Welcome to
1st AROI - ESTRO GYN Teaching Course

Transition from

"Conventional 2D to 3D Radiotherapy"

with a special emphasis

on

"Brachytherapy in Cervical Cancers"

ESTRO School

MOU – Torino Italy

ESTRO – AROI : April 2016

AROI - ESTRO GYN TEACHING COURSES IN INDIA 2017- 2019

- **1st year (2017): Theme: "Transition from 2D to 3D BT in Cervical Cancers In 2017"** Principles of Advanced EBRT and Conventional BT planning including procedure details preferably by *cadaveric hands-on workshop*, commissioning and quality assurance, planning and plan evaluation, reporting and introduction to Concepts of Image Based BT and protocols in Cervical Cancers.

- **2nd year (2018): Theme: "Image Based BT in Cervical Cancers with emphasis on GEC-ESTRO ICRU 89 Reporting"** Principles of 3D Image Based BT in cervical cancers including various imaging modalities, target concepts, planning details, plan evaluation and reporting. Preliminary discussion on protocol development.

- **3rd year (2019): Theme: "Evaluation & Finalization of Protocol for BT in Cervical Cancers"** Principles of Advanced EBRT including IMRT /IGRT, 3D Image Based BT and systemic therapy in current era, development of a template for future Indian courses and finalization on research protocol.

- **Participants:** A team of physician and physicist from each institution who are actively involved in treating cervical cancers including BT. **Limited number of teams: 40 - 45 teams approximately.**

TEAM OF RADIATON ONCOLOGIST & MEDICAL PHYSICIST POTENTIALLY INTERESTED IN IMPLEMENTING AND ENHANCING EXISITING GYN BT PRACTICE IN THE INSTITUTION

Transition from Conventional 2D to 3D Radiotherapy with a special emphasis on Brachytherapy in Cervical Cancers

Ist ESTRO-AROI GYN Teaching Course

8-11 March 2017
Bengaluru, India

ROADMAP

RADIOTHERAPY TREATMENT PLANNING AND DELIVERY

RADIATION ONCOLOGIST, MEDICAL PHYSICIST, RADIATION THERAPIST, OTHER SPECIALIST

FACULTY

ESTRO COURSE DIRECTORS
- Richard Pötter, *Radiation Oncologist, Medical University Hospital, Vienna (AT)*
- Kari Tanderup, *Medical Physicist, University Hospital, Aarhus (DK)*

AROI COURSE DIRECTORS
- Umesh Mahantshetty, *Radiation Oncologist, Tata Memorial Hospital, Mumbai (IN)*
- Jamema Swamidas, *Medical Physicist, ACTREC, Tata Memorial Centre, Mumbai (IN)*

TEACHERS
- Christine Haie Meder, *Radiation Oncologist, Institut Gustave Roussy, Villejuif (FR)*
- D. N. Sharma, *Radiation Oncologist, AIIMS, Delhi (IN)*

LOCAL ORGANISERS
- M G Janaki, *Radiation Oncologist, MS Ramiah Medical College, Bengaluru*
- Revathi, *Medical Physicist, MS Ramiah Medical College, Bengaluru*

ESTRO COURSES : So far!
Image-guided cervix radiotherapy – with a special focus on adaptive brachytherapy

In the ESTRO school for more than 10 years:

- 1st edition Vienna 08 2004: 80 participants
- 2nd edition Paris 08 2005: 100 participants
- 3rd edition Vienna 08 2006: 130 participants
- 4th edition Copenhagen 08 2007: 106 participants
- 5th edition London 08 2008: 158 participants
- 6th edition (1st intern.) Manila 01 2009: 160 participants ESTRO-SEAROG
- 7th edition Amsterdam 09 2009: 120 participants
- 8th edition Warsaw 08 2010: 110 participants
- 9th edition Chandigarh (2nd intern.) 03 2011: 102 particip. AROI-ESTRO
- 10th edition Izmir 09 2011: 104 participants
- 11th edition Beijing (3rd intern.) 03 2012: 128 participants ESTRO-CSRO
- 12th edition Budapest 10 2012: 102 participants
- 13th edition Moscow (4th intern.) 06 2013: 180 participants
- 14th edition Barcelona 09 2013: 90 participants
- 15th edition Florence 10 2014: 99 participants
- 16th edition Utrecht 11 2015: 82 participants
- 17th edition Toronto (5th intern.) 04 2016: 110 particip. ESTRO-CARO
- **18th edition Bengaluru (6th Itern) 03 2017: 80 parti. AROI ESTRO**

In total ~ 2000 participants

Discussion on the program & logistics!

Tata Memorial Hospital Mumbai
Feb. 2017

Preparation for commissioning of the workshop at TMH!

7th March 2017 at the Venue

ESTRO Course Directors:

- Richard Pötter, Radiation Oncologist, Medical University Hospital, Vienna (AUT)
- Kari Tanderup, Physicist, University Hospital, Åarhus (DEN)

AROI Course Directors:

- Umesh Mahantshetty, Radiation Oncologist, Tata Memorial Centre, Mumbai (IND)
- Jamema SV, Medical Physicist, ACTREC, Tata Memorial Centre, Mumbai (IND)

ESTRO & AROI Teaching Faculty:

- Christine Haie Meder, IGR, Villejuif, (FRA)
- D N Sharma, Radiation Onclogist, AIIMS, Delhi (IND)

LOCAL ORGANISER

- **M G Janaki, Radiation Oncologist, MS Ramaiah Medical College, Bengaluru, (IND)**
- **Revathi, Medical Physicist, MS Ramaiah Medical College, Bengaluru, (IND)**

PROJECT MANAGER

- **Melissa Vanderijst, ESTRO**

Program Highlights

Transition from 2D to 3 D Radiotherapy for Cervical Cancer

- **Day 1:**
  - External Beam RT : 2D to State of the art RT
  - EBRT Contouring and Planning Workshop
- **Day 2:**
  - Basics of cervical brachytherapy
  - Hands on Workshop of BT Application on Cadevers
  - BT Commissioning Workshop
- **Day 3:**
  - Transition form 2D to 3D BT
  - Principles of BT planning
  - BT Contouring and Applicator Reconstruction workshop
- **Day 4:**
  - Treatment planning workshop
  - Practical implementation
  - Setting goals

- *On behlaf of AROI and ESTRO,*
  - *The Advanced learning Center, MSRMC Staff*
  - *The Volunteers who donated their body for Research*
  - *The Enthusiastic Teaching Staff*
  - *The Enthusiastic participants*
  - *The Sponsors*

GUSTAVE ROUSSY
CANCER CAMPUS GRAND PARIS

GUSTAVE ROUSSY
COMPREHENSIVE CANCER CENTER

Cervix cancer : generalities

- 500,000 new cervical cancer cases each year
- 80% of the new cases in developing countries
- 3rd most common cause of female cancer mortality
- 274,000 deaths each year
- Human papillomavirus is responsible for virtually all cases of cervical cancer
- HPV-16 and -18 = the most prevalent of the oncogenic types

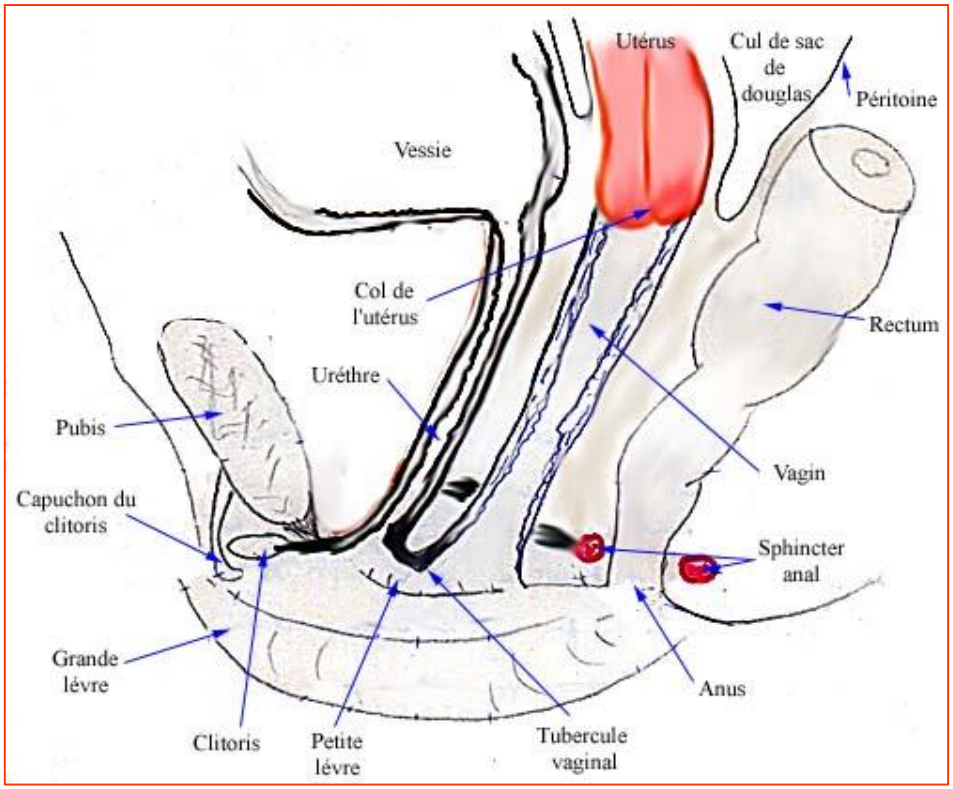
Cervix cancer : generalities

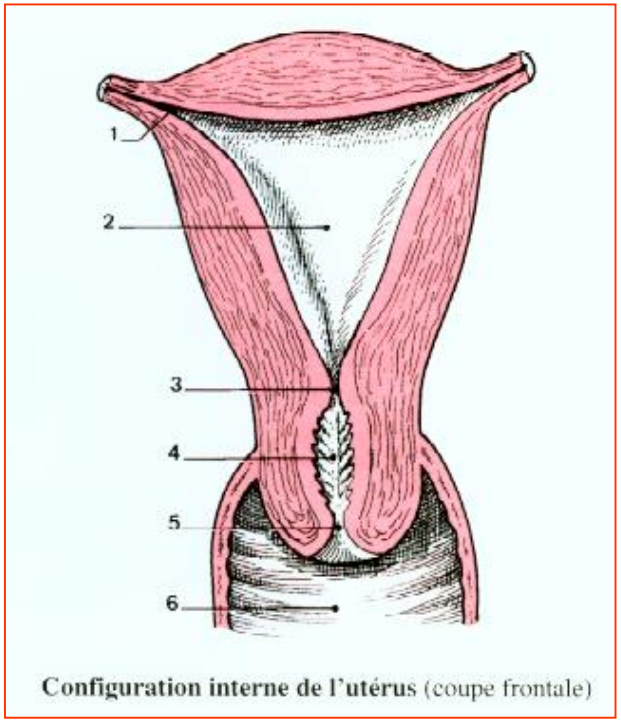
- Curable disease

Local Control	Survival
IA: 95–100%	IA: 95–100%
IB1: 90–95%	IB1: 85–90%
IB2: 60–80%	IB2: 60–70%
IIA: 80–85%	IIA: 75%
IIB: 60–80%	IIB: 60–65%
IIIA: 60%	IIIA: 25–50%
IIIB: 50–60%	IIIB: 25–50%
IVA: 30%	IVA: 15–30%
	IVB: <10%

Anatomical considerations

Uterus





Configuration interne de l'utérus (coupe frontale)

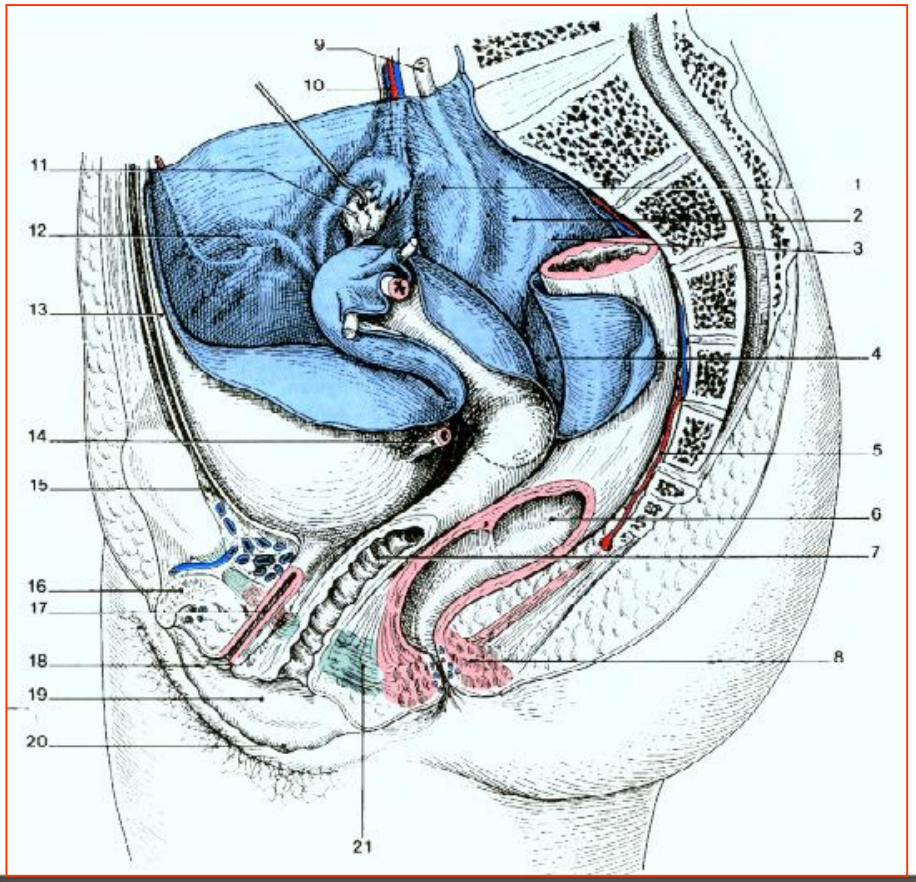
Hollow muscle

weight : 50 g (nulliparous)
70 g (multiparous)

Anatomical considerations

Uterus

Supravaginal part
Bladder and rectum faces covered with peritoneum

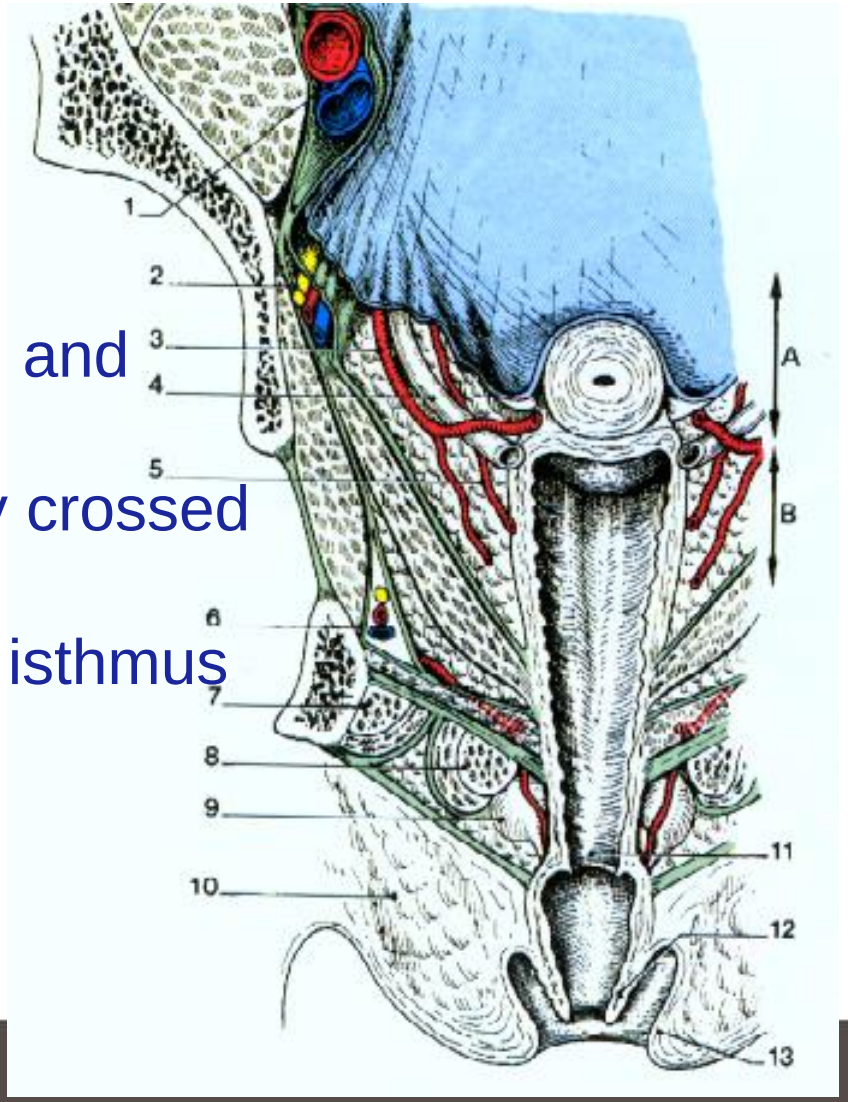


Vaginal part
Separated from the vagina
by vaginal fornices

Anatomical considerations

Uterus

- **Vascularization** : uterine artery arising from internal iliac artery
- **3 segments** : parietal, parametrial and mesometrial
- **Parametrial segment** is anteriorly crossed by the **ureter**
- **Located 20 mm** laterally from the isthmus **+/- 15 mm** from the vaginal fornix

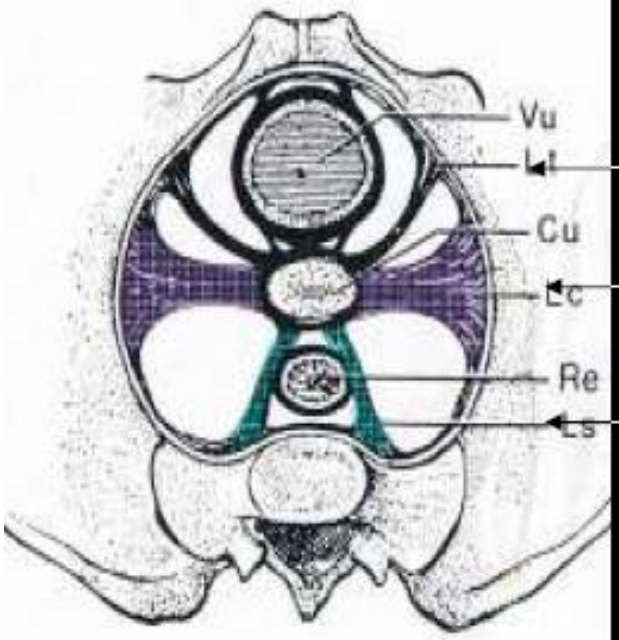


Anatomical considerations

Uterus

Anatomical considerations

Uterus



Transverse cervical ligament

Broad ligament

Uterosacral ligament

Anatomical considerations

Uterus

Parametrial Limits:

Ventral : bladder
Dorsal : perirectal fascia
Medial : cervical rim/tumor
Lateral : pelvic wall

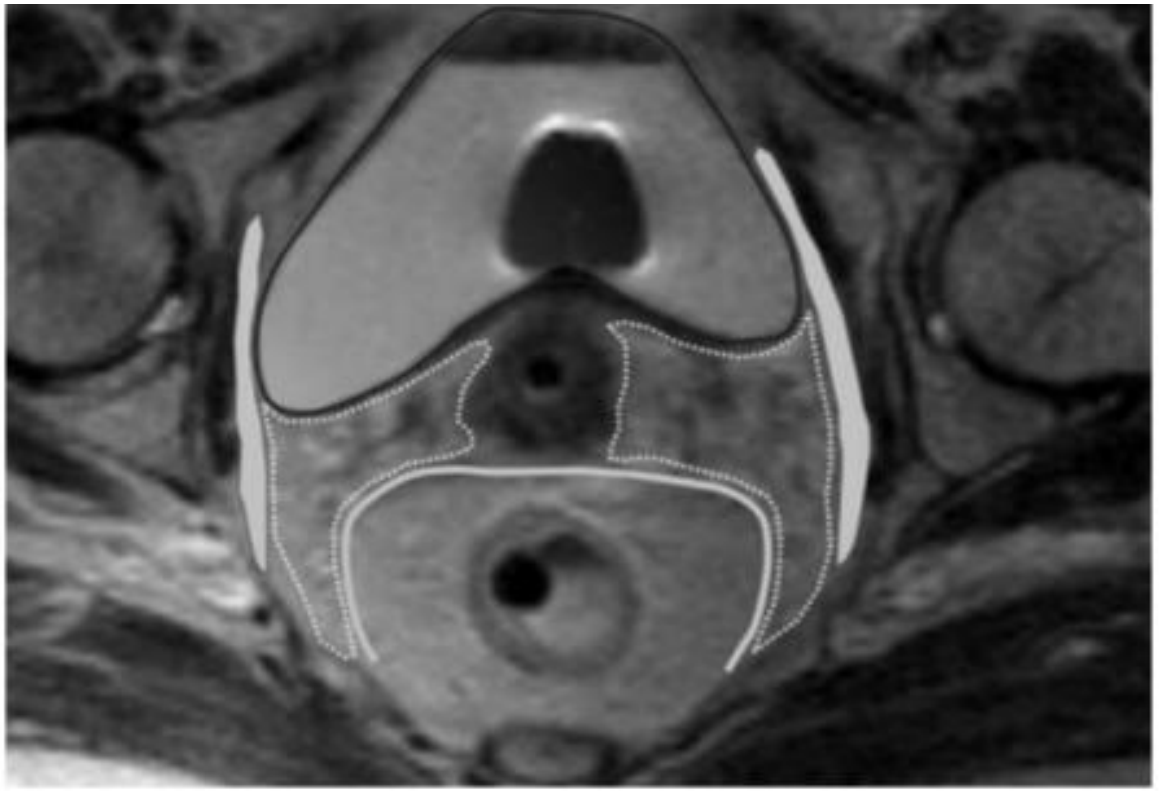


Fig. 2. Definition of parametria according to visible and reproducible radiologic criteria at its borders: ventral = bladder, dorsal = perirectal fascia, medial = tumor/cervical rim, lateral = pelvic wall (PW). At the PW, the space that contains vessels and lymph nodes is particularly indicated. For measurements between tumor and PW, the internal obturator muscle was taken because of its superior visibility.

Dimopoulous et al IJROBP 64(5):1380-1388, 2006

Anatomical considerations

Classification of radical hysterectomy

Denis Querleu, C Paul Morrow

Lancet Oncol 2008; 9: 297–303

Lancet Oncol 2008; 9: 297–303

Figure 4

Type A radical hysterectomy

Same anatomical preparation as shown in figure 1 . Border shows area of resection.

Anatomical considerations

Classification of radical hysterectomy

Denis Querleu, C Paul Morrow

Lancet Oncol 2008; 9: 297–303

Figure 5

Type B1 radical hysterectomy

Same anatomical preparation as shown in figure 1 . Border shows area of resection.

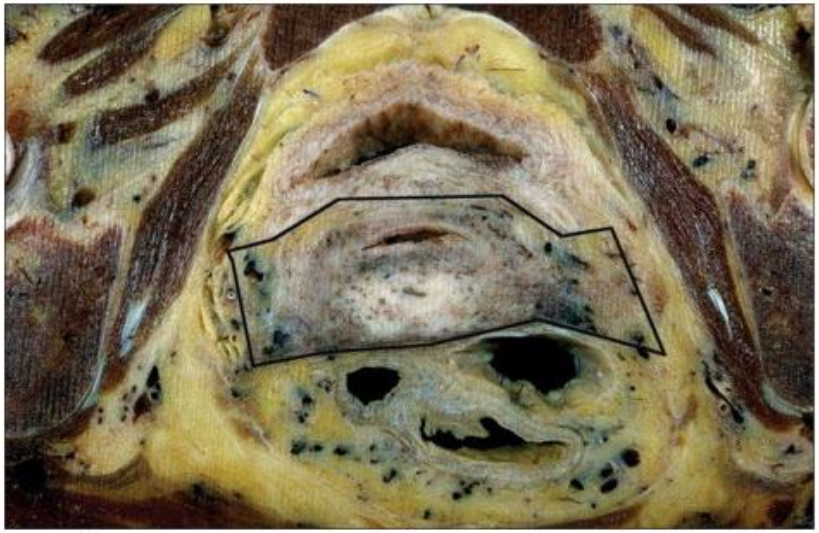

Figure 6

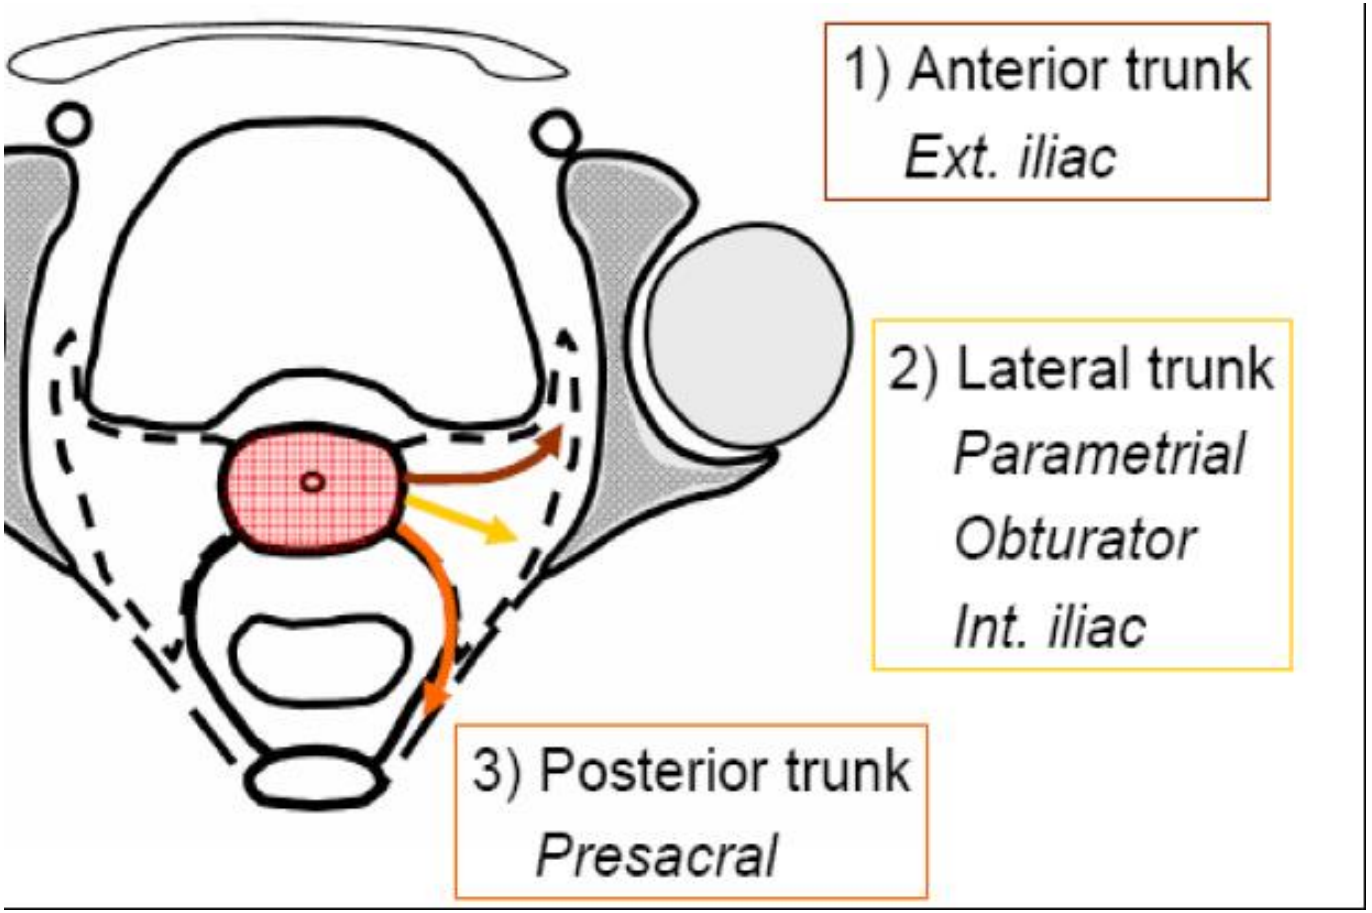
Type C2 radical hysterectomy

Same anatomical preparation as shown in figure 1 . Border shows area of resection.

Anatomical considerations

Lymphatic drainage

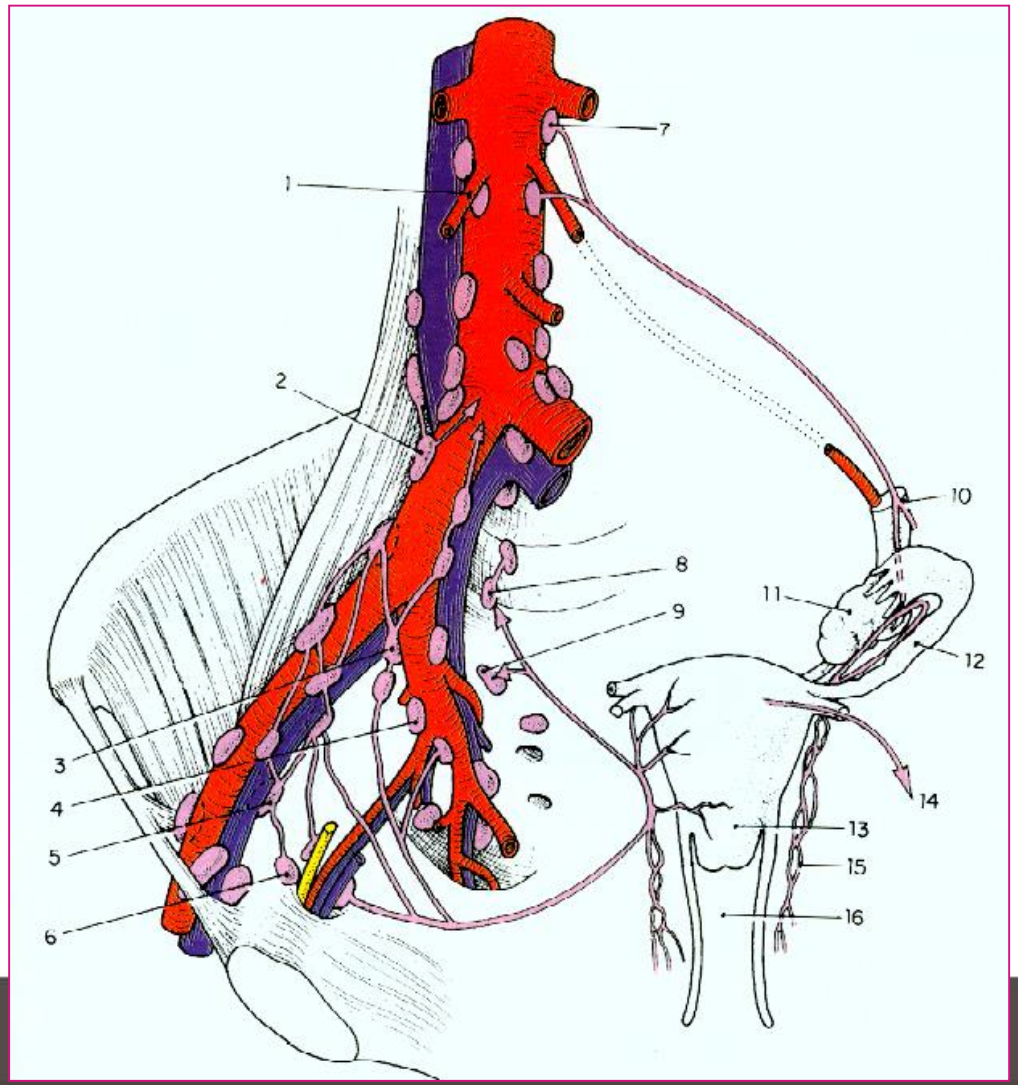
Uterus



Anatomical considerations

Lymphatic drainage

Uterus



Lymph nodes	Anatomical boundaries					
	Cranial	Caudal	Medial	Lateral	Anterior	Posterior
Common iliac nodes	Bifurcation of abdominal aorta (at the inferior border of L4)	Bifurcation of the common iliac vessels (at the inferior border of L5, at the level of the superior border of the ala of sacrum)	Loose cellular tissue	Psoas muscle	Loose cellular tissue anterior to the common iliac vessels	Body of L5
Internal iliac nodes	Bifurcation of common iliac vessels (at the inferior border of L5)	Plane through superior border of the head of femurs at the level of the superior border of the coccyx	Loose cellular tissue	Piriformis muscle	Posterior border of the external iliac lymph nodes and loose cellular tissue	Loose cellular tissue
External iliac nodes	Bifurcation of common iliac vessels (at the inferior border of L5)	Femoral artery	Loose cellular tissue	Iliopsoas muscle	Loose cellular tissue	Anterior border of the internal iliac lymph nodes and loose cellular tissue
Obturator nodes	Plane through the acetabulum	Superior border of the neck of femurs, at the small ischiadic foramen	Loose cellular tissue	Internal obturator muscle (intrapelvic portion)	Loose cellular tissue	Loose cellular tissue
Presacral nodes	Intervertebral space of L5–S1 (sacral promontory)	Superior border of the 1st coccygeal vertebra	–	Piriformis muscle	Loose cellular tissue	Anterior aspect of sacrum
Inguinal nodes	Superior limit of the neck of femurs	Bifurcation of the femoral artery into its superficial and deep branches	Adductor muscles	For superficial inguinal nodes: the adipose and loose connective tissue and the sartorius muscle; for deep inguinal nodes: the femoral vessels	Subcutaneous adipose tissue	Pectineal muscle

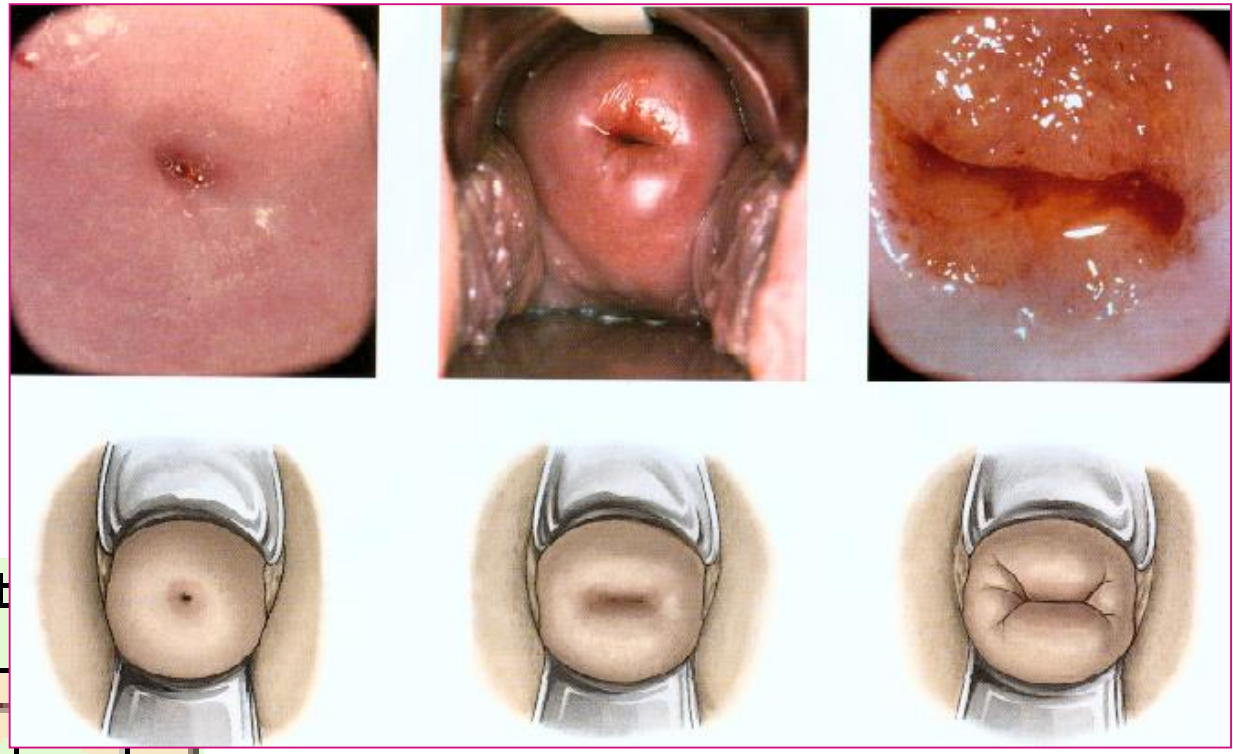
Role of clinical examination

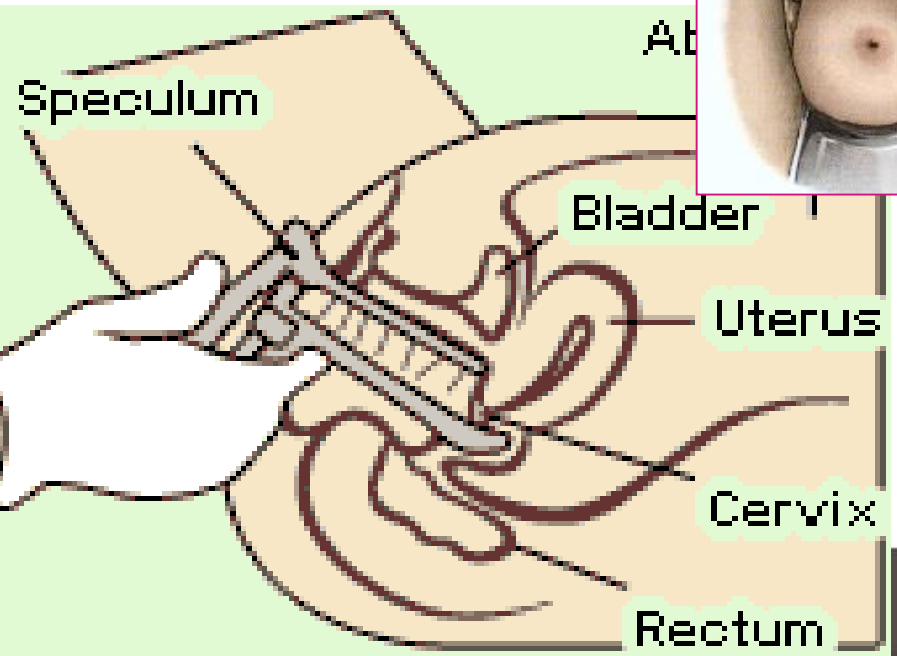
- Accurate tumor characteristics
- Staging
- General condition and fitness for radical treatment

Do you do gynaecological examination under general anaesthesia?

