Clin Exp Metastasis (2014) 31:735–748

Oligometastases

Oligometastatic
A malignancy that has progressed to a limited number of haematogenous metastases, defined in most studies as 1–3 or 1–5 metastatic lesions.

Synchronous oligometastasis
A clinical scenario in which oligometastatic disease is detected at the time of diagnosis of the primary tumour.[111]

Metachronous oligometastasis
The development of oligometastatic disease after treatment of the primary tumour. The interval for classification of 'metachronous' versus 'synchronous' is not standardized.[111]

Oligorecurrence
Oligometastasis in the setting of a controlled primary tumour.[111]

Oligoprogression
Progression of a limited number of metastatic deposits, while all other metastases are controlled with systemic therapy.

Palma et al, Nature Reviews Clin Oncol 2014

Metastasis-to-metastasis seeding occurs either by a linear or by a branching pattern of spread.

Fundamentals of pain management

- Initial assessment
- Diagnosis of the underlying cause
- Initiation of treatment
  - general
  - specific
- Review and reassessment

ESTRO School

Principles of symptom control

- Make a diagnosis
- Individualise treatment
- Keep it simple

Treatment of cancer pain
Objectives

- Pain free at night
- Pain free a rest
- Pain free on movement

ESTRO School

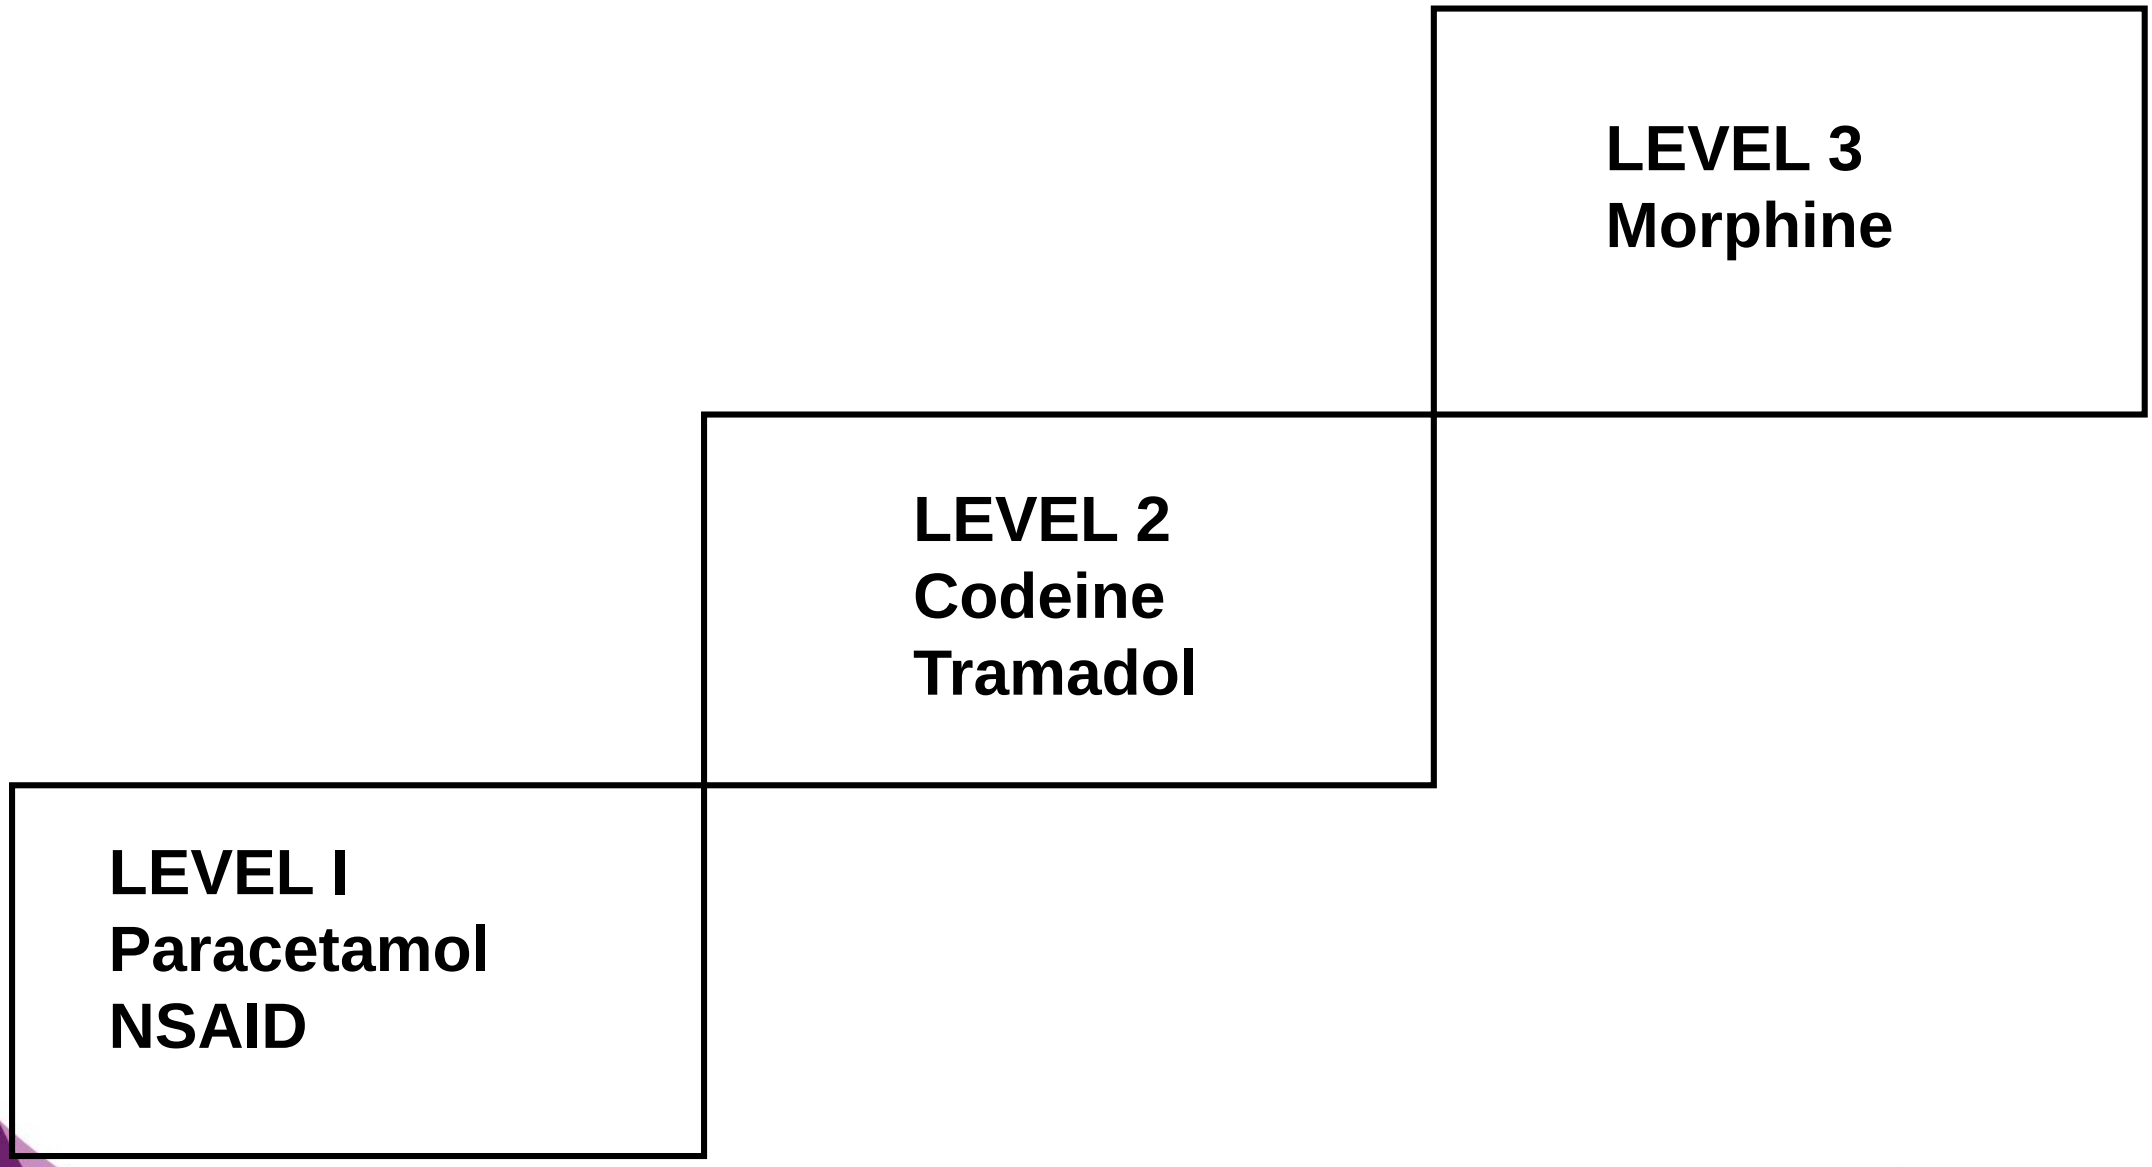
Pharmacological pain relief

- Regular medication to prevent pain
- Ready access to breakthrough medication

- Initiate with immediate release formulations or sustained release formulations and adequate breakthrough

- Monotherapy is not usually sufficient
- Monitor any changes
- Be prepared to withdraw ineffective medication

Analgesic ladder



Analgesics: the WHO ladder

- Prospective series of 129 patients

[Ventafidda et al 1987]

Pain control using ladder in 871

Step 1 alone:	11%
Step 2 alone:	24%
Step 3 alone:	26.5%
All 3 steps:	33.6%

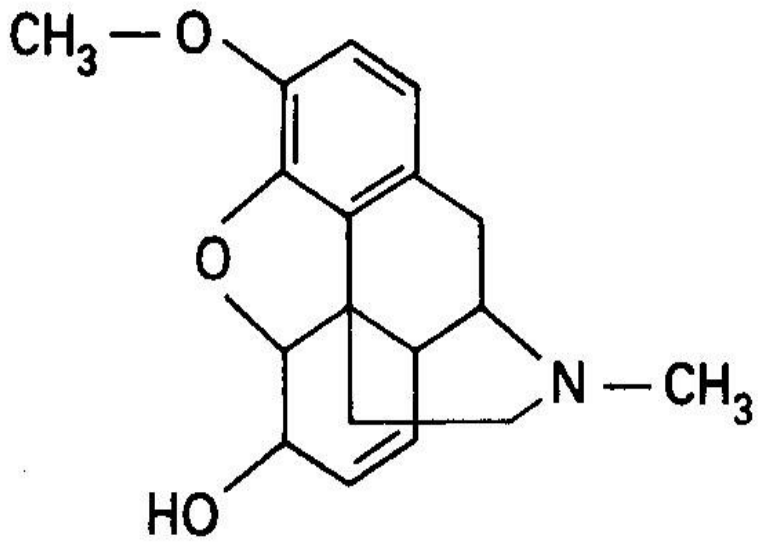
ESTRO School

Use of opioid analgesics in the treatment of cancer pain: evidence-based recommendations from the EAPC

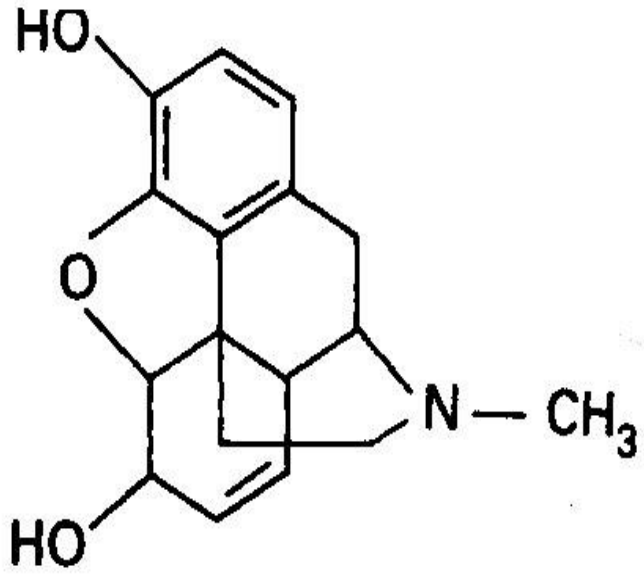
Lancet Oncol 2012; 13: e58–68

Level II analgesics

Codeine	Step II drug only: use alone or in combination with paracetamol; daily doses ≥360 mg not recommended
Tramadol	Step II drug only: use alone or in combination with paracetamol; daily doses ≥400 mg not recommended
Hydrocodone	Step II drug only: used as a substitute for codeine in some countries
Oxycodone	Step II opioid when used at low doses (eg, ≤20 mg per day) alone or in combination with paracetamol
Morphine	Step II opioid when used at low doses (eg, ≤30 mg per day)
Hydromorphone	Step II opioid when used at low doses (eg, ≤4 mg per day)



Codeine



Morphine

Tramadol

- Weak opioid agonist
- Acts on noradrenaline and 5HT uptake in spinal cord

- Single dose efficacy 150mg = 60mg codeine

- Chronic use = codeine
- Similar side -effect profile to codeine/DHC
  - ?less constipating
  - NB epileptogenic with phenothiazines

- Max dose 100mg 6hrly = morphine 10mg 4 hourly

Opioid drugs

AGONISTS

Morphine
Codeine
Oxycodone
Dihydrocodeine
Hydromorphone
Pethidine
Levorphanol
Oxymorphone
Methadone
Fentanyl
Dextropropoxyphene
Diamorphine
Tramadol
Phenazocine
Dextromoramide

PARTIAL AGONISTS

Buprenorphine

AGONIST-ANTAGONIST

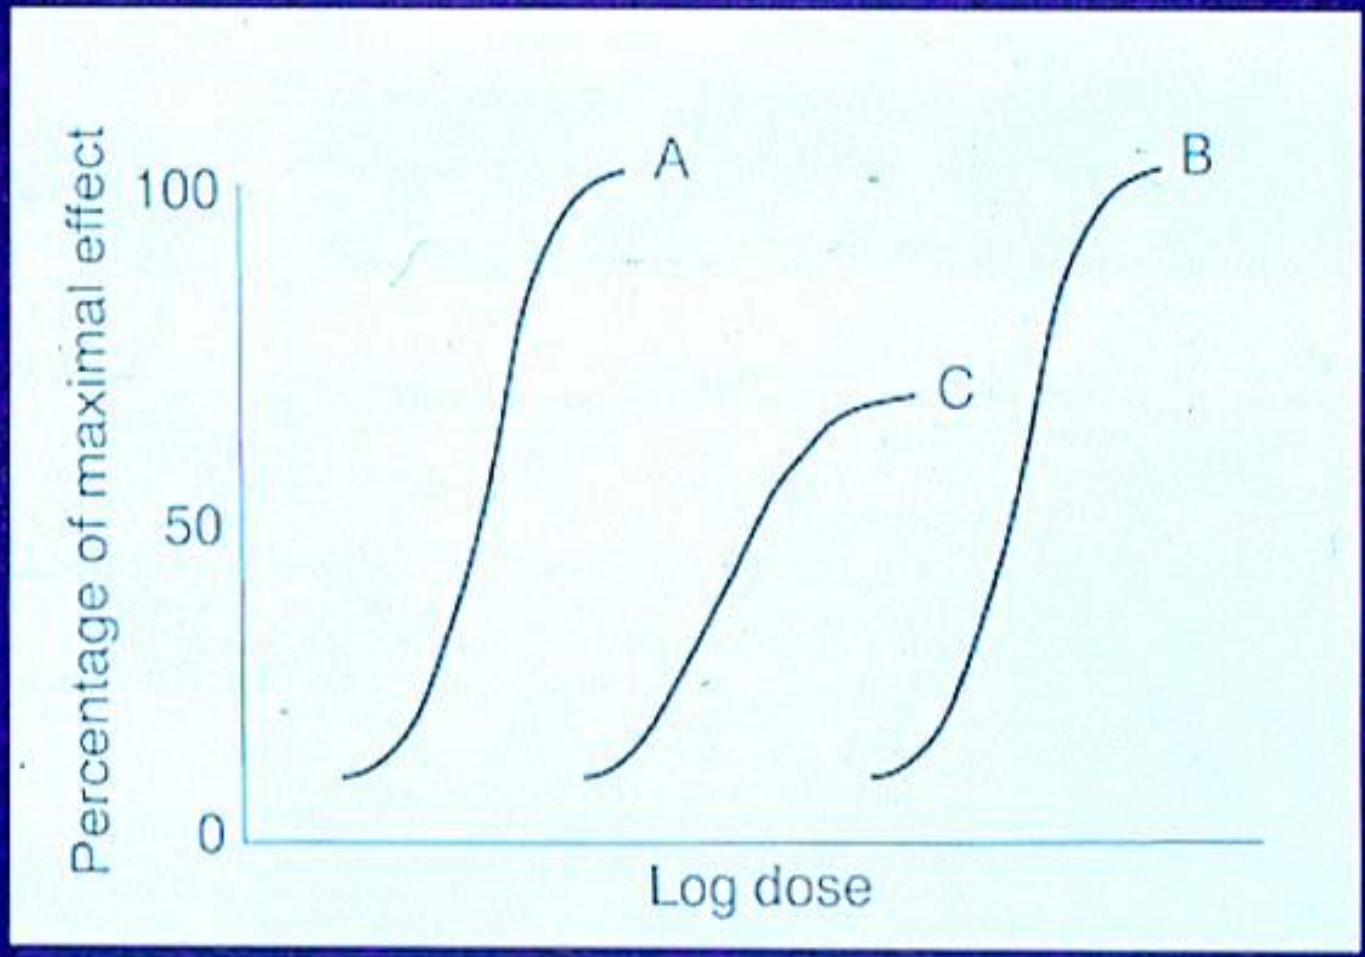
Pentazocine
Butorphanol
Nalbuphine
Dezocine
Meptazinol

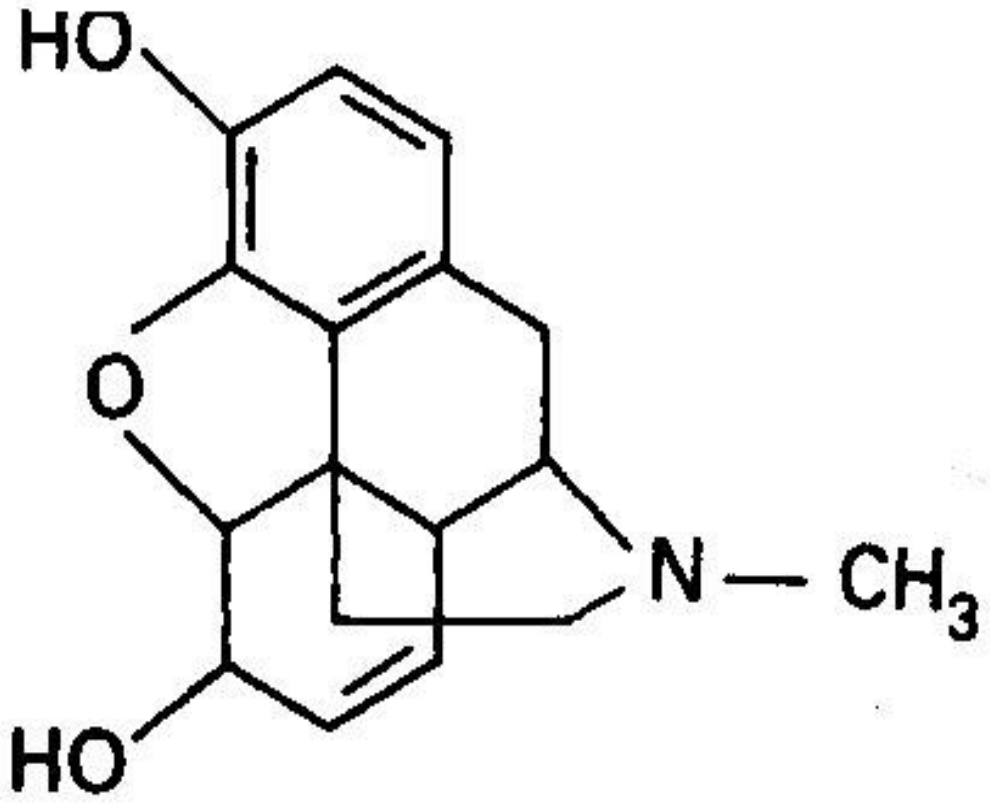
ANTAGONISTS

Naloxone
Naltrexone (methylnaltrexone)
Naloxegol

ESTRO School

Dose response curves for pure agonists (A) and (B) and partial agonist (C)





Morphine

Opioid receptors

- μ analgesia, respiratory depression
  miosos, euphoria, reduced GI motility
- δ analgesia (in animal models)
- κ analgesia, dysphoria, miosis
  psychotomimetic effects
  respiratory depression

ESTRO School

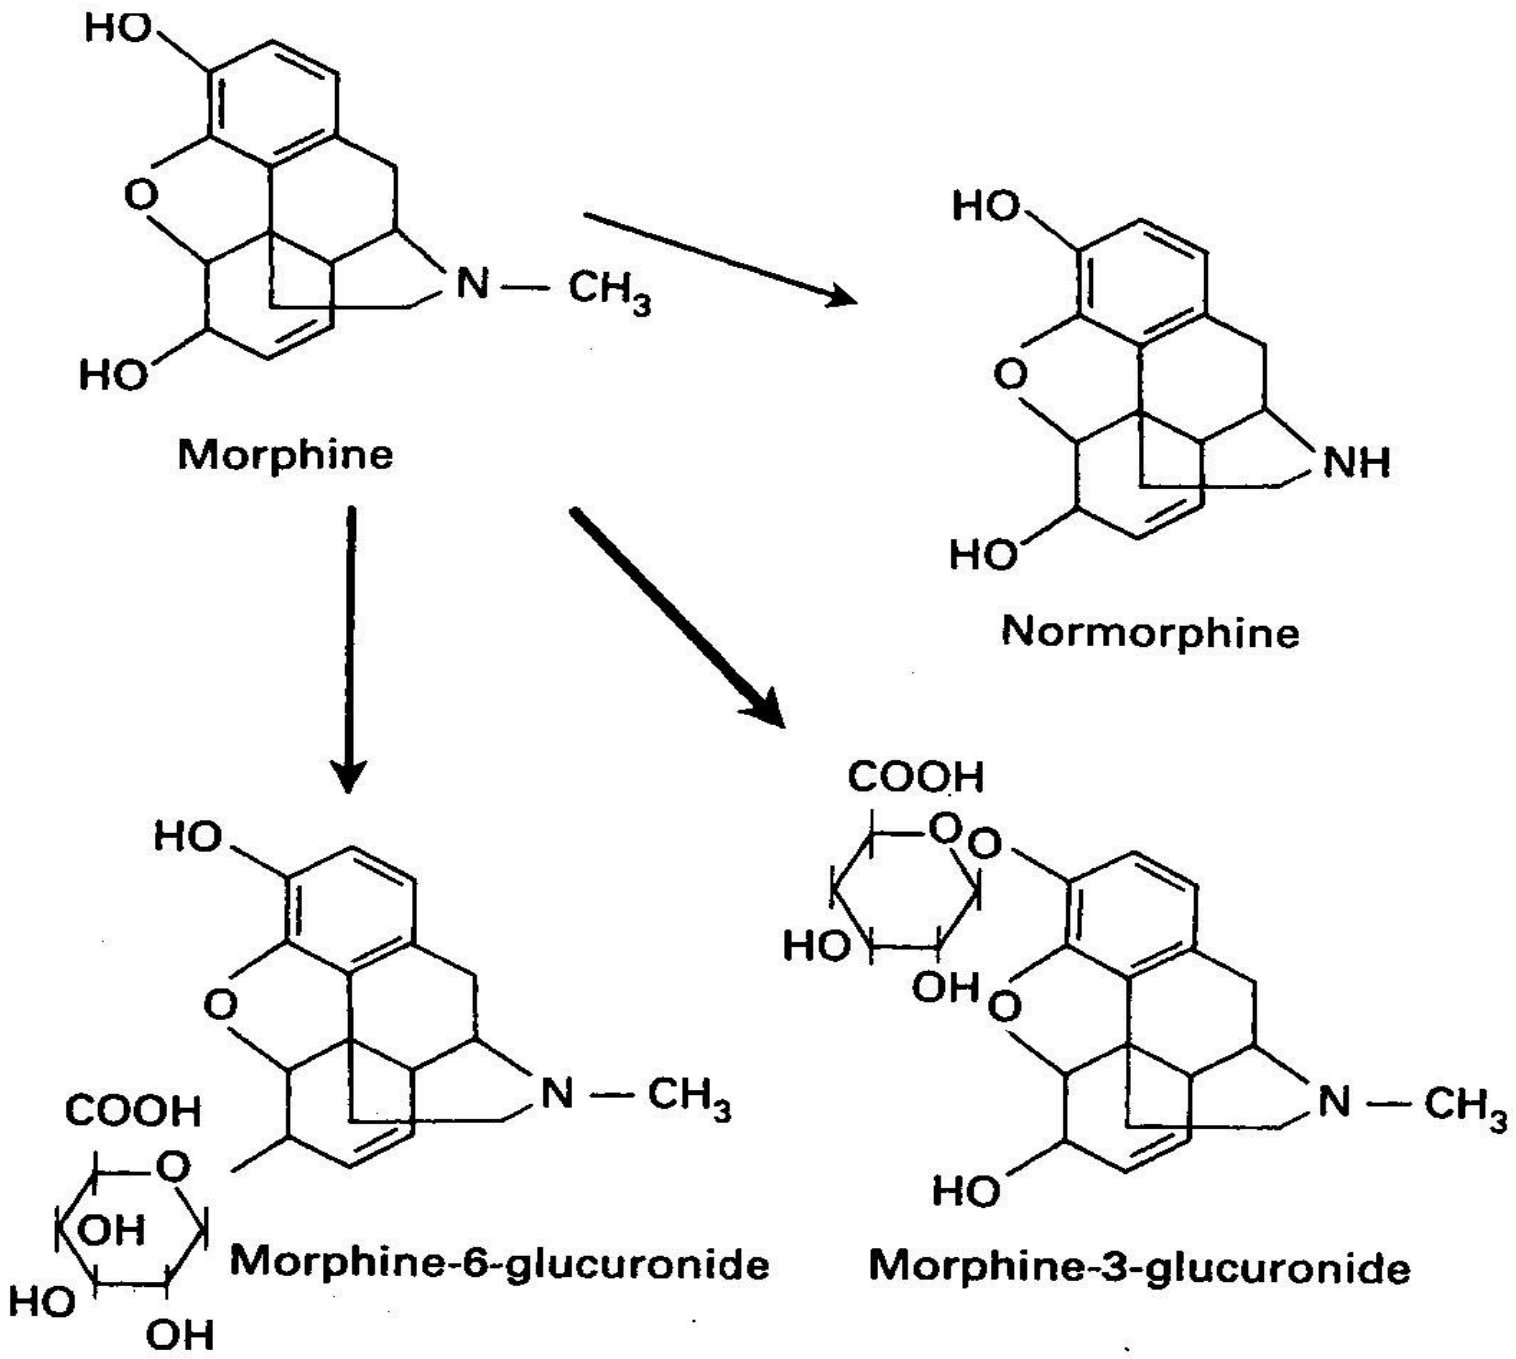
Level III analgesia

- Morphine

- Immediate release 4 hourly or controlled release 12 hourly
- If immediate release a double dose at night
- Breakthrough as required
- Laxative mandatory
- Anti-emetic access essential

Morphine pharmacokinetics

- Oral bioavailability around 30%
- Similar rectal absorption
- Plasma T½ 2 to 3 hours
- Extensive first pass metabolism
- Major metabolites are M3G and M6G
- Renal excretion of parent drug and metabolites
- Enterohepatic circulation also occurs



Morphine metabolites

- Active: M6G
  Codeine

- Inactive: M3G
  Normorphine
  M ethereal sulphate

Morphine metabolites; plasma levels

- Morphine: M3G 1: 20-30
- Morphine: M6G 1: 3-10

M6G analgesic efficacy

Relative analgesic efficacy: rat hot plate model

	Morphine	M6G
Shimomura et al 1971		
Subcutaneous	1	3.7
Intracerebral	1	45
Pasternak et al 1987		
Intraventricular	1	20

Bioavailability of M6G

Route	Ratio $AUC_{morphine} : AUC_{M6G}$
IV	1: 2.0
Oral solution	1: 10.9
Oral MST	1: 11.1
Buccal	1: 11.0

Morphine: ***Dose titration***

- Starting dose is 10mg four hourly
- Double dose if ineffective after 48 hours up to 80mg then use 50% increments
- Breakthrough dose must be

  same as 4 hourly dose

- Median 4 hourly dose requirement is 40 mg

ESTRO School

Controlled release morphine

- 8 hourly, 12 hourly or 24 hourly

- If switching from 4 hourly morphine start from same total 24 hour dose as immediate release morphine once dose requirements defined by titration
- No loading dose required

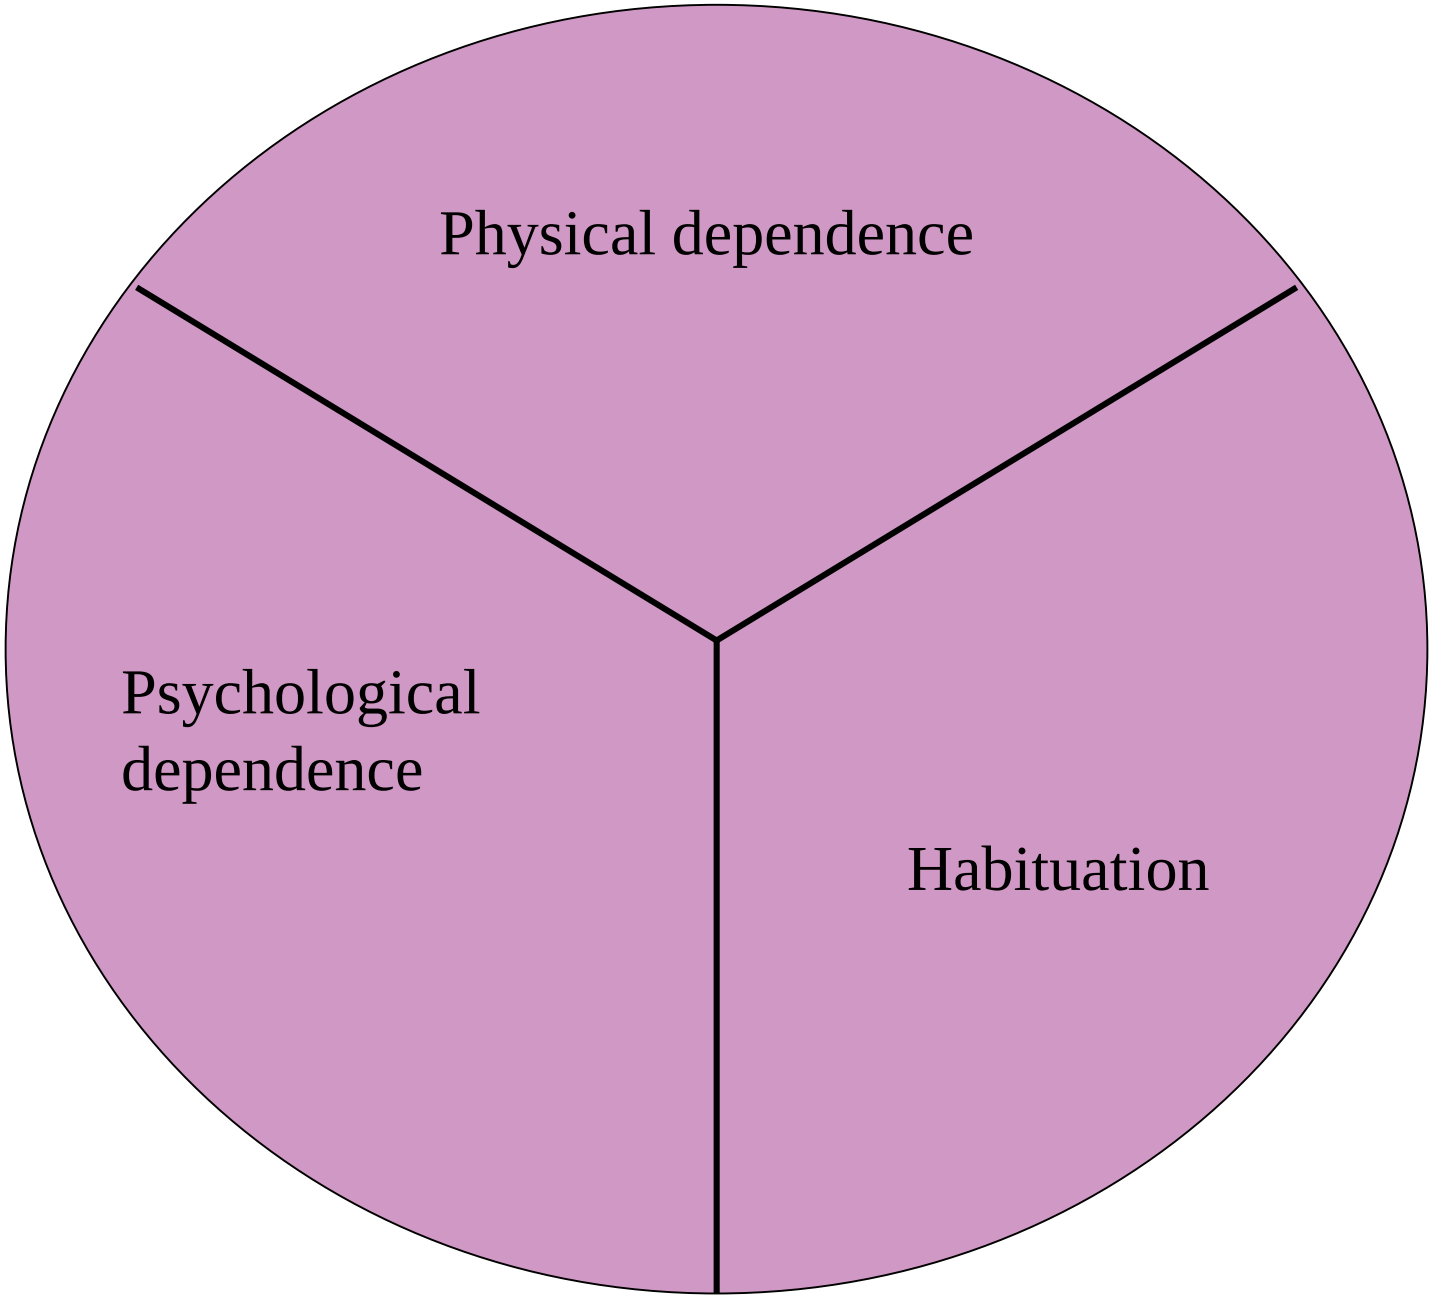
- Ensure breakthrough morphine also available
- Anticipate slow increase in morphine dose with time

- Median dose in advanced cancer 40-60mg 4 hourly

ESTRO School

Respiratory depression

- Only seen with doses above those needed for analgesia or where accumulation occurs due to inappropriate dosing or renal failure
- Receptor tolerance develops with titration
- Pain is the ‘physiological antagonist’ of respiratory depression



Physical dependence
Psychological dependence
Habituation

Opioid pseudoaddiction

- Abnormal behaviour as a direct consequence of inadequate pain control:

Inadequate prescription of analgesia

↓

Escalation of analgesic demands

Associated behavioural change to convince others of pain severity

↓

Crisis of mistrust

ESTRO School

Parenteral opioids

- ***NOT*** intrinsically more potent: dose ratio 1: 2-3

- Appropriate only where drug delivery is a problem
  - intestinal obstruction
  - intractable vomiting
  - complete dysphagia
  - falling LOC
  - AP resection

- Diamorphine used only because more soluble

Transdermal fentanyl

- Fentanyl more potent than morphine;
  - equianalgesic dose 25µg/hr = 10-20mg 4 hourly
- Morphine required for breakthrough pain

- Controlled release formulation
- T½e is around 12 hours
- Absorption temperature dependent

- Side-effect profile similar to morphine
- Morphine ⟶ Fentanyl may cause withdrawal reaction in 10% …..? 24 hour overlap period required

Pain poorly responsive to opioids

- Opioid irrelevant pain
- Opioid intolerance
- True opioid resistance

Pain poorly responsive to opioids

- Opioid irrelevant pain
  - Reassess: neuropathic, non-cancer
  - Introduce adjuvant analgesics
  - Review indications for non-drug therapy
- Opioid intolerance
- True opioid resistance

ESTRO School

Pain poorly responsive to opioids

- Opioid irrelevant pain
- Opioid intolerance
- True opioid resistance

Use of opioid analgesics in the treatment of cancer pain: evidence-based recommendations from the EAPC

Lancet Oncol 2012; 13: e58–68

	Relative analgesic ratio	Strength of the recommendation for use
Oral morphine to oral oxycodone	1:1·5	Strong
Oral oxycodone to oral hydromorphone	1:4	Strong
Oral morphine to oral hydromorphone	1:5	Weak
Oral morphine to TD buprenorphine*	75:1	Weak
Oral morphine to TD fentanyl†	100:1	Strong

TD=transdermal. *Example: 60 mg oral morphine to 35 µg/h TD buprenorphine (equivalent to 0·8 mg per 24 h). †Example: 60 mg oral morphine to 25 µg/h TD fentanyl (equivalent to 0·6 mg per 24 h).

Pain poorly responsive to opioids

- Opioid irrelevant pain
- Opioid intolerance
- True opioid resistance

Opioid resistance: ‘wind up’

- ***Allodynia:*** altered sensitivity of central neurones with relatively minor pain being perceived as severe pain

- NMDA (N-methyl-D-aspartate receptors mediate allodynia

- NMDA receptor antagonists eg methadone or ketamine may be of value in resetting opoioid tolerance: hence work best ***with*** morphine

ESTRO School

Ketamine

- Indicated in allodynia and hyperalgesia

- Use needs careful supervision:
  - continue opioids but titrate dose down
  - haloperidol or benzodiazepine may be indicated for psychotomimetic effects
  - benzodiazepine will increase bioavailability by inhibition of liver metabolism

Incident pain

- Short acting strong opioid:
  - Dextromoramide
  - Fentanyl 'lollipop'

Adjuvant analgesics

- Modify underlying pain process
- Consider at all stages of analgesic ladder

Adjuvant analgesics

- NSAIDs
- Steroids
- Anxiolytics
- Antidepressants
- Neuroleptics
- Anticonvulsants
- Muscle relaxants
- Bisphosphonates

Analgesic ladder

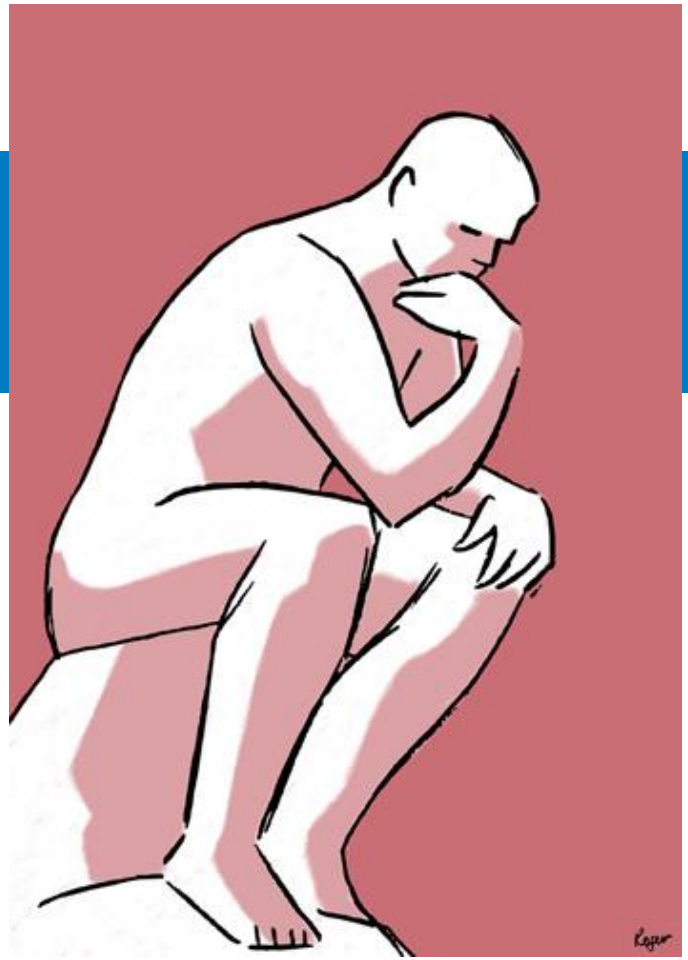
Medical Center

Evaluation of pain and other symptoms



Signal, screen, monitor, diagnose

Yvette van der Linden

Centre of Expertise Palliative Care

& Dept. of Radiotherapy

Why should we evaluate? When… ? How… ?

Why…….

- to list all complaints
- to accomplish proactive care
- to check what your doing!
- to integrate a proactive attitude

-> apply method of palliative reasoning

" the sooner any symptom load is diminished, the sooner improvement (stabilizing) QoL, and, if treatment not effective, switch to another"

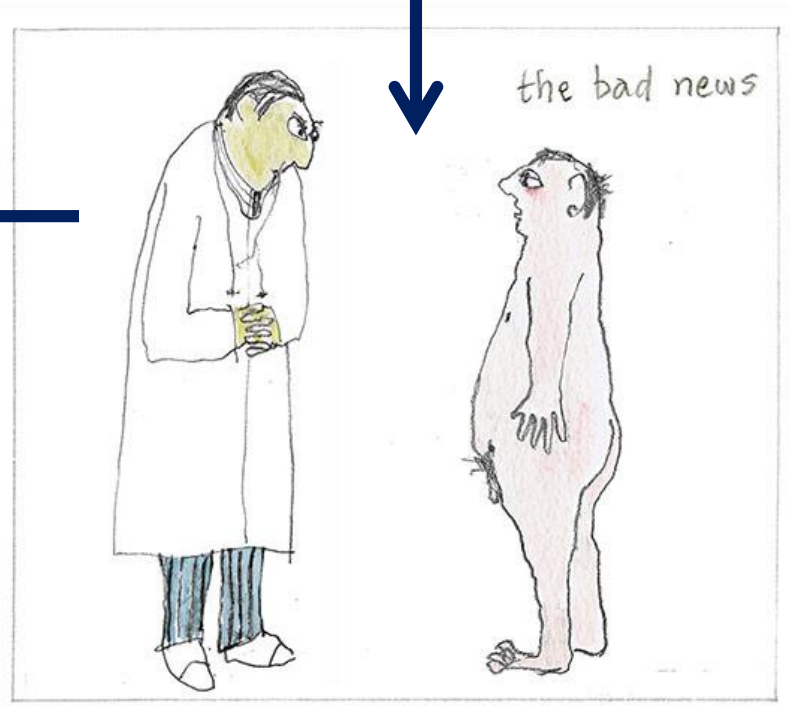
When…….

- as soon as you expect any treatment effect
  - Pain medication -> 24 hrs
  - RT for bone mets -> 4 weeks

How…….

- simply by asking? Yes, but…….

I've been so
forgetful
lately.
I've been so
forgetful
lately.



the bad news

☐ Caregiver-assisted

Use the right measurement tools

1. Signalling
2. Monitoring

3. Screening

- Standardized measurement

using a specific tool, that indicates the presence of a diagnosis (e.g. delirium, depression)

Example

Hospital Anxiety and Depression Score (HADS)

This questionnaire helps your physician to know how you are feeling. Read every sentence. Place an "X" on the answer that best describes how you have been feeling during the LAST WEEK. You do not have to think too much to answer. In this questionnaire, spontaneous answers are more important

A	**I feel tense or 'wound up':**	
	Most of the time	3
	A lot of the time	2
	From time to time (occ.)	1
	Not at all	0
D	**I still enjoy the things I used to enjoy:**	
	Definitely as much	0
	Not quite as much	1
	Only a little	2
	Hardly at all	3
A	**I get a sort of frightened feeling as if something awful is about to happen:**	
	Very definitely and quite badly	3
	Yes, but not too badly	2
	A little, but it doesn't worry me	1
	Not at all	0
D	**I can laugh and see the funny side of things:**	
	As much as I always could	0
	Not quite so much now	1
	Definitely not so much now	2
	Not at all	3
A	**Worrying thoughts go through my mind:**	
	A great deal of the time	3
	A lot of the time	2
	From time to time, but not often	1
	Only occasionally	0
D	**I feel cheerful:**	
	Not at all	3
	Not often	2
	Sometimes	1
	Most of the time	0
A	**I can sit at ease and feel relaxed:**	
	Definitely	0
	Usually	1
	Not often	2
	Not at all	3

D	**I feel as if I am slowed down:**	
	Nearly all the time	3
	Very often	2
	Sometimes	1
	Not at all	0
A	**I get a sort of frightened feeling like "butterflies" in the stomach:**	
	Not at all	0
	Occasionally	1
	Quite often	2
	Very often	3
D	**I have lost interest in my appearance:**	
	Definitely	3
	I don't take as much care as I should	2
	I may not take quite as much care	1
	I take just as much care	0
A	**I feel restless as I have to be on the move:**	
	Very much indeed	3
	Quite a lot	2
	Not very much	1
	Not at all	0
D	**I look forward with enjoyment to things:**	
	As much as I ever did	0
	Rather less than I used to	1
	Definitely less than I used to	2
	Hardly at all	3
A	**I get sudden feelings of panic:**	
	Very often indeed	3
	Quite often	2
	Not very often	1
	Not at all	0
D	**I can enjoy a good book or radio/TV program:**	
	Often	0
	Sometimes	1
	Not often	2
	Very seldom	3

Zigmond, AS; Snaith, RP (1983).

Use the right measurement tools

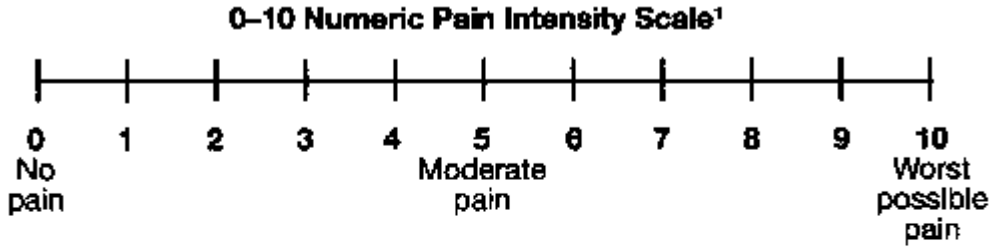
1. Signalling
2. Monitoring
3. Screening

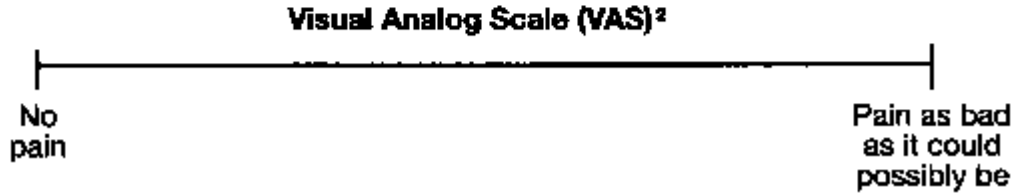
4. Diagnostic
- Using objective criteria to diagnose (e.g. depression using DSM V)

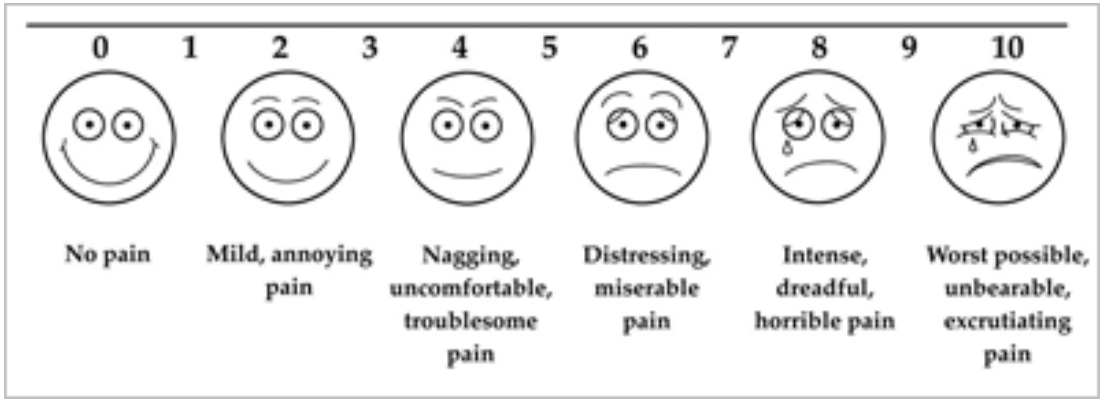
Tools for pain

Unidimensional

- NRS
  - Cut off 4-5
  - ≥ 2 points reduction
- VAS







Multidimensional

- Brief Pain Inventory
  - NRS
    - Last three days
  - 7 QoL questions
  - Pain medication intake

(Cleeland and Ryan, 1994)

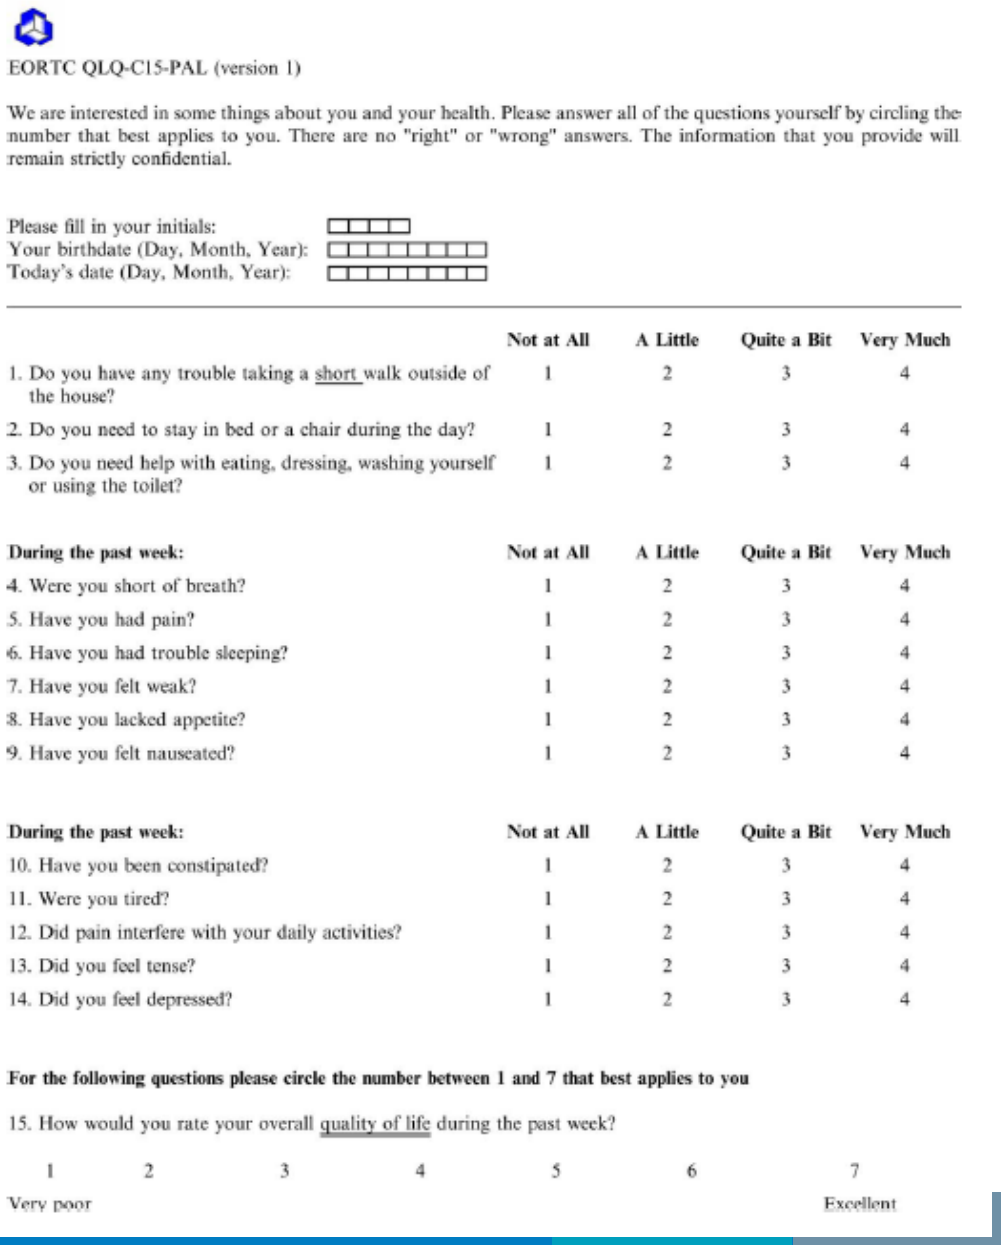
Tools to assess changes in QoL

EORTC QLQ

- C-30
- C-15 PAL

And additional specific lists

- BM 22 -> bone mets
- BN 20 -> brain mets



EORTC QLQ-C15-PAL (version 1)

We are interested in some things about you and your health. Please answer all of the questions yourself by circling the number that best applies to you. There are no "right" or "wrong" answers. The information that you provide will remain strictly confidential.

Patients sometimes report that they have the following symptoms or problems. Please indicate the extent to which you have experienced these symptoms or problems during the **past week**. Please answer by circling the number that best applies to you.

During the past week have you had pain in any of the following parts of your body?	**Not at All**	**A Little**	**Quite a Bit**	**Very Much**
1. in your back?	1	2	3	4
2. in your leg(s) or hip(s)?	1	2	3	4
3. in your arm(s) or shoulder(s)?	1	2	3	4
4. in your chest or rib(s)?	1	2	3	4
5. in your buttock(s)?	1	2	3	4
During the past week:				
6. Have you had constant pain?	1	2	3	4
7. Have you had intermittent pain?	1	2	3	4
8. Have you had pain not relieved by pain medications?	1	2	3	4
9. Have you had pain while lying down?	1	2	3	4
10. Have you had pain while sitting?	1	2	3	4
11. Have you had pain when trying to stand up?	1	2	3	4
12. Have you had pain while walking?	1	2	3	4
13. Have you had pain with activities such as bending or climbing stairs?	1	2	3	4
14. Have you had pain with strenuous activity (e.g. exercise, lifting)?	1	2	3	4
15. Has pain interfered with your sleeping at night?	1	2	3	4
16. Have you had to modify your daily activities because of your illness?	1	2	3	4
17. Have you felt isolated from those close to you (e.g. family, friends)?	1	2	3	4
18. Have you worried about loss of mobility because of your illness?	1	2	3	4
19. Have you worried about becoming dependent on others because of your illness?	1	2	3	4
20. Have you worried about your health in the future?	1	2	3	4
21. Have you felt hopeful your pain will get better?	1	2	3	4
22. Have you felt positive about your health?	1	2	3	4

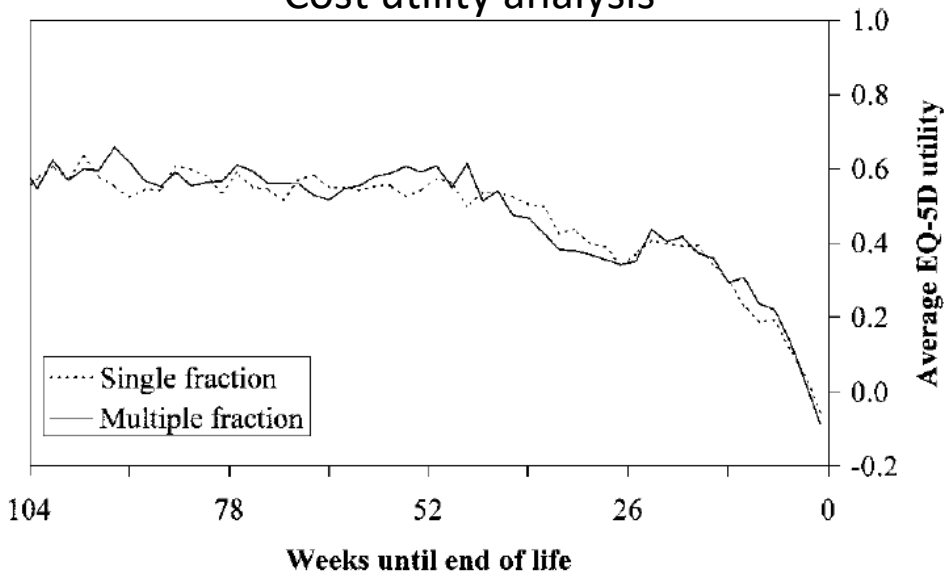
EuroQol group questionnaire

EQ-5D

- Standardized measure of health status
- Applicable to wide range of diseases
- Economic evaluations

E.g. Dutch Bone Metastasis Study

- Cost utility analysis



By placing a tick in one box in each group, please indicate which statements best describe your health today.

