.

2 - The Value Of Flexibility In Long-haul Transportation Network Design

Mike Hewitt, Loyola University Chicago, mhewitt3@luc.edu, Natashia Boland, Martin W P Savelsbergh

Freight transportation carriers are facing increased demands from customers for shorter service standards. At the same time, some cusotmers are flexible in terms of when they want their shipments delivered, and will accept longer delivery times if given a discount. In this talk we present a model that will not only design a long-haul transportation network, but will do so while also determining which customers to offer a discount to in order to have more time for delivery. We present a solution approach for the model and the results of an extensive computational study.

3 - Decomposition Methods For Multi-period Network Design Problems

Ioannis Fragkos, Rotterdam School of Management, fragkos@rsm.nl, Jean-Francois Cordeau, Raf Jans

We devise decomposition methods to solve large-scale instances of multi-period network expansion problems. For capacitated networks, we devise a custom heuristic procedure combined with arc-based Lagrange relaxation. For uncapacitated networks, we employ Bender's decomposition, where the subproblems are decomposable per period and per commodity. We formulate the problem of generating Pareto Optimal cuts, and based on structural properties of optimal solutions we devise a heuristic approach to solve it, thereby improving the original Benders cuts. Computational results demonstrate the efficiency of this approach.

4 - New Lagrangian Relaxation For Multicommodity Capacitated Network Design

Mohammad Rahim Akhavan, Universite de Montreal (DIRO), Monrteal, QC, Canada, Akhavanm@iro.umontreal.ca, Teodor Gabriel Crainic, Bernard Gendron

The usual Lagrangian relaxations for multicommodity capacitated network design are the so-called shortest path and knapsack relaxations, which are obtained, respectively, by relaxing linking constraints and flow conservation equations. We present a new reformulation and Lagrangian relaxation for the problem. We show that the Lagrangian dual bound improves upon the so-called strong LP bound (known to be equal to the Lagrangian dual bounds of the shortest path and knapsack relaxations).

Multi-objective Optimization: Algorithms and Applications

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Lakmali Weerasena, University of Tennessee, College Dr, Chattanooga, TN, 31705, United States, lweeras@g.clemson.edu

1 - New Multicriteria Models For Robust Data Classification In Supervised Learning

Alexander Engau, University of Colorado Denver, alexander.engau@ucdenver.edu

Data classification is a key task for predictive analytics, data mining and supervised machine or statistical learning. In extension of its current state-of-the-art optimization approaches this presentation highlights several new multicriteria mixed-integer goal programming models that can further improve their performance for classification and prediction by combining a variety of different objectives including solution accuracy as well as total and minimum or maximum internal or external deviation. Computational experiments on financial and medical data sets are reported and demonstrate promising results with highly improved robustness and better classification accuracy overall.

2 - Utility Indifference Pricing Under Incomplete Preferences Via Vector Optimization

Firdevs Ulus, Bilkent University, firdevs@bilkent.edu.tr

Under some assumptions on an incomplete preference relation, utility maximization problem is a convex vector optimization problem. Accordingly, the utility buy and sell prices are defined as set valued functions of the claim. It has been shown that the buy and the sell prices recover the complete preference case where the utility function is univariate. Moreover, buy and sell prices satisfy some monotonicity and convexity properties as expected. It is possible to compute these set valued prices by solving convex vector optimization problems.

3 - Local Branching Algorithm For Approximating The Pareto Set Of The Multiobjective Set Covering Problem

Lakmali Weerasena, University of Tennessee at Chattanooga, Chattanooga, TN, United States, lweeras@g.clemson.edu

The multiobjective set covering problem (MOSCP), a challenging combinatorial optimization problem, has received limited attention in the literature. We present an algorithm to approximate the Pareto set of the MOSCP. The proposed algorithm applies a local branching approach on a tree structure and is enhanced with a node exploration strategy specially developed for the MOSCP. The key idea is to partition the search region into subregions based on the neighbors of a reference solution. Numerical experiments confirmed that the proposed algorithm performs well on the MOSCP. Results on a performance comparison with benchmark algorithms from the literature show that the new algorithm is competitive.

4 - Interactive Weight Region-based Approach For Multiobjective Optimization Problems

Mehmet Basdere, Northwestern University, Evanston, IL, United States, mehmetbasdere2016@u.northwestern.edu, Sanjay Mehrotra, Karen Smilowitz

We introduce an interactive weight region-based approach that can iteratively find the most preferred solution of a decision maker (DM) after exploring a small fraction of all nondominated solutions. To obtain preference information, the DM is given a series of questions to compare and these comparisons define constraints restricting the weight region. New solutions are obtained by using diverse weight vectors generated from the remaining weight region via a mixed integer programming formulation. We develop two finitely converging algorithms for multi-objective linear and integer programs respectively. The results show that the algorithms terminate after a reasonable number of iterations.

1 - Relationships Between Online Daily Deal Promotions And Local Retailers' Online Reputation

Gang Wang, University of Delaware, gangw@udel.edu

Online daily deal sites such as Groupon have recently provided an innovative marketing tool for local retailers. On the one hand, a local retailer's online reputation is an important fact that may impact its decision whether to run a promotion. On the other hand, an online daily deal promotion may also impact the local retailer's online reputation. In this study, we study the causal relationships between a local retailer's promotion decision and its online reputation using data collected from Groupon and Yelp. Our current results enhance understanding of local retailers' Groupon promotion decisions and yield important implications related to daily deal sites.

2 - Free Riders Versus Social Capital: An Empirical Analysis Of An Exogenous Shock On Online Reviews

Zaiyan Wei, Purdue University, West Lafayette, IN, United States, zaiyan@purdue.edu, Paulo B Goes, Yang Wang, Dajun Daniel Zeng

We study the effects of network sizes on individuals' contributions to online product reviews. Individuals have conflicting incentives of free riding and maximizing social benefits when producing online reviews. We leverage a "natural experiment," an exogenous expansion in the users population on a major third-party platform, to better understand the tradeoffs between the conflicting incentives. We find that a larger population of users caused individuals to post more and longer reviews. In addition, the larger population of audience led individuals to assign higher and more diverse ratings in their reviews. However, the helpfulness or "quality" of reviews is not affected.

3 - Enterprise Systems And Merger And Acquisition Activities

Chengxin Cao, University of Minnesota, 321 Nineteenth Avenue South, Minneapolis, MN, United States, caoxx161@umn.edu, Gautam Ray, Alok Gupta, Mani Subramani

This paper examines the relationship between Enterprise Resource Planning (ERP) and Customer Relationship Management (CRM) systems and upstream and downstream mergers and acquisitions (M&A). We also investigate how any such relationship is contingent on the characteristics of the focal firms' industry environment. Using a sample of 491 Fortune 1000 firms that made 4543 M&A deals from 2006 to 2012 the empirical analysis suggests that ERP (CRM) systems are negatively associated with upstream (downstream) M&A. However, if the upstream (downstream) industry is concentrated (dynamic), ERP (CRM) systems are associated with more vertical M&A.

4 - The Influences And Biases Of Social Network In Referral Hiring: Empirical Study

Kyungsun Rhee, University of Washington, 4725 24th Avenue NE, # 405, Seattle, WA, 98105, United States, ksr22@uw.edu, Elina Hwang, Param Vir Singh

It is well known that importance of social networks in labor market has been growing rapidly. However, there have been rigorous researches on characteristics of job seekers who are likely to achieve better results in job market, but not many on the referrer behavior. Using data from social referral platform, this paper constructs an empirical model to capture the influences and biases of referrers' social capital on their actual referring behavior in the IT labor market.

Data Analytics for Quality and Reliability Assurance

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Mingyang Li, Tampa, FL, United States, mingyangli@usf.edu

1 - A Data-driven Heterogeneity Quantification Approach For Chloride Ingress Profiles Of Aging Marine Infrastructures

Suiyao Chen, University of South Florida, 4202 E. Fowler Avenue ENB302, Tampa, FL, 33620, United States, suiyaochen@mail.usf.edu, Lu Lu, Yisha Xiang, Alberto A Sagüés, Mingyang Li

Chloride ingress is the leading cause to corrosion failures of aging infrastructures in marine environments. Existing studies on chloride ingress mainly assumed homogeneous populations and were constrained by the simplified physical assumptions and availability of chloride ingress profiles. In this work, a data-driven approach is presented to comprehensively explore, quantify and analyze the heterogeneous chloride ingress profiles collected from a field survey on marine infrastructures. A real-world case study is provided to illustrate the proposed work and demonstrates its validity and performance.

2 - Reliability Meets Big Data: Opportunities And Challenges

Yili Hong, Virginia Tech, yilihong@vt.edu

In this talk, I will review some applications where field reliability data are used and explore some of the opportunities to use modern reliability data to provide stronger statistical methods to operate and predict the performance of systems in the field. I will also provide some examples of recent technical developments designed to be used in such applications and outline remaining challenges.

3 - Heterogeneous Recurrence Representation And Quantification Of Dynamic Transitions In Continuous Nonlinear Processes

Hui Yang, Penn State, huy25@engr.psu.edu

Many real-world systems are evolving over time and exhibit dynamical behaviors. In order to cope with system complexity, sensing devices are commonly deployed to monitor system dynamics. Online sensing brings the proliferation of big data that are nonlinear and nonstationary. Although there is rich information on nonlinear dynamics, significant challenges remain in realizing the full potential of sensing data for system control. This paper presents a new approach of heterogeneous recurrence analysis for online monitoring and anomaly detection in nonlinear dynamic processes.

4 - Latent Dirichlet Allocation (lda) Based Analytic Framework For Topic Modeling Of Cfpb Consumer Complaints

Kaveh Bastani, Recovery Decision Science, Cincinnati, OH, United States, kaveh@vt.edu, Hamed Namavari, Jeffrey Shaffer

We propose a text mining analytic framework based on latent Dirichlet allocation (LDA) to analyze Consumer Financial Protection Bureau (CFPB) consumer complaints. The proposed analytic framework aims to extract latent topics/clusters in CFPB complaint narratives, and explores their associated trends over time. The time trends will then be used to evaluate the quality of industry regulations and expectations on financial institutions in creating a consumer oriented culture that takes into account consumer protection in their decision making processes.

1 - A Random Effect Autologistic Regression Model With Application To The Characterization Of Multiple Microstructure Samples

Qingyu Yang, Wayne State University, qyang@wayne.edu

The microstructure of the material can strongly affect material properties which in turn plays an important role of the product quality produced by these materials. The existingstudies on material microstructure mainly focus on a single microstructure sample's characteristics, while the variation among different microstructure samples is ignored. In this paper, we propose a novel random effect autologistic regression model to characterize the microstructure variation of different samples for the two phase materials. A simulation study is conducted to verify the proposed methodology. A real world example of a dual-phase high strength steel is used to illustrate the developed methods.

2 - A Bayesian Variable Selection Method For Joint Diagnosis Of Manufacturing Process And Sensor Faults

Yong Chen, University of Iowa, Iowa City, IA, 52242, United States, yong-chen@uiowa.edu

This paper presents a Bayesian variable selection based diagnosis approach to identify both process mean shift faults and sensor mean shift faults simultaneously in manufacturing processes. Important concepts are introduced to understand the diagnosability of the proposed method. A conditional maximum likelihood method is proposed as an alternative method to provide robustness to selection of some key model parameters. Systematic simulation studies are used to provide insights on the relation between the success of the diagnosis method and related system structure characteristics. And a real assembly example is used to demonstrate the effectiveness of the proposed diagnosis method.

3 - A Preposterior Analysis To Predict Identifiability In The Experimental Calibration Of Computer Models

Daniel Apley, Northwestern University, apley@northwestern.edu

When calibrating computer simulation models using physical experimental data, it is usually very difficult to identify unknown physical parameters and distinguish their effects from the discrepancy function that represents the difference between the simulation model and reality. We develop a preposterior analysis to predict (prior to conducting physical experiments but after conducting simulations) the identifiability that will result for any candidate physical experimental design. This can be used as a criterion for designing physical experiments to achieve better identifiability of the physical calibration parameters.

1 - Considering Passenger Recovery In Airline Operations Recovery

Jia Kang, Senior Operations Research, Sabre Airline Solutions, 3150 Sabre Drive, Southlake, TX, 76092, United States, jia.kang@sabre.com, Dinakar Gade, Sureshan Karichery

The Sabre AirCentre Recovery Manager (Ops) helps airlines quickly recover both the schedule and aircraft rotations from various disruptions (curfews, weather, unplanned maintenances, etc.) by taking into account operational restrictions and several conflicting tradeoffs. In this presentation we introduce a new feature of Recovery Manager called the Passenger Flow Module (PFM) that incorporates passenger re-accommodation decisions during schedule recovery. The generated solutions significantly reduce the impact to passenger flows in airline network as well as overall passenger inconvenience.

2 - Fuzzy Association Rule Mining Framework For Product Selection In E-Commerce

Shekhar Shukla, Doctoral Candidate, Indian Institute of Management Lucknow, FPM H-2 Room No. 41, IIM Campus Prabandh Nagar Off Sitapur Road, Lucknow, 226013, India, shekhar.shukla@iiml.ac.in, Ashwani Kumar

We present a robust and a unique framework of product selection that incorporates social influence factors and provides a numerical strength of suitability of each available product based on a customer’s set of requirements. The Framework generates Fuzzy Association Rules based on product attributes incorporated with customer reviews as objective weights to these attributes (using Shannon’s Entropy) and market popularity parameters as rule implications. These rules are used as a descriptive model for each product to perform an Association Based Classification.

3 - A Modeling Framework For The Strategic Design Of Local Fresh Food Systems

Hector Flores, PhD Candidate, Arizona State University, 513 W. 17th Street, Tempe, AZ, 85281, United States, hector.flores@asu.edu, Rene Villalobos

In this work we demonstrate that certain geographical regions might have the potential to produce high-value fresh fruits and vegetables that can be both profitable for current farmers and can incentivize new entrants into local food systems. Specifically, we develop an optimization-based framework that uncovers hidden production capabilities within a region by (1) identifying needed technologies and resources, (2) considering complementary environmental characteristics and market price behavior, and (3) addressing logistic and supply chain planning decisions. It also sets the framework for incorporating parameter randomness. This work addresses research related to local food systems.

4 - Product Bundling For Airline Customers

Manini Madireddy, Senior Operations Research, Sabre, 3150 Sabre Dr, Southlake, TX, 76092, United States, Manini.Madireddy@sabre.com, Goda Doreswamy, Meisam Hejazi Nia, Ramasubramanian Sundararajan

We consider the problem of product bundling (seats and ancillaries) in the context of offering the right products to the right customer at the right price and time, in such a way as to satisfy customer needs and maximize airline revenue. This problem falls in the realm of airline revenue management and retail e-commerce. We present a solution approach to construct, optimize and personalize offers to customers. We demonstrate the utility of our approach through illustrative results on real and simulated data.

1 - A Segmented Logistic Regression Model To Construct A Valid Set Of Itineraries From A List Of Weekly Flight Legs

Anand Seshadri, Principal, Operations Research, SABRE Airline Solutions, 3rd Floor, Navigator Building, International Tech Park, Bangalore, 560045, India, ug97044@yahoo.com, Gautam Pradhan

In this paper, we present a robust approach to rank and remove invalid itineraries and retain a set of good itineraries. Traditionally, this has been accomplished by a heuristic model. The main disadvantage of a heuristic model is that the rules are based on the past behavior of the system and is not dynamic enough to account for changes in airline service variables (alliances, flight departure times etc.). A heuristic model also does not allow the modeler to eliminate itineraries during the building stage leading to inefficient memory utilization. We calibrate the logistic regression model based on a week of historical and schedule data for a major US carrier and compare the results to a rule based model.

2 - Location Of Stations In A One-way Electric Car Sharing System

Hatice Çalık, Université Libre de Bruxelles, Université Libre de Bruxelles, Boulevard du Thriomphe, Brussels, 1050, Belgium, hatice.calik@ulb.ac.be, Bernard Fortz

We focus on an electric car sharing system where we have a set of customers, each of which wishes to travel from a point of origin to a point of destination at a certain time of the day. The customers can pick up a car from a station close to their point of origin and leave it to a station close to their destination. The location of the stations, the customers to be served, and the stations they will visit need to be decided in a way that maximizes the profit. We provide exact and heuristic methods to solve the problem and conduct computational experiments on newly generated problem instances.

3 - Spatial-temporal Crash Severity Modeling For Aging-involved Crashes: A Case Of Interstate 95 In Florida

Aschkan Omidvar, University of Florida, Gainesville, FL, 32611, United States, aschkan@ufl.edu, Arda Vanli, Eren Erman Ozguven

This research aims to develop a binary logistic regression model to discover the significant factors affecting the severe crash occurrences for aging drivers. Crash data from two major metropolitan areas, Miami and Jacksonville, for three consecutive years (2010-2012) are extracted, processed and analyzed using Geographical Information Systems (GIS). These data sets are used to determine factors influencing the severity of crashes and compare them with those for other age groups. Next, we investigate the spatial and temporal variation of the effect of the influential variables, on severity of aging-involved crashes by applying variable selection on the fitted logistic regression models.

Chair: Mohamed Mahmoud Saleh Abdulkader, PhD Candidate, University of Manitoba, 708-1833 Pembina Highway, Winnipeg, MB, R3T 3X8, Canada, abdulka3@myumanitoba.ca

1 - Multi-depot Two Echelon Pollution Minimizing Routing Problem With Heterogeneous Vehicles

Surendra reddy Kancharla, PhD Student, Indian Institute of Technology Madras, Chennai, India, surendrareddy.kancharla@gmail.com, Gitakrishnan Ramadurai

A new variant of VRP to find the heterogeneous fleet mix and routes at two levels by jointly minimizing the operational and pollution cost is proposed. Fuel consumption and the pollutants emitted are a function of load, speed, and acceleration characteristics. A mixed-integer program is formulated and an effective metaheuristic solution algorithm is presented.

2 - Heuristics For Online Orders Delivery Optimization

Mohamed Mahmoud Saleh Abdulkader, PhD Candidate, University of Manitoba, 708-1833 Pembina Highway, Winnipeg, MB, R3T 3X8, Canada, abdulka3@myumanitoba.ca, Yuvraj Gajpal, Tarek ElMekkawy

E-commerce became a global trend and its volume has been expanded remarkably. Consumers can order products to be delivered at their homes. These online ordered products are supplied from the retail stores available inventories. The retail stores require products from central warehouse as well. In this paper we consider the vehicle routing problem for the delivery of products ordered online and the delivery of products from central warehouse to retailers. We provide mathematical description and heuristics to solve the problem. Numerical experiment is performed on randomly generated problem instances to evaluate the heuristics performance.

1 - Financing Schemes For Upstream Suppliers

Weixiang HUANG, City University of Hong Kong, Kowloon Tong, Kowloon, Hong Kong, China, wxhuang4-c@my.cityu.edu.hk, Yanzhi LI, Qiaohai HU

We consider four financing schemes for a supplier with limited capital: bank loans, purchase order financing (POF), retailer loans and advance payments. We model players' interaction as Stackelberg games. We show that: (1) The bank loan helps the supplier to overcome the capital constraint and produce its desired quantity. (2) While the production quantity in retailer loans or advance payments can be either lower or higher, the one under POF is always higher than the supplier's desired quantity. (3) No scheme is dominating in terms of players' own and chain's sake. (4) Different from retailer loans and advance payments, POF allows each player to obtain profits larger than that under bank loans.

2 - Optimizing Joint Replenishment Problem For Non-instantaneous Deteriorating Items With Multiple Suppliers Offering Quantity Discounts

Xueyi Ai, Huazhong University of Science and Technology, Luoyu Road, NO. 1037, Wuhan, China, Wuhan, 430074, China, aixueyi1030@gmail.com, Jinlong Zhang

This paper deals with a new joint replenishment problem, in which a number of non-instantaneous deteriorating items are replenished from several suppliers under different quantity discounts schemes. We develop a model integrated with a supplier selection system and the joint replenishment programmes for non-instantaneous deteriorating items. An improved moth-flame optimization (IMFO) algorithm is proposed to solve this NP-hard problem so that the total cost is minimized. Numerical examples are shown to illustrate the performance of IMFO algorithm. Extensive experiments are performed to further investigate the effectiveness of the proposed algorithm.

3 - Management Of Supply Chains With Perishable Assets

Maxim A. Dulebenets, Assistant Professor, Florida State University, Tallahassee, FL, United States, mdlbnets@memphis.edu, Mihalis Golias, Mehdi Amini

Nowadays many of supply chains deal with design, production, distribution, and retailing of perishable assets. Perishable assets may deteriorate due to certain external factors, such as time, temperature, humidity, pressure, power, air composition, etc. This presentation will focus on the key features of supply chains with perishable assets, attributes of perishable assets, sustainability of supply chains with perishable assets, best practices revealed in the relevant scientific literature and applied in the industry, and outline some critical issues and potential directions for the future research.

4 - Designing Power Supply Chains- Understanding India's Electrification Underachievement And Disparity

Prateek Raj, PhD Student, University College London, Gower Street, UCL School of Management, London, WC1E 6BT, United Kingdom, p.raj.12@ucl.ac.uk, Achal Bassamboo

Power supply has a complex supply chain. It involves coordination between several players for both everyday operations and for long term planning. We consider different ways of organizing decision making in power supply chains, and study the varying outcomes in capacity and efficiency of power supply. Using this framework, we study why India has lagged behind in rural electrification compared to other large countries. We also explore why there is high heterogeneity in rural electrification within India.

Operations Management II

Contributed Session

1 - Queue Joining Decisions When There Is A Prerequisite Condition For Getting Service

Mona Imanpoor Yourdshahy, PhD Student, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T 1Z2, Canada, mona.imanpoor@sauder.ubc.ca, Woonghee Tim Huh, Steven Shechter

We consider an M/M/1 queueing system in which a customer requires some prerequisite condition to be met prior to receiving service. We investigate whether an individual arriving to this system should join the queue at that time, or wait to join at some future time. We formulate this problem as a Markov decision process and show how the structure of the optimal policy depends on in-queue and out-of-queue waiting costs, the arrival and service rates, as well as the time until the prerequisite condition is satisfied.

2 - Codified Knowledge Sharing And Operational Failure In Healthcare: Evidence From NHS Hospitals' Risk Management Documents

Bilal Gokpinar, University College London, London, United Kingdom, b.gokpinar@ucl.ac.uk, Mecit Can Emre Simsekler

Focusing on codified knowledge sharing among healthcare personnel in the form of written documents (e.g. risk management policies, procedures, strategies, etc.), we examined the role of the nature and content of codified knowledge on risk management performance. We used a unique dataset from NHS acute trusts in England and employed text-mining techniques to investigate the impact of documents on risk management.

3 - Study On The Scheduled Bus-bridging Service And Emergent Strategy Of Bus Fare Discount Under Operation Disruptions Of The Metro System

Li_bing Wan, Huazhong University of Science&Technology, Wuhan, China, wanlibingltt@163.com

The rail transit has many advantages, at the same time, it also often fails and operation disruptions . This thesis studies the bus-bridging evacuation service for complete passengers' travel and the emergent strategy of bus fare discount under operation disruptions of the rail transit. Firstly, we systematically summarize and analyze operation disruptions of three cities . Secondly,the conventional metro-bus evacuation equilibrium model is established . Thirdly, the thesis deeply researches the effect of bus fare discount to the original equilibrium and determines optimal bus fare discount strategies for two different targets.

4 - Multi-recipe & Multi-variety Blast Furnace Production Planning Under Carbon Cap & Trade Policy Based In An Improved Block Molding Method

Ye Yang, Southeast University, School of Economics and Management, Southeast, Nanjing, China, yangye1120@163.com, Wei-da Chen

Carbon emission reduction policies have become key elements affecting production operations in the enterprises. Considering an iron making plant which outputs various products by multiple recipes, it studies multi-period blast furnace production planning problem with two types of carbon constraints (periodic carbon constraint, cumulative carbon constraint) under Carbon Cap and Trade policy. Firstly, based on an improved block molding method, two kinds of multi-recipe and multi-variety iron blast furnace production planning MILP models are constructed. Secondly, Cplex software is used for numerical analysis, discussing the effects of carbon cap and carbon price on production planning.

1 - Global Optimum Of The Complementarity Constrained Program: Algorithm And Application

Yu-Ching Lee, Assistant Professor, National Tsing Hua University, No. 101, Section 2, Kuang-Fu Road,, Engineering Building I,, Hsinchu, Taiwan, yclee@ie.nthu.edu.tw, En-Cheng Chang Chang

The complementarity constrained program is found well applied in the area of inverse optimization, parameter selection, and hierarchical decision-making. The global optimality in these applications are important compared with other nonlinear programming problems. We discuss methodologies with some numerical experiments in this talk.

2 - Computational Study On Bilevel Mixed Integer Convex Programming Problems

Liang Xu, University of Pittsburgh, 3700 O'Hara Street, 1048 Benedum Hall, Pittsburgh, PA, 15261, United States, lix21@pitt.edu, Bo Zeng

In this talk, we present a solution algorithm for bilevel mixed integer nonlinear (BiMINLP) programming problems through reformulation and decomposition. For the mixed integer convex lower level problem, we show that strong duality and KKT conditions of the continuous portion can be incorporated to achieve fast computation. Our solution procedure is evaluated on instances from literature as well as randomly generated ones, and a superior computational performance is observed.

3 - Sales Persons Compensation Scheme Considering Customer Satisfaction And Multiple Distribution Channels

Chulok Ahn, PhD Candidate, Korea University Business School, Korea University Business School, Anam-ro, Seongbuk-gu, Seoul, 02841, Korea, Republic of, ahncokr@korea.ac.kr, Hosun Rhim, Kwangtae Park

We examine the compensation strategy of a firm's sales person in the multiple distribution channels with customer satisfaction considered. While customer's satisfaction level differs to the distribution channel, the firm tries to find an optimal compensation scheme for both direct and retail channel. The firm sells same product with constant price but the incentive schemes differ on the basic salary, sales commission, and customer satisfaction. The mathematical model provides the optimal compensation schemes for both channels and can be applied to a company using multiple distribution channels.

4 - Optimization Based Decision Tree Construction

Chaosheng Dong, University of Pittsburgh, 1025 Benedum Hall, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States, chaosheng@pitt.edu, Bo Zeng

We construct Decision Tree with an optimization-based approach.

Behavioral Operations II

Contributed Session

Chair: Arpit Goel, PhD Student, Stanford University, 475 Via Ortega, Huang Engineering Center, Stanford, CA, 94305, United States, argoel@stanford.edu

1 - The Behavioral Bayesian Newsvendor In Supply Chain

Ju Myung Song, Rutgers Business School, PhD Program, Washington Park, Room 430C, Newark, NJ, 07102, United States, jumyungsong@gmail.com, Xiaowei Xu

Behavioral Bayes' rule using weighted updating model has been adopted in the literature on behavioral economics. In this paper, we study a single-period newsvendor problem with the supply chain coordination structure, and show how this behavioral bias leads to forecasting bias and affects the coordination and profit distribution.

2 - Impact Of Operational Failures On Worker Productivity: Evidence From An Agribusiness Setting

Pradeep Pendem, PhD Candidate in OM, University of North Carolina, Chapel Hill, 300 Kenan Center Drive, Chapel Hill, NC, 27599, United States, pradeep_pendem@kenan-flagler.unc.edu, Bradley R Staats, Paul Green, Francesca Gino

Failures in operational processes are ubiquitous in actual environments and play an important role in worker performance. Utilizing real time with-in shift data of harvest workers, we examine the impact of one class of operational failures, Breaks and Disruptions on their productivity. We find that productivity follows an inverted U-shaped response to breaks and negative effect to disruptions. In addition, we show that these effects are exacerbated by workload. Our findings suggest the need to give more emphasis on understanding the type of failure before taking any corrective action. Our study has important implications on the design of operating systems, scheduling policies more generally.

3 - Role Of Partnerships And Point Expiry On Customer Behavior In Reward Programs

Arpit Goel, PhD Student, Stanford Univeristy, 475 Via Ortega, Huang Engineering Center, Stanford, CA, 94305, United States, argoel@stanford.edu, Ashish Goel, Vijay Kamble

Customer behavior in loyalty programs is often attributed to irrational decision making. We provide and analyze an alternate model under which this behavior has a rational explanation. The key characteristics of our model are influence of business partnerships which increase the exogenous visits by the customer leading to higher switching costs with the reward program store and frequent expiry of earned reward points which create an urgency to make more frequent visits. We show that neither of these modeling assumptions provides a rational explanation on its own, but both together justify many observed customer behavioral aspects.

Resource Allocation

Contributed Session

Chair: Lei Bu, Institute for Multimodal Transportation, Jackson, MS, United States, leibu04168@gmail.com

1 - Selecting Corporate Structure For Diversified Firms

Arkadiy Sakhartov, Assistant Professor, The Wharton School, University of Pennsylvania, 2017 Steinberg Hall-Dietrich Hall, 3620 Locust Walk, Philadelphia, PA, 19104, United States, arkadiys@wharton.upenn.edu

The study explores implications of corporate structure for performance of diversified firms. The benchmark for the scrutiny is the set of extant conflicting predictions about the optimal choice of two features of corporate structure, centralization of resource allocation and incentives to unit managers. The study considers relatedness between a firm's businesses and uses the option valuation model to disentangle the existing conflicting predictions. The new results lay the groundwork for a better empirical identification of the effects of relatedness and corporate structure on corporate value, often tested in corporate diversification research.

2 - Modeling Allocation Of Project Resources In Multiproject Portfolio

Zinovy Radovilsky, Professor of Management, California State University, East Bay, 25800 Carlos Bee Blvd., Hayward, CA, 94506, United States, zinovy.radovilsky@csueastbay.edu, Vishwanath Hegde

We introduced a conceptual model of modeling resource allocations in a multi-project portfolio over its projects lifetime. Using practical resource data in a multi-project setting, we demonstrated that resource allocation patterns can be captured by parametric regression models before and after projects' due dates.This enables us to accurately forecast resource allocations during projects lifetime.

3 - Resource Allocation And Revenue Management For Age-based Products

Hossein Jahandideh, PhD Student, UCLA Anderson School of Management, 3777 Mentone Avenue, Apt 405, Los Angeles, CA, 90034-6473, United States, hs.jahan@gmail.com, Christopher S Tang, Kevin F McCardle, Behnam Fahimnia

The value of certain products such as whiskey increases with age. For such products, introducing a new age to the market means introducing a whole new product with demand uncertainty and substitution effects on existing products. Assuming that the firm is able to start the aging process of a set number of barrels every year, we study the question of what fraction of this capacity to allocate to the new age. The goal is to maximize the expected revenue extracted from a fixed yearly production capacity.

4 - Solving Resource Station Location-routing Problem In Emergency Evacuation Through A Resource-space-Time Network Representation

Lei Bu, Institute for Multimodal Transportation, Jackson, MS, United States, leibu04168@gmail.com, Zhibin Jiang, Feng Wang, Xing Fu, Chuanzhong Yin

Based on a representation of discretized resource-space-time networks, a formulation is proposed to optimize dynamic bus station location and routes decisions in an emergency evacuation of subway station. The proposed integer linear programming formulation could effectively build the modeling representation of time window, resource change and passenger travel distance constraints through a multi-dimensional network with an objective function to minimize the total travel cost. A Lagrangian relaxation approach is utilized to solve the problem. A case study of subway and bus station network in Lianhu District, Xi'an City in China verifies the effectiveness of the model and algorithm.

1 - Application Of Linear Programming In Dimension Stone Industry

Gangaraju Vanteddu, Associate Professor, Southeast Missouri State University, Harrison College of Business, One University Plaza, MS 5815, Cape Girardeau, MO, 63701, United States, gvanteddu@semo.edu

A typical dimension stone business unit has to contend with many unique demand and availability related characteristics and constraints, which makes the application of Linear Programming techniques an ideal solution in a wide variety of contexts. In this research, a generic MILP model is proposed to maximize revenue in the presence of demand, operational and technical constraints.

3 - Portfolio Model For Natural Gas Combined Cycle Power Plant

Asiye Ozge Dengiz, Research Assistant, Baskent University, Baskent Univesity Industrial Engineering Bagl, Ankara, 06810, Turkey, aokarahanli@baskent.edu.tr, Mehmet Gulsen, Orhan Dengiz

Among different types of power generation facilities, natural gas power plants (NGPP) get considerable attention because of the advantages of being able to generate on demand and location flexibility. The producers, often operating several generators, need to make simultaneous planning for their entire plant portfolio to maximize their profit based on the information coming from the market of Turkey and equipment characteristics. For this purpose, in this study for the NGPP, a model is developed for producers to plan generation for a certain horizon considering operation costs and forecasted market data.

4 - A Generalized Framework For The Estimation Of Edge Infection Probabilities

Lauren Gardner, Senior Lecturer, University of New South Wales, Kensington Campus, Building H20, Sydney, 2052, Australia, l.gardner@unsw.edu.au, Andras Botas

Most network-based infection spreading and diffusion models require a real value or (transmission) probability on the edges of the network as an input, which is often unknown in real-life applications. This work presents a general framework to estimate the value of these probabilities on a network exposed to an infection process, where spatiotemporal information on the outbreak pattern is known. This general model works with a range of infection models, and is able to handle an arbitrary number of observations on such processes.

Chair: Parimal Kulkarni, Manager, Supply Chain Analytics, BJC Healthcare, 8300 Eager Rd, Suite 500 D Mailstop 92-92-277, St Louis, MO, 63144, United States, pskf44@umsl.edu

1 - Varying Routes For The Bus Driver's Sanity Problem

Paul Hadavas, Associate Professor, Armstrong State University, 11935 Abercorn Street, Savannah, GA, 31419, United States, Paul.Hadavas@armstrong.edu, Jeremy Dyal

The bus driver's sanity problem is a graph theoretic problem with variable weighted edges. A bus driver needs to minimize the total kid exposure based on kid-minutes. This amounts to summing each kid's time spent on the bus. The graph characteristics (time to the next stop, number of kids aboard) change once kids are dropped off at a particular stop. In this talk, we expand the possible routes the bus driver can take, including cul-de-sacs and tree-like structures with multiple stops located off the main road, and discuss solution techniques for optimal or near-optimal routes.

2 - A Lagrangian Heuristic For A Rapid Transit Line Design Problem

Souhaïla El Filali, University of Montreal, 3520-2920, Chemin de la Tour, Montreal, QC, H3T 1J4, Canada, souhaila.elfilali@cirrelt.ca, Bernard Gendron, Gilbert Laporte

We propose a tight formulation for the rapid transit line design problem, which consists of locating stations and segments between them to form a line, with the objective of maximizing O-D pairs coverage under topological and budget constraints. We develop a Lagrangian heuristic to solve the problem, and we test it on artificial and real-life instances.

3 - Search For An Immobile Target On An Undirected Unit Network

Songtao Li, Tsinghua University, 519A, Shunde Building, Tsinghua University, Haidian District, Beijing, 100084, China, list14@mails.tsinghua.edu.cn, Simin Huang

We consider the problem of searching an immobile target on an undirected network with unit length links. In this problem, multiple searchers traverse the network to find the target. When at least one searcher crosses the target point, the detection happens and the search process end. Our purpose is to optimally guide those searchers to the target (with known distribution) to minimize expected search duration. A binary integer programming model is built, and primary computation results is given. Based on the computation results, we discuss the influence of searcher number and targets distribution to the expected search duration.

4 - Supporting Campus Evacuation Decisions Via Network Optimization

Jorge Huertas, Graduate Student, Universidad de los Andes, Carrera 1 Este No. 19 A - 40, Bogotá, 111711, Colombia, ja.huertas1845@uniandes.edu.co, Daniel Duque, Ethel Segura, Raha Akhavan-Tabatabaei, Andres L Medaglia

In this work we evaluate different emergency scenarios to support an evacuation plan in a campus comprised of multiple buildings. With a time-space network and a Geographical Information System (GIS), we model a campus with 1.7 million square feet that holds up to 27,000 people in a critical moment. To find an evacuation plan, we formulate a MIP based on a minimum cost flow problem formulation with side constraints. To support campus managers, we visualize the solutions under various evacuation scenarios at different scales.

5 - Optimizing Procurement Of High-value Medical Products In A Health-care Network

Parimal Kulkarni, Manager, Supply Chain Analytics, BJC Healthcare, 8300 Eager Rd, Suite 500 D Mailstop 92-92-277, St Louis, MO, 63144, United States, pskf44@umsl.edu
Parimal Kulkarni, Manager, Supply Chain Analytics, University of Missouri, St.Louis, One University Blvd, St Louis, MO, 63121, United States, pskf44@umsl.edu, L. Douglas Smith, Glen Moser

We use MILP optimization and simulation in concert to develop procurement strategies for high-value medical supplies in a health-care network. With a multi-objective MILP model, we determine product groups to be purchased from alternative vendors to achieve quantity discounts while maintaining diversity of supply. Considered are physician preference, budgetary limits, and scorecards of vendor performance on several dimensions. Discrete-event simulation is used iteratively to test procurement solutions and help set the MILP constraints to keep risk at acceptable levels.

Opt, Stochastic II

Contributed Session

Chair: Hernan Andres Caceres Venegas, Ph.D. Student, University at Buffalo - SUNY, 342 Bell Hall, University at Buffalo, Buffalo, NY, 14260, United States, hernanan@buffalo.edu

1 - Efficient Solving Of Multi-stage Mixed-integer Stochastic Problems Under Mean-dispersion Distributional Information

Krzysztof Postek, PhD Candidate, Tilburg University, Warandelaan 2, Tilburg, 5037 AB, Netherlands, k.postek@tilburguniversity.edu, Ward Romeijnders, Dick den Hertog, Maarten H van der Vlerk

We propose a solution method for multi-stage robust optimization and stochastic programming problems under distributional uncertainty, when the means and mean absolute deviations of the parameters are known. Using new theoretical results we show for problems with integer recourse how to construct good convex approximations with known performance bounds and how to solve these problems efficiently. Our approach gives insights into the performance of the various recourse rules, the value of distributional information, and the trade-offs between different variants of the objective function (worst-case, worst-case expected, best-case).

2 - Multi-project Scheduling With Multi-mode Resource Constrained Under Uncertainty

Berna Dengiz, Professor, Baskent University, Eskisehir Road 20th Km, Baglica Campus, Ankara, 06530, Turkey, bdengiz@baskent.edu.tr, Serdar Soysal

In this study, we address a resource constrained project scheduling problem including uncertainties in resource usage rate in a multi-project environment. The activities of each project have alternative resource usage modes. Resources are dedicated to all projects considering their dedication policy. The projects involve finish to start zero time lag, nonpreemptive activities and limited renewable and nonrenewable resources. In this study, the optimal dedication of resource capacities to the projects and minimum value of weighted tardiness over all projects will be determined by proposed solution approach.

3 - Stochastic Integer Programming With Endogenous Uncertainty In Open Access Outpatient Clinic Appointments Scheduling

Amarnath Banerjee, Associate Professor, Texas A&M University, 4041 Engineering Technology Building, 3131 Tamu, College Station, TX, 77843-3131, United States, banerjee@tamu.edu, Yu Fu

This study develops a two-stage Stochastic Integer Programming (SIP) model to solve the online outpatient scheduling problem. The model considers different types of patients and uncertain factors in system throughput, no-show, cancellation and lateness. A modified L-shaped algorithm is designed to handle the endogenous uncertainty brought by these factors and solve the SIP model. The analysis method and solution algorithm can be applied to two-stage SIP model with simple recourse function satisfying certain properties.

4 - A Stochastic Mixed Integer Programming Model For Risk Minimization

Yiming Yao, Lawrence Livermore National Laboratory, 7000 East Avenue, L-181, Livermore, CA, 94550-9234, United States, yao3@llnl.gov, Vic Castillo, Andrew Mastin, Carol A Meyers, Deepak Rajan

We present a two-stage stochastic mixed integer programming model that minimizes enterprise risk subject to supply, demand, capacity and other constraints, with the consideration of uncertainty in some parameter values. We describe risk measurement and uncertainty characterization in the application context. Finally, we describe the model's implementation in the open source optimization modeling language PYOMO/PYSP.

5 - Pricing Tax Return For Students That Opt-out From Using School Bus

Hernan Andres Caceres Venegas, PhD Student, University at Buffalo - SUNY, 342 Bell Hall, University at Buffalo, Buffalo, NY, 14260, United States, hernanan@buffalo.edu, Rajan Batta, Qing He

School districts are often mandated to provide transportation but can encounter ridership that varies between 22-72 percent. Consequently, buses run with unused capacity over long routes. We explore the scenario where students are compensated for giving up the option to ride a bus, in an effort to reduce the overall cost of the system. Mathematical formulations for this problem are developed and analyzed. Results from a case study along with algorithmic computational results will be presented.

Monte Carlo Methods for Multi-stage Decision Making under Uncertainty

Sponsored: Artificial Intelligence

Sponsored Session

Chair: Michael Fu, University of Maryland, mfu@isr.umd.edu

1 - Back To The Future: Google Deep Mind, Alpha Go & Monte Carlo Tree Search

Michael Fu, University of Maryland, College Park, MD, 20742, United States, mfu@rhsmith.umd.edu

In March 2016 in Seoul, Korea, Google DeepMind's AlphaGo, a computer Go-playing program, defeated the reigning human world champion Go player, a feat far more impressive than previous computer programs victories in chess (Deep Blue) and Jeopardy (Watson). Due to the sheer combinatorial nature of the number of possibly game configurations, at the heart of all computer Go-playing algorithms is Monte Carlo tree search based on an upper confidence bound (UCB) algorithm that traces its roots back to an adaptive multi-stage sampling algorithm for estimating the value function in finite-horizon Markov decision processes (MDPs). We describe this algorithm and the main ideas behind AlphaGo.

2 - Cumulative Prospect Theory Meets Reinforcement Learning: New Monte Carlo Algorithms

Cheng Jie, University of Maryland, cjie@math.umd.edu, Prashanth L.A., Michael Fu, Marcus Steve, Csaba Szepesvari

We bring cumulative prospect theory (CPT) to a risk-sensitive reinforcement learning (RL) setting and present Monte Carlo simulation-based algorithms for both estimation and optimization. The estimation scheme uses the empirical distribution to estimate the CPT-value of a random variable. The optimization procedure is based on simultaneous perturbation stochastic approximation (SPSA). Both theoretical convergence results and numerical experiments are provided.

3 - Weighted Bandits Or: How Bandits Learn Distorted Values That Are Not Expected

L. A. Prashanth, University of Maryland, College Park, MD, 20742, United States, prashla@umd.edu, Aditya Gopalan, Michael Fu, Steve Marcus

We formulate a novel multi-armed bandit setup, where the arms' reward distributions are distorted by a weight function. The distortions are motivated by models of human decision making that have been proposed to explain commonly observed deviations from conventional expected value preferences We study two representative problems in this setup: The classic K-armed bandit setting and the linearly parameterized bandit setting. In both settings, we propose algorithms that are inspired by UCB, incorporate reward distortions and exhibit sub-linear regret assuming Holder-continuous weights. We provide empirical demonstrations of the advantage due to using distortion-aware learning algorithms.

Sponsored Session

Chair: Michael P. Johnson, Univrsity of Massachusetts, Department of Public Policy and Public Affairs, Boston, MA, 3, United States, Michael.Johnson@umb.edu

1 - The Foodbank Compliance Problem: A Multicriteria Vehicle Routing Approach

Sarah Nurre, University of Arkansas, snurre@uark.edu, Kellie Schneider

Over 49 million Americans do not have access to a sufficient quantity of affordable, nutritious food. To address the issue of food insecurity in our area, our food bank services many agencies that provide emergency food relief. To maintain regulatory compliance, each agency receives an audit every 12-18 months. We formulate the Food Bank Compliance problem as a multicriteria vehicle routing problem to investigate trade-offs between multiple objectives. We solve the model using both exact and heuristic approaches and provide solutions that appease various stakeholders in the community.

2 - How Can Value Elicitation In Adult Basic Education Support Learners' Success In Goal-setting Policy?

Alma Biba, University of Florida, Jacksonville, FL, United States, Alma.Biba@jax.ufl.edu, Michael P Johnson

For the last two decades, federal legislation and Massachusetts' state ABE policies have linked adult learners' educational outcomes to accountability requirements. Using a multi-method approach ABE learners' goal setting was presented as a decision problem in order to reveal and disentangle the conflicting preferences fueled by outcome-based accountability requirements. Elicitation of values using value-focused thinking (VFT) methodology revealed that learner's self-defined goals are consistently distinct from program-defined goals, that teachers recognize this disjunction, and that efforts to reconcile the two could yield significant improvements in ABE program outcomes.

3 - From Spatial Swot Analysis To Mcda And Choice Experiments: An Integrated Approach For Historical Heritage Management In A New World Heritage Site

Valentina Ferretti, London School of Economics and Political Science, London, United Kingdom, V.Ferretti@lse.ac.uk, Elisa Gandino

This study develops a multi-methodology intervention designed and deployed to support planning and management of a new World Heritage site in Italy. The proposed framework develops through subsequent phases and experiments an integrated approach based on mixed Decision and Economic Analysis techniques, i.e. Spatial SWOT Analysis and Multicriteria Decision Aiding in Phase 1 (problem identification - knowledge phase), Stakeholders Analysis and Spatial Multicriteria Decision Aiding in Phase 2 (problem formulation - planning phase), and Choice Experiments during Phase 3 (problem solving - design).

4 - Mobile Dentistry Network Design: Improving Dental Care Access For Under-served Populations In Rural Regions

Ronald McGarvey, University of Missouri, IMSE and TSPA, E3437D Lafferre Hall, Columbia, MO, 65211, United States, mcgarveyr@missouri.edu, Andreas Holger Thorsen

We investigate the implications of adding mobile dentistry services to a community health center (CHC) in southwest Montana. CHCs are not-for-profit healthcare corporations which provide comprehensive primary care services to patients in the US, including under-served and uninsured people. Mobile dentistry involves dentists and dental hygienists traveling with dental equipment in vans or trailers to serve patients. We model the mobile dentistry network design problem using a mixed-integer programming model to assess the financial feasibility of offering a mobile dentistry service in southwest Montana and measure the potential social impact of mobile dentistry on the region.

Service Science Best Student Paper Competition II

Award Session

Chair: Robin Qiu, Penn State University, 30 E. Swedesford Road, Malvern, PA, 19355, United States, robinqiu@psu.edu

1 - Appointment Scheduling And The Effects Of Customer Congestion on Service

Zheng Zhang, University of Michigan, Ann Arbor, MI, United States, zzhang0409@gmail.com, Zheng Zhang, Brian Denton, Xiaolin Xie

This paper addresses an appointment scheduling problem in which the server responds to congestion of the service system. We characterize the congestion induced behavior of the server as a function of customer waiting time. Decision variables are the scheduled arrival times for customers in order to minimize a weighted cost incurred for customer waiting time, server overtime and server speedup in response to congestion. We illustrate the importance of congestion effects using a case study for an outpatient clinic at a large medical center.

2 - Managing Consumer Return Abuse And an Assessment Of Technology-Enabled Countermeasures

Mustafa Serkan Akturk, Texas A&M University, 4217 TAMU, Wehner 320 M, College Station, TX, 77843-4217, United States, makturk@mays.tamu.edu, Michael Ketzenberg

This paper examines retail return abuse with respect to both opportunistic and fraudulent consumer returns and explores two innovative technology-enabled countermeasures: customer profiling and product tracking. A customer profiling system identifies opportunistic customers by using their personal identification and transaction history. In contrast, a product tracking system identifies fraudulent returns by recording each transaction of a product through the use of unique identifiers. We investigate the value of making such investments and evaluate how these countermeasures impact a retailer's profitability, demand structure, and policy parameters with respect to price and refund.

3 - Data-Driven Management Of Post-Transplant Medications: An APOMDP Approach

Alireza Boloori, Arizona State University, Tempe, AZ, United States, alireza.boloori@asu.edu, Soroush Saghafian, Harini Chakkera, Curtiss Cook

Anti-rejection drugs are heavily prescribed after organ transplantations to reduce the risk of organ rejections. However, this practice has been shown to increase the risk of diabetes, which makes patients insulin-dependent. To address this conflict and generate effective medication management strategies, we propose an ambiguous POMDP framework that accounts for (1) patients' quality of lives, (2) inevitable estimation errors in a data-driven system, and (3) physicians' attitudes in decision making. We also provide several managerial and medical implications for policy makers and physicians.

4 - Speedup And Slowdown In Multi-Class Service Systems With Returns

Nasser Barjesteh, University of Chicago Booth School of Business, Chicago, IL, United States, barjesteh@chicagobooth.edu, Hossein Abouee-Mehrizi

We consider a service system facing several classes of customers in which the arrival rate and service time depend on the workload, while the chance of return depends on the service time. We provide conditions under which the system is stable and characterize the equilibria of the system. We show that the system may shift between several equilibria. We demonstrate conditions under which an equilibrium is stable and prove that the stability of an equilibrium may depend on the time a customer spends outside of the system before returning for rework. We also observe that the congestion level at which the service rate of one class is changed affects the impact of adjusting the service rate of another class.

5 - Simulation Optimization For Medical Staff Configuration At Emergency Department In Hong Kong

Hainan Guo, City University of Hong Kong, KLN, Hong Kong, Hong Kong, hainaguo-c@my.cityu.edu.hk, Siyang Gao, Kwok-Leung Tsui

This paper seeks to solve the problem of minimizing the medical staff cost constrained by certain service requirements at ED in HK. In our formulation, the service requirements are characterized by some stochastic constraints. Due to the special structure of this problem and ease of computing the objective values, we proposed an efficient random search approach which iteratively identifies solutions with better objective values than that of the current best solution. Experimental studies demonstrate the significantly higher efficiency of our method. In order to obtain the same solution quality, it is able to reduce the computational time by 90% compared with the existing methods in the literature.

1 - A Node Splitting-Recovery Model For Congestion Evolution Process On Road Networks

Xianyuan Zhan, Purdue University, Evanston, IL, United States, zhanxianyuan@purdue.edu, Satish V. Ukkusuri, Suresh C. Rao

This study presents a node splitting-recovery model for congestion evolution process on urban road networks. We introduce a new dynamic graph representation of road networks that incorporates both the network structure as well as functional states. The congestion evolution in road networks can be modeled as an equivalent node splitting-recovery process on the new graph representation. The congestion evolution data of Beijing road network are collected and used to analyze the real world congestion evolution pattern as well as the node splitting-recovery process.

2 - Doubly Dynamic Traffic Assignment Model Based On Regional Macroscopic Fundamental Diagrams

Xiaozhang He, Perdue University, West Lafayette, IN, United States, seanhe@purdue.edu, Mehmet Yildirimoglu, Srinivas Peeta, Xiaozhang He

This study develops a doubly dynamic traffic assignment model, incorporating within-day and day-to-day dynamics, to capture interactions between demand and supply in heterogeneously congested urban transportation networks. The model is constructed on homogenous sub-regions with static macroscopic fundamental diagrams. Numerical examples are used to investigate the properties of equilibrium states that provide insights for developing coordinated traffic management strategies.

3 - Modeling Cruising Dynamics For Downtown CurbsideParking

Zhengtian Wu, University of Florida, Department of Civil and Coastal Engineering, Gainesville, FL, United States, zhengtianxu@ufl.edu, Yafeng Yin

Cruising for parking not only worsens traffic conditions, but also causes additional energy consumptions and emissions. This study presents a macroscopic model for cruising dynamics in a downtown parking system. The stationary states of the system as well as their stabilities are investigated under different facility scenarios and operation strategies. The optimal occupancy of curbside parking as well as the recommendations for downtown parking management are provided.

Technology Tutorial: SAS/SAS-JMP

Technology Tutorial

1 - SAS: Building And Solving Optimization Models With SAS

Edward P Hughes, SAS Institute, Inc., Sas Institute Inc., Sas Campus Drive, Cary, NC, 27513, United States, ed.hughes@sas.com

SAS provides a broad and deep array of data and analytic capabilities, including data integration, statistics, data and text mining, econometrics and forecasting, and operations research. The SAS optimization, simulation, and scheduling features coordinate easily and fully with other SAS strengths in data handling, analytics, and reporting. OPTMODEL from SAS provides a powerful and intuitive algebraic optimization modeling language and unified support for building and solving LP, MILP, QP, NLP, CLP, and network-oriented models. And because OPTMODEL is also a SAS procedure (software module), it integrates seamlessly with the entire family of SAS functions, procedures, and macros. We'll demonstrate how you can use OPTMODEL to solve both basic and advanced problems, highlighting its newer capabilities and its support for both standard and customized solution strategies

2 - SAS: Data Discovery And Analysis With JMP 13 Pro

Mia L Stephens, SAS Institute Inc, PO Box 290, York Harbor, ME, 03911, United States, mia.stephens@jmp.com

JMP Statistical Discovery Software is visual and interactive desktop software for Windows and Mac, with a complete array of integrated graphical and statistical features. In this workshop we use the newly released JMP 13 Pro to demonstrate tools for data preparation, visualization, and exploration, including recode, Graph Builder®, the data filter, and geographic mapping. We'll see how to analyze univariate, bivariate, and multivariate data, and will demonstrate tools for building and interacting with predictive models. Finally, we'll see how to share results using HTML output and interactive web reports.

An Optimization Algorithm For Train Timetabling Problem Based On Lagrangian Relaxation

Haiying Li, Prof., Beijing Jiaotong University, Shangyuan Cun No.3, Haidian District, Beijing, 100044, China, hyli@bjtu.edu.cn, Zhengwen Liao, Jianrui Miao, Lingyun Meng

The research established a cumulative flow variable-based binary programming model for train timetable optimization. A Lagrangian relaxation based time-space-state network was designed to decrease the problem scale by transforming the complicated schedule problem into a set of time-space shortest path problems of independent trains.

Sparsely-sampled Hyperspectral Beam-scanning Imaging System Based On 3d Triangular Lissajous Trajectory

Haonan Lin, Purdue University, West Lafayette, IN, United States, lin676@purdue.edu, Nan Kong

In this work we exploited information redundancy of spatially and spectrally adjacent pixels in hyperspectral images, so as to recover the complete image with low sampling fill rate. 3D triangular wave Lissajous trajectory with high least common multiplier was used to sparsely sample the hyperspectral data cubes. Model-based image in-painting is applied to recover the complete data cubes. Results based on the sparse-sampled version of a hyperspectral coherent Raman scattering image indicates that 10% fill rate is able to recover an image without much quality degradation.

Taxi Sharing

Mustafa Lokhandwala, Purdue University, 241 Sheetz Street, Apt 14, West Lafayette, IN, 47906, United States, mlokhand@purdue.edu

New York City has one of the busiest transportation systems in the world. This study focuses on a part of this network i.e. taxis and attempts to analyze the benefit of Taxi Sharing using simulation software and optimization techniques. The focus of our study will be to build an agent-based simulation model using trip data obtained from the New York Taxi and Limousine Commission, model the decision making methodologies of the agents in a taxi sharing scenario and run this model using the most recent trip data within New York City. The result from this experiment will be to optimize the number of taxis operating on the streets of New York City and also quantify the economic and environmental benefits of the same.

Acceleration Of A Communication Efficient Distributed Dual Block Descent Algorithm

Chenxin Ma, Lehigh University, 200 West Packer Avenue, Bethelehem, PA, 08801, United States, chm514@lehigh.edu

Distributed optimization algorithms for very large-scale machine learning suffer from communication bottlenecks. Confronting this issue, a communication-efficient primal-dual coordinate ascent framework (CoCoA) and its improved variant CoCoA+ have been proposed, achieving a convergence rate of O(1/t) for solving empirical risk minimization problems with Lipschitz losses. In this paper, we propose an accelerated variant of CoCoA+ and show that it has a rate of O(1/t2) in terms of reducing dual suboptimality. Our analysis is also notable in that our convergence rate bounds involve constants that, except in extreme cases, are significantly reduced.

Enhancing Operational Performance Of Emergency Room Team

Maryam M Mahdikhani, PhD Candidate, Rutgers University, 1 Washington Park, Room 1019C, Newark, NJ, 07102, United States, m.mahdikhani@rutgers.edu

The study investigates the effect of situational awareness concepts on the operational performance of involved agents at emergency rooms to increase the efficiency of performance. Applying ABM techniques makes contributions to illustrate that the effect of which attributes for which agent is more significant than others. We considered three main agents by developing their attributions and variables through random function. Furthermore, situational awareness is described by availability of authority in case of problems, supervisor feedback, and resource availability.

An Integrated Black Topsis And Grey Linear Programming Approach To Deal With Uncertainty And Confidence Level Of Decision Makers

Hanif Malekpoor, PhD Student, University of East Anglia, Norwich Research Park, Norwich, NR4 7TJ, United Kingdom, H.Malekpoor@uea.ac.uk

In order to deal with uncertainty of Decision Makers (DMs) opinions in supplier selection, applying interval valued data is a popular method. However the level of confidence, DMs have about their judgments, is also significant. In addition the supplier's information related to constraints of order allocation problem is not always trustable and precise. In this research to overcome the two aforementioned problems we have developed an integrated approach for order allocation, using Black-TOPSIS (TOPSIS with interval numbers which their upper and lower bounds are also grey numbers) and multi objective grey linear programing to determine the best supplier and order quantity from each suppliers.

Development Of A Least-cost Diet For The Crew Of A Brazilian Navy's Warship

LATE CANCELLATION

Ernesto Rademaker Martins, Commander, Brazilian Navy, Arsenal de Marinha no Rio de Janeiro (AMRJ), Rua da Ponte S/N, Ilha da Cobras, Centro, Rio de Janeiro, 20091000, Brazil, radmart@yahoo.com.br, Marcos Santos, Jessica Alves Souza, Fabrício Costa Dias, Marcone Freitas Reis

Develop an analytical model for the meals served to the crew of Brazilian Navy's warship. Such a diet should take into account the nutritional needs of adult men aged 18-45 years, as well as the specifics of the work activities performed aboard a warship. Due to its deterministic nature, sought a solution to the problem in the light of linear programming, specifically the Simplex Method. The analytical model was established by the data obtained in the Brazilian Navy's normative legislation. The solution of the mathematical model in screen can support the decision of the management of the military organization, to contribute to the fulfillment of the Brazilian's Law.

Modeling Strategic Decisions In Football

Christopher G McCord, Massachusetts Institute of Technology, Cambridge, MA, United States, mccord@mit.edu

Football has long been recognized as one of the most strategically advanced professional sports in the US. A team must continually take into account many different factors when making decisions. In this work, I present a probabilistic model for the decisions an NFL team may face during the course of the game. I then present the strategy that maximizes the team's probability of winning in various situations, as well as a measure of uncertainty for each decision. Finally, I compare the model's optimal decisions with the observed strategies of NFL teams and hypothesize why coaches behave sub-optimally in many situations.

A Novel Distributed Coordinated Approach For Real-time Signal Control

Mehrzad Mehrabipour, Graduate Research Assistant, Washington State University, 1630 NE valley Rd, Pullman, WA, 99164, United States, mehrzad.mehrabipour@wsu.edu, Ali Hajbabaie

This study develops a distributed-coordinated methodology for traffic signal timing optimization problem. Our formulation and solution methodology distribute the network level signal timing optimization problem to intersection level. We formulated a mathematical programing model for each intersection, based on the cell transmission model and created coordination between them to avoid finding locally optimal solutions. The neighboring intersections coordinate their decisions to avoid long queues. We also proposed a rolling horizon solution algorithm and applied it to several case study networks under various demand patterns and observed very promising results.

Optimal Parking Utilization Management Under Uncertain Demand

Amir Mirheli, Washington State University, 405 Spokane Street, Sloan 242, Pullman, WA, 99163, United States, amir.mirheli@wsu.edu, Leila Hajibabai

Excessive cruising to find parking spots contributes to additional delays and imposes indirect costs, safety, and health concerns, particularly in congested urban areas with limited parking capacity. This research develops a bi-level stochastic dynamic parking management model under uncertain demand to simultaneously minimize total costs due to drivers' decisions, maximize parking agency's revenue, and push parking utilization towards a target occupancy. The problem is solved using a hybrid technique including an approximate dynamic programming with an embedded single-level conversion. Numerical experiments show the performance of the proposed algorithm and draw managerial insights.

Regularized Discriminant Analysis For Multisensory Damage Detection And Decision Fusion Using Lamb-waves

LATE CANCELLATION

Spandan Mishra, Florida State University, 2005 Levy Avenue, Tallahassee, FL, 32310, United States, sm13ax@my.fsu.edu, Arda Vanli, Fred Huffer

We have propose a for damage detection which does not require an intermediate feature extraction step and therefore more efficient in handling data with high-dimensionality. A robust discriminant model is obtained by shrinking of the covariance matrix to a diagonal matrix and thresholding redundant predictors without hurting the predictive power of the model. The shrinking and threshold parameters of the discriminant function are estimated to minimize the classification error. Furthermore, bayesian decision-fusion formulation is used to improve the damage classification obtained from the regularized linear discriminant analysis approach

Identification Of Optimal Partition For Semidefinite Optimization

Ali Mohammad Nezhad, PhD Candidate, Lehigh University, 200 West Packer Ave, Mohler lab, Bethlehem, PA, 18015, United States, alm413@lehigh.edu

The concept of optimal partition was originally introduced for linear optimization and linear complementary problems and subsequently extended to semidefinite optimization. For linear optimization and sufficient linear complementary problems, the optimal partition and a maximally complementary optimal solution can be identified in strongly polynomial time. In this paper, under no assumption on strict complementarity, we formalize the optimal partition concept for semidefinite optimization and present a methodology for an ϵ-feasible maximally complementary solution.

Should We Decrease Corn Subsidies And Subsidize Fruits & Vegetables?

Philip F. Musa, Associate Professor and Programs Director, University of Alabama-Birmingham, PO Box 55544, Birmingham, AL, 35255, United States, musa@uab.edu

This Poster calls for programmed reductions of Corn Subsidies with a corresponding ramping up of Subsidies for fruits and vegetables. If implemented, this Public Health initiative could have a dramatic positive impact on Obesity reduction, its associated comorbidities, and healthcare costs in the USA. It should also enhance Quality of Lives.

Endogenous Time Preference And Exhaustible Resource Use

Makiko Nagaya, Showa Women' University, Tokyo, Japan, makiko.nagaya@gmail.com

This paper re-examine a classical topic of exhaustible resource use on the basis of recent developments in time preference models. We analyze the effects of endogenous time preference on dynamic properties of resource use, contrasting to classical Hotelling's results. Finally, we introduced a concept of minimum required level of consumption.

An Optimization Approach To Detection Of Epistatic Effects

Maryam Nikouei Mehr, Graduate Student, Iowa State University, 3004 Black Engineering, Ames, IA, 50011, United States, mnmehr@iastate.edu, Lizhi Wang

Epistasis refers to the phenomenon where the interaction of multiple genes affects a certain phenotype more than they do separately. Similar epistatic effects are also ubiquitous in other application areas, where a certain effect is only observable when a particular combination of multiple factors is present. Due to the enormous solution space, it's hard to detect the epistatic effect. We propose an optimization model that attempts to detect epistatic effects where a large number of observations are available for a relatively small number of explanatory factors. We will share our preliminary results and discuss future research directions.

Measuring Competition Between Spanish Engineering Schools

Jordi Olivella, Universitat Politecnica de Catalunya, Avda. Diagonal 647, Barcelona, 08860, Spain, jorge.olivella@upc.edu, Fernando Terres

In Spain the higher education institution choice is highly affected by the distance between a student's family home and the institutions. The higher education market is, at least in part, geographically based. Measuring competition among higher education centers needs to take also into account the specializations offered, the number of students admitted and the tuition fees. Several measures are proposed and tested. They are applied to the Spanish Engineering Schools.

Ambulance Dispatching Problem To Minimize Response Time And Hospital Congestion Using Approximate Dynamic Programming

Seonghyeon Park, Yonsei University, 29, Yonsei-ro 11-gil, 403-ho, Seoul, 03788, Korea, Republic of, s.park10@yonsei.ac.kr

Ambulance dispatching problem is to decide which ambulance to send to an emergency call. Previous literature has mainly focused on minimizing response time to an emergency call. However, in the environment where congestions of each emergency room are quite different, it's important to determine to which hospital to transport patients to treat them efficiently. In this paper, an approximate dynamic programming model is suggested to optimize ambulance dispatching, minimizing response time as well as decreasing hospital congestion. In addition, a case study based on real data is performed to demonstrate the proposed model performs better in comparison with the existing ones.

Quantifying The Benefits Of Continuous Replenishment Program For Partner Selection

Payam Parsa, PhD Candidate, University of Arkansas, Fayetteville, AR, United States, pparsa@uark.edu,
Manuel D Rossetti, Shengfan Zhang, Edward A Pohl

Supply chain collaboration programs such as Continuous Replenishment Program (CRP) face challenges with regard to sharing the financial benefits. Supply chain partners often suffer from the ambiguity that exists with the Return on Investment (ROI) of the collaboration programs. This research provides a multi-echelon supply chain model that quantifies the benefits of a continuous replenishment program (CRP) for both partners, and at three levels of inventory holding, transportation and ordering cost component. The model is adopted by a major healthcare manufacturer, with thousands of products and hundreds of demand points, in the form of a software tool.

Using An Ontology To Create Content For Clinical Assessment Questions

Anna Perini, Innovative Knowledge Representative Specialist, Elsevier, 1600 JFK Blvd, Philadelphia, PA, 19103, United States, a.perini@elsevier.com

Using an ontology to create content for clinical assessment questions. This was done by modeling patterns of existing questions and building templates to modify existing questions using our ontological relations to create a new question.

Profile Monitoring Using Non-parametric Models For Poisson Data

Sepehr Piri, Virginia Commonwealth University, 1015 Floyd Ave., PO Box 842014, Richmond, Richmond, VA, 23284, United States, piris@vcu.edu

Profile monitoring is a relatively new technique used to monitor the functional relationship between a response variable and one or more explanatory variables at each time period. Although many studies have been conducted in this field, in most of them, the distribution of the response variable is assumed to be normal which is not always appropriate. To our knowledge, few works have used profile monitoring for poisson data. In this study, we aim to use non-parametric approaches in profile monitoring for those situations where the appropriate distribution is defined by the poisson.

Joint Inventory Replenishment For High Variety Mass Customizers

Michael Prokle, PhD Candidate, University of Massachusetts-Amherst, 290 N Pleasant Street, Apt 2, Amherst, MA, 01002, United States, mprokle@umass.edu, Ana Muriel

We address the joint inventory replenishment problem faced by a manufacturer that builds unique products to customer's specifications. Historic part usage shows lumpy & intermittent demand. The objective is to find a joint part replenishment policy that incorporates the status of the current order pipeline and balances inventory, ordering, and stock-out costs, under given MOQ and lot size requirements. In a case study of a small-size, fast-growing mass customizer, our computational results show that a coordinated part inventory policy results in higher customer service, virtually eliminating lost sales, while lowering cost by taking advantage of shipping economies of scale.

Cross Price Elasticities In Retail Price Optimization

Jagdish Ramakrishnan, Walmart Labs, San Bruno, CA, United States, jramakrishnan@walmartlabs.com, Mátyás Sustik

In store retail, cross price effects have a significant impact on product sales. Determining and estimating cross price elasticities for a large number of products is a challenging problem. We use categorical information and LASSO to estimate a sparse cross item set. We then solve a convexified price optimization problem.

Evolving Airplane Boarding Zone Plans

Ed Ramsden, Consultant, 1080 County Street, Attleboro, MA, 02703, United States, earamsden@comcast.net

To manage the boarding process and reduce boarding times, airlines often assign passengers into a series of 'boarding zones'. This presentation describes a methods of developing improved improved boarding zone assignment plans through the use of a passenger-level boarding simulation model combined with an evolutionary optimization algorithm.

Decision Facing Ambiguity: Mdp, Pomdp And Beyond

Mohammad Rasouli, PhD Candidate, University of Michigan, 430 South Fourth Ave, Ann Arbor, MI, 48104, United States, rasouli@umich.edu

While most of the decision making tools are developed for a Bayesian framework where the decision maker knows full stochastic description of uncertainties in the environment, decision facing ambiguity (model uncertainty and non-stochastic uncertainty) is a better approach for modeling a lot of practical situations. We discuss how decision making tools including MDP, POMDP, learning (e.g. Multi-armed bandit) and team decision making can be extended for environments with ambiguity. We discuss robustness and bounded rationality in this framework.

Optimizing Socioeconomic Balances In Schools

Rebecca Reddoch, Furman University, 3300 Poinsett Highway, Greenville, SC, 29613, United States, lattie.reddoch@furman.edu

Does the socioeconomic class of a student's peers matter in the student's ability to learn? Several studies have suggested that it does. Despite the identification of socioeconomic status as a correlating factor between education and achievement, there are still large performance gaps in high schools throughout the nation. Zoning based on distance ideally provides convenience and minimal travel costs for students, but it is effectively zoning by neighborhood and socioeconomic status. Here we study a multi-criteria model that assigns students to schools based on a combination of socioeconomic and distance factors.

Sterilization Network Design

Ahmed Saif, Postdoctoral Fellow, HEC Montréal, 3000, Chemin de la Côte-Sainte-Catherine, Montréal, QC, H3T 2A7, Canada, ansaif1976@yahoo.com

Centralizing sterilization services in hospital networks can cut cost and improve efficiency through better utilization of resources, risk-pooling and economies-of-scale. We compare three organization schemes: fully distributed, centralized processing, and centralized processing and stock keeping. The sterilization network design problem is formulated as a mixed-integer concave minimization program, then reformulated as a mixed-integer second-order cone program with a piecewise-linear cost function so it can be solved efficiently. Testing is done on a realistic case study under different scenarios. The cost components in every scheme are analyzed and managerial insights are drawn.

An Integrated Facility Location And Network Restoration Model Under Repair Time Uncertainty

Ece Sanci, PhD Pre-Candidate Student, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States, ecesanci@umich.edu, Mark Stephen Daskin

We propose a two-stage stochastic programming model for an integrated facility location and network restoration problem in a disaster-prone region where facility location decisions should be made in the pre-disaster stage. We capture uncertainty in the network availability by incorporating the repair times required to restore the damaged arcs. In contrast to other models that ignore repair times, our model locates some facilities in remote, low-demand areas that are unreachable for a certain number of periods following a disaster.

Application Of Multicriteria Methodology For Decision Aid In The Formation Of A Projects Portfolio

Marcos Santos, Liutenant Commander, Brazilian Navy, Arsenal da Marinha no Rio de Janeiro (AMRJ), Rua da Ponte S/N, Ilha da Cobras, Centro, Rio de Janeiro, 20091000, Brazil, marcosdossantos_doutorado_uff@yahoo.com.br, Hudson Souza, Fabrício Costa Dias, Ernesto Rademaker Martins, Marcone Freitas Reis

Decide correctly is a constant challenge faced by man since the beginning of time. Among the numerous multicriteria methods of decision support, it was used the Analytic Hierarchy Process (AHP), which, as a compensatory method, it seems appropriate to solve such problems. The AHP was one of the first methods developed by the American School, one of the most used methods in the world. This paper aims to propose through AHP, a methodology for constitution the portfolio of IT projects of a non-profit company. Based on this interview it was possible to raise the projects evaluation criteria as well as the preference of the decision maker.

Pro Bono Analytics - Informs Volunteers Create Societal Impact With Applied Analytics

Rina R Schneur, ARCKS, Lexington, MA, 02420, United States, rinarsg@gmail.com, Michael P Johnson

Pro Bono Analytics was established by INFORMS in 2015, in the tradition of other disciplines' efforts to utilize specialized skills and knowledge to generate social impact. Pro Bono Analytics' goal is to provide analytics technical support for nonprofit organizations without the capacity and/or resources to perform data analysis related tasks on their own. This poster presentation will provide knowledge about why INFORMS members should consider volunteering for Pro Bono Analytics, how this initiative works, and what promising current and recently-completed engagements look like.

MLB And Regression Analysis. Predictions For The 2016 Chicago Cubs And White Sox

Kurt J Schuepfer, Graduate Researcher, Miami University, Oxford, OH, 45056, United States, schuepferk@gmail.com

Logistic and linear regression models were built to predict outcomes for the 2016 Chicago Cubs and White Sox. The models in concert predicted overall wins, runs scored, runs allowed, and finally the predicted playoff status for each team. Future directions in web scraping and model building are discussed.

Fuzzy-logic / Dempster - Shafer Based Information Fusion Formulism For Land-marine Decision Analysis

Nicholas V Scott, Spectral Scientist/Physical Oceanographer, Riverside Research, 2640 Hibiscus Way, Beavercreek, OH, 45431, United States, nscott@riversideresearch.org

A land-marine problem is heuristically addressed using a fuzzy logic/Dempster-Shafer based information fusion formulism which demonstrates the efficacy of such tools as aids in optimal decision making. The initial computational segment contains a five component feature extraction system which provides the inputs to a fuzzy logic inference system. Multiple human assessments, which emanate from the use of the inference system and ancillary intelligence, are then amalgamated using Dempster-Shafer evidential theory. A probabilistic assessment of environmental state is provided finally allowing for decisions in which information ignorance and data uncertainty are taken into account.

Reducing Social Risks In The Supply Chain: An Examination Of S&P 500 Companies

Rose Sebastianelli, Professor, University of Scranton, Brennan Hall 423, Scranton, PA, 18510, United States, rose.sebastianelli@scranton.edu, Nabil Tamimi

Approximately half of S&P 500 companies report implementing initiatives to reduce social risks in the supply chain. Based on Bloomberg data, these S&P 500 companies are compared to those without such initiatives in terms of firm characteristics (e.g., size, industry sector), related policies (e.g., child labor, human rights, environmental) and profitability (e.g., return on assets).

Optimal Balanced Sample Selection For Causal Inference Using Machine Learning

Dhruv Sharma, Graduate Student, George Washington University, Washington, DC, 20429, United States, dhruvsharma@gwmail.gwu.edu

With the availability of observational survey data and big data the ability to sample accurately to determine causal effects beyond correlational studies is important. This paper investigates machine learning supervised ensemble classification Area Under the Curve (AUC) measure, for optimization of balanced sample selection. Synthetic data sets and actual experimental data are used to compare results of existing optimization metrics.

Adaptive Sampling Trust Region Algorithms For Derivative Free Simulation Optimization

Sara Shashaani, Purdue University, 782 N Commodores Ln., Lafayette, IN, 47909, United States, sshashaa@purdue.edu, Raghu Pasupathy

We develop derivative free algorithms for optimization contexts where the objective function is observable only through a stochastic simulation. The algorithms we develop follows the trust-region framework where a local model is constructed, optimized, and updated as the iterates evolve through the search space. The salient feature of our algorithms is the incorporation of adaptive sampling to keep the quality of the local model in lock step with the trust-region radius, in a bid to ensure optimal convergence rates.

Ruled Based Prediction Analysis For 30-days Neurological Recovery Status Post Stand Assisted Treatment Of Brain Aneurysm

Karmel Shehadeh, PhD Student, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States, ksheha@umich.edu, Chun An-Chou

Recently, it has been observed that stroke patients could recover with asymptomatic outcome in a short period with use of stent-assisted coiling (SAC) treatment. We employed a rule-based decision model to identify key rules that are used for predicting the clinical outcomes post 30-Days of SAC treatment. A 95% and 75% prediction accuracy were obtained for a cohort of 65 training and 21 validation patients, respectively.

The Impact Of Social Feedback On Reviewers' Review Decisions

Wenqi Shen, Virginia Tech, Blacksburg, VA, United States, shenw@vt.edu, Yan Liu

In this paper, we empirically examine how social incentives, namely online reputation and social feedback which reflects peer recognition and attention, affect reviewers' review decisions. We develop a state-space model which captures the dynamics of reviewers' incentives as influenced by both online reputation and social feedback.

Quay Crane Scheduling Problem With Considering Tidal Impact And Fuel Consumption

LATE CANCELLATION

Yu Shucheng, doctor, Shanghai university, Shangda Road 99, Shanghai 200444, China, Shanghai, 200444, China, yushucheng2007@163.com

This study investigates a quay crane scheduling problem with considering the impact of tides in a port and fuel consumptions of ships. A mixed-integer nonlinear programming model is proposed. Some nonlinear parts in the model are linearized by approximation approaches. For solving the proposed model in large-scale problem instances, both a local branching based solution method and a particle swarm optimization based solution method are developed. Numerical experiments with some real-world like cases are conducted to validate the effectiveness of the proposed model and the efficiency of the proposed solution methods.

A Dynamic Programming Approach To Solve Bi-level Programming Problem With Fuzzy Rule-base Constraints

LATE CANCELLATION

Vishnu Pratap Singh, Research Scholar, Indian Institute of Technology-Kharagpur, Department of Mathematics, Kharagpur, WB, 721302, India, vishnupratapsingh56@gmail.com

In this work, A bi-level programming problem has been considered where the functional relationship between decision variables and the objective functions of leader and follower are not completely known to us. So a bi-level programming problem with fuzzy rule-base constraints has been developed. A dynamic programming approach with appropriate fuzzy reasoning scheme is used to determine the crisp functional relationship between the objective functions and the decision variables. Thus a bi-level programming problem is formulated from the original fuzzy rule-based to the conventional bi-level programming problem.

Using Discrete Event Simulation To Improve Acute Stroke Care Quality Measurement

Lina Song, PhD Candidate, Harvard University, 14 Story Street, 4th floor, Cambridge, MA, 02138, United States, dahye.lina.song@gmail.com

Time from stroke onset to the administration of tissue plasminogen activator (tPA) is an important acute stroke care performance measure, but it should be adjusted for the operational characteristics of hospitals to avoid setting unrealistic benchmarks for smaller hospitals. We developed a discrete event simulation model to compare the time-to-tPA among four types of hospitals with varying stroke-related resources. Stroke patients arrive at an emergency department (ED) according to a Poisson process and navigates through the system. According to the model, larger comprehensive stroke centers can achieve better performance on time-to-tPA measures compared to non-stroke centers.

Multi-agent Simulation For Integrative Analysis Of Renewable Energy Policy – Feed-in Tariffs Vs. Renewable Portfolio Standards

Masaaki Suzuki, Tokyo University of Science, 2641 Yamazaki, Noda-shi, Chiba, Japan, m-suzuki@rs.tus.ac.jp, Mari Ito, Ryuta Takashima

Recently support schemes for renewable energy as renewable portfolio standards (RPS) and feed-in tariff (FIT) have been introduced due to further penetration of renewable energies. In this work, multi-agent simulation analysis of RPS and FIT has been conducted. Especially, we analyze an effect of the level of RPS and FIT price on electricity price and power output. By comparing the results obtained from the simulation and the equilibrium analysis, we have examined an effect of the policies on agents' behaviors from both bottom-up and top-down viewpoints comprehensively.

Finding Constrained Paths In Edge Colored Graphs

Marta Szachniuk, Associate Professor, Poznan University of Technology, Institute of Computing Science, Piotrowo 2, Poznan, 60-965, Poland, marta.szachniuk@cs.put.poznan.pl
Marta Szachniuk, Associate Professor, Institute of Bioorganic Chemistry, Noskowskiego 12/14, Poznan, 61-704, Poland, marta.szachniuk@cs.put.poznan.pl, Giovanni Felici, Gaurav Singh

Edge colored graphs are used to model various real-life problems. One of them inspired us to define an orderly colored longest path (OCLP) problem which amounts to finding the longest path in a graph whose edges are colored with a given number of colors, under the constraint that the path follows a predetermined order of colors. To solve OCLP, ILP algorithms were formulated by means of max flow models with packing constraints and cycle elimination. Recently, alternative formulations of the problem led to its scheduling interpretation and proposing other variants of path with constraints. The presentation will cover basic theoretical and computational issues concerning above mentioned issues.

Optimal Policies For Deterioration Inventory Problems With Multiclass Demand Fulfillment

LATE CANCELLATION

[illegible] Hu[illegible]zhong university of science and technology, [illegible]yu Road 10[illegible]3, wuhan, China, [illegible]lemma@163.com

In this paper, we study the problem of allocating deteriorating inventory to demand from several classes of customers when partially backlogging of unfilled demand is possible. The customer classes are distinguished by the price they pay for the item and their backlogging cost. The firm is able to make an allocation decision on which demand to fill and which to delay. The unfilled demand may then wait for later fulfillment. We describe the optimal ordering and allocating policy in an inventory deteriorating environment. Through comparison to a naive allocation of inventory without inventory rationing, we show that profits are significantly influenced by the inventory allocation.

A Multiple Linear Regression Model For High Tech Talent Retention In China

Jingjing Tong, Assistant Professor, Southeast Missouri State University, One University Plaza, MS 6825, Cape Girardeau, MO, 63701, United States, jtong@semo.edu, Zhi Yang

The high tech talent is the backbone of the high tech companies and higher institutions. It is especially important for the developing countries to maintain the innovative capacity and seek competitive advantage during their economic development process. The Chinese governments and organizations have experienced significant difficulties in retaining the high tech talent in spite of their continuous efforts. To address this issue, we apply the multiple linear regression model to the survey data collected from 113 high tech individuals from companies and higher institutions in China in order to identify the most effective strategies to retain them within the organizations.

The Effect Of National Culture On Safety: A Near-miss Analysis

Xun Tong, Carlson School of Management, 425 SE 13 th Ave, Minneapolis, MN, 55414, United States, bruce.tong@connect.polyu.hk, Xun Tong, Business School, The Hong Kong Polytechnic University, Hong Kong, Hong Kong, bruce.tong@connect.polyu.hk, Kevin Linderman

We argue that near-miss events can increase the likelihood of the future serious accident. We investigate the effect of national culture on safety by using data from international shipping industry. Fixed-effects Poisson regression results show that near-miss events of a ship significantly increase the likelihood of the future serious accident while power distance, individualism, and uncertainty avoidance levels play significant roles in moderating the hypothesized main effect. This study shows that near-miss events lead to unlearning of the accidents and thus increases failure likelihood in the future. It also provides evidence on the significant effects of national culture on safety.

An Investigation On Fuzzy Aggregate Production Planning Using Flexible Requirement Profiles

LATE CANCELLATION

[illegible] Torabzadeh, PhD Student, University of North Carolina-Charlotte, 1100[illegible], [illegible] Dr, Charlotte, NC, [illegible]8262, United States, storabza@uncc.edu, Ertunga C.Ozelkan

This paper investigates the production planning problem using a flexible optimization approach called the Flexible Requirement Profile (FRP). FRP determines flexible bounds on production levels in different periods based on previous plans and forecasted demand. In this paper, a fuzzy linear programming approach is taken to model the uncertainty of data of demand and cost parameters in the future periods, using fuzzy membership functions. The results of the fuzzy model is compared to a deterministic model.

Analyzing Supply Chain Resiliency To Mitigate Drug Shortages

Emily L. Tucker, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States, eltuck@umich.edu, Mark S. Daskin, Wallace J. Hopp, Burgunda V. Sweet

Despite efforts from the FDA, pharmaceutical companies, and other stakeholders, drug shortages continue to be a national problem. These outages can directly affect patients' health and are often caused by disruptions that expose manufacturing and supply chain vulnerabilities. These disruptions can include contamination, delays in the delivery of raw materials, and loss of the manufacturing site. We present a preliminary model designed to maximize the resiliency and robustness of the supply of drugs to reduce the impact of potential shortages when there are disruptions in production. We consider uncertainty in the occurrence of disruptions and in the recovery of manufacturing capacity.

Optimal Placement Of Inspection Points For Hazmat Routing

Harshavardhan Reddy Vempati, Student, University at Buffalo (SUNY), 81 Merrimac St, Buffalo, NY, 14214, United States, hvempati@buffalo.edu, Rajan Batta"

There is perennial need of hazmat material transportation for various fields. Minimization of risk involved in road transportation of hazmat has been a significant OR problem. We present a model for optimally placing inspection points after every k miles to reduce the risk. However, since there is a cost involved in setting up inspection points, our model minimizes the no. of inspection points for a given amount of risk.

Merging Knapsack Constraints With Cover Inequalities

Fabio T Vitor, Graduate Teaching Assistant, Kansas State University, 2061 Rathbone Hall, 1701B Platt St., Manhattan, KS, 66506, United States, fabioftv@k-state.edu, Todd W Easton

Merged knapsack cover inequalities is a new class of cutting planes to solve integer programs. This class of cutting planes combines the information from a cover inequality and a knapsack constraint to generate strong valid inequalities. These inequalities can also be exactly lifted through a pseudo-polynomial time dynamic programming algorithm. The resulting exact lifted merged knapsack cover inequality is valid and potentially stronger than the original merged knapsack cover inequality. Computational experiments demonstrate that exact lifted merged knapsack cover inequalities, when implemented as preprocessing cuts, decrease the solution time by 15% and number of ticks from CPLEX by 10%.

Containership Deployment On A Liner Service

Shuaian Wang, The Hong Kong Polytechnic University, Hong Kong, Hong Kong, wangshuaian@gmail.com, Zhiyuan Liu, Xiaobo Qu, Lu Zhen, hongtao HU

This paper investigates how to determine the optimal sequence of ships in a string to minimize the expected number of delayed containers taking uncertain demand into consideration. We use the phrases "sequence of ships", "string" and "permutation" interchangeably. The main challenge for the problem is that it is almost impossible to predict the probability distribution functions for the future demand. In fact, even if we have the historical data on the demand, the data may be of limited value because the shipping environment changes rapidly. Therefore, a good string should be robust in that it is optimal or near-optimal for any random demand.

Outsourcing Decisions Under Scale Effect For Competitive Firms With Product Substitutability

Jianghua Wu, Professor, Renmin University of China, 59 Zhongguancun street, Beijing, 100872, China, jwu@ruc.edu.cn, Qiuai Huang

This paper discusses outsourcing decisions for a supplier with scale effect and two competitive firms(firm 1 and firm 2) with product substitutability. Based on the profit functions, this study analyzes the effect of firm 1's outsourcing on the supplier and both firms, finds out the optimal outsourcing strategies and the best wholesale prices, and compares the effects of substitutability on decision variables before and after outsourcing. The results show that a firm may make products by itself when its production cost is higher than wholesale price. However, a firm may also choose to oursource production when its production cost is lower than wholesale price.

Cost Minimization Of Government Issued Cell Phones

John Yannotty, Slippery Rock University, 1 Morrow Way, Slippery Rock, PA, 16057, United States, jcy1001@sru.edu, Alexander Reid Barclay

Increasing costs associated with cell phone circuits has led the United States Government to study consolidation of its wireless network in attempt to minimize annual expense while maximizing efficiency. During consolidation, Private Virtual Channels (PVCs) are transferred from either low utilized or expensive circuits to existing circuits with higher utilization and lower annual cost. The consolidation process is further constrained by region, service package (VCI code), and utilization capacity per circuit. Through the use of an optimized network annual expenses are decreased from approximately $11 million to $3.1 million.

Applications Of Text Mining Techniques To Fleet Health And Maintenance Data

Bingjing Yu, Analyst I, Boeing Vancouver, 1146 Homer Street, Vancouver, BC, V6B 2X6, Canada, bingjing.yu@aeroinfo.com, Candice Chan, Gaku Tobinobu, Ehsan Nobakht

Textual data is one of the richest data sources for fleet health and maintenance analytics. Taking advantage of these information is the key for optimizing airline's and Boeing's business. Due to its large volume and highly unstructured nature, however, its full potential is rarely leveraged. Advanced Analytics group works on text analytics projects with airlines in the areas such as reliability, maintenance program and Boeing customer support. Case studies on how we help businesses by applying natural language processing, machine learning and visualization techniques will be presented.

A Cross Comparison Of Proactive And Reactive Mitigation Policies For Regions Experiencing Repeated Hazards

Chengwei Zhai, University of Michigan, Ann Arbor, 1205 Beal Ave, Ann Arbor, MI, 48109, United States, cwzhai@umich.edu, Allison C Reilly, Seth Guikema

Repeated disasters affect various areas differently. We hypothesize that much of this variation may be explained by regional policies that influence building codes, constituents understanding of the hazard, and homeowners' decision to mitigate. This work builds an agent-based model that integrates a physical hazard model with a homeowner decision model to understand how various policy options promote mitigation. A case study using household-level data from 9 counties in Maryland that experience hurricanes is presented to demonstrate how various policies might affect the region's vulnerability.

Second-order Conic Robust Optimization With Application To Radiation Therapy Treatment Planning Of Breast Cancer

Zengbo Zhang, Beijing Institute of Technology, Beijing Institute of Technology, Beijing, 10081, China, zhangzengbo_1999@163.com, Zihao Jiao

We incorporate robust optimization into CVaR to formulate a loss distribution under uncertainty. We demonstrate an application of our model to the radiation therapy treatment planning problem of breast cancer. In this therapy process, the dose distribution dependented on each state is uncertain. Our framework generalize and develop this type of uncertainty and that the uncertainty set is ellipsoidal, then the formulation can be re-written as second-order conic programs. Monte Carlo simulation example are presented to illustrate the proposed approach. Our results increased dosimetric performance for former treatment planning methods and improved cardiac sparing.

Study Of Patient Satisfaction Perception Based On Medical Experience And Health Cognition

Jianjie Zhang, Beijing Institute of Technology, Beijing, China, zhjj_2013@163.com, Jinlin LI, Rong Zhang, Jian Xue

This paper examines patient experience and health cognition in outpatient from nine cities of China.By conducting discrete choice experiments,we identify discrepant patients in several attributes and the individual-difference about the health cognition that can explain such discrepancy.For the high degree of the health cognition patients,medical environment and waiting time affection is not significant.however,for the low degree of group,both two attributes affect significantly.In addition to providing the empirical description in China's healthcare market,our study offers patient behavioral optimization suggestions to improve patient satisfaction perception.

Accelerating The Adoption Of Bundled Payment Reimbursement Systems: A Data-driven Approach Utilizing Claim Data

Wenchang Zhang, Graduate Assistant, University of Maryland, 7621 Mowatt Ln, College Park, MD, 20742, United States, wzhang@rhsmtih.umd.edu

Bundled payments as a reimbursement mechanism have the potential to reduce health care expenditures. One of the crucial components to the implementation of a bundled payment is to identify procedural homogeneous groups within an episode of care. We propose a data-driven clustering approach to automatically detect and explicitly represent homogeneous sub-groups of services for a given episode of care. We explore the results of clustering two conditions with different complexities. The automatically extracted clusters with different cost patterns highlight the payer's expenditure and provider's financial risk under bundled payments.

Integrated Operational And Financial Hedging With Capacity Reshoring

Lima Zhao, Assistant Professor of Supply Chain Finance, WHU - Otto Beisheim School of Management, Burgplatz 2, Vallendar, 56179, Germany, lima.zhao@whu.edu, Arnd H Huchzermeier

We consider a multinational corporations (MNC) that adopts capacity reshoring, production switching, and financial hedging to manage supply—demand mismatches and currency risk. Adopting mean-conditional value-at-risk (CVaR) optimization, we decompose operations and finance: Operational flexibility maximizes expected profit subject to CVaR constraint, while financial hedging minimizes CVaR subject to minimum expected profit. We show that: Operational flexibility and financial hedging can be complements, and they are substitutes in risk reduction. Collaboration and coordination between operations and finance is crucial in minimizing the substitution effects.

Forecasting Equity Risk Using Firm Risk Disclosures

Xiaodi Zhu, Stevens Institute of Technology, Hoboken, NJ, 07030, United States, xzhu@stevens.edu, Steve Yang, Somayeh Moazeni

Corporate risk disclosures as part of U.S. public companies' financial reports provides information about companies' potential risks. This study analyzes risk types revealed in these risk disclosures and examines their potential predictive power over stock returns. Using 16,110 risk disclosures from 2011 to 2015, we apply Sentence Latent Dirichlet Allocation model to infer risk types and propose a novel algorithm to match new factors with existing risk types which generates 90% correct matches. Our findings provide evidence that the companies' self-disclosed risk factors have significant impacts on subsequent stock return volatility which can be used to predict potential stock change.

Integrating Anode Recycle In A Real-time Solid Oxide Fuel Cell Model With Pressure Loss

Amelia McIlvenna, University of Tennessee, 550 Lost Tree Ln, Knoxville, TN, 37934, United States, amcilven@vols.utk.edu

Anode recycle helps solve one of fuel cell technology's major challenges: maximizing fuel utilization without destroying the fuel cell. Anode recycle was added to an existing real-time Solid Oxide Fuel Cell (SOFC) model to investigate effects within the fuel cell. SOFC's are sensitive to small parameter changes. An increase in fuel mass flow was found to impact pressure losses in the fuel manifold. The updated model allowed for a pipe sensitivity analysis to optimize design of the fuel manifold. This work allows for improvements in SOFC design, and opens avenues to future transient analysis.

Information Network Design And Optimization With Social Media In Disaster Management

Bairong Wang, Industrial & System Engineering, University at Bufflao, SUNY, 150 longmeadow rd apt 2, buffalo, NY, 14226, United States, bairongw@buffalo.edu, Jun Zhuang

Social media becomes a popular information sharing platform during disasters. However, rumors also spread due to the problems that no information gate exists on social media to ensure information accuracy and security. This study analyzes information behavior of both common and official users, and rumor distribution patterns during Hurricane Sandy on Twitter. Our results show that nearly 90 percent of impressions are generated from followers, while one re-tweet can contribute 5,688 impressions on average. Based on results from rumor pattern analysis, we design information spreading and sharing model to debunk rumors during disasters to improve information coverage and efficiency.

Flexible High Density Puzzle Storage Network

Ehsan Shirazi, West Virginia University, Morgantown, WV, ehshirazi@mix.wvu.edu

A puzzle-based storage system has been introduced to replenish and retrieve items from the top and bottom of a highly dense storage system. Each cell of the puzzle storage is considered as a grid. Each grid is able to store an item and or to move items in the south direction. We describe a high density storage system that can retrieve and replenish items from all sides. A puzzle storage with this characteristic is a lot more flexible than what has been introduced before. We will illustrate how this puzzle storage scheme affects replenish and retrieve time based on different network policies, distributions of replenishing and retrieving items, and number of free spaces on the puzzle network

Fluid Genetic Algorithm (FGA)

Roy Jafari Marandi, Mississippi State University, Mississippi State, MS, rj746@msstate.edu, Brian Smith

Genetic Algorithm (GA) has been one of the most popular Optimization methods. A review of the literature shows extensive research attempting to adapt and develop the standard GA. Nevertheless, the essence of GA which consists of different concepts rarely has been the focus of recent researchers. In this paper method, Fluid Genetic Algorithm (FGA), some of these concepts are changed, removed, and furthermore, new concepts are introduced. The performance of GA and FGA are compared through seven benchmark functions. FGA not only shows a better success rate and better convergence control, but it can be applied to a wider range of problems including multi-objective and multi-level problems.

Privacy In Social Networks; Do People Care? A Regulatory Focus Theory Perspective

Behrooz Davazdahemami, Doctoral Student, Oklahoma State University, 4599 N Washington St, Apt 40A, Stillwater, OK, 74075, United States, davazda@okstate.edu, Pankush Kalgotra

Relying on the Regulatory Focus Theory this study extends information privacy literature to explain the reason for relatively low influence of individuals' information privacy concerns on their intention to share information on social networking websites. The proposed model was empirically tested (n=688) and sufficient support was provided for all the hypothesized relationships in the model. Results indicate that accounting for situational factors in assessing the effect of privacy concerns on willingness to share can significantly better explain the real behaviors of social network users.

Candidate List Strategies For Resource Constrained Project Scheduling

Christopher Riley, Assistant Professor of Management, Delta State University, DSU Box 3275 - Broom 252, 1003 West Sunflower Road, Cleveland, MS, 38733, United States, criley@deltastate.edu, Cesar Rego

Certain metaheuristic methods can benefit greatly from an appropriate candidate list strategy. We present our findings on the analysis of candidate lists for tabu search and filter-and-fan approaches to solving the resource constrained project scheduling problem. Both new candidate list strategies as well as strategies from the literature are considered.

A Model Of Concession Tracking To Improve Fairness Of Repetitive Shared Resource Use

Dmitry Gimon, Assistant Professor, Fort Hays State University, 600 Park St., Hays, KS, 67601, United States, d_gimon@fhsu.edu

Fair use of a shared resource is a common task in everyday life and in industry. We propose a model to improve its fairness using the theory of reciprocal concessions and refined preference functions. Our simulation demonstrates that our proposed model results in fairer use of shared resources.

I Have No Data! A Practical Introduction To Range Building

Gustavo Vinueza, Director of Custom Solutions, Palisade Corporation, 798 Cascadilla Street, Palisade Corporation, Ithaca, NY, 14850, United States, gvinueza@palisade.com

Simulation models, they require a set of inputs translated into probabilistic distributions. Fitting the data to a distribution or specific experience from expert teams in the shape of 3-point estimation. Nevertheless, there are situations in you say "I have no data, so I can t generate any distribution". The work presented is the beginning of a series of practical exercises aimed for people asked to give an opinion, a report or a napkin draft of numerical values which don t necessarily have organized supporting data. A step by step workflow is proposed along with a framework on how to rapidly generate estimations that are on the same wavelength of the people requiring them.

New Technologies And Women's Empowerment

Jimin Han, SolBridge International School of Business, Daejeon, Korea, Republic of, jhan154@Student.solbridge.ac.kr, Sung-Tae Kim

Prior research has claimed that energy poverty disempowers women in the ghetto areas and tends to increase illiteracy among their children. Such research also discovered that providing them ample access to energy and new technologies might break unfair social norm on them. However, the major barrier for the fast distribution of new technologies is the lack of understanding existing power relations between genders and the weak bargaining power of women within the households. In this regard, our study attempts to investigate (1) factors that might help improve women's decision-making power and (2) the relationship between those factors and women's decision-making power.

Voluntary Delisting & Executive Compensation

Juhi Bhardwaj Sapra, PhD Student, Rensselaer Polytechnic Institute, 110 8th Street, Troy, NY, 12180, United States, bhardj@rpi.edu

this paper explores the event of voluntary delisting in the us. Delisting is defined as the process where the firm listed on an exchangeis removed. A firm can voluntarily request to be delisted and become a privately traded firm. We primarily explore the question: does executive compensation structure influence the decision to delist? Since executive compensation can be aligned with shareholder interests, we attempt to understand if it influences the managerial decision to become a private firm. If the firms choose exit the public trading in order to avoid costs, we try to explore the extent managerial compensation, would explain the decision to delist.

Does The GLL-APS Model Reward Investor Over Time?

Maria Luisa Ceprini, Research Associate, Massachusetts Institute of Technology, 100 Main Street, Cambridge, MA, 02142, United States, mceprini@mit.edu, John D Little

Our goal is to create an investment portfolio that adapts to market conditions and rewards customer expectations over time. Answers to an interview questionnaire assess the key attributes creating a customer profile to guide the investor, trading risk versus expected return over time. Afterwards, the Generalized Little's Law-Asset Picking System model selects assets and number of shares per asset to build the portfolio according to the investor profile. Periodic updates check Average Portfolio Expected Return and Average Asset Systematic Risk performances.

A Trilevel Optimization Model For Resilient Transportation Network Design

Mohammad Rahdar, Iowa State University, 3130 Turnberry CT, Unit 195, Ames, IA, 50014, United States, rahdar@iastate.edu, Guiping Hu, Jing Dong, Lizhi Wang, Xuesong Zhou

We propose a trilevel optimization model for transportation network design, which improves the resiliency of the network against uncertain disruptions. The middle and bottom levels are the network interdiction problem, in which we identify the worst-case scenario disruptions that could lead to a maximal cost to the transportation system. The top level takes the system perspective, which designs the optimal strategy to expand the existing transportation network so that it confronts the worst-case scenario disruptions in the most resilient manner.

Team Coordination In Service Organizations: Antecedents And Consequences Of Customer Involvement

Onyi Nwafor, University of Houston, 5710 Ballina Canyon Ln, Houston, TX, 77041, United States, onyid.nwafor@gmail.com

Service encounters demand both employee and customer participation. As a result, coordination in the service context should involve the integration of customer contributions (knowledge, skills, and abilities) and employee contributions to service production and delivery. Yet, existing coordination studies set in service environments continue to focus on how best to integrate employee contributions alone. This study explores the effects of customer involvement on coordination in service environments. I also propose and test how organizations can promote customer involvement. Results of my analyses have important implications for both theory and practice.

Decision Support For Dynamic Adjusting Emergency Department Workforce

Phichet Wutthisirisart, Mayo Clinic, 200 First Street SW, Harwick Bldg. 2, Rochester, MN, 55905, United States, Wutthisirisart.Phichet@mayo.edu, Mustafa Y Sir, David Nestler, Thomas Hellmich, Kalyan Pasupathy

Emergency departments (EDs) often face changes in number of patients and level of illness severities throughout a day. The goal of this study is to develop a method to best allocate available resources, such as residents and scribes, to each physician-led care team considering patient demand volume and severity. An optimization model was proposed to minimize the number of patient care hours in excess of the team capacity. The proposed model was implemented into a decision support system through the ED Clinical Engineering Learning Lab. It compares the original master schedule with the optimized schedule based on the changes in resource availability, and provides severity index as decision measure.

Predictive Analytics Approach To Analyze Vectorcardioram To Discern Myocardial Infarcted And Healthy Heart

Rupesh Agrawal, Research Assistant, Oklahoma State University, 408 Business Building, Spears School of Business, stillwater, OK, 74078, United States, rupesh.agrawal@okstate.edu, Rahim Sewani, Bruce Benjamin, Dursun Delen

Heart disease causes 610,000 deaths among the US population per year. Coronary heart disease: myocardial infarction causes ~60% of deaths. This study uses predictive modeling on Vectorcardiogram (VCG) derived RR and QT features to discern healthy and diseased patients. Neural networks (ANN), Support vector machine (SVM), Decision tree (C5), and Ensemble model were developed and tested on a 10 K cross-validation data sample. SVM and ANN models resulted in 88.14% and 86.4% overall accuracy. C5 algorithm led to a sensitivity of 100%, specificity of 96.55% and overall accuracy of ~98%. Ensemble models led to a sensitivity of 96.67%, specificity of 100.00% and overall accuracy of ~98%.

A Tale Of Three States Factors Influencing Public Private Partnership Acceptance

Vandit Shah, California State University-Fullerton, 2404 Nutwood Avenue, Apt K-12, Fullerton, CA, 92831, United States, vandit_2293@csu.fullerton.edu, Deepak Kanhaiyalal Sharma

Several infrastructure projects have been successfully pursued through Public Private Partnerships (PPPs) across the United States. While the PPPs remain same, the PPP acceptance rate across the US has been significantly different. While major emphasis has been laid to identify PPP success factors little has been done to identify factors differentiating states' PPP acceptance. This poster presents the factors that differentiate the states' PPP acceptance. Using Principal Component Analysis (PCA) we found average education, gender distribution, traffic volume and daily vehicle miles traveled as the most influential factors affecting PPP acceptance.

Attraction Recommendation For Tour Operators Under Stochastic Demand

Chao Huang, Southeast University, Nanjing, Jiangsu Province, China, huangchao@seu.edu.cn, Weihao Hu

The main stakeholders of attraction recommendations include tourists who refer to the recommendation to make traveling decisions and the tour operator who operates the recommendation. Existing attraction recommendation methods focus on recommending most relevant attractions to the tourists, yet overlook the benefit attraction recommendation could bring to the tour operator under stochastic demand. We provide a focused study on cost-based attraction under stochastic demand from the perspective of tour operators. We analyze the costs of attraction recommendation of tour operators and the impact of stochastic tourist demand, and formulate the cost-based attraction recommendation problem. We then propose a two-stage stochastic optimization model that involves joint chance constraint to optimize the attraction recommendation solution that focuses solely on tourist preferences, and solve the optimization model with Sample Average Approximation method. To verify the effectiveness of the proposed cost-based attraction recommendation method, comprehensive experimental studies are conducted with simulated instances as well as real-world case.

Dynamic Pricing Of A Bottleneck With Heterogeneous User Preferences And Value Of Time Using Tradable Credits

Mahyar Amirgholy, Postdoctoral Research Associate, Cornell University, 220 Hollister dr, Ithaca, NY, 14850, United States, amirgholy@cornell.edu, H. Oliver Gao, Eric J. Gonzales

We propose an optimal credit-based pricing scheme for a single bottleneck with time-dependent demand and heterogeneous user preferences. Implementing such a strategy using a revenue neutral credit-based pricing scheme allows the value of the credits to be determined by the interaction between the users in the equilibrium condition of the market. The proposed strategy allocates the money raised from the “credit buyers” to subsidize the commutes of the “credit sellers” in order to incentivize the commuters to form a uniform distribution of arrival times over the peak period. As a result, designing a revenue neutral pricing strategy can raise public support by improving the social welfare of the users.

Optimal Design Of The Large-scale Transit Systems In Urban Regions Using The Macroscopic Fundamental Diagram

Lan Liu, Cornell University, Ithaca, NY, 14853, United States, ll745@cornell.edu, Mahyar Amirgholy, Mehrdad Shahabi, H. Oliver Gao

In this research, we propose a continuum approximation model for optimizing the network structure (line spacing and stop spacing) and the operating characteristics (headway and fare) of the transit system by minimizing a linear combination of (1) the generalized cost that users experience in their trips, (2) the operating cost of the transit system for the agency, and (3) the external cost of the emission in region. The optimal design of the transit system can be derived by minimizing the total cost of the transportation system in three different network allocation scenarios: (i) mixed network (Bus), (ii) dedicated lanes (Bus Rapid Transit), and (iii) parallel networks (Metro).

Dynamic Pricing And Demand Side Management In Smart Communities

Vignesh Subramanian, University of South Florida, 5006, Bordeaux Village pl, Apt 201, Tampa, FL, 33617, United States, vigneshs@mail.usf.edu, Tapas K. Das

Dynamic pricing will actively engage the electricity consumers, having an advanced metering infrastructure (AMI), in centralized demand side management (CDSM), a key to price stability and network reliability. We propose a quadratic binary programming model for a centralized controller to schedule the consumer load. The numerical result demonstrates how CDSM can lower the price peaks, reduce the reserve capacity of the generator and minimize the consumer’s hourly tariff.

Multi-stage Stochastic Optimization For Considering Investment Risk In Conflict Prone Countries – A Case Study Of South Sudan

Neha Satish Patankar, PhD Student, NC State University, 2366 Champion court, Raleigh, NC, 27606, United States, nspatank@ncsu.edu

Open source framework for energy system modeling - referred to as Tools for Energy Model Optimization and Analysis, Temoa - is employed to explore possible energy planning strategies for South Sudan. Stochastic optimization is utilized to explicitly consider the risk of conflict and the resultant damage to generators and transmission lines within the system. Because data related to both conflict probabilities and damage are subjected to deep uncertainty, we rely on sensitivity analysis to generate key insights. Results show that while large, centralized plants benefit from economies of scale, distributed solar photovoltaic are more resilient to conflict.

Two-stage Methodology For Multiobjective Robust Decision Making With Application In Water-energy Planning

Daniel Jornada, Texas A&M University, 2734 San Felipe Dr, College Station, TX, 77845, United States, djornada@tamu.edu, V.Jorge Leon

The large number of compromise solutions to choose from a multiobjective program poses significant challenge for decision making. We formalize a two-stage optimization methodology to narrow the alternatives under consideration by introducing secondary robustness criteria to hedge against implementation uncertainties. A water-energy planning problem illustrates the significance of the methodology.

Modeling And Maximizing Power For Wind Turbine Arrays

Lucas Buccafusca, University of Illinois Urbana-Champaign, Urbana-Champaign, IL, United States, buccafus@illinois.edu

This talk considers a specific application domain, that of wind turbine arrays, and explores the use of partitioning and control design to optimize energy extraction. Large wind turbine arrays, or wind farms, can be viewed as coupled networks, which present many problems when applying traditional optimization techniques. In our work, we apply heuristic techniques, exploiting the inherent symmetry found in wind turbine arrays, to obtain simplified models for large arrays. Using these simplified models we first consider a dynamic programming-like approach to maximize power extraction under the condition of uniform wind.

Using A Private Marketplace To Build A Hybrid Workforce For IT Service Delivery

Monica Johar, Associate Professor, University of North Carolina, 9201 University City Blvd, Friday 352 C, Charlotte, NC, 28223, United States, msjohar@uncc.edu, Su Dong, Ram Kumar

The emergence of on-demand service marketplaces is a relatively new phenomenon. Technology is facilitating innovative work arrangements using an on-demand workforce. As the range of services available on such marketplaces increases, organizations could explore innovative uses of on-demand workers. Organizations can explore work arrangements that benefit from using a hybrid workforce that consists of full-time and on-demand workers. This paper addresses this interesting new work paradigm by presenting a mathematical programming model of service delivery that leverages in-house workers and on-demand marketplaces for service delivery.

A New Class Of Measures For Independence Test With Its Application In Big Data

Qingcong Yuan, PhD Candidate, University of Kentucky, 305 MDS Building, 725 Rose Street, Lexington, KY 40506, Lexington, KY, 40506, United States, qingcong.yuan@uky.edu, Xiangrong Yin

We introduce a new class of measures for testing independence between two random vectors, using characteristic functions. By choosing a particular weight function in the class, we study a new index for measuring independence and its property. Sample versions and their asymptotic properties using different estimations are developed. We demonstrate the advantage of our methods via simulations and real data. In particular, we illustrate the effective use of our methods in big data analysis.

A Time-series System To Predict Glucose Concentrations Based On Continuous Glucose Monitoring

Lei LI, Beihang University, Beijing, 100191, China, lilei19940219@163.com, Yimeng Shi, Jun Yang, Xiaolei Xie

The estimated prevalence of diabetes in Chinese adults in 2013 was 11.6%, which for the first time surpassed the U.S. In recent years, Continuous Glucose Monitoring (CGM) systems are developed to record the patient’s daily blood glucose level. Such systems provide us the real- time glucose level. Recently, researchers implemented AR or ARMA models on a small pool of CGM data to predict future glucose level. In this study, we developed a method by using adaptive Autoregressive Integrated Moving Average (ARIMA) model on a larger data- set rather than models with fixed-order, which is more practical and accurate as the order of the whole data is unknown before.

Optimizing Screening Policies Inside A Food Production Facility

Nicole T Lane, PhD Candidate, North Carolina A&T State University, 3511 Carrington Street, Greensboro, NC, 27407, United States, nicole.t.lane@gmail.com, Lauren Berrings Davis

New legislation requires food production facilities to have a food safety plan including mitigation strategies to increase security. This research identifies an optimal set of implementable strategies. The two-stage stochastic model presented incorporates the need for production minimums and food safety constraints. The results of a numerical study show that for relatively low costs, the implementation of these policies ensures that products leaving the facility are safe for consumption.

Multi-agent Routing In Shared Guide Path Networks

Greyson Daugherty, Georgia Institute of Technology, 765 Ferst Dr NW, Atlanta, GA, 30318, United States, sdaugherty3@gatech.edu, Spyros Reveliotis, Greg Mohler

This poster describes a heuristic algorithm for minimizing the makespan required to route a set of agents inhabiting a shared guidepath network from their initial locations to their respective destinations. The work is motivated by operations taking place in the context of some unit-load material handling systems like zone-controlled AGV systems, as well as in quantum computers. This poster presents a brief description of the considered problem and of the inner workings of the proposed algorithm, along with a set of computational results that reveal the efficacy of the derived solutions and directions for further research.

Cost Minimization Of Government Issued Cell Phones

John Yannotty, Slippery Rock University, 1 Morrow Way, Slippery Rock, PA, 16057, United States, jcy1001@sru.edu, Alexander Reid Barclay

Increasing costs associated with DSL circuits has led the United States Pentagon to study consolidation of its wireless network in attempt to minimize annual expense while maximizing efficiency. During consolidation, Private Virtual Channels (PVCs) are transferred from either low utilized or expensive circuits to existing circuits with higher utilization and lower annual cost. The consolidation process is further constrained by region, service package (VCI code), and utilization capacity per circuit. Through the use of an optimized network annual expenses are decreased from approximately $11 million to $3.1 million.

Visualization Of Cross Validation For Prediction And Classification

Alexander Engau, Associate Professor, University of Colorado Denver, P.O. Box 173364, Department of Mathematical Sciences, Denver, CO, 80217-3364, United States, aengau@alumni.clemson.edu, Paola Andrea Gonzalez

In supervised learning, the performance of data mining and machine learning algorithms is often measured and compared only numerically using cross validation. Here, we describe two case studies in which we can complement and further extend such numerical comparisons with a visualization in the form of new validation maps. These validation maps are illustrated using several state-of-the-art classifiers from Scikit-Learn and offer substantial new insights into advantages and remaining limitations of support vector machines, decision trees, boosting and discriminant analysis.

Bayesian Optimization Of Predictive Precision For Business Ledger Analytics

Abhinav Maurya, Carnegie Mellon University, 5634 Stanton Avenue, Apt 306, Pittsburgh, PA, 15206, United States, ahmaurya@gmail.com, Aly Megahed

Predicting changes in account revenues is of vital importance to a business in order to take action on accounts that are predicted to shrink, and to learn from success stories of offerings that led to maximum revenue growth. However, the corresponding datasets are often imbalanced, and therefore accuracy is a poor metric to optimize for. We present a Gaussian Process-based method that maximizes precision, yielding actionable results without sacrificing much accuracy. We find that our method gives better results than exhaustive uniform grid search, since Gaussian Process-based optimization can focus on areas of parameter space that have higher chances of attaining the maximum objective value.

The Continuous Network Location Problem For The Alternative Fuel Refueling Station

Sang Jin Kweon, PhD Candidate, Pennsylvania State University, 310 Leonhard Building, Industrial and Manufacturing Engineering, University Park, PA, 16802, United States, svk5333@psu.edu

Unstable price of oil and concerns about the finite nature of reserves, coupled with increasing awareness of the environmental issues caused by the burning of fossil fuels, increased spotlight on alternative-fuel vehicles. In order to stimulate the use of alternative-fuel vehicles, the inherent problem with the lack of refueling infrastructure must be resolved. In this study, we propose a novel methodology to locate an alternative-fuel refueling station on a road network with the objective of maximizing the total traffic flow covered by the station, so that more customers are able to refuel their alternative-fuel vehicles.

Optimal Number Of Choices In Rating Contexts

Sam Ganzfried, Assistant Professor, Florida International University, 11200 SW 8th St, Miami, FL, 33199, United States, sam.ganzfried@gmail.com

In many settings people give numerical scores to entities from a small discrete set, e.g., attractiveness from 1-5 on dating sites and papers from 1-10 for conferences. We study the problem of understanding when using a different number of options is optimal. We study several natural processes for score generation. One may expect that using more options always improves performance, but we show that this is not the case, and that using fewer choices—even just two—can surprisingly be optimal. Our results suggest that using fewer options than typical could be optimal in certain situations. This would have many potential applications, as settings requiring entities to be ranked by humans are ubiquitous.

Improving Patient Access To Primary Care Through E-visits

Xiang Zhong, University of Florida, Gainseville, FL, 32601, United States, oliver040525@gmail.com, Jingshan Li, Philip Bain, Albert Musa, Peter Hoonakker

To improve primary care access, many healthcare organizations have introduced electronic visits to provide patient-physician communication through securing messages. In this study, we introduce an analytical model to characterize primary care physician's operations on office and e-visits, and other non-direct care tasks. Analytical formulas to evaluate the mean and variance of patient office visit and e-visit cycle times are derived, and discussions of the impacts of e-visits on traditional primary care delivery are carried out. It can be observed that the patient e-visit to office visit referral ratio plays an important role in determining whether it's beneficial to conduct e-visits.

Optimizing Inventory Under Non-stationary Demand For Profitability Improvement

Liu Yang, Assistant Professor, Purdue University, 3000 Technology Ave, New Albany, IN, 47150, United States, LYang@purdue.edu

This research presents a multi-period optimization model that integrates inventory classification and control decisions to maximize the NPV of profit. The model explicitly addresses nonstationary demand, limited inventory budget, arbitrary reviews periods, and SKU-specific lead times and holding costs. The model is applied to a real-life company that currently uses the multi-criteria inventory classification, and improves its profit by nearly 3%. The comparison to the ABC shows an average profit increase of 7.5%. We find that profit is insensitive to the number of classes in a wide range, but when the budget is tight, a large number of classes with a wide range of service levels is optimal.

Analytics In Action: When Will I Get Out Of The Hospital? Modeling Length Of Stay Using A Disease Network

Pankush Kalgotra, PhD Candidate, Oklahoma State University, 308 W Maple Avenue, Apt 5, Stillwater, OK, 74074, United States, pankush@okstate.edu, Ramesh Sharda

Comorbidity is a medical condition when a patient develops multiple diseases simultaneously. We examine the impact of comorbidity on the patient's hospital length of stay (LOS). We present a unique approach to model comorbidities by creating a network of diseases from the pair-wise combinations of the diseases diagnosed in the 1.6 million patient visits in US hospitals in 2011. Using the small-world property of the network, we proposed a new comorbidity score for a patient. Finally, we built an explanatory and predictive model on the patient visits in 2012, to predict a patient's LOS. The model with our proposed comorbidity score outperformed the existing models.

The GetFruved Project Uses Integer Programming To Match Freshmen To Peer Mentors

Wangcheng Yan, The University of Tennessee, Knoxville, Knoxville, TN, 37996, United States, wcyan2009@hotmail.com, Wenjun Zhou, Sarah Colby, Kendra Kattelmann, Anne Mathews, Melissa D. Olfert

In this study, we took a quantitative approach to the friend-matching problem to assign peer mentors (PMs) to freshmen (FMs) recruited for the GetFruved project. A 20 "fun"-question survey was used to develop the PM-FM matching algorithm. Data were collected from two semesters. Semester 1 served as training period, and matching was made in Semester 2. Our strategy was to train a model with logistic regression, and optimize the matching with integer programming. The empirical study verified the homophily theory, and demonstrated the effectiveness of our approach to identifying the optimal PM assignments.

Dynamic Model Validation Metric Based On Wavelet Thresholded Signals

Andrew D Atkinson, Captain, Air Force Institute of Technology, 2950 Hobson Way, Wright-Patterson AFB, OH, 45433, United States, andrew.atkinson@afit.edu, Raymond R Hill

Model validation is a vital step in simulation development to ensure that a model is sufficiently representative of the system. Transient phase model validation deserves special attention because the experimental system data is often contaminated with noise, due to the short duration and sharp variations in transient data. We propose a process to validate the transient phase of a model that uses wavelet thresholding to de-noise the data signals and calculates a validation metric that incorporates shape, phase, and magnitude error. A simulation study and empirical data from an automobile crash study illustrate the wavelet thresholding validation approach.

Joint Service In Primary Care Clinics

Hyo Kyung Lee, University of Wisconsin-Madison, 313 N Frances St Apt 601, Apt 601, Madison, WI, 53703, United States, hlee555@wisc.edu, Xiang Zhong, Jingshan Li, Albert Musa, Philip Bain

To improve patient flow and reduce provider workload, joint service has been proposed and implemented in many primary care clinics. As no model is available yet to quantify joint visit's impact, we introduce Markov chain models of patient flow with joint visits, and investigate the system behavior under different scenarios. Particularly, to reduce the state space dimension, convergent iterative procedures are proposed. Furthermore, the study is extended to non-Markovian case by introducing empirical formulas. To illustrate the applicability of the methods, an application study at Dean East Clinic is presented.

Ensemble Methods in Data Mining

Sponsored: Data Mining

Sponsored Session

Chair: Waldyn Martinez, Miami University, 117 Country Club Dr., Oxford, OH, 45056, United States, wmartine@cba.ua.edu

1 - Ensemble Methods For Credit Risk Assessment

Youqin Pan, Salem State University, Bertolon School of Business, 352 Lafayette Street, Salem, MA, 01970, United States, ypan@salemstate.edu

More and more banks and financial institutions have started to pay more attention on credit risk due to the recent financial crisis. This paper aims at improving predictive powers of the credit score models using bagging and boosting algorithms.

2 - Multi-engine Out-of-sample Boosting

Meinolf Sellmann, Senior Manager, IBM Research, 1101 Kitchawan Rd, Yorktown Heights, NY, 10566, United States, meinolf@us.ibm.com

We present a new machine learning method that combines ensemble learning with meta-algorithmics, in particular algorithm portfolios. The result is a method that automatically determines a collection of predictive models which may or may not not consider the same concept class. To avoid over-fitting, these models are never trained on examples from regions they are later used for, nor do we ever combine predictions with each other. A portfolio method is used to select one and only one predictor at runtime, which effectively serves as regularization technique. Numerical results demonstrate that the new method massively improves the state of the art in predictive modeling.

3 - Applying Directed Acyclic Graph-based Ensemble Method For Analyzing Huge And Mixed Data In Mobile Manufacturing

Seonghyeon Kang, Samsung Electrotics, Suwon, Korea, Republic of, shyeon.kang@gmail.com

In mobile manufacturing, following the rapidly increasing deployment of sensing to maintain high productivity and quality, the data that we have to analyze is growing exponentially. However, in practical approach, constructing the predictive model is difficult because of the huge size of data and the mixed datatypes on the training phase. In this study, we propose the efficient ensemble method to handle those problems in mobile devices manufacturing. The effectiveness of the proposed method is demonstrated by real data from the mobile plant in one of the leading mobile companies in South Korea.

4 - Reducing The Complexity Of Ensemble Methods For Use In Large Scale Multidimensional Data

Waldyn Martinez, Assistant Professor of Business Analytics, Miami University, 117 Country Club Dr., Oxford, OH, 45056, United States, martinwg@miamioh.edu

Ensemble models refer to methods that combine a typically large number of fitted values into a bundled prediction. A key challenge of using ensembles in large-scale multidimensional data lies in their complexity and the computational burden they create. Recent research effort in ensembles has concentrated in reducing ensemble size, while maintaining their predictive accuracy. Here, we propose a way to reduce the complexity of an ensemble solution by optimizing on its margin distribution, while reducing their similarity. The proposed method results in an ensemble that uses only a fraction of the original weak learners, with improved or similar generalization performance.

1 - Artificial Neurons Meet Real Neurons: Pattern Selectivity In V4

Reza Abbasi-Asl, University of California, Berkeley, CA, United States, abbasi@berkeley.edu, Yuansi Chen, Adam Bloniarz, Jack L. Gallant, Bin Yu

Vision in humans and in non-human primates is mediated by a constellation of hierarchically organized visual areas. One important area is V4 which has highly nonlinear response properties. To better understand the filtering properties of V4 neurons we recorded from 71 well isolated cells stimulated with 4000-12000 static grayscale natural images. We fit predictive models of neuron spike rates using transformations of natural images learned by a convolutional neural network (CNN). Furthermore, we introduce new processes for interpreting such models. We conclude that the V4 neurons are tuned to a remarkable diversity of shapes such as curves, blobs, checkerboard patterns, and V1-like gratings.

2 - A New Adaptive Seizure Onset Detection Framework

Sina Khanmohammadi, SUNY Binghamton, 4400 Vestal Pkwy E, SSIE Department, Binghamton, NY, 13902, United States, skhanmo1@binghamton.edu, Chun-An Chou

In this study, we present a new adaptive distance-based seizure detection algorithm that provides comparable performance to more complex seizure onset detection methods in the literature using much less computational resources. The proposed framework is validated using CHB-MIT dataset, which is one of the most comprehensive scalp EEG recordings of pediatric epileptic patients.

3 - Efficient Heuristic For Large Scale Networked Data Classification

Daehan Won, University of Washington, wondae@uw.edu

Networked data classification is a kind of data classification where each instance is a constructed by networked structure. Similar to the current data classification, it involve huge computation time and over fitting results when the input networks have complicated structure with large size of nodes and links. To overcome those drawbacks, we present a new mathematical model based on the node selection scheme and provide a heuristic algorithm to solve the proposed math. model which is NP-hard. As a demonstration, we provide investigation results based on the human brain networks as well as simulated data set.

Panel: Publication Tips

Sponsored: Junior Faculty JFIG

Sponsored Session

Moderator: Anahita Khojandi, University of Tennessee, Knoxville, TN, United States, anahitakhojandi@gmail.com

1 - Panel Discussion: Tips For Successful Publication From Journal Editors

Anahita Khojandi, University of Tennessee, Knoxville, TN, United States, khojandi@utk.edu

The panelists consist of past and current editors from top journals, including Management Science, Operations Research, INFORMS Journal on Computing and Decision Analysis. The editors will share tips on how to get your paper successfully published, from selecting the right journal and preparing the manuscript, to revising the paper and responding to reviewers' comments. They will also answer questions pertaining to writing and publication.

2 - Panelist

Alice Smith, Auburn University, 3301 Shelby Center, Auburn, AL, 36849, United States, smithae@auburn.edu

3 - Panelist

Jay Simon, American University, 4400 Massachusetts Avenue, NW, Washington, DC, 20016, United States, jaysimon@american.edu

4 - Panelist

Alice Smith, Auburn University, Auburn, AL, United States, smithae@auburn.edu

5 - Panelist

Douglas Shier, Clemson University, Clemson, SC, United States, shierd@clemson.edu

6 - Panelist

Serguei Netessine, Insead, Singapore, Singapore, serguei.netessine@insead.edu

1 - Ramp Capability Modeling For Reliable And Efficient Integration Of Renewable Energy

Congcong Wang, MISO, Carmel, IN, United States, cwang@misoenergy.org, Dhiman Chatterjee

With increasing penetration of renewable energy, net load variations and uncertainties impose challenges to maintain real-time power balance. This presentation highlights MISO's recent development of Ramp Capability Product to manage system ramping needs. It starts with an examination of recent market evolutions that drive both operational and economic needs of resource flexibility and then presents the design of Ramp Capability Product that systematically pre-position resources with flexibility to meet future net load at a specified level of confidence. More importantly, explicit price signals are developed to reflect the underlying cost causation and provide economic incentives.

2 - Is Being Flexible Advantageous For Demands?

Farzaneh Abbaspourtorbati, EPFL, Lausanne, Switzerland, Farzaneh.Abbaspourtorbati@swissgrid.ch, Antonio J. Conejo, Jianhui Wang, Rachid Cherkaoui

This paper analyzes the impacts of flexible demands on day-ahead market outcomes in a system with significant wind power production. We use a two-stage stochastic market-clearing model, where the first stage represents the day-ahead market and the second stage the real-time operation. On one hand, flexibility of demands is beneficial to the system as a whole since such flexibility reduces the operation cost, but on the other hand, shifts in demands from peak periods to off-peak periods may influence prices in such a way that demands may not be willing to provide flexibility. Specifically, we investigate the impacts of different degree of demand flexibility on day-ahead prices.

3 - Aggregating (almost) Symmetric Generators In Unit Commitment

Ben Knueven, University of Tennessee, Knoxville, TN, United States, bknueven@vols.utk.edu, Jim Ostrowski, Jean-Paul Watson, Jianhui Wang

We consider a method to precisely aggregate symmetric ramping unconstrained generators in unit commitment formulations. We apply the same methods to nearly symmetric generators to create symmetric relaxations of the unit commitment problem, and empirically test the strength of the relaxation. We demonstrate massive computational improvements over the standard formulation for the CAISO set of generators. Extensions to accelerate stochastic unit commitment are also examined.

Sponsored Session

Chair: Bo Zeng, University of Pittsburgh, Benedum Hall 1009, Pittsburgh, PA, 15261, United States, bzeng@pitt.edu

1 - Tighter Modeling And Enhanced Solutions For Power System Operations Under Uncertain Environment

Lei Wu, University of Clarkson, lwu@clarkson.edu

In emerging power systems, as the generation side gets more distributed and the demand side becomes more active, it is of critical importance to evaluate the impacts of individual assets on the reliable and economic operation of power systems. This presentation will highlight several key issues in the operation of power systems with significant penetration of renewable energy and DR assets, and discuss advanced modeling and optimization techniques, robust security-constrained unit commitment (SCUC) models in particular, for enhancing the reliability and economics of power system operations under uncertain environment.

2 - Reliable Fuel Supply Chain Design

Bo Zeng, University of Pittsburgh, bzeng@pitt.edu, Anna Danandeh, Brent Caldwell

To ensure reliable operations of a power plant, an optimization based fuel supply chain model is developed and implemented.

Data-Intensive Computational Methods for Large-scale Infrastructure Systems

Sponsored: Data Mining

Sponsored Session

Chair: Adrian Albert, C3IoT, 1300 Seaport Boulevard, Suite 500, Redwood City, CA, 94063, United States, adrian.t.albert@gmail.com

1 - Sparse Data Analytics For Modern Engineering Systems

Borhan Sanandaji, Risk Management Systems (RMS), Hall, Newark, CA, 24061, United States, sanandaji@eecs.berkeley.edu

Forecasting plays a vital role in reliable operation of modern engineering systems such as smart grids and transportation systems. These systems are often large-scale and generate a huge amount of data. It is, therefore, quite important to come up with forecasting schemes that can deal with such high-dimensionality. In this work, we propose a Sparse Spatio-Temporal Forecasting (SSTF) scheme which exploits the intrinsic low-dimensionality and structure of the generated data. We applied SSTF to predict wind speed, residential electric load, and solar irradiance in different scenarios to prove its significance as compared to other benchmark models.

2 - A Learning Based Method For Real Time Prediction Of Cascading Failures

Yue Zhao, Stony Brook University, Stony Brook, NY, United States, yue.zhao.2@stonybrook.edu, Jianshu Chen

Real time prediction of imminent cascading failures in a dynamically evolving power grid is studied. As the cascade look-ahead window increases, the number of future cascade scenarios grows exponentially. A novel learning based method is developed to compute the marginal failure probability of each line due to cascades at times deep into the future. The proposed method enjoys the unique advantage that a labeled data set can be generated in an arbitrarily large amount at very low cost. Numerical results demonstrate that the off-line trained predictive model provides very fast online and accurate prediction of cascading failures.

3 - New Approaches In Data Analysis For Infrastructural Networks: Combinatorial Hodge Theory

Chase Dowling, University of Washington, Seattle, WA, United States, Cdowling@uw.edu, Lillian Ratliff, Baosen Zhang

Recent advances in Hodge theory have shed light on a deep relationship between graph theory and calculus. One important theorem in calculus—the Helmholtz decomposition—splits a vector field into conservative and solenoidal components. The combinatorial Hodge decomposition extends this technique to graphs, and gives conservation law respecting flows on edges. Power, gas, and traffic networks all respect some form of conservation law, and their optimal utilization has proven difficult owing to nonlinearities in flow. We explore a novel application of the Hodge decomposition in traffic and power networks with the aim of developing control strategies in face of these nonlinearities.

4 - Energy Profile Prediction: Implications For Electric Vehicle Demand Response

Caroline Camille Le Floch, University of California, Berkeley, Berkeley, CA, United States, caroline.le-floch@berkeley.edu, Scott Moura

This work shows a predictive framework that uses demographic data to predict energy profiles and acceptance of smart grid tariffs. Our analysis is based on the Australian Smart Grid Data, including electricity use interval readings, customer demographics, peak event offers and acceptances. First, we use clustering methods to define a representative dictionary of hourly load shapes, and assign individual energy profiles as his/her most frequently used shapes. Second, we present the performance of several estimators to predict energy profiles and peak event responses from demographic data. Third, we discuss implications for designing smart grid programs for Electric Vehicles owners.

Information and Influence Diffusion in Networks

Sponsored: Data Mining

Sponsored Session

Chair: Wenjun Wang, University of Iowa, Pappajohn Business Building, Iowa City, IA, 52242-1994, United States, wenjun-wang@uiowa.edu

1 - Community Detection And Correlation Analysis

Lian Duan, Hofstra University, Hempstead, NY, United States, Lian.Duan@hofstra.edu, Nick Street, Yanchi Liu, Meral Binbasioglu, Haibing Lu

The advances in graphs play an important role to understand interrelated data. Inside graphs, there are usually community structures where different portion of nodes are more tightly connected to form a group, and community detection has wide applications in marketing, management, health care, and education. Nowadays, many different methods are proposed to detect community structures from different perspective. In our research, we build a connection between community detection and correlation analysis. It helps to utilize the progress in correlation analysis for community detection.

2 - Detection Of Online Manipulation And Information Diffusion

Onur Varol, Indiana University, ovarol@indiana.edu

Social media have become vehicles for instantly disseminating and accessing information on a global scale. Understanding mechanisms governing information diffusion is important and detection of malicious intents and activities are also curious. In this talk, I will present our prediction and early detection framework for social media campaigns and our online social bot detection platform called BotOrNot. Then I will present our work on information diffusion on heterogenous-intent networks. We experiment with user-level perception of messages, analyze large-scale information cascades, and model information diffusion in heterogeneous-intent networks.

3 - Modeling Influence Diffusion For Viral Marketing In Social Networks

Wenjun Wang, University of Iowa, Iowa City, IA, United States, wenjun-wang@uiowa.edu, Nick Street

Viral marketing is a technique that induces users in a social network to pass on a marketing message to other users so as to achieve the largest cascade of product sales. It can be formulated as an influence maximization problem under a stochastic diffusion model. In this paper, we propose a novel Multiple-path-based Asynchronous Cascade (MAC) model, which captures both direct influence from neighboring influencers and indirect influence from influencers two or three hops away. It also takes into account influence attenuation along diffusion paths, influence decay over time, and temporal diffusion dynamics. We then investigate various heuristics to address the influence-maximization problem.

4 - How Peer Influence Affects Preference Evolution And Product Selection In Offline Retail

LIN ZHAO, Tsinghua University, Tsinghua University, Shunde Builiding Room 615, Beijing, 100084, China, zhaolin14@mails.tsinghua.edu.cn

We combine offline retail with social network by presenting different types of social network information to consumers. We also investigate how the social influence mechanism may differ for different types of products. We propose a multistage conjoint choice experiment to observe initial preferences and products selection of consumers prior to observing their choice interdependence. We try to show that it is possible to improve marketing response through the visibility of consumers' social network information. Also, we want to support the recommendation system for offline retail.

Ethics and Sustainable Business Models

Invited: Business Model Innovation

Invited Session

Chair: Elena Belavina, University of Chicago Booth School of Business, Chicago, IL, United States, elena.belavina@chicagobooth.edu

1 - Honesty, Ethical Free Agency And The Hold-up Problem

Manu Goyal, University of Utah, Salt Lake City, UT, United States, Manu.Goyal@eccles.utah.edu, Krishnan S Anand, He Chen

We construct a finite-horizon model of incomplete contracts, where contracting partners are vulnerable to ex-post opportunism and hold-ups, that also integrates bounded rationality, moral hazard and adverse selection. We prove that an honest player - who never holds up its contracting partner - can obtain strictly greater profits than an unconstrained profit-maximizer, even though the latter has access to a superset of strategies, including the option of mimicking the honest type. Our research provides a bridge between normative rationales for honesty, the province of ethics, and profit-maximization, which is axiomatic in economics, by providing a compelling economic rationale for honesty.

2 - Increasing The Adoption Of New Life-improving Technologies

Gonzalo Romero, Rotman, University of Toronto, 91 Ferrier Avenue, Toronto, ON, M4K 3H6, Canada, gonzalo.romero@rotman.utoronto.ca, Andre Du Pin Calmon

Motivated by the operations of a distributor of life-improving technologies in India, we consider a model where a retailer sells an item to risk averse consumers, who derive an uncertain value from using this product. Without external intervention, the market might collapse such that no sales occur. The distributor intervenes in the market using two levers: (i) educating consumers, which reduces the uncertainty in their valuation and (ii) implementing a reverse logistics channel that allows for regret-returns and also a higher salvage value for the retailer. We compare the relative effectiveness and substitutability degree of each of these levers.

3 - New, Refurbished, And Used: Key Factors That Influence Consumers' Choices

Erin Cassandra McKie, University of South Carolina, 1014 Greene Street, Columbia, SC, 29212, United States, erinmckie@gmail.com, Mark Ferguson, Michael Galbreth, Sriram Venkataraman

Remanufacturing is increasingly providing new profit opportunities for firms, as well as more product condition options - such as new, refurbished, and used - for consumers to choose. Using secondary data and choice model analysis techniques, we estimate the influence of various factors on consumers' purchasing decisions

4 - Kicking Ash: Who (or What) Is Winning The War On Coal?

David Drake, Harvard Business School, ddrake@hbs.edu

Power generators throughout the U.S. have shed coal capacity at an unprecedented rate over the past few years. Multiple stakeholders have claimed credit - natural gas executives, renewables advocates, policy makers, and environmental NGOs among them. In this nascent work, we explore the extent to which each has impacted the expected life of coal-fired power generating units.

Sponsored Session

Chair: Dincer Konur, Missouri University of Science and Technology, Rolla, MO, United States, konurd@mst.edu

1 - Economic And Environmental Considerations In A Stochastic Inventory Control Model With Order Splitting Under Different Delivery Schedules Among Carriers

James F Campbell, University of Missouri-St Louis, campbell@umsl.edu, Dincer Konur, Sepideh Monfared

We analyze an integrated inventory control and delivery scheduling problem with stochastic demand and economic and environmental considerations. Models consider order splitting among many carriers and two delivery scheduling policies: sequential splitting and sequential delivery. Bi-objective mixed-integer nonlinear models are formulated and solved with an adaptive -constraint algorithm and an evolutionary search algorithm to approximate the Pareto front. Numerical studies are used to compare the algorithms, explore the effects of demand variance, show how delivery policy and carrier selection affect performance, and document the need for a good approximation of the Pareto front.

2 - Environmental Considerations In Liner Shipping And Vessel Scheduling

Maxim A Dulebenets, Florida State University, Tallahassee, FL, United States, mdlbnets@memphis.edu, Mihalis Golias, Sabya Mishra

Carbon dioxide emissions from maritime transportation constitute 2.2% of the world's anthropogenic carbon dioxide emissions. A number of environmental regulations were released by the International Maritime Organization to reduce the pollution levels over the last decade. Considering an increasing attention of the community to environmental issues in liner shipping, this presentation will focus on: 1) approaches for modeling emissions produced by vessels; and 2) alternatives that would reduce vessel emissions and improve environmental sustainability. A number of case studies will be presented to demonstrate how negative environmental externalities can be alleviated.

3 - Freight Demand Management And It's Role In Sustainable Supply Chains

Johanna Amaya, Rensselaer Polytechnic Institute, Troy, NY, 12180, United States, amayaj@iastate.edu
Johanna Amaya, Iowa State University, Ames, IA, 50011, United States, amayaj@iastate.edu

A wide range of potential actions could enhance the sustainability of urban freight activity ranging from supply to demand sides. By far, the least frequently used group is freight demand management (FDM). Managing the demand could play a key role in increasing the sustainability of urban freight activity as this group seeks to alter the demand for freight to mitigate the negative impacts produced. Instead of focusing on the carriers, these initiatives focus on changing the behavior of the receivers of the supplies, which are the ones that generate the demand. Their potential and current implementation is discussed as a tool to foster sustainable supply chains.

4 - Analysis Of Non-cooperative Joint Emissions Targeting Decisions In A Leader-follower Channel

Dincer Konur, Missouri University of Science and Technology, konurd@mst.edu

In this study, we analyze joint emission targeting along a leader-follower channel. In particular, a non-cooperative game theory model is constructed to determine the agents' decisions on joining their emissions targets. Joint emission targeting might decrease individual as well as channel costs while ensuring that total emissions do no exceed cumulative emission target. We characterize the equilibrium solution of this game. Furthermore, how costs and emissions change with joint targeting is analyzed. In addition, we investigate the role of the leader on channel emissions and costs. It is discussed that changing the leader might decrease not only costs but also emissions.

Optimizing Distributed Energy Generation I

Sponsored: Energy, Natural Res & the Environment, Energy II Other

Sponsored Session

Chair: Alexandra M Newman, Colorado School of Mines, Golden, CO, newman@mines.edu

1 - Optimizing The Design Of A Hybrid, Distributed Energy Generation System With Alternate, Renewable Technologies

Gavin Goodall, Colorado School of Mines, Golden, CO, ggoodall@mymail.mines.edu

We formulate a mixed integer linear program to select renewable technologies such as photovoltaic panels, hydrogen fuel cells and plasma converters, and conventional technologies such as diesel generators and lithium-ion batteries, to minimize system costs subject to operational, load, and spinning reserve constraints. We use statistical models to generate realizations of load and solar irradiance. Solutions from our optimization model prescribe both a procurement and an hourly dispatch strategy for these realizations.

2 - Geothermic Fuel Cell System Modeling And Optimization

Gladys Anyenya, Colorado School of Mines, Golden, CO, ganyenya@mymail.mines.edu

This study presents a techno-economic nonlinear optimization model to determine the optimal design and dispatch of a Geothermic Fuel Cell (GFC) system. GFCs present an ambitious new approach to cost-effective, environmentally responsible oil-shale processing. Heat produced from solid-oxide fuel cells (SOFCs) during electricity generation is used to directly retort oil shale into liquid oil and natural gas. The electricity produced by the SOFCs during the oil-liberation process can be used to drive other balance-of-plant equipment, or be placed back onto the grid. The model solves for the optimal GFC operating conditions that meet the system electricity and heating demands at the lowest cost.

3 - Optimization Of Energy Efficient Operation Of HVAC System As Demand Response With Distributed Energy Resources

Young M Lee, IBM Research Center, 1101 Kitchanwan Road, P.O. Box 218, Yorktown Heights, NY, 10598, United States, ymlee@us.ibm.com, Raya Horesh, Leo Liberti

A model predictive control (MPC) framework that optimally determines control profiles of the HVAC system as demand response in presence of on-site distributed energy resources such as energy storage system and energy generation system is described. The approach computes optimal set point profile of HVAC system that minimizes the total energy costs and GHG emission, considering demand response signal, on-site energy storage system, and on-site energy generation system while satisfying thermal comfort (e.g., zone temperature) within physical limitations of HVAC equipment, energy storage system and energy generation system.

4 - An Optimization Model For Leftover Biomass Feedstock

N. Muhammad Aslaam Mohamed Abdul Ghani, Graduate Student, North Dakota State University, 1320 Albrecht Blvd, Quentin Burdick Building, Fargo, ND, 58108, United States, nmuhammadaslaam.moha@ndsu.edu, Chrysafis Vogiatzis, Joseph Szmerekovsky

We address the issue of leftover biomass feedstock by designing a biomass supply chain for biofuel and biopower production. A mixed integer linear program (MILP) is proposed to minimize total societal costs in the supply chain and is then used to analyze the impact of government incentives for producing biofuel and biopower. Potential farms for incentivizing will be identified using the proposed model, which can be useful tool for decision and policy makers.

Paths, Cycles, and Transversals

Sponsored: Optimization, Network Optimization

Sponsored Session

Chair: Balabhaskar Balasundaram, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States, baski@okstate.edu

1 - Algorithms For Cycles In Graphs

James B Orlin, Massachusetts Institute of Technology, jorlin@mit.edu

We present: an O(nm) algorithm for finding the least cost cycle in a graph, an O(nm log n) randomized algorithm for finding the shortest negative cost cycle in a graph, and a proof that finding the 2nd shortest s-t path is "harder" than finding the least cost cycle.

2 - New Facets For The Clique Transversal Polytope

Timothy Becker, Rice University, tjbecker04@gmail.com

The Clique Transversal Problem is the problem of finding a minimum set of nodes that covers every maximal clique in a given graph. We define three new classes of facets for the Clique Transversal Polytope. These are extensions of the classes of facets with coefficients in {0,1,2} for the set covering polytope. One class contains an odd hole with distinct cliques on each edge of the hole. The second similar class contains a clique with distinct cliques on |K| edges, where |K| is the number of nodes in the given clique. The last class contains a clique with distinct cliques on every edge of the initial clique.

3 - Elementary Shortest Path Problem On Networks Containing Negative Cycles

Baski Balasundaram, Oklahoma State University, Stillwater, OK, United States, baski@okstate.edu, Devaraja Radha Krishnan

In this talk, we consider the elementary shortest path problem (to find a shortest path from a specified origin to destination) in a directed network that contains negative cycles. This problem is known to be NP-hard unlike its classical counterpart on networks without negative cost directed cycles. We propose a delayed constraint generation framework to solve this problem using a branch-and-cut algorithm. Two variants are proposed and compared against solving direct formulations of this problem. Results and insights from our computational study will be reported.

4 - Speed Optimization Over A Path In Quadratic Time

Xiaochen Zhang, University of Minnesota, zhan4487@umn.edu, Qie He, Kameng Nip

The speed optimization problem over a path aims to determine speed over each arc of the given path to minimize the total cost, while respecting speed limits over arcs and time-window constraints of the nodes. The cost over each arc is a strictly differentiable convex function of the speed over the arc. This problem is motivated by the goal of improving fuel efficiency in maritime transportation. It can be formulated as a min-convex-cost flow problem. We propose an iterative algorithm running in time quadratic in the number of nodes over the path. This is joint work with Qie He and Kameng Nip.

New Results on Nonconvex Optimization

Sponsored: Optimization, Integer and Discrete Optimization

Sponsored Session

Chair: Daniel Bienstock, Columbia University, 500 W 120th St, New York, NY, 10027, United States, dano@columbia.edu

Co-Chair: Daniel Bienstock, Columbia University, Departments of IEOR and APAM, Columbia University, New York, NJ, 10027, United States, dano@columbia.edu

1 - Centerpoints: A Link Between Optimization And Convex Geometry

Amitabh Basu, Johns Hopkins University, basu.amitabh@jhu.edu, Timm Oertel

We introduce a concept that generalizes several different notions of a "centerpoint" in the literature. We develop an oracle-based algorithm for convex mixed-integer optimization based on centerpoints. Further, we show that algorithms based on centerpoints are "best possible" in a certain sense. Motivated by this, we establish several structural results about this concept and provide efficient algorithms for computing these points.

2 - On Decomposability Of Multilinear Sets

Alberto Del Pia, University of Wisconsin-Madison, delpia@wisc.edu, Aida Khajavirad

We consider the Multilinear set defined as the set of binary points satisfying a collection of multilinear equations. Such sets appear in factorable reformulations of many types of nonconvex optimization problems, including binary polynomial optimization. In this talk, we study the decomposability properties of Multilinear sets. Utilizing an equivalent hypergraph representation, we derive necessary and sufficient conditions under which a Multilinear set is decomposable based on the structure of pair-wise intersection hypergraphs. Finally, we propose a polynomial-time algorithm to optimally decompose a Multilinear set into simpler subsets.

3 - An FPTAS For Minimizing Some Indefinite Quadratics Over The Integer Points In A Polyhedron In Fixed Dimension

Robert Hildebrand, IBM Research, robdhildebrand@gmail.com

Although integer linear programming is an NP-Hard problem, Lenstra showed that in fixed dimension the problem can be solved in polynomial time. On the other hand, the problem of minimizing a quartic polynomial objective function over the the integer points in polyhedra is NP-Hard even in dimension 2. The complexity of minimizing quadratic and cubic polynomials in fixed dimension remains an open question. As a step in this direction, we will present an FPTAS for minimizing some quadratic polynomials in fixed dimension.This is joint work with Robert Weismantel and Kevin Zemmer.

Sponsored Session

Chair: Gonzalo Munoz, Columbia University, 500 W. 120th Street, IEOR Department, New York, NY, 10027, United States, gonzalo@ieor.columbia.edu

1 - Low-rank/sparse-inverse Decomposition

Victor Fuentes, University of Michigan, Ann Arbor, MI, United States, vicfuen@umich.edu, Jon Lee

A well-known matrix decomposition problem is to split an input matrix into sparse and low-rank components. We look at decomposing an input matrix as the sum of a matrix having a sparse inverse and a low-rank matrix. One approach that we have developed is a convex SDP approximation. Also, employing the Woodbury matrix identity, we establish another framework for attacking the problem. Our numerical results demonstrate that: (1) our proposed methodology is useful and practical, (2) our method leads to a means for generating good test instances for algorithms that we are developing for the problem, and (3) a direct generalization of the recovery theorem for the ordinary version of the problem is unlikely.

2 - Improving The Randomization Step In Feasibility Pump

Andres Iroume, Georgia Institute of Technology, airoume@gatech.edu, Santanu Subhas Dey, Marco Serpa Molinaro, Marco Serpa Molinaro

In this work, we modify the randomization step in feasibility pump. This step is used when staling is detected in order to avoid cycling. In our version, we use a WALKSAT-type method that automatically detects sparse structures. We prove theoretical upper bounds on the running time (to the best of our knowledge for the first time for feasibility pump) and provide computational results that show a considerable reduction both in terms of numbers of iterations and computing time when applied to MIPLIB instances.

3 - A Branch-and-bound Algorithm For The Facility Location Problem With Random Utilities

Eduardo Moreno, Universidad Adolfo Ibáñez, Santiago, Chile, eduardo.moreno@uai.cl, Alexandre S Freire, Wilfredo Yushimito

The maximum capture problem with random utilities seeks to locate new facilities in a competitive market such that the captured demand of users is maximized, assuming that each individual chooses among all available facilities according to a random utility model. We also introduce a new branch-and-bound algorithm based on a column generation scheme for solving the original problem. Extensive computational experiments are presented, benchmarking the proposed approach with other linear and non-linear relaxations of the problem. Computational experiments show that our algorithm is competitive with all other methods as there is no method which outperforms the others in all instances.

4 - Submodular Path Inequalities For Capacitated Lot-sizing With Inventory And Backlogging Bounds

Birce Tezel, University of California-Berkeley, Berkeley, CA, 94720, United States, btezel@berkeley.edu, Alper Atamturk

We consider single item capacitated lot-sizing problems with backlogging (CLSB) where the maximum production, inventory and backlogging values are bounded. Using the underlying fixed-charge network structure of CLSB, we derive strong submodular path inequalities. These inequalities generalize flow cover inequalities for single node relaxations of CLSB. The computational results suggest that submodular path inequalities are quite effective in solving CLSB instances when used in a branch-and-cut algorithm.

1 - Valuing A Cellulosic Biofuel Project Considering Supply Uncertainty

Guiping Hu, Iowa State University, gphu@iastate.edu, Yihua Li, Chung-Li Tseng, Wei-Chung Miao

Iowa intends to invest in cellulosic biofuel production to expand its renewable fuels consumption. The yield of main feedstock, corn stover, fluctuates due to climate change, especially the rainfall amount. Dual sourcing is a possible strategy to mitigate the supply uncertainty, which in our case is the option of investing in growing dedicated energy crops as an additional supply source. A real options approach is used to analyze the optimal investment timing and benefits of the dual sourcing.

2 - Lot Sizing With Emission Dependent Demand

Gokce Palak, Shenandoah University, gpalak@su.edu

We extend economic lot sizing models to maximize profit and minimize emissions. This model captures the tradeoffs between supplier and mode selection decisions, as well as profits and emissions. We analyze impacts of price and emissions sensitive demand on the replenishment decisions.

3 - A Competitive Supply Chain Framework With Sustainable Environmental Policies

Min Yu, University of Portland, Portland, OR, United States, yu@up.edu, Jose Cruz

We develop a competitive supply chain network model with multiple firms, each of which produces a differentiated product. Multiple production, storage, and transport mode options are allowed. In order to control firms' environmental emissions, the policy-maker seeks to decide the optimal policy instrument. Numerical illustrations provide managerial insights and policy implications.

Sponsored: Artificial Intelligence

Sponsored Session

Chair: Bin Zhang, Assistant Professor, University of Arizona, 1130 E. Helen St, Tucson, AZ, 85715, United States, binzhang@arizona.edu

1 - Analyzing Heterogeneity Of User Participation Behavior In Online News Article Propagation

Devi Bhattacharya, University of Arizona, dbhattac@email.arizona.edu

The session will illustrate the diversity in users' article sharing behavior on social media. The literature on social media based propagation although considerable generally undercompensates heterogeneity in users' behavior incidental to the source or type of content being propagated. In contrast, our research provides extensive empirical evidence of multiplicity in users' article sharing behavior by analyzing 5 different facets of user participation. Our research uses network theoretic and statistical techniques on a Twitter dataset of 35 news providers collected over 9 months to provide critical insights essential for modeling users' news article sharing behavior on social media.

2 - Knowledge Discovery Using Disease Comorbidity Networks

Karthik Srinivasan, University of Arizona, Tucson, AZ, 85719, United States, karthiks@email.arizona.edu, Faiz Currim, Sudha Ram

Comorbidity or disease co-occurrence is the simultaneous presence of two or more diseases. A disease comorbidity network (DCN) can be constructed based on repeated evidence of two or more diseases co-occurring in anonymized patient visit datasets. We report on an empirical study using a large dataset of electronic health records to explore the characteristics of this network including community formation and structural measures. Our network analysis is used to reinforce existing medical knowledge about comorbidity and to reveal previously unknown comorbidity relationships.

3 - Social Networks In Online Games: The Impact Of Peer Influences On Repeat Purchase

Bin Zhang, University of Arizona, binzhang@arizona.edu, Ruibin Geng, Xi Chen

Consumers' purchase decisions can be affected by both direct and indirect peer influences. However, there is no existing work about how these two types of influence impact repeat-purchase of. In this study, we fill such gap by investigating the interdependent repeat-purchase of online game players embedded in a social network. We build a new hierarchical Bayesian model that can support response variable following Poisson distribution and simultaneously include both types of peer influence, direct and indirect. Our empirical study yields interesting findings that peer influences have a significant impact on repeat purchase, but the directions of direct and indirect influences are different.

Inverse Optimization: Applications

Sponsored: Optimization, Optimization Under Uncertainty

Sponsored Session

Chair: Taewoo Lee, Rice University, 1, Houston, TX, United States, taewoo.lee@rice.edu

1 - Inverse Optimization For The Analysis Of Competitive Markets: An Application To The North American Fuel Market

Michael Pavlin, Wilfrid Laurier University, mpavlin@wlu.ca

In this talk we consider conditions under which inverse optimization can be used to analyze unobservable supply constraints underlying pricing of competitive markets. We present a study of price differentiation in the North American fuel market.

2 - Inverse Optimization For Intensity Modulated Proton Therapy

Neal Kaw, University of Toronto, Toronto, ON, Canada, neal.kaw@mail.utoronto.ca, Timothy Chan, Albin Fredriksson

Robust multiobjective optimization models can be used to determine treatment plans for intensity-modulated proton therapy (IMPT), which is a method of cancer therapy. The uncertainty set in such a model is a set of scenarios. In this work, we propose a novel inverse optimization model to determine objective weights and a set of scenarios, such that a historical treatment plan is optimal with respect to a given robust IMPT optimization model. We apply our model to prostate cancer data.

3 - Data-driven Objective Selection In Multi-objective Optimization: Inverse Optimization Approach

Taewoo Lee, Rice University, 6100 Main MS-134, Houston, TX, 77005, United States, taewoo.lee@rice.edu, Tayo Ajayi, Andrew J Schaefer

Performance of a multi-objective optimization problem largely depends on the choice of objectives. Currently, objectives are typically chosen in a trial-and-error manner based on subjective beliefs. We propose an inverse optimization approach to learn from data and determine a minimal set of objectives for a multi-objective optimization problem such that the problem generates solutions that are comparable to the given data. We provide theoretical properties of the methodology in comparison with regression, and establish a relationship with the traditional best subset regression approach. We demonstrate the methodology in cancer therapy applications.

Stochastic Optimization for Large-Scale Learning

General Session

Chair: Qihang Lin, the University of Iowa, 21 East Market Street, PBB, S380, Iowa City, IA, 52245, United States, qihang-lin@uiowa.edu

1 - Adadelay: Delay Adaptive Distributed Stochastic Optimization

Adans Wei Yu, Carnegie Mellon University, Pittsburgh, PA, United States, weiyu@cs.cmu.edu

We develop distributed stochastic optimization algorithms under a delayed gradient model in which server nodes update parameters and worker nodes compute stochastic (sub)gradients. Our setup is motivated by the behavior of real-world distributed computation systems; in particular, we analyze a setting wherein worker nodes can be differently slow at different times. In contrast to existing approaches, we do not impose a worst-case bound on the delays experienced but rather allow the updates to be sensitive to the actual delays experienced. This sensitivity allows use of larger stepsizes, which can help speed up initial convergence without having to wait too long for slower machines.

2 - Rsg: Beating Subgradient Method Without Smoothness And Strong Convexity

Tianbao Yang, the University of Iowa, tianbao-yang@uiowa.edu, Qihang Lin

In this paper, we propose novel deterministic and stochastic {\bf R}estarted {\bf S}ub{\bf G}radient (RSG) methods that can find an ϵ-optimal solution for a broad class of non-smooth and non-strongly convex optimization problems faster than the vanilla deterministic or stochastic subgradient method (SG). We show that for non-smooth and non-strongly convex optimization, RSG can reduce the dependence of SG's iteration complexity on the distance to the optimal set of the initial solution to that of points on the ϵ-level set. For a family of non-smooth and non-strongly convex optimization problems whose epigraph is a polyhedron, we further show that RSG could converge linearly.

3 - Worst-case Complexity Of Cyclic Coordinate Descent

Ruoyu Sun, Stanford University, ruoyus@stanford.edu, Yinyu Ye

We establish several complexity bounds of cyclic coordinate descent (C-CD) for quadratic minimization, and prove that these bounds are almost tight. Although some existing examples showed C-CD can be much slower than randomized coordinate descent (R-CD), in many practical examples C-CD is faster than R-CD, making it unclear whether the worst-case complexity of C-CD is better or worse than R-CD. One of our bounds shows that C-CD can be O(n^2) times slower than R-CD in the worst case. One difficulty with the analysis of the constructed example is that the spectral radius of a non-symmetric iteration matrix does not necessarily constitute a lower bound for the convergence rate.

4 - Homotopy Smoothing For Structured Non-smooth Problems

Qihang Lin, Assistant Professor, University of Iowa, Iowa City, IA, 52242, United States, qihang-lin@uiowa.edu, Yi Xu, Yan Yan, Tianbao Yang

We develop a novel homotopy smoothing (HOPS) algorithm for non-smooth convex optimization where the non-smooth term has a max-structure. The best known iteration complexity of first-order method for this problem is O(1/epsilon). We show that the proposed

HOPS achieves a lower iteration complexity of O (1/epsilon^(1-theta)) with theta in (0, 1] capturing the local sharpness of the objective function around the optimal solutions. The HOPS algorithm uses Nesterov's smoothing method in stages and gradually decreases the smoothing parameter until it yields a sufficiently good approximation of the original function.

106A-MCC

Finance, Portfolio

Contributed Session

Chair: Christopher M Rump, Associate Professor, Bowling Green State University, College of Business Administration, Bowling Green, OH, 43403-0267, United States, cmrump@bgsu.edu

1 - A Goal Programming Approach To Municipal Bond Portfolio Management

Laura Ventura, PhD Student, The Pennsylvania State University, University Park, PA, 16802, United States, ljv115@psu.edu, Barbara Venegas Quintrileo

The consequence of the municipal bond tax-exemption is that retail investors represent the overwhelming majority of municipal bondholders. Retail investors' buy and hold strategy results in low portfolio turnover causing limited inventory levels and obscure historical pricing that render modern portfolio theory unsuitable. In exchange we propose a non-preemptive goal programming model for municipal bond portfolio management. We consider a municipal bond index replication strategy using Morningstar's municipal bond index data and Bloomberg's municipal bond market data. The model determines bond selection that meets risk and return metrics sensitized to the number of transactions.

2 - Asset Selection In Indian Stock Market Using PCA-DEA Framework

Dhanya Jothimani, Doctoral Student, Indian Institute of Technology Delhi, DMS, IIT Delhi, Vishwakarma Bhawan, Hauz Khas, New Delhi, 110016, India, dhanyajothimani@gmail.com, Ravi Shankar, Surendra S Yadav

Portfolio optimization has three important stages. Among them, asset selection is the first and important stage. We use a Principal Component Analysis - Data Envelopment Analysis (PCA-DEA) framework for asset selection in Indian stock market. The sample consisted of firms listed in National Stock Exchange. The contributions are two-fold: first, the framework helps to avoid the curse of dimensionality of DEA and second, it aids in selection of asset for the second stage of portfolio optimization.

3 - Optimal Portfolio Under Black Litterman Framework With Certain Confidence Level

Cagatay Karan, North Carolina State University, Raleigh, NC, United States, ckaran@ncsu.edu, Tao Pang

Under the Black-Litterman framework, the investor's views can be integrated with the classical mean-variance portfolio optimization in a Bayesian manner. Typically, the investor is not 100% sure about her view, so the confidence level of the view plays an important role in determining the optimal portfolio. We propose a simple but meaningful method based on the investor's confidence level on whether the market is a bull market. Conditional Value at Risk (CVaR) is used as the risk measure instead of variance, and mixed Gaussian distributions are used to model the assets' market returns. The optimal portfolio is explicitly obtained from the optimal portfolio weights under the proposed setting.

4 - Evolution Of A Lottery Jackpot

Christopher M Rump, Associate Professor, Bowling Green State University, College of Business Administration, Bowling Green, OH, 43403-0267, United States, cmrump@bgsu.edu

We develop a predictive model for the growth of the jackpot prize in large, multi-state lotteries. The prediction is based on ticket sales inferred from the number of lesser prizes awarded after each lottery drawing. With this jackpot growth model, we investigate whether or not this gamble ever has positive expected value and make recommendations for the best time to play the lottery if you must.

Population Health: Infectious and Chronic Diseases

Sponsored: Computing

Sponsored Session

Chair: Nedialko Dimitrov, The University of Texas at Austin, The University of Texas at Austin, Austin, TX, 00000, United States, ned.dimitrov@gmail.com

1 - Risk Sensitive Control And Cascading Defaults

Agostino Capponi, Columbia University, ac3827@columbia.edu

We consider an optimal risk-sensitive portfolio allocation problem, which explicitly accounts for the interaction between market and credit risk. The investor allocates his wealth on a portfolio of assets, which can default sequentially and cause distress to the remaining assets in the portfolio. We give an explicit characterization of the optimal feedback strategies. A numerical analysis indicates that the investor accounts for contagion effects when making investment decisions, reduces his risk exposure as he becomes more sensitive to risk, and that his strategy depends non-monotonically on the aggregate risk level.

2 - Resource Allocation For Hepatitis C Elimination

Qiushi Chen, Georgia Institute of Technology, Atlanta, GA, United States, chenqiushi0812@gatech.edu, Turgay Ayer, Jagpreet Chhatwal

More than 170 million people are infected with hepatitis C virus (HCV) globally. The recent availability of highly effective treatments offers an opportunity to control current epidemic and eliminate HCV worldwide. However, high drug cost and unawareness of infection are challenges for achieving this goal. In this study, we develop an HCV transmission model, and identify optimal allocation of resources towards HCV screening and treatment to achieve the disease control target at the minimum cost. We present the allocation policies in different health care settings and target population profiles.

3 - Optimizing Arbovirus Surveillance

Xi Chen, University of Texas at Austin, carol.chen@utexas.edu

We introduce a county-level risk assessment framework for identifying areas that may be at high risk for importation of arboviruses. Human importation risk is estimated using a maximum entropy algorithm, based on historical dengue importation data, socioeconomic, demographic, and bio-climatic data. A significant reason for the popularity of the maximum entropy methodology is its applicability to presence-only data. To address the uncertainty quantification in the point estimation of maximum entropy model, we analytically derive an expression of the variance of the target species distribution probabilities and comparing the results with bootstrap methods.

Payment Models, Pricing, and Incentives in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Mehmet U.s. Ayvaci, University of Texas at Dallas, Richardson, TX, United States, mehmet.ayvaci@utdallas.edu

1 - The Role Of Physician Alignment And Organizational Structures In Bundled Payments

Jan Vlachy, Georgia Institute of Technology, Atlanta, Georgia, vlachy@gatech.edu, Turgay Ayer, Mehmet U.S. Ayvaci, Srinivasan Raghunathan

Bundled payments in healthcare unify the payments to care providers. Motivated by the low rates of voluntary bundling, we formulate game-theoretic models to understand the incentives of hospitals and physicians when forming a bundle. Our analyses lead to several interesting findings with policy implications: 1) alignment between the hospital management and physicians is critical in successful bundling, 2) integrated hospital systems or hospitals with salaried physicians are likely to benefit more from bundling, and 3) under the current bundled payment mechanism, overall care quality may decrease. We further propose alternative designs to ensure sufficient quality.

2 - Incentive Programs For Reducing Readmissions When Patient Care Is Co-produced

Dimitrios Andritsos, HEC Paris, andritsos@hec.fr,
Christopher S Tang

To compare the effectiveness of three different hospital reimbursement schemes (i.e., Fee-for-Service, Pay-for-Performance and Bundled Payment) in reducing readmissions, we develop a "health co-production" model in which the patient's readmission is "jointly controlled" by the efforts exerted by both the hospital and the patient.

3 - Reference Pricing For Healthcare Services

Shima Nassiri, University of Washington, shiman@uw.edu,
Hamed Mamani, Elodie Adida

The traditional payment system between an insurer and hospitals does not incentivize hospitals to limit their prices and patient to choose less expensive providers, hence contributing to high insurer costs. Reference pricing (RP) has been proposed as a way to better align incentives and control costs. Under RP, the patient may be responsible for part of the cost if they select a high-price hospital. We propose a model to analyze the RP payment scheme that incorporates an insurer, competing hospitals, and patients with the goal of understanding how RP compares with the current payment system.

4 - Role Of Payment Models In The Value And Adoption Of Health-information Exchanges

Mehmet U Ayvaci, University of Texas-Dallas,
800 W Campbell Rd SM33, Richardson, TX, United States,
mehmet.ayvaci@utdallas.edu, Huseyin Cavusoglu,
Srinivasan Raghunathan

We study the interrelationships among the payment model, the providers' incentives to exchange health information (HIE), and the value of HIEs in terms of improving quality or reducing costs. In the context of a stylized healthcare setting, we examine the fee-for-service, performance-, and episode-based payment contracts that induce socially optimal care levels and HIE adoption. Our findings suggest that as payment models evolve over time, there is a real need to reevaluate the value of HIE adoption and the government policies that induce providers to adopt HIEs.

Dealing with Uncertainty in Hospital Operations

Sponsored: Health Applications

Sponsored Session

Chair: Song-Hee Kim, USC Marshall School of Business, Bridge Hall 307A, 3670 Trousdale Pkwy, Los Angeles, CA, 90089, United States, songheek@marshall.usc.edu

Co-Chair: Tinglong Dai, Johns Hopkins University, 100 International Dr, Baltimore, MD, 21202, United States, dai@jhu.edu

1 - Time-driven Activity Based Costing Of Coronary Artery Bypass Grafting Across National Boundaries To Identify Improvement Opportunities

Feryal Erhun, University of Cambridge, f.erhun@jbs.cam.ac.uk

Coronary artery bypass graft (CABG) surgery is a well-established, commonly performed treatment for coronary artery disease—a disease that affects over 10% of US adults and is a major cause of morbidity and mortality. In 2005, the mean cost for a CABG procedure among Medicare beneficiaries in the USA was \$32,201±\$23,059. The same operation reportedly costs less than \$2,000 to produce in India. The goals of this study are to (1) identify the difference in the costs incurred to perform CABG surgery by three Joint Commission accredited hospitals with reputations for high quality and efficiency and (2) characterize the opportunity to reduce the cost of performing CABG surgery.

2 - Clinical Ambiguity And Conflicts Of Interest In Interventional Cardiology Decision-making

Tinglong Dai, Assistant Professor, Johns Hopkins University,
100 International Drive, Baltimore, MD, 21202, United States,
dai@jhu.edu, Xiaofang Wang, Chao-Wei Hwang, Chao-Wei Hwang

Cardiovascular disease is the leading cause of death in the United States, and coronary artery disease (CAD) is the major underlying culprit. Percutaneous coronary intervention (PCI) has proven to be beneficial to patients with acute coronary syndrome, yet its benefit to stable CAD patients is more nuanced. Indeed, unnecessary PCI procedures for stable CAD patients have contributed to wasteful health spending and, in certain cases, patient harm. In this paper, we model both clinical ambiguity and conflicts of interest in interventional cardiology decision-making. Among other results, we show the PCI usage may be non-monotonic in the conflict-of-interest level.

3 - The Value And Price Of Flexibility In Robust Assignment Of Patients To Radiation Therapy Machines

Philip Allen Mar, Dept. of MIE, University of Toronto,
5 King's College Road, Toronto, ON, M5S 3G8, Canada,
philip.mar@mail.utoronto.ca, Timothy Chan

In a radiation cancer therapy program, radiation therapy machines are allocated to treat particular types of cancers to form a fixed network that acts as a guideline for the hospital when assigning patients to machines for treatment. We study the operational efficiency of this system from a manufacturing process flexibility viewpoint. Furthermore, we use robust optimization to prescribe new allocation and assignment guidelines which are robust against deviations from the optimal assignment, and against capacity uncertainty.

4 - Maximizing Intervention Effectiveness Through Robust Optimization

Rong Qing Brian Han, Marshall School of Business,
University of Southern California, Los Angeles, CA, United States,
rongqing.han.2019@marshall.usc.edu, Vishal Gupta,
Song-Hee Kim

In medicine and social science, practitioners often seek to implement interventions that have previously been proven effective via randomized control trials (RCT). Typically, practitioners cannot access the raw data of the RCT, but do have summary statistics from published papers. We propose a novel robust optimization framework to identify a small, targeted group of candidates for the intervention to maximize effectiveness based on these summary statistics. Using data from a large urban hospital, we show that our method often outperforms conventional methods, especially when the target and RCT populations differ substantially.

New Models in Health Care

Sponsored: Health Applications

Sponsored Session

Chair: Lawrence Wein, Stanford University, 655 Knight Way, Stanford, CA, 94305, United States, lwein@stanford.edu

1 - Personalized Medicine

Dimitris Bertsimas, MIT, dbertsim@mit.edu

We use a) Electronic Medical Records from 1.5 million patients over 15 years from the Boston Medical Center and 200 thousand cancer patients from Dana Farber and b) state of the art as well as new machine learning algorithms to propose an algorithmic theory of personalized medicine for several human diseases. We discuss the overall vision, results and possible impact.

2 - Data Uncertainty In Cost-effectiveness Analyses Of Medical Innovations

Joel Goh, Harvard University, jgoh@hbs.edu, Mohsen Bayati,
Stefanos Zenios, Sundeep Singh, David W Moore

Cost-effectiveness studies of medical innovations often suffer from data inadequacy. When Markov chains are used as a modeling framework for such studies, this data inadequacy can manifest itself as imprecision in the elements of the transition matrix. We study how to compute maximal and minimal values of the chain as these uncertain transition parameters jointly vary within a given uncertainty set. We show that these problems are computationally tractable if the uncertainty set has a row-wise structure but generally intractable otherwise. We apply our model to assess the cost-effectiveness of fecal immunochemical testing (FIT), a new screening method for colorectal cancer.

3 - New Models For Fecal Microbiota Transplantations

Lawrence Wein, Stanford University, lwein@stanford.edu,
Abbas Kazerouni

A nonprofit organization, OpenBiome, has created a public stool bank to facilitate fecal microbiota transplantation, which is an effective treatment for Clostridium difficile infection and is being investigated as a treatment for other microbiota-associated diseases. We discuss two problems: optimizing OpenBiome's operations, and using pooled stools to improve the efficacy in clinical trials against microbiota-associated chronic diseases such as ulcerative colitis.

4 - Designing Strategic National Stockpile – A Two-stage Robust Optimization Approach

Peter Yun Zhang, Massachusetts Institute of Technology,
Cambridge, MA, United States, pyzhang@mit.edu,
Nikolaos Trichakis, David Simchi-Levi

We present a model that captures two sets of decisions a supply chain network designer faces: placement of inventory in preparation for demand uncertainty, and resource allocation after the uncertain events unfold. We show optimality and tractability results for problem structure that arises from designing the Strategic National Stockpile.

Public Health and Health System Modeling

Sponsored: Health Applications

Sponsored Session

Chair: Stan Neil Finkelstein, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States, snfinkel@mit.edu

1 - A Dynamic Model Of Post-traumatic Stress Disorder For Military Personnel And Veterans

Navid Ghaffarzadegan, Virginia Tech, 307 Craig Dr., Blacksburg, VA, 24060, United States, navidg@vt.edu, Alireza Ebrahimvandi, Mohammad S. Jalali

The importance and complexity of PTSD raise a critical question: What are the future trends in the population of PTSD patients among military personnel and veterans? We developed a system dynamics simulation model of the population of combat-related PTSD patients. The model is validated by replicating the historical data from 2000 to 2014. It forecasts PTSD prevalence, and estimates costs for the military and the VA under various policies and scenarios. One particular finding is that in a postwar period, current health policy interventions have only marginal effects on mitigating the problem of PTSD.

2 - Modeling Food Supply Systems To Identify Outbreak Origins

Elena Polozova, Undergraduate Student, Massachusetts Institute of Technology, 77 Massachusetts Ave., Cambridge, MA, 02139, United States, polozova@mit.edu, Abigail Lauren Horn, Andreas Balster, Hanno Friedrich

The aim of this research is to efficiently identify the source of large-scale outbreaks of foodborne disease while contamination-caused illnesses are still occurring, thereby resolving investigations earlier and averting potential illnesses. We propose a holistic system for real-time source detection, which combines a dynamic model of commodity flows with a spatio-temporal method for source localization on networks. We evaluate the ability of the system to identify the source of simulated outbreaks and real historical outbreaks of foodborne disease in Germany, quantifying benefits in comparison to current methods in outbreak identification.

Scheduling in Practice

Invited: Project Management and Scheduling

Invited Session

Chair: Emrah Cimren, Nike, Portland, OR, United States, cimren.1@gmail.com

1 - Integrated Staffing And Scheduling In Call Centers Using Dynamic Queueing Models

Raik Stolletz, University of Mannheim, Chair of Production Management, Schloss, Mannheim, 68131, Germany, stolletz@bwl.uni-mannheim.de

Traditional sequential approaches derive staff requirements using queueing models in a fist step and use these results as constraints in determinist shift scheduling as a second step. We present a simultaneous approach, which determines the shift schedule directly based on a forecast of the arrival rates, the constraints on shift, and service level requirements.

We present a general stochastic optimization model for the simultaneous approach. Based on an approximation method for time-dependent queues, we will analyze the respective non-linear optimization model. In a numerical study we compare both approaches.

2 - Scheduling Of Vehicles With Handover Relations At Transshipment Terminals

Dirk Briskorn, University of Wuppertal, briskorn@wiso.uni-koeln.de, Malte Fliedner, Martin Tschöke

We consider a generic problem arising when coordinating deliveries and collections at a transshipment terminal. A set of vehicles and a set of doors given, we distinguish between problem settings where each vehicle can be docked only once, each vehicle can be docked multiple times at the same door, and each vehicle can be docked multiple times at different doors. We have a set of handover relations meaning that one vehicle delivers goods to be picked up by an other. For such a handover relation to be satisfied the second vehicle must be docked at some point of time after the first arrival of the first vehicle. We consider settings where storing goods is allowed and settings where this is not the case and investigate the computational complexity of finding a feasible docking policy.

3 - Staff Scheduling For Regular And On-call Hours In Retailers When Sales Are Correlated With Store Traffic And Staffing

Osman Alp, University of Calgary, Haskayne School of Business, 2500 University Drive, Scurfield Hall 120, Calgary, AB, T2N1N4, Canada, osman.alp@ucalgary.ca

Sales in retail stores are closely related to store traffic and level of staffing, among other factors. We consider a retail store which can keep track of customer traffic continuously and has the option of scheduling some of their staff on an on-call basis in addition to their regular shift hours. Based on the observed store traffic, retailer may summon the reserved on-call workers with an offset. We investigate the staff scheduling problem of such retailers. The retailer aims to find an optimal staff schedule for regular shifts, the number of on-call staff reserved for every hour, and a decision rule to summon the workers if necessary. We propose a model to solve this problem and conduct numerical analysis.

Combinatorial Auctions

Invited: Auctions

Invited Session

Chair: Sven Seuken, University of Zurich, Zurich, Switzerland, seuken@ifi.uzh.ch

1 - Core-selecting Payment Rules For Combinatorial Auctions With Uncertain Availability Of Goods

Dmitry Moor, University of Zurich, Zurich, Switzerland, dmoor@ifi.uzh.ch, Sven Seuken, Tobias Grubenmann, Abraham Bernstein

In some auction domains, there is uncertainty regarding the final availability of the goods being auctioned off. For example, a government auctioning off spectrum from its public safety network may need this spectrum back in times of emergency. In such a domain, standard combinatorial auctions perform poorly as they lead to violations of individual rationality (IR), even in expectation, and to very low efficiency. We present payment rules for such domains. We show that in these domains, there does not exist a payment rule which is guaranteed to be ex-post core-selecting. We then demonstrate that by making the rules "execution-contingent", we can reduce IR violations while achieving IR in expectation.

2 - SATS: A Spectrum Auction Test Suite

Michael Weiss, tba, tba, Switzerland, weiss.michael@gmx.ch, Benjamin Lubin, Sven Seuken

For the past 16 years, much of the work on combinatorial auctions (CAs) has used the CATS instance generator [Leyton-Brown et al., 2000]. While this test suite has been very beneficial to the community, it does not model spectrum auctions particularly well, which in recent years have become the most important application of CAs. In this talk, we introduce SATS, a new "spectrum auction test suite," providing a unified framework and code base for several of the spectrum auction generators that have been proposed in the literature. Furthermore, we include a novel generator that captures the important and difficult to model geographic complementarities of auctions such as the 2014 Canadian auction.

3 - Design Of Combinatorial Auctions Using Machine Learning-based Bidding

Gianluca Brero, University of Zurich, Zurich, Switzerland, brero@ifi.uzh.ch, Benjamin Lubin, Sven Seuken

Combinatorial auctions are attractive mechanisms to efficiently allocate resources even when bidders have combinatorial valuations. However, the large number of items sold in many real-world auctions prevents a direct application of combinatorial auction formats. In particular, designing concise bidding languages that do not constrain the bidders' expressiveness is a challenging task. In this talk, we will present a new paradigm for designing bidding languages based on machine learning principles. We show that we can exploit simple knowledge about bidders' preferences to automatically design concise bidding languages that don't limit the expressiveness of the bidders.

4 - Designing A Combinatorial Market For Offloading Cellular Traffic Via Wireless Access Points

Sven Seuken, University of Zurich, seuken@ifi.uzh.ch

We study a market where mobile network operators (MNOs) are enabled to offload some of their peak-time cellular traffic via wireless access points. This is a challenging domain because the MNOs have complex combinatorial preferences regarding when and where to offload their cellular traffic. We first describe how the MNOs' preferences can be modeled succinctly. Then we introduce a combinatorial allocation mechanism that computes an optimal allocation, i.e., which MNOs get to offload how much of their traffic in which of their cell sectors and at what time of the day. Finally, we show how to use core-selecting combinatorial auctions to computes prices for each MNO.

Empirical Studies in Supply Chain Management

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Jun Li, Ross School of Business, University of Michigan, Ann Arbor, MI, United States, junwli@umich.edu

1 - The Causes Of Drug Shortages: An Empirical Analysis

Yixin (Iris) Wang, Ross School of Business, University of Michigan, Ann Arbor, MI, United States, iriswang@umich.edu, Jun Li, Ravi Anupindi

The country has seen an increasing number of drug shortages starting from mid-2000s, which led to rationing in treatment, delays in care, increasing medication errors and higher costs of care. This research tries to uncover the root causes of drug shortages and to quantify the size of each of their impacts. In particular, one of the objective is to understand what caused increasing quality problems? Is it due to manufacturing quality deterioration (and if so, why)? Or is it due to increasing FDA regulation stringency? To disentangle these possible causes, we conduct text analysis on FDA warning letters from 2000 to 2015.

2 - Ration Gaming And The Bullwhip Effect: A Structural Econometric Study

Robert Bray, Kellogg School of Management, Northwestern University, r-bray@kellogg.northwestern.edu

We develop a dynamic discrete choice estimator of (s, S) inventory models. We apply this estimator to a 5,320-SKU, 1,371-day sample from a Chinese supermarket to quantify the effect of ration gaming.

3 - Quality Propagation In The Supply Chain And Its Implication On Customer Future Purchasing Behavior: An Empirical Study

Qiuping Yu, Kelley School of Business, Indiana University, 1309 E. Tenth Street, Bloomington, IN, 47405, United States, qiupyu@indiana.edu, Shawn Mankad, Masha Shunko

We integrate transaction data from all stages of the supply chain including the manufacturers, distributors, restaurants and customers along with the customer survey and supply chain complaints data from a fast food restaurant chain to understand customer purchasing behavior. In particular, we focus on how customer satisfaction, supply chain quality, and promotions shape customer future purchasing decisions.

Operations-Marketing Interface

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Xuanming Su, University of Pennsylvania, Philadelphia, PA, United States, xuanming@wharton.upenn.edu

1 - Online And Offline Information For Omnichannel Retailing

Fei Gao, University of Pennsylvania, Philadelphia, PA, United States, feigao@wharton.upenn.edu, Xuanming Su

Omnichannel consumers strategically make use of online and offline channels to gather information and purchase products. We study different omnichannel information strategies and their profit implications for firms.

2 - Leveraging Physical Presence In Omni-Channel Retail

Antonio Moreno-Garcia, Kellogg School of Management, a-morenogarcia@kellogg.northwestern.edu, David Bell, Santiago Gallino

With the growing relevance of online channels, retailers are exploring new ways in which they can overcome the impediments associated with selling products with non-digital attributes, such as apparel, without customers having physical access to products. By implementing a series of randomized field experiments, we study the value of virtual fit information in online retail.

3 - Signaling To The Crowd: Private Quality Information And Rewards-based Crowdfunding

Robert Swinney, Associate Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27516, United States, robert.swinney@duke.edu, Soudipta Chakraborty

We consider the problem a seller designing a rewards-based crowdfunding campaign via a platform like Kickstarter. The seller solicits donations from contributors, and if total contributions exceed a pre-determined threshold the campaign is a success, the seller receives all donations and each contributor receives a reward; otherwise, contributors are refunded their donations and the campaign is a failure. When contributors know less than the seller, e.g. about the value of the reward or the likelihood of success, we determine how the seller should design its crowdfunding campaign.

4 - Donor Product-subsidies To Increase Consumption: Implications Of Consumer Awareness And Profit-maximizing Intermediaries

Terry Taylor, University of California Berkeley, Berkeley, CA, 94720, United States, taylor@haas.berkeley.edu, Wenqiang Xiao

Increasingly, donors that subsidize socially-desirable products (e.g., improved cook stoves, malaria drugs) in the developing world are shifting from distributing through non-commercial to commercial channels, ceding control of the product price to for-profit intermediaries. This paper advises a donor as to how the donor's loss of price control and the level of consumer awareness—defined as the fraction of the consumer population that is informed of the product's benefits—influence the donor's optimal subsidy and utility.

Issues in Environmental Operations: Managing Risk, Customer Returns, and Regulations

Sponsored: Manufacturing & Service Oper Mgmt, Sustainable Operations

Sponsored Session

Chair: Gokce Esenduran, Ohio State University, Columbus, OH, United States, esenduran_1@fisher.osu.edu

1 - Risk Management Through Investment In Sustainability

Ali Shantia, HEC Paris, Paris, France, ali.shantia@hec.edu, Sam Aflaki, Hamed Ghoddusi

We study firms' incentives to hedge input price risks through investment in energy efficiency (EE) solutions. In particular, we focus on how the convexity in profit function and the level and nature of uncertainties in the price of input commodities affect the decision of a single firm regarding the level of EE investment. We then characterize conditions under which investment in EE solutions substitutes or complements conventional financial hedging mechanisms. Finally, our analysis is further extended to a case with market power, where multiple firms make strategic decisions regarding optimal hedging and production.

2 - The Impact Of Consumer Returns On The Multichannel Sales Strategies Of Manufacturers

Paolo Letizia, Assistant Professor of Business Analytics, University of Tennessee, Knoxville, TN, 37996, United States, pletizia@utk.edu, Terry P Harrison

Manufacturers can provide consumers with a higher value when selling products through thei

3 - A Framework To Estimate The Economic And Environmental Impacts Of Take-back Legislation

Eda Kemahlioglu-Ziya, North Carolina State University, Raleigh, NC, United States, ekemahl@ncsu.edu, Megan Jaunich, Hadi Gashti, Joseph F DeCarolis, Robert Handfield, Ranji S Ranjithan

We develop a process model of returned product recycling under take-back legislation. We use data from this model to populate an optimization model and use it to estimate the cost and environmental impact of take-back legislation. Our research provides insights regarding how costs and environmental impact (measured in GHG emissions) of legislation change as implementation details such as covered products, minimum take-back requirements change.

4 - Valuable E-waste: Implications For Extended Producer Responsibility

Atalay Atasu, Georgia Institute of Technology, atalay.atasu@scheller.gatech.edu, Gokce Esenduran, Luk N Van Wassenhove

In a market regulated with take-back regulation, if recycling is profitable then producers have to compete with independent recyclers in collection and recovery of end-of-life (EoL) products. We answer the question of whether recovery targets lead to better environmental and economic outcomes in a competitive market for EoL products. We also compare two regulatory scenarios, where only producer collection counts and where both producer and recycler collection count towards meeting recovery targets. Our results show that counting recycler collection towards recovery targets does not always improve the welfare.

Supply Chain Channel Management

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Guoming Lai, University of Texas at Austin, United States, guoming.lai@mccombs.utexas.edu

Co-Chair: Abhishek Roy, UT Austin, UT Austin, Austin, TX, 78712, United States, abhishek.roy@utexas.edu

1 - Financial Cross-ownership And Information Dissemination In A Supply Chain

Noam Shamir, Tel-Aviv University, Coller School of Management, Tel-Aviv, Israel, nshamir@post.tau.ac.il, Yossi Aviv

We study the effect of financial cross-ownership on two imperative operational decisions in a supply-chain with competing retailers and a mutual supplier: Information acquisition and production level. Financial cross-ownership describes a situation in which an incumbent retailer holds non-voting stocks in an entrant retailer. We demonstrate the significant operational effect of this investment tool. At the production stage, financial cross-ownership results in lower production level and reduced competition level. However, financial cross-ownership can result in pro-competitive effects; it facilitates information acquisition, that can benefit the consumers.

2 - Broader Market Coverage For Innovative Products With Deliberate Supply Chain Leadership

Hyoduk Shin, UC San Diego Rady School of Management, hdshin@ucsd.edu, Vish Krishnan, Junghee Lee, Oleksiy Mnyshenko

How can we achieve broader market coverage for innovative products, i.e., inclusive innovation? Grounded in industrial practice, we show that deliberately choosing the contract leader and the investor in a multi-tiered supply chain can have a significant impact on market coverage. We discuss leadership handovers along the product life cycle.

3 - Manufacturer Rebate Competition In A Supply Chain With A Common Retailer

Yunjie Wang, Hong Kong University of Science and Technology, yunjie89@gmail.com, Albert Y Ha, Weixin Shang

We consider manufacturer rebate competition in a supply chain with two manufacturers selling substitutable products to a common retailer. We characterize the manufacturers' equilibrium rebate decisions and show how they depend on several key factors such as the fixed cost of a rebate program, competition intensity, cost effectiveness of rebate and the proportion of rebate-sensitive consumers in the market. We also consider the case when the retailer subsidizes the manufacturers to offer rebate.

4 - The Implications Of Visibility On The Use Of Strategic Inventory In A Supply Chain

Abhishek Roy, University of Texas at Austin McCombs School of Business, abhishek.roy@utexas.edu, Stephen M Gilbert, Guoming Lai

It is now widely accepted that a retailer's use of strategic inventory benefits both the retailer and the manufacturer. However, it has typically been assumed that the manufacturer has perfect information about the retailer's level of inventory, either by observing it directly, or by inference based on sales observations. Yet, in reality, there are many situations in which a manufacturer may lack the ability to observe either the sales or the inventory of the retailer. We investigate how this lack of inventory observability affects the use of strategic inventory in a supply chain, and how the possibility of strategic inventory shapes the information preferences of the retailer and the manufacturer.

Co-Chair: Volodymyr O Babich, Georgetown University, 3700 O St NW, Washington, DC, 20057, United States, vob2@georgetown.edu

1 - Inventory And Signaling To Creditors

Jiri Chod, Boston College, Chestnut Hill, MA, United States, chodj@bc.edu, Nikolaos Trichakis, Gerry Tsoukalas

We argue that by borrowing goods (e.g., through supplier trade credit) rather than cash (e.g., through a bank), firms may be able to convey private information to their creditors more efficiently. As a result, in-kind financing mitigates signaling costs, rationalizing among others, why firms may prefer to finance their operations through their suppliers. Our model suggests this preference can persist even when in-kind lenders have no prior informational advantage and face comparatively higher cost of capital, and is more pronounced when the borrowed goods have higher margins or differentiation, or require less production effort.

2 - Innovative Financing For Sme Suppliers: Factoring, Reverse Factoring And Retailer's Engagement

Fasheng Xu, Washington University in St. Louis, St. Louis, MO, fasheng.xu@wustl.edu, Panos Kouvelis

We consider a pull supply chain with a large retailer and an SME supplier, who is in need of short-term pre-shipment financing. The bank offers a fairly priced loan and repayment failure leads to costly bankruptcy. Benefits of recourse factoring are limited, but non-recourse factoring achieves surprisingly better performance by eliminating market frictions. Further, we investigate two financing schemes in reverse factoring: the partial credit guarantee (PCG) and the purchase order commitment (POC). We find PCG can slightly reduce supplier's financing cost, meanwhile POC can lead to a win-win solution for the decentralized supply chain, with even higher expected profit than the centralized one.

3 - R&D Investments In The Presence Of Free-riding And Risk-shifting Incentives: Can Debt Financing Mitigate Under-investment?

