Gemelli ART
Advanced Radiation Therapy

Overview

- Anamnesis
- Diagnosis
- Staging
- Treatment
- Re-staging

- Voting

UNIVERSITÀ CATTOLICA del Sacro Cuore

Anamnesis

- Male
- 68 years old
- WHO PS O
- No co-morbidity
- No family history of cancer
- Symptoms:
  - Rectal bleeding
  - Altered bowel habits
  - Bowel cramps
  - Bloating

UNIVERSITÀ CATTOLICA del Sacro Cuore

Diagnosis

- **DRE:**
  - At 5 cm from the internal anal sphincter:
    - Circumferential tumor
    - Fixed
    - Blood on the exploring finger

- **Colonoscopy:**
  - Bleeding tumor at 7 cm from the anal verge, extending for 5 cm.

- **Biopsy:**
  - Moderately differentiated adenocarcinoma

- **Blood Tests:** Elevated CEA (>30 ng/ml), other blood tests normal

UNIVERSITÀ CATTOLICA del Sacro Cuore

Staging

- **CT Scan Thorax + Abdomen:**
  - Circumferential lesion in the high/mid rectum reaching the mesorectal fascia
  - Hepatic VII segment, superficial hypodense lesion of 1 cm, to be confirmed with MRI
  - No other suspect lesions in the lungs or in the lymph nodes

UNIVERSITÀ CATTOLICA del Sacro Cuore

Staging

- **Pelvic MRI:**
  - Circumferential tumor at 5.5 cm from the anorectal junction, longitudinal extension of 4 cm
  - Branches in the mesorectum reaching the mesorectal fascia
  - “Multiple lymph nodes” in the mesorectum, globular and infiltrating the mesorectal fascia on the postero-lateral left side

UNIVERSITÀ CATTOLICA del Sacro Cuore

Pelvic MRI

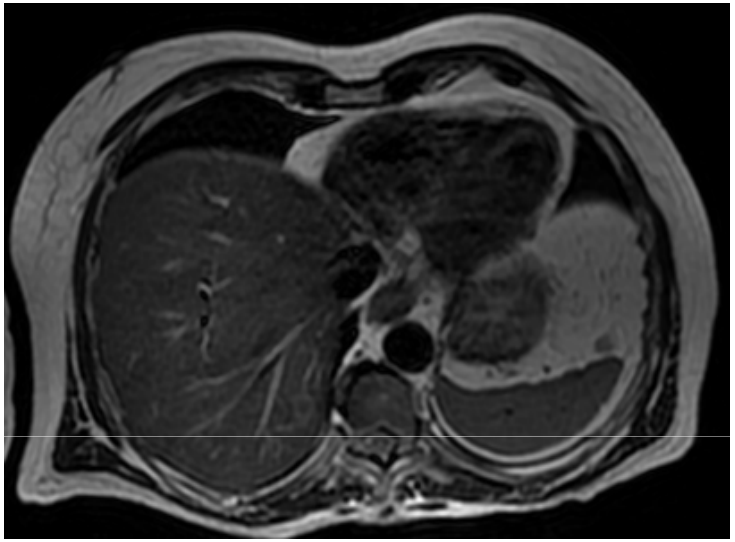
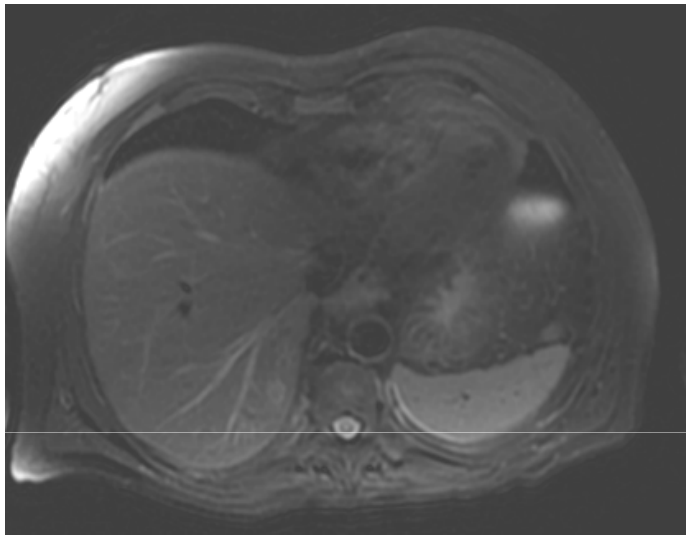
Staging

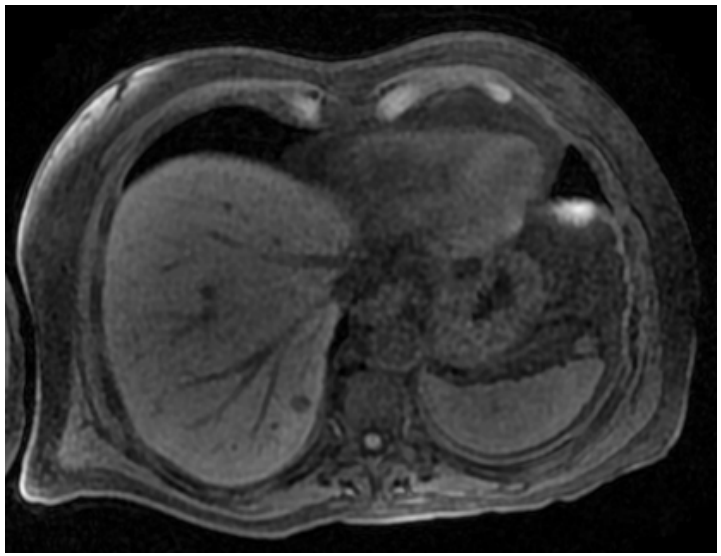
- **MRI abdomen:**
  - At the level of the hepatic VII segment, 1.4 cm superficial lesion hypointense on T1 and hyperintense on T2, no other hepatic lesions

UNIVERSITÀ CATTOLICA del Sacro Cuore

Upper Abdomen MRI







UNIVERSITÀ CATTOLICA del Sacro Cuore

Question 1

Do you need additional imaging?

A. No

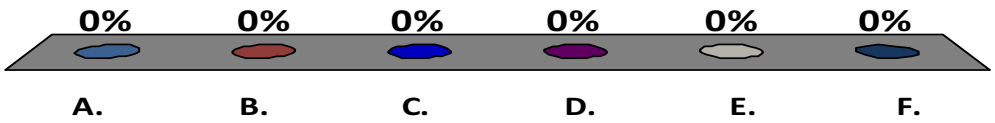
B. FDG PET-CT Scan

C. Pelvic MRI with Diffusion weighted imaging (DWI) sequences

D. Abdominal MRI hepatospecific contrast-enhanced

E. Ultrasound of the liver

F. Other

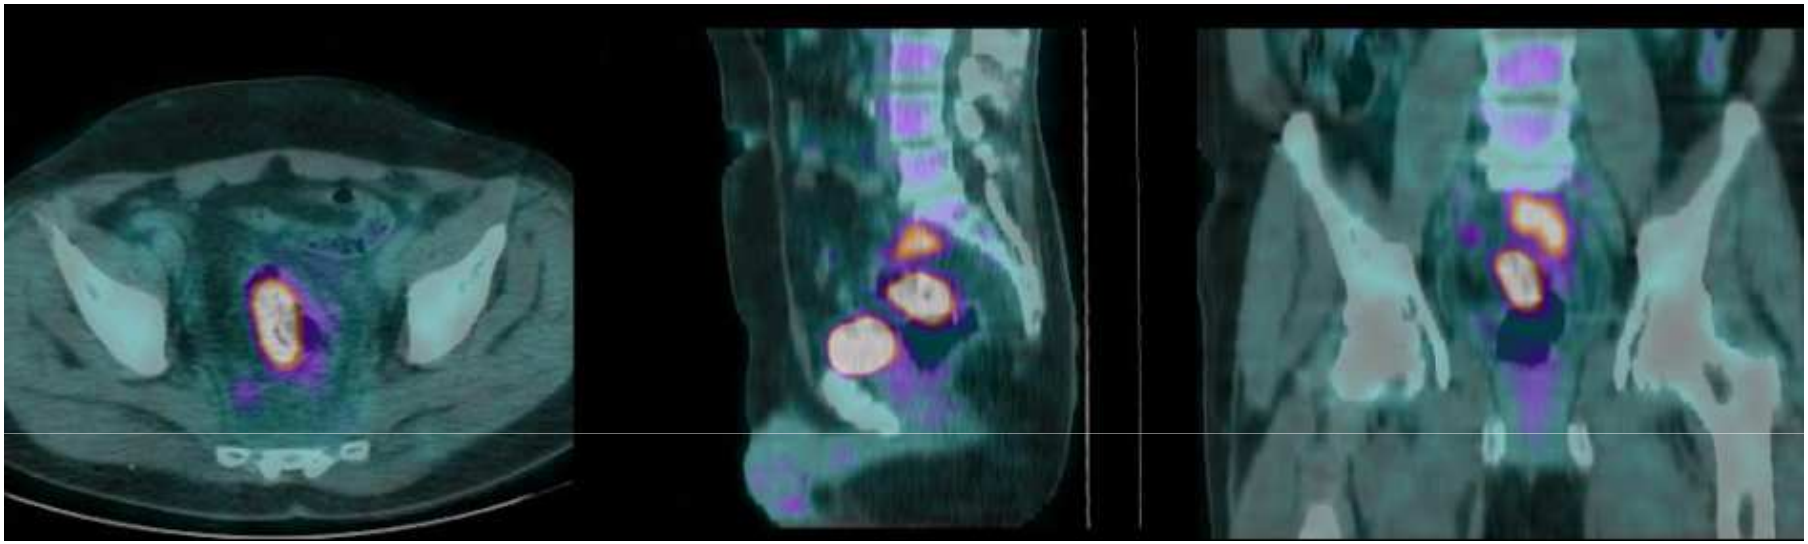


Staging

- **PET-CT:**
  - **Increased metabolic activity** at the level of the known **rectal lesion** with a longitudinal extension of about 4 cm and **SUV max of 11.9**; **perirectal nodes** and **presacral** globular nodes with an axial diameter of 34 mm and **SUV max of 6.2**.
  - Focal area of **increased metabolism** in the **VII hepatic segment**, superficial.
  - No other pathologic accumulation of FDG.

UNIVERSITÀ CATTOLICA del Sacro Cuore

fdg PET-CT



UNIVERSITÀ CATTOLICA del Sacro Cuore

Question 2

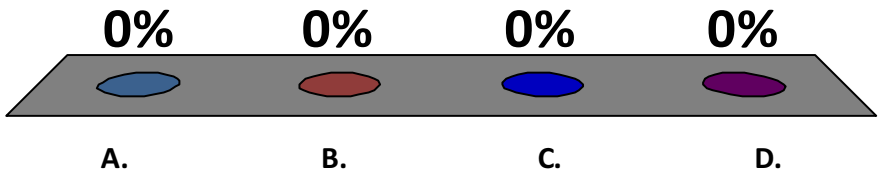
What is the Clinical Stage in this patient?

A. T3 N1 M1

B. T3 N2 M1 (MRF+)

C. T4 N1 M1

D. T4 N2 M1



Staging

Stage: IV

cT3; N2; M1 (liver)

MRF +

UNIVERSITÀ CATTOLICA del Sacro Cuore

Question 3

What treatment would you propose ?

A. Upfront Surgery (liver and rectum)

B. Short-Course RT → Surgery (rectum) → CT → Surgery (liver)

C. Short-Course RT → Surgery (rectum) → CT → Surgery (liver)

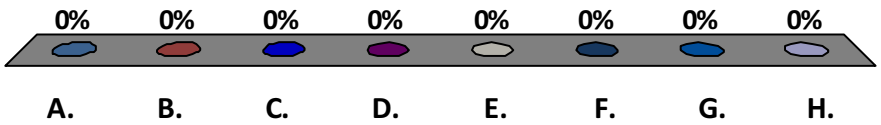
D. Short-Course RT → Chemotherapy → Surgery (liver and rectum) Long-Course RT-CT → Chemotherapy → Surgery (liver and rectum)

E. Long-Course RT-CT → Chemotherapy → Surgery (liver and rectum)

F. Chemotherapy →Short-Course RT→ Surgery (liver and rectum)

G. Chemotherapy →Long-Course RT-CT → Surgery (liver and rectum)

H. Other



Treatment (1/3) Clinical Trial

- **Radiotherapy**
- 45 Gy/25 fx/1.8 Gy on the CTV2:
  - Pelvic subsites (M, PS,IIN,ON)
- 10 Gy 1 Gy delivered concomitantly , 2 days a week on the CTV1: GTV + corresponding mesorectum
  - Total dose 55 Gy on the CTV1 in 5 weeks

- **Concomitant chemotherapy**
  - Capecitabine 1650 mg/m^2 a day

UNIVERSITÀ CATTOLICA del Sacro Cuore

Treatment (1/3)

Clinical Trial

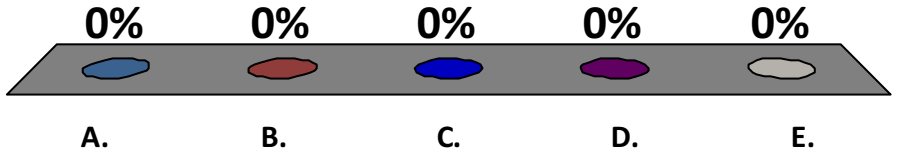
Question 4

What further treatment would you propose?

A. Surgery on the primary tumor only
B. Surgery on the liver metastasis only
C. Surgery on both sites
D. Further Chemotherapy
E. Other



Treatment (3/3)

- **Surgery:**
  - Anterior Resection with TME + sampling of suspicious extra mesorectal tissue on the posterior- left lateral pelvic wall
  - Partial hepatectomy

UNIVERSITÀ CATTOLICA del Sacro Cuore

Pathological Report

- Residual adenocarcinoma post-neoadjuvant therapy infiltrating the perirectal tissue; extramural invasion.
- Metastases in 9/16 lymph nodes.
- Negative circumferential, proximal and distal margins

- Nodule of 7 mm, metastasis of adenocarcinoma; Ras and B-raf WT

ypT3, ypN2b, ypM1
TRG 3/5 (Mandard's score)

UNIVERSITÀ CATTOLICA del Sacro Cuore

Question 5

What next option would you propose at this point?

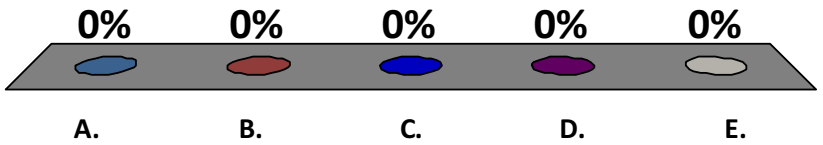
A. Follow–up

B. Adjuvant Chemotherapy with same regimenAdjuvant

C. Chemotherapy adding monoclonal antibodies

D. Adjuvant Chemotherapy with different/multiple drugs

E. Other



Treatment (4/4)

- **Adjuvant chemotherapy:**
  - FOLFOX-4, 5 cycles, up to a total of 6 months CT

Gemelli ART
Advanced Radiation Therapy

Initial work-up

- **Pt's characteristics:** Female, 71 years old. No familiarity for cancer**.**
- **Comorbidities**: Diabetes Type 2 treated with insuline; allergy to FANS

- **Symptoms:** she started 4 month erlier with rectal bleeding, alternating stipsis/diarrhea, mucous discharge, anal-rectal pain during defecation

Initial work-up

- **DRE:** Lesion starting from the **anal canal**, located to the anterior left lateral and posterior wall of the rectum, extending cranially for 5 cm, fix. Blood on the finger
- **Pt's Colonoscopy:** Lesion starting from the **anal canal** extending on the left lateral wall of the pelvis, extending for **6 cm**, **ulcerated** and **bleeding**. Biopsies.

- **Biopsy:** Poor differentiated adenocarcinoma

Staging Imaging

- **Thorax-abdomen CT:** Negative for M
- **MRI:** Lesion located in the antero left lateral rectal wall extending on the ¾ of the rectal circunference, beyond the anal-rectal junction. The lesion infiltrates the external anal sphincer on the left side. At the level of the rectum the tumor infiltrates the perirectal fat. More than 3 enlarged lymph nodes in the mesorectum, the biggest has a diameter of 7 mm. Bilateral aspecific inguinal lymph nodes. Rectovaginal septum not infiltrated by the disease.

Previous hysterectomy.

Definitions

Primary Tumor (T)

- TX Primary tumor cannot be assessed
- T0 No evidence of primary tumor
- Tis Carcinoma in situ: intraepithelial or invasion of lamina propria[1]
- T1 Tumor invades submucosa
- T2 Tumor invades muscularis propria
- T3 Tumor invades through the muscularis propria into pericolorectal tissues
- T4a Tumor penetrates to the surface of the visceral peritoneum[2]
- T4b Tumor directly invades or is adherent to other organs or structures[2,3]

Regional Lymph Nodes (N)[4]

- NX Regional lymph nodes cannot be assessed
- N0 No regional lymph node metastasis
- N1 Metastasis in 1–3 regional lymph nodes
- N1a Metastasis in one regional lymph node
- N1b Metastasis in 2–3 regional lymph nodes
- N1c Tumor deposit(s) in the subserosa, mesentery, or nonperitonealized pericolic or perirectal tissues without regional nodal metastasis
- N2 Metastasis in 4 or more regional lymph nodes
- N2a Metastasis in 4–6 regional lymph nodes
- N2b Metastasis in 7 or more regional lymph nodes

Distant Metastasis (M)

- M0 No distant metastasis
- M1 Distant metastasis
- M1a Metastasis confined to one organ or site (for example, liver, lung, ovary, nonregional node)
- M1b Metastases in more than one organ/site or the peritoneum

NOTE: cTNM is the clinical classification, pTNM is the pathologic classification. The y prefix is used for those cancers that are classified after neoadjuvant pretreatment (for example, ypTNM). Patients who have a complete pathologic response are ypT0N0cM0 that may be similar to Stage Group Over I. The r prefix is to be used for those cancers that have recurred after a disease-free interval (rTNM).
* Dukes B is a composite of better (T3 N0 M0) and worse (T4 N0 M0) prognostic groups, as is Dukes C (any T N1 M0 and Any T N2 M0). MAC is the modified Astler-Coller classification.

ajcc

American Cancer Society

Financial support for AJCC 7th Edition Staging Posters provided by the American Cancer Society

Notes

1 Tis includes cancer cells confined within the glandular basement membrane (intraepithelial) or mucosal lamina propria (intramucosal) with no extension through the muscularis mucosae into the submucosa.

2 Direct invasion in T4 includes invasion of other organs or other segments of the colorectum as a result of direct extension through the serosa, as confirmed on microscopic examination (for example, invasion of the sigmoid colon by a carcinoma of the cecum) or, for cancers in a retroperitoneal or subperitoneal location, direct invasion of other organs or structures by virtue of extension beyond the muscularis propria (that is, a tumor on the posterior wall of the descending colon invading the left kidney or lateral abdominal wall; or a mid or distal rectal cancer with invasion of prostate, seminal vesicles, cervix, or vagina).

3 Tumor that is adherent to other organs or structures, grossly, is classified cT4b. However, if no tumor is present in the adhesion, microscopically, the classification should be pT1–4a depending on the anatomical depth of wall invasion. The V and L classifications should be used to identify the presence or absence of vascular or lymphatic invasion, whereas the Pn site-specific factor should be used for perineural invasion.

4 A satellite peritumoral nodule in the pericolorectal adipose tissue of a primary carcinoma without histologic evidence of residual lymph node in the nodule may represent discontinuous spread, venous invasion with extravascular spread (TV2), or a totally replaced lymph node (N1/2). Replaced nodes should be counted separately as positive nodes in the N category, whereas discontinuous spread or venous invasion should be classified and counted in the Site-Specific Factor category Tumor Deposits (TD).

Question 2

What treatment would you propose ?

A. Surgery→ long course RT-CT

B. Short-Course RT → Surgery

C. Long-Course RT-CT → Surgery

D. Short-Course RT → Chemotherapy → Surgery

E. Other

NHS

Recommended Standards

- MRI staging assessment of all primary rectal cancer
- CT Thorax Abdomen and Pelvis for routine staging for metastatic disease
- ERUS : optional in addition to MRI
- PET-CT: in selected cases

The problems with TNM

- T3 category is enormous and survivals range from 90% (same as Dukes A) to 25% (T3 depth is far more important)
- Stage III classification is too heterogenous
- TNM does not take into account CRM status
- TNM does not take into account extramural vascular invasion
- TNM does not take into account low rectal cancer stage system
- Using T and N staging does not perform adequately in the assessment following neoadjuvant therapy

These tumours have entirely different prognostic outcomes

Stage II (T3N0)

mrT3dN0EMVI pos CRM+ CRT+chemo + beyond TME surgery

Stage III (T3N1)

PET-CT Recommendations

- The routine use of PET is not recommended for the diagnosis or staging of clinical stage I-III CRC.
- PET is recommended for determining management and prognosis if conventional imaging is equivocal for the presence of metastatic disease.
- The routine use of PET is not recommended for the measurement of treatment response in locally advanced rectal cancer before and after preoperative chemotherapy.
- PET is also not recommended for routine surveillance in patients with CRC treated with curative surgery at high risk for recurrence.
- PET is recommended to determine site of recurrence in the setting of rising CEA when conventional work-up fails to unequivocally identify metastatic disease.
- PET is recommended in the preoperative assessment of CRC liver metastasis before surgical resection.

Commonly encountered equivocations:

- Indeterminate pulmonary nodule
- Lesion – “too small to characterise”
- Multiple lesions in liver…
- Prominent retroperitoneal lymph nodes
- Stranding/nodularity

When is it important to know?

- Patients undergoing major radical surgery with curative intent: e.g. ELAPE/ extenteration
- Oligometastatic disease – potentially resectable vs widespread metastatic disease
- Synchronous metastatic disease control – liver first/ primary first?
- Type and duration of adjuvant chemotherapy
- Biomarker for resistance to 1st line chemotherapy
- Unexplained rise in CEA level

The indeterminate pulmonary nodule

Indeterminate Pulmonary Nodules at Colorectal Cancer Staging: A Systematic Review of Predictive Parameters for Malignancy

Andreas Nordholm-Carstensen, MD, Peer A. Wille-Jørgensen, MD, DMSci, Lars N. Jorgensen, MD, DMSci, and Henrik Harling, MD, DMSci

Department of Surgery K, Bispebjerg Hospital, University of Copenhagen, Copenhagen, Denmark

ABSTRACT

Background. This study aimed to estimate the prevalence of indeterminate pulmonary nodules and specific radiological and clinical characteristics that predict malignancy of these at initial staging chest computed tomography (CT) in patients with colorectal cancer. A considerable number of indeterminate pulmonary nodules, which cannot readily be classified as either benign or malignant, are detected at initial staging chest CT in colorectal cancer patients.

Methods. A systematic review based on a search in EMBASE, Medline, the Cochrane library and science citation index, PubMed databases, Google scholar, and relevant conference proceedings was performed in cooperation with the Cochrane Colorectal Cancer Group.

Results. A total of 2,799 studies were identified, of which 12 studies met the inclusion criteria. The studies primarily consisted of case series and included a total of 5,873 patients. Of these patients, 9 % (95 % confidence interval [95 % CI] 8.9–9.2 %) had indeterminate pulmonary nodules at chest CT, of which 10.8 % (95 % CI 10.3–11.2 %) turned out to be colorectal cancer metastases at follow-up. Generally, regional lymph node metastasis, and multiple numbers of indeterminate pulmonary nodules were reported to predict malignancy, whereas calcification of the nodules indicated benign lesions.

Conclusion. It was found that 1 in 100 colorectal cancer patients subjected to preoperative staging chest CT will have an indeterminate pulmonary nodule that proves to be metastatic disease. Such a low risk suggests that indeterminate pulmonary nodules should not cause further preoperative diagnostic workup or follow-up besides routine regimens.

Colorectal cancer (CRC) is common; there were more than 1.2 million new cases and more than 600,000 deaths worldwide in 2008.[1]. An initial staging procedure is necessary in all patients for allocation to the optimal treatment, and survival is highly related to the extent of disease at the time of diagnosis. The lungs are the second most common location of metastasis in CRC, surpassed only by the liver. The reported prevalence of synchronous lung metastases in CRC patients at the time of diagnosis varies between 2 and 18 %.[2–6]

According to the National Comprehensive Cancer Network, the Association of Coloproctology of Great Britain and Ireland, and the Danish Colorectal Cancer Group, the initial staging procedure should include a preoperative chest computerized tomography (CT).[7–10] The use of CT is justified by a higher sensitivity than chest X-ray and a higher sensitivity than positron emission tomography (PET) for pulmonary metastases of less than 1 cm in diameter.[4,11–14]

The high sensitivity of CT scans is not accompanied by an equally distinguished specificity. Thus, this staging procedure reveals lung lesions of uncertain nature, supposed indeterminate pulmonary nodules (IPN), in up to one-third of patients, some of which prove to be metastatic disease.[4,15–19]

The clinical significance of IPN and the further diagnostic approach are debated.[20] In an era with increasing focus on overtreating, overdiagnosing, and overpromising in cancer treatment, this debate is relevant.[21] As most of the nodules ultimately prove to be benign and therefore of no clinical relevance, there is a need to identify possible

Funding was received from the Danish Cancer Society, Aase and Ejnar Danielsen's Foundation, and The Einar Willumsen Foundation.

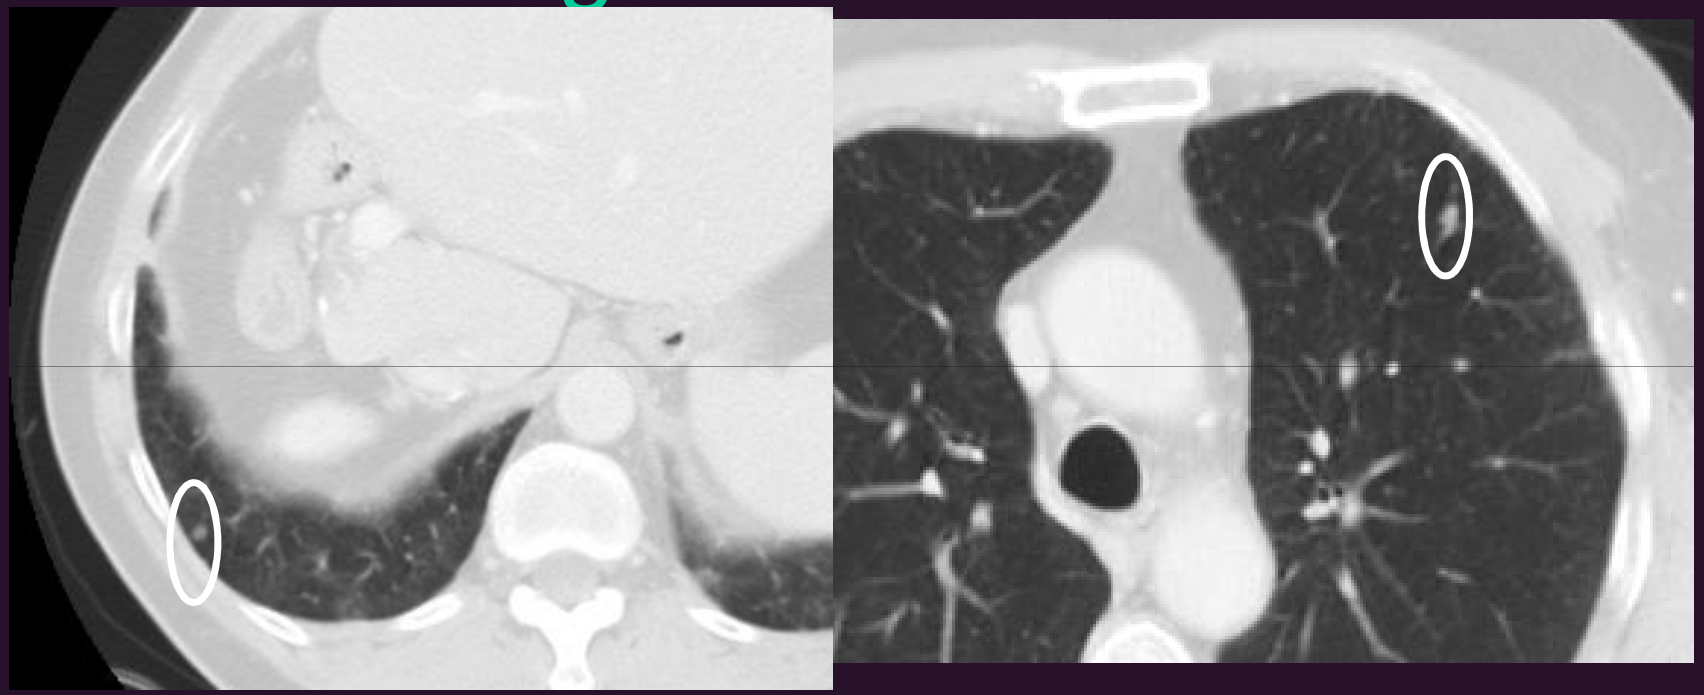
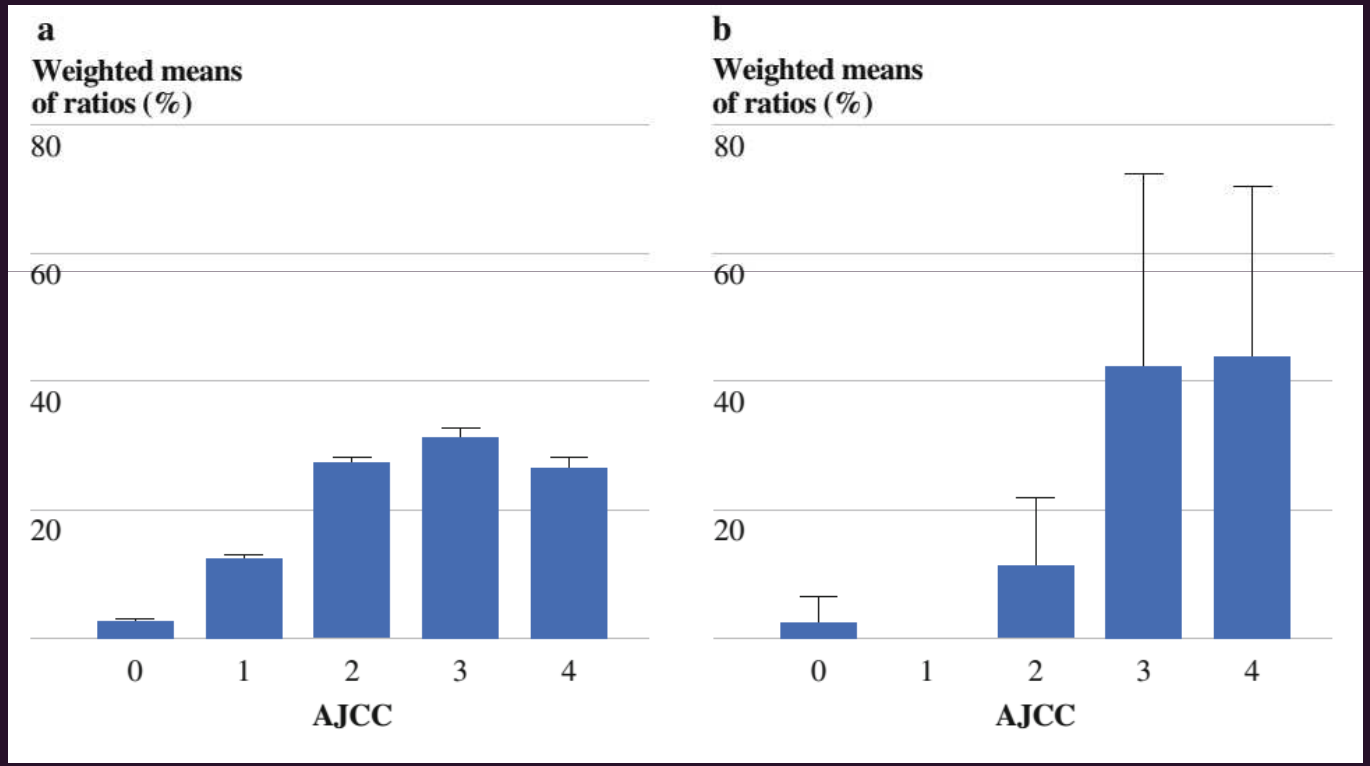
Varol[30]	<15 mm in size	4	+

Lung mets on MDCT

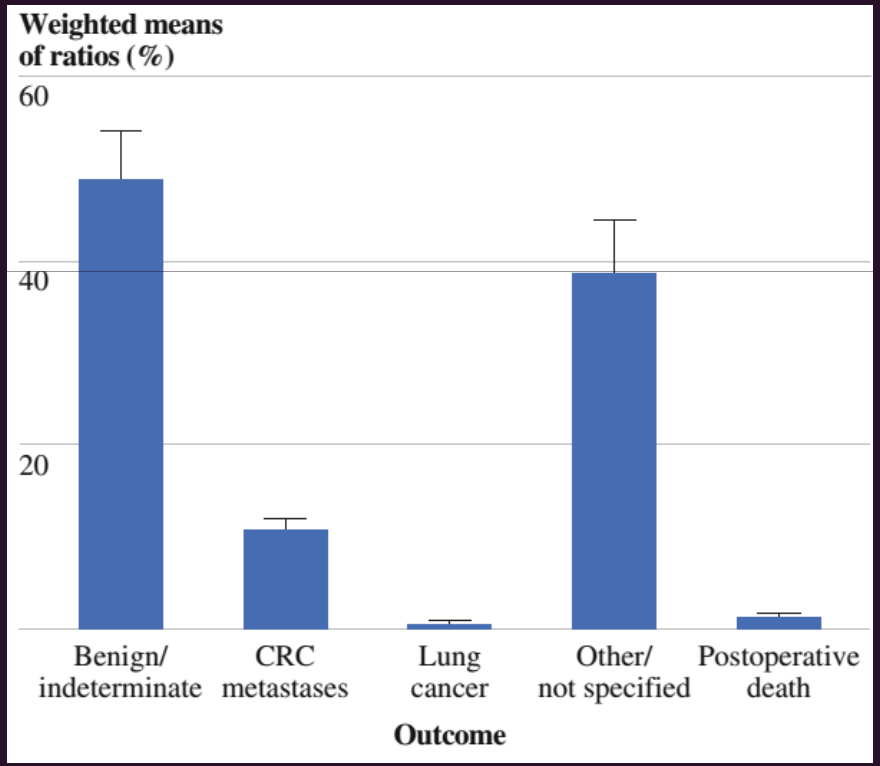


Preoperative chemotherapy and lung metastatectomy

Stage distribution vs stage distribution of IPN



Outcomes of IPN



Risk factors for IPN being malignant

Reference (year)	Characteristics for prediction of malignancy	Level of significance	Statistical analysis	Conclusion
Brent[18]	Positive nodal status	NS	NS	Few IPN progressed to metastatic disease. IPN should not delay surgery for CRC
Phillips[25]	Multiple/bilateral IPN Positive nodal status Distant metastases	NS	NS	Malignant progression of IPN is associated with multiple/bilateral lesions and nodal/ distant metastases. Targeted surveillance is recommended in this high-risk group
Choi[26]	Positive nodal status	NS	NS	Follow-up CT-scans recommended at 3- to 6-month intervals when IPN are detected preoperatively in patients with positive nodal status
Christoffersen[17]	Positive nodal status Elevated postoperative CEA	$P = 0.047$ $P = 0.02$	χ^2, Mann-Whitney, and log-rank test	Close follow-up with repeated CT scans is advisable, especially in patients with nodal disease and postoperatively elevated CEA
Quyn[32]	≥4 IPN Positive nodal status	$P < 0.01$ NS	χ^2 NS	Surveillance guidelines for IPN should include tumor stage and size and number of IPN
Pomerri[29]	>5 mm in size Irregular margin Calcification[a]	$P = 0.02$ $P = 0.02$ $P = 0.04$	Multivariate logistic regression	Follow-up CT-scan for 3–6 months after baseline staging of noncalcified IPN with irregular margins and >5 mm in size
Varol[30]	Multiple IPN Rectal cancer Calcification[a] Parenchymal location Irregular margin	$P = 0.006$ $P = 0.037$ $P = 0.026$ $P = 0.016$ $P = 0.002$	χ^2, Mann-Whitney, and multivariate logistic regression	Multiple IPN with an irregular border in a parenchymal location more likely to represent metastatic disease

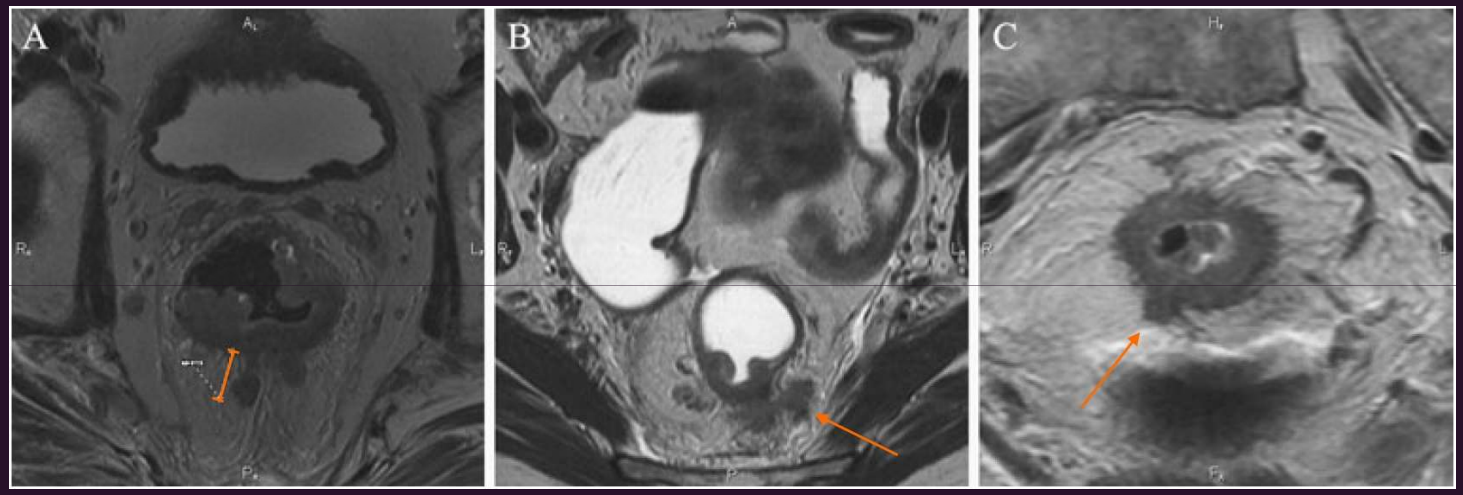
Pulmonary nodules that are likely to be malignant:

- >5mm in diameter
- Irregular bordered rather than malignant
- Lack of calcification
- Multiple rather than single
- CEA elevated post op

Suggested algorithm for IPN

- Pulmonary nodule and no previous imaging to compare:
  - High risk primary: compare against post op/postRx CT
    - If enlarging refer for VATS/metastatectomy after 1st line metastatic chemotherapy
    - If no change but post op CEA elevated, check PET-CT, surveillance CT after completion of adjuvant chemotherapy
  - Low risk/postop CEA normal: consider additional surveillance CT, likelihood of malignancy is low
- Consider possibility of synchronous lung primary in low risk colorectal cancer

Collaborative Study with McGill University



A - 15mm of extramural spread

B - involved circumferential resection margin

A-C - evidence of extramural venous invasion

MRI liver imaging protocol

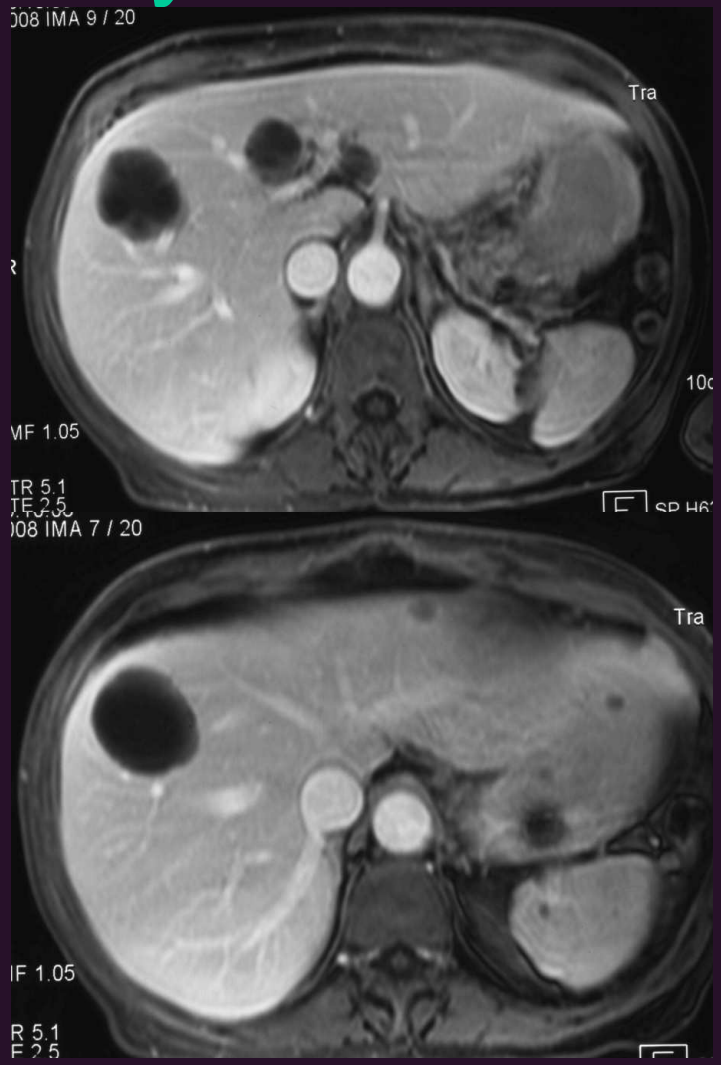
Lesion characterisation

1. T1 breath-hold 3D volume unenhanced
2. T1 in and out of phase axial
3. T2W axial liver (triggered)
4. Heavily T2 weighted Long TE, TR>6000 (triggered)
5. T1 dynamic contrast IV gadolinium

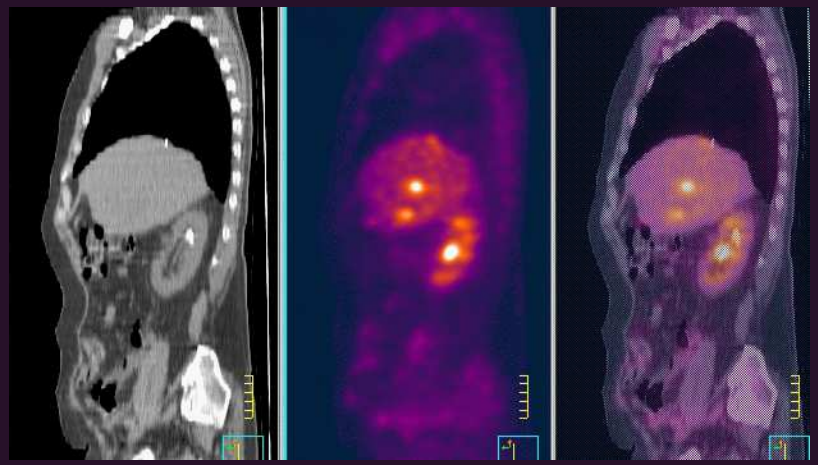
Lesion mapping

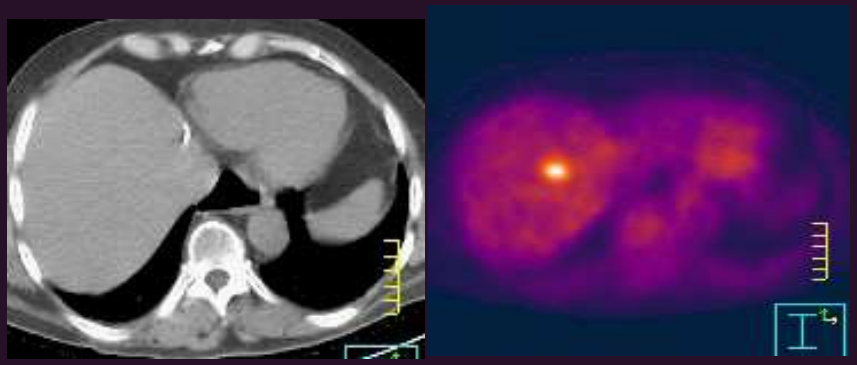
- Liver specific agent e.g.Gd BOPTA immediate and delayed 20min scan

Just simple cysts?

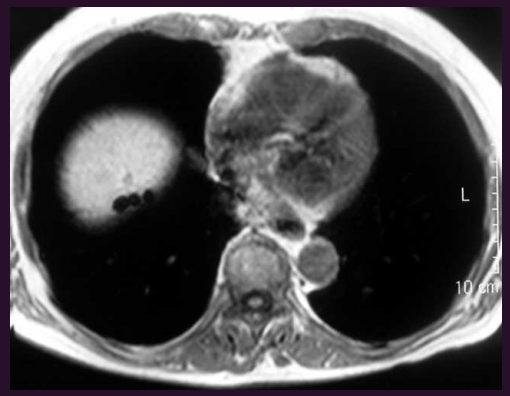


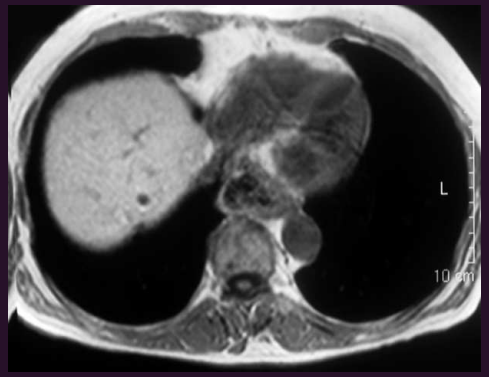
PET-CT – 3 lesions

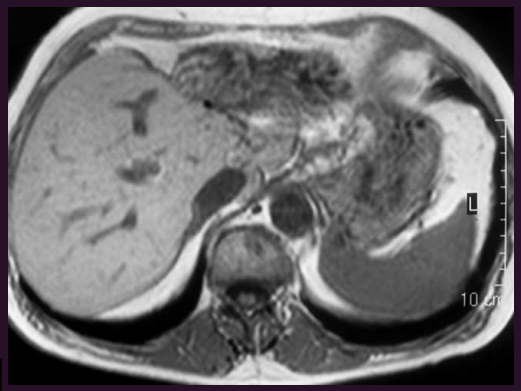


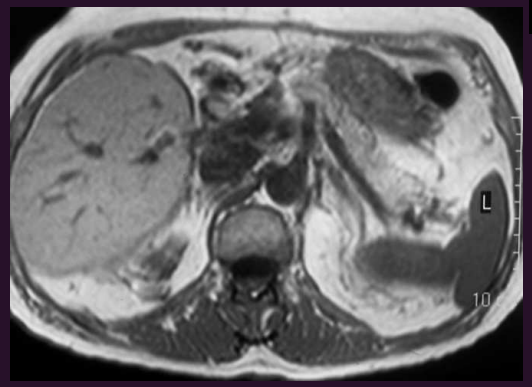


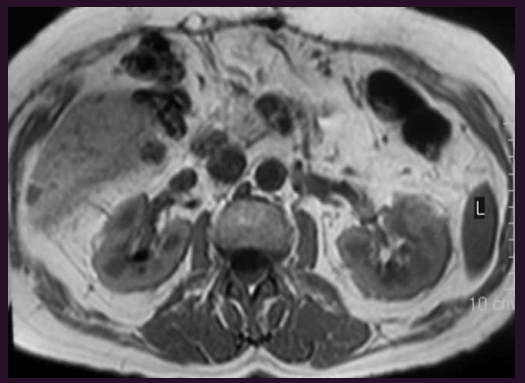
MRI - 5 lesions



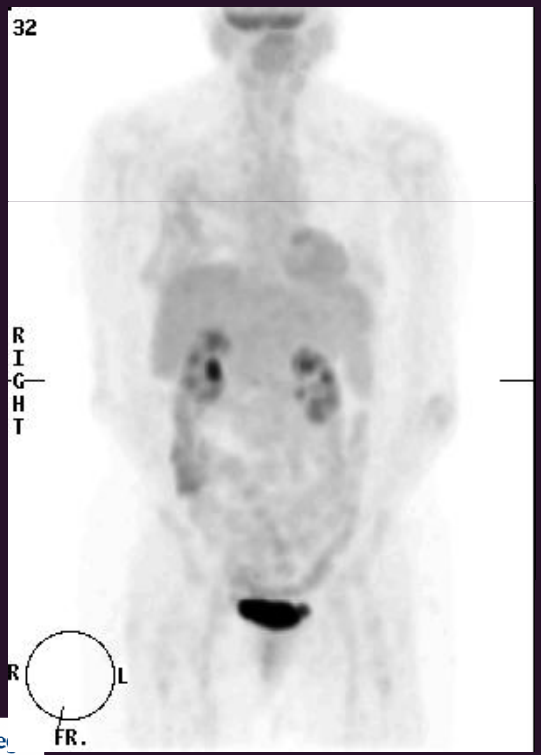


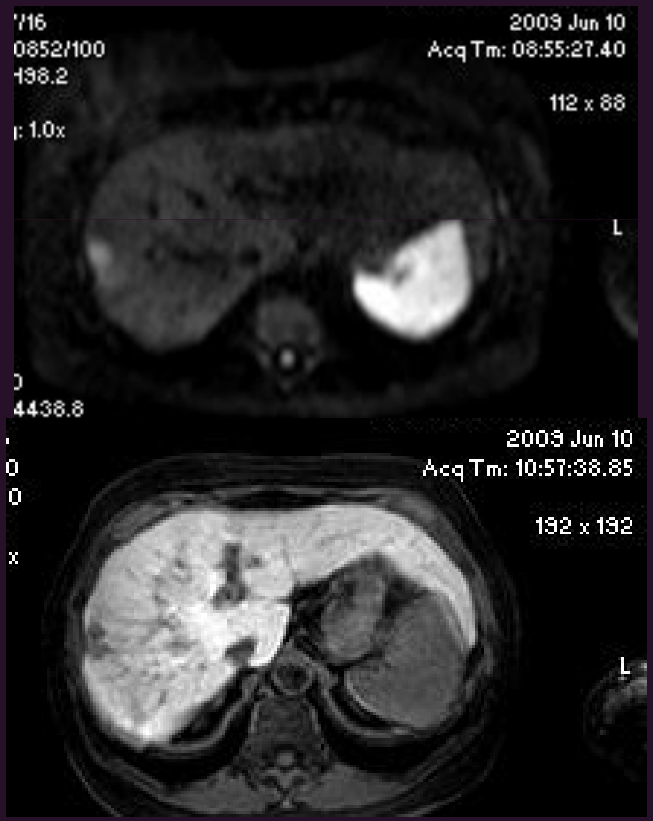






False negative PET - if suspicious about liver metastasis – must do an MRI





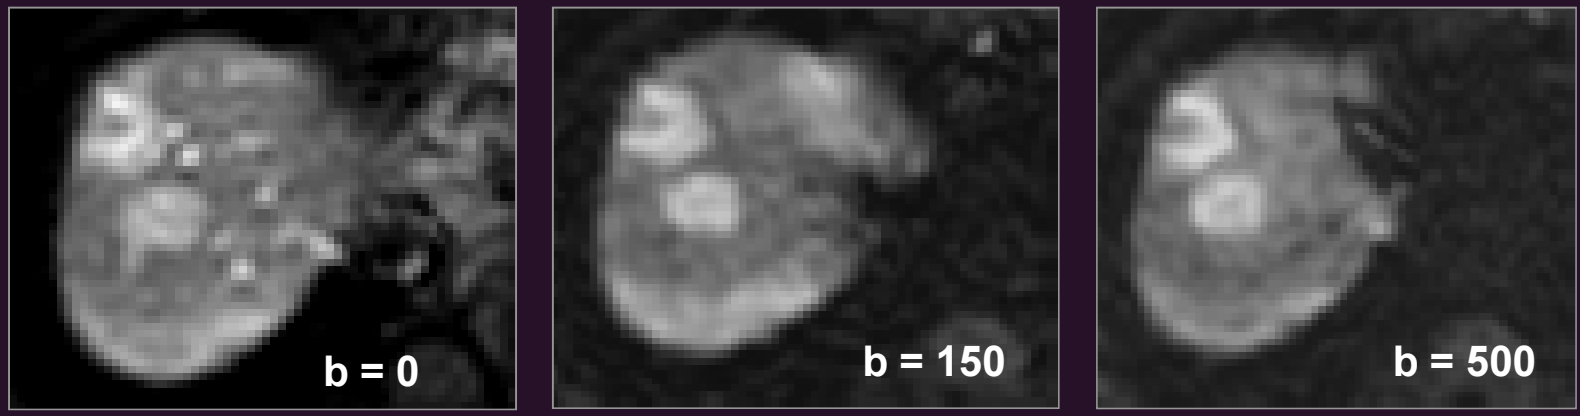
PET-CT vs MRI in detecting liver lesions

- On a per-lesion basis, PETCT and MRI were discordant in 15% (10/66 scans).
- MRI correctly identified more sub-centimetre metastases in eight scans.
- PETCT correctly identified more metastases in one case and confirmed disease in one equivocal MRI. Kong et al 2008 Eur J Nucl Med Mol Imaging.
- lesion detection reduces below 1 to 1.5 cm Park et al 2001

Diffusion-weighted MRI (DWI)

Features of colorectal metastases:

- High signal (restricted diffusion)



Koh, Riddell, Brown, Scurr et al ERad 2007

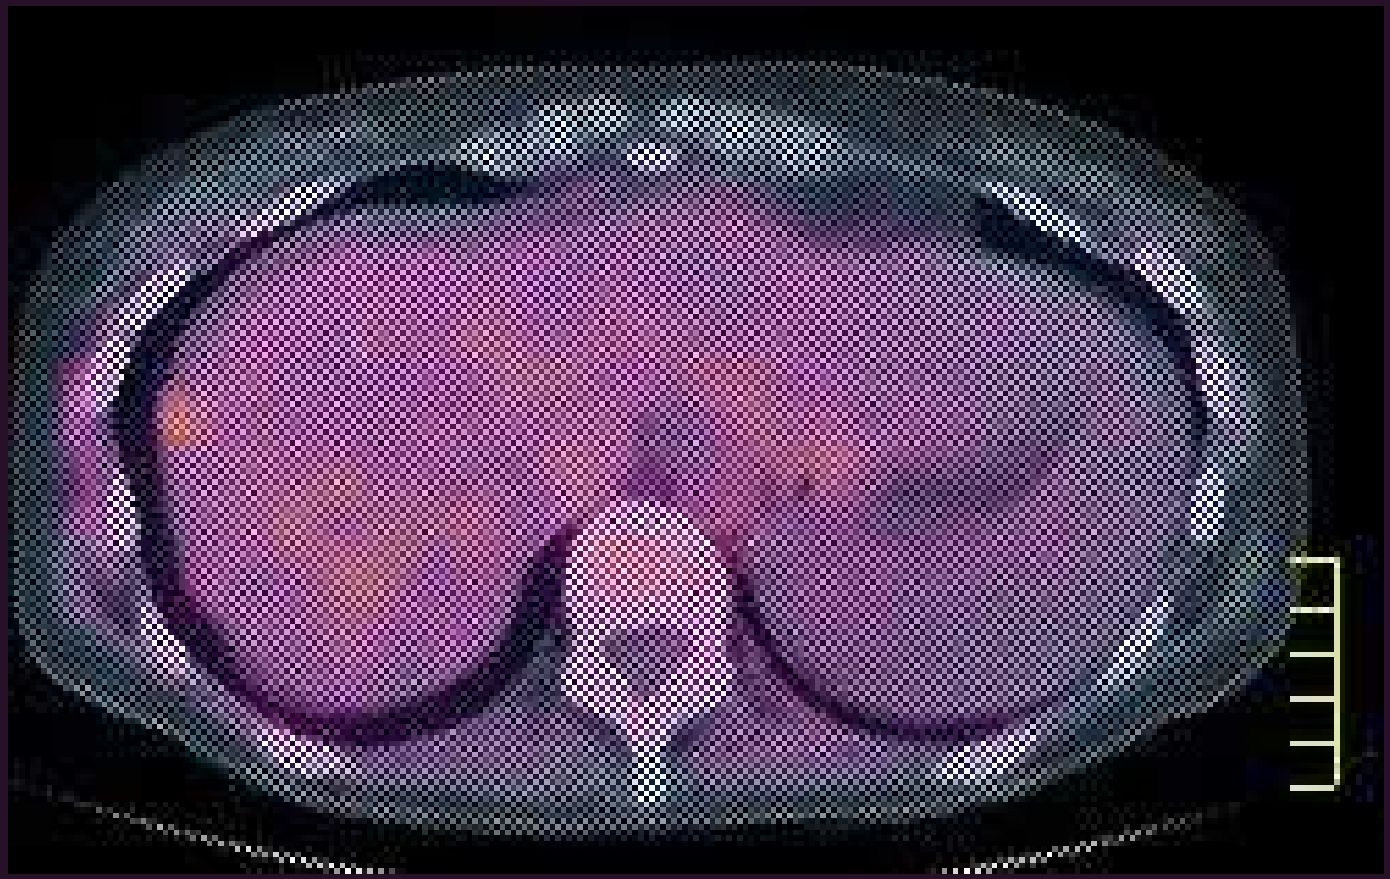
PET-CT extra information



The Royal Marsden

Survival outcomes for patients with equivocal ^{18}FDG-PET CT scan for extrahepatic disease prior to liver resection for metastatic CRC

- Patients included if they had Liver Resection and a PET prior to LR.
- PETs were coded as no EHD and “possible EHD”.
- Of the 2,480 patients on the registry, 273 had had Liver resection.
- Of these, 183 (67.0%) had a PET
- 137/183 – 75% had no EHD
- 46/183 – 25% had possible EHD on PET-CT / normal CT.

NHS

Imperial College London

J Clin Oncol 31, 2013 (suppl; abstr 1581)

	No EHD	PET-CT detected EHD (normal CT)
age	66.7 yrs	68.4 yrs
male	61.3%	63.0%
KRAS wildtype	11.0%	16.3%,
stage IV disease at initial diagnosis	49.6%	54.3%
colonic primary	74.4%	65.2%
one Liver resection	82.5%	89.1%
one line of chemotherapy	52.4%	48.6%
well-moderate tumour differentiation	85.7%	86.4%

Outcomes for PET-CT detected EHD

- The OS for no EHD vs possible EHD at 1-year was 98.5%-vs-93.5%
- 2-years OS was 87.6%-vs-88.0%
- 5-years OS was 61.5%-vs-59.4%.

On adjustment for age, gender, stage at diagnosis, primary site, number of LRs, lines of chemotherapy and tumour differentiation, the hazard ratio remained non-significant; HR=0.76 (95% CI 0.37–1.59, *P*-value = 0.47), for possible EHD.

Guidelines

Evidence-based Guideline Recommendations on the use of Positron Emission Tomography Imaging in Colorectal Cancer

K. Chan *, S. Welch †, C. Walker-Dilks ‡, A. Raifu ‡

* *Sunnybrook Odette Cancer Centre, Toronto, Ontario, Canada*
† *Department of Oncology, University of Western Ontario, London Health Sciences Centre, London, Ontario, Canada*
‡ *Program in Evidence-Based Care, Cancer Care Ontario (CCO), McMaster University, Hamilton, Ontario, Canada*

Received 11 February 2011; received in revised form 17 October 2011; accepted 23 November 2011

Abstract

Aims: To provide evidence-based practice guideline recommendations on the use of fluoro-2-deoxy-D-glucose positron emission tomography (PET) for diagnosis, staging, assessing treatment response, liver metastasis and restaging or recurrence of colorectal cancer.
Materials and methods: A systematic review by Facey *et al.* (*Health Technology Assessment* 2007;11(44):iii–iv, xi–267) was used as the evidence base for recommendation development. As the review was limited to August 2005, the evidence base was updated to May 2010 using the same search strategies for MEDLINE and EMBASE used in the original review. The authors of the current systematic review drafted recommendations, which were reviewed, adapted and accepted by consensus by the Ontario provincial Gastrointestinal Disease Site Group and a special meeting of clinical experts.
Results: The results from the Facey *et al.* review for colorectal cancer included three other systematic reviews and 24 primary studies. The 2005 to 2010 updated search included 10 additional systematic reviews and 28 primary studies. Recommendations were developed based on this evidence and accepted by consensus.
Conclusions: The routine use of PET is not recommended for the diagnosis or staging of clinical stage I–III colorectal cancers. PET is recommended for determining management and prognosis if conventional imaging is equivocal for the presence of metastatic disease. PET is also not recommended for routine surveillance in patients with colorectal cancer treated with curative surgery at high risk for recurrence. It is recommended to determine the site of recurrence in the setting of rising CEA when conventional work-up fails to unequivocally identify metastatic disease. Finally, PET is recommended in the preoperative assessment of colorectal cancer liver metastasis before surgical resection.

Key words: Colorectal cancer; diagnosis; FDG-PET; liver metastases; recurrence; staging

Introduction

Colorectal cancer (CRC) is the third most common cancer, with an estimated 22,500 new cases and 9100 deaths for 2010 in Canada [1]. According to Canadian cancer statistics [1] for 2010, CRC is the second cause of death from cancer among both men and women. The mortality due to CRC in

mortality since 1986 has been attributed to the treatment of the cancer through chemotherapy.

The use of positron emission tomography (PET) as a major diagnostic imaging tool for cancer is on the increase in the USA, Canada, Europe and parts of Asia. Different studies have suggested that PET may perform better than other technological imaging modalities like X-ray, computed tomography (CT) and magnetic resonance

- 37/50 (74%) patients undergoing FDG-PET/CT were being investigated for an apparently unexplained elevated CEA or equivocal CT or MRI studies.
- Careful review of serial imaging studies, using the defined reporting protocol, enabled a definitive diagnosis to be made in 24/37 (65%) patients.

Relative contributions of PET-CT after review of imaging

Peritoneal pelvic recurrence

Take home messages:

- Primary tumour assessment of T substage and EMVI on imaging is a strong predictor for synchronous metastatic disease
- Liver only is dominant site of spread and MRI should be undertaken at baseline to assess resectability
- Pulmonary nodules should fulfil criteria for malignancy – irregular, >5mm and multiple (otherwise routine follow up)
- PET-CT is indicated for patients with metastatic disease diagnosed on CT/MRI or unexplained rising CEA
- Caution when PET-CT identifies extrahepatic metastatic disease – as outcome data suggests this may not be prognostic, when conventional imaging is negative

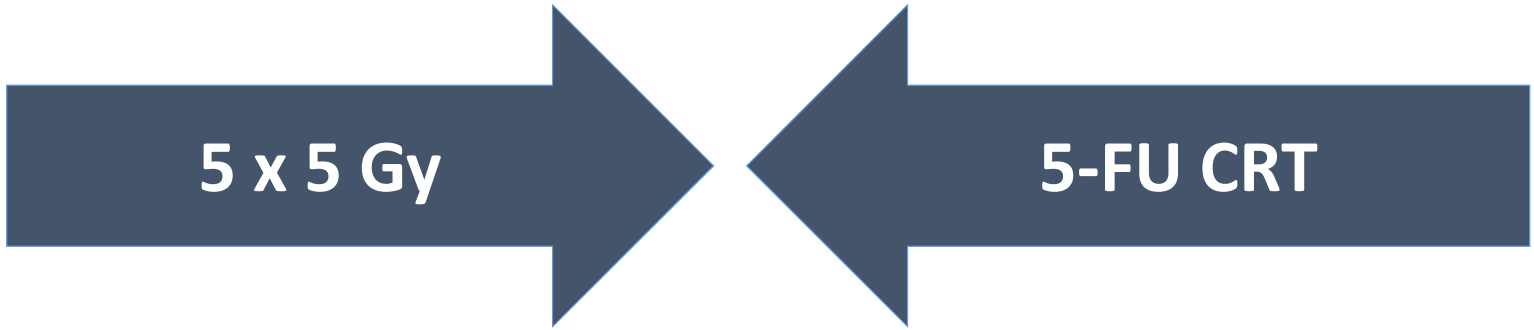
Limitations and Critical Points

Polish Trial

- Small (powered for 15% diff.)
- **Sphincter Preserv. dependent on surgical commitment**
- Poor compliance of CRT (69%)
- Imbalance in adjuvant CTx (46 vs 30% after CRT)
- No central quality control

Trans-Tasman

- Small
- **Local control: 10 % difference?**
- MRI staging not mandatory
- Lack of info on MRF
- Lack of info on TME, CRM
- Imbalance in tumor location (10% more low tumors in SCRT)



- Less acute tox
- Patient covenience
- Lower cost

- Better downsizing
- Lower surgical morbidity
- Ability to safely combine with chemo

Conclusions (II)

What have we learned?

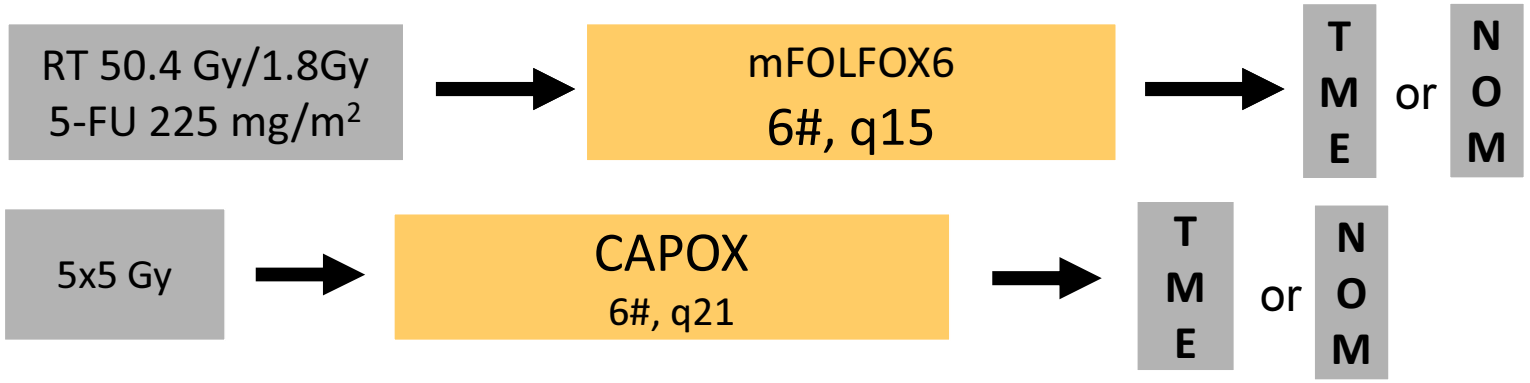
5x5 Gy + immediate S vs CRT + delayed S

- *Equally effective for SP, LC, OS, late tox (Polish, Trans-Tasman)*
- *Downsizing: CRT preferred for T4, MRF+, low RC (?)*
- *May be revised for SCRT and delayed S (Stockholm III, Polish II, RAPIDO)*

Conclusions (III)

Where do we go from here (with both concepts)?

- ***T**otal**N**eoadjuvant**T**reatment - **S** postponed/avoided*



- ***Selection and monitoring by modern imaging!***

Current (European) Guidelines:
What is considered standard of care for concurrent and adjuvant chemotherapy ?

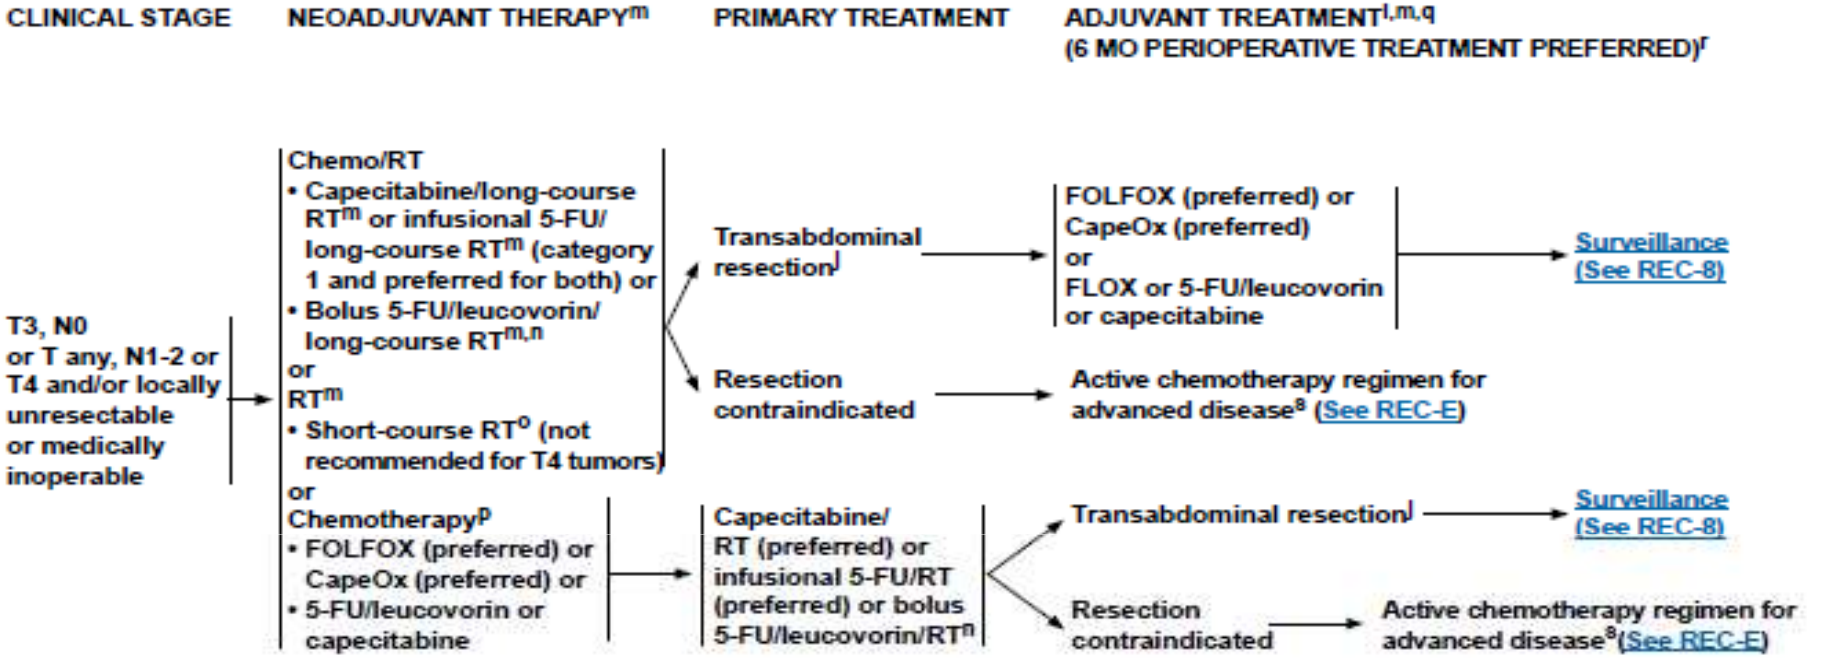
Rectal Cancer

NCCN Guidelines Index
Rectal Cancer Table of Contents
Discussion



[j]See Principles of Surgery (REC-B).
[l]See Principles of Adjuvant Therapy (REC-C).
[m]See Principles of Radiation Therapy (REC-D).
[n]Bolus 5-FU/leucovorin/RT is an option for patients not able to tolerate capecitabine or infusional 5-FU.
[o]Evaluation for short-course RT should be in a multidisciplinary setting, with a discussion of the need for down-staging and the possibility of long-term toxicity.
[p]Fernandez-Martos C, Pericay C, Aparicio J, et al: Phase II, randomized study of concomitant chemoradiotherapy followed by surgery and adjuvant capecitabine plus oxaliplatin (CAPOX) compared with induction CAPOX followed by concomitant chemoradiotherapy and surgery in magnetic resonance imaging-defined, locally advanced rectal cancer: Grupo cancer de recto 3 study. J Clin Oncol 2010;28:859-865.

Cercek A, Goodman KA, Hajj C, et al. Neoadjuvant chemotherapy first, followed by chemoradiation and then surgery, in the management of locally advanced rectal cancer. J Natl Compr Canc Netw 2014;12:513-519.
[q]Postoperative therapy is indicated in all patients who receive preoperative therapy, regardless of the surgical pathology results.
[r]Total duration of perioperative chemotherapy, inclusive of chemotherapy and radiation therapy, should not exceed 6 months.
[s]FOLFOXIRI is not recommended in this setting.

Note: All recommendations are category 2A unless otherwise indicated.
Clinical Trials: NCCN believes that the best management of any cancer patient is in a clinical trial. Participation in clinical trials is especially encouraged.

Current ESMO Guidelines

- **Glimelius** B, Tiret E, Cervantes A, Arnold D; ESMO Guidelines Working Group.
- Ann Oncol. 2013 Oct;24 Suppl 6:vi81-8

Risk group	TN substage	Therapeutic options
Very early	*c*T1 sm1 (-2?) N0	Local excision (TEM). If poor prognostic signs (sm ≥ 2, high grade, V1), resection (TME) (or possibly CRT)
Early (good)	*c*T1-2; *c*T3a (b) if middle or high, N0 (or cN1 if high), mrf-, no EMVI	Surgery (TME) alone. If poor prognostic signs (crm+, N2) add postop CRT or CT[a]. (CRT with evaluation, if cCR, wait-and-see, organ preservation)
Intermediate (bad)	*c*T2 very low, *c*T3mrf- (unless cT3a(b) and mid- or high rectum, N1-2, EMVI+, limited *c*T4aN0	Preop RT (5 × 5 Gy) or CRT followed by TME. (if CRT and cCR, wait-and-see in high risk patients for surgery)
Advanced (ugly)	*c*T3mrf+, *c*T4a,b, lateral node+	Preop CRT followed by surgery (TME + more extended surgery if needed due to tumour overgrowth). 5 × 5 Gy with a delay to surgery in elderly or in patients with severe comorbidity who cannot tolerate CRT

- To my mind muddied by watch and wait

Guidelines for Postoperative adjuvant chemotherapy

Poulsen et al Acta Oncol 2015

Table I. International and national guidelines on postoperative adjuvant chemotherapy for rectal cancer.

	ESMO	NCCN	Norway	Sweden	Finland	Denmark	Spain	Dutch	NICE
Year	2013 [22,23]	2012 [2]	2013 [24]	2014 [25]	2009 [26]	2013 [27]	2013 [28]	2014 [29]	2011 [30]

RC stage III	FU/5FU	5FU/Ox	No	5FU(+ Ox)	5FU-Ox	5FU(+ Ox)	Yes*	No	Yes
After preop. CRT**	n.s.	Yes	No	No	n.s.	Yes	No	No	n.s.

ONLY ESMO GUIDELINES state level of evidence supporting the recommendations

ESTRO School

The European Society for Medical Oncology rectal cancer guidelines 2013 state

"Standard preoperative chemoradiotherapy means a dose of 45-50.4 Gy, 1.8 Gy/fraction, or alternatively 50 Gy, 2 Gy/fraction together with a fluoropyrimidine"

Evidence base for the 2 Options for radiotherapy in locally advanced rectal cancer

- **Preoperative long course chemoradiotherapy CRT (25-28 X 1.8Gy Gy)**

- **(Post-op CRT as adjuvant)**

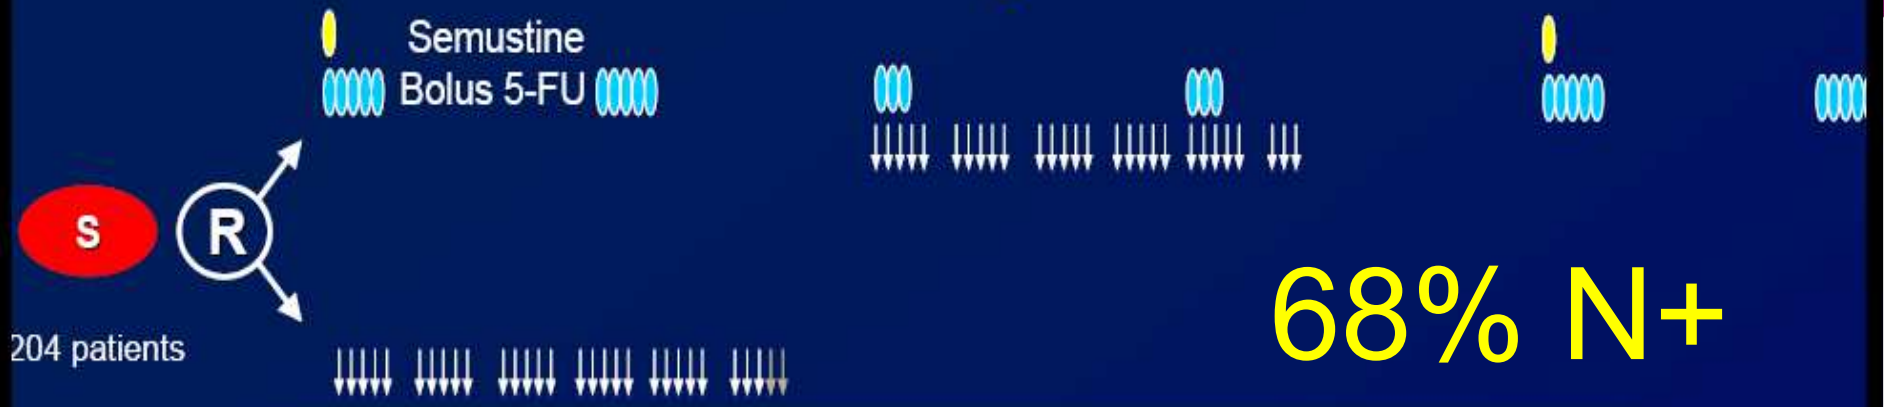
Postoperative Trials : Rectal Cancer

Randomised Trials of post-op CRT

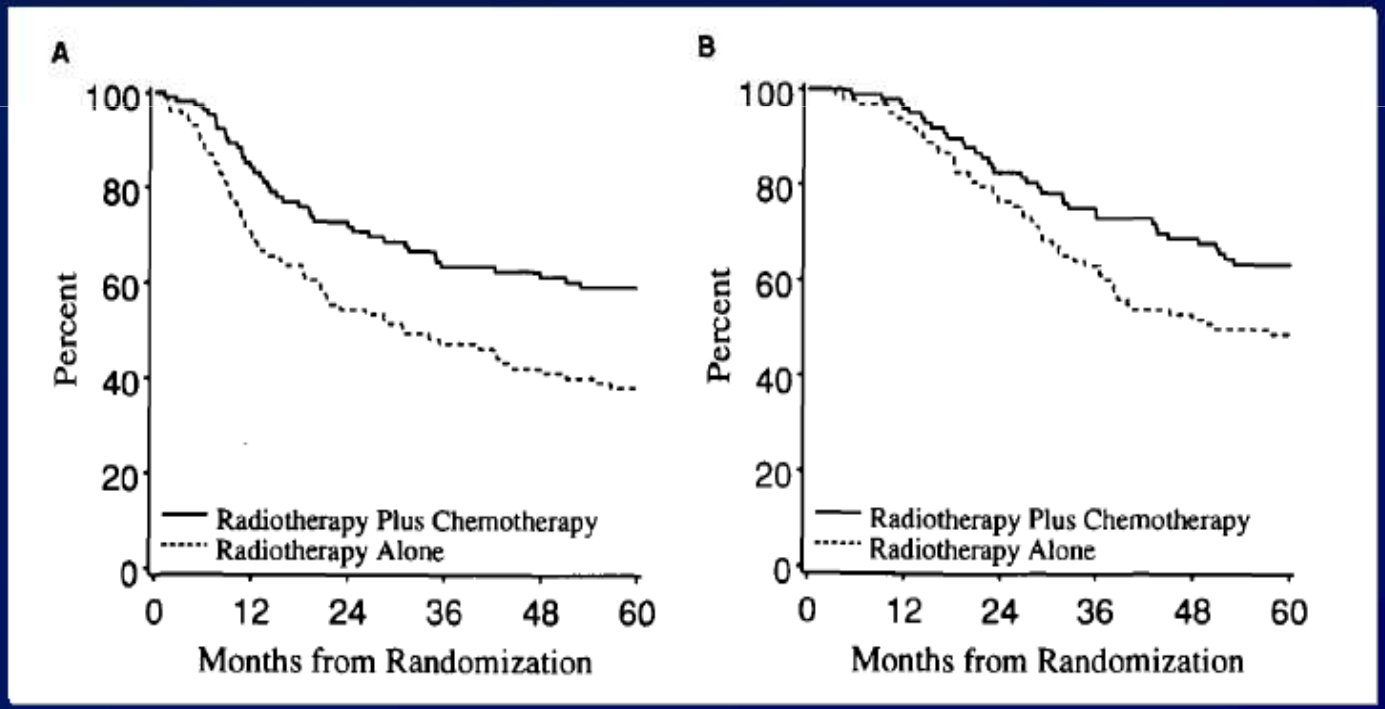
- GITSG
- NCCTG (Krook et al 1991)
- NSABP R02
- Intergroup (Infusional 5FU)

Further Intergroup studies

NCCTG/Mayo 794751



68% N+

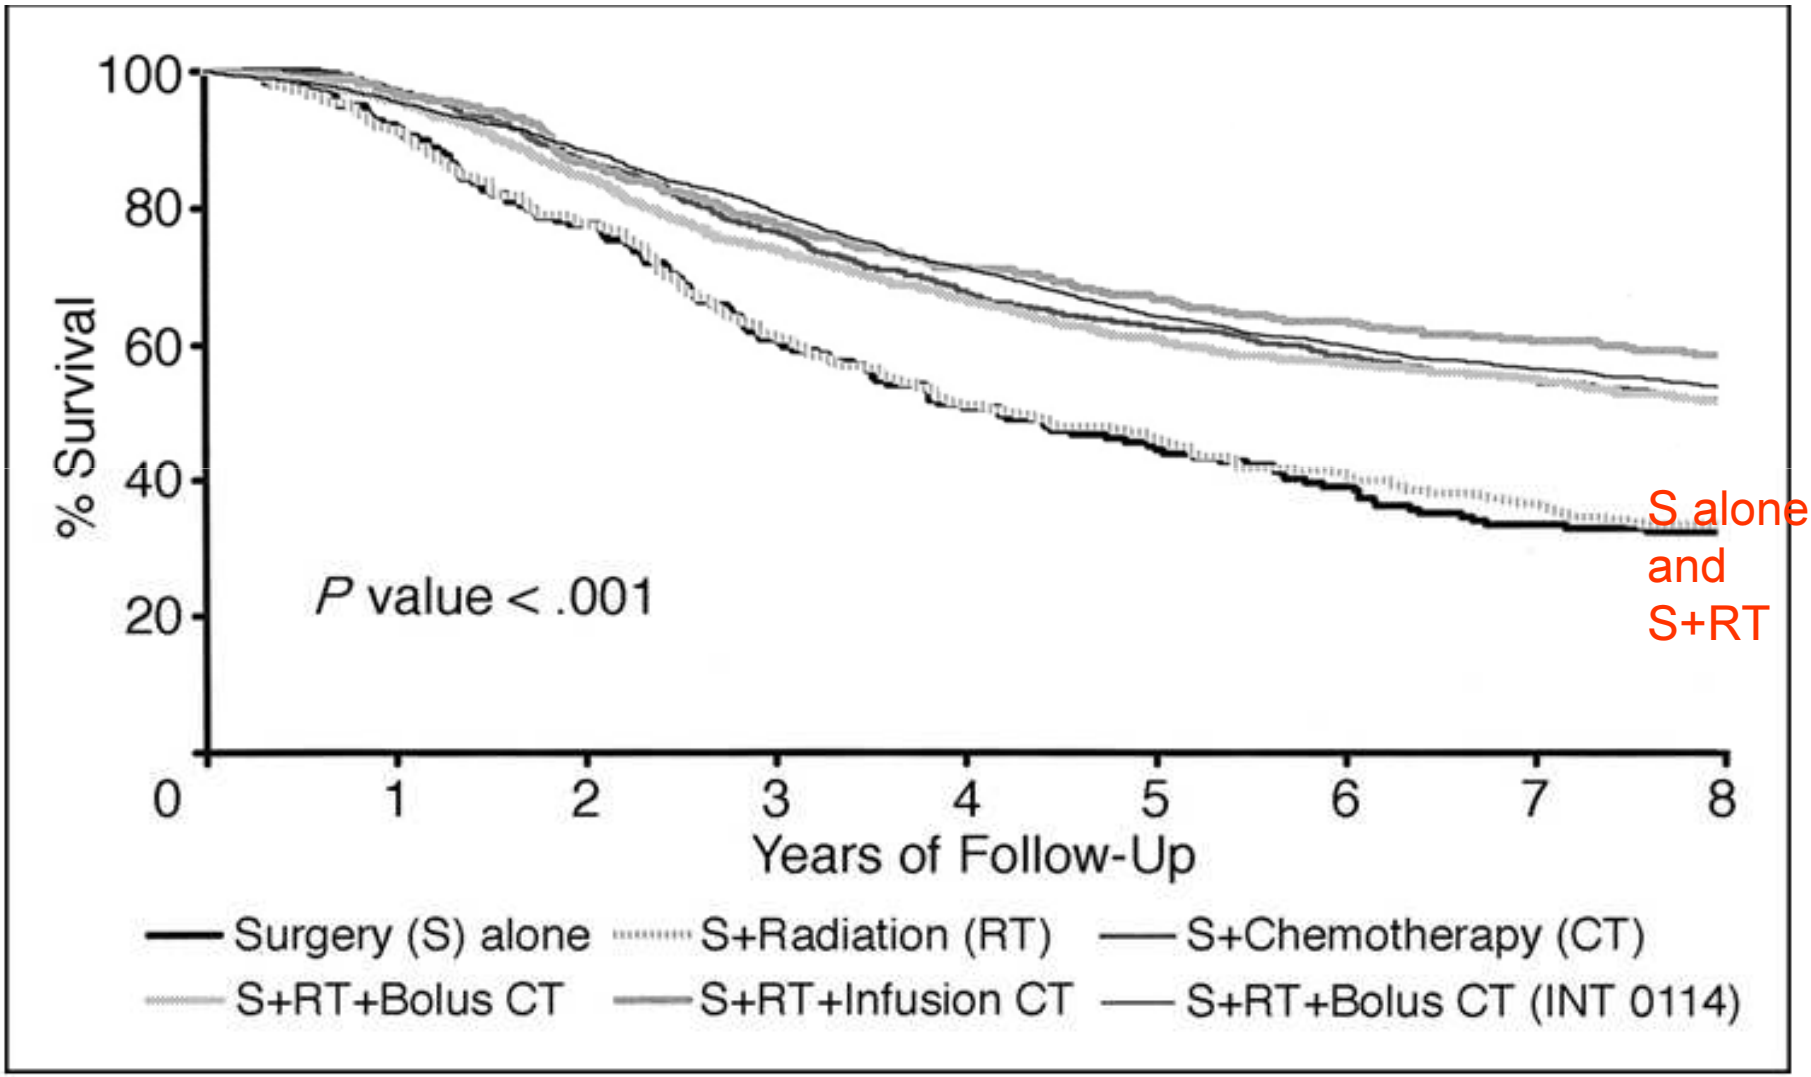


Disease-free survival

Overall survival

Krook et al. N Eng J Me 1991

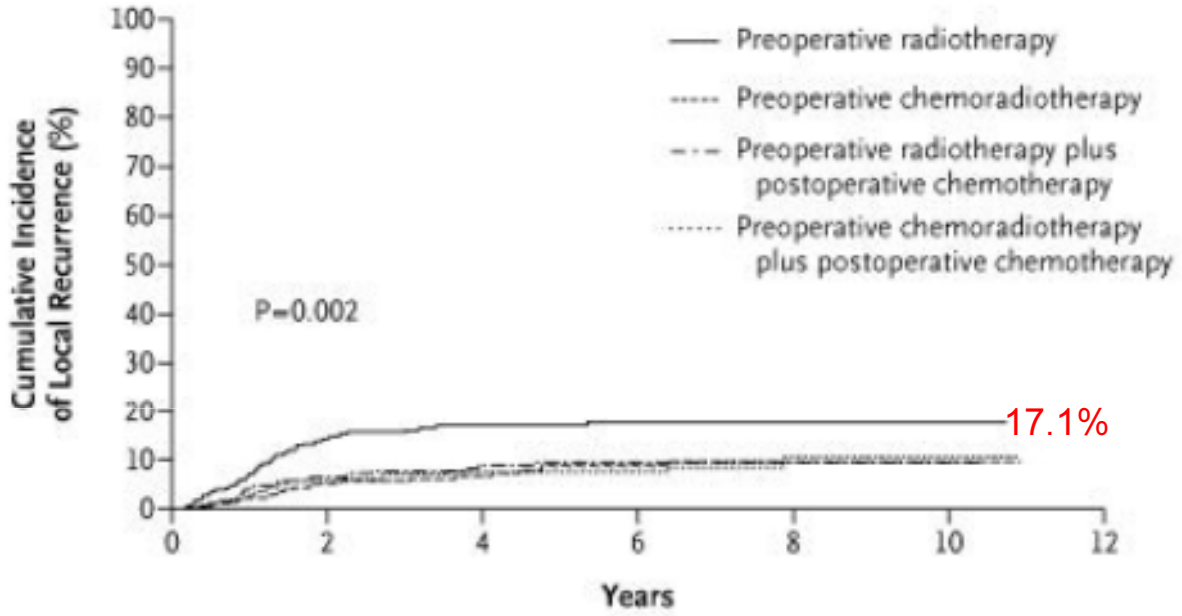
Impact on overall survival of 6 methods of treatment in rectal cancer pooled analysis



Gunderson, L. L. et al. J Clin Oncol; 22:1785-1796 2004

EORTC 22921 Trial

Local recurrence as a first event at 5 years was **17.1%** in the preoperative-radiotherapy group vs 8.7%, 9.6% and 7.6% in the group receiving preoperative chemoradiotherapy and postoperative chemotherapy.