Mobility
- I have no problems in walking about ☑
- I have some problems in walking about ☐
- I am confined to bed ☐

Self-Care
- I have no problems with self-care ☑
- I have some problems washing or dressing myself ☐
- I am unable to wash or dress myself ☐

Usual Activities *(e.g. work, study, housework, family or leisure activities)* ☐
- I have no problems with performing my usual activities
- I have some problems with performing my usual activities ☑
- I am unable to perform my usual activities ☐

Pain/Discomfort
- I have no pain or discomfort ☐
- I have moderate pain or discomfort ☐
- I have extreme pain or discomfort ☑

Anxiety/Depression
- I am not anxious or depressed ☐
- I am moderately anxious or depressed ☑
- I am extremely anxious or depressed ☐

Pain and other symptoms

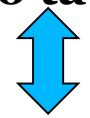
Experts consider how to tackle overtreatment in US Healthcare



Palliative treatment➔ palliative care➔ terminal care

"It's clear that not just one thing needs to be changed to fix the problem.

We have to have a culture change in medicine that will include

-changing payment schemes,

-how medical journals report studies,

-how patients receive their information,

-how professional guidelines are devised,

-and how we perceive good care.

BMJ 2012;344:e3144

Intervention Review

Chemotherapy and supportive care versus supportive care alone for advanced non-small cell lung canc

Non-Small Cell Lung Cancer Collaborative Group

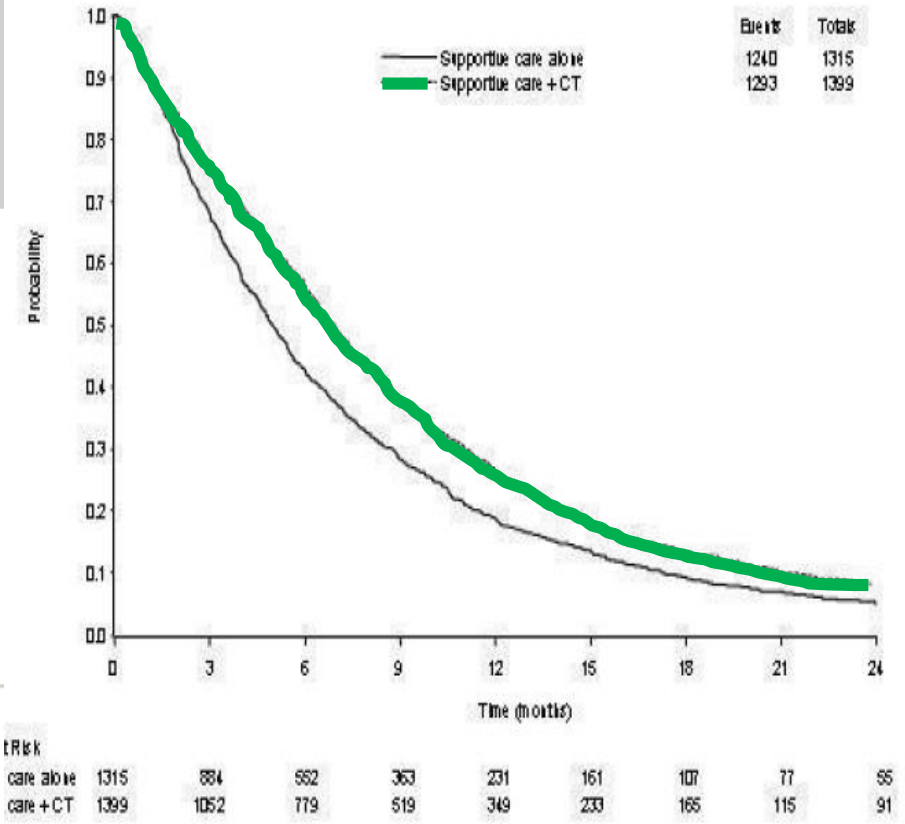
Editorial Group: Cochrane Lung Cancer Group

Published Online: 12 MAY 2010

Browse by Topic

-This meta-analysis of chemo in the supportive care setting demonstrates that chemo improves OS in all patients with advanced NSCLC.

-Patients who are fit enough and wish to receive it should be offered chemotherapy.



More & better treatment…?

Palliative Care patients are patients with:

life-limiting chronic diseases *especially in the far-advanced stages*

such as
- -cancer,
- -heart, liver, renal, repiratory failure,
- - neurodegenerative disorders
- -…frailty and aged persons

Terminal care is the final care for a good death

after long term **palliative care** for a good life

Palliative care : when does that start?

-Advance care planning (~ communication skills)

-Integrate palliative care earlier in the disease trajectory

-2006: The gold standard framework,

-Palliative prognostic index

Too many times:
-Patients are waiting for the doctor to start a palliative initiative…
&
-Physicians are waiting for questions of the patient…

The **7 Key messages – or core tasks** (or quality standards),

7 C's, according to GSF:

C1 –Communication: ask for symptom control/wishes/needs in every contact!!!

C2 –Coordination: who can be contacted for questions/problems?

C3 -Control of symptoms: evaluate treatment effect

C4 -Continuity (incl. 'out of hours' (≠ *voice mail*))

C5 -Continued learning: stay at the "state of the art"

C6 -Carer support: for your team and for yourself

C7 -Care in the dying phase: for patient (+family + carers+ bereavement)

ESTRO School

Total pain…?

Causes for suffering *(that need palliative care)* include:

-Disease/therapy-mediated **physical** symptoms

PAIN, DYSPNEA & FATIGUE

-**Psychological** symptoms ➔**feeling of uselessness**

(depression, anxiety,.....)

-More difficult to quantify and to treat are:

- the **existential or spiritual** dimensions of suffering

(*loss of a sense of purpose in living).*

- progressive loss of function
- dramatic changes in **social** status and roles within family, in occupational domains ...

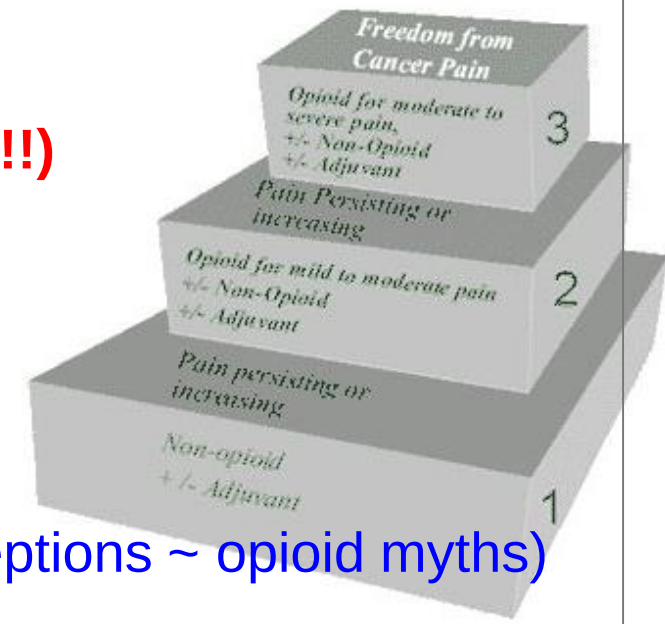
➔ **overwhelming sense of despair.**

Pain in oncology

	Prevalence of pain
Curative therapy	**± 30%**
Palliative therapy	**± 50-60%**
Palliative care	**± 80-90%**

More & better treatment…?

A relatively easy-to-follow generic approach to cancer pain management, the **WHO 3-step ladder**,
has been validated as being useful
for most patients with cancer-related pain (**1985!!!)**



But….a subset of patients still remains:

-withholded from this guideline
  -lack of knowledge
  -undertreatment (due to opioid misconceptions ~ opioid myths)
  -lack of availability of opioids
-not leading to the possible effective pain relief

Modification of the WHO stepladder approach to pain control.

Menten 2003, PhD Thesis

More & better treatment…?

A Scottisch survey suggests that

of the 8%–20% of cancer patients

who have indications for treatment by anesthesiology pain specialists,

…few patients are ever referred for specialty pain consultation

Linklater GT, Leng ME, Tiernan EJ, et al.
Pain management services in palliative care: a national survey.
Palliative Medicine 2002; 16: 435-9

"total analgesia" for refractory pain

(different from "anesthesia")

is defined as a state of minimal / absent pain perception in the face of a potent neuropathic or nociceptive pain stimulus without intentional alteration in awareness.

Therapeutic goal = pain relief
-not sedation, amnesia or unconsciousness.

➔ketamine given in subanesthetic doses

Fine PG.
Low-dose ketamine in the management of opioid non responsive terminal cancer pain.
J Pain and Symptom Manage 1999; 17: 296 –300.

More & better treatment…?

In practice

➔ketamine , administered in **subanesthetic** doses

An IV or SC continuous infusion is initiated at a rate determined by the total dose and duration of effect of bolus doses.

For example,

if sufficient pain relief for 15 min with 5 mg of ketamine,
➔ infusion of 20 mg/h would be appropriate.

In patients receiving large-dose opioids,

it is often possible (& desirable) to immediately reduce the opioid by 25%–50%

Typical effects of **anesthetic** doses of ketamine do not pose problems when given in subanesthetic doses

(e.g., salivation, sedation, loss of airway reflexes, and hallucinations)

Patients with advanced COPD have similar complaints as advanced cancer patients

Chronic Obstructive Pulmonary Disease Diagnosis and Management in Older Adults

Nalaka S. Gooneratne, MD, MSc; Nirav P. Patel, MD, MPH; Amy Corcoran, MD

Disclosures

J Am Geriatr Soc. 2010;58(6):1153–1162

Table 4. Management of Symptoms of End-Stage Chronic Obstructive Pulmonary Disease in Older Adults

Symptom	Management
Dyspnea	Opioids: morphine 2.5–5 mg orally or SL every 3–4 hours as needed or 1 mg IV/SC every 10–15 minutes as needed would be recommended starting dose in an opioid-naïve older adult. Nebulized opioids: nebulized morphine 2 mg or fentanyl 25 μg in 5 mL normal saline every hour as needed can be used. Conflicting data exist regarding efficacy of nebulized opioids, and there is the risk of bronchospasm with nebulized morphine. Humidified oxygen Nebulizers (albuterol or ipratropium) Steroids Fan placed near patient to increase air flow Breathing techniques: breathing control strategies, pacing, relaxation techniques
Anxiety	Benzodiazepines: lorazepam 0.5–1 mg every 4 hours orally, SL, or IV as needed would be recommended starting dose in a benzodiazepine naive older adult
Secretions	Anticholinergics: glycopyrrolate 0.1 mg IV or IM every 4 hours as needed or scopolamine 1.5 mg patch every 3 days as needed would be recommended starting dose. Glycopyrrolate IV/IM will have a more-rapid onset and may be more appropriate for patients in their final 24 hours of life. Position changes: position patient on their side or semiprone if tolerated Suctioning for oral secretions may be helpful, but this may also be uncomfortable if attempt deep suctioning

IV=intravenously; SL= sublingually; SC=subcutaneously; IM=intramuscularly.

Letter to the Editor

Opioids and COPD

American College of Chest Physicians consensus on dyspnoea stated:

'with appropriate titration opioids have not caused significant changes in survival after withdrawal of life support

Intern Med J. 2015 Sep;45(9):898-904. doi: 10.1111/imj.12857.

Management of refractory breathlessness with morphine in patients with chronic obstructive pulmonary disease.

Smallwood N[1], Le B[2], Currow D[3], Irving L[1], Philip J[4].

[1]Department of Respiratory and Sleep Medicine, [2]Palliative Care, The Royal Melbourne Hospital, Melbourne, Victoria, Australia.

[3]Palliative and Supportive Services, Division of Medicine, Flinders University, Adelaide, South Australia, Australia.

[4]Centre for Palliative Care, St Vincent's Hospital, Melbourne, Victoria, Australia.

-**Breathlessness** is common in advanced COPD and **remains undertreated**.

Cancer

-As all reversible causes of breatlessness are being optimally managed, **low dose morphine can reduce safely & effectively breathlessness** in patients with severe COPD and refractory dyspnoea.

-Despite numerous guidelines recommending opioids in this clinical setting, **many barriers limit their uptake by clinicians**.

-**Integration of palliative care earlier in the disease course** can help to improve symptom control for people with severe COPD and refractory breathlessness.

chronicOPD ~ chronic pain

3-fold prescription:

1-Maintenance (long acting)
(never on demand,
but around the clock)

2-Breakthrough medication
(short acting)
= 1/12 - 1/6 of the daily dose

3-Laxatifs allways,
anti-emetics if needed

Daisy JA Janssen et al. Chronic Respiratory Disease 2015;12:85-92

Dyspnoea “ladder” in COPD

-Conventional management with **bronchodilatators/steroids.**

-Manage co-morbidities

-**Nonpharmacological** treatments

support /exercise / chest wall vibration / fan,..

~physiotherapy

Supplemental **oxygen** if hypoxic/

consider ambulatory oxygen if desaturation with exercise

opioid therapy for dyspoea

+/- anxiolytics

Some authors suggest

Morfine slow release 5mg po x2/d

Uptitrate to 1-2,5 mg po/4h by the end of the first week

Doses are uptitrated by 25% weekly until adequate symptom relief is achieved

Other authors use sustained release morphine

Starting dose 10 mg/d and titrated weekly to 20 or 30 mg/d without respiratory depression or significant side effects

➔Compliance is highest with once daily dosing or patch/3 days

Safety of benzodiazepines and opioids in very severe respiratory disease: national prospective study

BMJ 2014;348:g445
M Ekström, Department of Medicine, Blekinge Hospital, SE-37185, Karlskrona, Sweden pmekstrom@gmail.com

- **Objective** To evaluate the safety of benzodiazepines and opioids in patients with very severe chronic obstructive pulmonary disease.
- **Design** Population based longitudinal consecutive cohort study.
- **Setting** Centres prescribing long term oxygen therapy in Sweden.
- **Patients** 2249 patients starting long term oxygen therapy for COPD in Sweden between 2005 and 2009 in the national Swedevox Register.
- **Main outcome measures** Effects of benzodiazepines and opioids on rates of admission to hospital and mortality, adjusted for age, sex, arterial blood gases, body mass index (BMI), performance status, previous admissions, comorbidities, and concurrent drugs.

Safety of benzodiazepines and opioids in very severe respiratory disease: national prospective study

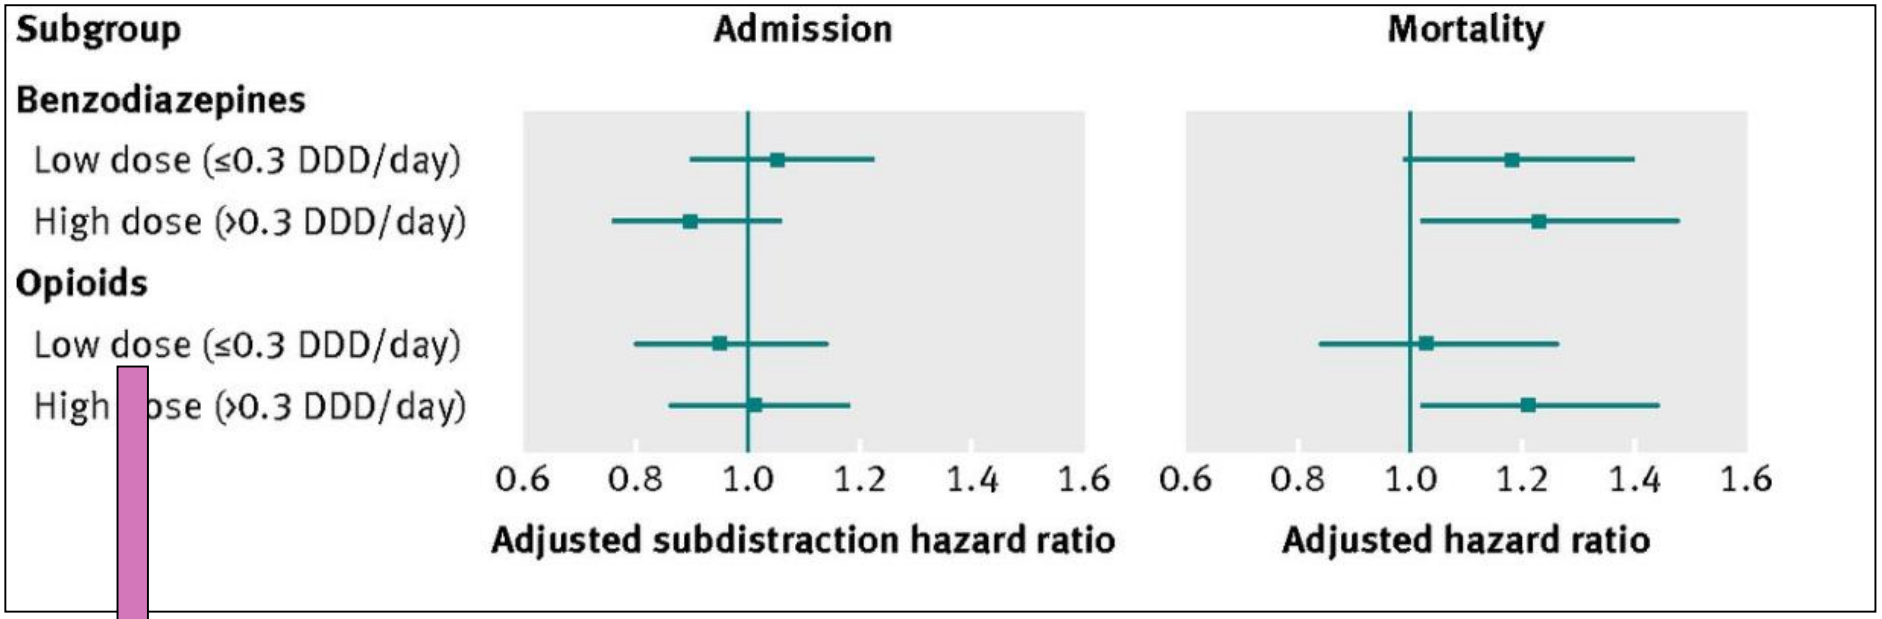
M Ekström, Department of Medicine, Blekinge Hospital, SE-37185, Karlskrona, Sweden
pmekstrom@gmail.com



up to 30 mg oral morphine equivalent dose /d

Safety of benzodiazepines and opioids in very severe respiratory disease: national prospective study

BMJ 2014;348:g445
M Ekström, Department of Medicine, Blekinge Hospital, SE-37185, Karlskrona, Sweden pmekstrom@gmail.com

The approach for chronic refractory breathlessness is not different from that of opioid treatment for refractory pain.

Sustained release morphine should be a first line treatment and should be initiated at a low dose and titrated upward over days and weeks, balancing beneficial and adverse effects.

Titration up to 30 mg morphine/d might safely improve breathlessness in > 60% of patients, with a mean decrease of 35% in the intensity of breathlessness from the person's own baseline.

Opioids in oncology

friend:

-used with scientific knowledge

-offered with communicative skills

-titrated according the scientific evidence

*** COPD & IPF up to 30 mg omeq/dag**

*** in cancer: as much as needed to relief the pain ➔NRS <4/10**

enemie:

-if knowledge & prescription experience is lacking

(academic centres have the duty to teach!)

- if communication fails to correct the misconceptions in patients, families, caregivers, volunteers,..

Fatigue

1-Haematological and biochemical urgencies:

1,1 Anaemia

-Hgb <5 + terminal R/ “expectare et sedare ? “

-Hgb <8 + terminal + tachycardia/polypnoe

➔subjective complaints last R/ transfusion

1,2 Hypoglycemia = less apetite

R/less insuline substitution

1,3 Hypercalcemia : to treat or not to treat??

Fatigue

2-Hypotension

R/to withdraw antihypertensiva?
« I had to take that for the rest of my life »

3-Lack of condition ± to muscle wasting

-corticoisteroids needed?
-physical exercise possible?
-good sleep
-uncertainty about the future ➔ communication
-anxiety for death or dying process

Arch Intern Med. 2009 Mar 9;169(5):480-8

Health care costs in the last week of life: associations with end-of-life conversations

Zhang B1, Wright AA, Huskamp HA, Nilsson ME, Maciejewski ML, Earle CC, Block SD, Maciejewski PK, Prigerson HG

603 participants

188 (31.2%) reported EOL discussions at baseline.

the remaining 415 patients did not differ in sociodemographic characteristics, recruitment sites, illness acknowledgment, or treatment preferences.

-the mean (SE) aggregate costs of care (in 2008 US dollars) were:

-$1876 ($177) for patients who reported EOL discussions

Difference = $ 1041

($285) for patients who did not,

Patients with higher costs had worse quality of death in their final week (Pearson production moment correlation partial r = -0.17, *P =.006*).

Conclusion:

1-collaborate in the multidisciplinary palliative teams that exist

-to provide Your knowledge in development of palliative guidelines-expertise bedside when necessary

2-initiate palliative care initiatives in your hospital, in your wards?

about DNR-codes & advanced care planning:

➔what (not or no longer) to do?

3-correct misconceptions about opioids ~ analyse your data

4-help to educate caregivers (physicians, nurses, public,...)

about effective pain & symptom control

↳ Also psycho-social and spiritual care!!

Radiation drug interaction
(in palliative radiotherapy)

Morten Høyer
Professor clinical oncology
Aarhus University Hospital
E-mail: hoyer@aarhus.rm.dk

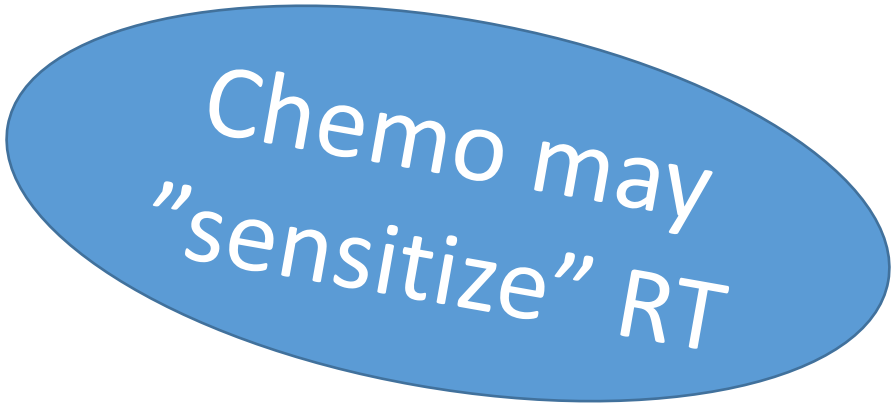
In palliative radiotherapy……..

- Poor level of knowledge
- Imprecise assessment of prevalence of complications
  - Insufficient diagnosis and reporting
- Extrapolation from normo-fractionation
- ……..and from curative therapy
- Sparse knowledge on the importance of timing of drug-radiotherapy

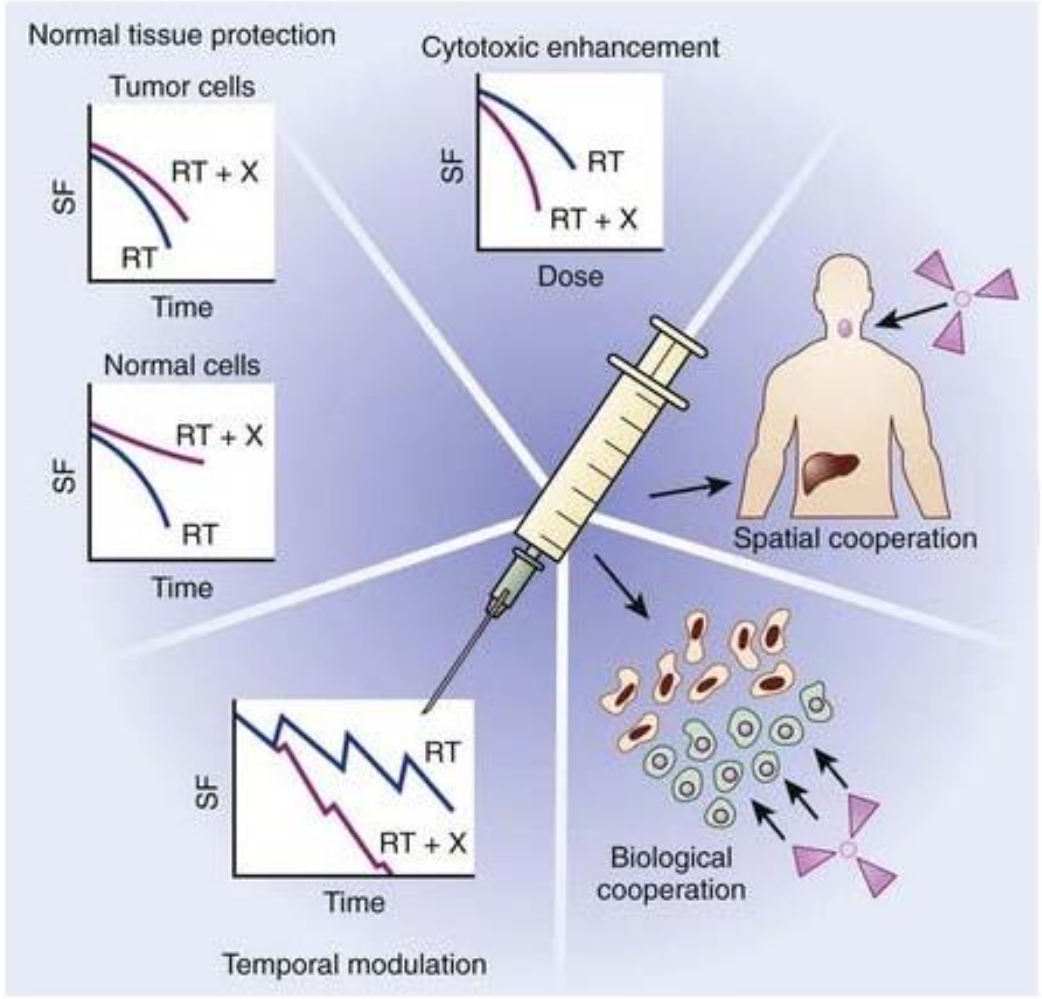
- *Toxicity independence* refers to the concept of combining a drug that caused systemic toxicity with radiation, in which toxicity is expressed locally

Concomitant chemoradiation

- Improves responses/outcomes in
  - Glioma
  - Head and neck cancer
  - Esophageal cancer
  - Lung cancer
  - Pancreas cancer
  - Cervix cancer
  - Rectal cancer
  - Anal cancer
- The price is increased acute toxicity



Interplay between spatial cooperation, cytotoxic enhancement, biologic cooperation, temporal modulation, and normal tissue protection



Bentzen et al Nat Clin Pract Oncol 4(3):172–180, 2007

*Skin reaction includes all Coding Symbols for a Thesaurus of Adverse Reaction Terms (COSTART) terms in the Skin and Appendages body system. †Mucositis/stomatitis includes COSTART terms aphthous stomatitis; gingivitis; glossitis; mouth ulceration; mucous membrane disorder; stomatitis; and ulcerative stomatitis. ‡Xerostomia is COSTART term dry mouth. §Acneiform rash includes COSTART terms acne; rash; maculopapular rash; exfoliative dermatitis. ¶Infusion reaction includes COSTART terms allergic reaction; anaphylactoid reaction; and/or fever; chills; or dyspnoea on the first day of treatment. ‖Statistically significant (p<0·05) difference between the treatment groups; Fisher's exact test.

***Table 2:* Most common adverse events**

Bonner et al Lancet Oncol 2010; 11: 21

A case of enhanced skin toxicity due to concomittant cetuximab-radiotherapy

- 56 year old male, squamous-cell carcinoma of the right base of tongue cT2cN2M0
- Suffered from mucosal toxicity during concomittant 5-FU+ mitomycinC-radiation. Needed feeding tube
- Changed to cetuximab-radiation
- Vesicular and pustular eruptions confined to the irradiated skin

Most frequently used drugs

- 5-FU
- MMC
- Cisplat
- Carboplati
- Oxaliplatin
- Gemcitabine

Long-term experience

- Capecitabine (oral 5FU)
- an
- Temozolamide
- Cetuximab
- Bevacizumab

New agents……..

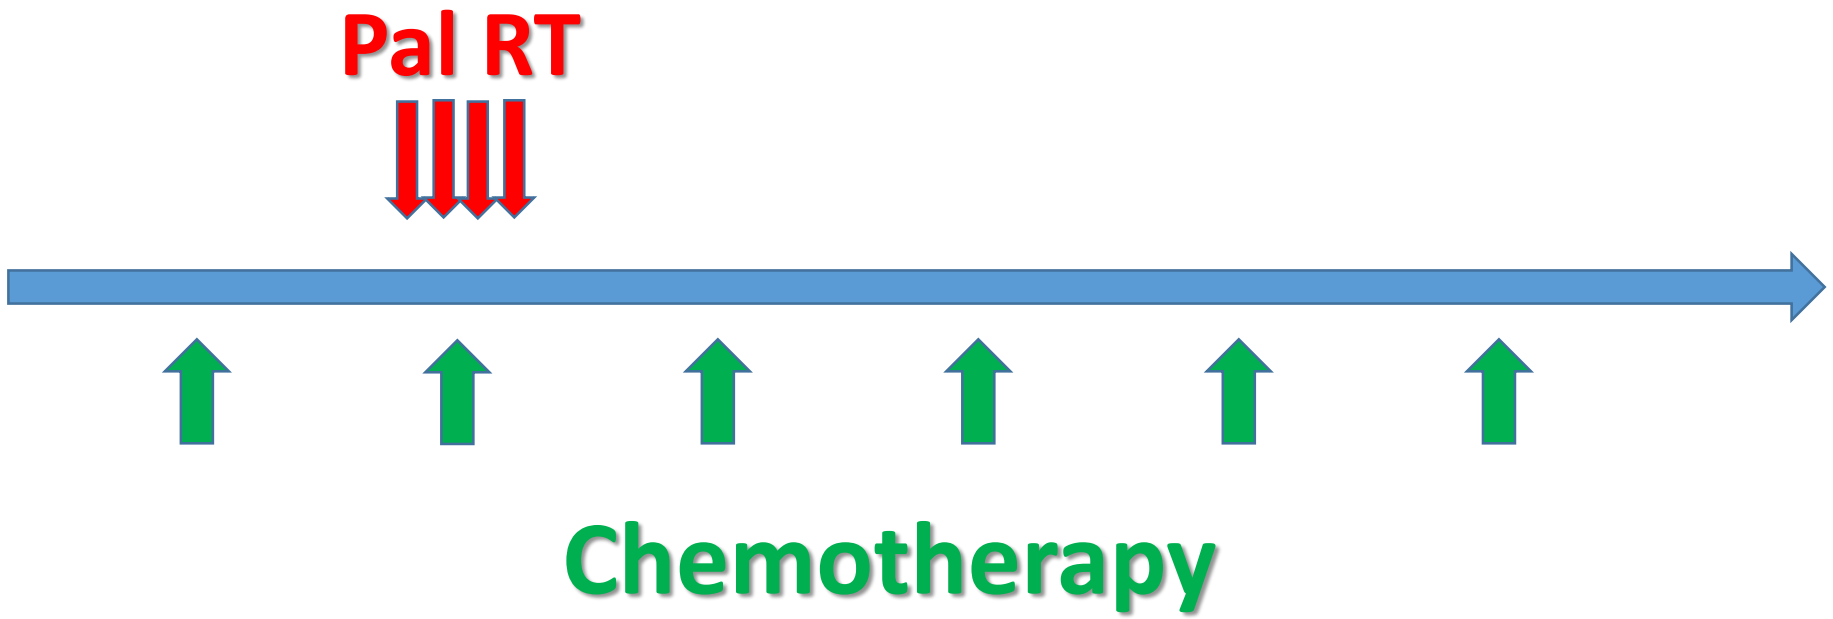
- Trastuzumab (anti-HER-2)
- Panitumumab (a
- Gefitinib (EG
- Erlotinib (EGFR
- PARB inhibitors
- PD-1 and PD-L1 inhibitors

Why not just pause the drug……?

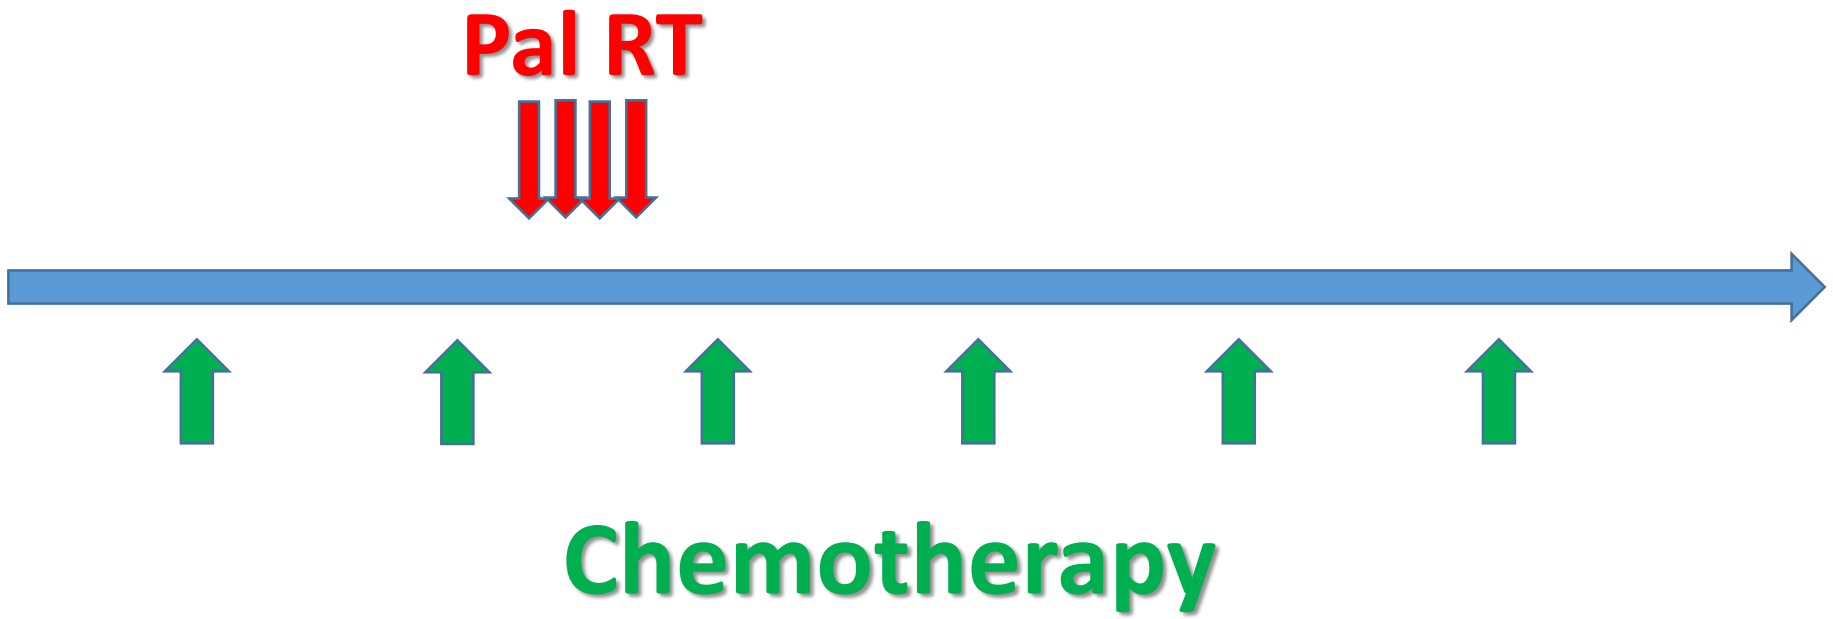
Medical oncologist: ”Because the response rates drops”

”Because tumor flare are frequent”

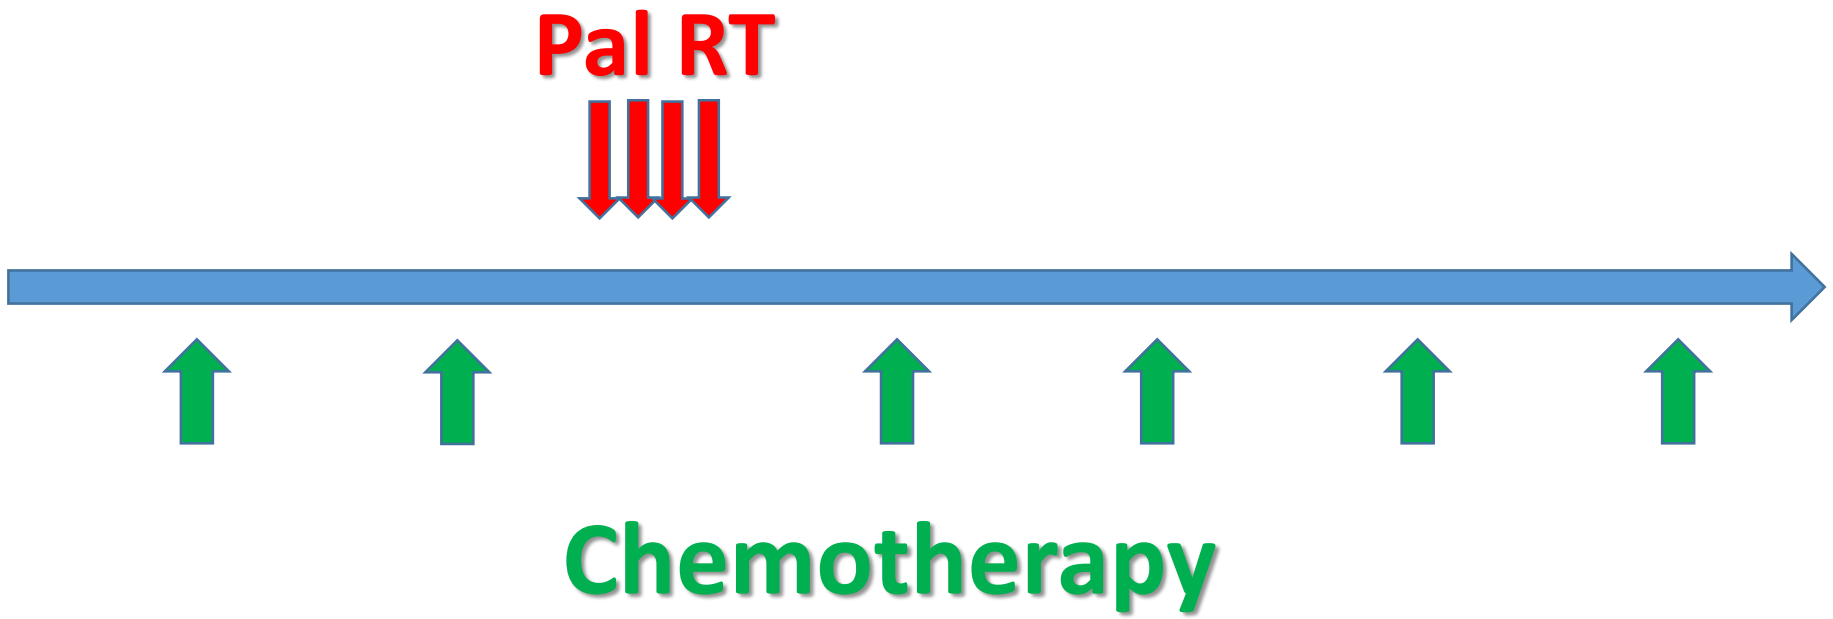
Timing of palliative radiotherapy



Timing of palliative radiotherapy



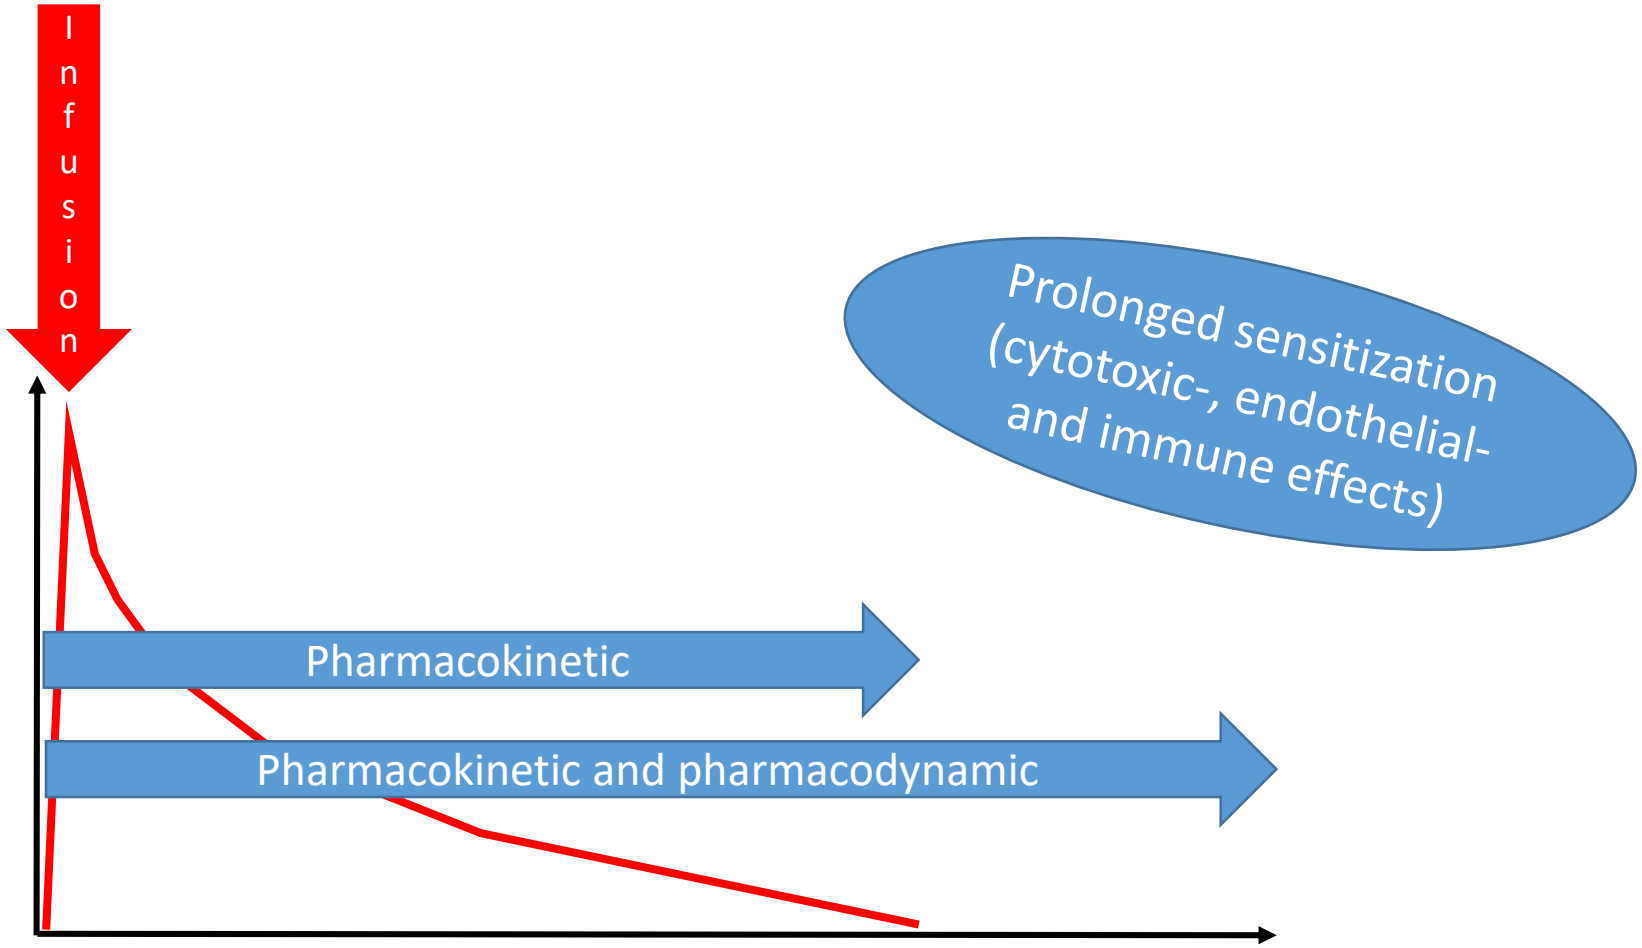
Timing of palliative radiotherapy



Flaire after discontinuation of TKI

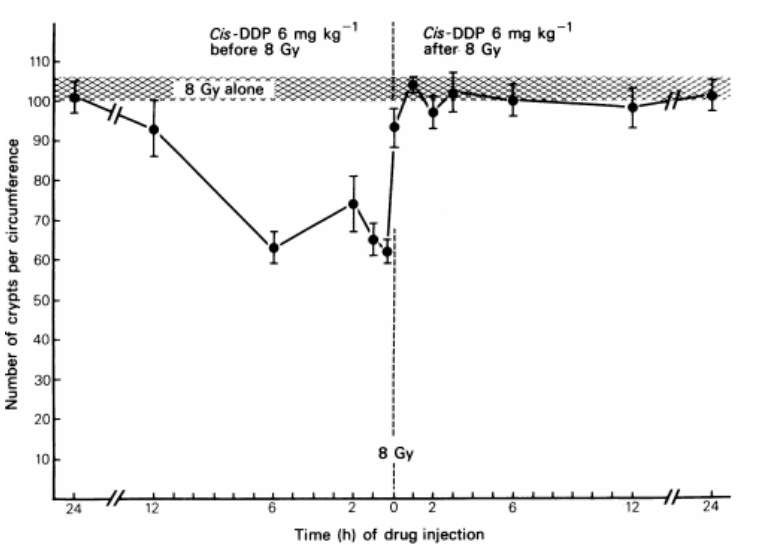
- *Some patients with **EGFR-mutant lung cancer and acquired resistance to erlotinib or gefitinib** (RECIST progression after initial benefit) have accelerated progression of disease after discontinuation of TKI*
- *14/61 patients experienced a disease flair with a median of 8 days (range 3–21) after discontinuation*

Pausing chemotherapy?

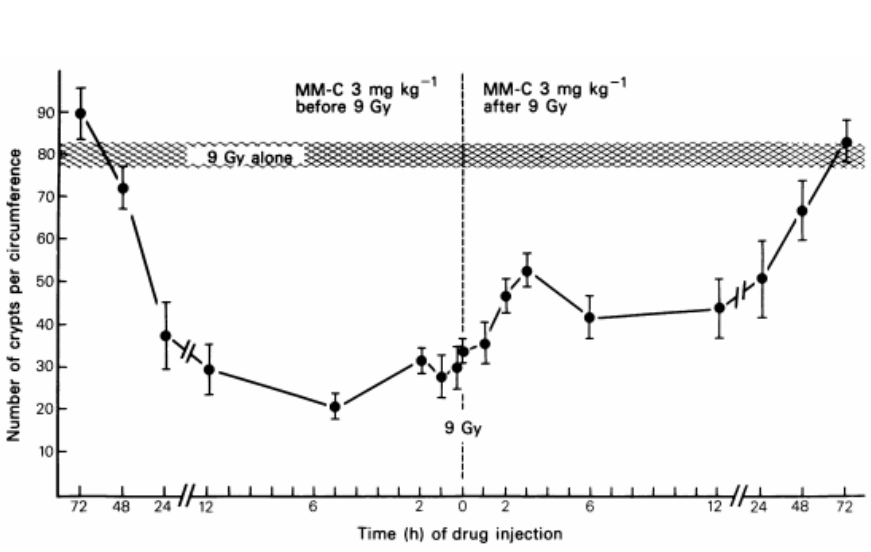


Chemo-radiation interaction (intestinal crypt assay)

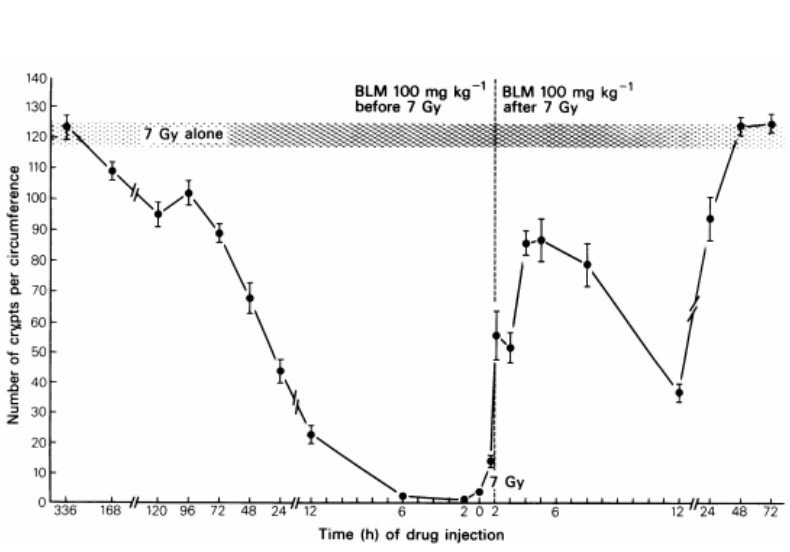
Cisplatin



MitomycinC

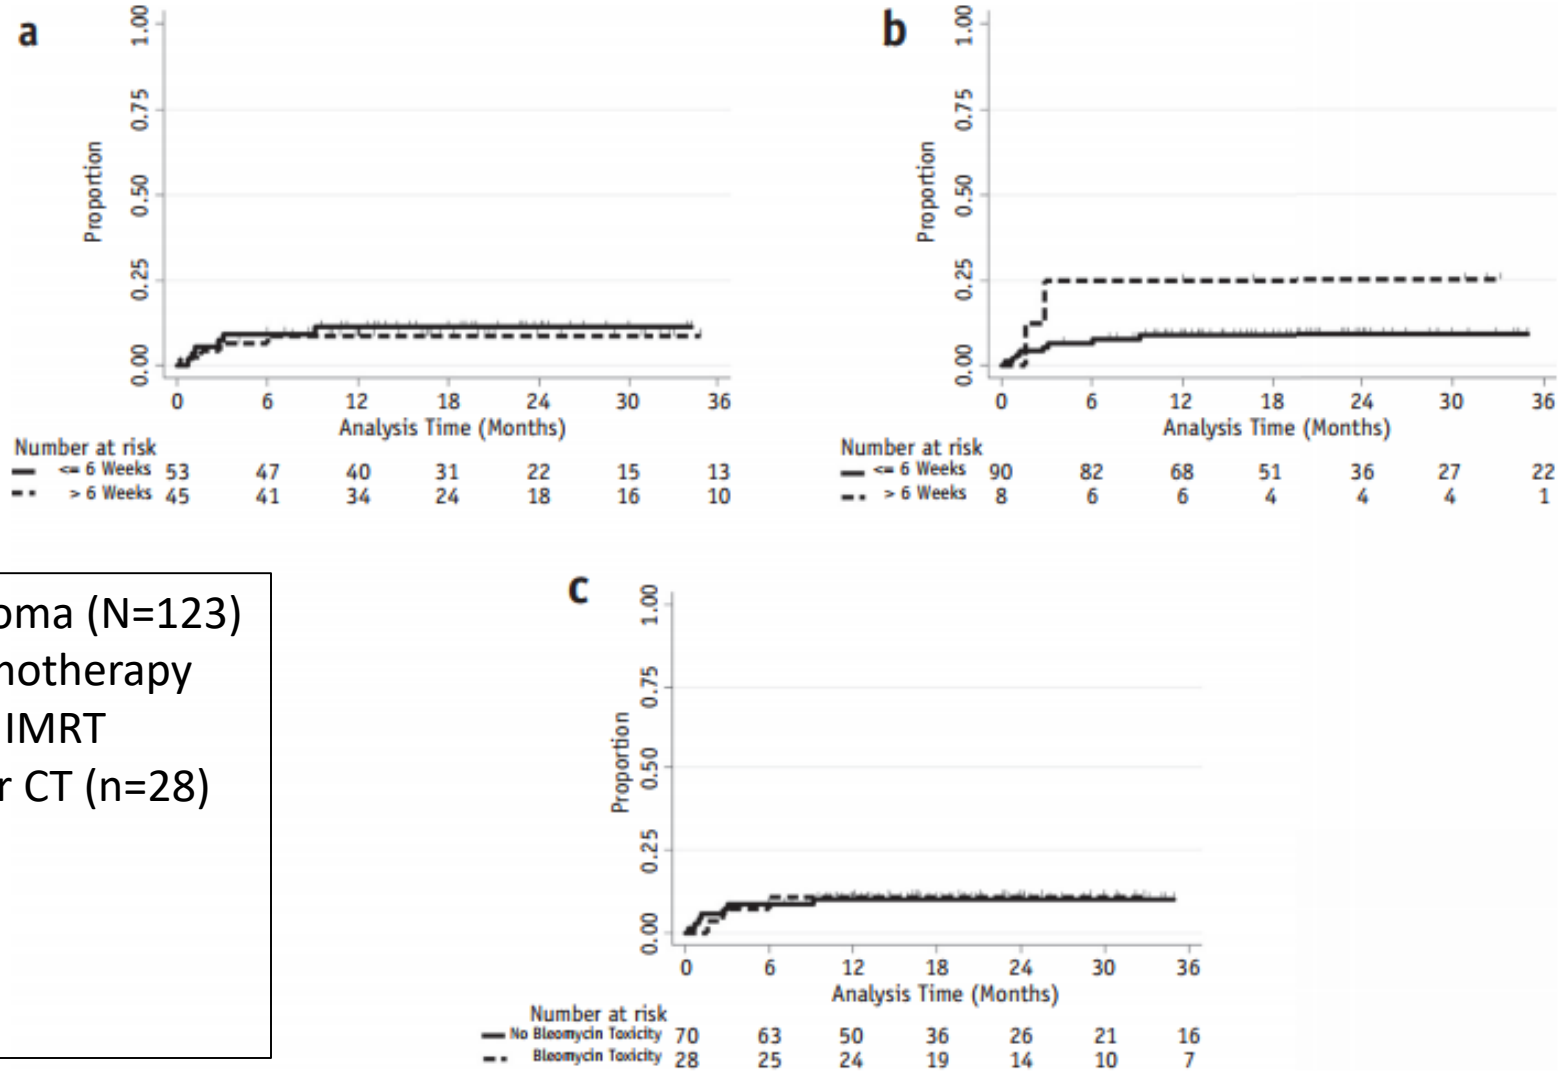


Bleomycin



Von der Maase Br J Cancer (1984), 49, 779

Bleomycin



- Mediastinal Hodgkin lymphoma (N=123)
- Average 6 cycles ABVD-chemotherapy
- RT: 30.6 Gy (20-47 Gy); 80% IMRT
- Bleomycin toxicity, clinical or CT (n=28)
- RT-pneumonitis
  - Clinical symptoms
  - Radiological changes
  - Any grade

Yehia et al. IJROBP 2016; 96(5): 951

Palliative radiotherapy

- Most palliation is with hypofractionation
- The total dose is low
- Nausea, mucositis, diarrhoea, fatigue and pain-flaire are the most frequent side effects
  - *Relatively mild symptoms. May, however, affect quality of life.*
- And ablative RT (i.e. SBRT) is used more in frequently in palliation

Morbidity in SRT and SBRT

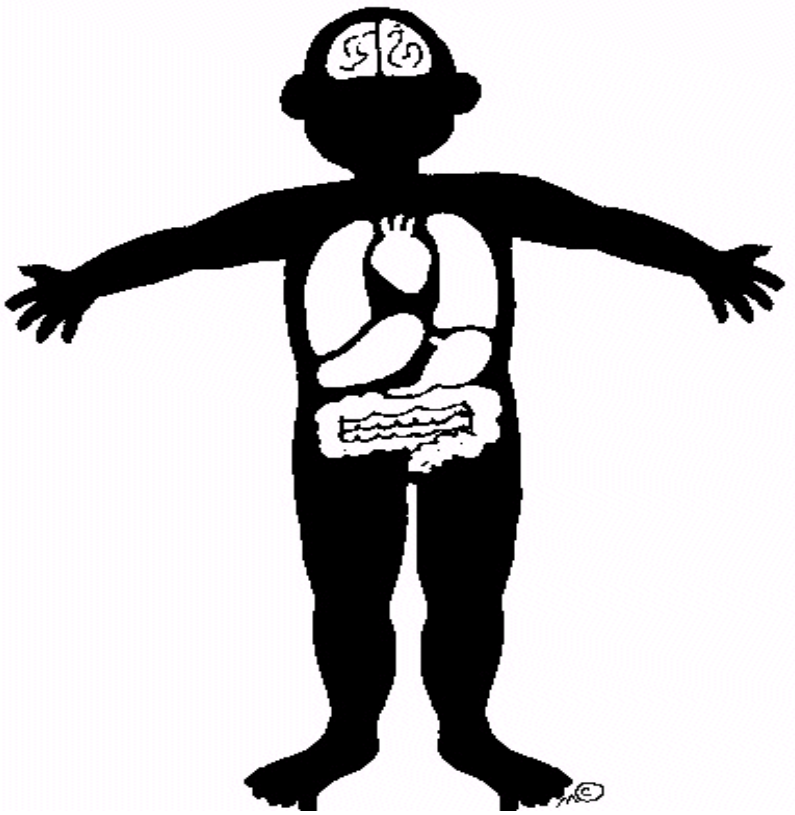
Radiotherapy for bone pain

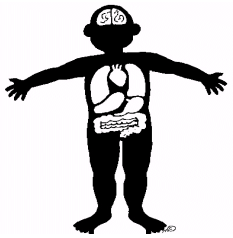


Yvette van der Linden

Centre of Expertise Palliative Care

& Dept. of Radiotherapy

Topics



1. bone metastases
   - pain incl. neuropathic pain
   - retreatment
   - remineralisation
   - other treatment options; radioactive agents, bisphosphonates

2. skin / lymph nodes / soft tissues / organs
   - pain
   - bleeding, ulceration
   - stenoses → edema, dyspnea

oligometastases
use of prognostic models

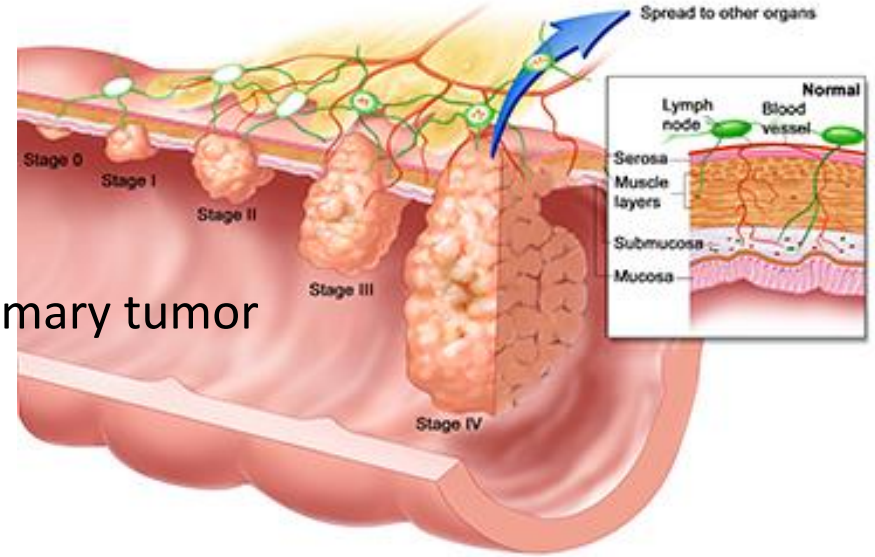
Conclusions radiotherapy as palliative treatment

- patient friendly
  - non invasive
  - quick procedure
  - few side effects
  - effective local treatment → responses about 60-70%
    - pain
    - ulceration, bleeding
    - dyspnea, edema
    - ..