Jie Ning, Case Western Reserve University, Cleveland, OH, United States, jie.ning@case.edu, Volodymyr O Babich

When information is a public good, in equilibrium firms under-invest (relative to the social optimum) in acquiring it to free-ride on investments of other firms. When firms are financed by debt, in equilibrium equity holders invest in riskier projects relative to the firm-optimal. The interactions between these two inefficiencies arise when risky investments are needed to acquire information that becomes a public good, as in some R&D projects. We model these interactions in a three-stage game with two firms and an external debt market. We show that the presence of free-riding and risk-shifting incentives may lead to either under-investment, over-investment, or socially optimal investment.

Revenue Mgt, Pricing II

Contributed Session

Chair: Sareh Nabi Abdolyousefi, University of Washington, 2727 NE 55th Street, Seattle, WA, 98105, United States, snabi@uw.edu

1 - A Pricing Setting Retailer Sourcing From Competing Suppliers Facing Disruption

Xi Shan, Student, The University of Texas at Dallas, 800 W. Campbell Road, Richardson, TX, 75080, United States, 130630@utdallas.edu, Suresh P Sethi", Tao Li

We study the case of a price-setting retailer who sources from two strategic suppliers subject to independent or correlated disruption and sets the retail price upon delivery. We model this case as a Stackelberg-Nash game with the suppliers as the leaders and the retailer as a follower, and obtain explicitly the equilibrium of the game. We identify cases in which the retailer orders from one perfectly reliable supplier and one unreliable supplier, and two correlated unreliable suppliers. In the latter case, the equilibrium suppliers' profits can increase in supplier disruptions correlation, which is not consistent with the literature.

2 - Pricing Of Internet Dynamically Under Changing Capacity

Demet Batur, Assistant Professor, University of Nebraska - Lincoln, CBA 209, Lincoln, NE, 68588-0491, United States, dbatur@unl.edu, Jennifer Ryan, Zhongyuan Zhao, Mehmet C Vuran

Technological advancements created the TV white space (TVWS)—the opportunity to use parts of the TV spectrum for Internet when and where the TV channels are not actively used by broadcasting companies. The Internet capacity generated from the emerging TVWS systems will change stochastically. Also, the capacity needed by the customers for various Internet activities differ significantly, e.g., email checking versus video streaming. We present a Markov Decision Process model for the service provider to post dynamically changing prices to the customers based on the current available capacity and the expected customer usage with a revenue maximization objective.

3 - Evaluating The Impact Of Adopting 3d Printing Services On The Retailers

Sharareh Rajaei dehkordi, PhD Student of industrial engineering, New Jersey Institute of Technology, 10 Hill Street, Apt 2N, Newark, NJ, 07102, United States, sr552@njit.edu, Wenbo (Selina) Cai

As 3D printing technology becomes more agile to react to customers' demands, one important question for the retailers is whether they should provide 3D printing services in their brick-and-mortar store in addition to the traditional off-the-shelf product? If so, what is the pricing scheme that achieves the optimal profit? What is the optimal capacity of the 3D printers? In this study we answer these questions by examining retailer's optimal joint decisions on pricing scheme and capacity while considering consumers preferences for self-designed, 3D printed products versus off-the-shelf products, using queueing systems and stochastic optimization models.

4 - Choice-based Revenue Management Under Online Reviews

Dirk Daniel Sierag, CWI, Science Park 123, Amsterdam, 1098 XG, Netherlands, dirk@cwi.nl

This article proposes a choice-based network revenue management model that integrates the effect of reviews. Application areas include airlines, hotels, and rental cars. The dependency between reviews and revenue is two-fold: the content of a review depends on the product the customer purchases, and reviews impact the demand. A complicating factor in this model is that the effects of reviews are delayed, i.e., by sacrificing revenue now in order to get better reviews, long-term revenue can be increased. Novel solution methods are proposed that exploit the presence of reviews in order to optimise revenue.

5 - Customer'S Strategic Behavior Using Thompson Sampling

Sareh Nabi Abdolyousefi, University of Washington, 2727 NE 55th Street, Seattle, WA, 98105, United States, snabi@uw.edu

Retailer is pricing dynamically in order to maximize his cumulative expected revenue in a multi-armed bandit setting. Retailer has no information regarding expected demand and type of customers he is facing, myopic or strategic. He is applying a machine learning technique, updated Thompson Sampling, to learn expected demand and customer's type in an exploration vs exploitation fashion. We have proved analytically that retailer's long run price is lower for strategic customers compared to myopic ones. We have also shown numerically that retailer can be better off with strategic customers.

Queueing Models II

Contributed Session

Chair: Iqra Ejaz, Texas A&M University, College Station, TX, United States, iejaz@tamu.edu

1 - Multiple Server Preemptive Scheduling With Impatience

Yang Cao, University of Southern California, Los Angeles, CA, 90089, United States, cao573@usc.edu

We study a scheduling problem with n impatient customers to be served by m parallel servers (n>m). We assume that the impatience time of customers in queue and the service time on servers are all exponentially distributed, and the system earns a positive reward upon each service completion. We consider both the case of non-preemptive servers and the case of preemptive servers. The objective is to maximize the expected total return for both cases. We give conditions under which a list policy is optimal.

2 - Optimal Control Of General Dynamic Matching System

Mohammadreza Nazari, PhD Student, Lehigh University, Lehigh University, Murray H Goodman Campus, Bethlehem, PA, 18015, United States, mon314@lehigh.edu, Aleksandr Stolyar

Consider a system with random arrivals of items of multiple types. There is a finite number of possible matchings, each being a subset of item types. Each matching has associated fixed reward, and matched items leave the system. We propose a matching algorithm and prove its asymptotic optimality in the sense of maximizing the long-term average reward, while keeping the item queues stable. This algorithm applies an extended version of the greedy primal-dual (GPD) algorithm to a virtual system, which allows negative item queues.

3 - Acuity-based Nurse-staffing Strategies For Inpatient Settings Using A Stochastic Modeling Approach

Parisa Eimanzadeh, PhD Student, Wichita State University, 6000 E Mainsgate Street, Apt 108, Wichita, KS, 67220, United States, pxeimanzadeh@wichita.edu, Ehsan Salari

Minimum nurse-to-patient ratios have been traditionally used to guide staffing decisions in inpatient units. However, the severity of nursing care may vary across inpatients, rendering those ratios ineffective. We develop a stochastic modeling framework to quantify the impact of different staff levels on the performance of inpatient units while accounting for heterogeneity in patient acuity and staff nursing skill levels.

4 - Condition-based Maintenance For Queues With Degrading Servers

Iqra Ejaz, Texas A&M University, College Station, TX, United States, iejaz@tamu.edu, Michelle M. Alvarado, Nagi Gebraeel, Natarajan Gautam, Mark Alan Lawley

We derive an analytical model for condition monitoring of a single server queue with Markovian degradation, Poisson arrivals, and general service and repair times. Stability conditions and performance measures (e.g., average queue length, average degradation.) are derived through steady state analysis. An optimal repair decision model is presented that minimizes an objective function with four costs: repair, catastrophic failure, quality and holding. We develop and verify a simulation model, perform a sensitivity analysis, and show insights learned from relaxing underlying assumptions.

Co-Chair: Lauren Xiaoyuan Lu, University of North Carolina at Chapel Hill, Chapel Hill, NC, United States, lauren_lu@unc.edu

1 - Do Mandatory Overtime Laws Improve Quality? Staffing Decisions And Operational Flexibility Of Nursing Homes

Lauren Xiaoyuan Lu, University of North Carolina at Chapel Hill, Chapel Hill, NC, United States, lauren_lu@unc.edu, Susan F Lu

During the 2000s, over a dozen U.S. states passed laws that prohibit health care employers from mandating overtime for nurses. Using a nationwide panel dataset from 2004 to 2012, we find that these mandatory overtime laws reduced the service quality of nursing homes, as measured by an increase in deficiency citations. This outcome can be explained by two undesirable changes in the staffing hours of registered nurses: decreased hours of permanent nurses and increased hours of contract nurses per resident day.

2 - Predicting Nurse Turnover And Its Impact On Staffing Decisions

Eric Webb, Indiana University, Bloomington, IN, United States, ermwebb@indiana.edu, Kurt Bretthauer

Nurse turnover remains a significant problem in skilled nursing facilities across the United States. High turnover leads to two important questions: (1) Hiring decisions - What applicant attributes should be valued when hiring nurses, in order to hire nurses that are effective at their jobs and likely to stay for a long duration? (2) Staffing decisions - How should nurse workload be managed in order to prevent burnout and decrease turnover? Based on a large dataset from skilled nursing facilities in the United States, we first use a survival model to predict nurse turnover. For this talk we then focus on staffing and incorporate these empirical results into analytical models for nurse staffing decisions.

3 - Hospital Readmissions Reduction Program: An Economic And Operational Analysis

Dennis Zhang, Washington University in St. Louis, St. Louis, MO, 90024, United States, zjj1990228@gmail.com

The Hospital Readmissions Reduction Program (HRRP) requires the Centers for Medicare and Medicaid Services to penalize hospitals with excess readmissions. We take an economic and operational (patient flow) perspective to analyze the effectiveness of this policy in encouraging hospitals to reduce readmissions. We develop a game-theoretic model to show that the competition among hospitals can be counterproductive: it increases the number of nonincentivized hospitals. We calibrate our model with a data set of more than 3,000 hospitals and draw several policy recommendations to improve this policy's outcome.

Public Sector Service Operations

Sponsored: Manufacturing & Service Oper Mgmt, Service Operations

Sponsored Session

Chair: Gad Allon, Northwestern University, Kellogg School of Management, Evanston, IL, 60208, United States, g-allon@kellogg.northwestern.edu

1 - Social Engagement And Learning In Massive Open Online Courses: Evidence From Field Experiments

Dennis Zhang, Washington University, 8342 Delcrest Drive, Apt 328, University City, MO, 63124, United States, denniszhang@wustl.edu, Gad Allon, Jan A Van Mieghem

This paper studies how service providers can design social interaction among participants and quantify the causal impact of that interaction on service quality. We focus on education and analyze whether encouraging social interaction among students improves learning outcomes in Massive Open Online Courses (MOOCs), which are a new service delivery channel with universal access at reduced, if not zero, cost. We analyze three randomized experiments in a MOOC with more than 30, 317 students from 183 countries. Combining results from these three experiments, we provide recommendations for designing social interaction mechanisms to improve service quality.

2 - Menu Design In Subsidized Housing Lotteries

Peng Shi, Massachusetts Institute of Technology, pengshi@mit.edu

The right to purchase subsidized housing is often allocated by lottery. When allocating multiple types of houses, one design question is whether to run the lotteries in sequence or in parallel. When the lottery is done in parallel, which is the case for example in Singapore for Build To Order (BTO) flats, another design question is what menu of options to offer at the same time. We develop a tractable model to help policy makers think about the welfare consequences of different lottery designs.

3 - Matching Applicants To Apartments In The Nyc Public Housing Waiting List

Jacob Leshno, Columbia University, yarboz@gmail.com

Public housing apartments become available stochastically over time, and get assigned to applicants in an overloaded waiting list. Applicants choose apartments based on their preferences and the expected wait estimates for the different apartments open to them. We combine theoretical work looking at waiting list allocation mechanism and data from the assignment from new york city to investigate efficiency of current and suggested policies.

4 - Should Hospitals Keep Their Patients Longer? The Role Of Inpatient Care In Reducing Post-discharge Mortality

Carri Chan, Columbia Business School, cwchan@columbia.edu, Ann Bartel, Song-Hee Kim

CMS endorsed 30-day mortality rates as important indicators of hospital quality, despite concerns that post-discharge mortality rates consider the frequency of an event that occurs after a patient is discharged and no longer under the watch and care of the hospital. Using a dataset of all Medicare hospital encounters from 2000 to 2011 and an instrumental variables methodology to address the potential endogeneity bias in hospital length-of-stay, we find evidence that 30-day mortality rates are appropriate measures of hospital quality. For patients with diagnoses of Pneumonia or Acute Myocardial Infarction, an additional day in the hospital could decrease 30-day mortality rates by up to 12.8%.

Innovative Pricing

Sponsored: Manufacturing & Service Oper Mgmt, Supply Chain

Sponsored Session

Chair: Yao Cui, Cornell University, 401N Sage Hall, Ithaca, NY, 14853, United States, yao.cui@cornell.edu

1 - Price Competition In The Presence Of Social Comparison And Demand Uncertainty

Yun Zhou, University of Toronto, Toronto, ON, Canada, Yun.Zhou13@Rotman.Utoronto.Ca, Ming Hu, Tony H Cui

We consider the price competition between a duopoly selling differentiated substitutable products under additive demand uncertainty, in which firms' decisions are influenced by social comparison. Social comparison theory, as well as conventional wisdom, suggests that social comparison behaviors, such as behind aversion (upward comparison) and ahead seeking (downward comparison), all work in the similar fashion to intensify competition. We demonstrate how opposite-directional social comparisons interact with demand variability to change competitive behaviors.

2 - The Operational Advantages Of Threshold Discounting Offers

Simone Marinesi, WHARTON, marinesi@wharton.upenn.edu, Karan Girotra, Serguei Netessine

We study the use of threshold discounting, the practice of offering a discounted service only if a pre-determined number of customers subscribe to the service, as pioneered by Groupon. We show novel operational advantages of these offers, including making strategic customers beneficial to the firm.

3 - Dynamic Pricing Under Debt: Spiraling Distortions And Efficiency Losses

Dan Andrei Iancu, Stanford University, 655 Knight Way, Stanford, CA, 94305, United States, daniancu@stanford.edu, Omar Besbes, Nikolaos Trichakis

We analyze the distortions induced by the presence of debt on a seller's dynamic pricing policy, as well as the efficiency losses that such distortions generate. We show that sellers under debt always price higher and discount items at a lower pace than optimal, and that these distortions compounds over time, leading to a form of spiraling down in efficiency.

4 - Price Dispersion And Consumer Upgrades: Theory And Empirical Evidence From Airline Industry

Yao Cui, Cornell University, Ithaca, NY, United States, yao.cui@cornell.edu, A. Yesim Orhun, Izak Duenyas

We study how the offering of premium seating upgrades affects the airline's ticket price dispersion. We provide insights into this effect both analytically and empirically.

1 - Carrot Or Stick? An Analysis Of Environmental Policies In Supply Chains

Xuan Zhao, Associate Professor, Wilfrid Laurier University, 75 University Ave. W., Waterloo, ON, N2L3C5, Canada, xzhao@wlu.ca, Junsong Bian

We examine two types of environmental policies: pollution abatement subsidy ("Carrot" policy) and pollution emission tax ("Stick" policy), in a supply chain where the manufacturer invests in a pollution abatement technology. We find the "Carrot" policy furnishes a higher incentive to the manufacturer's pollution abatement, does not intensify double marginalization, and yields higher profits for both the manufacturer and the retailer. However, when the pollution abatement is very costly and the production emission is highly damaging, the government prefers to implement the "Stick" policy as the "Carrot" policy leads to lower social welfare and environmental performance.

2 - Strategies To Combat Refurbished And Remanufactured Counterfeit Products

Morteza Pourakbar, Erasmus University, Vignolahof 14, Rotterdam, 3066 AV, Netherlands, MPourakbar@rsm.nl, Paolo Letizia, Mohammad Nikoofal

End-of-life and end-of-use products are considered as one of the main sources of core acquisitions for counterfeiters. In this paper, we study what and how anti-counterfeiting strategies could be used to deter counterfeiters from producing refurbished and re-manufactured counterfeit products.

3 - The Value Of Competition In Remanufacturing

Narendra Singh, Indian School of Business, Sector 81, Mohali, 140306, India, narendra_singh@isb.edu, Karthik Ramachandran, Ravi Subramanian

We study an OEM's product strategy when the OEM offers a new product that depreciates over time and consumers are strategic. The OEM competes with a third-party remanufacturer for acquisition and remanufacturing of the depreciated products. We study how competition from the third-party remanufacturer affects the OEM.

1 - Financial Valuation Of Wellness Centered Operations

Min Kyung Lee, Clemson University, 100 Sirrine Hall, Clemson, SC, 29634, United States, minl@g.clemson.edu, Aleda Roth, Rohit Verma, Bernardo F. Quiroga

The importance of individual health and their wellbeing sheds light on the evolution of building design to achieve human sustainability. This study contributes the unstudied area of the financial and market impact of hotel guest rooms with wellness inspired features by comparing the Revenue Per Available Room (RevPAR) and customer satisfaction score.

2 - Extended Warranty Information Availability Formats: Impact On Consumer Purchase Decisions

Paul R Messinger, University of Alberta, Faculty of Business, 3-20e Faculty Of Business Bldg, Edmonton, AB, T6G 2R6, Canada, paul.messinger@ualberta.ca, Moein Khanlari Larimi

Information about extended service contracts, mainly price, is generally offered to buyers subsequent to their product purchase decision during the checkout. However, extended service contract (ESC) information has also been made available alongside product attribute information. In this research, we ask whether and how the mere availability of ESC information during the product choice phase might affect consumers' product and ESC purchase decisions. To answer this question, we pit the simultaneous vs. delayed ESC information availability strategies against one another in choice experiments.

3 - Technology In Service – From Dumb To Thinking To Feeling

Ming-Hui Huang, Distinguished Professor, National Taiwan University, 1 Sec 4, Roosevelt Road, Taipei, 10617, Taiwan, huangmh@ntu.edu.tw

In this paper a three-generational technology evolution (from automated to thinking to feeling technology) is presented and the way they can be used in service is illustrated. Automated technologies are mainly developed for productivity, which achieves greater output with less input by standardization. Thinking technologies are designed to handle cognition-based personalization for customer satisfaction. Feeling technologies are to handle emotion-based personalization that enriches interactions. Given the multiplicity of technology, we should explore how to use the right technology for the right purpose in the right context by the right employees for the right customers.

4 - Development Of An Online To Offline Service Blueprint

Do-Hyeon Ryu, Pohang University of Science and Technology, Pohang, Kyungbuk, Korea, Republic of, dhryu@postech.ac.kr, Chie-Hyeon Lim, Kwang-Jae Kim

The online to offline(O2O) service is to find and attract users online and direct them to offline stores. Examples include Uber, Zipcar, Groupon, and so on. Although the term, O2O, is frequently used in academia and industries, research on systematic methods for developing O2O services has been scarce. This research aims to develop a new type of service blueprint specially designed for O2O services. This blueprint is expected to help O2O service providers visualize their services from the customer perspective.

Dynamic Learning Applications

Sponsored: Applied Probability

Sponsored Session

Chair: N. Bora Keskin, Duke University, Durham, Durham, NC, 27708, United States, bora.keskin@duke.edu

1 - Dynamic Pricing In Unknown Environments With Memory

Abbas Kazerouni, Stanford University, Stanford, CA, 94305, United States, abbask@stanford.edu, Benjamin Van Roy

We consider the problem of dynamic pricing in an unknown environment where the demand at any time is governed by the prices at that time as well as the previous time steps. The delayed consequences of the prices introduce new challenges to the problem and require more sophisticated pricing strategies. To deal with this problem, we propose a pricing strategy based on Reinforcement Learning techniques and derive bounds on its performance. We show the efficiency of the proposed strategy by comparing its performance against other strategies as well as the lower bound through some examples.

2 - Online Active Linear Regression

Carlos Riquelme, Stanford University, rikel@stanford.edu, Ramesh Johari, Baosen Zhang

We study the problem of online active learning to collect data for regression modeling; a decision maker that faces a limited experimentation budget but must efficiently learn an underlying linear model. Our main contribution is a novel threshold-based algorithm for selection of most informative observations; we characterize its performance and fundamental lower bounds. We extend the algorithm and its guarantees to sparse linear regression in high-dimensional settings. Simulations show significant benefits over random sampling in several real-world datasets that exhibit high nonlinearity and high dimensionality - strongly reducing the mean and variance of the squared error.

3 - Learning Preferences With Side-information: Near Optimal Recovery Of Tensors

Andrew A Li, MIT, Cambridge, MA, United States, aali@mit.edu, Vivek Farias

Many recent problems of great interest in e-commerce can be cast as large-scale problems of tensor recovery in three dimensions. Thus motivated, we study the problem of recovering 'simple,' 3D tensors from their noisy observations. We provide an efficient algorithm to recover structurally simple tensors given noisy (or missing) observations of their entries; our version of simplicity subsumes low-rank tensors for various definitions of tensor rank. Our algorithm is practical for large datasets and provides a significant performance improvement over incumbent approaches to Tensor completion. Further, we show theoretical recovery guarantees that under certain assumptions are order optimal.

4 - On Incomplete Learning And Certainty-equivalence Control

N. Bora Keskin, Duke University, Durham, NC, United States, bora.keskin@duke.edu, Assaf Zeevi

Motivated by dynamic pricing applications, we consider a dynamic control-and-estimation problem. The decision-maker sequentially chooses controls and observes responses that depend on both the chosen controls and an unknown parameter. The decision-maker uses a certainty-equivalence policy, and we characterize the asymptotic accuracy performance of this policy.

1 - Controlling Bias From Data Exploration Using Information Theory

Daniel Russo, Northwestern University, Evanston, IL, United States, dan.joseph.russo@gmail.com, James Zou

Modern data is messy and high-dimensional, and it is often not clear a priori which questions to ask. Instead, the analyst typically needs to use the data to search for interesting analyses to perform and hypotheses to test. It's widely recognized that this process, even if well-intentioned, can lead to biases and false discoveries, contributing to the reproducibility crisis in science. We propose a general information-theoretic framework to quantify and provably bound the bias of an arbitrary adaptive analysis process. We prove that our bound is tight in natural models, and then use it to give rigorous insights into when common procedures do or do not lead to substantially biased estimation.

2 - K-nearest Neighbor Methods For Information Estimation

Sewoong Oh, University of Illinois, Urbana, IL, United States, swoh@illinois.edu

Estimators of information theoretic measures such as entropy and mutual information from samples are a basic workhorse for many downstream applications in modern data science. State of the art approaches have been either geometric (nearest neighbor (NN) based) or kernel based. In this paper we combine both these approaches to design new estimators of entropy and mutual information. Our estimator uses bandwidth choice of fixed k-NN distances; such a choice is both data dependent and linearly vanishing in the sample size and necessitates a bias cancellation term that is universal and independent of the underlying distribution.

3 - Semidefinite Programming Relaxations For Exact Recovery Of Hidden Communities

Jiaming Xu, Purdue University, West Lafayette, IN, United States, xu972@purdue.edu, Bruce Hajek, Yihong Wu

We study a semidefinite programming (SDP) relaxation of the maximum likelihood for exactly recovering hidden communities under the stochastic block model. It is shown that when the community size is large comparing to the network size, the SDP relaxation achieves the information-theoretic recovery threshold with sharp constants; when the community size is small, the SDP becomes strictly suboptimal comparing to the maximum likelihood estimator.

4 - Influence Maximization In Linear Threshold And Triggering Models

Po-Ling Loh, UW - Madison, Madison, WI, 53717, United States, polingloh@gmail.com

We discuss upper and lower bounds for the influence of a set of nodes in certain types of contagion models. We quantify the gap between our upper and lower bounds in the case of the linear threshold model and illustrate the gains of our upper bounds for independent cascade models in relation to existing results. Furthermore, our lower bounds are monotonic and submodular, implying that a greedy algorithm for influence maximization is guaranteed to produce a maximizer within a $\left(1-\frac{1}{e}\right)$-factor of the truth. Our bounds may be evaluated efficiently, leading to an attractive, highly scalable algorithm for influence maximization with rigorous theoretical guarantees.

Quantitative Risk Management

Sponsored: Financial Services

Sponsored Session

Chair: Abel Cadenillas, University of Alberta, Edmonton, AB, Canada, abel@ualberta.ca

1 - Systemic Influences On Optimal Equity-credit Investment

Christoph Frei, University of Alberta, cfrei@ualberta.ca, Agostino Capponi

Recent events showed that the dependence structure of financial markets is more complex than what is captured by classical models. For example, the financial instability of some companies spread out to affect other companies. We analyze how such systemic influences are reflected in optimal investment decisions. To this end, we introduce a model with dependence structure between market risk and default risk of the companies. An investor can use stocks and credit default swaps (CDSs) to participate in the market. We derive an explicit expression for the optimal investment strategy in stocks and CDSs. An empirical analysis reveals the critical role of systemic risk in portfolio monitoring.

2 - Optimal Governement Debt Ceiling

Abel Cadenillas, University of Alberta, abel@ualberta.ca, Ricardo Huaman-Aguilar

Motivated by the debt crisis in the world, we apply methods of stochastic control to obtain an explicit formula for the optimal government debt ceiling.

3 - Optimal Cash Holdings Under Funding Risk

Andreea Minca, Cornell University, acm299@cornell.edu

This talk explores a one-period model for a firm that finances itsoperations through debt provided by heterogeneous creditors. Creditorsdiffer in their beliefs about the firm's investment outcomes. We showthe existence of Stackelberg equilibria in which the firm holds cashreserves in order to provide incentives for pessimistic creditorsto invest in the firm. We find interest rates and cash holdings tobe complementary tools for increasing debt capacity. In markets witha high concentration of capital across a small interval of pessimisticcreditors or by a few large creditors, cash holdings is the preferredtool to increase the debt capacity of the firm.

4 - EM Algorithm and Stochastic Control

Steven Kou, National University of Singapore, matsteve@nus.edu.sg

We propose an algorithm called EM-Control (EM-C) algorithm to solve multi-period finite-time horizon stochastic control problems. Generalizing the idea of the EM algorithm, the EM-C algorithm sequentially updates the control parameters in each time period in a backward manner. The EM-C algorithm has monotonicity of performance improvement in every iteration. We apply the EM-C algorithm to solve stochastic control problems in real business cycle and monopoly pricing of airline tickets. This is a joint work with Xianhua Peng and Xingbo Xu.

Revenue Management with Advertising Applications

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: John G Turner, University of California - Irvine, Room SB2 338, Irvine, CA, 92697-3125, United States, john.turner@uci.edu

1 - The Bid Adjustment Problem In Search Advertising

Mustafa Sahin, University of Maryland, mustafa.sahin@rhsmith.umd.edu, Subramanian Raghavan, Abhishek Pani, Abhishek Pani

We discuss the problem faced by the advertiser in search advertising in the presence of bid adjustments. Recent developments in search advertising created a setting in which the advertiser can target specific demographics by using bid adjustments. We propose a Mixed Integer Programming formulation for the problem. However, the problem is computationally hard and cannot be solved by a generic commercial solver for any instance of reasonable size. Therefore, we offer heuristic approaches to tackle the intractability issues and present results on hard instances.

2 - Analysis Of Competitive Pricing With Multiple Overlapping Competing Bids In Revenue Management

Goutam Dutta, Professor, Indian Institute of Management, House No 407, Iima Old Campus, Vastrapur, Ahmedabad, 380015, India, goutam@iima.ac.in

We formulate the pricing problem from the point of view of one seller having one or multiple competitors (say n). Based on past experience, we know the distribution of bid prices of the competitors. We consider uniform and normal distribution to describe the bid price of the competitors. The prices of the competitors are mutually independent and the price ranges are either identical or different and overlapping. We maximize the expected contribution of the seller. Assuming the contribution as a linear function of price we find the conditions for maximization of the expected contribution to profit in case of n bidders. Further, we also compare the optimization results with simulation results.

3 - Markov Chain Models For Controlling The Frequency Distribution Of Online Advertising

Seyed Ali Hojjat, University of New Hampshire, Durham, NH, United States, ali.hojjat@unh.edu, John G Turner

Recent trends in online advertising show that explicit reach and frequency specifications are more desired over aggregate impression or budget goals. Depending on whether the frequency of ad serving to each user is measured over a fixed timespan (e.g., the number of times each user is exposed to the ad within each calendar week) or on a rolling basis (e.g., over any contiguous 24-hour period throughout the campaign's horizon), we propose an appropriate Markov chain model for serving ads and investigate its properties in maintaining a desired frequency distribution for an online ad campaign.

4 - Planning Online Advertising Using Lorenz Curves

John G Turner, University of California - Irvine, Irvine, CA, United States, john.turner@uci.edu, Miguel A Lejeune

Lorenz curves are commonly-used to depict dispersion; e.g., income inequality. Motivated by online advertising campaigns that desire impressions spread over targeted audience segments and time, we formulate a problem that minimizes Gini Coefficients (area under the Lorenz curve), and develop a specialized decomposition technique to solve instances quickly.

Decision Making in Public Policy

Sponsored: Decision Analysis

Sponsored Session

Chair: Cameron MacKenzie, Iowa State University, Ames, IA, United States, camacken@iastate.edu

1 - Hurricane Decision Simulator

Eva D Regnier, Naval Postgraduate School, eregnier@nps.edu, Cameron MacKenzie, Eric S Hodson

When threatened by a hurricane, Marines in New Orleans face a classic sequential decision under uncertainty with regularly updated information, but few opportunities to learn from experience. The Hurricane Decision Simulator allows personnel to run experience key decisions in the context of many realistic simulated storms, to develop a better understanding of the interrelated decisions required, and a familiarity with the forecast products and their evolving uncertainty. This talk highlights application of both "hard" and "soft" sides of analytics in the development of the tool. This is the first hurricane training tool that allows users to explore many different decision paths.

2 - Subsidizing Cybersecurity Information Sharing: A Game Between A Government And N-Companies

Ali Pala, University at Buffalo, Buffalo, NY, 14260, United States, alipala@buffalo.edu
Ali Pala, Turkish Military Academy, Devlet Mahallesi, Bakanlıklar, Ankara, Turkey, alipala@buffalo.edu, Jun Zhuang

More cybersecurity information sharing would lead to stronger resistance against cyber-attacks in the presence of a cooperative and trustworthy sharing network. Sharing cyber-attack information, however, could harm reputation, create disadvantages against competitors and additional costs, and cause disclosing vulnerabilities and some private information. In this research, we study what, how, and to whom government incentives should be provided in order to encourage and improve information sharing. We incorporate game theory and agent-based simulation modeling to develop a dynamic decision support tool that generates information sharing strategies in the face of strategic attackers.

3 - Resource Allocation Decisions With Deep Uncertainty

Cameron MacKenzie, Iowa State University, camacken@iastate.edu

Mathematical models to help public policy decision makers often have a great amount of uncertainty, sometimes called deep uncertainty. Decision makers may also be skeptical about solely relying on model recommendations. A solution to this deep uncertainty and a decision maker's skepticism is for the model output to consist of ranges or intervals rather than point solutions. This presentation will offer a method for identifying intervals for resource allocation models in which every solution within the interval differs from the optimal solution by a predetermined value.

4 - Economic Contagion And The Role Of Beliefs: Findings From A Borrower-lender Game

Jonathan William Welburn, University of Wisconsin - Madison, welburn@wisc.edu

We present a within-period sequential-move game with multiple borrower countries and a single common lender to model cross-country contagion. We discuss the role of beliefs, modeled through Bayesian updating, and determine equilibrium solutions using nonlinear optimization. The model is calibrated to the 2010 Eurozone crisis, but sensitivity analysis is used to identify conditions under for contagion. Results demonstrate that what appears to be contagion may be the result of a crisis of confidence. Findings and their implications for decision making and policy are discussed.

Decisions, Sensitivity and Applications

Sponsored: Decision Analysis

Sponsored Session

Chair: Emanuele Borgonovo, Bocconi University, Via Roentgen 1, Milano, 20833, Italy, emanuele.borgonovo@unibocconi.it

1 - Strength Of Preferences In Repeated Prospects

Alessandra Cillo, Assistant Professor, Bocconi University, Milan, 20146, Italy, alessandra.cillo@unibocconi.it, Enrico G De Giorgi

Experimental studies have found that people reject a single lottery but accept a repeated play of the same lottery. Other studies have also found that the higher acceptance rates for the repeated play when the overall distribution is displayed depends on the type of prospect. These results have critical managerial relevance, but they are based on acceptance rates. The paper provides a theoretical framework, which allows quantifying the strength of preferences in repeated prospects. We provide an experiment to test possible editing processes in the context of repeated prospects.

2 - Tolerance Sensitivity And Maximum Regret In Linear Programming

Richard E. Wendell, University of Pittsburgh, Pittsburgh, PA, 15260, United States, wendell@katz.pitt.edu, Emanuele Borgonovo

Within a tolerance framework for linear programming, we present a new approach for calculating optimal coefficient sets. The approach solves an otherwise NP hard problem and, moreover, allows us to streamline the computation of regret functions.

3 - Randomized Differential Sensitivity

Sumeda Siriwardena, Bocconi University, sumeda.siriwardena@phd.unibocconi.it, Emanuele Borgonovo

Sensitivity analysis is an integral part of the decision analysis process. In several situations, analysts have not only the dataset of realizations of the model output but also of the corresponding partial derivatives. We introduce a new method based on the randomization of the differential importance measure. This sensitivity indicator does not require independence and possesses the additivity property, which makes the calculation of joint sensitivities seamless. We study numerical estimation and obtain the expression of the convergence rate. Managerial insights are discussed in detail.

4 - Estimating Strategic Impacts Of Foreclosed Housing Redevelopment Using Spatial Analysis

Michael Johnson, University of Massachusetts Boston, MA, michael.johnson@umb.edu

Community-based organizations engaged in foreclosure response wish to quantify the relative value of housing units for redevelopment. We measure the 'strategic value' of property acquisition candidates based on proximity to site-specific neighborhood amenities and disamenities, given the relative importance of that proximity to CDC organizational and community objectives. We show that strategic values can differ in systematic ways depending on the types of amenities and disamenities identified as relevant for acquisition decisions, the relative importance assigned to those amenities and disamenities, and the utility maximization objectives of the organization.

Multi-Objective Optimization Via Simulation

Sponsored: Simulation

Sponsored Session

Chair: Susan R Hunter, Purdue University, West Lafayette, IN, United States, susanhunter@purdue.edu

Co-Chair: Enlu Zhou, Georgia Institute of Technology, na, Atlanta, GA, na, United States, enlu.zhou@isye.gatech.edu

1 - A Partition-based Random Search For Stochastic Multi-objective Optimization Via Simulation

Loo Hay Lee, National University of Singapore, Singapore, Singapore, iseleelh@nus.edu.sg, Weizhi Liu, Siyang Gao

We proposed two parallel partition-based random search methods to solve the stochastic multi-objective optimization via simulation considering Pareto optimality for constrained and unconstrained case. The idea is to explore the whole feasible region and exploit on current most promising regions in the same time. Partition methods are used to shrink current most promising regions iteratively, and simulation allocation rules are adopted to decrease the noise. Both methods are proven to converge to the global Pareto set with probability one. Numerical experiments are conducted to demonstrate the effectiveness and robustness of the proposed algorithm compared to well-known methods.

2 - An Assessment Of Model Based Methods In Multi-objective Optimization

Joshua Hale, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, Atlanta, GA, United States, jhale32@gatech.edu, Helin Zhu, Enlu Zhou

We propose domination measure as a new concept to measure the quality of solutions in multi-objective optimization. The domination measure of a solution can be intuitively interpreted as the size of the portion of the decision space that dominates that solution. We reformulate the multi-objective problem to a single-objective stochastic problem and solve it using a model-based approach. The numerical experiment shows that our proposed algorithm is effective at approximating the optimal Pareto set and is competitive with some previously proposed methods.

3 - On Multi-objective Ranking And Selection Methods

Susan Hunter, Purdue University, susanhunter@purdue.edu, Guy Feldman, Raghu Pasupathy

Consider the context of selecting Pareto-optimal systems from a finite set of systems based on multiple stochastic objectives. We seek a characterization of the asymptotically optimal sample allocation that maximizes the rate of decay of the probability of misclassification, i.e., the probability a Pareto system is falsely estimated as non-Pareto, or a non-Pareto system is falsely estimated as Pareto. We discuss recent advances in solving this problem.

4 - Precision Irrigation System Optimization Using Subsurface Water Retention Technology For Multiple Conflicting Objectives

Kalyanmoy Deb, Michigan State University, kdeb@egr.msu.edu

Water is precious and recent efforts to achieve precision irrigation with minimum use of water through subsurface water retention technology (SWRT) are getting popular. In this study, we have linked a water permeation simulation process with a multi-objective optimization algorithm to obtain optimized solutions involving shape and location of subsurface impermeable membranes and simultaneously obtain optimal surface water supply. The procedure is pragmatic and is customized for specific soil and crop combination and average precipitation level.

Empirical and Data-Driven Studies in Revenue Management and Pricing

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Jun Li, Ross School of Business, University of Michigan, Ann, MI, United States, junwli@umich.edu

Co-Chair: Serguei Netessine, INSEAD, Singapore, Singapore, serguei.netessine@insead.edu

1 - Compete With Many: Price Competition In High Dimensional Space

Jun Li, Ross School of Business, University of Michigan, junwli@umich.edu, Serguei Netessine, Sergei Koulayev

We study price competition in markets with a large number (in the magnitude of hundreds or thousands) of potential competitors. We propose a new instrument variable approach to address simultaneity bias in high dimensional variable selection problems. The novelty of the idea is to exploit online search and clickstream data to uncover demand shocks at a granular level, with sufficient variations both over time and across competitors. We apply this data-driven approach to study the New York City hotel market.

2 - Randomized Markdowns And Online Monitoring

Ken Moon, The Wharton School, Philadelphia, PA, United States, kenmoon@wharton.upenn.edu, Kostas Bimpikis, Haim Mendelson

Using data tracking customers of a North American retailer, we present empirical evidence that monitoring products online associates with successfully obtaining discounts. We develop a structural model of consumers' dynamic monitoring to find substantial heterogeneity, with consumers' opportunity costs for an online visit ranging from $2 to $25 in inverse relation to their price elasticities. We show implications for retail operations and also discuss targeting customers with price promotions using their online histories.

3 - A Nonparametric Approach To Learning Mixture Models

Srikanth Jagabathula, NYU Stern, sjagabat@stern.nyu.edu, Lakshminarayanan Subramanian, Ashwin Venkataraman

We consider the problem of learning a mixture model, where the number of mixture components is learned directly from the data. Our framework applies to any mixture model, but we specialize our techniques to learn the mixture of multinomial (MNL) models. We pose the learning problem as that of minimizing a loss function (likelihood, squared-loss, etc.) over the data and model parameters. Common formulations result in a non-convex problems. We overcome this through a novel reformulation that converts the problem into a semi-infinite convex program. We then apply conditional-gradient techniques to solve the convex program. We validate our methods theoretically and empirically.

4 - Leveraging Inventory In Profit Maximization For Personalized Online Bundle Pricing Recommendation

Anna M Papush, Massachusetts Institute of Technology, 1 Amherst Street, Cambridge, MA, 02139, United States, apapush@mit.edu, Pavithra Harsha, Georgia Perakis

E-commerce has been vastly growing in popularity over the past decade. It has been capturing increasing proportions of the retail market. Thus gaining the competitive edge in this sector is of utmost importance to any firm's success. This work presents a model for providing relevant product recommendations at personalized prices while leveraging knowledge of inventory at-risk for markdowns and maximizing retailer profits. We demonstrate practical applications through implementation on actual e-tailer data, as well as establishing performance guarantees relative to an optimal offline approach.

Choice-based Demand and Strategic Consumers

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Gustavo Vulcano, New York University, 44 West Fourth St, Suite 8-76, New York, NY, 10012, United States, gvulcano@stern.nyu.edu

1 - Predicting Individual Customer Responses To Product Promotions

Dmitry Mitrofanov, NYU, dm3537@stern.nyu.edu, Srikanth Jagabathula, Gustavo Jose Vulcano

We consider the problem of predicting an individual customer's response to a product promotion using historical purchase transactions data, tagged by the customer id. The problem is challenging because of the limited number of observations available for each individual. To extract the signal from the limited data most efficiently, we model each individual through a partial-order consisting of weak and strong preferences (A is strongly preferred to B if non-promoted A is purchased over promoted B). We calibrate an MNL model over the partial orders and quantify its prediction power on out-of-sample transactions. Then, we use this information to optimize personalized promotions.

2 - The Heteroscedastic Exponomial Choice Model

Aydin Alptekinoglu, Penn State, aydin@psu.edu, John H Semple

We develop analytical properties of the Heteroscedastic Exponomial Choice (HEC) model and demonstrate its estimation using a household panel data of grocery purchases. The HEC model compares quite favorably to MNL in out-of-sample prediction.

3 - Assortment Optimization With Product Costs And Constraints

Sumit Kunnumkal, ISB, sumit_kunnumkal@isb.edu, Victor Martinez de Albeniz

We consider the assortment optimization problem under the MNL model with product fixed costs and constraints. We propose a new method to obtain an upper bound on the optimal expected profit. We show that our method is tractable and has provable performance guarantees for some common types of assortment constraints.

4 - Optimal Pricing In Continuous Time

José Correa, University of Chile, Santiago, Chile, correa@uchile.cl

We consider continuous time pricing problems with strategicconsumers that arrive over time. By combining ideas from auctiontheory and recent work on pricing with strategic consumers we derivethe optimal continuous time pricing scheme in some situations. Ournovel approach is based on optimal control theory and is well suitedfor numerical computations.

Social Media Analysis IV

Invited: Social Media Analytics

Invited Session

Chair: Anandasivam Gopal, University of Maryland, Smith School of Business, College Park, MD, 11111, United States, agopal@rhsmith.umd.edu

1 - Extraction Of Adverse Events From Social Media

Lina Zhou, University of Maryland-Baltimore County, 1000 Hilltop Circle, Baltimore, MD, 21250, United States, zhoul@umbc.edu, Yin Kang

Adverse events have significant impacts on patients' safety. Understanding patient reports of adverse events in social media remains a significant research challenge. We proposed new methods based on syntactic dependency relations to extract adverse events. The experiment results demonstrate that our proposed methods improve the extraction performance across all data sets in terms of both precision and recall.

2 - When It Rains, It Pours: Effect Of Social Media On Stock Price Behavior During Firm Crises

Soo Jeong Hong, Michigan State University, 404 Wilson Rd, Room 311, East Lansing, MI, 48824, United States, hongsoo3@msu.edu, Kwangjin Lee

We examine the effect of social media usage on the capital market under a firm crisis situation. Focusing on consumer product recalls, we investigate the factors which determine individuals' information sharing decisions in social media. We also analyze when recall information shared via social media can exacerbate negative market reactions.

3 - Networked Pattern Recognition Frameworks For Understanding And Detecting Future Terrorism Threats

Salih Tutun, Turkish Military Academy, and Binghamton University, 4400 Vestal Pkwy E, Binghamton, NY, 13850, United States, slh.tutun@gmail.com, Mohammad Khasawneh

The challenge of governments are how to track threats, since terrorists have learned how to avoid unsecured communications, such as social media. This research is proposed as a new framework that will better understand the characteristics of future suicide attacks by analyzing the relationship among the attacks. It is also proposed as a new unified detection framework that applies pattern classification techniques to network topology to detect terrorist activity. The finding results can potentially use to propose reactive strategies thus enabling precautions to be taken against future attacks.

Experiential Field Learning

Sponsored: Education (INFORMED)

Sponsored Session

Chair: Benjamin Grannan, Virginia Military Institute, Lexington, VA, United States, grannanbc@vmi.edu

1 - A Survey Of Issues And Best Practices In Field-based Education

Michael F Gorman, University of Dayton, michael.gorman@udayton.edu

There is a growing literature on field-based education in OR/MS. I survey recent literature and share common benefits, issues and best practices from published works.

2 - A Toolkit To Facilitate Quality Work In Field Courses

Patrick S. Noonan, Emory University, Atlanta, GA, United States, patrick.noonan@emory.edu

Two beliefs about field courses are widely shared: 1. Good field experiences can greatly boost student ability to apply course concepts & tools to real-world challenges ahead. 2. Facilitating "good field experiences" is hard... for everyone. Tackling real-world problems is inherently difficult - that's the point! But one central problem that educators can address is that few participants - students, faculty, TAs - have been trained in the consultative process. Adapting the toolkit of management consultants can improve the learning experience and the results for clients/problem-owners, and ease the teaching burden. We share experience & techniques from Emory's "Management Practice" program.

3 - Supervising Undergraduate Field Based Analytics Projects

Benjamin Grannan, Virginia Military Institute, grannanbc@vmi.edu

Supervising undergraduate students working on real world analytics projects results in unique challenges. In this talk we discuss the experience of recruiting undergraduate students from multiple disciplines, selling the value of analytics to clients and helping students transition their classroom skills to the often messy real world project setting. Examples from both a summer five week field based independent research course and an extracurricular student-led analytics consulting club are presented.

SpORts: Sports Analytics I

Sponsored: SpORts

Sponsored Session

Chair: Stephen Hill, University of North Carolina Wilmington, 601 South College Road, Wilmington, NC, 28403-5611, United States, hills@uncw.edu

1 - Do Pitchers Differ on Batting Average on Balls In Play or Defense Independent Slugging Percentage?

Matthew Hall, University of Alabama, Culverhouse College of Commerce and Business Administration, Tuscaloosa, AL, 35487-0226, United States, mjhall5@crimson.ua.edu, James Cochran

Using ANOVA and MANOVA, we systematically examine data for pitchers who have pitched at least 160 innings in five or more seasons since 1999 to assess whether they differ on Batting Average on Balls in Play (BABIP - common Sabermetric wisdom says they do not) or Defense Independent Slugging Percentage (DISP).

2 - Are You Ready For Some Football? An Analysis Of Monday Night Football Viewership

Bhupesh Shetty, University of Iowa, bhupesh-shetty@uiowa.edu

Analyzing data from 1993 to 2014, we conduct a three-pronged analysis of Monday Night Football (MNF) viewership. First, we present a model using ex post facto factors that explains over 90% of the variability. Then we present a model using only factors known in the April preceding the season (when the NFL schedule is announced). Finally, we use the predictive regression model to estimate objective function coefficients in an integer program formulation that maximizes expected MNF viewership. We conduct simulation experiments to determine the impact of forecast error on the optimal MNF schedule.

3 - A Handicap System For Tennis

Timothy Chan, University of Toronto, Toronto, ON, Canada, tcychan@mie.utoronto.ca, Raghav Singal

Handicap systems are used in many sports and games to improve competitive balance and equalize the probability of winning a match between two or more players. In this paper, we develop a handicap system for tennis using a MDP model to quantify the appropriate handicap between two players of unequal ability. We apply the model to real match data to estimate professional handicaps. We also demonstrate how our handicap can be mapped to a tennis rating system, which can facilitate broader uptake at a grassroots level.

4 - Does The Current Golf Handicap System Bias Match Play Outcomes?

Martin L Puterman, Professor Emeritus, University of British Columbia, Sauder School of Business, 2053 Main Mall, Vancouver, BC, V6T 1Z2, Canada, martin.puterman@sauder.ubc.ca, Timothy Chan, David Madras

In amateur golf, lower handicap players "give strokes" to higher handicap players on the basis of the difference between handicaps so as to make head-to-head matches fair. In a match, the "standard way" to allocate handicap strokes is on the basis of the course hole difficulty ranking. Using a data driven simulation based on over 600 rounds, we show that standard stroke allocation and hole rankings favor the superior player. We investigate the simultaneous impact on match fairness of alternative hole rankings, allocations of handicap strokes to specific holes and awarding extra strokes to higher handicap players.

Modeling Complex Systems in Education

Sponsored: Public Sector OR

Sponsored Session

Chair: Roxanne Moore, Georgia Institute of Technology, 1, Atlanta, GA, 30333, United States, roxanne.moore@gatech.edu

1 - Applying System Dynamics Models To Steam Interventions

Michael Helms, Georgia Tech, michael.helms@gatech.edu

Education researchers implement education interventions in highly complex systems, where intervention outcomes depend heavily on the system attributes, actors and interactions over time. We developed a modeling process using system dynamics principles to better understand the complex interactions and mechanisms of a STEAM education intervention. In this presentation we will discuss the resulting causal loop diagram, and the implications of our modeling process in terms of intervention design, implementation and sustainability.

2 - Education as a Complex System: Opportunities, Challenges, and Perspectives

Mirsad Hadzikadic, University of North Carolina, Charlotte, NC, United States, mirsad@uncc.edu

Education is a large complex systems. It presents many challenges for its full understanding. However, if done well, it can bring tremendous benefits to people, society, and industry. It can be simulated and modeled from different perspectives, including the content of education, the modality of teaching/learning, improving access to education, school assignments, classroom assignmnents, seating assignments, within classroom interaction, student-student interaction, or student-teacher interaction. This talk will present an overview of various technologies to analyze/simulate/model the previously stated perspectives.

3 - Modeling Interventions In Complex Educational Systems

Britte H Cheng, SRI International, Menlo Park, AL, United States, britte.cheng@sri.com

The ability of complex social systems to resist policy mandates—to revert to the norm—has gained increased attention in educational research. This paper presents a perspective on the reasons behind the policy resistance of education systems including the lack of approaches for evaluating possible policies before implementation. We highlight two projects (one around STEM retention in undergraduate and one on K-12 formative assessment systems) that modeled educational systems to explore proposed policy implementations before they are put into practice.

Urban Transportation and Logistics in Public Sector OR II

Sponsored: Public Sector OR

Sponsored Session

Chair: Sung Hoon Chung, Binghamton University, PO Box 6000, Binghamton, NY, 13902, United States, schung@binghamton.edu

1 - A New Fast Algorithm For The Time-expanded Network Of Dynamic Building Evacuation

Dong-jin Noh, Postech, Pohang, Korea, Republic of, visionph@postech.ac.kr, Chang Hyup Oh, Young Myoung Ko, Byung-In Kim

Time-expanded network models have been widely used in many evacuation studies. Linear programming and heuristics algorithms have been applied for the models. In this presentation, we propose a new fast exact algorithm for a time-expanded network model arisen in a dynamic building evacuation. The proposed algorithm takes advantage of the characteristic that there exist no cycle in the time-expanded network model. Experimental results demonstrate the efficiency of the proposed approach. The proposed algorithm can be applied for real-world dynamic building evacuation problems.

2 - Human In The Loop Optimization For Recovery From Extreme Events

Aybike Ulusan, Northeastern University, Boston, MA, 02115, United States, ulusan.a@husky.neu.edu, Ozlem Ergun

We consider the problem faced by contractors of collecting debris from a transportation network to the disposal facilities in the aftermath of a disaster. The problem has a multi-objective nature which embodies implementable division of a service region among subcontractors such that the assigned workload among different subcontractors is balanced and time to complete debris collection operations is minimized. In this study, we explore the potential of having humans collaborate with algorithms, and the use of game-based experiments to build a decision support tool. We investigate how to exploit human input to achieve a performance that can not be achieved by human or computer itself individually.

3 - Clearing Roads And Collecting Debris By Integrating Remote Sensing Technique And Vrp

Eunsu Lee, New Jersey City University, ELee3@njcu.edu

Every natural disaster generates large amount of debris on roads. Clearing the debris from roads is crucial to recover mobility and accessibility to support humanitarian aids and normal life. This study investigates an integrated approach using remote sensing technology and vehicle routing problem to find, clear, and dispose the items quickly and efficiently.

4 - Disaster Relief Routing under Uncertainty

Sung Hoon Chung, Binghamton University, 4400 Vestal Parkway East, Binghamton, NY, 13902, United States, schung@binghamton.edu, Yinglei Li

We propose a robust optimization approach for vehicle routing problems (VRPs) under uncertainty for humanitarian logistics. In addition to classical cost-minimizing and route-minimizing objectives of the VRPs, we employ alternative objectives such as minimizing the average arrival time, the latest arrival time, and the demand weighted arrival time, as it is critical for deliveries to be fast and fair in routing for relief efforts. We show the use of the proposed approach using benchmark problems and identify instances in which solutions of the VRP variants are significantly different than ones of conventional VRPs.

1 - Linking The Firm's Internal Innovation Context With Commercialization Choices

Lee Davis, Copenhagen Business School, ld.ino@cbs.dk, Karin Hoisl, Jerome Davis

This paper investigates the linkages between the firm's internal innovation context and how the innovation is commercialized (by the firm itself or an external third party). By analyzing these linkages at the level of the individual innovation, we add to the literature on how firms profit from R&D. We base our study on original survey data comprising 3,773 commercialized innovations from 23 countries in all major industries. We find that three aspects of the innovation context - external knowledge inputs, encouragement of creativity, and high autonomy - are positively related to external commercialization. Sufficient resources are negatively related to external commercialization.

2 - Managing External Intellectual Capital In New Product Development: The Case For Ontological Semantic Analysis Of Patent Data

Charles Weber, Portland State University, webercm@pdx.edu, Farshad Madani, Nitin Mayande

Historically, intellectual capital from outside the firm has been derived from patent metadata. This paper presents a potentially much more effective approach, which automatically analyzed the body text of patents.

3 - Logistics Service Performance In Nova Scotia: Facilitators, Barriers, And Measurement

M. Ali Ulku, Rowe School of Business, Dalhousie University, Halifax, NS, B3H3S7, Canada, ulku@dal.ca, Horand I. Gassmann, Michael Foster

Logistics plays a pivotal service role in efficient management of supply chains. Building on the extant literature and company-survey results, we explore the facilitators and barriers logistics companies face in the province of Nova Scotia, Canada. We also propose key metrics for measuring the performance of regional logistics services.

4 - Management Of Service And R&D Portfolios

Kai Basner, PhD Candidate, Copenhagen Business School, Solbjerg Plads 3, Frederiksberg, DK-2000, Denmark, kba.om@cbs.dk, Thomas Frandsen, Jawwad Raja, Juliana Hsuan

Managing technological innovation is critical to the continued success of industrial companies, which in recent years have been observed to expand their business models by complementing their products with services. For manufacturers with a strong focus on product technology, we explore the challenges of introducing service innovation in R&D portfolios.

Service Science: Best Cluster Paper Presentation

Sponsored: Service Science

Sponsored Session

Chair: Paul Maglio, University of California, Merced, 5200 N Lake Rd, Merced, CA, 95343, United States, pmaglio@ucmerced.edu

1 - Scheduling Promotion Vehicles To Boost Profits

Lennart Baardman, Massachusetts Institute of Technology, Cambridge, MA, United States, baardman@mit.edu, Maxime Cohen, Georgia Perakis, Kiran Panchamgam, Segev Danny

With our collaborators from Oracle, we model how to schedule promotion vehicles to maximize profits using ideas from the non-linear bipartite matching problem. Promotion vehicles should be assigned to time periods, subject to capacity constraints. We introduce a class of models for which the boost effects of vehicles on demand are multiplicative. We show that the problem is computationally intractable and develop a greedy method as well as a (1-epsilon)-approximation using an IP of polynomial size. We analyze our methods as well as validate them on actual data and finally, quantify their impact.

2 - Optimizing Precision In Machine Learning Models For Actionable Predictions Of Revenue Change

Abhinav Maurya, Carnegie Mellon University, 5634 Stanton Avenue, Apt 306, Pittsburgh, PA, 15206, United States, ahmaurya@cmu.edu, Aly Megahed, Ray Strong, Jeanette Blomberg, Alaa Elwany

Predicting changes in account revenues is of vital importance to a business in order to take action on accounts predicted to shrink, and learn success stories of offerings that led to revenue growth. However, the corresponding datasets are often imbalanced, and so optimizing prediction accuracy, as the majority of classifiers do, yields poor results in this case. We present a Gaussian Process-based method that directly maximizes precision subject to a minimum recall level, yielding actionable results without sacrificing much accuracy. Numerical experiments show very promising results.

3 - Data Analytics Approaches For Winning Service Contracts: Development And Impacts on Practice

Aly Megahed, IBM Research - Almaden, San Jose, CA, 95123, United States, aly.megahed@us.ibm.com, Taiga Nakamura, Kugamoorthy Gajananan, Mark Smith, Gregory Heim

Service providers in B2B often must prepare bids to win service outsourcing contracts. For high-value IT service outsourcing deals, the solution design and deal pricing process can be a complicated, expensive gamble. We present an approach based in data analytics to automate and customize the often manual practices used to configure such contract proposals. We propose a base model and model enhancements, demonstrating their performance using historical contract data and third-party vendor market data. The actionable methods demonstrate how data analytics tools can enable more effective manager decisions regarding contract proposal solution design and pricing.

4 - Welfare Implications Of Congestion Pricing: Evidence from SFpark

Hsin-Tien Tsai, University of California, Berkeley, 1822 Francisco St., Apt 4, Berkeley, CA, 94703, United States, hsintien@berkeley.edu, Pnina Feldman, Jun Li

SFpark is a congestion pricing program for street parking implemented in San Francisco. We investigate whether consumers benefit from congestion pricing using data from this program. We build a structural model of consumer search and quantify the change in consumer welfare.

5 - On a Variation Of Two-part Tari Pricing Of Services: A Data Driven Approach

Charles Thraves, Massachusetts Institute of Technology, Cambridge, MA, United States, cthraves@mit.edu, Georgia Perakis

We present a pricing optimization problem for the data plans of a big satellite firm. First we address the problem of missing data (as reservation prices are not directly observed especially for those who are not current customers). We formulate the price optimization problem as a MIP and develop properties and heuristics in order to solve realistic instances providing analytical lower bounds of their performance. We conclude that with our method the company can increase its profits by more than 10% and outperform the current plans' prices even under misspecifications of the assumptions.

Inventory Management V

Contributed Session

Chair: Hueon Lee, PhD Candidate, University of Arkansas, 4207 Bell Engineering Center, 1 University of Arkansas, Fayetteville, AR, 72701, United States, hueonlee@uark.edu

1 - Long Term Outsourcing Under Stochastic Learning And Information Asymmetry

Ting Luo, UT Dallas, 7208 Fair Valley Way, Plano, TX, 75024, United States, tingluo2006@gmail.com

We study a firm's procurement and selling decisions in a multiclass demand and multisupplier inventory system. We show that optimal procurement is driven by multisourcing and intertemporal substitution, while optimal selling is driven by customer segmentation and intertemporal rationing.

2 - Selling Luxury Fashion Online With Social Influences

Bin Shen, Donghua University, Xuri Building, 1882 Yanan Road,, Donghua University, Shanghai, China, binshenjerry@gmail.com

In the luxury fashion retailing industry, consumers can be categorized into the groups of fashion leader and fashion follower. These two groups influence one another and create social influences in the market. In this paper, we construct an analytical model to examine the effects of demand changes on a luxury fashion supply chain with social influences. We consider the case when the supply chain consists of one supplier and one online retailer providing differentiated services to different groups of consumers.

3 - A Multi-product Dynamic Block Stacking Problem With Deterministic Demand

Hueon Lee, PhD Candidate, University of Arkansas, 4207 Bell Engineering Center, 1 University of Arkansas, Fayetteville, AR, 72701, United States, hueonlee@uark.edu, Kelly Sullivan, John A White

Block stacking is a commonly used storage method for palletized loads where unit loads are stacked on top of each other and stacks are aligned in storage rows having different depths. In a multi-product storage system each product is assigned to storage rows having a specific depth. As the inventory level changes for a product, it can be relocated to storage rows having a different depth if relocation minimizes the cost of relocation and the cost of storage space. In our formulation, we require all inventory of a product to be stored in rows having the same depth. With the assumption of a given layout and known inventory cycles, we formulate the problem as a variation of the multicommodity flow problem.

Managing Sales in On-demand Economy

Sponsored: EBusiness

Sponsored Session

Chair: Michelle Wu, Washington State University, WA, United States, michelle.wu@wsu.edu

1 - We Are On The Way: Analysis Of On- Demand Booking Systems

Guiyun Feng, Student, University of Minnesota, 1006 27th Avenue SE, Apt E, Minneapolis, MN, 55414, United States, yunny.feng@gmail.com, Guangwen (Crystal) Kong, Zizhuo Wang

On-demand platforms such as Uber allow passengers with smartphones to submit trip requests and match them to drivers based on their locations and drivers' availability. We build a model to analyze the efficiency of such on-demand systems and compare it to systems where people hail taxis on streets. We simulate customers' waiting time in the two different systems and find that customers' waiting time with on-demand system can be higher than street hailing. We provide a cap policy that takes advantages of both on-demand system and street hailing in order to minimize customers' waiting time.

2 - Conform Or To Be Cast Out: Quantifying The Effect Of Platform Endorsement And Consumer Generated Reputation In Online Service Marketplace Demand System

Yong Tan, University of Washington, ytan@uw.edu, Jinyang Zheng, Youwei Wang

We estimate demands for online service to understand heterogeneous sensitivity to platform endorsement and consumer generated reputation, and to investigate "conform or to be cast out" policy which is applied to force sellers to improve platform endorsement. Our finding shows individuals exhibiting consistent sensitivity to consumer generated reputation, but perceiving platform endorsement differently. With regard to the policy, we find that even though casting out reduce variety of sellers, the negative effect is offset by conforming sellers' improvement. Furthermore, we find sellers' further quality escalation in the establishment of new equilibrium, benefiting consumer welfare.

3 - Measuring Consumer Surplus In The On Demand Economy The Case Of Ride Sharing

Meng Liu, MIT Sloan, Cambridge, MA, United States, mengliu@mit.edu

Uber and Lyft, two pioneer ride-sharing platforms have seen dramatic growth over the last few years. To understand their roles and impacts on the economy, we estimate the consumer welfare of these platforms in a structural demand model for rides. In our model, consumers choose their rides based on price, convenience, brand, and unobserved characteristics. Our identification leverage on the taxi/Uber/Lyft trip records from the New York City, and Uber/Lyft surge price and waiting time at granular location-time levels. We contribute to the understanding of the On-Demand Economy by providing evidence of an increase in consumer welfare due to the fast-growing satisfied instantaneous demand.

4 - Mobility Analytics For Parking Support

Michelle Wu, Washington State University, michelle.wu@wsu.edu, Zachary Owen, David Simchi-Levi

Ford is developing smart mobility business model as part of the company's strategic plan to deliver the next level of connectivity, mobility, and customer experience. We develop analytics for dynamic pricing strategies that enable efficient matching of supply with demand.

New Topics in Behavioral Operations

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Leon Matias Valdes, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States, lvaldes@mit.edu

1 - Observational Learning Through Inventory Availability Information: Empirical And Field Evidence

Ruomeng Cui, Kelley School of Business, Indiana University, Bloomington, IN, 47401, United States, cuir@indiana.edu, Achal Bassamboo, Dennis Zhang

Consumers, when making such purchasing decisions, tend to be influenced by others' actions, i.e., observational learning, or the out-of-stock pressure, i.e., product availability information. Using a unique dataset of more than thousands of daily deals, we empirically measure the herding effect. Well-sold products in the last hour tend to attract more customers in the next hour. The phenomenon persists after controlling for alternative explanations such as consumer reviews, search/experience goods and discount depth. We study the underlying drivers: observational learning or out-of-stock risk.

2 - The Decision To Recall: A Behavioral Investigation In The Medical Device Industry

George Ball, Indiana University, Kelley School of Business, gpball@indiana.edu, Karen L Donohue, Rachna Shah

The decision to recall can impact a manager's career and the performance of the firm. We identify a set of situational and dispositional factors that may influence the recall decision despite not being specified by the FDA. We test these factors through an experiment with a Fortune 500 firm. We find that a physician's inability to detect a defect in the product and understanding the root cause of the defect increases the likelihood of recalling the product but these factors vary across individuals. We find that an individual's cognitive reflection level helps divide managers into two groups, those who are more influenced by situational factors and those who are more influenced by dispositional factors.

3 - The Behavioral Impact Of Queueing Visibility On Server Effort Allocation.

Yaroslav Rosokha, Purdue University, yaroslav.rosokha@gmail.com, Masha Shunko, Julie Niederhoff

Using behavioral lab experiments we explore the impact of feedback on workers' effort allocation in a queueing environment with multiple human servers. We focus on the visibility of workload and the visibility of other servers' effort as mechanisms controlling feedback.

4 - Supply Chain Visibility And Social Responsibility: Investigating Consumers' Behaviors And Motives

Leon Valdes, Massachusetts Institute of Technology, lvaldes@mit.edu, Tim Kraft, Yanchong Zheng

We conduct an experiment to investigate: (i) when does supply chain visibility impact consumers' valuations of social responsibility (SR)? And (ii) what roles do reciprocal motives and prosocial orientations play in affecting their valuations? We show that consumers value visibility when workers are disadvantaged or when consumers use the lack of visibility as an excuse not to pay for SR. We also observe that high prosocial consumers do not exhibit reciprocal motives, while these motives can have a significant impact on low prosocial consumers' valuations. Our work thus identifies when there is a revenue benefit to greater visibility and what information best resonates with different consumers.

Energy XII

Contributed Session

Chair: Kenneth Bruninx, Post-doctoral researcher, KU Leuven, Leuven, Belgium, kenneth.bruninx@kuleuven.be

1 - The Relationship Between Energy Consumption And Economic Development

Yuan Qian, Tsinghua University, Beijing, China, qiany14@mails.tsinghua.edu.cn, Pingke Li

This paper estimates the causal relationship between aggregate energy consumption, disaggregate energy consumption and real GDP of China for the 1994-2013 period. Results indicated that bidirectional Granger causality runs from total energy consumption to real GDP and from industrial energy consumption to real GDP but no Granger causality between real GDP and transport energy consumption.

2 - Applying The Modern Portfolio Theory For A Dynamic Energy Portfolio Allocation In The Electricity Markets

Reinaldo Crispiniano Garcia, Associate Professor, University of Brasilia - UnB, Faculty of Technology, Industrial Engineering Department, Brasilia, 70904-970, Brazil, rcgar@yahoo.com, Javier Contreras, Janiele Custodio, Virginia Gonzalez

New energy markets undergoing deregulation induce participants to face increasing competition and volatility, where the objective of a Generation Company (Genco) is to maximize their profit while minimizing their risk. This work proposes two MPT models applying the Mean Variance Criteria (MVC) and the Conditional Value at Risk (CVaR) one. The MPT models are combined with a Generalized Autoregressive Conditional Heteroskedastic (GARCH) prediction technique for a Genco to optimally diversify its energy portfolio. The two models are applied to the PJM electricity market showing their capabilities and comparisons between them helping decisions makers to apply these two models as tools for a Genco.

3 - Carbon Dioxide Source Selection And Analysis

Xin Li, Pennsylvania State University, University Park, PA, 16803, United States, xzl118@psu.edu, Jose Antonio Ventura, Luis F. Ayala H., Uday Shanbhag

This paper aims at identifying and analyzing potential sources of CO_2 from power plants and industrial facilities in any geographical location in the U.S. that can be used to supply CO_2 for fracturing operation in well pads. Different approaches to capture CO_2 from power plants and industrial sources, as well as their corresponding technological maturity, are discussed. Detailed models to calculate costs incurred by CO_2 capture in two types of prime candidates for CO_2 capture, coal-fired power plants (CPP) and high-purity CO_2 sources (HPS), are presented.

4 - Cooptimization Of Series Facts Device Set Points And Generation Dispatch

Mostafa Sahraei-Ardakani, Assistant Professor, University of Utah, 1249 E Spence Avenue, Apt 242, Salt Lake City, UT, 85281, United States, mostafa.ardakani@utah.edu

No energy or market management system today optimizes the set point of flexible AC transmission system (FACTS) devices along with generation dispatch, due to the computational complexity of the problem. We propose an extremely effective and fast linear programming heuristic that facilitates such co-optimization. As a result, the operation of FACTS devices can be significantly enhanced leading to substantial economic and reliability gains.

5 - A Probabilistic Unit Commitment Model

Kenneth Bruninx, Post-doctoral researcher, KU Leuven, Leuven, Belgium, kenneth.bruninx@kuleuven.be, Erik Delarue

Stochastic unit commitment models allow calculating an optimal trade-off between the cost of scheduling and activating reserves, load shedding and curtailment, but may become computationally intractable for real-life power systems. Therefore, we develop a probabilistic unit commitment (PUC) formulation, which allows internalizing the reserve sizing and allocation in a deterministic unit commitment problem, considering the full cost of reserve allocation and activation. This PUC formulation yields UC schedules that are nearly as cost-effective as the theoretical optimal solution of the stochastic model in calculation times similar to that of a deterministic equivalent.

Robust and Reliable Optimization in Transportation and Logistics

Invited: Transportation Science & Logistics

Invited Session

Chair: Ehsan Jafari, University of Texas, Hart Lane, Austin, TX, 78731, United States, ejafari@utexas.edu

1 - Multicriteria Shortest Path Problem For Electric Vehicles In Stochastic Networks

Ehsan Jafari, University of Texas, Hart Lane, Austin, TX, 78731, United States, ejafari@utexas.edu, Stephen Boyles

This presentation focuses on the problem of finding a prior path for a single electric vehicle in a network with stochastic travel times. There are a number of non-identical charging stations (different charging prices and charging rates) through the network and charge depletion rate is modeled as a function of arc length and arc travel time. We formulate the problem as a multicriteria shortest path problem with three components: reliability, cost and time.

2 - Reliability Of Transit Connections For Informed Traveler Decision-making

Michael Redmond, University of Iowa, Iowa City, IA, 52240, United States, michael-a-redmond@uiowa.edu, Ann Melissa Campbell, Jan Fabian Ehmke

When faced with the decision of journeying from an origin to a destination, travelers have a multitude of options and criteria for making this decision. Travel websites generally look at price and travel time, leaving out the important component of reliability. We compute the probability of making all of the required connections and arriving on-time at the destination and refer to this as reliability. We utilize publicly available airline data to model the probability distributions and will present the reliability associated with different paths between several origin and destination pairs involving different hubs and start times.

3 - Stochastic Multi-period Orienteering With Time Windows And Uncertain Customer Adoption

Shu Zhang, Chongqing University, Chongqing, China, zhangshu@cqu.edu.cn, Jeffrey W Ohlmann, Barrett Thomas

We introduce an orienteering problem in which a sales representative visits customers over a multi-period horizon to increase the chance of customer adoption. Each customer's adoption likelihood is uncertain and evolves stochastically over the horizon. The salesperson may experience queueing after arrival and the wait times are uncertain. We model the problem as a Markov decision process and propose heuristic approaches to facilitate decision making. In the computational experiments, we demonstrate the effectiveness of our heuristic methods on various customer behaviors.

4 - Application Of A Robust Approach For Vessel Crew Scheduling

Seda Sucu, University of Strathclyde, 130 Rottenrow Gardens, Sir Willam Duncan Building, Glasgow, G4 0QE, United Kingdom, seda.sucu@strath.ac.uk, Kerem Akartunali, Robert van der Meer

Crew scheduling problems have a significant place among the NP-Hard problems, and are very popular especially in the transportation settings. Although there are many studies in airline crew scheduling, there is a lack of literature for crew scheduling for offshore supply vessels. In our problem, we focus on having a robust crew schedule to handle unexpected weather conditions and changes in crew members' conditions for a global vessel company with long planning horizon.

Network Optimization for Efficiency, Sustainability and Resilience

Sponsored: TSL, Urban Transportation

Sponsored Session

Chair: Mohammadali Shirazi, TAMU, College Station, TX, United States, alishirazi@email.tamu.edu

1 - A Fast Method To Estimate The Minimal Revenue Tolls In Large-scale Roadway Networks

Mohammadali Shirazi, TAMU, alishirazi@email.tamu.edu

The minimum toll revenue problem is one of the models that were proposed for toll pricing. When applied to real and large-scale road networks, this model is difficult to be solved optimally in reasonable time, due to its large size. We propose a fast method to estimate the minimal revenue tolls in large-scale road networks using the dynamic penalty function method. The proposed method also allows measuring the improvement of the network when the system flows are considered only for a subset of network links.

2 - Pothole Repair Planning

Fatemeh Aarabi, University at Buffalo, faarabi@buffalo.edu

Potholes degrade the functionality of roadway networks (throughput of traffic flow) in addition to concerns of safety and vehicle damages. A suitable repair planning strategy is developed to minimize total traffic flow throughput degraded over time. The proposed model determines the optimal decisions of repair segment, type, and timing given limited resources. We apply the proposed model to a New York City case study.

3 - Joint Optimization Of Traffic Rationing Schemes And Transit Services Under Environmental And Mobility Considerations

Daniel Rodriguez Roman, URPM, daniel.rodriguez6@upr.edu

An optimization-based approach for the design of traffic rationing schemes is proposed that accounts for: (1) the environmental goals of urban planners, (2) the budgetary and fleet size limitations of transit agencies, and (3) the mobility preferences of travelers. The proposed optimization problem can be used to determine traffic rationing levels and related transit service adjustments that minimize the health impacts of air pollution and the traveler dissatisfaction caused by rationing programs, subject to pollutant concentration and transit budget constraints. A surrogate-assisted, multi-objective differential evolution algorithm is presented for the proposed problem.

4 - Modeling And Enhancing The Resilience Of Complementary Transportation Systems

Saumya Sangoi, Purdue University, West Lafayette, IN, 47906, United States, ssangoi@purdue.edu, Xiaozheng He, Srinivas Peeta

This study proposes a new resilience measure by capturing the complementarity among interdependent transportation systems, such as bus and metro systems. Based on the proposed resilience measure, we construct an optimization model to identify the optimal allocation of resources and maximize the interdependent system resilience under a budget constraint. Numerical examples are constructed to evaluate the effectiveness of the optimization model on a network comprising bus and metro systems.

Stochastic Network Design

Sponsored: TSL, Freight Transportation & Logistics

Sponsored Session

Chair: Mike Hewitt, Loyola University Chicago, NA, Chicago, IL, NA, United States, mhewitt3@luc.edu

1 - Scheduled Service Network Design With Stochastic Travel Times

Teodor Gabriel Crainic, Professor, Universite du Quebec a Montreal, Case postale 8888, succursale Centre-ville, Montreal, QC, H3C 3P8, Canada, TeodorGabriel.Crainic@cirrelt.net, Giacomo Lanza, Nicoletta Ricciardi, Walter Rei

We propose to study a SSND problem focusing on the uncertainty related to the variability in travel times and the respect of service quality targets, while aiming for a cost-effective operation plan. We will discuss the issues and modeling challenges, and present a two-stage stochastic programming formulation with wimple recourse. The results of a proof-of-concept analysis will also be presented.

2 - Multi-commodity Stochastic Network Design

Stein W Wallace, Norwegian School of Economics, stein.wallace@nhh.no, Stein W Wallace, University of Sichuan, Chengdu, China, stein.wallace@nhh.no, Congshi Sun

We investigate the quality of the solution to the expected value problem by checking the Value of the Stochastic Solution VSS, the quality of the skeleton (that is, taking the discrete variables from the expected value problem and letting a stochastic linear program set the capacities) and finally by checking if the expected value problem can be upgraded to a good solution for the stochastic case. Numerical results are reported. For most situations the skeleton is very good, so for these problems, it seems enough to solve a deterministic MIP and a stochastic LP, rather than a stochastic MIP.

3 - Dynamic Load Planning For Less-than-truckload Carriers

Luke Marshall, Georgia Institute of Technology, Atlanta, GA, United States, luke.jonathon.marshall@gmail.com, Martin W P Savelsbergh, Natashia Boland, Alan Erera, Iman Dayarian

In practice, deterministic service network design for LTL problems on a given time horizon, can yield poor results if the quantities for future commodities have been estimated from data with high fluctuations. We investigate a sampled scenario based modelling approach that aims to improve solution quality on real-life, large scale instances, while constraining computational time.

4 - Stochastic Interdependent Network Design Problem

Andrés D González, Rice University, 6100 Main St., MS-318, Houston, TX, 77005, United States, andres.gonzalez@rice.edu Leonardo Dueñas-Osorio, Andres L Medaglia, Mauricio Sánchez-Silva, Andrew J Schaefer

Diverse models now exist to study the resilience of interdependent networks. Nevertheless, the prevailing methods are post-event schemes designed to identifying recovery strategies for particular disaster instances, making it difficult to extend these for pre-event decision making. In this work, we present a new methodology that considers the uncertainty associated with the occurrence of a destructive event, fusing both pre- and post-event decision analysis into a two-stage optimization problem, effectively enabling the stochastic resilience optimization of interdependent networks.

Robust and Low Cost Airline Operations under Uncertainty and Disruptions

Sponsored: Aviation Applications

Sponsored Session

Chair: Heng Chen, University of Nebraska-Lincoln, Supply Chain Management and Analytics, Lincoln, NE, 68588, United States, Supply Chain Management and Analytics

1 - Incorporating Downstream Disruptions In Robust Planning And Recovery

Jeremy Castaing, PhD Student, University of Michigan, 1205 Beal Avenue, 2753 IOE Building, Ann Arbor, MI, 48109-2117, United States, jctg@umich.edu, Amy Cohn

When disruptions occurs in the network, airlines have to make recovery decisions to recover and minimize future cancellations, delays, passenger missed connections etc... These decisions are often made solely based on the current state of the system. We propose a robust recovery approach that takes into account correlation and propagation of delays to mitigate future disruptions.

2 - Lower Cost Airport Departure Operations Under The Departure Metering Concept

Heng Chen, Assistant Professor, University of Nebraska–Lincoln, Lincoln, NE, 68588, United States, heng@unl.edu, Senay Solak

Departure metering is an airport surface management procedure that limits the number of aircraft on the runway by holding aircraft at gates or at a predesigned metering area. We develop a stochastic dynamic programming framework to identify the optimal gate, metering area and departure queue allocation policies to minimize expected overall fuel burn costs. In addition, we introduce easy-to-implement practical departure metering policies and evaluate their performances. We also identify the optimal metering area capacity and quantify the value of the presence of a departure metering area at airports.

3 - On The Competition Intensity Of U.S. Airline Market With Fuel Cost Fluctuations

Soheil Sibdari, University of Massachusetts, Charlton College of Business,, Dartmouth, MA, 0, United States, ssibdari@umassd.edu

We investigate a recent phenomenon in the U.S. airline market that despite lower jet fuel costs, which is a major part of airlines' operational cost, airline customers are experiencing higher airfares and more crowded planes. This can be, in part, due to the recent policies of airlines in selecting airplane sizes that changes the competition intensity. In this paper, we analyze the operations of seven major airlines including two low cost carriers and measure the impact of fuel cost fluctuations in capacity choice and competition intensity.

Location Analysis I

Sponsored: Location Analysis

Sponsored Session

Chair: Dmitry Krass, University of Toronto, 105 St. George Street, Toronto, ON, M5S 3E6, Canada, krass@rotman.utoronto.ca

1 - Random Attractiveness Level In Huff's Competitive Model

Tammy Drezner, California State University-Fullerton, Steven G. Mihaylo College of Business and Economics, 800 N State College, Fullerton, CA, 92834, United States, tdrezner@fullerton.edu, Dawit Zerom, Zvi Drezner

We investigate the Huff competitive location model assuming that the attractiveness level is normally distributed. It is realistic to assume that different consumers have a different perception of the attractiveness level. The model becomes the standard model when the standard deviation of the normal distribution for all facilities vanishes. We investigate the effect on the market share captured by the new facility and its optimal location by increasing the standard deviation of the new facility and/or the existing facilities.

2 - An Alternative Solution For The Time-difference-of Arrival (TDOA) Location Problem

Lin Dearing, Clemson University, 520 Bentbrook Lane, Clemson, SC, 29631, United States, pmdrn@clemson.edu

The TDOA location problem is to locate the source of a signal using the known locations of a set of receivers and the arrival times of a signal sent from the source to the receivers. A new approach for intersecting n-dimensional hyperboloids gives the location.

3 - Optimal Addition Of A New Facility To The Existing Network. Planar Continuous Demand Case

Dmitry Krass, University of Toronto, Toronto, ON, Canada, krass@rotman.utoronto.ca, Jonathan Lorraine

We consider the optimal addition of a new facility to a set of facilities serving continuously distributed demand under the Euclidean norm. The objective is to maximize the demand attracted to the new facility; in the case of continuously distributed demand, this is equivalent to maximizing the area of the Voronoi cell of the new facility. New computational results, as well as extensions to non-uniform demand, will be presented. Relation to the L1 norm case will be discussed.

4 - Joint Optimization Of Location And Design Of New Facilities

Dmitry Krass, University of Toronto, krass@rotman.utoronto.ca, Robert Aboolian, Oded Berman

We address the problem of simultaneous location and design of a network of service facilities. A novel solution approach is developed, consisting of a optimal design solution for the single facility case and a an approximation scheme for the case of multiple facilities. Computational results illustrating the efficiency of the method will be presented.

Multiple Criteria Decision Making Applications I

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Banu Lokman, Middle East Technical University, Ankara, Turkey, lbanu@metu.edu.tr

1 - An Interactive Approach To Design Parameter Optimization Considering Response Surface Prediction Errors

Melis Ozates, Middle East Technical University, Çankaya/Ankara, 06800, Turkey, mozates@metu.edu.tr, Gulser Koksal, Murat Mustafa Koksalan

An interactive approach is presented for finding parameter settings of a product or process design that allows achieving targets for two responses as well as robustness. The approach utilizes response surface models and it allows the decision maker to consider magnitude of prediction errors in choosing the design solution.

2 - Prioritization Of Military Threats For Ground Based Air Defense By Analytic Hierarchy Process

Gulser Koksal, Middle East Technical University, Ankara, Turkey, koksal@metu.edu.tr, Omer Kirca, Can B. Cetin, Derya Dinler, Derya Ipek Eroglu, Gulten Gokayaz

In threat evaluation and weapon assignment for ground based air defense it is aimed to make threats such as bombers and missiles ineffective with systems involving weapons and jammers. Assignment of these weapons to threats may require prioritization of the threats. In this study, a threat prioritization approach based on AHP is developed and implemented. Final weights of prioritization criteria are determined by following an iterative test and optimization approach. The approach has been effective in handling inconsistencies of decision makers, and verification and validation of results.

3 - Finding Representative Nondominated Sets For Multi-objective Integer Programs

Banu Lokman, Middle East Technical University, lbanu@metu.edu.tr, Gokhan Ceyhan, Murat Mustafa Koksalan

We develop algorithms to generate representative nondominated sets for multi-objective integer programs. The algorithms are designed to produce a desired number of nondominated points satisfying certain quality criteria. We show that our algorithms work well on randomly generated instances of multi-objective assignment and knapsack problems.

4 - Issues In Selecting A Representative Set For Multi-objective Integer Programs

Sami Serkan Ozarik, ASELSAN, ssozarik@hotmail.com, Banu Lokman, Murat Mustafa Koksalan

We observe that many alternative representative sets may satisfy existing performance measures equally well. It may be useful to develop additional performance measures to break ties. We provide various properties of such sets and discuss additional possible measures. We present some empirical results.

1 - Ad-blockers, Publishers And The Internet: A Study On The Economic Implications Of Ad-blockers

Abhishek Ray, Purdue University, ray52@purdue.edu

The rise of Ad-Blockers has prompted discussions about whether the age of free content on the internet are numbered. This research is aimed at investigating issues at the heart of this discussion - does adoption of Ad-Blocker necessarily mean that users will be better off and whether websites will have to start looking elsewhere to monetize their content? Through applied game theory, we aim to answer important questions about the implications of the increasing popularity of Ad-Blockers for users and whether Ad-Blockers are blessings in disguise or a crash waiting to happen.

2 - The Advertising Big Picture: Analyzing The Cross Platform Synergies Between TV And Online Advertising

Mohammed Alyakoob, Purdue University, alyakoob@purdue.edu

The advent of the Internet gave rise to digital advertising, which provides a unique avenue for researchers to monitor customers' responses to different types of advertisements. This research utilizes this potential in combination with a detailed television advertising data set to gain insights regarding the synergies that exist between television and online advertising platforms. By utilizing a Bayesian Vector Autoregressive model to account for the lagged interdependencies among variables in a marketing context, we study the relationships between the online and television advertising platforms and the impact these synergies have on a customer's propensity to purchase online.

3 - Social Influence In Public And Private Behaviors

Shan Huang, MIT, shanh@mit.edu

To compare peer influence between public and private behaviors quantitatively, I designed and analyzed a large-scale field experiment involving more than 37 million users on WeChat Moments ads. I randomized the number of social cues and identified the effects of them on consumers' public (i.e.liking) and private (i.e.clicking and following) responses to ads. We found that public responses were associated with significantly more positive effects of social cues than private responses. Tie strength generally exerted larger effects on public responses than on private responses. Relative to homophily, influence explains more of the temporal clustering of public behaviors than private behaviors.

4 - Labor Market Risk And Technological Investment

Daniel Rock, MIT, Cambridge, MA, 02114, United States, drock@mit.edu, Prasanna Tambe

Prior work in financial economics demonstrates that firms make capital structure choices to mitigate their employees' exposure to unemployment risk. We combine firm-level financial data from 2010 to 2014 with data from Burning Glass Technologies, an online labor market intermediary to provide evidence consistent with the argument that firms choose technologies in part to mitigate the financial risk faced by technical workers. We also find that while greater employer market value is associated with a decrease in our measure of skill generality cross-sectionally, companies with very large market values tend to demand similar technical skills as other employers in the same region.

Networked System Reliability and Resilience

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Chi Zhang, Tsinghua University, Tsinghua University, Beijing, 100084, China, czhang@tsinghua.edu.cn

1 - Resilience Optimization Of Interdependent Critical Infrastructure Systems Under Multiple Hazards

Min Ouyang, Huazhong University of Science and Technology, min.ouyang@hust.edu.cn

Considering multiple types of initiating events in critical infrastructure systems (CISs), including terrorist attacks, natural hazards and random failures, and taking interdependent power and gas systems as an example, this paper proposes a resilience optimization model and its solution algorithm for interdependent CISs, where the candidate resilience enhancement strategies are selected from all three disaster stages, including resistant stage, absorptive stage and restorative stage.

2 - Multi-dimensional Vulnerability Of Public Transportation Services Provided To Urban Residential Communities In China

Liu Hong, Associate Professor, Huazhong University of Science and Technology, Wuhan, 430074, China, liu.hong@hust.edu.cn, Min Ouyang, Xiaozheng He, Yongze Yan

This paper proposes a network-based approach to model and analyze the multi-dimensional vulnerability of public transportation services provided to urban residence communities in a Chinese city, where complementary subway and bus systems in the city forms the public transportation system and its service for residential communities are measured by multi-dimensional metrics, such as average accessibility to all public subway and bus stations, accessibility to the hospitals, accessibility to large shopping centers and accessibility to long distance travel services.

3 - Modeling And Visualizing Reliability In An Urban Bicycle Sharing Program

Gabriela Góngora-Svartzman, Stevens Institute of Technology, Hoboken, NJ, 07030, United States, ggongora@stevens.edu, Jose Emmanuel Ramirez-Marquez, Kash Barker

Bicycle sharing programs are providing modern cities with an alternative mode of transportation. Thereby it becomes important to analyze such systems to asses their reliability. This work presents a behavioral analysis, aided by visualization, and proposes a methodology for assessing reliability in New York City's bicycle sharing program, CitiBike. This is performed on a station basis and two errors; the error where a user is not able to return a bicycle to a docking station, and the error of not having bicycles for the users to take at a docking station. In future work this methodology could be used to rebalance stations according to demand distributions, enabling a decision-making optimization.

4 - A New Approach For Approximating Complex Network Reliability

Huaxing Zhu, Tsinghua University, Beijing, 100084, China, zhuhx15@mails.tsinghua.edu.cn, Chi Zhang

Our modern society is highly dependent on networked critical infrastructures, such as telecommunication, power transmission, and so forth. Thus, it is paramount to ensure their high reliability, to fulfill which we need to efficiently evaluate their reliability. Represented by complex networks, critical infrastructures usually have non-trivial topology and large amounts of components, which make their reliability computation intractable and existed enumeration-based algorithms inefficient. To solve this problem, we propose a new algorithm to approximate a complex network's reliability, based on identifying its edge-disjoint minimal path sets, guided by its minimal cut sets.

Industrial Big Data System

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Ran Jin, Virginia Tech, Blacksburg, VA, United States, jran5@vt.edu

Co-Chair: Hui Wang, Florida State University, 2525 Pottsdamer St, B-373D, Tallahassee, FL, 32310, United States, hwang10@fsu.edu

1 - Manufacturing Modeling And Interpretation Via Natural Language Processing Techniques

Hongyue Sun, Virginia Tech, hongyue@vt.edu

To extract useful information from industrial data for better system understanding and decision making is urgent. Motivated by techniques from natural language processing, a framework for learning informative and interpretable patterns from industrial data is proposed. A Czochralski crystal growth process is used to demonstrate the proposed framework.

2 - Monitoring E-commerce Reviews By Discovering Hidden Rating Criterion

Ke Zhang, Hong Kong University of Science and Technology, kzhangah@connect.ust.hk

Recently, the boom of electronic merchants have attracted many researchers on analyzing customer reviews, which usually contain text-data and ratings. Conventional monitoring methods are mainly based on the ratings provided by customers, failing to reflect a customers' accurate opinions, since a customer may possess different attitudes towards different facets of a product. Here we investigate an extension of LDA method to discover hidden aspects and aspect-ratings by analyzing textual contents and associated ratings jointly. Then we propose a control chart based on the discovered rating criterion. Simulations and real-data analysis is presented to show effectiveness and efficiency.

3 - Classification Based Approach To Nanorod Segmentation In Scanning Electron Micrographs

Mostafa Gilanifar, Florida State University, Tallahassee, FL, United States, mg14m@my.fsu.edu, Abhishek Shrivastava

Estimation of nanorod morphology from scanning electron micrographs requires extracting nanorods from the image. This foreground-background segmentation of nanorods is challenging due to several reasons - low signal to noise ratio, high degrees of nanorod overlap and shape similarity. In this talk, we present a classification-based approach to the segmenation problem. We use a decomposition-based approach to identify nanorod and background image patterns, which can be discriminated accurately using a trained classifier. We demonstrate the accuracy of the approach through several examples.

4 - An Order-invariant Cholesky-log-garch Model For Multivariate Financial Time Series

Xinwei Deng, Associate professor, Virginia Tech, 211 Hutcheson Hall, 250 Drillfield Drive, Blacksburg, VA, 24060, United States, xdeng@vt.edu, Xiaoning Kang, Kam-Wah Tsui, Mohsen Pourahmadi

Accurate estimation of time-varying covariance matrices is of great importance in the analysis of financial data. Most existing models are known to break down at the estimation stage for dimensions larger than ten or so. In this work, we propose a novel order-invariant Cholesky-log-GARCH model for estimating the covariance matrix of multivariate time series based on a random sample from a population of all possible permutations of the p variables. The ensuing methodology not only provides accurate estimation, but also gives accurate prediction at future time points. The merits of the proposed method are illustrated through three real financial data sets in comparison with conventional methods.

Reliability Evaluation and Optimization from Complex Systems II

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Eunshin Byon, University of Michigan, College Station, MI, United States, ebyon@umich.edu

Co-Chair: Qingyu Yang, Wayne State University, Detroit, MI, United States, qyang@wayne.edu

1 - Reliability Estimation Of Systems With Spherically Distributed Units

Jingbo Guo, Rutgers, The State University of New Jersey, guojingbochina@gmail.com, Elsayed A. Elsayed

Spherically distributed systems are emerging in a diverse range of industries such as aerospace, nuclear, military and oceanography. We refer this kind of units on a spherical arrangement as k-n-i: G balanced systems. In such a system, n pairs of units are distributed evenly on i vertical planes in a sphere. The system is considered functioning when at least k out of n pairs of units operate properly while satisfying the system's balance requirement. In this presentation, we introduce an efficient and general algorithm to estimate the reliability of such systems for any range of k, n, i. We also present a numerical example to illustrate the algorithm.

2 - Condition-based Selective Maintenance Optimization For A Large-scale System

Young Myoung Ko, Pohang University of Science and Technology, youngko@postech.ac.kr, Eunshin Byon

We extend our previous study on condition-based maintenance optimization that schedules maintenance activities in a large-scale system comprising identical units. Our previous method was based on the assumption that each maintenance activity renews all units, which made the analysis tractable by taking advantage of the results from the renewal theory, but indeed restricts the applicability of the method. In this talk, we present a new approach that relaxes the renewal assumption and finds the optimal thresholds that trigger maintenance operations to repair a subset of units (i.e., highly deteriorated or failed units) in a system.

3 - A Two-stage Structural Degradation Modeling In Sparse Datasets

Abdallah Chehade, University of Wisconsin - Madison, chehade@wisc.edu, Kaibo Liu

Degradation modeling has become essential to the field of condition monitoring for better logistics and decision-making. Existing approaches assume there exists a high-quality data-rich environment. However, in many scenarios, the provided dataset is sparse with limited observations. For example, patients tend to skip their semi-annual clinic visits and result in a highly sparse dataset. To fill the literature gap, we propose a novel two-stage approach for structural degradation modeling in sparse datasets. Both simulation and case studies that involve a dataset (ADNI) for Alzheimer disease were used to numerically evaluate and compare the performance of the proposed methodology.

4 - Title: Resistance Level Determination At The Reliability-based System Design

Qiyun Pan, University of Michigan, qiyun@umich.edu, Eunshin Byon

In order to provide a guideline for choosing appropriate design parameters to meet a required level of system reliability, resistance level determination becomes crucial in many applications. At the design stage, resistance level can be estimated using stochastic simulations, and the resistance level estimation can be formulated as a statistical quantile estimation problem. We present a new adaptive importance sampling algorithm to improve the estimation accuracy, given a computational budget.

Sponsored Session

Chair: Emad Alharbi, NJIT, 8 Gordon Cir, Parsippany, NJ, 07054, United States, eaa3@njit.edu

1 - An Airport Scheduling Mechanism Based On Efficiency, Equity And On-time Performance Objectives

Alexandre Jacquillat, Assistant Professor of Operations Research, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States, ajacquil@andrew.cmu.edu, Vikrant Vaze

Airport congestion can be mitigated through scheduling interventions that control imbalances between peak-hour demand and capacity. We design and optimize a non-monetary scheduling mechanism that starts with scheduling inputs from the airlines and airport capacity estimates, and that reschedules flights based on efficiency, inter-airline equity and on-time performance objectives. Theoretical and computational results suggest that large equity gains can be achieved at no, or small, losses in efficiency, and that accounting for airline preferences can enhance the mechanism outcomes.

2 - Integration Of Airport Runway And Taxi Planning

Giuseppe Sirigu, ETS Ingeniería Aeronáutica y del Espacio, Dep Matemática Aplicada Ingenieria Aeroespaci, Plaza Cardenal Cisneros 3, Madrid, 28040, Spain, angel.marin@upm.es, John-Paul Clarke, Angel Marin

We develop and compare network flow-based and Monte Carlo sampling-based deterministic algorithms for the joint optimization of runway and taxiway operations considering required separation minima and environmental concerns. The objective is to minimize the movement time and/or taxi delay considering the desired takeoff time windows and earliest pushback times. The algorithms are compared using numerical simulations that replicate real-word airport operations.

3 - Departure Queue Management - A Data Driven Analysis

Marc Rose, Senior Operations Research Analyst, MCR Federal, LLC, 600 Maryland Ave, 306E, Washington, DC, 20024, United States, mrose@mcri.com

At the FAA the Terminal Flight Data Manager (TFDM) is composed of many capabilities. A major component is the Departure Queue Manager (DQM) which is designed to shift aircraft taxi-out delay away from the runway queue to either the gate (preferred) or a designated waiting area, thus saving fuel. In this paper I discuss the databases and calculations applied to estimate the amount of time that can be shifted from the queue. This will include some discussion of the programming and constraints required to capture some of the uncertainties in the concept

4 - Continuous Descent Arrival Adoption During High Traffic Periods: A Data-driven And Predictive Modeling Approach

Emad Alharbi, PhD Candidate, New Jersey Institute of Technology, Newark, NJ, 07102, United States, eaa3@njit.edu, Layek Abdel-Malek

This study investigates Continuous Descent Arrival (CDA) adoption during high traffic levels periods. We utilize data-driven system approach and predictive analytics to build an online CDA predictive model for an enhanced Air Traffic Management (ATM) procedures as well as an efficient CDA adoption. A Hierarchical Clustering Analysis (HCA) is performed to aggregate data from offline flight tracking logs and Meteorological Aviation Reports (METARs) at selected U.S. airports. The analysis facilitates the visualization of descent profiles and assists in developing a predictive model for CDA instances using Decision Trees with AdaBoost and Support Vector Machines (SVM).

1 - Modeling Wet Pavement Crashes

Michael Anderson, Professor, UAH, Civil Engineering, Huntsville, AL, 35899, United States, andersmd@uah.edu, Mehrnaz Doustmohammadi

Crashes when the pavement is wet are a significant issue within Alabama. This work develops models to identify the key roadway and pavement characteristics that are associated with wet pavement crashes. Additionally, the analysis will include the type of crash generally occurring and the cause of the crash associated with wet pavement.

2 - A Framework For Intelligent Decision Support System For Traffic Congestion Management System

Mohamad kamal El Din Ahmad Hasan, Professor of Operations and Supply Chain Manag, Dept. of Quantitative Methods and Information Systems, CBA, Kuwait University, Department of Quantitative Methods and Information Systems, College of Business Administration, Kuwait University, P.O. Box 5486, Safat 13055, Kuwait City, 13055, Kuwait, mkamal@cba.edu.kw

Traffic congestion problem is one of the major problems that face many transportation decision makers for urban areas. The problem has many impacts on social, economic and development aspects of urban areas. In this paper we propose a comprehensive framework for an Intelligent Decision Support System (IDSS) for Traffic Congestion Management System that utilizes a state of the art transportation network equilibrium modeling and providing an easy to use GIS-based interaction environment. The developed IDSS reduces the dependability on the expertise and level of education of the transportation planners, transportation engineers, or any transportation decision makers.

3 - Locating Emergency Vehicles With An Approximate Queueing Model And A Meta-heuristic Solution Approach

M. Altan Akdogan, Research Assistant, Middle East Technical University, Ankara, Turkey, aaltan@metu.edu.tr, Z Pelin Bayindir, Cem Iyigun

In this study, optimal location decision of Emergency Service(ES) vehicles such as ambulances as a server-to-customer service is discussed. Spatial Queueing Model (SQM) is introduced for spatial networks in locating emergency vehicles in the literature. This study proposes a generalization of SQM for complete networks. Service times for the calls are differentiated for every demand call regarding the location of the responding vehicle and the demand call. The number of servers located in a single location is taken unrestricted. The effect of allowing multiple servers in a location is reported. A genetic algorithm is proposed to solve the model for which no closed-form expression exists.

4 - Toll Road Profit Maximization Under Mixed Travel Behaviors Of Cars And Trucks

Xiaolei Guo, Associate Professor, University of Windsor, Odette School of Business, 401 Sunset Avnue, Windsor, ON, N9B 3P4, Canada, guoxl@uwindsor.ca, Da Xu, Guoqing Zhang

This paper examines the profit maximizing behavior of a private firm which operates a toll road competing against a free alternative in presence of cars and trucks. Trucks differ from cars in value of time, congestion externality, pavement damage, and link travel time function. We assume that trucks choose routes deterministically (i.e., choose the route with the lowest actual cost) while cars follow stochastic user equilibrium in route choice (i.e., choose the route with the lowest perceived cost).

5 - Transportation, Jobs And Social Networks

Bruce C Hartman, Professor, University of St Francis, 684 Benicia Drive #50, Santa Rosa, CA, 95409, United States, bruce@ahartman.net
Bruce C Hartman, Professor, California State University Maritime, 200 Maritime Academy Drive, Vallejo, CA, 94590, United States, bruce@ahartman.net

Logistics clusters provide economic benefit, but expansion has not produced proportionate sector job growth. We hypothesize a network effect not accounted for in traditional analysis. We apply egonets from social network analysis to a weighted network modeled by Total Requirements matrix data for 15 US industry clusters. We propose network measures of value creation and leverage for each sector. A quadrant assessment of our two measures classifies influence of industry sectors. Transportation and Wholesaling sectors create high leverage in the industries they touch, using relatively low value added.

1 - Using Drones To Minimize Waiting Times Of Customers

Mohammad Moshref-Javadi, PhD Candidate, Purdue University, School of Industrial Engineering, 315 N. Grant St., West Lafayette, IN, 47907, United States, moshref@purdue.edu, Seokcheon Lee

Drone is an emerging technology which can be used in logistics operations for more efficient transportation. We propose a new problem which incorporates drones in delivery processes to minimize waiting time of recipients.

2 - A Mathematical Programming Framework That Integrates Customer Decisions Within The Distribution Planning Of Petroleum Products

Yan Cheng Hsu, University at Buffalo, SUNY, 412 Bell Hall, Buffalo, NY, 14260, United States, yhsu8@buffalo.edu, Jose Luis Walteros, Rajan Batta

This work develops a methodological framework for designing the daily distribution and replenishment operations of petroleum products by simultaneously considering the perspectives of both the transporter and its customers. We provide empirical evidence that minor alterations to the customer requirements, triggered by some strategic decisions by the transporter, can in turn fexibilize the transporters' restrictions, allowing for better routing strategies that reduce late deliveries. Therefore, The main objective of this work is studying the interactions that exist between these strategic and operational decisions within a unied approach.

4 - Solving Multi Period Multi Traveling Salesmen Problem With Time Windows: Comparison Of Heuristic Approaches

Haluk Yapicioglu, Assist. Prof. Dr., Anadolu University, Anadolu Universitesi Yunusemre Kampusu, Proje Birimi Ogrenci Merkezi Kat: 1, Eskisehir, 26470, Turkey, hyapicio@anadolu.edu.tr

The problem addressed in this study aims at minimizing number of university representatives visiting exam locations by departing from a central location and returning back. Visits to the exam locations must be done in specified time windows. The problem is modeled as a multi-period traveling salesmen problem with time window. Two stochastic optimization approaches based on simulated annealing and robust taboo search are used. For this a new solution representation is proposed. Finally, a method for obtaining travel distance and travel time matrices from Google Distance Matrix API is developed. The results obtained from a real case are discussed and future research directions are provided.

5 - Optimal Routing Of Unmanned Aerial Vehicles In Wind Fields

Jimena A. Pascual, P. Universidad Católica de Valparaíso, Valparaíso, Chile, jimena.pascual@pucv.cl, Ricardo A. Gatica, Andrea Leticia Arias, Andrea Leticia Arias, Kundu Abhishake, Darío Canut De Bon, Timothy I Matis

The power consumption of an Unmanned Aerial Vehicle (UAV) to overcome directional wind forces may be represented as a non-linear convex function of airspeed. As a result, the optimal flight path between two targets may not be Euclidean, and may have implications on the optimal sequencing of multiple targets. In this presentation, we present research related solving shortest path and traveling salesman type problems to determine the optimal flight path for UAVs, and discuss how this might be extended to other classes of unmanned vehicles, often referred to as UXVs.

Supply Chain Mgt XI

Contributed Session

Chair: Fang Fang, California State University, LA, 1250 S Alhambra Circle, Apt 18, LA, CA, 33146, United States, f.fang@umiami.edu

1 - Traceability And Supply Chain Design

John F Kros, Vincent K. McMahon Distinguished Professor, East Carolina University, College of Business Dept of M&SCM, 3205 Harold Bate Building, Greenville, NC, 27858-4353, United States, krosj@ecu.edu, James Zemanek, Jon Kirchoff

In light of recent issues, supply chain managers' focus on product and service traceability has increased. While research on how/where disruptions occur and supply chain risk mitigation have taken center stage, the topic of traceability across the supply chain has received little attention. This research seeks to investigate the topic of traceability across the supply chain and what policies/procedures supply chain managers have implemented to trace their products/services within and across the supply chain.

2 - Developing A Novel Service-part Classification Approach For Large-scale Multi-echelon Replenishment System

Alireza Sheikhzadeh, PhD Candidate, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, asheikhz@uark.edu, Manuel D Rossetti

The purpose of this research is to create, analyze and test a new classification approach for large-scale multi-echelon service-part replenishment system. The classification approach is defined to address the need to provide the lowest penalty cost associated with grouping. In this research, we define the concept of artificial stocking policy (ASP) as a new classification criterion. We also propose a new partitioning approach which takes into the account the characteristics of the (aggregated) pseudo-items.

3 - How To Get The Conflict Out Of The Mineral Supply Chain

Han Zhang, Student, Kelley School of Business, Indiana University Bloomington, IN, 47408, United States, hz8@indiana.edu, Goker Aydin, H. Sebastian Heese

New legislation requires manufacturers to disclose their sources of “conflict minerals” - natural resources whose trade might finance conflicts. We study the effect of such interventions, using a model with mines, smelters, and manufacturers. We show that imposing penalties on manufacturers alone is not sufficient to eliminate conflict minerals from supply chains, and that an industrial alliance to pool audit costs among compliant manufacturers can be effective in increasing the equilibrium quantity traded of certified metal.

4 - Sourcing And Procurement Coordination In Multi-division Firms

Fang Fang, California State University, LA, 1250 S Alhambra Circle, Apt 18, LA, CA, 33146, United States, f.fang@umiami.edu, Harihara Natarajan

Large firm must coordinate multiple divisions’ procurement activities to leverage volume discounts from suppliers. Facing such a procurement coordination problem, we examine how a firm can design transfer prices to maximize firm-wide cost savings considering divisional off-contract buying. Our analysis of commonly-used transfer pricing rules shows interesting impacts on vendor selection, divisional participation, and gain allocation

Operations Management III

Contributed Session

Chair: Sanchoy Das, New Jersey Institute of Technology, University Heights, Newark, NJ, 7102, United States, das@njit.edu

1 - Design Of Operational Policies To Reduce Boarding Time In Emergency Departments

Cheng Zhu, McGill University, 701-801 Sherbrooke Est, Montreal, QC, H2L 0B7, Canada, cheng.zhu@mail.mcgill.ca, Beste Kucukyacizi

In this research, we aim to reduce emergency department overcrowding by shortening waiting times for: i) for an admission by a consulting physician, ii) boarding to the inpatient ward. We consider patient flows in an open queueing network in the hospital, while the availability of inpatient beds in each ward is exogenous for physicians. Then, we focus on designing admission and boarding policies based on different possibility of given inpatient bed availability.

2 - Efficient Business Operations In A Poultry Firm

Sanjeev K Bordoloi, University of St. Thomas, Opus College of Business, 1000 LaSalle Avenue, TMH 443, Minneapolis, MN, 55403, United States, sbordoloi@stthomas.edu, Jahnavi Indukuri, Indukuri Srinivas Varma

In life-stock business, it is important to make operational decisions. This paper is an analysis of a poultry business in India. We conducted several optimization analyses on decision parameters such as life cycle of birds, break-even point, investment options, branding, and expansion.

3 - Advanced Orders Picking Heuristics For Internet Fulfillment Warehouses With And Explosive Storage Policy

Sanchoy Das, New Jersey Institute of Technology, University Heights, Newark, NJ, 07102, United States, das@njit.edu, Sevilay Onal

IFWs use an explosive storage policy whereby the same item is stored simultaneously in small lots in a large number of locations. Customer orders arrive continuously and the IFW objective is to minimize the fulfillment time. For a free picker the list of candidate picks is very large, and the solution space is described by the product of the number of pending orders and the active inventory locations. Decision variables are (i) which orders to serve next and (ii) which storage locations to fulfill the orders from. We present a narrow band selection heuristic which generate dynamic pick lists.

Optimization Methodology III

Contributed Session

Chair: Mahamaya Mohanty, Research Scholar, IIT Delhi, Shaheed Jeet Singh Marg, New Delhi, 110016, India, mahamayamohanty@gmail.com

1 - Service Network Design With Heterogeneous Resource Constraints: Branch-and-price Approach

Kai Wei, PhD, Tongji University, Siping Road, Shanghai, China, 0359weikai@tongji.edu.cn

In this paper, we first present two kinds of different formulations for service network with heterogeneous asset constraints. The first is node arc formulation and the second is path cycle formulation. In the problem, we assume that each asset has a specific fixed cost and capacity and each arc can be used be several assets simultaneously. We introduce a branch and price algorithm to solve the path cycle formulation and use CPLEX to solve node arc formulation. The experimental results show our branch and price outperform CPLEX, especially in large benchmark instances.

2 - Selective Linearization For Multi-block Convex Optimization

Yu Du, PhD Candidate, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08854, United States, duyu@rutgers.edu, Andrzej Ruszczynski, Xiaodong Lin

We consider the problem of minimizing a sum of several convex non-smooth functions. We introduce an algorithm called the selective linearization method, which iteratively linearizes all but one of the functions and employs simple proximal steps. The algorithm is a form of multiple operator splitting in which the order of processing partial functions is not fixed, but rather determined in the course of calculations. Global convergence is proved and estimates of the convergence rate are derived. Specifically, the number of iterations needed to achieve solution accuracy is of order O(ln(1/)/). We also illustrate the operation of the algorithm on large scale structured regularization problems.

3 - Globally Convergent Probability-one Homotopies For Linear Programs With Complementarity Constraints

Stephen C Billups, Associate Professor, University of Colorado Denver, Dept. of Mathematical & Statistical Sciences, Campus Box 170, P.O. Box 173364, Denver, CO, 80217-3364, United States, stephen.billups@ucdenver.edu

Probability-one homotopy algorithms work by tracking the zero set of a specially constructed homotopy mapping from a known point to a solution to the problem at hand. To apply this idea to linear programs with complementarity constraints (LPCCs), we consider a family of relaxations of the LPCC and replace the complementarity constraints with nonlinear relaxations of NCP functions. Two different homotopy mappings have been developed based on these ideas. We show that these mappings have several desirable properties and we illustrate these properties using small numerical examples.

4 - Application Of Analytics In Modeling The Decision Making Perspectives Of Integrated Logistics In Supply Chain

Mahamaya Mohanty, Research Scholar, IIT Delhi, Shaheed Jeet Singh Marg, New Delhi, 110016, India, mahamayamohanty@gmail.com, Ravi Shankar

As sustainability is a growing concern in a supply chain, we aim to model integrated logistics with a formulation of Sustainable Index(SI). To obtain an optimal solution to rising problems of logistics in a company, the decision maker should take into consideration the reduction of energy consumption, carbon emission, and waste generation to achieve sustainability. Formulation of Sustainability Index is considered by taking into account minimization of cost, time, and risk and maximizing quality, flexibility and revenue.

Behavioral Operations III

Contributed Session

Chair: Sam Kirshner, UNSW Business School, Level 2, West Wing, Quadrangle Building, UNSW, Sydney, 2052, Australia, s.kirshner@unsw.edu.au

1 - The Price Of Privacy: Experimental Evidence For The Value Of Privacy With Respect To Social Norms

Rachel Cummings, California Institute of Technology, 1200 E California Boulevard, MC 305-16, Pasadena, CA, 91125, United States, rachelc@caltech.edu

In a series of multi-player experiments, we measure people's willingness to pay for privacy, and how this value depends on behavioral social norms. Each player is given the option to ``steal" monetary payments from the other players; the information shared about these decisions varies across treatments, which includes revealing partial or noisy information information about the player's actions. By varying the information sharing policy, we can measure how people trade off money for privacy. We also measure how people's willingness to steal changes as stealing behavior becomes more prevalent.

2 - Behavioral Analysis Of Consumers' Purchase Timing Decision

Ilhan Emre Ertan, PhD Candidate, University of Texas at Dallas, 430 Southwest Pkwy., Apt 2102, College Station, TX, 77840, United States, emre.ertan@gmail.com

From a long history of markdown sales, consumers have expectations that retailers will provide markdown discounts during a selling horizon. The consumer purchase timing decision is analyzed by using discounted expected utility theory. The consumer's sequential decision-making process is formalized under uncertain product availability and several behavioral biases. An optimal purchase timing policy is identified in a market environment, in which a strategic customerknows the markdown pricing scheme, available inventory level, and remaining time to the end of the selling horizon.

3 - A Behavioral Experiment On Sharing Advance Warning Of A Supply Chain Disruption

Sourish Sarkar, Assistant Professor, Pennsylvania State University - Erie, 5500 Copper Dr, Apt 104, Erie, PA, 16509, United States, sourishs@gmail.com, Sanjay Kumar

Using the beer distribution game in a controlled laboratory setting, we explore the effect of advance warning of a supply chain disruption. Effect of sharing that information with supply chain partners is also investigated. Considering both upstream and downstream disruptions, we summarize the results from our experiment with several scenarios: disruption with no advance warning but information sharing; disruption with no advance warning and no information sharing; disruption with advance warning but no information sharing; disruption with advance warning and sharing of this warning information.

4 - The Behavioral Traps Of Making Multiple, Simultaneous, Newsvendor Decisions

Shan Li, Assistant Professor, Baruch College, City University of New York, Baruch College, 55 Lexington Avenue, New York, NY, 10010, United States, shan.li@baruch.cuny.edu, Kay-Yut Chen

We conducted an experimental study to explore behaviors of newsvendors who make order decisions for two stores simultaneously. While the two stores are independent, we find that order decisions are impacted not only by the history from the same store, but also by the past information from the other store.

5 - The Impact Of Reference Points On Supply Chain Coordination

Sam Kirshner, UNSW Business School, Level 2, West Wing, Quadrangle Building, UNSW, Sydney, 2052, Australia, s.kirshner@unsw.edu.au, Lusheng Shao

Prospect theory and reference points have recently been utilized to explain the behavioral ordering of human newsvendors. Adopting this approach to modeling newsvendor behavior, we analytically explore the implications of reference points in a two-tier supply chain. We show that reference points enable coordination in a wholesale contract setting, and demonstrate how the reference points alter coordinating contracts under buy-backs and revenue sharing agreements.

1 - General Model For Dynamic Learning Ambiguity vs Bayesianism

Mohammad Rasouli, University of Michigan, 430 South Fourth Ave, Ann Arbor, MI, 48104, United States, rasouli@umich.edu

We propose a general framework for adaptive learning that can model both Bayesian and non-Bayesian learning. We show how different objectives including expected outcome, minmax, and min regret can be modeled in this framework. This framework gives a unified view to the existing results in learning. We complete the existing results by proposing new sufficient statistics and dynamic programming techniques. The connection with zero-sum games is discussed. We will discuss conditions under which pure strategies can achieve optimal performance.

2 - Remove A Paradox In Data Envelopment Analysis

Dariush Khezrimotlagh, Dr., Miami University, Oxford, OH, 45056, United States, khezrid@miamioh.edu

Data Envelopment Analysis (DEA) is a non-parametric linear programming tool to assess the relative efficiency of a set of homogenous firms with multiple input factors and multiple output factors. DEA has been used in thousands of published papers and books in well-known qualified journals and by reputable publishers since 1978. DEA assumes that the relationships between the factors can be varied from one firm to another. This article proves that this assumption has a contradiction with the homogeneity of firms and concludes that the provided scores by DEA models are not relatively meaningful and should not be used to rank or benchmark firms. The instructions to remove the paradox in DEA are illustrated.

3 - Reproducing Kernel Hilbert Space Approach To Stochastic Frontier Semiparametric Estimation

Carlos Felipe Valencia Arboleda, University of los Andes, Cra 1 Este No 19A - 40, Edificio Mario Laserna, Bogota, 11001000, Colombia, cf.valencia@uniandes.edu.co

We develop a nonparametric estimator for the Stochastic Frontier Analysis problem based on the Reproducing Kernel Hilbert Space approach. We prove minimax optimality of convergence for the frontier estimator, and semiparametric efficiency for the finite dimensional parameters. Using Sobolev Hilbert Spaces, we implement the method under monotonicity and concavity constrains. We perform a simulation study to show the benefits of our estimators.

1 - Computer-assisted Discovery And Automated Proofs Of Cutting Plane Theorems

Yuan Zhou, University of California - Davis, One Shields Avenue, Davis, CA, 95616, United States, yzh@math.ucdavis.edu, Matthias Koeppe

Inspired by the breakthroughs of the polyhedral method for combinatorial optimization in the 1980s, generations of researchers have studied the facet structure of convex hulls to develop strong cutting planes. We ask how much of this process can be automated: In particular, can we use algorithms to discover and prove theorems about cutting planes? We focus on general integer and mixed integer programming, and use the framework of cut-generating functions. Using a metaprogramming technique followed by practical computations with semialgebraic cell complexes, we provide computer-based proofs for old and new cutting-plane theorems in Gomory-Johnson's model of cut generating functions.

2 - Mixed-integer Programming For Detecting Cycles In Non-reversible Markov Processes

Ambros Gleixner, Zuse Institute Berlin, Takustr. 7, Berlin, 14195, Germany, gleixner@zib.de, Isabel Beckenbach, Leon Eifler, Konstantin Fackeldey, Andreas Grever, Marcus Weber, Jakob Witzig

Spectral clustering methods are used successfully to identify so-called metastable sets or dominant cycles of Markov processes. They analyze the spectrum of matrices based on the transition probabilities between states. However, current spectral methods have limited applicability for many biological and catalytic processes with a systematic, but slow cyclic behavior on the timescale of the simulation. We use mixed-integer programming to develop a new method that is able to detect the existence and measure the strength of such cyclic processes.

3 - Enhanced Equations For Linearizing Discrete Product For Generalized Programming Problems

Qi An, North Carolina State University, 2119A Gorman Street, Raleigh, NC, 27606, United States, nival.ann@gmail.com, Tiantian Nie, Shu-Cherng Fang

This paper advances ``Equations for Linearizing Discrete Product” — a set of equations that linearize discrete polynomial terms in an effective manner. We exploit the logarithmic feature and propose an enhancement technique to further reduce the number of linear constraints for the current ELDP-based reformulations. We extend the applicability of ELDP to a more general set of ``representable programming problems”. Computational experiments on both random problems and literature-reported problems support that the proposed method indeed increases the computational effectiveness.

4 - A Farm-level Precision Land Management Model Based On Integer Programming

Qi Li, Iowa State University, 0076 Black Engineering, Ames, IA, 50010, United States, qili@iastate.edu, Guiping Hu, Zaki Jubery, Baskar Ganapathysubramanian

A farm level precision farmland management model based on mixed integer linear programming has been proposed. Optimal decisions are provided for preseason crop planning and irrigation water allocation. The model captures the effect of size and shape of decision scale as well as special irrigation patterns. We illustrate the model by conducting a case study on a farm in California and show the model is capable of representing the decision making process and flexible to accommodate various scenarios. The results show that a threefold increase of annual net profit could be achieved by carefully choosing irrigation and seed types.

5 - Whistler-Blackcomb Mega Day As An Integer Programming Problem

John Shane Lyons, PhD Student, Western University-Ivey Business School, 23 Pine Ridge Drive, London, ON, N5X 3G7, Canada, jlyons.phd@ivey.ca

The Whistler-Blackcomb ski area has recently implemented a system which tracks use of 25 lifts across both mountains. A web-based application offers skiers a variety of analytic information pertaining to their skiing activity, and poses a number of ‘badges’ to be earned. One of these, called Mega Day, requires a skier to ride all lifts on both mountains, and consequently ski roughly 10,000 vertical metres. On a particular date of study less than 0.1% of skiers on the mountain achieved this goal. This presentation describes an integer programming model developed to identify feasibility and optimal routing for the Mega Day challenge.

Chair: Oliver Lum, U of Maryland, College Park, 11604 Parkedge Drive, Rockville, MD, 20852, United States, oliver@math.umd.edu

1 - On The Complexity Of Sparse Maximum Flow Problems

Andrew Romich, Systems Engineer, Sandia National Laboratories, 4617 Gerrilyn Way, Apt 206, Apt. 206, Livermore, CA, 94550, United States, aromich@sandia.gov, Cole Smith, Guanghui Lan

We consider several sparsity-inducing restrictions of the standard maximum flow problem. Each restriction is a unique combination of the number of nodes having an out-degree greater than one and the inclusion of either a restriction on the total amount of flow on all arcs or the total number of arcs used in the network. Assuming an option of initially allowing continuous or integer flow, we analyze a total of twelve problems.

2 - Mathematical Optimization For Managing Selective Catalytic Reduction For A Fleet Of Coal-fired Power Plants

Jay Michael Rosenberger, University of Texas-Arlington, Dept of Industrial Manuf Systems Eng, PO Box 19017, Arlington, TX, 76019, United States, jrosenbe@uta.edu, Antonio Alejandro Alanis

Selective Catalytic Reduction (SCR) reduces emissions of oxides of nitrogen (NOx) in coal-fired power plants. With a given set of scheduled outages for a fleet of power plants, we develop a heuristic multi-commodity flow problem with schedule elimination constraints, and a knapsack problem with assignment constraints, to create an SCR management plan, which minimizes the total SCR operational cost of the entire fleet of power plants and maintains NOx emissions below a desired target. We present results indicating that our approach provides an equally optimal solution to that of a schedule generation and optimization approach in less computational processing time.

3 - A Parametric Linear Programming Approach To A Cluster Ratio Based Hierarchical Consensus Clustering Algorithm

Victoria Ellison, North Carolina State University, 2152 Burlington Labs 2500 Stinson Dr., Raleigh, NC, 27695, United States, vmelliso@ncsu.edu, Yahya Fathi, Amy Langville

The minimum cluster ratio cut is a well studied partition-based clustering method used to partition a data set into two or more clusters of balanced size. We propose a natural extension of the minimum cluster ratio cut, which we call the minimum beta-ratio cut, which lends itself to hierarchical clustering methods. We propose a divisive hierarchical consensus clustering algorithm which uses the minimum beta-ratio cut and a heuristic for this algorithm by modifying a BILP formulation of Median Partition problem and applying a parametric programming algorithm to it.

4 - A Hybrid Heuristic For The Windy Rural Postman Problem With a Time-Dependent Zigzag Option

Oliver Lum, U of Maryland, College Park, 11604 Parkedge Drive, Rockville, MD, 20852, United States, oliver@math.umd.edu, Rui Zhang, Bruce L Golden

In some vehicle routing applications, service is required along both sides of the road. During early morning hours, the vehicle may service both sides of the street during a single traversal by zigzagging between the two. This scenario is modeled by the Windy Rural Postman Problem with Time-Dependent Zigzag Options (WRPPZTW). We present a hybrid heuristic for the WRPPZTW which uses well-known insertion techniques in concert with a new integer programming formulation for the WRPPZ. We compare computational performance relative to an existing exact procedure for a set of small instances and present more extensive results for a set of larger instances.

5 - The Deviation-flow Continuous Location Problem For A Single Refueling Station On A Tree Network

Sang Jin Kweon, PhD Candidate, Pennsylvania State University, 310 Leonhard Building, Industrial and Manufacturing Engineering, University Park, PA, 16802, United States, svk5333@psu.edu

In this study, we address the continuous version of the single refueling station location problem on a tree network considering that a given portion of drivers has the option to deviate from their preplanned paths to be able to refuel their vehicles. The objective of the problem is to determine the set of optimal station locations that maximizes the total traffic flow covered (in round trips per time unit). To achieve this goal, we derive optimality properties regarding deviation and determine the sets of candidate sites to locate the refueling station. Then, we develop a polynomial algorithm to determine the set of optimal locations.

1 - Multi-depot Fleet Dimensioning For Seasonal Stochastic Demand

Marcus V. Poggi, PUC-Rio, Rua M. S. Vicente 225, Rio de Janiero, 22591-900, Brazil, poggi@inf.puc-rio.br, Fabian Penaranda

Given a predicted demand behavior represented by a generation function over time and space, distances between clients and the depots, cost to lease one vehicle for the period, unity cost for traveling a distance for leased and for short time hired vehicles and a demand allocation rule, find the (heterogeneous) fleet size at each depot that minimizes the expected operation cost for the period. We propose a decomposition approach based on Stochastic Dual Dynamic Programming that allows dealing with the integrality of the sub-problems. Instances based on CVRPLIB are generated and experimental results are presented.

2 - Scenario Generation Assessment For Stochastic Programs

Didem Sari, Iowa State University, 3219 Roy Key Avenue, Unit 207, Ames, IA, 50010, United States, dsari@iastate.edu, Sarah M Ryan

We propose an approach for assessing the reliability of a scenario generation method using historical outcomes. The distances among scenarios and the observed value are measured by fixing first-stage decisions to a common value and computing second-stage costs. A rank histogram constructed from these distances, motivated by mass transportation metrics, can diagnose bias or other defects. The method is demonstrated using unit commitment case studies and server location simulations.

3 - Route Optimization: A Risk Averse Shortest Path Problem

Marcelo Ricardo Figueroa, Rutgers University, 93 Marvin Lane, Piscataway, NJ, 08854, United States, marcelo.figueroa@rutgers.edu, Melike Baykal-Gursoy

We study a risk-averse shortest path route optimization problem on a vehicular traffic setting, to inform users of optimal routing decisions under particular levels of risk-aversion. We make use of specialized travel-time distributions derived from analytic queueing models with Markov modulated service times to model random traffic interruptions.

4 - Developing A CCHP-microgrid Operation Decision Model Under Uncertainty

Md Abdul Quddus, PhD Student, Mississippi State University, Department of Industrial & Systems Engineering, PO Box 9542, Starkville, MS, 39762, United States, mq90@msstate.edu, Carlos Marino, Mohammad Marufuzzaman, Mengqi Hu

A combined cooling, heating, and power (CCHP) system provides a cost efficient solution for energy demand, energy security supply along with sustainability. The power grid is heavily vulnerable to breakdowns, natural disaster and targeted attacks. Researchers have proposed stochastic optimization models for CCHP operation for small scale (i.e. single buildings). However little attention has given for modeling CCHP units operation that satisfy multiple energy demand nodes. This study bridges the research gap by developing a scalable two stage stochastic programming model for large scale micro-grid operation under uncertainty considering a larger number of scenarios.

1 - Showrooming And The Length Of Product Line

Yilong Luo, Illinois Institute of Technology, 6716 Idaho Avenue, Hammond, IN, 46323, United States, yluo4@hawk.iit.edu, Jiong Sun

Showrooming is a strategy that consumers touch and feel the products in the offline store but purchase from online store which usually offer a lower price. As the improvement of technology, like high speed internet and mobile phone, showrooming are widely applied by consumers. Thus offline stores always regard showrooming as something evil and attribute the sales decline to this effect. In our paper, however, we explore the strategy that brick store can actually benefit from showrooming effect by partially carrying the product line. We also show that the presence of showrooming behavior may or may not induce the brick-and-mortarretailer to reduce the length of the product line it carries.

2 - A Model Of Cause-related Marketing

Sreya Kolay, Assistant Professor, University of California, Irvine, Irvine, CA, 92697, United States, skolay@uci.edu

Cause-related marketing (CRM) is the popular practice of linking purchases to donations made to charitable causes. They include price-based CRM policies wherein a firm donates a percentage of revenues or profits for every purchase made, or quantity- or unit-based CRM policies wherein the firm donates a unit of its own product for every unit purchased. In this paper, we develop an analytical model to examine conditions on consumer valuations and seller's cost structure that determine the optimality of CRM, price-based CRM, and quantity-based CRM from the perspective of a seller. We also compare and contrast these conditions with those that maximize donations and social welfare.

3 - Optimal Pricing Of Multiple Events

Rajeev Kumar Tyagi, Professor, University of California, Irvine, 5 Murasaki, Irvine, CA, 92697, United States, rktyagi@uci.edu

Event organizers often sell a series of events that occur sequentially over time. For example, concert series with multiple performers and sports tournaments. Consumers may enjoy more than one event in the series, and the events may differ in popularity with the audience (e.g. two operas of different popularity in successive months, pre-season games followed by more popular regular-season games). In this paper, we analytically characterize the optimal pricing and bundling strategy of such an event organizer. We allow for sellers who can commit to future prices as well as those who cannot.

1 - Managing Service Systems With Unknown Quality And Customer Anecdotal Reasoning

Hang Ren, University College London, London, United Kingdom, hang.ren.13@ucl.ac.uk, Tingliang Huang

In this paper, we study a service system where customers estimate service quality from anecdotal evidence. We characterize the service provider's pricing, quality information disclosure, and quality control decisions. We find that the service provider adopts a pricing strategy very different from the fully rational benchmark. Moreover, she should reserve quality information when queueing is more costly, and she may disclose one type of service quality anecdote but not the other type. Lastly, the service provider may reduce service quality when customers obtain more anecdotes.

2 - The Use And Value Of Social Network Information In Selective Selling

Ruslan Momot, INSEAD, Fontainebleau, France, Ruslan.momot@insead.edu, Elena Belavina, Karan Girotra

We consider the use and value of social network information in selectively selling goods and services whose value derives from exclusive ownership among network connections. Our model accommodates customers who are heterogeneous in their number of friends (degree) and proclivity for social comparisons (conspicuity). We show how the firm with information on either (or both) of these traits can use it to increase profits making a product selectively available to the firm's best targets - high-conspicuity customers within intermediate-degree segments. We find that information about degree is more valuable than information about conspicuity and that the two are substitutes.

3 - Embedding Assignment-Routing Constraints through Multi-Dimensional Network Construction For Solving Multi-Vehicle Routing With Pickup & Delivery Time Windows

Monireh Mahmoudi, Arizona State University, Tempe, AZ, United States, mmahmoudi@asu.edu, Junhua Chen, Xuesong Zhou

Optimization of ride-sharing services in on-demand transportation systems involves solving a class of complex vehicle routing problems with pickup and delivery with time windows. In this paper, by embedding complex assignment-routing constraints through constructing a multi-dimensional network, we intend to reach optimality for local clusters derived from a reasonably large set of passengers on real world transportation networks. In addition, by the aid of the passengers' cumulative service patterns defined in this paper, our solution approach is able to tackle the symmetry issue which is a common issue in the combinatorial problems.

4 - Using Patient-centric Quality Information To Unlock Hidden Health Care Capabilities

Guihua Wang, Ross School of Business, University of Michigan, Ann Arbor, MI, 48105, United States, guihuaw@umich.edu, Jun Li, Wallace J Hopp

We document a wide variation in quality among 188 surgeons at 35 hospitals in New York state that perform mitral valve surgery. Our analysis shows that patients of different demographics and levels of acuity benefit differently from elite surgeons. In this paper, we develop an approach for computing patient-centric information from outcome data and evaluate the potential health benefits from using such information to guide patients to surgeons. We estimate that the total societal benefits from using patient-centric information are comparable to those achievable by enabling the best surgeons to treat 40% more patients under population-average information.

5 - On The Benefit (or Cost) Of Large-scale Bundling

Tarek Abdallah, New York University, tabdalla@stern.nyu.edu

We study the effectiveness of a simple bundling mechanism in extracting the consumer surplus in the presence of non-negative marginal costs and correlated valuations. We develop simple robust analytics that identify the main drivers for the effectiveness of the pure bundling mechanism and allow the sellers to easily quantify the potential profits of a large-scale bundling mechanism relative to more complicated selling mechanisms. Our numerical simulations show that these analytics provide high predictive power for the true performance of the bundling mechanism and are robust to different parametric assumptions even for relatively small bundles.

1 - On The Equity Issue Of Taxi Market Under A Centralized Recommendation System

Xinwu Qian, Purdue University, West Lafayette, IN, United States, qian39@purdue.edu, Xianyuan Zhan, Sattish Ukkusuri

The lack of perfect information between passengers and drivers is the main cause of the taxi system inefficiency, and having a centralized recommendation system will effectively address this inefficiency. In this study, we model the taxi market with centralized recommendation system, with the objective to minimize the income differences among taxi drivers. The model aims to address the equity issue related to income variance, which helps to improve the stability of the taxi market. We first prove that the problem is NP-hard, and we propose a meta-heuristic algorithm to solve the large-scale real world case efficiently.

2 - Feedback-based Traffic Signal Perimeter Control For Urban Networks Under special Traffic Events

Jiawen Wang, Tongji University, School of Transportation Engineering, Shanghai, China, 07wangjiawen@tongji.edu.cn, Xiaoguang Yang, Xiaozheng He, Srinivas Peeta

This study develops a proportional-integral-derivative controller for traffic signal perimeter control to maximize the throughput of urban networks under special traffic events. The proposed control strategy applies the notion of macroscopic fundamental diagram to dynamically estimate the control targets. Numerical examples are constructed to investigate the benefits of the proposed control strategy in improving the traffic mobility when special traffic events occur.

3 - Simulation-based Optimization With AdaptiveSampling Strategy For Network-wide Traffic Management And Control

Shubham Agrawal, Purdue University, West Lafayette, IN, 47907, United States, shubham@purdue.edu, Xiaozheng He, Ragu Pasupathy, Srinivas Peeta

This study develops a simulation-based optimization model to address network-wide traffic management and control problems under a tight computational budget by applying an adaptive sampling strategy. The proposed model is suitable to solve traffic management and control problems, which can determine traffic signal timing, route guidance, and ramp metering simultaneously. Numerical results are used to illustrate the efficiency of the adaptive sampling strategy in enhancing the performance and reliability of traffic management and control systems in operational context.

Optimizing the Future – Supply Chain at Amazon

Keynote Session

Chair: Anne Robinson, Verizon Wireless, Basking Ridge, NJ, anne.robinson@verizonwireless.com

1 - Optimizing The Future - Supply Chain at Amazon

Jason Murray, Amazon, 410 Terry Avenue North, Seattle, WA, 89109, United States, n.a@na.org

The retail supply chain of the future will be built on massive data, advanced analytics and innovative technology. At Amazon, we are constantly pushing the frontier in each of these areas to help create that future. Our vision is to move products at an unprecedented scale through the most technologically advanced supply chain possible, where intelligent optimization algorithms drive efficiency. To achieve this vision, we focus on three core pillars: research, technology, and business ownership. We develop new research, implement it in technology, and own the top- and bottom-line of the business. To be successful, we believe business ownership, research, and development must be tightly coupled. During this presentation, I will discuss our vision for the future of retail supply chain — where we have been, where we are, and where we plan to go. I will share some cases of research innovation and its integration with technology and business. These include inter-disciplinary modeling and optimization (from machine learning, statistics, simulation and optimization) to make Amazon's supply chain more efficient. Finally, I will provide examples of some challenges we will need to overcome to make our vision a reality.

1 - UPS Optimizes Delivery Routes

Jack Levis, Director of Process Management, UPS, Timonium, MD, United States, jlevis@ups.com, Ranganeth Nuggehalli

UPS, the leading logistics provider in the world, and long known for its penchant for efficiency, embarked on a journey to streamline and modernize its pickup and delivery operations in 2003. This journey resulted in a suite of systems, including an optimization system, which is called "On Road Integrated Optimization and Navigation" (ORION). Every day, ORION provides an optimized route for each of UPS' 55,000 U.S. drivers based on the packages to be picked up and delivered on that day. The innovative system creates routes that maintain the desired level of consistency from day to day. To bring this transformational system from concept to reality, UPS instituted extensive change management practices to ensure buy-in from both users and executives. Costing more than $250 million to build and deploy, ORION is expected to save UPS $300 to $400 million annually. ORION is also contributing the sustainability efforts of UPS by reducing the CO2 emissions by 100,000 tons annually. By providing a foundation for a new generation of advanced planning systems, ORION is transforming the pickup and delivery operations at UPS.

New Methods in Data Mining

Sponsored: Data Mining

Sponsored Session

Chair: Mariya Naumova, Rutgers University, 640 Bartholomes Road, Piscataway, NJ, 08854, United States, mnaumova@rci.rutgers.edu

1 - A Fast Algorithm For Discretization In A Big Data Space

Abdelaziz Berrado, Associate Professor, University Mohammed V in Rabat, BP 765, Avenue Ibn Sina, Agdal, Rabat, 10080, Morocco, berrado@emi.ac.ma

Discretizing continuous attributes is a necessary preprocessing step before association rules mining or using several inductive learning algorithms with a heterogeneous big data space. This important task should be carried out with a minimum information loss. We combine bagging and nonlinear optimization techniques to build an automated supervised, global and dynamic discretization algorithm that derives its ability in conserving the data properties from the Random Forest algorithm. Empirical results indicate the performance of our discretization algorithm.

2 - Orthogonal Tensor Decomposition

Cun Mu, PhD Student, Columbia University, 500 West 120th Street, Room 315, New York, NY, 10027, United States, cm3052@columbia.edu, Donald Goldfarb

Many idealized problems in signal processing, machine learning, and statistics can be reduced to the problem of finding the symmetric canonical decomposition of an underlying symmetric and orthogonally decomposable (SOD) tensor. In this talk, we will address several practical issues arising from conducting this orthogonal tensor decomposition.

3 - Distance-based Methods For Classification Of Groups Of Objects

Mariya Naumova, Rutgers University, 110 Frelinghuysen Rd., Piscataway, NJ, 08854, United States, mnaumova@rci.rutgers.edu

Given a finite number of learning samples from several populations (groups) and a collection of samples from the union of these populations, it is required to classify the entire collection (not a single sample) to one of the groups. Such problems often arise in medical, chemical, biological and technical diagnostics, classification of signals, etc. We consider different methods of solving the problem based on distance formulas and make comparison of their quality based on numerical results. We give an illustrative example with real data to demonstrate the effectiveness of the classification methods.

1 - Statistical Learning Of Neuronal Functional Connectivity

Chunming Zhang, University of Wisconsin - Madison, cmzhang@stat.wisc.edu

Identifying the network structure of a neuron ensemble is critical for understanding how information is transferred within such a neural population. We propose a SIE regularization method for estimating the conditional intensities under the GLM framework to better capture the functional connectivity among neurons. A new algorithm is developed to efficiently handle the complex penalty in the SIE-GLM for large sparse data sets applicable to spike train data. Simulation results indicate that our proposed method outperforms existing approaches. An application of the proposed method to a real spike train data set provides some insight into the neuronal network.

2 - Graph Mining For Alzheimer Disease

Fei Gao, Arizona State University, Tempe, AZ, 85281, United States, fgao16@asu.edu, Teresa Wu

Apolipoprotein E (APOE) is a gene considered to be highly correlated with the risks of having Alzheimer's disease (AD). In this study, imaging data (T1 and DWI) of two cohorts of patients: APOE carrier and non-carrier is studied. Brain network were first generated based on which linear regression on graphic features such as clustering coefficient, mean degree versus age was conducted. The results showed there may be differences between the two cohorts. This finding motivated us further to develop a multi-task feature selection method to identify the critical sub-graphic regions that can significantly improve the discriminative power using the new graph features versus age correlation.

3 - Mining Hierarchical Event Labels In Large-scale Eeg Collections

Kay Robbins, University of Texas at San Antonio, Kay.Robbins@utsa.edu, Nima Bigdely-Shamlo

When comparing results from two similar EEG studies, researchers must manually map event types in one study to those of the other. To address event mapping and to facilitate large-scale data sharing, we created an event-labeling scheme called Hierarchical Event Descriptors (HED). HED is a common, extensible vocabulary, with more detailed tags appearing lower in the hierarchy. We tagged over 3 million events across 1,127 datasets using the HED tag system. We perform a cross study analysis by investigating ERP/ERSP patterns calculated by averaging over data recording trials extracted by matching HED tags. We evaluate the correlations of these patterns and their relationship to particular tags.

4 - Capturing Dynamics Of Brain Functional Networks Through Data Driven Techniques

Laleh Najafizadeh, Rutgers University, laleh.najafizadeh@rutgers.edu

The brain is a highly complex dynamic system in which neuronal connections are continuously formed and dissolved at multiple temporal scales. A challenging problem in the field of neuroscience has been to find reliable techniques that can describe such inherently dynamic properties of brain function. One promising approach to investigate brain's functional architecture is to study its function at the network level within the context of functional connectivity. Utilizing this approach, here, we present data driven frameworks to examine the dynamic nature of neuronal activity, during the execution of tasks.

Recent Developments in Opaque and Probabilistic Selling

Invited: Business Model Innovation

Invited Session

Chair: Tingliang Huang, Carroll School of Management, Boston College, Chestnut Hill, MA, United States, tingliang.huang@bc.edu

1 - Selling Through Priceline? On The Impact Of Name-your-own-price In Competitive Market

Xiao Huang, John Molson School of Business, Concordia University, xiao.huang@concordia.ca, Greys Sosic, Gregory E Kersten

We study how competitive sellers with substitutable goods may sell their products (1) as regular goods, through a direct channel at posted prices, and/or (2) as opaque goods, through a 3rd-party NYOP channel. We establish a stylized framework with two competing sellers, an intermediary NYOP firm, and a sequence of customers. We characterize customers' optimal purchasing/bidding decisions and sellers' dynamic pricing equilibrium, and then illustrate the impact of inventory and time on prices, profits and channel strategies via numerical studies. Interestingly, although competing sellers seldom benefit from the existence of NYOP, it is possible that some seller(s) may adopt it in equilibrium.

2 - Opaque Selling And Last-minute Selling: Revenue Management In Vertically Differentiated Markets

Hang Ren, School of Management, University College London, London, United Kingdom, hang.ren.13@ucl.ac.uk, Tingliang Huang

Firms in many industries often reduce the price of products/service at the end of the selling season to dispose of unsold inventory/capacity. This last-minute selling induces consumers to wait for sales and thus lowers the regular price. To overcome the problem, many firms switch to opaque selling, i.e., mixing different types of leftovers and sell them as one type of product. We study the performance of last-minute selling and opaque selling in vertically differentiated markets, and find that opaque selling is less efficient in cleaning up leftovers, and the firm may switch to last-minute selling when high demand becomes more likely. Both results are contrary to the horizontal differentiation case.

3 - Vertical Probabilistic Selling Under Competition: The Role Of Consumer Anticipated Regret

Dongyuan Zhan, University College London, London, WC1E 6BT, United Kingdom, d.zhan@ucl.ac.uk, Yong Chao, Lin Liu

We study probabilistic selling with vertically differentiated products when firms compete and consumers anticipate the potential post-purchase regret raised by obtaining the inferior products. Intuitively, anticipated regret hurts the attractiveness of probabilistic selling. However, we find that probabilistic selling can be more profitable, and more likely to arise with anticipated regret than without it. That is due to the "reverse quality discrimination" (perceived quality of the random product is non-increasing in consumer type), which increases the perceived differentiation at the competition margin, and maintains the random products attractive to the infra-marginal consumers.

Joint Session QSR/ENRE: Data-driven Modeling and Analytics in Wind Power Systems

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Arash Pourhabib, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States, arash.pourhabib@okstate.edu

Co-Chair: Eunshin Byon, University of Michigan, College Station, MI, United States, ebyon@umich.edu

1 - Extreme Loads Analysis: Extrapolation And Importance Sampling

Peter Graf, National Renewable Energy Laboratory, 15013 Denver West Parkway, Golden, CO, 80401, United States, Peter.Graf@nrel.gov

Assessing wind turbine extreme loads requires estimating tails of probability distributions to construct "exceedance plots" of probability versus peak loads in a 10 minute simulation corresponding to a once-in-50-years event. The IEC standard contains a prescription for how to estimate these loads. Many find it unsatisfying because it relies on extrapolation to achieve the 10E-8 level. Alternative methods based on more strategic sampling of conditions are promising because they may allow for direct statistical realization of the extreme loads. This paper compares the existing IEC approach to one based on Importance Sampling.

2 - Space-time Modeling Of Asymmetric Local Wind Fields

Ahmed Aziz Ezzat, Texas A&M University, College Station, TX, United States, aa.ezzat@tamu.edu, Mikyoung Jun, Yu Ding

Local wind fields refer to the wind dynamics in a space-time domain composed of a dense grid of locations with close space-time proximity. A typical application is modeling wind stream behavior using measurements at wind turbines on a wind farm. Existing literature tends to overlook space-time interaction by imposing separable, symmetric models. Our analysis suggests that local wind dynamics are asymmetric in nature, and this asymmetry pattern is dynamically changing due to alternation of dominant winds. Modeling such physical phenomenon can have a vital impact on our understanding of local wind dynamics, enabling better forecasts and robust control strategies in wind energy applications.

3 - Data-driven Stochastic Transmission Expansion Planning

Ali Bagheri, Oklahoma State University, ali.bagheri@okstate.edu

Due to the significant improvements of power generation technologies and replacing traditional power plants with renewable ones, the generation portfolio will experience dramatic changes. The uncertainty of renewable energy and their sitting call for economic plans for expanding the transmission capacities. In this study, by learning from the historical data, we first construct a confidence set for the unknown distribution of the uncertain parameters. Then, we develop a two-stage data-driven transmission expansion framework, by considering the worst-case distribution within the constructed confidence set. To tackle the model complexity, we propose a decomposition framework.

4 - Data-driven Approach For Wake Effect Analysis: Generalization To All Wind Directions

Mingdi You, University of Michigan, mingdyou@umich.edu, Eunshin Byon, Judy Jin

Utility-scale wind farms consist of a large number of turbines. To improve the power generation efficiency of turbines, accurate quantification of power generations of multi-turbines is critical in wind farm design and operations. One challenging issue is that the power outputs of multiple turbines are different because of complex interactions among turbines, known as wake effects. In general, downstream turbines tend to produce less power than upstream turbines. When wind direction changes, such wake correlations among turbines also change. This study proposes a new statistical approach that quantifies the wake effects on power generations under different wind directions.

1 - Stochastic Forestry Planning Problem Using Progressive Hedging

Cristobal Pais, PhD Student, Instituto de Sistemas Complejos de Ingeniería, Domeyko 2367, Santiago, 8370397, Chile, cpais@ing.uchile.cl, Andres P Weintraub

The forest planning problem with road construction consists in managing the production of a land divided into harvest cells. The goal is the maximization of the expected NPV for a tactical plan subject to uncertainties. A method is applied for generating scenario trees (price, demand and growth) with their probabilities. Non-anticipativity constraints are needed in the model to link scenarios. This problem is difficult to solve due to the number of scenarios. We have implemented Progressive Hedging which separates the problem by scenarios, with multiple adjustments to improve its solvability exploiting its parallel implementation. With this approach, instances up to 1000 scenarios were solved.

2 - Using Critical Component Detection In Graphs For Wildfire Fuel Management

Dmytro Matsypura, The University of Sydney, Business School, Abercrombie Building H70, Sydney, 2006, Australia, dmytro.matsypura@sydney.edu.au

We study the problem of wildfire fuel management. The problem is formulated as a non-linear optimization problem. We apply the formulations and objectives used for critical element detection in graphs. We present the results of simulations and empirical study.

3 - A Stochastic Programming Approach To Satellite Constellation Design

Aaron B Hoskins, PhD Candidate, Mississippi State University, P.O. Box 9542, Starkville, MS, 39762, United States, abh318@msstate.edu, Hugh Medal

A constellation of satellites is launched to collect data on wildfires. The time and location of the wildfires is not known at the time the satellites are launched into orbit. This research implements a stochastic programming algorithm to select the initial constellation design that minimizes the expected cost of maneuvering the satellites to collect data once the location of the wildfire has been realized.

4 - Optimal Carbon Sampling In Remote Forest Regions

Sándor F. Tóth, University of Washington, School of Environmental & Forest Sciences, Seattle, WA, 9, United States, oths@uw.edu, Hans Eric Andersen

We present a spatial optimization approach to find the best integrated ground and air sampling strategy for carbon in remote boreal forests. We minimize the expected variance on estimates of the mean carbon tonnage in six forest pools by optimal flight path selection for remote sensing and by optimal vehicle routing for ground calibration. We apply the model, which incorporates budgetary and logistical constraints, to the Tanana District of the U.S. Forest Service in the Interior of Alaska.

Optimization for Large-Scale Learning

Sponsored: Data Mining

Sponsored Session

Chair: Dzung Phan, IBM Research, Yorktown Heights, NY, United States, phandu@us.ibm.com

1 - Gradient Sliding For Structured Convex Optimization

Yuyuan Ouyang, Clemson University, yuyuano@clemson.edu, Guanghui Lan

We present a gradient sliding method for a class of structured convex optimization. In particular, we assume that the optimization problem has the structure of the sum of two components. The proposed method is capable of skipping the evaluation of one of the components in the problem, will preserving the overall iteration complexity. The proposed method can be applied to smooth optimization, bilinear saddle point optimization, and variational inequalities.

2 - Storm: Stochastic Optimization Using Random Models

Matthew Joseph Menickelly, Lehigh University, mjm412@lehigh.edu

In this talk, we will discuss work in developing an algorithmic framework (STORM) for the unconstrained minimization of a stochastic function, f. The framework is based on the class of derivative-free trust-region methods. It essentially requires that both the quality of random models of f and the error in a pair of point estimates - one at the current iterate and a second at the trial step - scale with the square of the trust region radius. We compare this approach to usual methods of stochastic optimization, e.g. stochastic gradient descent, and discuss possible applications of STORM in hyperparameter tuning and AUC optimization.

3 - Extended Gauss-Newton-Type Algorithms For Low-rank Matrix Optimization

Quoc Tran-Dinh, University of North Carolina at Chapel Hill, quoctd@email.unc.edu

We develop a Gauss-Newton framework for solving nonconvex optimization problems involving low-rank matrix variables. The algorithm inherits advanced features from classical Gauss-Newton method to this extension such as local linear and quadratic convergence. Under mild assumptions, we prove the local linear and quadratic convergence of our method.By incorporating with a linesearch, the algorithm has a global convergence guarantee to a critical point of problems. As a special case, we customize our framework to handle the symmetric case with provable convergence guarantees. We test our algorithms on various practical problems including matrix completion, and quantum tomography.

4 - Projection Algorithms For Nonconvex Minimization With Application To Sparse Principal Component Analysis

Dzung Phan, IBM Research, phandu@us.ibm.com, William Hager, Jiajie Zhu

We minimize a concave function over nonconvex sets, and propose a gradient projection algorithm (GPA) and an approximate Newton algorithm (ANA). Convergence results are established. In numerical experiments arising in sparse principal component analysis, it is seen that the performance of GPA is very similar to the fastest current methods. In some cases, ANA is substantially faster than the other algorithms, and gives a better solution.

Emerging Topics on Internet of Things (IoT) and Data Analytics

Sponsored: Data Mining

Sponsored Session

Chair: Chen Kan, Pennsylvania State University, University Park, PA, United States, cjk5654@psu.edu

1 - A Pomdp Approach For Optimal Alerting To Remotely Monitored Asthma Patients Considering Alert Compliance Issue

Junbo Son, Assistant Professor, University of Delaware, Newark, DE, United States, sonjunbo@gmail.com, Shiyu Zhou

Driven by the IoT, a smart asthma management (SAM) system has been implemented where rescue inhalers with a wireless connection record the inhaler usage and transmit the data to a centralized server. Based on the diagnosis result, the system may alert the patient for timely interventions. A crucial challenge is to decide when to alert the patients considering the fact that the patient may not comply the alert. This alert compliance issue complicates the decision process. In this research, a novel partially observable Markov decision process considering alert compliance is proposed and useful insights were found which would benefit both the asthma patients and company who run the SAM system.

2 - Integration Of Data-level Fusion Model And Kernel Methods For Degradation Modeling And Prognostic Analysis

Changyue Song, University of Wisconsin-Madison, Madison, WI, United States, csong39@wisc.edu, Kaibo Liu

Internet of things has enabled a data-rich environment with multiple sensors to monitor the degradation process of a unit in real time. As each sensor signal often contains partial and dependent information, data-level fusion methods have been developed that aim to construct a health index via the combination of multiple sensor signals. The existing data-level fusion methods are limited by only considering a linear fusion function, which may be insufficient to accurately characterize the complex relations of sensor signals in practice. This study fills the literature gap by integrating the kernel methods with data-level fusion approaches to incorporate nonlinear fusion functions.

3 - Parallel Computing For The Optimization Of A Large-scale Dynamic Network - The Internet Of Hearts

Chen Kan, Pennsylvania State University, University Park, PA, 16802, United States, cjk5654@psu.edu, Hui Yang

Rapid advancements of mobile computing provide an unprecedented opportunity to empower a next generation mobile health system - the internet of heart (IoH). The IoH embeds patients into a dynamic network and reveals the change of patient's status through network variations. However, it poses a great challenge for real-time recognition of disease patterns when large number of patients are involved in IoH. This study develops a novel scheme to optimize the network in a parallel, distributed manner, thereby improving the the efficiency of computation. Experimental results show that the developed scheme is effective and efficient for realizing smart connected healthcare in large-scale IoH contexts.

4 - Control Policies For Iot Manufacturing Systems: A Two Stage Stochastic Approach

Xu Jin, Texas A&M University, College Station, TX, United States, jinxu@tamu.edu, Natarajan Gautam, Satish Bukkapatnam, Hoang Tran

We consider a smart manufacturing setting where materials and machines are part of an IoT. A two-stage stochastic model is formulated to determine tool replacement and processing speed decisions based on the availability of the job arrival as well as machine health and processing status information. Stage 1 uses a Lyapunov method to cluster jobs for throughput optimization, and Stage 2 employs a stochastic scheduling algorithm to minimize cycle times. We also analyze the effectiveness of this approach using extensive numerical testing.

Outsourcing Innovation

Invited: Business Model Innovation

Invited Session

Chair: Ersin Korpeoglu, University College London, London, United Kingdom, e.korpeoglu@ucl.ac.uk

1 - Performance Feedback In Competitive Product Development

Daniel P Gross, Harvard Business School, dgross@hbs.edu

Performance feedback is ubiquitous in competitive settings where new products are developed. This paper introduces a tension between incentives and improvement in performance evaluation. Using a sample of four thousand commercial logo design tournaments, I show that feedback reduces participation but improves the quality of submissions, with an ambiguous effect on high-quality output. To evaluate this tradeoff, I develop a procedure to estimate agents' effort costs and simulate counterfactuals under alternative feedback policies. The results suggest that feedback on net increases the number of high-quality ideas produced and may thus be desirable for a principal seeking innovation.

2 - Workforce Mobility And Innovation Outcomes In Manufacturing

Philipp Cornelius, University College London, London, United Kingdom, philipp.cornelius.12@ucl.ac.uk, Bilal Gokpinar, Fabian Sting

Employee ideas are a valuable starting point to improve operational efficiency. We empirically investigate how moves between problems and sites affect the innovation value created by employee ideas for the organization. We document that the dynamic effects of problem switches differ fundamentally from the effects of site switches: The innovation outcomes of problem switching employees follow a concave inverse u-shaped pattern, whereas the innovation outcomes of site switching employees follow a convex u-shaped pattern over time. We discuss implications for theory.

3 - Contest Among Contest Organizers

Ersin Korpeoglu, School of Management, University College London, London, United Kingdom, e.korpeoglu@ucl.ac.uk, Isa E Hafalir

This paper analyzes the organization of multiple innovation contests in which organizers post problems to a group of agents, and elicit innovative solutions. We compare the contest organizers' payoffs when they organize multiple contests simultaneously or when they compete with other contest organizers for the effort of agents towards solving their problems. We show that depending on problem structure, more intense competition among organizers and organizing multiple contests may harm or, counter-intuitively, benefit each organizer. Our findings explain why organizers find it beneficial to hold multiple contests or organize similar contests with their competitors simultaneously.

Big Data II

Contributed Session

Chair: Haibo Wang, Killam Distinguished Associate Professor, Texas A&M International University, 5201 University Boulevard, Laredo, TX, 78045, United States, hwang@tamiu.edu

1 - Integrating Data Science In Statistical Practice And Analytics

Steven B Cohen, RTI International, 701 13th Street NW, Washington, DC, 20005, United States, scohen@rti.org

The field of data science has served to rapidly expand the knowledge base and decision-making ability through the combination of seemly disparate and diverse sources of information and content, which include survey and administrative data, social, financial and economic micro-data, and content from mobile devices, the internet and social media. Other attributes of data science include data visualization; predictive, mathematical and simulation modeling; use of Bayesian methods, machine learning; GIS and geospatial analytics and Big Data technologies. In this presentation, attention is given to demonstrate the capacity of data science to enhance study designs and predictive analytics.

2 - Next-generation Sequencing (NGS) Data Analysis: Developing A Scalable Framework For The Future

Michael Chuang, State University of New York, 1 Hawk Drive, New Paltz, NY, 12561, United States, chuangm@newpaltz.edu

NGS analysis presents a domain for biomedical and information technology professionals to explore. Due to the large amount of data involved and various constraints of technologies, we delineate issues to consider to develop a framework using parallel computing and NoSQL database service to greatly reduce the required time under less infrastructure investments while achieving satisfactory accuracy.

3 - Five Steps To Big Data Analytics

Xuan Wang, PhD Student, Louisiana State University, 2200 Business Education Complex, Nicholson Extension, Baton Rouge, LA, 70803, United States, xwang35@lsu.edu, Helmut Schneider

Analytics has been categorized as descriptive, predictive and prescriptive. However, much many challenges lie in the data preparation. Also, analytics is typically concerned about prediction rather than explaining, leaving manager's to question whether to trust results. Hence, data preparation and causal inference are two important steps in analytics at the beginning and end of an analytics project life cycle.

4 - Prescriptive Analytic For Public Transportation Corridor Planning

Haibo Wang, Killam Distinguished Associate Professor, Texas A&M International University, 5201 University Boulevard, Laredo, TX, 78045, United States, hwang@tamiu.edu, Wei Wang, Jun Huang

We investigate how public transportation planning affects the economic growth and social development in the urban areas, especially the economic enhancement zones in US cities. We build visualization tools to help decision makers understand the impact of future planning and issues of existing system.

Optimization in Renewable Energy

Sponsored: Energy, Natural Res & the Environment, Energy II Other

Sponsored Session

Chair: Sushil Raj Poudel, MSU, MSU, Starkville, MS, 39760, United States, srp224@msstate.edu

1 - Sustainable Network Design For Multi-purpose Pallet Processing Depots Under Biomass Supply Uncertainty

MD Abdul Quddus, PhD Student, Mississippi State University, Department of Industrial & Systems Engineering, P.O. Box 9542, Starkville, MS, 39762, United States, mq90@msstate.edu, Niamat Ullah Ibne Hossain, Mohammad Marufuzzaman, Raed Jaradat

This study develops a two-stage stochastic mixed-integer programming model to manage sustainable pellet processing depots under feedstock supply uncertainty. The proposed optimization model not only minimizes cost but also mitigates emissions from the supply chain network. We develop a hybrid decomposition algorithm that combine Sample average approximation with an enhanced Progressive Hedging (PH) algorithm. Mississippi and Alabama are selected for testing ground of this model. The results of the analysis reveal promising insights that could lead to recommendations to help decision makers to achieve a more cost-effective environmentally-friendly supply chain network.

2 - Supply Chain Design As A Mechanism To Introduce Biofuel Feedstock Adoption In Africa

Liang Lu, UC Berkeley, Berkeley, CA, United States, lld2x1515@berkeley.edu, Wei Qi, Zuo-Jun Max Shen, David Zilberman

Many biofuel projects in Africa are not sufficiently developed to benefit smallholders. We propose models of capacity planning and dynamic feedstock sourcing design for a biorefinary. We show that refineries have to reach a critical capacity to justify outsourcing. The role of smallholders' learning rate/project length/credit availability/government subsidy are discussed.

3 - Designing A Reliable And Congested Multi-modal Facility Location Problem For Bio-fuel Supply Chain Network

Sushil Raj Poudel, Mississippi State University, Dept of Industrial & Systems Engineerring, PO Box 9542, Starkville, MS, 39762, United States, srp224@msstate.edu, MD Abdul Quddus, Mohammad Marufuzzaman, Sudipta Chowdhury, Brian Smith, Linkan Bian

This study presents a mathematical model that designs a reliable multi-modal transportation network for a bio-fuel supply chain system. The proposed model investigates the effect of different levels of congestion and disruption on locating multi-modal facilities and bio-refineries. The nested decomposition algorithm we propose combine Constraint Generation (CG) and Rolling Horizon (RH) to solve this NP-hard problem. Results obtained from the experiments revealed that the effect of congestion reduces the total number of multi-modal facilities and the consideration of disruption probability move away the facilities from coastal areas while increasing the total unit cost of bio-fuel.

Quality-Guaranteed Network Design: Interdiction, Routing, and Resource Allocation

Sponsored: Optimization, Network Optimization

Sponsored Session

Chair: Tachun Lin, Assistant Professor, Bradley University, 1501 W Bradley Ave, Bradley Hall 171, Peoria, IL, 61625, United States, djlin@bradley.edu

1 - Risk-averse Bi-level Stochastic Network Interdiction Model For Cyber-security

Tanveer Hossain Bhuiyan, Mississippi State University, P.O Box 9542, 260 McCain Hall,, Mississippi State University, Starkville, MS, 39762, United States, tb2038@msstate.edu, Apurba K Nandi, Hugh Medal

We propose a bi-level stochastic network interdiction model to enable a risk-averse and resource constrained cyber network defender to optimally deploy security countermeasures. The model minimizes both the overall expected maximum loss and the expected loss from worst cyber-attacks while capturing the interaction between the defender and the attacker. The budget of an attacker in our model is uncertain. In the presence of uncertain attack scenarios, this risk aversion approach provides a more robust interdiction plan as compared to the risk-neutral approach. We develop parallelizable exact and heuristic algorithms to solve the model.

2 - Revisiting Integrated Fleeting And Routing Design For International Flight Management

Zhili Zhou, United Airlines, zhili.zhou@united.com

We study the integrated fleeting and routing problem for international flight management, which requires maximally preserve the consistency of fleet and flight leg assignment. We analyze the historical patterns of fleet routes and develop approximation algorithms for fleet routing through splitting and adding with historical patterns as base. We further integrate the routing model with fleeting model. Computational results demonstrate that the solution approaches achieves assignment consistency and CAPEX maximization.

3 - Network Function Placement: A Game-theoretic Approach

Tachun Lin, Bradley University, djlin@bradley.edu

Network function virtualization decouples network functions from proprietary networking hardware and enables adaptive services to end-user requests. We study a network virtualization scheme and propose an integrated design for network function instance allocation and end-to-end demand realization sharing the same physical substrate network. We first propose an MILP formulation to find the optimal solution, and then present a two-player pure-strategy game which captures the competition on physical resources between network function instance allocation and routing. We then design an algorithm based on iterative weakly dominated elimination in Game Theory to solve this problem.

New Results on Polyhedral Relaxations

Sponsored: Optimization, Integer and Discrete Optimization

Sponsored Session

Chair: Akshay Gupte, Clemson University, Clemson, SC, United States, agupte@clemson.edu

1 - Approximation Guarantees Of Closures

Joseph Paat, Johns Hopkins University, jpaat1@jhu.edu

Intersection cuts for Gomory's corner polyhedron can be generated using lattice-free sets. While the intersection of all of these cuts reproduces the corner polyhedron, a question of interest is how well does a subfamily of intersection cuts approximate the corner polyhedron. We examine this question and develop conditions for approximation based on the number of facets of the underlying lattice-free sets. This work was done in collaboration with Gennadiy Averkov from the University of Magdeburg in Germany, and Amitabh Basu from Johns Hopkins University in the USA.

2 - Some Lexicographic Perspectives On Valid Inequalities

Michael Eldredge, Clemson University, michaelgeldredge@gmail.com, Akshay Gupte

If B is a box in n-dimensional space, then the convex hull of integer points that are lexicographically between two given points is describable with 4n linear constraints. In this presentation we analyze a process that exploits this representation to define disjunctions and split cuts in integer programming problems, including presenting complexity results for determining the feasibility of lexicographically defined sets.

3 - An Efficient Algorithm For Trivial Lifting In Two Dimensions

Alinson Xavier, University of Waterloo, Waterloo, ON, Canada, axavier@uwaterloo.ca, Ricardo Fukasawa, Laurent Poirrier

When generating cuts for MIPs from multiple rows of the simplex tableau, the usual approach has been to relax the integrality of the non-basic variables, compute an intersection cut, then strengthen the cut coefficients corresponding to integral non-basic variables using the so-called trivial lifting procedure. Although of polynomial-time complexity in theory, this lifting procedure can be computationally costly in practice. For two-row relaxations, we present an algorithm that computes trivial lifting coefficients in constant time, for arbitrary maximal lattice-free sets. Computational experiments confirm that the algorithm works well in practice. We discuss possible generalizations.

4 - On MIP Relaxations For Nonlinear Programs

Taotao He, Purdue University, Rawls Hall, 100 S Grant Street, West Lafayette, IN, 47907-2076, United States, he135@purdue.edu, Mohit Tawarmalani

In this talk, we propose new recursive relaxation techniques for factorable programs. We consider the graph of product on non-negative convex functions and show that tighter relaxations than the McCormick scheme can be developed in a variety of ways. We use these schemes in conjunction with disjunctive programming to develop a hierarchy of MIP relaxations whose optimal value converges asymptotically to that of the nonlinear program. We provide preliminary computations to demonstrate the efficacy of our scheme.

Software and Methodologies for (Nonlinear) Integer Programming

Sponsored: Optimization, Computational Optimization and Software

Sponsored Session

Chair: Alexandra M Newman, Colorado School of Mines, Golden, CO, United States, anewman@mines.edu

1 - Software For Nonlinearly Constrained Optimization

Sven Leyffer, Argonne National Laboratory, leyffer@anl.gov

We survey different methodologies for solving general nonlinearly constrained optimization problems, including interior-point, augmented Lagrangian, and active-set methods. We discuss linear algebra requirements of these different techniques; present different globalization strategies; and comment on their relative performance for solving large-scale optimization problems. Time permitting we will present preliminary results with a new solver library that we are developing.

2 - Choosing A Solution Strategy For Discrete Quadratic Optimization

Robert Fourer, AMPL Optimization Inc., 4er@ampl.com

The combination of integer variables with quadratic objectives and constraints is a powerful formulation tool. But when it comes to solving the resulting optimization problems, there are numerous good approaches but no one best way — even in simpler cases where the objective is convex or the constraints are linear. Both linearization of quadratic terms and quadratic generalization of linear methods turn out to be preferable in some circumstances. This presentation exhibits a variety of examples to illustrate the questions that should be asked and the decisions that must be made in choosing an effective formulation and solver.

3 - Performance Tuning For Cplex's Spatial Branch-and-bound Solver For Global Nonconvex Mixed Integer Quadratic Programs

Ed Klotz, IBM, klotz@us.ibm.com

MILP solvers have been improving for more than 40 years, and performance tuning tactics regarding both adjusting solver strategies and model formulations have evolved as well. State-of-the-art global nonconvex MIQP solvers have improved dramatically in recent years, but they lack the benefit of 40 years of evolution. Also, they use a broader notion of branching that can create different performance challenges. This talk will assess the effectiveness of existing MILP tuning tactics for solving nonconvex MIQPs, as well as consider more specific strategies for this challenging type of problem.

4 - On The Benefits Of Enumeration Within An Optimization Framework

Alexandra M Newman, Colorado School of Mines, Golden, CO, anewman@mines.edu

While the branch-and-bound algorithm, and associated enhancements such as cuts and heuristics, vastly dominates the performance of pure enumeration for obtaining optimal solutions for (mixed) integer programming problems, this basic strategy can sometimes expedite solutions. Specifically, for cases in which enumeration of partial solutions leaves an exploitable structure in place, a small amount of enumeration over fast-solving subproblems drastically reduces solution time. We demonstrate using examples from mining (with reformulations of a monolith) and interdiction (with Benders decomposition).

1 - Volatility-based Metrics To Analyze Network Traffic Over Time: Situational Awareness And Anomaly Detection

Soumyo Moitra, Carnegie Mellon University, Software Engineering Institute, Pittsburgh, PA, 15213, United States, smoitra@sei.cmu.edu

We develop some metrics to analyze temporal data that investigate different aspects of volatility. The metrics would be useful for monitoring network traffic data as well as other time series data. We discuss the motivation for the metrics and apply them to simulated data to demonstrate the properties of the metrics and to show how they can be used to derive insights into traffic patterns. Results under different scenarios are presented and compared.

2 - Security And Multidimensional Prediction Problems

Anthony Boyles, Novetta, 7921 Jones Branch Drive, McLean, VA, 22102, United States, ABoyles@Novetta.com

Modern security forecasting often requires comparatively high-dimensional predictions: for example, a drug bust can only be made at a specific location during the window of time that the drugs will be in that location. A forecaster must therefore be able to predict in at least three dimensions: latitude, longitude, and time. We examine techniques to reduce the complexity and increase predictive power of models grappling with this problem.

3 - Smart Strategies For Matching Big Data

Matthew Teschke, Novetta, 1111 Arlington Blvd., Apt. 707, Arlington, VA, 22209, United States, mteschke@novetta.com

Matching, such as entity resolution, is often a required part of an analysis; however, in a Big Data environment this can be a challenging task for analysts. Naive matching implementations are not computationally feasible when record counts are measured in millions or even billions, so a different approach is needed. Blocking is a strategy for making these problems tractable, taking them from an n-squared time to near-linear time. This presentation will provide an overview of blocking, its applications, and details of implementation.

4 - Predicting Return Abuse With Data Analytics

Michael Ketzenberg, Associate Professor, Texas A&M University, Mail Stop 4217, College Station, TX, 77845, United States, mketzenberg@tamu.edu

We apply data analytics to the transactional history of a large national retailer to identify the characteristics of customers who abuse return policies and then utilize this information to develop and test predictive models to help prevent such abuse.

Joint Session AI/Analytics: Machine Learning for Public Policy

Sponsored: Artificial Intelligence/Analytics

Sponsored Session

Chair: John J Nay, Vanderbilt University, PMB 351826 2301 Vanderbilt Place, Nashville, TN, 7235-1826, United States, john.j.nay@vanderbilt.edu

1 - Text Modeling For Understanding And Predicting The Federal Government

John J Nay, Vanderbilt University, john.j.nay@vanderbilt.edu

We describe the application of neural network based language modeling to better understand and predict the federal government. We embed institutions and the words from their policy documents into shared "semantic" space to explore differences across institutions with respect to policy topics. We apply our method to learn useful representations of the Supreme Court, House, Senate, and President. We also develop a machine learning approach to forecasting the probability that any bill will be enacted. The model outperforms competitor models across the three validation measures and is systematically analyzed to investigate textual and contextual factors predicting enactment.

2 - Simple Rules For Pretrial Release Decisions

Jongbin Jung, Stanford University, jongbin@stanford.edu

While predictive machine learning techniques might seem appealing for policy decisions, their opaque nature often render them inappropriate for the task. We investigate the possibility of constructing transparent and interpretable rules, and evaluate their performance compared to complex models in the context of pretrial release decisions. Although complex models generally outperform simple rules, we find the difference to be arguably small, especially considering the benefit of transparent rules being more likely to be implemented.

3 - Data-driven Agent-based Modeling

Yevgeniy Vorobeychik, Vanderbilt University, eug.vorobey@gmail.com, Haifeng Zhang

Agent-based modeling has been extensively used to study innovation diffusion. We develop a novel methodology for data-driven agent-based modeling that enables both calibration and rigorous validation at multiple scales. Our first step is to learn a model of individual agent behavior from individual event data. We then construct an agent-based simulation with the learned model embedded in artificial agents, and proceed to validate it using a holdout sequence of collective adoption decisions. We instantiate our model in the context of solar PV adoption, and utilize it to evaluate and optimize policy decisions aimed at promotion of rooftop solar.

Joint Session DM/Optimization Under Uncertainty: Optimization in Data Mining and Machine Learning

Sponsored: Optimization, Optimization Under Uncertainty/DM

Sponsored Session

Chair: Ozgu Turgut, Wayne State University, 1230 Wisteria Drive, A321, Ann Arbor, MI, 48104, United States, ozguturgut@wayne.edu

Co-Chair: Michael Hahsler, Southern Methodist University, Dallas, TX, United States, mhahsler@lyle.smu.edu

1 - Sequential Aggregation-disaggregation Optimization Methods For Data Stream Mining

Michael Hahsler, SMU, Dallas, TX, 75275, United States, mhahsler@lyle.smu.edu, Young Woong Park

Clustering-based iterative algorithms to solve certain large optimization problems have been proposed in the past. The algorithms start by aggregating the original data, solving the problem on aggregated data, and then in subsequent steps gradually disaggregate the aggregated data. In this contribution, we investigate the application of aggregation-disaggregation on data streams, where the disaggregation steps cannot be explicitly performed on past data, but has to be performed sequentially on new data.

2 - Building Ensembles Of Support Vector Machine Classifiers Through Multi Objective Optimization

Ozgu Turgut, Wayne State University, ozguturgut@wayne.edu, Ratna Babu Chinnam

The trade-off parameter 'C' of support vector machine (SVM) classifiers is the key input of training which tries to balance the generalization and empirical error. However existing methods in determining this parameter usually based on brute force search which is inefficient. The intend of this study is to incorporate a genuine exact multi objective optimization algorithm that generates representative Pareto optimal sets, with SVM in order to avoid C tuning phase. Utilization of the algorithm for additional two major purposes is also studied; namely, ensemble formation and confidence calculation of SVM classifiers.

3 - Multi-objective Optimization Under Multicollinearity

Haidar Almohri, Wayne State University, almohri@wayne.edu, Ratna Babu Chinnam, Arash Ali

While data driven process optimization methods are routine, several challenges arise when dealing with variables with strong multicollinearity. In practice, there might be multiple conflicting objectives as well, influenced by a common set of variables. We propose optimization algorithms to jointly optimize multiple objectives under multicollinearity. Methods are motivated by problems from retailing and manufacturing domains.

Statistical Learning with Convex Optimization

Sponsored: Optimization, Nonlinear Programming

Sponsored Session

Chair: Robert Freund, Massachusetts Institute of Technology, 100 Main Street, Cambridge, MA, 02142-1347, United States, rfreund@mit.edu

Co-Chair: Rahul Mazumder, Massachusetts Institute of Technology, 100 Main Street, Cambridge, MA, 02142-1347, United States, rahulmaz@mit.edu

1 - An Optimal Aggregation Procedure For Nonparametric Regression With Convex And Non-convex Models

Alexander Rakhlin, University of Pennsylvania, rakhlin@gmail.com

Exact oracle inequalities for regression have been extensively studied in statistics and learning theory over the past decade. In the case of a misspecified model, the focus has been on either parametric or convex classes. We present a new estimator that steps outside of the model in the non-convex case and reduces to least squares in the convex case. To analyze the estimator for general non-parametric classes, we prove a generalized Pythagorean theorem and study the supremum of a negative-mean stochastic process (which we term the offset Rademacher complexity) via the chaining technique. (joint work with T. Liang and K. Sridharan)

2 - Convex Regularization For High-dimensional Tensor Regression

Ming Yuan, University of Wisconsin, myuan@stat.wisc.edu

Data in the format of tensors, or multilinear arrays, arise naturally in many modern applications. In this talk, I shall discuss several examples where convex optimization approaches can be utilized for solving high-dimensional tensor problems under low-dimensional structural assumptions.

3 - Distributed Proximal Algorithms For Convex Optimization

Garud Iyengar, Columbia University, garud@ieor.columbia.edu

We propose a distributed first-order augmented Lagrangian algorithm to minimize the sum of composite convex functions, where each term in the sum is only known at one of the nodes, and only nodes connected by an edge can directly communicate with each other. This optimization model abstracts a number of applications in distributed sensing and machine learning. We show that any limit point of the iterates is optimal; and for any epsilon>0, an epsilon-optimal solution can be computed within O(log(1/epsilon)) iterations, whichrequire O((d_max^{1.5}/d_min) /epsilon}) communications steps, where d_max (resp. d_min) denotes the degree of largest (resp. smallest) degree node.

4 - Linear Estimation Through Unknown Non-linear Transformations

Constantine Caramanis, University of Texas, constantine@utexas.edu

Abstract to come.

Resource Allocation Problems in Nonprofit Settings

Sponsored: Public Sector OR

Sponsored Session

Chair: Gemma Berenguer, Purdue University, 403 W State St, West Lafayette, IN, 47907, United States, gemmabf@purdue.edu

1 - Public Facility Location And Fair Distribution Problem: Fractional Programming Approach

Chong Hyun Park, Purdue University, West Lafayette, IN, 47906, United States, park456@purdue.edu, Gemma Berenguer

We consider a public facility location problem. A decision maker wants to maximize the aggregated utilities of the service recipients while achieving the fair distribution of distributed items. A bi-objective mixed integer linear fractional programming problem is formulated and solved by various algorithms.

3 - Payment For Results: Funding Non-profit Operations

Sripad K Devalkar, Indian School of Business, Hyderabad, India, sripad_devalkar@isb.edu, Milind Sohoni, Neha Sharma

We consider the interaction between a donor making voluntary contributions to fund a development project and the non-profit organization (NPO) using the funds to implement the project. With information asymmetry about the NPO's efficiency and exogenous uncertainty affecting the actual benefit delivered by the project, we show that ex-post funding (payment for results) may not always maximize the donor's utility even though it helps overcome information asymmetry. We also characterize conditions under which ex-ante funding (traditional funding) and ex-post funding (payment for results) are equilibrium outcomes of the donor-NPO interaction.

4 - Using Optimization To Maximize Diversity In Engineering Discussion Groups at The University Of Michigan

Kayse Lee Maass, University of Michigan, Ann Arbor, MI, United States, leekayse@umich.edu, Mark Daskin

The College of Engineering at the University of Michigan assigns over 1250 freshmen to discussion groups for a "freshman reads" program. They want each group to be as diverse as possible with respect to (a) country of origin, (b) gender, (c) ethnicity, (d) in-state/out-of-state status, and (e) whether a student is the first in his/her generation to attend college. We implemented a large-scale optimization model to assign students to groups and have successfully used the results for two years. The model and implementation are discussed.

Stable Sets, Zero-forcing Sets, and Target Sets in Graphs

Sponsored: Computing

Sponsored Session

Chair: Balabhaskar Balasundaram, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States, baski@okstate.edu

1 - Discrete vs. Continuous Formulations For Computing The Stability Number: Results And Insights

Jitamitra Desai, Nanyang Technological University, jdesai@ntu.edu.sg, Jitamitra Desai, Nanyang Technological University, Singapore, Singapore, jdesai@ntu.edu.sg, Balabhaskar Balasundaram

In this research, we compare and contrast discrete (0-1) and continuous formulations for determining stable (independent) sets of a graph. In this context, we define a new class of "vertex sets", and derive an explicit characterization to compute the number of alternate optima present in both the 0-1 and fractional programming formulations. A byproduct of these vertex sets is another approach to determine maximal independent sets. We also pose a conjecture that relates the solution of the LP-relaxation to the 0-1 formulation to the number of alternate optima to the stable set problem. Finally, some preliminary computations on some standard testbed problems from the literature are presented.

2 - Connected Zero Forcing Of A Graph

Boris Brimkov, Rice University, boris.brimkov@rice.edu

Zero forcing is a dynamic graph coloring process whereby a colored vertex with a single uncolored neighbor forces that neighbor to be colored. This talk introduces the connected forcing process - a restriction of zero forcing in which the initially colored set of vertices induces a connected subgraph. The connected forcing number - the cardinality of the smallest initially colored vertex set which forces the entire graph to be colored - can be used to bound various linear algebraic and graph parameters, as well as to model the spread of diseases and information in social networks. Other properties of the connected forcing number are discussed, and closed formulas are given for several families of graphs.

3 - An Integer Programming Approach To Finding Minimum Zero-forcing Sets

Caleb Fast, Rice University, caleb.c.fast@rice.edu, Illya V Hicks

In this talk, we introduce an integer programming approach for finding minimum zero-forcing sets. Zero-forcing is a graph coloring process that, in addition to applications in power networks and quantum computing, is used to bound the minimum rank of matrices characterized by the given graph. Straightforward integer programming formulations of this problem do not perform well; however, we incorporate new bounds on the zero-forcing iteration index and zero-forcing number to improve the performance of the integer program.

4 - Mathematical Programming Approaches To Influence Maximization Problems On Social Networks

Rui Zhang, University of Colorado - Boulder, Boulder, CO, United States, rui.zhang@colorado.edu, Subramanian Raghavan

We study influence maximization problems on social networks from an integer programming perspective. In this talk, we focus on the weighted target set selection problem. Motivated by the desire for exact approaches, a tight and compact extended formulation is presented on trees. A complete description of its polytope is given as well. Furthermore, based on the extended formulation, a branch-and-cut approach is proposed for general networks. Computational results based on large scale graphs are discussed. Lastly, we present our results for different variants and generalizations of influence maximization problems.

Optimality Conditions for Inventory Control

Invited: Tutorial

Invited Session

Chair: Eugene A Feinberg, Stoney Brook University, Department of Applied Mathematics, Stoney Brook, NY, 11794, United States, eugene.feinberg@stonybrook.edu

1 - Optimality Conditions For Inventory Control

Eugene A Feinberg, Stoney Brook University, Department of Applied Mathematics & Statistics, Stoney Brook, NY, 11794, United States, eugene.feinberg@stonybrook.edu

This tutorial describes recently developed general optimality conditions for Markov Decision Processes that have significant applications to inventory control. In particular, these conditions imply the validity of optimality equations and inequalities. They also imply the convergence of value iteration algorithms. For total discounted-cost problems only two mild conditions on the continuity of transition probabilities and lower semi-continuity of one-step costs are needed. For average-cost problems, a single additional assumption on the finiteness of relative values is required. The general results are applied to periodic-review inventory control problems with discounted and average-cost criteria without any assumptions on demand distributions. The case of partially observable states is also discussed.

Data Analytics for Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Qingpeng Zhang, City University of Hong Kong, 83 Tat Chee Ave, Kowloon Tong, TX, 00000, Hong Kong, qingpeng.zhang@cityu.edu.hk

1 - Bayesian Data Analytics For Individualized Health Care Demand Modeling Of Aging Population

Xuxue Sun, University of South Florida, 4202 E. Fowler Ave. ENB118, Tampa, FL, 33620, United States, xuxuesun@mail.usf.edu, Paul Cirino, Hongdao Meng, Nan Kong, Mingyang Li

With high risk of having health problems, elderly people are mainly users of health care services. Successfully modeling of their demands will facilitate decision makings in health care management. Existing approaches mainly utilized aggregate-level data from single type of health care facility and studied the observed factors' influence. In this study, a Bayesian data analytics approach accounting for competing risk of different facilities is proposed to characterize individualized health care demand and to jointly quantify both unobserved individual heterogeneity and observed factors' influence. A real case study is further provided to demonstrate the effectiveness of proposed method.

2 - Harnessing The Power Of Twitter With Offline Contact Networks For Probabilistic Flu Forecasting

Kusha Nezafati, University of Texas, Dallas, TX, United States, Kusha.Nezafati@utdallas.edu, Qingpeng Zhang, Yulia Gel, Leticia Ramirez-Ramirez

The prompt detection and forecasting of infectious diseases are critical in the defense against these diseases. Despite many promising approaches, the lack of observations for near real-time forecasting is still the key challenge for operational disease prediction and control. In contrast, online social media has a great potential for real-time epidemiological forecasting and could revolutionize modern biosurveillance capabilities. We investigate utility of Twitter to serve as a proxy for unavailable data on flu occurrence and propose a predictive platform for disease dynamics by accounting for heterogeneous social network interactions, space-time, and socio-demographic information. .

3 - The Diffusion Of User Behavior via Social Network In Online Health Communities

Xi Wang, University of Iowa, xi-wang-1@uiowa.edu, Kang Zhao, Gautam Pant

As a major source of social support for people with health problems, Online Health Communities (OHCs) have attracted a great number of members. Prior research has examined that users involved in online community motivated either by community-interest or by self-interest. Using text mining and unsupervised machine learning techniques, we revealed that users of a popular breast cancer OHC acting different roles corresponding to their motives. We also found user role can diffuse via social ties. Our research has implications to for OHC operators to track users' behaviors in order to manage an OHC.

1 - Gatekeeper Or Roadblock: Optimizing Evidence Generation Andgatekeeper Or Roadblock: Optimizing Evidence Generation And Access To New Drugs

Liang Xu, Pennsylvania State University, 419A Business Building, Penn State University, State College, PA, 16801, United States, lzx103@psu.edu, Hui Zhao

In 1992, the accelerated approval pathway (AP) is was instituted to speed up the development of new drugs but failed to be effective due to sponsors' lack of incentives to complete post-market study. We propose and analyze three mechanisms, i.e., extra market exclusivity, pay for evidence, and augmented user fee to incentivize post-market study. Our results provide insights for policy makers on granting accelerated approval with the consideration of post-market study.

2 - Hospital Quality, Medical Charge Variation, And Patient Care Efficiency: Implications For Bundled Payment Reform Models

Seokjun Youn, Texas A&M University, College Station, TX, United States, syoun@mays.tamu.edu, Gregory R Heim, Subodha Kumar, Chelliah Sriskandarajah

We examine how unwarranted variation in hospital medical charges relates to patient-centric goals. From a policy maker's viewpoint, the results imply that managerial incentives based on process quality (rather than outcome quality) may be more effective for changing operational behaviors that lead to lower variation and higher efficiency. We investigate these implications for bundled payment programs. Empirical results suggest that the current bundled payment provider selection mechanism does not consider the degree of unwarranted variation in charges, which we claim to be the improvement opportunity for each participating provider.

3 - The Hospital Readmission Reduction Program: Coordinating Service Rate And Readmission Reduction Efforts

Kenan Arifoglu, University College London, k.arifoglu@ucl.ac.uk, Hang Ren, Tolga Tezcan

We study the performance of Hospital Readmissions Reduction Program (HRRP) in inducing hospitals to choose the socially-optimal service rate and readmission reduction efforts. Readmissions pose two incentive misalignments between the social planner and each hospital. The HRRP in use cannot fix both misalignments simultaneously and thus cannot coordinate in general. We propose a coordinating contract, which highlights the function of the reimbursement rate in reducing readmissions.

Operations Management Approaches Applied in Healthcare Settings: Achieving Patient Health and Operational Effectiveness.

Sponsored: Health Applications

Sponsored Session

Chair: Yann Ferrand, Clemson University, 131-A Sirrine Hall, Celmson, SC, 29634, United States, yferran@g.clemson.edu

1 - Incentive Scheme For Diabetes Patients To Take A1c Test Quarterly

Muer Yang, University of St. Thomas, Minneapolis, MN, United States, yangmuer@stthomas.edu, Sameer Kumar, Paul Bekx

Type II diabetes patient is recommended to take A1c measurement quarterly. However, many patients do not. Comparing their empirical behavior and the optimal behavior derived from a mathematical model, we seek to recommend practical incentives that encourage patients to take A1c tests close to the optimal rational behavior.

2 - Operating Room Management When Considering Microbial Loads

Brandon Lee, Clemson University, Clemson, SC, United States, woohyel@clemson.edu, Lawrence Fredendall, Kevin M Taaffe, Anjali Joseph

We examine the OR activities and their effect on the microbial bacteria environment using air filters, culture dishes and video recordings. The goal is to identify how to reduce the microbial load in the OR and to identify the effect that traffic flows and door openings have on the microbial load. This research will discuss findings from a specific case study of orthopedic and pediatric OR's at an academic health center in South Carolina.

3 - Reducing Patient Wait In The Emergency Department With New Patient Flow Models

Yann Ferrand, Clemson University, yferran@clemson.edu, Todd F. Glass, Duane Steward

Before opening a newly constructed emergency department, a discrete event simulation model was employed to validate novel patient flow concepts envisioned. This approach was uniquely applied to enable a specific operations strategy with a naive facility and staff, contributing to significantly lower average length of stay than comparable facilities.

4 - Implementing Lean Operations In Service

Yunsik Choi, PhD Student, Clemson University, 100 Sirrine Hall, Clemson, SC, 29634-1305, United States, yunsikc@g.clemson.edu, Lawrence Fredendall, Aleda Roth

Service industries have been applying lean principles to achieve continuous improvement. However, the industries have not fully used lean principles like top manufacturers have done. The study provides service providers with insight about how lean operations change employees' behaviors to improve small steps every day.

Modeling Systems for Public Health

Sponsored: Health Applications

Sponsored Session

Chair: Hyojung Kang, University of Virginia, 102A Engineer's Way, Charlottesville, VA, 22904, hkang@virginia.edu

1 - Optimizing Screening For Secondary Renal Cell Carcinoma

Jennifer Mason Lobo, Assistant Professor, University of Virginia, Charlottesville, VA, United States, jem4yb@virginia.edu, Tracey Krupski

Renal cell carcinoma is the most common form of kidney cancer. After surgery, patients are at risk for local and metastatic recurrence. We use our Monte Carlo simulation model to identify the optimal timing, duration, and modalities of imaging surveillance considering cost, radiation exposure, and cancer control. We present numerical results comparing the optimal strategies to current guidelines from four clinical organizations: American Urological Association, Canadian Urological Association, European Association of Urology, and National Comprehensive Cancer Network.

2 - Incentive Contract Design For Food Retailers To Reduce Food Deserts In The US

Nathaniel D. Bastian, The Pennsylvania State University, University Park, PA, 16802, United States, nathaniel.bastian@fulbrightmail.org, Eric Swenson, Linlin Ma, Hyeong Suk Na

In the US, obesity affects over 37% of the adult population and over 16% of the child and adolescent population. Although not-for-profit agencies cannot directly control what a person eats, they can influence the supply side of the obesity epidemic by incentivizing food retailers to open stores in regions of the US where food deserts exist. As a risk-sharing grant incentive program, we develop principal-agent based optimization models that determine the optimal subsidy these agencies should offer to food retailers to incentivize operation in certain regions. These subsidies are designed to create financially viable conditions for food retailers to offer high quality, healthy food alternatives.

3 - Modeling Supply, Demand, And Allocation In Liver Transplantation

Wesley Marrero, University of Michigan, Ann Arbor, MI, United States, wmarrero@umich.edu, Jingyuan Wang, Justin Steuer, Eunshin Byon, Mariel Sofia Lavieri, David W Hutton, Neehar D Parikh

Liver transplantation can be a lifesaving intervention for patients with end-stage liver disease. Unfortunately, there has been an increase in the disparity among the number of patients listed for liver transplants and the liver transplants performed. We first aimed to forecast the availability for liver donors in the US considering populations shifts. Furthermore, geographical redistricting models have been proposed as an alternative to decrease the supply-demand inequity. We then aimed to understand the impact of redistricting on the availability of donors per population. Lastly, we aimed to predict the future demand for liver transplantation as a function of obese population in the US.