1. Yes
2. No

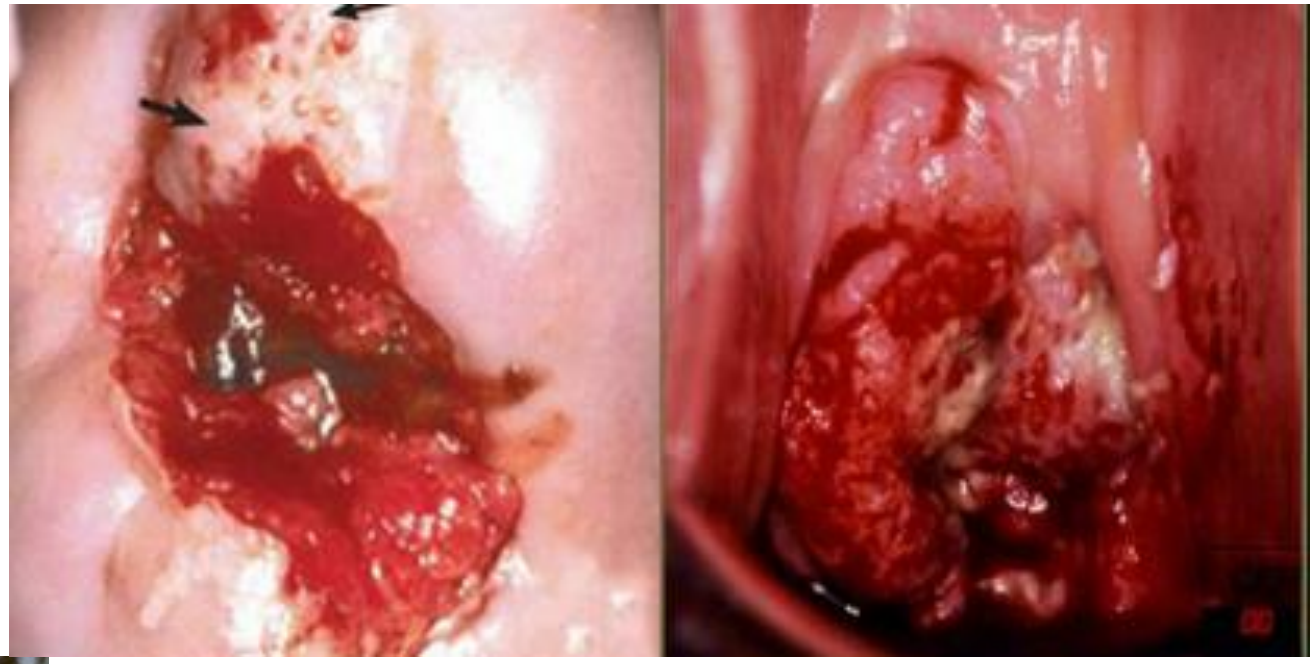
Clinical examination

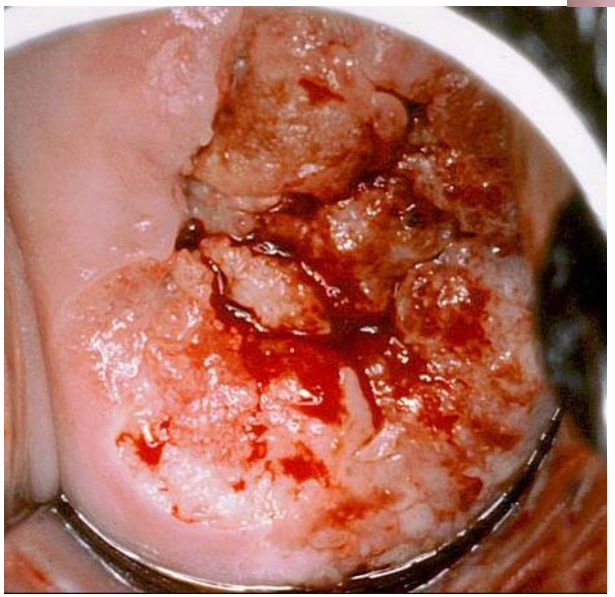


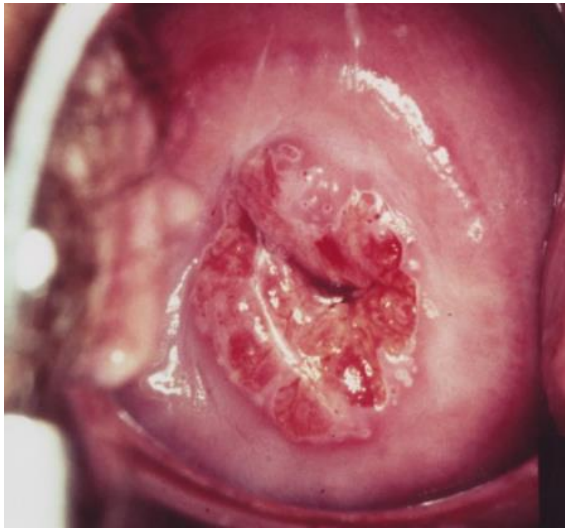


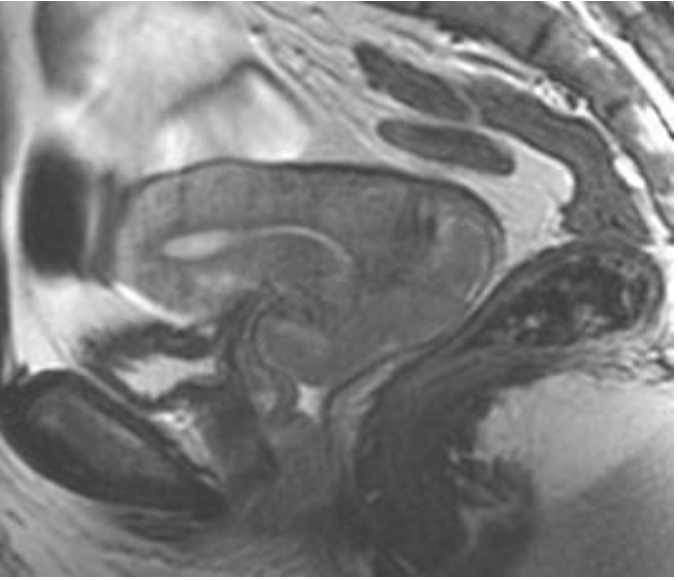
GUSTAVE ROUSSY
CANCER CAMPUS GRAND PARIS

ESTRO School









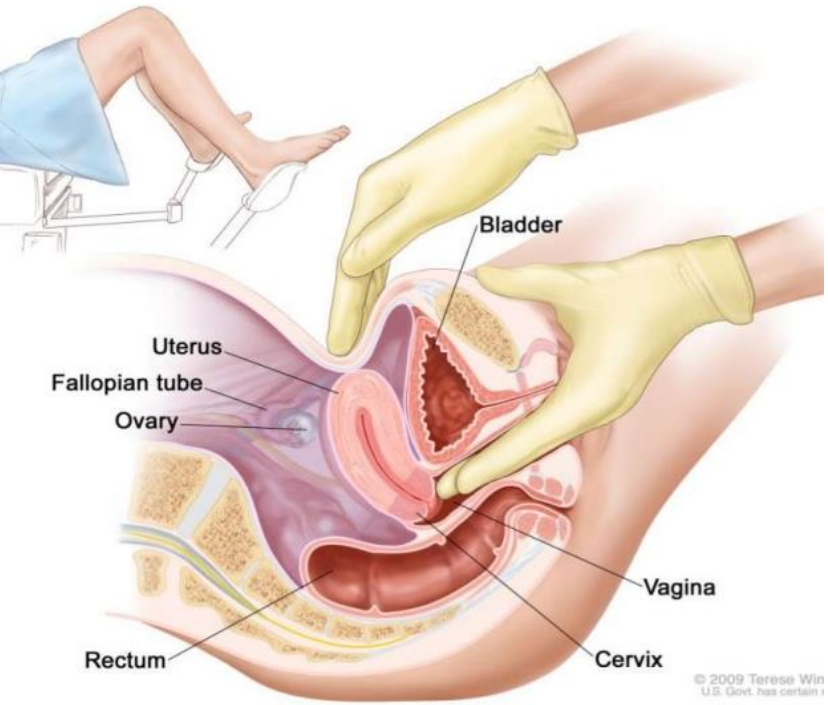
Clinical examination

Tumor measurement

Tumor extension:

vagina (vaginal impression)

parametrium



Staging

Which staging do you use?

1. **FIGO**
2. **TNM classification**

Seminars in Diagnostic Pathology (2012) 29, 167-173

ELSEVIER

Seminars in
Diagnostic
Pathology

Issues and inconsistencies in the revised gynecologic staging systems

Lisa Cole, MD, Mark H. Stoler, MD

- Lymphovascular invasion
- Extension to the uterine corpus
- Nodal status

FIGO staging 2008

- **Stage I: confined to cervix**
  - Ia1: minimal microscopic invasion
  - Ia2: invasion ≤ 5mm depth and ≤ 7mm horizontally
  - Ib1: greater than Ia, clinically visible, confined to the cervix, ≤ 4 cm size
  - Ib2: > 4 cm size

5-year survival: 89.1%

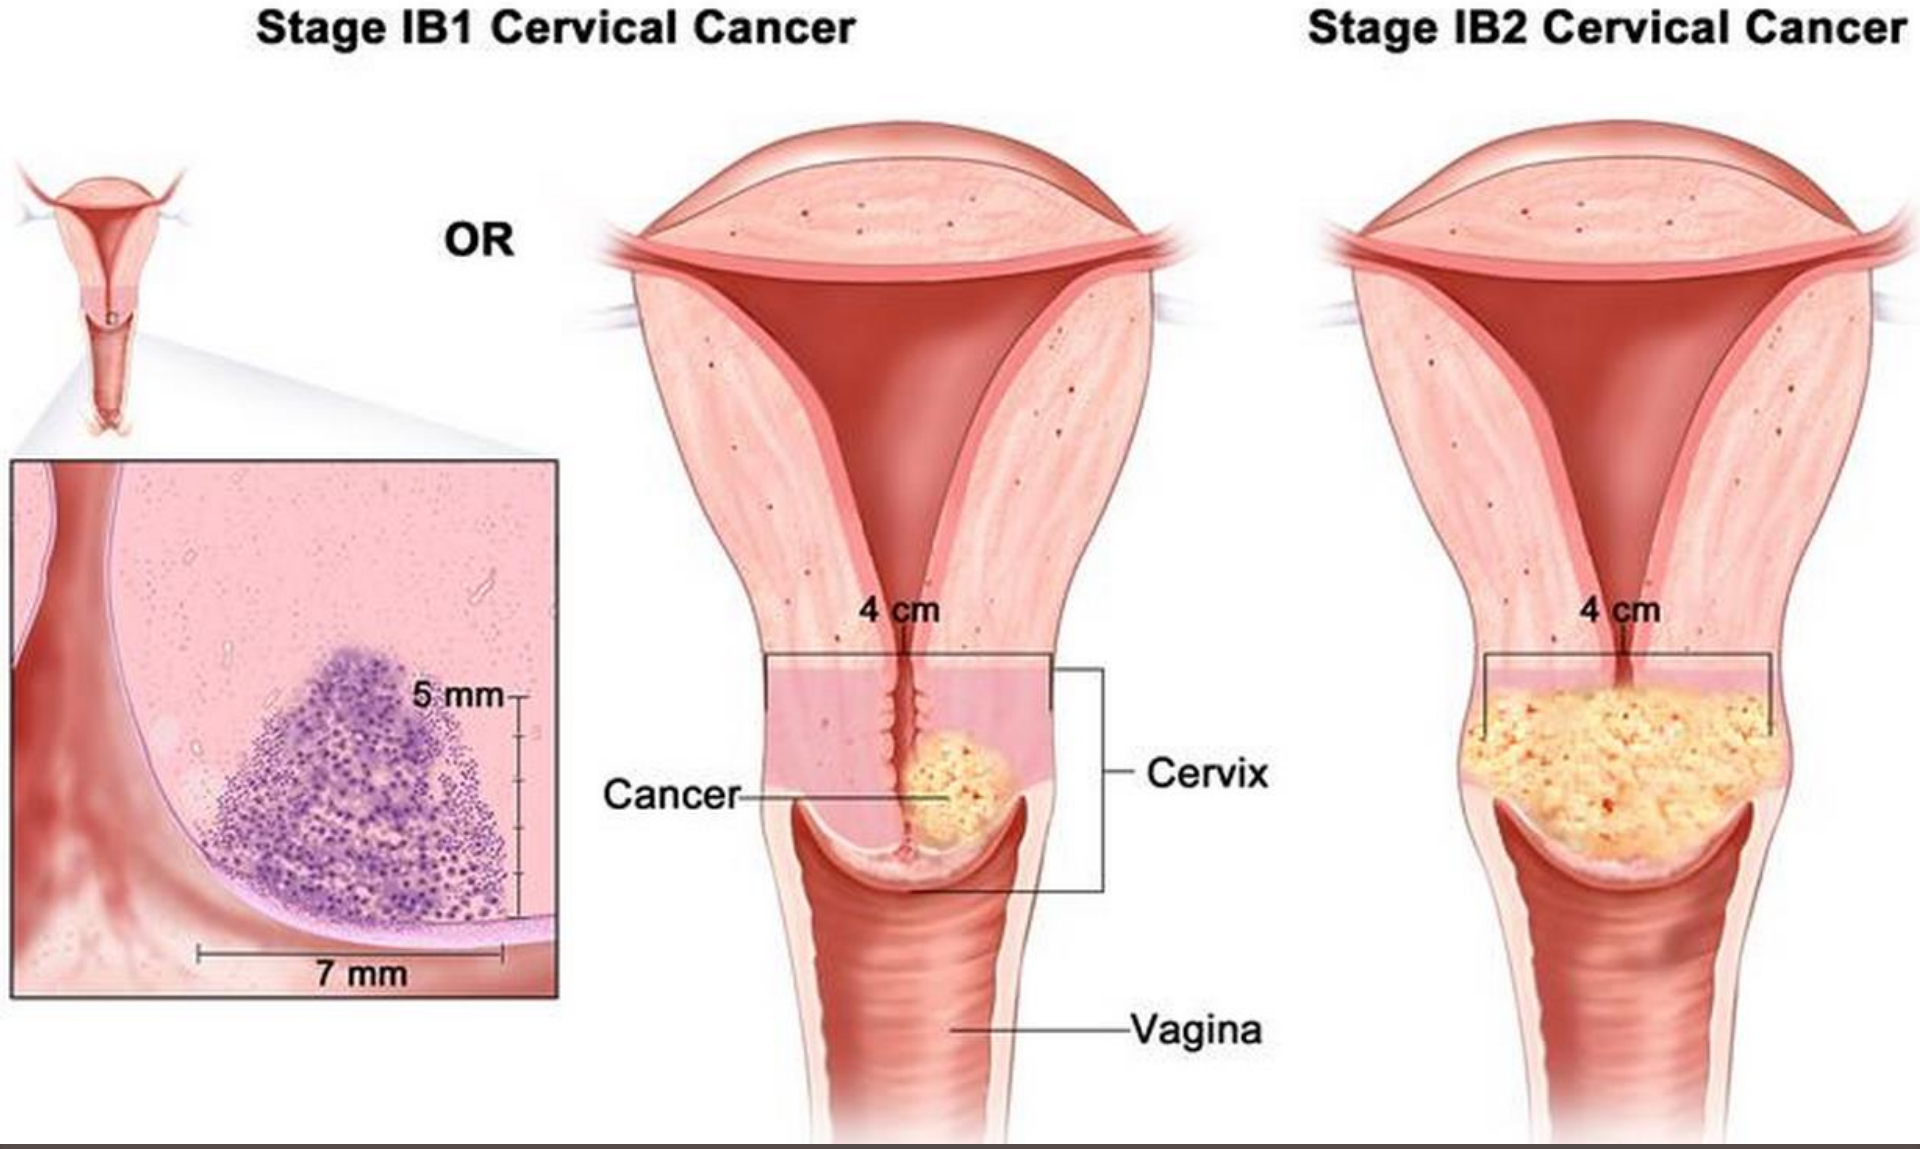
5-year survival : 75.7%

- **Stage II: invades beyond cervix but not to side wall or lower third of vagina**
  - IIa: tumour without parametrial invasion
    - IIa1: ≤ 4 cm size
    - IIa2: > 4 cm size
  - IIb: tumour with parametrial invasion

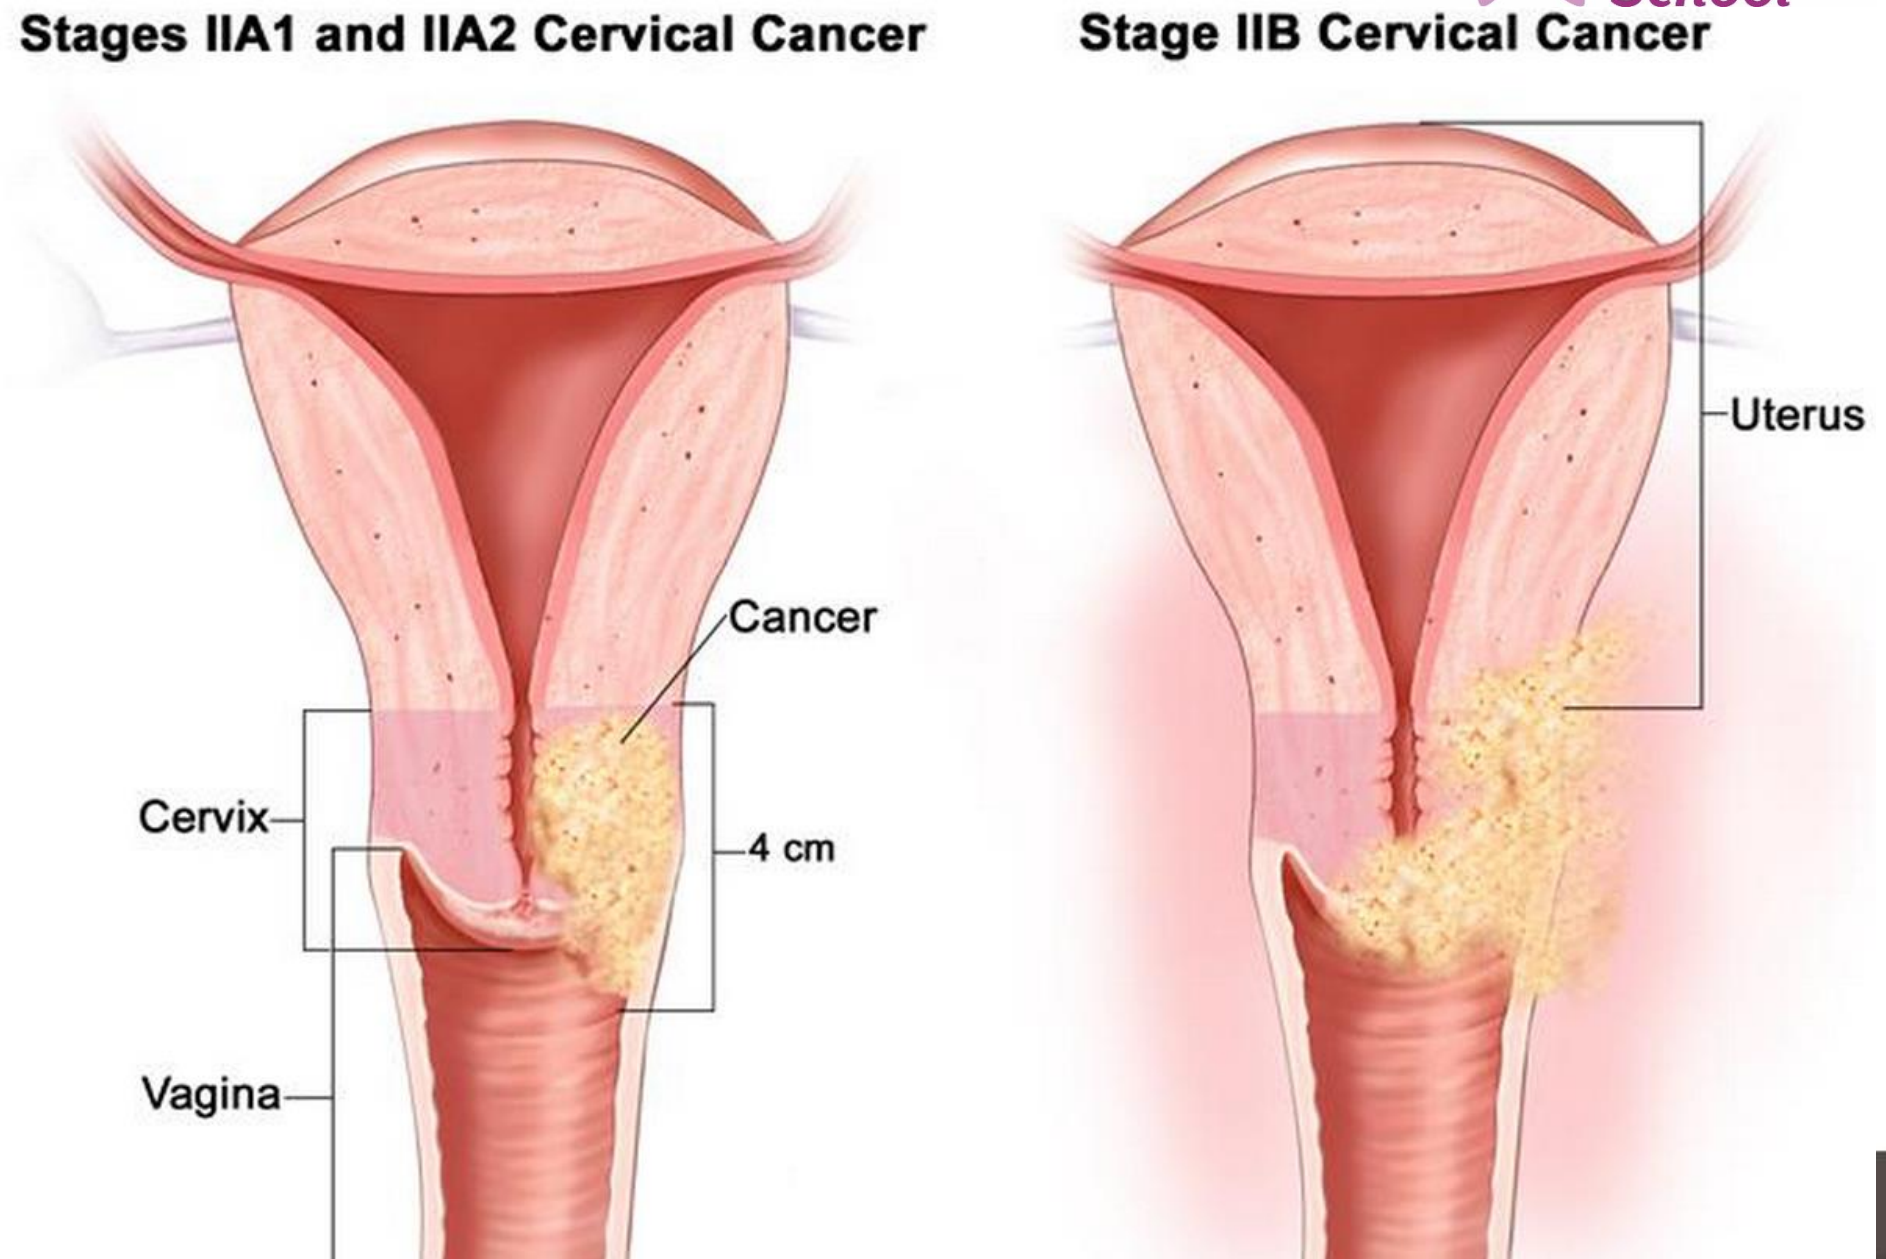
- **Stage III: tumour extends to pelvic sidewall and/or lower third of vagina or causes hydronephrosis or non-functioning kidney**
  - IIIa: lower third of vagina, no pelvic side wall extension
  - IIIb: involving pelvic side wall or causing hydronephrosis

- **Stage IV: tumour invades mucosa of bladder or rectum and/or extends beyond true pelvis**

FIGO stage I 2008



FIGO stage II 2008



FIGO stage III/IV 2008

Stage IA1	T1a1	N0	M0
Stage IA2	T1a2	N0	M0
Stage IB	T1b	N0	M0
Stage IB1	T1b1	N0	M0
Stage IB2	T1b2	N0	M0
Stage II	T2	N0	M0
Stage IIA	T2a	N0	M0
Stage IIA1	T2a1	N0	M0
Stage IIA2	T2a2	N0	M0
Stage IIB	T2b	N0	M0
Stage III	T3	N0	M0
Stage IIIA	T3a	N0	M0
Stage IIIB	T3b	Any N	M0
	T1–3	N1	M0
Stage IVA	T4	Any N	M0
Stage IVB	Any T	Any N	M1

Conclusion

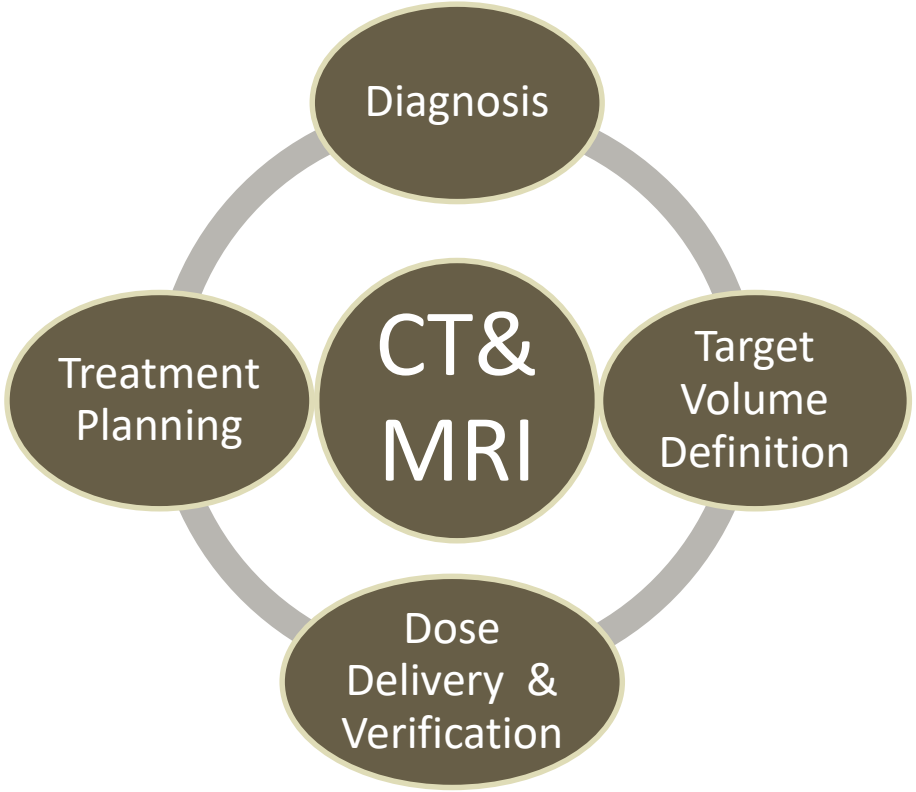
- Importance of clinical examination
- Knowledge of lymphatic drainage
- FIGO classification ⟶ therapy

IMAGING : NORMAL PELVIC ANATOMY

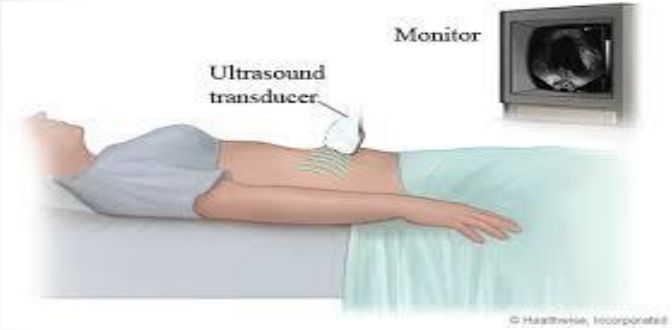
UTERUS,PARAMETRIA,ORGANS AT RISK & NODES : ON USG, CT & MRI

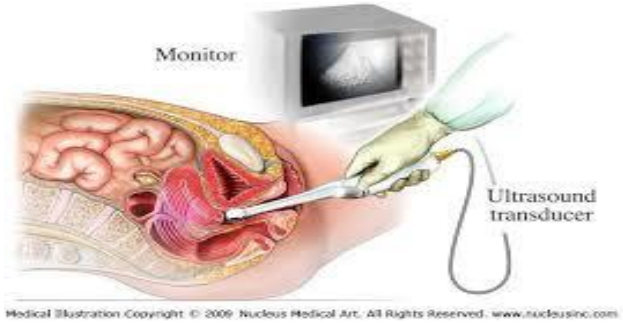
Dr Aditi Jain
Department of Radiodiagnosis
M.S. Ramaiah Medical College & Hospitals.

Role of Imaging



ULTRASONOGRAPHY (USG)





TAS

- Frequency of USG probe - 3.5 to 5 MHz
- Full Bladder
- + Larger field of view

TVS

- Frequency of USG probe - 5 to 7.5 MHz
- Empty Bladder, Better Resolution, Obese patient, Retroverted Uterus
- Limited field of view

ULTRASONOGRAPHY (USG)

Advantages

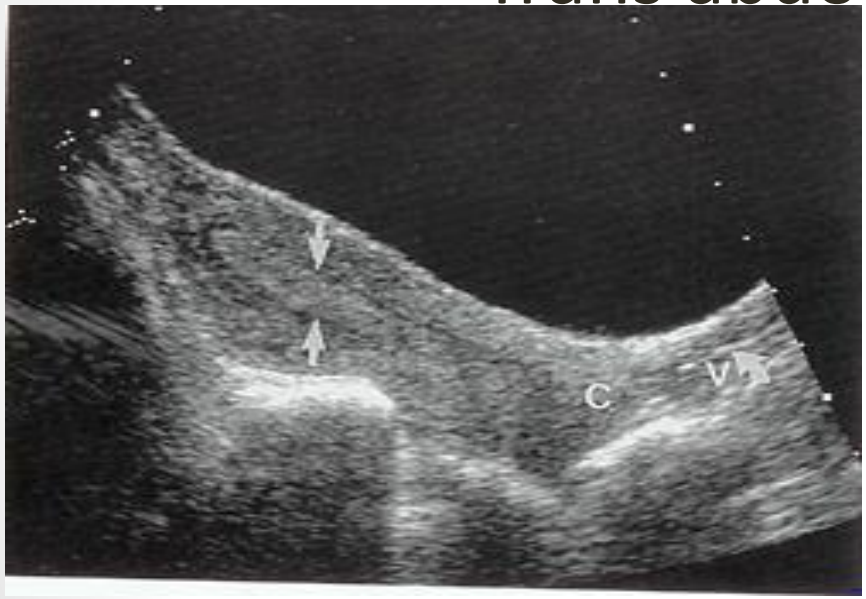
- First line imaging investigation
- Non invasive
- Widely available & inexpensive
- No ionizing radiation
- Detection of primary tumours
- Hydronephrosis

Limitations

- User dependent
- Non-reproducible results
- Obscuration of details by bowel gases
- Primary tumour
- Pelvic lymph nodes and pelvic side walls, peritoneal disease
- Parametrial spread
- Bladder invasion

Normal Sonographic Anatomy: Uterus

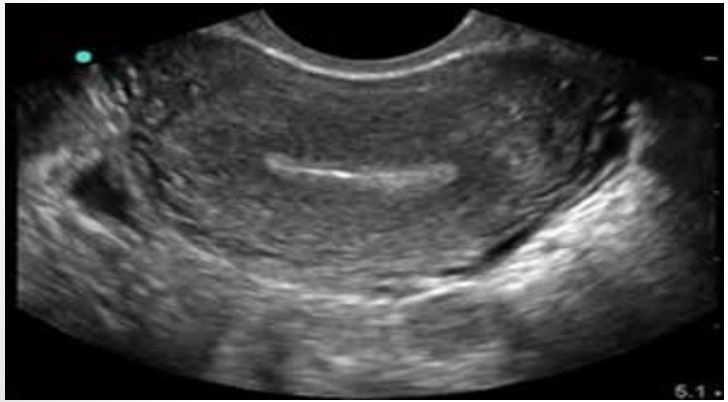
Trans abdominal Scan



Sagittal

Axial

TVS: Uterus



- The **Perimetrium** : not visible on ultrasound examination.
- The **myometrium** has three layers:
  - Inner myometrium appears as a thin hypoechoic area surrounding the echogenic endometrium.
  - The Intermediate layer is the thickest and has a uniformly homogeneous low to moderate echogenicity.
  - The thin outer layer is less echogenic
- **Endometrial cavity** : seen as a central echogenic line, thickness varies during the menstrual cycle.

