2015 Summer Research Program in Biophysics

University of North Carolina at Chapel Hill

Priority Application Deadline: February 16, 2015

Interested in interdisciplinary science? Want to work in the fast-growing area of biomedical research? Looking to get some hands-on lab experience this summer? Check out the Summer Research Program in Biophysics, an 11 week course for undergraduate minority students at the University of North Carolina, Chapel Hill. Course expenses, travel costs, meals, and housing are covered.

Course includes:

- Lectures with UNC faculty members and seminars with visiting professors from graduate programs across the country
- Mentored research experience
- Team-building activities and field trips

Recommended Prerequisites:

- Studying quantitative science: chemistry, physics, biochemistry, and/or computer science
- 2 semesters of biology
- 2 semesters of calculus-level physics
- 3.0 cumulative or higher GPA in science courses

See what past students have to say about the Summer Research Program!

"…this has been the most useful and wonderful summer of my college career. Not only have I learned academically, I have built multiple bridges that can only benefit me in the future."

"It has influenced me to take an additional science course at my university as well as has helped me create ideas for my senior project... the environment of the course created learning."

"I learned new lab techniques as well as worked on the project independently. I was able to complete my own experiments and when I had questions or hit a snag, my mentor was available to help."

For more information or to recommend a student, email Ellen Mackall: **emackall@biophysics.org**, or visit **www.biophysics.org**.

Networking: Optimizing Your Time at BPS 2015

You surely have heard that *networking* is a key component of the successful job search. The term itself often conjures up negative thoughts and reactions to the uninitiated, sometimes to the point of paralysis. Professional conferences (such as BPS 2015) provide endless networking opportunities. If, however, your perception of networking means tackling someone at the coffee station while thrusting your CV in his/her hands, you may want to stop in on this session. The practice of networking has become so much easier with the advent of the internet. We will discuss what hope to get out of your presence at the meeting, how to set objectives beforehand, and how to meet those objective once you arrive (while minimizing anxiety).

4:00 PM–5:00 PM, MEZZANINE

Undergraduate Mixer and Poster Fest

A social and scientific mixer for all undergraduate students attending the meeting. Come meet other undergraduates and learn about their research projects. Undergraduates listed as co-authors on posters are welcome to practice their poster presentation in a less formal setting, even if not listed as the presenting author. For undergrads who will be presenting during the standard scientific sessions, the mixer provides an additional opportunity to hone presentation skills. Limited presentation spots may be available for those who did not pre-register. Check with the Society Office in the VIP Lounge in the Charles Street Lobby. Organized by the Education Committee.

FEI Cryo-TEM Workflow Solutions: A New Era for 3D Structural Biology
A new frontier exists in unraveling interactive biological and biochemical processes and pathways at the macromolecular level. Of critical importance is the three-dimensional visualization of macromolecular structures and molecular machines in their native functional state. Three techniques play a major role in orchestrating this.

Nuclear magnetic resonance (NMR) has the capability to study specific protein domains or fragments and their functional role in protein folding and dynamics and in ligand binding whereas X-Ray crystallography (XRD) allows visualizing high-resolution but more static 3D structures of apo and liganded proteins, mainly in a monomeric or dimeric state after crystallization. To unravel more physiologically relevant situations however, it is essential to visualize multimeric complexes in their tertiary and quaternary state and their interaction with other complexes. By performing typical cryo-TEM applications like single particle analysis or tomography, this can be achieved. In this so-called translational methodology, cryo-TEM thus provides complementary information to NMR and XRD that can be crucial for drug discovery, e.g. in terms of a better understanding of the mechanism of action inferred from the EM structure of the physiologically relevant complex. This will eventually contribute to answer real biologically as well as medically relevant questions.

Latest developments in the cryo-TEM workflow have brought the 3 major structural biology technologies closer together. Now, finally, a continuum has been reached on all important aspects with regards to resolution and macromolecular scales which allows for the full deployment of the combination of these technologies.

Here, we will illustrate the historical context of these technologies with respect to one another and show how latest developments have reached the critical requirements to fully unleash the power of structural biology in not just answering fundamental questions, but actually contribute to curing diseases and improving health. Also, we will discuss the future of structural biology based on the latest developments of the FEI workflow and its components with a special focus on the advances in contrast enhancement (phase plates) and (direct electron) detection.

Technology Innovations from ZEISS, the New ZEISS LSM 880 Confocal with Airyscan and the ZEISS Lightsheet Z.1
New microscopes from ZEISS address both ends of the spectrum of samples, live high speed imaging with superresolution and high speed imaging of large live and fixed tissues. Learn how the ZEISS LSM 880 with Airyscan maintains the mantra that each photon of emission light is precious, while expanding the triangle of sensitivity, resolution and speed of acquisition.

The LSM 880 with Airyscan allows you to use multicolor samples with any label and get image quality like you've never seen before. With Airyscan you are always able to select the optimal acquisition strategy for your sample: Simply decide whether you want to gain 1.7x higher resolution in all three dimensions – resulting in a 5x smaller confocal volume. Or push the sensitivity beyond the limits of all conventional confocals. Or use the increase in signal-to-noise ratio to speed up your image acquisition.

Traditionally, deeply imaging into intact tissue typically requires multiphoton excitation to penetrate deeper than near the surface of a tissue. Using a "clearing" method to remove the light obstructing opaque molecules from a tissue has been another technique for deep imaging. Techniques such as SCALE, CLARITY, ClearT, SeeDB, CUBIC and others have allowed researchers to image deeper than a millimeter into cleared animal model brains and organs.

The ZEISS Lightsheet Z.1 features high speed image acquisition and greatly reduced photodamage making imaging of live developmental samples and fixed and cleared tissues easier than ever before. Come learn about using the innovative ZEISS Lightsheet Z.1 microscope for imaging of fixed and cleared tissues.