4 - Simulation And Spatio-temporal Modeling Approaches For Surveillance Of Hospital-acquired Infections

Hyojung Kang, University of Virginia, Charlottesville, VA, 22904, United States, hkang@virginia.edu, Jennifer Mason Lobo

The prevalence and mortality of antibiotic-resistant infection has increased globally and in the U.S. Traditionally, studies have focused on identifying transmission chains of infected patients as the reservoir for organisms to be transferred to new patients in order to track hospital outbreaks with drug resistant pathogens. This study aims to understand the role care providers and other non-patient reservoirs within a hospital play in transmission of the infection. We will develop agent-based simulation models using various sources of data to analyze risk factors and evaluate what-if scenarios.

Scheduling with Applications

Invited: Project Management and Scheduling

Invited Session

Chair: Hui-Chih Hung, National Chiao Tung University, 1001 University Rd., MB103, Hsin-Chu, 300, Taiwan, hhc@nctu.edu.tw

1 - On Scheduling Restoration Tasks For Pipeline Networks In Post-disaster Management

I-Lin Wang, Professor, National Cheng Kung University, Tainan, Taiwan, ilinwang@mail.ncku.edu.tw

Pipeline networks that ship flows of gas or water are important for daily living support. Suppose arcs of a pipeline network are damaged by disasters and the resources (equipment, manpower, and time) required to restore each damaged arc have been estimated. We investigate when and who to restore which arcs such that the flows over pipelines become accessible for people along all arcs at minimum total waiting time in the post-disaster management. We propose a network reduction scheme, an integer program, and heuristics for solving this special resource constrained project scheduling problem.

2 - Scheduling Sequential Locks Along Waterways

Frits Spieksma, KU Leuven, frits.spieksma@kuleuven.be

Inland waterways form a natural network infrastructure with capacity for more traffic than is currently the case. Transportation by ship is widely promoted as it is reliable, efficient and an environmental friendly way of transport. Nevertheless, locks managing the water level on waterways may constitute bottlenecks for transport over water. We aim to minimize total waiting time of ships in a setting where locks are located in a sequential manner along a waterway.

3 - V-shaped Sampling Based on Kendall-distance To Enhance Optimization With Ranks

Haobin Li, Scientist, A*STAR, Institute of High Performance Computing, 1 Fusionopolis Way, #16-16 Connexis North, Singapore, 138632, Singapore, lihb@ihpc.a-star.edu.sg, Giulia Pedrielli, Loo Hay Lee, Ek Peng Chew, Chun-Hung Chen

Optimization over rank values has been of concern in multi-fidelity simulation optimization. Specifically, Chen et al. (2015) proposes the concept of Ordinal Transformation (OT) to translate multi-dimensional discrete optimization problems into simpler single-dimension problem, where the dimension being used is the rank in the ordinal space. In this paper we build on the idea of OT in order to derive an efficient sampling algorithm to identify the solution with the best rank in the settings of multi-fidelity optimization. We refer to this algorithm as V-shaped, in which the concept of Kendall distance adopted in the machine learning theory, is used to characterize solutions in the OT space.

4 - Bicycle-sharing With Reallocation Trucks And Private Exchange Taipei YouBike System as Example

Hui-Chih Hung, National Chiao Tung University, Hsin-Chu, 300, Taiwan, hhc@nctu.edu.tw, Jun-Min Wei, Ming-Te Chen

Subject to limited numbers of bicycles and docks, we consider trucks for bicycle reallocation and mobile apps for private exchange in bicycle-sharing systems. Trucks are hired to dynamically redistribute bicycles among unbalanced stations and mobile apps are used to transfer bicycles among users without docks. This allows bicycle exchange even when all docks are full. Three objectives are studied: (1) maximizing the utilization of bicycles, (2) maximizing the net profit of system, and (3) optimizing the fleet sizes of bicycles and trucks. Finally, mathematical programming models are built and real data of Taipei YouBike system from 2013 to 2015 are adopted for numerical study.

Spectrum Auction

Invited: Auctions

Invited Session

Chair: Oleg Baranov, University of Colorado at Boulder, 256 UBC, University of Colorado, Boulder, CO, 80309, United States, oleg.baranov@colorado.edu

1 - Efficient Dynamic Auction For U-shaped Returns

Oleg Baranov, Colorado, Oleg.Baranov@Colorado.edu

When bidders have decreasing returns, the efficient dynamic auction is well-known. Recently, Baranov et al. (2016) described an efficient dynamic auction for bidders with increasing returns. In this paper, we design an efficient auction for bidders with single-peaked returns. For auctions to buy, our setting includes one of the most typical cost structures in economics. For auctions to sell, our setting is a good approximation for single-band spectrum auctions.

2 - Obtaining The Final Channel Assignment In The Federal Communications Commission's First-ever Incentive Auction

Karla L Hoffman, Professor, George Mason University, Mail Stop 4A6, 4400 University Drive, Fairfax, VA, 20124, United States, khoffman@gmu.edu, Brian Smith, Steven Charbonneau, James Costa, Tony Coudert, Rudy Sultana

In this talk, we will discuss the procedure for determining the Final Channel Assignment for U.S. and Canadian broadcasters at the conclusion of the "Incentive Auction." The FCC is utilizing a sequence of optimizations to create a channel assignment that will be the least disruptive to both broadcasters and the over the air television viewers. We will outline this sequence and explain how this sequence satisfies the objectives of the FCC, Industry Canada and broadcasters.

3 - Determining The Stations Not Needed In The Federal Communication Commission'S First-ever Incentive Auction

Karla L Hoffman, George Mason University, System Eng and Operations Research Dept, 4400 University Drive Mailstop 4a6, Fairfax, VA, 22030, United States, khoffman@gmu.edu, James Andrew Costa, Steven Charbonneau, Anthony Coudert, Brian Smith, Rudy K Sultana

The FCC uses a novel descending-price auction to determine the spectrum to be purchased from broadcasters. The auction is designed for stations to compete until there are no channels available in the market. If a station always has a channel available, they are not needed in the auction. An optimization procedure was used to determine whether a station always had a channel available, and therefore had no chance of winning in the auction.

4 - Combinatorial Land Assembly

Tzu-Yao Lin, University of Maryland, LinT@econ.umd.edu

We propose a reverse auction for real estate developers to acquire complementary urban lands from multiple owners. Apart from the all-or-nothing mechanisms in the previous literature, we determine the set of land parcels to be assembled in a descending clock auction, which gradually lowers the offer to each remaining owner until the trading condition is met. This mechanism is obviously strategyproof for sellers. The optimal price adjustment trajectory is a solution for the corresponding stochastic optimal control problem, which minimizes the expected welfare loss from inefficient rejection."

Stochastic Modeling In Healthcare Operations

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Carri Chan, Columbia Business School, New York, NY, United States, cwchan@columbia.edu

Co-Chair: Vahid Sarhangian, Columbia Business School, New York, NY, United States, vs2573@columbia.edu

1 - Identify Optimal Overflow Policies Using Approximate Dynamic Programming

Pengyi Shi, Purdue University, shi178@purdue.edu, Jim Dai

To alleviate Emergency Department congestion, boarding patients who wait to be admitted to inpatient wards may have to be overflowed to a non-primary ward when they wait too long. We develop approximate dynamic programming tools to identify the optimal overflow policies under different system states.

2 - Yardstick Competition For Emergency Department Queues

Ozlem Yildiz, University of Rochester, Rochester, NY, United States, ozlem.yildiz@simon.rochester.edu, Nicos Savva, Tolga Tezcan

We study whether an alternate pay-for-performance method can alleviate ED overcrowding through incentivizing socially-desired ED capacity levels, although the healthcare regulator does not know the capacity cost structure. Using yardstick competition, we propose a regulatory scheme that achieves this using the wait time and arrival rate information of each ED.

3 - Timing Of Hospital Discharges Matters

Jonathan Helm, Indiana University, helmj@indiana.edu, Rene Bekker

The mismatch in timing of arrivals and discharge processing in hospitals leads to a census process that causes the hospital to experience significant congestion in the middle of the day. This leads to a chaotic environment and major operational efficiencies. In this research we formulate and analyze a stochastic census process to investigate the effect of the timing of doctor's discharge processing on inpatient census levels and identify new approaches to discharge processing that can alleviate congestion and also provide benefits to the patients being discharged themselves.

4 - Dynamic Server Allocation In A Multiclass Queueing System With Shifts: Nurse Staffing In Emergency Departments

Vahid Sarhangian, Columbia Business School, New York, NY, United States, vs2573@columbia.edu, Carri Chan

Nurse staffing decisions in emergency departments (EDs) are typically assigned weeks in advanced, which can create staffing imbalances as patient demand fluctuates. In this work, we consider the potential benefits of assigning nurses to different areas within an ED at the beginning of each shift. We study the problem of optimal reassignment of nurses to areas by considering a multiclass queueing model of the system. We analyze an associated fluid control problem and use the solution to develop policies that achieve asymptotically optimal performance under fluid-scaling for the original stochastic system. We find this additional flexibility can substantially reduce waiting times for patients.

Topics in Sustainability

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Arzum E Akkas, Boston University, Cambridge, MA, United States, aakkas@bu.edu

1 - Design Of Sales Compensation Schemes To Reduce Product Waste

Arzum Akkas, Boston University, aakkas@bu.edu, Sahoo Nachiketa

We investigate sales-force compensation schemes that can alleviate product expiration driven by over-selling in retail supply chains. Using sales commission data from a consumer packaged goods manufacturer, we recommend parameters for a compensation scheme based on our structural model of sales-force selling behavior.

2 - Extended Warranties And Secondary Market Strategies

Wayne Fu, Georgia Institute of Technology, Atlanta, GA, United States, Wayne.Fu@scheller.gatech.edu, Atalay Atasu, Necati Tereyagoglu

We investigate the implications of extended warranties in a durable goods market from both producer and environmental perspectives. Considering a product subjected to failure, offering extended warranties helps an OEM increase the value-added of its products, but implies repair costs and cannibalization from its secondary market. In this context, we formulate a stylized durable goods model that explores the interaction between the OEM's warranty offerings and buy-back programs (to reduce secondary market cannibalization). We find that the choice of warranty offering is surprising non-monotonic in product failure and that secondary market interference influences the choice significantly.

3 - Sustainable Urban Water Management

Buket Avci, Singapore Management University, Singapore, Singapore, buketavci@smu.edu.sg, Onur Boyabatli

Climate change, escalating costs and other risks are causing cities to face ever-increasing difficulties in efficiently managing scarcer and less reliable water resources. We develop a stylized analytical model that captures the salient features of urban water management by modeling different demand classes (domestic vs. industrial) and supply processes (rainwater catchment, reclaimed water and desalination).

4 - Re-manufacturability And Investment Planning

Avinash Geda, University of Florida, 361B Stuzin Hall, Gainesville, FL, 32611, United States, avinashgeda@ufl.edu, Gulver Karamemis, Gulver Karamemis, Vashkar Ghosh, Asoo J Vakharia

We consider a monopolist manufacturer who produces a single-branded product and uses a mix of virgin and recycled materials in its production. The manufacturer can invest in either upstream or downstream technologies or both to improve recyclability/re-manufacturability and to reduce recycling costs respectively. We investigate profit maximizing investment strategies in presence of green consumers.

Issues in Sustainable Operations

Sponsored: Manufacturing & Service Oper Mgmt, Sustainable Operations

Sponsored Session

Chair: Adem Orsdemir, University of California Riverside, 900 University Ave., Riverside, CA, CA 92521, United States, orsdemiradem@gmail.com

1 - Why And How Do Consumers Discount Remanufactured Products?

James Duane Abbey, Texas A&M University, 4217 TAMU, College Station, TX, 77843-4217, United States, jabbey@mays.tamu.edu, Rainer Kleber, Gilvan Souza, Guido Voigt

We empirically isolate the impact of quality concerns on consumers' willingness to pay (WTP) and the likelihood to purchase remanufactured products. Perceived risk, in the form of quality defects and cosmetic defects, has a significant impact on WTP, even after controlling for the WTP for new products, and other attributes.

2 - Coopeting For Green Product Development

Karthik Murali, University of Alabama, Tuscaloosa, kmurali@cba.ua.edu

We study the impact of collaboration between supply chain partners and coopetition between supply chains on the level of investment in green product design and development and its ensuing implications to society and the environment. We also address the role of policy makers in stimulating such partnerships between organizations.

3 - Designing Sustainable Products Under Co-production Technology

Shouqiang Wang, Clemson University, 131D Sirrine Hall, Clemson, SC, 29634, United States, shouqiw@clemson.edu, Yen-Ting (Daniel) Lin, Haoying Sun

We consider a firm who utilizes co-production technology to introduce a green product with raw material that would be otherwise discarded. Some consumers value resource savings achieved by green product while others do not. We examine impact of resource scarcity, technology feasibility, consumers' greenness on firm's profitability and environmental impact.

1 - Personalized Diabetes Management Using Electronic Medical Records

Alexander M Weinstein, Massachusetts Institute of Technology, Cambridge, MA, United States, amw22@mit.edu, Dimitris Bertsimas, Nathan Kallus, Ying Zhuo

Current clinical guidelines for managing type 2 diabetes do not differentiate based on patient-specific factors. We present a data-driven algorithm for personalized diabetes management using a k-nearest neighbor approach. Using electronic medical records for 10,806 type 2 diabetes patients from Boston Medical Center, we evaluated the effect of the algorithm's recommendations on matched patient outcomes from unseen data. The personalized approach yielded substantial improvements in glycated hemoglobin outcomes relative to the standard of care. The algorithm's evidence-based recommendations can be summarized for providers in an intuitive, interactive dashboard.

2 - A Template Matching Approach To Comparing Hospital Quality In An Integrated Health Care System

Wenqi Hu, Columbia Business School, New York, NY, United States, whu17@gsb.columbia.edu, Carri Chan, Jose Zubizarreta, Gabriel Escobar

There is a growing interest from healthcare providers and policymakers to better measure and improve quality of hospital care. Commonly used risk adjustment models can be inconsistent measures of hospital quality and do not enable a clear understanding of the potential impact of unobservable risk factors on hospital rankings. This work applies a new template matching approach to define a reference population over which 21 hospitals within an integrated healthcare system are compared. This approach enables more transparent comparisons than prior approaches. We further quantify the influence of hospital operational factors on patient outcomes for performance improvement considerations.

3 - A Room With A View: An Econometric Analysis Of How Facility Layout Impacts Care Provision In The Emergency Department

Lesley Meng, Doctoral Candidate, The Wharton School, University of Pennsylvania, 3730 Walnut Street, Suite 500 JMHH, Philadelphia, PA, 19104, United States, lmeng@wharton.upenn.edu, Robert Batt, Christian Terwiesch

The hospital emergency department (ED) has frequently been used to study the dynamics of service operations and how such operations adapt to fluctuations in workload. We study how the facility layout of ED patient rooms impacts nurse workflow decisions. Specifically, our dataset is comprised of infrared nurse location tracking data from a large urban teaching hospital over a study period of six consecutive months in 2013. In linking this to room occupancy patient data, we are able to investigate potential facility layout variables, such as distance from the nurses' station, that impacts the patient's length of stay in the ED through variation in the amount of nurse attention received.

1 - Listen To The Crowd: Network Effects And Online Reviews In Restaurant SalesForecasting

Shawn Mankad, Cornell University, Ithaca, NY, United States, smankad@cornell.edu, Qiuping Yu, Masha Shunko

Using a comprehensive dataset from a major restaurant franchise, we forecast weekly store sales using classical measures of service quality from internal surveys at focal and neighboring stores, in addition to online ratings. Our results show that higher quality at the neighboring stores leads to higher sales at the focal store. We also find that the accumulation of online reviews reduces the importance of internal quality surveys at focal and neighboring stores as predictors.

2 - Information Sale And Competition

Kostas Bimpikis, Stanford University, kostasb@stanford.edu, Davide Crapis, Alireza Tahbaz-Salehi

This paper studies the strategic interaction between a seller of information and a set of firms competing in a downstream market. We show that the nature and intensity of competition play a first-order role in determining the seller's optimal strategy. When firms's actions are strategic complements (Bertrand competition), it is optimal for the seller to trade with all her customers. In contrast, when actions are strategic substitutes (Cournot competition), the seller maximizes her profits by restricting the supply of information and/or distorting its content. Furthermore we establish that her incentives to restrict the supply of information grow stronger in the presence of information leakage.

3 - Efficient Information Heterogeneity In A Queue

Yang Li, CUHK Business School, liyang@baf.cuhk.edu.hk, Ming Hu, Jianfu Wang

How would the growing prevalence of real-time delay information affect a service system? We consider an M/M/1 queueing system in which only a fraction of customers are informed about real-time delay. Perhaps surprisingly, we find that throughput and social welfare can be unimodal in the fraction of informed customers. In other words, some amount of information heterogeneity in the population can lead to strictly more efficient outcomes, in terms of the system throughput or social welfare, than information homogeneity. Moreover, we show that the impacts of growing information prevalence on system performance measures are determined by the equilibrium joining behavior of uninformed customers.

4 - Multi-stage Intermediation In Display Advertising

Ozan Candogan, University of Chicago, ozan.candogan@chicagobooth.edu, Santiago Balseiro, Huseyin Gurkan

We consider a setting where an advertiser seeks to acquire impressions from an advertising exchange through a network of intermediaries, and characterize mechanisms offered by strategic intermediaries when the advertiser's value is private. Our results indicate that the position in the intermediation process has a significant impact on the profits of the intermediaries and the most profitable position depends on the underlying value distribution. Intuitively, when the private value distribution is heavy tailed, downstream intermediation positions are more profitable, and otherwise upstream positions are more profitable. We also analyze merger decisions of intermediaries.

Revenue Mgt, Pricing IV

Contributed Session

Chair: Yanqiao Wang, UC Berkeley, Berkeley, CA, United States, yanqiao@berkeley.edu

1 - Application Of Optimization Techniques And Survival Analysis On Pricing And Revenue Management In Semiconductor Industry

Amir Meimand, Pricing Scientist, Zilliant Inc, 1781 Spyglass Drive, Apt 359, Austin, TX, 78746, United States, amir.meimand@zilliant.com, Steve Tao, Lee Rehwinkel

Prices in some markets such as the semiconductor industries tend to decrease over time due to market pressure, product life-cycle, etc. Hence, it is desirable to reduce discounting behavior while maximizing sale/profit simultaneously. To meet this goal, we present a novel two-phase method. The first phase is based on an optimization model relies on elasticity estimation emerging from historical transactions. The second phase is modification of optimization solution based on price survival analysis to minimize the discount rate considering transaction date. We also present the numerical result of model applied to a real world problem with +2,000 products and +5,000 customers over a year.

2 - A Customized Dynamic Pricing Based Optimization Model For In-house Electricity Consumption Scheduling With Energy Storage Renewable Option

Goutam Dutta, Professor, Indian Institute of Management, Wing 3, Room No 3H, Production Quantitive Methods Area, Ahmedabad, Gujarat, 380015, India, goutam@iima.ac.in, Krishnendra Mitra

In this paper we propose a scheduling model for electrical appliances in a dynamic pricing environment. Initially we provide a vector of price points for the next twenty four hours. Then we develop an optimization model that minimizes cost to customer subject to different operating constraints of the appliances. We consider five different cases of price variation. We also study the effects of including energy storage and renewable energy generation at the consumer level. In this case we propose a linear price function that helps in automatically generating a price value for a time slot.

3 - Pricing Consumable Products To Maximize Profit

Randy Robinson, Assistant Professor, Bemidji State University, 1500 Birchmont Dr. #30, Bemidji, MN, 56601, United States, rrobinson@bemidjistate.edu

An introduction of a new consumable product to market is expected to have a sales growth rate that follows a sigmoid growth curve. If changes in price will affect the growth rate of this curve, what price should the producer charge to maximize profit over the time period in which they believe the product will remain popular? This talk will explore an explicit solution for the optimal price and the associated sensitivity analysis.

4 - Joint Optimization Of Capacitated Assortment And Pricing Problem Under The Tree Logit Model

Yanqiao Wang, UC Berkeley, Berkeley, CA, United States, yanqiao@berkeley.edu, Zuo-Jun Max Shen

Assortment and pricing decisions are of significant importance to firms and have huge influences on profit. How to jointly optimize over both assortment and prices draws increasing attention recently. However, in the existing literature, there is no flexible and comprehensive way to deal with the joint effects of assortment and price since the tangle between them makes the joint optimization problem less tractable. In this paper, we study the joint assortment and price optimization problem under the d-level nested logit model. Assume there are k lowest-level nests and each has n products, we develop an efficient algorithm that runs in O(kn^2) time to locate the joint optimal assortment and prices.

Queueing Models III

Contributed Session

Chair: Petra Vis, VU Amsterdam, De Boelelaan 1105, Amsterdam, 1081 HV, Netherlands, petra.vis@vu.nl

1 - Meeting Service-level Constraints In Multi-class Service Systems

Rene Bekker, VU Amsterdam, De Boelelaan 1081a, Amsterdam, 1081 HV, Netherlands, r.bekker@vu.nl, Ger M Koole, Petra Vis

In many service systems, the service level (SL) is defined in terms of the tail probability of the waiting time. Different customer classes typically have different SL constraints. We first study a call blending system with an urgent (inbound) and best effort (outbound, email, call back) class, where the former has a severely more stringent SL. For threshold control, we show that the waiting time distribution is a mixture of exponentials. Second, we identify how to optimally assign agents to customers by exploiting the waiting time process of the first customer in line; we derive the value function for an isolated customer class and then apply one-step policy improvement.

2 - A General Workload Conservation Law With Applications To Queueing Systems

Muhammad A El-Taha, Professor, University of Southern Maine, Department of Mathematics and Statistics, 96 Falmouth Street, Portland, ME, 04104-9300, United States, el-taha@maine.edu

In the spirit of Little's law L=\lambda W and its extension H=\lambda G we use sample-path analysis to give a general conservation law. For queueing models the law relates the asymptotic average workload in the system to the conditional asymptotic average sojourn time and service times distribution function. This law generalizes previously obtained conservation laws for both single and multi-server systems, and anticipating and non-anticipating scheduling disciplines. Applications to single and multi-class queueing and other systems that illustrate the versatility of this law are given.

3 - Queue Now Or Queue Later

Brett Hathaway, Doctoral Candidate, UNC Chapel Hill, Chapel Hill, NC, United States, Brett_Hathaway@kenan-flagler.unc.edu, Seyed Emadi, Vinayak Deshpande

We study caller redial behaviors using call center data from a US-based bank. We show which factors affect the probability of redialing and the time between queue abandonment and redial. Using structural estimation, we show through counterfactual experiments how a center with callers who redial performs under various routing policies.

4 - Access Times In Appointment-driven Systems And Level-dependent MAP/G/1 Queues

Petra Vis, VU Amsterdam, De Boelelaan 1105, Amsterdam, 1081 HV, Netherlands, petra.vis@vu.nl
Petra Vis, Centrum Wiskunde & Informatica, Amsterdam, Netherlands, petra.vis@vu.nl, Rene Bekker

We study access times in appointment-driven systems. The access time is the number of days between a request for an appointment and the day that the appointment can take place. To meet target access times, we allow for overbookings, as they often occur in practice. Applications of this type of systems can be found in health care; e.g., patients making appointments with a doctor. We argue that such a system can naturally be modelled as an MAP/G/1 queue; the level corresponds to the access time and the phase to the dynamics of the number of free slots at the first available day. To allow for overbookings, we analyze a level-dependent version of the MAP/G/1 queue, leading to intuitively appealing results.

Joint Session HAS/MSOM-HC: Care Transition Policy and Management

Sponsored: Manufacturing & Service Oper Mgmt, Healthcare Operations

Sponsored Session

Chair: Nan Kong, Purdue University, West Lafayette, IN, United States, nkong@purdue.edu

1 - System Modeling For Patient Transitions Within Hospital

Hyo Kyung Lee, University of Wisconsin Madison, 1, Madison, WI, 1, United States, wilchess27@gmail.com, Jingshan Li, Albert J. Musa, Philip A. Bain

Among various issues in healthcare delivery, many complex and critical problems occur at the interfaces of healthcare systems. A patient's hospital stay may encompass various care units, but due to limited capacity, substantial amount of patients experience delay during the transition. This not only impacts the care quality and patient satisfaction, but in some cases is directly associated with mortality risk. Thus, to contribute to this end, we present a Markov chain model to study the transitions between emergency department, intensive or critical care unit, and hospital ward in community hospitals. Furthermore, an iteration method is introduced to evaluate the performance.

2 - Reduce COPD Readmission - Risk Identification And Patient-centered Intervention

Xiang Zhong, University of Wisconsin, 1513 University Avenue, Room 3235, Madison, WI, 53706, United States, oliver040525@gmail.com, Cong Zhao, Philip Bain, Albert Musa, Craig Sommers

30-day hospital readmission has been established as a critical performance indicator in promoting quality and patient-centered care. Individuals with serious chronic conditions such as chronic obstructive pulmonary disease (COPD) suffer high readmission risks and incur significant hospital penalty cost. To reduce COPD readmission, it's important to provide tools for physicians and hospitals to manage patients post discharge. In this study, we build statistical models to identify the risk factors for COPD readmission. Based on patients' risk levels, different patient-centered intervention policies prior to discharge and post discharge are developed.

3 - Optimal Inpatient Discharge Planning Under Uncertainty

Maryam Khatami, Texas A&M University, 4050 ETB, College Station, TX, 77840, United States, maryam.khatami@tamu.edu, Mark Lawley, Nan Kong, Michelle M. Alvarado

We study the inpatient discharge planning problem to enable efficient design of optimal discharge plans on a daily basis. If some of the discharge processes are delayed, the ensuing backup in the upstream units will cause inpatient admission delays. Hence, it is critical to tradeoff competing issues of upstream patient boarding (e.g. Emergency Department (ED) boarding), inpatient discharge lateness, and Inpatient Unit (IU) workload integration. We develop a novel two-stage stochastic programming model with uncertain IU discharge processing time and IU bed request time. Using data from a Texas hospital, we calibrate our model and fine-tune our solution method.

1 - Drivers, Riders And Service Providers: The Impact Of The Sharing Economy On Mobility

Harald Bernhard, Singapore University of Technology and Design, Singapore, Singapore, harald_bernhard@mymail.sutd.edu.sg, Saif Benjaafar, Costas Courcoubetis

We study a heterogeneous population of agents interacting through a platform that facilitates on-demand ride-sharing. We build an equilibrium model to analyze the impact of key parameters such as car usage and ownership costs on traffic volume and welfare. Furthermore we define and find conditions to differentiate between a 'need' and 'profit' driven sharing economy.

2 - The Role Of Surge Pricing On A Service Platform With Self-scheduling Capacity

Gerard P Cachon, University of Pennsylvania, cachon@wharton.upenn.edu, Kaitlin Daniels, Ruben Lobel

Recent platforms, like Uber and Lyft, offer service to consumers via "self-scheduling" providers who decide for themselves how often to work. These platforms may charge consumers prices and pay providers wages that both adjust based on prevailing demand conditions. We study the effectiveness of different contractual forms, from the perspective of platform profit, provider surplus and consumer surplus. We find that while surge pricing is not optimal, it is nearly so. We describe conditions under which all parties benefit from the use of surge pricing.

3 - Bike-share Systems: Accessibility And Availability

Ashish Kabra, INSEAD, Boulevard de constance, Fontainebleau, 77305, France, ashish.kabra@insead.edu, Elena Belavina, Karan Girotra

This paper estimates the relationship between ridership of a bike-share system and its design aspects— station accessibility and bike-availability. Our analysis is based on a structural demand model that considers the random-utility maximizing choices of spatially distributed users, and it is estimated using high-frequency system-use data from the bike-share system in Paris and highly granular data on sources of bike-share demand. A novel model separates the long-term and short-term effects of higher bike-availability. Because the scale of our data render traditional numerical estimation techniques infeasible, we develop a novel transformation of our estimation problem.

MSOM/Supply and Procurement

Sponsored: Manufacturing & Service Oper Mgmt, Supply Chain

Sponsored Session

Chair: Zhixi Wan, University of Oregon, 1208 University of Oregon, Eugene, OR, 97403, United States, zwan@uoregon.edu

1 - Optimal Procurement In Assembly Supply Chains

Bin Hu, University of North Carolina, Chapel Hill, NC, 27519, United States, bin_hu@unc.edu, Anyan Qi

We consider an OEM's contracting mechanism to procure multiple components from different suppliers and assemble them into products under simultaneous and sequential contracting. We derive optimal mechanisms in both cases, and show that they can be implemented by simple quantity flexibility contracts. Furthermore, we find that optimal simultaneous and sequential contracting are revenue-equivalent for all parties, despite them having different asymmetric information structures. All results are extended to general convex costs and concave revenues, confirming that the results capture fundamental properties of optimal procurement in assembly supply chains.

2 - Optimal Procurement Auctions Under Multi-stage Supplier Qualification

Wei Chen, University of Kansas, wei.chen@ku.edu, Milind Dawande, Ganesh Janakiraman

We consider a firm that solicits bids from a fixed-sized pool of yet-to-be-qualified suppliers for an indivisible contract. The contract must be awarded to a supplier who passes a multi-stage qualification process. For each stage of the process, the buyer incurs a fixed testing cost for each supplier she chooses to test. Motivated by the buyer's urgency of time (or the lack of it) for completing the process, we study optimal mechanisms for the buyer under two testing environments: simultaneous testing, where in each stage, the buyer selects a subset of previous-stage-qualified suppliers and tests them simultaneously; and non-simultaneous testing, where simultaneous-testing is not required.

3 - Global Sourcing Under Non-contractible Capacity And Asymmetric Cost Information

Ehsan Bolandifar, The Chinese University of Hong Kong, Hong Kong, Hong Kong, ehsan@baf.cuhk.edu.hk, Fuqiang Zhang, Tianjun Feng

This paper studies a global sourcing problem where a buyer sources a product from a supplier to satisfy uncertain market demand. The buyer faces two issues when designing the sourcing contract: the supplier's cost structure is private information and the supplier's capacity investment is not contractible. We show that the presence of moral hazard does not necessarily lead to a lower profit for the buyer, but it may require a more complex contract format. We find that a single, linear contract could be optimal for the buyer under certain conditions. Even when such a contract is suboptimal, it can deliver close-to-optimal profit for the buyer for a wide range of situations.

4 - Screening Product Quality With Service Contracts

Dong Li, Singapore University of Technology and Design, Singapore, Singapore, lidong1107@gmail.com, Nishant Mishra, Serguei Netessine

We study contracting for product support under information asymmetry. Product reliability is privately informed for the customer, and the supplier then designs mechanisms to achieve screening product failure rates. We investigate the screening effects of two types of service agreement: Performance-based Contracts (PBC) and Transaction-based Contracts (TBC). Despite the advantages of PBC highlighted in previous studies, we find that TBC may have a lower screening cost than PBC when the customer has high levels of reserved utility. Our model provides theoretical supports for co-existence of multiple contract forms in product repair and maintenance outsourcing.

Investment in Renewable Energy and Energy Efficiency

Sponsored: Manufacturing & Service Oper Mgmt, Sustainable Operations

Sponsored Session

Chair: Safak Yucel, Duke University, 100 Fuqua Drive, Durham, NC, 27705, United States, safak.yucel@duke.edu

1 - The Impact Of Carbon Pricing On Improving Supply Chain Energy Efficiency

Quang Dang Nguyen, University of Minnesota, nguy1762@umn.edu, Karen Donohue, Mili Mehrotra

We study the impact of a carbon pricing policy and its accompany on the energy efficiency investment decisions of a small manufacturing supplier facing competition for the business from a large industrial buyer. We also derive the optimal strategy for policy maker and the resulting social welfare, taking into consideration the social and environmental externalities of the supplier's operations.

2 - Quantifying The Impact Of Intermittent Renewable Generation On German Electricity Market

Shadi Goodarzi, HEC Paris, shadi.goodarzi@hec.edu
Shadi Goodarzi, California State University Fullerton, Fullerton, CA, United States, shadi.goodarzi@hec.edu, Derek W Bunn, Syed Basher

How does the penetration of renewable energy affect electricity market? Using high frequency 15-minute interval data, we quantify the impact of wind and solar production forecast errors on intraday electricity market equilibrium in Germany. We find, among others, higher wind and solar production forecast errors decrease the spot price and supply-demand imbalance.

3 - Designing Hydro Supply Chains For Water, Food, Energy And Flood Nexus

Kwon Gi Mun, Assistant Professor, Fairleigh Dickinson University, 1000 River Rd. H-DH2-06, Teaneck, NJ, 07666-1914, United States, kgmun@fdu.edu, Raza Ali Rafique, Yao Zhao

We study the nexus of water, food, energy and flood, which are among the most formidable challenges faced by developing countries around the world. The development of hydropower has the potential to address all these issues in the same time and thus is prioritized in the international community to reduce poverty, promote the sustainable development of the economy, and achieve the Millennium Development Goals. We apply the SCM concept to water resource development and provide the end-to-end and dynamic perspectives (the supply chain perspectives) needed in the expansion of hydropower network for energy security, irrigation and flood control.

4 - Reversing The Death Spiral: A New Business Model For Utility Firms Under Social Network Effects

Safak Yucel, Georgetown University, Washington, DC, United States, safak.yucel@georgetown.edu, Gurhan Kok, Kevin Shang

Utility death spiral describes a phenomenon in which retail electricity prices increase as more consumers invest in residential rooftop solar panels. In this paper, we present a technology-adoption model and show that this phenomenon occurs because of the current net metering policy, which allows consumers to sell their excess electricity back to utility firms. We then study several new business models that aim to counteract the death spiral phenomenon.

Service Science I

Contributed Session

Chair: Sreekanth V K, Research Scholar, Indian Institute of Technology Kharagpur, Kharagpur, 721302, India, sreekanthvettikkadu@iitkgp.ac.in

1 - Impact Of Staffing Flexibility On Unit Climate And Patient Safety In Hospitals

Adelina Gnanlet, Associate Professor, California State University-Fullerton, 800 N State College Blvd, Department of Management, Fullerton, CA, 92831, United States, agnanlet@fullerton.edu, Chris McDermott, Rommel O Salvador

Floating, the frequent use of flexible staff, is typically associated with the benefits of scheduling ease and lowered costs but results in work interruption and discontinuity of patient care in hospitals. Therefore, higher floating can lead to deterioration of staff unit climate and patient safety. Using unit-level data from hospitals, we find that floating more than 8hrs negatively impacts patient safety, with unit climate mediating the relationship between floating and patient safety.

2 - Two New History-based Delay Predictors For Call Centers

Wyean Chan, Universite de Montreal, DIRO Pavillon Andre-Aisenstadt, CP 6128 succ Centre-Ville, Montreal, QC, H3C 3J7, Canada, chanwyea@iro.umontreal.ca, Mamadou Thiongane, Pierre L'Ecuyer

We propose two predictors to estimate the delay of customers in call centers or similar service systems. The first method predicts the delay by extrapolating the wait history of customers currently in queue. The second predictor uses an exponential smoothing of the delays of past customers conditional to the queue length. These predictors are attractive in practice because they are simple to implement, they require very few parameters and basically no optimization.

3 - Designing Service Machine For Emergency Medical Services

Sreekanth V K, Research Scholar, Indian Institute of Technology Kharagpur, Kharagpur, 721302, India, sreekanthvettikkadu@iitkgp.ac.in, Ram Babu Roy, Paul M Lillrank

Service machine is a metaphorical concept used in Translational Systems Sciences to explore the possibilities of applying machine design principles to the design of service production systems. The design of a service machine needs to consider several constraints arising from the nature of services: immateriality of the offering, heterogeneity of demand, inseparability of the production process, and perishability of resources. The customer behavior must be incorporated in the design as the service value is realized through co-creation by customers and producers. This research proposes an application of service machine concept for designing emergency medical services in Indian context.

1 - Adaptive Control Of Flexible Queueing Networks

Yuan Zhong, Columbia University, New York, NY, 10027, United States, yz2561@columbia.edu, Ramtin Pedarsani, Jean Walrand

We consider the problem of designing adaptive control policies for queueing networks with flexible servers of overlapping capabilities. We show that a simple, adaptive version of the classical maxweight policy can lead to system instability. We then provide tight characterizations for systems that are stable under the simple, adaptive maxweight policy. Finally, we propose class of adaptive control policies that are throughput optimal for general parallel server systems.

2 - Delay Performance Of Scheduling Algorithms For Data Center Networks And Input Queued Switches

Sivateja Maguluri, IBM, siva.theja@gmail.com

Today's era of cloud computing is powered by massive data centers hosting servers that are connected by high speed networks. It is therefore desirable to design scheduling algorithms for data packets that have low computational complexity and result in small average packet delays. We consider the scheduling problem in an input-queued switch, which is a good abstraction for a data center network. We present low complexity scheduling algorithms that have optimal queue length (equivalently, delay) behavior in the heavy traffic regime. We also present bounds on the queue length in light traffic. These results are obtained using drift based arguments.

3 - Characterizing Global Stability Of Queueing Networks Via Robust Optimization

Chaithanya Bandi, Northwestern University, Evanston, IL, United States, c-bandi@kellogg.northwestern.edu, Itai Gurvich

We study the conditions of global stability in open multi-class queueing networks, that is stability under any work conserving policy. We propose a new approach, where rather than aiming at the full characterization of global stability, we seek toidentify assembly (LEGO) operations, such as pooling of networks, and assembly rules-of-thumb that, when followed, crate a globally stable network from globally stable building blocks. We also use robust optimization as a key methodology that brings a new perspective to known results on global stability, state space collapse and the network Skorohod problem.

4 - Using Robust Queueing To Expose The Impact Of Dependence In Single Server Queues

Wei You, PhD Student, Columbia University, 500 W. 120th St., Mudd 323, New York, NY, 10027, United States, wy2225@columbia.edu, Ward Whitt

Queueing applications often exhibit dependence among interarrival times and service times, e.g., when there are multiple customer classes with class-dependent service-time distributions, or when arrivals are departures or overflows from other queues or superpositions of such complicated processes. In this talk, we show that the robust queueing approach proposed by Bandi et al. can be extended to describe the impact of dependence structure on customer waiting times and the remaining workload in service time as a function of the traffic intensity. Thus, robust queueing can be useful to develop performance approximations for queueing networks and other complex queueing systems.

Chair: Kevin Leder, University of Minnesota, 111 Church St, Minneapolis, MN, 55455, United States, kevinleder@gmail.com

1 - A Stochastic Model Of Order Book Dynamics Using Bouncing Geometric Brownian Motions

Xin Liu, Clemson University, xliu9@clemson.edu

In a limit order book, market ask price is always greater than market bid price, and these prices move upwards and downwards due to new arrivals, market trades, and cancellations. We model the two price processes as "bouncing geometric Brownian motions (GBMs)", which are defined as exponentials of two mutually reflected Brownian motions (BM). We then modify these bouncing GBMs to construct a discrete time stochastic process of trading times and trading prices, which is parameterized by a parameter $c > 0$. It is shown that the logarithmic trading price process, under a suitable scaling, converges to a standard BM, and the modified ask and bid price processes approach the original bouncing GBMs, as c goes to 0.

2 - Synchronization Of Discrete Pulse-coupled Oscillators

David Sivakoff, Ohio State University, dsivakoff@stat.osu.edu

We introduce a discrete state, discrete time model of inhibitory oscillators, and analyze the long time behavior of a system of oscillators located on the integer lattice. We show that, when started from random initial condition, the system clusters (weakly synchronizes), and give upper and lower bounds on the clustering rate.

3 - Sample Path Large Deviations For Heavy Tailed Levy Processes And Their Applications

Chang-Han Rhee, CWI, C.Rhee@cwi.nl

While the theory of large deviations has been wildly successful in providing systematic tools for studying rare events, the central ideas behind the classical large deviations theory critically hinge on the assumption that the underlying uncertainties are light-tailed. As a result, the heavy-tailed counterparts have remained significantly less mature. In this talk, we introduce a new large deviations result for heavy-tailed Levy processes, which enables systematic study of the rare events associated with multiple big jumps, beyond the celebrated "principle of one big jump." We illustrate the implications of the new theory in applications in computational finance and stochastic networks.

Quantitative Methods in Finance

Sponsored: Financial Services

Sponsored Session

Chair: Qi Wu, Chinese University of Hong Kong, Hong Kong, Shatin, NT, 12345, Hong Kong, qwu@se.cuhk.edu.hk

1 - Option Pricing In The Presence Of Market Microstructure

Nan Chen, Chinese University of Hong Kong, nchen@se.cuhk.edu.hk

No-arbitrage prices of vanilla options becomes nontrivial when the underlying dynamic is modeled at the order book level. By taking into account the market microstructure such as market depth and resilience, we formulate the traditional option pricing problem as a singular-impulsive control problem. Our analysis demonstrates that the liquidity-related microstructure has a profound impact on the resulting prices.

2 - On The Measurement Of Economic Tail Risk

Xianhua Peng, Hong Kong University of Science & Technology, maxhpeng@ust.hk, Steven Kou

This paper attempts to provide a decision-theoretic foundation for the measurement of economic tail risk, which is not only closely related to utility theory but also relevant to statistical model uncertainty. The main result is that the only risk measures that satisfy a set of economic axioms for the Choquet expected utility and the statistical property of general elicitability (i.e. there exists an objective function such that minimizing the expected objective function yields the risk measure) are the mean functional and Value-at-Risk (VaR), in particular the median shortfall, which is the median of tail loss distribution and is also the VaR at a higher confidence level.

3 - Persistence And Procyclicality In Margin Requirements

Qi Wu, Chinese University of Hong Kong, qwu@se.cuhk.edu.hk

Derivatives central counterparties (CCP) impose margin requirements on their clearing members to protect the CCP from the default of a member firm. A spike in volatility leads to margin calls in times of market stress. Risk-sensitive margin requirements are procyclical in the sense that they amplify shocks. We analyze how much higher margin levels need to be to avoid procyclicality. Our analysis compares the tail decay of conditional and unconditional loss distributions to compare stable and risk-sensitive margin requirements. Greater persistence in volatility leads to a slower decay in the tail of the unconditional distribution and a higher bu er needed to avoid procyclicality.

4 - Over-the Counter Markets andCounterparty Risk

Agostino Capponi, Columbia University, ac3827@columbia.edu

We develop a parsimonious model to study how counterparty risk influences the structure of OTC markets. A unit continuum of traders, who are risk-averse agents with exponential utility, are organized into banks. Traders of a bank strategically engage in bilateral transactions with traders of another bank taking into account the terms of deal and counterparty risk. We show that the rise of counterparty risk leads to a higher concentration of dealers.

RM in Online Markets

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Dragos Florin Ciocan, INSEAD, Fontainebleau, France, florin.ciocan@insead.edu

1 - Learning Demand Curves In B2b Pricing: A Case Application Of Optimal Learning

Ilya Ryzhov, Robert H. Smith School of Business, University of Maryland, iryzhov@rhsmith.umd.edu, Huashuai Qu, Michael Fu

We consider a sequence of B2B transactions involving a wide variety of buyers, products, and other characteristics, where the seller only observes whether buyers accept or reject the offered prices. The seller must adapt to this uncertain environment and learn quickly from new deals as they take place. We propose a new framework for statistical and optimal learning in this problem, based on approximate Bayesian inference, that has the ability to measure and update the seller's uncertainty about the demand curve based on new deals. A case study demonstrates the practical potential of this approach.

2 - Pricing Of Conditional Upgrades In The Presence Of Strategic Consumers

Yao Cui, Cornell University, Ithaca, NY, United States, yao.cui@cornell.edu, Izak Duenyas, Ozge Sahin

We study a conditional upgrade strategy that is recently used by the travel industry. A consumer can accept an upgrade offer in advance and pay the upgrade fee at check-in if higher-quality products are still available. Consumer make forward-looking decisions regarding which product type to book. We characterize the firm's optimal upgrade pricing strategy and identify multiple benefits of conditional upgrades. We also evaluate the revenue performance of conditional upgrades by comparing to other policies.

3 - Revenue Management With Repeated Interactions

Dragos Florin Ciocan, INSEAD, florin.ciocan@insead.edu, Andre Du Pin Calmon, Gonzalo Romero

We consider an RM problem where a seller of heterogeneous goods interacts with a dynamically evolving population of buyers over multiple periods. The basic trade-off we explore is between myopically optimizing the seller's revenues over one period versus optimizing buyer surplus in the hope of increasing buyer participation in future periods. We exhibit a simple policy that is asymptotically optimal.

4 - Joint Pricing And Inventory Management With Strategic Customers

Yiwei Chen, Singapore University of Technology and Design, stevenyiweichen@gmail.com, Cong Shi

We consider a joint pricing and inventory management problem wherein a seller sells a single product over an infinite horizon via dynamically determining anonymous posted prices and inventory replenishment quantities. Customers have a deterministic arrival rate but heterogeneous product valuations. Customers are forward-looking, who can strategize their times of purchases. A customer incurs waiting and monitoring cost if he delays his time of purchase. The seller seeks a joint pricing and inventory policy that maximizes her long-run average profit. We show that the optimal policy is cyclic. Under the optimal policy, strategic customer equilibrium behaviors are proven to be myopic.

Portfolio Decision Analysis

Sponsored: Decision Analysis

Sponsored Session

Chair: Janne Kettunen, The George Washington University, The George Washington University, Washington, DC, 00000, United States, jkettune@gwu.edu

1 - Systematic Bias, Selection Bias, And Post-decision Disappointment

Eeva Vilkkumaa, Aalto University, Helsinki, Finland, eeva.vilkkumaa@aalto.fi, Juuso Liesiö

Based on empirical studies, the realized values of highest-ranked decision alternatives tend to be lower than estimated. This phenomenon has been explained by a systematic bias in the alternatives' value estimates, or selection bias. We develop models for estimating the relative magnitudes of these biases using data on the estimated values of all alternatives but the realized values of selected alternatives only. Results obtained from real data on 5,610 transportation infrastructure projects suggest that out of the total cost overrun of $2.77 billion, 25% is due to systematic bias and 75% due to selection bias.

2 - Scheduling Public Procurement Contracting

Janne Kettunen, Assistant Professor, The George Washington University, Washington, DC, United States, jkettune@gwu.edu, Young Hoon Kwak

We show that the schedule according to which procurements are contracted can impact the number of proposals and thereby the cost of procured services or products. To help the owner of the procurements to schedule the contracts, we develop an optimization framework and apply it to the Florida Department of Transportation's procurement contracts scheduling problem. Our results show that the optimal schedule yields about 2% ($15 million) cost savings annually.

3 - Multi-period, Multi-objective Portfolio Optimization

Ernest H Forman, George Washington University, forman@gwu.edu

Multi-Period, Multi-Objective and Multi-Perspective portfolio optimization requires synthesis of hard data as well as judgment. The Analytic Hierarch Process and extensions are increasingly being used to facilitate the portfolio optimization process in a variety of applications, ranging from project portfolio optimization to capital budgeting.

Applications of Multiattribute Preferences

Sponsored: Decision Analysis

Sponsored Session

Chair: Jay Simon, American University, 4400 Massachusetts Ave NW, Washington, DC, 20016, United States, jaysimon@american.edu

1 - Preference Programming For Spatial Multiattribute Decision Analysis

Mikko Harju, Aalto University, Espoo, Finland, mikko.harju@aalto.fi, Kai Virtanen, Juuso Ilari Liesio

The additive spatial value function models preferences among decision alternatives with spatially varying multiattribute consequences. Use of this value function can be challenging as it requires assessing a weighting function across the (uncountably infinite) set of spatial locations. To overcome this challenge, we develop (i) methods for capturing incomplete preference information about relative importance of locations, and (ii) models for identifying the resulting dominance relations among the alternatives. The use of these models is demonstrated with a military planning application. Finally, we provide some new insights about the axiomatic basis of spatial value functions.

2 - Multiattribute Preference Models For Computational Creativity

Debarun Bhattacharjya, IBM T. J. Watson Research Center, Yorktown Heights, NY, United States, debarunb@us.ibm.com, Lav Varshney

There is vigorous debate around definitions of creativity, yet there is general consensus that creativity inherently involves a subjective value judgment by an evaluator. In this talk, I will present evaluation of creative artifacts and computational creativity systems through a multiattribute preference modeling lens. Various implications are illustrated with the help of examples from and inspired by the creativity literature.

3 - Multilinear Utility Functions For Multiattribute Portfolio Decision Analysis

Juuso Ilari Liesio, Aalto University, Helsinki, Finland, juuso.liesio@aalto.fi, Eeva Vilkkumaa

In project portfolio selection applications, portfolio utility is often modeled as the sum of the projects' multi-attribute utilities. We establish the preference assumption underlying this linear portfolio utility function. Furthermore, we show how relaxing some of these assumption leads to a more general class of multilinear portfolio utility functions, which can capture risk preferences on the portfolio level. We also develop techniques to elicit these utility functions, and optimization models to identify the project portfolio which maximizes the expected utility subject to resource and other portfolio feasibility constraints.

4 - Multiattribute Procurement Auctions With Unknown Buyer Preferences

Jay Simon, American University, jaysimon@american.edu

In procurement auctions for new large-scale products or services, the length of time between the request for bids and the selection of the winning bid can be extremely long. During this time, the specific needs of the buyer may change. Additionally, the new product or service being procured may involve technology that is not fully understood. Thus, the buyer may not know what her eventual preferences will be when the bid selection decision is made. However, the buyer must tell the bidders how their bids will be scored at the start of the process. This work explores optimal strategies for the buyer in the case where preferences at the time of bid selection are uncertain when the scoring rule is chosen.

Simulation Optimization and Ranking and Selection

Sponsored: Simulation

Sponsored Session

Chair: Demet Batur, University of Nebraska-Lincoln, CBA 209, Lincoln, NE, 68588, United States, dbatur@unl.edu

1 - Optimization-based Learning Of Simulation Model Discrepancy

Henry Lam, University of Michigan, Ann Arbor, MI, United States, khlam@umich.edu, Matthew Plumlee

The vast majority of stochastic simulation models are imperfect in that they fail to fully emulate the entirety of real dynamics. Despite this, these imperfect models are still useful in practice, so long as one knows how the model is inexact. We propose a method to learn the amount of the model inexactness using data collected from the system of interest. Our approach relies on a Bayesian framework that addresses the requirements for estimation of probability measures that are ubiquitous in stochastic simulation, and an embedded optimization to enhance the involved computational efficiency.

2 - Quantile-based Ranking And Selection In A Bayesian Framework

Yijie Peng, Fudan University, pengy10@fudan.edu.cn, Chun-Hung Chen, Michael Fu, Jian-Qiang Hu, Ilya O Ryzhov

We propose two quantile-based ranking and selection schemes in a Bayesian framework, i.e. myopic allocation policy (MAP) and optimal computing budget allocation (OCBA). MAP has a superior small sample performance, while OCBA shows a desirable asymptotic behavior. As a result, a switching strategy that that switches from MAP to OCBA is provided to achieve balanced performances in both small sample and large sample scenarios.

3 - Multi-information Source Optimization With Applications

Matthias Poloczek, Cornell University, poloczek@cornell.edu, Jialei Wang, Peter Frazier

We consider Bayesian optimization of an expensive-to-evaluate black-box function, where we also have access to cheaper approximations of the objective that are typically subject to varying unknown bias. Our novel algorithm rigorously treats the involved uncertainties and uses the Knowledge Gradient to maximize the predicted benefit per unit cost. We discuss applications and demonstrate that the method consistently outperforms other state-of-the-art techniques, finding designs of considerably higher objective value at lower cost.

4 - Tractable Dynamic Sampling Strategies For Quantile-based Ordinal Optimization

Dongwook Shin, Columbia Business School, dshin17@gsb.columbia.edu, Mark Nathan Broadie, Assaf Zeevi

Given a certain number of stochastic systems, the goal of our problem is to dynamically allocate a finite sampling budget to minimize the probability of falsely selecting non-best systems, where the selection is based on quantiles of their performances. The key aspect is that the objective depends on underlying probability distributions that are unknown. To formulate this problem in a tractable form, we introduce a function closely associated with the aforementioned objective. To derive sampling policies that are practically implementable, we suggest a policy that combines sequential estimation and myopic optimization, as well as certain variants of this policy for finite-time improvement.

1 - Welfare Implications Of Congestion Pricing: Evidence from SFpark

Hsin-Tien Tsai, University of California, Berkeley, 1822 Francisco St., Apt 4, Berkeley, CA, 94703, United States, hsintien@berkeley.edu, Pnina Feldman, Jun Li

SFpark is a congestion pricing program for street parking implemented in San Francisco. We investigate whether consumers benefit from congestion pricing using data from this program. We build a structural model of consumer search and quantify the change in consumer welfare.

2 - Inventory Announcements And Customer Choice: Evidence From The Air Travel Industry

Katherine Ashley, University of California-Berkeley, kate_ashley@haas.berkeley.edu, Pnina Feldman, Jun Li

Does inventory announcement influence consumer decision-making in the market for airline tickets? We estimate the impact of the firm's announcement policy on customer purchase timing and itinerary choice. In doing so, we measure the information content of inventory announcements, and analyze the extent to which customers treat these messages from the firm as cheap talk or credible information.

3 - Designing Listing Policies For Online B2b Marketplaces

Wenchang Zhang, University of Maryland, COLLEGE PARK, MD, CA, United States, wzhang@rhsmith.umd.edu, Konstantinos Bimpikis, Wedad Jasmine Elmaghraby, Kenneth Moon

Excess inventory amounts to $500 billion a year for big-box retailers. Much of this inventory is sold through online B2B auctions. Based on a natural experiment, we provide strong evidence that increasing the market thickness by concentrating the auction ending times to just a couple of days of the week has a significant positive effect on their final prices. We find that bidders' monitoring cost has a large impact on their auction entry choices and outweighs the potentially negative effect of cannibalization among competing auctions. Our findings may have implications for the design of online marketplaces beyond liquidation auctions.

4 - Distribution Channel Relationships And Multimarket Competition

Necati Tereyagoglu, Assistant Professor of Operations Management, Scheller College of Bussiness - Georgia Institute of Technology, 800 W Peachtree St NW, Atlanta, GA, 30308, United States, necati.tereyagoglu@scheller.gatech.edu, O. Cem Ozturk

We study the role of the distribution channel relationships in determining competitive intensity when manufacturers encounter in multiple markets. We explore the manufacturers' pricing decisions when they have asymmetric distribution channel relationships with retailers across multiple markets. Using an extensive scanner data set, we find that cross-market interdependence due to shared ties with the retailers softens competition when manufacturers have asymmetric distribution channel relationships across multiple markets.

1 - Optimal Resource Consumption via Data Driven Prophet Inequalities With An Application To Cloud Infrastructure

Andrew A Li, MIT, Cambridge, MA, United States, aali@mit.edu, Muhammad J Amjad, Vivek Farias, Devavrat Shah

Buyers of cloud compute resources are generally interested in completing workloads by fixed deadlines as cheaply as possible. This entails purchasing enough resources at the lowest prices possible, which is a challenge in today's market where the largest providers all use some form of demand-driven pricing. We formulate this as a covering problem, and introduce the Data-Driven Prophet Model, which uses historical price data to interpolate between stochastic modeling and a fully adversarial model. We propose a simple, scalable threshold policy that is order-optimal and has, in a real-world implementation, completed workloads significantly cheaper than the current practice benchmark.

2 - Stochastic Optimal Control Of Time-varying Cloud Workloads

Mark S Squillante, IBM Thomas J. Watson Research Center, mss@us.ibm.com, Yingdong Lu, Mayank Sharma, Bo Zhang

We consider a cloud computing system modeled as a GI/GI/1 queue under workloads (arrival and service processes) that vary on one time scale and under controls (server capacity) that vary on another time scale. Taking a stochastic optimal control approach and formulating the corresponding optimal dynamic control problem as a stochastic dynamic program, we derive structural properties for the optimal dynamic control policy in general. We also derive fluid and diffusion approximations for the problem and propose analytical and computational approaches in these settings. Computational experiments demonstrate the benefits of our approach.

3 - Conic Optimization Model For Replicated Data Stores In Geo-distributed Cloud Applications

Julio Cezar Goez, NHH Norwegian School of Economics, Bergen, Norway, jgoez1@gmail.com, Juan F. Pérez

We consider a software application provider that serves geographically distributed users using cloud resources. The application provides a service to access content via a set of channels, and it must comply with a certain quality of service (QoS). The provider must decide where to locate and how to replicate the data considering traffic patterns. The goal is to find the deployment of minimum cost. We introduce a mixed integer non-linear optimization model, which may be reformulated as a mixed integer second order cone optimization problem. In many of our test instances CPLEX reaches the time limit without feasibility. We developed a feasibility test that also provides an initial feasible solution.

4 - Large Scale Dynamic Network Revenue Management With Application In Pricing Of Interactive Cloud Applications

Hossein Jahandideh, UCLA Anderson School of Management, 3777 Mentone Avenue, Apt 405, Los Angeles, CA, 90034-6473, United States, hs.jahan@gmail.com, Julie Ward, Filippo Balestrieri

We consider a cloud provider making customized dynamic pricing decisions for hosting interactive applications. The dynamic pricing problem is a large-scale dynamic network revenue management problem. We decompose the stochastic dynamic program into single-resource problems by exploiting structural properties of the optimal Lagrangian variables, removing the necessity for an extensive search over Lagrangian variables. We define a pricing mechanism based on the solution to the decomposed problem, and demonstrate its effectiveness through several numerical experiments.

1 - Breaking The Chill Of The Tie In The National Hockey League

Marty Thomas, Georgia Gwinnett College, athomas1@ggc.edu

In order to increase fan excitement in overtime periods, the National Hockey League changed the point structure of the overtime period (winner receives 2 points and the loser receives 1 point). However, tied games now had more points associated with them (regulation win = 2 points; regulation loss = 0 points). This research explores the implications of a soccer point system (3 points = regulation win; 2 points = overtime win; 1 point = overtime loss). The Real Time Scoring System is used to develop probability distributions of goal production for each of the 30 NHL teams. Monte Carlo simulation is used to determine whether the new point system benefits certain teams over others in terms of making the playoffs?

2 - The Advantage Of Lefties In Sports

Hal Cooper, PhD Candidate, Columbia University, 500 West 120th Street, Rm. 345, Mudd, New York, NY, 10027, United States, hal.cooper@columbia.edu, Francois Fagan, Martin B Haugh

Left-handers comprise a staggering 15% of professional tennis players, but only 11% of the general population. In sports as varied as boxing, baseball and fencing, the contrast is even more stark. Here we present a method for extracting the advantage of being left-handed in sports (as well as the inherent skill of each player) from match results. Unlike previous approaches to this problem, our formulation is Bayesian and uses induced order statistics to address the truncated nature of the data set. We further demonstrate an approach in the absence of explicit match result data that can be used to determine the latent advantage of specific factors wherever there exists notions of ranking and competition.

3 - The Optimal Value Bill James' Pythagorean Method For Major League Lacrosse

Hayden Howell, University of Alabama, Culverhouse College of Commerce and Business Administration, Tuscaloosa, AL, 35487-0226, United States, hphowell@crimson.ua.edu, James Cochran

Bill James' Pythagorean Method of Baseball, which quantifies the nature of the relationship between the win/loss percentage of a Major League Baseball (MLB) team and the number of runs the team scores and allows over the course of a season, is extended to Major League Lacrosse (MLL). We find the optimal form of James' model using both the squared and the absolute error criteria over a broad range of algebraic possibilities. We also examine the stability in the relationship between win/loss percentage and runs scored and allowed over time.

4 - Determining The Optimal Locations For Indoor Tennis Camps In Canada

Islay Wright, University of Toronto, 1, Toronto, ON, Canada, islay.wright@mail.utoronto.ca, Timothy Chan

Winter tennis camps are often inaccessible for Canadians due to the high rental costs of indoor tennis facilities. To increase the involvement of youth in tennis, it is important to make camps available year-round at a reasonable price. Tennis Canada wants to evaluate holding tennis camps at indoor turf stadiums instead of at indoor tennis facilities. To help them, we developed a location model to optimize camp locations, using demand estimates generated by a logistic regression model and data from surveys and census.

Chair: Theodore T Allen, Ohio State University, 210 Baker Systems Engineering, 1971 Neil Avenue,, Columbus, OH, 43210, United States, allen.515@osu.edu

1 - The Role Of Peer Influence On Vaccine Uptake In A Pandemic Disease Spread Model

Kevin Chan, University of Toronto, Toronto, ON, Canada, kevinm.chan@mail.utoronto.ca, Dionne Aleman

Most pandemic spread models that consider vaccination assume vaccine adopters are evenly spread across the population. However, evidence suggests vaccine adoption is peer-influenced. Treating populations as contact networks with vaccination determined by influence-spread models, we analyze pandemic outcomes using agent-based simulation. Far more infections occur with peer-influenced v. uniformly-spread vaccination.

2 - Emergency Medical Service Response Models With Patient Priorities

Soovin Yoon, University of Wisconsin, 1415 Engineering Drive, Room 3261, Madison, WI, 53706, United States, yoon57@wisc.edu, Laura Albert McLay

In this talk, we study how to use optimization models and algorithms to effectively leverage patient triage information when determining how to locate and dispatch ambulances. Research in this area is valuable since it provides important guidance into how emergency medical services departments should use scarce resources to balance the needs of high-priority and low-priority patients given that triage information regarding patient needs is dynamic. This research has resulted in several key insights into how to optimally use scarce public resources for responding to health emergencies.

3 - Generalized Binary Search With Indifference Zones So All Can Wait Less than 30 Minutes

Shijie Huang, Carillion Clinic, skylovtata@gmail.com

We propose efficient methods to identify all resource combinations which minimally satisfy a standard with probability greater than P*. These methods are based on a generalized binary search combined with the fully sequential methods of Andradóttir and Kim. Numerical examples and case studies illustrate and compare the method with alternatives.

4 - Operations Research Meets Voting Laws In The U.S.A.: NAACP v. Mccrory, Arizona, And Others

Theodore T Allen, Ohio State University, allen.515@osu.edu

Waiting lines are a political weapon to demoralize voters on the other side. Evidence shows aspirants lost in New Mexico because of provisioning causing lines. Also, in North Carolina we explore the possibility that racially motivate lines affected a key senate election even while a judge has a different opinion.

1 - An Open Source Tool For The Visualization, Analysis And Reporting Of Regional And Statewide Transit Networks

Saeed Ghanbartehrani, Ohio University, Stocker Engineering Center 276, Athen, OH, 45701, United States, ghanbart@ohio.edu, Jose David Porter

Assessing the current "state of health" of individual transit networks is fundamental when planning improvements to a transportation network. These improvements must be guided by strategies based on key performance metrics, which require the availability of accurate data. This research focuses on the design and implementation the transit network analysis (TNA) software tool. Some of the inputs to this tool include transit network data from 66 different Oregon transit agencies, census data, and employment data, and can be used to visualize, analyze, and report on the Oregon transit network.

2 - Mobility Patterns And Service Level Analysis Of A Free Floating Bike Sharing System

Aritra Pal, University of South Florida, Tampa, FL, United States, aritra1@mail.usf.edu, Yu Zhang, Changhyun Kwon

Bike Sharing is a sustainable mode of urban mobility. Free-floating bike sharing (FFBS) is an innovative bike sharing model, which saves on start-up cost and offers significant opportunities for smart management. In this study, we identify mobility patterns of users of Share-A-Bull Bikes (SABB) FFBS and analyse the effect of external factors (eg: weather) on them. These results are then used to measure lost demand in SABB FFBS, which is used to compute desired inventory levels, of various regions in the SABB FFBS operating area. We also present a model to estimate the probability of a bike being unusable and identify users who are mishandling bikes, based on available historical trip data.

3 - Bike-sharing Market Acceptance Considering A Mixed Fleet Of Bicycles

Mohammad Hossein Shojaei, Michigan State University, Building, East Lansing, MI, 48824, United States, shojaeim@msu.edu, Mehrnaz Ghamami

This study aims to minimize emission and launch costs of a transportation system, while maximizing its health benefits. The system consists of currently available services, as well as an intended bike-sharing scheme with mixed fleets of bicycles. Fleets can include regular bikes, pedelces and power-on-demand e-bikes. User's choice is captured with a utility function defined by the average distance to be traveled, mode availability, area's topology, travel time, and user costs. Results will help policy makers provide a cost-effective, eco-friendly and more active transportation system.

1 - A Behavioral Analysis On The Use Of An Intermediary In Manufacturing Outsourcing

Qiong Chen, University of Science and Technology of China, qcchen@ustc.edu.cn, Aleda Roth, Gulru F Ozkan-Seely, Fred Switzer

In this paper, we examine how the level of outsourcing competence of the firm, the amount of time-to-market pressure and the buyer's perceived incentive alignment with the agent, act to systematically influence the decision to outsource the new product directly or indirectly through an intermediary.

2 - Managing Supplier Incentives For Key Component Testing

Timofey Shalpegin, The University of Auckland Business School, t.shalpegin@auckland.ac.nz

Suppliers of a key component for a new product are often required to perform testing of the key component. However, they might not have sufficient incentives to perform a sufficient number of tests if they do not fully internalize the risks of new product failure. We examine different contracts, such as reward and residual claimant contracts, and analyze their influence on the supplier incentives for component testing. Finally, we design a contract ensuring the suppliers keep to the efficient component testing level.

3 - Optimal Product Launch Times For A Firm With A Niche Product

Jacqueline Ng, Northwestern University, Evanston, IL, 60201, United States, jacqueline.ng@northwestern.edu, Izak Duenyas, Seyed Iravani

We consider the optimal production introduction policy for a technology firm that produces a single niche product that progresses through a series of product generations over time. The novel part of this problem is that the firm's niche product is a subset or peripheral part of a larger product offering from a multi-product firm. We develop a dynamic programming model to analyze the small firm's new product introduction strategy, and prove the optimality of a threshold policy. We then compare and contrast the optimal policy with the common time-pacing and event-pacing product introduction policies use in practice.

4 - Student Perceptions Of The Entrepreneurial Mindset Within Capstone Design Projects

Ahad Ali, Lawrence Technological University, sali@ltu.edu

For many engineering curricula, student teams are formed to complete a capstone design project. Besides technical knowledge, capstone projects can foster team building skills, leadership skills, problem-solving skills, opportunity recognition, project planning and budgeting, innovation, tolerance for uncertainty/ambiguity, and risk management among other attributes of the entrepreneurial mindset. This paper provides an expanded analysis of student perceptions of the entrepreneurial activity and the recognition of the entrepreneurial mindset associated with capstone design projects.

Service Science: Health Care Services

Sponsored: Service Science

Sponsored Session

Chair: George Cai, Santa Clara University, Leavey School of Business, Santa Clara, CA, 95053, United States, gcai@scu.edu

Co-Chair: Hui Zhang, Lakehead University, Lakehead University, Thunder Bay, ON, P7B 5E1, Canada, hzhang2@lakeheadu.ca

1 - Payment Contracts To Promote Use Of Optional Diagnostic Tests In Cancer Treatment

Salar Ghamat, Ivey Business School, Western University, sghamat.phd@ivey.ca, Greg Zaric, Hubert Pun

We examine performance-based payment contracts to promote the use of an optional diagnostic test for newly diagnosed cancer patients. We model the interaction between a health care payer and an oncologist with both adverse selection and moral hazard. We show that, in the presence of information asymmetry, an oncologist should never test all patients, even when the test was available for free. Moreover, although the oncologist has additional information about a patient's risk, the payer can guarantee that the oncologist obtains the same profit regardless of the characteristics of the patients. Finally, we find that the payer might benefit from an increase in reputational concerns of the oncologist.

2 - Fair Competition Of Brand Name Drugs Under Rebate Arrangements

Hui Zhang, Faculty of Business Administration, Lakehead University, hzhang2@lakeheadu.ca

When new drugs are listed for a third-party payer's coverage, they are often required to sign rebate arrangements to reduce payers' financial risk. In this paper, we consider two forms of rebate arrangements. 1, the new drug is paid at its original price if its sale is under a volume threshold and then is paid at the old drug's price otherwise. 2, a volume threshold is specified for all drugs. If the total sales of all drugs exceed the threshold, each drug is required to pay a rebate according to its market share. We investigate the optimal decisions of the payer and the drug manufacturers and identify the impact of the rebate on the fairness of competition.

Inventory Management VI

Contributed Session

1 - Dynamic Pricing, Hedging, And Inventory Management In A Two-product Monopoly Under Cost And Demand Risk

Max F Schoene, Doctoral Student, WHU - Otto Beisheim School of Management, Reinhold-Friedrichs-Str. 49, Muenster, 48151, Germany, max.schoene@whu.edu, Stefan Spinler, John R Birge

We study the joint inventory management, dynamic pricing, and financial hedging problem of a risk-averse, two-product monopolist facing cost and demand risk. These risks can be correlated across markets and customers may view the two products as substitutes or complements creating demand interdependencies. We provide an analytic solution to the firm's multi-period decision problem and characterize the implications of operating in several interdependent markets for integrated policy making.

2 - A Newsvendor Analysis Of Binomial Yield Production Process

Sungyong Choi, Assistant Professor of Supply Chain Management, Yonsei University, 1 Yoneseidae-gil, College of Government and Business, Wonju, 26493, Korea, Republic of, sungyongchoi@gmail.com, Sumin Jeon, Jinmin Kim, Kwangtae Park

We study a Binomial yield production process with a newsvendor approach. We provide a reformulation of the original model to convert the discrete exact model to the continuous approximate model by Normal approximation. We conduct comparative static analysis for model parameters in the approximate model and derive monotone properties to the optimal solution. All the analytical results are consistent with our insights and supported by economic explanations. Our numerical examples by sample-based optimization show that the approximate model is sufficiently close to the exact model. Finally, all the results of sensitivity analysis in model parameters are also confirmed numerically.

3 - Onshore And Offshore Procurement: Global Sourcing Strategies

Zhe Liu, PhD Candidate, Columbia University, 511 W 112th Street, Apt 24C, New York, NY, 10025, United States, zliu18@gsb.columbia.edu, Awi Federgruen, Lijian Lu

This paper studies a finite horizon, single product, periodic review inventory system with two supply sources, which originates from real world global sourcing firms facing onshore and offshore procurement problems. Supply sources are differentiated by their fixed and variable ordering costs, delivery lead times, as well as constraints on the order sizes. Excess inventories may be salvaged at the end of each period with a fixed cost and variable revenue, or be carried over to the next period. We derive structural results for the optimal solution, based on which we are able to characterize the optimal sourcing and salvaging decisions.

4 - Evaluating The Potential Of Additive Manufacturing For Spare Parts Supply

Rob Basten, Assistant professor, Eindhoven University of Technology, PO Box 513, IE&IS - OPAC, Eindhoven, 5600MB, Netherlands, r.j.i.basten@tue.nl, Bram Westerweel, Geert-Jan Van Houtum

We investigate the decision of whether or not to replace a regularly produced spare part with an alternative produced via additive manufacturing (AM), also called 3D printing. Such a transition requires a one-time investment and changes characteristics such as procurement lead time, production costs and component reliability. We consider the entire product lifecycle and take into account performance benefits and design, inventory, maintenance and downtime costs. We derive analytical properties of the required reliability and production costs of the AM part such that its lifecycle costs break even with that of its regular counterpart.

Online Crowdfunding

Sponsored: EBusiness

Sponsored Session

Chair: Zaiyan Wei, Purdue University, West Lafayette, IN, United States, zaiyan@purdue.edu

1 - Users' Resilience To Kickstarter Scam

Xue Tan, University of Washington, xuetan@uw.edu, Yingda Lu, Yong Tan

Users' expected quality of crowdfunding projects is an important determinant of their backing choice. Users who have experienced scam or unsuccessful projects may update their belief in the quality of projects over the platform to a lower level. In this study, we analyze how users learn from their past experience of unsuccessful or scam projects. We use longitudinal backing history of Kickstarter backers, and adopt text mining technique to analyze project failure types. By categorizing the unsuccessful delivery of products into several types, we examine the impacts of different types of project failures. Our work contributes to the policy design of crowdfunding platforms.

2 - Institutional Investors In Online Crowdfunding

Zaiyan Wei, Purdue University, West Lafayette, IN, 47907, United States, zaiyan@purdue.edu, Mingfeng Lin, Richard Sias

The "crowd" in online crowdfunding is no longer only comprised of retail investors; in fact, debt-based crowdfunding has long attracted the interest of institutional investors. We study whether they are indeed better able to screen borrowers than, and have any impacts on the behaviors of, retail investors. We find that although institutional investors indeed behave differently, overall their portfolios do not outperform those of retail investors. Their bids have significant impacts on the behavior of retail investors, as well as funding outcomes. We find that this effect is driven by the designation of "institutional investors" rather than just the portfolio size.

3 - Effects Of Charitable Giving In Crowdfunding: Crowds Fund Our Kids

Qiang Gao, University of Arizona, Tucson, AZ, 85721, United States, qiangg@email.arizona.edu, Paulo B Goes, Mingfeng Lin

We investigate how crowdfunding contributes to public goods by exploring the geographical expansion of a donation-based crowdfunding funding platform for educational purpose. Our initial results show that the emergence of crowdfunding as a viable financial source actually affects classroom activities and that crowd donation contributes to the improvement of education. We also find that the impact vary among different projects. Our findings help promote the awareness of such opportunities not documented in literature and benefit society as a whole.

4 - Information Disclosure And Crowdfunding

Keongtae Kim, City University of Hong Kong, keongkim@cityu.edu.hk, Jooyoung Park

Several strategies in crowdfunding have been introduced to dampen information asymmetry between funders and creators. This study examines one such possible mechanism, namely a platform-wide rule to require the disclosure of project risk, implemented in a crowdfunding platform during our study period. We find that the new disclosure policy led to a decrease in the creation of new projects, even successful ones. Our additional analyses show a stronger effect on creators bearing a larger burden from the disclosure requirement. We further find that the decrease is partly driven by the negative perceptions of funders about the risk information disclosed.

Emerging Behavioral Work by Doctoral students

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Julie Niederhoff, Syracuse University, 721 University Ave, WSOM 500, Syracuse, NY, 13244, United States, jniederh@syr.edu

1 - Risk And Loss Aversion In Information Security Investment: Theory And Experiments

Jie Zhang, The University of Texas at Arlington, 701 S Nedderman Dr, Arlington, TX, 76019, United States, jie.zhang2@mavs.uta.edu, Kay-Yut Chen, Jingguo Wang

Information security has gained much attention in the information systems literature. In this paper, we study how organization should decide the proper levels of investment to reduce the chances of loss, under different risk and loss aversion assumptions. We found that, theoretically, investment should decrease with firm revenue under specific settings and preference conditions, while experiments suggest the reverse. We also uncover dynamics in decisions where the setting is independent over time, counter to the theory.

2 - Incentivizing Suppliers Using Scorecard

Sina Shokoohyar, University of Texas at Dallas, 800 West Campbell Road, Richardson, TX, Jindal School of Management, Richardson, TX, 75080, United States, Sina.shokoohyar@utdallas.edu, Elena Katok, Anyan Qi

Suppliers' scorecard is a tool for manufacturers to track suppliers' performance. We investigate the effectiveness of two approaches for a manufacturer to incentivize suppliers to improve their performance based on the evaluation of their scorecard performance, the absolute and relative approaches. Under the absolute approach, the manufacturer provides incentive to the supplier if the supplier reaches a targeted score. Under the relative approach, the manufacturer incentivizes suppliers based on the suppliers' scorecard ranking in the supplier base. Comparing the suppliers' resultant scores under the two approaches, we characterize conditions on which approach is preferable.

Service Science

Contributed Session

Chair: Sara Saberi, Worcester Polytechnic Institute (WPI), Washburn Rm 217, Foisie School of Business, Worcester, MA, 01609, United States, ssaberi@wpi.edu

1 - Server Scheduling Policies For The Queues With Abandonment

Sina Ansari, Northwestern University, McCormick School of Engineering, 2145 Sheridan Road, Evanston, IL, 60208, United States, sinaansari2013@u.northwestern.edu, Seyed Iravani, Laurens G Debo

We study the optimal server scheduling policy in a two-class service system with abandonment. With the objective of minimizing the total average abandonment cost per unit time, we characterize the optimal control policy at the server using Markov Decision Process.

2 - A Data_driven Approach To Model Fatigue At The Workplace

Zahra Sedighi Maman, PhD Student , Research Scientist, Auburn University, Auburn, AL, 36849, United States, zzs0016@auburn.edu, Mohammad Ali Alamdar Yazdi, Fadel Megahed, Lora Cavuoto

This paper presents feature selection and predictive modeling approaches for physical workload that can improve the fatigue prediction. The goal of this feature selection is to reduce the number of the used sensors and variables obtained from multiple sensors. The results show that the proposed approaches perform well both in prediction performance and more importantly in feature reduction.

4 - A Network Economic Game Theory Model Of A Service-oriented Internet With Price And Quality Competition In Both Content And Network Provision

Sara Saberi, Assistant Professor, Worcester Polytechnic Institute, Foisie School of Business, 100 Institute Road, Worcester, MA, 01609, United States, ssaberi@wpi.edu, Anna B Nagurney, Tilman Wolf

This paper develops both a basic and a general network economic game theory model of a quality-based service-oriented Internet to study the competition among the service providers. We derive the governing equilibrium conditions and provide the equivalent variational inequality (VI) formulations. In order to illustrate the modeling framework and the algorithm, we present computed solutions to numerical examples. The results show the generality of the proposed network economic model for a future Internet.

Green Vehicle Routing

General Session

Chair: Mesut Yavuz, University of Alabama, Box 870226, Tuscaloosa, AL, 35487, United States, myavuz@cba.ua.edu

1 - Electric Vehicle Routing Problem With Time Windows And Multiple Charger Types

Bulent Catay, Prof., Sabanci University, FENS, Tuzla, Istanbul, 34956, Turkey, catay@sabanciuniv.edu, Merve Keskin

The electric vehicle charging stations may be equipped with chargers having different power supply, power voltage, and maximum current configurations. The type of the charger affects the recharge duration. In this study, we extend the Electric Vehicle Routing Problem with Time Windows by allowing partial recharges using three different charger types. The objective is to minimize total energy costs while operating minimum number of vehicles. We formulate this problem as a mixed integer linear program and propose a matheuristic approach to solve it effectively. The proposed approach uses an Adaptive Large Neighborhood Search algorithm to construct the routes and utilizes a solver to improve them.

2 - Cost Minimization And Fleet Sizing For Multifunction Electric Bus Fleets

Amanda Farthing, Clemson University, Clemson, SC, United States, adfarth@g.clemson.edu, Nora Harris, Robert Riggs, Scott J. Mason

We address the unique barriers facing university campus fleet managers considering a transition to electric bus fleets. Specifically, the logistical issues pertaining to multifunction vehicle fleets with fixed daytime routes and nighttime dial-a-ride service are addressed. A university vehicle fleet is analyzed in order to integrate real-world constraints, industry perspectives, and previous optimization research to develop a vehicle selection and fleet-sizing model that minimizes total cost. The model considers electric vehicle and infrastructure purchases, operation costs, and environmental benefits in this setting.

3 - The Maximum Profit Mixed-fleet Electric Vehicle Routing Problem

Isil Koyuncu, University of Alabama, Tuscaloosa, AL, United States, ikoyuncu@crimson.ua.edu, Mesut Yavuz

This talk presents a maximum profit mixed fleet electric vehicle routing problem. A mixed fleet consists of traditional gasoline or diesel and electric vehicles. Electric vehicles enable the fleet operator to reduce their operating costs as well as carbon emissions. In addition, a set of customers are willing to pay a premium to receive service by electric vehicles to reduce their supply chain carbon footprint. We formulate the emerging problem as a mixed integer linear program, and present a route first cluster second and a greedy algorithm as well as their computational evaluation from our preliminary experiment.

4 - Greening Patrol Routing Via Extended-range Electric Vehicles

Mesut Yavuz, University of Alabama, myavuz@cba.ua.edu, Burcu B Keskin, Cameron Harvey, Patrick Mitchell

This study investigates patrol routing on state highways with hybrid electric vehicles, which operate in electric mode until battery depletion, and then switch to the more expensive gasoline mode. We present a mixed-integer non-linear programming formulation of the problem as well as analyze some special cases in which the problem reduces to one of minimum cost network flow. The objective is a weighted combination of "hot spot" coverage maximization and cost minimization. The model is tested on real data from Alabama State Troopers.

Understanding Shared Mobility and Autonomous Vehicles: Data, Models and Optimization

Sponsored: TSL, Urban Transportation

Sponsored Session

1 - Studying Trip Planning Behavior For Taxi Drivers

Xian-Biao Hu, Metropia, Inc., Tucson, AZ, 85718, United States, xb.hu@metropia.com, Song Gao

Taxi cabs account for a significant portion of traffic in megacities. However, research on taxi driver behaviors are limited and mostly formulated to maximize the probability of picking up or minimize search time to find next passenger. Such myopic approach departs from the driver's actual objective to maximize profit over the entire operation period, and may fail to explain the search behavior around certain hotspots with high customer demand. This research aims to bridge this gap by studying the daily trip planning behavior for taxi drivers with the goal of maximizing profit over the entire operation period. Numeric analysis based on one-month taxi trajectory data will also be presented.

2 - Discovering Relationships Of Round-trip Carsharing Factors With Association Rules Technique

Dahye Lee, Texas A&M University, College Station, TX, United States, dahyelee1991@tamu.edu, Luca Quadrifoglio, Benedetta Sanjust di Teulada, Italo Meloni

The objective of this research is a comprehensive analysis for discovering relationships between factors of round-trip carsharing with the association rules approach. Results of analysis show that the strongest dependent variables do not have high correlations with the variables of distance from customers' residence locations. Although the results gave an idea of connections of round-trip operations characteristics, the degree of impact of each variable still need to be investigated. The goal for future studies is to maximize connectivity to public transportation to help in reducing congestion and pollution.

3 - Household Use Of Autonomous Vehicles: Modeling Framework And Traveler Adaptation

Yashar Khayati, University at Buffalo, Amherst, NY, United States, yasharkh@buffalo.edu, Jee Eun Kang, Mark Henry Karwan, Chase Murray

We define a framework to model and evaluate potential household-level use of Autonomous Vehicles (AVs), to understand advantages, potential issues and negative external effects. We introduce a new formulation, the Household Activity Pattern Problem for AVs, to simulate the travel patterns of people using AVs. The key modeling challenge is to include modeling capabilities of driverless parking, pickup, drop-off and waiting during travelers' engagement in activities. We develop solution approaches to this NP-hard problem and conduct a scenario analysis to evaluate changes in travel behavior.

Routing and Scheduling

Sponsored: TSL, Freight Transportation & Logistics

Sponsored Session

Chair: Ali Ekici, Ozyegin University, TBD, Istanbul, TBD, Turkey, aliekici@gmail.com

1 - Integration Of Passenger And Freight Rail Scheduling

Liang Liu, University of Southern California, Los Angeles, CA, United States, liangliu@usc.edu, Maged M Dessouky

We study the integration of passenger and freight rail scheduling to improve the efficiency of freight trains while maintaining the punctuality of passenger trains. An optimization model that jointly considers the travel times of freight trains and the tardiness of the passenger trains is formulated. We proposed a decomposition based solution procedure to solve the problem, in which optimization-based or heuristic algorithms are applied on each of the subproblems.

3 - Congestion Reduction Through Efficient Empty Container Movement

Santiago Carvajal, University of Southern California, 1150 W 29th Street, Los Angeles, CA, 90007, United States, scarvaja@usc.edu

The optimization problem for efficiently routing multi-container trucks to better reposition both loaded and empty containers is studied. Our formulation adds the multi-container truck to the empty container reuse problem. Our aim is that by more efficiently routing trucks that the number of truck trips would be reduced, thus decreasing transportation costs, and reducing the natural environmental impact of transporting goods.

4 - A Tour Generation-based Algorithm For An Inventory Routing Problem

Ali Ekici, Ozyegin University, Istanbul, Turkey, ali.ekici@ozyegin.edu.tr, Okan Orsan Ozener

We study a variant of inventory routing problem and develop an integrated two-phase solution approach. In the first phase, we cluster the customers such that each clustered is served by a single vehicle. Then, in the second phase, we determine the delivery routes and volumes for each cluster using an integer programming based heuristic approach. In this phase, we first generate several tours and solve mixed integer program to choose among these generated tours and determine the delivery volumes. We compare the performance of the proposed algorithm against the ones in the literature.

Data and Decisions for Airline and Air Traffic Management

Sponsored: Aviation Applications

Sponsored Session

Chair: Alexandre Jacquillat, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02116, United States, alexjacq@mit.edu

1 - Flight Scheduling, Flight Planning And Operations Recovery To Minimize Airline Operating Costs

Jane Lee, University of Illinois at Urbana Champaign, jjlee1@illinois.edu

The focus of this work is to evaluate impact of stochasticity of disruptions on airline's recovery decision. In particular, we aim to model the dynamic recoverability of flight schedule in response to disruptions based on Stochastic Queueing Model of airport congestion. We consider the typical mechanisms of departure time holdings, flight cancellations, and aircraft swaps used in aircraft recovery in practice today using Integer Programming. Additionally, we also consider dynamic decision making in recovery based on Dynamic Programming model. Our real-world experiments involve the original schedule of a major carrier in the US and disruptions at a secondary hub.

2 - A Combinatorial Auction For Allocation Of Departure And Arrival Slots

Alexander Estes, University of Maryland-College Park, College Park, MD, 20742, United States, aestes@math.umd.edu, Michael O Ball, Mark M Hansen, Yulin Liu

We present a combinatorial auction mechanism for the allocation of arrival and departures slots at an airport. This mechanism selects a profile of slots that will be available and provides an allocation of these slots to airlines based on their bids in the auction. Vickrey-Clarke-Grove payments are used so that it dominant strategy for airlines to bid truthfully. This provides a way in which the airlines' valuation of congestion costs can be incorporated into slot allocations.

3 - Data-driven Choice-based Airline Fleet Assignment

Chiwei Yan, Massachusetts Institute of Technology, chiwei@mit.edu, Cynthia Barnhart, Vikrant Vaze

We propose models to incorporate customer choice behaviors into the capacity allocation problem under a network revenue management setting, namely, the airline fleet assignment problem. Unlike network revenue management, the capacity allocation problem with customer choice is usually intractable for real-world instances. We thus devise efficient decomposition approaches with provable performance guarantees. Our approach is data-driven in nature, which learns a choice model from transaction data and builds effective fleeting decisions based on that.

4 - A Model For Airport Schedule Coordination Based On The IATA Guidelines

Nuno Ribeiro, University of Coimbra, Coimbra, Portugal, nuno_r_@hotmail.com

The International Air Transport Association (IATA) slot allocation process is the dominant demand management mechanism used at busy airports worldwide. In this process, each coordinated airport provides its "declared capacity", the airlines submit their scheduling requests, and a slot coordinator sets the schedule of flights at the airports. This research develops a new modeling approach to support slot coordinators to accommodate airline preferences better, while complying with the IATA guidelines and other constraints. Results are shown from a case study at Madeira airport (FNC).

1 - Optimal Placement Of M Finite-size Rectangular Facilities In An Existing Layout

Rakesh Nagi, University of Illinois, Urbana-Champaign, 117 Transportation Building, MC-238, 104 South Mathews Avenue, Urbana, IL, 61801, United States, nagi@illinois.edu, Ketan Date

We study the problem of placing M new finite size rectangular facilities (NFs) in a layout with N existing rectangular facilities (EFs). Interactions are present between different pairs of EFs and NFs, serviced through the Input/output points located on the facility boundary. The objective is to minimize the total weighted rectilinear distance between the interacting facilities by optimally placing the NFs. Main contribution of this paper is an analytical framework that unifies and generalizes the facility location/layout problems for minisum objective and rectilinear distance metric.

2 - Solving The Quadratic Assignment Problem Using Graphics Processing Unit Clusters On The Blue Waters Supercomputer

Ketan Date, University of Illinois at Urbana-Champaign, Urbana, IL, United States, date2@illinois.edu, Rakesh Nagi

In this work, we discuss a parallel branch-and-bound algorithm for solving the Quadratic Assignment Problem (QAP). Our parallel architecture is comprised of CUDA enabled NVIDIA Graphics Processing Unit (GPU) clusters on the Blue Waters supercomputer at the University of Illinois at Urbana-Champaign. For obtaining a lower bound, we adopt the RLT2 formulation of the QAP, and we propose a novel parallelization of the Dual Ascent algorithm on the GPUs, which shows excellent parallel speedup for large problems. We show that this GPU-accelerated approach is extremely effective in solving large QAPs to optimality.

3 - Discrete Budget Allocation In Competitive Facility Location.

Tammy Drezner, Cal State Fullerton, tdrezner@fullerton.edu, Zvi Drezner

We apply the gravity-based model for estimating the market shares attracted by competing facilities. We assume that a budget is available for expanding existing facilities and building new ones. We assume that the investments for improving existing facilities or constructing new ones are an integer multiple of a basic value such as 0.1% of the available budget.

4 - An Iterative Procedure For Solving Non-Convex Non-Linear Programs

Zvi Drezner, Cal State Fullerton, zdrezner@fullerton.edu, Pawel J. Kalczynski

Non-linear programming problems of minimizing a convex objective function subject to convex constraints are convex, and can be optimally solved by numerous approaches and canned programs. Non-convex programs such as a maximization of a convex objective subject to constraints which are outside of convex regions usually have many local optima and are generally difficult to solve. We found that such problems can be heuristically solved by a multi-start approach based on solving a sequence of linear programs. Our iterative approach is much faster than a direct multi-start approach (one to three orders of magnitude) and provided better results on four test problems and 116 instances.

Multiple Criteria Decision Making Applications 2

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Murat Mustafa Koksalan, Middle East Technical University, Ankara, Turkey, koksalan@metu.edu.tr

1 - Probabilistic Algorithms For Multiple Criteria Sorting

Sinem Mutlu, Roketsan, sinemmutlu01@gmail.com, Murat Mustafa Koksalan, Yasemin Serin

We develop interactive approaches to place alternatives that are defined by multiple criteria into preference-ordered classes. Our approaches place alternatives into classes either deterministically or probabilistically with a desired level of accuracy. We also control the magnitude of misclassification regarding the number of classes between the true and placed classes of a misplaced alternative. We demonstrate the approach on a variety of problems.

2 - Properties Of Optimal Stochastic Programming Solutions In Portfolio Optimization With Different Criteria And Planning Periods

Ceren Tuncer Sakar, Hacettepe University, cerents@hacettepe.edu.tr, Murat Mustafa Koksalan

Incorporating multiple criteria, considering different risk measures and using multiple-period models have been recent important developments in portfolio optimization. We make a detailed analysis of the properties of optimal stochastic programming solutions for portfolio optimization problems. We work with models that have different criteria and planning periods. We compare the solutions of single and multiple-period models using expected return and Conditional Value at Risk as criteria, and demonstrate our results with tests performed with stocks traded on Istanbul Stock Exchange (Borsa Istanbul). We also consider rolling horizon settings.

3 - An Interactive Approach For Biobjective UAV Route Planning In Continuous Space

Murat Mustafa Koksalan, Middle East Technical University, Indus Engineering Department, Ankara, 06531, Turkey, koksalan@metu.edu.tr, Diclehan Tezcaner Ozturk, Hannan Tureci

We consider the route planning problem for Unmanned Air Vehicles (UAVs) which we formulate as finding the path that the UAV follows in a continuous terrain visiting all target points. We consider two criteria: minimization of distance traveled and radar detection threat. We develop an interactive algorithm that finds the most preferred point of a route planner (RP). We assume that the RP has an underlying linear preference function whose parameters are unknown to us. We ask the RP to compare pairs of tours and his/her preferences guide us to his/her most preferred nondominated point.

4 - Interactive Algorithms For a Wide Variety Of Preference Functions

Gulsah Karakaya, Middle East Technical University, Ankara, Turkey, kgulsah@metu.edu.tr, Murat Mustafa Koksalan, Selin Damla Ahipasaoglu

In this study, we introduce a broad family of preference functions that can represent a wide variety of preference functions. We develop interactive algorithms that guarantee to find the most preferred solution of a decision maker whose preferences are consistent with such functions. Our algorithms converge to the most preferred solution of the decision maker by reducing the solution space based on the preference information obtained from the decision maker and the properties of the assumed preference functions. We demonstrate the algorithms on an example problem.

Chair: Lu Yan, Indiana University, Indiana University, Bloomington, IN, 47405, United States, yanlucy@indiana.edu

1 - How Online Comments And Government Ratings Affect Patients' Opinion Of Medical Providers

Weiguang Wang, University of Maryland, 3330 B Van Munching Hall, College Park, MD, 20742-1815, United States, weiguangwang@rhsmith.umd.edu, Niam Yaraghi, Guodong (Gordon) Gao, Ritu Agarwal

One critical decision for every patient is to choose a high quality doctor. In recent years, new online channels have profoundly changed how patients access physician quality information. Most notably are the government-led efforts such as PhysicianCompare, and the grass-root movement by voluntary patient reviews such as those on Yelp.com. However, little is known how these two channels affect patient decision making. Using experimental designs, we examine patient's choice of primary physicians with quality information from both Yelp and the government website. Our study provides the first empirical evidence of how patients weigh different information sources to inform their decision making.

2 - Modeling Dynamics Of Service Mechanism, Feedback Mechanism, And Sharing Mechanism: An Empirical Analysis Using Vector Autoregression

Liuan Wang, Harbin Institute of Technology, Harbin, China, wangliuan1973@163.com, Xitong Guo

With the utilization of social media in healthcare online healthcare communities has become an integral part of people's daily lives. In this study, we explore how the interdependencies among service mechanism, feedback mechanism, and sharing mechanism affect physicians and patients in the online healthcare communities. We use vector auto-regression to model the co-movements of service mechanism, feedback mechanism, and sharing mechanism and provide evidence of strong Granger-causal interdependencies. In addition, we also investigate the effect of values in the online healthcare communities. Our results provide both theoretical and practical implications.

3 - Facilitate Fit Revelation In a DistributionChannel

Lin Hao, University of Notre Dame, 351 Mendoza College Of Business, Notre Dame, IN, 46556, United States, lhao@nd.edu, Yong Tan

We investigate a retailer's and a supplier's incentive to facilitate fit revelation, i.e., facilitate consumer learning of their true product fit, under two popular channel pricing models, agency pricing model and wholesale pricing model.

1 - Discovering The Nature Of Variation In Nonlinear Profile Data

Daniel Apley, Northwestern University, apley@northwestern.edu

Most prior work on profile data in the quality control literature has focused on monitoring to detect sudden changes in the characteristics of the profiles, relative to an in-control sample of profiles. In contrast, we develop an approach for exploratory analysis of a sample of profiles to discover the nature of any profile-to-profile variation present over the sample via manifold learning. Instead of analyzing parameter variation in some prespecified parametric profile model, our focus is on discovering and visualizing an appropriate characterization or parameterization of the variation, as a tool to facilitate discovery (and ultimately elimination) of its root causes.

2 - A Bootstrap Metropolis-hastings Algorithm For Bayesian Analysis Of Big Data

Faming Liang, University of Florida, faliang@ufl.edu

MCMC methods have proven to be a powerful tool for analyzing data of complex structures. However, their computer-intensive nature precludes their use for big data analysis. We propose the bootstrap Metropolis-Hastings (BMH) algorithm, which provides a general framework for how to tame powerful MCMC methods to be used for big data analysis; that is to replace the full data log-likelihood by a Monte Carlo average of the log-likelihoods that are calculated in parallel from multiple bootstrap samples. The BMH algorithm possesses an embarrassingly parallel structure and avoids repeated scans of the full dataset in iterations, and is thus feasible for big data problems.

3 - Online Updating Of Statistical Inference In The Big Data Setting

Elizabeth D. Schifano, University of Connecticut, Storrs, CT, United States, elizabeth.schifano@uconn.edu, Ming-Hui Chen, Chun Wang, Jing Wu, Jun Yan, Yuping Zhang

We present statistical methods for big data arising from online analytical processing, where data arrive in streams and require fast analysis without storage/access to historical data. In particular, we develop computationally efficient, minimally storage-intensive iterative estimating algorithms and statistical inferences for linear models and estimating equations that update as new data arrive. We propose goodness of fit tests, a new estimator within the estimating equation setting, and a modification to incorporate new variables midway through the data stream. We demonstrate the effectiveness of our procedures through theoretical and empirical analysis, as well as in application.

1 - A Mixed-effect Model For Analyzing Experiments With Multistage Processes

Kaibo Wang, Tsinghua University, kbwang@tsinghua.edu.cn

In industrial practice, most products are produced by processes that involve multiple stages. In this paper, through an analysis of the error transmission mechanism, we propose a mixed-effect model for analyzing experiments with multistage processes. Based on an analysis of simulated and real experimental data, we find that different conclusions about factor significance may be drawn if the data are analyzed differently. In addition, the mixed-effect model can help separate errors at different stages and hence provide more information on process improvement.

2 - Setup Adjustment For Asymmetric Cost Functions Under Unknown Process Parameters

Arda Vanli, Florida State University, 2525 Pottsdamer St, Tallahassee, FL, FL, 32310, United States, oavanli@eng.fsu.edu, Zilong Lian, Enrique Del Castillo"

We present a bayesian approach for the optimal control of a machine that can experience setup errors assuming an asymmetric off-target cost function. It is assumed that the setup error cannot be observed directly due to presence of measurement and part-to-part errors and the variance of this error is not known a priori. The setup error can be compensated by performing sequential adjustments of the process mean based on observations of the parts produced. We show how the proposed method converges to the optimal (known variance) trajectory, recovering from a possibly biased initial variance estimate. Simulations results are presented for constant asymmetric and quadratic asymmetric cost functions.

3 - Bounded Loss Functions And The Characteristic Function Inversion Method For Computing Expected Loss

Matthias Tan, City University of Hong Kong, matthtan@cityu.edu.hk

In robust parameter design, the quadratic loss function is commonly used. However, this loss function is not always realistic. We propose a general class of bounded loss functions that are cumulative distribution functions and probability density functions. New loss functions are investigated and they are shown to behave differently from the quadratic loss. For models linear in the noise factors, we give a numerical method based on characteristic functions inversion for computing expected loss. The method is very quick and accurate. It is applicable as long as the distributions chosen to represent the loss function and variation in the noise factors have tractable characteristic functions.

4 - Quasi-feedforward And Feedback Control For Random Step Shift Disturbance Models

Lihui Shi, Senior Data Scientist, Centerfield Corporation, El Segundo, CA, 90245, United States, shilihui@uw.edu
Lihui Shi, Senior Data Scientist, University of Washington, Seattle, WA, 98195, United States, shilihui@uw.edu

Process monitoring and process adjustment strategies are two important parts of the process improvement methods, and they should be integrated together in stead of separated. Integrated moving average (IMA) model is the most common disturbance model, and step shift model is one type of more complicated one that often exists in real applications. We investigate the IMA background disturbance subject to random step shifts with a certain probability. We propose a feedback control with a quasi-feedforward control by monitoring the output errors. It is very robust against parameter misspecifications. We also investigate the type I and type II errors in process adjustment on this disturbance model.

Reliability Modeling and Optimization in Early Product Design Stages

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Zhaojun Li, Western New England University, Springfield, MA, United States, zhaojun.li@wne.edu

1 - Assessing Failure Dependency In A Complex System

Rong Pan, Arizona State University, Rong.Pan@asu.edu, Petek Yontay

In this talk we will discuss a Bayesian network model for assessing system reliability of a complex system. Coupling with Bayesian inference methods , the posterior distributions of the conditional probabilities in a BN model can be estimated by combining failure information and expert opinions at both system and component levels.

2 - A Multi-objective Approach For Multi-stage Reliability Growth Planning By Considering The Timing Of New Technologies Introduction

Steven LI, Western New England University, zhaojun.li@wne.edu, Mohammad Sadegh Mobin, Hossein Cheraghi

This paper proposes a new multi-stage reliability growth planning model which optimizes and balances the product development cost, time, and the product reliability. The number of test units, test time, and the percentage of introduced new technologies are major decision variables. Different reliability growth rates are considered for each sub-system in each stage. An integrated approach is developed to optimize the problem, which starts with a multi-objective evolutionary algorithm to find a set of Pareto optimal solutions followed by the application of clustering tools to cluster the solutions. The clustered solutions are further ranked using a multiple criteria decision making tool.

1 - The Effect Of Parking Price Adjustment On Drivers Behavior Evidence From Sf Park Program

Ahmad Mohassel, PhD Candidate, University of Arizona, 1130 E helen st, McClelland Hall, 401, Tucson, AZ, 85721, United States, mohassel@email.arizona.edu

Congestion pricing is considered the solution to the high traffic congestion cost. One way to implement congestion pricing is to use real time pricing for parking spaces in the downtown areas of the large cities. Using the data from SFpark pricing experiment that was conducted between 2011 and 2014 in San Francisco, I investigate the effect of real-time pricing on driver's behavior. The effect of the experiment is a reduction in the traffic congestion and a decrease in the search cost for available parking. The results of this paper help to design a market mechanism to relieve congestion.

2 - Service Network Design With Heterogeneous Fleet And Time Requirements

Zujian Wang, Tsinghua University, Beijing, China, buwansangyu@gmail.com

To satisfy specific real-life demand of freight transportation carriers, this paper proposes an arc-based formulation for service network design with time requirements to schedule heterogeneous fleet. The computational study indicates the validity of the formulation both academically and practically. The results shows that heterogeneous fleet is essential to tactical planning for increasing the loading rate of vehicles.

3 - Holistic Trip Planning In The Charter Bus Business

Alexander Döge, Technical University of Munich, Schaufeleinstrasse 27B, Munich, 80687, Germany, alexander.doege@tum.de

In the charter bus business, generally a single request is planned and priced at a time. This practice leads to a considerable amount of empty trips and driver idle times. Our holistic approach is to dynamically plan and price all requests within a certain time interval yielding significant economic and environmental benefits. The approach is based on dynamic programming and state of the art metaheuristics.

Applied to real-world data, our results reveal that bus operators use their buses and drivers more efficiently, customers pay less and the booking agency makes more profit. Further, since empty trips are minimized, environmental pollution is reduced.

4 - Modeling Dynamics Of Crowd-delivery And Activity Participation Behavior

Mahdieh Allahviranloo, Assistant Professor, City College New York, CUNY, Steinman Hall, Rm T-134, 160 Convent Avenue, New York, NY, 10031, United States, mallahviranloo@ccny.cuny.edu

The work presented here is devoted to designing an optimal crowd-shipping model based on activity enrollment behavior of travelers and assessing its impacts on shifting demand for travel on a synthesized population. The analysis was performed using household travel survey data for New York City.

Vehicle Routing V

Contributed Session

Chair: Debdatta Sinha Roy, PhD Student, Robert H. Smith School of Business, University of Maryland, 7699 Mowatt Lane, 3330 Van Munching Hall, College Park, MD, 20742, United States, debsroy@rhsmith.umd.edu

1 - A Multi Depot Vehicle Routing Problem With Partial Coverage

Elham Kookhahi, wichita state university, 2330 N Oliver St Apt 1018, Wichita, KS, 67220, United States, exkookhahi@wichita.edu Elham Kookhahi, wichita state university, Wichita, KS, United States, exkookhahi@wichita.edu, Mehmet Bayram Yildirim, Mehmet Bayram Yildirim

In this paper, a mathematical model is presented for a multi depot capacitated vehicle routing problem with partial coverage in which a sub tour of a set of cities can be visited to maximize the number of customers that can be served with a limited budget and time. The problem is solved using a genetic algorithm and numerical results are presented.

2 - Heuristic Approaches For Advanced Pick, Place, And Transport-vehicle Routing Optimization Problems: Applications In Warehouse Order Picking Robotics

Hung-Yu Lee, PhD Student, Auburn University, 306 E Magnolia Avenue, 3339 Shelby Center, Auburn, AL, 36849, United States, hzl0024@auburn.edu, Chase Murray

The pick, place, and transport vehicle routing problem (PPT-VRP) was presented in our previous work. The problem is a variant of vehicle routing problems with multiple synchronization constraints representing the collaborations between two types of heterogeneous vehicles at certain locations for warehousing order picking. For shortening the routes, an advanced PPT-VRP is proposed to consider the collaborations at more potential locations. Heuristic approaches are proposed to solve the problems of practical sizes. From the managerial prospective, trade-offs to improve the routing performance, such as between using vehicles with faster speeds versus with higher capacity, are investigated.

3 - Addressing Uncertainty In Meter Reading For Utility Companies Using Radio-frequency Identification Technology

Debdatta Sinha Roy, PhD Student, Robert H. Smith School of Business, University of Maryland, 7699 Mowatt Lane, 3330 Van Munching Hall, College Park, MD, 20742, United States, debsroy@rhsmith.umd.edu, Bruce L Golden

Utility companies have to collect usage data from meters on a regular basis. It is done automatically using radio-frequency identification (RFID) technology. Each meter has a signal transmitter and a receiver can read it within a certain specified distance. It is a Close Enough Vehicle Routing Problem (CEVRP) on a street network. In reality, there is lot of uncertainty while reading meters. Each meter differs with respect to the distance from which they are read and this distance varies from day-to-day. We address this uncertainty using data analytics and we seek to design improved routes.

Supply Chain Mgt XII

Contributed Session

Chair: Jooyol Maeng, Assistant Professor, Pacific Lutheran University, School of Business, 12180 Park Avenue S, Tacoma, WA, 98447-0003, United States, maengjy@plu.edu

1 - Vertical Integration And Diversification: Value Chain Analysis From The Smartphone Industry

Suri Gurumurthi, University of North Carolina, 3516 Sawtelle Boulevard, Apt 114, Los Angeles, CA, 90066, United States, Suri_Gurumurthi@kenan-flagler.unc.edu

The strategy literature studies vertical integration from the perspective of core competencies, while the operations literature uses models based on cost and risk structures. Both however, points to the diminished differentiation capacity for a vertically integrated firm that might make outsourcing more attractive at various stages in the value chain. Using economic and operational models, I outline some long term benefits of vertical integration to the diversified firm whose business segments have considerable overlap. The benefits are shown to be predicated on the increased synergies and capabilities in innovation provided to a vertically integrated firm.

3 - Supply Chain Ambidexterity

Mehmet G Yalcin, University of Rhode Island, 216 Ballentine Hall, 7 Lippitt Road, Kingston, RI, 02881, United States, mgyalcin@uri.edu, Douglas N Hales

Grounded with ambidexterity theory, this research study proposes that while supply chain ambidexterity (SCX) has a positive influence in firm performance, SCX factors consist of supply chain integration (SCI), and supply chain agility (SCA). Employing literature review, interviews, and survey methods within the research design, the applied SCX is proposed in an empirical model with supply chain management related concepts that are used in the extant literature and among practitioners. In other words, the applied model posits a relationship between SCI and SCA towards forming SCX. The interaction between SCI and SCA is further investigated.

4 - Entry Deterrence And Price Competition Under Asymmetric Information

Jooyol Maeng, Assistant Professor, Pacific Lutheran University, School of Business, 12180 Park Avenue S, Tacoma, WA, 98447-0003, United States, maengjy@plu.edu, Sungyong Choi

An incumbent has an incentive to deter entry of a potential entrant by lowering pre-entry price. We study limit pricing in a price-based duopoly market under asymmetric demand information. We present a separating perfect Bayesian equilibrium, which indicates the incumbent with private information can successfully deter entry.

Operations Management IV

Contributed Session

Chair: Jose M. Merigo, University of Chile, Av. Diagonal Paraguay 257, Santiago, 8330015, Chile, jmerigo@fen.uchile.cl

1 - Understanding And Managing Sequences Of Alignment Between Technologies And Adopters: Case Research Of Implementations Of A Health Screening Program

Jose Coelho Rodrigues, Researcher, INESC TEC and Faculty of Engineering, University of Porto, Rua Dr Roberto Frias, Porto, 4200, Portugal, jose.c.rodrigues@inesctec.pt, Ana C Barros, João Claro

Misalignments (lack of compatibility) between technologies and adopters cause productivity losses in early stages of implementation projects. Alignment management is particularly challenging when the adopter is a network of organizations. We use multiple case research of implementations of a health screening program in networks to understand how alignment efforts are sequenced, focusing on the non-linear and cascading sequences. We provide guidelines to improve implementations' performance, by addressing why non-linear and cascading sequences occur and what are their impacts on such projects.

2 - Mapping Production And Operations Management With VOS Viewer

Jose M. Merigo, University of Chile, Av. Diagonal Paraguay 257, Santiago, 8330015, Chile, jmerigo@fen.uchile.cl, Claudio Muller, Sigifredo Laengle

The VOS viewer is a computer software that visualizes the bibliographic material through different bibliometric indicators. This study develops a visualization of production and operations management research by using the VOS viewer. The analysis considers bibliographic coupling, co-citation, co-occurrence of keywords and co-authorship for journals, documents, authors, institutions and countries. The results indicate that this field is very diverse with two main cores focused on engineering and management. Researchers from all over the World are making important contributions in the field although the USA is still the leader.

Optimization Methodology IV

Contributed Session

Chair: Xiang Gao, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States, gaoxx460@umn.edu

1 - Auction Algorithms For Distributed Integer Programming Problems With A Coupling Cardinality Constraint

Ezgi Karabulut, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30308, United States, ezgi.karabulut@gatech.edu, Shabbir Ahmed, George L Nemhauser

We are interested in optimizing discrete problems that use a common resource, namely integer programming problems coupled with a cardinality constraint. Our auction algorithm finds the optimal resource allocations when individual problems are concave. When the problems are not concave, but rather have a concave approximation; and we provide respective error bounds for the auction algorithm.

2 - Fuzzification Of Search Techniques For Linear And Nonlinear Optimization

Paul Eugene Coffman, Technical Leader, Virtual Manufacturing and O.R., Ford Motor Company, 6100 Mercury Drive, Dearborn, MI, 48126, United States, gcoffman@ford.com, Stephany Coffman-Wolph

Using a three-step framework any algorithm can be converted into an equivalent abstract version known as a fuzzy algorithm. This goes beyond simply converting the raw data into fuzzy data by converting both operators and concepts into their abstract equivalents. Although precision may be reduced, it can be counteracted by gains in computational efficiency. This presentation will discuss linear and non-linear search algorithms that can benefit from fuzzification, results within the context of potential applications, and the characteristics of an algorithm where fuzzification can be utilized.

3 - Non-stationary Regret Analysis For A Non-convex Online Learning Model

Xiang Gao, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States, gaoxx460@umn.edu, Xiaobo Li, Shuzhong Zhang

In this talk we present a non-stationary regret analysis for an online learning model with smooth but non-convex cost functions. The cost functions are assumed to satisfy a condition which is more relaxed than the usual pseudo-convexity. Moreover, the cost functions are assumed to satisfy an error bound condition, which is implied by the analyticity. Under this framework, assuming only the loss function values can be evaluated we design a learning algorithm without the gradient information, and show that the regret of the algorithm is proportional to the square root of the product of learning periods and the variational budget which is the total variation of the optimal solutions measured in distance.

Behavioral Operations IV

Contributed Session

Chair: Junlin Chen, Associate Professor, Central University of Finance and Economics, 39 South College Road, Haidian District, Beijing, 100081, China, chenjunlin@cufe.edu.cn

1 - Manufacturer Salespersons Relationships In Global Markets Considering Inventory Policies And Cultural Effects

Sepideh Alavi, PhD Candidate, University of Wisconsin Milwaukee, 1559, N Prospect Ave. Apt 309, Milwaukee, WI, 53202, United States, alavi@uwm.edu

The influence of salespersons' intermediary behaviors on customer retention has encouraged the manufacturers to develop and monitor strategies to increase loyalty in salespersons (Keiko Yamakawa, 2002).Also, cultural types reflect different trust characteristics in their relationship. Little is known about the impacts of culture in manufacturer- salespersons' relationships. This paper intends to address this gap by investigating the research questions: What are the inventory- related policy factors that enhance manufacturer-salespersons' relationship? And does culture play a role in the manufacturer- salespersons' relationship?

2 - Prediction Of SNS User's Behavior Preference

Peng Zhu, Nanjing University of Science and Technology, School of Economics and Management, 200 Xiaolingwei Street, Nanjing, 210094, China, p.zhu@outlook.com

Analysis and prediction of user behavior has become significant means to enhance the user experience in Social Networks Services(SNS). However, due to features of social networks, the limitations of user's time and energy, the social relationships of most social users are incomplete and sparse, it restricts the coverage and accuracy of user behavioral prediction. In response to these problems, this paper extracts user potential social relationship, and by making use of user preference information, it designs effective user preference consistency algorithm. Meanwhile, it proposes a visualizer evaluation method, which also can evaluate the performance of prediction algorithm from micro level.

3 - Strategic Consumer Behavior In Single Rider Lanes At Adventure Parks

Arpit Goel, PhD Student, Stanford, 475 Via Ortega, Huang Engineering Center, Stanford, CA, 94305, United States, argoel@stanford.edu

Adventure park rides often have separate lanes for single riders. Single riders are added to any ride tram which is not fully occupied, which increases the efficiency of the queuing process. Thus single rider lanes are usually served much faster than regular lanes. But often these lanes are strategically used by families to expedite their waiting times, the risk being the family not being able to take the same ride tram. We model this scenario as a stochastic process, understanding the strategic tradeoffs, showing situations where this strategic behavior significantly harms the welfare, and thereby implying some managerial ideas for adventure parks to further improve their queuing process.

4 - Crowding-out And Overjustification Effects On Pro-social Behaviors: A Quasi-experimental Study

Dandan Qiao, Tsinghua University, HaiDian District, Beijing, China, qiaodd.12@sem.tsinghua.edu.cn, Shun-Yang Lee, Andrew B Whinston, Qiang Wei

We explore how external incentives would influence one's pro-social behavior both in the short term and in the long run. Using a large data set on Amazon product reviews (1997-2014), we design a quasi-experimental approach by combining a propensity score matching (PSM) and a difference-in-differences (DiD) method. Several novel measures are proposed to capture reviewers' writing style and quality by applying linguistic, language processing, and machine learning techniques. Through estimating a series of fixed-effect DiD models, we find evidence consistent with reciprocity, crowding-out, and overjustification effects.

5 - An Experimental Study Of Customer's Risky And Egalitarian Behaviors In a Clearance Sales Problem

Junlin Chen, Associate Professor, Central University of Finance and Economics, 39 South College Road, Haidian District, Beijing, 100081, China, chenjunlin@cufe.edu.cn, Yingshuai Zhao

We consider a monopolist set prices in a two-period selling season such that low-value customers postpone the purchase for a lower price but subject to rationing risk, whereas high-value customers buy regularly. Traditionally, the optimal regular price is usually set with making high-value customers indifferent between buying early and late, and then basically all high-value customers are assumed to buy regularly. By conducting laboratory experiments, we provide evidence against this basic assumption. We demonstrate that the behavior of subjects can be explained by risky and egalitarian behaviors. We also find evidence about irrational waiting and myopic buying strategic customers.

Decision Analysis II

Contributed Session

Chair: Nikita Korolko, PhD Candidate, Massachusetts Institute of Technology, 1 Amherst st, E40-106 ORC, Cambridge, MA, 2139, United States, korolko@mit.edu

1 - Impact Of Service Payment On Product And Service Supply Chain Considering Time Value

Jiayuan Liu, Tsinghua University, Tsinghua University, 14 Zijing Department, Beijing, 100084, China, liujiayuan46@163.com, Wanshan Zhu

We investigate a supply chain consisting of a service provider (e.g. AT&T) and a product maker (e.g. Apple), where the payment for service is in installments through a contract time frame. By modeling the installment payment and time value and solving the equilibrium strategies of pricing and inventory decisions, we analyze the impact of the service payment on the structure of the supply chain.

2 - Almost Stochastic Dominance When Utility Is Action-dependent

Chunling Luo, National University of Singapore, Singapore, Singapore, c_luo@u.nus.edu, Chin Hon Tan

Current stochastic dominance rules assume that utility function is identical across all actions. This assumption makes stochastic dominance rules not applicable under some practical settings. To help reveal decision makers' preferences under these settings, we generalize almost stochastic dominance by allowing utility functions to differ among actions.

3 - Decision Analysis For Locating Partial Building Renovations Regarding Adaptive Reuse

Kristopher Harbin, Doctoral Candidate, The University of Alabama, Tuscaloosa, AL, 35487-0205, United States, kbharbin@ua.edu

When considering a building renovation for an adaptive reuse there are numerous building attributes and systems that should be considered. These building attributes should be compared to the proposed reuse and any alterations needed should be noted. The impact of these alterations should be noted and assigned an appropriate weight reflecting the level of impact. This is done for multiple areas of the building which helps ensures a complete listing of the renovation options are seen.

4 - Covariate-adaptive Optimization In Online Clinical Trials

Nikita Korolko, PhD Candidate, Massachusetts Institute of Technology, 1 Amherst st, E40-106 ORC, Cambridge, MA, 02139, United States, korolko@mit.edu, Dimitris Bertsimas, Alexander M Weinstein

Pharmaceutical companies spend tens of billions of dollars each year to operate clinical trials needed for the approval of new drugs. We present an online allocation algorithm for clinical trials that leverages robust mixed-integer optimization. In simulated experiments involving both single and multiple controlled covariates, our method reduces the number of subjects needed to achieve a desired level of statistical power by at least 35% relative to state-of-the-art allocation algorithms. Correspondingly, we expect that our computationally tractable approach could significantly reduce both the duration and operating costs of a clinical trial.

2 - Using Odheuristics To Solve Hard Mixed Integer Programming Problems

Alkis Vazacopoulos, Optimization Direct, Inc., 202 Parkway, Harrington Park, NJ, 07640, United States, alkis@optimizationdirect.com, Robert Ashford

It is not practical to prove optimality for most large scale MIP models. Indeed, many are so computationally onerous that it is not possible to raise the best bound at all beyond the root solve. ODHeuristics is a general purpose program built on CPLEX for obtaining good feasible solutions to such MIPs. It is designed for scheduling problems but works for any MIP which has a reasonable number of integer feasible solutions. It has been deployed effectively on packing problems, supply chain and telecoms as well as scheduling applications. This talk looks at what ODHeuristics does and how - in general terms - it goes about it with reference to some simple examples.

3 - Objective Scaling Ensemble Approach For Integer Linear Programming

Weili Zhang, University of Oklahoma, 202 W. Boyd St., Room 116, Norman, OK, 73019, United States, weili.zhang-1@ou.edu, Charles D. Nicholson

The objective scaling ensemble approach is a novel, approximate solution procedure for integer linear programming problems\deleted[id=WZ]{in general} \added[id=WZ]{shown to be effective on a wide variety of ILP problems}. The technique identifies and aggregates multiple partial solutions to modify the problem formulation and significantly reduce the search space. An empirical analysis on widely available difficult problem instances demonstrate the efficacy of our approach by outperforming the existing advanced solution strategies implemented in modern optimization software.

4 - Preventive Maintenance And Replacement Scheduling

Farzad Pargar, University of Oulu, Oulu, Finland, farzad.pargar@oulu.fi, Jaakko Kujala

In this paper, a pure integer linear programming model is developed to determine the optimal preventive maintenance and replacement schedules for a series of multi-component systems. In this model, we have considered a finite and discretized planning horizon in which three possible actions must be planned for each component in each system, namely maintenance, replacement, or do nothing. The objective is to minimize the total cost of projects by grouping maintenance and replacement operations. Because of the complexity of the model, several heuristic methods are applied to tackle the problem.

5 - Non Monotone Submodular Knapsacks And Applications

Avinash Bhardwaj, Postdoctoral Fellow, Georgia Institute of Technology, Room 336, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States, abhardwaj@gatech.edu, Alper Atamturk

We study the facial structure of the convex hull of the level sets of a given submodular set function. In particular we derive valid inequalities and their extensions for the general lower level sets of submodular set functions, and propose the facet defining conditions for the same. We relax the monotonicity assumptions on the underlying set function and thus offering a generalization to earlier studies on this subject matter. We derive the appropriate valid inequalities and their extensions from the aggregation of the linear knapsack inequalities corresponding to the extended polymatroid of the set function in context.

1 - Generalizations And Applications Of The Multiperiod Assigment Problem

Joseph B Mazzola, Professor and Endowed Chair, Cleveland State University, 1860 East 18th Street, BU 530, Cleveland, OH, 44115, United States, j.b.mazzola@csuohio.edu

The Multiperiod Assignment Problem (MultiAP) involves the cost-minimizing assignment of a set of tasks to a set of agents within each period of a finite planning horizon when, in addition, there are transition costs associated with changing agent-task assignments from one period to the next. We review the literature on MultiAP and consider generalizations of the MultiAP including, for example, a model in which task learning occurs when an agent is able to work repeatedly on the same task. We also discuss applications of MultiAP.

1 - Cost Minimization Of Government Issued Cell Phones

Alexander Reid Barclay, Slippery Rock University, 20439 Hillview Road, Saegertown, PA, 16433, United States, axb1106@sru.edu, John Yannotty

Increasing costs associated with cell phone circuits has led the United States Pentagon to study consolidation of its wireless network in attempt to minimize annual expense while maximizing efficiency. During consolidation, Private Virtual Channels (PVCs) are transferred from either low utilized or expensive circuits to existing circuits with higher utilization and lower annual cost. The consolidation process is further constrained by region, service package (VCI code), and utilization capacity per circuit. Through the use of an optimized network annual expenses are decreased from approximately $11 million to $3.1 million.

2 - Bi-objective Maximal-covering Minimal-tour Problem With Applications In Disaster Relief

Sanaz Goldani, PhD. Student, North Carolina State University, 2127A Gorman Street, Raleigh, NC, 27606, United States, sgoldan@ncsu.edu, Yahya Fathi

The Bi-objective Maximal-covering Minimal-tour Problem (BCTP) is defined on a graph G = (V W, E), where W is a set of vertices associated with the demand. The BCTP aims at determining a Hamiltonian cycle on a subset of V so as to simultaneously minimize the cycle length and the total uncovered demand. A demand is covered if its associated vertex lies within a pre-specified distance from a vertex of the cycle. The problem is formulated as a bi-objective IP and a branch-and-cut algorithm is proposed to solve this problem in the context of the -constraint method. Computational results are presented.

3 - A Dynamic Programming Approach For Solving The Orienteering Problem With Time Windows Stochastic Profits And Risk Constraints

Hadi Feyzollahi, State University of New York at Buffalo, Buffalo, NY, 14260, United States, hadifeyz@buffalo.edu, Jose Luis Walteros

Given a graph with stochastic profits, risk levels and time windows associated with stopping at each of its nodes, we tackle the problem of finding a route that visits a subset of nodes, within a predefined time, so that the expected sum of the prizes collected is maximized, without exceeding a limit on the observed risk. We model the random nature of the profits and risk levels as mixed probability distributions and propose a dynamic programming approach to solve the resulting problem. We test our approach by solving a test bed of instances arising from the context of airborne sensor routing.

4 - Pedestrian-vehicle Mixed-flow Routing Problem In Emergency Evacuation Network For Public Places

Lei Bu, Institute for Multimodal Transportation, Jackson, MS, United States, leibu04168@gmail.com, Chuanzhong Yin, Wang Feng, Wenchao Shen, Liang Zou

Pedestrian-vehicle mixed-flow routing problem is studied at a public place to decrease the traffic delay at intersection based on a network planning strategy. An integer linear programming formulation is proposed to optimize the representation of space-time status, intersection selection, signal timing, turning strategy, walkway capacity and roadway capacity constraints with an objective function to minimize the total cost in the evacuation network. A case study using traffic microsimulation S-Paramics for pedestrian-vehicle mixed-flow evacuation around Tianhe Sports Centre Stadium in Guangzhou, China verifies the effectiveness of the formulation.

5 - Vulnerability Analysis Of Optimal Power Flow Problem Under Data Manipulation Attacks

Devendra Anil Shelar, Graduate Research Assistant, Massachusetts Institute of Technology, 550 Memorial Drive, Tang Residence Hall, 8D2, Cambridge, MA, 02139, United States, shelard@mit.edu, Saurabh Amin

A transmission network operator (TSO) solves the classical optimal power flow (OPF) problem to ensure supply-demand balance, subject to the constraints on generator outputs, line capacities, and power flows. We study the effects of malicious parameter manipulations on the OPF solutions using a sequential game formulation. The defender is the TSO who minimizes the cost of generation. The attacker is a malicious adversary who can manipulate certain parameters of the network to introduce capacity bounds violations. We show that an approximately optimal attack can be computed using a MILP.

Opt, Stochastic IV

Contributed Session

Chair: Junfeng Zhu, University of Minnesota, 1019 29th Ave SE Unit C, Apt 103, Saint Paul, MN, 55414, United States, zhuxx793@umn.edu

1 - A Chance-constrained Two-stage Stochastic Program For A Reliable Microgrid System

Md Abdul Quddus, PhD Student, Mississippi State University, Department of Industrial & Systems Engineering, PO Box 9542, Starkville, MS, 39762, United States, mq90@msstate.edu, Carlos Marino, Ridvan Gedik, Mohammad Marufuzzaman

Curtailment of renewable resources generation during the Microgrid operation affects revenues and increases greenhouses gas emissions. Researchers pay little attention in scalable stochastic models for Microgrid for multiple nodes considering the variability of renewable resources. This study bridges the research gap by developing a scalable a chance-constrained two-stage stochastic program to ensure that a significant portion of the renewable resource power output at each operating hour will be utilized.

2 - Tackling Drug Shortages By Examining Resiliency And Robustness In Pharmaceutical Supply Chains

Rana Azghandi, PhD Candidate, Northeastern University, 360 Huntington Avenue, Boston, MA, 02115, United States, azghandi.r@husky.neu.edu, Jacqueline Griffin, Ozlem Ergun

Over the past five years, there has been an epidemic of drug shortages. While the drug shortage problem is widespread, there is a poor understanding of the features of disruptions in the complex system that lead to these shortages, which are difficult to recover from. Using a stochastic optimization modeling framework, we identify system features and policies that are needed to operate a robust and resilient pharmaceutical supply chain, with minimal drug shortages and quick recovery from shortages.

3 - Robust And Optimistic Games With Bounded Polyhedral Uncertainty Sets

Giovanni Paolo Crespi, Associate Professor, Universita' Degli Studi dell'Insubria, Via Monte Generoso, 71, Varese, 21100, Italy, giovanni.crespi@uninsubria.it, Matteo Rocca, Davide Radi

We introduce a distribution-free model of incomplete information for finite games with bounded polyhedral payoff uncertainty sets. We assume players adopt either a robust or an optimistic approach to contend with payoff uncertainty. When all players adopt a robust optimization approach, we obtain a robust game as in Aghassi and Bertsimas in 2006. When all players adopt an optimistic optimization approach, we define an optimistic game. Existence of equilibrium in both approaches is proven. Further, we propose an algorithm for optimistic-optimization equilibria. Both equilibria are identifiable by a method analogous to those used for Nash equilibria of a finite game with complete information.

4 - Robust Optimization For Chronic Myeloid Leukemia Treatment Under Uncertainty

Junfeng Zhu, University of Minnesota, 1019 29th Ave SE Unit C, Apt 103, Saint Paul, MN, 55414, United States, zhuxx793@umn.edu

We propose an approach to deal with parameter uncertainty for multistage mixed integer optimal control problem(MIOCP) in CML applications. We first build a model to describe the dynamics of leukemic cells and side effects during CML treatment. The nominal optimization problem is to minimize the cumulative leukemic cell size over a planning horizon. We then consider about how the parameter uncertainty affects the optimal solution. In this project, we only consider about uncertainty for parameter with the most important factor. Finally, we propose the robust mixed integer problem and transform it into a mixed integer linear problem which is solvable.

Marketing VII

Contributed Session

Chair: Zhouyang Lu, Hohai University, Business School, Hohai Univ, 8 Fochengxilu, Jiangning, Nanjing, 211100, China, lzyseu@hhu.edu.cn

1 - Using Trade-in Programs To Mediate Secondary Market Effects In Platform Competition

Chia-Hang Li, PhD Candidate, Illinois Institute of Technology, 10 W. 35th Street, Chicago, IL, 60616, United States, cli63@hawk.iit.edu, David Richardson, Elizabeth J Durango-Cohen

We develop an analytical model of sales of successive generations of a consumer durable in which each generation brings an exogenous quality improvement to vertically differentiated consumers who can sell legacy products in a secondary market. Our model provides closed form solutions for the optimum pricing policy with and without trade-in programs. We use comparative statics on the model to characterize the circumstances in which trade-in programs prove advantageous and gain insights into how they increase profits in monopoly and duopoly settings with network effects.

2 - Evaluating Start Ups Marketing Strategies Using An Agent Based Modeling And Simulation Approach.

Ali Arian, Graduate Student, University of Arizona, 1202 e 2nd street, Tucson, AZ, 85721, United States, arian@email.arizona.edu, Yi-Chang Chiu

Marketing for a start-up company is a great challenge due to limited capital and intellectual resources and lack of brand recognition and visibility. This talk using an agent based simulation and modeling (ABMS) approach to evaluate various marketing opportunities. Existing and past data were used to calibrate the model.

3 - Brand Leadership, Competitive Pressure, And Social Marketing In The High-end Fashion Industry

Cuicui Chen, PhD Candidate, Harvard University, 79 JFK St, Cambridge, MA, 02138, United States, cuicuichen@fas.harvard.edu, Jorge Ale Chilet, Yusan Lin

While the fashion industry has been subject to mostly qualitative research, we adopt a data-driven approach to study high-end fashion brands' leadership, competitive pressure and social marketing. Applying Natural Language Processing to department store listings, expert runway reviews, and Instagram posts, we find that high-end fashion brands respond to competitive pressure more by relying on brand-building posts (such as celebrity patronage and press mentions) on social media, than by sharing product information. Furthermore, this effect is stronger for following, or adopting, brands than leading, or innovative, brands. We develop a microeconomic model to explain these findings.

4 - A Game Theoretic Approach For Achieving Higher Communities Satisfaction On Ppp Infrastructure Projects

Zhouyang Lu, Hohai University, Business School, Hohai Univ, 8 Fochengxilu, Jiangning, Nanjing, 211100, China, lzyseu@hhu.edu.cn, Jason Salim, Xuemei Su

PPP are often mistaken as merely a relationship between private and government agencies. Real "public" (the community) is often ignored, and public marginalization may cause future problem, like protests and/ or low demand. Analysis based on game theory shows that chance of community acceptance towards a project is inversely related to the chance of PPP agents behaving fairly towards the community.

Economics I

Contributed Session

Chair: Youzong Xu, Wuhan, China, xu.youzong@wustl.edu

1 - Pricing In A Robust Approach To Electricity Markets

Xiaolong Kuang, Lehigh University, 14 Duh Drive, Apt 324, Bethlehem, PA, 18015, United States, xik312@lehigh.edu, Alberto J Lamadrid, Luis F Zuluaga

The existence of market clearing prices and the economic interpretations of strong duality for integer programs in the economic analysis of markets with nonconvexities have been studied in literature. We follow this line of research and study the market clearing prices in a robust approach to electricity markets.

2 - Voting With Behavioral Heterogeneity

Youzong Xu, Xi'an Jiaotong-Liverpool University, Wuchan, Suzhou, China, xu.youzong@wustl.edu

This paper studies collective decisions made by behaviorally heterogeneous voters with asymmetric information. Here "behavioral heterogeneity" models voters' different levels of sophistication in handling information, in the sense that some voters take the information revealed by pivotality into account when making decisions (call "sophisticated voters"), while other voters vote only according to their private information (called "sincere voters"). The presence of sincere voters enriches information revelation of pivotality and such enriched information exacerbates the "pivotal voter's curse." The exacerbation of the "pivotal voter's curse" can improve collective decisions

3 - Committee Size And Resistance To Information Manipulation

Youzong Xu, Xi'an Jiaotong-Liverpool University, Suzhou, China, xu.youzong@wustl.edu, Bo Li

Consider a committee that needs to choose between two alternatives. This committee employs an agent (she) who may be biased to provide information for the committee members to make the decision. Say that the committee resists information manipulation if the biased agent's desired alternative is chosen with a lower probability when the committee knows that the agent may be biased than when the committee knows for sure that the agents is unbiased. We show that small-size committees resist information manipulation while large-size committees do not. Actually, when committee size is large enough, all committee members act as if they entirely ignore the possibility that the agent may be biased.

4 - Surviving Recessions: Relationships In Thoroughbred Horse Industry

Cristina Nistor, Chapman University, One University Drive, Orange, CA, 92866, United States, nistor@chapman.edu, Darcy Fudge Kamal

The great recession of 2008 affected the entire US and world economy. The Thoroughbred horse industry emerged from the recession with higher quality, and less overall risk in the market. We study how the Thoroughbred horse industry was affected by the recession by using a large longitudinal dataset containing details of relationships between Thoroughbred stud farms and nurseries that spans ten years of detailed transactions between 2005 and 2014. Our results indicate that the increase in quality is more pronounced in situations where firms transact with each other repeatedly in a relationship.

Sponsored Session

Chair: Mirko Kremer, Frankfurt School of Finance and Management gGmbh, Frankfurt, Germany, m.kremer@fs.de

1 - Goal Setting In Teams: A Real-effort Coordination Experiment

James Fan, Penn State University, State College, PA, 16802, United States, juf187@psu.edu, Joaquin Gomez-Minambres

We experimentally study the impact of non-binding goals for a team of workers facing high levels of strategic complementarity. These production settings include assembly lines and group projects. Participants act as workers and managers on a team completing a real-effort task that contributes towards team production. The manager can assign a goal to her team that does not impact monetary payoffs. Consistent with our theoretical predictions, we find that when managers are able to set goals for the team, team production increases. The positive effect of goal setting is especially strong when goals are challenging but attainable for the weak-link worker, whose output determines team production.

2 - Experiment Of Hospital Admission Decision Behavior Under Congestion And Patient Severity Uncertainty

Song-Hee Kim, Marshall School of Business, University of Soouthern California, Los Angeles, CA, United States, songheek@marshall.usc.edu

Hospitals have limited capacity to admit patients who arrive at different wards, such as an intensive care unit. We explore how physicians make decisions to admit patients in order to understand how to improve this important decision-making process. Specifically, in a controlled laboratory experiment setting, we observed and compared admission decision-making behaviors based on current unit occupancy and severity of arriving patient conditions.

3 - Social Norms In Customer-operated Service Systems

Chen Jin, Northwestern University, chen.jin198829@gmail.com

We study whether and how social norms evolve in, and affect the performance of, customer-operated service systems, where service times are (partially) endogenously determined by the customers. We find that service times are positively serially correlated and explore several boundary conditions of this phenomenon, as well as managerial levers to mitigate its adverse impact on system level metrics. Our results complement a growing literature that demonstrates the effect of system load on service times in server-operated systems.

Sponsored Session

Chair: Lili Du, Illinois Institute of Technology, 3201 South Dearborn Street, Chicago, IL, 60616, United States, ldu3@iit.edu

1 - Information Spreading Dynamics Over Vehicular Ad Hoc Network On Road Segments Based On Cell Transmission Model

Siyuan Song, Illinois Institute of Technology, Department of Civil, Architectural, and Environmental Engineering, Chicago, IL, 60616, United States, sgong1@hawk.iit.edu, Lili Du, Xiang-Yang Li

This research develops an information-traffic coupled cell transmission model (IT-CTM) to capture discrete information spreading dynamics along with traffic flow dynamics on a road segment. The IT-CTM is built upon CTM, and involves mathematical formulations to capture in-cell and intro-cell information spreading so that we can track the information spreading dynamics along the chain of IT-CTM cells. Numerical experiments based on simulation data were conducted to validate the accuracy of the proposed approach.

2 - How Likely Am I To Find Parking? – Modeling of Stochastic Parking Processes And Probabilistic Estimation Of Parking Availability

Jun Xiao, Arizona State University, Tempe, AZ, United States, jun.xiao.1@asu.edu, Yingyan Luo, Joshua Frisby

This research has developed two Markov models to describe the stochastic parking process with capacity constraint. Given parameters in the process, the Markov transition matrix can be calculated for each model, which in turn leads to the probability distribution of the parking facility occupancy as a function of time. Mathematical properties of these models have been derived analytically under specific conditions. Using real data from San Francisco, we have demonstrated that the proposed approach is able to predict time-dependent occupancy accurately.

3 - Identifying Social Interaction Networks For Planned Special Events

Arif Mohaimin Sadri, Purdue University, West Lafayette, IN, United States, asadri@purdue.edu, Samiul Hasan, Satish Ukkusuri, Juan Esteban Suarez

Planned Special Events (PSE) include large sporting events, conventions and other similar events. Because of specific locations and times of occurrence, PSEs are associated with operational needs that can be anticipated and managed ahead of time. Social media platforms can be used to disseminate information more efficiently. In this study, we propose a new technique to infer social interaction networks for PSEs by using data from Twitter. This network of direct social influence can serve as an important tool to disseminate information effectively and manage real-time traffic.

4 - Psychological Effects Of Real-Time TravelInformation On Route Choice Behavior Of Heterogeneous Travelers – Analysis Of Interactive Driving Simulator Experiment Data

Dong Yoon Song, Purdue University, School of Civil Engineering, West Lafayette, IN, United States, song50@purdue.edu, Srinivas Peeta

Using interactive driving simulator data, we investigate the psychological effects of real-time travel information on route choice decision-making by considering travelers' heterogeneity in information perception. An analytical framework for characterizing the traveler classes and interpreting the psychological processes under the information provision for each class is proposed.

Health Care, Modeling XI

Contributed Session

Chair: Miao Bai, Lehigh University, Bethlehem, PA, 18015, United States, mib411@lehigh.edu

1 - Evaluating Prioritization Schemes For Hepatitis C Treatment Under Budget Constraints

Lauren E Cipriano, Assistant Professor, Ivey Business School, 1255 Western Road, Room 2361, London, ON, N6G 0N1, Canada, lcipriano@ivey.uwo.ca, Shan Liu, Kaspar S. Shazada, Mark Holodniy, Jeremy D Goldhaber-Fiebert

Highly effective, but expensive, treatments could improve the health of individuals chronically infected with hepatitis C virus (HCV). We develop a multi-period HCV treatment budget allocation model to evaluate the trade-offs of prioritization schemes including first-come first-served, priority to patients with most severe disease, and priority to patients based on incremental cost effectiveness ratio. We also apply an optimization framework to determine the priority sequence that maximizes net monetary benefit in the population. Explicit prioritization guidelines targeting younger patients with more severe disease first provide the greatest population health benefits.

2 - Robust Surgery Planning And Scheduling With Downstream Bed Capacity In ICU

Chun Peng, PhD Candidate, Beijing Institute of Technology, Haidian District, 5 South Street, Beijing, 100081, China, pengchun12.18@163.com, Jinlin Li, Shanahan Wang

Due to the coupled effect of multiple sources of uncertainty, planning and scheduling surgeries is a complicated combinatorial optimization problem. In this paper, we consider the downstream bed capacity in ICU, employ uncertainty set to capture the uncertainties for surgery duration and length-of-stay in ICU. Then, we propose a two stage robust model to address these uncertainties, derive the tractable robust counterpart. Numerical results show that, compared with uncertainty of length-of-stay, surgery duration uncertainty has a significant effect on the total cost and the overtime of blocks, whereas uncertainty of length-of-stay has a dramatic impact on the amount of short beds in ICU.

4 - Using Simulation To Improve Access To Care For Underserved Populations

Rozhin Doroudi, Northeastern University, 360 Huntington Ave, Boston, MA, 02115, United States, doroudi.r@husky.neu.edu, Ayten Turkcan, Tammy Toscos, Huanmei Wu, Brad Doebbeling

Underserved patients experience multiple barriers for health care access. Community Health Centers play an important role in improving access to care for the underserved by accepting all patients regardless of their financial status. We developed simulation models tailored for three different CHCs from a range of geographic and populations with various clinical operational concerns. We tested several scenarios and found best interventions to enhance patient access to care.

5 - Reactive Surgery Rescheduling On The Day Of Surgery

Miao Bai, Lehigh University, Bethlehem, PA, 18015, United States, mib411@lehigh.edu, R.H. Storer, G.L. Tonkay, Terrill Theman

Surgery schedules are subject to disruptions on the day of surgery due to random surgical durations, insufficient resource, unpunctual patients and emergency. We incorporate a sample-based gradient descent algorithm in a rescheduling strategy to make timely adjustment to alleviate the negative consequences of schedule disruptions. Our objective is to minimize the cost of patient waiting time, surgeon idle time, operating room (OR) blocking time, OR overtime and post-anesthesia care unit (PACU) overtime in multiple OR with PACU capacity constraints. Numerical results demonstrate the effectiveness of our method in reducing the overall cost on the day of surgery.

Forecasting

Sponsored: Data Mining

Sponsored Session

Chair: Ivan G Guardiola, Missouri S&T, 600 W. 14th St, Rolla, MO, 65409, United States, guardiolai@mst.edu

1 - Ensemble Methods With Disparate Data Sources For Stock Market Prediction

Lin Lu, Auburn University, Auburn, AL, United States, lzl0032@auburn.edu, Bin Weng, Fadel Mounir Megahed

Stock market has time critical characteristics which draws attentions from both investors and researchers. The objective of this study is to develop a prediction model for stock's short-term movement forecasting. We assume more related data sources used will increase the prediction performance. In this study, we consider data from Wikipedia, Financial news, Market sentiment and Stock market history data. Different features are generated from these data sources and data mining methods are applied to select the most important ones. Next, ensemble methods are used to develop the model. As a result, our prediction model dominates related studies for the stock market forecasting.

2 - Occupancy Level Analysis At A VA Hospital That Considers Discharge Of Patient Medical Decisions

Ivan G Guardiola, Associate Professor, Missouri S&T, 600 W. 14th St, Rolla, MO, 65409, United States, guardiolai@mst.edu, Tatiana Cardona

The improvement of short-term information is vital to obtain positive gains in various hospital operational and business processes. To this end, the prediction or forecasting of hospital census gives insight into hospital resource use that results in better planning. This paper presents a combination of nonparametric and parametric models to deal with the intra-week seasonality from the daily discharge distribution.

3 - Neural Networks Based Linear Ensemble Framework for Time Series Forecasting

Lin Wang, Huazhong University of Science and Technology, Wuhan, China, Zhigang Wang

In this study, a combination forecasting model resulting from a novel ensemble framework of four neural networks is proposed for time series forecasting. The proposed framework has two primary advantages: (a) a heuristic to determine the number of input and hidden neurons for each neural network, and (b) a BPNN-BSA based mechanism for the associated combining weights. Both of the advantages will improve the accuracy of each individual model and the final linear combination modle. Experimental results performed on nine time series datasets show that the ensemble framework outperforms the component neural network models and other well recognized models.

1 - Using Data Mining To Detect Fraud And Abuse Under National Health Insurance System In China

Chong Li, Beijing Institute of Technology, Beijing, 100081, China, lichongbit@163.com, Zihao Jiao, Huijuan Cao

Health care fraud and abuse are pressing problems, causing an important fraction of total health expenditure wasted. Data mining methods can be used to automatically detect fraud in billions insurance claim data, superior to the time-consuming and practically efficient traditional auditing methods. Nevertheless, few studies have been dedicated to this field in China. This paper presents how to apply unsupervised methods to extract useful information and identify a smaller subset from the claims for further assessment under China National Health Insurance system. Our approach will help in streamlining auditing approaches towards the suspect groups rather than routine auditing of all claims.

2 - Understanding The Association Of Clinical Characteristics Of Low Grade Gliomas With Disease Outcomes

Anh Pham, Student, University of Arkansas, 1 University Avenue, Fayetteville, AR, 72701, United States, anh.pham1234@gmail.com, Shengfan Zhang

Glioma is among the most prevalent and most devastating primary brain tumor. Gliomas represent 28% of all brain tumors and 80% of malignant brain tumors. 70% of Low Grade Glioma patients eventually die from cancerous tumor transformation. This study uses The Cancer Genome Atlas (TCGA) data to understand relationships between different clinical characteristics of Low Grade Glioma, such as tumor grades, tumor status, vital status and first presented symptoms. Two data mining methods, association rules and decision trees, are used.

3 - Modeling The Accumulation Of Comorbidities In Patients With Multiple Chronic Conditions

Adel Alaeddini, University of Texas at San Antonio, Department of Mechanical Engineering, One UTSA Circle, San Antonio, TX, 78249, United States, adel.alaeddini@utsa.edu

Long-lasting diseases known as chronic conditions can be considered as a staple example of degradation processes that can progress and accumulate over time. Approximately a quarter of all Americans and 75% of citizens aged 65 years and older are burdened with two or more (multiple) chronic conditions (MCC). Here, we introduce a latent regression Markov mixture (LRMM) model to explore major patterns of disease accumulation in MCC patients and identify the risk factors affecting the accumulation process. The new methodology will be validated through a national healthcare dataset.

1 - Discriminant Analysis And The Baseball Hall Of Fame

Tom Brady, Purdue University, 1401 S US Hwy 421, Westville, IN, 46391, United States, tbradyjr@pnc.edu, Tom Brady

Baseball has long been referred to as the national past time in America. The most fundamental discussions center around the inclusion, or exclusion of individual players in the Baseball Hall of Fame. Election to this esteemed organization is done on a purely subjective basis. The movie "MoneyBall" has highlighted the recent trend towards using a more quantitative approach to managing and operating a professional baseball team. The term Sabermetrics refers to the application of quantitative techniques in all areas of baseball. In this paper, we apply Discriminant Analysis to the selection problem faced by the Baseball Hall of Fame members and analyze the performance of the process since its inception.

2 - Graphical Lasso And Thresholding: Conditions For Equivalence

Somayeh Sojoudi, University of California, Berkeley, 1543 Delaware Street, Berkeley, CA, 94703, United States, somayeh.sojoudi@gmail.com

Graphical lasso is a popular technique for finding a sparse inverse covariance matrix from a small number of samples. Graphical lasso is computationally expensive for large-scale problems due to a positive semidefinite constraint. A cheap heuristic method for finding a graphical model is to simply threshold the sample correlation matrix. By introducing the notions of sign-consistent and inverse-consistent matrices, we derive sufficient conditions under which graphical lasso and thresholding produce the same solution. These conditions are expected to be satisfied for sufficiently sparse graphical models. We test the conditions on electrical circuits and functional MRI data.

3 - Quantitative Compliance As A Driver For Automation

Leif Meier, Professor, University of Applied Sciences Bremerhaven, An der Karlstadt 8, Bremerhaven, 27568, Germany, lmeier@hs-bremerhaven.de

Compliance management covers all efforts to comply with regulations such as laws and rules, policies and standards. Automated processes are dealing with a huge number of (trans-) actions to be executed in short term, depending on big data sets. Each single transaction that is executed must comply with regulations and must be transparent to auditors. Quantitative Compliance provides methods to manage processes and risks in complex systems considering regulations to improve decisions from available information. We provide an example to identify risks from Anti-Money-Laundering (AML) in Financial Transactions and show applications of this approach to data-driven systems in new areas.

4 - Representing Uncertainty With Convex Model Databases

Anushka Chandrababu, Research Scholar, International Institute of Information Technology, Bangalore, 26/C, Electronic City, Bangalore, India, anushka.babu@iiitb.org, Srinivasa Prasanna

We present Convex Model Databases for storing and querying uncertain data sets. The database stores convex models which could be a collection of polytopes, ellipsoids etc. We will discuss methods to represent them, generate them from uncertain or big-data applications, associated relational algebra and results from new optimized queries based on I-structures, a generalization of database indices. We will also show case real world applications of this database representing uncertain or big data.

5 - A Recommender Systems Approach For Predicting Utility Of Various Mobile Services

Abhay Kumar Bhadani, Indian Institute of Technology-Delhi, Ground Floor office, New Delhi, 110016, India, abhaybhadani@gmail.com, Ravi Shankar, Vijay Rao

Modeling human behavior and predicting their preferences is of interest to many organizations. The ability of predict one's preference in mobile ser- vices arena pertains high business value for the service providers. This paper attempts to model user's preference using collaborative filtering based recommender system.

1 - Designing Microgrid Dynamics

Baosen Zhang, University of Washington, zhangbao@uw.edu

Power electronics interfaces allows us to design dynamical behaviors in microgrids. As an important example, the moment of inertia and damping coefficients can be designed to optimize system performance. In this talk, we will consider the optimal design problem of choosing these coefficients, subject to the physical constraints of the power electronics. We show how to cast this problem as an eigenvalue problem, which can then be approximated via a convex program. We also investigate the role of network topology.

2 - Frequency Control In Microgrids: Distributed Implementation And Intrusion Detection

Lin-Yu Lu, University of Illinois at Urbana Champaign, Urbana, IL, United States, lyl@illinois.edu, Hao Zhu

High penetration of distributed generation in microgrids has raised the frequency stability issue. Secondary control can resolve it by dispatching active power resources, which may be vulnerable to malicious attacks on the communication infrastructure. A distributed secondary control for distributed energy resources is developed in this paper along with the cyber-security considerations. The control scheme can achieve the goal of power sharing while restoring frequency in a distributed fashion. Attack detection and localization strategies are developed using local measurements and neighbor information.

3 - Optimizing The Interplay Between The Micro And Macro Grids: From Challenges To Perspectives

Luckny Zephyr, Postdoctoral Associate, Cornell University, Ithaca, NY, 14853, United States, lz395@cornell.edu, C. Lindsay Anderson

Efficient management of power networks is a difficult task. This is exacerbated by the integration of renewables. Finding good operating policies depends upon two complementary tasks (i) finding an acceptable representation for the underlying stochastic process, and (ii) given an approximation, finding an optimal operating policy for the power network. The interface between these two steps is a challenge. We assert that a significant proportion of the flexible loads are located in the distribution system, we then want to develop a comprehensive stochastic co-optimization scheme for the interplay between the generation and transmission system, and the distribution-system-as-micro grid.

4 - Optimizing Power Electronic Converters Using Geometric Programming

Andrija Stupar, University of Toronto, andrija@stupar.com

We formulate the design of power electronic converters as a geometric program (GP). The GP formulation allows the use of existing convex optimization solvers and techniques which greatly speeds up the optimization process. Some components are naturally modeled as posynomials, and those that are not can be accurately approximated via empirical fitting. The GP formulation allows a quick generation of Pareto curves and surfaces over a number of operating points and component combinations for a converter. This is illustrated using an example where loss-volume Pareto-optimal solutions for different multi-level converter topologies are compared.

Forest Management II

Sponsored: Energy, Natural Res & the Environment II Forestry

Sponsored Session

Chair: Peter Rauch, BOKU-Univ of Natural Resources & Life Sciences, Institute of Production and Logistics, Wien, 1180, Austria, Peter.rauch@boku.ac.at

1 - Quantifying The Conflict between Competing Forest Ecosystem Services under Alternative Climate Scenarios

Nicholas Kullman, University of Washington, Nick.Kullman@gmail.com, Sandor Toth

The potential impact of climate change on the production of forest ecosystem services is well-documented. Much less understood is how the tradeoffs among these services would change. Would more conflicts arise? How would one measure such a conflict at the first place? We introduce a new method to quantify conflict as the ratio between the volume of n-dimensional objective space under the production possibilities frontier of a set of competing ecosystem services vs. the space defined by the ideal solution. We illustrate the method via use of real examples from management.

2 - A Replanning Model For Maximizing Woodland Caribou Habitat Alongside Timber Production

David L Martell, University of Toronto, david.martell@utoronto.ca, Andrew B. Martin, Jonathan Leo William Ruppert, Eldon Gunn

Woodland caribou in the boreal forest region of Canada tend to prefer older jack pine forest stands but such habitat needs can conflict with industrial fibre needs. We present a forest harvest scheduling model that meets timber harvest targets while maximizing a proxy for woodland caribou habitat, the configuration of preferred habitat on the landscape. We used our model to carry out a case study of the Trout Lake forest in northern Ontario, Canada, and found that our model creates about 10% more caribou habitat than an earlier heuristic procedure and 30% more than the current plan for the forest.

3 - Modeling The Spatial Interactions Of Timber Harvesting And Sitka Deer Habitat On The Tongass National Forest

Yu Wei, Colorado State University, yu.wei@colostate.edu, Michael Bevers, Curt Flather, Greg Hayward, Ben Case, Mary Friberg, Thomas Hanley

We developed and implemented a spatially explicit timber harvest scheduling model to optimize the joint production of timber and deer habitat capability on management units of the Tongass NF. We found model solutions to be sensitive to variation in sea level snow depths, with notable effects on timber harvest schedules, deer habitat capacity, and the amount and location of old-growth remaining at the end of a forest planning horizon. We also discovered that a spatially scattered harvesting pattern helped create diversified forest compositions; which consequently could improve the overall deer forage production.

4 - How Does Climate Change Impact On Wood Supply Security?

Peter Rauch, BOKU-Univ of Natural Resources & Life Sciences, Peter.rauch@boku.ac.at

In order to assess climate change risks and their mid and long-term impacts on the bio-based industry a System Dynamics model of the Austrian wood supply was developed that includes a stochastic simulation of the main risk agents. The model examines future annual cut and evaluates wood supply security considering climate change impacts. Simulation results provide insights on probabilistic future wood supply security and reveal a contra-intuitive system effect for the climate change scenario.

Text Mining I

Sponsored: Data Mining

Sponsored Session

Chair: Majeed Simaan, RPI, 231 Congress Street, Troy, NY, 12180, United States, simaam@rpi.edu

1 - Text Mining Based Prediction Model For Incident Occurrences In Steel Plant

Sobhan Sarkar, Research Scholar, IIT, IIT kharagpur, kharagpur, 721302, India, sobhan.sarkar@gmail.com, Vishal Lakha, Irshad Ansari, Jhareswar Maiti

The aim of this study is to provide the predictive solution using text mining and classification algorithms. Data on accident occurrences for a period of four years from a steel industry was collected. The outputs of text mining have been fed into four binary classification algorithms (SVM, k-NN, Random Forest, Maximum Entropy) which were tested further for evaluation of the best fit model to predict

the accident classes (injury or property damage). The year-wise results showed that RF outperforms other classifiers with higher accuracy, i.e., 92.7%, 91.4%, and 91.8%, and area under curve values as 0.926, 0.910, and 0.912, respectively as tested with 10-fold cross validation for years 1, 3, and 4.

2 - Analyzing Analytics Curricula

Thomas Tiahrt, Assistant Professor of Decision Sciences, University of South Dakota, 414 E. Clark St., Beacom School of Business, Vermillion, SD, 57069, United States, thomas.tiahrt@usd.edu

The data deluge has produced a need for analytics professionals across the organizational spectrum. The academic response has been the establishment of a host of new analytics programs, combining courses already taught with innovative offerings, often leveraging existing institutional strengths. We examine the curricula of one hundred twenty-three analytics programs using text mining to discover commonality, differences and subdivisions. Our objective is to provide information for academics either developing or modifying an analytics curriculum, employers evaluating graduate skills and their needs, as well as students considering the alignment of coursework with their interests.

3 - When Positive Sentiment Is Not So Positive Textual Analytics And Bank Failures

Majeed Simaan, RPI, 231 Congress St., TroyY, NY, 12180, United States, simaam@rpi.edu, Aparna Gupta, Mohammed Zaki

Looking at 10-K annual reports for a large sample of banks in the 2000-2014 period, 52 public bank holding companies that were associated with bank failures during the global financial crisis serve as a natural experiment. Utilizing negative and positive dictionaries proposed by Loughran and McDonald (2011), we find that both sentiments on average discriminate between failed and non-failed banks 80% of the time. However, we find that positive sentiment contains stronger predictive power than negative sentiment; out of ten failed banks, on average positive sentiment can identify seven true events, whereas negative sentiment identifies five failed banks at most.

1 - Value In The Eye Of The Beholder: Insights From Data Mining Diamond Prices.

Stanislav Mamonov, Montclair State University, 1 Normal Ave, School of Business, Montclair, NJ, 07043, United States, stanislav.mamonov@montclair.edu, Tamilla Mavlanova, Nibedita Mohanty, Jacqueline Galal

We use a large dataset of diamonds, currently available for sale, to analyze the effects of physical properties of diamonds on diamond prices. The results suggest a high degree of subjectivity in diamond pricing that challenges the accuracy of predictive models. To illustrate the apparent subjectivity, we discuss several price anomalies that are present in the dataset.

2 - Paid Search Advertising: Ideas And Pitfalls

Lihui Shi, Centerfield Corporation, 1637 E Maple Avenue, Apt 6, El Segundo, CA, 90245, United States, shilihui@uw.edu

In internet marketing, search advertising is a method of placing online advertisements on web pages that show results from search engine queries. I will cover search engine marketing (SEM), search engine optimisation (SEO), pay-per-click (PPC), cost-per-click (CPC), cost-per-impression (CPM), search engine advertising, sponsored listings, paid for placement, etc. Keyword bidding, search ads, display ads, product listing ads (PLA), native ads will be discussed in details, with their definitions, methodologies and challenges. It will provide an overview of paid search advertising, and how this industry utilizes the statistical methods, data mining and machine learning techniques.

3 - Research On The Influence Of Microblog Advertising Of Theatre Chain On Its First Week Box Office Revenue

Jiayin Qi, Shanghai University of International Business and Economics, Shanghai, 100876, China, qijiayin@139.com, Jiaqi Liu

With the participation of enterprise in social network, a question arises of how enterprise can gain more real profit from social network advertising. This article analyzes the relationships among contents of enterprise's online post, consumer's participation on microblog, and short-term product sales. Taking movie market as research set, this research finds that short-term product sales is positively influenced by the information quantity of enterprise's post, and the influence is mediated by the "repost" of other users of Sina microblog. The mechanism examined in this research on the influence of microblog advertising on short-term sales can be guidelines of social network advertising.

Contributed Session

Chair: Cao Binbin, PhD Candidate, School of Management, Xi'an Jiaotong University, No.28, Xianning Road, Xi'an, Shaanxi, Xi'an, Shaanxi, 710049, China, caobinbin89@stu.xjtu.edu.cn

1 - On The Optimal Control Of Remanufacturing Activities With Quality Variation Of Returns

Sajjad Farahani, PhD Student, University of Wisconsin - Milwaukee, Milwaukee, WI, 53211, United States, farahani@uwm.edu, Wilkistar A Otieno, Xiaohang Yue

This paper develops a model for the optimal disposition decision for product returns in a remanufacturing system with limited recoverable inventory capacity. The quality grade of returned products is uncertain and remanufacturing cost increases as the quality level decreases, and remanufacturer wishes to determine which returned product to accept to be remanufactured for reselling, and any unaccepted returns may be salvaged at a value that increases with their quality level. A continuous time Markov chain defined and Matrix-Geometric method is applied to evaluate various performance measures for this system and obtain the optimal remanufacturing policy.

2 - Forwarders' Cooperative Game In Excessive Capacity Exchange

Xuefei Shi, Southeast University, Sipailou II, nanjing, 211189, China, 230159160@seu.edu.cn, Haiyan Wang, Minghui Lai

We study logistics forwarders' cooperative game in capacity exchange. The forwarders book their capacity in advance, and may have capacity deficit or excessiveness after their random demand are realized. Thus they can cooperatively exchange their excessive capacities to improve their profits. We develop several profit sharing rules.

3 - The Implications Of Environmental Regulations On Market Area Size And Green Investment Decisions

Nazli Turken, Assistant Professor, Cleveland State University, 11900 Edgewater Dr. Apt 1308, Apt 1308, Lakewood, OH, 44107, United States, n.turken@csuohio.edu

In this paper we analyze the effect of different environmental regulations on the market area size and green technology investment of a company. We try to identify the environmental regulations that minimize local or global emissions. We identify scenarios when the green technology and end-of-pipe abatement decisions are completely separated from each other.

4 - Supplier's Environmental Innovation Under Government's Emission Tax On A Manufacturer

Bosung Kim, PhD Candidate, KAIST College of Business, 85 Hoegi-ro, Dongdaemun-Gu, Seoul, 130-722, Korea, Republic of, kim-bs@business.kaist.ac.kr, Se Youn Jung, Kun Soo Park

We study supplier's environmental innovation in a supply chain under government's emission tax. We analyze and compare the equilibrium outcomes under three types of supply chain contracts: wholesale-price, quality-dependent, and revenue-sharing contracts. In addition, we discuss the impact of factors that can discourage the supplier's innovation.

5 - Joint Decision on Emission And Pricing In Waste-based Supply Chain: Insights from Hybrid Environmental Policies

Cao Binbin, PhD Candidate, School of Management, Xi'an Jiaotong University, No.28, Xianning Road, Xi'an, Shaanxi, 710049, China, caobinbin89@stu.xjtu.edu.cn, Xiao Zhongdong

Carbon Disclosure Project reported around 50% of a product's emission is generated from manufacturing process. A more general waste-based supply chain model including one retailer, one manufacturer and one supplier was built. We analytically showed joint decision processes on emission level of the manufacturer and pricing in supply chain under three hybrid policies including tax and offset, cap and trade, tax and trade. An analytical comparison between different hybrid policies was provided in terms of profits and emission reduction. Numerical study was presented to further illustrate the effects of emission reduction investment factors and parameters of each hybrid environmental policy.

Sustainable and Responsible Supply Chain Management II

Sponsored: Energy, Natural Res & the Environment I Environment & Sustainability

Sponsored Session

Chair: Jose Cruz, Associate Professor, University of Connecticut, 100 Constitution Plaza, West Hartford, CT, 06103, United States, jcruz@business.uconn.edu

1 - Social Responsibility Investments: Financial Networks Analysis

Jose Cruz, University of Connecticut, jcruz@business.uconn.edu

This paper develops a network equilibrium model in conjunction with capital asset pricing model (CAPM) and the net present value (NPV) to determine the optimal portfolio, prices, profits, and equity values of financial network firms under financial risks and economic uncertainty. We investigate how social responsible financial investment decisions affect the values of interconnected financial firms from a network perspective. We model the behavior of the decision-makers, derive the equilibrium conditions, and establish the variational inequality formulation.

2 - Corporate Environmental And Social Responsibility In Supply Chains: Exploring Actions And Performance

Trisha Anderson, Texas Wesleyan University, trdanderson@txwes.edu

A company's financial strength (doing good in the market place) is based on the social reputation of the company. We study the level of corporate social responsibility and performance in Environmental and Social Corporate Social Responsible activities from the period 2009-2013. We investigate the level of involvement in each factor over time and determine the relationships between the CSR factors for the major supply chain players.

3 - Economic Generation Dispatch: A Viral Approach

Carlos Marco Ituarte-Villarreal, SWCA Environmental Consultants, El Paso, TX, 79912, United States, cmituartevillarreal@miners.utep.edu, Francisco O Aguirre

The authors present a hybrid Viral Systems Algorithm-Universal Generating Function approach to solve the multiple-objective network-constrained economic reallocation of generation resources problem. The here proposed algorithm considers not only the economic resource dispatch and reliability system restrictions, but also takes into account environmental constraints, particularly mass and rate carbon dioxide and nitrogen oxides emissions.

Open Pit and Supply Chain Mine Planning

Sponsored: Energy, Natural Res & the Environment, Natural Resources I Mining

Sponsored Session

Chair: Alexandra M Newman, Colorado School of Mines, 1104 Maple Street, Golden, CO, 80401, United States, anewman@mines.edu

1 - Optimal Stockpiling Strategies In Open Pit Mining

Mojtaba Rezakhah, Colorado School of Mines, mrezakha@mines.edu

Mines use stockpiles for blending different grades of material, storing excess mined material until processing capacity is available, or keeping low-grade ore for possible future processing. We consider stockpiles as part of our open pit mine scheduling strategy, and propose multipleinteger-linear models to solve the open pit mine production scheduling problem. Numerical experiments show that ourproposed models are tractable, and correspond to instances which can be solved in afew minutes, at most, in contrast to nonlinear models whose instances fail to solve.

2 - An Aggregation Branching Scheme For The Resource-constrained Open Pit Mine Scheduling Problem

Renaud Pierre Chicoisne, University of Colorado denver, renaud.chicoisne@gmail.com

For the purpose of production scheduling, open-pit mines are discretized into 3D arrays known as block models. Production scheduling consists of deciding which blocks should be extracted and when they should be extracted during the time horizon. Blocks that are close to the surface should be extracted first, defining a set of precedence constraints, and capacity constraints limit the production in each time period. This Resource Constrained Open Pit Mining scheduling problem (RC-OPM) can be cast as a linear Integer Programming problem. In this work, we describe a constraint branching that uses special features of RC-OPM to reach an integer solution when solving the formulation by Branch and Bound.

3 - Heuristic Method For The Stochastic Open-pit Mine Production Scheduling Problem

Adrien Rimélé, Master's Student,École Polytechnique de Montréal, 7593 Rue Berri, Montréal, QC, H2R2G8, Canada, adrien.rimele@polymtl.ca, Michel Gamache, Roussos Dimitrakopoulos

Long term open-pit mine planning under geological uncertainty can be assessed with a Stochastic Integer Program. The complexity of such program is so high that it is usually hopeless to obtain an optimal or at least good feasible solution within a reasonable time. This work first presents the application of new partial relaxation strategies to facilitate the resolution by solver using the strong interconnections of the variables. Then, a topological sorting algorithm is applied on the fractional obtained schedule to make it fully binary. Tested on a real deposit, the methods have given solutions proven to be very close to the optimality after a short computational time.

4 - A Benders-decomposition-based Method For The Simultaneous Optimization Of A Mineral Value Chain

Jian Zhang, McGill University, Montreal, QC, Canada, jian.zhang9@mail.mcgill.ca, Roussos G. Dimitrakopoulos

The classical Benders decomposition is used to solve the simultaneous optimization of a mineral value chain. A dynamic bench-pushback generation method is developed based on the dual price in each benders iteration to optimize the upstream mine production schedule and a moving window amelioration method is developed to improved the obtained schedule. The proposed method is tested in a hypothetical case where the market uncertainty is integrated. The test results show the importance of integrating market uncertainty in mineral value chain optimization.

Risk Averse Optimization in Networks

Sponsored: Optimization, Network Optimization

Sponsored Session

Chair: Pavlo Krokhmal, Professor, University of Arizona, 1127 E James E. Rogers Way, Tucson, AZ, 85721, United States, krokhmal@email.arizona.edu

1 - Analysis Of Budget For Interdiction On Multicommodity Network Flows

Neng Fan, University of Arizona, nfan@email.arizona.edu, Pengfei Zhang

In this talk, we first discuss several versions of network interdiction models for multicommodity flows, including the model with risk-averse leader. For this kind of Stackelberg game, where a leader try to destroy the network with limited budget and the follower seeks the minimum cost of flows to meet the demands in the resulted network. We will mathematically analyze the interdiction results under different models and budget limits. Some theories and properties will be shown. Additionally, some solutions approaches will be proposed.

2 - Detecting Large Risk-averse 2-clubs In Graphs With Random Edge Failures

Foad Mahdavi Pajouh, University of Massachusetts Boston, Boston, MA, United States, foad.mahdavi@umb.edu, Esmaeel Moradi, Balabhaskar Balasundaram

We address the problem of detecting large risk-averse 2-clubs in graphs subject to probabilistic edge failures, which is modeled as a CVaR-constrained single-stage stochastic program. We present a new decomposition algorithm based on a Benders decomposition scheme, which outperforms an algorithm based on an existing decomposition idea on random, and real-life biological and social networks.

3 - Clusters Represent Cliques

Maciej Rysz, Air Force Research Lab, mwrysz@yahoo.com

We propose a solution algorithm for identifying the most central clusters in graphs and examine its effectiveness when the centrality measure is defined by betweenness and the clusters represent cliques. Numerical experiments demonstrating the computational performance of the proposed method are conducted and compared with results obtained from solving an equivalent mixed integer programming representation.

4 - Optimization Of Cascading Processes In Multiscale Networks With Stochastic Interactions

Oleg A Prokopyev, University of Pittsburgh, 1037 Benedum Hall, Pittsburgh, PA, 15261, United States, droleg@pitt.edu, Juan Borrero, Pavlo Krokhmal

We study the problem of optimal cascade propagation in a network, where the cascade's spread depends on a vector of given attributes. Given there are costs associated with changing the attributes' values, a decision-maker desires to minimize the time until all network nodes receive influence, subject to a budget constraint. To this end, we propose a stochastic optimization model based on Markov chains. Under simple assumptions, we derive analytical solutions for the optimal budget allocation in terms of a minimum spanning arborescence on an auxiliary graph. These results establish that optimal solutions have a hierarchical structure, and show that they can be found in polynomial time.

1 - A Supply Chain Network Game Theory Model Of Cybersecurity Investments With Nonlinear Budget Constraints

Shukla Shivani, University of Massachusetts, Amherst, MA, United States, sshukla@som.umass.edu, Anna B Nagurney, Patrizia Daniele

In our paper, we develop a supply chain network game theory model consisting of retailers that compete noncooperatively to maximize their expected profits and reduce network vulnerability by determining their optimal product transactions as well as cybersecurity investments subject to nonlinear budget constraints that include the cybersecurity investment cost functions.

2 - Optimal Scheduling Of Cybersecurity Analysts For Minimizing Risk

Rajesh Ganesan, George Mason University, Fairfax, VA, 22030-4422, United States, ashah20@masonlive.gmu.edu, Ankit Shah, Sushil Jajodia, Hasan Cam

The talk presents a generalized optimization model for scheduling cybersecurity analysts to minimize risk (a.k.a maximize significant alert coverage by analysts) and maintain risk under a pre-determined upper bound. The paper tests the optimization model and its scalability on a set of given sensors with varying analyst experiences, alert generation rates, system constraints, and system requirements.

3 - Dynamic Scheduling Of Cybersecurity Analysts For Minimizing Risk Using Reinforcement Learning

Rajesh Ganesan, George Mason University, Fairfax, VA, 22030-4422, United States, ashah20@masonlive.gmu.edu, Ankit Shah, Sushil Jajodia, Hasan Cam

The talk presents a reinforcement learning-based stochastic dynamic programming optimization model that incorporates the estimates of future alert rates and responds by dynamically scheduling on-call cybersecurity analysts to minimize risk (a.k.a maximize significant alert coverage by analysts) and maintain the risk under a pre-determined upper bound.

4 - A Two-stage Stochastic Shift Scheduling Model For Cybersecurity Workforce Optimization With On Call Options

Doug Altner, MITRE Corporation, McLean, VA, United States, daltner@mitre.org, Les Servi

This talk proposes a two-stage stochastic program for optimizing staffing and shift scheduling decisions at a 24/7 cybersecurity operations center with three shifts per day, several staffing and scheduling constraints, uncertain workloads and on call staffing options. We then show how near optimal solutions can be obtained in a few minutes without a full branch-and-price implementation.

1 - Selected Benchmark Results

Hans Mittelmann, Arizona State University, mittelmann@asu.edu

We will present results from selected benchmarks we are maintaining in both continuous and discrete optimization by both commercial and open source software.

2 - Recent Advances In The New Mosek 8

Andrea Cassioli, MOSEK, andrea.cassioli@mosek.com Erving Anderson

In this talk we present the new features and improvements in the new MOSEK 8 solver. Improved presolving, automatic dualization for conic quadratic problems and other new developments in the core routines has lead to a significant improvements of the solver performance both in terms of speed and accuracy. Computational results will be presented and discussed.

3 - Recent Advances In The SCIP Optimization Suite

Gregor Hendel, Zuse Institute Berlin, Takustrasse 7, Berlin, 14195, Germany, hendel@zib.de

The general-purpose branch-and-cut solver SCIP is one of the fastest noncommercial software tools for solving mixed integer linear optimization problems. In this talk, we will give an overview of algorithmic advances in the upcoming release with a special focus on new and extended primal heuristics of SCIP.

4 - UG[PIPS-SBB, MPI]: A Massively Parallel Branch-and-bound Solver For Stochastic Mixed-integer Programs

Yuji Shinano, Zuse Institute Berlin, shinano@zib.de, Lluis-Miquel Munguia, Geoffrey Malcolm Oxberry, Deepak Rajan

PIPS-SBB is a LP-based branch-and-bound solver using a distributed-memory simplex algorithm that leverages the structure of stochastic mixed-integer programs (MIPs). However, it does not parallelize its branch-and-bound tree search. The Ubiquity Generator (UG) is a general framework for the external parallelization of mixed-integer programming solvers. It has been used to develop ParaSCIP, a massively parallel version of the academic constraint integer programming solver SCIP. In this talk, we will introduce a parallel solver ug[PIPS-SBB, MPI] in which PIPS-SBB's branch-and-bound tree search is parallelized on top of the parallel solution of the LP relaxations.

1 - Inventory Control Policy For A Periodic Review System With Expediting

Yi Tao, Assistant Professor, Guangdong University of Technology, 161 Yinglong Road, Tianhe District, Guang Zhou, 510520, China, kenjimore@gmail.com, Loo Hay Lee, Ek Peng Chew, Gang Sun, Charles Vincent

We study a periodic review inventory system where two modes, regular and fast mode, are available to obtain replenishment. A firm can choose fast mode with shorter lead time at a higher cost when necessary. A two-replenishment-mode model, with random expediting points is established and an ordering policy (S,e) which replenishes the inventory to S in every cycle and expedites part of the order using fast mode when the inventory drops below e, is proposed. A simulation optimization based heuristic which uses infinitesimal perturbation analysis (IPA) method and gradient search algorithm is employed to find the best (S,e). Numerical experiments have shown our new policy outperforms existing policies.

2 - A Hybrid Approach To Centralized Drug Inventory Management In A Chain Of Pharmacy Stores

Tom Brady, Purdue University, 1401 S US Hwy 421, Westville, IN, 46391, United States, tbradyjr@pnw.edu

Inventory analysis has long been a fundamental component of operations research, decision analysis, and operations management. In this paper, we discuss a hybrid approach of inventory policy to pharmaceuticals applied to small pharmacy chain. Decentralized inventory management policy had been in place as the chain grew where the individual store managers were responsible for inventory decisions. After an analysis of the inventory from the chain perspective, it was theorized that by moving certain inventory policy decisions to the chain level rather than the store level could result in potential inventory savings while maintain customer service targets.

3 - Managing Inventory Of Perishable Products at Multiple Locations

Fang Liu, Assistant Professor, Nanyang Technological University, S3-B2a-13, 50 Nanyang Avenue, Singapore, 639798, Singapore, liu_fang@ntu.edu.sg, Yun Fong Lim

A retailer selling multiple perishable products with random demands over a single season. The warehouses, each with a limited storage capacity, have different store and retrieve costs. Before demand realizes, the products are stored to each warehouse and after demand realizes products are retrieved from the warehouses. We develop a two-dimension table to determine under optimality which warehouses are non-empty, and among the non-empty warehouses, the products are stored following a nested assortment structure. In the retrieval stage, it is optimal to retrieve a product from a warehouse with the lowest retrieve cost that contains the product.

4 - Solving Stochastic Inventory Problems By Integer Programming

Reha Uzsoy, North Carolina State University, Dept. of Industrial & Systems Engg, 300 Daniels Hall Camps Box 7906, Raleigh, NC, 27695-7906, United States, ruzsoy@ncsu.edu, Jaap Arts, Ton de Kok, Seza Orcun

We propose binary integer programming models to approximately solve finite-horizon stochastic inventory problems with stochastic demand. The models proceed by discretizing the PDF of the demand in each period in a manner emulating numerical integration. The resulting integer programs have a consecutive ones property which provides additional computational efficiency. Cost minimizing service levels are endogenously determined. Computational results are reported for a variety of single-stage stochastic inventory models.

1 - PH-BAB: A Progressive Hedging Based Branch And Bound Algorithm

Semih Atakan, PhD Student, University of Southern California, Los Angeles, CA, United States, atakan@usc.edu, Suvrajeet Sen

Progressive Hedging (PH) is a well known algorithm for solving multi-stage stochastic convex optimization problems. Most previous extensions of PH for stochastic mixed-integer programs (SMIPs) have been implemented without convergence guarantees. In this talk, we present a new framework that shows how PH can be utilized while guaranteeing convergence to globally optimal solutions of SMIPs. We demonstrate the efficacy of the proposed framework through computational experiments.

2 - New Approaches For The Stochastic Network Interdiction Problem

Eli Towle, University of Wisconsin-Madison, etowle@wisc.edu, Jim Luestke

We investigate methods to solve the maximum-reliability stochastic network interdiction problem (SNIP). To begin, we introduce a novel reformulation of the SNIP extensive formulation. We then propose a path-based formulation of the SNIP. We present cuts for this new formulation which are dependent on the structure of the given interdicted arc probabilities. To solve this path-based SNIP formulation, we implement a branch-and-cut (BC) algorithm. Computational results demonstrate an improvement of this BC algorithm over a traditional Benders decomposition.

3 - Two-stage Stochastic Programming For Influence Maximization

Hao-Hsiang Wu, Ohio State University, Columbus, OH, 43202, United States, wu.2294@osu.edu, Simge Kucukyavuz

Influence maximization problem is to find top-k influential nodes in a social network. Kempe. et al propose the greedy algorithm as a heuristic to solve the linear threshold and independent cascade models for influence maximization. By using the greedy algorithm, only 63% optimal value can be guaranteed. In this project, we formulate influence maximization problem as a two-stage stochastic program, and use a delayed constraint generation algorithm for its exact solution. Our algorithm exploits the submodularity of the influence spread function. We demonstrate the performance of our algorithm on large-scale real-world datasets.

4 - Solving Large-scale Stochastic Programs Using Generalized Value Function

Onur Tavaslioglu, PhD Student, University of Pittsburgh, Pittsburgh, PA, United States, ont1@pitt.edu, Andrew J Schaefer, Oleg A Prokopyev

This work considers two-stage mixed integer programs with discretely distributed stochastic right-hand sides and objective functions. We present an equivalent superadditive dual formulation that uses the value functions of both stages. We introduce the generalized value function of a mixed-integer program simultaneously parametrized by its objective function and right-hand side. We describe fundamental properties of the generalized value function and three algorithms to calculate it. Then, we present a global branch-and-bound algorithm for solving one stage pure integer and one stage mixed integer program. We conclude with computational results.

1 - A New Perspective On Boosting In Linear Regression Via Subgradient Optimization And Relatives

Rahul Mazumder, MIT Sloan School of Management, rahulmaz@mit.edu

Boosting is one of the most powerful and popular tools in machine learning/statistics that is widely used in practice. They work extremely well in a variety of applications. However little is known about many of the statistical and computational properties of the algorithm, and in particular their interplay. We analyze boosting algorithms in linear regression from the perspective modern first-order methods in convex optimization. We derive novel comprehensive computational guarantees for several boosting algorithms, which provide a precise theoretical description of the amount of data-fidelity and regularization imparted by running a boosting algorithm.

2 - Making Sketchy Decisions: Semidefinite Programming With Optimal Storage

Madeleine Udell, Cornell University, Ithaca, NY, United States, udell@cornell.edu, Joel Tropp, Alp Yurtsever, Volkan Cevher

Is it possible to solve an optimization problem using far less memory than the natural size of the decision variable? In this talk, we propose an affirmative answer to this question when both the problem data and solution have a concise representation. We present an algorithm for provably solving many semidefinite programming problems whose natural size is O(n^2) using no more than O(n) memory.

1 - Remaining Useful Life Prediction Of Lithium Ion Batteries Using A Novel Degradation Model

Fangfang Yang, City University of Hong Kong, Hong Kong, China, fangfyang2-c@my.cityu.edu.hk, Kwok-Leung Tsui

Some lithium-ion battery materials show two-phase degradation behavior, such as lithium nick manganese cobalt oxide (NMC) cells. To predict remaining useful life (RUL) for these types of batteries, a model-based Bayesian approach is propose. First, a novel degradation model is developed to capture the degradation trend of NMC batteries. Next, a particle filtering-based prognostic method is incorporated into the model to estimate possible degradation trajectories of the batteries. The effectiveness of the developed method is verified using our experimental data. The results indicate that the proposed prognostic method can achieve high prediction accuracies at an early stage of life.

2 - Process Monitoring And Diagnosis Of Hot Rolled Trip Based On Regression Coefficients Of Batches

Fei He, University of Science and Technology Beijing, China, Beijing, China, hefei@ustb.edu.cn

First of all, regression model between process parameters and product quality data is established. And then regression coefficients are used for process monitoring and diagnostics. In this paper the model based on partial least squares is bulit between process variables and width of finishing hot rolling, and regression coefficients of all batches are obtained that is used for process monitoring and diagnostics. Experiments on simulated data sets and real data sets show that can effectively locate the important abnormal process parameters.

3 - Data Science And The Liberal Arts Curriculum

Anna Engelsone, Maryville College, Maryville, TN, United States, anna.engelsone@yahoo.com

This paper draws on over ten years of experience practicing DMA in an industry setting and teaching data science concepts to students ranging from 8th graders to MBAs. Our main interest is in incorporating DMA into the liberal arts curriculum. Liberal arts colleges are uniquely positioned to produce versatile data professionals with the ability to ask the right questions, consider the social implications of their work, and communicate their findings effectively to different audiences. We discuss the challenges of introducing DMA to undergraduates and present examples of in-class exercises, homework problems and research projects suitable for students of different levels and backgrounds.

4 - A Measure Of General Functional Dependence Among Multiple Continuous Variables

Nuo Xu, University of Alabama at Birmingham, 5720 11th Avenue South, Birmingham, AL, 35222, United States, nuoxu@uab.edu, Xuan Huang

Existing measures in the literature that are specifically concerned with testing and measuring independence between two continuous variables are all based on examining the definition of independence. In a previous paper of ours, we construct a new measure that uses the absolute value of first difference on adjacent ranks of one variable with respect to the other. This measure captures the general functional dependence between two variables. Here, we are presenting the method of generalizing this measure to capture functional dependence among N variables and some preliminary results of its application in variable interaction detection and variable selection.

Uncertainty in Engineered Networks

Sponsored: Computing

Sponsored Session

Chair: Russell Bent, Los Alamos National Laboratory, Los Alamos National Laboratory, Los Alamos, NM, 00000, United States, rbent@lanl.gov

1 - Optimal Robust Battery Operation

Shuoguang Yang, Columbia University, sy2614@columbia.edu

We present formulations, algorithms and computational results on mult-time period problems involving battery operation. In this context, batteries are used to compensate for errors in forecasts for renewable power generation. We model uncertainty sets using the uncertainty budgets model, and we describe efficient implementations. Joint work with D. Bienstock, G. Munoz and C. Matke.

2 - Unit Commitment With N-1 Security And Wind Uncertainty

Kaarthik Sundar, Texas A&M, kaarthik01sundar@gmail.com, Harsha Nagarajan, Miles Lubin, Sidhant Misra, Russell Bent, Line Roald, Daniel Bienstock

As wind energy penetration rates continue to increase, a major challenge facing grid operators is the question of how to control transmission grids in a reliable and a cost-efficient manner. The stochasticity of wind forces an alteration of traditional methods for solving the day-ahead unit commitment problem. To address these questions, we present an N-1 Security and Chance-Constrained Unit Commitment that includes the modeling of generation reserves to respond to wind fluctuations and tertiary reserves to account for single component outages. We develop a benders decomposition algorithm to solve the problem to optimality and present a detailed case study on the IEEE RTS-96 three-area system.

3 - Efficient Dynamic Compressor Optimization In Natural Gas Transmission Systems

Pascal Van Hentenryck, University of Michigan, pvanhent@umich.edu

The growing reliance of electric power systems on gas-fired generation to balance intermittent sources of renewable energy has increased the variation and volume of flows through natural gas transmission pipelines. Adapting pipeline operations to maintain efficiency and security under these new conditions requires optimization methods that account for transients and that can quickly compute solutions in reaction to generator re-dispatch. This talk presents an efficient scheme to minimize compression costs under dynamic conditions where deliveries to customers are described by time-dependent mass flow.

Mining Qualitative Attributes to Assess Corporate Performance

Invited: Tutorial

Invited Session

Chair: Ananda Swarup Das, IBM India Research Labs, India, New Delhi, 1, India, anandas6@in.ibm.com

1 - Mining Qualitative Attributes To Assess Corporate Performance

Aparna Gupta, Rensselaer Polytechnic Institute, 110 Eighth Street, Troy, NY, 12180, United States, guptaa@rpi.edu, Ananda Swarup Das, L Venkata Subramaniam, Gagandeep Singh

We present an overview of systems and methods to track ongoing events from sources such as corporate filings, financial articles, expert or analyst reports, press releases, customers' feedback and news articles that have an effect on corporate performance. In this paper we discuss text analytics and sentiment mining approaches to determine quantitative attributes that can be an indicator of corporate performance. For example, strengths, weaknesses, opportunities and threats (SWOT) analysis is a well-known structured planning method widely applied to identify the factors determining success or failure of an enterprise. This analysis can be strongly indicative of the business or financial health of the enterprise. It can provide broader indicators for the firm's business environment, in terms of ease of doing business in the country, government policies helping (or hurting) business environment.

Chronic Disease Management

Sponsored: Health Applications

Sponsored Session

Chair: Vedat Verter, McGill University, 1001 rue Sherbrooke Ouest, Bronfman Building, Montreal, QC, H3A 1G5, Canada, vedat.verter@mcgill.ca

Co-Chair: Michael Klein, McGill University, McGill, Montreal, QC, Canada, michael.klein2@mail.mcgill.ca

1 - Chronic Disease Management And The Role Of Incentives

Christian Wernz, Virginia Tech, cwernz@vt.edu, Hui Zhang

Chronic diseases can be prevented by changing the behavior of patients and physicians. Incentives are one of the mechanisms to motivate such change. We present a two-player, multi-period model in which patients and physicians jointly decide on prevention activities. The physician-patient interaction is modeled as a general-sum stochastic game with switching control structure. The Health Belief Model (HBM) is incorporated to capture behavioral aspects. We illustrate our modeling approach by applying it to a coronary heart disease cases study. Result show how and to what extent a re-alignment of incentives can improve chronic disease management initiatives.

2 - Dialysis Facility Network Design

Michael Klein, McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A 1G5, Canada, michael.klein2@mail.mcgill.ca, Vedat Verter, Brian Moses

We study the problem of improving access for patients in a rural area by designing a network of dialysis facilities. We incorporate the possibility of home dialysis for which the patients need to travel to a city centre for training.

Healthcare Analytics

Sponsored: Health Applications

Sponsored Session

Chair: Zahra Gharibi, Southern Methodist University, 3145 Dyer Street, Suite 372, Dallas, TX, 75205, zgharibi@mail.smu.edu

1 - Optimal Care Pathways For Lower Back Pain Patients

Danny R Hughes, Harvey L. Neiman Health Policy Institute, Reston, VA, United States, dhughes@neimanhpi.org
Danny R Hughes, George Mason University, Fairfax, VA, United States, dhughes@neimanhpi.org, Jeremy Eckhause, Katharina Ley Best

Aggressive treatment of lower back pain is frequently cited as low value care that contributes to rising health care costs with limited effects on patient outcomes. In order to identify cost-effective early treatment policies for these patients, we model the physician's sequential decision problem as a finite-horizon Markov decision process where the boundary condition is defined as the patient completing the episode of care. We compare the results from historical claims data with optimal decisions solved via stochastic dynamic programming to determine desirable initial treatment strategies.

2 - Effect Of Report Cards On Kidney Transplantation Related Decision Making

zahra Gharibi, Dept. of Engineering Management, Information, and Systems Bobby B. Lyle School of Engineering, SMU, zgharibi@smu.edu, Mehmet U.S. Ayvaci, Michael Hahsler

Report card programs collect and publicize information on patient outcomes as a means of improving quality. However, it is unclear whether behavioral responses to such programs improve patient outcomes. We study the report cards as an incentive mechanism to induce socially-optimal medical decisions in the context of kidney transplantation. Using a game theoretic framework, we investigate how performance reporting and flagging for low performance influence acceptance/rejection decisions for offered kidneys and patient selection by transplant centers. We also study the implications of new allocation system for such decisions.

Operations Research for Public Health: Data-Driven and Dynamic Decion Making Approaches

Sponsored: Health Applications

Sponsored Session

Chair: Soroush Saghafian, Harvard Univeristy, 79 John F. Kennedy Street, Mailbox 37, Cambridge, MA, 02138, United States, soroush_saghafian@hks.harvard.edu

1 - Impact Of Breast Density And Supplemental Screening Methods On Breast Cancer Screening Policies

Mucahit Cevik, University of Wisconsin - Madison, Madison, WI, United States, cevik2@wisc.edu, Burhaneddin Sandikci

Mammography screening is the golden standard for breast cancer screening, but it is less accurate for women with dense breasts. Supplemental screening methods are recently introduced to improve detection accuracy. We study the impact of supplemental tests through incorporating breast density information in a partially observable Markov decision process model.

2 - Impact Of Ambiguity on Medications Management Strategies: An Application To NODAT

Alireza Boloori, Arizona State University, Tempe, AZ, United States, alireza.boloori@asu.edu, Soroush Saghafian, Harini A. Chakkera, Curtiss B. Cook

Patients after organ transplantations receive high amounts of immunosuppressive drugs (e.g., tacrolimus) to reduce the risk of organ rejection. However, this practice has been shown to increase the risk of New-Onset Diabetes After Transplantation (NODAT). We propose an ambiguous POMDP framework to generate effective medication management strategies for tacrolimus and insulin. Our approach increases the patient's quality of life while reducing the effect of transition probability estimation errors. We also provide several managerial and medical implications for policy makers and physicians.

3 - Robust Dynamic Programming For Medical Decision Making

Lauren N. Steimle, University of Michigan, Ann Arbor, MI, United States, steimle@umich.edu, Brian T Denton

Markov Decision Processes (MDPs) are useful for studying the management of chronic diseases, which is characterized by a series of treatment decisions under uncertainty about the future progression of the disease. Dynamic programming algorithms can be used to determine the optimal treatment policies for these diseases, but these policies may not be robust to perturbations of the model parameters. We discuss robust dynamic programming algorithms that provide protection against variation in the estimates of MDP model parameters. We present our results in the context of treatment of cardiovascular disease.