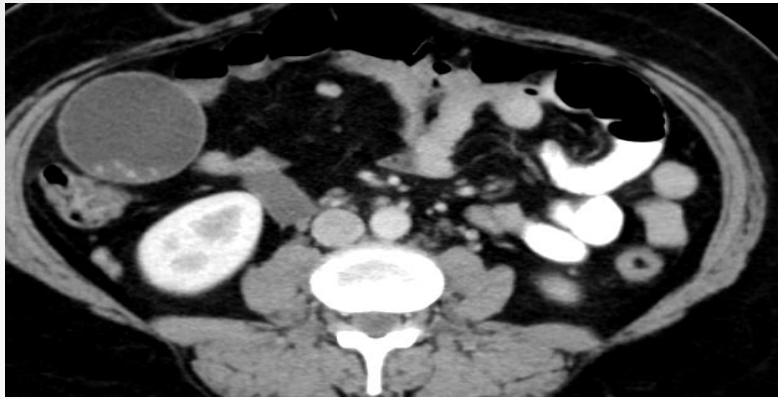
TVS: Cervix

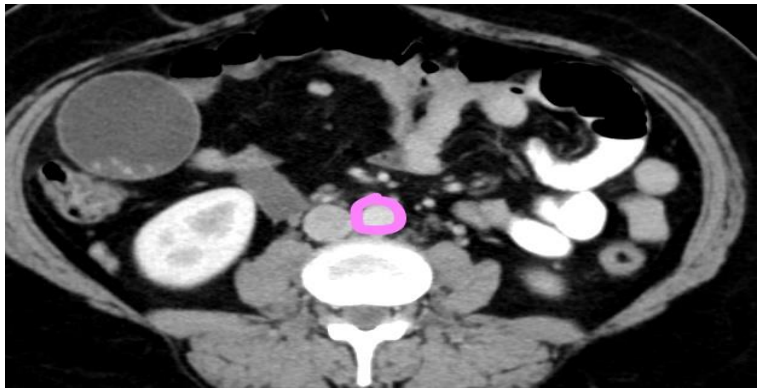
A tubular structure of homogeneous echogenicity. The endocervical canal appears as an echogenic interface

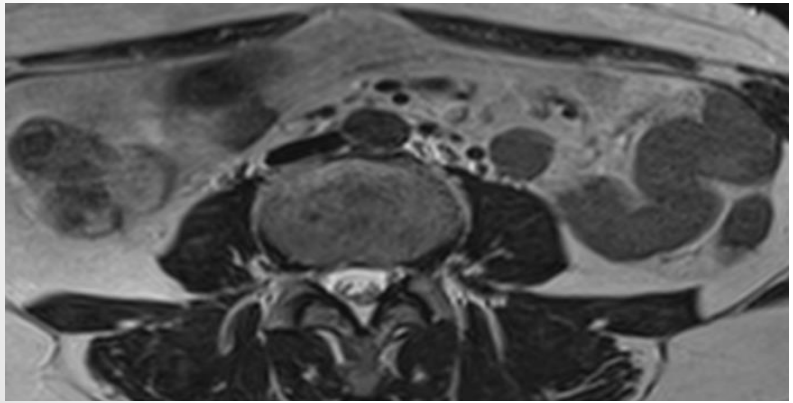
CROSS SECTIONAL IMAGING ANATOMY : CT &MRI

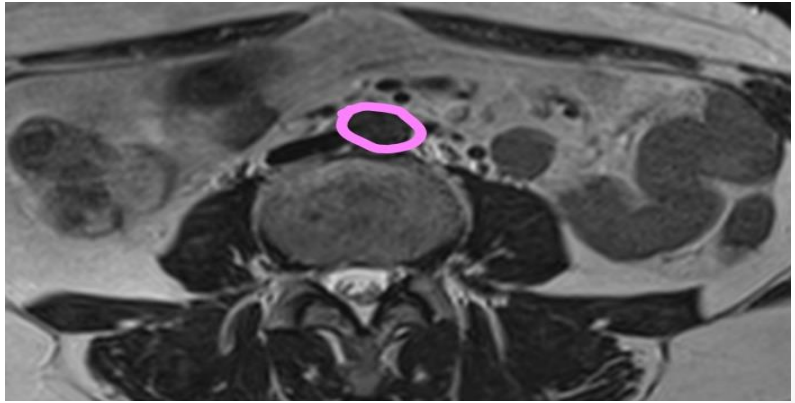
Axial, Coronal, Sagittal
& Post Contrast

Aorta

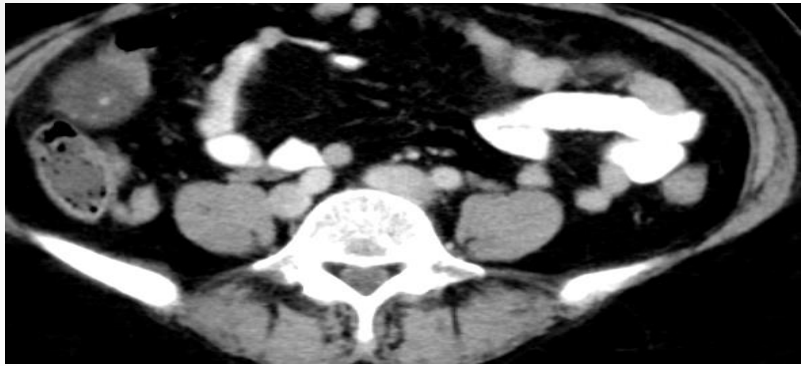


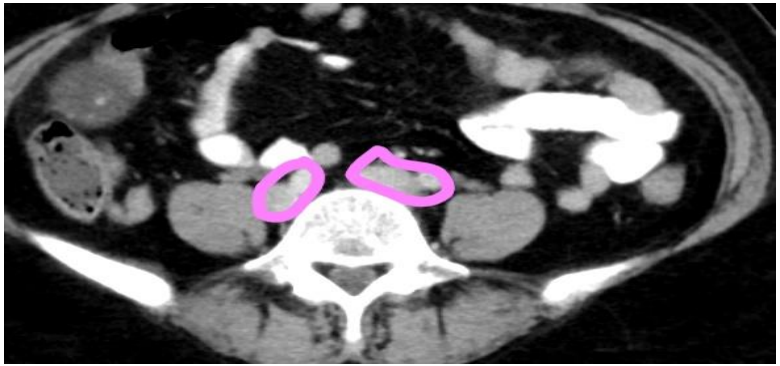


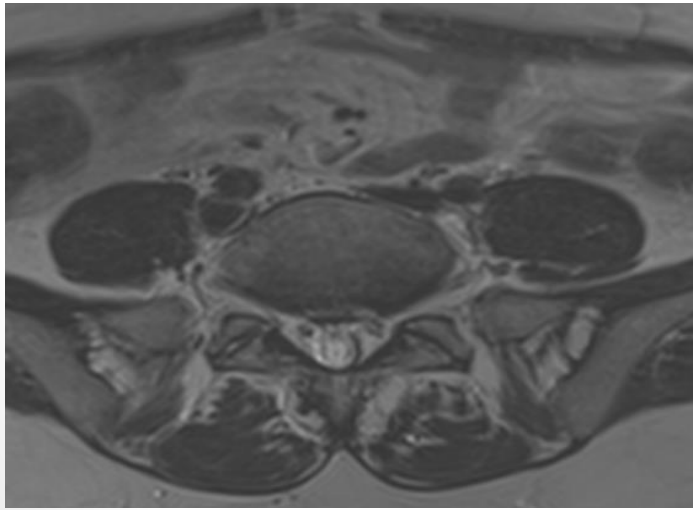


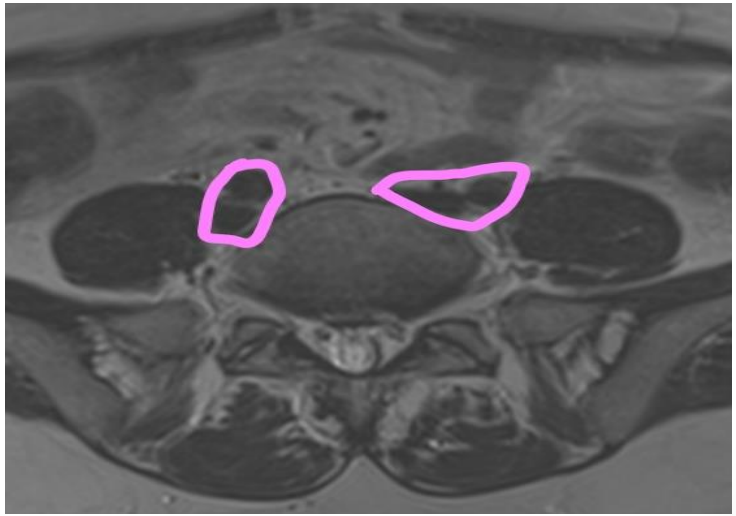


Common Iliac vessels

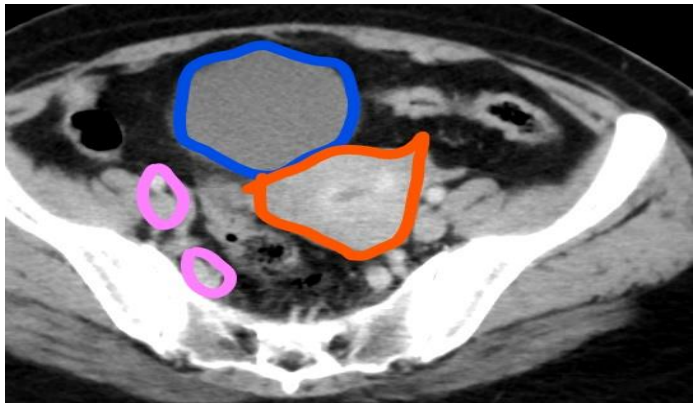


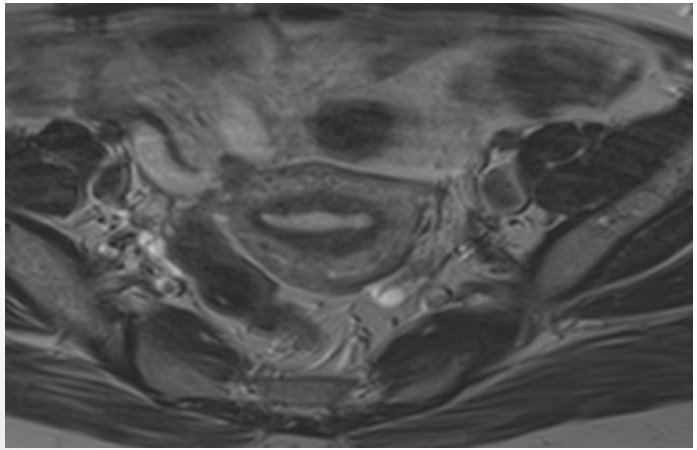


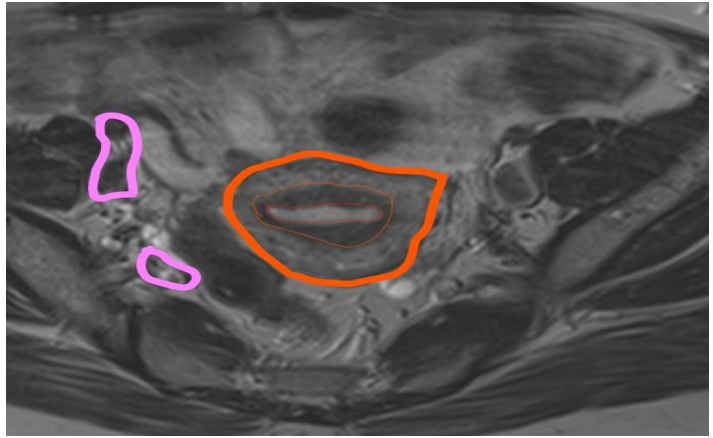




Uterus & Iliac vessels

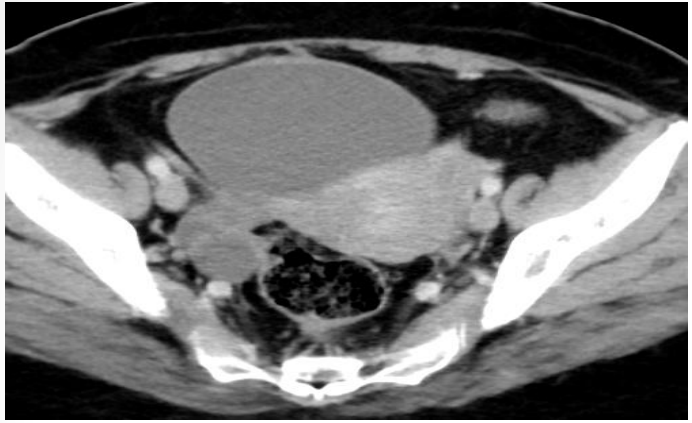


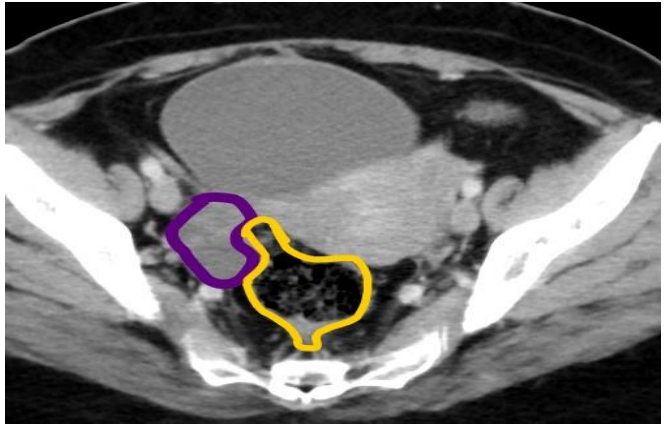


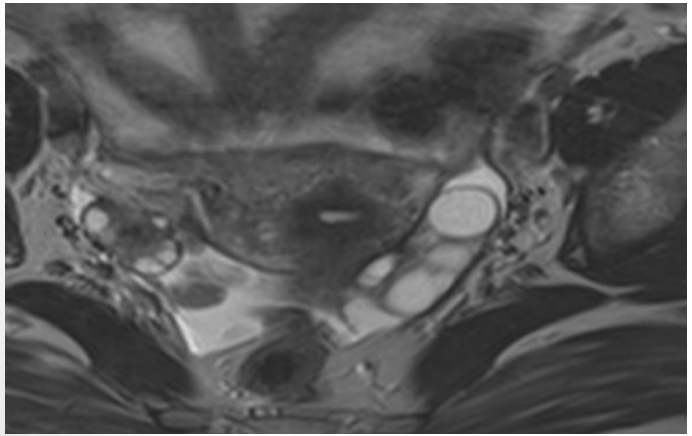


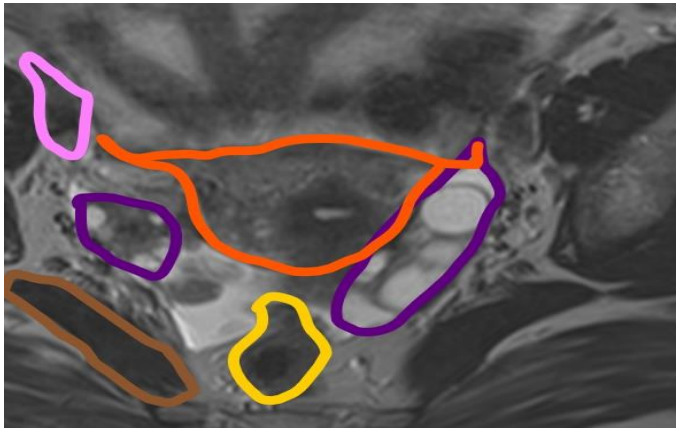
Sigmoid Colon

Pelvic side walls & Ovaries

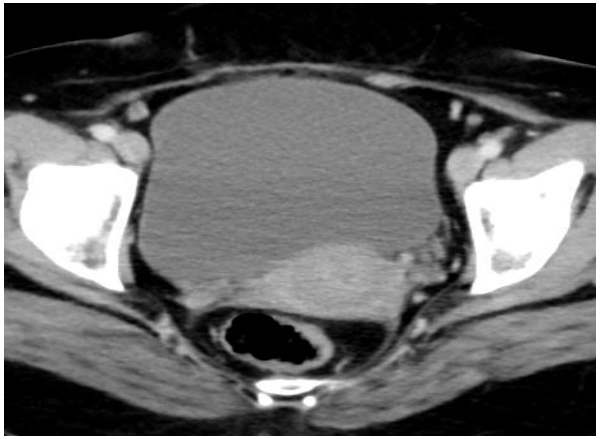


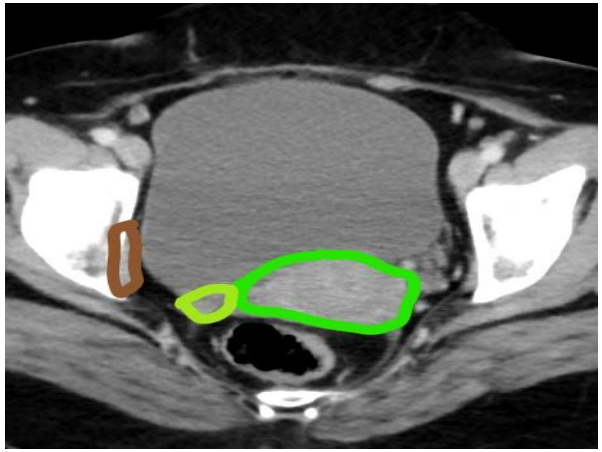


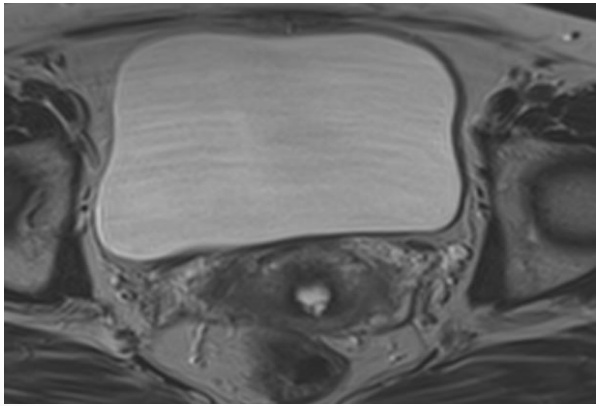


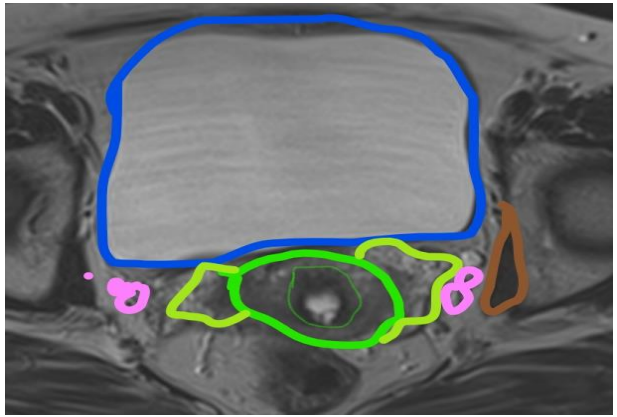


Cervix & Parametria

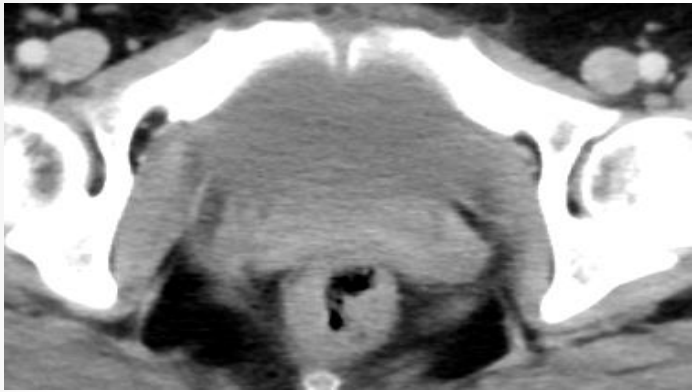


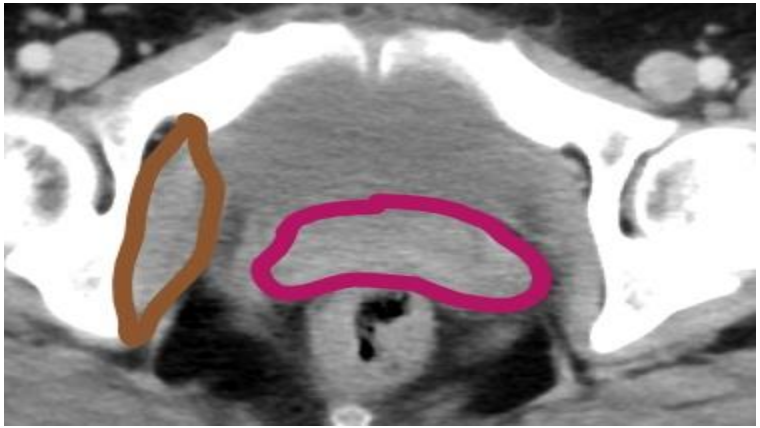


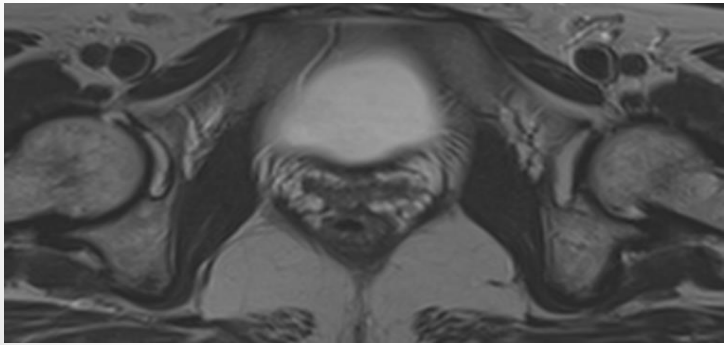


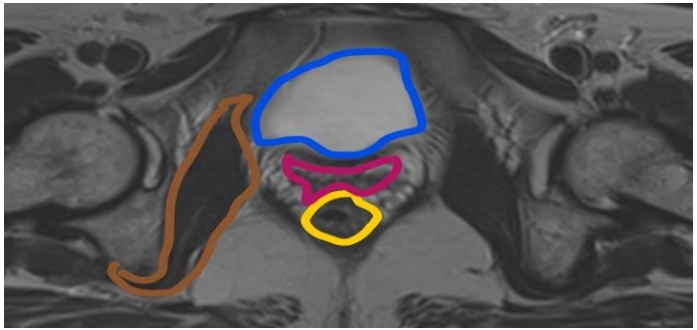


Vagina









Bladder: Coronal

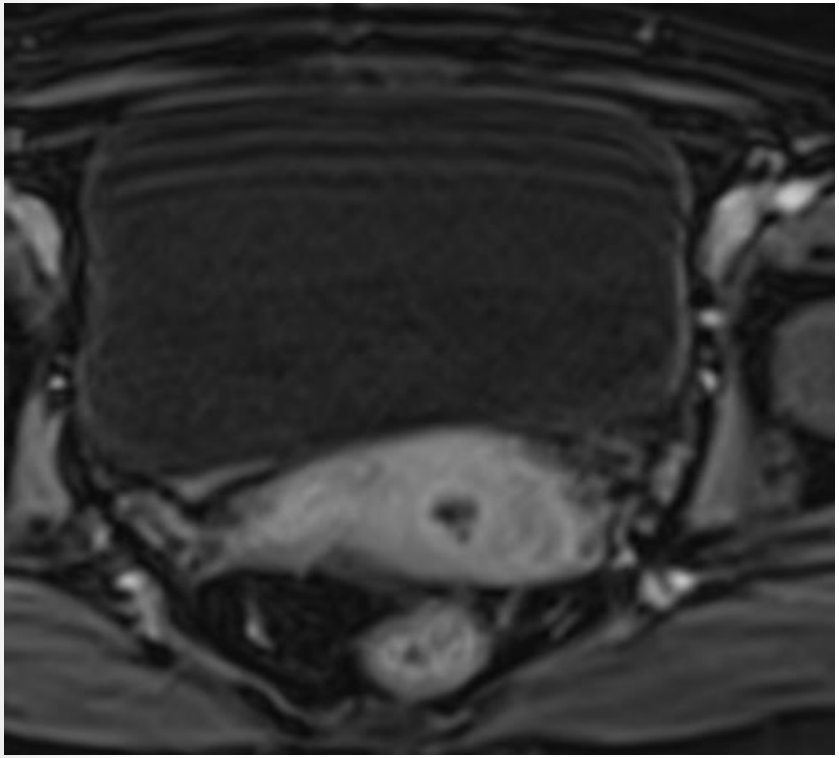
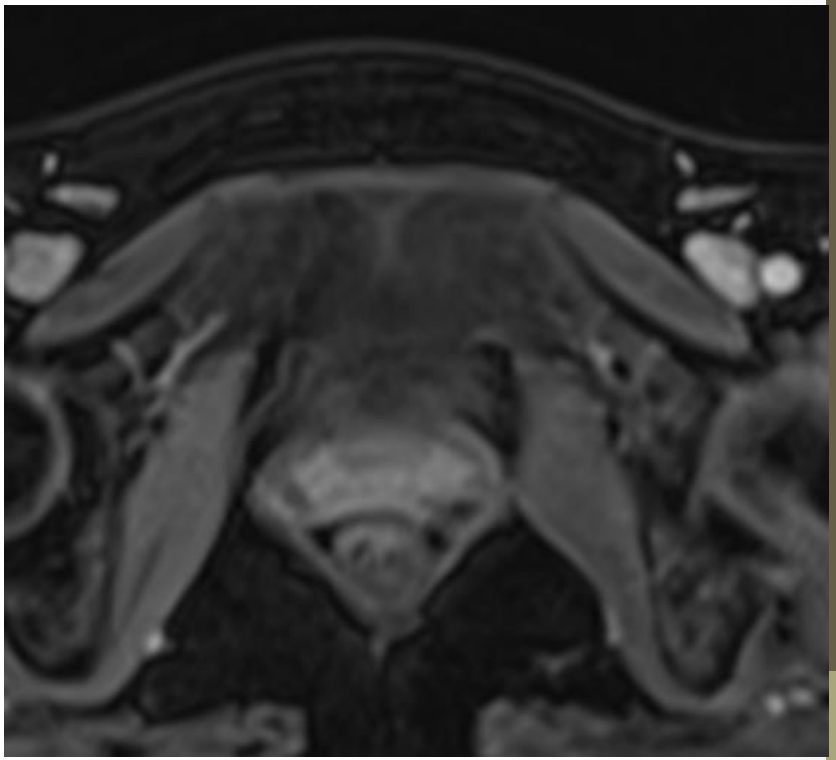
Post contrast MRI

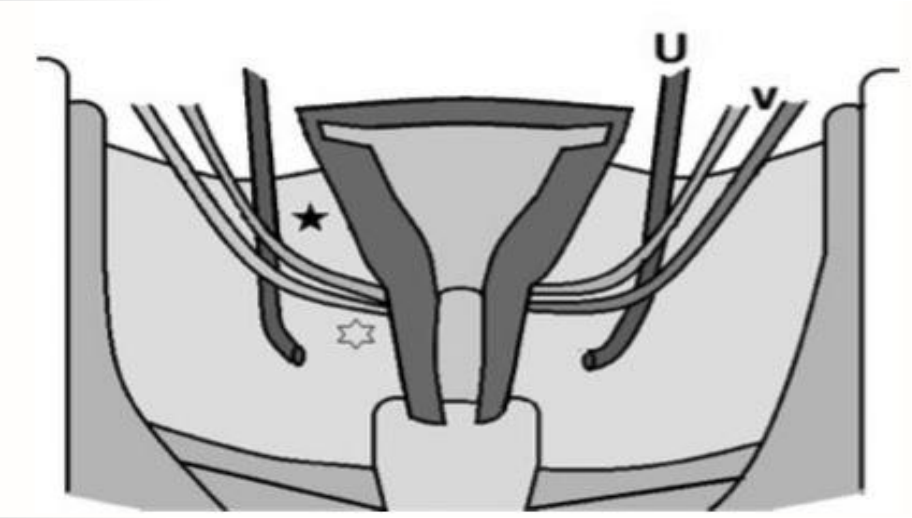


Cervix



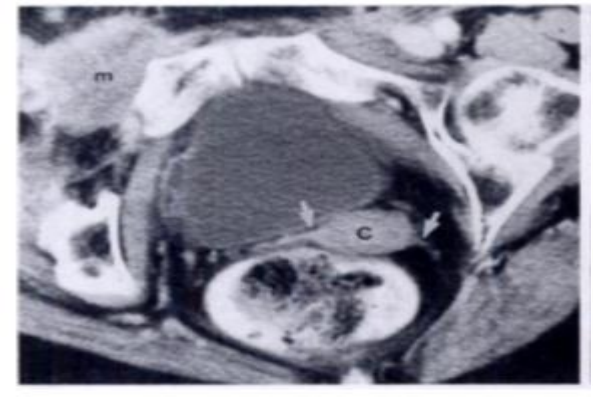
Vagina

PARAMETRIA

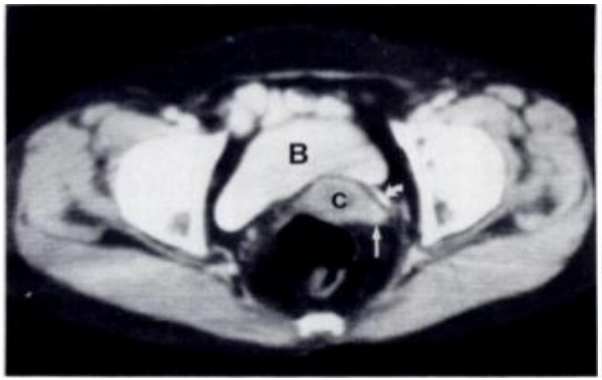


- Cellular connective tissue located between the leaves of the broad Ligament.
- Contents :Uterine artery ,ovarian ligament ,parauterine blood vessels and/or nerves, lymphatics, and fibrous tissue.
- The distal ureter is in the parametrium
- Seen as predominately fat density regions that outline the lateral margins of the uterus, cervix, and upper vagina and extend laterally toward the pelvic sidewalls