Networking: Optimizing Your Time at BPS 2015

You surely have heard that *networking* is a key component of the successful job search. The term itself often conjures up negative thoughts and reactions to the uninitiated, sometimes to the point of paralysis. Professional conferences (such as BPS 2015) provide endless networking opportunities. If, however, your perception of networking means tackling someone at the coffee station while thrusting your CV in his/her hands, you may want to stop in on this session. The practice of networking has become so much easier with the advent of the internet. We will discuss what hope to get out of your presence at the meeting, how to set objectives beforehand, and how to meet those objective once you arrive (while minimizing anxiety).

Technology Advances in Ultrasensitive Isothermal Titration Calorimetry

TA Instruments introduces the Affinity ITC, with all new technology for advanced isothermal titration calorimetry. Isothermal Titration Calorimetry is the most effective analytical tool for simply and accurately measuring A/B interactions, especially protein-protein binding. Isothermal Titration Calorimetry provides complete thermodynamics and kinetics without labelling, fixing, or otherwise altering the sample of interest. All new technology from TA Instruments improves the sample throughput, usability, and data quality of all isothermal titration calorimetry experiments.

All-new advanced stirring technology and an innovative isolated injection system improves baseline stability, and mixing homogeneity while applying minimal perturbation to the material of interest. For large-scale screening and high throughput testing, an all-new unattended sample handling system automates up to 96 full titrations and continuous unattended operation for multiple days. Based around a 96-well plate format and multiple wash/rinse containers, the Affinity ITC Auto will greatly increase laboratory productivity without sacrificing sensitivity or reproducibility. The Affinity ITC is available in both the standard (1.0 mL) and low volume (190 µL) cell sizes, extending the range of applications for which automation is available. This presentation will include data examples and tech tips on experimental design using the Affinity ITC Auto.

Science Funding: Is it Time for a New Paradigm?

Public funding has played a key role in supporting the scientific enterprise in the United States and abroad. But with government budgets flat and little political will to change any time soon, scientists are wondering not only how to keep their labs afloat, but also what the future holds for research moving forward. During this informal moderated discussion, BPS members from around the globe will talk about how science is funded in other countries, both from government and private sources.

Super-Resolution Microscopy and Its Applications in Fast and Complex Biological Systems

Super-resolution microscopy has revolutionized the field of biological imaging by providing new insights into biological processes in fields as diverse as developmental biology, neuroscience, cardiovascular research, genetics, infectious disease, and DNA/chromatin structure. The Vutara 350 super-resolution microscope offers a ten-fold improvement in resolution in comparison to traditional light microscopy techniques and is capable of achieving resolutions of 20 nm laterally and 50 nm axially. The Vutara 350 is based on a patented 3D biplane single molecule localization platform. We will discuss the basic principles of operation and features of the Vutara 350 super-resolution microscope. The capability to do 3D multicolor imaging, high speed live cell imaging, 3D particle tracking, and

z-stacking in various biological systems such as cells, tissue, drosophila, C. elegans, bacteria and virus makes the Vutara 350 very versatile.

The Light Scattering Toolkit for Biophysical Characterization: Lab Essentials for Enhancing Studies of Purification, Crystallization, Formulation, Conjugation, Conformation, and Interactions
Biophysical techniques based on static and dynamic light scattering address many of the key analytical challenges associated with proteins, oligonucleotides, vesicles and other biomacromolecules. This workshop covers the following topics:
1. Batch DLS – traditional cuvette-based dynamic light scattering (DLS) is a fast, easy means of estimating macromolecular and nanoparticle size distributions to assess protein aggregation or the sizes of virus-like particles or drug delivery nanovehicles. In microwell-plate format, DLS is a high-productivity tool useful for optimizing formulation or crystallization conditions with minimal sample consumption or manual labor.
2. SEC-MALS and SEC-DLS – coupling of multi-angle static light scattering (MALS) and DLS detection to size-exclusion chromatography to assess molar mass, size, conformation and conjugation, in solution, independently of column calibration and non-ideal sample-column interactions. In addition to readily assessing aggregation and fragmentation in line with SEC purification, SEC-MALS analyzes protein conjugates such as glycoproteins or membrane proteins bound to surfactant micelles, determining protein oligomeric state and the mass of glycans, polysaccharides or surfactant modifying the protein.
3. FFF-MALS and FFF-DLS – coupling of MALS and DLS to a field-flow fractionation (FFF) device to achieve accurate characterization of macromolecules and nanoparticles from 1-1000 nm, even when soluble and insoluble components are both present in the solution. It does not employ a stationary phase; FFF separates without shear and with minimal surface interactions. FFF produces high-resolution size distributions thanks to true hydrodynamic separation upstream of the light scattering detectors. It also offers the benefits of post-separation downstream analysis by spectroscopy for additional information on samples.
4. CG-MALS – coupling MALS to a composition-gradient device results in a uniquely powerful system for characterizing complex biomolecular interactions, label-free and immobilization-free. Because MALS measures molar masses it is one of the most useful techniques for analyzing multi-domain, multi-protein interactions that go beyond standard 1:1 interactions including systems exhibiting cooperativity and allostery. CG-MALS determines the affinity and absolute molecular stoichiometry of self and/or heteroassociating systems from pM to mM.

Advances in Correlative Light and Electron Microscopy
Correlative light and electron microscopy (CLEM) is a powerful approach that enables combining dynamic information and labelling specificity from fluorescence microscopy with ultra-structural information at nanometer resolution from electron microscopy on the same sample. In recent years technical improvements in fluorescence microscopy have enhanced z-resolution, enabled imaging with high sensitivity using TIRF

and, with super-resolution microscopy, improved the resolution of light microscopy to up to 20 nm. Despite all these advances, fluorescence microscopy can only show what was labelled and an EM is needed to provide the full morphological context on the ultra-structure of the cell. However, CLEM experiments still remain challenging and low throughput.