4 - Optimal Intervention Strategies For Hypertensive Disorders Of Pregnancy

Aysegul Demirtas, Arizona State University, Tempe, AZ, United States, Aysegul.Demirtas@asu.edu, Esma S Gel, Soroush Saghafian, Dean Coonrod

Hypertensive disorders of pregnancy (HDP) constitute one of the leading causes of maternal and neonatal mortality and morbidity. We consider the decision problem of timing and mode of child delivery for women with HDP. We formulate a discrete-time Markov decision process (MDP) model that minimizes the risks of maternal and neonatal adverse outcomes, and assess its outcomes with clinical data by performing probabilistic sensitivity analysis. We also build a robust MDP model in which the transition probabilities are contained in a controllable uncertainty set. Our robust MDP approach considers the sensitivity of estimated transition probabilities while avoiding over-conservative policies.

Scheduling and Capacity Management in Healthcare

Sponsored: Health Applications

Sponsored Session

Chair: Maya Bam, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States, mbam@umich.edu

1 - Scheduling Operating Rooms With Elective And Emergency Surgeries

Kyung Sung Jung, University of Florida, 364 Stuzin Hall, PO Box 117169, Gainesville, FL, 32611, United States, ksjung@ufl.edu, Michael L Pinedo, Chelliah Sriskandarajah, Vikram Tiwari

Hospital accounted for 30% of total health expenditures. Operating rooms (ORs) are typically a bottleneck during the entire processes. We solve multiple-OR scheduling problems with elective and emergency patients. First, we provide general guidelines for these scheduling problems, and then develop several scheduling and rescheduling methods for these patients.

2 - Two-stage Robust Optimization Of Multi-stage Care Planning: Formulation And Computational Challenges

Saba Neyshabouri, George Mason University, Fairfax, VA, 22030, United States, sneyshab@gmu.edu, Bjorn Berg

We study the problem of scheduling surgeries in a block-booking setting in which both the surgery duration and length-of-stay (LOS) in the surgical intensive care unit are subject to uncertainty. We utilize the theory of robust optimization and propose a novel formulation that captures the complexities in modeling uncertainty in LOS, which is modeled as a discrete random variable. We propose an exact solution approach and perform computational experiments to analyze the quality of the solutions obtained. Computational challenges and future directions are discussed.

3 - Capacity And Flow Management In Emergency Departments With A Fast Track

Elham Torabi, University of Cincinnati, 2925 Campus Green Dr., Cincinnati, OH, 45221, United States, torabiem@mail.uc.edu
Elham Torabi, University of Cincinnati Medical Center, Cincinnati, OH, United States, torabiem@mail.uc.edu, Craig Froehle, Craig Froehle, Craig Froehle, Christopher Miller

In EDs with a fast track, sub-optimal allocation of patients to capacity results in under-utilization of the fast track while main ED area is congested. Using data-mining we identify sub-groups of moderate-acuity patients who can be treated in the fast track instead of the main ED. We use simulation analysis to find routing policies that better allocate the identified patients to the two capacity segments. The proposed routing policy results in less patient waiting and more parity in utilization of the capacity segments.

4 - Planning Models For Skills-sensitive Surgical Nurse Staffing
Maya Bam, University of Michigan, Ann Arbor, MI, United States, mbam@umich.edu, Maya Bam, University of Michigan Health System, Ann Arbor, MI, United States, mbam@umich.edu, Zheng Zhang, Brian T Denton, Mark P Van Oyen, Mary Duck, Joshua Pigula

Surgical nurses are essential resources in the surgery delivery system. However, surgical nurse staffing decisions present a challenge due to the stochastic nature of surgical demand, nurse availability, skill requirements, and hospital regulations. Based on collaboration with a large academic hospital, we present planning level optimization models to group services into teams based on difficulty and overnight call volume, and then assign shifts to services and teams subject to skill requirements. We present results that provide insight into optimal nurse staffing decisions based on a large hospital data set.

Logistics I

Contributed Session

Chair: Jiahong Zhao, Guangdong University of Technology, No.100 Waihuanxilu Daxuecheg, Guangzhou, 510006, China, zhaojiahong1@126.com

1 - The Regional Logistics Hubs Location Problem Based On The Topsis And Genetic Algorithm The Case Of Sichuan In China
Si Chen, Dr., Southwest Jiaotong University, #111 The First Block of North Erhuan Road, Chengdu, 610031, China, chensi@swjtu.edu.cn, Dong Chen, Mi Gan

The regional logistics demands, which are the key factor for logistics hubs location problem, are changing with the developing regional economic and the structure of industry. Noted that different industries will result in different kind of logistics demand, we aims to modeling the regional logistics hubs location problem with consider of industries affected logistics demand. Then the real data case of Sichuan province is employed to verify the feasibility of proposed models and approach, the results indicate that Chengdu, Leshan and Deyang is selected from 18 candidate cities as the comprehensive logistics hub, cross-regional logistics hub and internal-oriented logistics hub, respectively.

2 - Data Driven Approach To Crowd Delivery In Last Mile
Loo Hay Lee, National University of Singapore, 10 Kent Ridge Cresent, Industrial and Systems Engineering, Singapore, 119260, Singapore, iseleelh@nus.edu.sg, Yuan Wang, Dong Xiang Zhang, Ek Peng Chew

In urban logistics, the last-mile delivery has become more challenging with the continuous growth of E-commerce. In this paper, we propose an effective large-scale mobile crowd-tasking model in which a large pool of citizen workers are used to perform the last-mile delivery. To efficiently solve the model, we present network min-cost flow based method with pruning techniques and constrained clustering approach to partition large data points. Comprehensive experiments were conducted with Singapore and Beijing datasets. The results show that our solution can support real-time delivery optimization in the large-scale mobile crowd-sourcing problem.

3 - Adaptive Warehouses: Look At The Past, Not The Future
Nima Zaerpour, Assistant Professor of Operations Management, California State University San Marcos, 333 S Twin Oaks Valley Rd., Markstein 446, San Marcos, CA, 92096, United States, nzaerpour@csusm.edu, Sholeh Norouzzadeh

The growth of online shopping is bringing new challenges to warehouses. For instance, Amazon receive 35 orders/second, each including few items. The timing for delivery varies between the same day deliveries to a couple of days. The product popularity and assortment varies frequently influenced by various factors. Thus, warehouses need to become more responsive to customers and more adaptive to changes while the customer information does not become available sufficiently in advance. We ask the following: can self-learning techniques improve efficiency of warehouses and reduce the time/effort required to retrieve a product for a customer order? This paper tries to answer this question.

4 - A Location Inventory Routing Optimization Model For Explosive Waste Management
Jiahong Zhao, Guangdong University of Technology, No.100 Waihuanxilu Daxuecheg, Guangzhou, 510006, China, zhaojiahong1@126.com, Ginger Yi Ke

Recently, attentions have been drawn to reducing the risks derived from facility location, inventory management, and multi-depot vehicle-routing of the explosive waste management. In this research, risks are assessed as impact solids with certain hazardous radii posed by explosions happening en route and at site. An optimization model minimizing the total cost and risk is developed to determine the corresponding location-inventory-routing plan. In addition to a well-defined solution procedure, a real-world problem of Southwest China is examined to provide further managerial insights.

Display Advertising Markets

Invited: Auctions

Invited Session

Chair: De Liu, Carlson School of Management, 3-163 CSOM, University of Minnesota, Minneapolis, MN, 55455, United States, deliu@umn.edu

Co-Chair: Dengpan Liu, Iowa State University, 3321 Gerdin Building, Ames, IA, 50011, United States, dliu@iastate.edu

1 - Closed-loop Versus Open-loop Advertising Competition In Electronic Retailing: Operational And Organizational Considerations
Dengpan Liu, Iowa State University, dliu@iastate.edu

This study examines two different types of dynamic advertising competition, namely, closed-loop and open-loop, among e-retailing firms. In particular, we focus on how the considerations of IT operations and organizational structure would affect firms' performance in dynamic advertising competitions. Using a differential game framework, we find that firms can be better off engaging in the closed-loop competition. Another interesting finding is that the advantage of flexibility in closed-loop game may reduce as IT becomes more costly.

2 - Architecture Of In App Ad Recommender System
Anik Mukherjee, Indian Institute of Technology - Madras, India, anikit.jgec@gmail.com

Increased adoption of smartphones has caused mobile advertising to be the second-most revenue-generating medium among all forms of existing online advertising. Appl developers try to monetize their apps by selling in-app ad-spaces to the advertisers through various intermediaries such as ad-networks. Surveys indicate that mobile ad campaigns are not as successful as they can be due to inappropriate audience targeting and user-apathy toward such ads. This motivates the need for a system, where both the parties gain from the in-app advertising eco-system. So, we propose an architecture of design-science artifacts for an ad-network, to meet the objectives of both these stakeholders.

3 - Procurement Policies For Mobile-promotion Platforms
Manmohan Aseri, University of Texas - Dallas, Richardson, TX, 75080, United States, mxa113030@utdallas.edu

Mobile-Promotion platforms such as Cidewalk enable advertisers to directly launch their personalized mobile advertising campaigns. These platforms contract with advertisers to provide a certain number of impressions on mobile apps in their desired sets of geographic locations within their desired time durations; the execution of each such contract is referred to as a campaign. In practice, campaigns arrive dynamically over time and the platform bids in real-time at an ad exchange to fulfill their demands. Our analysis offers a rolling-horizon procedure in which the platform periodically recomputes its procurement/bidding policy and its policy for allocating the impressions to the campaigns.

Sponsored Session

Chair: Alfonso J Pedraza-Martinez, Indiana University, 1309 E 10th Street, Bloomington, IN, 47405, United States, alpedraz@indiana.edu

1 - Volunteer Management In Charity Storehouses
Alfonso J Pedraza-Martinez, Indiana University, Kelley School of Business, 1309 East 10th Street, Bloomington, IN, 47405, United States, alpedraz@indiana.edu, Maria Besiou

We study volunteer management at a large faith-based organization. The whole supply chain operates exclusively with volunteers (from supply to delivery). We focus our study on the preparation of beneficiaries' orders by volunteers in a storehouse. There are different categories of volunteers; some are more experienced while others may work in the system for the first time. The volunteers' arrival in the system and their skills are uncertain. Using empirical data we explore the drivers of on-time order fulfillment at the storehouse level.

2 - Deployment Guidelines For Community Health Workers In Sub-saharan Africa

Jonas Jonasson, London Business School, London, United Kingdom, jjonasson@london.edu, Carri Chan, Sarang Deo, Jeremie Gallien

Community health workers (CHWs) are increasingly important to the delivery of health care in many African countries. Leveraging an extensive dataset featuring time, clinical findings and GPS information for CHW visits in Ghana, we develop a stochastic model describing the health dynamics of a population served by a time-constrained CHW. This model supports the design of managerial guidelines for patient prioritization and catchment area assignment in a CHW operation.

3 - Global Vehicle Supply Chains In Humanitarian Operations: A Network Analysis Approach

Jon M. Stauffer, Texas A&M University, College Station, TX, United States, jstauffer@mays.tamu.edu, Alfonso J Pedraza-Martinez, Lu Yan

We examine the vehicle supply chain network structure of the International Federation of the Red Cross (IFRC) as they respond to a mega disaster while continuing to support development programs and minor disasters. Using Exponential Random Graph Models, we examine the significance of the vehicle supply chain network changes year-to-year. Results show that temporary hubs are utilized in mega disaster locations and that supply chain support for areas outside the mega disaster region, while present, is reduced. This allows us to better understand how all supply chain networks could improve their response to large disruptions.

4 - Assessing The Impact Of Network Vulnerability On Relief Distribution Operations Considering Social Costs

Miguel Jaller, University of California Davis, mjaller@ucdavis.edu, Luis Fernando Macea, Victor Cantillo

This paper develops a model to asses the impacts that network vulnerability can have on the distribution of critical supplies after a disaster. The model estimates the changes in total social costs due to stochastic network disruptions. The analyses are based on the difference between the logsum, which measures the changes in consumer surplus or benefits, before and after the failure. In addition, the model allows identifying the critical links in a network from the critical response perspective.

Operations with Social Impact

Sponsored: Manufacturing & Service Oper Mgmt, Sustainable Operations

Sponsored Session

Chair: Deishin Lee, Boston College, Chestnut Hill, MA, United States, deishin.lee@bc.edu

1 - Dynamic Staffing Of Volunteer Gleaning Operations

Erkut Sonmez, Assistant Professor, Boston College, Carroll School of Management, Boston College, Fulton Hall, Office 350D, Chestnut Hill, MA, 02467, United States, sonmeze@bc.edu, Baris Ata, Deishin Lee

Gleaning refers to collecting food from what is left in the fields after harvest, and donating the goods to food bank or pantries that serve food insecure individuals. In this paper we study a dynamic control problem for volunteer capacity management of gleaning operations.

2 - Strategic Commitment To A Production Schedule With Supply And Demand Uncertainty: Renewable Energy In Day-ahead Electricity Markets

Nur Sunar, UNC at Chapel Hill, nur_sunar@kenan-flagler.unc.edu, John R Birge

Motivated by fast penetration of variable renewable energy (such as wind and solar energy) into the electricity generation mix, we study a day-ahead electricity market that consists of finitely many competing firms, each facing supply uncertainty. In electricity markets, the purpose of an undersupply penalty is to improve reliability by motivating each firm to commit to a production schedule it can deliver in the production stage. Using differential equations theory, we prove that imposing or increasing a market-based undersupply penalty rate can result in a strictly lower equilibrium reliability with probability 1. (Joint work with John Birge)

3 - Distributed Renewable-energy Generation And Implications For Strategic Consumer Behavior, Electricity Pricing And Installed Capacity

Alex Angelus, UT Dallas, Alexandar.Angelus@utdallas.edu

We propose a continuous-time model of electricity markets, in which heterogeneous consumers can purchase and install their own renewable-energy generators, such as solar panels, and thus reduce electricity consumption from the local utility. We analyze both in-the-grid and off-the grid scenarios. The optimal time to install distributed generation follows a threshold policy on customer demand. We derive explicit expressions for the threshold level and optimal distributed generation to install, and determine the optimal price the utility should charge to maximize its revenue. Contrary to the prevailing industry practice, higher electricity prices can lead to lower revenues for the utility.

4 - Converting Retail Food Waste Into By-product

Mustafa H Tongarlak, Bogazici University, istanbul, Turkey, tongarlak@boun.edu.tr, Deishin Lee

By-product synergy (BPS) is a form of joint production that uses the waste stream from one (primary) process as useful input into another (secondary) process. The synergy is derived from avoiding waste disposal cost in the primary process and virgin raw material cost in the secondary process. We investigate how BPS can mitigate food waste in a retail grocer setting, and how it interacts with other mechanisms for reducing waste (i.e., waste disposal fee and tax credit for food donation). We also present a hybrid approach to implementing BPS that preserves managerial autonomy.

1 - Models For Hospital Inpatient Operations: A Data Driven Optimization Approach For Reducing ED Boarding Times

Shasha Han, National University of Singapore, shashahan@u.nus.edu, Shuangchi He, Hong Choon Oh

The long ED boarding times are a threat to most public hospitals. To tackle this problem, we examine datasets from a public hospital in Singapore and propose a data-driven approach to optimizing bed assignments. Our formulation incorporates practical features conventionally absent from the queueing control framework. With a slightly increased overflow proportion, it can greatly reduce the mean boarding times as well as the percentage of them exceeding given targets. It also helps to resolve the time-of-day effect of boarding times, which results from routine discharge procedures in hospitals. Interestingly, we show there exists an optimal solution that is fair to patients within each category.

2 - An Empirical Study Of Adding Physician Assistants To Critical Care Consultation Teams

Yunchao Xu, New York University, yxu4@stern.nyu.edu, Mor Armony, Carri Chan, Michelle Gong

Physician assistants (PAs) can sometimes be cost-effective alternatives to physicians in healthcare systems, but their impact on critical care delivery remains unclear. Over the course of 18 months, PAs were added to the Critical Care Consultation team at a major urban hospital system. In new multi-period analysis, we empirically measure the impact of part-time versus full-time PA coverage. We find that adding PAs can reduce the average time-to-transfer for all ICU patients and reduce mortality risk for low-severity patients. Interestingly, we do not find evidence that the benefits of having PAs further improves patient outcomes when adding PAs on non-weekdays.

3 - Predicting Triage Standing Orders

Han Ye, U of Illinois at Urbana-Champaign, hanye@illinois.edu, Zhankun Sun, Haipeng Shen

Overcrowding in emergency department (ED) has become a major problem worldwide. In order to mitigate ED overcrowding, we explore the potential of triage nurse ordering by developing models for predicting test orders using detailed information available at the triage stage. We then study the impact and trade-off of such predictive models in ED patient flows and patient outcomes.

4 - Optimal Workload Management During A Physician's Shift In Emergency Departments

Zhankun Sun, University of Calgary,
zhankun.sun@haskayne.ucalgary.ca

ED physicians can adjust their workload, which is measured by the number of patients signed up, to reduce patient handovers at the end of their shift. Patient handovers raise safety concerns due to the discontinuation of care. We present a dynamic programming model to inform patient flow management during a single ED physician's work shift. Case studies based on real data will also be discussed.

1 - Scheduling Networks With Synchronization Constraints And Heterogeneous Customers

Amy R Ward, Professor, University of Southern California, Marshall School of Business, Bridge Hall BRI 401H, Los Angeles, CA, 90089-0809, United States, amyward@marshall.usc.edu, Erhun Ozkan

Networks in which the processing of jobs occurs both sequentially and in parallel are prevalent in many applications domains, such as computer systems, healthcare, and manufacturing. The relevant control decision is how to dynamically determine job priority at the servers that process multiple job types. A key difficulty in finding a delay-minimizing control is that the parallel processing of jobs gives rise to synchronization constraints. We propose a state-dependent departure pacing control under which job priorities are determined so as to balance the jobs waiting to be joined at the synchronization servers. We prove our control is asymptotically optimal for certain network topologies.

2 - Collaboration And Multitasking In Networks: Aligning Task Priorities And Collaboration Levels

Itai Gurvich, Kellogg School of Management,
i-gurvich@kellogg.northwestern.edu, Jan A Van Mieghem

We study networks where some tasks require the simultaneous processing by multiple types of multitasking indivisible resources. As one maximizes capacity, we prove, the achievable performance space collapses into a single policy.: the highest priority must be given to the tasks that require the most collaboration: a mismatch between priority levels and collaboration levels inevitably inflicts a capacity loss. We further establish a fundamental difference between the achievable performance spaces of preemptive and non-preemptive collaborative networks.

3 - The Costs And Benefits Of Ridesharing: Sequential Individual Rationality And Sequential Fairness

Ragavendran Gopalakrishnan, Research Scientist, Xerox Research Centre India, Bangalore, India, Ragavendran.Gopalakrishnan@xerox.com, Koyel Mukherjee, Theja Tulabandhula

We formulate a cost sharing framework for ridesharing that explicitly takes into account the inconvenience costs of passengers due to detours. We then introduce a notion of sequential individual rationality (SIR) that requires that the disutilities of existing passengers decrease as additional passengers are picked up, and show that these constraints induce a natural limit on the permissible incremental detours as the ride progresses. We characterize routes for which there exists some cost sharing scheme that is SIR on that route, and explore the consequences of SIR on the design of sequentially fair cost sharing schemes. We conclude by addressing the algorithmic challenges associated with SIR.

4 - Scheduling Impatient Customers Based on Time In Queue

Achal Bassamboo, Northwestern University,
a-bassamboo@northwestern.edu, Ramandeep Randhawa

We study scheduling impatient customers in multi-class parallel server queueing systems. From the system's perspective, customers that are of the same class at time of arrival get further differentiated on their residual patience time as they wait in the system. Using a fluid approach, we propose a novel cost-minimizing policy that schedules customers on two dimensions of heterogeneity: class and time-in-queue information.

1 - Optimal Capital Requirements In Financial Networks With Fire Sales

Jongsoo Hong, Duke University, 100 Fuqua Drive, Durham, NC, 27707, United States, jh176@duke.edu

We consider an interbank network with fire sales externalities of multiple illiquid assets and study the problem of optimally trading off between capital reserves and systemic risk. We find that the optimal capital requirements under maximum payments and prioritized liquidation rule can be formulated as a convex and convex mixed integer programming, respectively. To solve the convex MIP, we offer an iterative algorithm that converges to the optimal. We show the results of the methodology on numerical examples and provide implications for capital regulation policy and stress test.

2 - A New Approach To Fuzzy Risk Assessing Large Renewable Energy Construction Projects

Jose-Ignacio Munoz-Hernandez, University of Castilla - La Mancha, Edifico Politecnico - UCLM, Avda Camilo Jose Cela, S/N, Ciudad Real, 13071, Spain, joseignacio.munoz@uclm.es, Luis Serrano-Gomez

The Fuzzy Sets Theory deals with simple linguistic terms in order to classify the level of an impact or a probability in risk assessing. Expressions like "Moderate Impact" or "Very High Probability" are more clear and intuitive to experts for carrying out risk assessments than the use of numerical values. However, idiomatic expressions are not useful to calculate severity or probability levels accurately. This work uses Fuzzy Logic and Monte-Carlo simulation not only to evaluate those expressions numerically but also to calculate experts evaluations coherence, weighing up their results according to the coherence level in their responses.

3 - Accounting For Heterogeneity And Macroeconomic Variables In The Estimation Of Transition Intensities For Credit Cards

Jonathan Crook, University of Edinburgh, Business School, 29 Buccleuch Place, Edinburgh, EH8 9JS, United Kingdom, j.crook@ed.ac.uk, Viani Djeundje

The literature has considered intensity models that give predictions of the probability, for each customer, that he/she will transit from one state of delinquency to another between any two months in the life of the loan. The transitions include not only transitions into further delinquency but also transitions to lesser states of delinquency, that is cure. We now extend this work by including frailty terms relating to the individual cases. This means that any statistical bias that may exist because of the omission of unobserved effects due to these types of variation should be removed. Results of applying the method to a large dataset relating to credit card holders will be illustrated.

4 - Risk Strategy For Managing Information Privacy

Gwendolyn K Lee, Chester C. Holloway Professor, University of Florida, Gainesville, FL, 32611, United States, gwenlee@ufl.edu, Ye Xia

Firms' risk strategy involves choosing a probability of success/failure in realizing a certain size of impact on the firm's competitive strength. We observe a disturbing pattern general across a broad family of shapes of risk distribution (e.g., changing from Gaussian to Pareto distributions where the tails of the distribution become longer or heavier). One and one firm only always chooses to take risks that carry the possibility of inflicting extreme privacy harm. The risk strategy does not shift as the risk-return distribution changes its shape. The risk strategy for managing information privacy is studied in the context of firms pursuing data-intensive innovation such as personalized medicine.

Production and Scheduling I

Contributed Session

Chair: Atieh Madani, University at Buffalo, The State University of New York, 11221 Nickel Way, Amherst, NY, 14228, United States, atiehmad@buffalo.edu

1 - Transient Analysis Of Geometric Serial Lines With Perishable Intermediate Products

Feng Ju, Assistant Professor, Arizona State University, 699 S. Mill Avenue, #553, Tempe, AZ, 85287, United States, fengju@asu.edu, Ningxuan Kang, Li Zheng

Perishable intermediate products are commonly seen in practical manufacturing systems, where the residence time of intermediate products in the buffer is limited. Parts have to be scrapped if their maximum allowable time is exceeded. In order to reduce the scrap ratio and optimize the production operation in a timely manner, the transient behavior of the system needs to be investigated to evaluate and predict the system performance in real time. In this paper, we develop an analytical model to analyze the transient behaviors for such systems. Compared with simulation, it is shown that the proposed method could estimate the system's transient performance with high accuracy.

2 - Integrated Production Planning And Distribution Problems

Utku Koc, MEF University, Huzur Mah. Ayazaga Cad No:4, Maslak-Sariyer-Istanbul, Istanbul, 34396, Turkey, utku.koc@mef.edu.tr

In this study, we consider multiple integrated production and distribution problems. Given a set of orders, a subset will be selected to be included in the production plan. Each order has a profit, size and deadline for distribution. Among the two types of vehicles available for distribution, the first type is unlimited in supply but costly. The availability of the second type of vehicle, which is less costly, varies by time. A number of problem classes are defined depending on the distribution characteristics of the system. The difficulty of each class is determined. Moreover, the value of integration is assessed depending on the distribution characteristics.

3 - Incorporation Of Breaks In A Staffing Model For A Service Center With Flexible Servers

Atieh Madani, University at Buffalo, The State University of New York, 11221 Nickel Way, Amherst, NY, 14228, United States, atiehmad@buffalo.edu

The shift scheduling problem (SSP) is a problem of assigning tasks to the resources for each shift with the aim of minimizing costs and fulfilling the demand. In our study we consider breaks, different levels of skill (for staff), and multiple tasks for resources in the shift scheduling problem. In our work we use the shift scheduling model that is developed by Batta, Berman, and Wang as the base model. A column generation heuristic is developed and used to solve this problem. The performance of this model and heuristic method is good. The average gap between the integer program result and the lower bound (for different size of problems) is 2.47%.

Co-Chair: Serhan Ziya, University of North Carolina, 356 Hanes Hall CB# 3260, Chapel Hill, NC, 27599, United States, ziya@unc.edu

1 - Managing Returning Customers In An Appointment Based Service System

Yichuan Ding, University of British Columbia, daniel.ding@sauder.ubc.ca

We study how to manage returning customers in a slotted queue with the goal of maximizing service volume. Applications of this model include outpatient or dental appointment scheduling. We consider a simple strategy that a service provider may use to reduce balking — book a potential returning customer right before she leaves the clinic. We focus on a threshold-type policy and prove that the throughput rate is a quasi-concave function of the threshold under the retrials see time averages (RTA) assumption. We also analyze possible impact of the panel size and panel mix on the choice of this threshold.

2 - Proactive Patient Service: An Operational And Economic Analysis

Kraig Delana, London Business School, kdelana@london.edu, Nicos Savva, Tolga Tezcan

We present an operational and economic analysis of the value derived from healthcare providers using knowledge of upcoming patient care needs to proactively initiate service. On the operational side, we develop a novel queueing model to show that proactive service leads to significant reduction in delays. On the economic side, we show that if proactive service generates an inconvenience cost, strategic patients are less likely to choose to adopt than socially optimal due to economic frictions. This has important implications for providers working to implement proactive service in practice.

3 - Online Surgical Case Scheduling With Repeating Blocks

Shashank Goyal, University of Minnesota, Minneapolis, MN, United States, goyal030@umn.edu, Diwakar Gupta

Hospitals often assign surgeons a fixed number of blocks of operating-room time on a periodic basis. The value and the duration of a surgery request are revealed upon its arrival. The surgeon must place it in one of the blocks or decline it without knowing the future requests. This decision must respect capacity constraints and cannot be modified at a later time because the patients have to make arrangements for travel and post-operative care. The aim is to maximize the total value of accepted requests. We model the problem as the online multiple knapsack problem and propose algorithms that have provable worst-case performance. We also present bounds on the best performance that any algorithm can achieve.

4 - Data-driven Patient Scheduling In Emergency Departments: A Hybrid Robust-stochastic Approach

Meilin Zhang, National University of Singapore, meilin.zhang@u.nus.edu

Emergency care necessitates adequate and timely treatment, which has unfortunately been compromised by crowding in many emergency departments (EDs). To address this issue, we study patient scheduling in EDs so that mandatory targets imposed on each patient's door-to-provider time and length of stay can be collectively met with the largest probability. Exploiting patient flow data from the ED, we propose a hybrid robust-stochastic approach to formulating the patient scheduling problem, which allows for practical features such as a time-varying patient arrival process, general consultation time distributions, and multiple heterogeneous physicians.

Topics in Service Operations

Sponsored: Manufacturing & Service Oper Mgmt, Service Operations

Sponsored Session

Chair: Yong-Pin Zhou, University of Washington, Seattle, Michael G. Foster School of Business, Seattle, WA, 98195, United States, yongpin@uw.edu

1 - Search Among Queues Under Quality Differentiation

Luyi Yang, University of Chicago, Chicago, IL, United States, luyi.yang@chicagobooth.edu, Laurens G Debo, Varun Gupta

To understand implications of policy initiatives to cut elective surgical wait times, we build an equilibrium search model where customers choose over a large collection of vertically differentiated, congested service providers. We find that policies that reduce either the search cost or customer demand may increase the average waiting time in the system as customers substitute toward high-quality service providers. Moreover, the improved quality customers obtain may not compensate the prolonged wait, degrading the overall search reward while yielding no returns in customer welfare.

2 - Observational Learning In Environment With Multiple Options

Chen Jin, Northwestern University, chenjin2011@u.northwestern.edu

This paper studies, both theoretically and empirically, the choice strategy (behavior) of agents in a system with multiple options for which agents observe the aggregate choices of previous agents. With information asymmetry regarding the quality of the different options, the choices of better informed agents turn sales into informative signals, allowing uninformed agents to learn about the options' quality. Contrary to the traditional observational learning literature with binary choice, our theoretical analysis shows that options with less sales usually have higher chance of being high quality. But the experiment data reveals that uninformed subjects tend to choose options with most sales.

3 - Customer Segmentation And Fairness: A Queueing Perspective

Yong-Pin Zhou, Professor, Foster School of Business, University of Washington, Seattle, Seattle, WA, 98195-3226, United States, yongpin@uw.edu, Jian Liu

When a service firm uses limited capacity to serve heterogeneous customers, it can employ customer segmentation and prioritization techniques to maximize profit. Customers are often assumed to be rational decision makers in choosing which service option to use. In this research, we incorporate customers' sense of fairness and show that it can make a difference in how the firm should choose which services to offer, and how to prioritize.

Co-Chair: Xin Chen, UIUC, UIUC, Urbana, IL, 61801, United States, xinchen@illinois.edu

1 - Population Monotonicity In Newsvendor Games

Xiangyu Gao, UIUC, 104 S. Mathews, Urbana, IL, 61801, United States, xgao12@illinois.edu, Xin Chen, Zhenyu Hu, Qiong Wang

We use the concept of population monotonic allocation scheme (PMAS), which requires the cost allocated to every member of a coalition to decrease as the coalition grows, to study the cooperative newsvendor game. We focus on the dual-based allocation scheme and identify conditions under which it is a PMAS.

2 - Strategic Inventories And Supplier Encroachment

Xin Geng, University of Miami, Miami, FL, United States, xgeng@bus.miami.edu, Huiqi Guan, Haresh Gurnani, Yadong Luo

We study the interaction between strategic inventories and supplier encroachment in a two-period model. The buyer may withhold excess inventory and the supplier can introduce a direct selling channel in the second period. We find that irrespective of the buyer's unit holding cost, strategic withholding may occur and the supplier's encroachment strategy is distorted.

3 - A Non-cooperative Approach To Cost Allocation In Joint Replenishment

Xuan Wang, Hong Kong University of Science and Technology, Kowloon, Hong Kong, xuanwang@ust.hk, Simai He, Jay Sethuraman, Jiawei Zhang

We consider the joint replenishment game in which the major setup cost is split equally among the retailers who place an order together. Each retailer pays his own holding and minor setup cost. Under this allocation rule each retailer determines his replenishment policy to minimize his own cost anticipating the other retailers' strategy. We show that a payoff dominant Nash equilibrium exists and quantify the efficiency loss of the non-cooperative outcome relative to the social optimum.

4 - Cost-sharing Mechanism Design For Supply Chain Consolidation

Wentao Zhang, University of Southern California, Los Angeles, CA, United States, wentao@usc.edu, Nelson A Uhan, Alejandro Toriello, Maged M Dessouky

We design cost-sharing mechanisms to incentivize suppliers to cooperate in freight consolidation, in which suppliers have their shipping demand consolidated before sending it to the customers to benefit from lower transportation rates. The nonconvex and nonconcave cost functions resulting from multiple-truck volumes make it impossible to design a truthful and budget-balanced cost-sharing mechanism under the Moulin mechanism framework. With this in mind, we propose a truthful cost-sharing mechanism that attempts to maximize the fraction of the total cost that will be recovered from the prices charged. We also study our proposed cost-sharing mechanism from the social welfare perspective.

Sponsored Session

Chair: Xin Wang, Tepper School of Business- Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States, xinwang1@andrew.cmu.edu

1 - Remanufacturing Strategies For Oems Without Remanufacturing Capabilities

Zhou Yu, Chongqing University, Chongqing, China, cquyuzhou@163.com, Anton Ovchinnikov, Yu Xiong

We discuss two strategies for how an OEM without remanufacturing capabilities could interact with independent remanufacturers: outsourcing and relicensing. Factoring in the possibility of unauthorized remanufacturing and the resultant participations concern, we solve for the equilibrium strategies and discuss how the problem fundamentals impact the resultant solution. In addition to the analytical results we also present numerical illustrations with behaviorally-estimated parameters for North American and Chinese consumers and highlight how the equilibrium solution depends on the consumer behavior and market characteristics.

2 - Design And Technology Choice For Recycling: Collective Versus Individual Implementation

Morvarid Rahmani, Georgia Tech, Atlanta, GA, United States, Morvarid.Rahmani@scheller.gatech.edu, Luyi Gui, Atalay Atasu

Efficient and effective treatment of end-of-life products requires not only product design improvements but also advancement in recycling technologies. In this paper, we study how the complementarity between product design and recycling technology affects the efficiency of collective and individual recycling implementations.

3 - Green Technology Development And Adoption: Competition, Regulation, And Uncertainty – A Global Game Approach

Xin Wang, Assistant Professor, Hong Kong University of Science and Technology, IELM, HKUST, Clear Water Bay, 15213, Hong Kong, xinwang@ust.hk, Soo-Haeng Cho, Alan Scheller-Wolf

When a government is considering tightening a standard on a pollutant, their decision often is influenced by the number of firms being able to meet the tightened standard, because a higher number indicates a more feasible standard. We study how such regulation may affect a firm's incentive to develop a new technology to reduce a pollutant. To analyze this problem, we use the global game framework recently developed in economics. We find that regulation that considers industry capability, compared with regulation that ignores it, can more effectively motivate development of a new green technology. Surprisingly, uncertainty in the payoff can also help promote development of a new green technology.

Opt, Robust

Contributed Session

Chair: Abhilasha Aswal, Phd Candidate, International Institute of Information Technology, Bangalore, 26 Willow drive, Apt 8B, Ocean, 7712, India, abhilasha.aswal@iiitb.ac.in

1 - Efficient Methods For Stronger Performance Bounds On Two-stage Adaptive Optimization Models

Frans de Ruiter, PhD Candidate, Tilburg University, Warandelaan 2, Tilburg, 5037AB, Netherlands, f.j.c.t.deruiter@tilburguniversity.edu, Dimitris Bertsimas

Many efficient methods have been developed to find suboptimal solutions to two-stage adaptive linear optimization problems. Although these solutions appear to perform very well in practice, bounds on the performance of these solutions are often far off. We present new efficient methods to obtain stronger performance bounds. We show numerically that our method can obtain bounds quickly and improve upon existing techniques.

2 - Performance Of Affine Policies In Dynamic Robust Optimization

Omar El Housni, Columbia University, NYC, NY, United States, omarhousni@hotmail.com, Vineet Goyal, Chaithanya Bandi

We study the performance of affine policy approximation for multi-stage robust linear optimization problem under right hand-side uncertainty. Such problems arise in many applications where right hand side models demand uncertainty. Surprisingly, affine policies are not necessarily optimal even for simplex uncertainty sets in multi-stage unlike two-stage. We show that affine policies give a $O(\sqrt{ \lot T m})$-approximation if the uncertainty is a Cartesian product of identical (or nested) uncertainty sets in each period and $O(\sqrt {Tm})$-approximation for general multi-stage uncertainty.

3 - Robust And Reliable Solutions Bilevel Optimization Problems Under Uncertainties

Zhichao Lu, Michigan State University, 16789 Chandler Rd Apt 0436D, East Lansing, MI, 48823, United States, luzhicha@msu.edu, Kalyanmoy Deb

Bilevel optimization problems have received a growing attention in the recent past due to their relevance in practice. A number of studies on bilevel applications and solution methodologies are available for deterministic set-up, but studies on uncertainties in bilevel optimization are rare. In this paper, we suggest methodologies for handling uncertainty in both lower and upper level decision variables that may occur from different practicalities. For the first time, we discuss and demonstrate the effect of uncertainties in each level on the overall definition of a robust and reliable bilevel solution and present simulation results on a number of problems.

4 - Uncertainty Quantification For Robust Optimization

Abhilasha Aswal, Phd Candidate, International Institute of Information Technology, Bangalore, 26 Willow drive, Apt 8B, Ocean, 07712, India, abhilasha.aswal@iiitb.ac.in, Srinivasa Prasanna

We present a Hartley-like measure for quantification of information driving the optimization using robust uncertainty sets. Based on this, we present transformation based uncertainty equivalent materializations of alternative uncertainty sets from a given uncertainty set. We show that using polyhedral models for uncertainty leads to optimization models that are computationally simpler than probabilistic alternatives, with potentially mixed continuous and discrete variables.

Sponsored Session

Chair: Cong Shi, University of Michigan, Ann Arbor, Ann Arbor, MI, 48105, United States, shicong@umich.edu

1 - Nonparametric Learning Algorithms For Optimal Base-stock Policy In Perishable Inventory Systems

Huanan Zhang, University of Michigan, zhanghn@umich.edu

We develop the first nonparametric learning algorithm for periodic-review perishable inventory systems, where the firm does not know the demand distribution a priori but makes the replenishment decision in each period based only on the past sales (censored demand) data. It is well-known that even with complete information about the demand distribution a priori, the optimal policy for this problem does not possess a simple structure. Hence in this paper we focus on finding the best base-stock policy, which performs near-optimal in these systems. We establish a square-root convergence rate of the proposed algorithm, which is the best possible for this class of problems.

2 - Dynamic Inventory Control With Stockout Substitution And Demand Learning

Beryl Boxiao Chen, University of Illinois at Chicago, Chicago, IL, United States, boxchen@umich.edu, Xiuli Chao

Stock-out substitution is the phenomenon that if the primary choice of a customer is out of stock, besides leaving the market immediately, the customer may also substitute for other products. In this paper, we study a data-driven inventory management problem and infer the customer substitution behavior from historical sales data.

3 - Demand Estimation And Price Optimization With Endogeneity Effect

He Wang, Massachusetts Institute of Technology, Cambridge, MA, United States, wanghe@mit.edu, Milashini Nambiar, David Simchi-Levi

Inspired by many applications, we consider a revenue management setting where heterogeneous products are offered sequentially over a finite horizon. Demand for each product is modeled as a function of price, a product feature vector, and a random noise. Our model allows for price endogeneity — a common problem in the presence of heterogeneous product features — where price is correlated with demand noise. We propose an online pricing algorithm which uses randomized price shocks to estimate parameters via a two-step regression. Theoretical and numerical evidence is provided to show the performance of this algorithm.

1 - Limiting Theorems For The Optimal Alignments Score In Multiple Random Words

Ruoting Gong, Illinois Institute of Technology, rgong2@iit.edu

Let X_{1}, ..., X_{m} be m independent sequences of i.i.d. random variables taking values in a finite alphabet A. Let the score function S, defined on A^{m}, be non-negative, bounded, permutation-invariant, and satisfy a bounded differences condition. Under a variance lower-bound assumption, a central limit theorem is proved for the optimal alignments score of the m random words. This is in contrast to the Bernoulli matching problem or to the random permutations case, where the limiting law is the Tracy-Widom distribution. In particular, when S(x)=1_{x_{1}=x_{2}= ... =x_{m}}, a central limit theorem is obtained for the length of the longest common subsequence of random words X_{1}, ..., X_{m}.

2 - Changing Graph Structure For Performing Fast, Approximate Inference In Probabilistic Graphical Models

Areesh Mittal, The University of Texas at Austin, areeshmittal@utexas.edu

Complexity of exact marginal inference algorithms in probabilistic graphical models is exponential in the treewidth of the underlying graph. We develop a method to perform approximate inference on discrete graphical models by modifying the graph to a new graph of lower treewidth. We prove error bounds on the approximate inference solution compared to the exact solution. We formulate the problem of finding parameters of the new graph which gives the tightest error bounds as a linear program (LP). The number of constraints in the LP grow exponentially with the number of nodes. To solve this issue, we develop a row generation algorithm to solve the LP. We discuss heuristics for choosing the new graph.

3 - Tight Adaptive Policies For The Dynamic And Stochastic Knapsack Problem

Xinchang Xie, Duke University, Durham, NC, United States, xinchang.xie@duke.edu, Alessandro Arlotto, Yehua Wei

In this talk, we consider a dynamic and stochastic knapsack problem in which items have unitary values and the knapsack has finite capacity. A decision maker is sequentially presented with n items with independent and identically distributed sizes, and the goal of the decision maker is to maximize the expected number of items that are included in a knapsack subject to the capacity constraint. We propose adaptive selection policies that are tight. That is, such adaptive policies have an expected number of selected items that is close to that of the optimal policy.

4 - A Central Limit Theorem For Temporally Non-homogenous Markov Chains With Applications To Dynamic Programming

Alessandro Arlotto, Duke University, Fuqua Drive, Durham, NC, 27708, United States, aa249@duke.edu, J. Michael Steele

We prove a central limit theorem for a class of additive processes that arise naturally in the theory of finite-horizon Markov decision problems. The main theorem generalizes a classic result of Dobrushin (1956) for temporally non-homogeneous Markov chains, and principal innovation is the summands are permitted to depend on both the current state and a bounded number of future states of the chain. We show through examples that this added flexibility gives one a direct path to asymptotic normality of the optimal total reward of finite-horizon Markov decision problems. The examples explain why such results are not easily obtained by alternative Markovian techniques such as enlargement of state space.

Sponsored Session

Chair: Justin Sirignano, University of Illinois at Urbana-Champaign, Champaign, Champaign, IL, 61801, United States, jasirign@illinois.edu

1 - Recurrent Neural Networks For Modeling Financial Data

Justin Sirignano, University of Illinois at Urbana-Champaign, Champaign, IL, jasirign@illinois.edu

We explore using recurrent neural networks for modeling financial time series. Recurrent neural networks depend upon the full history of the time series, allowing for modeling long-term correlations. In out-of-sample tests on financial data, we show recurrent neural networks can outperform standard feedforward neural networks.

2 - Deep Learning For Mortgage Risk

Apaar Sadhwani, Stanford University, apaars@gmail.com

We analyze mortgage risk at loan and pool levels using an unprecedented data set of over 120 million mortgages originated in United States, which includes the origination data, monthly updates on loan performance, and several time-varying economic variables. We develop, estimate, and test dynamic models for mortgage prepayment, delinquency, and foreclosure that capture loan-to-loan correlation. At heart of our model is a deep neural network trained using GPU-accelerated clusters. We develop several metrics to test model performance, which is a major improvement over existing models and highlights the importance of local factors. This is joint work with Justin Sirginano and Kay Giesecke.

3 - Background Subtraction For Pattern Recognition In High Frequency Financial Data

Alex Papanicolaou, Integral Development Corporation, alex.papanic@gmail.com

Financial markets produce massive amounts of complex data from multiple agents, and analyzing these data is important for building an understanding of markets, their formation, and the influence of different trading strategies. We apply low-rank plus sparse background subtraction methods to high frequency FX quote data. For prices in a single currency pair from many sources, we model the market as a low-rank structure with an additive sparse component representing transient market making behavior. We show case studies with real market data, showing both in-sample and online results, for how the model reveals pricing reactions that deviate from prevailing patterns.

1 - Dynamic Pricing And Learning In Airline Revenue Management

Ravi Kumar, PROS Inc, rkumar04@pros.com, Wei Wang

Many airlines have been actively looking into class-free demand control structures, which requires demand models where price varies over a continuous interval. As evidenced both in literature and in practice one of the big challenges in this setting is the trade-off between policies that learn quickly and those that maximize expected revenue. We investigate applicability of recent advances in the area of optimal control with learning. We examine a demand model where customers maximum WTP is modeled as Gaussian and study approaches that generate sufficient variability in pricing to ensure discovery of the underlying customer behavior while providing appropriate level of expected revenue.

2 - Risk Management In Price And Revenue Optimization

Yanqi Xu, Princess Cruises, yanqi6@yahoo.com

Price and revenue optimization has been instrumental in delivering profit lift for companies across industries. Typical analytical models in this area involve providing a forecast, and then use price and revenue optimization model to balance supply and demand to extract the maximum profit for company's assets. In many cases, critical factors in the model are treated as deterministic and their stochastic nature is frequently ignored, a trade-off for simplicity in models. The utility of such solutions may be doubtful at best in situations where the modeled factors have large variances. In this talk, we will discuss models that account for risks in optimization, and show why it can be productive to do so.

3 - Implementing Optimal Decisions In Business Processes Using 4Ps: Proof Of Concept, Prototyping, Production, Performance

Sachin Sumant, Hertz Car Rental, sumantsachin@yahoo.com

In the new era of analytics, there is abundance of data, analytical models, visualization tools and integration technologies. Corporations are spending millions of dollars in building analytical infrastructure in the hope of significant ROIs. Large teams are getting formed and everybody is talking about "Next Generation Systems" within analytics team and "Change Management" among business users. This paper discusses how 4Ps can be utilized to unify the analytics team and business users to achieve the optimal benefit from decision making systems and processes by reducing rework, providing well-calibrated solutions, increasing acceptability and guaranteeing positive results.

4 - Deriving Price Elasticity Estimates In The UK Cruise Market

John Harvey, Carnival UK, johnandrewharvey@googlemail.com

I shall outline the data-driven approach used in deriving a first set of price elasticities for the UK Cruise Market, using purely observations from booking history. By segmenting UK cruises based on their demand and price behaviour, I will show how we approximated elasticity estimates through constructing willingness-to-pay models and including a weighting factor based on the average expected demand in different time intervals; we can estimate elasticities that represent the impact of price at points in the booking curve versus an average assumed weekly demand across the booking horizon.

1 - Case Studies In Water Resources Management For Sustainability And Resilience

Cate Fox-Lent, US Army Corps of Engineers, 696 Virginia Rd, Concord, MA, 01742, United States, Catherine.Fox-Lent@usace.army.mil, Igor Linkov

The US Army Corps of Engineers has several missions related to Environmental Restoration, Water Quality, and goals for Sustainability and Resilience. Meeting those goals requires life-cycle planning and decision making beyond the usual project time horizon. This presentation will present 3 case studies of the various ways in which formal decision analytics are integrated in to water resources management in a Federal agency context.

2 - Optimizing Adaptive Stormwater Management With Green Infrastructure: A Case Study In Wingohocking Watershed, Philadelphia

Fengwei Hung, Johns Hopkins University, 3400 North Charles Street Ames Hall 313, Baltimore, MD, 21218, United States, hfengwe1@jhu.edu, Benjamin F Hobbs, Arthur E McGarity

Due to heterogeneous hydrology and uncertain maintenance effectiveness, the long run performance of Green Infrastructure (GI) for managing urban stormwater and pollution is highly uncertain. Implementing GI adaptively provides opportunities to modify plans in response to learning. We apply three stochastic optimization models for adaptive GI planning that represent monitoring and active experimentation. The models recommend optimal immediate GI and learning actions.

3 - Flood Risk Management Using Artificial Avulsions In The Yellow River Delta

Liang Chen, Johns Hopkins University, chenliang1468@gmail.com, Benjamin Hobbs

Due to high in-channel sedimentation rates, the Yellow River Delta of China has changed course frequently in its history, with huge socioeconomic impacts. Water storage and deliberately engineered avulsions can reduce these impacts, but at a cost. Multi-objective analysis and Monte Carlo simulation is used to develop decision rules and choose sizes and locations for engineered avulsions and floodways, considering uncertain future floods and trade-offs between flood risk and management cost.

4 - The Process Of Co-producing a ClimateIndicators System

Melissa A Kenney, University of Maryland, kenney@umd.edu

In this talk I will discuss the development and implementation of a climate indicators system that was designed to be owned collaboratively by multiple Federal agencies and designed to support for undefined climate adaptation and mitigation decisions. The process of development involved over 200 producers and users of climate information from the Federal government, academic, and private sector/NGOs over the past 5 years. I will reflect on the implications and lessons learned for future co-production processes that similarly adopt best practices in the development of indicators.

Chair: Giulia Pedrielli, National University of Singapore, TBD, Singapore, TBD, Singapore, giulia.pedrielli.85@gmail.com

1 - Simulation Analytics For Virtual Statistics

Yujing Lin, Northwestern University, yujinglin2013@u.northwestern.edu

“Virtual statistics” are performance measures that are conditional on the occurrence of an event; the virtual waiting time of a customer arriving to a queue at time t is one example. We describe methods for estimating virtual statistics post-simulation from the retained sample paths, examining both their small-sample properties and asymptotic consistency.

2 - The Effects Of Estimation Of Heteroscedasticity On Stochastic Kriging

Xi Chen, Virginia Polytechnic Institute and State University, xchen6@vt.edu

In this talk, we discuss the effects of using smoothed variance estimates in place of the sample variances on the performance of stochastic kriging (SK). Different variance estimation methods are investigated, and we show that such a replacement leads to improved predictive performance of SK. An SK-based dual metamodeling approach is further proposed to obtain more accurate prediction results given a fixed simulation budget.

3 - Extended Kernel Regression Method To Combine Analytical Methods And Simulation

Andrea Matta, Shanghai Jiao Tong University, matta@sjtu.edu.cn

Simulation is widely adopted to predict system performance. The main drawback is that it is slow in execution and the related computer experiments can be very expensive. On the other hand, analytical methods can rapidly provide system estimates but they are approximate. Recently the Extended Kernel Regression (EKR) has been proposed to combine simulation with analytical methods. This work has different purposes: 1) test EKR on different cases; 2) compare EKR with other state of the art techniques; 3) propose two different methods for calculation of confidence bands. Numerical results show the EKR method provides accurate predictions, particularly when DOE size is small.

4 - G-STAR A New Kriging Based Trust Region Method For Global Optimization

Giulia Pedrielli, Arizona State University, giulia.pedrielli.85@gmail.com, Szu Hui Ng

Stochastic Trust region methods iteratively generate meta-models for local optimization. We propose the Global Stochastic Trust Region Augmented Method (G-STAR): local meta-models are iteratively improved, through a new sampling criterion balancing exploration and exploitation. Specifically, a global model guides the search, while local models are fitted using sampled points in the generated trust regions. The best point is predicted at each iteration through an ensemble of the global and the local meta-models generated along the search. Preliminary numerical tests show an improved performance with respect to the previously proposed extended Two Stage Sequential Optimization algorithm.

Revenue Management with Strategic Customers

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Woonghee Tim Huh, University of British Columbia, Vancouver, BC, Canada, tim.huh@sauder.ubc.ca

Co-Chair: Jaelynn Oh, University of Utah, Salt Lake City, UT, United States, jaelynn.oh@business.utah.edu

1 - Dynamic Pricing In The Presence Of Strategic Consumers: Theory And Experiment

Anton Ovchinnikov, Queen’s School of Business, 143 Union Street, Kingston, ON, K7L 3N6, Canada, ao37@queensu.ca, Mirko Kremer, Benny Mantin

We investigate the behavior of retailers who sell a fixed inventory of products over a two period horizon (main selling season followed by a markdown period) to a mixture of myopic and strategic consumers. We present a stylized model and an experimental study. Our main result is that retailers myopically underprice when facing consumers who are strategic. We explore the drivers for such underpricing and show that it is related to a counter-intuitive model prediction that most revenue is obtained at markdowns.

2 - Choosing To Be Strategic: Implications Of The Endogenous Adoption Of Forward-looking Purchasing Behavior On Multiperiod Pricing

Arian Aflaki, Duke University, 923 White Pine Drive, Durham, NC, 27705, United States, aa251@duke.edu, Pnina Feldman, Robert Swinney

We consider whether strategic consumer behavior benefits consumers when they purchase from a revenue-maximizing firm that sets prices over multiple periods. We show that many consumers have lower surplus if they are strategic than if they are myopic. We then develop a model in which consumers choose to become strategic by exerting costly effort, and show that considering this choice can have a significant qualitative impact on firm and consumer decisions. In addition, we illustrate that it is possible to increase firm profit and consumer welfare simultaneously by increasing the cost of strategic behavior. Finally, we find that price commitment can encourage more strategic waiting and harm firms.

3 - Product Quality And Pricing Management

Ruxian Wang, Johns Hopkins Carey Business School, Baltimore, MD, 21202, United States, ruxian.wang@jhu.edu, Shiliang Cui

Product quality, price and service are arguably the most important factors consumers consider in purchasing a product. We investigate a firm’s strategy for managing multiple products under various monopolistic and oligopolistic settings. Our analytical results show that the optimal quality level of any product should always be set at the global optimum, even if the firm can change price simultaneously, faces other firms’ competition, or offers a free ancillary service. Moreover, consumer surplus may be higher.

New Models for Pricing and Assortment Optimization

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Adam Nabil Elmachtoub, Columbia University, 500 W 120th St., New York, NY, 10027, United States, adam@ieor.columbia.edu

1 - Assortment Optimization And Pricing Under A Nonparametric Tree Choice Model

Jake Feldman, U Washington, jbf232@cornell.edu

We consider assortment and pricing problems under a nonparametric ranking-based choice model. Under this nonparametric choice model, each customer class is distinguished by a unique ranking of the available products and an arrival probability. Given the arrival of a customer from a particular customer class, this customer will purchase the highest ranking offered product in her respective ranking list. First, we study assortment problems, where the goal is to find a set of products to offer so as to maximize the expected revenue from each customer. Second, we study the joint assortment and pricing problem, where the goal is to simultaneously select the set of products to offer as well as their prices.

2 - Revenue Management By Strategic Customer Selection

Roger D Lederman, IBM, rlederman@gmail.com, Vineet Goyal, Adam Elmachtoub

We describe a framework for managing product transitions, including the role that sales targeting can have in shaping customer decisions, managing inventory, and increasing revenue. We provide algorithms that select customers dynamically, each with their own choice model, in order to maximize revenue from a limited supply of inventory. We propose constant factor approximations when assortments may be chosen dynamically, and for a constrained setting where the set of offered products can only decrease over time.

3 - The Price Of Opacity

Michael Hamilton, Columbia, mh3461@columbia.edu

In this work, we study the value of selling opaque products, i.e., products where some features are hidden from the customer until after purchase. Opaque selling has seen use in airline and hotel contexts as well as by online retailing companies such as on Amazon and Threadless. Opaque selling allows for price discrimination between customers with strong or weak preferences among products. We study the impact of this discrimination and compare the revenue garnered against traditional selling strategies. We theoretically show that the revenue increase from opaque selling, which we call "The price of opacity", can be considerable in a number of contexts that we explore.

Interdisciplinary Business Analytics

Invited: Social Media Analytics

Invited Session

Chair: Mingfei Li, Bentley University, Waltham, MA, 02452, United States, mli@bentley.edu

Co-Chair: David Oury, Bentley University, 175 Forest Street, Waltham, MA, 02451, United States, doury@bentley.edu

1 - Role Of Collaborative Consumption Factors: A Cross-national Case Of Airbnb

Funda Sarican, Bentley University, fsarican@bentley.edu

With the rise of social platforms consumers recreated value by sharing resources. As a result, there has been an increase in collaborative consumption. To contribute to a better understanding of this phenomenon I focused on the peer-to-peer travel accommodation service Airbnb. The value of my research lies in identifying meaningful factors; product, social, cultural, and economic that have been studied in relation to the price or economy in previous literature.

2 - Health Analytics On The Quality And Efficiency Of Clinical Practice On Several Major Cancers

Chao Wang, Bentley University, cwang@bentley.edu

Cancer treatment has been a hot topic for healthcare domain for quite a long time. Efficiency and quality of the cancer treatment has been accessed from the medical point of view for past decades. However, for this study, HCUP state level inpatient data would be used to evaluate the changes of the quality and efficiency of major cancers' treatment in hospital care.

3 - Socio-economic Perceptions In Emerging Markets

Fernanda Maciel, Bentley University, Waltham, MA, United States, fmaciel@bentley.edu

In recent years, citizens in emerging economies are reporting higher levels of satisfaction with their living conditions and demonstrating high optimism about future perspectives compared to people in advanced economies in self-reported well-being surveys. This paper investigates the convergence of the socio-economic perceptions in emerging markets over time, tracking statistical clustering and movement of these countries using self-organizing maps (SOMs).

4 - Diversification Of Risk Management Strategies

Olga Biedova, Bentley University, obiedova@bentley.edu

Diversification of risk management strategies allows to achieve a well-balanced risk-return profile, which surpasses the profile of an approach of simple asset diversification. We present the results of numerical simulations of two conceptually different risk management techniques: a dynamically risk-managed fund and a guarantee structure linked to capital markets, which can be often seen in indexed Variable Annuity or Fixed Indexed Annuity. We show how these techniques would have worked in the past and compare their performance to a more traditional balanced portfolio with 60% equity and 40% bond without risk management.

Strategic Behavior, Competition, and Coordination under Uncertainty

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Sila Cetinkaya, Southern Methodist University, 3145 Dyer street, Dallas, TX, 75205, United States, sila@smu.edu

Co-Chair: Olga Bountali, Southern Methodist University, 3145 Dyer street, Dallas, TX, 75205, United States, obountali@smu.edu

1 - The Impact Of Batch Services On Customers' Equilibrium Actions And On Social Welfare

Olga Bountali, Southern Methodist University, obountali@smu.edu, Antonis Economou

We consider a single-server batch service queue and investigate the equilibrium behavior of customers when they strategically decide whether to join the system or not, driven by maximizing their own revenue. Usually congestion forms a discouraging factor for joining, as it is associated with long waiting. In batch-service systems, however, it induces both positive and negative externalities to customers' decisions. This leads to an intricate mixture of Avoid The Crowd and Follow The Crowd behavior. Consequently, it is not clear whether it becomes socially beneficial to incite customers to join or not. We shed light on these topics and investigate ways to regulate the queue.

2 - Price And Lead-time Competition With Customer Choice

Philipp Afèche, Rotman School of Management, University of Toronto, Toronto, ON, Canada, afeche@rotman.utoronto.ca

We consider the price/lead-time design problem of capacity-constrained providers that compete for heterogeneous price- and time-sensitive customers with private information on their preferences. We model the problem as a queueing game and discuss how the equilibrium properties depend on the capacity and the demand characteristics.

3 - The Impact Of Inspection Cost On Equilibrium, Revenue And Social Welfare In A Single Server Queue

Ricky Roet-Green, Simon Business School, University of Rochester, CS 3-345, Rochester, NY, 14627, United States, ricky.roet-green@simon.rochester.edu, Refael Hassin

Classical models of customer decision making in unobservable queues assume it is too costly to acquire queue length information. However, various services now make this kind of information accessible to customers at a reasonable cost. In our model customers choose among three options: join the queue, balk, or inspect the queue length at a cost before deciding whether or not to join. We map all possible input parameter sets into three scenarios. Each scenario is characterized by a different impact of inspection cost on both equilibrium and revenue maximization queue disclosure policy: fully observable, fully unobservable, or observable by demand (when inspection cost is at an intermediate level).

1 - National Hockey League Goaltending: An Analysis Of Goaltender Performance In Relation To Amount Of Days Rest

Paul Weisgarber, U.S. Air Force Academy, USAF Academy, CO, United States, paul.a.weisgarber@gmail.com, Jeremy Forbes, Luke Guinan

When deciding which goalie to start, professional hockey teams have historically made that decision based on who the better overall goaltender is and whether they need a night (or more) rest. Aside from coach and player intuition, little data has been involved in such decisions. Motivated by an SB Nation article on broadstreethockey.com, we attempt to better inform NHL coaches and general managers on the relationship between the number of days rest between games (DRBG) for a goalie, his save percentage (SV%), and team wins and losses.

2 - Analysis Of Corner Kicks In Football (Soccer)

Nils Rudi, INSEAD, Nils.Rudi@insead.edu, Tong Wang

Using coded events and tracking data from football matches in a major football (soccer) league, we (1) study the prediction of the number of corner kicks in a match statically (using only the information available before the match starts) and dynamically (using live feed of critical events) and (2) investigate the dynamics that convert an awarded corner kick into a goal and factors that affect the conversion rate.

3 - Is Strength Of Schedule A Real Strength For NFL Teams

Ismail Civelek, WKU, ismail.civelek@wku.edu, Murat Kurt

The National Football League (NFL) uses both complex analytical tools and panel of experts to schedule regular season games to assure owners, coaches, players and fans that no team has an advantage. The strength of schedule has been a major disagreement in scheduling NFL games due to ongoing dispute about this measure. This paper proposes a mixed-integer-linear program to investigate the relationship between the strength of schedule and teams' making into the play-off and tries to answer whether the strength of schedule is a real strength for the NFL teams.

Evaluating Health Systems of Public Interest

Sponsored: Public Sector OR

Sponsored Session

Chair: Andres Garcia-Arce, University of South Florida, USF, Tampa, FL, 3, United States, andresg@mail.usf.edu

1 - Hospital Preventable Readmissions And Interventions In Medicare Patients

Andres Garcia-Arce, University of South Florida, Tampa, FL, United States, andresg@mail.usf.edu, Jose L. Zayas-Castro

Hospital preventable readmissions in the US are considered as a target for quality improvement by the affordable care act. Medicare uses economic penalties for hospitals with excessive readmissions. National experts present concerns about the appropriateness and fairness of these measurements such as the excessive impact on safety net hospitals. The use of disease-specific interventions reduces readmissions while directly improves the quality of care and produce savings. This research aims to use disease-specific health interventions to reduce readmissions. The results from this work are intended to open a discussion on alternative policies to address preventable readmissions.

2 - Predicting Likelihood Of Drug Approval From Clinical Trials

Felipe A Feijoo, Johns Hopkins University, ffeijoo@jhu.edu, Sauleh Ahmad Siddiqui, Jenny Bernstein

Pharmaceutical companies face huge risks and costs in order to launch a new drug to market. These costs are associated with expensive and timely clinical trials with a success rate that from 10% to 20%. In order to understand the drivers that make drugs to fail at some stage of a clinical trial, we developed a machine learning (based random forest) to determining the factors that are associated with clinical success. Our model is capable to predict with an 85% accuracy the new compounds that will get FDA marketing approval.

3 - The Future Burden Of CKD In China: A Simulation Model For The CKD Initiative

Nan Chen, Tsinghua University, Room 615, Shunde Building, Tsinghua University, Haidian District, Beijing, 100084, China, chenn618@gmail.com, Jinwei Wang, Xiaolei Xie, Luxia Zhang, Li Zheng

The prevalence of chronic kidney disease (CKD) is high in China, which is approximately 10.8% in 2010. However, awareness of CKD remains low, only 12.5% of the 119.5 million patients are aware of the condition. There exist very few studies to estimate the future burden of CKD. We developed a CKD Health Policy Model for Chinese people based on annual decrements in estimated glomerular filtration rates that depend on age and risk factors. We used this model to simulate the residual lifetime incidence of CKD and project the prevalence of CKD in China.

Network Repair and Resiliency for Service Restoration

Sponsored: Public Sector OR

Sponsored Session

Chair: Ozlem Ergun, Northeastern University, 453 Meserve, 360 Huntington Avenue, Boston, MA, 02115, United States, o.ergun@neu.edu

Co-Chair: Aybike Ulusan, Northeastern University, 360 Huntington Avenue, Boston, MA, 02115, United States, ulusan.a@husky.neu.edu

1 - Network Science Based Quantification Of Resilience Of Multi-scale Infrastructure Systems

Udit Bhatia, Northeastern University, bhatia.u@husky.neu.edu

Natural or human-induced disruptions to multi-scale critical lifeline infrastructure networks can damage economies and cause loss of lives. Characterizing brittleness and guiding restoration are crucial for post-hazards recovery and proactive design. Here we develop a quantitative network-science framework to understand fragility and resilience of interdependent lifelines, which we demonstrate on the interdependent Boston Mass Transit, Power transmission system by assessing robustness and evaluating recovery strategies. Natural hazards and cyber-physical attacks, as well as non-systematic and cascading infrastructure failures are considered.

2 - Transportation Network Recovery Based On Multi-industry Economic Impact

Mohamad Darayi, The University of Oklahoma, mdarayi@ou.edu, Kash Barker, Nazanin Morshedlou

Freight transportation networks, considered a means to enable the flow of commodities and to facilitate economic productivity, are prone to natural and human-made hazards. This research pursues an approach to improve restoration order decision making based on the broader perspective of their impact to multiple industries and multiple regions.

3 - On The Cost Of Decentralized Scheduling For Interdependent Network Restoration

Hongtan Sun, Rensselaer Polytechnic Institute, 110 8th St., Troy, NY, 12180, United States, sunh6@rpi.edu, Thomas Sharkey

We consider the problem of restoring disrupted services across multiple interdependent networks after extreme events. The restoration efforts are usually formulated in a decentralized manner as each system optimizes their own restoration schedule. We consider integer programming approaches to determine the equilibrium (stable) solutions for this decentralized scheduling system. These approaches help to calculate the price of anarchy and the price of stability which help to measure the loss in the centralized objective from the decentralized scheduling process.

4 - Restoration Of Network Connectivity In Large-scale Disaster Management Problems

Aybike Ulusan, Northeastern University, ulusan.a@husky.neu.edu, Ozlem Ergun

The goal of this study is to offer enlightening insights on the network restoration problems by developing network science based quantitative frameworks. As the name suggests, the generic network restoration problem seeks for the best recovery strategy for a given perturbed network. As a case study, a disrupted network from a pot-disaster environment is tackled. Proposed frameworks are demonstrated on the real world disrupted road networks of different cities in USA having various topological properties.

New Product Development and Process Development in Healthcare

Sponsored: Technology, Innovation Management & Entrepreneurship

Sponsored Session

Chair: Zhili Tian, Florida International University, 11200 SW 8th St, Miami, FL, 33199, United States, zhili.a.tian@gmail.com

1 - An Empirical Analysis Of The Barriers To And Optimal Use Of Clinical Decision Support Systems In Health Care

Xiaojin Liu, University of Minnesota, Minneapolis, MN, United States, liux1591@umn.edu, Susan Goldstein, Karen Soderberg, Kingshuk K Sinha

Clinical Decision Support (CDS) systems provide critical clinical information for health care processes, and development of capabilities related to their use enable provide knowledge related to both the current workflow and for process improvement. Yet, little is known about the barriers and outcomes of the development of these capabilities. We empirically investigate the barriers to CDS use and the consequences of using CDS features, controlling for organizational characteristics in the clinical setting.

2 - Management Of Cancer Drug Shortage Under Demand And Supply Uncertainty

Shanling Li, McGill University, shanling.li@mcgill.ca, Dali Zhang, Xiaowen Chang, Huifu Xu

In this research, we aim at developing an optimization model that characterizes the supply chain disruption of a generic cancer drug resulted from operational problems. We consider the trade-off between generic and brand name drugs and uncertainties in demand and supply. The cancer drug shortage problem is formulated as a chance-constrained model. Our aim is to investigate the severe impact of short supply of the generic cancer drug on supply chain decisions and to propose optimal purchasing plans to mitigate the drug shortage risk.

3 - Outsourcing Stategy For Intermediate Production Steps

Yang Wang, UC Berkeley, 4174 Etcheverry Hall, University of California Berkeley, Berkeley, CA, 94720, United States, yangwang0803@berkeley.edu, Philip Kaminsky

Small biopharmaceutical firms often outsource their final filling and labeling operations to a third party, but these firms use a variety of different outsourcing strategies. In particular, we consider two types of strategies. In the first, the firm orders when inventory position is low, so that its order is triggered by inventory level. In the second, the firm reserves a limited amount of capacity at the outsourcer at repeated fixed intervals, so that its order is triggered by time. These strategies impact inventory management at the biopharma firm, as well as capacity utilization at the outsourcer, and we develop models to explore the trade-off between these two types of strategies.

4 - Clinical Trials And New Drug Development: Optimal Investment Policies And Application

Zhili Tian, Florida International University, 11200 S.W. 8th Street, Miami, FL, 33199, United States, zhili.a.tian@gmail.com

Firms conduct Phase 3 trials by enrolling and treating patients who meet certain conditions. Opening test centers and finding patients to participate in trials are expensive and time consuming, with a great deal of uncertainty around these. We develop a dynamic recruitment policy for clinical trials, which depends on the available information on drug quality, potential market size, and likelihood of FDA approval. It also takes into account the costs of the clinical testing and the current success in enrolling patients. We consider cases with and without interim analysis of the clinical data. We develop structural results and provide conditions for accelerating or suspending a clinical study.

1 - Agent-based Modeling Of Chinese University Admission Mechanisms: From The Boston Mechanism To The Chinese Parallel Mechanism, Mission Accomplished?

Shu-Heng Chen, National Chengchi University, chen.shuheng@gmail.com

Between 1952 and 2003, all provinces in China used the algorithms equivalent to the Boston mechanism to admit college students. However, after a prolonged period of experimentation, the Boston mechanism has been criticized for its invoking "justified envy." In response, since 2003, some Chinese provinces have gradually promulgated a new system called the Chinese parallel mechanism, aiming to allocate students based more on their abilities than on their choices in order to answer the criticism of justified envy. Has this policy reform accomplished its mission? In this article, we use the agent-based model to evaluate the admission policy reform in Chinese higher education.

2 - An Empirical Zero-intelligence Model Of Chinese Stocks

Wei-Xing Zhou, East China University of Science and Technology, 130 Meilong Road, Shanghai, 200237, China, wxzhou@ecust.edu.cn, Gao-Feng Gu, Xiong Xiong, Wei Zhang, Yong-Jie Zhang, Wei Chen

Computational experimental finance is an important topic in finance. Order-driven models constructed based on the statistical properties of order flows are able to reproduce the main stylized facts of financial variables. In this talk, we will introduce a microscopic model based on the order flows of Chinese stocks. We will also discuss the potential applications of order-driven models in stock market micro structures and financial engineering. For instance, we study the optimal trading strategy problem of large orders and the impact of asymmetric price limits on stock price evolution.

3 - Nonlinear Transient Shock, Implementation Shortfall Optimum Strategy And Market Influences: Based On The Framework Of Computational Finance

Haifei Liu, Nanjing University, Nanjing, China, hfliu@nju.edu.cn, Xindan Li, Xiong Xiong

This paper builds an artificial stock market to simulate the real market, and make sure that the artificial market has the same statistical features with the real market. The mechanism of information sharing will also play an important role in the artificial market. Then the paper proposes a nonlinear quadratic IS (Implementation Shortfall) algorithm. We will analysis the impact on market when perform the algorithm and the different effects when compared with linear IS and Minimum Risk Volume Weighted Average Price. To conduct robust test, this paper also analysis the performance of the above algorithms under the different levels of private information in the market.

4 - Biased Information, Peer Pressure And Expectation Formation

Dehua Shen, Tianjin University, Tianjin, China, dhs@tju.edu.cn, Yongjie Zhang, Andrea Teglio, Wei Zhang

Behavior economics has relaxed the assumption on perfect rationality and recognized the impact of psychological biases on the expectation formation. However, existing literature mainly postulates the unbiased information generated by information sources. In that sense, the information reporting behavior is hugely simplified. In this paper, we address this issue by simulating an agent-based computational model with the consideration of the diffusion of biased information and investigate its influence on expectation formation. Meanwhile, the peer pressure mechanism is introduced to depict the social learning behavior among investors.

Inventory Management VII

Contributed Session

Chair: Sepideh Alavi, University of Wisconsin Milwaukee, 1559 N Prospect Ave. Apt 309, Milwaukee, WI, 53202, United States, alavi@uwm.edu

1 - Inventory Replenishment Decision Support

Matthew D. Dean, University of Southern Maine, Portland, ME, Contact: matthew.dean1@maine.edu

We describe an MBA-led project to help a local glass and metal fabricator improve its inventory replenishment system. Historically, it relied on a manual inventory system controlled by a single person with many years of experience. The MBA team developed a spreadsheet-based linear programming model to recommend purchasing decisions. This tool was then migrated to a user-friendly web-based application.

2 - A Rental Problem With Unreliable Products

Mohammad Firouz, PhD Candidate, University of Alabama, 610 13th, Apt 19, Tuscaloosa, AL, 35401, United States, mfirouz@crimson.ua.edu, Burcu B Keskin, Linda Li

We investigate a capacity planning problem of a rental system as an M/M/c/c queuing model with breakdowns and reneging, and derive the closed form state distributions for a special case. Our proposed algorithm finds the guaranteed global optimal for the non-concave profit function. Bounds are derived for the general case. Numerical experiments demonstrate the performance of our algorithm and some managerial insights.

3 - Shelf And Backroom Inventory Management Under Shelf Stock Dependent Demand

Weili Xue, Southeast University, Hankou Road 22, Nanjing, China, wlxue1981@gmail.com, Ozgun Caliskan Demirag, Frank Y Chen, Yang Yi

Under shelf-stock-level-dependent demand, we develop inventory control policies to determine the amount of inventory to maintain in the backroom and the amount to display on the retail shelf.

4 - Inventory Classification Versus Statistical Clustering For Solving Multi-echelon Inventory Grouping Problem

Alireza Sheikhzadeh, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, asheikhz@uark.edu, Manuel D Rossetti

Inventory classification and statistical clustering methods are two distinct approaches that can be used for inventory grouping. In this research, we compare the performance of the inventory classification and statistical clustering methods in the context of the multi-echelon stocking policy problem. Numerical experiments indicate there is a significant difference between these two methods, in terms of the service performance. We discuss the reasons why clustering is not an appropriate method for inventory grouping problem.

5 - Inventory Management Of Products With Irregular And Intermittent Demand Pattern

Sepideh Alavi, University of Wisconsin Milwaukee, 1559 N Prospect Ave. Apt 309, Milwaukee, WI, 53202, United States, alavi@uwm.edu

In this paper, we highlight the weakness of inventory turnover curve analysis proposed by Ballou (1981) in cases where products have intermittent demand pattern. The inventory management of a cookware manufacturer is studied in this research where planning for the stock of the products which do not have any demand in most of the months in a year or have lumpy demand, is important. We try to fit a gamma distribution to a set of fast- moving. We then will be able to estimate the base stock level for each item under study based on a periodic review inventory policy.

Strategic Customer Behavior in Retail and Manufacturing

Sponsored: Behavioral Operations Management

Sponsored Session

Chair: Pelin Pekgun, University of South Carolina, Columbia, SC, United States, Pelin.Pekgun@moore.sc.edu

1 - Punishment And Reward In a Cooperative Advertising Game

Yukun Zhao, Tsinghua University, Beijing, China, zhaoyk1989@gmail.com, Tony H Cui, Xiaobo Zhao

In this paper, we investigate the counterfactual effects of punishment and reward decisions in an investment-pricing game. Specifically, we consider a dyadic channel where a manufacturer and a retailer first make investments to increase market base demand and then make sequential pricing decisions to sell to end consumers. We build a behavioral model with several relevant behavioral biases to study how firms pricing and profits are affected by the incorporated behavioral constructs. Experimental results confirm the behavioral model's predictions.

2 - Consumer Stockpiling Behavior In A Changing Economy: Implications For Retail Inventory Management

Xiaodan Pan, University of Maryland, College Park, MD, United States, xiaodan.pan@rhsmith.umd.edu, Benny Mantin, Martin E Dresner

Assessing consumer stockpiling behavior is critical for managing promotions. Distinguishing between non-stockpilers and stockpilers we explore how the changing economy influences consumers' purchasing behavior. While the consumption rates of both consumer segments increase (decrease) during expansion (contraction) period, we find that consumer stockpiling propensity is higher during contraction than during expansion period and that regional variations emerge. We discuss implications for inventory management.

3 - Behavioral Ordering And Competition

Brent Moritz, Penn State University, University Park, PA, 16802, United States, bmoritz@psu.edu, Bernardo Quiroga, Anton Ovchinnikov

We investigate the impact of behavioral ordering on profitability. Since most firms compete for customers, we compare the decisions of humans and a management science-driven competitor who places orders under three plausible policies. We evaluate performance when consumers are fully loyal and when they switch to the competitor with higher service levels. We show that the large differences in profits are primarily driven by suboptimal ordering of behavioral decision makers rather than the sophistication of their management-science-driven competitors.

4 - Using Capacity Allocation Policies For Truthful Forecast Sharing

Minseok Park, University of South Carolina, 1520 Senate Street, Apt 127, Columbia, SC, 29201, United States, minseok.park@grad.moore.sc.edu, Pelin Pekgun, Pinar Keskinocak

Through a behavioral study, we investigate customers' strategic forecasting and ordering behavior under different allocation policies from their supplier. Our results suggest that rewarding forecast accuracy in allocating inventory can lead to improved forecast sharing, particularly when the supplier communicates this policy to the customers.

Finance I

Contributed Session

Chair: Huawei Niu, Nanjing Audit University, School of Finance, Nanjing, 211815, China, niuhuawei@gmail.com

1 - Optimal Construction And Rebalancing Of Index-Tracking Portfolios

Oliver Strub, University of Bern, Schuetzenmattstrasse 14, FM Quantitative Methoden, Bern, 3012, Switzerland, oliver.strub@pqm.unibe.ch, Philipp Baumann

Index funds have become popular because they offer attractive risk-return profiles at low cost. The index-tracking problem consists of revising (rebalancing) the composition of the index fund's tracking portfolio in response to new market information and cash changes such that the tracking accuracy of the index fund is maximized. We propose a novel formulation of the index-tracking problem as a mixed-integer linear program. In an empirical study, we demonstrate that the proposed formulation outperforms existing formulations in terms of tracking accuracy and running time.

2 - An Endogenous Structural Credit Risk Model And Its Application In Pricing Derivatives With Credit Risk

Huawei Niu, Nanjing Audit University, School of Finance, Nanjing, 211815, China, niuhuawei@gmail.com, Yajuan Lu

We propose an endogenous structural credit risk model with rollover debt by incorporating with the optimal contracting between the agent and equity holders. The model quantitatively shows that the agency costs induced by the moral hazard can endogenously have significant impacts on a firm's credit risk. Besides, we embed this structural approach into pricing vulnerable options as an application.

3 - Approximation Of Long Memory Process With Short Memory Process With Application To Option Valuation

Barret Pengyuan Shao, Crabel Capital Management, Charlottesville, VA, Contact: barretshao@gmail.com

Options on an asset which follow a long memory process are difficult to value, due to the existence of arbitrage opportunities. Here we show how to avoid the problem of arbitrage opportunities and value vanilla European options when underlying asset returns follow a FARIMA processes which is widely used as an model of long memory price processes. By approximating FARIMA by a stationary ARMA process, we show that the well understood option values for a sufficiently close stationary ARMA process can be taken as option values for the FARIMA process, with very low probability of error. We examine how long memory affects the option values and implied volatility surface.

Sharing Logistics

Sponsored: TSL, Facility Logistics

Sponsored Session

Chair: Wei Qi, Lawrence Berkeley National Laboratory, 1 Cyclotron Rd, Berkeley, CA, 94720, United States, qiwei@berkeley.edu

1 - A Study Of Corporate Barter Exchange Mechanisms

Min Zhao, University of California at Berkeley, Berkeley, CA, United States, vivianmzhao@berkeley.edu, Zuo-Jun Max Shen, Xiaobo Zhao

The study considers a modern corporate barter platform operating under different exchange mechanisms. It focuses on the chance that a participant can find exchange partners and his waiting time before being able to exchange. We derive closed form waiting time distribution under certain conditions and analyze participant's preference according to the waiting time. Insights on improving the performance of a barter platform are also provided.

2 - Household-level Economies Of Scale In Transportation

John Gunnar Carlsson, University of Southern California, jcarlsso@usc.edu

One of the fundamental concerns in the analysis of logistical systems is the trade-off between localized, independent provision of goods and services versus provision along a centralized infrastructure such as a backbone network. We study the "mini-economies" of scale that arise when households make multi-stop trips rather than using package delivery services. Our study is facilitated by an analysis of the Generalized Travelling Salesman Problem in the Euclidean plane.

3 - Shared Mobility For Last-mile Delivery: Implications Of Costs And Green House Emissions

Wei Qi, Lawrence Berkeley National Laboratory, qiwei@berkeley.edu, Lefei Li, Sheng Liu, Zuo-Jun Max Shen

We evaluate the prospect where shared mobility of passenger cars prevails throughout urban areas for home delivery services. We develop logistics planning models that characterize drivers' responses to wages, optimal open-loop routes and service zone design. Then we prescribe several scenarios where this business model is economically and environmentally favorable.

4 - Setting Inventory Levels In A Bike Sharing Network

Michal Tzur, Professor, Tel Aviv University, Tel Aviv, Israel, tzur@eng.tau.ac.il, Sharon Datner, Tal Raviv

Bike sharing operators address the non-homogeneous asymmetric demand processes by repositioning operations. This is a challenging task due to the nature of the user behavior that creates interactions among inventory levels at different stations. For example, an empty/full station can create a spill-over of demand to nearby stations. For the first time, we take this effect into consideration when setting target inventory levels for repositioning. We develop a robust guided local search algorithm and show that neglecting the interactions among stations leads to inferior decision-making.

Understanding and Optimizing Route and Mode Choices in a Dynamic/Multimodal Environment

Sponsored: TSL, Urban Transportation

Sponsored Session

Chair: Monireh Mahmoudi, Arizona State University, Arizona State University, Tempe, AZ, 85281, United States, mmahmoudi@asu.edu

1 - A Dynamic Programming Approach Based On State Space Time Network Representations For The Pickup And Delivery Problem

Monireh Mahmoudi, PhD Student, Arizona State University, Tempe, AZ, 85281, United States, mmahmoudi@asu.edu, Xuesong Zhou

This research proposes a new time-discretized multi-commodity network flow model for the VRPPDTW based on the integration of vehicles' carrying states within space-time transportation networks. Our three-dimensional state-space-time network construct is able to comprehensively enumerate possible transportation states at any given time along vehicle space-time paths, and further allows a forward dynamic programming solution algorithm to solve the single-VRPPDTW. By utilizing a Lagrangian relaxation approach, the primal multi-VRP is decomposed to a sequence of single-vehicle routing sub-problems, with Lagrangian multipliers for individual passengers' requests.

2 - Route Choice In Highly Disrupted Network: Learning, Inertia And Real-time Information

Xinlian Yu, University of Massachusetts, Amherst, MA, United States, xinlianyu@umass.edu, Song Gao

This paper studies the role of inertia, learning and real-time information in route-choice decisions in highly disrupted networks where travel time varies greatly with significant delays. A route-choice experiment with two different scenarios was conducted: the Information scenario provides subjects with real-time information regarding a probable incident and the Incident scenario does not. In both scenarios, subjects were provided with feedback information about the actual travel times on the chosen route. A discrete choice model with a Mixed Logit specification, accounting for panel effects, was estimated based on the experiment's data.

3 - Understanding Traveler Route Choices In Stochastic Multimodal Travel Environment Using Automatic Fare Collection Data

Laiyun Wu, University at Buffalo, 326 Bell Hall, University at Buffalo, Buffalo, NY, 14226, United States, laiyunwu@buffalo.edu, Jee Eun Kang, Alexander Nikolaev

The goal of this paper is to extract traveler behavior patterns from route choice observations in a stochastic multimodal environment, based on Automatic Fare Collection (AFC) data. First, we reconstruct the stochastic travel environment to enable simulation, with the travel times, transfer times, and level-of-service information accounted for. Second, route choices are analyzed to understand and model traveler decision-making.

4 - Personalized Multimodal Mobility Options Discovery In A Social Structure

Ali Arian, PhD Student, University of Arizona, Tucson, AZ, 85721, United States, arian@email.arizona.edu, Yi-Chang Chiu

This study uses a supernetwork to investigate the feasibility and attractiveness of multimodal mobility options. The modeling approach considers driving, walking, public transit and carpooling among users in an existing social structure. Besides desirability measures, algorithmic details and case studies using Metropia data are presented.

Shared-use Rail Corridor Operation and Planning

Sponsored: Railway Applications

Sponsored Session

Chair: Bo Zou, University of Illinois at Chicago, 2073 ERF, 842 West Taylor Street, Chicago, IL, 60607, United States, bzou@uic.edu

1 - Capacity Screening Tool For Mixed Operations

Mei-Cheng Shih, University of Illinois at Urbana - Champaign, Urbana, IL, 61801, mshih2@illinois.edu

In order to determine the appropriate solutions for rail network congestion, we need to identify the capacity constraints of the network first. In this study, we will develop a capacity screening tool based on the concept of "Root Cause Analysis" proposed by White (2005). This tool can calculate the traffic conflict density by taking account the current train schedule and the associated train departure and trip time variation. The traffic conflict density can later be used to identify the capacity constraints of a mainline. Using this tool can help the practitioners to find the weakness of their network in the most efficient way.

2 - Schedule Flexibility And Shared Corridor Capacity

Darkhan Mussanov, University of Illinois at Urbana - Champaign, Urbana, IL, 61801, mussano2@illinois.edu

North American railways operate in the unstructured manner, i.e without strictly adhered to timetable and pre-planned meets. Unscheduled operation poses a challenge the railway planners by increasing the number of possible meets on railway track. This research aimed to investigate the relationship between the schedule flexibility, infrastructure investment and level of service. The results revealed the fragile nature of the structured operation and the substantial investment requirements for the small shifts toward unscheduled operation.

3 - Siding Length, Train Length, And Capacity For Additional Traffic On Single Track Lines

Bradford Kippen, University of Illinois at Urbana - Champaign, Urbana, IL, 61801, United States, kippen2@illinois.edu

Operation of longer freight trains on single track lines has allowed North American Class 1 Railroads to expand freight car throughput without investment in additional infrastructure. However, implementation of this strategy is often limited when the length of longer trains exceeds length of existing passing sidings. RTC analysis has been used to model train delay patterns associated with various strategies of implementing long trains on a hypothetical corridor. In addition, following a simulated increase in traffic volume, a model was developed to determine the infrastructure investment required in either new or longer sidings to return to a baseline level of service.

4 - Capacity Allocation In Vertically Integrated Rail Systems: A Bargaining Approach

Bo Zou, University of Illinois at Chicago, Chicago, IL, United States, bzou@uic.edu, Ahmadreza Talebian

This paper presents a game-theoretic bargaining approach to allocating rail line capacity in vertically integrated systems. A passenger rail agency (PRA) negotiates with the host freight railroad (FRR) to determine train schedules and the associated payment. Bargaining in both complete and incomplete information settings are considered; the latter arises because FRR may withhold its private cost information. Equilibrium schedule with complete information, maximizes system welfare. With incomplete information, PRA may choose between pooling and separating equilibrium strategies while proposing a payment, depending on its prior belief the cost type of FRR.

1 - Terminal Area Sequencing And Scheduling: The Single Runway Case

Jitamitra Desai, Professor, Nanyang Technological University, Singapore, Singapore, jdesai@ntu.edu.sg, Rakesh Prakash

This paper addresses the aircraft sequencing problem over the entire terminal maneuvering area (TMA) under a mixed-mode, single runway operating scenario. In contrast with existing approaches that only consider the runway as a bottleneck, our 0-1 mixed-integer LP formulation optimizes flight sequences and schedules by taking into account the configuration and associated constraints of the entire TMA region. Variable fixing strategies and valid inequalities are derived to tighten the continuous relaxation of the problem. Computational results show the overall delay in the system can be reduced by nearly a 30% margin over the default FCFS policy and by nearly 10% over the runway sequencing policy.

2 - Passenger Route Choice Prediction In The U.S. Airline Industry: Statistical Methods versus Machine Learning Techniques

Chia-Mei Liu, FAA, Chia-Mei.Liu@faa.gov, Peng Wei, Jerrod Sharpe

In the community of airline forecast research, while there are plenty research in airline passenger demand modeling that designs to forecast passenger growth, relatively little attention has been paid to passenger route choice forecast between nonstop and connecting flights. This paper contributes to this area of the research by constructing a route choice model, estimated through statistical methods as well as machine learning methods. The results have important implications in operation forecast as route choice forecast affects airline fleet planning. Consequently, this research benefits policy makers and industry practitioners by expanding our understanding on passenger route choice.

3 - Capturing Passenger Compensation Impacts For An Integrated Airline Recovery

Luis Cadarso, Rey Juan Carlos University, Camino del Molino s/n, Fuenlabrada, 28943, Spain, luis.cadarso@urjc.es, Vikrant Vaze

The European flight delay compensation regulation (EC) No 261/2004 establishes common rules on compensation to passengers in the event of disruptions. We develop an integrated approach that recovers airline timetable, fleet assignment, aircraft routings, and passenger itineraries capturing the impacts of airlines' decisions on passenger compensation. We evaluate scenarios involving disruptions, and optimize recovery decisions to maximize profits by modeling passenger no-shows after disruptions.

Location Models

Sponsored: Location Analysis

Sponsored Session

Chair: Oded Berman, University of Toronto, 105 St. George Street, Toronto, ON, M5S 3E6, Canada, berman@rotman.utoronto.ca

1 - Responsive Supply Chain Network Design

Oded Berman, University of Toronto, 105 Saint George Street, Toronto, ON, M5S 3E6, Canada, berman@rotman.utoronto.ca, Robert Aboolian, Jiamin Wang

In this paper, we address the network design of a responsive supply chain consisting of make-to-order facilities facing stochastic demand. Each facility has a finite capacity and stochasticity of demand may lead to congestion delays at the facilities. We consider three problems. In the first, we minimize the total network cost including delivery and capacity costs while maintaining an acceptable response time to customers. In the second, a penalty is charged on the number of units delivered later than the targeted response time. In the third, the penalty charged also depends on the number of days that the delivery is late. The penalty cost in both problems 2 and 3 are a function of network's response time.

2 - The p-center On A Network With Probabilistic Demand Weights

Jiamin Wang, Long Island University, Brookville, NY, United States, Jiamin.Wang@liu.edu, Oded Berman

We study the p-center problem on a network with probabilistic demand weights. Two models are presented. The objective of the first model is to maximize the probability that the longest weighted distance from the nodes to the closest facility does not exceed a pre-selected target level. In the second model, facilities are located so as to minimize the value-at-risk, namely, a quantile of the longest weighted distance with a specified confidence level. Special cases are identified that are equivalent to the deterministic center model. The problem is shown to be NP-hard. Exact solution procedures and heuristics are developed for demand weights of discrete and continuous probability distributions.

3 - Location Depots To Facilitate Routing A Mixed Fleet Of Electric And Conventional Vehicles

Nan Ding, Univesity of Buffalo (SUNY), Buffalo, NY, nanding@buffalo.edu, Rajan Batta

Most of current works of routing electric vehicles (EVs), assuming charging availability en route, may need high cost of establishing charging infrastructures. In this work, an alternative strategy to adopt EVs is proposed. This strategy considers charging to be only allowed at depots over the night. To this end, intermediate depots (IDs) are introduced to facilitate routing EVs to customers while conventional vehicles are used to serve IDs from center depot. To determine optimal locations of IDs and routing plans, a joint location-routing problem is formulated. A bi-level heuristic method with upper level determining the locations of IDs and lower level determining routing plans is developed.

Pareto Set Reduction Theories and Methods

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Daniel Jornada, Texas A&M University, 1700 Research Parkway, College Station, TX, 77843, United States, djornada@tamu.edu

1 - New Notions Of Efficiency For Multicriteria Optimization Under Uncertainty

Devon Sigler, PhD Candidate, University of Colorado Denver, Denver, CO, United States, devon.sigler@ucdenver.edu, Alexander Engau

We present several new notions of efficiency for multicriteria optimization problems under uncertainty. We demonstrate that these new definitions can be fully characterized theoretically in a hierarchical manner and methodologically using a collection of modified scalarization and generation methods. Related computational comparisons and applications will be discussed.

2 - Robust Solutions To Uncertain Multiobjective Linear Programs

Garrett M. Dranichak, Department of Mathematical Sciences, Clemson University, Clemson, SC, United States, gdranic@clemson.edu, Margaret M Wiecek

We study highly robust efficient solutions to multiobjective linear programs with uncertainty in the objective function coefficients drawn from finite uncertainty sets. We present results on existence and identification of highly robust efficient solutions, as well as properties of and bounds on the highly robust efficient set. Additional attention is given to a special case of problems yielding a robust counterpart that is easily solvable.

3 - Pareto Set Reduction Theories And Methods

Kalyanmoy Deb, Department of Electrical and Computer Engineering, Michigan State University, kdeb@egr.msu.edu

In many multi-objective optimization problems, objectives become correlated to each other thereby reducing the dimension of the Pareto-optimal set. In an evolutionary multi-objective optimization method, we have integrated a principal component analysis method to identify redundant objectives and solve very large-scale problems.

4 - A Post-pareto Approach Using A Non-uniform Weight Generator Method With Prioritized Objectives

Juan V Fernandez, Industrial, Manufacturing and Systems Engineering Department, University of Texas at El Paso, jvfernandez@miners.utep.edu

Multi-objective optimization has been recognized as an important research area in the last years since many real life problems present multiple criteria that need to be optimized simultaneously. Using metaheuristic methods or evolutionary algorithms as solution methodologies leads to a large number of Pareto solutions rather than a single unique optimum. Ultimately, all solutions are considered to be Pareto-optimal and selecting the one solution among others can be an arduous task for the decision-maker. This research presents a new developed approach that uses a non-uniform weight generator method to reduce the size of the Pareto-optimal set under the consideration of prioritized objectives.

Digital Transformation of Labor, Media, Telecom, and Financial Markets

Sponsored: Information Systems

Sponsored Session

Chair: Wei Chen, University of Arizona, University of Arizona, Tucson, AZ, 85721, United States, weichen@email.arizona.edu

1 - What Do Employers Look For In Candidates?

Xuan Ye, New York University, xye@stern.nyu.edu, Prasanna Tambe

Using novel data with descriptions of job interview processes collected from a career intelligence platform, I test the hypothesis that employers assess job candidates' ability, i.e. problem-solving skills and analytical skills, not labor market experience when they recruit for jobs that require new technical skills. These cognitive skills are hypothesized to be important in a fast moving production environment. Employers' evaluation methods are measured by text-mining the interview questions contributed by the job candidates. With employer fixed effects estimates, I find that employers use ability-based assessment question 39% more frequently for NewTech jobs than for other jobs.

2 - New Product Launch With Capacity Constraints And Congestion-sensitive Consumers

Duy Dao, University of California, San Diego, Duy.Dao@rady.ucsd.edu, Terrence August, Hyoduk Shin

A problem faced by the entertainment industry is the impact of congestion on the release of a product. For theatrical releases, consumers have learned to delay consumption, trading off this congestion cost with the loss of movie buzz as the movie fades in relevance over time. Some may even forgo purchase because of congestion. For online games, a surge of consumers logging on to play an MMORPG can result in server issues during the initial release. In this paper, we model how consumers decide when to make a purchase, considering the congestion they experience. We then offer a strategy for how to profitably expand the market when taking into consideration congestion-sensitive consumers.

3 - The Role Of Technological Discontinuity On Incumbency Advantage

Xiahua Wei, University of Washington, Bothell, xhwei@uw.edu

This study examines how technological discontinuity contributes to market competition, especially the incumbency of established firms. Based on the theory of barrier to entry, we investigate the consequence of technological change in the mobile telecommunications industry. We find that the ability of new entrants to disrupt incumbents depends on the responsiveness of incumbents to the new technologies. Further, we show that intense competition in the wake of technological discontinuities, driven entirely by incumbents, can delay industry shakeouts.

4 - Taxes And Equity Investment: Evidence From Equity Crowdfunding

Wei Chen, University of Arizona, weichen@email.arizona.edu, Mingfeng Lin

Given the positive externality that entrepreneurial activities bring to the economy, governments around the world have routinely resorted to various incentives to spur entrepreneurship. In this paper, we empirically study whether and how investments in early stage businesses respond to tax incentives, using a natural experiment due to a policy change, and a comprehensive transaction-level dataset from leading online equity crowdfunding platforms in the United Kingdom.

Data Analytics in Emerging Applications

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Nan Chen, National University of Singapore, Singapore, Singapore, isecn@nus.edu.sg

1 - Inferring Three-dimensional Porous Defects Based On Cross-sectional Images In Metal-based Additive Manufacturing

Jianguo Wu, Assistant Professor, University of Texas-El Paso, 500 W University Ave, Engineering Building, A-244, El Paso, TX, 79968, United States, jwu2@utep.edu, Nan Chen, Haijun Gong

Porosity is one of the most critical quality issues in the metal-based additive manufacturing. This paper develops a novel quality inspection method by inferring the size distribution, void density and volume fraction of 3D porosity defects based on 2D cross-sectional images. The linkage between the size of ellipsoidal defects and the size of cross-sectional elliptical contours is established. An efficient Quasi-Monte Carlo EM algorithm is developed for 3D size distribution estimation. The relationship between the 3D and 2D void densities is developed to estimate the 3D void density and porosity. The effectiveness of the proposed method is demonstrated through simulation and case studies.

2 - Change-point Detection On Solar Panel Performance Using Thresholded Lasso

Youngjun Choe, University of Washington, Seattle, WA, United States, yjchoe@umich.edu, Weihong Guo, Eunshin Byon, Judy Jin, Jingjing Li

Solar energy is a fast growing energy source. Solar energy stakeholders are, however, concerned with sudden deterioration of photovoltaic systems' performance. This study focuses on retrospectively identifying the time points of abrupt changes. We present a nonparametric detection method based on Thresholded LASSO. The proposed method is able to accurately detect performance changes, while being robust against false detection under noisy signals. The performance of the proposed method is evaluated and compared with state-of-the-art methods through extensive simulations and a case study using data collected from four solar energy facilities.

3 - Data-driven Diagnosis For Asthma Control Status In Smart Asthma Management System Based On Correlated Gamma-based Hidden Markov Model

Junbo Son, Assistant Professor, University of Delaware, Newark, DE, United States, sonjunbo@gmail.com, Shiyu Zhou, Patricia Brennan

Driven by the IoT, a smart asthma management (SAM) system has been implemented in practice. The SAM system includes rescue inhalers with a wireless connection and the system records the inhaler usage and transmits the data to a centralized server. To effectively manage the asthma, a statistical model based on the patient monitoring data from the SAM system is crucial. In this research, we propose a data-driven diagnostic tool for assessing underlying asthma control status of a patient based on hidden Markov model (HMM). The proposed correlated gamma-based HMM can visualize the asthma progression to aid therapeutic decision making and its promising features are shown in both simulation and case study.

4 - Reliability Analysis Considering Dynamic Material Local Deformation

Wujun Si, Wayne State University, fk9456@wayne.edu, Qingyu Yang, Xin Wu

We conduct reliability analysis utilizing dynamic material local deformation information. A novel multivariate general path model with a new variance-based failure criterion is proposed. A two-stage parameter estimation method is developed to overcome the computational complexity. Both simulation studies and physical experiments are conducted for verification and illustration.

1 - Statistical Process Control Of Stochastic Textured Surfaces

Anh T Bui, Northwestern University, Evanston, IL, United States, atbui@u.northwestern.edu, Daniel Apley

We develop a defect monitoring and diagnostic approach for manufactured products that have stochastic textured surfaces (e.g., textiles or material microstructures). We first use generic supervised learning methods to characterize the stochastic behavior of “normal” in-control samples of the textured surfaces. Based on the residuals of the supervised learning model applied to new samples in a statistical process control context, we propose two spatial moving statistics for detecting local aberrations in the textured surfaces. We illustrate the approach using simulated and real examples.

2 - Causation-based Process Monitoring And Diagnosis For Multivariate Categorical Processes

Xiaochen Xian, the University of Wisconsin, Madison, WI, xxian@wisc.edu

Statistical surveillance for multivariate categorical processes have attracted more and more attentions. In many applications, causal relationships may exist among categorical variables, where the shifts at upstream variables will propagate to their downstream variables. We employ Bayesian network to characterize such causal relationships and integrate it with the statistical process control technique. We propose two control charts for detecting shifts in the conditional probabilities of the multiple categorical variables that are embedded in the Bayesian network. Both simulation and real case studies are used to demonstrate the effectiveness of the proposed schemes.

3 - A Thermal Field Estimation Method Based On Spatial-temporal Dynamics Using Multi-channel Sensor Data

Xi Zhang, Peking University, Beijing, China, xi.zhang@pku.edu.cn, Di Wang, Kaibo Liu

Thermal field profile is one of the critical issues for the quality assurance of the grain warehouse. However, only limited sensors are afforded to characterize the dynamics in the grainhouse, leading to an inappropriate decision for grain maintenance. This article presents a field estimation approach to model spatio-temporal dynamics of warehouse temperature through integrating thermodynamics model and spatiotemporal stochastic processes. Specifically, we integrate a 3-D unsteady heat transfer model into a Gaussian Markov random field to achieve a parsimonious representation of spatial patterns. Simulation and real case are conducted to show the effectiveness of the developed method.

4 - Multivariate Ordinal Categorical Process Control Based On Log-linear Modeling

Jian Li, Xi’an Jiaotong University, Xi’an, China, jianli@mail.xjtu.edu.cn, Junjie Wang, Qin Su

The quality of products or services is sometimes measured by multiple categorical characteristics, each of which is classified into attribute levels such as good, marginal, and bad. There is usually natural order among these attribute levels. By assuming that each ordinal categorical quality characteristic is determined by a latent continuous variable, this work incorporates the ordinal information into an extended log-linear model and proposes a multivariate ordinal categorical control chart. Simulations show that the proposed chart is efficient in detecting location shifts and dependence shifts in the corresponding latent continuous variables of ordinal categorical characteristics.

Statistical Models for Computer Experiments

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Qiong Zhang, Richmond, VA, United States, qzhang4@vcu.edu

1 - Efficient Gaussian Process Modeling For Computer Experiments

Yibo Zhao, Rutgers State University of New Jersey, Piscataway, NJ, United States, yz346@scarletmail.rutgers.edu

We study the problem of simultaneous variable selection and parameter estimation in Gaussian process models. Conventional penalized likelihood approaches are attractive but the computational cost of the penalized likelihood estimation (PMLE) or the corresponding one-step sparse estimation (OSE) can be prohibitively high as the sample size becomes large. This is because the likelihood function heavily involves operations of a covariance matrix of the same size as the number of observations. To address this issue, this article proposes an efficient subsample aggregating (subagging) approach with an experimental design-based subsampling scheme. The proposed method is computationally cheaper, yet it can be shown that the resulting subagging estimators achieve the same efficiency as the original PMLE and OSE asymptotically. The finite-sample performance is examined through simulation studies. Application of the proposed methodology to a data center thermal study reveals some interesting information, including identifying an efficient cooling mechanism.

2 - Change-point Detection For Spatial-temporal Organ Image Data

Shuyu Chu, Virginia Tech, cshuyu@vt.edu, Xinwei Deng, Ran Jin

The demand for organ transplantation increases rapidly, but only a limited number of viable organs is available. Poor preservation and evaluation cause many organs to be discarded. Current evaluation methods are often inaccurate or result in organ damage. There is a great need for accurate non-invasive evaluation methods. In this work, we focus on detecting quality changes in organs under preservation by only using biomedical thermal image data. Scalable Gaussian processes with expressive spectral mixture kernels is applied on the large multidimensional image data to conduct model fitting and inference. A real case study will be used to elaborate the performance of the proposed method.

3 - Asymmetric Process For Stochastic Simulation

Qiong Zhang, Virginia Commonwealth University, qzhang4@vcu.edu

Quantiles serve as important measurements in stochastic simulation. In simulation practice, we need statistical methods to model these quantiles for optimization or calibration. However, the traditional Gaussian process model often fails to capture the behavior of quantiles if the sample path is not long enough. To resolve this issue, we will introduce the asymmetric process for modeling the quantiles in stochastic simulation. Numerical results will be provided to show the effectiveness of this new approach.

Joint Session Telecom/MIF: Modeling and Optimization for Social Network Analysis

Sponsored: Telecommunications/MIF

Sponsored Session

Chair: Eli Olinick, Southern Methodist University, P.O. Box 750100, Dallas, TX, 75275, United States, olinick@lyle.smu.edu

1 - Design Of Survivability Networks Under Vulnerability Constraints

Luis Gouveia, University of Lisbon, legouveia@fc.ul.pt, Markus Leitner

We consider the Network Design Problem with Vulnerability Constraints (NDPVC) which simultaneously addresses resilience against failures and bounds on the lengths of each communication path. We show how the new problem differs from the Hop-Constrained Survivable Network Design Problem. We explain that the reason for this difference is that hop-constrained Mengerian theorems do not hold in general. Three graph theoretical characterizations of feasible solutions to the NDPVC are derived and used to propose integer linear programming formulations that are compared in a computational study.

2 - Characterizing Cohesive Subgroups In Social Networks

Zeynep Ertem, university of Texas at Austin, Austin, TX, United States, ertem@utexas.edu, Zeynep Ertem, University of Texas at Austin, Austin, TX, United States, ertem@utexas.edu, Sergiy Butenko, Alexander Veremyev, Yiming Wang

Identifying closely-knit groups of entities within complex systems might reveal interesting social circles. In this talk, we first introduce a new mathematical model that corresponds to a new definition for cohesive subgroups based on a commonly used graph metric, clustering coefficient. We develop a network-clustering algorithm using this new model. Second, we develop exact and approximate algorithms for a special case of our first model, for which two classical canonical problems (i.e., maximum independent set and maximum clique) are lower bounds.

3 - The 2-club Polytope

Illya Hicks, Rice University, ivhicks@rice.edu, Foad Pajouh, Balabhaskar Balasundaram

Given some positive integer k, a k-club of a graph G is a subset of its vertices S such that the subgraph induced by S, say G[S], has diameter at most k. The concept of k-clubs is one of many known relaxations of the concept of cliques for graphs. The k-club model is particularly interesting from a polyhedral point of view since it does not posses the hereditary property for k values larger than one. In this talk, we explore the 2-club polytope and derive facets related to distance domination. We also present some computational results displaying the effectiveness of these new inequalities. This is joint work with Foad Pajouh and Balabhaskar Balasundaram.

4 - A Network Flow Duality Foundation For Hierarchical Cluster Analysis

Eli Olinick, Southern Methodist University, olinick@lyle.smu.edu

Many popular data clustering and classification techniques from the social sciences lack a rigorous foundation in graph theory and mathematical optimization even though they are often based on graph and network models of interaction and affinity. We show that a clustering method based on the fundamental graph-theoretic concept of density and implemented via a duality to network flows can produce more comprehensive and meaningful results in appropriate problem domains.

1 - A Simulation-based Optimization Framework For Online Urban Traffic Control Problems

Linsen Chong, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Room 1-245, Cambridge, MA, 02139, United States, linsenc@mit.edu, Carolina Osorio

We propose an online simulation-based optimization (SO) framework that uses computationally expensive microscopic simulators for real time traffic control problems. The framework consists of a metamodel SO method, a data-fed analytical traffic model method and a data-driven method. This framework is computationally efficient and allows a high-dimensional non-linear optimization problem to be solved in real time. We illustrate the performance of the proposed method through a large-scale urban traffic responsive control case study.

2 - Spatial-temporal Air Quality Mapping For Smart-in Vehicle Climate Control Management

Yimin Liu, Ford Motor Company, Dearborn, MI, United States, yliu59@ford.com, Yu Chen, Jinjing Yang, Yun-Jhong Wu

The proliferation of connected car technologies with App and cloud-based analytics provided opportunities for effective vehicle climate control management. To enable the technologies, we propose an advanced spatial-temporal model to forecast a high resolution air pollution map fusing existing government data with the data from vehicle external sensors. Furthermore, an optimization algorithm is developed to manage in-vehicle air quality at the optimal level during the trip via the technology.

3 - Road Pricing For Informed Users With Risk Neutral Time Cost And Risk Averse Health Cost

Zhen Tan, Cornell University, 314 University Ave., Apt 7, Ithaca, NY, 14850, United States, zt78@cornell.edu

We analyze tolling for road users with differentiated trip value and delay and health cost incurred by congestion. Users are informed with delay and pollutant exposure level. We assume users are risk-neutral to delay but risk-averse to toxic air inhalation. The linear delay disutility has a multiplier increasing in the trip-value, while user's disutility function of inhalation has absolute risk-aversion decreasing in trip-value. Based on properties of steady-state volume-delay/inhalation relationships, we characterize the welfare /revenue maximizing price for one bottleneck and for one prioritized route among two. We discuss on how health information affects congestion management.

4 - Using Optimization To Improve The Freight Transportation Operations Of A Fedex Licensee

Omar Ben-Ayed, Qatar University, College of Business and Economics, Doha, Qatar, omar.benayed@qu.edu.qa, Salem Hamzaoui, Leandro C Coelho

We describe the applications of network design and timetabling optimization to a major freight transportation company in the MENA region in order to improve its performance in terms of cost and delivery time. The application involved two sequential projects. The first developed and implemented new design and new timetable that led to remarkable gains for the company. Later, the second project involved devising better optimization models, obtaining more accurate data, and more importantly establishing a broader cooperation with the practitioners, mostly thanks to the trust gained after the success of the first project. Again, the implementation of our results led to significant improvements.

5 - Column Generation For Vehicle Routing Problems With Synchronization Constraints

Markus Matthaus Frey, Dr., Technical University Munich, Arcisstrasse 21, Munich, 80333, Germany, markus.frey@tum.de, Martin Fink, Ferdinand Kiermaier, Francois Soumis, Guy Desaulniers, Rainer Kolisch

Synchronization of workers and vehicles plays a major role in many industries and belongs to the class of vehicle routing problems with multiple synchronization constraints (VRPMSs). We present a VRPMSs archetype covering all synchronization types including movement and load, and propose two mathematical formulations to efficiently model all synchronization types. Additionally, we develop a column generation approach employing a novel fixing strategy.

1 - A Unified Framework For Vehicle Licenses Allocation

Zhou Chen, Hong Kong University of Science and Technology, Clear Water Bay, Hong Kong, Hong Kong, zchenaq@connect.ust.hk, Qi Qi, Changjun Wang

Recently, many big cities began to adopt the vehicle licenses quantitative control policies. In these cities, a limited number of licenses are allocated every month. The current allocation policies differ from city to city. In this work, we propose to target the dual objectives of efficiency and equality and present a two-stage framework that unifies most current mechanisms and outperforms all existing mechanisms in both efficiency and equality. The unified framework also leads to easy implementation due to its truthfulness, distribution-free and highly efficiency. Furthermore, we extend our unified framework into multiple stages and fully characterize the optimal mechanism.

2 - Exclusivity In Online Advertising

Marjan Baghaie, Microsoft, Seattle, WA, 98105, United States, marjanb@microsoft.com, Amin Sayedi, Kinshuk Jerath

We investigate auction mechanisms for sponsored search in which advertisers can bid to be displayed exclusively after a keyword search. We find that allowing advertisers to bid for exclusivity can increase the revenue of the search engine because bidders compete not only for positions in the non-exclusive outcome but also for the outcome to be exclusive or non-exclusive. Interestingly, however, under certain conditions, the revenue of the search engine can decrease because competition between outcomes leads to bidders reducing bids for their non-preferred outcome. We also find that, under certain conditions, advertisers have the incentive to bid above their true valuations.

3 - Game-theoretic Modeling Of Players' Ambiguities On External Factors

Jian Yang, Associate Professor, Rutgers University, 1 Washington Park Rm 1084, Newark, NJ, 07102, United States, jyang@business.rutgers.edu

We propose a game-theoretic framework that incorporates general ambiguity attitudes on factors external to all players. Our starting point is players' preferences on payoff-distribution vectors, essentially mappings from states of the world to distributions of payoffs to be received by players. When the preferences possess ever more features, we can gradually add ever more structures to the game. Particular attention is paid to what we shall call the enterprising game, in which players exhibit ambiguity seeking attitudes while betting optimistically on the favorable resolution of ambiguities.

4 - Equilibrium Structure Of Fixed-cost-reducing Alliances When Firms' Market Power Is Asymmetric

Edward Anderson, The University of Texas at Austin, Austin, TX, hirosano@fc.ritsumei.ac.jp, Hiroki Sano

With the context of alliance formation between semiconductor manufacturers in new technology development, we study how competing firms' cooperative decisions in a new market entry opportunity can be stabilized from a game-theoretic perspective. We discuss the equilibrium alliance structure when firms can be asymmetric in their relative market power while the individual investment cost is symmetric. In a three-firm case, we show that, under certain conditions, the firm with the second highest market power can choose not to enter a new market while the other two firms cooperatively enter.

1 - Web-based Grocery Retail Business With Order Cancellation And Refund Options

Yi Zhang, Shandong Institute of Business and Technology, Yantai, China, iynnezhangyi@foxmail.com, Yang Li, Xiangpei Hu

This research is based on a real web-based B2C grocery retail business in China. Customers to this business demand fresh products and efficient delivery, at the same time, want to keep options of cancelling the orders and getting refund. In this study, we aim to derive an effective joint strategy on inventory planning, selling price and the order cancellation charges, which maintains the profitability and sustainability of the business.

2 - A Meta-analytic And Latent Semantic Analysis Approach To Informing Quality Management

Xianghui Peng, Assistant Professor, Eastern Washington University, Spokane, WA, United States, xpeng@ewu.edu, Victor R Prybutok

A meta-analytic study of empirical Baldrige Quality Award research is conducted. The analysis includes an evaluation of the relationships among award categories. The Baldrige framework is examined using latent semantic analysis to analyze winning applications. We identify opportunities to further develop quality management theory based on the integrated results.

3 - A Capacitated Vehicle Routing Problem With Order Available Time

Ling Liu, Huazhong U of Science and Technology, 1037 Luoyu Road, Hong Shan District, Wuhan, 430074, China, 182028870@qq.com

The capacitated vehicle routing problem with order available time is considered in this paper, the orders are not available for delivery at the beginning of the planning period. It is observed in the context of integrated production and transportation scheduling. An efficient tabu search algorithm and a genetic algorithm are presented to tackle the problem.

1 - Equilibrium Analysis On Price-matching Policy For Two Competitive Retailers

Jinpeng Xu, Xidian University, 266 Xinglong Section of Xifeng Road, Xi'an, 710126, China, jinpxu@foxmail.com, Yufei Huang

Price-matching policy is widely used by retailers as a competitive strategy to stimulate demand. Under this policy, retailers promise to match the lowest price in the market. We consider two retailers selling the same product in their exclusive market and a competitive market. We use a game theoretical model to investigate whether price-matching policy should be offered by the retailers in competition, and how such decisions are influenced by the size of the exclusive and competitive market. Our results show that the retailer with larger exclusive market is more likely to offer the price-matching policy, and the optimal equilibrium strategy depends on the cost of providing price-matching policy.

2 - Keys To Green Product Line Design: Consumer Perceptions, Cost Implications, Price And Quality Optimization

Monire Jalili, PhD Candidate, University of Oregon, 1208 University of Oregon, Eugene, OR, 97403, United States, mjalili@uoregon.edu, Tolga Aydinliyim, Nagesh N Murthy

Consumers may have opposing perceptions of the green quality (the amount of recycled content in a green product). Naturalite consumers may prefer a green product with some recycled content, while conventional consumers prefer a base product with no recycled content. While the firm can save on material cost by using some recycled content, processing a mixed material input may increase the production cost. Considering these contrasting demand and supply forces, we study a monopolist's price and quality optimization problem in a product line context and in particular, answer whether/when it is optimal for the monopolist to offer only the green version of the product.

3 - Does Social Image (Pakistani Consumers) Mediate Relationship Between Brand Performance And Brand Attachment For An Imported Cosmetic Brand?

Huma Amir, Chairperson Marketing Deptt., Assistant Professor, Inst of Bus Admin- Karachi, Suite # 218, Main Campus, University Road, Karachi, 75270, Pakistan, huma.amir@hotmail.co.uk, Wajid Rizvi

Empirical study on cosmetic industry suggests brand performance influences brand attachment (= .71 p <.05) with explained variance, R2 =.51. Further investigation on whether this relationship is mediated by social image suggests full mediation. When social image was used as mediating variable the direct influence of brand performance on brand attachment reduced from = .71 (p <.05) to = .01 (p >.05) and became insignificant, whereas indirect effect was = .83 (p < .05). After the mediation, variance explained by the model also increased from R2 =.51 to R2 =.71. The model fit indices also show model fit. The sample size was bootstrapped to 5000 to assess mediation effect and also showed full mediation.

4 - Empirical Evidence On The Contagion Effect Of Product Harm Recall

Alireza Azimian, Wilfrid Laurier University, 75 University Avenue West,, Unit 103, Waterloo, ON, N2L 3C5, Canada, azim9110@mylaurier.ca, Kevin B Hendricks

The results of the studies on the impact of product harm recalls on rivals are quite mixed. Our research explores whether the signal value of the harm, commoditization level of the industry and physical length of the value chain can explain the differences.

5 - Uniform Pricing Vs. Non-uniform Pricing For Branded Variants: Implications For Channel Structure Equilibrium

Xue Li, Tsinghua University, Beijing, China, lix2.11@sem.tsinghua.edu.cn, Jian Chen

Traditionally, firms adopt non-uniform pricing to discriminate product prices and improve profitability. However, considering consumers' concerns of peer-induced price fairness, it is a reasonable choice for a firm to adopt uniform pricing for branded variants. Under these two different pricing strategies, we analyze channel structure equilibrium in a game-theoretic model.

1 - Hierarchical Response Model For Casualty Processing In Mass Casualty Incidents

Alkis Vazacopoulos, Optimization Direct, Inc., 202 Parkway, Harrington Park, NJ, 07640, United States, alkis@optimizationdirect.com, Nathaniel Hupert, Dimitris Paraskevopoulos, Panagiotis Petros Repoussis, Panagiotis Petros Repoussis

This work presents a response and resource allocation model in the aftermath of a Mass-Casualty Incident. A mixed integer math programming formulation is proposed for the combined ambulance dispatching, patient-to-hospital assignment, and treatment ordering problem. The goal is to allocate effectively the limited resources during the response effort so as to improve patient outcomes, while the objectives are to minimize the overall response time and the total flow time required to treat all patients. The model is solved via exact and MIP-based heuristic methods. The applicability of the model and the performance of the new optimization methods are challenged on realistic scenarios.

2 - Key Factors And Patterns In Employee Choice Of High Deductible Health Plans

Qing Ye, Purdue University, 315 N Grant St, West Lafayette, IN, 47907, United States, yqing@purdue.edu, Bhagyashree Katare, Yuehwern Yih

U.S. employers have increasingly provided high-deductible health plans in response to the rising cost of health care. This study provides insight into selecting and switching behavior of employees towards high-deductible health plans. Data mining techniques are utilized to identify factors associated with their plan choice mobility. A case study is presented using five years' claims information.

3 - Hospital Information Technology Investment Impacts On Patient Satisfaction, Clinical Performance, Efficiency, And Patient Outcomes

Neset Hikmet, Associate Professor, University of South Carolina, 1301 Gervais St, Suite 1010, Columbia, SC, 29208, United States, nhikmet@sc.edu, Benjamin Schooley

This study extends prior research on healthcare information technology (HIT) investment impacts on hospital performance. We analyzed 102 different HIT investment types; categorized them as clinical, administrative, strategic, and infrastructure HIT investments; and examined relationships between these and hospital performance scores. Combining secondary survey data from U.S. hospitals and a separate data set from CMS, we found significant positive and negative relationships between clinical and infrastructure HIT investment and hospital total performance, clinical performance, patient satisfaction, and efficiency scores - controlling for organizational factors.

1 - Flexible Estimation Of Conway-maxwell Poisson Distribution

Suneel Babu Chatla, Doctoral Student, National Tsing Hua University, Hsinchu, 30013, Taiwan, suneel.chatla@iss.nthu.edu.tw, Galit Shmueli

The Conway-Maxwell Poisson (CMP) distribution is popularly used for its ability to handle both overdispersed and underdispersed count data. Yet, there is no efficient algorithm for estimating CMP regression models, especially with high-dimensional data. Extant methods use either nonlinear optimization or MCMC methods. We propose a flexible estimation framework for CMP regression based on iterative reweighted least squares (IRLS). Because CMP belongs to the exponential family, convergence is guaranteed and is more efficient. We also extend this framework to allow estimation for additive models with smoothing splines.

2 - Fast Approximate Policies For Large Networks

Ankur Mani, University of Minnesota, 808 Berry St. Apt. 410, St. Paul, MN, 55114, United States, amani@umn.edu

Optimal policies for networks may be computationally hard and still may lead to suboptimal outcomes if the network information is noisy. We present simple heuristics with comparable performance. These policies are easy to compute and we provide guarantees for their performance. As an example we study price discrimination in networks and show that our heuristics give approximately optimal expected profits for large random networks.

3 - Multivariate Subexponential Distributions And Their Applications

Julian Sun, Cornell, Ithaca, NY, 14850, United States, ys598@cornell.edu, Gennady Samorodnitsky

We propose a new definition of a multivariate subexponential distribution. We compare this definition with the two existing notions of multivariate subexponentiality, and compute the asymptotic behavior of the ruin probability in the context of an insurance portfolio, when multivariate subexponentiality holds. Previously such results were available only in the case of multivariate regularly varying claims.

1 - Territory Design With Risk For A Micro Finance Institution

Tahir Ekin, Assistant Professor of Quantitative Methods, Texas State University, 601 University Dr. Mccoy 411, San Marcos, TX, 78666, United States, t_e18@txstate.edu, Fabian Lopez Perez, Francis Mendez, Jesus Jimenez

Micro finance institutions (MFIs) play an important role in emerging economies as part of programs that aim to reduce income inequality and poverty. This talk addresses a territory planning problem for a MFI. We propose a mixed integer programming model that lets the decision maker choose the location of the branches to be designated as territory centers and allocate the customers to these territory centers with respect to risk and planning criteria: the total workload, monetary amount of loans and profit allocation. In order to solve this model for the large size instances of the MFI, we utilize heuristics such as fixing variables, perturbation, and dynamic relocation of territory centers.

2 - Model Of Ambulance Deployment And Dispatch Arrangement And Simulation-based Assessment Of Mass Casualty Incident

Yu-Ching Lee, Assistant Professor, National Tsing Hua University, Hsinchu, Taiwan, liuyentingthomas@gmail.com, Yen-Ting Liu, Albert Y. Chen, Yu-Shih Chen

A major focus of emergency medical service (EMS) systems is to save lives, minimize response time and to increase the survival rate in both the cases of stochastic events and extreme events. The extreme events, such as natural disaster (earthquake) and man-made disaster (terrorist attacks), are usually not predictable and need multiple rounds of ambulance dispatch. This paper is committed to model the deployment and split dispatch of ambulances, and to generate numerical results to assess the overall services, hoping to be an optimization-model-aided support to the real world operations.

3 - Solving Utility-maximization Multinomial Choice Problems: When Is The First-choice Model A Good Approximation?

Victoire Denoyel, PhD Candidate, ESSEC Business School, Paris, France, victoire.denoyel@essec.edu, Victoire Denoyel, PhD Candidate, Brooklyn College, Brooklyn, NY, NY, United States, victoire.denoyel@essec.edu, Laurent Alfandari, Aurelie Thiele

For optimization problems with a utility maximization objective, it is common to model consumer behavior with MNL logit. This can lead to high fractional complexity when binary decision variables are involved. A first-choice or assignment model is computationally simpler although less close to reality. We design the first comparison of the two approaches in the context of optimization. Our main contribution is to quantify which probabilistic assumptions allow the use of the solution of the first-choice model as an approximation to the MNL logit model. Applications vary from policy to retail or facility location.

Andrii Berdnikov, Graduate Student, University of Tennessee, Knoxville, 525 John D. Tickle Building,851 Neyland Drive, Knoxville, TN, 37996-2315, United States, andrii@utk.edu

We establish a Markov model of parallel algorithm portfolio performance that captures communication between individual algorithms. Based on the proposed model we investigate different probabilistic measures of efficiency and speed to evaluate performance of algorithm portfolios. These measures are used to optimize communication between individual algorithms in portfolio configuration.

2 - Metaheuristics For Dynamic Lot Sizing Problem With Returns And Hybrid Products

Pakayse Koken, PhD Candidate, Binghamton University, 4400 Vestal Parkway East, Binghamton, NY, 13902, United States, pakoken@gmail.com

For a hybrid system with manufacturing and remanufacturing, a variant of dynamic lot sizing problem is addressed. In the hybrid system, manufactured, remanufactured and hybrid products are produced. Hybrids are composed of approximately 90% new parts and 10% returns. The main objective of this study is to investigate the profitability conditions for producing hybrids. Therefore, a variant of dynamic lot sizing problem is formulated as a mixed-integer nonlinear programming (MINLP) problem. The performance of the system with hybrids is compared to the same system with no hybrids. Metaheuristic algorithms are used to find near optimal solutions to the MINLP problem.

3 - A Hybrid Genetic Algorithm For The Fixed Charge Transportation Problem With The Non-linear Unit Costs

Kiseok Sung, Gangneung-Wonju National University, Gangneung, Korea, Republic of. Contact: sung@gwnu.ac.kr

We present a hybrid method of the Genetic Algorithm for the Fixed Charge Transportation Problem with the Non-linear Unit Costs, mathematically formulated with the 0-1 mixed integer program with non-linear objective function and linear constraints. The GA is used in the upper level to optimize the connectivity of the transportation route between each supply and demand pair. The Continuous GA is used in the lower level to optimize the amount of transportation between each supply and demand pair. In the upper and lower level of procedure, the solutions are verified of the feasibility and modified if necessary to maintain the feasibility.

1 - A New Framework For Shortest Path Problem In Dynamic Network

Yingying Kang, Senior Operations Research Developer, Southwest Airlines Co., Dallas, TX, United States, eing.008@gmail.com

Shortest path algorithm has been well developed over years. The classic dijkstra's algorithm provides exact solution with reasonable run time. However, it has limitation in solving complicated problems, especially when network is dense and changes dynamically. This presentation presents a new framework and enhanced searching procedure to raise the efficiency in dynamic network. This solution has been proved to improve the solution quality and efficiency significantly in large scaled dynamic network and provide a practical and effective solution to real time problems.

2 - An Enhanced Sample Average Approximation Technique To Solve A Two-stage Chance-constrained Optimization Problem

Sudipta Chowdhury, PHD Student, Mississippi State University, 260 McCain Engineering Building, ISE Department, Starkville, MS, 39762, United States, sc2603@msstate.edu, Adindu Emelogu, Mohammad Marufuzzaman, Linkan Bian

This study proposes an enhanced Sample Average Approximation (SAA) technique to solve a two-stage stochastic chance-constrained optimization problem. The problem is challenging to solve as the feasibility region defined by chance constraints is generally non-convex and hence requires multi-dimensional integration. The numerical studies show that for all sized instances the combined enhanced SAA approach gives faster and better quality solution than the combined SAA approach. Results also indicate that, strengthened formulation which is typically much faster to solve chance constrained MILP, can also be outperformed by the enhanced SAA approach for larger instances.

1 - Application Of System Dynamics To Private Sector Versus Medicare Cost Projections

Michael P D'Itri, Associate Dean and Professor, Dalton State College, 650 North College Drive, Dalton, GA, 30720, United States, mditri@daltonstate.edu, Robert Culp, Jon Littlefield

A source of contention over the Affordable Care Act results from analyses based on segmentation of the population studied into public (Medicare) versus private healthcare providers. This research controls for this effect by employing a systems dynamic method to model private sector and Medicare costs over time. Age data from the 2000 United States Census is represented using a distributed delay with net annual changes in population calibrated to match the 2010 census data. Average costs per person in each age group are calculated and used to make future cost projections.

2 - Identifying The Impact Of Outdated Drug Limit Library Usage By Smart Infusion Pump Logs

Kang-Yu Hsu, PhD Student, Purdue University, Gerald D and Edna E Mann Hall, 203 S. Martin Jischke Drive, Lafayette, IN, 47907, United States, hsu66@purdue.edu, Poching DeLaurentis, Yuval Bitan, Daniel Degnan, Yuehwern Yih

Drug Limit Library (DLL) in infusion pumps may not be updated efficiently. The inconsistency between DLL in pumps and the most up-to-date DLL may put patient safety at risk. In this study, we quantify the impact of adopting out-of-date DLL through investigating smart infusion pump logs, and examine infusions which potentially jeopardized patient safety with outdated DLL usage.

3 - A Game Theoretic Approach To Pediatric Vaccine Pricing

Banafsheh Behzad, Assistant Professor, California State University, Long Beach, 1250 Bellflower Blvd, MS 8506, Long Beach, CA, 91101, United States, banafsheh.behzad@csulb.edu, Sheldon H Jacobson

Pricing strategies in the US pediatric vaccines market are studied using a Bertrand-Edgeworth-Chamberlin price game. The game analyzes the competition between asymmetric, capacity-constrained manufacturers producing differentiated products in a market with linear demand. The results indicate that the pure strategy equilibrium exists if the production capacity of a manufacturer is at their extreme. In a duopoly setting, the distribution functions of the mixed strategy equilibrium for manufacturers are provided. The proposed game is applied to the US pediatric vaccine market, where competing vaccines are differentiated based upon the number of reported medical adverse events.

4 - Storage And Transport Considerations In Designing The WHO-EPI Vaccine Distribution Network

Jayant Rajgopal, Professor, University of Pittsburgh, Department of Industrial Engineering, University of Pittsburgh, Pittsburgh, PA, 15261, United States, rajgopal@pitt.edu, Jung Lim, Bryan A Norman

The WHO-EPI vaccine distribution chain is used to deliver vaccines for inoculating children against vaccine-preventable diseases. The structure of this chain is rigid and almost identical in most low and middle income countries, despite significant demographic, geographical and economic differences. We describe the problem of designing a network that is based on the parameters associated with a specific country and present an integer programming formulation that optimizes the structure for a given country while also determining the primary parameters of cold storage and transportation along with the design. Issues related to solving this model are also discussed.

5 - Healthcare Facility Location Model Based On Choice Behaviour Of Catchment Population

Amit K Bardhan, Professor, University of Delhi, Delhi, 110007, India, amit-bardhan@fms.edu, Arun K Sharma, Kaushal Kumar

Due to excessive demand and limited capacity, public healthcare delivery systems in developing countries operate under immense pressure. New facilities when established should not only be useful to the unserved, they should also reduce pressure on existing centers. Most healthcare facility location models focus on ease of access criteria like distance, travel-time, population density etc. In recent studies it has been reported that assurance and quality of care are also important while choosing healthcare facility. In this paper we propose a hierarchical facility location model that incorporates such behavioral choice criteria of target population.

Mustafa Y Sir, Mayo Clinic, 200 First Street SW, Rochester, MN, 55905, United States, sir.mustafa@mayo.edu, Maria Gabriela Martinez, Todd Huschka, Kalyan Pasupathy

Delayed access to receive treatment negatively affects patient satisfaction and health outcomes. This study presents scheduling policies that integrate patient flow in an elective surgical department in order to match capacity to patient needs. A data-driven model is formulated to determine appropriate scheduling time bounds for a fair distribution of surgical load among surgeons, considering medical need of patients. A simulation model is implemented to evaluate the performance of the proposed policies.

2 - Assessing Decisions In Medical Referral Networks From Empirical Data

Michael Pavlin, Wilfrid Laurier University, School of Business and Economics, 75 University Avenue West, Waterloo, ON, N2L 3C5, Canada, mpavlin@wlu.ca, Mojtaba Araghi

Informal referral networks are central to the allocation of medical resources in many healthcare systems. In this paper we assess decisions in a cataract surgery referral network. The system is modeled as a bipartite queueing network and empirical techniques are developed to estimate decision making parameters from aggregate data.

3 - A System Dynamics Model To Investigate The Impacts Of Non-invasive Sensor Based Interventions

Mehmet Serdar Kilinc, Pennsylvania State University, 310 Leonhard Building, Department of Industrial Engineering, University Park, PA, 16802, United States, serdarmehmet@gmail.com, Jose Angel Castro, Linlin Ma, Harriet Black Nembhard

Non-invasive sensor based interventions promise opportunities to reduce the burden of Parkinson's disease (PD) on our healthcare system. These interventions can be implemented for various purposes such as early detection, remote monitoring of medication adherence, physical rehabilitation, and fall detection. To date, however, the US healthcare system has been slow to adopt these interventions. In this study, we use a system dynamics model to examine the long-term macro-level impacts of non-invasive sensor based interventions on the healthcare system. The model addresses both healthcare demand and supply by considering the prevalence and progress of PD with and without these interventions.

4 - Does The Office Of Patient Experience Matter In Improving Delivery Of Care? An Econometricstudy Of US Hospitals

Luv Sharma, Ohio State University, 601 Tuscarawas Court, Columbus, OH, 43210, United States, sharma.154@osu.edu, Aravind Chandrasekaran

We assemble a unique dataset regarding the presence of office of patient experience for 3250 US hospitals. We study the impact of this office on patient satisfaction. Results indicate that effectiveness of this office depends on the background of the chief experience officer, clinical complexity and its year of origin.

1 - Facets And Valid Inequalities For The Pathwidth Problem

Tom Rihm, University of Bern, Schuetzenmattstrasse 14, Bern, Switzerland, tom.rihm@pqm.unibe.ch, Arie Koster

The pathwidth specifies the similarity between a given graph and a path, and is relevant for many algorithms in real-world applications. In general, the problem of determining the pathwidth of a given graph is NP-complete. We formulate this problem as an integer linear program. Furthermore, we provide classes of valid inequalities to tighten the linear programming relaxation, and we identify conditions under which these inequalities are facet-defining. Our computational results indicate that these inequalities improve the performance.

2 - Network Design Problem With Relays

Baris Yildiz, Assistant Professor, Koc University, Rumeli Feneri Yolu, Sariyer, Istanbul, Turkey, baris.yildiz@bilkent.edu.tr, Oya Ekin Karasan, Hande Yaman

We study the network design problem with relays and present a multi-commodity flow formulation and a branch-and-price algorithm to solve it. Motivated by the practical applications we investigate the special case where each demand has a common designated source. In this special case, we can show that there exists an optimal design that is a tree. Using this fact, we replace the multi-commodity flow formulation with a tree formulation enhanced with Steiner cuts. Employing a branch-and-price-and-cut schema on this formulation, we are able to further extend computational efficiency.

3 - A Sampling Strategy For Estimating Features Of Large Networks

Jingjing Zou, Columbia University, 434 W.120th St, Apt 3J, New York, NY, 10027, United States, jz2335@columbia.edu, Richard Davis, Gennady Samorodnitsky, Zhi-Li Zhang

We propose a sampling procedure with the goal of estimating certain population features of the entire network. Such features might include tail behavior of the in- and out-degree distributions. Our procedure is based on selecting some initial nodes and then following the path of linked nodes in a structured fashion. Targeted nodes with desired features will have a larger probability of being retained. In order to construct unbiased or nearly unbiased estimates of the quantities of interest, weights associated with the sampled nodes must be calculated. We will illustrate this procedure and compare it with multiple random walks on datasets including webpage network and Google+ social network data.

4 - Games On Influence Networks: Equilibria, Free Riding And Dynamics

Zhengyuan Zhou, Stanford University, 160 Comstock Circle, Unit 106002, Stanford, CA, 94305, United States, zyzhou@stanford.edu, Nicholas Bambos, Peter Glynn

An influence network consists of a set of interacting agents, each of whose actions produces effects on his neighbors' actions. In general, the effects can be arbitrary, inhomogeneous functions of the neighbors' joint action. Such effects capture the commonality of a variety of networks in economics and engineering. Therefore, the study of strategic interactions among agents in an influence network can be of great applicability. We formulate a simple game-theoretical model of influence networks that investigates strategic interactions among agents in light of such influence. We study the equilibria properties, the resulting free-riding phenomenon and the dynamics for reaching an equilibrium.

Supply Chain Optimization I

Contributed Session

Chair: Stewart Liu, PhD Candidate, Univeristy of California - Berkeley, 4141 Etcheverry Hall, MC 1777, Berkeley, CA, 94720, United States, stewart_liu@berkeley.edu

1 - A Newsvendor Problem With Multiple Unreliable Suppliers

Roshanak Mohammadivojdan, PhD Student, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32611, United States, rmohammadivojdan@ufl.edu, Yasemin Merzifonluoglu, Joseph Geunes

We consider a single period (newsvendor) inventory planning problem in which the newsvendor must determine how much to order from each of a number of suppliers, and where each supplier may default on delivery with a certain probability. Our goal is to minimize total expected cost, including total ordering costs and overstocking and understocking costs. We characterize key structural properties of optimal solutions and provide algorithms for solving problems in this class.

2 - Topological Network Design Of Closed Finite Capacity Supply Chain Networks

Laoucine Kerbache, Professor, HEC Paris School of Management, Ops Mgmt & Information Systems, 1 Rue de La Liberation Jouy-En-Josas, 78351, France, kerbache@hec.fr, James Macgregor Smith

We wish to examine the layout, location, and general topological arrangement of queues in a closed queueing network environment for supply chains. Since our focus is on manufacturing environments, then maximizing throughput is a worthy performance measure objective. We are given a network topology G(V,E) with a finite set of nodes and edges and we wish to assign the queues to the nodes such that the maximum throughput is achieved. We examine the performance of the system in a closed queueing network environment. This is a nonlinear continuous optimization problem with implicit integer variables. We show that decentralization can have a major impact on the throughput of the supply chain.

3 - Vendor-buyer Cooperative Policy With Penalty For Late Delivery

Md Shahriar Jahan Hossain, Graduate Assistant, Louisiana State University, 2508 Patrick F. Taylor Hall, Baton Rouge, LA, 70803, United States, msjhossain1@gmail.com, Mohamed M. Ohaiba, Bhaba R Sarker

This research presents a single-vendor, single-buyer integrated inventory model under stochastic lead-time environment and late delivery penalty. The problem is formulated as a nonlinear cost model which is minimized to arrive at an optimal policy for reorder point, order quantity and number of shipments from the vendor to the buyer. The solution procedure involves both closed form solution and iterative search procedure. Numerical examples with potential industrial implications are presented for uniform, exponential and normally distributed lead-times.

4 - Two-step Gradient Search For Optimizing Biopharmaceutical Supply Chain Decision-making

Stewart Liu, PhD Candidate, Univeristy of California-Berkeley, 4141 Etcheverry Hall, MC 1777, Berkeley, CA, 94720, United States, stewart_liu@berkeley.edu, Philip Kaminsky

Motivated by our success in solving stochastic supply chain optimization problems in the biopharmaceutical industry using retrospective optimization, we present a two-step retrospective optimization-stochastic gradient search algorithm that in initial empirical testing is both fast and effective. This method also allows us to optimize policy parameters of complex supply chains with an assembly or distribution structures subject to random demand, lead time and quality control disruptions between stages.

Supply Chain, Risk I

Contributed Session

Chair: Iris Luan, Tongji University, Rm 611, Tongji Building A, No.1500 Siping Road, Shanghai, 200092, China, luanxiaoxi@163.com

2 - Political Risk In Supply Chain And Operations Management: A Conceptual Model

Remi Charpin, PhD Candidate, Clemson University, 100 Sirrine Hall, Box 341305, Clemson, SC, 29634, United States, rcharpi@clemson.edu, Aleda Roth

Political risk has been overlooked in the supply chain and operations management literature while it remains one of the environmental factors that influences the most operations and supply chains for foreign firms operating abroad. We review the literature and propose an original conceptual model that links risk causes to their potential consequences at the operational and supply chain levels.

3 - The Impact Of Responsiveness On Supply Chain Risk A Heuristic Method With Adaptive Genetic Algorithm

Seyed Vahid Reza Nooraie, NC A&T State University, Greensboro, NC, United States, snooraie@aggies.ncat.edu, Mahour Mellat parast, Paul M Stanfield, Saeed Zamiri Marvizadeh

This paper examines the relationship between responsiveness, cost and supply chain risk of disruptions. A conceptual model is developed to address flexibility, agility, Internal Integration, visibility and responsiveness relationships, which are further, examined using hypotheses testing. A heuristic algorithm based on adaptive GA will be developed to solve NP hard problem.

4 - Financial And Order Strategies In A Supply Chain With Option Contracts

Shengya Hua, Peking University, Room 121, Building 1, ChangChun Xin Yuan, Peking University, Yiheyuan Road No.5, Haidian District, Beijing, 100871, China, huasy@pku.edu.cn, Xin Zhai

We study a supply chain consisting of one supplier and one budget constraint retailer who purchases from the supplier via an option contract. To satisfy the stochastic customer demand, the retailer will order before the sales season and if needed, she can a take bank credit financing (BCF) or trade credit financing (TCF) to get enough working capital. After the sales season, the retailer should repay the credit loan and interests with all the money in hand. To study the financial and order strategies in the supply chain, we establish a Stackelberg game with the supplier as the leader. The results show that the retailer's order quantity is affected by her wealth and both the supplier and retailer prefer the TCF.

5 - Structural Equation Model Of The Association O2O Platform Between Service Supply Chain Risk And Vulnerability

Iris Luan, Tongji University, Rm 611, Tongji Buildding A, No.1500 Siping Road, Shanghai, 200092, China, luanxiaoxi@163.com

Abstract: Compared with the traditional supply chain, service supply chain is possessed with the feature of intangibles and difficult to store, thus service supply chain is more vulnerable. The present study used structural equation model based on a large number of data to analyze which kind of service supply chain risk would affect vulnerability typically. Studies have revealed that: demand risk having a significant impact on the vulnerability of the service supply chain, operational risk on service supply chain vulnerabilities affect the effect is not significant. This study may provide theoretical guidance for service supply chain risk and vulnerability relationship is of great significance.

Sustainability I

Contributed Session

Chair: Jen-Yi Chen, Assistant Professor, Cleveland State University, 1860 E. 18th Street, Bu 545, Cleveland, OH, 44114, United States, j.chen27@csuohio.edu

1 - Impact Of Official Regulation Policies On Chinese Power Plant's Reusable Environmental Investments And Sustainable Operations

Xiang Ji, School of Management, University of Science and Technology of China, Hefei, China, signji@mail.ustc.edu.cn, Jiasen Sun

We analyze how Chinese coal-fired power plant's reusable environmental investments and sustainable operations would be influenced by different official environment regulation policies. An empirical study of 27 mainland China's major million-KW coal-fired power plants is presented. With this empirical analysis, we have answered following three questions: (1) what kind of reusable environmental investment should be chosen by the coal-fired power plant, (2) how to choose the "best" reusable environmental investment, and (3) what kind of policy is better in China.

2 - Design Of Rainwater Harvesting And Greywater Recycling Systems For Urban Areas

Juliana Arango, Graduate Student, Universidad de los Andes, Bogotá, 111711, Colombia, j.arango905@uniandes.edu.co

In urban areas, rainwater harvesting and greywater recycling systems provide additional water supplies for houses, buildings, and industries, and mitigate flooding events and pollution. This work proposes an optimization model for the design of rainwater harvesting and greywater recycling systems (RHGRS) in residential construction projects. Our methodology provides an optimal design of the RHGRS, considering rainwater variability via stochastic programing. We apply the model for a case study of low-income housing in Bogota (Colombia) with 696 apartments.

3 - Supply Chain Sustainability: A Case Study Based On The Triple-bottom-line Perspective

Mei Cao, University of Wisconsin-Superior, Belknap & Catlin, P.O. Box 2000, Superior, WI, 54880-4500, United States, mcao1@uwsuper.edu, Qingyu Zhang

As the pressure of global energy conservation and public awareness of environmental and social responsibility increase, sustainable development has become a core problem of any manufacturing firm in managing their supply chain. A case study was conducted to analyze the relationships among supply chain exchange hazards, governance mechanisms, sustainability practices, and the triple-bottom-line performance.

4 - Leadership And Collaboration For Supply Chain Sustainability

Jen-Yi Chen, Assistant Professor, Cleveland State University, 1860 E. 18th Street, Bu 545, Cleveland, OH, 44114, United States, j.chen27@csuohio.edu

We analyze a firm's decision on how to collaborate for more sustainable operations by exploring the following two questions: What collaborative strategy should the firm adopt? and How external market factors affect internal supply chain strategic decisions? Managerial implications are discussed.

Telecommunications Modeling and Analysis

Sponsored: Telecommunications

Sponsored Session

Chair: Dimitri Papadimitriou, Nokia Bell Labs, Antwerp, Belgium, Belgium, dimitri.papadimitriou@nokia.com

1 - Reducing The Internet Adoption Gap Between Rich And Poor Through Auction Mechanisms

Sergio Cabrales, Universidad de los Andes, Bogota, Colombia, s-cabral@uniandes.edu.co, Luis Andrés Marentes, Yezid Donoso, Tilman Wolf, Anna B Nagurney

The latest Millennium Development Goals Report by the United Nations has found that poor populations are behind in their internet adoption due to high prices relative to available budgets. We design an auction mechanisms to suit the allocation of bandwidth to user needs and their budgets. The article develops another dimension to the topic of dynamic pricing models design, which is resource allocations to favor target groups by finding Nash Equilibria of underlying games using extreme value theory and a self-discrimination induced on users. Results indicate the auction mechanism let increase allocation for the population being part of the target group during peak periods.

2 - An Efficient Sampling-based Algorithm For Chance-constrained Two-stage Problems

Jianqiang Cheng, Sandia National Laboratories, Livermore, CA, United States, jianqiang.cheng@gmail.com, Richard Li-Yang Chen

We consider a chance constrained version of two-stage stochastic optimization problems which minimizes the sum of the first-stage costs and the p-quantile of the second-stage random costs. To solve this problem, we first apply sampling-based approximation techniques, precisely, the partial sample average approximation, to obtain an approximate deterministic formulation. Then, we develop decomposition algorithms to solve the approximation problems. Computational results on a stochastic network design show the strength of our proposed approximation approach.

3 - On The Convex Piecewise Linear Unsplittable Multicommodity Flow Problem

Bernard Fortz, Université Libre de Bruxelles, Brussels, Belgium, bernard.fortz@ulb.ac.be, Luis Gouveia, Martim Joyce-Moniz

We consider the problem of finding the cheapest routing for a set of commodities over a directed graph, such that: i) each commodity flows through a single path, ii) the routing cost of each arc is given by a convex piecewise linear function of the load i.e. the total flow) traversing it. We propose a new mixed-integer programming formulation for this problem. The linear relaxation of this formulation gives an optimal solution for the single commodity case, and produces very tight linear programming bounds for the multi-commodity case. We also derive new valid inequalities for the compact basic model based on the projection of the extended formulation.

4 - Mixed-integer Programming Model For The Joint Function Placement And Assignment Problem

Dimitri Papadimitriou, Bell Labs, dimitri.papadimitriou@alcatel-lucent.com

Function-oriented networks take as input demands described by unsplittable finite sequences of operations and perform by executing at each node at most one out of the n possible operations part of the sequence. The problem consists of selecting the subset of nodes where to jointly place function operators and assigning demands to paths crossing these nodes without exceeding both their processing and arc capacity. Following the objective of minimizing the sum of location, allocation and routing cost, we formulate the corresponding mixed-integer program. Numerical experiments are conducted to evaluate the performance tradeoffs with different placement and routing schemes/constraints.

Production and Scheduling

Contributed Session

Chair: Rasaratnam Logendran, Oregon State University, School of Mech lndustrial & Mfgr Engr, Rogers Hall Rm 204, Corvallis, OR, 97331-6001, United States, logen.logendran@oregonstate.edu

1 - A Scheduling Algorithm For Additive Manufacturing

Kai-Oliver Zander, PhD Student, Texas Tech University, Box 43061, Lubbock, TX, 79409-3061, United States, Kai-Oliver.Zander@ttu.edu, Milton Louis Smith

Recent studies have shown that additive manufacturing (AM) can enable an increase in efficiency and generate an enhanced customer value. The increased utilization of AM will lead necessarily to practical problems regarding production scheduling. This presentation introduces a new scheduling method specifically designed for an AM production environment with multiple machines. Based on existing research, a new algorithm has been developed to allow an efficient scheduling and batching of jobs for AM machinery. A simulation study shows the effectiveness of the developed algorithm.

2 - Hybird Robust And Stochastic Production Planning On The Shop Floor Considering Real Time Information

Zhengyang Hu, Research Assistant, Iowa State University, 100 Enrollment Services Center Ames, Ames, IA, 50011, United States, zhengya@iastate.edu, Guiping Hu

Assembly and fabrication factories are universally challenged with the need to continually reduce costs and improve efficiency while simultaneously becoming increasingly flexible to meet ever-changing customer demand. A hybrid decision making model is proposed to address the uncertainties on the shop floor considering real time information. Stochastic programming is adopted to deal with unexpected machine breakdown. Robust optimization is utilized to address the demand uncertainty considering the worst-case scenario. The goal is to minimize the total production cost and the worst-case cost associated with unmet demand. A case study based on a manufacturing shop floor is presented.

3 - Quantifying The Performance Of The Tabu Search/Path Relinking Algorithm For Batch Scheduling In Hybrid Flow Shops

Rasaratnam Logendran, Professor, Oregon State University, School of Mech lndustrial & Mfgr Engr, Rogers Hall Rm 204, Corvallis, OR, 97331-6001, United States, logen.logendran@oregonstate.edu, Omid Shahvari

We address a batching and scheduling problem in hybrid flow shops with the objective of simultaneously minimizing total weighted completion time and total weighted tardiness. It is assumed that dynamic job release and machine availability times exist, batch sizes can have desired lower bounds, and jobs can skip one or more stages. The performance of the tabu search/path relinking algorithm is evaluated based on tight lower bounds identified by the column generation technique.

Military Applications I

Contributed Session

Chair: Ali Pala, PhD Student, University at Buffalo, SUNY, 271 Palmdale Drive, Apt 5, Buffalo, NY, 14221, United States, alipala@buffalo.edu

1 - Military Modeling Of Unconventional Conflict

Dean S Hartley, Principal, Hartley Consulting, 106 Windsong Lane, Oak Ridge, TN, 37830, United States, DSHartley3@comcast.net

Unconventional conflict refers to conflicts involving at least one nation state and which is not dominated by conventional combat. There is significant overlap between unconventional conflict and operations other than war (OOTW) and irregular warfare (IW). While unconventional conflict needs a whole of government approach, the military is the only organization that is organized and staffed to undertake large and long-term modeling efforts in this domain. This presentation will investigate many of the issues in modeling unconventional conflict.

2 - The Expanding Search Ratio Of A Graph

Thomas Lidbetter, London School of Economics, Houghton Street, London, WC2A 2AE, United Kingdom, t.r.lidbetter@lse.ac.uk Thomas Lidbetter, Rutgers Business School, Newark, NJ, 07102, United States, t.r.lidbetter@lse.ac.uk, Spyros Angelopoulos, Christoph Dürr

We study the problem of searching for a hidden target in an edge-weighted graph. We use a recently introduced search paradigm called expanding search, where a sequence of edges is chosen starting from a given root vertex such that each edge is adjacent to a previously chosen edge. We define the search ratio of an expanding search as the max. over all vertices of the ratio of the time taken to reach the vertex and the shortest-path cost to it from the root. We seek the randomized expanding search with minimum expected search ratio, which is equivalent to solving a zero-sum game between a Searcher and a Hider. We solve the problem for certain classes of graphs, and obtain constant-factor approximations for others.

3 - Modeling Short Range Missile Defense And Iron Dome

Michael J Armstrong, Associate Professor, Brock University, Dept of FOIS Faculty of Business, St Catharines, ON, L2S 3A1, Canada, michael.armstrong@brocku.ca

This paper develops a model of short range ballistic missile defense and uses it to study the performance of the Israeli Iron Dome system. The deterministic model allows for inaccurate missiles, unsuccessful interceptions, and civil defense. Model enhancements consider the trade-offs in attacking the interception system, the difficulties faced by militants in assembling large salvos, and the effects of imperfect missile classification by the defender. A stochastic model is also developed. Analysis shows that system performance is highly sensitive to the missile salvo size.

4 - United States Coast Guard Reduced Staffing Simulation

Chad A Long, United States Coast Guard, FAA Technical Center Building 350, Atlantic City International Airport, Atlantic City, NJ, 08234, United States, chad.a.long@uscg.mil

Under the current schedule, Air Station Atlantic City pilots are averaging 17 flight hours per month, which is below the United States Coast Guard requirement. A new schedule, with decreased staffing was simulated in Arena, to determine if it would increase flight time and be robust enough to staff the unit year-round.

5 - Behavioral Analysis Of Illegal Fishery In The Gulf Of Mexico

Ali Pala, PhD Student, University at Buffalo, SUNY, 271 Palmdale Drive, Apt 5, Buffalo, NY, 14221, United States, alipala@buffalo.edu, Vineet Madasseri Payyappalli, Jun Zhuang

Illegal fishery activities in the Gulf of Mexico pose a threat to U.S. national security, as well as damage to the economy. The U.S. Coast Guard estimates over 1,100 incursions annually by Mexican fisherman into U.S. regulated waters in the Gulf of Mexico. In this research, we study the behavior of illegal fishermen and analyze how that is affected by various factors such as weather, fish habitats, seasonal effects, and others. We use data mining techniques and mathematical models to propose optimal patrolling strategies that improve the chances of interdicting illegal fishery.

Sponsored Session

Chair: Peiheng Li, Arizona State University, 1, Tempe, AZ, 6, United States, peihengl@asu.edu

1 - A Distributed Framework For Network-Wide Traffic Monitoring And Platoon Information Aggregation Using V2V Communications

Peiheng Li, Arizona State University, Tempe, AZ, United States, peihengl@asu.edu, Yingyan Lou

This study explores an innovative framework for distributed traffic monitoring and information aggregation using vehicle-to-vehicle communications alone. Distributed protocols that run on individual vehicles are developed and tested through simulation. A new concept of micro-discontinuity is proposed for identifying platoons, and initiating and terminating traffic information aggregation. The impact of market penetration rate is also analyzed.

2 - Development Of Adaptive Forward Collision Warning Algorithm Incorporating Prediction Uncertainty To Reduce False Alarms

Yong Hoon Kim, Purdue University, West Lafayette, IN, United States, kim523@purdue.edu, Shubham Agrawal, Srinivas Peeta

This study proposes an adaptive forward collision warning (FCW) algorithm that adjusts its warning threshold according to the uncertainty in vehicle trajectory prediction. The prediction uncertainty is modeled by kinematic information of surrounding vehicles obtained through vehicle-to-vehicle communication. Numerical experiments show that the proposed adaptive FCW algorithm can provide early warning while reducing the rate of false/nuisance alarms.

3 - Integrating The Operations Perspective Into Planning Of Automotive Vehicle Platforms

Paul Jana, Research assistant, Technische Universität Muenchen, Arcisstr 21, Munich, 80333, Germany, paul.jana@tum.de, Martin Grunow

To address the mass customization trade-off many automotive OEMs moved towards a multi-platform based product portfolio. One major benefit is the reduced internal variety in operations. So far, the multi-platform problem is mostly approached from the product perspective without adopting the operations perspective. We present a mixed-integer linear programming approach integrating network design, capacity configuration, and further operations requirements into automotive multi-platform planning and show the superiority of an integrated approach in a numerical study based on an industry setting.

Health Care, Modeling XII

Contributed Session

Chair: Yang Zhan, Shanghai Jiao Tong University, Shanghai, 200030, China, zhanyangjy@sjtu.edu.cn

1 - A Stochastic Stackelberg-Nash-Cournot Equilibrium Model For Long-term Care Capacity Planning

Ashkan Hassani, Texas A&M University, 4050 ETB, College Station, TX, 77840, United States, ashkanhassani@tamu.edu, Mark Alan Lawley, Nan Kong

Long-term care (LTC) is needed by people who have limitations in activities of daily living. In general, there are two types of LTC delivery: nursing home care and home- and community-based service (HCBS). We develop a stochastic Stackelberg-Nash-Cournot (SNC) equilibrium model to determine the optimal capacities for nursing home and HCBS. The capacity of HCBS will be determined by the public insurer who performs as a leader in a Stackelberg game. Nursing homes will be followers in the Stackelberg game with knowledge of the public insurer's policy, and they compete with each other and could reach Nash equilibrium in a Nash-Cournot game.

2 - Dynamically Tracking Multiple Types Of Risks Of Falls With Wearable Sensors via Data Association Problem

Alla Kammerdiner, Assistant Professor, New Mexico State University, Las Cruces, NM, United States, alla@nmsu.edu, Andre Nunes Guerrero

Wearable sensors are used in practice for detection of falls. We formulate the data association problem arising in dynamic tracking multiple types of risks of falls with wearable sensors as the multi-dimensional problem (MAP). Tracking of risks is done dynamically as data from multiple sensors arrive continually and are partitioned into frames. We consider multiple-frame risk-track initiation and risk-track maintenance for single-pane, double-pane, and multiple-pane sliding windows. Track maintenance include: extending existing risk-tracks, terminating existing tracks, and initiating new risk-tracks. The optimization models are applied to empirical data from wearable sensor system.

3 - A Simulation Model Of Glucose Metabolism For Predicting Blood Glucose Level

Buket Aydas, University of Wisconsin-Milwaukee, Milwaukee, WI, 53202, United States, baydas@uwm.edu, Mukul Goyal

We develop a human body glucose metabolism model for predicting blood glucose levels using discrete event simulation. The model estimates the glycated hemoglobin (HbA1c) level in the blood and predicts the impact, in terms of BGL and HbA1c levels, of a particular diet-exercise routine. Each organ in the human body that relates to glucose metabolism is modeled individually within the simulation. The results are validated by using reference glycemic index (GI) values of food.

4 - Two-level Optimization To Balance Value Flow And Patient Flow In Operating Room Block Scheduling

Wei Li, Assistant Professor, University of Kentucky, 414J CRMS Building, 147 Graham Avenue, Lexington, KY, 40506-0108, United States, wei.mike.li@uky.edu

Operating room (OR) block scheduling in the long term is important for OR scheduling in the medium term and OR control in the short term. Similar to the trade-off between production cost and holding cost in manufacturing systems, there is a trade-off between value flow and patient flow in OR scheduling. We use a two-level optimization model to balance the trade-off in OR scheduling, and test the robustness of the model through simulation.

5 - Home Health Care Routing And Appointment Scheduling With Stochastic Service Durations

Yang Zhan, Shanghai Jiao Tong University, Shanghai, 200030, China, zhanyangjy@sjtu.edu.cn, Zizhuo Wang, Guohua Wan

Motivated by the practice of home health care services, we consider an integrated routing and appointment scheduling problem with random service durations. The objective of the problem is to determine the visit route and appointment times to minimize the summation of the costs of traveling and idling of the health care team and the cost of waiting of the patients. To solve the intractable problem, we propose both exact and approximate algorithms. We conduct computational experiments to assess the performance of the proposed methods on problems of practical size.The computational results show that the methods work very well.

1 - The Goals Of Analysis are Understanding, Decisions, And Influencing Policy

Gerald G. Brown, Naval Postgraduate School, Monterey, CA, United States, gbrown@nps.navy.mil

While we are variously skilled at applying a diverse set of mathematical tools to analysis, we all share (or should share) the same goals: understand the problem at hand; advise decisions influencing that problem; and influence policy for dealing with entire classes of problems resembling the one we analyze. Sometimes, our answers are not welcomed by a client who brings us a problem, and we face significant obstacles to conveying good, convincing advice and thus contributing to good decision policy. There are a number of techniques that apply to such situations and cross all our various analysis domains. Few of these appear in textbooks or our open literature. These turn out to be vitally important for success.

1 - Can Prediction be Better than Cure? On Analytics In Health-Care

Edmund Jackson, Clinical Services Group, HCA, Nashville, TN, United States, edmund.jackson@hcahealthcare.com

Healthcare is different: the intrinsic complexity, absolute moral imperatives and regulatory oversight of this business are unique. As such many of the technologies in healthcare differ from other industries. That said, the industry is entering a new regime where data is widely available, technology exists for analytics to run in real-time and the intention of bringing this intelligence into the workflow is widespread. Moreover, the advent of techniques such as diagnostic, predictive, and prescriptive analytics in other industries have ready applications in healthcare. The potential benefits of these activities to all stakeholders in the healthcare system, such as patients, providers and payers are enormous. In this talk Dr Edmund Jackson, Vice President and Chief Data Scientist of HCA will discuss this topic and provide a perspective of what has already been achieved and what is soon to come.

1 - SportSource Analytics

Stephen Prather, SportSource Analytics, Nashville, TN, United States, team@coachesbythenumbers.com

Think back about 15 years ago about how difficult it was for anyone to access large amounts of data on virtually any subject. Now, think about how easy it is today for virtually anyone to access enormous amounts of data with the click of a few buttons. We live in an extremely data rich world. We are surrounded by information and data in all walks of life. The problem with all of this “big data” is that we are really struggling in finding ways to make it small and more importantly make it USEFUL. My talk is going to be about how four guys all working full-time jobs and without a single advanced degree in any sort of statistical analysis between them were able to become the official analytic consultant to the college football playoff selection committee. This is a story of the pursuit of being useful and understanding that data is only as good as the analysis associated with it.

Pattern Recognition Applications in Data Mining

Sponsored: Data Mining

Sponsored Session

Chair: Cory Stasko, Massachusetts Institute of Technology, 4 Garden Court, Apt 4, Cambridge, MA, 02138, United States, cstasko@mit.edu

1 - Auto Detection Of Tool Wear Using Sequence Alignment Technique

Cheng-Bang Chen, Penn State University, 445 Waupelani Dr., Apt K18, State College, PA, 16801, United States, czc184@psu.edu, Dika Handayani, Deepak Agrawal, Juxihong Julaiti

Tool wear is one common criteria used to measure the machinability of a material. Manual tool wear measurement, which is still widely done, raises an issue on how reproducibility and repeatability the measurements are. In order to reduce the variation of the measurement and speed up the process, we propose a new method using edge detection, sequence mapping, and area projection to measure the wear automatically.

2 - Mini-batch Proximal Semi-stochastic Gradient Descent In Signal Processing

Jie Liu, PhD Student, Lehigh University, 14 Duh Dr Apt 324, Bethlehem, PA, 18015, United States, jild13@lehigh.edu, Jakub Konecny, Peter Richtarik, Martin Takac

We propose the mini-batch proximal semi-stochastic gradient descent (mS2GD). First, we provide convergence results for mS2GD and show that it maintains a complexity of O((n+)log(1/)), comparable to modern stochastic gradient descent methods such as SVRG, SAG, SAGA. Second, we show that mS2GD benefits from both mini-batch speedup and the simple parallel implementation. In the numerical experiments, we first compare different algorithms on public available datasets; then, we compare mS2GD with different batch sizes to illustrate efficiency of mini-batching; last, we conduct experiments on one of the popular signal processing problems—a simple image deblurring problem.

3 - Deconstructing Va Procurement And Logistics Policy With Natural Language Processing

Cory Stasko, Massachusetts Institute of Technology, 4 Garden Court, Apt 4, Cambridge, MA, 02138, United States, cstasko@mit.edu

Over 120 policy documents of are involved in governing VHA procurement and logistics. This large volume of active policy makes it difficult for individuals to understand what exists, where, and how it affects them. Furthermore, the policy set includes redundancies, missing elements, and other weaknesses. This work investigates the value of natural language processing in deconstructing and mapping interrelated policy texts. We describe and organize the logical, linguistic, and substantive patterns within and between policy documents, thereby producing a dynamic map of policy evolution that highlights patterns, inter-dependencies, conflicts, ambiguities, and redundancies in the text.

1 - Doctors Performance In Emergency Rooms

Amir Mousavi, George Washington University, 2700 Wisconsin Ave, Unit 305, Washington, DC, 20007, United States, ahmn00@gmail.com

Emergency Rooms are known as a vital ward in a hospital. Improving the efficiency in the ER has been a challenging question for researchers. Throughout the academic literature, people have defined different efficiency indexes in order to tackle this problem. This research aims to apply Data Envelopment Analysis technique in order to identify the performance (i.e. productivity) variation among doctors and use this result as a component for the optimization model in order to improve the efficiency of the system. The final goal will be to show how patient waiting time is affected by doctors' productivity and how the proposed scheduling model using this information can reduce patient wait times in the ER.

2 - A Deep Feature Selection Approach For Personalized Medicine

Milad Zafar Nezhad, PhD Student, Wayne State University, Wayne State Univesity, Detroit, MI, 48202, United States, fq3963@wayne.edu, Kai Yang

Personalized Medicine has been defined in different ways in the literature. A good interpretation for Personalized Medicine is "the use of combined knowledge (genetic or otherwise) about a person to predict disease susceptibility, disease prognosis, or treatment response and thereby improve that person's health". In this research, we propose a new deep feature selection method based on deep learning. Our method used stacked auto-encoders for feature representation in higher level abstraction. We applied our approach to a specific precision medicine problem. The results show that our feature learning and representation approach leads to better results in comparison with otherwise.

Advances in Emergency Department Operations Management/Research

Sponsored: Manufacturing & Service Oper Mgmt, Healthcare Operations

Sponsored Session

Chair: Soroush Saghafian, Harvard Univeristy, 79 John F. Kennedy Street, Mailbox 37, Cambridge, MA, 02138, United States, soroush_saghafian@hks.harvard.edu

1 - Managing Emergency Operations

Eva Lee, Georgia Tech, eva.lee@isye.gatech.edu, William Wang

This is joint with Grady Health System, Children's Healthcare of Atlanta and Emory University School of Medicine. Most scheduling is done based on availability of physician's preference time. The patients are then offered the best possible time that may fit his/her doctor's schedule. This study will identify the needs of patients and develop a predictive model to estimate the individual needs (and thus LOS for the appointment). This information is then incorporated within a scheduling optimization framework for dynamic optimization. This allows for optimizing the scheduled service as well as unexpected emergency service.

2 - The Impact Of Health Information Exchanges On Emergency Department Length Of Stay

Jan Vlachy, Georgia Institute of Technology, Atlanta, GA, United States, vlachy@gatech.edu, Turgay Ayer, Mehmet U.S. Ayvaci, Zeynal Karaca

Health information exchanges (HIEs) are expected to improve information coordination in emergency departments (EDs), but their impact on ED operations remains poorly understood. We study the effect of HIE on ED length of stay (LOS) based on about 5.8 million ED visits in Massachusetts. We find that HIE a) reduces ED LOS overall by 11.1%, b) is even more effective in teaching hospitals, c) is less effective in crowded EDs, and d) its effectiveness depends on severity and complexity of the patients. Our findings have implications for the nationwide HIE adoption.

3 - Assignment Policy To Improve Emergency Department Boarding Time: A Safety And Quality Of Care Perspective

Derya Kilinc, Arizona State University, dkilinc@asu.edu, Soroush Saghafian, Stephen J Traub

One important reason for ED crowding problem is prolonged boarding time of admit patients. We study effective ways of reducing ED boarding times by focusing on the trade off between keeping patients in ED and assigning them to a secondary inpatient unit. We model the patient flow problem as a parallel queueing system and show that the optimal policy is a state-dependent threshold policy. Since the optimal policy is hard to implement, we use a simple and effective policy which we term penalty adjusted Largest Expected Workload Cost. Using simulation model, we show that implementing the proposed policy can improve patient safety by reducing the boarding times while controlling the overflow of patients.

4 - Robust Data-driven Emergency Department Management Via Percentile Optimization: Multi-class Queueing Systems With Model Ambiguity

Austin Bren, Arizona State University, Phoenix, AZ, United States, asbren@asu.edu, Soroush Saghafian

To help hospital Emergency Departments address overcrowding issues and increase patient safety, we implement a robust multi-class queueing model to overcome inherent ambiguities arising in parameter specification. Our technique, based on percentile optimization, is uniquely suited to incorporate both learning and the degree of optimism expressed by the manager. We demonstrate the benefits of using our framework for improving current patient flow policies using real-world data collected from a leading U.S. hospital and utilizing highly effective, easy-to-implement management strategies.

Optimization Methods in Smart Grid

Sponsored: Energy, Natural Res & the Environment, Energy I Electricity

Sponsored Session

Chair: Andrew Liu, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47907, United States, andrewliu@purdue.edu

1 - Online Opf With Quasi-Newton Algorithm

Yujie Tang, California Institute of Technology, Pasadena, CA, United States, ytang2@caltech.edu, Krishnamurthy Dvijotham, Steven Low

Optimal power flow is a central problem in the operation of power systems. So far the majority of the literature deals with offline algorithms for traditional power system applications, but the proliferation of distributed energy resources and smart appliances in power networks motivates real-time, decentralized and scalable algorithms. In this talk we will introduce an online OPF algorithm based on quasi-Newton methods that is real-time and can track the optimal operation when the state of the network is changing.

2 - Power System State Estimation In The Presence Of Bad Data

Ramtin Madani, University of California, Berkeley, Berkeley, CA, United States, ramtin.madani@berkeley.edu, Javad Lavaei, Ross Baldick

This talk introduces a method for finding the unknown operating point of a power network based on a given set of potentially corrupted measurements including nodal active powers, nodal reactive powers, nodal voltage magnitudes and line flows. We propose a conic optimization problem in order to handle nonconvexity and deal with bad data simultaneously. The proposed convex program is guaranteed to recover the exact vector of complex voltages as long as the number of bad measurements is small. Numerical experiments on a large-scale European system are performed to demonstrate the efficacy of the proposed framework.

3 - Parallelized Interior Point Method For Security Constrained Optimal Power Flow Problem

Na Li, Assistant Professor, Harvard University, 33 Oxford St,, MD 147, Cambridge, MA, 02139, United States, nali@seas.harvard.edu, Ariana Minot, Yannick Meier

Solving the security constrained optimal power flow problem (SCOPF) is challenging due to the large size of the power system and large number of contingencies. However, in SCOPF, different contingencies are only coupled via the power injection control variables, yielding a sparse system. We design a domain decomposition technique based on this sparsity to parallelize the problem across different contingencies. For each subproblem associated with a contingency, we exploit the network structure through graph coloring techniques to enhance parallelism. In summary, we design an effective method to utilize two layers of parallelism: 1) across contingencies and 2) across buses in the network.

4 - Implement Real Time Pricing With Regret Based Learning
Andrew Lu Liu, Purdue University, andrewliu@purdue.edu
The situation where price-responsive consumers determine what to do in the near future (such as when to charge their PEVs) forms a dynamic and incomplete-information game, in which the consumers' collective actions will impact electricity prices, which in turn affect their payoffs. We propose a regret-matching-based algorithm for each consumer to learn their strategies, as opposed to naively responding to day-ahead prices. We will show convergence to a correlated equilibrium of the regret-matching approach, and study the price of anarchy of the regret-based learning approach.

Forest management: Transportation and/or Collaborative Logistics

Sponsored: Energy, Natural Res & the Environment II Forestry

Sponsored Session

Chair: Mikael Ronnqvist, Universite Laval, Quebec, QC, Canada, mikael.ronnqvist@gmc.ulaval.ca

1 - Overlapping Coalitions In Collaborative Transportation Of Forest Biomass
Mario Guajardo, Norwegian School of Economics, Mario.Guajardo@nhh.no, Patrik Flisberg, Mikael Frisk, Mikael Ronnqvist
Given a set of companies, we address a collaborative transportation problem in which a same company can collaborate in more than one coalition. This problem corresponds to what in cooperative game theory is known as coalition configuration. We develop area-driven approaches and another approach that embeds the coalition configuration in the transportation problem. We report numerical results for a case in Sweden involving about 6 million tons of forest biomass. Collaboration in this case has not only the potential of cost savings, but also of increasing the use of bioenergy. The results improve substantially compared to a coalition structure and are competitive with the grand coalition.

2 - Bundle-based Auction For Timber Allocations
Sophie D Amours, Université Laval, Sophie.Damours@gmc.ulaval.ca, Marc-André Carle, Mikael Ronnqvist
Tenure of the public forest in Québec, Canada, includes the usage of an auctioning system to allocate the 25% of the commercial forest to industry. We have studied the system and explored new strategies to increase its performance. This includes using combinatorial auctions. The presentation will review the context, the literature and illustrate using a case study the potential and challenges of implementing a combinatorial auctioning system. These include higher efficiency in coordinating needs with supplies as well as the potential challenge of finding multiple optimal solutions and the need for discriminating criteria.

3 - Supply Network Planning Of Forest Fuel Using Robust Optimization
Jens Bengtsson, Norwegian University of Life Sciences, jens.bengtsson@nmbu.no, Patrik Flisberg, Mikael Ronnqvist
Fluctuating and uncertain temperature during the year will cause an uncertain demand at heating plants. These plants use district heating with an energy supply of forest fuel. Changed supply contracts with customers (heating plants) on a yearly frequency may result in very different optimal supply network. We use robust optimization to analyze where forests fuel storage points should be located and their capacities in order to take transportation cost and lead times into account. Critical is to ensure that there is enough supply and transport capacity available throughout the year.

4 - Collaborative Logistics
Mikael Ronnqvist, Universite Laval, mikael.ronnqvist@gmc.ulaval.ca
Collaborative logistics is an efficient approach to improve the logistics operations. In our presentation, we consider horizontal collaboration between several companies and larges savings have been reported in the literature. However, there is also a number of practical issues to deal with including sharing principles and how the joint planning is done without revealing sensitive information. We describe a number of practical applications and discuss their potentials and pitfalls.

Simulation and Data Mining

Sponsored: Data Mining

Sponsored Session

Chair: Mohammad Ali Asudegi, UTK, 301 Woodlawn Pike, Apt G12, Knoxville, TN, 37920, United States, aliasudegi@gmail.com

1 - Discrete Event Simulations Of Urgent Care Resource Scheduling
Leyla Zhuhadar, Assistant Professor, Western Kentucky University, 1906 College Heights Boulevard, 226 Grise Hall, Bowling Green, KY, 42101, United States, leyla.zhuhadar@wku.edu, Evelyn Thrasher, Kirk Atkinson
Discrete-event simulation is used to estimate the average amount of time that a patient spends waiting to see a nurse and/or waiting to see a doctor. In addition, the model has been extended to estimate the effect on the waiting times if additional nurses or doctors are hired. In this presentation, a study of the value of multiple replications for discrete-event simulation models is discussed and factors to enable greater control on multiple design points with the experiment are defined. Finally, to control the simulation runs for easier model verification, random seeds are used.

2 - A Data Mining Approach For Evaluating Simulation Output
Thomas Robbins, East Carolina University, 3212 Bate Building, Greenville, NC, 27858, United States, robbinst@ecu.edu
We conduct a detailed simulation experiment to compare two different queuing models over a wide range of inputs with the goal of determining the conditions under which each model works best. We implement a data mining approach to characterize the outputs and evaluate the input conditions that best predict model superiority. Since performance can be evaluated across multiple measures we use a clustering approach to characterize output performance. We then investigate multiple classification techniques to isolate inputs that best predict model superiority.

3 - Performance Indicators And Operating Factors In A Complex Manufacturing System
Mohammad Ali Asudegi, UTK, 525 John D. Tickle Engineering Building, 851 Neyland Dr, Knoxville, TN, 37996, United States, aliasudegi@gmail.com, Rupy Sawhney
Reliability, Lead-Time and Cycle-Time are the first and most important key performance indicators, KPIs, of each manufacturing system. Understanding the relation between operating factors, system design factors and key performance indicators would help to be able to make better scheduling and run the system within its optimal specification.A simulation has been conducted to study the relation between the operating speed of each machine in a complex system with Lead-Time, Cycle-Time and the reliability of the whole system.

Supply Chain Mgt, Green

Contributed Session

Chair: Jianan Sun, Doctoral Student, Xi'an Jiao Tong University, 28 Xianning Road, Shanxi Province, Xi an, 710049, China, sjn168@stu.xjtu.edu.cn

1 - Price Competition Induced By A Partially Green-sensitive Consumer Market In A Dual Manufacturer-single Retailer Channel
Arka Mukherjee, PhD Scholar, Concordia University, 1455 De Maisonneuve Blvd. W., Montreal, QC, H2G 1M8, Canada, ar_mukh@live.concordia.ca
In a marketing channel with two manufacturers and one retailer, price competition between green and non-green products is studied. Considering different market power structures Game theoretic models are developed.A simple Nash game, a cost-sharing contract and a scenario where manufacturers are the market leaders are considered. The results from the different power structures are compared analytically and numerically and interesting conclusions are drawn.

2 - Incentives For Fair Labor Practices In a Supply Chain
Susan A Slotnick, Professor, Cleveland State University, 1860 E. 18th Street, BU 542, Cleveland, OH, 44115, United States, s.slotnick@csuohio.edu, Matthew J Sobel
This paper investigates the tradeoffs involved in a firm's decision to implement policies and procedures to ensure that its products are not manufactured using unfair labor practices. We consider a firm that repeatedly sources a product from a single supplier, maximizes its own profit, and decides whether to cut its profit margins and/or expend resources to inspect the supplier, as well as to improve and/or maintain fair labor practices at that supplier. Retail demand for the product is influenced by reputation.

3 - Channel Choice For Closed-loop Supply Chain Under Government Replacement-subsidy

Jianan Sun, doctoral Student, Xi'an Jiao Tong University, 28 Xianning Road, Shanxi Province, Xi an, 710049, China, sjn168@stu.xjtu.edu.cn

This paper considered government replacement-subsidy policy to examine the channel choice of remanufacturer consisting of a single manufacturer and a single remanufacturer. Based on the replacement-subsidy and carbon emission, we constructed two CLSL channel models which the remanufacturer may cooperate or compete with the manufacturer through different channels. Then, we discussed the impacts of the replacement-subsidy on the channel choice decision of remanufacturer and profits of CLSC system and its members by the method of game theory. At last, the numerical analysis was adopted to emulate the optimal price, optimal quantity and emission quantity of each channel.

1 - Responsible Customers

Brian Jacobs, Michigan State University, jacobsb@broad.msu.edu, Vinod R Singhal

Responsible sourcing is of increasing research interest. But what happens if your customer is not socially responsible? We examine the impact of the 2015 VW diesel emissions scandal on automotive suppliers.

2 - The Role Of Managerial Commitment On The Relationship Between Controversy And Environmental Practice Adoption

Rick Hardcopf, University of Minnesota, rhardcopf@gmail.com

The adoption of environmental management practices (EMPs) intended to reduce a firm's environmental footprint has increased steadily over the years. EMPs are also positively related to superior environmental, financial, and operational performance. But while the general drivers of EMP adoption have been evaluated extensively, no empirical research has evaluated whether a negative environmental event, such as an environmental spill or pollution event, impacts a firm's pattern of EMP adoption. We evaluate this relationship, and the moderating effect of managerial commitment, using a novel secondary dataset derived from 10k filings, sustainability reports, and other public sources.

3 - The Relationship Between Corporate Social Performance, Productivity, Financial Performance, And Risk

Richard Kraude, Michigan State University, kraude@broad.msu.edu, Sriram Narayanan, Brian W Jacobs

We employ DEA-based measures for productivity and corporate social performance to examine their relationship with multiple dimensions of financial performance and risk. We test our hypotheses in a panel that comprises 476 firms in nine US manufacturing industries during the period 1999-2009.

4 - Relationship Between Appointments Of Corporate Sustainability Leaders And Firm Performance

Priyank Arora, Georgia Institute of Technology, 800 W Peachtree St NW, Atlanta, GA, 30308, United States, priyank.arora@scheller.gatech.edu, Manpreet Singh Hora, Vinod R Singhal, Ravi Subramanian

With an increasing significance of sustainability as a corporate goal, firms have been establishing new positions in their top management teams - positions that we collectively term as Corporate Sustainability Leaders (CSLs). We empirically examine whether and under what conditions does the stock market react to announcements of CSL appointments. While we find that CSL appointments are overall value-neutral, interestingly, we find that under certain conditions, the stock market reaction is significantly more positive. Our findings evidence nuances in the market reactions to the various categories of announcements of CSL appointments considered in our work.

Underground Mine Planning

Sponsored: Energy, Natural Res & the Environment, Natural Resources I Mining

Sponsored Session

Chair: Alexandra M Newman, Colorado School of Mines, 1104 Maple Street, Golden, CO, 80401, United States, anewman@mines.edu

1 - Sensitivity Analysis as a Tool For Improving Robustness Of Underground Mine Production Schedule

Tacio Vinicius Ferreira Lopes, South Dakota School of Mining and Technology, 501 E Saint Joseph Street, Rapid City, SD, 57701, United States, taciovinicius.ferreiralopes@mines.sdsmt.edu, Andrea Brickey

Underground mine production scheduling has long been a manual and time-consuming task performed by mining engineers. Recent research has shown that an integer programming formulation can be used to determine a large-scale underground mine production schedule. We perform sensitivity analysis of an underground mine production schedule model and the results are used in determining a more robust and operationally implementable schedule.

2 - Optimal Support Pillar Placement In An Underground Mine

Levente Sipeki, Colorado School of Mines, lsipeki@mymail.mines.edu

We determine support pillar placement for a top-down one-stope retreat mining operation to maximize the profit from ore extraction, subject to constrains on pillar stress, hydraulic radius, pillar length-to-width rations, and stope-to-pillar extraction rations depending on level depth. A heuristic produces a pillar placement design that increases the extraction capacity of the mine by (1) shifting the pillars to find the most profitable stopes to extract, (2) allowing less ore to be used as a pillar and (3) reducing the total cost of stope slotting by creating fewer pillars.

3 - Short And Medium-term Scheduling Model For Large Underground Mines

Louis-Pierre Campeau, PhD Student, Polytechnique Montreal, 2900 Edouard-Montpetit, Montreal, QC, H3T 1J4, Canada, louis-pierre.campeau@polymtl.ca, Michel Gamache

Applications of operations research to short-term underground mine scheduling are very few, mostly because of the complexity and specificity of its constraints. This presentation will discuss the advances made with a model for short- and medium-term scheduling in large underground mines. The results of the model application to real-world and fictional datasets will also be explained. Comment on future work and possibilities in this field will conclude the presentation.

4 - Underground Mine Plan Optimization

David Whittle, University of Melbourne, a, Melbourne, Australia, dwhittle1@Student.unimelb.edu.au

We present a new approach to the optimization of the design of an underground mine. Our algorithm determines the design and selection of stopes, the network of horizontal development and the selection of levels, in order to maximize undiscounted cashflows. In solving the mine planning problem we have devised a new method to solve the Node-Weighted Geometric Steiner Tree problem, which has potential applications in other fields.

1 - An Integrated Fleet Management Model Introducing Alternative Fuel Trucks

Ilke Bakir, PhD Candidate, Georgia Institute of Technology, Atlanta, GA, United States, ilkebakir@gatech.edu, Alan Erera

We generalize a fleet replacement problem in long-haul trucking by considering some infrastructural and operational decisions alongside with fleet replacement decisions. We propose an integrated fleet management model designed to be particularly helpful in situations where new truck types (alternative fuel trucks, as the main focus) are being introduced into existing fleet. To demonstrate the benefits of utilizing this computationally challenging model instead of simpler methods, we present a comparative computational study. Later, to ease the computational burden of solving this problem, we propose a Benders' decomposition framework.

2 - Solving The Split Delivery Vehicle Routing Problem With A Priori Split

Xingyin Wang, University of Maryland, College Park, MD, 20742, United States, wang_xingyin@yahoo.com, Ping Chen, Bruce L Golden, Edward Andrew Wasil

In the split delivery vehicle routing problem (SDVRP), a customer's demand is allowed to be delivered by more than one vehicle. From a practitioner's point of view, the state-of-the-art heuristics are often difficult to implement and usually take long computing times. We propose an efficient and easily implemented approach to solve the SDVRP using an a priori split strategy combined with a capacitated VRP solver. Our computational experiments show that our algorithm is overall much more efficient and produces results that are comparable to those from the state-of-the-art approaches.

3 - A Computation - Implementation Parallelization Approach For Computation - Time Limited Vehicle Routing Problem With Soft Time Windows

Bahar Cavdar, Middle East Technical Univeristy, Universiteler Mahallesi, Dumlupinar Bulvari No: 1, Ankara, 06800, Turkey, bcavdar@metu.edu.tr, Joel Sokol

Focusing on real-time and time-sensitive routing problems with soft time windows, we develop a new tabu search algorithm which uses a preprocessing step to eliminate unpromising moves and avoids exact computation of time window violations to speed up the computation. We also implement our algorithm using a Computation-Implementation Parallelization approach and show that almost all computation-time can be embedded into the implementation of the solution without hurting the solution quality.

Polyhedral Methods in Combinatorial Optimization

Sponsored: Optimization, Integer and Discrete Optimization

Sponsored Session

Chair: Carla Michini, University of Wisconsin, 330 North Orchard Street, Madison, WI, 53715, United States, michini@wisc.edu

1 - 2-level Polytopes: Recent Results And Open Problems

Yuri Faenza, Columbia University, New York, NY, United States, yuri.faenza@gmail.com

2-level polytopes are a generalization of stable set polytopes of perfect graphs. They naturally appear in several areas of mathematics, including polyhedral combinatorics, combinatorial optimization, and statistics. Those polytopes have received quite some attention in the last years because of their connections with the theory of extended formulations and the prominent log rank conjecture in communication complexity. Still, many questions about their structure have not been answered yet. In this talk, I will survey known results and present open problems and promising research directions.

2 - Approximation Algorithm For Structured Packing IPs

Qianyi Wang, Georgia Institute of Technology, qianyi.wang@gatech.edu, Santanu Subhas Dey, Marco Molinaro

In this talk, we present an approximation algorithm for sparse structured packing IPs. In order to apply this algorithm, we first solve a series of sub-IPs derived from the original instance. Next, we construct a feasible solution according to the sparsity structure of the constraint matrix. The performance guarantee of this algorithm is a graph-theoretical parameter that depends on the sparsity structure only.

3 - Totally Unimodular Congestion Games

Carla Michini, University of Wisconsin, Madison, WI, United States, michini@wisc.edu, Alberto Del Pia, Michael C Ferris

We define Totally Unimodular (TU) Congestion Games, where the players' strategies are binary vectors inside polyhedra with TU constraint matrices. In the symmetric case, we design strongly polynomial-time algorithms to (i) find a pure Nash equilibrium, and (ii) compute a socially optimal state, if the delay functions are weakly convex. We also show how to extend our technique to matroid congestion games. In the asymmetric case, we prove that for some combinatorial TU congestion games (i) it is PLS-complete to find a pure Nash equilibrium even in case of linear delay functions, and (ii) it is NP-hard to compute a socially optimal state, even in case of weakly convex delay functions.

4 - Learning To Dynamically Select Primal Heuristics In MIP Branch-and-bound

Elias B Khalil, Georgia Institute of Technology, Atlanta, GA, 30332, United States, lyes@gatech.edu, Bistra Dilkina, George L Nemhauser, Shabbir Ahmed

A variety of primal heuristics have been proposed in the MIP literature, with varying computational cost and effectiveness in finding good feasible solutions. At each node of a branch-and-bound search tree, the MIP solver must select some heuristics and run them, with the goal of finding a better feasible solution. We formalize this decision-making problem, and propose a theoretical framework for analyzing algorithms that solve it. Towards creating better decision-making policies for primal heuristics, we show how Machine Learning can be leveraged to predict whether a primal heuristic will find an incumbent at a given node. Promising experimental results on MIPLIB with SCIP will be presented.

Detection of Structure and Anomalous Patterns in Data

Sponsored: Artificial Intelligence

Sponsored Session

Chair: David Sungjun Choi, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, davidch@andrew.cmu.edu

1 - Efficient Discovery Of Heterogeneous Treatment Effects In Randomized Experiments Via Anomalous Pattern Detection

Edward McFowland, Assistant Professor, University of Minnesota, Minneapolis, MN, United States, emcfowla@umn.edu, Satya Venkata Somanchi, Daniel B Neill

There is a growing literature on the use of machine learning to estimate heterogeneous treatment effects across subpopulations in randomized experiments. However, each proposed method makes a set of restrictive assumptions about the intervention's effects, the underlying data generating processes, and which subpopulation-level effects to explicitly estimate. Moreover, the majority of the literature provides no guidance on identifying the most significantly affected subpopulations. Therefore, we propose a new method for automatically identifying the subpopulation which experiences the largest distributional change as a result of the intervention, while making minimal assumptions.

2 - Detecting Anomalous Patterns Of Care Using Health Insurance Claims

Satya Venkata Somanchi, University of Notre Dame, 344 Mendoza College of Business, Notre Dame, IN, 46556, United States, somanchi.1@nd.edu, Edward McFowland

In this work, we propose methods for detecting heterogeneous treatment effects in observational data. We apply these methods to the patient health insurance claims to improve clinical practice by analyzing patterns across patients and providing actionable insights. Our goal is to analyze this complex patient care data in order to identify interesting patterns in patient care that have led to anomalous health outcomes. Specifically, we detect treatments in the outpatient patient care that have significantly deviated from the regular treatment process and have affected health outcomes either negatively or positively. This can further help improve patient health and reduce health care costs.

3 - FastMemory-efficient Anomaly Detection In Streaming Heterogenous Graphs

Emaad Ahmed Manzoor, Carnegie Mellon University, Pittsburgh, PA, 19106, United States, emaad@cmu.edu

We present StreamSpot, a method to continuously track anomalous graphs as they evolve from a stream of edges with node and edge types. We introduce a graph similarity function that captures both node/edge types and temporal order, and a constant-space sketch that can be maintained incrementally to approximate this similarity in constant time. We show that when applied to detect malicious software from a stream of system call traces of executing processes, StreamSpot scales to over 10,000 edges/second and demonstrates an average precision of over 95%. Project website: http://bit.ly/streamspot

4 - Sequential Goodness Of Fit Testing With False Discovery Rate Control

Sangwon (Justin) Hyun, Carnegie Mellon, Pittsburgh, PA, United States, robohyun66@gmail.com, Max G'Sell

We consider sequential goodness-of-fit testing for sequential model selection procedures. This leads to a multiple hypothesis testing setting where the hypotheses are ordered and one is only permitted to reject an initial contiguous block, H_1, ..., H_k, of hypotheses. A rejection rule in this setting amounts to a procedure for choosing the stopping point k, corresponding to a particular selected model. We will discuss a multiple hypothesis testing procedure for FDR control in this setting. We will also introduce recent results for goodness-of-fit testing for clustering and the graphical lasso as an illustration of this approach.