} improvement of QoL

- evidence based outcome → single or short course schedules
- retreatments –always- possible

Pathofysiology of bone metastases



Cascade of events

- progressive growth at the primary site
- tumor neo-vascularization
- detachment of tumor cells from the primary tumor
- invasion in the neighboring tissues
- intravasation into the blood stream
- survival in the circulation

↓

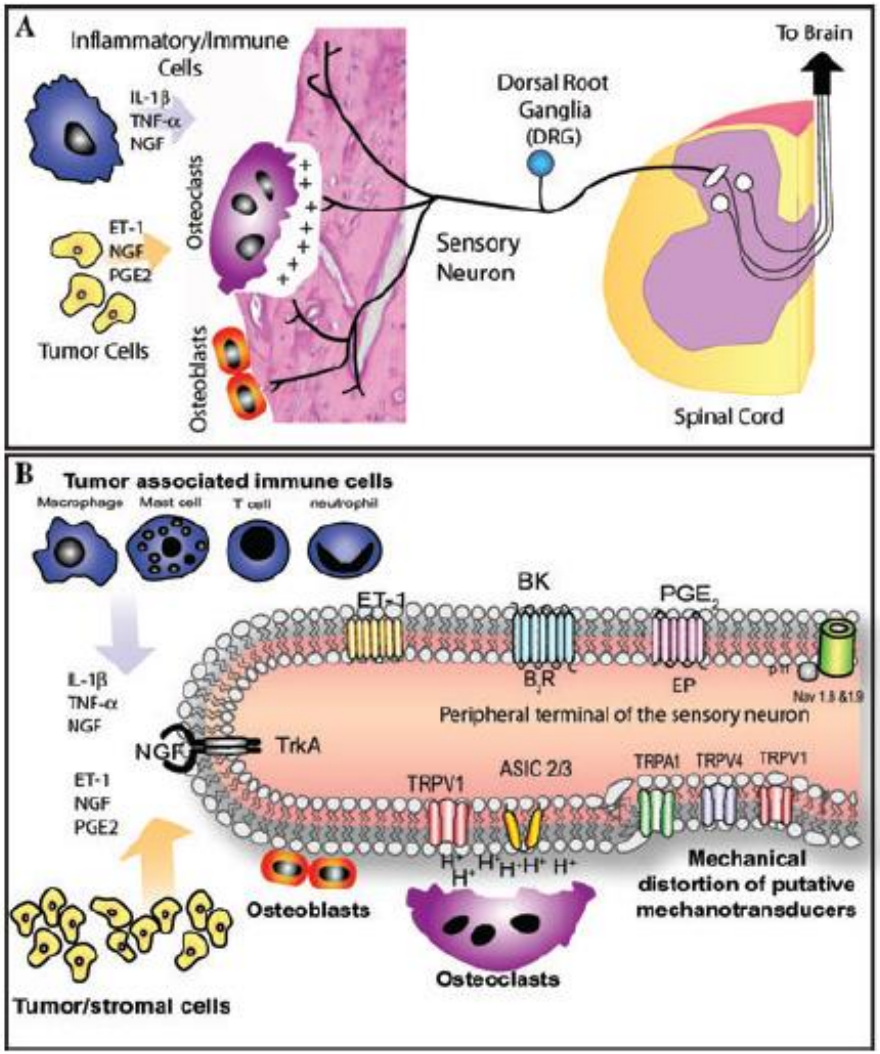
- homing and arrest at the level of the bone marrow
- extravasation
- evasion of the host defence
- growth and stimulation of the osteoclast mediated bone resorption

(Mareel et al., 1991; Choong, 2003; Vakaet et al, 2009)

Pathofysiology of bone metastases

Local mechanisms of bone pain

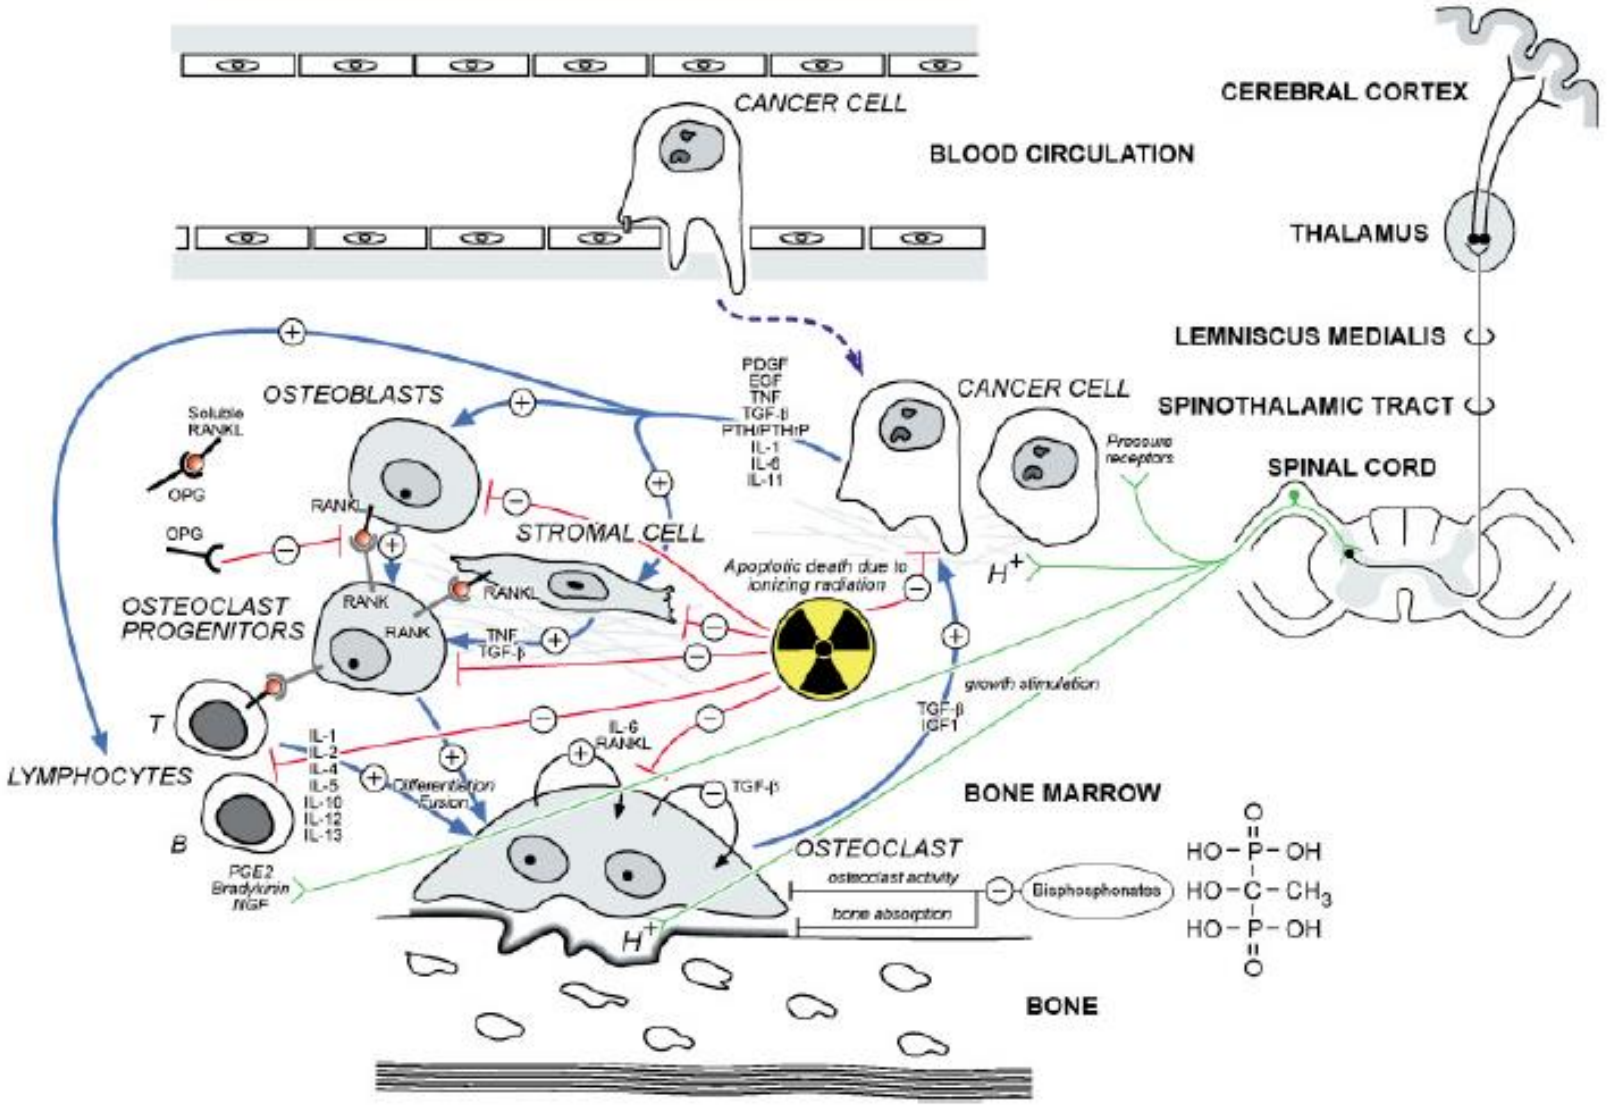
- Release of chemical mediators
- Increased pressure within the bone
- Micro fractures
- Stretching of the periosteum
- Nerve root infiltration
- Compression of the nerves due to collapse of the bone



(Vakaet et al, 2009)

(Jimenez et al, 2010)

Radiation effects several mechanisms



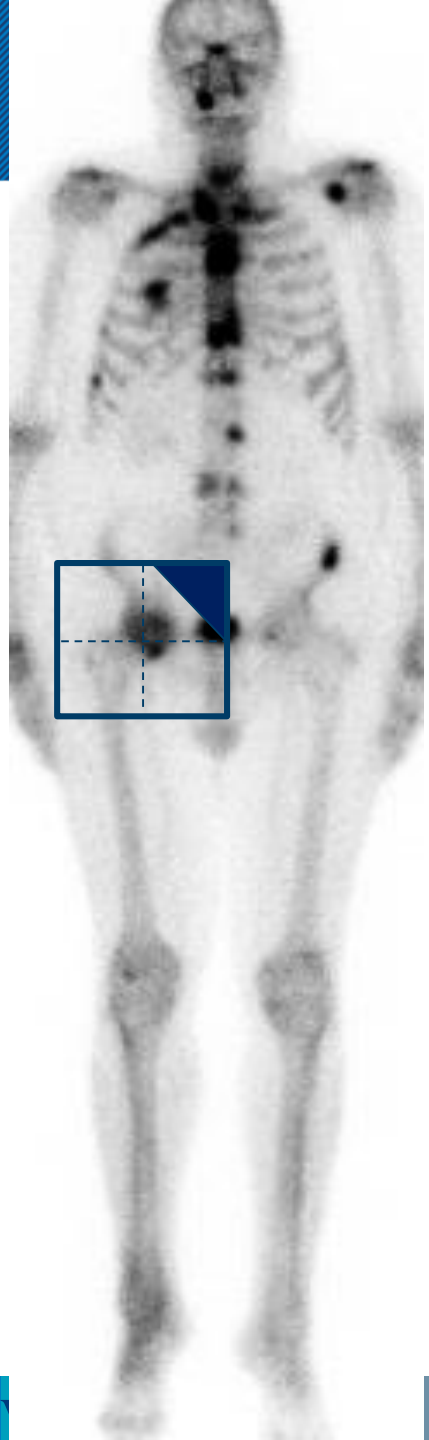
Vakaet et al, Int.J.Dev.Biol.2004

Effectiveness bone pain → two phases

1. Inflammatory cells ↓↓↓

- Chemical pain mediators ↓↓↓
  - prostaglandines
- Edema ↓↓
- ..
- ..

2. Tumor cell kill ↓



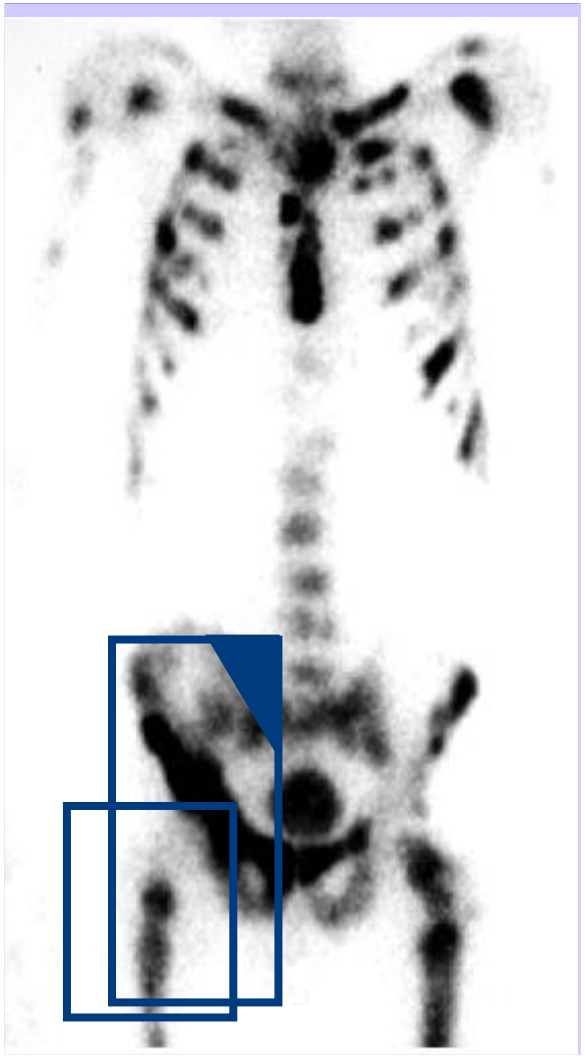
Choices in palliative radiotherapy

Target?

- Lesion only?
- Whole organ / bone?

Dose schedule ?

- 12 x 2.5 Gy
- 10 x 3 Gy
- 5 x 4 Gy
- 1 x 8 Gy

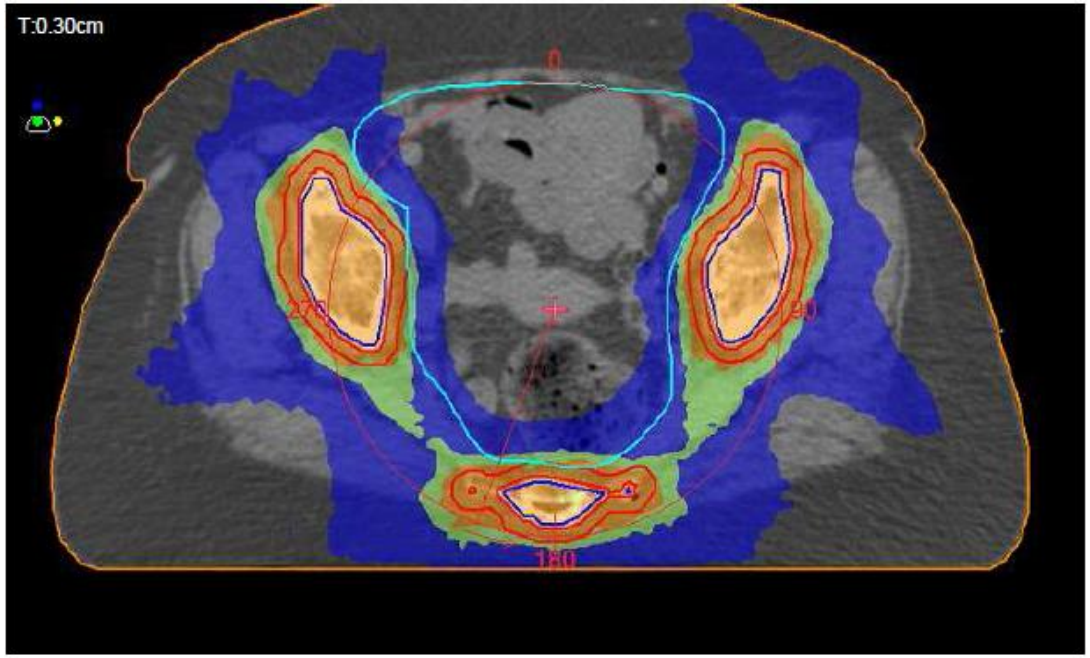


More choices…..

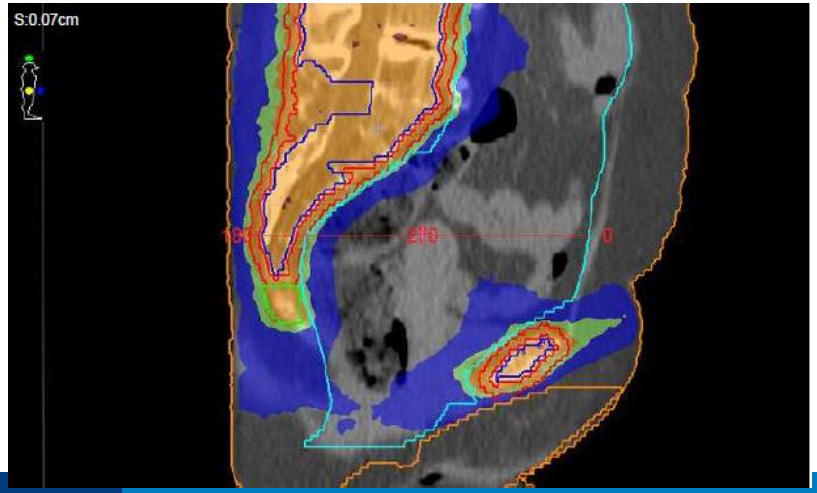
Technique

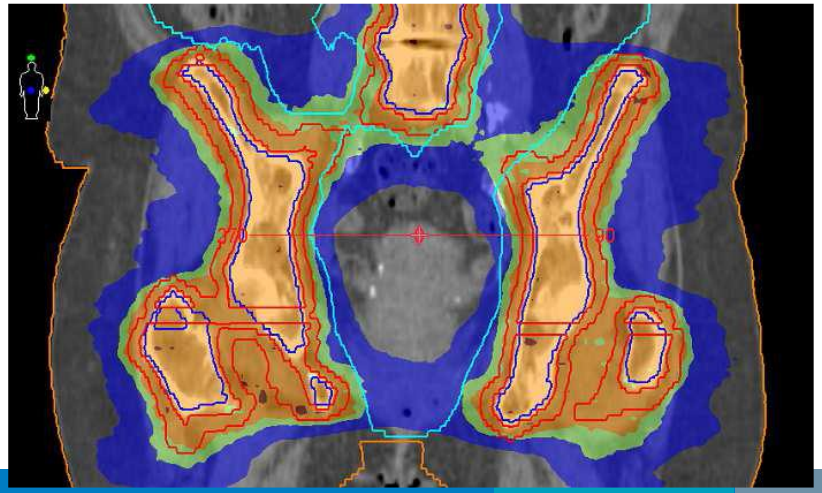
- Simple or advanced?
- Photons of electrons?
- CT or conventional sim?
- Immobilization devices?

1x 8 Gy in patient with multiple myeloma

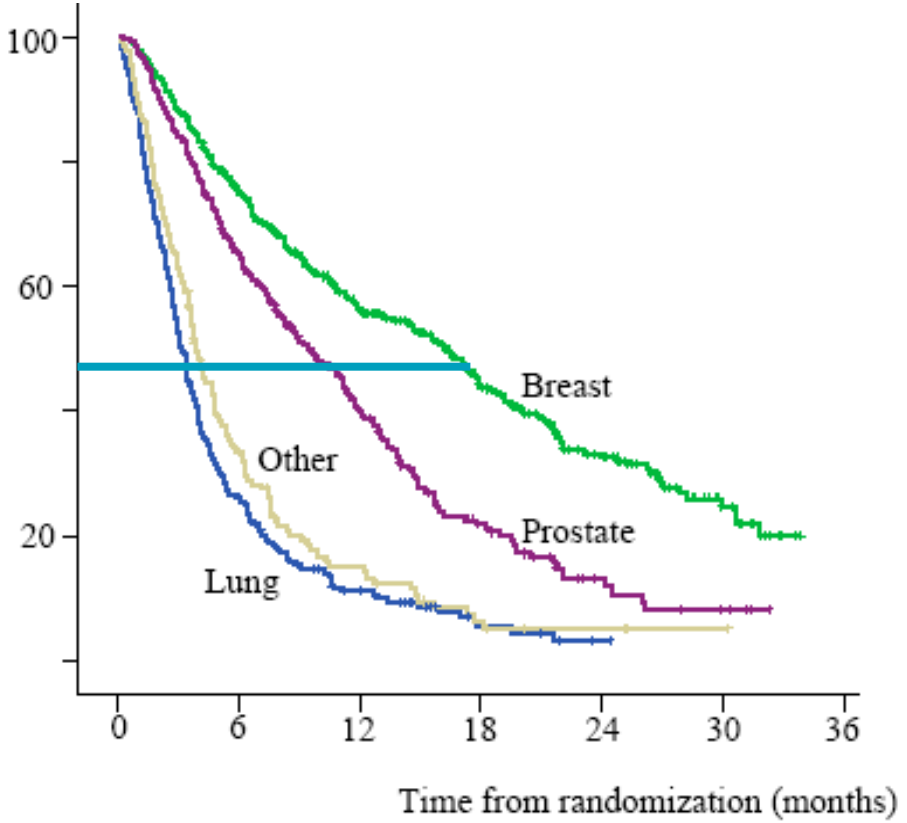


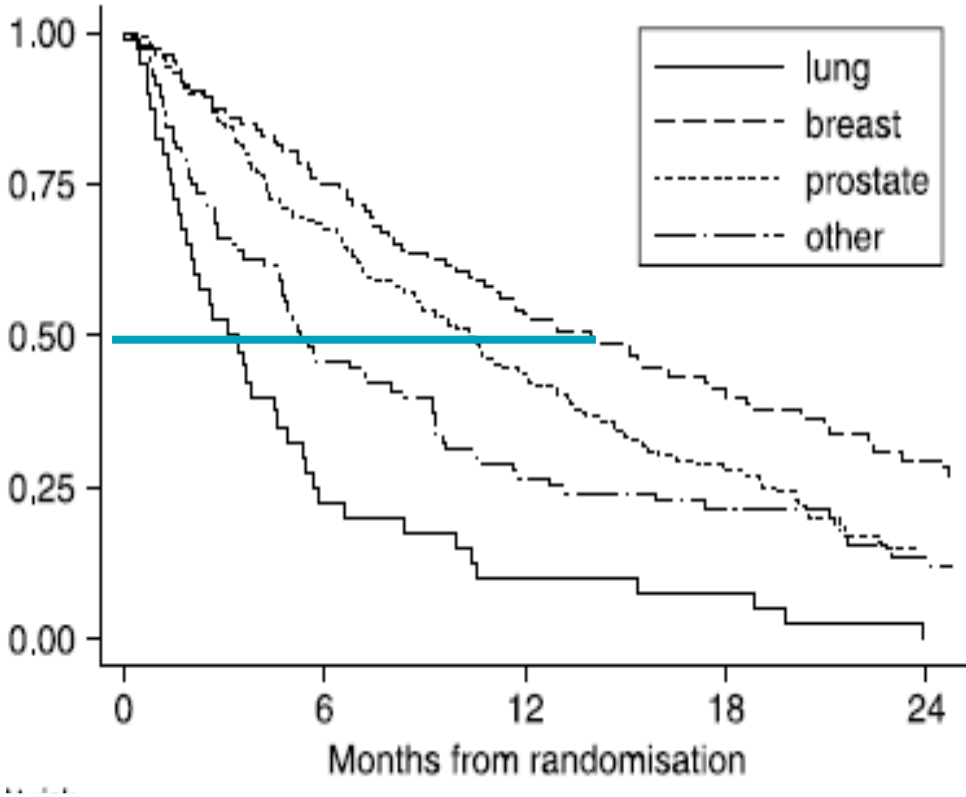
Courtesy dr. Kaspers, UMCU





Survival is dependent on primary tumor





van der Linden et al, R&O 2006

Kaasa et al, R&O 2006

Survival prediction model Dutch Bone Mets Study has reasonable predictivity

Model	Variables	C-statistic
Best	Sex Primary tumor Visceral metastases KPS VAS-general health VRS-valuation of life	0.72
Model	**Variables**	**C-statistic**
Simple	KPS, primary tumor	0.71
Simple	primary tumor, VRS-valuation of life	0.69
Simple	primary tumor, VAS-general health	0.69

Survival prediction model → external validation

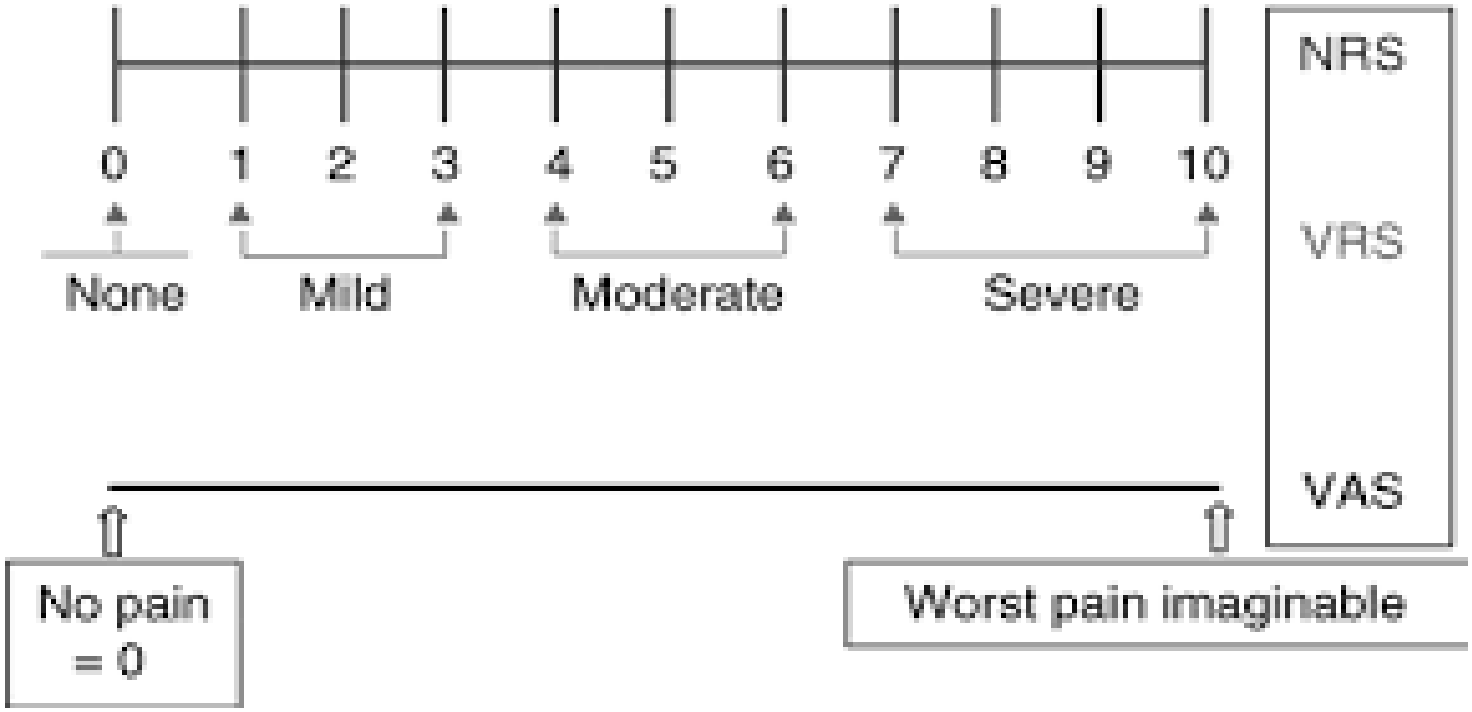
Chow et al. JCO 2007

Response is measured using pain scales

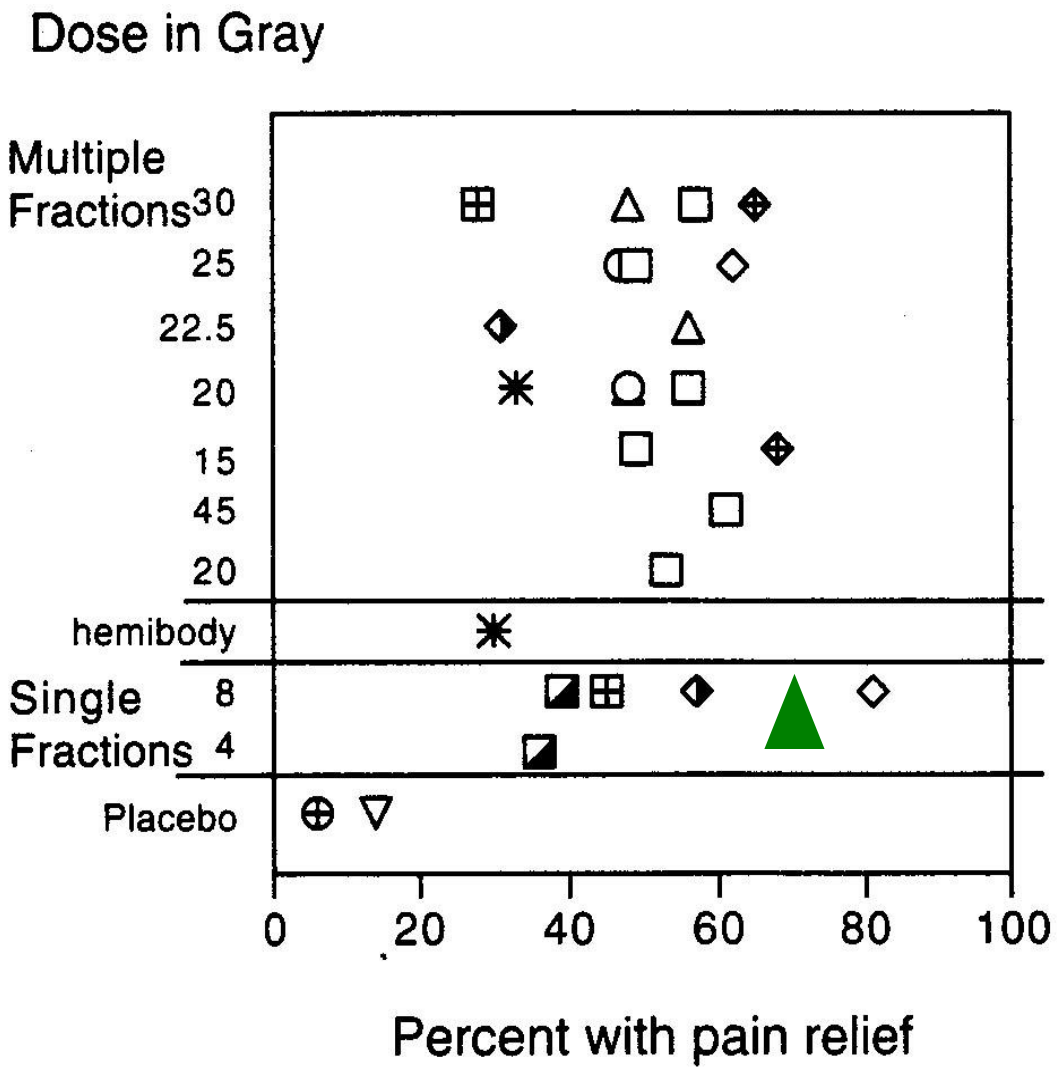


Response criteria International Consensus Group

Term	Definition
Complete response	A pain score of 0 at treated site with no concomitant increase in analgesic intake (stable or reducing analgesics in daily oral morphine equivalent [OMED])
Partial response	Pain reduction of 2 or more at the treated site on a scale of 0 to 10 scale without analgesic increase, or Analgesic reduction of 25% or more from baseline without an increase in pain.
Pain progression	Increase in pain score of 2 or more above baseline at the treated site with stable OMED, or An increase of 25% or more in OMED compared with baseline with the pain score stable or 1 point above baseline
Indeterminate response*	Any response that is not captured by the complete response, partial response, or pain progression definitions

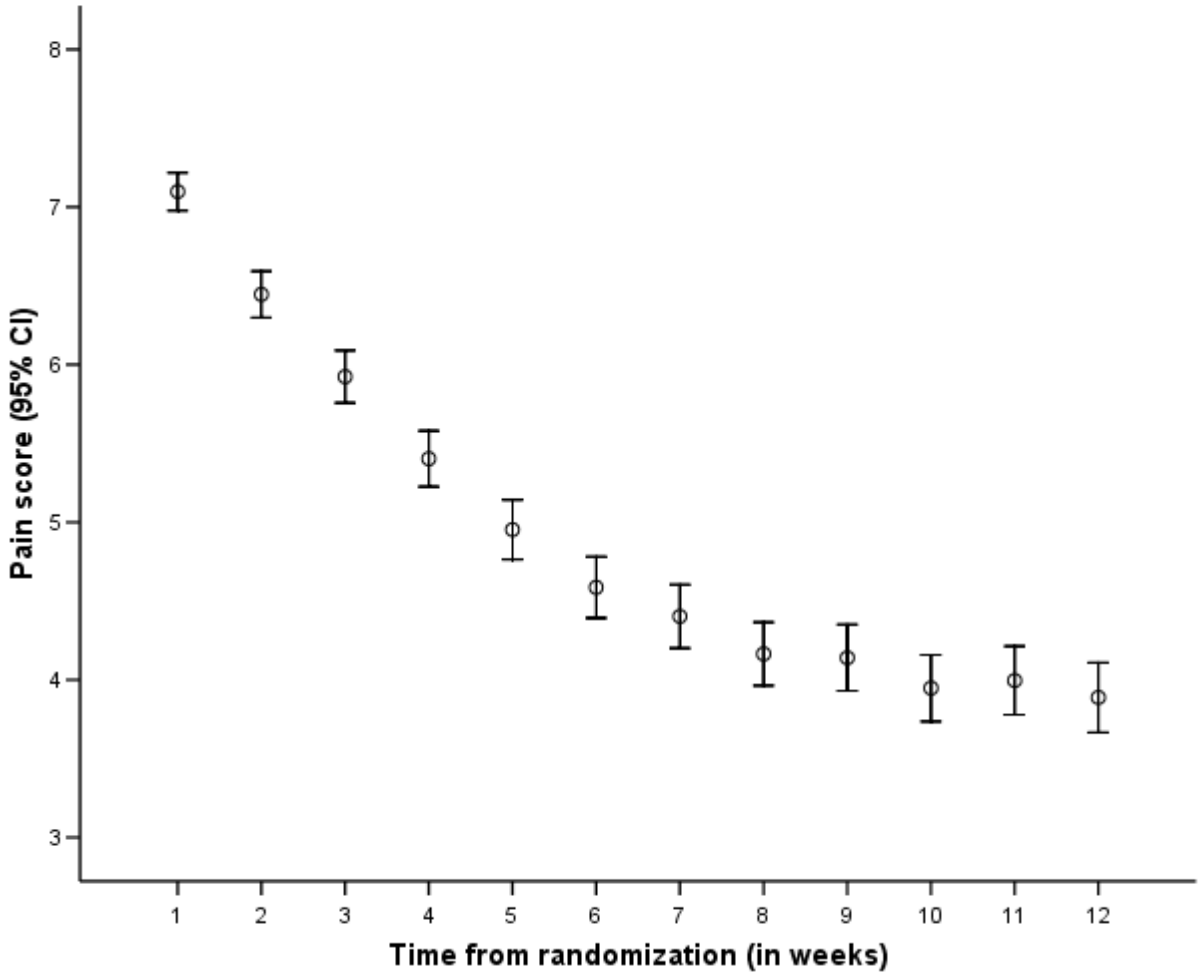
Chow et al IJROBP 2012

Response about 60-70%

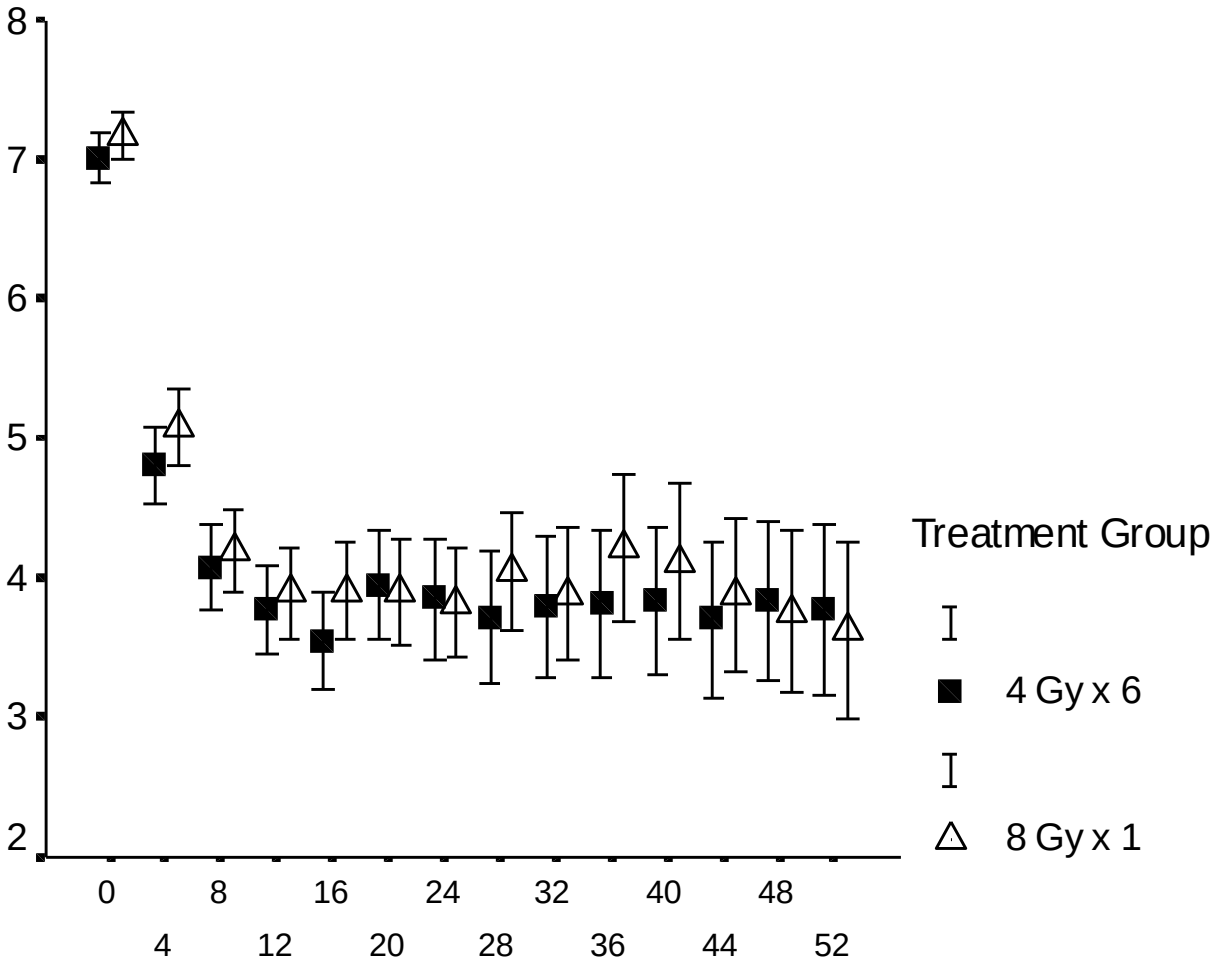


[Cochrane review McQuay et al 1997]

Response within four weeks -> DBMS



Durable response -> DBMS



Individual pain scores → pain flare

2 points increase

After RT 20-40% pain flare

Phase 3, n= 298

-> dexamethasone 8 mg, 5x

35% to 26%

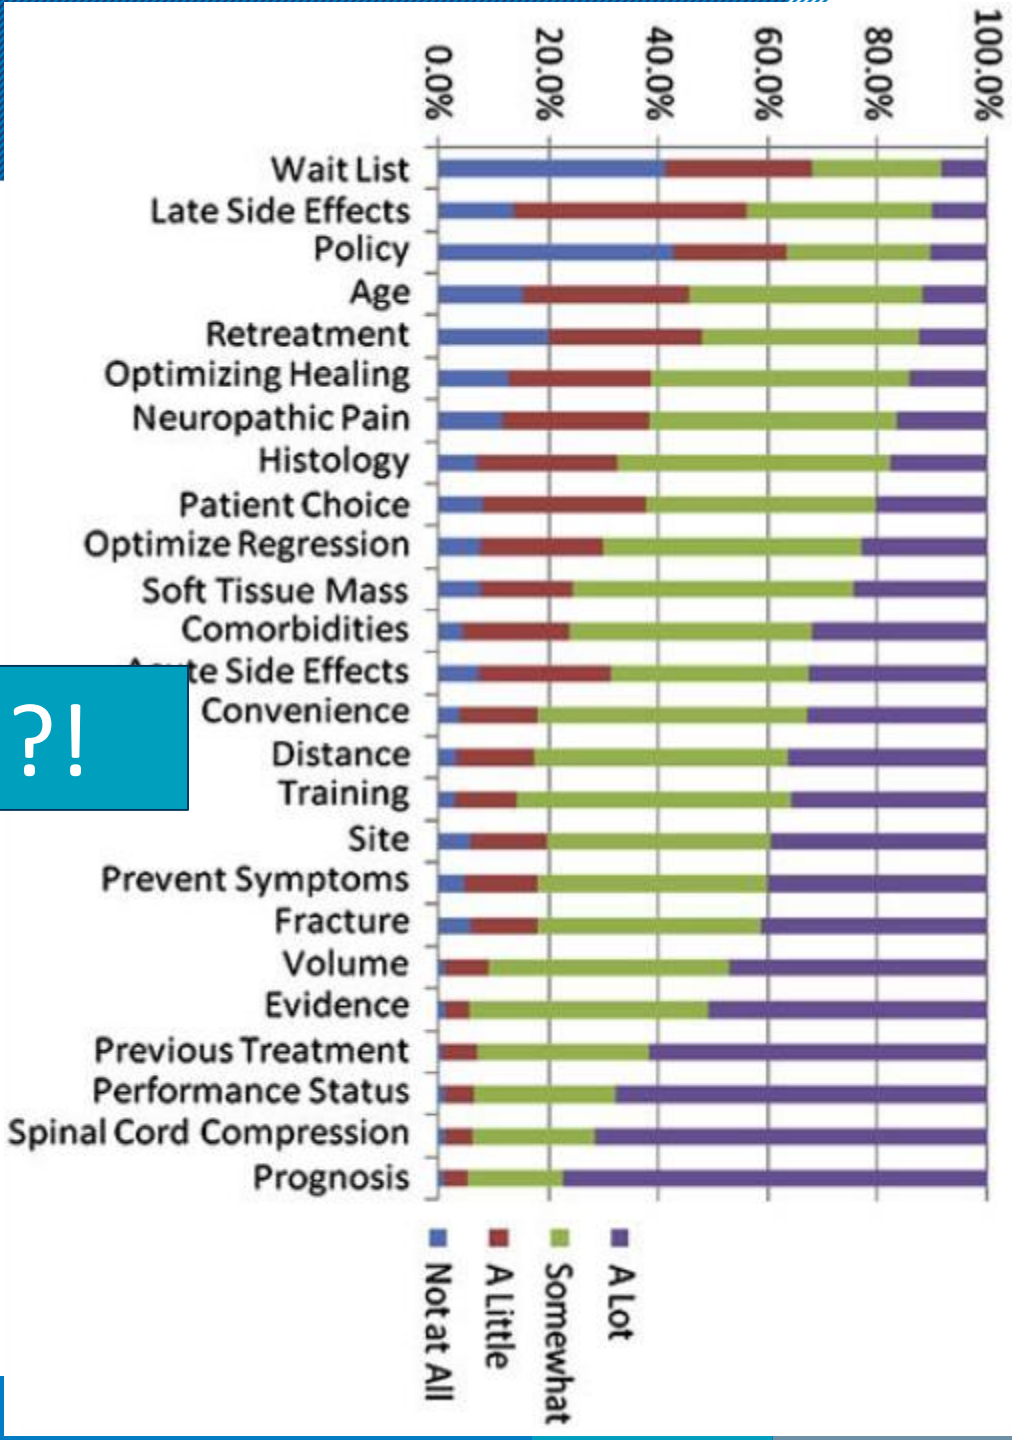
Fairchild et al. IJROBP 2009

Factors influencing choice for dose fractionation



Reimbursement ?!

Fairchild et al. IJROBP 2009

SF vs. protracted regimens

Perspective	Pros	Cons
Patient	Convenience • One stop treatment • Less time in hospital or department • Less side effects	Higher percentage of retreatment; 7–25%
Doctor	Convenience	Reimbursement • Lower revenues
Department	Lower costs [26–28] Less use of available equipment Ease of scheduling among other therapies	Reimbursement • Lower revenues
Society	Lower costs Less use of available equipment

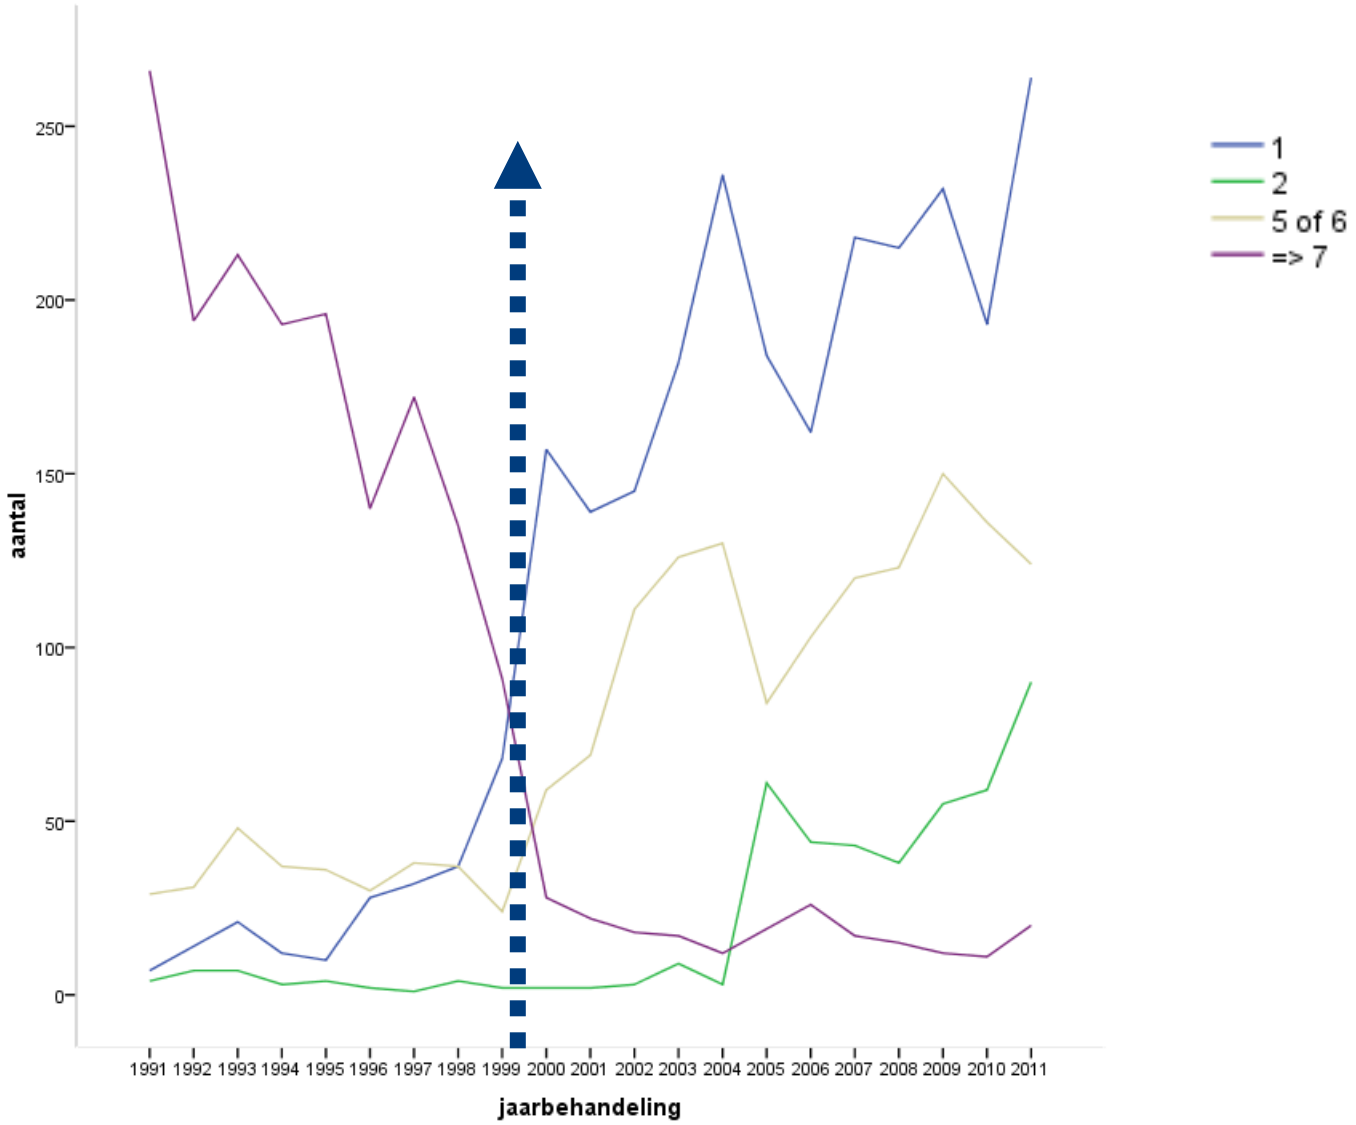
Costs vs. reimbursement in Belgium

	1998	2004
8Gy single fraction	0%	25%
20Gy/4Gy	14%	22%
30Gy/3Gy	82%	47%
other	4%	6%

Lievens et al. personal communication

Leiden changed its schedules…



Concluding remarks

SF is still underexploited

- Cost effective
- More convenient for patients

Need to optimize usage of SF

- Awareness
- Education
- Change in reimbursement system

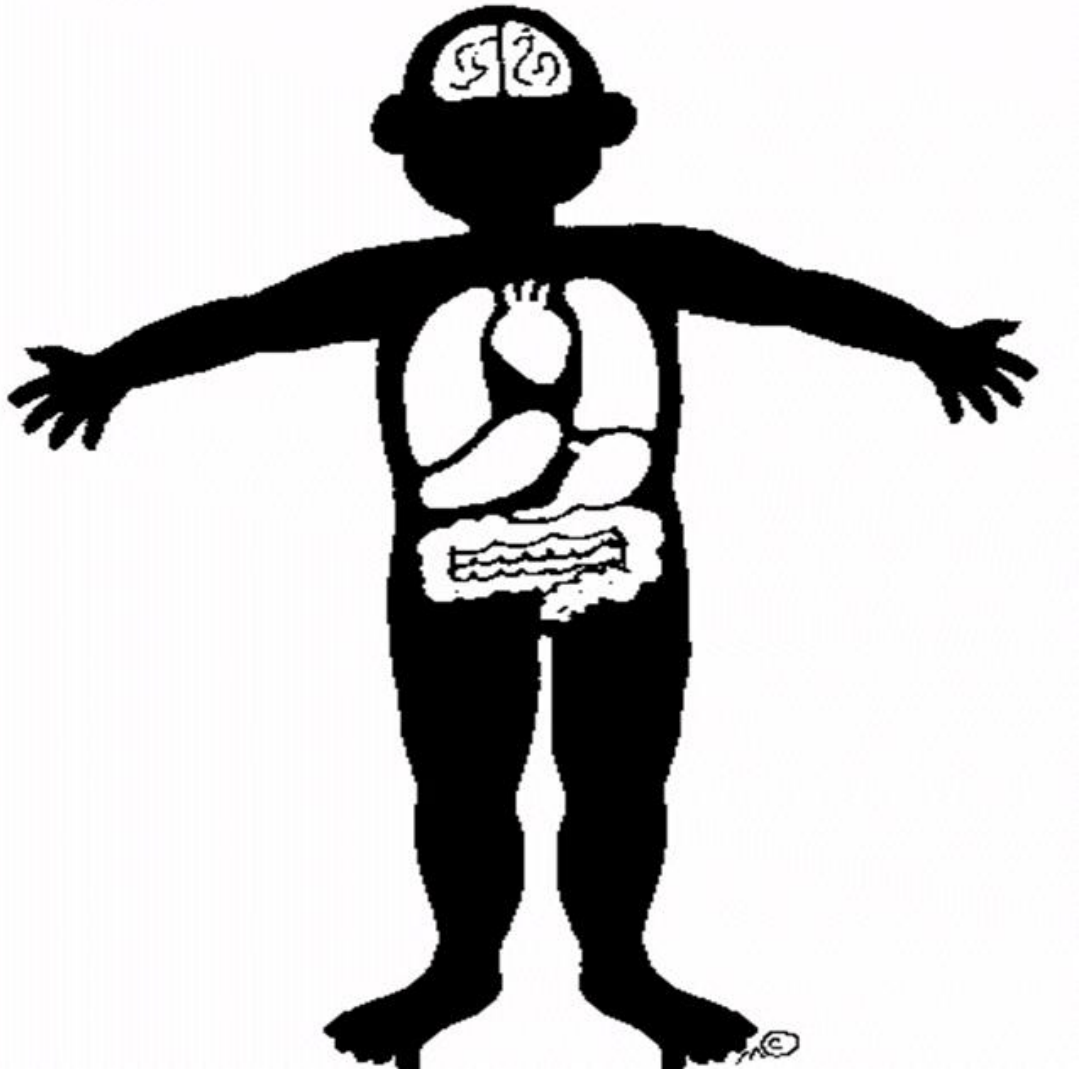
Conclusions radiotherapy for bone pain

- patient friendly
  - non invasive
  - quick procedure
  - few side effects
  - effective local treatment → responses about 60-70%
    - pain
    - ulceration, bleeding
    - dyspnea, edema
    - ..