Over the last years, FEI has introduced different solutions to overcome some of the challenges in CLEM experiments and to make CLEM experiments easier and more efficient. But correlative experiments are rapidly evolving – here, we will present updates on latest developments that have pushed the boundaries of correlative experiments.

Measuring Engineered Changes in Binding Affinity with the BLItz® Label-Free System

Combining Organic Synthesis and Directed Evolution to Design Glycocluster HIV Vaccine Candidates

We will describe a new method for design of carbohydrate HIV vaccines, which combines organic synthesis and directed evolution techniques. This work originates from the observation that some HIV positive individuals produce antibodies which are broadly neutralizing and protective against HIV infection. One such antibody, 2G12, recognizes and binds to a cluster of carbohydrates on the viral envelope protein gp120. Our goal is to develop synthetic carbohydrate clusters which closely mimic the viral carbohydrate cluster, and which might thus elicit a 2G12-like antibody response when used as a vaccine. In order to design carbohydrate clusters which closely mimic gp120, we have developed evolution-based strategies, in which immobilized 2G12 is used to recognize and fish out the best glycocluster mimics of gp120 from amongst large libraries of ~10 trillion different glycosylated peptide- or DNA structures. The glycocluster structures obtained by these methods are recognized by antibody 2G12 as strongly as is the viral protein itself, and are thus of great interest for vaccine studies.

Tips and Tricks for Developing BLItz Assays

The BLItz label-free assay system is a simple-to-use benchtop instrument for measuring binding interactions of antibodies and proteins using as little as 4µl of sample. Additional case studies of how the BLItz system is being used to qualify biophysical models will be presented, along with tips and tricks for developing kinetics assays on the BLItz system.

Ten Tough Industrial Interview Questions (and Ten Pretty Good Responses)

You've been invited to interview with that drug development company that you've always wanted to work for. You've soaked up the details of the position description. You are confident in your ability to do the job, as well as answer any/all technical questions during the interview process. The day is yours…until…that first question catches you by surprise and your confidence begins to wilt. Be prepared for those non-technical questions that you will almost certainly hear at some point, know why they are asked, and learn what a good (if not great) response to each question might be by attending this workshop.

Performing Positive Allosteric Modulator (PAM) Assays and Investigating Use-Dependent Inhibition of Ion Channels on Automated Electrophysiology Systems Including the IonFlux™ Benchtop Reader and the IonWorks Barracuda® Instrument

PAM Assays

Nicotinic acetylcholine receptors (nAChRs) have been extensively studied due to their importance in physiological processes as well as involvement in several muscle and neuronal human pathologies, and are major therapeutic targets for pharmaceutical drug discovery. Ensemble recordings on the IonFlux HT System were validated with human hnAChR recombinant cell lines developed by Eurofins Discovery Services. Response properties of the nAChRs to the endogenous ligand acetylcholine (ACh), reference agonists, antagonists and positive allosteric modulators (PAMs) were characterized and will be presented.

Ion Channel Use-Dependence

Use-dependent inhibition of ion channels by potential drug candidates is an important aspect to investigate for many drug classes. Data will be presented to demonstrate the ability of automated electrophysiology systems to study the use-dependence block of Na+ channel targets by peptide toxins and known compounds. We will demonstrate the ability of the IonWorks Barracuda system to deliver complex voltage protocols and generate long assay windows which are required for these studies. Pulse trains delivered at 10Hz are used to measure the blockade of current. These experiments demonstrate stable assay windows with uniform currents for 30 minutes and longer during the delivery of periodic pulse trains.

HTS-Compatible Giga-Seal Ion Channel Drug Discovery: Beyond the Bottleneck and Ready for CiPA

Nanion Technologies is one of the leading providers of automated patch clamp systems, offering a diverse product portfolio covering a broad experimental range from single channel recordings to HTS-compatible ion channel screening from up to 768 cells in parallel. Allowing 20,000 data points per day, the SyncroPatch 384/768PE is unrivalled for high throughput and high quality recordings. Diverse ion channel targets and cell types have successfully been tested on the SyncroPatch 384/768PE including challenging targets such as fast desensitizing ligand ion channels (P2X3 und GluA2), ion channels requiring intracellular activation (Katp, TMEM16a) and heavily regulated channels such as TRPA1.

Early cardiac arrhythmic risk assessment is a hot topic these days calling for new safety screening strategies. Patchliner, a medium-throughput APC platform, supports automated current clamp recordings, experiments at physiological temperatures, and a minimal cell usage, making it the ideal partner for safety testing on stem cell derived cardiomyocytes. Additionally, the CardioExcyte 96, a unique hybrid system for parallel impedance-based and MEA-like recordings from intact cardiomyocyte networks, has proven a versatile tool for safety and toxicity screening applications serving as an excellent complement to APC. These three platforms enable you to keep up with the requirements of the CiPA-initiative for early prediction of potential cardiac arrhythmias.

During this workshop, we will show how to push the boundaries of ion channel screening projects to achieve HTS-screening standards, and how to get ready for comprehensive safety screening beyond hERG.

Side-Stepping the Animal Model: Cardiac Work Loops in Human iPSC-derived Myocytes

Cardiac pressure-volume loops on a complete organ provide the framework for understanding cardiac mechanics in experimental animal models, most notably in the context of Frank-Starling mechanisms. With the development of more sensitive transducers, this work has been applied to single cardiac cells, using freshly isolated cells from an animal model. With the advent of iPSC-derived myocytes, a whole new range of cell types is now available to the investigator. We introduce a novel mounting application for overcoming the technical difficulties in instrumenting these cells for force measurements. With this technology, it is now possible to conduct experiments on human stem cell-derived myocytes.