Optimal Learning and Optimization via Simulation

Sponsored: Optimization, Optimization Under Uncertainty

Sponsored Session

Chair: Peter Frazier, Cornell University, 410 Thurston Ave, Ithaca, NY, United States, pf98@cornell.edu

1 - Optimal Learning With Discrete Priors

Weidong Han, Princeton University, whan@princeton.edu

We consider an optimal learning problem with a random parameter following a discrete prior distribution. We formulate the problem into a dynamic program, and propose several applicable polices. We consider both finite-horizon and infinite-horizon problems, provide a lower bound on a well-known heuristic policy in the former case, and prove asymptotic convergence properties of the proposed policies in the latter case. We also present comparisons against an optimal learning policy for selected problem instances. Empirical experiments show that the proposed policies achieve near-optimal performances.

2 - Parallel Knowledge Gradient For Global Optimization Of Expensive Functions

Jian Wu, Cornell University, Ithaca, NY, 14850, United States, jw926@cornell.edu, Peter Frazier

In this talk, we will introduce parallel knowledge gradient (pKG) algorithm for batch Bayesian optimization. The method chooses to evaluate the one-step Bayes optimal batch of points. We demonstrate empirically that the method can find global minima significantly faster than previous batch Bayesian Optimization methods on both synthetic functions and tuning hyperparameters of complex machine learning algorithms. Especially, the method provides most value in noisy setting.

3 - Secant Tangents-averaged Stochastic Approximation (STAR-SA)

Marie Chau, Virginia Commonwealth University, mchau@vcu.edu

We present new theoretical results for Secant Tangents-AveRaged stochastic approximation (STAR-SA) and extend it to higher dimensions using simultaneous perturbation stochastic approximation. Under a setting where both direct and indirect gradients are available, STAR-SA and STAR-SPSA (for the multidimensional case) combine direct and indirect gradients using a convex weight. We derive deterministic weights to minimize the MSE of the gradient and of the estimate, both of which are lower than the classical Robbins-Monro and Kiefer-Wolfowitz SA methods. We prove convergence, show asymptotic normality, and investigate their empirical performance against well-known SA algorithms.

4 - Optimal Learning For Nonlinear Parametric Belief Models With Continuous Alternatives

Xinyu He, Princeton University, Princeton, NJ, United States, xinyuhe@princeton.edu, Warren B Powell

We consider the optimal learning problem for nonlinear parametric belief models, where our goal is to find the optimal alternative through a series of noisy and expensive measurements. This problem has been studied when the number of alternatives is finite. Our work presents an algorithm that extends the optimal learning framework to the case with continuous alternatives. Experiments show that our algorithm on the continuous framework exhibits significant performance improvements, especially in higher dimensions.

1 - DQM: Decentralized Quadratically Approximated Alternating Direction Method Of Multipliers

Aryan Mokhtari, University of Pennsylvania, 200 South 33rd Street, Room 203 Moore Building, Philadelphia, PA, 19104, United States, aryanm@seas.upenn.edu, Wei Shi, Qing Ling, Alejandro Ribeiro

The decentralized alternating method of multipliers (DADMM) is a well-established iterative method for solving consensus optimization problems; however, implementation of DADMM requires solving an optimization subproblem at each iteration for each node which can be computationally costly. We propose a decentralized quadratic approximation of ADMM (DQM) that reduces the computational complexity of DADMM by minimizing a quadratic approximation of the objective function. We show that DQM converges to the optimal argument at a linear rate which is identical to the convergence rate of DADMM. Moreover, as time passes the coefficient of linear convergence for DQM approaches the one for DADMM.

2 - A Geometrically Convergent Method For Distributed Optimization Over Time-varying And Directed Graphs

Wei Shi, Postdoctoral Research Associate, Coordinated Science Laboratory, University of Illinois at Urbana-Champaign, Urbana, IL, 61801, United States, wilburs@illinois.edu, Angelia Nedich, Alex Olshevsky

In this presentation, we introduce a class of first-order algorithms, referred to as DIGing and its variants, for distributed optimization over time-varying and/or directed graphs. The algorithms employ fixed step-sizes and, yet, drives all the agents' iterates to a global and consensual minimizer. Under the strong convexity assumption, we show that the algorithms all converge at some explicit global R-linear (geometric) rates as long as the step-sizes are no greater than some explicit bounds. We also show that the rate for DIGing scales polynomially in the number of agents. Numerical experiments demonstrate the efficacy of the introduced algorithms and validate our theoretical findings.

3 - Distributed Admm-like Methods For Cooperative Multi-agent Optimization Over Conic Constraints

Erfan Yazdandoost Hamedani, Penn State University, Department of Industrial Engineering, 310 Leonhard Bldg. University Park, State College, PA, United States, evy5047@psu.edu, Necdet Serhat Aybat

We consider the sharing problem over an undirected (dynamic) network of agents, where only those agents connected by an edge can directly communicate. The objective is to minimize the sum of agent-specific composite convex functions subject to a conic constraint coupling all agents' local decisions. An ADMM-like primal-dual distributed algorithm is proposed. We examine the convergence rate in terms of suboptimality, and infeasibility; study the effect of underlying network topology on the rates; and show how to extend this method to handle communication networks with time-varying topology.

Contributed Session

Chair: Jose M. Merigo, Full Professor, University of Chile, Av. Diagonal Paraguay 257, Santiago, 8330015, Chile, jmerigo@fen.uchile.cl

1 - Cyber Attacker Choices In A Three-way Behavioral Security Game

Jinshu Cui, University of Southern California, 3620 McClintock Avenue, # 501, Los Angeles, CA, 90089, United States, jinshucu@usc.edu, Richard S John, Heather Rosoff

This study focuses on cyber attackers' choices in a security game involving attackers, defenders, and users. An attacker can choose to attack the defenders or the users. Deterrence is measured by the third option of the attacker - no attack. Conversely, the defenders and users can select either a standard or enhanced security level. We conducted a behavioral experiment in which 497 subjects played as attackers over 30 rounds of the game and were incentivized based on their performance. Defenders' and users' joint strategies were manipulated. Results indicated that subjects were more likely to hack database when EV(database) was higher, and were more deterred when both EVs were negative.

2 - Sequential Decisions Following Near Misses

Jinshu Cui, University of Southern California, 3620 McClintock Avenue, # 501, Los Angeles, CA, 90089, United States, jinshucu@usc.edu, Richard S John

Prior near miss experiences have been identified as a contributing factor in responses to risks of disasters. Researchers found a near miss event could lead individuals to interpret the risk as either "vulnerable" or "resilient", while had no conclusions on what could lead to different interpretations. The current study hypothesizes that responses to near miss events are determined by psychological distance. We conducted a behavioral experiment in which 100 subjects were exposed to a sequence of 20 events. Results indicated that subjects were less likely to engage in protective measures when a near miss event is psychological distant to the decision maker and when more near misses were experienced.

3 - Column Generation For Airline Crew Rostering: Practical Considerations In A Production System

Andreas Westerlund, Optimization Expert, Jeppesen, Odinsgatan 9, Gothenburg, 411 03, Sweden, andreas.westerlund@jeppesen.com

Jeppesen's crew rostering optimizer is today used by around 40 airlines to produce monthly schedules for their flying crew. The optimizer allows the user to configure various kinds of business logic and it solves monthly schedules for problem instances with above 20k crew-members and 100k activities.

In this presentation we will start by defining the rostering optimization problem in general. Then we will describe our column generation framework that is used to deal with it. Finally we will look at the specific problem of having an efficient fixing process in the presence of high degree of symmetry.

4 - The Internet Of Things: Preliminary Research Results

Gary D Scudder, Vanderbilt University-OGSM, 401 21st Avenue South, Nashville, TN, 37203-2422, United States, gary.scudder@owen.vanderbilt.edu, Sal March

In this research, we look at the emerging field of the Internet of Things and develop a research agenda for managerial issues. In addition, we will discuss research in IoT for preventive maintenance. IoT is shown to be beneficial in reducing costs and increasing profits.

5 - The Ordered Weighted Average Division

Jose M. Merigo, Full Professor, University of Chile, Av. Diagonal Paraguay 257, Santiago, 8330015, Chile, jmerigo@fen.uchile.cl, Sigifredo Laengle, Ronald R Yager

The ordered weighted average division is an aggregation operator that aggregates a set of divisions providing a parameterized family from the minimum to the maximum division. The work considers a wide range of particular cases including the average division, the median division and the weighted average division. It also develops some further extensions including the weighted ordered weighted average division and the generalized weighted ordered weighted average division. This approach can be applied in a wide range of problems dealing with the aggregation of divisions including decision making and computational intelligence.

Future of Disease Modeling in Clinical and Public Health

Sponsored: Computing

Sponsored Session

Chair: Zeynep Ertem, University of Texas-Austin, University of Texas-Austin, Austin, TX, United States, zeynepsertem@gmail.com

1 - Pandemic Influenza Preparedness

David Morton, Northwestern University, david.morton@northwestern.edu

We describe three data-driven optimization models that inform resource allocation in preparing for an influenza pandemic. In particular, we optimize: the mix of central and regional stockpiles of ventilators, accounting for stochastic peak-week demand; the spatial allocation of antivirals, considering under-insured populations and hard-to-reach locations; and, the spatial allocation of multiple types of vaccines with differing suitability for each prioritized target population. We discuss challenges and extensions.

2 - Role Of Operations Research In Chronic Disease Management

Mariel Lavieri, University of Michigan, lavieri@umich.edu

I discuss past and future challenges encountered in managing chronic diseases.

3 - Mathematical Models for Cancer Screening

Fatih Safa Erenay, University of Waterloo, ferenay@uwaterloo.ca

My talk will provide an overview of models proposed for the optimal cancer screening problem from societal and personal perspectives. I will start with the classical models that schedule screening interventions over a planning horizon, and describe the evolution of the literature towards more dynamic, partially observable, and personalized models over examples from colorectal cancer screening. The talk will also highlight the current challenges and recent trends in cancer screening literature.

Assets and Structured Hedges in Energy Markets Severe Incompleteness and Methods for Dealing with It

Invited: Tutorial

Invited Session

Chair: Glen Swindle, Scoville Risk Partners, 405 Lexington Avenue, 21st Floor, New York, NY, 112, United States, glenswindle@scovilleriskpartners.com

1 - Assets And Structured Hedges In Energy Markets – Severe Incompleteness And Methods For Dealing With It

Glen Swindle, Scoville Risk Partners, 405 Lexington Avenue, 21st Floor, New York, NY, 12, United States, glenswindle@scovilleriskpartners.com

Risks in energy markets are inherently high dimensional due to large numbers of delivery locations and physical attributes, stochastic demand, and seasonality. In contrast, the number of instruments with sufficient liquidity to support hedging activities is relatively small, and has never been able to span the set of risks sustained by market participants. This mismatch has spawned an interesting and arguably unique set of challenges related to the valuation and hedging of energy portfolios. Here we will survey examples of such, including variable quantity swaps, generation and structured asset hedges.

Emerging Methods for Healthcare Analytics and Visualization

Sponsored: Health Applications

Sponsored Session

Chair: Rahul C Basole, Georgia Institute of Technology, 85 Fifth Street NW, Atlanta, GA, 30332, United States, basole@gatech.edu

1 - A Semi-supervised Learning Approach To Enhance Health Care Community-based Question Answering

Papis Wongchaisuwat, Northwestern University, Evanston, IL, United States, papiswongchaisuwat2013@u.northwestern.edu, Diego Klabjan, Siddhartha R Jonnalagadda

Community-based Question Answering (CQA) sites play an important role in addressing health information need. We developed an algorithm to automatically answer health-related questions based on past questions and answers. Our algorithm uses information retrieval techniques to identify candidate answers from resolved QA. In order to rank these candidates, we implemented a semi-supervised learning algorithm that extracts the best answer to a question. On our dataset, the semi-supervised learning algorithm has an accuracy of 86.2% while UMLS-based (health-related) features used in the model enhance the algorithm's performance by approximately 8%.

2 - Visual Analytics For Population Level Health Analysis

Rahul C Basole, Georgia Institute of Technology, 85 Fifth Street, Atlanta, GA, 30332, United States, basole@gatech.edu, Mark L. Braunstein, Hyunwoo Park, Dhruv Mutturaju, Myung Choi, Richard Starr

We present the design, implementation, and use cases of a FHIR-centric population health analysis and visualization platform.

3 - Double Sided Network Externalities In Healthcare Information Exchanges

Emre Muzaffer Demirezen, School of Management, Binghamton University, School of Management Binghamton University, State University of New York AA278, Binghamton, NY, 13902, United States, edemirezen@binghamton.edu, Subodha Kumar, Arun Sen

Based on our interactions with different healthcare information exchange (HIE) providers, we develop models to study participation levels and sustainability of HIEs. We examine how heterogeneity among healthcare practitioners (HPs) affects participation of HPs in HIEs. We find that, under certain conditions, low-gain HPs choose not to join HIEs. Hence, we explore several measures that can encourage more participation in HIEs and find that it might be beneficial to: (i) establish a second HIE in the region, (ii) propose more value to the low-gain HPs, or (iii) offer or incentivize value-added services. We present several other interesting and useful results.

Empirical Analysis of Resource Utilization

Sponsored: Health Applications

Sponsored Session

Chair: David Anderson, CUNY Baruch, 55 Lexington Ave, New York, NY, 10010, United States, davidrybberganderson@gmail.com

1 - Comprehensive Prediction Models For Colorectal Cancer Mortality

David Anderson, CUNY Baruch, David.Anderson@Baruch.Cuny.Edu

Having accurate, unbiased prognosis information can help patientsand providers make better decisions about what course of treatment to take.Using a comprehensive dataset of all colorectal cancer patients in California, wegenerate predictive models that estimate short-term and medium-term survivalprobabilities for patients based on their clinical and demographic information.Our study addresses some of the contradictions in the literature about survival rates and signicantly improves predictive power over the performance of anymodel in previously published papers.

2 - Slow First, Fast Later: Temporal Speed-up In Service Episodes Of Finite Duration

Aditya Jain, CUNY Baruch, Aditya.Jain@baruch.cuny.edu, Sarang Deo

Many services comprise repeated episodes of finite duration wherein customers must be served before the end of that episode leading to non-stationary operational dynamics. We hypothesize and empirically validate (using data from a high volume tertiary care outpatient department) the presence of a ``slow first, fast later" work speed pattern in such environments. This pattern allows sufficient build-up of inventory earlier for more efficient utilization of faster work speed later. As a natural corollary of this pattern, we also find that greater anticipated workload, which causes faster inventory build-up, leads to a greater increase in work speed earlier during the service episode.

3 - The Impact Of Reminder Calls For A Pediatrics Practice

Kiatikun Louis Luangkesorn, Assistant Professor, University of Pittsburgh, 1028 Benedum Hall, 3700 Ohara St, Pittsburgh, PA, 15261, United States, lluangkesorn@pitt.edu, Tricia Pil

Primary care practices often use reminder phone calls to reduce missed appointments. The same factors that make reminder calls useful can also be used for improving patient engagement in the form of well child visits and vaccinations. However, studying the impact in a clinical setting can be difficult because it may not be practical or ethical to conduct random control trials on patients. We present two studies, one in the context of a series of interventions to inprove human papillomavirus (HPV) vaccination and to increase the fraction of patients who meet the recommendation of annual well child visits within a multi-practice pediatrics network.

Optimal Treatment & Screening of Chronic Care Patients

Sponsored: Health Applications

Sponsored Session

Chair: Huaiyang Zhong, Stanford University, 475 Via Ortega, Stanford, CA, 94305, United States, hzhong34@stanford.edu

1 - Optimal Statin Therapy Plan For Diabetic Patients

Saeideh Mirghorbani, University of Alabama, Tuscaloosa, AL, United States, smirghorbani@crimson.ua.edu

The importance of cardiovascular risks in diabetic patients has been emphasized because of their high cardiovascular mortality rate. Statins are a class of medicines used to lower blood cholesterol levels and mitigate the risk of heart problems. In this research, we address the optimal time to initiate and terminate statin therapy considering patient adherence as well as the influence of statin side-effects. We develop a finite horizon, discounted Markov decision process in which patients transition through health states. The objective is to maximize the expected quality-adjusted life years.

2 - Fairness In Down Syndrome Screening

Jia Yan, Georgia Institute of Technology, Atlanta, GA, United States, jyan40@gatech.edu, Turgay Ayer, Pinar Keskinocak

Detection and false positive rates of prenatal screening for Down syndrome depend on the selected risk cutoff values. In current practice, one-size-fit-all type cut off values are being used, which may lead to suboptimal outcomes and unfairness among different age groups. We first propose a Monte Carlo simulation model to capture prevalence and test outcomes in the population. Then, we combine this simulation model with an optimization modeling framework to identify the optimal age-specific risk cutoff values by taking fairness among different age groups into account. Our findings indicate that age-specific cutoff values significantly improve health outcomes and fairness.

3 - Improving The HIV Care Cascade Via Mental Health Interventions

Huaiyang Zhong, Stanford University, hzhong34@stanford.edu

The UNAIDS' 90-90-90 targets having 90% of HIV-infected people aware of their status, 90% of diagnosed HIV-positives on antiretroviral therapy (ART), and 90% of those on ART virally suppressed. In most sub-Saharan African countries, these percentages are far lower. Developing effective and cost-effective approaches to improve the HIV care cascade is critical. We focus on one potential opportunity for improving the HIV care cascade: the provision of antidepressant therapy (ADT) for HIV-infected individuals with depression.

Optimization in Radiation Therapy

Sponsored: Health Applications

Sponsored Session

Chair: Omid Nohadani, Northwestern University, 2145 Sheridan Road, Room M233, Evanston, IL, 60208-3119, United States, nohadani@northwestern.edu

1 - Designing Radiation Therapy Criteria With Data-driven Robust Optimization

S. Nastaran Shojaei, Northwestern University, 2145 Sheridan Road Room C210, Evanston, IL, 60208, United States, nastaranshojaei@u.northwestern.edu, Seyed M.R. Iravani, Omid Nohadani

Radiation therapy planning is an iterative process of optimization and evaluation, making it both time consuming and not reproducible. Often feasibility is not attainable for which planners relax some of the criteria. We present a data-driven robust optimization approach that can provide a new and less sensitive set of criteria which warrant high quality plans despite some constraint violations within a realistic range. A large set of clinical data is used to inform the method.

2 - Multicriteria Optimization For Brachytherapy Treatment Planning

Victor Wu, University of Michigan, vwwu@umich.edu, Marina Epelman, Michael Herman, Kalyan Pasupathy, Mustafa Sir, Christopher Duefel

High Dose Rate Brachytherapy (HDR-BT) has become a popular mode of radiation therapy for its ability to deliver high dose localized to the tumor, resulting in lower risk of side effects. The goal is to allow the physician to explore trade-offs via an intuitive GUI with respect to multiple dose-volume criteria (also known as value-at-risk) among high quality plans. The underlying problem is non-convex and therefore is not practically solvable. The desire to generate plans quickly, i.e., within the 30 minutes while the patient is under anesthesia, motivates solving convex approximations (based on conditional value-at-risk) instead. Our method is retrospectively tested on various cancer sites.

3 - Automated IMRT Treatment Planning For SBRT Paraspinal Case Using Prioritized Optimization

Masoud Zarepisheh, Assistant professor/attending, Memorial Sloan Kettering Cancer Center, New York, NY, United States, zarepism@mskcc.org, Linda Hong, James Mechalakos, Margie Hunt, Gikas Mageras, Joseph Deasy

Treatment planning is a patient specific and time consuming task, with plan quality heavily dependent on planners' skills. In this study, we are employing prioritized optimization (PO) to automate the planning process. PO is a step-wise technique where the highest priority goal (e.g., tumor coverage) is optimized first. At each iteration step the previous objectives are turned into constraints and a new goal is optimized. We integrate our optimization package with the commercial treatment planning system called Eclipse.

4 - Time-dependent Radiation Therapy Optimization

Arkajyoti Roy, Bowling Green State University, 4154 Moser Ln, Bowling Green, OH, 43551, United States, aroy@bgsu.edu, Omid Nohadani

Low oxygen concentration reduces the radio-sensitivity of cells. Re-oxygenation leads to temporal changes during treatment. However, the re-oxygenation trajectory is unpredictable, leading to uncertain radio-sensitivity. We develop a time-dependent uncertainty set that models the evolution of radio-sensitivity. To reduce over conservativeness at later time-periods, a two-stage robust optimization approach is proposed that can incorporate such uncertainties. For a clinical prostate cancer case, the robust method is compared to current clinical methods.

Logistics II

Contributed Session

1 - Coordination Between Shipper And Carrier In City Logistics

Gitae Kim, Hanbat National University, Dept. of Industrial Management Engineering, School of Engineering, Daejeon, 34158, Korea, Republic of, gitaekim@hanbat.ac.kr, Juncheul Park

In a decentralized system in city logistics, two stakeholders such as shipper and carrier have different their own objectives. Coordination is necessary to obtain the win-win strategy for two parties. This paper investigates contract models between a shipper and a carrier to achieve the coordination in city logistics. Quantity flexibility (number of transportation services) and revenue sharing contract types are formulated by stochastic programming model using options. From the experimental results, we find the efficient frontier for two stakeholders.

2 - An Optimization Framework For Simultaneous Space Logistics Mission Planning And Spacecraft Design

Hao Chen, University of Illinois at Urbana-Champaign, 310 E. Springfield Ave, Champaign, IL, 61820, United States, hchen132@illinois.edu, Koki Ho

This paper proposes a network modeling and optimization method for human space exploration campaign-level mission planning. The interplanetary space is discretized into nodes and the space missions are modeled as generalized multi-commodity network flows, where payload, propellant, and spacecraft are considered as separate commodities. This problem results in a mixed-integer nonlinear programming, and we solve this problem with branch-and-bound and gradient-based method (e.g., SQP). The proposed framework enables us to optimize the space mission and its spacecraft design concurrently at a mid-fidelity.

Information Systems I

Contributed Session

1 - Designing Referral Policies For Optimal Membership Growth: A Real World Randomized Experiment In An Exclusive Online Dating Site

Rodrigo Belo, Assistant Professor, Erasmus University, Mandeville Building T09-20, Burgemeester Oudlaan 50, Rotterdam, 3062 PA Rotterdam, Netherlands, rbelo@rsm.nl, Ting Li

We use data from a real-world randomized experiment in an exclusive online dating site to study the effect of member-get-member referral policies on membership growth and online user activity. We find that stricter policies, i.e., policies that require members to invite more friends so that they can continue using the service for free, are more effective at fostering growth in multiple dimensions, including invitations, online user activity, and paid memberships. We discuss the mechanisms that may be at play and implications for business.

2 - Agent Based Simulation For Social Support Networks

M. Gisela Bardossy, University of Baltimore, 1420 N. Charles Street, Baltimore, MD, 21201, United States, mbardossy@ubalt.edu, Stefano Za, Eusebio Scornavacca

Support networks have benefited from digital and networking tools. In an interconnected world, people depend on each other to achieve their personal and group goals. We model this inter dependency using agent based simulation and test various hypothesis regarding rules of engagement, dissipation of information in the network, discrepancy between reality and beliefs and the updating and correction of beliefs. This information can inform the design of social platforms as the implications of choice characteristics are better understood. Some preliminary results are analyzed and discussed.

3 - Multi-homing Within Platform Ecosystems: The Strategic Role Of Human Capital

Vijayaraghavan Venkataraman, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States, vijayaraghavan.venkataraman@scheller.gatech.edu, Marco Ceccagnoli, Chris Forman

Even though there has been considerable research on platform ecosystems, prior literature has focused mostly on the platform owners and their strategies. In this paper, I look at the complementor firms, instead, and try to understand why the incidence of multi-homing, a strategy in which a complementor firm chooses to join multiple platforms rather than one, is often quite low. I build a capability framework based on human capital and test it on micro-level data from the ERP platform ecosystem. The study has important implications for our understanding of platform growth and innovation and contributes toward the literature on platform ecosystems as well as strategic human capital.

4 - The Impact Of Sharing Markets On Product Durability

Maryam Razeghian, Ecole Polytechnique Federale de Lausanne, ODY 4.16, Station 5, Lausanne, 1015, Switzerland, maryam.razeghian@epfl.ch, Thomas A. Weber

This paper studies the effects of sharing markets on the prices for new products and on product design in terms of durability. In a dynamic economy with overlapping generations, consumers take strategic purchasing decisions, anticipated by a durable-goods monopolist. Without sharing, the optimal durability increases in the production cost. In the presence of sharing, the firm prefers to limit durability for low-cost products, effectively disabling a secondary sharing market. However, all else equal, a peer-to-peer economy never decreases the incentives to provide durability.

5 - Are All Data Thieves Created Equal? An Empirical Analysis Of Customer Response To Identity Theft

John N Angelis, Elizabethtown College, 100 Farmhouse Lane, Mountville, PA, 17554, United States, angelisj@etown.edu, Joseph C Miller

The popular press tends to report on data hacking and identity theft instances as if all such crimes are relatively equal in business impact and public perception. To challenge this assertion, we exposed independent study panels to four unique recent real-world instances of identity theft. Analysis reveals that the extent to which thieves, the business, and customers are blamed for their role in the crime is highly dependent on both parameters of the localization of the breached firm and the uniqueness of the identity of the customers affected, as well as perceived cleverness of said thieves. In certain cases, the public will assign equivalent blame to both affected customers and the hacked business.

Information and Consumer Behavior in Supply Chain Management

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Hyoduk Shin, UC-San Diego, La Jolla, CA, United States, hdshin@ucsd.edu

1 - Loss Aversion And The Uniform Pricing Puzzle For Media And Entertainment Products

Javad Nasiry, Hong Kong University of Science and Technology-HKUST, nasiry@ust.hk

The uniform pricing puzzle for vertically differentiated media and entertainment products (movies, books, music, mobile apps, etc.) is that a firm with market power sells high- and low-quality products at the same price even though quality is perfectly observable and price adjustments are not costly. We resolve this puzzle by assuming that consumers have an uncertain taste for quality and accounting for consumer loss aversion in monetary and consumption utilities. The novelty of our approach is that the so-called reference transactionis endogenously set as part of a “personal equilibrium” and is based only on past purchases of same-quality products.

2 - Generalized Reverse Auctions: Efficiency And Credibility Under Information Asymmetry

Hedayat Alibeiki, McGill University, 1001 Sherbrooke Street West, Desautels Faculty of Management, Montreal, QC, H3A 1G5, Canada, hedayat.alibeiki@mail.mcgill.ca, Mehmet Gumus

Non-price factors such as product quality and reliability can be even more important than bidding prices for the buyers when selecting the winner of an e-Auction. In practice, buyers usually evaluate and assign an originally-private “quality score” to each supplier that determines the relative position of the supplier toward its competitors. In this paper, we study whether or not and in what fashion the buyer can credibly share suppliers’ quality scores with them.

3 - Incentives For Sharing Cyber-security Breaches Among Competing Firms

Noam Shamir, Tel Aviv University, nshamir@post.tau.ac.il

Presidential Executive Order 13691, which was issued by President Obama, characterizes cyber threats as a “national emergency”. This executive order calls for increased cooperation and information sharing on such threats. A main concern regarding this initiative is related to the companies’ incentives to pool cyber threat information. Although policy makers claim that the companies will benefit from a shared database of threat assessment information, each company must find it beneficial to share its cyber-threat information. In this work we evaluate the incentives of companies that operate in a competitive environment to share such information.

Chair: Harish Krishnan, University of British Columbia, Vancouver, BC, Canada, krishnan@sauder.ubc.ca

Co-Chair: Juan Camilo Serpa, Assistant Professor, McGill University, 1001 Rue Sherbrooke O, Montreal, QC, H3A 1G5, Canada, juan.serpa@sauder.ubc.ca

1 - Cover-up Of Safety Hazards: Delays In Voluntary Product Recalls

Woonam Hwang, Assistant Professor, HEC Paris, Paris, France, hwang@hec.fr, Soo-Haeng Cho, Victor DeMiguel

Product safety regulators often have to rely on manufacturers’ voluntary disclosure of information when investigating product defects, because manufacturers have better information about safety hazards through internal testing and warranty claims. However, manufacturers may not always truthfully report all safety hazard information. For instance, several automakers including GM and Toyota have been recently accused of deliberately hiding safety hazards from regulators and delaying product recalls, putting the public in danger. In this paper, we investigate how regulators can induce manufacturers to truthfully report any safety issues in a timely manner.

2 - Board Composition And Firm Responsiveness To Product-harm Crises

George Ball, Indiana University, Kelley School of Business, gpball@indiana.edu, Kaitlin Wowak, Corinne Post

Even though firms are subjected to the same regulatory, consumer protection, and market pressures, they vary considerably in how swiftly they issue recalls in product-harm situations. In this study, we explore how firm responsiveness to product recalls is impacted by several Board of Director characteristics, including female board representation and board independence. We study these questions using over 5,000 recalls from a 12-year panel covering all recalls in industries regulated by the U.S. Food and Drug Administration (e.g., Food, Medical Devices, and Pharmaceuticals).

3 - Why Do Automakers Initiate Recalls? A Structural Econometric Study

Ahmet Colak, Northwestern University, Evanston, IL, United States, a-colak@kellogg.northwestern.edu, Robert Louis Bray

We model a manufacturer’s and regulator’s joint recall decisions as a dynamic discrete choice game. We estimate our model with 14,124 U.S. auto recalls and 976,062 defect reports over the period 1994—2015. We find that (i) automakers initiate recalls mainly to avoid field failure costs, and (ii) automakers don’t preempt the regulator’s interventions in 86% of our sample.

Managing Responsibility in Supply Chains

Sponsored: Manufacturing & Service Oper Mgmt, Sustainable Operations

Sponsored Session

Chair: Jing-Sheng Jeannette Song, Duke University, Durham, NC, United States, jssong@duke.edu

1 - Cooperative Approaches To Managing Social Responsibility In Supply Chains: Joint Auditing And Information Sharing

Soo-Haeng Cho, Carnegie Mellon University, soohaeng@andrew.cmu.edu, Xin Fang

This paper investigates two cooperative approaches of firms’ managing social responsibility violations of suppliers: auditing a common supplier jointly or sharing independent audit results with other firms. We develop a model based on a cooperative game in partition function form, and show that: (1) competing firms have incentives to cooperate when the negative externality of one firm’s social responsibility violation on other firms is high; and (2) neither cooperative approach necessarily improves social responsibility, especially when one firm can benefit from others’ social responsibility violations (i.e., the positive externality is high).

2 - Improving Supplier Compliance Through Joint And Shared Audits With Collective Penalty

Prashant Chintapalli, UCLA, Los Angeles, CA, United States, prashant.chintapalli.1@anderson.ucla.edu, Felipe Caro, Kumar Rajaram, Christopher S Tang

Motivated by the Accord on Fire and Building Safety in Bangladesh we study the effectiveness of buyer consortiums in supply chains . Using a game-theoretic model, we show that while a consortium improves supplier compliance and buyers' profits, it puts supplier at a disadvantage. We identify a few sufficient conditions for the existence of a Pareto improving transfer-payment mechanism that a buyer consortium can offer the supplier.

3 - Testing By Competitors In Enforcement Of Product Standards

Terry Taylor, University of California Berkeley, Berkeley, CA, 94720, United States, taylor@haas.berkeley.edu, Erica Plambeck

This paper explores a novel mechanism to encourage compliance with and identify violations of safety and environmental standards: Firms testing competitors' products.

Management of Critical Care

Sponsored: Manufacturing & Service Oper Mgmt, Healthcare Operations

Sponsored Session

Chair: Vedat Verter, McGill University, Montreal, QC, Canada, vedat.verter@mcgill.ca

Co-Chair: Michael Klein, McGill University, Montreal, QC, Canada michael.klein2@mail.mcgill.ca

1 - Specialist Care In Rural Hospitals: From Emergency Department Consultation To Inpatient Ward Discharge

Michael G. Klein, McGill University, Montreal, QC, Canada, michael.klein2@mail.mcgill.ca, Vedat Verter, Hughie F. Fraser, Brian G. Moses

Patients often wait in the Emergency Department for admission to inpatient wards, resulting in crowding and adverse health outcomes. In rural hospitals, Internal Medicine Specialists (Internists) take on a dual role as ICU physician and Internist on call. We study the workflow decisions of Internists at two hospitals in Nova Scotia, Canada. We propose a stochastic dynamic programming model to analyze current practice and identify strategies for improvement.

2 - Effects Of Admission And Discharge Delays On Intensive Care Unit Patient Outcomes

Elisa Long, Assistant Professor, UCLA Anderson School of Management, Los Angeles, CA, 90095, United States, elisa.long@anderson.ucla.edu, Kusum Mathews

Patients admitted to the ICU often endure excessive delays for bed assignment due to capacity shortages, and prolonged ICU boarding following receipt of care. Using 2 years of data for 2 academic hospitals, we estimate that each hour of admission delay increases in-hospital mortality by 4%. We also examine whether simultaneous ICU and ward occupancy surges affect length of stay. Unlike prior studies we find that service time (when critically ill patients are stabilized) is unaffected by occupancy, yet ICU boarding accelerates during periods of high ICU occupancy and slows when ward occupancy is high. We find no adverse effects of occupancy on ICU bouncebacks or 30-day readmissions.

3 - A Delay-differential Equation Model Of An Intensive Care Unit

Eman Almehdawe, University of Regina, Regina, SK, Canada, Eman.Almehdawe@uregina.ca, Armann Ingolfsson

We investigate a fluid approximation model of an intensive care unit, in which patients are discharged at an adjustable speed, which influences the proportion of patients that are readmitted after a delay. We formulate the model as a delay-differential equation. We study the transient and steady-state behavior of the system occupancy in four different regimes and we obtain conditions under which speedup reduces average occupancy.

1 - Ethics, Bounded Rationality And Ip Sharing In Knowledge-based Outsourcing

Manu Goyal, University of Utah, Salt Lake City, UT, United States, manu.goyal@eccles.utah.edu, Krishnan S Anand

Our dynamic model of knowledge-based outsourcing integrates (i) its major impediments— incomplete contracts, moral hazard and adverse selection, and (ii) its major facilitators— ethics, IP sharing and reputations. We show that, under bounded rationality, an ethical firm can obtain strictly greater profits than a profit-maximizing firm unconstrained by ethics. We find a novel explanation, rooted in ethics, for IP sharing, which arises as a strategic imperative even when it lowers firms' profits. Our results explain why (a) a commitment to ethics can boost profits, (b) IP sharing is widespread, and (c) knowledge-based outsourcing is booming despite several formidable impediments.

2 - Accurate Estimation Of Retail Store Traffic From People Counters To Achieve Better Conversion

Anup Hanamant Walvekar, INSEAD, anup.walvekar@insead.edu

Conversion rate is an important KPI for retail store manager that captures fraction of sales opportunities that store was able to capture. As group of customers seldom have multiple transactions, #groups of customers visiting the store is more appropriate measure of sales opportunities than #customers. #Groups of customers visiting the store is not readily available from traffic counters. In this paper, we model the customer arrival process. We derive five different estimators of #groups of customers using customer arrival data and analyse their performance in different traffic profiles.

3 - Mitigating Digital Discrimination With Reviews In The Sharing Economy: Field Evidence From Airbnb

Dennis Zhang, Kellogg School of Management, Northwestern University, Evanston, CA, 60201, United States, zjj1990228@gmail.com, Jun Li, Ruomeng Cui

This project studies how agents may discriminate each other based on demographic information in the sharing economies. We conduct several field experiments on the Airbnb platform to quantify the impact of such discrimination on the platform's revenue and provide several recommendations to mitigate it.

4 - Impact Of Operational Risks In Financial Organizations

Yuqian Xu, New York University, 44 West 4th Street, New York, NY, 10012, United States, lillian.xyq@gmail.com, Fangyun Tan, Serguei Netessine

We analyze extensive data from a Chinese bank which contains information on operational risks in retail banking. We find that workload affects incidence of risks in this service setting.

Chair: David Menachof, Peter Thompson Chair in Port Logistics, The University of Hull, Logistics Institute, Hull University Business School, Kingston upon Hull, HU6 7RX, United Kingdom, d.menachof@hull.ac.uk

1 - Macroscopic Look At The Equity Market

Abdullah Alshelahi, PhD Student, University of Michigan, 2410 Leslie Circle, Ann Arbor, MI, 48105, United States, shelahi@umich.edu, Romesh Saigal

The aim of this research is to investigate the existence of sensors which may aid in the monitoring of Equity Markets. While the classical approach consists of studying the stock market following the evolution of individual stocks, we use a so-called macroscopic viewpoint by considering a global view of the equity markets. This way, we see the market within the context of the principles of mass and momentum conservation and the variables such as density, pressure, average velocity, etc. We can then define `sensors' that can monitor some of these variables in the market. Finally, we propose a model that predicts and provides alerts in the case of abnormal events.

2 - The Analytics Of A Business Traveler's Alert System

Fletcher Lu, Associate Professor, University of Ontario Institute of Technology, Faculty of Business and IT, 2000 Simcoe Street North, Oshawa, ON, L1H 7K4, Canada, fletcher.lu@uoit.ca

An insurance company is minimizing its business clients' exposure to dangerous and risky environments by providing a dynamic mobile travel alert system. I present the analytics of this alert system, which gathers world-wide current information using big data analytics to rank alerts regarding dangerous situations and matches the alert information to clients' relevant travel information such as location, travel time, health issues, etc. to send to the clients. Included in the system's alerts are safety recommendations and instructions.

3 - Risk Sharing Between The Insured And The Insurer

Christopher Gaffney, Drexel University, 3141 Chestnut St, LeBow College of Business, Philadelphia, PA, 19104, United States, ctg39@drexel.edu

Risk reduction is a key benefit of insurance. We derive many of the properties that govern the way in which risk is shared, with a particular focus on the properties of insurer and insured variance and covariance. Additionally, we consider the conception of optimal risk sharing, and discuss how an insurance contract can constitute such an arrangement.

4 - Filtering For Risk Assessment Of Interbank Network

Majeed Simaan, PhD Student, RPI, 110 8th Street, Pittsburgh Building, TROY, NY, 12180, United States, simaam@rpi.edu, Aparna Gupta, Koushik Kar

We develop a framework for risk assessment in an interbank network, where banks interact with each other via short-term debt contracts. Focusing on the demand side of liquidity and omitting credit rationing, the framework identifies the interbank network structure and its degree of interconnectedness. Identification is facilitated by a statistical learning procedure that reverse engineers signals (transactions) observed in the interbank market and conducts inference about banks' individual and network-level characteristics. The results from the simulation study undermine the value of integration, even when the network is identified in its simplest forms.

5 - Decision Making Under Uncertainty Using Monte Carlo Simulation: Case Of The Offshore Wind Industry Supply Chain

David Menachof, Peter Thompson Chair in Port Logistics, The University of Hull, Logistics Institute, Hull University Business School, Kingston upon Hull, HU6 7RX, United Kingdom, d.menachof@hull.ac.uk, Negar Akbari

Offshore wind energy has emerged as an emission free source of energy globally, especially across Northern European countries. The projects are now moving further from shore and into deeper waters, which in turn increases the levelized cost of energy (LCOE) and related risks. Furthermore, government support schemes are also subject to uncertainties that influence investment in such projects. A Monte Carlo Simulation model is proposed that aims to consider the risks within the project and suggests ways that risks can be incorporated in the project evaluation phase including port selection. An offshore wind project case is considered and the results are reported.

1 - Sequencing In Mixed Model Assembly Lines

Mary Beth Kurz, Clemson University, 271 Freeman Hall, Clemson, SC, 29634-0920, United States, mkurz@clemson.edu, Anas Alghazi

Mixed model assembly lines are used by manufacturers to satisfy customer's demand for products' customization while keeping the cost down. Since customization is available via different options, some orders that include labor-intensive options require more time to be assembled. In order to minimize work overload throughout the assembly line, a sequencing decision must be taken to sequence customer's orders such that work overload is minimized. We investigate this problem which is tackled in two different ways in the literature; the car sequencing problem and the mixed model sequencing problem.

2 - A Systematic Literature Review Of Rolling Methods For Production Planning

Reha Uzsoy, North Carolina State University, Dept. of Industrial & Systems Engg, 300 Daniels Hall Camps Box 7906, Raleigh, NC, 27695-7906, United States, ruzsoy@ncsu.edu, Rafael Gumaraes Wollmann, Raimundo de Sampaio

The effective implementation of production plans over time requires them to be updated a new information becomes available. This motivates the extensive use of rolling methods in both industry and academia. Rolling methods for production planning can be implemented in different ways and terminology is not always well-defined in the literature. The objective of this paper is to characterize rolling methods, focusing on the quality of the resulting production planning decisions, using the Systematic Literature Review methodology and suggest unifying themes and directions for future research.

3 - A Simulated Annealing Approach For Scheduling Jobs On Identical Parallel Machines

Pravin Tambe, RCOEM, Katol Road, Nagpur, 440013, India, tambepp@gmail.com, Makarand Kulkarni

Identical parallel machine scheduling problem for minimizing the total tardiness is a very important scheduling problem, but there have been many difficulties in solving large size identical parallel machine scheduling problem with too many jobs and machines. Metaheuristic approach like Simulated Annealing(SA) has shown efficient results in solving the combinatorial optimization problem. In this paper, a hybrid approach of a SA algorithm combined with backward-forward heuristic has been proposed for solving identical machine scheduling problem for minimizing the total tardiness. A numerical example of scheduling jobs on identical high pressure die casting machines is presented.

4 - Cross-training Policies For Team Cost And Robustness

Jordi Olivella, Assistant professor, Universitat Politecnica de Catalunya, Avda. Diagonal 647, Barcelona, 08028, Spain, jorge.olivella@upc.edu, David A Nembhard

We assess alternative cross-training policies for work-teams considering cost, and levels of cross training. The policies are assessed with respect to their robustness to demand-mix variation and absenteeism coverage. We employ simulation to examine instances where cross training can be used to help meet a fixed demand scenario, and with instances where cross-training can help to meet demand mix variability. Current results indicate that when minimizing cross-training costs, policies related to equalizing the cross-training level among the workforce, may provide improvement in terms of robustness without additional cost.

5 - The Robust Simple Assembly Line Balancing Problem

Jorge Pereira, Universidad Adolfo Ibáñez, Avda. Padre Hurtado 750, office 216-C, Viña del Mar, 2530852, Chile, jorge.pereira@uai.cl

In this work we consider the simple assembly line balancing problem (SALBP) with uncertainty on the operation time of the tasks. In order to deal with the uncertainty, we put forward a robust version of the problem in which the solution can handle a limited number of disruptions. Several new lower bounds as well as adaptations of the current state-of-the-art procedures for the SALBP are proposed. These methods are tested on a computational experiment, and the results show that the method is able to solve large-sized instances within reduced running times, outperforming available procedures in the literature.

1 - Allocation Of ICU Beds During Periods Of High Demand

Huiyin Ouyang, University of North Carolina, ouyanghuiyin@gmail.com

We formulate an MDP model for admission decisions in an ICU where patients' health conditions changeover time according to Markovian probabilities. We find that the optimal decision can depend on the mix of patients in the ICU and provide an analytical characterization of the optimal policy. We also identify conditions under which the optimal policy is state-independent.

2 - Late-onset Neonatal Sepsis Prediction Using Supervised Learning Techniques

Nadia Aly, College of William and Mary, naaly@email.wm.edu

In this study, we derive features from the R-R intervals (distance between R peaks) and apply novel machine learning algorithms to predict if an infant will be diagnosed with a sepsis infection within the next twelve hours. The dataset used in this study consisted of the R-R intervals recorded by monitoring electrodes in the NICU for approximately 3,000 infants. A Support Vector Machine model, outperformed all other models with a 0.07% false alarm rate and a 91.70% classification accuracy. These encouraging results imply potential clinical applications for the NICU to implement this algorithm on real-time heart rate data to influence decisions on when to proceed with diagnostic procedures.

3 - Price Discrimination In a Regulated Healthcare Market: Role Of Government Subsidy And Price Cap

Jianpei Wen, Peking University, Founder Building, No.298 ChengFu Rd, HaiDian District., Beijing, 100871, China, wenjianpei@pku.edu.cn, Frank Y Chen, Jie Song

The long waiting times in the public health sector in many countries has motivated the government to shift health authority waiting lists to the private sector, by setting a price cap and subsidizing switching patients in private services. We propose a novel queuing model incorporating choice behavior of heterogeneous time-sensitive customers. The optimal pricing policy with price discrimination to maximize the private sectors' revenue will exam the effect of subsidy and price cap in a government regulated market.

4 - A Reservation Policy For Medical Diagnostic Resource Allocation

Weifen Zhuang, Xiamen University, wfzhuang@xmu.edu.cn

We study the problem of the resource allocation of medical diagnostic facilities, accessed by three types of patients. Both inpatients and outpatients have to make appointments in advance, and emergency patients walk in directly. We formulate a dynamic programming model of the resource allocation problem and study the structural properties, based on which we fully characterize the optimal reservation policy. An upper bound and a lower bound to the DP value are created and proved to be asymptotically optimal. Numerical studies show that the performance of bounds works very well, and our heuristic policy outperforms the hospital's target policy significantly.

1 - Dynamic Selling Mechanisms For Exploring Markets With Customer- And Time-heterogeneity

Meng Li, University of Massachusetts, Dartmouth, MA, United States, meng.li@umassd.edu, N. Bora Keskin

Consumers are often heterogeneous in their preferences for product quality, and firms usually face uncertainty about consumer preferences when they sell vertically differentiated products to such heterogeneous consumers. We study this problem in a setting where a firm can dynamically optimize its prices.

2 - Consumer Choice Models With Endogenous Network Effects

Ruxian Wang, Johns Hopkins Carey Business School, Baltimore, MD, 21202, United States, ruxian.wang@jhu.edu, Zizhuo Wang

Network externality arises when the utility of a product depends not only on its attributes, but also on the number of consumers who purchase the same product. We first characterize the choice probabilities under such models and conduct studies on comparative statics. Then, we show that a new class of assortments, called quasi-revenue-ordered assortments, which consist of a revenue-ordered assortment plus at most one additional item, are optimal under mild conditions. An empirical study on a mobile game dataset shows that our proposed model can provide better fits for the data, increase the prediction accuracy for consumer choices and potentially increase revenue.

3 - Two Echelon Distribution Systems With Random Demands And Storage Constraints The Multi-product Case

Awi Federgruen, Columbia University, af7@columbia.edu, Daniel Guetta, Garud N Iyengar

We address a general model for a two-echelon system with arbitrarily many retailers and products, joint storage constraints and joint order costs.. We develop an approach to compute a tractable lower bound dynamic program (DP) for the optimal system-wide costs, along with a novel order, withdrawal and allocation policy that is derived from the strategy which is optimal in the lower bound DP. The lower bounds are based on a combination of relaxation methods, Lagrangian and others. Based on an extensive numerical study, the lower bound is found to be very accurate, and the proposed system-wide policy is close to optimal. We also show how the model can be used to make strategic, e.g., assortment decisions.

4 - An Expectation-maximization Algorithm To Estimate The Parameters Of The Markov Chain Choice Model

A Serdar Simsek, The University of Texas at Dallas, Naveen Jindal School of Management, 800 W Campbell Road, Richardson, TX, 75080, United States, serdar.simsek@utdallas.edu, Huseyin Topaloglu

We develop an expectation-maximization algorithm to estimate the parameters of the Markov chain choice model. The parameters of the Markov chain choice model are the probability that the customer arrives into the system to purchase each one of the products and the probability that she transitions from the current product to another one for each pair of products. We give computational experiments on multiple data sets, one of which uses real hotel data from the literature. Markov chain choice model, coupled with our expectation-maximization algorithm, yields better predictions of customer choice behavior when compared with other commonly used alternatives.

1 - Ensuring Corporate Social And Environmental Responsibility Through Vertical Integration And Horizontal Sourcing

Adem Orsdemir, University of California Riverside, adem.orsdemir@ucr.edu, Bin Hu, Vinayak V Deshpande

Inspired by Taylor Guitars' vertical integration with its supplier to ensure corporate social and environmental responsibility (CSER), we investigate vertical integration as an alternative strategy for ensuring CSER in a competitive setting. We find that demand externality due to violation exposures and the possibility of supplying the competitor may fundamentally change firms' behaviors and CSER outcome. Furthermore, we find that high probability of violation exposure may discourage responsible sourcing under strongly negative demand externalities. Our findings suggest guidelines for firms interested in ensuring CSER, and for NGOs' violation scrutiny and reporting policies.

2 - Peer-to-peer Product Sharing: Implications For Ownership, Usage, And Social Welfare

Guangwen Kong, University of Minnesota, 111 Church Street, Minneapolis, MN, 55455, United States, gkong@umn.edu, Saif Benjaafar, Xiang Li

We consider a two-sided market consisting of product owners and renters, mediated by an online platform. Individuals decide on whether to be owners or renters. Owners are able to generate income from renting their products to non-owners while non-owners are able to access these products through renting on as needed basis. The platform decides on rental prices, commission rates, and membership fees. We characterize equilibrium outcome and compare product ownership and product usage with and without sharing.

3 - Capacity Allocation For A Green Farm

Dong Li, Singapore University of Technology and Design, Singapore, Singapore, dong_li@sutd.edu.sg, Saif Benjaafar, Niyazi Taneri

Much of the farmland in the United States is leased to farmers by landlords through a crop-sharing agreements. Consumers are willing to pay a premium for green produce and some even more for locally sourced green produce. However, yields for green farming are typically lower than conventional farming. We model the strategic interaction between a farmer and a landlord, the capacity allocation decision of the farm across conventional and green produce, and the decision of the farm to allocate its green produce across a global market and a local market under a crop-sharing agreement.

4 - Design Of Public Warning System

Saed Alizamir, Yale University, saed.alizamir@yale.edu, Francis E De Vericourt, Shouqiang Wang

We study the design of public warning systems in a multi-period model. In each period, the sender (she) receives an imperfect signal about the true state of the world (dangerous or safe), and has to decide whether to warn the receiver to act. Depending on the true realization of the random event, the receiver updates his belief about sender's credibility. The sender, therefore, has to dynamically manage her reputation over time, while also incentivizing the receiver to act on her warnings. We characterize the optimal warning policy, and gain insights into why it may sometimes be optimal for the sender to distort her signal.

1 - On The Sample Compexity Of Multistage Robust Convex Optimization Problems

Francesca Maggioni, Assistant Professor, University of Bergamo, Via dei Caniana n 2, Bergamo, 24127, Italy, francesca.maggioni@unibg.it, Fabrizio Dabbene, Marida Bertocchi, Roberto Tempo

In this talk probabilistic guarantees for constraint sampling of multistage robust convex optimization problems are derived. The dynamic nature of these problems is tackled via the scenario-with-certificates approach. This allows to avoid the conservative use of explicit parametrizations through decision rules, and implies a significant reduction of the sample complexity to satisfy a given level of reliability. An explicit bound on the probability of violation is then given. Numerical results show the efficacy of the proposed approach.

2 - Conditions Under Which Adjustability Lowers The Cost Of A Robust Linear Program

SeyyedAli Haddadsisakht, Iowa State University, Ames, IA, 50011, United States, alihadad@iastate.edu, Sarah M Ryan

The adjustable robust counterpart (ARC) of an uncertain linear program lets some decision variables of the robust counterpart (RC) adjust to uncertainty. It may produce a less conservative solution than the RC does but cases are known in which it does not. The affinely adjustable RC (AARC) is a tractable compromise between RC and ARC. Numerical conditions under which the AARC optimal cost is lower than the RC optimal cost provide insight into problem structures where adjustability is valuable.

3 - Robust Optimization For The Transportation Problem Under Boundedly Rational User Equilibrium

Guanxiang Yun, PhD Student, University of Central Florida, 12800 Pegasus Drive, PO Box 162993, Orlando, FL, 32816, United States, ygx8822@gmail.com, Qipeng Zheng

We proposed a model for the static transportation path problem when the evacuation happens. We supposed that all the users in the system will obey the bounded rational principle. In real world instances, people will feel just fine even if they do not reach the best utility they can achieve but only attain a certain level. We proposed totally four conditions for our static models with two of them having the pricing strategy. By using the pricing strategy, we have a robust optimization model, we solve it by using the column and constraint generation method. For transportation path problem, it is also a large scale problem. In order to solve it, we use the branch and price method.

4 - A Robust Optimization Framework For Electric Power Grid Protection

Alberto Costa, NUS, Singapore, Singapore, isealc@nus.edu.sg

We consider a flow problem on oriented network, where the decision maker wants to send a quantity of goods from a source to a destination node, and an enemy can destroy the arcs of the network at a given cost. The decision maker can use a fortification budget to increase the cost to destroy the arcs, with the goal of maximizing the total price that the enemy must pay to disrupt the network. We model the optimal allocation of the fortification budget as a multistage robust optimization problem, and we propose an algorithm to find an -approximation of the global optimum. Computational results show that the algorithm is scalable and can solve efficiently instances with a few hundred nodes and arcs.

1 - Optimal Appointment Schedules

Mor Armony, New York University, marmony@stern.nyu.edu, Rami Atar, Harsha Honnappa

We consider the problem of optimally scheduling a finite, but large, number of customers over a finite time horizon at a single server FIFO queue, in the presence of ‘no-shows’. We study the problem in a large population limiting regime as the number of customers scales to infinity and the appointment duration scales to zero. We show that in the fluid scaling heavy-traffic is obtained as a result of asymptotic optimization. We also characterize the diffusion-scale optimal schedule.

2 - Efficient Transition To Post-acute Care

Alex Mills, Indiana University, Bloomington, IN, United States, millsaf@indiana.edu, Sean Yu, Jonathan Helm

Many hospital patients are discharged to a skilled nursing facility (SNF) for post-acute care. A shortage of SNF beds can lead to expensive discharge delays. Using a queueing model, we show that a hospital may want to contract with a SNF to reserve some capacity. However, when hospitals compete for capacity at multiple SNFs, such contracting leads to an equilibrium where total SNF capacity is de-pooled. Although this de-pooling hurts system performance overall, it benefits the hospital with the lower discharge rate, who becomes the market leader. Under the de-pooled scenario, the hospital with the higher arrival rate has an incentive to finance SNF expansion, even if it leads to free-riding.

3 - Steady-state Diffusion Approximations For Discrete-time Markov Chain In Hospital Inpatient Flow Management

Jiekun Feng, Cornell Universtiy, Ithaca, NY, United States, jf646@cornell.edu, Pengyi Shi

Motivated by the recent development of steady-state approximation via Stein’s method for Erlang-A and Erlang-C models, we apply the framework to a discrete-time Markov chain (DTMC), which is motivated from studying hospital inpatient flow and captures the dynamics of the midnight census in the inpatient department. We develop diffusion models to approximate the stationary distribution of the DTMC, and characterize the convergence rate of the approximations.

4 - A Queueing Model For Internal Wards

Jing Dong, Northwestern University, Evanston, IL, United States, jing.dong@northwestern.edu, Ohad Perry

Hospital queues have unique features, which are not captured by standard queueing assumptions. In this project we propose a queueing model that takes into account the most salient features of queues associated with large Internal Wards (IW’s). We characterize the maximum long-run workload that the IW can handle. We also introduce a deterministic (fluid) approximation for the non-stationary dynamics. The fluid model is shown to converge to a unique periodic equilibrium, so that long-run performance analysis can be carried out by simply considering that equilibrium.

1 - Randomized Load Balancing With General Service Distributions

Kavita Ramanan, Brown University, kavita_ramanan@brown.edu

Randomized algorithms are used in a variety of applications to balance load to improve performance. Randomized load balancing algorithms with exponential service distributions have received much attention, but in practice job sizes have been observed to be non-exponential. We characterize equilibrium properties of fluid limits of several randomized load balancing algorithms, including the well-known “power of two choices” algorithm in the presence of general service distributions. This is joint work with Pooja Agarwal.

2 - Beyond Heavy-traffic Regimes: Universal Bounds And Controls For The Single-server Queue

Itai Gurvich, Kellogg School of Management, i-gurvich@kellogg.northwestern.edu, Junfei Huang

Brownian approximations provide tractability in the analysis of queues. Their stationary distributions are used as proxies for those of the original queues and the convergence of suitably scaled primitives and processes provides mathematical support for the use of these Brownian models. From a heuristic viewpoint, however, there is an immediate Brownian analogue of the queueing model that is derived directly from the primitives. For the M/GI/1+GI queue, this direct (limitless approach) works: the Brownian model is universally accurate. It maintains the tractability and appeal of the limit approximations while avoiding many of the assumptions that facilitate them.

3 - The Bravo Effect For Brownian Queues

Rob J Wang, Stanford University, robjwang@stanford.edu,
Peter W Glynn

In queueing theory, departure processes play a fundamental role. Indeed, for single-station queues, they provide insights into system performance; for feedforward networks, departures from one station constitute arrivals into the next. Recently, there has been much interest in the asymptotic variability of departure processes. The "BRAVO" (Balancing Reduces Asymptotic Variance of Outputs) effect has been shown to manifest itself in many systems. This talk will discuss BRAVO in the context of Brownian queues, which are tractable approximations for various systems in heavy traffic. In particular, we will discuss the timescales at which BRAVO appears, and offer explanations for its occurrence.

4 - Optimal Driver Routing In Crowdsourced Transportation Systems

Anton Braverman, Cornell University, Ithaca, NY, United States,
ab2329@cornell.edu, J.G. Dai, Xin Liu, Lei Ying

We consider a queueing network that models the flow of drivers in a crowdsourced transportation system such as Lyft or Uber. Each time a driver drops off a passenger at their destination, a routing decision needs to be made. Should the driver stay and wait for the next customer at their current location, or should they drive empty to another part of town to try their luck there?

The way this decision is made greatly affects the supply of drivers across a city, and can even cause extreme driver shortages in certain regions. We analyze the fluid model corresponding to our network to develop a centralized routing policy for drivers.

1 - Leverage, Market Liquidity, And Systemic Risk

Nan Chen, Chinese University of Hong Kong,
nchen@se.cuhk.edu.hk

We present a macroeconomic model with a financial intermediary sector subject to a leverage constraint. The model allows us to examine the transition from "normal" states to systemic risk states. An amplification effect through the liquidity channel, both market and funding, can be characterized.

2 - Recursive Utility With Narrow Framing: Existence And Uniqueness

Xuedong He, Chinese University of Hong Kong,
xdhe@se.cuhk.edu.hk

We study the utility of an agent in a model of narrow framing with constant elasticity of intertemporal substitution and relative risk aversion degree and with infinite time horizon. In a finite-state Markovian setting, we prove that the utility uniquely exists when the agent experiences nonnegative utility of gain and loss incurred by holding risky assets and that the utility can be non-exist or non-unique otherwise; in the latter case, we prove the existence and uniqueness with further conditions. Moreover, we prove that the utility, when uniquely exists, can be computed by a recursive algorithm with any starting point. Finally, we solve a portfolio selection problem with narrow framing.

3 - Diversification Of Portfolio Tail Risk

Qi Wu, Chinese University of Hong Kong, qwu@se.cuhk.edu.hk

We develop explicit and accurate asymptotic expansions of the portfolio VaR and portfolio Expected Shortfall (ES) for a large family of multivariate elliptical distributions. We show that while the tail heaviness of joint asset distribution dictates how much larger portfolio ES is comparing to VaR, it is the tail dependence structure that determines the diversification benefits when sub-portfolios are merged together for joint portfolio margining.

4 - An Empirical Likelihood Method Of Combining Stock And Option Prices

Xianhua Peng, Hong Kong University of Science and Technology,
maxhpeng@ust.hk, Steven Kou, Tony Sit, Zhiliang Ying

As discussed in the finance literature, option prices may contain information about the dynamics of the underlying asset returns including the drift. In this paper, we confirm this viewpoint by showing that the options information leads to shorter confidence intervals for the parameters of the returns dynamics and more efficient ways to reflect current market information. We propose an empirical likelihood based method that can combine the stock return and the associated derivative prices. Our empirical analysis of the S&P500 index and options suggest that inclusion of option prices provides a more seasonable estimates that can reflect the market conditions during the 2009 financial crisis.

1 - Single-resource Capacity Control In The Presence Of Cancellations, No-shows And Overbooking

Jason Chen, Principal Operations Research Specialist, SAS
Institute, Inc., Cary, NC, 27513, United States,
Jason.Chen@sas.com

Single-resource capacity control problem is one of the most basic and well-studied problems in quantity-based revenue management. Both exact methods and efficient heuristic methods exist when cancellations and no-shows are ignored. Dynamic-programming models have been proposed to solve the problem with cancellation, no-show, and overbooking. But the DP model is only tractable for small size problems. We present an efficient and highly scalable heuristic and analyze its performance.

2 - Evolution Of Revenue Management Systems At Intercontinental Hotels Group

Chanjoo Lee, InterContinental Hotels Group,
chanjoo.Lee@ihg.com

IHG's PERFORM Price Optimization project started in 2005 to drive key strategic priorities such as brand performance enhancement and excellent hotel returns. The project was a large-scale enterprise implementation of price optimization in the hospitality industry and provided a 2.7% increase in revenue as verified in the IHG 2009 Annual Report. In this talk, we will discuss how the IHG Revenue Management Systems including PERFORM Price Optimization evolved to increase user acceptance from the hotels and drive revenue improvement over the years.

3 - Pricing And Revenue Management Of Function Space In Hotels

Xiaodong Yao, SAS Institute, Cary, NC, 27513, United States,
Xiaodong.Yao@sas.com, Altan Gulcu

Function space sales may provide significant contribution to the bottom line of hotels, but implementing revenue management principles comes with additional challenges. In this presentation, we review pricing and revenue management techniques used for planning and management of function space in hotels.

Decision Making with Incentives

Sponsored: Decision Analysis

Sponsored Session

Chair: Andrea Hupman Cadenbach, University of Missouri - St. Louis, St Louis, MO, United States, cadenbach@umsl.edu

1 - Consider The Alternatives: New Ways To Finance Early-stage Entrepreneurs

Samuel E Bodily, University of Virginia, bodilys@virginia.edu

A startup business is ready for launch, yet the entrepreneur is unwilling to take the considerable financial and potentially career-debilitating personal risk. We compare game-changing alternatives to the usual equity model a backer may use to finance the start-up: revenue contracts, derivative swaps, incentive gifts, and insurance. We answer which best reduces the risk to the entrepreneur and provides the best incentives, at a given cost to the backers, and without moral hazard. Risk analysis models are used to compare certainty equivalents of these financing alternatives.

2 - Nudging Vaccination With A No-fault Insurance

Emmanuel F Drabo, University of Southern California,
Los Angeles, CA, 90089-3333, United States, drabo@usc.edu,
Neeraj Sood, Joel W Hay, Jason N Doctor

Loss aversion in prospect theory and the K szegi-Rabin utility theory predicts that insurance will be preferred to its expected value, hence implying that insuring small risks of vaccine side effects can incentivize vaccine uptake. We test this prediction through a discrete choice experiment with 1257 MTurk subjects randomized into an insurance and a subsidy (expected value of insurance) group to make choices among hypothetical vaccination scenarios. Vaccine uptake was 1.5 percentage points greater among non-female respondents in the insurance arm relative to the subsidy arm. This suggests that a no-fault insurance against vaccine side effects can be an effective vaccine incentive strategy.

3 - Operations Decisions With Target Based Incentives

Andrea Hupman Cadenbach, University of Missouri - St. Louis, cadenbach@umsl.edu

Supply chains represent complex systems in which numerous performance measures are used and in which responses to incentive structures can change system performance. One type of incentive is a fixed target in which performance above a threshold is rewarded. The literature shows that high targets tend to induce risk taking while low targets tend to induce the selection of safer decision alternatives, but this talk examines the effects of setting targets on different types of performance measures in addition to the magnitude of the target.

4 - Team Incentives In Multi-level Principal Agent Problems

Aditya Umesh Kulkarni, PhD Candidate, Virginia Tech, 11700 Cardinal Court, Apt E, Blacksburg, VA, 24060, United States, aditya88@vt.edu, Christian Wernz

Existing literature on relational contracts typically does not account for the interdependency of stochastic performance outcomes across multiple levels of superior-subordinate interactions in organizations. We use multiscale decision theory to derive relational, that is, trust-based, contracts for teams while accounting for the aforementioned influences. We derive the optimal job design for employees, which is a function of rewards and performance influence. Our results extend agency theory by accounting for cascading and team-based incentives in organizations.

Behavioral Decision Analysis

Sponsored: Decision Analysis

Sponsored Session

Chair: Matthias Seifert, IE Business School, Maria de Molina 12, 5, Madrid, Spain, matthias.seifert@ie.edu

1 - Exploring The Consistency Of Higher-order Risk Preferences

Timo Heinrich, IN-EAST School, Universität Duisburg-Essen, Duisburg, Germany, timo.heinrich@ibes.uni-due.de, Alexander Haering, Thomas Mayrhofer

We measure higher-order risk preferences and explore their consistency across orders. We analyze the role of (i) country differences between China, Germany, and the US, (ii) differences in stake size, and (iii) differences through displaying reduced rather than compound lotteries. We replicate the finding of mixed risk-averse and mixed risk-loving behavior by Deck and Schlesinger (2014) in the US and identify a similar pattern in Germany and in China. Moreover, we observe an increase in risk aversion when stakes are increased tenfold. Finally, in reduced lotteries there is only weak evidence for prudence and no evidence for temperance.

2 - Regime Shift Detection In The Domain Of Losses

Matthias Seifert, Associate Professor of Decision Sciences, IE Business School, Madrid, 28006, Spain, matthias.seifert@ie.edu, Sara Farooqi

We extend Massey and Wu's (2005) work on regime shift detection by studying the influence of system neglect on trading behavior in experimental markets. We show in a series of laboratory experiments how patterns of probabilistic over- and underreaction translate into investment decisions under risk and use Prospect Theory to explain systematic differences between buyers/sellers as well as gains/loss domains.

4 - Risky Choice Following Near Miss Events In Sequential Tasks Under Ambiguity

Florian Federspiel, IE Business School, Madrid, Spain, fmfederspiel@faculty.ie.edu, Matthias Seifert

Studies have shown that near miss events can lead to inconsistent risk perceptions. Yet near misses are often clouded in ambiguity, allowing for hubris and misattribution of what caused success or prevented failure. We provide an analytical model of near misses and investigate the experience of such an event on risk taking in a real options task. We show that increases in risk taking following a near miss occur mainly under ambiguity. We further find that this effect depends on the decision maker's prior expectation. Only those with an expectation of failure fall prey to the near miss bias.

3 - The Reasonability Of Behavioral Assumptions Made In Complex Systems Models

Allison C Reilly, University of Michigan, Ann Arbor, MI, United States, allison.reilly@gmail.com, Seth Guikema

Improved capture of human behavior in complex systems modeling has significantly advanced in recent decades and proffers a more cohesive approach to understanding how these systems may operate, fail, or evolve. The behavioral assumptions have significant implications on the insights derived from these models, though these implications are rarely explored. In this work, we address frequently confused decision science terminology used in systems models - from rationality to strategy - the reasonability of the behavioral assumptions, and their implications via case studies.

Simulation for Performance of Non-Stationary Queues

Sponsored: Simulation

Sponsored Session

Chair: John Shortle, George Mason University, Fairfax, VA, United States, jshortle@gmu.edu

1 - A Performance Algorithm For Periodic Queues

Ni Ma, Columbia University, nm2692@columbia.edu, Ward Whitt

An efficient algorithm is developed to calculate the steady-state distribution of virtual waiting time in a general Gt/G/1 queue with a periodic arrival-rate function. We first approximate the Gt/G/1 model by an associated GIt/GI/1 model based on a recent heavy-traffic functional central limit theorem, and then compute the exact tail probabilities of the virtual wait by exploiting a modification of the classic exponential change of measure. That algorithm is then applied to compute related performance measures, such as the mean and variance of the virtual wait.

2 - Fourier Trajectory Analysis For Identifying System Congestion

Russell R Barton, Pennsylvania State University, 210 Business Building, University Park, PA, 16802, United States, rbarton@psu.edu, Xinyi Wu

We examine the use of the Fourier transform to discriminate dynamic behavior differences between congested and uncongested systems. Simulation continuous time statistic 'trajectories' are converted to time series for Fourier analysis. We use this knowledge to explore statistical process control methods to monitor nonstationary systems for transition from uncongested to congested state and vice versa.

3 - Staffing To Stabilize Blocking In Loss Models With Time-varying Arrival Rates

Jingtong Zhao, Columbia University, jz2477@columbia.edu, Ward Whitt

It is not possible to find a time-varying staffing policy to stabilize blocking probabilities in a multiserver loss model with a time-varying arrival rate to the same extent as in corresponding delay models, because the blocking probabilities necessarily change dramatically after each staffing change, but nevertheless a variant of the established modified-offered-load staffing algorithm performs well if we randomize appropriately.

4 - Effects Of Arrival Variability on Delays at Congested Airports

John Shortle, George Mason University, jshortle@gmu.edu

More precise spacing of flight arrivals into airports has the potential to increase capacity and reduce delays. However, even with precise spacing, delays can also result from the variability in the mean arrival rates throughout the day (i.e., the non-stationary nature of the arrival process) due to banking of flights at hub airports. This talk presents a queueing simulation of an airport and investigates the relative impact of reducing the uncertainty in the spacing of arrivals versus reducing the schedule variability. Under conditions of high utilization, reducing the arrival variability has limited impact on delays unless also accompanied by reduced schedule variability.

Networks and Games in Operations

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Kimon Drakopoulos, Marshall School of Business, 3670 Trousdale Pkwy, Los Angeles, CA, 90089, United States, kimondr@mit.edu

1 - Information Obfuscation In Strategic Experimentation

Kimon Drakopoulos, Massachusetts Institute of Technology, kimondr@mit.edu

In our work we model a continuous time strategic experimentation problem against an informed opponent (incumbent) who can take actions to obfuscate learning. We show that the unique (weak) perfect Bayesian equilibrium of this dynamic game takes the form of the "delayed war of attrition" where over a range of beliefs of the experimenter, both players use mixed strategies — for the entrant, to determine when to stop experimenting and for the incumbent, to determine when to stop obfuscating. The uniqueness of the outcome gives rise to many questions such as market design in order to maximize fairness for the entrants, or consumer surplus.

2 - Coordination And Social Value Of Information In Networks

Gowtham Tangirala, Columbia Business School, 3022 Broadway, 4th Floor West, New York, NY, 10027, United States, gtangirala18@gsb.columbia.edu, Alireza Tahbaz-Salehi

This paper studies the social and equilibrium value of information in network games. We provide a complete characterization of conditions under which equilibrium is efficient under incomplete information and study the impact of varying the commonality of information across agents and the network structure, on equilibrium welfare. In particular, we find that when social conformity is desirable (undesirable), the more interconnected the network is, the lesser (greater) its equilibrium welfare.

3 - The Effect Of Information On Traffic Congestion

Ali Makhdoumi, Massachusetts Institute of Technology, makhdoum@mit.edu

We study the implications of additional information about routes provided to certain users (e.g., via GPS-based route guidance systems) in a traffic network. We formulate the question in the form of Informational Braess' Paradox (IBP), which extends the classic Braess' Paradox in traffic equilibria, and asks whether users receiving additional information can become worse off. We provide a necessary and sufficient condition for the occurrence of this paradox in terms of network characteristics.

4 - Optimal Promotion Period Of Products With Network Externality

Ningyuan Chen, HKUST, Hong Kong, Hong Kong, nc2462@columbia.edu, Saed Alizamir, Vahideh Manshadi

Many products exhibit network externality: a customer who has purchased the product makes his/her neighbors or friends more likely to buy the same product. This includes eco-friendly products such as electronic cars and solar panels. The government subsidizes customers to promote such products. We find that it is optimal for the government to stop the subsidy when the total externality of the owners reaches a threshold, which depends on the spectrum of the externality matrix. The optimal stopping time is not monotone in the strength of the externality between customers. We investigate how the structure of the network affects the stopping time and the optimal reward of the government.

Applications of RM and Pricing

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Maxime Cohen, Google NYC, 110 Bleecker Street Apt 6F, New York, NY, 10012, United States, maxccohen@gmail.com

1 - Simple Pricing Schemes For Consumers With Evolving Values

Balasubramanian Sivan, Research Scientist, Google Research, New York, NY, United States, balusivan@google.com, Shuchi Chawla, Nikhil R. Devanur, Anna Karlin

We consider a pricing problem where a buyer is interested in purchasing/using a good, such as an app or music or software, repeatedly over time. The consumer discovers his value for the good only as he uses it, and the value evolves with each use as a martingale. We provide a simple pricing scheme and show that its revenue is a constant fraction of the buyer's expected cumulative value.

2 - Strategic And Proactive Pricing Optimization In The Airline Industry

Michael Benborhoum, British Airways, New York, NY, United States, michael.benborhoum@ba.com, Maxime Cohen

Pricing in the airline industry has become increasingly competitive, with a strong emphasis on reactive fare matching, arguably to the detriment of more strategic and proactive decision frameworks. Setting the right price in a strategic and proactive fashion raises at least three questions: (i) when is the right time and what is the right level for a proactive fare change; (ii) what is the right fare ladder structure leading to optimal sell-ups and fare rule segmentation; and (iii) how non-pricing factors should affect pricing decisions. In this talk, we propose an original approach to the strategic and proactive pricing problem in the airline industry.

3 - Dynamic Pricing With Heterogeneous Patience Levels

Ilan Lobel, NYU Stern, ilobel@stern.nyu.edu

We consider the problem of dynamic pricing in the presence of patient consumers. We call a consumer patient if he is willing to wait a certain number of periods for a lower price, but will purchase as soon as the price is equal to or below her valuation. We allow for arbitrary joint distributions of patience levels and valuations. We propose a dynamic-programming-based polynomial-time algorithm for finding optimal pricing policies. Our findings suggest that pricing for patient consumers is a more challenging problem than pricing for strategic consumers, in the sense that the dynamic program requires a larger state-space.

4 - Overcommitment In Cloud Services – Bin-packing With Chance Constraints

Maxime Cohen, NYU Stern, New York, NY, 10012, United States, maxime.cohen@stern.nyu.edu, Phil Keller, Vahab Mirrokni, Morteza Zadimoghaddam

A cloud provider needs to decide how many physical machines to purchase in order to accommodate the incoming virtual jobs efficiently. This is typically modeled as a bin-packing optimization problem. Overcommitting servers clearly improves the bin-packing objective, but induces a risk for the provider. In this work, we show that the bin-packing with chance constraints can be solved using a class of simple online algorithms that guarantee a constant factor from optimal. We explicitly model job size uncertainty to motivate new algorithms and evaluate them on realistic workloads.

Business Applications in Social Media Analytics

Invited: Social Media Analytics

Invited Session

Chair: Michel Ballings, University of Tennessee, 255 Stokely Management Center, Knoxville, TN, 37996, United States, michel.ballings@utk.edu

1 - Identifying New Product Ideas: Waiting For The Wisdom Of The Crowd Or Screening Them In Real-time

Steven Hoornaert, Ghent University, Ghent, Belgium, steven.hoornaert@ugent.be, Michel Ballings, Edward C Malthouse, Dirk Van den Poel

This article studies idea ranking in innovation communities using the contributor's history of submitting ideas and comments, the Content of the idea suggestion, and the Crowd's feedback on the idea.

Results show that contributor and content variables improve ranking between 22.6% and 25.8% over exhaustive idea selection across classifiers.

2 - Evaluating The Importance Of Different Communication Types In Tie Strength Prediction On Social Media

Matthias Bogaert, Ghent University, matthias.bogaert@ugent.be, Michel Ballings, Dirk Van den Poel

The purpose of this paper is to evaluate which communication types on social media are most indicative of tie strength. To ensure that we have the best possible model we benchmark several classifiers. The results indicate that we can predict tie strength with very high accuracy. The top performing classification algorithm is adaboost with an AUC of 0.976. The top five communication predictors are the recency of commenting on links, posts, videos, the frequency of liking post comments and the recency of commenting on albums. To the best of our knowledge, this study is the first to provide such an extensive analysis of tie strength in social media.

3 - Evaluating Prediction Models For Targeting Product Reviewers

Michel Ballings, Assistant Professor, University of Tennessee, 249 Stokely Management Center, Knoxville, TN, 37996, United States, michel.ballings@utk.edu, Rachel Van Deventer, Ryan Erwin, Miller Moore, Dirk Van den Poel

As customers increasingly rely on product reviews while making their purchases, businesses must take action and make obtaining high review volume a priority. The purpose of this study is to develop a predictive model that identifies if an online reviewer is likely to write a review for a selected product. To develop our model, we extracted product reviewer data from Amazon.com. We find that the model accurately predicts if an individual will review the focal product. Businesses can target that population and obtain high review volume for their investment. While a large body of research has been published on product reviews we have focused on the individuals behind the reviews.

4 - Behavioral Engagement In Social Media: Measurement, Drivers And Impact On Purchase Behavior

Welf H. Weiger, University of Goettingen, Platz der Goettinger Sieben 3, Goettingen, D-37073, Germany, welf.weiger@wiwi.uni-goettingen.de, Wendy W Moe, Hauke A Wetzel, Maik Hammerschmidt

In this study, we focus on understanding and measuring behavioral consumer engagement in social media. Our research combines three sources of individual-level user data (i.e., matched survey, social media behavior and purchase behavior data) collected in the context of an online fashion retailer's social media site. We develop a composite engagement measure and we identify its motivational drivers and consequences for purchase behavior. Our results reveal different drivers for the incidence (i.e., the "whether") and the nature (i.e., the "how") of engagement. As a counterintuitive finding, our results further show that complaining users buy more than complimenting users.

SpORts: Sports Analytics IV

Sponsored: SpORts

Sponsored Session

Chair: Sean Barnes, Univ of Maryland-College Park, Robert H. Smith School of Business, College Park, MD, 20742, United States, sbarnes@rhsmith.umd.edu

Co-Chair: Margret Bjarnadottir, University of Maryland, College Park, College Park, MD, 2, United States, margret@rhsmith.umd.edu

1 - A Predictive Modeling And Robust Optimization Framework For Prioritizing Major League Baseball Free Agent Acquisitions

Margrét Bjarnadóttir, Univ of Maryland-College Park, College Park, MD, United States, margret@rhsmith.umd.edu, Sean Barnes, Aurelie Thiele

Major League Baseball teams are tasked with constructing rosters of players that can compete successfully against other teams. This process involves making decisions about which players to acquire via free agency. We propose a predictive modeling and robust optimization framework for supporting these free agent acquisition decisions. Specifically, we develop predictive models for expected player performance, and optimize free agent acquisitions (robustly) for a given budget. We demonstrate the effectiveness of this approach across several scenarios of budget levels and free agent markets.

2 - An Optimization-based Approach For The National Football League Tiebreaking Procedure

Matias Siebert, Georgia Institute of Technology, Atlanta, GA, United States, msiebert6@gatech.edu, George L Nemhauser, Joel Sokol

When the NFL regular season is in its final weeks, teams, fans and media want to know which teams have clinched a place in the playoffs, which one are eliminated and which teams still have the chance to make the playoffs. Given the number of possible scenarios and the intricacies of the tiebreaking procedures, simple enumeration approaches to solve this problem become highly inefficient in practice. We propose an optimization-based approach to determine the current situation and the possibilities for each team to make the playoffs.

3 - Sporting: A Large Applied Research Project In Sport Scheduling

Tomas Nordlander, SINTEF ICT, Trondheim, Norway, Tomas.Nordlander@sintef.no

Sports leagues and tournaments are scheduled daily around the world. Although the underlying problem is a hard mathematical problem, most end-users resort to manual scheduling. In 2005, SINTEF's optimisation developed CupCom for Profixio AS. This is an optimisation engine for tournament scheduling, which last year scheduled around 150,000 matches of handball, football and volleyball in Norway and Sweden. We have also been helping the Norwegian Football Federation with scheduling their top professional leagues for several years. I will talk about this and our new large research-based innovation project together with PROFIXIO AS.

4 - Automating The Scheduling Of A Softball League

Kent J Kostuk, Federated Co-Operatives Limited, kent.kostuk@usask.ca, Keith Willoughby

A local minor softball league was finding it difficult to manually develop and publish league schedules in the short time window available between when teams were formed and when a published schedule was required. Early prototypes were developed to demonstrate proof of concept as prior attempts to automate had not been successful. A complete solution was developed allowing the league to produce and publish league schedules with significantly less work and eliminating the need to transcribe manually generated schedules into electronic documents.

1 - A Holistic Conceptual Framework For Assessing The Effectiveness And Viability Of an Academic Program

munir majdalawieh, Associate Professor, zayed university, Mirdif, Dubai, 19282, United Arab Emirates, munir@themajd.com

Many aspects of the accreditation process focus on the past and the present (prove), the "program review" assessment is "forward-looking assessment" (improve) and thus transforms the process into a continuing assessment activity rather than a periodic event. The aim of this paper is to propose a conceptual framework for "program review" to assess the effectiveness and viability of an academic program and to improve the academic program and the education of the students. The proposed framework and the program review measurement matrix will provide an opportunity to colleges and universities to undertake a robust and targeted approach to proactively and continuously review their academic programs.

2 - Experience With A New Online Game To Teach Sourcing In A Supply Chain Management Course

Samuel C Wood, President, Responsive Learning Techologies, 4546 El Camino Real, #243, Los Altos, CA, 94022, United States, wood@responsive.net, Mozart Batista de Castro Menezes

The Gleacher Sourcing game is a new online competitive simulation from the developers of Littlefield Technologies and the Supply Chain Game. In the game, students compete and collaborate in ad hoc supply chains to maximize cash position or earnings. After an overview of the game this paper will discuss the use of the game in a Masters level Supply Chain Management course. In a 2-hour game, students managed the interplay between double marginalization, sourcing agreements, pricing, and working capital management.

3 - A Closer Look At Underrepresented Women In Engineering: A Classroom Study Exploring The Effects Of Anonymity On Student Peer Reviewers

Jacqueline Ng, PhD Candidate, Northwestern University, 2145 Sheridan Road, C-230, Evanston, IL, 60208, United States, jacqueline.ng@northwestern.edu, Bruce Ankenman, Seyed Iravani

The underrepresentation of women in STEM is a complex problem with few answers. We conduct a classroom study investigating the effects of anonymity on the critical nature of peer feedback. Using NLP and machine learning, we find that women are more sensitive than men to anonymity. Specifically, anonymous women provide more negative feedback than non-anonymous women, but less constructive feedback. Moreover, the negative sentiment is directed mainly at their male peers. In contrast, we do not find such dissimilarities between anonymous and non-anonymous men. This study suggests that STEM women may benefit from greater opportunities to support and mentor each other, outside of the classroom.

4 - Simple Tools To Help Agricultural Decision Makers Think About Risk

Jay Parsons, Associate Professor, University of Nebraska - Lincoln, 103B Filley Hall, P.O. Box 830922, Lincoln, NE, 68583-0922, United States, jparsons4@unl.edu, Jim Jansen

The focus of this talk will be on experiences in developing and using simple tools to help agricultural producers think about and manage risk. Using a simulation scenario and a Risk Scenario Planning tool, we focused on helping producers to think about managing market risk from the standpoint of controlling the distribution of possible outcomes. Marketing alternatives and risk have been difficult topics to education common producers about in the past and continue to be so. However, our approach has shown significant growth in audience commitment to action in managing market risk better in the future.

New Advances in Operating Room (OR) Scheduling

Sponsored: Public Sector OR

Sponsored Session

Chair: Gino J Lim, University of Houston, E206 Engineering Building 2, Houston, TX, 77204, United States, ginolim@uh.edu

1 - Integrated Anesthesiologist And Room Scheduling For Surgeries

Sandeep Rath, UCLA Anderson School of Management, Sandeep.Rath.1@anderson.ucla.edu, Kumar Rajaram

At large hospitals the assignment and scheduling of anesthesiologists and operating rooms is a complex resource allocation decision undertaken daily by the managers of operating room suites. We validate and implement a data-driven decision support system at the UCLA Ronald Reagan Medical Center. We also conduct analyses related to capacity expansion and process improvement efforts.

2 - A Discrete Event Simulation Evaluation Of Distributed Operating Room Scheduling

Vahid Roshanaei, PhD Candidate, University of Toronto, 5 King's College Road, Toronto, ON, M5S3G8, Canada, vroshana@mie.utoronto.ca, Shuo Wang, Dionne Aleman, David Urbach

We use discrete event simulation to assess the performance of deterministically optimized OR schedules in a network of collaborating hospitals with shared resources, called distributed OR scheduling (DORS), in the face of uncertain surgical durations, emergency arrivals, and limited downstream resources. We quantify the individual and combined disruptive impact of these stochastic factors on the DORS schedule, using real data obtained from the University Health Network (UHN) in Toronto, Canada. We show that the schedule constructed by DORS results in higher OR utilization and lower average surgery cost compared to UHN's current schedule.

3 - Scheduling Of Multi-priority Patients With Preference, Cancellation, No Show And Capacity Uncertainty

Deepak Agrawal, Penn State University, dua143@psu.edu, Guodong Pang, Priyantha Devapriya, Soundar Kumara

Reasons of No-shows and how to stop them, has been focus of the research since more than a decade. No-show adds up to the increases healthcare waste. Therefore, motivated by this we aim to develop advanced scheduling models which can reduce No-shows by scheduling appointments at patients' preferred day and time with their preferred physicians while simultaneously maximizing the profit for clinics. Patient choices are modeled as mixed-logit model. The dynamic scheduling process is modeled as a Markov decision process. We conduct numerical experiments to test the performance of the dynamic model in comparison to several heuristics proposed in the literature.

4 - A Lagrangian Relaxation Algorithm For Solving Surgery Scheduling Problem Under Uncertain Durations

Amirhossein Najjarbashi, University of Houston, amirhossein.najjarbashi@gmail.com, Gino J Lim

We studied a surgery scheduling and resource allocation problem by considering uncertain durations. A mixed integer programming formulation is developed in order to maximize throughput and minimize overtime. A Lagrangian Relaxation algorithm is applied to solve large-scale problems efficiently. Having a risk-averse attitude, we applied Conditional Value-at-Risk to tackle uncertainty.

Music Row 1- Omni

Opt, Stochastic VI

Contributed Session

Chair: Tugce Isik, Clemson University, 277D Freeman Hall, Dept. of Industrial Engineering, Clemson, SC, 29634, United States, tisik@clemson.edu

1 - Valuing A Portfolio Of Systemic Urban Infrastructure Investments Using Approximate Dynamic Programming With Decision Dependent Uncertainties

Sebastian Maier, Imperial College London, Imperial College Road, Skempton Building, London, SW7 2AZ, United Kingdom, s.maier13@imperial.ac.uk, John W Polak, David M Gann

We present a new portfolio-based framework for the application of approximate dynamic programming to the valuation and risk-management of urban infrastructure investments with decision dependent uncertainties. We use this framework to formulate a multistage stochastic optimisation model in which the value function is approximated by linear regression using both simulation and the modelling of decision dependent uncertainties. Using the real-world case of district heating network investments in London, we investigate the effects of the consideration of decision dependent uncertainties on both the optimal portfolio value and the underlying optimal strategic and operational decisions.

2 - A Stochastic Program For Debris Collection Problem

Derya Ipek Eroglu, Research and Teaching Assistant, Middle East Technical University, Dumlupinar Street N:1, Ankara, 06400, Turkey, eipek@metu.edu.tr, Duygu Pamukcu

Our aim is to develop a stochastic program for debris collection problem, which enables us to make decisions regarding different disaster types or different scenarios that can take place for a disaster type. Debris collection is important for human health since uncollected debris may lead to pollution. We develop stochastic programs using appropriate decomposition methods which will be compared in terms of computational efficiency, test the program with different variants, compare the model with pre-developed deterministic model(Celik et al.) and analyse related performance measures. We present results of our computational studies and analysis.

3 - Management Of Scarce Blood Supplies Accounting For Cross-matching Characteristics

Nooshin Valibeig, Northeastern University, 360 Huntington Ave, Boston, MA, 02115, United States, n.valibeig@neu.edu, Jacqueline Griffin

For blood transfusion, availability of blood of a compatible type is crucial to patient treatment and reductions in mortality rate. In isolated environments, such as in the aftermath of a disaster or combat environment, demand for blood is unpredictable and timing and quantity of stock replenishment is unreliable. Correspondingly, the risk and the cost of blood shortages is high. We develop a stochastic optimization model to develop threshold policies to prevent from blood shortages considering proactive allocation, accounting for cross-matching criteria, to satisfy the requests for various blood types. We assess the effectiveness of these real-time allocation policies via simulation method.

4 - Multistage Power Generation Capacity Expansion Models With Different Risk Measures

Shu Tu, lehigh university, 200 West Packer Avenue, Bethlehem, PA, 18015, United States, sht213@lehigh.edu, Boris Defourny

When it comes to the multistage problems, the stochastic programming models rely on the convexity property of the problems and the solution approaches usually rely on the stage independence assumption, with Markov decision processes being advantageous from these aspects. Therefore, we adapts the "good-deal" generation capacity expansion model to the form of Markov decision processes and will implement it with C++ which can make use of parallel computing and ILOG Concert Technology.

5 - Control Policies For Queueing Systems With Time Sensitive Jobs

Tugce Isik, Clemson University, 277D Freeman Hall, Dept. of Industrial Engineering, Clemson, SC, 29634, United States, tisik@clemson.edu, Bahar Cavdar

We consider a queueing system where each job has a preferred time window for service. We assume that all jobs must be served and the jobs are outsourced when the capacity is insufficient. Costs are incurred for both outsourced jobs and early service. For systems with short time windows and a single class of jobs, we show that a class of threshold service policies are optimal. For general systems, we devise heuristic policies based on similar threshold structures.

Service Science: Uncertainty in Business Processes

Sponsored: Service Science

Sponsored Session

Chair: Genady Grabarnik, St. John's University, St. John's University, Queens, NY, United States, genadyg@gmail.com

1 - Continuity Of The Lyapunov Exponenets Under Continuity Of Measures In Sl (2, R)

Genady Grabarnik, St. John's University, genadyg@gmail.com

In the business processes composition of processes results in special type of product of the appropriate distributions. In this case it corresponds to product of random matrices. It is well know that behavior of random matrices controlled by its Lyapunov exponents. We are investigating stability of the top Lyapunov exponent under perturbation of defining measure in weak topology.

2 - IT Processes Improvement

Larisa Shwartz, IBM, lshwart@us.ibm.com

With the advent of cognitive computing, new generations of cognitive systems and services are being conceived. In IT service management, cognitive approaches used for optimization and automation of IT Service management processes. We discuss an integrated framework for problem resolution that enables an automated discovery of informative phrases from IT incident tickets which are later used to construct knowledge and facilitate automation of IT service management. The effectiveness and efficiency of our framework are evaluated by an extensive empirical study of a large scale real ticket data.

3 - Business-driven Optimization Of It Service Configuration In Public And Hybrid Clouds Based On Performance Forecasting

Genady Grabarnik, St. John's University, Queens, NY, Mauro Tortonesi, Larisa Shwartz

Modern Cloud environments are rapidly evolving, leading to a growing adoption of dynamic pricing for virtual resources and of speedier deployment tools and to the emergence of hybrid Cloud scenarios. The need to address these challenges is paving the way to a new generation of Cloud services, capable of adapting to changes in their operating conditions and deployment environments by dynamically realigning their configuration. However, their management will require new and more sophisticated tools. This paper presents a new optimization solution for Cloud-based IT services, that tries to address these issues by using queuing analysis of the services' workflows and ILP optimization.

Inventory Management VIII

Contributed Session

Chair: Yue Zhang, Duke University, 5507 Butterfly Ln Apt 207, Durham, NC, 27707, United States, yueyue.zhang@duke.edu

1 - Deep Learning For Newsvendors

Afshin Oroojlooyjadid, Lehigh University, 200 West Packer Ave, Bethlehem, PA, 18015, United States, afo214@lehigh.edu, Martin Taká , Lawrence Snyder

We study a newsvendor problem in which each demand observation also has a set of features. We propose an algorithm based on deep learning that optimizes the order quantity based on the features. It integrates the forecasting and inventory-optimization steps, rather than solving them separately. The algorithm does not require probability distributions. Numerical experiments on real-world data suggest that our algorithm outperforms approaches from the literature, including data-driven and SVM approaches, especially for volatile demands.

2 - Inventory Repositioning In Product Sharing Networks

Xiang Li, University of Minnesota, 2508 Delaware St SE, Apt 473A, Minneapolis, MN, 55414, United States, lixx1315@umn.edu, Saif Benjaafar, Xiaobo Li

We study a product sharing network in which customers can pick up a product without reservation, and are allowed to keep the product for as long as they want, without committing to a specific return time or location. We model the periodic inventory re-positioning as a Markov decision process. We characterize the qualitative properties of the optimal policy .

3 - Dynamic Inventory And Price Control In The Face Of Unknown Demand

Tingting Zhou, Rutgers university, Newark, NJ, 07102, United States, tingzhou@rutgers.edu, Michael N Katehakis, Jian Yang

We study adaptive policies that combat unknown demand in a dynamic inventory and price control setting. Inventory control is achieved by targeting newsvendor ordering quantities for empirical demand distributions learned over time. On top of that, demand-affecting prices are selected in a fashion that balances between exploration and exploitation. When burdened with the task of selecting the most profitable price, bounds for the regret can range between the orders of T1/2and those of T2/3. Simulation studies are conducted as well.

4 - Approximating Optimal Inventory Policies For Assemble To Order Manufacturing Systems

Levi DeValve, Duke University, 716 Turmeric Lane, Durham, NC, 27713, United States, levi.devalve@duke.edu, Yehua Wei, Sasa Pekec

We study the classical one-period assemble-to-order problem, modeled as a two stage stochastic integer program with recourse. We leverage a primal-dual approach to develop several approximation methods based on newsvendor solutions. We identify co-monotone demand and symmetric hierarchy systems as special cases where a component newsvendor solution is optimal under a constant mark-up assumption, and provide closed-form bounds on sub-optimality for more general cases. Further, we establish closed-form bounds for systems where components serve many products and show asymptotic optimality.

5 - Serial Inventory Systems With Markov-modulated Demand: Derivative Bounds, Asymptotic Analysis, And Insights

Yue Zhang, Duke University, 5507 Butterfly Ln Apt 207, Durham, NC, 27707, United States, yueyue.zhang@duke.edu, Li Chen, Jing-Sheng Jeannette Song

We consider the inventory control problem for serial supply chains with continuous, Markov-modulated demand. We perform a derivative analysis and develop general, analytical solution bounds for the optimal policy. We further derive a simple procedure for computing near-optimal heuristic solutions. We next perform asymptotic analysis with long replenishment lead time. We show that the relative errors between our heuristics and the optimal solutions converge to zero as the lead time becomes sufficiently long, with the rate of convergence being the square root of the lead time.

Predictive Analytics in eBusiness

Sponsored: EBusiness

Sponsored Session

Chair: Ajit Sharma, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States, ajits1@andrew.cmu.edu

1 - Online Assortment Optimization at Scale

Deeksha Sinha, MIT ORC, deeksha@mit.edu, Theja Tulabandhula

We revisit the problem of assortment optimization in retail and consider a setting where (a) the product universe is large, (b) there are time constraints in offering an assortment, and (c) the user choice model can be personalized. In this setting, we propose an offline algorithm based on the theory of locality sensitive hashing (LSH) that computes approximately optimal assortments quickly. We also perform a sensitivity analysis of the optimal assortment to the choice model used. We then propose an online learning setup where we get feedback on the quality of assortments offered in each round. We come up with new online algorithms based on our offline solutions that can learn the user choice model quickly.

2 - Crowd-driven Competitive Intelligence: Understanding The Relationship Between Local Market Structure And Online Rating Distribution.

Dominik Gutt, Paderborn University, Dominik.gutt@upb.de, Philipp Herrmann, Mohammad Saifur Rahman

Crowdsourced information, such as online ratings, are increasingly viewed as a critical source for understanding local market dynamics. A key aspect of utilizing online ratings to derive competitive market intelligence is to delineate the systematic relationship between local market structure and distributional properties of online ratings. Using restaurant review data from Yelp.com for 372 isolated markets in the U.S., our empirical findings suggest that an increase in competition leads to a broader range of ratings and to a decrease in the average mean rating in a market. Moreover, we present evidence in support of both the internal and external validity of Yelp's crowdsourced online ratings.

3 - Networks And Income: Evidence From Individually Matched Income And Mobile Phone Metadata

Guillaume Saint-Jacques, MIT Sloan School Of Management, Cambridge, MA, 02142, United States, gsaintja@mit.edu, Eaman Jahani, Pål Roe Sundsøy, Johannes Bjelland, Bjørn-Atle Reme, Sinan Aral, Alex "Sandy" Pentland

Measuring the relationship between income and various properties of one's social network has proven difficult because it requires data on income and social ties to be matched at the individual level. We offer the first large-scale investigation of this question using data that is both large scale and individually matched. How are ego-networks different across income levels? Are there measurable differences in degree, reciprocity, diversity and centrality? We use a dataset of Call Detail Records from an Asian country of over 100M individuals and income surveys sent to over 110,000 individuals. We use location data to control for location effects, rather than rely on it to match incomes.

Sponsored Session

Chair: Evgeny Kagan, Ann Arbor, MI, United States, ekagan@umich.edu

Co-Chair: Stephen Leider, University of Michigan, Ann Arbor, MI, United States, leider@umich.edu

1 - When To Hire The First Employee? Behavioral Evidence And Insights

Anton Ovchinnikov, Queens University, Kingston, ON, Canada, anton.ovchinnikov@queensu.ca, Beatrice Boulu-Reshef, Charles J Corbett

Effectively any entrepreneur shifts from doing all the work him/herself to hiring someone to do part of that work. We use an analytical model and behavioral experiments to study when entrepreneurs should and do hire their first employee. Understanding both the optimal timing/conditions of hiring and the deviations of the hiring patterns from optima have the potential to provide insights to a very broad spectrum of entrepreneurs at the critical early stage of their new venture formation process.

2 - Managing The Dynamics Of Delegated Search

Karthik Ramachandran, Scheller College of Business, Georgia Institute of Technology, karthik.ramachandran@scheller.gatech.edu, Morvarid Rahmani

Firms often delegate search for solutions to challenges such as product design, advertisement creation, executive search, etc. We study the dynamics of delegated search. We identify conditions under which the client should use a committed or open-ended approach to evaluating solutions.

3 - Incentives In Startups: Form And Timing Of Equity Contracting

Evgeny Kagan, Ross School of Business, University of Michigan, ekagan@umich.edu, William S Lovejoy, Stephen Leider

We explore theoretically and experimentally how form and timing of equity contracting affects contribution behavior to the startup. Our experimental findings are consistent with the empirical evidence that equal division is associated with reduced contributions. However, the differences in contributions are mainly driven by self-selection of low-contributors into equal contracts, rather than by the incentive effects of the contracts. We also find that the negotiation process itself may be an important driver of contribution behavior in collaborative work settings.

4 - An Experimental Investigation Of Favour Exchange Under Monetary And Non-monetary Incentives

Kyle Hyndman, Naveen Jindal School of Management, UT Dallas, Richardson, TX, United States, KyleB.Hyndman@utdallas.edu, Matthew Embrey, Rudolf Muller

We experimentally study a the situation in which subjects must trade favors - costly actions by one person which only benefits another. We are interested in the role of monetary incentives in promoting efficient exchange. Our results show that monetary exchange achieves the most efficient outcome, but that non-monetary exchange can do as well or better provided that the group scores highly on “social value orientation”.

Energy XIII

Contributed Session

Chair: Mohammad Majidi-Qadikolai, Graduate Research Assistant, University of Texas-Austin, 3373 Lake Austin Boulevard, Apt D, Austin, TX, 78703, United States, majidi.mohammad@gmail.com

1 - A Hybrid Top-down, Bottom-up Approach For Saudi Arabia

Hossa Almutairi, King Abdullah Petroleum Studies & Research Center (KAPSARC), King Abdullah Petroleum Studies & Research Ce, Airport Road, Riyadh, 11672, Saudi Arabia, hossa.mutairi@kapsarc.org

We show how to combine a CGE-like top-down model with a technology-rich bottom-up energy model in a single Mixed Complementarity Problem (MCP). Calibrated on Saudi Arabia’s data, this hybrid model will be used to study the interaction between energy and non-energy sectors and to get insights on the effects of energy policies on the whole Saudi economy.

2 - A Convex Relaxation Approach To Strategic Bidding In Nodal Electricity Markets

Hamed Mohsenian-Rad, Associate Professor, University of California - Riverside, 900 University Ave, Department of Electrical Engineering, Riverside, CA, 92521, United States, hamed@ee.ucr.edu, Mahdi Ghamkhari, Ashkan Sadeghi

Strategic bidding problems in electricity markets are formulated by bi-level optimization problems which are often translated to mixed-integer linear programs (MILPs). In this paper, we instead propose convex programming to solve the strategic bidding problem in nodal electricity markets. Our approach guarantees a feasible and accurate bidding solution, with 99% optimality. While the computation time of the MILP approach grows exponentially as the scheduling horizon or number of random scenarios increases, the computation time of our approach increases rather linearly.

3 - Optimization In Smart Grid With Limited System Observability

Sunil K Vuppala, INFOSYS/IIITB, 309, Elil Abode, Mahadevapura, Outer Ring Road, Bangalore, 560048, India, sunil.vuppala@iiitb.ac.in, Srinivasa Prasanna

We present optimization of energy management in smart grid in the presence of limited system observability and controllability. We assume at least % of the scheduled demand is followed by the consumers. Remaining (1-)% is arbitrary, assumed adversarial. Bounds are found with min-min / max-max formulations which is LP/ILP problem. Robust bounds are obtained using heuristics. The initial results indicate adversarial bounds of 200% in 10,000 consumer example which is equal to price ratio.

4 - Handling Dynamic Constraints In Power System Optimization

Francois Gilbert, Postdoctoral Appointee, Argonne National Laboratory, 9700 S. Cass Avenue, Lemont, IL, 60439, United States, fgilbert@anl.gov, Shrirang G Abhyankar, Hong Zhang, Mihai Anitescu

The inclusion of dynamic stability constraints is the nominal objective of many optimization-based power system analyses. In current practice, this is typically done off-line. We present an approach for the on-line inclusion of dynamic constraints in power grid optimization problems. The approach is based on an encapsulation that allows for a loose coupling between the optimization and the numerical simulations. We demonstrate the benefits of the approach on a 118 bus systems, for which we solve an economic dispatch with transient constraints.

5 - Integrating Short-term And Long-term Transmission Expansion Planning

Mohammad Majidi-Qadikolai, Graduate Research Assistant, University of Texas-Austin, 3373 Lake Austin Boulevard, Apt D, Austin, TX, 78703, United States, majidi.mohammad@gmail.com, Ross Baldick

For long-term transmission expansion planning (LTEP), 10 + years is usually selected as a planning horizon; however short-term planning (STEP) is limited to less than 5 years. Common practice is to run these two planning studies separately. On one hand, the impact of long-term load and generation growth on STEP is ignored, and on the other hand, LTEP cannot represent network configuration changes as a result of STEP that makes LTEP results less realistic. In this paper, we integrate these two planning studies into a single multi-stage TEP and discuss modeling and computational challenges.

1 - Drone Routing And Optimization For Wildlife Surveillance

Adindu Emelogu, PhD Student, Mississippi State University, 260 McCain Engineering Building, Mississippi State, MS, 39762, United States, aae39@msstate.edu, Sudipta Chowdhury, Mohammad Marufuzzaman, Linkan Bian, Brian Smith

The drone is one of the leading edge technologies developed for military applications with the potential of evolving into useful public and private uses. In this study, we investigate the use of drones in the surveillance and monitoring of wildlife population. Such operation is important for several wildlife conservation and animal health infrastructural initiatives. We formulate the surveillance problem as a mixed-integer linear programming model that determines the location of the drone launching stations and the optimal routing of the drone’s to safely survey the target area and minimize the total location, transportation, and energy costs of the system.

2 - Efficient And Reliable Package Delivery Path Planning For Drones

Mohannad Kabli, Mississippi State University, mrk297@msstate.edu, Sudipta Chowdhury, Mohammad Marufuzzaman

The development of efficient and reliable path for drones is becoming crucial in today's world due to its potential applicability in many commercial purposes. This research focuses on designing an efficient and reliable path planning for the delivery of packages by considering power requirement, collision, altitude, and other related factors into account. The characteristics of the optimal path are expressed in terms of a multi-objective cost function which we solved by using an Adaptive Large Neighborhood Search (ALNS) heuristic.

3 - A Continuum-approximation Approach To Optimize Routing Decisions For Drones Under Extreme Events

Sudipta Chowdhury, Mississippi State University, sc2603@msstate.edu, Adindu Emelogu, Mohammad Marufuzzaman, Linkan Bian

Application of drones in various sectors is becoming common place day by day, and it has got huge potential in humanitarian logistics. This research pertains to optimization of logistics management of drones under extreme events. The key decisions investigated in this study is where to locate the transportation centers, how to assign demand points at each transportation center, and what should be the inventory policy such that the total network cost is minimized. Continuous Approximation (CA) approach is used to solve this problem. As a test bed for computational experiments, coastal region of Mississippi is selected due to its long history of getting affected by various natural disasters.

Chair: Ahmed Ghoniem, Associate Professor, University of Massachusetts Amherst, 121 Presidents Dr., Amherst, MA, 01002, United States, aghoniem@isenberg.umass.edu

1 - A Branch-and-cut-and-price Algorithm For The Generalized Vehicle Routing Problem

Mohammad Reihaneh, University of Massachusetts Amherst, Amherst, MA, 01002, United States, mreihaneh@som.umass.edu, Ahmed Ghoniem

We consider the Generalized Vehicle Routing Problem in which customers are partitioned into mutually exclusive clusters, each with a specific demand. The goal is to construct cost minimizing tours such that exactly one customer is visited in every cluster, subject to vehicle capacity constraints. The proposed specialized branch-and-cut-and-price algorithm compares favorably against state-of-the-art exact algorithms in the literature and closes several open benchmark instances.

2 - A Two-level Optimization Approach For Robust Aircraft Routing And Retiming

Mohamed Haouari, Qatar University, mohamed.haouari@qu.edu.qa

We address the robust aircraft routing and flight retiming problem, and we propose a two-level solution strategy that embeds a simulation-optimization procedure within an evolutionary algorithm. The proposed approach requires inserting buffer times prior to the flight departure times in order to improve the robustness of both aircraft and passengers connections. We present the results of extensive computational experiments that were carried out on a set of real data.

3 - Resource Constrained Arc Routing For Snow Plowing

Joris Kinable, Carnegie Mellon University, Pittsburgh, PA, United States, jkinable@cs.cmu.edu, Willem-Jan Van Hoeve, Stephen F Smith

This work considers a Resource Constrained Arc Routing Problem for snow plowing, a fundamental problem faced by many cold-weather cities. In RC-ARP, routes for a heterogeneous set of vehicles must be computed such that they collectively cover a network of streets, while adhering to various resource (salt) usage and replenishment constraints. We contrast exact and heuristics approaches, as well as a decomposition method. The performance is demonstrated on real-world data from the city of Pittsburgh, PA.

4 - Vehicle Routing Problems With Drone Delivery

Ahmed Ghoniem, University of Massachusetts Amherst, aghoniem@isenberg.umass.edu, Mohamed Haouari, Mohammad Reihaneh

We study a Vehicle Routing Problem with drone delivery. In this setting, a customer is directly visited by a vehicle or his/her demand is indirectly delivered from a neighboring customer using a drone. A mixed-integer formulation is presented along with a branch-and-price algorithm. Alternative solution approaches are investigated for the column generation pricing subproblem and computational results are presented.

Railway Analytics

Sponsored: Railway Applications

Sponsored Session

Chair: Qing He, SUNY Buffalo, Buffalo, NY, United States, qinghe@buffalo.edu

1 - Estimating The Probability And Impact Of Track Defects In Railroad Operations And Maintenance Planning

Alexander Lovett, University of Illinois at Urbana-Champaign, alovett2@illinois.edu

Slow orders and spot maintenance and are used by railroads to mitigate the impact of track defects and ensure safe train operations between capital maintenance actions. Individually, slow orders and spot maintenance do not appear to have a significant cost impact, but in aggregate, they can reduce efficiency and increase costs over the rail network. This presentation will discuss probabilistic methods to predict when slow orders and spot maintenance will be required to allow for more efficient objective track maintenance planning.

2 - Predictive Switch Health

Casey Jen, CSX, Jacksonville, FL, United States, Casey_jen@csx.com, Bob Gutman, Aihong Wen

Among all the Communication and Signal (C&S) components, switches cause biggest number of train delays on line of road. In this study, we leveraged cutting-edge Big Data and Predictive Analytics techniques and developed a set of prediction models to assess future switch health. Taking information from multiple data sources, such as Computer Aided Dispatching System (CADS) event logs, switch inspection records, switch incidents records, and many others, these prediction models will enable CSX to proactively maintain our vital assets and better plan C&S workforce.

3 - Data-driven Optimization Of Railway Track Inspection And Maintenance Using Markov Decision Process

Qing He, University at Buffalo, SUNY, Buffalo, NY, United States, qinghe@buffalo.edu, Siddhartha Sharma, Yu Cui, Zhiguo Li

This paper develops a data-driven condition-based maintenance policy for track inspection. This paper will help in maintaining high service level of the railway tracks which is a difficult task to accomplish. Dataset is two-year track geometry inspection data which contains a variety of geometry measurements for every foot. We employ Markov Chain to model track deterioration, and build a Markov Decision Process for track maintenance decision making and optimize it using value iteration algorithm. By comparing with existing maintenance policy with Markov Chain Monte Carlo simulation, the new maintenance policy developed in this paper can save nearly 10% maintenance costs.

Sponsored Session

Chair: Ricard Gil, Johns Hopkins Carey Business School, 100 International Drive, Baltimore, MD, 21202, United States, ricard.gil@jhu.edu

1 - A Profit Maximizing Integrated Model Of Fleet Assignment And Aircraft Routing With Considerations Of Flight Schedule Disturbances

Muhammed Sutcu, Assistant Professor, Abdullah Gul University, Sumer Campus, Erkilet Bulvari, Kayseri, 38060, Turkey, muhammed.sutcu@agu.edu.tr, Baris Yildiz, Yeliz Yoldas

Airline schedule disturbances are one of the most critical problems due to the unpredictable disruptions such as technical failures and severe weather conditions. In this work, a mixed-integer mathematical model integrating fleet assignment and aircraft routing is proposed to select from among a set of flights and to assign the selected flights to appropriate aircraft for a profitable daily schedule with as minimum delay and idle time in total as possible. The uncertainties of demand, failures of the aircraft and delays arising from adverse weather conditions are also integrated to the corresponding model. To propose a solution methodology for this model is another purpose of this paper.

2 - Prescriptive Analytics In Airline Operations: Cost Index Optimization Through Improved Arrival Time Prediction

Anna Achenbach, PhD Candidate & Research Assistant, WHU - Otto Beisheim School of Management, Burgplatz 2, Vallendar, 56179, Germany, anna.achenbach@whu.edu

Facing enduring cost pressure, the European airline industry has turned to machine learning to enhance their operations. In this paper, we develop a prescriptive model which improves the prediction of an aircraft's flight time taking as inputs different speed levels, flight and weather information. Through a more accurate flight time prediction an optimal cost index can be determined by considering increased fuel burn against cost of time. The study is based on random forest regression combined with convex optimization of the cost index using actual flight data of a European airline.

3 - Adaptation And Relational Contracting In The US Airline Industry

Ricard Gil, Johns Hopkins Carey Business School, 100 International Drive, Baltimore, MD, 21202, United States, ricard.gil@jhu.edu, Myongjin Kim, Giorgio Zanarone

In the airline industry, ex-post adaptation of flight schedules is necessary in the presence of bad weather. When major carriers contract with independent regionals, conflicts over adaptation decisions typically arise. This paper analyzes the importance of relational adaptation in the airline industry. Our model shows that the long-term value of the major-regional relationship must be at least as large as the regional's total cost of adaptation across joint routes. Thus, the major is more likely to preserve routes outsourced to regional airlines that have higher adaptation costs. Using the 2008 financial crisis as exogenous shock, we find consistent evidence with our theoretical predictions.

Location Models in Humanitarian Logistics

Sponsored: Location Analysis

Sponsored Session

Chair: Kayse Lee Maass, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States, Leekayse@umich.edu

1 - Emergency Shelter Location Analysis And Logistics For Hurricane Preparedness

Nicholas E. Lownes, University of Connecticut, nlownes@engr.uconn.edu

Deterministic and stochastic location models are presented as decision support tools for emergency shelter planning in the state of Connecticut. Several scenarios are evaluated, including local and statewide evacuation strategies. Jurisdictional boundary and backup power generation constraints are also examined in the context of evacuation strategy.

2 - Perishable Commodity Allocation In Humanitarian Supply Chains With Multiple Demand Types

Melih Celik, Middle East Technical University, cmelih@metu.edu.tr, Ozlem Ergun, Julie L Swann

In this study, we consider the allocation of a perishable item in a humanitarian supply chain, which consists of a capacitated warehouse and distribution locations (DLs). Each DL serves multiple demand classes with varying benefits for satisfying the uncertain demand, and applies a usage policy (prioritization of the higher classes or first-come, first-served). We develop algorithms that maximize the expected net benefit of the system. When demand arrivals are Poisson, we establish structural results on relative performance of usage policies and centralization of the DLs. These results are extended using computational experiments based on the H1N1 vaccination campaign in the state of Georgia.

3 - Time-variant Adaptive Robust Optimization For Hurricane Preparedness

Xinfang Wang, Georgia Southern University, Statesboro, GA, 30460, United States, xfwang@georgiasouthern.edu, Jomon A Paul

We propose an adaptive robust model for determining the stockpile location and capacities and impacts of these decisions on social costs (logistic, deprivation and fatality), given time-variant hurricane characteristics. Uncertainty set size is adjusted according to storm advisory released every six hours, making the model adaptive to time-variant uncertainty realization.

Representations and Approximations in Multiobjective Optimization

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Serpil Sayin, Koc University, Istanbul, Turkey, ssayin@ku.edu.tr

1 - On Measures Of Quality For Representations And Approximations

Serpil Sayin, Koc University, ssayin@ku.edu.tr

We revisit the definition of discrete representations of the nondominated set in multiobjective optimization. We focus on the coverage error as a measure of quality, review some related measures and investigate relationships among them. We note that the computational features of a measure become critical while building algorithms that deliver representations that conform to given quality expectations. We report on our computational experience with a lower bound on the coverage error as embedded in a recent algorithm that delivers representations. Finally we analyze the output of our algorithm in relation to an approximation of the nondominated set.

2 - On The Existence Of Ideal Solutions In Multi-objective Binary Programming And Its Applications: Preprocessing, Valid Inequalities, And Probing

Hadi Charkhgard, University of South Florida, Tampa, FL, United States, hadi.charkhgard@gmail.com, Natashia Boland, Martin Savelsbergh

Studying objective functions of multi-objective binary problems (MBPs) can be helpful in detecting MBPs that can be solved in polynomial time. This talk shows that in addition to this important fact, studying this topic can also result in developing some preprocessing, valid inequalities, and probing techniques that can be incorporated in any solver of MBPs. More precisely, this talk focuses on studying objective functions to show that under which conditions a MBP has an ideal solution. Based on that, it shows that (1) how the number of objectives may be reduced; (2) how some classes of valid inequalities may be generated; and (3) how the size of a MBP may be reduced by eliminating some certain variables.

3 - A Novel Multi-criteria Optimization Method For Volumetric Modulated Arc Therapy (vmat) Treatment Planning

Gokhan Kirlik, University of Maryland School of Medicine, Baltimore, MD, 21201, United States, gokhankirlik@umm.edu, Warren D. D'Souza, Hao Howard Zhang

Volumetric modulated arc therapy (VMAT) is one of the radiation therapy techniques for cancer patients. In VMAT, the main goal is to deliver right amount of radiation dose to the tumor while sparing the normal tissue. Therefore, VMAT requires considering several conflicting objectives, which is called multi-criteria optimization (MCO). In MCO, efficient solutions are used instead of the optimal solution. In this study, we use achievement scalarization to obtain efficient solutions for VMAT. We tested our approach on 10 locally advanced head-and-neck cancer cases. We demonstrated that the proposed MCO method was able to obtain VMAT plans with significant improvement in dosimetric plan quality.

1 - Promotion Strategy, Operating Mechanism, And Economic Value Of Digital Platform For Consulting Services: A Two-sided Market Perspective

Tae Hun Kim, Michigan State University, East Lansing, MI, United States, thkim@broad.msu.edu, Kyung Ho Song, Daegon Cho

A platform plays as a two-sided market by matching clients with consultants in a digitized way for consultancy. To show its value, we focus on promotion strategy, operating mechanism, and economic impact. The success depends on its attraction for potential customers initially and IT-mediated operation for existing clients over time. Its economic value is explained for both client and consultant sides. We first explore possible ways to promote the digitized services. Second, specific IT features are identified to enable user engagement and interactions. Finally, economic value is analytically proved by a pricing model for the two-sided market and a synergy between online and offline services.

2 - Justification And Justice Matter: Organizational Attention To Ideas On Digital Innovation Platforms

Inchan Kim, University of New Hampshire, Durham, NH, United States, i.kim@unh.edu, John Qi Dong

Digital innovation platforms allow crowdsourcing of ideas, in effect generating big data for organizations. Then, to which ideas do organizations direct their focus? Based on the six logics of justification together with the four justice principles, we use qualitative comparative analysis (QCA) to analyze the configurational impacts of justification and justice reflected in ideas from MyStarbucksIdea.com on organizational allocation of attention.

3 - Domain Specific Lexicon For Clinical Trial Subject Eligibility Analysis

Euisung Jung, University of Toledo, Euisung.Jung@utoledo.edu

It is well understood that an NLP application requires sophisticated lexical resources to support its processing goals. Different solutions have been proposed to identify multi-gram disease named entities in the healthcare informatics literature. In this study, we develop a domain-specific lexicon for n-gram Named Entity Recognition (NER) in the breast cancer domain. The domain-specific dictionary was evaluated by comparing it with Systematized Nomenclature of Medicine—Clinical Terms (SNOMED CT). The results showed that it add significant number of new terms which is very useful in effective natural language processing.

1 - Generalized Graph Shortest Path For Calibration Of Computer Simulations.

Babak Farmanesh, Oklahoma State University, farmane@ostatemail.okstate.edu

Calibration refers to the process of adjusting parameters of a computer simulation so that the simulation responses match the corresponding physical responses. Calibration can be interpreted as a curve to surface matching problem. We propose a graph-theoretic non-isometric matching approach to solve this problem using the graph shortest path algorithm in one-dimensional spaces. For higher dimensional spaces, we introduce the generalized shortest path concept to solve the matching problem.

2 - Spectral Graph Theoretic Sensor Fusion

Prahalad Rao, Binghamton University, prao@binghamton.edu

The central theme of this talk is motivated from the compelling need for sensor-based in situ quality assurance approaches in complex systems and processes, such as additive manufacturing (AM). The key research question is: how to fuse information from multidimensional sensor signals for monitoring and prognosis? The proposed approach maps a multidimensional signal as an un-weighted undirected network graph. Through this talk, it is demonstrated that graph theoretic signal processing has the potential to monitor complex systems in a data rich environment.

3 - Learning Data Association Graph

Chiwoo Park, Florida State University, 2525 Pottsdamer St., Tallahassee, FL, 32310, United States, cpark5@fsu.edu, Taylor J. Woehl, James E. Evans, Nigel Browning

We presents a general formulation for a minimum cost data association problem which associates data features via one-to-one, m-to-one and one-to-n links with minimum total cost of the links. A motivating example is a problem of tracking multiple interacting targets imaged on video frames. Many existing multitarget tracking methods are capable of tracking non-interacting targets or tracking interacting targets of restricted degrees of interactions. The proposed formulation solves a multitarget tracking problem for general degrees of inter-object interactions.

4 - Measuring Redundancy Of State Estimators In Large Networks By Combining L1-minimziation And Integer Programming

Vishnu Vijayaraghavan, Texas A&M University, College Station, TX, 77843, United States, vishnunitr@tamu.edu, Kiavash Kianfar, Yu Ding, Hamid Parsaei

Finding the degree of redundancy for structured linear systems is proven to be NP-hard. Bound-and-decompose, 0-1 mixed integer programming (MIP) and hybrid algorithms embedding 0-1 mixed integer programming within a bound-and-decompose framework have all been studied and compared in the literature. In this paper we take advantage of the computational efficiency of linear programs to present an l1 minimization approach combined with mixed integer programming to address this problem. This approach proves to be very effective in measuring redundancy of state estimators in large networks.

Joint Session QSR/DM: Process Monitoring for Diverse Types of Data

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Youngseon Jeong, Annandale, VA, United States, youngseonjeong@gmail.com

Co-Chair: Myong K Jeong, Rutgers University, Piscataway, NJ, United States, mjeong@rci.rutgers.edu

1 - Bayesian Based Distribution Free Procedure For Fault Identification

Mehmet Turkoz, Rutgers University, 16 Rachel Terrace, Piscataway, NJ, 08854, United States, turkoz@scarletmail.rutgers.edu, Sangahn Kim, Youngseon Jeong, Myong K Jeong, Elsayed A. Elsayed, A.M.S. Hamouda, Khalifa Al-Khalifa

Many real life process control problems do not follow multivariate normal distribution. In a process with unknown underlying distribution, identifying fault variables of an out-of-control signal is a challenging issue for quality problems. In this research, we present a new Bayesian fault identification method that does not assume any specific probability distribution.

2 - Modeling And Shape Control Of Large Composite Components For Section-to-fuselage Joints

Yuchen Wen, Gatech, ycwen@gatech.edu

Shape control of large composite components is important in aerospace industry. The current method of shape control has limitations of low efficiency and non-optimal. We propose a surrogate-model based optimal shape control strategy in order to achieve dimensional variation reduction and efficient shape adjustment in large composite parts assembly process. The objective is accomplished by (i) Investigating a surrogate model to achieve good prediction performance; (ii) Conducting multi-objective optimization to determine the control actions from the Pareto solutions; (iii) Implementing the sensitivity analysis to determine the best number and positions of the locators.

3 - Process Tracking And Monitoring Based On Discrete Jumping Model

Chao Wang, University of Wisconsin-Madison, Madison, WI, United States, cwang436@wisc.edu, Shiyu Zhou

Jumping model has been used as an effective tool in tracking and detecting changes for continuous statistics in various applications. In this paper, we extend the current jumping model from the continuous case to the discrete case to track and monitor the changes in attribute data. The jumping model based posterior distribution of the process mean is constructed with attribute data and prior knowledge of the process. Using the posterior distribution, a control chart is then developed to monitor the attribute data process.

4 - A New Bayesian Classification Model For Uncertain Data

Young-Seon Jeong, Chonnam National University, Gwangju, Korea, Republic of, youngseonjeong@gmail.com, Byunghoon Kim, Myong K Jeong, Jeongsub Choi, Soonmok Kwon, Jihoon Kang

This talk presents a new Bayesian classification model which considers the correlation among uncertain features. Even though several classifiers for uncertain data have been developed, they did not consider the dependency among uncertain features, which have a critical effect on classification accuracy. Experimental results with simulated data and real-life data show that the proposed approach for uncertain data is more accurate than existing approaches.

1 - Spatial Discrete Model For Clustered Defects On Wafer Maps

Hao Wang, Tsinghua University, w-h14@mails.tsinghua.edu.cn

Yield, which contributes to increase the process quality, is a key concern in the fabrication of semiconductor wafers. In this paper, we propose a novel discrete spatial model based on discrete spatial defects data on wafer maps for analyzing and predicting the yields at different chip locations. Based on the Bayesian framework, we adopt a generalized linear model that considers both the spatial coordinates and random spatial error, thereby significantly improving the performance of the model. The experimental results show that the generalized linear Poisson model that considers both the spatial coordinates and random spatial error offers an improved fit to spatially correlated wafer map data.

2 - Spatial Models In Metal Additive Manufacturing

Bianca Maria Colosimo, Politecnico di Milano, Milano, Italy, biancamaria.colosimo@polimi.it, Marco Grasso

Additive manufacturing is more and more often moving from prototyping to production and this is why new methods and tools for quality inspection and monitoring are needed. In order to model shapes and internal defects, spatial models can be used. This talk shows how spatial modeling can be used to model complex shapes and internal defects (e.g., porosity) in metal additive manufactured products.

3 - Reduced-dimension Mcusum Chart For Spatio-temporal Surveillance

Junzhuo Chen, Georgia Institute of Technology, Atlanta, GA, United States, jz.chen@gatech.edu, Seong-Hee Kim, Yao Xie

In spatiotemporal surveillance, control chart with scan statistics is a powerful method. Usually calculating monitoring statistic requires observations from the whole monitoring area and the full covariance matrix inversion. However, if the dimensionality is high, implementation can be challenging. First, it is hard to estimate the full covariance matrix. Second, the computation of matrix inversion is expensive. Finally, collecting data from all the sensors may be costly. To address such issues, we propose the Reduced-Dimension MCUSUM chart that constructs the monitoring statistic using measurements from a small group of locations. We conduct simulations to study performance of the method.

1 - Modulation Design For MIMO HARQ Channel

Hans Mittelmann, Arizona State University, mittelma@asu.edu, Wenhao Wu, Zhi Ding

Modulation diversity (MoDiv) is a simple and practical transmission enhancement technique that utilizes different modulation mappings to reduce packet loss rate and achieve higher link throughput. MoDiv is particularly meaningful and effective in hybrid-ARQ systems. We study the deployment and optimization of MoDiv for HARQ in a MIMO-coordinated multi-point (MIMO-CoMP) scenario to mitigate packet loss. We formulate the design optimization of MoDiv into a quadratic three-dimensional assignment problem (Q3AP), then solve it using a modified iterated local search (ILS) method. Numerical results demonstrate clear performance gain over simple retransmissions and over a heuristic design.

2 - A Robust Optimization Approach For Network Interdiction

Amelia Musselman, Georgia Institute of Technology, Atlanta, GA, United States, amusselman@gatech.edu, Richard Li-Yang Chen, Janson Wu

Networks arise in many systems that play an integral role in our daily lives, from the internet to the national electric grid. It is important to protect these networks from potential attacks. However, oftentimes the budget for network security is limited, and the effectiveness of various defense mechanisms may be uncertain. In this research we develop a robust optimization algorithm for selecting defense options to strengthen network security with a limited budget. We use a bi-level programming model, where the adversary's goal is to maximize damage to the system while the defender's goal is to minimize this damage. We test our method on a large synthetic problem of the U.S. supply chain network.

1 - Travel Time Estimation Based On Complex Networks Within A DTA Framework

Rui Chen, Tsinghua University, Shunde building of Tsinghua University, Beijing, China, chenruiest@163.com, Satish Ukkusuri

Data-driven estimation based on complex networks is a most important one of new methods which could deal with DTA for both associated mathmatical properties and computational ability. Therefore, we proposed a data-driven travel time estimation model based on Complex Networks within a DTA framework.

2 - System Optimal Traffic Signal Control Under Dynamic User Equilibrium

Rui Ma, Postdoc Scholar, University of California, Davis, 1001 Ghausi Hall, One, Davis, CA, 95616, United States, drma@ucdavis.edu, Hao Yu, Michael Zhang

Dynamic user equilibrium (UE) introduces nonlinear constraints with time-varying state-dependent delay terms. An optimal traffic signal control framework is proposed to find the signal control settings that minimize the total travel time in a road network, as well as maintaining the UE condition and other realistic spillback constraints. In this study, a heuristic solution method is proposed to solve the nonlinear problem with time-varying, state-dependent delays. The resulting solution satisfies the desired properties, which suggests the proposed solution algorithm is better than the previous introduced method with approximation by constant time delays.

3 - Managing The Daily Operations Of A Bike Sharing System Using Portable Stations

Rahul Swamy, PhD Student, University of Illinois Urbana-Champaign, Champaign, IL, 61820, United States, rahulswa@illinois.com, Jose Luis Walteros

This research aims to provide an integrated mathematical framework for operating a bike-sharing system using portable stations. We propose solving a sequence of MILPs to optimally determine the locations of portable stations across a time period in order to minimize redistribution logistics. A Bender's decomposition based solution strategy is presented. Existing work in this area treat this problem separate from the bike station location problem. We propose an integrated approach.

4 - The Impact Of Demand Uncertainty On Subsidy Design In BOT Road Projects

Zhuo Feng, Dalian University of Technology, No. 2 Linggong Road, Dalian, 116024, China, zhfeng@dlut.edu.cn, Yiwen Zhang

The private investor faces substantial demand uncertainty in BOT (Build-Operate-Transfer) road projects, which depresses her participation. To attract private investors, the government often offers subsidies in some BOT road projects. In this paper, we will mainly consider usage-based subsidy. We first examine the impact of demand uncertainty on the government's subsidy design by considering the private investor's response in designing toll price and road capacity. We further make two extensions by locating the project in a road network and by considering the private investor's information advantage of her operating cost, respectively.

5 - An Optimized Insertion Method To Prevent Bus Bunching: Simulation And Comparisons

Antoine Petit, U of Illinois at Urbana-Champaign, 205 N Mathews Avenue, # B156, Urbana, IL, 61801, United States, apetit@illinois.edu, Yanfeng Ouyang

Bunching is an inherent problem in transit systems, due to the randomness of passengers arrival and traffic conditions. Because maintaining regular bus headways is critical for providing a satisfactory service to the passengers, transit agencies developed strategies to mitigate this problem. Although convenient, those methods fall short if they were not optimized. This work proposes an optimized bus insertion approach to prevent bus bunching, by minimizing the in-vehicle travel time and the agency costs. Managerial decisions will include the location and size of the idling fleet, and the headway threshold to put the extra buses in service.

1 - Cooperative Game Theory Applied To Clusters Competitive Value

Dionicio Neira, Universidad de la Costa, CUC, Barranquilla, Colombia, dneira1@cuc.edu.co, Daniela Carolina Landinez, Diana Gineth Ramirez-Ríos, Luis Eduardo Ramirez

This research is based on the analysis of supply chains in clusters, where it is known that the competitiveness of the company participating in the cluster contributes to the cluster's competitive value as a whole. This paper proposes cooperative game theory to suggest the contribution of these companies, which is based not only on its individual competitiveness but also on its willingness to cooperate. Shapley value was calculated to obtain a solution that is both stable and feasible for the companies involved.

2 - An Evolutionary Stochastic Multi Agent Game To Forecast The Procurement Of Food Grains From Farmers In a Public Distribution System

Sankaranarayanan G, Research Scholar, IIT-Kharagpur, B-121 Sir Acharya Jagadish Chandra Bose, IIT-Kharagpur Campus, Midnapore, 721302, India, samhara23@gmail.com, Sri Krishna Kumar, Manoj Kumar Tiwari

A stochastic multi-agent evolutionary game is proposed to obtain forecast of the procurement of food grains in a public distribution system for effective decision making in supply chain planning and ensuring preparedness in presence of Interdictions.

3 - Regret-optimal Strategies For Playing Repeated Games With Discounted Losses

Vijay Kamble, Stanford University, Stanford, CA, United States, vijaykamble.iitkgp@gmail.com

The regret-minimization paradigm has emerged as a powerful technique for designing algorithms for online decision-making in adversarial environments. But so far, designing exact minmax-optimal algorithms for minimizing the worst-case regret has proven to be a difficult task in general, with only a few known results in specific settings. In this paper, we present a novel set-valued dynamic programming approach for designing such exact regret-optimal policies for playing repeated games with discounted losses. As an illustration of our approach, we design the first known near-optimal strategy for prediction using expert advice for the case of 2 experts and discounted losses.

4 - An Attacker-defender Resource Allocation Game With Complementary Or Substituting Effects

Meilin He, University at Buffalo, SUNY, 4291 Chestnut Ridge Rd. Apt 5, Buffalo, NY, 14228, United States, meilinhe@buffalo.edu, Jun Zhuang

This work develops a game-theoretical model for the government's resource allocations facing with strategic attackers, with consideration of the complementary or substituting effects. We study how the joint effectiveness and the uncertainty of the interactions between different security programs influence the defender's and the corresponding attacker's strategies. Then we explore the dynamics between defender and attacker. We provide numerical illustrations using real data, then compare the results of the models with and without the joint effectiveness coefficient. Finally, we conduct the sensitivity analysis. This research helps provide new insights into security budget allocation.

Contributed Session

1 - The Effect Of Store-Induced Returns on Warehouse Store Supply Chain

Hao-Wei Chen, San Jose State University, San Jose, CA, 95125, United States, hao-wei.chen@sjsu.edu, Wen-Ya Wang

In a warehouse clubs supply chain, the suppliers are usually responsible for any cost induced by merchandise returns. When a product has a higher than usual return rate, a store may strategically ask other customers to return their same purchases voluntarily in order to maintain store reputation. We study how such a strategy affect the quality of the product provided by the supplier and the profits of the supplier and the retailer.

2 - The Impact Of 3D Printing On Spare Parts Management

Jakob Heinen, PhD Candidate, Kühne Logistics University, Großer Grasbrook 17, Hamburg, 20457, Germany, johannes.jakob.heinen@the-klu.org, Kai Hoberg

Based on logistical decision parameters and supply chain performance criteria, the research aims to identify spare parts that offer a potential for 3D printing. A theoretical model is developed contrasting subtractive (conventional) production with inventories against a production using 3D printers with no or highly reduced inventories. In calculating the optimal inventory policies for both manufacturing approaches, we identify cost settings where additive manufacturing is preferable over traditional manufacturing. In addition, a large data set of spare part inventory and demand data is utilized to provide a use case for the introduced model.

3 - Outsourcing With Learning-by-doing: The Case Of Two Oems

Min Wang, Drexel University, 3220 Market Street, Philadelphia, PA, 19104, United States, mw638@drexel.edu, Wenjing Shen

In this paper, we consider two OEMs outsourcing to a single powerful CM, and both OEMs and CM can learn from production to reduce future cost. We show that even if the two OEMs do not compete with each other, the presence of another OEM outsourcing to the same CM can have a significant impact on an OEM.

4 - Robust Optimization Of The Beer Distribution Game Incorporating Uncertainties In Forecasted Customer Demand

Adarsh Elango, Application Engineer, ESTECO North America, 39555 Orchard Hill Place, Suite 457, Novi, MI, 48375, United States, elango@esteco.com, Saket Kansara, Zhendan Xue

This paper introduces a novel concept of adding uncertainty over the customer demand cycle to the well-known theoretical example - Beer Distribution Game. The added uncertainties make the model a closer representation of the real market dynamics. A robustness assessment as well as a robust optimization approach is used to determine the best ordering policies across an entire supply chain. Various optimization formulations such as single objective and multi-objective have been compared using traditional and robust optimization approaches.

Bonie(He) Zhang, PhD Candidate, Rutgers University, 1 Washington Park, # 196 Mailbox, Newark, NJ, 07102, United States, boniezhang331@gmail.com, Yao Zhao

We study the co-author network of flag-ship INFORMS journals in operations management such as Management Science and Operations Research. We present our modeling approach and our empirical exploration characterizes the changing patterns of the co-author network and provides insights to authors on how to improve productivity through exploitation of the academic social network.

2 - Hybrid Flow Shop Scheduling Problem With Parallel Lines

Arshad Ali, PhD Student, University of Manitoba, Winnipeg, MB, Canada, alia@myumanitoba.ca, Yuvraj Gajpal, Tarek Y. El Mekkawy

This paper considers the special case of hybrid flow shop problem where machines are arranged in parallel lines. Each line has multiple stages but the number of stages in each line are same. A job is required to go through only one of the lines to become final product. One job can be assigned to only one line. The problem involves finding job sequence for each line to minimize the total competition time of jobs. Three heuristics has been developed to solve the problem. A new benchmark problem instances has been created to evaluate the performance of the proposed heuristics.

3 - A Three-stage Intelligent Solution Approach To Order Picking Scheme For Vegetables Under B2c Direct Sale In China

Xiaochun Feng, Dalian University of Technology, No.2 Linggong Road, Ganjingzi District, Dalian, 116024, China, fxc11011@126.com, Xiangpei Hu

The paper focuses on the 'farm-to-door' order picking problem of organic vegetables in online direct sales, with the objective of enhancing the scientific, efficient and on-time processing level. Taking online order picking scheme generation as a breakthrough point, by applying the theories of fuzzy clustering artificial intelligence and operational research, this paper presents a three-stage solution approach to order picking problem that aims to significantly reduce the solution's state space. Finally, a numerical example is used to demonstrate the efficiency of the intelligent solution approach.

1 - Selective Newsvendor Problem With Dependent Lead Time And Marketing Decisions

Jianing Zhi, Penn State Erie The Behrend College, Eire, PA, 16509, United States, jzz5296@psu.edu, Burcu B Keskin

We consider a company that experiences quantity-dependent lead times from the supplier. Due to a limited sales force and lead time issues, the company may not be able to meet all customer demands. We develop mixed integer nonlinear programming model to maximize the total expected profit by determining order quantity, demand satisfaction percentage, and agent-customer match up. We evaluate the model with varying parameters, including demand, lead time, capabilities of agents, and waiting time tolerance of customers to estimate their impacts on total expected profit, ordering policies and marketing strategies.

2 - The Impact Of Consumer Quality Target On Product Line Design

Lucy Gongtao Chen, National University of Singapore, NUS Business School, Biz 1 Mochtar Riady Building, #8-60, Singapore, 119245, Singapore, bizcg@nus.edu.sg, Qingshan Kong

In this paper, we study a firm's product line design when consumers care about not only the offered product quality but also the difference between the offered quality and their target quality level. In a market where consumers have heterogeneous quality targets, we find that targets have a significant impact on the product line offering strategy. In particular, both single product line strategy and full product line strategy can be optimal and when a full product line is offered, both the downward distortion of the low quality level and the upward distortion of the high quality level can be possible.

3 - Big Data vs Small Data: Consumer Profiling With Data Requirements

Jiahua Wu, Imperial College Business School, Office 382, Tanaka Building, Imperial College London, London, SW7 2AZ, United Kingdom, j.wu@imperial.ac.uk, Tommaso Valletti

We consider a model where a monopolist can profile consumers in order to price discriminate among them, and consumers can take costly actions to protect their identities and make the profiling technology less effective. We show that the optimal investment level from the monopolist is closely related to the flexibility of consumers to conceal their identities as well as to data requirements.We also show that the monopolist has a tendency to invest excessively.

1 - information Aggregation In Markets With Heterogenous Traders

Yaarit Even, Columbia Business School, 601 W 113th Street, Apt 2k, New York, NY, 10025, United States, yeven18@gsb.columbia.edu, Alireza Tahbaz-Salehi

We study a rational expectations model, consisting of heterogenous traders with private information. We show that the extent of heterogeneity in the market determines the extent of information revelation via prices and equilibrium inefficiency. In particular, we show that as the heterogeneity in trader valuations is increased, the rational expectations equilibrium would reveal less information about agents' private information. Furthermore, this reduction in the extent of information revelation leads to more inefficient equilibria.

2 - Is The Chinese Macro Financial System More Resistant To Outside Shocks

Yunfei Cao, Beijing Institute of Technology, Beijing, China, caoyunfei1986@163.com, Youzong Xu, Yi Zhang

Using the flow data in the macroeconomic accounts of China's macro-financial system from 1998 to 2012, we develop a dynamic network of the interdependent macro sectors that depicts the connections between the main financial and non-financial sectors in the Chinese economy. Based on this network, we examine the evolution and weakness of China's macro-financial system by investigating the shock propagation processes. We find that even though by absolute value the foreign sector plays a much smaller role than all the other sectors in China's macro-financial system, a shock to the foreign sector causes larger loss to the whole Chinese macro-financial system than shocks to other sectors do.

3 - Foreign Direct Investment In Mexico: A Spatial Approach

Lorena Alexandra Berumen, Universidad Panamericana, Augusto Rodin 498, Ciudad de Mexico, Mexico, laberumen@up.edu.mx, Roldán Andrés-Rosales, Margarita Hurtado

Foreign Direct Investment (FDI) has played an important role in the growth and development of the Mexican economy. The main contribution of this work is the analysis of FDI by sector and of its spillover effect in the different regions in which FDI has been concentrated. Using spatial panel data and a spatial Durbin Model to assess the direct and indirect effects of FDI, we find that in some regions there are positive or negative impacts depending on the sectors.

1 - Optimal Capacity Management With Limited Buffer

Melda Ormeci Matoglu, University of New Hampshire, University of New Hampshire, 10, Durham, NH, 03824, United States, melda.ormecimatoglu@unh.edu

We use a Brownian motion to model the problem of managing capacity and determining optimal buffer size in a BTO environment. The controller can change the processing rate as well as reject orders or idle the system. We seek a policy that minimizes long-term average cost of control and holding cost. We show that a simple control band policy is optimal and determine its parameters.

2 - Efficient Markov Chain Decomposition Algorithm Based On The Total Expectation Theorem

Katsunobu Sasanuma, Assistant Professor, Stony Brook University, Stony Brook, NY, 11794, United States, katsunobu.sasanuma@stonybrook.edu, Stephen Roehrig, Robert Hampshire, Alan Scheller-Wolf

We propose an efficient decomposition algorithm for solving large Markov Chains, based on the total expectation theorem (the law of total expectation) applied in a Markov Chain setting. Tests of our algorithm on several examples show that it possesses an exponential speed of convergence in terms of the number of iterations. We also discuss potential Markov chain structures that could cause a slowdown of convergence and propose the means to overcome these issues.

3 - How The Swine Flu Epidemic Spread: Lessons From The Data

Jussi Keppo, National University of Singapore, Mochtar Riady Building, BIZ 1 8-69, 15 Kent Ridge Drive, Singapore, 119245, Singapore, keppo@nus.edu.sg, Elena Quercioli, Lones Smith

Contagious diseases are passed on when contagious and susceptible individuals meet. This paper introduces and explores a new matching game, characterized by individuals meeting pairwise, possibly unwittingly passing along a disease in a contagion-like fashion. We assume that individuals can expend costly effort to avoid acquiring it. In this population game, efforts are strategic substitutes: The harder other individuals try, the more lax one can be. We solve for the unique Nash equilibrium when individuals are heterogeneous. We then estimate this structural model and argue that it improves on the explanation of the data without endogenous behavior.

4 - An Unbiased Measure Of Integrated Volatility In The Frequency Domain

Fangfang Wang, University of Illinois at Chicago, 601 South Morgan Street, Chicago, IL, 60607, United States, ffwang@uic.edu

This work studies the effect of market microstructure noise on volatility estimation in the frequency domain. We propose a bias-corrected periodogram-based estimator of integrated volatility. We show that the new estimator is consistent and the central limit theorem is established under a general assumption of the noise. We also provide a feasible procedure for computing the bias-corrected estimator in practice. As a byproduct, we extract a consistent frequency-domain estimator of the long-run variance of market microstructure noise from high-frequency data.

5 - A Parallel Computation Of Characteristics Of Markov Chains With “Islands” And “Ports”

Amod Basnet, University of North Carolina-Charlotte, 9201 University City Blvd, Fretwell, Charlotte, NC, 28262, United States, abasnet@uncc.edu, Isaac M Sonin

We present a new algorithm to calculate the invariant distribution of a large Markov chain (MC) whose state space is partitioned into “islands” and “ports”. An island is a group of states with potentially many connections inside of the island but a relatively small number of connections between islands. The states connecting different islands are called “ports”. Our algorithm is developed in the framework of the “state reduction approach”, but the special structure of our MCs allows for computations to be performed in parallel. Additional problems for such MCs, including computation of a Fundamental matrix, optimal stopping, and the case of small transitions between islands are also analyzed.

1 - A Branch And Price Approach For Deployment Of Multi-tier Software Services In Clouds

Bjorn Nygreen, Retired, Dept. of Ind. Econ. & Techn. Management, NTNU, Trondheim, NO 7491, Norway, bjorn.nygreen@iot.ntnu.no, Anders Nordby Gullhav

This talk considers a problem of a cloud service provider (SP) that offers a set of applications to its end-users. In short, the SP seeks to find the minimum cost deployment of its services on an infrastructure consisting of a private and public cloud, while maintaining a certain quality of service. We propose to solve the problem using branch and price, where the sub problem is solved both by a MIP solver and a heuristic label-setting algorithm. Our results show the benefits of using the heuristic in addition to the exact MIP solver.

2 - Project Scheduling And Multi-skill Workforce Assignment For Property Management Applications

Anthony Vatterott, Assistant, University of Missouri Saint Louis, 1 University Boulevard, Saint Louis, MO, 63121, United States, anthonygvatterott@gmail.com, Haitao Li, Norman Keith Womer

We present a new optimization framework to schedule, assign and route maintenance tasks with a multi-skilled workforce. Mixed integer programming methods are applied to obtain effective and efficient solutions to advance the state-of-the-art of property management. Practical emphasis on job priority, skill development and knowledge transfer are considered to form the temporal, spatial and resource constraints while minimizing the total cost of project delivery.

3 - Optimal Selection Of Parsimonious Arima Forecasting Models

George G Polak, Professor, Wright State University, 227 Rike Hall, Raj Soin College of Business, Dayton, OH, 45435, United States, george.polak@wright.edu, Bogdan C Bichescu

In a parsimonious ARIMA Forecasting model the total number of terms chosen is constrained, and treatment for nonstationarity is limited to differencing of a pre-specified order. Accordingly, a term for non-stationary variation is included along with autoregressive, moving average and white noise terms in a decomposition of the time series. Mixed integer quadratic optimization problems are then formulated for prescribing model parameters. Walsh functions and Haar wavelets are employed to represent white noise and non-stationary variation, respectively.

4 - A Comparative Analysis Of MILP Formulations For The Multi-family Capacitated Lot-sizing Problem (MFCISP)

Andrea L. Arias, Graduate Student, Texas Tech University, 4425 82nd Street, Apt 2258, Lubbock, TX, 79424, United States, andrea.arias@ttu.edu, Andrea L. Arias, Graduate Student, P. Universidad Católica de Valparaíso, Valparaíso, Chile, andrea.arias@ttu.edu, Ricardo A. Gatica

The MFCLSP is a variant of the CLSP with setup times in which items are organized into families. We present three MILP models for the MFCLSP (TRAD, LI and RC), and develop a comparative analysis in order to evaluate their performance using Cplex. Since solving large-scale problems has been shown to consume a great amount of computational time (very unviable for application purposes), we examine the performance of the formulations under solving time constraints. The results show a major advantage for both LI and RC regarding to linear relaxation bounds, and that RC performs much better in terms of computational time to obtain the first feasible solution, yielding at the same time, very good optimality gaps.

Michael Hirsch, ISEA TEK, LLC, 3283 Hickory Lane, Longwood, FL, 32779, United States, mhirsch@iseatek.com, Hector Juan Ortiz-Pena

Workflow management systems allow for visibility, control, and automation of many business processes. Recently, non-business domains have taken an interest in the management of workflows, and the optimal assignment and scheduling of workflow tasks to users across a network. This research aims at developing a rigorous mathematical programming formulation of the workflow optimization problem. The resulting formulation is non-linear, but a linearized version is produced. Three heuristics are developed to find solutions efficiently. Computational experiments are presented and analyzed, comparing solutions to the original linearized formulation with the three heuristics.

2 - An Intelligent Production Control System For Automotive Parts Manufacturing With A CPS Approach

Jun Kim, Sungkyunkwan University, Suwon, Korea, Republic of, tomatoes10@skku.edu, Hyun Jung Kim

This paper examines an intelligent production control system for automotive parts manufacturing based on a cyber-physical systems (CPS) approach. We propose a CPS-based operations monitoring platform that helps decision-making processes in production management such as predicting undesirable events and reacting to such problems in advance. Various issues in designing and implementing a CPS platform for engine piston manufacturing processes are addressed.

3 - An Efficient Heuristic For The Capacitated Lot Sizing Problem With Setup Carryover And Splitting

Srimathy Mohan, Associate Professor, Arizona State University, Department of Supply Chain Management, W.P. Carey School Of Management, Phoenix, AZ, 85069-7100, United States, srimathy@asu.edu, Cheng-Lung Chen, Muhong Zhang

We present a new formulation for the Capacitated Lot Sizing Problem with Setup Carryover and Setup Splitting. Setup carryover transfers a completed machine setup from one period to the next. Setup splitting completes a setup across period boundaries. We present a Fix-and-Optimize heuristic that is easy to adapt for model extensions. Our extensive experimentation shows that the heuristic produces results within 6% and 8% of optimality for problems without and with demand backlogging, respectively.

4 - Biased Randomization: Heuristics In Transportation, Logistics, And Production

Alex Grasas, EADA Business School, C/ Arago 204, Barcelona, 08011, Spain, agrasas@eada.edu, Angel A Juan, Javier Faulin, Jesica De Armas, Helena Ramalhinho

This paper reviews heuristics that contain biased-randomized procedures (BRPs). A BRP is a procedure that uses a biased probability distribution to select the next constructive movement at each algorithm's iteration. BRPs can be categorized into two main groups according to how choice probabilities are computed: (i) BRPs using an empirical bias function; and (ii) BRPs using a skewed probability distribution. This paper analyzes the second group and reviews the use of these BRPs in some applications in transportation, logistics, and production problems.

5 - A Parallel Dynamic Programming Solution For The Dynamic Facility Layout Problem

Clara Novoa, Associate Professor, Texas State University, 601 University Dr, San Marcos, TX, 78666, United States, cn17@txstate.edu, Apan Qasem, Chandra Kolla

We develop a parallel approximate dynamic programming solution to the Dynamic Facility Layout Problem (DFLP) using OpenMP. We experiment with data sets from Dr. Balakrishnan's repository. Including a relatively small set of feasible solutions, the accuracy and speed of our method is very satisfactory if contrasted to simulated annealing, hybrid genetic algorithm, and ant systems. In the DFLP, the flow of materials between departments is known but it varies over time due to changes in demand and introduction of new products. The trade-off costs are material handling and relocation costs.

1 - A Fast Socp-based Method For Optimal Selection Problem In Tree Breeding

Makoto Yamashita, Associate Professor, Tokyo Institute of Technology, W8-29 2-12-1 Oh-Okayama, Meguro, Tokyo, 152-8552, Japan, makoto.yamashita@c.titech.ac.jp, Tim J Mullin, Sena Safarina

One of new frontiers for optimization methods is to solve practical problems arising from breeding. A purpose of an optimal selection problem in tree breeding is to determine the contributions of candidate genotypes that attains the highest profit subject to a constraint on genetic diversity. We propose a fast numerical method based on second-order cone programming by exploiting the structural sparsity in the problem. The proposed method reduced the computation time from 39,000 seconds of an existing method to just 2 seconds.

2 - Shape Constrained Data Smoothing With Penalized Splines

Yu Xia, Professor, Lakehead University, Business Administration, 955 Oliver Rd, Thunder Bay, ON, P7B 5E1, Canada, yxia@lakeheadu.ca, Farid Alizadeh

We consider fitting noisy data to a smooth function by penalized B-splines. The underling function is assumed to have some shape properties, such as non-negative, monotonic, convex. We solve the data smoothing problem by convex optimization methods.

3 - On The Convexity Of Optimal Decentralized Control Problem And Sparsity Path

Salar Fattahi, PhD Student, University of California, Berkeley, 4141 Etcheverry Hall, Berkeley, CA 94720-1777, Berkeley, CA, 94702, United States, fattahi@berkeley.edu, Javad Lavaei

This talk is about an important special case of the optimal stochastic decentralized control problem, where the objective is to design a static structured controller for a stable stochastic system. We show that if either the noise covariance or the input weighting matrix is not too small, the problem is locally convex. In the case where these conditions are not satisfied, we modify the problem by a penalization term to convexify it, leading to a near-global solution. We also study the problem of designing a sparse controller using a regularization technique. Under some genericity assumptions, we prove that this method is able to design a controller with any arbitrary sparsity level.

4 - Snug Circumscribing Simplexes For Convex Hulls

Ghasemali Salmani Jajaei, PhD Student, Virginia Commonwealth University, 1015 Floyd Avenue, Harris Hall, Richmond, VA, 23284-3083, United States, salmanijajaeg@vcu.edu

We propose procedures for enclosing convex hulls of finite m-dimensional point sets with simplexes. These are snug in since they intersect the hull in some way. We report on experimental results.

5 - Volume Allocation Optimization For Space Mission Tasks

Churlzu Lim, Associate Professor, University of North Carolina at Charlotte, Systems Engineering & Engineering Management, 9201 University City Boulevard, Charlotte, NC, 28223, United States, clim2@uncc.edu, Simon M Hsiang, Sherry Thaxton, Maijinn Chen, Jerry G Myers

Volume in space missions is costly and often must be traded with competing resources and mission needs, such as launch mass, systems/hardware requirements, and consumables. Spacecraft and habitat designers must allocate sufficient volume for different tasks without incurring excessive cost penalties or failure modes. How a volume can be optimized should be based on a balancing of risk and benefits. In this talk, we present a mathematical optimization model that maximizes the total value of tasks of astronauts given a limited volume in the spacecraft. An illustrative example will be demonstrated.

Health Care, Public II

Contributed Session

Chair: Samantha Meyer, Assistant Professor, Ross School of Business, 701 Tappan Ave., Ann Arbor, MI, 48109, United States, srmeyer@umich.edu

1 - How Much Sleep Do You Need?: Evidence From Public Health

Philip F. Musa, Associate Professor and Programs Director, University of Alabama-Birmingham, PO Box 55544, Birmingham, AL, 35255, United States, musa@uab.edu

Could the amount of sleep people get be associated with hypertension? This presentation outlines an epidemiological cross-sectional study to shed some light on this important Public Health chronic matter. We present a background from the literature using a population based sampling. Our proposed study will employ the previously validated Pittsburgh Sleep Quality Index and Berlin questionnaire. The inclusion/exclusion criteria and the strengths and limitations are presented.

2 - A Little Empathy Goes A Long Way In Disease Dynamics On A Network Game

Ceyhun Eksin, Georgia Tech, 85 5th St. NW, Atlanta, GA, 30332, United States, ceyhuneksin@gatech.edu, Jeff S Shamma, Joshua Weitz

Individuals change their behavior during an epidemic in response to whether they and those they interact with are healthy or sick. Healthy individuals may utilize protective measures while sick individuals may adopt preemptive measures to stop disease spread to their contacts. Yet, in practice both protective and preemptive behavior come with costs. We propose a stochastic network disease game that captures the self-interests of individuals during disease spread on a network. We show that there is a critical level of concern, i.e., empathy, by the sick individuals that eradicates the disease fast while the protective measures cannot eradicate the disease without the preemptive measures.

3 - Spatial Evolutionary Game For Changes Of Human Behaviors In Epidemic

Songnian Zhao, Kansas State University, 2037 Durland Hall, Manhattan, KS, 66502, United States, songnian@ksu.edu, Yan Kuang, John C Wu, David Ben-Arieh

Spatial evolutionary game, used to study multiple players' behaviors in a spatial structure, was incorporated into the epidemic models for sake of evaluating spontaneous changes of human behaviors when individuals acquire information about the spread of infectious disease and make a tradeoff between costs and benefits. Through the comparison between two different mechanisms, a spatial game model in epidemic is validated to generate the consistent results with the traditional dynamic systems in this paper.

1 - Nursing Home Rating System Inspection And Audit

Xu Han, Research Assistant, University of Connecticut School of Business, 2100 Hillside Road, Storrs, CT, 06269, United States, xu.han@business.uconn.edu

CMS's nursing home rating system gives ratings by combining inspection and self-reported measures, which are subject to inflation. In this paper, we optimize CMS's inspection and audit mechanism to control inflation and improve system performance. We formulate the inspection problem by using an innovative graph-based method, and test it with CMS data. Our result shows that the measure currently being inspected is optimal only if an effective audit mechanism is in place. We then add nursing homes' reactions to audit into consideration and conduct a simulation to study the optimal parameter settings. Our result suggests that CMS should set a moderate extensiveness of audit, and a high punishment rate.

2 - Calling For Care? The Risky Proposition Of Teletriage In Healthcare Demand Management

Ozden Engin Cakici, Assistant Professor, American University, 4400 Massachusetts Avenue, NW, Washington, DC, 20016, United States, cakici@american.edu, Alex Mills

A major challenge in healthcare is the need to match the patient's medical condition to the right provider. Patients are medically inexperienced, so their decision can lead to costly service mismatches. We model the effect of adding telephone triage by a "nurseline" on the patient's decision as a POMDP. We examine the effect of adding a free or low cost nurseline on the patient's decision and on accessibility to an appointment. We show that a patient's choice is a threshold policy based on her belief about her illness severity. We also show that nurseline may reduce cost and increase quality of care for a risk-neutral patient, but it may lead to an opposite behavior for a risk-seeking patient.

3 - Association Between Reserve Capacity And Surge Event Resiliency In Community Hospitals

Raymond L Smith, Doctoral Candidate, North Carolina State University, 318 Weycroft Grant Drive, Cary, NC, 27519, United States, rlsmith5@ncsu.edu

This paper explores the association between the reserve capacity maintained by a community hospital and the operational recovery period following a patient surge event. The study examines whether increasing the ready reserve bed capacity results in greater benefits over other alternatives that include clinical area expansion. A model of a community hospital is used to explore the effects of varied unit capacity on congestion and recovery duration. Results indicate that increasing the ready reserve bed capacity and contingency surge capacity can provide the most competitive outcomes; however, outcomes are demonstrated to be vulnerable to resource activation responsiveness.

4 - A Multi-method Simulation Model Of Hospital Readmission Reduction Strategies

Michelle M. Alvarado, Visiting Assistant Professor, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States, michelle.alvarado@tamu.edu, Mark Alan Lawley

In 2012 the Centers for Medicare and Medicaid Services implemented a penalty-only system to reduce the rate of hospital readmissions. We develop a multi-method simulation model to assess the impact of alternative readmission reduction strategies, including an incentive-only reimbursement model. The multi-method model combines agent-based simulation of the patient population with system dynamics of the healthcare reimbursement system. Impact is assessed by improvements in the quality of care and reduction in 30-day hospital readmission rates. Results indicate that the incentive-only model is preferred to the penalty-only model under certain conditions.

Supply Chain Optimization II

Contributed Session

Chair: Wang Shukun, Huazhong University of science and technology, Luoyu Road 1037, Wuhan, 430074, China, wsk17951@163.com

1 - Optimization Of Lignocellulosic Biomass To Biofuel Supply Chains With Mobile Pelleting

Nibal Albashabsheh, PhD Student, Kansas State University, 1604 Roof Drive, Apt 101, Manhattan, KS, 66502, United States, nibal15@ksu.edu, Jessica Heier Stamm

The low density of lignocellulosic biomass (LB) results in high costs associated with biomass transportation, storage, and handling in the biomass-to-biofuel supply chain (BBSC). Mobile pelleting machines provide an as-yet-unexplored opportunity to increase LB density. A comprehensive BBSC optimization model that integrates mobile pelleting is developed to minimize the overall cost of producing ethanol from LB. The proposed model addresses the unique challenges of having different baling forms of LB and of the potential to use mobile pelleting machines. A sensitivity analysis is conducted to identify the impact of important parameters on decisions related to biomass densification.

2 - Supply Chain Coordination Under Price Sensitive Demand: A Game Theoretic Approach

Barbara Venegas Quintrileo, Penn State University, University Park, PA, 16802, United States, bbv105@psu.edu, Jose Antonio Ventura

This research explores the coordination between a supplier and a buyer within a decentralized supply chain, through the use of quantity discounts in a game theoretic model. We propose both non-cooperative and cooperative approaches considering that the product traded experiences a price sensitive demand, uniquely defined by an elasticity coefficient. In the first case we study the dynamics of the game from the supplier's perspective as the leader obtaining a Stackelberg equilibrium. In the second case we formulate a cooperative model where decisions are taken jointly, emulating a centralized decision making process.

3 - Flexible Production Resources And Capacity Utilization Rates: A Robust Optimization Perspective

Aldis Jakubovskis, University of Missouri - St. Louis, Saint Louis, MO, United States, jakubovskisa@missouri.edu

We apply robust optimization in the context of optimal choices of product-dedicated and flexible capacities in a spatial setting under demand uncertainty. Total capacity may not be fully utilized because of the distinction between largest and costliest demand realizations. More flexible capacity can increase utilization; however, our results report less than full capacity utilization even using flexible capacity only.

4 - Robust Data Collaboration Application For Large Teams

Haraldur Haraldsson, Optimization Specialist, AIMMS inc, 11711 SE 8th Street, #303, Suite 1780, Bellevue, WA, 98005, United States, Haraldur.Haraldsson@aimms.com

For most analytic teams, collaboratively working with centralized data, data conflicts and version control issues can substantially impact the team's performance. We will introduce a new application enabling robust collaborative data management which controls multi-dimensional data, (backed up by a central data repository) that enables large teams to make supply chain plans using the latest up to date data, as well as exploring multiple scenarios without corrupting the main data. This new way of working streamlines data management, saves time, and improves team productivity.

5 - Reliable Biomass Supply Chain Design Under Feedstock Seasonality

Wang Shukun, Huazhong University of science and technology, Luoyu Road 1037, Wuhan, 430074, China, wsk17951@163.com

We consider design of a reliable supply chain for biomass networks against seasonal variations of feedstock and the risk of disruptions for collection facility in which the disruption probability varies seasonally.We identify location,inventory,biomass quantity and collection routing in a multiperiod planing horizon setting.A variety of approaches (e.g,Lagrangian relaxation and Benders decomposition)to solving the problem are assessed. Computational results are provided to test the performance of the solution approach and realistic case in Henan China are developed to offer managerial insights.

Supply Chain, Risk II

Contributed Session

Chair: Wenpo Huang, Post-Doctor, Shanghai Jiao Tong University, 1954 Huashan Rd., Xuhui, Shanghai, 200030, China, bobhuang09@gmail.com

1 - Loan Guarantee And Subsidy For Small And Medium Suppliers

Boray Huang, Eindhoven University of Technology, PO Box 513, School of Industrial Engineering, Eindhoven, 5600MB, Netherlands, b.huang@tue.nl, Lei Jing

We investigate the the pros and cons of loan guarantee and subsidy for SME suppliers in supply chains.

2 - Currency Exchange Rate Flexibility Contracts In Global Supply Chain

Leke Ogunranti, PhD Student, Drexel University, Gerri C. Lebow Hall 734, Decision Sciences, Philadelphia, PA, 19104, United States, gao32@drexel.edu, Avijit Banerjee, Oben Ceryan

This paper investigates a decentralized supply chain under a newsvendor setting, in which a supplier produces and delivers a single product to buyer, subsequently receiving payment. We analyze the effect of random currency exchange rate fluctuation on the order quantity of a risk neutral buyer, through a contract involving mutually agreed upon thresholds on exchange rate variation. These thresholds are designed to limit the potential loss incurred by either party.

3 - On The Structural Properties Of Wholesale Price Contracts Within Random Yield Supply Chains

Guang Xiao, Assistant Professor, The Hong Kong Polytechnic University, Hung Hom, Kowloon, Hong Kong, xiaoguang@wustl.edu, Panos Kouvelis

We consider a bilateral supply chain with supply random yield and propose three variants of wholesale price contracts, which induce different risk allocations between the supply chain parties. We completely characterize the Pareto set of any contract type combination to fully explore the price negotiation possibilities and profit improvement opportunities within the supply chain.

4 - Suboptimal Capacity Investments Under Information Asymmetry

Junhyun Bae, Student, Cornell University, Ithaca, NY, 14850, United States, jb2258@cornell.edu, William Schmidt

We investigate imperfect demand information sharing in a supply chain with an external investor. We identify conditions under which firms will invest sub-optimally in capacity, thereby exposing themselves and the supply chain to disruption. We introduce an equity-sharing contract which can mitigate the impact of the firm's capacity choices. Our results show that supplier's risk can be reduced by sharing a portion of equity, and supplier's involvement helps to mitigate supply chain inefficiency due to information asymmetry.

5 - The Optimal Decision Of Dual Sourcing System Under Lead-time And Price Uncertainties

Wenpo Huang, Post-Doctor, Shanghai Jiao Tong University, 1954 Huashan Rd., Xuhui, Shanghai, 200030, China, bobhuang09@gmail.com, Wei Jiang, Wenhui Zhao

We setup a dynamic programming model to study the sourcing decision of an MTO manufacturer who decides whether to order a key component from a contract supplier with fixed wholesale price but random lead-time and/or purchase from spot market with fixed lead time but stochastic price. We show there are at most two stop-waiting thresholds and the manufacturer purchases from the spot market if the spot price is within the two thresholds and keeps on waiting otherwise. We further establish the conditions under which only one threshold exists and increases monotonically in time. Interestingly, we show the spot price volatility in fact benefits the manufacturer.

Chair: Anthony Craig, Iowa State University, Ames, IA, tcraig@iastate.edu

1 - Life Cycle Assessment For The Sustainable Supply Chain – A Case Study

Chao Wen, Eastern Illinois University, 600 Lincoln Avenue, Lumpkin Hall, Charleston, IL, 61920, United States, cwen@eiu.edu

Sustainable supply chain requires not only a competitive financial performance, but better management of environmental and social impacts. Life cycle assessment (LCA) is used to find the full range of environmental impact of the product from cradle to grave. This study investigated the implication of LCA through a case analysis of an organization in energy sector.

2 - Sustainable Product Development Based On Innovative Product Opportunity Gap

Mohammad Hessam Olya, Wayne State University, 4815 Fourth Street, Detroit, MI, 48202, United States, h.olya@wayne.edu, Hamed Fazlollahtabar, Kai Yang

New product development (NPD) is significant to sustain market share and satisfy customer needs. Different approaches proposed to handle NPD were mostly focused on the customer and design requirements. In this work, with respect to product opportunity gap (POG) concept, innovation analysis for a product is performed based on market, design and process aspects. A dynamic programming approach has been used to model our multi-dimensional problem. This integrated approach provides sustainability for product design and development.

3 - Supply Chain Emissions And Firm Performance

Anthony Craig, Iowa State University, 3236 Gerdin Business Building, Ames, IA, 50011, United States, tcraig@iastate.edu, Sachin B Modi

We present a method to evaluate corporate carbon disclosures in relation to the overall carbon impact of the supply chain. We also explore the firm performance implications of publicly disclosed supply chain emissions.

Military Applications II

Contributed Session

Chair: Michael Atkinson, Naval Postgraduate School, 1411 Cunningham Road, Building 302, Monterey, CA, 93943-5219, United States, mpatkins@nps.edu

1 - Critical Resources

Richard F Deckro, Professor of Operations Research, Air Force Institute of Technology, Afit/ENS; Bldg 641, 2950 Hobson Way, Wright Patterson AFB, OH, 45433-7765, United States, richard.deckro@afit.edu

Resources are the key to any operation. The question of criticality of a resource or resources can be characterized in relation to timing, availability, scarcity, and replacement sources, among other factors. This study focus on approaches to investigate the impact of resource availability on the delay, diversion, disruption, and destruction of required resources where those resources may be commodities, personnel, or intangibles.

2 - A Multi-level Approach To Network Attack Graph Interdiction

David Joseph Myers, Research Engineer, Air Force Research Laboratory, AFRL/RISB, Attn: David Myers, Rome, NY, 13441-4505, United States, david.djm.myers@gmail.com

Attackers have a distinct advantage in the cyber domain, having unlimited time to perform reconnaissance on an enterprise system. A key component of the defender's ability to protect their system is a situational awareness about the system attack graph. The defender's goal is to minimize the potential damage through the exploitation of vulnerabilities. This presentation will explore the development of these attack graphs, and then the consideration of three approaches to interdicting this graph.

3 - Evaluating Basing Options For Optimizing Accessibility For Global Response Force

Jeremy Eckhause, Operations Researcher, RAND Corporation, 1200 S. Hayes St., Arlington, VA, 22202, United States, eckhause@rand.org, Katharina Ley Best, Christopher Pernin, Michael Schwille, Katherine Pfrommer

For a global response force to achieve its mandate, rapid access to almost any point on the globe is essential. Since the long-term presence of the US is difficult to predict, using of a set of intermediate bases may be required for establishing fast and sustainable access to large numbers of contingency locations. We present an approach and results for identifying a robust set of intermediate bases for ensuring global access and a methodology for identifying new bases as infrastructure requirements change.

4 - Predicting Future World Conflict Using Factor Sample Paths

Darryl K Ahner, Air Force Institute of Technology, 135 Eastwick Court, Dayton, OH, 45440-3647, United States, darryl.ahner@afit.edu, Nicholas Jerred Shallcross

The prediction and forecasting of nation conflict is of vital importance. This paper discusses the formulation and construction of a suite of region-specific conditional logistic regression models that predict nation-state transitions into and out of violent conflict. This approach allows for the accurate modeling of complex regional environments with parsimonious and operationally interpretable models. The conditional logistic regression models proposed in this study achieve conflict transition prediction accuracies of 84.67% for 182 of the world's nations. Several predictor variable paths are explored and their effect on probability of nations being in a state of conflict are analyzed.

5 - Assignment Of UAVs To Search And Communication Roles

Michael Atkinson, Naval Postgraduate School, 1411 Cunningham Road, Building 302, Monterey, CA, 93943-5219, United States, mpatkins@nps.edu, Ezra Akin, Kevin D Glazebrook

Once a search UAV detects a target, the UAV must transmit the target's position to a shooter who will fire on the target. If the shooter is far away from the search area in a communication-degraded scenario, we may need several communication UAVs in intermediate positions to relay the message from the search UAV to the shooter. We examine the assignment of UAVs to tasks in real-time. On one hand we want as many UAVs searching so they can quickly detect as many targets as possible. On the other hand we need a sufficient number of communication UAVs to ensure a robust communication network. We formulate an MDP that provides optimal solutions for small problems and develop heuristics to use on larger problems.

1 - The Ship Loading Problem With Straddle Carrier Assignment And Scheduling

Dario Pacino, Technical University of Denmark, Ostrigsgade 28, Copenhagen, Denmark, darpa@dtu.dk

The maritime shipping sector is under pressure to provide reliable and cheap services. Operations research techniques have caught the interest of the industry as can be seen from the increasing number of publications in e.g. liner shipping network design and terminal optimization. In this paper we proposed the Ship Loading Problem, a novel collaboration approach to integrate shipping line and container terminal cost optimizations. We present a novel mathematical formulation and a heuristic approach which demonstrates the benefits of this collaboration.

2 - Containership Deployment On A Liner Service

Shuaian Wang, Hong Kong Polytechnic University, Department of Logistics and Maritime Studies, Hong Kong, China, hans.wang@polyu.edu.hk

This study proposes an important ship voyage management problem (SVMP) that aims to minimize the bunker fuel consumption of a containership. To address the SVMP, we first develop a tailored method to build two robust artificial neural network (ANN) models using ship voyage report data to quantify the synergetic influence of sailing speed, displacement, trim, and weather/sea conditions on ship fuel efficiency. We proceed to put forward three viable solution countermeasures for the SVMP by means of dynamic programming and simulation-based optimization techniques.

3 - A Metaheuristic For a Multi-product Maritime Inventory Routing Problem

Marielle Christiansen, Norwegian University of Science & Technology, Industrial Economics & Technology Mgmt, Trondheim, Norway, Marielle.Christiansen@iot.ntnu.no

We consider a multi-product maritime inventory routing problem where an actor is responsible for both the inventory management of the various products at the ports and the ships' routing and scheduling. In addition, we take the allocation of products to undedicated compartments into account. A mixed integer programming model is formulated, and it can be solved to optimality for small instances only. A matheuristic, exploiting the two sub sets of constraints related to the routing and inventory management, is developed. The computational study shows promising results for the matheuristic.

Contributed Session

Chair: Masoud Kamalahmadi, Doctoral Student, Indiana University, 1309 E Tenth St, Bloomington, IN, 47405, United States, maskamal@iu.edu

1 - Inventory Policies For Platelet Management At Hospitals Under Demand Uncertainty

Suchithra Rajendran, PhD Candidate and Research Assistant, The Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16802, United States, sur205@psu.edu, Arunachalam Ravindran

Demand uncertainty at hospitals leads to a significant wastage of blood platelets. Hence, a stochastic mixed integer linear programming (SMILP) model is developed with the objective of minimizing platelet wastage and shortage. Due to the complexity of the SMILP, five different heuristic approaches are developed using historical data such as mean and variance of platelet demand. Real-life data from a Regional Medical Center is used to evaluate the different methods. In addition, sensitivity analysis is performed to evaluate the robustness of the proposed heuristics. The results indicate that the heuristic approaches on average, provide a solution within a gap of 10% from the optimal solution.

2 - An Optimization Framework To Improve Patient Safety In Radiation Therapy

Pegah Pooya, PhD Candidate, North Carolina State University, 304 Ravenstone drive, Raleigh, NC, 27518, United States, ppooya@ncsu.edu, Osman Ozaltin, Julie Ivy, Lukasz Mazur, Lawrence Marks, Katharin Deschesne, Prithima Mosaly, Gregg Tracton

The use of safety barriers (SB) in radiation therapy (RT) is a widely recognized method for detecting potential human and non-human errors before they reach patients. We develop an optimization framework to determine the reliable design of SBs to improve patient safety considering SB implementation costs.

3 - A Theoretical Agent-based Framework To Evaluate The Anticompetitive Implications Of Accountable Care Organizations

Abdullah Alibrahim, PhD Candidate, University of Southern California, 344 Hauser Blvd Apt 219, Los Angeles, CA, 90036, United States, alibrahi@usc.edu, Shinyi Wu

In the wake of Affordable Care Act, two initiatives have seemingly counteracting effects. Market share shifts due to coordinating healthcare provision (Accountable Care Organizations -ACOs) might negate the effects of concentrating purchasing for care and coverage (Health Exchanges). This study justifies characterizing healthcare markets as a complex adaptive system and outlines a framework to assess competitive implications of ACOs in private healthcare markets. The theoretical, structural, behavioral, and iterative relationships of the system are outlined. An agent-based simulation model will then be used to assess competitive effects of ACOs to inform antitrust policies.

4 - Tractable Approximations Of Distributionally Robust Chance Constraints In Radiation Therapy

Azin Khabazian, Research Assistance, University of Houston, 5465 Braesvalley Dr. Apt 566, Houston, TX, 77096, United States, akhabazian@uh.edu, Maryam Zaghian, Gino J. Lim

Quadratic approximations of the distributionally robust chance constraints are developed for treatment planning to guarantee the probabilistic constraint when only partial information of the random dose contribution is known. Robust chance constraints can be conservatively approximated by second-order cone programming. In this study, we explore the condition in which the constraints depend quadratically on the random parameter, and develop more precise approximations for robust chance constraints. We evaluate these approximations in the context of a radiation therapy treatment planning problem and numerically demonstrate its superiority over the affine assumption of the constraints.

5 - Hospitalist's Service Mix And Impacts On Length Of Stay

Masoud Kamalahmadi, Doctoral Student, Indiana University, 1309 E Tenth St, Bloomington, IN, 47405, United States, maskamal@iu.edu, Kurt Bretthauer, Alex Mills, Jonathan Helm

Hospitalists are physicians that specialize in caring for hospital inpatients, replacing a primary care physician who may only make rounds once per day and thereby reducing delays. Given a limited number of hospitalists in a hospital, we seek to determine their optimal service mix (workload and patient types).

Wednesday, 12:45PM - 2:15PM

Data Mining in Aviation

Sponsored: Data Mining

Sponsored Session

Chair: Nima Safaei, Bombardier Aerospace., Unit 701, 23 Rean Dr., Toronto, ON, M2K 0A5, Canada, nima.safaei@aero.bombardier.com

1 - Multivariate Analysis Of Flight En Route Efficiency

Yulin Liu, University of California - Berkeley, 107 McLaughlin Hall, Berkeley, CA, 94709, United States, liuyulin101@berkeley.edu, Michael O Ball, Mark M Hansen

We apply clustering and regression techniques to a large flight level trajectory dataset that includes associated traffic management initiative (TMI) data. The results quantify how TMIs, weather and other factors impact en route flight efficiency. We further evaluate the variations of en route efficiency across city pairs and over time.

2 - Data Clustering Using A Network Flow Problem To Study The Aircraft Component Failure

Nima Safaei, Senior Specialist, Bombardier Aerospace., Unit 701, 23 Rean Dr., Toronto, ON, M2K 0A5, Canada, nima.safaei@aero.bombardier.com

An integer programing model based on the network flow problem is proposed to cluster the categorical variables and their attributes. The variables are related to the age-related and -unrelated factors affecting the aircraft component failure. The proposed model split the variables' attributes into a number of clusters with maximum transitive dependencies within each cluster

3 - Improving Airline Fuel Burn Predictions Using Super Learner

Lei Kang, Graduate Student Researcher, University of California-Berkeley, 107 McLaughlin Hall, Berkeley, CA, 94720, United States, lkang119@gmail.com, Yulin Liu, Mark M Hansen

Accurate flight fuel burn predictions are crucial in the aviation industry. By levering a large flight level fuel consumption dataset provided by a major US airline, we propose to use integrated LASSO selection and Adaboost algorithm to combine various machine learning algorithms into a super learner which can help significantly reduce the fuel burn prediction error compared to our study airlines flight planning system. The potential benefit of improved fuel burn predictions will be quantified in terms of fuel savings.

Data Mining Applications in Health Care

Sponsored: Data Mining

Sponsored Session

Chair: Eric Swenson, US Army, 643 Belmont Circle, State College, PA, 16803, United States, eswen75@gmail.com

1 - Identification Of Flu Hubs Using A Scale Free Network Of Flu Distance

Hootan Kamran, PhD Candidate, University of Toronto, Department of Mechanical and Industrial Engin, Room RS 311, Toronto, ON, M5S 3G8, Canada, hootan@mie.utoronto.ca, Michael W Carter, Dionne Aleman, Kiearn Moore

Influenza is among the leading causes of death in the world. Rapid changes in influenza virus make permanent immunity through vaccination an unviable solution, and signify the importance of surveillance systems. Current systems aggregate data based on predefined geopolitical divisions, and neglect historically significant inter-regional time connections. We have devised a network structure to model historic inter-regional flu distances in Ontario. We show that the resulting network is not a random network and in fact, exhibits behaviours of a scale-free network. The scale-free property helps us identify highly-connected regions as flu hubs, which can be prioritized in containment policies.

2 - Children Segmentation Based On Risk Of Chronic Diseases

Nooshin Hamidian, Resaerch Assistant, University of Tennessee at Knoxville, 301 Woodlawn Pike, Apt A5, Knoxville, TN, 37920, United States, nhamidia@vols.utk.edu, Jafar Namdar, Rapinder Sawhney

Type 2 diabetes and obesity has increased among children during the last 3 decades. The main purpose of this study is to provide a framework that identifies children who are at risk of diabetes and obesity. We explore a group of demographic and behavioral characteristics, which increase the chance of these diseases. Once the risk factors have been determined we develop a preventive model. This model determines who is at risk of these diseases. Preventing chronic diseases not only is beneficial for patients and their families, but also from the hospital point of view, it can be a solution for cutting cost and increasing hospitals' revenue.

3 - Health Market Segmentation And Classification Of Total Joint Replacement Surgery Patients

Eric Swenson, PhD Student, US Army, 643 Belmont Circle, State College, PA, 16803, United States, ers187@psu.edu
Eric Swenson, PhD Student, Pennsylvania State University, University Park, PA, 16802, United States, ers187@psu.edu, Nathaniel Bastian, Harriet Black Nembhard

Understanding healthcare consumers' behaviors and attitudes is critical information when it comes to delivering patient-centered care. We apply a two-stage methodology using supervised and unsupervised machine learning methods to a 21 month sample of total joint replacement patient data. Patients cluster into 6 distinct market segments from which the cluster assignment is used as the response variable in supervised learning to classify patients. The classification model accurately predicts the cluster assignment for out-of-sample patients, while offering insight into patient behaviors and attributes to help clinicians, health marketers, and consumers enhance patient-centered care.

Big Data III

Contributed Session

Chair: Mahamaya Mohanty, Research Scholar, IITDelhi, Shaheed Jeet Singh Marg, New Delhi, 110016, India, mahamayamohanty@gmail.com

1 - Establishing A Big Data Analysis Framework For Computing Nash Equilibrium With Vehicle Data

Lee Yu-Ching, National Tsing Hua University, Hsinchu, Taiwan, yclee@ie.nthu.edu.tw, Ciou Si-Jheng, Huang Yi-Hao

This paper provides scalable framework to handle the data unable to be dealt with by the general software. The aim is to generate a quantifiable value to represent the customers' willingness to buy products. Finally, the proposed method is further validated by the real data of vehicles.

2 - Incremental Methods For Additive Convex Cost Optimization

Mert Gurbuzbalaban, Postdoctoral Researcher, MIT, 176 Elm St #1, Building 32, Cambridge, MA, 02140, United States, mert.gurbuzbalaban@gmail.com, Asuman Ozdaglar, Pablo Parrilo

Motivated by machine learning problems over large data sets and distributed optimization over networks, we consider the problem of minimizing the sum of a large number of convex functions. We develop and study incremental methods for solving such problems, in particular for the random reshuffling method we provide a sharp convergence result that answers an open question.

3 - Virtual Casted Supply Chain For Information Sharing

Mahamaya Mohanty, Research Scholar, IITDelhi, Shaheed Jeet Singh Marg, New Delhi, 110016, India, mahamayamohanty@gmail.com, Ravi Shankar

Cloud computing creates a multiplier effect in IT, supply in service chain management with an intersection of virtualization and cloud where both fit together. The cloud is a virtualization of resources that maintains and manages itself as well as plays a vital role in making the overall system cost-effective, enhanced flexibility, and sharing information with availability of resources thus improving agility and enhancing flexibility. This article focuses on designing a virtualized environment that is used to address a variety of business goals aimed at improving efficiency and reducing costs of operation and maintenance of physical servers.

Power System Operation Models for Ramping Scarcity Mitigation

Sponsored: Energy, Natural Res & the Environment, Energy I Electricity

Sponsored Session

Chair: Masood Parvania, University of Utah, 50 S. Central Campus Drive, Salt Lake City, UT, 84112, United States, masood.parvania@utah.edu

1 - Ramping Deliverability Enhancement Through Flexible Transmission

Mostafa Ardakani-Sahraei, University of Utah, Salt Lake City, UT, United States, mostafa.ardakani@utah.edu

Proxy reserve constraints are employed within electricity market models in an attempt to attain reliability in the face of uncertain load and element failures. However, due to the complexities of the transmission network, the available reserve, and specifically ramping capabilities, may not be deliverable to the desired location. This talk discusses how flexibilities of the transmission network can be exploited to enhance ramping deliverability. The results confirm the effectiveness of the proposed method in improving reliability and reducing reliability costs.

2 - Explicit And Implicit Mechanisms For Ensuring Reserve And Ramping Capability

Erik Ela, EPRI, eela@epri.com

In this presentation, we will present the central needs for operating reserve which are used to meet variability and uncertainty. We compare the performance of explicitly scheduled reserve, which is done through reserve inequality constraints to meet the associated impact, with the implicitly scheduled operating reserve, that in which the reserve is scheduled inherently by advanced scheduling applications. We review case studies to compare performance in terms of efficiently procuring sufficient capacity and ramp capability.

3 - Definition And Valuation Of Continuous-time Ramping Trajectory In Power Systems Operation

Masood Parvania, University of Utah, masood.parvania@utah.edu

The current discrete-time power system operation models imply that generating units shall follow piecewise constant generation trajectories. This means that the units' ramping is modeled as the finite difference between the consecutive generation samples. The discrete-time generation schedules and the resulting rampings do not fully utilize the units' flexibility to compensate the faster variations of net-load, which may lead to ramping scarcity events. In this presentation, we introduce a novel unit commitment model that schedules for continuous-time generation and ramping trajectories, opening the door for continuous-time valuation of ramping trajectories in power system operation.

4 - Wind Ramping Product For Power System Ramping Scarcity Mitigation

Venkat Krishnan, NREL, Venkat.Krishnan@nrel.gov Golden, CO, 80401, United States, Venkat.Krishnan@nrel.gov, Bri-Mathias Hodge, Anthony Florita

This talk will investigate the potential of wind power to provide ramping service and the importance of ramp event forecasting. Forecasting mid-term (day-ahead and intra-day) and short-term wind ramp events efficiently will be the basis of managing and dispatching wind in a co-optimized energy and ramp service markets. There are two aspects to this: 1) efficient wind forecasting platforms- developed using big-data information processing technologies; and 2) wind ramp event forecasting algorithm- based on optimized swinging door algorithm (OpSDA) and dynamic programming.

Spatial optimization

Sponsored: Energy, Natural Res & the Environment II Forestry

Sponsored Session

Chair: Nahid Jafari, University of Florida, Gainesville, FL, United States, jnahid@hotmail.com

1 - Fine-scale Spatial Targeting Of Surveillance To Minimize Costs Of Invasive Species Introduction Across Large Landscapes

Rebecca Epanchin-Niell, Resources for the Future, Epanchin-Niell@rff.org

Early detection of new invasive species populations can reduce costs and damages by allowing control when populations are smaller and less costly. This talk presents a bioeconomic modeling approach to optimally target invasive species surveillance at fine spatial scales (1 km2) to minimize total costs from invasions and surveillance. The model accounts for spatial-temporal interdependencies arising from invasion spread and surveillance costs. We apply the model to surveillance for gypsy moth in the northwestern US.

2 - Analyzing Trade-offs Between Fire Prevention And Suppression In The Republic Of Korea

Yohan Lee, Yeungnam University, yohanlee76@gmail.com

This study explores the spatial tradeoff between the number of initial attack firefighting resources and the level of fire prevention efforts mitigating the probability of human-made fires in the Republic of Korea. To examine the spatial trade-off, we utilize a hybrid system that combines a scenario-based, standard-response optimization model with a stochastic simulation model. A mixed policy that includes fire suppression and fire prevention efforts works better than a single dominant policy such as a strong fire suppression policy, in particular, with the consideration of spatial allocations because returns to effort in fire prevention policy is dependent on the location of fires.

3 - Spatial Control Of The Argentine Black And White Tegu. An Approach Using Linear Programming

Julien Martin, United States Geological Survey, 7920 NW 71 Street, Gainesville, FL, 32653, United States, julienmartin@usgs.gov, Mathieu Bonneau, Fred A. Johnson, Brian Smith, Christina M. Romagosa

We propose to frame spatial control of tegu in south Florida as a linear programming optimization problem. This formulation with a discrete reaction-diffusion model permits calculation of an optimal control strategy that minimizes the remaining number of tegus for a fixed cost or that minimizes the control cost to achieve containment. We compute the optimal strategy for a range of possible model parameters and discuss the best strategy to use in practice as a function of the risk attitude of the decision maker.

4 - Robust Spatial Optimization For The Invasive Species Management

Nahid Jafari, University of Florida, nahid.jafari@ufl.edu

The problem of invasive species management concerns modeling the pattern of spread of the invasive, estimation of control costs, spatial design of the control effort, and accounting for uncertainties in model parameters. Robust optimization constructs a solution that is feasible for any realization of the uncertainty in a given uncertainty set (achieves the best worst-case objective function value). Given the computational efficiency of robust optimization, we are developing a spatial-optimization model to select sites for efficiently controlling invasive species to minimize their ecological damage, as well as to minimize the costs given limited financial resources.

1 - Disease Detection Analytics: Comparing And Contrasting The Performance Of Popular Predictive Models For Breast Cancer And Diabetes Data Sets

Subhashish Samaddar, Professor, Business Analytics and Operations, Georgia State University, Managerial Science, P.O. Box 4014, Atlanta, GA, 30302-4014, United States, s-samaddar@gsu.edu, Somnath Mukhopadhyay

Disease detection based on clinical data of the patient can save health care costs. Consequently, data mining in disease detection is fast gaining popularity. Our study applies popular predictive modeling algorithms such as random forest, linear programming classifiers, and, neural network to two examples data sets of clinical data: Breast cancer and Diabetes. The former data set has been bench marked in the literature - so comparison with prior results was possible. The data set on Diabetes can be used as new benchmark for future research. The article reports compares and contrasts results from each method.

2 - Characterization Of Breast Cancer Patients Receiving Unexpected Treatments

Milton Soto-Ferrari, Western Michigan University, 4601 Campus Drive, Parkview Campus Building I, Kalamazoo, MI, 49008-5336, United States, miltonrene.sotoferrari@wmich.edu, Diana Prieto

In 2016, approximately 40,450 women in the US are expected to die from breast cancer. Medical treatments are mainly driven by clinical factors including cancer staging, tumor size, histology, and age. This research aims to propose a systematic methodology to identify the clinical and non-clinical features that influence the receipt of an unexpected treatment in breast cancer patients. We extend the factor exploration and characterization of patients through a Bayesian Network breakdown methodology that allows the analysis of conditional probabilities to relate patient features with treatment receipt. We use registers of the SEER program from Detroit area considering the period 2007-2012.