No. at Risk						
Preoperative radiotherapy	252	147	87	60	24	6
Preoperative chemoradiotherapy	253	165	99	52	22	5
Preoperative radiotherapy plus postoperative chemotherapy	253	156	103	65	29	6
Preoperative chemoradiotherapy plus postoperative chemotherapy	253	159	113	59	20	3

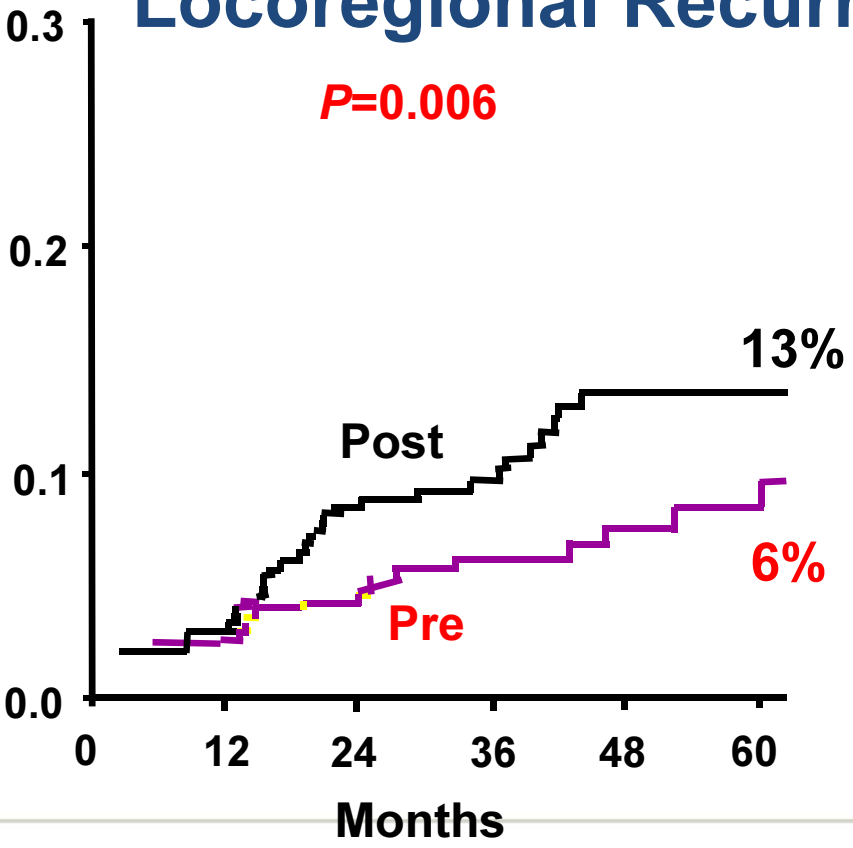
ESTRO School

So you need chemotherapy in there somewhere!

(but I will come back to this)

Pre- vs post-operative chemoradiation CAO/ARO/AIO-94

Locoregional Recurrences

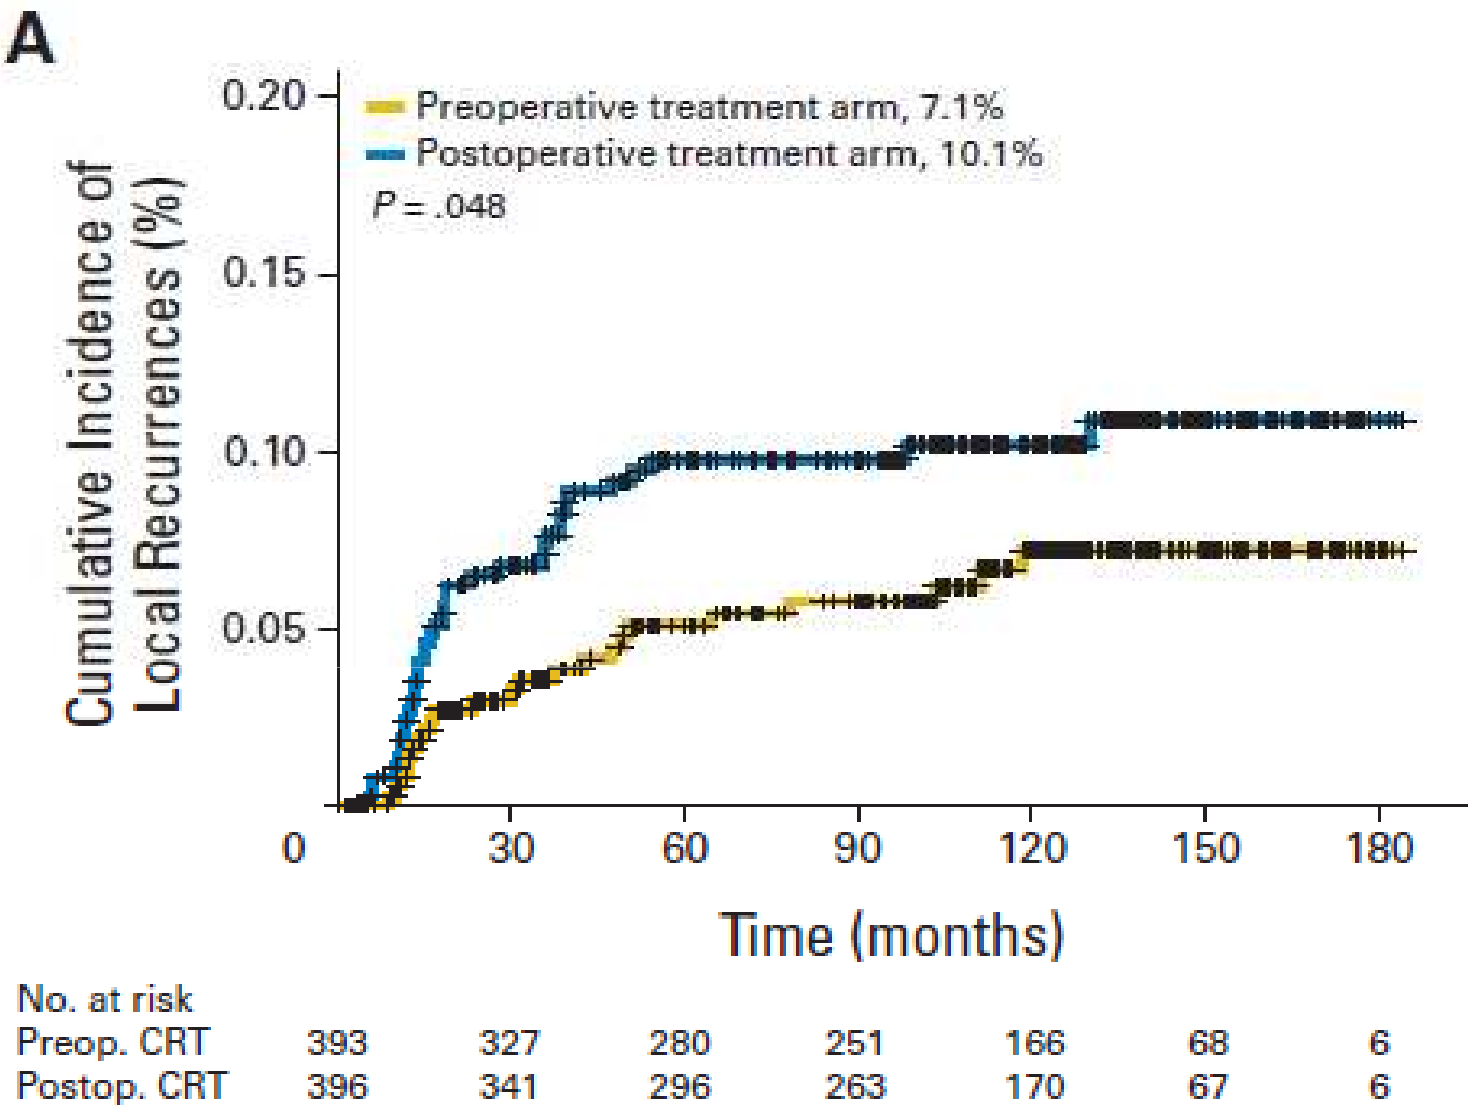


Acute G3/4 adverse events
27% vs 40% (p=0.001)

Long-term G3/4 adverse events
14% vs 24% (p=0.01)

There is a standard for chemoradiation

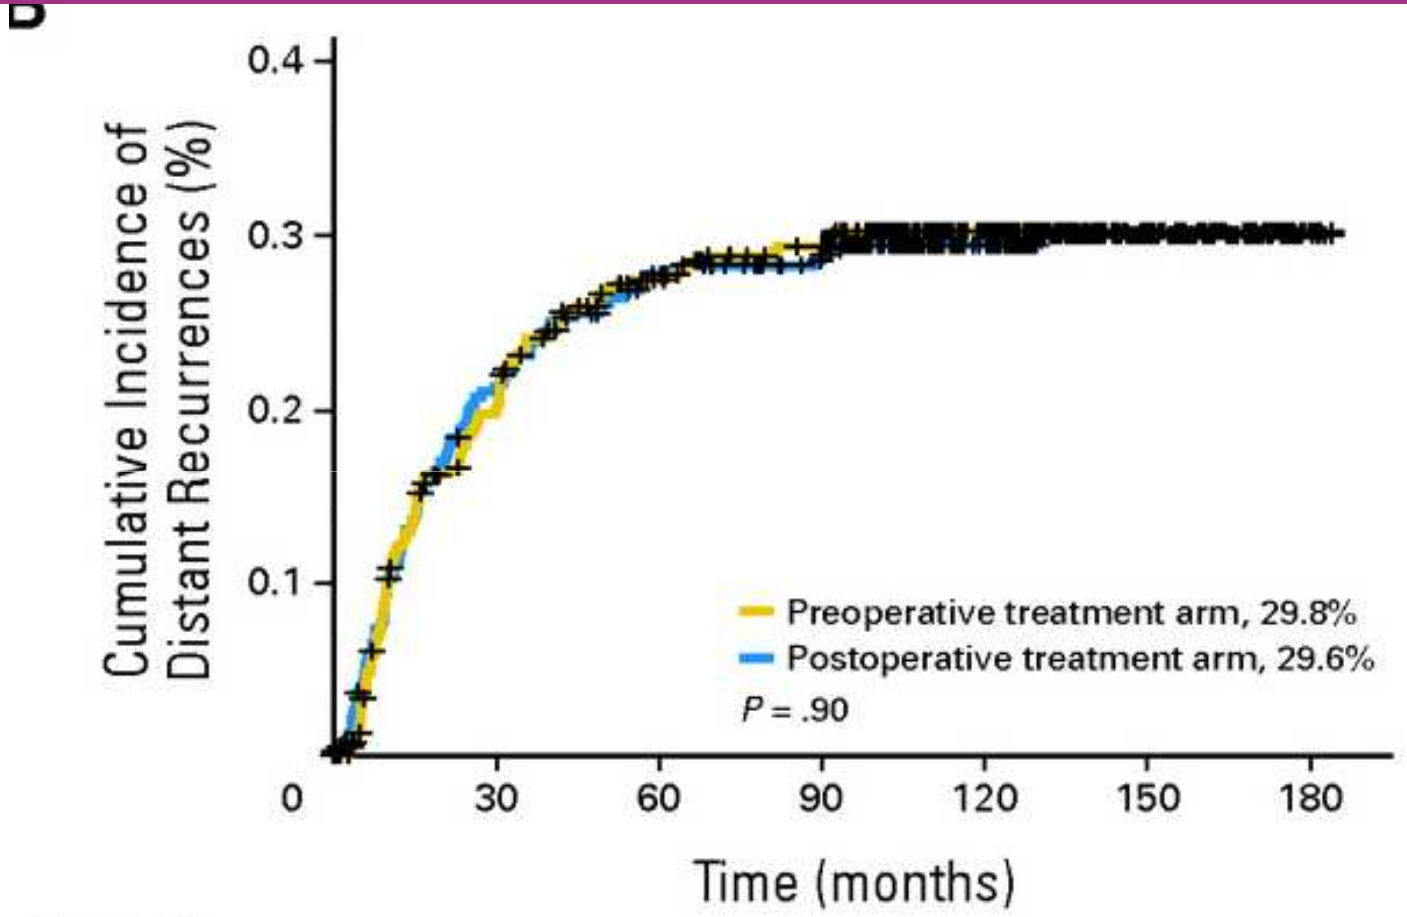
Sauer R. et al., N Engl J Med 2004;351: 1731-39



Long-term data on LOC REC from German study – 5/22 local recurrences ie 23% after 5 years (not like CR07)

ESTRO School

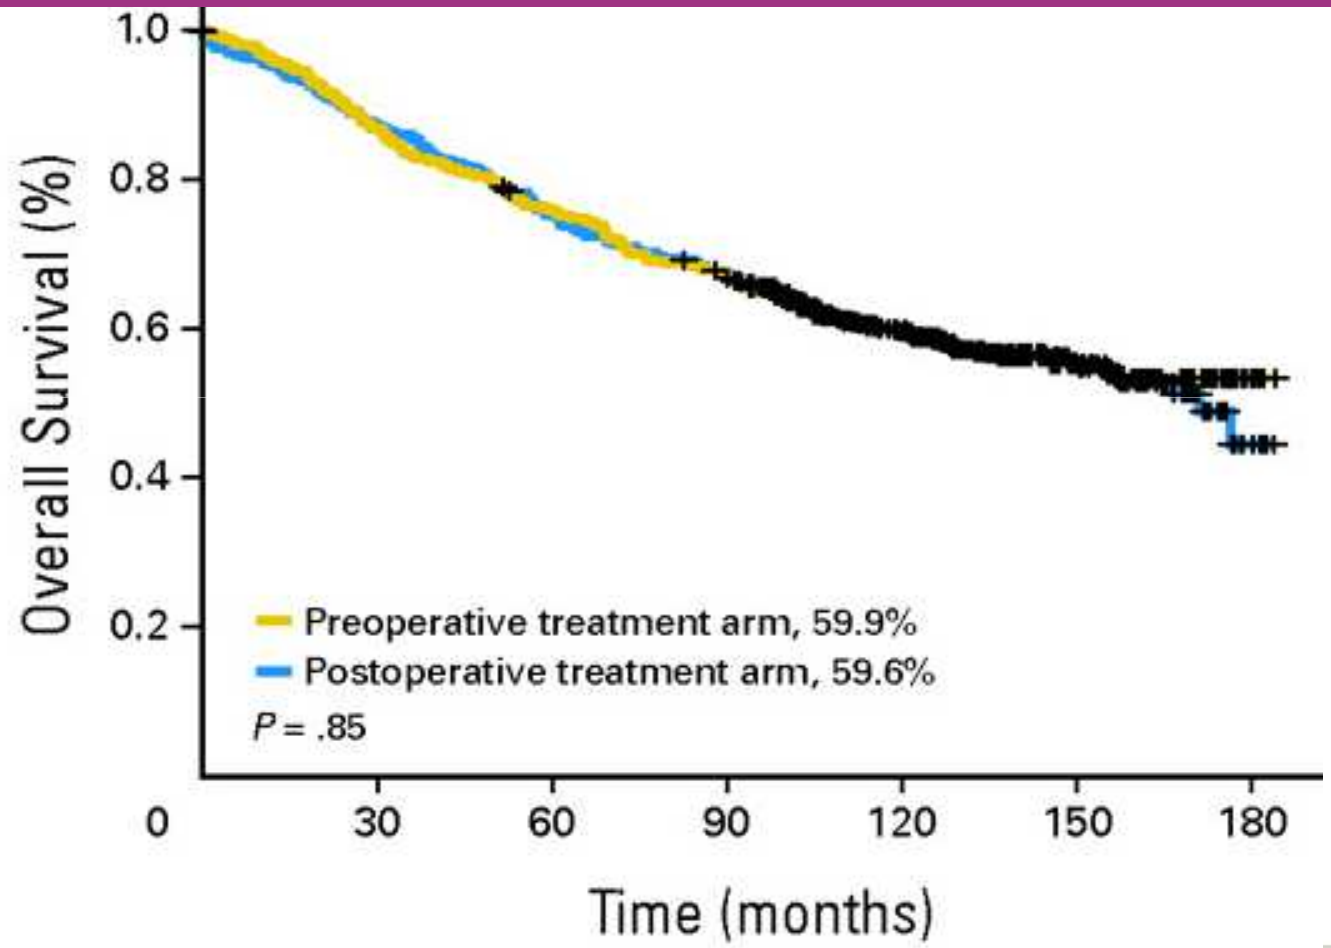
Pre- vs post-operative chemoradiation CAO/ARO/AIO-94



No. at risk							
Preop. CRT	393	295	262	241	158	60	5
Postop. CRT	396	310	267	246	162	63	6

ESTRO School

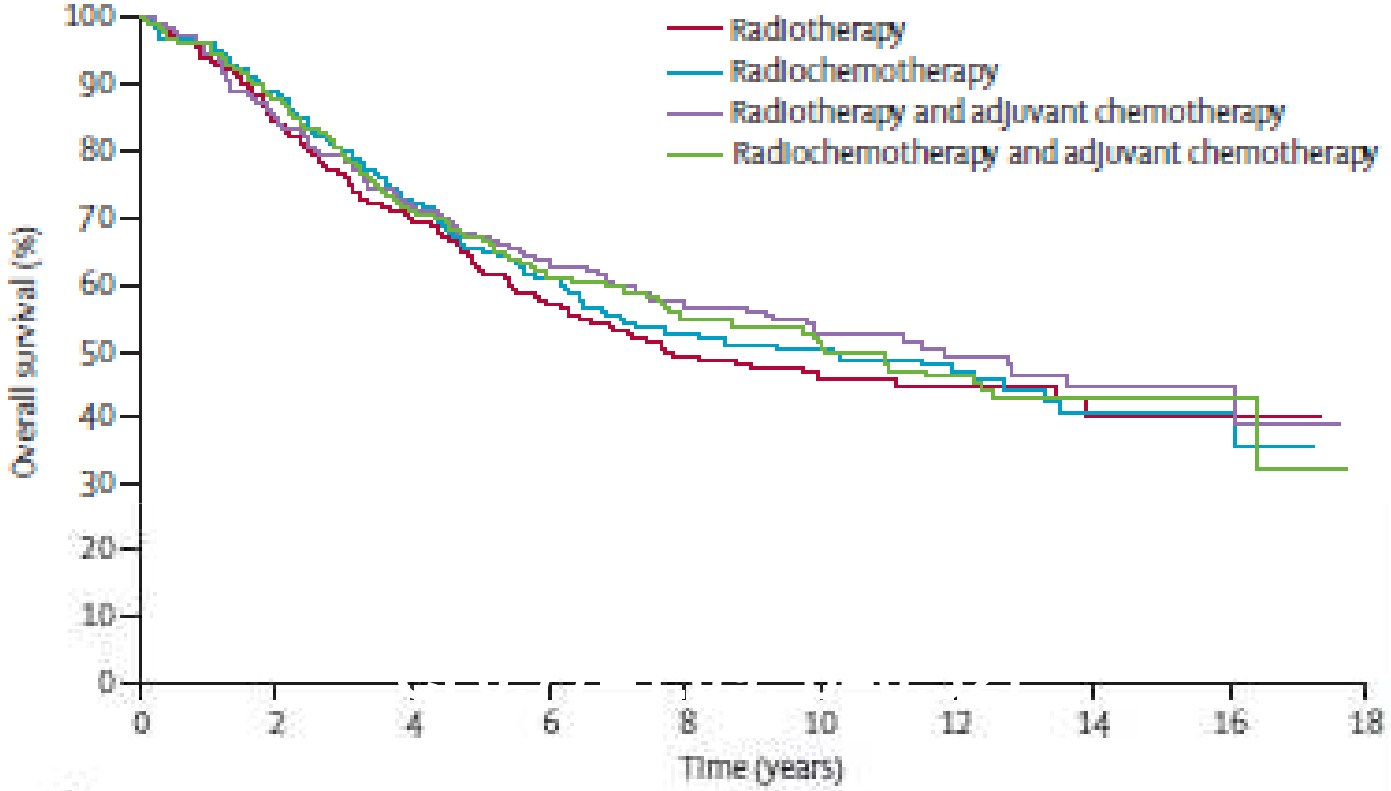
Pre- vs post-operative chemoradiation CAO/ARO/AIO-94



No. at risk							
Preop. CRT	404	351	305	268	174	67	6
Postop. CRT	395	342	295	262	172	70	6

ESTRO School

EORTC 22921 – Overall Survival



Number at risk									
Radiotherapy	252	208	165	129	98	62	32	15	5
Radiochemotherapy	253	223	173	135	96	66	41	19	9
Radiotherapy and adjuvant chemotherapy	253	212	171	140	102	69	42	18	8
Radiochemotherapy and adjuvant chemotherapy	253	221	174	143	108	77	44	18	4

So why have post-op CRT studies shown an improvement in survival

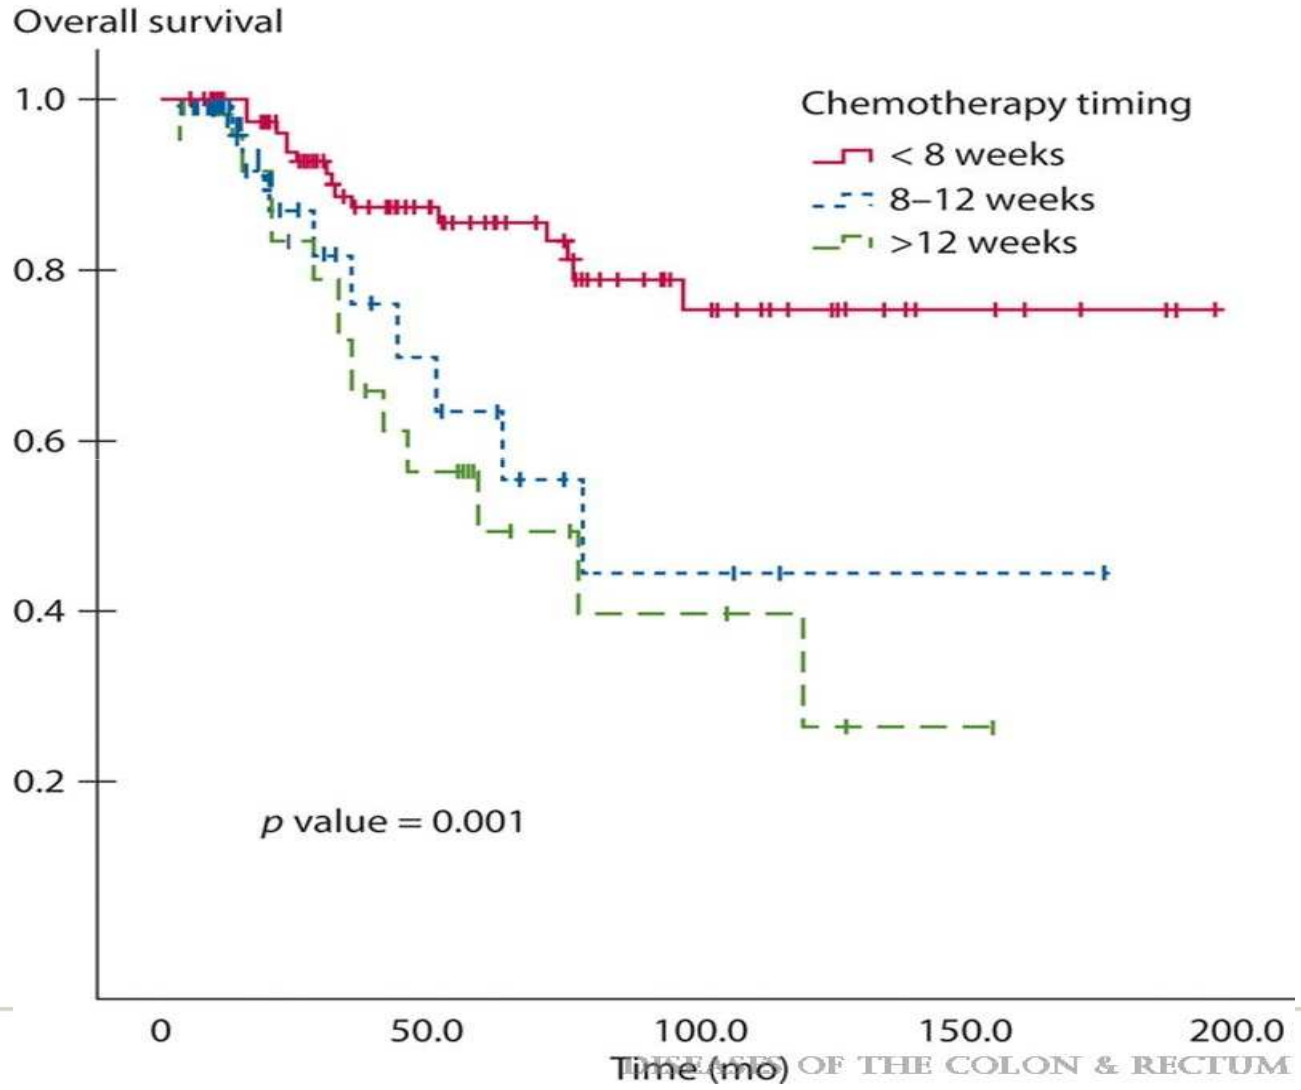
whereas preop CRT has not?

Suggests that in the trials

50-60% cN0

Compliance to postoperative adjuvant chemotherapy approx 50%

Timing of start of Adjuvant Postoperative Chemotherapy:

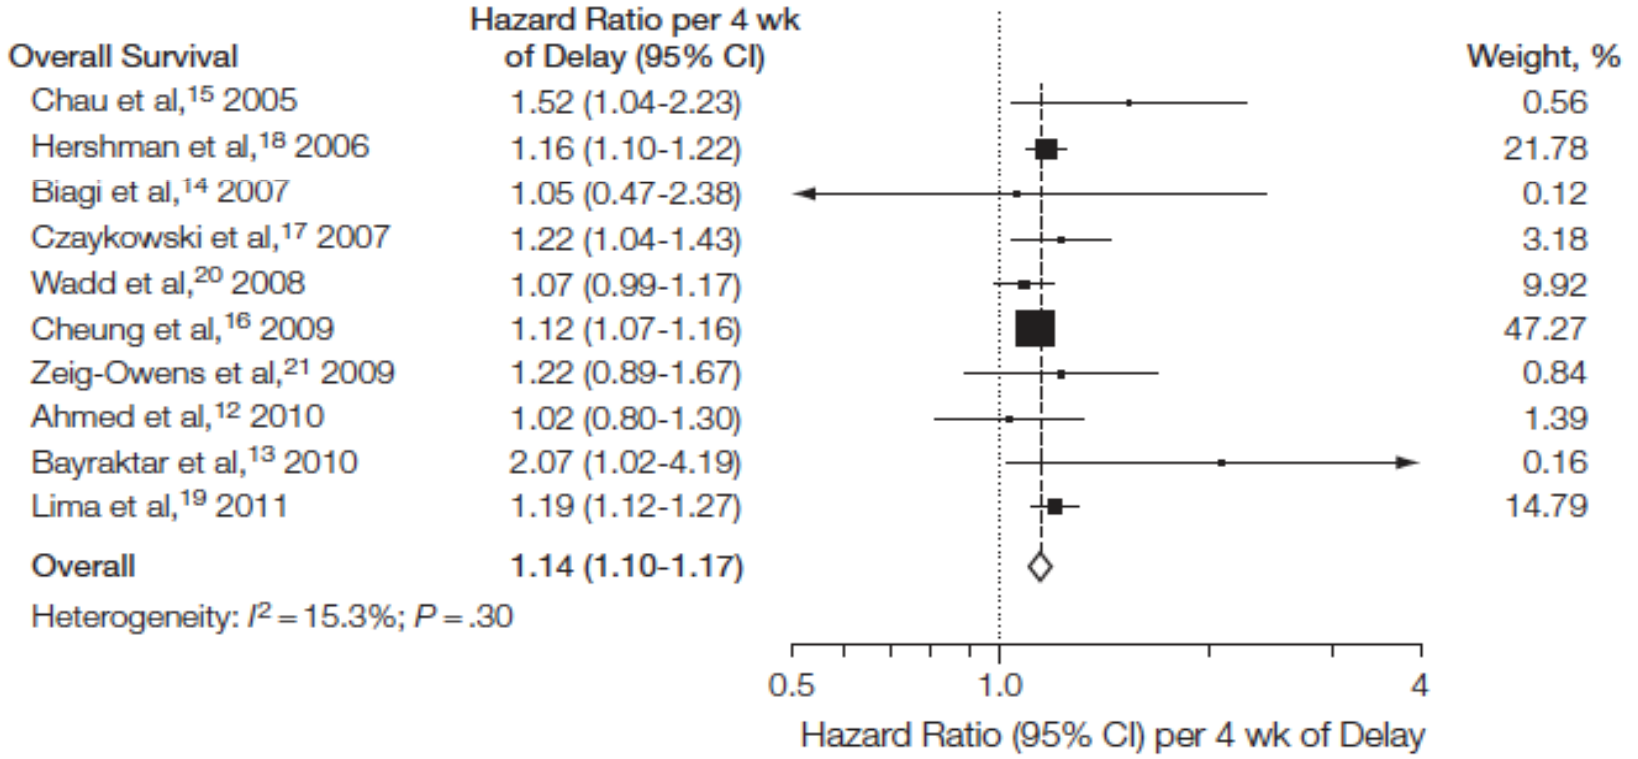


Tevis et al, DCR 2013

Association Between Time to Initiation of Adjuvant Chemotherapy and Survival in Colorectal Cancer

A Systematic Review and Meta-analysis

Increase in interval to start Adjuvant Chemotherapy
was associated with a **decrease in overall survival**



Biagi JJ et al., JAMA 2011 Jun 8;305(22):2335-42

Champalimaud Foundation

ESTRO School

So - What about?

- Oxaliplatin
- Irinotecan
- Biologicals

So what have the trials shown us?

All 5 Oxaliplatain trials used low dose oxaliplatin as a radiosensitizer with CRT

2 trials mandated oxaliplatin also as postoperative adjuvant (so if benefit which component?)

Some of the 5 trials did not mandate TME (NB the German trial did)

Phase III trials – Investigating

Trial	Eligibility	Fluoropyrimidine Platform
CAO/ARO/AIO-04	<12cm from anal verge T3/T4 cN0/N+ TRUS, CT and/or MRI	5FU 1000mg/2 X 5 days 1-5 + 29-33
NSABP R04 N=1606	<12cm; resectable stage II, III TRUS or MRI – CT if T4/ N1-2	PVI 5FU vs Capecitabine
FFCD N=598	Palpable; resectable; T3/4 N0-2; T2 distal anterior	Capecitabine in both arms
STAR – 01 N=747	Resectable stage II, III (c stage) <12cm from anal verge	PVI 5FU in both arms
PETTAC 6 N=1090	Stage II or III resectable or expected to become resectable <12cm from anal verge	Capecitabine in both arms

ESTRO School

Phase III: CAO/ARO/AIO-04

Best arm of CAO/ARO/AIO-94:

RT 50.4 Gy + 5-FU
1000 mg/m² days 1-5 + 29-33
623 patients

From Phase I/II Studies:

RT 50.4 Gy + 5-FU/OX
Ox: 50 mg/m² d 1, 8, 22, 29
5-FU: 250 mg/m² d 1-14 + 22-35

Note: Chemo gap 3rd week of RT !

613 patients

T

M

E

5-FU
500 mg/m² d 1-5, q29
4 cycles (4 months)

mFOLFOX6
Oxaliplatin: 100 mg/m² d1,q15
Folinic Acid: 400 mg/m² d1
5-FU: 2400 mg/m² d1-2
8 cycles (4 months)

ESTRO School

So what about postoperative adjuvant chemotherapy after Chemoradiation?

clinical practice guidelines

Annals of Oncology 24 (Supplement 6): vi81–vi88, 2013
doi:10.1093/annonc/mdt240

Rectal cancer: ESMO Clinical Practice Guidelines for diagnosis, treatment and follow-up†

B. Glimelius[1], E. Tiret[2], A. Cervantes[3] & D. Arnold[4], on behalf of the ESMO Guidelines Working Group*

[1]Dept of Radiology, Oncology and Radiation Science, Akademiska sjukhuset, Uppsala University, SE-751 85 Uppsala, Sweden; [2]2AP-HP, Hôpital Saint-Antoine, Pierre et Marie Curie University, Paris 6, France; [3]Department of Hematology and Medical Oncology, INCLIVA, University of Valencia, Valencia, Spain; [4]Klinik fuer Tumorbiologie, Freiburg, Freiburg, Germany

These Clinical Practice Guidelines are endorsed by the Japanese Society of Medical Oncology (JSMO)

" As in colon cancer stage III (and 'high-risk' stage II), adjuvant chemotherapy can be given, even if the level of scientific evidence for sufficient benefit is much lower than in colon cancer [33, 34, 35] [II, B]."

ESTRO School

Adjuvant chemotherapy in Colon Cancer

Good evidence for fluoropurimidines

Definite Benefit in Stage III (stage II QUASAR)

Good evidence for **Oxaliplatin** stage III

?Small benefit for 5FU in stage II

? Benefit Stage II for oxaliplatin

? Benefit over 70 years

Meta-analysis - reduction in risk of disease recurrence (25%) with adjuvant chemotherapy compared to observation (**HR=0.75,** CI: 0.68-0.83).

Trials randomising up front before CRT

The majority of patients are over-staged and probably Stage II

Compliance is poor in timing to start and doses received

Other trials randomising after CRT

TRIAL	Patient number	Primary endpoint	OS	DFS	HR for DFS
QUASAR (92% stage II)	3239 overall 968 rectal 203 preop RT	all-cause mortality.	80% versus 83.4%	Not stated	0.78 CI [0.44-1.22] (p=0·004)
PROCTOR SCRIPT	437	OS	5-year-OS 79·2% vs 80·4% (HR 0·93)	5-year-DFS 55·4%vs62·7 %(HR0·80)	0.80 CI [0.60-1.07] (p=0·13).
GERCOR	357 69% preop RT	DFS	OS HR =0.87	5-year DFS 58% vs 63%	0.80, (p=0.154)
Chronicle	113	DFS	3-year-OS 89% vs 88% (HR 1·18)	5-year DFS 71% vs 78%	0.80 (p=0.50)
ADORE	321	DFS	3-year-OS 86%vs95% (HR 0·46)	3-year DFS 63% vs 72%	0.63 (p=0.03)

So consider postop histology

Factors to consider 2

The type and quality of surgery are major (non-randomized) prognostic factors

Poor compliance may compromise the activity of adjuvant chemotherapy

After preoperative chemoradiation and surgery, time to start adjuvant chemotherapy is probably too long

Any benefit from 5FU may be achieved by the preop 5FU ie pCR

Conclusions

1. 5FU-based CRT (45-50Gy) more effective (downsizing) than RT but no improvement in SpS, DFS or OS
2. Capecitabine is an equivalent option
3. Watch and wait remains experimental
4. Radio-sensitizing 5FU-based CRT not improved by additional oxaliplatin ?
5. Biologicals have not yet delivered
6. Postop adjuvant chemotherapy after SCPRT or CRT remains of unproven benefit

Table 1. Surgical classification of low rectal cancer

Classification	*Definition*	*Surgical procedure*
Type I	Supra-anal tumor > 1 cm from anal ring	CAA
Type II	Juxta-anal tumor < 1 cm from anal ring	pISR
Type III	Intra-anal tumor Internal sphincter invasion	tISR
Type IV	Transanal tumor External sphincter invasion	APR

Type IVa includes the levator ani muscles; IVb, external sphincter; IVc, Levator ani muscles and external sphincter.
CAA = conventional coloanal anastomosis; pISR = partial intersphincteric resection; tISR = total intersphincteric resection; APR = abdominoperineal resection.

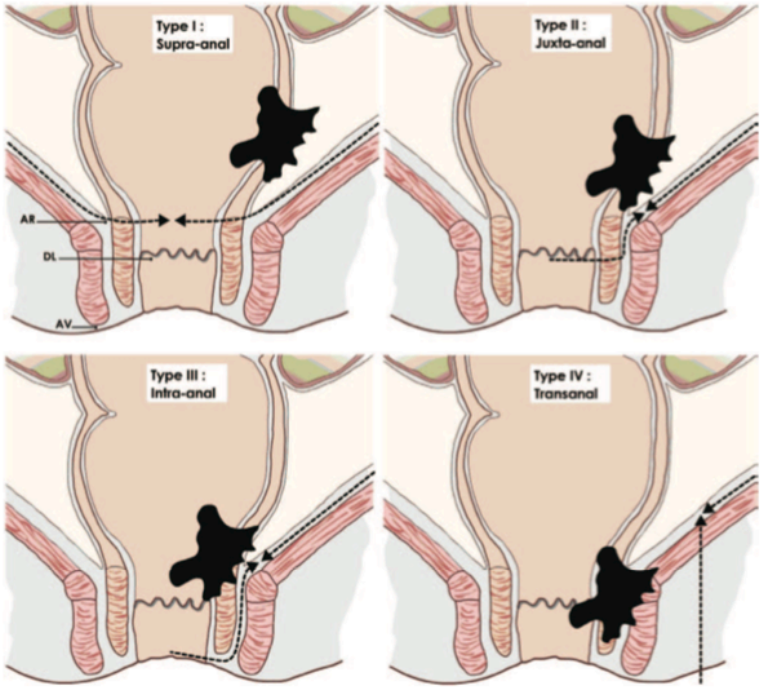

FIGURE 1. Surgical classification of low rectal cancer. Type I are supra-anal tumors (> 1 cm from the anal sphincter) and treated by conventional coloanal anastomosis; type II are juxta-anal tumors (< 1 cm from the anal sphincter) treated by partial intersphincteric resection; type III are intra-anal tumors (internal sphincter invasion) treated by total intersphincteric resection; and type IV are transanal tumors (external sphincter invasion) treated by APR. AR = anal ring, DL = dentate line; AV = anal verge. The dotted line represents the surgical dissection plane.

D. JOHNSTON

University Department of Surgery, The General Infirmary, Leeds.

Br. J. Surg. Vol. 70 (1983) 460–462 Printed in Great Britain

The quality of life after rectal excision for low rectal cancer

The quality of life for patients with carcinoma of the lower two-thirds of the rectum (5–12 cm from the anal verge) treated by abdominoperineal resection (APER, n = 38) was compared with that of a similar group of patients treated by low sphincter saving resection (SSR, n = 40). Assessment was by questionnaire conducted a minimum of one year after operation. Thirty patients (75 per cent) after SSR were entirely continent and ten patients (25 per cent) had occasional episodes of incontinence. Each patient with a colostomy was incontinent and 25 (66 per cent) had leaks from their appliance (12 frequent; 13 occasional). Patients after APER avoided more items in the diet and took more medication to control their bowel habit than patients after SSR. Fifteen of the 18 patients (83 per cent) who were employed before SSR returned to work after operation; only 6 of 15 patients (40 per cent) returned to work after APER ($P<0{\cdot}05$). Sexual function was impaired in 6 of 20 men (30 per cent) after SSR and in 12 of 18 men (67 per cent) after APER ($P<0{\cdot}06$). Depression was significantly more prevalent after APER than after SSR. Patients with low rectal cancer who are treated by modern sphincter saving resection have a quality of life superior to those who are treated by APER.

'Thus, provided it is technically feasible and compatible with complete eradication of the disease, every effort should be made to conserve the anal sphincter with low rectal cancer'

Decisions over APER versus SSS should be individualized

Ann Surg 2015;261:144–148

ESTRO School

How far do we go to pursue R0 margin?

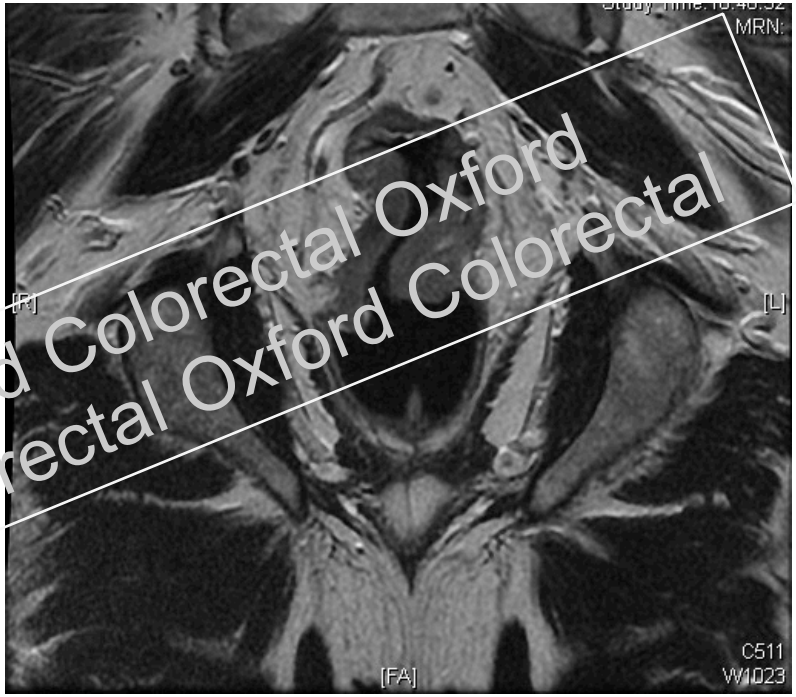
Beyond TME….

Pelvic lymphadenectomy

Sacrectomy

Cysto-prostatectomy

Outcomes favourable if Ro achieved



Is it suitable for local excision?

Usually not!

If complete response, best to observe

If suspected residual cancer in comorbid patient LE may have a role

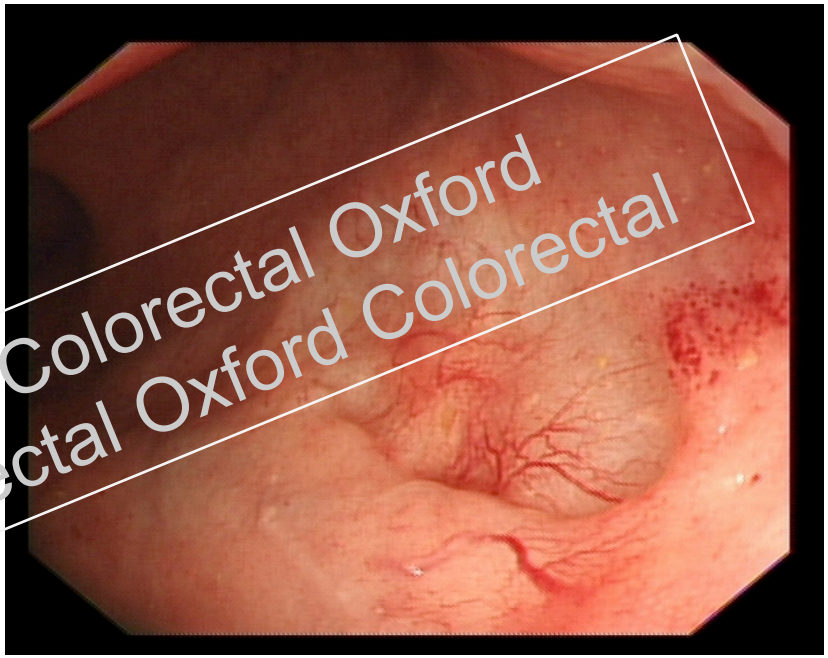
If initially T3/4, N+, unlikely to be improved by LE

Avoid Surgery: Watch and wait approach

Attractive in elderly and comorbid patients

Needs infrastructure and engagement of patient and MDT

Should be considered in all patients?



Summary

Surgical decision-making is complex in rectal cancer

Patient centred

What is possible technically may not be best for the patient

Complex physical, psychological and cultural considerations

One value of CRT is the decision may be deferred

What does the surgeon want from the radiotherapist?

Improve outcomes!

Reduced R1 rates

Increase sphincter preservation

Minimal impact on complications

Minimal impact on patient QoL

CLINICAL INVESTIGATION — Gastrointestinal

TUMOR DOWNSTAGING AND SPHINCTER PRESERVATION WITH PREOPERATIVE CHEMORADIATION IN LOCALLY ADVANCED RECTAL CANCER: THE M. D. ANDERSON CANCER CENTER EXPERIENCE

Nora A. Janjan, M.D.,* Vincent S. Khoo, M.D.,* James Abbruzzese, M.D.,†
Richard Pazdur, M.D.,† Ronelle Dubrow, M.D.,‡ Karen R. Cleary, M.D.,§
Pamela K. Allen, M.P.H.,* Patrick M. Lynch, M.D.,‖ Gary Glober, M.D.,‖
Robert Wolff, M.D.,† Tyvin A. Rich, M.D.,¶ and John Skibber, M.D.#

Departments of *Radiation Oncology, †Medical Oncology, ‡Diagnostic Radiology, §Pathology, ‖Gastrointestinal Oncology and Digestive Diseases, and ¶Surgical Oncology, The University of Texas, M.D. Anderson Cancer Center, Houston, TX, and the #Department of Radiation Oncology, University of Virginia Health Science Center, Charlottesville, VA

Tumor down-staging occurred in 72 (62%) cases

Pathological complete response (CR) in 32 (27%) of patients

In cancers < 6cm from AV, sphincter preservation was performed in 9 of the 17 (53%) CRs but only 20 of 52 patients (38%) when residual disease present

Impact of RT seems to be for population with probable CCR

Conclusion

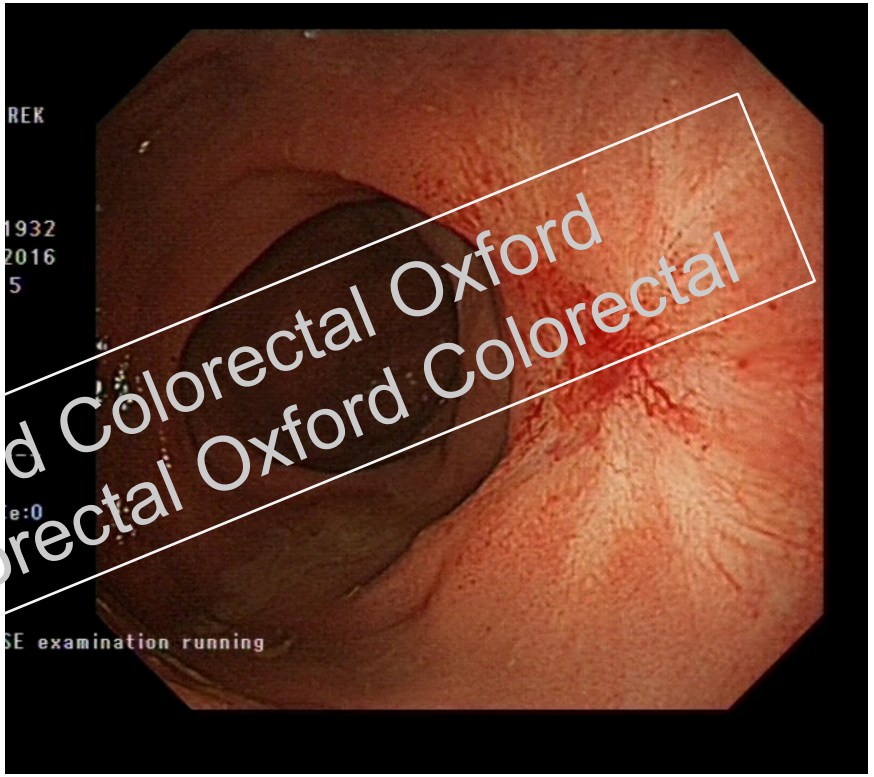
Radiotherapy offers value in advanced disease and will reduce R1 rate

Role of radiotherapy in surgically resectable disease yet to be defined

Most benefit from RT comes from those with complete response

-Increase sphincter preservation

-Avoid radical surgery

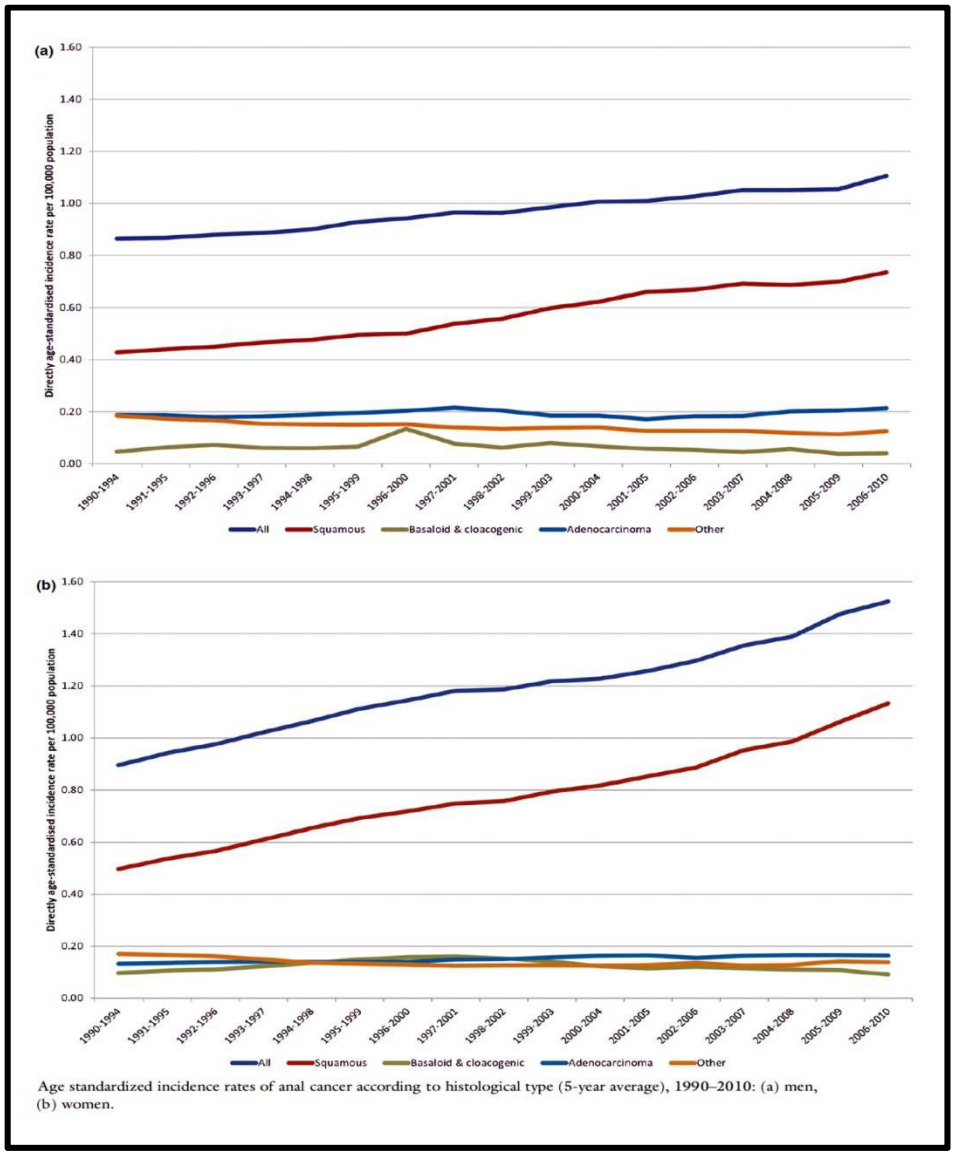


Prognostic Factors in Anal Cancer

ESTRO LOWER GI COURSE :

Technical & Clinical Challenges for Radiation Oncologists

Anal cancer – Increasingly Common

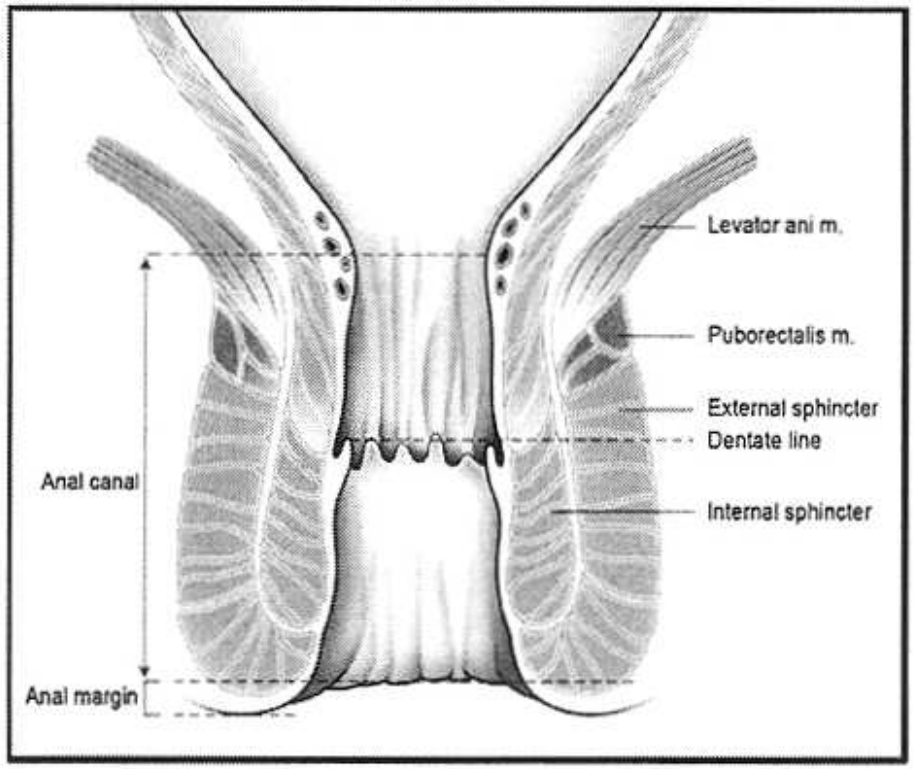


Age standardized incidence rates of anal cancer according to histological type (5-year average), 1990–2010: (a) men, (b) women.

- **English National Cancer Data Repository 1990 – 2010 (all anal cancers diagnosed in England)**
- **69 % increase in age standardised incidence for SCC in men from 0.43 per 100,000 to 0.73 per 100,000**
- **126 % increase for women from 0.5 per 100,000 to 1.13 per 100,000**
- **No change in incidence of anal adenocarcinoma**
- **Similar changes reported in Scotland, Denmark, Sweden, Australia and the USA**

(Wilkinson et al 2014)

Anal cancer – Anal Canal & Anal Margin



Most Anal tumours arise in the Anal Canal

- The anal margin is defined as the area of pigmented skin around the anal orifice - extending laterally to a radius of 5cm
- Anal margin tumours are staged as cutaneous SCCs

ANAL CANCER : UICC TNM STAGE

T STAGE

- **TX** - tumor cannot be assessed
- **T0** - no primary tumor
- **Tis** - AIN 2 & 3 ; high grade SIL
- **T1** - tumor < 2cm maximum diameter
- **T2** - tumor > 2cm & < 5cm
- **T3** - tumor > 5cm
- **T4** - tumor of any size invading adjacent organs eg. vagina, urethra,bladder (excludes rectum, peri-anal skin & sphincter muscle)

N STAGE

- **NX** - nodes cannot be assessed
- **N0** – no node metastasis
- **N1** – metastasis in peri-rectal nodes
- **N2** – metastasis in unilateral internal iliac and/or inguinal nodes
- **N3** – metastasis in peri-rectal & inguinal nodes or bilateral internal iliac node involvement or bilateral inguinal node involvement

- **any tumor between rectum and peri-anal skin**
- **anal margin tumors classified as skin cancers**

Anal Cancer : TNM stage & Outcome

- **US GI Intergroup RTOG 98-11 phase 3 anal cancer trial**
- **RCT of RT + 5FU/MMC versus RT + 5FU/CDDP & indictin chemotherapy with 5FU/CDDP**
- **T2 – T4 +/- LN metastases (excludes T1 N0-3 and M1 disease)**
- **N = 620 patients**

	No.	5yr Local Failure	5yr DM	3yr Colostomy failure	5yr DFS	5yr OS
T2 N0	323	17 %	10 %	11 %	72 %	82 %
T3 N0	96	18 %	14 %	13 %	61 %	74 %
T4 N0	31	37 %	21 %	26 %	50 %	57 %
T2 N1-3	99	26 %	27 %	11 %	57 %	70 %
T3 N1-3	46	44 %	24 %	27 %	38 %	57 %
T4 N1-3	25	60 %	24 %	24 %	31 %	42 %
T2 or 3 N0	419	17 %	11 %	11 %	70 %	80 %
T4N0 or T2-4 N1-3	201	36 %	25 %	19 %	49 %	62 %

(Gunderson et al 2013)

Anal Cancer : the importance of tumour size

- **Das et al (2007) : 167 patients treated with CRT**
- **3 yr locoregional control :**
- **T1/Tx 90 % (76 – 100)**
- **T2 86 % (76 – 96)**
- **T3 77 % (61 – 93)**
- **T4 63 % (41 – 86)**

T stage a significant independent predictor of loco-regional failure on multivariate analysis (HR 1.71)

- **Ajani et al (2009 & 2010) : RTOG 98-11 trial of RT + 5FU/MMC versus RT + 5FU/cisplatin**
- **Tumour diameter > 5cm associated with a greater risk of colostomy, worse 5 yr DFS & 5 yr OS (p = 0.0003) compared with smaller tumours**

Anal Cancer : the importance of nodal metastasis

- Das et al (2007) : 167 patients treated with CRT

	3 yr locoregional control	3 yr distant control
N0	85 %	94 %
N1	88 %	79 %
N2	84 %	75 %
N3	39 %	76 %

- N stage an independent predictor of loco-regional failure, distant metastasis and OS on multivariate analysis !

- Ajani et al (2010) : RTOG 98-11 trial
- Clinically positive nodes associated with worse 5 yr DFS and 5 yr OS ($p < 0.0001$)

Other Prognostic Factors

- **Male gender**

- **EORTC 22861 :**
- **local control p= 0.0028**
- **overall survival p=0.0034**

- **RTOG 98-11 :**
- **disease free survival p = 0.02**
- **overall survival p=0.016**

- **ACT 1 Trial :**
- **Loco-regional failure HR 1.6 (1.03-2.49) p=0.036**
- **Anal cancer death HR 1.8 (1.03-3.16) p=0.039**
- **Overall survival HR 1.56 (1.12 – 2.17) p=0.008**

Other Prognostic Factors

- **ACT 1 trial :**

➢ **low Hb associated with increased anal cancer death (p=0.008)**

- **EORTC 22861 :**

➢ **skin ulceration associated with loco-regional failure (p=0.003) and overall survival(p=0.005)**

ANAL CARCINOMA : HISTOLOGICAL CLASSIFICATION

- **SQUAMOUS CELL CARCINOMA NOS (80 - 90%)**
  - size of neoplastic cell
  - basaloid morphology
  - keratinization
  - presence of mucinous microcysts
  - degree of differentiation
  - presence of adjacent AIN

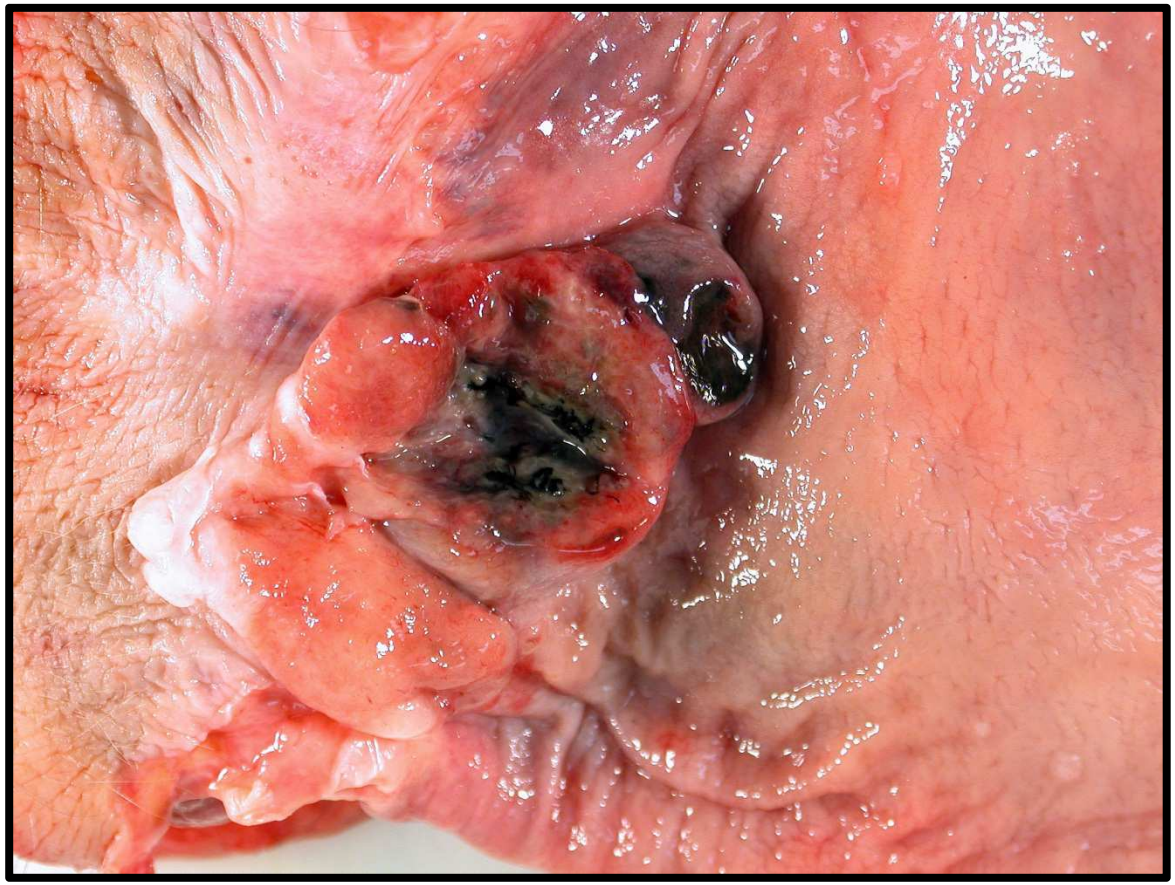
WHO 2nd Edition.
large cell keratinizing
large cell non-keratinizing
Basaloid (cloacogenic)

- **VERRUCOUS CARCINOMA (GIANT CONDYLOMA OF BUSCHKE-LOWENSTEIN) (< 1 %)**

- **ADENOCARCINOMA (anal gland, mucinous – fistula related, rectal type) (10 – 15 %)**
- **NEUROENDOCRINE CARCINOMA (large cell & small cell type) (< 2 %)**

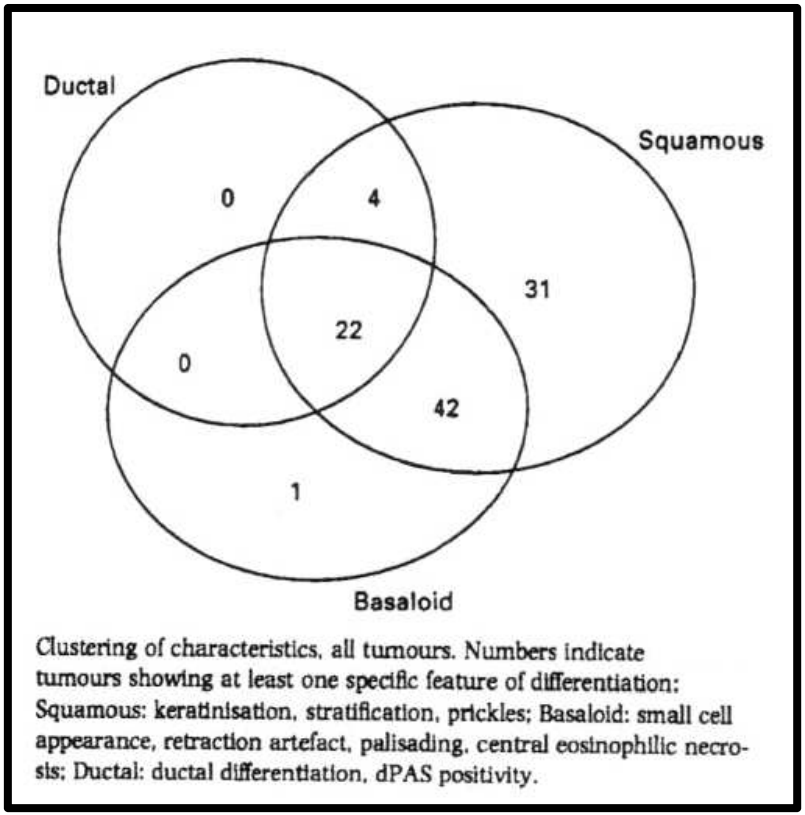
Other Cancers

- **Malignant Melanoma (< 2 %)**



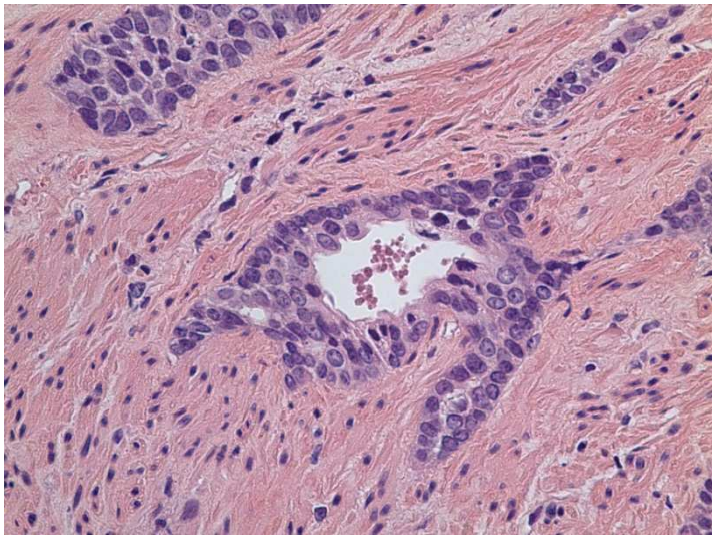
- **Lymphoma**
- **Sarcoma**

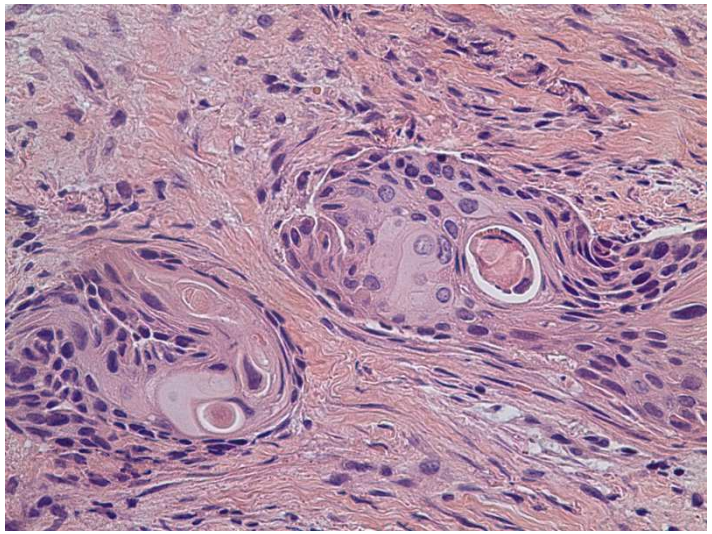
SCC of the Anal Canal : Overlap of Histological Types

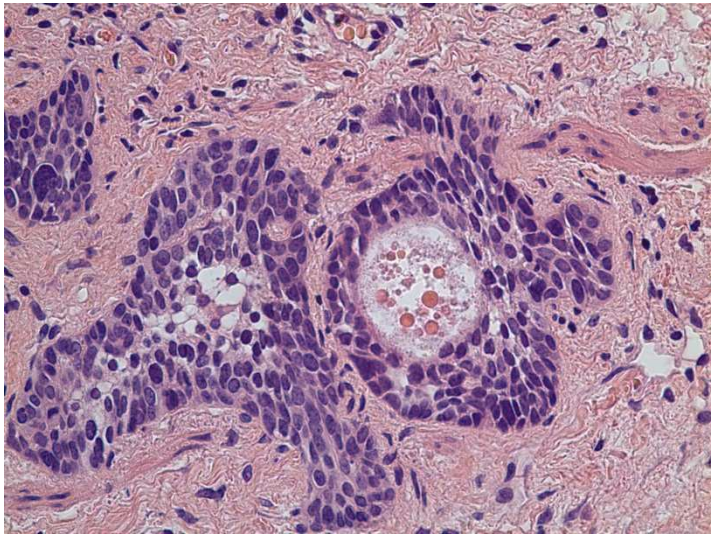


Clustering of characteristics, all tumours. Numbers indicate tumours showing at least one specific feature of differentiation: Squamous: keratinisation, stratification, prickles; Basaloid: small cell appearance, retraction artefact, palisading, central eosinophilic necrosis; Ductal: ductal differentiation, dPAS positivity.

(Williams & Talbot 1994)

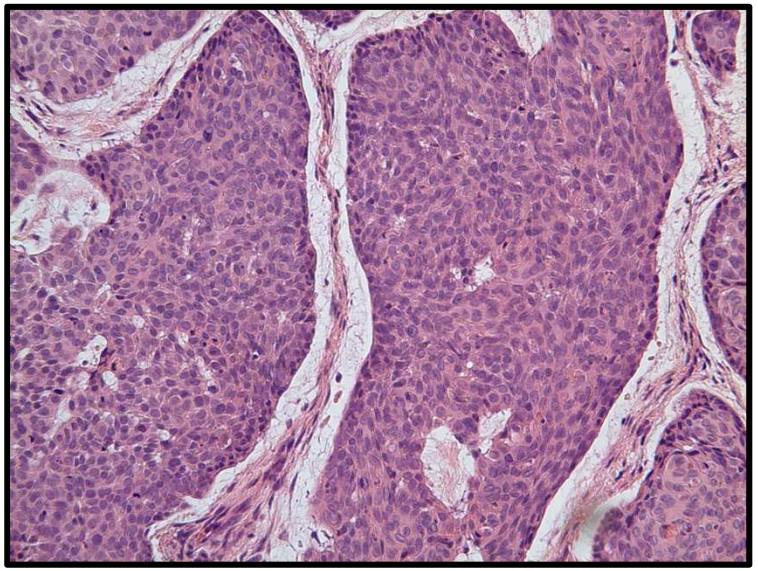


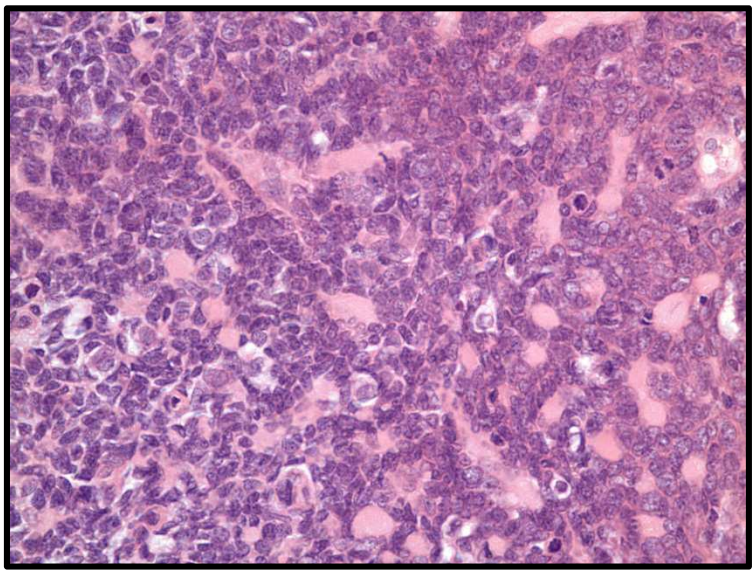


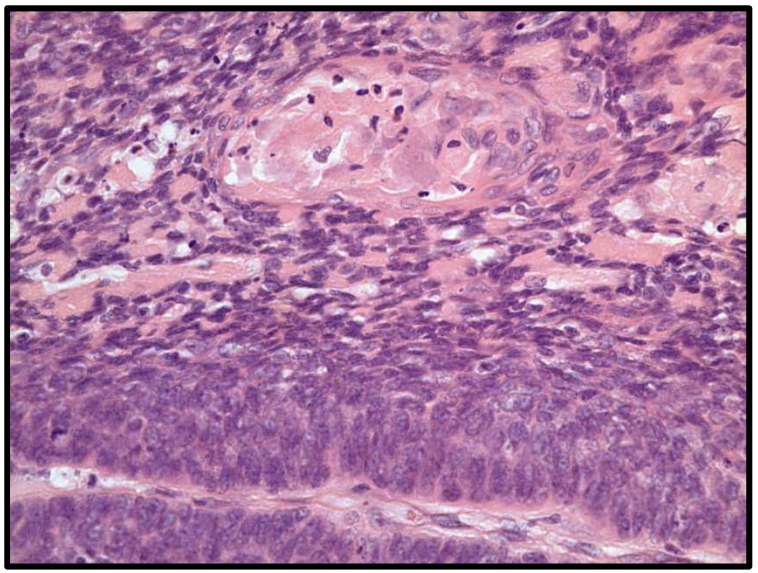


Basaloid Variant SCC

Bonnen et al (1984)	61/160	(38 %)
Dougherty et al (1984)	11/79	(13.9 %)
Shepherd et al (1989)	60/166	(36 %)

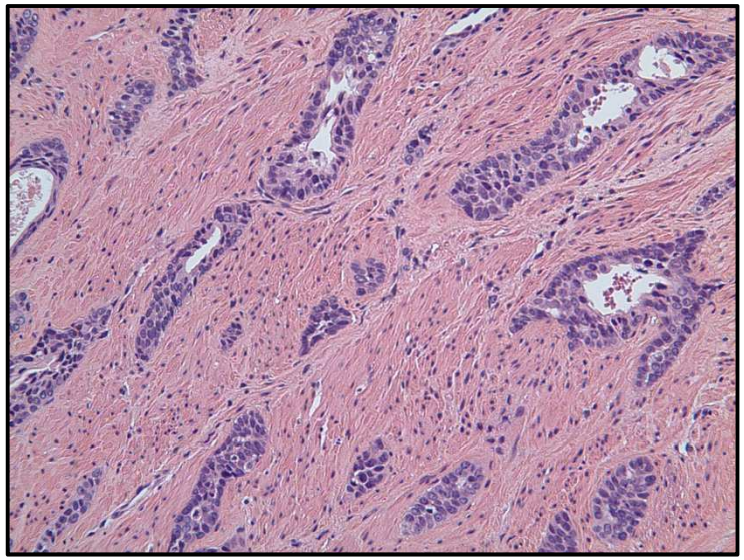


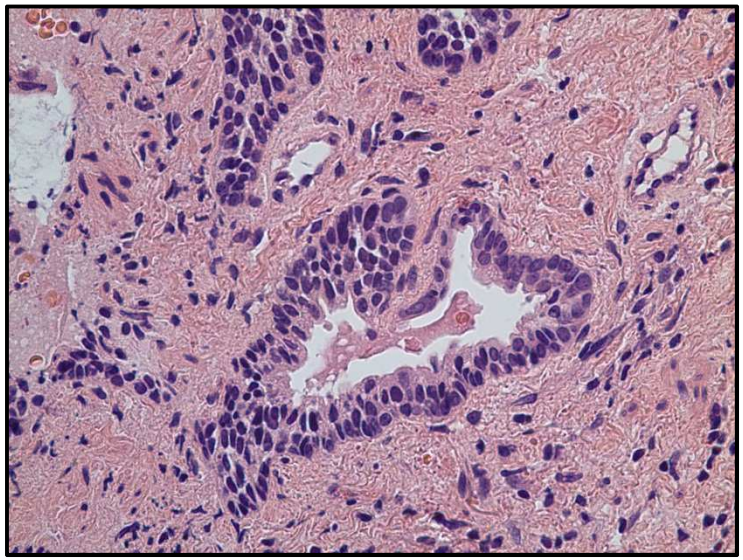


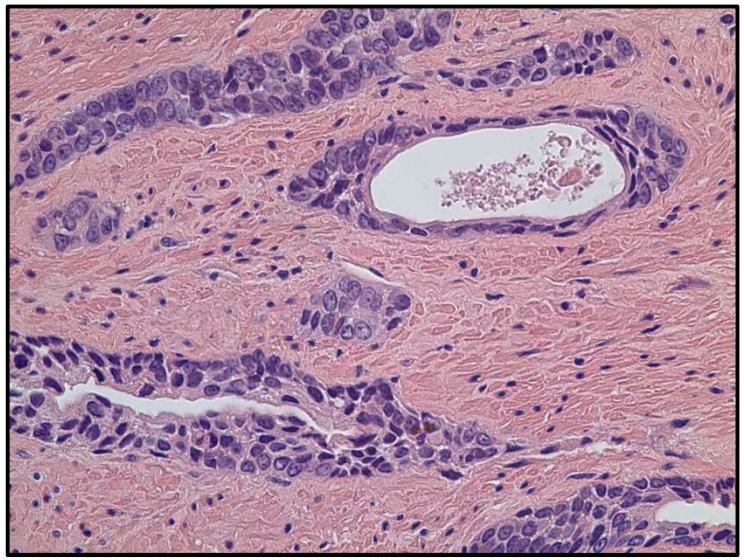


Squamous Cell Carcinoma with Mucus Microcysts (“Mucoepidermoid carcinoma of the anus”)

Morson et al (1963)	21/178	(11.8 %)
Dougherty et al (1984)	6/79	(7.6 %)
Shepherd et al (1989)	10/235	(4.3 %)







study	No.	Time period	treatment	outcome
Boman et al (1984) SCC – grades 1 to 4 Basaloid type SCC	188	1950-1976	Surgery	Grade & type correlated with stage. No significant correlation with survival after adjusting for stage.
Dougherty et al (1984) Keratinizing SCC Non-keratinizing SCC Basaloid SCC SCC with microcysts	79	Pre 1978	Surgery	No correlation of histologic type with depth of invasion or node metastasis. No correlation with survival.
Shepherd et al (1989) SCC Basaloid type Mixed type	235	1948-1985	Surgery	Histologic type not predictive of survival in multivariate analysis.
Bartelink et al (1997) SCC versus other types Histologic grade	110	1987-1994	RT & CRT	Neither type nor grade predicted local control or survival.
Myerson et al (2001) SCC – low & high grade Basaloid type	106	1975-1997	Mainly CRT	Borderline significant improved 5yr DFS for basaloid type. No effect of tumour grade.
Das et al (2007) SCC grades 1 to 3 Basaloid type	167	1992-2004	CRT	Basaloid type associated increased risk of Distant Metastasis (HR 4.23). No correlation type or grade with loco-regional failure or survival.

Biomarkers in Anal Carcinoma – Much Ado About Nothing

- **p53 : 8 studies 1996 – 2009 (n = 14 – 214)**

- immunohistochemistry used in all studies
- 34% – 100 % cancers positive (34-60% in 6/8 studies)
- All cancers treated with CRT
- **No prognostic significance in 6/8 series** ; reduced DFS in 2/8

- **p21 : 3 studies 2001 – 2006 (n = 94 – 215)**

- immunohistochemistry used in all studies
- 65 % – 71 % cancers showed positive staining
- **absent expression associated with reduced OS in one study and a trend towards reduced DFS in the other two** ; significant association with loco-regional failure in one out of three.

- **EGFR : 3 studies 2005 – 2009 (n = 21 – 38)**

- immunohistochemistry used in all 3 series
- EGFR expression seen in 55 % – 100 % of cancers
- **NO prognostic significance found**

(Lampejo et al 2010)

Biomarkers in anal Carcinoma – Much Ado About Nothing

- **BCL – 2 : 3 studies 2003 – 2009 (n = 21 – 98)**

- immunohistochemistry in all 3 studies
- BCL 2 expressed in 24 – 58 % of cancers
- associated with reduced local control and DFS in one study ; no prognostic significance in the other two

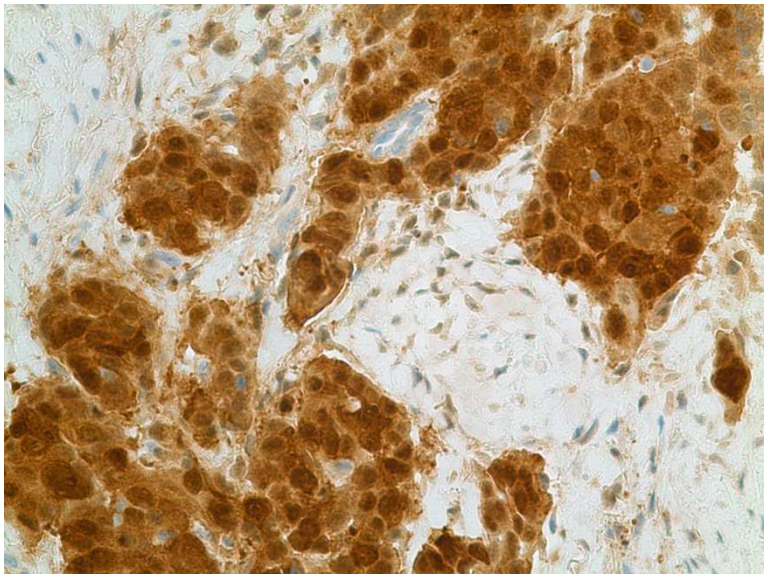
- **Ki67 : 4 studies 1998 – 2009 (n = 31 – 62)**

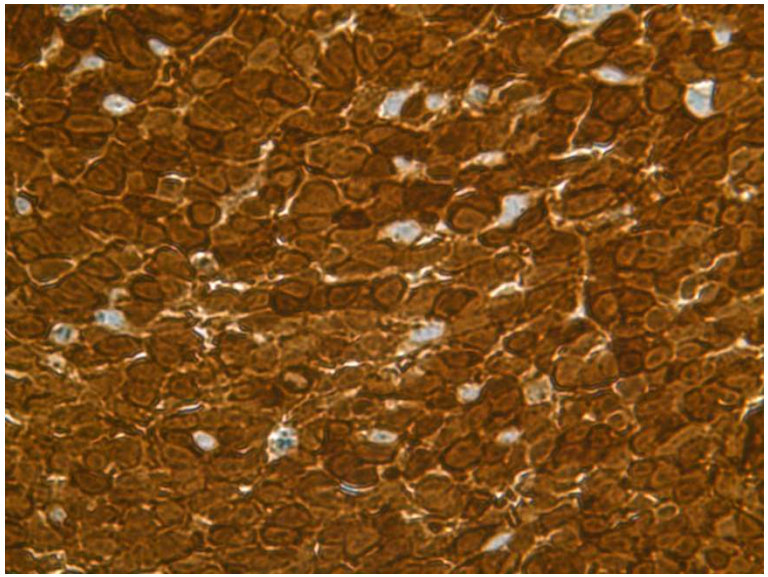
- Immunohistochemistry (MIB1) used in all studies
- No prognostic significance in 2 out of 4 studies ; elevated Ki67 associated with longer DFS in one study and improved colectomy free survival in a second study.

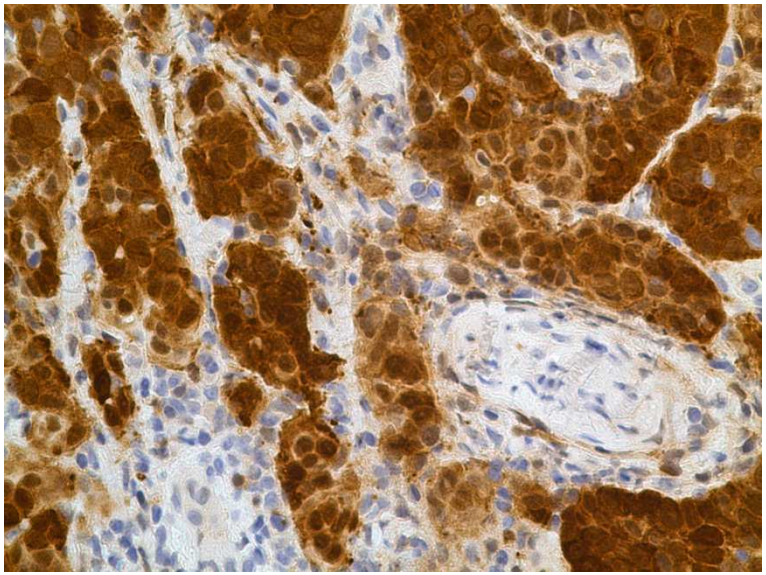
- **Others : VEGF - no prognostic significance**
  MVD - no prognostic significance
  PCNA - no prognostic significance
  Cyclins - no prognostic significance in 3 out of 4 studies

(Lampejo et al 2010)

p16 – a promising biomarker in Anal Cancer







p16 – ink4a
Chromosome 9p21
Inhibits entry into S phase of the cell cycle
Binds CDK4/6 inhibiting formation of the cyclin-CDK4/6 complex
HPV E7 protein binds Rb releasing E2F transcription factor leading to increased p16 expression

p16 overexpression in anal cancer is a useful surrogate marker of high risk HPV infection !!!

Human Papilloma Virus & Anal Carcinoma

- Vuyst et al (2009) – meta-analysis of 29 international studies between 1986 – 2008

➢ Overall prevalence of HPV in AIN = **92.7 %** (1280 cases)

➢ Overall prevalence of HPV in anal carcinoma = **84.3 %** (955 cases)

	All types	HPV 16	HPV18	Multiple types
AIN 1	91.5 %	37.2 %	21.3 %	54.4 %
AIN 2 & 3	93.9 %	59.8 %	17.4 %	
SCC	84.3 %	73.4 %	5.2 %	6.8 %

- ? HPV more common in basaloid variant SCC (> 95 %)
- ? HPV associated lower T stage & N stage at diagnosis

HPV & ANAL CANCER

- **143 stage I – III anal SCCs (2000 – 2010)**
- **Single centre in Denmark**
- **52 % treated with RT ; 48 % treated with CRT**
- **Median F.U 51.2 months**
- **Recurrent disease in 23 %**
- **87.6 % HPV + (79.6% HPV16)**
- **92.9 % p16 +**

	Overall Survival	Disease Specific Survival
HPV +	74 %	84 %
HPV -	52 %	52 %
p16 +	76 %	85 %
p16 -	30 %	30 %

(Serup-Hansen et al 2014)

HPV associated Anal Cancer is genetically distinct

- Meulendijks et al (2015)
- 138 anal SCC

	No.	% p53 I/C +	% p53 disruptive mutations	3 yr loco-regional control	3yr OS
HPV+ p16+	93	10% (9/93)	6 % (1/18)	82 %	87 %
HPV- p16+	4		33 % (1/3)	75 %	75 %
HPV- p16-	10	50% (5/10)	80 % (8/10)	15 %	35 %

No difference in T or N stage between HPV+ and HPV - cancers

HIV & ANAL CANCER

Historically (pre-HAART) anal carcinoma treatment in HIV positive patients associated with lower response rate and reduced survival

Radiotherapy and chemotherapy poorly tolerated with more toxicity and breaks in treatment

More recent studies (post HAART) suggest outcomes equivalent to non-HIV+ patients

Is the prognosis of Anal cancer worse in HIV infected patients ?

- **Oehler – Janne et al (2008)**
- **40 consecutive HIV(+) patients from 4 centres in Switzerland, France & Canada treated with CRT between 1997-2006**
- **Compared with 81 HIV(-) patients**
- **98 % SCC**

	HIV (+)	HIV (-)
cCR	92%	96%
5 yr local control	38%	87%*
5 yr sphincter preservation	38%	74%**
5 yr DM free survival	91%	84%
5 yr DSS	68%	85%***
5 yr OS	61%	65%
Acute G3/4 toxicity	48%	31%
Severe skin toxicity	35%	17%
Severe haematologic toxicity	33%	12%

- **poorer local control experienced by HIV(+) group with significantly higher colostomy rate**
- **Higher treatment related toxicity**
- **Less use of MMC in HIV(+) group**
- **Longer duration of RT in HIV(+) group (? more treatment breaks)**

(* P = 0.008 ; **p = 0.035 ; *** p = 0.09)

HIV & ANAL CANCER

- **Wexler et al (2007)**
- 32 HIV+ patients treated with CRT (5FU+MMC) between 1997 and 2005
- Median tumour size 2.8 % ; **44% cT1 cN0**
- 5 yr actuarial risk of local failure = 16 %
- 3 / 32 developed distant metastases
- 5 yr overall survival = 65 %
- 5 yr cancer specific survival = 75 %
- **Fraunholz et al (2011)**
- 25 HIV + patients and 45 HIV – patients
- No difference in T or N stage at diagnosis (all M0)
- More young males in the HIV+ group
- No difference in RT dose delivered
- 72 % HIV+ received full dose of chemotherapy cf. 91 % HIV- group

	CR at 8 wks	5 yr local control	5 yr metastasis free survival	5 yr overall survival
HIV +	**84 %**	**65 %**	**86 %**	**71 %**
HIV -	**93 %** pNS	**78 %** pNS	**91 %** pNS	**77 %** pNS

SCC of the Anal Margin

- 5 – 10x less common than anal canal tumours
- more often well differentiated & keratinizing
- less often hrHPV positive (80% in women & 28% in men – Frisch et al 1999)
- Small well differentiated tumours < 2cm can be treated by local excision +/- adjuvant radiotherapy
- Larger tumours that are poorly differentiated or metastatic to inguinal lymph nodes (15 – 20 % of patients) are treated with radiotherapy or CRT

SCC of the Anal Margin

- Risk of lymph node metastasis is related to tumour size:

Tumour size	% Node Metastasis Papillon & Chassard (1992)	% Node Metastasis Cummings et al (1986)
< 2cm	0 %	0 %
2 – 5 cm	24 %	
> 5cm	67 %	25 %

SCC of the Anal Margin : Results of Radiotherapy

	number	5 yr LRC	5 yr OS	Sphincter preservation
Chapel et al 2006	26	61 %	71 %	65 %
Cummings et al 1986	29	72 %	NS	NS
Papillon et al 1992	57	88 %	59 %	90 % (in cured patients)
Touboul et al 1995	17	86 %	82 %	82 %
Bieri et al 2001	24	70 %	56 %	67 %
Peiffert et al 1997	31	77 %	67 %	84 %
Khanfir et al 2008	45	78 %	55 %	80 %

SCC of the Anal Margin : Prognostic Factors

- Anal margin tumours have been reported to have both a better and worse prognosis than anal canal lesions – ACT 1 trial found no effect for LRF or OS.
- Studies of prognostic factors specific to anal margin tumours are lacking and reported series are small

➢ Chapet et al (2007) - 26 patients treated with primary EBRT or adjuvant RT after local excision : cancer specific survival related to age, tumour differentiation, T stage & N stage

Tumour diffn	5 yr CSS
Well diffn	85 %
Mod diffn	67 %
Poor diffn	50 %

T stage	5 yr CSS
T1	100 %
T2	92 %
T3	37 %
T4	0 %

N stage	5 yr CSS
N0	93 %
N1	67 %
N2	33 %

➢ Khanfir et al (2008) – 45 patients with primary EBRT or adjuvant RT after local excision : no factors (T stage, N stage, histological grade or age) were predictive of loco-regional control

Prognostic Factors in Anal Cancer

- Tumour size
- T stage
- N stage
- Distant Metastasis
- ? Histological type (probably not !)
- ? Histological grade (probably not !)
- Presence of skin ulceration (EORTC 22861)
- Male sex (ACT 1, EORTC 22861 & RTOG 98-11)
- Low Haemoglobin (ACT 1)
- HIV status (not so important post HAART)
- HPV status & p16 immunohistochemistry

Rectal Carcinoma: staging the bad tumours

Gina Brown
Department of Radiology
Royal Marsden Hospital
Imperial College, London

gina.brown@rmh.nhs.uk

The Royal Marsden

Cuthbert Dukes 1932: Nodes as a prognostic factor

- *A cases* - carcinoma is limited to the wall of the rectum, no extension into the extra-rectal tissues and no metastases in lymph nodes.
- *B cases* - carcinoma has spread by direct continuity to the extra-rectal tissues but has not yet invaded the regional nodes,
- *C cases* - metastases are present in the regional lymph nodes.
- system predicted **prognosis** and became a gold standard: Three-year survival after surgery was 80%, 73% and **7%** for A,B and C respectively.