} improvement of QoL

- evidence based outcome → single or short course schedules
- retreatments –always- possible

Skin / lymph nodes / soft tissues / organs



Radiotherapy in palliative care

Joanna Kazmierska
Radiotherapy Department II
Grater Poland Cancer Center
Poznan

wielkopolskie centrum onkologii

Outline

- Symptoms: Bleeding, Dyspnea
- Thorax: Airway obstruction,SVCS, breast
- Abdomen: Upper GI, liver
- Pelvis: bladder cancer
- Head and neck

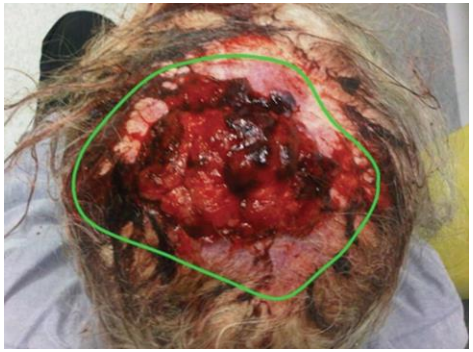
Outline

- ✓ Symptoms: Bleeding, Dyspnea
- Thorax: Airway obstruction, SVCS, breast
- Abdomen: Upper GI, liver
- Pelvis: bladder cancer
- Head and neck

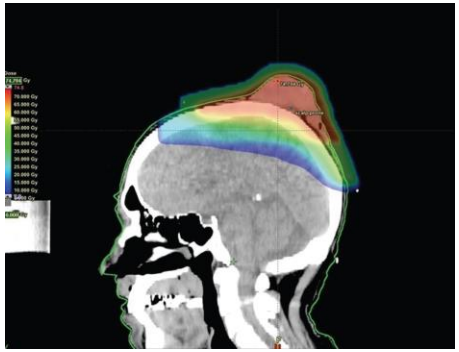
Bleeding

- From different sites: hemoptysis, hematuria, vaginal bleeding, melena, hematochezia, hematemesis, bleeding from ulceration of skin

- Why: infiltration of vessels by cancer, bleeding from pathological tumor's vessels, ulceration and inflammation



Malignant Fibrous Histiocytoma MFH



Radiotherapy

4 mts after treatment RT +surgery

JK 4/49

Jang H Case Rep Med 2012

Radiotherapy in bleeding

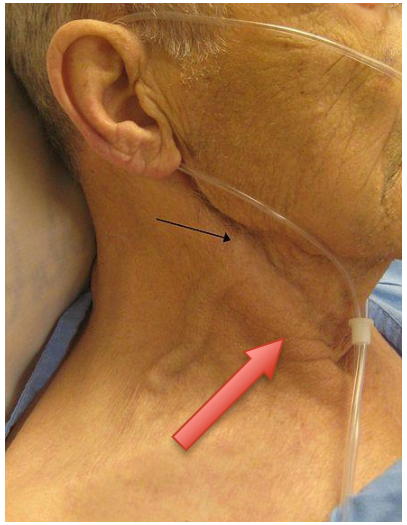
- RT helps in 24-48 h (think about transfusion if massive bleeding!)
- Schedules – preferred hypofractionation:
  - 1x 8-10 Gy,
  - 3-5 x 4-8 Gy,
  - 10 x 3 Gy
- Different definition of succes:
  - no further bleeding,
  - increased level of Hb
  - less transfusions
  - RT effective in vaginal bleeeding almost 100%, hemoptysis 86%, upper GI - 90%

Dyspnea

- Main symptom in many malignancies, not only in thorax
- 29-74% patients in terminal state complains of dyspnea, especially when KPS<60
- Experienced together with pain and psychosocial distress which inrease dyspnea
- Central, neural and mechnical reasons
- Interfere with acid base homeostasis

Dyspnea – when you are on call

- Evaluate possible reason of dyspnoea. Sudden onset and evolution?
- Symptoms presents at rest? Positional?
- Tachypnea? Cyanosis? Hemoptysis? Cough?
- Lung examination – sounds? Signs of pleural effusion? X-ray, CT, angiogram (embolisation!)
- Cardiac examination: tamponade? Jugular Venous Pressure?
- Bronchoscopy?
- Malignacy in abdomen (pressure on diaphragm)?

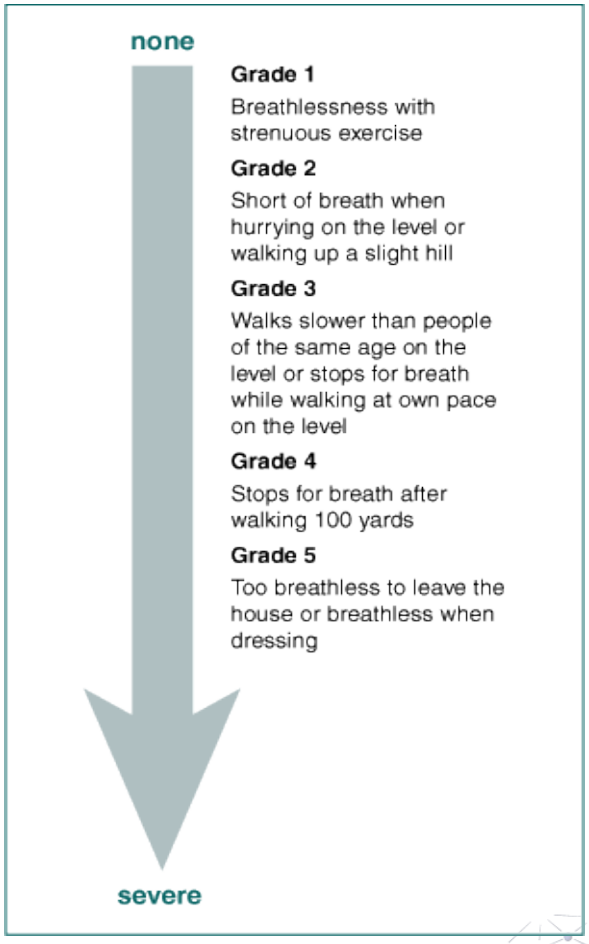


Visible external jugular vein, JVP raised, no pulsation = SVCS

Evaluation of dyspnea

- Lab:
  - oxygen saturation,
  - arterial gases,
  - acid- base balance

- Scales:
  - Modified Medical Reasearch Council Cancer Dyspnea Scale 1-5 functional
  - Stanford Anatomical Scale for SVCS



Nursing Best Practice Gudelines

Dyspnea - intervention

- Risk and benefits of intervention - balance!

- Pharmacotherapy (opioids, benzodiazepin)
- Oxygen therapy

- Steroids –no EBM proof for use, except first days of radiotherapy

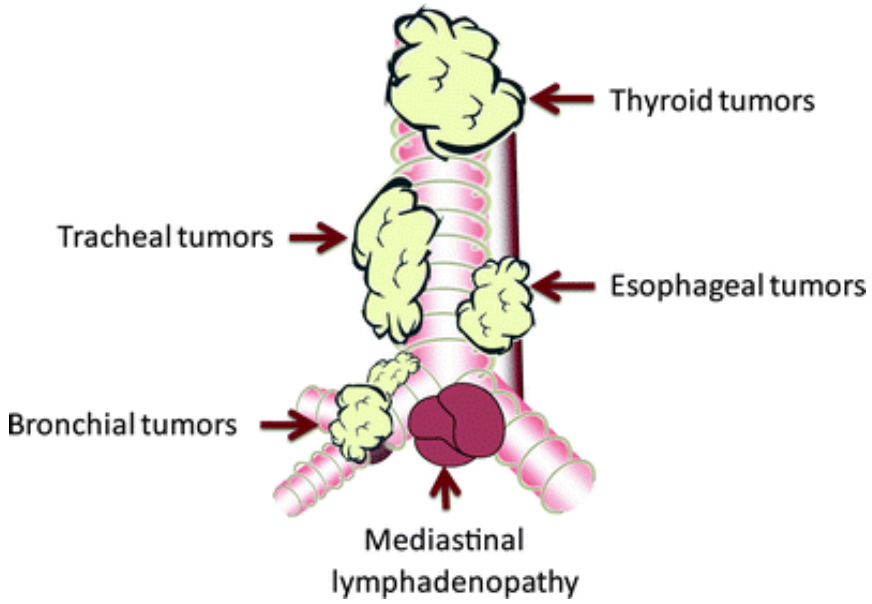
- Further intervention depends on main cause of dyspnea – MAO? Upper airway obstruction?

Outline

- ✓ Symptoms: Bleeding, Dyspnea
- ✓ Thorax: Airway obstruction, SVCS, breast
- Abdomen: Upper GI, liver
- Pelvis: bladder cancer
- Head and neck

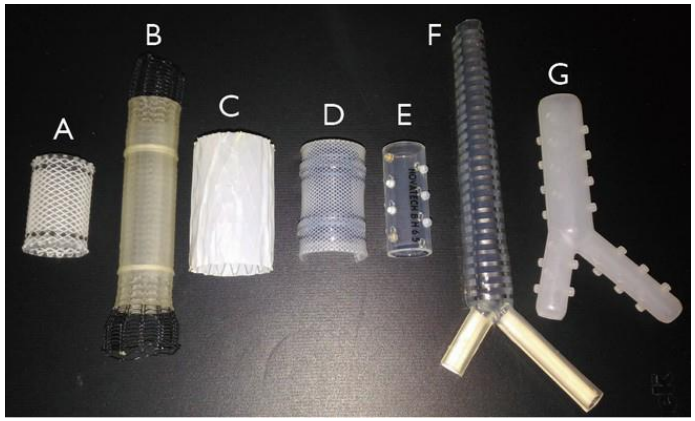
Malignant problems in Thorax

- Malignant airway obstruction (MAO)
- Superior Vena Cava Syndrom



Malignant Airway Obstruction (MAO)

- Symptoms: dyspnea, pneumonia, cough, hemoptysis
- Diagnosis: CT with bronchial reconstruction + bronchoscopy
- Tratment: stents and baloons, laser, surgery, cryotherapy and
- Radiotherapy – including EBRT and BT



Stents used in different types of MAO from *Guibert N JDT 2016*

RT for MAO – what really matters?

- RT schedules:
  - 1 x 8Gy
  - 10 x 3 Gy
  - 5 x 4 Gy
  - 15 x 3 Gy
- Important for response: size of the tumour < 6cm (p=0.04)
- BED_{10} >= 39 Gy (p=<0.01)
- Response for treatment important for OS!

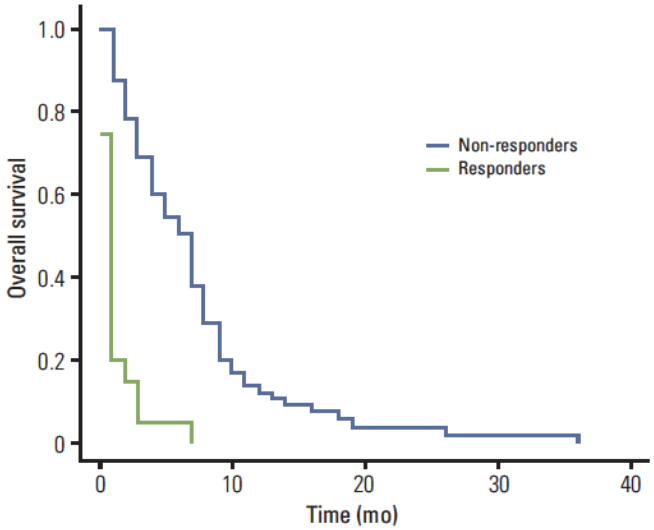


Fig. 2. The 1-year survival rate for responders to the irradiation was significantly higher than non-responders (12.5% vs. 0%, p < 0.001).

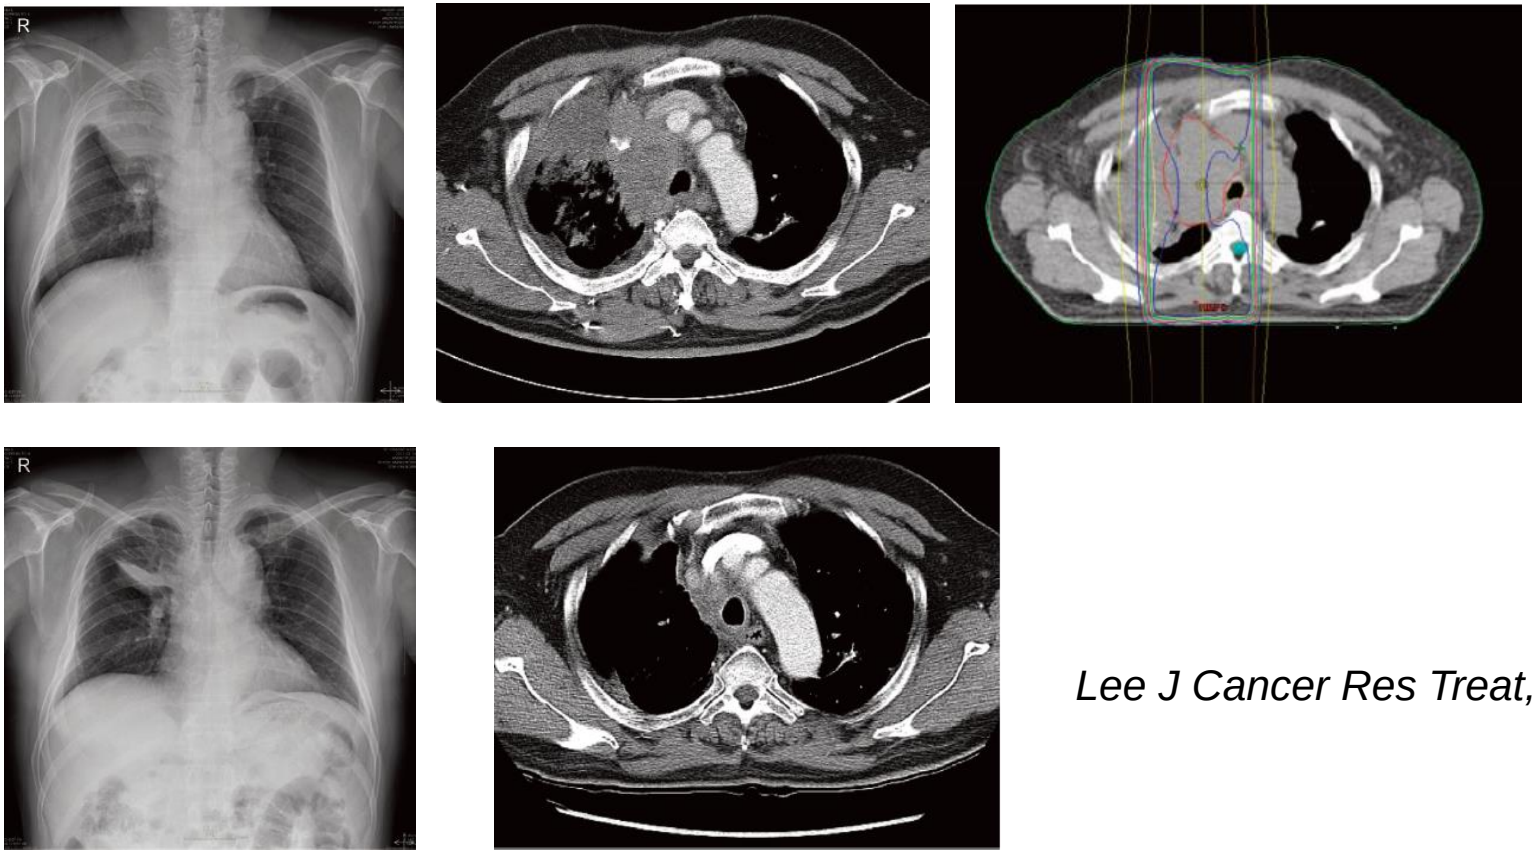
Lee J. Cancer Res Treat, 2015

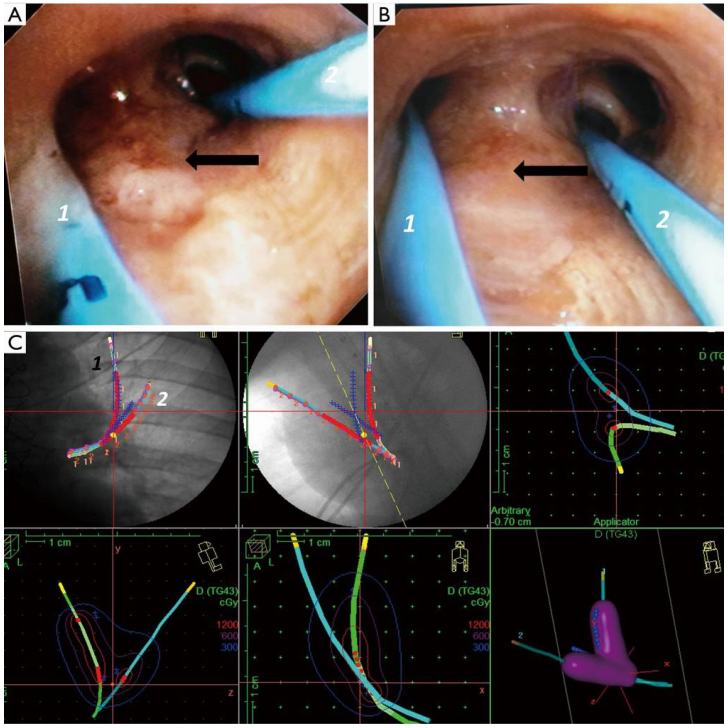
MAO – an example of EBRT



Lee J Cancer Res Treat, 2015

Fig. 3. A patient with small cell carcinoma had obstructive pneumopathy in right upper lobe and received a radiation dose of 30 Gy in 10 fractions. (A) There was an obstructive lesion in right upper lobe at the initial chest X-ray and computed tomography (CT). (B) Radiation-dose distributions in axial and coronal planning CT image. (C) Follow-up chest X-ray and CT showed an improvement of obstruction in right upper lobe 7 days after external beam radiotherapy.

MAO – an example of BRT



Guibert N JDT 2016

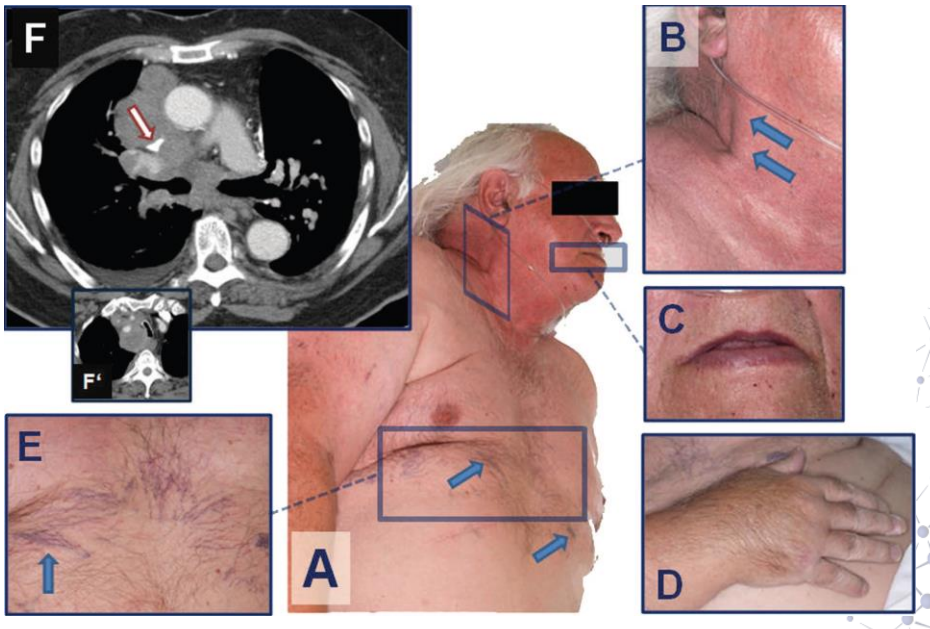
Example of brachytherapy for an endobronchial infiltration of the upper left lobe.

Bronchoscopic view of the two catheters showing local improvement.

(A) before
(B) after the three first fractions (6 Gy)
(C) planning of dose distribution from radiographic images

Superior Vena Cava Syndrome - SVCS

- Obstruction of SVC, reduction of blood flow and increased blood pressure in proximal vessels
- Signs:
  - Dyspnea
  - Edema of face, neck chest, upper extremities
  - cyanosis
  - Stridor, headeache (2-10%)
  - Visible collateral blood flow network in the chest wall
  - Sympoms are worse in horizontal position



Lepper M. Resp Care 2011

SVCS

- Lung cancer (2-4% all, SCLC -10%), lymphadenopaty, other
- First described by William Hunter in 1757
- Management depends on severity of symptoms and whole strategy of treatment: including diagnosis and staging
- Traditionally – immediate intervention, but be careful- the reason and pathological diagnosis **is** important!
- RT can affect biopsy results

SVCS - Scoring system

Clinical signs (Lacout et al. 2012; Kishi et al. 1993)	Weighting
Neurological signs	
Awareness disorders or coma	4
Visual disorders, headache, vertigo or memory disorders	3
Mental disorders	2
Malaise	1
Thoracic or pharyngeal-laryngeal signs	
Orthopnea or laryngeal edema	3
Stridor, dysphagia or dyspnea	2
Coughing or pleurisy	1
Facial signs	
Lip edema, nasal obstruction or epistaxis	2
Facial edema	1
Vessel dilation	
Neck, face or arms	1

Presence of any of the symptoms in the left column give the points indicated in the right column. The total points are added to together. A score of 4 or higher indicates a need for percutaneous stent placement

SVCS treatment recommendations I

- Asses life threatening symptoms:
  cerebral or laryngeal oedema (5%),
  tracheal obstruction and
  pericardial effusion
  (Yu 2008 Thorac Oncol, Soufe Intervent Radiol, 2013)

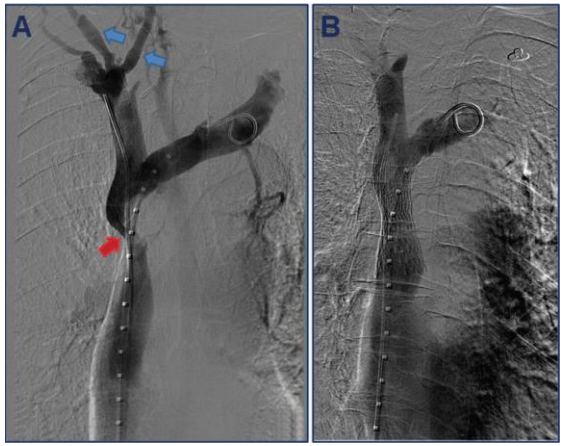
  - If yes: endovascular stenting (optimal, fast relief), or immediate RT or CHT

  - If less severe: histology first, staging , MDT.
    - SCLC, DLBCL – CHT **and** RT
    - NSCLC and other – stenting **and** RT

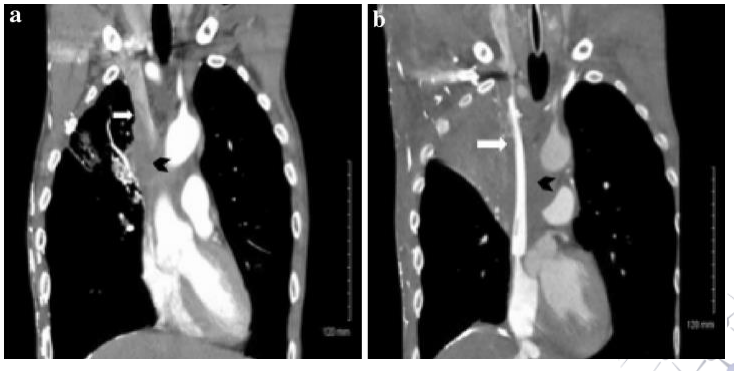
- RT vs CHT similar response rate
  - For SCLC 76,9% vs 77.6%
  - For NSCLC 59% vs 63%

SVCS treatment recomendations II

- Stenting of SVCS – final diagnosis not necessary, but needs **techical expertise**
- No studies on: use of steroids alone. Helpful in first days of RT
- **Immediate RT**: *(Soufe, Intervent Radiol, 2013, Taguchi Cancer Chemoter 2011)*
  - Brain edema
  - Laryngeal edema
  - Tracheal obstruction
  - Pericardial efusion



Lepper M. Resp Care 2011



Straka C Springer Plus 2016

Radiotherapy for SVCS I

- **RT schedules**: fractions 3-4 Gy.
- SVCS in lung cancers is **dose dependent**, dose should be above 20Gy!
  - 10 x 3 Gy,
  - 5 x 4 Gy,

- Improvement ~ 72h

- Symptoms - 77% response but only 11% of full recanalisation and 24%-partial in imaging

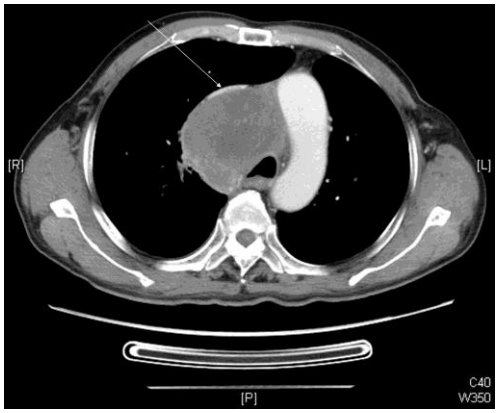
- Why such discrepancy?
  - RT decrease tumor size what allows for better collateral circulation

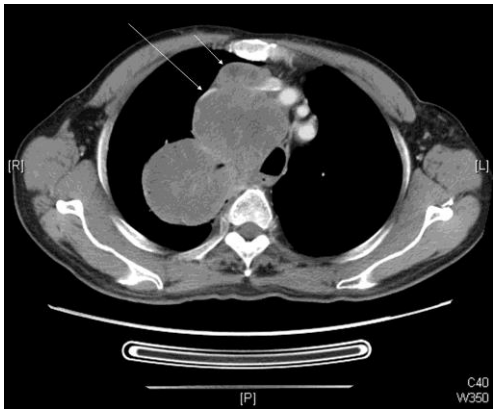
  (Wilson NEJM 2007)

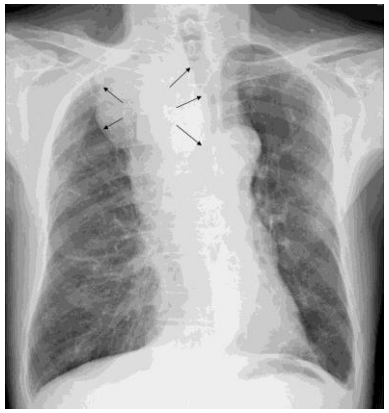
Radiotherapy for SVCS II

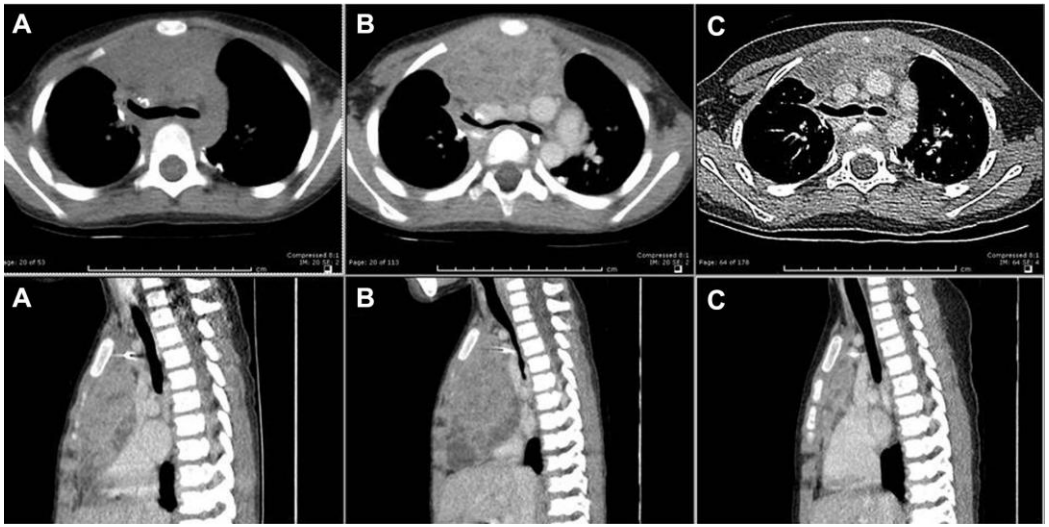
- SBRT – promising but so far no proven benefit, for highly selected patients in better condition *(Mc Kenzie Rep Pract Radiot Oncol 2013)*
- Always think about the future of patient and doses – some patients may be further treated with RT!
- BT- HDR, following stenting or as a salvage after EBRT for intraluminal recurrence
- Addition endobronchial BT to EBRT – no benefit
- Concurrent chemotherapy – no added benefit

SVCS two examples





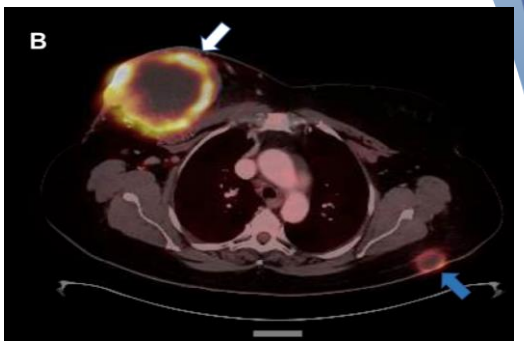




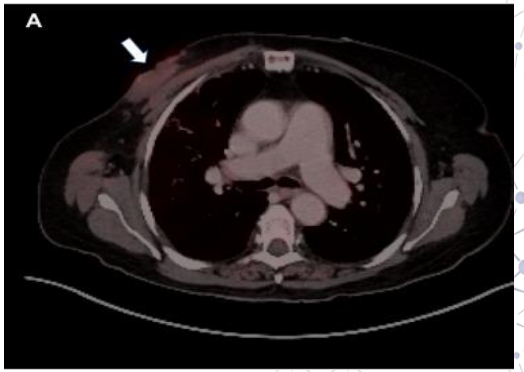
Rvigema C Advances in Radiation Oncology 2017

Breast – palliative treatment

- Locally advanced cancer (LABC) symptoms: pain, ulceration, infection, bleeding, brachial plexopathy
- Very important: decision should be made in MDT,
  no single best solution for everyone
- Palliative RT effective not only in LABC, also in recurrences, metastases



Before treatment

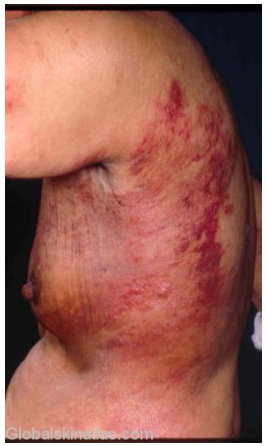


4 months after treatment

Gao R, Cureus 2017

Breast – palliative radiotherapy

- LABC – rarely RT alone, if yes 27-35% long term respons.
- Doses in palliative LABC – 50-60 Gy
- Bleeding – 8-20 Gy in 2-5 fractions
- Ulceration, infection, malodor – 20-30 Gy in 5-10 fractions
- Whole chest recurrence „brestplate pattern ”- photons or electrons, tangential fields.
- Lymph nodes - supraclavicular 71% subjective respons after RT



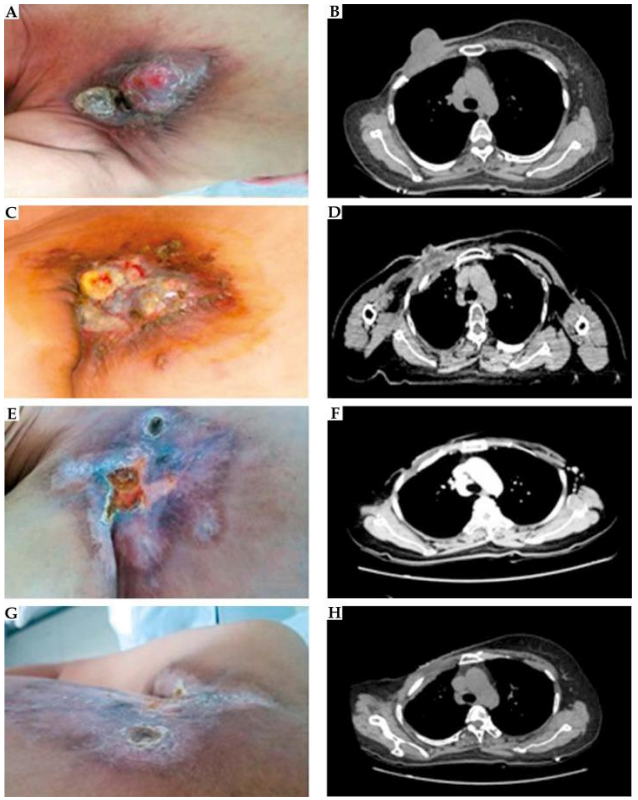
globalskinatlas.com

Breast re-irradiaton

- Role unclear – individual decisions in reurrence in skin, ribs, subcutaneous tissue, limiting factor: doses for lungs and heart

- EBRT : Combined dose to 100 Gy for local control *(Wurschmidt F Radiat Oncol 2008, Harkenrider M Clin Breast Cancer 2011)*
- BT: *(Harms W IJROBP 2001)*

- Hypertermia enhaces effect of RT 41 vs 59% of CR *(Koulalais V, Clin Cance Res 2002)*



Before and 7 mts after BT: 5 x 6 Gy

Wu N, JCB 2015

Outline

- ✓ Symptoms: Dyspnea, Bleeding
- ✓ Thorax: Airway obstruction,SVCS, breast
- ✓ Abdomen: Upper GI, liver
- Pelvis: bladder cancer
- Head and neck

Upper GI malignacies

- 50% patients presents in advanced stage
- Symptoms: dysphagia, bleeding, obstruction, nausea, malnutrition and pain

Gastric cancer

- Bleeding from gastric cancer = melena, hematemesis causing anemia
- RT alone 1 x 8 Gy or 5 x 4 Gy, improvements in 50-73% of patients: increase Hb, decrease number of transfusions *(Chaw C ecancer, 2014)*
- The pooled overall response rates for bleeding, pain and obstruction symptoms were 74%, 67% and 68% *(meta-analysis Tey J,Ocotarget 2017)*

Radiotherapy in gastric bleeding

- There was no difference in response rate of bleeding between regimens with high BED of ≥ 39Gy versus regimens with low BED < 39Gy
- Thus, low dose regiments 1 x 8Gy, 5 x 4Gy, 10 x 3Gy, 3 x 6Gy most beneficial and repeatable *(Kawabata, H, J Palliat Med 2017)*
- Conflicting results: *(Lee Y, BMC Cancer 2017)*, BED10 >36Gy most significant factor for EBRT response for gastric bleeding
- Grade 3 to 4 toxicities occurred in up to 15% of patients when treated with RT alone and up to 25% of patients treated with chemoradiotherapy: gastritis, anorexia, neutropenia
- Health-related quality of life (HRQL) outcomes **were not reported**

Gastric bleeding RT OS – responders vs non - responders

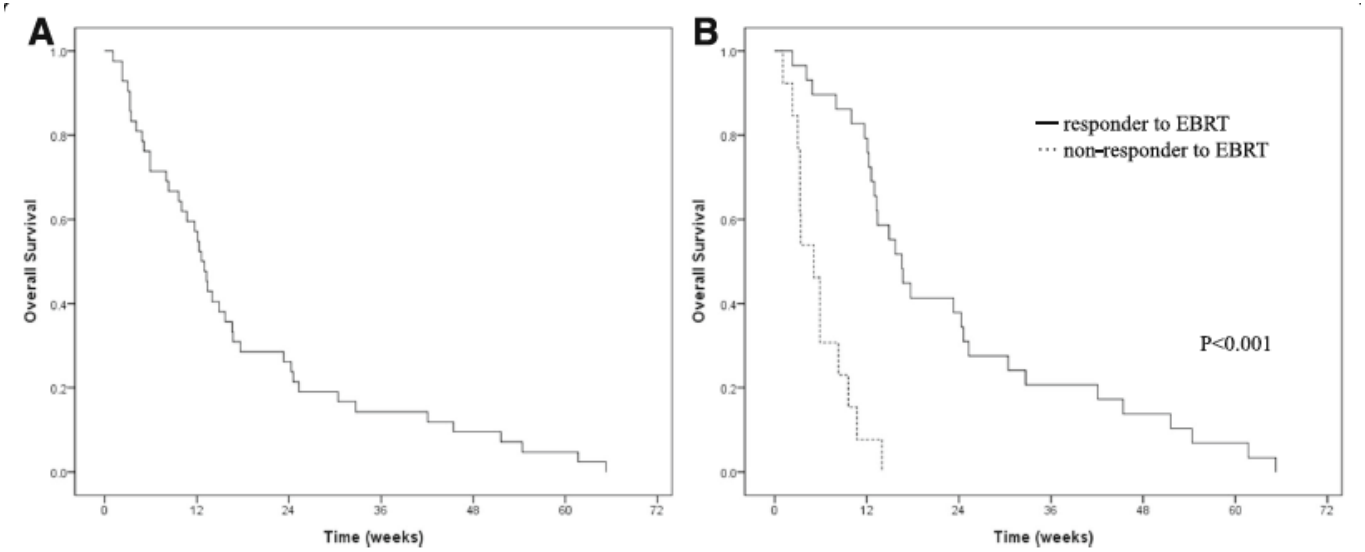


Fig. 1 Overall survival of all patients (**a**) and based on the response to radiotherapy (**b**)

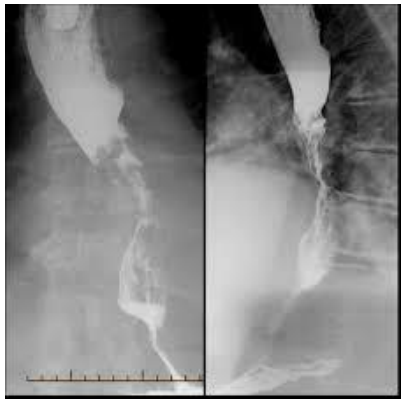
Lee Y, BMC Cancer 2017

Dysphagia in esophageal cancer - treatment

- Dysphagia mostly in esophageal cancer, but also in head and neck cancer
- Risk of cachexia, dehydratation, aspiration pneumonia
- Procedures used:
  - endoscopic dilatation,
  - stenting,
  - PhotoDynamicTherapy,
  - APC laser and
  - Radiotherapy

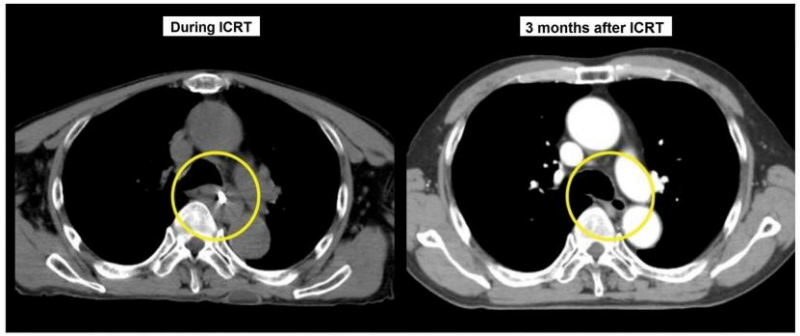


- CONSORT1a,b: best results in recanalisation, days to recurrence dysphagia and QoL for combination of APC and HDR (88 days vs 35 days, p=0.002) *(Rupinski M, Am J Gastroenter 2011)*

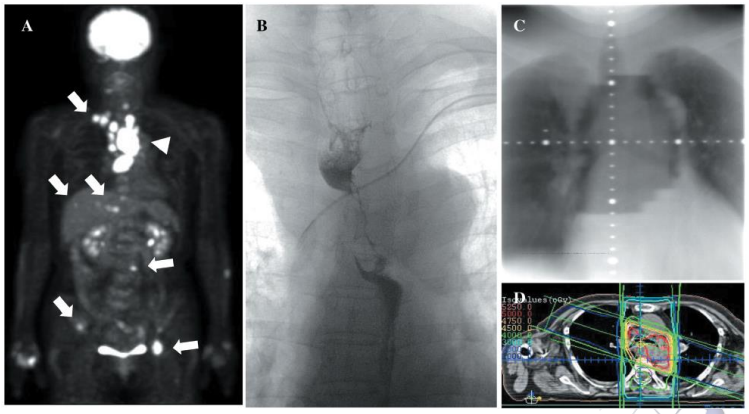
- Respons after RT lasts longer than stenting due to decrease of tumor volume.
- Single fraction BT bettter than stenting alone in long term relief, toxicity and QoL *(Homs M. Lancet 2004 SIREC)*

Dysphagia in esophageal cancer - radiotherapy

- Combination of EBRT 10 x 3 Gy and stenting prove to be better for sustained relief vs stenting alone in randomized study (7 vs 3 months)
- No difference in mortality and OS. *(Javed A, J Gastroin Cancer 2012)*
- Combination HDR 1 x 8 Gy i EBRT 10 x 3 Gy was better in duration of relief all symptoms: dysphagia (p<0.0001), chest pain, odynophagia and PS. Benefit in OS 18% in 200 days *(Rosenblatt E, R&O 2010, Welsch J Journal of Cancer 2016)*



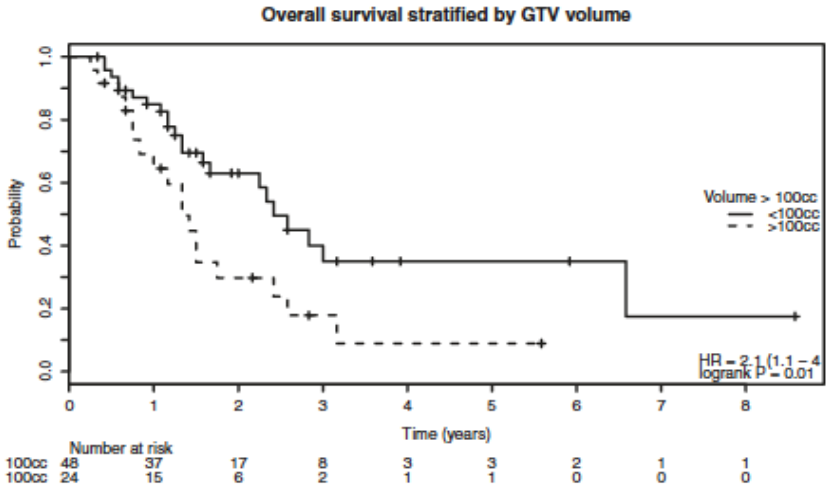
Yamashita M, Oncoclogy Lettres 2015

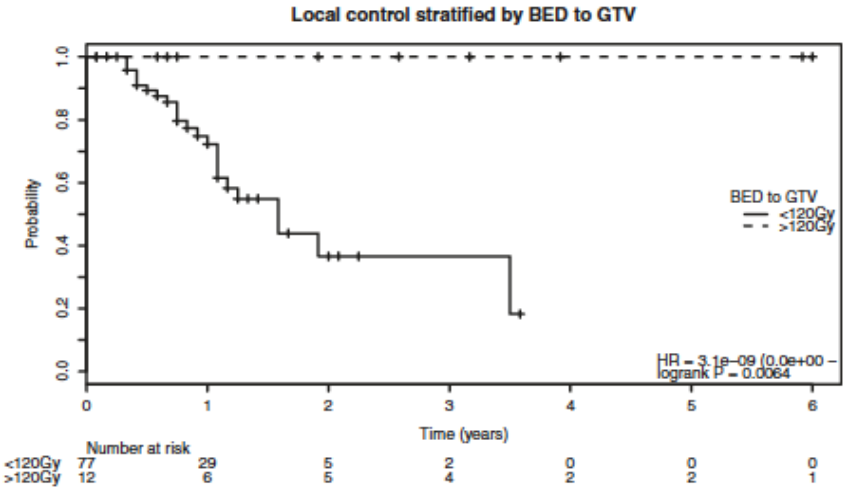


Suzuki G. Anticanc Res 2017

Liver metastases

- From **any site**, but most common: breast, lung, colorectal cancer
- **Symptoms**: pain, nausea, vomiting, fever
- **Options:** surgery, ablations (chemo-, radiofrequency RFA, radioembolization, SIRT: Y-90-SIRFLOX,
- **RT-SBRT:** 1-3 lesions, < 6cm, 60 Gy in 5 fraction,
  small lesion <3 cm - 2y control 100%, OS depends on histology fav vs unfav. *(Rusthoven K, JCO 2009)*

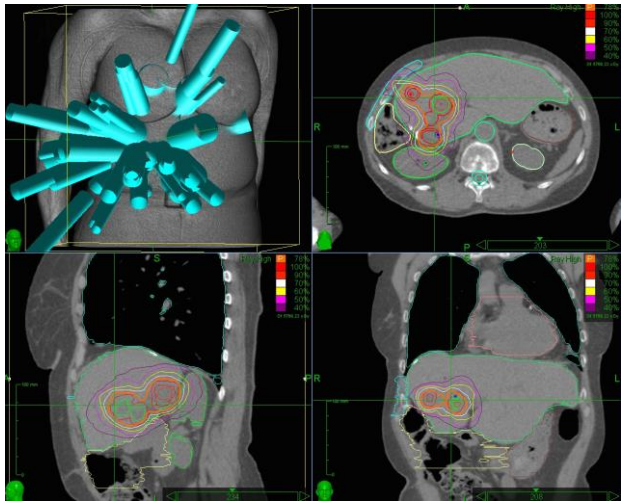




Andratschke N, Radiation Oncol 2015

Example of liver metastases SBRT

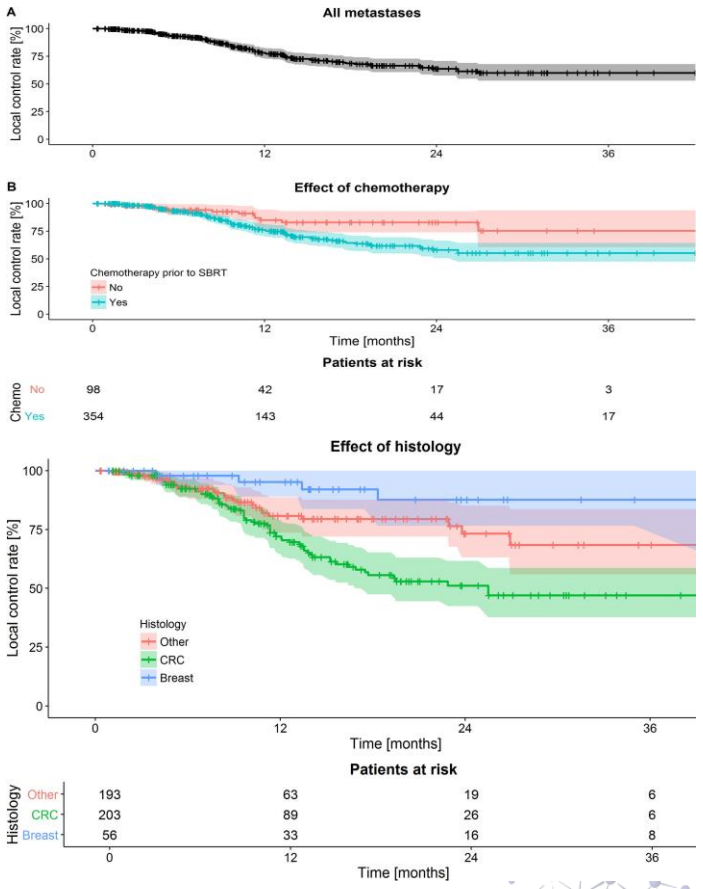
CK treatment 4 liver metastases
Courtesy
A. Skrobala, WCO



- Progress in technology allows for better targeting, better management tumor motions, high dose gradient
- Whole spectrum of lesions including metastases not accesible for surgery
- SABR for oligometastatic comparable to surgery, 5yOS 49 vs 41% (p=0.43)
- No added mortality: grade 3 toxic effects often reported in 1-10% of patients

Liver SBRT- modeling of response

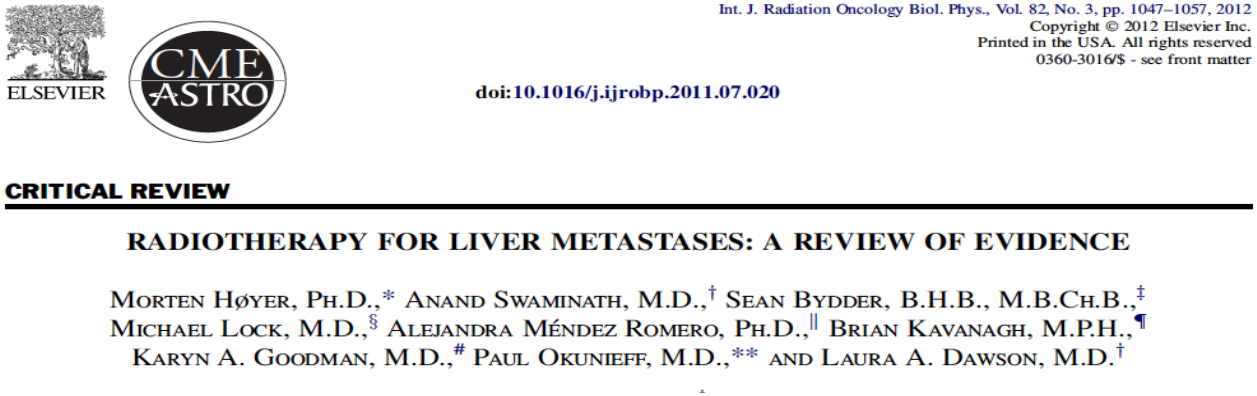
- TCP modeling for alfa/beta of 10Gy (BED max)
- 90% TCP at 2 y needs BED 209 Gy_{10} for patients never treated with chemo and inreases to 286 Gy_{10} after chemo.
- Larger PTV(>70.4 cc) and simple motion managemnet predicted signifantly lower TCP
- Favourable histology: breast cancer: 157 Gy_{10} with prior chemo or 80 Gy_{10} without chemo
- SBRT for liver metastases yields a strong dose–response relationship that is modified by factors such as chemotherapy and metastases histology.*(Klement RJ, R&O 2017)*



Klement RJ, R&O 2017

Liver SBRT guidelines and toxicity

- Generally, doses 30-60 Gy in 1-6 fraction, tumor size about 6 cm, not more than 5 mets
- RILD –rare, transient elevation liver ezymes
- No more than 700 cc uninvolved liver received 15 Gy in 3 fraction (QUANTEC) *(Pan CC IJROBP 2010)*
- Rib fracture, subcutaneous tissue damage, duodenal ulceration –very rare



Int. J. Radiation Oncology Biol. Phys., Vol. 82, No. 3, pp. 1047–1057, 2012

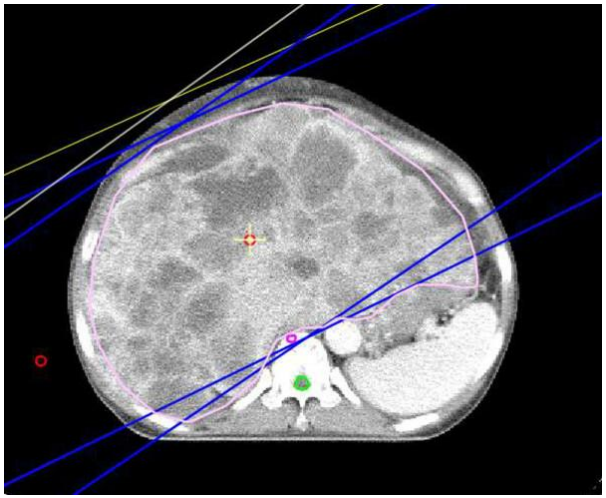
CRITICAL REVIEW

RADIOTHERAPY FOR LIVER METASTASES: A REVIEW OF EVIDENCE

Morten Høyer, Ph.D.,* Anand Swaminath, M.D.,† Sean Bydder, B.H.B., M.B.Ch.B.,‡ Michael Lock, M.D.,§ Alejandra Méndez Romero, Ph.D.,‖ Brian Kavanagh, M.P.H.,¶ Karyn A. Goodman, M.D.,# Paul Okunieff, M.D.,** and Laura A. Dawson, M.D.†

Whole Liver Irradiation (WLI)

- EBRT- for pain from infiltration of capsule
- Relief in pain 60-90%, other symptoms: anorexia, fever, sweating- about 20-30%
- Low doses 21-30 Gy in 7-19 fractions 1,5 -3 Gy or 1 x 8Gy
- Improvement of PS -25%
- Survival advantage – unclear
- No evidence for better results in combination with chemotherapy or readiosensitizers *(see review M.Hoyer IJROBP 2012)*



Yeo SG Radiation Oncol 2010

Outline

- ✓ Symptoms: Dyspnea, Bleeding
- ✓ Thorax: Airway obstruction,SVCS, breast
- ✓ Abdomen: Upper GI, liver
- ✓ Pelvis: bladder cancer
- Head and neck

Bladder cancer – role of palliative RT

- Symptoms: hematuria, pelvic pain, dysuria

- Example of palliative schedules:
  - 5 x 4 Gy,
  - 10 x 3 Gy,
  - 6 x 5.75 Gy to a total dose of 34.5 Gy in six fraction given once a week
    (*Dirix P Support Care Cancer 2016)*
  - 35 Gy in 10 fractions over two weeks versus 21 Gy in 3 fractions over one week *(MRC BA09, Duchesne IJROBP 2000)*

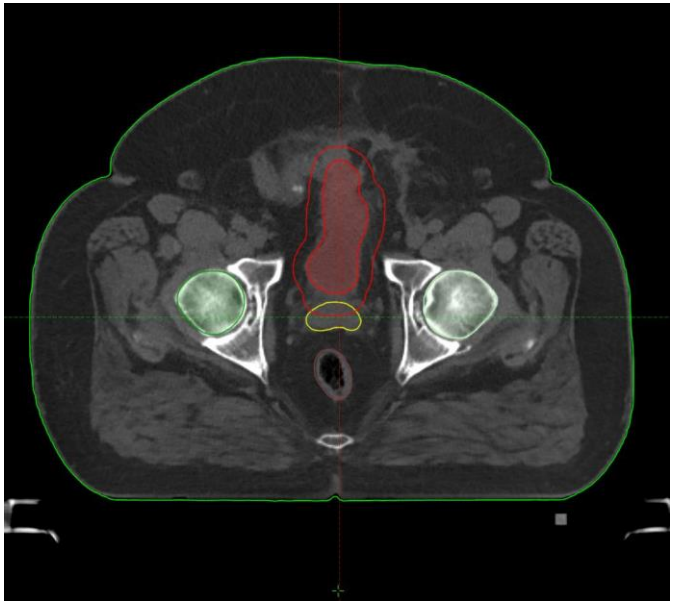
Bladder cancer – role of palliative RT

- 58 - 91% of response (hematuria), 47% (dysuria)

  No significant difference between schedules

- Mean hematuria - free survival of 10-13 months. Severe (≥ grade 3) acute and late urinary toxicity was observed in 9 and 19% of patients, respectively.