We will show preliminary results, the tools required for these types of experiments, mounting methods, and a novel method for direct force measurements on human iPSC-derived myocytes. In addition, two different methods for real-time determination of length changes in isolated iPSC-derived myocytes will be presented. The results are preliminary, however indicate the possibility for not only a reduction in the use of the animal models in cardiac research, but also the direct investigation of human cardiovascular disease.

Super-Resolution Microscopy

Eric Betzig, Stefan W. Hell and William E. Moerner were awarded the Nobel Prize in Chemistry 2014 for their great achievements in developing super-resolution/single-molecule microscopy. This revolutionary progress in optical microscopy enables us to have an unprecedented power peering into the nanoworld in live organisms. This year's "Biophysics 101" session will include two lectures on this topic, outlining the practice of super-resolution/single-molecule microscopy for not-yet-experts, and describing some of its uses and rewards. The session is part of a continuing series of symposia initiated by the Education Committee to educate the Society membership about fundamentals of various biophysical techniques with which they may not be familiar but might want to use.

How to Get Your Scientific Paper Published

This panel discussion, sponsored by the Publications Committee, will focus on the practical issues involved in publishing a scientific paper. The panelists have extensive experience in writing, reviewing, and editing papers, and will provide information on the dos and don'ts of submitting research manuscripts. Discussions will likely focus on strategies to avoid common pitfalls, how to prevent and fix problems before submission, and how to respond to critiques and even rejection of a paper. Attendees are encouraged to ask questions during the session.

Overcoming Unconscious Bias & Barriers in Science

Most scientists want to detect (and to mitigate) the influence of bias in the context of their research. However, in the context of interpersonal relationships, scientists often act with unconscious biases against another person's gender, age, ethnicity, or socioeconomic status. These unchecked biases limit the career advancement of susceptible individuals and propagate harmful stereotypes. This panel will explore strategies for detecting our unconscious biases and overcoming them.

US Science Education in a Global Context

Why do students in other countries outperform US students in science? As other countries are increasing their investment in scientific research and creating new opportunities for higher education and work, who will fill the seats in tomorrow's US university science classrooms? Panelists in this session will discuss what other countries are doing differently than the US in science education and the role of the next generation science standards in US education.

Sutter Instruments

Scientists Empowering Scientists

For over 40 years, Sutter Instrument has designed and produced electro-mechanical and optical instrumentation that helps scientists push the limits. While Sutter has long been the market leader in products for micropipette fabrication and micromanipulation, we have continued to expand our Lambda imaging product line and XenoWorks microinjection systems. A strong emphasis has always been placed on providing expert tech support to help our customers achieve the best results in their research.

To further this goal, Sutter Instrument is starting a series of user meetings with tutorial presentations. We will be providing step-by-step guidance to the new experimenter as well as advanced tips and tricks for the experienced user. To round it off, newly introduced products will be discussed on a case-by-case basis. Registration is available online through the Sutter Event Registration Page (http://sutter.eventbrite.com), or by email to info@sutter.com. The number of available spaces is limited, and registrations are accepted on a first-come-first-served basis.

Who should attend?

- Electrophysiologists who use micropipettes and micromanipulators for patch clamp, sharp electrode or extracellular recordings.
- Researchers who perform microinjections, including nuclear transfer, sperm injection and application of substances into cell cultures or intact organisms.
- Scientists who want to learn more about optimizing their results with pipette pullers and micromanipulators

Bruker Nano Surfaces

Recent Advances in Atomic Force Microscopy for Biological Research

Bruker's latest BioScope AFM is the perfect integration of AFM and inverted light microscopy. It incorporates Bruker's latest Peak Force Tapping innovations including the new nanomechanics package, which significantly expands mechanobiology applications into a lower modulus range covering live cells and tissues. With its open access design, and bio friendly features and accessories, the latest BioScope AFM is the most integrated and easiest to use life science AFM available. The workshop will include examples of the functional integration of light microscopy techniques with AFM in order to conduct optically guided, high-resolution mapping of both the structural and mechanical properties of mammalian cells.

Successfully Navigating the International Job Search

Applying for a job in one country while finishing up your education and training in another can be challenging, but it can be done with success. In this workshop we will discuss specific strategies to finding jobs in another country while one is abroad and how to leverage your networks in-country to access opportunities, especially those that are hidden. Special emphasis will be placed on establishing your reputation as a leader in your field with professionals in the country or region in which you wish to work. Case studies will be shared.

SensiQ Technologies Inc

High End Microscope Platform for Multimodal Live Cell Imaging
SensiQ's dynamic injection methods provide complete, one-pass kinetic and equilibrium data from a single injection while reducing statistical error/noise. Simply load one, highest analyte concentration vial and the instrument exposes the surface to either a stepwise (FastStep®) or continuous gradient (OneStep®) of concentrations. These approaches increase the ease/throughput of SPR experiments and provide complete data sets for interactions that are complicated by incomplete surface regeneration. FastStep® uses a patented onboard micro-mixing technique to create increasing fixed concentrations of analyte in real time without generating partial dissociation responses as the instrument prepares subsequent concentrations. This technique improves throughput by decreasing the time to complete a full run while simplifying data analysis. OneStep® is the ultimate evolution of FastStep®. Taylor dispersion fluidics establish a continuous gradient of analyte concentrations which is flowed over the surface to generate a sigmoidal binding curve. This technique introduces a time dependent variable that is not possible in traditional injection techniques and allows for the quantitative separation of multiple binding sites with different affinities. OneStep® also increases the dynamic range of allowable concentrations thereby removing the need to perform test injections or accurately guess the affinity of an unknown interaction. Importantly, OneStep® also provides added data content in SPR experiments by providing a measure of the analyte diffusion coefficient to help identify analytes that have a tendency to oligomerize or aggregate. SensiQs' operational software was developed to simplify assay development and instrument operation. Using a drag and drop icon based programming approach, traditional program "scripting" is eliminated to simplify and speed assay development. Executable protocols for high throughput experiments can be developed in minutes. Programming examples will show how operational actions have been optimized to decrease runtime and increase throughput. Streamlining data analysis of small or large data sets using our Q-Dat software will also be presented.