NHS

There are big problems with the current TNM system and preoperative staging rectal cancer…..

The problems with TNM

- T3 category is enormous and survivals range from 90% (same as Dukes A) to 25%
- Stage III classification is too heterogenous
- TNM does not take into account CRM status
- TNM does not take into account extramural vascular invasion
- TNM does not take into account low rectal cancer stage system
- Using T and N staging does not perform adequately in the assessment following neoadjuvant therapy

These tumours have entirely different prognostic outcomes

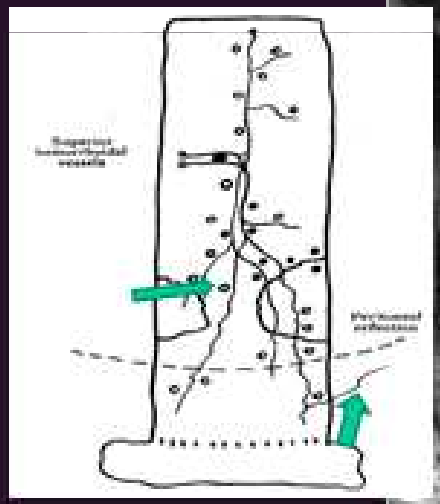
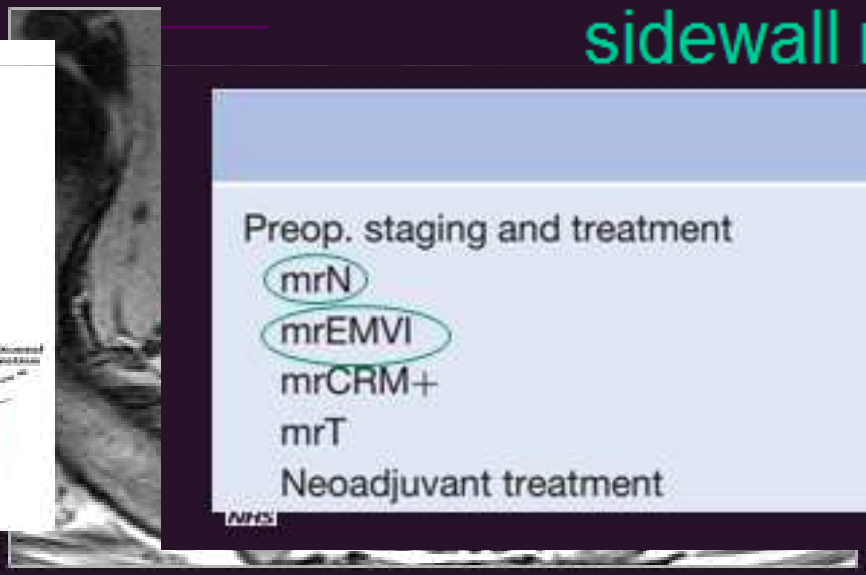
#8.Lateral Pelvic Tumour Spread

mrEMVI is as
sidewall t





Preoperative risk factors associated with MRI pelvic sidewall nodes

	Odds ratio	*P*
Preop. staging and treatment		
mrN	3·64 (1·67, 7·94)	0·032
mrEMVI	2·48 (1·08, 5·69)	0·001
mrCRM+	0·85 (0·33, 2·17)	0·738
mrT	1·14 (0·64, 2·01)	0·663
Neoadjuvant treatment	1·72 (0·77, 3·86)	0·190

The Royal Marsden

How do we find tumours that require neoadjuvant therapy?

- Definition of mrCRM at risk
- Importance of mrT substage rather than stage
- The importance of MRI detected EMVI as a gold standard
- Prognostic importance of assessment of height and MRI low rectal stage
- Prognostic relevance of mrTRG
- Prognostic relevance of mucinous tumours
- examples of how MRI is being used for treatment stratification in clinical surgical and oncological trials

NHS

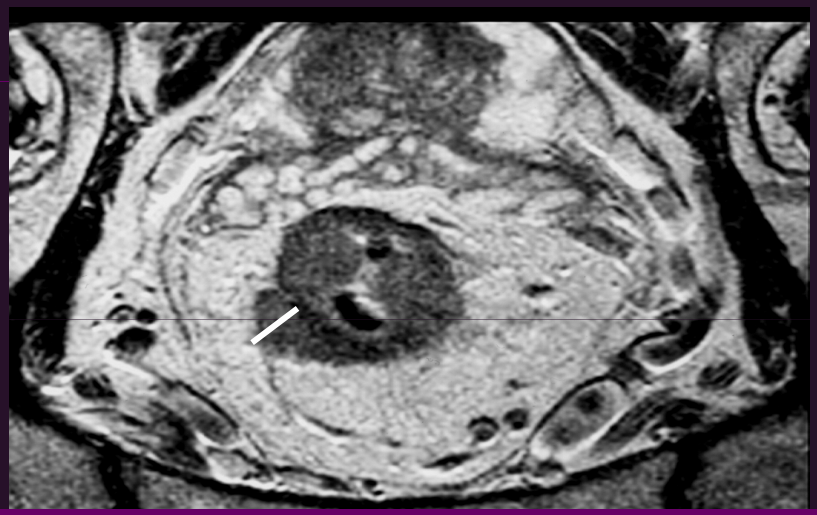
1958 – to present

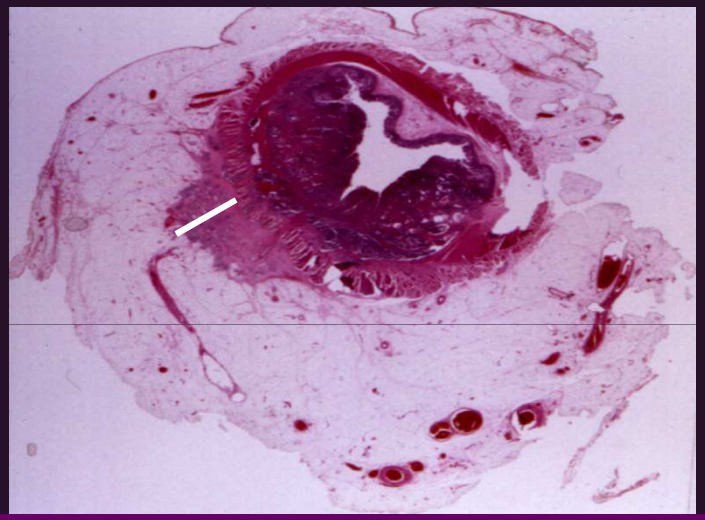
- Jass (St Marks, UK) : increasing depth of spread – independent prognostic significance
- Harrison (Tennessee, USA): prognostic score use depth of spread in mm
- Cawthorne (Guildford, UK): depth of spread significance
- Merkel and Hermanek (Erlangen, Germany) :
  - T3 subclassification
    - T3a <1mm
    - T3b>1-5mm,
    - T3c>5-15mm
    - T3d>15mm (TNM staging system 1993 supplement)

Extramural depth of spread is an equally important prognostic factor as node status

NHS

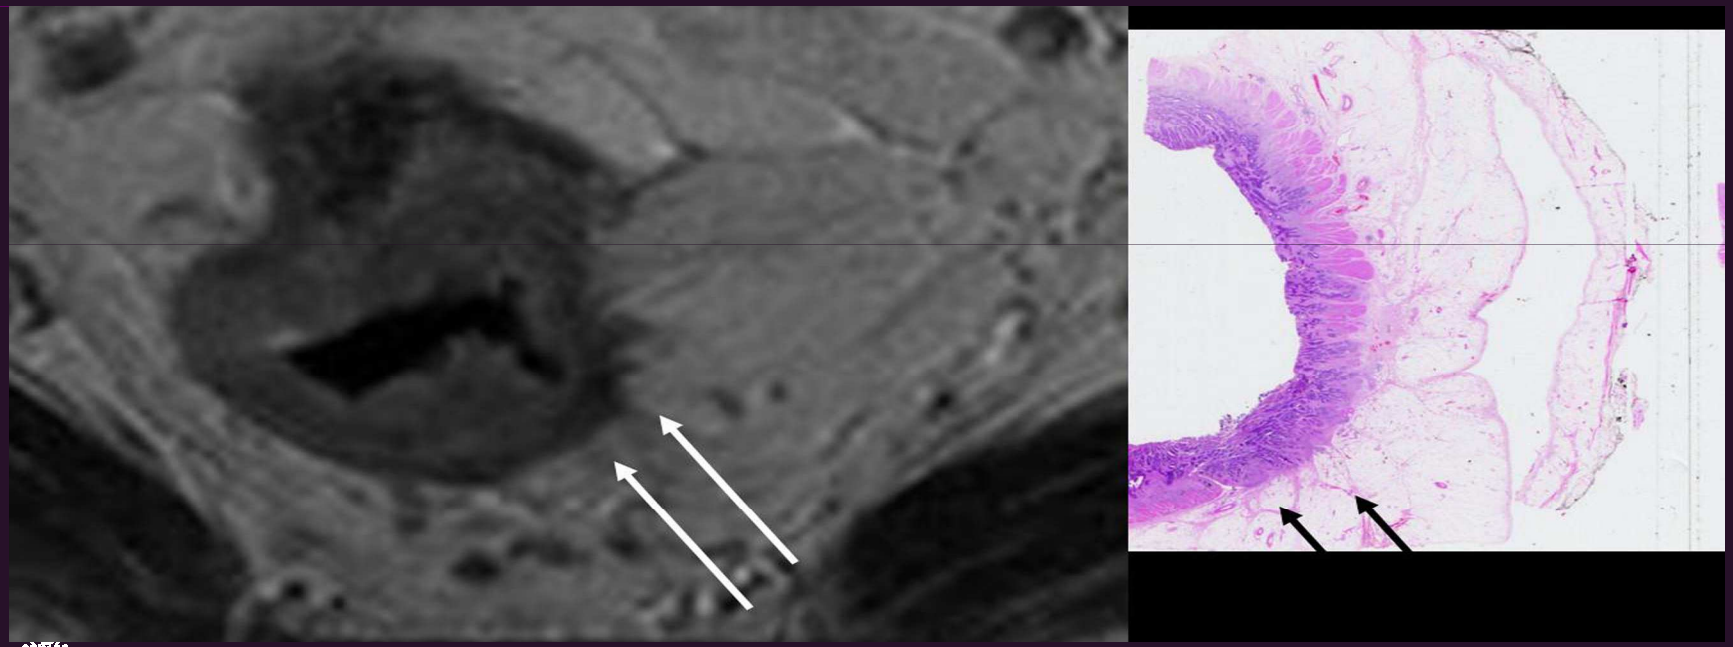
“measuring depth is the least subjective and most reliable of all the observations by a radiologist”

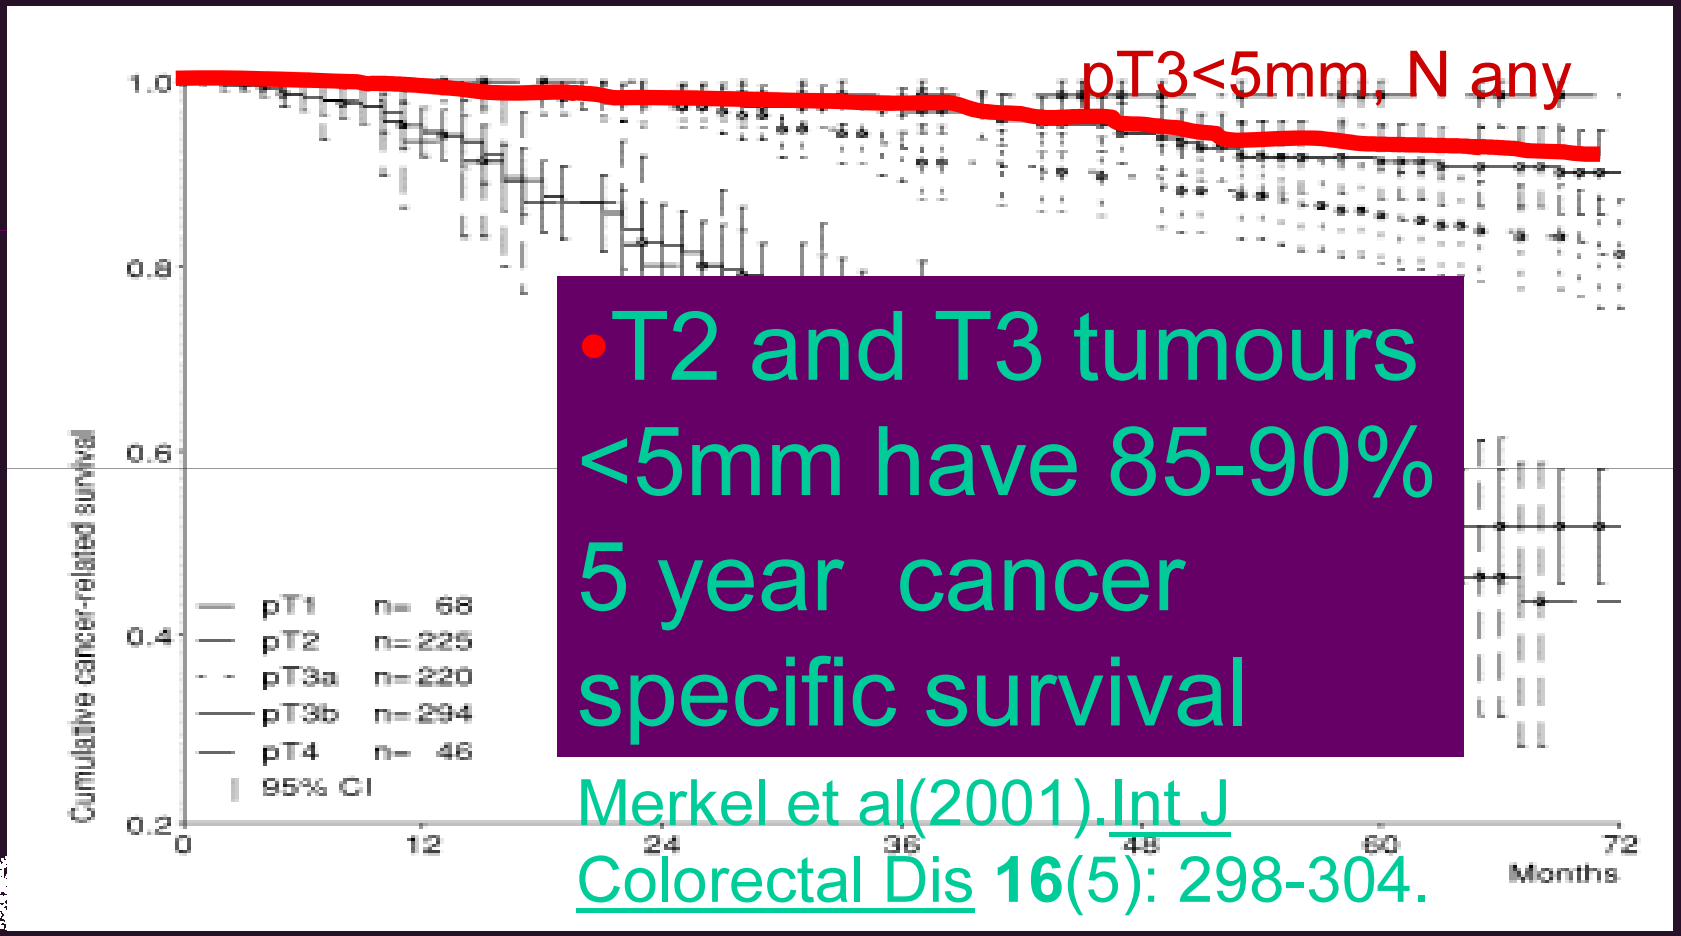




295/311 (95 %) patients who underwent primary surgery.
The mean difference between MRI and histopathology assessment of tumor EMD was -0.046 mm, SD = 3.85 mm, the 95 % CI was -0.487 to 0.395 mm.
MRI and histopathology assessment of tumor spread are considered equivalent to within 0.5 mm (θR). ***Radiology 2007***

Does it matter if this tumour is T3a or T2? Prognosis is identical…





- T2 and T3 tumours <5mm have 85-90% 5 year cancer specific survival

Merkel et al(2001).Int J Colorectal Dis **16**(5): 298-304.

NHS

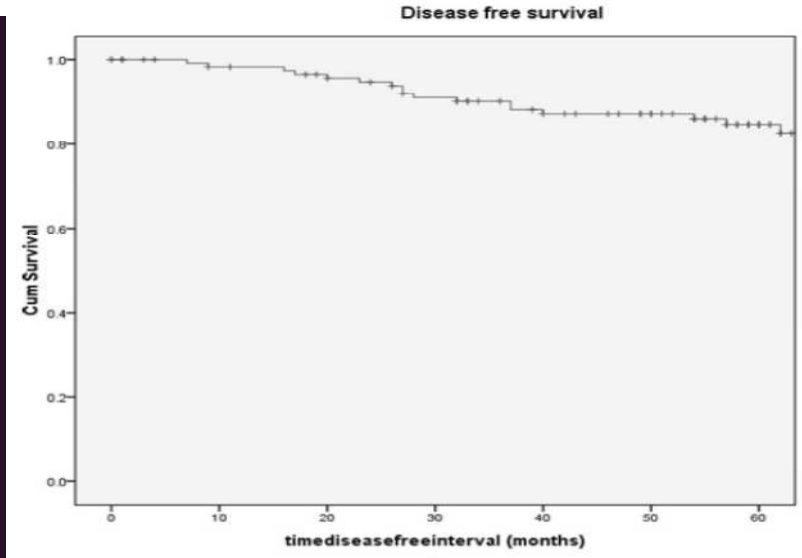
MERCURY trial

- 2002-2003
- 11 international centres (30 radiologists)
- 295 patients undergoing primary surgery
- Policy to avoid radiotherapy for mrCRM clear, mrEMVI negative, T3b or less rectal cancers, regardless of N stage

NHS

Outcomes for MRI good prognosis rectal cancers: regardless of N stage

MERCURY—MRI-predicted Good Prognosis Patients	Local Recurrence
Total patients (n = 122)	3.3%
T3a/b N0, N1, and N2 (n = 58)	1.7%
T1,2, or, 3b, N positive disease (n = 22)	0%



5-Year Disease-free Survival
84.7% (95% CI, 76.0%–90.4%)
81% (95% CI, 66.1%–89.8%)
95% (95% CI, 69.5%–99.3%)

Taylor et al, MERCURY
Annals of Surgery 2011

MERCURY experience
MRI “good prognosis tumours”

TABLE 3. Outcomes for MRI-predicted Good Prognosis Patients and Effect of Univariate and Multivariate Analysis Local Recurrence, 5-year Overall Survival and Disease-free Survival

MERCURY—MRI-predicted Good Prognosis Patients	Local Recurrence	5-Year Overall Survival	5-Year Disease-free Survival
Total patients (n = 122)	3.3%	68.2% (95% CI, 60.3%–7.0%)	84.7% (95% CI, 76.0%–90.4%)
T3a/b N0, N1, and N2 (n = 58)	1.7%	67.9% (95% CI, 53.9%–78.5%)	81% (95% CI, 66.1%–89.8%)
T1,2, or, 3b, N positive disease (n = 22)	0%	81% (95% CI, 48.7%–78.2%)	95% (95% CI, 69.5%–99.3%) .

If a radiologists calls all patients with <5mm spread node negative, the pre-test probability for the node negative status to be correct is 82%, the risk of local recurrence for patients with path node positive in patients mrTR3b or less, mrCRM clear and EMVI negative is 0% . For the whole MRI “good prognosis” group – risk is 3.3%

Therefore overcalling nodes in patients with low risk features results in overtreatment and more harm than benefit.

The Royal Marsden

What is the risk of local recurrence for node positive vs negative if CRM is clear

- For a good quality TME CRM-ve – no difference – CR07 5-6% LR (Quirke et al Lancet Oncology) rates irrespective of node status
- OCUM trial follow up data...

NHS

Canadian “Quicksilver Trial”

- Prospective trial testing avoidance of CRT in MRI defined good risk tumours
  - T3b or less N stage any
  - EMVI negative
  - CRM and low rectal plane safe

The Royal Marsden

Questions to think about regarding mrEMVI

1. MRI does not always agree histopathology at detecting vascular invasion by tumour especially after CRT
2. MRI detected EMVI is a stronger predictor for distant metastatic disease and pelvic recurrence than MRI assessment of nodal involvement
3. Is more prevalent than nodal metastatic disease in patients with rectal cancer

NHS

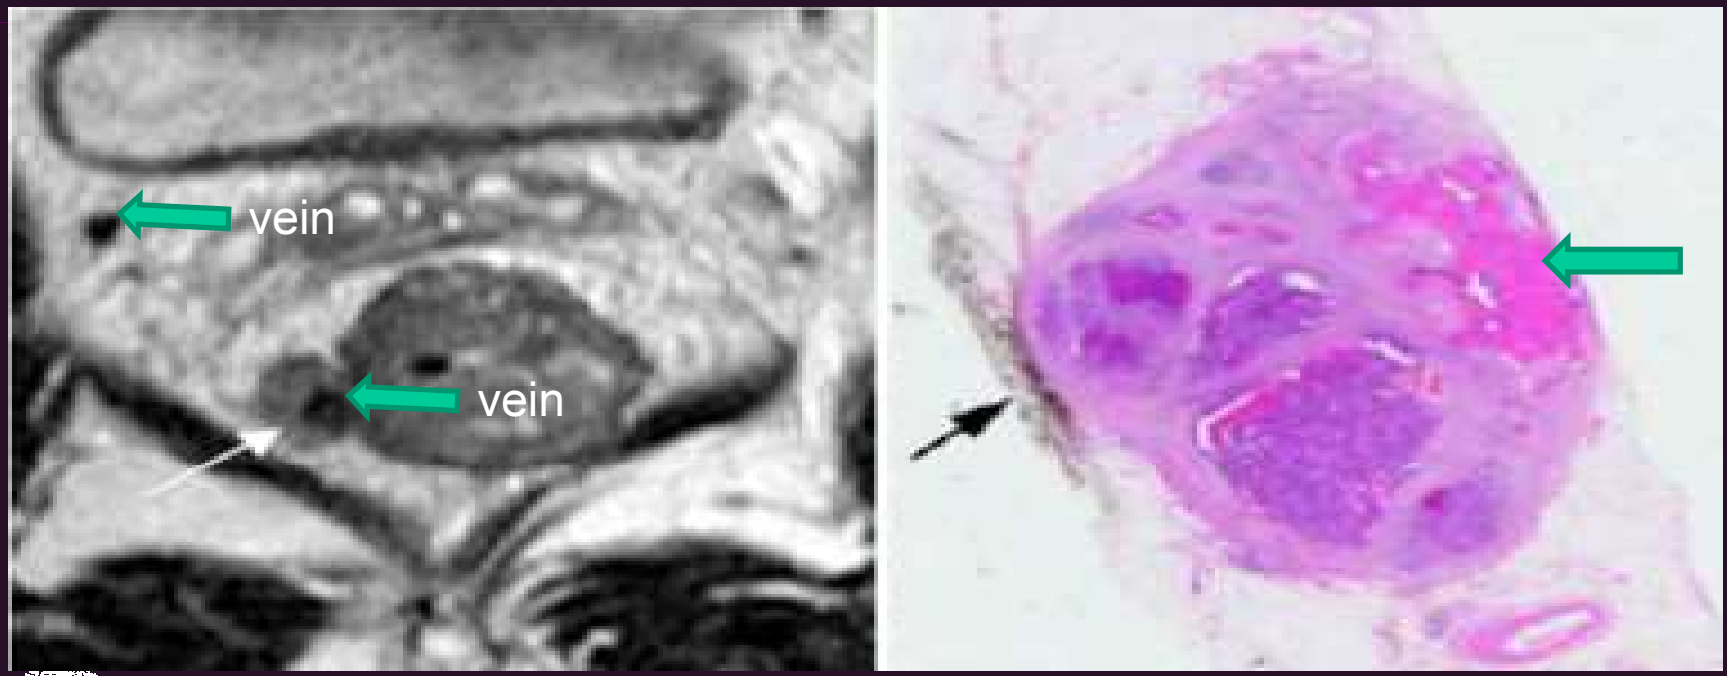
The Royal Marsden

When is a node not a node?



Detection of venous invasion

- The search for vessel invasion as recommended by Brown and Warren.
- At least three sections of the tumor were taken in each case and stained with Masson's aniline blue trichromestain to emphasize the smooth muscle wall of the small veins.

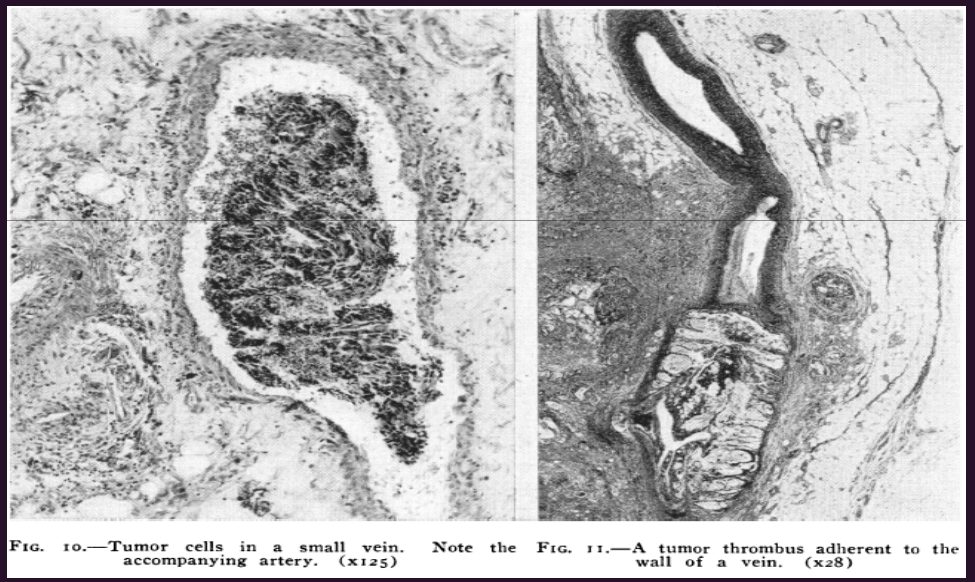


FIG. 10.—Tumor cells in a small vein. Note the accompanying artery. (x125)

FIG. 11.—A tumor thrombus adherent to the wall of a vein. (x28)

Vascular Invasion

- Brown and Warren Surg Obstet Gynaecol1938
- 170 rectal cancer post mortem examinations majority palliative colostomy/ no surgery/ immediate postoperative death.
- histological evidence of tumour invasion of veins in 61% of 165 rectal adenocarcinomas
- 67 of the 100 patients with venous invasion were found to have visceral metastases, mostly liver.
- Only one case of metastasis in the absence of any vascular invasion was found

Venous invasion important

"as far as the prediction of visceral metastases in rectal carcinoma from the local growth and nodes is concerned, the presence of intravascular tumour means as much from the prognostic standpoint as neoplastic nodes, and their absence means much more"

Brown and Warren 1938

THE LYMPHATIC AND VENOUS SPREAD OF CARCINOMA OF THE RECTUM*

ROBERT S. GRINNELL, M.D.

NEW YORK, N. Y.

FROM THE DEPARTMENT OF SURGERY, PRESBYTERIAN HOSPITAL, AND THE SURGICAL PATHOLOGY LABORATORY COLLEGE OF PHYSICIANS AND SURGEONS, COLUMBIA UNIVERSITY, NEW YORK, N. Y.

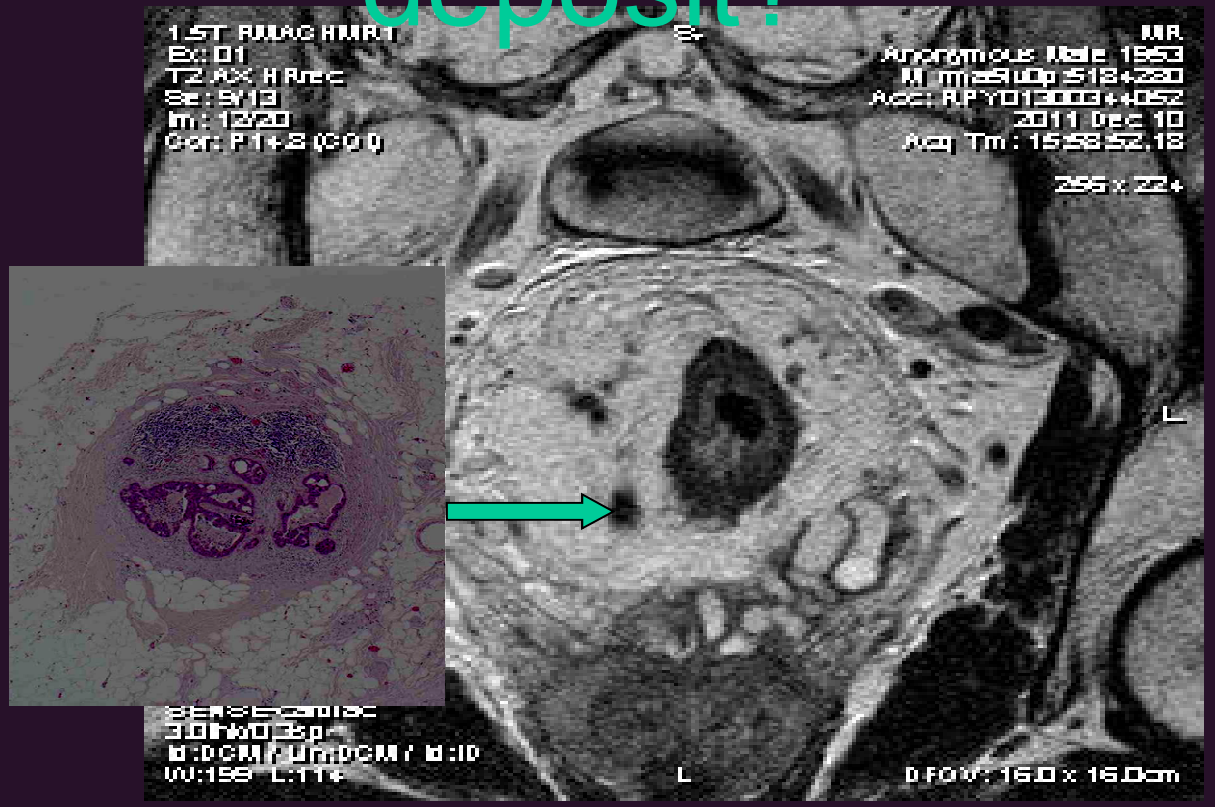
AN UNDERSTANDING of the spread of carcinoma of the rectum is essential for the treatment of the disease. Four main routes are possible: (1) By direct extension; (2) by the lymphatics; (3) by the blood stream; and (4) by transplantation through the peritoneal cavity. The second and third routes of spread are the subjects of this report.

The Royal Marsden

Is this is a venous deposit or a Lymph node?

The Royal Marsden

Lymph node or venous deposit?

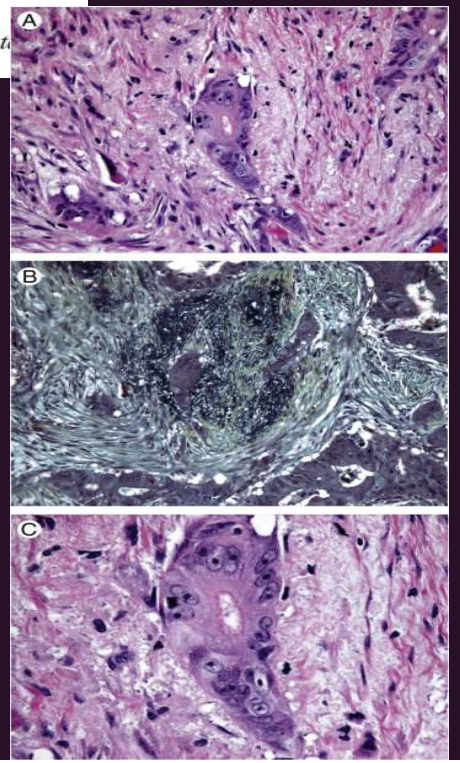


Developments in the assessment of venous invasion in colorectal cancer: implications for future practice and patient outcome

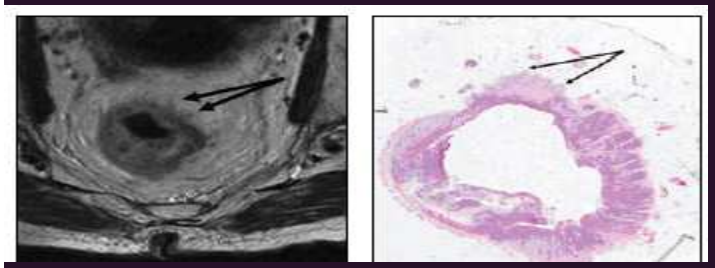
David E. Messenger MBChB[a], David K. Driman MBChB[b,*], Richard Kirsch MBChB, PhD[c]

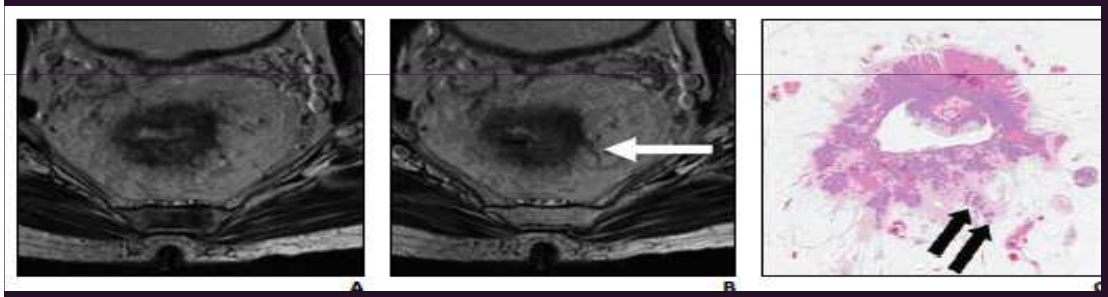
[a]Division of General Surgery, Royal United Hospital NHS Trust, Bath, BA1 3NG, UK
[b]Department of Pathology, London Health Sciences Centre and University of Western Ontario, London, Ontario, Canada N6A 5A5
[c]Departments of Pathology and Laboratory Medicine, Mount Sinai Hospital and University of Toronto, Toronto, Ont Canada M5G 1X5

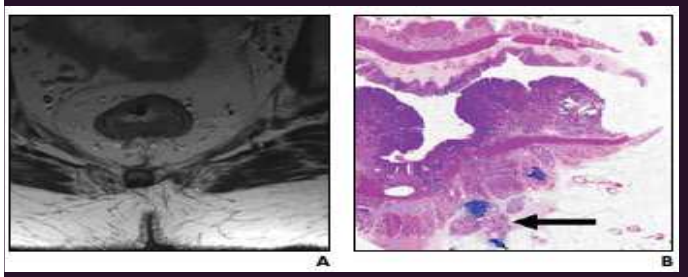
- Poor interobserver agreement for EMVI
- Large variations in reporting rates 10% -50% - underreporting widespread
- Lack of agreement of definitions



Characteristic features of EMVI







- Expansion of extramural vessels by tumour
- Serpiginous / tubular extension of tumour signal

MRI for detection of extramural vascular invasion in rectal cancer.
AJR Am J Roentgenol **191**(5): 1517-1522.

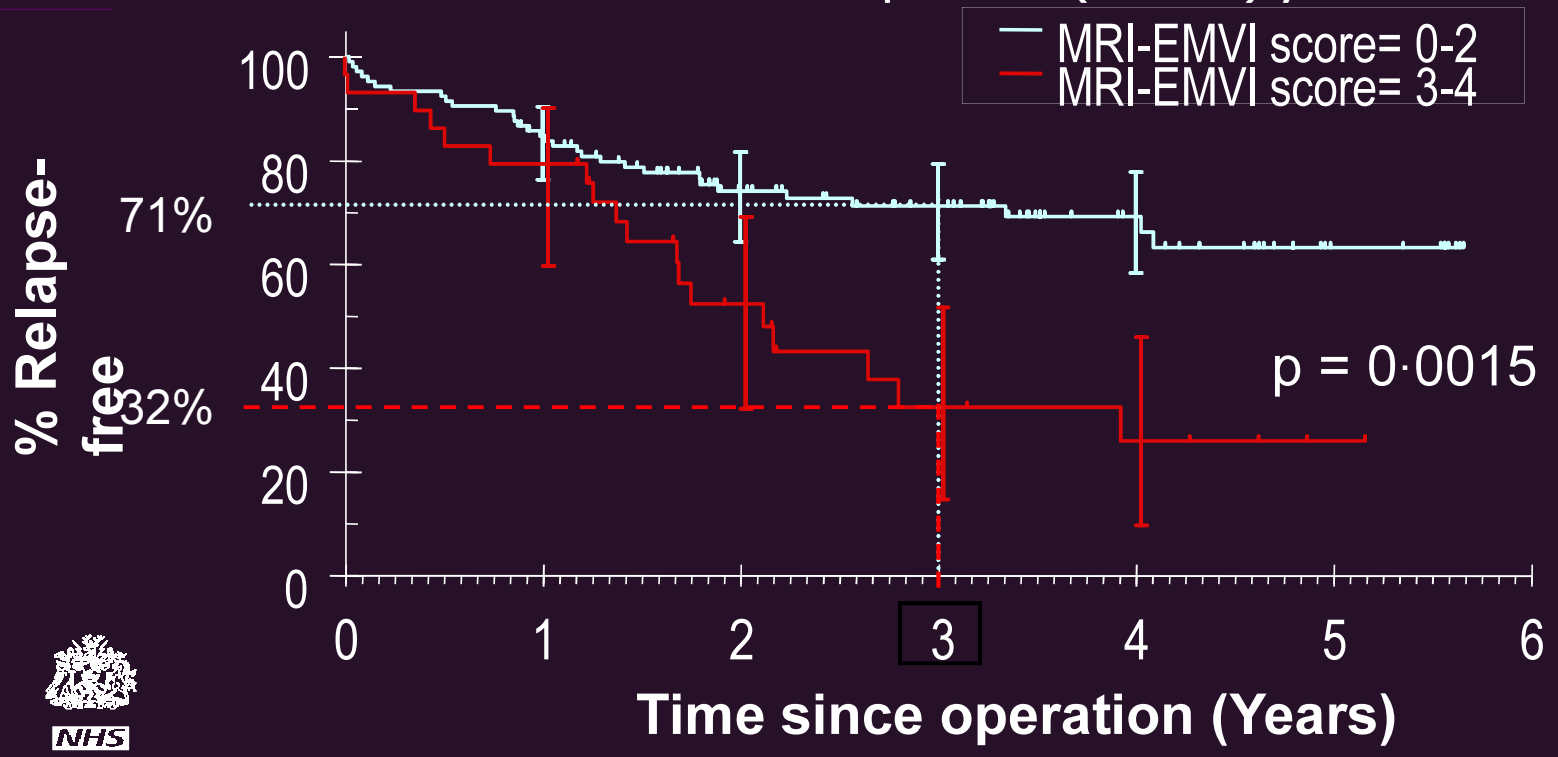
Vascular invasion is an independent risk factor for CRM invovlement

Smith et al. "Prognostic significance of MRI-detected Extramural Vascular Invasion." BJS. 2008

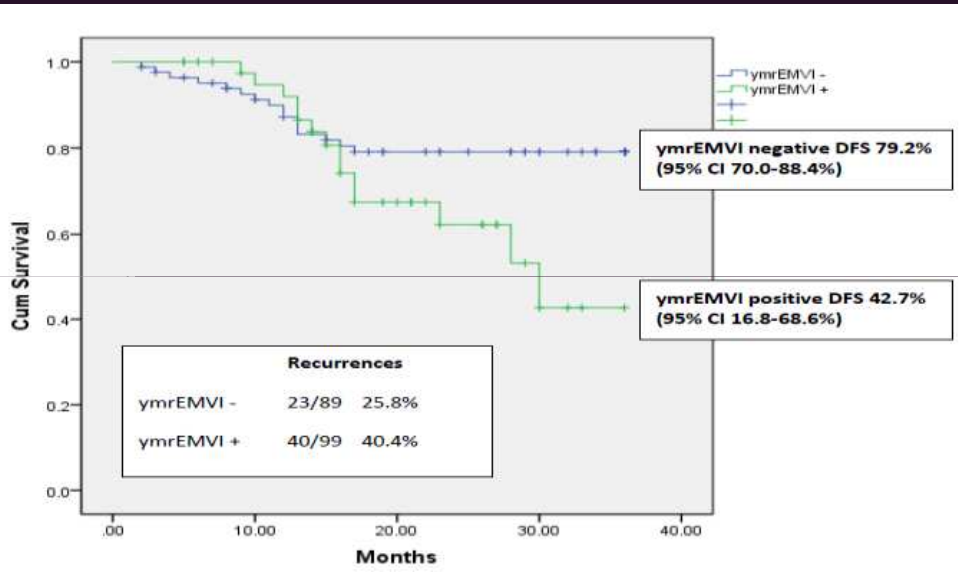
MRI-EMVI score & Outcome

n=135. Median follow-up=3·12 (0·9-5·7) years.



MRI detected more persistent EMVI post CRT than pathology

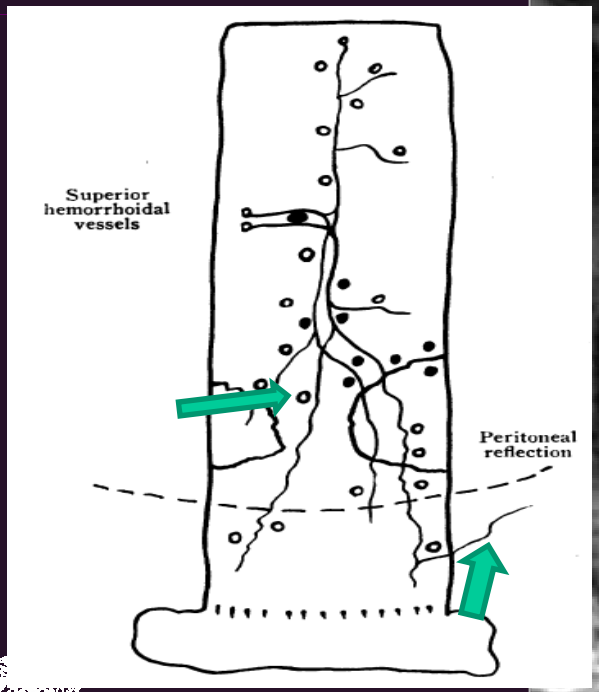
Group	Local/distant Recurrence		p-v
ypEMVI -	34/142	23.9%	
ypEMVI +	20/46	43.5%	<0.05
ymrEMVI -	23/89	25.8%	
ymrEMVI +	40/99	40.4%	<0.05

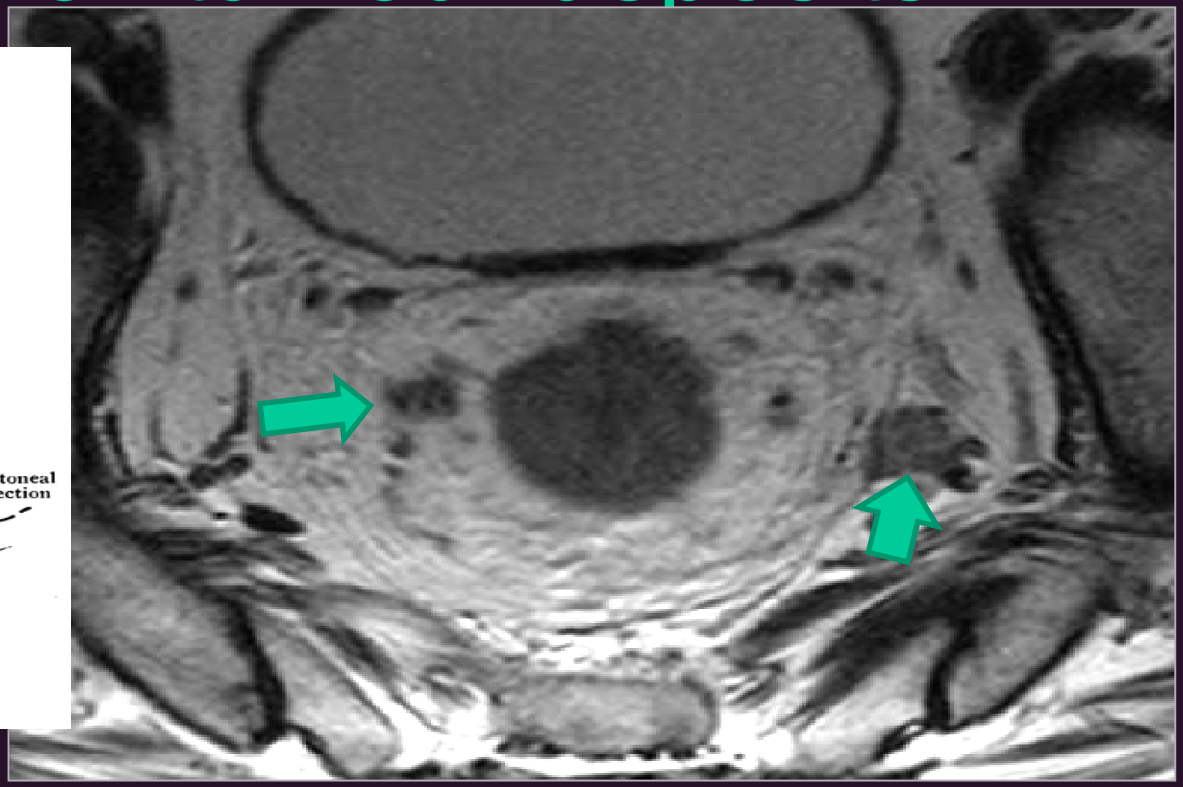


Chand M, Evans J, Swift RI, et al. Prognostic Significance of Postchemoradiotherapy High-Resolution MRI and Histopathology Detected Extramural Venous Invasion in Rectal Cancer. Ann Surg. 2014.

The Royal Marsden

mrEMVI is associated with pelvic sidewall tumour deposits





NHS

Preoperative risk factors associated with MRI PSW nodes

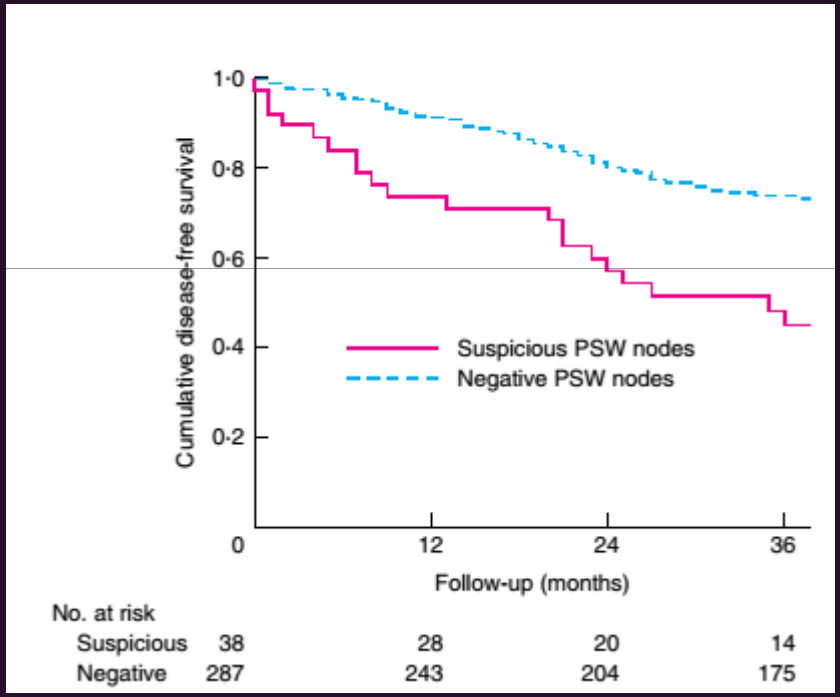
	Odds ratio	*P*
Preop. staging and treatment		
mrN	3·64 (1·67, 7·94)	0·032
mrEMVI	2·48 (1·08, 5·69)	0·001
mrCRM+	0·85 (0·33, 2·17)	0·738
mrT	1·14 (0·64, 2·01)	0·663
Neoadjuvant treatment	1·72 (0·77, 3·86)	0·190

What is the relevance of MRI detected PSW nodes?

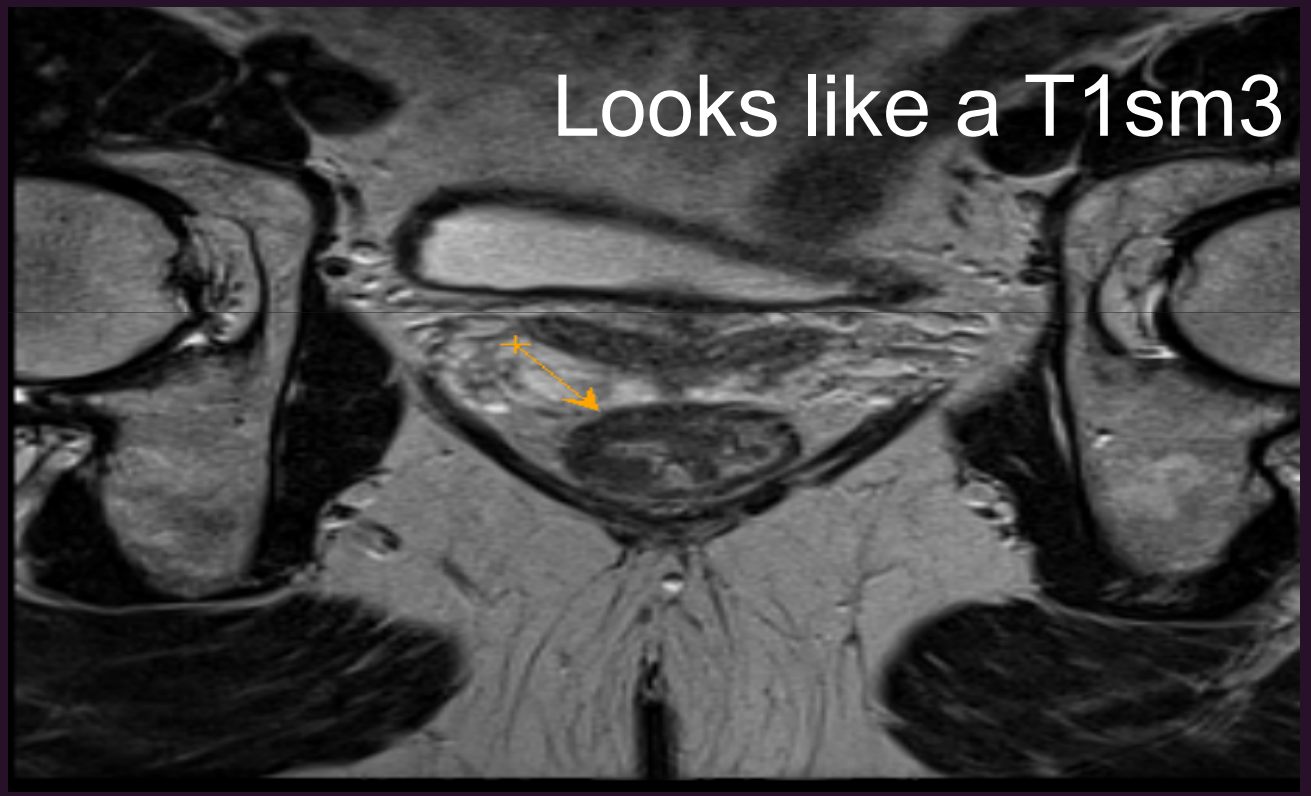
- 325 patients, 38 (11.7%) had MRI-identified suspicious PSW nodes on baseline MRI scans
- The size of pelvic nodes was not a factor
- PSW nodes with either mixed signal or capsular irregularity were considered to have a high suspicion of malignancy, whereas those with neither feature were considered negative for malignancy – irrespective of size

Outcomes for PSW

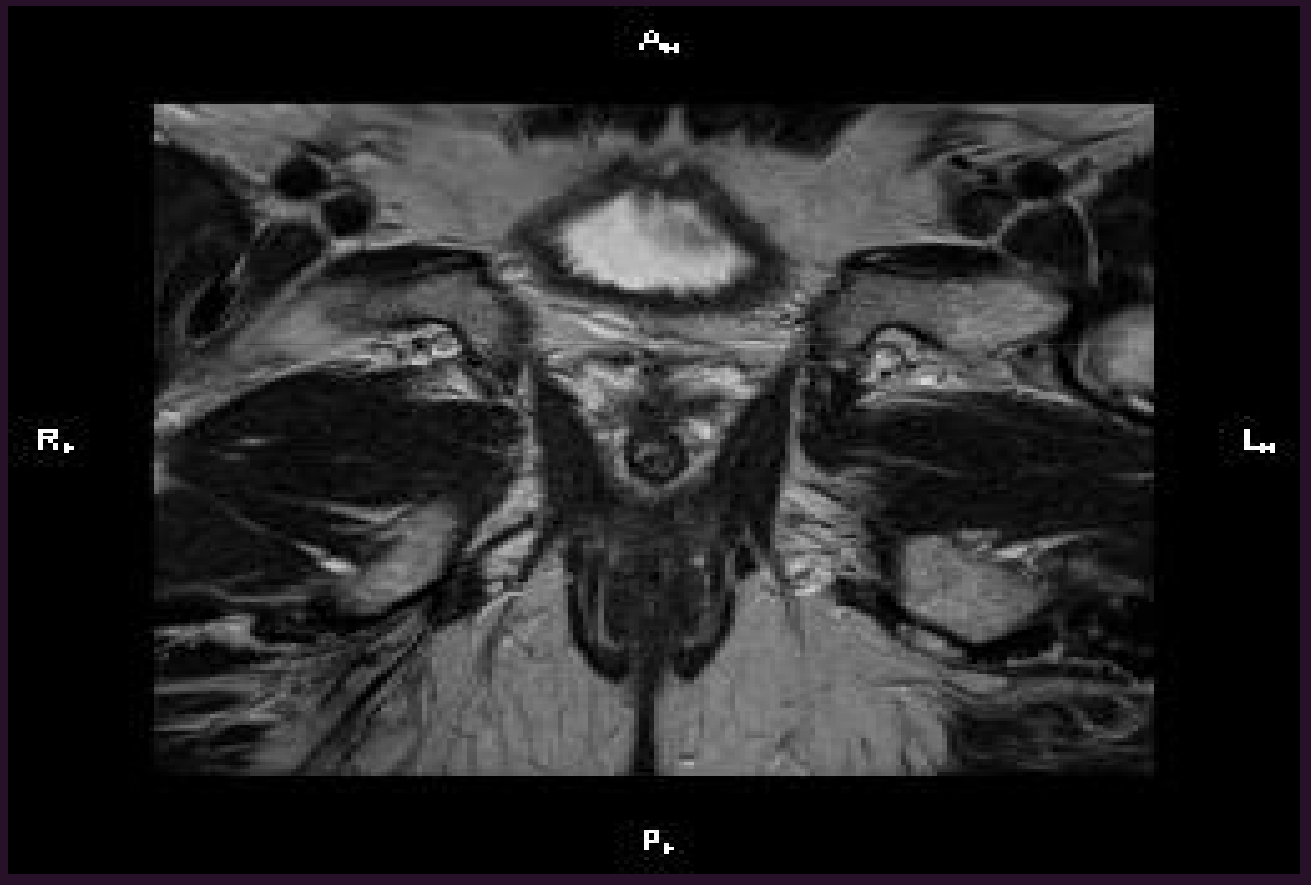
- 5-year DFS of patients with suspicious PSW nodes on MRI was significantly worse than that of patients without suspicious nodes: 42% versus 70·7% (P<0·001).



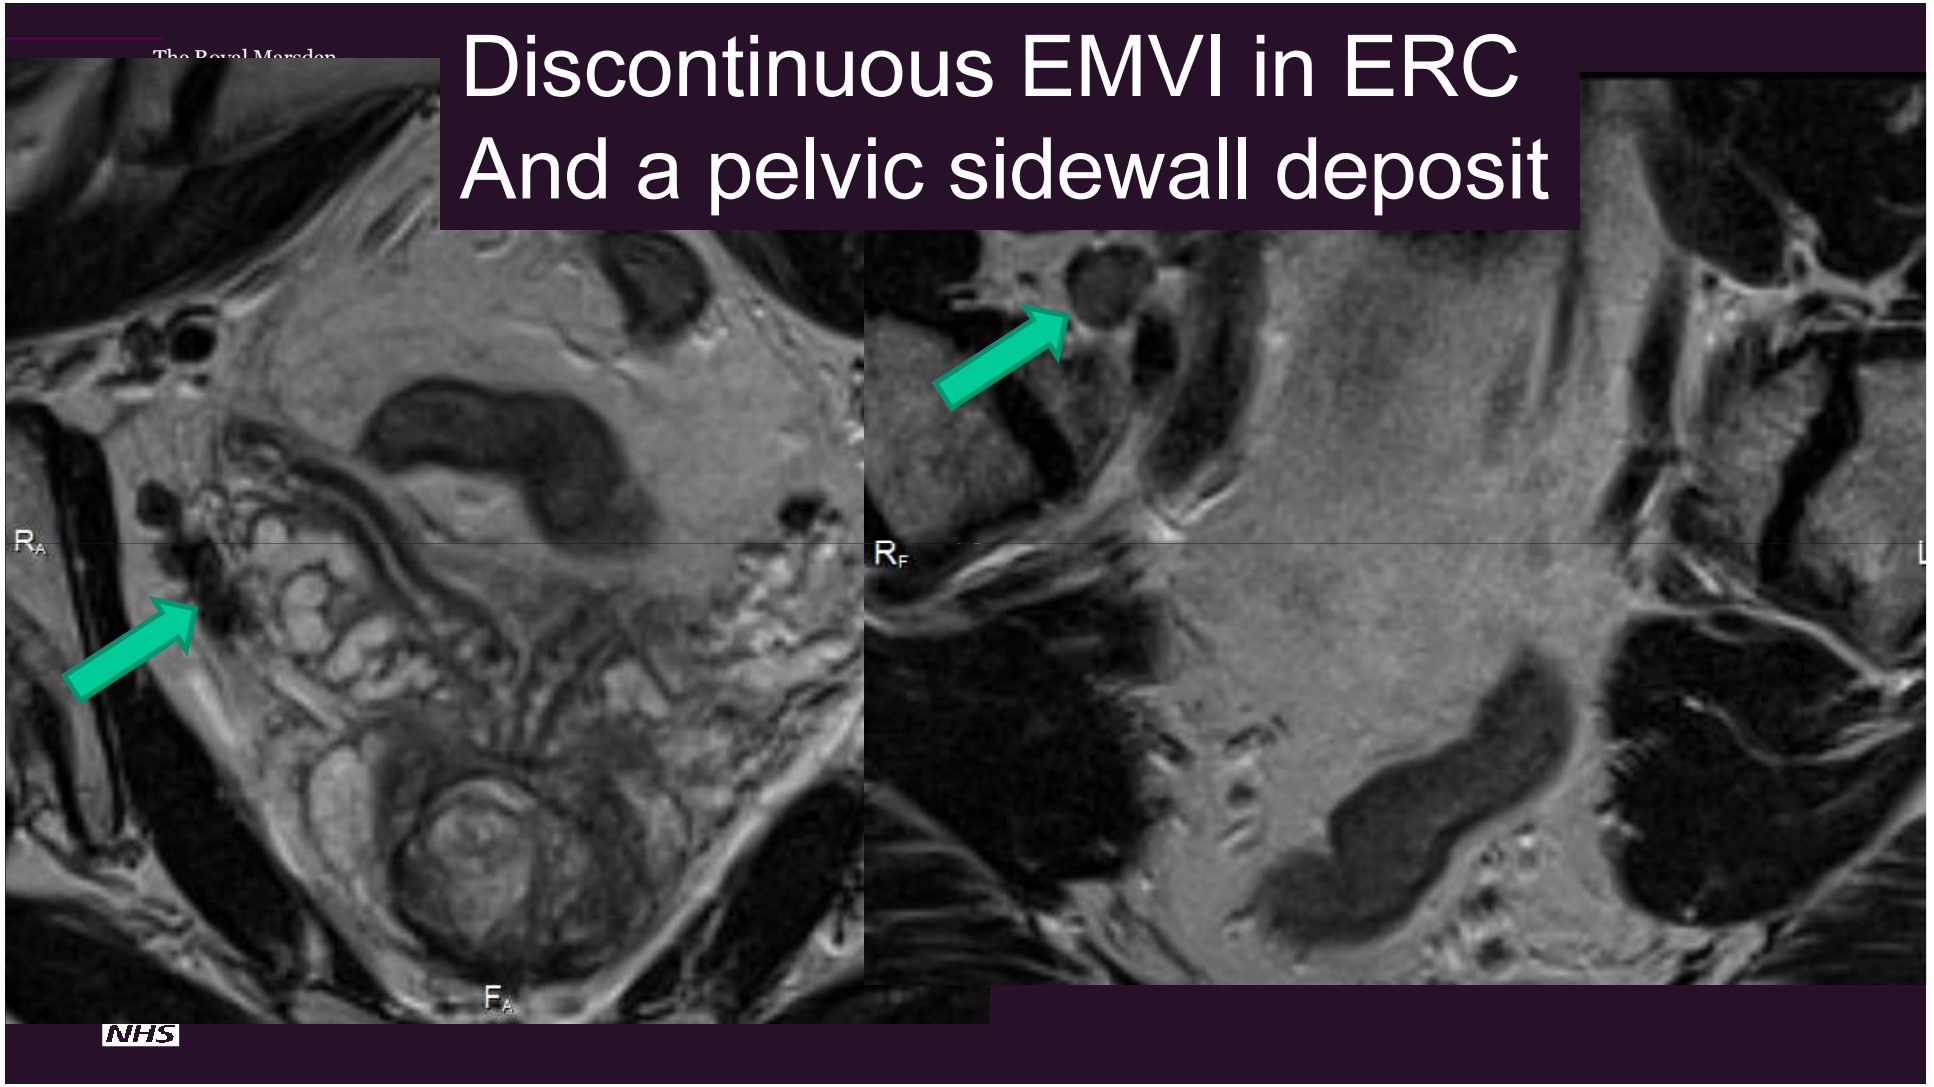
A good prognosis tumour?

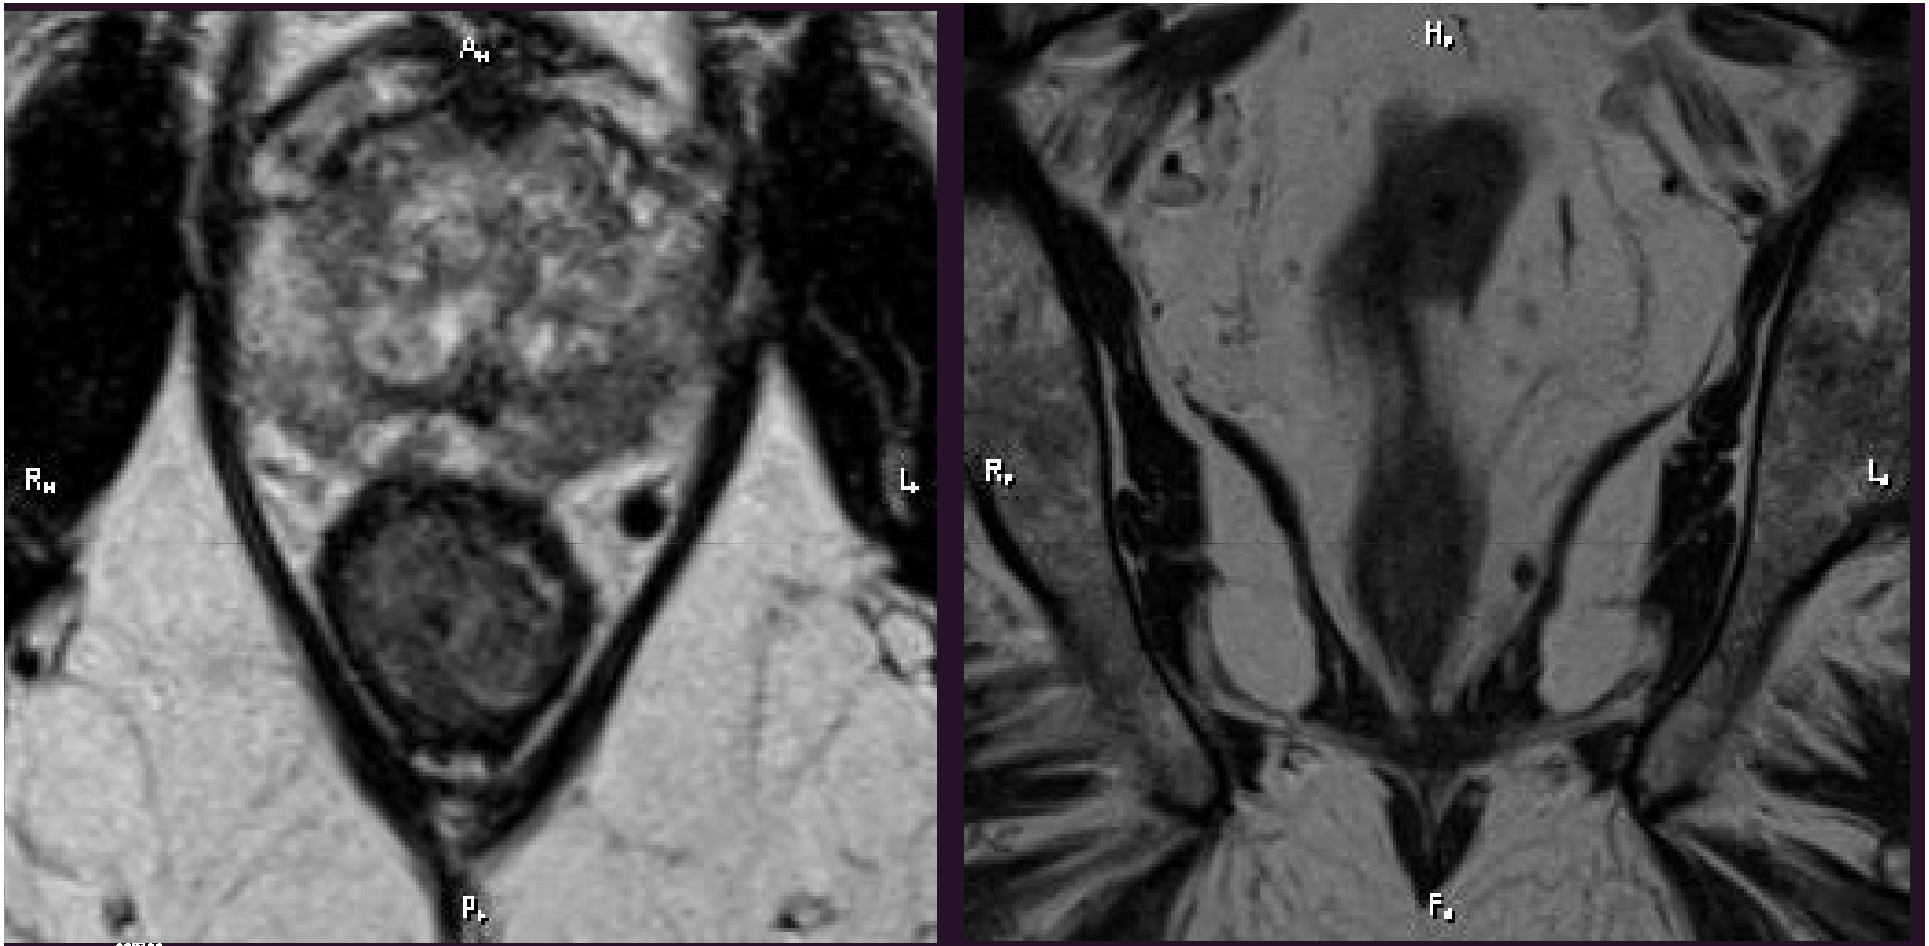


Discontinuous EMVI in low rectal cancer



Discontinuous EMVI in ERC
And a pelvic sidewall deposit

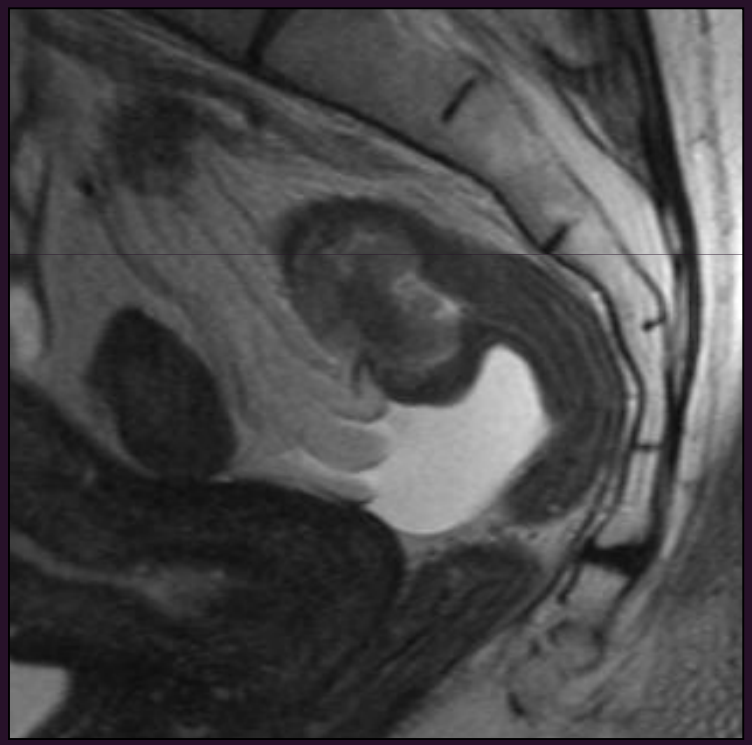




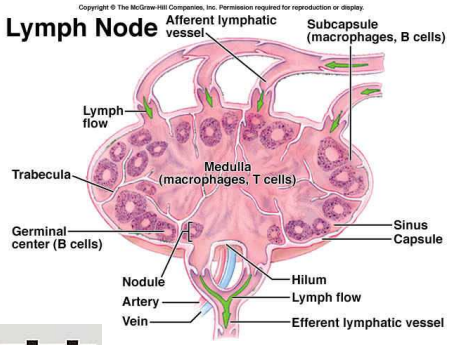
Discontinuous extramural venous spread – a poor prognostic factor

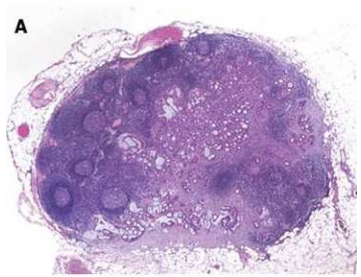
mrEMVI

- mrEMVI seen in 40% of rectal cancers
- Detected more readily than by pathology
- Independent risk factor for CRM involvement, local and distant recurrence

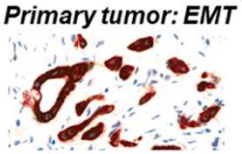


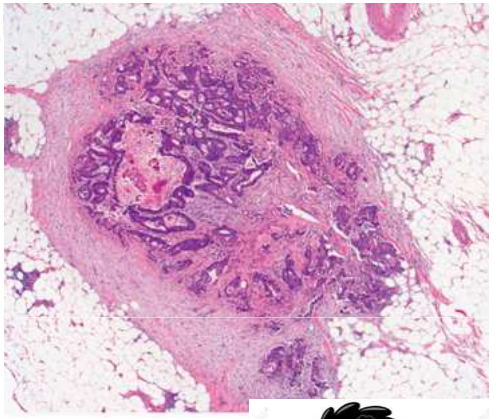
Lymph nodes versus extranodal deposits



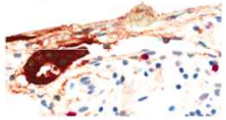


Tumor Budding

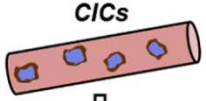




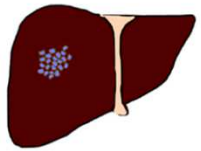
Angioinvasion

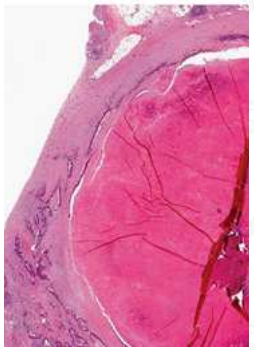


Systemic spread

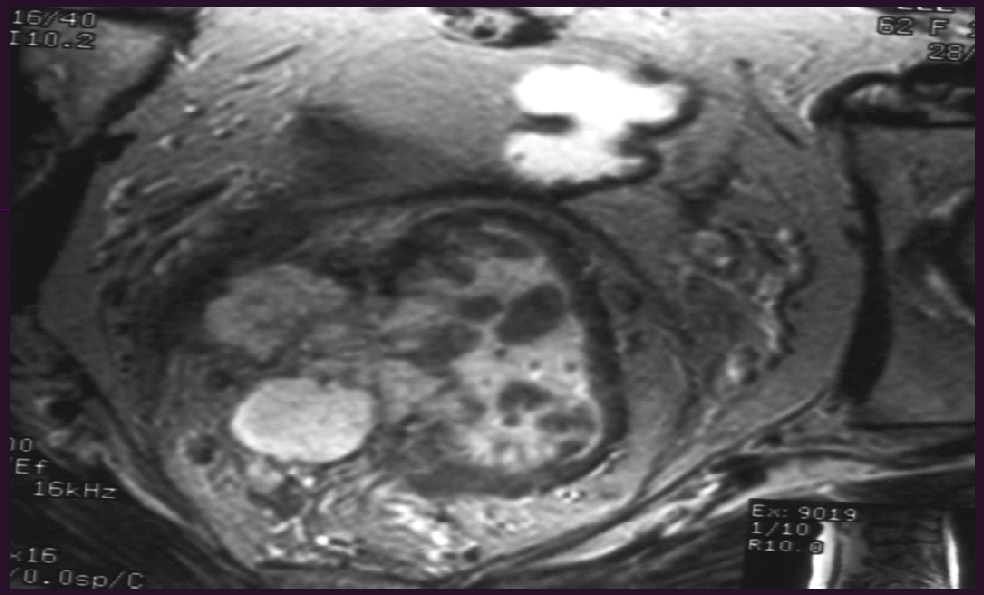


Distant metastasis





The Royal Marsden



Mucinous carcinoma

Poor prognosis

MRI more likely to diagnose mucinous subtype

- diagnostic odds ratio MRI vs biopsy = 4.67, $p < 0.05$.
- All 60 (100%) patients undergoing surgery for mrMucinous tumours were confirmed as such on final histopathology.

Yu SKT, Tait DM, Chand M, Brown G. Magnetic resonance imaging defined mucinous rectal carcinoma is an independent imaging biomarker for poor prognosis and poor response to preoperative chemoradiotherapy. European Journal of Cancer 2014

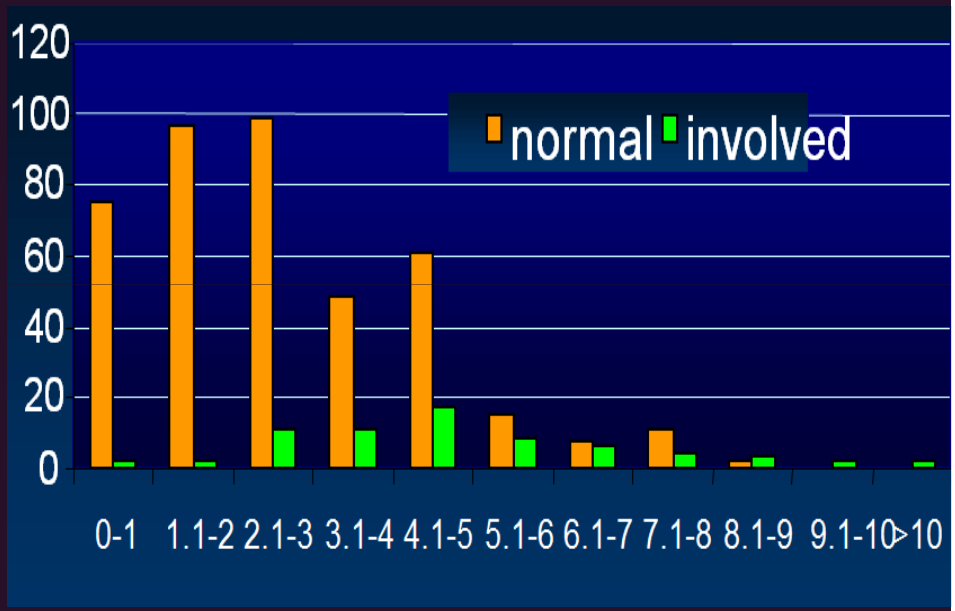
NHS

The Royal Marsden

Measuring size of nodes worsens results – overstaging and overtreatment of low risk patients

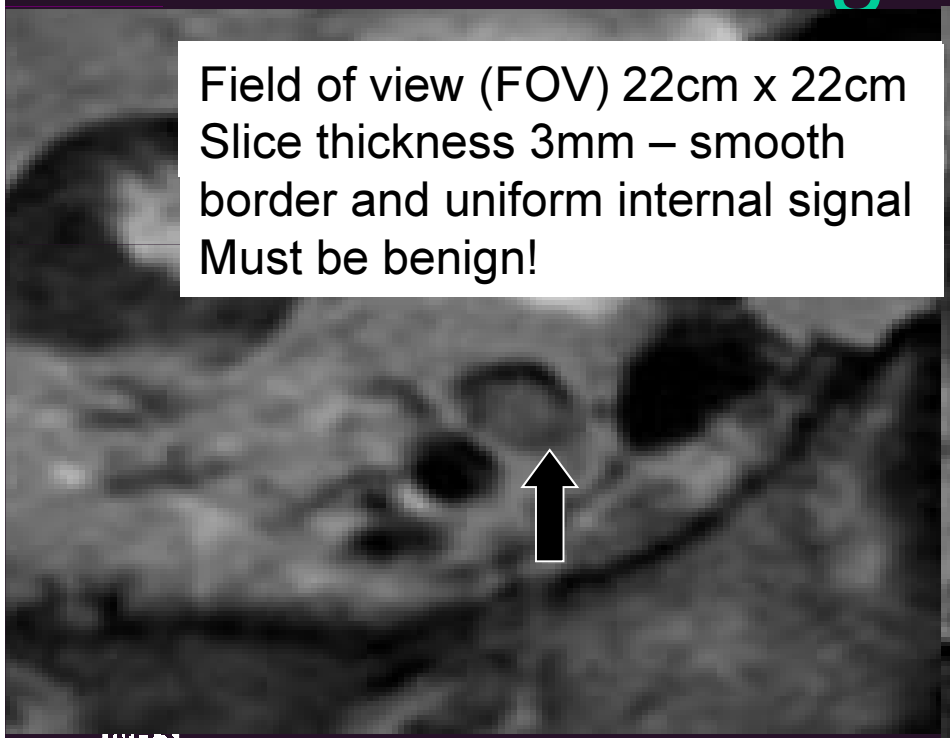
- node positive if either irregular border or mixed signal intensity.
- Metastases demonstrated in 51/56 nodes (91%, 95% CI 81% to 96%) with either an irregular border or a mixed intensity signal.
- only 9/225 nodes (4%, CI 2.1% to 7.4%) with smooth borders and a uniform signal contained metastases irrespective of size.
- Size of node bears no relationship to malignant risk

Brown et al Radiology 2003

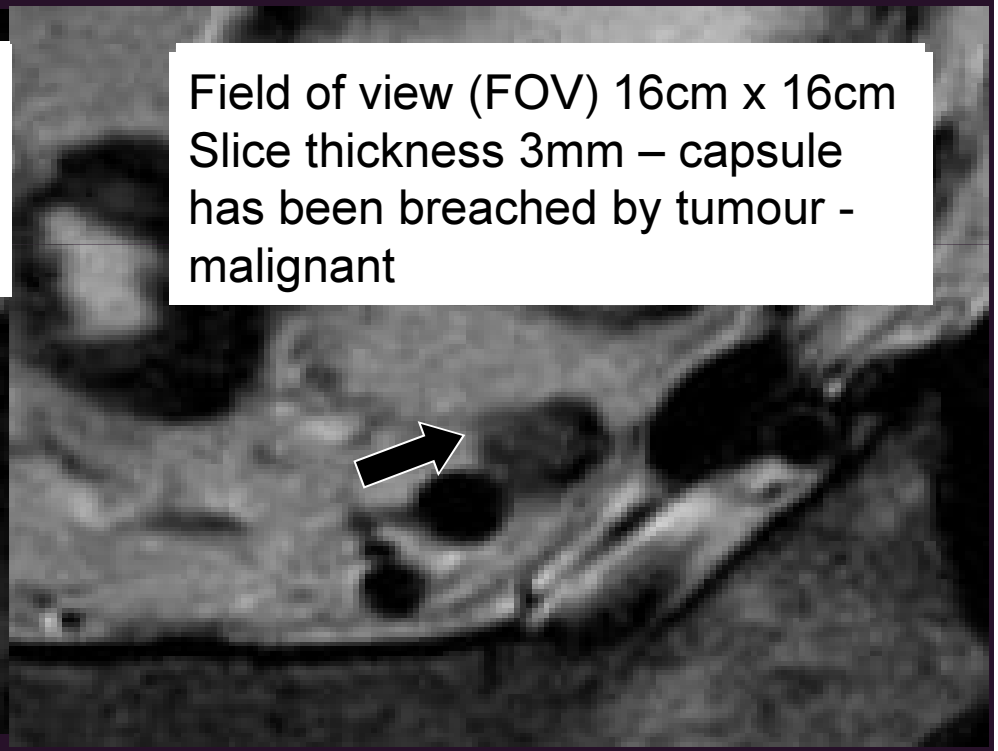


NHS

Is this a benign or malignant node?



Field of view (FOV) 22cm x 22cm
Slice thickness 3mm – smooth border and uniform internal signal
Must be benign!



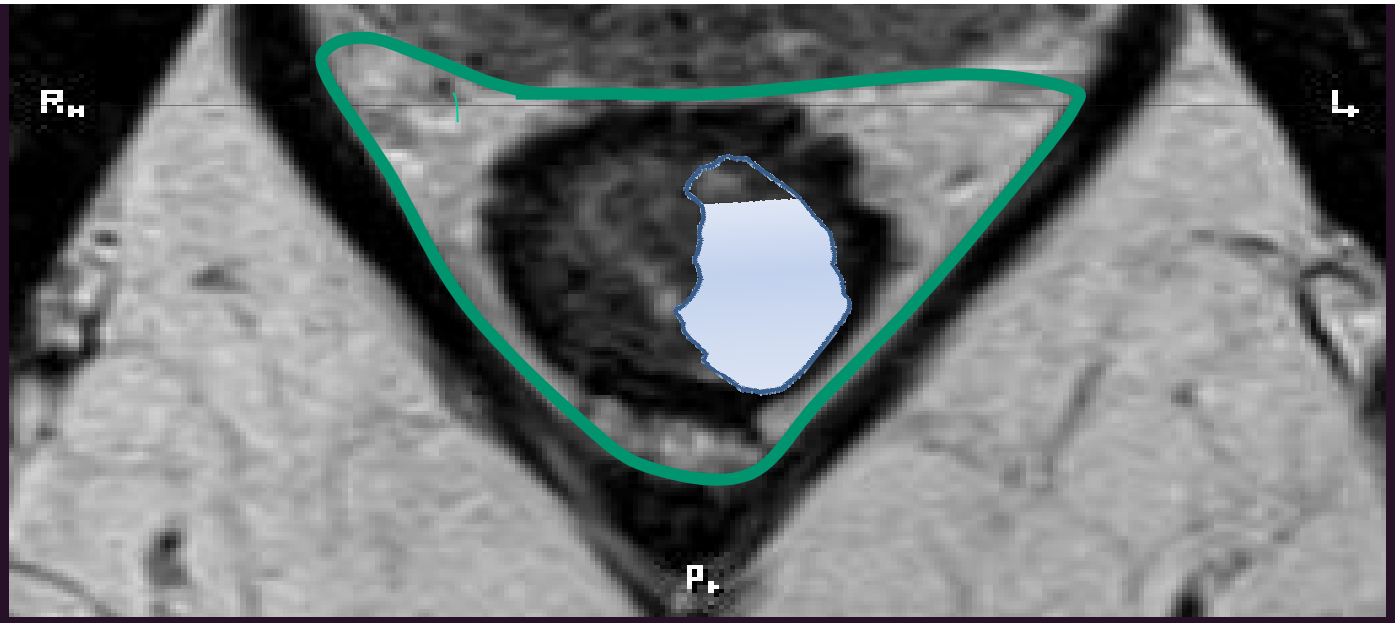
Field of view (FOV) 16cm x 16cm
Slice thickness 3mm – capsule has been breached by tumour - malignant

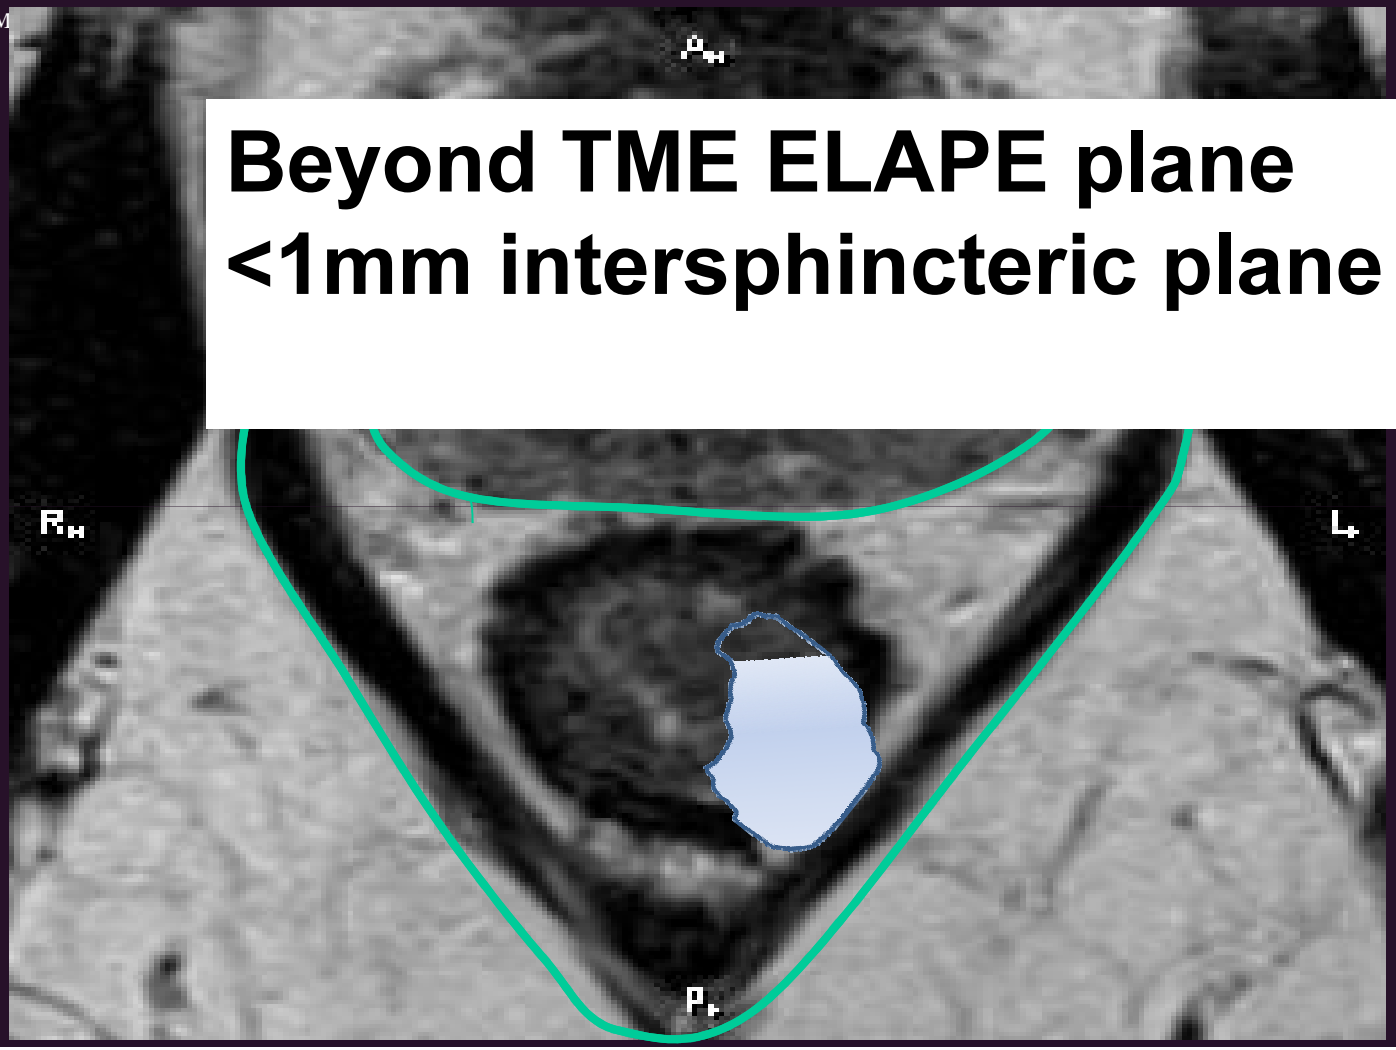
MRI detected **Lymph Nodes** close to the mesorectal fascia are not associated with pCRM involvement (Shihab et al, BJS 2010)

- Involvement of CRM by lymph node metastases alone is uncommon (1.3% of all patients in MERCURY series).
- Caution when recommending neoadjuvant therapy based solely on an MRI-detected lymph node close to the mesorectal fascia.