Chair: Najibe Sadatijafarkalaei, Wayne State University, 4815 Fourth Street, Detroit, MI, 48202, United States, fv0017@wayne.edu

1 - An Efficient Nonparametric Fault Variable Identification Method

Mehmet Turkoz, Rutgers University, 16 Rachel Terrace, Piscataway, NJ, 08854, United States, turkoz@scarletmail.rutgers.edu

In a process, identifying which variables cause an out-of-control signal is a challenging issue for quality problems. If the distribution of the process is unknown, existing parametric methods are not suitable for identification of changed variables. In this paper, we propose a new nonparametric method to identify the fault variables and demonstrate its performance through various simulation studies.

2 - A Hybrid Genetic Algorithm With Tabu List For Generating a Stochastic Process Tree Model Based on Event Logs

Jin Young Choi, Ajou University, Worldcup-ro 206, Yeongtong-gu, Suwon, 16499, Korea, Republic of, choijy@ajou.ac.kr, Woo-Min Joo, Do Gyun Kim

We present an efficient hybrid algorithm integrating genetic algorithm and tabu search for generating a stochastic process tree model using event logs. It is examined for its performance by considering some example event logs in literature, evaluating four fitness measure such as simplicity, precision, replay, and generalization.

3 - Observational Data Driven Modeling And Optimization Of Manufacturing Processes

Najibe Sadatijafarkalaei, PhD Student, Wayne State University, 4815 Fourth Street, Detroit, MI, 48202, United States, fv0017@wayne.edu, Ratna Babu Chinnam

The main objective of this study is to rely on observational data to achieve robust parameter design of manufacturing processes. Controlled experiments can be challenging in production environments and this paves for an effective alternative approach to attain robust process parameter conditions. The proposed framework relies on an integrated feature selection, response surface modeling, and optimization methodology. We also report illustrative results from a tire compound production process.

1 - Wearable Technology In Fitness – Fitbit

Hongwei Du, Professor, California State University-East Bay, 25800 Carlos Bee Boulevard, Hayward, CA, 94542, United States, hongwei.du@csueastbay.edu

One trending of wearable technology is Fitness Devices. This paper focuses on wearable technology for fitness tracking and the FitBit Company. It identifies and presents wearable technology behind the FitBit products, the pros and cons of the FitBit, and the role that FitBit plays in the Internet of Things. Last, the future of the FitBit Company and product is discussed.

2 - Dominant Design, Sequential Product Categories, And Product Innovation

Hyunwoo Park, Postdoctoral Fellow, Georgia Institute of Technology, 85 5th St NW, Atlanta, GA, 30332, United States, hwpark@gatech.edu, Rahul C Basole

We study the impact of dominant design in sequential product categories on product innovation using a dyadic perspective in the context of mobile phone industry. Our results indicate that dominant design accelerates incremental product innovation and causes temporary adverse shift in product category focus.

3 - Technological Innovation, International Patenting And National Economic Development: A Multinational Multi-year Study

Kelvin Wayne Willoughby, Professor, Innovation and Intellectual Property, Skolkovo Institute of Science and Technology, Skolkovo Innovation Center, 3 Nobel Street, Moscow, 143026, Russian Federation, kelvin@skoltech.ru, Alexander Vidiborskiy

This paper reports the results of a study of the inbound and outbound patenting activity of 78 countries for which reliable data were obtained over the 14 years from 2000 to 2013. Several new indicators of the international patenting proclivities of inventors were utilized in multiple phases of statistical analysis and data vizualization to investigate the relationship between domestic inventive activity, international patenting profiles and changes in the relative per capita wealth levels of countries. The results suggest that the economic benefits countries may gain from investing in technological innovation may be enhanced by emphasizing the international patenting of domestic inventions.

4 - The D-day, V-day, And Bleak Days Of A Disruptive Technology: A New Model For Ex-ante Evaluation Of The Timing Of Technology Disruption

Chialin Chen, Professor, National Taiwan University, Taipei, 10617, Taiwan, cchen026@ntu.edu.tw, Jun Zhang, Ruey-Shan Guo

We conduct theoretical and empirical analyses to evaluate the timing of technology disruption. We conceptualize the ease and network factors as key determinants of performance improvement for a disruptive technology. A dynamic consumer model is developed to identify two critical times, termed D-Day and V-Day, of technology disruption. We also show that there may exist some “bleak days” during which a firm would discontinue a “promising” technology that will eventually disrupt. Empirical tests are conducted with data of hard disk drives, semiconductor technologies, and CPU performance for mobile devices to verify key model assumptions and to show how to estimate the ease and network factors.

Designing Energy and Water Supply Chains for Prosperity

Sponsored: Energy, Natural Res & the Environment, Energy

Sponsored Session

Chair: Yao Zhao, 1 Washington Street, Newark, NJ, 07102, United States, yaozhao@andromeda.rutgers.edu

1 - Distressed Selling By Farmers: Policy Recommendations

Shivam Gupta, University of Texas Dallas, sxg104920@utdallas.edu, Milind Dawande, Ganesh Janakiraman, Ashutosh Sarkar

In many developing countries, farmers sell a significant portion of their produce at prices much lower than the guaranteed support price offered by the government. We build a dynamic programming model to analyze this practice and illustrate how it can serve as a useful decision making tool for policy recommendations.

2 - Designing Hydro Supply Chains For Water, Food, Energy And Flood Nexus

Kwon Gi Mun, Assistant Professor, Fairleigh Dickinson University, Teaneck, NJ, United States, kgmun@fdu.edu, Raza Ali Rafique, Yao Zhao

The interconnected issues of water, food, energy and flood are among the most formidable challenges faced by developing countries. We apply SCM principles to water resource development and provide the end-to-end and dynamic perspectives needed in the expansion of hydropower network, and also identify the unique features and economies of hydropower systems and construct an integrated location optimization model to capture the conflicts of these issues, to explore the synergy among different sectors, and to maximize the overall benefit. With the real-life situation of Pakistan, we provide solutions that outperform common practices in all aspects of energy, irrigation, and flood control.

3 - Agricultural Support Prices In Developing Economies: Operational Analysis And Its Use In Policy-making

Harish Guda, University of Texas Dallas, hxg131530@utdallas.edu, Tharanga Kumudini Rajapakshe, Milind Dawande, Ganesh Janakiraman

The Guaranteed Support Price (GSP) scheme has been adopted in several developing economies. Through this scheme, the government promises to procure a crop from farmers at a guaranteed (and attractive) price announced ahead of the selling season, and then distributes the procured amount to the underprivileged population. The goal of this scheme is twofold: (a) as a supply-side incentive, to ensure high output from farmers, and (b) as a demand-side provisioning tool, to subsidize the consumption of the poor. In this talk, I present our work on the operational decisions of the farmers and the government under the GSP scheme, its impact on social welfare, and the use of our analysis to policy-makers.

4 - Coordinating And Sharing Demand-side Energy Resources – A Conceptual Design

Wei Qi, Lawrence Berkeley National Laboratory, WQi@lbl.gov, Bo Shen, Hongcai Zhang, Zuo-Jun Max Shen

We present a coordination scheme for shared use of demand-side energy resources (e.g. distributed generation, electric vehicles, etc.). Multiple users form a sharing community within which trading electricity improves economic efficiency. We develop a cost splitting scheme to ensure the participation of the aggregator and the users.

Decision Making Under Multistage Uncertainty

Sponsored: Optimization, Linear and Conic Optimization

Sponsored Session

Chair: Kartikey Sharma, Northwestern University, 2145 Sheridan Rd, Evanston, IL, 60208, United States, kartikeysharma2014@u.northwestern.edu

Co-Chair: Omid Nohadani, Northwestern University, Northwestern University, Evanston, IL, 60208, United States, nohadani@northwestern.edu

1 - Adjustable Robust Optimization Via Fourier-motzkin Elimination

Jianzhe Zhen, Tilburg University, Tilburg, Netherlands, J.Zhen@tilburguniversity.edu, Melvyn Sim, Dick den Hertog

We demonstrate how adjustable robust optimization (ARO) problems with fixed recourse can be casted as static robust optimization problems via Fourier-Motzkin elimination (FME). Through the lens of FME, we characterize the structures of the optimal decision rules for a broader class of ARO problems. A scheme based on a blending of classical FME and a simple Linear Programming technique, that can efficiently remove redundant constraints, is used to reformulate ARO problems. This generic reformulation technique, contrasts with the classical approximation scheme via linear decision rules, enables us to solve adjustable optimization problems to optimality.

2 - Distributionally Robust Inventory Control When Demand Is A Martingale

Linwei Xin, U of Illinois at Urbana-Champaign, lxin@illinois.edu, David Goldberg

Independence of random demands across different periods is typically assumed in multi-period inventory models. In this talk, we consider a distributionally robust model in which the sequence of demands must take the form of a martingale with given mean and support. We explicitly compute the optimal policy and value, and shed light on the interplay between the optimal policy and worst-case martingale. We also compare to the analogous setting in which demand is independent across periods, and identify interesting differences between these two models.

3 - Robust Optimization With Decision Dependent Uncertainty Sets

Kartikey Sharma, Northwestern University, kartikeysharma2014@u.northwestern.edu, Omid Nohadani

Robust optimization is increasingly used to solve multistage optimization problems. In most such problems, the uncertainty sets are fixed. However in many cases, these sets can be influenced by decision variables. We present a two-stage robust optimization approach in which future uncertainty sets can be affected by the decisions made in the first stage. We illustrate the advantages of this model on a shortest path problem with uncertain arc lengths.

4 - Adaptive Probabilistic Satisficing Models

Zhi Chen, National University of Singapore, National University of Singapore, Singapore, Singapore, chenzhi@u.nus.edu, Melvyn Sim

In this paper, we study adaptive probabilistic satisficing models that can be used for multi-stage decision making. We introduce the finite adaptability into probabilistic satisficing models to overcome the difficulties of incorporating recourse decisions as arbitrary functions of unfolded uncertain parameters. For two-stage problems, we show that the complete adaptability is exact to the finite adaptability, under a mild monotone condition. We propose an iterative scheme for increasing the level of probabilistic satisficing. We discuss extensions of our results for multi-stage problems. Our computational studies present that the probabilistic satisficing solutions can be competitive.

Recent Advances in Decision Diagrams for Optimization

Sponsored: Optimization, Integer and Discrete Optimization

Sponsored Session

Chair: Andre Augusto Cire, University of Toronto Scarborough, Toronto, ON, Canada, acire@utsc.utoronto.ca

1 - A Generic Approach To Solving Sequencing Problems With Time-dependent Setup Times

Joris Kinable, Carnegie Mellon University, Pittsburgh, PA, United States, jkinable@cs.cmu.edu, Andre Augusto Cire, Willem-Jan Van Hoeve

Tailoring dedicated solution approaches to solve scheduling and routing problems is often complex and time consuming. This work presents a flexible framework based on Constraint Programming, Mixed Integer Programming and Decision Diagrams to solve hard scheduling problems including the Time-Dependent (TD) TSP, TD-SOP and TD-TSP with Time Windows. The proposed method is sufficiently generic to render it applicable to a variety of related sequencing problems. Moreover, experiments indicate significant performance improvements over pure MIP or CP approaches.

2 - Decision Diagram Bounds For Integer Programming Models

Christian Tjandraatmadja, Carnegie Mellon University, Pittsburgh, PA, United States, ctjandra@andrew.cmu.edu, Willem-Jan Van Hoeve

Decision diagrams are capable of generating strong bounds in practice for discrete optimization problems when a certain structure is present. However, generalizing decision diagram techniques to integer programming can be challenging due to the lack of clear structure to exploit. We propose a framework to generate decision diagram bounds that aims to overcome this issue. We start with a set of base constraints that are well suited for decision diagrams and progressively incorporate further constraints via strengthening and Lagrangian relaxation. We discuss computational experiments on a set of binary optimization problems.

3 - An MDD-based Approach For The Time-dependent TSP

Tallys Yunes, University of Miami, tallys@miami.edu,
David Bergman, Andre Augusto Cire

The Time-Dependent Traveling Salesman Problem (TDTSP) is a variant of the classical Traveling Salesman Problem in which arc-traversal times vary over time, a typical real-life example being rush-hour traffic. We describe a solution approach for the TDTSP using Multivalued Decision Diagrams (MDDs) and present preliminary computational results for a set of known benchmark instances.

4 - Branching With Less Repetition

Thiago Serra, Carnegie Mellon University, Pittsburgh, PA, 15213, United States, tserra@cmu.edu, John Hooker

When branching to solve a problem on discrete variables, we may reach nodes that will root isomorphic subtrees. Hence, the subproblem from each of such nodes has the same solutions. If we merge those equivalent nodes after they are explored, we get a reduced decision diagram. But if we can anticipate that a new node is equivalent to an explored node, then we keep a reduced decision diagram and prevent redundant work. In this paper, we generalize previous results on constructing a reduced decision diagram for linear contraints, and we extend those results to discrete problems on multiple constraints. We characterize node states and we provide some sufficient conditions to check node equivalence.

Computational Approaches to Large-scale/Exact Optimization

Sponsored: Optimization, Computational Optimization and Software

Sponsored Session

Chair: Ilbin Lee, Georgia Tech, Georgia Tech, Atlanta, GA, 30332, United States, ilee79@gatech.edu

1 - Solving Large Batches Of Linear Programs

Ilbin Lee, Georgia Institute of Technology, Atlanta, GA, 30332, United States, ilee79@gatech.edu, Stewart Curry, Nicoleta Serban

Solving a large number of linear programs (LPs) with varying parameters is needed in stochastic programming and sensitivity analysis among other modeling frameworks. The common approach is solving each individual LP, called the brute-force approach, which can be computationally infeasible when the parameter space is high-dimensional and/or the underlying LP is computationally challenging. We introduce a computationally efficient approach for solving a large number of LPs in batches and suggest a data-driven version of our algorithm. The experimental results show that our approach can be more efficient and scale better in the number of LPs than the brute-force that uses MATLAB solver.

2 - Bilinear Optimization And Its Application In Robust Optimization

Wei Wang, University of Pittsburgh, Pittsburgh, PA, United States, w.wei@pitt.edu, Anna Danandeh, Bo Zeng, Brian Buckley

We derive exact and approximated methods to compute bilinear optimization. And we show applications of bilinear optimization in robust optimization.

3 - Efficient Validation Of Basic Solutions Via The Roundoff-error-free Factorization Framework

Adolfo R Escobedo, Assistant Professor, Arizona State University, Tempe, AZ, 85281, United States, adolfo.escobedo@asu.edu, Erick Moreno-Centeno

The Roundoff-Error-Free (REF) factorization framework solves systems of linear equations without accruing roundoff errors or excessive entry growth, thereby permitting LPs and MIPs to be solved exactly and efficiently. This work discusses results showing that the integer-preserving REF framework is up to two orders of magnitude quicker than the standard-use rational arithmetic LU factorization method while requiring half the memory. Moreover, we adapt Edmond's integer-preserving Q-Matrices to validate basic solutions, and summarize additional experiments that demonstrate the REF factorization framework remains superior in terms of memory requirements and computational effort.

4 - Computational Study Of Valid Inequalities For A Semidefinite Relaxation Of Maximum-k-cut

Miguel F. Anjos, Professor and Canada Research Chair, GERAD & Polytechnique Montreal, Montreal, QC, Canada, miguel-f.anjos@polymtl.ca, Vilmar Rodrigues de Sousa, Vilmar Rodrigues de SousaLe Digabel

We present the results of a computational study to identify the best inequalities to tighten a semidefinite relaxation of the maximum-k-cut problem. We focus on four families of inequalities (Clique, General clique, Wheel and Bicycle wheel) and tested them for different values of k using a set of 147 benchmark instances (with nearly equal numbers of dense and sparse). Our results suggest that Bicycle wheel and Wheel are the strongest inequalities for k = 3, and that for k > 3 the Wheel inequalites are the strongest by far.

1 - Analyzing Complex Social Contagion During Hurricane Sandy Using Social Media Communication Data

Arif Mohaimin Sadri, Purdue University, West Lafayette, IN, United States, asadri@purdue.edu, Samiul Hasan, Satish Ukkusuri, Manuel Cebrian

Hurricane Sandy was one of the strongest and costliest in the history of hurricanes. Many people used social media to communicate during this period while lacking access to traditional information sources. In this study, we analyzed raw data (~52 M tweets, ~13 M users, Oct 14 -Nov 12, 2012) obtained from Twitter. First, we identify different communities from the subgraph of Twitter that was active before, during, and after Sandy's landfall. Then, we extract the topics evolved in this subgraph over time. Finally, we examine the relationship between network topology and user activity.

2 - Short-term Taxi Demand Forecasting Accouting For Spatio-temporal Correlations

Xinwu Qian, Purdue University, qian39@purdue.edu

To improve efficiency of taxi market, we may dispatch taxicabs to specified locations or framing dynamic pricing policies before the reveal of passenger demand. This requires knowledge on spatial taxi demand in immediate future, and is less prone to prediction errors. In this study, we develop a Gaussian Conditional Random Field model to forecast the short-term taxi demand using history time series. The model captures spatio-temporal dependencies, and generates multiple steps ahead probabilistic estimations of short-term taxi demand. The results suggest the superiority of the GCRF model over other methods, with best overall MAPE of 0.117 and being robust for predicting demand under anomalies.

3 - Traffic State Estimation For Arterial Networks Using License-plate Recognition Data

Xianyuan Zhan, Purdue University, zhanxianyuan@purdue.edu

This study proposes a statistical modeling framework to estimate the network-wide real-time traffic states using License-plate recognition (LPR) data from a subset of intersections. The model operates in two steps: first, the cycle maximum queue lengths are estimated for monitored links (downstream intersections equipped with LPR cameras); second, a Hybrid Dynamic Bayesian Network model is developed to infer the queue length states for unmonitored links as well as the average link travel times for the entire network. A week's LPR data from 13 intersections in a small road network from Langfang, China are used to test and validate the model.

Exploiting Sparse and Low Rank Structures for Inference

Sponsored: Artificial Intelligence

Sponsored Session

Chair: Meisam Razaviyayn, Stanford University, 275 Ventura Ave, Apt 27, Palo Alto, CA, 94306, United States, meisamr@stanford.edu

1 - Understanding Non-convex Optimization For Matrix Completion

Ruoyu Sun, Stanford University, ruoyus@stanford.edu

Low-rank matrix completion is usually solved by machine learning practitioners using the non-convex factorization formulation. A natural question is whether a non-convex formulation for matrix completion can be solved to global optima. We provide an affirmative answer to this question by showing that under mild conditions, many standard optimization algorithms converge to the global optima of a factorization formulation, and recover the true low-rank matrix. The high level idea is that the problem exhibits a nice geometrical property, which is why we can provide recovery guarantee for a wide variety of algorithms including SGD (stochastic gradient descent) and BCD (block coordinate descent).

2 - Covariance Thresholding And Sparse Pca

Yash Deshpande, Stanford University, yashd@stanford.edu

In sparse principal components analysis (PCA), we wish to infer a sparse, low-rank matrix from noisy data. Johnstone and Lu proposed the popular "spiked covariance" model, where the data is n samples with population covariance $I + vv^t$. Assuming that the spike v is sparse, they proposed the diagonal thresholding scheme to estimate its support. Despite considerable work, there was no computationally efficient procedure that provably improved over this scheme. We analyze a simple "covariance thresholding" algorithm and show that it outperforms the diagonal thresholding scheme. In fact, assuming hardness of the hidden clique problem, it is impossible to significantly improve this guarantee.

3 - Vanishing Duality Gap In Nonconvex Optimization

Mengdi Wang, Princeton University, mengdiw@princeton.edu

Consider the optimization problem that involves multiple participants driven by self interests and common goods. We focus on the nonconvex problem which is often NP-hard. We analyze the nonconvex duality and show that it often vanishes to zero as the number of participants goes to infinity. Moreover, we show that there exists an approximate optimum by solving the dual problem and provide a coordinative dual algorithm to achieve the optimum in polynomial time. We demonstrate the application of the proposed method in estimating large spatial graphical model with sparsity constraints, and show that the dual solution is statistically optimal for large graphs.

4 - Nestt: A Nonconvex Primal Dual Splitting Method For Distributed And Stochastic Optimization

Davood Hajinezhad, Iowa State University, dhaji@iastate.edu, Mingyi Hong, Zhaoran Wang, Tuo Zhao

We study a stochastic and distributed algorithm for a nonconvex problem, whose objective consists a sum of N nonconvex L_i-smooth functions g_i, plus a nonsmooth regularizer. The proposed algorithm splits the nonconvex problem into N subproblems, and utilizes an augmented Lagrangian based primal-dual scheme to solve it in a distributed and stochastic manner. Further, we reveal a fundamental connection between the proposed {\it primal-dual splitting} methods and a few {\it primal only} methods such as IAG/SAG/SAGA.

Optimization and Learning in Supply Chain Systems

Sponsored: Optimization, Optimization Under Uncertainty

Sponsored Session

Chair: Huanan Zhang, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States, zhanghn@umich.edu

Co-Chair: Cong Shi, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States, shicong@umich.edu

1 - Closing The Gaps: A Learning-while-doing Algorithm For Lost-sales Inventory System With Lead Times

Huanan Zhang, University of Michigan, Ann Arbor, MI, 48108-1094, United States, zhanghn@umich.edu, Xiuli Chao, Cong Shi

We develop an improved nonparametric learning algorithm for periodic-review lost sales inventory systems with positive lead time, where the firm does not know the demand distribution a priori but makes the replenishment decision in each period based only on the past sales (censored demand) data. It is known that the optimal policy is hard to compute even with full information, hence in this paper we focus on finding the best base-stock policy. We establish a square-root convergence rate of the proposed learning algorithm, which is the best possible rate for this class of problems.

2 - Nonparametric Data-driven Algorithms For Capacitated Inventory Systems

Weidong Chen, University of Michigan, aschenwd@umich.edu, Cong Shi, Izak Duenyas

We propose data-driven algorithms for the management of stochastic inventory systems with fixed ordering capacity and random ordering capacity. We consider a single-product, periodic-review inventory system with backlogging. We assume that the manager has no prior information on the demand distribution nor the capacity distribution and only has access to past demand and supply data . In our model, we propose cyclic gradient-descent type of algorithms whose running average holding and backlogging cost asymptotically converges to the cost of the optimal. We prove the rate of convergence guarantee of our algorithm is O(1/sqrt(T)) for both cases.

3 - Primal-dual Algorithm For Online Transportation Problem

Yuchen Jiang, University of Michigan, Ann Arbor, MI, United States, ycjiang@umich.edu, Cong Shi, Siqian Shen

In this paper, we study a transportation problem in which customers come one by one in an online manner. The retailer chooses a particular warehouse from which a shipment is made to meet the current customer's demand without knowing the information of subsequent customers. We design a Primal-dual Algorithm for the retailer to maximize the total revenue under the uncertainty of those customers who have not yet arrived. We also compare our online policy with the offline optimal policy and obtain a competitive ratio which guarantees the performance of our Primal-Dual Algorithm.

4 - Preservation Of Additive Convexity And Its Applications In Stochastic Optimization Problems

Xiting Gong, The Chinese University of Hong Kong, xtgong@se.cuhk.edu.hk, Tong Wang

In this paper, we establish a new preservation result of additive convexity for a class of multi-dimensional optimization problems. We demonstrate the applications of this result and and its variant to several important stochastic optimization problems, including stochastic inventory control problems with remanufacturing, dynamic inventory rationing with multiple demand classes, and dynamic capacity management with general upgrading.

Co-Chair: Frank Edward Curtis, Lehigh University, 200 West Packer Avenue, Bethlehem, PA, 18015, United States, frank.e.curtis@gmail.com

Co-Chair: Andreas Waechter, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States, waechter@iems.northwestern.edu

1 - An Active-set Algorithm For Chance-constrained Nonlinear Optimization

Andreas Waechter, Northwestern University, waechter@iems.northwestern.edu, Frank Edward Curtis, Victor M Zavala

A new algorithmic framework for the solution of nonlinear chance-constrained optimization problems is proposed. Similar to Fletcher's Sl1QP algorithm, the method computes trial points from the minimization of a piece-wise quadratic model subject to a trust region. Theoretical convergence results and numerical experiments will be presented.

2 - Logical Benders Decomposition For Binary-constrained Quadratic Programs With Complementarity Constraints

Francisco Jara-Moroni, Northwestern University, Evanston, IL, United States, franciscojaramoroni2013@u.northwestern.edu, Andreas Waechter, Jong-Shi Pang, John E Mitchell

We study a Benders decomposition approach to solving Binary Constrained Quadratic Programs with Linear Complementarity Constraints. It formulates a satisfiability master problem with feasibility cuts are added by solving primal and dual subproblems for chosen complementarity pieces and binary variables. Our method strengthens the feasibility cuts by solving L0-norm or L1-norm problems, and guides the satisfiability problem solution by means of a convex piecewise linear approximation of the objective function.

3 - Trust Region Methods With Optimal Complexity For Nonconvex Functions

Mohammadreza Samadi, Lehigh University, Bethelehem, PA, United States, mos213@lehigh.edu, Frank E. Curtis, Daniel Robinson

We present a trust region method for unconstrained nonconvex optimization that, in the worst-case, is able to drive the norm of the gradient of the objective below a prescribed threshold eps > 0 after at most O(eps^(-3/2)) iterations. This complexity bound has been shown to be optimal with respect to a wide class of methods. Our algorithm (called TRACE) is modeled after a traditional trust region algorithm, but employs modified step acceptance criteria and a novel trust region updating mechanism that allows it to achieve this desirable property. As an extension, we discuss the implications of our new algorithm on equality constrained problems. Numerical results are presented.

1 - Optimal Reimbursement Schemes For Maternity Care Safety And Quality

Cheng Zhu, McGill University, 701-801 Sherbrooke Est, Montreal, QC, H2L 0B7, Canada, cheng.zhu@mail.mcgill.ca, Beste Kucukyazici

The amount of unnecessary C-Sections, which expose proven higher postpartum complications of mothers and newborns as well as heavy economic burden, has been increasing constantly and this growth raises great concerns for the policy makers. This research focuses on optimizing payment mechanisms to reimburse obstetricians, in order to reduce unnecessary C-sections while retain it for those who need it, resulting in enhanced birth quality with alleviated economic burden for overall health care system. The optimal reimbursement schemes are further verified empirically with large datasets.

2 - Using Policy Flight Simulator To Evaluate Scalability Of Evidence Based Practices

Zhongyuan Yu, Research Assistant Professor, Stevens Institute of Technology, Hoboken, NJ, 07030, United States, zyu7@stevens.edu, William B Rouse, Michael Pennock, Kara Pepe

Numerous evidence-based practices have demonstrated reduced medical costs, improved patient experiences and better quality of life. However, concern from stakeholders in health system seems to be holding back adoption. Policy flight simulator is proposed to find out what affects scalability of these practices, and assess what needs to be adjusted in order to increase confidence of senior administrators to expand these practices. Policy flight simulators fuse aspects of traditional scientific analysis, engineering, social science, and visualization to provide decision makers an immersive experience to increase comfort level with simulation-based data-driven decision making processes.

4 - Modeling And Assessment Of The Risk Of Colorectal Polyp

Kaiye Yu, Tsinghua University, Room 615,Shunde Building, Tsinghua University, Beijing, BJ100084, China, yky15@mails.tsinghua.edu.cn, Jie Xing, Wenying Zhou, Shutian Zhang, Xiaolei Xie, Nan Kong

Most colorectal cancer (CRC) arise from polyps. We identify colorectal polyps risk factors and develop risk stratification model using machine learning approaches. The individualized risk assessment tool could offer decision support to both clinicians and patients.

1 - New Developments In Pyomo

William E Hart, Sandia National Laboratory, wehart@sandia.gov

Pyomo is a Python-based open-source software package that supports a diverse set of optimization capabilities for formulating, solving, and analyzing optimization models. In this presentation, we describe new capabilities in Pyomo, including support for new versions of Python, installation with conda, and updates for modeling capabilities (bilevel, sp, dae, etc). This talk will also highlight new documentation resources for users.

2 - Jmarkov: An Integrated Java Framework For Stochastic Modeling

Daniel F Silva, Georgia Institute of Technology, Atlanta, GA, United States, dfsi3@gatech.edu, Julio C Goez, Juan F Perez, German Riano

jMarkov allows users to define stochastic models from the basic rules underlying the system dynamics and then solve the models to obtain performance measures. It is composed of four modules: (i) the main module supports Markov Chain models with a finite state space; (ii) jQBD enables the modeling of Quasi-Birth-and-Death processes; (iii) jMDP offers the capabilities to model and solve Markov Decision Processes; and (iv) jPhase supports the manipulation and inclusion of phase-type variables. In addition, jMarkov is highly extensible, allowing the users to introduce new modeling abstractions and solvers. In this talk we give an overview of jMarkov, as well as some examples.

Understanding the US Index Futures Stock Market using Research

Invited: Tutorial

Invited Session

Chair: William T. Ziemba, University of British Columbia, 1, Vancouver, BC, 2, Canada, wtzimi@mac.com

1 - Understanding The US Index Futures Stock Market Using Research

William T. Ziemba, University of Bristish Columbia, Vancouver, BC, 2, Canada, wtzimi@mac.com

I begin with five views or camps of beliefs concerning the US stock market. There are efficient markets where prices are correct except for transactions costs, risk premium where excess returns can be made only by bearing additional risk, efficient markets is hogwash, great investors exist but you cannot tell who they are in advance and the study of anomalies and other research. Edges arise from cash flows, institutional practices and behavioral biases. These include the turn of the year effect, the turn of the month effect, presidential election effects and mispriced options. I describe the effects and explain why they exist and then discuss their use in trading considering operational risks, the effect of volatility, prediction of stock market crashes, slippage, risk management, and optimal betting sizing. I won the 2015 futures trading contest of the Battle of the Quants in New York and have been able to obtain very good risk adjusted returns during July 2013 to May 2016 in the Alpha Z Futures Fund.

1 - Admission, Routing And Early Discharge Decisions In A Hospital Setting

Lerzan E Ormeci, Koc University, lormeci@ku.edu.tr, Nermin Kurt, Amin Khoshkenar

We consider the problem of bed management in a hospital. The patients stay at the hospital for a random length of time to recover after a surgery. Hence, the operation schedule has a long-term effect on the occupancy levels, which significantly affect the quality of care for the patients. To control the occupancy levels, hospital management has a number of options: 1) New patients may be rejected at high levels of occupancy, 2) Patients operated by a certain department may stay in the ward of another department, 3) Patients staying at the hospital may be discharged early. In this study, we analyze the effects of these decisions on the hospital performance by modeling the system via Markov decision processes.

2 - Ambulance Redeployment And Dispatching Under Uncertainty With Personnel Workload Limitations

Shakiba Enayati, North Carolina State University, Raleigh, NC, United States, senayat@ncsu.edu, Osman Ozaltin, Maria Esther Mayorga

Emergency Medical Services managers are concerned with providing maximum possible coverage in a service area. Redeployment refers to dynamic relocation of idle ambulances to compensate for the coverage loss due to busy ambulances. Unsystematic redeployments, however, impose superfluous workload on the personnel. We propose a two-stage stochastic programming model to redeploy and dispatch ambulances to maximize expected coverage. Our model includes personnel workload restrictions in a shift. We develop a decomposition algorithm to determine an upper bound and apply a branch and bound algorithm to find the optimal solution. We evaluate the performance using a largescale real dataset.

3 - An Optimization Approach For Coordinating Clinic And Surgery Appointments To Meet Access Delay Service Levels

Esmaeil Keyvanshokooh, University of Michigan, Ann Arbor, Ann Arbor, MI, United States, keyvan@umich.edu, Mark P. Van Oyen

Providing timely access to surgery is crucial for patients with high acuity diseases like cancer. In this paper, we present an optimization approach for coordinating clinic and surgery appointments to meet access delay service levels in Colorectal surgery (CRS). The methodology is applied to historical patient data for CRS to show its better performance than the current scheduling policy.

4 - Optimizing Admission And Discharge Decisions In Icu With Flexible Bed Allocation

Xuanjing Li, Tsinghua University, Room 519A,Shunde Building,Tsinghua Univ, Beijing, Beijing, 100084, China, lixj15@mails.tsinghua.edu.cn, Dacheng Liu, Xiaolei Xie, Ye Wang

This paper studies the admission and premature discharge policy in the intensive care unit (ICU) at Peking University Third Hospital. Patients are classified into two categories based on their survival benefit and discharge cost. A Markov Decision Process (MDP) model is established to strike balance between those two factors. Structural properties are obtained and a new admission policy is proposed.

1 - Improving Patient Satisfaction: Customizing Patient Appointment

Yutian Li, University of Miami, 421 Jenkins Building, 5250 University Drive, Coral Gables, FL, 33124, United States, ytli@umiami.edu, Joseph Johnson, Yu Tang

In this paper, we develop a Bayesian logit model which improves no-show prediction accuracy over the widely-used simple logit model. The accuracy gain arises from the individual patient-level coefficients provided by the Bayesian approach. Comparison of model fit on 12-months of appointment data shows the Bayesian model outperforms the simple logit model. In simulation studies, our results show that applying Bayesian model's prediction to scheduling algorithm can reduce patient's waiting time and physician's idle time and increase clinic's profit.

2 - Managing Appointment-based Services In The Presence Of Walk-in Customers

Shan Wang, Shanghai Jiao Tong University, 1954 Huashan Road, Shanghai, 200030, China, wangshan_731@sjtu.edu.cn, Nan Liu, Guohua Wan

Walk-in customers are accepted in many service industries and especially in healthcare. Motivated by practice in and data collected from two large community health care networks in New York City, we study how to coordinate scheduled patients in a clinic session in anticipation for random walk-ins. We use a Poisson regression framework to analyze the temporal pattern of walk-in patients based on 3-year data, and propose data-driven optimization models to identify the optimal appointment schedule. Our models can incorporate other practical aspects of appointment scheduling such as patient no-shows, patient preferences and restricted walk-in windows.

3 - Physician Scheduling To Improve Patient Flow Through Emergency Rooms

Farzad Zaerpour, PhD Candidate, Haskayne School of Business, University of Calgary, Calgary, AB, T3A 2E1, Canada, farzad.zaerpour@haskayne.ucalgary.ca, Zhankun Sun, Marco Bijvank

Emergency department (ED) crowding has become a serious concern worldwide. Hours of waiting is the main consequence of crowding in emergency departments. In this study, we develop a mixed-integer stochastic program for scheduling physicians to improve patient flow through an emergency department. The operational performance of an emergency department is vulnerable to mismatch between demand and supply. Therefore, the proposed model takes into account the stochastic natures of both demand and supply. We use physician productivity to evaluate the performance of each physician in the emergency department.

4 - When Waiting To See A Doctor Is Less Irritating: Understanding Patient Preferences And Choice Behavior In Appointment Scheduling

Nan Liu, Columbia University, 722 W. 168th St., Room 476, New York, NY, 10032, United States, nl2320@columbia.edu, Stacey Finkelstein, Margaret Kruk, David Rosenthal

This talk examines patient preferences and choice behavior in scheduling medical appointments. We conduct four discrete choice experiments on two distinct populations and identify several operational attributes that affect patient choice. We observe an interesting gender effect with respect to how patients tradeoff speed (delay to care) vs. quality (doctor of choice), and demonstrate that risk-attitudes mediate the impact of gender. As many operational strategies aim to improve patient experience by making tradeoffs between speed and quality, we make suggestions for when managers should intervene and how such interventions might look based on the patient mix and current delay level.

Optimization in Radiation Therapy Treatment Planning

Sponsored: Health Applications

Sponsored Session

Chair: Victor Wu, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States, vwwu@umich.edu

1 - Deriving Imrt Treatment Plans From Dvh Curves

Aaron Babier, University of Toronto, Toronto, ON, Canada, ababier@mie.utoronto.ca, Justin James Boutilier, Andrea McNiven, Michael Sharpe, Timothy Chan

Plan quality is often assessed using dose volume histograms (DVHs), which are a high level representation of a dose distribution. Clinical quality DVHs can be accurately predicted, however their corresponding treatment plans are more challenging to determine. We present an inverse optimization model that can produce treatment plans from DVH curves, with minimum treatment complexity. The model is applied to several clinical head and neck treatment plans, and the outcomes are compared to their corresponding clinical plans.

2 - Evaluation Of Multi-source Treatments For Prostate Brachytherapy Optimized Using An Interior Point Constraint Generation Algorithm

Dionne Aleman, University of Toronto, Toronto, ON, Canada, aleman@mie.utoronto.ca, Rachel Mok Tsze Chung, William Song

A novel approach to treat prostate cancer using multi-source high-dose-rate brachytherapy is investigated. The effectiveness of different combinations of the radionuclides 192Ir, 60Co, and 169Yb is analyzed. We use an inverse planning interior point algorithm to generate treatment plans for every possible combination of the three sources, and then compare treatment quality to the 192Ir plan. Overall, for the same target coverage, double- and triple-source plans provided better organ-at-risk sparing than the 192Ir plan.

3 - Threshold-driven Optimization For Reference-based Auto-planning

Troy Long, University of Texas Southwestern, Dallas, TX, United States, troy.long@utsouthwestern.edu, Steve Jiang, Mingli Chen, Weiguo Lu

We study the procedure of reference-based auto-planning for treatment plan optimization. We develop a threshold-driven optimization methodology for automatically generating an intensity-modulated radiation therapy treatment plan that is motivated by a reference dose-volume histogram. The commonly used voxel-based quadratic penalty objective functions have three components: an overdose weight, and underdose weight, and some target dose threshold. The proposed methodology directly relates reference information to threshold values, which influence the optimization in an effective, intuitive way.

4 - Optimal Fractionation With Two Modalities

Sevnaz Nourollahi, University of Washington Seattle, sevnaz@uw.edu

We introduce an optimal fractionation problem with two modalities. This involves finding the number of treatment sessions and the dose per session administered via each modality. The goal is to maximize the biological effect of such bimodal treatment on the tumor while keeping the toxic effects on nearby normal tissue within tolerable limits. We formulate this problem as a nonconvex quadratically constrained quadratic program. We show that the KKT conditions for this problem reduce to solving a quartic equation. We are thus able to provide an analytical solution to the KKT system. We study properties of the resulting solutions via numerical experiments.

Scheduling Providers and Patients

Sponsored: Health Applications

Sponsored Session

Chair: Nadia Lahrichi, Ecole Polytechnique de Montreal, 2900 Boul. Édouard-Montpetit, A-520.20, Montreal, QC, H3T 1J4, Canada, nadia.lahrichi@polymtl.ca

1 - Adaptive Appointment Scheduling For Patient Centered Medical Homes

Ali Kemal Dogru, OM PhD Student, University of Alabama, Tuscaloosa, AL, 35487, United States, akdogru@crimson.ua.edu, Sharif Melouk

Incorporating patient centered medical home (PCMH) principles, we develop an adaptive appointment scheduling model for a primary care setting. We propose a simulation optimization approach to sequentially schedule appointments to provide desirable schedules from the perspective of both patients and the medical practice. Our data-driven algorithm is efficient and takes patient preferences into account. We benchmark against myopic and optimal algorithms. Computational results show that the adaptive scheduling approach provides significant value.Key Words: Appointment Scheduling, Simulation, Patient Centered Medical Home

2 - Elective Surgery Scheduling Considering Patient Health Condition

Joonyup Eun, Vanderbilt University Medical Center, Nashville, TN, 37212, United States, joonyup.eun@vanderbilt.edu, Sang-Phil Kim, Yuehwern Yih

Surgery scheduling considering patient health condition can contribute to preventing patients from being exposed to the risk of sentinel events. This research describes an operating room planning problem that considers uncertainty in patient health condition. In addition, overutilization of operating rooms is restricted to reduce a hospital's surgical costs. We employ the sample average approximation to identify the optimal assignment of surgeries and analyze the assignment based on Ceteris Paribus.

3 - Scheduling Physicians To Improve Patient Flow In Radiotherapy Centers

Nadia Lahrichi, Ecole Polytechnique de Montreal, nadia.lahrichi@polymtl.ca

When a patient is referred to a radiotherapy center, a sequence of tasks (consultation with the physician, a CT scan and the treatment planning) take place. This phase is referred to as the pre-treatment and is followed by the treatment per se. Bottlenecks in such centers are often related to the unavailability of one of the human resources. Here, we focus on improving the flow of patients during the pre-treatment phase through physician scheduling. We consider uncertainty related to the arrival rate of patients and their profiles. To solve this problem, we develop a stochastic Tabu search algorithm. It appears to provide very high quality solutions when compared to the solutions obtained by CPLEX.

1 - Identifying Collaborative Shipping Opportunities

Jeroen Belien, KU Leuven, Warmoesberg 26, Brussel, 1000, Belgium, jeroen.belien@kuleuven.be, Stefan Creemers, Robert Boute

Collaborative shipping, where companies bundle their transport loads, is a growing trend in logistics. We present a tool that enables the quick identification of potential partners based on their geographical compatibility, even when the database of shipment lanes is very large. The tool allows the detection of bundling, backhauling, and roundtrip opportunities, as well as “collect-and/or-drop” opportunities where shipments are collected and/or dropped off en route. The tool is currently being used (among others) by Tri-Vizor, a facilitator and orchestrator of horizontal logistics partnerships, but is also applicable for any company that is looking for collaborative shipping partners.

2 - A Multilocation Distribution System With Resupply And Vehicle Routing

Stefan Minner, Technical University of Munich, Arcisstrasse 21, Munich, 80333, Germany, stefan.minner@tum.de, Belma Turan, Richard F. Hartl

We analyze the problem of delivering perishable products from a depot to stores with the option of a second delivery per day. We determine initial delivery quantity, timing and quantity of resupply and the sequence of visiting stores. The stochastic inventory optimization problem is solved by stochastic dynamic programming, while the tour problem is solved using variable neighborhood search. The algorithm is tested on randomly generated test instances and a real-world scenario is investigated. The results show a considerable improvement compared to the “single-order” model.

3 - Minimizing Fuel Consumption And Gas Emissions In Urban Distribution With An Instantaneous Energy Model

Hugo Tsugunobu Yoshida Yoshizaki, Associate Professor, University of Sao Paulo, Av. Almeida Prado Trav 2, 128, Cidade Universitaria, Sao Paulo, 05508-900, Brazil, hugo@usp.br, Anderson Oliveira Paschoal

Route optimization is an important tool for reducing fuel consumption and green house gas emissions. This paper show test results from a Pollution Routing Problem (PRP) model applied to an actual problem of urban distribution in the city of São Paulo. An instantaneous energy model (CMEN) has been used to obtain objective function parameters considering road slopes (using Graphhopper maps), vehicle speed, payload, time windows, and traveled distances, showing 2 to 10% savings. Potential operational strategies been also been evaluated, as dropping first the heaviest delivery.

4 - Optimal Design For Block Stacking Warehouses

Shahab Derhami, PhD Candidate, Auburn University, 3301 Shelby Center, Auburn, AL, 36849, United States, sderhami@auburn.edu, Jeffrey Smith, Kevin Gue

Storing pallets of SKUs on top of one another on a warehouse floor is known as block stacking. The arrangement of lanes in the layout of this system significantly impacts utilization of the storage space. We present a new approach to measure waste of storage space for block stacking and develop a model to calculate the optimal lane depth with respect to space utilization for a layout-free storage area. We, also propose a mixed integer programming model to design the optimal layout for the warehouses using block stacking. Several effective solution techniques are developed to solve the model.

5 - A Location Based System For Managing Cart Operations At A Mail Facility

Chun Hung Cheng, Associate Professor, Chinese University of Hong Kong, Rm 607 William MW Mong Eng Bldg, Shatin NT, Hong Kong, chcheng@se.cuhk.edu.hk, Yong-Hong Kuo

We have developed a location based system for managing cart operations at a mail facility. The RFID-tag attachments to carts and reader mounts at the top of the building allows the facility operators to locate target carts quickly. We have also conducted an initial analysis of data collected using this technological infrastructure to understand issues on cart movements and operational efficiency.

1 - Why Do Firms Outsource Empirical Evidence For Resource Constraint And Slack Mechanisms

Shivom Aggarwal, IE Business School, Instututo de Empresa S.L., CIF B82334319, Calle de Maria de Molina, 12 Bajo, Madrid, 28006, Spain, dr.shivom@gmail.com, Kiron Ravindran, Gautam Ray

Why do firms outsource Information Technology (IT)? The literature is divided on whether IT Outsourcing is a cost-reduction strategy or a growth strategy. We argue that organizations can do both, depending on the degree of resource constraint and slack availability under certain environmental conditions (competition). We found empirical evidence of these underlying mechanisms using a longitudinal dataset on IT outsourcing contracts. We provide important implications for IS scholars working on IT Outsourcing and practitioners from outsourcing firms as well as IT vendors.

2 - Developing A Non Invasive Tool To Diagnose Diabetic Retinopathy

Saeed Piri, PhD Student, Oklahoma State University, School of Industrial Engineering & Management, Engineering North, Stillwater, OK, 74078, United States, saeed.piri@okstate.edu, Tieming Liu, Dursun Delen

Diabetic retinopathy is the leading cause of vision loss in the US. In this study a non-invasive tool is developed to detect this disease. The demographic and lab data of more than 1.4 million diabetics has been analyzed and four sets of predictive models have been developed. The first set encompasses the models that have been developed using lab and demographic data. In the second set, comorbidity data was included in addition to basic data. Third set consists of models that are built using the oversampled data by applying SMOTE method. Fourth set includes ensemble models that have been developed using the outputs of different single predictive models. The accuracy of the best model is close to 90%.

3 - Call For Bids To Improve Matching Efficiency: Evidence From Online Labor Markets

Xue Guo, Doctoral Student, Temple University, Fox School of Business, 1801 North Broad Street, Philadelphia, PA, 19122, United States, xueguo@temple.edu, Jing Gong, Pavlou Paul

In online labor markets, Call for Bids (CFB) plays an important role in affecting the efficiency and quality of labor matches. In this study, we analyze the text of CFBs and examine five attributes associated with the clarity of CFBs that may affect the contracting success rate and post-project satisfaction—codifiability, uncertainty, complexity, flexibility and monitoring. We propose to use deep learning algorithms to analyze large unstructured textual data and test our model using archival data from one of the largest online labor platforms.

4 - An Empirical Investigation Of Online Marketplace Users

Yuanyuan Shen, Stanford University, Stanford, CA, 94305, United States, yyshen@stanford.edu, Haim Mendelson, Kenneth Moon

We develop a simple Markovian model of user behavior which incorporates user learning and social value on an online marketplace. We test the model and analyze additional tradeoffs and market characteristic. We use data from Kiva, a non-profit lending marketplace. Consistent with the predictions of our model, we find evidence of user engagement begetting greater engagement. Meanwhile, an engaged user's tenure is negatively correlated with his lending rate while the correlation turns to be positive when the user has no loans. We also identify significant differences in the behaviors of user acquired directly and those acquired virally.

Innovations in Retail Operations

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Nicole DeHoratius, University of Chicago, 58071 S Woodlawn Ave., Chicago, IL, 60637, United States, Nicole.DeHoratius@ChicagoBooth.edu

1 - Retail Inventory Liquidation Value: Local Economic Factors

Nathan Craig, OSU, craig.186@osu.edu

The liquidation value of a firm's assets is an input to numerous models. Our research characterizes liquidation values in practice and identifies factors that affect liquidation value. In the context of retail inventories, we analyze data from multiple sources to identify economic features of a store's local market that significantly impact inventory liquidation value.

2 - Here Comes The Sun: Measuring And Exploiting Weather Shocks In Fashion Retailing

Victor Martinez-de-Albeniz, Professor, IESE Business School, Barcelona, 08034, Spain, valbeniz@iese.edu, Abdel Belkaid

We model and empirically study the impact of weather variables on the operations of a large apparel retailer. Specifically, we focus on traffic store and the conversion of traffic into product category sales. We find that rain increases traffic but decreases conversion in shopping mall stores, while the opposite is true in street stores. Lower temperatures increase traffic and increase conversion of sales of the "appropriate" categories (summer vs. winter). Finally, we demonstrate how to exploit weather variations to improve profits.

3 - Optimizing Prepacks To Ship Products In Retail Supply Chains

Stephen A Smith, Santa Clara University, Omis Lucas Hall 216h, 500 El Camino Real, Santa Clara, CA, 95053-0382, United States, ssmith@scu.edu, Naren Agrawal

We present recent results from the analysis of shipping and inventory policies in retail supply chains when multiple pre-packs are permissible. We compute exact solutions to a dynamic stochastic programming formulation and derive insights based on numerical analysis of a sample case study.

4 - Package Size And Pricing Decisions With A Bulk Sale Option

Ismail Kirci, University at Texas at Dallas, ismail.kirci@utdallas.edu

We investigate the package size and pricing decisions of a retailer selling a perishable product that can be offered in packages or in a container that allows consumers to buy as much as they want (Bulk Sale). We show how the existence of a bulk sale option affects the optimal package size, the optimal price and product waste at the consumer level.

Mechanisms to Enhance the Value of Used and Returned Products

Sponsored: Manufacturing & Service Oper Mgmt, Sustainable Operations

Sponsored Session

Chair: Eda Kemahlioglu-Ziya, Poole College of Management at North Carolina State University, 2801 Founders Dr, Raleigh, NC, 27695, United States, ekemahl@ncsu.edu

1 - Impact Of Recycling Standards On E-waste Recovery In The Presence Of Secondary Market

Gokce Esenduran, Ohio State University, esenduran.1@osu.edu, Yen-Ting (Daniel) Lin, Wenli Xiao, Minyue Lin

There are two voluntary certification programs for e-waste recyclers: e-Stewards and R2. While both provide assurance of proper e-waste handling, e-Stewards is much stricter than R2, resulting in a higher processing cost. With the aim of identifying when a recycler should adopt e-Stewards versus R2, we model the competition between two recovery channels; each consisting of a recycler and a collector who can sell collected e-waste either in the secondary market or to its recycler. We find that devoid of competition, a recycler always chooses R2; whereas under competition, recyclers may choose either one. We also examine how secondary market and scale economies affect recyclers' decisions.

2 - Design For Reusability And Product Reuse Under Radical Innovation

Michael Galbreth, University of South Carolina, galbreth@moore.sc.edu

Many industries, including consumer electronics and telecommunications equipment, are characterized by short product lifecycles, constant technological innovations, rapid product introductions, and fast obsolescence. Firms in such industries need to make frequent design changes to incorporate innovations, and the effort to keep up with the rate of technological change often leaves little room for the consideration of product reuse. In this paper, we study the design for reusability and product reuse decisions in the presence of both a known rate of incremental innovations and a stochastic rate of radical innovations over time.

3 - Extracting Maximum Value From Consumer Returns

Cerag Pince, Kuhne Logistics University, Cerag.Pince@the-klu.org, Mark Ferguson, Beril L Toktay

Consumer returns constitute a substantial fraction of sales in the consumer electronics industry and often cannot be re-sold as new due to litigation concerns. Therefore, identifying the best joint pricing and disposition strategy is a challenging but important decision for consumer electronics OEMs. This paper investigates how an OEM should price new and refurbished products while allocating consumer returns between remarketing and warranty coverage options over the product's short life cycle.

4 - Truth-inducing Mechanism For Medical Surplus Products Allocation

Can Zhang, Georgia Institute of Technology, Atlanta, GA, 30309, United States, czhang2012@gatech.edu, Atalay Atasu, Turgay Ayer, Beril L Toktay

We study a product allocation problem faced by a Medical Surplus Recovery Organization (MSRO) that recovers and manages reusable medical products to fulfill the needs of under-served healthcare facilities in developing countries. We focus on designing truthful mechanisms to elicit the recipients' needs information, and we prove that the optimal truthful mechanism has a very simple structure. We further show that our mechanism significantly improves the MSRO's total value provision compared with the current practice and previously proposed recipient-driven models.

Data-Driven Models in Healthcare

Sponsored: Manufacturing & Service Oper Mgmt, Healthcare Operations

Sponsored Session

Chair: Yichuan Ding, University of British Columbia, 2053 Main Mall, Sauder School of Business, Vancouver, BC, V6T1Z2, Canada, daniel.ding@sauder.ubc.ca

1 - Bundled Payments And Value Based Delivery

Jillian B Jaeker, Boston University, jjaeker@bu.edu

This study aims to understand the care pathways, both inpatient and outpatient (i.e. end-to-end), for congestive heart failure (CHF) patients, and how these pathways impact the costs and quality of care. Specifically, our objective is to identify pathways that are associated with lower or higher than normal readmission rates, and the associated financial costs of these pathways. Moreover, we work with hospitals that are participating in the Bundled Payments for Care Improvement (BPCI) initiative and explore if any recent interventions on behalf of these hospitals affects the probability of 30 day readmission and total episode costs.

2 - Dynamic Allocation Of Vaccine Stocks For Pandemic Influenza Mitigation

Ozden O Dalgic, University of Waterloo, Waterloo, ON, Canada, oodalgic@uwaterloo.ca

Vaccination is our best response against influenza pandemics. However, finding effective vaccine allocation strategies with current modeling technics can be challenging. In this study, we propose a hybrid approach combining simulation and analytical modeling. We employ a model based on a chain-binomial transition scheme calibrated to an existing agent-based simulation model. The proposed approach efficiently evaluates the performance of a given vaccine allocation strategy by reducing the number of random variates. Numerical experiments show that the proposed approach results in effective dynamic vaccine allocation strategies.

3 - Designing Personalized Anticoagulation Therapy

Rouba Ibrahim, University College London, rouba.e.ibrahim@gmail.com, Vedat Verter, Beste Kucukyazici, Michel Gendreau, Mark Blostein

We develop an analytical framework for personalizing the anticoagulation therapy of patients who are taking warfarin, and present results from a case study using data collected at the anticoagulation clinic of the Jewish General Hospital in Montreal.

4 - Do Patients From Rural Areas Get Proper Referral For Surgical Care

Yichuan Ding, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, daniel.ding@sauder.ubc.ca

We examined surgical records throughout 98 hospitals in British Columbia during year 1995-2004, and had two interesting observations: (1) hospitals in rural areas are correlated with smaller likelihood of post-surgical complications, possibly because those hospitals have less risky case mix groups; (2) patients from rural areas, however, are correlated with lower risk of post-surgical complications. We conduct further investigation and find that the reason for (2) to happen might be the inefficient communication between the referral hospital and the one that the surgery takes place.

Consumer Behavior in Services

Sponsored: Manufacturing & Service Oper Mgmt, Service Operations

Sponsored Session

Chair: Qiuping Yu, Assistant Professor, Kelley School of Business, Indiana University, 1275 E 10th St, Bloomington, IN, 47401, United States, qiupyu@indiana.edu

1 - Rational Abandonment From Observable Priority Queues

Philipp Afèche, Rotman School of Management, University of Toronto, Toronto, ON, Canada, afeche@rotman.utoronto.ca, Vahid Sarhangian

The literature on customer behavior in queueing systems largely focuses on customers' joining decisions and ignores their subsequent abandonment decisions. Such abandonment behavior is important in priority queues, which are prevalent in practice. We characterize the equilibrium joining and abandonment behavior of utility-maximizing customers in an observable priority queue. We then discuss how the abandonment process in our equilibrium model compares to that under the standard exogenous abandonment model, and to its empirical counterpart in a real system.

2 - Learning Quality Through Service Outcomes

Senthil Veeraraghavan, The Wharton School, University of Pennsylvania, senthilv@wharton.upenn.edu, Laurens G Debo

We study a new firm whose service value is unknown to arriving customers. Service outcomes are random depending on the quality of the service provider. Customers decide whether patronize the service based on the limited service outcomes/reviews that they observe. We consider how service policies influence consumer learning and social welfare.

3 - Design Of Discretionary Service Lines: An Operational Driver Of Variety

Laurens Debo, Tuck School of Business, Dartmouth College, 100 Tuck Drive, Hanover, NH, 03755, United States, Laurens.g.Debo@tuck.dartmouth.edu, Cuihong Li

For discretionary services, the longer the service time, the more value is created for the customer. In the presence of variability, longer service times also create more congestion. Hence, a service firm needs to trade off congestion costs with value creation in service line design. We find that it is optimal to offer a service line with multiple varieties (that differ in duration and price), even when customers are homogeneous.

4 - Linking Customer Behavior And Delay Announcements: Are Customers Really Rational?

Eric Webb, Kelley School of Business, Indiana University, Bloomington, IN, United States, ermwebb@indiana.edu, Qiuping Yu, Kurt M Bretthauer

We empirically explore customer abandonment behavior in the presence of delay information using data from a call center. Previous work has assumed that customers are at least partially rational in responding to announcements. In contrast, we relax all rationality assumptions. Our findings indicate that customers exhibit loss aversion behavior. In addition, customers may update their announcement-induced reference point as they hear subsequent announcements. Our results also indicate that customers may fall for the sunk cost fallacy while waiting in the queue. We show the impact of these effects on staffing decisions using a classic staffing model.

Risk Analysis III

Contributed Session

Chair: Dexiang Wu, Stockholm University, Stockholm Business School, Stockholm, 106 91, Sweden, dexiang.wu@sbs.su.se

1 - Modeling Behavior Of Attackers Against The Uncertainty Of Cascading Failure

Sinan Tas, Assistant Professor, University of Wisconsin-Platteville, 1 University Plaza, Platteville, WI, 53818, United States, tass@uwplatt.edu

Cascading failure is a common phenomenon in capacity-constrained networks such as power grids. What if attackers consider manipulating the additional impact of cascading failure to enhance the damage to the network? We analyze various attacker types and corresponding defensive investments when cascading failure is modeled stochastically in a game-theoretic setting.

2 - Analysis Of Intraday Data Effects On Two-stage Risk-averse Portfolio Optimization

Sitki Gulten, Stockton University, School of Business, 101 Vera King Farris Drive, Galloway, NJ, 08205, United States, sitki.gulten@stockton.edu

This study examines the application of risk-averse optimization techniques to daily portfolio management. First, I develop efficient clustering methods for scenario tree construction. Then, I construct a two-stage stochastic programming problem with conditional measures of risk, which is used to re-balance the portfolio on a rolling horizon basis, with transaction costs included. Finally, I present an extensive simulation study on both interday and high-frequency intraday real-world data of the methodology.

3 - Exploring Multi-stage Recovery Resilience

Daniel Hernando Romero, University of South Florida, 4411 Shady Terrace Ln, Unit A, Apt 212, Tampa, FL, 33613, United States, danielromero@mail.usf.edu, Alex Savachkin, Alvaro Sierra, Weimar Ardila

Multi-stage recovery models enable resilience measurement in the scenarios where the recovery time is long, so it is estimated en months or years. High magnitude disruptive events severely affect communities and generate long lasting consequences. These scenarios require model flexibility to capture different recovery rates and transitions between recovery stages.

4 - Cardinality Constrainted CDS Portfolio Optimization

Dexiang Wu, Stockholm University, Stockholm Business School, Stockholm, 106 91, Sweden, dexiang.wu@sbs.su.se, Desheng Dash Wu

We study the Credit Default Swap (CDS) market from the portfolio perspective. CDS-based portfolios are constructed through incorporating solvency and cardinality constraints for the purpose of decentralization. Portfolio size is controlled exactly and therefore mixed integer quadratic and linear programs that consider different risk measurements are studied. We found that moderate size can generally obtain better performance in terms of portfolio Sharpe ratio and other metrics. Moreover, due to the specific structure of CDS correlation matrix, a cluster simplification process is applied to speed up the computation.

Production and Scheduling III

Contributed Session

Chair: Steffen T. Klosterhalfen, BASF SE, Ludwigshafen, Germany, steffenklosterhalfen@googlemail.com

1 - Fitting Clearing Fun Actions Using Generalized Regression Methods

Reha Uzsoy, North Carolina State University, Dept. of Industrial & Systems Engg, 300 Daniels Hall Camps Box 7906, Raleigh, NC, 27695-7906, United States, ruzsoy@ncsu.edu, Karthick Gopalswamy

Clearing functions are widely used in production planning models to capture the nonlinear relationship between workload and output. Traditionally least squares methods have been used to fir the data, which weight the errors of both signs equally and assume errors to be iid normally distributed. In this work we relax the assumption of normality and provide a generalized regression approach to fit the data taking into consideration that the data is not balanced. Computational experiments evaluate the performance of the proposed methods for fitting clearing functions.

2 - A Two-stage Stochastic Programming Model For Lot-sizing And Scheduling Under Uncertainty

Zhengyang Hu, Research Assistant, Iowa State University, 100 Enrollment Services Center Ames, Ames, IA, 50011, United States, zhengya@iastate.edu, Guiping Hu

Lot-sizing and scheduling is one of the medium-term production planning problems in manufacturing. In this study, demand uncertainty has been considered and a robust production plan has been proposed with a two-stage stochastic programming framework. A case study proves that uncertainty has a significant impact on production planning.

3 - Managing Product Transitions In Semiconductor Wafer Fabrication Facilities

Reha Uzsoy, North Carolina State University, Dept. of Industrial & Systems Engg, 300 Daniels Hall Camps Box 7906, Raleigh, NC, 27695-7906, United States, ruzsoy@ncsu.edu, Atchyuta B. Manda, Sukgon Kim, Karl Kempf

We consider the problem of managing the introduction of new products into a wafer fabrication facility when the new product is subject to higher levels of process uncertainty than the current one. We propose a model for the impact of the new product on the cycle time of the fab using queueing concepts, and illustrate the behavior of the model with computational experiments.

4 - Scheduling With Batching Decisions And Energy Constraints For Steelmaking Continuous Casting Production

Wenjie Xu, Northeastern University, NO. 3-11, Wenhua Road, Heping, Shenyang, 110819, China, xuwenjie.neu@outlook.com, Lixin Tang

We study a novel scheduling problem with batching decisions of steelmaking continuous- casting (SCC) production. The energy constraints in this problem represent the conversion process from the Linz-Donawitz process gas (LDG) to electricity. The problem uses the minimum makespan as the scheduling objective and the minimum total electricity cost as the energy objective. A multi-objective optimization framework which incorporates an improved epsilon-constraint method is proposed to solve the problem. Preliminary results show the effectiveness of the multi-objective optimization framework and demonstrate the tradeoffs between minimum makespan and energy cost.

5 - Integrated Production And Safety Stock Planning In The Process Industry

Steffen T. Klosterhalfen, BASF SE, Ludwigshafen, Germany, steffenklosterhalfen@googlemail.com, Stefan Minner, Dariush Tavaghof Gigloo

We develop and apply a new approach for integrated production lot-sizing and safety stock planning in the process industry where high demand uncertainty and large production campaigns are the rule. Our approach is based on mixed-integer linear programming and benchmarked with common sequential lot-sizing and safety stock planning frameworks characterized by different levels of sophistication in optimization methodology and parameter updating.

Joint Session HAS/MSOM-HC: Advances in Healthcare Operations

Sponsored: Manufacturing & Service Oper Mgmt, Healthcare Operations

Sponsored Session

Chair: Van-Anh Truong, Columbia University, 500 120th Street, New York, NY, 10027, United States, vt2196@columbia.edu

1 - A Pomdp For Reducing Readmissions Through Inpatient Outpatient Joint Control

Xiang Liu, University of Michigan, liuxiang@umich.edu, Jonathan Helm, Mariel Sofia Lavieri, Ted Skolarus

Hospital readmissions affect hundreds of thousands of patients, placing a tremendous burden on the healthcare system. We develop a two-stage POMDP that spans the inpatient stay and the post-discharge outpatient monitoring to reduce readmission. By learning and reducing readmission risk in the inpatient stage, and monitoring and intervening patient's health condition in the second stage, our model jointly optimizes both discharge and post-discharge decisions to reduce readmissions.

2 - A Fluid Model For An Overloaded Bipartite Queueing System With Scoring Based Priority Rules

Yichuan Ding, Assistant Professor, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, daniel.ding@sauder.ubc.ca, Mahesh Nagarajan, S. Thomas McCormick

We consider an overloaded bipartite queueing system (BQS) with multi-type customers and service providers. A service provider assigns each customer a score based on customer type, waiting time, and server type. Service is always provided to the customer with the highest score. We approximate the behavior of such a system using a fluid limit process, which has two important features: (1) the routing flow rates at a transient state coincide with the maximal flow in a parameterized network; (2) the routing flow rates in the steady state coincide with the minimal-cost maximal-flow in a capacitated network. We illustrate the application of our machinery via an example of public housing assignment.

3 - Routing Shared Vehicles With Matching Constraints For Medical Home Care Delivery

Miao Yu, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States, miaoyu@umich.edu, Viswanath Nagarajan, Siqian Shen

In this paper, we study a vehicle routing problem variant for medical home care delivery. A health care provider assigns multiple vehicles to transport homecare devices and/or medical staff to patients' home locations given that each patient can only be served by a subset of vehicles. We construct an integer-programming model solved by column generation, to minimize the total traveling distance of all the vehicles. We also propose an approximation algorithm that yields fast assignment, and conduct out-of-sample simulation to numerically evaluate the performance of the proposed methods.

4 - A Periodic Little's Law And Its Application To Emergency Department Data

Xiaopei Zhang, Columbia University, 1 Morningside Drive, Apt. 1710, New York, NY, 10025, United States, xz2363@columbia.edu, Ward Whitt

We establish a new periodic discrete-time version of Little's law and apply it to explain the remarkable fit of a data-driven stochastic process model, which is periodic over a week, of the emergency department occupancy over time in the Israeli Rambam hospital.

Economic Models in Supply Chains

Sponsored: Manufacturing & Service Oper Mgmt, Supply Chain

Sponsored Session

Chair: Gizem Korpeoglu, University College London, Gower Street, London, WC1E 6BT, United Kingdom, c.korpeoglu@ucl.ac.uk

1 - Supply Chain Expansion And Integration

C Gizem Korpeoglu, University College London, c.korpeoglu@ucl.ac.uk, Ersin Korpeoglu, Soo-Haeng Cho

This paper studies expansion and integration of supply chains under uncertain consumer demand. We show that when a supply chain expands to include more suppliers or more retailers, the supply chain profit and efficiency increase. We then consider the integration of two local supply chains (e.g., an economic union such as the European Union (EU) Single Market), and show that the integration may reduce total profit of firms in a supply chain with a smaller ratio of suppliers to retailers. Our analysis suggests that the United Kingdom, which has a smaller ratio of suppliers to retailers than the EU, could enjoy greater supply chain profits after disintegrating from the EU, while the EU may incur profit losses.

2 - Pricing And Inventory Management For An Online Retailer

Rui Yin, Arizona State University, ryin@anderson.ucla.edu

We consider two selling mechanisms for an online retailer: price markdown and inventory disclosure, and examine the impacts of these mechanisms on the retailer's sales and profits.

3 - Decentralization And Outsourcing In A Global Supply Chain Under Arm'S Length Principle On Transfer Pricing

Kun Soo Park, KAIST, kunsoo@kaist.ac.kr, Bosung Kim, Seyoun Jung, Sang-Hun Park

We consider a multinational firm's (MNF) production and procurement decisions of global supply chain under a regulation on its transfer pricing, i.e., the arm's length principle. We analyze when it is beneficial for the MNF to open the local division considering the tax rate differential. We also further consider if the local division should seek for outsourcing from the 3rd party instead of the manufacturing division of the MNF.

Topics in Sustainable Operations

Sponsored: Manufacturing & Service Oper Mgmt, Sustainable Operations

Sponsored Session

Chair: Vishal Agrawal, Georgetown University, Washington, DC, United States, Vishal.Agrawal@georgetown.edu

Co-Chair: Isil Alev, Boston College, Boston, MA, United States, isil.alev@bc.edu

1 - The Value Of Product Returns: Intertemporal Product Management With Strategic Consumers

Narendra Singh, Indian School of Business, Hyderabad, India, narendra_singh@isb.edu, Karthik Ramachandran, Ravi Subramanian

We study the impact of consumer product returns and their potential refurbishing on the intertemporal product strategy of a firm facing strategic consumers, who anticipate future availability and prices of products and time their purchases to maximize net utility. Using a two-period model, we show that returns may act as a commitment device for a firm selling durable products and thereby mitigate the time inconsistency problem. Specifically, a sufficiently high return rate coupled with the firm's incentive to refurbish the returns allows the firm to credibly commit that the new product will be offered exclusively in the first period. As a result, firm profit could even increase with the return rate.

2 - Lemons, Trade-ins, And Remanufacturing

Ximin Huang, Georgia Institute of Technology, 800 West Peachtree Street, NW, Atlanta, GA, 30308, United States, ximin.huang@scheller.gatech.edu, Atalay Atasu, Beril L Toktay

Trade-in programs have been shown to partially mitigate the lemons problem in secondary markets. In this paper, we show when and how remanufacturing traded-in products can further improve the efficiency in secondary markets.

3 - Trade-in Remanufacturing, Customer Purchasing Behavior, And Government Policy

Renyu Zhang, Assistant Professor of Operations Management, New York University Shanghai, 1555 Century Ave, Shanghai, 200122, China, renyu.zhang@nyu.edu, Fuqiang Zhang

We study the impact of customer purchasing behavior on the value of the widely used trade-in remanufacturing program to the firm and the environment. We find a brand new value of trade-in remanufacturing that helps exploit the forward-looking behavior of strategic customers. The value of trade-in remanufacturing is sensitive to customer purchasing behavior. Under intensive strategic customer behavior, trade-in remanufacturing creates a tension between profitability and sustainability: It significantly improves the firm profit but also significantly hurts the environment. We also characterize the government policy that can induce the social optimum under different customer behaviors.

4 - Extended Producer Responsibility (epr) And Export Bans

Isil Alev, Boston College, Chestnut Hill, MA, 02467, United States, isil.alev@bc.edu, Vishal Agrawal, Atalay Atasu

We focus on the ongoing global debate about the export of electronics to developing countries for recycling under EPR-based legislation. To prevent such practices, the US and the EU introduced partial export bans that only allow the export of electronics with remaining useful life. We compare these bans with no and full export ban scenarios and show that they may lead to exacerbated environmental harm in both developing and developed countries.

General Session I

Contributed Session

Chair: Hedayat Alibeiki, McGill University, 1001 Sherbrooke Street West, Desautels Faculty of Management, Montreal, QC, H3A 1G5, Canada, hedayat.alibeiki@mail.mcgill.ca

1 - Teaching And Learning Of Decision Making In Complex Projects Under Uncertainties

K Jo Min, Iowa State University, 3004 Black Engineering, Department of Industrial &, Ames, IA, 50011-2164, United States, jomin@iastate.edu, John Jackman, Michelle Zugg

How best to teach and learn decision making under uncertainties for complex projects has become a critical topic in operations research and management science education. In this paper, we show how a module in an introductory engineering economy course and an experimental advanced course are used to facilitate this aim. Data-driven results are analyzed and lessons will be shared.

2 - When To Introduce An Online Channel, And Offer Money Back Guarantees And Personalized Pricing?

Jing Chen, Professor, Dalhousie University, 6100 University Avenue, Halifax, NS, B3H 4R2, Canada, JChen@dal.ca, Bintong Chen

Retail sales through an online channel is increasingly popular in the retailing industry. Customers, however, cannot touch or feel a product before they purchase online. This leads to much higher rates of customer returns in the online channel, which in turn leads to significant costs to retailers. In this paper, we develop a model of a dual-channel structure with an online and a retail channels to examine when a retailer should introduce an online channel and how it should offer returns policy for two channels.

3 - Retail Power Impacts On Assortment Decisions By Power Retailers

Hedayat Alibeiki, McGill University, 1001 Sherbrooke Street West, Desautels Faculty of Management, Montreal, QC, H3A 1G5, Canada, hedayat.alibeiki@mail.mcgill.ca

Using several game-theoretic models, this paper examines potential impacts of different sources of retail power on the assortment choice of a power retailer. We find that assortment decisions of power retailers are strongly connected to their pricing power in the market, which suggests that pricing and assortment decisions are two different sides of the same coin for power retailers in a competitive market. On the other hand, product cost advantage seems to play a secondary role in comparison with market pricing leadership. We also find that larger market share in all scenarios amplifies the retailer's control over the market and can have a significant impact on pricing and assortment decisions.

4 - Education Engineering [SIC]

Kingsley Anthony Reeves, University of South Florida, Tampa, FL, Contact: reeves@usf.edu

The craft of engineering has been applied to numerous industries, especially the manufacturing-oriented industries such as automotive, pharmaceuticals, and petroleum. In more recent history we have seen the application of engineering approaches to the service sector; examples include financial services and healthcare. A notable exception (and area of great need) is the application of engineering to education. While there is currently significant momentum in the growth of engineering education programs across the nation, this paper calls for the creation of education engineering as a discipline and explores the opportunities that exist particularly for industrial engineering.

5 - Operational Performance Of Retail Stores

Andreas Holzapfel, Catholic University of Eichstaett-ingolstadt, Ingolstadt, Germany, andreas.holzapfel@ku.de, Heinrich Kuhn2, Michael Sternbeck

We study which factors drive instore operations efficiency. For this purpose we develop explanatory models that quantify the impact of operational circumstances on working hours required in the stores and financial performance. The results are valuable input for store and logistics planning as well as for staff assignment planning.

Joint Session APS/MSOM: Service Systems in Applied Probability II

Sponsored: Applied Probability/MSOM

Sponsored Session

Chair: Jing Dong, Northwestern University, Evanston, Evanston, IL, United States, jing.dong@northwestern.edu

1 - When The Past Does Not Predict The Future: Delay Announcements With Customer Priorities

Rouba Ibrahim, University College London, rouba.ibrahim@ucl.ac.uk, Mor Armony, Achal Bassamboo

Motivated by the problem of making delay announcements, we study the accuracy of announcements based on the history of delays in a system with multiple customer classes and a priority service discipline. We present ways of exploiting this historical information to design new and improved announcements.

2 - Managing Overstaying Electric Vehicles In Park-and-charge Facilities

Ragavendran Gopalakrishnan, Research Scientist, Xerox Research Centre India, Bangalore, India, Ragavendran.Gopalakrishnan@xerox.com, Arpita Biswas, Partha Dutta

With the increase in adoption of Electric Vehicles (EVs), ensuring proper utilization of the charging infrastructure is a key emerging challenge. Overstaying by EVs after charging is complete can be discouraged by imposing penalties, but the upfront uncertainties in parking and charging durations render higher penalties riskier, which might turn prospective users away, leading to decreased utilization (and revenue). We develop a framework that integrates models for realistic user behavior into queueing dynamics to locate the optimal penalty from the points of view of utilization and revenue, and discover a surprising alignment between the “green” objective and the “commercial” objective.

3 - The Superposition-traffic Game

Harsha Honnappa, Purdue, 315 N. Grant St., West Lafayette, IN, 47906, United States, honnappa@purdue.edu, Ashish R. Hota, Shreyas Sundaram

Motivated by ride-sharing and online-platform systems, we consider a model of a single-server service system where a finite number of traffic sources compete for service. The presence of a large, but finite, number of traffic sources is assumed to have positive network effects, but also causes an increase in congestion. The goal of the sources is to choose the traffic rate, trading-off these two effects. We present an analysis of the generalized Nash equilibrium (GNE), and discuss implications on pricing and mechanism design for such service systems.

4 - Finite-size Effects In Critically Dimensioned Emergency Departments

Britt Mathijsen, Eindhoven University of Technology, PO Box 513, MetaForum 4.086, Eindhoven, 5600MB, Netherlands, b.w.j.mathijsen@tue.nl, Johan van Leeuwaarden, Foekje Sloothaak

Motivated by the desire to determine staffing levels in an emergency department, we study a queueing model in which patients alternate between being in need of direct care from a nurse and being stable, while the total number of patients present in the ED is limited. We identify a two-fold scaling policy for which the system exhibits quality-and-efficiency-driven (QED) type behavior as it grows large, and approximate its performance through a fixed-point method. Building upon the asymptotic results, we ultimately propose a dimensioning scheme for the number of nurses and beds necessary to ensure good quality of care in both stationary and time-varying environments.

Queueing Systems

Sponsored: Applied Probability

Sponsored Session

Chair: Guodong Pang, Penn State University, University Park, University Park, PA, 16801, United States, gup3@psu.edu

1 - Parameter Uncertainty In Naor’s Model

John Hasenbein, University of Texas-Austin, jhas@mail.utexas.edu, Ying Chen

We examine the classical Naor’s model when the arrival rate is not known with certainty by either the system controller or the customers. Rather, only the arrival rate distribution is known. We analyze the system in the observable and unobservable queue length regimes from the point of view of individuals, a social optimizer, and a revenue maximizing firm.

2 - Strong Approximations For General Time Varying Queues

Jamol Pender, Cornell University, jamol.pender@gmail.com

We present a novel methodology for approximating the queue length distributions of non-Markovian and time varying queueing systems. The first step is to approximate the general distributions with phase type distributions and second step is to use strong approximations to construct fluid and diffusion limits for the phase type queueing process. We show that our approximations are quite accurate in a variety of parameter settings.

3 - Pull-based Load Distribution Among Heterogeneous Parallel Servers: The Case Of Multiple Routers

Aleksandr Stolyar, Lehigh University, sasha.stolyar@gmail.com

We consider a heterogeneous service system, consisting of several large server pools and multiple ‘routers’. Each router receives equal fraction of the customer arrival flow, and assigns each customer to a server immediately upon arrival. The asymptotic regime is considered such that the total arrival rate and pool sizes scale to infinity simultaneously, while the system load remains subcritical. We introduce a ‘multi-router’ version of the ‘pull-based’ routing scheme and prove that, under this scheme and certain assumptions, both waiting times and blocking probabilities asymptotically vanish.

4 - The Method Of Chaining For Many Server Queues

Yuhang Zhou, Penn State University, YXZ197@psu.edu, Guodong Pang

We discuss how the method of chaining can be applied to prove two-parameter process limits for many server queues. It provides useful maximal inequalities for two-parameter processes. The method is universal for models with general i.i.d. and dependent service times, and with general time-varying service times (e.g., arrival dependent services or entering-service-time dependent services).

Sponsored: Financial Services

Sponsored Session

Chair: Kuno Huisman, Tilburg University, Best, Netherlands, kuno.huisman@gmail.com

1 - Predatory Pricing Under Uncertainty: Revisiting The Deep Pocket Argument

Maria Lavrutich, Tilburg University, mlavrutich@gmail.com

In this paper we develop a stochastic model of predatory pricing. When profits evolve stochastically, a negative demand shock can lead to bankruptcy for firms, that cannot immediately raise external capital. This creates incentives for market incumbents to use predatory pricing strategies in order to keep new players out of the industry. We show that firms may use a large cash reserve as a war chest to initiate a price war that could drive the opponent out of the market. Because of uncertainty the new player may wish to take a chance and enter based on the probability of success. Therefore, the realized market structure may vary for different sample paths of the stochastic process.

2 - Optimal Timing Of Technology Adoption By Incumbents: War Of Attrition Versus Preemption

Nick Huberts, Tilburg University, N.F.D.Huberts@uvt.nl

I consider two incumbent firms with an option to adopt a differentiated technology. The firms decide upon both the investment moment and the investment size. I find that adoption kills the old technology only when innovation is radical. When the degree of innovation is small and when the products are not close substitutes a war of attrition arises. Otherwise the firms end up in a preemption equilibrium. When a second-mover advantage is present, firms either want to stay alone on the old market or want to set a larger capacity as Stackelberg follower. Market uncertainty increases the first-mover advantage and at the same time makes it more attractive for the endogenous follower to forego adoption.

3 - Disruptive Innovation In A Declining Market

Kuno Huisman, Tilburg University, kuno.huisman@gmail.com

The paper considers the problem of a firm operating in a declining market. The firm has an option to innovate and has to derive the right time to do so, if at all. We find that it can be optimal for the firm to innovate because of two reasons. The first reason is that a new technology is available with which the firm can achieve high profits. The second reason is that, due to demand saturation, profits of the established product have become so low that the firm will adopt a new technology even if the newest available innovation has not improved for some time.

Behavioral Considerations in Pricing and Revenue Management

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Monire Jalili, The University of Oregon, 488 Lillis, Lundquist College of Business, Eugene, OR, 97403, United States, mjalili@uoregon.edu

1 - Dynamic Pricing And Learning In Prediction Markets

Adam Schultz, University of Chicago-Booth School of Business, Chicago, IL, United States, adam.schultz@chicagobooth.edu, John Birge, N. Bora Keskin, Yifan Feng

We consider a market maker who operates a prediction market for an event with an uncertain outcome (e.g., government election, sporting event, etc.) and must dynamically select a control (i.e., price) over time. We characterize the market maker's optimal policy when the market includes only myopic agents and show how a myopic policy exhibits near-optimal performance. We also consider a market including a strategic agent who knows the event outcome (e.g., an insider trader) and demonstrate that the market maker's policies are robust to the presence of a strategic agent in the market.

2 - Try Before You Buy Pricing. Should Rental Fees Apply To Purchases?

Monire Jalili, The University of Oregon, mjalili@uoregon.edu, Michael Pangburn

When a product has uncertain value or is used repeatedly over time, customers may opt to rent the product before purchasing. In some instances, sellers entice purchase conversions by offering part of the already-paid rental fee as a discount towards purchase. But, another common pricing tactic is for the seller to apply no such credit towards conversion to purchase. In this paper, we analyze the optimal pricing and discounting policy for a monopolist selling to a market of consumers facing uncertain product valuation, and derive the conditions under which a firm should optimally apply some of the rental price towards the product purchase.

3 - Analysts Decisions In Airline Revenue Management – An Experimental Study

Claudia Schuetze, M.Sc., RWTH Aachen University, Aachen, Germany, claudia.schuetze@rwth-aachen.de, Catherine Cleophas

Revenue management could, in theory, fully rely on automated systems to predict demand and optimize revenue. In practice, analysts play a crucial role for revenue management. They influence the system given additional information about market changes and the firm's strategic objectives. We present a range of behavioural experiments to test how analyst decisions are affected by factors such as demand complexity and decision variables. Our analysis considers achieved revenue, learning effects, and decision biases. The aim is to prepare the ground for an improved decision support for revenue management analysts.

Sponsored Session

Chair: Majid Karimi, Waterloo, ON, Canada, mk.majidkarimi@gmail.com

1 - Accept-reject Mechanisms For Team Formation

Yevgeniy Vorobeychik, Vanderbilt University, Nashville, TN, United States, eug.vorobey@gmail.com, Jian Lou, Martin van der Linden, Gregory Leo, Pranav Batra, Chen Hajaj, Myrna Wonders

Team (coalition) formation has been studied from a number of perspective. However, treatment of this problem from the point of view of mechanism design has received relatively little attention, with few concrete and general mechanisms proposed. We describe and motivate a class of accept-reject mechanisms for this problem, and demonstrate their theoretical properties (both positive and negative). These mechanisms are computationally very challenging, and we describe several algorithmic approaches to these.

2 - Prediction Market Equilibria Via Substitutes And Complements

Bo Waggoner, Harvard University, Computer Science, bwaggoner@fas.harvard.edu

Based on joint work with Yiling Chen. I will propose definitions for when pieces of information, modeled as signals, can be considered substitutes or complements. We will see that substitutes (respectively, complements) characterize cases where prediction market participants rush to truthfully report (respectively, delay as long as possible). I will try to give a geometric picture for how probabilistic structure of signals and choice of scoring rule interact to produce substitutes or complements, and discuss implications for designing markets.

3 - Arbitrage-free Combinatorial Market Making Via Integer Programming

Christian Kroer, Carnegie Mellon University, ckroer@cs.cmu.edu, Miroslav Dudík, Sébastien Lahaie, Sivaraman Balakrishnan

We present a new combinatorial market maker that operates arbitrage-free combinatorial markets specified by integer programs. Although the problem of arbitrage-free pricing with bounded loss is #P-hard, we posit that the typical case might be amenable to modern integer programming (IP) solvers. At the crux of our method is the Frank-Wolfe algorithm which is used to implement a Bregman projection aligned with the market maker's cost function, using an IP solver as an oracle. We demonstrate the tractability and improved accuracy of our approach on real-world prediction market data from combinatorial bets placed on the 2010 NCAA Men's Division I Basketball Tournament.

4 - Making Science Of "Black Art": Risk Bias In Market Scoring Rules

Majid Karimi, University of Waterloo, Faculty of Engineering, mk.majidkarimi@gmail.com, Stanko Dimitrov

We study market scoring rules (MSRs) prediction markets (PMs) in the presence of risk averse or risk seeking agents. We show that agents' submitted reports always deviate from their beliefs. This means, in most cases it is impossible for a MSR PM to elicit an agent's belief. We introduce a measure to calculate the deviation between an agent's report, and her personal belief. We find that the deviation of a MSR PM is related to the amount of market depth provided by the MSR's cost-function PM. We use the relation between deviation and market depth to present the first systematic approach to determine the optimal amount of market depth, an activity that has been described as "black art" in the literature.

Strategic Management Decision Making

Sponsored: Decision Analysis

Sponsored Session

Chair: Dharma Kwon, University of Illinois at U-C, Champaign, IL, United States, dhkwon@illinois.edu

1 - Dynamic Sourcing Decisions In Presence Of Technology Spillover Risks

Yunke Mai, Duke University, yunke.mai@duke.edu, Sasa Pekec

We study optimal dynamic sourcing decisions of a serial innovator. There are two types of manufacturers: competitive ones who might pose technology spillover risks, and non-competitive ones. Manufacturers' production capabilities are uncertain, impacting success of innovations. Single period contracts allow learning about the uncertainty by observing the production outcome. Long-term contracts lock the innovator with one manufacturer but guarantee a low wholesale price. We describe optimal strategies and show that contracting with a competitive manufacturer could be attractive as it allows for sharing the innovation risk in exchange for the technology spillover exposure.

2 - When Suppliers Climb Value Chain: A Theory Of Value Distribution In Vertical Relationships

Zhixi Wan, University of Oregon, Eugene, OR, United States, zwan@uoregon.edu, Brian Wu

Offshore outsourcing gives rise to the phenomenon of value chain climbing - suppliers in emerging markets can develop capabilities by supplying, with aspirations to compete with the buyers in the product market. We build an analytical model to study the impact of value chain climbing on value distribution in vertical relationships. The analysis identifies a set of dominant relationships, characterizes how the buyer's optimal choice among these relationships depends on firms' relative competitiveness in the product market and the supplier's speed of capability development, and shows how the optimal choice evolves with the dynamics of the supplier's capability development.

3 - Strategic Investment In Common Assets Under Uncertainty

Dharma Kwon, Associate Professor, University of Illinois at Urbana-Champaign, Champaign, IL, United States, dhkwon@illinois.edu, Youngsoo Kim, George Georgiadis

We investigate the game of investment in common assets under uncertainty as a two-player stochastic war of attrition in continuous time. We characterize the equilibrium when there are indefinitely many opportunities of investment. We focus on the impact of stochasticity and the asymmetry between the two players.

4 - Playing A Dominated Strategy In A Simple Bankruptcy Case: Field And Experimental Data

Steven A Lippman, Univ of California-Los Angeles, slippman@anderson.ucla.edu, Sushil Bikhchandani

We consider a real life bankruptcy case in which the judge asked unsecured creditors the least they would accept in full satisfaction of their claims. Even when real money is at stake, creditors play dominated strategies. An even greater percentage of MBAs play dominated strategies.

Network Economics I

Sponsored: Simulation

Sponsored Session

Chair: Bruno Tuffin, INRIA, Rennes Cedex, France, bruno.tuffin@inria.fr

Co-Chair: Patrick Maillé, Telecom Bretagne, 2, rue de la Cha^taigneraie, Cesson Sévigné, 35576, France, patrick.maille@telecom-bretagne.eu

1 - Auctions For Online Ad Space Among Advertisers Mixing Pay-per-view And Pay-per-click

Bruno Tuffin, INRIA, bruno.tuffin@inria.fr, Patrick Maillé

Advertisement in dedicated webpage spaces or in search engines sponsored slots is usually sold using auctions, with a payment rule that is either per view or per click. But advertisers can be both sensitive to being viewed and being clicked. We generalize the auction mechanism by including both pricing components. Applying VCG auctions, we show how to compute payments to ensure incentive compatibility from advertisers as well as maximize the total value of the advertisement slot(s). We provide bounds for the loss of efficiency due to applying only pay-per-click (or pay-per-view) pricing instead of our scheme. We also describe how the generalized second price auction can be extended to this context.

2 - Investment And Competition With Shared Spectrum

Randall Berry, Northwestern University, rberry@eecs.northwestern.edu

Meeting the exploding demand for wireless data services will require access to new wireless spectrum. This in turn has led to much interest in approaches for sharing spectrum among different users. These approaches raise not only technical challenges but also can fundamentally change the economic interactions among wireless service providers. We consider such effects by adapting models for price competition with congestible resources. We also study how such sharing can impact a service provider's incentives to invest in shared spectrum bands.

3 - Data Bundling And Pricing In The Internet Of Things

Maurizio Naldi, University of Rome Tor Vergata, Roma, Italy, naldi@disp.uniroma2.it, Luis Guijarro, Vicent Pla, José Ramon Vidal

The upcoming Internet of things will generate a massive amount of data. Much of them will be distributed and traded in a marketplace. Brokering third-parties may ease the relationship between data producers and data consumers. Brokers take care of bundling data coming from different sources and delivering them to consumers within a single commercial offer. In this context, pricing data is an extremely important decision, impacting both the broker's role feasibility and the success of the distributing scheme. Optimal pricing strategies are derived and discussed, considering their impact on all the stakeholders.

Demand Learning with Strategic Customers

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Xi Chen, New York University, Stern, New York, NY, United States, xchen3@stern.nyu.edu

Co-Chair: Zizhuo Wang, University of Minnesota, Minneapolis, MN, United States, zwang@umn.edu

1 - Nonparametric Algorithms For Joint Pricing And Inventory Control With Lost-sales And Censored Demand

Beryl Boxiao Chen, University of Illinois at Chicago, Chicago, IL, United States, boxchen@umich.edu, Xiuli Chao, Cong Shi

We consider the classical joint pricing and inventory control problem with lost-sales and censored demand in which the customer's response to selling price and the demand distribution are not known a priori, and the only available information for decision-making is the past sales data. A major difficulty lies in the fact that the estimated profit function from observed sales data is multimodal even when the expected profit function is concave. We develop a nonparametric data-driven algorithm and show that the algorithm converges to the optimal policy as the planning horizon increases, and obtain the convergence rate of regret.

2 - Bayesian Dynamic Learning And Pricing With Strategic Customers

Xi Chen, New York University, xchen3@stern.nyu.edu, Zizhuo Wang

In this talk, we study a pricing problem when the customer is aware of the seller's policy, and thus may behave strategically when making a purchase decision. We first show that a naive myopic Bayesian policy (MBP) by the seller may lead to incomplete learning —- the seller may never be able to ascertain the true type of the customer and the regret may grow linearly in time. To resolve this issue, we propose a randomized Bayesian policy (RBP), which updates the posterior belief of the customer in each period with a certain probability. We show that the seller can learn the customer type exponentially fast with the RBP even if the customer is strategic, and the regret is bounded by a constant.

3 - Operational Implications Of Choice Paralysis

Srikanth Jagabathula, New York University, sjagabat@stern.nyu.edu, Rene A Caldentey, Anisha Patel

We consider the operational implications of the "choice paralysis" effect, which states that customers are less likely to choose as the number of choices becomes large. The choice paralysis effect has been established in various lab studies, but so far has received little attention in the operations community. To address that, we first carry out an empirical study with supermarket data and observe that, at the aggregate-level, the choice paralysis effect varies across different product categories. Based on this evidence, we propose a modification to the multinomial logit (MNL) model to capture the choice paralysis effect. In the context of the model, we discuss the operational implications.

Unique Applications in Pricing and Revenue Management

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Jon A Higbie, Revenue Analytics Inc, Atlanta, GA, United States, jhigbie@revenueanalytics.com

1 - Emerging Topics In Revenue Management For The Cruise Industry

Gregory Vogel, Holland America Line, gvogel@hollandamerica.com

Much research has been done in traditional travel and hospitality industries such as Airlines, Hotels, Resorts, Casinos etc. Very little has been done in regards to the specific problem that are cruise lines. In this talk we discuss similarities and differences between traditional OR research into these industries and the cruise industry and then delve into the problems that the industry is most interested in solving along with an overview of problems that are currently being investigated.

2 - Pricing Strategies For Sustainable Green Marketing

Thunyarat Bam Amornpetchkul, Faculty member, NIDA Business School, Bangkok, Thailand, thunyarat.a@nida.ac.th

This study investigates the potential of using pricing strategies to improve the sustainability of businesses, environments, and the society. Different scenarios, in terms of manufacturer's cost structure and customer valuation of the green product, are analyzed. Under each scenario, we propose an optimal pricing strategy which could bring about a larger profit to the manufacturer as well as reduced consumption of the non-green product. Based on the findings, we suggest measures to help create a market situation where green products are likely to thrive.

3 - Driving Organic Revenue Growth With Ancillaries

Dan Iliescu, Revenue Analytics, diliescu@revenueanalytics.com

The application of Pricing and Revenue Management principles beyond traditional revenue streams are generating organic revenue growth opportunities for companies. Among recent developments in this area, analytical solutions that incorporate ancillary offerings were first introduced in industries such as airlines, travel and hospitality, and car rental. This presentation focuses on presenting a high level overview of key design considerations while implementing Ancillary Pricing and Revenue Management solutions. In addition, this presentation outlies practical examples of successful applications, while uncovering and identifying opportunities for future research.

Intelligent Applications in Social Media Analytics

Invited: Social Media Analytics

Invited Session

Chair: Victor Benjamin, University of Arizona, 1130 E Helen St, Tucson, AZ, 85719, United States, vabenji@email.arizona.edu

1 - Is Weight Loss Social Contagious?

Chunxiao Li, Arizona State University, chunxiaoli@asu.edu, Bin Gu

The recent IT innovation invokes the emergence of weight intervention mobile apps, in which massive users share their weight loss achievements to their peers. Except for monetary incentive, the social networking may provide extra incentive for weight loss behavior, and therefore results in better outcomes. This paper studies how users' weight loss behavior can be affected by both monetary reward and behavior of their followees, controlling for personal characteristics and experience with the app. Moreover, we examine the interplay between the two incentives. We suggest that app designers should better use social contagion together with monetary incentive to motivate health related behavior.

2 - A Sentiment Breakdown Approach For Dissecting The Dna Of Medical Social Media Posts

Anwar Chutoo, University of Utah, anwar.chutoo@utah.edu, Olivia R Liu Sheng

Many medical social forums allow a user to rate their experience with a drug according to different criteria. While these ratings have high correlations, we propose to dissect differences between them according to the sentiments in different types of sentences within the post. We test a series of hypotheses regarding the relationships between sentiments of different types of sentences and ratings. We also demonstrate that the texts in user reviews can successfully explain the variations between the ratings. We introduce a novel method to describe qualitative aspects of drugs using texts from user reviews and sentiments rather than ratings.

3 - Understanding Malicious Tools In Underground Hacker Communities

Sagar Samtani, University of Arizona, sagars@email.arizona.edu

As many modern facilities are becoming reliant upon computing technology, cybersecurity is becoming a societal concern. Many cyber-attacks are executed using tools like Zeus Trojans or Point of Sale Malware. These tools, also known as hacker assets, are often accessible in online, hacker forums. However, collecting and analyzing such tools is a non-trivial task. This study demonstrates a web, data, and text mining framework leveraging techniques such as SVM, LDA, and social network analysis to analyze and identify hacker assets and key hackers in underground hacker forums. The results of this study indicate that emerging forum assets are consistent with root causes of recent cyber-attacks.

Teaching Analytics

Sponsored: Education (INFORMED)

Sponsored Session

Chair: Thomas G Groleau, Carthage College, Kenosha, WI, United States, tgroleau@carthage.edu

1 - Topics And Goals For An Introductory Business Intelligence Course Offered To Business Majors

Wendy Swenson-Roth, Georgia State University, wroth@gsu.edu

Analytics skills are in demand by business. Business schools are seeking to provide classes to address this need. In an introductory course for business students, what topics need to be covered to provide a foundation in this field. Also, what methods can be used to improve student understanding.

2 - Back To Basics: Framing The Foundations Of Analytics

Patrick S. Noonan, Goizueta Business School, Emory University, Atlanta, GA, United States, patrick.noonan@emory.edu

Analytics represents substantial new opportunities for INFORMS researchers & educators. The good news: "Analytics" remains hot. The bad news: Few people can explain exactly what it is. The worse news: Opinions vary widely, so the word is becoming meaningless mush. By asserting a better framework for "analytics," INFORMS educators can create wins all around: sharpening the definition for researchers and practitioners; increasing the impact of our courses on student understanding, skill, and ability to apply to real problems; and heightening visibility for our fields in the analytics boom. The keys to coherent integration of the modeling & data science worlds: decision-making & decision analysis.

3 - Alternate Framework For Analytics Education

Thomas G Groleau, Carthage College, tgroleau@carthage.edu

The Descriptive, Predictive, and Prescriptive Analytics framework for analytics has become widely accepted. At the same time, the terms "analytics" and "data analytics" are often used interchangeably and students can get the impression that all analytics is based on data. For educational purposes, we should consider an alternate framework that simply distinguishes between data based and model based analytics so that students get a more accurate view of the field.

Chair: Narasimhan Ravichandran, Indian Institute of Management-Ahmadabad, Wing 2 D, Vastrapur, Ahmedabad, 380015, India, nravi@iimahd.ernet.in

1 - Tailgating Games As Teaching Tools

Matthew Bailey, Associate Professor, Bucknell University, School of Management, Taylor Hall, Lewisburg, PA, 17837, United States, matt.bailey@bucknell.edu

Many students are familiar (some too much so) with common tailgating and backyard games such as cornhole and ladderball. I will present an activity to exploit this experience and solidify student understanding of data collection and analysis, modeling, and Monte Carlo simulation. This activity is sufficiently flexible and scalable to be used as a single project or as a set of small scaffolding activities culminating in a comprehensive project. The presenter will share his experience with this activity in an undergraduate business analytics course with associated student feedback.

2 - Understanding The Impact Of In-class Undergraduate Research In Engineering Education For Non-traditional Students: An Adaptive Guide

Justin Yates, Assistant Professor, Francis Marion University, PO Box 100547, Florence, SC, 29501, United States, jyates@fmarion.edu, Lorna Cintron-Gonzalez, Rahul Renu

Engineering students with non-traditional backgrounds face significant challenges during their early years in engineering. This talk discusses the adaptation of Freshman-Sophomore curriculum to include early and frequent exposure to research-based course assignments and examines the impact of these practices on student efficacy and academic performance. The model used is adapted from colleagues in Sociology who have implemented such practices for 14 years in a rural, public university in South Carolina and consistently see 30% or higher graduate school enrollment within their Senior class.

3 - Awesome A Women In Stem Student And Faculty Organization For Small Universities And Colleges

Stephany Coffman-Wolph, Assistant Professor, West Virginia University Institute of Technology, 105 Silver Maple Ridge, #5, Charleston, WV, 25305, United States, sscoffmanwolph@mail.wvu.edu

AWESOME (Association for Women Engineers, Scientists, Or Mathematicians Empowerment) was started 2 years ago at WVU Tech to bring together female students and faculty for a variety of activities including: networking, outreach, speaker events, and professional development. AWESOME was designed specifically for smaller universities/colleges that may be unable to support several field-specific female organizations. This presentation describes the structure of the organization, previous and future activities, and the challenges/advantages of an inclusive and diverse STEM organization.

4 - Managing Transport Concession To Senor Citizens

Narasimhan Ravichandran, Indian Institute of Management-Ahmadabad, Wing 2 D, Vastrapur, Ahmedabad, 380015, India, nravi@iimahd.ernet.in

We present by a case study the challenges in administering a transport concession scheme in India for senor citizens and means to deal with them .The case can be used in a MBA class to illustrate the use of formal methods in structuring a managerial context.The teaching approach is documented as apart of the case study.Some general abstraction as how subsidy can be handled is also discussed.

Chair: Hamed Kianmehr, PhD Student, Binghamton University, 142 1/2 Beethoven, Binghamton, NY, 13905, United States, hkianme1@binghamton.edu

1 - A Non-discretionary Dea Methodology For Competitive Environment Analysis In Retailing

Yeming Gong, Em Lyon Business School, Building B, Office 1018, 23 Avenue Guy De Collongue, Ecully, 69134, France, gong@em-lyon.com, Jiawen Liu

Competitive environment analysis is critical to global operations strategy research. We develop a non—discretionary two-stage DEA model, allowing supply chain capability as inter-temporal effects in efficiency measuring, to assess the corporate performance in retailing industry and verify the influence of the environment. Using first-hand and second-hand data of more than 100 organizations from 32 countries and regions in retailing industry, we provide a new method using non—discretionary DEA integrated with econometric analysis in competitive environment analysis for retailing supply chain strategy.

2 - Hospital Performance Evaluations In New York State Using Data Envelopment Analysis

Kelly Ann Stickle, Stony Brook University, 120 Sound Beach Blvd., Sound Beach, NY, 11789, United States, Kelly.Stickle@stonybrook.edu, Thomas Raymond Sexton, Christine Pitocco

With the healthcare system focused on improving quality, measuring hospital performance is essential in order to maximize efficiency and to implement improvements system wide. We use DEA to evaluate hospitals in New York State. Inputs include number of deaths, number of readmissions, and average length of stay. The sole output is the number of survivors. Site characteristics take into account the expected length of stay and total number of patients.

3 - Assessing China's Healthcare Service Efficiency Using Improved Dynamic Data Envelopment Analysis

Tao Du, Beijing Institute of Technology, Beijing, China, dutao0608@163.com

We propose a DtSBM model, which has improved the existing Dynamic DEA model DSBM and more accordant with the practical situation. The model is applied for measuring the healthcare service efficiencies of China's 31 provinces through panel data from 2008 to 2013. By measuring the DMUs' term efficiencies and overall efficiencies, we proves the china's new medical and health system reform, which was acted in 2009, has obvious effect. This research also results that the efficiency scores of eastern region is highest, western region is second, and the central region is lowest. According to the analysis of the inefficiency DMUs, we also figures out the improved orientations and objectives.

4 - The Use Of Spatial Traffic Data For Traffic Signal Control At Signalized Intersections

Pei-Shan Hsieh, Univerisy of Arizona, Tucson, AZ, 85721, United States, phsieh@email.arizona.edu, Wei-Hua Lin, Zeng Wang

In this study, we consider the use of spatial data for traffic signal control at signalized intersections, replacing the conventional data sources, those generated from the existing stationary traffic surveillance systems. Time-dependent location coordinates obtained from individual vehicles are processed into information key to traffic control at signalized intersections for determining the optimal green time allocation and cycle length.

5 - A Dynamic Model of Antibiotic Prescribing for Acute Respiratory Tract Infection

Hamed Kianmehr, PhD Student, Binghamton University, 142 1/2 Beethoven, Binghamton, NY, 13905, United States, hkianme1@binghamton.edu

The emergence of antimicrobial resistant diseases has reawakened dangers of a pre-antibiotic era. The issue is largely tied to the decreased production of new classes of antibiotics and antibiotic misuse in agriculture, etc. Compounding this issue are changing guidelines for killing these evolving organisms as well as the need for greater vaccine compliance. This imminent risk highlights past and fomenting structural failures contributing to nosocomial and community associated antibiotic resistant infections. This paper seeks to evaluate the physician decision making process as a focal site for reversing antibiotic resistance trends.

Inventory Management VX

Contributed Session

1 - A Synthesis And Generalization Of Structural Results In Inventory Management: Generalized Convexity Properties

Zhe Liu, Columbia University, 511 W 112th Street, Apt 24C, New York, NY, 10025, United States, zliu18@gsb.columbia.edu, Awi Federgruen, Lijian Lu

Since the initiation of stochastic inventory theory, 65 years ago, a multitude of papers have addressed problems with three principal complications: (a) fixed in addition to variable order costs; (b) orders are subject to capacity limits and (c) possibly bilateral adjustments of inventories. Different papers cover a specific subset thereof, under specific restrictions. This paper addresses the fully general model, characterizing the structure of an optimal policy and identifying an associated solution method. We thus provide a unifying structure that synthesizes and generalizes a seemingly disparate set of structural results.

2 - Incorporating Parcel Transportation Costs Into Lot Sizing Decisions

Matthew J Drake, Associate Professor of Supply Chain Management, Duquesne University, School of Business, 925 Rockwell Hall, Pittsburgh, PA, 15282, United States, drake987@duq.edu, Adam Wenger

For the past century, researchers have created and studied variants of the EOQ model. One consideration that has been left relatively untouched has been the inclusion of parcel transportation costs into the lot sizing decision. Examination of the parcel rate tables for UPS and FedEx Ground shows that the rates are not linear with respect to the shipment weight. We have developed linear approximations for these rates and have examined the performance of this approximate model compared to the cost of the global optimal order quantity. We have also extended the model to consider the new dimensional pricing based on the volume of the shipment that parcel carriers have introduced in recent years.

3 - Monitoring Inventory Control Forecasting System Under Non-normal Input Noise Distributions

Hoda Sabeti, West Virginia University, 390 Gilmore St., Morgantown, WV, 26505, United States, hoda.sabeti@gmail.com, Omar Ahmed Al-Shebeeb, Majid Jaridi

In quantitative forecasting models and tracking signal methods, the input noise is often assumed to be normally and independently distributed. The goal in this paper is to study the distribution of tracking signal and build new monitoring schemes when the input noise distribution is not necessarily normal. To perform the analysis, we simulate a demand process in Wilson inventory model, using several input noise distributions. The effectiveness of the proposed tracking signal model is evaluated and compared to existing methods using an inventory cost model.

1 - Dynamic Resource Allocation For Effective Distribution Of In Kind Donations

Merve Ozen, PhD Student, University of Wisconsin-Madison, 602 Eagle Heights, Apt I, Madison, WI, 53705, United States, mozen@wisc.edu, Ananth Krishnamurthy

In the aftermath of a disaster, victim demands for relief items exceed the immediate supply. In-kind donations sent to the affected region help reduce the gap. In most cases, large amounts of cargo of various degrees of priority arrive at a disaster site with in a short period of time. To sort, grade and distribute the critical resources; prioritization and staffing decisions must be made. We model this problem as a discrete time, discrete state space, finite horizon decision problem where the number of resources to be dedicated to sorting operations is decided. We investigate the structure of the optimum policies and provide managerial insights for humanitarian organizations.

2 - Robust Ambulance Allocation Using Risk-based Metrics

Kaushik Krishnan, Graduate Research Assistant, University of Illinois at Urbana-Champaign, Urbana, IL, United States, kkrishn3@illinois.edu, Lavanya Marla

We present robust location strategies for an ambulance fleet in order to maximize service levels under unexpected demand patterns. Our work is motivated by the fact that when small parts of networks incur large emergencies (modeled as a heavy-tailed distribution), the entire system behaves in a heavy-tailed manner. We achieve robust allocations by including risk metrics that account for tail behavior as well as average performance. We build an efficient data-driven algorithm that optimizes based on risk metrics. Our computations show that our solutions account for spatiotemporal patterns and prevent the extent of delay cascades that are typically seen in heavy-tailed arrival distributions.

3 - Identifying And Monitoring International Shipments Of Hazardous Materials And Waste

Haibo Wang, Killam Distinguished Professorship, Texas A&M International University, 5201 University Boulevard, Laredo, TX, 78045, United States, hwang@tamiu.edu

This project will develop a decision support system for identifying and monitoring international shipments of hazardous materials and waste using service-oriented platform, and provide participants with a U.S. domestic and international cross-border pilot program.

Finance II

Contributed Session

Chair: Phillip J Lederer, Professor, University of Rochester, Simon School of Bus Admin, Rochester, NY, 14627, United States, Lederer@simon.rochester.edu

1 - Toward A Firm Inefficiency Risk Factor Of Stock Returns: Model And Empirical Analysis

Daqi Xin, PhD Student, Rensselaer Polytechnic Institute, 110 8th St, Troy, NY, 12180, United States, xind@rpi.edu, Chanaka Edirisinghe

Relative operational inefficiency of a firm in responding to supply/demand competition manifests in high distress risk and vulnerability to economic shocks. A set of firm financial variables are used to compute the inefficiency, relative to its competition, having a positive lagged correlation and negative synchronous correlation with stock returns. The proposed new inefficiency risk factor for the market is robust to size, value and momentum risk factors.

2 - Review And Evaluation Of Operations Capital Projects

Phillip J Lederer, Professor, University of Rochester, Simon School of Bus Admin, Rochester, NY, 14627, United States, Lederer@simon.rochester.edu

A major interface between finance and operations is a firm's capital justification process by which are set of activities to evaluate and approve a project proposal, and to tie the its performance to managers' incentives. We study a principal-agent model where the agent is a manager who designs and proposes a project and, if approved, oversees its execution, and where the principal is general management. A unique aspect of this research is the agent's choice of project, its effort to manage risk and private information project riskiness. The magnitudes of economic losses due to mis-designed compensation structure, observability of effort, and information asymmetry are presented.

Location of Energy-Efficient Facilities

Sponsored: TSL, Facility Logistics

Sponsored Session

Chair: Mohannad Kabli, Mississippi State Univ, MSU, Mississippi State, MS, 39762, United States, mrk297@msstate.edu

Co-Chair: Mohammad Marufuzzaman, Mississippi State University, PO Box 9542, Starkville, MS, 39762, United States, marufuzz@dasi.msstate.edu

1 - Stochastic Model For Locating Multiple Type Recharging Station Under Flow Uncertainty

Sushil Raj Poudel, PhD Candidate, Mississippi State University, Department of Industrial & Systems Engineering, P.O. Box 9542, Starkville, MS, 39762, United States, srp224@msstate.edu, Md Abdul Quddus, Sudipta Chowdhury, Mohammad Marufuzzaman, Linkan Bian

This study presents a two-stage stochastic mixed-integer programming model to formulate capacitated multiple-recharging station location problem under flow uncertainty. We solve the problem using a hybrid decomposition algorithm combining sample average approximation with an enhanced progressive hedging algorithm We use Washington DC as a testing ground to visualize and validate the modeling results. The computational experiments provide the geographical distribution for multiple types of recharging stations to ensure the completion of overall tours of multiple type of electric vehicles in each path.

2 - Biorefinery Location And Green Perspectives

Javier Faulin, Full Professor, Public University of Navarra, Los Magnolios Bdg. 1st floor, Campus Arrosadia, Pamplona, 31006, Spain, javier.faulin@unavarra.es, Adrian Serrano-Hernandez, Alejandro Garcia del Valle, Javier Belloso

The concern about sustainability is gaining importance leading to seek for renewable energy sources to reduce greenhouse gas emissions (GHG) in transportation. Therefore, this work proposes a procedure to determine a biorrefinery location considering its supply chain environmental impact (including, among others, crop selection and stock policy). A Mixed Integer Linear Programming model, coded in GAMS, was solved giving promising results. Thus, some meaningful sensitivity analysis were run in order to have the environmental criteria met at an affordable cost. Finally, a case study of location of a Biorefinery in Navarre, Spain has been solved.

3 - Chance-constrained Stochastic Programming Model For Locating Charging Stations Under Uncertainty In Green Power Availability

Sudipta Chowdhury, Mississippi State University, sc2603@msstate.edu, Mohannad Kabli, MD Abdul Quddus, Mohammad Marufuzzaman

Due to the scarcity and negative consequences the use of fossil fuel brings, green energy sources are being increasingly used as an alternative clean source of electricity. Electric vehicles are a part of the solution, and their spread is imminent as the technologies of batteries are advancing faster than ever. This calls for plans that regulates the potential increase in the number of charging stations, which will lead to an increase in the demand for electricity. This work presents a chance-constrained stochastic programming model that plans for the expansion of charging stations with limited power supply and chance-constrained green energy availability.

4 - A Stochastic Programming Approach For Ev Charging Station Expansion Plans

Mohannad Kabli, MSU, mrk297@msstate.edu, MD Abdul Quddus, Mohammad Marfuzzaman

This paper presents a two-stage stochastic programming model that helps making the decisions for expanding and connecting power in anticipation the increase of electric vehicle charging stations under demand uncertainty . We solve the model using a hybrid algorithm that combine Sample average algorithm with an enhanced Progressive hedging (PH) algorithm. Along with SAA and Progressive hedging we applied some heuristics such as Rolling Horizon (RH) algorithm, variable fixing technique to enhance the PH algorithm. We choose Washington DC as a testing ground to visualize and validate the modeling results.

Prescriptive Analytics for Transportation and Inventory

Sponsored: TSL, Freight Transportation & Logistics

Sponsored Session

Chair: Wesley Dyk, Revonos, Lone Tree, CO, United States, wesley.dyk@revonos.com

Co-Chair: Alexander Engau, University of Colorado Denver, NA, Denver, CO, United States, alexander.engau@ucdenver.edu

1 - Stochastic Liquid Inventory Management For Transportation And Logistics

Alexander Engau, Associate Professor, University of Colorado Denver, Denver, CO, United States, aengau@alumni.clemson.edu, Wesley Dyk

This talk presents a recent case study with an independent energy provider in the Denver-Julesburg Basin in Northeastern Colorado, one of the largest natural gas deposits in the United States. In contrast to related exploration and production operations in other geographic locations, for this present case, the inherent logistics of liquid products including crude oil and waste water is limited to distribution and transportation primarily using trucks which require the careful management of their generally uncertain load inventories and qualities. These challenges will be addressed in some detail and their current solutions using stochastic optimization outlined for questions and discussion.

2 - Network Flow Relaxations For Batched Transportation Models

Wesley Dyk, Revonos, wesley.dyk@revonos.com, Alexander Engau

We present a new approach to solve mixed-integer batched transportation models using a new class of network flow relaxation for actual use in real-time applications. This approach has been implemented in actual practice for inventory management and liquid hauling of crude oil and waste water using trucked transportation in the petroleum exploration and production sector to give directive insights to decision makers in short timeline scenarios.

3 - Adaptive Robust Optimization For Tactical Vehicle Routing Problems

Anirudh Subramanyam, Carnegie Mellon University, Pittsburgh, PA, United States, asubramanyam@cmu.edu, Frank Mufalli, Jose M Pinto, Chrysanthos E Gounaris

It is fairly common during the tactical planning of multi-period vehicle routing operations that customer requests arrive dynamically over a planning horizon. This is the case in settings where customer service is provided by appointment. In such settings, the dispatcher must incorporate enough flexibility in the routing plan to accommodate potential customers who have not yet called in to place their order. Failure to do so may result in insufficient fleet capacity to serve future requests. We shall describe an adaptive robust optimization approach to solve this problem and illustrate the tradeoffs in using an adaptive strategy over a static strategy in terms of computational time and cost savings.

4 - Analytics For Logistics Supply Chain: An Overview And Research Outlook

M. Ali Ulku, Rowe School of Business, Dalhousie University, Halifax, NS, Canada, ulku@dal.ca

There are myriad of opportunities, and thereby challenges, for research and education in supply chain management. This talk comprises of an overview of the current literature and practices and an outlook as to how companies can employ analytics for logistics supply chains so as to gain a competitive edge.

Yard and Terminal Operations

Sponsored: Railway Applications

Sponsored Session

Chair: Tyler Dick, University of Illinois, Urbana, IL, United States, ctdick@illinois.edu

1 - Switch-it; A New Yard Modeling Tool

Chip Kraft, Transportation Economics & Management Systems, Inc., ckraft@temsinc.com

SWITCH-IT simulates any type of rail yard, tracking each car movement as trains arrive and depart and cars are sorted, inspected, repaired and flat switched. Command scripts give the user total control over the simulation. The model supports fixed block-to-track assignment, dynamic block “swinging” and matrix sorting; pull and cut, shove and couple, and push back to clear from either end of the yard. It simulates lead confliction, crossovers and ladder tracks. Animation uses a “console” presentation which accepts, but does not require detailed track network coding. Its simple yet powerful approach to modeling complex yard operations provides quick feedback and a simple user interface.

2 - Animation Of Switch-it Analysis Using Anylogic

Roger William Baugher, President, TrAnalytics, LLC, 100 Villamoura Way, Johns Creek, GA, 30097, United States, rwbaugher@aol.com

In an earlier presentation, the features and capabilities of the SWITCH-IT program were described and demonstrated. While the program provides an animation capability, a richer animation environment was desired. Using a newly developed interface, data were fed to AnyLogic’s Rail Library, resulting in new and enhanced animation capabilities, which will be described and demonstrated.

3 - Blocking Capacity, Throughput Volume And Level Of Service In Hump Classification Yards

Tyler Dick, University of Illinois, ctdick@illinois.edu

This presentation summarizes simulation research on fundamental hump classification yard capacity relationships. In particular, simulation experiments have been conducted to quantify the relationship between level of service and throughput volume of railcars as a function of the number of blocks assembled in the yard.

4 - Boston North Terminal District: Infrastructure Demand Modeling And Improvements

Bradford Kippen, University of Illinois, Urbana, IL, 61801, United States, kippen2@illinois.edu

Boston’s Tower A Interlocking connects all of the MBTA’s North Side commuter rail lines with North Station terminal and has over 260 daily scheduled trains. Proposed replacement of the Charles River Drawbridges, critical interlocking appliances, catalyzed development of Infrastructure Demand Models which quantify minute to minute demand for infrastructure at key locations given a proposed plan of operations and conditional infrastructure constraints. This presentation outlines the project background, modeling methodology, proposed improvements, and potential applications.

1 - Analyzing Interactions Between Social And Technical Systems: A Retrospective Study In The Pediatric Environment

Yi-Chin Kato-Lin, Hofstra University, Hempstead, NY, United States, YiChin.Lin@hofstra.edu

Using the lens of Socio-technical theory, we examine the effect of digitization of individual pain plans (IPP) on process outcomes of care delivery for patients with sickle cell disease, and the interactions between digitized IPP and care delivery teams. We found improved care coordination and satisfaction, unaltered usage behavior among physicians, and an unexpected, negative opinion among nurses that might explain the neutral/negative process outcomes after the digitization. Our results provide new insights into the important and inconclusive debate about the diverse impacts of HIT.

2 - Dynamics Of Social Influence On New Employees' Use Of Volitional Is: m-EHR Case In Hospital Setting

Sanghee Lim, The Johns Hopkins University Carey Business School, 100 International Drive, Baltimore, MD, United States, lim.sanghee@jhu.edu, Juntae Kim, Byungtae Lee, Jae-ho Lee, Yura Lee

We investigate the effect of social influences on m-EHR usage by new doctors who recently began working at a hospital. Drawing upon the concept of organizational socialization and social influences, we hypothesize that coworkers' m-EHR usage is positively associated with one by new doctors, and the strength of this association varies by the coworkers' type of usage, by the hierarchical rankings of coworkers, and by the stage of socialization process in which the new doctors are situated. Our analyses using longitudinal m-EHR usage data generally support our hypotheses.

3 - Does Health Information Technology Change The Prospect Of Continuity Of Care?

Changmi Jung, Johns Hopkins University, changmi@jhu.edu

Continuity of care has long been the core element in healthcare discussion particularly concerning the improvement of care quality and patient health outcome. However, the emergence of healthcare information technology (HIT) is changing the landscape. As an enabler to comprehensive data storage and immediate information retrieval, HIT is filling the gap in the degree of available information, and thus, empowers more seamless care from end to end. In this study, we examine the effect of HIT on the patient health outcome and the extent of continuity of care in the hospitals in Maryland. Also, we explore the impact of the change in the degree of continuity of care on the patient health outcome.

Chair: Tugce Martagan, Eindhoven University of Technology, P.O. Box 513 5600 MB, Eindhoven, N/A, Netherlands, t.g.martagan@tue.nl

Co-Chair: Murat Kurt, Merck & Co., Inc., TBD, North Wales, PA, 19454, United States, murat.kurt7@gmail.com

1 - Reliability Sensitivity Analysis Based On Kriging Metamodel And Importance Sampling

Juan Wang, Nanjing University of Science and Technology, dongzao1115@gmail.com

Due to the lack of the gradient information, the reliability sensitivity analysis can't be implemented in an analytical manner.Therefore we proposed a simulation-based sensitivity method. It is suggested to compute the failure probability by the combination of Kriging model and importance sampling at first, and then the estimator of failure probability is differentiated through the score function approach. The calculation of failure probability resort to the construction of an accurate Kriging surrogate of the limit state function, and score function approach enables the estimation of the gradient of the failure probability without any additional evaluation to the limit state function.

2 - Optimize The Prognostic Performance Of Data-level Fusion Approach

Changyue Song, University of Wisconsin - Madison, Madison, WI, United States, csong39@wisc.edu, Kaibo Liu

Multiple sensors have been widely employed to monitor the degradation status of a unit. Since each sensor signal contains partial and dependent information, data-level fusion methods have been proposed to combine the information and make decision on the remaining useful life. Existing data-level fusion methods are mainly based on experience and still lack theoretical basis to ensure their prognostic performance. To fill the literature gap, this paper proposes a novel data-level fusion approach with the following features: 1) It ensures the prognostic performance; 2) It allows varying parameters for different units; 3) The training and testing procedures are integrated.

3 - Optimal Reliability And Commonality In Component Design: A Service Logistics Perspective

Geert-Jan van Houtum, Eindhoven University of Technology, Eindhoven, Netherlands, G.J.v.Houtum@tue.nl, Joni Driessen, Joachim Jacob Arts

An Original Equipment Manufacturer sells multiple types of machines to groups of customers under full service contracts. For one component, we consider the design choice between one common component for all machine types and a dedicated component per machine type. We compare the Life Cycle Costs and find general conditions for the optimality of choosing a common and dedicated component, respectively. For a third area, numerical work has to show what is optimal. We also show how these areas behave as a function of numbers of sold machines and the commonality cost factor.

4 - Economic Design Of Run To Failure Binary State K Out Of N Systems With Identical Components And Geometrically Distributed Lifetimes

Tugce Martagan, Eindhoven University of Technology, t.g.martagan@tue.nl, Murat Kurt

K-out-of-N systems represent integrated collection of N individual units of which at least K of them are required to function for the system to survive; and have broader ability to model the operating structure of complex industrial systems. We consider the design of run-to-failure K-out-of-N systems consisting of identical components with geometrically distributed lifetimes under total and average cost criteria. We propose exact and faster approximate approaches to minimize the total cost due to operation, design and failure of the system and derive managerial insights from numerical analyses.

1 - Data Fusion For Degradation Modeling In Multi-edged Machining Processes

Wenmeng Tian, Virginia Tech, 250 Durham Hall, Blacksburg, VA, 24061, United States, tian0414@vt.edu, Jaime Camelio

Tool wear is a widely used direct degradation measure of machining process, and can be measured from the cutting edges using machine vision system. Though there are methods available for single-edge machining process, degradation modeling for a multi-edged machining process using mixed-type data is still a challenge. This work proposes a novel scheme for degradation modeling and prognostics of multi-edged machining process by fusing mixed-type sensor data, including images and process signals. A broaching process is used as a case study to illustrate the effectiveness of the proposed approach.

2 - An MCDM Model For Maintenance Outsourcing

Felipe Macedo de Morais Pinto, Universidade Federal de Pernambuco, Recife, 50630971, Brazil, felipe_mmp94@hotmail.com, Adiel Teixeira De Almeida Filho

This work presents an MCDM approach for a maintenance outsourcing decisions, which including contract selection and supplier selection. Given the MCDM nature of maintenance outsourcing, models to address this problem include maintainability, dependability, quality of repair besides cost, which are detailed in the reference Multicriteria and Multiobjective Models for Risk, Reliability and Maintenance Decision Analysis.

3 - A Multicriteria Decision Model To Support Maintenance Planning In An Electrical Power Distribution Company

Adiel Teixeira de Almeida-Filho, Assistant Professor, Universidade Federal de Pernambuco, Recife, 50630971, Brazil, adieltaf@cdsid.org.br, Rodrigo J Ferreira, Ana Paula Cabral Seixas Costa, Adiel Teixeira de Almeida

This work presents a decision model built for an electrical power distribution company to aid the decision regarding maintenance planning and establishing the priority amongst maintenance orders to be accomplished. The problem approached is similar to most of the electrical power distribution companies, once there is a complex distribution network with different types of customers leading to consider multiple criteria such as income losses, the probability of service interruption, national regulation criteria, and others.

Design and Modeling for Quality Improvements

Sponsored: Quality, Statistics and Reliability

Sponsored Session

Chair: Hongyue Sun, Virginia Tech, Blacksburg, VA, United States, hongyue@vt.edu

1 - Economic Parameter Design In Laser Micro-Drilling Process Considering Quality Loss And Rejection Cost

Jianjun Wang, Nanjing University of Science and Technology, wangjj0818@163.com

An intractable issue in the fabrication of laser micro-drilling array is to achieve high product quality with the minimum cost through economic parameter design. A new Bayesian modeling method is developed in this paper. Firstly, Bayesian seemingly unrelated regression (SUR) models are utilized to develop the relationship models between input factors and output responses in the laser micro-drilling process. Secondly, the rejection cost function and the quality loss function are constructed by using simulated responses. Finally, an optimization scheme is implemented to find the optimal economic parameter settings of laser micro-drilling process.

2 - Experimental Design And Parameter Optimization Of Multi-extremum Process

Qing'an Cui, Professor, Zhengzhou University, Zhengzhou, 455000, China, cuiqa@zzu.edu.cn

Firstly, Least squares support vector regression model is selected as the basic model for multi-extrimum process; Secondly, a sequential experimental design method is proposed considering the significance of Lagrange multipliers of sample points in different sub-domains of the process. Finally, by taking the geometric cluster centers of sample points as initial points, the multi-extremum of the response are found through concurrent SQP optimization. Simulation and empirical studies show that the approach can find multi-extremum of the process and therefore get better optimization of parameters under a relative smaller sample size.

3 - Service Quality Variation And Customers Behavior Intention

Jianlan Zhong, Fujian Agriculture and Forestry University, Fuzhou, China, zhongjianlan_29@163.com

We investigate the effect of variation in service quality on customers behaviors intention. Variation, stemming from manufacturing industry, refers to difference and deviation. In the service context, it wouldn't be wise to drive out all variation. Customers themselves are key inputs to the service process. In this interaction process, customers expect how much variation that they introduce is accommodated, not how sternly it is eliminated. Therefore, based on the prospect theory, we postulate a mechanism involving risk aversion and learning, and propose the propositions about the impact of service quality variation (positive and negative variability) on customer behaviors.

1 - Modeling Dense Human Centric Iot Networks

Albena Mihovska, Aalborg University, albena@es.aau.dk

The current Internet of Things (IoT) concept is characterized with billions of devices interworking through a myriad of technologies for the delivery of smart personalized services and applications. At the center of these is the human user who drives his/her own interconnected cluster. In the future the number of such clusters will grow exponentially, leading to an ultra-dense environment of interconnected devices belonging to the same or different clusters with the human user the center point for the information being sensed, gathered and processed. This concept is known as "human center sensing (HCS)". We propose a new model for handling the complexity of large-scale and dense HCS connectivity.

2 - Generalized Local Branching: An Application To Capacitated Ring Tree Problems

Stefan Voss, Professor, Director Institute of Inf. Systems, University of Hamburg, IWI - Von-Melle-Park 5, Hamburg, 20146, Germany, stefan.voss@uni-hamburg.de, Alessandro Hill

Generalized local branching is a heuristic framework based on mathematical programming. In an iterative strategy an existing solution is refined by solving restricted mixed integer programs (MIPs) to optimality. Similar to the corridor method, we introduce generalized local branching cuts using two parameters: the number of considered variables and the number of allowed variable flips. This concept implies an efficient algorithm for the capacitated ring tree problem (CRTP) on top of a branch and cut algorithm for the CRTP. Results for literature instances shows a considerable improvement over existing best results for the CRTP outperforming pure refinement or local branching.

3 - A Satellite Detection And Ranging System For Diurnal Atmospheric Survey

Yupo Chan, University of Arkansas - Little Rock, Little Rock, AR, United States, yxchan@ualr.edu, A. S. M. Sarwar Zahan, Po-Hao Adam Huang, Edmond W. Wilson

A satellite detection-and-ranging system is proposed. Using a pair of CubeSats flying in formation, the paired system consists of a light Emitter, followed by a Chaser. The combination provides new, non-existing monitoring capabilities. This includes atmospheric cooling on the ecliptic side of an orbit by using a reference provided by the Emitter, with a spectrometer hosted on the Chaser. Being a 1-unit CubeSat, the Emitter will follow a regular orbit, while the 2-unit Chaser will experience drag, which can throw the it out of orbit. The tracking algorithm, consisting of signal- and image-processing routines, helps to monitor the orbit of the Chaser and identify its location at all time.

1 - Beating Reservation Anxiety: Flexible Online Location-based Service Reservation

Xin Wang, University of Wisconsin-Madison, 1513 University Avenue, 3258 Mechanical Engineering Bldg, Madison, WI, 53706, United States, xin.wang@wisc.edu, Xiaotian Wang

A flexible online location-based service reservation system, like those for public vehicle parking or charging, is established. We focus on addressing the "reservation anxiety", where customer late arrivals are priced and service slots are assigned within a neighborhood at a discount rather than to a specific location. Jointly considering both time and location flexibilities at reservation, a game-theoretic model under continuum approximation is developed to analyze the system equilibrium and provide managerial insights.

2 - Monthly-card Management Policy For Office Building Parking Under Different Commuting Traffic Characteristics In Metropolises Of China

Kaifeng Ji, Phd Candidate, Tsinghua University, Graduate School in Shenzhen of Tsinghua University, Shenzhen, 518000, China, 359067080@qq.com

Due to the limited parking spaces and fast-growing vehicle trips in metropolises of China, the intensive management of parking is necessary for office buildings, especially under the traffic restriction policy such as Beijing. In this paper, using license data collected in Beijing and Shenzhen from parking companies, we identify the characteristics of parking vehicles under different traffic restriction policies. Two models are built to analyze the maximum benefit and the maximum capacity of monthly-cards for one garage under different traffic restriction policies and dynamic monthly-card management policy (monthly-cards for free parking but not appointed to one specific parking space).

3 - Revenue Management In Synchromodal Container Transportation

Rommert Dekker, Professor of Quantitative Logistics, Erasmus University-Rotterdam, Burg. Oudlaan 50, Po Box 1738, Rotterdam, 3000 DR, Netherlands, rdekker@ese.eur.nl, Bart Riessen

In order to obtain a balanced cargo load in time, booking classes are introduced for hinterland intermodal container transport. We consider the case of two classes and two destinations. The first class of containers is transported the same day, while the second class can be delayed one day. We use daily booking limits to control the demand for both classes, while demand outside the classes is trucked to the destination which is more expensive. Using Markov chains we determine expected costs for each pair of limits and determine the optimal ones. We show the application of the model using a real case.

4 - Loss Aversion And Subsidy Design In Bot Road Projects

Yiwen Zhang, Tianjin University, 92 Weijin Rd, Nankai District, Tianjin, P.R., 300072, China, zhangyiwen@tju.edu.cn, Shuibo Zhang, Zhuo Feng

Government subsidy plays an important role in attracting private investors in BOT projects. Previous studies only consider the material surplus of the government and the private sector with their psychological losses ignored. As a result, an inappropriate subsidy design may be proposed that prevents efficient renegotiation afterwards. In this paper, by taking the initial subsidy design as the reference point and considering loss aversion of both the government and the private sector, we investigate the optimal government subsidy to maximize social surplus in the whole concession period. This project provides decision support for the government in designing the optimal government subsidy.

5 - Optimizing Daily Service Routes For Major Grocery Chains

Luis J. Novoa, The George Washington University, 2201 G Street, NW, Funger Hall, Washington, DC, 20052, United States, ljnovoa@gwu.edu, Ahmad I Jarrah, Jonathan F Bard, Sifeng Lin, Xinhui Zhang

We develop a customized column generation algorithm to solve industrial-scale instances of a retail route design problem. This problem extends the capacitated vehicle routing problem with time windows by including order loading constraints, order-dependent vehicle capacity, material handling at the warehouse, time limits and idle time costing. Routes are iteratively generated by solving parallel dynamic programs which implement novel efficiency procedures. Considerable cost reductions are found when evaluating against current solutions from a major grocery chain.

Game Theory III

Contributed Session

Chair: Ying Zhang, University of North Carolina-Chapel Hill, 116 Saint Andrews Ln., Chapel Hill, NC, 27517, United States, Ying_Zhang@kenan-flagler.unc.edu

1 - Applicability Of The Proportional Nucleolus In Cooperative Games Based Highway Cost Allocation

Saurav Kumar Dubey, PhD Student, University of Tennessee, 1615 Laurel Avenue, Box 203, Knoxville, TN, 37916, United States, skumardu@vols.utk.edu, Alberto Garcia-Diaz

A highway cost allocation (HCA) problem is formulated as a Least-Core model with Aumann-Shapley Values defining the characteristic function of the game. For such a game, the nucleolus offers a unique and stable solution. However, the nucleolus concept is non-monotonic because any marginal increase in total highway cost is distributed unevenly among vehicle classes. A derivative of the least-core model, known as Proportional Nucleolus, and known to be unique and monotonic will be considered.

2 - Locating Warehouse In An Emerging Country A Win Win Proposition

Ying Zhang, University of North Carolina-Chapel Hill, 116 Saint Andrews Ln., Chapel Hill, NC, 27517, United States, Ying_Zhang@kenan-flagler.unc.edu, Jayashankar M Swaminathan

We investigate the trend of warehouse outsourcing in offshore business where a retailer in a developed country sources from a supplier in an emerging country. The retailer can deliver products directly to the developed country or use a warehouse in the emerging country to hold second-tier safety stock. The supplier and the retailer negotiate over the wholesale price and batch size conditional on the retailer's warehouse outsourcing decision. We explore when the retailer prefers the emerging-country warehouse and show that the emerging-country warehouse can be beneficial even without cost advantage.

1 - Towards Supply Chain Information Flow Theory

Abdurrezzak Sener, PhD Student, Wichita State University, 1845 Fairmount St, Wichita, KS, 67260, United States, axsener@wichita.edu, Mehmet Barut, Mehmet B Yildirim

Information sharing and coupling have been interest of researchers for decades. Empirical studies focused to understand the impact of information sharing to operational and organizational performance. A few studies focused on developing integration matrices to measure coupling. In this study we are taking initiative steps towards developing information flow theory.

2 - Debt Financing And Supply Chain Competition

Ping Su, Assistant Professor, Hofstra University, Frank Zarb School of Business, Hofstra University, Hempstead, NY, 11549, United States, Ping.Su@hofstra.edu, Joice (Qiaohai) Hu

Existing literature has concluded that debt financing causes two firms that engage in a Cournot game to compete more aggressively, each expanding its product supply level. However, both firms are worse off than if they are purely equity financed, resulting in the so-called prisoner's dilemma. Introducing two supply chain structures, distributional and parallel, we examine whether this prisoner dilemma persists if the firms' upstream could influence their competition. We find that the answer is positive because the upstream benefits from the intensified downstream competition. Moreover, the supply expansion effect varies in different supply chain structures.

1 - Seller Response To Customer-driven Substitution

Secil Savasaneril, Associate Professor, Middle East Technical University, Orta Dogu Teknik Universitesi End. Muhendisligi, Dumlupinar Bulvari No:1, Dumlupinar Bulvari No:1, 06800, Turkey, ssecil@metu.edu.tr, Nursen Tore

We study how seller (producer or retailer) sets inventory and price in the presence of customer driven substitution. We assume the seller can affect the substitution behavior by price and availability of the products. Demand for each product is stochastic, and spills over due to cross-price effects. If one product stocks out then this also results in spillovers to the other product. The products are sold in two periods, where in the second, seller may markdown price to exploit stockout based substitution. We determine optimal stock levels, initial and markdown prices. Then, through numerical analysis, we quantify the value of exploiting price- and stockout-based substitution.

2 - Mechanism Design With Heterogeneous Agent Demand Profiles: Applications To Carbon Capture And Storage(ccs)

Wenbo (Selina) Cai, New Jersey Institute of Tech, Mec 308, University Heights, Newark, NJ, 07102, United States, cai@njit.edu, Dashi Singham

Classic mechanism design problems optimize contracts offered to different types of agents, where the agents have private information on some of their characteristics, such as demand. We consider heterogenous agent demand distribution profiles and apply our results to analyzing contracts for carbon capture and storage systems, where the demand of emissions sources for transporting and storing carbon varies based on the type of emitter, and each type having its own distribution of emissions month to month.

1 - Selling To An Off-price Retailer To Ration Inventory For Strategic Consumers

Moutaz J Khouja, University of North Carolina-Charlotte, BISOM Department, College of Business, Charlotte, NC, 28223, United States, mjkhouja@uncc.edu, Jing Zhou, Xin Liu

Strategic consumers are likely to delay purchases when retailers have large inventory. Retailers can reduce this inventory by selling some of it to off-price retailers. If an off-price retailer has many bargain-hunters, such a strategy may be beneficial to the retailer in mitigating the effects of strategic consumer behavior.

2 - Multi-agent Salesforce Compensation With Supply Chain Considerations

Sandra Transchel, Kuehne Logistics University, Grosser Grasbrook 17, Hamburg, 20457, Germany, Sandra.Transchel@the-klu.org, Kristoph Kurt Reinhard Ullrich, Ruud Teunter, Jasper Veldman

We study the impact of limited inventory on sales force incentive contracts and the induced efforts of firms which employ multiple sales agents. We show that if demand is censored by inventory levels, pooling inventory may lead to a free-riding problem of the sales agents. This implies that, on the one hand, firms face reduced cost by pooling inventory, but on the other hand, they may face lower sales because of lower efforts exerted by their agents.

3 - Vegetable Equity: Insights From Agri-food Supply Chain Innovations In Emerging Economies

Fei Qin, Assistant Professor, Oakland University, 2200 North Squirrel Road, Rochester, MI, 48309-4401, United States, qinfei99@gmail.com, Saibal Ray, Mehmet Gumus

We build an analytical model to examine the impact of VK Agri-food supply chain intervention on fruits and fresh vegetables prices and social welfares. We find that while a supply chain innovation like VK may be good for consumers or even for bringing more farmers into the market system, one of its main goals - improving the financial condition of all farmers - may not be true. We explore sample data to test a list of hypotheses, and in this regard, elicit the impact of VK intervention on the prices and sales as well as farmer's welfare.

4 - Personal Fabrication

Nagarajan Sethuraman, PhD Student, University of North Carolina, Chapel Hill, NC, 27514, United States, Nagarajan_Sethuraman@kenan-flagler.unc.edu, Ali Kemal Parlakturk, Jayashankar M Swaminathan

We study the idea of personal fabrication and its implications for firms. We propose and analyze a mechanism, through which, firms can benefit from personal fabrication.

5 - Product Quality Strategy With Consumer Heterogeneity Of Technology Platform

Xiuli He, Associate Professor, UNC-Charlotte, 1207 Doughty Place, Sugar Land, TX, 77479, United States, xhe8@uncc.edu, Yong Zha, Subodha Kumar, Lu Zhang

We study the firm's optimal quality strategy when selling a base product and a complementary platform. We consider two cost structures of platform quality and two consumer valuations along the platform quality.

1 - Optimal Subsidy And Tax Policy And Consumer Environmental Awareness

Jie Zhang, University of Texas, 701 South West Street, Arlington, TX, 76019, United States, jiezhang@uta.edu, Linghong Zhang

This paper investigates the optimal subsidy and tax policies in response to different consumer environmental awareness (CEA) and firms' product selection (generic, green or both), plus quality and pricing decisions. We investigated all the equilibria under different policy combinations and derived the analytical and numerical solutions.

2 - The Effect Of Agricultural Subsidy Policy on The Land Scale Management Of Farmers

Xuechen Meng, Tongji University, 1239 Siping Road, Shanghai, China, xuechenmeng@126.com

Based on the Nerlove adaptive expectations model and the dynamic panel GMM model, this paper studies the impact of subsidies on farming land scale operation. Results show that when controlling for other factors that influence the conditions of land scale, agricultural subsidies only has a slight positive impact on expanding land scale, the effect mainly reflects in the main producing area while negative on the sales areas. This paper also examines the impact of main producing subsidies on difference kinds of crops and finds that the effect of subsidies on wheat plantings are greater than corn and rice, indicating the importance of precisely target subsidies in the future.

3 - Discounting Long-term Public Investments Under Model Uncertainty

Dowon Kim, PhD Student, KAIST, Guseng Dong, Daejeon, Korea, Republic of, kimdowon@kaist.ac.kr, Kyoung-Kuk Kim, Jiwoong Lee

This paper proposes a new approach to deal with social discount rates for long-term public investments. Using the recursive-utility framework, we explicitly account for consumption inequality aversion, risk aversion, and ambiguity aversion. In addition, the proposed approach overcomes limitations of two-period models in the literature. As an illustration, estimation results are presented based on binomial lattices and IPCC emission scenarios data.

1 - Non Stationary Gaussian Process Bandits

Ankur Mani, University of Minnesota, 808 Berry St. Apt. 410, St. Paul, MN, 55114, United States, amani@umn.edu, Ashish Kapoor, Eric Horvitz

We study the non-stationary version of the correlated multi-armed bandit problem where the correlations between the rewards from different bandits and at different times are captured by a Gaussian process. We identify the rate at which the optimal regret grows and provide an algorithm that achieves the optimal regret.

2 - Valuing Optimal Switching Options With The Moving-boundary Method

Arun Chockalingam, Eindhoven University of Technology, Hoog Gagel 62, Eindhoven, 5611BG, Netherlands, a.chockalingam@tue.nl, Taimaz Soltani, Shaunak Dabadghao, Jan C Fransoo

The contribution of this paper is extending the Moving Boundary Method to tackle the optimal-switching problem. The Moving Boundary Method has been successfully applied to optimal-stopping problems. Optimal-switching problems can be thought of as sequences of optimal-stopping problems and possess complicating features, making an extension of the Moving-Boundary Method to tackle such problems non-trivial. The method is then applied to problems in the sourcing and energy domains.

3 - Random Dimensional Spaces

Kemal Gursoy, Professor, Rutgers University, 100 Rockafeller Road, Room 5146, Piscataway, NJ, 08854, United States, kgursoy@rci.rutgers.edu

In this work, a probability law for random dimensional spaces was investigated. Where points could appear and disappear randomly. Consequently, the dimension of a space would be continuously translated from a real number to another one. Therefore, the main interest is to identify persistent properties of the space, under all possible continuous transformations.

4 - Analysis Of Customer Abandonment In Ticket Queues: A Bayesian Approach

Kaan Kuzu, Assistant Professor, Univ of Wisconsin-Milwaukee, Sheldon B Lubar School of Business, P.O. Box 742, Milwaukee, WI, 53201-0742, United States, kuzu@uwm.edu, Refik Soyer

Ticket queue systems collect interval censored data for customer abandonment. The abandonment of a customer is only realized when the ticket for that customer is called for service and the customer does not show up. We present a modulated Poisson process model to analyze customer abandonments in ticket queues. A Bayesian analysis of the model is developed considering covariates such as branch and weekday. The proposed model and the methodology are implemented using real ticket queue data. We show the heterogeneity in customer abandonments and provide insights on server allocation policies.

1 - An Agglomerative Clustering Based Large-Scale Minimum Cost Flow Algorithm

Yuan Zhou, PhD Candidate, University of Memphis, 174 Windover Cove, Apt 3, Memphis, TN, 38111, United States, yuanzhou0924@gmail.com, Stephanie Ivey

When the size of an input network exceeds computer hardware capabilities, minimum cost flow (MCF) becomes problematic in terms of computational and memory requirements. This research focuses on the large-scale MCF problem by adopting a divide-and-conquer policy during the optimization process. We propose an agglomerative clustering based tiling strategy which can ensure consistency between local and global optimum solutions, decomposes the input network into sub-networks, and then solves MCF in each sub-network independently to reduce peak memory consumption and improve efficiency.

2 - Large Scale Scheduling Problems On Internet Of Things

Carlos Eduardo De Andrade, Senior Inventive Scientist, AT&T Labs Research, 200 S Laurel Avenue, Room A5-1E33, Middletown, NJ, 07748, United States, cea@research.att.com

The number of connected devices has been increasing exponentially over past years. Such devices do not only use the network for their main purposes, such as collect and share data but also in the maintenance mode for updates. We present a scheduling problem to deal with massive download updates on millions of devices connected to radio networks. One of the main challenges of this problem is the fact of the devices are mobile and can connect to several access points in the network over the time, and the server usually can not control the download process other than suggesting a start time to the download. The problem also includes other constraints such as network and server capacities, and devices limitations.

3 - Optimum Product Introduction And Strategic Capacity Planning Including Demand And Price Cannibalization

Gorkem Yilmaz, Assistant Professor, Ozyegin University, Cekmekoy, Istanbul, 34794, Turkey, gorkem.yilmaz@ozyegin.edu.tr, Amaia Lusa Garcia, Ernest Benedito

In literature, product introduction and strategic capacity planning typically address optimal timing, pricing decisions and capacity management independently regardless of demand and price cannibalization effects. We develop a Mixed Integer Linear Program (MILP) model for solving strategic capacity planning and product introduction problems, simultaneously, including demand and price cannibalization. With dynamic demand and pricing senario, we analyze several numerical examples to display the interaction between demand and price.

4 - Benders Decomposition And Column-and-row Generation For Solving Large-scale Linear Programs With Column-dependent-rows

Kerem Bulbul, Associate Professor, Sabanci University, Faculty of Engineering & Natural Sciences, Orhanli, Tuzla, Istanbul, 34956, Turkey, bulbul@sabanciuniv.edu, Ilker S Birbil, Ibrahim Muter

We study a general class of LP problems - known as problems with column-dependent-rows (CDR-P). These LPs feature two sets of constraints with mutually exclusive groups of variables in addition to a set of structural linking constraints, in which variables from both groups appear together. The number of linking constraints grows very quickly with the number of variables, which motivates generating both columns and their associated linking constraints simultaneously on-the-fly. The structure of CDR-P is amenable to Benders decomposition and leads to an effective approach. The unavailability of a full description of the Benders subproblem over the iterations is our main theoretical challenge.

5 - The Branching Dual Of A Discrete Optimization Problem

Gerdus Benade, Carnegie Mellon University, 6235 Fifth Avenue, Apt B17, Pittsburgh, PA, 15232, United States, gerdusbenade@gmail.com, John Hooker

We formulate the branching dual of a discrete optimization problem as maximizing an inferred lower bound over the space of partial search trees. We identify a class of optimization problems with limited information transfer for which a greedy node selection rule is approximately optimal. A computational study compares the efficiency of the branching dual with other methods for proving bounds on the minimum bandwidth problem. It is found that the branching dual requires significantly fewer nodes than the alternatives to prove a given bound.

1 - A Microsimulation Cost-effectiveness Analysis Of Nalmefene To Reduce Heavy Alcohol Consumption In An Alcohol-dependent Canadian Population

Estefania Ruiz Vargas, Ivey Business School, 1255 Western Rd, London, ON, N6G 0N1, Canada, eruizvar@uwo.ca, Richard Zur, Greg Zaric

Nalmefene is an opioid antagonist believed to reduce the analgesic and positive reward effect of alcohol. A microsimulation of alcohol consumption was developed to determine if nalmefene combined with psychosocial support is cost-effective for reducing alcohol consumption in an alcohol-dependent Canadian population. We considered a number of different nalmefene treatment approaches, and evaluated the public health benefit of implementing nalmefene as a pharmacological intervention for alcohol dependence in Canada.

2 - Managing A Multi-physician Clinic With Heterogeneous Patients

Wen-Ya Wang, San Jose State University, San Jose, CA, United States, wenya.wang@sjsu.edu, Hao-Wei Chen

This paper focuses on the physician panel design problem of determining the patient composition (i.e. panel size and types of patient) for physician panels. In particular, we investigate how clinics would allocate a given pool of two types of patient flows that have different appointment patterns (i.e. low frequent/routine service vs. high frequent/complex care needs). We identify the characteristics of patient and capacity allocation strategies from the perspectives of the clinics and the patients

3 - A Markovian Model For Blood Components Production System

Harshal Lowalekar, Indian Institute of Management-Indore, Prabandh Shikhar, Rau-Pithampur Road, Indore, 453331, India, lwlherschelle@gmail.com

We develop a Markovian model for the production of major components such as red blood cells, platelets and plasma from whole blood at a blood bank. The supply quantity of whole blood is assumed to be a random variable. Using the Markovian approach we determine the optimal target collection level for whole blood and the percentage of whole blood to be separated into components.

1 - Reformulation-linearization Technique Application On Integer Programming Models For Organ Exchange Program

Seokhyun Chung, Korea University, Seoul, Korea, Republic of, tcheong@korea.ac.kr, Junsang Yuh, Taesu Cheong

Kidney exchange allows a potential living donor whose kidney is incompatible with the intended recipient to donate a kidney to another patient so that the donor's recipient receives a compatible kidney from another donor. This can be modeled as maximum weight cycle packing problems in a directed graph. In this study, we verify relationship between existing models via reformulation-linearization technique (RLT), and develop a new integer programming model for kidney exchange program by implementing the RLT. In addition, we devise new integer programming model for liver exchange program, which has distinct character. Moreover, we enhance the integer programming model by applying RLT.

2 - Solution Approaches To Network Design Problems With Decision Dependent Uncertainty

Nathaniel Richmond, University of Iowa, 446 4th Avenue, Iowa City, IA, 52241, United States, nathaniel-richmond@uiowa.edu, Pavlo A Krokhmal, Dmytro Matsypura

Robust network design problems have many important practical applications, and for this reason are well-represented in the operations research literature. However, until the last decade very little research has examined stochastic robust network design problems in which the user's decisions affect the underlying probability distribution of the random outcome. In this talk, we present a model for the stochastic network design problem with decision-dependent uncertainties. We discuss computational challenges and explore different solution approaches. In particular, we present a metaheuristic algorithm that draws from strengths of GRASP and genetic algorithms.

3 - A New Mathematical Formulation For Choice-based Optimization Problems

Shadi Sharif Azadeh, Ecole Poloytechnique Federale de Lausanne, 38 Route de la Condemine, Lausanne, 1030, Switzerland, shadi.sharifazadeh@epfl.ch, Meritxell Pacheco, Michel Bierlaire

The mathematical modeling of choice behavior has been an active field of research. Their complexity leads to mathematical formulations that are highly non convex in the explanatory variables especially when they are integrated inside an MILP to take into account both supply and demand constraints. We propose a new mathematical modeling that can simplify nonlinear and nonconvex choice-based optimization models with the help of simulation inside an MILP framework. We have tested the model on a real case study and computational results testify the goodness of this modeling approach.

4 - Microsoft Excel Evolutionary Solver And Resource Constrained Project Scheduling

Norbert Trautmann, Professor, University of Bern, FM Quantitative Methoden, Schuetzenmattstrasse 14, Bern, 3012, Switzerland, norbert.trautmann@pqm.unibe.ch, Mario Gnägi

We discuss how to apply the evolutionary solver contained in Microsoft Excel's Solver Add-in to the resource-constrained project scheduling problem (RCPSP). Combining a novel spreadsheet-based implementation of an appropriate schedule-generation scheme with the evolutionary solver provides surprisingly good schedules.

5 - An Exact Algorithm For The Demand Constrained 0-1 Knapsack Problem

Christopher John Wishon, PhD Candidate, Arizona State University, Tempe, AZ, United States, cwishon@asu.edu, J. Rene Villalobos

The demand constrained KP is a variant of the binary KP in which a weighted summation of the variables must exceed a given threshold in addition to the standard KP constraint. The first exact algorithm for solving this variant is presented which utilizes a reduction routine prior to a breadth-first expanding core approach for determining the remaining variables. A polynomial time solution to the continuous relaxation is employed such that high quality, integer Lagrangian and surrogate relaxations are solved to obtain tight upper bounds. Performance is tested using computational experiments with results demonstrating that the algorithm can outperform commercial software.

1 - Micro-decision Patterns In Prescription Data: An Investigation Of Local And Non-communicable Diseases Among Vertically Differentiated Social

W. Art Chaovalitwongse, University of Arkansas, Fayetteville, AR, Contact: artchao@uark.edu, Praowpan Tansitpong, Apirak Hoonlor

This study explores electronic healthcare database in defining decision patterns in prescribed medicines among government-subsidized benefit schemes in Thailand. The analysis focuses on three major non-communicable diseases (diabetes, cancer, and cardiovascular) and three local diseases located in inpatient and outpatient database. The study separates uniform prescription patterns in all three schemes from non-uniform patterns and predicts brand and amount of dosage to be prescribed to other diseases. The findings also suggest prescription priority in medicine inventory control.

2 - Minimizing Radiology Error By Improving Staff Scheduling

Mahdi Nasereddin, Penn State- Berks, Tulpehocken Road, P.O. Box 7009, Reading, PA, 19610-6009, United States, mxn16@psu.edu, Michael Bartolacci, Michael Bruno

Errors are sometimes made when reading radiology charts. A 2001 study reported that depending on the area, the radiology error rate is between 2 - 20%. A team of researchers at the Penn State University is currently studying how to minimize radiology error rate. In this study, the relationship between under-staffing and radiology errors is being investigated.

3 - Evaluating Policy Options For Improving Access To Dental Care For Children In Georgia

Benjamin Johnson, Georgia Institute of Technology, 3245 Wellbrook Drive, Loganville, GA, 30052, United States, benjohnson@gatech.edu, Nicoleta Serban, Paul Griffin, Susan Griffin

Policies regulating dental providers differ by state. Policies in Georgia are compared to similar policies in other states to estimate the impact of each policy on access to dental care. Policy changes are then evaluated to show the impact a new policy could have on improving access to children in Georgia.

4 - Obesity In Africa: The Ultimate Black Belt Region Bursting At The Seams

Philip F. Musa, Associate Professor and Programs Director, The University of Alabama at Birmingham (UAB), P. O. Box 55544, Birmingham, AL, 35255, United States, musa@uab.edu

What are the root causes of obesity as a Public Health epidemic across Africa? We present comparisons of demographics of those most predisposed to this precursor to chronic comorbidities in developed countries such as the United States and the least developed regions such as Sub-Saharan Africa. It was only fairly recently that mortality rates due to chronic diseases surpassed those due to infectious diseases in industrialized countries. While that has not yet occurred in Africa, there is evidence that the burden due to chronic diseases associated with obesity may soon eclipse those affiliated with infectious diseases. Public Health interventions are suggested in this paper.

1 - A Branch-and-cut Algorithm Using Two-period Relaxations For Big-bucket Lot-sizing Problems

Kerem Akartunali, Senior Lecturer, Strathclyde Business School, Dept. of Management Science, University of Strathclyde, Glasgow, G4 0GE, United Kingdom, kerem.akartunali@strath.ac.uk, Mahdi Doostmohammadi, Ioannis Fragkos

We study the polyhedral structure of the two-period subproblem proposed by Akartunali et al. (2016). Based on two relaxations of the subproblem, we propose new families of valid inequalities and present facet-defining conditions. These inequalities are lifted to the original space of the two-period subproblem, and they also inspire the derivation of a new family of inequalities defined in the original space. We exploit the structural similarities of the different families in order to design an efficient separation algorithm, and embed it in a modern branch-and-cut solver.

2 - Prescriptive Analytics To Improve E-warehouse Operations

Fatma Gzara, Associate Professor, University of Waterloo, 200 University Avenue W, Waterloo, ON, N2V 2N1, Canada, fgzara@uwaterloo.ca

We use data for an e-commerce warehouse characterized with high order volumes, significant seasonality, and a large number of SKUs. Based on extensive descriptive data analysis, the packing operation is identified as a major cause for long order completion times. We develop an optimization model and solution methods based on decomposition and heuristics to optimize order packing. We validate our results using industry data.

3 - Finding Optimal Solutions For Emergency Evacuation By A Dynamic Programming Approach Based On State-space-time Network Representation

Lei Bu, Institute for Multimodal Transportation, Jackson, MS, United States, leibu04168@gmail.com, Feng Wang, Xuesong Zhou

Based on a representation of state-space-time network, a formulation is proposed to optimize dynamic vehicle routes strategy in an emergency evacuation. The proposed integer linear programming formulation could effectively build the modeling representation of time status, evacuation demand, node capacity and traffic volume change constraints through a multi-dimensional network with an objective function to minimize total travel cost of visiting all nodes. Bellman-Held-Karp algorithm working as a dynamic programming algorithm is utilized to solve the problem. Two scale levels of networks in Mississippi State are tested using the model and algorithm proposed to verify the effectiveness.

4 - A Modified Cutting Plane Algorithm For Inverse Mixed Integer Linear Programming Problems

Vishnu Vijayaraghavan, Texas A&M University, 400 Nagle Street, College Station, TX, 77840, United States, vishnunitr@tamu.edu, Kiavash Kianfar, Andrew J Schaefer

Given a feasible solution to an optimization problem, the purpose of an inverse optimization problem is to minimally perturb the cost vector to make this feasible solution an optimal one. Inverse optimization for mixed integer programming is particularly challenging and previously a cutting plane algorithm has been proposed. In this paper we present a modification of this algorithm which significantly reduces the number of iterations, and hence run-time, until termination.

1 - The Impact Of Visual Aesthetics On The Utility, Affordance, And Readability Of Network Graphs

Patrick Michael Dudas, Faculty Research Associate, Pennsylvania State University, 691 Wiltshire Drive, State College, PA, 16803, United States, pmd19@psu.edu

Network visualizations facilitate the understanding of relationships, where research classically focuses more on readability. While existing studies are mostly concerned with the readability of topological mapping (based on different layouts), this work focuses on how visual aesthetics affect users' understanding of network structures by both readability (direct utility) and perceived affordance (indirect utility). Accompanied with these measures are eye-tracking data and retrospective think-aloud protocol to provide qualitative context to these visual strategies. Our study contributes to the understanding of visual aesthetics in network visualization design.

2 - An Algorithm To Design LDPC Codes With Low Error Floor In Communication Systems

Banu Kabakulak, Bogazici University, Istanbul, Turkey, banu.kabakulak@boun.edu.tr, Z. Caner Ta kın, Ali Emre Pusane

In a digital communication system, information is sent from one place to another over a noisy communication channel using binary symbols (bits). Original information is encoded by adding redundant bits, which are then used by low-density parity-check (LDPC) codes to detect and correct the errors. Error correction capability of an LDPC code is severely degraded due to harmful structures such as cycles in its bipartite graph representation (Tanner graph). Hence, we can achieve a low error floor when there are no small cycles in Tanner graph. We introduce an integer programming formulation for maximizing the smallest cycle size in Tanner graph. We propose a branch-and-cut algorithm for its solution.

3 - Critical Effect Of Dependence Clusters On Cascading Failures In Network Systems

Jian Zhou, PhD Student, Rutgers University, Bevier Road, Buell Apt, 0378, 2145 Bpo Way, Piscataway, NJ, 08854, United States, zhoujian977913@gmail.com, Ning Huang, David W Coit

Current failure models focusing on network load dynamics provide powerful approaches to analyze cascading failures in networks. However, previous studies don't take the impacts of dependencies among network nodes beyond network connection into account. Recent research show that dynamics of networks considering dependencies differ greatly from that with only connectivity links. Based on a mixed cascading failure model for networks including load dynamics and dependencies, we analyze numerically the influences of dependence clusters of nodes on failure mechanism in networks subjecting to random failures. How network topology affects the robustness of such networks are also investigated.

4 - The Interval Transportation Problem

Monica Gentili, Associate Professor, University of Louisville, 132 Eastern Parkway, Louisville, KY, 40205, United States, monica.gentili@louisville.edu, Raffaele Cerilli, Ciriaco D'Ambrosio

The basic transportation problem (TP) deals with the transportation of goods from a set of supply points to a set of demand points so as to minimize linear transportation costs. The interval transportation problem extends TP to take into consideration uncertainty in the supply and demand when they are expressed in interval forms. We analyze the set of the optimal solutions of the problem and apply a heuristic algorithm to explore it.

1 - Stochastic Models For Strategic Sourcing In Energy Industry

Ashesh Kumar Sinha, University of Wisconsin-Madison, 1402 Regent St Apt 731A, Madison, WI, 53711, United States, ashesh.sinha24@gmail.com, Ananth Krishnamurthy

We analyze the supply chain in oil and gas industries that manufacture custom-engineered equipment. We consider a multi-period centralized system and decentralized system where the product can be made either at the in-house manufacturing facility or at dedicated facilities of the external supplier. At each time period, the manufacturer and the supplier decide their capacity levels and the production quantity to satisfy a random demand. Using stochastic models, we analyze optimal production and capacity investment decisions, and also analyze the inefficiencies in the decentralized system.

2 - A Joint Supplier Selection And Lot-sizing Problem With Quality Constraint Under An All-unit Discount Environment

Xin Li, Pennsylvania State University, University Park, PA, 16802, United States, xzl118@psu.edu, Jose Antonio Ventura, M. Jeya Chandra

This paper considers a joint supplier selection and lot-sizing problem, where suppliers are capacitated and offer all-unit discounts. The product's perfect rate differs among suppliers and a minimum overall acceptable perfect rate exists. A cyclic order schedule is employed and the set of selected suppliers, and corresponding order quantities and frequencies are determined accordingly so that the total cost per time unit is minimized. A mixed-integer nonlinear mathematical model is presented and analyzed. A dynamic programming algorithm is proposed to solve the discretized version of the model.

3 - Liquid Helium Global Supply Chain Modeling And Optimization

Ethan Malinowski, University at Buffalo, 8 Affinity Lane, Apt 251 E, Buffalo, NY, 14215, United States, ejmalino@buffalo.edu, Mark Karwan, Banu Gemici-Ozkan, Jose M Pinto

The global supply chain for liquid helium presents a complex structure due to increasing foreign demand, elaborate recovery techniques, and costly forms of distribution. Although the task contains parallels to the vehicle routing and traveling salesmen problems, supply requirements and problem-specific network constraints require a unique optimization model. We develop a large-scale discrete time, path-based integer-programming model which solves optimally using CPLEX. Computational results implementing a rolling horizon structure and testing against historical data are presented.

1 - A Robust Decision-Making In a Supply Chain Under Disruption Risks

Tadeusz J Sawik, Professor and Chair, AGH University of Science & Technology, Al. Mickiewicza 30, Krakow, 30059, Poland, sawik@zarz.agh.edu.pl

A robust decision-making in a supply chain under local and regional disruption risks is considered. The robustness refers to an equitably efficient average and worst-case performance, which reflects the decision-makers common requirement to maintain an equally good performance of a supply chain under different conditions. The problem objective is to select suppliers of parts and schedule customer orders for products to equitably optimize average and worst-case cost or service level. The robust solution is obtained using the ordered weighted averaging aggregation of the expected value and the conditional value-at-risk.

2 - Investigating WOMs Behind Crisis: Contingent Negative Spillover Effect In Supply Chain Partnership

Xiaolun Wang, PhD Candidate, Fudan University, 670 Guoshun Road, Yangpu District, Shanghai, 200433, China, wangxiaolun@fudan.edu.cn, Cenying Yang, Cheng Zhang

This paper aims to investigate mechanism that governs the vertical spillover effect of crisis from stricken firm to its supply chain partners. Based on Accessibility-Diagnosticity theory, we explain why and when WOM could contribute to the negative spillover, that is, guilt by association mechanism for large downstream partners and information asymmetry mechanism for small upstream partners. Based on a merged, multi-sources, and longitudinal dataset from Capital IQ, and Sina Microblog, we apply PVAR model with GMM estimators to capture the dynamic interactions between WOM attributes (volume/valence/dispersion) and abnormal return of the supply chain partners.

3 - Supplier Assessment Policies In Total Cost Auctions

Karca Aral, Asst. Professor, Syracuse University, 721 University Avenue, Syracuse, NY, 13244, United States, kdaralwa@syr.edu

We address the trade-off between compulsory and voluntary supplier assessments in a procurement auction. Compulsory assessments enable buyers to learn the total cost of ownership (TCO) before selecting a supplier; however, this leads to decreased supplier competition. In contrast, voluntary assessments increase supplier competition, however provide less information on the TCO.

4 - A Data Driven Approach To Managing Food Safety In Global Supply Chains

Amine Anoun, PhD Student, Massachusetts Institute of Technology, 273 Cardinal Medeiros Ave, Apt 2, Cambridge, MA, 02141, United States, aanoun@mit.edu

Economically motivated adulteration poses a serious threat to public health. Prevention is achieved by sampling food shipments. However, the sampling resources are limited. In an effort to mitigate risk in the shipping supply chains, we develop a data-driven approach to identify risky manufacturers. We obtained over 850,000 shipment records of shrimp to the U.S. from the FDA. We determine structural features of shipping supply chains that correlate with risk of adulteration, at the global scale and in China. We use a Bayesian approach to model both the risk of adulteration, and the sampling procedure of the FDA, and show that our model predicts high risk manufacturers with high accuracy.

5 - Humanitarian Medical Supply Chain In Disaster Response: Role And Challenges

Irina Dolinskaya, Northwestern University, 2145 Sheridan Road, Tech Institute, M235, Evanston, IL, 60208-3119, United States, dolira@northwestern.edu, Maria Besiou, Sara Guerrero-Garcia

In this talk we study the humanitarian medical supply chain (HMSC) aspect of disaster response. More specifically, we describe HMSC in the case of disaster response, and identify the challenges encountered in the setting, especially focusing on the challenges that are unique to medical aspect of the humanitarian supply chain.

1 - Dynamic Eco-efficiency Assessment For Supplier Selection And Monitoring

Aineth Torres-Ruiz, Tecnológico de Monterrey, Guadalajara, Mexico, atorresr@itesm.mx

In this study, we propose a methodology that integrates multiple factors into a single performance measure to allow a more complete evaluation of supplier eco-efficiency. Particularly, our model investigates the joint application of Data Envelopment Analyses (DEA) and Malmquist analyses for supplier evaluation, selection and monitoring of actual supplier progress. Single and multiple sourcing strategies are applied and goal programming is used in the allocation of orders to integrate different preferences for budget and eco-efficiency performance targets. For illustrative purposes, we have applied our methodology to an autoparts manufacturer located in central Mexico.

2 - Research In Corporate Social Responsibility: A Bibliometric Analysis

Jose M. Merigo, University of Chile, Av. Diagonal Paraguay 257, Santiago, 8330015, Chile, jmerigo@fen.uchile.cl, Verónica Pizarro, Leslier Valenzuela

This study develops a bibliometric analysis of the research carried out in corporate social responsibility (CSR) during the last twenty-five years. The aim of the article is to identify and analyze the most productive and influential journals where CSR is published. The work presents a general overview of the leading journals, a temporal classification and the citation structure of these journals. The study also maps the bibliographic material through the VOS viewer software developing bibliographic coupling and co-citation of journals in CSR. The Journal of Business Ethics is the most active journal in this field although the Academy of Management Review is the most influential one.

3 - How Social Image Investment Pays Off In A Supply Chain

Wenqing Zhang, University of Minnesota - Duluth, 1318 Kirby Drive, Labovitz School of Business and Economics, Duluth, MN, 55812, United States, zhangwenqing@gmail.com, Chiang Chung-Yean

In a mature consumer market, the social image of a company plays, as well, a more and more important role in developing or maintaining the competitive edge. This paper studies the pricing and sourcing choices in a two-echelon supply chain selling a procure-to-stock product to a price-sensitive and social welfare conscious market. We illustrate the significance of the social image in a company's sourcing decision.

4 - A Model For Integrating Remanufacturing And Product Service System (PSS) During Product Development Stage

Johnson Adebayo Fadeyi, Wayne State University, 690 Martin Luther King Jr. Blvd-Apt 2005, Detroit, MI, 48201, United States, kontaktjohnson@gmail.com, Leslie Monplaisir

Remanufacturing has been identified as the most viable strategy among the product end-of-life (EOL) management approaches. However, over 80% of manufactured products currently end up as wastes. Meanwhile, some of the bottlenecks of product remanufacturing could be remedied by PSS. Therefore, the integration of remanufacturing and PSS is an improved product offering. The factors that are most critical for the success of remanufacturing and PSS have been identified. In this work, two essential criteria-core cleaning operations and product serviceability are considered. These criteria are optimized to make improved product modularity decisions during product development.

5 - Environmentally Friendly Car Purchase Intention In The United States

Lu Xu, MBA, Doctoral Student, UNT, 1307 West Highland Street, Denton, TX, 76201, United States, lu.xu@unt.edu, Victor R Prybutok

The purpose of this study is to incorporate self-image and quality with individual environmental awareness to assess the impact on the consumers' intention of purchasing the environmental friendly car. Does individual environmental awareness has some role when formatting purchase intention? Partial least squares structural equation modeling (PLS-SEM) allowed testing the posited model and associated hypotheses.

1 - End-of-life Inventory Control Of Aircraft Spare Parts Under Performance Based Logistics Environment

Mansik Hur, Visiting Researcher, The University of Alabama, Tuscaloosa, AL, 35487, United States, mhur@crimson.ua.edu, Burcu Keskin, Charles Schmidt

We consider an inventory control problem of aircraft spare parts during the end-of-life (EOL) phase of fleet operation. An algorithm computes optimal stock levels according to aircraft availability over the EOL period under a budget constraint, which is a common scenario in PBL environment. As opposed to the previous research, we take a 'system approach' by incorporating the aircraft availability in simultaneously determining final order sizes of multiple items. The optimization algorithm is applied to the operational data of an F-16 aircraft systems in Korea Air Force and finds optimal stock levels for given budget level with reasonable accuracy and in reasonable amount of time.

2 - Game-Theoretic Models For Locating Camera Towers In Urban Areas And Scheduling Surveillance

Javier Salmeron, Naval Postgraduate School, Operations Research Dept, Monterey, CA, 93943, United States, jsalmero@nps.edu, Kevin Wood

We develop optimization models for location of tower cameras and surveillance scheduling used by a military force in an urban setting. With a game-theoretic foundation we seek to minimize the worst-case expected damage from undetected events. A mixed-integer program approximates detection probability; then, column generation creates an implementable distribution of camera assignments, making the approximation exact. Realistically sized computations find high-quality solutions quickly in most cases. An alternative game-theoretic model may produce better solutions when limitations arise.

3 - Air And Missile Defense Integration Challenges

George E Mayernik, Raytheon Integrated Defense Systems, 235 Presidential Way, Mailstop 26/5445, Woburn, MA, 01801, United States, George_E_Mayernik@raytheon.com, Christopher M Menard

Many allied countries are in the process of defense modernization. A top priority is expanding Air and Missile Defense capability, and incorporation of the new systems into the military force structure which involves many integration challenges. Some key integration categories and challenges are: Technical & Interoperability, Organizational & Force Structure, Operations & Sustainment, and Programmatic. This paper provides some potential integration solutions, however is more intended to stimulate discussion that will benefit the planning needed to guide deployment.

4 - The Impact Of Data Quality: A Study On The Coast Guard's Data

Nelson Christie, Rutgers University, Princeton, NJ, 08540, United States, christie.l.nelson.phd@gmail.com

We report our findings with the US Coast Guard on a project designed to identifying errors in a large operational database. We combined interview results with statistical algorithms to identify a large number of errors in the data. We then examine the impact that data quality has on operational planning.

Large-Scale Optimization in Transportation

Sponsored: TSL, Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Velibor Misic, Massachusetts Institute of Technology, Massachusetts Avenue, Cambridge, MA, 02139, United States, vvmisic@mit.edu

1 - Planning Optimization For Integrated Transportation Systems

Bradley Sturt, Massachusetts Institute of Technology, Massachusetts Avenue, Cambridge, MA, 02139, United States, bsturt@mit.edu, Dimitris Bertsimas, Sebastien Martin, Yee Sian Ng, Julia Yan

Passengers move through large cities via various public transportation systems, such as subway and bus systems. City operators need to decide how to schedule the trains and buses throughout the day. Prior work has addressed making the decisions for each transportation system in isolation, which may result in a suboptimal citywide transportation system. This work proposes an optimization approach for holistically and cooperatively optimizing the decisions for decision makers for the subway, bus systems and the city.

2 - From Physical Properties Of Transportation Flows To Demand Predictions: An Optimization Approach

Julia Y. Yan, Massachusetts Insitute of Technology, Massachusetts Avenue, Cambridge, MA, 02139, United States, jyyan@mit.edu, Dimitris Bertsimas

Transportation system management requires accurate demand data. The main data sources are often aggregated datasets such as entry/exit data, and one must recover the original demand. Such problems are generally underspecified. We present an optimization framework to recover origin-destination matrices under minimal assumptions, enforcing reasonable physical constraints such as flow conservation, smoothness, and sparsity. We evaluate this on real-world datasets and show 6-7% improvement in R2 over a baseline.

3 - Online Taxi Routing In New York City

Sebastien Martin, Massachusetts Institute of Technology, Massachusetts Avenue, Cambridge, MA, 02139, United States, semartin@mit.edu, Dimitris Bertsimas, Patrick Jaillet

Taxi dispatching used to have little room for optimization. However, more and more customers request cabs from their cellphone. This gives transportation network companies prior information that can be leveraged to achieve a better efficiency. Large-scale taxi routing has usually been done with simple rules or heuristics. Our work proposes ways to scale optimization-based online routing algorithms to the largest instances of vehicle routing with real data. We use historical taxi trip data in New York City to dispatch in real time thousands of taxis and serve tens of thousands of customers.

4 - A Modern Optimization Approach To The Airlift Planning Problem For The United States Transportation Command (USTRANSCOM)

Velibor Misic, Massachusetts Institute of Technology, Massachusetts Avenue, Cambridge, MA, 02139, United States, vvmisic@mit.edu, Dimitris Bertsimas, Allison An Chang, Nishanth Mundru

USTRANSCOM plans missions globally, the majority traveling by air. These missions are challenging to plan due to their combinatorial nature and complex constraints. We propose a novel solution approach that combines local search, mixed-integer optimization and column generation, and show that it provides high quality solutions. This material is based upon work supported by USTRANSCOM under Air Force Contract No. FA8721-05-C-0002. Any opinions, findings, conclusions or recommendations expressed in this material are those of the authors and do not necessarily reflect the views of USTRANSCOM.

1 - Safety Stock For Blood Products With Short Shelf Life

Christine Pitocco, Research Professor, Stony Brook University, 202 Harriman Hall, Harriman Hall Room 202, Stony Brook, NY, 11794-3775, United States, christine.pitocco@stonybrook.edu, Katsunobu Sasanuma

Poorly managed inventory of apheresis platelets in a blood bank can result in a loss of revenue and safety issues for patients in need. A safety stock of platelets must be available, but higher levels of safety stock may cause wastage if not utilized. We discuss how the safety stock level should change according to the change in demand and shelf life. We propose an optimal inventory control policy based on a simulation of blood bank operations.

2 - Facility Location Problem For Stochastic Mixed-integer Programming In Healthcare

Mengnan Chen, University of Central Florida, 12800 Pegasus Drive, PO Box 162993, Orlando, FL, 32816-2993, United States, cmn891127@knights.ucf.edu, Qipeng Zheng

This paper considers a facility location problem with patients' appointment and physician scheduling. We model this problem as a two-stage optimization problem. In the first stage, depending on the patients' choices, which is relative to their characteristics and physicians/clinics' attributes, physicians will be scheduled to the different clinics. In the second stage, the central hospital will match patients' choices and physicians' scheduling. Using discrete choice model, we estimate the probability for patient's choice. Let the scenario is the different combination of patients' choices, then we can develop a stochastic mixed-integer programming to solve the facility location problem.

3 - Test Modality Capacity Simulation: A Nuclear Medicine Radiology Assessment

Haris Ackerman, Management Engineer, Virtua Health, 303 Lippincott Drive, Marlton, NJ, 08053, United States, hackerman@virtua.org, Mojisola Otegbeye, Hala Sweidan

Significant delays in the nuclear medicine radiology department of a 433 bed acute-care hospital increases patient length of stay resulting in patient dissatisfaction and reduced reimbursement rates. Simulation modeling deployed to show a budget neutral increase in daily stress test fulfillment rate from 80% to 99.9% while maintaining current staffing roster by utilizing optimal staff scheduling patterns.

4 - Outpatient Appointment Scheduling And Sequencing Model With Uncertain Service Time And Correlation

Shanshan Wang, PhD Candidate, Beijing Institute of Technology, 5 Southstreet Zhongguancun, Haidian District, Beijing, 100081, China, shshwang_bit@163.com, Jinlin Li, Chun Peng

As the window of hospital, outpatient appointment scheduling and sequencing plays a critical role in the allocation of healthcare resources. We take different jobs and uncertain service time into consideration. Based on support and moment of service time distribution, we employ mean absolute deviation to capture its correlation, propose distributionally robust models, and can be reformulated them as tractable counterparts. Numerical results show that when sequence is fixed, it's optimal to allocate time allowances with a decreasing pattern. When considering "New" and "Repeat" patients, optimal outpatient sequence of repeat patients is in the front of new patients.

1 - Machine Learning And Cognitive Pricing

Zhengliang Xue, IBM Research Center, 1101 Kitchawan Road, Route 134, Yorktown Heights, NY, 10598, United States, zxue@us.ibm.com, Markus Ettl

We study a method to price personalized configuration of software and services. The seller has to deal with a customized configuration without any similar records in history. A data-driven approach is applied to estimate the purchase probability for any unique configuration based on historical trading data. In addition, client relationship and firmographic information need to be incorporated to the pricing decision. We establish a utility model to evaluate the configuration and recognize the impact of relationship. The business impact of optimal pricing is justified by the actual data.

2 - Investigating Sparse Demand Models To Support The Assortment Planning Decision

Matthew Lanham, Purdue University, West Lafayette, IN, 47905, United States, malanham@gmail.com, Ralph D Badinelli

We present research examining the performance of substitution-based multi-classification models currently being researched and employed in practice by major retailers, versus more naïve binary classification models to understand purchase propensity. We discuss how these models would yield different assortments for sparse demand products.

Decision Analysis in Health Care Data Mining

Sponsored: Data Mining

Sponsored Session

Chair: Diego Martinez, Johns Hopkins University, 1, Baltimore, MD, 212, United States, dmart101@jhmi.edu

1 - Multiscale Decision Making Based on Variational Evidential Reasoning For Medical Record Label Recommendation

Haiyan Yu, Lecturer, Chongqing University of Posts and Telecommunications, 2 Chongwen Road, Nan'an District, Chongqing, P.R.C, 400065, China, yhy188@tju.edu.cn
Haiyan Yu, Lecturer, University of Electronic Science and Technology of China, Chengdu, China, yhy188@tju.edu.cn, Man Xu, Jiang Shen

Due to the characteristics of fragmentation and uneven distribution of the clinical data, the issues of reducing its misdiagnosis and improving the system discrimination ability arises in evidential reasoning. To solve these issues, the model of belief propagation was constructed based on the hierarchical Dirichlet process, achieving the confidence fusion of fragmented evidence. Through parameter learning, the recommendation of indentifying the lables of medical instances were achieved with the control trajectory of the reasoning model. Finally, simulation study verified the effectiveness and resilience of the reasoning models, improving the efficiency and quality of medical services.

2 - Using Matrix-based Multi-criteria Decision Method For Assessing Risk Of Harm Of Alert-overridden Intravenous Infusions

Wan-Ting Su, PhD Student, Purdue Univeristy, West Lafayette, IN, United States, su33@purdue.edu, Poching DeLaurentis, Mark Lehto

Hospital medication safety teams regularly review and analyze infusion drug alert reports to evaluate infusion performance. Previously an Intravenous (IV) medication harm index was developed to help clinicians assess the potential patient harm of each alert-overridden infusion. We aim to apply a matrix-based multi-criteria decision method to improve the existing harm index. The improved index can help medication safety teams better identify the medication and care unit combinations of high risk and further prioritize the targets for improvement on nursing practice, workflows and drug limit settings.

3 - Control System For Electronic Triage In The Emergency Department: Integrating The User Into Development Loop

Diego A. Martinez, Johns Hopkins School of Medicine, Baltimore, MD, 21201, United States, dmart101@jhmi.edu, Scott R Levin

The potential for machine learning systems to improve via exchange of information with knowledgeable users has yet to be explored in much detail. In a pilot study in an emergency department of a large hospital, nurses were presented with triage level predictions, and they were able to provide feedback through a real-time communication system. The types of some of this feedback seem promising for assimilation of clinical gestalt by machine learning systems. The results show that to benefit from clinical gestalt; machine learning systems must be able to absorb information in a graceful manner and provide clear explanations of their predictions.

1 - A Revaluation Of The Relationship Between Environmental Management And Financial Performance – A Multilevel Longitudinal Analysis

Zuoming Liu, Lynchburg College, 1501 Lakeside Drive, School of Business & Economics, Lynchburg, VA, 24501, United States, lzuoming@gmail.com

This study employs a multilevel cross-lagged model to investigate the causal relationships between a corporation's environmental performance and financial returns by using a 4-year dataset of the largest US500 companies. The goal is to identify variation of relationship due to different features at various levels. By conducting multilevel analyses, the relationship between environmental performance and financial returns is demystified into three levels, intra-firm dynamic variations over time, inter-firm variations, as well as variations across industries.

2 - A Class Of First Order Methods That Do Not Rely On Any Norm

Haihao Lu, PhD Student, MIT, 60 Wadsworth St, Apt 8B, Cambridge, MA, 02142, United States, haihao@mit.edu, Yurii Nesterov, Robert Michael Freund

This work generalizes the notion of smoothness, strong convexity, and Lipschitz continuity of a convex function by introducing a reference function, and uses the reference function to derive convergence rates for generalized first-order methods for convex optimization. The approach yields clear intuition behind convex optimization with composite functions as a corollary. We also developed a first-order interior-point method using a weak definition of self-concordance.

3 - A Method For Developing Confidence Bands For Multiple Dimensional Functional Responses

Wenbo Sun, University of Michigan, 2013 Medford Rd Apt 161, Ann Arbor, MI, 48104, United States, sunwbgt@umich.edu, Jionghua Jin

The standard method for specifying target responses' variabilities involves developing a confidence band for a set of empirical mechanical responses. These responses are multiple-dimension signals obtained from identical trials of different subjects. The existing methods commonly normalize responses with respect to subject characteristics, point-wisely generate confidence bands ignoring times and direction's correlation. A new method was developed in the structure of mixture models based on basis-representation and Gaussian process and provided an approach for outlier detection. It is applied to the kinematic response data collected in Children's Hospital of Philadelphia.

1 - Robust Optimization For The Alternating Current Optimal Power Flow Problem

Alvaro Lorca, Georgia Institute of Technology, alvarolorca@gatech.edu, Andy Sun

We present an adaptive robust optimization model for the alternating current optimal power flow problem (ACOPF) under uncertainty in renewable power availability and the active and reactive power injections at demand nodes. We will discuss solution methods and the performance of the approach proposed through computational experiments.

2 - Comparison Of Stochastic Programming And Robust Optimization For Risk Management In Energy Generation

Ricardo M Lima, KAUST, Thuwal, Saudi Arabia, ricardo.lima@kaust.edu.sa, Sabique Langodan, Ibrahim Hoteit, Omar Knio, Antonio J. Conejo

In this talk, we address the optimal self-scheduling and market involvement of a virtual power plant (VPP) by using three different methods. The VPP faces a decision-making problem with uncertainty in the wind power and electricity prices forecast. We define this problem using a risk-averse stochastic programming model, a robust optimization model, and with a new hybrid robust-stochastic formulation. We analyze these methods from the point of view of formulations, uncertainty quantification and risk, decomposition algorithms, and computational performance. Furthermore, we compare the impact of the risk measures and their parameterizations on the results obtained with the three methods.

3 - Risk-constrained Optimal Power Flow With Moment And Unimodality Information

Bowen Li, University of Michigan, Ann Arbor, MI, United States, libowen@umich.edu, Ruiwei Jiang, Johanna Mathieu

We propose a risk-constrained optimal power flow (OPF) problem with uncertain renewables. Using historical data and domain knowledge, we incorporate moments of the renewable forecast errors and assume unimodality to derive reformulations and approximations based on semidefinite programs and second-order cone programs, and evaluate them on IEEE test systems.

4 - An Efficient Robust Solution To The Two-stage Stochastic Unit Commitment Problem

Ignacio Blanco, PhD Student, Technical University of Denmark, Kgs. Lyngby, 2800, Denmark, igbl@dtu.dk, Juan M Morales Gonzalez

This paper proposes a reformulation of the scenario-based two-stage unit commitment problem under uncertainty that allows finding unit-commitment plans that perform reasonably well both in expectation and for the worst case realization of the uncertainties. The proposed reformulation is based on partitioning the sample space of the uncertain factors by clustering the scenarios that approximate their probability distributions. It is, furthermore, very amenable to decomposition and parallelization using a column-and-constraint generation procedure.

Sponsored Session

Chair: Eghbal Rashidi, Mississippi State University, Industrial & Systems Engineering, Mississippi State University, MS, 39762, United States, er442@msstate.edu

1 - Vulnerability Analysis Of The Initial Attack In Suppressing The Worst Case Wildfires

Eghbal Rashidi, Mississippi State University, er442@msstate.edu, Hugh Medal

In this research, we perform a quantitative gap analysis between available capacity for responding to wildfires and the estimated capacity needs for responding to a worst case scenario wildfire. We model the problem as a Stackelberg game using a bilevel max-min MIP model. We use the model to evaluate the impact of the worst-case wildfire, i.e., the arrangement of ignition points that causes the maximal damage. We then investigate the relationship between fire response capacity and the rate of spread, fire ignition location and number of fire ignitions in the landscape.

2 - An Optimization Model For Wildfire Suppression

Andres L Medaglia, Professor and Chair, Universidad de los Andes, Cr 1 este #19 A 40, ML708, Bogota, Cundinamarca, 111711, Colombia, amedagli@uniandes.edu.co

An effective early attack is essential to control wildfires. In this work, we propose an MIP to support decisions related to the planning and response phases of fire management. For the planning phase, the MIP addresses the decisions related to the location of facilities and how much inventory to store. In the response phase, decisions are concerned to the location of coordination centers and how to allocate available resources. The model includes a risk measure to limit the downside risk of different scenarios. We apply this methodology in a setting that resembles wildfires nearby the city of Bogotá (Colombia).

1 - New Developments Of L1 Splines: Fast Computation And Shape-preserving Capability

Ziteng Wang, Assistant Professor, Northern Illinois University, DeKalb, IL, United States, th2168@gmail.com

Cubic splines are widely used for data interpolation and approximation in terrain surface fitting, computer aided design, and numerical control. Conventional L2-norm based splines often show undesired oscillation and do not preserve shape, especially for irregular or multiscale data. L1 splines, by minimization of the L1-norm based metrics, have shown superior and robust shape-preserving performances and enjoyed increasing application potentials. We introduce the development of L1 splines over the past decade, present the latest research on the fast computing strategy and the quantitative measure of shape-preserving capability, and discuss future opportunities.

2 - Probing The Pareto Frontier Of Computational Statistical Tradeoffs

Zhaoran Wang, Princeton University, Princeton, NJ, 08540, United States, zhaoran@princeton.edu

In this talk, we discuss the fundamental tradeoffs between computational efficiency and statistical accuracy in big data. Based on an oracle computational model, we introduce a systematic hypothesis-free approach for developing minimax lower bounds under computational budget constraints. This approach mirrors the classical Le Cam's method, and draws explicit connections between algorithmic complexity and geometric structures of parameter spaces. Based on this approach, we sharply characterize the computational-statistical phase transitions that arise in a broad class of learning problems.

1 - Proactive Data: A Rich Source Of Occupational Accident Prediction

Jhareswar Maiti, Professor, IIT, Kharagpur, Kharagpur, 721302, India, jhareswar.maiti@gmail.com, Sobhan Sarkar, Saicharan Pardhu, Rutwick Ayi

The proactive data (e.g., inspection reports) is a source of rich information for prediction of occurrence of accidents. The main aim of the study is to use the proactive data properly along with reactive data (e.g., incident reports) retrieved from an integrated steel industry in building a prediction model to predict the occurrences of future incidents. Decision tree algorithms like C5.0, CART, CHAID, exhaustive CHAID, and ensemble techniques i.e., boosting have been implemented in order to predict the accidents. Results show that the C5.0 outperforms all other algorithms in terms of higher accuracy.

2 - Detecting Node Propensity Changes In Dynamic Degree-corrected Stochastic Block Model

Lisha Yu, City University of Hong Kong, Hong Kong, lishayu2-c@my.cityu.edu.hk, Kwok-Leung Tsui

Many real-world data can be represented as dynamic networks which are the evolutionary networks with timestamps. Studying the evolution of node propensity over time is significant to exploring and analyzing networks. In this paper, we propose a multivariate surveillance plan to monitor node propensity in dynamic social networks based on the degree-corrected stochastic block model (DCSBM). Experiments on simulated and real social network streams demonstrate that our surveillance strategies can efficiently detect different types of node propensity change in dynamic DCSBM with different kinds of community structure.

1 - Adoptive Vehicle Cruise Control Using Real Time Data And A Dynamic Programming Model: A Web Based Application

Mohammad Ali Alamdar Yazdi, PhD Student, Auburn University, 354 W Glenn Ave, Auburn, AL, 36830, United States, mza0052@auburn.edu, Fadel Mounir Megahed

Recent investigations have included exploring the benefits of autonomous vehicle systems in improving a vehicle's miles per gallon (mpg) fuel-economy performance. This talk examines a new direction where large amounts of online data will be used to develop a fuel efficient cruise controller. More specifically, a dynamic programming model is constructed to capitalize on existing fuel consumption models and use real-time data collected from different Google APIs to minimize fuel efficiency. The minimization is based on dynamically optimizing the current speed and route based on forthcoming route conditions (traffic, elevation, etc.).