Measure More Membrane: Cells, Bilayers and Transporter Activity
The Port-a-Patch turned 10 years old last year, and is going stronger than ever. It's still the smallest patch clamp rig in the world, and makes patch clamp recordings accessible to anyone spending a couple of hours with it. Giga-seal recordings and the excellent voltage-clamp of the cellular membrane ensure high quality data, and the Port-a-Patch add-ons allow unprecedented experimental freedom, including temperature control, internal perfusion, automated action potential recordings, and recordings from primary and stem cell-derived cells.

The Orbit 16 is a parallel device for efficient formation of and recordings from up to 16 artificial bilayers at once, for parallel bilayer-reconstitution of ion channels and nanopores. Using Micro Electrode Cavity Array (MECA, Ionera), a 4 x 4 array of circular micro-cavities in a highly inert polymer, the bilayer is automatically formed by remotely actuated painting (Ionera- SPREAD), which all will be demonstrated during the session.

Ion transporters and pumps play an important role within general metabolism and information processing of organisms. The SURFE2R is a unique platform for direct measurements ion transporters and ion channels in diverse and heterologous membranes. It is easy-to-handle, highly sensitive and a very efficient screening platform. The SURFE2R N1 is a small footprint, fully automated device recording from membrane preparations, with proven success using native tissue, mammalian and insect cell lines, bacteria, organelles, and proteoliposomes.

Join this workshop for hands-on experiments and information about three outstanding platforms: Port-a-Patch, Orbit 16 and SURFE2R N1! We look forward to seeing you!

KinTek Explorer Software: New Advances in Fitting Kinetic and Equilibrium Data
Fitting kinetic data based upon numerical integration of rate equations offers many advantages over conventional fitting of data based upon equations derived from simple models. Fitting by simulation is the most rigorous and eliminates numerous errors in simplifying assumptions needed to derive equations. Every day papers are published that contain errors in kinetic analysis that could have been avoided if the data had been fit using KinTek Explorer software.

In this presentation, Dr. Johnson will show how global fitting of kinetic data can be accomplished with ease using the fast, dynamic simulation in KinTek Explorer software, overcoming the all-to-common errors in conventional fitting. Moreover, data are fit to derive rate constants directly defining steps in a model, not merely observed rates (Eigenvalues). New advances in the software allow fitting kinetic data from single molecule experiments and families of curves can be fit simultaneous to define voltage-dependent rate constants or data from Temperature-jump or Pressure-jump experiments. In addition, equilibrium titration data can be fit using a unique endpoint simulation method, and time-resolved spectra can be fit using singular value decomposition (SVD). All experiments can be fit simultaneously and accurate error estimates are derived using robust confidence contour analysis.

Ten Tough Industrial Interview Questions (and Ten Pretty Good Responses)

You've been invited to interview with that drug development company that you've always wanted to work for. You've soaked up the details of the position description. You are confident in your ability to do the job, as well as answer any/all technical questions during the interview process. The day is yours…until…that first question catches you by surprise and your confidence begins to wilt. Be prepared for those non-technical questions that you will almost certainly hear at some point, know why they are asked, and learn what a good (if not great) response to each question might be by attending this workshop.

FEI Cryo-TEM Workflow Solutions: A New Era for 3D Structural Biology

A new frontier exists in unraveling interactive biological and biochemical processes and pathways at the macromolecular level. Of critical importance is the three-dimensional visualization of macromolecular structures and molecular machines in their native functional state. Three techniques play a major role in orchestrating this.

Nuclear magnetic resonance (NMR) has the capability to study specific protein domains or fragments and their functional role in protein folding and dynamics and in ligand binding whereas X-Ray crystallography (XRD) allows visualizing high-resolution but more static 3D structures of apo and liganded proteins, mainly in a monomeric or dimeric state after crystallization. To unravel more physiologically relevant situations however, it is essential to visualize multimeric complexes in their tertiary and quaternary state and their interaction with other complexes. By performing typical cryo-TEM applications like single particle analysis or tomography, this can be achieved. In this so-called translational methodology, cryo-TEM thus provides complementary information to NMR and XRD that can be crucial for drug discovery, e.g. in terms of a better understanding of the mechanism of action inferred from the EM structure of the physiologically relevant complex. This will eventually contribute to answer real biologically as well as medically relevant questions.

Latest developments in the cryo-TEM workflow have brought the 3 major structural biology technologies closer together. Now, finally, a continuum has been reached on all important aspects with regards to resolution and macromolecular scales which allows for the full deployment of the combination of these technologies.

Here, we will illustrate the historical context of these technologies with respect to one another and show how latest developments have reached the critical requirements to fully unleash the power of structural biology in not just answering fundamental questions, but actually contribute to curing diseases and improving health. Also, we will discuss the future of structural biology based on the latest developments of the FEI workflow and its components with a special focus on the advances in contrast enhancement (phase plates) and (direct electron) detection.