NHS

TME Mesorectal plane
For coloanal anastomosis/ intersphincteric
>1mm of intersphincteric plane clear



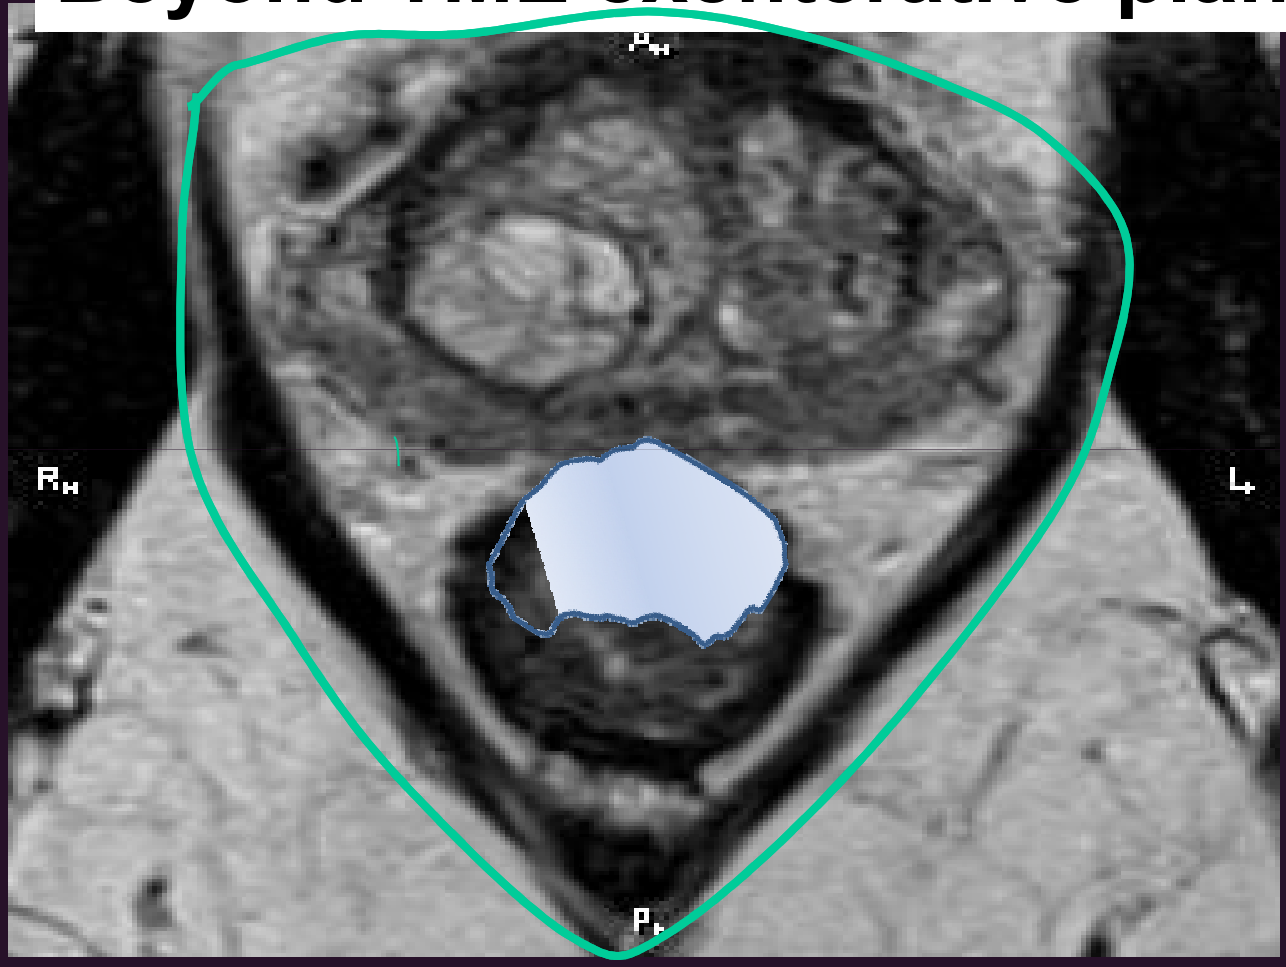


Beyond TME ELAPE plane
<1mm intersphincteric plane clear

NHS

The Royal Marsden

Beyond TME exenterative planes



The tumours that require preoperative therapy because of poor prognosis:

- TME plane CRM involvement
- Depth of extramural spread >5mm risk factor for poor DFS
- Presence of MRI detected venous invasion – risk factor for local and distant recurrence and seen more frequently than path EMVI
- MRI detected mucinous tumours
- MRI Nodal involvement in the absence of any of the above does not confer any significant additional risk of either local or distant relapse

Assessing response

Method	Prospectively validated against DFS outcomes
MRI DWI	No – many retrospective quantitative cut-offs and qualitative assessments – none prospectively validated
DCE-MRI	No – many retrospective values proposed – none validated
PET-CT	No – but retrospective SUV cut-offs proposed – unverified prospectively
mrVolume assessment	Yes: >80% volume reduction
mrTRG	Yes : TRG1-5 validated prospectively and against outcomes
mrT and mrN stage	validated prospectively and against outcomes

The Royal Marsden

The Royal Marsden

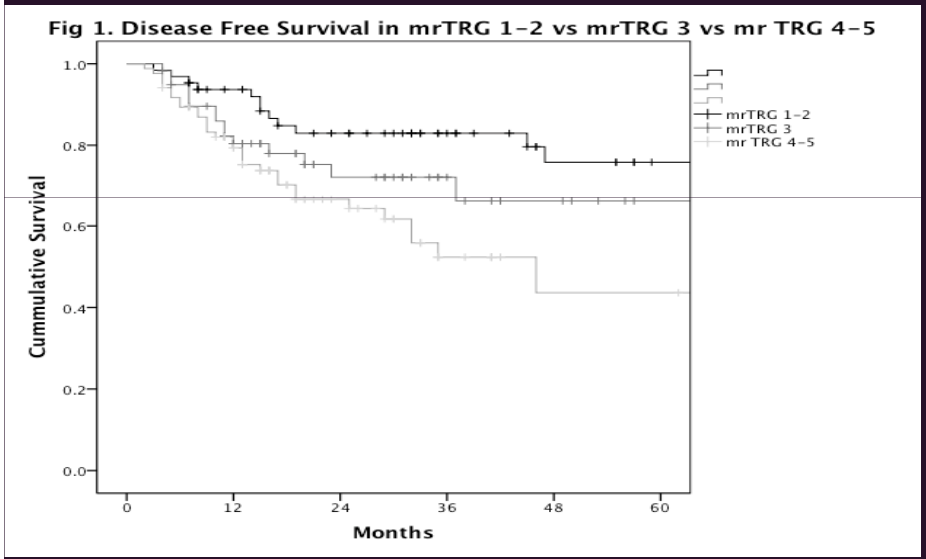
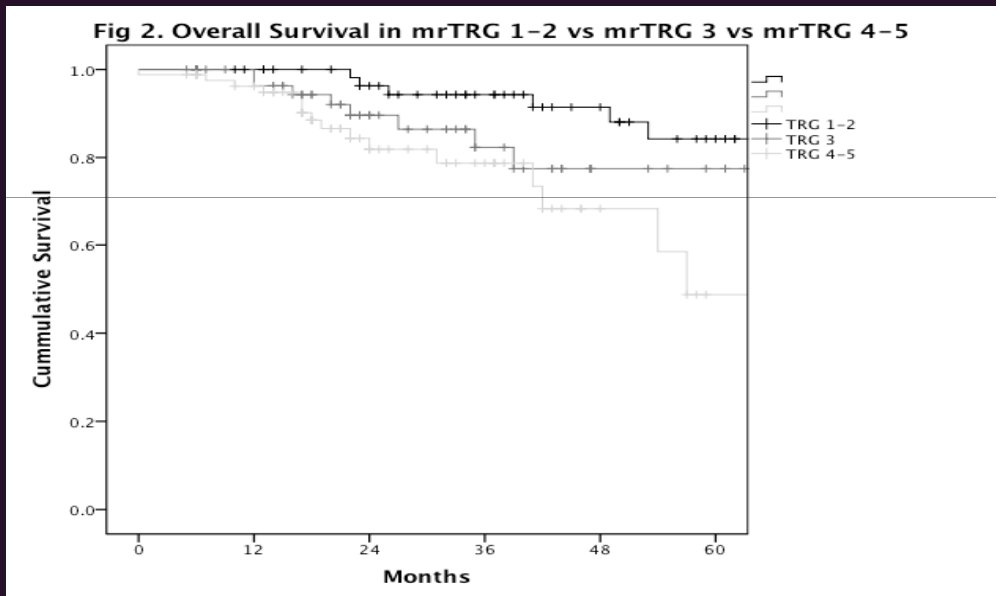
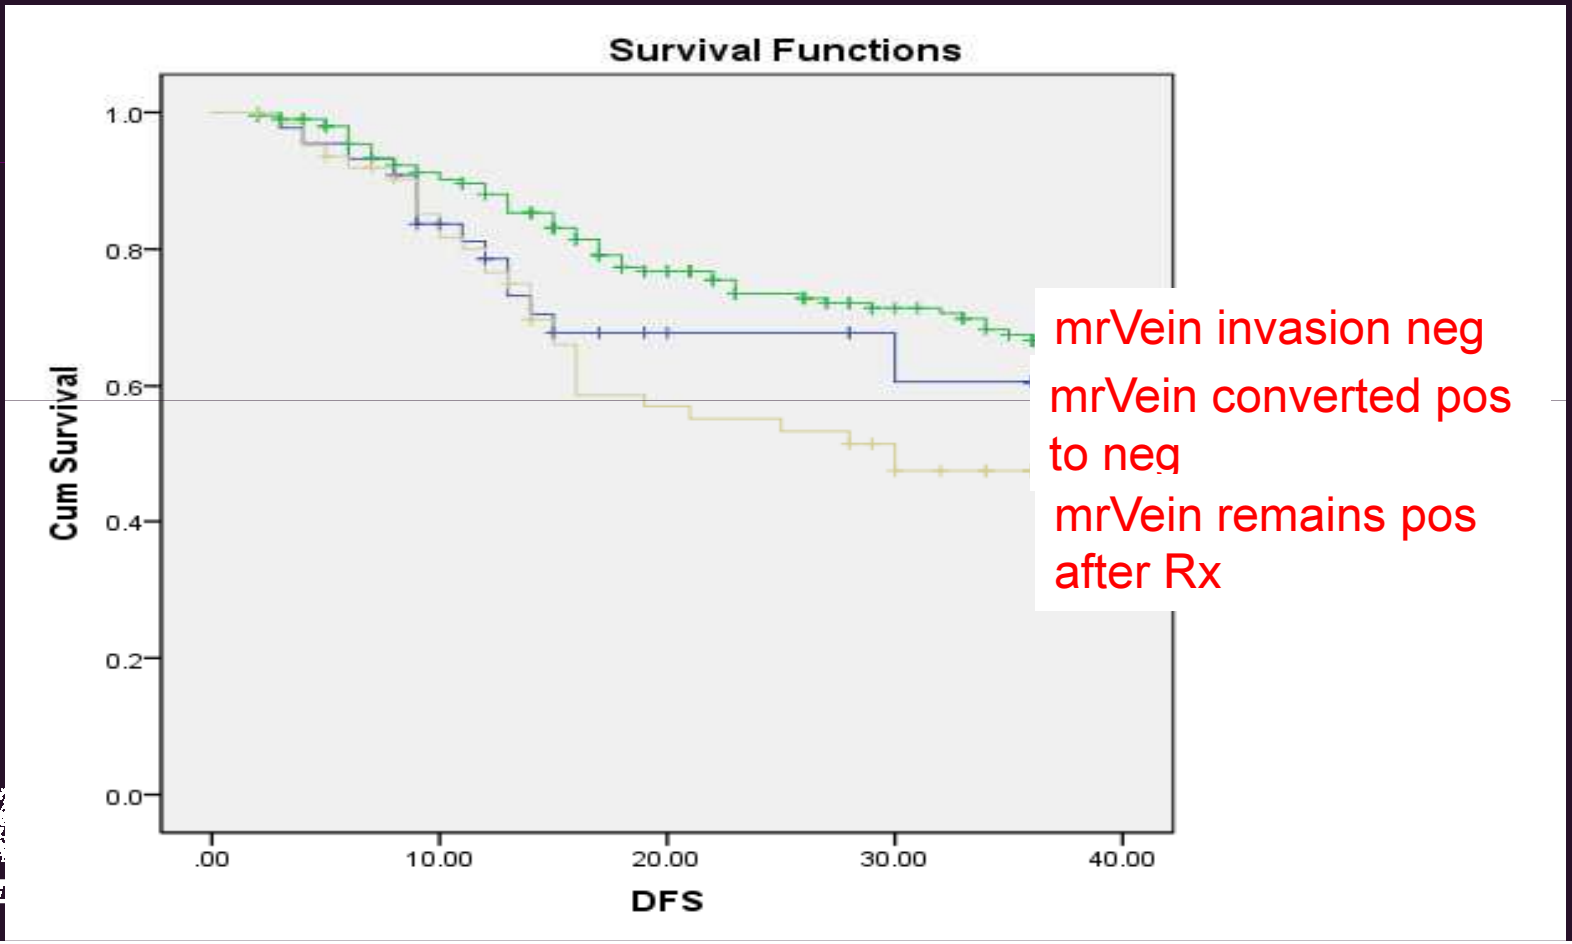
Royal Marsden n=208 patients





Yu et al , ESMO World GI Congress, Barcelona 2015

Post CRT effect on EMVI – 3-year DFS



mrTRG is a prognostic (and predictive) biomarker

- Shows good interobserver radiology agreement and reproducibility
  - MERCURY trial (JCO 2011 – multiple radiologists)
  - EXPERT-C trial
  - GEMCAD study (17 radiologists)
  - CORE study (interobserver agreement)
  - MERCURY 2 trial – risk factor for CRM involvement
- In EXPERT C trial identified 40% of patients with mrTRG1/2 – 89.8% overall survival. Compared with only 15% pathologic CR rate (90% survival).
- Therefore mrTRG could be justified as a more clinically relevant endpoint

NHS

Prognostic/predictive item	Validation by modality?	
	EUS	MRI
T substage rather than T stage	no	yes
Detection of EMVI rather than N stage	no	yes
CRM status – should be a staging item	no	yes
Assessment of low rectal plane	no	yes
Reassessment after CRT	no	yes
Effective treatment stratification?	no	yes

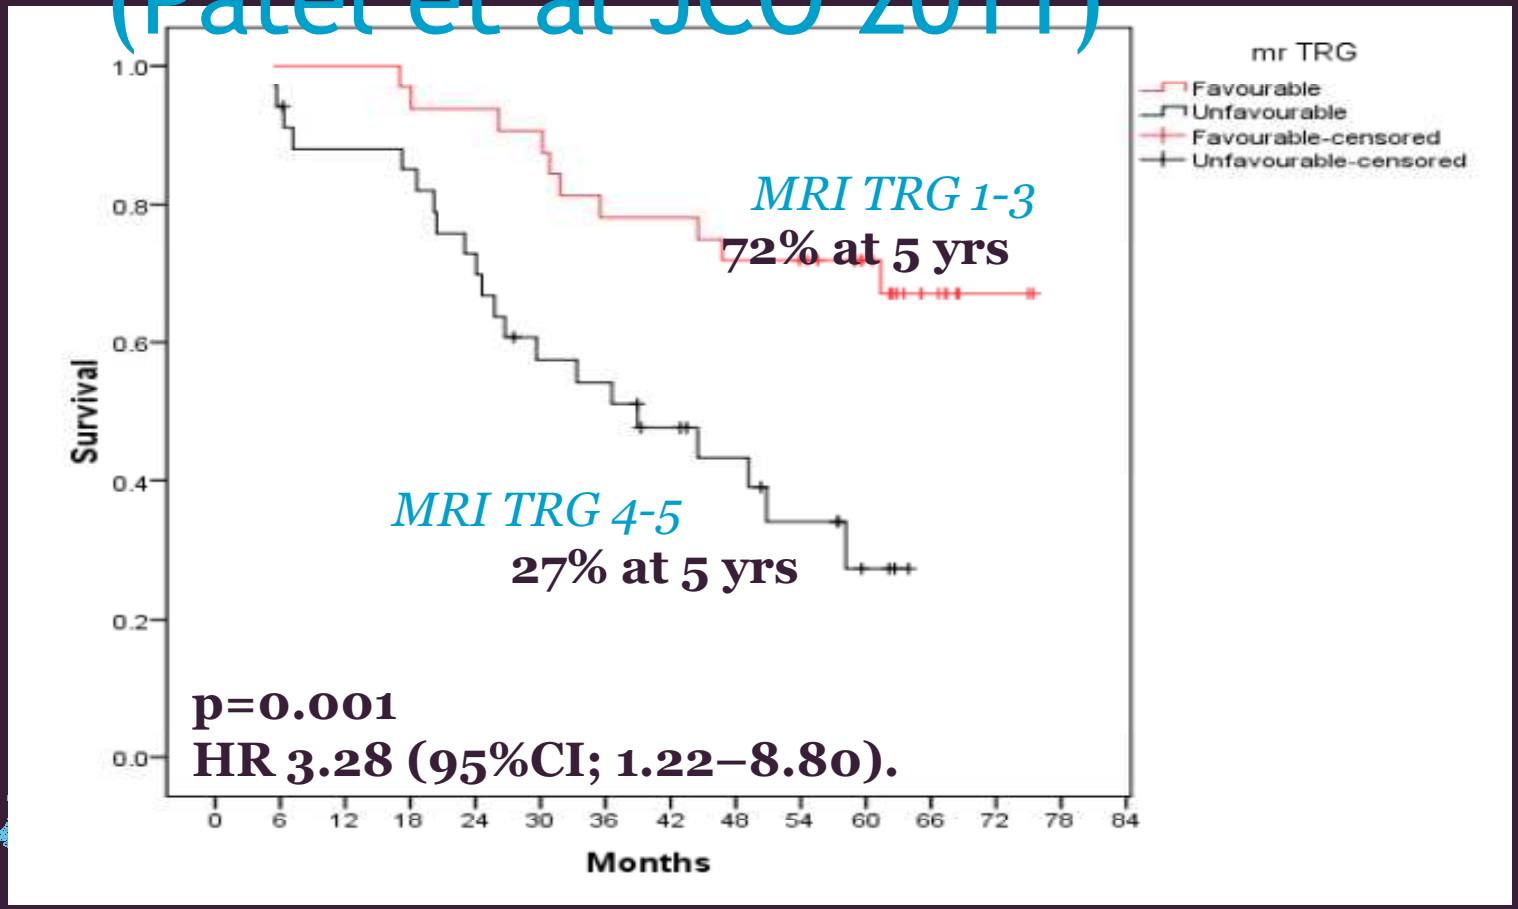
The Royal Marsden

MRI reassessment after CRT

- Philosophy of avoiding APE surgery if patient has had a good response to treatment
- mrTRG 1-3 - used to identify patients suitable for deferral (many are falsely positive on biopsy, DWI and PET-CT)
- Serial imaging – decision for deferral is not based on a single scan – uses the advantage of high resolution MRI monitoring
- Employing serial MRI monitoring - gives opportunity to delay surgery until there is evidence of tumour regrowth rather than biopsy of tumour cells which are of uncertain viability

NHS

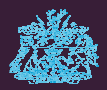
TRG and Survival (Patel et al JCO 2011)



Timing of Surgery after Radiotherapy – Prospective Randomised Study

– Hypothesis

Greater downstaging and tumour regression is observed when surgery is delayed to 12 weeks after completion of CRT compared to 6 weeks.



Timing after CRT? When is maximum response reached?

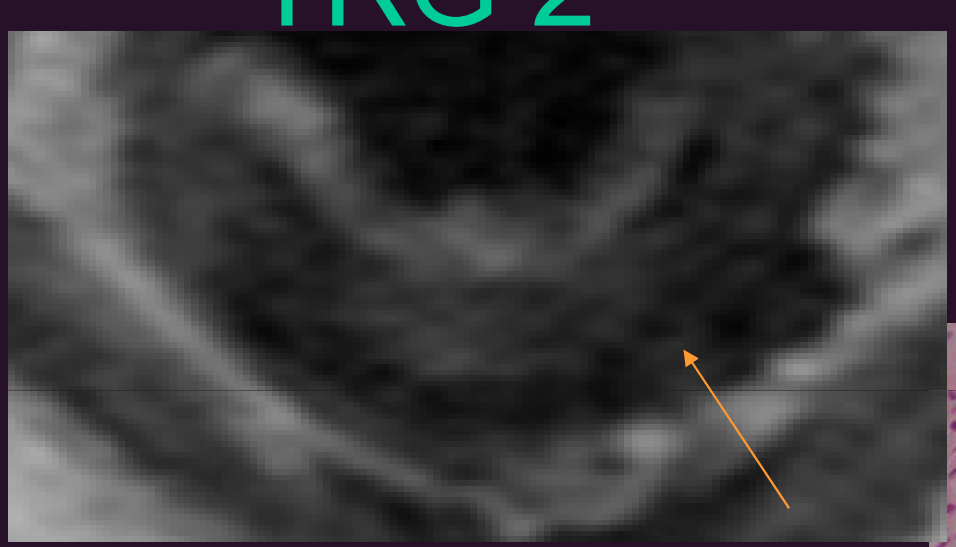
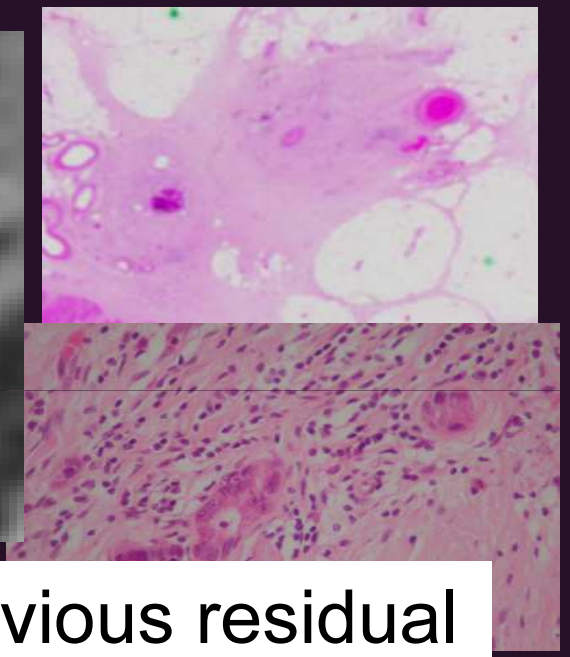
The Royal Marsden

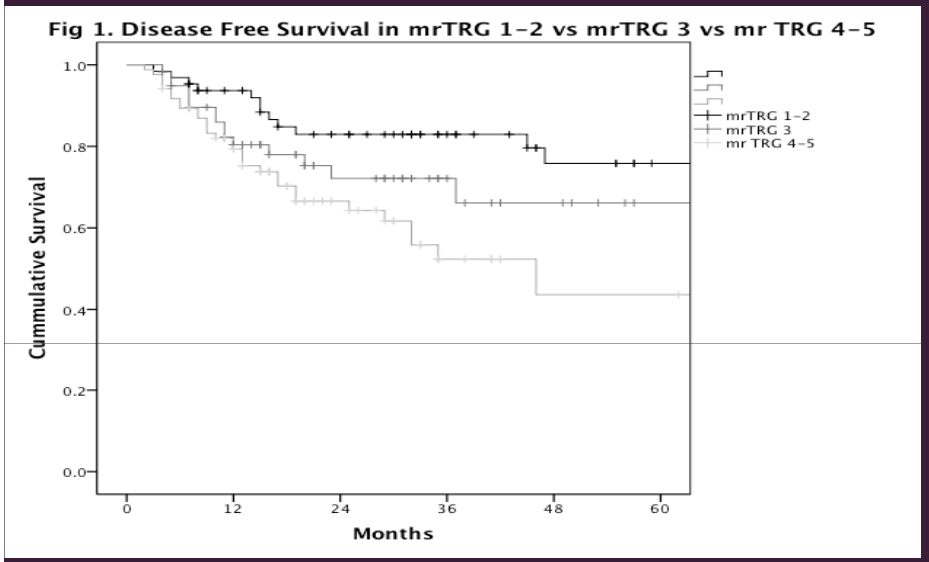
TRG 2

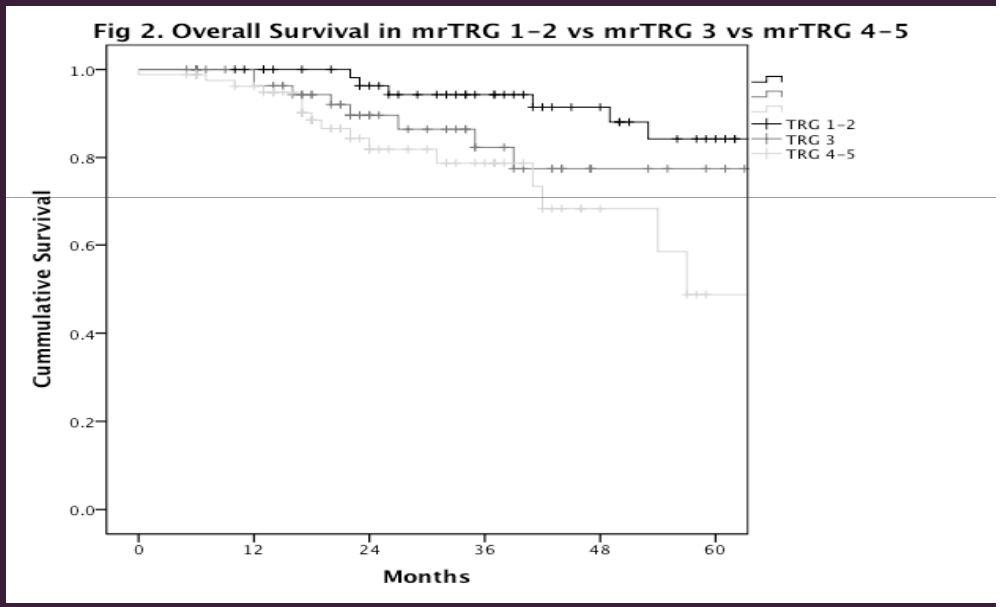




Good response :dense fibrosis; no obvious residual tumour, signifying microscopic residual disease only and on continued surveillance may become TRG1 no viable tumour

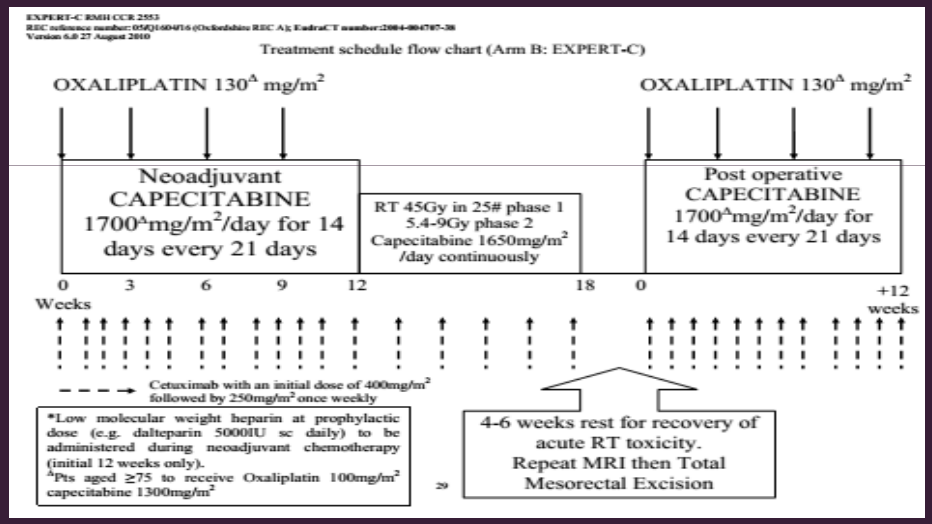
Royal Marsden database n=208 irradiated patients



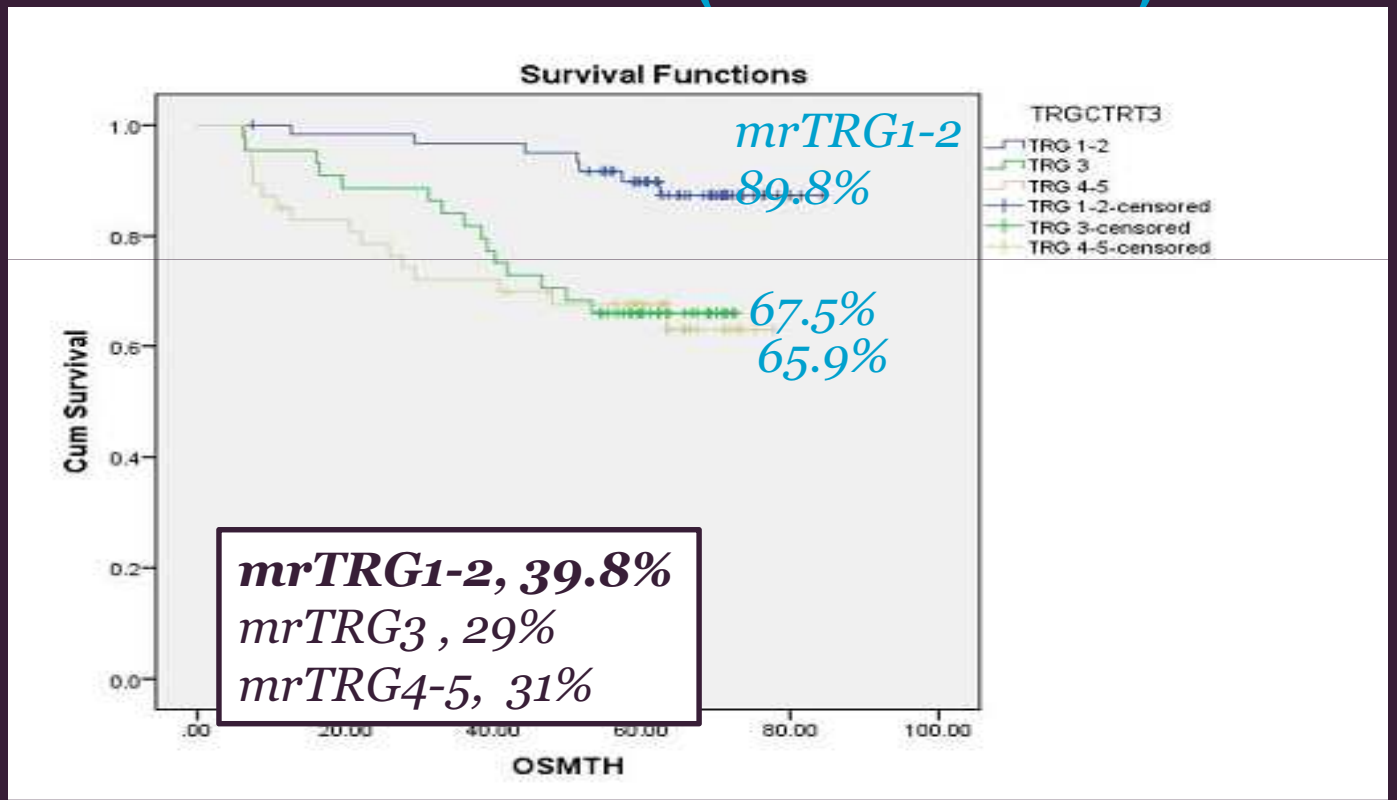


EXPERT C trial for patients at high risk of local and distant failure

- Tumors within 1 mm of mesorectal fascia (ie, potential circumferential resection margin involvement)
- T3 c (extramural spread 5-15 mm) and T3 d (extramural spread >15 mm), regardless of N stage
- MRI T4a or T4b disease regardless of N stage
- Low rectal cancer with tumor bordering the intersphincteric/ distal TME plane on MRI
- Tumors with MRI extramural venous invasion (mrEMVI)



Overall Survival by TRG (1-2 v 3 v 4-5) after Chemo-Radiotherapy in EXPERT-C trial (both arms)



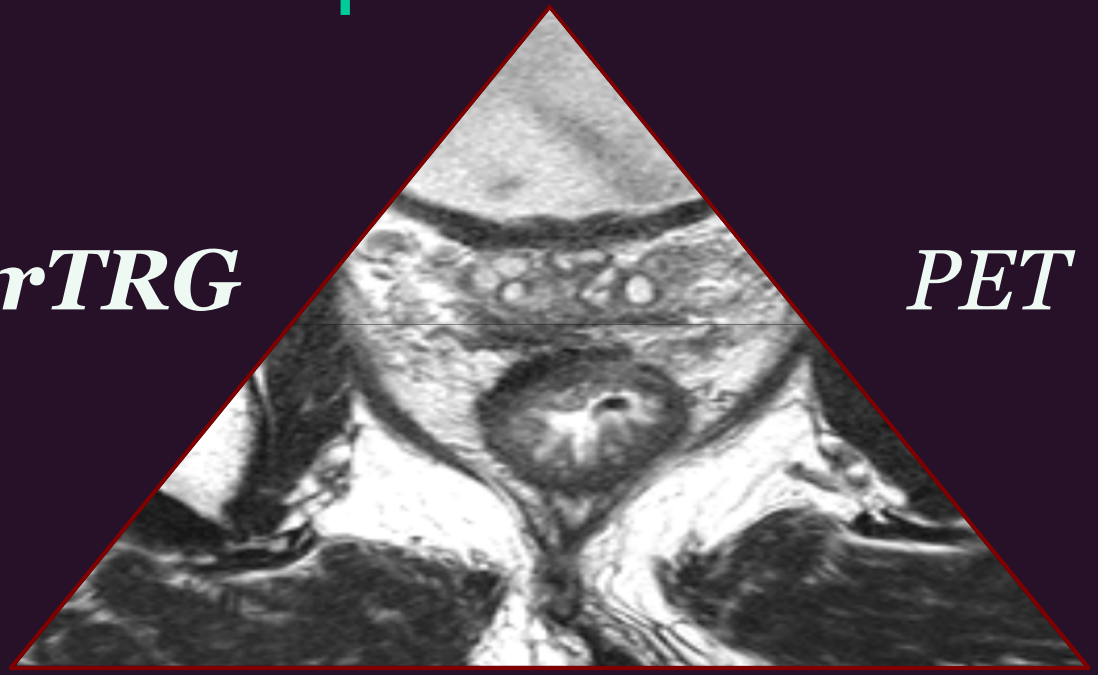
mrTRG is a prognostic (and predictive) biomarker

- Shows good interobserver radiology agreement and reproducibility
  - MERCURY trial (JCO 2011 – multiple radiologists)
  - EXPERT-C trial
  - GEMCAD study (17 radiologists)
  - CORE study (interobserver agreement)
- Identified 40% of patients with mrTRG1/2 – 89.8% overall survival. Compared with only 8.8% patients with pathologic CR.
- Therefore mrTRG could be justified as a more clinically relevant endpoint

The Royal Marsden

SELECTING PATIENTS FOR DEFERRAL

How are the patients identified?



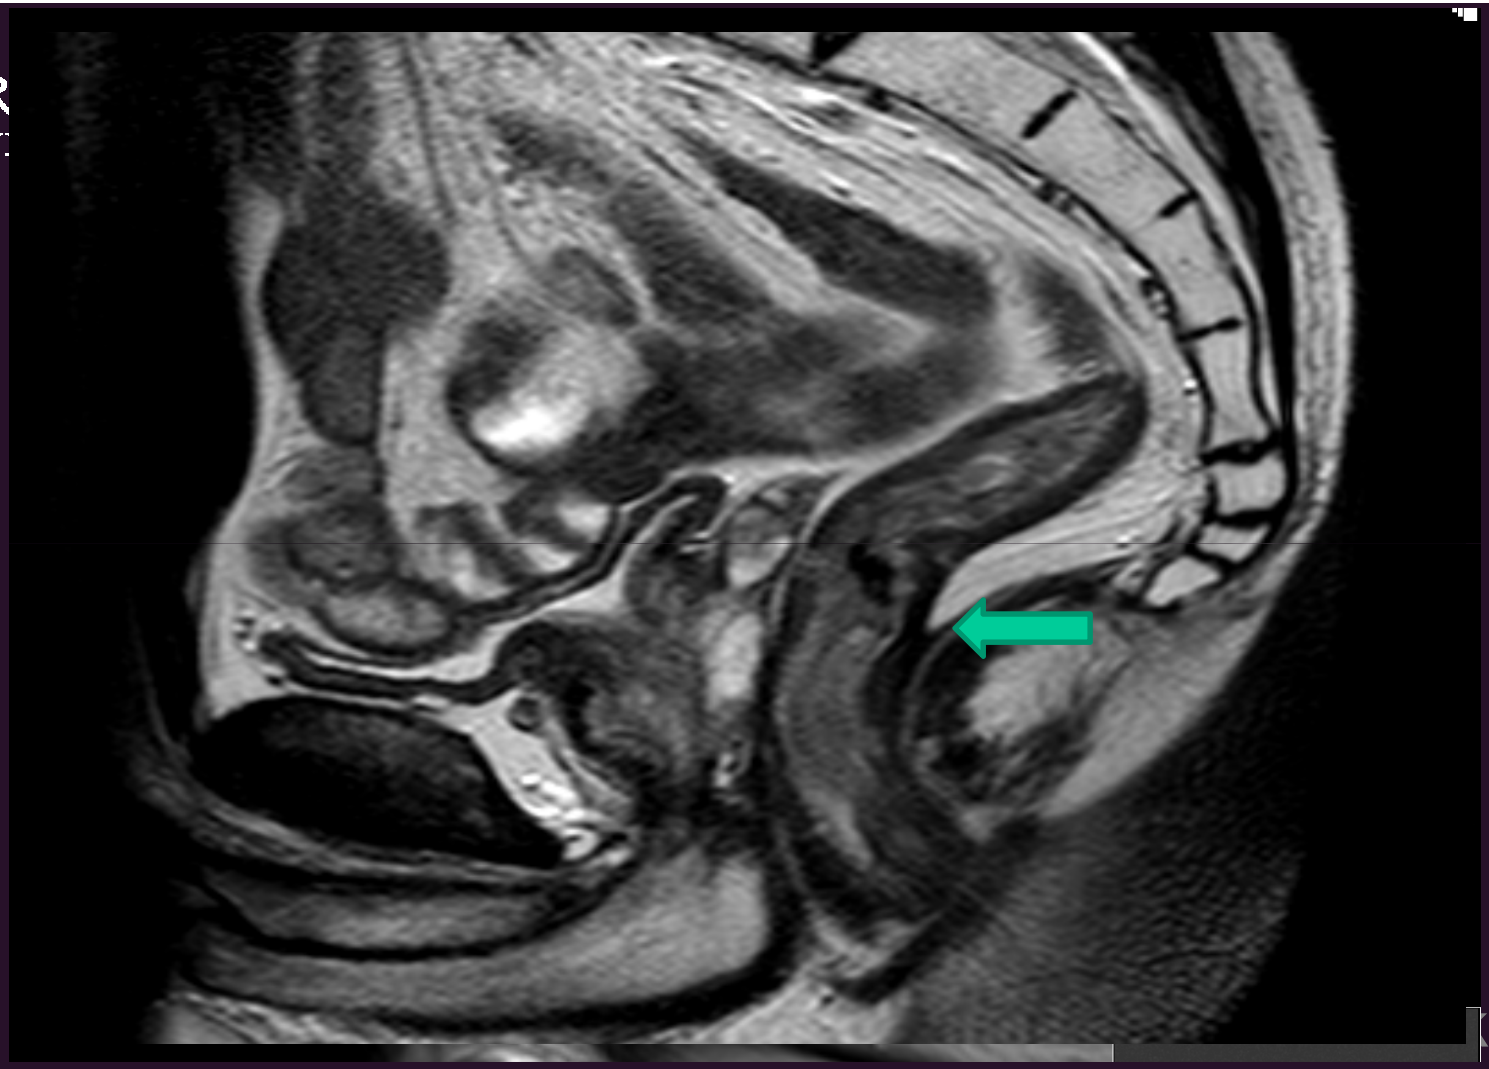
mrTRG

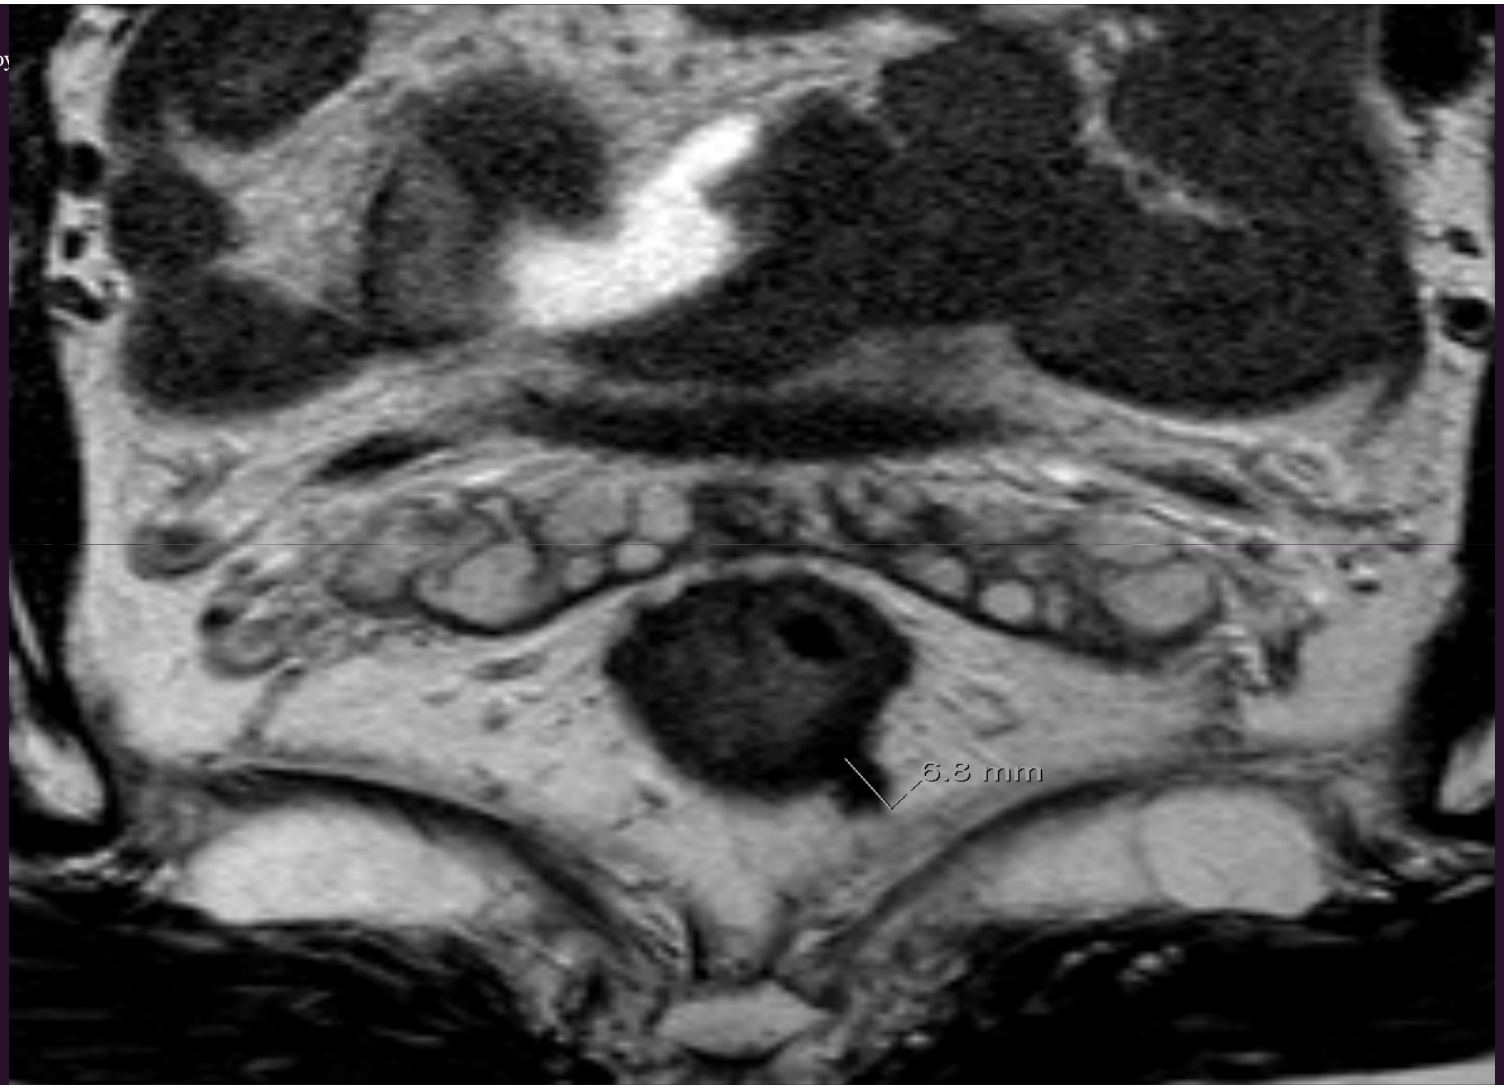
PET

Clinically - DRE
+/- biopsy

The R

N





6.8 mm

Enrolment

mrTRG1 -2 @4-6 weeks post CRT → no viable disease
(low signal intensity fibrotic scar tissue only)
confirmed by MRI @ 8-12 weeks

mrTRG3 @ 4-6 weeks post CRT → a good partial response
Continued incremental response on MRI @ 8-12 weeks

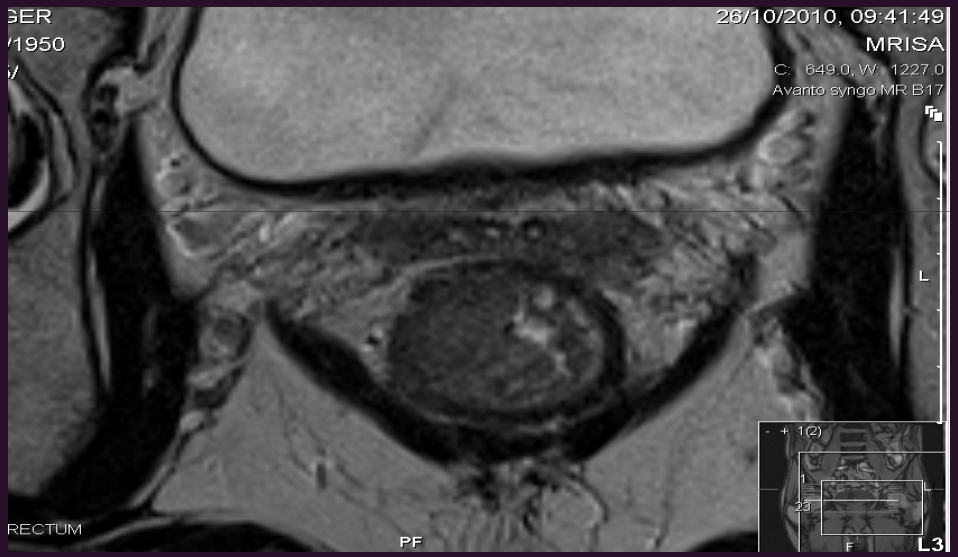
NOT INITIALLY EXCLUDED EVEN IF:

- DRE - Thickening of rectal wall or clinically palpable tumour
- Endoscopically – mucosal abnormality
- Pathology - Biopsy positive

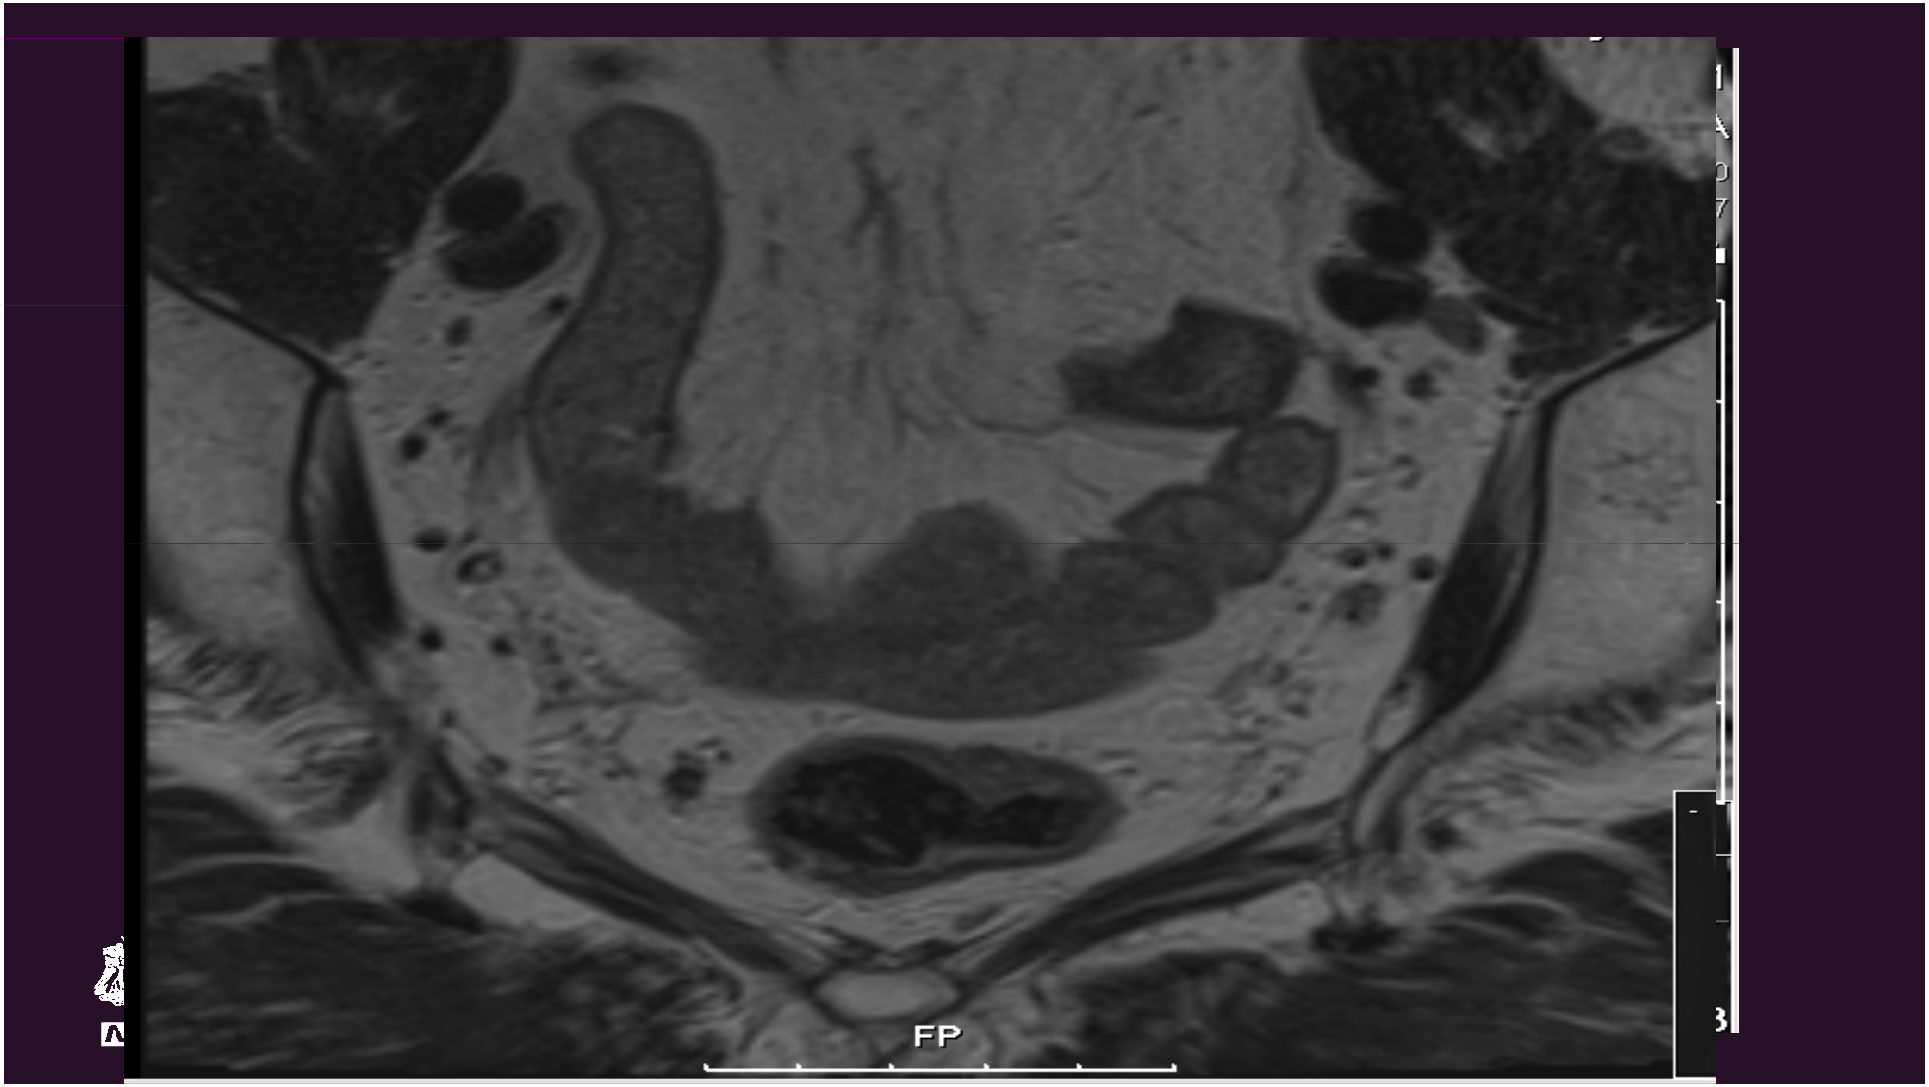
NHS

The Royal Marsden

MDT options: MRI T1sm3N1



- Primary surgery : abdominoperineal excision, permanent stoma
- Local excision and chemoradiotherapy
- Preoperative Chemoradiotherapy



FP

Royal Marsden Criteria

1. MRI defined complete response: mrTRG1-2 : low signal intensity fibrotic scar tissue only seen at MRI performed 4 weeks after long-course CRT, confirmed at 8-12 week MRI.

Biopsy positive disease not an initial exclusion criterion

Thickening of rectal wall – not an exclusion

Abnormality on endoscopy – not an exclusion

Clinically palpable tumour – not an exclusion

PET-CT positivity not an initial exclusion

Persistent DWI signal – not an initial exclusion

Patients deferring surgery

Follow-up Schedule

The ROYAL MARSDEN NHS Foundation Trust

TIME	Year 1							Year 2				Year 3		Year 4		Year 5		Yr 6

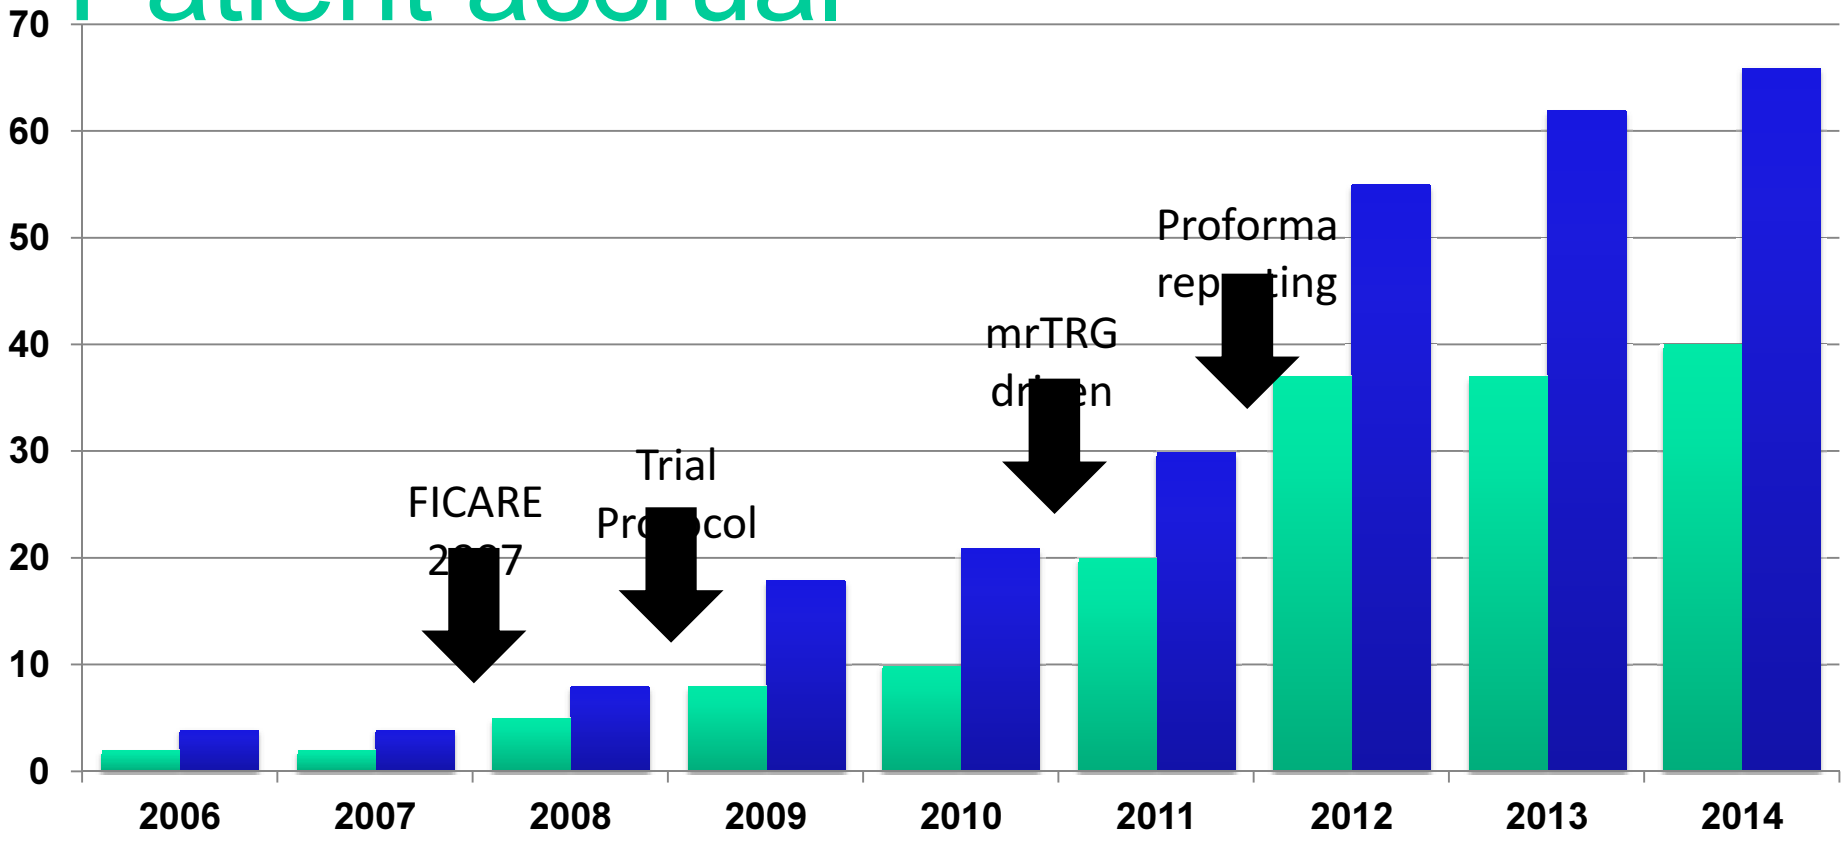
MRI	1M, 2M, 3Mly – 1st Yr, 6Mly - 2nd Yr, Annually
PET	2M, 4M, 1yr
Sigmoidoscopy	3Mly – Yr 1, 6Mly – Yr 2, Annually
CT & Colonoscopy	as per current NICE guidelines.

Patient accrual



The Royal Marsden

Proforma reporting

Post Treatment Assessment MRI Rectal Cancer

Comparison is made with the previous examination of:

- The treated tumour: shows no fibrosis,TRG5
- Less than <25% fibrosis, predominant tumour signal, TRG4
- 50% tumour/fibrosis, TRG 3
- >75% fibrosis, minimal tumour signal intensity,TRG2
- low signal fibrosis only no intermediate tumour signal TRG1

The distal edge of the luminal tumour arises at a height of [ ] mm from anal verge:
The distal edge of the tumour lies [ ]mm [Above, at, below] the top of the puborectalis sling compared with []mm previously
The tumour extends craniocaudally over a distance of [ ] mm compared with [ ]mm previously
The proximal edge of tumour lies [above at below] the peritoneal reflection
The invading edge of treated tumour extends from [to] O'clock
Tumour signal is [Confined to / Extends through the muscularis propria.]
Fibrotic signal is [Confined to / Extends through muscularis propria.]
Extramural spread: [ ]mm for tumour signal [ ]for fibrotic stroma

yMR T stage: • T1 • T2 • T3a • T3b • T3c • T3d •T4 visceral •T4 peritoneal

Treated tumour [is/ is not] present at or below the puborectalis sling
- tumour signal/fibrosis extends into the submucosal layer/part thickness of muscularis propria : intersphincteric plane/mesorectal plane is safe intersphincteric APE or ultra low TME possible, CRM is safe
- tumour signal/fibrosis extends through the full thickness of muscularis propria : intersphincteric plane/mesorectal plane is unsafe, for extralevator APE.
- tumour signal/fibrosis extends into external sphincter : intersphincteric plane/mesorectal plane is unsafe:for extralevator APE
- tumour signal/fibrosis extends into beyond external sphincter into [prostate/vagina] : intersphincteric plane / mesorectal plane is unsafe, for extralevator APE.

Additional comments:

Lymph nodes:
- None /Only benign reactive [N0]
- Present number mixed signal/irregular border [N1/N2]

Extramural venous invasion: [• No evidence • Evidence]
[• Small • Medium • Large]

CRM
Closest circumferential resection margin: [ ]O'clock
Closest CRM is from [Direct spread of tumour • Extramural venous invasion • Tumour deposit]
Minimum tumour distance to mesorectal fascia: [ ]mm [• CRM clear • CRM involved]

Peritoneal deposits: [• No evidence • Evidence]

Pelvic side wall lymph nodes: • None • Benign • Malignant
[Location: Obturator fossa • R •L . External Iliac Nodes •R •L. Inf Hypogastric •R •L]

Summary: y MRI Overall stage ymrT ymr N M , TRG
- Good prognosis, CRM clear, TRG 1-3, EMVI negative
- Poor prognosis, CRM pos or TRG4/5 or EMVI positive

TRG1-2 low tumour – eligible for consideration for deferral of surgery

NHS

The Endpoint

Local Failure

- Powered for unacceptable failure rate – 80% power <15% local recurrence at 2 years.
- STOPPING RULE - ≥5 regrowth resulting in positive pathologic CRM – trial ends

Safe deferral

- 90% power - ≥10% defer - expected to be at least 25%
- ✓ success ≥ 11 of 59 patients safely defer surgery at 2yrs

NHS

Secondary endpoints

1. Time to local re-growth.
2. Time to maximal tumour response after CRT
3. Time to local pelvic relapse, pre or post surgery.
4. Time to metastatic relapse, pre or post surgery.
5. Percentages of positive margins, and sphincter-preservation rates in patients who have had surgery. Pathology T N stage.
6. Progression-free and overall survival
7. Quality of Life including long-term bowel and urinary function
8. Probability of detecting early re-growth on MRI at 16 weeks, 24 weeks and 9 months.
9. Report on proportion of patients eligible at 12 weeks compared to eligible at 6 weeks.
10. Frequency of local re-growth detected outside scheduled imaging/endoscopic timepoint by DRE/CEA.

RMH Deferral Trial Entry Criteria

1. MRI defined complete response: mrTRG1-2 : low signal intensity fibrotic scar tissue only seen at MRI performed 4 weeks after long-course CRT, confirmed at 8-12 week MRI.

Biopsy positive disease not an initial exclusion criterion

Thickening of rectal wall – not an exclusion

Abnormality on endoscopy – not an exclusion

Clinically palpable tumour – not an exclusion

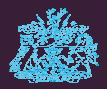
Magnetic Resonance Tumour Regression Grade (mrTRG) Directed Management Of Good And Poor Responders To Chemoradiotherapy in Rectal Cancer: A Multicentre Randomised Control Trial

Life demands excellence

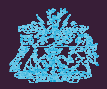
objectives

- A feasibility trial for locally advanced rectal cancer investigating whether response to chemotherapy and radiotherapy can be assessed with a novel MRI technique
- Can (mrTRG), MRI directed management improve patient outcomes



Inclusion criteria

- Tumors within 1 mm of mesorectal fascia (ie, potential circumferential resection margin involvement)
- T3 c (extramural spread 5-15 mm) and T3 d (extramural spread >15 mm), regardless of N stage
- MRI T4a or T4b disease regardless of N stage
- Low rectal cancer with tumor bordering the intersphincteric/ distal TME plane on MRI
- Tumors with MRI extramural venous invasion (mrEMVI)



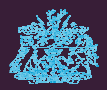
The Royal Marsden

TRIGGER trial

Life demands excellence

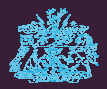
Objectives of trial

- recruit patients and stratify treatment using mrTRG directed management. The ‘good responders’ (mrTRG1&2) often have no evidence of tumour and it may be possible to avoid surgery in this group (deferral of surgery).
- The ‘poor responders’ (mrTRG3-5) are at high risk of poor oncological outcomes and additional therapy before surgery may improve prognosis.



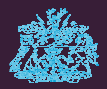
Phase III

- the phase III trial will be designed to detect an improvement in 3 year DFS in the intention to treat population from 74% to 82% (i.e. a hazard ratio of 0.66) with 80% power and a 5% 2- sided level of statistical significance.
- 633 patients over 3-5 years – recruitment rate 5-11 patients (total from all sites) randomised per month



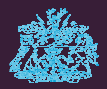
Radiology support and training

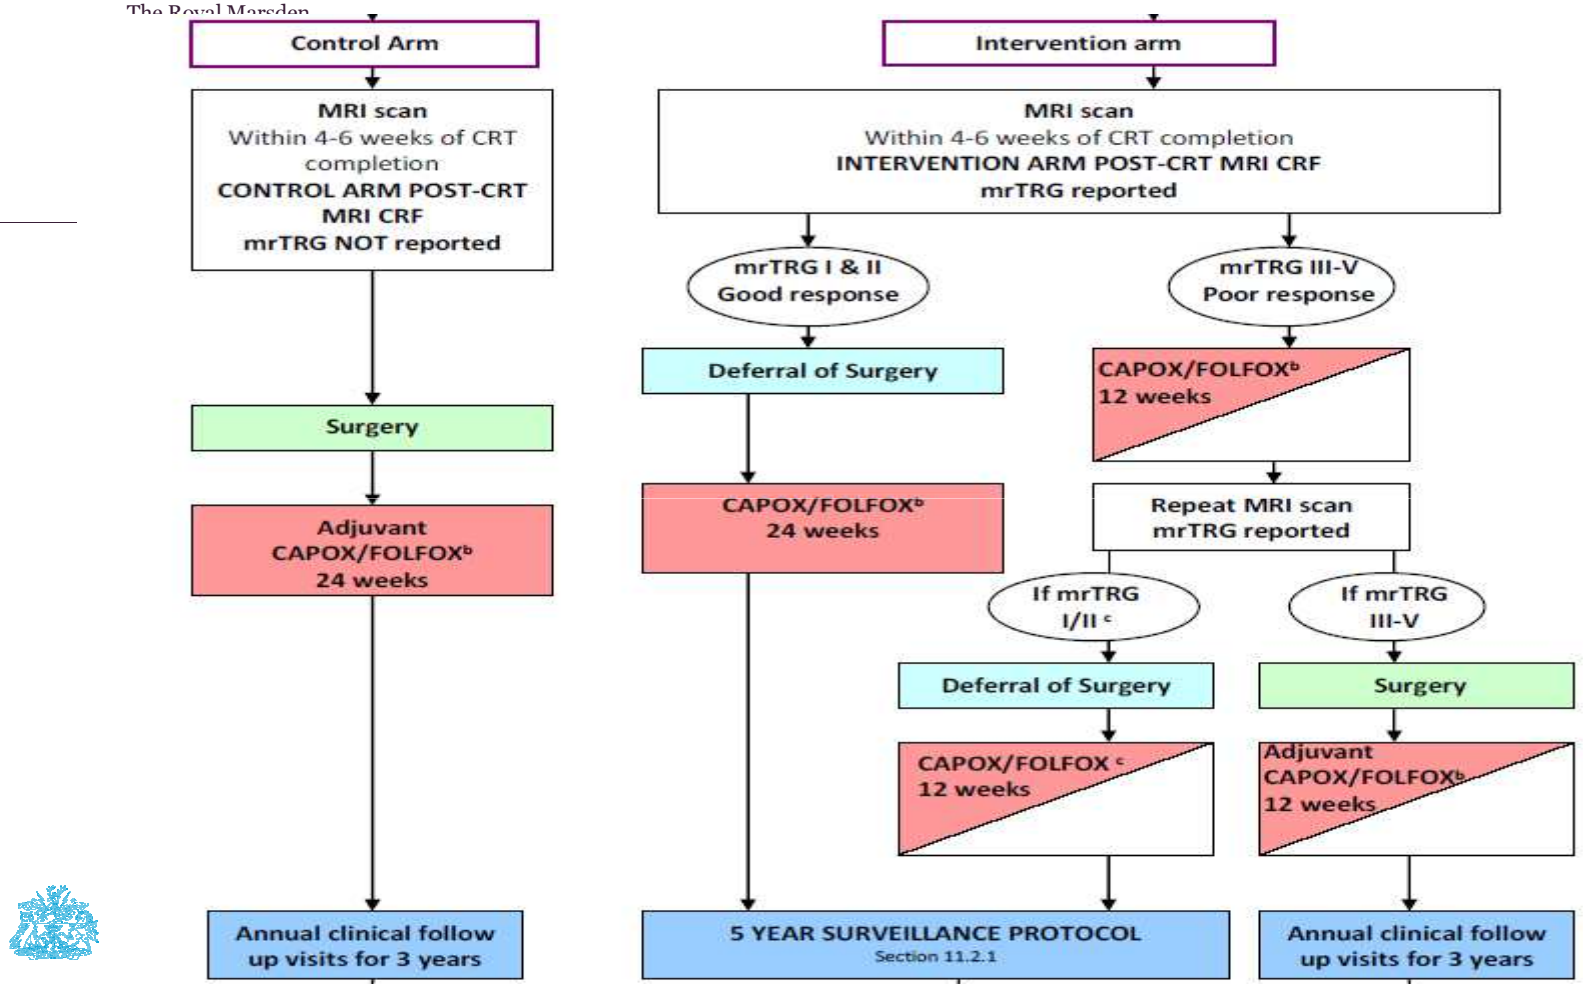
- To ensure consistency, a nominated study GI radiologist will be asked to participate in an CME-accredited trial-specific MRI reporting workshop/webinar.
- A site will not be able to open until the allocated radiologist has achieved mrTRG competency (mrTRG kappa ≥ 0.7). But training and support will be available to enable all radiologists to achieve this.



Feasibility secondary endpoints

- Assess response rates by comparing the reported mrTRG in the control and intervention arm
- Evaluate the reproducibility of mrTRG by recruiting radiologists
- To evaluate safety by assessing acute drug toxicity and 30 day surgical morbidity
- pCRM involvement rate in the control versus intervention arm
- Quality of surgery in control vs intervention arms





Control Arm
MRI scan
Within 4-6 weeks of CRT completion
CONTROL ARM POST-CRT MRI CRF
mrTRG NOT reported
Surgery
Adjuvant CAPOX/FOLFOX[b] 24 weeks
Annual clinical follow up visits for 3 years
Intervention arm
MRI scan
Within 4-6 weeks of CRT completion
INTERVENTION ARM POST-CRT MRI CRF
mrTRG reported
mrTRG I & II Good response
mrTRG III-V Poor response
Deferral of Surgery
CAPOX/FOLFOX[b] 24 weeks
CAPOX/FOLFOX[b] 12 weeks
Repeat MRI scan mrTRG reported
If mrTRG I/II [c]
If mrTRG III-V
Deferral of Surgery
Surgery
CAPOX/FOLFOX [c] 12 weeks
Adjuvant CAPOX/FOLFOX[b] 12 weeks
5 YEAR SURVEILLANCE PROTOCOL
Section 11.2.1
Annual clinical follow up visits for 3 years

Conclusions restaging MRI - prognostic and predictive imaging biomarkers for DFS

- Persistent ymrEMVI seen twice as frequently as ypEMVI and independent risk factor for poor DFS
- mrTRG 1-2 has similar DFS and OS as pCR but seen 4 times more frequently than pCR (prospective randomised trial data)
- mrTRG1-2 represents a population of patients highly likely to have no viable tumour hence suitable for MRI monitoring in deferral of surgery trial
- Patients will be randomised to have an mrTRG defined treatment strategy in the TRIGGER trial – do please join us!

Reporting Minimum Standards

Baseline assessment of Rectal cancer MRI report
Primary tumour
The primary tumour is demonstrated as an [Annular | Semi-annular | Ulcerating | | Polypoidal | Mucinous] mass with a [nodular / smooth] infiltrating border.

The distal edge of the luminal tumour arises at a height of [ ] mm from anal verge:
The distal edge of the tumour lies [ ]mm [Above,at, below] the top of the puborectalis sling
The tumour extends craniocaudally over a distance of [ ] mm
The proximal edge of tumour lies [above at below] the peritoneal reflection
Invading edge of tumour extends from [to] O'clock
Tumour is [confined to] [extends through] the muscularis propria:
Extramural spread is [ ] mm
mrT stage: [T1] [T2] [T3a] [T3b] [T3c] [T3d] [T4visceral] [T4 peritoneal]

Tumour is [present] [not present] the level of the puborectalis sling at this level:
[Tumour is confined to the submucosal layer/part thickness of muscularis propria indicating that the intersphincteric plane/mesorectal plane is safe and intersphincteric APE or ultra low TME is possible]
[Tumour extends through the full thickness of the muscularis propria : intersphincteric plane/mesorectal plane is unsafe, Extralevator APE. is indicated for radial clearance]
[Tumour extends into the intersphincteric plane : intersphincteric plane/mesorectal plane is unsafe, therefore an extralevator APE. is indicated for radial clearance]
[Tumour extends into the external sphincter : intersphincteric plane/mesorectal plane is unsafe.]
[Tumour extends into adjacent [prostate/vagina/bladder/sacrum] : exenterative procedure will be required

Additional comments:

.

Lymph node assessment
Only benign reactive and no suspicious nodes shown [N0]
[ ] mixed signal/irregular border nodes [N1/N2]
Extramural venous invasion: [No evidence] [Evidence]
[ ] Small [ ]Medium [ ]Large vein invasion is present
CRM
The closest circumferential resection margin is at o'clock
The closest CRM is from [Direct spread of tumour] [Extramural venous invasion] [Tumour deposit]
Minimum tumour distance to mesorectal fascia: mm [CRM clear] [CRM involved]
Peritoneal deposits: [No evidence] [Evidence]
Pelvic side wall lymph nodes:
[None] [Benign] [Malignant mixed signal/irreg border]
Location: [Obturator fossa • R •L] . [External Iliac Nodes • R •L] .[Internal iliac • R •L]

Summary: MRI Overall stage: T N M [CRM clear] , [CRM involved] , [EMVI positive] [EMVI negative],[PSW positive] [PSW negative]
No adverse features eligible for primary surgery
High risk safe margins for preoperative therapy : eligible for Serenade, Marvel
Poor prognosis unsafe margins eligible for preoperative chemoradiotherapy: eligible for 6 vs 12 trial
Low Rectal <6cm – eligible for the Low Rectal Study.

Reporting Template Post Treatment

Post Treatment Assessment MRI Rectal Cancer
Comparison is made with the previous examination of:
• The treated tumour: shows no fibrosis,TRG5
• Less than <25% fibrosis, predominant tumour signal, TRG4
• 50% tumour/fibrosis, TRG 3
•>75% fibrosis, minimal tumour signal intensity,TRG2
•low signal fibrosis only no intermediate tumour signal TRG1

The distal edge of the luminal tumour arises at a height of [ ] mm from anal verge:
The distal edge of the tumour lies [ ]mm [Above, at, below] the top of the puborectalis sling compared with []mm previously
The tumour extends craniocaudally over a distance of [ ] mm compared with [ ]mm previously
The proximal edge of tumour lies [above at below] the peritoneal reflection
The invading edge of treated tumour extends from [to] O'clock
Tumour signal is [Confined to / Extends through the muscularis propria.]
Fibrotic signal is [Confined to / Extends through muscularis propria.]
Extramural spread: [ ]mm for tumour signal [ ]for fibrotic stroma

yMR T stage: • T1 • T2 • T3a • T3b • T3c • T3d •T4 visceral •T4 peritoneal

Treated tumour [is/ is not] present at or below the puborectalis sling
• tumour signal/fibrosis extends into the submucosal layer/part thickness of muscularis propria : intersphincteric plane/mesorectal plane is safe intersphincteric APE or ultra low TME possible, CRM is safe
• tumour signal/fibrosis extends through the full thickness of muscularis propria : intersphincteric plane/mesorectal plane is unsafe, for extralevator APE.
• tumour signal/fibrosis extends into external sphincter : intersphincteric plane/mesorectal plane is unsafe:for extralevator APE
•tumour signal/fibrosis extends into beyond external sphincter into [prostate/vagina] : intersphincteric plane / mesorectal plane is unsafe, for extralevator APE.

Extramural venous invasion: [• No evidence • Evidence]
[• Small • Medium • Large]
CRM
Closest circumferential resection margin: [ ]O'clock
Closest CRM is from [Direct spread of tumour • Extramural venous invasion • Tumour deposit]
Minimum tumour distance to mesorectal fascia: [ ]mm [• CRM clear • CRM involved]

Peritoneal deposits: [• No evidence • Evidence]

Pelvic side wall lymph nodes: • None • Benign • Malignant
[Location: Obturator fossa • R •L . External Iliac Nodes •R •L. Inf Hypogastric •R •L]

Summary: y MRI Overall stage ymrT ymr N M , TRG
• Low/intermediate risk, CRM clear, TRG 1-2, EMVI negative
• High prognosis, CRM pos or TRG4/5 or EMVI positive

TRG1-2 low tumour – eligible for consideration for deferral of surgery

Prognostic Factors in Rectal Cancer after Chemo-Radiotherapy

ESTRO Lower GI Course:

Technical & Clinical Challenges for Radiation Oncologists

RECTAL CANCER AUDIT 1997 - 2013

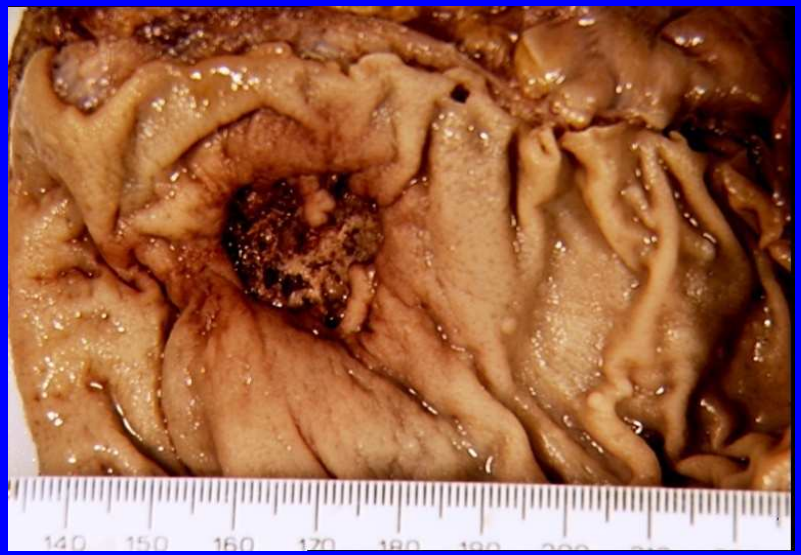
	No. of resections	% RT or CRT	Median LNs
1997	28	0 %	12
1998	34	3 %	14
1999	36	14 %	18.5
2000	28	32 %	19
2001	25	48 %	17
2002	29	41 %	18
2003	29	48 %	18.5
2004	17	71 %	15
2005	24	54 %	18
2006	39	59 %	19
2007	41	51 %	17
2008	40	33 %	16
2009	62	55 %	14
2010	44	57 %	18
2011	21	48 %	21
2012	74	65 %	15

- downstage advanced tumours prior to surgery
- reduce CRMI
- reduce local recurrence
- ? increase sphincter preservation
- ? allow organ-sparing approaches in selected patients

Examining the Rectal Cancer Specimen after Chemo-Radiotherapy

- Determine prognosis : predict local recurrence and distant metastasis
- Assess response of the tumour to radiotherapy / chemotherapy
- Audit surgical technique
- Audit the quality of imaging

MACROSCOPIC APPEARANCE OF LARC POST CHEMO-RADIOTHERAPY



Tumour Regression after Neoadjuvant Therapy

	ypT0 N0
• short course radiotherapy : 5x5 Gy (surgery within 1 week)	**< 1 %**
• short course radiotherapy with delay: (5x5 Gy – surgery after 4-8 weeks)	**13 %**
• long course radiotherapy eg. 25x2 Gy	**5 – 14 %**
• long course combined CRT	**10 – 30 %**

pCR after CRT for LARC – Evidence for a Better Outcome.

- Maas et al (2010) : pooled analysis of 3105 patients undergoing surgery after CRT for LARC (17 datasets ; 27 published articles)
- **pCR** – 484/3105: **16 %**
- median follow-up : **48 months** (0 – 277)

- 5 yr crude DFS : pCR **83.3 %**
  non-pCR **65.6 %**

- Adjusted HRs after multivariate analysis:
- **DFS** **0.54** (0.4 – 0.73)
- **Local recurrence** **0.41** (0.21 – 0.81)
- **Distant metastasis free survival** **0.49** (0.34 – 0.71)
- **OS** **0.65** (0.47 – 0.89)

"Colloid Response" – Acellular Mucin Pools after Radiotherapy

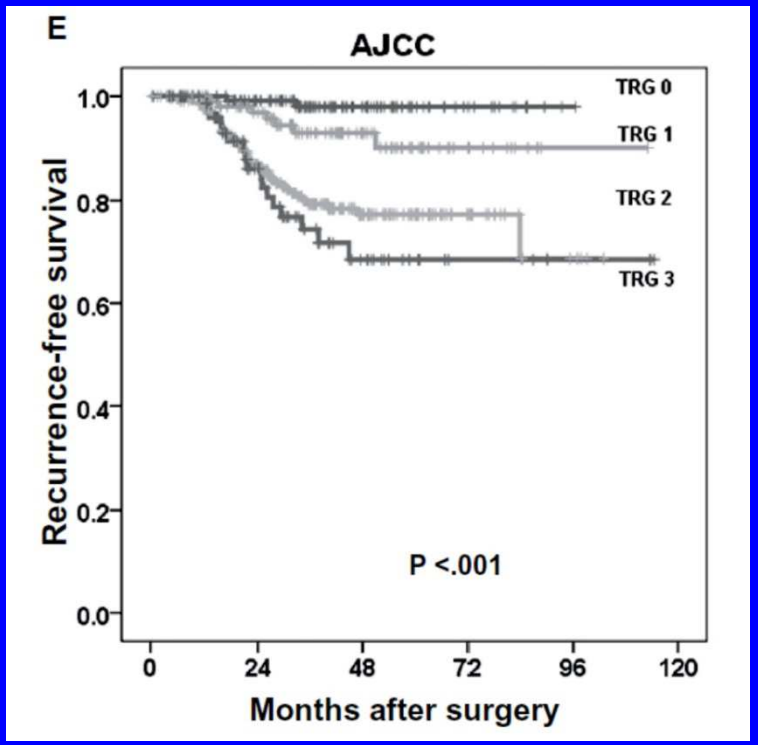
TRG : WHICH IS BEST ?

- Trakarnsarga et al (2014)
- 563 rectal cancers : cT3/4 or N+ : 1998 – 2007
- CRT : 50.4 Gy plus 5FU based chemotherapy
- TME after 6 – 8 weeks
- Median F.U. 39 months
- pCR = 21 % ; LR = 2 %; DM = 17 %
- TRG determined by expert GI pathologists
  - Mandard (5 & 3 tier)
  - Dworak / Rodel (5 & 3 tier)
  - MSKCC
  - AJCC / CAP

TRG : WHICH IS BEST ?

- All TRGs predicted recurrence free survival (univariate analysis)
- No benefit from 5 tier system over 3 tier system
- Concordance index highest for AJCC (= 0.694)

AJCC TRG	5yr recurrence free Survival
TRG 0	98 %
TRG 1	90 %
TRG 2	73 %
TRG 3	68 %



Trakarnsarga et al 2014

TRGs : A TRANSATLANTIC CONSENSUS ?

Tumor Regression Grade (modified from Ryan et al[29])

Description	Tumor Regression Grade
No viable cancer cells	0 (Complete response)
Single cells or small groups of cancer cells	1 (Moderate response)
Residual cancer outgrown by fibrosis	2 (Minimal response)
Minimal or no tumor kill; extensive residual cancer	3 (Poor response)

Tumor regression should be assessed only in the primary tumor; lymph node metastases should not included in the assessment.

College of American Pathologists AJCC 2013

d) Response to pre-operative therapy

There is evidence that patients with completely excised rectal carcinomas who have received pre-operative chemoradiotherapy, which has resulted in complete or marked regression, have a better prognosis than those without significant regression.[15,16,80,81] However, there is no consensus over how lesser degrees of regression are estimated histologically.[82] Despite this, an indication of regression is regularly sought by oncologists at MDTM and therefore it is recommended that the degree of tumour regression following pre-operative therapy is recorded as a core data item. A descriptive four-tier system is recommended, similar to that described by Ryan *et al*:[66,83]

- no viable tumour cells (fibrosis or mucus lakes only)
- single cells or scattered small groups of cancer cells
- residual cancer outgrown by fibrosis
- minimal or no regression (extensive residual tumour).

Royal College of Pathologists 2014

TRG , ypT & ypN stage

• 131 resectable cT3/T4 rectal carcinomas treated with CRT (polish RCT of SCRT versus pre-op CRT)

- TRG 0 : no cancer cells present
- TRG 1 : a few cancer foci (< 10% of tumor mass)
- TRG 2 : residual cancer representing 10 – 50 % of tumor mass
- TRG 3 : residual cancer representing > 50 % of tumor mass

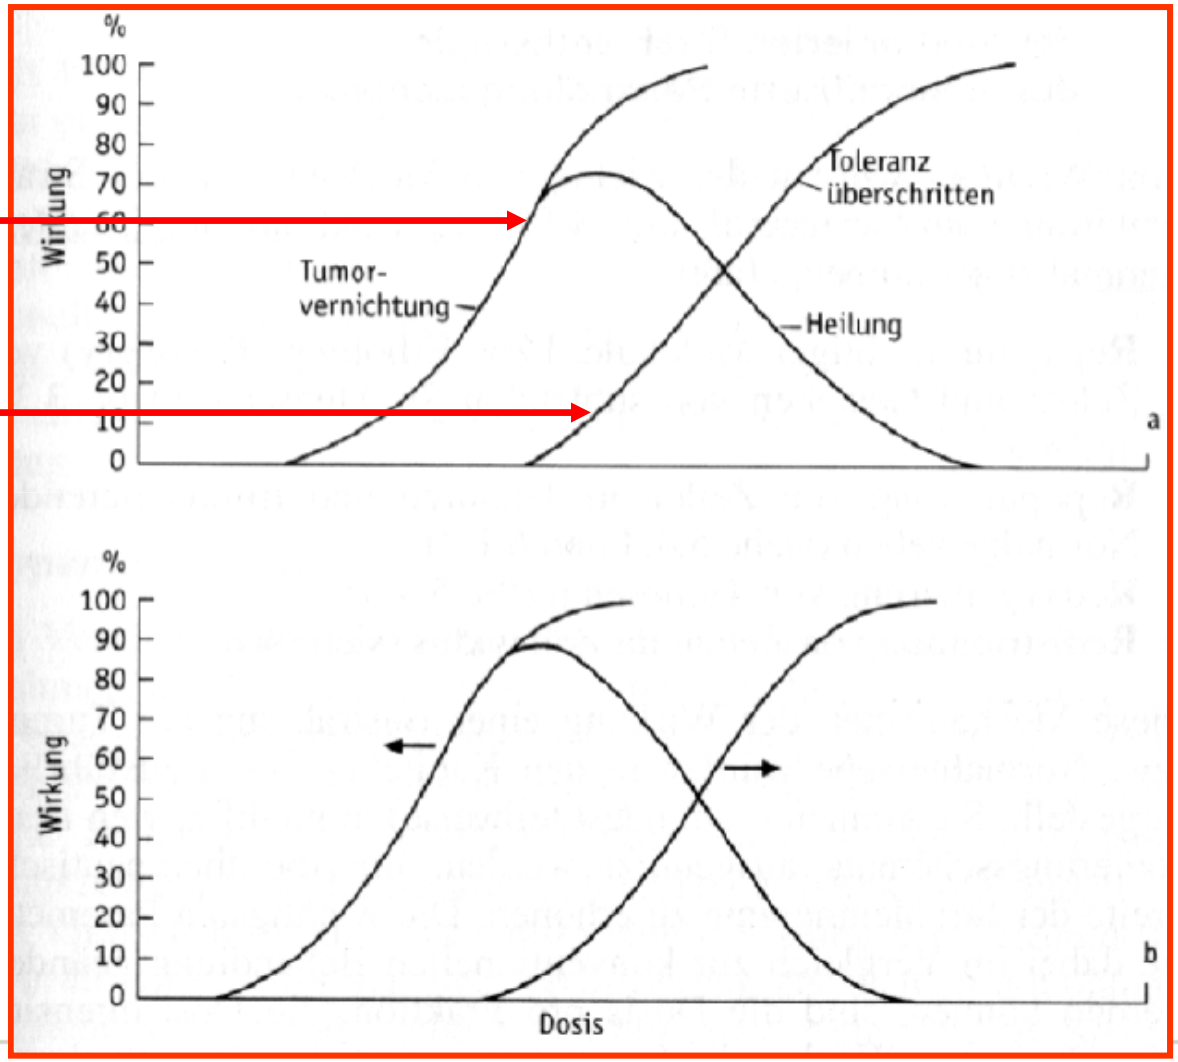
Therapeutic window

TCP
= tumor control probability

NTCP
= normal tissue complication probability



Holthusen, *Strahlentherapie* 57: 254, 1936

ESTRO School

Therapeutic ratio (I)

$$P_+ = TCP \cdot (1 - NTCP)$$

- Easy to interpret: if TCP and NTCP are statistically independent, this is the probability of being cured without a complication
- Has been used in several published studies
- The same relative change in NTCP will have a much larger influence on P_+ for large NTCP relative to small NTCP
- Face validity for non-fatal complications?
  - A: TCP=40% and NTCP=40% ⇒ R=24%
  - B: TCP=60% and NTCP=60% ⇒ R=24%
  - ...but proportion of patients with tumor control AND side-effects is 16% with treatment A versus 36% with treatment B

Therapeutic ratio (II)

$$R = \frac{TCP}{NTCP}$$

- Easy to interpret: this is the cure rate in percentage point per percentage point patients with toxicity

- Very sensitive to statistical uncertainty for small values of NTCP

- Face validity?