  (*Dirix P Support Care Cancer 2016)*

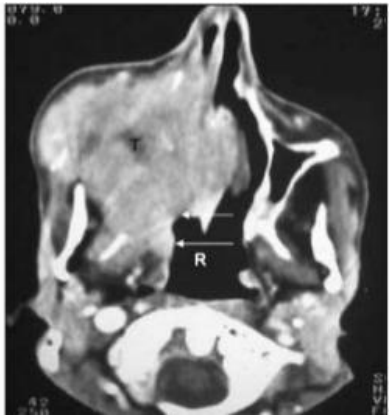


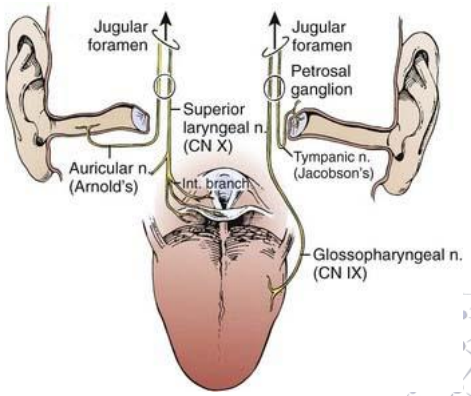
Outline

- ✓ Symptoms: Dyspnea, Bleeding
- ✓ Thorax: Airway obstruction,SVCS, breast
- ✓ Abdomen: Upper GI, liver
- ✓ Pelvis: bladder cancer
- ✓ Head and neck

Head and neck

- Different types of symptoms:
  - Pain: somatic, neuropatic
  - otalgia from infiltration of clivus
  - bleeding, ulceration, direct infiltration of vessel wall, exposure of extratumoral vessel
  - airway obstruction
  - speech and swallowing difficulties
  - aspiration, cough





Before start of palliative RT, let's look at the patient

- Tracheotomy
- Feeding tube
- PEG
- Nutrition and hydratation
- Pain management
- Smoking cesation
- Treating of infections
- Local management of ulceration
- Charlson comorbidity index

Mercurynews.com

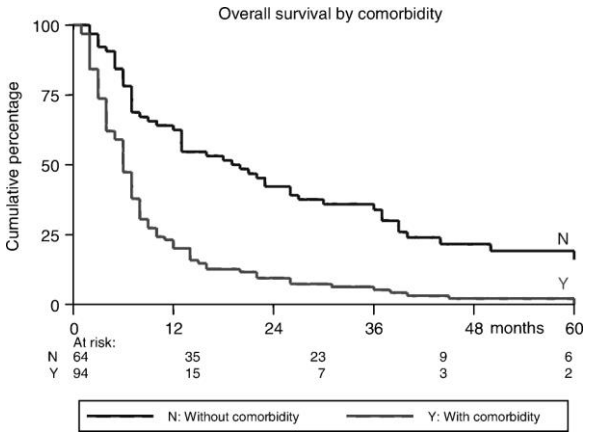
Classic palliative schedules

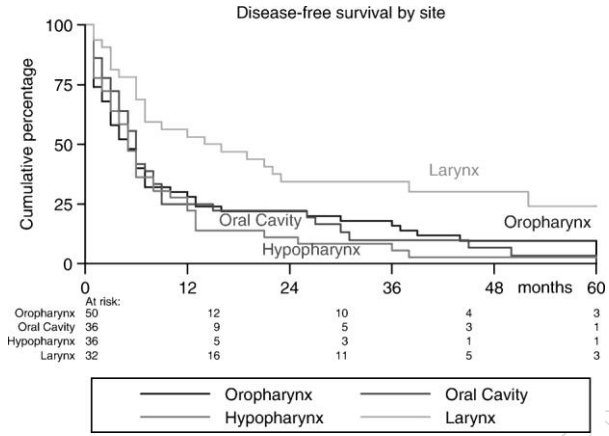
- No difference in results between conventional and hypofractionated schedules *(Porccedu S R&O 2007, Cory J R&O 2006)*

- Schedules:
- 5 x 4 Gy
- 10 x 3 Gy
- 16 x 3 Gy
- Split course: 2 x 25 Gy in 10 fraction separated by two weeks

- Overall response rate: 73%
- Median survival time was average 17 months

- Acute grade 3 skin and mucosal toxicities were observed in 45% and 65% of patients, respectively. *(Al. Mamgani A, Acta Oncol 2009)*



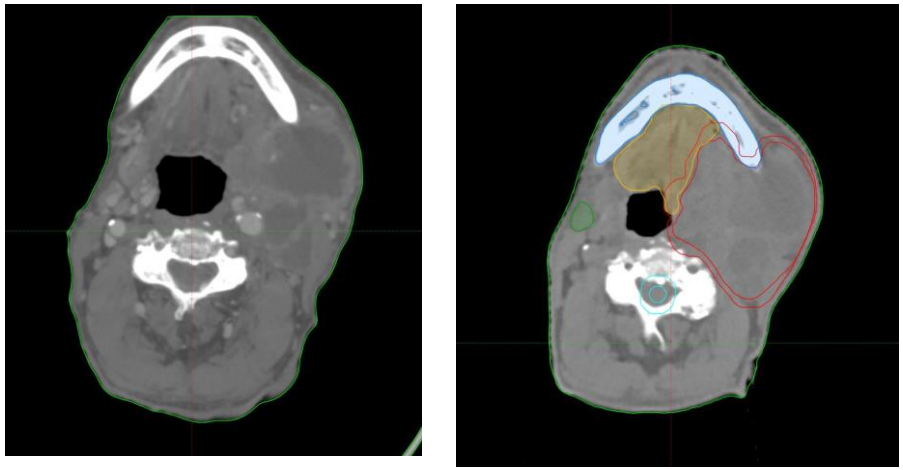


Beyond classic palliative schedules

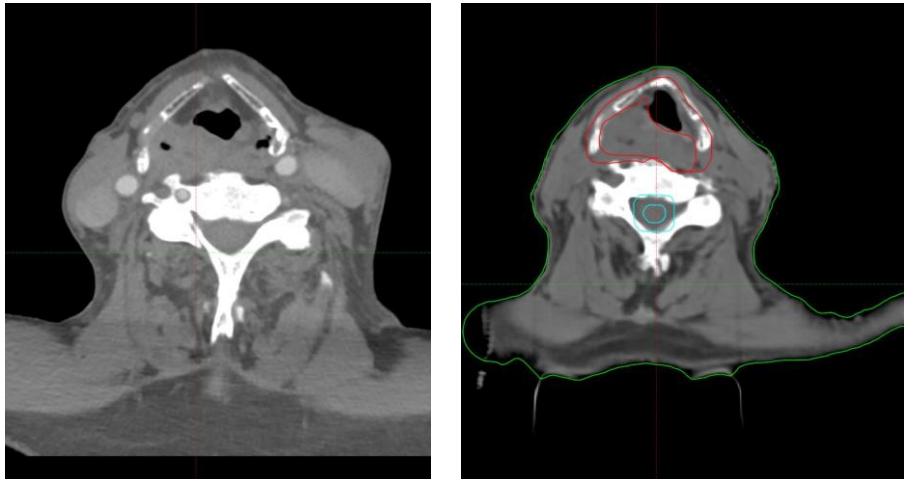
- RTOG 85-02: 3,7Gy twice daily over 2 consecutive days at 2 to 3 week intervals up to a total dose of 44 Gy
- 37% completed three cycles of the regimen.
- 65% palliative response.
- Median OS was 5.67 months *(Lok B. Oral Oncol 2015)*

- „0-7-21”: 3 x 8 Gy day 0,7,21
- 31% complete tumor response
- 40% complete symptoms response
- OS 50% patients survive at least 6 mts
- Tumor volume predictive for OS and PFS, TNM stage for response level. *(Nguyen A BJR 2014)*

Examples of palliation in head and neck cancer



Oropharyngeal cancer
76yo, CCI 7, symptoms:
pain, anemia, malnutrition
due to pain and ulceration



Hypopharyngeal cancer
86yo, CCI 8, symptoms:
pain, hemoptysis

Summary I

- Radiotherapy is an effective method of palliative treatment of symptoms of different cancers.
- There are almost no detailed guidelines (except bone mets) for doses and scheduling, due to often complicated clinical situation of the patient.
- Therefore, treatment choices and decisions are more individual than ever before.
- Generally shorter, hypofractionated courses are recommended as convenient for patient, highly effective and minimally toxic.
- Some symptoms are dose dependent (liver metastases) others –not (gastric cancer)

Summary II

- Radiotherapy is effective in emergencies: SVCS, MAO, bleeding, dyspnea and dysphagia.
- In life threating symptoms – be fast, but careful, detailed physical examination +/- other test are necessary to prepare optimal plan of tretment (*stent first?, transfusion? Is there time for pathology? Immediate RT?)*
- Remember, RT is not a knife – relief takes time (hours to days). Make sure your patient is safe.
- Carefull planning, delineation and consultation are VERY IMPORTANT in palliative treatment, don’t be afraid to use modern technology if necessary! (see SBRT for liver, IGRT for re-irradiation etc.)
- Communicate with your patients in whole process to find the best way of treatment together.

- **Thank you!**

Stereotactic body radiation therapy for oligo-metastases

Morten Høyer

Aarhus University Hospital, Denmark

CIRRO AARHUS UNIVERSITET

SBRT in palliation

- SBRT for
  - *Lung, liver, abdominal nodes and adrenal gland*
  - *Vertebral metastases (Spinal SBRT)*
- SBRT for
  - *Colorectal and prostate metastases*

Aim for eradication of oligo-metastases

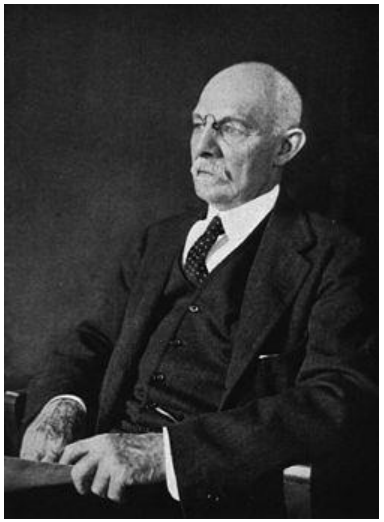
Oligometastases: Reduction of tumor burden to achieve long-term survival

Oligoprogression: Maintaining chemosensitivity

Metastases: Preventing cancer related symptoms

W.S. Halsted at Johns Hopskins 1894

The Halsted theory proposed that cancer spread is orderly, extending in a contiguous fashion from the primary tumor through the lymphatics to the lymph nodes and then to distant sites.



Cancer progression

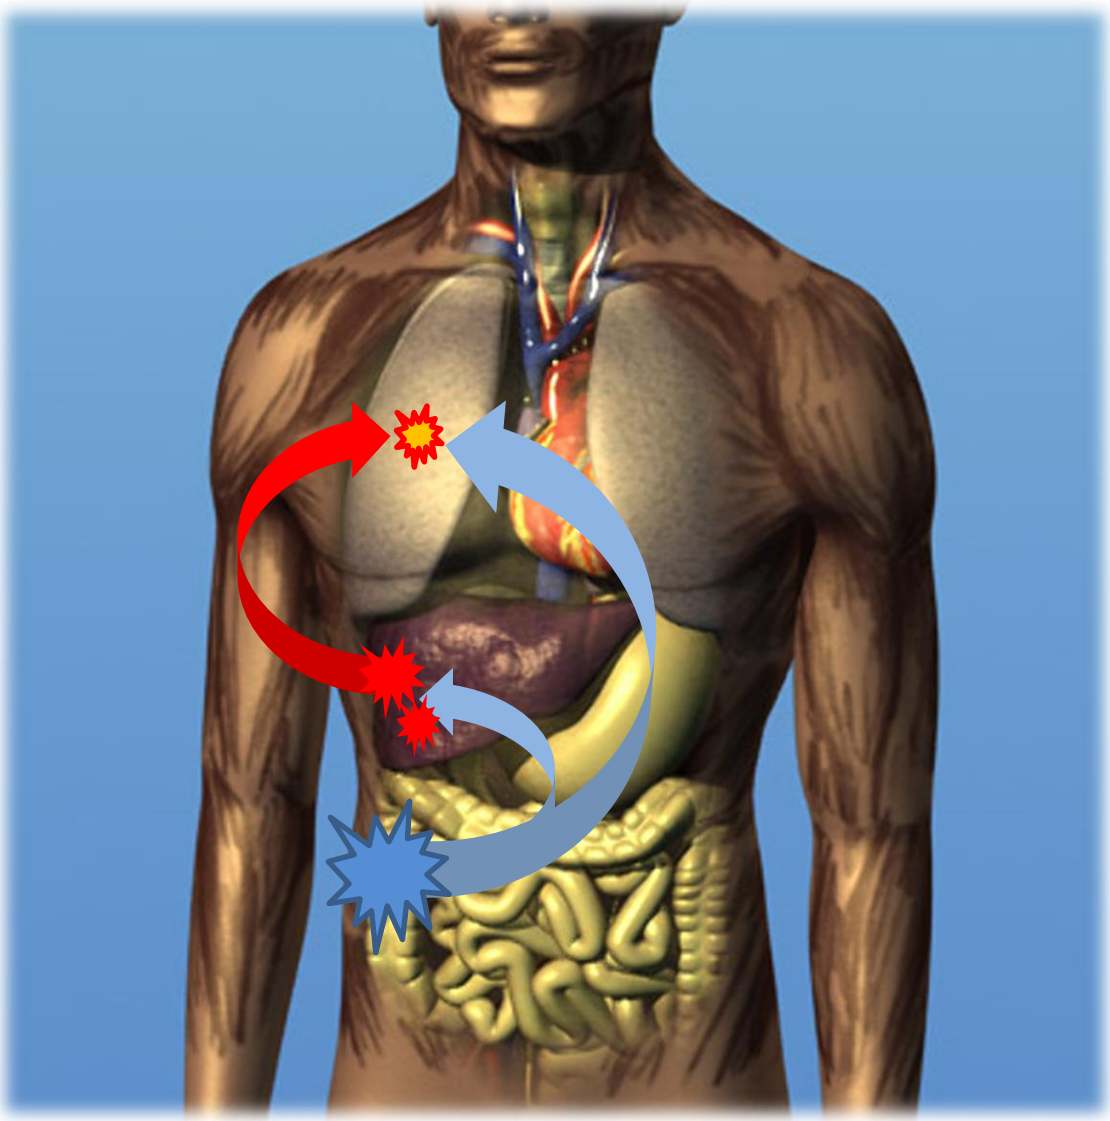
Localized (primary tumor)

Oligometastases (one/few)

Multiple metastases (widespread)

Hellman & Weichselbaum JCO 1995

Natural history of metastasis



CLOCC/EORTC 40004

Chemotherapy +/- RFA of 1-10 liver metastases
Phase II (2002); N=119

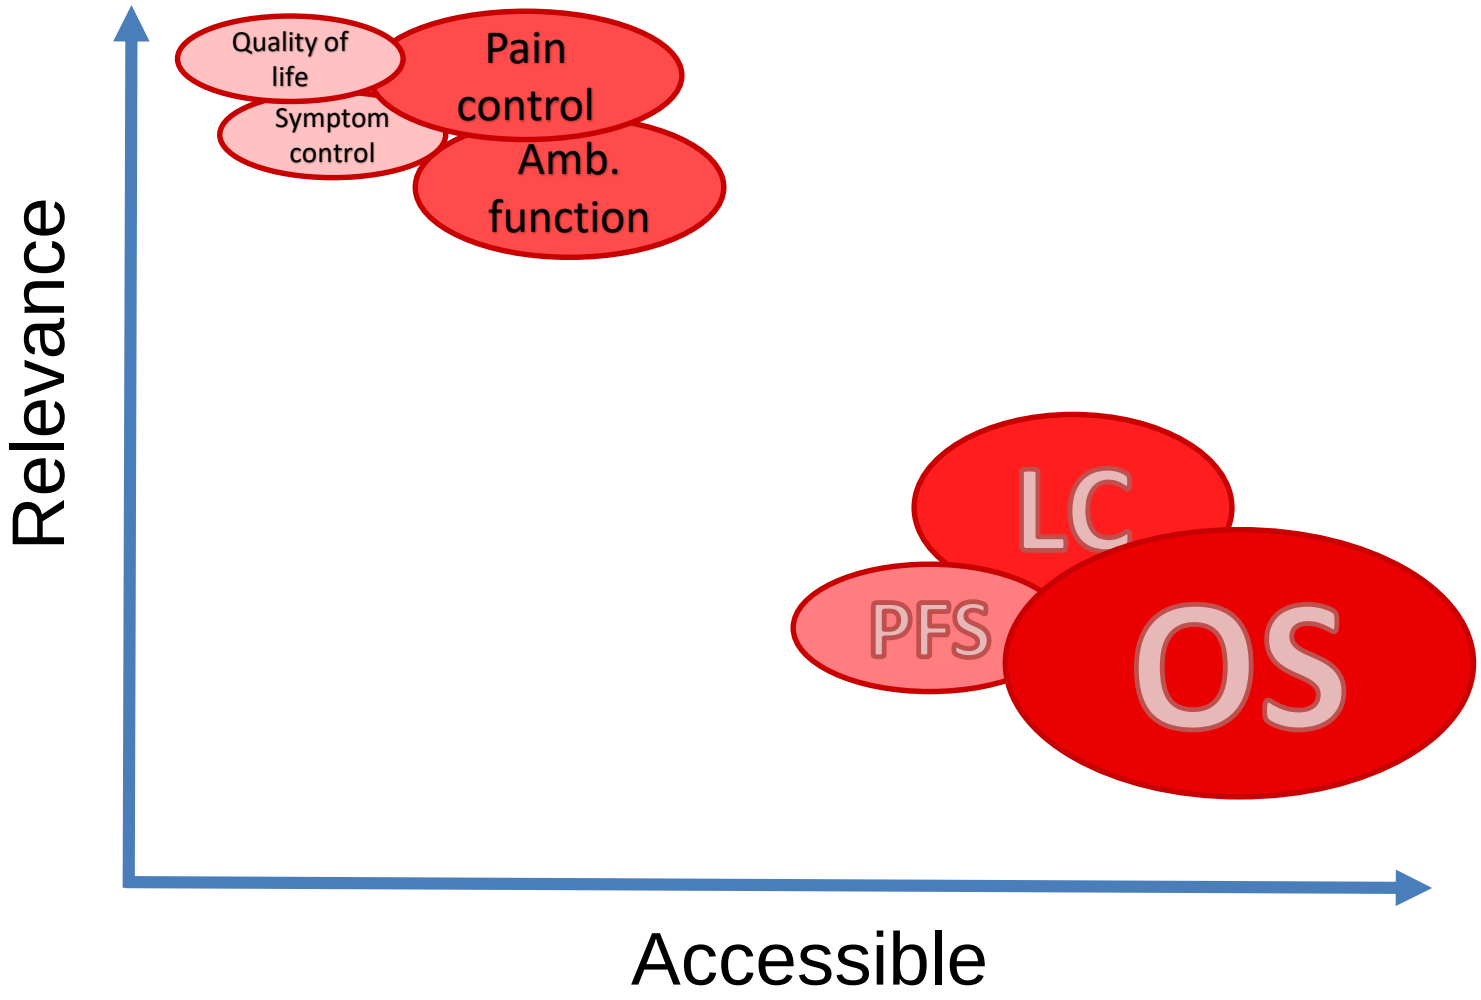
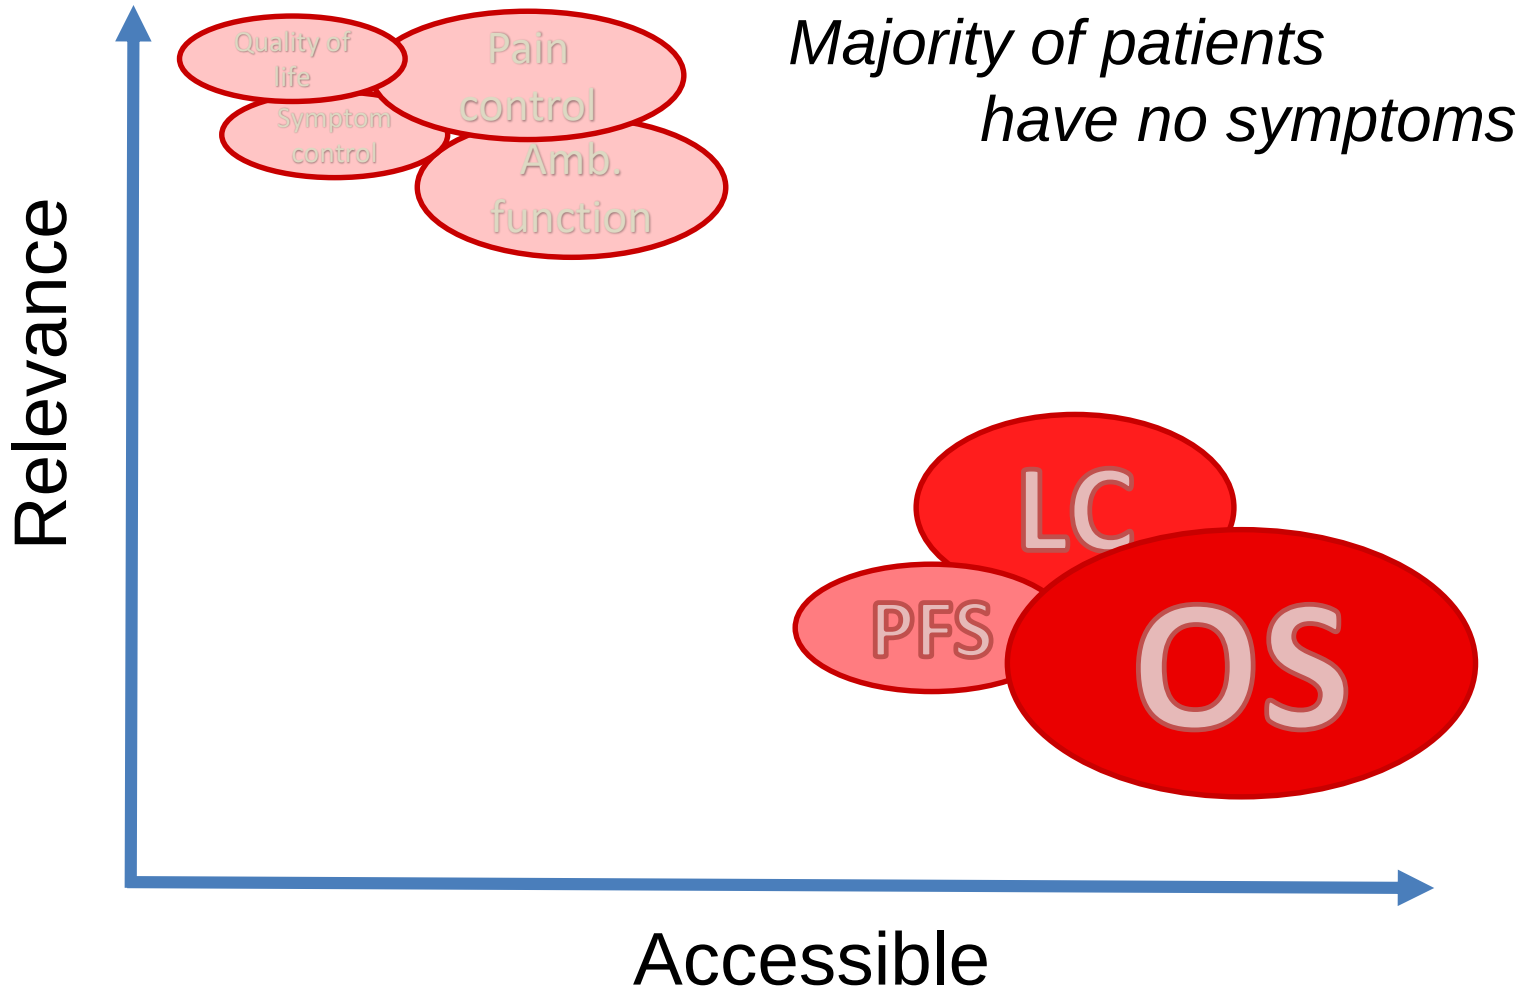
Endpoints in palliative care

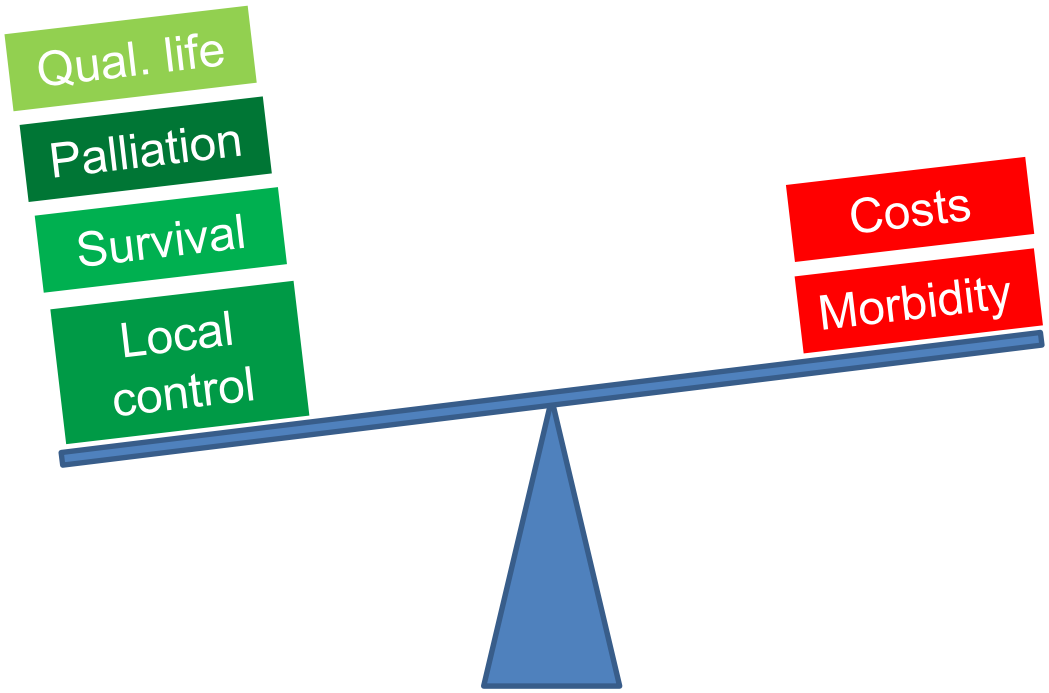


Endpoints in SBRT

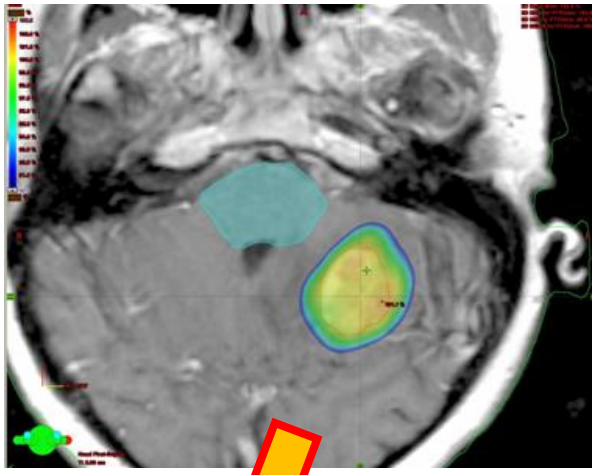


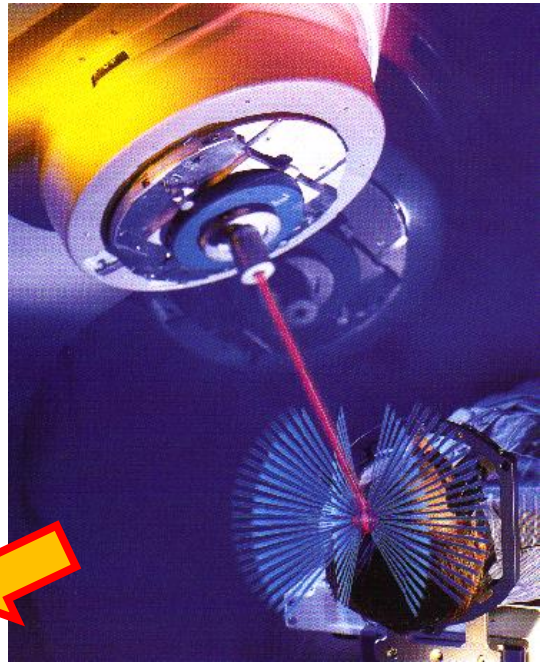
Majority of patients have no symptoms

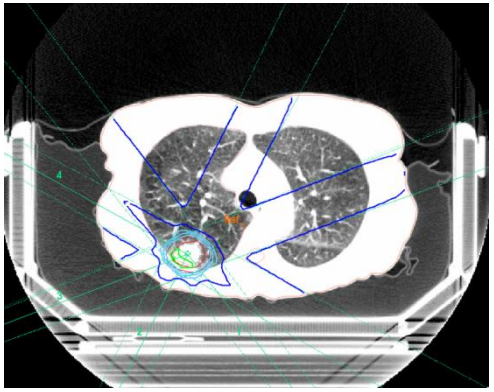
Therapeutic ratio



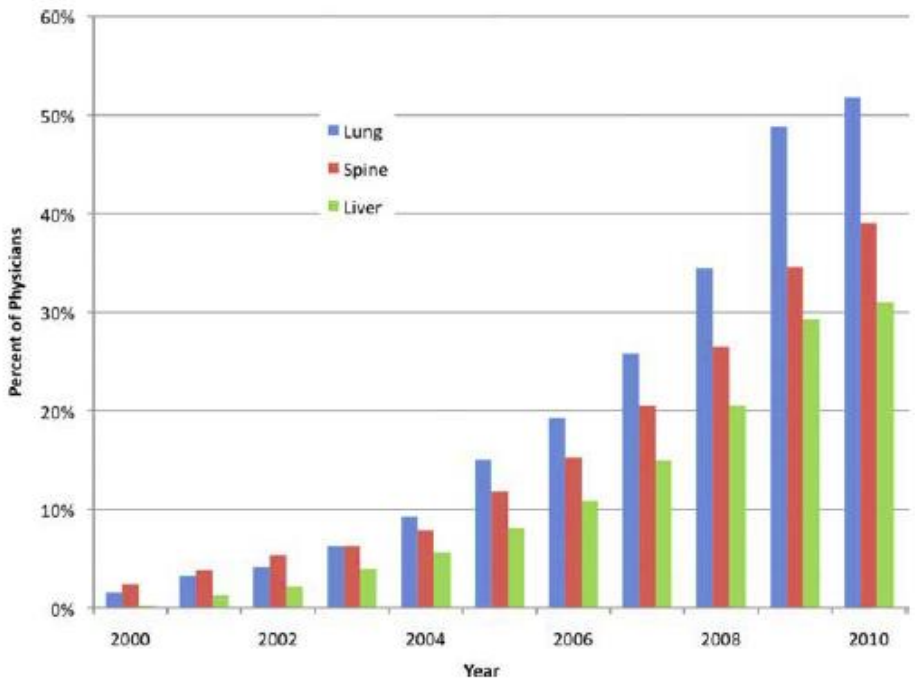
From brain to body





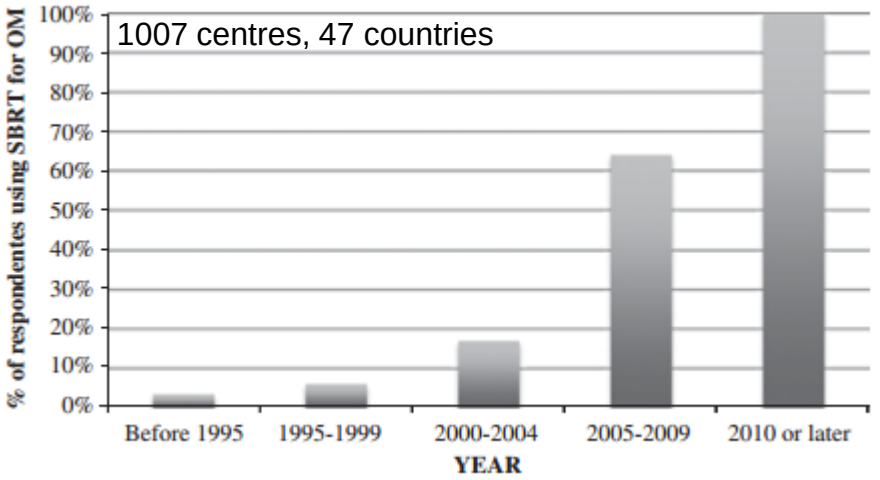


Survey: The use of SBRT



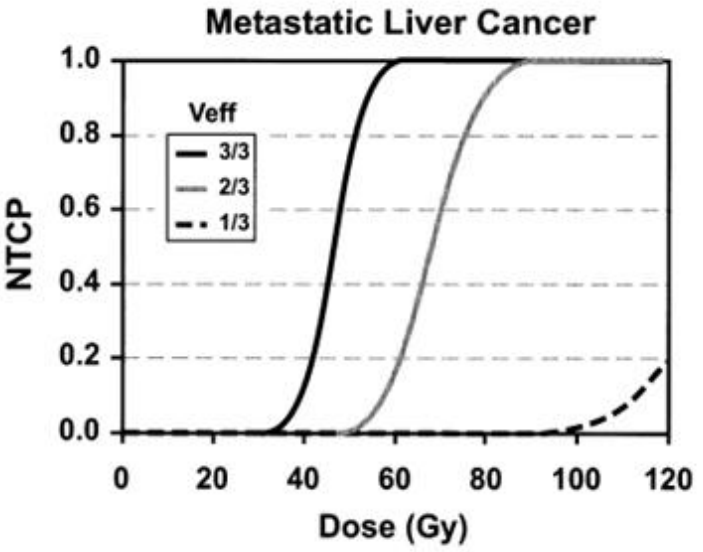
Pan et al. Cancer 117: 4566-72; 2011

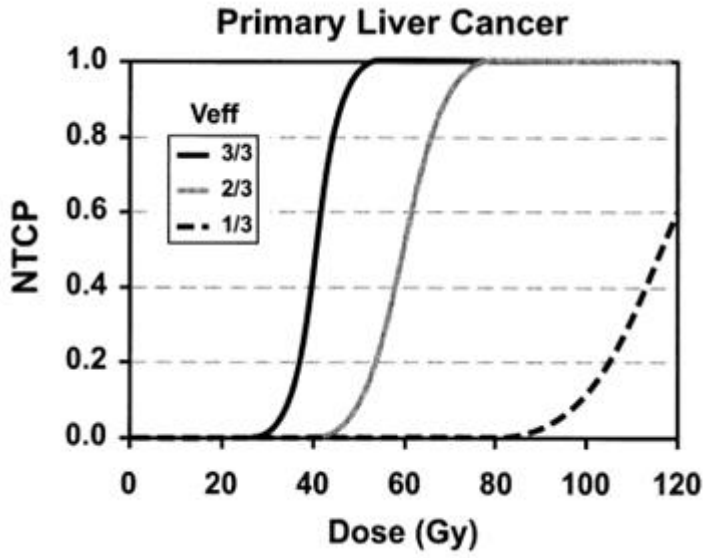
Lung (90%), spine (68%), liver (63%), bones (58%), and adrenals (39%)



Lewis et al. Am J Clin Oncol e-pub; 2015

Challenge I: Risk of morbidity (RILD)



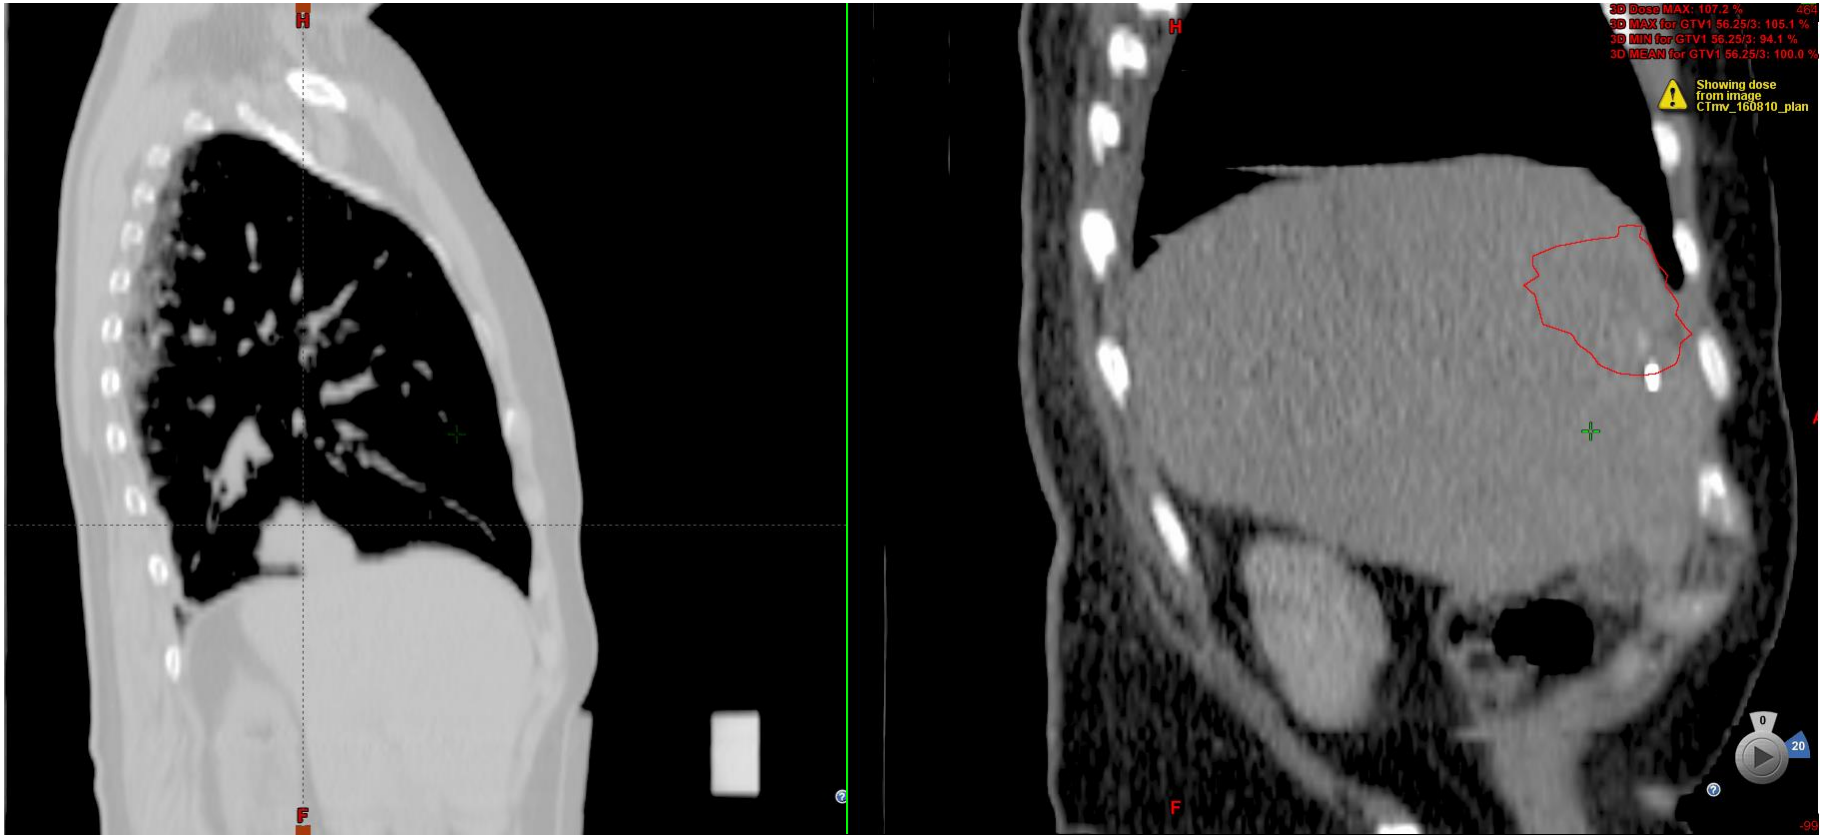


Dawson et al. 2002

Conventional fractionation:

- TD_{50} in metastases patients < 46 Gy
- TD_{50} in primary liver cancer < 40 Gy
  - Dawson et al. IJROBP 53: 810; 2002
- TD_{50} in non-HBV carriers: 50 Gy
- TD_{50} in HBV carriers: 46 Gy
  - Cheng et al. IJROBP 60:1502; 2004

Challenge II: Moving target



Case: colorectal metastases

- 68 year old man with T4N1M0 rectal cancer
- Chemo-radiation of the rectum nov 2014
- Coronary artery stenosis and angina during chemotherapy
- Liver metastases may 2015

SBRT for prostate cancer metastases

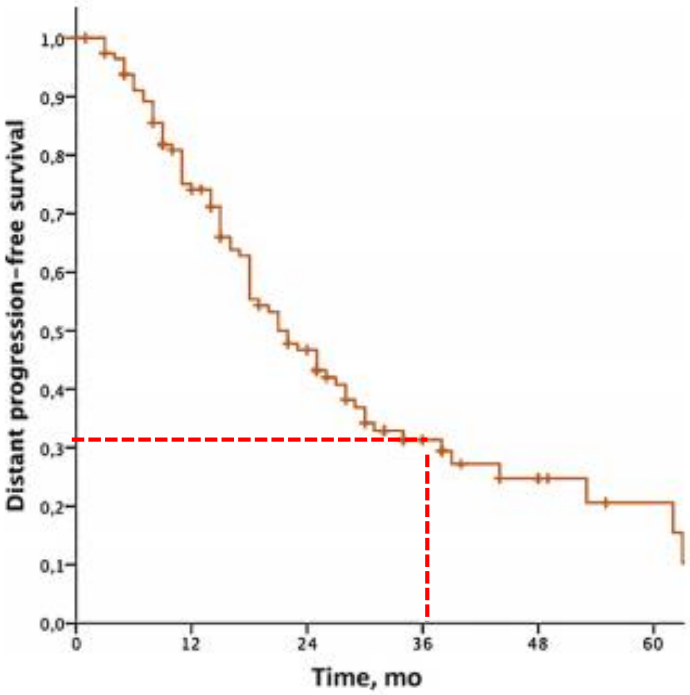

Fig. 1 – Kaplan-Meier analysis depicting time to distant progression.

- Multi-institutional database (n=119)
- Hormone naïve with metastases in:
  - Lymph nodes (n=72)
  - Bone (n=43)
  - Viscera (n=2)
- Number of metastases (1-3; 1 met.: 72%)
- LPFS 79% (BED<100 Gy) and 99% (BED≥100 Gy)
- The median time to start of palliative ADT was 28 months (95% CI, 16.2–69.7)
- The 3- and 5-yr OS was 95% and 88%, respectively

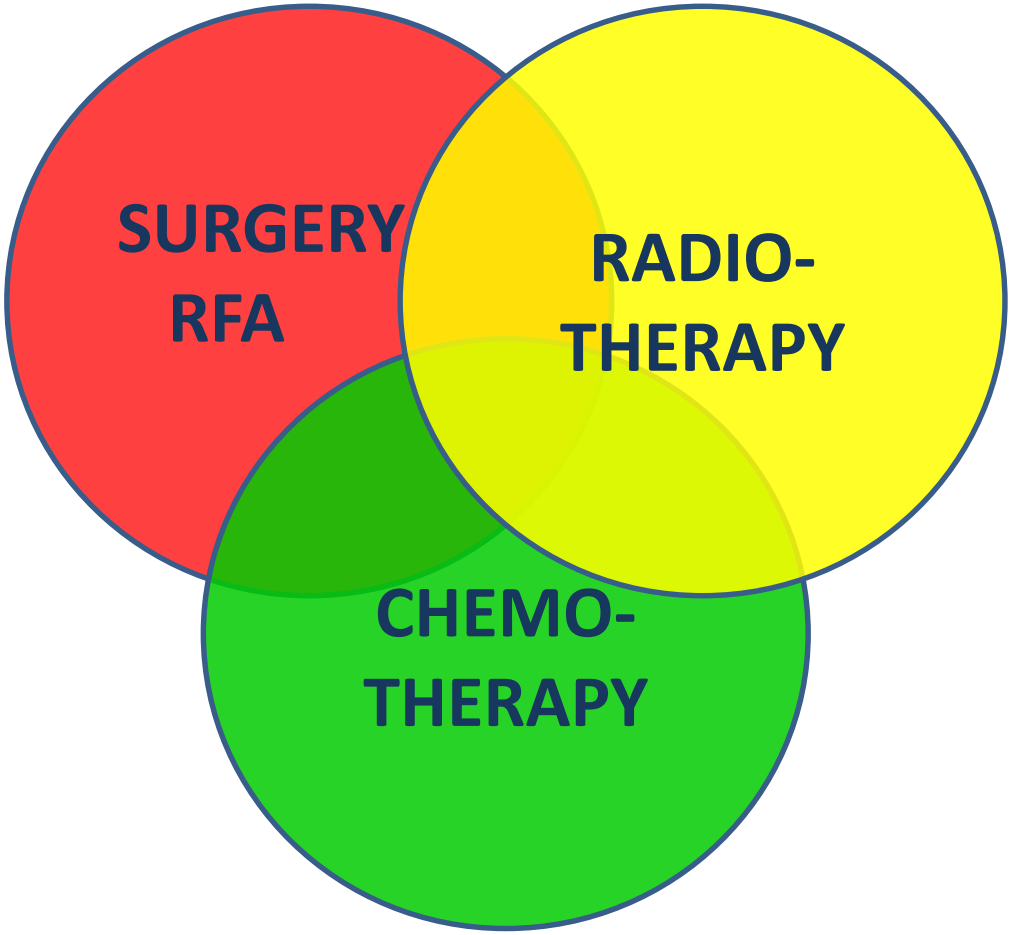
P. Ost et al. Eur Urol 2016; 69(1): 9-12

SBRT of prostate cancer and systemic therapies

- *Is SBRT replacing systemic therapy?*
- *Or should they be combined?*

- ***TOAD trial*** *(Duchesne et al, ASCO 2015): immediate versus delayed ADT at PSA relapse after definitive therapy*
  - *HR=0.55 (CI: 0.30-1.00)*
- ***CHAARTED-*** *(Sweeney et al NEJM 2015): ADT+docetaxel versus ADT alone in advanced stage hormone sensitive PCa*
  - *HR=0.61 (CI: 0.47-0.80)*
  - *m-OS: 58 and 44 months, respectively*
- ***STAMPEDE*** *(James et al Lancet 2016): SOC+docetaxel versus SOC in advanced stage hormone sensitive PCa*
  - *HR=0·78 (CI: 0·66–0·93)*
- *Combination with immune stimulating agents*

Treatment of cancer in a Multidisciplinary Team



Conclusions – SBRT in palliation

……, but evidence is still lacking

- We may cure a few. At least, we observe long-term survivors after SBRT for metastases
- Some patients may benefit in terms of prolonged survival
- Ablation of metastases may prevent cancer related symptoms

Conclusions – SBRT in palliation

Experience based on selected patients

- Long-term survival after SBRT may be achieved in patients with favorable prognostic factors:
  - Colorectal and prostate primaries
  - Good performance status
  - Small size of the metastases
  - Low number of metastases
- Few patients with grade $\geq$ 3 morbidities
- Candidates for SBRT should enter phase III trials

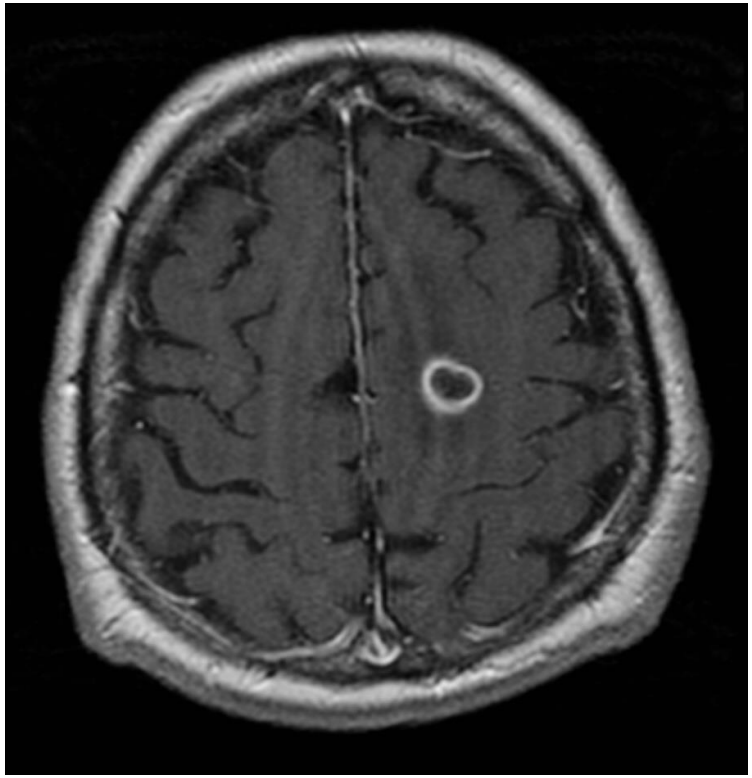
Treatment of patients with solitary brain metastasis

Morten Høyer

Aarhus University Hospital

hoyer@aarhus.rm.dk



ESTRO School

Epidemiology of brain metastases

Accounting for 50% of all brain tumors

Most common brain tumor

Increasing incidence

- More use of MRI
- Some patients live longer with targeted therapy with limited activity in the brain (i.e. HER-2 pos breast cancer)

Epidemiology of brain metastases

Primary sites	
Lung	50-60%
Breast	15-20%
Melanoma	5-10%
Gastrointestinal	4-6%
Genitourinary	3-5%
Other	3-5%
Unknown primary	4-8%

Newton: *Am Fam Physician.* 1999 Feb 15;59(4):878-886.

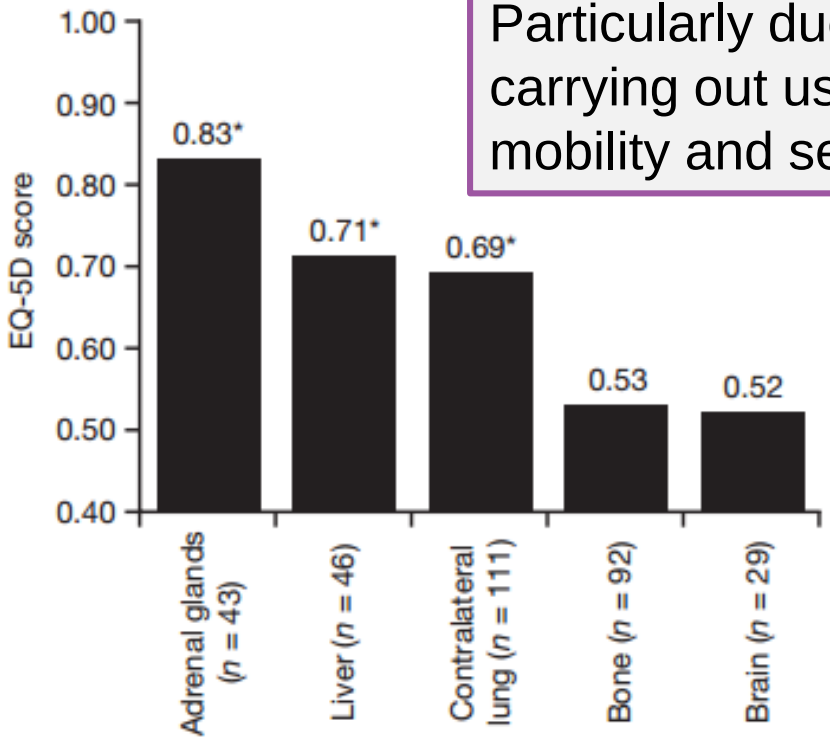
Symptoms and signs of brain metastases

Symptoms	
Headache	49%
Mental problems	32%
Focal weakness	30%
Ataxia	21%
Seizures	18%
Speech problems	12%

Clinical signs	
• Hemiparesis	59%
• Cognitive deficit	58%
• Sensory deficit	21%
• Papillary edema	20%
• Ataxia	19%
• Apraxia	18%

Impact of brain metastasis on qol

Advance stage NSCLC patients with one metastasis site
France and Germany; N=365 pts.



Particularly due to difficulty in carrying out usual daily activities, mobility and self-care

Roughley et al ISPOR 2014

Management patients with brain metastases

Metastasis directed therapy

(Systemic therapy)

Supportive management of metastasis-related conditions

- *Edema*
- *Seizures*
- *Venous thrombosis*

Cortico-steroids on brain metastasis patients

Reduces peritumoral vasogenic edema

Antiemetic and analgesic effects

Improve appetite and mood

Why not high-dose steroids in all brain metastasis patients?

Cortico-steroids to patients with brain metastases

No evidence for corticosteroids patients without symptoms (mass effects)

Corticosteroids are recommended to provide temporary symptomatic relief of symptoms related to increased intracranial pressure and edema secondary to brain metastases

Dexamethasone is the best choice

a starting dose of 4 – 8 mg/day of dexamethasone be considered severe symptoms consistent with increased intracranial pressure, it is recommended that higher doses such as 16 mg/day or more be considered

Ryken et al. J Neurooncol (2010) 96:103–114

……..

Definition: solitary brain metastasis

- Only **ONE** metastasis in the brain on contrast enhanced T1W-MRI
- Symptoms and clinical signs consistent with findings on MRI

65% die from intra-cranial progression

End-points:
- Quality of life
- Neurocognitive function
- Functional independency
- Overall survival
- Brain control
- Distant brain control
- Local control

Is SRT better than surgical resection?

Endpoints:

- Failure free survival
- Overall survival

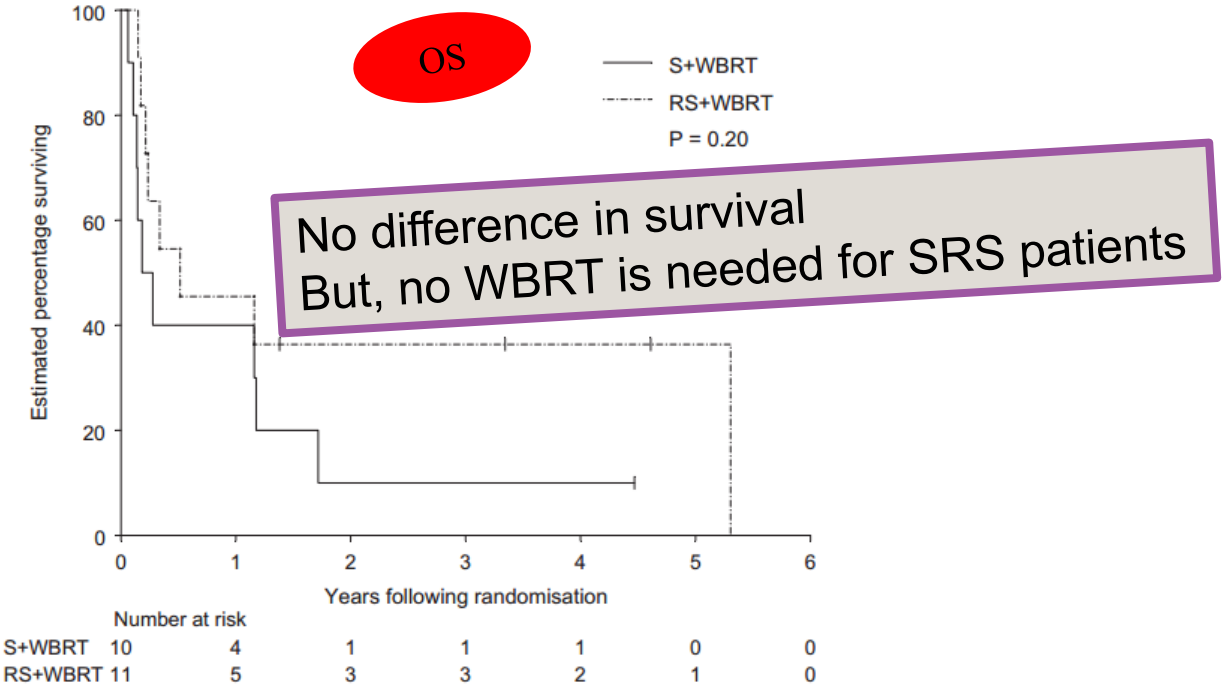

Fig. 2. Overall survival by arm, intention-to-treat, 21 patients. S + WBRT, surgery + whole brain radiotherapy; RS + WBRT, radiosurgery + whole brain radiotherapy.

JAMA Oncology Clinical Evidence Synopsis

Targeted Therapy as an Alternative to Whole-Brain Radiotherapy in *EGFR*-Mutant or *ALK*-Positive Non–Small-Cell Lung Cancer With Brain Metastases

Pablo Martínez, MD, PhD; Raymond H. Mak, MD; Geoffrey R. Oxnard, MD

JAMA Oncology Published online May 18, 2017

Evidence Profile

No. of randomized clinical trials: 3

Comparisons: Icotinib vs whole-brain radiotherapy plus chemotherapy; ceritinib vs chemotherapy; alectinib vs crizotinib

No. of patients randomized: 176; 376; 207

Patients with brain metastases, %: 100%; 32%; 20%

Brain metastases characteristic: 3 or more; stable with or without any symptoms; asymptomatic

Primary outcome: Intracranial progression-free survival; overall progression-free survival; overall progression-free survival

Benefit primary end point: Hazard ratio (HR) 0.56; HR 0.55 (0.70 with brain metastases); HR 0.34 (0.08 with brain metastases)

CLINICAL APPLICATION Patients with *EGFR*-mutant or *ALK*-positive non–small-cell lung cancer with brain metastases now have the potential to achieve a prolonged survival. Through use of highly active targeted therapies, whole-brain radiotherapy can be safely postponed, diminishing toxic effects that could impair quality of life.

Recommendations on Disease Management for Patients With Advanced Human Epidermal Growth Factor Receptor 2–Positive Breast Cancer and Brain Metastases: American Society of Clinical Oncology Clinical Practice Guideline

J Clin Oncol 32:2100-2108. © 2014

Key Recommendations

- For patients with a favorable prognosis for survival and a single brain metastasis, treatment options include surgery with postoperative radiation, stereotactic radiosurgery (SRS), whole-brain radiotherapy (WBRT; ± SRS), fractionated stereotactic radiotherapy (FSRT), and SRS (± WBRT), depending on metastasis size, resectability, and symptoms. After treatment, serial imaging every 2 to 4 months may be used to monitor for local and distant brain failure.
- For patients with a favorable prognosis for survival and limited (two to four) metastases, treatment options include resection for large symptomatic lesion(s) plus postoperative radiotherapy, SRS for additional smaller lesions, WBRT (± SRS), SRS (± WBRT), and FSRT for metastases > 3 to 4 cm. For metastases < 3 to 4 cm, treatment options include resection with postoperative radiotherapy. In both cases, available options depend on resectability and symptoms.

Cochrane meta-analysis 2007 & 2012

Supportive care versus whole brain radiotherapy

There is a lack of high quality randomized evidence to clarify the value of WBRT versus supportive care alone

Supportive care alone is an option (for example, for patients with poor performance status or widely disseminated cancer based on short life expectancy).

There is lack of contemporary high quality trials to guide practitioners as to which subsets of patients with brain metastases should be managed with supportive care alone without whole brain radiotherapy.