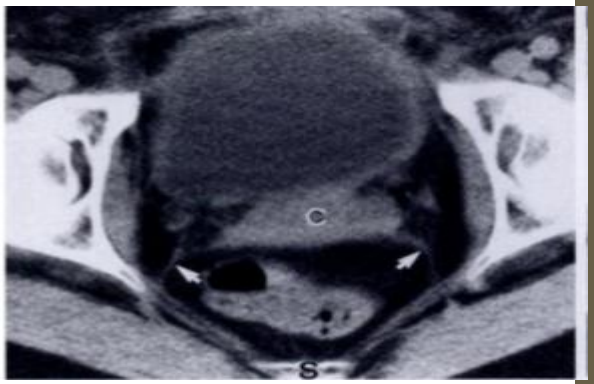
Parametrium: CT



Cardinal ligament

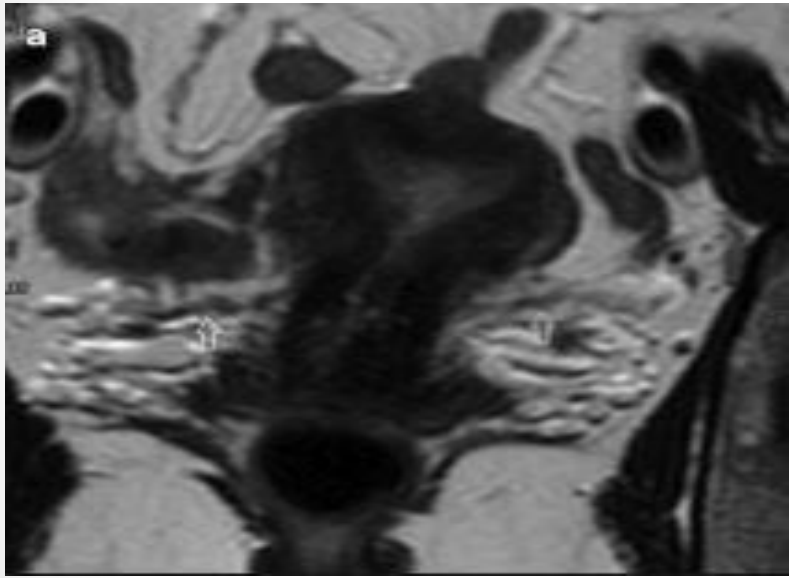


Ureter

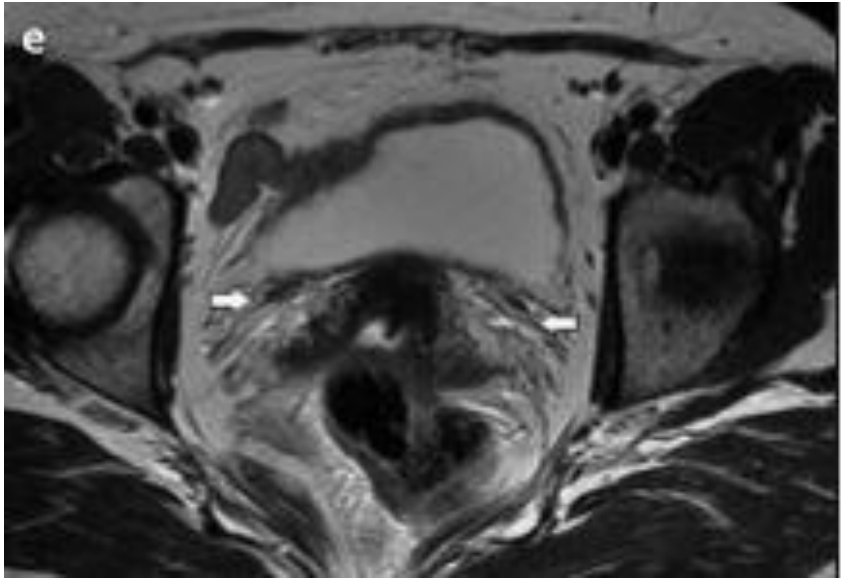


Uterosacral ligament

Parametrium: MRI



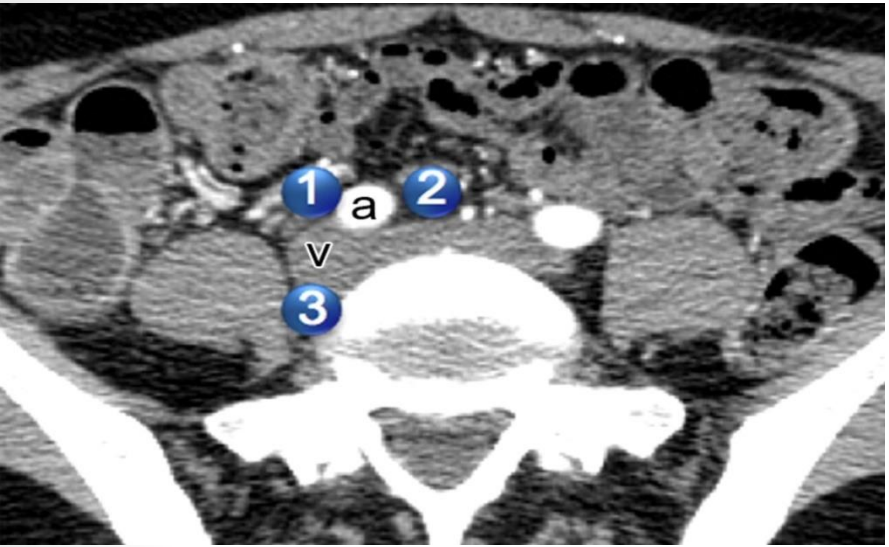
Coronal

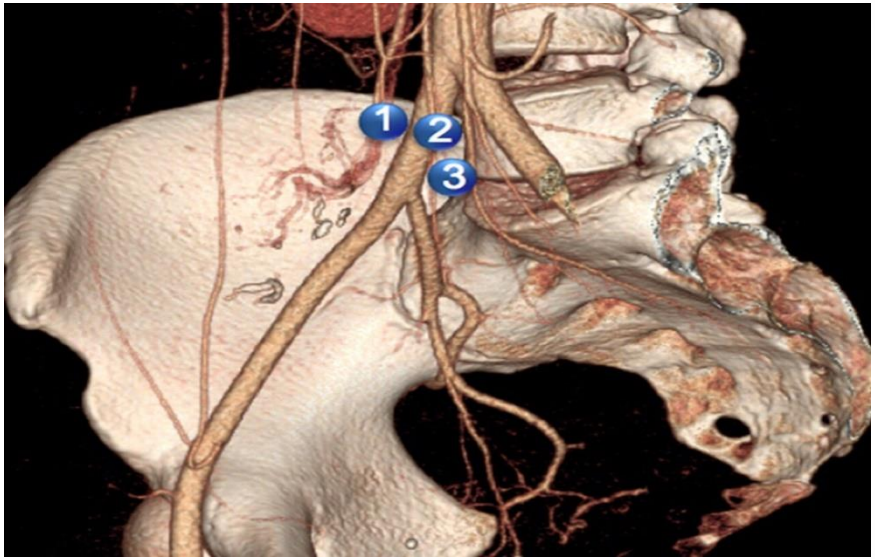


Axial

Nodal Anatomy

Common Iliac nodes

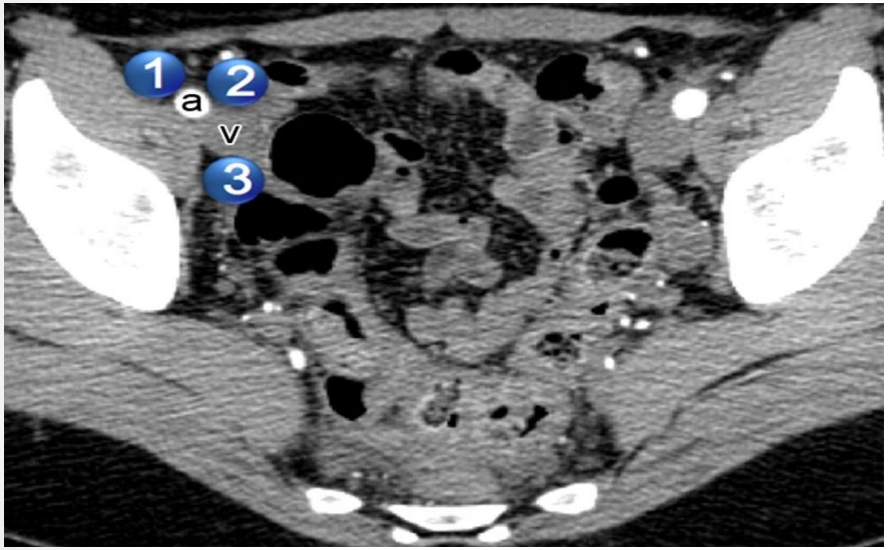




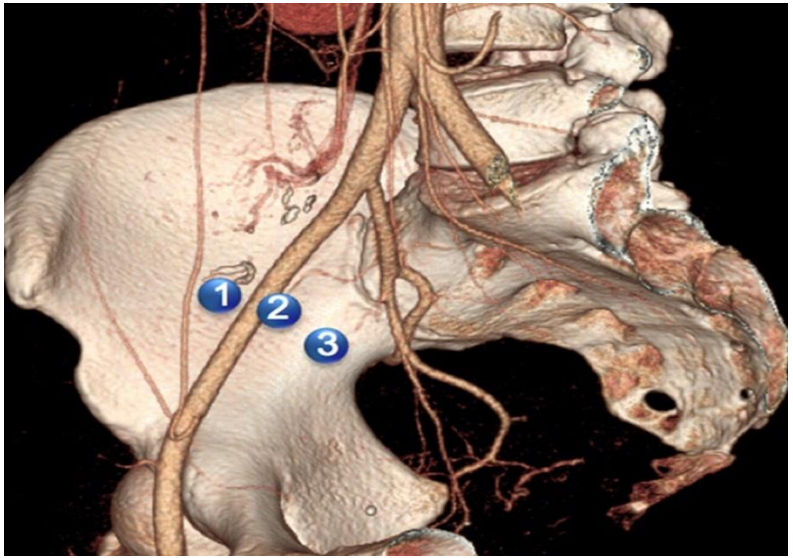
Axial CT

Volume rendered reformatted CT

External Iliac nodes

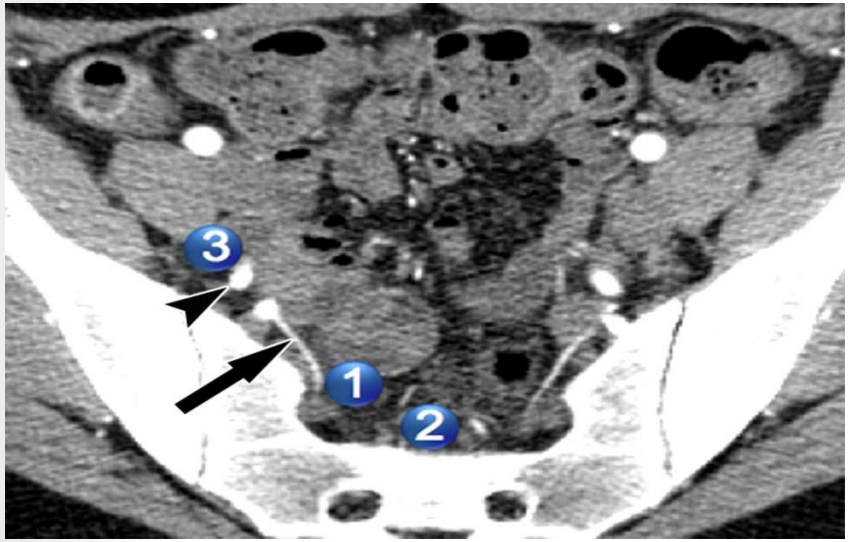


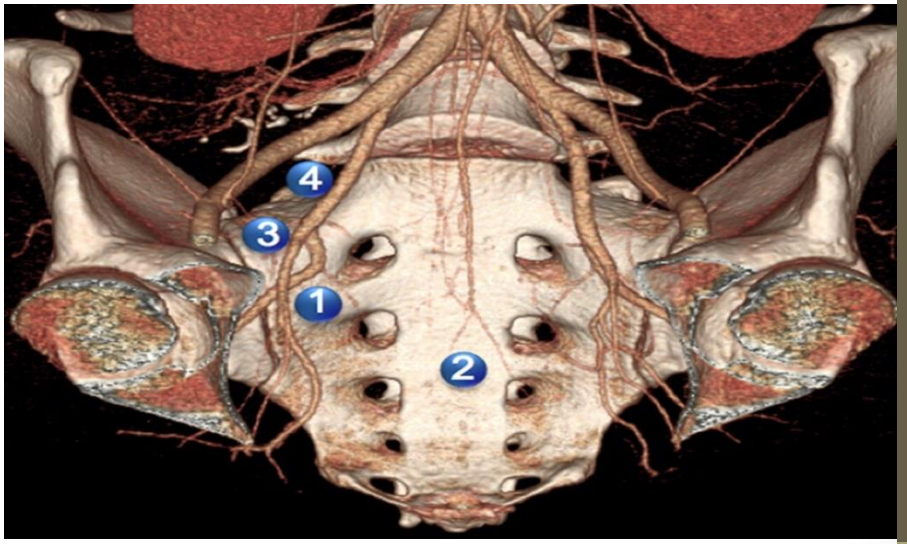
Axial CT



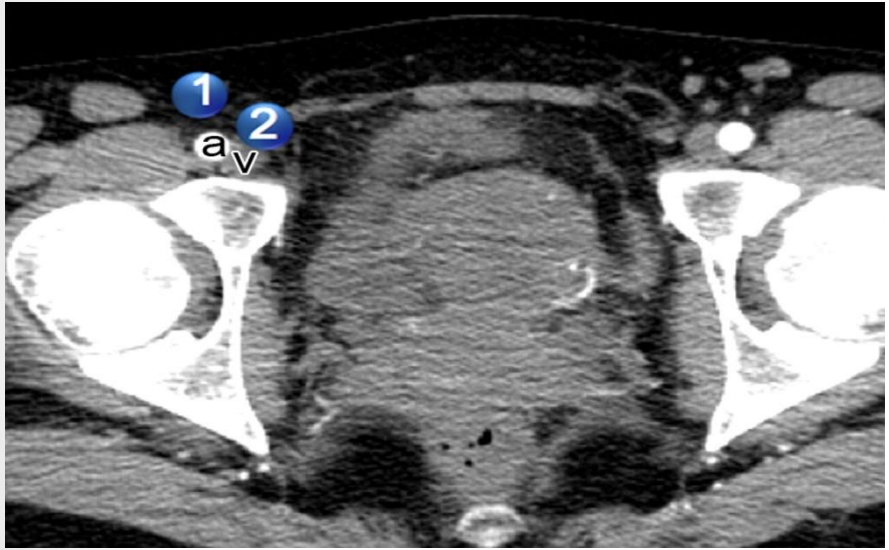
Volume rendered reformatted CT

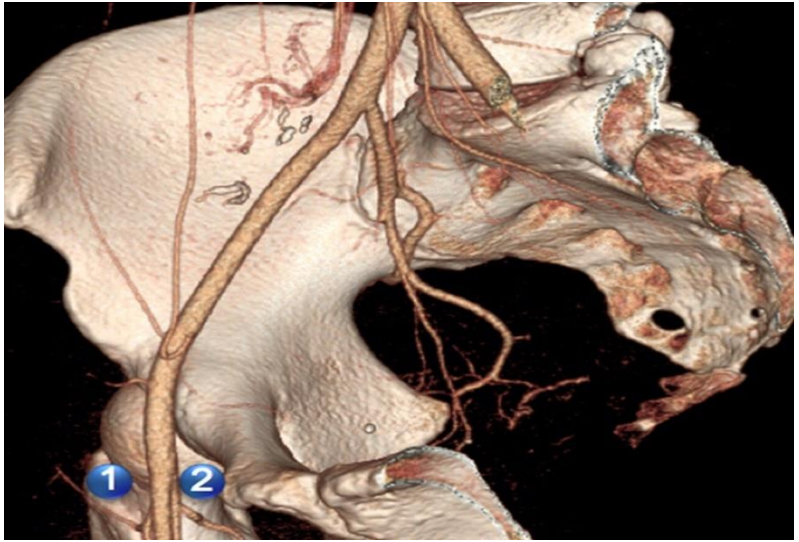
Internal Iliac nodes



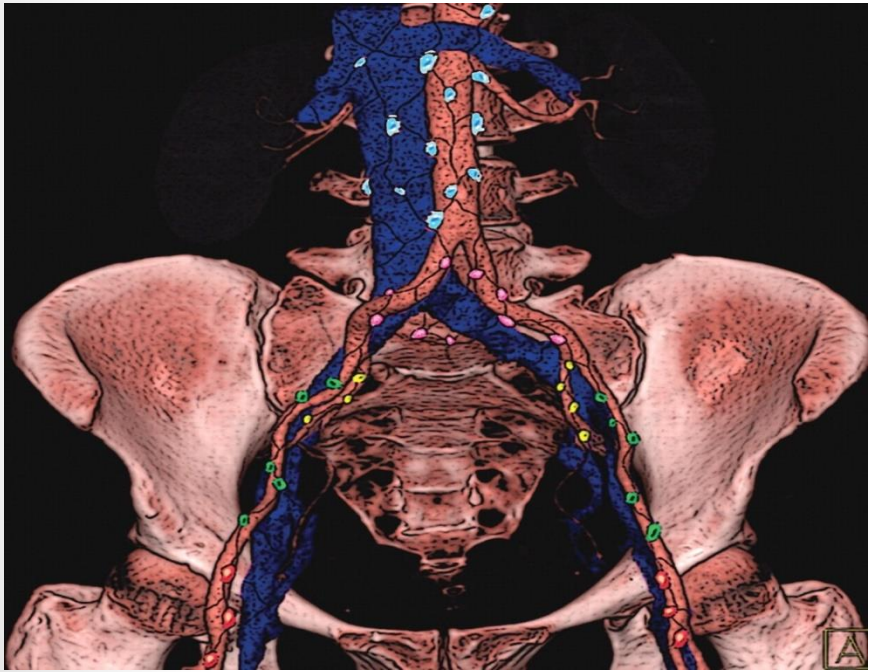


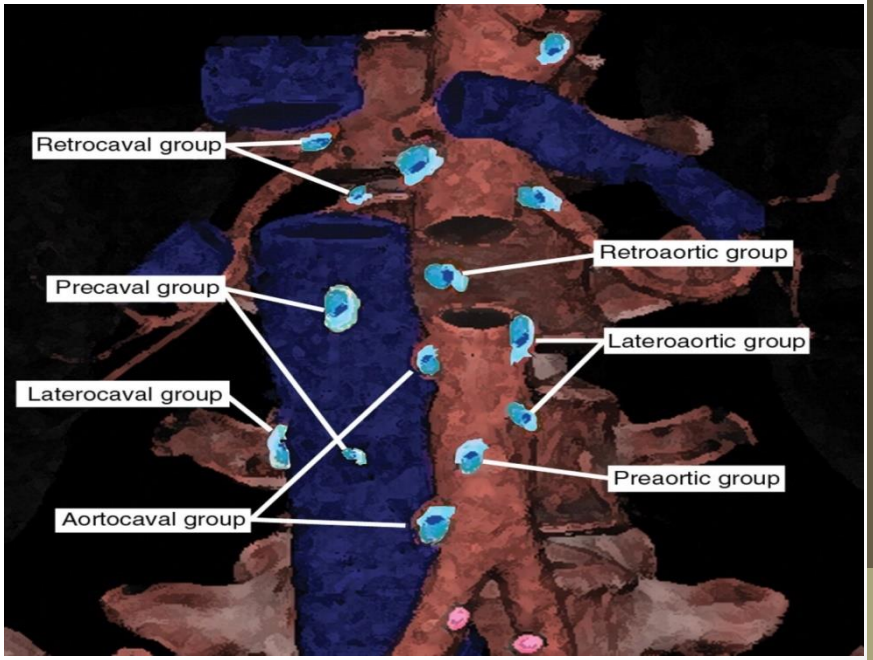
Inguinal nodes



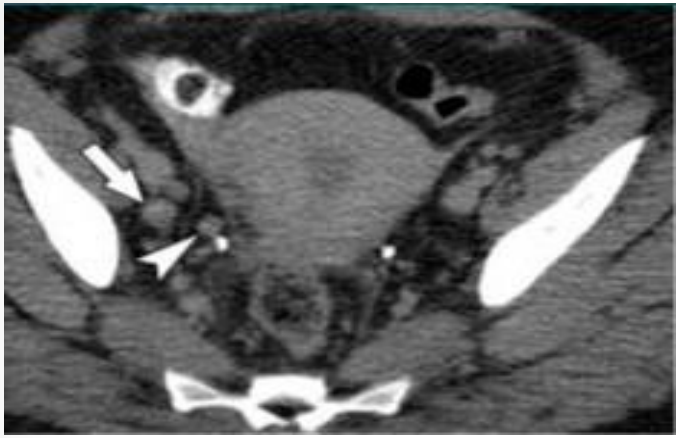


Pelvic & Para-aortic nodes





Enlarged Nodes: CT

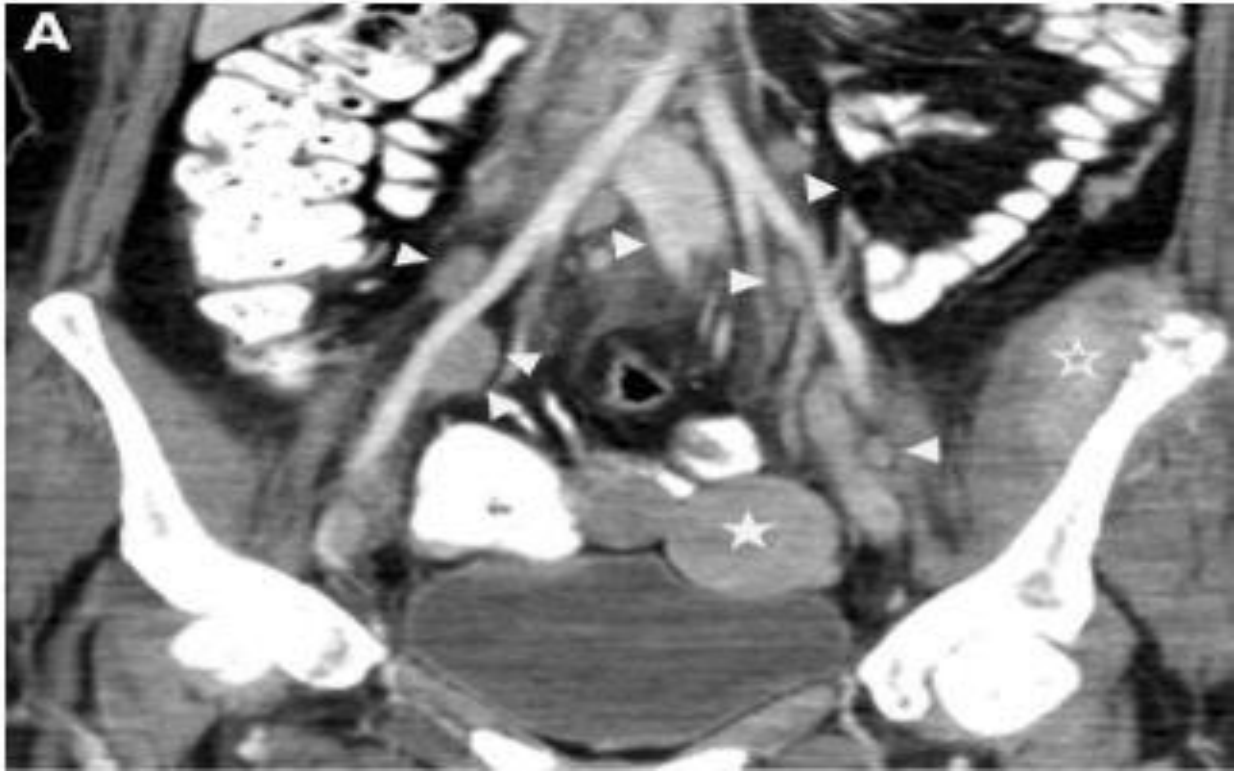


Obturator & Parametrial

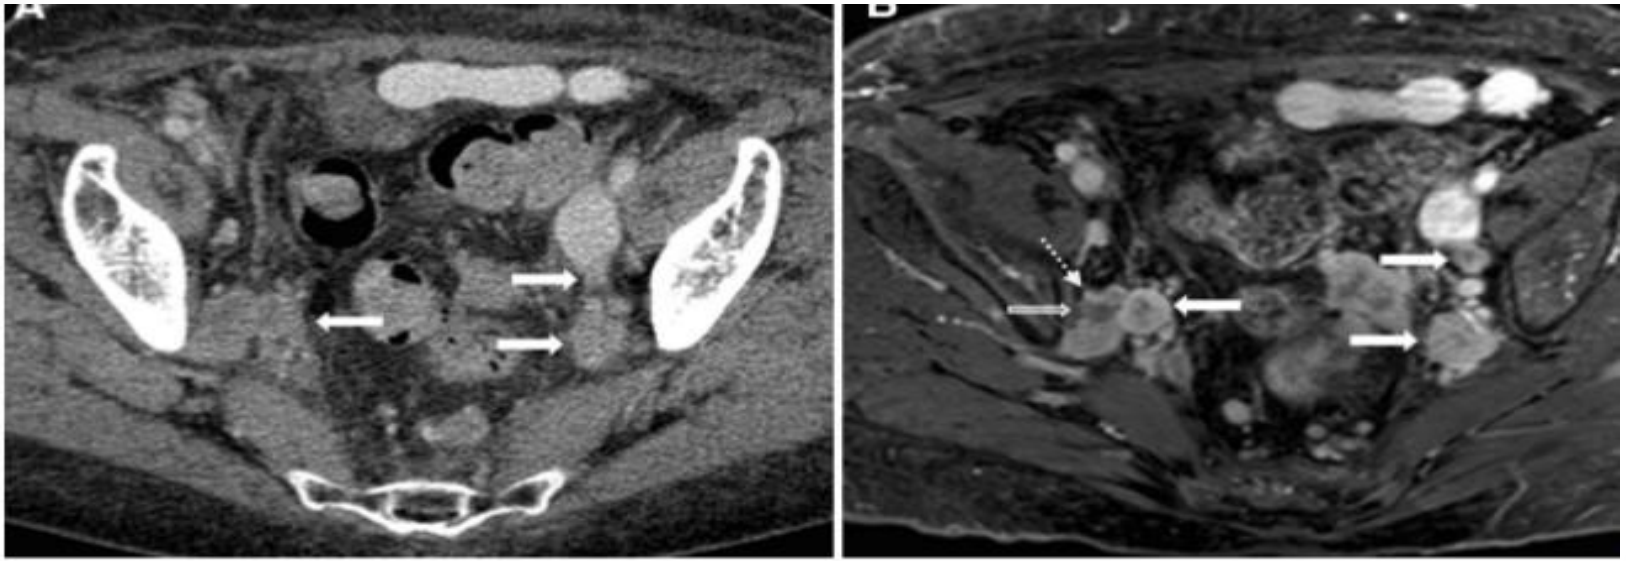
Middle common Iliac

Para-aortic

Coronal CT: Nodes vs Vessels



MRI: Nodal architecture



CT

Advantages

- Adenopathy
- Defining Advanced disease
- Monitoring Distant metastases
- Planning placement of radiation ports
- Guiding percutaneous biopsies
- Electron density of tissues for dose calculation algorithms
- Image acquisition of less than 1 min in multislice CT
- Spatial relationship between brachytherapy , uterus and other organs visible.
- Organs at risk: CT and MRI equal

Limitations

- Ionizing radiation
- Normal organ contours, borders between organs and uterine parts not clearly visible even after oral, rectal, i.v contrast
- Tumour detection
- Overestimation of early parametrial spread
- Early involvement of bladder wall and vagina not reliable
- Radiation changes
- Cervix and residual disease
- Target volumes based contouring overestimated the contour width.

MRI

Advantages

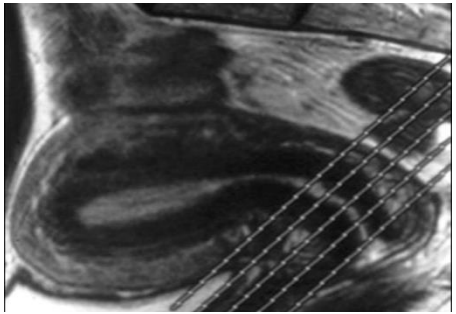
- Single best modality for evaluation of cervical cancer
- For staging, treatment planning and follow-up of cervical cancer
- High contrast resolution.
- Multiplanar capability
- Easy orientation for clinicians
- Tumor regression during radiotherapy

Limitations

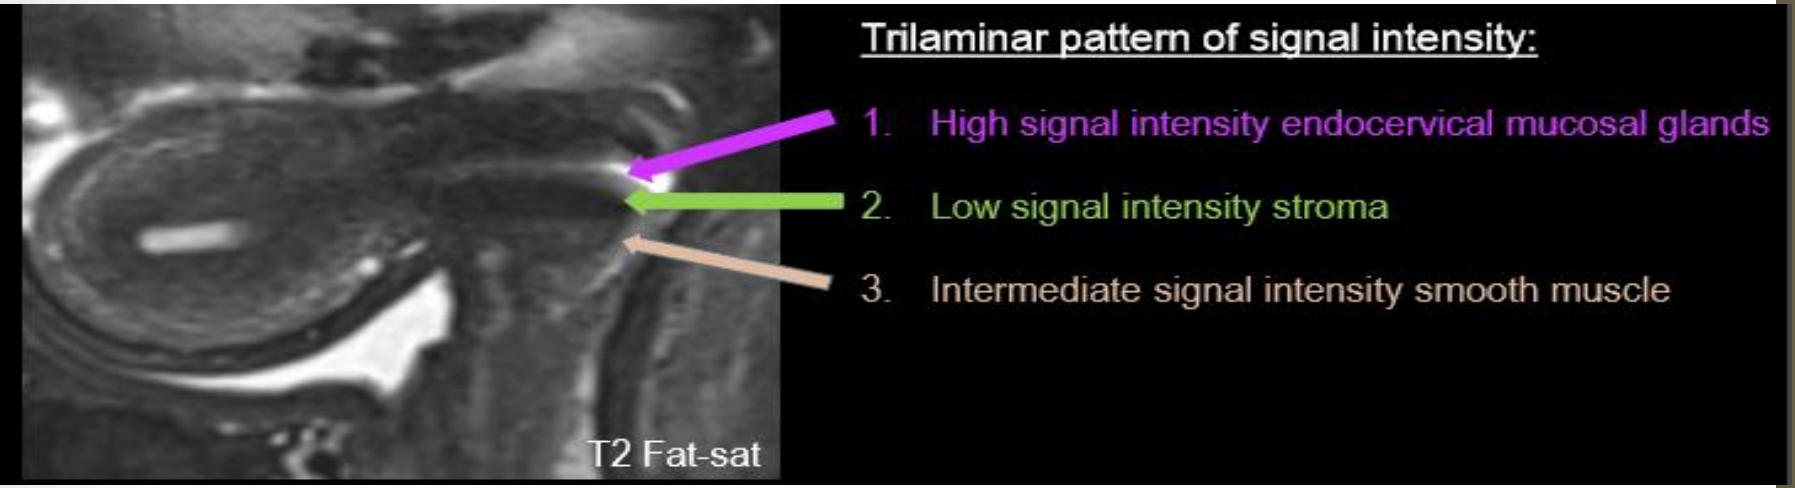
- Intrinsic spatial image distortion
- Missing electron density information
- Manual tissue attenuation coefficient to be put or presumption of homogeneous attenuation throughout

Technical considerations: MRI

- **High resolution T2-weighted imaging: mainstay for tumor detection**
- Oblique axial T2W images : perpendicular to the cervical long axis: Fat-suppressed sequences : evaluation of parametrial involvement.
- Complementary sequences : Post contrast T1 weighted , Diffusion weighted imaging
- Role of IV contrast :
  - Detection of small tumors
  - Improves accuracy of diagnosing bladder and rectal invasion.
  - Post-treatment : differentiate residual or recurrent tumor from radiation fibrosis.
  - Delineate complications of treatment, such as fistula

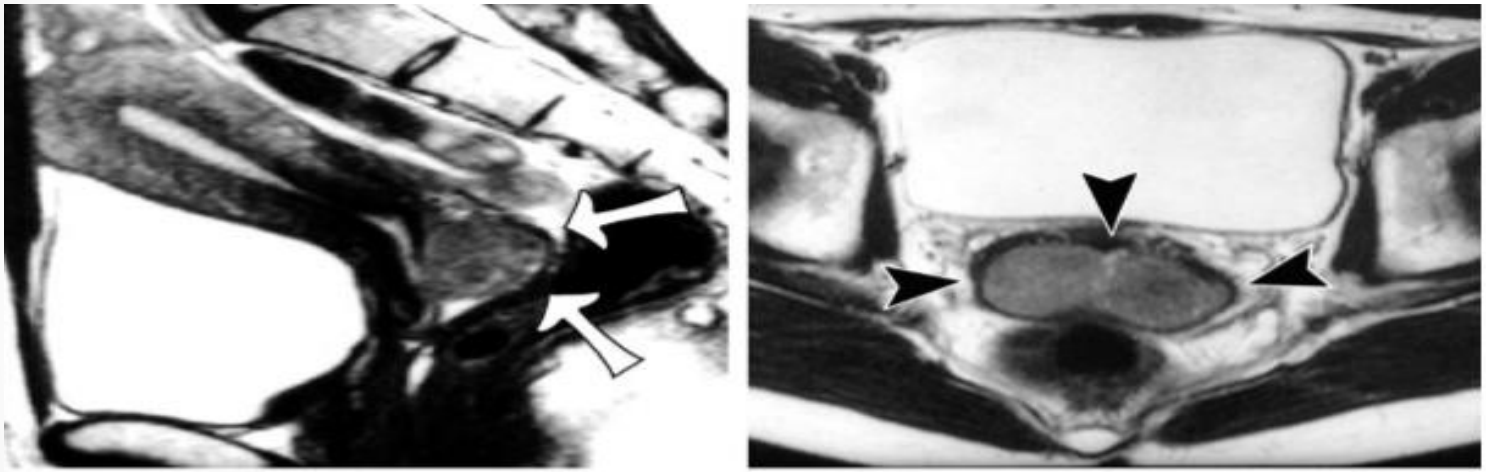


Zonal Anatomy: Cervix



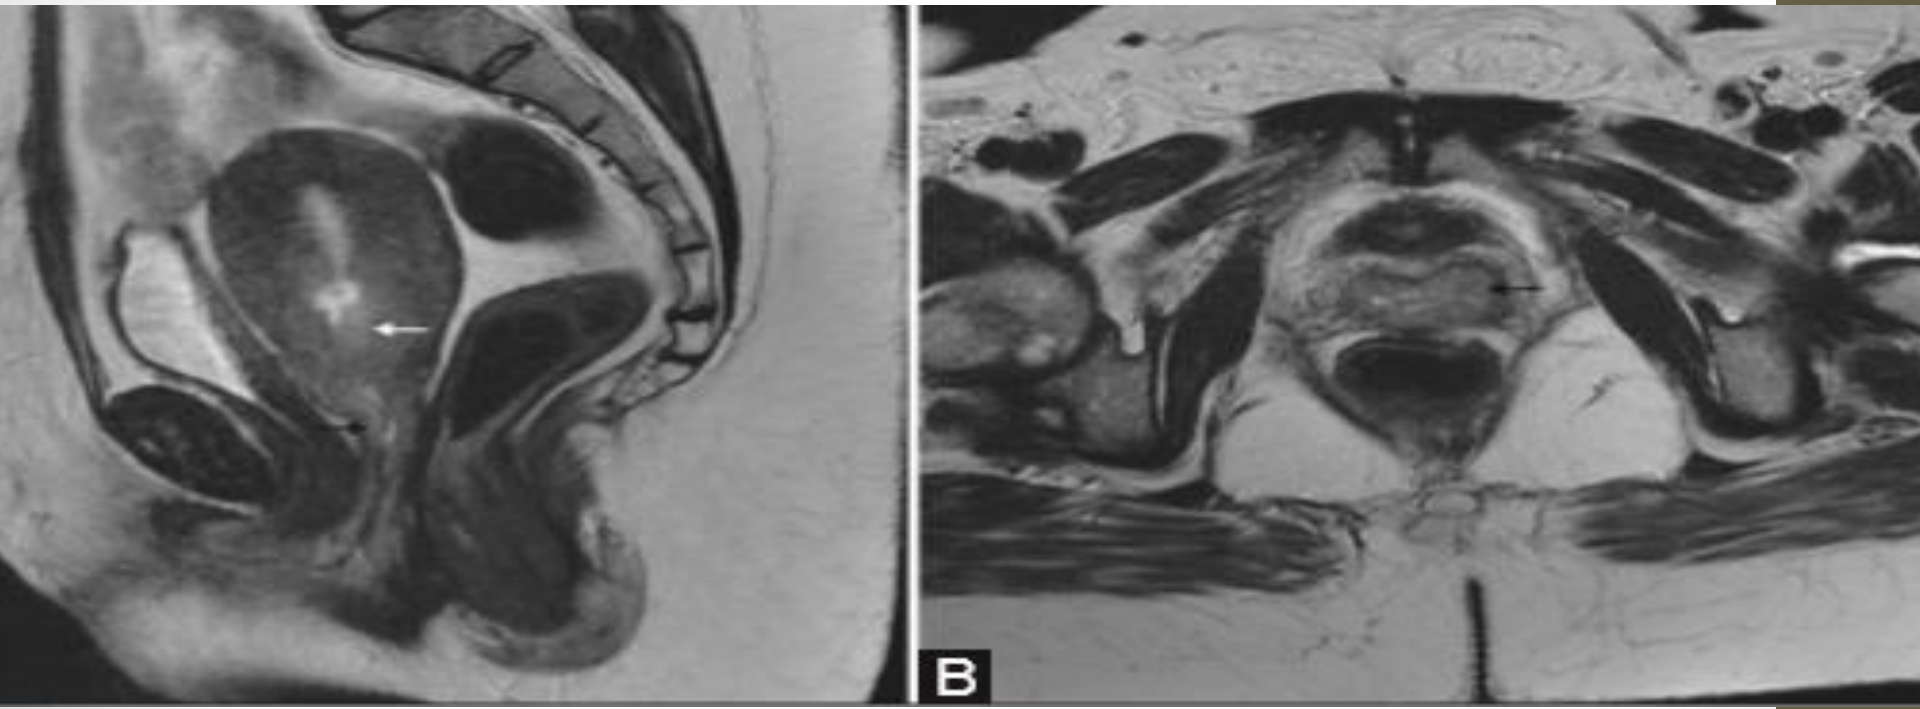
Cervical Cancer Staging: CT&MRI

Stage IB

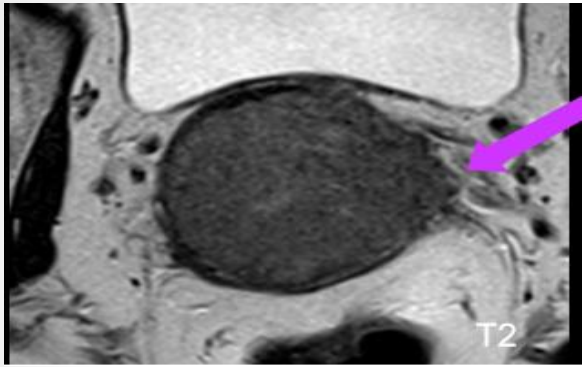


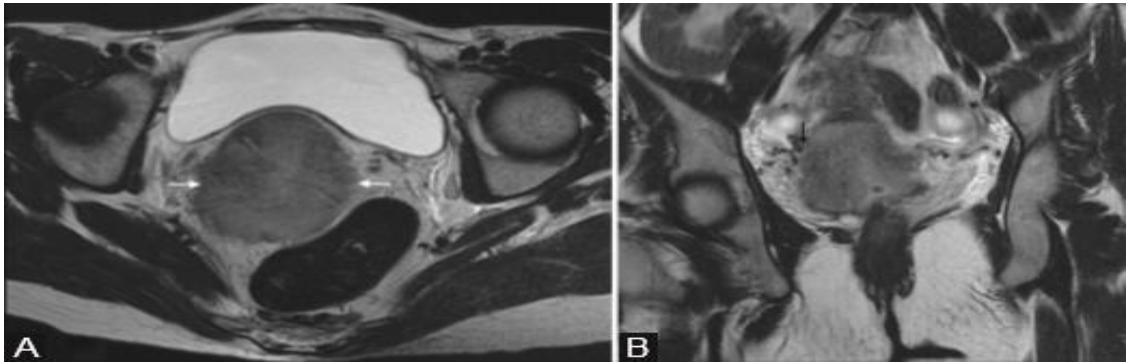
On T2-weighted images, cervical cancer : a relatively hyper-intense mass easily distinguishable from low signal-intensity cervical stroma.

Stage IIA



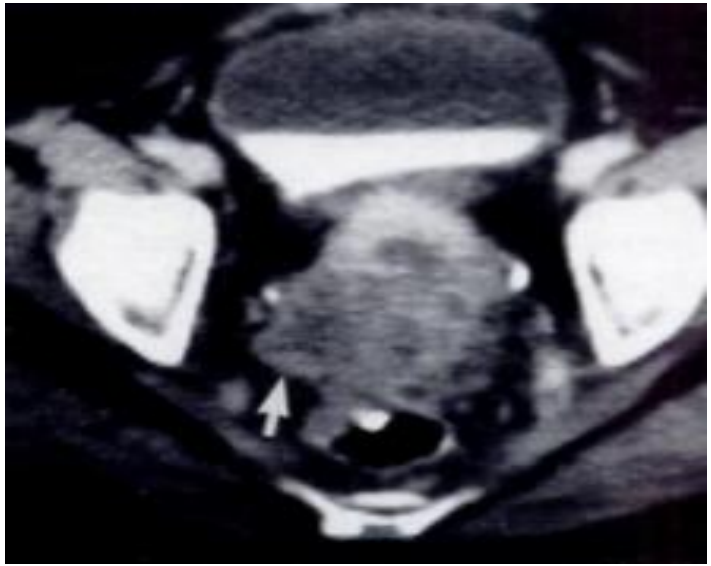
Stage IIB: MRI



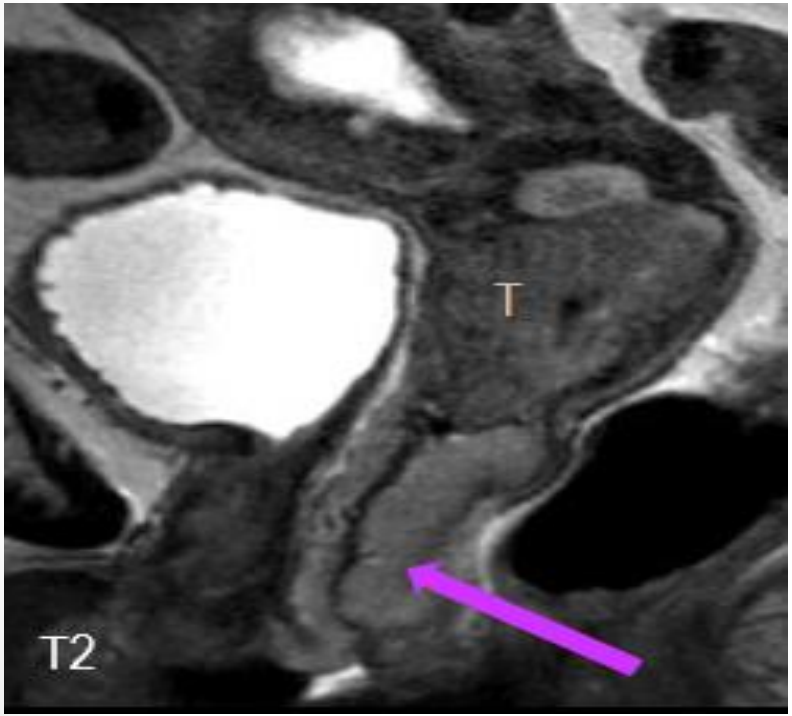


Complete disruption of the cervical stroma with nodular or irregular tumor signal intensity extending into the parametrium is a reliable sign of invasion

Stage IIB: CT

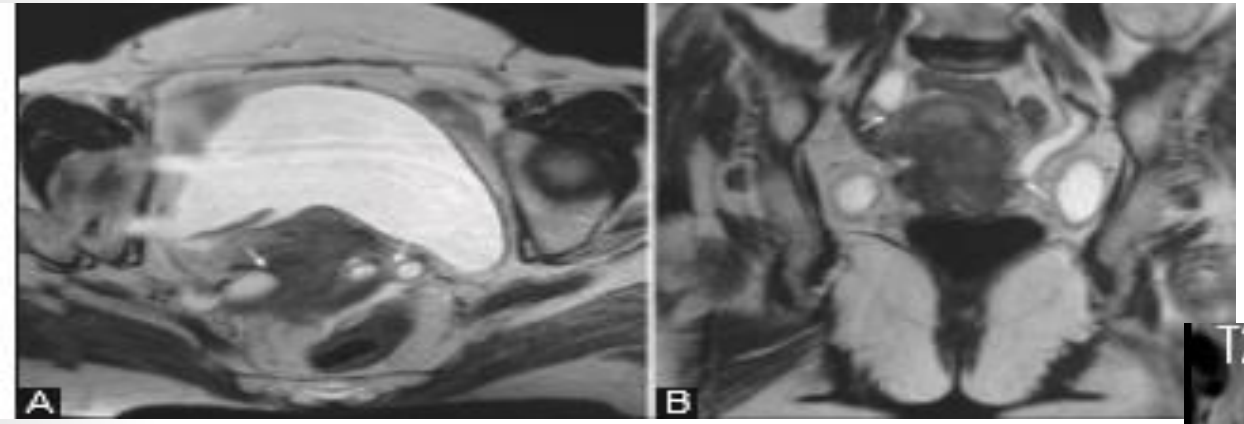


Stage III A

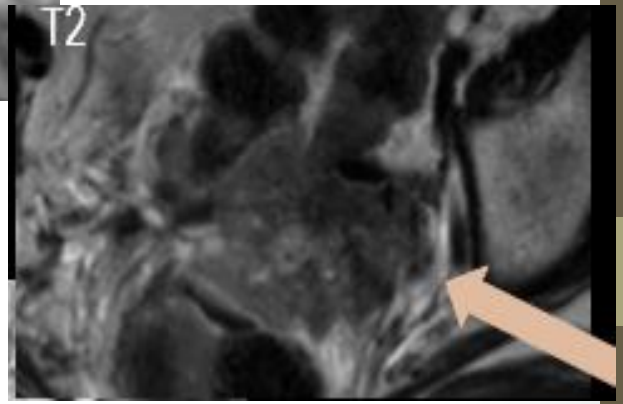


T2 sagittal image demonstrates cervical tumor (T) with invasion of the lower one-third of the vagina (arrow).