  TCP=40% and NTCP=1% $\Rightarrow$ R=40

  TCP=80% and NTCP=2% $\Rightarrow$ R=40

There are 2 preoperative radiation regimens accepted as standard:

- Short course (5 X 5 Gy delivered over 1 week) with surgery performed ideally within the next 5 days
- conventionally fractionated chemoradiation 45-50.4Gy (25-30 fractions of 1.8 or 2 Gy over 5-6 weeks) with surgery performed 4 to 10 weeks after treatment completion.

- (Folkesson et al, JCO 23, 24: 5644 – 5650, Kapiteijn *et al*, NEJM, 345 (9), 638-646, 2001, David Sebag-Montefiore *et al,* Lancet. 2009 Mar 7;373(9666):811-20)

The ideal fractionation/dose

To reduce local recurrence prior to surgery

To combine with chemotherapy to achieve maximum down-staging

To avoid surgery (non-operative/organ sparing)

To fit with systemic chemotherapy (adjuvant, neoadjuvant or palliative

To minimise late effects

To produce the optimum immune effects

To reduce local recurrence

Who uses preoperative Chemoradiation?

45Gy?

50Gy?

Higher?

Locally advanced Rectal Cancer (LARC) 1:

- Low doses of RT are administered
- Chemoradiation and SCPRT are potentially curative treatments for locally advanced rectal adenocarcinoma.
- Not usually intended to be curative ‘per se’ (unless brachytherapy/Papillon boost)

Locally advanced Rectal Cancer (LARC) 2:

- However, only 10-25% achieve a pathological CR or CCR after definitive CRT
- Approx 30-40% of patients fail to respond
- Most patients will not achieve sustained local control unless surgery is added.
- Despite low dose - considerable late morbidity
- Late morbidity is contributed to (but not usually caused) by surgery.

Therefore if you are going to model

You have to know that you are comparing like with like

Therefore if you are going to model

You have to know that you are comparing like with like

Unless you control for the quality of surgery

then you simply cannot model RT dose and local control

Therefore if you are going to model

You have to know that you are comparing like with like

Unless you control for the quality of pathology

then you simply cannot model RT dose and local control

Randomised trials SCPRT (5x5Gy)

Trial	MRI mandated	EUS mandated	TME mandated	Good Quality TME	Median no of nodes resected

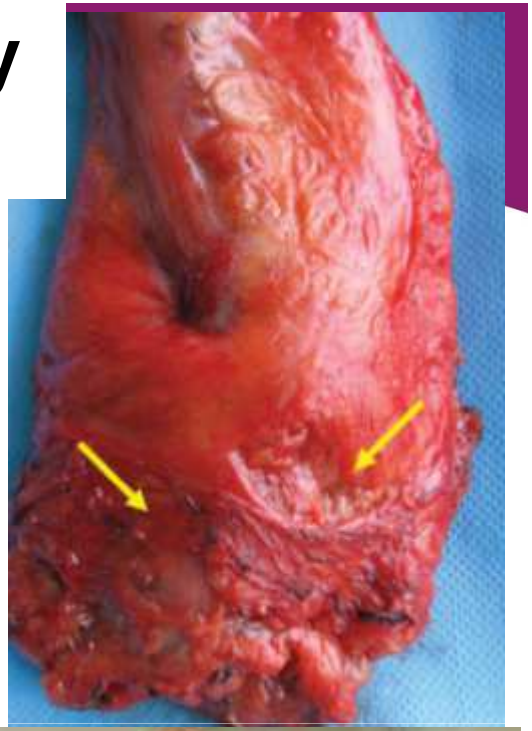
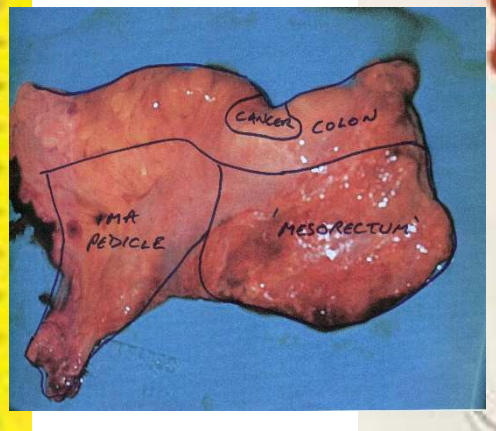
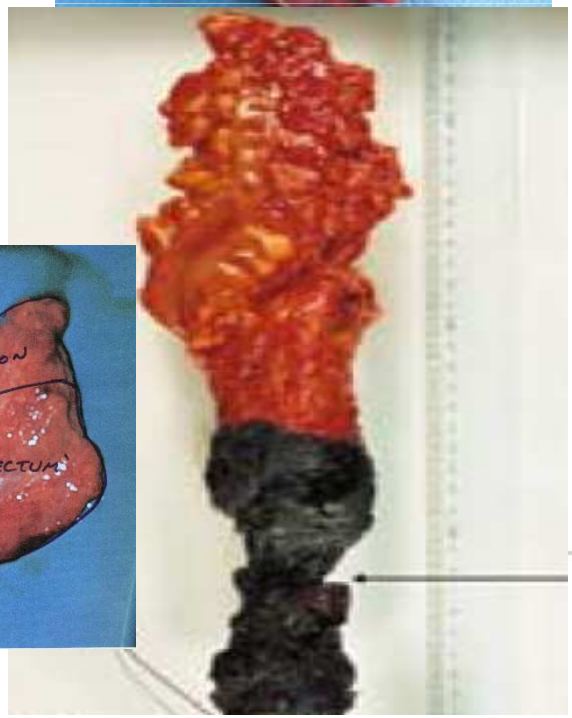
We can judge the quality of the Surgery







Aims from this session

Is there a standard ?

or

Can we select patients for short course/long course chemoradiation and total dose and fractionation

ie Risk adaptive/aims adaptive

Can we tailor the treatment to the individual patient?

Dose/ fractionation

Depends on what we are trying to achieve??

Aims of treatment: 1

- Radiotherapy to render unresectable/borderline resectable cancers (CRM+) resectable

Aims of treatment 2. Resectable cancers

- To reduce the risk of local recurrence
- To help to achieve sphincter/organ sparing?

ie Refuseniks/ frail, aged or unsuitable for radical surgery because co-morbidity

What is the mechanism of effect of preoperative CRT?

1. To prevent local recurrence by treating microscopic areas not seen and so not routinely removed by surgeon (discontinuous deposits etc ?
2. To prevent local recurrence by treating areas not routinely removed by surgeon (external iliac nodes/obturator nodes etc..) ?
3. To prevent local recurrence by countering spillage ie rendering cells non-viable with RT?
4. To prevent local recurrence by countering spillage growing ie tumour bed effect?
5. To prevent local recurrence by compensating for poor surgical technique?
6. To prevent local recurrence by immune effects?

So what is the optimum fractionation/dose?

Fluoropyrimidine based chemoradiation?

Fractionation 1.8Gy-2.0Gy conventional

more toxicity if combined with larger fractions

Reasonable to add Papillon/brachytherapy if surgery not intended

?evidence for EBRT dose escalation in randomised studies

ABSTRACT

Purpose: We conducted a systematic review and meta-analysis to quantify the pathological complete response (pCR) rate after preoperative (chemo)radiation with doses of $\geqslant$60 Gy in patients with locally advanced rectal cancer. Complete response is relevant since this could select a proportion of patients for which organ-preserving strategies might be possible. Furthermore, we investigated correlations

Conclusion

"Dose escalation above 60Gy for locally advanced rectal cancer results in high pCR-rates and acceptable early toxicity."

Randomised trials of Dose escalation of RT

Are there any trials?

Viani

- using this model, we could hypothetically predict that a BED of approximately 68.8 Gy_{10} would need to be delivered to patients with localized rectal cancer to achieve 100% local control with surgery

- using a high dose for fraction of 5 Gy to achieve a BED Gy_{10} of 68.8 would require nine fractions, resulting in a BED of 117 Gy_3.

Conclusions

Thank you

For optimum dose – we would need

Large randomised trials

Meta-analyses with large number of individual patient data

Controlled for quality of surgery/pathology

performed over a short time frame with little change in radiation delivery

The same field sizes

- Radiotherapy is generally regarded as a cell death inducing technique.

- Radiation also induces inflammatory or anti-inflammatory reactions depending on dose and fractionation

Reichl B, et al. DEGRO practical guidelines for radiotherapy of non-malignant disorders: Part I: physical principles,radiobiological mechanisms, and radiogenic risk. Strahlenther Onkol 2015;191(9):701-9.

Shahabi V, et al. Immune-priming of the tumor microenvironment by radiotherapy: rationale for combination with immunotherapy to improve anticancer efficacy. Am J Clin Oncol 2015;38(1):90-7.

PCR and CCR not the same (but some linkage)

small tumours show high rate of pCR and high rate of cCR (about 30- 40%)

and high rate of agreement between pCR and cCR (about 70%)

CCR evident within a few weeks

No of patients	pCR	ypT1	ypT2	ypT3
62	20 (32%) 13/27 (48%) with uT0/uT1 disease 5/29 (17%) with uT2	23 (37%)	18 (29%)	1 (2%)

ESTRO School

Larger Tumours (T3/T4)

Lower rate of pCR (about 15%) and lower rate of cCR (about 5% in some studies at 6-8 weeks)

lower rate of agreement between pCR and cCR (ulceration and fibrosis may not mean tumour is present)

May need to wait much longer to assess CCR

Evidence Base:There is a systematic bias

Earlier historical trials

- Gave lower doses of RT
- Gave less effective chemotherapy
- Had shorter intervals to surgery
- Were not accurately staged
- Did not perform such good quality surgery
- Did not have good pathology (accurate pCR)

ESTRO School

Tumour control Probability (TCP)

- Appears different according to T stage (T1/T2 versus T3/T4)
- And nodal stage

- Local response is time dependent
- Local control may be blurred by the occurrence of metastases

NTCP

May be different according to

T stage (T1/T2 versus T3/T4)and nodal stage because may reflect field size

Modern more sophisticated and less toxic methods of radiotherapy delivery with IMRT

Different fractionation schedules

Brachytherapy for Rectal Cancer

Karin Haustermans on behalf of Corrie Marijnen

Department of Radiation Oncology

UZ Leuven

ESTRO School

Introduction

Surgery = mainstay of cure for rectal cancer

However:

- Serious adverse events possible[1-3]
- Postoperative mortality increases in the elderly:
  - 12% vs. 3-4%[4]

➔Radiotherapy with curative intent for a subgroup of patients

1. Peeters et al. J Clin Oncol 2005;23(25):6199-6206
2. Birgisson et al, J Clin Oncol 2005;23(34):8697-8705
3. Frykholm et al. Dis Colon Rectum 1993;36(6):564-572
4. Marijnen et al. J Clin Oncol 2002;20:817-825.

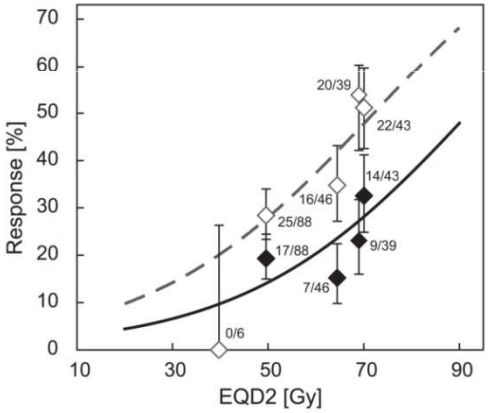
Dose escalation

- Dose response relationship in rectal cancer
- EBRT dose escalation leads to increased toxicity
- Other strategy is needed

➔ Intracavitary irradiation

→ Contact Therapy (Papillon)

→ Endoluminal Brachytherapy (EBT)

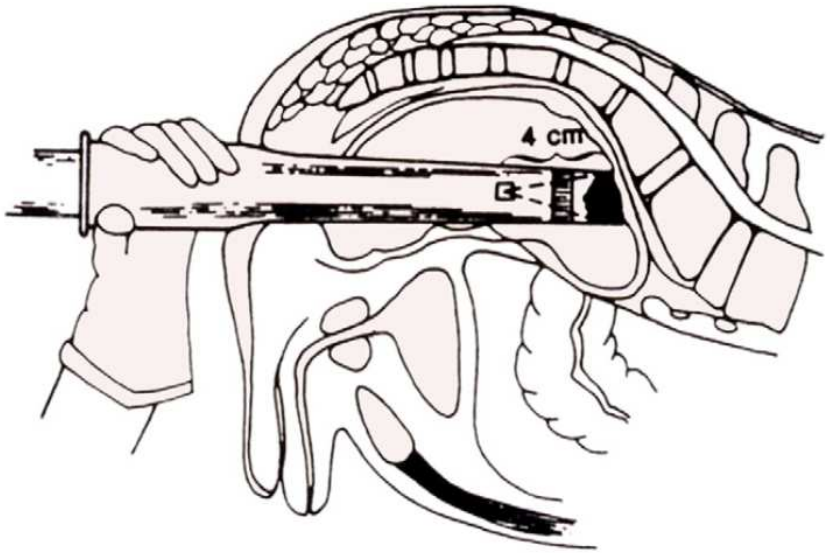


ESTRO School

CONTACT THERAPY (PAPILLON)

Contact Therapy (Papillon)

- Jean Papillon (Lyon)
- 50 kV maximal energy X-ray beam
- Focal distance of 4 cm
- Applicator diameter of 20-30 mm
- Direct visual control
- Outpatient basis
- Output: 20 Gy/min
- Percentage depth dose:
  - 100% at surface
  - 44% at 5 mm
  - 10% at 20 mm



Gerard et al. Clin Oncol (R Coll Radiol) 2007;19(9):661–73.

ESTRO School

Contact therapy (Papillon)

- Dose prescribed at the surface of the tumor
- Steep fall-off of dose with depth

  44% at 5 mm

  25% at 10 mm
- Delivery of large doses per fraction (approximately 30 Gy per fraction)
- Gradual destruction of exophytic tumours layer per layer in a few fractions
  - 3-4 fractions (90-120 Gy)
  - 4-6 weeks overall treatment time

Gérard et al. Int J Radiat Oncol Biol Phys. 1996;34(4):775–83.
Papillon et al. Int J Radiat Oncol Biol Phys. 1989;17(6):1161-9
Coatmeur et al. Radiother Oncol 2004;70(2):177–82.

Contact therapy alone

Papillon:

- 312 patients between 1951 – 1984
- T1 and favorable T2 rectal adenocarcinoma
- 5Y local control: 90 %
- 5Y overall survival: 75 %
- Low morbidity

Mendenhall:

- Early stage rectal adenocarcinoma
- 20 patients contact therapy vs. 45 patients local excision +EBRT
- 5Y LC 80 vs. 86%

Papillon et al. Int J Radiat Oncol Biol Phys. 1989;17(6):1161-9
Mendenhall et al. J Clin Oncol 1997;15(10):3241-3248

Contact therapy alone

Coatmeur:

- 124 patients treated with contact therapy +/- interstitial brachytherapy
- Outcome was related to Dijon clinical staging (T1 < 3 cm; T2 > 3 cm)
- Average dose 95 Gy
- 10 patients interstitial brachytherapy 24 Gy
- 5Y LC: 83 % (T1) and 38 % (T2)
- 5Y OS: 62,4 %

Papillon, Mendenhall & Coatmeur:

→ **Local control rate for tumors < 3 cm is good**

→ **Contact therapy can be an alternative to surgery**

→ **Results not satisfactory for tumors > 3 cm**

Coatmeur et al. Radiother Oncol 2004;70(2):177–82.
Marijnen et al. Clin Oncol (R Coll Radiol) 2007;19(9):706–10.

Combined therapy

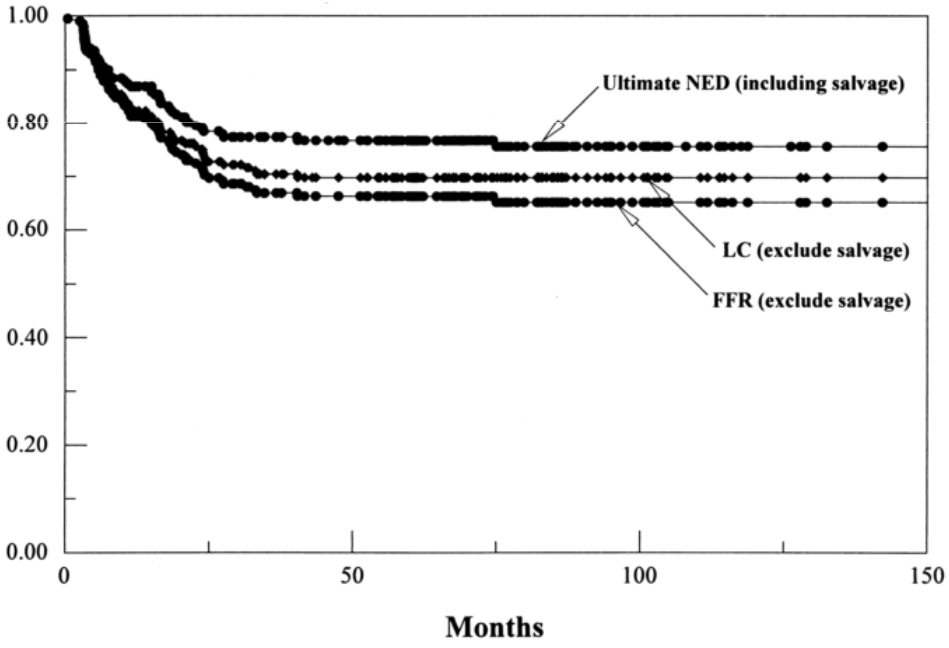
Aumock:

- 199 patients with local rectal cancer
- 77 cases staged by ERUS
- Contact therapy alone (n=21) or preceded by EBRT (45Gy/1,8Gy) (n=178)

- 71 % local control (141 patients)
- Significant factors for control:
  - Mobility on palpation
  - Use of EBRT
  - Pretreatment debulking
- LC 100% if uT1, 85% freely mobile uT2, 56% uT3 and immobile uT2

➔ **Excellent results for small tumors**

➔ **Reasonable results for larger tumors**



Aumock et al. Int J Radiat Oncol;51(2):363–70.

ESTRO School

Contact therapy - Conclusions

- Tumor < 3 cm: contact therapy is an alternative for surgery
  - T1 or early T2 (freely mobile)
  - No nodal involvement
- Tumor > 3 cm: combination with EBRT (39 – 45 Gy) or interstitial brachytherapy (20 – 30 Gy) and close follow-up is needed
- Local control 70 – 90 %
- Toxicity is acceptable
  - Acute: 10 – 40%, mainly mucositis, no grade 3 – 4 toxicity
  - Late: mainly rectal bleeding or ulceration
- **TWO DRAWBACKS:**
  - **Diameter of the proctoscope determines the maximal size of the tumor that can be treated (max. 4 – 5 cm)**
  - **Rapid dose fall-off hampers treatment of tumors invading mesorectal fat**

Gérard et al. Int J Radiat Oncol Biol Phys. 1996;34(4):775–83.
Papillon et al. Int J Radiat Oncol Biol Phys. 1989;17(6):1161-9

ENDOLUMINAL BRACHYTHERAPY

ESTRO School

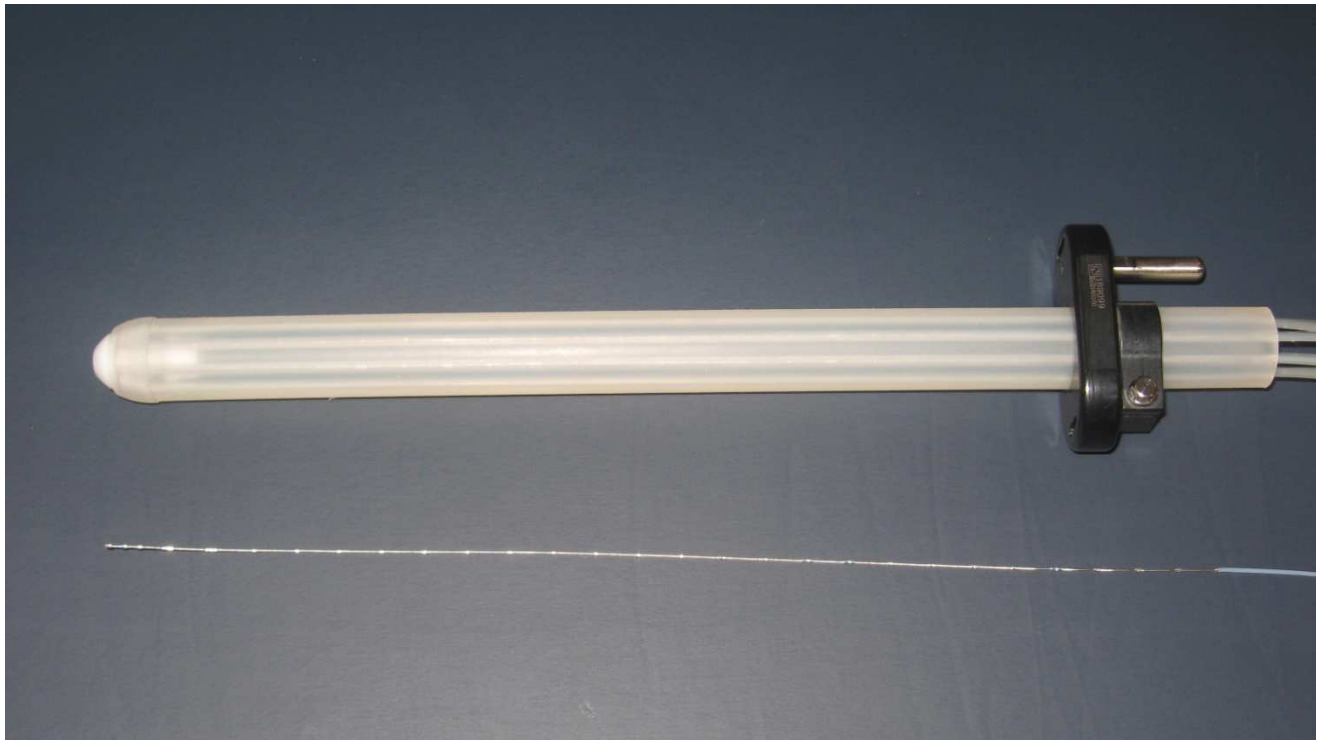
1. HDR-EBT – Procedure

- HDR Brachytherapy
- Remote after-loading system using 192-Ir
- Most common: single source catheter
  → Dose prescription at 1 cm
- More recently: flexible catheter with 8 channels
  → Selective loading possible
  → Dose prescription at tumor radial margins (better dose penetration at the radial depth)
- Treatment time: 10 min per fraction
- Curative, adjuvant and palliative treatment possible

Vuong et al. Brachytherapy 2005;4:230e235.

ESTRO School

Flexible multi-channel rectal probe



1. HDR-EBT – Procedure

- MRI and EUS for staging
- Sigmoidoscopy to clip tumor
- Planning CT scan with applicator in situ
- Delineation of tumor on CT scan
- Optimizing dose with planning system
- HDR radiotherapy (consecutive days)
- Position verification with X-rays and clips

Vuong et al. Brachytherapy 2005;4:230e235.

2. HDR-EBT – Alternative to EBRT

Hesselager:

- Resectable rectal cancer (T1, T2, T3)
- 318 patients: preoperative HDR-EBT (4x 6,5 Gy) → surgery after 4 – 8 weeks
- Matching with Swedish Rectal Cancer Registry:
  - 318 patients SCRT: 5x 5 Gy EBRT
  - 318 patients surgery only

- Purpose: to compare immediate postoperative outcome after EBRT with outcome after HDR-EBT

Hesselager et al. Color Dis. 2013;15(6):662–6.

ESTRO School

2. HDR-EBT – Alternative to EBRT

Variable	HDREBT (n = 318)	SCRT (n = 318)	RT- (n = 318)	P-value HDREBT/SCRT
Cardiovascular	30 (9.4%)	10 (3.1%)	23 (7.2%)	0.002
Infection	30 (9.4%)	26 (8.2%)	20 (6.3%)	0.2
Surgery-related overall	87 (27.4%)	87 (27.4%)	71 (22.3%)	0.3
Wound infection	29	39	19	0.25
Intra-abdominal infection	12	8	9	0.4
Anastomotic dehiscence	13	20	13	0.2
Wound dehiscence	9	8	5	0.4
Reoperation	13 (4.1%)	45 (14.2%)	39 (12.3%)	0.0005

Conclusion:

- **No major differences in postoperative complications when comparing HDR-EBT with SCRT or surgery only.**
- **HDR-EBT appears to be a safe alternative**

Hesselager et al. Color Dis. 2013;15(6):662–6.

ESTRO School

3. HDR-EBT – Boost after EBRT

Dose-Effect Relationship in Chemoradiotherapy for Locally Advanced Rectal Cancer: A Randomized Trial Comparing Two Radiation Doses

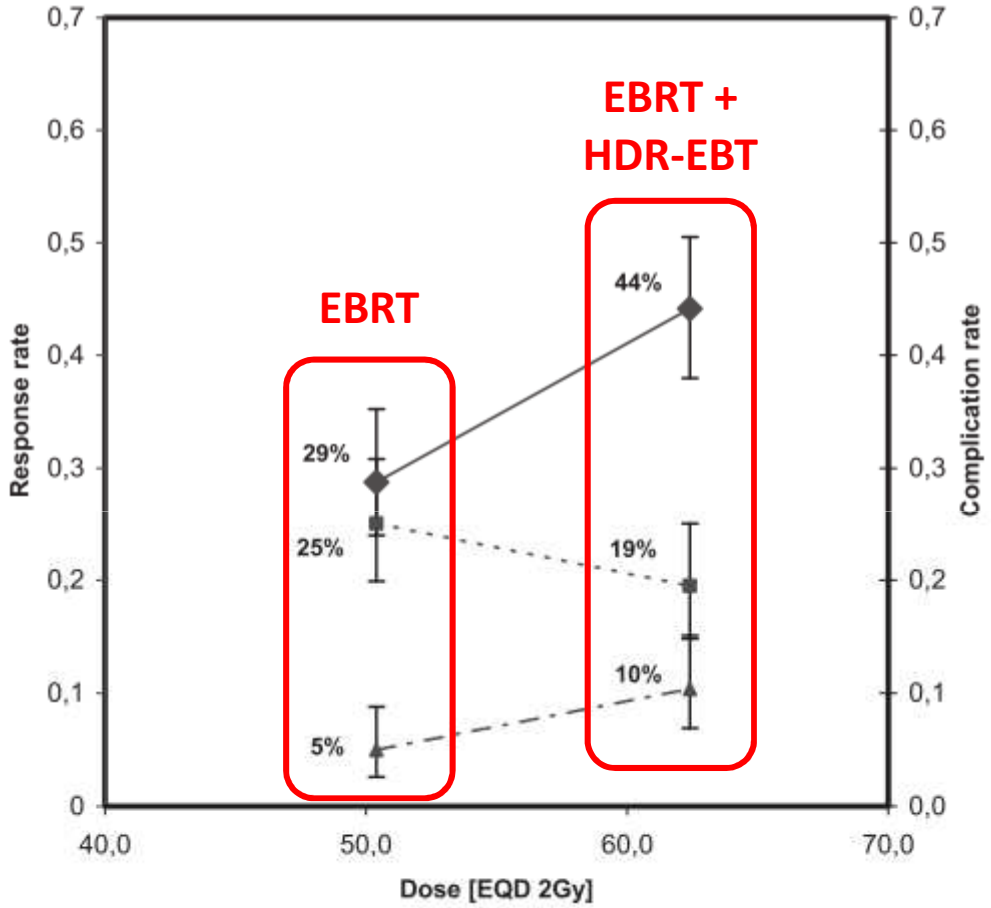
Anders Jakobsen, DMSc,*,† John Ploen, MD,† Té Vuong, MD,‡ Ane Appelt, MSc,*,† Jan Lindebjerg, MD,* and Soren R. Rafaelsen, MD*

- A dose-escalation phase III trial comparing 2 doses of radiation:
  - → 50,4 Gy in 28 fractions (n = 123)
  - → 50,4 Gy in 28 fractions + HDR-EBT boost 10 Gy in 2 fractions (n = 120)
- Both arms concomitant chemotherapy

- **Primary endpoint: pCR**
- Secondary endpoints:
  - → Tumor response
  - → Rate of complete resection

Jakobsen et al. Int J Radiat Oncol Biol Phys;84(4):949–54.

3. HDR-EBT – Boost after EBRT

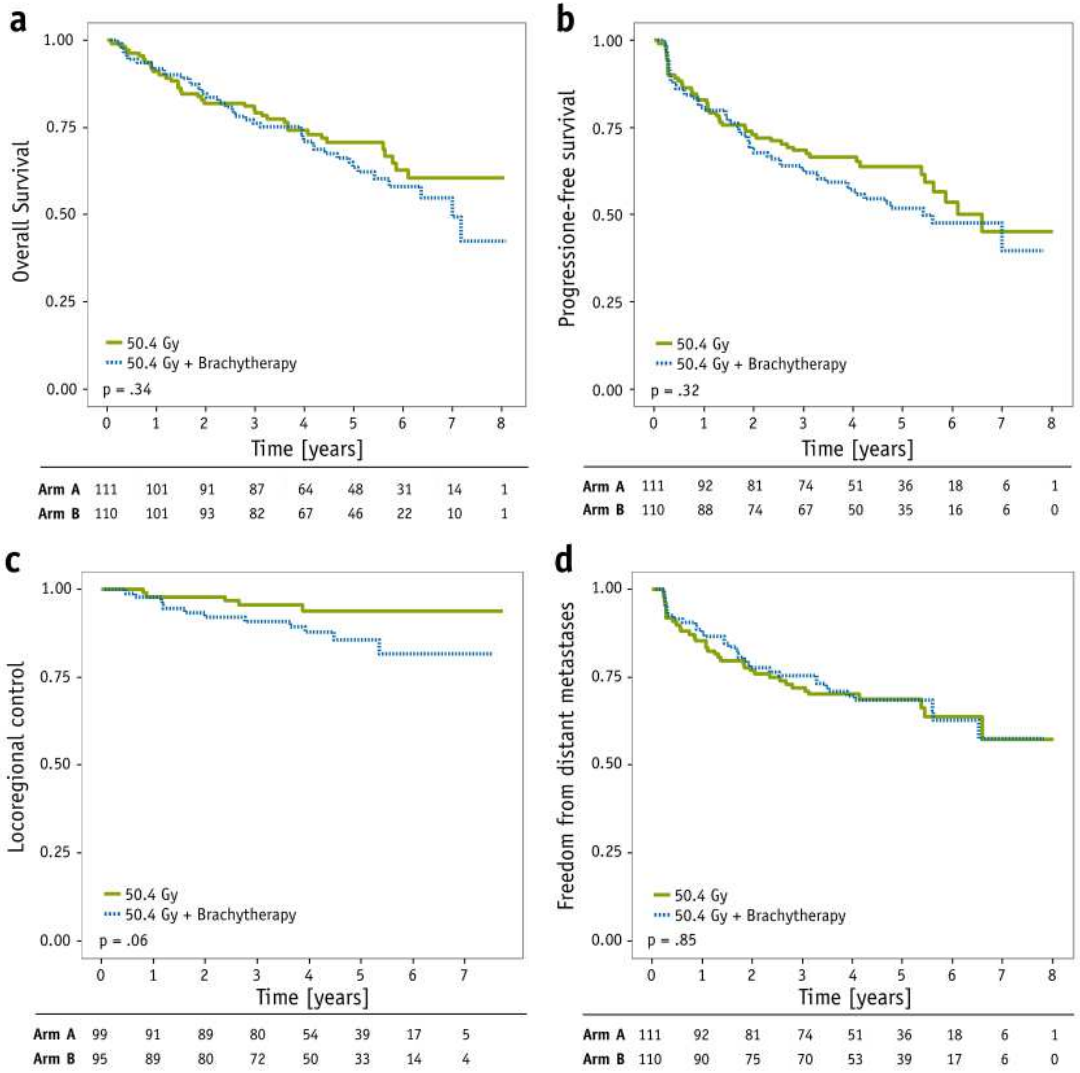


➔ **HDR-EBT boost is feasible without increase in toxicity**

Jakobsen et al. Int J Radiat Oncol Biol Phys;84(4):949–54.

ESTRO School

3. HDR-EBT – Boost after EBRT



Late results (published in 2014)

- No benefit on late outcome (OS, PFS, LC, distant mets)
- Improved tumor regression does not lead to relevant clinical benefit when high-quality surgery is performed

Appelt et al. Int J Radiat Oncol Biol Phys. 2014;90(1):110–8.

ESTRO School

4. HDR-EBT – Palliation

Hoskin:

- HDR-EBT with a single channel applicator
- 50 inoperable rectal cancer patients
  - → Palliation (n=22): HDR-EBT 1x10 Gy
  - → Unfit for surgery (n=26): radical treatment
    - HDR-EBT 6x6 Gy
    - HDR-EBT boost of 12 Gy after 45 Gy/1,8 Gy EBRT+CTx

Table 1
Patient details

Age	
Median	82.3 years
Range	35–91 years
Males	25
Females	25

Hoskin et al, Radiother Oncol 2004;73(2):195–8.

4. HDR-EBT – Palliation

- Local tumor response only available for 25 patients: median duration 7 months
  - 14/25 achieved complete remission
  - 7/25 achieved partial remission
  - 4/25 reached stable disease
- Limited toxicity

➔ **HDR-EBT:**

- **Simple outpatient procedure**
- **Minimal toxicity**
- **Important role in offering effective and durable palliation for the frail elderly**
- **Can be offered in combination with EBRT when surgery is contra-indicated**

Hoskin et al, Radiother Oncol 2004;73(2):195–8.

5. HDR-EBT – Definitive option

Herbert study (presented at ESTRO 2016)

- Dose-finding feasibility study of EBRT + HDR-EBT boost for patients unfit for surgery
- Rectal adenocarcinoma < 15 cm, < 2/3 of circumference, cT2-4 N0-1 M0-1
- Life expectancy ≥ 6 months

Marijnen C., Rijkmans E. LUMC, Leiden, The Netherlands.
Presented at ESTRO 2016

ESTRO School

HDR-EBT – Conclusions

1. **HDR-EBT delivers a high dose to the tumor and a limited dose to surrounding normal tissues**
2. **In resectable rectal cancer, HDR-EBT is a feasible and safe alternative to EBRT**
3. **HDR-EBT can be used as a boost technique after EBRT:**
   - **No increase in toxicity**
   - **No improved outcome (OS, PFS, LC, distant metastases)**
   - **However, higher tumor regression grade potentially interesting for organ preservation strategies**
4. **Effective palliation can be obtained with HDR-EBT, which is a simple outpatient procedure**
5. **In elderly inoperable patients, trials for EBRT + HDR-EBT as a definitive option are ongoing**

Small bowel enteritis

Small bowel Toxicity

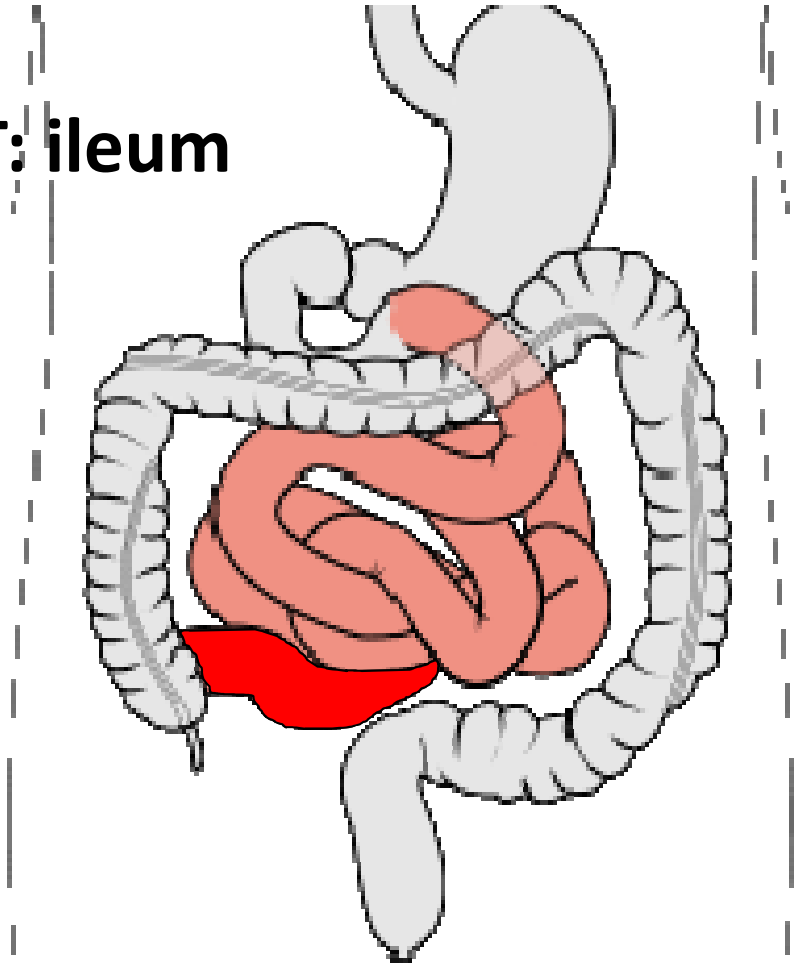
- **Acute SB toxicity**
  - Any grade **20-70%**

- **Late SB toxicity**
  - Any grade: **5-30%**
  - **65%** long survivor patients

Acute Small Bowel toxicity

@ the 2nd II week of treatment → month after treatment

Most frequent site in pelvic RT: ileum



Symptoms:

- Abdominal pain (cramps)
- Diarrhea
- Nausea
- Lack of appetite
- Weight loss

Andreyev HJ. Clin Oncol.2007 **Ruiz-Tovar.** J,Clin Transl Oncol 2009

Acute SB Toxicity: pathogenesis

DAMAGE

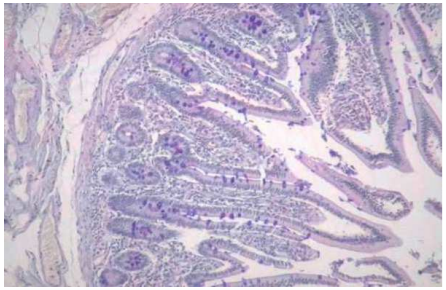
↓

ADSORPTION

↓

SYMPTOMS

Distortion of the villous → enzymatic deficit→ decreased capability to digest macromolecules in the intestinal lumen



Accumulation of **glucides e peptons** retains osmotically fluids in the bowel lumen. **Osmotic DIARRHEA**

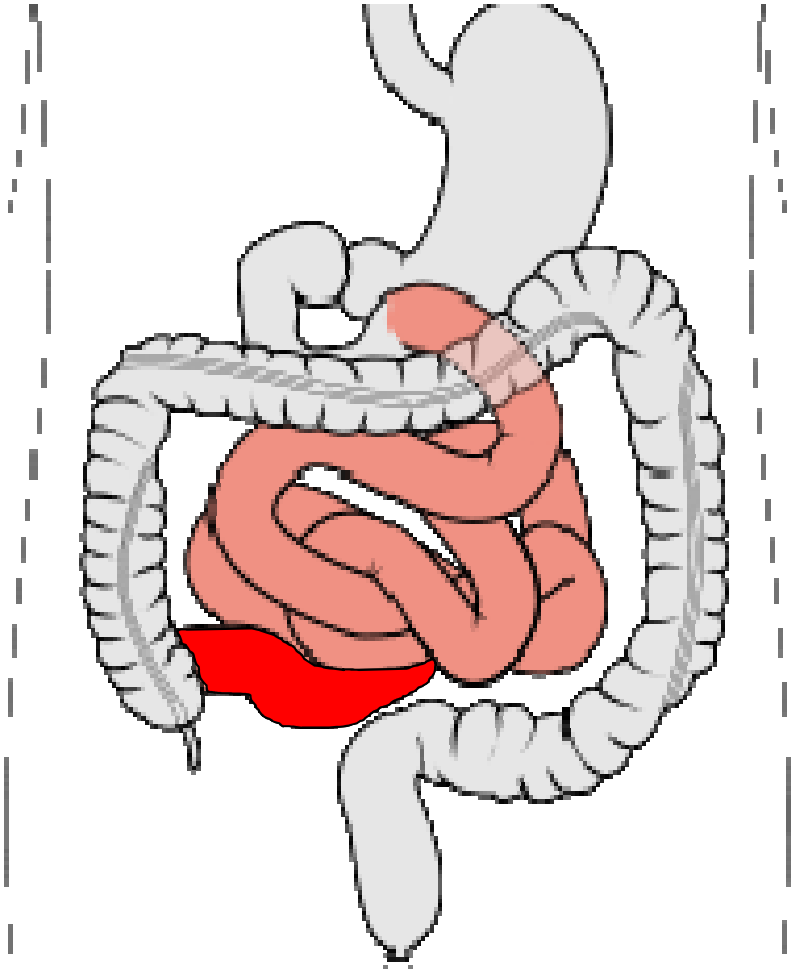
Increase of **organic residues** with **ph reduction** → reduced adsorbtion of electrolites, gas production, endotoxin secretion. **METHEORISM, CRAMPS, PAIN**

Increase of the intraluminal fats → decreased absorption of biliary salts→ Direct mucolytic action, increased cellular permeability and sodium trasudation
Hyperperistaltism → Reduction of the transit time
Increased pathogenic bacterial. Aqueous DIARRHEA

loss of appetite, weight loss, electrolyte imbalance…

Late Small Bowel toxicity

- **Time:** 18 mths - 6 yrs after treatment. Cases also after 15 yrs
- **Incidence:** increased with survival, reported 1/5 patients
- **Underestimated**
- **Cause:** RT dose and volumes.
- **Medical treatment**: 55% of symptomatic pts requires medical treatments



Game B. Aliment Pharmacol Ther 2003

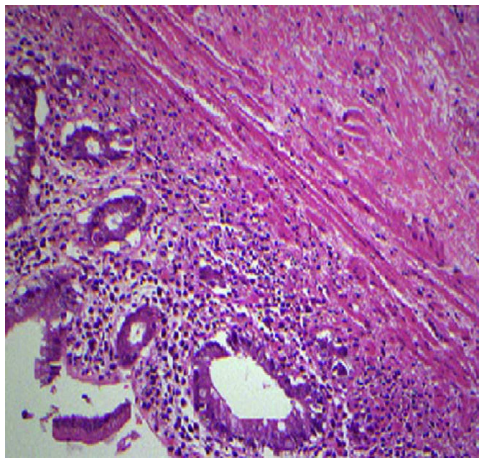
Late SB Toxicity: pathogenesis and symptoms

DAMAGE

- Vascular degeneration (endoarteritis)
- Collagen production/deposition
- Damage of the lymphatic vessels

- Ischemia
- Intestinal wall edema
- Mucosal ulcer
- Intestinal wall necrosis
- Hemorrages
- Strictures/Stenosis
- Adherences

SYMPTOMS



Sub-mucosal fibrosis, atipical fibrobasts, inflammatory infiltration, increased size of the endotelial cells

- Intestinal transit alterations: PAIN and CRAMPS
- Alternating STIPSIS and DIARRHEA
- Maladsorption syndrome, FOOD INTOLEREANCE
- Bleeding and anemia

Management during therapy

150	42.5 (4.7)	> Control ($p = 0.034$)
100	18.3 (3.4)	< 150 U ($p < 0.001$) < 50 U ($p = 0.006$) < 25 U ($p = 0.022$) < Control ($p = 0.016$)
50	34.9 (3.9)	
25	31.9 (3.9)	
Control	29.7 (2.3)	

Vuong T et al. IJROBP 2011

Proctitis toxicity scale CTCAE v.04

	Grade 1	Grade 2	Grade 3	Grade 4	Grade 5
P R O C T I T I S	Rectal discomfort, intervention not indicated	Symptoms (e.g., rectal discomfort, passing blood or mucus); medical intervention indicated; limiting instrumental ADL	Severe symptoms; fecal urgency or stool incontinence; limiting self care ADL	Life-threatening consequences; urgent intervention indicated	Death

Acute Proctitis: therapy

Topic steroids → RESOLUTION of ACUTE SYMPTOMS (burning, pain, mucous…)

Mesalazine (5-ASA) oral 3/day + topical 1/day

→ **REDUCTION** of hemorragic proctitis,

→ NO ACTION on pain, tenesmus or frequency of defecation

Sucralphate: Sucrose sulfate-aluminium complex that binds to the ulcer, creating a physical barriers

→ **ACTIVE** in chronic proctitis

→ **small**/no EFFECT in ACUTE proctitis

Sodium Butyrate: short chain fatty acid, produced by colon bacteria, increasing blood flow and mucosal integrity

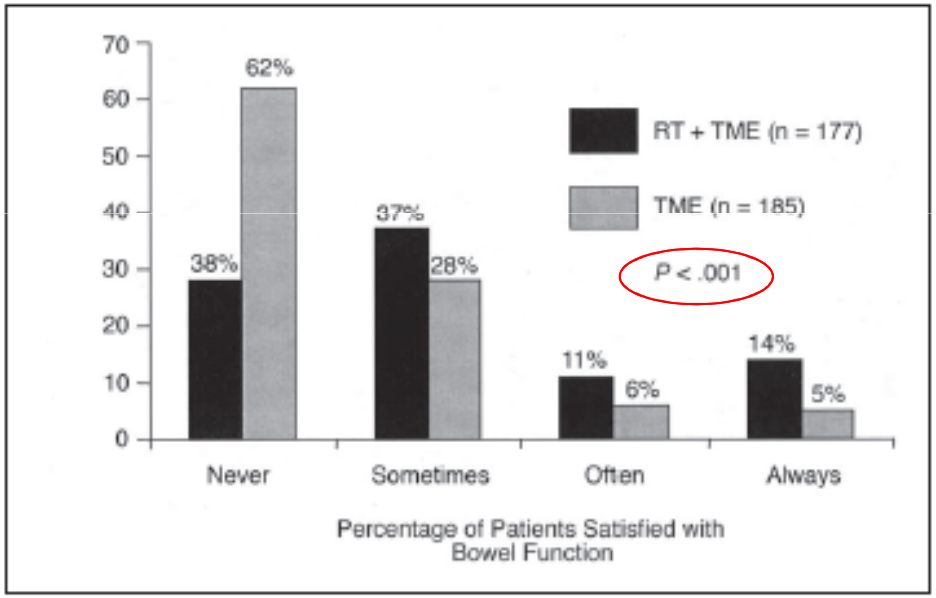
→ **small EFFECT** vs PLACEBO in ACUTE PROCTITIS

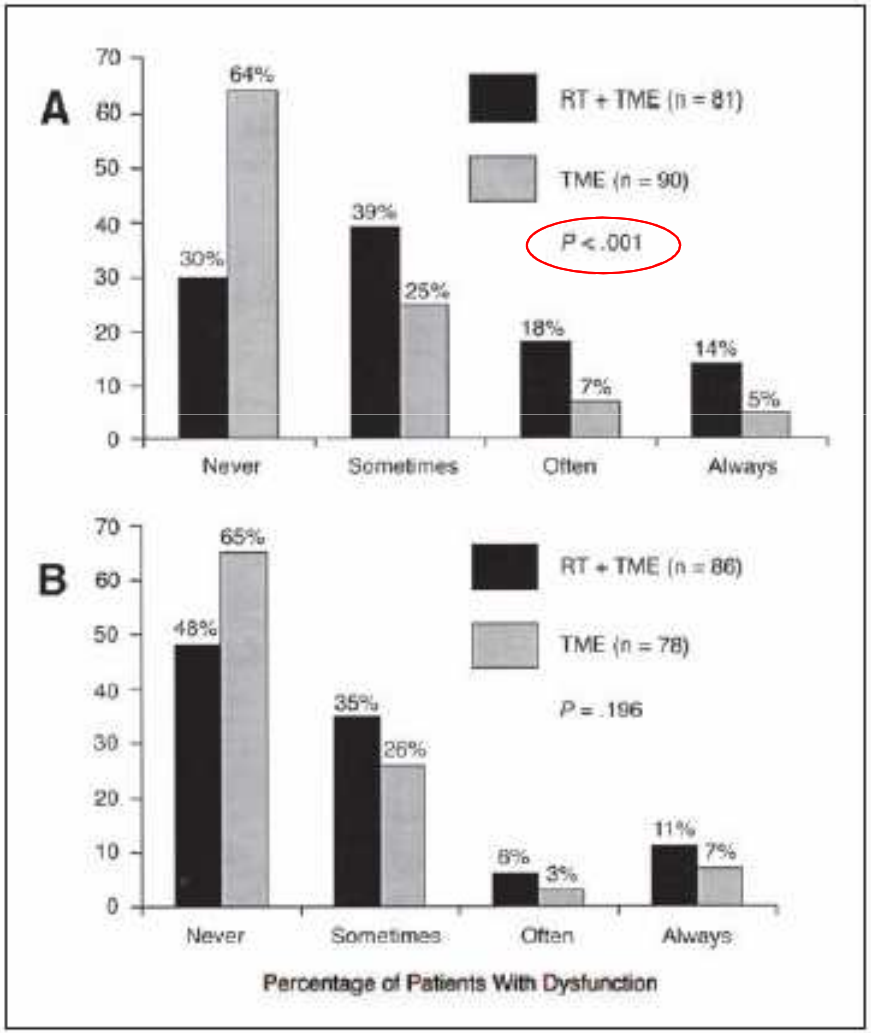
Gibson RJ et al. Supp Cancer Care 2013

INCONTINENCE

Bowel funtion: incontinence

Dutch Trial



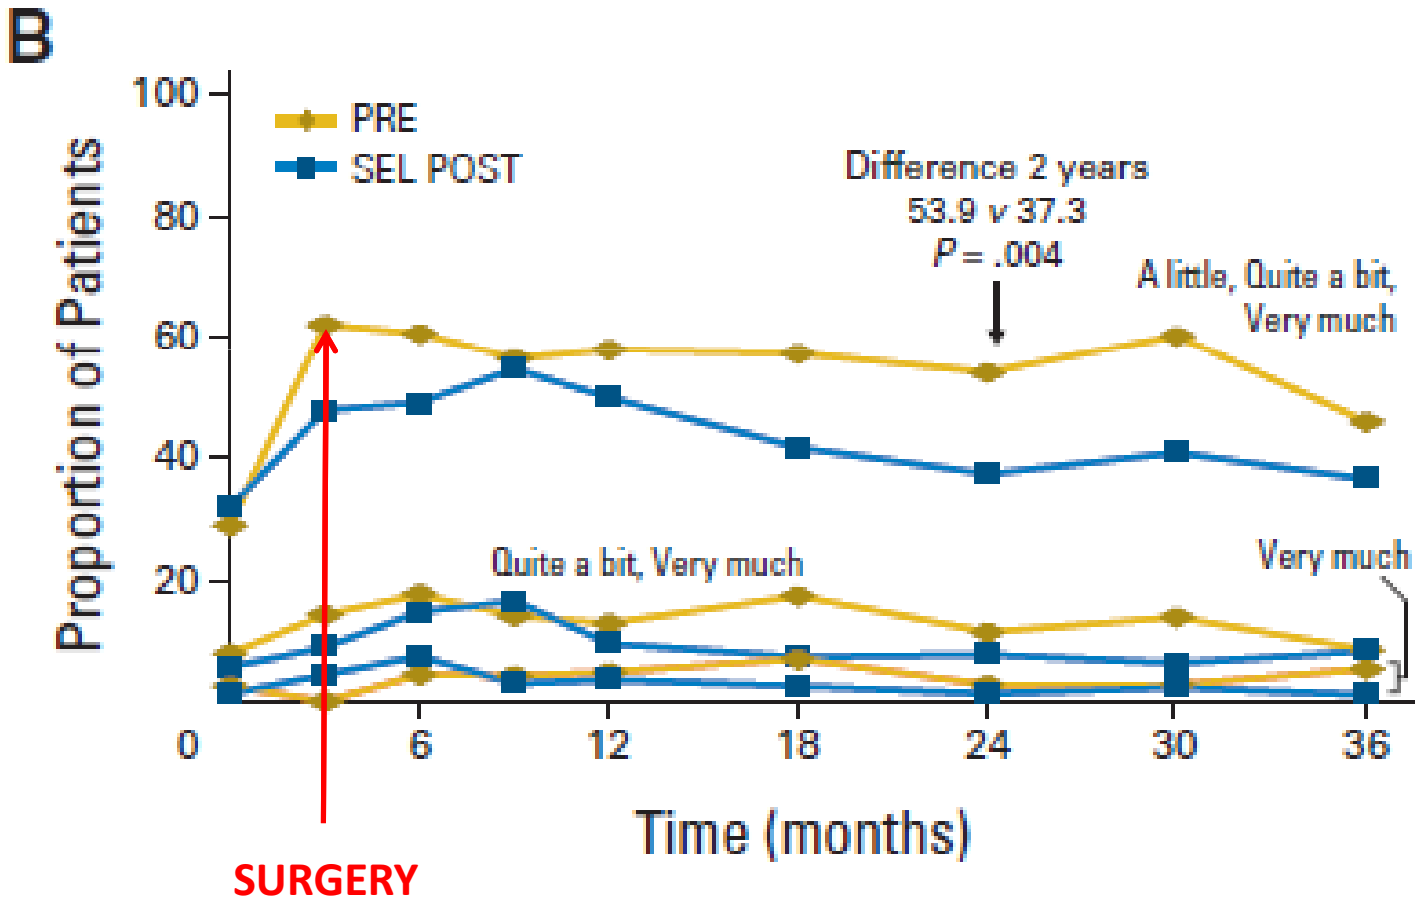


A: mid rectum (5-10 cm)
B: high rectum (10-15 cm)

Peeters et al JCO 2005

Unintentional release of stool

MRC-CR07 trial



Stephens et al JCO 2010

Bowel QLQ-C30 (no stoma)

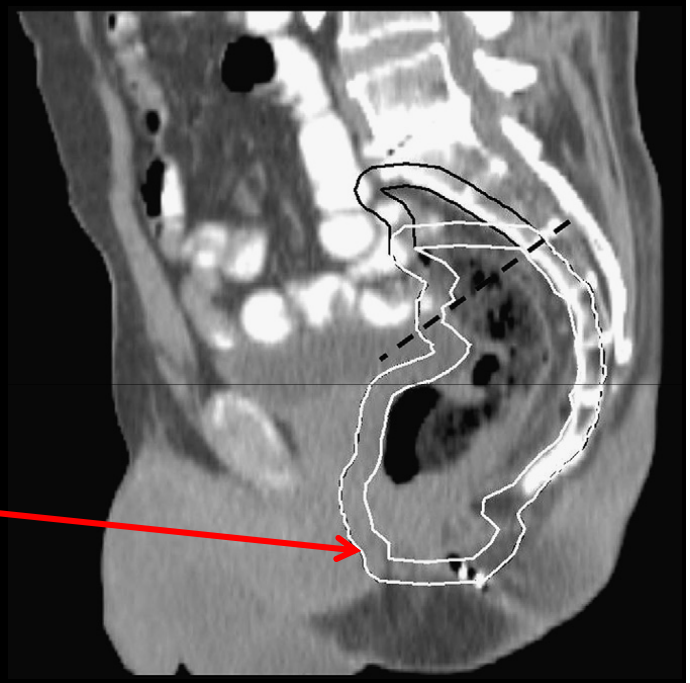
Treatment	Incontinence for liquid	Incontinence for gas
RT	38%	56%
RT-CT	58%	75%
Treatment	**Good function**	**P**
RT	30%	0.046
RTCT	11%	

Braendegen et al IJROBP 2011

CTV reduction: sphincter

Anal canal inclusion in CTV → incontinence

Anal canal in CTV	Y	N	p
incontinence	93%	65%	0.059



Inferior limit → avoid anal sphincter and IRF when not invaded

DISTAL MARGIN from the tumor
High → T + 4 cm margin of mesorectum
mid-low → entire mesorectum

SEXUAL FUNCTION

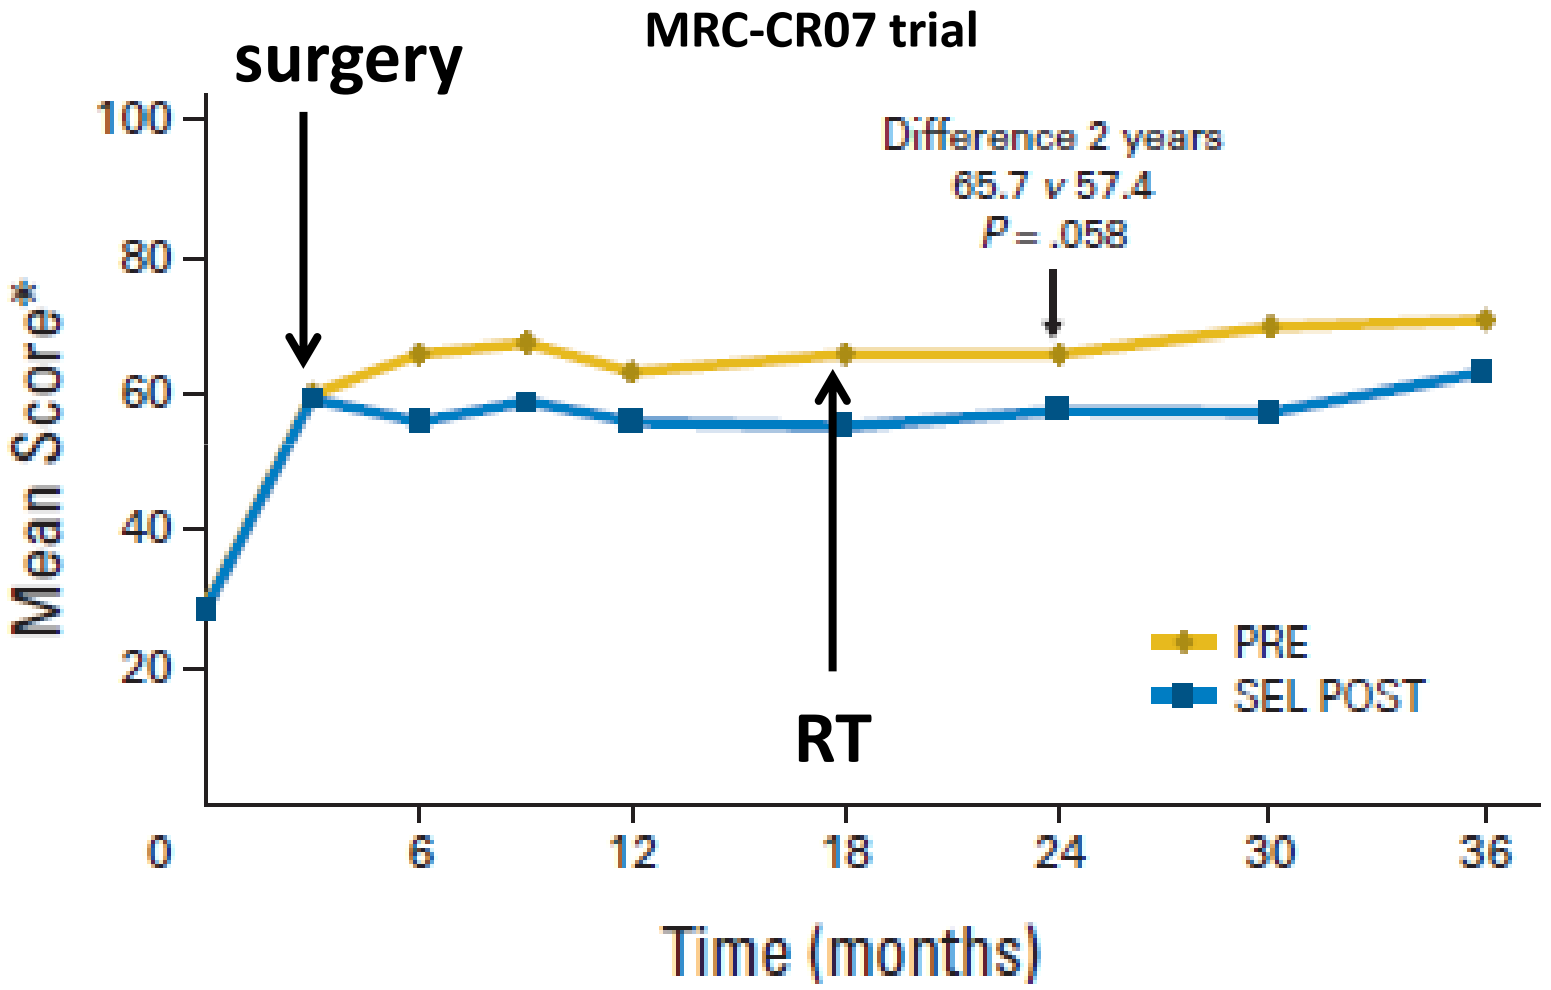
Sexual function: SC-RT

Dutch trial

SEXUAL ACTIVITY (pts active before therapy)	Sex	TME	RT-TME	p
	Male	76%	67%	0.06
	Female	90%	72%	0.01

Marijnen et al JCO 2005

Sexual function (male*)



*Only 11% of women completed the questionnaire at 2 yrs

Stephens et al JCO 2010

Male sexual function: IIEF (LC-RT)

	CRT ($n = 26$)	RT ($n = 18$)	Maximum points on IIEF questionnaire
Age (y)	66 (42–79)	64 (51–78)	
Erectile function*	6.9 (1–29)	10.4 (1–29)	30
Orgasmic function	2.6 (0–10)	3.9 (0–10)	10
Sexual desire	4.8 (2–8)	5.6 (2–9)	10
Intercourse satisfaction	2.7 (0–13)	4.2 (0–13)	15
Overall satisfaction	4.5 (1–9)	4.9 (1–9)	10

***1-10: severe dysfunction**

11-16: moderate dysfunction

17-21: mild to moderate dysfunction;

22-25: mild dysfunction;

26-30: no dysfunction

Braendegen et al IJROBP 2011

Female sexual function (LC-RT)

- < 50% sexually active during the last month
- vaginal dryness during intercourse
- Low interest in sex
- Sex doesn’t affect their life

Braendegen et al IJROBP 2011

CTV: sexual

Anterior limit

Exclude inferior part of the vagina (Bartolini glands)

Inferior limit: penile bulb

D 70	Erectile dysfunction
0-40 Gy	0%
40-70 Gy	80%
>70 Gy	100%

Fish et al Urology 2001

Bujiko *Multidisciplinary Management of Rectal Cancer 2012*

Conclusions

- Acute toxicity → treatment interruptions, QoL
- Late toxicity → Long survivors, QoL
- Medical therapy → symptomatic
- Prevention
  - Set-up → Belly board, bladder filling
  - IMRT → possibility of avoidance of OARs
  - Delineation of OAR → fundamental
  - CTV/field borders→ modulation according T stage
  - Medical prevention → not conclusive results

Treatment planning: state of the art I (rectal cancer)

C. Fiorino

Medical Physics

San Raffaele Institute, Milano, Italy

OSPEDALE SAN RAFFAELE

ESTRO School

Summary

Techniques for external beams optimization (mainly focused on long course…no bracky, no inoperable advanced disease):

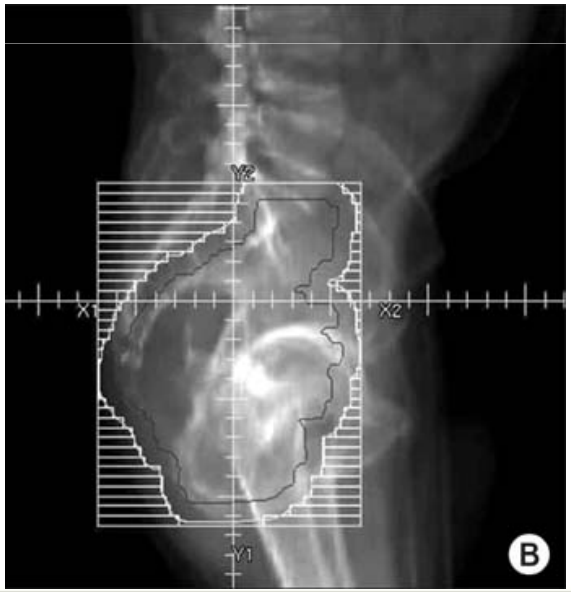
- 3DCRT
- IMRT (vs 3DCRT)
- Rotational techniques (IMAT/VMAT, Tomotherapy)
- Sequential and simultaneous boosting
- IGRT and potentials for plan adaptation

- Sparing bowel and bladder
- Sparing bone marrow (haematological tox)
- Sparing genitalia

- Conclusive remarks

3DCRT: robust conformal delivery

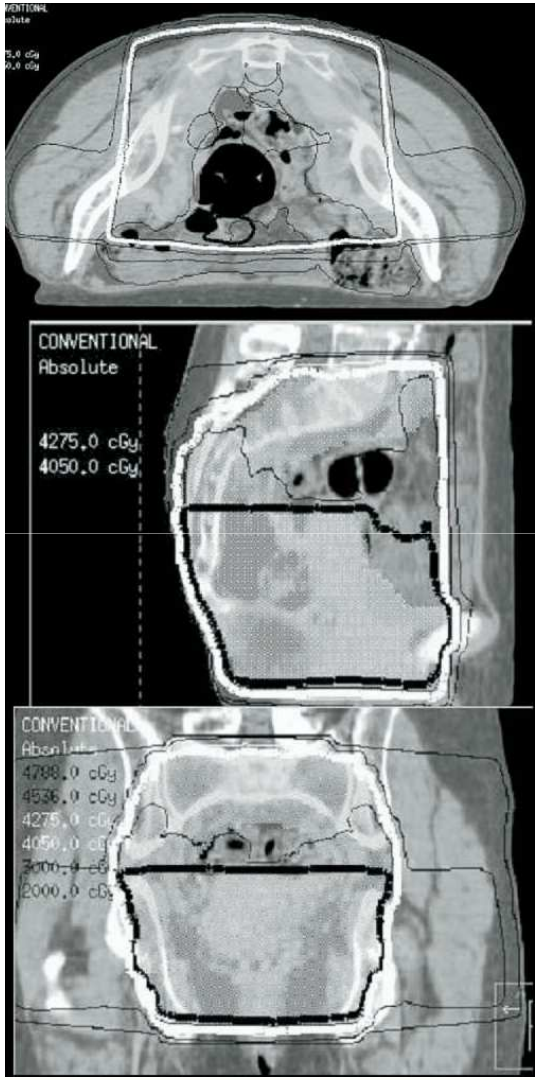
- (Favourable) geometry of irradiation
- Lateral BEV highly efficient in sparing bowel and bladder
- 3-4 field techniques mostly used (i.e.: PA±AP + R/L wedged)
- Prone vs supine (use of belly board, repeatibility…pre-IGRT)



ESTRO School

3DCRT: robust conformal delivery

- Limits in conformality (limited, but existing, concavity of PTV !)
- Treated volume (ICRU) much larger than PTV
- Dose to many structures not strictly «under control» (genitals, bones, bone marrow.....) and, in several cases, relevant (50-80%)



Guerrero-Urbano 2006

ESTRO School

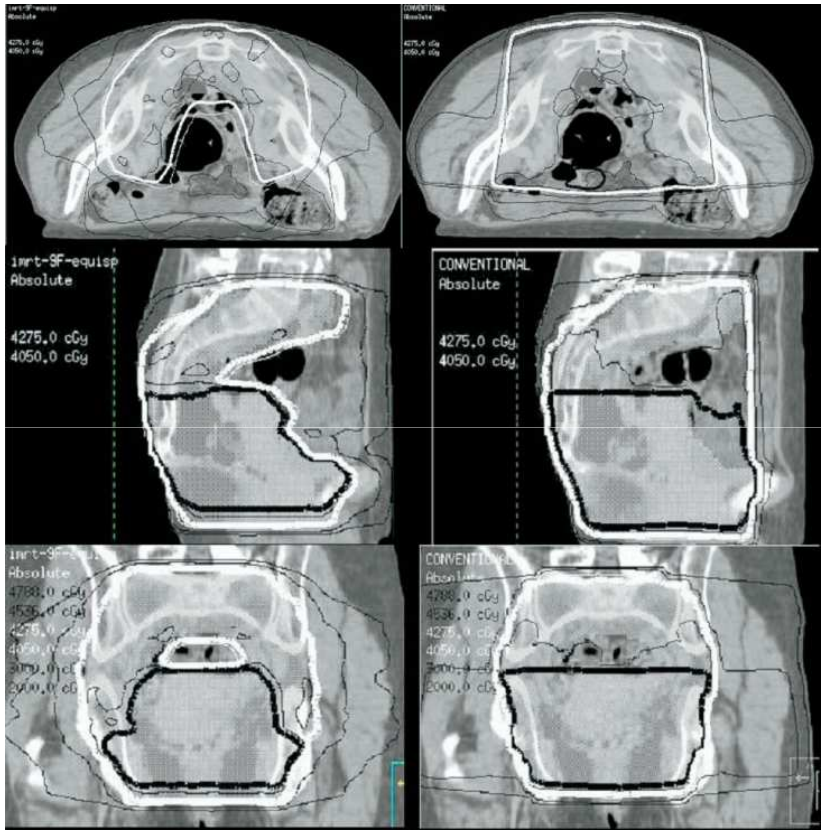
IMRT (vs 3DCRT)

- Better conformality (suggested ≥ 5 fields)
- Better sparing of bowel and bladder (high dose)

Table 4. Comparison of mean ± SD bladder dose statistics

	Conventional	3D-CRT	$IMRT_{3FFW}$	$IMRT_{9FEq}$	$IMRT_{7FEq}$	$IMRT_{5FEq}$	$IMRT_{5FCSS}$
Mean dose (Gy)	26.4 ± 7.2 ($p = 0.05$*)	41.1 ± 6.0 ($p = 0.03$*)	38.8 ± 5.6 ($p = 0.07$)	35.5 ± 3.3	35.0 ± 3.3 ($p = 0.5$)	35.8 ± 4.6 ($p = 0.7$)	37.0 ± 4.4 ($p = 0.1$)
V_{50} (%)	11.9 ± 14.3 ($p = 0.3$)	32.7 ± 18.43 ($p = 0.007$*)	21.7 ± 15.6 ($p = 0.01$*)	6.3 ± 6.8	6.4 ± 8.0 ($p = 0.8$)	5.4 ± 8.4 ($p = 0.4$)	3.2 ± 4.6 ($p = 0.05$*)
V_{40} (%)	19.3 ± 23.0 ($p = 0.3$)	65.1 ± 22.0 ($p = 0.007$*)	57.3 ± 20.5 ($p = 0.009$*)	31.9 ± 15.7	29.0 ± 13.0 ($p = 0.4$)	36.2 ± 21.0 ($p = 0.1$)	41.1 ± 22.5 ($p = 0.08$)

Abbreviations as in Tables 1 and 3.
* Statistical significance of all plans compared with $IMRT_{7FEq}$ plan using Student's paired t test.



Guerrero-Urbano 2006

ESTRO School

IMRT (vs 3DCRT)

- Better conformality (suggested ≥ 5 fields)
- Better sparing of bowel and bladder (high dose)

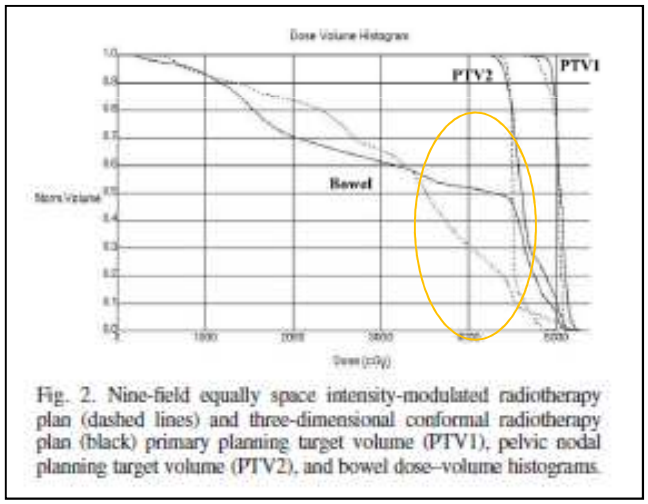


Fig. 2. Nine-field equally space intensity-modulated radiotherapy plan (dashed lines) and three-dimensional conformal radiotherapy plan (black) primary planning target volume (PTV1), pelvic nodal planning target volume (PTV2), and bowel dose–volume histograms.

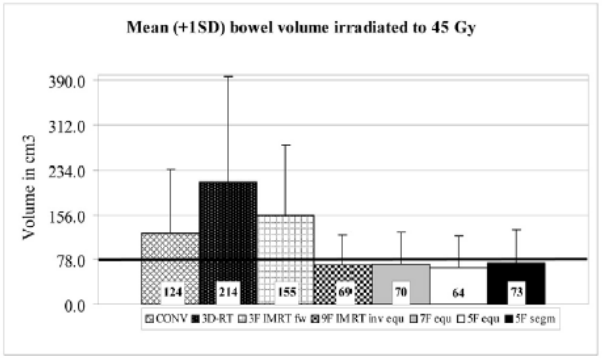

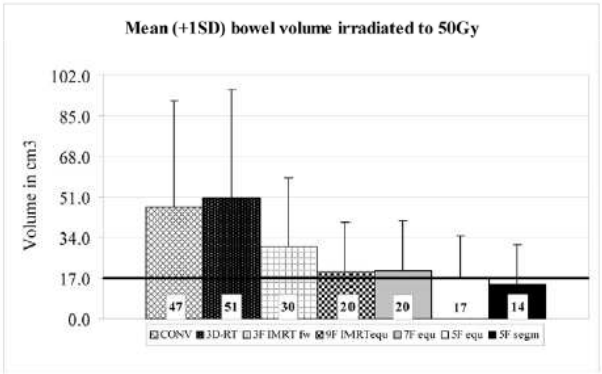

Fig. 3. Mean bowel volume (±SD) irradiated to 45 and 50 Gy. CONV = conventional radiotherapy plan; 3D-RT = three-dimensional conformal radiotherapy; 3F IMRT fw = three-field forward planned intensity-modulated RT; 9F IMRT inv equ, 7F equ, 5F equ = nine-field, seven-field, and five-field, respectively, equally spaced inverse planned IMRT; 5F segm = five-field segmented IMRT.

Guerrero-Urbano 2006

IMRT (vs 3DCRT)

- Is the sparing of bowel with IMRT clinically relevant ?
- Very few positive reports….(for instance: Samuelian 2012, Parekh 2013)

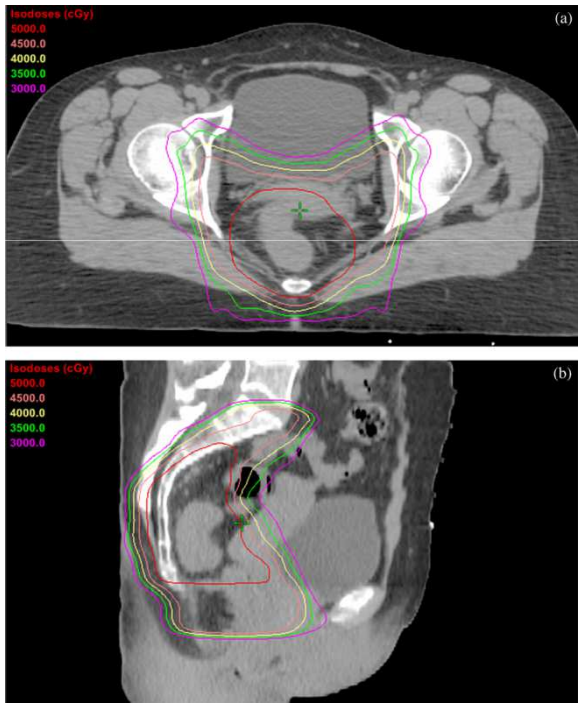

Table 1. Patient, tumor, and treatment characteristics

Characteristic	IMRT $n = 31$ (%)	CRT $n = 61$ (%)	p
Median age, y (range)	63 (26–75)	67 (38–86)	0.007
Sex			0.51
M	20 (65)	35 (57)

WHY ?

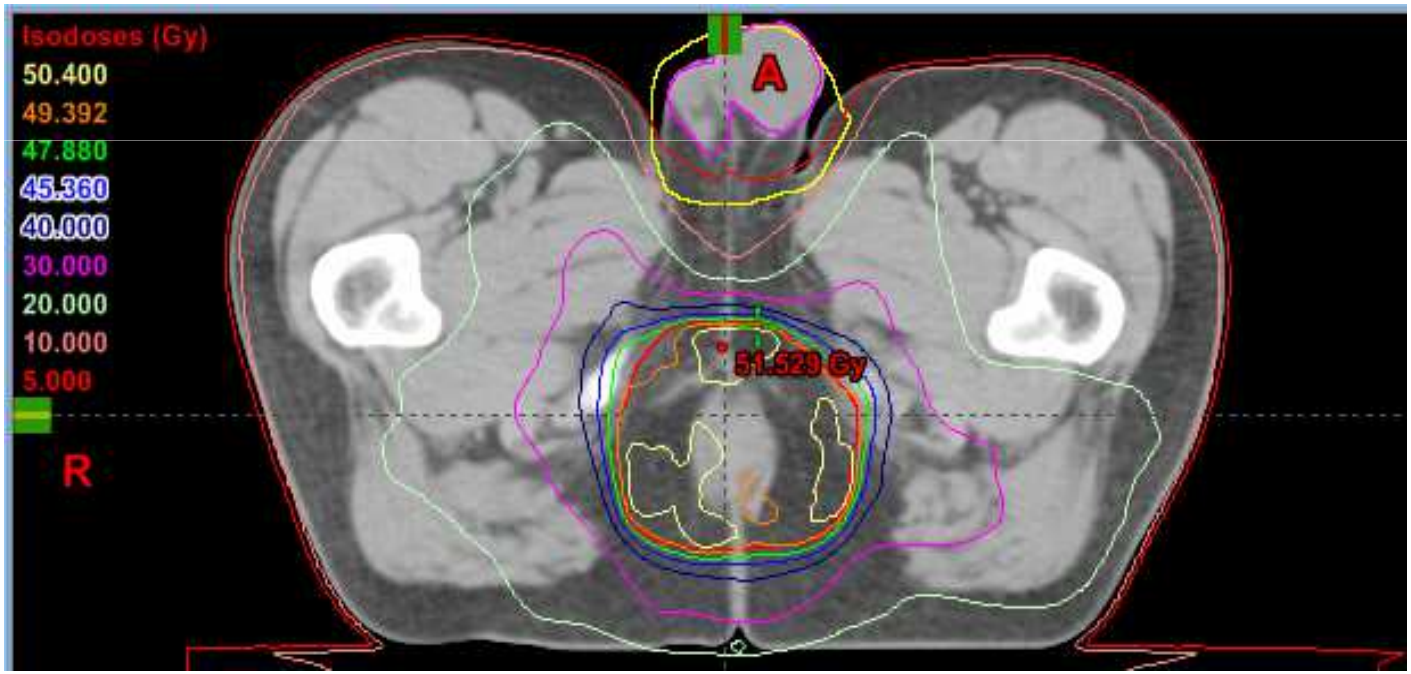
- Constraints V35<180 cc; V40<100 cc; V45<65 cc ?…they used «peritoneal space» as «small bowel» contour
- No sparing on V15-V20 ? (no !, they tested: V10-V45 not correlated..)
- Little portion of bowel to be spared compared to 3DCRT ?
- Major contribution from CHT and from rectum irradiation ?
- It is a question of CTV/PTV volumes ?
- Hot spots permitted in the PTV (V115%<5%) & no constraints on bowel >V45/Dmax

……Good to discuss bowel constraints….come back later !

ESTRO School

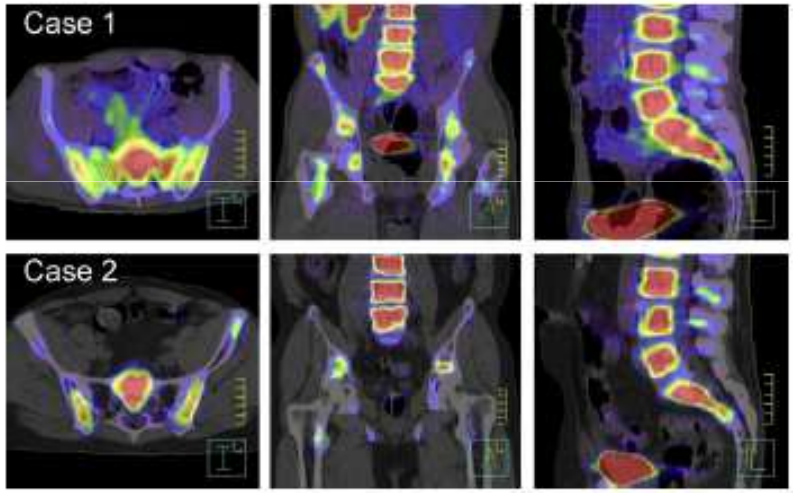
IMRT to spare genitalia

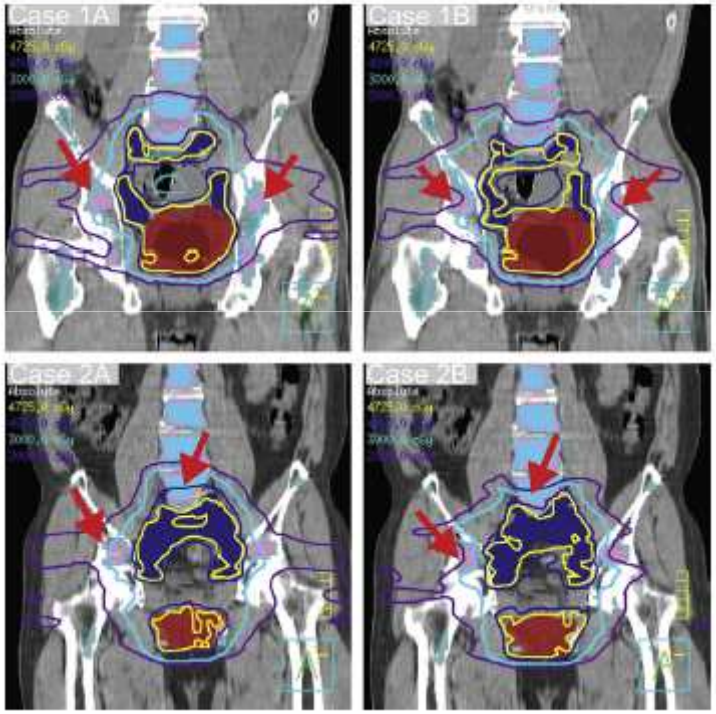
- Highly efficient in avoiding external genitals
- Role for sparing structures involved in erection (i.e.: penile bulb)
- Sparing Vagina (?)



IMRT to spare bone marrow ?

- Potentials for reducing the dose to bone marrow





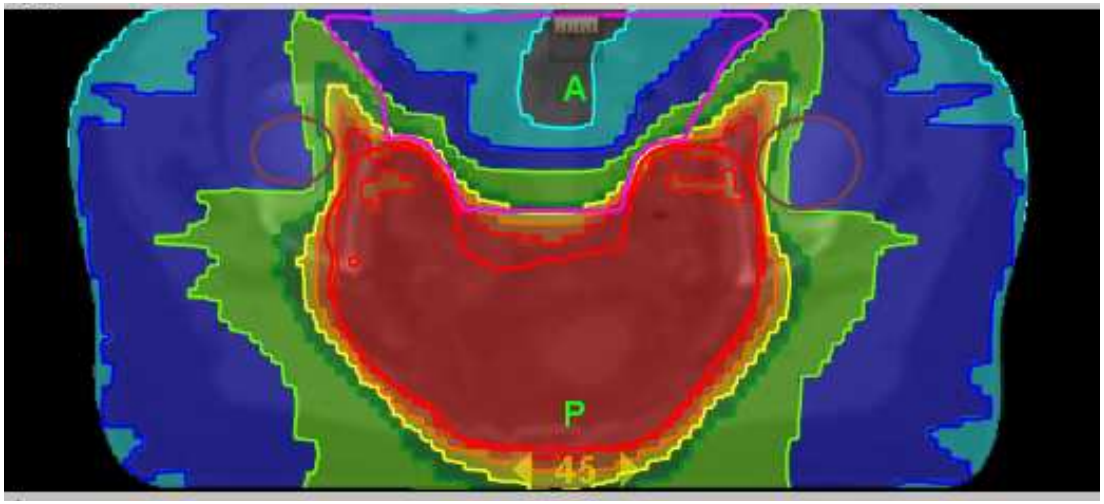
McGuire 2011

Gyno patients ([18F]FLT_PET based planning)

ESTRO School

Rotational (intensity-modulated) techniques

- Cone-beam: IMAT, VMAT, RA…; Helical Tomotherapy (> degrees of freedom)
- Pro's: > conformality, > efficiency
- Con's (?)…low-dose bath (….may be controlled by using blocking options during planning optimization)
- Candidate to become «gold standard» …



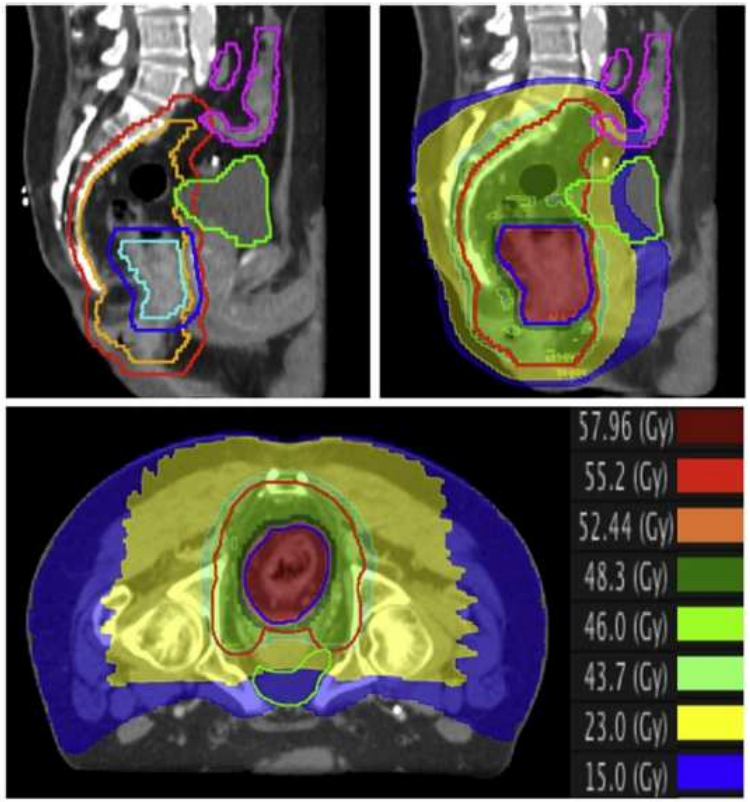
Passoni 2013 Tomotherapy planning

Sequential vs concomitant boosting

- Existence of a dose effect vs Major response/pCR….boosting GTV

- Seq. vs SIB: different radiobiology meaning
- SIB with conventional or moderate hypo
- IMRT better than 3DCRT
- From the point of view of plan optimization:

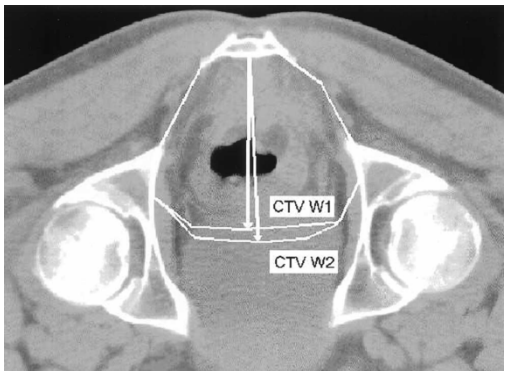
Concomitant boosting is more efficient: better control of the dose to OARs, better conformity index ansd dose homogeneity in PTVs



Engels 2013 46Gy/23fr, SIB 55.2Gy (no CHT)

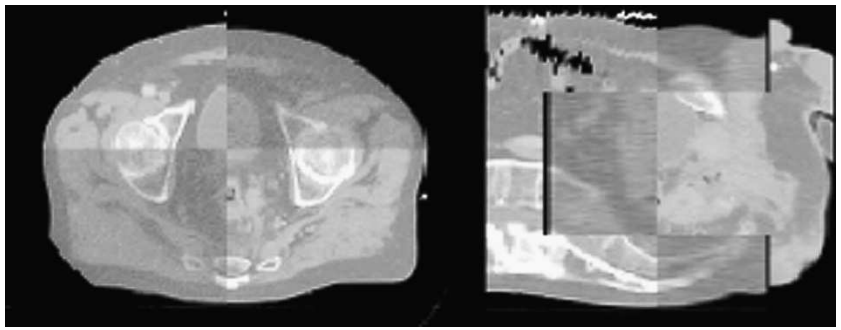
IGRT for rectal cancer

- Diagnostic kVCT
- CT in-room imaging, highly effective for image-guidance: CBCT, MVCT,…mesorectum is quite well visible
- Image-guidance during neo-adjuv/adjuv RT
- Only rigid correction !