2 - Modeling Quality Of Care In Hospice Operations

Leela Nageswaran, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, lnageswa@andrew.cmu.edu, Alan Scheller-Wolf, Aliza R Heching

We study a hospice manager's problem of controlling quality of care in light of recent regulatory changes mandating reporting of quality metrics. To explore the potential effects of such reporting, we develop an analytical Markov Decision Process model that incorporates how staffing - a primary determinant of quality - affects the rate at which patients join the hospice (due to quality reputation effects) and depart the hospice (due to quality of care effects). This in turn affects the hospice's revenues and costs. We solve our model to obtain properties and insights related to the optimal quality control policy.

3 - Decision Facing Ambiguity MDP POMDP And Beyond

Mohammad Rasouli, University of Michigan, 430 South Fourth Ave, Ann Arbor, MI, 48104, United States, rasouli@umich.edu

While most of the decision making tools are developed for a Bayesian framework where the decision maker knows full stochastic description of uncertainties in the environment, decision facing ambiguity (model uncertainty and non-stochastic uncertainty) is a better approach for modeling a lot of practical situations. We discuss how decision making tools including MDP, POMDP, learning (e.g. Multi-armed bandit) and team decision making can be extended for environments with ambiguity. We discuss robustness and bounded rationality in this framework.

4 - Iterative Methods For Large Markov Decision Problems

Xiaodong Luo, Sabre Holdings Inc, 3150 Sabre Drive, Southlake, TX, 76092, United States, Xiaodong.Luo@sabre.com

We propose a new unified LP formulation for the Infinite Horizon Markov Decision Problem (MDP), both with the total discounted reward criteria and the long-run expected average reward criteria (assuming the gain is constant). We embed a column generation scheme into a multiplier method to solve the new formulation. Our algorithm can solve large randomly generated MDPs faster than commercial solvers. It scales up linearly for MDPs with hundreds of millions of nonzero. It uses much less memory than Barrier method, easy to warm start and is highly parallelizable.

Spatial Optimization and Conservation Reserve Design

Sponsored: Energy, Natural Res & the Environment I Environment & Sustainability

Sponsored Session

Chair: Bistra Dilkina, Georgia Institute of Technology, 266 Ferst Drive, Klaus Bldg 1304, Atlanta, GA, 30332-0765, United States, bdilkina@cc.gatech.edu

1 - Density Based Design: A Spatial Optimization Model For Protecting The Fisher

Richard Church, University of California, Santa Barbara, church@geog.ucsb.edu

We discuss the necessary elements of home range core areas in supporting female fishers during the key natal-maternal season. We propose an integer linear programming model that schedules harvests and spatially tracks and meets needed habitat elements over time and present preliminary results for an industrial forest in California.

2 - Optimizing Conservation Designs With Home Range And Connectivity Criteria

Bistra Dilkina, Georgia Institute of Technology, Atlanta, GA, United States, bdilkina@cc.gatech.edu

We develop a wildlife reserve design approach that takes into account both the number of individuals supported and the accessibility of the whole design to those individuals. In particular, a spatial capture-recapture model based on ecological resistance distance gives rise to three estimated quantities of interest (density, potential connectivity and density-weighted connectivity) that can be used to evaluate the ability of a reserve design to support individuals. We formulate a set of optimization problems to examine the use of these three quantities for selecting land parcels for conservation.

3 - Delaying Invasive Spread: Is Effective Control Possible Without Effective Prediction?

Gwen Spencer, Smith College, gwenspencer@gmail.com

Some (continuous) models of species spread yield impossibly-clean analytical results. Productive mathematical exchange with ecologists must acknowledge and attempt to capture disciplinary knowledge and critiques, even if this means sacrificing analytical traction. We will discuss computational work motivated by experimental and statistical papers in the invasive-species literature, making the case for discrete methods that acknowledge landscape heterogeneity and objectives that go beyond expected value.

4 - Avicaching: A Two Stage Game For Bias Reduction In Citizen Science

Yexiang Xue, Cornell University, yexiang@cs.cornell.edu

The data collected in citizen science projects are often biased, more aligned with the citizens' preferences rather than scientific objectives. We introduce a novel game for reducing the data bias in which the organizer, a citizen-science program, incentivizes the agents, the citizen scientists, to visit under-sampled areas. We provide a novel way to encode this two-stage game as a single optimization problem, cleverly folding the agents' problems into the organizer's problem. We apply our methodology to eBird, a well-established citizen science program, as a game called Avicaching. Since its deployment, Avicaching has been very successful, surpassing the expectations of the eBird organizers.

Various Aspects of Second Order Cone Optimization

Sponsored: Optimization, Linear and Conic Optimization

Sponsored Session

Chair: Sertalp Bilal Cay, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States, sertalpbilal@gmail.com

1 - On Disjunctive Conic Cuts When They Exist When They Cut

Mohammad Shahabsafa, Lehigh University, 200 West Packer Ave, Bethlehem, PA, Bethlehem, PA, 18015, United States, mos313@lehigh.edu, Tamas Terlaky

The development of Disjunctive Conic Cuts (DCCs) for MISOCO problems has recently gained significant interest in the optimization community. Identification of cases when DCCs do not exist, or are not useful, saves computational time. In this study, we explore cases where either the DCC methodology does not derive a DCC which is cutting off the feasible region, or a DCC does not exist. Additionally, we work on extending the DCCs to other conic optimization problems such as Mixed Integer p-order Cone Optimization and Mixed Integer Semidefinite Optimization.

2 - Effects Of Disjunctive Conic Cuts Within A Branch And Conic Cut Algorithm

Sertalp Bilal Cay, Lehigh University, sertalpbilal@gmail.com

Recently, Mixed Integer Second Order Cone Optimization (MISOCO) has gained attention. This interest has been driven by the availability of efficient methods to solve second order cone optimization (SOCO) problems and the wide range of applications of MISOCO. In this work, we experiment with the recently developed methodology of Disjunctive Conic Cuts (DCC). In particular, we test it on variations of portfolio optimization problems within a Branch and Conic Cut (BCC) framework. Our experiments show that our proposed methodology using DCCs is effective in practical settings.

3 - A Rounding Procedure For A Maximally Complementary Solution Of Second Order Conic Optimization

Ali Mohammad Nezhad, Lehigh, alm413@lehigh.edu

The concept of optimal partition was originally introduced for linear optimization, and later the concept was extended to second-order conic optimization. In this paper, we present a rounding procedure, which uses optimal partition information to generate a pair of maximally complementary optimal solutions. The rounding procedure starts from a strictly interior solution, close to the optimal set. It either gives an exact maximally complementary optimal solution in strongly polynomial time, or provides a fast iterative procedure to approximate a maximally complementary optimal solution.

Recent Advances in Discrete Optimization

Sponsored: Optimization, Integer and Discrete Optimization

Sponsored Session

Chair: Andres Gomez Escobar, University of California, Berkeley, CA, United States, a.gomez@berkeley.edu

1 - Final Point Generalized Intersection Cuts

Aleksandr Mark Kazachkov, Carnegie Mellon University, akazachk@cmu.edu

We introduce a new class of cuts for mixed-integer programming called final point cuts. Generated from arbitrary valid disjunctions, this class is an extension of the generalized intersection cut paradigm. We present theoretical and computational results demonstrating the strength of these cuts as compared to both standard intersection cuts and previous types of generalized intersection cuts.

2 - Generating Cuts From The Ramping Polytope For The Unit Commitment Problem

Jim Ostrowski, University of Tennessee, jostrows@utk.edu

We present a perfect formulation for a single generator in the unit commitment (UC) problem. This generator can have characteristics such as ramping constraints, time-dependent start-up costs, and start-up/shut-down ramping. The perfect formulation is polynomially large, so we use it to create a cut-generating linear program for a single generator. We test the computational efficacy of these cuts in a utility-scale UC MIP model, based on the FERC generator set and 2015 hourly data from PJM. These cuts may also beneficial for the more complex UC models used by ISOs today because they reduce the enumeration needed to enforce a generator’s technical constraints.

3 - Conic Quadratic Program With Indicator Variables

Hyemin Jeon, University of California Berkeley, hyemin.jeon@berkeley.edu, Alper Atamturk

We investigate a conic quadratic mixed 0-1 programming problem with on-off constraints that arises from mean risk optimization. Analysis is conducted on the properties of the optimal solutions of the problem and its relaxation. A class of linear valid inequalities is derived by lifting the extended polymatroid inequalities that are known to be highly effective for the pure 0-1 case. We report the result of computational experiments to demonstrate the impact of the inequalities on strengthening the continuous relaxation.

4 - Polymatroid Inequalities For Mixed-integer Second Order Cone Programming

Andres Gomez, University of California Berkeley, a.gomez@berkeley.edu, Alper Atamturk

We propose valid inequalities for mixed-integer second order cones programs. We show that the proposed inequalities completely describe the convex hull of a single second order cone constraint. Moreover we show how to strengthen the inequalities using other constraints of the optimization problem. We report computational experiments on mixed-integer second-order cone programs, using the proposed valid inequalities as cutting planes.

1 - Cubic Regularization For Conjugate Gradient Minimization And Symmetric Rank-one Methods

Hande Benson, Drexel University, benson@drexel.edu

Regularization techniques have been used to help existing algorithms solve “difficult” nonlinear optimization problems. Over the last decade, regularization has been proposed to remedy issues with equality constraints and equilibrium constraints, bound Lagrange multipliers, and identify infeasible problems. In this talk, we will focus on the application of cubic regularization in the context of the symmetric rank-one and conjugate gradient methods for nonlinear programming.

2 - Two New Efficient Algorithms For Compressed Sensing

Robert J Vanderbei, Princeton University, rvdb@princeton.edu

We present two new approaches for solving large-scale compressed sensing problems. The first approach uses the parametric simplex method to recover very sparse signals by taking a small number of simplex pivots while the second approach reformulates the problem using Kronecker products to achieve faster computation via a sparser problem formulation. Numerical studies show that each of these two algorithms are about 10 times faster than current state-of-the-art methods.

3 - Using A Fast Projected Gradient Method To Solve Large Scale Nonlinear Optimization Problems.

Igor Griva, George Mason University, igriva@gmu.edu

Some modern nonlinear optimization problems have a large number of variables and dense Hessians that makes challenging or impossible using second order methods. We discuss how the fast projected gradient method can be used for addressing optimization problems in machine learning, nonnegative least squares and positive emission tomography reconstruction.

Chair: David Mendez, Graduate Student, University of Tennessee, 2621 Morgan Circle, Knoxville, TN, 37996, United States, dmendez@vols.utk.edu

1 - The Price Of Deception In Social Choice

James Patrick Bailey, Georgia Institute of Technology, 755 Ferst Drive, NW, Unit 2401, Atlanta, GA, 30332, United States, james.bailey@gatech.edu, Craig Aaron Tovey

Classic impossibility theorems rule out strategy-proofness for all popular voting rules, but is it wise to always settle for nothing with respect to manipulation? We introduce a measure, the price of deception, of how much strategic voting could alter an election outcome with respect to the winning criterion. We analyze this measure for several standard voting rules and find significant differences among them. We also analyze several standard cost functions for facility location, and again find large differences. These results give good evidence that the price of deception, like computational complexity, does offer finer distinctions of manipulability than between ”yes” or ”no”.

2 - A Comprehensive Model For Location/allocation Of Maritime Search And Rescue Vessels

Amin Akbari, PhD Candidate, Dalhousie University, 1104-1094 Wellington Street, Halifax, NS, B3H 2Z9, Canada, amin.akbari@dal.ca, Ronald P Pelot, H A Eiselt

The general methodology utilized in this study is building a mathematical model to optimize the Location/Allocation of Maritime Search and Rescue Resources with regard to several criteria such as primary and backup coverage, mean access time and service equality. A multi-objective model is built to optimize the location and response allocation of SAR resources with simultaneously taking several objectives into account in order to achieve greater responsiveness and resource utilization. Atlantic Canada serves as the area of the study. Sensitivity analyses are performed on variable objective weights and other parameters to examine their impact on the optimal solution.

3 - A Study on Optimal Locations Of Public Facilities To Maximize Social Benefit”

Hyunhong Choi, PhD Student, Seoul National University, 1 Gwanak-ro Gwanak-gu, Seoul, 08826, Korea, Republic of, hongchoi@snu.ac.kr, Misuk Lee, Yoonmo Koo

Economic feasibility analysis on the public facility construction is widely being studied. However, studies concerning the optimal location of these facilities has not been fully explored yet. In this study, we estimated consumers’ willingness to pay depending on the distance to non-market goods(i.e., arboretums) by using the contingent valuation method. Then, we utilized nested partitions method, one of the categorical optimization methods, to find optimal locations maximizing social benefit among numerous alternatives.

4 - Location Determination Of A Milk Condensing Plant In Tennessee

David Mendez, Graduate Student, University of Tennessee, 2621 Morgan Circle, Knoxville, TN, 37996, United States, dmendez@vols.utk.edu

Given the increasing popularity of local foods and the desire to reduce shipping costs and carbon footprint, Tennessee-based dairy product processors are likely interested in sourcing condensed milk from an in-state milk condensing plant. Based on dairy farmer surveys, distances, and transportation costs, this study uses a mixed integer linear programming model to determine the optimal location for a condensing plant that minimizes transportation costs from farms to the condensing plant and the condensing plant to further processors.

1 - Using Big Data And Analytics To Enable Smart Mobility

Yun Wang, University of Arizona, Tucson, AZ, 85716, United States, yunw@email.arizona.edu, Faiz Currim, Sudha Ram

In this work we introduce a three-layer management system to support smart urban mobility with an emphasis on bus transportation. In Layer-1, we apply novel Big Data techniques to efficiently compute bus travel times and passenger demands using universal data streams. Layer-2 contains two analytic components: network analysis of passenger transit patterns and causal relationship analysis for bus delays. The third layer provides interactive visualization tools for decision support. Our system is developed in cooperation with the city of Fortaleza in Brazil. The use of generally available urban transportation data makes our methodology adaptable and customizable for other cities.

2 - Analyst Language In Quarterly Earnings Calls: Comparing Interactions With Fraudulent And Non-fraudulent Managers

Lee Spitzley, University of Arizona, lspitzley@email.arizona.edu

Corporate financial fraud damages investors, the public, and the companies involved. Fraudulent managers must convince investment analysts who study the company that what they say is accurate and represents the true state of the business. I will examine the content of analyst utterances when they are interacting with the managers during earnings calls. If analysts suspect abnormalities, they may modify their questioning strategies. This study will test for differences in the topic composition of all analysts on a call, and for differences within analysts who follow both fraudulent and non-fraudulent companies in the same industry.

3 - An Empirical Study Of Venders’ Profit Under Different Mechanisms On Online Crowdsourcing Platforms

Xiao Han, Shanghai Jiao Tong University, Shanghai, China, hanxiao@sjtu.edu.cn, Pengzhu Zhang

Online crowdsourcing markets not only allow buyers of any size to tap into a large talented pool of workforce but also expand the market reach for vendors. Prior studies on crowdsourcing markets have mainly focused on buyers, and there is a lack of understanding of how vendors survive and evolve in the crowdsourcing markets. This paper aims to fill this gap by taking the perspective of vendors and ask how vendors benifit in crowdsourcing markets under different mechanisms.

4 - The Dark Side Of The Singularity: Can OR/MS Help?

John D Little, Massachusetts Institute of Technology, Sloan School of Management, Room E62-534, Cambridge, MA, 02142, United States, jlittle@mit.edu

The “Singularity” is the point in time when artificial intelligence (AI) exceeds human intelligence. This may occur by putting AI on computers, by biological creation, or by a mixture of both. Some of the people writing about this or developing advanced AI are Victor Vinge, Ray Kurzweil (the Singularity is Near), Tom Malone, Ben Goertzel and Hugo de Garis. The dark side is that most people in this room will be left far behind. Kurzweil notes that AI develops exponentially, whereas most of us extrapolate linearly.

Sponsored Session

Chair: Lei Zhao, Tsinghua University, Qinghua West Road, Beijing, 100084, China, lzhao@tsinghua.edu.cn

1 - Robust Inventory Management Under Supply And Demand Uncertainties

Jie Chu, McMaster University, Hamilton, ON, Canada, chuj6@mcmaster.ca, Kai Huang

We simultaneously consider demand and supply uncertainties in a robust optimization framework. We first consider a single-station case, then we extend to a multi-echelon network case. The resulting robust counterpart of the network case does not maintain the same difficulty as its nominal problem. Nonetheless, we present an approximation and thus it can be solved more efficiently. We demonstrate the effectiveness of proposed models numerically.

2 - Learning In Multi-stage Rollouts

Saul Toscano-Palmerin, Cornell University, Ithaca, NY, United States, st684@cornell.edu, Peter Frazier

We consider a transportation company choosing routes on which to offer service. Each route has an unknown parametric demand distribution, and we wish to choose routes subject to a budget constraint to maximize total demand. We propose a two-stage optimal learning algorithm, where first we offer service on some routes, and learn from observed demand about demand distributions on other similar routes. Then in a second stage, we offer service on additional routes suggested to be good by the first stage. We demonstrate that this two-stage optimal learning approach captures more demand than a one-stage approach that does not leverage the opportunity to learn.

3 - Optimal Learning In Urban Delivery Resource Allocation

Yixiao Huang, Tsinghua University, 530 Shunde Building, Beijing, 100084, China, huangyx12@mails.tsinghua.edu.cn, Lei Zhao, Warren B Powell, Ilya O Ryzhov

We study knowledge gradient (KG) based optimal learning methods to optimize the urban delivery resource allocation decisions, when the evaluation of such decisions is expansive.

1 - A Geometry Driven Active-set Method For Elastic-net Minimization

Daniel Robinson, Johns Hopkins University, daniel.p.robinson@gmail.com

We propose an efficient and provably correct active-set based algorithm for solving the elastic net problem. The proposed algorithm exploits the fact that the nonzero entries of the elastic net solution fall into an oracle region, which we use to define and efficiently update an active set. The proposed update rule leads to an iterative algorithm which is shown to converge to the optimal solution in a finite number of iterations. We present experiments on computer vision datasets that demonstrate the superiority of our method in terms of both clustering accuracy and scalability.

2 - A Reduced-space Algorithm For Minimizing L1-regularized Convex Functions

Tianyi Chen, Johs Hopkins University, tchen59@jhu.edu

We present a new method for minimizing the sum of a convex function and an l1-norm regularizer. The main features of the new method include: (i) an evolving set of indices corresponding to variables that are predicted to be nonzero at a solution; (ii) a reduced-space subproblem defined in terms of the predicted support; (iii) conditions that determine how accurately each subproblem must be solved; (iv) a computationally practical condition that determines when the predicted support should be updated; and (v) a reduced proximal gradient step that ensures sufficient decrease. We prove a convergence guarantee for our method and demonstrate its efficiency on a large set of model prediction problems.

3 - R-linear Convergence Rate Of A Limited Memory Steepest Descent Method

Wei Guo, Lehigh University, weg411@lehigh.edu

We provide some theoretical convergence results for a limited memory steepest descent (LMSD) method, proposed by Fletcher, when minimizing strictly convex quadratics. First, we show a finite termination property for the algorithm when there are duplicate eigenvalues. However, our main result shows an R-linear convergence rate for the algorithm when minimizing a strictly convex quadratic of any dimension with any limited memory history length. This extends the R-linear convergence rate of the Barzilai Borwein “two-point step size” method which uses information from only the previous iteration.

1 - An Operational Model To Support Cotton Trade In India

Sundaravalli Narayanaswami, I I M, Ahmedabad, 380015, India, sundaravallin@iima.ac.in, Narasimhan Ravichandran

Cotton Corporation of India (CCI) is a government agency created to regulate the market dynamics of cotton trade in India, (a cotton surplus country) to promote and protect the economic interest of cotton growing farmers in India. When there is a demand supply imbalance, CCI operates by appropriate price intervention and procurement of the quantity available to stabilize price. The procured quantity is sold by CCI at an appropriate time to maximize the economic value. The operational expenses are reimbursed by the Union Government. We develop and present simulation based models to facilitate negotiation between the government and CCI on this activity.

2 - Internet Of Things And Smart City

Michael Chuang, SUNY New Paltz, 1 Hawk Drive, New Paltz, NY, 12561, United States, chuangm@newpaltz.edu

Internet of Things have emerged as an enabler in various domains for facilitating business or operations such as its application in smart cities. In this preliminary study, we will review various scenarios where internet of things show potentials in smart city applications, and also opportunities and challenges for Internet of Things to be developed in this area.

3 - Connected Vehicle Analytics For In Vehicle Air Quality Management

Yimin Liu, Mobility Analytics Manager, Ford Motor Company, One American Road, Dearborn, MI, 48121, United States, yliu59@ford.com, Yu Chen, Jinjing Yang, Oleg Gusikhin, Omar Makke, Jeff Yeung

This talk presents a concept of cloud-based system for in-cabin air quality management. It leverages SmartDeviceLink technology to seamlessly integrate smartphone apps with Ford SYNC infotainment system and allow programmatically manage vehicle HVAC (Heating, Ventilation and Air Conditioning) settings. This approach allows integrating advanced connected car technologies, portable after-market sensors and cloud-based analytics into climate control loop.

4 - Sustaining The Drone Enterprise

Kiel Michael Martin, Assistant Professor, USAF, 8940 Rochester Dr, Colorado Springs, CO, 80920, United States, c05kielmartin@gmail.com, Dan Richmond, John Swisher

The Remotely Piloted Aircraft (RPA), colloquially labeled the “drone,” has become iconic of American military campaigns this century. The most salient question concerning these aircraft at the Pentagon today is operational, not ethical: given increasing global demand, how can the United States Air Force (USAF) produce and retain sufficient numbers of pilots to fly these aircraft? As part of a recent effort by the Secretary of Defense to stabilize the RPA enterprise, we developed a dynamic manpower projection model, quantifying the potential impact of myriad initiatives and directly informing new, Air Force-wide RPA policy.

Sponsored Session

Chair: Adolfo Raphael Escobedo, Arizona State University, Brickyard Engineering (BYENG) 553, 699 S Mill Ave, Tempe, AZ, 85281, United States, adolfo.escobedo@asu.edu

1 - Extensions Of Subadditive Duality For Conic Mixed-integer Programs

Diego Moran, Universidad Adolfo Ibañez, dmoran@gatech.edu, Burak Kocuk

In a recent paper it was proven that the subadditive dual for mixed-integer conic program is a strong dual under a strict feasibility requirement. In this paper, we generalize this result by exploring alternative sufficient conditions when strict feasibility is not present. In particular, we prove that in the case of essential strict feasibility and in the case of bounded feasible region, the subadditive dual has zero duality gap. Moreover, we show that the dual is solvable when essential strict feasibility holds while the solvability of the dual problem cannot be guaranteed for bounded feasible regions. Finally, we discuss a relationship between strong duality and cut generating functions.

2 - The Hamiltonian P-median Problem: Complexity And Algorithms

Erick Moreno-Centeno, Department of Industrial and Systems Engineering, Texas A&M University, emc@tamu.edu, Ahmed Mohamed Marzouk, Halit Uster

Given an undirected graph, G, the Hamiltonian p-median problem is to find p cycles partitioning G with minimum cost. This problem is NP-hard for any given value of p; however, the problem’s actual difficulty depends on the value of p. Similarly, the state-of-the-art algorithms outperform each other (or fail altogether) depending on the value of p. We give some insights on these observations. This work is in collaboration with Halit Uster and Ahmed Marzouk, both from Southern Methodist University.

3 - A Quadratic Relaxation For A Dynamic Knapsack Problem With Stochastic Item Sizes

Daniel Blado, H. Milton Stewart School of Industrial and Systems Engineering, Georgia Institute of Technology, deblado@gatech.edu

We examine the stochastic knapsack problem with random item sizes that are realized upon each attempted insertion. The process aims to maximize expected profit and ends after a failed insertion. We investigate dynamic programming-based LP bounds and their gap with the optimal adaptive policy. Our relaxation involves a quadratic value function approximation that encodes interactions between remaining items. We compare the bound to the best known pseudopolynomial bound and contrast their corresponding policies with two greedy policies. We conclude that the quadratic bound is theoretically more efficient than the pseudopolyomial bound yet empirically competitive in value and runtime.

4 - Routing Optimization With Time Windows Under Uncertainty

Yu Zhang, Northeastern University, Shenyang, China, waltyuzhang@gmail.com, Roberto Baldacci, Melvyn Sim, Jiafu Tang

We study an a priori Traveling Salesman Problem with Time Windows under uncertain travel times. We propose a decision criterion for articulating service levels that takes into account both the probability of lateness and its magnitude, and can be applied in contexts where either the distributional information of the uncertain travel times is fully or partially known. The criterion has the computationally attractive feature of convexity that enables us to formulate and solve the problem more effectively. Particularly, we obtain in some cases closed-form solutions to the Benders subproblems.

Sponsored Session

Chair: Ozgur M Araz, University of Nebraska-Lincoln, CBA 260 1240 R Street, P.O. Box 880491, Lincoln, NE, 68588-0491, United States, oaraz2@unl.edu

1 - Predicting Hospital Admissions From Emergency Department

Ozgur M Araz, University of Nebraska-Lincoln, oaraz2@unl.edu

Emergency departments (EDs) are critical for healthcare services delivery and coordination between EDs and inpatient units are essential for higher quality of service in hospitals. In this study, we are investigating the predictive factors of hospital admissions from the emergency department (ED) in order to inform resource capacity planning for the ED boarding process. We used ED visits data which include demographic and administrative variables from a major hospital in Omaha Metro area and performed analyses using several predictive models, e.g., logistic regression and artificial neural network, to predict admissions from the ED. The predictive accuracy of these models are discussed.

2 - Seasonal Forecasting For Infectious Disease From Multiple Data Sources

Zeynep Ertem, University of Texas at Austin, zeynepsertem@gmail.com, Lauren Meyers, Kai Liu, Ravi Srinivasan

Epidemics of contagious diseases may cause widespread loss in terms of mortality, morbidity, and economic burden. There have been several studies about forecasting focusing on one data source. However, there can be other more data sources that are correlated with an important data source. I will show a problem formulation of forecasting a target data source related to an epidemic using multiple other data sources. I will also present preliminary results for forecasting when no data is available for the target data source in the current season. Furthermore, I will relax this assumption and show results for forecasting when partial data is available for the target data source in the current season.

3 - Psa Screening For Prostate Cancer: A Dynamic Feedback Model To Understand Long Term Trends In Population Screening

Ozge Karanfil, Massachusetts Institute of Technology, Sloan School of Management, Cambridge, MA, United States, karanfil@mit.edu, Hazhir Rahmandad, Jack Homer, John D Sterman

Practice guidelines for routine screening have changed significantly over time and often not followed, with significant over-screening for some tests and under-screening for others. In this study we develop a behaviorally realistic simulation model to explore reasons of this phenomenon. The model is firmly grounded in empirical evidence through collection of quantitative and qualitative data. Our formal theory includes a decision theoretic core around costs and benefits, cognitive and social feedbacks. The model can be used as a guide to understand future effects of policy scenarios and be tested in a systematic fashion to find ways to overcome the policy resistance seen in population screening.

4 - A Queueing Model For Nurse Staffing In Critical Care Outreach Team And Intensive Care Unit

Ali Haji Vahabzadeh, The University of Auckland Business School, Auckland, New Zealand, a.vahabzadeh@auckland.ac.nz, Valery Pavlov

We propose a queueing model of CCOT to examine the effects of this team on the ICU performance and patient outcomes. To gain more insights into the effectiveness of the role of critical care nurses on the ICU utilisation rate and patient outcomes, we analyse different nurse allocation policies between ICU and CCOT. To validate the proposed queueing model, a discrete-event simulation and accordingly an optimisation study have been performed. Finally, the study provides recommendations to hospitals on the functionality of the CCOT and the nurse staffing policy.

1 - Mathematical Optimization And Simulation Analyses For Optimal Liver Allocation Boundaries

Monica Gentili, University of Louisville, Louisville, KY, 40205, United States, monica.gentili@louisville.edu, Naoru Koizumi, Rajesh Ganesan, Chun-Hung Chen

This study combines mathematical programming models and Discrete Event Simulation to advance existing research on organ allocation system and geographic equity and efficiency in liver transplantation system. The main objectives of the study are: (i) to identify key factors determining geographic disparity in kidney transplantation; (ii) to identify optimal locations for both existing and new liver transplant centers (iii) to identify new OPO boundaries and (iv) to test whether the mathematically produced liver allocation system can perform better than the actual system. We will show the results of our combined approach when applied to liver transplantation in USA.

2 - Small Representations Of Big Kidney Exchange Graphs

John Dickerson, Carnegie Mellon University, Pittsburgh, PA, United States, dickerson@cs.cmu.edu, John Dickerson, University of Maryland, College Park, MD, United States, dickerson@cs.cmu.edu, Aleksandr Mark Kazachkov, Ariel Procaccia, Tuomas W Sandholm

Kidney exchanges are organized markets where patients swap willing but incompatible donors. We observe that if the kidney exchange compatibility graph can be encoded by a constant number of patient and donor attributes, fundamental problems in kidney exchange are solvable in polynomial time. We give conditions for losslessly shrinking the representation of an arbitrary compatibility graph. Then, using data from the UNOS nationwide kidney exchange, we show how many attributes are needed to encode real compatibility graphs. The experiments show that, indeed, small numbers of attributes suffice. This has application to optimal pre-transplant immunosuppression policies.

3 - Offer Batching For Organ Placement

Tinglong Dai, Assistant Professor, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21202, United States, dai@jhu.edu, Sommer Gentry, Sommer Gentry, Sridhar R Tayur, David Axelrod, Dorry Segev, Dorry Segev

In this study, we consider an organ procurement organization's problem of determining the optimal batch size of simultaneous offers made to transplantation centers. We model the strategic interaction among transplant centers both within and across batches, leading to structural properties and computational insights.

4 - Redistricting Liver Allocation: Challenges And Extensions

Sommer Gentry, United States Naval Academy, gentry@usna.edu Sommer Gentry, Johns Hopkins University, Baltimore, MD, United States, gentry@usna.edu, Josh Pyke, Eric K Chow, Dorry Segev

Livers for transplant in the U.S. are distributed within eleven regions, and are much more available in some geographic areas, leading to dramatic disparities in transplant rates. We have used redistricting to design novel sharing districts which significantly reduce these geographic disparities. The improved districts might be implemented soon, if concerns about increased transport time for organs and about the variability of organ supply and demand can be addressed. We will explore the efficient frontier of the policy space, trading off organ transport for disparity reduction. We will also discuss a robust formulation of the redistricting problem.

Socially-responsible Healthcare Operations

Sponsored: Health Applications

Sponsored Session

Chair: Priyank Arora, Georgia Institute of Technology, 800 West Peachtree, NW, Atlanta, GA, 30308, United States, priyank.arora@scheller.gatech.edu

1 - Ambulance Routing In Resource Constrained Settings

Milind G. Sohoni, Indian School of Business, milind_sohoni@isb.edu, Lavanya Marla, Achal Bassamboo, Chandrasekhar Manchiraju

Using real-world data we look at optimal dispatch policies and compare those with current best practices. We develop insights and guidelines for practicing managers.

2 - Healthcare Payment Model Impact On Hospital Readmissions

Jon M Stauffer, Texas A&M University, College Station, TX, United States, jstauffer@mays.tamu.edu, Jonathan Helm, Kurt M Bretthauer

We examine the transition from Fee-for-Service (FFS) to pay-for-performance (P4P) reimbursement plans, such as bundled payments and the Hospital Readmission Reduction Program (HRRP). We use a game theory approach to understand how healthcare providers interact to improve their individual contribution margins. Results show that P4P plans do motivate extra readmission reduction effort, but that misalignments can occur between the player's efforts and the minimum total system cost effort. We find that the smaller post-discharge player can be over-motivated to reduce readmissions and that HRRP is not necessary with well-designed bundled payment plans.

3 - Delivering Long Term Surgical Care In Underserved Communities

Ujjal Kumar Mukherjee, University of Illinois at Urbana–Champaign, Champiagn, IL, United States, ukm@illinois.edu, Emily J. Kohnke, Kingshuk K Sinha

How can international NPOs enable the long-term delivery of surgical care in underserved communities? We report findings from a longitudinal field study spanning 11 years conducted at Gansu province of China. We triangulate insights from qualitative and quantitative data analyses to develop and validate an integrative framework that demonstrates how an international NPO's efforts related to affordability, provider-awareness, and access are interdependent, and how the efforts interact and impact the volume and quality of surgeries in underserved communities.

4 - Improving Societal Outcomes In The Organ Donation Value Chain

Priyank Arora, Georgia Institute of Technology, 800 W Peachtree St NW, Atlanta, GA, 30308, United States, priyank.arora@scheller.gatech.edu, Ravi Subramanian

Our paper studies the operational actions of supply-side players in an organ donation value chain (ODVC), namely, the Organ Procurement Organization that coordinates organ recovery activities, and the hospital, where potential cadaveric donors arrive. The main contributions of our work are two-fold: First, while the majority of the literature focuses on the demand side of an ODVC, we develop an analytical model to study the effects of contextual parameters and decisions of the supply-side entities in an ODVC on their respective payoffs and societal outcomes. Second, we recommend Pareto-improving contracts that a social planner can use to help the ODVC achieve socially-optimal performance.

Topics in Resident and Medical Student Scheduling

Sponsored: Health Applications

Sponsored Session

Chair: Amy Cohn, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States, amycohn@umich.edu

1 - Using Maximally Feasible And Minimally Infeasible Request Sets To Construct Resident Schedules

Brian Lemay, University of Michigan, Ann Arbor, MI, United States, blemay@umich.edu, Amy Cohn, Marina Alex Epelman

When scheduling healthcare providers, it is frequently not possible to satisfy every scheduling request. Multi-criteria objective functions provide one method for overcoming this challenge, but can result in undesirable schedules. We discuss an alternative method for resolving conflicting requests that identifies maximally feasible and minimally infeasible sets of scheduling requests by solving a sequence of optimization problems. We present results based on a resident scheduling problem at a major teaching hospital.

2 - A General Model For Medical Resident Rotation Scheduling

William Pozehl, University of Michigan, pozewil@umich.edu, Amy Cohn

Building annual rotation schedules for medical residents is often extremely challenging for program directors and chief residents. Scheduling requires a complex tradeoff of resident needs, service needs, and a multitude of preferences and requests. We present a general model for automatically constructing these schedules using linear programming and explore algorithms for iteratively improving the measures of schedule quality.

3 - Creating Resident Shift Schedules Under Multiple Objectives By Generating And Evaluating The Pareto Frontier

Young-Chae Hong, University of Michigan, hongyc@umich.edu, Amy Cohn, Marina A Epelman

Preparing a schedule for residents is a complex task, which requires considering a large number of complex rules and multiple conflicting metrics at the same time: patient safety, educational requirements, and resident satisfaction. However, it is not easy for chief residents to quantify weights to trade off metrics or to provide a single objective function. Thus, it is better to provide a set of Pareto schedules to the chief residents and make them choose the most preferable one. This research uses integer programming and a recursive algorithm for generating Pareto schedules to reduce the solution space for chief residents to review and to help elicit their preferences.

4 - A Linear Programming Model For Scheduling Medical School Clinical Experiences

Roshun Sankaran, University of Michigan, Ann Arbor, MI, United States, roshuns@umich.edu, Amy Cohn, Anna Munaco

The University of Michigan Medical School unveiled a new curriculum in 2015 aimed at providing medical students with a sustained balance of science coursework and clinical exposure over their four years via the Initial Clinical Experience (ICE) and M4 Pilot programs. Building schedules for these programs are multi-criteria objective problems that consider constraints unique to each course. Easy-to-use scheduling tools using Open Solver were developed to create optimal group and clinic assignments for each program in order to streamline the scheduling process in the future.

Logistics IV

Contributed Session

Chair: Jafar Namdar, University of Tennessee, 2109 Laurel Avenue, Knoxville, Knoxville, TN, 37916, United States, jafer.namdar@gmail.com

1 - Designing Robust Beef Supply Chain With Environment And Animal Welfare Costs: Small Or Large Slaughter Facilities

Faisal M. Alkaabneh, Huaizhu Oliver Gao, Cornell University, Ithaca, NY, Contact: fma34@cornell.edu

We consider the problem of designing robust beef supply chain for some regions in New York State by simulating supply and demand side shocks. We developed a Mixed Integer Programming model that decides simultaneously the assignment of beef slaughter facilities to beef feedlots, locating slaughter facilities, and routing of trucks from slaughter facilities to a set of customers. The problem under consideration takes into account environmental costs and animal welfare. We show how the structure of the supply chain changes when considering environmental cost and animal welfare and how the promotion of small slaughter facilities provides more agile and robust network under different scenarios.

2 - Smart Logistic Management

Mostafa Ghafoorivarzaneh, Student, University of Tennessee-Knoxville, 851 Neyland Drive, Room 511, Knoxville, TN, 37996, United States, mghafoor@utk.edu, Roshanak Akram, Rupy Sawhney

In this study, a smart logistic management approach will be introduced. First a set of KPIs will be discussed for logistic management, which are mostly in tactical level of supply chain. At the second step information needed for smart logistic management will be collected and visualized automatically. In the third step a time dependent Periodic VRP will be introduced based on collected information in second step using a meta-heuristic approach. In the last section a heuristic rerouting method will be introduced based on collected information in second and third steps.

3 - A Robust Model Predictive Control Approach For Logistics Planning In Response To An Earthquake

Yajie Liu, Associate Professor, National University of Defense Technology, Changsha, 410073, China, liuyajie@nudt.edu.cn, Hongtao Lei, Jianmai Shi

Making transportation plans usually faces many challenges in response to earthquakes, especially when the post-disaster environment is dynamic and uncertain. This study provides a model predictive control (MPC) approach combined with robust optimization (RO) to the problem of efficiently transporting both commodities to affected areas and injured people to hospitals in post-disaster stage, in which the MPC approach is utilized to adjust to frequent updated information and RO is used to deal with uncertainties on each decision making point. At the end, a numerical example demonstrates the feasibility and effectiveness of our proposed approach.

4 - Designing A Resilient Supply Chain Network

Jafar Namdar, University of Tennessee, 2109 Laurel Avenue, Knoxville, Knoxville, TN, 37916, United States, jafer.namdar@gmail.com, Rapinder Sawhney, Nooshin Hamidian

This paper investigates different sourcing strategies to achieve supply chain resilience under disruptions aiming for a deeper understanding of how supply chain characteristics are related to resilience and how to better support disruption planning and mitigation. Specifically, we consider different coping strategies, including a single sourcing versus multiple sourcing, signing contract with backup supplier, spot purchasing, collaboration and visibility.

Information Systems III

Contributed Session

Chair: Benjamin Schooley, Assistant Professor, University of South Carolina, 1301 Gervais Street, Columbia, SC, 29201, United States, schooley.ben@gmail.com

1 - Digital Ecosystem Competition, To Open Or To Close?

Chao Ding, Assistant Professor, KK Leung 807, The University of Hong Kong, Pok Fu Lam, Hong Kong, chao.ding@hku.hk

IT firms are currently striving to build their own digital empire of ecosystem that profit from sales of both hardware/system and content/service. This study sets under the context of duopoly ecosystems and examines their content/service offering strategies and pricing strategies.

2 - A Quasi Experiment Using Social Network Approach To Effects Of Trust Building In Sharing Economy

Shivom Aggarwal, Instututo de Empresa S.L., Instututo de Empresa S.L., IE Business School, Calle de Maria de Molina, 12 Bajo, Madrid, 28006, Spain, dr.shivom@gmail.com, Gautam Ray

Trust is inherent in the success of Sharing economy business models, but how building trust affects such success poses a crucial issue for firms competing with sharing economy business models. We analysed a longitudinal data of bike sharing systems across several cities using a social network approach. We found that trust helped in increasing the overall revenues of a given station, but the average revenue per bike decreased significantly. The study discusses the implications and remedial possibilities based on the results.

3 - The Effect Of Ambidextrous Developers On Open Source Project Success

Orcun Temizkan, Ozyegin University, Istanbul, Turkey, orcun.temizkan@ozyegin.edu.tr, Ram Kumar

Open Source Software (OSS) development is an important, yet poorly understood type of software development with high project failure rates. We analyze a sample of real OSS projects to better understand project success. We argue that there are different types of developers and study their effects on success. We argue that developers can be classified into non-ambidextrous and different types of ambidextrous developers. Our results illustrate direct and interaction effects that ambidextrous developers have on project success and the importance of having multiple types of ambidextrous developers in projects.

4 - Effects Of Health Information Exchange On The Process Of Care, Patient Care Delivery, Administrative Productivity, And Population Health Outcomes

Benjamin Schooley, Assistant Professor, University of South Carolina, 1301 Gervais Street, Columbia, SC, 29201, United States, schooley.ben@gmail.com, Sue Feldman, Neset Hikmet

Health information exchange (HIE) is expected to transform the U.S. healthcare system through access to patient data from electronic health records across organizational boundaries - for the purpose of supporting care provision to improve care quality and population health. However, relatively few of the more than 100 operational U.S. HIE's have been the subject of published evaluations. We surveyed Virginia healthcare providers to assess perceived value of HIE, including impacts on the process of care, patient care delivery, information quality, and population health outcomes. Perspectives differ based on organizational, medical specialty, and prior experience characteristics.

Empirical Healthcare Operations

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Diwas S KC, Emory University, Atlanta, GA, United States, diwas.kc@emory.edu

1 - The Effects Of Discrete Workshifts On Non-terminating Queues

Robert Batt, University of Wisconsin, bob.batt@wisc.edu, Diwas S KC, Bradley R Staats, Brian W Patterson

While an emergency department is a non-terminating queue, it is staffed by care providers working discrete workshifts. We examine how productivity changes over the workshift. Further, because care providers work fixed-duration shifts, they sometimes must hand off care of in-process patients to another provider. We examine the impact these handoffs have on treatment time and revisit rate. Using simulation, we show that policies that prohibit starting new patients near the end of the shift can lead to improved system throughput.

2 - A Near-term Mortality Indicator For Terminal Cancer Patients Using High Frequency Medical Data

Donald Lee, Yale University, New Haven, CT, United States, donald.lee@yale.edu, Edieal J Pinker

Although end of life cancer care accounts for a significant portion of the costs of all cancer care, it often fails to improve quality or quantity of life. Yet, oncologists consistently overestimate the chances of survival, leading to suboptimal delays in the transition to hospice care. To more accurately assess mortality risk, we develop a bedside statistical tool that utilizes high frequency EMR data to predict near term mortality. Projected savings from averting excessive curative interventions suggest significant inefficiencies in current practice. Joint work with the Smilow Cancer Centre.

3 - A Machine Learning Approach For Personalized Health Care Outcome Analysis

Guihua Wang, Ross School of Business, University of Michigan, Ann Arbor, MI, United States, guihuaw@umich.edu, Jun Li, Wallace J Hopp

Using a patient-level data set across 35 hospitals for cardiovascular surgeries in New York, we first provide empirical evidence that the quality gaps between hospitals are heterogeneous for subgroups of patients. We then use a machine learning approach to identify subgroups of patients that have large or small quality gaps. After that, we estimate the quality gaps between a hospital and the state average for each subgroup of patients to derive patient-centric information. Lastly, we show that providing patient-centric information not only helps patients choose providers but also helps hospitals identify areas for improvement and payers design cost-effective payment programs.

4 - Are Patients Patient? The Effect Of Universal Healthcare On Emergency Department Visits

Diwas KC, Emory University, diwas.kc@emory.edu

We study a natural policy experiment to examine the impact of universal healthcare on emergency departments. We find that the policy has differential effects on hospitals. Compared to EDs with high pre-policy workloads, we observe a relative increase in volume at EDs with lower levels of pre-policy workload.

Product Strategies and Channel Structure in Supply Chain Management

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Laurens G Debo, Dartmouth College, Hanover, NH, United States, laurens.g.debo@tuck.dartmouth.edu

Co-Chair: Cuihong Li, University of Connecticut, Storrs, CT, United States, cuihong.li@uconn.edu

1 - Salesforce Incentives For Managing Product Returns

Rashmi Sharma, Pennsylvania State University, University Park, PA, 16802, United States, rashmi.sharma@psu.edu, Aydin Alptekinoglu

We study a setting where product sales and returns are effort-dependent and the selling activity is conducted by a salesforce. We investigate the effect of salesforce behavior on net sales and compare different incentive schemes to identify optimal incentive strategies.

2 - Returns Policies For Overstock And Consumer Returns In Distribution Channels

Meng Li, University of Massachusetts, Amherst, MA, United States, meng.li@umass.edu, Yunchuan Liu

This paper studies the interactions between an upstream manufacturer and competing downstream retailers on offering returns policies to retailers and end-consumers respectively. The effects of channel structure, demand uncertainty, and retail competition are studied in a unified model covering both overstock returns and consumer returns.

3 - Retail Market Power: A Supplier-side Perspective

Shuya Yin, University of California at Irvine, Irvine, CA, United States, shuya.yin@uci.edu, Yuhong He, Saibal Ray

Does a supplier prefer that its downstream retailers are more balanced in terms of their market power or that one of them is dominant, especially when the market power might be correlated to their bargaining powers? In this paper we address this issue and establish the supplier's preference for a monopoly value chain as well as when there is value chain competition.

4 - Discretionary Service Line Design With Heterogeneous Customers

Cuihong Li, University of Connecticut, cuihong.li@uconn.edu, Laurens G Debo

We study discretionary service line design facing heterogeneous customers. For discretionary services, the longer the service time, the higher is the quality of the service. In the presence of variability, longer service times also create more congestion. Hence, a service firm needs to trade off congestion costs with value creation. We find that self-selection of heterogeneous customer might lead to distortion of the high-quality service, contrary to the classic product line design result of Moorthy (1984).

1 - When Is Capacity Trading Among Consumers A Win-win To Consumers And Service Providers?

Behrooz Pourghannad, University of Minnesota, Minneapolis, MN, United States, behrooz@umn.edu, Saif Benjaafar, Jian-Ya Ding

We study a setting where consumers can trade among themselves unused capacity they purchased from a service provider (e.g., excess data on a mobile data plan). We examine implications for service provider profits and consumer surplus.

2 - Allocating Capacity In Bikeshare Systems

Daniel Freund, Cornell University, Ithaca, NY, 14850, United States, df365@cornell.edu, Shane Henderson, David B Shmoys

A Bikeshare system (BSS) allows users to rent and return a bike at any station within the system. The amount of usage data BSSs collect has increased greatly in the last decade, allowing us to develop data-driven methods to support their operations. In this talk we extend a continuous-time Markov chain model to allocate docks within a BSS so as to minimize the expected number of out-of-stock (OOS) events. We compute that quantity & efficiently find the allocations of bikes and docks that minimize it both over a finite horizon & at steady-state. Our work is used by NYC Bikeshare to redistribute bikes & (re-)allocate docks.

3 - Skill Screening In Large-scale Service Marketplaces

Eren Basar Cil, University of Oregon, erencil@uoregon.edu, Gad Allon, Achal Bassamboo

We consider a large-scale service marketplace where the moderating firm can run two skills tests on agents to assess if their skills are above certain thresholds. Our main objective is to evaluate the effectiveness of skill screening as a revenue maximization tool. We find that skill screening leads to negligible revenue improvements in marketplaces where agent skills are highly compatible. As the compatibility of agent skills weakens, we show that the firm starts to experience as much as 25% improvement in revenue from skill screening. Apparently, the firm can reap the most of these substantial benefits when it runs only one test.

Risk Analysis

Contributed Session

Chair: David S Kim, Professor, Oregon State University, 204 Rogers Hall, School of Mech., Industrial and Mfg Eng., Corvallis, OR, 97331-2407, United States, david.kim@oregonstate.edu

1 - Uncertainty, Entropy, And Ambiguity As Risk Measures In Decision Modeling For Portfolio Optimization

David F. Rogers, University of Cincinnati, Department of Operations, Business Analytics, and Information Systems, Carl H. Lindner College of Business, 2925 Campus Green Drive, Cincinnati, OH, 45221-0130, United States, David.Rogers@UC.edu, George G Polak

For a portfolio optimization setting, the risk from uncertain outcomes is typically considered. Other risk measures, including the choice of how to best employ the state-space probabilities and how to consider alternative probability functions are also important. Information entropy is incorporated for measuring the risk associated with the stratification of state-space probabilities resulting in convex integer optimization models with entropy employed as either the objective to minimize or as a constraint with a maximum return objective.

2 - Quantifying The Contribution Of Seawalls To Mitigating Tsunami Damage

Tom M Logan, PhD Pre-Candidate, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States, tomlogan@umich.edu, Jeremy D Bricker, Seth Guikema

Seawalls are commonly used to defend against tsunamis, making it is essential we understand whether they truly mitigate damage. The north-east of Japan has been stuck by four tsunamis in the past 110 years. A model combining a cellular automaton and hydrodynamic models simulates how land development hypothetically changes with time and under different seawall height options. The insights will indicate which scenarios they provide physical protections and which scenarios require alternative action.

3 - Sample Sut Of Sample Inference Based On Wasserstein Distance

Yang Kang, PhD Candidate, Columbia University, 1255th Amsterdam Ave SSW, RM901, New York, NY, 10027, United States, yangkang@stst.columbia.edu, Jose Blanchet

We present a novel inference approach which we call Sample Out-of-Sample (or SOS) inference. Our motivation is to propose a method which is well suited for data-driven stress testing, in which emphasis is placed on measuring the impact of (plausible) out-of-sample scenarios on a given performance measure of interest (such as a financial loss). The methodology is inspired by Empirical Likelihood (EL), but we optimize the empirical Wasserstein distance (instead of the empirical likelihood) induced by observations. From a methodological standpoint, our analysis of the asymptotic behavior of the induced Wasserstein-distance profile function shows dramatic qualitative differences relative to EL.

4 - Destructive Testing Gauge Capability Analysis

David S Kim, Professor, Oregon State University, 204 Rogers Hall, School of Mech., Industrial and Mfg Eng., Corvallis, OR, 97331-2407, United States, david.kim@oregonstate.edu, Xinyu Luo

This research examines the current state-of-the-art in gauge capability analysis for destructive testing. Results are then presented that extend the specific destructive testing situations where gauge repeatability can be estimated.

Retail Analytics & Optimization

Sponsored: Manufacturing & Service Oper Mgmt, Service Operations

Sponsored Session

Chair: Tulay Flamand, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States, varol@som.umass.edu

1 - Store-wide Shelf Space Analytics To Optimize Impulse Buying

Tulay Flamand, University of Massachusetts Amherst, Amherst, MA, United States, varol@som.umass.edu, Ahmed Ghoniem, Bacel Maddah

We address a store-wide retail shelf space allocation problem with the objective of promoting impulse buying. Basket data analysis is conducted using real data in order to calibrate a predictive model of in-store traffic. This predictive model is then embedded in a non-linear mixed-integer model in order to prescribe shelf space solutions that maximize impulse buying.

2 - Pricing And Inventory Decisions Of an Assortment Under Equal Profit Margins

Bacel Maddah, American University of Beirut, Bliss Street, Beirut, Lebanon, bacel.maddah@aub.edu.lb, Hussein Tarhini, Melanie Jabbour

We consider the interdependent decisions on inventory and pricing of substitutable products in an assortment. Within a newsvendor-type supply setting, we analyze the joint pricing and inventory decision problem of the retailer under the assumption that all products have equal profit margins. We derive several concavity and monotinicity results under two common consumer choice models, the logit and the nested-logit. We also present an extensive numerical study testifying to the near-optimlity of equal-margin pricing.

3 - Online Assortment Optimization When Customers Refine Their Search

Zhichao Feng, The University of Texas at Dallas, Richardson, TX, 75080, United States, zxf140830@utdallas.edu, Dorothee Honhon, Shengqi Ye

When shopping online, a consumer often searches a keyword and checks the products displayed by the retailer. In many cases, the retailer has numerous products matching the keyword, with different features and functionalities, but is only able to show a subset of them due to limited displaying space. The assortment shown by the retailer influences the consumer's decision to buy or not. In addition, when the consumer is not familiar with the product category, the assortment may trigger interest in a specific product feature, leading the consumer to refine her search, and focus only on products with this feature. Taking this into consideration, we study the online retailer's optimal assortment decision.

4 - Flexible Break Assignment Problem For Ground Handler Shift Scheduling

Youngbum Hur, Graduate Research Assisstant, The University of Texas at Austin, 1 University Station C2200, United States, youngbum.hur@utexas.edu, Jonathan F Bard, Ferdinand Kiermaier, Markus Frey

The purpose of this paper is to investigate the benefits that flexibility offers in daily shift scheduling. The different forms of flexibility considered include shift start times, the number of breaks, break lengths, and break placement. Four related mixed-integer programming models are developed and used to compare break scheduling in advance and in real-time for various shift and break profiles. Tests were performed using demand data for ground handlers at a major European airport.

Payment Models in Healthcare

Sponsored: Manufacturing & Service Oper Mgmt, Supply Chain

Sponsored Session

Chair: Hamed Mamani, University of Washington, Seattle, WA, United States, hmamani@uw.edu

Co-Chair: Shima Nassiri, University of Washington, ISOM, Foster School of Business, Seattle, WA, 98195, United States, shiman@uw.edu

1 - The Impact Of Reimbursement Policy On Patient Welfare, Readmission Rate And Waiting Time In A Public Healthcare System: Fee-for-service Vs. Bundled Payment

Yulan Wang, Hong Kong Polytechnic University, yulan.wang@polyu.edu.hk, Christopher S Tang, Pengfei Guo, Ming Zhao

We examine two commonly used reimbursement schemes: Fee-For-Service (FFS) and Bundled Payment (BP) from aspects of congestion (waiting times patients incur) and service quality (measured by readmission rate). We consider a three-layer public health care system including a funder who decides the reimbursement payment, a representative health care provider who decides the service rate (affecting service quality) and patients who decide to join or balk based on their net utility. We determine equilibrium outcomes and find that, in general, BP scheme improves patient welfare and service quality but FFS scheme results in less congestion. Under certain conditions, the two are equally efficient.

2 - Bundled Payment Vs. Fee-for-service: Impact Of Payment Scheme On Performance

Shima Nassiri, University of Washington, Seattle, WA, United States, shiman@uw.edu, Elodie Adida, Hamed Mamani

Healthcare reimbursements in the US have been traditionally based upon a fee-for-service (FFS) scheme, providing incentives for high volume of care. The new healthcare legislation tests new payment models that remove such incentives, such as the bundled payment (BP) system. Our interest is in analyzing the effect of different payment schemes on outcomes such as the presence and extent of patient selection, the treatment intensity, the provider's utility and financial risk, and the total system payoff. We design two payment systems, hybrid payment and stop-loss mechanisms, that alleviate the shortcomings of FFS and BP and may induce system optimum decisions in a complementary manner.

3 - Bundled Payment Implementation via Market Segmentation

Ruben Proano, Rochester Institute of Technology, rpmeie@rit.edu

This talk illustrates the opportunities of applying market segmentation and tiered pricing to the implementation of bundled payments in replacement of fee-for-service for the reimbursement of healthcare expenses. Relying on a cluster-based episode construcion approach, the study shows how market segmentation and tiered pricing can reduce the risks of over- and under- paying for claims facilitating the adoption ob bundled payment by providers and payers.

4 - Incentive Design For Coordination In Care Of Chronic Patients

Sasa Zorc, INSEAD, Singapore, Singapore, sasa.zorc@insead.edu, Stephen E Chick, Sameer Hasija

We consider contracting issues in care of chronic patients. The government contracts with several healthcare providers in effort to maximise public health minus the cost. We model the decision of whether to contract with individual providers or alliances of providers, as well as which contract type to use. We show that with risk neutral agents, first best can be achieved with both options by using outcomes adjusted capitation or per-patient contracts. We also examine adverse effects arising from fragmentation of care: free riding within an alliance and collusion between individual providers. We show that individual outcomes-adjusted capitation contracts perform best under these effects.

Chair: Leon Valdes, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States, lvaldes@mit.edu

1 - To Recycle Or Not: An Analysis Of The Environmental And Financial Impact Of Recycling

Hailong Cui, University of Southern California, Los Angeles, CA, United States, Hailong.Cui.2019@marshall.usc.edu, Greys Sosic

We evaluate the impact of recyclability on the emissions through the products' life cycle and derive conditions for reduction of long-run average emissions. We investigate the underlying costs imposed on the supply chain and on the society to understand optimal decisions for decentralized (manufacturer or government-driven recycling) and centralized cases.

2 - How Do You Pay Your Electricity Bill? Payment Methods And Energy Conservation

Christian Blanco, University of California-Los Angeles, Los Angeles, CA, 90095, United States, cblanco@anderson.ucla.edu, Magali Delmas

We explore whether different payment methods may make electricity cost more or less salient. We then look at whether the introduction of smart meters can complement different payment methods and lead to changes in electricity consumption. We explore this using data from the largest electric utility company in the US.

3 - Are Hazardous Substance Rankings Effective? An Empirical Investigation Of Changing Assessments Of The Relative Hazards Of Chemicals And Voluntary Emissions Reductions

Wayne Fu, Georgia Institute of Technology, Atlanta, GA, 30308, United States, wayne.fu@scheller.gatech.edu, Basak Kalkanci, Ravi Subramanian

Governmental organizations such as the ATSDR provide extensive information on potential hazards of industrial chemicals to public. We investigate the link between such information dissemination and voluntary environmental efforts of firms and the implications of firms' operational characteristics on the extent and the nature of the efforts. Finding that increases in assessed hazard level are associated with greater reductions in emissions, we suggest that the effect of information dissemination is significant. We also find evidence that operational leanness may limit the ability of facilities to reduce emissions in response to increases in assessed levels of hazard.

4 - Investing In Supplier Social Responsibility And Supply Chain Visibility

Leon Valdes, Massachusetts Institute of Technology, lvaldes@mit.edu, Tim Kraft, Yanchong Zheng

We study a manufacturer's decisions when the social responsibility (SR) performance of her supplier cannot be perfectly observed and where only the supplier can directly impact SR. However, the manufacturer can: (i) increase her visibility into the supplier's performance; and (ii) invest in the supplier's capabilities to improve SR. A third party may disclose SR information to consumers, affecting demand. Our results provide insights into the impact of supply chain visibility on the supplier's and the manufacturer's strategies. We identify conditions under which the manufacturer is more likely to invest in visibility and we show that higher visibility does not always translate into greater SR.

1 - Pricing Decision Model For New, Upgraded And Remanufactured Short-life Cycle Products

Che-Wei Yeh, PhD Student, National Taiwan University, Floor 9, No.1, Sec. 4, Roosevelt Road, Taipei, Taiwan, d99741008@ntu.edu.tw

Despite remanufacturing short life cycle products is rewarding economically as well as environmentally, very little is known about modeling upgraded decisions for products with short life cycle. In this paper, we develop a closed loop supply chain model that optimizes the price for new, upgraded and remanufactured products where demands are time-dependent and price sensitive. Using numerical analysis, the findings give reasonable results and have important implications for the impact of demand's speed of change to the optimal prices.

2 - Effects Of The Adopting Distillers Grain In The Feed Ration For Swine Industry In Argentina

Maria Celeste De Matteis, Graduate Assistant, University of Tennessee, Knoxville, TN, United States, mdematt1@vols.utk.edu, Tun-Hsiang Edward Yu

Driven by the Biofuels Law enacted in 2006, the production of corn-based ethanol in Argentina has surged over the past decade. Distillers grain, a co-product of corn ethanol, is expected to become an important feedstuff in Argentine livestock feed ration because of its high content of protein and other nutrition. Our study aims to evaluate the potential impact of adopting this emerging feedstuff in the feed ration for Argentine hog industry. A multi-objective model will be developed incorporating both feedstuff cost and animal performance in the decision criteria.

3 - Integrated Operations Scheduling Under Different Penalty Terms

Gang Wang, University of Massachusetts Dartmouth, 285 Old Westport Rd, Room 214, North Dartmouth, MA, 02747, United States, gwang1@umassd.edu

This paper studies an integrated operations scheduling problem under service level contracts over a capacitated supply chain and considers three different scheduling sub-problems in terms of the types of service level: 1) The first sub-problem takes into account no specified service level (e.g., one-time transaction in spot contracts); 2) the second is regarding single service level contracts, where penalty function is convex; and 3) the third deals with multiple service level contracts.

Learning and Model Uncertainty in Stochastic Systems

Sponsored: Applied Probability

Sponsored Session

Chair: Yuan Zhong, Columbia University, New York, NY, 10025, United States, yz2561@columbia.edu

1 - Staffing Service Systems With Distributional Uncertainty

John Hasenbein, University of Texas-Austin, jhas@mail.utexas.edu, Ying Chen

We examine the problem of staffing service systems in which either the exact arrival rate or even the arrival rate distribution is unknown. The decision maker's goal is to minimize staffing costs while satisfying quality-of-service constraints on the probability that a customer is delayed. We use bounds related to the Halfin-Whitt approximation and prove asymptotic optimality of the proposed methods.

2 - Ambiguous Partially Observable Markov Decision Processes

Soroush Saghafian, Harvard University, Cambridge, MA, United States, soroush_saghafian@hks.harvard.edu

We present a generalization of Partially Observable Markov Decision Processes (POMDPs) termed Ambiguous POMDP (APOMDP), which allows the decision maker to take into account inevitable model ambiguities. We establish various structural results, and discuss new opportunities for superior decision-making in applications such as machine replacement, medical decision-making, inventory control, revenue management, optimal search, bandit problems, and dynamic principal-agent settings.

3 - How Being Distributionally Robust Can Improve Learning In High Dimensions?

Karthyek R Murthy, Columbia University, New York, NY, United States, karthyek@gmail.com, Jose Blanchet, Yang Kang

In learning problems where the number of training samples is smaller than the ambient dimension, usual empirical risk minimisation may not be enough to find the best fit. We introduce RWPI, a novel learning methodology that is aimed at enhancing out-of-sample performance in such settings. By casting the learning problem as an optimization problem in the presence of model uncertainty, we recover a wide range of regularisation procedures (such as generalized Lasso, SVM) as particular cases. Further, an asymptotic analysis of a suitably defined profile function allows to optimally select the regularisation parameter. We shall discuss this optimality in the context of generalized Lasso.

4 - Learning And Hierarchies In Service Systems

Michail Markakis, Universitat Pompeu Fabra, Barcelona, Spain, mihalis.markakis@upf.edu

We consider a service systems with servers that have different capabilities and tasks whose types are ex-ante unknown. Information about a task's type can only be obtained while serving it. We show that the system's stability region depends on the entire distributions of service times, and that heavier tails cause greater performance loss. We also consider endogenizing the servers' capabilities, and find that optimal designs have a "hierarchical" structure: all tasks are initially routed to the least skilled servers and progressively move to more skilled ones, if necessary. Comparative statics show that uncertainty in task types leads to higher training costs and less specialized server pools.

1 - Collaborative Filtering With Low Regret

Guy Bresler, MIT, Cambridge, MA, United States, guy@mit.edu, Devavrat Shah, Luis Voloch

Empirical evidence suggests that item-item collaborative filtering (CF) works well in practice. Motivated to understand this, we provide a framework to design and analyze recommendation algorithms. The setup amounts to online binary matrix completion, where at each time a user requests a recommendation and the algorithm chooses an entry to reveal in the user's row. The goal is to maximize the number of +1 entries revealed at any time. We analyze an item-item CF algorithm that can achieve fundamentally better performance as compared to user-user CF. Good "cold-start" performance is achieved by quickly making good recommendations to new users about whom there is little information.

2 - Predicting The Unseen Mutations Provides A Roadmap For Precision Medicine.

James Zou, Stanford University, Palo Alto, CA, 02139, United States, jamesyzou@gmail.com

A fundamental question in genomics is to estimate the frequency distribution of all the genetic variants in a population. This is a challenging task because we have sequenced the genomes of relatively few individuals, and most existing mutations are not observed in our samples. We give a non-parametric algorithm to estimate the frequency distribution of all the variants, including the ones that not seen in the sequenced individuals. We prove that also algorithm has strong finite-sample convergence guarantees, and applied it to one of the largest human sequencing data. Our estimates provide a roadmap for the discovery rate of large sequencing efforts, including the Precision Medicine Initiative.

3 - Causal Inference With Random Forests

Stefan Wager, Stanford University, Stanford, CA, United States, swager@stanford.edu

Many scientific and engineering challenges, ranging from personalized medicine to customized marketing recommendations, require an understanding of treatment heterogeneity. We develop a non-parametric causal forest for estimating heterogeneous treatment effects that extends Breiman's widely used random forest algorithm. Given a potential outcomes framework with unconfoundedness, we show that causal forests are pointwise consistent for the true treatment effect, and have an asymptotically Gaussian and centered sampling distribution. We also propose a practical estimator for the asymptotic variance of causal forests.

Risk in Financial Markets

Sponsored: Financial Services

Sponsored Session

Chair: Daniel Mitchell, University of Minnesota, University Avenue, Minneapolis, MN, 55455, United States, damitche@umn.edu

1 - Systemic Risk Of High-frequency Trading

Agostino Capponi, Columbia University, ac3827@columbia.edu

We introduce a dynamic high-frequency trading model which accounts for the costs of overnight inventory. The HFT optimally and continuously chooses bid and ask prices in order to maximize end-of-day expected profits, net of inventory costs. The model pits the HFT's profit maximizing motives against its desire to avoid carrying inventory overnight, which effectively generates a tradeoff. We show that the tradeoff, which is unique to the business model of HFTs, leads to destabilizing price dynamics.

2 - Determining Estimation Risk Using Distributional Properties Of Portfolio Weights

Luis Chavez-Bedoya, Esan Graduate School of Business, lchavezbedoya@esan.edu.pe

Using the expected loss function of Kan and Zhou (2007), we find closed-form expressions to determine the impact of parameter uncertainty on the performance of the minimum-variance and the optimal mean-variance portfolio but when these portfolios are fully invested in risky assets. The mathematical proofs of the closed-form expressions are based on distributional properties of the portfolio weights instead of distributional properties of the sample mean and covariance matrix. In the numerical experiments, we assess the impact on estimation risk when the risk-free asset is not included in the portfolio construction.

3 - Modeling Limit Order Books With Neural Networks

Justin Sirignano, Stanford, jasirign@gmail.com

This paper develops a new neural network architecture for modeling spatial distributions (i.e., distributions on R^d) which is computationally efficient and takes advantage of local spatial structure. We find statistical evidence for local spatial structure in limit order books, motivating the new neural network's application to limit order books. The neural network is trained and tested on nearly 500 stocks. The neural network uses information from deep into the limit order book (i.e., many levels beyond the best bid and best ask). Techniques from deep learning such as dropout are employed to improve performance. Due to the computational challenges associated with the large amount of data, GPU clusters are used for training. The "spatial neural network" is shown to outperform other models such as the naive empirical model, logistic regression (with nonlinear features), and a standard neural network architecture.

4 - Liquidation Risk

Daniel Mitchell, University of Minnesota, damitche@umn.edu, Jingnan Chen

We examine risk management in a portfolio liquidation setting. We consider a model of market and limit order execution and investigate trading profiles of risk averse traders. Our primarily interest is to determine when market orders are preferred to limit orders in execution. Market orders can reduce variation in price but also come at a higher expected cost.

Sponsored Session

Chair: Ozan Candogan, University of Chicago, Chicago, IL, United States, ozan.candogan@chicagobooth.edu

Co-Chair: Santiago Balseiro, Duke University, Durham, NC, United States, sbalseiro@gmail.com

1 - The Impact Of Platform Control Capabilities On The Performance Of Rideshare Networks

Zhe Liu, Columbia Business School, 511 W 112th Street, Apt 24C, New York, NY, 10025, United States, liuzhe821@gmail.com, Costis Maglaras, Philipp Afeche

We are motivated by the rise of rideshare platforms such as Uber and Lyft, that match service providers (drivers) with demand (riders) over a network. A key challenge is that such platforms face supply/demand imbalances. To manage performance, the platforms have several control capabilities, specifically, they can decide a) which demand requests to accept at each location, and b) which capacity to reposition from one location to another. This paper studies within a stylized network model the impact of these control levers on key performance measures, including the revenue rate, congestion, lost demand (riders), and idleness time (drivers), taking into account the network's flow dynamics.

2 - Competitive Equilibrium And Trading Networks: A Network Flow Approach

Ozan Candogan, University of Chicago, ozan.candogan@chicagobooth.edu, Markos Epitropou, Rakesh Vinay Vohra

In trading networks where agents exchange indivisible goods (or indivisible contracts), recent literature has established that under a full substitutability condition on agents preferences, a competitive equilibrium exists. Moreover, competitive equilibria of trading networks are also stable outcomes, which is equivalent to the seemingly weaker chain stability condition. This paper's contribution is to show that under the full substitutability assumption, all these results can be obtained simply and directly from the optimality conditions of a generalized submodular flow problem in an appropriately defined network.

3 - Mean Field Equilibria For Competitive Exploration In Resource Sharing Settings

Krishnamurthy Iyer, Cornell University, kriyer@cornell.edu, Pu Yang, Peter Frazier

Inspired by crowdsourced transportation services and other location-based activities, we consider a model comprising of a group of nomadic agents and a set of locations each endowed with a dynamic stochastic resource process. Each agent derives a periodic reward based on the overall resource level at her location, and the number of other agents there. Each agent is free to move between locations, and at each time decides whether to stay at the same location or switch to another one. We study the equilibrium behavior of the agents as a function of dynamics of the stochastic resource process and the nature of resource sharing in the limit where the number of agents and locations increase proportionally.

4 - On The Efficacy Of Static Prices For Revenue Management In The Face Of Strategic Customers

Yiwei Chen, Singapore University of Technology and Design, Singapore, Singapore, ywchen@mit.edu, Vivek Farias

We consider a revenue management problem wherein a monopolist seller seeks to maximize revenues from selling a fixed inventory of a product to customers who arrive over time. Customers are forward looking and strategize their times of purchase. We consider a general class of customer utility models that allow for multi-dimensional customer types. We also allow for a customer's disutility from waiting to be positively correlated with his valuation. We show that static prices are asymptotically optimal. We further show that irrespective of regime, an optimally set static price captures at least 63.2% of revenue under an optimal dynamic mechanism.

Advances In Risk Modeling Theory: Nonlinear Systems

Sponsored: Decision Analysis

Sponsored Session

Chair: Ghorbanmohammad Komaki, Case Western Reserve University, Cleveland, OH, United States, gxk152@case.edu

Co-Chair: Behnam B Malakooti, Case Western Reserve University, Cleveland, OH, United States, bxm4@po.cwru.edu

1 - Storage Impact On Micro-grids With Renewable Energy Sources

Shaya Sheikh, New York Institute of Technology, 1855 Broadway, New York, NY, United States, ssheik11@nyit.edu

Integrating renewable energy sources and energy storages in micro-grid has captured the attention of researchers in recent years. We investigate the impact of energy storages on energy costs and thermal comfort in a micro-grid with heterogeneous buildings. Our proposed model features two electricity generators (e.g., wind and solar). Due to the stochastic nature of both renewable energy sources and energy demand, a simulation approach is proposed to analyze this model. The proposed model reduces total energy cost while it achieves the thermal comfort requirements of residents.

2 - A Brief Survey Of Recent Decision-making Models And Experiments

Mohammad Komaki, Case Western Reserve University, komakighorban@gmail.com, Behnam Malakooti

Decision-making under risk has a long history and is one of the challenging areas in many fields including economics, finance and engineering. Technically, decision-making is the selection of an alternative among group of alternatives. Several models have been developed to assist decision-makers (DMs) in the presence of risk, for instance, Expected Utility Theory, Cumulative prospect theory and so on. Recently, several models have been proposed. In this study, we investigate these models and their properties. Also, we investigate their performances in term of resolving the well-known paradoxes.

Chair: Bruno Tuffin, INRIA, TBD, Rennes Cedex, France, bruno.tuffin@inria.fr

Co-Chair: Patrick Maillé, Telecom Bretagne, 2, rue de la Cha^taigneraie, Cesson Sévigné, 35576, France, patrick.maille@telecom-bretagne.eu

1 - On Revenue-oriented Content Delivery Networks And Their Impact On Net Neutrality

Patrick Maillé, Telecom Bretagne, Rennes, 35510, France, patrick.maille@telecom-bretagne.eu, Gwendal Simon, Bruno Tuffin

We investigate the decisions made by a CDN actor willing to maximize revenue through the management of its cache servers. Through simple models, we highlight that revenue-oriented management policies can affect the user-perceived quality of experience, impacting the competition among content providers (and also among network access providers) in favor of the incumbent. Since this goes in the opposite direction to the one aimed by net neutrality proponents and it seems that CDNs are not discussed much in the net neutrality debate, we wonder about the need for a definition of what a “neutral” CDN should look like.

2 - An Optimization Approach For Long-term Network Planning With Protection Constraints

Nicolas Stier-Moses, Facebook, Menlo Park, CA, United States, nicostier@yahoo.com, Josue Kuri

We present an optimization approach for strategic, long-term network planning. We forecast supply (network assets), demand (network traffic) and possible failures, and employ a robust optimization approach to optimize which assets to use and how much capacity must be turned up in each of them. A key element of this model is its dynamic nature which allows us to consider inter-temporal constraints (e.g., turned up capacity is monotone over time) and the amortization of fixed costs.

3 - Profit, Welfare, And Consumer Surplus Implications Of Sponsored Data Plans

Jialin Song, University of Illinois at Urbana-Champaign, 117 Transportation Building, 104 S Mathews Ave, Urbana, IL, 61801, United States, jsong83@illinois.edu, Qiong Wang

Major Mobile Service Providers are now offering sponsored data plans that allow Content Providers to pay for the access of their contents by end users. How such practice affects profit, social welfare, and consumer surplus is a critical question in the network neutrality debate. We address this issue from the perspective of commodity bundling: without a sponsored data plan, users purchase data blocks to access all contents, which corresponds to pure bundling; sponsored data plans separate some contents from the bundle. We develop a two-stage model, involving both Nash bargaining solution and Nash equilibrium, to analyze and compare the two situations.

1 - Ellipsoidal Methods For Choice-based Conjoint Analysis

Denis Saure, Universidad de Chile, Republica 701, Santiago, 8370439, Chile, dsaure@dii.uchile.cl, Juan Pablo Vielma

In this talk we introduce a variant of the polyhedral method by Toubia, Hauser and Simester (2004) that uses ellipsoids instead of polyhedral. This change allows the method to (1) include approximate Gaussian priors on the parameters, (2) explicitly consider respondent error, and (3) perform quick approximate posterior updates whose quality nearly matches a full Bayesian update. We also introduce a practical question selection method that is optimal with respect to the D-efficiency criterion for one question, and leads to an extremely effective one-step look-ahead policy for multiple questions.

2 - Capturing Multitaste Preferences: A Machine Learning Approach

Daria Dzyabura, New York University, ddzyabur@stern.nyu.edu, Liu Liu

In diverse product categories, a consumer’s preferences may include several tastes. For example, one may enjoy cooking American and Chinese recipes, with different specific criteria for each. We propose a model that allows for multiple tastes and an efficient estimation algorithm. In a numerical study, we simulate multi-taste consumers and demonstrate the proposed algorithm accurately recovers parameters, while benchmark models underfit. We test the algorithm on recipe texts, after extracting attributes from recipe text using text mining. We achieve significant improvements in prediction over single-taste benchmarks.

3 - Estimating Customer Spillover Learning Of Service Quality: A Bayesianhierarchical

Andres I Musalem, Universidad de Chile, Beauchef 851, Santiago, 8370456, Chile, amusalem@duke.edu, Yan Shang, Jeannette Song

We propose a Bayesian framework for estimating customer “spillover learning,” — the process by which customers’ learn from previous experiences of similar but not necessarily identical services. We apply our model to a data set containing shipping and sales historical records provided by a world-leading third-party logistics company.

1 - Better Late Than Now: Delayed Vs. Instantaneous Price Discounts With Repeat Customers

Monire Jalili, PhD Student, University of Oregon, 1455 East 25th Ave, Eugene, OR, 97403, United States, mjalili@uoregon.edu, Michael Pangburn

In this paper, we contrast the delayed versus instantaneous discounting policies in a repeat purchase setting with rational and forward-looking consumers. We first establish that if consumer spending is consistent over time, then there is no benefit to the firm (or consumers) from delayed discounts. With varied spending, we prove that when the firm can target individual consumers with their optimal discount percentage, delaying discounts increases profits only for a limited range of transition shoppers. However, when the same discount percentage applies to all customers, delayed discounting outperforms the instantaneous discounting, thus motivating the prevalence of this policy in practice.

2 - Competitive Pricing With Stockouts And Satisficing Customers

Varun Gupta, Penn State Erie, The Behrend College, 5101 Jordan Rd, Burke 281, Penn State Erie, The Behrend College, Erie, PA, 16563, United States, vxg15@psu.edu, Metin Cakanyildirim

Stockouts for high inventory turnover products lead to loss of sales as customers may substitute their preferred product (stocked out) with another product (available). We study single period equilibrium prices for competing retailers selling to satisficing customers with stockout-based substitution under lost sales and backorders.

3 - Pricing Decisions In Fast Fashion Retailing Using Discrete Choice Dynamic Programming Model

Elcin Ergin, McGill, 3465 Hutchison Street, Apt 905, Montreal, QC, H2X 2G3, Canada, elcin.ergin@mail.mcgill.ca, Mehmet Gumus

We study the pricing decisions in fast-fashion retailing firms under a forward-looking setting utilizing the dynamic nature of the problem. In this context, we consider a discrete choice dynamic programming model to estimate the optimal pricing decisions throughout the life cycle of a product. We develop decomposition approaches based on different functional forms and assess their performances in terms of computational complexity and objectives of the problem on a large real-life dataset taken from a fast-fashion company.

1 - Big Data And Marketing Analytics In Practice: Key Skills And Competencies

Amir Gandomi, Ryerson University, 350 Victoria Street, Toronto, ON, M5B 2K3, Canada, agandomi@ryerson.ca, Morteza Mashayekhi, Margaret Osborne, Michael Sparling

Several recent studies report a significant talent gap in analytics. This study aims to address this gap by establishing a body of knowledge for marketing analytics professionals. We perform a large-scale empirical study using the data from a professional social network. By analyzing the unstructured textual data, we specify the required skills and competencies in different domains of marketing.

2 - Ranking Cuisines And Customers From Geosocial Restaurant Data

Syagnik Banerjee, University of Michigan-Flint, syban@umflint.edu

We mine location based check-ins and tweets from 40 types of restaurants and 400 visitors across San Francisco, Chicago, Boston, New York, DC and Seattle to fit a 2 parameter IRT model that estimates the cuisine conspicuity of the restaurant and the palate diversity of the visitors.

3 - Learning Product Attribute Embedding Model From Online Reviews

Feng Mai, Stevens Institute of Technology, Hoboken, NJ, United States, feng.mai@stevens.edu, Xin (Shane) Wang, David J Curry, Roger Chiang

Online reviews provide a valuable source of information to help identify the latest attitudes, opinions, and preferences circulating among consumers. We propose a product attribute embedding model that uses a deep learning approach to learn computable semantic vectors from online reviews. The dimensions of the vector space correspond to latent consumer needs, while product attributes are indexed by their capacity to meet these needs. We demonstrate the implications of the model in market structure analysis and conjoint analysis.

1 - On Broyden-Conjugate Gradient Methods For Solving Unconstrained Optimization Problems

Idowu Ademola OSINUGA, Federal University of Agriculture, Abeokuta, Department of Mathematics, Alabata Road, Abeokuta, 234, Nigeria, osinuga08@gmail.com

An hybrid methods known as BFGS-CG plays an importatnt role in solving large-scaled optimization problems. Hence, we carried out computational experiments on standard BFGS-CG methods (BFGS-FR, HS & PR). In comparison with the newly introduced hybrid methods BFGS-BAN and BFGS-IMW, the hybrid method BFGS-IMW shows significant improvement in the total number of iterations and CPU time required to solve large-scaled optimization problems.

2 - Fast Solutions With Performance Guarantee For Operational Decisions In Real Time Industrial Gas Network Problems

Pelin Cay, Lehigh University, Department of Industrial and Sys Engineering, 200 W Packer Ave, Bethlehem, PA, 18015, United States, pec212@lehigh.edu, Robert H Storer, Luis Zuluaga, Camilo Mancilla

In the gas distribution industry, meeting customer demand in real time while meeting the physical constraints in a gas pipeline network leads to complex and challenging optimization problems. We study the performance of different approaches in the literature to either find global optimality or determine the optimality gap between the best local optimum and a valid lower bound. In industry-sized problem instances significant improvements are possible using a better reformulation compared to solving the standard formulation of the problem.

3 - Convex Hulls Of Graphs Of Bilinear Functions On The Unit Cube

Fabian Rigterink, University of Newcastle, University Dr, Callaghan, 2308, Australia, fabian.rigterink@uon.edu.au, Natashia Boland, Akshay Gupte, Thomas Kalinowski, Hamish Waterer

In his 1989 seminal paper, The boolean quadric polytope: Some characteristics, facets and relatives, Padberg introduced five classes of valid inequalities for the boolean quadric polytope: triangle, clique, cut, generalized cut and odd cycle inequalities. These inequalities outer-approximate the convex hull of a bilinear function. In this talk, we study classes of bilinear functions where some of the Padberg inequalities characterize the convex hull. Furthermore, we study which of the inequalities are strongest, i.e., outer-approximate the convex hull best. We then apply the strong inequalities to (QC)QP instances from the literature to find good lower bounds fast.

4 - A Spatiotemporal Radiotherapy Planning Approach For Cancer Treatment

Ali Adibi, PhD Student, Wichita State University, 7413 E 18th Street N, Wichita, KS, 67206, United States, aliadibi.ie@gmail.com, Ehsan Salari

Radiotherapy is one of the main modalities for cancer treatment. This research aims at developing a spatiotemporal radiotherapy planning optimization approach and evaluating the potential benefit of varying radiotherapy plans and thus the spatial dose distribution over the treatment course. The proposed approach is applied to a phantom cancer case to test its computational performance.

5 - Tightening McCormick Relaxations For Nonlinear Programs Via Dynamic Multivariate Partitioning

Harsha Nagarajan, Postdoctoral Research Associate, Los Alamos National Laboratory, 3000 Trinity Drive, Apt 8, Los Alamos, NM, 87544, United States, harsha@lanl.gov, Mowen Lu, Emre Yamangil, Russell Bent

In this work, we propose a two-stage approach to strengthen piecewise McCormick relaxations for mixed-integer nonlinear programs with multi-linear terms. 1st stage exploits constraint programing techniques to contract the variable bounds. In 2nd stage, we partition the variable domains using a dynamic multivariate partitioning scheme via sparse addition of binary variables, which is independent of the size of variable domains. We demonstrate the performance of the proposed algorithm on well-known MINLPLIB problems and discuss the computational benefits of CP-based bound tightening procedures.

1 - A Course Timetabling Problem In A University

Gulsah Hancerliogullari, Assistant Professor, Istanbul Technical University, Macka Campus Faculty of Management, Istanbul, Turkey, ghancerliogullari@itu.edu.tr, Ozlem Pehlivan, Emrah Koksalmis

Course timetabling has received much attention in the literature over the years. Each university has specific constraints, rules and objective function. Therefore, studies in the literature cannot be adapted to our course scheduling problem, which motivates us to conduct this research. The course timetabling problem involves assigning predetermined courses to available timeslots and classrooms. The aim of this study is to develop a mathematical model to assign the courses of each department to the propose timeslots for a week. We validate our model using the data collected from the university, show that our model is tractable in practice and can be solved in a reasonable amount of time.

2 - How To Advise Business Students Choose An Appropriate Concentration?

Bhushan Kapoor, Professor and Chair, California State University -Fullerton, Fullerton, CA, 92831, United States, bkapoor@fullerton.edu, Sinjini Mitra, Zvi Goldstein

We study Business students' characteristics and factors they consider while selecting a concentration, and how well they perform in their chosen concentrations, via statistical tools and models. We look at some key demographic and academic background characteristics such as age, ethnicity, GPA, and grades, to determine which ones are important in these respects. Moreover, we conduct a survey among students in three different concentrations in our College to understand why they chose a certain concentration, and their experience. Our proposed models will be used to advise future students for selecting suitable Business concentrations, and can easily be adapted for other disciplines as well.

3 - Creative Storytelling And Choreography For Senior Design

Elif Akcali, University of Florida, Dept of Industrial and Systems Engineering, 303 Weil Hall PO Box 116595, Gainesville, FL, 32611-6595, United States, akcali@ise.ufl.edu, Tzveta Kassabova, Tom Hart, Leela Corman

Creative Storytelling and Choreography Lab was developed to teach some creative processes to industrial and systems engineering students to help them develop engaging and informative presentations to communicate goals, execution, and results of engineering projects to engineering and general audiences. Throughout the semester, students were systematically introduced to a host of tools for creative processes in graphic and performance arts by a multi-disciplinary instructor team were asked to utilize these tools to develop and deliver engaging narratives in the form of graphic stories or dance works.

4 - Applying Gamification In Engineering Classrooms

Sinan Tas, Assistant Professor, University of Wisconsin - Platteville, 1 University Plaza, Platteville, WI, 53818, United States, tass@uwplatt.edu

Gamifying classrooms can make your classes more interesting, fun, and engaging. In this talk, I will provide an example of gamification, a game called "SPOT-it!", which consists of four mini games: Spy it!, Pop it!, Operate it! and Top it! I will also discuss the additional benefits of gamification including participation, classroom management, and grading.

1 - Using Mobile Clinics To Address Equity In Pharmaceutical Supply Chains In Low-resource Settings

Rajan Batta, University at Buffalo (SUNY), Buffalo, NY, United States, batta@buffalo.edu, Biplab Sudhin Bhattacharya

Low-resource rural settings are challenged with sparse drug availability at medicine outlets. Medicine outlets, being cash constrained, are strapped to keep up with demand. This results in people from the served community having to commute from one provider to another to avail the required drugs. A mobile-outlet location-tour model can address this issue. The first phase of the model identifies optimal candidate locations to maximize equitable coverage and the second phase is to identify an optimal closed loop for minimize distance travelled by the mobile-outlet.

2 - A Multi-modal Vehicle Routing Model For Post-disaster Relief Supply In Inaccessible Mountainous Regions

Abhinav Khare, University at Buffalo (SUNY), Buffalo, NY, United States, abhinavk@buffalo.edu, Rajan Batta, Jee Eun Kang

Earthquake in mountainous regions pose a great logistics challenge for the relief-providing agencies. A large part of the affected population is located in remote areas putting pressure on the humanitarian community to design a response enabling access to these areas. We present a multi-modal vehicle routing model for such a scenario. In our model, we supplement regular air transport with porters/animal packs for last mile deliveries to villages accessible only by mountain trails. The helicopters carrying relief are routed through the Helicopter Landing Zones which form the depots for the porters performing last mile delivery. The model is tested on data collected from the 2015 Nepal earthquake.

3 - Contending With Material Convergence After A Disaster Impacting Nashville, Tennessee: An Optimal Donations Information Management System

Miguel Jaller, University of California Davis, mjaller@ucdavis.edu, Jose Holguin-Veras, Luk N Van Wassenhove, Johanna Amaya

This presentation discusses an optimal donations information management system to contend with unsolicited donations after a large disaster impacting Nashville, Tennessee. The analyses are based on empirical disaster donation generation models, and a mathematical formulation that minimizes total social costs.

4 - Searching For Entities Under Dynamic Emergencies

Gina Galindo, Universidad del Norte, ggalindo@uninorte.edu.co, Jose Betancourt

In this research we address the problem of searching for a missing entity under an emergency or disaster setting. Our problem considers events such as wildfires, with dynamic affected regions where some areas gradually become consumed by the event. We approach the problem by means of a bi-objective model which seeks to maximize the probability of finding the missing entity while trying to cover as soon as possible those areas in risk of becoming consumed by the event.

Business Applications in Social Media Analytics

Contributed Session

Chair: Oscar Albeiro Herrera-Restrepo, PhD Industrial and Systems Engineering, Virginia Tech, 4339 Taney Avenue, Apt 401, Falls Church, VA, 22304, United States, oscar84@vt.edu

1 - The Impact Of Implementing Full Capacity Protocol On The Operational Performance In An Emergency Department

Lu Wang, PhD Student, University Of Kansas, 2406 Alabama St Unit 7C, Lawrence, KS, 66046, United States, lu.wang@ku.edu, Mazhar Arikan, Suman Mallik

Full capacity protocol (FCP) is a set of guidelines that coordinates the patients flow when the emergency department (ED) is overcrowded. Utilizing data from a large urban teaching hospital, we show that the operational performance of the study ED is improved after the implementation of FCP. Furthermore, we find additional improvement when the FCP is triggered. We propose recommendations to further improve the operational outcomes under FCP.

2 - Dynamic Time Warping For Cold Start Problems In Digital Advertising

Pavan Murali, Research Scientist, IBM Research, 1101 Kitchawan Road, Rt 134, 04-024, Yorktown Heights, NY, 10598, United States, pmurali@usc.edu

In digital advertising, a real-time decision has to be made to bid on a set of ad impressions daily to reach as much of the audience group as possible, while being restricted by the daily campaign budget. When a new campaign begins, there is insufficient information about click or conversion events to optimize budget allocation. We propose dynamic time warping algorithm to compare temporal characteristics of two campaigns to identify a similar campaign with significantly more data, which can serve as a proxy to estimate win and conversion rates and to optimize temporal budget allocation.

3 - Bank Branch Operational Performance Through a Robust Multivariate And Fuzzy Clustering Approach

Oscar Albeiro Herrera-Restrepo, PhD. Industrial and Systems Engineering, Virginia Tech, 4339 Taney Avenue, Apt 401, Falls Church, VA, 22304, United States, oscar84@vt.edu, Konstantinos P Triantis, William L. Seaver

We propose a multi-step procedure that integrates fuzzy clustering analysis and data envelopment analysis (DEA) to group bank branches into managerial clusters and to investigate their operational performance. We build and expand on previous research by including fuzzy clustering. We look for changes in clustering composition due to branches belonging to multiple clusters, and changes in operational efficiency performance due to fuzzy clustering. All this while looking at influential branches. Our premise is that fuzzy clustering allows differentiating clusters beyond scale/size, and that it affects operational efficiency performance.

1 - Identifying New Service Opportunities For Driving Safety Enhancement Based On Driving Behavior Analysis: Commercial Vehicle Case In Korea

Chang-Ho Lee, Pohang University of Science and Technology, 77 Cheongam-Ro. Nam-Gu., Pohang, Korea, Republic of, dlckdgh@postech.ac.kr, Min Jun Kim, Young-Mok Bae, Kwang-Jae Kim

The goal of this research is to identify service opportunities for enhancing driving safety for commercial vehicles (including intra-city buses, express buses, and trucks). Based on an analysis of vehicle operational data in conjunction with accident data, new service opportunities for enhancing driving safety are identified. The service opportunities would contribute to developing new services for commercial vehicle companies and related authorities in Korea.

2 - Development Of A Daily Health Behavior Index For College Students

Ki-Hun Kim, Pohang University of Science and Technology, Pohang, Korea, Republic of, kh_kim@postech.ac.kr, Kwang-Jae Kim

Recently, a smart wellness service has been developed to support daily wellness management for college students. During a day, the service collects health behavior (activities, sleep, and diet) data of a student via smart devices. As part of the service, a daily health behavior index was developed to evaluate the student's health behaviors based on the collected data. Daily health behavior data of 47 college students were collected during a four-week experiment and used to develop the index. This talk presents how the index was developed and utilized in the service.

1 - On-site Personalized Product Recommendations: A Field Study

Dimitrios Tsekouras, Erasmus University, Burgemeester Oudlaan 50, 3062PA, Rotterdam, P.O. Box 1738, Netherlands, dtsekouras@rsm.nl, Ting Li

Consumers receive on-site personalized product recommendations about alternative products based on their past behavior. In this paper, we study the effectiveness (click and purchase) of these recommendations based on products (1) browsed, (2) put on wishlist, or (3) bought, using a large dataset from a major e-retailer. We examine the extent to which these effects differ for products with different price levels, in different product categories, as well as depending on how long after the initial interaction with the product source are the recommendations presented. The findings provide suggestions for improving the on-site recommendation for e-commerce websites.

2 - The Effect Of Direct Marketing On Online Purchases – An Empirical Study

Xingyue Zhang, Lehigh University, 621 Taylor Street, Bethlehem, PA, 18015, United States, xiz313@lehigh.edu, Yuliang Yao

Use a unique dataset collected from one of the largest classified ads website in China, we empirically examine the effect of offline call intensity on online customer purchase probability and the carryover effect of call intensity. We find that online customer purchase probability is increasing in call intensity but at a decreasing rate. In addition, there exists a strong carryover effect where the call intensity in the past 4 weeks does not fade away but have a positive effect on recent customer purchase. Our estimations show that both too much or too little call intensity will result in considerably worse outcomes.

3 - Product Recommendations In E-mail Marketing: A Randomized Field Experiment

Ting Li, Erasmus University, T09-14, Burg Oudlaan 50, Rotterdam, 3000DR, Netherlands, tli@rsm.nl, Dimitrios Tsekouras

Websites retarget their customers by sending e-mail with personalized product recommendations based on their past browsing behavior and preferences. In this study, we examine the effectiveness of such e-mail communication across two types of product recommendations: content-based recommendations and visual recommendations. We conducted a large-scale randomized field experiment to investigate how these effects vary depending on customers' purchase stage and the temporal distance between their last website visit and receiving the email. The study provides insights for e-commerce websites regarding the improvement of their e-mail retargeting campaigns.

Decision Support Systems II

Contributed Session

Chair: Koki Ho, University of Illinois at Urbana-Champaign, 302F, Talbot Laboratory, 104 S. Wright St, Urbana, IL, 61801, United States, kokiho@illinois.edu

1 - A Decision Framework For Uber-like Transportation Platform

Peiyu Luo, PhD Student, University of Louisville, Louisville, KY, 40217, United States, p0luo002@louisville.edu, Lihui Bai

The rising platforms such as Uber, Lyft and Sidecar empower individuals to provide short-range point-to-point ridesharing services other than traditional transportation services (e.g. bus, subway, taxi). This paper aims to provide decision support tools for such peer-to-peer transportation businesses. We divide the business operations into three stages: resource identification, resource allocation and task assignment, and use optimization models and prospect theory in decision making to formulate the three stages. Computational results will be reported.

2 - Leveraging Machine Learning To Support Agricultural Decision-making

Emily Burchfield, PhD Candidate, Vanderbilt University, Nashville, TN, 37212, United States, emily.k.burchfield@vanderbilt.edu, John J Nay, Jonathan Gilligan

This project applies machine learning to remotely sensed imagery to train and validate predictive models of vegetation health. We processed eleven years of NASA MODIS data and applied gradient boosted machines to the lagged data to forecast future values of vegetation health. We assessed the predictive power of our model across space, time, and land use categories. Our models have significantly more predictive power on held-out datasets than simpler baselines. We constructed an open source tool that predicts per-pixel vegetation health in a user-specified region of interest at 16-day intervals. This tool is useful in regions where clouds prevent real-time monitoring of vegetation dynamics.

3 - Profit Optimization For Rare Earth Permanent Magnet Value Recovery Under Supply And Demand Uncertainties

Hongyue Jin, PhD Candidate, Purdue University, 2101 Cumberland Ave Apt 2107, West Lafayette, IN, 47906, United States, jin156@purdue.edu, Yuehwern Yih, John Sutherland

Rare earth permanent magnets (REPMs) play an essential role in green energy production and yet face a significant supply risk. To alleviate the risk, value recovery from end-of-life product is proposed. This research develops an inventory management strategy for REPM recovery under market supply and demand uncertainties. A linear programming (LP) model is then developed to find an upper bound for the proposed strategy. Several scenarios are evaluated with a hard disk drive (HDD) example. The proposed strategy helps increase the profit, and the performance is well comparable to the upper bound.

4 - Operations Research In Space Engineering

Koki Ho, University of Illinois at Urbana-Champaign, 302F, Talbot Laboratory, 104 S. Wright St, Urbana, IL, 61801, United States, kokiho@illinois.edu

This presentation provides a survey of the state-of-the-art of operations research (OR) in an unconventional application area: space engineering. Over the last 10-15 years, optimization, probability, and stochastic analysis have been successfully applied to various problems in space exploration, enabling more efficient space mission planning and more effective in-orbit platform design. This presentation reviews the representative theory and application development in this area and lays out the potential future research directions.

1 - Optimal Dispatching Policies For Donation Collection And Distribution

Robert Cook, University of Alabama, 201 Marina Drive, Tuscaloosa, AL, 35406, United States, Racook1@crimson.ua.edu, Emmett J Lodree

This study introduces a Markov decision process (MDP) model for collecting donations and distributing them to disaster survivors. Donations that accumulate over time at collection sites are periodically transported to a relief center where they are distributed to beneficiaries. The MDP model minimizes expected unsatisfied demand during a finite horizon.

2 - Flood Disaster Relief Services: A Research Agenda For Recovery

Niratcha Grace Tungtisanont, PhD Candidate, Clemson University, 100 Sirrine Hall, Management Dept, Clemson, SC, 29634, United States, ntungti@g.clemson.edu, Aleda Roth, Yann Ferrand, Bernardo F. Quiroga

We propose a research framework that covers the pre-, during- and post phases of natural disasters relief services. More specifically, we focus on the service operations strategies for improving the post-disaster recovery phase of flood disasters. We aim to answer the following research questions: where should we place our resources and efforts on the “pre- and during flood phases? Relatively, how much should we invest in the first two phases in order to improve the overall effectiveness in the recovery phase? We apply rigorous econometric analyses that provides managerial and policy implications for improving the resilience of communities and individuals affected by flood disasters.

3 - A Network Model For Relief Distribution In Emergency Response Phase

Shaligram Pokharel, Professor, Qatar University, Doha, Qatar, shaligram@qu.edu.qa, Rojee Pradhananga, Fatih Mutlu, Jose Holguin-Veras

A relief distribution model that minimizes the total cost while considering the supply and transportation capacities constraints is developed. the distribution network structure presented here considers distribution of the supplies through pre-selected district bases that are reachable by land from the supply collection points. Air-lifting is dedicated to end distribution of the supplies from the district bases to the affected regions. Results and analysis are discussed based on model performance in the context of a real-case network from recent disaster “Nepal Earthquake 2015”. (This research is funded through Qatar/QNRF/NPRP Project: 5-200-5-027)

4 - A Multistage Stochastic Approach For Disaster Response In Humanitarian Relief

Shaolong Hu, PhD Candidate, Tongji University, 1 Zhangwu Road, Tongji Building-A, Room 1706, Shanghai, 200092, China, shaolong.hu@hotmail.com

This paper focuses on a transshipment problem with consideration of uncertain road network capacity and vehicles coordination. Scenario tree is employed to demonstrate the multi-stage stochastic decision process. A multi-stage stochastic program model is developed to coordinate vehicles and scheduling of a transportation plan with the objectives of minimizing rental, transportation, handling, and penalty costs. Progressive hedging algorithm (PHA) is proposed for solving large scale problems. Based on the real-world case of an earthquake, numerical experiments are presented to study the applicability of the proposed model, and the effectiveness of the proposed PHA is illustrated.

Chair: Yi-Ting Hsin, National Chi Nan University, Nantou, Taiwan, s100213024@mail1.ncnu.edu.tw

1 - Human Capital Of President Of Venture Capital Firm And Investment Performance

Cong Chen, PhD Candidate in SEM, THU, Tsinghua University, Haidian Dstrict, 708A, 14# Zijing Apartment, Tsinghua University, Beijing, 100084, China, thuchencong@163.com, Jizhen Li

This paper examined the effects of human capital of president of the venture capital firm (VCF) on investment performance. We concerned two key demographic characteristics, education and experience. In this paper, we proposed several hypotheses about the relationship between human capital and performance of VCF. Then we conducted empirical analysis to examine the hypotheses, using data from 107 VCFs in China. We find that education background in technology and business, finance experience, venture capital experience and entrepreneurial experience of presidents of VCFs increase investment performance.

2 - The Generalized Little’s Law And an Asset Picking System To Model And Maintain an Investment Portfolio: A Working Model

Maria Luisa Ceprini, Professor, Massachusetts Institute of Technology, E62-534 Cambridge, MA 02139 United States, Cambridge, MA, 02139, United States, mceprini@mit.edu, John D.C. Little

In this second phase of our research project we are testing the Generalized Little’s Law-Asset Picking System (GLL-APS) model, in order to tailor a customized investment portfolio for the investor. We use more advisers, customers, a wider selection of financial institution portfolios and our customized portfolios. We plan an orderly rollout of our model in multiple sectors. These include private and public investors, supplemental and social security funds. At the end the model will be assessed.

3 - Trust Evolution Dynamics In The Venture Capital Syndicate Network: An Analysis Based On A Wright-Fisher Process

Heyin Hou, Southeast University, School of Economics and Management, Nanjing, 211189, China, heyinhou@hotmail.com, Jun Yin

Venture Capital Syndicate Network (VCSN) derives from syndicate investments and relies on trust evolutions between venture capitalists (VCs). Based on a Wright-Fisher process, we introduce a general model of trust evolution dynamics with multi-strategy and protection mechanism in the VCSN. Then, we explore influences of the protection mechanism on evolutionary stability conditions for the two-strategy and the four-strategy models. Finally, we construct the global profit function for the VCs and adopt simulation experiments to verify the trust evolution dynamics for the two-strategy and the four-strategy models.

4 - Optimizing The Omega Ratio In Portfolio With Floating Return Threshold

Yi-Ting Hsin, National Chi Nan University, Nantou, Taiwan, s100213024@mail1.ncnu.edu.tw, Jing-Rung Yu, Wan-Jiun Paul Chiou, WenYI Lee

The omega ratio is the ratio of the expected upside deviation to the downside deviation of the threshold. The previous literature set the threshold fixed, which leads the portfolio (1) to overweight on risky assets, and (2) to lower risk-return efficiency. To better response the dynamics in market, we modify the threshold changing according to the recent returns. To improve the feasibility, we further model optimal asset short-selling, transaction cost, and buy-in limits in constructing portfolio. We use the daily data of a wide range of high-liquidity ETFs to analyze the effectiveness of the model. The empirical findings show that the proposed model demonstrates higher realized performance.

Facility Logistics - Potpouri

Sponsored: TSL, Facility Logistics

Sponsored Session

Chair: Debjit Roy, Indian Institute of Management - Ahmedabad, 34355, India, debzitt@gmail.com

1 - Retrieving Multiple Loads In Very High Density Storage Systems

Masoud Mirzaei, Erasmus University, mirzaei@rsm.nl, Masoud MirzaeiB.M. De Koster, Nima Zaerpour

Compact storage systems aim to utilize the available space more efficiently than conventional aisle-based storage systems. The most compact system has only one open space available to perform the retrieval and storage requests. More open locations, reduce space usage, but can reduce the retrieval time. However, in both situations, much space and time can be saved by performing multiple-load retrieval using a limited number of open locations. Current models for such systems study retrieving loads one at a time. We develop optimal models to do this for two loads and propose heuristics for more loads. Results show savings of 20% can be achieved compared to single-load retrieval.

2 - Loading And Unloading Trains And Trucks At Container Terminals

Debjit Roy, Indian Institute of Management - Ahmedabad, Ahmedabad, 380015, India, debjit@iima.ac.in, Jan-Kees Van Ommeren, Amir Gharehgozli

We first develop a closed queuing network with a fixed number of Automated Guided Vehicles that continuously circulate in the network during train loading or unloading process and interact with truck arrivals at the stacking cranes. We develop exact solutions for the case with one automated stacking crane by using an imbedded Markov chain approach. We then use these results to develop a semi-open queuing network model to analyse and approximate the expected throughput times for handling containers that arrive via trains (bulk arrivals) and trucks (single arrivals).

3 - A Fluid Model For Optimal Lot Selection And Dispatching Policies In Semiconductor Wafer Fabs

Dima Nazzal, Georgia Institute of Technology, Atlanta, GA, 30332, United States, dima.nazzal@gatech.edu, Shabbir Ahmed, Kelly Bartlett, Haejoong Kim, Junho Lee, George L Nemhauser, Matias Siebert Sandoval, Joel Sokol

In semiconductor manufacturing, congestion in an automated material handling system may negatively impact production throughput. For a prototype facility, we identify optimal lot selection and dispatching policies for various WIP levels and workload conditions. We propose a fluid-model lot selection policy that iteratively optimizes selection based on current WIP distribution.

Time-Sensitive Delivery Planning and Routing

Sponsored: TSL, Freight Transportation & Logistics

Sponsored Session

Chair: Okan Orsan Ozener, Ozyegin University, Istanbul, Turkey, orsan.ozener@ozyegin.edu.tr

1 - A Lagrangian-based Approach For Consolidating Freight Of Perishable Products

Christine Vi Nguyen, Northern Illinois University, DeKalb, IL, United States, cnguyen@niu.edu, Alejandro Toriello, Maged M Dessouky

We study a supply chain with small suppliers of perishable products, where shipping via a shared consolidation center allows for more economical FTL rates versus LTL or courier rates. We propose a Lagrangean relaxation of the center's inventory capacity to decompose the problem by destination, and develop a related heuristic that balances consolidated shipping costs and inventory costs.

2 - Same-day Delivery Planning With Store Fulfillment

Ming Ni, University at Buffalo, mingni@buffalo.edu, Qing He, Jose Walteros, Xuan Liu, Arun Hampapur

This study presents a same-day delivery planning with store fulfillment problem, which can be characterized by three main factors, the store selection, the delivery fleet sizing, and the multi-commodity distribution for online shoppers. It develops a mix integer programming model to represent the problem and use a Benders decomposition based approach to solve it efficiently. The numerical examples are derived from same day delivery from a real-world retailer store network.

3 - A Partially Time-expanded Network-based Solution Approach For The Traveling Salesman Problem With Time Windows And Its Variants

Minh Duc Vu, Quinlan School of Business, Loyola University Chicago, 16 E. Pearson, Chicago, IL, 60611, United States, dvu3@luc.edu, Natashia Boland, Mike Hewitt, Martin Savelsbergh

We present an exact approach for solving the Traveling Salesman Problem with Time Windows (TSPTW) that is based on repeatedly solving a mixed integer programming formulation of the problem over partially time-expanded networks. We show that the same algorithmic framework can be applied to different objectives for the problem. We develop new speed-up techniques for the algorithm and with an extensive computational study we are able to outperform many of the state-of-the-art approaches. Finally, we show how the algorithm can be adapted to variants of the TSPTW wherein the makespan is the objective or travel times are time dependent.

4 - Minimizing Routing Costs In Blood Supply Chain

Okan Orsan Ozener, Ozyegin University, orsan.ozener@ozyegin.edu.tr

We study the routing of blood collection vehicles for managing the platelet supply in blood supply chain. In order to extract platelets, donated blood has to be processed at a central processing facility within six hours of donation time. Blood collection organizations have to dispatch collection vehicles and schedule pickups from the donation sites so that the donated units can be used in platelet production. The objective is to collect and process a pre-specified number of donations for platelet production via a limited number of vehicles at minimum transportation cost. In our analysis, motivated by the practices in real-life, we cluster the donation sites so that a single vehicle serves the donation sites in each cluster. We propose a solution method based on route generation/selection and test the performances of the proposed method on randomly generated instances.

Scheduling in Passenger-Oriented Railway Networks

Sponsored: Railway Applications

Sponsored Session

Chair: Nikola Besinovic, Delft University of Technology, Mekelweg 2, Deflt, 2628, Netherlands, N.Besinovic@tudelft.nl

1 - Functional Relationship Between Primary And Secondary Delays On Railway Lines

Steven Harrod, Technical University of Denmark, stehar@dtu.dk, Fabrizio Cerreto, Otto Anker Nielsen

Performance, robustness, and punctuality of railway lines are most commonly evaluated with simulation software. This research proposes a cubic relationship between aggregate train delays over the planning horizon and identifiable primary delays. This relationship provides a heuristic for reducing the number of simulation instances. The method is presented in the context of ongoing research into robustness and punctuality on the Danish railways under the IPTOP research project. In addition, the presentation will discuss the identification of cause and effect between primary and secondary delays in a very large data set.

2 - Passenger Train Service Network Design Based On A State-space-time Network

Lingyun Meng, Beijing Jiaotong University, menglingyun2001@hotmail.com, Xuesong Zhou

We propose a solution framework for matching passenger travel demand to vehicle transport services and vehicles to infrastructure in a railway system based on a triple-layer (state-space-time) network. Following a method for carefully constructing the triple-layer network, we present an integer programming formulation and a lagrangian relaxation solution framework. Numerical experiments are conducted for validating the proposed approach.

3 - Towards Operationally Feasible And Robust Railway Timetables

Nikola Besinovic, Delft University of Technology, Stevinweg 1, Delft, Netherlands, n.besinovic@tudelft.nl, Rob M.P. Goverde

Railway timetabling has been a focus of research over the years and multiple approaches have been proposed. However, most of the existing models for timetabling focus on a macroscopic level of detail, taking stations as nodes and tracks between as arcs, and disregard changes in operational aspects. We propose an optimization approach that integrates a macroscopic model with microscopic details. The objective is to find a robust timetable that is also operationally feasible and ready to be implemented in practice. In addition, the model allows for optimal use of infrastructure capacity and reduces wasted resources. We present computational results on real-life cases from the Dutch railways.

Optimization in Crew Planning and Crew Leave Planning

Sponsored: Aviation Applications

Sponsored Session

Chair: Norbert Lingaya, Kronos Incorporated, 3535 Queen Mary Rd, Suite 500, Montreal, QC, H3V 1H8, Canada, nlingaya@kronos.com

1 - Bulk Annual Leave Slot Generator: A Two-phase Approach

Luc Charest, Operations Research Specialist, AD OPT, A Kronos Division, 3535 chemin Queen-Mary Ouest, bureau 500, Montréal, QC, H3V 1H8, Canada, luc.charest@kronos.com

AD OPT has enriched its Man Power Planning tool, namely "Altitude Insight", with a new component: the Leave Solver. This new component solves the problem of generating, awarding and assigning Long Service Leave and Bulk Annual Leave slots to crew member. With this presentation, we cover how the two-phase approach of the Leave Slot Generator is effective at generating slots in order to meet the first optimization requirement of leveling the gap related to the operational requirement while attaining the second objective of controlling the distribution and variety of generated slots.

2 - A Satisfaction Distribution Approach For Airline Crew Rostering Problems

Babacar Thiongane, AD OPT, A Kronos Division, 3535 Queen-Mary, Bureau 650, Montreal, QC, H3V1H8, Canada, babacar.thiongane@kronos.com

The satisfaction distribution problem in airline crew rostering aims to have a fair distribution of the bids satisfaction among crewmembers. We propose a new approach to solve this problem that also provides good quality of global satisfaction.

3 - Integral Column Generation

Guy Desaulniers, GERAD, guy.desaulniers@gerad.ca
Guy Desaulniers, Polytechnique Montreal & GERAD, Montreal, QC, Canada, guy.desaulniers@gerad.ca

We introduce an integral column generation method, which is an adaptation of the integral simplex using decomposition algorithm to the column generation context. The new method finds an improved integer solution at each column generation iteration until reaching an optimal solution. We present results for some crew scheduling problems for which optimal solutions are often obtained in few iterations.

4 - Monthly Crew Pairing With 40 000 Flights

Francois Soumis, GERAD, francois.soumis@gerad.ca, François Lessard, Mohammed Saddoune

The crew pairing problem is modelled as a set-partitioning problem solved by columns generation. The Dynamic Constraints Aggregation speed-up the master problem and permit to solve a weekly window of 10 000 flights in few hours. The rolling horizon with weekly windows produces solutions improver by up to 5%.

Probabilistic Location Models

Sponsored: Location Analysis

Sponsored Session

Chair: Kayse Lee Maass, University of Michigan, 1205 Beal Avenue Ann Arbor, Westland, MI, 48109-2117, United States, Leekayse@umich.edu

1 - Robust Defibrillator Placement Under Cardiac Arrest Location Uncertainty

Auyon Siddiq, UC Berkeley, Berkeley, CA, United States, auyon@berkeley.edu, Timothy Chan, Zuo-Jun (Max) Shen

The placement of automated external defibrillators (AED) in public locations allows bystanders of cardiac arrest to administer treatment prior to the arrival of emergency medical responders. A key challenge in AED positioning is that cardiac arrest locations are unknown in advance. We address this by formulating the AED problem as a distributionally robust facility location model with uncertainty in the locations of the demand points. Numerical results demonstrate that hedging against demand location uncertainty has the potential to improve cardiac arrest survival outcomes by mitigating the risk of long response times.

2 - Reliable Sensor Deployment For Object Positioning And Surveillance In A Two Dimensional Space

Siyang Xie, U of Illinois at Urbana-Champaign, Urbana, IL, United States, sxie13@illinois.edu, Kun An, Yanfeng Ouyang

This paper formulates a mixed-integer non-linear mathematical model for the reliable sensor deployment problem considering site-dependent sensor failures, where at least three sensors are required to work together to locate an object in a two-dimensional plane. The non-linear program is first linearized and customized Lagrangian relaxation algorithm is then developed to effectively solve the model. Numerical examples are presented.

3 - Facility Location Planning Under Uncertainty In Disaster Management

Emilia Grass, Institute for Operations Research and Information Systems (ORIS), e.grass@tuhh.de

Establishing relief facilities and the pre-positioning of first aid supplies before the occurrence of natural disasters is one of the most important preparation strategies in disaster management. Such location and storage decisions have to be made under a high level of uncertainty since the magnitude, time and location of disasters are not known in advance. In this talk, two-stage stochastic programs are presented which are particularly valuable for these situations. This is due to their ability to model uncertainties and to take into account possible implications of location decisions on relief item distribution in the aftermath of a disaster.

4 - Comparison Of Various Chance Constraints On The Inventory Modulated Capacitated Location Problem

Kayse Lee Maass, University of Michigan, Ann Arbor, MI, United States, leekayse@umich.edu, Mark Stephen Daskin, Siqian Shen

Using diverse data instances, we compare three approaches to incorporating chance constraints into a stochastic capacitated facility location problem in which processing facilities are able to accept demands in excess of the capacity constraint for short periods of time. Each of the formulations simultaneously assesses a penalty cost for each unit of unprocessed demand and imposes limits on the amount of unprocessed demand allowed. We show how the different approaches affect the optimal solution in terms of the facility locations, demand allocations, amount of unprocessed demand, and overall cost.

Theory and Application of the Analytic Network Process

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Orrin Cooper, University of Memphis, Memphis, TN, United States, olcooper@memphis.edu

1 - Improving Coherency In The Anp With A Clustering Algorithm

Orrin Cooper, University of Memphis, olcooper@memphis.edu, Idil Yavuz

When incoherent priority vectors in an ANP Supermatrix are identified it can be costly to elicit new pairwise comparisons. The proposed method can save decision makers valuable time and effort by using the information and relationships that already exist in the weighted Supermatrix. There is also useful information in the linking estimates that were already calculated and used to measure the coherency of the Supermatrix. A dynamic clustering method is used to automatically identify a cluster of coherent linking estimates from which a new coherent priority vector can be calculated and used to replace an incoherent priority vector.

2 - Being Consistent With Ahp Consistency: Issues And Applications

Enrique Mu, Carlow University, emu@carlow.edu

Consistency has been a cornerstone of AHP theory and applications. The rule of thumb has been that any pairwise comparison matrix for which the consistency ratio (CR) is less or equal than 0.1 will yield an eigenvector which will diverge very little from the calculated eigenvector for the ideal case of CR=0. However, putting aside the theoretical need for a low inconsistency, we will discuss here what are the potential practical applications of this. Can we use it to screen out of the decision-making process, "irrational" decision-makers? What else can consistency tell us about the decision-maker or the decision-making process? In which situations may consistency take a greater degree of importance?

3 - How Understanding The Sensitivity And Stability Of Preferences Among Colorectal Cancer Screening Alternatives Could Lead To "better" Medical Decisions

M. Gabriela Sava, Assistant Professor, Clemson University, Clemson, SC, United States, msava@clemson.edu, Luis G Vargas, Jerrold H May, James G Dolan

Patients are faced with multiple alternatives when selecting the preferred method for colorectal cancer screening, and there are multiple criteria to be considered in the decision process. We model patients' choices using a multi-criteria decision model and propose a new approach for characterizing the idiosyncratic preference regions for individual and group of patients. We show how insights derived from the sensitivity and stability of patients' preferences could be used within the medical decision making process.

4 - Quick Anp - A New Approach To Anp Sensitivity Analysis

Elena Rokou, Chief Research Officer, Creative Decisions Foundation, Pittsburgh, PA, 15213, United States, erokou@creativedecisions.net, Bill Adams

The proposed approach consists of two phases, in the first one each decision maker fills out a very short version of the ANP questionnaire. This way the initial point of views are collected by the negotiator. The initial questionnaires give the needed input to define what are the points of greater conflict and which judgments have a primary role in the final decision outcome. In the second phase the team focuses only on those conflicting points that have great impact on the outcome. The focal point of this work is to present a new type of sensitivity analysis for single level ANP models.

1 - Sensory-updated Failure Threshold Estimation For Remaining Useful Life Prediction

Abdallah A Chehade, University of Wisconsin-Madison, chehade@wisc.edu, Kaibo Liu

The rapid development of sensor technology led to significant research efforts in remaining useful life (RUL) prediction. Such efforts often consider that a unit fails when it crosses a failure threshold, which is estimated offline. Unfortunately, such failure threshold estimation may not be valid due to the stochastic nature of the underlying degradation mechanism. In this talk, we propose a novel data fusion model that combines the information from the degradation profiles of historical units and the in-situ sensory data from an operating unit to online estimate and update the failure threshold distribution of this unit in the field. This approach is expected to help better online predict the RUL.

2 - Hard Failure Prediction Based on Joint Models With Extended Hazard

Jianing Man, City University of Hong Kong, Kowloon, Hong Kong, jianinman2-c@my.cityu.edu.hk, Qiang Zhou

Remaining useful life (RUL) prediction is essential for the prognostics and health management (PHM) to guarantee the system performance. We use joint models for the individual units (or systems) which subject to hard failure, including the random effects model for degradation signals and the extended hazard (EH) model for time-to-event data. The EH model is a general model that includes the proportional hazards (PH) model and accelerated failure time (AFT) model as special cases. A two-stage method and a Bayesian updating scheme are used in the offline estimation and online prediction separately.

3 - To Integrate Or Not? Covariance Selection In Gaussian Process Modeling

Ran Yang, Northwestern University, RanYang2011@u.northwestern.edu, Daniel Apley

Power exponential, Gaussian, and Matern are the most commonly used covariances for Gaussian process modeling of simulation response surfaces. A recently proposed class of fundamentally different, integrated covariance functions has been shown to work remarkably well for simulation models of many real physical systems. We demonstrate that likelihood and leave-one-out cross validation can both reliably select the best covariance model for a given response surface and data set and, in particular, determine whether an integrated covariance function should be used.

4 - Diagnostic Monitoring And Fault Diagnosis In Large Scale Multivariate Process Via Compressive Sensing And Optimization Screening

Yan Jin, University of Washington, yanjin@uw.edu, Shuai Huang

Smart manufacturing has been an emerging concept in many industries that highlights unprecedented connectivity of manufacturing infrastructure and abundance of sensors for real-time monitoring of many system entities. While it provides a data-rich environment, how to effectively model the variations of system entities and synthesize decentralized information into global situational awareness have been challenging issues. To tackle these challenges, we propose an integrated framework that unifies multivariate statistical monitoring, compressive sensing, and convex optimization. The advantages of proposed method are demonstrated through both simulations and real world application.

1 - Combined Condition-based Maintenance And Repairman Routing Optimization

Bram de Jonge, University of Groningen, Groningen, Netherlands, b.de.jonge@rug.nl, Lisa M Maillart, Oleg A Prokopyev

Existing studies on maintenance optimization for multiple machines generally ignore the required travel times to move from one machine to another. We consider the problem of a single repairman who is responsible for the maintenance activities of a set of geographically distributed machines with condition monitoring. The problem is formulated as a Markov decision process and insights are obtained on when to relocate and when to carry out preventive and corrective maintenance activities.

2 - Maintenance Of Degrading Servers Stored In A Stack

Mahboubeh Madadi, Louisiana Tech, madadi@latech.edu, Lisa M Maillart, Charles Richard Cassady, Shengfan Zhang

Inspired by queueing systems in which the servers are stored in a stack and arriving customers are served by the server on the "top" of the stack, we consider an M/M/n/n queue under a Most Recently Busy (MRB) service discipline in which the operating cost of each server increases in its cumulative time-in-use. More specifically, we formulate a continuous time Markov model to characterize the transient utilization of each server and to determine optimal maintenance policies of various forms.

3 - Condition-based Repair Prioritization In Repairable Inventory Supply Chains

Chiel van Oosterom, Eindhoven University of Technology, Eindhoven, Netherlands, c.d.v.oosterom@tue.nl, Joachim Jacob Arts, Geert-Jan Van Houtum

We propose a model for exploiting condition information to dynamically prioritize repairs in a capacitated repair shop. The repair shop supports a system with a number of different repairable components. The system is down whenever a component fails and no ready-for-use spare part is available for that component. The objective in prioritizing repairs is to maximize the long-run availability of the system.

4 - Joint Optimization Of Replacement And Inspection Decisions For Two-unit Standby Redundant Systems With Non-silent System Failures

Anahita Khojandi, University of Tennessee, Knoxville, TN, United States, khojandi@utk.edu, Murat Kurt

We consider a two-unit standby redundant system in which individual unit failures are silent, but simultaneous unit failures cause system shutdown. We propose a Markov decision process to jointly determine inspection frequency and preventive repair decisions to minimize the total expected operational cost, including inspection, repair and failure costs. We analytically establish properties of the value function and the optimal policy, derive insights from a wide range of numerical examples, perform extensive sensitivity analysis, and discuss algorithmic enhancements.

1 - A Predictive Modeling Of Pump Breakdown For Semiconductor Fabrication Based On Sensor Data

Kil Soo Kim, Principal Engeneer, Samsung Electronics, SamsungJeonja-ro, Hwasung, Gyeonggi-do, 18448, Korea, Republic of, ks1.kim@samsung.com, Chanhwi Jung, Solmi Park, Hyung-Seok Kang, Dongkyu Jeon, Seung Hoon Tong

We present a method for predictive monitoring of pump breakdown failure which may result in wafer scrap or unnecessary main chamber stop loss based on secondly collected sensor data. The sensor data set that were collected massively during several months from pumps contains useful information to monitor and predict the condition of pump connected with main chamber. We developed the monitoring statistics and predictive model which can estimate the remaining useful life. The real-life case study is presented to illustrate our proposed procedures.

2 - Application For Modeling And Optimization Of A Crucial Parameter Identification

Shreya Gupta, University of Texas at Austin, Austin, TX, shreya.gupta@utexas.edu

We are working with Samsung Semiconductor on building a statistical optimization model that identifies equipment and parameters to rank best and worst routes for the purpose of scheduling and testing modified recipes. We are also employing data mining and statistical techniques to identify control spec to improve process capability and yield for semiconductor manufacturing. Finally, we are developing a prototype software to demonstrate the use and value of the proposed analysis and algorithms.

3 - Phase I Analysis Of Nonlinear Profiles Via Gaussian Process Models

Yang Zhang, Tianjin University of Commerce, No. 409, Guangrong Rd., Tianjin, China, yzhang@tjcu.edu.cn, Nini Gao, Qing Wang

In profile monitoring, process monitoring and diagnosis remains and important and challenging problem. Although the analysis of nonlinear profile data have been extensively studied in the literature, the challenges associated with diagnosis of nonlinear profiles with within-profile correlation are yet to be well addressed. In consideration of within-profile correlation, a Gaussian process model is applied to model the nonlinear profiles. A practical diagnosis scheme based on Schwarz's Bayesian information criterion is proposed to identify the outliers in Phase I. Simulation results show that the proposed method could effectively find outlying profiles in a historical dataset.

4 - Adaptive Variability Monitoring Procedure For High-dimensional Processes

Jinho Kim, Qatar University, jhkim04@gmail.com

Monitoring process variability of a multivariate process is crucial to ensure high quality of product. However, monitoring process variability in high-dimensional processes is considerably difficult due to the large number of variables and the limited number of samples. In this talk, we present a procedure based on an adaptive LASSO-thresholding for monitoring changes in the covariance matrix. The performance of the proposed chart, is evaluated for various shift patterns and compared with one of the existing penalized likelihood based methods. The results show the effectiveness of the proposed chart.

1 - Public Transit Regulation And Subsidization Under Asymmetric Information

Yanshuo Sun, PhD Candidate, the University of Maryland, College Park, MD, 20740, United States, yssun@umd.edu, Qianwen Guo, Zhongfei Li

This paper studies how to subsidize a monopolistic public transit operator with unknown production cost parameters. An incentive-compatibility regulatory mechanism which induces the operator to report its true parameter are design: government seeks to maximize social welfare by determining the transit service parameters and the subsidy to operator to induce its participation, and the operator implements the operation schedule to meet financial constraint. Comparison between complete and asymmetric information in terms of fixed cost and marginal cost are proposed. It will provide an effective tool for designing policies and evaluating practices regarding public transit subsidization.

2 - Effects Of Multiple Capacity Changes on Congestion Pricing Model To Handle "Day Of Operations" Airport Capacity Reduction

Abdul Qadar Kara, Asst. Professor, King Fahd University of Petroleum and Minerals, KFUPM Box 5067, Dhahran, 31261, Saudi Arabia, aqkara@kfupm.edu.sa

In an earlier work, a model was built on basic econometric principle of congestion pricing embedded within an optimization model. The model provided a mechanism to manage airport runway capacity reduction on "day of operations". The current work reports further analysis of the model, mainly its response towards the effect of multiple changes in runway access to arriving flights on both the schedule and the pricing.

3 - Price-compatible Matching Mechanisms For Carrier Collaboration

Su Xiu Xu, The University of Hong Kong, LG108, Composite Building, HKU, Pokfulam Road, Hong Kong, 999077, China, xusuxiu@gmail.com

This study is the first extending the existing market design theory to the field of supply chain and logistics management. It is known that money flow is not allowed in the matching markets like stable marriage, house allocation, and kidney exchange. In this study, we explore the potential of lane exchange among a number of self-interested truckload carriers in a collaboration network. We propose the (price-compatible) top trading cycles and deals (TTCD) mechanism and the price-compatible top trading cycles and chains (PC-TTCC) mechanism. Both mechanisms are effective in terms of the compatibility with money flow, strategy-proofness, the realized welfare of carriers, and budget balance.

4 - Dynamic Team Orienteering Problem

Emre Kirac, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States, ekirac@uark.edu, Ashlea Bennett Milburn

This study introduces the dynamic team orienteering problem (DTOP), which is a combinatorial optimization problem with many practical applications such as humanitarian relief logistics and tourist trip organizations. In DTOP, some locations are known at planning time while others are dynamic and each associated with a profit. The goal is to maximize collected profits by visiting a set of static and dynamic locations throughout a planning horizon within a specified timeframe. The multiple plan approach (MPA) is adapted to solve DTOP. Competitive ratio analysis using an offline algorithm is performed to assess the performance of MPA.

1 - On Learning How Players Learn: A Mechanical Turk Experiment

Walid Krichene, University of California, Berkeley, Berkeley, CA, 94720, United States, walid@eecs.berkeley.edu

We consider a noncooperative game in which players compete for resources. In the online model, the game is played repeatedly and players update their strategies using an online learning algorithm. We study whether learning dynamics are descriptive of human behavior. We developed a web application to simulate the game, and used the Mechanical Turk platform to collect data on decision dynamics of human players. Using this data, we pose and solve a dynamics estimation problem, and show that a parameterized online model (based on the mirror descent method) can be descriptive of players' decision dynamics. We give qualitative insights, evaluate the predictive ability of this model, and discuss its limits.

2 - Better Bounds On Convergence Rates For First-order Methods In Sequential Games

Christian Kroer, Carnegie Mellon University, Computer Science Department, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, ckroer@cs.cmu.edu, Fatma Kılınç-Karzan, Kevin Waugh, Tuomas W Sandholm

First-order methods, are known to be very effective in solving large-scale two-player zero-sum extensive-form games. The convergence rates of these methods depend heavily on an associated distance-generating function. By introducing a new weighting scheme for the dilated entropy function, we develop the first distance-generating function for the strategy spaces of sequential games that has no dependence on the branching factor of the player. This significantly improves the convergence rate of several first-order methods. Numerical experiments further support the effectiveness of our new weighting scheme by demonstrating better practical convergence rates.

3 - Formulation Of A Continuous Equilibrium Mapping And A Simplicial Path-following Method For Approximating Proper Equilibria

Yabin Sun, City University of Hong Kong, Nam Shan Office-705, Hong Kong, yabinsun-c@my.cityu.edu.hk, Yin Chen, Chuangyin Dang

This paper formulates a continuous equilibrium mapping for a specifically defined perturbed game that deforms with an extra variable. As a result of this formulation, we develop a simplicial path-following method for approximating a proper equilibrium. The method follows a simplicial path that starts from any given totally mixed strategy profile and leads to a proper equilibrium. Numerical results further confirms the effectiveness of the method.

4 - Price Of Anarchy In Bayesian Congestion Games

Manxi Wu, Massachusetts Institute of Technology, 235 Albany Street, 3112B, Cambridge, MA, 02139, United States, manxiwu@mit.edu, Saurabh Amin

We study a new model of congestion games to understand the effects of asymmetric information on the equilibrium costs of individual players and the social cost. We present a full characterization of the Bayesian Wardrop Equilibrium (BWE) of the game by exploiting the properties of a weighted potential function. We compare the equilibrium cost in any BWE to the socially optimal costs under incomplete and perfect information structures. Our main result estimates the contribution to the price of anarchy (PoA) of the game due to two factors: selfish routing and information heterogeneity.

1 - Can A Buyer Benefit From Bounded Rationality?

Sha Luo, North Carolina State University, 4335 Avent Ferry Road, Apt 3, Raleigh, NC, 27606, United States, sluo3@ncsu.edu, Russell Edward King, Shu-Cherng Fang

Abstract: Bounded rationality takes into account that human decision makers are prone to biases and mistakes. General wisdom suggests that people fail to reap the highest level of benefits when they are not perfectly rational. In this study, we consider a supplier pricing game when the retailer is not a perfect optimizer. The decision model of bounded rationality is derived from the classical logit model. We apply the concept of Nash equilibrium to predict the rational outcome of the pricing game when two suppliers submit their wholesale prices simultaneously. It is found that bounded rationality can be advantageous to the buyer when her bounded rationality level is moderate.

2 - Using Point-of-sale Data To Improve Shelf Replenishment Performance

Suzanne de Treville, University of Lausanne, Anthropôle 3073, Lausanne-Dorigny, CH1015, Switzerland, suzanne.detreville@unil.ch, Valérie Chavez-Demoulin, Joerg S Hofstetter

Shelf replenishment for a retail chain is done once daily. Point-of-sale data lets us estimate the value of a second replenishment opportunity. We begin from a standard newsvendor approach with flexible second-replenishment capacity made available, and show that flexible capacity will often outperform capacity allocated at the level of single stock-keeping units. We define a “Demand at Risk” measure similar to Value at Risk in quantitative finance that captures the highest demand that might be reasonably encountered, and use machine-learning techniques to identify data features of the data that may signal increases in the Demand at Risk, warranting priority replenishment.

3 - A Structurally Enhanced Fuzzy Inference System Partner Selection Technique In Forming Virtual Enterprise

Shahrzad Nikghadam, PhD Student, Middle East Technical University, 425, graduate studies dorm,METU, Cankaya, Ankara, 06800, Turkey, shahrzad.nikghadam@metu.edu.tr, Hakki Ozgur Unver, Ahmet Murat Ozbayoglu, Sadik Engin Kilic

In this study we considered a partner selection problem of Virtual Enterprise in forming consortiums based on customer preferences. Previously, we have presented a Fuzzy Inference System (FIS) based methodology for the problem. Though, in this study, an enhanced form of the previous model is presented by editing the fuzzy rules and their reasoning structure. New rules are established by asking fewer questions from customer, yet the computational results show that it still gives the reasonable decisions by having less detailed information about the customer.

4 - Supplier Selection Models With Product Life Cycle Considerations

Richard Titus, PhD Candidate at Penn State, Adjunct Lehigh Univ, The Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16802, United States, rjt4@lehigh.edu

This research examines the global supplier selection process and includes supplier attributes, determined by an empirical case study and product life cycle considerations. The empirical study examines the relationship of key supplier attributes to quality and delivery performance. Goal programming methodologies, including Preemptive, Non-preemptive, Chebycheff’s Min/Max and Fuzzy GP, are used to solve the multi-objective supplier selection problem for the four product life cycle phases. An illustrative example and an industrial case study are included in the testing of the supplier selection models.

1 - Leveraging Suppliers To Calibrate Product Specification

Sha Liao, University of the Fraser Valley, Vancouver, BC, Canada, sha.liao@ufv.ca, Hao Zhang, Yimin Wang

We examine a two-period game between an Original Equipment Manufacturer (OEM) and his supplier during new product development. The supplier may detect specification problems during production. We first prove that it is strictly better for the OEM to design the contract so that the supplier will voluntarily point out specification problems. We then characterize the optimal contract for the OEM.

2 - Private Label Encroachment And Supply Chain Information Sharing

Xue Li, Tsinghua University, Beijing, China, xueli@mit.edu, Yanchong Zheng, Jian Chen

Our paper investigates the retailer’s private label encroachment strategy and its implications for the national brand manufacturer and the retailer in the environment where the national brand manufacturer may have private product intrinsic information. We consider information sharing via cheap talk in this setting, investigate the effects of private label encroachment on credible information sharing and show that the private label strategically introduced by the retailer may also benefit the national brand manufacturer.

3 - Supply Chain To Product Matching And Firm Performance

Donald Paul Warsing, North Carolina State University, College of Management, Campus Box 7229, Raleigh, NC, 27695-7229, United States, don_warsing@ncsu.edu, Mohamed Desoky, Russell Edward King, Mark Walker

We present an empirical analysis of Fisher’s (1997) conceptual model of supply chain-to-product matching. We use longitudinal COMPUSTAT data across several industries and develop proxies to measure Fisher’s characterizations of products (functional vs. innovative) and supply chains (efficient vs. responsive), and we find a strong, positive relationship between the strength of a firm’s market performance and the strength of the match between its product and supply chain characteristics.

1 - Omni-channel Retail In The Presence Of Operational Frictions

Xiaomeng Guo, Assistant Professor, The Hong Kong Polytechnic University, M628, Li Ka Shing Tower, Hung Hom, Kowloon, Hong Kong, xiaomeng.guo@wustl.edu, Panos Kouvelis, Danko Turcic

Some firms are implementing omni-channel strategies by offering consistent products and prices across their multiple channels, and some other firms essentially prevent seamless transition between different channels. Our paper provides a game-theoretical model to compare the traditional multi-channel and omni-channel strategies by focusing on product and price consistency.

2 - The Study About Crowdfunding Flight

Zihao Zhang, Master, University of Science and Technology of China, 96 Jinzhai Road, Management Research Building 613,Room, Hefei, 230026, China, zhangzih@mail.ustc.edu.cn, Liuyi Ling

Airline may have a loss when passenger load factor is very low due to high costs.So we try to solve the problem with crowdfunding.The study investigates the optimal pricing decision and other decisions about crowdfunding for OTA and airline with Stackelberg game.Results indicate that OTA can determines the optimal price and the lowest tickets sales to maximize its profit,in addition,we can get that lead time will be decided by rent and price. Airline will find the optimal rent according to decisions of OTA. The study also establish a contract to coordinate the supply chain consisting of OTA and airline.

3 - Equilibrium Power Structures In The Presence Of Stochastic Learning

Guowei Liu, Tianjin University, 92 Weijin Road, Nankai District, Tianjin, 300072, China, gwliu@tju.edu.cn, Yunchuan Liu, Jianxiong Zhang

This paper studies equilibrium power structures in a two-period model, where a manufacturer produces a product with stochastic batch learning and sells it to end consumers through a retailer facing a linear demand. The manufacturer and the retailer can implement a dynamic or commitment contract over both periods. We show that when the learning efficiency is sufficiently high, Vertical Nash and Retailer Stackelberg are the equilibrium power structures under the dynamic and commitment contracts, respectively. Meanwhile, the equilibrium power structures are beneficial to consumers. We also extend our main model to the continuous learning and non-linear demand cases.

4 - Storage Assignment In Mobile Fulfillment System

Zhenyu Gao, Tsinghua University, 14#430, Zijing Department, Beijing, 100084, China, gaozy14@mails.tsinghua.edu.cn, Chen Wang

In the thriving E-commerce market with expanding scale of customers and items, fulfilling large volume of small orders accounts for most of the operational cost. The mobile fulfillment system provided by Amazon dispatches large scale of robots to assemble multiple inventory pods with items needed simultaneously, which makes storage assignment more flexible by storing multiple items in one pod and saves cost significantly compared to traditional warehouses. We extract correlation information among items with factorization machines, which is then integrated into a clustering model for the assignment solution. Algorithms are developed both for the factorization machine and assignment model.

1 - Dynamic Decision Making In A Two Echelon Repairable Inventory System With Purchase And Order Options

Rana Afzali-Baghdadabadi, Operation Researcher, General Motors, 2462 John R Rd, # 107, Troy, MI, 48083, United States, rana.afzali@gm.com, Wooseung Jang

In this study, we consider a two echelon repairable parts inventory system, where emergency purchasing and ordering from a central warehouse are allowed to deliver high service levels to customers. A dynamic decision making model is developed that minimizes the system's operational costs, including transportation, stocking and purchasing. The numerical experiments show the benefits of purchasing and ordering options in the systems with high penalty costs and long repair times. The benefits are more significant in systems with tight inventories. Our analysis identifies the best inventory levels that minimize both the operational costs and the initial investments at the stock location.

2 - Procurement Under Price Uncertainty – An Analysis Of Operational Hedging Strategies

Ashutosh Sarkar, Associate Professor, Indian Institute of Management Kozhikode, IIM Campus, Kunnamangalam, Kozhikode, Kerala, Kozhikode, 673570, India, asarkar@iimk.ac.in, Goutam Sutar, Arun Kumar Misra

Consider a manufacturer procuring one of its raw materials from overseas sources. The manufacturer, while facing the risks of price uncertainty due to exchange rate fluctuations, needs to decide the timing, the source and the quantity of purchase. We modeled the manufacturer's decision problem as a multi-period inventory problem and showed that the (s, S) policy is optimal when the manufacturer buys only once during the planning horizon. We also evaluated various operational hedging strategies like, switching, postponement and switching with financial options.

3 - Additive Manufacturing In A Bio-medical Supply Chain: A Continuous Approximation Approach

Adindu Emelogu, PhD Student, Mississippi State University, Dept of Industrial & Systems Engineering, 479-2 Hardy Road, Mississippi State, MS, 39762, United States, aae39@msstate.edu, Sudipta Chowdhury, Mohammad Marufuzzaman, Linkan Bian

The fabrication of biomedical devices close to hospitals via Additive Manufacturing (AM) technology has been gaining popularity due to the many potential benefits it provides such as patient-customized parts, fast response, and reduced delivery cost. However, not much attention has been given to AM deployment methods which impact the supply chain and the amount reaped of these benefits. We propose a continuous approximation (CA) model that quantifies the supply chain network costs of AM-produced biomedical implants. We present an algorithm that optimizes the location of the AM centers and raw material inventory to satisfy the customers. We use hospitals in the southeastern USA as our case study.

4 - Considering Dynamic Demand On The Supply Chain Optimization Via Bargaining Models On A Common Replenishment Epochs Environment

José Velásquez, Universidad de los Andes, Calle 44D # 45-86 Int.1 Apto-503, Bogotá, 111321, Colombia, jl.velasquez1322@uniandes.edu.co, Jose Fidel Torres

In this work we present five different linear programing models to coordinate the supply chain inventories on a single-supplier, single-buyer environment for a variety of products. We considered the common replenishment epochs (CRE) approach on different scenarios where the demand faced by the buyer is dynamic. Depending on the case, one of the actors offers a compensation to the other, in order to accept a strategy for a fixed replenishment period. Finally, we conducted a numerical study to evaluate the benefits of the proposed coordination strategies.

5 - Heuristic Algorithm For Multi-criteria Procurement In Energy Systems

Mohammad Komaki, Case Western Reserve University, 10900 Euclid Avenue, Cleveland, OH, 44106, United States, gxk152@case.edu

Each distributed energy system has several agents, including customer, storage units, and energy source centers that produce energy. Each of these agents are connected to other agents either directly or through other agents and these connections form a network called energy distribution network. To find the optimal route, several heuristic algorithms have been developed. All of the developed algorithms are for a single objective function. However, in reality, decision-makers have to consider several criteria simultaneously. Therefore, the problem is a multi-criteria problem. In this study, we propose multi-criteria heuristic algorithm based on Dijkstra's algorithm.

1 - Inexact Block Coordinate Descent Methods For Symmetric Nonnegative Matrix Factorization

Haoran Sun, Iowa State University, Ames, IA, United States, hrsun@iastate.edu, Qingjiang Shi, Songtao Lu, Mingyi Hong, Meisam Razaviyayn

Symmetric nonnegative matrix factorization (SNMF) is equivalent to computing a symmetric nonnegative low rank approximation of a data similarity matrix. It inherits the good interpretability of the NMF technique and performs better on nonlinearly separable data. In this paper, we focus on the algorithmic aspect of the SNMF problem and propose simple inexact block coordinate decent methods, leading to both serial and parallel algorithms. The proposed algorithms have guaranteed stationary convergence and can efficiently handle large-scale and/or sparse SNMF problems. Extensive simulations verify the effectiveness of the proposed algorithms compared to recent state-of-the-art algorithms.

2 - Generalized Sparse Precision Matrix Selection For Fitting Multivariate Gaussian Random Fields To Large Data Sets

Sam Davanloo, The Ohio State University, Columbus, OH, United States, sdt144@vt.edu, Necdet Serhat Aybat, Enrique Del Castillo

This paper generalizes the Sparse Precision matrix Selection (SPS) algorithm, proposed by Davanloo et al. (2015),for estimating scalar Gaussian Random Field (GRF) models, to the multivariate, second-order stationary case under a separable covariance function. Theoretical convergence rates for the estimated covariance matrix and for the estimated parameters of the correlation function are established. Numerical simulation results validate our theoretical findings. Data segmentation is used to handle large data sets.

3 - Large Scale Distributed Hessian-free Optimization For Deep Neural Network

Xi He, Lehigh University, 837 Cedar Hill Drive, Allentown, PA, 18109, United States, xih314@lehigh.edu, Martin Takac

It is well known that the optimization problem derived from deep neural network is always in high dimension with high non-convexity. In this paper, we revisit Hessian-free optimization method for deep network and develop its distributed variant which can utilize computing cluster to train large models. Furthermore, we propose new algorithm to explore negative curvature direction by solving the subproblem with BICGSTAB method involving possible indefinite true batch Hessian information. We show that these techniques accelerate the training process of deep neural network and sharing considerable speed-up by increasing number of nodes.

4 - Comparing Different Approaches To Solve Airline Crew Recovery Problem

Helder Inacio, Sabre Holdings Inc, 3150 Sabre Drive, Southlake, TX, 76092, United States, Helder.Inacio@Sabre.com, Chunhua Gao, Ramakrishna Thiruveedhi

Airline Crew Recovery can greatly reduce impact caused by disruptions by assigning new rosters to crew. We compare different approaches that can be used to solve this problem. The first approach is optimization based and is focused on reducing overall cost by exploring all recovery options. Other heuristic approaches focus on obtaining fast solutions but have limited search space. We analyze the quality of solutions obtained by using different strategies. We compare the benefits and drawbacks of using these in real-time recovery. The comparisons are made on realistic scenarios of varying size and type of disruption.

1 - Building And Exploring Multiple Time-to-target Plots (m-tttplots) To Compare Randomized Algorithms

Celso C Ribeiro, Full Professor, Universidade Federal Fluminense, Rio de Janeiro, Brazil, celso.ribeiro@gmail.com, Alberto Reyes

Time-to-target plots (tttplots) for each problem instance are a useful tool to characterize, evaluate, and compare the behavior of randomized heuristics for combinatorial optimization problems. Multiple time-to-target plots (m-tttplots) are their natural extension to sets of multiple instances. We show how to build an m-tttplot from the individual tttplots for each instance in the set and we illustrate several case studies to illustrate the applicability and usefulness of the newly proposed m-tttplots tool.

2 - Guided Tabu Algorithm For Parallel Optimization

Hesam Shams, PhD Student, University of Tennessee, 851 Neyland Drive, 525 John D Tickle Engineering Building, Knoxville, TN, 37996, United States, hshams@vols.utk.edu, Oleg Shylo

We consider a large class of optimization algorithms that explore solution space by moving from one solution to another via some local neighborhood structure. To enhance the performance of such techniques, we explore effective and scalable methods for storing information about visited solutions to guide future search steps. In particular, we investigate an extension of the tabu search methodology by integrating a long term memory with tabu list dynamics. The proposed algorithm and its parallel version was tested on well-established benchmark instances of job shop scheduling and max-cut problems revealing excellent computational performance.

3 - Heuristics For The Steiner Traveling Salesman Problem

Celso C Ribeiro, Universidade Federal Fluminense, Rio de Janeiro, Brazil, celso.ribeiro@gmail.com, Ruben Interian

Given a weighted undirected graph and a set of required vertices, the Steiner traveling salesman problem seeks a minimum weighted closed walk on the graph that visits all required vertices. Since a walk is sought, some vertices may be visited more than once. Similarly, some edges may be traversed more than once. We describe a set of benchmark instances and present numerical results obtained with a GRASP heuristic developed for this problem.

4 - Statistical Bounds For Grasp Heuristics Of Np-hard Problems

Mengjie Han, PhD, Dalarna University, Högskolan Dalarna, 791 88 Falun, Sweden, Falun, 791 88, Sweden, mea@du.se, Kenneth Carling

This work aims at providing statistical bounds for Greedy Randomized Adaptive Search Procedures (GRASP) to NP-hard problems. The quality of the solution to the NP-hard problems is always difficult to be evaluated due to the pre-set the number of iterations. The studies of suggesting statistical bounds as evaluation methods are rare. Thus, we propose the statistical estimator with confidence intervals for GRASP heuristics where four classical NP-hard problems are tested. We also suggest examining a new statistic SR for a stopping rule as a complimentary criteria when probabilistic stopping rules are used.

5 - Optimal Shelf Space Allocation And Inventory Planning For Fresh Produce In Retail Store

Hasmukh Gajjar, Associate Professor, Indian Institute of Management Indore, Rau-Pithampur Road, C#208, Prabandh Shikhar, Indore - Madhya Pradesh, 453331, India, hasmukh@iimidr.ac.in, Bhavin J. Shah

We consider the stock-dependent demand for fresh produce in a retail store. This paper formulates a mathematical model for joint optimization of shelf space allocation and inventory replenishment.

1 - An Exact Algorithm For The Covering Capacitated Vehicle Routing Problem

Christopher John Wishon, Arizona State University, Tempe, AZ, United States, cwishon@asu.edu, J. Rene Villalobos

The Covering Capacitated VRP is similar to the traditional VRP except customers can have their demand serviced by a vehicle stopping at a nearby location assuming that the visited location is within the predetermined service radius of the customer seeking service. This problem is applicable to many VRP applications including the planning of emergency services and mobile retailers. An exact solution method is presented based on the set covering formulation. A branch-and-price methodology was employed and feasible covering routes were generated as needed. The algorithm was tested on existing data sets with the results demonstrating the technique was able to solve problems with up to 50 customers.

2 - Heuristics For The Covering Capacitated Vehicle Routing Problem

Christopher John Wishon, Arizona State University, Tempe, AZ, United States, cwishon@asu.edu, Guilherme Sproesser Ferreira, J. Rene Villalobos

The covering VRP is a variant of the traditional VRP in which a vehicle can satisfy a customer's demand by visiting one out of a set of predetermined alternate locations within the network. This variant is motivated by many practical applications including the routing of mobile retailers, urban bus lines, and emergency vehicles. In this work, the Greedy, Sweep, Savings, and Ant Colony Heuristics are adapted to solve the covering VRP. These techniques are employed to solve nearly 200 test instances and the results are compared to any known optimal solutions. These results demonstrate the superiority of the Ant Colony and Savings methods.

3 - New Formulations For The Hub Interdiction Median Problem

Prasanna Ramamoorthy, IIM Ahmedabad, Vastrapur, Ahmedabad, 380015, India, prasannar@iima.ac.in

In this work, we present new formulations for the hub interdiction median problem. We present a bi-level formulation and explore reducing it to a single level using KKT(Karush - Kuhn - Tucker) conditions and closest assignment constraints. We present new closest assignment constraints for the problem in addition to the existing ones in literature (Lei 2013). The new closest assignment constraints has some interesting properties which aids in solving the problem efficiently. We also present computational results highlighting the efficiency of the closest assignment constraints and the proposed model in solving the problem.

1 - Efficient Workforce Scheduling In Retail Stores Considering Overtime Or Part-time Workforce

Peeyush Pandey, Doctoral Student, Indian Institute of Management, Indore, IIM Indore, Indore, 453331, India, f12peeyushp@iimidr.ac.in, Hasmukh Gajjar, Bhavin J. Shah

This paper deals with the problem of identifying optimal workforce size and their schedule to satisfy hourly and daily requirements of workers at the retail store. We consider a multiple day planning horizon divided into periods of equal length for the retail store that caters to daily requirement of customer and offers a wide variety of product. An optimization model is proposed for both overtime and part-time workers considering different shift lengths and different lunch and tea breaks during the working shift. A heuristic presented in the paper guarantees to obtain optimal number of workers and their schedule.

2 - Analyzing Impact Of Cardinality And Similarity Context-effects On Assortment Optimization

Uzma Mushtaque, Rensselaer Polytechnic Institute, 110 8th St, Troy, NY, 12180, United States, uzmamu@rpi.edu, Jennifer Pazour

Assortment planning problem in an online retail environment explicitly modeling no-choice behavior is presented. Difficulty of selecting an item under cardinality-context effects and the attraction due to underlying utility are modeled as the fundamental driver's behind opting for no-choice. Optimality conditions are developed for cardinality context effects and for an interaction of cardinality with similarity effects. Three different algorithms exploit the structure of the optimal solution under these two conditions.

3 - Assortment Planning And Replacement Under Attractiveness Decay Effect

Huiqiang Mao, City University of Hong Kong, Tat Chee Avenue, Kowloon, Hong Kong, 000, Hong Kong, huiqiangm@gmail.com, Yanzhi Li

Inspired by assortment renewal strategies of many industries, we consider the capacitated assortment planning and replacement problem, where the attractiveness of the product decays over time. Based on Locational Choice Model, we characterize the structural properties of the optimal assortment. We also consider the assortment replacement problem, where the retailer is allowed to update the assortment over the horizon. We explore conditions under which the retailer should employ this replacement strategy.

4 - The Phantom Inventory Menace: The Effect Of Unobserved Stock-outs On Lost Sales

Fredrik Eng-Larsson, Postdoctoral Associate, MIT Center for Transportation and Logistics, Boston, MA, United States, frengl@mit.edu, Daniel Waymouth Steeneck

Based on retail audit data, we find retail inventory records are an unreliable indicator of out-of-stock (OOS) events. Worse yet, the records are rarely validated or corrected. As a result, many OOS event are never observed in the inventory record. We estimate the impact of the unobserved OOS events on lost sales via a novel demand estimation technique, which accounts for inventory uncertainty in the presence of scarce inventory record validation.

5 - Warehousing And Shipping Decisions For An Online Replacement Parts Retailer

Kamal Lamsal, Assistant Professor, Emporia State University, Campus Box 4039, 1 Kellogg Circle, Emporia, KS, 66801, United States, klamsal@emporia.edu, Amit Kumar Verma

Online replacement parts sellers offer big selection of products. These products are held in several locations. With every incoming order, the seller must decide whether to split the various items from one order or not and from where each item will ship. We work with an online OEM parts retailer which competes on customer service level. The retailer charges a flat shipping fee per product and promises a delivery time. We develop an Approximate Dynamic Programming (ADP) based algorithm that makes shipping decisions by minimizing the on hand shipping cost plus estimate of future shipping costs. We use the lessons from the exercise to decide which parts should be located in which warehouse.

1 - Financial Decision-maker's Preferences Modeling Within Goal Programming Model

Belaid Aouni, Associate Dean, Qatar University, College of Business and Economics, Al Jamiaa Street, Doha, 2713, Qatar, belaid.aouni@qu.edu.qa

Goal Programming (GP) model has been applied to financial portfolio selection problem where several conflicting and incommensurable attributes are simultaneously aggregated, such as return, risk and liquidity . The aggregation of the conflicting attributes requires some compromises from the Financial Decision-Maker (FDM) based on his/her preferences. The aim of this paper is to present a new typology of the FDM's preferences modeling within the GP model for financial portfolio selection.

2 - Rethinking Sfpark'S Demand Response Pricing

Tayo Fabusuyi, Research Associate, University of Michigan, 5520 Baywood Street, Floor #3, Ann Arbor, MI, 15206, United States, Fabusuyi@umich.edu, Robert Hampshire

In an effort to eliminate circling and reduce parking search time and cruising, SFpark, an innovative demand-responsive pricing program was implemented by the City of San Francisco. Over a two year period, the program was piloted across seven San Francisco neighborhoods made up of 256 distinct parking blocks. The evaluation of the pilot program has however met with mixed reviews particularly with regards to the relationship between price changes and occupancy levels. These issues are addressed by employing a non-dominated sorting genetic algorithm approach from which figures of merit are generated that allow for an objective comparison between treatment and control blocks.

3 - Assets And Liabilities Management Within An Integral Risk Framework For A Microfinance Institution

Tayo Fabusuyi, Numeritics, Pittsburgh, PA, Contact: Tayo.Fabusuyi@numeritics.com

While the microfinance industry has recorded some success in providing financial services to the poor, it has also attracted criticism with regards to the quality of services offered and the lack of a robust risk framework observed across the industry. Using data over a period of a decade (2006-2016), our study addresses these concerns by employing a multiple-criteria decision analysis which provides management with a menu of measures of risk-return tuples that maintains fidelity to the bank's non-financial constraints. The approach is enumerated using Grameen Bank as a case study.

1 - An Eco-urban Logistics Network Design Problem Based On Truck-related Greenhouse Gas Emissions

Mi Gan, Associate Professor, Southwest Jiaotong University, Jinniu District, 111 N 1st Erhuan Road, Chengdu, 610031, China, migan@swjtu.cn, chen si, Zhenggang He

Through multivariate regression analysis on greenhouse gas (GHG) emission rate and truck trajectory data, the GHG emissions function of various kind of logistics facility is obtained. Then, the eco-facility location problem is modeled by integrating pure facility location model and GHG emissions function. Through experiments on real case, the effectiveness of models and algorithms were verified. The eco-facility location model for ULN is tending to obtain the location decision environmentally friendly.

2 - The Interaction Of Forward And Reverse Supply Chains

Qiang Qiang, Penn State, Management Division, 30 E Swedesford Rd, Malvern, PA, 19355, United States, qzq10@psu.edu, Min Yu

In this paper, we study the interaction between a forward supply chain and a reverse supply chain network. In particular, we study the impact of the change in the forward supply chain on the reverse supply chain. Managerial insights are generated from numerical results.

3 - A Strategic Analysis Of a Green Manufacturer With a Risk Averse Retailer Under a Green Supply Chain

Yushan Jiang, Tianjin University, 92 Weijin Road, Tianjin, China, yshjiang@tju.edu.cn, Bo Li

The green manufacturer produces green products in a green supply chain. Considering the trade-off between the R&D investment and returns of green products, the manufacturer decides the wholesale price and the green innovation level. The manufacturer and the retailer adopt the Retail Price Recommendations policy. As the follower in the Stackelberg game, the retailer decides the order quantity. The Conditional value-at-risk (CVaR) criterion is used to evaluate the retailer's risk-averse behavior and we analyze the impacts of the risk-averse level and the innovation cost on member's decisions in both decentralized and centralized supply chain. Channel coordination is also investigated.

4 - Third-party Remanufacturing: Authorization Or Not?

Mingzhou Jin, Professor, University of Tennessee-Knoxville, 525D John D. Tickle Engineering Building, Industrial and Systems Engineering, Knoxville, TN, 37996, United States, jin@utk.edu

The high profit margin of remanufacturing has attracted many third party remanufacturers (TPRs). The presence of remanufactured products, authorized or not, has complex effects on the demand of new products. When an OEM authorizes a TPR, the presence of remanufactured products will lower the consumers' perceived value of new products but OEM can get authorization fee. Without authorization, the presence of remanufactured products will enhance the valuation for the new products. This studies investigates the impact of authorization on OEM and TPR's decisions and further discuss conditions under which OEM will authorize remanufacturing.

5 - When Should Small Firms Collaborate Externally on R&D? A Study Of NIH SBIR/STTR Awards

Mengyang Pan, PhD Candidate, The Ohio State University, Columbus, OH, United States, pan.295@osu.edu, Aravind Chandrasekaran, James Hill, Manus Rungtusanatham

Research on external R&D collaboration predominantly focuses on large firms. Small businesses face different challenges when collaborating externally on R&D. This study uses longitudinal data from the National Institute for Health (NIH) on how small businesses choose their levels of external collaboration, and how this choice affects their R&D commercialization capability.

1 - Risk Management Using Structural Controllability For Resilient Supply Networks

Amirhossein Khosrojerdi, University of Oklahoma, 1021 East Brooks Street, Norman, OK, 73071, United States, akhosrojerdi@ou.edu, Janet K. Allen, Farrokh Mistree

A resilient supply network is one that has the ability to recover quickly from disruptions and ensure customers are minimally affected. Designing the structure of supply networks to be controllable is a way toward resilience. A method is proposed to manage risk in supply networks under disruptions using design for resilience and design for structural controllability.

2 - Measuring The Supply Chain Risk In Global Sourcing

Hokey Min, James R. Good Chair in Global Supply Chain Strateg, Bowling Green State University, 1001 Wooster Street, College of Business 3008C, Bowling Green, OH, 43403, United States, hmin@bgsu.edu

In times of prolonged financial crisis across the globe, a growing number of MNFs have focused their attention on cost saving opportunities through offshoring in LCCs. However, an indiscreet strategy of sourcing from LCCs can do more harm than good, since invisible supply chain risks may increase hidden costs and subsequently more than offset cost saving opportunities. Considering the potential impact of these risks on global sourcing, this paper aims to identify risk factors that significantly hinder the efficiency of offshoring and then measure specific risks associated with offshoring in foreign countries.

3 - Preponement Instead Of Postponement: Two-echelon Disruption Risk Management Under Stochastic Demand

Florian Lucker, EPFL, EPFL-Tom, Odyssea 416, Lausanne, 1015, Switzerland, florian.luecker@epfl.ch Sunil Chopra, Ralf W Seifert, Ralf W Seifert

We consider the multi-echelon inventory problem in the presence of disruption risk and stochastic demand. We derive novel structural insights on optimal inventory levels for the three supply chain topologies: serial, assembly and distribution. We show that an early commitment of end-product inventories is beneficial, as opposed to a delayed differentiation of the end-product. We further provide conditions when risk diversification occurs for two-echelon distribution supply chains.

1 - The Role Of Social Planner In Closed-loop Supply Chain

Lan Wang, California State University at East Bay, 25800 Carlos Bee Blvd., Management Department, VBT 345, Hayward, CA, 94542, United States, lan.wang@csueastbay.edu, Tharanga Kumudini Rajapakshe, Asoo J Vakharia

In recent years, as remanufacturing has significantly increased all over states, recycling of the un-remanufactured products and disposal treatment become a hot potato. Our paper studies the problem of legislation practices on who should be responsible for recycling, and compares the existing mechanisms on the efficiency of environmental protection. In particular, we compare two models.Given different social objectives - prioritized consumer welfare, prioritized environmental benefit, or jointly social objective, we aim to provide roadmap to the social planner on legislation and incentives for remanufacturing and the end-of-life/use product recycling activities.

2 - Towards A Theoretical Framework Of Sustainable Operations Strategy

Yeming Gong, Em Lyon Business School, Building B, Office 1018, 23 Avenue Guy De Collongue, Ecully, 69134, France, gong@em-lyon.com

This paper conducts an integrated analysis of quantitative and qualitative data to study Sustainable Operations Strategy in retailing industry. (1) In quantitative study, using a sample of about 100 organizations we apply structural equation modeling to understand nonlinear relationship among cross-value integration, supply chain coordination and integration, and the performance of sustainable supply chain. (2) In qualitative study, we conducted case studies to validate quantitative results and conducted the archive qualitative analysis for about 50 organizations to provide additional management insights.

3 - Determinants For A Sustainable Relationship In Outsourcing – A Case Study

Mousumi Modak, PhD Student, IIT Kharagpur, Room No-1F-4, VGSOM, IIT Kharagpur, West Midnapore, West Bengal, Kharagpur, 721302, India, mousumimodak10@gmail.com, Khanindra Pathak, Kunal Kanti Ghosh

The growing dependence of firms on service providers for achieving competitive advantage has necessitated the development of long-term sustainable relationship with them. Opportunism has been recognized as one of the vulnerabilities affecting an enduring relationship. The objective of this paper is to examine the antecedents of opportunism and identify their effects on the exchange relationship in the context of outsourcing for the coal mining organization in India.

4 - Strategic Disclosure Of Environmental And Social Performance: Greenwashing In Supply Chains Under Activist Pressure

Avijit Raychaudhuri, Doctoral Candidate, Nanyang Technological University, Division of IT & Operations Management, 50 Nanyang Avenue, South Spine S3-01B-73, Singapore, 639798, Singapore, avijit001@e.ntu.edu.sg, S Viswanathan, Fang Liu

Economic gains derived by firms from voluntarily disclosing positive and negative environmental and social performances are generally complicated. Greenwashing occurs when a firm voluntarily discloses information about its performances in such a way that it portrays an overall greener image than what it actually is. We characterize a firm’s optimal policy for disclosure of environmental and social performances under non-linear and non-monotonic economic gains from disclosure derived by the firm. Further, we study the efficacy of activist power of penalizing a greenwashing firm in accordance with the magnitude of greenwashing, as opposed to penalizing according to a fixed penalty.

1 - Finding A Hider By An Unknown Deadline

Kyle Y Lin, Associate Professor, Naval Postgraduate School, 1411 Cunningham Rd, Monterey, CA, 93943, United States, kylin@nps.edu, Dashi Singham

An object is hidden among several locations. Each search at the object’s location independently finds the object with some location-dependent probability. The goal is to find the object by a deadline, but the deadline is unknown. Assuming the worst-case scenario, where Nature knows the deadline and uses this knowledge to hide the object to hinder the search, this paper shows that there is a randomized search strategy that simultaneously maximizes the probability of finding the object by any deadline.

2 - Planning Effective Police Patrol Routes On Urban Road Networks

Ruben Dario Yie Pinedo, Universidad del Norte, Barranquilla, Colombia, ryie@uninorte.edu.co, Andrea Margarita Ditta Narváez

It is well-known that police patrolling is one of the best preventive practices for public safety against urban crimes. This work, deals with the problem of planning police patrol routes to minimize the overall risk at minimum cost. A specific mathematical formulation models the problem, under critical time constraints and resources. Algorithms of local search and evolutionary techniques, offers effective solutions for this model. A case study in Barranquilla (Colombia), allows validate the performance of our approach in real scenarios.

3 - Modeling Long Term Radiation Fatalities In The National Operational Environment Model

Venkat Venkateswaran, Rensselaer Polytechnic Institute, Room 725, RPI-Hartford, Hartford, CT, 06120, United States, venkav3@rpi.edu

The National Operational Environment Model is a systems dynamics model that recreates in software a model of any nation of interest. The goal is to capture the essential features of the nation so that an analyst can then simulate and analyze in software different intervention actions. We describe our models for estimating long term radiation fatalities arising from a nuclear explosion. They are based on the latest update of the long-running Life Span Study which we briefly describe. These long term fatalities appear in two disease groups: cancers and heart and circulatory diseases.

4 - Development Of Text Analytic Tools Focused On Application To Military Specific Corpora

Nathan L Parker, MAJ, TRADOC Analysis Center - Monterey, 700 Dyer Road, Room 178, Monterey, CA, 93943, United States, nparker@nps.edu, Theodore T Allen, Zhenhuan Sui

Large volumes of free text data present many challenges to analysts, especially when working in time-constrained environments. This research focuses on the development of text analytic tools, primarily topic model based, that can enable military analyst to quickly process large free text data sets. This presentation will discuss our research into text analytic tool development, including supporting visualizations, along with the application of the tools in several field use cases.

Health Care, Strategies

Contributed Session

Chair: Tuomas W Sandholm, Professor, Carnegie Mellon University, Gates Center for Computer Science, Carnegie Mellon University, Pittsburgh, PA, 15213, United States, sandholm@cs.cmu.edu

1 - Assessing The Long-term Value Of Non-clinical Prevention: Improving Life Paths Through Early Childhood Investments

George J. Miller, Institute Fellow, Altarum Institute, 3520 Green Court, Suite 300, Ann Arbor, MI, 48105, United States, george.miller@altarum.org, Charles Roehrig

We illustrate use of a life-path approach to estimate the long-term benefits of early childhood interventions such as perinatal home visits and preschool education. A life path describes an age cohort’s progression through the life course, as characterized by rates of morbidity, mortality, health care costs, earnings, incarceration, and public support. The approach represents the effects of an intervention as a shift from one multi-dimensional life path to a more favorable one and estimates the associated economic value to potential investors, including federal, state, and local governments.

2 - A System Dynamic Model Of Human Papillomavirus Vaccination

Nasser Sharareh, PhD Student, State University of New York at Binghamton, Binghamton, NY, United States, nsharar1@binghamton.edu, Nasim Sabounchi, A. Serdar Atav, Nicole Rouhana

Human papillomavirus (HPV) is a sexually transmitted infection (STI), with a 8.1% incidence rate among boys aged 13-17 years within United States. Although HPV vaccination is available, however the vaccination rate in 2014 was only 22% among boys. It is necessary to study the barriers and facilitators in increasing the uptake of the vaccine among this group of adolescents. In this paper we use a system dynamics simulation method to understand how psychological, socio-economic, and health system factors influence the completion of recommended series of HPV vaccination among adolescents boys.

3 - Hospital Payment Schemes Under Competition

Zheng Han, University of Kansas, Lawrence, KS, United States, hanzheng@ku.edu, Mazhar Arikan, Suman Mallik

We consider two hospitals competing for patients and operating under different payment schemes. Using a game-theoretic approach, we determine equilibrium operating parameters and develop intuitions for healthcare policies.

4 - Sequential Planning For Steering Immune System Adaptation

Tuomas W Sandholm, Professor, Carnegie Mellon University, Gates Center for Computer Science, Carnegie Mellon University, Pittsburgh, PA, 15213, United States, sandholm@cs.cmu.edu, Christian Kroer

Biological adaptation is a powerful mechanism that makes many disorders hard to combat. We study steering adaptation through sequential planning. We propose a general approach that leverages Monte Carlo tree search to compute a treatment plan, and the biological entity is modeled by a simulator. We apply the framework to a leading T cell simulator. We run experiments with two alternate goals: developing regulatory T cells or effector T cells. The former is key for preventing autoimmune diseases; the latter is associated with better survival rates in cancer patients. We show that for the development of regulatory cells, sequential plans yield significantly higher utility than the best static therapy.

Sang Min Lee, Senior Researcher, Samsung Electronics, 816 ChanguiKwan, Korea Univ., 145 Anam-ro, Seongbuk-gu, Seoul, Korea, Republic of, smlee5679@gmail.com, Jee Hyuk Park

In automated material handling systems of semiconductor manufacturing, vehicular congestion is a persistent problem resulting in the reduction of production efficiency. In order to effectively route vehicles to reduce traffic congestion, this study presents a congestion-avoidance routing model based on congestion prediction. A congestion prediction model is proposed to predict the possibility of probable heavy congestion that can lead to significant production loss. The effectiveness of the proposed model is demonstrated by using real data supplied by a semiconductor fabrication plant in South Korea.

2 - Profile Monitoring And Fault Diagnosis Via Sensor Fusion For Multi-stream Data

Weihong Guo, Assistant Professor, Rutgers, The State University of New Jersey, 96 Frelinghuysen Rd, CoRE Rm 220, Piscataway, NJ, 08854, United States, wg152@rutgers.edu

When multiple signals are acquired from different sources, sensor fusion and data dimension reduction are two major issues to achieve a better comprehension of the process. Methods for analyzing multi-stream profiles based on multilinear discriminant analysis and ensemble learning are proposed in this research for the purpose of profile monitoring, fault detection, and fault diagnosis. The proposed methods are compared with state-of-the-art methods with both simulated and real data.

1 - Crew Assignment Subject To Flight Delay Risks

Hing Kai Chan, Associate Professor, University of Nottingham Ningbo China, 199 Taikang East Road, Room AB260, Ningbo, 315100, China, hingkai.chan@nottingham.edu.cn, Sai Ho Chung, Jing Dai

Crew cost ranks as the second highest cost of flight operations, but failure of assigning sufficient crew members to a flight will lead to flight disruption such as delay. The dilemma is obvious. This study adopts a big-data approach by utilizing historical flight arrival delay data and a learning algorithm to predict such risks for optimizing crew assignment. Numerical experiment demonstrates that the proposed algorithm can increase the flight stability, meanwhile minimize the total disruption cost induced.

2 - Developing A Dynamic Tool For Transplant Survival Analysis

Hamidreza Ahady Dolatsara, PhD Candidate, Auburn University, Suite 3301, 345 West Magnolia Ave., Auburn, AL, 36849, United States, hamid@auburn.edu, Ali Dag, Bin Weng, Fadel Mounir Megahed

This study present a toll developed for three types of survival analysis for the transplants. In the first type, it estimates if a patient could survive certain time windows which are integer multiples of one year. As the second type, it yield probability of survival. This tool also estimates expected survival time. Surgeons or other practitioners could utilize it based on their available data from their patients and donors. These data are collected during the registration, waiting list, operation, and after the operation. The tool utilizes machines learning methods to identify the importation features and then utilizes the features for model training and delivering a requested analysis.

3 - An Optimization Approach To Detection Of Epistatic Effects

Maryam Nikouei Mehr, PhD Student, Iowa State University, 3004 Black Engineering, Ames, IA, 50011, United States, mnmehr@iastate.edu, Lizhi Wang

Epistasis refers to the phenomenon where the interaction of multiple genes affects a certain phenotype more than they do separately. Similar epistatic effects are also ubiquitous in other application areas, where a certain effect is only observable when a particular combination of multiple factors is present. Due to the enormous solution space, it's hard to detect the epistatic effect. We propose an optimization model that attempts to detect epistatic effects where a large number of observations are available for a relatively small number of explanatory factors. We will share our preliminary results and discuss future research directions.

4 - Warehouse Process Improvement Through Data Analytics And Optimization

Vedat Bayram, Postdoctoral Research Fellow, University of Waterloo, 200 University Ave. West, Waterloo, ON, N2L 3G1, Canada, vbayram@uwaterloo.ca, Fatma Gzara, Samir Elhedhli

With the advance of the technologies on collecting and storing data, warehouses, from the most automated to the manual, generate large amounts of data. Warehouse management companies are seeking ways to get the full value from the massive amounts of data and use it as a competitive advantage in the marketplace. In this presentation, we report on data analytics solutions for a warehouse management and control systems company. We develop descriptive tools to analyze the big data of e-retailing warehouses and identify process improvement opportunities. We develop data driven optimization solutions and validate by comparing to real system operation.

Capacity-Expansion Planning with Increasing Renewable Levels

Sponsored: Energy, Natural Res & the Environment, Energy I Electricity

Sponsored Session

Chair: Ramteen Sioshansi, Ohio State University, 1971 Neil Avenue, Columbus, OH, 43210, United States, sioshansi.1@osu.edu

Co-Chair: Antonio J. Conejo, The Ohio State University, 1971 Neil Avenue, Columbus, OH, 43210, United States, conejonavarro.1@osu.edu

1 - Analyzing European Climate And Energy Policy Using Stochastic Optimization

Asgeir Tomasgard, NTNU, asgeir.tomasgard@iot.ntnu.no

The paper presents a modeling based analyses of decarbonization options for the European power sector. Different support schemes designed to incentive early development of CCS are studied, like public grants, feed-in premiums and emission portfolio standards are evaluated. As an alternative we study storage and transmission expansion in combination with a high renewable share. For the analysis we use the EMPIRE model, a multi-horizon stochastic investment model for the European power system that combines long-term capacity expansion with operational modeling under different load and generation scenarios.

2 - A Convex Optimization Model For The Combined Electricity And Natural Gas Expansion Planning Problem Under Gas-price Volatility Considerations

Conrado Borraz-Sánchez, Associate Postdoctoral Researcher, Los Alamos National Laboratory, Los Alamos, NM, United States, conradob@lanl.gov, Russell Bent, Pascal Van Hentenryck, Seth Blumsack, Hassan Lionel Hijazi

Recent trends towards installation of gas-fired power plants have increased the economic growth and mutual dependency of electric power and natural gas industries. These industries, however, have commercial, political and technical constraints that often force them to plan, operate and manage in isolation. As a result, adverse upshots may arise such as those experienced by both systems during the winter of 2013/2014 in the US Northeast. Here, we present a joint gas-grid elastic model to optimize required expansions to meet peak demand under consideration of gas-price volatility caused by congested areas. We conduct experiments on integrated test systems that include the New England area.

3 - Electricity Capacity Expansion And Cost Recovery With Renewables

Ramteen Sioshansi, The Ohio State University, Integrated Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States, sioshansi.1@osu.edu, Yixian Liu

High levels of renewables can suppress electricity prices, reduce revenue for all generation resources, and lead to uneconomic retirements and failure to make needed investments. To analyze this problem quantitatively, two models are utilized: (1) a multi-stage stochastic model seeking an optimal investment plan with consideration of uncertainties and operating constraints; (2) a unit commitment model giving electricity and reserve prices based on the investments. Policies such as emission restrictions and renewable subsidies are considered in this analysis. The investment model is large in scale and solved effectively by the progressive hedging algorithm.

Wildland Fire Management II

Sponsored: Energy, Natural Res & the Environment II Forestry

Sponsored Session

Chair: Matthew Thompson, U.S. Forest Service, 800 E Beckwith, Missoula, MT, 59801, United States, mpthompson02@fs.fed.us

1 - Filling Requests For National Interagency Hotshot Crews

Erin Belval, Colorado State University, Fort Collins, CO, United States, mccowene@gmail.com, David Calkin, Matthew Thompson, Yu Wei

Interagency Hotshot Crews are groups of 18 to 20 highly trained personnel used in the United States for fighting wildland fires. Dispatching criteria for these crews include minimizing travel distance and time, not taking crews away from areas with high levels of predicted near-term fire activity and balancing workloads across crews. We employ a simulation-optimization routine to examine the effects of these factors on dispatching decisions during a fire season. We compare our solutions with historical decisions using data from the Resource Ordering and Status System.

2 - Advancements In Spatial Fire Planning

Matthew Thompson, U.S. Forest Service, 800 E Beckwith, Missoula, MT, 59801, United States, mpthompson02@fs.fed.us, Yu Wei, Christopher Dunn, Christopher O'Connor, Greg Dillon, David Calkin

Pre-fire assessment and planning can support incident management decision making by dampening time pressures, reducing uncertainties, expanding options, and clarifying risk-benefit tradeoffs that unfold over different time horizons. This presentation will highlight the role of simulation and optimization in spatial fire planning on federal lands in the western US, with an emphasis on factors relating to cost, responder exposure, probability of success, and consequences.

3 - A Stochastic Optimization Model To Account For Climate Change In Forest Planning

Jordi Garcia-Gonzalo, Centre Tecnològic Forestal de Catalunya (CTFC)., Solsona, Spain, j.garcia@ctfc.es, Andres Weintraub, Cristóbal Pais

We consider a short/medium term multi-objective forest planning problem considering harvesting decisions in the presence of uncertainty due to climate change which impacts in the forest production. We introduce a multistage Stochastic model considering multiple climate change scenarios and including the corresponding non-anticipativity constraints. This enables the planner to make more robust decisions than using a single average scenario.

4 - Learning Optimal Mobility And Demand Pressure from Fire Resource Ordering Data

Alex Taylor Masarie, CSU and U.S. Forest Service, Fort Collins, CO, 80523, United States, alex.masarie@gmail.com, Yu Wei, Matthew Thompson, Michael Bevers, Iuliana Oprea, Erin Belval, David Calkin

An inverse partial differential equation model is used to evaluate how fire suppression resource allocation patterns vary with environmental and managerial factors. This presentation will convey the physical basis for the applied math technique demonstrating a finite difference approach to the spatial dynamics of allocation. A calibration case study will relate features of continuous optimization to operational research methodologies and present preliminary results.

Optimization in Data Mining 2

Sponsored: Data Mining

Sponsored Session

Chair: Taghi Khaniyev, University of Waterloo, 200 University Ave., CPH 3669, Waterloo, ON, N2L 3G1, Canada, thanalio@uwaterloo.ca

1 - A Linear Separation Based MILP Model For Multi-class Data Classification Problem

Fatih Rahim, Koç University, Rumelifeneri Yolu, Sarıyer, stanbul, 34450, Turkey, frahim@ku.edu.tr, Metin Turkay

We address the multi-class data classification problem by a mixed integer linear programming model (MILP). We split each class's data set into subsets such that the subsets of different classes are separable by a hyperplane. The hyperplanes that separate a subset form a polyhedral region and the regions of different classes are disjoint. A MILP model is used to find the optimal separation by minimizing the total number of regions and misclassified data points. A preprocessing step is proposed to decompose or simplify the problem considering pairwise separation of classes. We evaluated two approaches for the testing phase, based on the convex hulls of subsets and the regions defined by the hyperplanes.

2 - Robust Multicategory Support Vector Machines Using Difference Convex Algorithm

Minh Pham, Postdoc Associate, University of Virginia, 1555 Montessori Ter, Charlottesville, VA, 22911, United States, ptuanminh@gmail.com

The Support Vector Machine (SVM) is one of the most popular classification methods in the machinelearning literature. In this paper, we focus on classification in the angle-based framework,which is free of the explicit sum-to-zero constraint, hence more efficient, and propose two robust MSVM methods using truncated hinge loss functions. We show that our new classifiers can enjoy Fisher consistency, and simultaneously alleviate the impact of outliers to achieve more stable classification performance. To implement our proposed classifiers, we employ the difference convex algorithm (DCA) for efficient computation.

3 - Scaling For Training Set Selection In Classification

Walter Dean Bennette, Air Force Research Lab, 7280 Lake View Dr, Ava, NY, 13303, United States, wdbennette@gmail.com

To allow for faster and better predictions from instance based classifiers such as k-Nearest Neighbors, Training Set Selection techniques can be used to intelligently select the classifier's training dataset. However, Training Set Selection techniques are limited in the size of datasets to which they can be practically applied. In this work scaling approaches are introduced that improve the execution time of Training Set Selection techniques. Results show that scaling methods maintain data reduction rates and achieve acceptable levels of accuracy for experimental datasets.

4 - Structure Detection In Mixed Integer Programs

Taghi Khaniyev, PhD Student, University of Waterloo, 200 University Ave., CPH 3669, Waterloo, ON, N2L 3G1, Canada, thanalio@uwaterloo.ca, Samir Elhedhli, Safa F. Erenay

Bordered block diagonal structure in constraint matrices of integer programs lends itself to Dantzig-Wolfe decomposition. We introduce a new measure of goodness to capture desired features in such structures. We then use it to propose a new approach to identify the best structure inherent in the constraint matrix. The main building block of the proposed approach is the use of community detection which alleviates one major drawback of the existing approaches in the literature: predefining the number of blocks. When compared against the state-of-the-art techniques, the proposed algorithm is found to identify very good structures, require shorter CPU time, and lead to comparable dual bounds.

Data Mining in Decision Analytics

Sponsored: Data Mining

Sponsored Session

Chair: Roy Jafari Marandi, Mississippi State University, MD, United States, rj746@msstate.edu

1 - Next-generation Sequencing (NGS) Data Analysis: Developing A Scalable Framework For The Future

Michael Chuang, State University of New York, New Paltz, NY, 12601, United States, mikeychuang@gmail.com

NGS analysis presents a domain for biomedical and information technology professionals to explore. Due to the large amount of data involved and various constraints of technologies, we delineate issues to consider to develop a framework using parallel computing and NoSQL database service to greatly reduce the required time under less infrastructure investments while achieving satisfactory accuracy.

2 - The Magnificent 7- The Killer Data Mining Errors

Samuel Koslowsky, Senior Analytic Consultant, Harte Hanks, 2118 Ave T, Brooklyn, NY, 11229, United States, sam.koslowsky@hartehanks.com

Most managers agree that data mining plays a critical role in assuring a successful marketing campaign. At times, errors can creep in. While analytic and technical errors can certainly harm a data mining exercise, most of the problems that emerge in a modeling project have little to do with technical issues. Rather, basic reasoning, and marketing related issues are at fault. Errors emerge from all phases of an exercise. From establishing an appropriate objective, to allowing sufficient time for completion, to misinterpreting the results to deploying results incorrectly. A good data mining analysis requires qualified personnel, domain knowledge experts, analysts, and IT professionals.

3 - Estimating Distance Decay Functions For Arts & Culture Markets

Young Woong Park, Technical Professor, Southern Methodist University, 6212 Bishop Blvd. Fincher 303, Dallas, TX, 75275, United States, ywpark@smu.edu, Glenn Voss

Distance decay functions capture the effect of distance on interaction intensity. Unlike typical efforts that use distance as a sole independent variable, we estimate a model that uses organizational, market, and demographic characteristics to explain variance across geographic markets. We build the model using transaction data for 7M HHs in 6 geographic markets and investigate characteristics predicting decay function shape and market-level differences. The resulting model can estimate decay functions in the absence of interaction intensity data.

4 - Self Organizing And Error Driven (SOED) Artificial Neural Network For Smarter Classifications

Ruholla Jafari Marandi, Research Assistant, Mississippi State University, Starkville, MS, 39759, United States, rj746@msstate.edu, Mojtaba Khanzadeh, Brian Smith, Linkan Bian

Albeit Artificial Neural networks' high prediction power, the technique suffers from drawbacks such as intransparency. In this paper, motivated by learning styles in human brains, ANN's shortcomings have been assuaged and, its prediction power has also been improved. Self-Organizing Map and Feedforward ANN are hybridized to solidify their benefits and help remove their limitations. The proposed method, which we have named Self-Organizing Error-Driven (SOED) Artificial Neural network, showed significant improvements in comparison with usual ANNs. Through experiencing 5 different datasets, we showed SOED is a more accurate, more reliable and more transparent technique.

Improving Electricity Grid Flexibility Under Uncertainty

Sponsored: Energy, Natural Res & the Environment, Energy I Electricity

Sponsored Session

Chair: Feng Qiu, Argonne National Laboratory, 9700 S. Cass Avenue, Lemont, IL, 60439, United States, fqiu@anl.gov

1 - Enhancing Flexibility Of Power Systems With Intelligent Periphery

Yunhe Hou, University of Hong Kong, yhhou@eee.hku.hk

Flexibility is a critical prerequisite for accommodating large-scale variable renewables before a clean, efficient, reliable, resilient, and responsive smart grid can be established. In this talk, the metrics for assessing flexibility of the systems with large-scale renewable integration will be discussed first. Second, a method for enhancing flexibility, entitled risk-limiting dispatch, will be introduced. Finally, the operating strategies of intelligent periphery with electric springs will be discussed as a powerful tool to enhance flexibility of systems.

2 - Robust Defense Strategy For Gas-electric Systems Against Malicious Attacks

Cheng Wang, Tsinghua University, Beijing, China, wangcheng525525@gmail.com, Wei Wei, Jianhui Wang, Feng Liu, Feng Qiu, Shengwei Mei

This talk proposes a methodology to identify and protect vulnerable components of connected gas and electric infrastructures from malicious attacks, and to guarantee a resilient and flexible operation by deploying valid corrective actions (while accounting for the interdependency of gas pipeline network and power transmission network). The proposed mathematical formulation reduces to a tri-level optimization problem. By reformulating the lower level problem as a mixed integer linear programming , a nested column-and-constraint generation algorithm is developed to solve the min-max-min model. Case studies demonstrate the effectiveness and efficiency of the proposed methodology.

3 - A Study Of Ramp Management And Its Compensation Schemes

Dane Andrew Schiro, ISO New England, Holyoke, MA, United States, dschiro@iso-ne.com, Eugene Litvinov, Tongxin Zheng, Feng Zhao

The integration of renewable generation could make it more difficult for U.S. ISOs to satisfy real-time power balance constraints. This talk will summarize the existing power balance issue, present the current solution of ISO New England, and explore two potentially better solutions: ramp products and multi-period market clearing. Formulations of these new methods will be presented along with discussions of their foreseeable issues. It is hoped that this talk will encourage rigorous investigation into these emerging ideas, thus aiding in future ISO market improvements.

4 - Provide Ramping Service With Wind To Enhance Power System Operational Flexibility

Qin Wang, National Renewable Energy Laboratory (NREL), Golden, CO, United States, qin.wang@nrel.gov, Bri-Mathias Hodge

Maintaining the power system balance requires controllable resources to adjust their power output to match the time-varying net load. This is becoming more challenging when the proportion of generation from variable and uncertain renewable resources in the system is high. This presentation will demonstrate the feasibility and approaches to rely on wind power to provide ramping service in the electricity markets. Advanced wind ramp forecasting methodologies are discussed. In addition, methods on how to quantify power system flexibility enhancement by using wind power to provide ramping service will be presented.

Logistics of Biomass Feedstock for Liquid Fuel Production

Sponsored: Energy, Natural Res & the Environment I Environment & Sustainability

Sponsored Session

Chair: Daniela Gonzales, Texas A & M University, 3014 Jennifer Drive, College Station, TX, 77845, United States, danielasofiagonzales@gmail.com

1 - A Two-Stage Chance-constrained Stochastic Programming Model For a Bio-fuel Supply Chain Network With Uncertain Biomass Supply

Md Abdul Quddus, PhD Student, Mississippi State University, Department of Industrial & Systems Engineering, PO Box 9542, Starkville, MS, 39762, United States, mq90@msstate.edu, Sudipta Chowdhury, Mohammad Marufuzzaman

This study presents a two-stage chance-constrained stochastic programming model that captures the uncertainties due to feedstock seasonality in a bio-fuel supply chain network. The chance constraint ensures that, with a high probability, Municipal Solid Waste (MSW) will be utilized for bio-fuel production. To solve our proposed optimization model, we use a combined sample average approximation algorithm which is made faster by using star-inequalities. We use the state of Mississippi as a test bed to visualize and validate the modeling results. Our computational experiments reveal some insightful results about the impact of MSW utilization on a bio-fuel supply chain network performance.

2 - Optimization Of Large Scale Tennessee Bioenergy Production From Field To Blending Facility

Lixia He-Lambert, University of Tennessee, 2621 Morgan Circle, 310 Morgan Hall, Knoxville, TN, 37996, United States, llamber3@utk.edu, Burton C. English, James Larson, Tun-Hsiang Edward Yu, Bradly Wilson, Oleg Shylo

A large scale spatial-oriented mixed integer linear model was developed to maximize the net present value of the Tennessee switchgrass-based biofuel supply chain. Location of the production of feedstock within each five square-mile hexagon was determined along with the location of candidate preprocessing centers and biorefinaries. Shipping routes from field, and from biorefinary to biorefinary and to blending facilities were determined.

Sequential Stochastic Optimization

Sponsored: Optimization, Optimization Under Uncertainty

Sponsored Session

Chair: Xiangyu Gao, University of Illinois, 04 Transportation Building, 104 S. Mathews Ave, Urbana, IL, 61801, United States, xgao12@illinois.edu

1 - A Transformation Technique For Stochastic Optimization With Decisions Truncated By Random Variables

Xiangyu Gao, UIUC, Urbana, IL, United States, xgao12@illinois.edu, Xin Chen, Zhan Pang

A common technical issue encountered in many operations management models is that decision variables are truncated by some random variables. The challenge arising from this problem is that the objective functions are not convex in the decision variables due to the truncation. To address this challenge, we develop a powerful transformation technique which converts a non-convex minimization problem to an equivalent convex minimization problem. We show that such a transformation enables us to prove the preservation of some desired structural properties,such as convexity, submodularity and L^natural-convexity, under optimization operations.

2 - Stochastic Optimal Control Based Rental Of Production Capacity Under Uncertain Production Requirements

Maurizio Tomasella, University of Edinburgh, Edinburgh, United Kingdom, Maurizio.Tomasella@ed.ac.uk, Artur Korinski

We model and analyse problems related to the optimal rental of manufacturing capacity, when requirements for both demand and product technical specifications evolve stochastically over time. We study a number of variants of business models of capacity rental. Adopting Stochastic Optimal Control based formulations, we derive the optimal closed-form policies that lead to choosing rental solutions with respect to the more established models of full ownership of manufacturing technology. A numerical case example involving high power fiber laser sources, one of the leading technologies in materials processing, shows the applicability of our optimal policies to real production environments.