Stage IIIB

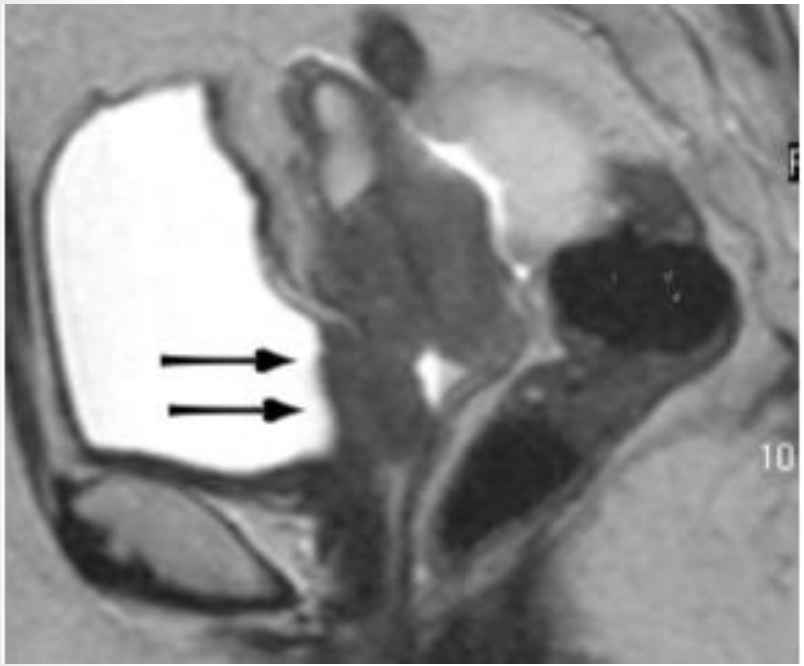


Ureter involvement



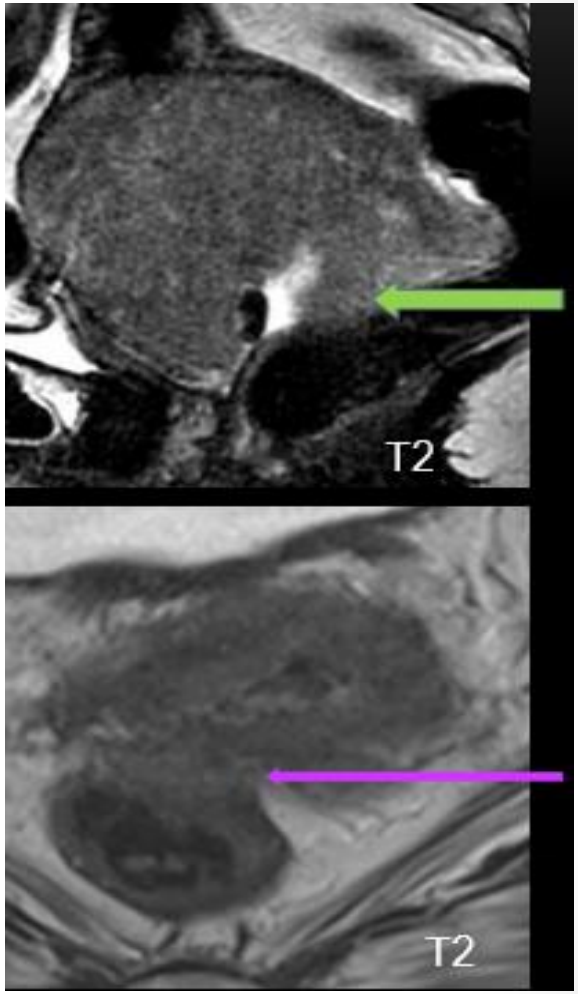
Side wall involvement

STAGE IV A

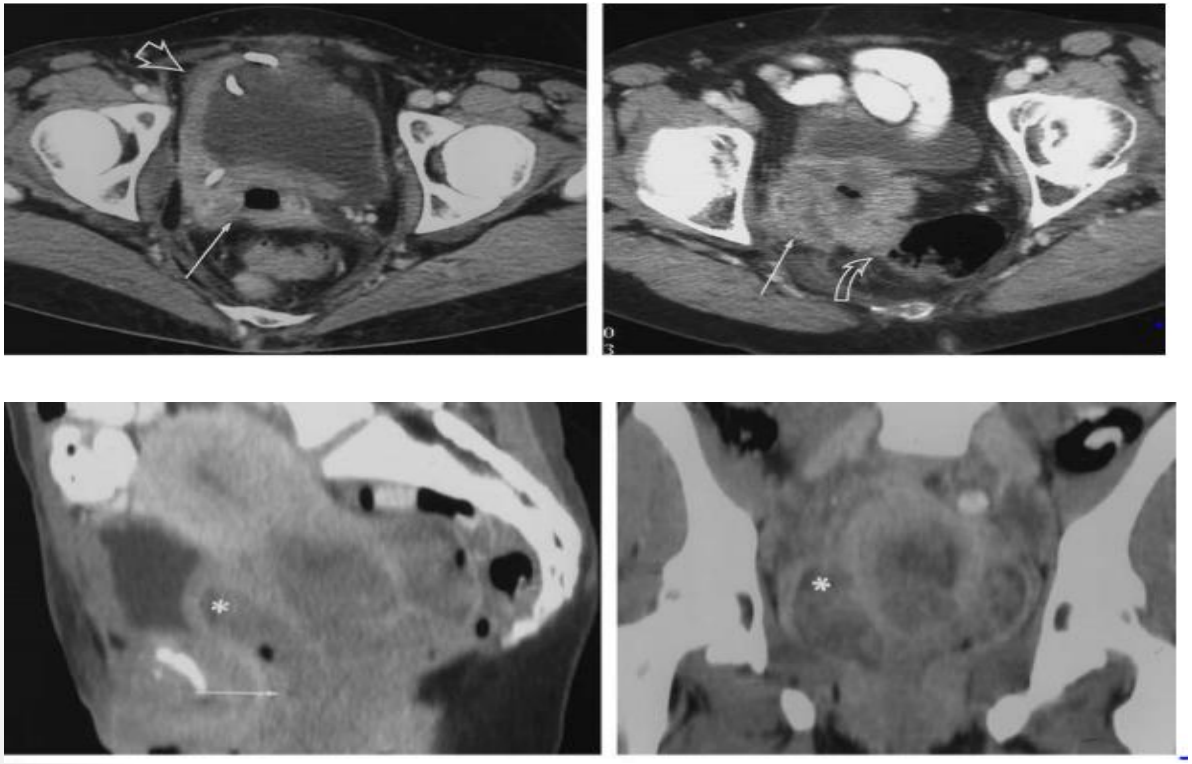


Bladder invasion

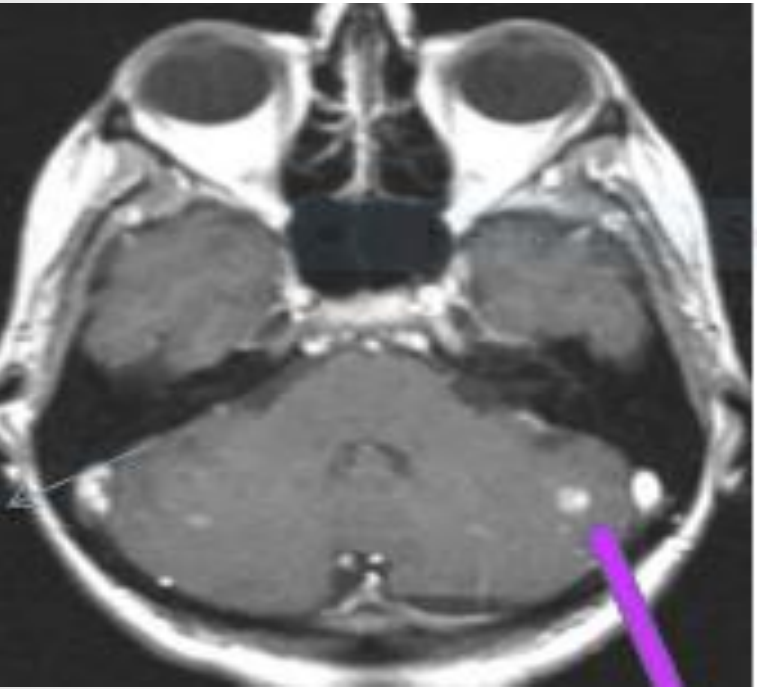
Rectal invasion



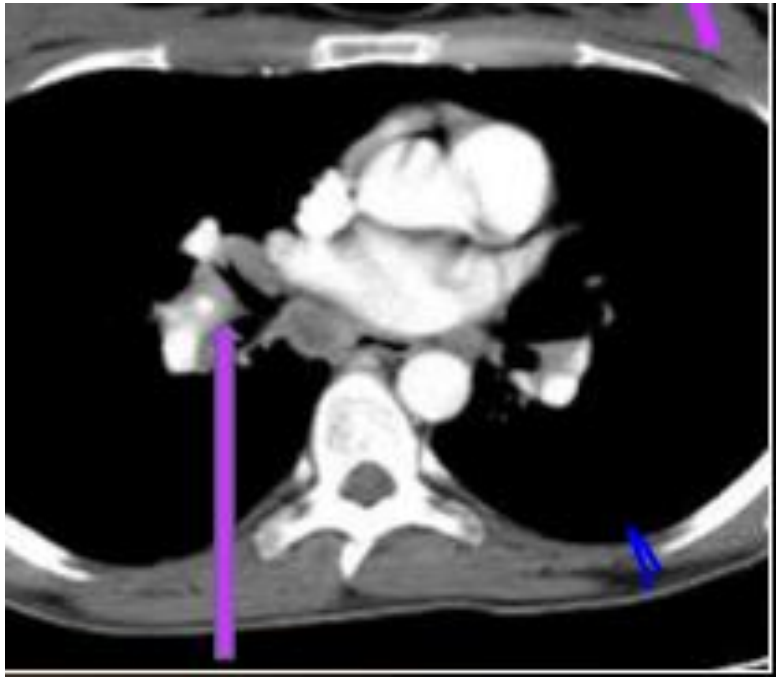
Stage III & IV :CT



Stage IVB



Brain metastases



Mediastinal Nodes

CT VS MRI

	General characteristics					
	Soft tissue depiction	Image acquisition	Contrast media	Multiplanar imaging	Radiation exposure	Scanning time
MRI	Superior quality on T2-weighted sequences	Specific protocols required	Not obligatory needed	without reconstruction	No	Long
CT	Inferior quality	Specific protocols required	Recommended	only with reconstruction	Yes	Short

	Diagnostic scan					
	Tumor detection	Parametrial invasion	Invasion of organs	Invasion of vagina	LN status	Recurrence detection
MRI	Estimation of dimensions within 0.5 cm compared to pathology specimen. Detection of endocervical growth and uterine corpus invasion is possible	High accuracy for: –Distinction between stromal and parametrial invasion –Estimation of degree of parametrial invasion	High accuracy in prediction of infiltration of surrounding organs	High accuracy in predicting vaginal invasion, if vaginal contrast is used (e.g., ultrasound gel)	CT and MRI have similar inaccuracy in detecting LN metastases	Dynamic contrast-enhanced MRI enables differentiating tumor recurrence from radiation fibrosis
CT	Inaccurate estimation of tumor dimensions even with contrast enhancement and inability to detect uterine corpus invasion	Low accuracy in distinction between parametrial tumor spread and normal parametrial tissue	Early invasion of bladder and rectum is not reliably detectable	Low accuracy in predicting vaginal infiltration, especially at early stages	CT and MRI have similar accuracy in detecting LN metastases	CT is of low predictive value for differentiation between radiation fibrosis and recurrence

Thank you

IMAGING PATHOLOGY OF CERVICAL CANCER

Clinical drawings, US, CT, MRI, PET-CT..

At the time of Diagnosis/ Brachytherapy

Umesh Mahantshetty

Professor,

Department of Radiation Oncology

&

GYN Disease Management Group Member

Tata Memorial Hospital, Mumbai, India

IMAGING PATHOLOGY OF CERVICAL CANCER

RADIATION ONCOLOGIST'S PERSPECTIVE

- Clinical Examination
- US
- CT
- MR
- PET-CT

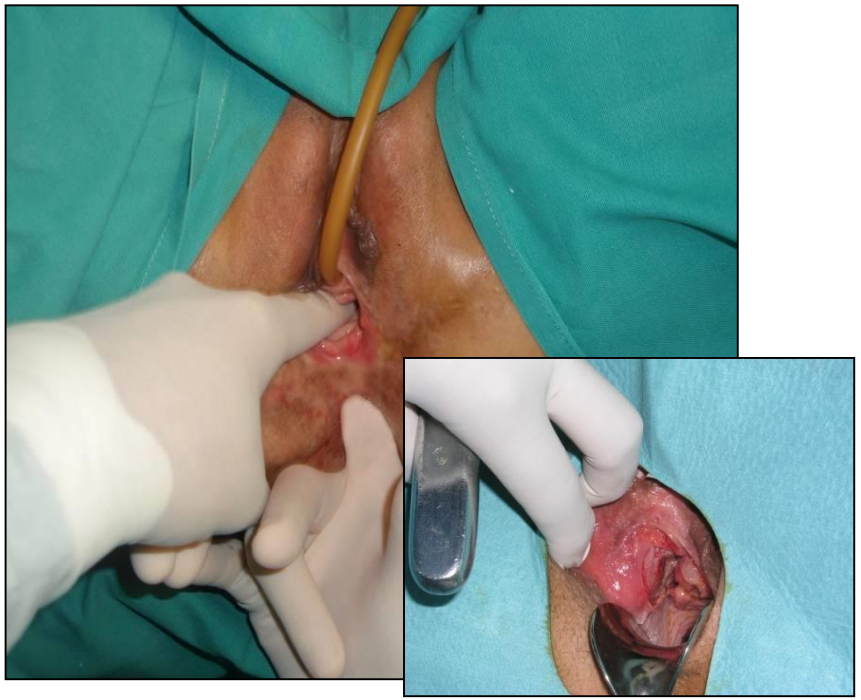
At Brachytherapy ……. Prof. Richard Poetter

Basic imaging level

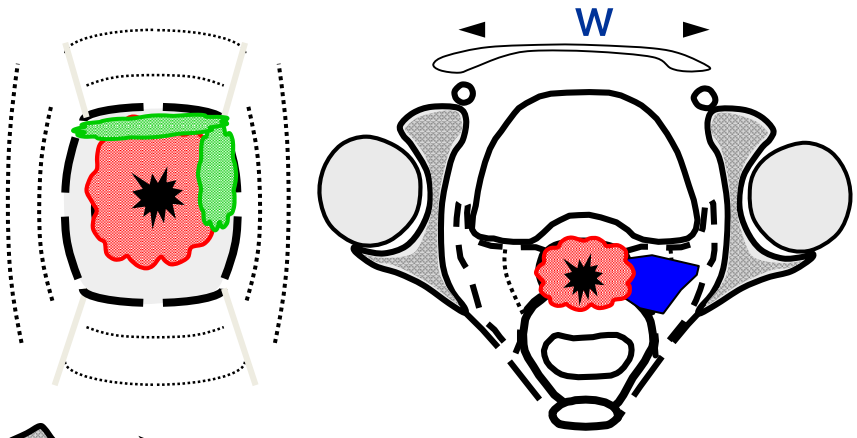
Clinical Examination : Inspection & Palpation

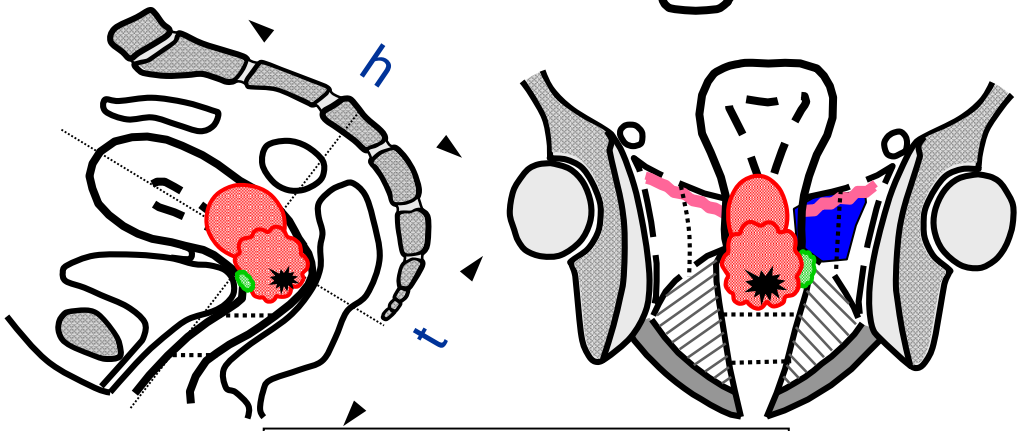
Imaging device: Eye & Finger

- *Technology widely available*
- *Low cost*
- *Largest amount of experience accumulated*
- *Superior to US, CT, MRI, PET CT for portio, vagina, vulva, skin...*



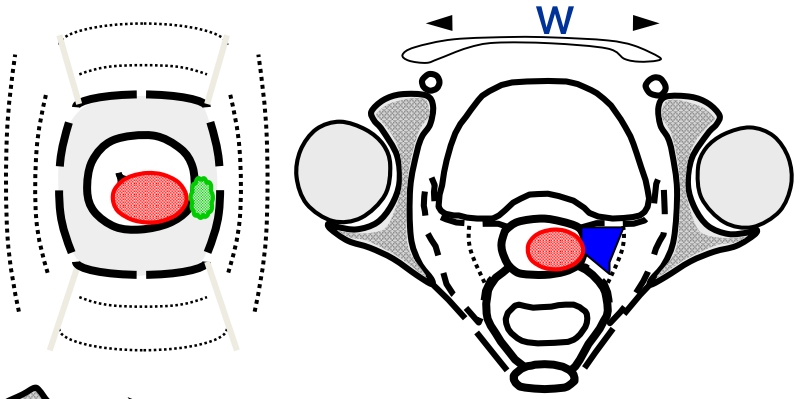
Documentation by Clinical Drawings

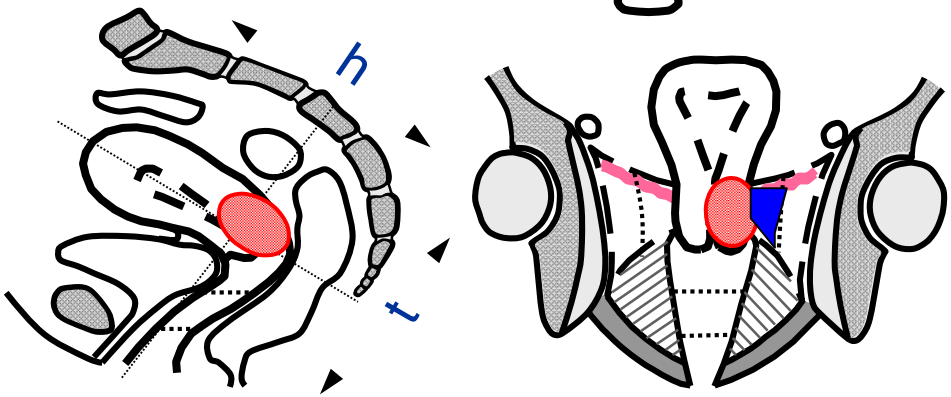




At Diagnosis

At Brachytherapy





- Complimentary to other imaging modalities

Ultrasonography (US)
Trans-abdominal, trans-vaginal & trans-rectal US

- Early tumors (stage- I & II) not detected by US

Signs

- Enlargement of cervix
- Irregularity of cervical outline
- Haemato/ Pyometra
- Hydroureteronephrosis / bladder invasion

LIMITATIONS OF US

- OPERATOR DEPENDENT

- INTER OBSERVER VARIATION

US IN BT

- REAL TIME IMAGING TO PREVENT PERFORATIONS

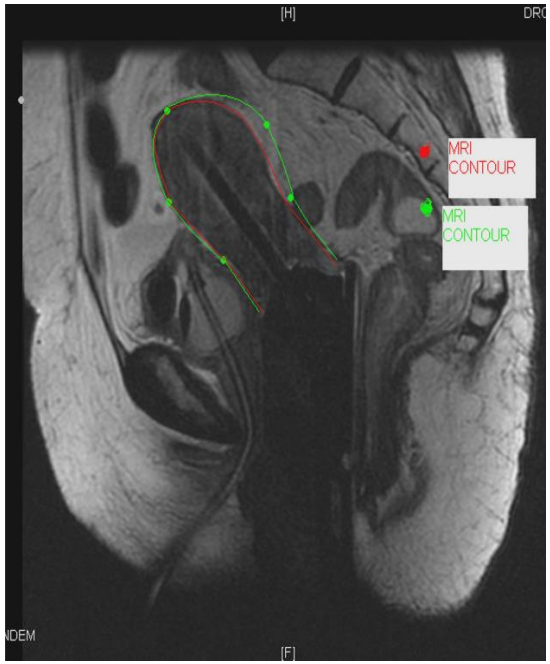
- GUIDE BT APPLICATION

US in Cx Brachytherapy

- Ultrasound guided insertion of central tandem
  - Tandem length
  - Retroverted uterus
  - False passage
- Ultrasound based planning
  - Uterine wall thickness
  - Bladder points
  - Rectal points
- Drawbacks
  - Coronal imaging not available
  - Posterior uterine surface not visible well

TAUS and MRI correlation (TMH data)

- 32 Applications with MRI Compatible Applicator
- Anterior Reference Points : 96 %
- Posterior Reference Points : 72 %
- Magnitude of Variation (>15%) : < 8%



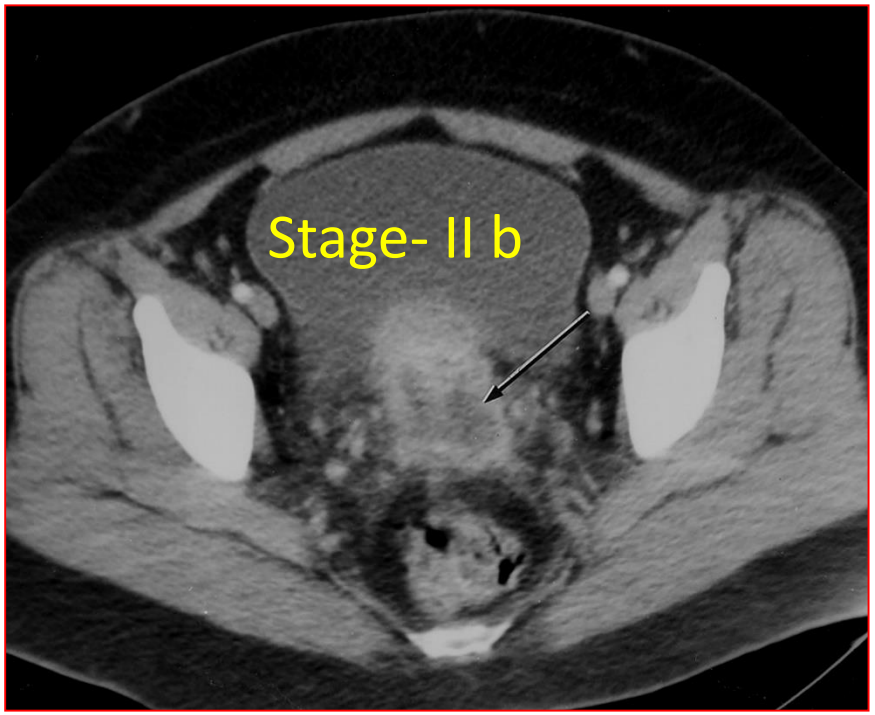
Significant Correlation between the USG and MRI Reference Points

Suggest : Use of USG for ICA Planning (21/2 D Planning)

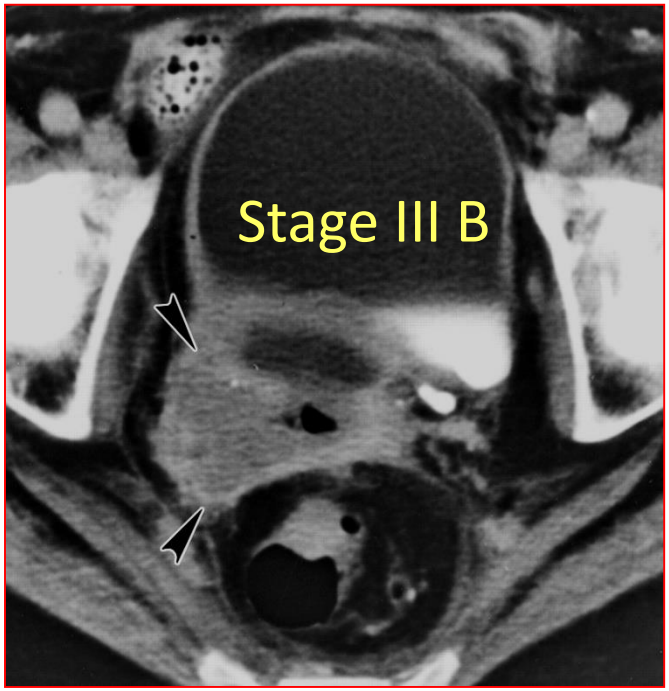
Mahantshetty et al. Rad. Onc. Aug. 2011

CT

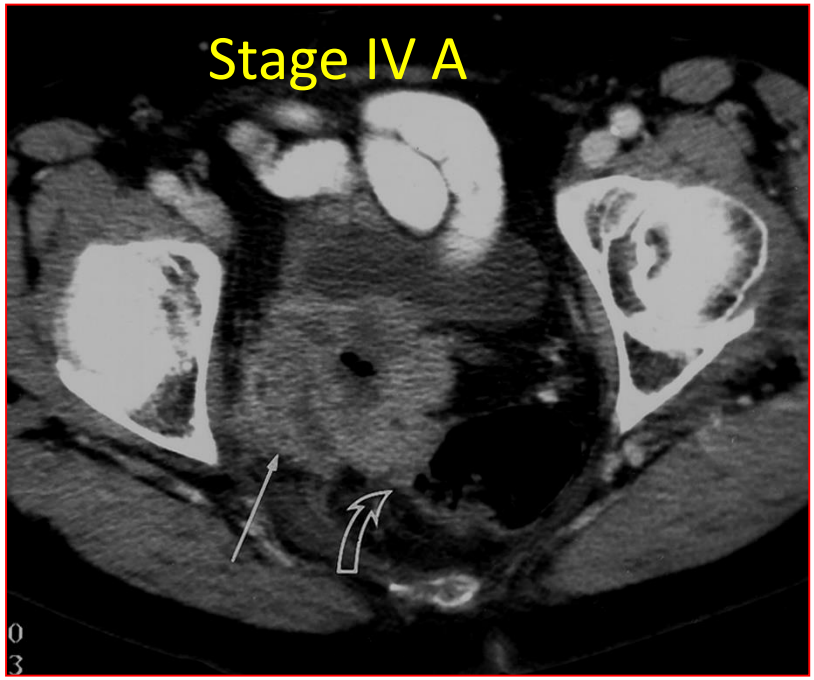
- Visualization of small primary tumor limited
- Currently used in staging of advanced disease (MR superior)
- Guide biopsy of nodes
- Plan RT ports



Stage- II b



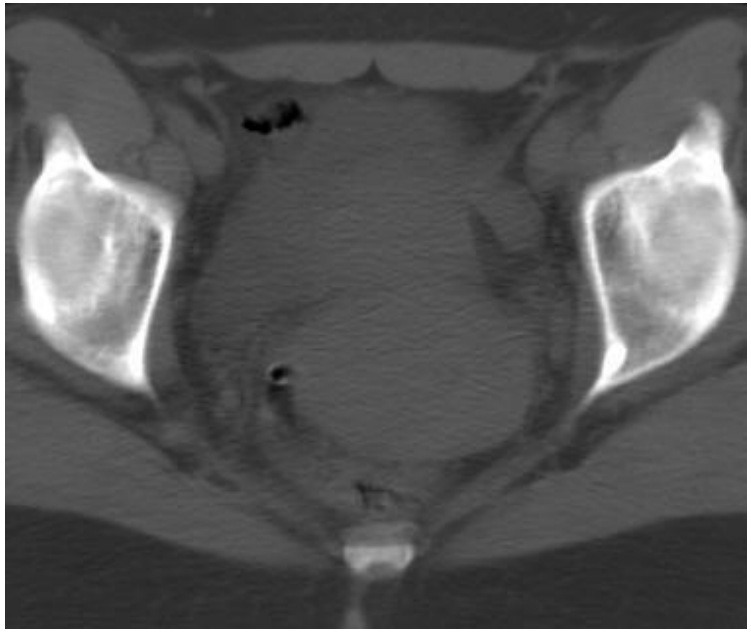
Stage III B



Stage IV A

Computed Tomography

Non-enhanced CT simulator images



Advantages

- Availability
- Cost
- Good depiction: organs at risk
- Infrastructure & personnel: less demanding than MRI

Limitations

- Low soft tissue depiction quality
- Poor GTV & CTV depiction

CT for EBRT- Image acquisition

What are the key issues for image acquisition when using CT?

- Administration of IV contrast

- Delayed image acquisition for bladder visualisation

- Administration of oral iodine based contrast

- Patient positioning

- Organ filing : Bladder & Rectum

CT: IV contrast for EBRT imaging

	Tumor detection	Parametrial invasion	Invasion of organs	Invasion of vagina	LN status	Recurrence detection
MRI	Estimation of dimensions within 0.5 cm compared to pathology specimen. Detection of endocervical growth and uterine corpus invasion is possible	High accuracy for: –Distinction between stromal and parametrial invasion –Estimation of degree of parametrial invasion	High accuracy in prediction of infiltration of surrounding organs	High accuracy in predicting vaginal invasion, if vaginal contrast is used (e.g., ultrasound gel)	CT and MRI have similar inaccuracy in detecting LN metastases	Dynamic contrast-enhanced MRI enables differentiating tumor recurrence from radiation fibrosis
CT	Inaccurate estimation of tumor dimensions even with contrast enhancement and inability to detect uterine corpus invasion	Low accuracy in distinction between parametrial tumor spread and normal parametrial tissue	Early invasion of bladder and rectum is not reliably detectable	Low accuracy in predicting vaginal infiltration, especially at early stages	CT and MRI have similar accuracy in detecting LN metastases	CT is of low predictive value for differentiation between radiation fibrosis and recurrence

Dimopoulos J, Fidarova E: The use of sectional imaging for image-guided radiotherapy. In: Viswanathan AN et al eds. Gynecologic Radiotherapy. Springer 2011

MR Imaging

Gold standard for evaluation of cervical cancer

Indications for MRI in cervical cancer

- Diagnosis
- Local staging of disease
- Nodal Disease: Pelvic and para-aortic
- RT Planning
- Evaluation of response to treatment
- Recurrent disease/ fibrosis
- Prediction of response to treatment

Advantages of MRI

- Multiplanar- axial, coronal, sagittal
- Superior soft tissue contrast
- No radiation hazards
- Suitable alternative for patients with contra-indications for iodinated CT contrast media such as allergy.
- Morphological as well as functional information (Diffusion weighted imaging, dynamic contrast enhanced MRI)

GEC-ESTRO Recommendations

Recommendations from Gynaecological (GYN) GEC-ESTRO Working Group (IV): Basic principles and parameters for MR imaging within the frame of image based adaptive cervix cancer brachytherapy

Johannes C.A. Dimopoulos [a], Peter Petrow [b], Kari Tanderup [c], Primoz Petric [d], Daniel Berger [e], Christian Kirisits [e], Erik M. Pedersen [c], Erik van Limbergen [f], Christine Haie-Meder [g], Richard Pötter [e,*]

[a] Metropolitan Hospital, Athens, Greece; [b] Institut Curie, Paris, France; [c] Aarhus University Hospital, Denmark; [d] Institute of Oncology Ljubljana, Slovenia; [e] Comprehensive Cancer Center, Medical University of Vienna, Austria; [f] Universitaire Ziekenhuis Gasthuisberg Leuven, Belgium; [g] Institut Gustave Roussy, Villejuif, France

A B S T R A C T

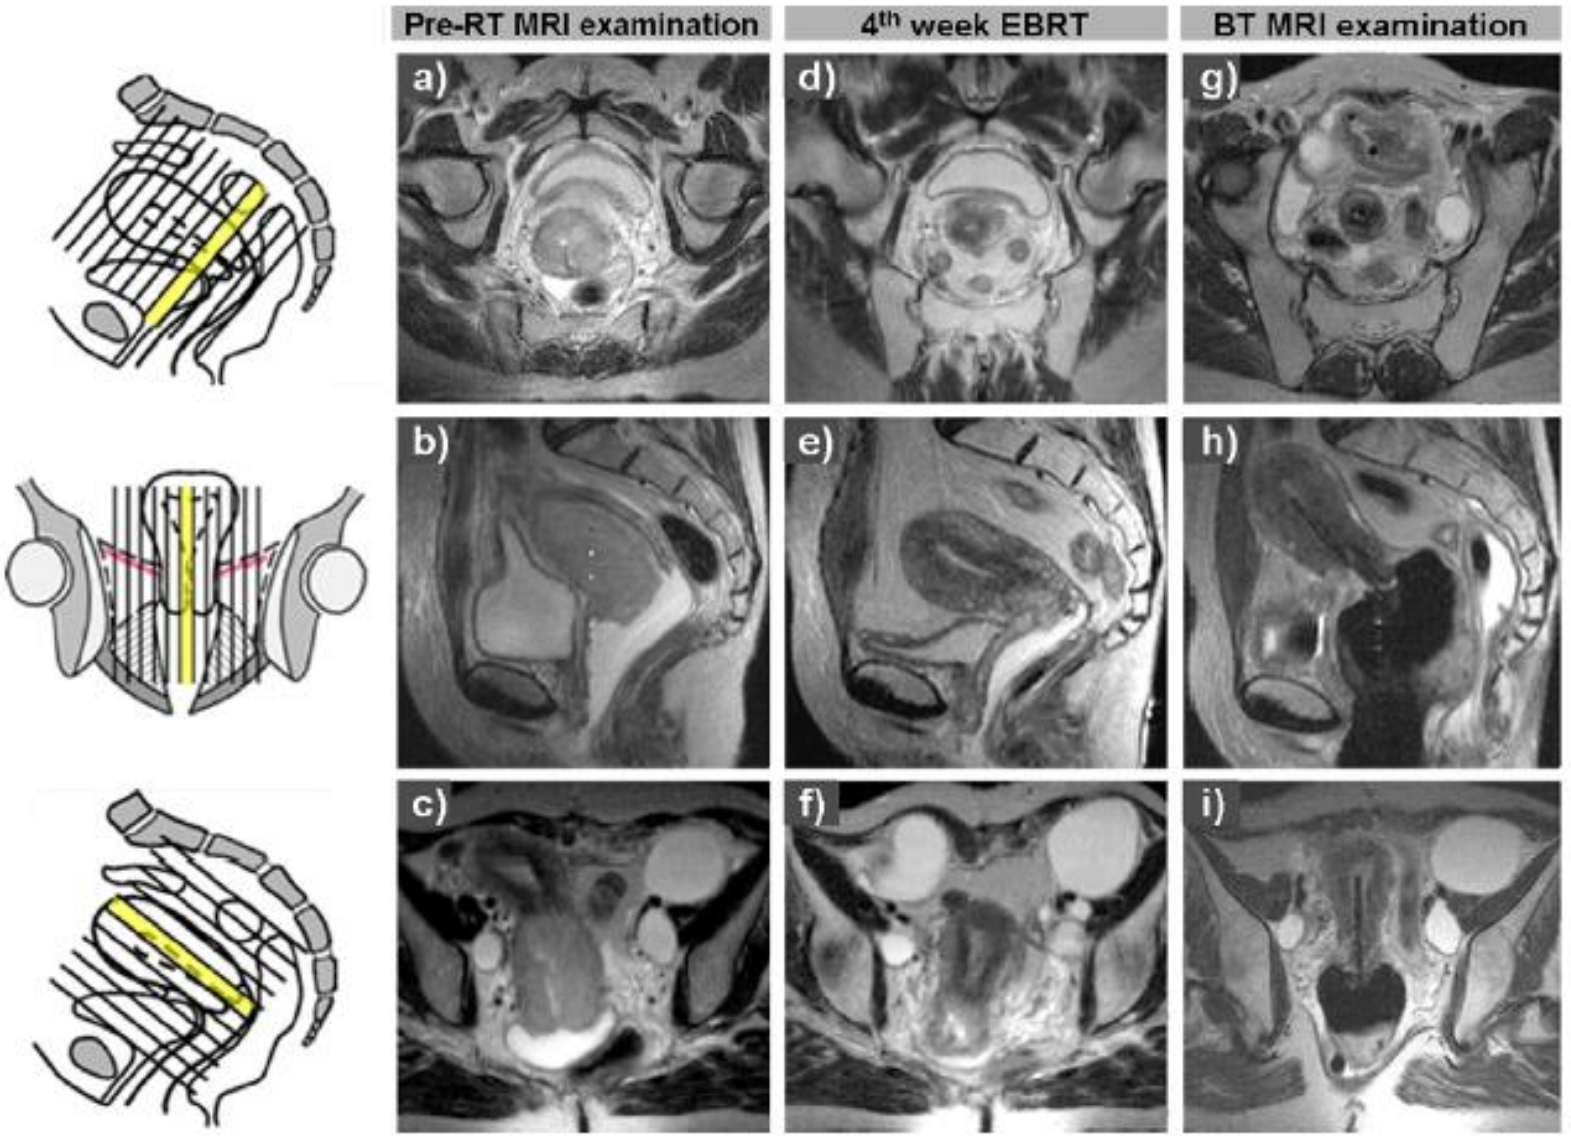
The GYN GEC-ESTRO working group issued three parts of recommendations and highlighted the pivotal role of MRI for the successful implementation of 3D image-based cervical cancer brachytherapy (BT). The main advantage of MRI as an imaging modality is its superior soft tissue depiction quality. To exploit the full potential of MRI for the better ability of the radiation oncologist to make the appropriate choice for the BT application technique and to accurately define the target volumes and the organs at risk, certain MR imaging criteria have to be fulfilled. Technical requirements, patient preparation, as well as image acquisition protocols have to be tailored to the needs of 3D image-based BT. The present recommendation is focused on the general principles of MR imaging for 3D image-based BT.