The Light Scattering Toolkit for Biophysical Characterization: Lab Essentials for Enhancing Studies of Purification, Crystallization, Formulation, Conjugation, Conformation, and Interactions

Biophysical techniques based on static and dynamic light scattering address many of the key analytical challenges associated with proteins, oligonucleotides, vesicles and other biomacromolecules. This workshop covers the following topics:

1. Batch DLS—traditional cuvette-based dynamic light scattering (DLS) is a fast, easy means of estimating macromolecular and nanoparticle size distributions to assess protein aggregation or the sizes of virus-like particles or drug delivery nanovehicles. In microwell-plate format, DLS is a high-productivity tool useful for optimizing formulation or crystallization conditions with minimal sample consumption or manual labor.

2. SEC-MALS and SEC-DLS—coupling of multi-angle static light scattering (MALS) and DLS detection to size-exclusion chromatography to assess molar mass, size, conformation and conjugation, in solution, independently of column calibration and non-ideal sample-column interactions. In addition to readily assessing aggregation and fragmentation in line with SEC purification, SEC-MALS analyzes protein conjugates such as glycoproteins or membrane proteins bound to surfactant micelles, determining protein oligomeric state and the mass of glycans, polysaccharides or surfactant modifying the protein.

3. FFF-MALS and FFF-DLS—coupling of MALS and DLS to a field-flow fractionation (FFF) device to achieve accurate characterization of macromolecules and nanoparticles from 1-1000 nm, even when soluble and insoluble components are both present in the solution. It does not employ a stationary phase; FFF separates without shear and with minimal surface interactions. FFF produces high-resolution size distributions thanks to true hydrodynamic separation upstream of the light scattering detectors. It also offers the benefits of post-separation downstream analysis by spectroscopy for additional information on samples.

4. CG-MALS—coupling MALS to a composition-gradient device results in a uniquely powerful system for characterizing complex biomolecular interactions, label-free and immobilization-free. Because MALS measures molar masses it is one of the most useful techniques for analyzing multi-domain, multi-protein interactions that go beyond standard 1:1 interactions including systems exhibiting cooperativity and allostery. CG-MALS determines the affinity and absolute molecular stoichiometry of self and/or heteroassociating systems from pM to mM.

Measuring Engineered Changes in Binding Affinity with the BLItz® Label-Free System

Combining Organic Synthesis and Directed Evolution to Design Glycocluster HIV Vaccine Candidates

We will describe a new method for design of carbohydrate HIV vaccines, which combines organic synthesis and directed evolution techniques. This work originates from the observation that some HIV positive individuals produce antibodies which are broadly neutralizing and protective against HIV infection. One such antibody, 2G12, recognizes and binds to a cluster of carbohydrates on the viral envelope protein gp120. Our goal is to develop synthetic carbohydrate clusters which closely mimic the viral carbohydrate cluster, and which might thus elicit a 2G12-like antibody response when used as a vaccine. In order to design carbohydrate clusters which closely mimic gp120, we have developed evolution-based strategies, in which immobilized 2G12 is used to recognize and fish out the best glycocluster mimics of gp120 from amongst large libraries of ~10 trillion different glycosylated peptide- or DNA structures. The glycocluster structures obtained by these methods are recognized by antibody 2G12 as strongly as is the viral protein itself, and are thus of great interest for vaccine studies.

Tips and Tricks for Developing BLItz Assays

The BLItz label-free assay system is a simple-to-use benchtop instrument for measuring binding interactions of antibodies and proteins using as little as 4µl of sample. Additional case studies of how the BLItz system is being used to qualify biophysical models will be presented, along with tips and tricks for developing kinetics assays on the BLItz system.

Side-Stepping the Animal Model: Cardiac Work Loops in Human iPSC-derived Myocytes.

Cardiac pressure-volume loops on a complete organ provide the framework for understanding cardiac mechanics in experimental animal models, most notably in the context of Frank-Starling mechanisms. With the development of more sensitive transducers, this work has been applied to single cardiac cells, using freshly isolated cells from an animal model. With the advent of iPSC-derived myocytes, a whole new range of cell types is now available to the investigator. We introduce a novel mounting application for overcoming the technical difficulties in instrumenting these cells for force measurements. With this technology, it is now possible to conduct experiments on human stem cell-derived myocytes.

We will show preliminary results, the tools required for these types of experiments, mounting methods, and a novel method for direct force measurements on human iPSC-derived myocytes. In addition, two different methods for real-time determination of length changes in isolated iPSC-derived myocytes will be presented. The results are preliminary, however indicate the possibility for not only a reduction in the use of the animal models in cardiac research, but also the direct investigation of human cardiovascular disease.

KinTek Explorer Software: New Advances in Fitting Kinetic and Equilibrium Data

Fitting kinetic data based upon numerical integration of rate equations offers many advantages over conventional fitting of data based upon equations derived from simple models. Fitting by simulation is the most rigorous and eliminates numerous errors in simplifying assumptions needed to derive equations. Every day papers are published that contain errors in kinetic analysis that could have been avoided if the data had been fit using KinTek Explorer software.

In this presentation, Dr. Johnson will show how global fitting of kinetic data can be accomplished with ease using the fast, dynamic simulation in KinTek Explorer software, overcoming the all-to-common errors in conventional fitting. Moreover, data are fit to derive rate constants directly defining steps in a model, not merely observed rates (Eigenvalues). New advances in the software allow fitting kinetic data from single molecule experiments and families of curves can be fit simultaneous to define voltage-dependent rate constants or data from Temperature-jump or Pressure-jump experiments. In addition, equilibrium titration data can be fit using a unique endpoint simulation method, and time-resolved spectra can be fit using singular value decomposition (SVD). All experiments can be fit simultaneously and accurate error estimates are derived using robust confidence contour analysis

Technology Innovations from ZEISS, the New ZEISS LSM 880 Confocal with Airyscan and the ZEISS Lightsheet Z.1

New microscopes from ZEISS address both ends of the spectrum of samples, live high speed imaging with superresolution and high speed imaging of large live and fixed tissues. Learn how the ZEISS LSM 880 with Airyscan maintains the mantra that each photon of emission light is precious, while expanding the triangle of sensitivity, resolution and speed of acquisition.