Complications of spinal disease

Pain, progressive instability, neurological symptoms

Yvette van der Linden

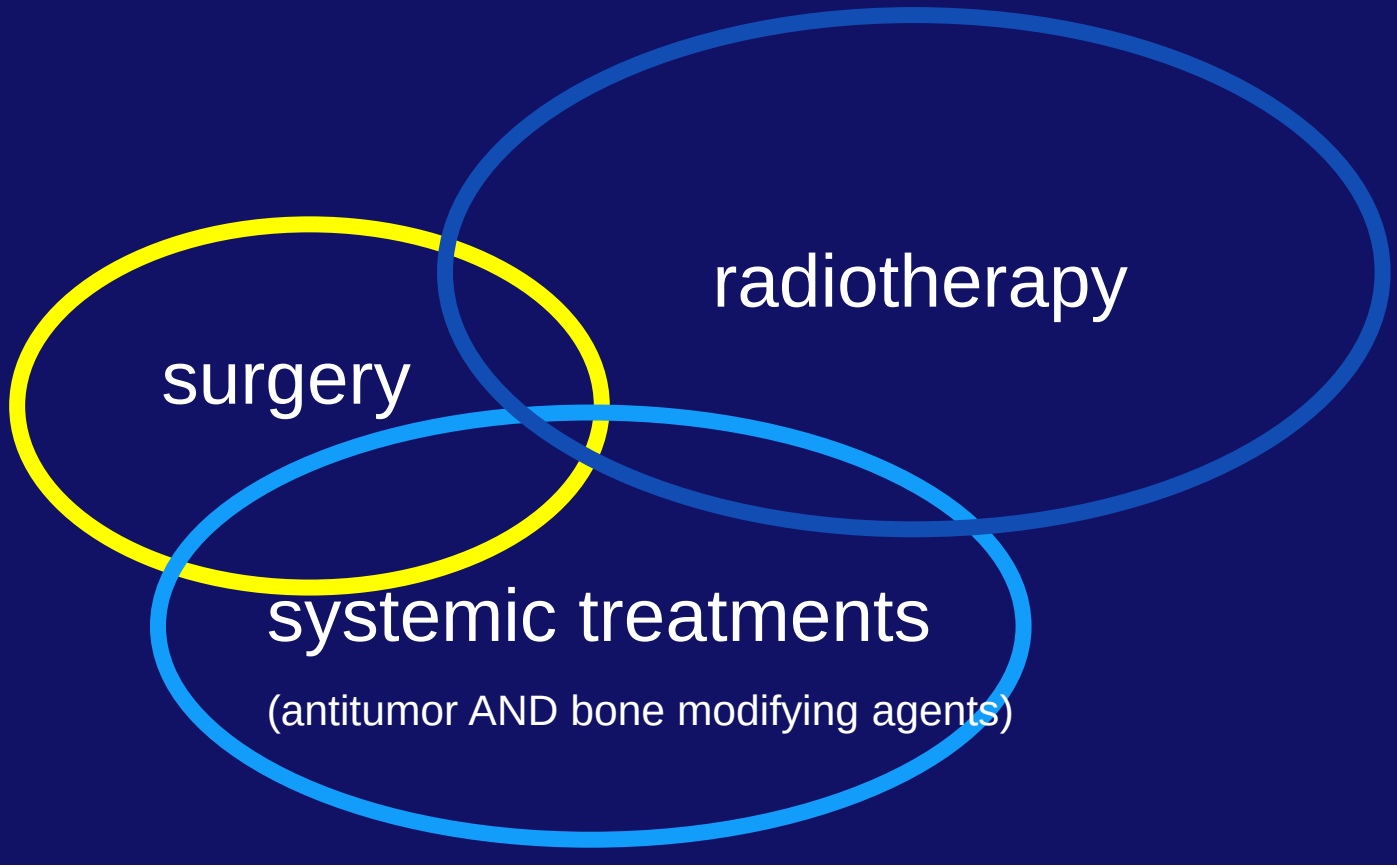
Centre of Expertise Palliative Care

& Dept. of Radiotherapy

Important factors when deciding on spinal treatment

Expected

- survival
- instability
- outcome



Selecting patients for treatment

- Easy
  - Pain only, stable spine
  - Progressive instability with neurological complaints on 1 level
- Less easy
  - Favourable prognosis, pain only, but MSCC on MRI on 1 level
- Difficult
  - Neurological complaints on 3 not-adjacent levels
  - Radiosensitive primary tumor
  - Young age / expected prolonged prognosis (years?)

Conclusions

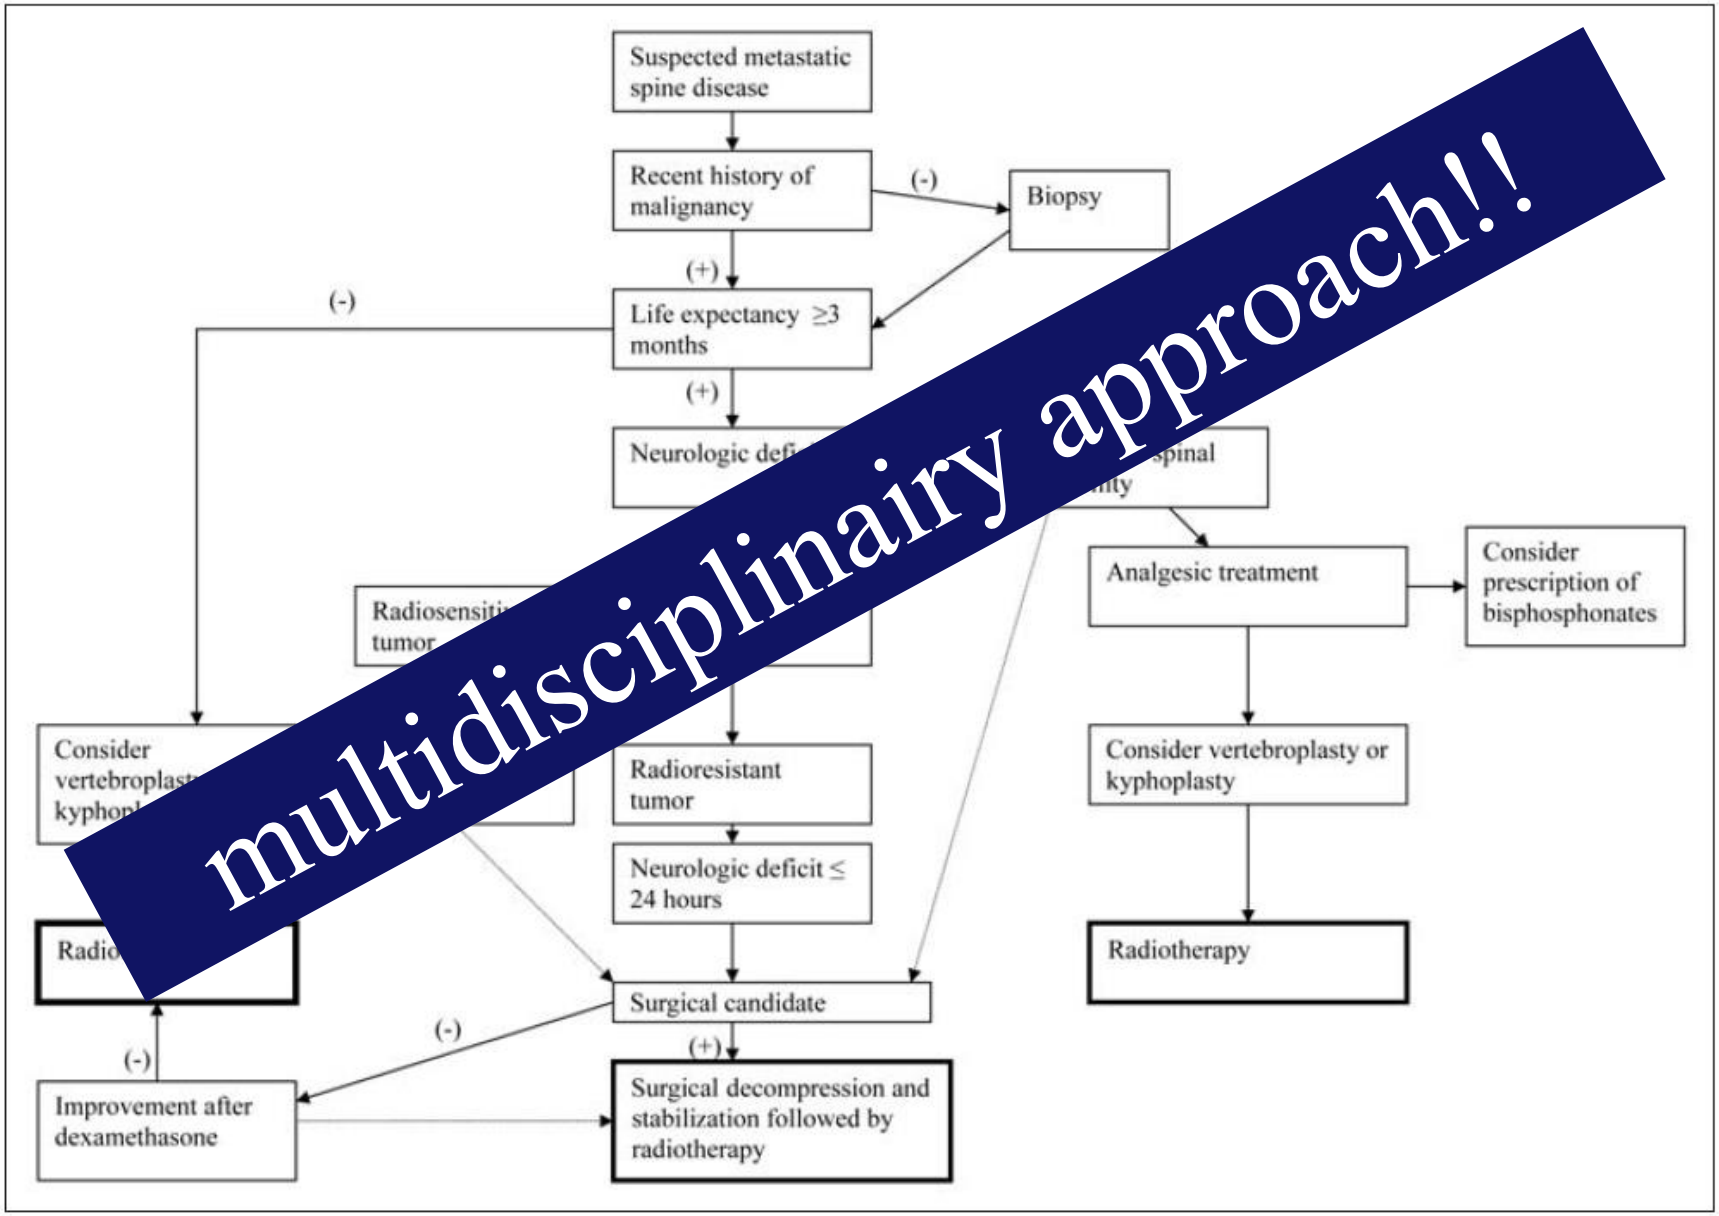
Pain

- RT SF
  - Simple techniques, await outcomes high dose trials
- If progressive pain; consider surgery
- SINS?
- Advanced techniques for retreatment

Neurological symptoms

- RT SF, or, if prolonged prognosis (single metastasis); consider higher doses
- Surgery
  - Survival > 6 months
  - Progressive complaints despite RT
  - New combinations -> preop RT followed by immediate surgery

Decision making protocol for spinal metastases



multidisciplinairy approach!!

R.Bartels, Y van der Linden , W. de Graaf, Ca Cancer J Clin, 2008

Research ongoing

- Prognostic value of SINS
- Finite element modeling to predict fracturing
- New combinations -> pre op RT followed by immediate surgery

Bollen et al. Clin Exp Met 2015

Proceed with RT
Practical considerations → patient comfort

- Quick procedure
- Minimize transfers
- Minimize pain during treatment

- Minimize toxicity

- Influence our choice for
  - Dose
  - Technique

Special palliative clinics

Rapid Radiotherapy Response Program

- Since 1996 -> provide timely palliative radiotherapy to relieve symptoms in patients with advanced cancer.

Specialized clinics and programs

- The RRRP clinic runs daily, Monday through Friday.
- Patients are seen within a week of referral and often treated on the same day of their consultation.
- This clinic has shortened waiting time for radiation treatment in patients with limited life expectancies
- RRRP has been well received by physicians who refer their patients to this service.
- Ongoing palliative care is provided by the referring physician during and after radiotherapy.
- The program is active in research and teaching.

www.sunnybrook.ca

Radiotherapy treatment -> minimum transfers

1. Patient's bed to ambulance stretcher
2. Ambulance stretcher to RT stretcher
3. RT stretcher to CT couch
4. CT couch on to stretcher
5. RT stretcher to linac couch
6. Linac couch to ambulance stretcher
7. Ambulance stretcher to patient's bed

Probably tiring and painful exercise !!

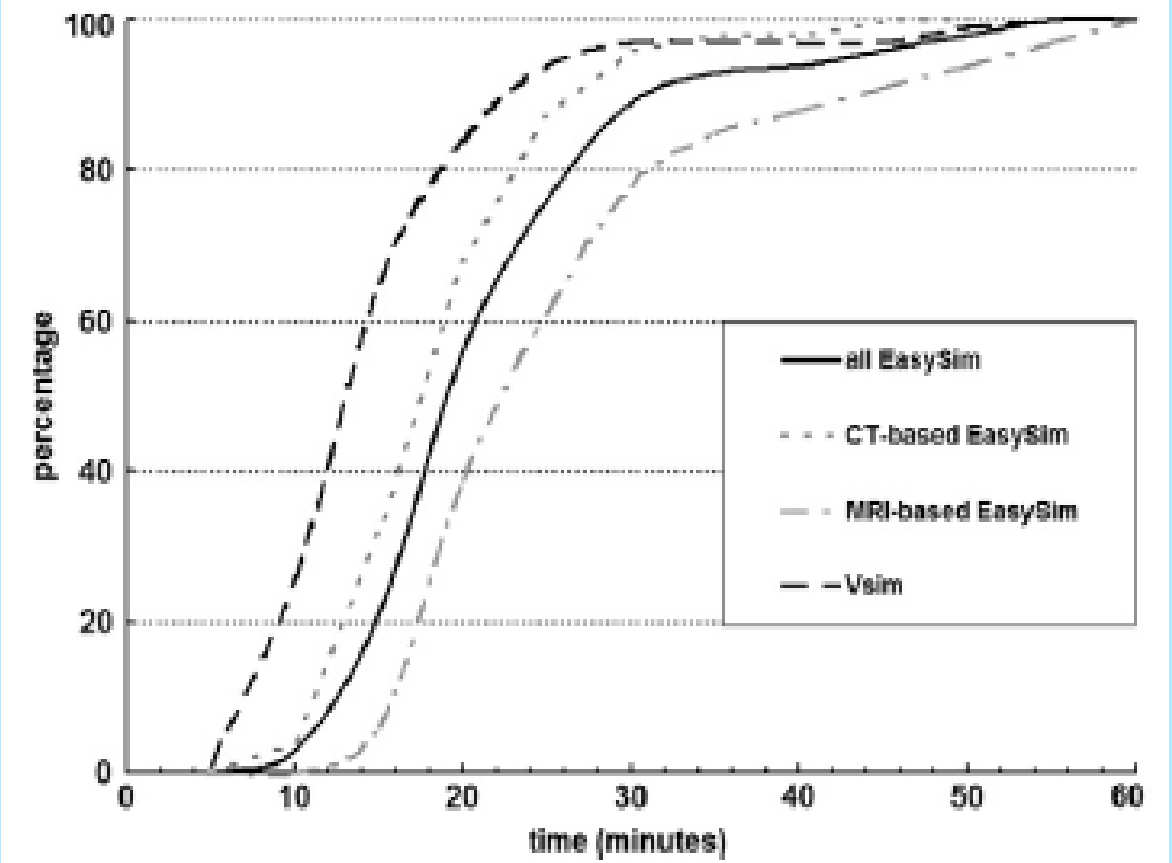
CBCT assisted RT without V-SIM

+ quick procedure

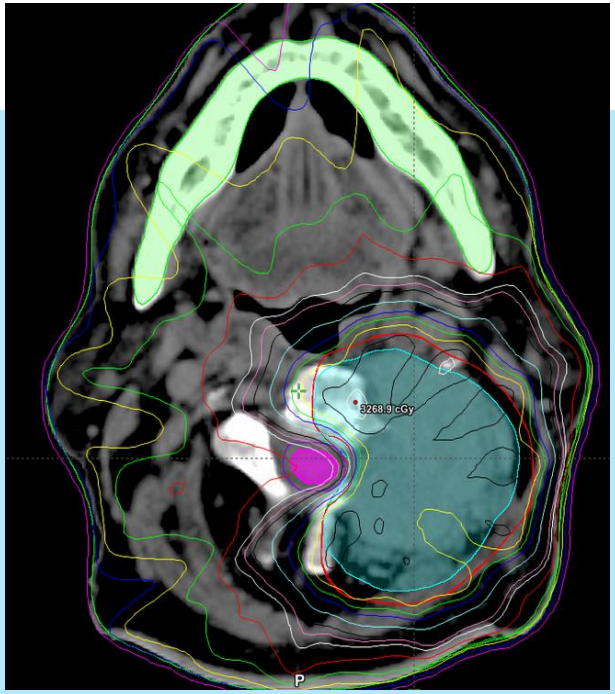
+ ambulance can wait

- No MLC

- Standard dose 5 cm



Haas et al R&O 2013



What are the costs of spinal radiotherapy?

SBRT for spinal metastases is costly

	Conventional radiotherapy ($)	Single-fraction stereotactic body radiosurgery ($)	3-fraction stereotactic body radiosurgery ($)
Hospital and clinic	3,119	9,440	14,681
Physician	1,013	2,204	2,204
Total	4,132	11,644	17,065

Saghal et al, IJROBP 2008

SBRT takes time

Table 1. Average duration of the online treatment strategy performed on phantom

Procedures	Time
Phantom Setup (aligned with lasers)	3.0 min
Cone-beam CT acquisition and processing	3.3 min
Cone-beam CT reconstruction	4.0 min
Transfer to planning system	1.2 min
On-line planning (outlining, beam arrangement and plan evaluation)	6.4 min
Transfer plan to record and verify	0.5 min
Treatment delivery (8 Gy)	4.7 min*
Total	**23.1 min**

Letourneau et al IJROBP 2007

Correction protocols: MVI EPI or CBCT

Off line → conventional EBRT

- single fraction → recording actual delivered radiotherapy field
- multiple fractions → No Action Level protocol

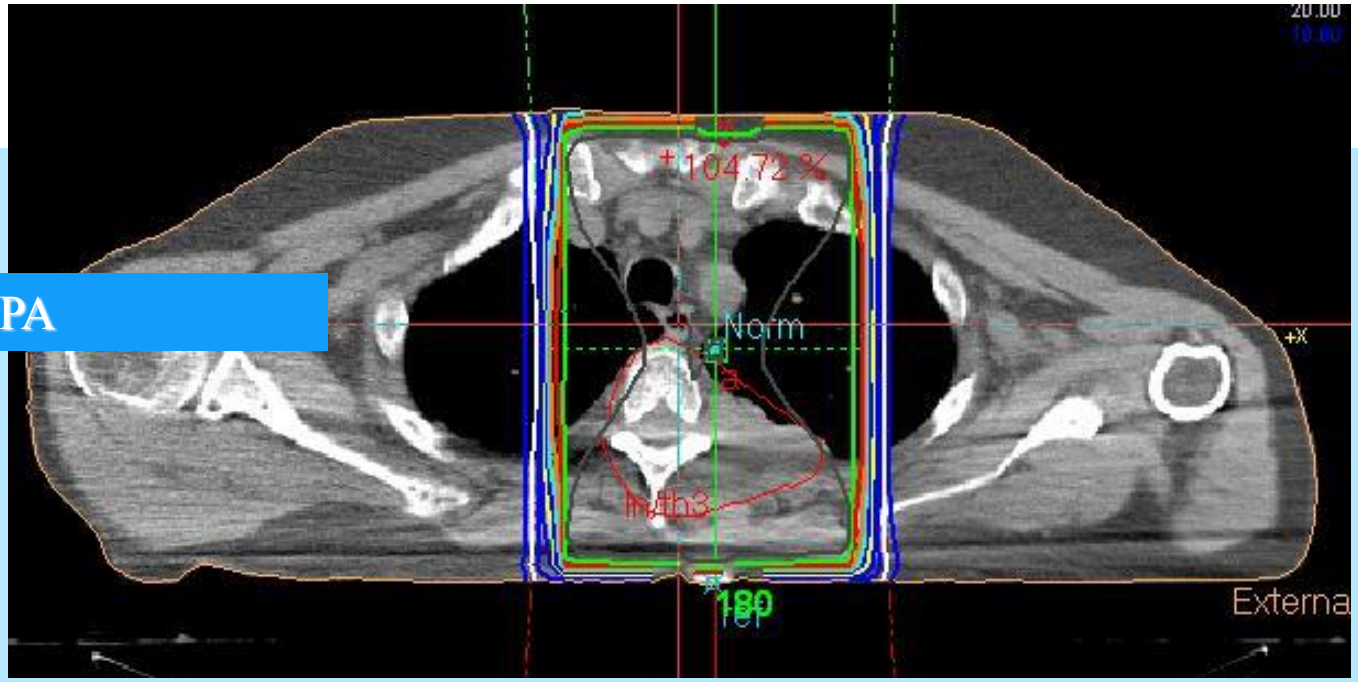
On line

- essential for stereotactic RT; high dose, high precision, risk of myelopathy
- if conventional EBRT; prevention of geographic miss; more time needed at LINAC
- poor man’s online; visual check if PTV is in treatment field
- helpful; automatic remote couch set up

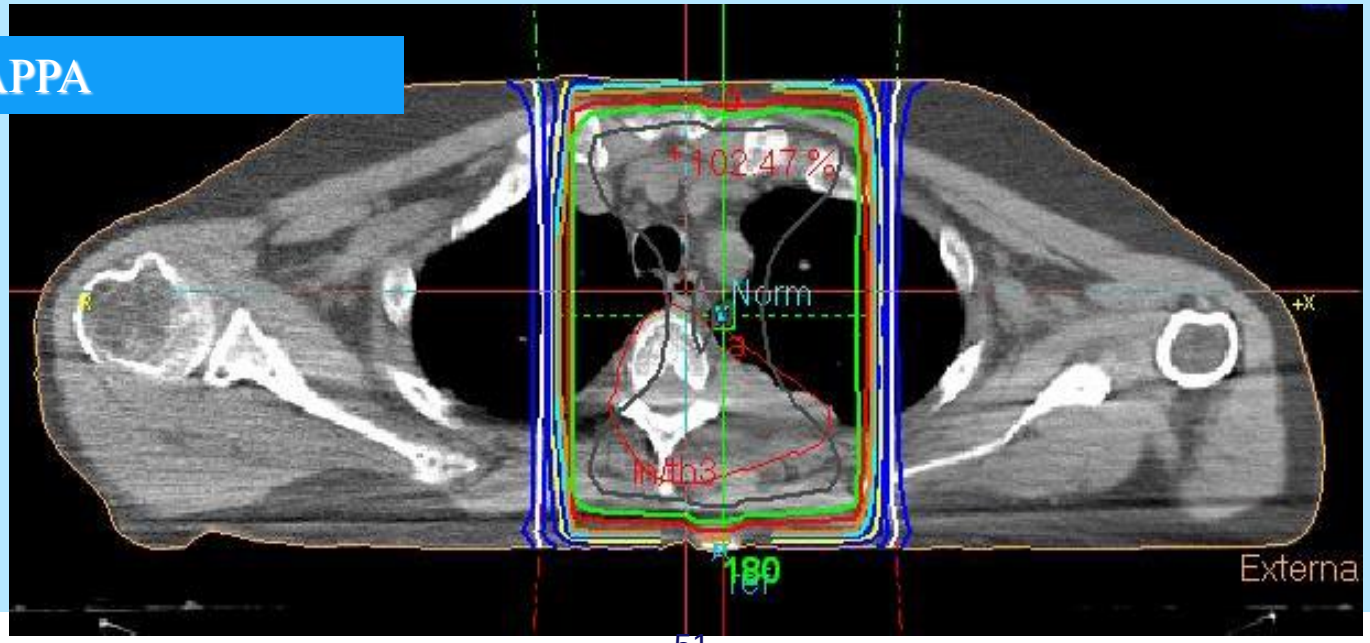
Choice for simulation technique / radiation technique

- Availability of personnel, equipment
- Goal of RT
  - patient selection → short or long term palliation
- Patient comfort
  - mobility, level of pain, other complaints (level of conciousness, nausea, involuntary muscle contractions)

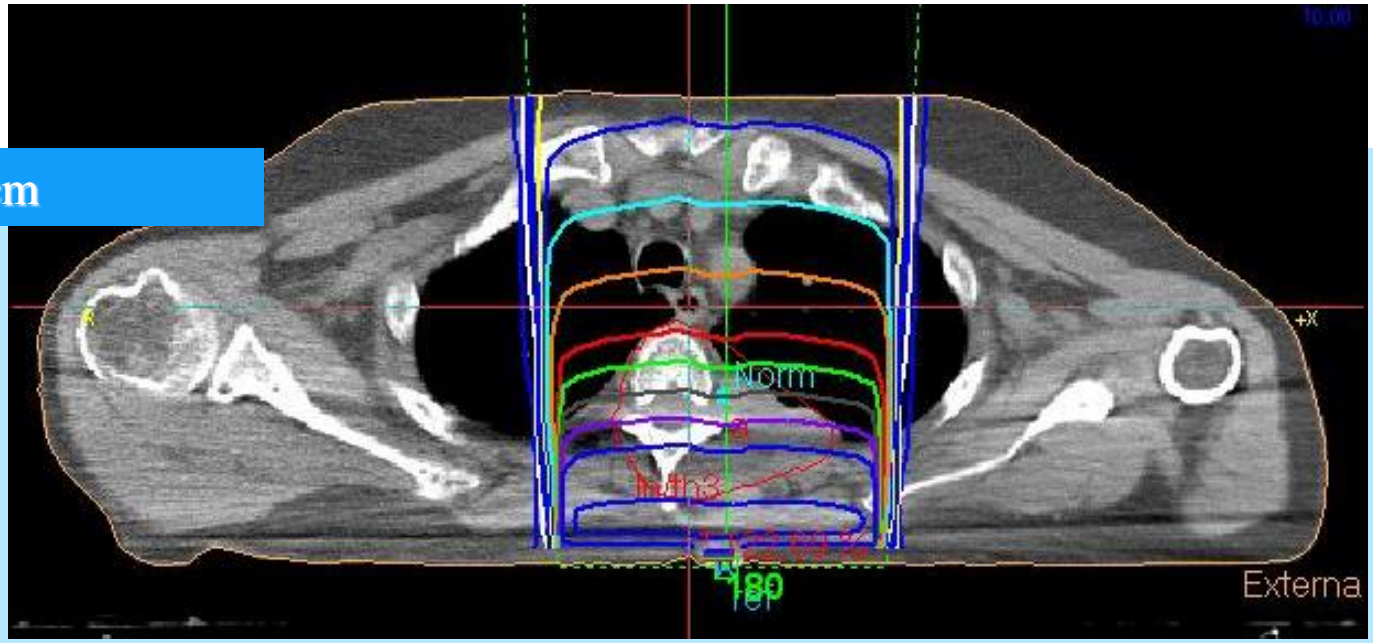
6 MV- APPA



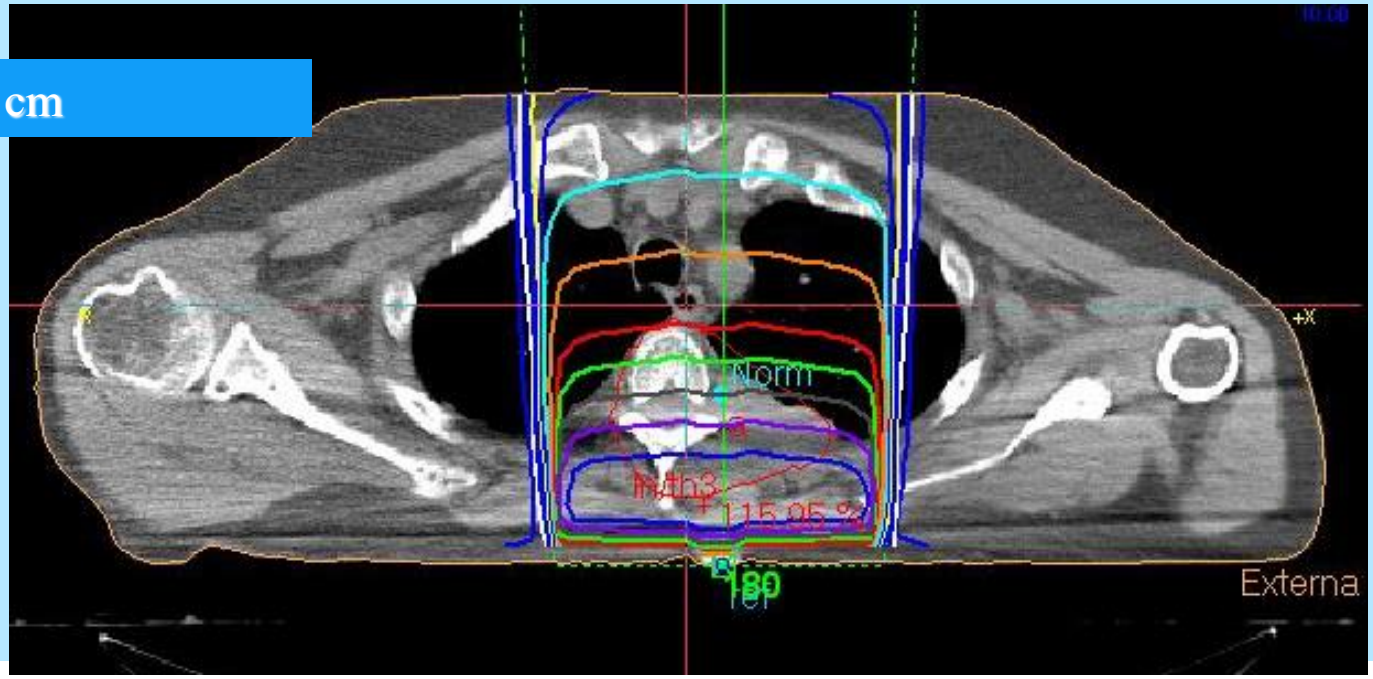
10 MV- APPA



6 MV-6 cm

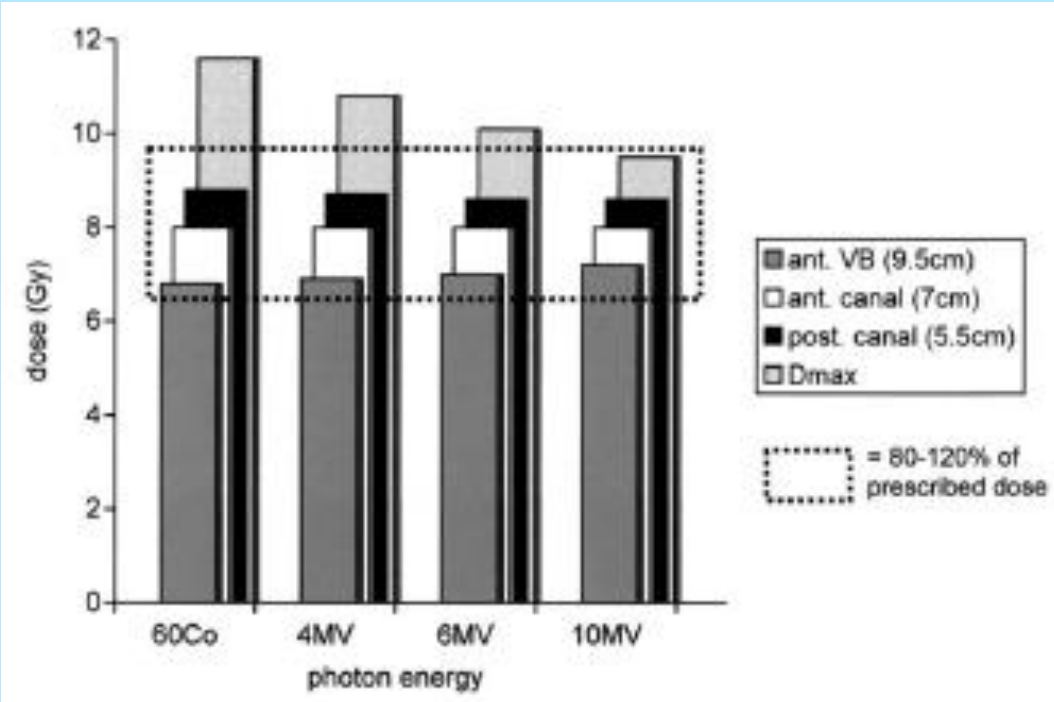


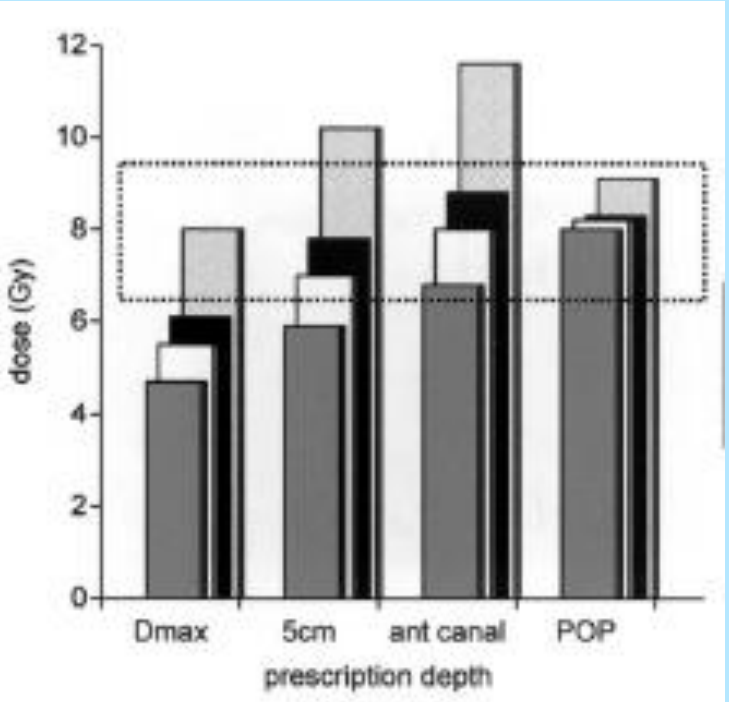
10 MV-6 cm



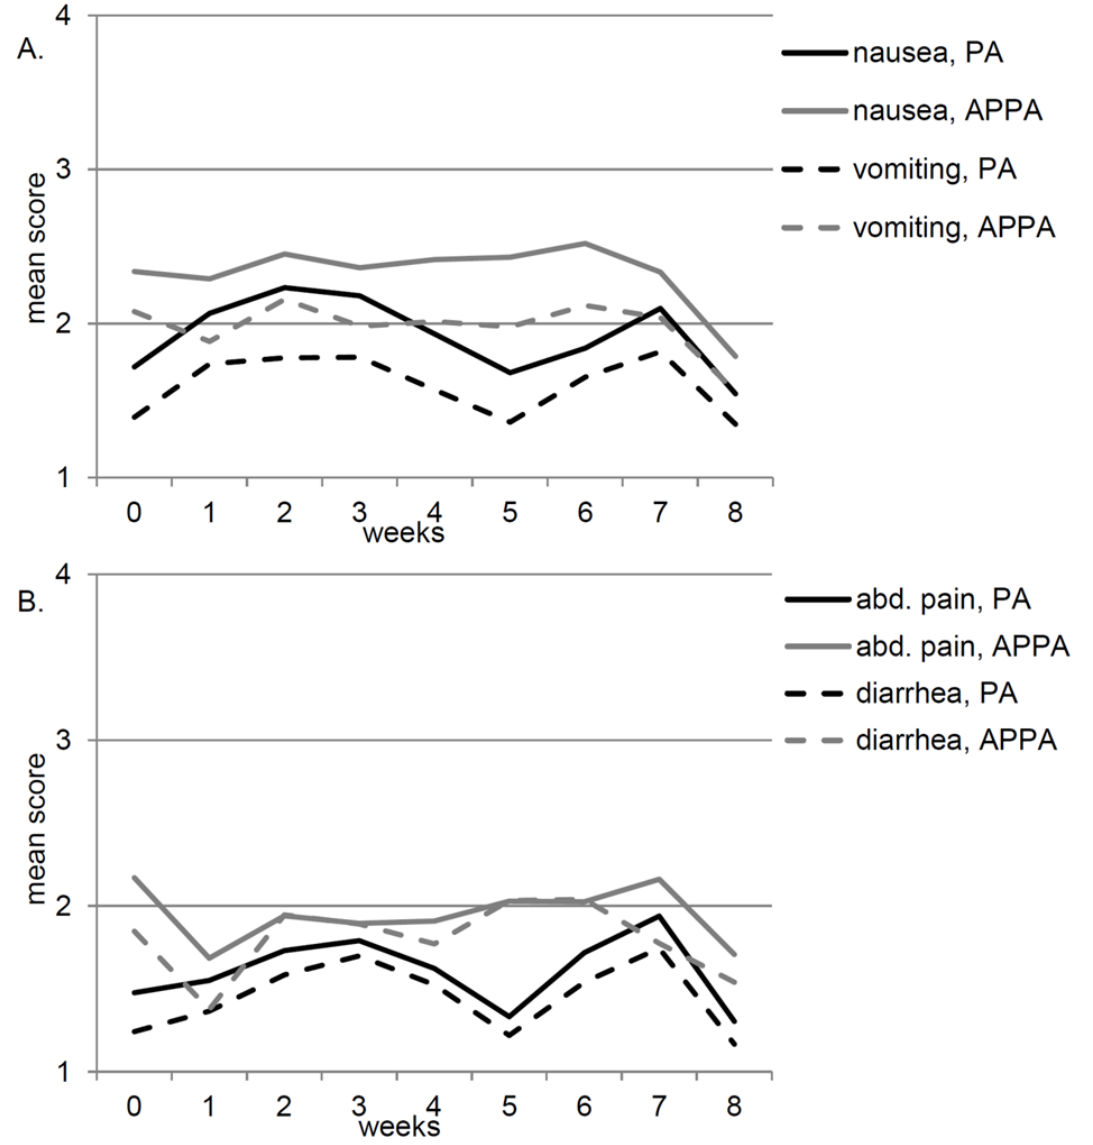
Doseren

- Barton et al, IJROBP 2002
  - Varying MV
  - PA vs APPA





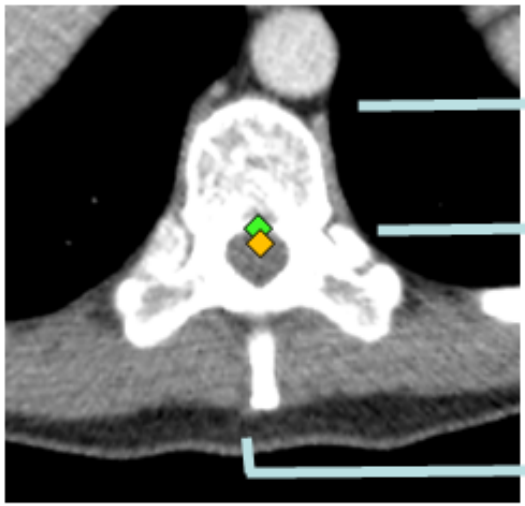
Toxicity after EBRT seems limited; results from DBMS



Westhoff et al, accepted Rad Onc

Optimal settings for simple dose planning -> V-SIM

- Dmax 115%
- Dmin 80%



Initial beam set up for all patients

- 10 MV
- PA veld

Poster ESTRO 2010

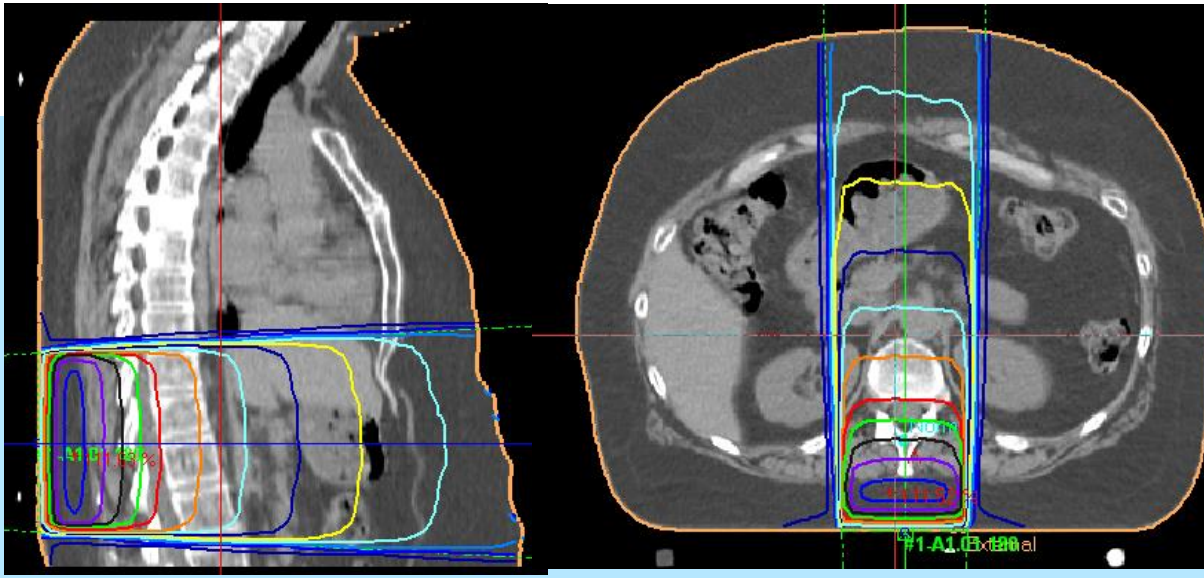
Modifications

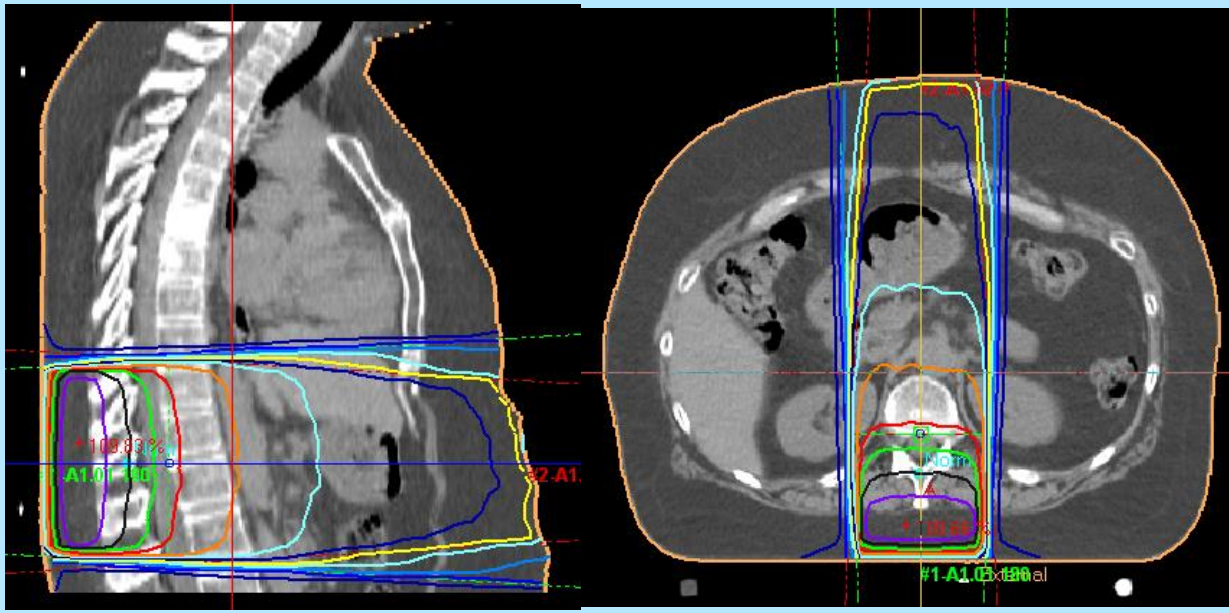
- If Dmax > 115%, and/or Dmin < 80%

↓

Add AP beam with increasing weight until 80% of total dose ventrally

Time= 10 minutes



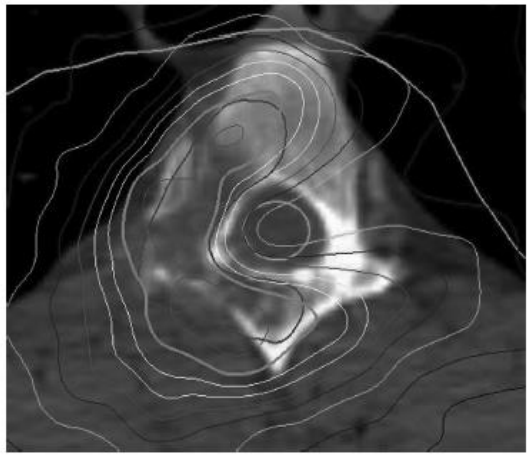


Ideal situation

MDT meetings

Optimally equipped radiation centre

1. proper patient selection
2. availability of EBRT and stereotactic RT
3. simulation and planning on CT or CBCT
4. online correction protocol



Gerstzen et al, Spine 2007

SUMMARY 1

	RS / SBRT	conv. RT
Higher rates of pain relief:		
Overall response:	82%	75%
Complete response:	43%	15%
More rapid pain relief:	1-4 wks.	1-4 wks.
Less side effects:		
Grade ≥3 acute toxicity:	mostly 0%	mostly 0%
Vertebral fractures:	2-39%	0-3%

In-field Recurrence after Long-course RT

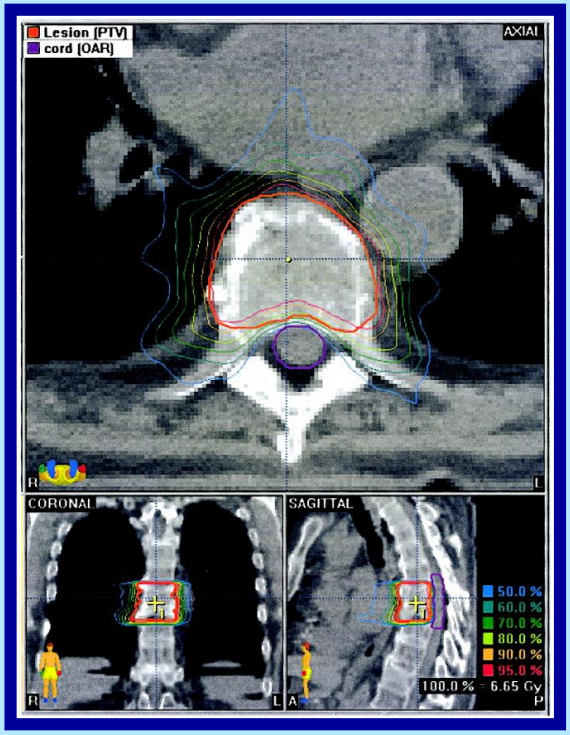
Surgery ? Re-RT ? (=> new RT-Techniques)

IMRT / Tomotherapy

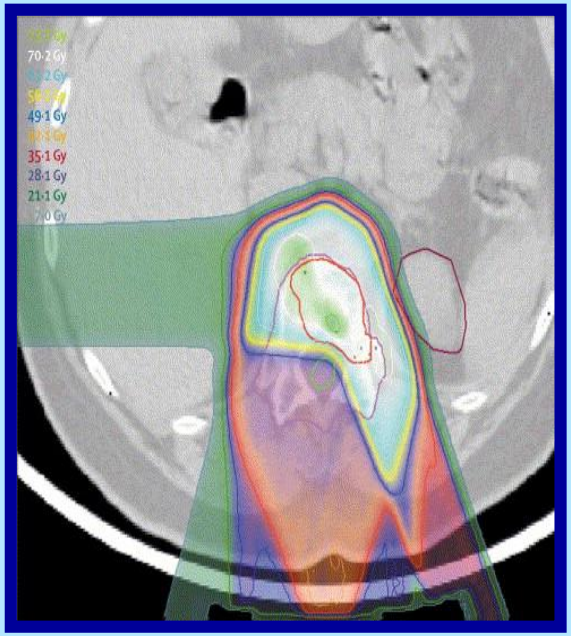
Milker-Zabel et al., IJROBP, 2003

Ryu et al., Cancer, 2003

Intensity-modulated RS

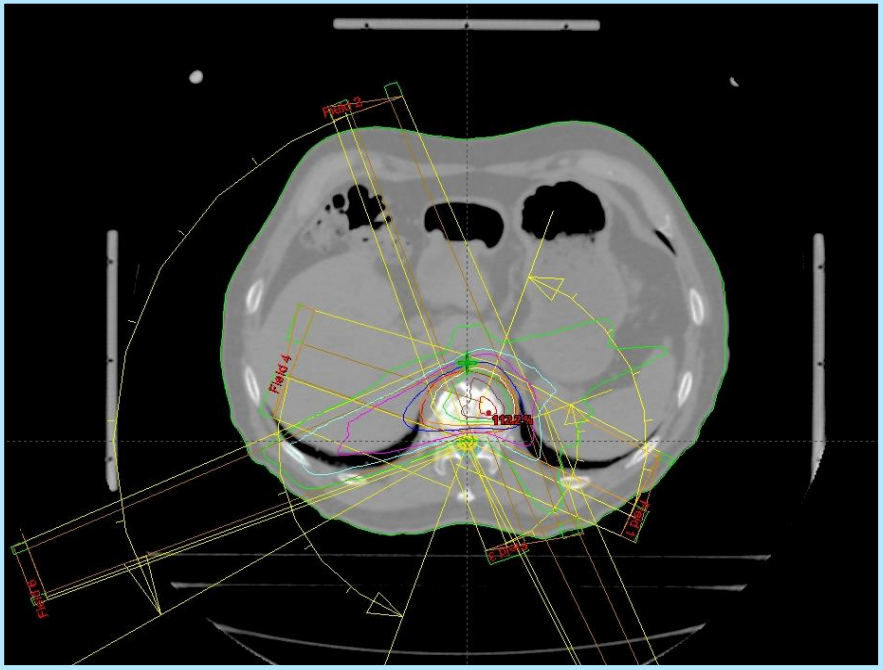


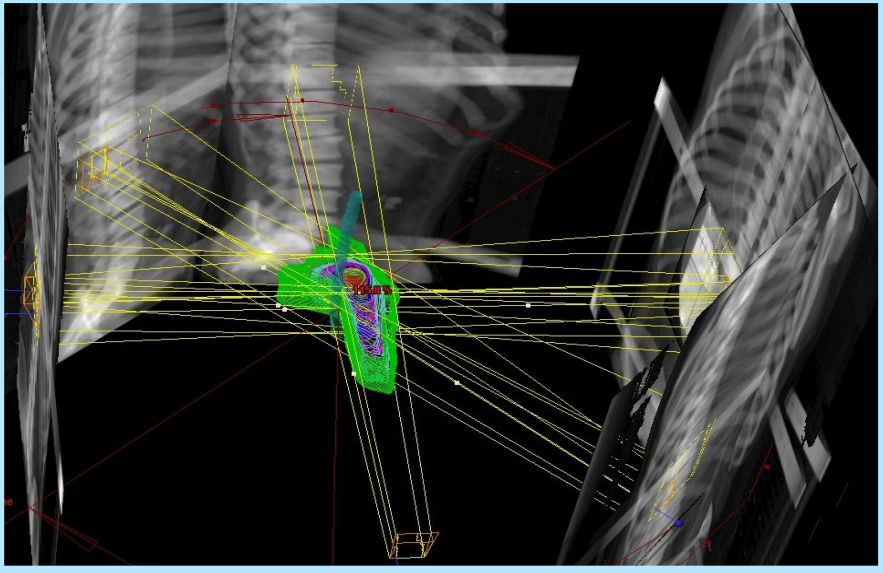
Protons

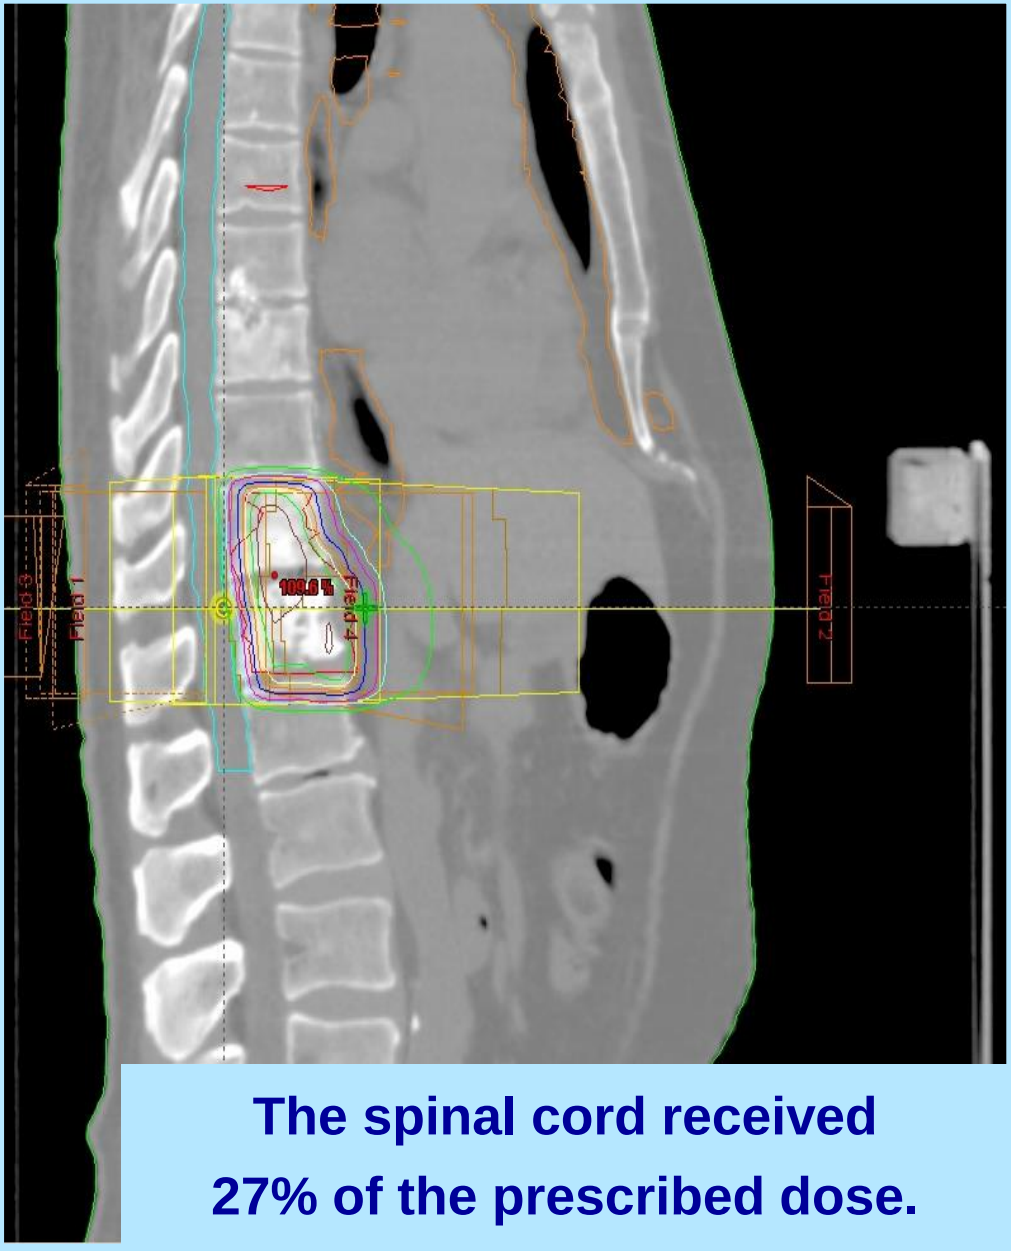


Prasad, Lancet Oncol, 2005

Fractionated SBRT: Re-RT (12x2 Gy) 12 mos. after

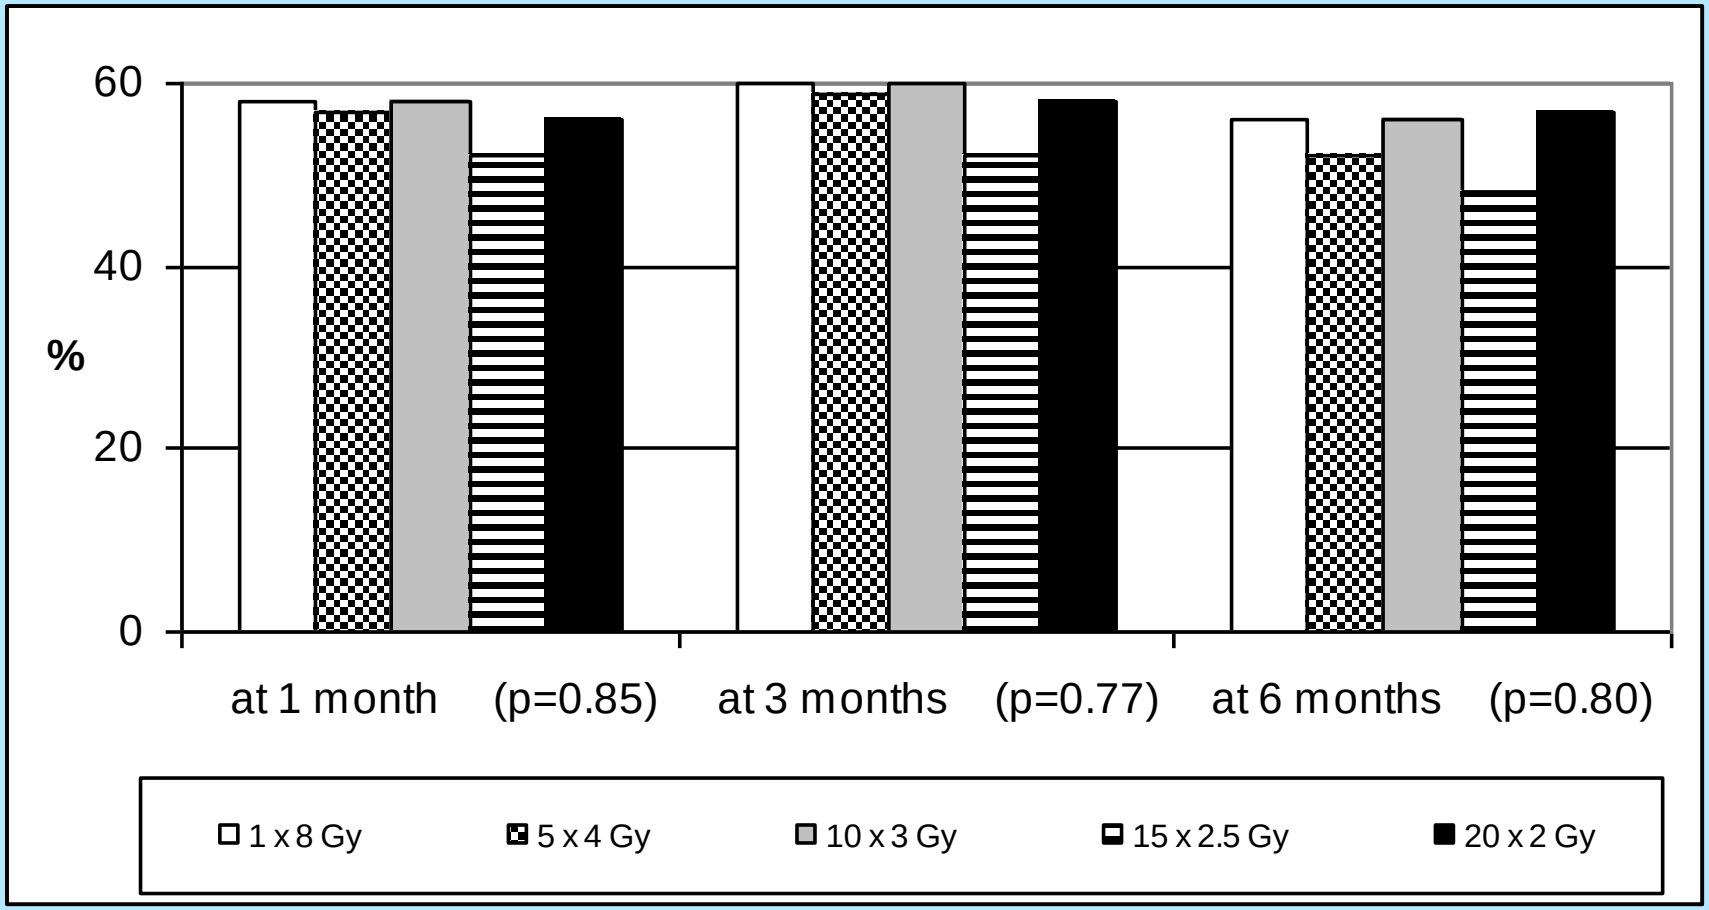






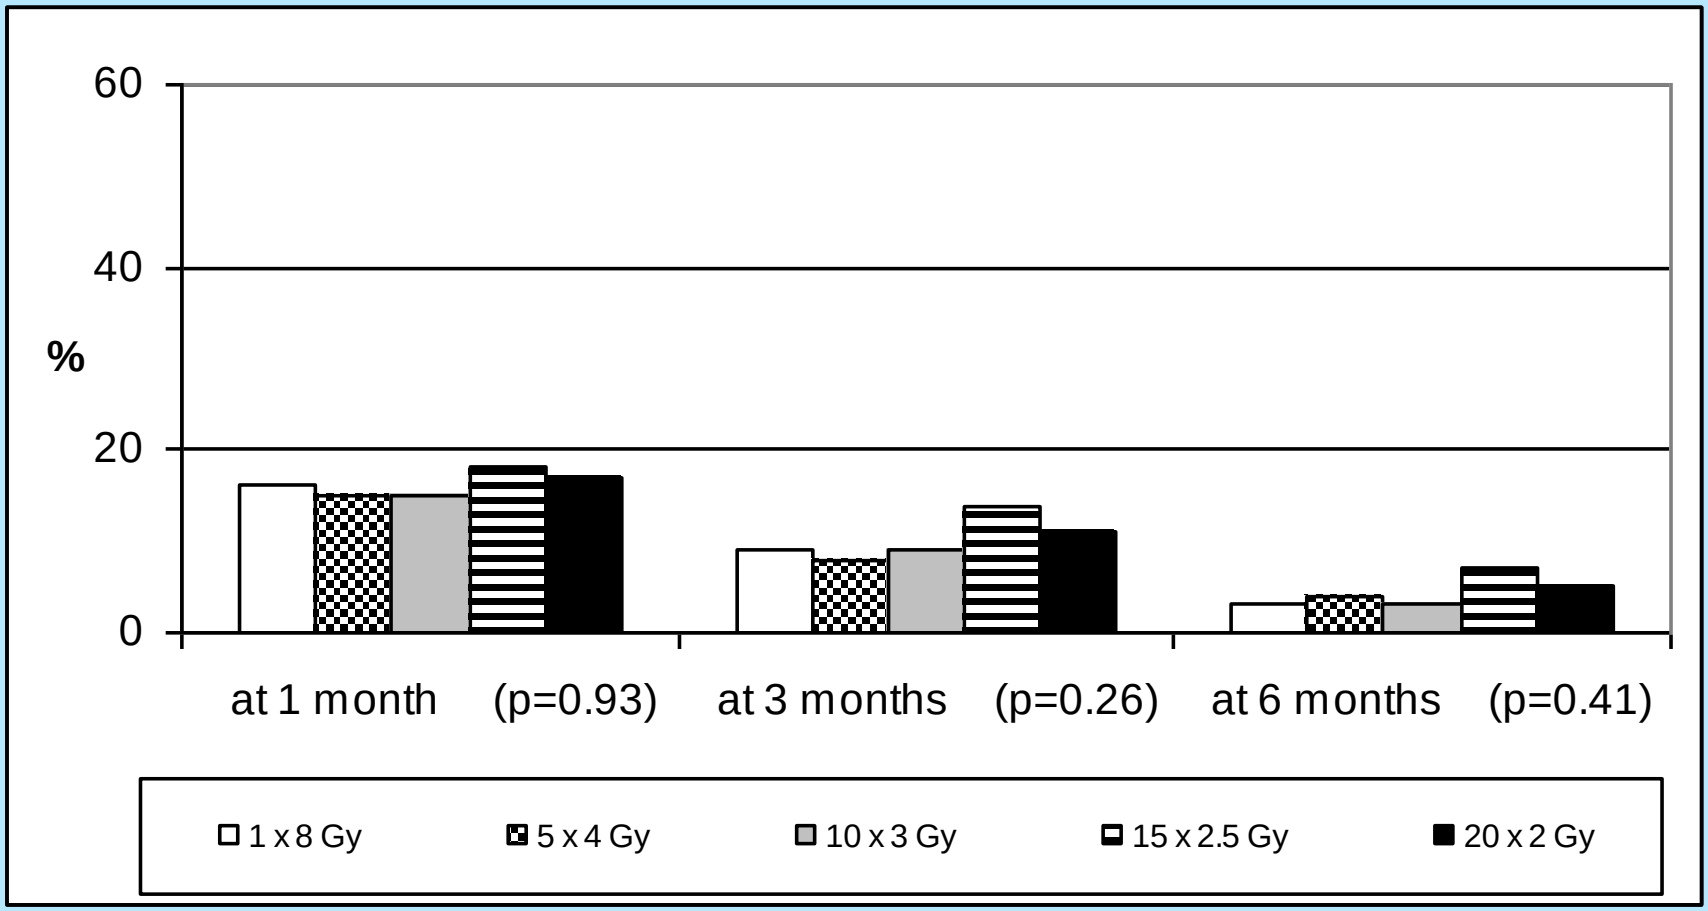
The spinal cord received 27% of the prescribed dose.