Methods and parameters have been developed and progressively validated from clinical experience from different institutions (IGR, Universities of Vienna, Leuven, Aarhus and Ljubljana) and successfully applied during expert meetings, contouring workshops, as well as within clinical and interobserver studies.

It is useful to perform pelvic MRI scanning prior to radiotherapy ("*Pre-RT-MRI examination*") and at the time of BT ("*BT MRI examination*") with one MR imager. Both low and high-field imagers, as well as both open and close magnet configurations conform to the requirements of 3D image-based cervical cancer BT. Multiplanar (transversal, sagittal, coronal and oblique image orientation) T2-weighted images obtained with pelvic surface coils are considered as the golden standard for visualisation of the tumour and the critical organs. The use of complementary MRI sequences (e.g. contrast-enhanced T1-weighted or 3D isotropic MRI sequences) is optional. Patient preparation has to be adapted to the needs of BT intervention and MR imaging. It is recommended to visualise and interpret the MR images on dedicated DICOM-viewer workstations, which should also assist the contouring procedure. Choice of imaging parameters and BT equipment is made after taking into account aspects of interaction between imaging and applicator reconstruction, as well as those between imaging, geometry and dose calculation.

In a prospective clinical context, to implement 3D image-based cervical cancer brachytherapy and to take advantage of its full potential, it is essential to successfully meet the MR imaging criteria described in the present recommendations of the GYN GEC-ESTRO working group.

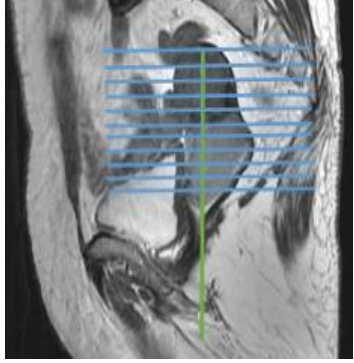
IMAGE PLANE, ORIENTATION AND COVERAGE



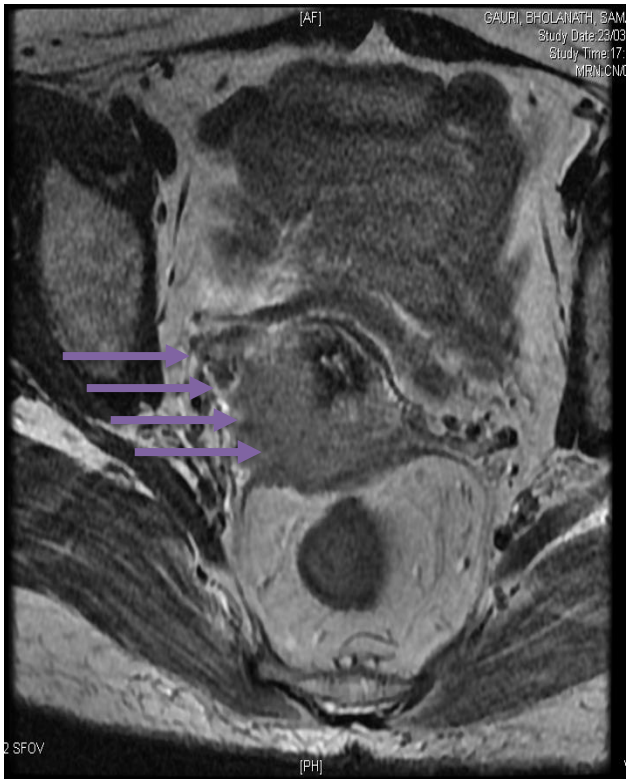
Para – transverse , para-coronal, para-saggital

RO 2012; GEC-ESTRO RECOMMENDATION-IV

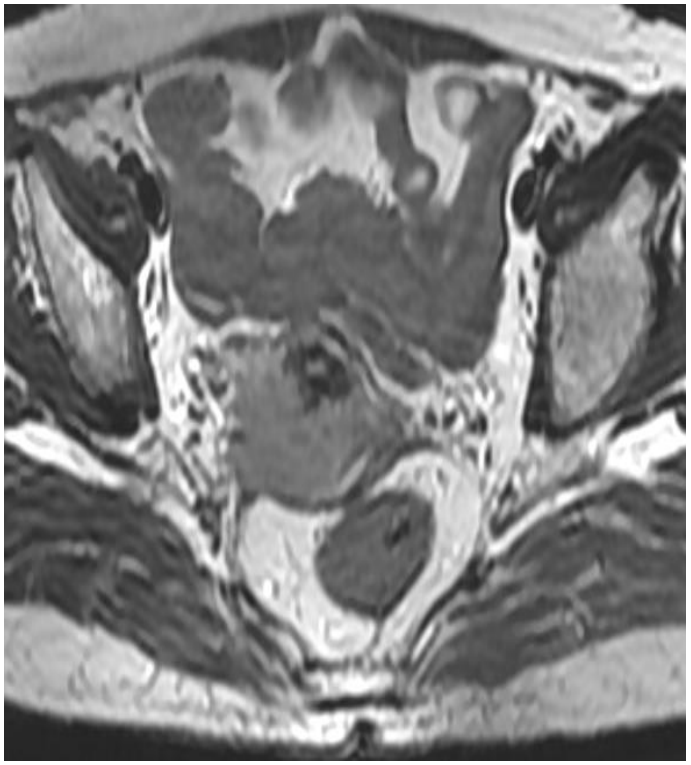
Right parametrial invasion



Para-axial



True-axial



Technical Requirements:

1. **Magnetic Field Strength:**

   - 0.2 – 1.5T for both Pre-Rx and BT MR series

   - 3T for Pre Rx MR (Experience growing)

   - 3T for BT : limited experience due to Image distortion, artefacts and heating effects of BT applicator

2. **Magnet Configuration:** Open or Closed

3. **Coils:** Pelvic coil

4. **Patient Preparation:**

   - Bowel preparation and reduction in bowel movements

   - Reduce ant. ABD motion by elastic bands and Anterior Pre-Saturation bands : to reduce signals form skin and sub-cut tissues

   - US jelly in the vagina for vaginal mucosal disease (Pre Rx MR)

   - Vaginal packing with dilute gado (0.2 T) and no contrast for (1.5T)

   - Bladder filling protocol : reproducible during BT MR and Rx delivery

   - Rectal dosimeters - optional

RO 2012; GEC-ESTRO RECOMMENDATION-IV

Table 2
Image acquisition protocols for pre-RT MRI scan and BT MRI scan. This table summarises the important information regarding sequence parameters for each of the different MRI sequences. The numbering of sequences is the same as in Table 1.

Protocol			Sequence parameters									
	Number		Fatsat	TR (ms)[a]	TE (ms)[b]	ETL[c]	FOV (cm^2)[d]	M(f)[e]	M(p)[e]	Nex[f]	SW[g]	NPW[h]

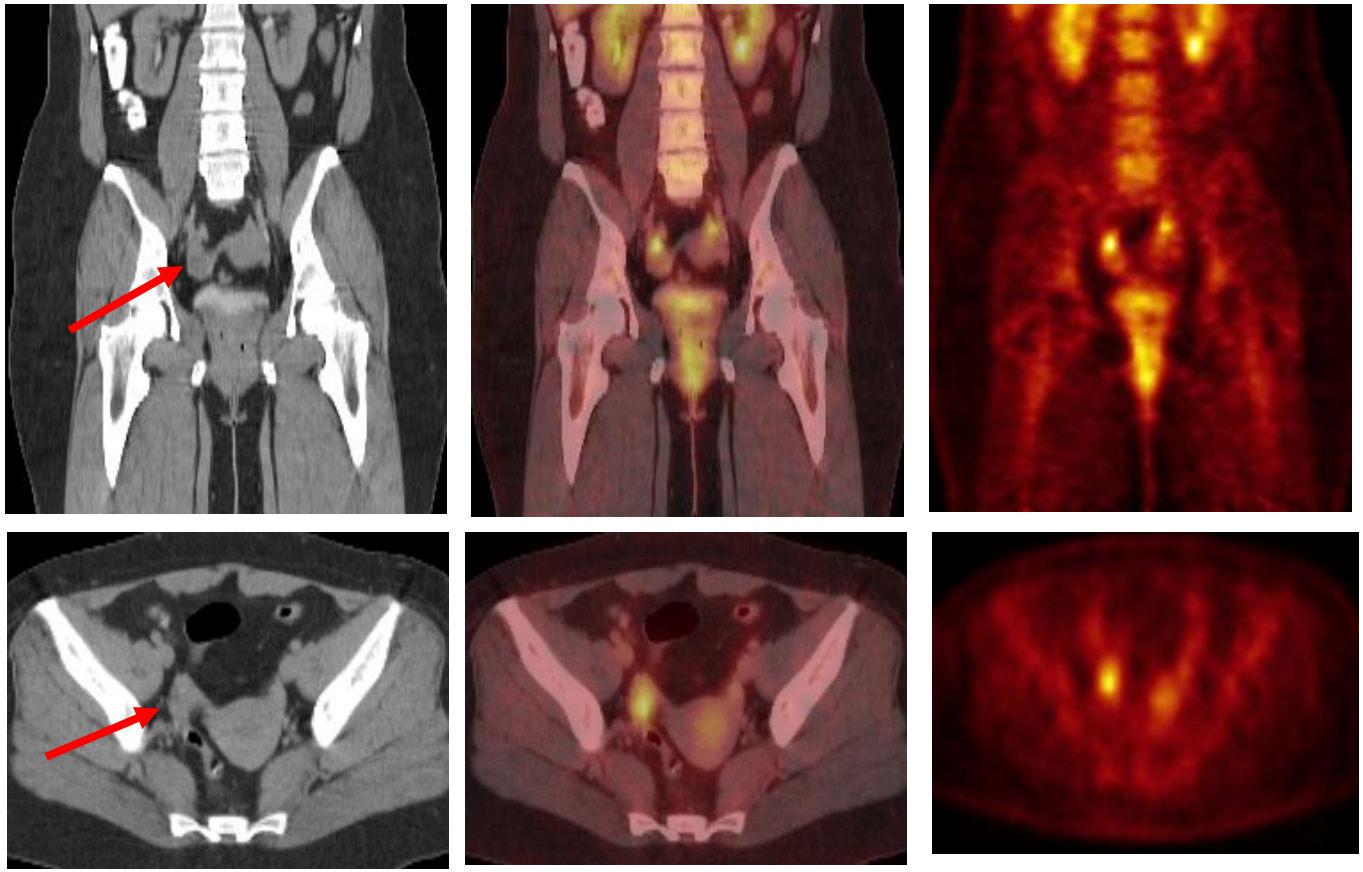
FDG-PET/CT



PET and Cervical Cancers

NEWLY DIAGNOSED

➢ Early Stage (I-IIA)

- ➢ Surgery / RT
- ➢ >50 % require Adj. Rx
- ➢ 20-30 % pelvic node +ve
- ➢ CT/MRI limitations
- ➢ Can PET identify these 20-30 % patients?
- ➢ Avoid morbidity of multi-modality Rx

➢ Advanced Stage (IIB-IIIB)

- ➢ Radical RT + CT
- ➢ Pelvic Radiation
- ➢ 30-45% para aortic node+ve
- ➢ CT/MRI limitations
- ➢ Can PET identify at least 30%
- ➢ Tailor multi-modality treatment Rx

Knowledge of natural history of GYN Cancers and Lymph Nodal Spread : Vital

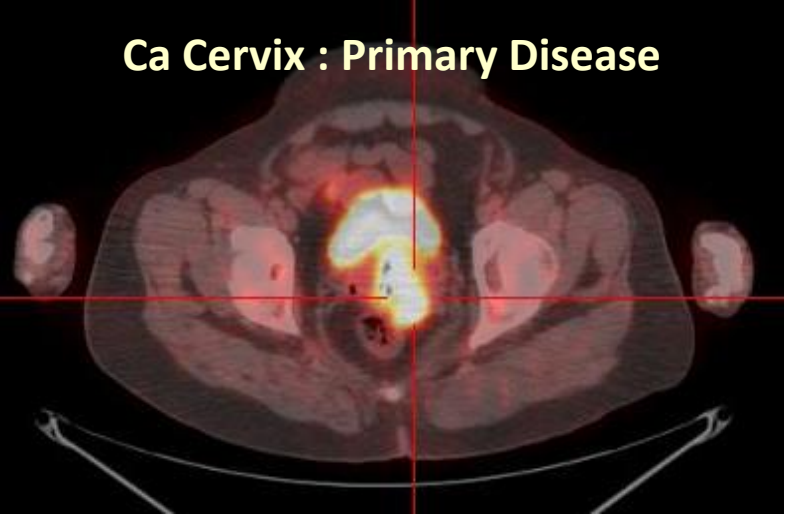
PET and Cervical Cancers

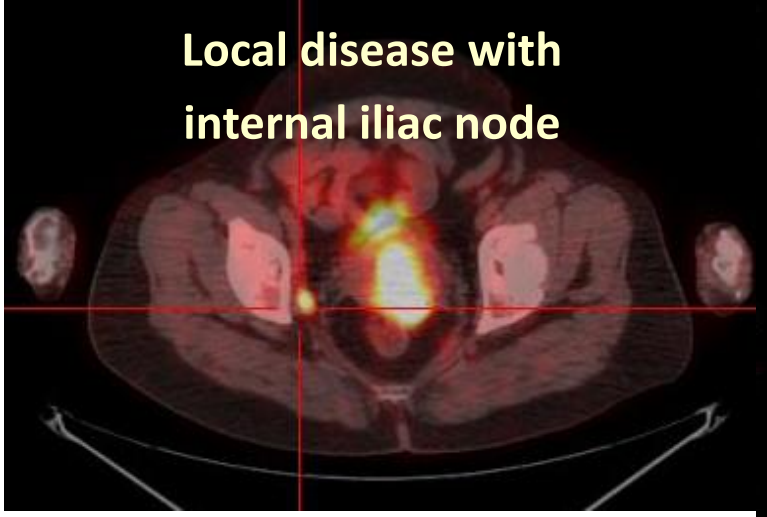
- **Primary Tumor Staging**
- **Lymph Nodal Staging : Early Vs Advance Stages**
- **Pre-treatment Prognostic Value**
- **Treatment Plan Optimization : Single modality, Aggressive Rx …**
- **Post-therapy Surveillance**

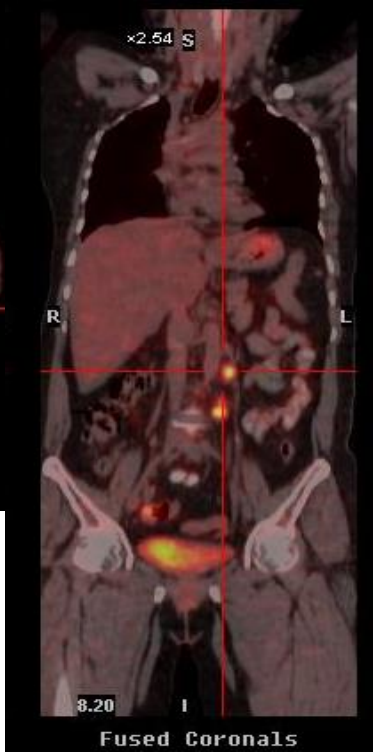
  - Local

  - Regional (Pelvic / Para-aortic)

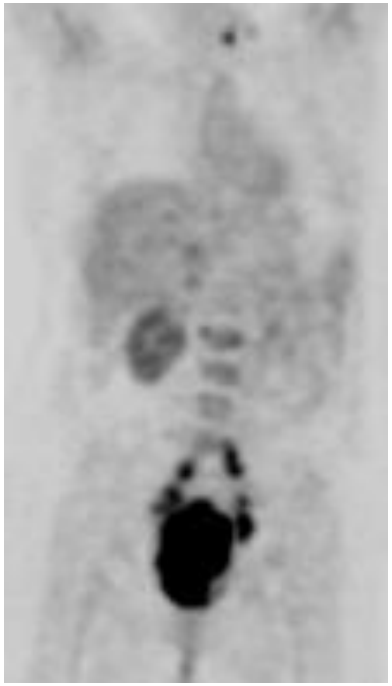
  - Distant Metastasis







PET and Cervical Cancers



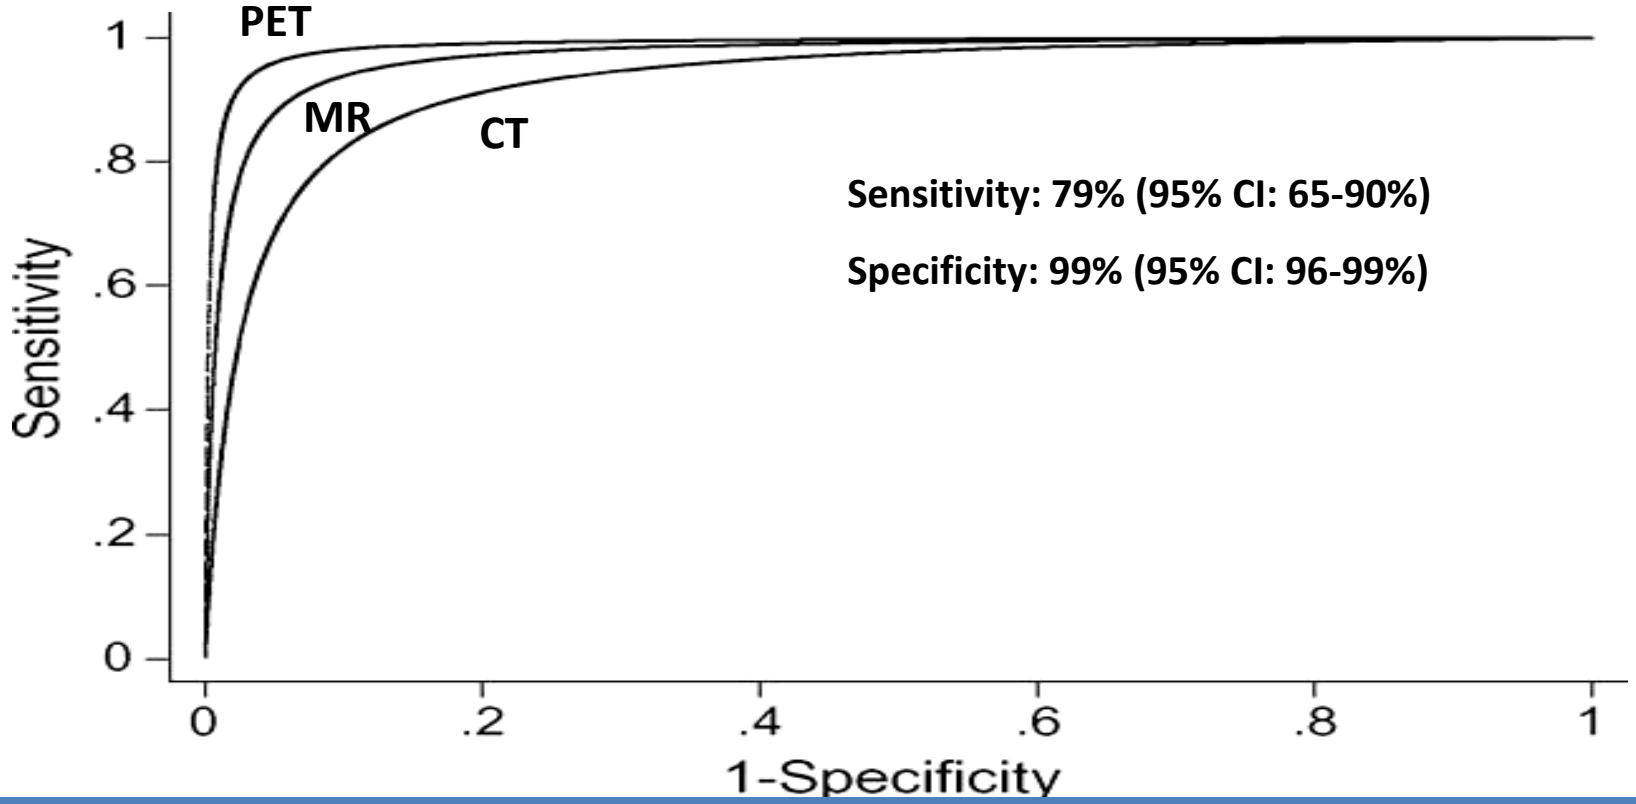
Ca Cervix IIIb with
SCF node

Ca Cervix IIIb with
Liver Metastasis

PET / PET-CT and Cancer Cervix

Lymph Nodal Staging

ROC curve for PET to detect pelvic nodal metastasis in newly diagnosed cervical cancer, with 95% confidence intervals (Area under curve = 0.970).



Sensitivity: 79% (95% CI: 65-90%)

Specificity: 99% (95% CI: 96-99%)

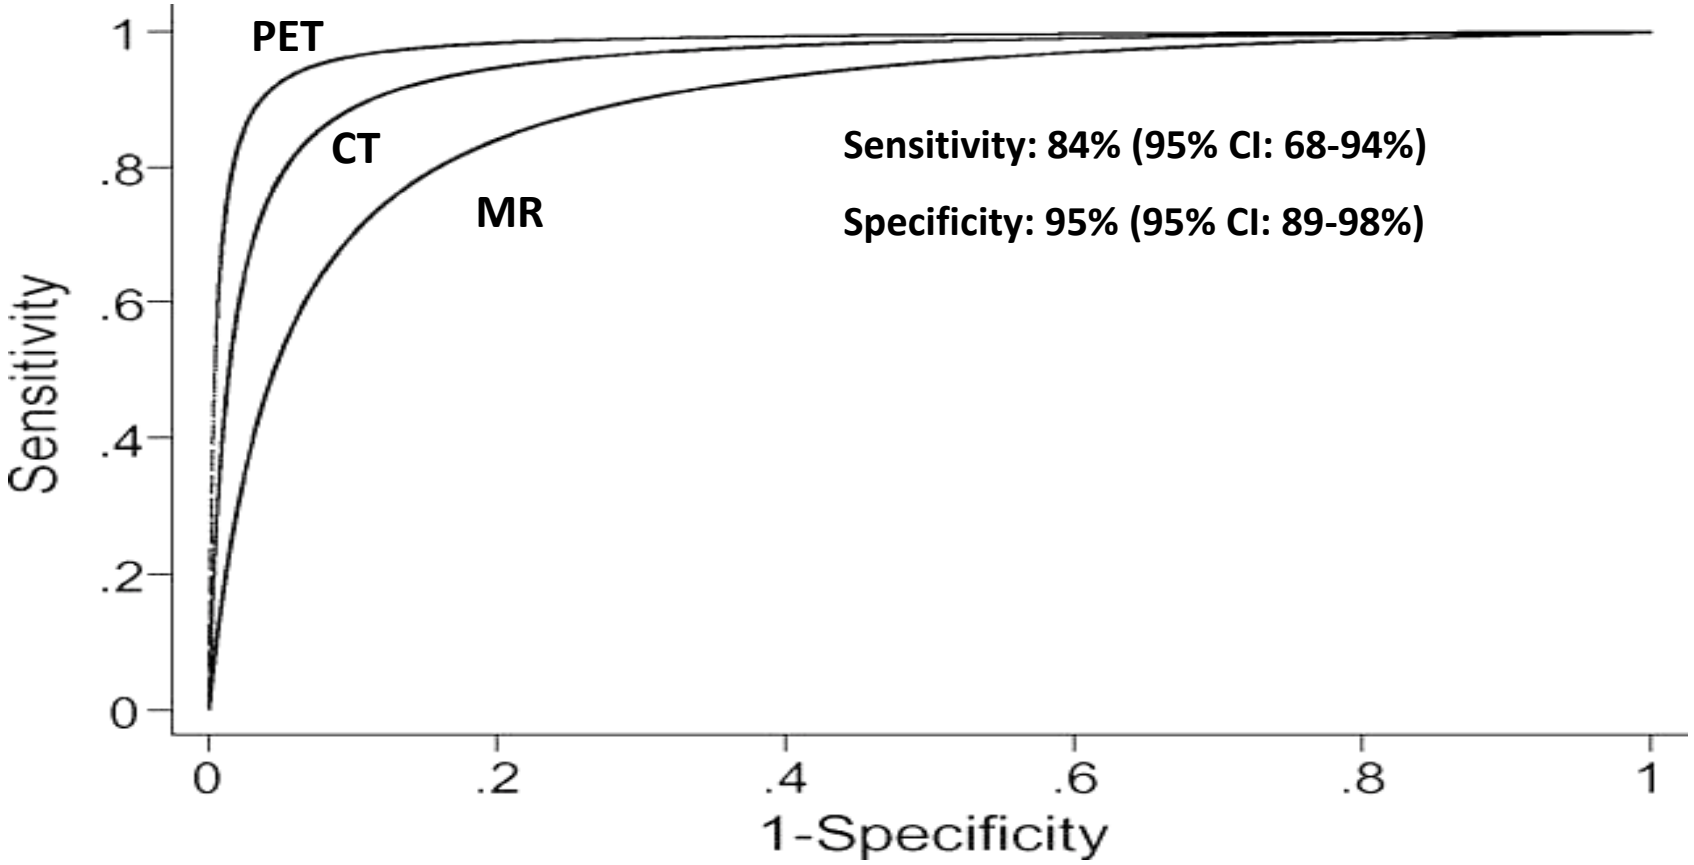
No enough evidence exists for detection of nodal disease in early Cx cancer and cannot replace lymph nodal dissection

L.J. Havrilesky et al. / G O 2005

PET / PET-CT and Cancer Cervix

Para-aortic Lymph Nodal Staging

ROC curve for PET to detect aortic nodal metastasis in newly diagnosed cervical cancer, with 95% confidence intervals (Area under curve = 0.952).



L.J. Havrilesky et al. / Gynecologic Oncology 97 (2005) 183–191

PET / PET-CT and Cancer Cervix

Post Therapy Surveillance

- **30 - 45% develop recurrences within 2 - 3 years Post Rx**
- **Response Evaluation : Important Predictor for recurrence & survivals**
- **Local Disease : Response and Detection of Early Local Recurrence**
- **Pelvic and / or Para-aortic Nodal Disease**
- **Other Sites of Distant Metastasis : Lung, Mediastinal Nodes, Bone,**

PET / PET-CT and Cancer Cervix

Response and Outcome

- Mean 3 months post therapy PET scan Evaluation
- Retrospective study in 152 pts

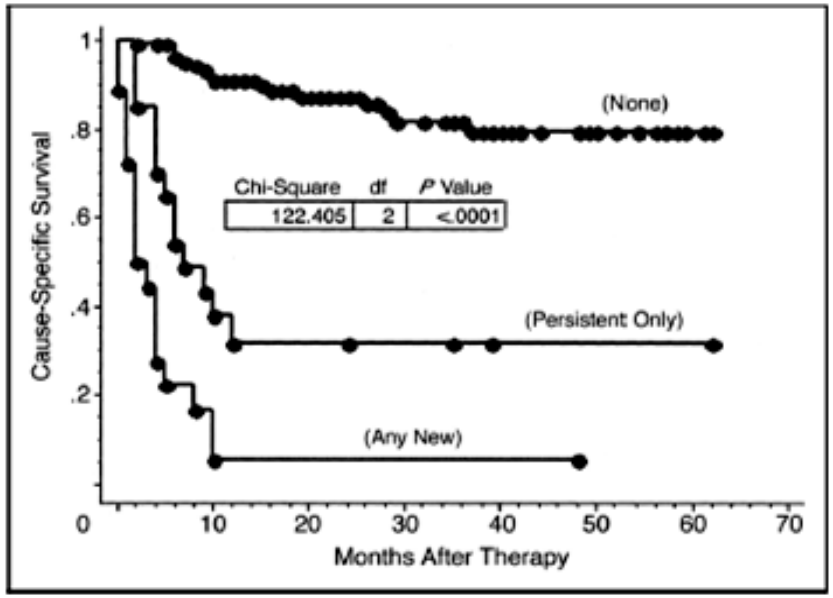


Fig 1. Cause-specific survival.

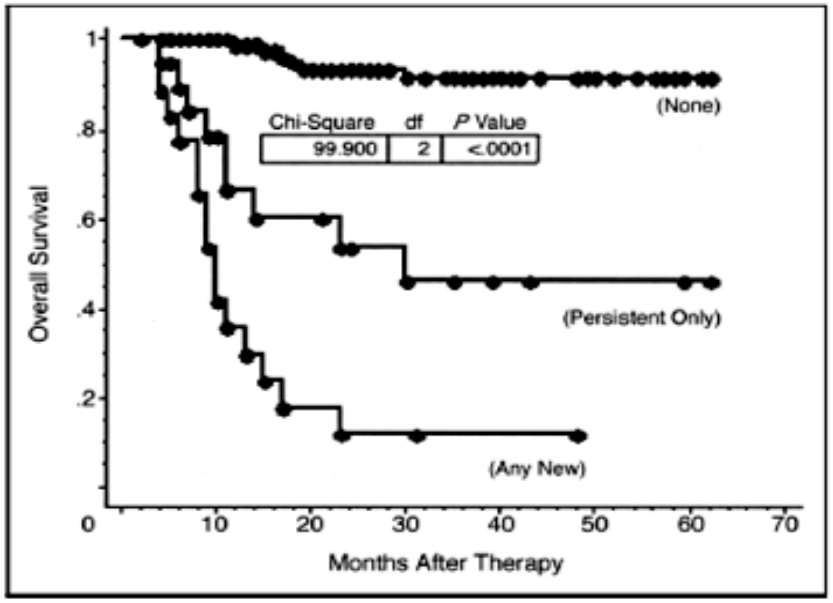

Fig 2. Overall survival.

Grigsby et al JCO 2004

- **PET has limitations to detect microscopic lesions <1cc**
- **Post Rx Pelvic inflammation might persists for months : false positivity high**
- **Need for further research to document treatment response**

SUMMARY

- Clinical Examination and objective documentation
- CT Imaging : Minimum in locally advanced Cervical cancer
- MR Imaging : Gold Standard
  - Understanding and Reading MR : Essential
- PET-CT : As an alternative to CT Imaging

THANK YOU

Patient Preparation for Treatment Planning

EBRT

Immobilization, Organ Filling / Reproducibility

Umesh Mahantshetty

Professor, Department of Radiation Oncology

Tata Memorial Hospital, Mumbai, India

- **Counseling and preparation**
- **Pre-planning Audit**
- **Consent**
- **Positioning**
- **Immobilization**
- **Organ filling: Bladder, Rectum etc.. & Reproducibility**

Counseling & Patient preparation Instructions

- Counseling about radiation, anticipated side effects etc..
- Obtain written Informed Consent
- Patient Preparation:

  - preparation of the parts (perineum)

- Dietary instructions & Rx of constipation

Pre-planning Audit

- Review history, clinical findings and staging
- Imaging findings: primary, nodal and normal anatomical variations
- Planning Aims:

  - Radical / Postoperative / Palliative

  - Radiation technique: 3D CRT / IMRT / VMAT etc..

Q. During external beam radiation therapy, following position is given for patients with cervical cancer

A. Supine
B. Prone
C. Prone with belly board
D. Lithotomy

Positioning & Immobilization

- AIM:- Comfortable and a Reproducible position through out the treatment

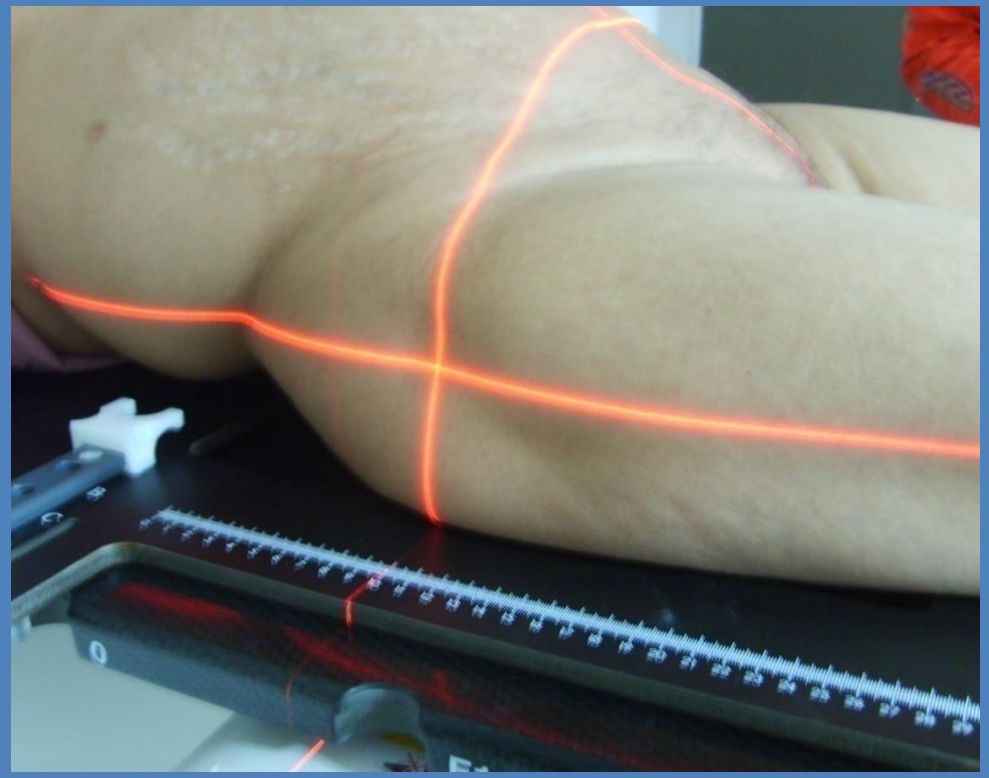
SUPINE POSITION

- Commonest position
- Hands on chest , legs straight with heels together

FROG leg position:- groin skin folds, low 1/3 vaginal tumors / inguinal regions

SUPINE WITH KNEE REST & ALIGNMENT

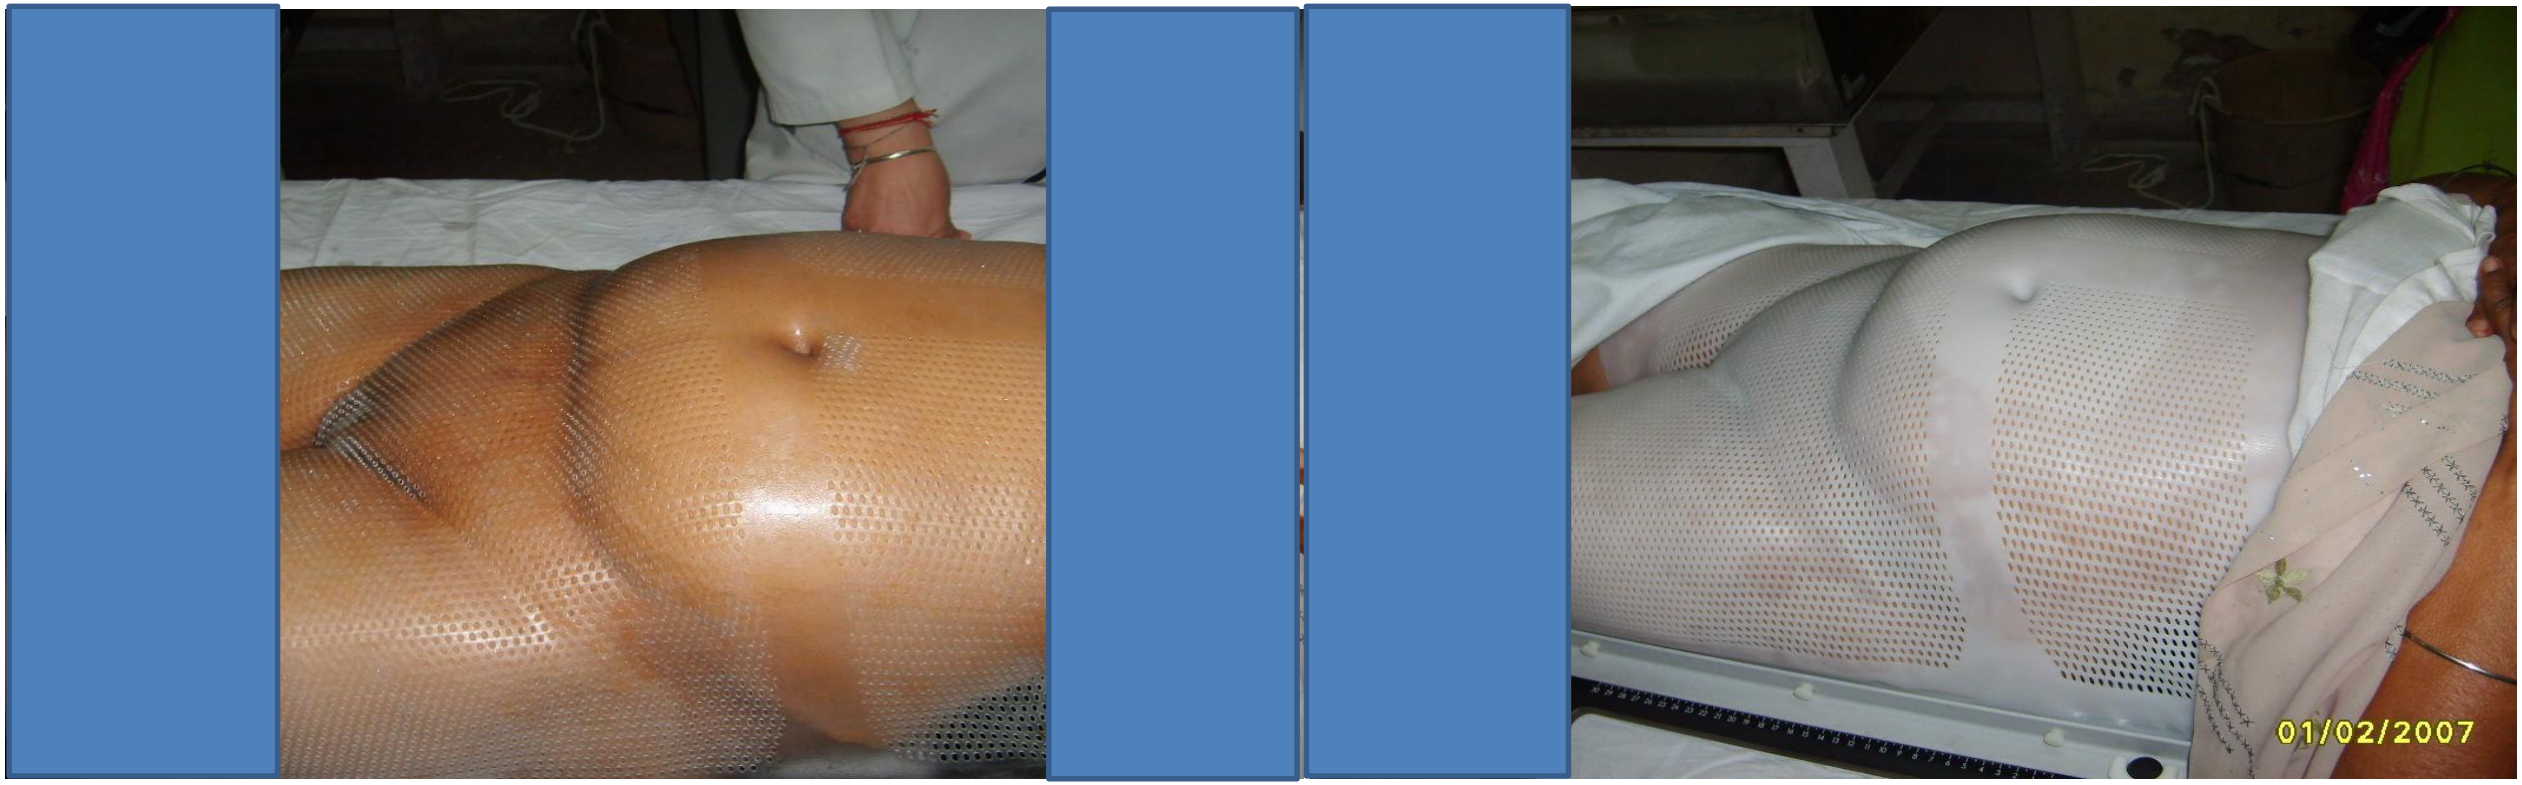
LASER ALIGNMENT



Immobilisation

1. Knee Rest- comfortable, relaxes back against flat couch, relieves lumbar lordosis
2. Ankle rest-change in foot-change/rotation bony reference points
3. Belly board with prone position
4. Vacloks / Body fix/ frame

Thermoplastic molds



- Fixation of lower thoracic cage and the pelvis after alignment
- Challenging in Obese patients
- Reproducibility : weight loss / shrinkage etc…

Immobilization: Other methods

Elekta Body Frame

Body Fix system with Vacloks

Prone Versus Supine

Prone vs. supine position in endometrial cancer IMRT

47 patients; adjuvant RT

- 21 pts: prone
- 26 pts: supine

Small Bowel dosimetric and clinical results:

	V10Gy	V20Gy	V30Gy	V40Gy	V45	V50 Gy	p-value
Prone	89%	69%	33%	12%	5%	0%	NS
Supine	87%	63%	26%	8%	4%	0%	

	Acute G1	Acute G2	Late G1	Late G3
Prone	7 pts	14 pts	7 pts	1 pts
Supine	6 pts	19 pts	5 pts	0 pts

Conclusion: no difference in dose and toxicity.