Recent Advances in Optimization and Related Topics

Sponsored: Optimization, Integer and Discrete Optimization

Sponsored Session

Chair: Sebastian Pokutta, Georgia Institute of Technology, Ferst Dr., Atlanta, GA, 30308, United States, sebastian.pokutta@isye.gatech.edu

1 - Structured Learning Revisited

Daniel Zink, Georgia Institute of Technology, Atlanta, GA, United States, daniel.zink@gatech.edu, Sebastian Pokutta, Gabor Braun

Frank-Wolfe techniques are popular due to their simplicity and more recently Frank-Wolfe algorithms also gained significant traction for online learning. We propose a new algorithm in the setting of online combinatorial optimization, where the underlying feasible region is a 0/1 polytope P (e.g., paths in a graph). We achieve the same regret bounds and convergence rates as Frank-Wolfe techniques both in the online case and offline case, while gaining a significant speed up in computation time. Moreover, our bounds hold in the online structured learning setting, only depending on the l1-diameter of P and independent of its actual (very large) dimension d.

2 - Approximate Hierarchical Clustering Via Lps

Aurko Roy, Georgia Institute of Technology, Atlanta, GA, United States, aurko@gatech.edu, Sebastian Pokutta

We study a cost function for hierarchical clusterings introduced by a recent work of Dasgupta for which a top-down algorithm was given that returns a hierarchical clustering of cost at most O(log1.5 n) times the optimal cost, using the ARV sparsest cut algorithm as a subroutine. We improve this by giving an O(log n)-approximation algorithm for this problem. Our main technical ingredients are a combinatorial characterization of ultrametrics induced by this cost function, deriving an IP formulation for this family of ultrametrics, and showing how to round an LP relaxation of this formulation by using the idea of sphere growing which has been extensively used in the context of graph partitioning.

3 - On The Computational Complexity Of Optimizing Over The Chvatal Closure Of A Polytope

Dabeen Lee, PhD Student, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States, dabeenl@andrew.cmu.edu, Gerard P Cornuejols, Yanjun Li

In this paper, we study the computational complexity of some problems that arise when taking the Chvatal closure of a polyhedron. Given a rational polytope contained in the unit hypercube or a rational simplex that does not contain any integer point, we prove that deciding emptiness of its Chvatal closure is NP-complete. It has two implications; first, it is NP-hard to check whether a given rational polytope contained in the unit hypercube or a rational simplex has Chvatal rank 1; second, the optimization and separation problem over the Chvatal closure of a given rational polytope contained in the unit hypercube or a rational simplex is NP-hard as well.

Disciplined Convex Programming for Nonconvex Problems

Sponsored: Optimization, Computational Optimization and Software

Sponsored Session

Chair: Miles Lubin, Massachusetts Institute of Technology-ORC, MIT, Cambridge, MA, 00000, United States, mlubin@mit.edu

1 - Polyhedral Approximation In Mixed-integer Convex Optimization

Miles Lubin, Massachusetts Institute of Technology, Cambridge, MA, United States, mlubin@mit.edu, Emre Yamangil, Juan Pablo Vielma, Russell Bent

We present recent developments in the polyhedral outer approximation algorithm for mixed-integer convex optimization derived from using disciplined convex programming to automatically generate extended formulations from a user's algebraic input.

2 - Disciplined Convex-concave Programming

Steven Diamond, Stanford University, Stanford, CA, United States, diamond@cs.stanford.edu, Xinyue Shen, Yuantao Gu, Stephen P Boyd

In this talk we introduce disciplined convex-concave programming (DCCP), which combines the ideas of disciplined convex programming (DCP) with convex-concave programming (CCP). Convex-concave programming is an organized heuristic for solving nonconvex problems that involve objective and constraint functions that are a sum of a convex and a concave term. By combining CCP with DCP, we obtain an automated system for applying CCP that correctly handles subtleties such as the domains of functions and nondifferentiability on the boundary of domains. We describe a Python implementation called DCCP, which extends CVXPY.

3 - Outer-approximation Techniques For Mixed-integer Semidefinite Optimization

Christopher Coey, Doctoral Student, Massachusetts Institute of Technology, Cambridge, MA, 02139, United States, coey@mit.edu, Miles Lubin, Emre Yamangil, Juan Pablo Vielma, Russell Bent

We will present an extension of the outer-approximation algorithm in Pajarito for mixed-integer semidefinite optimization problems, and test the new approach with computational experiments.

Facility Location II

Contributed Session

Chair: Jianmai Shi, Associate Professor, National University of Defense Technology, Changsha, 410073, China, jianmaishi@gmail.com

1 - The Maximal Covering Location Problem With Minimization Of Cardinality Of Upper Average

Eric C Blair, PhD Student, University of Florida, Gainesville, FL, 32601, United States, ecblair@ufl.edu, Matthew Norton

We present a reformulation of the Maximal Covering Location Problem (MCLP) using the new concept of Cardinality of Upper Average (CUA). In the MCLP, a fixed number of facilities are located to minimize the number of customers that must travel farther than some maximum desirable distance to the nearest facility. In the new formulation utilizing CUA, the number of customers with the largest travel distances whose average travel distance to the nearest facility is equal to the maximum desirable distance is minimized. The resulting problem is reduced to a mixed-integer linear program. We demonstrate the advantages of the new formulation with a numerical example.

2 - The Optimal Planning Of Electric Vehicle Battery Swapping Network With Fuzzy Customer Satisfaction

Fang Guo, Huazhong University of Science and Technology, 1037 Luoyu Road, Hongshan District, WuHan,, WuHan, 430074, China, fang_guo@hust.edu.cn

Key to the mass adoption of electric vehicles is the establishment of sufficient battery service Infrastructure network based on customer behavior and psychology. We present an EV battery swapping network planning with fuzzy customer satisfaction, which aims to determine the location and service capacity strategy of stations simultaneously with the consideration of customer satisfaction. A heuristic algorithm is proposed to solve the problem. Furthermore, we conduct the parameter analysis when EVs are used in the practice of the City Cluster in the Middle Reaches of the Yangtze River in China.

3 - Logistics Service Network Design For Humanitarian Response In East Africa

Marie-Eve Rancourt, Université du Québec à Montréal, 2920 Chemin de la tour, CIRRELT, Montreal, QC, H3T 1J4, Canada, marie-eve.rancourt@cirrelt.ca, Émilie Dufour, Gilbert Laporte, Julie Paquette

The United Nations Humanitarian Response Depot (UNHRD) is an important humanitarian logistics service provider that manages a network of depots. This research project aims to analyze the potential benefits of adding a regional distribution center in Kampala, Uganda, to its existing network. To this end, we used fieldwork, simulation, optimization and statistical analyses to assess the costs of prepositioning relief items in Kampala and to propose a robust stocking solution. The UNHRD has already started to implement the solution proposed in this study, which should result in a mean cost reduction of around 21%.

4 - Joint Deployment Of Electric Car Charging Stations And Servers On A Road Network

Jianmai Shi, Associate Professor, National University of Defense Technology, Changsha, 410073, China, jianmaishi@gmail.com, Yue Wang, Zhong Liu, Yajie Liu

A joint charging station location and charging piles (servers) configuration problem for electric cars is studied, where the service capacity of the station depends on the number of servers. The problem is an extension of the Flow-Capturing location problem, and an integer programming model is proposed to maximize the overall car flow served, subject to a finite budget. A heuristic algorithm is developed to solve the problem, and the performance of the algorithm is tested by networks with different scales. We finally present a case study based on a practical road network in China.

1 - Exploring Scada Devices And Their Vulnerabilities On The Internet Of Things

Sagar Samtani, The University of Arizona, sagars@email.arizona.edu

Much of modern society is reliant on critical infrastructure. Much of this infrastructure is controlled and managed by Supervisory Control and Data Acquisition (SCADA) systems. Recent years has seen an increase in internet connectivity of SCADA systems. While this has resulted in an increased level of convenience, it has also opened up the possibilities for devastating cyber-attacks. This study demonstrates a data and text mining approach to identify SCADA systems on Internet of Things. We also use state-of-the-art vulnerability assessment techniques to identify the vulnerabilities of these devices. The results of this study indicate that many SCADA vendors are vulnerable to various exploits.

2 - Key Conversation Trends And Patterns About Electronic Cigarettes On Social Media

Wenli Zhang, University of Arizona, Tucson, AZ, United States, wenlizhang@email.arizona.edu, Sudha Ram"

Electronic cigarettes (e-cig) usage has increased exponentially over the last few years and are perceived to be safer alternative to cigarettes use. In order to understand the public health impact of e-cig, a better understanding of population-wise use patterns, perceptions regarding the use and abuse liability of e-cig should be developed. However traditional survey is not adequate to get such information. The research objective of this study is to explore using social media data to identify key conversations, trends, and patterns about the usage of e-cig by using natural language processing, word embedding, topic modeling, content and sentiment analysis, and social network analysis.

3 - Stock Movements Prediction Using Textual And Technical Data

Juxihong Julaiti, The Pennsylvania State University, 445 Waupelani Drive, J01, State College, PA, 16802, United States, juxihongjulaiti1225@gmail.com

Predicting stock movements is one of the most appeal topics for researchers since an accurate predictive enables gain wealth, as well as the rapid progress of data acquisition has made the vast amount of data available. In this paper, we apply different machine learning techniques to predict the daily stock movement. In particular, we use the type, title of news articles of the current day that are related to the interested company from the Wall Street Journal, as well as its stock volume of the day. The result of predicting Google's stock changes indicates big drops or big growths are easier to capture, and the average AUC and accuracy of the Gaussian Naïve Bays are 0.83 and 0.97.

Chair: Feng Qiang, Argonne National Laboratory, 9700 S Cass Avenue, Argonne, IL, 60439, United States, fqiang@anl.gov

1 - Analysis Of The Proximal Quasi Newton Algorithm In Solving Convex Composite Problems

Hiva Ghanbari, Lehigh University, Bethlehem, PA, 18015, United States, hig213@lehigh.edu, Katya Scheinberg

In this work, we analyze the convergence properties of an inexact proximal quasi-Newton algorithm to solve composite optimization problems in the case of strong convexity. We consider solving subproblems to the eps-optimality while an inexact sufficient decrease condition is checked to be satisfied at each iteration. Furthermore, we apply the Nesterov's accelerated scheme to present the accelerated proximal quasi-Newton algorithm. In addition to the theoretical properties of the resulting algorithm, the numerical results will be presented.

2 - Parallel Problem Generation For Nonlinear Programming Problems In Julia

Feng Qiang, Argonne National Laboratory, Lemont, IL, 60439, United States, fqiang@anl.gov, Joseph A Huchette, Miles Lubin, Cosmin Petra

Large scale optimization problems usually have rich structural properties. In this talk, we present StructJuMP, a parallel modeling environment for structured optimization problems. Built as a parallel extension to modelling language JuMP, StructJuMP offers additional syntax to specify blocks of the problems and an MPI-based parallelization of the model generation. We demonstrate StructJuMP capabilities for the specification of power grid optimization problems on an HPC cluster at Argonne National Lab.

3 - Regularized Primal And Dual Methods For Convex Quadratic Programming

Elizabeth Wong, University of California-San Diego, elwong@ucsd.edu

We discuss active-set methods for convex quadratic program with general equality constraints and simple lower bounds on the variables. In the first part of the talk, two methods are proposed, one primal and one dual. In the second part of the talk, a primal-dual method is proposed that solves a sequence of quadratic programs created from the original by simultaneously shifting the simple bound constraints and adding a penalty term to the objective function. Numerical results are presented for the combined primal-dual active-set method.

1 - Risk Prediction On Life Insurance Lapse

Ceni Babaoglu, Dr., Ryerson University, Ryerson University, 350 Victoria Street, Toronto, ON, M5B 2K3, Canada, cenibabaoglu@ryerson.ca, Atakan Erdem, Ayse Bener

Lapse constitutes a material risk for life insurance companies and needs to be controlled and managed carefully. In this project, we study the risk prediction on life insurance lapse of an insurance company. The data that we mine includes demographics, household income, unemployment and geographical information of the clients. We build a model for the prediction of lapse by using machine learning techniques.

2 - Visualization Strategies For Prediction And Classification In Supervised Machine And Statistical Learning

Alexander Engau, Associate Professor, University of Colorado Denver, Denver, CO, United States, aengau@alumni.clemson.edu, Paola Gonzalez

Supervised machine and statistical learning is a key task in data mining and many areas of human decision making including finance, business and industry as well as health care, medicine and bioinformatics. To facilitate a better understanding of current classifiers for prediction whose performances are typically measured and compared only numerically using cross validation, here we present a novel idea for an additional and much more meaningful visualization. We also report its recent use in two financial and medical case studies for substantial new insights into several current state-of-the-art implementations of support vector machines, decision trees, boosting and discriminant analysis.

3 - An Anomaly Detection Algorithm Using Tree-based Phase Space Method

Cheng-Bang Chen, Penn State University, 445 Waupelani Dr., Apt K18, State College, PA, 16801, United States, czc184@psu.edu

The cost of out of control events is usually extremely high, but the anomaly patterns are sometimes hard to detect because of the nonlinear and the high dimensional signal. Current methods focus on single signal source or dimensionality reduction, but it decreases the accuracy and sensitivity. We propose an efficient method to detect the anomaly patterns in high dimensionality accurately, using the q-tree structure for phase space, and a tree structure indexing for the subsequence signals.

4 - Optimal Experimental Design On Non-euclidean Spaces For Active Learning

Hang Li, Pennsylvania State University, University Park, PA, United States, Huli80@psu.edu, Enrique Del Castillo, George Runger

An Active Learning (AL) strategy selects instances to label in order to improve a model with a relatively small number of queries, accelerating learning. In recent years a number of machine learning authors have noticed the similarities between AL used for linear models and the optimal experimental design problem. In this presentation we will discuss optimal experimental design for active learning in curved spaces. A double penalized least squares functions leads to a generalization of the notions of alphabetic optimality in classical optimal design. The impact of these penalization parameters on the designs are discussed. Extensions to other types of non-euclidean spaces will be discussed.

1 - Quay Crane Scheduling Problem With Considering Tidal Impact And Fuel Consumption

Yu Shucheng, Doctor, Shanghai University, Shang Da Road 99, Shanghai 200444, China, Shanghai, 200444, China, yushucheng2007@163.com

This study investigates a quay crane scheduling problem with considering the impact of tides in a port and fuel consumptions of ships. A mixed-integer nonlinear programming model is proposed. Some nonlinear parts in the model are linearized by approximation approaches. For solving the proposed model in large-scale problem instances, both a local branching based solution method and a particle swarm optimization based solution method are developed. Numerical experiments with some real-world like cases are conducted to validate the effectiveness of the proposed model and the efficiency of the proposed solution methods.

2 - A Cross Entropy Approach To The Single Row Facility Layout Problem

Xiu Ning, Tsinghua University, Shunde Building, Room 519A, Beijing, 100084, China, ningx13@mails.tsinghua.edu.cn

The single row facility layout problem (SRFLP) is to arrange a given number of facilities along a straight line so as to minimize the total cost associated with the interactions between the facilities. In this paper, a metaheuristic algorithm based on the cross-entropy (CE) method is developed to solve this problem. To speed up the convergence of the algorithm, we incorporated local search procedures and symmetry breaking techniques with the CE method. The proposed algorithm has been tested using the instances available in the literature. The computational results show that the proposed algorithm can find the best solutions obtained so far for instances with up to 100 facilities.

3 - Coordinated Dynamic Demand Lot Sizing And Delivery Scheduling Problem With Resource Restriction

Rui Liu, PhD, Huazhong University of Science and Technology, Wuhan, 430073, China, rliuhust316@gmail.com, Lin Wang

Coordinated strategy is often used to cut down cost and increase profit in supply chain management. A new coordinated dynamic demand lot sizing and delivery scheduling problem with resource restriction is proposed and formulated. The delivery policy is integrated into coordinated dynamic demand lot sizing problem with resource restriction. In fact, the proposed model is more practical.

4 - Optimal Communication Of Information For Warfighter Benefit

Azar Sadeghnejad, Buffalo, 157 Ranch Trail, Williamsville, NY, 14221, United States, azarsade@buffalo.edu, Michael Hirsch, Hector Juan Ortiz-Pena

There has been a significant increase in the number of sensors deployed to accomplish military missions. These sensors might be on manned or unmanned resources, and might collect quantitative and/or qualitative information important for mission success. Of critical importance for mission success is ensuring that the collected information is routed to the people/systems that need the information for the proper making of decisions. This research mathematically formulates the problem of information routing and collection on a temporally varying communication network, and discusses some heuristics for efficient solutions.

5 - Optimization Of Information Collection And Distribution Across A Limited Communications Network

McKenzie Worden, CUBRC, Inc., 4455 Genesee St., Suite 106, Buffalo, NY, 14225, United States, mckenzie.worden@cubrc.org, Azar Sadeghnejad, Chase Murray, Mark Henry Karwan, Hector Juan Ortiz-Pena

For this problem, we aim to develop a heuristic that defines information collection and exchange between unmanned resources and a control station. Decisions will be made determining the routes of each resource, as well as the areas from which their sensors will collect information. Considering bandwidth and communication range restrictions, the heuristic will determine when collected information will be sent back to the control station. We will also consider scenarios in which resources may send information amongst each other, as relays, prior to the ground station receiving the information.

Health Care, Other I

Contributed Session

Chair: Jingyun Li, Assistant Professor, California State University - Stanislaus, 1 University Circle, Turlock, CA, 95382, United States, jli9@csustan.edu

1 - The Lag In Service Encounter: Indian Healthcare Insurance Context

Sudipendra Nath Roy, Fellow Program in Management, Indian Institute of Management, Indore, Prabandh Shikhar, Rau- Pithampur Road, Indore, 453331, India, f13sudipendrar@iimidr.ac.in, Bhavin J Shah, Hasmukh Gajjar

Indian healthcare service providers primarily operate through third party administrator (TPA) for bill settlement for the services that are covered under a paid medical insurance cover. Patients usually have to wait for more than acceptable time for final settlement because of coordination inefficiencies between TPA and hospital administration. This study explores the potential process improvement to overcome such delays in Indian tertiary hospital setting.

2 - Determinants Of Meaningful Usage Of Health Information Technology

Jingyun Li, Assistant Professor, California State University - Stanislaus, 1 University Circle, Turlock, CA, 95382, United States, jli9@csustan.edu, Indranil R Bardhan, Steves Ring

Meaningful use (MU) is a new, government-funded initiative to improve health care system via adoption and usage of HIT. The first stage of MU focuses on capturing and sharing of electronic patient health information. In this study, we explore the characteristics of hospitals that are likely to be associated with achievement of MU. Using archival, hospital-level data gathered from several sources, we observe that hospitals with greater IT leadership are more likely to achieve meaningful use. We also observe that standalone hospitals are less likely to achieve meaningful use. Our findings indicate that hospitals with greater levels of EMR support are also more likely to achieve meaningful use.

Joint Session MSOM-HC/HAS: Healthcare Operations

Sponsored: Health Applications

Sponsored Session

Chair: Tolga Tezcan, London Business School, Regent's Park, O, London, TX, NW1 4SA, United Kingdom, ttezcan@london.edu

1 - The Role Of Non-clinical Workforce On Patient Service: Evidence From NHS Helpline

Bilal Gokpinar, UCL, London, United Kingdom, b.gokpinar@ucl.ac.uk, Emmanouil Avgerinos

Although non-clinical workers are vital in many healthcare delivery settings, their impact on efficiency and quality of patient service has not been examined in the OM literature. In this study, making use of a novel dataset based on NHS's 111 non-emergency helpline in England, we quantify and demonstrate trade-offs associated with employing non-clinical personnel in delivering patient service. Our results indicate that while non-clinical workforce increases the efficiency of patient service by reducing abandoned calls, it may lead to new inefficiencies through misuse of critical resources (i.e., unnecessary ambulance dispatches) and it may reduce the quality outcome of the patient service.

2 - Physiology-based Anticipative Icu Management

Yasin Ulukus, University of Pittsburgh, yasin.ulukus@gmail.com, Guodong Pang, Andrew J Schaefer, Gilles Clermont

The efficient operation of ICUs is crucial to providing high quality of care while controlling costs. We consider transfer operations from an ICU to a downstream unit. In current practice, downstream beds are requested only when a patient is clinically ready for transfer. We investigate anticipative bed requests that can be made before a patient is clinically ready for transfer, and show that such policy combined with effective use of clinical markers can significantly improve the system performance. We present a Markov Decision Process (MDP) model and solve it via approximations. We further investigate the sensitivity of policy change upon cost parameter estimation errors via robust models.

3 - New Empirical Evidence For The Clinical Effectiveness And Process Implications Of Managing Migraine Care Via Telemedicine: Interim Results

Abraham Seidmann, University of Rochester, Simon Business School, Dir of OR Dept, Rochester, NY, 14627, United States, avi.seidmann@simon.rochester.edu, Balaraman Rajan, Deborah Friedman

Telemedicine has been proved to increase access to patients and reduce travel burden. In the context of an ongoing pilot study of telemedicine for individuals with migraine, we completed in-person baseline assessments and follow-up visits via telemedicine to test the hypothesis that follow-up care delivered by telemedicine is as effective as with in-office visits. We then investigate ways in which telemedicine could add economic value to patients through convenience and better compliance, and benefit specialists through a higher productivity.

4 - Adaptive Monitoring Of Depression Treatment Population: A Data-driven Approach

Ying Lin, University of Washington, linyeliana.ie@gmail.com, Shan Liu, Shuai Huang

30 million Americans use antidepressant medication. Inadequate follow-up monitoring has been identified as a main challenge in managing the depression patient population. We developed a decision support algorithm to create patient-specific adaptive monitoring schedules and dynamically allocate limited sensing resources to detect high risk individuals of severe depression. The proposed method integrates depression trajectory modeling, prognosis, and selective sensing into a unified framework. The effectiveness of the proposed method is demonstrated on a depression treatment population.

1 - Designing an Efficient And Fair Heart Allocation Rule For Transplantation

Farhad Hasankhani, Clemson University, 278 Freeman Hall, Clemson, SC, 29634, United States, fhasank@g.clemson.edu, Amin Khademi

The optimal allocation of limited donated hearts to patients on the waiting list is one of the top priorities in heart transplantation management. To design an efficient and fair system for allocating donor hearts to patients waiting for transplantation, we model the waiting list as a fluid model of overloaded queues. The fluid model is an optimal control problem with vector valued state variable defined as number of patients waiting for transplantation in each class and control variable defined as number of hearts to be allocated to patients of each class.

2 - Cherrypicking Kidneys And Patients: Incentives In Transplant Centers

Mazhar Arikan, University of Kansas, 931 Drum Dr, Lawrence, KS, 66049, United States, mazhararikan@hotmail.com, Baris Ata, Rodney Parker

In 2007 the Centers for Medicare and Medicaid Services implemented a set of regulations for transplant centers. These rules evaluate transplant centers based on one-year patient and organ survival rates post transplantation. Using actual transplant data, we empirically analyze some potential unintended consequences of these regulations such that more risk averse centers choose healthier patients and higher quality organs to transplant.

3 - Modeling Of The United States Liver Allocation System Policy To Reduce Disparity Using Novel Approaches

Sanjay Mehrotra, Northwestern University, mehrotra@northwestern.edu, Vikram Kilambi

We propose and study a DSA-centered linking approach for organ sharing. This approach was tested in and out-of-sample by using different demand generation procedures. We show that, under suitable conditions, the known redistricting and concentric circle approaches for organ sharing are retrievable from our more general modeling framework. We will present results comparing the proposed approach with alternatives.

4 - Redesigning The National Network For Deceased Donor Organ Extraction In The Netherlands

Joris van de Klundert, Erasmus University Rotterdam, vandeklundert@bmg.eur.nl, Kristiaan Michel Glorie, Thije Van Barneveld, Sylvia Elkhuizen, Kirsten Ooms

End Stage Renal Disease is a fatal condition, for which a choice of costly treatment exists. Kidney transplantation is the most cost-effective treatment. In The Netherlands, kidney extraction for transplantation is nationally coordinated to ensure high quality transplantation. This requires responsive deployment of highly specialized teams, which forms a costly service process in itself. In this talk, we consider the present regional structure and operating mode, and consider the problem of finding improved structures and operating procedures. We present results of the simulation analysis, and consider practical requirements taken into account in the implementation which starts in 2017.

Surveillance of Diseases with Big Data

Sponsored: Health Applications

Sponsored Session

Chair: Qingpeng Zhang, City University of Hong Kong, 83 Tat Chee Ave, Kowloon Tong, TX, 00000, Hong Kong, qingpeng.zhang@cityu.edu.hk

1 - Patient-specific Depression Monitoring By Selective Sensing

Ying Lin, University of Washington, linyeliana.ie@gmail.com, Shuai Huang, Shan Liu

Development of personalized health surveillance is enabled by sensing and information technologies. Scaling it up to large scale depression population needs a seamless combination of data analysis and sensing strategy design. We developed a selective sensing method to capture individual depression progressions from acquired health data and optimally allocate sensing resources to high-risk individuals by exploiting the similarities of their progression trajectories. The proposed method can lead to efficient and cost-effective monitoring of depression population.

2 - An Optimization Approach To Concussion Management

Gian Gabriel Garcia, University of Michigan, garciagg@umich.edu, Mariel Sofia Lavieri

We apply data-driven optimization to improve concussion diagnosis for athletes suspected of concussion and apply dynamic programming to solve the sequential decision-making problem of optimal return-to-play management for athletes who have concussions.

3 - Biosurveillance Of Climate Sensitive Mosquito-borne Diseases Using Online Social Media

Kusha Nezafati, University of Texas, Dallas, TX, United States, Kusha.Nezafati@utdallas.edu, Yulia Gel, L. Leticia Ramirez Ramirez

Chikungunya is a mosquito-borne virus that is transmitted by the same type of mosquito as dengue and zika. Chikungunya is relatively well documented in Asia, Africa, and the Indian subcontinent. In 2014 the first confirmed case of chikungunya virus has been reported in the Americas, and since then its spread has been attracting a lot of attention from the health care professionals. However, the data on chikungunya still remain relatively scarce which makes forecasting of its epidemiological curve a very challenging task. In this talk we discuss predictive utility and limitations of online social media, particularly, Google trend, as a proxy for unavailable data on chikungunya.

4 - Semantic Social Network Analysis Of Online Health Communities

Ronghua Xu, City University of Hong Kong, ronghuaxu2-c@my.cityu.edu.hk, Qingpeng Zhang

The understanding of how people use online health communities/groups (OHCs) to discuss health-related topics is critical to the the effective use of social media to provide social support. In this research, we collected a comprehensive dataset of mental health related OHC in China, and developed a set of methods to model and analyze the information spread and semantic patterns of users' discussions. The results unveiled the unique topological features and semantic patterns of mental health related OHCs, with managerial insights of how to utilize OHCs to provide social support to complement conventional offline approaches.

Operations Research in Healthcare Management in Chile

Sponsored: Health Applications

Sponsored Session

Chair: Jorge Vera, Professor, Pontificia Universidad Catolica de Chile, Vicuna Mackenna 4860, Macul, Santiago, 7820436, Chile, jvera@ing.puc.cl

1 - Physiotherapy Treatment Appointments Scheduling Using An MDP-based System

Sergio Maturana, Pontificia Universidad Catolica de Chile, smaturan@ing.puc.cl, Ignacio Lazo

Scheduling physiotherapy treatment appointments in a hospital faced with a very high demand is complex. The current system in a Chilean hospital results in many patients waiting long times before their treatments can begin. This hospital has three types of specialists: a physiatrist and two types of therapist. Before the therapy can begin, patients must see the physiatrist, who indicates the appropriate treatment. We propose a scheduling system, based on a Markov Decision Process (MDP), which determines how to assign the patients to the physiatrist and how to distribute the patient's sessions within a planning horizon in order to reduce waiting times and assure that sessions are evenly spread.

2 - Chemotherapy Treatment Scheduling In Public Health

Juan-Carlos Ferrer, Professor, Pontificia Universidad Catolica de Chile, Santiago, Chile, jferrer@ing.puc.cl

This research addresses a real scheduling problem for chemotherapy patients at a Chilean public Hospital. We divide the problem into two subproblems, scheduling patients on an infinite time horizon and daily patient scheduling. The benefits of both stages are evaluated for a real case in the Hospital s Chemotherapy Unit using simulation in the first stage and solving the model to optimality in the second one. We evaluate potential opportunities for efficiency through a sensitivity analysis of key resources.

3 - A Hierarchical Solution Approach For Bed Capacity Planning Under Uncertainty In The Healthcare Service Industry

Ana Celeste Batista, PhD Candidate, Pontificia Unversidad Catolica de Chile, Santiago, Chile, abatista@uc.cl, Jorge Vera

Effective capacity planning under uncertainty ensures robust and consistent plans in time. The health sector is a service system of great relevance to consider better methods for inter-temporal decisions, since poor planning affects directly the welfare of people. This work presents a hierarchical multistage model applied to beds planning. We propose a solution method based on the formulation and solved using stochastic optimization. The problem is to determine the availability of beds that minimizes overall patient welfare loss as a function of waiting time. From the solution we propose policies allowing better decisions in different planning horizons.

Chair: Tayo Fabusuyi, University of Michigan and Carnegie Mellon University, 5520 Baywood Street, Floor #3, Pittsburgh, PA, 15206, United States, Fabusuyi@umich.edu

1 - Minimizing Customer Waiting Time In A Unit-load Warehouse

Mahmut Tutam, PhD Student, UARK, 1359 N Leverett Avenue, Apt 31, Fayetteville, AR, 72703, United States, mtutam@uark.edu, John A White

Although the number of delivery trucks arriving at a unit-load warehouse per unit time may well be Poisson distributed, the time required to perform rectilinear round-trip travel between the dock and a uniformly distributed point in the storage region is not exponentially distributed. However, it can be approximated using a k-Erlang distribution. Using the Method of Moments, the value of k is determined. The analysis includes one or more docks distributed along one wall of a rectangular-shaped warehouse. The dimensions of the warehouse that minimize customer waiting time are determined for a given storage area.

2 - The Mode Most Traveled: Parking Implications And Policy Responses

Tayo Fabusuyi, University of Michigan and Carnegie Mellon University, 5520 Baywood Street, Floor #3, Pittsburgh, PA, 15206, United States, Fabusuyi@umich.edu, Robert Hampshire, Zhen Qian

Driving to work alone continues to be the travel mode most utilized by commuters. Using the US Census public use microdata sample (PUMS) dataset from the Pacific region of the U.S., we examine why this trend persists by generating travel mode profiles for representative individuals. In addition to the profiles, we examine the marginal effects on travel mode choice for selected explanatory variables at their representative values. The empirical exercise provides insights on the influence policy measures may have in shaping individuals' travel mode preferences and how this will impact on demand for parking spaces.

Information Systems IV

Contributed Session

1 - Information System that Implements Shapley Algorithm For The Evaluation Of The Competitive Value at a Cluster And Enterprise Level

Miguel Jimenez, Information systems and technologies leader, Universidad de la Costa, Barranquilla, 08002, Colombia, mjimenez@fcimec.org, Luis Eduardo Ramirez, Luis Eduardo Ramirez, Lauren Castro, Lauren Castro, Diana Gineth Ramirez-Rios, Orlando Bustamante, Stefanie Cortina, Dionicio Neira, William Manjarres De Avila

Based on the strategic and financial valuation of enterprises that wish to participate in a cluster, we developed an information system that allows the enterprises evaluate their competiive value with or without their participation in the cluster, by implementing Shapley algorithm to solve a cooperative game model for supply chains.

2 - Advertising Competition With Third Party Cookies

Arslan Aziz, Carnegie Mellon University, 5624 Fifth Ave, Apt C16, Pittsburgh, PA, 15232, United States, arslan.aziz7@gmail.com, Rahul Telang

Tracking of online consumer behavior by third party data vendors has become ubiquitous. Data from such tracking is made available to advertisers to help increase the returns from targeting. However, such information may also increase competition among advertisers seeking to target the same consumers. We describe a duopoly model of brand advertisers competing for consumers with uncorrelated brand preferences in a second-price auction. We find the conditions under which availability of third party tracked data might reduce brand surplus by intensifying competition.

1 - Relationship Between R2 And F Statistic In Linear Regression

Nizar Zaarour, Assistant Teaching Professor, Northeastern University, Boston, MA, 02115, United States, n.zaarour@neu.edu, Emanuel Melachrinoudis

There are several misconceptions in interpreting the value of R2 in Regression Analysis. R2 is heavily dependent on the sample size n while outliers may skew its value. In this paper, we comment on these observations and express the relationship between the R2 and the F statistic to derive the range of values of R2 that provide consistent results with the Hypothesis Testing of the slope. This analysis is done by considering the Simple Linear Regression case, where there is only one independent variable k.

2 - Heuristic Search For Good Decisions In Generalized Quadratic Assignment Problems

Steven Orla Kimbrough, Professor, University of Pennsylvania, 103 Bentley Avenue, Bala Cynwyd, PA, 19004, United States, kimbrough@wharton.upenn.edu, Monique Guignard-Spielberg, Frederic H Murphy

We discuss decision sweeping of optimization models, in which we collect a number of judiciously chosen decisions (feasible and infeasible settings of the decision variables) from the larger space of decisions. We focus on the resulting insights, especially with regard to Generalized Quadratic Assignment Problems with soft constraints. In particular, we explore alternative heuristics for generating decisions of interest.

3 - Predicting Urban Blight Using A Data Science Approach

Naveen Kumar, University of Memphis, Memphis, TN, United States, nkumar7@memphis.edu, William J Kettinger, Chen Zhang

The existence of blighted neighborhoods is detrimental to public health, safety, and economic growth of urban areas. Identifying properties where early blight interventions would result in improvement of neighborhoods can have tremendous value to property owners, policymakers, and society. However, understanding urban blight is a complex problem demanding advanced data science. A wide variety of evolving social, economic, and political factors interact with each other causing the problem. We propose to predict blight incidences using data analytics and recommend early interventions to reduce blight incidences in the City of Memphis.

4 - Does Information Transparency Help Retain Customers? Evidence From The Insurance Industry

Zhi Cheng, Temple University, Philadelphia, PA, United States, aaronzhi.cheng@gmail.com, Ting Li, Paul Pavlou

This work investigates whether and how information transparency affects customer churn. Two competing theories predict this effect, price elasticity (that induces churn) and high product informedness (that reduces churn). To address this tension, we use a unique dataset from a major European insurance company to show that customers acquired from channels with higher information transparency (a price comparison website) are less likely to churn than those from lower transparent channels by 3%, implying that information transparency helps reduce customer churn. Our findings suggest managers better allocate resources across channels to reduce churn by considering information transparency.

5 - A Study On Stock Prices Forecasting

Byeong-Yun Chang, Associate Professor, Ajou University, San 5 Woncheon-dong, Yeongtong-gu, Suwon, 443-749, Korea, Republic of, bychang@ajou.ac.kr, Yucong Chen

Stock price forecasting is a very popular issues in nowadays, which can make a contribution to the investing technologies and facilitate those who want to get a better understanding of stocks' trend line in the future so as to make their investment decisions. this research is going to use a modified two stage EWMA and classical method, ARIMA and MAR to do prediction for companies' stock price and electricity. For further work, we are going to propose a hybird model which combine TS-EWMA, ARIMA, and MARS.

Retail Operations I

Sponsored: Manufacturing & Service Oper Mgmt

Sponsored Session

Chair: Jan C Fransoo, Eindhoven University of Technology, Eindhoven, Netherlands, j.c.fransoo@tue.nl

1 - Optimal Channel Choices Of Traditional Retail

Jiwen Ge, PhD Candidate, Eindhoven University of Technology, Eindhoven, Netherlands, j.ge@tue.nl, Dorothee Honhon, Jan C Fransoo, Lei Zhao

Nanostores are small retail stores which are prevalent in the mega-cities of emerging markets. We consider one CPG manufacturer selling one product to a cluster of nanostores either via the wholesale or the direct channel. We provide optimality conditions for each channel strategy when market demand is constant or grows deterministically within a finite time horizon.

2 - Coordinated Delivery To Nanostores In Megacities

Ruidian Song, Tsinghua University, Beijing, 100084, China, srd13@mails.tsinghua.edu.cn, Lei Zhao, Jan C Fransoo, Tom Van Woensel

In megacities in emerging economies, there exists a large amount of independently operated, traditional format, small grocery stores (nanostores). The limitation in store space and cash flow force them to order frequently with small order sizes, which results in high delivery cost. We study potential strategies to coordinate these deliveries and examine their impact.

3 - Demand Estimation Under Multi-store Multi-product Substitution In High Density Traditional Retail

Tianhu Deng, Tsinghua University, Beijing, China, deng13@tsinghua.edu.cn, Mingchao Wan, Lei Zhao, Jan C Fransoo

In large cities in emerging economies, traditional retail is present in a very high density, with multiple independently owned small stores in each city block. Consequently, when faced with a stockout, consumers may not only substitute with a different product in the same store, but also switch to a neighboring store. We study this problem using both Nested Logit Model and Exogenous Model. Furthermore, we estimate the parameters of the two models using a Markov chain Monte Carlo algorithm in a Bayesian manner. We numerically find that the Nested Logit model outperforms the Exogenous Substitution model in estimating substitution probabilities.

4 - A Structural Estimation Model Based On Socioeconomic Variables To Analyze The Evolution Of Retail Channels

Jan C Fransoo, Eindhoven University of Technology, School of Industrial Engineering, P.O. Box 513 Pav F4, Eindhoven, NL-5600MB, Netherlands, j.c.fransoo@tue.nl, Christopher Mejía-Argueta

Despite the prediction of many researchers that nanostores in the traditional retail channel would disappear, they continue to serve most of the world's population. We develop a structural estimation model to analyze current and future choice of clients among supermarkets, convenience stores and nanostores considering socioeconomic variables. Using data from two Latin American cities, we show that channel switching behavior is explained primarily by population density, income level, and the growth of stores. Furthermore, there are important reasons why nanostores will continue to retain their position as the largest retailing channel in big cities with large income differences.

2 - Sector, Industry, Firm, And Year Influence On Environmental Management Practice Adoption

Rick Hardcopf, University of Minnesota, 321 19th Avenue South, Minneapolis, MN, 55455, United States, hardc001@umn.edu, Rachna Shah, Ujjal Kumar Mukherjee

Firms take deliberate actions to reduce the impact of their operations, or supply chain, on the natural environment. While adoption of these practices has increased steadily over the years, firms within a common sector or industry vary greatly in their propensity to adopt. In this study, we use a novel secondary dataset to evaluate the relative influence of time, firm attributes, industry membership and sector participation in explaining heterogeneity in adoption across firms. We also evaluate several individual firm and industry characteristics to determine which specific aspects of the firm and industry are responsible for the variance explanation provided by the macro categories.

3 - Promoting Consumer Recycling: Effects Of EPR Legislation And Regional Traits

Erin Cassandra McKie, PhD Candidate, University of South Carolina, 1014 Greene Street, Columbia, SC, 29212, United States, erin.mckie@grad.moore.sc.edu, Mark Ferguson, Michael Galbreth

We will present results from consumer surveys about e-waste legislation from U.S. states that have different versions of e-waste legislation as well as from states with no e-waste legislation. Our findings indicate differences in customer awareness of e-waste policies and how they dispose of end-of-use electronic products.

Systemic Issues in Healthcare and Humanitarian Logsitics

Sponsored: Manufacturing & Service Oper Mgmt, Healthcare Operations

Sponsored Session

Chair: Jonathan Helm, Indiana University, 1309 E. 10th St, Bloomington, IN, 47401, United States, helmj@indiana.edu

Co-Chair: Alex Mills, Indiana University - Bloomington, Bloomington, IN, United States, millsaf@indiana.edu

1 - Inventory Dispersion, Stock Mobilizing Speed And Fortification In Humanitarian Operations

Shabnam Rezapoor, PhD Candidate, University of Oklahoma, Norman, OK, United States, shabnam_rezapoor@yahoo.com, Reza Zanjiranifarahani, Alfonso Pedraza-Martinez

We study the impact of joint decisions of locating relief stockpiles and identifying amount of pre-positioned inventory on humanitarian logistics. We explore how pre-positioning inventory quantity can be reduced in relief networks. By using analytical and numerical methods we investigate the effect of inventory dispersion, stock mobilizing speed, and stock fortification on amount of the required inventory. Due to uncertainty in demand location, a scenario-based modeling approach based on graph and network concepts is used. Then, the findings are tested on a case problem in Florida including 18 regions facing hurricane and the related insights and observations are extracted.

2 - Surge Capacity Deployment In Hospitals: Preparation, Response, Recovery, And Mitigation

Alex Mills, Indiana University, Bloomington, IN, United States, millsaf@indiana.edu, Yu Wang

Major hospitals often experience demand surges, requiring a rapid increase in capacity. While practitioners deploy several different actions to respond to surges, mitigative actions are often ignored. We show that both response and mitigation can be improved using ideas found in Operations Management, and we suggest specific operational improvements based on hospital characteristics.

3 - Malaria Treatment Distribution In Developing World Health Systems And Application To Malawi

Jonathan Helm, Indiana Universtiy, helmj@indiana.edu

Efficient medication distribution is key in the fight against malaria in developing countries with severe resource constraints. We propose a new transshipment methodology by integrating a tactical 2-stage stochastic program with an optimal operational policy derived from a MDP model. We design a decomposition strategy that enables a tractable solution for the entire country, including government 290 centers. Our approach is shown to be robust to challenges of developing countries, including slow paper-based inventory review, uncertain transportation infrastructure, the need for equitable distribution, and seasonal and correlated demand associated with malaria transmission dynamics.

4 - Healthcare Inventory Management In The Presence Of Supply Disruption And A Reliable Alternative Supply Channel

Erhun Kundakcioglu, Ozyegin University, Faculty of Engineering, Istanbul, Turkey, erhun.kundakcioglu@ozyegin.edu.tr

In this study, we investigate the inventory review policy for a healthcare facility to minimize the impact of inevitable drug shortages when an alternative reliable supplier is present. A continuous-time stochastic process is used to calculate optimal inventory levels for the primary (unreliable) and secondary (reliable but costly) suppliers. We present optimal strategies for tractable instances, provide insights through supervised learning tools, and highlight how these results can be generalized. In particular, we provide business rules for inventory managers that would simultaneously minimize average inventory and secondary supplier usage.

1 - Near-optimal Matching For Real-time Ridesharing

Erhun Ozkan, University of Southern California, Los Angeles, CA, United States, erhunozkan@gmail.com, Amy R Ward

Participants in real-time ridesharing services such as Uber, Lyft, etc. arrive stochastically over time and must be matched. One common heuristic myopically matches an arriving customer to the closest available driver. However, that heuristic does not account for differences in arrival rates across locations. We propose a linear programming based heuristic that does account for such differences, and prove it is asymptotically optimal in ridesharing systems with high volumes of demand, under the condition that drivers are in some sense "scarce".

2 - Product Support Forums: Customers As Partners In The Service Delivery

Konstantinos Stouras, INSEAD, konstantinos.stouras@insead.edu, Serguei Netessine, Karan Girotra

Online product support forums where customers can post complaints and questions, or report issues about a product or service of a firm abound. A large number of companies choose to crowdsource their product and service support back to their customers, employing a few dedicated service operators. We characterize the equilibrium behavior of such a novel business model for service and compare it with a call center model.

3 - Pricing And Optimization In Shared-Vehicle Systems

Siddhartha Banerjee, Cornell University, sbanerjee@cornell.edu

We propose a framework for data-driven pricing in shared vehicle systems in which customers can pick up and drop off vehicles in different locations. Compared to traditional pricing problems, pricing in shared vehicle systems is more challenging due to network externalities, wherein setting prices at one demand node may affect the supply at all other nodes in the network. Our framework provides efficient algorithms with rigorous approximation guarantees for a wide class of objective functions (including welfare and revenue, and also multi-objective problems such as Ramsey pricing), and under a variety of constraints on the prices. We achieve our guarantees by first projecting the problem to an infinite-supply setting, deriving optimal prices in this limit, and then bounding the performance of these prices in the finite-vehicle system; this technique may be of independent interest since it applies even more generally than the pricing problems that we consider.

4 - Managing Queues With A Self-scheduling Capacity

Rouba Ibrahim, University College London, rouba.ibrahim@ucl.ac.uk

Randomness in the number of servers often arises in practice, e.g., in virtual call centres with self-scheduling agents. We study the problem of staffing queueing systems with a random number of servers and impatient and costly customers. We characterize the optimal staffing policy and formulate related insights.

1 - Analysis Of World Baseball Softball Confederation Premier 12 Schedule

Seong Dae Kim, Associate Professor, University of Alaska Anchorage, 3211 Providence Drive, University Center, Room 155, Anchorage, AK, 99508, United States, sdkim2@uaa.alaska.edu, J.C. Kim

World Baseball Softball Confederation (WBSC) created the Premier12 tournament featuring the twelve best-ranked national baseball teams in the world. The first tournament was held in Taiwan and Japan in 2015. Questions were raised about the fairness of factors that can affect the team performance and the game result. This study analyzes the game schedule and other factors that might have unfairly affected the tournament and propose a better balanced schedule by formulating it as an OR problem. This study also discusses on what could have been done differently do make the tournament more successful.

2 - The Role Of Offensive System In The NBA Draft

Ryan Chen, Stanford University, 227 Ayrshire Farm Lane, Apt. 301B, Stanford, CA, 94305, United States, rdchen@stanford.edu, Eli Shayer, Travis Chen, Nicholas Canova

NBA teams look for every possible tool to help them decide which players to draft each year, avoiding "bust" players who perform much worse than expected and seeking out star players to become cornerstones of great teams. We propose an addition to this set of tools, using data describing the draft prospects' collegiate offensive systems to understand why players tend to outperform or underperform relative to their expected draft position and associated Win Shares. Our key contribution is a cluster analysis that shows the offensive play type distributions associated with star and bust players at each of the 5 on-court positions.

3 - Using Past Scores And Regularization To Create A Winning NFL Betting Model

Eric Webb, Kelley School of Business, Indiana University, Bloomington, IN, 47404, United States, ermwebb@indiana.edu, Wayne L Winston

Is the National Football League betting market efficient? We have devised a profitable betting model that would win 52.7% of the 7,705 bets against the spread it would have made over 34 seasons. Scores from previous weeks are used to estimate the point value of each team's offense and defense. These values predict next week's scores, and a bet is placed against the advertised spread. The sum of squares of offensive/defensive point values are constrained to be less than a regularization constant.

4 - An Optimal Pacing Strategy For Ultramarathons

Kristopher Pruitt, Associate Professor, United States Air Force Academy, 2354 Fairchild Dr, Ste 6D222, USAFA, CO, 80840, United States, kristopher.pruitt@gmail.com, Justin Hill

We present an optimization model designed to prescribe ideal pacing and nutrition strategies for athletes competing in ultramarathon races. The mixed-integer nonlinear program determines the level-of-effort and carbohydrate intake for the athlete during each kilometer in order to minimize the total completion time subject to the altitude, terrain, and distance of the race, as well as the fitness of the athlete. Our presentation includes modeling techniques required to linearize the problem and a numerical case study.

Chair: Vandit Shah, California State University - Fullerton, Fullerton, CA, United States, vandit_2293@csu.fullerton.edu

1 - Geography Still Matters: Examine The Role Of Location In Online Markets For Foreign Branded Products

Xia Zhao, Associate Professor, University of North Carolina at Greensboro, 479 Bryan Building, PO Box 26170, Greensboro, NC, 27402, United States, x_zhao3@uncg.edu, Kexin Zhao, Jing Deng

Internet technologies and e-commerce have significantly reduced communication costs and facilitated trade between distant parties. Conventional wisdom holds that the world becomes flat and geographic divisions are gradually irrelevant. This study investigates whether and how geographic location affects online sellers' pricing strategies and sales for foreign branded products using a large data set collected from a brand owner's website and an e-commerce retail platform. Our research provides empirical evidences that origin bias exists and geography still matters in the online platform.

2 - Value For Money Assessment Using Fuzzy Logic

Deepak Kanhaiyalal Sharma, Assistant Professor, California State University - Fullerton, 800 N State College Blvd, Dept. of Civil & Environmental Eng., Fullerton, CA, 92831, United States, dsharma@fullerton.edu, Baig Jufain Mirza

Value for Money (VfM) assessment is the gateway analysis for adopting the Public Private Partnerships (PPPs) for project delivery. Review shows that PPPs have evolved significantly but the VfM assessment has remained almost unchanged. Throughout the world, practitioners and researchers have voiced their concerns about the limitations of VfM assessment. Fuzzy Logic (FL) enables decision makers to assign degrees of truthfulness on the basis of "awareness" of the qualitative part of VfM and getting a single comprehensive VfM result. Using a case study this research also presents use of fuzzy decision analysis tools to supplement the existing VfM practice.

3 - Decision Science Tools For Value For Money (vfm) Analysis

Deepak Kanhaiyalal Sharma, California State University - Fullerton, 800 N State College Blvd, Dept. of Civil & Environmental Eng., Fullerton, CA, 92831, United States, dsharma@fullerton.edu, Vandit Shah, Baig Mirza

Value for Money (VfM) assessment is the gateway analysis that allows use of Public Private Partnerships (PPPs) for project delivery. Review shows that PPPs have evolved significantly but the VfM assessment has remained almost unchanged, mandating enhancement of the process. This research presents application of Bayesian Networks (BN), Fuzzy Logic (FL) and Data Envelopment Analysis (DEA) to supplement the VfM by seamlessly integrating the qualitative and quantitative results of the assessment. A case study has been included to demonstrate the application of these methods along with advantages and disadvantages of each method.

4 - Contracting For Services In Multiple Industries: An Empirical Analysis

Yuan Ye, PhD Candidate, University of Houston, 4800 Calhoun Rd, Houston, TX, 77004, United States, yye@bauer.uh.edu, David Xiaosong Peng

Service contracting is a prevalent business practice to reduce costs, improve quality, access external knowledge and enhance innovation. Yet, many services are highly specialized or unique, making service contracting a challenge for both the buyer and the supplier. Based on the strategic sourcing processing, we develop an empirical study to investigate the practices in service contracting. We intend to benchmark the practices in different industries (e.g., healthcare, oil and gas, and manufacturing) and identify the best practices that drive success outcomes in service contracting.

5 - Factors Affecting Public Private Partnership Acceptance

Vandit Shah, California State University, Fullerton, Fullerton, CA, United States, vandit_2293@csu.fullerton.edu, Deepak Kanhaiyalal Sharma

Many highway projects have been successfully implemented as Public Private Partnership (PPP) projects. The PPP projects, also known as toll roads, have been beneficial to the public but have received varying level of acceptance across the US. This research focuses on identifying the factors that differentiates the US States on the basis of PPP acceptance. We have used Principal Component Analysis (PCA) to identify education, gender, congestion (traffic volume) and daily vehicle mile traveled as the most influential factors influencing PPP acceptance. The results of this research will be useful for agencies to develop outreach programs for better PPP project implementation.

On-demand Service Platforms

Sponsored: Manufacturing & Service Oper Mgmt, Service Operations

Sponsored Session

Chair: Itai Gurvich, Kellogg School of Management, Northwestern University, Evanston, IL, 60208, United States, i-gurvich@kellogg.northwestern.edu

1 - On-demand Service Platforms

Terry Taylor, University of California - Berkeley, Berkeley, CA, 94720, United States, taylor@haas.berkeley.edu

An on-demand service platform (e.g., Uber, Instacart) connects waiting-time sensitive customers with independent service providers. This paper characterizes how two defining features of an on-demand service platform – congestion-driven delay and service provider independence—impact the platform's optimal per-service price and wage.

2 - The Efficacy Of Incentives In Scaling Up Marketplaces

Ashish Kabra, INSEAD, Boulevard de constance, Fontainebleau, 77305, France, ashish.kabra@insead.edu, Elena Belavina, Karan Girotra

Marketplaces spend billions in incentives to achieve scale, which is key to the efficacy and survival of marketplaces. Using detailed transaction data from a leading transportation marketplace, we estimate and compare the effects of incentives given to the "buyer" side and "seller" side of the marketplace as well as the effect of threshold and linear incentives.

3 - Labor Welfare In The Sharing Economy

Guangwen Kong, University of Minnesota, Minneapolis, MN, United States, gkong@umn.edu, Saif Benjaafar, Jian-Ya Ding, Terry Taylor

We consider an online service platform that relies on a self-employed and self-scheduled workforce to provide a service. Workers vary in their availability and their valuation of their time. The platform decides on wages and prices. We examine the resulting labor profile and labor surplus.

4 - Perception Of Dynamic Pricing In On-Demand Services

Nil Karacaoglu, Northwestern University, Kellogg, Evanston, IL, United States, n-karacaoglu@kellogg.northwestern.edu, Antonio Moreno-Garcia

Ride-sharing services such as Uber and Lyft adjust their prices using opaque dynamic-pricing algorithms that take demand and supply into account. In this research, we focus on how customers perceive and react to nontransparent dynamic pricing practices in ride-sharing services.

Sustainable Operations for Farmers

Sponsored: Manufacturing & Service Oper Mgmt, Supply Chain

Sponsored Session

Chair: Ming Hu, University of Toronto, Toronto, ON, Canada, ming.hu@rotman.utoronto.ca

1 - Distressed Selling By Farmers: Model And Analysis

Shivam Gupta, University of Texas-Dallas, sxg104920@utdallas.edu, Milind Dawande, Ganesh Janakiraman, Ashutosh Sarkar

In many developing countries, farmers sell a significant portion of their produce at prices much lower than the support price offered by the government. Using a dynamic programming model, we identify a near optimal policy to quantify distressed sales and show that the model predictions are reasonably accurate using real data.

2 - Knowledge Sharing And Learning Among Smallholders In Developing Economies: Implications, Incentives, And Reward Mechanisms

Shihong Xiao, HKUST, Hong Kong, Hong Kong, sxiaoab@connect.ust.hk, Ying-Ju Chen, Christopher S Tang

NGOs and governments are advocating knowledge sharing and learning platforms to improve smallholders' productivity. Putting altruism aside, we examine the economic implications for heterogeneous farmers to share their private farming knowledge voluntarily with other farmers under competition. By analyzing a multi-person sequential game, we provide a plausible reason for farmers' sharing motivation. We find that the voluntary knowledge shared level is always lower than or equal to the "first best" knowledge shared level. Upon examining different mechanisms, we establish a quota-based reward mechanism that can entice farmers to share their knowledge up to the first-best level voluntarily.

3 - Altruistic Rationality: The Value Of Strategic Farmers And Social Entrepreneurs In Crop Planting Decisions In Developing Economies

Wenbin Wang, Shanghai University of Finance and Economics, Shanghai, China, wang.wenbin@shufe.edu.cn, Ming Hu, Yan Liu

We study how farmers make crop-planting decisions over time. We consider both strategic farmers who rationally anticipate the near-future crop prices as a basis for making planting decisions, and naïve farmers who shortsightedly react to recent prices. The latter behavior may cause recurring over- or under-production which leads to price fluctuations. We examine the roles of the strategic farmers and social entrepreneurs in influencing the farmers' crop-planting decisions and stabilizing the market price. Surprisingly, we find the self-serving behaviors from a tiny amount of strategic farmers may be enough to reduce price volatility and benefit all the farmers.

Chair: Mostafa Hasan, Research Assistant, Wichita State University, 1629 N Fairmount St, Wichita, KS, 67208, United States, mhasann16@yahoo.com

1 - A System Dynamic Approach For Risk Assessment Of Lyme Disease – A Case Study At Binghamton University Campus In Broome County, New York State

Nasser Sharareh, PhD, Binghamton University, 4400 Vestal Parkway East, Binghamton, NY, 13902, United States, nsharar1@binghamton.edu, Nasim Sabounchi, Amanda Roome, Ralph Garruto

Our objective in this paper is to develop a risk assessment framework of Lyme disease that includes the pathogen, reservoir, vector and environmental factors as well as social, behavioral and demographic risk factors. System Dynamics modeling has been used to develop a simulation tool to evaluate significance of different risk factors on the Binghamton University campus in replicating the historical trend of Lyme disease cases. The data for human behavioral risk, pathway risk, and tick density and infectivity have been gathered by direct observation and laboratory analysis. The model provides recommendations for preventive strategies and control of tick population growth.

2 - Modeling Medical Overpayments Using Truncated Distributions

Babak Zafari, Babson College, Babson, MA, United States, zafari.babak@gmail.com

In this work, we explore some new methods used in overpayment extrapolations and compare their performance to existing models.

3 - Procurement Models For Clinical Supplies: Indian Context

Bhavin J Shah, Associate Professor, Indian Institute of Management, Indore, Faculty Office # C-206, First Floor,, Prabandh Shikhar, Rau-Pithampur Road,, Indore - Madhya Pradesh, 453556, India, bhavinj@iimidr.ac.in, Hasmukh Gajjar

This paper seeks to understand and explore applications of procurement models followed in sourcing clinical supplies to reduce cost of healthcare in Indian hospitals. It aims at improving efficiency of healthcare delivery without sacrificing service levels and explore various alternatives such as forming cross-functional collaborative teams comprising clinicians and sourcing experts for operational improvements.

4 - A Multiple Criteria Decision Tree Algorithm For Selecting Breast Cancer Treatment

Mostafa Hasan, Research Assistant, Wichita State University, 1629 N Fairmount St, Wichita, KS, 67208, United States, mhasann16@yahoo.com, Esra Buyuktahtakin, Elshami Elamin

According to the American Cancer Society, 246,660 new cases will be diagnosed with invasive breast cancer and approximately 40,450 women will die in the United States in 2016. To deal with the complexity, a decision support system is proposed combining MCDM techniques and decision trees. We then propose a detailed algorithm which will evaluate each factor and condition of the breast cancer patients in order to determine the best treatment alternatives.

Chair: Seyedali Mirzapour, PhD Student, Wichita State University, 1845 Fairmount St., Wichita, KS, 67260, United States, mirzapour.ie@gmail.com

1 - Modeling And Performance Evaluation Of Bernoulli Transfer Lines With Batch Processors

Feiyi Yan, Northwestern Polytechnical University, 127 West Youyi Road, Xi’an, China, pacpos.fyyan@gmail.com, Jun-Qiang Wang

This paper focuses on analytical methods for performance evaluation of transfer lines with Bernoulli unreliable batch processors and finite buffers. Each machine has a limited capacity to process a batch of parts simultaneously. Three different analytical models of production lines with two batch processors are established. The modulo n congruence class theory is introduced to depict the system state of the Markov chain and to prove the ergodicity condition. An aggregation method is proposed to analyze a general Bernoulli transfer lines. Numerical experiments are conducted to verify the accuracy of the proposed methods. The impact of machine capacity on system performance is analyzed.

2 - A New Relaxation Method For Mathematical Program With Complementarity Constraint

Tangi Migot, IRMAR-INSA, Rennes, France, tangi.migot@gmail.com, Jean-Pierre Dussault, Mounir Haddou

p { margin-bottom: 0.25cm; line-height: 120%; } Recent progress on optimality conditions for MPCC allows to build efficient relaxation methods starting from Kadrani et al. in 2009. We will present an overview on these methods and discuss both the properties of the sequence of non-linear program (NLP) generated by these algorithms and the weakest conditions needed to ensure convergence of the methods. We will also present a new method with improved properties on the sequence of NLP, which provides a certificate when the method converges to undesirable points. We run a numerical comparison of these methods on a large number of test problems.

3 - Leaf Trajectory Optimization For Dynamic Delivery Of Intensity-modulated Radiotherapy Plans

Seyedali Mirzapour, PhD Student, Wichita State University, 1845 Fairmount St., Wichita, KS, 67260, United States, mirzapour.ie@gmail.com, Ehsan Salari

In intensity-modulated radiotherapy, a multi-leaf collimator (MLC) consisting of rows of paired leaves, is used to dynamically modulate the shape and intensity of radiation beams. Traditionally, unidirectional leaf sweeping schemes have been considered for dynamic beam modulation. In this research, we investigate the potential gain in plan quality and efficiency obtained from allowing for a free movement of MLC leaves.

1 - The Magician’s Shuffle: Re-using Lottery Numbers For School Seat Redistribution

Irene Yuan Lo, Columbia University, New York, NY, United States, iyl2104@columbia.edu, Itai Feigenbaum, Yashodhan Kanoria, Jay Sethuraman

We consider a dynamic model of the school choice problem, where students are given an initial allocation, learn the value of their outside option, and are then given a final allocation based on their updated preferences. The goal is to obtain an efficient final allocation that is individually rational with respect to the initial allocation and minimizes student movement. We propose a family of mechanisms that are fair, efficient, two-round strategy-proof and individually rational. We show that when a natural ‘order’ condition is satisfied, all these mechanisms produce equivalent final allocations, and that the mechanism that reverses student lotteries between rounds minimizes student movement.

2 - Promotional Campaigns Under Social Learning

Ehsan Valavi, Columbia University, New York, NY, 30332-0205, United States, valavi19@gsb.columbia.edu, Costis Maglaras

We study some promotional pricing heuristics in settings where consumers get informed about a product through a product reviews via a social learning mechanism.

3 - The Strange Case Of Privacy In Equilibrium Models

Rachel Cummings, California Institute of Technology, 1200 E California Blvd, MC 305-16, Pasadena, CA, 91125, United States, rachelc@caltech.edu

We study how privacy technologies affect user and advertiser behavior in a simple economic model of targeted advertising. In our model, a consumer first decides whether or not to buy a good, and then an advertiser chooses an ad to show her. The advertiser would like to use information about the consumer’s purchase decision to target the ad that he shows, but he is given only a differentially private signal about the consumer’s behavior. We study equilibrium behavior as a function of the privacy level and show that this behavior can be highly counter-intuitive. The effect of adding privacy in equilibrium can be completely different from what we would expect if we ignored equilibrium incentives.

4 - Delay-predictability Tradeoffs In Reaching A Secret Goal

Kuang Xu, Stanford University, Stanford, CA, United States, kuangxu@stanford.edu, John N. Tsitsiklis

We formulate a model of dynamic decision-making to study an agent’s predictability as she attempts to reach a final goal through a sequence of intermediate actions, while watched by an adversary who tries to predict the goal before it is reached. We are motivated by the increasing ubiquity of large-scale data collection infrastructures capable of predicting an agent’s intentions and future actions, in juxtaposition with an agent’s desire for privacy. We show the predictability of the agent’s goal can be made inversely proportional to the time she spends reaching it, and that this is the best possible. This characterization does not depend on the structure of the agent’s state space beyond the diameter.

Queues with Correlations

Sponsored: Applied Probability

Sponsored Session

Chair: Ohad Perry, Northwestern University - Evanston, Evanston, IL, United States, ohad.perry@northwestern.edu

1 - The Impact Of Delays On Service Times In The Intensive Care Unit

Carri Chan, Columbia Business School, cwchan@columbia.edu

Most queueing models used to model healthcare delivery ignore the effects of delay experienced by patients awaiting care. We empirically verify that delays in time-to-treatment can increase a patient’s service requirement. We then propose a queueing model which incorporates these measured delay effects and approximation the expected work in the system when the service time of a job is adversely impacted by the delay experienced by that job. Our approximation demonstrates that work grows much faster than the traditional $1/(1 - \ )$ relationship seen in most queueing systems. As such, ignoring this effect of delay could have dire operational consequences.

2 - The Impact Of Dependence On Unobservable Queues

Jamol Pender, Cornell University, jamol.pender@gmail.com

In unobservable queueing systems, customers may choose to leave by balking, which is based on the queue length or they may leave by reneging from the queue, which is based on the virtual waiting time. The current literature assumes that the sequences of balking and reneging random variables are independent and a customer's decision to join the line is independent of the their willingness to wait. Thus, we relax the independence assumption and assess the impact of dependence. We show that the joint density near the origin and not the correlation of the balking and reneging random variables describes the impact of the dependence for the queue length and workload processes.

3 - Service Systems With Correlated Service And Patience Times

Chenguang Wu, Northwestern University, ChenguangWu2013@u.northwestern.edu

In most of the literature on service systems, a customer's patience time is typically assumed to be independent of her service time. However, in many settings one expects a customer's service and patience times to be related, as is empirically reported in call centers and intensive care units. In our work we capture the correlation in a many-server queuing model and explore the implications of the correlation on capacity decisions to maximize profit. The profit in our case is the difference between revenue generated by serving customers and personnel cost associated with capacity. We demonstrate a nontrivial relation between capacity and profit in a system with correlations.

4 - Service Systems With Slowdowns

Jing Dong, Northwestern University, jing.dong@northwestern.edu, Pnina Feldman, Galit Yom-Tov

Many service systems exhibit service slowdowns when the system is congested. In this project we investigate this phenomenon and its effect on system performance. We modify the Erlang-A model to account for service slowdowns and carry out the performance analysis in the heavy-traffic asymptotic regime. We find that when the load sensitivity is high, the system can alternate randomly between two performance regimes, a phenomenon which we refer to as bi-stability. We analyze how the system parameters affect the bi-stability phenomenon and propose an admission control policy to avoid the bad performance regime.

Topics in Portfolio Optimization

Sponsored: Financial Services

Sponsored Session

Chair: Brian Clark, Rensselaer Polytechnic Institute, Lally School of Management, Troy, NY, 12180, United States, clarkb2@rpi.edu

1 - The Implicit Value Of Tracking The Market

Majeed Simaan, Rensselaer Polytechnic Institute, Troy, NY, 12180, United States, simaam@rpi.edu, Chanaka Edirisinghe, Brian Clark

We find that the bias of the tracking error portfolio is mainly due to the mean-variance portfolio rather than the tracking error component. We find that shifting the weights of the portfolio toward the tracking error direction mitigates the higher estimation error that originates in the mean vector. Using bootstrap approach, we find that the committed estimation risk in the tracking error portfolio is significantly lower than that committed in the mean-variance portfolio. Additionally, this difference is amplified for cases that are associated with greater estimation risk.

2 - Optimal Portfolio Rebalancing Under Mean-risk Tradeoff, Market Impact, And Leverage

Jaehwan Jeong, Radford University, Department of Management, P.O. Box 6954, Radford, VA, 24142, United States, jjeong5@radford.edu, Chanaka Edirisinghe

A portfolio optimization problem is considered with frequent rebalancing, market impact costs, and random returns, to determine the efficient frontier between the Sharpe ratio and leverage ratio. Using an upper bound for portfolio variance, a nonconvex separable quadratic optimization model with two quadratic constraints is formulated. We develop an algorithm to solve this NP-hard problem and provide a strategy analysis.

3 - Disentangle Signals And Noises In Portfolio Optimization

Long Zhao, University of Texas at Austin, Austin, TX, United States, zhaolong.soul@gmail.com, Deepayan Chakrabarti, Kumar Muthuraman

Mean-variance portfolios constructed using the sample mean and covariance have a poor out-of-sample performance. There are two groups are better. The first group shrinks the covariance. The second imposes norm-constraints. However, the shrinkage targets and the norm-constraints are not validated. Our method disentangles signals and noises in sample covariance matrix. By using signals and bounding noises, this new method is parameter-free but can achieve significant lower out-of-sample variance than the naive portfolios across ten datasets. Finally, we show that the higher out-of-sample Sharpe ratio can be obtained by cautiously using the information in sample mean.

Strategic Behavior and Dynamic Choice in Revenue Management

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Jue Wang, Queen's School of Business, 143 Union St. West, Kingston, ON, K7L 3N6, Canada, jw171@queensu.ca

1 - To Ration Or Not To Ration? Selling To Strategic Customers Under Shortage Effect.

Stephen Shum, City University of Hong Kong, swhshum@cityu.edu.hk, Peng Hu, Hanqing Liu

We consider the dynamic pricing and rationing policy of a firm facing strategic customers under the influence of shortage effect. We provide conditions under which it is optimal for the firm to ration. We also identify the necessary and sufficient conditions for the existence of steady state. We also characterize the firm's pricing and rationing policy under this steady state.

2 - Dynamic Pricing Of Vertically Differentiated Products For Consumers With Sequential Search

Chi-Guhn Lee, University of Toronto, cglee@mie.utoronto.ca, Sajjad Najafi, Sami Najafi-Asadolahi, Steven Nahmias

We consider a firm that wishes to maximize the expected revenue from a line of vertically differentiated products with fixed inventory over a finite horizon. Consumers are utility maximizers and sequentially check the products for one maximizing the utility. We analytically derive the optimal prices of products as well as the optimal order of products' presentation. We show that if the reservation utility is stationary or increasing, it is optimal for the seller to present the products in the descending order of quality and to increase price over time under a certain condition.

3 - Competing With Responsive Follower: Imitator And Strategic Consumers

Mike Mingcheng Wei, University at Buffalo, mcwei@buffalo.edu

In this work, we study the production and pricing decisions of a market leader facing an imitator under strategic consumer behavior with possible network externalities.

4 - Dynamic Pricing Of The Fixed-term Subscription Contract Offered To The Strategic Customers

Roozbeh Yousefi, Smith School of Business, 143 Union St., Kingston, ON, K7L 3N6, Canada, r.yousefi@queensu.ca, Yuri Levin, Mikhail Nediak, Jue Wang

Subscriptions are contracts that a company makes with its customers for regular service delivery or for providing access to the service. Service access limits can be stipulated in the subscription contract. We present a continuous time dynamic pricing model for a monopolist offering a fixed term subscription contract without per-use charges to strategic customers. We formulate the monopolist's problem in terms of optimal control, derive its optimality conditions, and study the structure of the optimal solution. We also examine the stationary optimal pricing regime and evaluate it in numerical experiments.

Decision Analysis Arcade II

Sponsored: Decision Analysis

Sponsored Session

Chair: Alba Rojas, Virginia Tech, Progress Street, Blacksburg, VA, 24060, United States, albarc@vt.edu

1 - Adaptive Clinical Trials And The Hot Stove Effect

Alba Rojas-Cordova, Virginia Tech, Blacksburg, VA, United States, albarc@vt.edu, Niyousha Hosseinichimeh

Adaptive clinical trials promise cost savings to the pharmaceutical industry and have triggered significant regulatory changes. We model the dynamics of the drug development decision within the context of adaptive clinical trials. We consider the randomness surrounding the drug's probability of technical success and the bias inherent to its estimation. We show a bias against candidates that appear to be worse than they actually are.

2 - Sequential Exploration With Geological Dependencies And Uncertainty In Oil Prices

Babak Jafarizadeh, Statoil, Sandsliveien 90, SE-SV ND2, Bergen, 5020, Norway, bajaf@statoil.com

Economic valuation and analysis of drilling decisions for a cluster of exploration opportunities can be analytically challenging. If oil is found in one location, the probability of finding oil in the nearby prospects may increase. Furthermore, the time required to interpret data and update the geological understanding exposes these investments to hydrocarbon price dynamics. In this work, we develop a framework for valuation of clusters of exploration opportunities where prospects are geologically dependent and uncertainty in oil prices is described as a mean-reverting stochastic process.

3 - Sequential Sample Allocation For Multiple Attribute Selection Decisions

Dennis D Leber, NIST, 100 Bureau Drive, MS 8980, Gaithersburg, MD, 20899-8980, United States, dennis.leber@nist.gov, Jeffrey W Herrmann

When faced with a limited budget to collect data in support of a multiple attribute selection decision, the decision-maker must decide how many samples to observe from each alternative and attribute. This allocation decision is of particular importance when the observed attribute values contain uncertainty, such as with physical measurements. We present a sequential allocation scheme that relies upon Bayesian updating in an attempt to maximize the probability of correct selection when the attribute values contain Gaussian measurement error.

Perceptions, Behavior, and Decisions

Sponsored: Decision Analysis

Sponsored Session

Chair: Franklyn Koch, Koch Decision Consulting, Eugene, OR, United States, kochfg@gmail.com

Co-Chair: Gregory L Hamm, Stratelytics, LLC, Alameda, CA, United States, ghamm@strts.com

1 - Perceived Catastrophic Risks In Sequential Social Networks

Shu Huang, Master Candidate, Tsinghua University, Tsinghua University, Haidian District, Beijing, 100084, China, huang-s15@mails.tsinghua.edu.cn, Chen Wang

Slovic (1987) proposes to use degrees of dread, unknown and personal exposure to describe individual risk perception. These factors depend on whether an individual has undergone disasters or near misses in the past, and are also affected by experiences and perspectives of his or her neighbors in the social network. We model each individual’s risk perception of uncertain consequences and likelihood of personal exposure as a Bayesian learning process to achieve equilibrium of estimation within each neighborhood. We can then construct a utility map over the social network to depict the dynamics of risk perception in response to multiple disasters.

2 - Bipolar Cardinal Ranking For Group Disagreement Evaluations

Aron Larsson, Associate Professor, Stockholm University, Postbox 7003, Kista, SE-16407, Sweden, aron@dsv.su.se, Tobias Fasth

Public decision making involve decisions that affect many stakeholders who have conflicting opinions. This may cause implementation issues for an authority, and to avoid this and to identify which stakeholder groups that are credited or discredited, it is of interest for the authority to understand how their preferences differ. One way of approaching this is to provide effective means for stakeholders to state preferences and affect towards proposed alternatives. For this we developed a web questionnaire using bipolar cardinal ranking where stakeholders state negative, neutral, or positive affect towards alternatives. The approach is demonstrated in a real-life case in Upplands Väsby, Sweden.

3 - Effects Of Total Cost Of Ownership on Automobile Purchasing Decisions

Muhammed Sutcu, Assistant Professor, Abdullah Gul University, Sumer Campus, Erkilet Bulvari, Kayseri, 38060, Turkey, muhammed.sutcu@agu.edu.tr

We reveal a complete picture of ownership-related expenses and construct a decision model which helps decision maker to make the optimal choice when purchasing an automobile. The decision model helps the costumers to understand what a car will cost beyond its purchase price when customers consider out-of-pocket expenses like fuel, repair, and insurance. For that purpose, representative joint probability distributions of a decision maker are approximated using maximum cumulative residual entropy (CRE) and CRE based first order dependence tree approaches to elicit decision maker’s preferences to calculate the total cost of ownership of an automobile.

Simulation and Optimization

Contributed Session

Chair: B Vermeulen, Eindhoven University of Technology, Eindhoven, Netherlands, b.vermeulen@tue.nl

1 - Bi-level Stochastic Approximation For Decomposable Stochastic Optimization Formulations

Soumyadip Ghosh, IBM TJ Watson Research Center, 1101 Kitchawan Road, Route 134, Yorktown Heights, NY, 10598, United States, ghoshs@us.ibm.com, Ebisa Wollega, Mark S Squillante

We propose a bi-level algorithm to solve stochastic optimization formulations with a certain decomposable structure. Consider, for example, the problem of maximizing total revenue by jointly maximizing unit sales, subject to non-linear market conditions, and minimizing costs, which for fixed sales is a two-stage linear program (2SLP). An outer loop runs stochastic approximation (SA) accounting for the non-linear part. An inner loop solves the 2SLP. The gradient of the objective function of the 2SLP is used in the outer SA, and is obtained using parametric programming. We analyze the convergence of this bi-level SA, and provide experimental evidence of its efficacy on an energy-domain problem.

2 - A Decentralized Solution To The Car Pooling Problem

Pawel J. Kalczynski, Professor of IS and Decision Sciences, California State University-Fullerton, 800 N State College Blvd., Fullerton, CA, 92834-6848, United States, PKalczynski@fullerton.edu, Malgorzata Miklas-Kalczynska

Existing carpool optimization techniques based on the centralized approach serve policy-makers’ goals, but neglect the realities of participants. Moreover, absent strict enforcement, participants often ignore centralized solutions and maximize their own utility. We present a new model (formulated and tested on real-world and simulated problem instances) that mimics a decentralized carpool self-organization process. Our findings reveal savings similar to centralized models, and a potential strategy for improving carpool utilization.

3 - Avoiding Singularities In Parallel Robotic System Design

Cameron Turner, Associate Professor, Clemson University, 206 Fluor Daniel EIB, Clemson, SC, 29634-0921, United States, cturne9@clemson.edu, Sean Fry

Singular configurations in robotic systems present significant design and control problems. In parallel robotic systems, the complex nature of singularities makes their consideration during the design process even more significant when high precision motions are desired. Using surrogate-based optimization techniques, this paper achieves a solution for the design of a parallel robotic system for engineered material characterization.

4 - MO-COMPASS For Constrained Simulation Optimization

Haobin Li, Institute of High Performance Computing, A*STAR, 1 Fusionopolis Way, #16-16 Connexis North, Singapore, 138632, Singapore, lihb@ihpc.a-star.edu.sg, Xiaofeng Yin, Wanbing Zhang, Loo Hay Lee

MO-COMPASS is recently developed for multi-objective simulation optimization, which has limitation that only linear constraints on the decisions space can be explicitly handled. Whereas, for non-linear or stochastic constraints as simulation outputs, the default approach that penalizes the constraint violation on the objective values can be inefficient with the “most-promising-area” (MPA) structure. In this study, we propose a novel approach for constraint handling in the multi-objective environment, by considering Pareto optimality in different feasibility layers with generalized MPAs. So we extend MO-COMPASS to solve constrained optimization problems in an efficient manner.

5 - Approximate, Adaptive Maintenance Scheduling Of Maritime Assets Under Different Operating Modes

B Vermeulen, Eindhoven University of Technology, Eindhoven, Netherlands, b.vermeulen@tue.nl, Sena Eruguz, Tarkan Tan, Geert-Jan Van Houtum

In the maritime sector, vessels are used under different operating modes with different degradation rates, different maintenance setup and downtime costs, and particular maintenance/ replacement options. Given uncertainty on actual degradation rates for components, asset owners follow the OEMs’ hyper-conservative and hence costly maintenance and replacement policies. We provide an approximate dynamic programming model (and proprietary software tool) with online adjustment of degradation rates and adaptive planning of maintenance activities given the schedule of operating modes.

Revenue Management and Pricing with Consumer Choice Models

Sponsored: Revenue Management & Pricing

Sponsored Session

Chair: Ruxian Wang, The Johns Hopkins Carey Business School, 100 International Dr, Baltimore, MD, 21202, United States, ruxian.wang@jhu.edu

1 - Product Line Design And Pricing Under Logit Model

Anran Li, Columbia University, al2942@columbia.edu

We study a manufacture who wants to design and price products which are feature-level combinations. This allows us to design products of different quality at different prices. We assume that demand for products follows a Logit model (MNL or NL) that measures utility as the aggregate value of the feature-levels and the unit production cost is equal to the sum of the component's wholesale prices. We show that optimal product configurations give priority to feature levels with high net value. The K best configurations can be obtained through a greedy algorithm derived from the K-shortest path problem. This allows us to find an optimal profit configuration in polynomial time.

2 - Demand Estimation Under The Multinomial Logit Model From Sales Transaction Data

Tarek Abdallah, New York University, New York, NY, United States, tabdalla@stern.nyu.edu, Gustavo Jose Vulcano

We study an MNL model of demand when customers arrive over time in accordance to a non-homogeneous Poisson process. We characterize conditions under which the model is identifiable and our maximum likelihood estimates are consistent. Then, we propose a maximize-minorize (MM) method for estimating the model parameters. Through an exhaustive set of numerical comparisons we conclude that the MM-based estimates are of similar quality to the ones obtained by state-of-the-art benchmarks, but its computation is orders of magnitude faster.

3 - Pricing And Assortment Management Under New Choice Models

Ruxian Wang, Johns Hopkins Carey Business School, Baltimore, MD, 21202, United States, ruxian.wang@jhu.edu

When facing multiple products, a consumer chooses the one with the highest utility, which depends on the product attributes, its own price, and perhaps the prices of other products. We characterize the structure of the optimal strategies and provide efficient exact and approximation algorithms.

Social Media Collective

Invited: Social Media Analytics

Invited Session

Chair: Lauren Rhue, Wake Forest University, 212 Farrell Hall, Winston-Salem, NC, 27106, United States, rhuela@wfu.edu

1 - Communication Of Collective Action Over Time: The Arousal, Interpretation, And Realization Model

Sung Won Kim, University of Illinois at Urbana Champaign, swk@illinois.edu, Shaila Miranda

Social media have recently been used by participants in social movements. Twitter was a key tool in the 2011-2012 protest against the Stop the Online Piracy Act (SOPA). This research develops a theory of the role of affective and cognitive mechanisms in online social movements. Tweets from the protest against SOPA were analyzed using vector autoregression and Granger causality analysis. The results of the Granger causality were used as empirical data points to build a theory of communication of collective action over time. Affect was found not only to spread through the community, but also to influence cognitive mechanisms. Cognitive mechanisms were used to identify problems and their solutions.

2 - Who Gets Started On Kickstarter? Demographic Variation In Crowdfunding Success Rates

Jessica Clark, Stern, jclark@stern.nyu.edu, Lauren Rhue

This study examines the variance in success rates across racial groups in the crowdfunding platform Kickstarter using two novel data sets: the race of subjects in photos associated with projects (determined using facial recognition software), and linguistic elements of the project descriptions found to be predictive of the race of the project photos' subjects. Even controlling for observable differences in both project and text characteristics, we find that there are significant racial differences in success rates. The results have managerial implications for individual fundraisers and platform designers.

3 - Watch Where You Eat!

Jorge Mejia, University of Maryland, jmejia@rhsmith.umd.edu

We focus on how social media analytics can be incorporated into the efforts to reduce foodborne illness, a major public health concern. We demonstrate how machine learning techniques can be used to monitor the hygiene quality of restaurants through social media. Using these techniques, we show evidence of moral hazard in how restaurants achieve high grades in the New York City program.

Teaching OR at Service Academies

Sponsored: Education (INFORMED)

Sponsored Session

Chair: Richard McGrath, United States Naval Academy, 121 Blake Road, Annapolis, MD, 21402, United States, rmcgrath@usna.edu

1 - Teaching Operations Research At The United States Naval Academy

Richard G McGrath, United States Naval Academy, mcgrathrg@alum.mit.edu

The United States Naval Academy (USNA), founded in 1845, is the undergraduate college of the U.S. naval service. Midshipmen attend the academy for four years, graduating with Bachelor of Science degrees and commissions as ensigns in the U.S. Navy or second lieutenants in the U.S. Marine Corps. Since 2012, the Mathematics Department has offered an undergraduate major in Operations Research, which has become one of the most popular majors at the academy. In this talk, we will discuss the OR program at USNA. We will describe a typical course of study, as well as how military and security applications are incorporated into the curriculum through coursework, project-based learning, and capstone projects.

2 - Teaching Operations Research At The United States Air Force Academy

Gerry Gonzalez, United States Air Force Academy, Colorado Springs, CO, United States, gonzalezgo@aol.com, Jesse Pietz

The United States Air Force Academy (USAFA) is an undergraduate college and one of three commissioning sources for the United States Air Force. Cadets attend the Academy for four years, graduating with Bachelor of Science degrees and commissions as second lieutenants in the United States Air Force. USAFA has offered an undergraduate major in Operations Research since 1966. In this talk, we will discuss the OR program at USAFA. We will describe a typical course of study, as well as how operational military applications are incorporated into the curriculum through coursework, project-based learning, and capstone projects.

3 - Teaching Operations Research At The United States Coast Guard Academy

Melinda D. McGurer, Head, Department of Mathematics, United States Coast Guard Academy, 15 Mohegan Avenue, New London, CT, 06320, United States, melinda.d.mcgurer@uscg.mil, Eric C. Johnson

The United States Coast Guard Academy (USCGA), founded in 1876 as the Revenue Cutter School of Instruction, is the undergraduate college of the U.S. Coast Guard in the Department of Homeland Security. Cadets attend the academy for four years, graduating with Bachelor of Science degrees and commissions as ensigns in the U.S. Coast Guard. Since 1997, the Mathematics Department has offered a degree in operations research. This talk discusses the OR program at the USCGA including a typical course of study and the incorporation of USCG applications. The talk emphasizes the senior capstone course in which the cadets serve as OR consultants for the USCG and broader military and homeland security communities.

Opt, Nonlinear Programming II

Contributed Session

Chair: Carlos Deck, PhD Student, UC Berkeley, 4141 Etcheverry Hall, University of California Berkeley, Berkeley, CA, 94720, United States, cgdeck@berkeley.edu

1 - An Eigenvalue Decomposition Based Branch And Bound Algorithm For Nonconvex Qcqp With Convex Quadratic Constraints

Qingwei Jin, Zhejiang University, School of Management, 866 Yuhangtang Road, Hangzhou, 310058, China, qingweijin@gmail.com, Cheng Lu, Zhibin Deng

In this paper, we propose a branch-and-bound algorithm for finding a global optimal solution for a nonconvex quadratic program with convex quadratic constraints (NQPCQC). We reformulate NQPCQC by adding some nonconvex quadratic constraints induced by eigenvectors of negative eigenvalues associated with the nonconvex quadratic objective function to Shor's semidefinite relaxation. Under the assumption of having a bounded feasible domain, these nonconvex quadratic constraints can be further relaxed into linear ones to form a special semidefinite programming relaxation. Then an efficient branch-and-bound algorithm branching along the eigendirections of negative eigenvalues is designed.

2 - Deployment Of Patrolling And Stationary Service Vehicles For Freeway Incident Management

Mohsen Parsafard, University of South Florida, 14440 Hellenic Drive, Apt 206, Tampa, FL, 33613, United States, parsafard@mail.usf.edu, Xiaopeng Li, Zhenyu Wang, Pei-Sung Lin

Freeway Service Patrols (FSP) are effective incident management systems to alleviate the incident related congestion in urban areas. A FSP system divides a network of freeways into a set of non-overlapping patrol beats and a number of tow trucks are then assigned to these beats. This study investigates a FSP system design problem. A mixed-integer nonlinear programming model is formulated for designing the optimal beat configuration and service vehicle allocation to maximally reduce delay, avoid secondary accident risks and mitigating fuel consumptions and emissions. Also, this study considers not only traditional patrolling vehicles or but also newly proposed stationary vehicles.

3 - Solutions Of Complementarity Problems Monotone With Respect To Parameters

Vyacheslav V. Kalashnikov, Professor and Researcher, Tecnologico de Monterrey, ITESM, Campus Monterrey, Ave. Eugenio Garza Sada 2501 Su, Monterrey, 64849, Mexico, kalash@itesm.mx Nataliya I. Kalashnykova, Mariel A. Leal-Coronado

In many applied problems (such as the elastohydrodynamic lubrication problem, some economic equilibrium problems, etc.), one of the important questions is if certain complementarity problem's solution is monotone with respect to parameters. Our paper investigates this question and provides several types of sufficient conditions that guarantee such a monotonicity of the solutions to linear and nonlinear complementarity problems with parameters. In the majority of cases, it is required that the principal mapping of the complementarity problem be monotone with respect to the decision variables and, vice versa, antitone with respect to the parameters.

4 - Solving Lps Using Parametric Quadratic Programming

Carlos Deck, PhD Student, UC Berkeley, 4141 Etcheverry Hall, University of California - Berkeley, Berkeley, CA, 94720, United States, cgdeck@berkeley.edu

Our approach for solving a standard LP with m constraints and n variables is based on a parametric QP where we relax the inequality constraints of the polyhedron of optimal solutions in primal-dual space. Using this approach, we can solve the bad instances of the simplex method given by the deformed products of Amenta and Ziegler (1999) in a polynomial number of pivots.

1 - Cognitive Analytics For Financial Compliance

Aditya Vempaty, IBM Research, Yorktown Heights, NY, United States, avempat@us.ibm.com, Elham Khabiri, Swapna Buccapatnam, Matthew Riemer, Ta-Hsin Li, Ashish Jagmohan

Financial services firms require compliance with a complex set of regulatory requirements, laws, and regulators. In the face of increased regulatory enforcement, firms have significantly increased compliance spend. A major contributor to soaring compliance spend is the intensive expert manual component of current compliance processes. We propose approaches for automating key compliance processes using statistical machine learning and natural language processing techniques. We present preliminary results comparing performance against expert outcomes.

2 - On Determining The Viability Of Parametric Cost Forecasting Of Agile Software Development Projects To Improve Project Cost Forecasts

Bill DeGray, IT Program Manager, Deloitte Services, LP, Hermitage, TN, 37076, United States, william.degray@gmail.com

This presentation describes methods being used in a four phased investigation to determine whether parametric forecasting is a viable alternative to bottom-up forecasting for software development projects. Phase 1 (completed) - design. Phase 2 (completed) - determine if there is a relationship between the percentage of the historical project costs incurred (the response variable) and the percentage of the project schedule completed (the predictor variable). Phase 3 (in-progress) - identifying the model(s) that best describe(s) the relationship. Phase 4 will focus on development, testing, and piloting a parametric forecasting tool model based on the best regression model(s).

Value Co-creation

Sponsored: Service Science

Sponsored Session

Chair: Ralph D Badinelli, Professor, Virginia Tech, Blacksburg, VA, 24061, United States, RALPHB@vt.edu

1 - Empirical Analysis Of Hospital Behaviors Resulting From Value Based Purchasing

Gregory Heim, Mays Business School, Texas A & M University, College Station, TX, 77845, United States, GHeim@mays.tamu.edu

We examine impacts of the federal Value Based Purchasing financial incentive policy to determine whether this federal program has changed practices and processes of healthcare providers in a manner that enhances process quality and improves healthcare outcomes, thereby enhancing value for patients.

2 - Value Derivation In The Service Journey

Ralph Badinelli, Virginia Tech, ralphb@vt.edu

Value co-creation is accomplished in service systems through an adaptive journey by service participants in a hypernetwork of service contexts. The viability of the service ecosystem depends on the engagement decisions made by participants at each context of the journey. Predicting and controlling this path is made complex by the stigmergy enabled by social networking and other information sources. We use fuzzy models of engagement decisions and examine the role of swarm intelligence in determining the viability of service ecosystems. We justify a value derivation principle in the place of value propositions and we derive patterns of service journeys under different touchpoint strategies.

1 - Why Some Markets Refuse Innovation And Entrepreneurship, When They Say They Love It: Evidence From Uber's Transportation Network Service

Robert Seamans, New York University-Stern, 1 Washington Square Village, # 7J, New York, NY, 10012, United States, rseamans@stern.nyu.edu, Sukhun Kang, Yongwook Paik

We study how established firms use non-market strategy to slow entry by sharing economy firms. We study this issue using a unique dataset that includes data on Uber's expansion into various U.S. cities during 2011-2015, together with data on political contributions and election outcomes. We find that the more politically entrenched a market is, the more resistance the entrant faces when working to commercialize its innovation. This study has theoretical, managerial, and policy implications for the ever-growing sharing economy, and highlights that, despite the benefits of innovation, there often times exists strenuous resistance to it, particularly from established firms in a market.

2 - The Effect Of Individual Characteristics On Online Purchase Decision Processes And Outcomes

K. Nadia Papamichail, Senior Lecturer (Associate Professor), University of Manchester, Manchester Business School, Booth Street East, Manchester, M15 6PB, United Kingdom, nadia.papamichail@manchester.ac.uk, Sahar Karimi, Christopher P. Holland

This paper presents a typology of online purchase archetypes based on consumers' individual characteristics such as decision-making style and knowledge of product. Video material has been collected and analysed to capture how online purchase decision making processes unfold for different archetypes. This is followed by an empirical study that explores the effect of decision-making style and knowledge of product on decision-related outcomes such as satisfaction with process and satisfaction with choice. Practical implications for online retailers are discussed.

3 - Subscribe Or Sell: Itunes Versus Google Play Music All Access

Hooman Hidaji, Alberta School of Business, 2-24 Alberta School of Business, Edmonton, AB, T6G 2R6, Canada, hooman.hidaji@ualberta.ca

Recently, subscription has become a popular method of user monetization in online media business along with selling model. It is expected that firms utilize both approaches to cover as much demand as possible. However, pricing strategy of the firms is crucial in determining the demand for the two. In this study, using an economic model with endogenous demand, we set to model how the firm decides on the business model. Different user types and business model-dependent demand are considered. We also look into advertising and group plans (such as family plans) for such services in the online entertainment industry.

4 - Socioeconomic Determinants And Geographic Patterns Of Internet Use For E-commerce And E-entertainment In Counties Of The United States

Avijit Sarkar, Associate Professor, University of Redlands, 1200 E Colton Avenue, Redlands, CA, 92373, United States, avijit_sarkar@redlands.edu, James B Pick

This research analyzes social-economic, innovation, and social capital influences on the use of the internet to access e-commerce and e-entertainment services for a large sample of U.S. counties. Nationwide geographic patterns and clustering of e-commerce and e-entertainment use of the internet are identified and explained. A Spatially Aware Technology Utilization Model explicitly considers underlying geographic relationships between model variables and diagnoses spatial bias in standard multivariate analysis. Implications for the digital divide in the United States are discussed and policies to expand use of the internet for e-commerce and e-entertainment use are recommended.

1 - Re-Evaluating The Performance Of Markowitz's Portfolio Selection Model In Terms Of The Distance Measure Approach

Hunbae Jeon, Master Student, Yonsei University, 109-1902, Lotte Apt., 31, Saemal-ro, Guro-gu, School of Business (Bld.#212) Rm.#301, Seoul, 08291, Korea, Republic of, hborjh1021@naver.com, Hongseon Kim, Seongmoon Kim

We have used Sharpe Ratio to evaluate the performance. However, it couldn't evaluate portfolios itself, because it is no more than checking the risk and return. Therefore we suggest distance measure approach as a new method to evaluate the portfolio performance. In this paper, we construct the optimal portfolio by using Markowitz's model, and generate random portfolios, and then calculate some distances between optimal and random portfolios. Then we show Euclidean distance is the best for analyzing the performance of Markowitz's model by comparing differences in terms of these distances.

2 - Official Visits And Firms' Employee: Evidences From China

Qiu Muqing, Tongji University, Siping Road, Shanghai, China, qsolemn@126.com

Different from the articles which discuss how to seek the protection of government by political connections from the angle of the firms, this paper studies how to achieve the social goals by official visits from the angle of Chinese government. We find that political connections are common in countries around the world, but official visits have "Chinese Characteristics". The paper finds that the officials are inclined to visit the firms which can absorb more employees. Official visits can increase the number of employees, especially for employees with college degree or below. This relation is much stronger in state-owned firms.

3 - A Real Option Analysis On Performance-sensitive Debt

Bo Liu, University of Electronic Science and Technology of China, No.2006, Xiyuan Ave, West Hi-Tech Zone, Chengdu, 611731, China, b.liu07@fulbrightmail.org

This paper adopts a real option approach to examine how the use of Performance-Sensitive Debt (PSD) contract affects the inefficiencies arising from financing constraints. The results show that if financing constraints are sufficiently weak, the use of PSD encourages the constrained firm to use a higher investment threshold and thus leads to a significant decrease in ex ante firm value compared to fixed-coupon debt. These results further imply that although PSD makes more financially constrained firms better off, less financially constrained firms face a trade-off between lower efficiency in ex ante firm value and higher efficiency in investment and financing decisions.

Supply Chain Networks Design under Uncertainty

Sponsored: TSL, Facility Logistics

Sponsored Session

Chair: Nima Sadghiani, University of Michigan, Ann Arbor, MI, 12121, United States, nsalehi@umich.edu

1 - Rolling Stock Maintenance Location Routing: Stochastic And Robust Programming Formulations

Denise Désirée Tönissen, Eindhoven University of Technology, Eindhoven, Netherlands, D.D.Tonissen@tue.nl, Zuo-Jun Max Shen, Joachim Jacob Arts

The maintenance location routing problem for train units is a NP-hard problem, where we locate maintenance facilities, while also taking the maintenance routing into account. Facility location is a long term strategic decision, but the optimal facility locations depend on line planning and rolling stock schedules. Since these change on a regular basis, our objective is to minimize the costs under different discrete line planning and rolling stock schedule scenarios. We give robust and stochastic formulations, provide algorithms to solve the problems and perform numerical tests.

2 - Global Sourcing Under Correlated Uncertainties: A Scenario-based Stochastic Programming Approach

Nima Salehi Sadghiani, University of Michigan, 3545 GreenBrier Blvd,, Apt. 39A, Ann Arbor, MI, 48105, United States, nsalehi@umich.edu, Mark Stephen Daskin, Don Zhang, Mark Everson, Michael Sanders

Managing uncertainty is one of the challenging issues in supply chains. Using only the expected value of the uncertain parameters for sourcing decisions in a deterministic model can be risky due to the uncertainties that threaten both the optimality and feasibility of the decision variables. Most previous studies on supply chain network design assume that uncertainties are independent. In this study, we address the need for an effective tool to incorporate potential uncertainties associated with the model parameters and their correlation into sourcing decisions.

Collaborative Logistics

Sponsored: TSL, Freight Transportation & Logistics

Sponsored Session

Chair: Brett Shields, UTSI, 411 B.H. Goethert Parkway, Tullahoma, TN, 1, United States, bshields@utsi.edu

1 - A Classification For Collaborative Logistics State Of The Art Analysis

Andrea Rusich, Univeristy of Trieste, Andrea.Rusich@phd.units.it

Scientific literature on collaborative logistics still misses a harmonized approach to analyse its management implications. This paper aims to fill this gap by introducing a classification canvas based on four perspectives: decision-makers, form of collaboration, ICT and decision technology enablers, operations management. The proposed analysis enhances the understanding of existing collaborative logistics approaches and identifies further research steps. In addition, an application example to the Physical Internet shows how the classification could support the study of emerging collaborative logistics frameworks.

2 - Vehicle Routing Problem In Collaborative Environments: Introducing An Exchange Mechanism For Orders.

Vincent Karels, TUE, v.c.g.karels@tue.nl

Considering the distribution of orders, we introduce a system that exchanges orders in such a way that cooperating distribution companies maintain their competitiveness and autonomy while also decreasing their costs. First an instrument is formulated which determines the marginal costs of any order within the vehicle routing problem, while retaining that the calculations remain computationally tractable. Subsequently an auctioning mechanism utilizing this instrument is introduced, and the measure to which this mechanism evolves to the best allocation of orders (the social optimum) is evaluated.

3 - Fair Sharing Approach For Network-wide Adoption Of Collaborative Container Logistics

Rob A Zuidwijk, Professor of Ports in Global Networks, Erasmus University Rotterdam, P.O. Box 1738, Rotterdam, 3000 DR, Netherlands, rzuidwijk@rsm.nl, Irina Romochkina, Peter van Baalen

This paper draws from cooperative game theory while studying fair sharing schemes and is inspired by actual issues in the adoption of Inter-Organizational Systems (IOS) in container logistics in a sea port environment. We demonstrate (1) the influence that network effect, as experienced in business network communication structure and propensity for coordination between players, has on the chances of an IOS to be fully adopted by a business network under fair sharing conditions, and (2) that a fair sharing scheme has the potential to eliminate two types of conflicts related to uneven benefits distribution and through this enhance IOS adoption under certain conditions."

4 - A Stochastic Make Or Buy Model Considering Additive Manufacturing In Supply Chain

Brett Shields, University of Tennessee Knoxville, 411 B.H. Goethert Parkway, Tullahoma, TN, United States, bshields@utsi.edu, Javad Seif, Andrew Yu

In this project a two-stage stochastic program is presented in a make or buy setting, considering the supply of parts produced by additive manufacturing. This model generalizes a number of works in the literature and provides a framework for implementing additive manufacturing in supply chain during times of uncertainty.

1 - Service Network Design With Equilibrium Constraints Based On General M/g/1 Waiting Time

Mahdi Hamzeei, Post Doctoral Fellow, University of Maryland, Baltimore, 685 West Baltimore Street, MSTF 7-00D, Baltimore, MD, 21201, United States, hamzeei.m@gmail.com, Amir Ahmadi Javid

We consider the service network design in which an operator determines some facilities and their size to open. The customers then choose facilities to send their demand such that their time is minimized. Customers' time consists of a travel and a waiting time. Assuming M/G/1 waiting time in each facility, using conjugate duality and decomposition approaches, we propose and efficient method to solve this problem. This structure was motivated by several applications such as preventive healthcare and disaster management. We conclude by presenting preliminary numerical results.

2 - Service Level Restrictions In Location Problems With Disproportionate Assignment Costs

Jeremy W North, Murray State University, 9400 Wickliffe Rd., Wickliffe, KY, 42087, United States, jnorth@murraystate.edu, Robert M Nauss

A common assumption in facility location modeling is that customer assignment cost is proportional to distance. In this work, we drop this assumption and analyze the subsequent effect on service level when weighted average distance is minimized. Computational experiments contrast the p-median with an augmented version enforcing higher overall service levels. We show that our modeling approach is more economical than implementing a closest assignment restriction. Additionally, a Greedy Random Adaptive Search Procedures (GRASP) algorithm is applied to solve larger problem instances.

3 - A Continuum Approximation Method For Reliable Facility Location Design With Imperfect Information

Hongqiang Fan, University of South Florida, Tampa, FL, United States, hongqiangfan@mail.usf.edu, Xiaopeng Li, Lifen Yun

In this paper, we propose a continuum approximation method to solve the reliable facility location design problem with imperfect information. Then a discrete algorithm is proposed to obtain discrete facility locations. The results of case studies indicate that this model also can get the near-optimal solution compared with the discrete model and has a robust performance.

4 - Facility Location In A Competitive Market: Incorporating Network Congestion Effects

Zhaomiao Guo, Universtiy of California, Davis, 609 Anderson Road,, Apt. 264, Davis, CA, 95616, United States, zmguo@ucdavis.edu, Yueyue Fan

We assess facility networks in a competitive market, where the infrastructure system is shaped by collective actions of multiple decision entities from both supply and demand sides. A network-based multi-agent optimization modeling framework is developed to reflect "selfish" behaviors of individual service investors and users and to simultaneously capture the interactions among all over a network structure. To overcome computational difficulty imposed by non-convexity of the problem, we rely on recent theoretical development on variational convergence of bivariate functions to design a solution algorithm with analysis on its convergence properties.

Passengers and Parts: Analytics and Machine Learning in Aviation

Sponsored: Aviation Applications

Sponsored Session

Chair: Catherine Cleophas, RWTH Aachen University, Kackertstr. 7, Aachen, 52072, Germany, catherine.cleophas@rwth-aachen.de

Co-Chair: Phillip Mah, Boeing, Commerce, Richmond, BC, V6V 2L1, Canada, phillip.mah@aeroinfo.com

1 - Predictive Maintenance from Analysis Of Airplane Sensor Data

Phillip Mah, Boning, Commerce, Richmond, BC, V6V 2L1, Canada, phillip.mah@aeroinfo.com, Ruiwei Jiang, Dawen Nozdryn-Plotnicki

Unscheduled maintenance drives 10% of the annual operational cost to airlines worldwide. Predictive Maintenance could reduce those costs, particularly when synchronized with airline's operations. By using engineering expertise, statistics and machine learning on aircraft sensor and fault data, as well as analysis of an airline's flight and maintenance schedule, we detect impending issues on the aircraft and suggest maintenance tasks in accordance with the prediction and an airline's working rhythm. These predictive maintenance tasks will increase reliability and reduce unscheduled maintenance.

2 - Applications Of Text Mining Techniques To Fleet Health And Maintenance Data

Bingjing Yu, Boeing Vancouver, 1146 Homer Street, Vancouver, BC, V6B 2X6, Canada, bingjing.yu@aeroinfo.com, Gaku Tobinobu, Candice Chan, Ehsan Nobakht

Textual data is one of the richest data sources for fleet health and maintenance analytics. Taking advantage of these information is the key for optimizing airline's and Boeing's business. Due to its large volume and highly unstructured nature, however, its full potential is rarely leveraged. Advanced Analytics group works on text analytics projects with airlines in the areas such as reliability, maintenance program and Boeing customer support. Case studies on how we help businesses by applying natural language processing, machine learning and visualization techniques will be presented.

3 - On The Flight Choice Behaviour Of Business Purpose Passengers In The Australian Domestic Market

Cheng-Lung Wu, Associate Professor, UNSW Australia, School of Aviation, UNSW Australia, Kensington, NSW 2052, Australia, c.l.wu@unsw.edu.au, Hanson So

This paper examined the flight choice behaviour difference of business-purpose passengers who work in small and medium enterprises (SMEs,) and those in non-SMEs. Statistics show that SME business passengers tend to fly less, are more price-sensitive, and derive less satisfaction in flying with full-service carriers if they have previously flown with low-cost carriers. Discrete choice models show that fewer flight service attributes are significant on shorter flights. Flight comfort attributes have a larger significance on inbound flights. Attribute non-attendance (ANA) is above 55% for all tested attributes except fare; not all attributes are perceived equally by business passengers.

Chair: Daisuke Watanabe, Tokyo University of Marine Science and Technology, 2-1-6 Etchujima, Koto-ku, Tokyo, 135-8533, Japan, daisuke@kaiyodai.ac.jp

1 - Coverage Modeling In Public Street Lighting

Alan T. Murray, University of California at Santa Barbara, Santa Barbara, CA, 93106, United States, amurray@ucsb.edu, Xin Feng

The spatial distribution of public area lighting in an urban region greatly influences human activities and safety, yet is costly to provide. This paper details a coverage optimization model for nighttime light provision, enabling benefits and impacts to be taken into account. Application results for an urban area are presented and discussed.

2 - A Robust Optimization Approach For Ambulance Location Problem

Hozumi Morohosi, National Graduate Institute for Policy Studies, morohosi@grips.ac.jp, Takehiro Furuta

This work studies an application of robust optimization to a cooperative covering model with focusing on ambulance location problem. We propose a procedure for defining the uncertain set of parameters in the problem based on actual data in a Bayesian way. Then we bring out a robust version of cooperative covering problem and give a solution analysis with some numerical examples.

3 - Generalized Weighted Benefit And Maximal Expected Covering Location Problem

Daisuke Watanabe, Tokyo University of Marine Science and Technology, daisuke@kaiyodai.ac.jp, Richard Church

The purpose of this study is to analyze the optimal location model for Counter-Piracy Surveillance System in Somalia using Weighted Benefit and Expected Coverage Model based on Maximal Covering Location Problem.

Vector Optimization: Algorithms and Applications

Sponsored: Multiple Criteria Decision Making

Sponsored Session

Chair: Firdevs Ulus, Bilkent University, Ankara, Turkey, firdevs@bilkent.edu.tr

1 - Multiobjective Risk-averse Two-stage Stochastic Programming

Cagin Ararat, Assistant Professor, Bilkent University, Ankara, 06800, Turkey, cararat@bilkent.edu.tr, Ozlem Cavus

Risk-averse two-stage stochastic programming is concerned with the minimization of a risk measure of a random cost function over the feasible choices of a deterministic and a random decision variable. We study the multiobjective version of this problem in which case the cost function is vector-valued and its risk is quantified via a set-valued risk measure. Although the resulting problem has a set-valued objective function, we reformulate it as a convex vector optimization problem and propose a customized version of Benson's algorithm to solve it. In particular, we develop duality-based cutting-plane type methods to solve the scalar subproblems appearing in Benson's algorithm.

3 - Convex Vector Optimization Problems: Unboundedness

Firdevs Ulus, Bilkent University, firdevs@bilkent.edu.tr

In order to solve convex vector optimization problems (CVOPs), Benson type algorithms have been proposed recently. These algorithms work well if the feasible region is compact which implies that the problem is bounded and a 'finite weak epsilon-solution' to the problem exists. However, in many applications, the feasible region of the problem does not necessarily compact and the problem may be unbounded. In this talk, the aim is to discuss the following: 1- Is there a finite solution concept for unbounded convex optimization problems? 2- If this is the case, are there conditions which guarantee the existence of such a solution? 3- Can we extend the existing algorithms to unbounded CVOPs?

2 - Quantification Of The Robustness Gap For Uncertain Multiobjective Optimization Problems

Corinna Krüger, Georg August University Göttingen, Göttingen, Germany, ckrueger@math.uni-goettingen.de, Anita Schöbel, Margaret M Wiecek

We investigate linear multiobjective optimization problems with uncertain right hand sides of the constraints which are modeled as the elements of a polyhedral uncertainty set. Generalizing Ben-Tal and Nemirowski's definition of the robustness gap (RG) for the single objective case to the multiobjective case, we quantify the gap in two ways. We develop a quadratic program whose objective value corresponds to the RG. We also relate the RG to the distance beween appropriate Pareto sets.

1 - Statistical Process Monitoring Of Multimode Shape Profiles

Kai Wang, Hong Kong University of Science and Technology, kwangai@connect.ust.hk

Traditional shape profile monitoring focuses on one mode of shapes. Little attention has been paid to multimode shape profiles, where different types of shapes appear in a sample of objects. In this work, we exploit the process monitoring of multimode shape profiles. First, we develop a two-step feature extraction approach, where different shape modes can be separated into several clusters. This enables us to build a finite Gaussian mixture model for the extracted features. In Phase II, a control chart is built for detecting shifts in the proportions and shape features of multimode shape profiles. Numerical simulations and a real example demonstrate the effectiveness of our proposed framework.

2 - A Bayesian Self-starting Control Chart For Count Data

Baosheng He, University of Iowa, Iowa City, IA, United States, baosheng-he@uiowa.edu, Yong Chen

In this work we propose a Bayesian framework to detect a random but sustained shift in count data, including Poisson and Binomial data. The in-control and out-of-control states are both unknown and modeled by corresponding priors, and so as the shift probability, if necessary. The decision is based on the posterior probability that the shift occurs at each time. The monitoring performance is evaluated by the average run lengths. The effectiveness of the method is demonstrated via simulation and real data.

3 - Functional Regression Based Monitoring Of Service Systems

Devashish Das, Mayo Clinic, 2015, 41st Street NW, F47, Rochester, MN, 55901, United States, das.devashish@mayo.edu, Kalyan Pasupathy, Curtis B. Storlie, Mustafa Y Sir

In this research, we focus on building a statistical monitoring method for service systems that experience time varying arrival rates. The goal of the proposed method is to build a functional regression model based on customer arrival and departure time data collected from an in-control system. It is then used to find discrepancy between expected departure rates and observed departure rates. Deviations from expected departures greater than a threshold are used to signal a deterioration ins quality of service.

1 - Human-robot Interaction For Real-world Situations

Julie Adams, Professor/Computer Science & Computer Engineering, Vanderbilt University, Nashville, TN, 37212, United States, julie.a.adams@vanderbilt.edu

Robots (generally any semi-autonomous vehicle) are increasingly being used by individuals in their daily activities, be such activities personal or professional. However, robots have traditionally been used by highly trained personnel in highly controlled environments and settings. Real-world environments tend to be highly dynamic with large amounts of uncertainty. Further, the human may not have extensive training and cannot be a dedicated robot controller or supervisor, but must also be responsible for other activities and actions in said environment. Thus, traditional interaction mechanisms are difficult to use and place too many demands on the humans. The question is how can the human-robot interaction become more natural for the human in order to support the collective goals? The answer is multi-dimensional. From one perspective, the human needs to easily interact with the robot and be able to develop a reliable understanding of the robot's expected actions. Further, the robots need to easily perceive the human's state, predict what the human will do, and develop a plan to maximize the likelihood of achieving the goal, while minimizing the demands placed on the human. These and related questions are still open research questions within human-robot interaction.

2 - Developing an Innovative Research Methods Toolkit To Explore User Perceptions Of HRI: Part 1- The Laddering +ZMET Method

Thorsten Gruber, Loughborough University, Sir Richard Morris Building, Loughborough, United Kingdom, T.Gruber@lboro.ac.uk, Kathy Keeling

User acceptance is a critical issue in the domain of Human-Robot Interaction (HRI). Many studies address user acceptance through methods such as needs analysis, which allow users to interact with robots and identify the pros/cons of use. Such methods are effective in uncovering superficial needs but fail to obtain deeper meanings of use. We argue that HRI could benefit from innovative research designs that help researchers obtain a deeper understanding of what users value in HRI. We present a toolkit consisting of three well-established methods adapted to HRI and present research examples.

3 - Developing an Innovative Research Methods Toolkit To Explore User Perceptions Of HRI: Part 2 – The Netnography Method

Kathy Keeling, University of Manchester, Booth Street West, Manchester, United Kingdom, kathy.keeling@manchester.ac.uk

User acceptance is a critical issue in the domain of Human-Robot Interaction (HRI). Many studies address user acceptance through methods such as needs analysis, which allow users to interact with robots and identify the pros/cons of use. Such methods are effective in uncovering superficial needs but fail to obtain deeper meanings of use. We argue that HRI could benefit from innovative research designs that help researchers obtain a deeper understanding of what users value in HRI. As a follow-up to the first section on Innovative Research Methods, this section will introduce the method known as Netnography. The presentation concludes with some examples previous studies.

4 - Older Consumers Value Perceptions Of Service Robots: Exploring The Intersection Of Marketing, Robotics, And Design

Willy Barnett, The University of Manchester, Manchester Business School, Manchester, M13 9QS, United Kingdom, willy.barnett@postgrad.mbs.ac.uk

This study explores the relationship between two major phenomena facing developed worlds today: robotics and global aging. It attempts to examine human-robot interaction through a marketing lens by exploring the nature of robot value perceptions, their relationship to robot design and user acceptance. To address this goal, a multi-method, qualitative study of a service-dominant network consisting of older adults and their care providers is conducted. Results show that robot acceptance can be better understood and communicated in terms of high level user values associated with robot use.

Co-Chair: Shuai Huang, University of Washington, shuaih@uw.edu

1 - Parametric Uncertainty Propagation In Potassium Channel Model Of Mouse Ventricular Myocytes

Dongping Du, Texas Tech University, dongping.du@ttu.edu

Cardiac potassium (K+) channel plays an important role in cardiac electrical signaling. Mathematical models have been widely used for investigating the effects of K+ channels on cardiac functions. However, K+ channel models involve parametric uncertainties. It is critical to assess the parameter uncertainties to provide more reliable predictions. In this study, a generalized polynomial chaos expansion is used to propagate the uncertainties onto the modeled predictions of steady state activation and steady state inactivation of the K+ channel. As compared with the Monte Carlo simulations, the proposed method shows superior performance in terms of computational efficiency and accuracy.

2 - Correlation Based Adaptive Sampling Strategy For Online Monitoring Of Correlated High Dimensional Data Streams

Mohammad Nabhan, Georgia Institute of Technology, m.nabhan33@gmail.com, Jianjun Shi

Effective process control of High dimensional data with embedded spatial structure has been an arising challenge, due to the inability of classical techniques to detect changes in such processes. This article proposes an adaptive sampling technique that achieves better change detection power by identifying and exploiting the hidden spatial structure. The adaptive nature of the proposed method allows for effective monitoring with partial observations. Simulation studies are performed to validate the efficacy of the proposed monitoring scheme. This is followed by real data case studies to evaluate the performance under practical scenarios.

3 - An Effective Online Data Monitoring And Saving Strategy For Large-scale Climate Simulations

Xiaochen Xian, University of Wisconsin - Madison, Madison, WI, xxian@wisc.edu, Kaibo Liu

Large-scale climate simulation models have been developed and widely used to generate historical data and study future climate. This long-duration simulation process creates huge amount of data; however, how to effectively monitor and record the climate changes still remains to be resolved. To address this issue, we propose an effective online data monitoring and saving strategy over the temporal and spatial domains with the consideration of practical storage and memory capacity constraints. Specifically, our proposed method is able to intelligently select and record the most informative extreme values in the raw data in the context of better monitoring climate changes.

4 - A Wavelet-based Penalized Mixed-effects Model For Multichannel Profile Detection Of In-line Raman Spectroscopy

Xiaowei Yue, Georgia Institute of Technology, xwy@gatech.edu, Hao Yan, Jin Gyu Park, Richard Liang, Jianjun Shi

Modeling of high-dimension nonlinear profiles is an important and challenging topic in statistical process control. Conventional mixed effect model has limitations in solving the multichannel profile detection in nanomanufacturing. A wavelet-based penalized mixed-effects model (WPMM) is proposed to exploits a regularized high-dimensional regression with linear constraints to decompose profiles into four parts: fixed effect, normal random effect, defective random effect, and noise. An accelerated proximal gradient algorithm is developed to efficiently estimate parameters. Case study shows that the WPMM can realize a better detection power and shorter computation time.

Dynamic Programming /Control

Contributed Session

Chair: Jefferson Huang, Postdoctoral Associate, Cornell University, Ithaca, NY, United States, jh2543@cornell.edu

1 - Segmentation Of Anatomical Structures Using Dynamic Identification And Classification Of Edges (dice) Model In Medical Images

Maduka M. Balasooriya, Teaching Assistant, Southern Illinois University, Edwardsville, Edwardsville, IL, 62026, United States, mbalaso@siue.edu, Sinan Onal, Xin W Chen

Segmentation of anatomical structures using medical images such as MRI, CT scan, and digital fundus image is still ongoing research subject. We developed the dynamic identification and classification of edges (DICE) model that aims to automatically identify edges of a contour of an anatomical structure without any intervention from domain experts. The DICE model includes three sequential but intertwined steps: (a) identifying potential edge points of a contour using moving range control charts; (b) extrapolating additional edge points of a contour through noise reduction; and (c) classifying points into different edges using neighborhood gradient search.

2 - Military Applications Of Approximate Dynamic Programming: Optimizing Helicopter Lift Operations

James Grymes, Instructor, United States Military Academy, 646 Swift Rd, West Point, NY, 10996, United States, james.grymes@usma.edu

Military commanders rely on helicopter lift assets to serve as force multipliers by moving military personnel and equipment around the battlefield. Inefficiency is a byproduct of uncertainty inherent in military operations which can lead to mission delays and possible failures. This research is designed to explore approximate dynamic programming as a tool for assisting air movement planners. We model Army helicopter lift operations as a Markov Decision Process and learn the value of decisions through machine learning. The algorithm returns an approximating value function for scheduling air lift routes in order to enhance combat power.

3 - Value Function Discovery In Markov Decision Processes

Sandjai Bhulai, Vrije Universiteit Amsterdam, Faculty of Sciences, De Boelelaan 1081a, Amsterdam, 1081 HV, Netherlands, s.bhulai@vu.nl, Martijn Onderwater, Robert van der Mei

We introduce a novel method for discovery of value functions for Markov Decision Processes (MDPs). This method is based on ideas from the evolutionary algorithm field. Its key feature is that it discovers descriptions of value functions that are algebraic in nature. This feature is unique, because the descriptions include the model parameters of the MDP. The algebraic expression can be used in several scenarios, e.g., conversion to a policy, control of systems with time-varying parameters. We illustrate its application on an example MDP.

4 - Making College Admission Offers: A Dynamic Programming Approach

Subhamoy Ganguly, Indian Institute of Management Udaipur, IIM Udaipur, MLSU Campus, Udaipur, 313001, India, subhamoy.ganguly@iimu.ac.in, Michele Samorani, Ranojoy Basu, Viswanathan Nagarajan

College admissions problem refers to the problem where each college seeks to admit the best possible class from a pool of applicants and most applicants apply to multiple colleges, hoping to enroll in one of their most preferred colleges. Most of the extant literature models this problem in the context of a two-sided matching market. However, admissions offices often cannot use these approaches due to practical limitations. We develop a dynamic programming model that could help colleges make optimal decisions of offering admission to secure the best possible class while filling all seats.

5 - Reductions Of Undiscounted Markov Decision Processes And Stochastic Games To Discounted Ones

Jefferson Huang, Postdoctoral Associate, Cornell University, Ithaca, NY, United States, jh2543@cornell.edu, Eugene A Feinberg

We provide conditions under which certain total and average cost Markov decision processes (MDPs), with possibly uncountable state and action spaces, can be reduced to discounted ones. These reductions are used to obtain complexity estimates for computing an optimal policy for finite MDPs and for computing a nearly optimal policy for infinite MDPs. We also provide analogous reductions for zero-sum stochastic games with possibly uncountable state and action spaces, and show how they can be used to obtain results on the existence of the value and optimal strategies, as well as results on robust MDPs.

Game Theory V

Contributed Session

Chair: Edward Cook, Senior Vice President, Capital One, 4 Bisley Court, Henrico, VA, 23238, United States, Ed.cook2000@gmail.com

1 - Bayesian Opponent Exploitation In Imperfect-information Games

Sam Ganzfried, Ganzfried Research, 55 West 26th Street #36E, New York, NY, 10010, United States, sam.ganzfried@gmail.com

For all game classes one can potentially do better than following a static Nash equilibrium strategy by learning to exploit perceived weaknesses of opponents. An exact efficient algorithm is known for best-responding to the opponent's posterior distribution assuming a Dirichlet prior with multinomial sampling in normal-form games; however, for imperfect-information games the best known algorithm is a sampling algorithm approximating an infinite integral without theoretical guarantees. The main result is the first exact algorithm for accomplishing this in certain imperfect-information games. We also present an algorithm for the natural setting where the prior is uniform over a polyhedron.

2 - Strategic Decentralization: Implications For Equity And Equality

Omkar D Palsule-Desai, Faculty, Indian Institute of Management Indore, Rau Pithampur Road, Wing C, Ground Floor, Indore, 453331, India, omkardpd@iimidr.ac.in

We develop a noncooperative game theoretic model to examine network performance and stability related implications of allocation mechanisms that endogenously balance equity vis-à-vis equality, and hence, the degree of collusion among the network firms in a decentralized setting. We show that inefficiencies and instability of decentralization can be eliminated by incorporating an additional degree of freedom in the network formation game. Our model and the structural results are applicable to networks such as producers' cooperatives, industrial clusters, joint production and research facilities, etc., wherein the conflicts of equity-equality and degree of collusion are predominant.

3 - A Nonlinear Programming Approach For Determining A General Equilibrium For N-person Games

Ahmad Nahhas, Gradiate Researcj Associate I, University of Texas at Arlington, 706 W Mitchell Cir Apt 621, Arlington, TX, 76013, United States, ahmad.nahhas@mavs.uta.edu, H. W. Corley

A general equilibrium for n-person normal form games is a set of mixed strategies with the following property. No player in some subset B of all players can achieve a better payoff if players in an associated proper subset G of all players change strategies unilaterally. A nonlinear programming approach is presented to prove the existence of such an equilibrium and then compute one.

4 - Stability Analysis Of Horizontal Mergers In A Market With Asymmetric Substitutability

Kohei Takeda, Keio University, Hiyoshi 3-14-1 Kohoku-ku, Yokohama, 2238522, Japan, tkdkt.k@gmail.com, Nobuo Matsubayashi

We consider the stability of horizontal mergers between firms in a Cournot oligopoly in which the substitutability of goods is asymmetric. We specifically focus on the core allocation under the grand coalition in a general N-firm oligopoly. The main result of our analysis shows that the grand coalition is stable in a highly asymmetric market in terms of substitutability.

5 - Applying Game Theory To Multiobjective Multistakeholder Decisions

Edward Cook, Senior Vice President, Capital One, 4 Bisley Court, Henrico, VA, 23238, United States, Ed.cook2000@gmail.com

For Multi-Objective Decision Analysis (MODA) when the decision-makers grow past one, there is difficulty. Often one decision-maker's process impacts another. To solve this, the application of Game Theory to model the objectives can be used. Game Theory models the interaction between multiple players enabling discovery of the Pareto Equilibrium and not just a Nash Equilibrium which may be suboptimal.

Supply Chain, Decision II

Contributed Session

Chair: Emre Berk, Bilkent University, Faculty of Business Administration, Ankara, 6533, Turkey, eberk@bilkent.edu.tr

1 - Network Characteristics And Supply Chain Disruption Resilience

Yuhong Li, Virginia Tech, Blacksburg, VA, United States, yuhongli@vt.edu, Christopher Zobel, Onur Seref

Previous studies on supply chain network resilience focus on network types, which cannot describe a real supply chain network well. Hence, we focus on characteristic level in this study. This work aims to show what combinations of characteristics will make the supply network more resilient, and we expect to provide executable prescriptions to practitioners to improve supply chain resilience. Classification methods and simulations are employed to carry out this study.

2 - Supply Chain Cooperation In Enterprise Platform Transformation Strategies

Lyu Gaoyan, PhD, Guanghua School of Peking University, Beijing, China, swallowlvgaoyan@sina.com

With rapid development, the Internet has changed the traditional supply chain structure and is creating new business models and the way of enterprise management. Based on the background of Chinese market, we study the transformation of supply chain platform strategy considering the attitudes of decision makers in different supply chain stages. Using the revenue sharing contract, we obtain the pareto improvement interval. By solving the equilibrium of the platform innovation cooperation strategies, we find the innovation cooperation strategy between the supplier and the platform retailer and provide the profit allocation method of the full-cooperation strategy.

3 - Optimal Product Design And End-of-Life Options For an OEM Under Different Pricing Strategies

Jie Zhang, PhD Student, Virginia Tech, 852 Claytor Square, Blacksburg, VA, 24060, United States, jiezhang@vt.edu

The design of a product impacts its production cost, salvage value, and demand. In this paper, a novel two-stage model pertaining to the reverse supply chain of an original equipment manufacturer (OEM) and containing the impact of product design, is formulated. We first and foremost give demand function under different pricing strategies of new and remanufactured products. Then, optimal prices and optimal end-of-life options are derived. All the possible cases are analyzed and graphed under different market and cost parameters. By considering different pricing strategies and proportion of green market demand at the second stage, we generate insights pertaining to optimal product design strategies. Finally, we determine optimal product design strategies for the OEM.

4 - Quantifying The Benefits Of Continuous Replenishment Program For Partner Selection

Payam Parsa, PhD Candidate, University of Arkansas, 1818 W Bedford Loop, Apt 3, Fayetteville, AR, 72701, United States, pparsa@uark.edu, Manuel D Rossetti, Shengfan Zhang, Edward A Pohl

This research develops a data-driven model that quantifies the benefits of a continuous replenishment program (CRP). CRP is a well-established supply chain collaboration program that has been used widely in various business sectors. The proposed model is able to compute the cost savings of CRP for both partners and at three levels of inventory holding, transportation and ordering cost components. The model is adopted by a major healthcare manufacturer who seeks to estimate the cost savings of a business relationship with a major distributor. The results indicate that CRP reduces the total cost of supply chain by 19.1% where the distributor gains disproportionately more savings.

5 - The Newsvendor Problem Re-visited With Novel Funding Schemes

Emre Berk, Bilkent University, Faculty of Business Administration, Ankara, 06533, Turkey, eberk@bilkent.edu.tr

Recently novel funding mechanisms have emerged for new or small businesses which have limited access to traditional financing and credit mechanisms. These provide unique opportunities and challenges for operational decision making. In this talk, we revisit the newsvendor problem under such novel financing schemes and discuss some operational implications and issues.

Ops/Economics Inter

Contributed Session

Chair: Huaqing Wang, Assistant Professor, Emporia State University, 1 Kellogg Circle, Emporia, KS, 66801, United States, hwang4@emporia.edu

1 - Optimal Bundling Of Information Goods In A Duopoly

Araz Khodabakhshian, UCLA Anderson School of Management, 501 Gayley Avenue, Apt 11, Los Angeles, CA, 90024, United States, araz.khodabakhshian.1@anderson.ucla.edu, Uday S Karmarkar, Guillaume Roels

Bundling is a common practice in several business sectors, but there are also many examples of firms that choose not to bundle. We study bundling in the presence of competition to examine its implications for bundling strategy. We model the bundling strategy of two firms offering two products to two customers as a two-stage non-cooperative game. In the first stage, firms choose their product offering combinations. In the second, they simultaneously choose prices for their offerings. We consider two extreme cases of perfectly positively and perfectly negatively correlated customer valuations. We show that in equilibrium, only one of two competing firms chooses to bundle.

2 - Launching Next Generation Products In A Competitive Market

Xishu Li, Erasmus University, Mandeville (T) Building, Room 9-56, Erasmus University, Rotterdam, 3062PA, Netherlands, x.li@rsm.nl, Rob A Zuidwijk, M.B.M. (Rene) de Koster

We consider a next-generation product launch problem in a competitive market under uncertain product quality and consumer taste. We focus on two levels of competition: 1) next-generation product competes with the existing product for capacity and demand; 2) firm competes with its competitor for product quality, market share and price.

3 - Retailer Strategic Pricing Under Sticky Demand

Zheng Li, Student, Texas A&M University, 263 Navarro Dr, College Station, TX, 77845, United States, lzrain@tamu.edu, Haoying Sun, Xirong Chen, Haipeng Chen

The literature on dynamic pricing assumes that consumer demand responds to any changes in price. Recent advances in economics, however, have suggested that consumers may be rationally inattentive and not respond to small price changes, resulting in demand stickiness. We explicitly model the implications of this sticky demand on firm's pricing behaviors. Using a large dataset consisting of eight years of weekly grocery retail data, we estimate the magnitude of demand stickiness and demonstrate how the estimates vary with consumer demographics. Furthermore, we conduct a counterfactual analysis showing the profit improvement a retailer could enjoy by taking into account this demand stickiness.

4 - Association Between Relatedness In Diversification And Performance Of Us Public Firms

Muhammad Zubair, Nanyang Business School, 50 Nanyang Avenue, Blk S3-01B-73, Singapore, 639798, Singapore, c130016@e.ntu.edu.sg, Chen Chien-Ming

This study empirically examines the link between relatedness in the diversification of a firm and its inventory performance. The study is based on firms' annual financial and segment sales data in addition to US industry input-output data.

5 - Product Quality Differentiation Through Information Provision

Huaqing Wang, Assistant Professor, Emporia State University, 1 Kellogg Circle, Emporia, KS, 66801, United States, hwang4@emporia.edu, Haresh B Gurnani, Raphael Boleslavsky

We examine the joint interaction of information provision and pricing decisions by two competitive firms when a buyer is uncertain about product valuations. Firms generate product differentiation by allowing consumers to learn about valuations or prevent them from doing so. We characterize equilibrium prices and its interaction with information policies.

1 - How To Handle Extreme Supply Chain Situation

Wenqing Zhang, University of Minnesota Duluth, 1318 Kirby Drive, Labovitz School of Business and Economics, Duluth, MN, 55812, United States, zhangwenqing@gmail.com, Prasad Padmanabhan, Chia-Hsing Huang

We investigate the impact of industry market concentration on the ability of firms with adventurous and rational managers to deal with extreme cash flows. We provide simulation results on how market concentration (from a monopoly to a perfectly competitive structure), influence the NPV decisions of firms with different manager/cash flow types. While prices to consumers are higher under a monopoly, they may provide additional benefits to society in the form of having extended ability to survive extreme cash flows.

2 - Organizational Design: Scale, Scope, Focus And Decentralization

Phillip J Lederer, Professor, University of Rochester, Box 270100, Rochester, NY, 14627, United States, Lederer@simon.rochester.edu

Scale, scope, focus and decentralization affect the design of management hierarchy that monitors and controls production. Modeled as a network of information processors, an optimal design minimizes capacity and time delay costs. Among the results are: sufficient conditions that induce "product" and "process focus are derived. Large changes in cost don't much change the hierarchy's departmental structure but greatly affect capacity allocation. Local decision making has a much larger effect on hierarchy's height than large delay cost. Staff utilization falls with level.

3 - Volatility Spillover Dynamics In Chinese Steel Markets

Wen Fang, Xidian University, Xi'An, China, az-moju@163.com

The development of steel market plays an important role in the development of China's bulk stock commodity market. China has emerged a typical steel market —— steel electronic market, which is in the process of vigorous development. Three types of steel market coexisting is a realistic background and trend in Chinese steel industry. Our research focuses on volatility spillover in Chinese steel markets. The objective of our research is to reveal which steel market is a strong barometer for the steel price fluctuations. A dynamic multi-dimensional volatility spillover method based on GARCH model and Kalman filter is proposed aiming at the volatility dynamics research in Chinese steel markets.

4 - Optimal Design Of Discrete Dutch Auction With Time Limitation

Jinfeng Yue, Middle Tennessee State University, Department of Managment and Marketing, Murfreesboro, TN, 37132, United States, jinfeng.yue@mtsu.edu, Jinfeng Yue, Shanghai University of Finance and Economics, Shanghai, China, jinfeng.yue@mtsu.edu, Zhen Li

This research concerns the optimal design of discrete Dutch auction. It explains why Dutch auction is a fast auction; a secret reserve price alone cannot improve the auction outcome, but its influence can be achieved through the existence of strategic shoppers and the magnitude of their salvage values; the knowledge about bidding population size yields a higher expected revenue per unit of time.

5 - The Effects Of Financial And Operational Hedging On Operational Variables: Evidence From The Gold Mining Industry

Panayotis Markou, IE Business School, Calle Maria de Molina 12, Bajo, Madrid, 28006, Spain, pmarkou.phd2016@Student.ie.edu, Daniel S Corsten

Prior analytical models of hedging are sometimes contradictory, and the exact mechanism by which hedging affects operations is not well understood. We use a detailed data set comprising the financial and operational hedging decisions of 82 gold miners from 2003 to 2011 to analyze the effects of risk management on inventory and profit variance. Gold miners can utilize operational hedging, yet this strategy increases inventory and profit variance. Financial hedging is also used to mitigate price risk, and this reduces inventory and profit variance. When used simultaneously, the financial hedge controls the operational hedge, resulting in significant reductions in inventory and profit variance.

1 - The Impact Of Capability Portfolio on Competitive Position Between Industry Duopoly

Yanyun Zhang, Guanghua School of Management, Peking University, Beijing, China, yanyunzhang2010@163.com

We attempt to study the impact of a firm's capability portfolio on performance between industry duopoly with Stackelberg model. The weaker position firm owns its specific advantages, regarding as its capability as well as for the stronger one. Meanwhile, the capability's contribution weight differs. A firm faces a risk of failure when the performance is lower than a certain threshold. Respectively from static and dynamic perspectives, we know how to balance capabilities to overcome the competitors, or to remain competitive and whether to strengthen or weaken the capability to improve the competitive position where firm's performance varies with the boundary changes of the firm's capability.

2 - Resource Optimization Based On Data Envelopment Analysis - Dynamic Programming Method

Tao Du, Beijing Insititute and Technology, Beijing, China, dutao0608@163.com

As the resource optimization is one of main approach to improve organization's efficiency, we propose a DEA-Dynamic Programming (DEA-DP) method which is a resource optimization method combining with the DEA model for measuring efficiency and the Dynamic Programming method for multistage decision. The basic ideas of the method is to determine the optimal resource planning strategy for improving the inter DMUs' relative efficiency of organization through Dynamic Programming method. Through a case study, we proves investment can be saved by 11.23% using the method.

1 - Robust Principal Component Analysis In Multiclass Problem Structures

Sam Davanloo, Ohio State University, Columbus, OH, United States, sdt144@vt.edu, Xinwei Deng

Robust Principal Component Analysis (RPCA) is mainly used to decompose a data matrix to a low rank and a sparse component, and has applications in face recognition, video surveillance, latent semantic indexing, and etc. In this study, we consider a multiclass structure in which classes share a common low rank component, a class-specified low rank component, and a class-specific sparse component. RPCA is then utilized to estimate these components. A first-order optimization method is proposed to solve the problem in high-dimensional settings. Numerical simulation results support the proposed methodology.

2 - Stability Of The Stochastic Gradient Method For Approximated Large Scale Kernel Machine Using Random Fourier Features

Aven Samareh, PhD Student, University of Washington, 4324 8th ave NE, D7, Seattle, WA, 98105, United States, asamareh@uw.edu, Mahshid Salemi Parizi

We measured the stability of stochastic gradient method (SGM) for learning an approximated Fourier support vector machine. The stability of an algorithm is considered by measuring the generalization error in terms of the absolute difference between the test and the training error. Our problem is to learn an approximated kernel function using random Fourier features for binary classification data sets via online convex optimization settings. We showed that with a high probability SGM generalize well for an approximated kernel under a convex, Lipschitz continuous and smooth loss function given reasonable number of iterations. We empirically verified the theoretical findings as well.

3 - Modeling Improvements And Refinements To The Fleet Modernization Capability Portfolio Analysis Tool

Frank Muldoon, Sandia National Labs, 1525 Summit Hills Drive NE, Albuquerque, NM, 87112, United States, fmmuldo@sandia.gov, Matthew Hoffman, Stephen Henry, Lucas Waddell, Peter Backlund

The Capability Portfolio Analysis Tool (2015 Edelman Finalist) is currently being used to model both the fleet of ground combat systems under the U.S. Army PEO Ground Combat Systems and the fleet of logistics and support systems under PEO Combat Support & Combat Service Support to provide analytical capability in support of modernization and investment decisions. This large-scale multi-phase MILP has evolved over the last year to meet the challenges posed by both PEOs including the incorporation of budgetary earmarks, system age, and modeling techniques developed to mitigate its large size.

4 - An Iterative Rounding Algorithm And Almost Feasibility For Nonconvex Optimization

Tao Jiang, Purdue University, 403 W. State Street, Krannert School of Management, West Lafayette, IN, 47906, United States, taujiang@purdue.edu, Thanh Nguyen, Mohit Tawarmalani

We consider a class of high-dimensional non-convex minimization problems for which the objective is separable and constraints are linear. We solve a convex relaxation to obtain a lower bound and to restrict the original problem to an integer program. Then, we study the trade-off in approximation gap between admitting solutions that violate some constraints slightly versus not allowing such solutions. In particular, we show that if we admit solutions that "almost" satisfy the constraints with small coefficients, the iterative rounding procedure can find a solution much closer to the relaxation bound than if we disallow such solutions. We discuss applications of this result in various settings.

Opt, Linear Programing

Contributed Session

Chair: Joseph L Trask, North Carolina State University, 3500 Mill Tree Rd, Apt B2, Raleigh, NC, 27612, United States, jltrask@ncsu.edu

1 - Optimal Assignment Of Inspection Stations In A Flowline

Md Shahriar Jahan Hossain, Louisiana State University, 2508 Patrick F. Taylor Hall, Baton Rouge, LA, 70803, United States, msjhossain1@gmail.com, Bhaba R Sarker

The research deals with multiple in-line inspection stations that partition a production flowline into multiple flexible lines. A unit cost function is developed for determining the number and locations of in-line inspection stations along with the alternative decisions on each type of defects: scrapping or reworking (on/off-line). The problem is formulated as fractional mixed-integer nonlinear programming problem to minimize the unit cost of production, and solved with branch and bound method. A construction heuristic is also developed to determine a sub-optimal solution for large instances.

2 - The Double Pivot Simplex Method

Fabio T Vitor, Graduate Teaching Assistant, Kansas State University, 2061 Rathbone Hall, 1701B Platt St., Manhattan, KS, 66506, United States, fabioftv@k-state.edu, Todd W Easton

The Simplex Method (SM) is considered one of the top 10 algorithms of the 20th century. Each iteration of SM pivots between basic feasible solutions by exchanging one nonbasic variable with a basic variable. This talk presents the Double Pivot Simplex Method (DPSM), which can pivot on two variables. The Slope Algorithm is a new method that replaces the ratio test of SM, and guarantees the optimal basis at every iteration of DPSM. Furthermore, each iteration of DPSM not only has the same theoretical running time as SM, but also improves the objective value by at least as much as an iteration of SM. Computational experiments demonstrate that DPSM is approximately 15% to 40% faster than SM.

3 - Inverse Optimization For Utility Measurement

Yu-Ching Lee, National Tsing Hua University, Hsinchu, Taiwan, ylee77@illinois.edu, Yi-Hao Huang, Ciou Si-Jheng

Utility function has been prevalent to express one consumer's preference representing consumer's demand. We formulate a mathematical program with quadratic objective function and complementarity constraints as the inverse problem that minimizes the error of the measured utility function. Our research indicates that the program with complementary constraints will help us find a set of more accurate parameters.

4 - Determining The Aggregate Plan: A Cross-functional Perspective

Kathleen Iacocca, Villanova University, Villanova, PA, United States, kathleen.iacocca@villanova.edu, Kingsley Gnanendran

The traditional aggregate plan is extended to include marketing and financial aspects. On the marketing side, we determine the optimal price and demand for each period, while on the financial side we include month-by-month collections, taxes, interest on loans and/or return on surplus funds, depreciation, and minimum cash balances in determining optimal production levels. The problem is modeled as a linear program and implemented on a spreadsheet to demonstrate ease of managerial applicability.

1 - Consumer Perceptions Of Return Policies

Yue Cheng, Pennslyvania State University, 460A Business Building, University Park, PA, 16802, United States, yuc190@psu.edu, Daniel Guide, Margaret Meloy

This study investigates consumer perceptions of three types of return policies by using survey data. The consumers responded to the amount of discounts and premiums associated with different return policies and brand equity. We provide managerial insights for firms to take advantages of using different return policies strategically.

2 - Immediate And Long-term Benefits Of In-store Return Experience

Necati Ertekin, Assistant Professor, Santa Clara University, 500 El Camino Real, Santa Clara, CA, 95053, United States, nertekin@scu.edu

We study the association between in-store customer experiences during returns and immediate exchange/subsequent repurchase behaviors. Using transactional data and satisfaction survey responses from 7,921 customers at a jewelry retailer, we identify perceived product quality, customer-oriented selling, and time to return as the factors that may influence customer exchange and repurchase behaviors.

3 - Effects Of Assortment Size Announcements On Manufacturer Competition

H. Sebastian Heese, EBS University, ISCM, Burgstr. 5, Oestrich-Winkel, 65375, Germany, sebastian.heese@ebs.edu, Victor Martinez de Albeniz

We study the impact of retailer assortment strategies on manufacturer wholesale pricing. The size of an assortment affects both competition between manufacturers for inclusion in the assortment and competition between participating manufacturers for market share. We optimize retailer assortment strategies taking into account these two effects.

Multicriteria Decision II

Contributed Session

Chair: Tommi Juhani Pajala, Aalto University School of Business, Runeberginkatu 22-24, Helsinki, 100, Finland, tommi.pajala@aalto.fi

1 - An Integrated Black Topsis And Grey Linear Programming Approach To Deal With Uncertainty And Confidence Level Of Decision Makers

Hanif Malekpoor, PhD Student, University of East Anglia, Norwich Research Park, Norwich, NR4 7TJ, United Kingdom, H.Malekpoor@uea.ac.uk

In order to deal with uncertainty of Decision Makers (DMs) opinions in supplier selection, applying interval valued data is a popular method. However the level of confidence, DMs have about their judgments, is also significant. In addition the supplier's information related to constraints of order allocation problem is not precise. In this research to overcome the two aforementioned problems we have developed an integrated approach for order allocation, using Black-TOPSIS (TOPSIS with interval numbers which their upper and lower bounds are also grey numbers) and multi objective grey linear programing to determine the best supplier and order quantity from each suppliers.

2 - A Multi-criteria Decision Making Model For Evaluating Alternatives Under Large And Distinct Decision Makers

Anthony Afful-Dadzie, University of Ghana, P.O. Box LG 78, Legon, Accra, Ghana, atosarsah@gmail.com

This study proposes a method for analyzing the evaluation and ranking problem of alternatives in the case where there are large number of distinct decision makers for each alternative. Relying on the underlying distribution to the evaluation data, this peculiar problem is transformed into the format of a typical MCDM problem for easier analysis and interpretation. A numerical example is presented to illustrate the richness and applicability of the problem.

3 - P-center And P-dispersion Problems: A Bi-criteria Analysis

Golbarg Kazemi Tutunchi, Operations Research Specialist, SAS Institute, 100 SAS Campus Dr,, Cary, NC, 27513, United States, golbarg.tutunchi@sas.com, Yahya Fathi

We consider the p-center and the p-dispersion problems in the context of a bi-criteria location analysis. We propose a mathematical programming model and a binary search procedure to obtain the corresponding non-dominated frontier. We further study the structure of the proposed IP model and propose a new family of valid inequalities to help solve this IP model more effectively. Through a limited computational experiment we demonstrate the effectiveness of the proposed procedure and the valid inequalities.

4 - Judgments Of Importance Revisited: What Do They Mean?

Tommi Juhani Pajala, Aalto University School of Business, Runeberginkatu 22-24, Helsinki, 00100, Finland, tommi.pajala@aalto.fi, Pekka J Korhonen, Jyrki Wallenius

In a MCDM problem, decision makers can often say that one criterion is more important than another. What has remained unclear is whether value function weights are somehow connected to these judgments of importance. A surprisingly common assumption is that a more important criterion will have a larger weight, as if weights and importance were closely related. We present experimental evidence that Goldstein's (1990) idea of judgments of importance as impact is a better interpretation. Further, we show that if we wanted to interpret importances as weights, we would need to know the scale the decision maker has in her mind. Without that knowledge, considering importance in terms of weights is not feasible.

Supply Chain, General

Contributed Session

Chair: Arda Yenipazarli, Assistant Professor of Operations Management, Georgia Southern University, 2224 College Of Business Administration, Department of Logistics & Supply Chain Management, Statesboro, GA, 30460, United States, ayenipazarli@georgiasouthern.edu

1 - Mechanism Design In Pet Bottle Recycling Auction

Kazuaki Okubo, Assistant Professor, Saitama University, 255 Shimo-okubo, Sakura-ku, Saitama, 338-8570, Japan, okubo@dp.civil.saitama-u.ac.jp

This study examines an efficient auction mechanism where firms bid for set-period contracts to recycle polyethylene terephthalate (PET) bottles in Japan. For the auctions, the Japanese municipalities estimate their PET bottle recycling amounts in contract period, and the recycling firms prepare bids to win the recycling contracts. I focus on a negative impact of the estimation error of the amounts on the firms' bids and analyze an efficient mechanism with consideration of such uncertainty. I also examine the effect of asymmetric bidder size and the distance between the recycler's location and the municipality on the performance of the auction.

2 - Sales Agents Incentive Contracts In Competing Supply Chains

Samar K Mukhopadhyay, Professor, GSB SKK University, 53 Myeongnyung-dong 3-ga, Jongno-gu, Seoul, 110-745, Korea, Republic of, samar@skku.edu

We investigate contracting and sales agent incentives in two competing supply chains, each consisting of one manufacturer and one sales agent. The two supply chains are identical, but may have different contract types. We use a non-cooperative game where, in the first stage, the manufacturers decide the contract types. In the next stage, the manufacturers offer contracts to their sales agents who engage in competition. We analyze the game for two different contract types - a single linear contract and a menu of linear contracts. We find conditions under which a given contract type is preferred. We also find how risk aversions and uncertainties affect the profits.

3 - Managing Speed And Price In Customer-intensive Services

Chengzhang Li, Harbin Institute of Technology, No. 92 West b, Harbin, China, lcz_grown@163.com

This paper investigates the optimal price and service rate in a customer-intensive service, where customers' perceived service quality decreases in the service speed. Customers are assumed to be heterogeneous in terms of their reservation utility which is captured by a random variable and they will join the queue if their expected utility is greater than their reservation utility. The optimal service rate and price are derived under two classes of customers with different customer intensities. The results suggest that the optimal service rate and price depend on the customer intensity, customers' reservation utility distribution and the potential market size.

1 - A Fix & Optimize Heuristic For Capacitated Foodgrain Inventory Multi-Modal Transportation Problem In Indian Public Distribution System

Ajinkya Tanksale, Doctoral Student, Indian Institute of Technology Kharagpur, IIT Kharagpur, West Bengal, Kharagpur, 721302, India, ajinkya.tank@gmail.com, Jitendra Kumar Jha

In this work, we study an integrated inventory and multi-modal transportation problem in a region-bound multi-facility supply chain, which is motivated from the case of foodgrain distribution in the Indian public distribution system. The problem is formulated as mixed integer programming problem and solved using fix-and-optimize heuristic with several new decomposition schemes and a greedy heuristic for initial solution. The effectiveness and efficiency of the proposed solution approach is supported by comprehensive computational experiments.

2 - Pricing Model Of Feeder And Trunk Routes Combined Transport Based on Revenue Sharing Mechanism

Hualong Yang, Professor, Dalian Maritime University, Room 510, Management Building, 1 Linghai Road, Dalian, 116026, China, hlyang@dlmu.edu.cn

There are strong complementarities between feeder and trunk routes. This paper considered the competition among parallel substitute itineraries and studied the pricing problem of feeder and trunk routes combined path. Based on the vertical integration and diversification in transport chain, a Bertrand game model was established. A reasonable revenue sharing mechanism was further designed, making the transport chain coordinate under decentralized decision making. Numerical Example verifies the effectiveness of the model. The results show that centralized decision making and reasonable revenue sharing mechanism contribute more to boost profits and reduce the transport cost of the shipper.

3 - A Multi Objective Hub Location Model For A Distribution Network Under Uncertainty In Demand And Time

Andrew Junfang Yu, Associate Professor, The University of Tennessee Knoxville, UT Space Institute, 411 B.H. Goethert Pkwy., MS 19, Tullahoma, TN, 37388-9700, United States, ajyu@utk.edu, Fahimeh Rahmanniyay

In this paper, we develop a multi-objective mixed integer stochastic model (MMS) for hub location problem under uncertainty. The transportation time between each pair of nodes and demand of each node are uncertain parameters. Our multi-objective model includes (1) Minimization of establishment cost as well as transportation cost and (2) minimization of delay between each pair of nodes.

1 - Sustainable Supply Chain Habits: Translating Ethical Practices Into Socially Responsible Supplier Selection And Development Practices

Karen Eboch, Senior Lecturer, Bowling Green State University, Department of Management, BAA 3020, Bowling Green, OH, 43403, United States, eboch@bgsu.edu

This qualitative study examines the influence of individuals involved in sourcing decisions to determine how corporate social responsibility practices in the selection and development of suppliers are transformed. Based on the relationship between the neuroscience of routine decisions (habits) and the established views of moral development, triggers of critical reflection regarding current policies are investigated to identify the drivers which alter existing supplier relationships. As individual morality is judged along cultural norms, the establishment and change of corporate patterns is seen as an extension of an individual's development and alteration of existing habits.

2 - On Sustainability Reporting: Increasing Role Of Global Reporting Initiative?

Andriy Shapoval, Georgia Institute of Technology, Atlanta, GA, United States, ashapoval3@gatech.edu, Henry Osadolor Aigbedo, Marina Mattera, Ivan Oliver Hilliard

This is the continuation of the work of the same authors about standards and initiatives in sustainability and corporate social responsibility reporting. Many businesses around the world follow the Global Reporting Initiative, but at different levels and not necessarily incorporate what the stakeholders desire to see. This study evaluates the case of aerospace and defense companies.

3 - Climate Change Initiatives In Supply Chains

Alireza Tajbakhsh, McMaster University, DeGroote School of Business, 1280 Main Street West, Hamilton, ON, L8S 4M4, Canada, alirezt@mcmaster.ca

There is ample literature about regional, nationwide, and international efforts in establishing mechanisms to curb pollution and emissions. In this study, we first review a variety of these policy instruments, with a focus on emissions trading systems, and then propose a model in the presence of uncertain demand. To do so, through a static game we investigate a multi-pollutant framework in which a number of entities compete in their product markets.

4 - Environmental Benefits Of Individually Optimized Electric Vehicle Battery Range

Hua Cai, Assistant Professor, Purdue University, 315 N. Grant St., West Lafayette, IN, 47907, United States, huacai@purdue.edu, Xiao Shi, Jian Pan

Previous studies evaluating the environmental impacts of electric vehicles (EV) often assume that all the adopters will choose the same EV, neglecting the heterogeneity of individual decisions considering individual travel needs and access to charging infrastructure.This study develops optimization models to identify the optimal EV battery range at the individual level using real world vehicle travel data and charging station location information. This study includes both a static analysis, which optimizes with current and historical data, and a dynamic analysis, which considers the uncertainties in individual travel pattern change and the further development of charging infrastructure.

Strategy/Strategic

Contributed Session

Chair: Hye Ryeong Lim, Seoul National University, Gangnamgu Dogok2dong Academysweet A -1704, Seoul, Korea, Republic of, limhr@snu.ac.kr

1 - Stakeholders' Influence On Mergers And Acquisitions: The Analysis Of The Impact On Acquisition Premium And Deal Completion Probability

JaSeung Koo, Assistant Professor, Kobe International University, 9-1-6 Koyocho-naka, Higashinada-ku, Kobe, 658-0032, Japan, koo.academic@gmail.com

There is extensive management literature on stakeholders' influence on corporate business operations, yet there is little known about whether and how stakeholders influence M&A progress. This study focuses on three types of primary stakeholders: employees, shareholders, and lenders, and examined their influence on the likelihood of completing an announced M&A and acquisition premiums. I explored stakeholders' reactions, which reflect their anticipation of benefits and losses from the proposed M&A with an empirical analysis of longitudinal data for listed Japanese non-financial firms' M&As between 1986 and 2012. The results showed general support for the proposed hypotheses.

2 - The Relationship Between Deep Level Diversity And Team Benefits: A Mixed Method from China

Yanqiu Song, Central University of Finance and Economics, Haidian, 39th South College Road, Beijing, China, sunny_syq@163.com, Aijing Ran

By using a mix-method, this paper aims to explore the dynamics of deep-level diversity in heterogeneous teams. First, we use an exploratory multi-case study to identify the influential factors of team diversity and team outcomes. Through interviews of 12 innovation teams in 6 international corporations, this study explores the impact mechanism of personality diversity and culture diversity on team process and team outcomes. Secondly, based on a dataset of 209 questionnaires, we testify the mediating role of team conflict and the moderating role of personality diversity and culture diversity in teams.

3 - New Perspectives on Contingent Workers

Hye Ryeong Lim, Seoul National University, Gangnamgu Dogok2dong Academysweet A -1704, Seoul, Korea, Republic of, limhr@snu.ac.kr, Kyung Suk Lee

In a fast changing business environment, firms rely on contingent workers to achieve flexibility. We found that contingent workers with high trust and various backgrounds engage with more voice behaviors than regular workers, bringing new perspectives to the organization as strength of weak tie theory suggests. With panel-data collected biennially from 41,740 contingent workers in 355 different organizations from 2005 to 2013, we conducted cluster analysis, dividing them into four categories: high trust, different backgrounds, high fatigue and perception of competitive organizational culture. We suggest firms first need to build trust with them to make the most of their knowledge.

Chair: Babak Hoseini, PhD Candidate, NJIT, 10 Hill Street, Apartment 2N, Newark, NJ, 7102, United States, bh77@njit.edu

1 - Bi-criteria Appointment Scheduling Of Patients With Heterogeneous Service Sequences

Payman Jula, Associate Professor, Simon Fraser University, Beedie School of Business, WMC 5358, Vancouver, BC, V5A 1S6, Canada, pjula@sfu.ca

We address the appointment scheduling of patients with heterogeneous service sequences and stochastic service times in multi-stage facilities, while considering the availability and compatibility of resources with presence of a variety of patient types. Mathematical programming, simulation, and multi-objective Tabu Search methods are used to achieve our bi-objectives of minimizing the waiting time of patients, and the completion time of the facility. Results of a case study and insights for practitioners are provided.

2 - Wait Time Announcements At Hospital Emergency Departments

Marco Bijvank, University of Calgary, 2500 University Dr. NW, Calgary, AB, T2N 1N4, Canada, marco.bijvank@haskayne.ucalgary.ca, Zhankun Sun

A number of Canadian hospitals have started publishing live emergency department (ED) wait times online in an effort to provide patients with expectations on how long they will have to wait to be seen for non-urgent care after initial assessment by a triage nurse. We accurately predict the state-dependent wait times at emergency departments based on a busy-period analysis for a multi-class, multi-server priority queue with delayed feedback. We illustrate the robustness and impact of the predictor on patient flow and patient care with a case study at four major hospitals in the Calgary area.

3 - Modeling The Impact Of Mandated Quality Outcome Thresholds On Transplant Center Wait Times, Patient Mortality, And Unused Organs

Mohammad Delasay, Post-Doctoral Fellow of Operation Managemet, Tepper School of Business, Carnegie Mellon University, 6315 Forbes Avenue, #1105, Pittsburgh, PA, 15217, United States, delasays@cmu.edu, Sridhar R Tayur

We develop a queueing model of a transplant center's waiting list where patients arrive in two health states (with health deterioration over time) leading to differing post-transplant outcomes if transplanted. Offered organs, if accepted, are allocated to each health state based on a randomized policy. We derive performance metrics including wait list mortality. We extend the model to multiple health states using fluid approximations. We investigate the impact of the mandated survival outcome benchmarks on the transplant center's self-optimized allocation policy and their unintended negative consequences, including increase in the wait list mortality and the fraction of unused organs.

4 - Primary Care Scheduling With Urgent Patients In Carve Out Appointment System

Babak Hoseini, PhD Candidate, NJIT, 10 Hill Street, Apartment 2N, Newark, NJ, 07102, United States, bh77@njit.edu, Wenbo (Selina) Cai

In this work, we consider a carve-out scheduling where certain slots are allocated for the urgent patients while the rest are reserved for appointments requested in advance and some slots may be double booked if the demand arise. We develop a stochastic model under this policy to optimize the social welfare. Our model takes into account the stochastic demands of routine and urgent patients as well as no-shows and derives the optimal numbers of open slots and the maximum number of patients allowed being double-booked. We also develop heuristic schedules and compare their performances with the optimal schedules obtained from the complete enumeration algorithm.

Sunday, 11:00am – 12:30am

SB45 Model Uncertainty, Risk, & Compliance
SB46 Sharing Economy, Mechanism Design and Networks I
SB47 New Topics in Revenue Management and Pricing
SB48 Social Media Analytics for Businesses
SB49 Case Competition II
SB50 Decision Making in Healthcare
SB51 Emergency Response, Recovery, and Resilience
SB52 Proactive Planning Against Weather Events
SB53 Emerging Trends in Business Innovation
SB54 Panel: Meet the Editors of Service Science
SB55 Modeling and Optimization for Renewable Energy Integration
SB56 Analytical Models in E-business
SB57 Behavioral Research on Inventory and Pricing
SB58 Energy II
SB59 TSL Keynote Address
SB60 Advances in Traffic Equilibrium and Network Loading Models
SB61 Advances in Railway Research
SB62 Aviation Applications Section: Best Student Presentation Competition II
SB63 Alternative Fuel Vehicles and Sustainable Transportation
SB64 Applications and Methodological Issues on MCDM
SB65 Learning Analytics of Massive Open Online Courses (MOOCs)
SB66 Panel: QSR Student Introduction and Interaction and Best Student Poster Competition
SB67 Dynamic Data Driven Application Systems
SB68 Advanced Maintenance Modeling
SB69 Panel Discussion: Internet of Things Data Analytics
SB70 Trans, Freight II
SB71 Trans, Public II
SB72 Supply Chain Mgt II
SB79 JFIG Paper Competition II
SB86 Manufacturing II
SB94 Technology Tutorial – Bayesia/Palisade Corp.

Sunday, 1:30pm – 3:00pm

SC01 Supervised and Unsupervised Methods
SC02 Quality and Statistical Decision Making in Health Care Applications
SC03 Doing Good with Good OR I
SC04 Gas-Power Market Integration
SC05 Power transmission planning under uncertainty
SC06 INFORMS 2016 Data Mining Best Student Paper Awards
SC07 Joint Session DM/AI: Data Mining for Decision Making
SC08 Undergraduate OR Prize – II
SC09 Energy and Environmental Policy
SC10 Advances in Energy Systems Modeling
SC11 Dense Clusters in Network Optimization
SC12 Convex Relaxations for Nonconvex Polynomial Optimization
SC13 Advances in Mixed Integer Polynomial Optimization
SC14 Syngenta Crop Challenge in Analytics
SC15 Big Data Modeling
SC16 Algorithms for Large-Scale Stochastic Programs
SC17 Optimizing Chance-Constrained Programming Variants
SC18 HPC in Optimization 2
SC19 Computation and Theory in Network Optimization and Analysis
SC20 Novel Dimension Reduction Techniques for High Dimensional Data Using Information Complexity
SC21 Monitoring and Prevention of Healthcare Associated Infections
SC22 Joint Panel Session: ORHP/HAS/MSOM-Hlth: Challenges and Lessons Learned from Influencing National Policy Change in Organ Transplant
SC23 Risk Management in Global Food Supply Chains
SC24 Dynamics of Competition
SC25 Latest Developments in Scheduling Research
SC26 Auction Design Topics
SC27 Panel: Emerging Themes in Innovative Operations
SC28 Empirical Research in Operations Management
SC29 MSOM Energy and Sustainability
SC30 Empirical Studies in Operations Management
SC31 Managing Finances and Risk in Supply Chains
SC32 Scheduling III
SC33 Simulation and Optimization III
SC34 Joint Session HAS/MSOM-HC: Analytics in Drug Development
SC35 Frontiers of Supply Chain Research
SC36 Information and Risk in Supply Chain Networks
SC37 Revenue Management, Assortments and Choice Models
SC38 Collaborative New Product Development
SC39 Market Microstructure and Optimal Trading
SC40 Computational Issues in Productivity and Efficiency Measurement
SC41 Finance Section Student Paper Competition
SC42 Stochastic Systems in Finance
SC43 Spatial Risk and Decision Analysis
SC44 Modeling of Uncertainty and Preference in Decision Analysis
SC45 Panel: Systemic Risk Issues in Counterparty Risk and Central Clearing
SC46 Dynamic Pricing with Substitution, Learning and Reference Price Effects
SC47 New Topics in Revenue Management
SC48 Social Media in Marketing and Talent Management
SC49 Social, Political, and Economic Applications of Social Media Analysis
SC50 Achieving Professional Success by Managing the Work/Life Balance
SC51 Analytical Research in Humanitarian Service Delivery
SC52 Public Policy for Energy and the Environment
SC53 Advances in Research Exploring the Link between Learning and Innovation
SC54 Mathematical Modeling and Data Analytics in the Service Industry
SC55 Emerging Topics in Service Operations
SC56 Crowdsourcing and sharing economy
SC57 Consumer Behavior and Pricing Optimization
SC58 Energy III
SC59 Spatial Analysis in Transportation & Logistics
SC60 Facility Layout
SC61 Fleet Sizing Models
SC62 Aviation Applications Section: Best Student Presentation Competition III
SC63 Network Design and Maintenance in Transportation
SC64 DAAD Special Session on Multiobjective Optimization for Improved Modeling of Complex Systems
SC65 Machine Learning, Big Data and Economics
SC66 Additive Manufacturing
SC67 Decision Analysis Approaches and Predictive Modeling to Managing Uncertainty in Manufacturing and Service Systems Design & Operations
SC68 Panel Discussion: Funding Opportunities
SC69 Pierskalla I
SC70 Trans, Freight III
SC71 Trans, Public III
SC72 Supply Chain Mgt III
SC79 Health Care, Modeling III
SC86 Manufacturing III
SC94 Technology Tutorial – Wiley/Provalis Research

Sunday, 3:10pm – 4:00pm

Sunday, 4:30pm – 6:00pm

Monday, 8:00am -9:30am

MA34 Networks in Healthcare
MA35 Breakthroughs in Teaching Operations
MA36 Emerging Issues in Supply Chain
MA37 Securing Sustainable Future
MA38 Panel: Meet the Editors – NPD, Innovation, and Technology
MA39 Applied Probability and Machine Learning II
MA40 Supply Chain/ Inventory in Applied Probability I
MA41 FSS Tutorial
MA42 Systemic Risk and Financial Networks
MA43 Decision Analysis, Game Theory, and Disaster Management I
MA44 Environmental Decision Analysis
MA45 Agent-based Modeling and Simulation – Overview
MA46 Pricing, Revenue Management and Operations in Retailing
MA47 Optimizing Pricing for Multiple Substitutable Products
MA48 Social Media Analytics for Business Applications
MA49 Tutorials and Examples of Software and Methods for Social Media Analytics
MA50 Panel: Life after the PhD: Early Career Development
MA51 New Models in Criminology
MA52 Recent Developments in Humanitarian Logistics
MA53 Decision Analytics for Technology Management
MA54 Analytics and Operations Research for the IT Services Industry
MA55 Modeling, Optimization, and Data Analytic in the Service Industry
MA56 Economics of IS in the Age of Big Data
MA57 The George B. Dantzig Dissertation Prize
MA58 Energy V
MA59 Network Design and Operations
MA60 Fleet and Marketplace Optimization for Mobility-on-Demand (MOD) Systems
MA61 Intermodal Transportation
MA62 Determinants of Aviation Strategies and Market Outcomes
MA63 Continuous Space Location Modeling
MA64 MCDA Methods and Applications
MA65 Gamification and User Engagement
MA66 Model Calibration
MA67 Maintenance and Reliability Planning
MA68 Panel: IOT-enabled Data Analytics: Opportunities, Challenges and Applications
MA69 Game Theory and Competitive Applications
MA70 Trans, Maritime I
MA71 Supply Chain, Shipping I
MA72 Supply Chain Mgt V
MA79 Health Care, Modeling V
MA86 Marketing I
MA94 Technology Tutorial-Mathworks/Artelys

Monday, 10:00am -10:50am

Plenary Philip McCord Morse Lecture: Margaret L. Brandeau

Monday, 11:00am -12:30pm

MB01 Data Mining Under Uncertainty
MB02 Data Mining in Healthcare
MB03 Daniel H. Wagner Prize Competition II
MB04 Topics in Power Generation Scheduling
MB05 2016 INFORMS BOM Section Best Working Paper Awards
MB06 Data Mining in Text Analytics
MB07 New Product Development
MB08 Empirical Research in Operations and Service Innovation
MB09 Development of Electricity Systems
MB10 Energy Models: Diversity and Complementarity
MB11 Network Optimization Models and Applications II
MB12 Joint Session APS/Optimization: Advances in Causal Inference Using Optimization
MB13 Uncertain Linear Optimization
MB14 Data Analytics
MB15 Stochastic and First-order Methods for Data Analysis
MB16 Data-driven and Robust Optimization
MB17 Risk Measures on Stochastic Programs
MB18 Recent Advances in Theory and Applications of IPCO
MB19 Models and Methods for Large-Scale Mixed-Integer Optimization
MB20 Research and Teaching Opportunities in Project Management
MB21 Applications of Stochastic Models in Medical Decision-making Problems
MB22 Policy Evaluation from Operations to Public Health
MB23 Healthcare Analytics: Collaborations with Practitioners
MB24 Strategy and Uncertainty
MB25 Project Management Methodologies
MB26 Assignment and Matching Markets
MB27 Empirical Research in Operations
MB28 New Models for Pricing
MB29 Incentive Mechanisms and Sustainability
MB30 Sustainable Supply Chains
MB31 Operations and Finance Interface
MB32 Structural Estimation in Operations
MB33 Simulation II
MB34 Simulation and Stochastic Optimization
MB35 Empirical Research in Healthcare Operations
MB36 Empirical and Theoretical Models in Supply Chains
MB37 Socially and Environmentally Responsible Operations Management
MB38 Behavioral Modeling with Social Data
MB39 Panel: Future of Applied Probability
MB41 Advances in Quantitative Finance
MB42 Crowd-Commerce Applications in Operations and Revenue Management
MB43 Applied Decision Analysis
MB44 Panel: Advice from Award Winning Researchers
MB45 Advances in Simulation Optimization
MB46 Revenue Management and Assortment Optimization
MB47 Multi-product Revenue Management
MB48 Marketing Insights from Social Media
MB49 Predicting Business Outcomes Using Social Media
MB50 MIF Rising Young Scholars Award
MB51 Community-Based Operations Research I
MB52 Resilience Management Concepts for Infrastructure and Service Systems
MB53 Emerging Scholars in Technology Management
MB54 Optimal Services and Coordination Strategies of O2O Channel in Fast Fashion Supply Chain
MB55 Inventory Management I
MB56 Firm Competitive Strategies
MB57 Queues and Customer Behavior
MB58 Energy VI
MB59 Connected and Automated Vehicles
MB60 Latest Advances in Last Mile Distribution
MB61 Practical Steps Towards Shipment & Network Capacity Management
MB62 Data Mining in Air Transportation
MB63 HUB Location
MB64 MCDM for System Design: No Camels Allowed
MB65 Field Experiment Research on Mobile and Social Applications
MB66 Data Visualization
MB67 Advances in Degradation Modeling and Operations Management
MB68 Joint Session QSR/DM: Data Analytics for System Improvement I
MB69 Military Operations Research II

Monday, 12:30pm – 2:30pm

Monday, 1:30pm – 3:00pm

Monday, 3:10pm – 4:00pm

Monday, 4:30pm – 6:00pm

Recycling, and Servicization
MD30 Retail Operations II
MD31 Operations and Financing Interface
MD32 Scheduling
MD33 Simulation II
MD34 Joint Session HAS/MSOM: Healthcare Operations
MD35 Empirical Service Operations
MD36 Control, Learning, and Strategic Behavior in Queueing Models
MD37 Sustainability in Supply Chains
MD38 Reliability
MD39 Markov Lecture
MD40 Theoretical Development in Estimation
MD41 Quantitative Methods for Finance and Energy
MD42 Pricing and Information Provision of Services
MD43 Simulation for Supply Chain
MD44 DAS Awards Session
MD45 Simulation-based Optimization
MD46 Customer Choice Estimation and Assortment Optimization
MD47 Pricing, Promotion Planning, and Revenue Management
MD48 Peeling Back the Onion in Social Media Analysis
MD49 Social Media User Behavior
MD51 Humanitarian & Disaster Relief Logistics
MD52 Routing Models for Public Safety
MD53 TIMES Distinguished Speaker
MD54 Service Optimization, Design and Measure in Emerging Market
MD55 CPMS Isolated Practioner
MD56 IOT: Technology Innovation and Business Impact
MD57 Influencing Behavior in Aircraft Operations
MD58 Energy VIII
MD59 TSL Prize Winners
MD60 Modeling and Analysis of Innovative Mobility Services I
MD61 Advances in Blocking & Trip Planning
MD62 Aviation Applications Section: Keynote Presentation
MD63 UAS Traffic Management and Low-altitude Airspace Operations
MD64 Multicriteria Applications in the Public Section
MD65 Data Analytics and Machine learning
MD66 Computer Experiments and Uncertainty Quantification
MD67 IEEE T-ASE Invited Session II
MD68 Quality Engineering Invited Session
MD69 Routing and Allocation in Military Operations
MD70 Trans, Rail I
MD71 Vehicle Routing I
MD72 Supply Chain Mgt VIII
MD79 Health Care, Modeling VIII
MD94 Technology Tutorial- Gurobi/AMPL

Tuesday, 8:00am – 9:30am

TA01 Machine Learning II
TA02 Predictive Modeling for Wind Power
TA03 Entertainment Analytics
TA04 Advances in Using Market Models for Power Transmission Planning
TA05 Short-term Operation, Maintenance, and Long-term Planning for Power Systems
TA06 Optimization Models in Data Mining
TA07 Retail Analytics
TA08 Collaborative Innovation and Project Supply Chain Management Interfaces
TA09 Panel Discussion: Open Challenges in Internet of Things & Agriculture Analytics
TA10 Renewable Energy Systems and Grid Integration
TA11 Novel Applications of Network Optimization
TA12 Mixed-Integer Programming with Applications
TA13 Computational Linear Optimization
TA14 Data Mining in Genetics and Genomics
TA15 Academic Job Search Panel
TA16 Energy Systems
TA17 Stochastic Programming for Long Term Planning
TA18 Finance, Portfolio I
TA19 Optimization Modeling and Beyond with a Focus on Practice
TA20 Mathematical Finance, Models, Simulation and Today’s Pressing Problem
TA21 Beyond Predictive Analytics
TA22 Joint Session MSOM-HC/HAS: Modeling and Optimization for Chronic and End-Stage Renal Disease Patients
TA23 Modelling Care and Treatment of Chronic Diseases
TA24 Practice-Based Research in Healthcare OM
TA25 Project Related SCM III
TA26 Auctions and Econometrics
TA27 New Developments in Sourcing and Selling Strategies
TA28 hold Sequential Sampling and Optimization
TA29 Managing Capacity in Energy Markets Through Demand and Supply-side Interventions
TA30 Studies in Service Operations
TA31 Supply Chain Finance and Risk Management
TA32 Revenue Mgt, Pricing I
TA33 Queueing Models
TA34 Provider Staffing and its Impact on Patient Flow
TA35 Online Services: Learning and Pricing
TA36 Operations and Supply Chains for Innovative Goods
TA37 Sustainability Issues in Supply Chains I
TA38 Reliability II
TA39 Artificial Intelligence in Big Data
TA40 Markov Decision Processes: Applications
TA41 Quantitative Methods in Finance VI
TA42 Choice Models and Assortment Optimization
TA43 Data-Driven Decision Making
TA44 Investment Analysis and Financial Applications
TA45 Efficient Learning in Stochastic Optimization
TA46 Dynamic Games and Applications to Revenue Management
TA47 Personalized E-commerce
TA48 Social Media Analysis II
TA49 Classroom Activities
TA50 SpORts: Sports Analytics Education
TA51 Lifting up Populations
TA52 Transportation Issues in Smart Cities
TA53 Organizational learning, innovation and knowledge creation
TA54 Service Science in Electricity Supply
TA55 Inventory Management III
TA56 Economics of Information technology and social media
TA57 Insights from Relaxing Traditional Modeling Assumptions about Human Behavior in OM Settings
TA58 Energy VX
TA59 Modeling Interdependent Infrastructure Networks
TA60 Modeling and Analysis of Innovative Mobility Services II
TA62 Distributed Control of Multi-Agent Networks
TA63 Alternative Fuel Refueling Location Problems
TA64 Multi-Criteria Decision Making in Agriculture
TA65 Analytical and Empirical Analyses of Digital Markets
TA66 Data Analytics and Reliability in Energy/Smart Grids
TA67 IEEE T-ASE Invited Session III
TA68 Graph Analytics for Complex Systems
TA69 Economics IV
TA70 Trans, Rail II
TA71 Vehicle Routing I
TA72 Supply Chain Mgt IX
TA73 Operations Management I
TA74 Optimization Methodology I
TA75 Behavioral Operations I
TA76 Decision Analysis
TA77 Opt, Integer Programing I
TA78 Opt, Network I
TA79 Health Care, Modeling VX
TA86 Marketing V
TA87 Panel: Guide to the Analytics Body of Knowledge (ABOK)
TA88 Service Science Best Student Paper Competition I

TA89 Advances in Traffic Flow Modeling
TA90 Opt, Stochastic II
TA94 Technology Tutorial- Frontline/ SAS-GAP/EDU

Tuesday, 10:00am – 10:50am

Plenary Big Data and Big Decisions

Tuesday, 11:00am – 12:30pm

TB01 Clustering Methods in Data Mining
TB02 Methods for Analysis of Next-Generation Sequencing Data
TB03 Marketing Strategies of Entertainment Products
TB04 Developing Country Electricity Systems
TB05 Optimal Power Flow
TB06 Solving Hard Optimization Problems in Machine Learning
TB07 Networks and Data Analytics in Finance
TB08 Business Model Innovation
TB09 Information and Market Structure
TB10 Natural Gas Markets
TB11 Optimization in Network Reliability, Security, and Interdiction
TB12 New Models and Approximation Results in Stochastic and Combinatorial Optimization
TB13 Recent Advances in Stochastic Integer Programs
TB14 Revenue Mgt, Pricing
TB15 Industry Job Search Panel
TB16 Information in Optimization
TB17 Stochastic Sequential Assignment and Planning
TB18 Finance, Portfolio II
TB19 Computational Methods for Healthcare Applications
TB20 Robust Multiobjective Optimization for Decision Making under Uncertainty and Conflict
TB21 Coordinated Care Delivery
TB22 Data-Driven Healthcare Operations
TB23 Models in Medical Decision Making
TB24 Analytics in Evidence-Based Practice (EBP)
TB25 Scheduling and Contracts
TB26 Combinatorial Auction Pricing
TB27 Social Networks and Learning
TB29 Incentives Issues in Sustainable Operations
TB30 Predictive Modeling in Healthcare
TB31 Topics in Operations and Finance Interface
TB32 Revenue Mgt, Pricing III
TB33 Queueing Models I
TB34 Scheduling and Workload Assignment in Healthcare
TB35 Managing Service Systems with Strategic Servers
TB36 Pricing and Supply Chain Management in Healthcare Industry
TB37 Sustainability Issues in Supply Chains II
TB38 Reliability I
TB39 Applied Probability and Simulation I
TB40 Markov Decision Processes: Theory
TB41 Quantitative Methods in Finance XII
TB42 Learning, Estimation, and Experimentation in RM and Pricing
TB43 Panel: New Frontiers in Decision Analysis Practice and Theory
TB44 Graphical Methods
TB45 Parallel Simulation Optimization
TB46 Choice Modeling and Assortment Optimization
TB47 Pricing, Promotions and Bundling for Revenue Management
TB48 Optimization and Statistical Learning
TB49 Educational Research in OR/MS
TB50 Panel: Topics for PhD Students
TB51 Matchings and Assignments with Societal Impact
TB52 Urban Transportation and Logistics in Public Sector OR I
TB53 Innovations and Value Chain Management
TB54 Service Science in Emerging Economy
TB55 Inventory Management IV
TB56 Innovation through IT Management
TB57 Managing Decentralized Processes
TB58 Energy X
TB59 Innovations in Transporation Network Pricing
TB60 Moving People and Goods More Efficiently in Traffic Networks: Models and Algorithms
TB61 Online Delivery Routing
TB62 Data Mining and Optimization for Improved Airport Operations
TB63 Deterministic Network Design
TB64 Multi-objective Optimization: Algorithms and Applications
TB65 Digital Business Models and Strategies in the Era of Analytics
TB66 Data Analytics for Quality and Reliability Assurance
TB67 IIE Transactions Invited Session
TB68 Tutorial: Wind Energy Applications
TB69 Decision Support Systems I
TB70 Trans, Planning I
TB71 Vehicle Routing III
TB72 Supply Chain Mgt X
TB73 Operations Management II
TB74 Optimization Methodology II
TB75 Behavioral Operations II
TB76 Resource Allocation
TB77 Opt, Integer Programing II
TB78 Opt, Network II
TB79 Opt, Stochastic II
TB86 Monte Carlo Methods for Multi-stage Decision Making under Uncertainty
TB87 Community-Based Operations Research II
TB88 Service Science Best Student Paper Competition II
TB89 Evolution of Network-wide Traffic Dynamics
TB90 Health Care, Modeling X
TB94 Technology Tutorial- SAS/SAS-JMP

Tuesday, 12:30pm – 2:30pm

Poster Session Tuesday Poster Competitition

Tuesday, 1:30pm – 3:00pm

TC01 Ensemble Methods in Data Mining
TC02 Data Mining in Medical and Brain Informatics I
TC03 Panel: Publication Tips
TC04 Power System Operations Under Increasing Uncertainty
TC05 Reliable Power System Design and Operations
TC06 Data-Intensive Computational Methods for Large-scale Infrastructure Systems
TC07 Information and Influence Diffusion in Networks
TC08 Ethics and Sustainable Business Models
TC09 Environmental Logistics and Supply Chain Operations
TC10 Optimizing Distributed Energy Generation I
TC11 Paths, Cycles, and Transversals
TC12 New Results on Nonconvex Optimization
TC13 Recent Advances in Computational Optimization
TC14 Sustainable and Responsible Supply Chain Management I
TC15 Joint Session AI/SMA: Social Media Analytics and Big Network Data
TC16 Inverse Optimization: Applications
TC17 Stochastic Optimization for Large-Scale Learning
TC18 Finance, Portfolio
TC19 Population Health: Infectious and Chronic Diseases
TC20 Multiagent Systems Modeling
TC21 Payment Models, Pricing, and Incentives in Healthcare
TC22 Dealing with Uncertainty in Hospital Operations
TC23 New Models in Health Care
TC24 Public Health and Health System Modeling
TC25 Scheduling in Practice
TC26 Combinatorial Auctions

TC27 Empirical Studies in Supply Chain Management
TC28 Operations-Marketing Interface
TC29 Issues in Environmental Operations: Managing Risk, Customer Returns, and Regulations
TC30 Supply Chain Channel Management
TC31 Operations/Corporate Finance Interface
TC32 Revenue Mgt, Pricing II
TC33 Queueing Models II
TC34 Public Policy and Healthcare Operations
TC35 Public Sector Service Operations
TC36 Innovative Pricing
TC37 Sustainable Operations II
TC38 Service Science II
TC39 Dynamic Learning Applications
TC40 Applied Probability and Machine Learning I
TC41 Quantitative Risk Management
TC42 Revenue Management with Advertising Applications
TC43 Decision Making in Public Policy
TC44 Decisions, Sensitivity and Applications
TC45 Multi-Objective Optimization Via Simulation
TC46 Empirical and Data-Driven Studies in Revenue Management and Pricing
TC47 Choice-based Demand and Strategic Consumers
TC48 Social Media Analysis IV
TC49 Experiential Field Learning
TC50 SpORts: Sports Analytics I
TC51 Modeling Complex Systems in Education
TC52 Urban Transportation and Logistics in Public Sector OR II
TC53 Management of Product and Service Innovation
TC54 Service Science: Best Cluster Paper Presentation
TC55 Inventory Management V
TC56 Managing Sales in On-demand Economy
TC57 New Topics in Behavioral Operations
TC58 Energy XII
TC59 Robust and Reliable Optimization in Transportation and Logistics
TC60 Network Optimization for Efficiency, Sustainability and Resilience
TC61 Stochastic Network Design
TC62 Robust and Low Cost Airline Operations under Uncertainty and Disruptions
TC63 Location Analysis I
TC64 Multiple Criteria Decision Making Applications 1
TC65 Topics on Internet Economics
TC66 Networked System Reliability and Resilience
TC67 Industrial Big Data System
TC68 Reliability Evaluation and Optimization from Complex Systems II
TC69 Airports, Runways, and Descents
TC70 Trans, Planning II
TC71 Vehicle Routing IV
TC72 Supply Chain Mgt XI
TC73 Operations Management III
TC74 Optimization Methodology III
TC75 Behavioral Operations III
TC76 Decision Analysis I
TC77 Opt, Integer Programing III
TC78 Opt, Network III
TC79 Opt, Stochastic III
TC86 Marketing VII
TC87 Minority Issues Forum Paper Competition
TC88 Service Science Best Student Paper Competition III
TC89 Applications of Optimization and Control Theory in Traffic Management
TC90 Logistics, Humanitarian
TC94 Technology Tutorial- SIMIO/Neusrel

Tuesday, 3:10pm – 4:00pm

Keynote Optimizing the Future ? Supply Chain at Amazon
Keynote Wagner Prize Winner Reprise
Keynote Edelman Reprise-UPS

Tuesday, 4:30pm – 6:00pm

TD01 New Methods in Data Mining
TD02 Data Mining in Medical and Brain Informatics II
TD03 Recent Developments in Opaque and Probabilistic Selling
TD04 Joint Session QSR/ENRE: Data-driven Modeling and Analytics in Wind Power Systems
TD05 Forest Management
TD06 Optimization for Large-Scale Learning
TD07 Emerging Topics on Internet of Things (IoT) and Data Analytics
TD08 Outsourcing Innovation
TD09 Big Data II
TD10 Optimization in Renewable Energy
TD11 Quality-Guaranteed Network Design: Interdiction, Routing, and Resource Allocation
TD12 New Results on Polyhedral Relaxations
TD13 Software and Methodologies for (Nonlinear) Integer Programming
TD14 Predictive Analytics: Big Data with Purpose
TD15 Joint Session AI/Analytics: Machine Learning for Public Policy
TD16 Joint Session DM/Optimization Under Uncertainty: Optimization in Data Mining and Machine Learning
TD17 Statistical Learning with Convex Optimization
TD18 Resource Allocation Problems in Nonprofit Settings
TD19 Stable Sets, Zero-forcing Sets, and Target Sets in Graphs
TD20 Optimality Conditions for Inventory Control
TD21 Data Analytics for Healthcare
TD22 Decision Making in Healthcare Supply Chain
TD23 Operations Management Approaches Applied in Healthcare Settings: Achieving Patient Health and Operational Effectiveness.
TD24 Modeling Systems for Public Health
TD25 Scheduling with Applications
TD26 Spectrum Auction
TD27 Stochastic Modeling In Healthcare Operations
TD28 Topics in Sustainability
TD29 Issues in Sustainable Operations
TD30 Innovative Data-driven Analyses in Healthcare Research
TD31 Information Economics in Operations
TD32 Revenue Mgt, Pricing IV
TD33 Queueing Models III
TD34 Joint Session HAS/MSOM-HC: Care Transition Policy and Management
TD35 On Demand Services
TD36 MSOM/Supply and Procurement
TD37 Investment in Renewable Energy and Energy Efficiency
TD38 Service Science I
TD39 Applied Probability and Optimization III
TD40 Applications in Applied Probability
TD41 Quantitative Methods in Finance
TD42 RM in Online Markets
TD43 Portfolio Decision Analysis
TD44 Applications of Multiattribute Preferences
TD45 Simulation Optimization and Ranking and Selection
TD46 Empirical Research on Pricing and Revenue Management
TD47 Cloud Computing in RM
TD48 Social Media Analytics Award Session
TD49 Panel: First Course in Analytics or Only Course in Analytics – What Difference Does It Make?

Wednesday, 8:00am – 9:30am

Wednesday, 10:00am – 10:50am

Keynote The Goals of Analysis are Understanding, Decisions, and Influencing Policy
Keynote Can Prediction be Better than Cure? On Analytics in Health-Care
Keynote SportSource Analytics

Wednesday, 11:00am – 12:30pm

WB01 Pattern Recognition Applications in Data Mining
WB02 Data Mining in Healthcare 2
WB03 Advances in Emergency Department Operations Management/Research
WB04 Optimization Methods in Smart Grid
WB05 Forest Management: Transportation and/or Collaborative Logistics
WB07 Simulation and Data Mining
WB08 Supply Chain Mgt, Green
WB09 Empirical Research on Sustainable Operations
WB10 Underground Mine Planning
WB11 Transportation Network Analysis
WB12 Polyhedral Methods in Combinatorial Optimization
WB13 Advances in Integer Programming Software
WB15 Detection of Structure and Anomalous Patterns in Data
WB16 Optimal Learning and Optimization via Simulation
WB17 Distributed Consensus Optimization
WB18 DMA General
WB19 Future of Disease Modeling in Clinical and Public Health
WB20 Assets and Structured Hedges in Energy Markets Severe Incompleteness and Methods for Dealing with It
WB21 Emerging Methods for Healthcare Analytics and Visualization
WB22 Empirical Analysis of Resource Utilization
WB23 Optimal Treatment & Screening of Chronic Care Patients
WB24 Optimization in Radiation Therapy
WB25 Logistics II
WB26 Information Systems I
WB27 Information and Consumer Behavior in Supply Chain Management
WB28 Product Recalls
WB29 Managing Responsibility in Supply Chains
WB30 Management of Critical Care
WB31 Service Operations in a Modern Economy
WB32 Risk Analysis II
WB33 Production and Scheduling II
WB34 Operations Analysis in Healthcare
WB36 Supply Chain Analytics
WB37 Supply Chain Structure and Sustainability
WB38 Opt, Robust
WB39 Joint Session APS/MSOM: Service Systems in Applied Probability I
WB40 Queueing in Applied Probability I
WB41 Stochastic Control and Quantitative Finance
WB42 RM in Practice II
WB43 Decision Making with Incentives
WB44 Behavioral Decision Analysis
WB45 Simulation for Performance of Non-Stationary Queues
WB46 Networks and Games in Operations
WB47 Applications of RM and Pricing
WB48 Business Applications in Social Media Analytics
WB49 Panel: Publishing in INFORMS Transactions on Education
WB50 SpORts: Sports Analytics IV
WB51 Education I
WB52 New advances in Operating Room (OR) Scheduling
WB53 Opt, Stochastic VI
WB54 Service Science: Uncertainty in Business Processes
WB55 Inventory Management VIII
WB56 Predictive Analytics in eBusiness
WB57 Behavioral Aspects of Managing Innovation
WB58 Energy XIII
WB59 Drone-Based Logistics
WB60 Routing Optimization Problems
WB61 Railway Analytics
WB62 Aviation Economics Decision-making
WB63 Location Models in Humanitarian Logistics
WB64 Representations and Approximations in Multiobjective Optimization
WB65 Digital Innovation & Analytics
WB66 Graph Analytics for Complex Systems – II
WB67 Joint Session QSR/DM: Process Monitoring for Diverse Types of Data
WB68 Spatiotemporal Data based Quality Control Methods in Manufacturing
WB69 Network Design and Optimization
WB70 Trans, Ops II
WB71 Game Theory II
WB72 Supply Chain Mgt XIV
WB73 Operations Management VI
WB74 Ops Mgt/Marketing II
WB75 Economics II
WB76 Applied Probability II
WB77 Opt, Integer Programing VI
WB78 Opt, Metaheuristics II
WB79 Opt, Convex
WB80 Health Care, Public II
WB81 Health Care, Strategies II
WB82 Networks and Graphs II
WB83 Supply Chain Optimization II
WB84 Supply Chain, Risk II
WB85 Sustainability II
WB88 Military Applications II
WB89 Maritime Transportation
WB90 Health Care, Modeling XIII

Wednesday, 12:45pm – 12:15pm

WC01 Data Mining in Aviation
WC02 Data Mining Applications in Health Care
WC03 Big Data III
WC04 Power System Operation Models for Ramping Scarcity Mitigation
WC05 Spatial Optimization
WC06 Big Data 2
WC07 Process Modeling
WC08 Technology Mgt
WC10 Designing Energy and Water Supply Chains for Prosperity
WC11 Decision Making Under Multistage Uncertainty
WC12 Recent Advances in Decision Diagrams for Optimization
WC13 Computational Approaches to Large-scale/Exact Optimization
WC14 Transportation and Disaster Analytics
WC15 Exploiting Sparse and Low Rank Structures for Inference
WC16 Optimization and Learning in Supply Chain Systems
WC17 Nonlinear Optimization Algorithms I
WC18 DMA Healthcare
WC19 Open-Source Tools for Operations Research
WC20 Understanding the US Index Futures Stock Market using Research
WC21 Healthcare Operations and Capacity Planning
WC22 Appointment Scheduling Models and Analytics
WC23 Optimization in Radiation Therapy Treatment Planning
WC24 Scheduling Providers and Patients
WC25 Logistics III
WC26 Information Systems II
WC27 Innovations in Retail Operations
WC29 Mechanisms to Enhance the Value of Used and

Wednesday, 2:45pm – 4:15pm

Wednesday, 4:30pm – 6:00pm