Motorische functies: no change



Rades et al JCO 2005

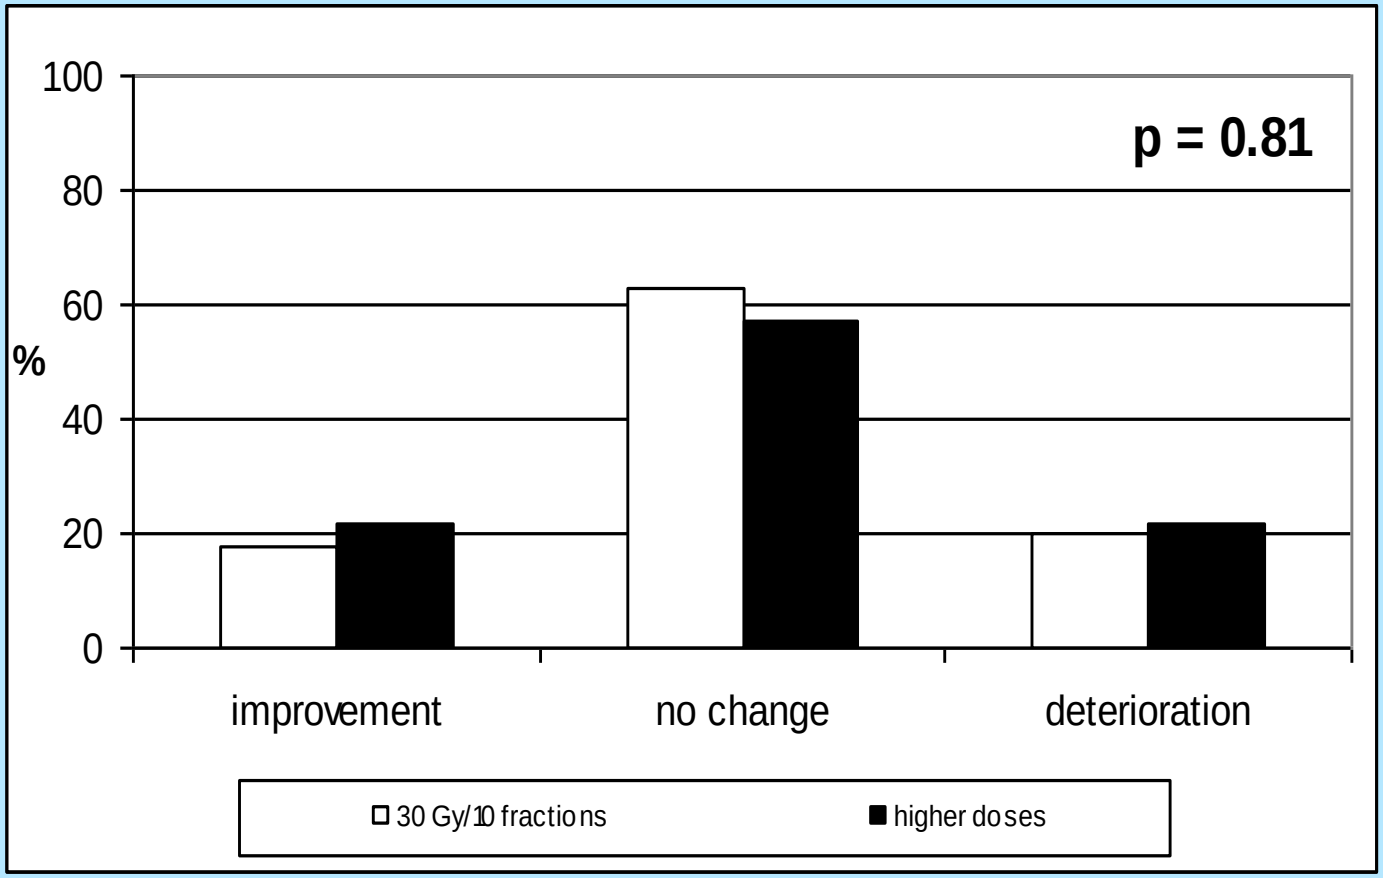
Motorische functies: decrease



Rades et al JCO 2005

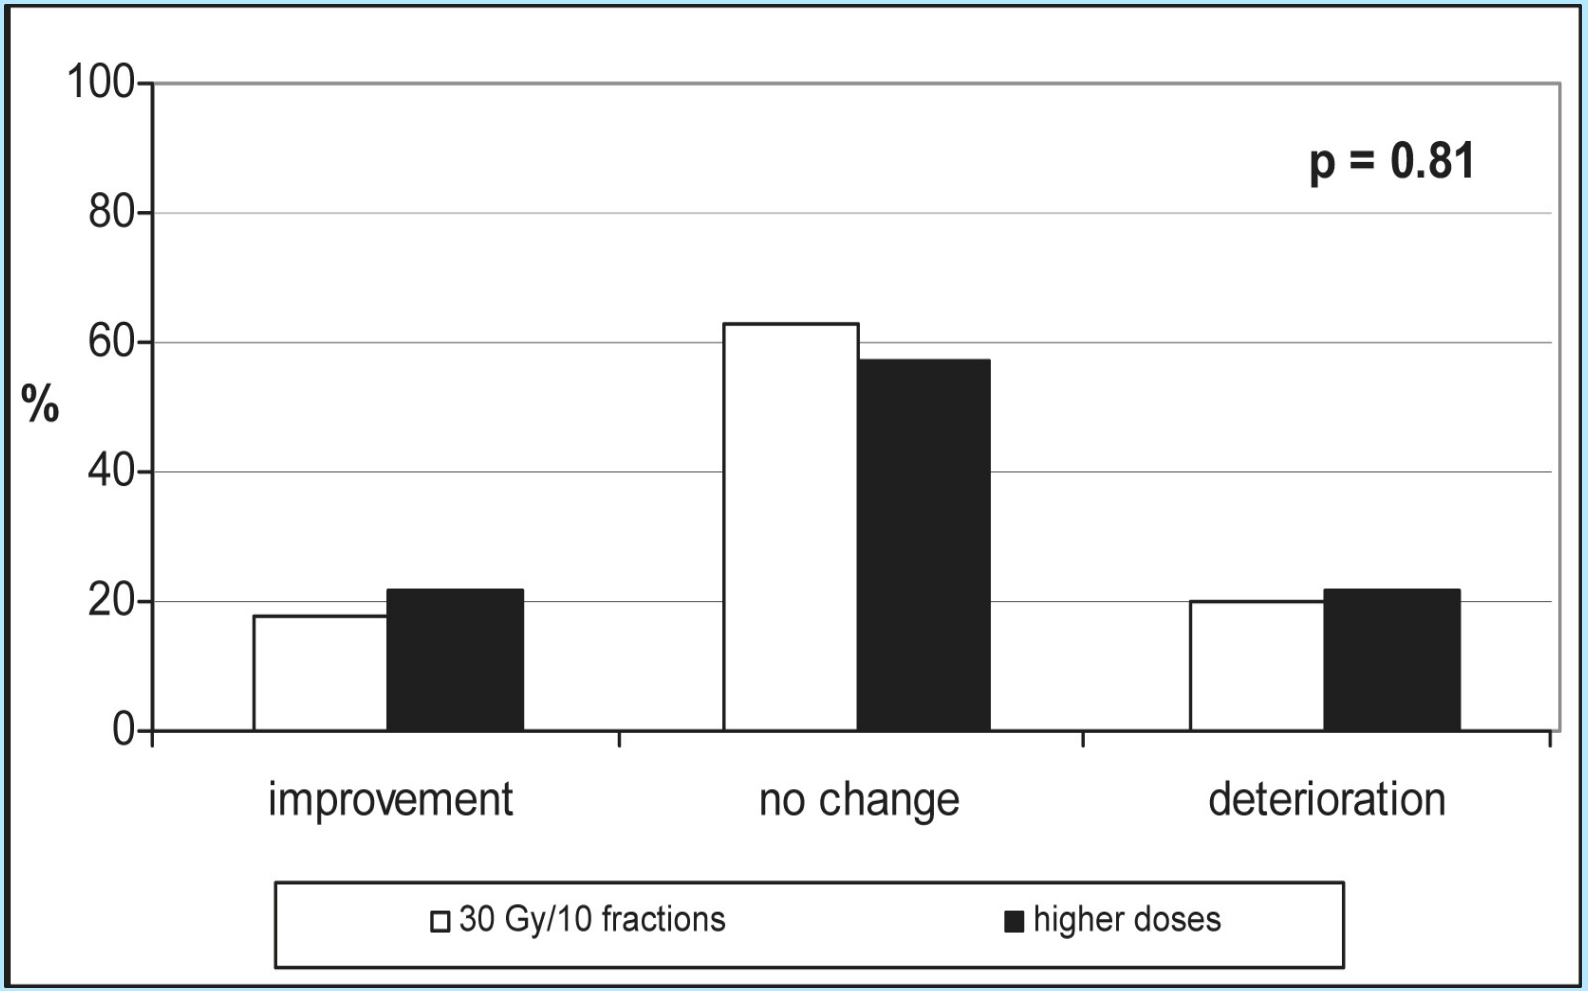
Less Radiosensitive Tumors: Dose Escalation

RCC (N=100), CRC (N=84), MM (N=22)



Rades et al., IJROBP, 2012

MSCC; > 30 Gy is not improving outcome



Rades D. et al. IJROBP 2011

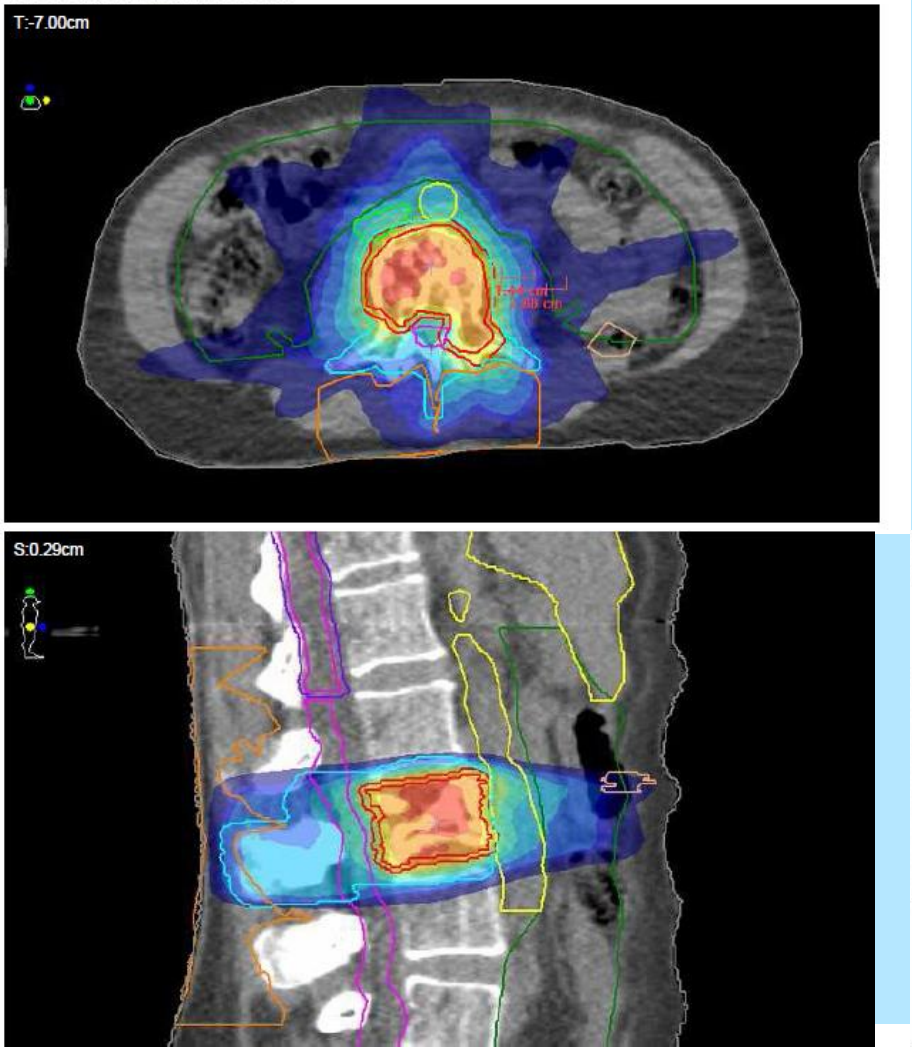
SUMMARY 2

MSCC RT	RS / SBRT	conv.
Improvement, less selected:	23%	40%
Improvement, myeloma:	71%	76%
Improvement, ambulatory:	63%	62%

Potential Benefit of RS / SBRT for:

- Long-term Survivors (SBRT instead of RS to reduce late toxicity)
- Less Radiosensitive Tumors
- Re-RT, in particular after previous longer-course RT

1x 18 Gy solitairy lesion breast ca
FUP -> PET/CT negative 1 year later



Courtesy dr. Kaspers, UMCU

Pros and cons of different techniques

		EBRT		SBRT
		CT / MVI EPI	CBCT	
Time investment	Patient	+	+++	++
	Linac	+++	++	+
Comfort	Pain with movement	+	++	++
	Pain when lying still	+++	++	+
Costs		+++	++	+
Planning	Margins	wide	in between	small

Practical application

Logistics and implementing research outcome

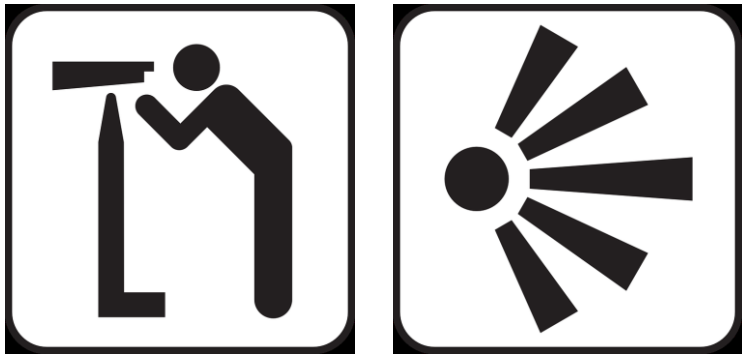
Yvette van der Linden

Centre of Expertise Palliative Care

& Dept. of Radiotherapy

Levels of influence

What viewpoints must we tackle?

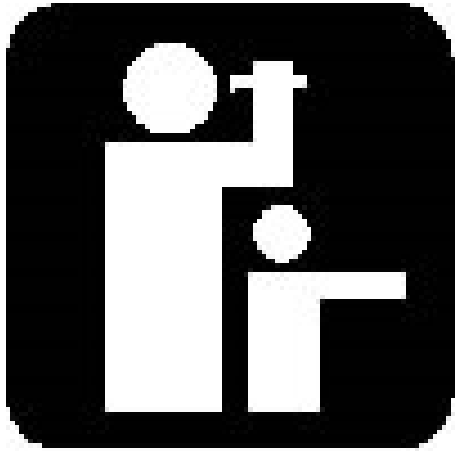


Personal

- As a person, as a doctor

Team

- Monodisciplinary -> RTs only
- Multidisciplinary team
  - Home & Hospital



Patient & carers

Public

Politics

Public & Politics → create awareness

From another point of view.

Campaigns

- Yearly donations
- Incidental
  - Hair donations
  - ALS ice bucket challenge

Implementation on (inter-) national agenda

- Guidelines, education

Reimbursement

- Fee for talking

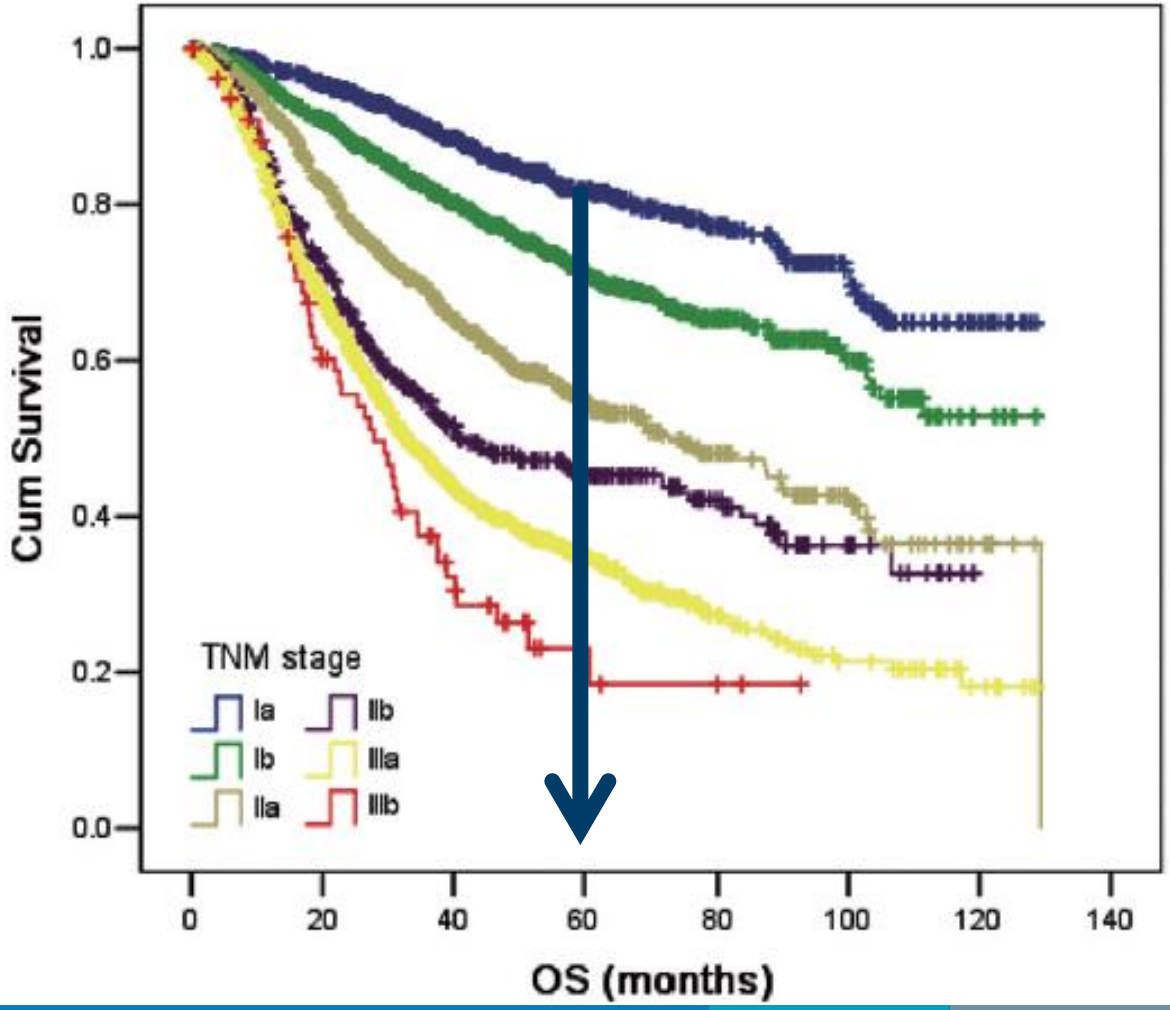
Treatment with curative intent ≠ cure

Survival in NSCLC is dependent on stage at diagnosis

N= 5853

treated with radical surgery

2001-2008

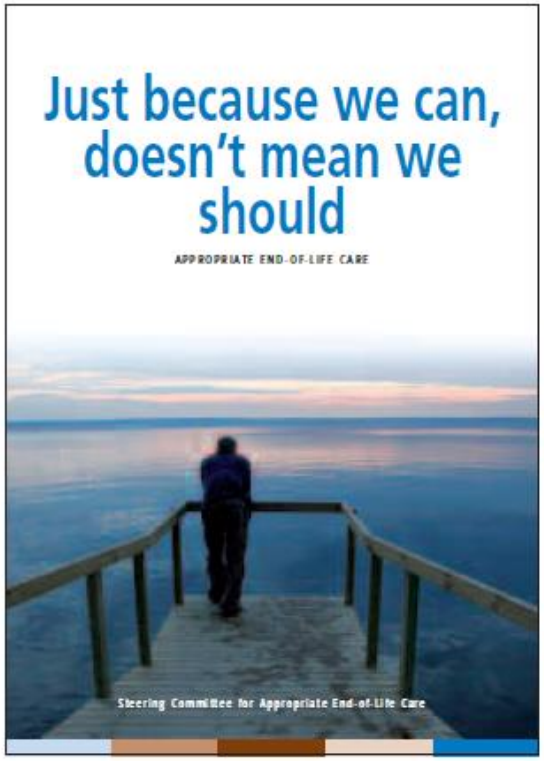


Dutch national steering committee for appropriate End of Life care 2015

" To treat is golden standard *unless*….. you have good reasons not to treat"

Mechanisms

- Discussing EoL is unusual and time costly
- Default attitude = do not give up
- Guidelines focus on 'action'
- Education focuses on 'action'
- Payment for treatment
- No holistic view
- Doing nothing = incompetence



23 Measures towards better care

Top 5

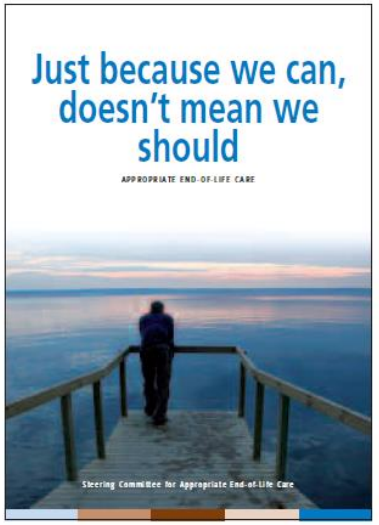
1.Make end-of-life acceptance and talking about death more common

2.Greater clarity on patients' wishes and improved coordination, including handover

3.Shared and improved decision-making

4.Guidelines directed also at 'inaction' or alternative action

5.Shift focus of healthcare system from production to appropriateness



Traditional versus early palliative care

For both curative and palliative phase apply a two track approach

Prerequisites for a true multidisciplinary team

Team multidisciplinary

MDTs

-Discuss all patients → curative / palliative intent

-Rad onc → Speak up! Educate!

- a broad scope
- large knowledge of diseases & treatment options

-Incorporate a multidisciplinary attitude

- List possible treatment options
- Prevent 'action' attitude only
  - Offer a meeting with the medical specialist

NB if you have a PCT in your hospital → join !

National level → participate in guidelines, implementation of EBM outcome

Team monodisciplinairy

RTs

- Appoint experts in palliative RT
- Write protocols on palliative RT using EBM
  - Background information
  - Schedules
  - Techniques

Changing goals….. even in palliation

Short Course

- Simple, effective
- Time efficient

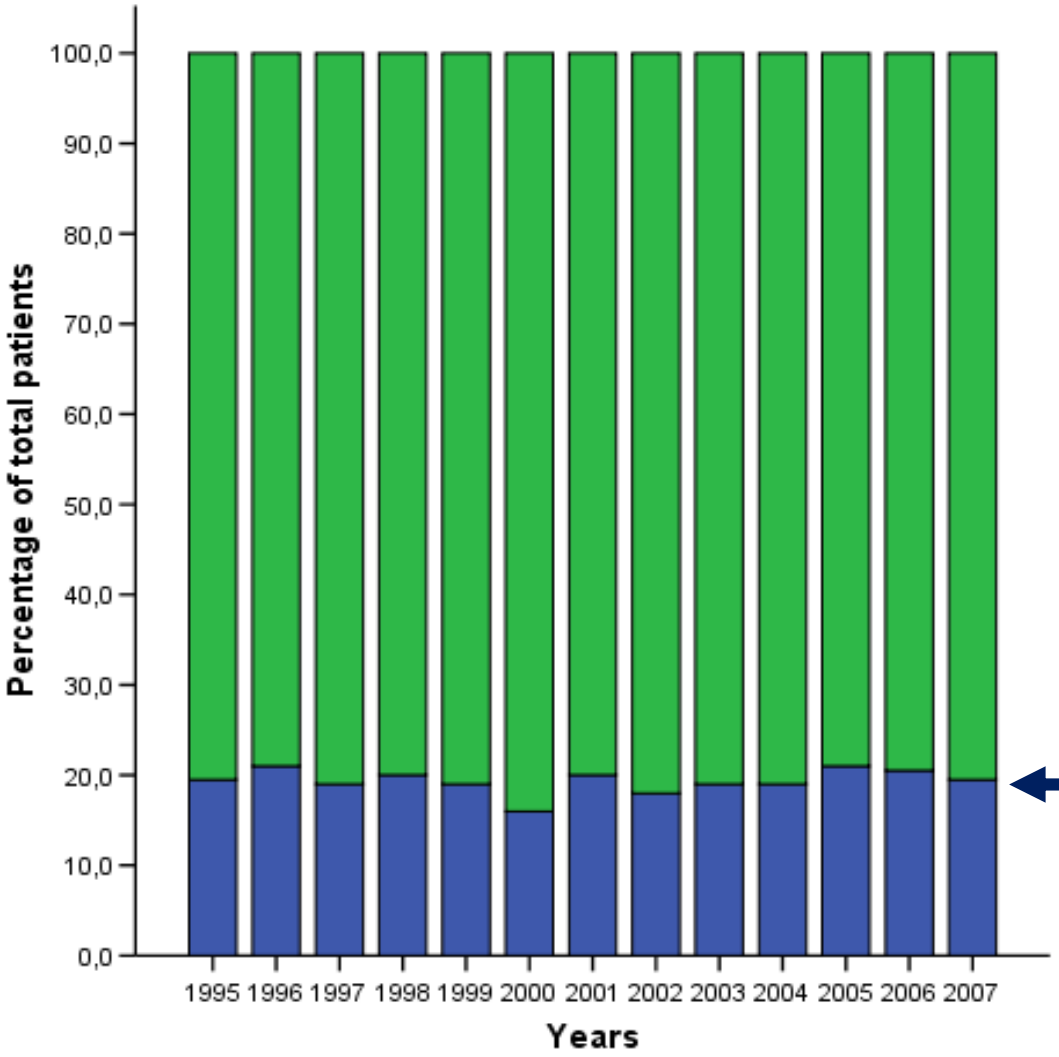
Radical

- More protracted, higher overall dose fractionation schedules for more durable symptom relief
- High dose hypofractionation using new technologies

Prophylactic

- Treatment in *asymptomatic* patients given with the intention of preventing symptoms, extending life

Palliative indications make up to 40% of our total



20% bone metastases

Team monodisciplinairy

RT department

-Appoint experts in palliative RT -> doctors and RTTs / PAs

-Write protocols on palliative RT using EBM

- Background information
- Schedules
- Techniques

- Patient discussions → debate treatment options considering
  - Wishes & goals of patient
  - Expected toxicity vs. expected outcome
  - Life expectancy
- Education of residents
  - Apply two track approach
  - Inform patients and carers
- FUP → evaluate your outcome, start prospective database

Educate your colleagues on the Key elements of palliative care

7 Key Elements
Relationship and rapport building
Addressing symptoms
Symptom assessment and review
Symptom management
Addressing coping
Ability to cope
Spirituality and faith
Emotional status
Referral to social work, psychiatry, or psychology
Establishing illness understanding
Information preference
Prognostic awareness
Current illness status
Discussing cancer treatments
Effect of cancer treatments
Decision making about cancer treatment
End-of-life planning
Resuscitation preferences
Hospice discussion or referral
Practical or personal plans
Health care proxy
Engaging family members

Young et al, 2013, JAMA

Get to know viewpoints

Five questions that you ask every patient who faces a life threatening incurable disease.

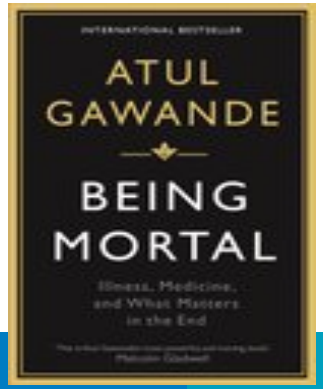
1. *What do you know of your illness and how far advanced it is?*

2. *What are your fears and uncertainties regarding your future?*

3. *What are your goals and priorities in life?*

4. *What are you willing to give up or not , and what will you accept?*

5. *What makes a day a good day for you?*



Learn the basic skills for Palliative Care

Primary Palliative Care

- Basic management of pain and symptoms
- Basic management of depression and anxiety
- Basic discussions about
  - Prognosis
  - Goals of treatment
  - Suffering
  - Code status

Specialty Palliative Care

- Management of refractory pain or other symptoms
- Management of more complex depression, anxiety, grief, and existential distress
- Assistance with conflict resolution regarding goals or methods of treatment
  - Within families
  - Between staff and families
  - Among treatment teams
- Assistance in addressing cases of near futility

Helpful for generalist doctors

- Practical palliative guidelines -> www.pallialine.nl -> per symptom
- PalliArts app

Presence of symptoms in palliative phase

	Palliative phase	Last two weeks of life
	N= 25.074	N= 2219
Tiredness	74%	88%
Pain	71%	45%
Loss of energy	69%	-
Weakness	60%	74%
Loss of appetite	53%	56%
Anxiety	48%	-
Weight loss	46%	86%
Dyspnea	35%	39%

Laxatives

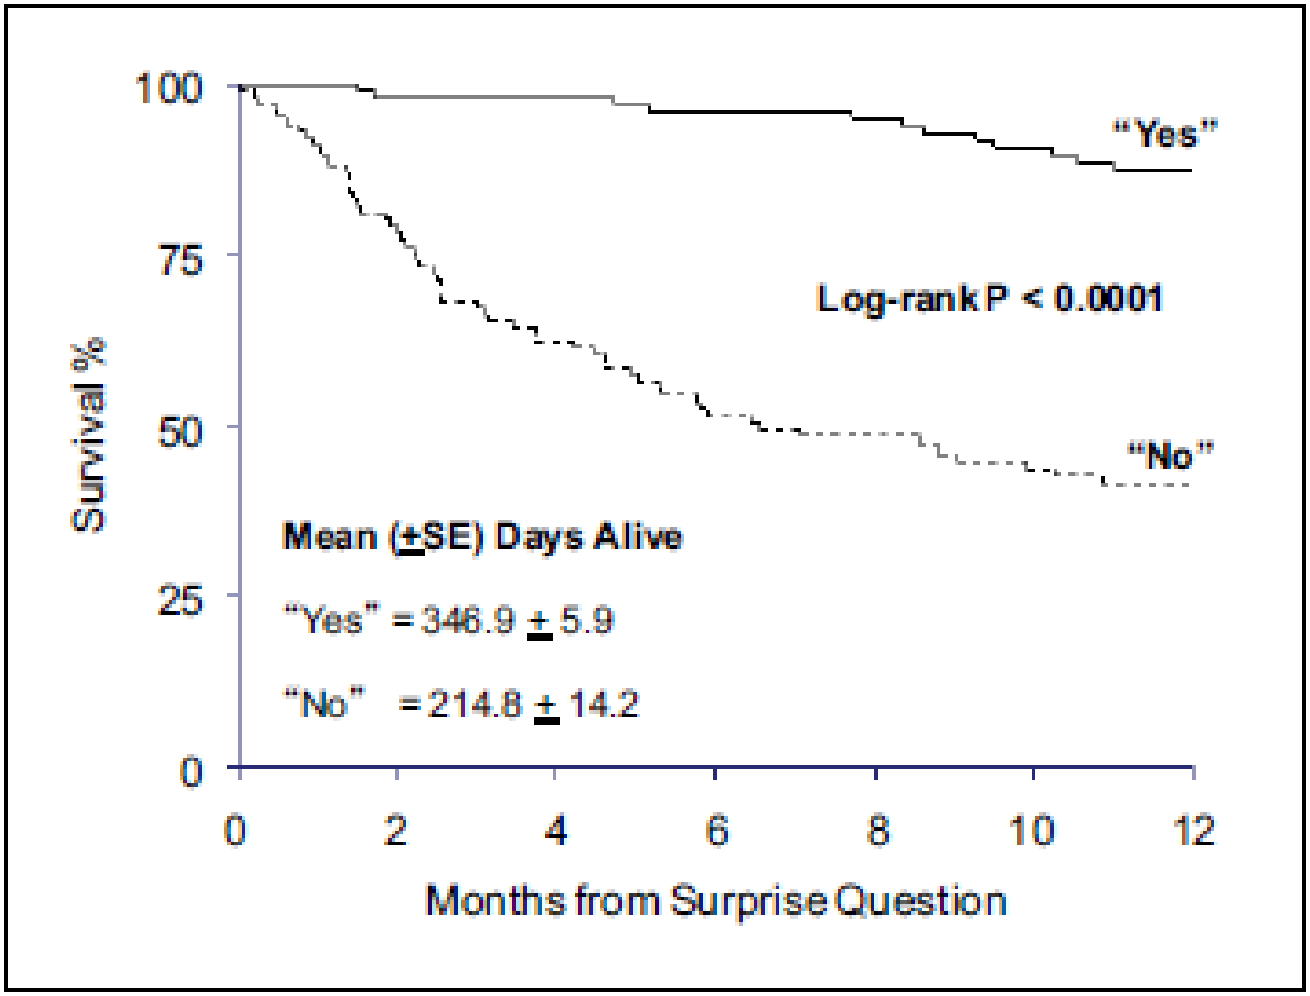
Laxans	Werking	Dosis	Werkzaamheid	Opmerkingen
Macrogol/ elektrolyten	Osmotisch	1-2 sachets dd Bij fecale impactie: 8 sachets dd binnen 6 uur gedurende maximaal 3 dagen	1-2 dagen	Sommige preparaten hebben een vieze smaak (minder bij oplossen in ijswater)
Magnesiumoxide Magnesium-hydroxide	Osmotisch	3 dd 500-1000 mg 3 dd 724-1448 mg	2-8 uur	Grote tabletten Niet bij ernstig gestoorde nierfunctie Niet gelijktijdig innemen met tetracyclines, ijzer of chinolonen
Lactulose (stroop of poeder)	Osmotisch	1-2 dd 15-30 ml (stroop) of 12-24 g granulaat	1-2 dagen	Voor sommigen: vieze smaak, opgeblazen gevoel, flatulentie
Lactitol	Osmotisch	1-2 dd 20-30 ml of 10-20 g granulaat	1-2 dagen	Flatulentie
Magnesiumsulfaat (bitterwater)	Osmotisch	10-30 g 's morgens op de nuchtere maag	1-3 uur	Alleen voor incidenteel gebruik
Psyllium	Volume-vergrotend	1 sachet of 1 maatdop 1-3 dd	2-3 dagen	Vochtopname meer dan 1500 ml per dag!
Sterculiagom	Volume-vergrotend	1-2 maatlepels of 1 sachet 1-2 dd	2-3 dagen	Vochtopname meer dan 1500 ml per dag!
Bisacodyl	Contactlaxans	10-20 mg p.o. voor de nacht of 10 mg supp. 's morgens	Oraal: 5-10 uur Rectaal: 15-60 minuten	Soms buikkrampen Niet gelijktijdig gebruiken met antacida of melk
Sennosiden A + B	Contactlaxans	10-20 ml	6-12 uur	Vieze smaak, soms buikkrampen
Natriumlauryl-sulfoacetaat	Emolliens	1 microklysma (5 ml)	5-20 minuten	Bij vol rectum
Natriumfosfaat-klysma	Osmotisch	1 klysma (133 ml), 1-3 dd	10-20 minuten	Bij harde feces in het rectum, gebruiksklaar wegwerpklysma
Natriumdocusaat + sorbitol klysma	Emoliens	1 klysma (120 ml), 1-3 dd	5-20 minuten	Bij harde feces in het rectum, kan voorafgaand aan fosfaatklysma worden gegeven

Tabel 1. Dosering en werking van veel gebruikte laxantia

Use the Surprise question to mark imminent death

'Would I be surprised if my patient died within the next year?'

N= 231



When should I ask for specialized care ?

Critical decision moments

- **Surprise question 1 year**
- **Considering yes / no disease modifying treatments**
- **Symptom control phase**
- **Admittance for symptom management**
- **Start dying phase**
- **Death**

Generalist care

Symptom-management (pro active)

Council and advise (multidisciplinairy)

Inform GP + coordinate care

Specialist care

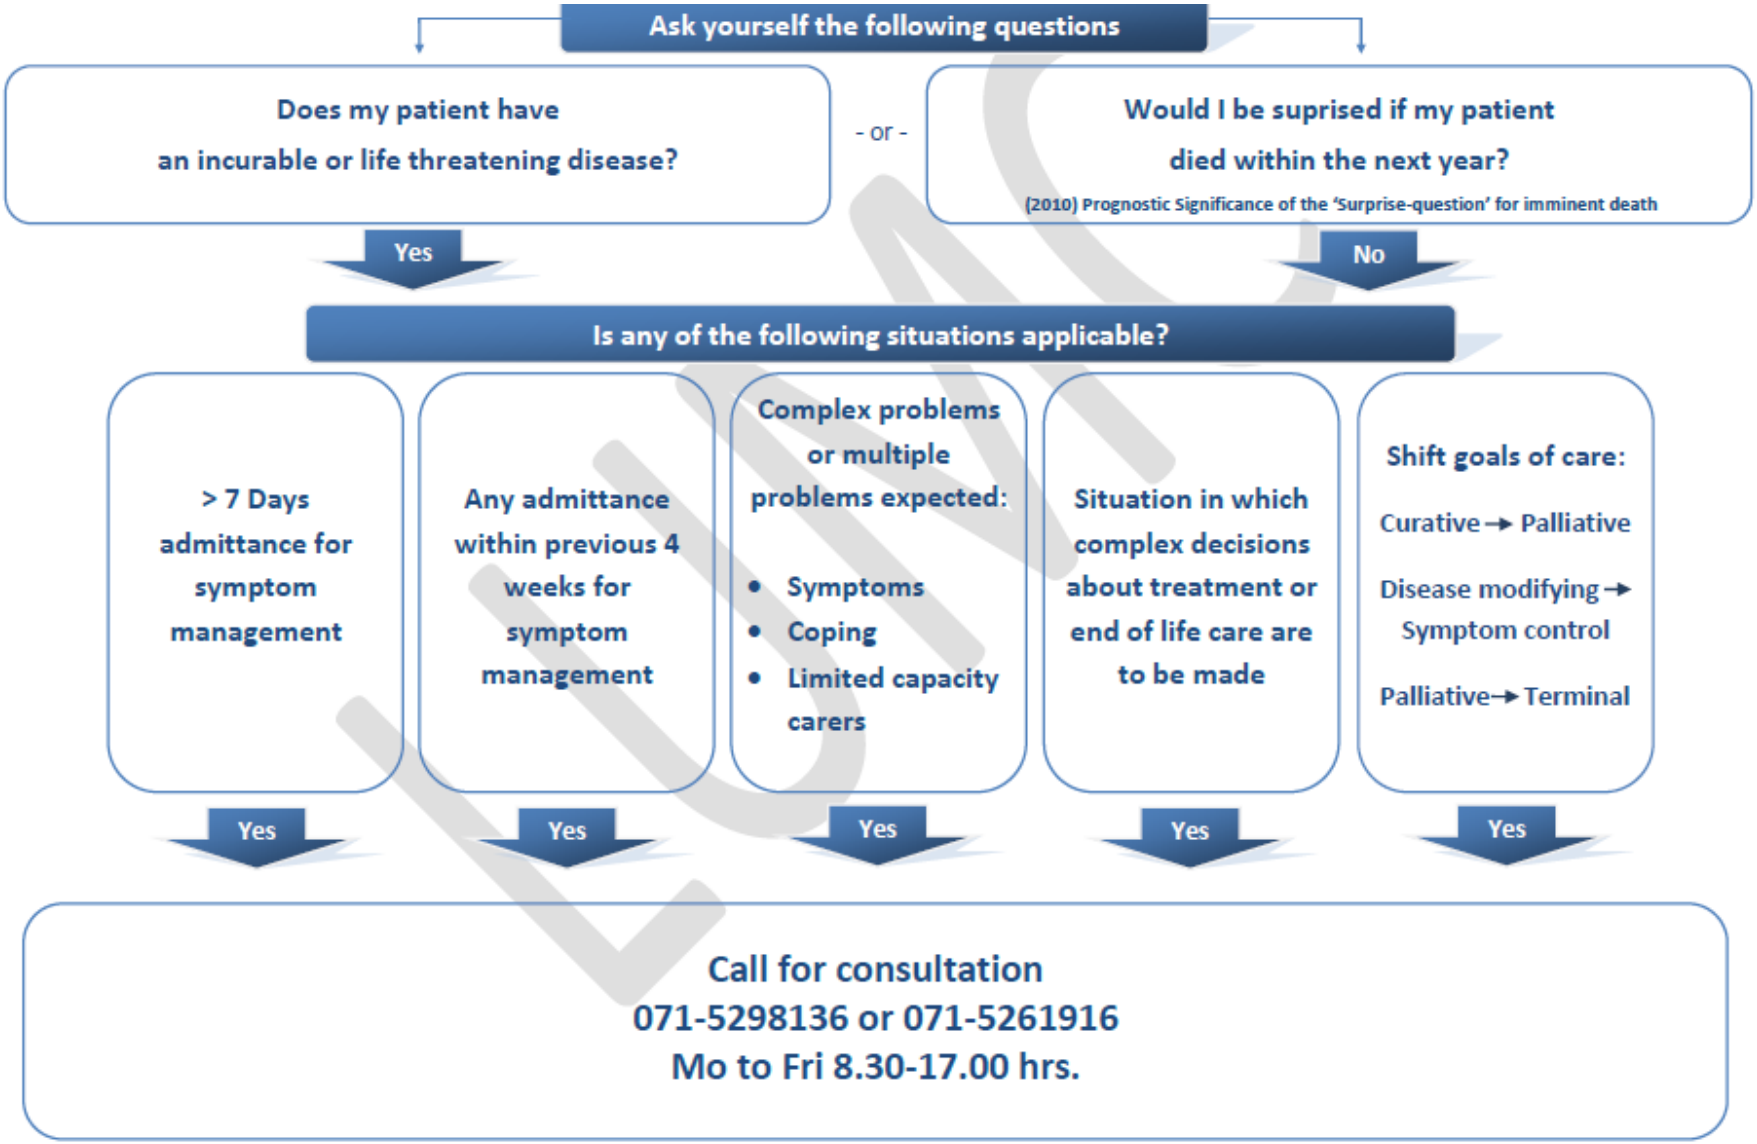
Symptoms that are difficult to treat, complex or rare

Hampered communication eg. treatment goals

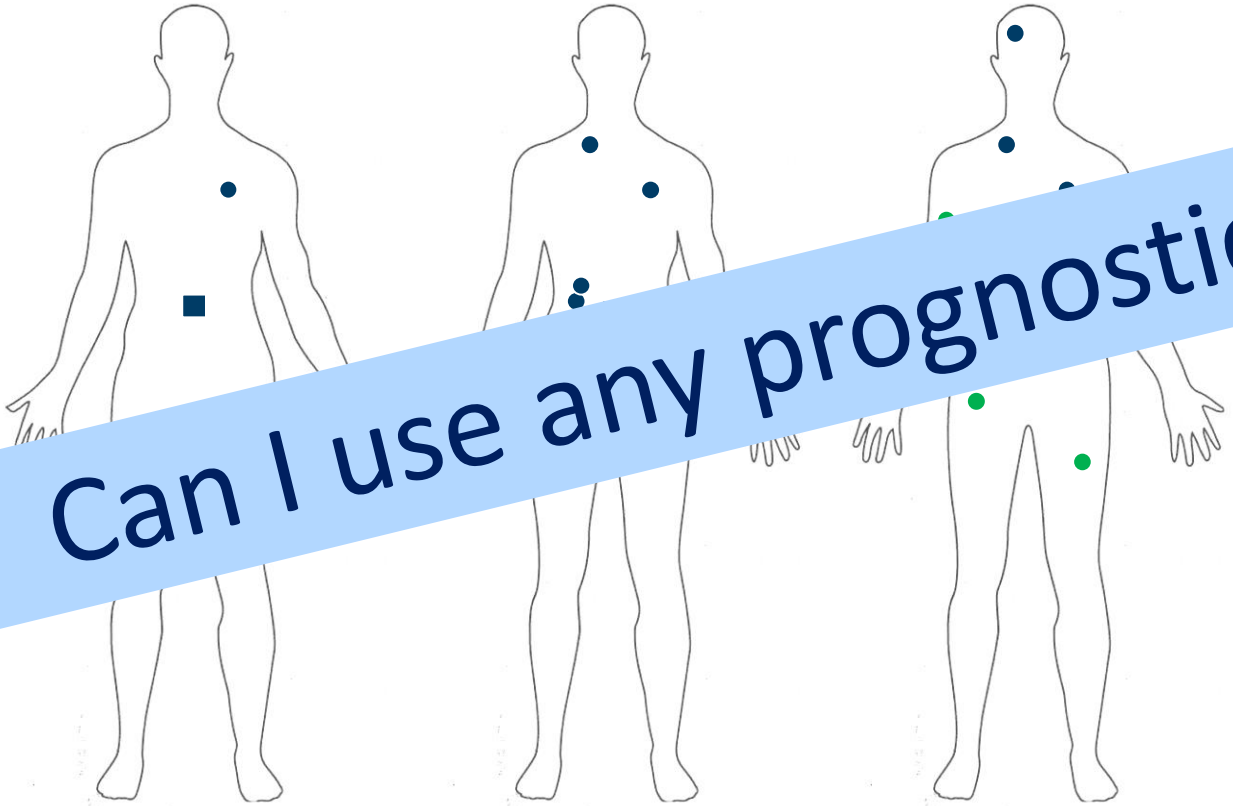
Shortcomings in knowledge and experience of generalists

→ After care

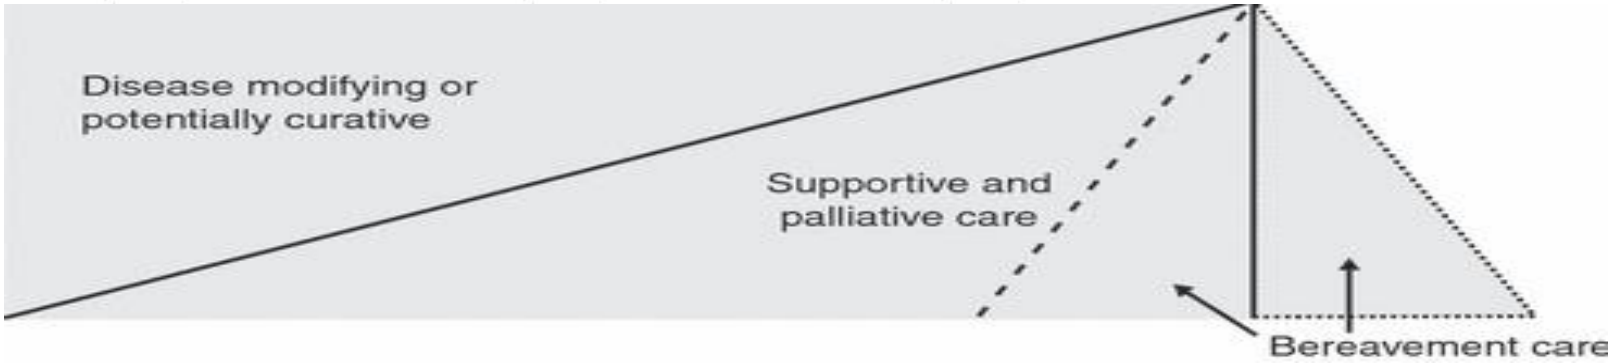
Use of a triggercard when to consult the PCT



Where in the trajectory is my patient?



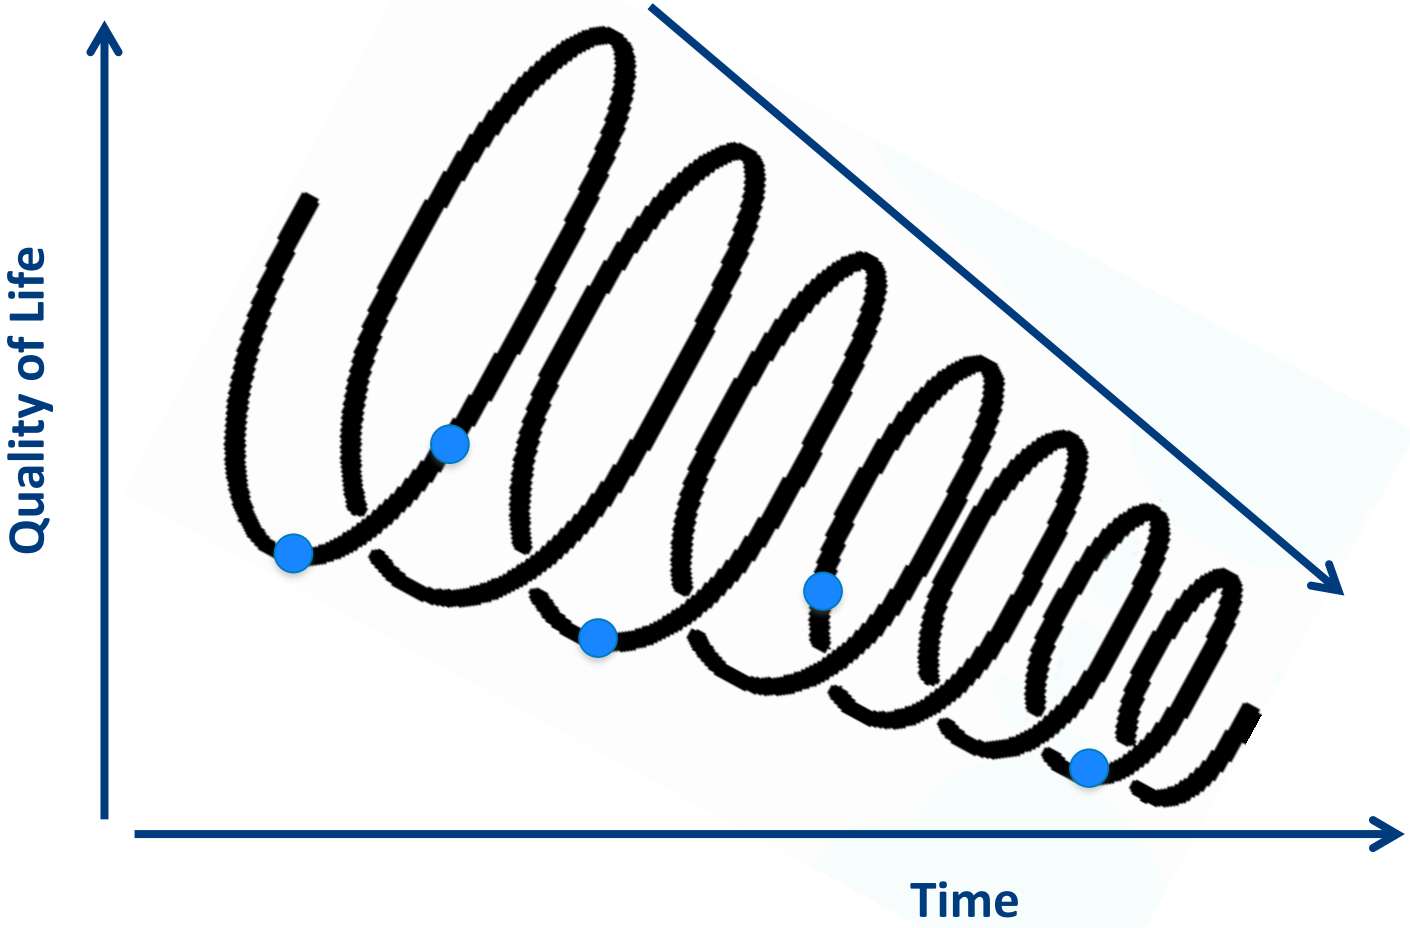
Can I use any prognostic tool?