The LSM 880 with Airyscan allows you to use multicolor samples with any label and get image quality like you've never seen before. With Airyscan you are always able to select the optimal acquisition strategy for your sample: Simply decide whether you want to gain 1.7x higher resolution in all three dimensions – resulting in a 5x smaller confocal volume. Or push the sensitivity beyond the limits of all conventional confocals. Or use the increase in signal-to-noise ratio to speed up your image acquisition.

Traditionally, deeply imaging into intact tissue typically requires multiphoton excitation to penetrate deeper than near the surface of a tissue. Using a "clearing" method to remove the light obstructing opaque molecules from a tissue has been another technique for deep imaging. Techniques such as SCALE, CLARITY, ClearT, SeeDB, CUBIC and others have allowed researchers to image deeper than a millimeter into cleared animal model brains and organs.

The ZEISS Lightsheet Z.1 features high speed image acquisition and greatly reduced photodamage making imaging of live developmental samples and fixed and cleared tissues easier than ever before. Come learn about using the innovative ZEISS Lightsheet Z.1 microscope for imaging of fixed and cleared tissues.

Advances in Correlative Light and Electron Microscopy

Correlative light and electron microscopy (CLEM) is a powerful approach that enables combining dynamic information and labelling specificity from fluorescence microscopy with ultra-structural information at nanometer resolution from electron microscopy on the same sample. In recent years technical improvements in fluorescence microscopy have enhanced z-resolution, enabled imaging with high sensitivity using TIRF and, with super-resolution microscopy, improved the resolution of light microscopy to up to 20 nm. Despite all these advances, fluorescence microscopy can only show what was labelled and an EM is needed to provide the full morphological context on the ultra-structure of the cell. However, CLEM experiments still remain challenging and low through-put.

Over the last years, FEI has introduced different solutions to overcome some of the challenges in CLEM experiments and to make CLEM experiments easier and more efficient. But correlative experiments are rapidly evolving – here, we will present updates on latest developments that have pushed the boundaries of correlative experiments.

Performing Positive Allosteric Modulator (PAM) Assays and Investigating Use-Dependent Inhibition of Ion Channels on Automated Electrophysiology Systems Including the IonFlux™ Benchtop Reader and the IonWorks Barracuda® Instrument

PAM Assays
Nicotinic acetylcholine receptors (nAChRs) have been extensively studied due to their importance in physiological processes as well as involvement in several muscle and neuronal human pathologies, and are major therapeutic targets for pharmaceutical drug discovery. Ensemble recordings on the IonFlux HT System were validated with human hnAChR recombinant cell lines developed by Eurofins Discovery Services. Response properties of the nAChRs to the endogenous ligand acetylcholine (ACh), reference agonists, antagonists and positive allosteric modulators (PAMs) were characterized and will be presented.

Ion Channel Use-Dependence
Use-dependent inhibition of ion channels by potential drug candidates is an important aspect to investigate for many drug classes. Data will be presented to demonstrate the ability of automated electrophysiology systems to study the use-dependence block of Na+ channel targets by peptide toxins and known compounds. We will demonstrate the ability of the IonWorks Barracuda system to deliver complex voltage protocols and generate long assay windows which are required for these studies.Pulse trains delivered at 10Hz are used to measure the blockade of current. These experiments demonstrate stable assay windows with uniform currents for 30 minutes and longer during the delivery of periodic pulse trains.

Learn How SensiQ's Dynamic Injection (diSPR®) Techniques Enhance the Biophysical Characterization of Binding Events Using Surface Plasmon Resonance Technology

SensiQ's dynamic injection methods provide complete, one-pass kinetic and equilibrium data from a single injection while reducing statistical error/noise. Simply load one, highest analyte concentration vial and the instrument exposes the surface to either a stepwise (FastStep®) or continuous gradient (OneStep®) of concentrations. These approaches increase the ease/throughput of SPR experiments and provide complete data sets for interactions that are complicated by incomplete surface regeneration.

FastStep® uses a patented onboard micro-mixing technique to create increasing fixed concentrations of analyte in real time without generating partial dissociation responses as the instrument prepares subsequent concentrations. This technique improves throughput by decreasing the time to complete a full run while simplifying data analysis.

OneStep® is the ultimate evolution of FastStep®. Taylor dispersion fluidics establish a continuous gradient of analyte concentrations which is flowed over the surface to generate a sigmoidal binding curve. This technique introduces a time dependent variable that is not possible in traditional injection techniques and allows for the quantitative separation of multiple binding sites with different affinities. OneStep® also increases the dynamic range of allowable concentrations thereby removing the need to perform test injections or accurately guess the affinity of an unknown interaction. Importantly, OneStep® also provides added data content in SPR experiments by providing a measure of the analyte diffusion coefficient to help identify analytes that have a tendency to oligomerize or aggregate.

SensiQs' operational software was developed to simplify assay development and instrument operation. Using a drag and drop icon based programming approach, traditional program "scripting" is eliminated to simplify and speed assay development. Executable protocols for high throughput experiments can be developed in minutes. Programming examples will show how operational actions have been optimized to decrease runtime and increase throughput. Streamlining data analysis of small or large data sets using our Q-Dat software will also be presented.