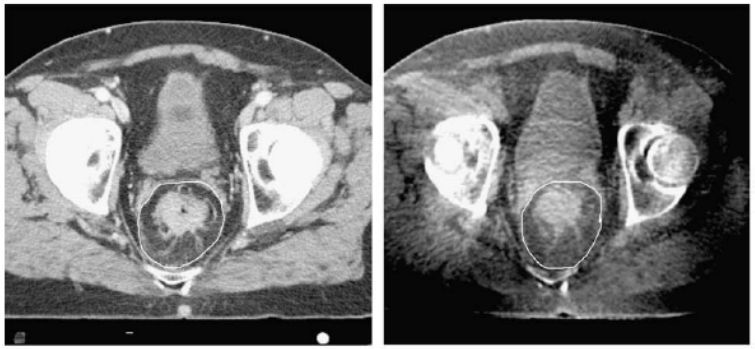


Nuyttens 2002 kVCT

Tournel 2008 MVCT Tomo



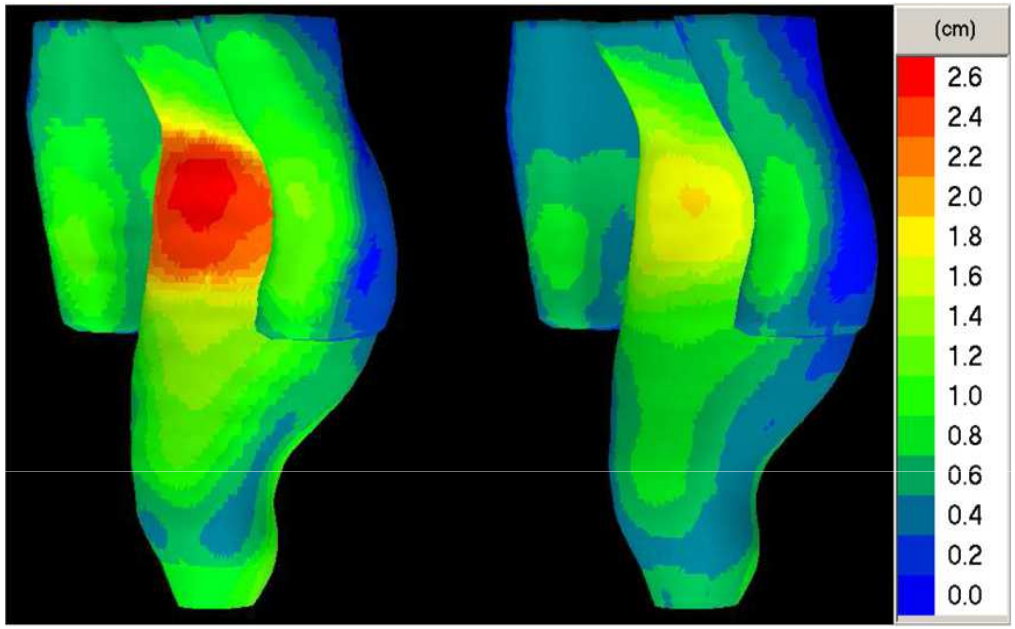
Niikamp 2009 CBCT



ESTRO School

IGRT for rectal cancer

- Mesorectum reported to change in shape (correlated mainly with bladder and, secondarily, rectum motion)
- Main changes in ANT direction
- Larger impact for short-course, prone position and female pts
- Residual margins difficult to assess (local deformations, CTV contouring uncertainty)
- «Optimal» margins often not clinically feasible (Dmin>95%/90% pts too strict criterion? Contouring uncertainty too high..?)
- Issues concerning the real clinical impact in neo-adjuv RT(CHT)



Wout With daily correction

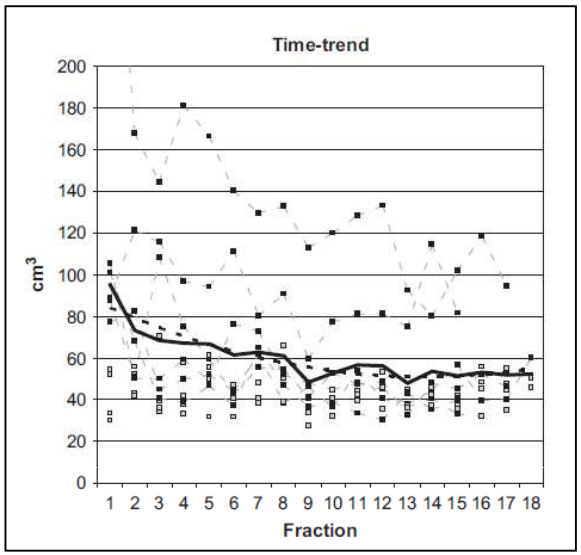
Njikamp 2012

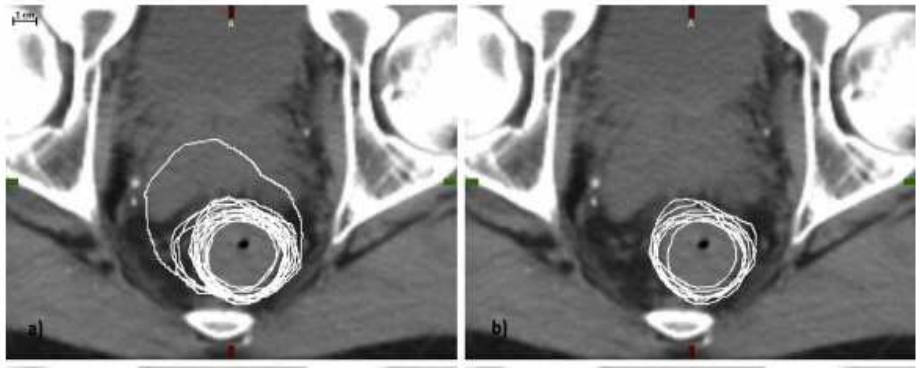
ESTRO School

IGRT for rectal cancer: boost

- IGRT focused on the boost volume (simpler assessment of margins ?)
- Rectal motion as a surrogate of GTV/CTVboost
- Reported trend for rectal volume reduction and for shape variation (Njikamp 2012, Maggiulli 2012, Raso 2015)
- Residual deformation error after rigid correction: anisotropic, higher in the first few fractions
- Relatively small «optimal» margins reported (especially if excluding the first fractions)….mainly 5-15 mm
- Larger motion in female pts

Maggiulli 2012





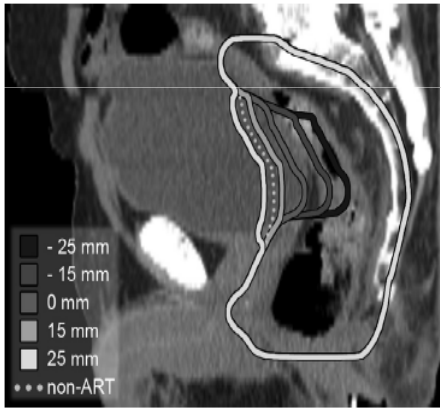
Raso 2015

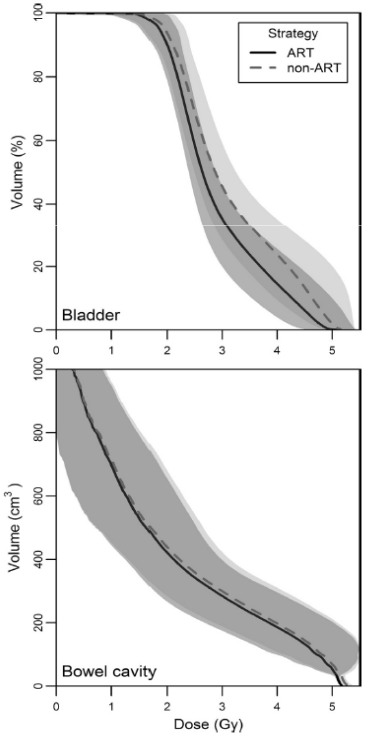
….to be better discussed later (IGRT & adaptive)

ESTRO School

Adaptive planning

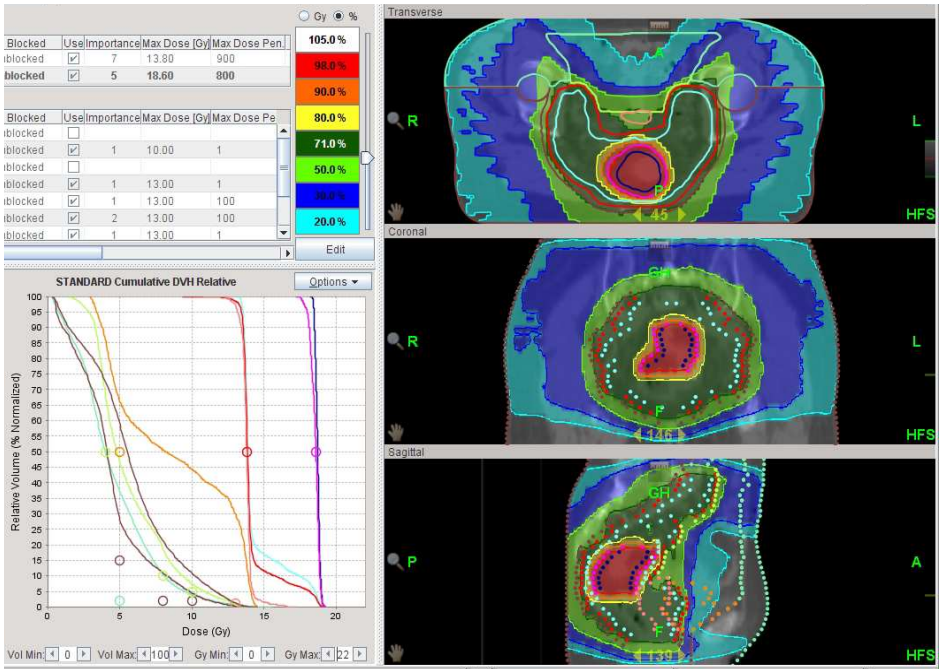
-Re-planning/plan of the day approach to take mesorectum changes into account, suggested but no clinical experiences (cost-benefit ?)





Lutkenhaus 2016

- Adaptive planning to boost the residual GTV after half-RT T regression (promising approach to escalate the dose to T)....to be better discussed later (IGRT & adaptive)



Passoni 2013

ESTRO School

Summary

Techniques for external beams optimization (mainly focused on long course…no bracky, no inoperable advanced disease):

- 3DCRT
- IMRT (vs 3DCRT)
- Rotational techniques (IMAT/VMAT, Tomotherapy)
- Sequential and simultaneous boosting
- IGRT and potentials for plan adaptation

- Sparing bowel and bladder
- Sparing bone marrow (haematological tox)
- Sparing genitalia

Quantec: Baglan-Robertson constraints…..rectal ca (with CHT), bowel loops !

Is V15 really important ?

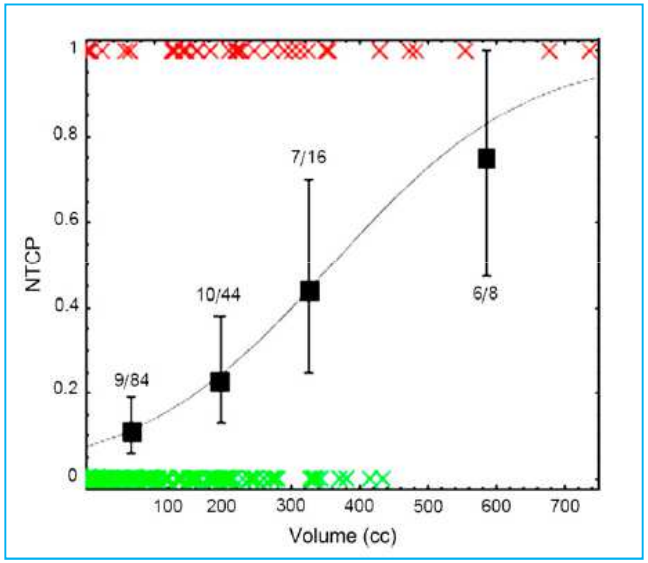
ESTRO School

Pelvic OARs constraints: sparing the bowel

- V15 as strong predictor in a recent updated model by Robertson (2010)
- Not confirmed in the NRG0822 controlled trial (!)…WHY ?

- Robertson study: 3DCRT 3 fields (pre & post-op)
- NRG0822: IMRT (pre-op)

- Robertson study: bowel loops
- NRG0822: «peritoneal space»

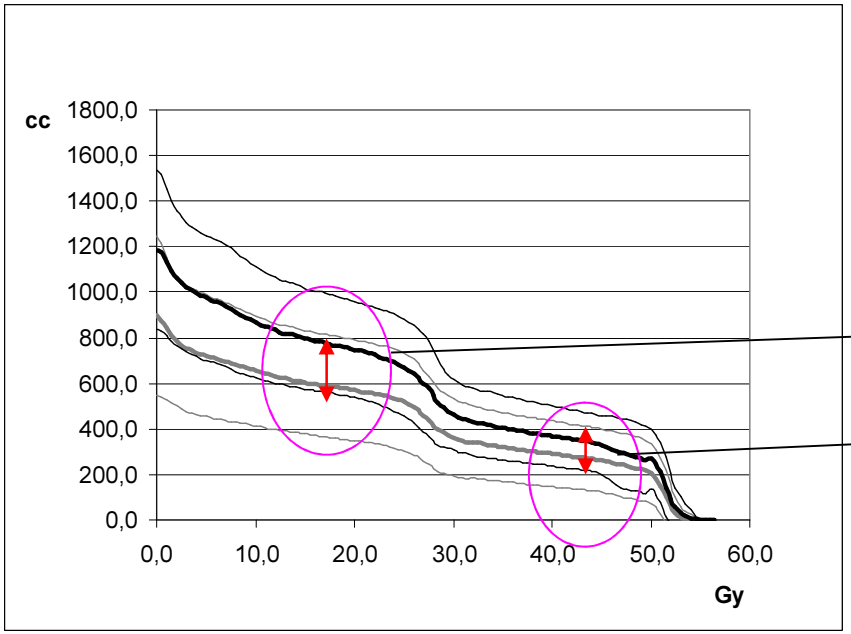


- Correlation between V40-V45 and V15 for 3DCRT

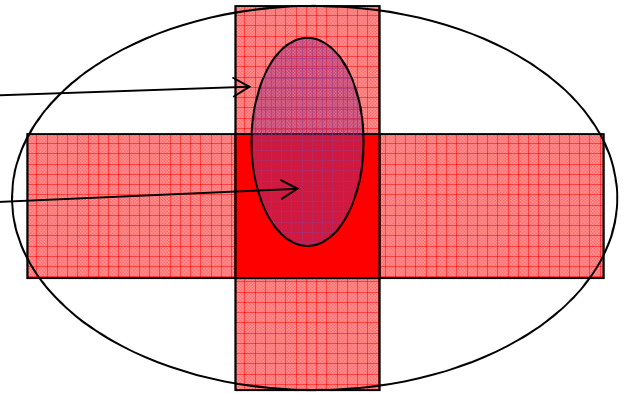
ESTRO School

Pelvic OARs constraints: sparing the bowel

- V15 as strong predictor in a recent updated model by Robertson (2010)
- Not confirmed in the NRG0822 controlled trial (!)…WHY ?



Comparing DVH of patients with/wout bowel tox (prostate ca) (Fiorino 2009)

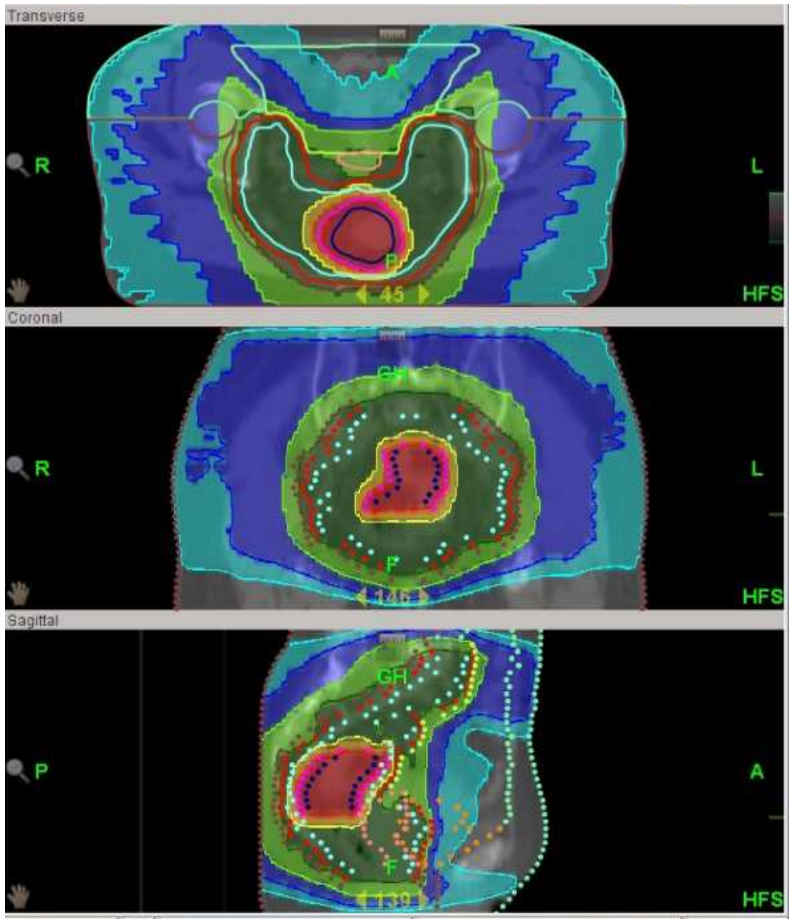


Correlation between V40-V45 and V15 for 3DCRT

ESTRO School

Pelvic OARs constraints: sparing the bowel

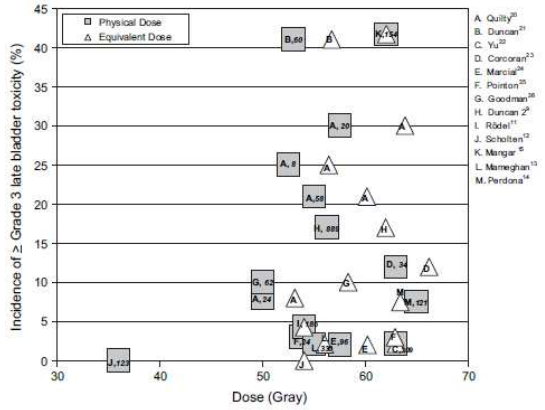
- Practical planning approach with IMRT: «as low as possible», avoidance of peritoneal space outside PTV starting to spare from «high» doses (V40-V50) and continuing to intermediate dose (V15-V20)
- Avoiding hot spots in the bowel loops overlapped with PTV
- Residual GI toxicity likely to be due mainly to the irradiation of rectum and bowel within PTV, CHT (surgery…..)
- Lack of dose-volume effect studies with prospective, patient-reported scoring of toxicity



ESTRO School

Pelvic OARs constraints: sparing the bladder

- GU toxicity, a relatively minor problem («low» dose): threshold around 50-55Gy, whole organ for RTOG G3 late tox (Quantec 2010, Fiorino 2009)
- No strong evidence of increased late GU tox compared to only surgery (Gilbert 2015)
- Recent important updates of predictors of GU tox (more relevant for prostate ca pts, Landoni 2016)
- Interplay between bladder filling and bowel sparing
- The avoidance approach of the peritoneal space should include bladder to guarantee adequate sparing of bowel during treatment (possible systematic deviations)



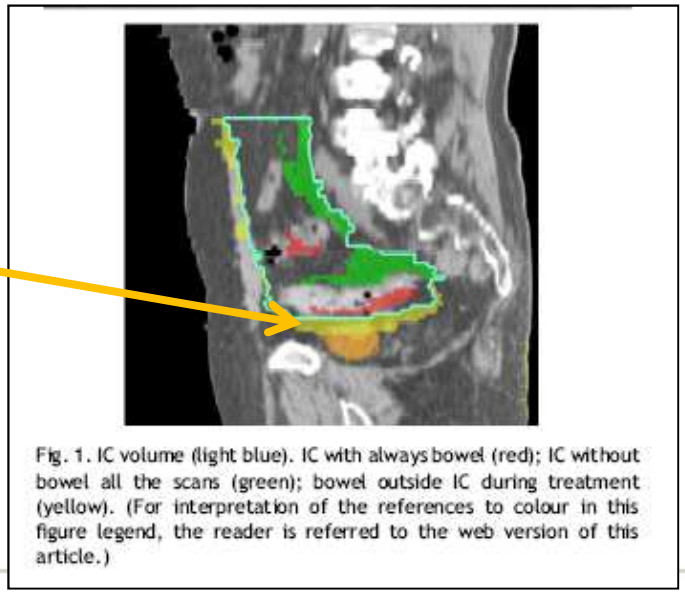


Fig. 1. IC volume (light blue). IC with always bowel (red); IC without bowel all the scans (green); bowel outside IC during treatment (yellow). (For interpretation of the references to colour in this figure legend, the reader is referred to the web version of this article.)

Sanguineti 2008

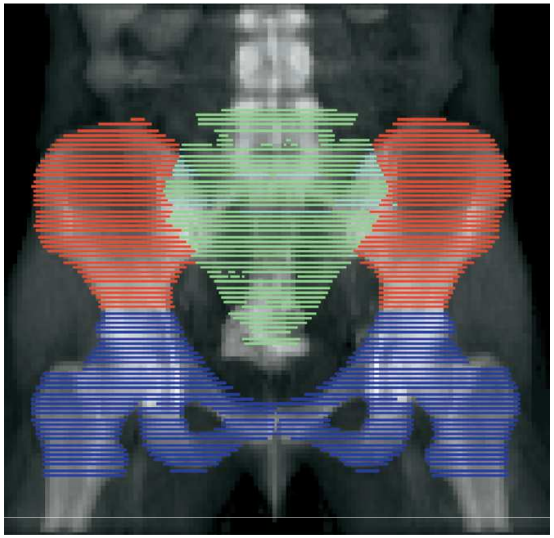
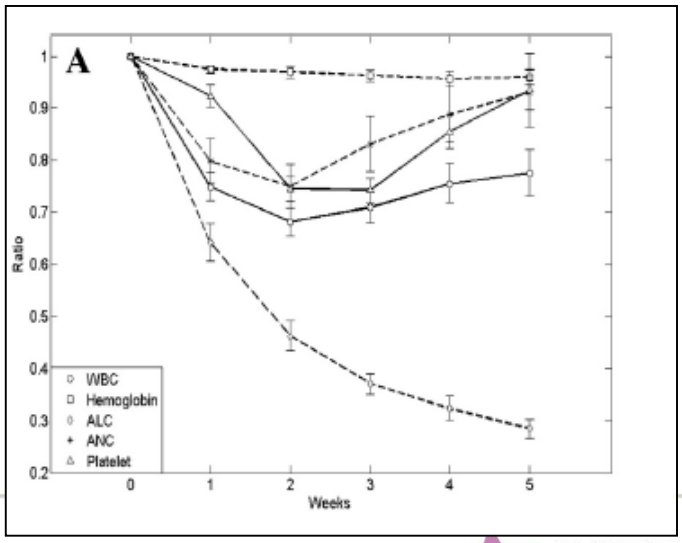
Pelvic OARs constraints: bone marrow

- Acute Hematological toxicity reported in RT+CHT for rectal ca; unclear the long-term impact
- Evidence of dose-volume effects for the pelvic bone marrow in rectal and anal canal ca. with 3DCRT +CHT (Mell 2007)
- Predictive models of hematological tox for rectal ca treated with 3DCRT/IMRT +CHT (Yang 2014, Wan 2015)
- Not yet reported BM-sparing planning strategies for rectal cancer.....potential interplay with bowel/bladder sparing



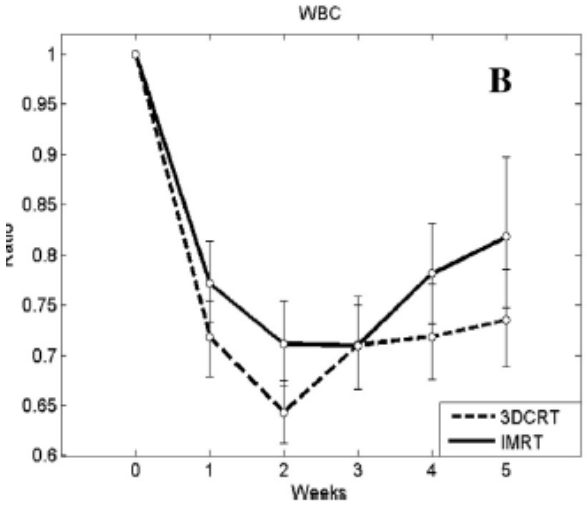


Yang 2014

ESTRO School

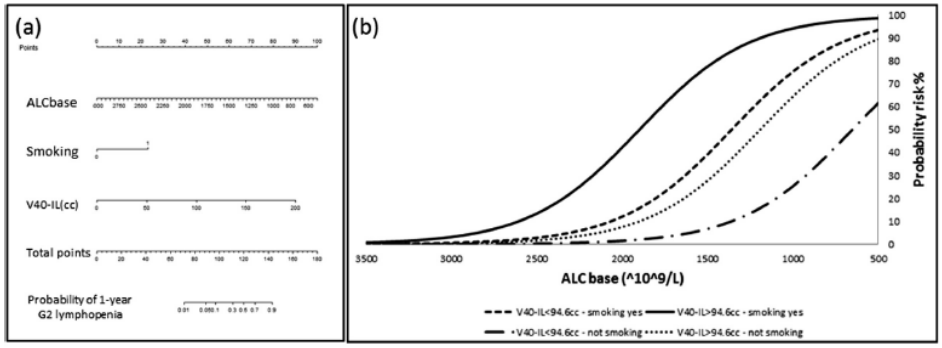
Pelvic OARs constraints: bone marrow

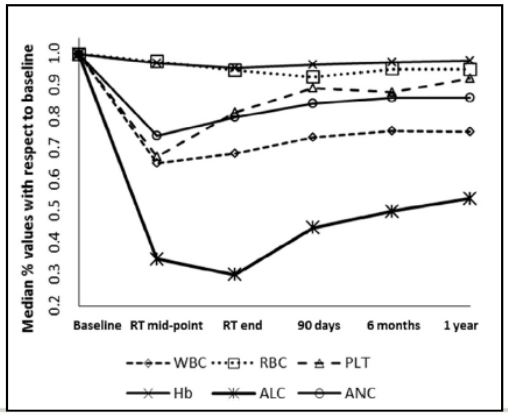
- Main dosimetry predictors (IMRT): coxal and sacral V45 mostly associated to lower nadir of WBC and neutrophils (Yang 2014)
- Worst WBC Nadir with 3DCRT



Yang 2014

- V40 of whole pelvic BM and iliac BM predicted acute and late limphopenia in a large prostate ca group (wout CHT) treated with IMRT (Sini 2016)





Sini 2016
Prostate ca pts,
no CHT

ESTRO School

Pelvic OARs constraints: genitals

- From recent large prospective studies & reviews, sexual problems are a major issue after rectal ca curative treatments; RT+CHT associated to an increased risk (Lange 2009, Bregendhal 2015, Kunnemann 2015, Gilbert 2015)
- Under-estimated problem in the past (?)
- Any effort should be activated to efficiently spare genitals outside PTV: beams geometry, blocking options in rotational techniques, testicle shielding when appropriate….

Table 3 Prevalence of toxicity reported by treatment type according to clinician or patient reports (PRO)

	Range of toxicity reported by treatment type (references in parentheses)				
Type of toxicity	Surgery alone	Short-course RT (25 Gy in 5)	Long-course RT (45-50.4 Gy in 25-28)	Long-course 5FU CRT (45-50.4 Gy in 25-28)	Long-course 5FU CRT with additional chemotherapy (45-50.4 Gy in 25-28)
Sexual dysfunction (males)

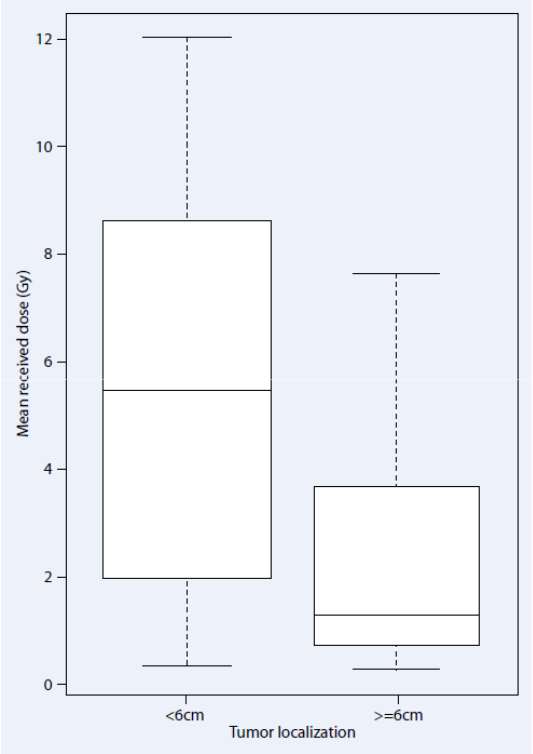
Gilbert 2015

ESTRO School

Pelvic OARs constraints: genitals

- Dose to testicles vs testosterone levels and libido: a controversial issue

- Few prospective studies including dose estimates (Piroth 2003, Dueland 2003, Hermann 2005, Yau 2009, Hennies 2012)
- Very large range of dose (<1 – 15 Gy), Evidence of transient and permament azoospermia for testicle doses above 1 and 2 Gy respectively (Yau 2009); higher rates of ipogonadism with EBRT vs HDRB (average testicles doses: 1.3 vs 0.3 Gy)
- Lack of relationship between testicle dose & testosterone/libido decrease in EBRT (Dueland 2003, Hennies 2012)
- relevant issues on accuracy in dose calculation/estimates («out-of-field» dose in TPS = high uncertainty !!!!)



Hennies 2015

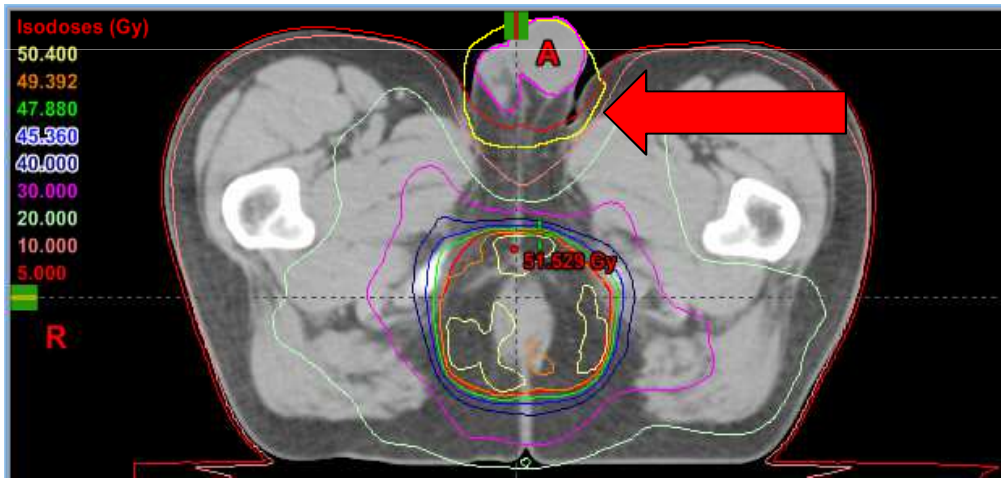
ESTRO School

Pelvic OARs constraints: genitals

- Dose to testicles vs testosterone levels and

Pragmatically: reducing the dose to testicles as much as possible (possibly < 2 Gy)

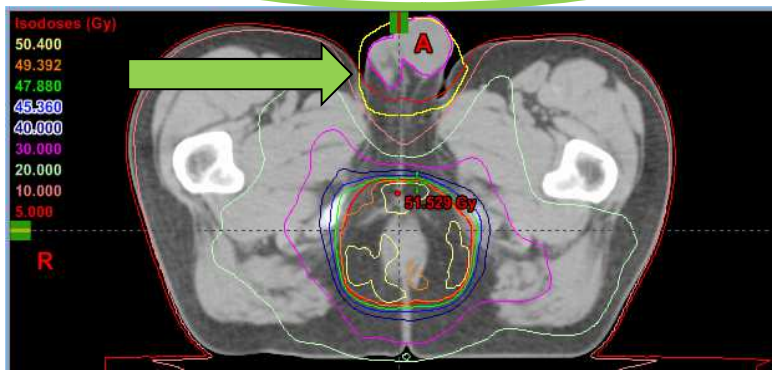
- IMRT highly efficient (blocking options in VMAT/tomo)
- Patient set-up, testicle shielding for very caudal field borders (head scatter)

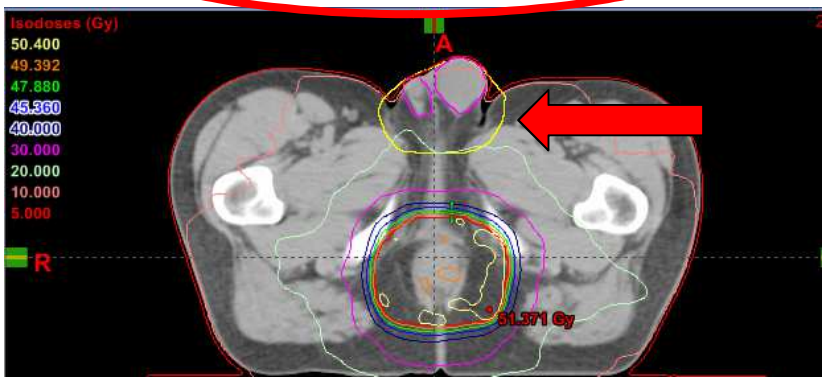


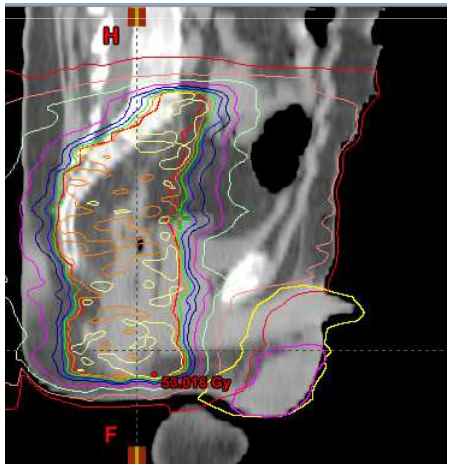
Pelvic OARs constraints: genitals

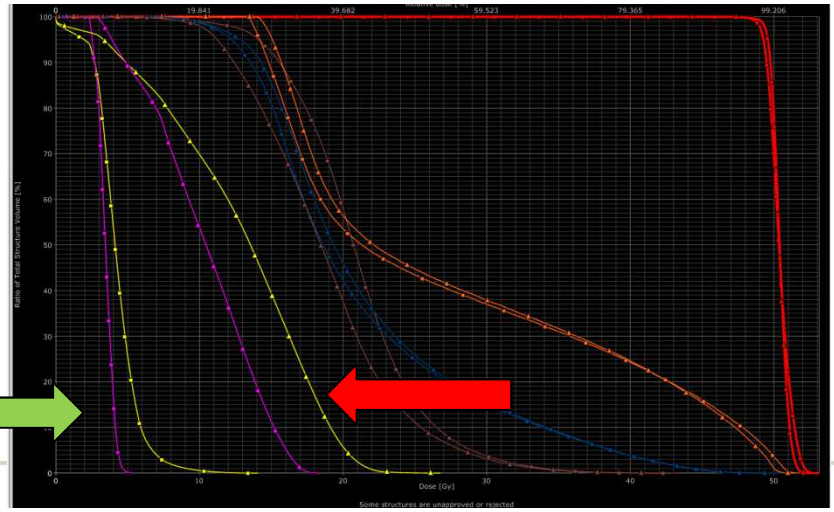
- Explicit inclusion in optimization

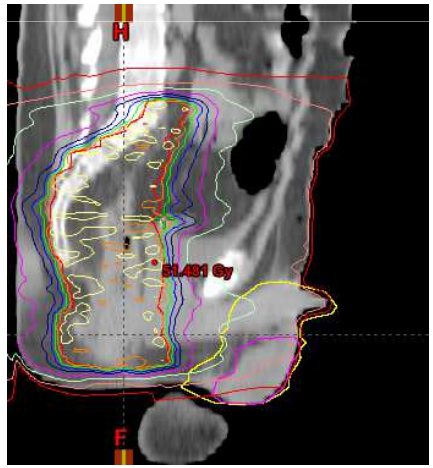
Not included











ESTRO School

Pelvic OARs constraints: genitals

- Dose to penile bulb (PB)/structures involved in erection
- Most experience from prostate ca RT
- Controversial results, some evidence for constraining PB<40-50Gy
- Lack of prospective trials including dose-volume data (no data to my knowledge in the rectal ca. context)
- Very relevant «confounding» factors: baseline situation, ageing, vascular problems, psychological aspects
- Prospective data suggests that avoiding overlap between PTV and PB may largely reduce erectile dysfunctions

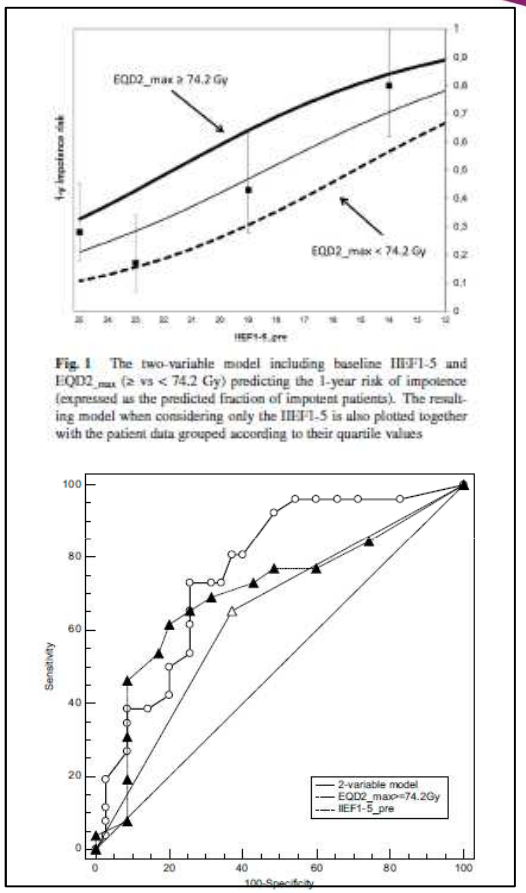


Fig. 1 The two-variable model including baseline IIEF1-5 and $EQD2_{max}$ (≥ vs < 74.2 Gy) predicting the 1-year risk of impotence (expressed as the predicted fraction of impotent patients). The resulting model when considering only the IIEF1-5 is also plotted together with the patient data grouped according to their quartile values

Cozzarini 2016

prostate ca pts, IIEF1-5 based impotence

ESTRO School

Pelvic OARs constraints: genitals

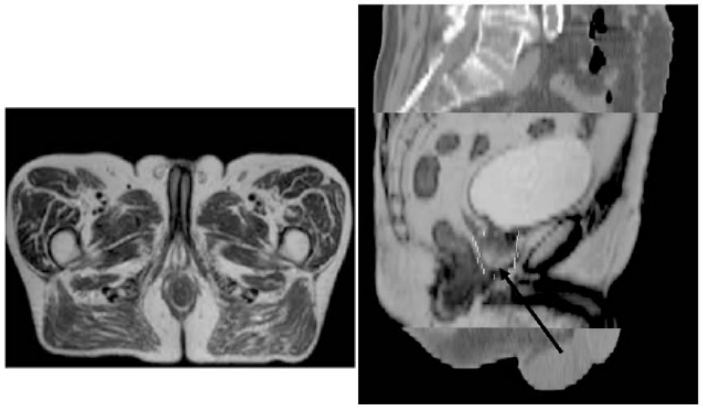
- Dose to penile bulb/structures involved in erection
- Role of IGRT to reduce caudal margins in lower tumors
- Space for PB-sparing techniques with IMRT ?

Table 4
Summary of studies on potency predictors in potent patients before radiotherapy (using a prospective questionnaire-based assessment of potency; knowledge of baseline statu well defined contouring of the penile bulb; availability of penile bulb dosimetry data; and wide range of doses).

Reference	N° pts	Score	Time	Impotence rate (%)	Prescription dose (Gy) RT technique	Dosimetry Predictors (penile bulb)	MVA[§]
Fisch 2001 [76]	21	UCSF	2 yrs	33[*]	65–72 3DCRT	D70% ≥ 70 Gy	No
Wernicke 2006 [77]	29	EDFS/ EJS	3 yrs[*]	–	66.6–79.2 3DCRT	D30%–D90%[**]	No
Mangar 2006 [78]	51	UCLA/ FACT-P	2 yrs	24[*]	64–74 Gy 3DCRT	D90% ≥ 5 0 Gy	No
Magli 2012 [79]	19	IIEF1-5	2 yrs	58[***]	72–76 3DCRT	Dmean /D90%[**]	No
Hoppe 2012 [80]	234	EPIC/ IIEF1-5	1–2 yrs	11[***]	70–72 or [illegible] Gy/fr protons		
Cozzarini 2016 [81]	62	IIEF1-5	1 yr	42[***]	74–78 or 70–74.2 (2.5 Gy/fr[**]) IMRT	EQD2max ≥ 74.2 Gy[¶]	Yes

UCSF = University of California San Francisco score
EDFS = erectile dysfunction firmness score
EJS = ejaculatory difficulty score
UCLA = University of California, Los Angeles score
FACT-P = Functional Assessment of Cancer for patients with Prostate cancer
IIEF1-5 = Short form (questions 1–5) of International Index of Erectile Function Questionnaire
EPIC = Expanded Prostate Cancer Index Composite
N° = number; pts = patients; MVA = multivariable analysis; yrs = years; fr = fraction; 3DCRT = three-dimensional conformal radiotherapy; IMRT = intensity modulate radiotherapy; DX% ≥ YGy = Dose to X% of the penile bulb should not be >YGy; EQD2 = Equivalent Dose 2 Gy/fraction; Dmean = mean dose; TD = total prescribed dose
[§] Inclusion of dosimetry parameters in multivariable models with clinical variables.
[*] Severe.
[**] moderate-severe.
[***] Average follow-up (minimum follow-up: 16 months).
[**] Continuous variable.
[¶] Only mean dose to the penile bulb was considered (cobalt-grey equivalent). Mean dose to the penile bulb and total prescribed dose (TD) were poorly correlate (p = 0.10–0.12) with EPIC-based impotency score.
[¶] Only mean dose and maximum dose to the penile bulb (2 Gy-Equivalent doses) were considered.
[**] Median daily dose of the hypo-fractionated sub-group.

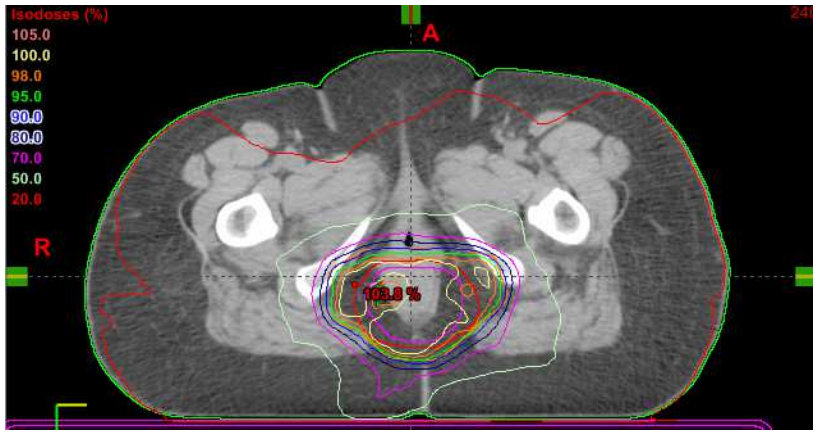
MRI Prostatic apex + IGRT with reduced margins, resulting in rare overlap between PTV and PB !

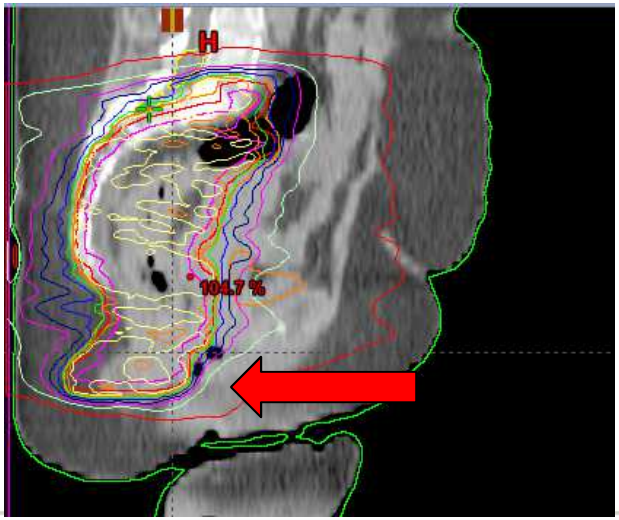


Landoni 2016
prostate ca pts, patient-reported impotence

Pelvic OARs constraints: genitals

- Dose to genitals (female)
- Under-estimated problem in the past, now quite «hot»
- Any effort should be activated to efficiently spare genitals outside PTV: beams geometry, blocking options in rotational techniques, ….
- IMRT highly effective in sparing external genitals to very low dose (even <5-10 Gy)
- Vaginal dryness/dyspareunia very commun problems importantly affecting QoL; impact of RT+CHT vs SURG only (Lange 2009, 2011, Bruheim 2010, Braendengen 2011, Incrocci 2013, Marijnen 2014, Ye 2014, Kunnemann 2015, Jensen 2015, Gilbert 2015)
- relationship with dose-volume parameters of vagina is lacking; some evidence of a dose-volume effect in cervix cancer braky (Park 2015)





ESTRO School

Pelvic OARs constraints: genitals

- Dose to vagina (Mirabeau-Beale 2015)
- Vaginal stenosis did not correlate with DVH/dose statistics of vagina/external genitals in a group of 52 pts treated with IMRT RT+CHT (50-54Gy) for anal canal ca. Lower age as a major risk factor
- Most part of vagina often included in PTV (median dose ≈ 55Gy)
- Need of more studies
- Potentials of image-guided IMRT to spare vagina to be still assessed (room for vagina-sparing trials ? Volumes definition issues)
- Practical suggestion: spare vagina and external genitals outside PTV «as much as possible» (no relevant interplays with other structures)

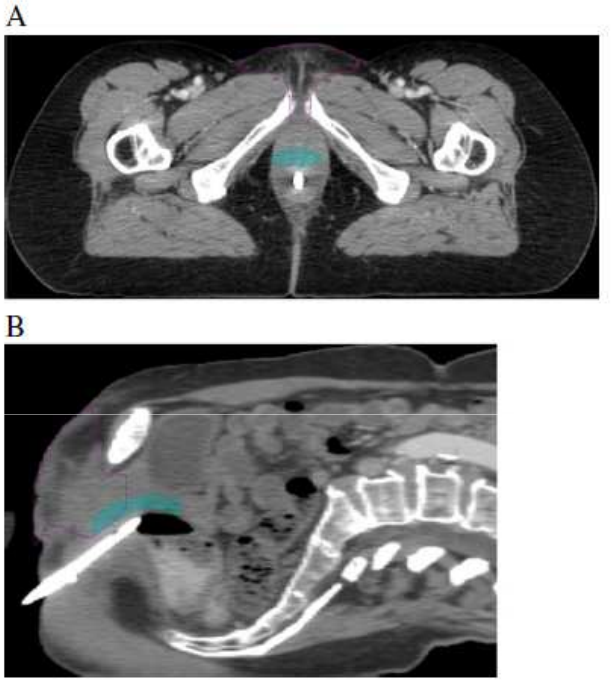


Figure 1 (A) Axial image of patient contours. (B) Sagittal image of patient contours. Cyan, vagina; pink, external genitals including mons pubis.

Mirabeau-Beale 2015

ESTRO School

Conclusive remarks

- 3DCRT and IMRT techniques offer good planning solutions
- IMRT should be preferred (better sparing of OARs, better conformation)
- Risk of sub-optimal planning with IMRT, be careful….
- Rotational IMRT (VMAT/IMAT/RA…., Tomo) highly effective and fast, better conformality and, sometime, better OAR sparing
- Constraints for OARs still poorly available (primarily for bowel, bone marrow, genitals)….much to be done (need of studies correlating prospective patient-reported outcomes/QoL scores vs dose-volume data)
- (Quantification of the impact of CHT poorly addressed)

- IGRT improves accuracy; potentials to reduce margins with the aim to spare OARs in specific patients (i.e: sexual dysfunctions ?)
- Adaptive re-planning in its very early phase…

Adaptive RT: background I

- Proven dose-effect response in RT+CHT regimens… boosting the tumor/mesorectum may increase pCR and major response rates

- Toxicity limits: exploring feasible protocols

- Exploiting acceleration (importance of repopulation) …reducing treatment time, Hyper/hypo in combination with IMRT (?)

- Evidence of relevant shrinkage during RT+CHT (especially in regimens including oxaliplatin), visible with MRI

- Can we exploit T shrinkage to safely boost the residual T ?

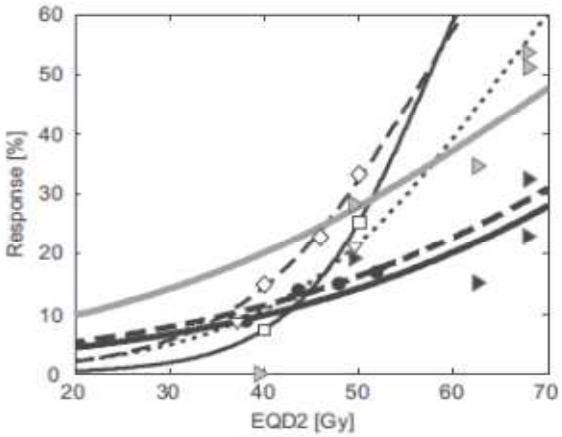

Fig. 3. Comparison of reported dose-response relationships between equivalent dose in 2 Gy fractions (EQD2) and complete response. All dose levels recalculated as EQD2, and logistic response curves fitted for each study. Each study is represented as follows: metaanalysis by Sanghera et al (6) (*bold dashed line, filled circles*), Chan et al (7) (*thin solid line, open squares*), Valentini et al (8) (*thin dotted line, open triangles*), Wiltshire et al (9) (*thin dashed line, open diamonds*), our study (*bold solid lines, filled triangles*), with response curves for complete response (*black line/triangles*) and major response (*grey line/triangles*).

Appelt 2012

ESTRO School

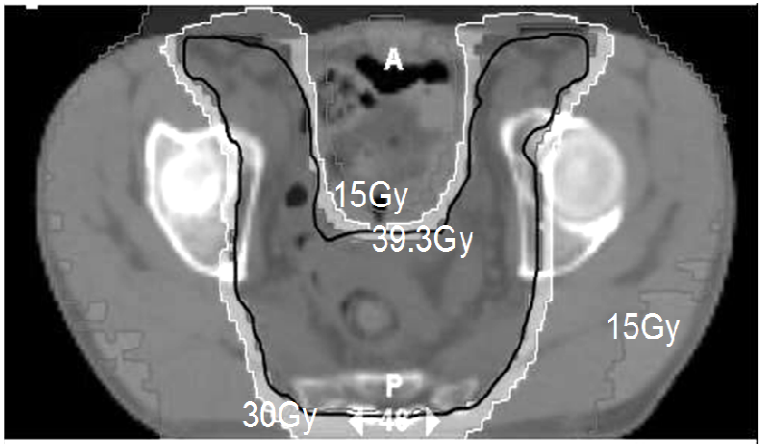
Adaptive RT: background II

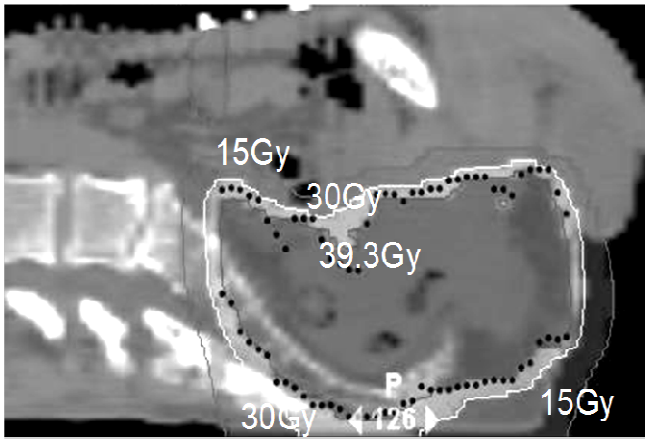
- At our Institute 2007-2009: pilot study exploring moderate hypo-fractionation, 41.4 Gy/18 fractions + Oxa/5FU*

- Daily image-guided Tomotherapy

- Feasible and efficient : G3 GI: 9%, pCR:28 % (data of first 35 pts)

- Introducing MRI for planning (+ diffusion MRI since 2013)





* Oxaliplatin 100mg/m2 on day -14, 0 (start of RT), +14; 5-FU 250mg/m2/day c.i. from day -14 to the end of RT.

ESTRO School

Adaptive RT: T regression as seen by MRI

- Evidence of large T regression in most pts, already during the first half of the treatment

- T2-weighted MRI suitable for assessing tumour regression and GTV/CTV contouring

- Defining GTV_boost as the fraction of rectum corresponding to visible tumor at half-RT MRI

- Dose/fractionation ?

- Margins ?

Mid-therapy (fr 9)
MRI_GTV: 7cc

ESTRO School

Adaptive RT: choosing the adaptive scheme

Applying LQ model including repopulation:

- Original scheme: **$BED = nd\,(1 + d/\alpha/\beta) - \gamma/\alpha\,(T - Tk)$**

where: d, daily dose, n n° fractions, γ/α repopulation factor (0.6Gy/day), Tk delay time (7 days), α/β=10 (Widder et al, 2005)

- Adaptive scheme:

$BED = md\,(1 + d/\alpha/\beta) + (n-m)d_{adapt}\,(1 + d_{adapt}/\alpha/\beta) - \gamma/\alpha\,(T - Tk)$

Assessing m and d_{adapt} to escalate the boost dose to EQD2=54Gy

- Practical limitations:

imaging for adaptive boosting not before half-RT

Leaving time for image matching, re-contouring, re-planning, scheduling….

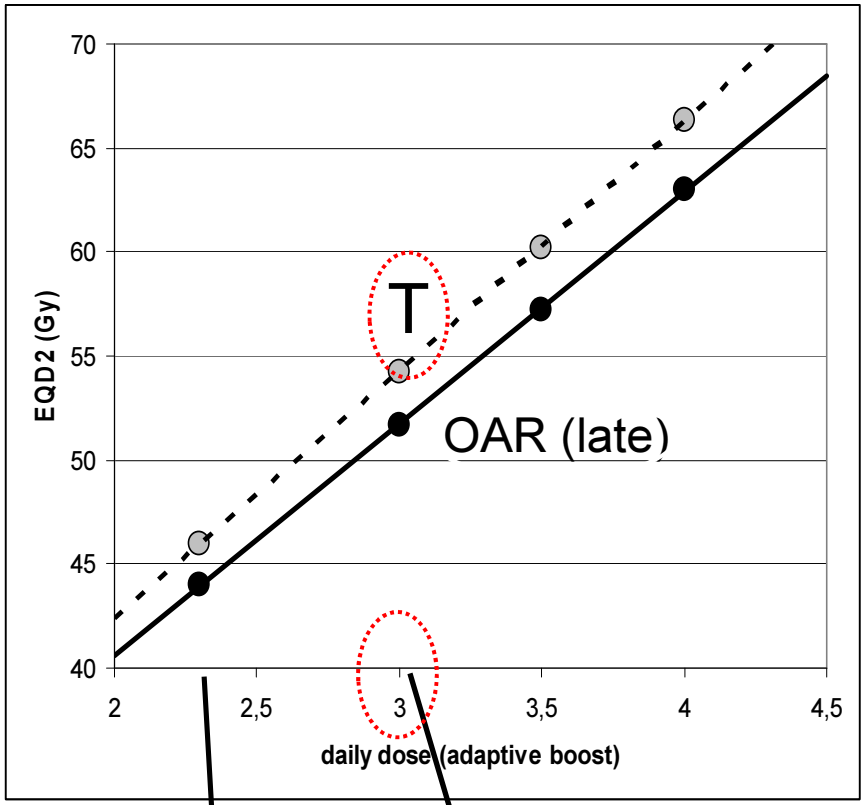
Adaptive RT: choosing the adaptive scheme

- MRI @ half therapy (fraction 9)

- Concomitant boost in the last 6 (3 days left)

- Calculating d_{adapt} to escalate to EQD2=54Gy ⇒ ≈ 3Gy/fr in the last 6 fractions (out of 18)

- Corresponding EQD2 for OAR (late tox, $\alpha/\beta=3$) slightly lower than for T



Summary of ART scheme:

Fractions 1-12: 2.3 Gy/fr (27.6 Gy) @ PTV1
Fractions 13-18: 2.3 Gy/fr (13.8 Gy) @ PTV1
concomitantly 3.0 Gy/fr (18Gy) @ PTV_{boost}

Total dose: 41.4Gy PTV1; 45.6Gy PTVboost (18 fractions)

ESTRO School

ART: margins for the boosting phase

Maggiulli 2012

$TCP_D=(1-\Delta V_D)^{V\_PRE}$

AUC: 0.87 (specificity: 71.4%, sensitivity: 96.4%) (not lower discriminative power compared to post_RT MRI, AUC:0.82 n.s.); n=42 pts

ESTRO School

Conclusive remarks

- IGRT for rectal cancer: relevant to improve accuracy of delivery
- Mesorectum changes occurr and can be corrected only in part, is it an issue ?
- IGRT for boosting: GTV/rectal motion can be (better) modeled
- Even with daily image-guided correction, still relevant residual error due to deformation (margins need to be carefully assessed)
- Trend in rectal changes and reduction of motion during long-course RCHT («small» margins were found to be adequate for adaptive SIB in the second part of treatment)
- Shrinkage of T may be relevant and may be exploited to optimize adaptive approaches (to boost the residual T)
- ART with this approach was implemented (78 pts treated up to now)
- Promising results and room for further dose escalation on residual T
- Predicting the response based on (mid-RT) MRI response

Ree; 2010	**Histone Deactylase Inhibition**	Vorinostat + palliative RT 30 Gy in 10#)	Phase I (n=17) (DLT: fatique, anorexia, diarrhea)
Czito; 2015	**PARP Inhibition**	Veliparil + Cape/RT	Phase I (n=25); pCR 28% (DLT: skin, nausea)
Buijsen; 2013	**PI3-K/AKT Inhibition**	Nelfinavir + Cape/RT	Phase I (n=11) pCR 27% (DLT: cholangitis, liver-enzymes)
Moos; 2014	**RAF/MEK/ERK and VEGF-R**	Sorafenib + Cape/RT	Phase II (n=40) pCR 15% (Grade 4: 3% neutropenia; Grade 3: diarrhea

Conclusion

- Cape/5-FU based CRT remains standard
- Oxaliplatin + CRT: more tox, less compliance
- But: DFS improved even if only added to CRT (!?!)
- CAPOX/FOLFOX as induction-/consolidation Tx (?)
- EGFR-/VEGF-Inhibition: no phase III data
- Other pathways: early phase I/II

Wait and see concept after clinical complete response

On-Going Trials

of Chemo-Radio-Therapy

Rob Glynne-Jones
Mount Vernon Cancer Centre

5 Options for chemotherapy in locally advanced rectal cancer

- **Induction** - pre RT (Short-course(SCPRT) or chemoradiation (CRT)(Contre, ?CREATE)

5 Options for chemotherapy in locally advanced rectal cancer

- **Induction** - pre RT (Short-course(SCPRT) or chemoradiation (CRT)(Expert, Expert C, Fernandez-Martos, Contre)
- **Concurrent** - With RT (CRT) (but NB toxicity) (5 oxaliplatin trials,1 irinotecan trial)

5 Options for chemotherapy in locally advanced rectal cancer

- **Induction** - pre RT (Short-course(SCPRT) or chemoradiation (CRT)(Expert, Expert C, Fernandez-Martos, Contre)
- **Concurrent** - With RT (CRT) (but NB toxicity) (5 oxaliplatin trials,1 irinotecan trial)
- **Consolidation** - post CRT or SCPRT if waiting 6 12 weeks before surgery (Garcia-Aguilar, Polish , RAPIDO –Nordic Countries/Holland)

5 Options for chemotherapy in locally advanced rectal cancer

- **Induction** - pre RT (Short-course(SCPRT) or chemoradiation (CRT)(Expert, Expert C, Fernandez-Martos, Contre)
- **Concurrent** - With RT (CRT) (but NB toxicity) (5 oxaliplatin trials,1 irinotecan trial)
- **Consolidation** - post CRT or SCPRT if waiting 6 12 weeks before surgery (Garcia-Aguilar, Polish , RAPIDO –Nordic Countries/Holland)
- **NACT alone Without radiation** (Prospect, Bacchus)
-

5 Options for chemotherapy in locally advanced rectal cancer

- **Induction** - pre RT (Short-course(SCPRT) or chemoradiation (CRT)(Expert, Expert C, Fernandez-Martos, Contre)
- **Concurrent** - With RT (CRT) (but NB toxicity) (5 oxaliplatin trials,1 irinotecan trial)
- **Consolidation** - post CRT or SCPRT if waiting 6 12 weeks before surgery (Garcia-Aguilar, Polish , RAPIDO –Nordic Countries/Holland)
- **NACT alone Without radiation** (Prospect, Bacchus)
- **Post-op adjuvant**

Advantage for NACT in rectal cancer

- Compliance should be increased to 90-95%
- Systemic Chemo can start immediately rather delayed many weeks post surgery
- Very few progress
- Can assess response to chemotherapy
- If 3 months sufficient from IDEA can be short and cost-effective

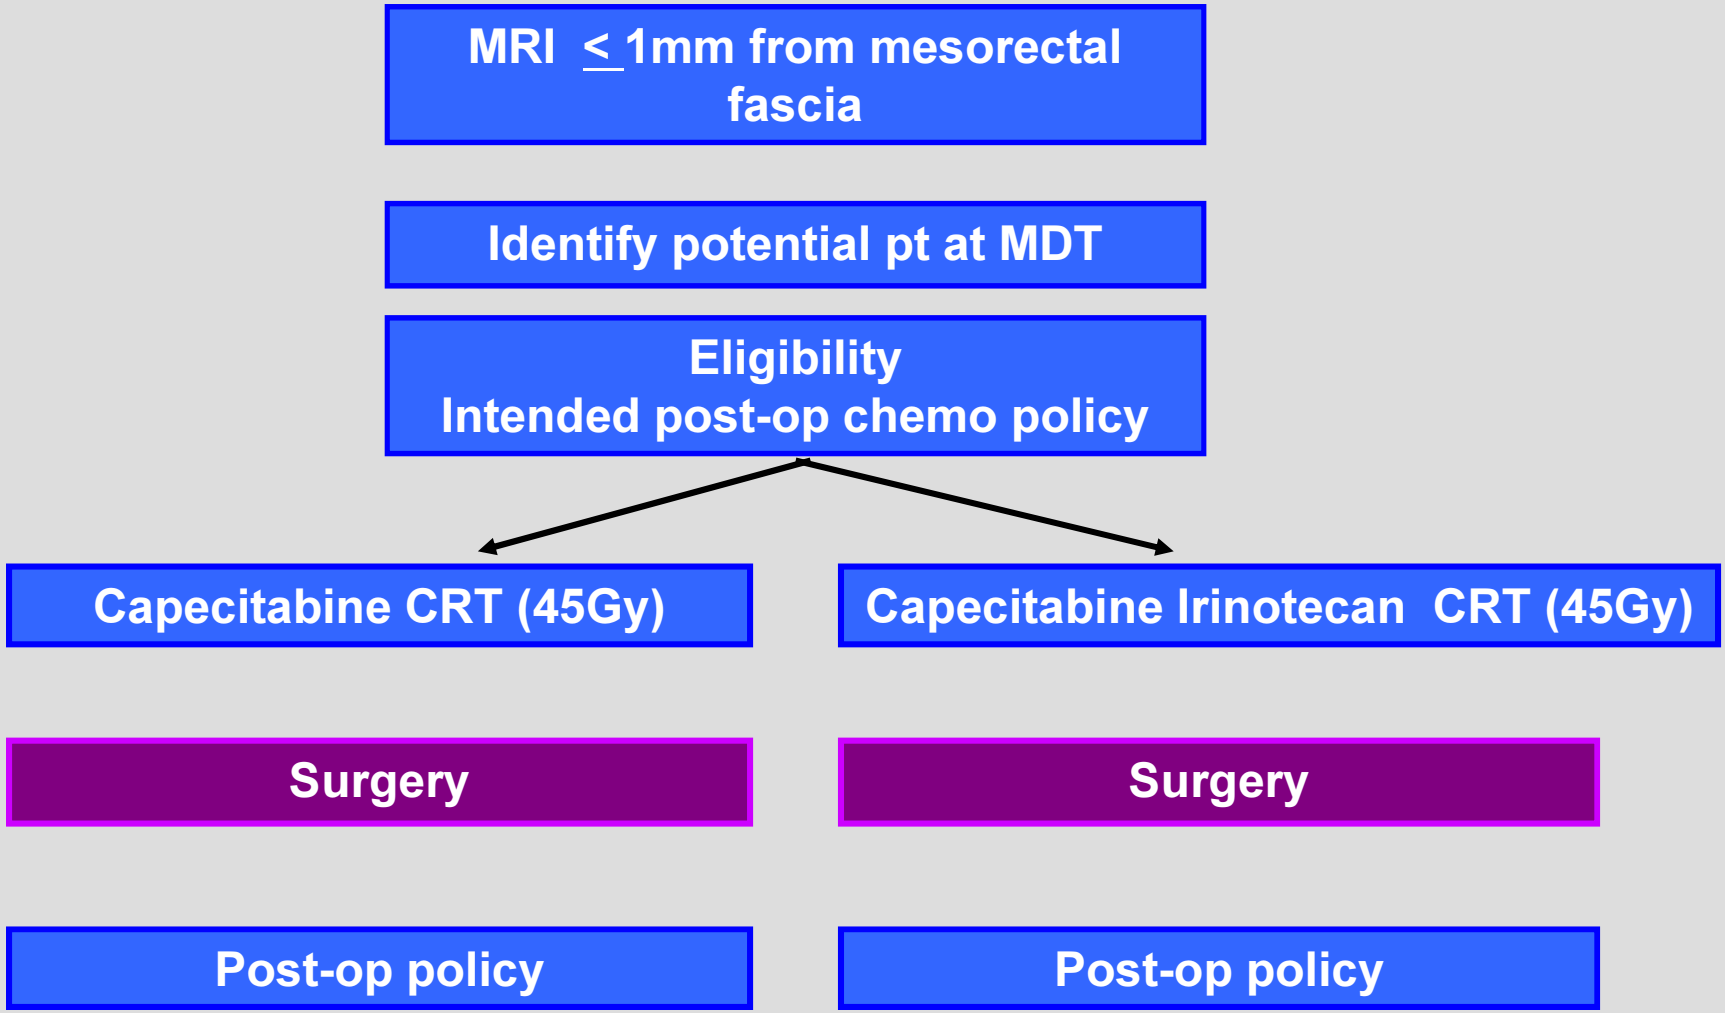
Clinical trials – several strategies

- Integrating chemotherapy into chemoradiation schedules
- Integrating induction chemo (IC) and CRT or SCPRT
- Integrating consolidation chemo (CC) after CRT or SCPRT
- Neoadjuvant chemotherapy alone instead of SCPRT/CRT

Problems with all trials

- Primary endpoint
- Imaging/staging
- Quality assurance
- Watch and wait
- Pathology stage
- Adjuvant chemotherapy
- You need to do it fast before practice changes

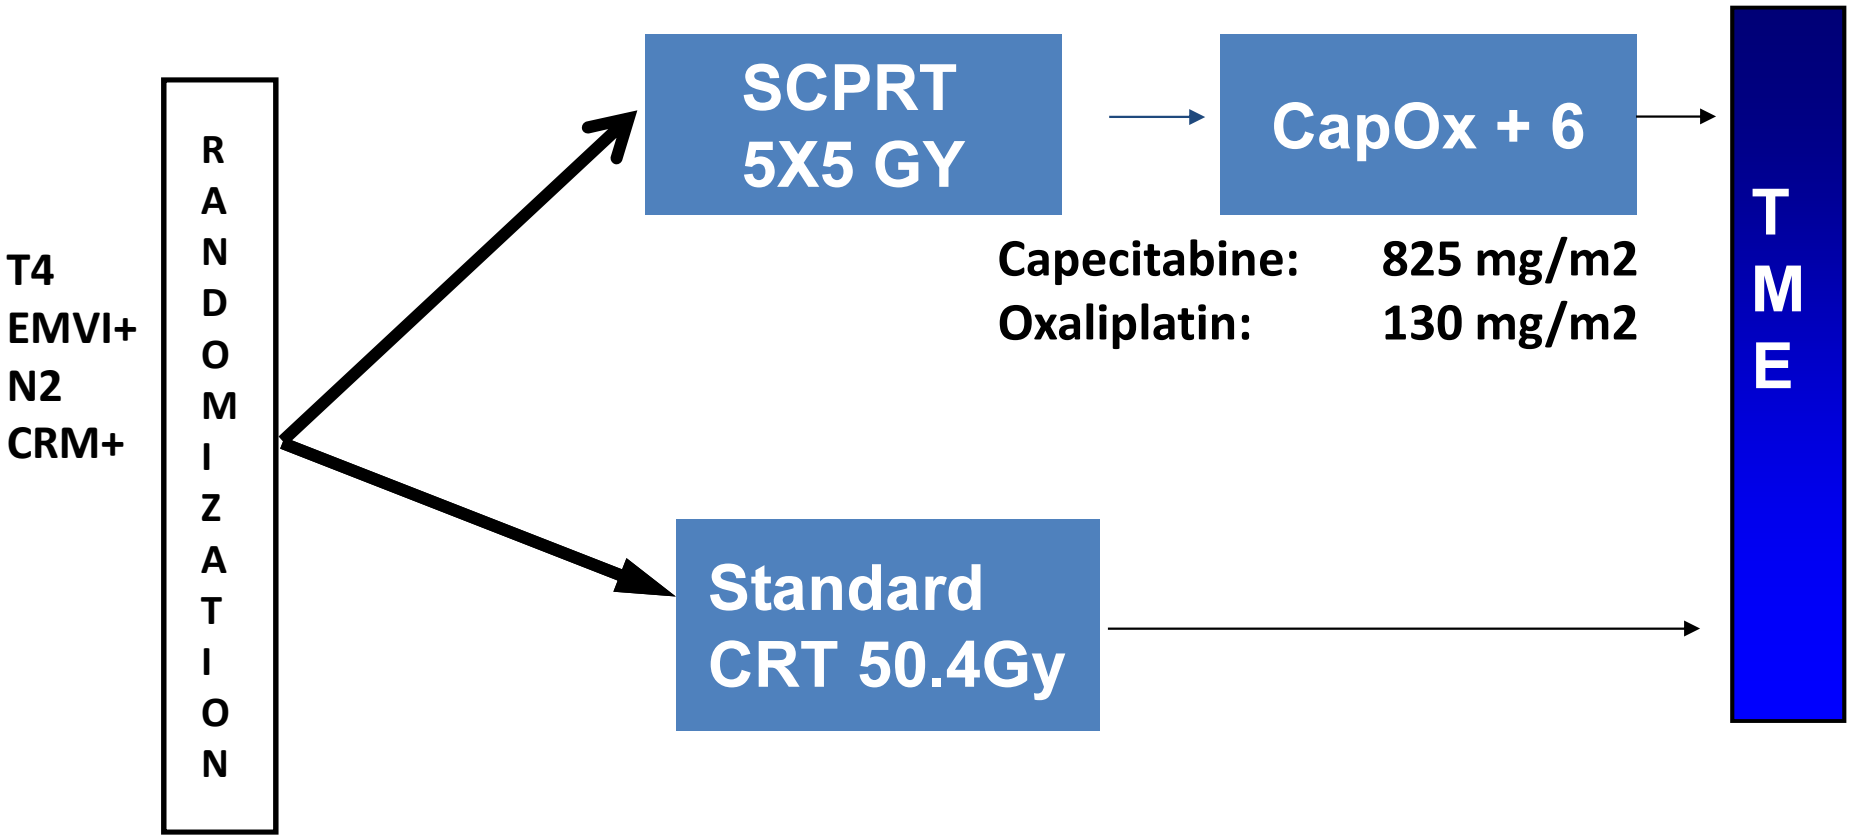
Aristotle National UK Trial schema n=920



Primary endpoint 2 year DFS

RAPIDO Trial

N = 885 patients



Primary endpoint 3 year DFS

Unicancer Prodige 23
NCT01804790

Anal SCC
Staging and re-staging

gina.brown@rmh.nhs.uk

Standards for assessment

- T staging – based on clinical assessment of maximum tumour length
- N staging – extrapolated from experience in rectal cancer
- M staging – requires CT TAP
- ERUS – not indicated
- PET-CT – changes stage in 30% - uncertain whether this improves outcomes.

Reporting standards

The tumour involves the circumference of the rectum from O'clock to the O'clock position

Tumour is [confined to] [extends through] the muscularis propria:
Extramural spread is [ ] mm at the O'clock position

Lymph node assessment
Mesorectal nodes
Only benign reactive and no suspicious nodes shown
[ ] mixed signal/irregular border nodes in the mesorectum only

Pelvic side wall lymph nodes:
[None] [Benign] [Malignant mixed signal/irreg border]
Location: [Obturator fossa • R •L] . [External Iliac Nodes • R •L] [Internal iliac • R •L]

Inguinal nodal territory
Only benign reactive and no suspicious nodes shown
[ ] mixed signal/irregular border nodes in the mesorectum only [N2]

Overall Nodal Status:
No nodal disease: N0
Perirectal nodal disease only: N1
Unilateral inguinal and/or Pelvic sidewall nodes: N2
Bilateral inguinal/pelvic sidewall or Perirectal plus inguinal/pelvic sidewall N3

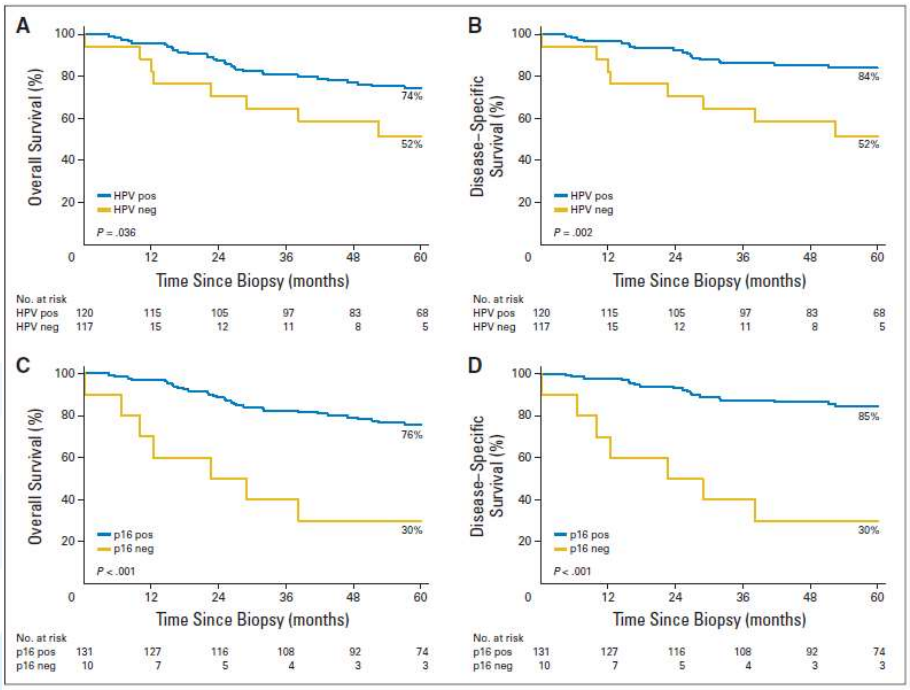
ESTRO School

Incidence and risk factors

- Rare disease
  - Annual incidence: 1/100 000 (USA)
  - Incidence is rising over the last 25 years
- 5 year survival: +/- 60%
- Risk factors:
  - HPV (in 90% of the patients)
  - HIV or HSV (secondary role in disease progression)
  - Immune suppression (transplant recipients)
  - Cigarette smoking (persistence HPV)



143 patients, PCR and p16

Serup-Hansen et al, JCO 2014

Pretreatment evaluation

- Specific history
- Symptoms (sphincter competence)
- Predisposing factors (history of HPV and HIV infections)
- Associated disease (CIS)
- Comorbidities possibly impacting on treatment

Disease staging

- To determine:
  - Tumor location
  - Tumor size
  - Nodal involvement
  - Distant Metastasis
- Primary tumor :
  - Clinical examination, preferentially under anesthesia
- Nodes
  - Clinical examination
  - Fine needle aspiration inguinal
- Radiological TN staging : MRI
  M staging : CT

Note : FDG-PET, inguinal sentinel N biopsy : investigational

Treatment of localized anal cancer

- Prior to mid-1980's: abdominoperineal resection as standard treatment

- Nigro et al: XRT 30 Gy + 5 FU Mito C (3 patients)

→ 2 AP resection tumour sterilised

→ 1 refusing surgery in complete clinical remission

⟶ No need for APR?

Mid eighties first phase III trials

	Arm A	Arm B
US (RTOG 8704)	XRT+ 5 FU	XRT + 5 FU-Mito C

- Type and scheme of CT
- Optimizing RT delivery

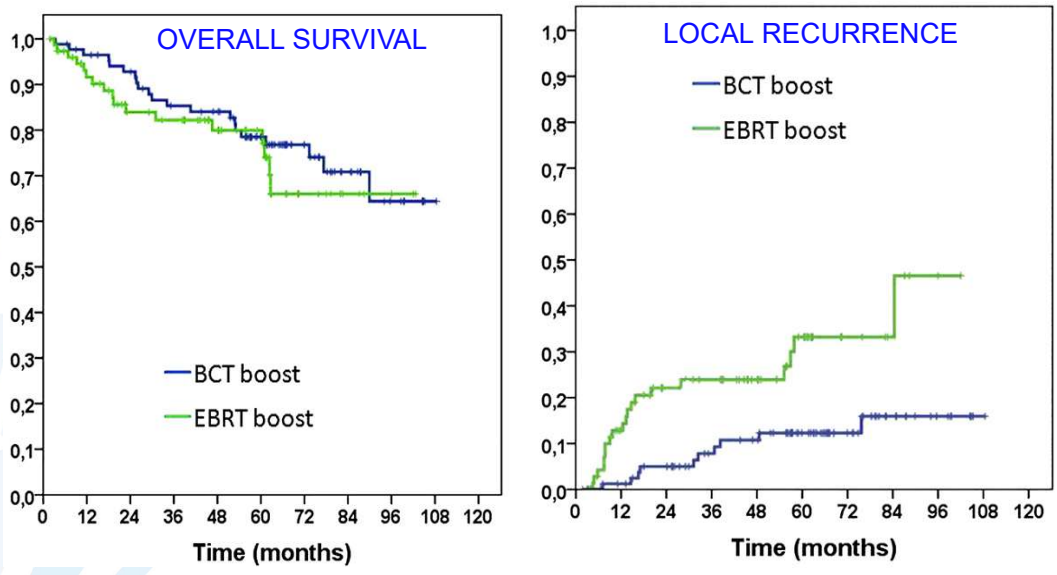
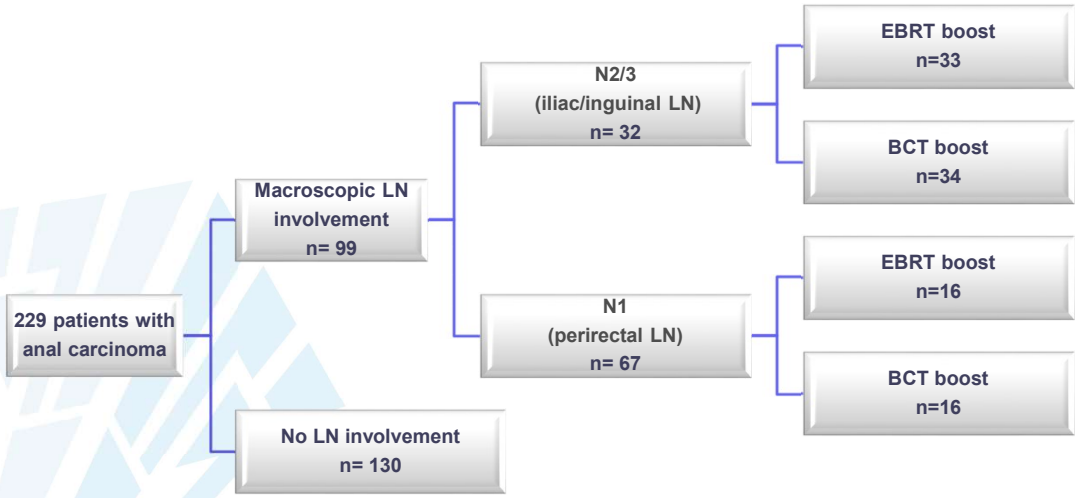
Boost with brachytherapy ?

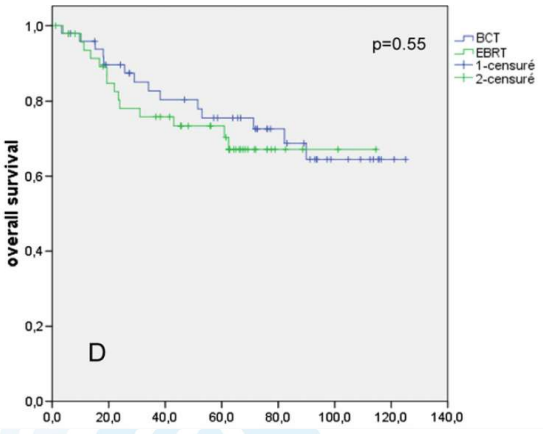


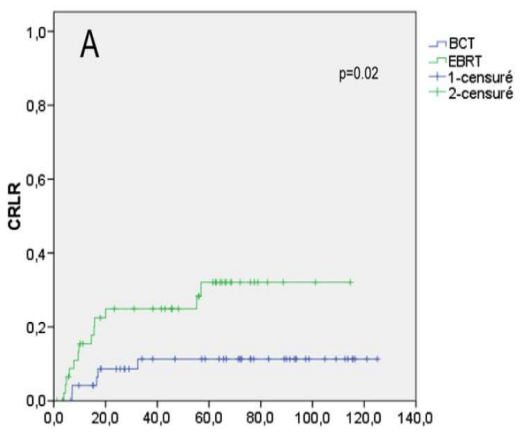
Hannoun-Levi, IJROBP 2011

CORS-03 study



CORS-3 study





BCT boost is superior to EBRT boost for local control , without an influence on OS

→ N1 status should not be a contraindication for a BCT boost technique

Laurence Moureau-Zabotto et al, IJROBP 2013

Unsolved questions

- Role of brachytherapy
- Management of inguinal region
- Type and scheme of CT
- Optimizing RT delivery

Management of the inguinal region

- Involvement %

Overall	T1-2	T3-4
25	< 10	15-30

- Risk increased
  - T below dentate line
  - Pelvic nodes
  - Anal margin involved
- Pic factor : 5-year survival ~ 50 %

Management of inguinal region (CMT)

- N negative
  - ENI 36 Gy if
    - T within 1 cm from a/m
    - Invasion of anal margin
    - Pelvic nodes involved
- N positive
  - CMT 60 Gy

Salvage surgery

Note : delayed CR possible up to ≥ 4 months

if incomplete clinical response 16 weeks after CRT

Current ESMO Guidelines

- **Glimelius** B, Tiret E, Cervantes A, Arnold D; ESMO Guidelines Working Group.
- Ann Oncol. 2013 Oct;24 Suppl 6:vi81-8

Risk group	TN substage	Therapeutic options
Very early	*c*T1 sm1 (-2?) N0	Local excision (TEM). If poor prognostic signs (sm ≥ 2, high grade, V1), resection (TME) (or possibly CRT)
Early (good)	*c*T1-2; *c*T3a (b) if middle or high, N0 (or cN1 if high), mrf-, no EMVI	Surgery (TME) alone. If poor prognostic signs (crm+, N2) add postop CRT or CT[a]. (CRT with evaluation, if cCR, wait-and-see, organ preservation)
Intermediate (bad)	*c*T2 very low, *c*T3mrf- (unless cT3a(b) and mid- or high rectum, N1-2, EMVI+, limited *c*T4aN0	Preop RT (5 × 5 Gy) or CRT followed by TME. (if CRT and cCR, wait-and-see in high risk patients for surgery)
Advanced (ugly)	*c*T3mrf+, *c*T4a,b, lateral node+	Preop CRT followed by surgery (TME + more extended surgery if needed due to tumour overgrowth). 5 × 5 Gy with a delay to surgery in elderly or in patients with severe comorbidity who cannot tolerate CRT

- To my mind muddied by watch and wait

Guidelines for Postoperative adjuvant chemotherapy

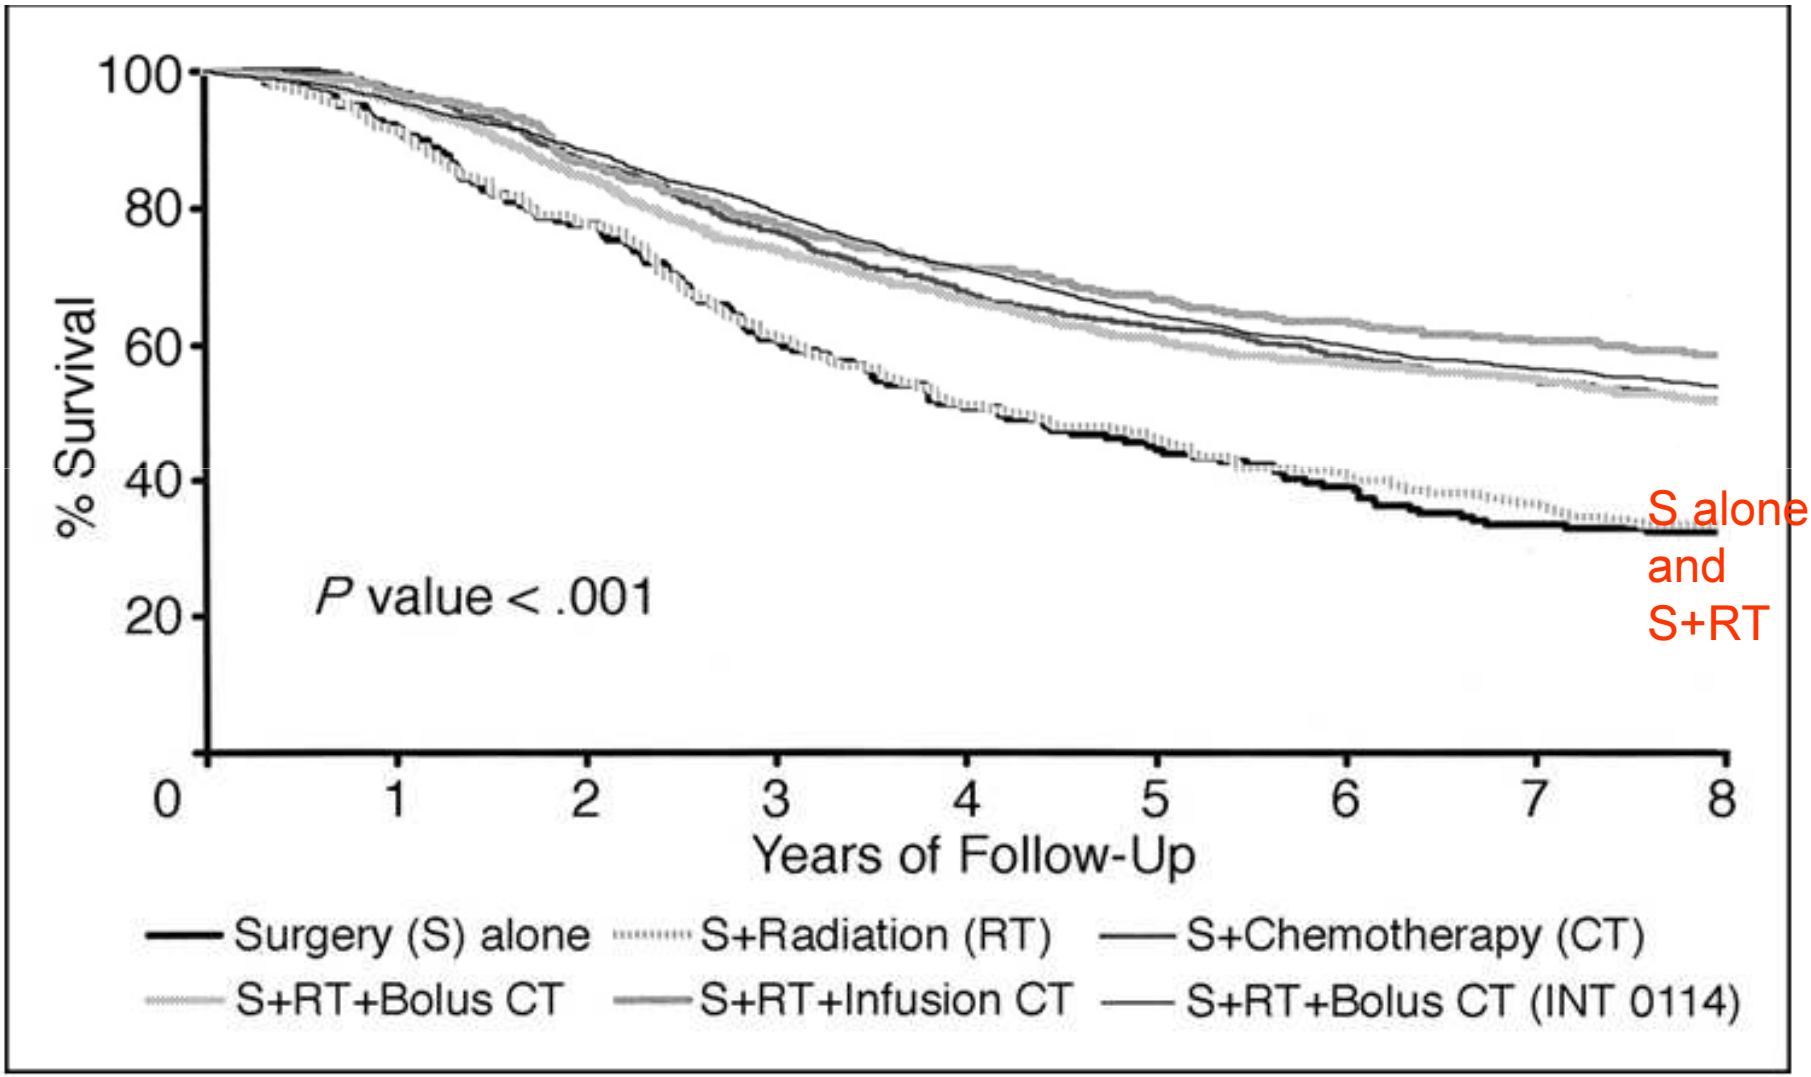
Disease-free survival

Overall survival

Krook et al. N Eng J Me 1991

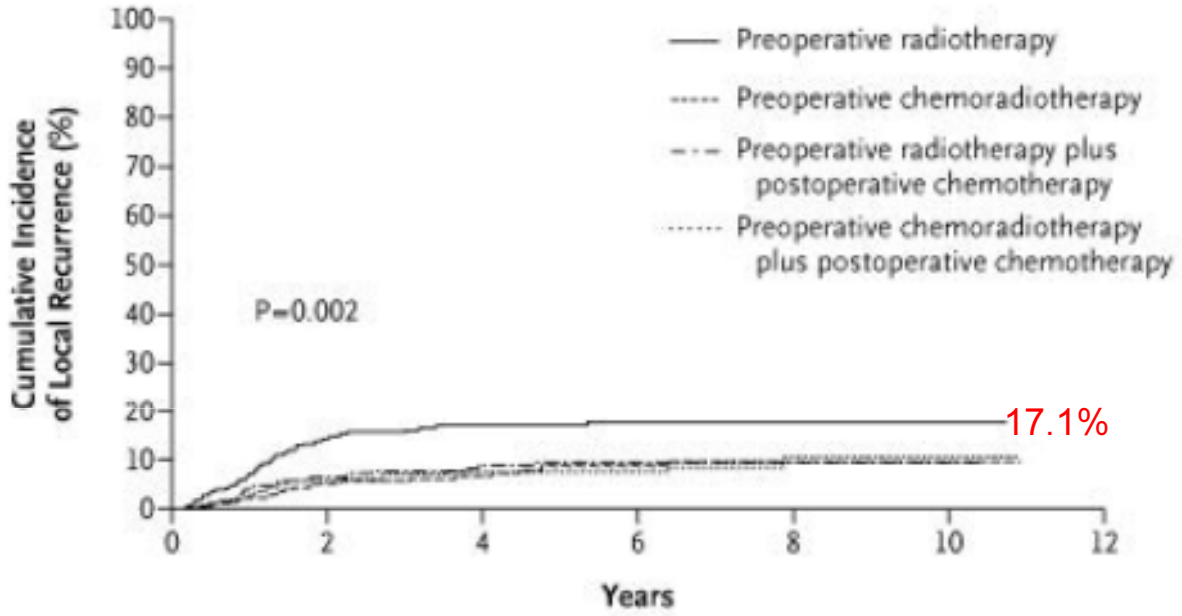
Impact on overall survival of 6 methods of treatment in rectal cancer pooled analysis



Gunderson, L. L. et al. J Clin Oncol; 22:1785-1796 2004

EORTC 22921 Trial

Local recurrence as a first event at 5 years was **17.1%** in the preoperative-radiotherapy group vs 8.7%, 9.6% and 7.6% in the group receiving preoperative chemoradiotherapy and postoperative chemotherapy.