Decision making needs multiple input

- Expected toxicity vs. expected outcome
- Life expectancy

Decision making needs repetition



- Consultations with health care professional

What is the role of active oncological treatment in inoperable NSCLC

- Symptom control
  - Cough
  - Haemoptysis
  - Dyspnoea
  - Chest pain
  - Anorexia
- Improved QoL
- Survival

ESTRO School

Metastatic non-small-cell lung cancer (NSCLC): ESMO Clinical Practice Guidelines for diagnosis, treatment and follow-up†

PS ≥2 patients:

- Chemotherapy prolongs survival and possibly improves the QoL in NSCLC patients with PS 2, when compared with BSC [I, B]. Single-agent chemotherapy with gemcitabine, vinorelbine, and taxanes represents an option [I, B].
- Carboplatin-based combination chemotherapy should be considered in eligible PS 2 patients [II, A].
- Poor PS (3–4) patients should be offered BSC [II, B] in the absence of tumours with activating (sensitising) EGFR mutations.

- Radiotherapy plays a major role in symptom control in the case of bone and brain metastases and is also effective in treating pain related to chest wall, soft tissue, or neural invasion.
- Neurological symptoms from spinal compression can be relieved by early radiotherapy.
- Radiotherapy is indicated in cases of haemoptysis, symptomatic airway compression or obstruction, and following CNS and, sometimes, bone surgery [II, B].

• 20Gy / 5f:	4.2%
• 30Gy / 10f	10%
• 39Gy / 13f	14.2%

ESTRO School

Opportunity cost in palliation of NSCLC

- Median survival with inoperable NSCLC
  - PS 2 - 3 or mets: 120 days
  - Asymptomatic
    - No treatment; no toxicity; no loss of survival
  - Symptomatic
    - 1 treatment for equivalent symptom control and toxicity to longer treatment
    - BUT…will any patients live longer with 20Gy/39Gy

Opportunity cost in palliation of NSCLC

- Median survival with inoperable NSCLC
  - PS 0 - 1, no mets: 240 days
    - MRC 13#: 17days treatment to gain 54 days
    - NCIC 5#: 5 days to gain 60 days
    - Equivalent toxicity and symptom control

Palliative management of lung cancer

- Chemotherapy for good PS patients and advanced disease
  - Improves survival by around 2 months
  - In NSCLC improves QoL
  - ? Role of second and third line tretament

- Palliative radiotherapy for specific symptoms
  - Cough, haemoptysis, chest pain, SOB
  - Hypofractionation
  - ?more prolonged RT for good PS patients

- PS 2-3: consider BSC alone

Re-irradiation for palliation

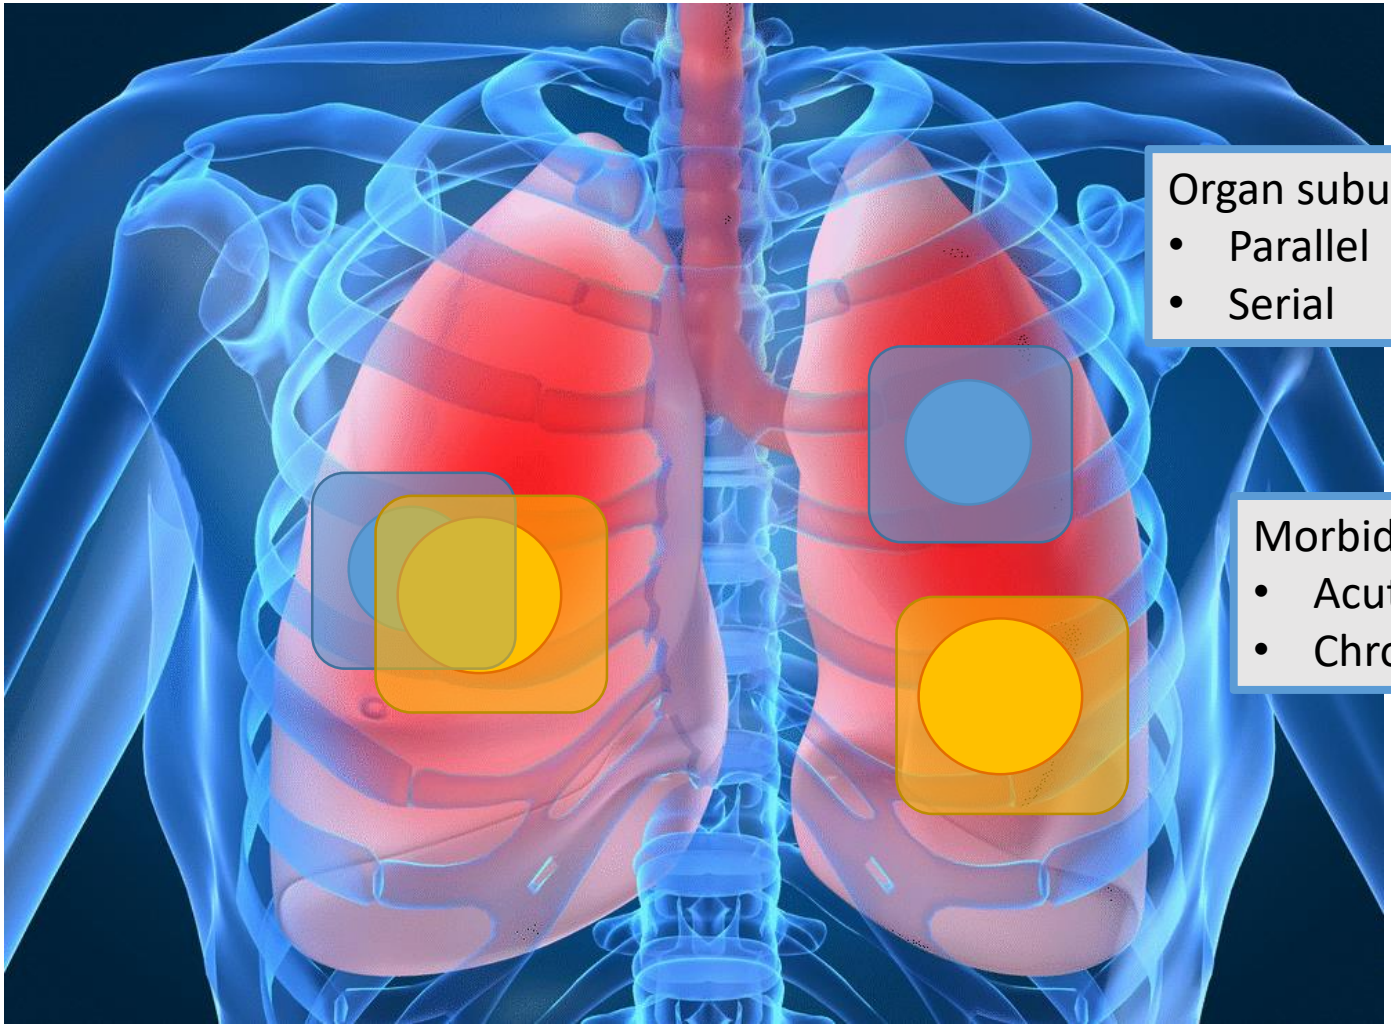
Morten Høyer
Danish Center for Particle therapy
Aarhus University Hospital
Denmark

Why is re-irradiation so underused?

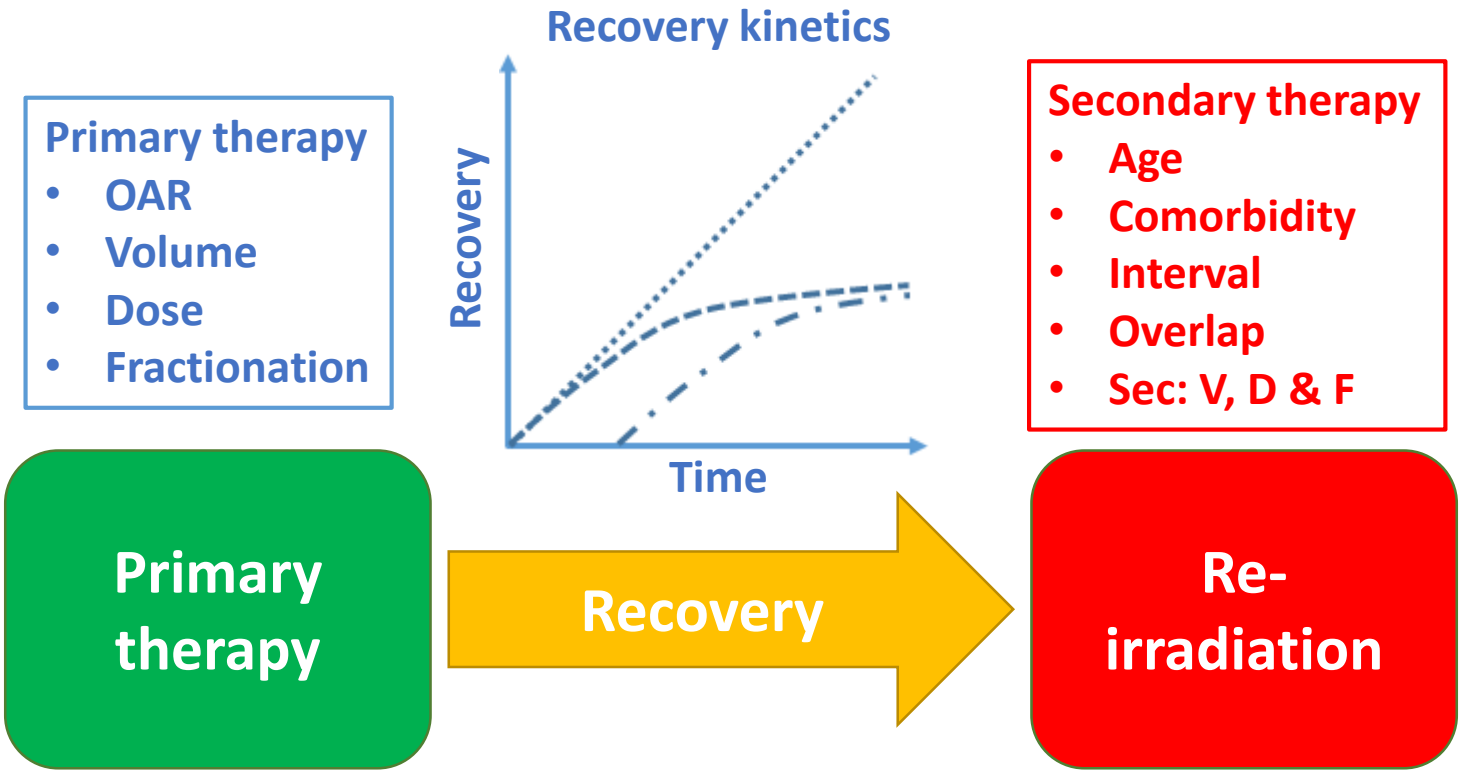
More reirradiation

- Patients live longer
- Technique allow normal tissue sparing (and higher doses)
- Patient’s and physician’s preferences

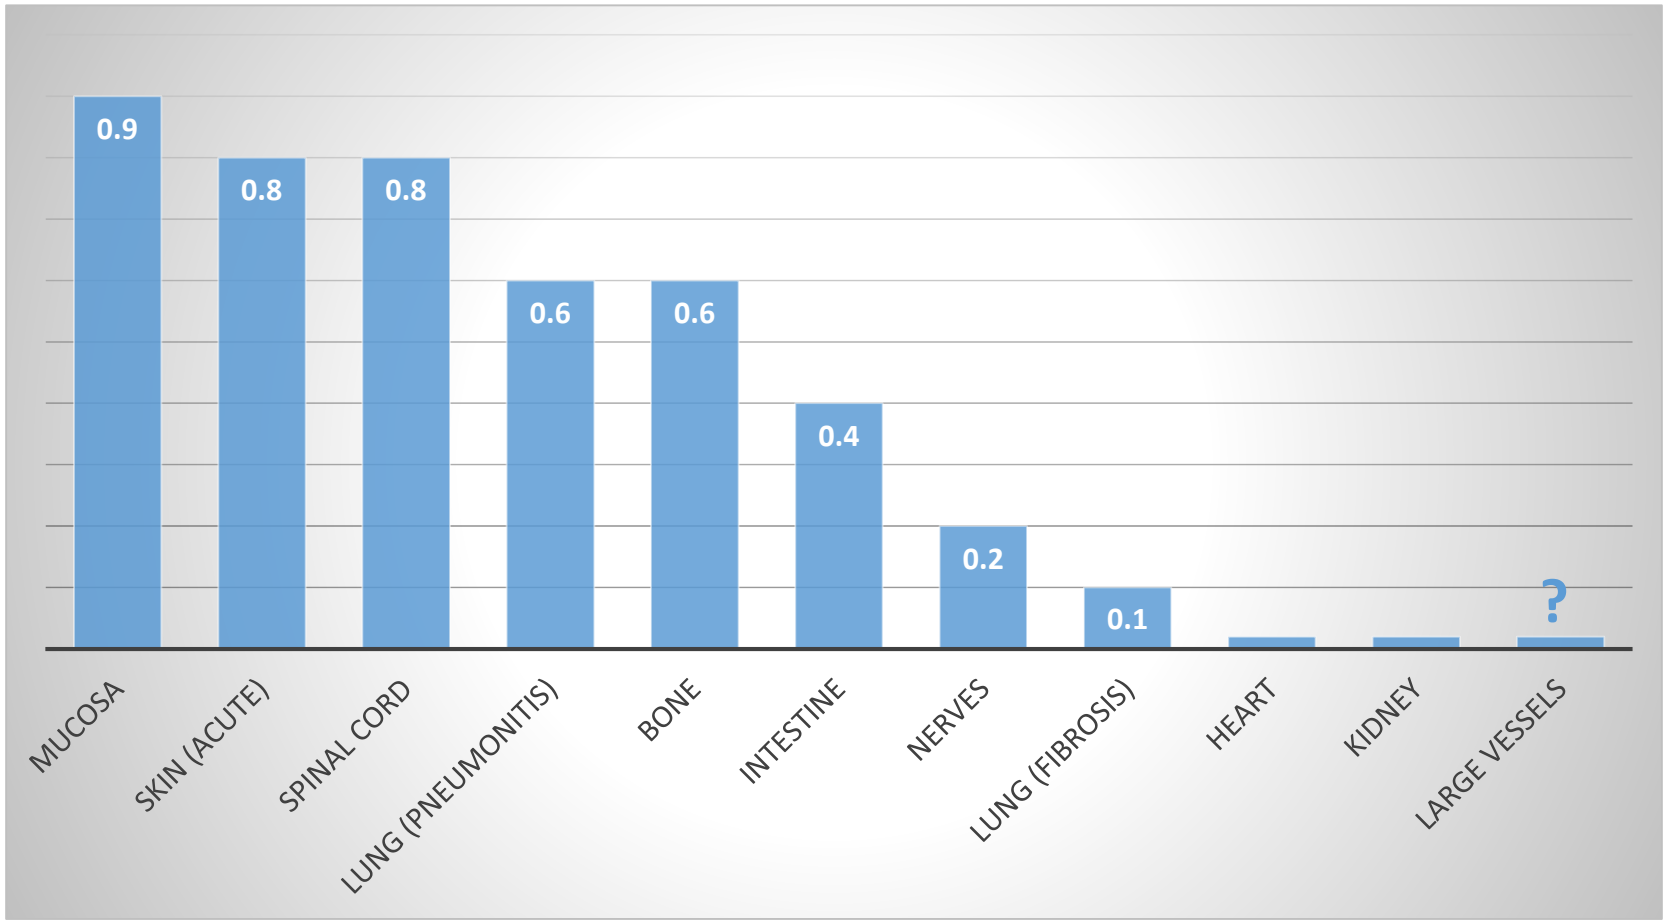
Re-irradiation for local- or distant relapse



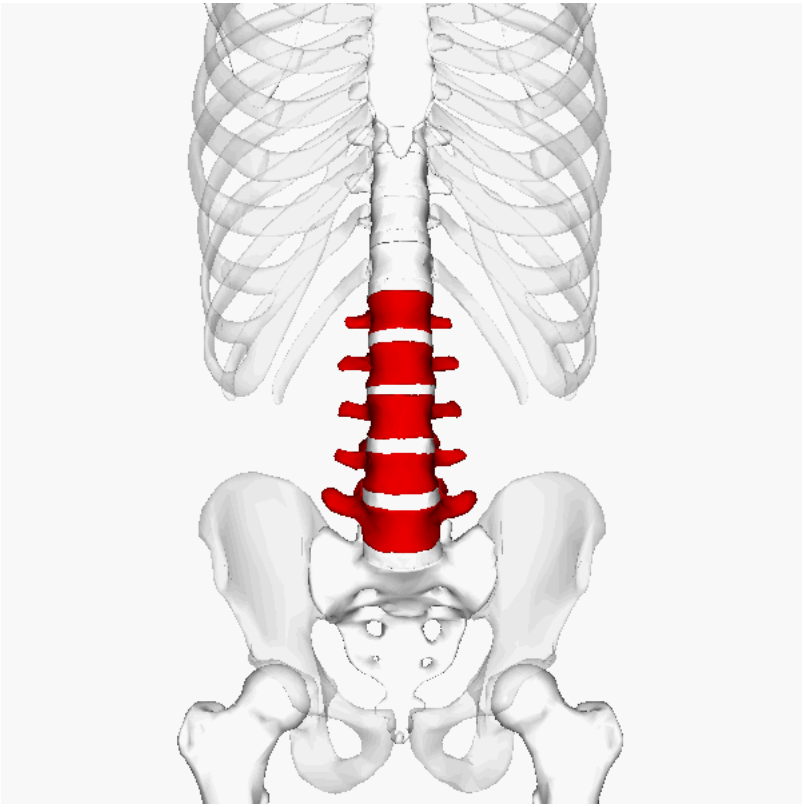
Considerations in reirradiation



Re-irradiation tolerance (recovery)
Feeling based…… (little evidence)



The equation



Total BED = BED (1) + BED (2) – Dose (recovered)

$$BED = n \times d \left(1 + d/[\alpha/\beta]\right)$$

SRT for re-irradiation in

This lecture

- Bone
- Spine
- Lung
- Liver

Additional sites

- Brain
- Head & neck
- Lymph nodes
- Pancreas
- Rectum
- Cervix
- Prostate

Bone metastases

Dogma

- Reirradiation more frequent if the patients received single frx in initial course

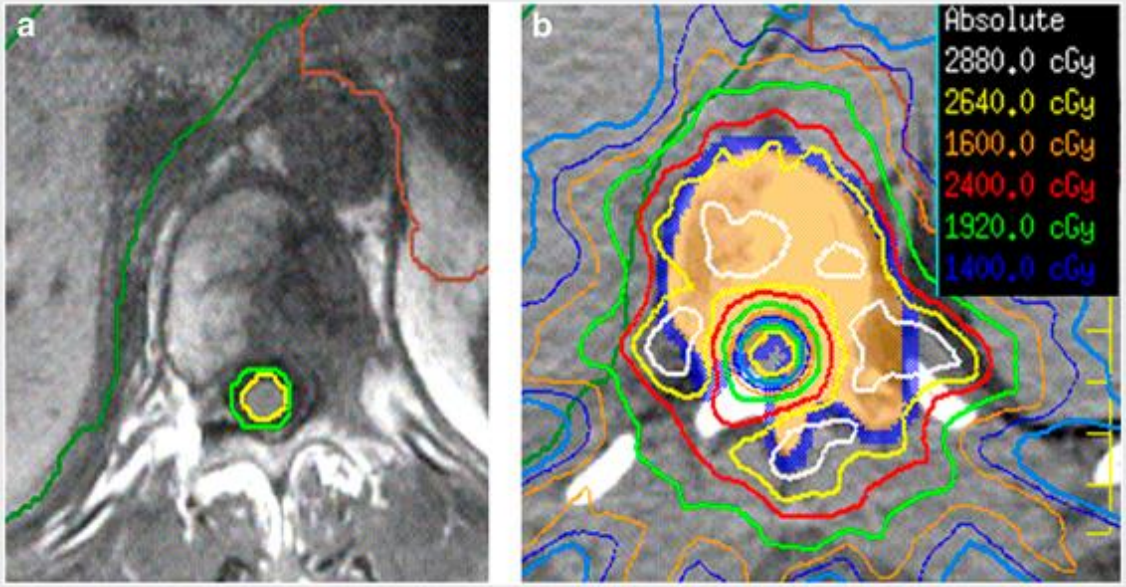
QUANTEC
Kirkpatrick IJOBP 2005;76(3 Suppl):S42

Radiation myelopathy



On the left (**a**) represents a spinal metastasis as imaged on a T1-weighted axial MRI. The planning organ-at-risk volume is the thecal sac (green) outlined with a 1.5 mm margin applied beyond the true cord (yellow). The disease involves the vertebral body, ipsilateral pedicle and lamina. The right panel (**b**) is the spine stereotactic radiation dose distribution targeting the entire vertebral body and ipsilateral posterior elements and demonstrates the dose wrapping around the spinal cord and the steep dose gradient. The prescription was 24Gy in two fractions and the spinal cord spared to a point maximum of 17Gy.

Wong et al. *Spinal Cord* (2015) **53,** 574

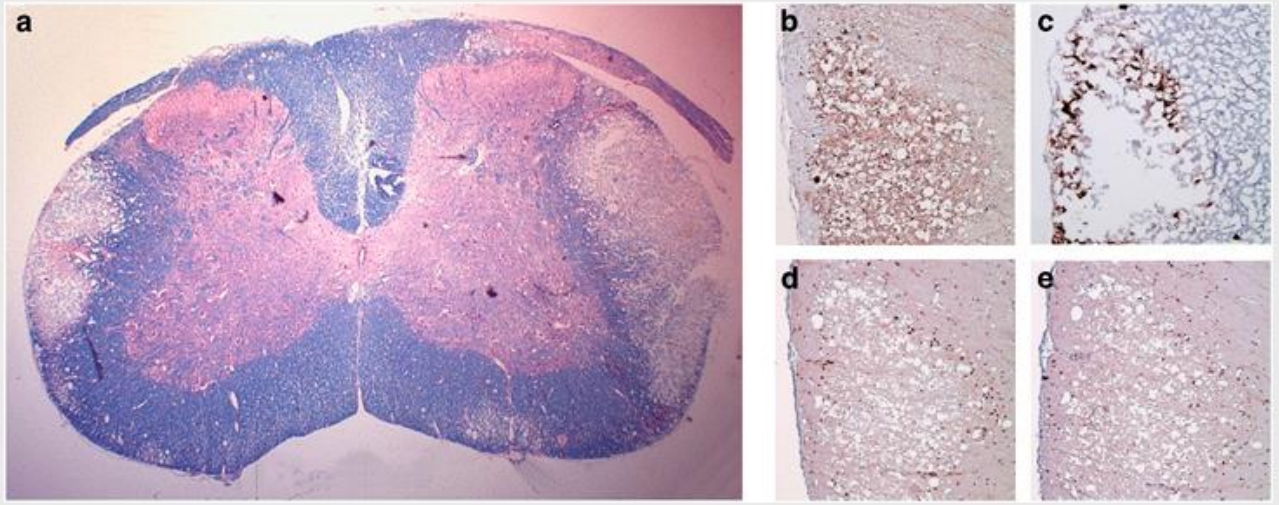
Radiation myelopathy

Spinal Cord (2015)
53, 574

MRI changes of radiation myelopathy. On the left (**a**) is a sagittal T1 postgadolinium MRI showing the area of enhancement within the cord (arrow) and on the right (**b**) is the T2-weighted image showing edema in the cord above and below the lesion (arrows). This patient developed a Brown–Séquard syndrome following spine stereotactic radiation treatment and represents a case of radiation myelopathy. A full color version of this figure is available at the *Spinal Cord* journal online.

Pathobiology of radiation myelopathy and strategies to mitigate injury
C S Wong, M G Fehlings and A Sahgal

Radiation myelopathy



Molecular pathology of radiation myelopathy. Demyelination and focal to confluent necrosis represent the hallmark of radiation myelopathy, as demonstrated by the absence of Luxol blue staining in rat spinal cord white matter at 20 weeks after 22Gy (**a**, blue). White matter lesions are associated with disruption of the blood–spinal cord barrier shown by albumin leakage (**b**, albumin immunohistochemistry), tissue hypoxia (**c**, nitroimidazole EF5 immunohistochemistry) and upregulation of HIFα and VEGF, as demonstrated by an increase in reactive glia immunopositive for HIFα (**d**) and VEGF (**e**).

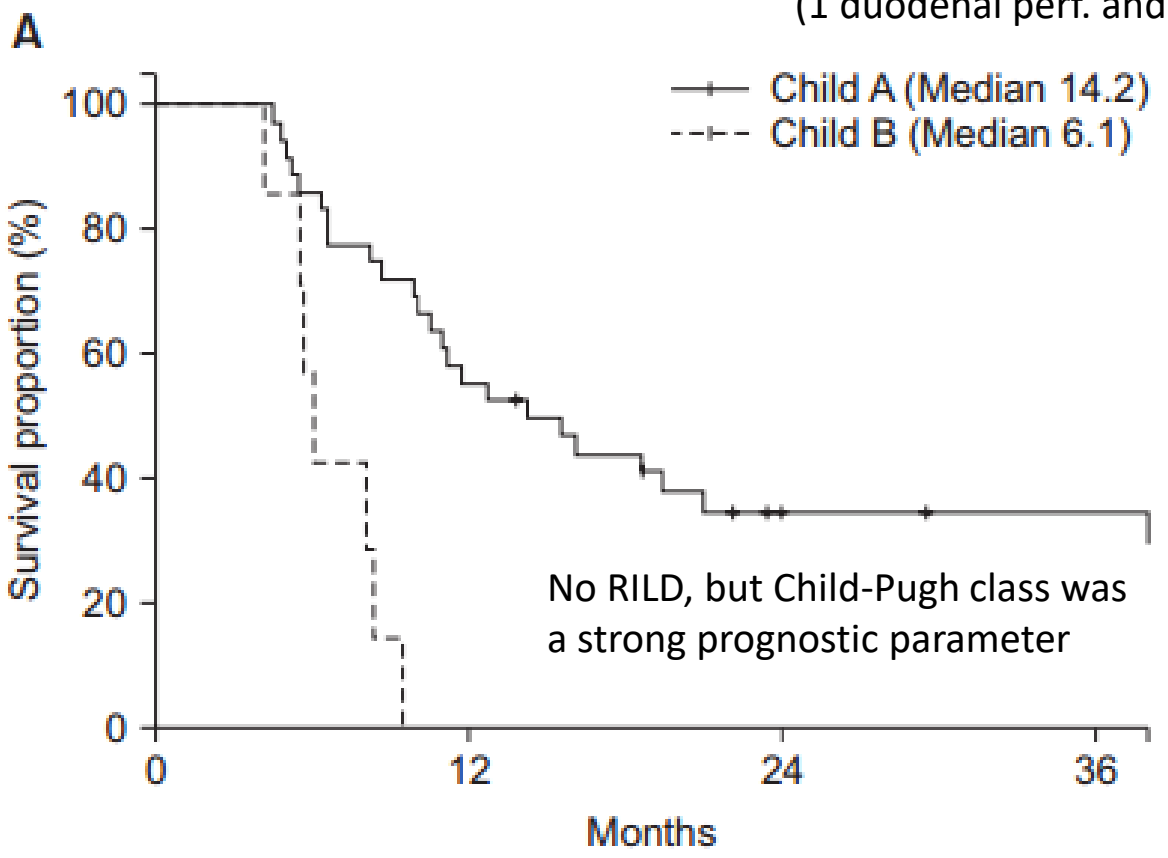
Treatment outcome of hepatic re-irradiation in patients with hepatocellular carcinoma

Seung Won Seol, MD, MS[1], Jeong Il Yu, MD[1], Hee Chul Park, MD, PhD[1], Do Hoon Lim, MD, PhD[1], Dongryul Oh, MD[1], Jae Myoung Noh, MD[1], Won Kyung Cho, MD[1], Seung Woon Paik, MD, PhD[2]

Departments of [1]Radiation Oncology and [2]Internal Medicine, Samsung Medical Center, Sungkyunkwan University School of Medicine, Seoul, Korea

1st: 33-94 Gy_{10} (median 49 Gy_{10})
2nd: 31-94 Gy_{10} (median 44 Gy_{10})
Only 2 patient developed $\geq$ 3 tox
(1 duodenal perf. and 1 pneumonitis)



Re-irradiation for liver metastases

- 28 patients re-irradiated with SBRT for liver metastasis 3-30 months after primary SBRT
- No patients developed RILD

Høyer et al Aarhus University Hospital 2016

SBRT re-irradiation of liver cancer

Safe SBRT re-irradiation of **HCC**

- Child-Pugh A $\leq$ 6
- Limited volumes
- No recommendation on dose, volume and interval

Notice

- Patients with portal hypertension have a high risk of peptic ulcer

Safe SBRT re-irradiation of liver **metastases**

- Limited volume
- Re-irradiation time interval >3 months
- No recommendation on dose and volume

Final conclusions

- Consider selection of the patients
  - Type and structure of the tissue (parallel/serial)
  - Volume
  - Previous dose
  - Overlap
  - Time interval
  - Summarize the plans
- Conservative dose
- Conservative fractionation

Terminal care

Johan Menten

Radiation Oncology & Palliative Care

University Hospital Gasthuisberg

Leuven (Belgium)

How / Do we recognize the terminal patient ?

WIKIPEDIA:

"terminal illness is a disease that cannot be cured or adequately treated and that is reasonably expected to result in the death of the patient within a short period of time "

UK Social Security legislation

terminal illness is defined as: "a progressive disease where death as a consequence of that disease can reasonably be expected within 6 months".

Mosby's Medical Dictionary, 9th edition. © 2009, Elsevier.

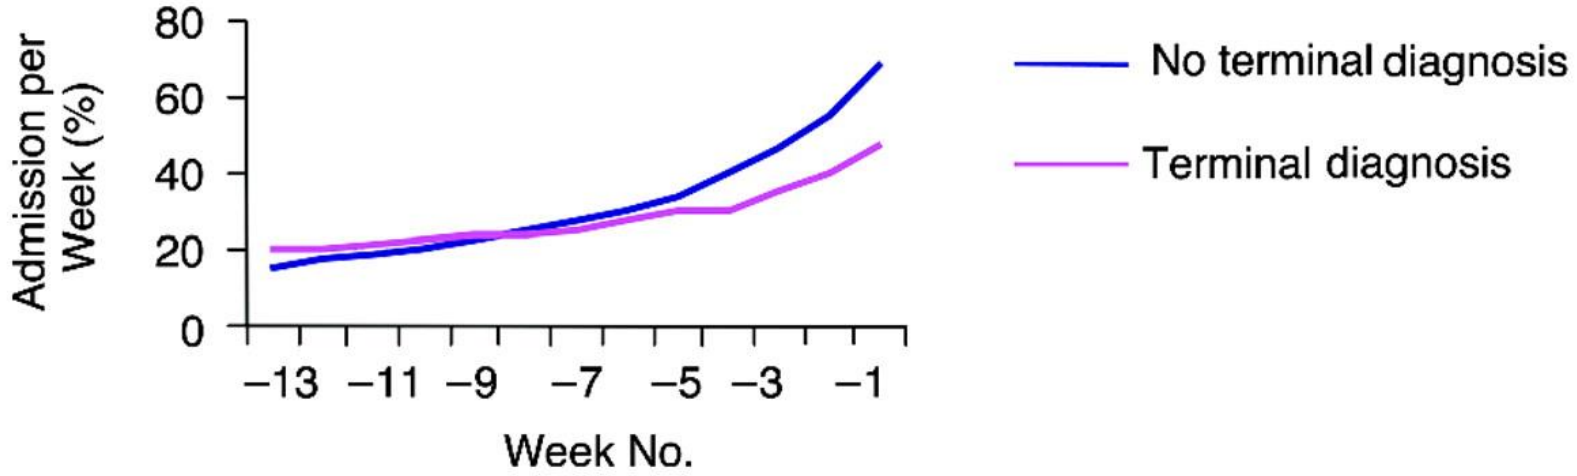
"Terminal illness is a malignancy which is expected to cause the patient's death in a short period of time—i.e., weeks to several months"

Defining Cancer Patients As Being in the Terminal Phase: Who Receives a Formal Diagnosis, and What Are the Effects?

The Danish “terminal declaration” issued by a physician for a formal terminal diagnosis (prognosis of death within 6 months) gives right to economic benefits and increased care for the dying

Aabom et al. JCO 2005;23:7411-7416

Effect of terminal diagnosis on admissions per week.



Conclusion:

1 Women and the elderly were less likely to receive a formal terminal diagnosis.

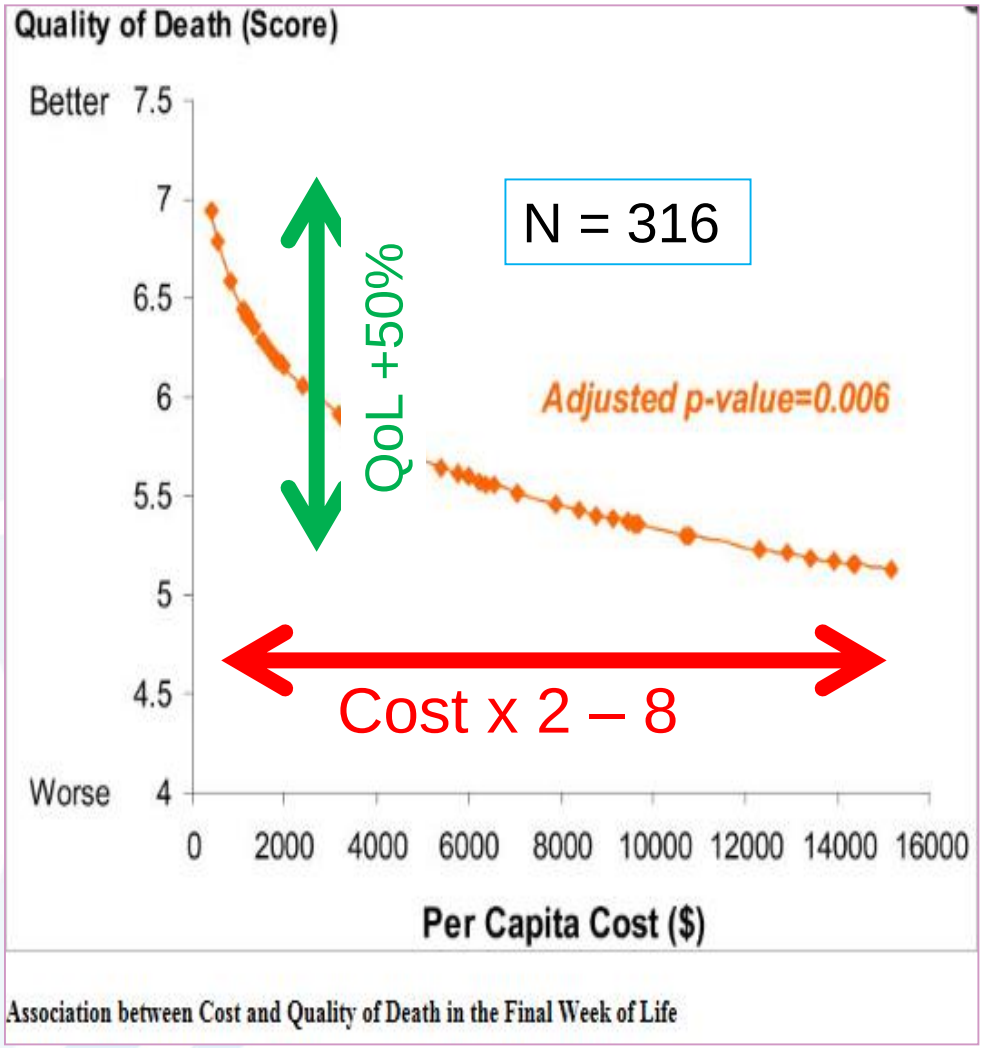
2 The formal terminal diagnosis reduced hospital admissions and increased the possibilities of dying at home.

B. Aabom et al. JCO 2005;23:7411-7416

Arch Intern Med. 2009 Mar 9;169(5):480-8

Health care costs in the last week of life: associations with end-of-life conversations

Zhang B1, Wright AA, Huskamp HA, Nilsson ME, Maciejewski ML, Earle CC, Block SD, Maciejewski PK, Prigerson HG



Association between Cost and Quality of Death in the Final Week of Life

Socio-demographic characteristics of
-age,
-race,
-gender,
-education,
-survival time,
-and source of report,
were controlled for in the adjusted analyses per capita cost predicting quality of death in the deceased cohort.

Systematic Review of Cancer Presentations with a Median Survival of Six Months or Less

Shelley R. Salpeter, M.D., Dawn S. Malter, M.D., Ph.D., Esther J. Luo, M.D.,Albert Y. Lin, M.D., and Brad Stuart, M.D.

Despite different cancer characteristics,
a fairly universal picture of terminal disease included :

1- decreasing performance status,
2- advancing age,
3- weight loss,
4- metastatic disease,
5- disease recurrence,
6- laboratory abnormalities indicating extensive disease.

Most of these **prognostic indicators** found were continuous, independent risk factors for mortality.

We found little evidence that treatment improved survival at these terminal stages, with increased risk for toxicity.

JOURNAL OF PALLIATIVE MEDICINE Vol, 15, No 2, 2012

Systematic Review of Cancer Presentations with a Median Survival of Six Months or Less

Shelley R. Salpeter, M.D., Dawn S. Malter, M.D., Ph.D., Esther J. Luo, M.D.,Albert Y. Lin, M.D., and Brad Stuart, M.D.

with relatively good prognosis and treatment options,

such as breast cancer, become terminal

-when the patient manifests KPS less than 60%

or

-at least three prognostic factors

while cancers with poor prognosis, such as biliary cancers, become terminal

-with KPS less than 90%

or

-1 prognostic factor

Our review of studies from 1980 to 1998 showed that survival for these presentations has not changed significantly over the past 30 years, despite many treatment advances.

JOURNAL OF PALLIATIVE MEDICINE Vol, 15, No 2, 2012

ESTRO School

Palliative Prognostic Index: PPI

The PPI is quick and easy to use,
can be applied to patients with cancer,
in hospital, in hospice and at home.

It may be used by general physicians
to achieve prognostic accuracy comparable,
if not superior,
to that of physicians experienced in oncology

Palliative Prognostic Index: PPI

Performance status/Symptoms	Partial score
Palliative Performance Scale	
10–20	4
30–50	2.5
≥60	0
Oral Intake	
Mouthfuls or less	2.5
Reduced but more than mouthfuls	1
Normal	0
Edema	
Present	1
Absent	0
Dyspnea at rest	
Present	3.5
Absent	0
Delirium	
Present	4
Absent	0

Scoring

PPI score
> 6 : survival < 3 weeks
> 4 : survival < 6 weeks
≤ 4 : survival > 6weeks

Prospective Validation of the Palliative Prognostic Index in Patients with Cancer.
Stone, C ,Tierman, E., & Dooley, B., Journal of Pain and Symptom Management, 2008,Vol. 35, No. 6, 617–622

Systematic Review of Cancer Presentations with a Median Survival of Six Months or Less

Shelley R. Salpeter, M.D., Dawn S. Malter, M.D., Ph.D., Esther J. Luo, M.D.,Albert Y. Lin, M.D., and Brad Stuart, M.D.

TABLE 4. PERFORMANCE STATUS SCORE[a]

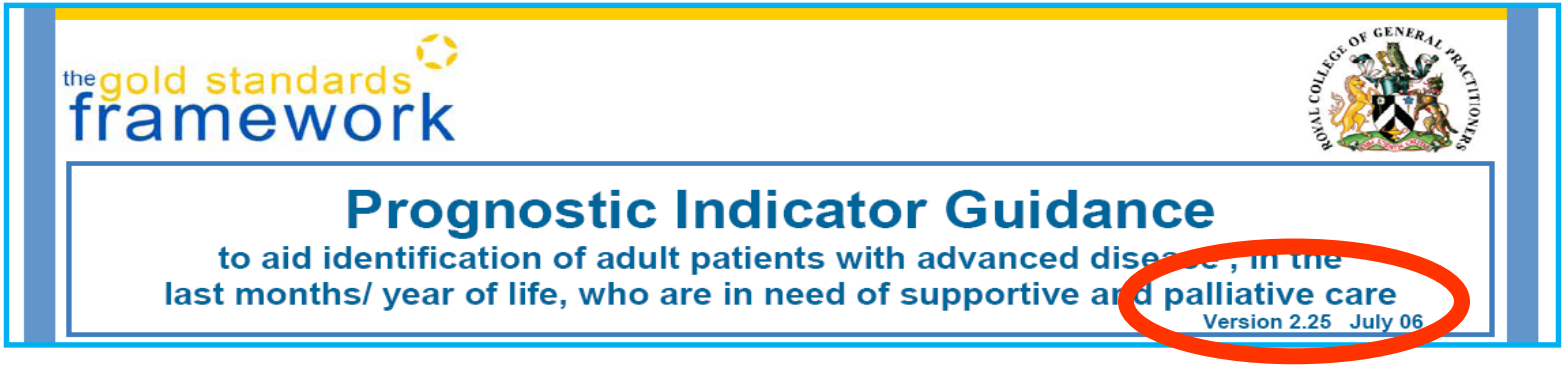
ECOG	*Level of functional capacity*	*Karnofsky*	*Level of functional capacity*
0	Fully active, able to carry on all predisease performance without restriction	100	Normal, no complaints, no evidence of disease
1	Restricted in physically strenuous activity but ambulatory and able to carry out work of a light or sedentary nature.	90	Able to carry on normal activity, minor signs or symptoms of disease
		80	Normal activity with effort, some signs or symptoms of disease
2	Ambulatory and capable of all self-care but unable to carry out any work activity. Up and about more than 50% of waking hours	70	Cares for self, unable to carry on normal activity or to do active work
		60	Requires occasional assistance, but is able to care for most needs
3	Capable of only limited self-care, confined to bed or chair more than 50% of waking hours	50	Requires considerable assistance and frequent medical care
		40	Disabled, requires special care and assistance
4	Completely disabled. Cannot carry on any self-care. Totally confined to bed or chair	30	Severely disables, hospitalization is indicated although death is not imminent
		20	Hospitalization is necessary, very sick, active supportive treatment necessary
		10	Moribund, fatal processes progressing rapidly
5	Dead	0	Dead

[a]Karnofsky Performance Status[10,12,13] and Eastern Cooperative Oncology Group (ECOG) performance status scale.[14]

JOURNAL OF PALLIATIVE MEDICINE Vol, 15, No 2, 2012

ESTRO School

How to identify the palliative care patient ?



Indications to start palliative care :

1-Surprise question:

"Would You be surprised if this patient is dying within 6-12m?"

or

2-What are the wishes and needs of this patient?

or

3- Are there clinical indicators of progressing disease:

cancer – organ failure - frailty (±dementia)

ESTRO School

Co-morbidities or other General Predictors of End Stage illness[1,2]

Co-morbidity is increasingly the biggest predictive indicator of mortality and morbidity. Also-

- Weight loss - Greater than 10% weight loss over 6 months
- General physical decline
- Serum Albumin < 25 g/l
- Reducing performance status / ECOG/Karnofsky score (KPS) < 50%. Dependence in most activities of daily living(ADLs)

1. Cancer Patients

Cancer[3]

Any patient whose cancer is metastatic or not amenable to treatment, with some exceptions – this may include some cancer patients from diagnosis e.g. lung cancer. 'The single most important predictive factor in cancer is performance status and functional ability' – if patients are spending more than 50% of their time in bed/lying down, prognosis is estimated to be about 3 months or less. More exact predictors for cancer patients are available elsewhere on the GSF website.

2. Organ Failure Patients

2.1 Heart Disease - CHF [4]

At least two of the indicators below :-

- CHF NYHA stage III or IV – shortness of breath at rest or minimal exertion
- Patient thought to be in the last year of life by the care team - the 'surprise' question
- Repeated hospital admissions with symptoms of heart failure
- Difficult physical or psychological symptoms despite optimal tolerated therapy

2.2 Chronic Obstructive Pulmonary Disease – COPD [5]

- Disease assessed to be severe e.g. (FEV1 <30%predicted – with caveats about quality of testing)
- Recurrent hospital admission (>3 admissions in 12 months for COPD exacerbations)
- Fulfils Long Term Oxygen Therapy Criteria
- MRC grade 4/5 – shortness of breath after 100 meters on the level or confined to house through breathlessness
- Signs and symptoms of right heart failure
- Combination of other factors e.g. anorexia, previous ITU/NIV/resistant organism, depression
- >6 weeks of systemic steriods for COPD in the preceding 12 months

2.3 Renal Disease [6]

- Patients with stage 5 kidney disease who are not seeking or are discontinuing renal replacement therapy. This may be from choice or because they are too frail or have too many co-morbid conditions.
- Patients with stage 5 chronic kidney disease whose condition is deteriorating and for whom the one year 'surprise question' is applicable ie overall you would not be surprised if they were to die in the next year?
- Clinical indicators:
  - CKD stage 5 (eGFR <15 ml/min)
  - Symptomatic renal failure - Nausea and vomiting, anorexia, pruritus, reduced functional status, intractable fluid overload)
- Increasingly severe symptoms from comorbid conditions requiring more complex management or difficult to treat

NB. many people with Stage 5 CKD have stable impaired renal function and do not progress or need RRT.

2.4 Neurological Disease - a) Motor Neurone Disease[7]

MND patients should be included from diagnosis, as it is a rapidly progressing condition

Indicators of rapid deterioration include:

- Evidence of disturbed sleep related to respiratory muscle weakness in addition to signs of dyspnoea at rest
- Barely intelligible speech
- Difficulty swallowing
- Poor nutritional status
- Needing assistance with ADL's
- Medical complications eg pneumonia, sepsis
- A short interval between onset of symptoms and diagnosis
- A low vital capacity (below 70% of predicted using standard spirometry)

http://www.gpscbc.ca/sites/default/files/Gold%20Standard%20Framework-Prognostic%20Indicator%20Guidance.pdf

Co-morbidities or other General Predictors of End Stage illness

Co-morbidity

is increasingly the biggest predictive indicator of mortality and morbidity.

Also-

- **Weight loss** - Greater than 10% weight loss over 6 months
- **General physical decline**
- **Serum Albumin** < 25 g/l
- **Reducing performance status** / ECOG/Karnofsky score (KPS) < 50%. Dependence in most activities of daily living(ADLs)

Disease specific predictors of end stage illness in cancer

Any patient whose cancer is metastatic and not amenable to treatment, with some exceptions – this may include some cancer patients from diagnosis e.g. lung cancer.

'The single most important predictive factor in cancer is performance status and functional ability' – if patients are spending more than 50% of their time in bed/lying down, prognosis is estimated to be about 3 months or less.

3. Patients with Frailty and Dementia

Frailty [10]

- Multiple comorbidities with signs of impairments in day to day functioning
- Deteriorating Karnofsky score
- Combination of at least 3 symptoms of: weakness, slow walking speed, low physical activity, weight loss, self reported exhaustion

Dementia [11]

- Unable to walk without assistance, and
- Urinary and fecal incontinence, and
- No consistently meaningful verbal communication, and
- Unable to dress without assistance
- Barthel score < 3
- Reduced ability to perform activities of daily living

Plus any one of the following:

10% weight loss in previous six months without other causes, Pyelonephritis or UTI, Serum albumin 25 g/l, Severe pressure scores eg stage III / IV, Recurrent fevers, Reduced oral intake / weight loss, Aspiration pneumonia

Stroke [12]

- Persistent vegetative or minimal conscious state / dense paralysis / incontinence
- Medical complications
- Lack of improvement within 3 months of onset
- Cognitive impairment / Post-stroke dementia

Palliative –Terminal care algorythme

PPS
palliative care

The **7 Key messages – or core tasks** (or quality standards),

7 C's, according to GSF:

C1 -Communication: ask for symptom control/wishes in every contact!!!

C2 -Coordination: who can be contacted for questions/problems?

C3 -Control of symptoms: evaluate treatment effect

C4 -Continuity (incl. 'out of hours' (≠ *voice mail*))

C5 -Continued learning: stay at the "state of the art"

C6 -Carer support: for your team and for yourself

C7 -Care in the dying phase: for patient (+family + carers+ bereavement)

ESTRO School

There is no strong
evidenced based medicine
about
medical decision making at the end of life.

Medical decision making in palliative care

There is a need for prospective randomised trials in palliative care and end of life issues!?

But:

-Trials measure only what is measurable
and not always what is meaningfull (QoL) !

-Moral and ethical issues are always coming up NOT to do clinical trials in this group of very frail patients!

Is it not immoral and unethical if no research
is done to solve the many difficult questions at the end of life?

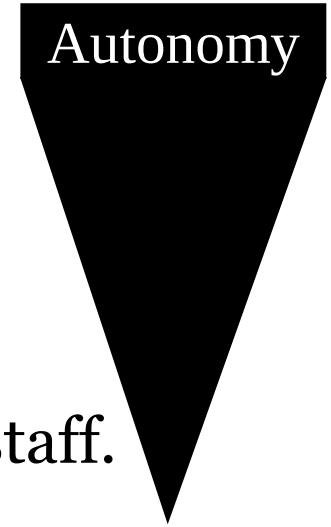
Medical decision making in palliative care

Some patients make decisions:

- only by themselves.

- with advice from medical and nursing staff.

- in collaboration with medical and nursing staff.



Others want

- that their doctors make the decisions for them.

Medical decision making in palliative care

How decide patients at the end of their life ?

9% decides self (= complete autonomy)

73% collaborate

younger, better educated, fitter patients

Oral presentation of a Study in London
Research congress EAPC dec 2000 Berlin

Medical decision making in palliative care

Patients at the end of life want :

to be treated as patients

-with dignity

-as they were (profession, social status, age,…)

-as an individual

to be known and respected

to be helped to avoid dehuminisation

Medical decision making in palliative care

Most patients want:

-not to be kept alive to all costs (not die in ICU)
-to die peacefully and with dignity
-to die at home (⇒ but, burden for family!?)
-to die pain free (⇒ or don't,
to avoid somnolence, confusion, …)

Medical decision making in palliative care

What does this patient want?

What does this patient NOT want?

“What is now troubling you?”

“What is most important at this moment of your life?”

“Look beyond stereotypes,
but to the individual patient !!”

Medical decision making in palliative care

-Help the patient / family to find their solution

-The physician / caregiver is katalysator,
not messanger / bringer of standard solutions.

-Avoid medicalisation of the dying process

Medical decision making in palliative care

Check what the patient wants,

not once

but at regular times

and give answers to their questions, not to ours.

End of life = a dynamic process !!

Medical decision making in palliative care

What patients want, is influenced by their:

- own history and experiences
- individual values
-wishes and dislikes

Medical decision making in palliative care

Who can give patients:

-information they want ? (Not all has to be told !)
-information they can understand ?
-repeated information ?
-time (or give at least the impression to have time) ?

public interest ?

Medical decision making in palliative care

The statement at the end of the ‘70 :

“We ‘ll kill cancer… !”

It was a wrong statement …

ESTRO School

Medical decision making in palliative care

The statement of the ‘80 :

> “If you can’t kill the tumour,
> kill the pain … !”

It was at least a partially wrong statement …

ESTRO School

Medical decision making in palliative care

The statement after 2000:

> "If you can't kill the tumour,
> and you can't kill the pain,
> kill patient … !"

Will this be the right statement … ?

School

Objectively observable signs of imminently dying in palliative patients

Results

-Somnolence is the most prevalent sign ➔ inform patients

-Oliguria and livid spots occurred the most early

-Death rattle and apnoea appeared most close to actual death

Objectively observable signs of imminently dying in palliative patients

Conclusion:

- Death ~ reproducible predictable within days

for terminal pal. pts by 8 obj. signs in standard nursing care.

-This study proved that clinical research is feasible in palliative care, necessary and useful.

Treatment terminal patient

Stop useless medication

It opens doors for communication.

Only medication that makes a difference today

Treatment terminal patient

Published studies indicate that
"within the context of adequate palliative care,
the refusal of food and fluids
does not contribute to suffering among the terminally ill",

and might actually contribute to a comfortable passage from life: "At least for some persons, starvation does correlate with reported euphoria."[11]

Patient Refusal of Nutrition and Hydration: Walking the Ever-Finer Line
American Journal Hospice & Palliative Care, pp. 8-13, March/April 1995

Pacemaker in terminal patients

Background

-Is it possible that a pacemaker postpones cardiac arrest in the dying patient,

➔ longer time to die for patients with a pacemaker

-If yes, do we have to switch of the pacemaker?

Method

Patients that died in the PCU in UH Leuven

Database = **3011 patients (1999- 2015)**

Pacemaker patients **n = 83**

2 matched patients for each pm-patient **(n = 163)**

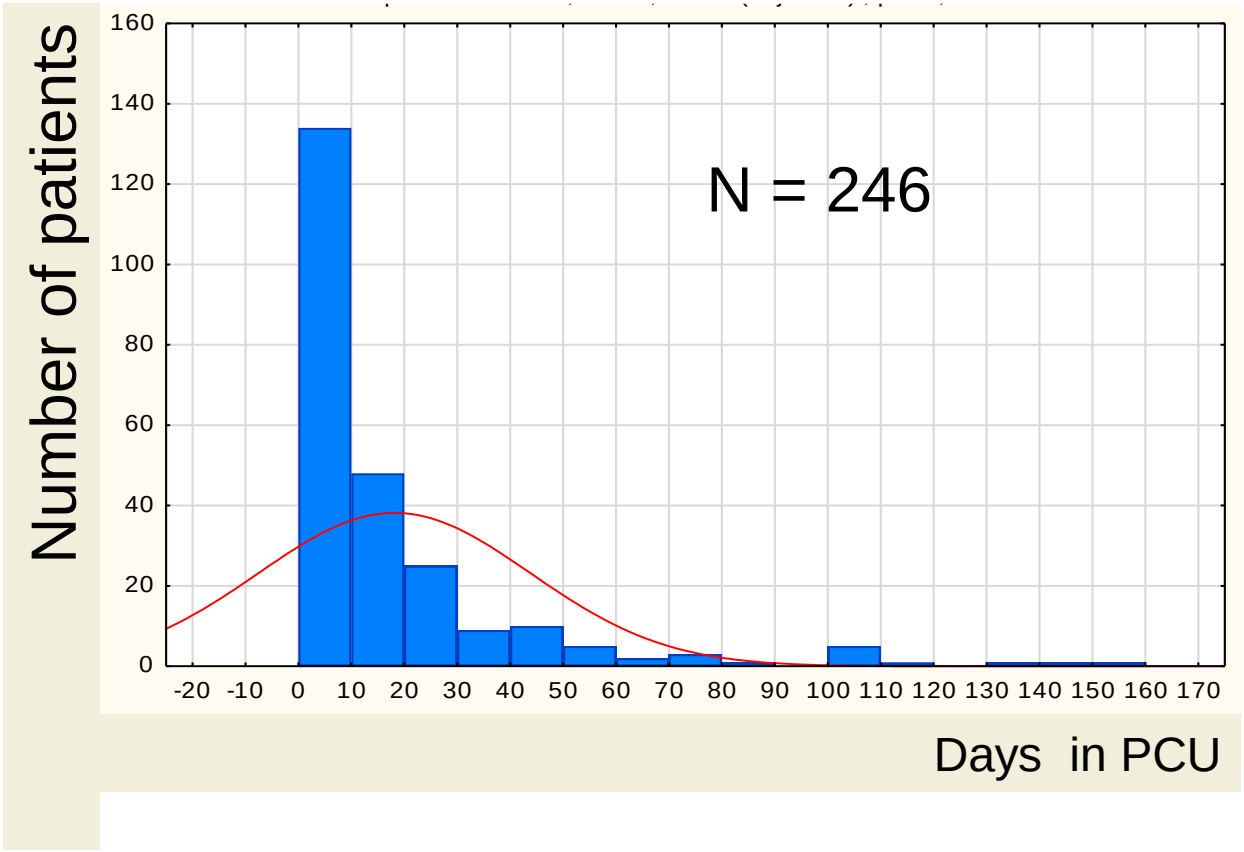
- 1 pt. died within 6 m before the pm patient
- 1 pt. died within 6 m after the pm-pt

Same age

Same gender

Same pathology (non-onco or onco: breast/urol/digest/neuro…)

Duration of stay on the PCU till death



Duration of stay in the PCU till death