Measure More Membrane: Cells, Bilayers and Transporter Activity

The Port-a-Patch turned 10 years old last year, and is going stronger than ever. It's still the smallest patch clamp rig in the world, and makes patch clamp recordings accessible to anyone spending a couple of hours with it. Giga-seal recordings and the excellent voltage-clamp of the cellular membrane ensure high quality data, and the Port-a-Patch add-ons allow unprecedented experimental freedom, including temperature control, internal perfusion, automated action potential recordings, and recordings from primary and stem cell-derived cells.

The Orbit 16 is a parallel device for efficient formation of and recordings from up to 16 artificial bilayers at once, for parallel bilayer-reconstitution of ion channels and nanopores. Using Micro Electrode Cavity Array (MECA, Ionera), a 4 x 4 array of circular micro-cavities in a highly inert polymer, the bilayer is automatically formed by remotely actuated painting (Ionera-SPREAD), which all will be demonstrated during the session.

Ion transporters and pumps play an important role within general metabolism and information processing of organisms. The SURFE2R is a unique platform for direct measurements ion transporters and ion channels in diverse and heterologous membranes. It is easy-to-handle, highly sensitive and a very efficient screening platform. The SURFE2R N1 is a small footprint, fully automated device recording from membrane preparations, with proven success using native tissue, mammalian and insect cell lines, bacteria, organelles, and proteoliposomes.

SensiQ Technologies Inc 643

800 Research Parkway, Suite 100
Oklahoma City, OK 73104
www.sensiqtech.com

SensiQ presents Dynamic SPR injection techniques in booth (643) and Exhibitor Workshop (Tuesday February 10th, Room B, 10:30am). These one-pass kinetic and equilibrium single injection techniques, reduce error/noise. Load one, highest analyte concentration vial and FastStep® (stepwise) or OneStep® (continuous gradient) concentrations are created. FastStep®'s patented onboard micro-mixing creates increasing fixed concentrations without partial dissociation responses, improving throughput. OneStep®, Taylor dispersion fluidics, establish a continuous analyte gradient concentration then flowed over the surface to generate a sigmoidal binding curve, introduces time dependency that is not possible conventionally and provides quantitative separation of multiple affinity binding sites. OneStep® increases the dynamic range of allowable concentrations eliminating test injections or guesswork for unknown affinities. OneStep® provides added data content in SPR experiments by providing a measure of the analyte diffusion coefficient to help identify analytes that have a tendency to oligomerize or aggregate.

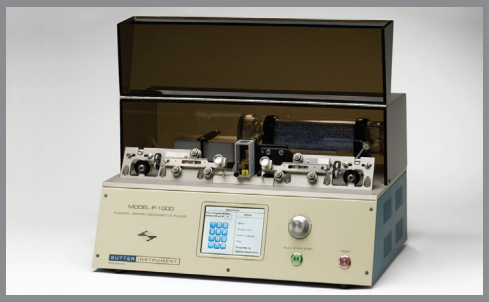
MICROMANIPULATION

The most powerful aspect of the **Multi-Link Position Control**™ software is the ability to link and coordinate movement of multiple devices that can be connected to our **MPC-200** controller. You can combine manipulators, translators, microscopes (**MOM** or **SOM**) and stages to give you complete control over your complex experiments. Bring all devices to memorized positions or bring pipettes to a working location in seconds. Available as a free download on our web site.

MICROPIPETTE FABRICATION

Sutter Instrument, the recognized leader in micropipette fabrication technology, offers leading edge technology in the **P-1000** micropipette puller with an intuitive, full-featured interface. An extensive library of built-in programs is available through the color touch-screen display, taking the guesswork out of pipette pulling.



OPTICAL PRODUCTS

Our latest products include the **Lambda HPX-L5**, a new high-powered white light LED and the versatile **SOM** simple moving microscope optimized to allow *in vivo* and *in vitro* experimentation in one set-up. As with our two-photon **MOM** microscope, the **SOM** can robotically position the objective over the sample and focus, opening up experimental possibilities.

MICROINJECTION

The **XenoWorks**® microinjection system has been designed to meet the needs of a wide variety of applications that require the manipulation of cells and embryonic tissues including ICSI, ES Cell Microinjection, and Adherent Cell Microinjection. Highly-responsive movement and excellent ergonomics intuitively link the user with the micropipette, improving yield – saving time and resources.

Biophysical *Journal*

Call for Papers

Special Issue: Electron Cryomicroscopy

Editors: Edward H. Egelman and Andreas Engel

Biophysical Journal will publish a special issue of the Journal with a focus on Electron Cryomicroscopy (cryo-EM). The Journal welcomes submissions that report on advances in the field of cryo-EM and its applications. Studies should further our understanding of cryo-EM imaging, cryogenic sample preparation techniques, or image analysis and reconstruction methods used in cryo-EM. The journal aims to publish the highest quality work and articles should have sufficient importance to be of general interest to biophysicists, regardless of their research specialty.

Deadline for submission: July 1, 2015

- Please include a cover letter stating that you would like to be part of the special issue on Electron Cryomicroscopy
- Select "Special Issue: Electron Cryomicroscopy" when uploading your submission.
- Instructions for authors can be found at: http://www.cell.com/biophysj/authors
- Questions can be directed to the *BJ* Editorial Office at BJ@biophysics.org or (240) 290-5545.

..... *Journal* publication fees will apply .....

PHYSICAL REVIEW **APPLIED**

journals.aps.org/prapplied

Physical Review Applied is APS's newest journal, dedicated to publishing the highest quality research at the intersection of physics and engineering.

The Editors encourage the submission of research that:

- Significantly advances the field of applied physics.
- Is forward thinking, with a clear vision for future directions.
- Offers qualitative, not merely quantitative or incremental, advances over prior work.
- Crosses disciplines, to interest more than a specialized group of readers.