No. at Risk						
Preoperative radiotherapy	252	147	87	60	24	6
Preoperative chemoradiotherapy	253	165	99	52	22	5
Preoperative radiotherapy plus postoperative chemotherapy	253	156	103	65	29	6
Preoperative chemoradiotherapy plus postoperative chemotherapy	253	159	113	59	20	3

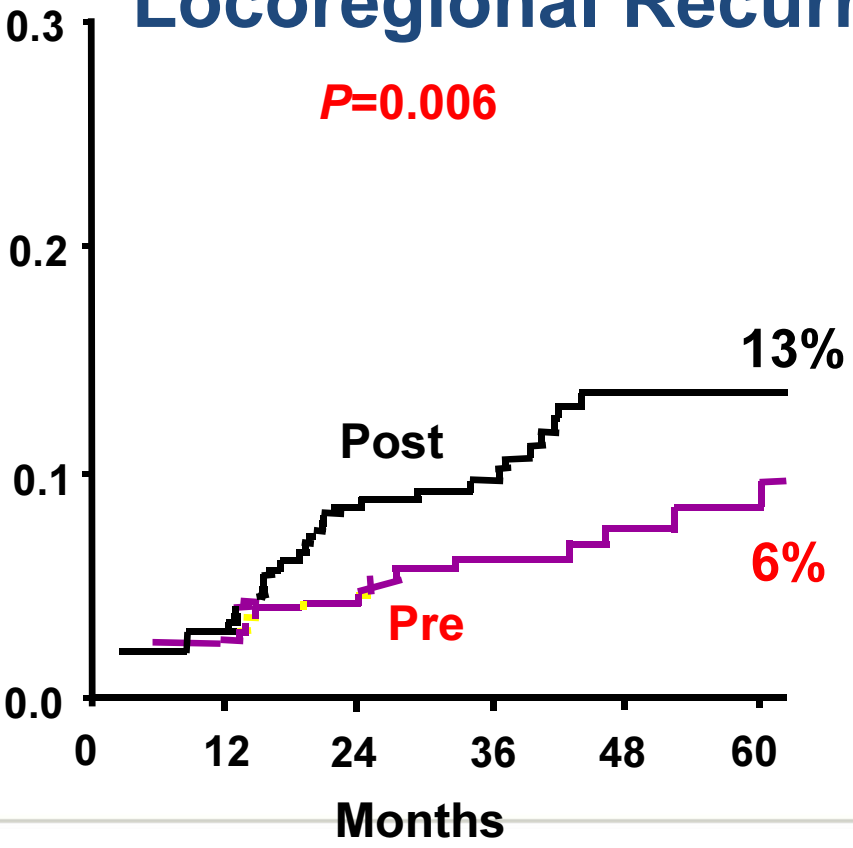
ESTRO School

So you need chemotherapy in there somewhere!

(but I will come back to this)

Pre- vs post-operative chemoradiation CAO/ARO/AIO-94

Locoregional Recurrences

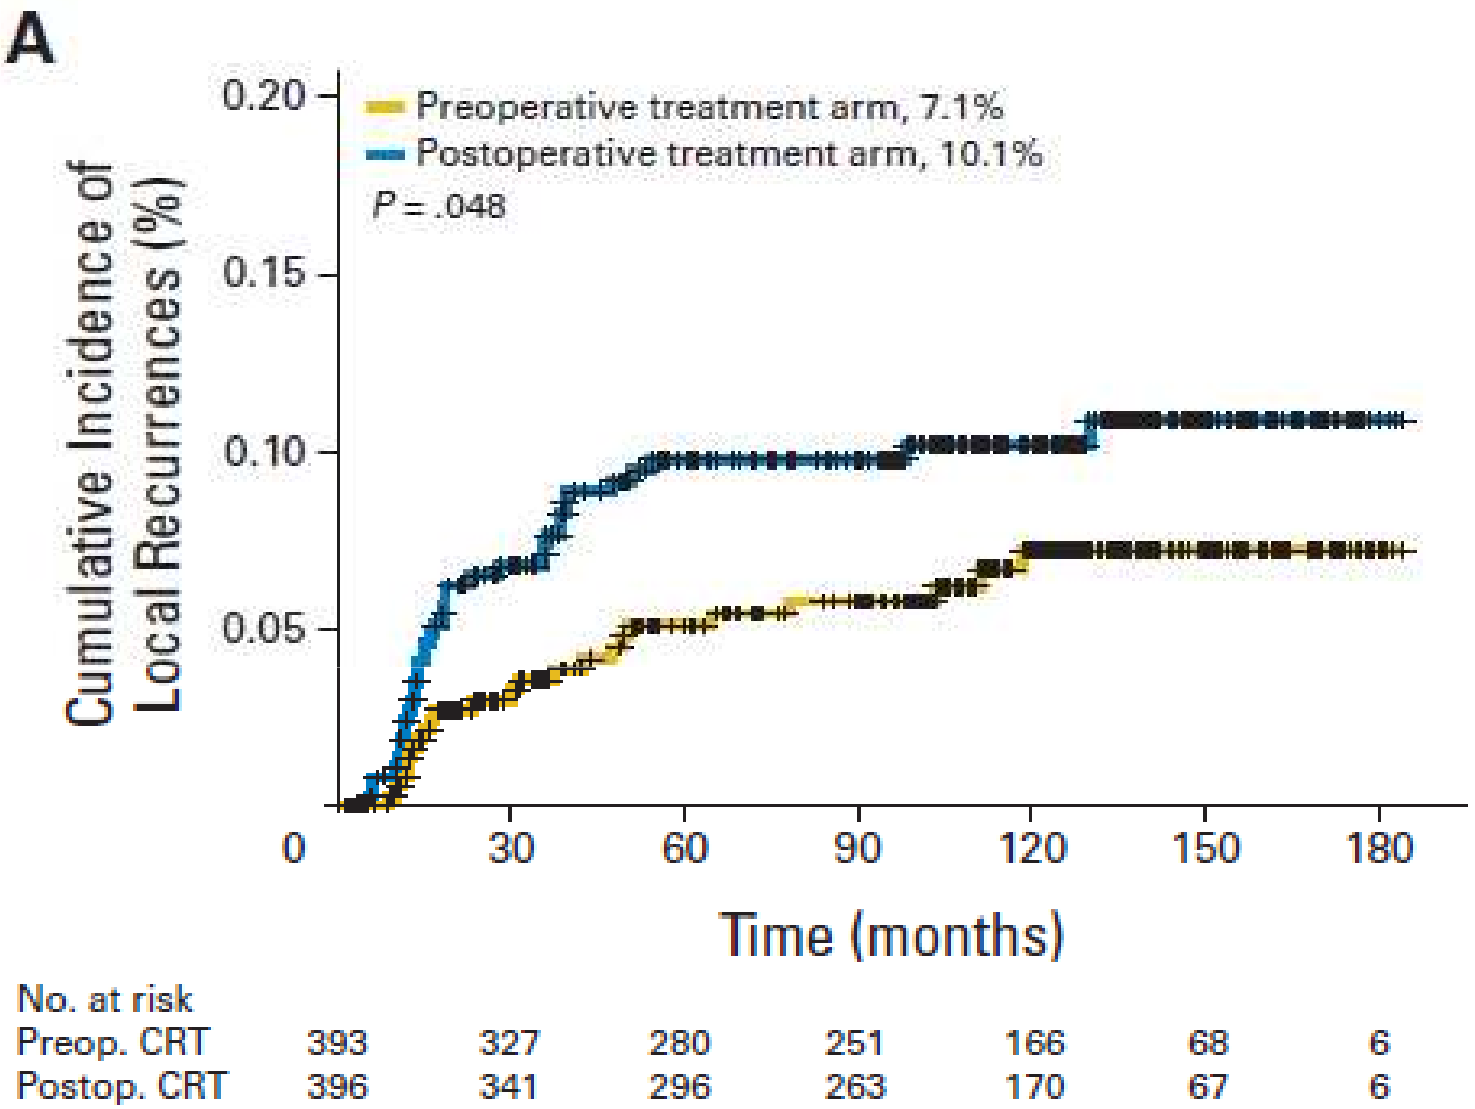


Acute G3/4 adverse events
27% vs 40% (p=0.001)

Long-term G3/4 adverse events
14% vs 24% (p=0.01)

There is a standard for chemoradiation

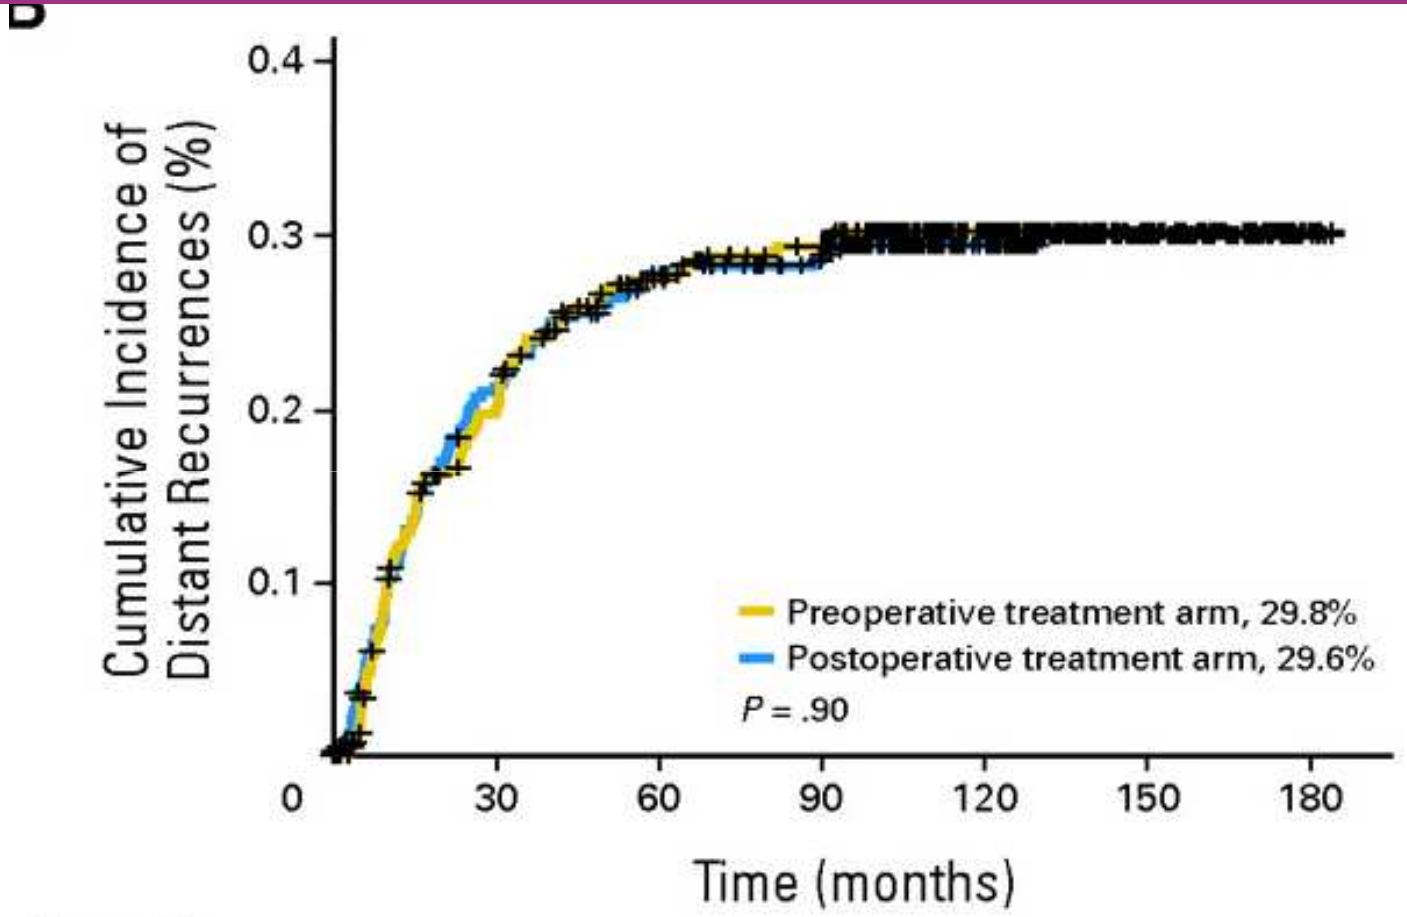
Sauer R. et al., N Engl J Med 2004;351: 1731-39



Long-term data on LOC REC from German study – 5/22 local recurrences ie 23% after 5 years (not like CR07)

ESTRO School

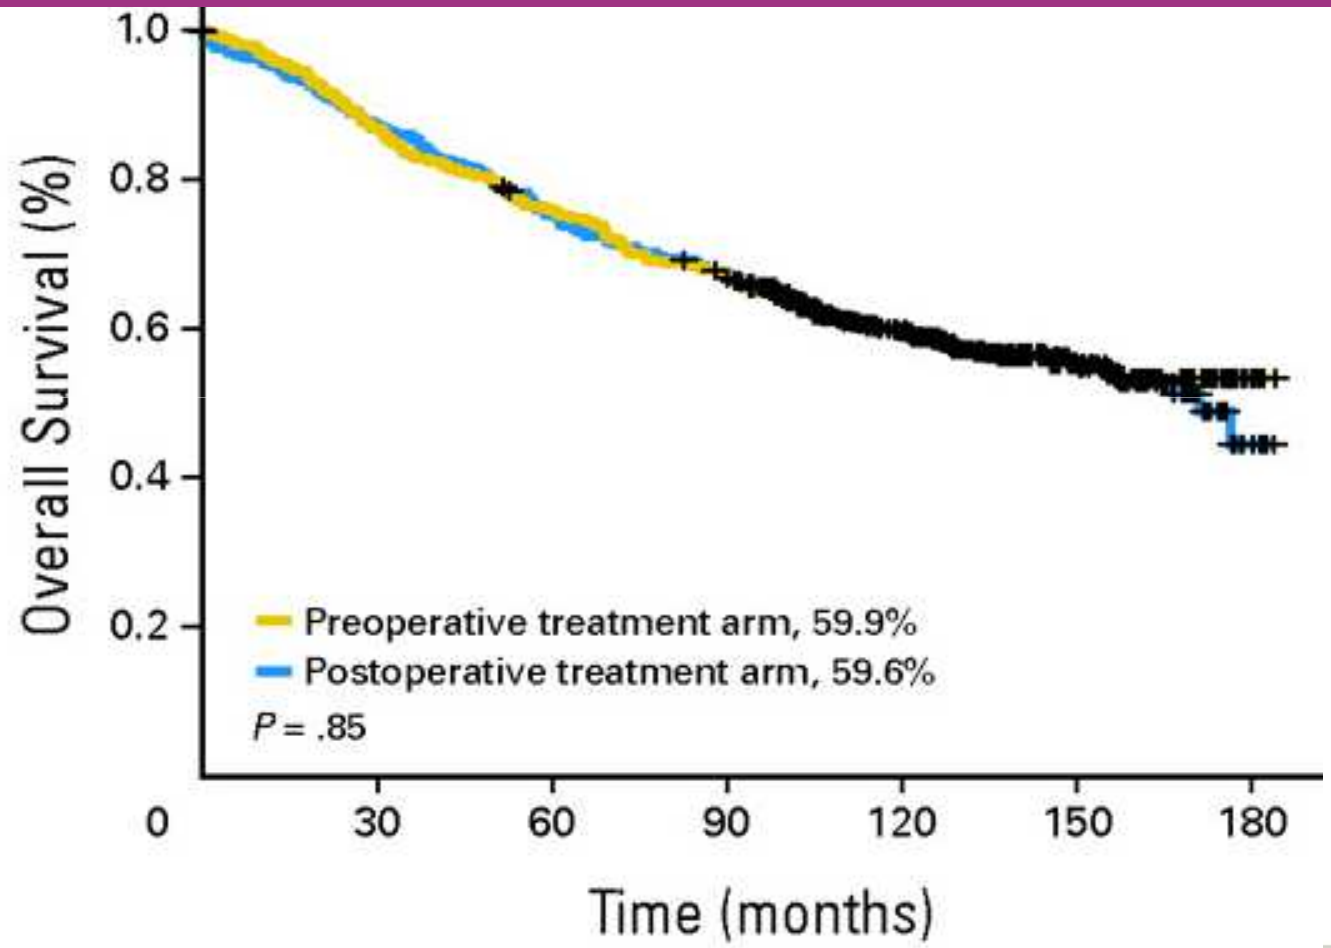
Pre- vs post-operative chemoradiation CAO/ARO/AIO-94



No. at risk							
Preop. CRT	393	295	262	241	158	60	5
Postop. CRT	396	310	267	246	162	63	6

ESTRO School

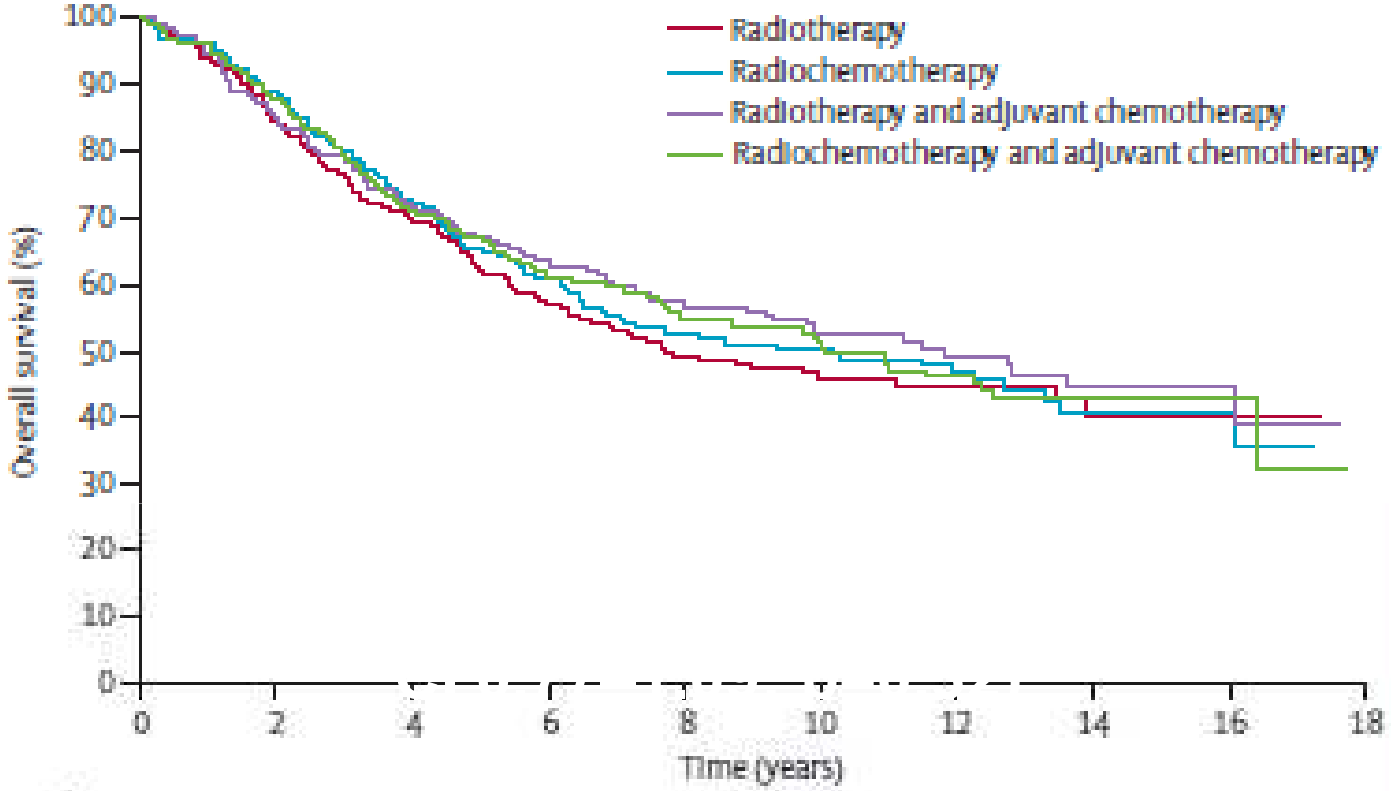
Pre- vs post-operative chemoradiation CAO/ARO/AIO-94



No. at risk							
Preop. CRT	404	351	305	268	174	67	6
Postop. CRT	395	342	295	262	172	70	6

ESTRO School

EORTC 22921 – Overall Survival



Number at risk									
Radiotherapy	252	208	165	129	98	62	32	15	5
Radiochemotherapy	253	223	173	135	96	66	41	19	9
Radiotherapy and adjuvant chemotherapy	253	212	171	140	102	69	42	18	8
Radiochemotherapy and adjuvant chemotherapy	253	221	174	143	108	77	44	18	4

So why have post-op CRT studies shown an improvement in survival

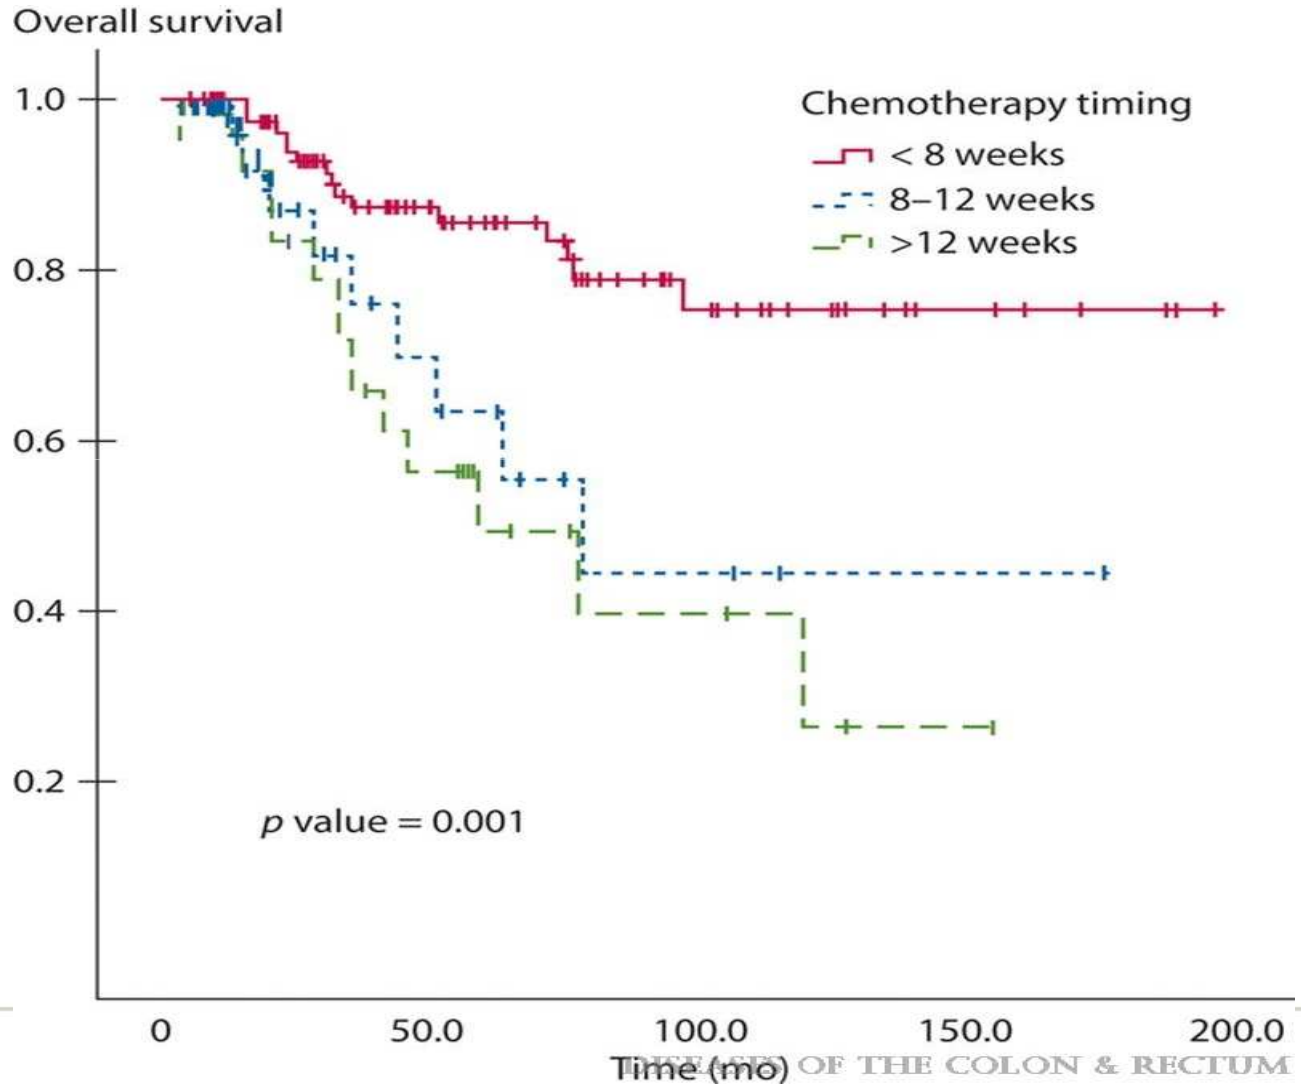
whereas preop CRT has not?

Suggests that in the trials

50-60% cN0

Compliance to postoperative adjuvant chemotherapy approx 50%

Timing of start of Adjuvant Postoperative Chemotherapy:

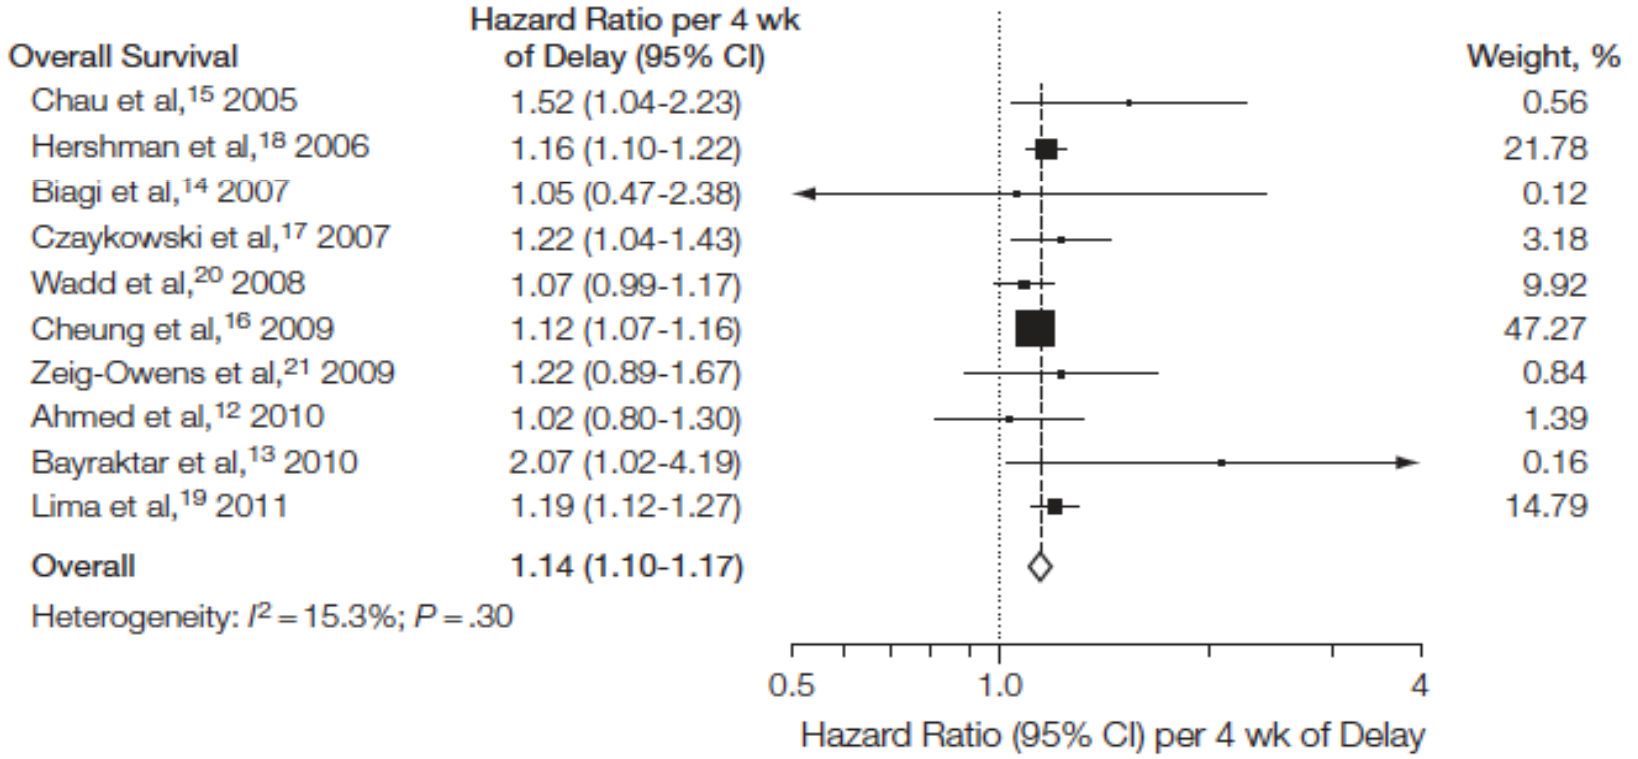


Tevis et al, DCR 2013

Association Between Time to Initiation of Adjuvant Chemotherapy and Survival in Colorectal Cancer

A Systematic Review and Meta-analysis

Increase in interval to start Adjuvant Chemotherapy
was associated with a **decrease in overall survival**



Biagi JJ et al., JAMA 2011 Jun 8;305(22):2335-42

Champalimaud Foundation

ESTRO School

So - What about?

- Oxaliplatin
- Irinotecan
- Biologicals

So what have the trials shown us?

All 5 Oxaliplatain trials used low dose oxaliplatin as a radiosensitizer with CRT

2 trials mandated oxaliplatin also as postoperative adjuvant (so if benefit which component?)

Some of the 5 trials did not mandate TME (NB the German trial did)

Phase III trials – Investigating

Trial	Eligibility	Fluoropyrimidine Platform
CAO/ARO/AIO-04	<12cm from anal verge T3/T4 cN0/N+ TRUS, CT and/or MRI	5FU 1000mg/2 X 5 days 1-5 + 29-33
NSABP R04 N=1606	<12cm; resectable stage II, III TRUS or MRI – CT if T4/ N1-2	PVI 5FU vs Capecitabine
FFCD N=598	Palpable; resectable; T3/4 N0-2; T2 distal anterior	Capecitabine in both arms
STAR – 01 N=747	Resectable stage II, III (c stage) <12cm from anal verge	PVI 5FU in both arms
PETTAC 6 N=1090	Stage II or III resectable or expected to become resectable <12cm from anal verge	Capecitabine in both arms

ESTRO School

Phase III: CAO/ARO/AIO-04

Best arm of CAO/ARO/AIO-94:

RT 50.4 Gy + 5-FU
1000 mg/m² days 1-5 + 29-33
623 patients

From Phase I/II Studies:

RT 50.4 Gy + 5-FU/OX
Ox: 50 mg/m² d 1, 8, 22, 29
5-FU: 250 mg/m² d 1-14 + 22-35

Note: Chemo gap 3rd week of RT !

613 patients

So what about postoperative adjuvant chemotherapy after Chemoradiation?

clinical practice guidelines

Annals of Oncology 24 (Supplement 6): vi81–vi88, 2013
doi:10.1093/annonc/mdt240

Rectal cancer: ESMO Clinical Practice Guidelines for diagnosis, treatment and follow-up†

B. Glimelius[1], E. Tiret[2], A. Cervantes[3] & D. Arnold[4], on behalf of the ESMO Guidelines Working Group*

[1]Dept of Radiology, Oncology and Radiation Science, Akademiska sjukhuset, Uppsala University, SE-751 85 Uppsala, Sweden; [2]2AP-HP, Hôpital Saint-Antoine, Pierre et Marie Curie University, Paris 6, France; [3]Department of Hematology and Medical Oncology, INCLIVA, University of Valencia, Valencia, Spain; [4]Klinik fuer Tumorbiologie, Freiburg, Freiburg, Germany

These Clinical Practice Guidelines are endorsed by the Japanese Society of Medical Oncology (JSMO)

" As in colon cancer stage III (and 'high-risk' stage II), adjuvant chemotherapy can be given, even if the level of scientific evidence for sufficient benefit is much lower than in colon cancer [33, 34, 35] [II, B]."

ESTRO School

Adjuvant chemotherapy in Colon Cancer

Good evidence for fluoropurimidines

Definite Benefit in Stage III (stage II QUASAR)

Good evidence for **Oxaliplatin** stage III

?Small benefit for 5FU in stage II

? Benefit Stage II for oxaliplatin

? Benefit over 70 years

Meta-analysis - reduction in risk of disease recurrence (25%) with adjuvant chemotherapy compared to observation (**HR=0.75,** CI: 0.68-0.83).

Trials randomising up front before CRT

The majority of patients are over-staged and probably Stage II

Compliance is poor in timing to start and doses received

Other trials randomising after CRT

TRIAL	Patient number	Primary endpoint	OS	DFS	HR for DFS
QUASAR (92% stage II)	3239 overall 968 rectal 203 preop RT	all-cause mortality.	80% versus 83.4%	Not stated	0.78 CI [0.44-1.22] (p=0·004)
PROCTOR SCRIPT	437	OS	5-year-OS 79·2% vs 80·4% (HR 0·93)	5-year-DFS 55·4%vs62·7 %(HR0·80)	0.80 CI [0.60-1.07] (p=0·13).
GERCOR	357 69% preop RT	DFS	OS HR =0.87	5-year DFS 58% vs 63%	0.80, (p=0.154)
Chronicle	113	DFS	3-year-OS 89% vs 88% (HR 1·18)	5-year DFS 71% vs 78%	0.80 (p=0.50)
ADORE	321	DFS	3-year-OS 86%vs95% (HR 0·46)	3-year DFS 63% vs 72%	0.63 (p=0.03)

So consider postop histology

Factors to consider 2

The type and quality of surgery are major (non-randomized) prognostic factors

Poor compliance may compromise the activity of adjuvant chemotherapy

After preoperative chemoradiation and surgery, time to start adjuvant chemotherapy is probably too long

Any benefit from 5FU may be achieved by the preop 5FU ie pCR

Conclusions

1. 5FU-based CRT (45-50Gy) more effective (downsizing) than RT but no improvement in SpS, DFS or OS
2. Capecitabine is an equivalent option
3. Watch and wait remains experimental
4. Radio-sensitizing 5FU-based CRT not improved by additional oxaliplatin ?
5. Biologicals have not yet delivered
6. Postop adjuvant chemotherapy after SCPRT or CRT remains of unproven benefit

Thank you for listening

Role of salvage surgery for non-responders, surgery for locoregional recurrent disease

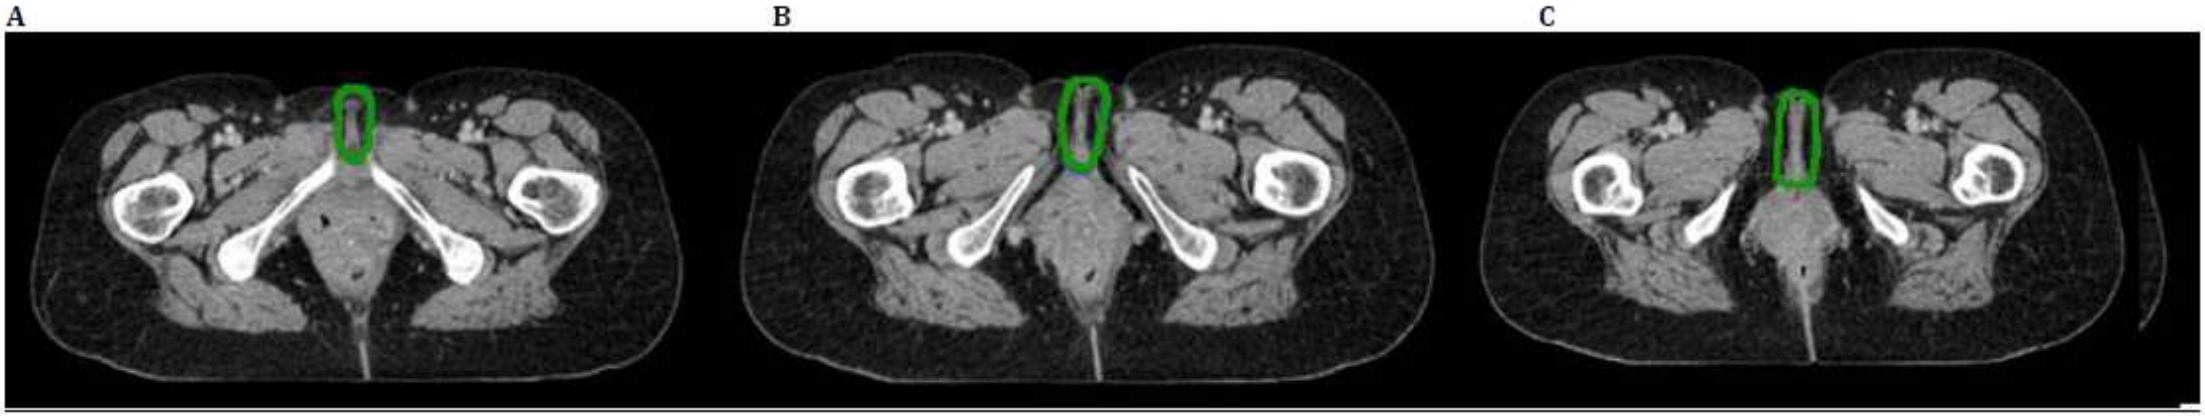
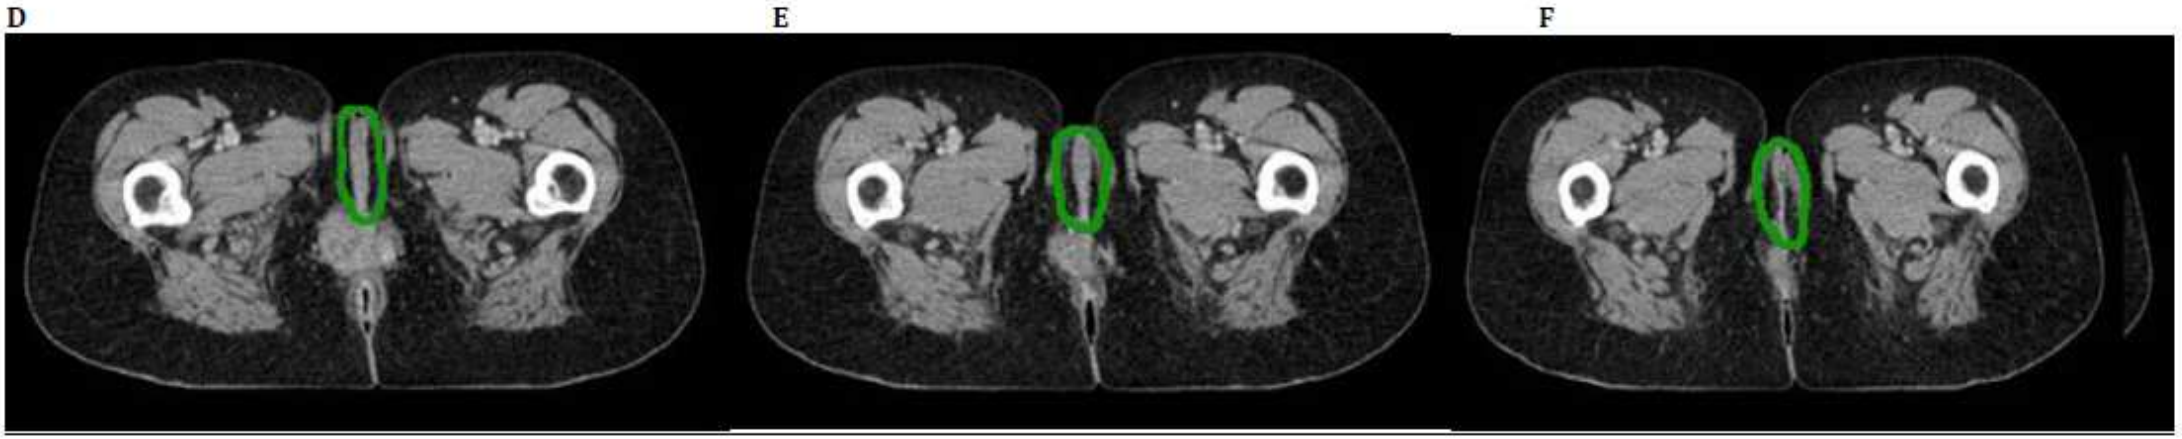
Female:



Superior slice: First image demonstrating the vulva mucosa (usually around the inferior border of the symphysis)



Inferior slice: Last slice where the vulva are visible.

Elective nodal volumes covered per stage of disease

- All nodal volumes should be covered for all stages
- **Exception:**

  cT1N0: the elective irradiation can be omitted of

  - inguinal nodes
  - high pelvic lymph nodes (caudal border of SI joint)

Delineation of primary tumor

STRUCTURE	MARGIN
GTV	Primary tumor, based on all available imaging
CTV	GTV + anal canal (anorectal junction – anal verge) + internal and external sphincters + 20 mm isotropic margin
PTV	5-10 mm (5-7 mm with daily IGRT)

Delineation of involved nodes

STRUCTURE	MARGIN
GTV	Involved node (MR registration)
CTV	Involved nodes or nodal region with 10-20 mm margin, respecting the anatomical boundaries
PTV	5-10 mm (5-7 mm with daily IGRT)

Therapeutic Schema

Dose prescription T1 /T2 N0 (and T2N1 at clinician's discretion)

- Elective (PTV_Elec) = 40 Gy in 28# (1.43 Gy per #) in 5.5 weeks
- Gross nodal disease (PTV_Nodes) = 50.4Gy in 28# (1.8Gy per #) in 5.5 weeks
- Gross anal disease (PTV_Anal) = 50.4 Gy in 28# (1.8 Gy per #) in 5.5 weeks

Dose prescription T3/4N0 or Tany N2/3 (and T2N1 at clinician's discretion)

- Elective (PTV_Elec) = 40 Gy in 28# (1.43 Gy per #) in 5.5 weeks
- Gross nodal disease (PTV_Nodes) = 50.4Gy in 28# (1.8Gy per #) in 5.5 weeks.
- Gross anal
- Disease (PTV_Anal) = 53.2 Gy in 28# (1.9Gy per #) in 5.5 weeks

Concurrent Chemotherapy

Concurrent chemotherapy should be prescribed in all patients that are considered fit for standard treatment.

Acceptable regimens are:

- Mitomycin 12mg/m2 Day 1 with 5FU 1000mg/m2 days 1-4 and day 29-32
- Mitomycin 12mg/m2 day 1 with Capecitabine 825mg/m2 BD on days of XRT.

Pre-Treatment

Patient Simulation and Immobilisation:

- Standard position: supine with immobilisation for popliteal fossa and feet
- Prior to pre-treatment scan, the clinician will assess the diagnostic imaging and ascertain whether the tumour is adequately bolused by the surrounding buttocks ie. 5mm of tissue surrounding GTV
- If there is not 5mm of tissue around whole GTV, tailored wax or sheet bolus should be considered in patients in whom additional bolus is required, this is more likely in ACT5 for nodal disease or larger primary tumours
- The distal point of macroscopic disease or anal verge will be wired prior to imaging, whichever is more inferior
- For tumours that have been excised, mark excision scar with radio-opaque marker where possible
- All patients must be scanned with a comfortably full bladder (>250mls)
- Strongly recommend the use of IV contrast to aid delineation of pelvic vessels
- The use of oral contrast is at the discretion of the site but may aid in delineation of small bowel
- Once patient is scanned, tattoo and document as per local protocol

Delineation

- If possible the diagnostic or planning MRI and PET/CT can be fused with planning CT: The treating consultant should review and approve the registration
- The GTV should be determined by the treating clinician using the planning CT, clinical data, MRI and PET/CT
- The borders of the GTV should not be defined using the PET/CT
- Principles of microscopic disease extent, in the vicinity of gross disease - There is no surgical data regarding the microscopic extent of anal cancer tumours. One study investigating a small number of SCC skin recommends CTV 11 mm for SCC <2 cm, and 14 mm for SCC > 2 cm [1]. We have therefore elected to have a smaller margin for early cancers (10mm) while using 15mm for locally advanced cancers

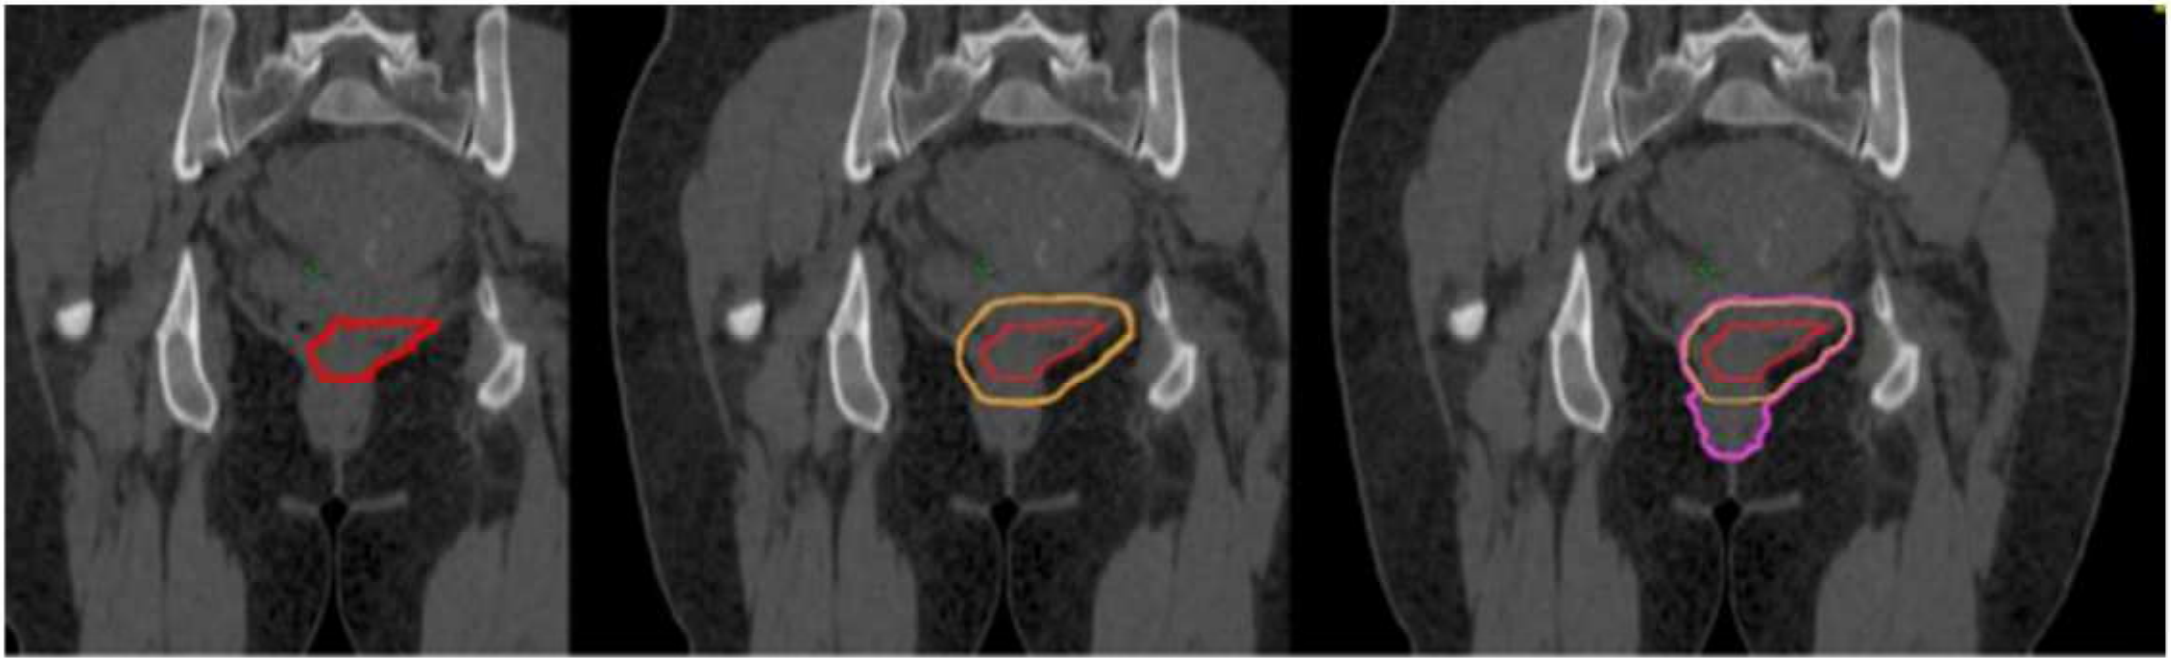
Volume Definitions

Good prognosis T1N0 Tumours

In small, good prognosis tumours it may be appropriate to offer CRT to the primary tumour plus a margin rather than deliver elective nodal irradiation. In these cases:

- **GTV_A** = Includes the gross primary anal tumour volume
- **CTV_A =** GTV_A + 10mm. Following this, manually enlarge to ensure coverage of entire anal canal including outer border, from the ano-rectal junction (approximately 4cm superiorly from anal verge identified by the radio-opaque marker) to the anal verge including the internal and external anal sphincters. Edit to exclude bone and muscle. (See Figure 1) Edit to exclude muscle and bone.
- **PTV_Anus** = CTV_A + 10mm

Example of a case with tumour extending into lower rectum aiming to demonstrate the steps to produce CTV_A.



3. ***To create GTV_A:*** ■
Draw the GTV_A using clinical findings, planning CT, diagnostic MRI.

2. ***To create GTV + margin:*** ■
Enlarge the GTV_A by the suggested margin (10mm for early tumours, 15mm for locally advanced).

1. ***To create CTV_A:*** ■
Enlarge the GTV + margin to incorporate the entire outer border of anal or rectal lumen around GTV, anal canal and anal verge including internal and external sphincters.

Early Tumours

GTV_A = Primary Tumour	**GTV_N** = Involved Nodes	
CTV_A = GTV_A + 5mm	**CTV_N** = GTV_N + 5mm	**CTV_ALL** = CTV_A + CTV_N + CTV_E
PTV_Anal = GTV_A + 10mm*	**PTV_Nodes** = GTV_N + 5mm*	**PTV_ELEC** = CTV_ALL + 5 mm

* These margins are appropriate for patients treated with daily online imaging. We recommend centres audit their local set up regularly.

Locally Advanced Tumours

GTV_A = Primary Tumour	**GTV_N** = Involved Nodes	
CTV_A = GTV + 15mm	**CTV_N** = GTV_N + 5mm	**CTV_ALL** = CTV_A + CTV_N + CTV_E
PTV_Anal = GTV_A + 10mm*	**PTV_Nodes** = GTV_N + 5mm*	**PTV_ELEC** = CTV_ALL + 5 mm

* These margins are appropriate for patients treated with daily online imaging. We recommend centres audit their local set up regularly.

Planning Parameters

Prescription Point - 100% to the median dose in PTV (ICRU 83)

Target coverage and OAR requirements, both objectives and mandatory constraints are documented on Anal IMRT planning sheet (Appendix 4).

Preferred priority of structures in planning

1) PTV's – these will always take priority over any OAR constraint.
2) Small bowel
3) Femoral Heads
4) Genitalia
5) Bladder

CASE

Female (°03/12/1951)

Problem: anal blood loss, general good condition

Clinical examination:
DRE: tumor palpable laterally at 5-6 o'clock, normal sphincter tone
No inguinal nodes palpable

CASE

Colonoscopy:

Tumor at anorectal junction

Pathology: squamous cell carcinoma, invasion cannot be assessd

ERUS:

Tumor 2,4 x 1,1 cm, invasion of internal anal sphincter

No invasion of the external anal sphincter

CASE

DW-MRI

Lesion at the anorectal verge, posteriorly and laterally located (left side)
Close proximity of the internal anal sphincter without invasion of the external sphincter
Necrotic, partly confluent nodes with extracapsular extension around the right internal iliac vessels

^{18}F-FDG PET/CT

Hypermetabolic lesion in the anal canal
Hypermetabolic nodes at the right internal iliac vessels
No hematogenous metastases

CASE

Treatment plan

cT2N2 SCC at anorectal junction

Chemoradiotherapy:

45 Gy/ 1,8 Gy on tumor and elective nodes

boost of 14,4 Gy/ 1,8 Gy on the macroscopic tumor and involved nodes

CI of 5-FU (225mg/m²/d) + mitomycine (10mg/m²) d1 and $d1_{boost}$

CASE

Female (°03/03/1968)

Problem: SCC of the anal canal, asymptomatic

Clinical examination:
DRE: small exofytic lesion of 7-8 mm at 12 o'clock, 5 mm from the internal anal sphincter, normal sphincter tone
No inguinal nodes palpable

CASE

Colonoscopy:

polipoid lesion of 1cm at the level of the linea dentata
Pathology: squamous cell carcinoma, invasion cannot be assessed

DW-MRI:

Diffusion restrictive lesion 37mm cranial from the anal verge, anteriorly and laterally located (right side). Not clearly visible on T1/T2-weighted images

^{18}F-FDG PET/CT:

Moderate to strong hypermetabolism at the level of the anal canal
No lymph nodes or hematogenous metastases

CASE

Treatment plan:

cT1N0M0 SCC at the level of the linea dentata

Chemoradiotherapy:

45 Gy/ 1,8 Gy on pelvis posterior

CI of 5-FU (225mg/m²/d) + mitomycine (10mg/m²) d1

Treatment planning: state of the art II (Anal cancer)

ESTRO School

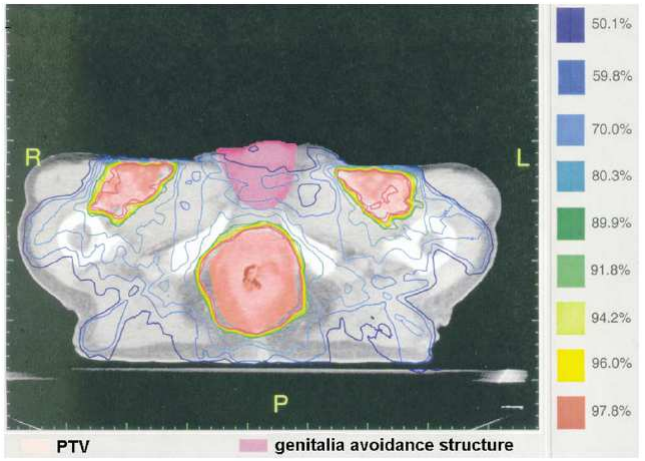
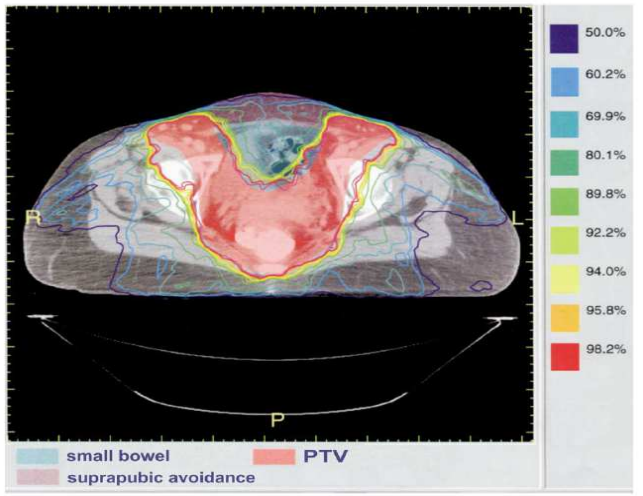
IMRT (vs 3DCRT)

- Differently from rectal ca.: larger volumes, more caudal border, (generally) higher doses, (always) concomitant to CHT, more complex shape, more concavity of PTV
- 3DCRT: very large incidence of severe acute tox (mainly skin, GI, hematological) and treatment breaks
- In the early 2000, several planning studies demonstrated a large gain of (sub-optimal*) IMRT vs 3DCRT (Moran 2004, Chen 2005, Milano 2005, Menkarios 2007)
- Largest sparing for genitals and bowel





Milano 2005

* Few segments, manual optimization, few fields, not stressing modulation….

ESTRO School

IMRT (vs 3DCRT)

Table 3. Volume of critical structures receiving greater than the threshold dose for 45 Gy treatment

EDITORIAL

RTOG 0529: Intensity Modulated Radiation Therapy and Anal Cancer, a Step in the Right Direction?

Joseph M. Herman, MD, MSc,* and Charles R. Thomas Jr., MD†

*Department of Radiation Oncology and Molecular Radiation Sciences, Johns Hopkins Medicine, Baltimore, Maryland; and †Department of Radiation Medicine, Knight Cancer Institute, Oregon Health & Science University, Portland, Oregon

Received Oct 18, 2012, and in revised form Jan 24, 2013. Accepted for publication Jan 30, 2013

Table 2. Comparison of Treatment Breaks, Toxicity, and Outcome in Patients With Squamous Cell Carcinoma of the Anus Treated With IMRT

	Bazan (N=46)	Salama (N=53)	Pepek (N=29)[a]
Median follow-up, mo	32 (IMRT) 26 (CRT)	14.5	19
Treatment breaks, %	34.5 (IMRT) 88.0 (CRT)	41.5	NR[b]
Acute GI toxicity, grade 3-4, %	7 (IMRT) 29 (CRT)	15.1	10
Acute skin toxicity, grade 3-4, %	21 (IMRT) 41 (CRT)	37.7	0
Acute hematologic toxicity, grade 3-4, %	21 (IMRT) 29 (CRT)	58.5	24
Overall survival, %	88 (3 y) IMRT	93.4 (1.5 y)	100 (2 y)
LRC, %	92 (3 y) IMRT	83.9 (1.5 y)	95 (2 y)
CFS, %	91 (3 y) IMRT	83.8 (1.5 y)	91 (2 y)

IMRT indicates intensity-modulated radiotherapy; CRT, conventional radiotherapy; NR indicates not reported; GI, gastrointestinal; LRC, locoregional control; CFS, colostomy-free survival.
[a] Includes only patients with squamous histology.
[b] Reports a value of 18% for all patients but not separately for patients with squamous histology.

Kachnic 2013 (RTOG0529: 45Gy elective nodes; 50.4-54 GTV + 5FU/MMC)

Bazan 2011

Kachnic 2013

- IMRT «must» be the standard (!)
- Are we next to «the limit» ?

Skin «constraints» ?

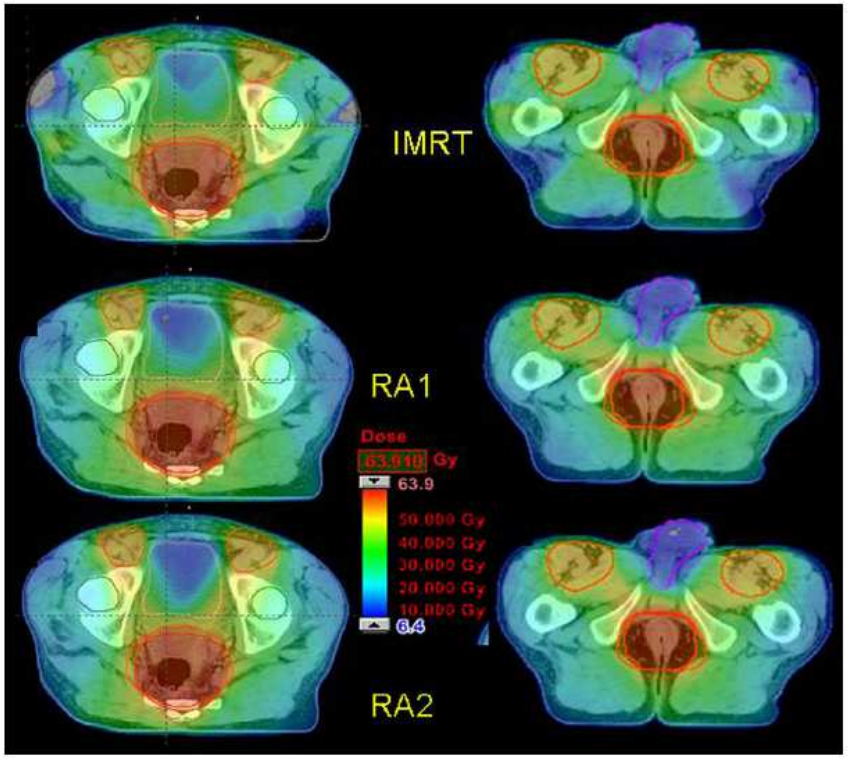
Rotational IMRT

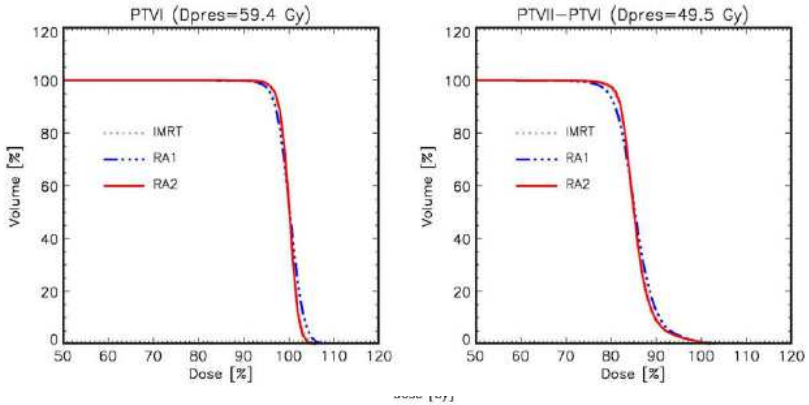
- ...PROBABLY NOT YET !

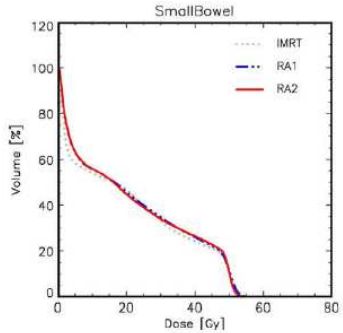
ESTRO School

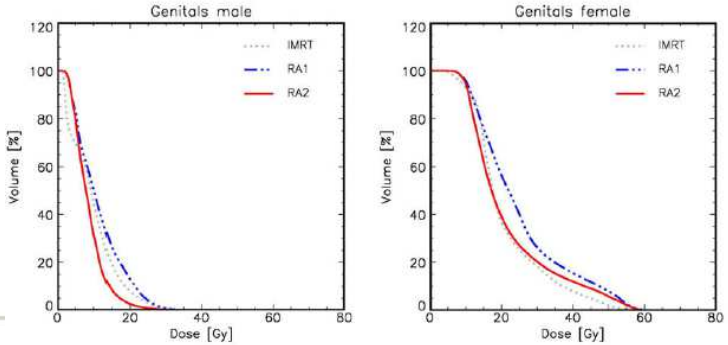
Improving IMRT in anal cancer: Rotational

- RA vs 7-9 fields IMRT (Clivio 2009, Vieillet 2010)
- One single arc detrimental ☹
- Two arcs similar or better than IMRT







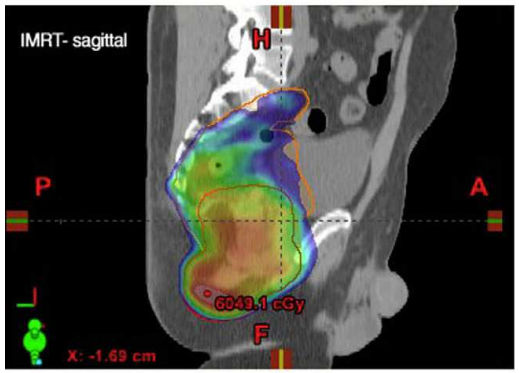


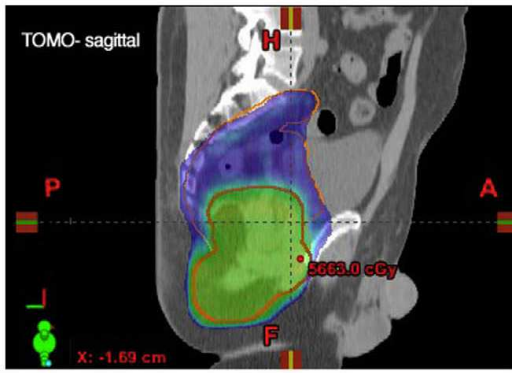
Clivio 2009

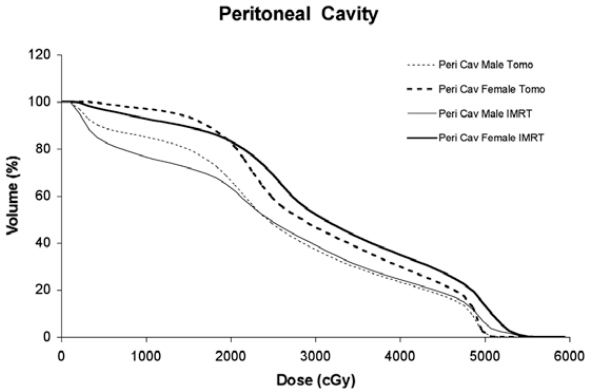
ESTRO School

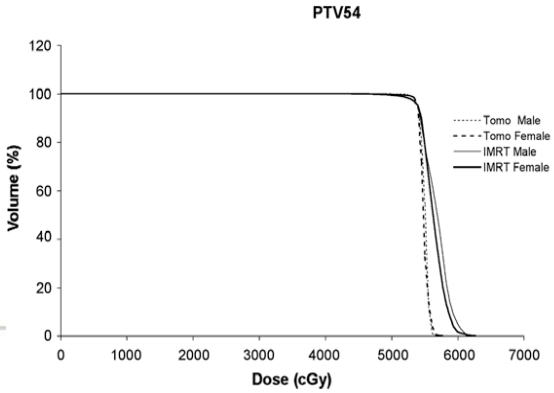
Improving IMRT in anal cancer: Rotational

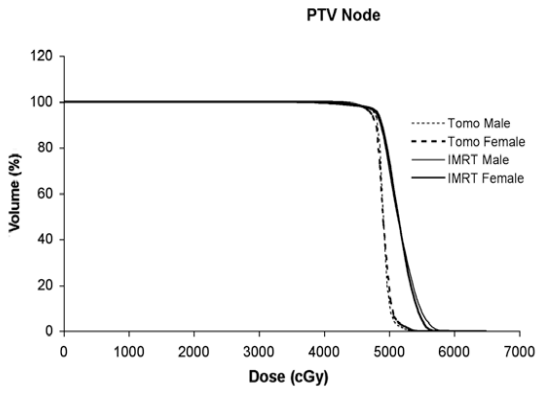
- Better sparing of bowel, genitals, bladder with Tomotherapy vs 9-fields IMRT
- More homogenous dose distribution (and improved conformality)
- More efficient e fast delivery (valid for all rotational techniques, still more for IMAT/VMAT/RA)

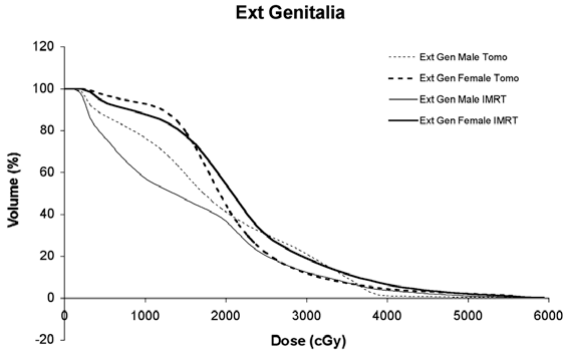












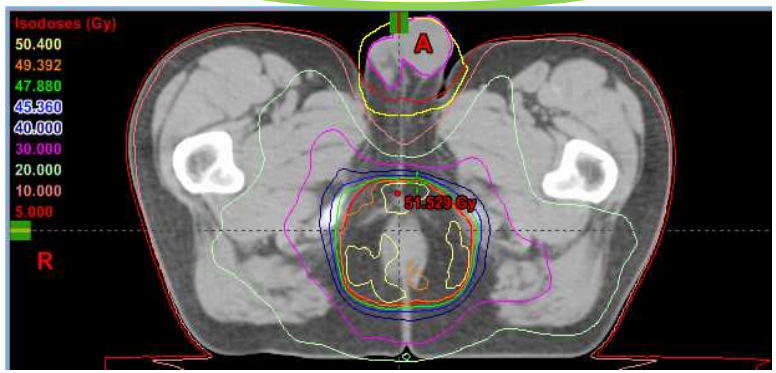
Joseph 2010

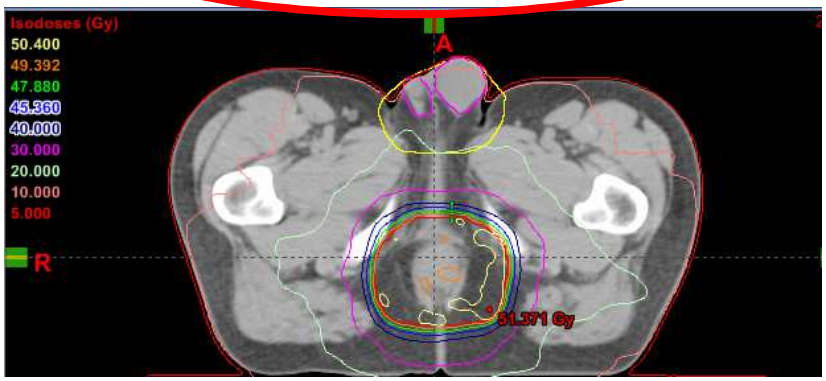
ESTRO School

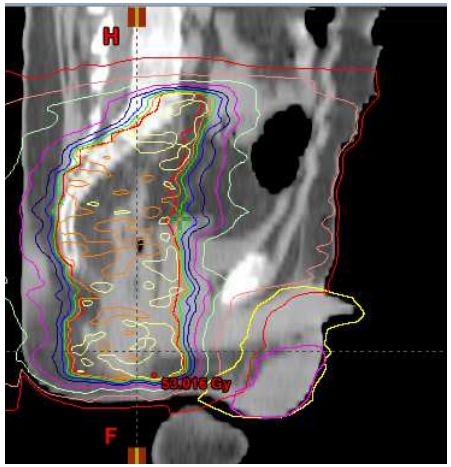
Improving IMRT in anal cancer: sparing genitals

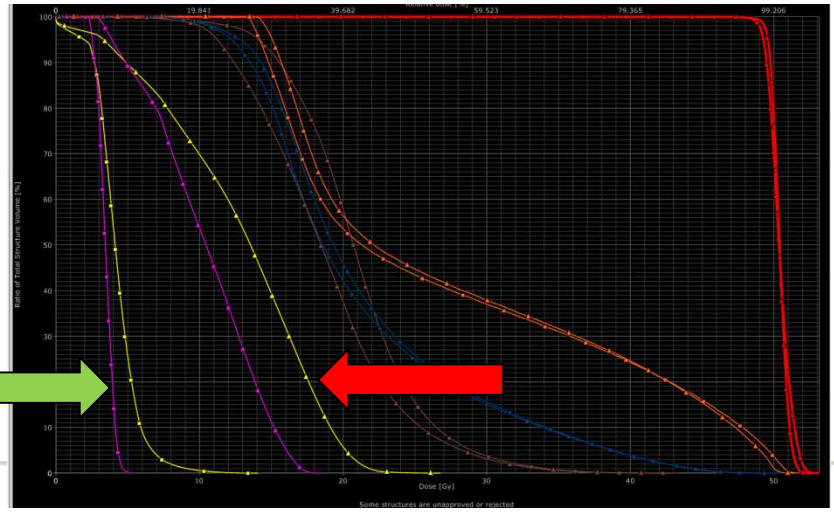
- Explicit inclusion in optimization

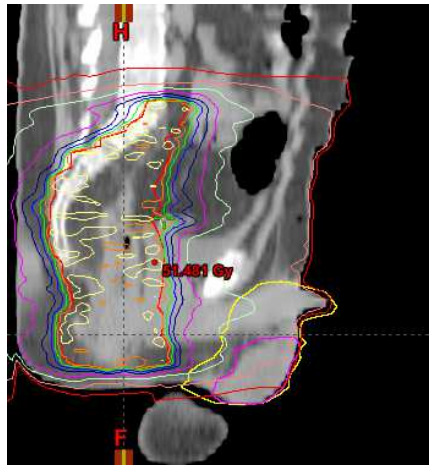
Not included







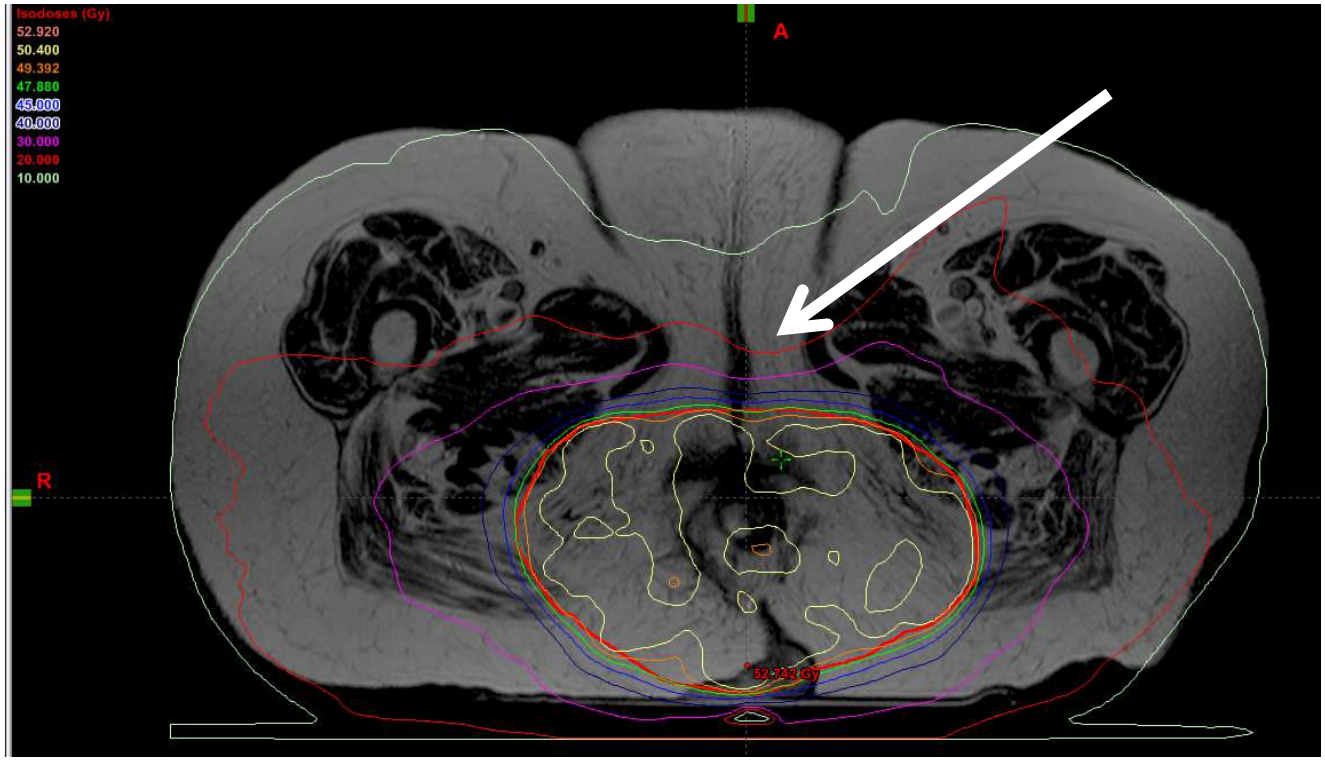




ESTRO School

Improving IMRT in anal cancer: sparing genitals

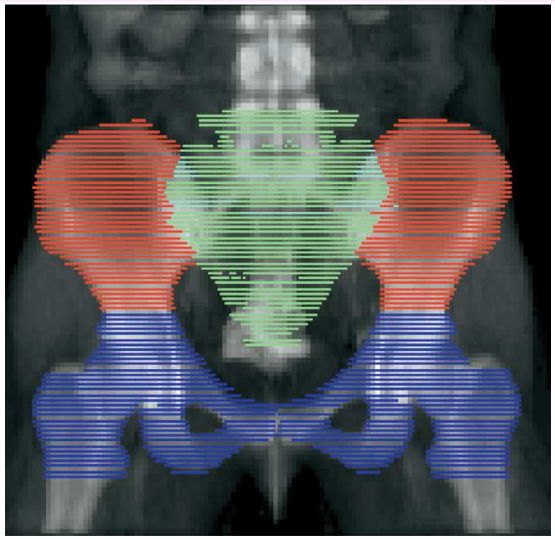
- «Stressing» the dose to genitals (sexual dysfunctions among the most relevant late effects): limitations when inguinal nodes need to be irradiated (?)
- Limits not yet fully explored (i.e.: rotational techniques with blocking, protons ?)



ESTRO School

IMRT to spare bone marrow ?

- Acute Hematological is relevant for anal ca RT
- Evidence of dose-volume effects for the pelvic bone marrow in rectal and anal canal ca. with 3DCRT (Mell 2007)
- V40 more predictive (Mell 2008), very few recent updates (Franco 2016, Julie 2016)
- BM-sparing planning for anal cancer rarely reported .....potential interplay with bowel/bladder sparing (?)



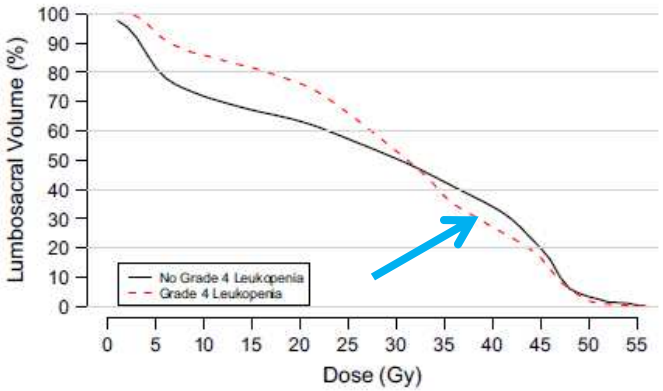


Fig. 2. Lumbosacral bone marrow dose-volume histograms for patients with (n = 14) and without (n = 34) Grade 4 leukopenia. p = 0.62 for comparison of area under the curve, $p < 0.05$ for comparison of area under the curve from 0 to 20 Gy (Mann-Whitney U test).

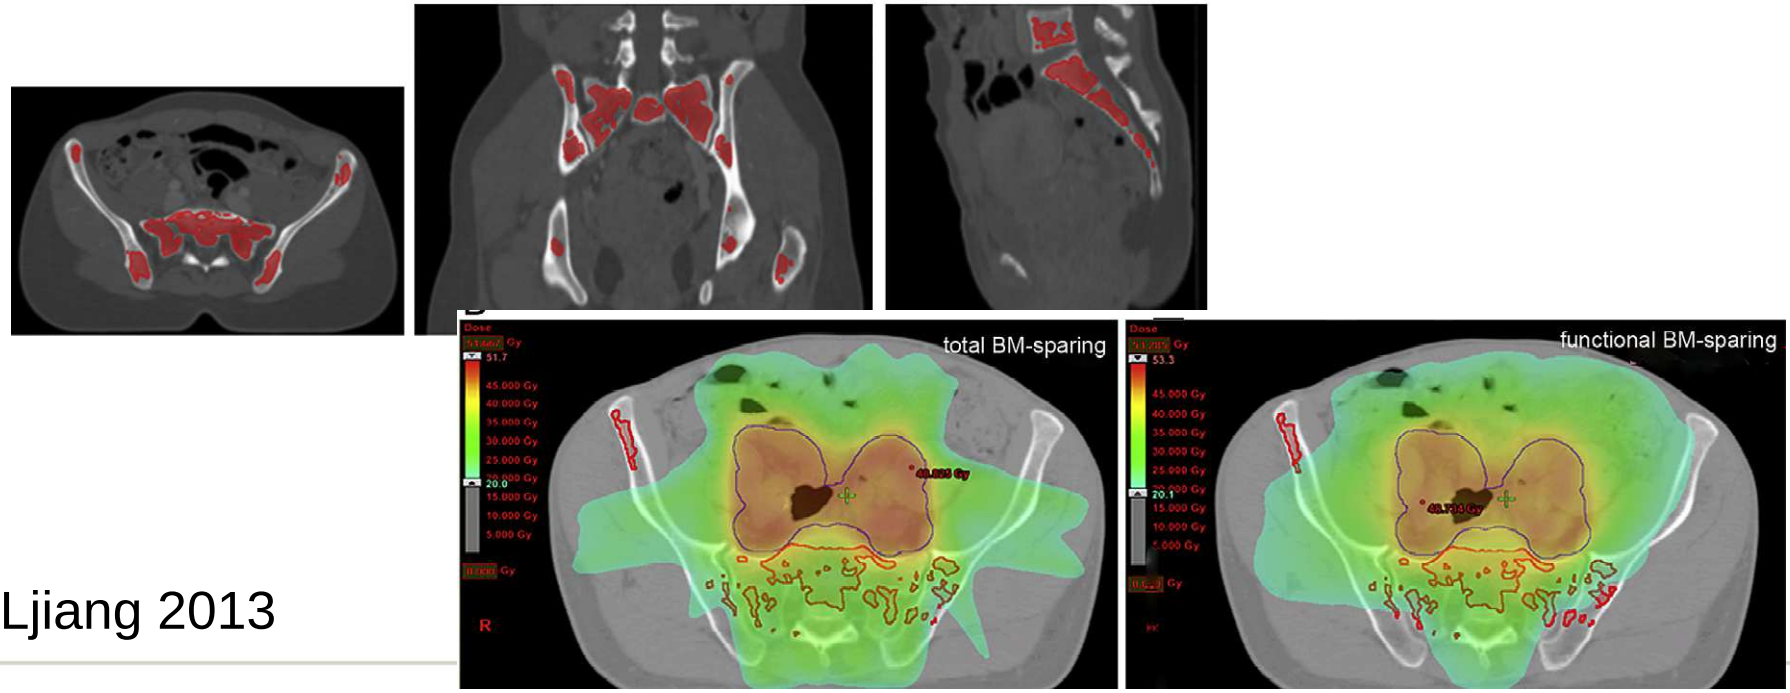
Mell 2008

ESTRO School

IMRT to spare bone marrow ?

- Pilot trial sparing active bone marrow (19 gyno, 12 anal ca pts)
- PET FDG +/- quantitative MRI (fat fraction map)
- Not large differences if sparing functional vs total BM
- Promising early results (3/10 grade 3 vs 9/19); phase II trial in progress



Ljiang 2013

ESTRO School

Protons to spare bone marrow ?

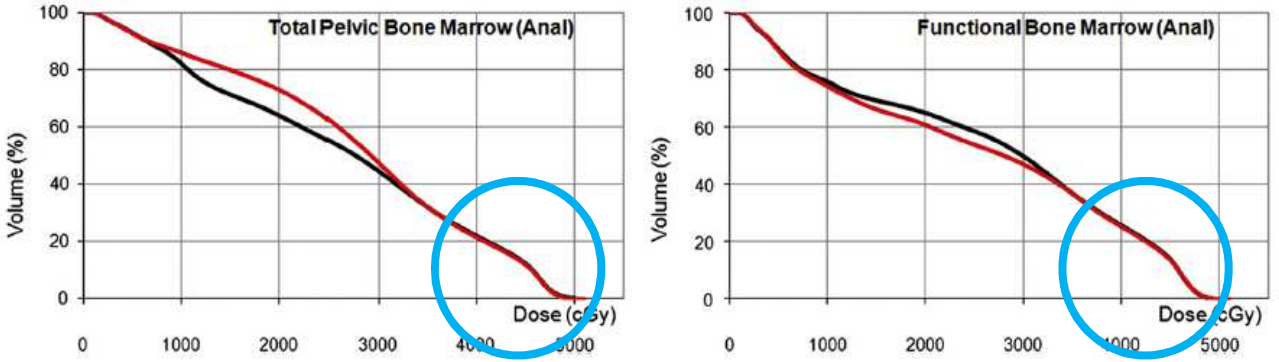


Fig. 2. Mean bone marrow (BM) dose-volume histograms for functional BM-sparing intensity modulated radiation therapy (IMRT) plans (red lines) vs total BM-sparing IMRT plans (black lines), by disease site.