Beriwal S, et al. 2007, IJROBP

Prone versus supine

Systematic review

Systematic review of the role of a belly board device in radiotherapy delivery in patients with pelvic malignancies

Esther M. Wiesendanger-Wittmer, Nanna M. Sijtsema *, Christina T. Muijs, Jannet C. Beukema

Department of Radiation Oncology, University of Groningen, The Netherlands

- 33 publications
- Prone position: lower irradiated small bowel V
- Prone on a belly board: more significant small bowel V reduction
- Possible effect on reduction of GI morbidity

Conclusion: prone positioning on a belly board can reduce the small bowel dose. Dose reduction depends on the IMRT technique used.

Wiesendanger-Wittmer EM, et al. Radiother Oncol 2012

Positioning & Immobilization - Summary

- Supine with mild flexion at knees with knee rest & alignment
- Vacloks or Bodyfix

  - Are now generally used and provide excellent reproducibility

  - Comfortable to patient

  - Cost Issues
- Immobilization device and Reproducibility should be adopted depending on the clinical environment especially the image guidance techniques (EPID/CBCT etc.) by each Institution

ORGAN FILING PROTOCOLS

- **Bladder filing**

  - Some bladder filing protocol

  - Various protocols utilized (500 – 1000 ml)

- **Rectal filing**

  - Empty bowels daily before planning / treatment

  - If gaseous distension of rectum / sigmoid at planning : Repeat planning after emptying

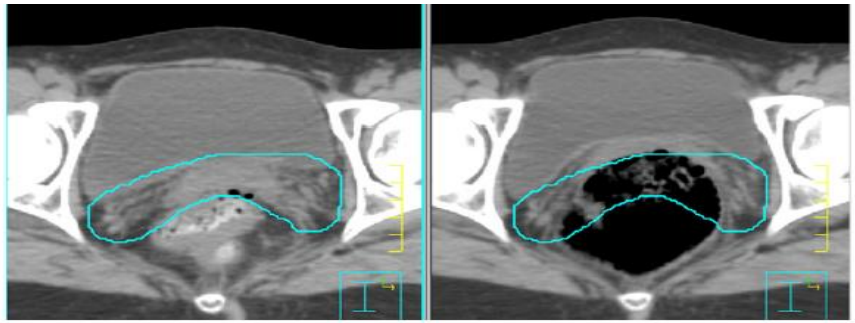


Fig. 2. Effect of rectal filling comparing the planning scan (left) to pretreatment scan (right). Cyan contour represents the CTV. (CTV - clinical target volume).

Organ filing: Bladder

Jhingran A, et al. IJROBP 2012

- 24 patients
- Post-histerectomy pelvic IMRT
- Simulation with full and empty bladder
- Bladder filling instructions (full bladder on treatment)
- Rescanning twice weekly during IMRT
- Bladder volumes varied: Median difference (max-min V): 247 cm3 (95-585)
- Rectal V variation less pronounced
- Vaginal fiducial markers movement:
    - 0.6 cm in lateral direction (0-0.9 cm)
    - 1.5 cm in AP direction (0.8-2.8 cm)
    - 1.2 cm in sup.-inf. direction (0.6-2.1)
- Large rectal/bladder V correlated with significant vaginal apex displacement
- **Conclusion:** even with detailed instructions, patients are unable to maintain consistent bladder filling.

Jhingran A, et al. IJROBP 2012

Organ filling

Chang JS, et al. Radiat Oncol 2013

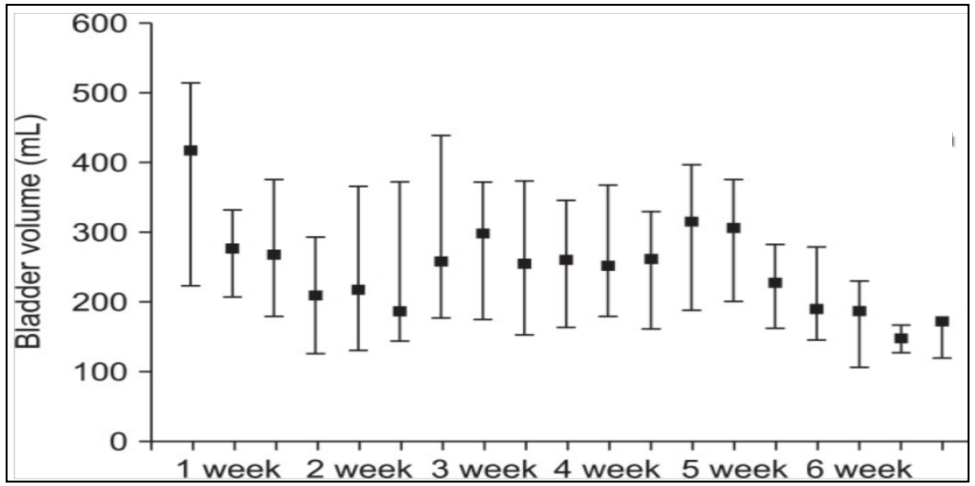
20 rectal cancer patients

5 US – based measurements of bladder V before and during treatment

Initial V: 417 (147 – 1.245) ml

Week 6 V: 157 ml (60 % reduction)

Average reduction per week: 161 ml (38 %)



TMH Study (N = 46 patients)

Protocol for Bladder filling : Oral Intake of 750-1000 ml over 15-20 minutes after emptying the bladder

Bladder filling (upto 300 +/- 50 ml) time after 30 minutes repeated every 15 min.

Methodology : Volume assessed by serial Trans-Abdominal US

	wk1	wk2	wk3	wk4	wk5
Median filling time	45	67.5	75	67.5	75
Mean filling time	57	67	66	66	69

Mahantshetty et al ; TCRT 2017 (under review)

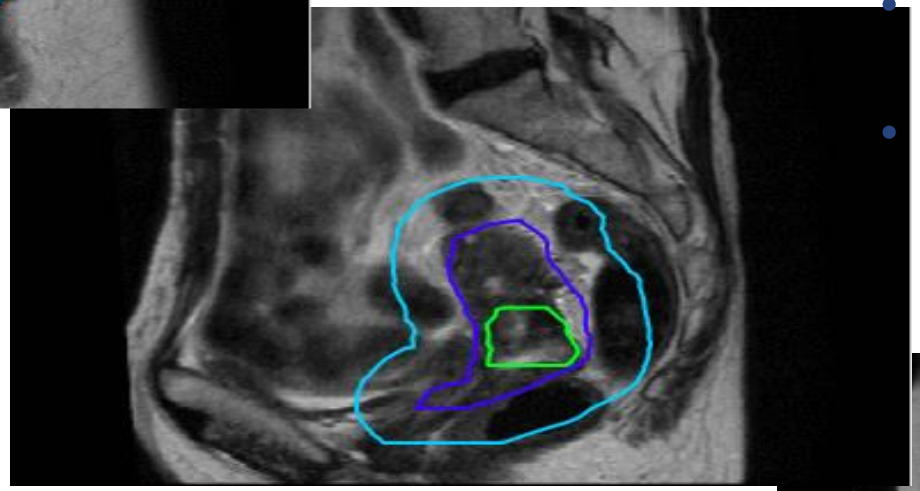
Target motion & Bladder filing effect during EBRT

Van de Bunt et al 2008

- 5 consecutive MRI's during EBRT
- Impact of changes in bladder and bowel filling on position changes of uterus
- Not only one organ is responsible

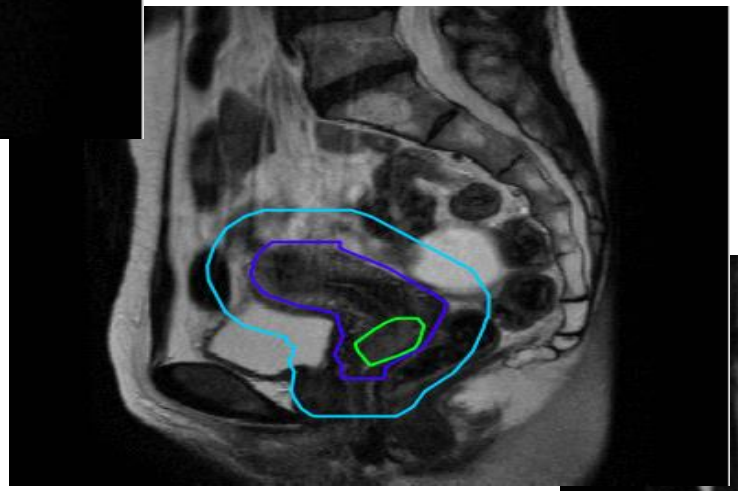
Low impact



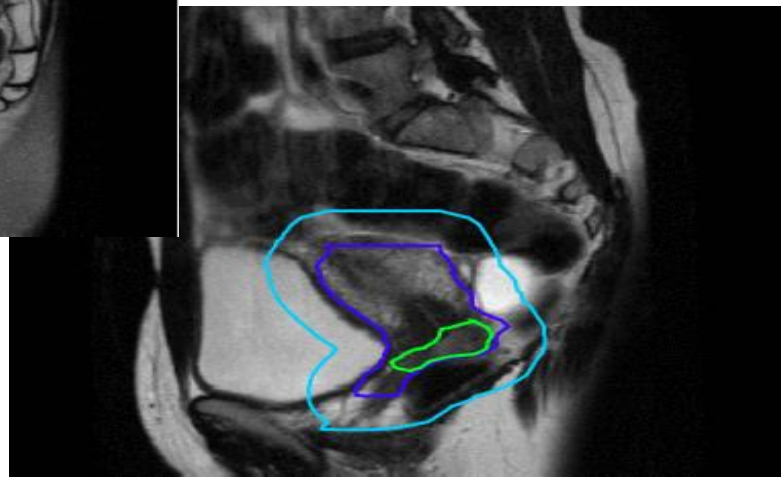
Low impact

GTV
CTV
PTV

High impact of bladder and bowel

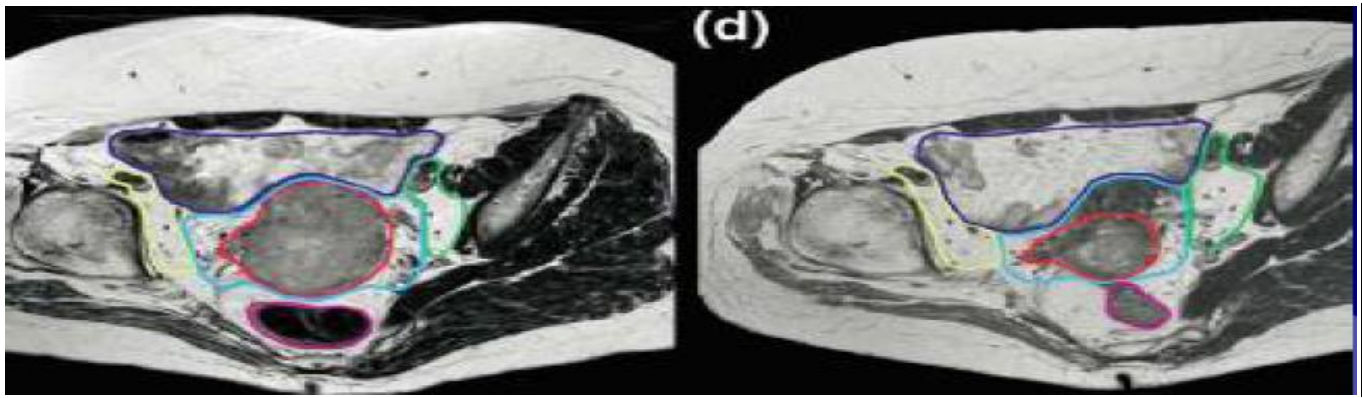


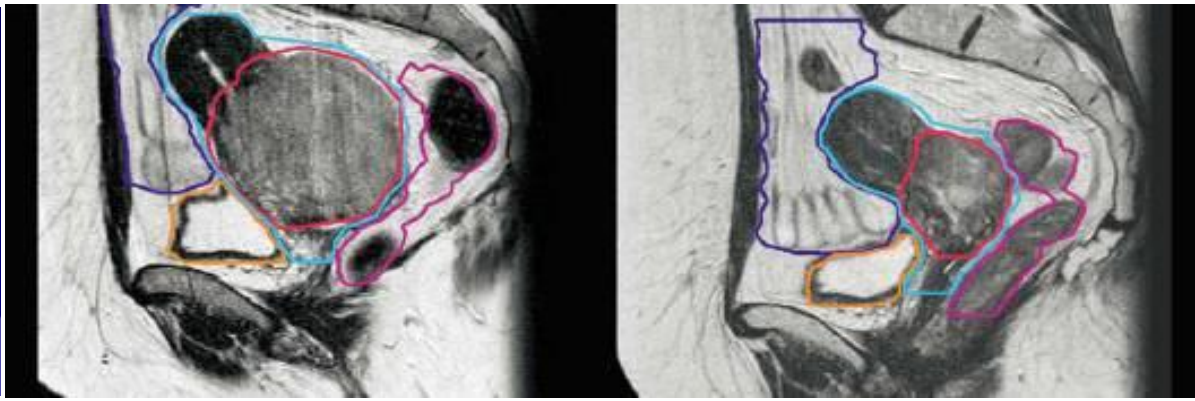
High impact of bladder



Courtesy : Ina Schulz, Utrecht

TUMOR REGRESSION DURING EXTERNAL RADIATION THERAPY





- Significant changes in tumor volumes occur during EBRT
- Tumors shrink & often quite quickly with CTRT
- Shrinkage is a double-edged sword

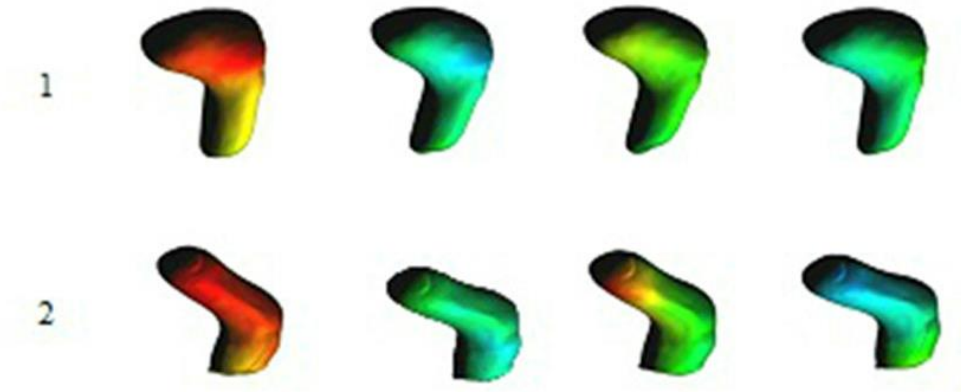
➢ University of Utah used physical exam measurements and found by 30.8 Gy tumors reduced by 50%

➢ MD Anderson used weekly conventional CT & noted a mean reduction of 64%

Lee et al. Red Journal 2005;58:625
Beadle et al. ASTRO 2006
Mayr et al. Am J Roentgenol 2006;187:65
Van de Bunt et al. Red Journal 2006;64:189

Organ Motion: Intrafraction

- 7 studies N= 92 patients
- Cinematic-MRI, VB/MVCT and portal imaging before and after each fraction.
- Mean range of 0.1-3.0 mm.
- Displacements greater than 5 mm occurred less than 3% of the time
- No predominance in direction



The overall mean (M), systematic error (Σ), and random error (σ) of the intra-fraction changes in patient setup over the entire patient group.

Patient motion	LR (mm)	CC (mm)	AP (mm)
M	−0.1	0.4	1.1
Σ	1.3	0.4	0.6
σ	1.4	1.0	1.1

Heijkoop, Sabrina T., et al. "Quantification of intra-fraction changes during radiotherapy of cervical cancer assessed with pre-and post-fraction Cone Beam CT scans." *Radiotherapy and Oncology* (2015).

SUMMARY

- Patient Position & Immobilization:

  - Supine with Knee rest and laser alignment

  - Whole body vacloks / body fix: as an alternative

- Organ filing:

  - Rectum: Preferably empty through out the planning and Rx

  - Bladder: Minimize the variation by adopting some bladder filing protocol

Imaging Protocols for Radiation Planning:
Fluoroscopic simulation, CT, Virtual simulation

Dr. D.N. Sharma

Professor,

Department of Radiation Oncology,

All India Institute of Medical Sciences, New Delhi

Outline

- X-ray/Fluoroscopy simulation:
  (Conventional Simulation)
- CT Simulation
- Virtual Simulation

I will not discuss

- Patient preparation, immobilisation
- MRI, PET-CT simulation
- Treatment verification

Patient preparation, Immobilization,

Imaging, Simulation etc.

Target /OAR delineation

DRR, Beam placement, Plan generation, Evaluation

Treatment verification, Treatment delivery

Role of Simulation in RT process

- The simulation belongs to the most important st
of whole treatment process
- Mimic the radiation t
diverg

Target coverage & OAR sparing

e beam

of the treatment field to optimize coverage
of target & minimize irradiation of normal tissue

Simulation Team

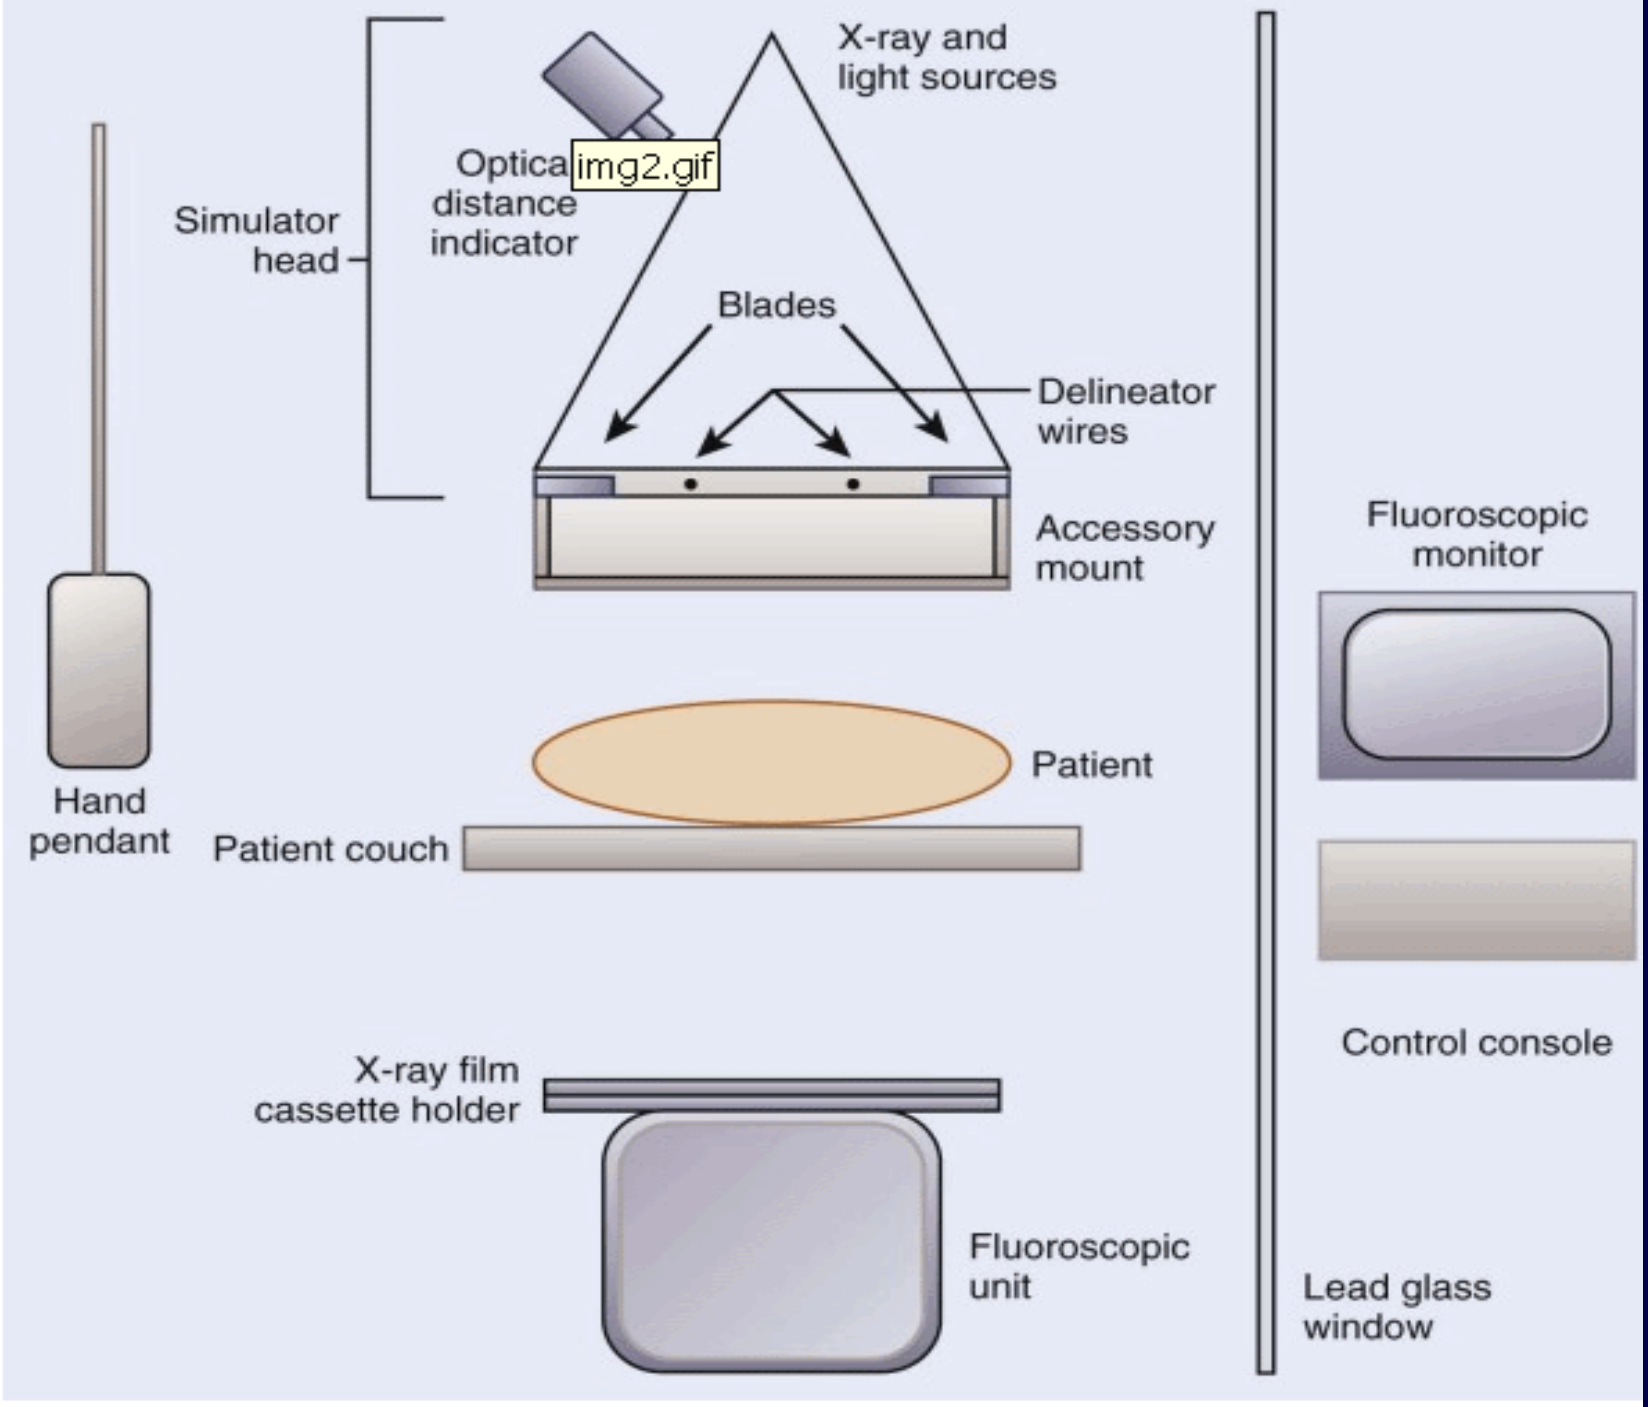
- Radiation Oncologist
- Medical physicist
- Radiation Therapist
- Radiation Staff nurse
- Maintenance Engineer

- Radiologist

Conventional Fluoroscopic Simulator

- It consists of diagnostic X-ray tube mounted on a rotating gantry,

- Mimics all the mechanical features and geometric field arrangement of various machines ranging from Cobalt-60 to high energy LINAC



X-ray and
light sources

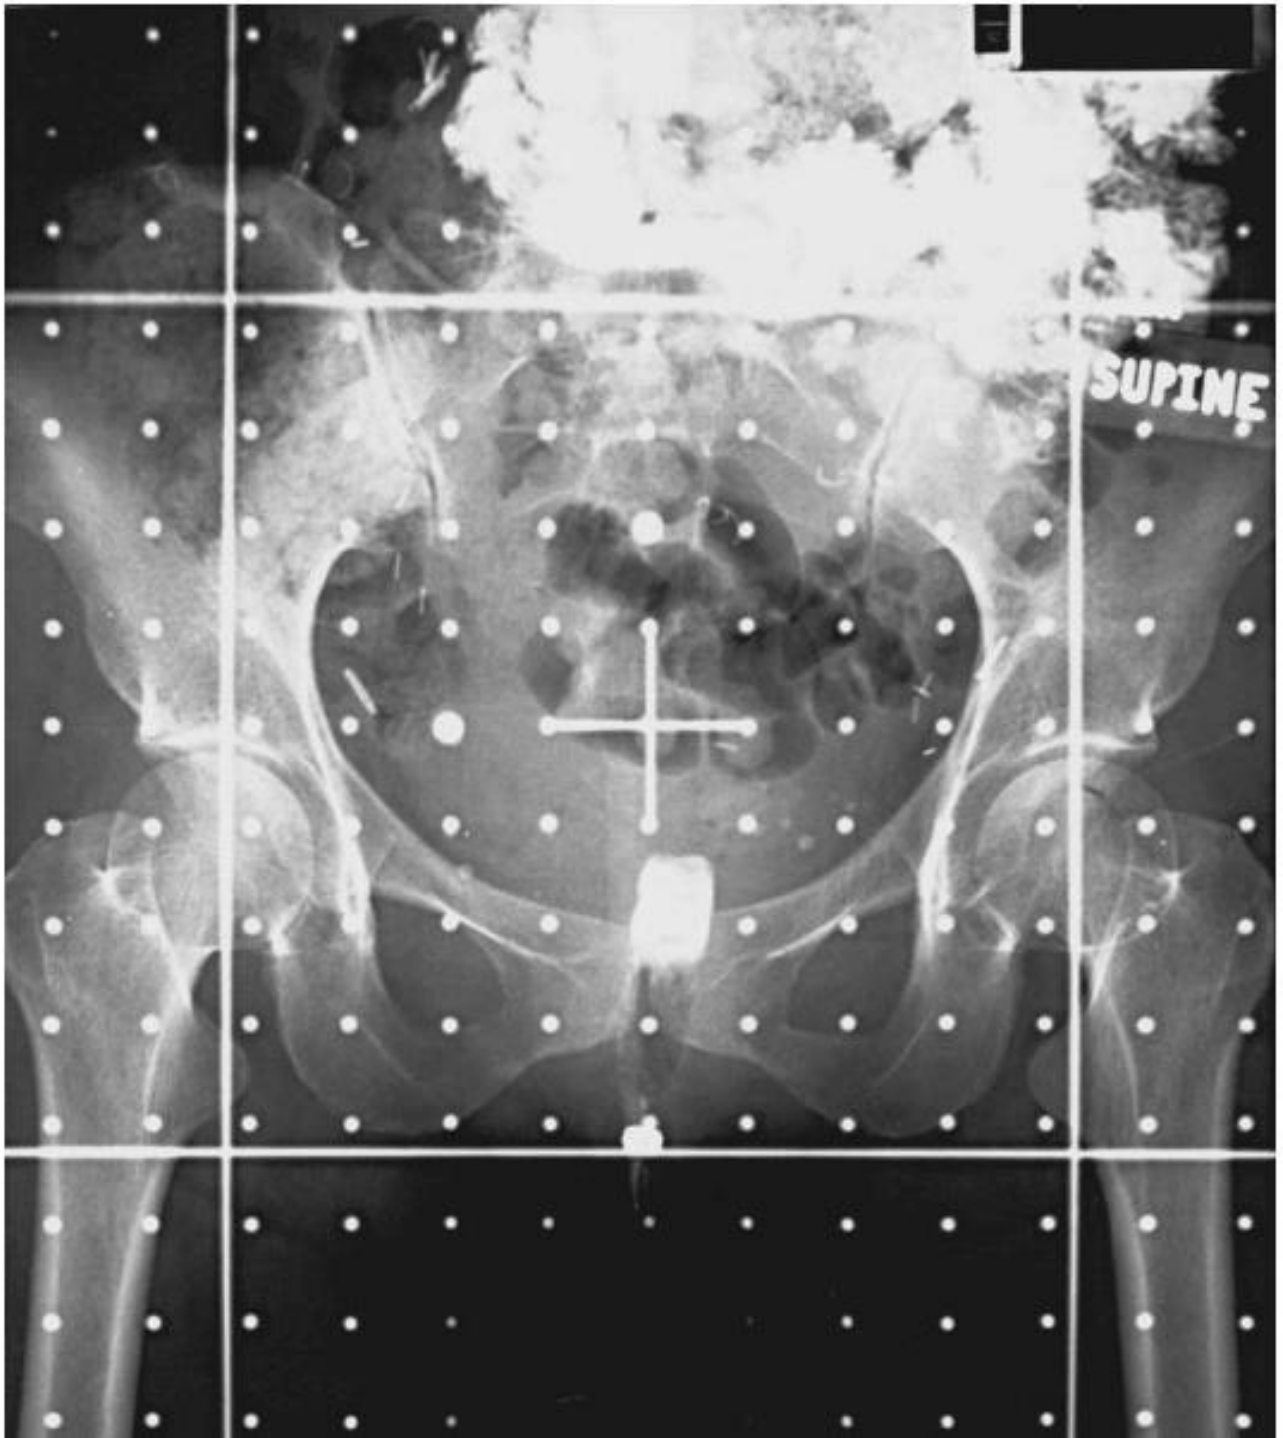
unit
Lead glass
window

Conventional Simulator

- Main simulation machine in the peripheral centers
- Provides live or real time X-ray imaging
- Useful for palliative and routine plannings
- Suits the busy centers with high patient load
- Easy availability and low cost
- Image quality: bony landmarks, contrast, markers
- Target and OAR not visible
- Only 2D image and therefore not for 3D-CRT

Procedure

- Supine position with immobilization device
- Set kV and mA
- Consistent Bladder filling protocol
- Oral and rectal contrast for bowel and rectum
- Marker in the vagina, seeds, titanium clips
- AP and lateral films, L2 to 3 cm below tuberosities
- FAD as per the treatment unit
- Keep image intensifier close to table
- Keep exposure ALARA