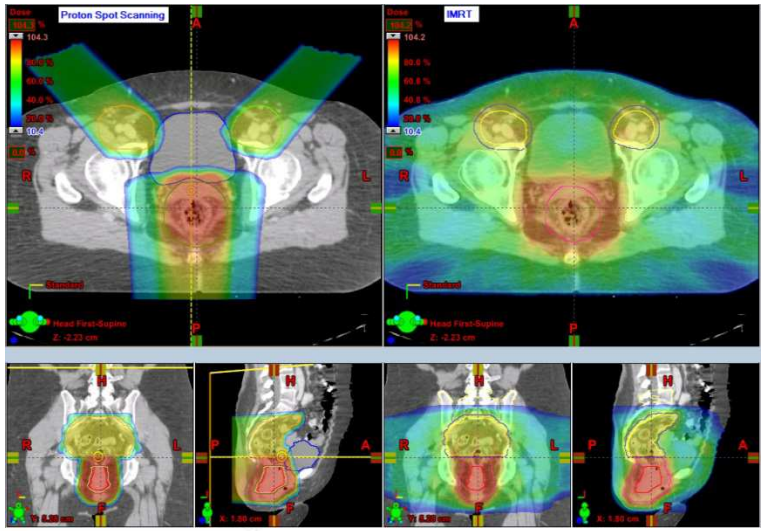
Ljiang 2013
X-Rays IMRT

- Scanning protons vs IMRT
- Major gains for intermediate-low dose levels
- Benefit to be proven



Dose volumes[a]	IMRT[b]	Proton therapy[b]	*P* value
Bone Marrow			
V10	84 (79–90)	37 (31–43)	.008
V20	75 (66–81)	31 (26–38)	.008
V30	52 (42–63)	27 (22–33)	.008
V40	21 (11–33)	17 (9–21)	.055

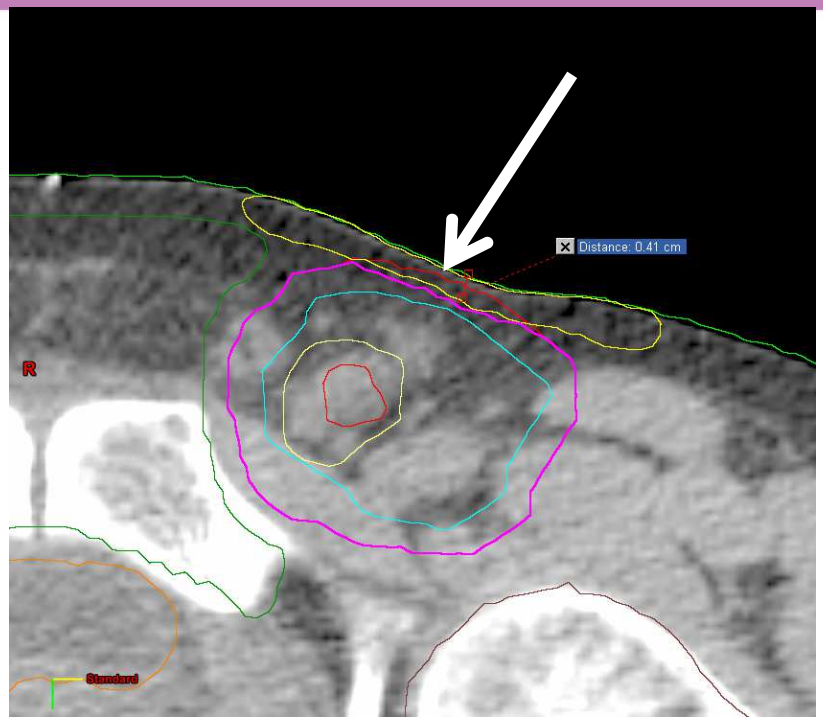
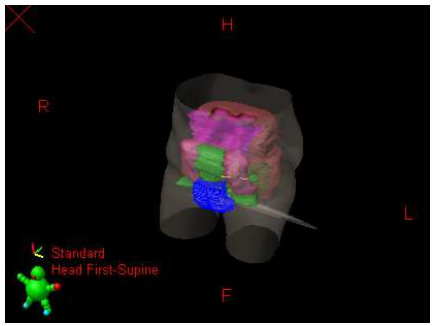
?

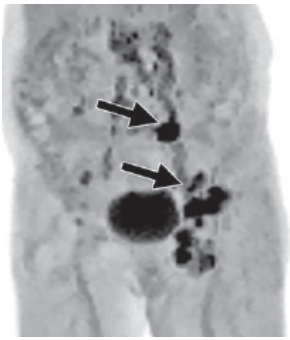
ESTRO School

Improving IMRT in anal cancer: skin tox

- Rotational technique may help (better conformality)
- Explicit inclusion of constrained «skin region» & PTV corrections near the skin….(be careful…)
- Role of IGRT
- Impact of bolus
- Inguinal nodes vs no inguinal node (role of sentinel lymphonode, PET imaging…)





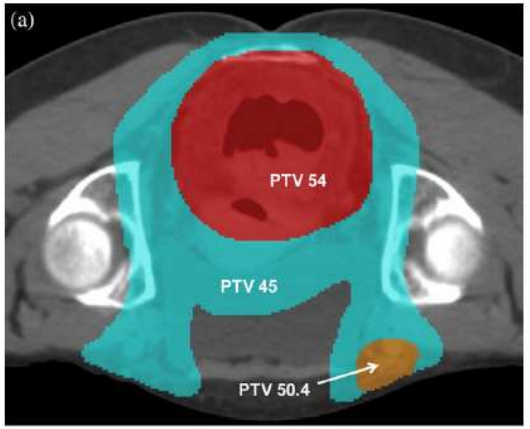


Joseph 2015 «…. PTV45 volumes were limited to 3–5 mm from the skin surface. Bolus was used for 4 patients with perianal extension.»

ESTRO School

Conclusive remarks

- IMRT should be «mandatory»
  (better sparing of OARs, better conformation)
- Quite strong evidence of clinical benefit using IMRT
- Rotational IMRT (VMAT/IMAT/RA…., Tomo) highly effective and fast, better conformality and, sometime, better OAR sparing
- Potential of IMRT not yet fully assessed, in particular for improving the sparing of genitals and bone marrow (a Phase II trial in progress)
- Skin toxicity could be reduced (very sensitive to CTV/PTV definition, planning strategies)
- IGRT /ART (?)



Thanks for your attention

4. Entire BM delineation:

   top L5 → ischial tuberosities

Rose BR et al. Int J Radiat Oncol Biol Phys 2016

Skin and external genitalia

Skin and external genitalia

- Common toxicity in anal RT → superficial target:
  - All patients experience a skin tox
  - **moist desquamation up to 45% (3D-RT)**

- Influencing factors: obesity, cigarettes, chronic sun exposure

- **Onset at the 2° wk of RT→ peak in the last 2 wks → disappear 4-5 wks after RT**

Treatment breaks → increased OTT → decreased RT effect

Toxicity scales

Table 1 Frequently used grading of acute radiation dermatitis

	RTOG	LENT/SOMA	CTCAE 4.0
0	No change from baseline/no symptoms	No change from baseline/no symptoms	Non change over baseline/no symptoms
1	Follicular, faint or dull erythema, epilation, dry desquamation, decreased sweating	Minor symptoms present that require no treatment	Faint erythema or dry desquamation
2	Tender or bright erythema, patchy moist desquamation, moderate edema	Moderate symptoms present that require conservative treatment	Moderate to brisk erythema, patchy moist desquamation, mostly confined to skin folds and creases, moderate edema
3	Confluent moist desquamation other than skin folds, pitting edema	severe symptoms, which have a significant negative impact on daily activities, and which require more aggressive treatment	Moist desquamation other than skin folds and creases, bleeding induced by minor trauma or abrasion
4	Ulceration, hemorrhage necrosis	Irreversible functional damage, necessitating major therapeutic intervention	Life-threatening consequences, skin necrosis or ulceration of full thickness dermis, spontaneous bleeding from involved site, skin graft indicated
5	Death related to treatment effects	Death or loss of organ	Death

ULCER/RADIONECROSIS

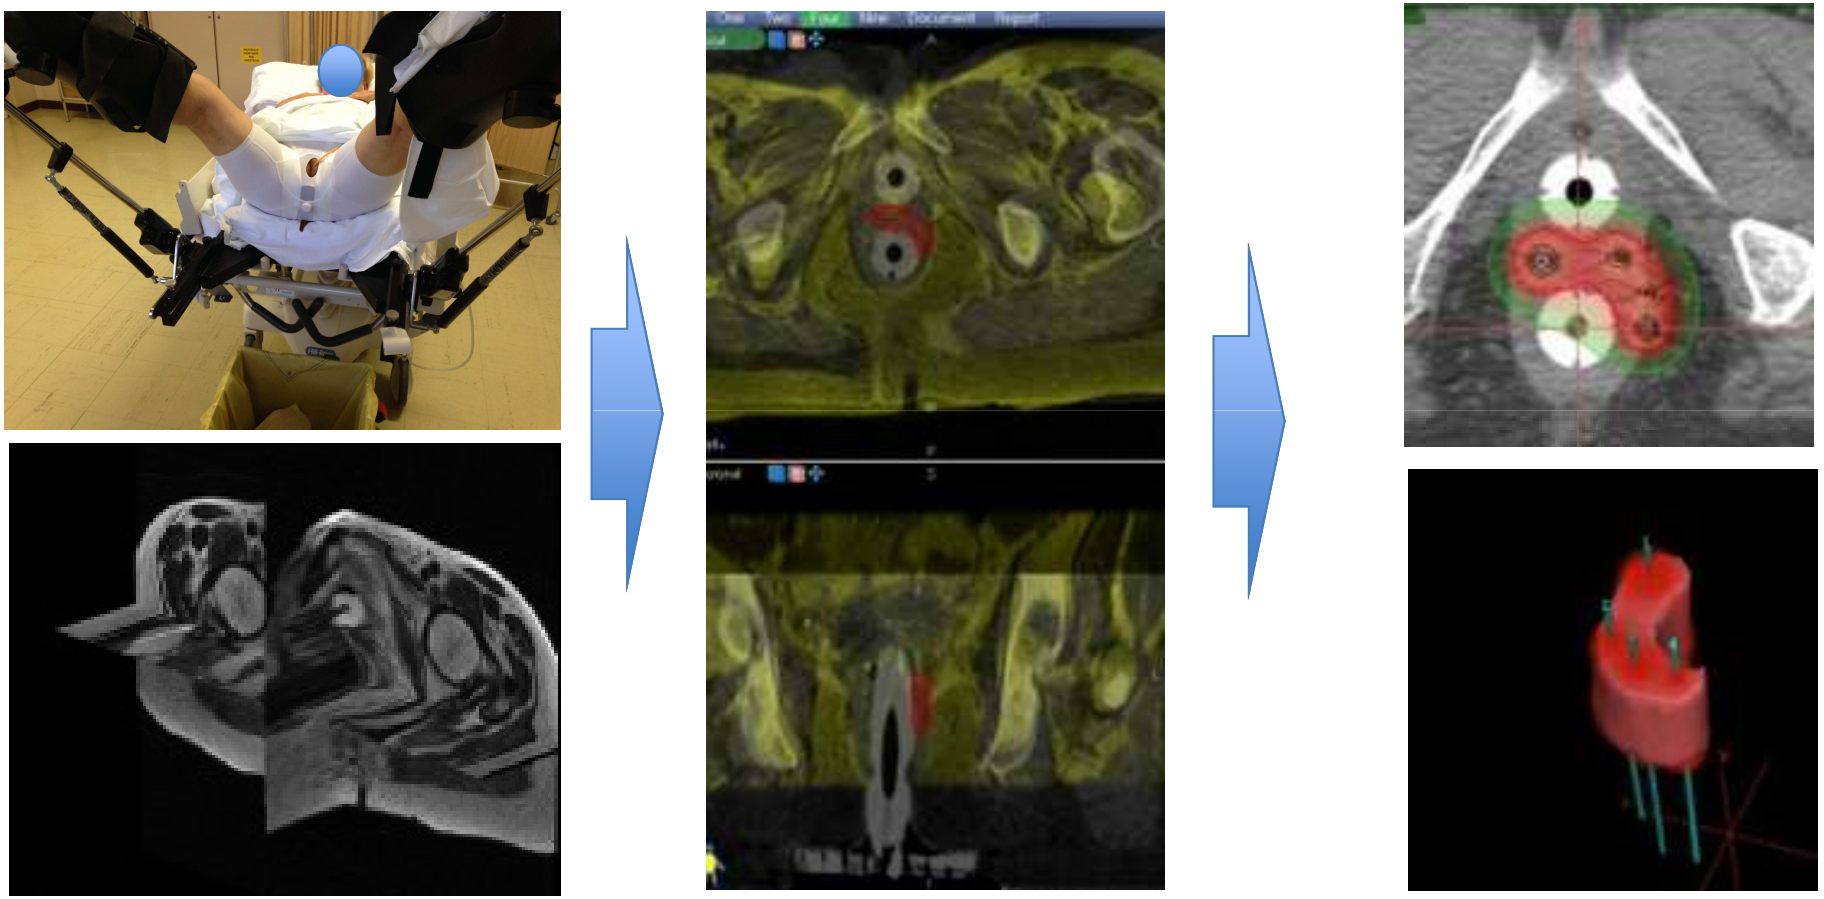
BT BOOST	ERT BOOST	
14%	6%	p=0.003

Conclusions: These results question the benefit of a radiotherapy boost after a 6-week gap. The higher doses of a boost may contribute more to an increased risk of late morbidity, rather than local control.

- Glynne-Jones R, Sebag-Montefiore D, Adams R, McDonald A, Gollins S, James R, Northover JM, Meadows HM, Jitlal M; "Mind the gap"--the impact of variations in the duration of the treatment gap and overall treatment time in the first UK Anal Cancer Trial (ACT I). **Int J Radiat Oncol Biol Phys. 2011**

MR-guided BT



Tagliaferri L et al. Journal of Contemporary Brachytherapy (2015

Contra-indications

- *Tumor more than half of the circunference*
- *Tumor thickness more than 10 mm*
- *Tumor lenght more than 5 cm*
- *OTT*

- Radiotherapy in Practice - Brachytherapy Peter Hoskin, Catherine Coyle
- The GEC ESTRO Handbook of Brachytherapy
- Niehoff P, Kovács G. HDR brachytherapy for anal cancer. **J Gastrointest Oncol. 2014**

Conclusions

- Anal cancer RT-CT → highly toxic
  - Dose, volume
  - Numerous OAR (GI, GU, BM, skin-genitalia)
- IMRT → standard to decrease toxicity
- Not defined constraints for BM, skin, genitalia
- Delineation of OAR → fundamental

- BT boost → questionable when increased OTT

Fertility and pregnancy

- Dose > 25 Gy → myometrium, endometrium, vascular damage
- Case-report: women 25 years old who was pregnant after 30Gy RT for anal cancer

Teh T W et al. Biomed Res Int 2014

Review Article

The Impact of Uterine Radiation on Subsequent Fertility and Pregnancy Outcomes

(ii) With improvements in radiotherapy delivery technology methods such as intensity modulated radiation therapy, cyberknife, tomotherapy, and stereotactic radiotherapy, there may be the potential to limit radiotherapy exposure to the uterus or to restrict exposure to part of the uterine corpus or cervix, depending on the tumour location and characteristics. Th
irradia

(iii) With the growing numbers of adult women surviving cancers managed with pelvic radiation, there is an urgent need to ensure that fertility issues are discussed prior to treatment and that further data are collected on the reproductive impact of total or partial uterine radiation in order to inform future clinical management (Figure 1).

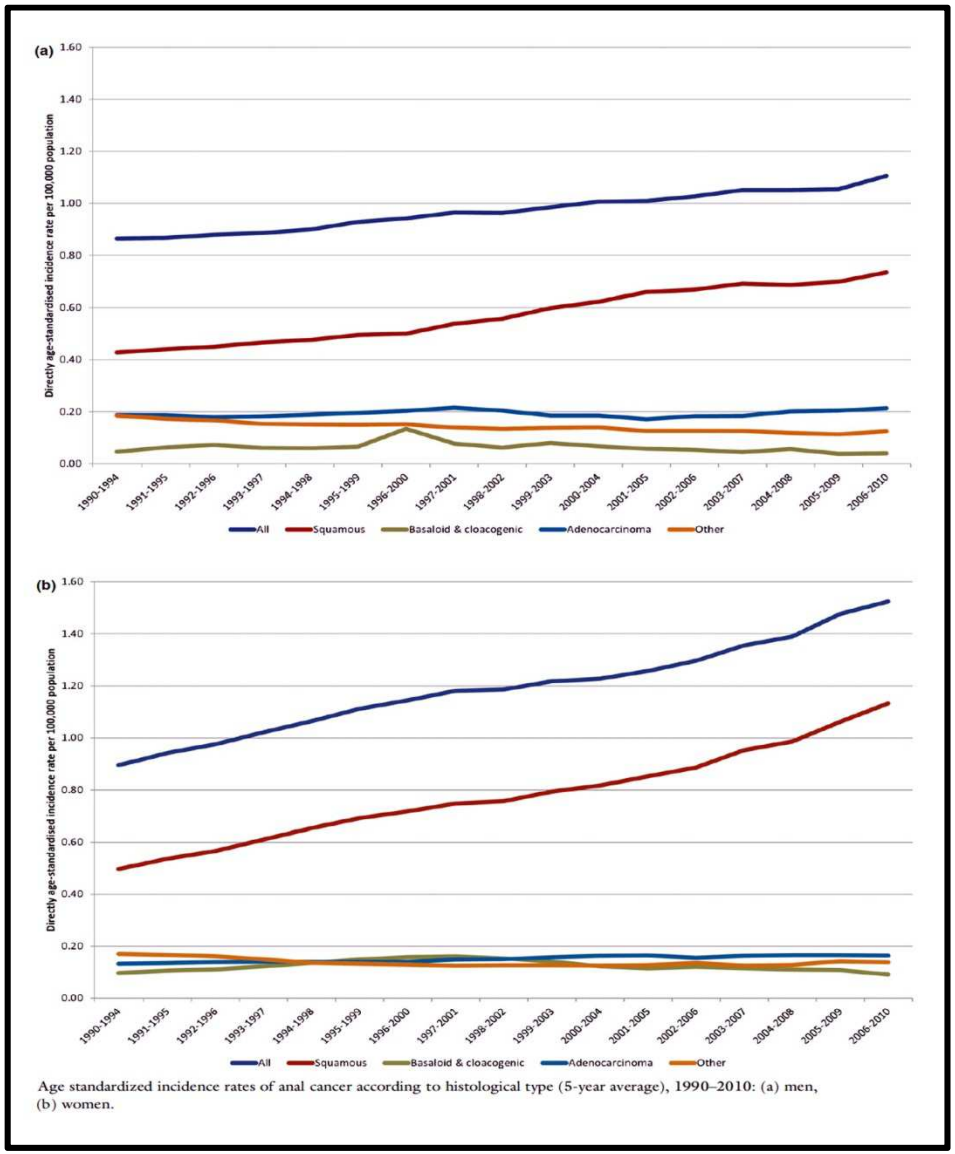
Teh T W et al. Biomed Res Int 2014

Prognostic Factors in Anal Cancer

ESTRO LOWER GI COURSE :

Technical & Clinical Challenges for Radiation Oncologists

Anal cancer – Increasingly Common

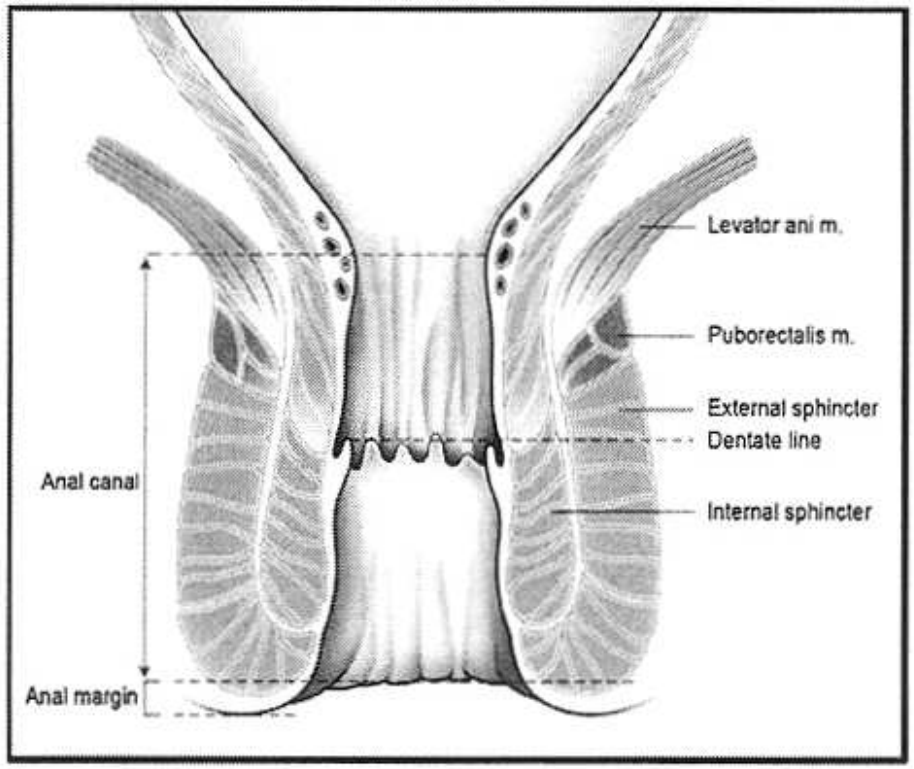


Age standardized incidence rates of anal cancer according to histological type (5-year average), 1990–2010: (a) men, (b) women.

- **English National Cancer Data Repository 1990 – 2010 (all anal cancers diagnosed in England)**
- **69 % increase in age standardised incidence for SCC in men from 0.43 per 100,000 to 0.73 per 100,000**
- **126 % increase for women from 0.5 per 100,000 to 1.13 per 100,000**
- **No change in incidence of anal adenocarcinoma**
- **Similar changes reported in Scotland, Denmark, Sweden, Australia and the USA**

(Wilkinson et al 2014)

Anal cancer – Anal Canal & Anal Margin



Most Anal tumours arise in the Anal Canal

- The anal margin is defined as the area of pigmented skin around the anal orifice - extending laterally to a radius of 5cm
- Anal margin tumours are staged as cutaneous SCCs

ANAL CANCER : UICC TNM STAGE

T STAGE

- **TX** - tumor cannot be assessed
- **T0** - no primary tumor
- **Tis** - AIN 2 & 3 ; high grade SIL
- **T1** - tumor < 2cm maximum diameter
- **T2** - tumor > 2cm & < 5cm
- **T3** - tumor > 5cm
- **T4** - tumor of any size invading adjacent organs eg. vagina, urethra,bladder (excludes rectum, peri-anal skin & sphincter muscle)

N STAGE

- **NX** - nodes cannot be assessed
- **N0** – no node metastasis
- **N1** – metastasis in peri-rectal nodes
- **N2** – metastasis in unilateral internal iliac and/or inguinal nodes
- **N3** – metastasis in peri-rectal & inguinal nodes or bilateral internal iliac node involvement or bilateral inguinal node involvement

- **any tumor between rectum and peri-anal skin**
- **anal margin tumors classified as skin cancers**

Anal Cancer : TNM stage & Outcome

- **US GI Intergroup RTOG 98-11 phase 3 anal cancer trial**
- **RCT of RT + 5FU/MMC versus RT + 5FU/CDDP & indictin chemotherapy with 5FU/CDDP**
- **T2 – T4 +/- LN metastases (excludes T1 N0-3 and M1 disease)**
- **N = 620 patients**

	No.	5yr Local Failure	5yr DM	3yr Colostomy failure	5yr DFS	5yr OS
T2 N0	323	17 %	10 %	11 %	72 %	82 %
T3 N0	96	18 %	14 %	13 %	61 %	74 %
T4 N0	31	37 %	21 %	26 %	50 %	57 %
T2 N1-3	99	26 %	27 %	11 %	57 %	70 %
T3 N1-3	46	44 %	24 %	27 %	38 %	57 %
T4 N1-3	25	60 %	24 %	24 %	31 %	42 %
T2 or 3 N0	419	17 %	11 %	11 %	70 %	80 %
T4N0 or T2-4 N1-3	201	36 %	25 %	19 %	49 %	62 %

(Gunderson et al 2013)

Anal Cancer : the importance of tumour size

- **Das et al (2007) : 167 patients treated with CRT**
- **3 yr locoregional control :**
- **T1/Tx 90 % (76 – 100)**
- **T2 86 % (76 – 96)**
- **T3 77 % (61 – 93)**
- **T4 63 % (41 – 86)**

T stage a significant independent predictor of loco-regional failure on multivariate analysis (HR 1.71)

- **Ajani et al (2009 & 2010) : RTOG 98-11 trial of RT + 5FU/MMC versus RT + 5FU/cisplatin**
- **Tumour diameter > 5cm associated with a greater risk of colostomy, worse 5 yr DFS & 5 yr OS (p = 0.0003) compared with smaller tumours**

Anal Cancer : the importance of nodal metastasis

- Das et al (2007) : 167 patients treated with CRT

	3 yr locoregional control	3 yr distant control
N0	85 %	94 %
N1	88 %	79 %
N2	84 %	75 %
N3	39 %	76 %

- N stage an independent predictor of loco-regional failure, distant metastasis and OS on multivariate analysis !

- Ajani et al (2010) : RTOG 98-11 trial
- Clinically positive nodes associated with worse 5 yr DFS and 5 yr OS ($p < 0.0001$)

Other Prognostic Factors

- **Male gender**

- **EORTC 22861 :**
- **local control p= 0.0028**
- **overall survival p=0.0034**

- **RTOG 98-11 :**
- **disease free survival p = 0.02**
- **overall survival p=0.016**

- **ACT 1 Trial :**
- **Loco-regional failure HR 1.6 (1.03-2.49) p=0.036**
- **Anal cancer death HR 1.8 (1.03-3.16) p=0.039**
- **Overall survival HR 1.56 (1.12 – 2.17) p=0.008**

Other Prognostic Factors

- **ACT 1 trial :**

➢ **low Hb associated with increased anal cancer death (p=0.008)**

- **EORTC 22861 :**

➢ **skin ulceration associated with loco-regional failure (p=0.003) and overall survival(p=0.005)**

ANAL CARCINOMA : HISTOLOGICAL CLASSIFICATION

- **SQUAMOUS CELL CARCINOMA NOS (80 - 90%)**
  - size of neoplastic cell
  - basaloid morphology
  - keratinization
  - presence of mucinous microcysts
  - degree of differentiation
  - presence of adjacent AIN

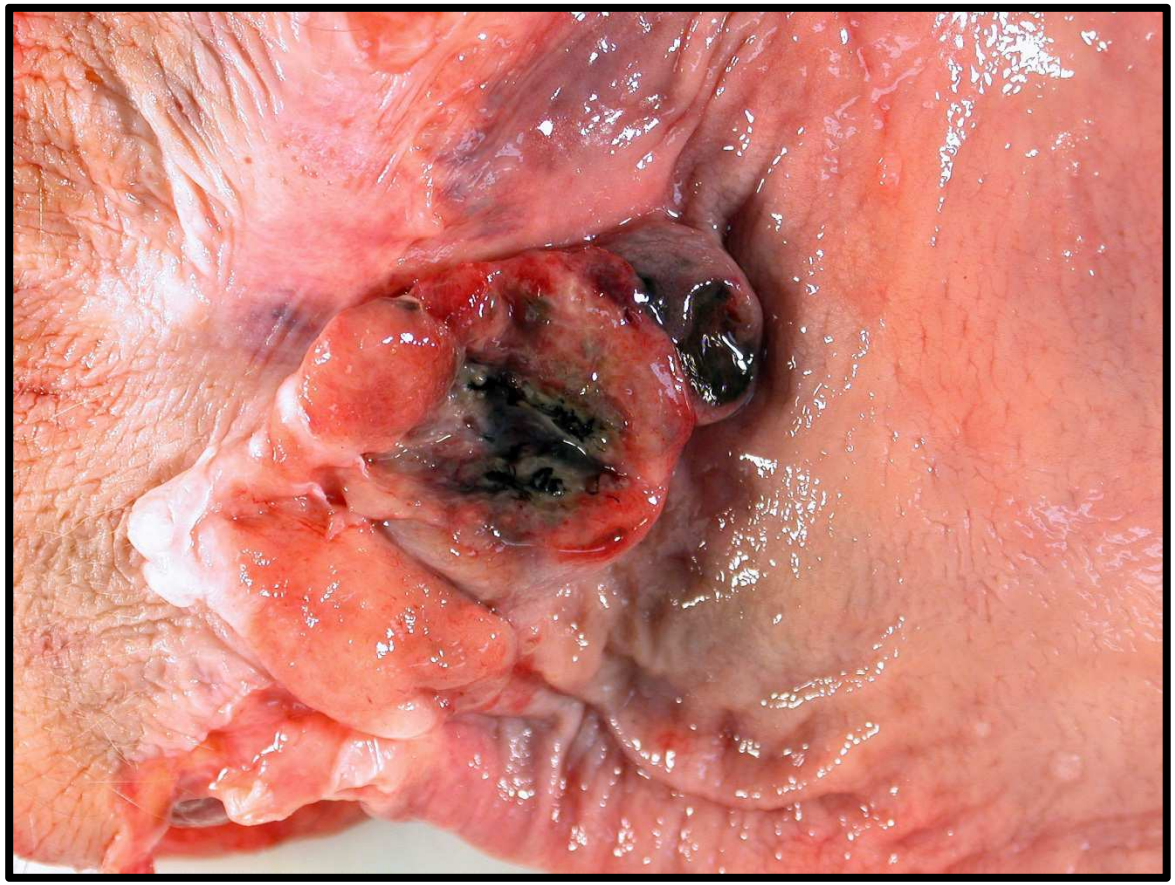
WHO 2nd Edition.
large cell keratinizing
large cell non-keratinizing
Basaloid (cloacogenic)

- **VERRUCOUS CARCINOMA (GIANT CONDYLOMA OF BUSCHKE-LOWENSTEIN) (< 1 %)**

- **ADENOCARCINOMA (anal gland, mucinous – fistula related, rectal type) (10 – 15 %)**
- **NEUROENDOCRINE CARCINOMA (large cell & small cell type) (< 2 %)**

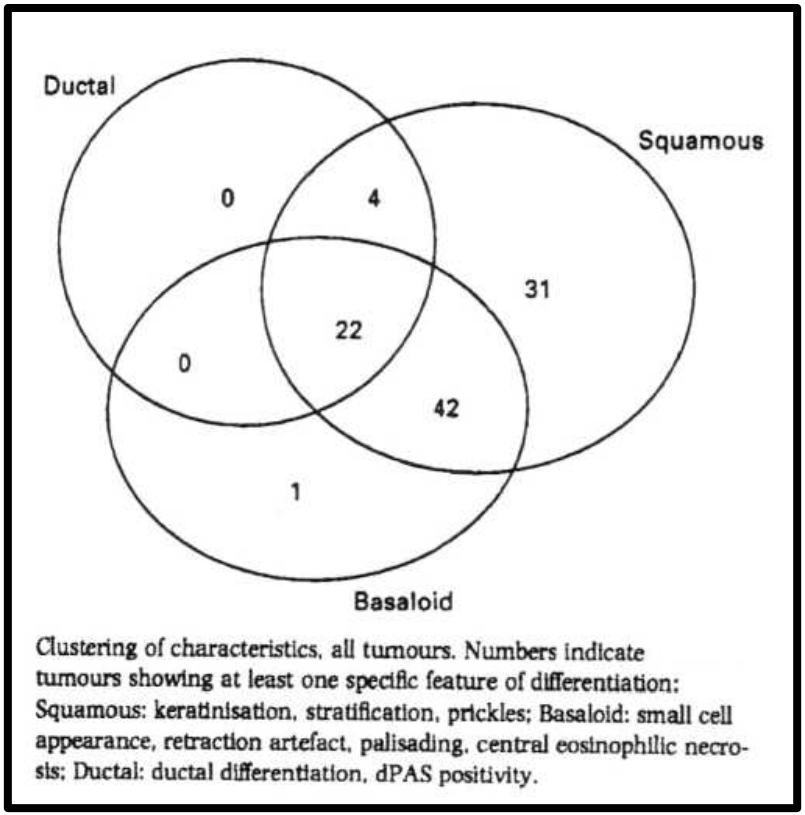
Other Cancers

- **Malignant Melanoma (< 2 %)**



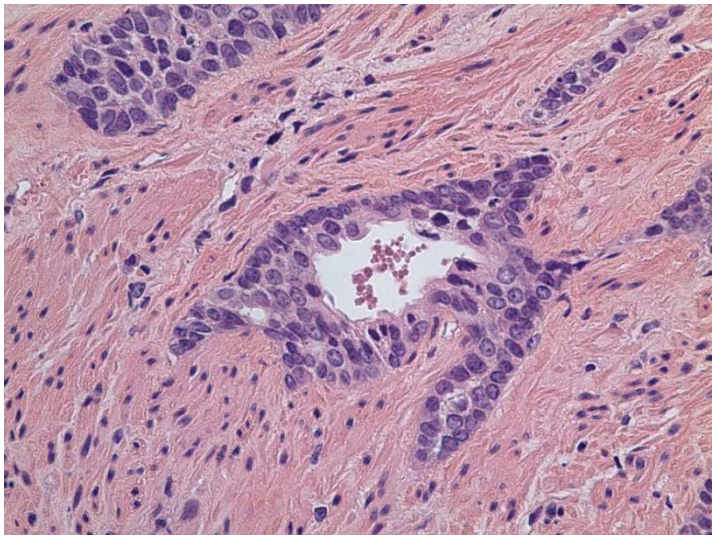
- **Lymphoma**
- **Sarcoma**

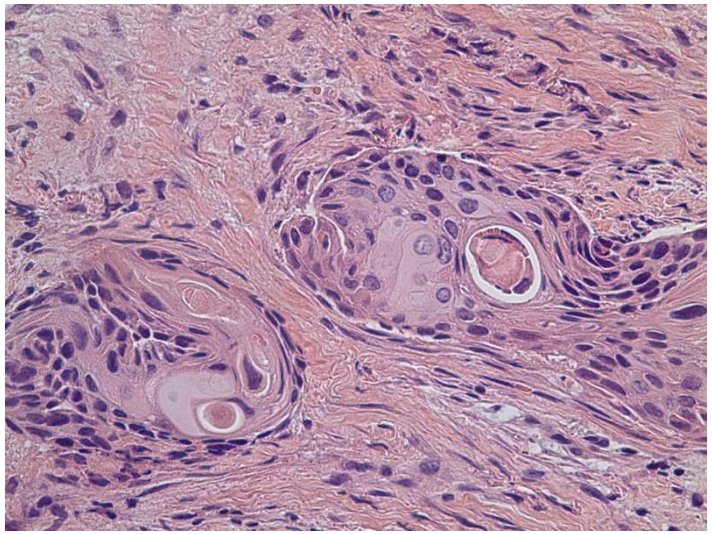
SCC of the Anal Canal : Overlap of Histological Types

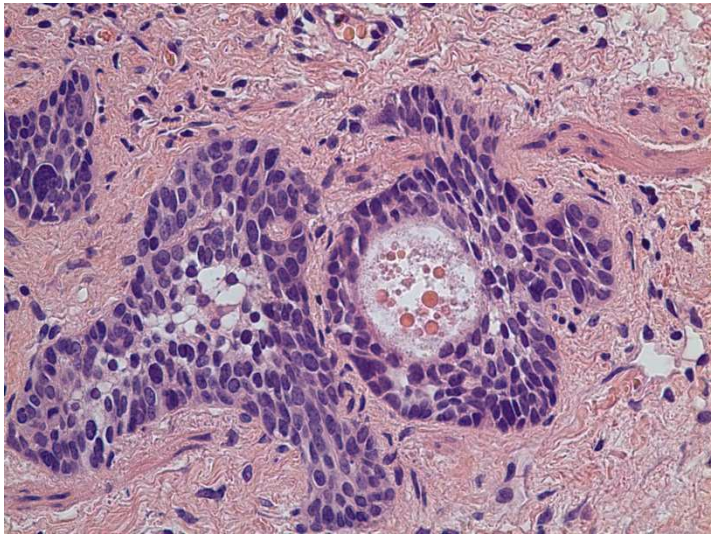


Clustering of characteristics, all tumours. Numbers indicate tumours showing at least one specific feature of differentiation: Squamous: keratinisation, stratification, prickles; Basaloid: small cell appearance, retraction artefact, palisading, central eosinophilic necrosis; Ductal: ductal differentiation, dPAS positivity.

(Williams & Talbot 1994)

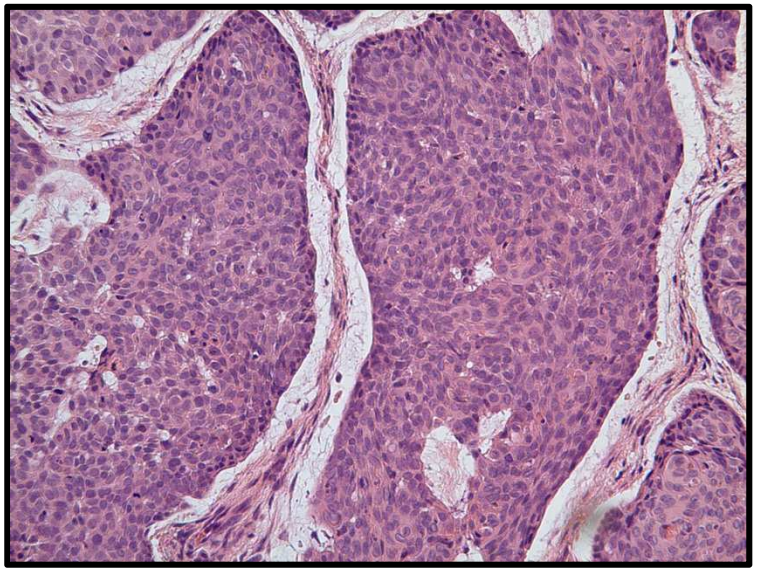


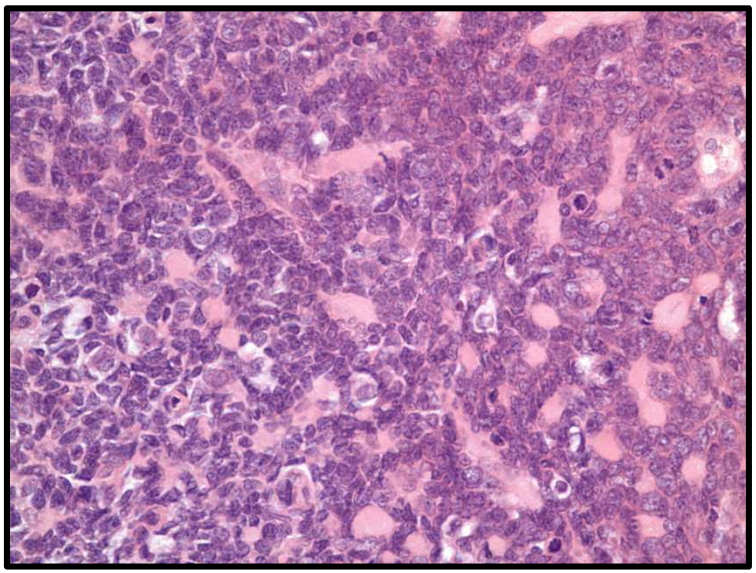


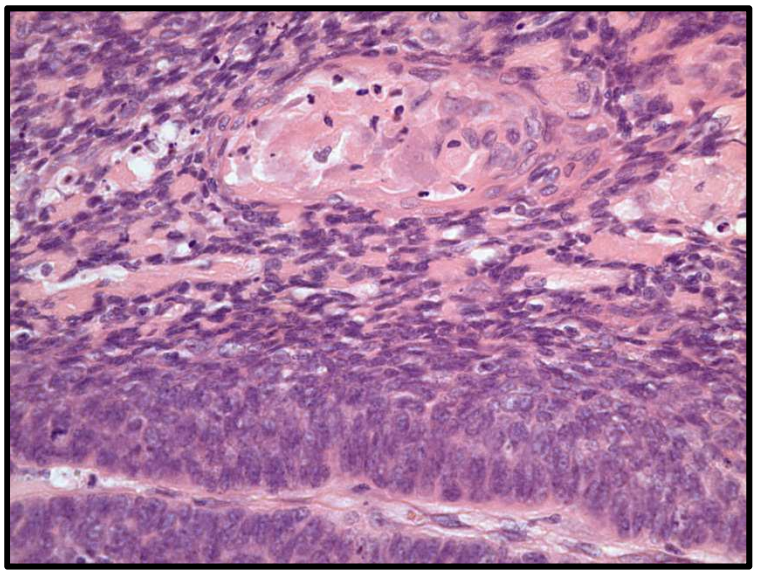


Basaloid Variant SCC

Bonnen et al (1984)	61/160	(38 %)
Dougherty et al (1984)	11/79	(13.9 %)
Shepherd et al (1989)	60/166	(36 %)

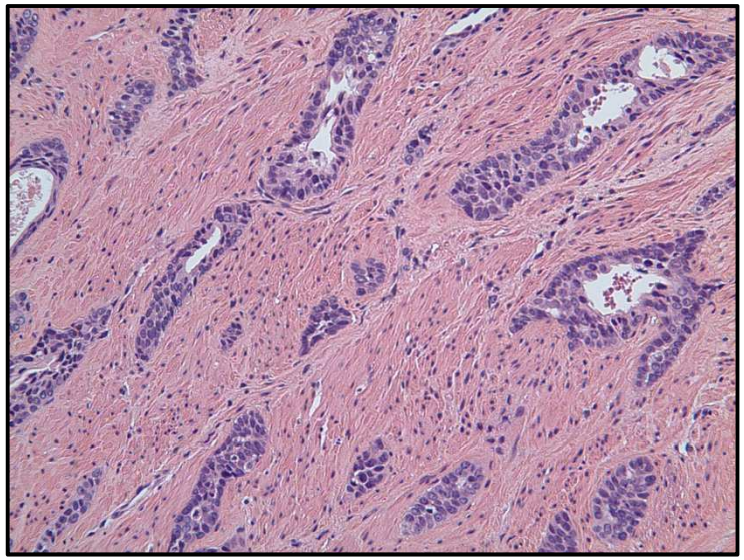


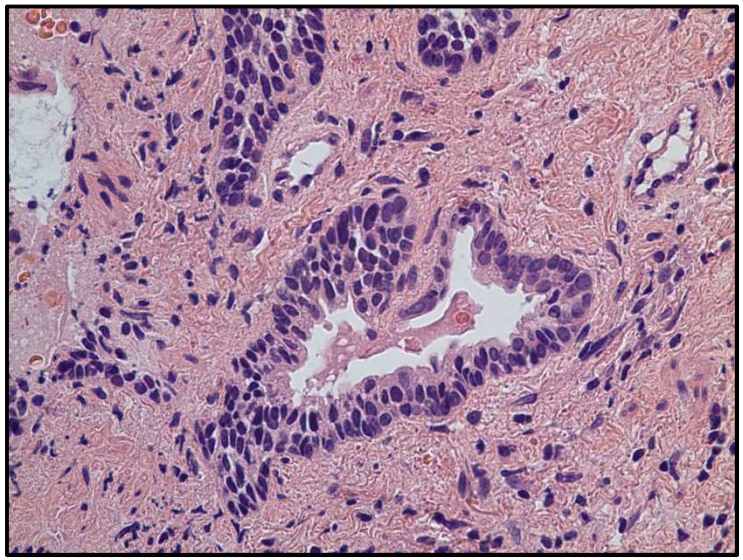


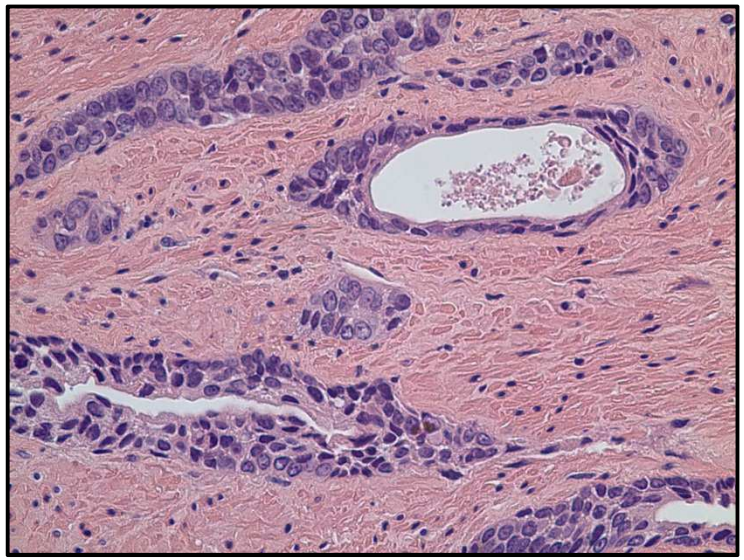


Squamous Cell Carcinoma with Mucus Microcysts (“Mucoepidermoid carcinoma of the anus”)

Morson et al (1963)	21/178	(11.8 %)
Dougherty et al (1984)	6/79	(7.6 %)
Shepherd et al (1989)	10/235	(4.3 %)







study	No.	Time period	treatment	outcome
Boman et al (1984) SCC – grades 1 to 4 Basaloid type SCC	188	1950-1976	Surgery	Grade & type correlated with stage. No significant correlation with survival after adjusting for stage.
Dougherty et al (1984) Keratinizing SCC Non-keratinizing SCC Basaloid SCC SCC with microcysts	79	Pre 1978	Surgery	No correlation of histologic type with depth of invasion or node metastasis. No correlation with survival.
Shepherd et al (1989) SCC Basaloid type Mixed type	235	1948-1985	Surgery	Histologic type not predictive of survival in multivariate analysis.
Bartelink et al (1997) SCC versus other types Histologic grade	110	1987-1994	RT & CRT	Neither type nor grade predicted local control or survival.
Myerson et al (2001) SCC – low & high grade Basaloid type	106	1975-1997	Mainly CRT	Borderline significant improved 5yr DFS for basaloid type. No effect of tumour grade.
Das et al (2007) SCC grades 1 to 3 Basaloid type	167	1992-2004	CRT	Basaloid type associated increased risk of Distant Metastasis (HR 4.23). No correlation type or grade with loco-regional failure or survival.

Biomarkers in Anal Carcinoma – Much Ado About Nothing

- **p53 : 8 studies 1996 – 2009 (n = 14 – 214)**

- immunohistochemistry used in all studies
- 34% – 100 % cancers positive (34-60% in 6/8 studies)
- All cancers treated with CRT
- **No prognostic significance in 6/8 series** ; reduced DFS in 2/8

- **p21 : 3 studies 2001 – 2006 (n = 94 – 215)**

- immunohistochemistry used in all studies
- 65 % – 71 % cancers showed positive staining
- **absent expression associated with reduced OS in one study and a trend towards reduced DFS in the other two** ; significant association with loco-regional failure in one out of three.

- **EGFR : 3 studies 2005 – 2009 (n = 21 – 38)**

- immunohistochemistry used in all 3 series
- EGFR expression seen in 55 % – 100 % of cancers
- **NO prognostic significance found**

(Lampejo et al 2010)

Biomarkers in anal Carcinoma – Much Ado About Nothing

- **BCL – 2 : 3 studies 2003 – 2009 (n = 21 – 98)**

- immunohistochemistry in all 3 studies
- BCL 2 expressed in 24 – 58 % of cancers
- associated with reduced local control and DFS in one study ; no prognostic significance in the other two

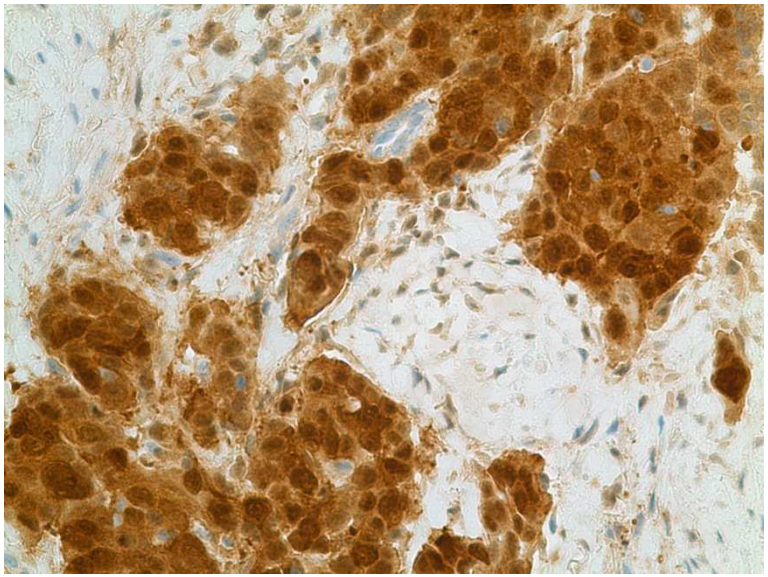
- **Ki67 : 4 studies 1998 – 2009 (n = 31 – 62)**

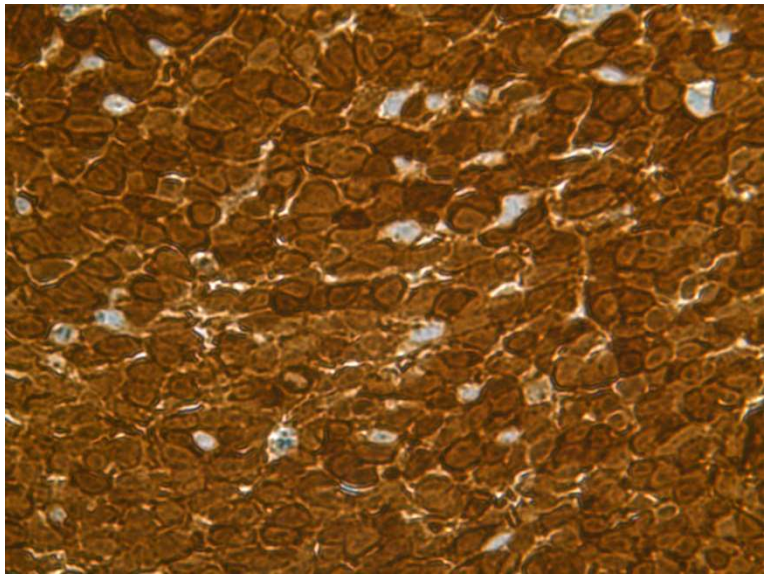
- Immunohistochemistry (MIB1) used in all studies
- No prognostic significance in 2 out of 4 studies ; elevated Ki67 associated with longer DFS in one study and improved colectomy free survival in a second study.

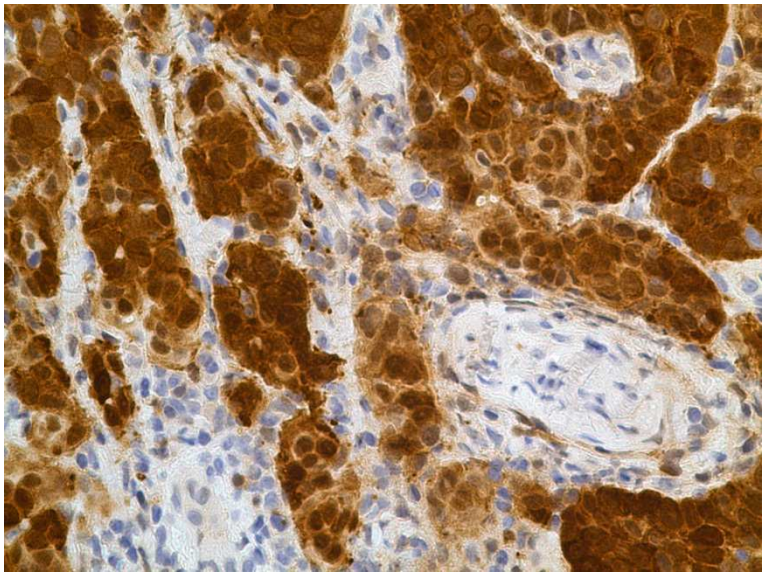
- **Others : VEGF - no prognostic significance**
  MVD - no prognostic significance
  PCNA - no prognostic significance
  Cyclins - no prognostic significance in 3 out of 4 studies

(Lampejo et al 2010)

p16 – a promising biomarker in Anal Cancer







p16 – ink4a
Chromosome 9p21
Inhibits entry into S phase of the cell cycle
Binds CDK4/6 inhibiting formation of the cyclin-CDK4/6 complex
HPV E7 protein binds Rb releasing E2F transcription factor leading to increased p16 expression

p16 overexpression in anal cancer is a useful surrogate marker of high risk HPV infection !!!

Human Papilloma Virus & Anal Carcinoma

- Vuyst et al (2009) – meta-analysis of 29 international studies between 1986 – 2008

➢ Overall prevalence of HPV in AIN = **92.7 %** (1280 cases)

➢ Overall prevalence of HPV in anal carcinoma = **84.3 %** (955 cases)

	All types	HPV 16	HPV18	Multiple types
AIN 1	91.5 %	37.2 %	21.3 %	54.4 %
AIN 2 & 3	93.9 %	59.8 %	17.4 %	
SCC	84.3 %	73.4 %	5.2 %	6.8 %

- ? HPV more common in basaloid variant SCC (> 95 %)
- ? HPV associated lower T stage & N stage at diagnosis

HPV & ANAL CANCER

- **143 stage I – III anal SCCs (2000 – 2010)**
- **Single centre in Denmark**
- **52 % treated with RT ; 48 % treated with CRT**
- **Median F.U 51.2 months**
- **Recurrent disease in 23 %**
- **87.6 % HPV + (79.6% HPV16)**
- **92.9 % p16 +**

	Overall Survival	Disease Specific Survival
HPV +	74 %	84 %
HPV -	52 %	52 %
p16 +	76 %	85 %
p16 -	30 %	30 %

(Serup-Hansen et al 2014)

HPV associated Anal Cancer is genetically distinct

- Meulendijks et al (2015)
- 138 anal SCC

	No.	% p53 I/C +	% p53 disruptive mutations	3 yr loco-regional control	3yr OS
HPV+ p16+	93	10% (9/93)	6 % (1/18)	82 %	87 %
HPV- p16+	4		33 % (1/3)	75 %	75 %
HPV- p16-	10	50% (5/10)	80 % (8/10)	15 %	35 %

No difference in T or N stage between HPV+ and HPV - cancers

HIV & ANAL CANCER

Historically (pre-HAART) anal carcinoma treatment in HIV positive patients associated with lower response rate and reduced survival

Radiotherapy and chemotherapy poorly tolerated with more toxicity and breaks in treatment

More recent studies (post HAART) suggest outcomes equivalent to non-HIV+ patients

Is the prognosis of Anal cancer worse in HIV infected patients ?

- **Oehler – Janne et al (2008)**
- **40 consecutive HIV(+) patients from 4 centres in Switzerland, France & Canada treated with CRT between 1997-2006**
- **Compared with 81 HIV(-) patients**
- **98 % SCC**

	HIV (+)	HIV (-)
cCR	92%	96%
5 yr local control	38%	87%*
5 yr sphincter preservation	38%	74%**
5 yr DM free survival	91%	84%
5 yr DSS	68%	85%***
5 yr OS	61%	65%
Acute G3/4 toxicity	48%	31%
Severe skin toxicity	35%	17%
Severe haematologic toxicity	33%	12%

- **poorer local control experienced by HIV(+) group with significantly higher colostomy rate**
- **Higher treatment related toxicity**
- **Less use of MMC in HIV(+) group**
- **Longer duration of RT in HIV(+) group (? more treatment breaks)**

(* P = 0.008 ; **p = 0.035 ; *** p = 0.09)

HIV & ANAL CANCER

- **Wexler et al (2007)**
- 32 HIV+ patients treated with CRT (5FU+MMC) between 1997 and 2005
- Median tumour size 2.8 % ; **44% cT1 cN0**
- 5 yr actuarial risk of local failure = 16 %
- 3 / 32 developed distant metastases
- 5 yr overall survival = 65 %
- 5 yr cancer specific survival = 75 %
- **Fraunholz et al (2011)**
- 25 HIV + patients and 45 HIV – patients
- No difference in T or N stage at diagnosis (all M0)
- More young males in the HIV+ group
- No difference in RT dose delivered
- 72 % HIV+ received full dose of chemotherapy cf. 91 % HIV- group

	CR at 8 wks	5 yr local control	5 yr metastasis free survival	5 yr overall survival
HIV +	**84 %**	**65 %**	**86 %**	**71 %**
HIV -	**93 %** pNS	**78 %** pNS	**91 %** pNS	**77 %** pNS

SCC of the Anal Margin

- 5 – 10x less common than anal canal tumours
- more often well differentiated & keratinizing
- less often hrHPV positive (80% in women & 28% in men – Frisch et al 1999)
- Small well differentiated tumours < 2cm can be treated by local excision +/- adjuvant radiotherapy
- Larger tumours that are poorly differentiated or metastatic to inguinal lymph nodes (15 – 20 % of patients) are treated with radiotherapy or CRT

SCC of the Anal Margin

- Risk of lymph node metastasis is related to tumour size:

Tumour size	% Node Metastasis Papillon & Chassard (1992)	% Node Metastasis Cummings et al (1986)
< 2cm	0 %	0 %
2 – 5 cm	24 %	
> 5cm	67 %	25 %

SCC of the Anal Margin : Results of Radiotherapy

	number	5 yr LRC	5 yr OS	Sphincter preservation
Chapel et al 2006	26	61 %	71 %	65 %
Cummings et al 1986	29	72 %	NS	NS
Papillon et al 1992	57	88 %	59 %	90 % (in cured patients)
Touboul et al 1995	17	86 %	82 %	82 %
Bieri et al 2001	24	70 %	56 %	67 %
Peiffert et al 1997	31	77 %	67 %	84 %
Khanfir et al 2008	45	78 %	55 %	80 %

SCC of the Anal Margin : Prognostic Factors

- Anal margin tumours have been reported to have both a better and worse prognosis than anal canal lesions – ACT 1 trial found no effect for LRF or OS.
- Studies of prognostic factors specific to anal margin tumours are lacking and reported series are small

➢ Chapet et al (2007) - 26 patients treated with primary EBRT or adjuvant RT after local excision : cancer specific survival related to age, tumour differentiation, T stage & N stage

Tumour diffn	5 yr CSS
Well diffn	85 %
Mod diffn	67 %
Poor diffn	50 %

T stage	5 yr CSS
T1	100 %
T2	92 %
T3	37 %
T4	0 %

N stage	5 yr CSS
N0	93 %
N1	67 %
N2	33 %

➢ Khanfir et al (2008) – 45 patients with primary EBRT or adjuvant RT after local excision : no factors (T stage, N stage, histological grade or age) were predictive of loco-regional control

Prognostic Factors in Anal Cancer

- Tumour size
- T stage
- N stage
- Distant Metastasis
- ? Histological type (probably not !)
- ? Histological grade (probably not !)
- Presence of skin ulceration (EORTC 22861)
- Male sex (ACT 1, EORTC 22861 & RTOG 98-11)
- Low Haemoglobin (ACT 1)
- HIV status (not so important post HAART)
- HPV status & p16 immunohistochemistry

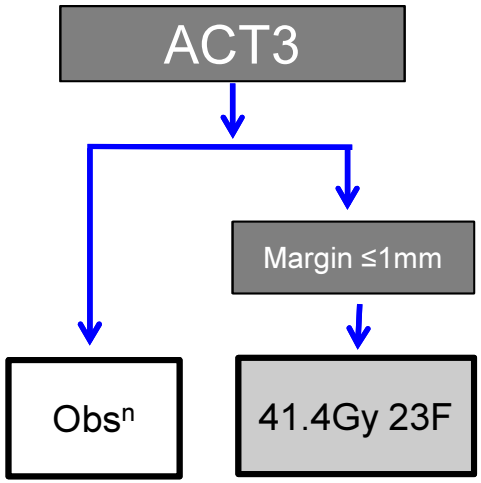
PLATO - PersonaLising Anal cancer RadioTherapy dOse

T1 N0 Anal margin

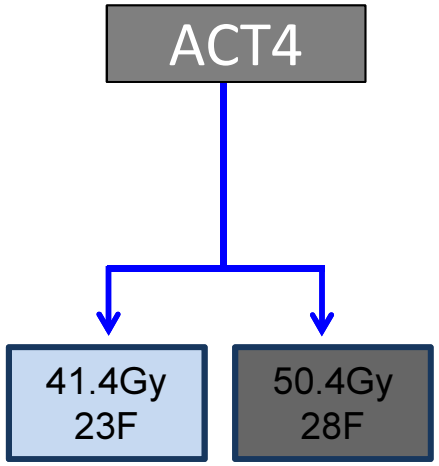
Local excision



Phase II trial

N=90

T1,T2<4cm N0

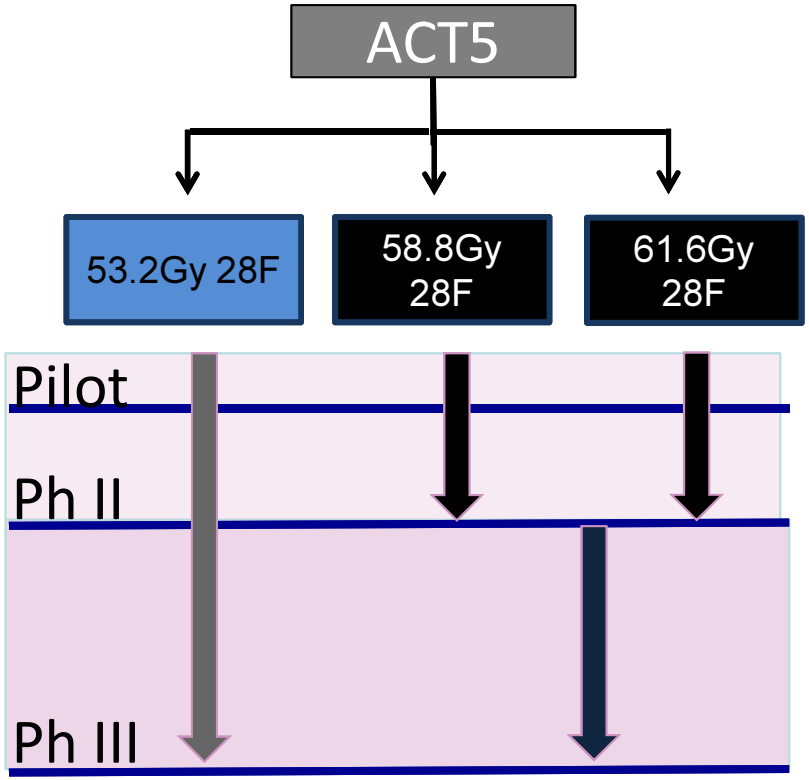


Randomised 2:1

Phase II trial

N=162

T3/4 Nany,T2N2-3



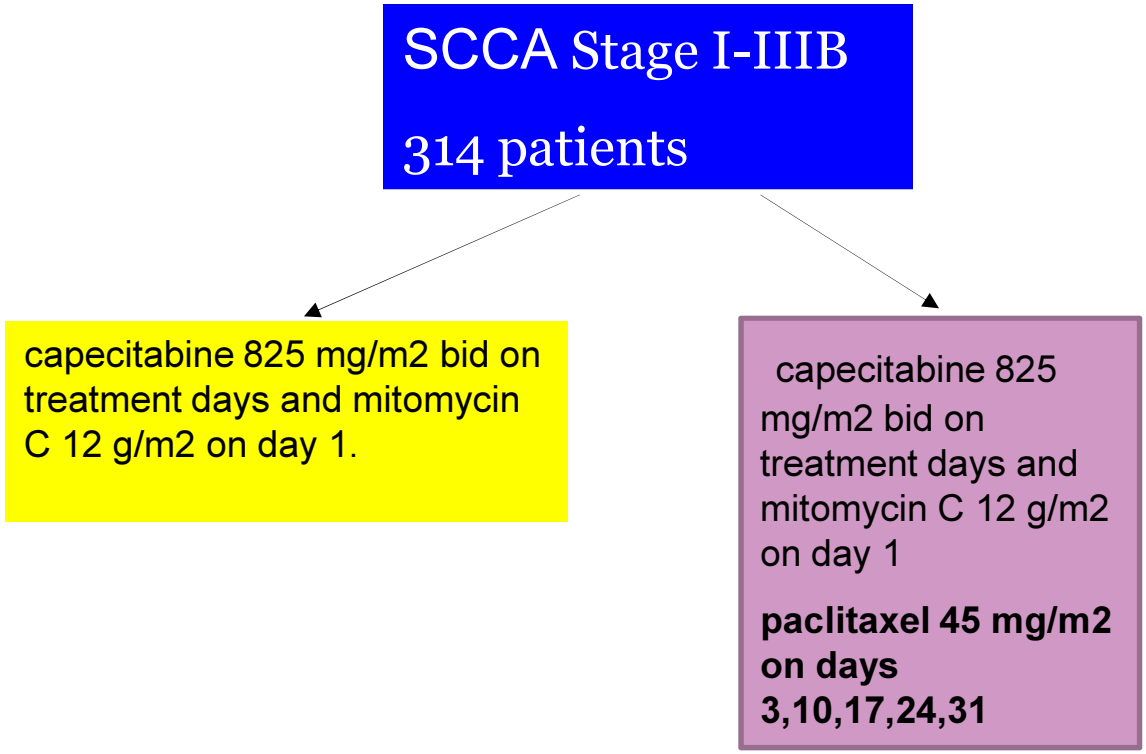
Pilot/Ph II/PhIII

N=677

Primary end point :- 3yr locoregional failure

ESTRO School

NCT02526953 Russian trial (S Gordeev) Efficacy Study of Chemoradiotherapy With or Without Paclitaxel in Squamous-cell Anal Carcinoma Patients



Primary Endpoint 3 year DFS

ESTRO School

p16INK4A (p16):

- Also known as cyclin-dependent kinase inhibitor 2A (CDKN2A)
- Cell cycle progression is unchecked via the activation of p16, a cyclin-dependent kinase inhibitor that functions as a checkpoint inhibitor.
- Immunohistochemistry for p16 has been used as a surrogate for HPV involvement.
- In addition to p16 - the prognosis is affected by tumour infiltrating lymphocytes TILs

Gilbert DC, et al, Tumour-infiltrating lymphocyte scores effectively stratify outcomes over and above p16 post chemo-radiotherapy in anal cancer. Br J Cancer. 2016

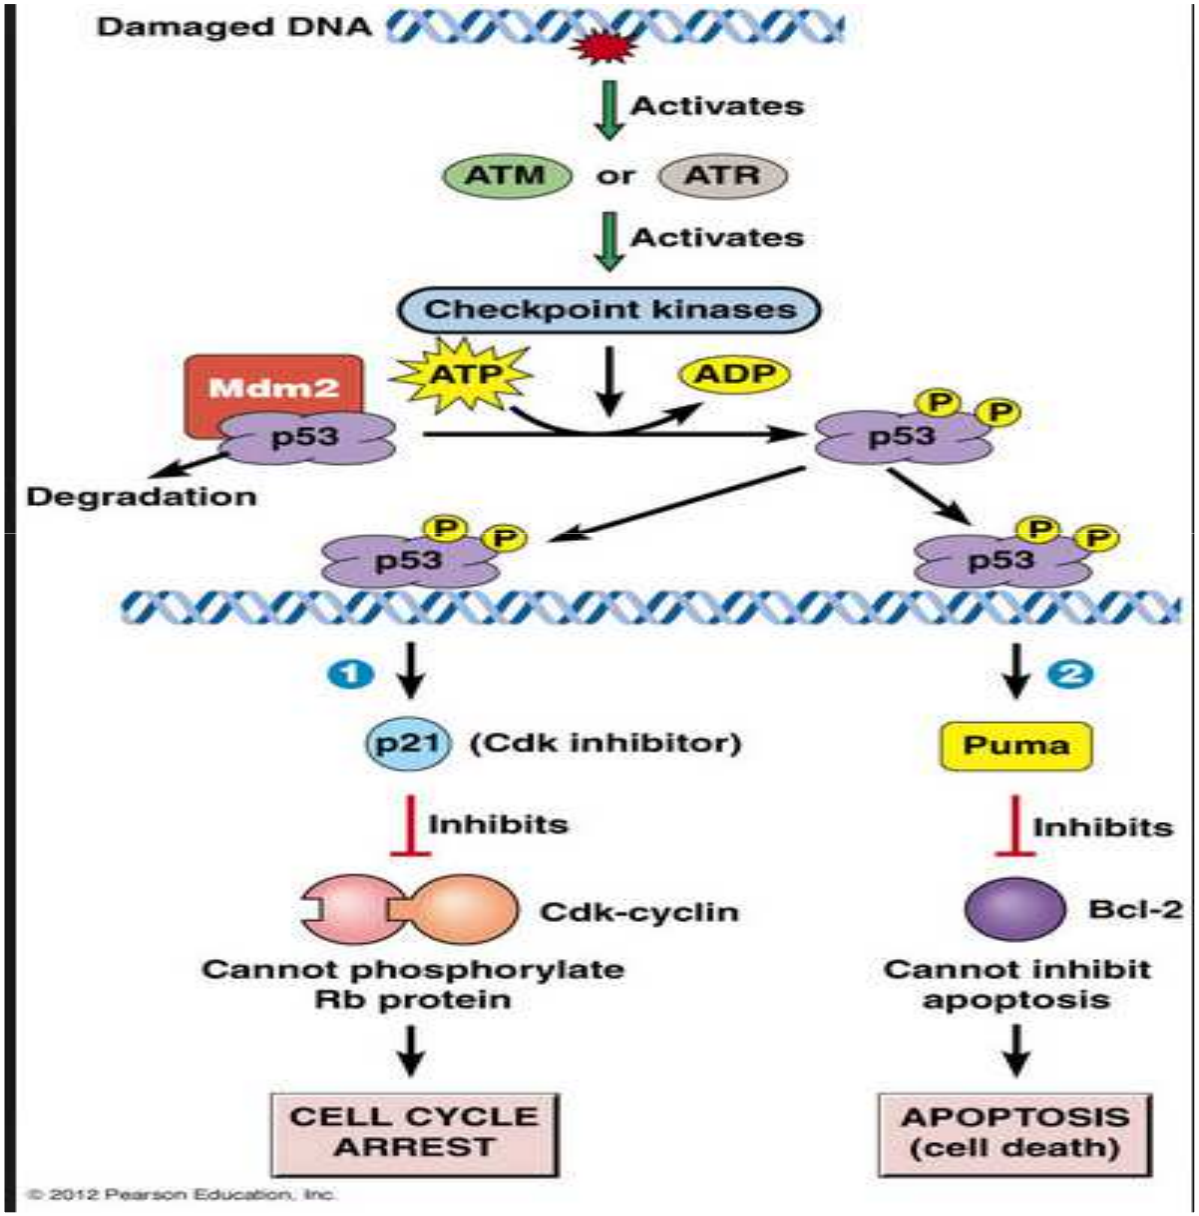
- Tissue samples of primary oral squamous cell carcinoma (OSCC) display
- hypermethylation in the promoter regions of p16.
- Cancer cells show a significant increase in the accumulation of methylation in CpG islands in the promoter region of p16
- This epigenetic change leads to the loss of tumor suppressor gene function

LY2606368

- CHK1 is a multifunctional kinase crucial for checkpoint control, DNA repair, cell cycle replication, and proliferation.
- Tumor cells with increased levels of CHK1 acquire survival advantages due to the ability to tolerate a higher level of DNA damage.
- By inhibiting CHK1, tumour DNA is damaged and unable to pass through mitosis.

- The CHK 1/2 inhibitor (LY2606368) is being investigated as a single agent in patients with metastatic SCCA and plans to integrate with CRT

Although neutropenia is side effect



ESTRO School

Immune checkpoints

supports trials of immunotherapy (targeting immune checkpoints

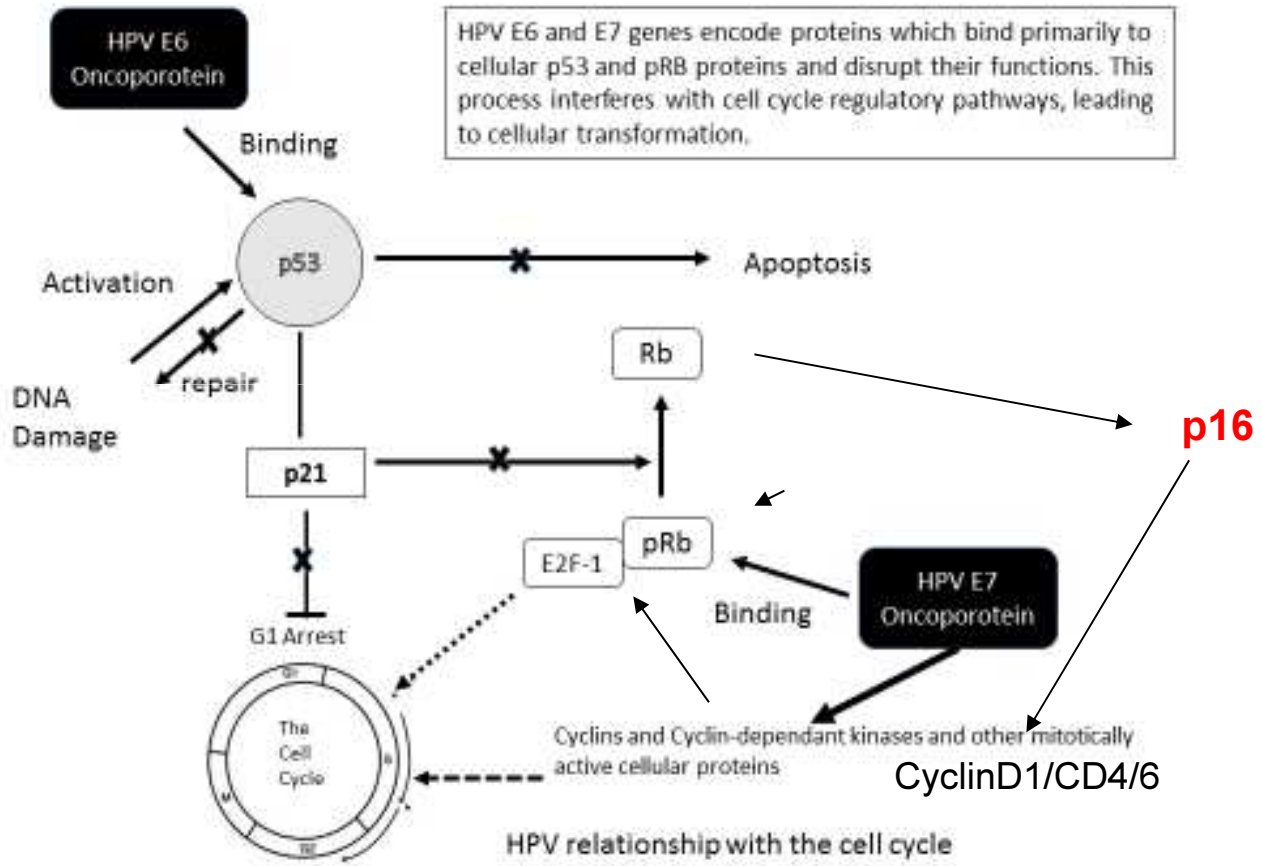
via anti CTLA4/PD1/PDL1 agents)

either in the metastatic setting

or potentially combined with chemo-radiotherapy either in the concurrent or (neo) adjuvant setting **(Illidge 2015)**

Illidge, T. Turning radiotherapy into an effective systemic anti-cancer treatment in combination with immunotherapy. Clin Oncol (R Coll Radiol). 2015 Dec;27(12):696-9

Immune checkpoint inhibitors



Hypothesis

- that combining radiation with checkpoint blockade immunotherapy will increase radiosensitisation
- improve local tumour control
- prevent the development of overt metastatic disease by reactivating anti-tumour T cells, which have become tolerant.

- Pembrolizumab is a potent and highly selective humanized monoclonal antibody (mAb) of the immunoglobulin G4 (IgG4)/kappa isotype designed to directly block the interaction between PD-1 and its ligands, PD-L1 and PD-L2

Pembrolizumab a humanized monoclonal antibody against PD-1

25 heavily pretreated patients with PD-L1-positive advanced SCCA

Overall response rate of 5/25 (20%)

Stable disease in a further 10/25 patients (40%)

(Ott P et al. Preliminary safety and efficacy results from KEYNOTE-028 ESMO 2015).

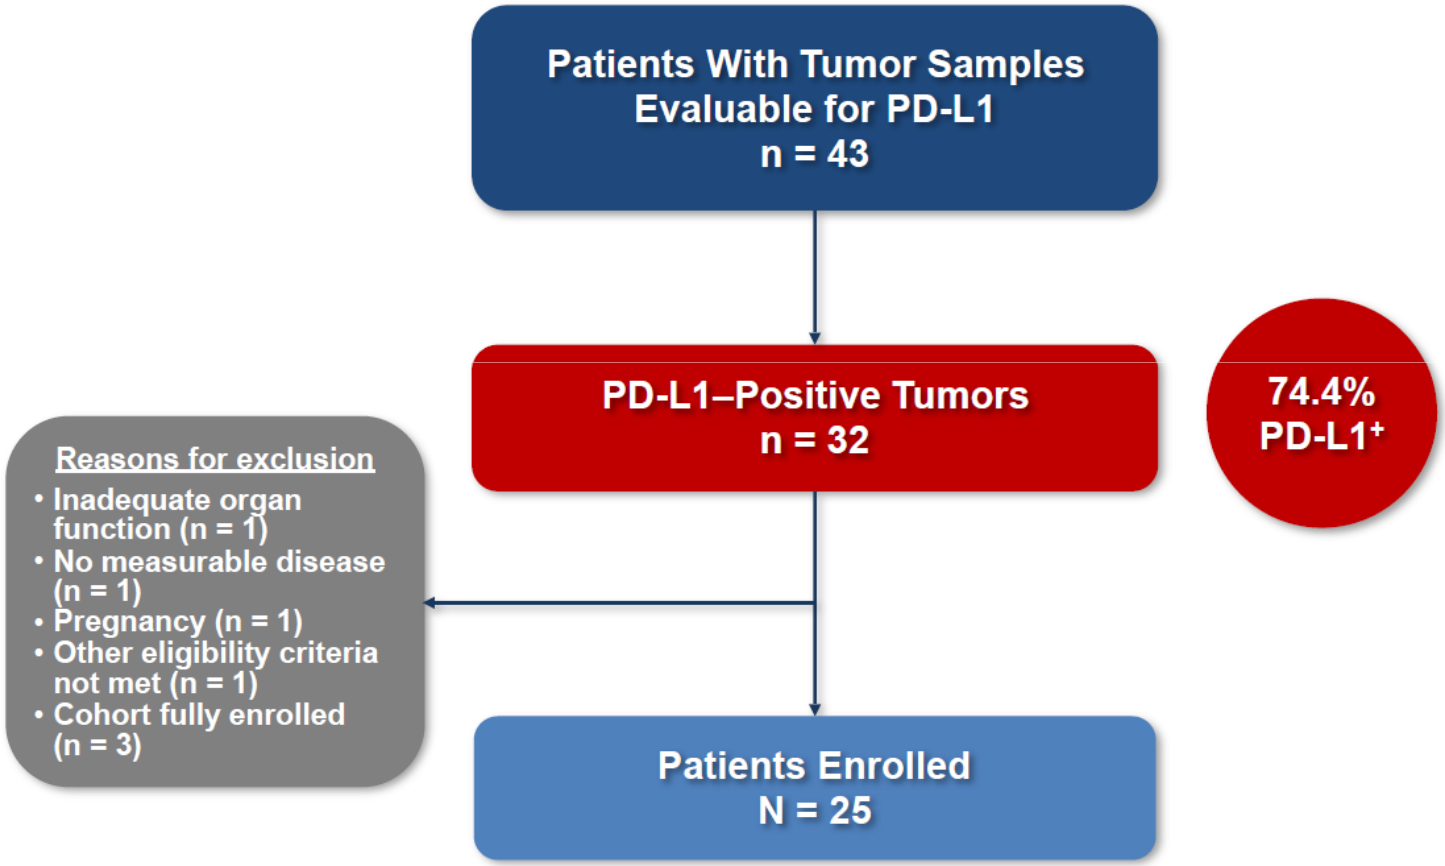
PD-L1 Screening: Anal Cancer Cohort



Anal Canal Cancer:Baseline Characteristics

Characteristic, n (%)	N = 25
Median age, years (range)	63 (46–82)
Female	23 (92)
Race	
White	19 (76)
Black or African American	1 (4)
Not specified	5 (20)
ECOG performance status	
0	5 (20)
1	20 (80)
Histology at baseline, n (%)	
Squamous cell carcinoma	22 (88)
Carcinoid[a]	1 (4)
Endometrioid[a]	1 (4)
Mucoepidermoid[a]	1 (4)

Characteristic, n (%)	N = 25
Adjuvant or neoadjuvant systemic therapy, n (%)	6 (24)
Prior lines of therapy for advanced disease, n (%)	
0	3 (12)
1	7 (28)
2	7 (28)
≥3	6 (24)
Unknown	2 (8)
Prior therapies for advanced disease[b]	
5-FU + mitomycin	15 (60)
5-FU ± platinum ± other	14 (56)
Gemcitabine + platinum ± other	4 (16)
Chk-1 inhibitor	2 (8)
Etirinotecan pegol	2 (8)
Other	5 (20)

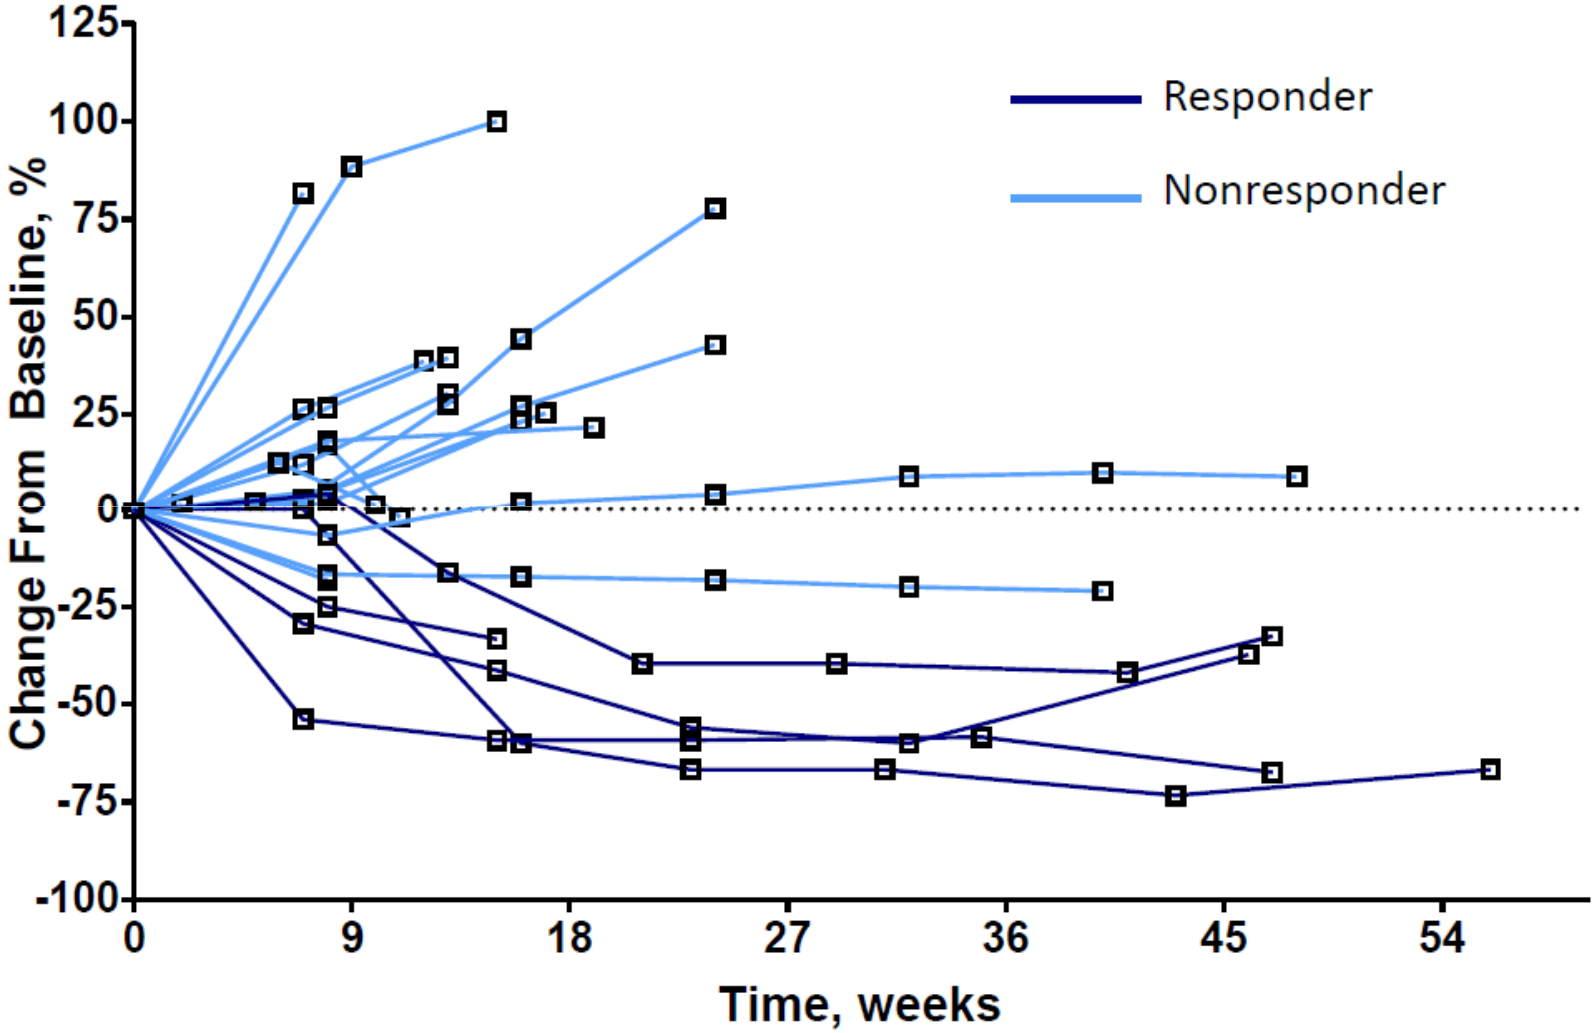
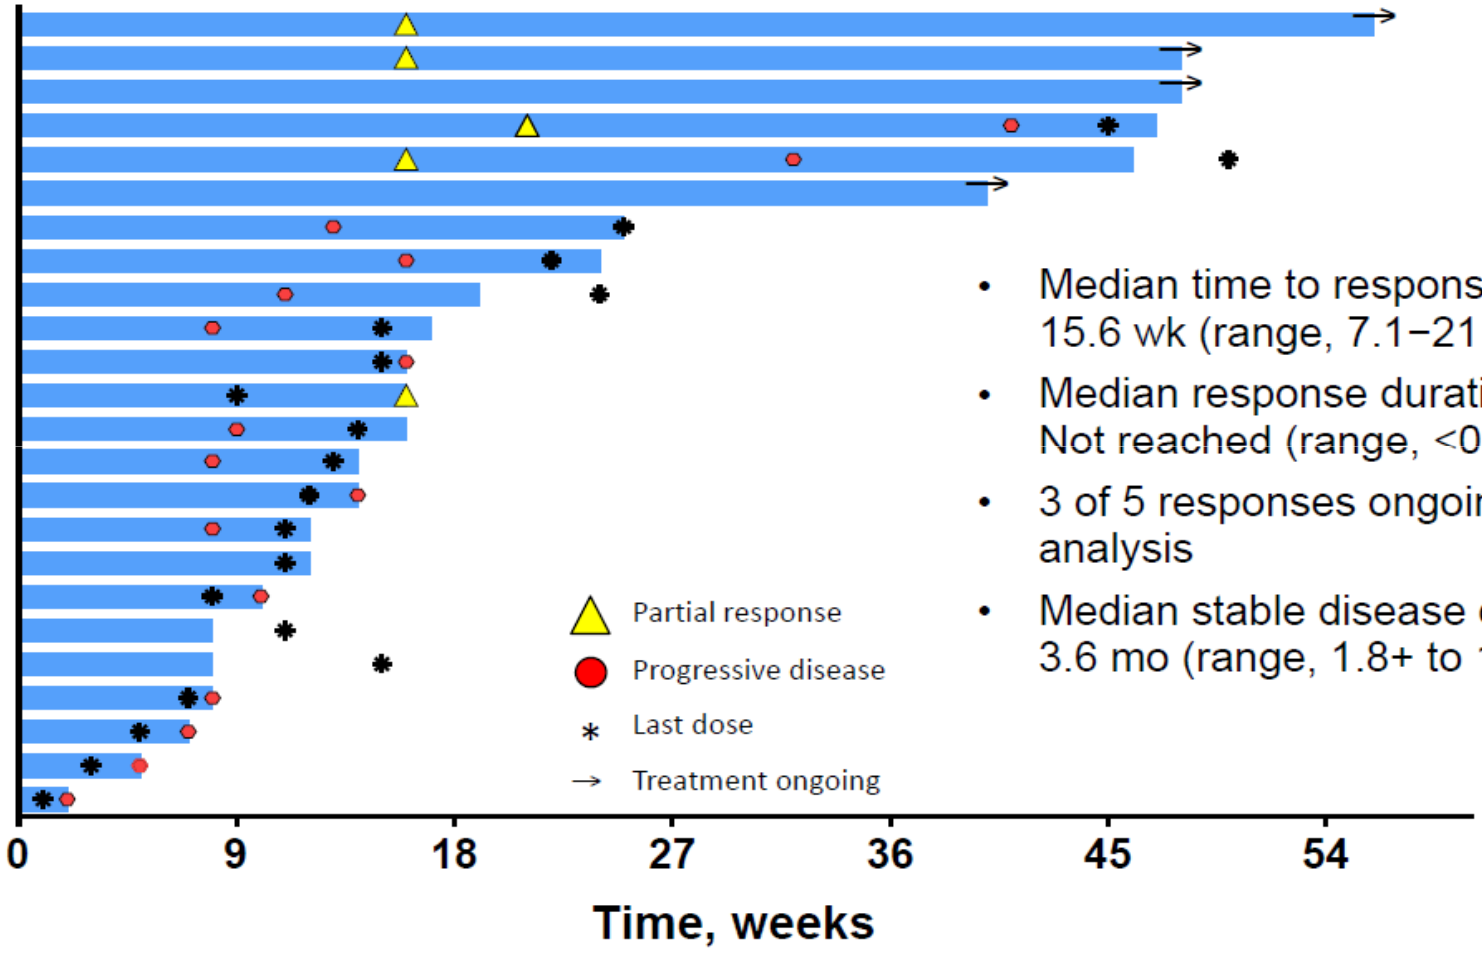
Anal Canal Cancer Longitudinal Change From Baseline in Tumor Size



ESTRO School

Anal Canal Cancer: Treatment Exposure and Response Duration



- Median time to response: 15.6 wk (range, 7.1–21.0)
- Median response duration: Not reached (range, <0.1+ to 9.2+ mo)
- 3 of 5 responses ongoing at time of analysis
- Median stable disease duration: 3.6 mo (range, 1.8+ to 11.0+)

PD-L1 Squamous cell carcinoma of the anus - Durable responses /stable disease in a population which was heavily pretreated

Manageable safety profile

Suggest evaluation of advanced anal cancer

PD-L1 expression was seen in

62% of advanced /unknown stage

33% of early stage (?T1/T2) disease

PD-L1-positive vs. negative patients respectively had RFS medians of 1.5 vs. 4.9 years (p = 0.068)

ADXS11-001 immunotherapy

- live attenuated Listeria monocytogenes (Lm)
- bioengineered to secrete a HPV-16-E7 fusion protein targeting HPV transformed cells.

- Anal cancer cells infected with HPV have the tumour associated antigen HPV E7.

- So ADXS11-001 causes antigen presenting cells to be stimulated to facilitate immune cells to attach to cancer cells expressing HPV E7

- neutralizes Tregs and myeloid-derived suppressor cells (MDSCs), which protect the tumour microenvironment from immunologic recognition and contribute to tumour growth.

Thank you