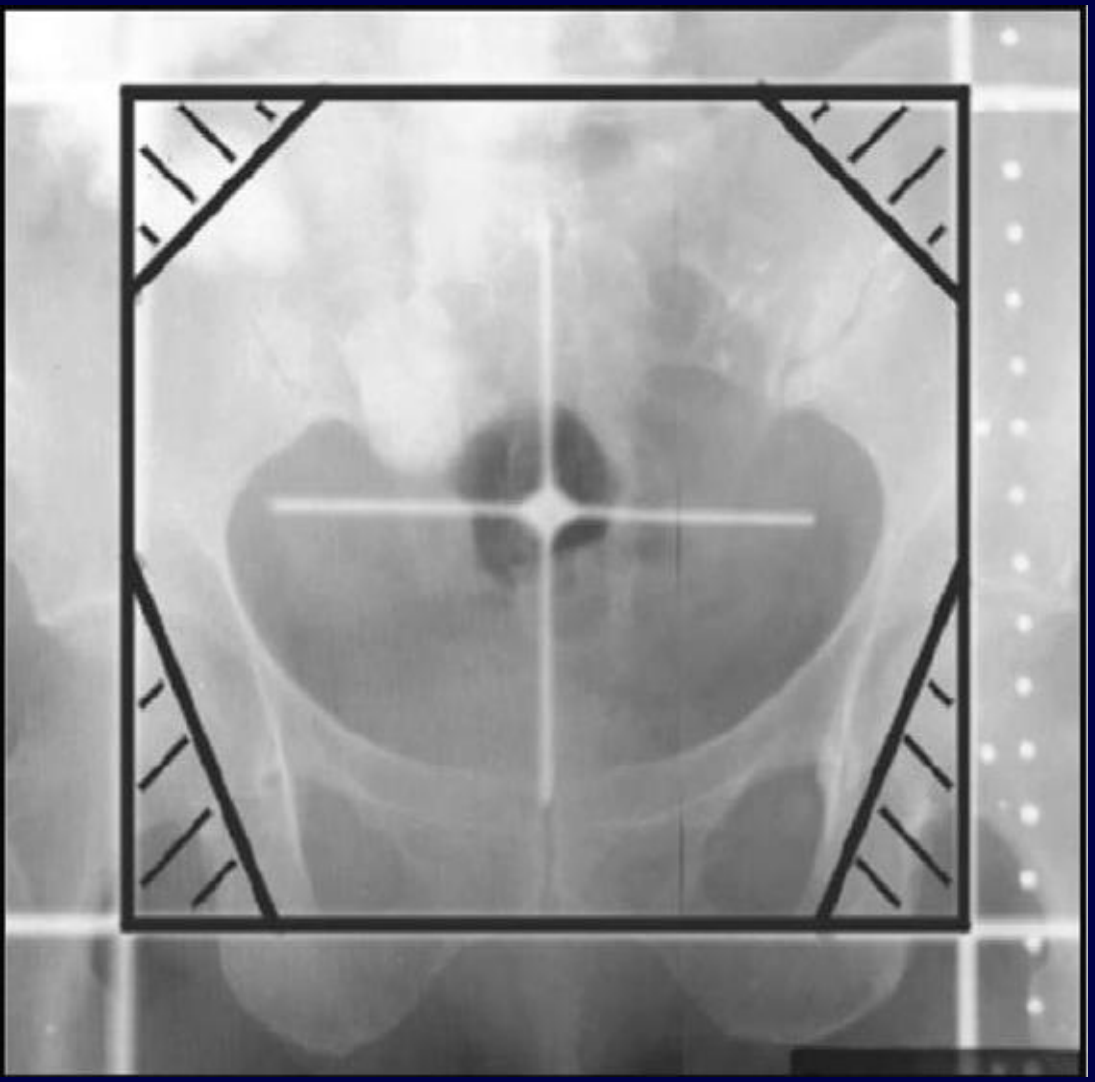
SUPINE

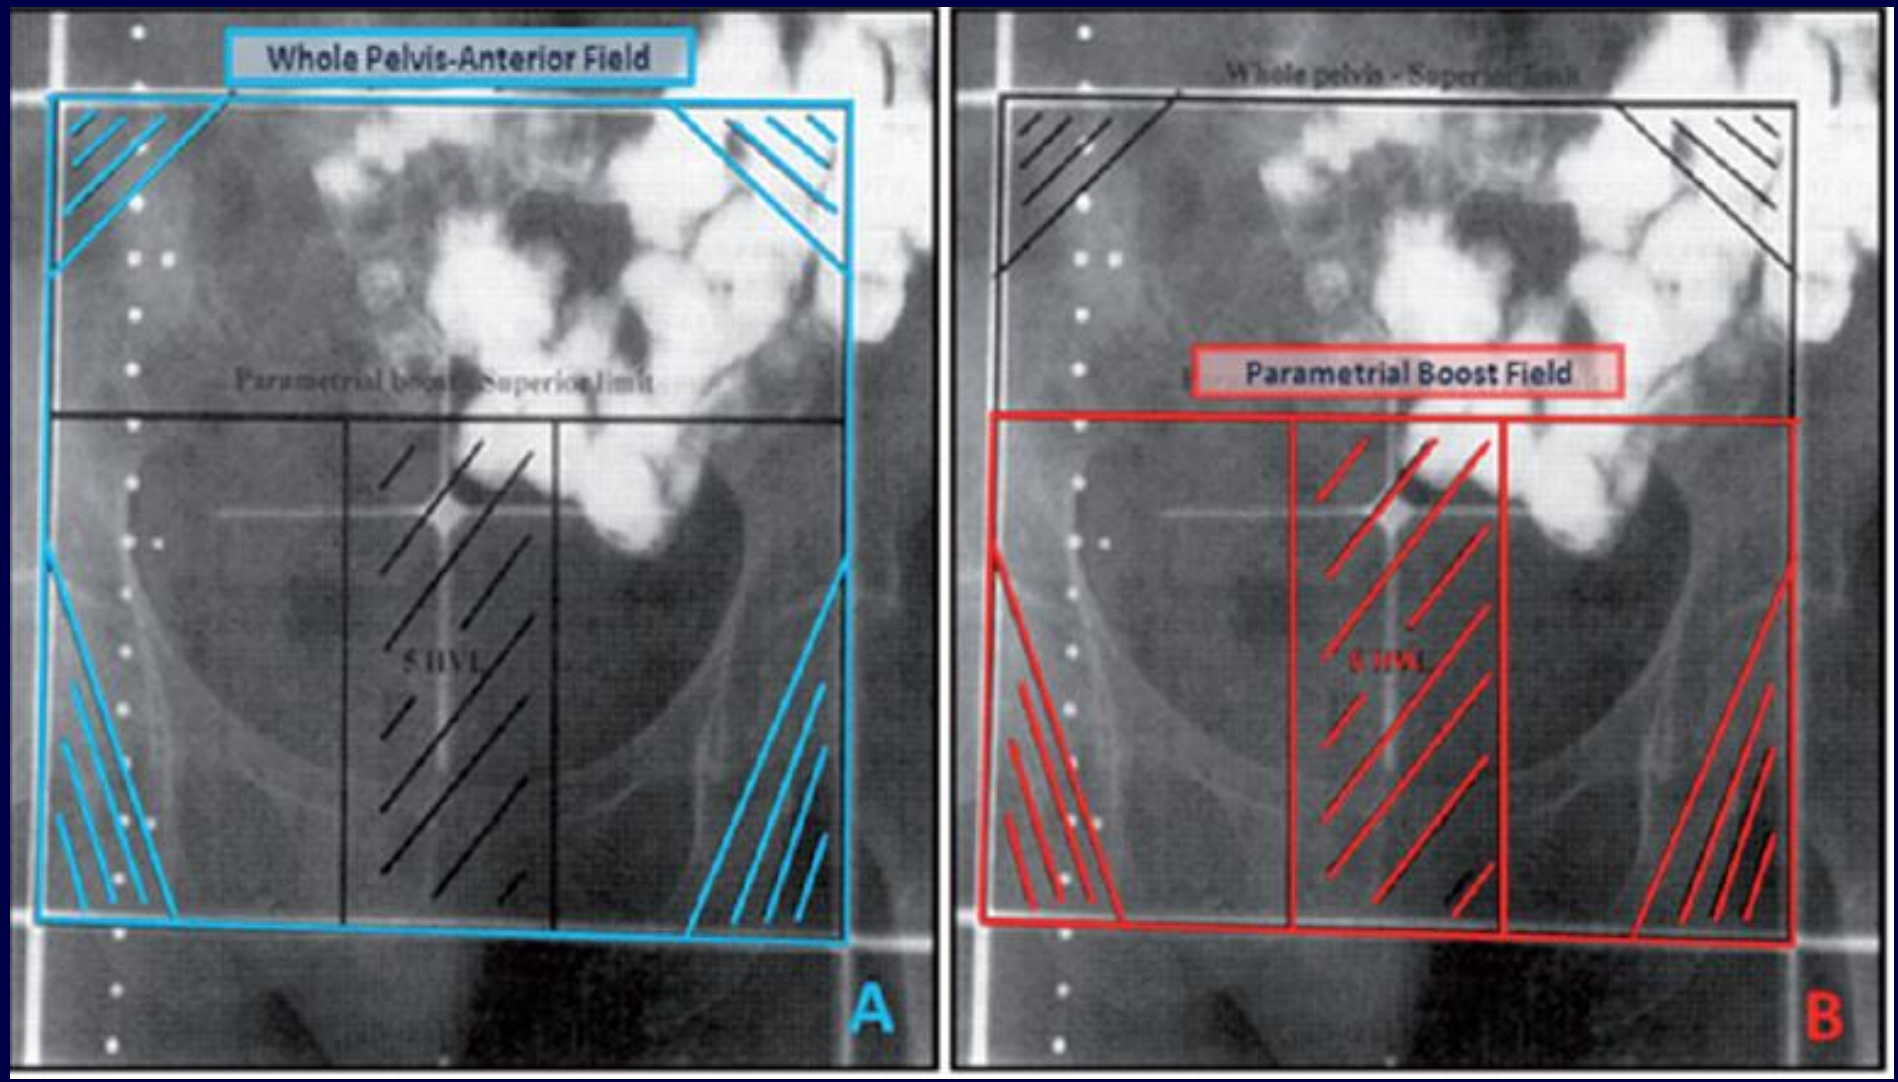
Field borders [AP-PA field]

- Superior border- L4-L5 junction (to encompass the common iliac node)
- Lateral border- 1.5 cm from the widest pelvic part of the pelvic brim
- Inferior-no vaginal wall involved- lower border of the obturator foramen.
- If they are then – 2cm below the lower most point of disease

Lateral fields

- Superior and inferior would be corresponding to the AP-PA fields
- Anterior –vertical line to the anterior edge of pubic symphysis
- Posterior-to encompass the sacral hallow (junction S2-S3)





Whole Pelvis-Anterior Field

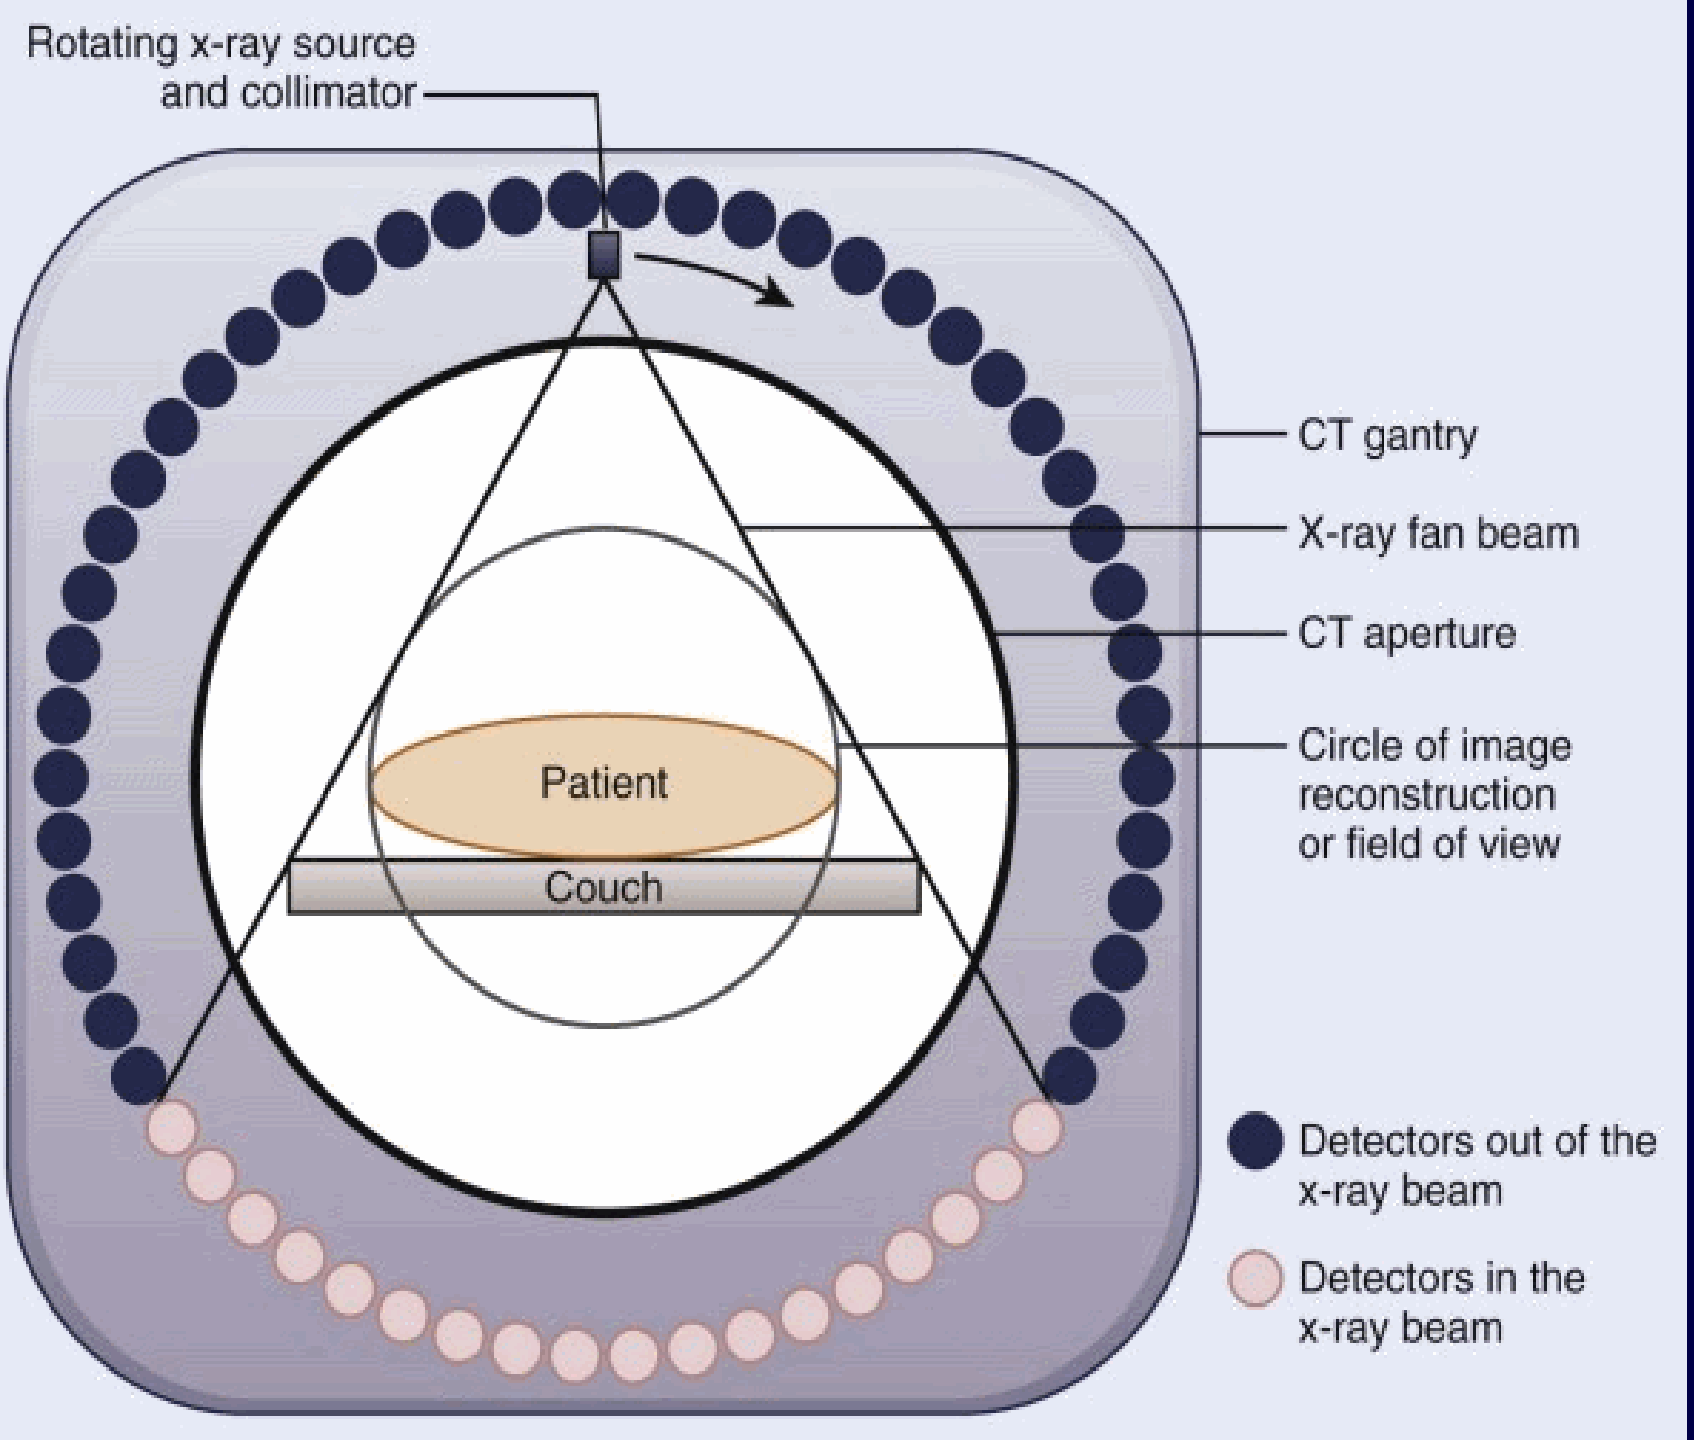
CT simulation

- The CT scanner is used to acquire a volumetric CT-Scan of a patients which represents the “virtual “or digital patients

- The CT-simulation software provides virtual representation of the geometric capabilities of a treatment machine

CT Simulator Components

- X-ray tube
- Large bore CT-scanner with opening of up to 85cm
- Detectors systems
- Collimators and attenuator
- Patients couch
- Laser
- Computer and work station
- Control console



Rotating x-ray source

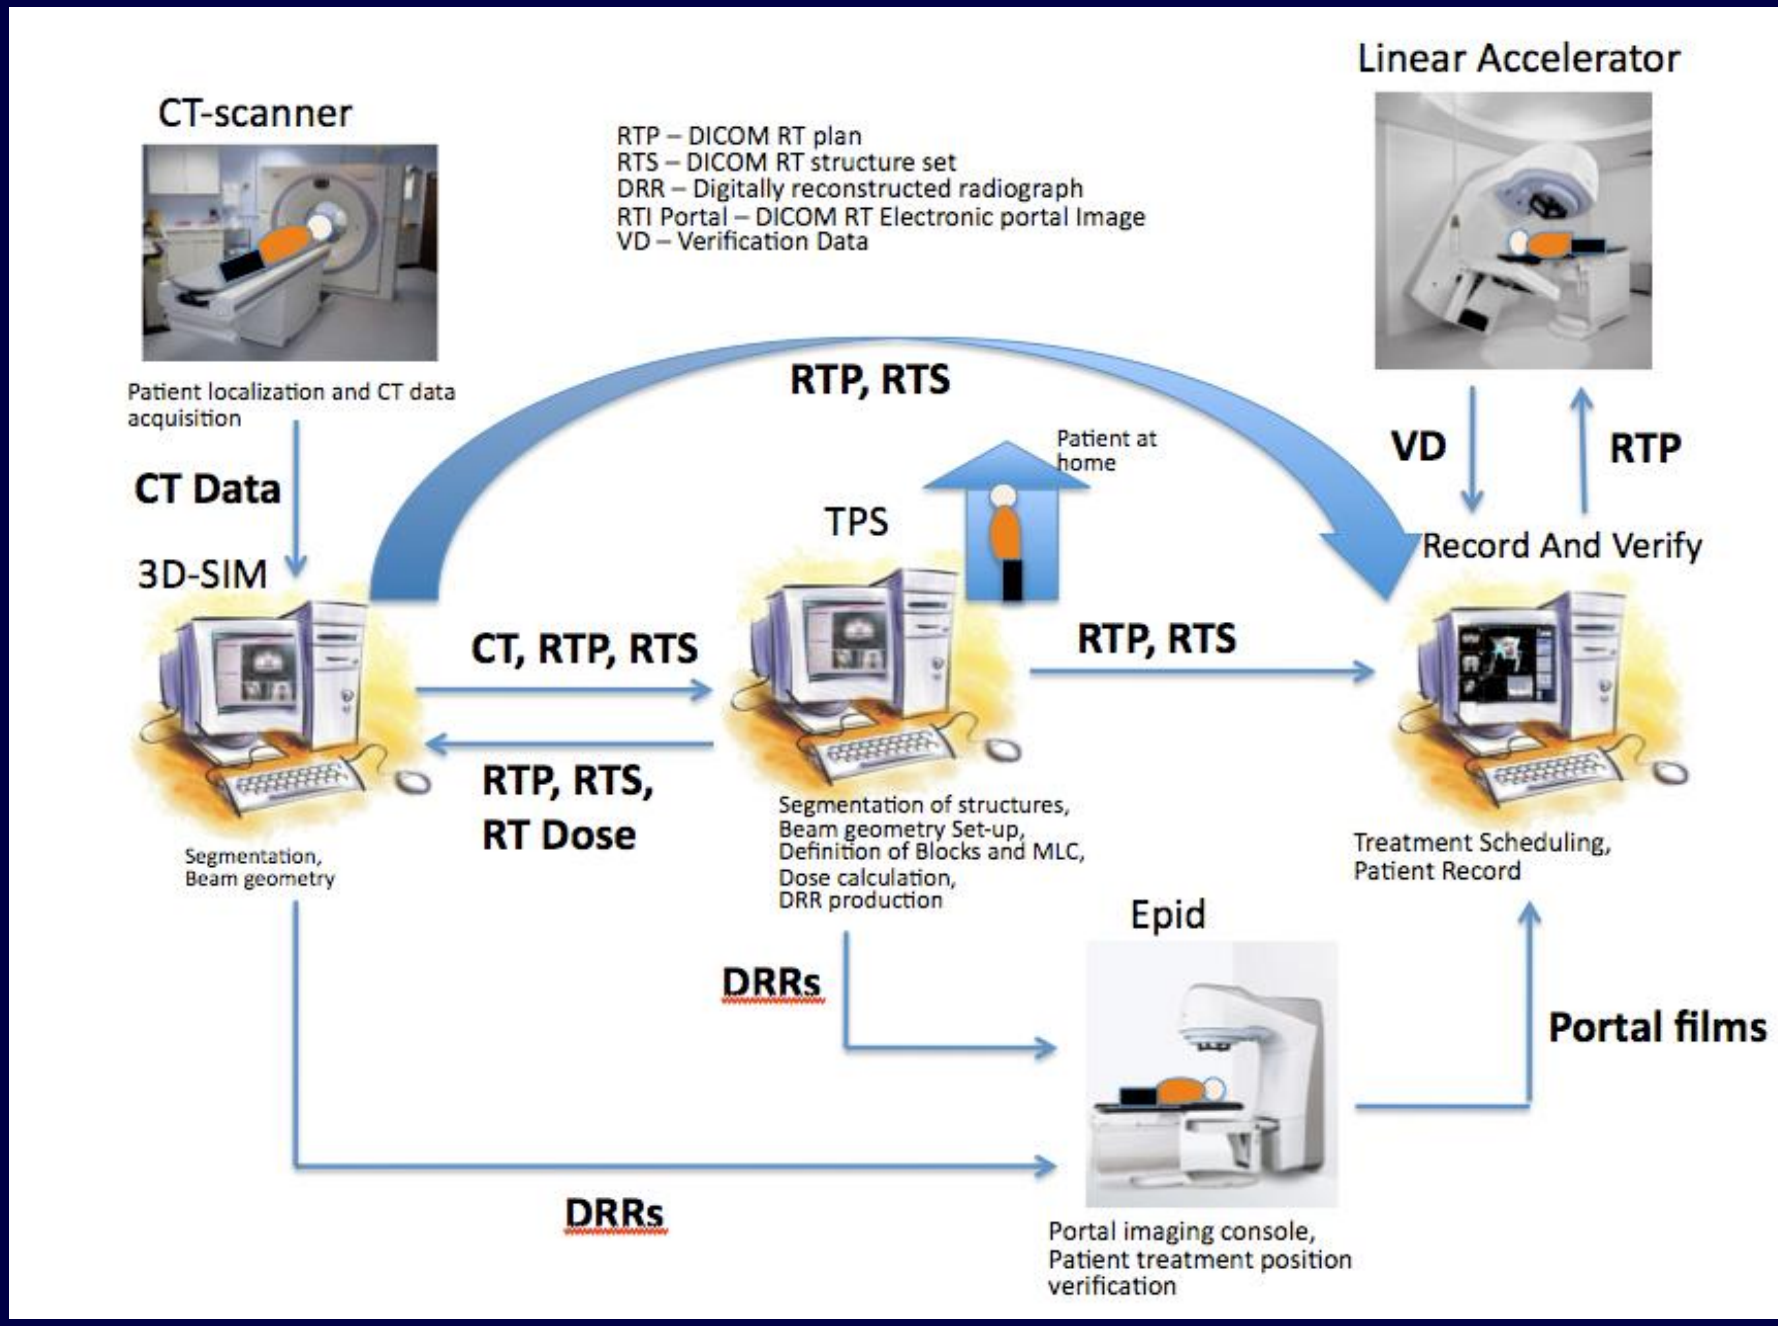
Features of Multislice CT scanner

- Faster scan times
- Lower tube heat loading
- Longer volume covered per rotation
- Improved temporal resolution - faster scan times
- Improved spatial resolution – thinner slices
- Decreased image noise – more mA available



Linear Accelerator

CT Simulation

- **Standard Bladder protocol**
- **Contrast materials**:
  - Intravenous contrast (Inj. Omnipaque/Iomerol @ 2cc/kg) preferably via an automatic timed contrast injector), unless medically contraindicated or patients had history of contrast allergy.
  - An oral contrast may be used to opacify bowel
  - Per-rectal barium for localizing the rectum

CT Simulation

- **Field of view: Large (80-85 cm)**
  - Pelvic RT: Upper border of T12 Vertebrae to 5cm below ischial tuberosity
- Slice thickness: (2.5-5 mm) ≤ 5 mm
- No interslice gap
- Table increments: 3mm
- Flat table couch

Virtual Simulation

- It is the process in which simulation is carried out using software created on patient CT data set.

- It simulates all the parameters of the actual treatment machine (Gantry angle, couch position, Radiation field).

- The presence of patient physically is not required, while doing treatment simulation planning.

- Thus it also called as Virtual simulation

George W. Sherouse, PhD, DABR, FAAPM, Univ North Carolina

Virtual Simulation: Workflow

- Software to perform virtual simulation
- DRR
- Target definition
- Treatment planning
- Dose planning

Advantages of Virtual-Simulation

- Patient throughput is more
- Non coplanar simulation is possible
- 3D data set is available, resulting in better visualization of tumor and nodal involvement, leads to reduction in side effect
- Full 3D allowing unique verification of beam coverage and avoidance in three dimensions
- Beams can be simulated and verified that are not possible with conventional simulation

CTV delineation
For External Beam RadioTherapy (EBRT)

Ina Jürgenliemk-Schulz

University Medical Centre Utrecht, The Netherlands

Primoz Petric

National Center for Cancer Care and Research, Doha, Qatar

Modified and Presented by

Richard Pötter,

Medical University of Vienna

1st ESTRO AROI Gyn teaching course

Transition for Conventional 2D to 3D Radiotherapy

With special emphasis on brachytherapy in cervical cancer

Bengaluru, India, March 2017

Definitions *(upcoming definitions in the frame of adaptive thinking)*

GTV = Gross Tumor Volume

- Macroscopic tumor, visible clinically and with imaging

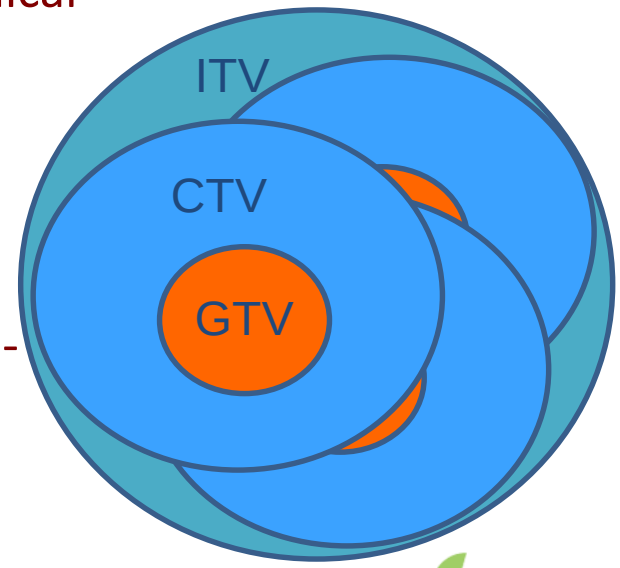
ICRU reports 50-83

CTV = Clinical Target Volume

- Tissue volume that contains a GTV and/or subclinical microscopic malignant disease, which has to be eliminated

ITV = Internal target volume

- Volume that accounts for internal inter- and intra-fraction motion and deformation of the CTV



Valid for the primary tumor: GTV-T, CTV-T
for lymph nodes: no GTV-N, CTV-E (elective nodal CTV)
GTV-N, CTV-N

The overall CTV of the primary tumor for EBRT always includes ?

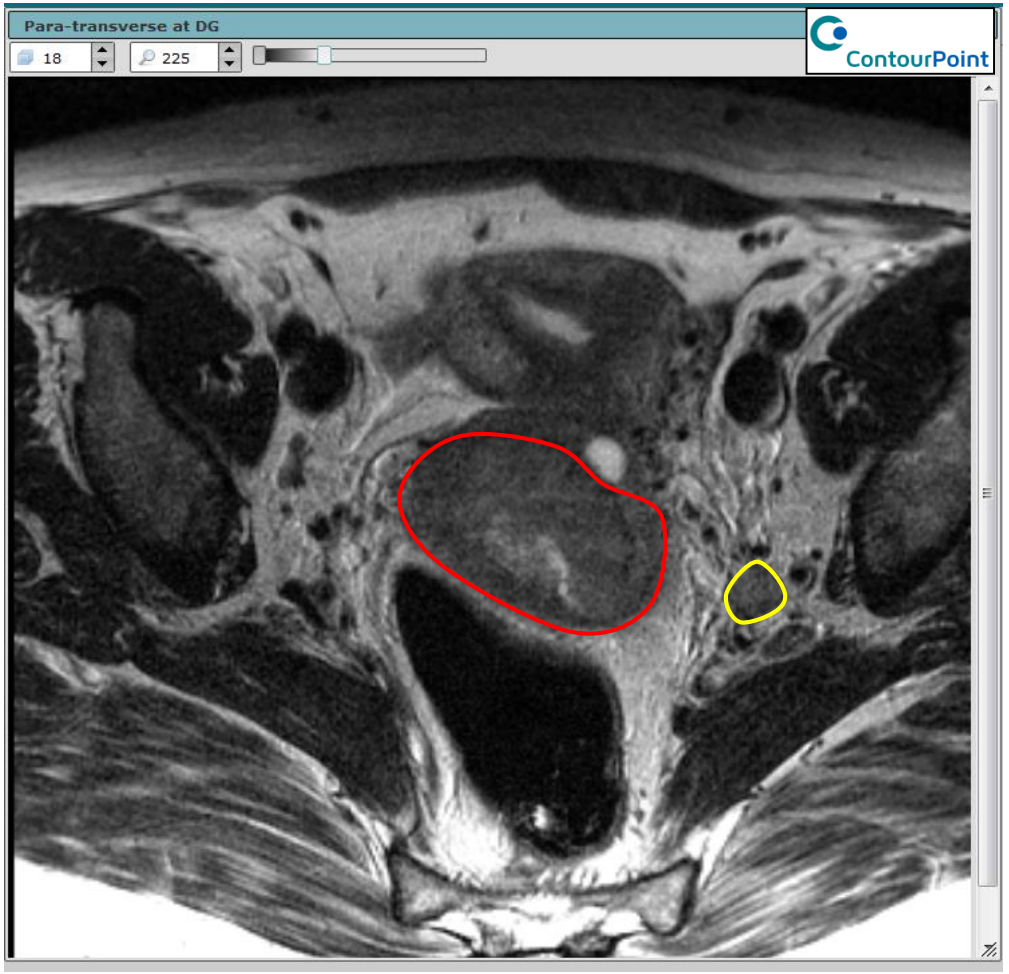
A. GTV +Cervix+Uterus +Parametria+upper vagina
B. GTV + cervix only
C. GTV, Cervix + Parametria only
D. GTV + whole Uterus only
E. GTV + cervix + Upper Vagina only
F. Adjacent organs
G. Ovaries

GTV-T *(GTV initial)*

GTV is in principal composed of:

- Primary tumor GTV-T
- macroscopic lymph node metastases GTV-N

High signal intensity on T2 weighted MRI

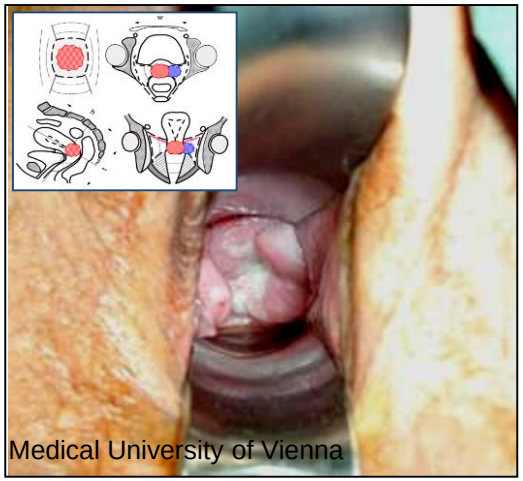


GTV

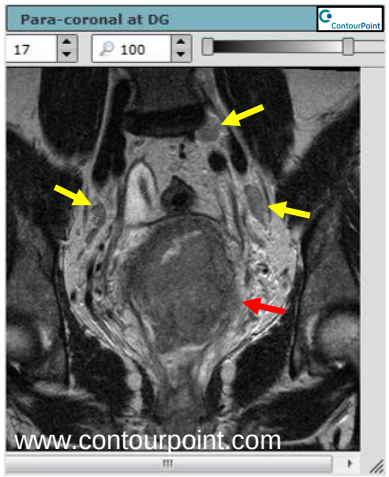
Consists of *Primary* and *Nodal* GTV *(GTV-T initial and GTV-N initial)*

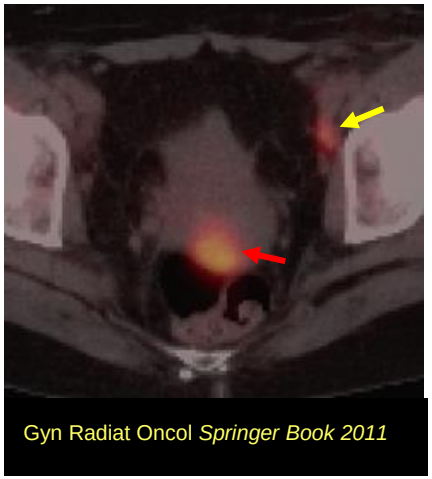
Investigation modality needs to be reported

Clinical Examination



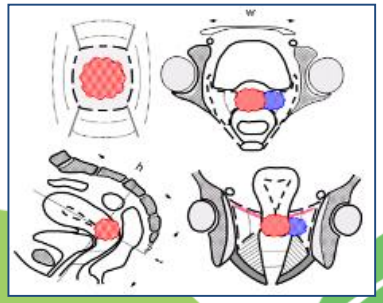
Imaging (MRI, CT, PET CT, US)





Invasive

GTV contouring: combine information from different modalities



In case of GTV-T and CT only available,

clinical examination

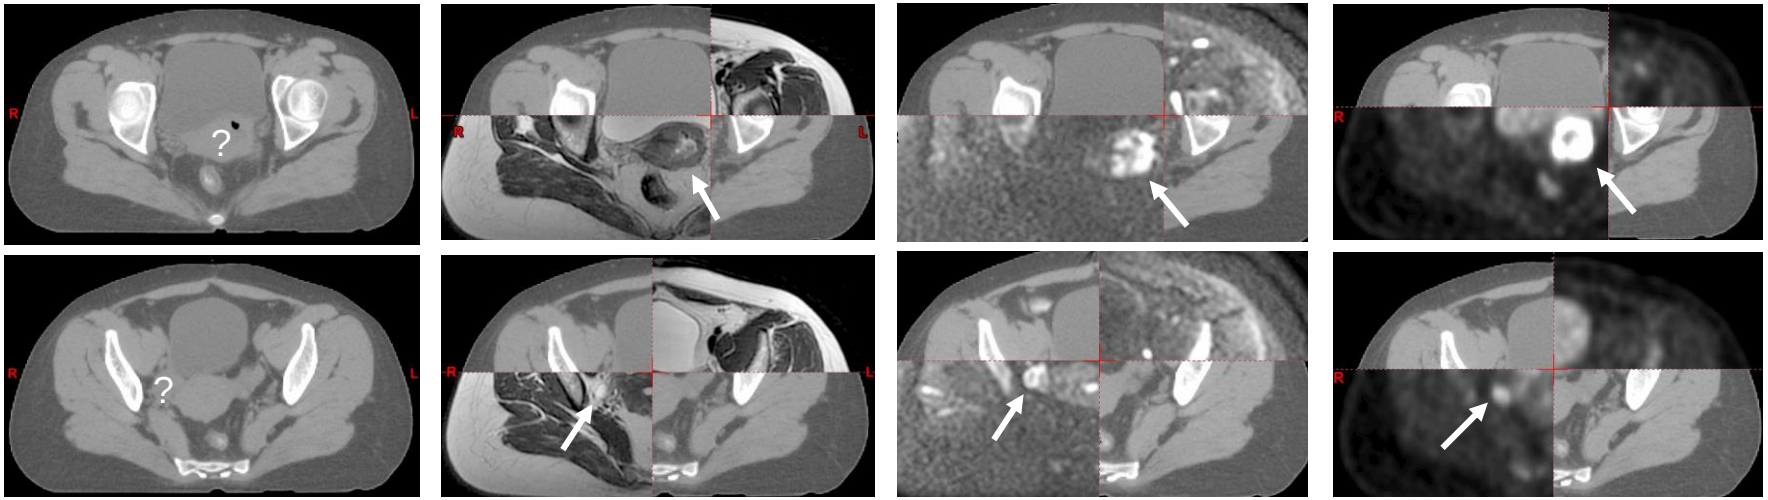
is essential plus full documentation

Initial GTV-T contouring (composite GTV)

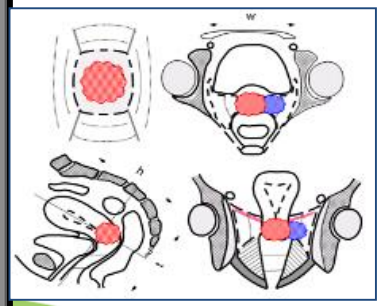
Co-registration of different imaging modalities?

Imaging in *same (treatment) position:* CT, MRI, PET-CT simulator

CT simulator | CT + T2w MRI | CT + DW MRI | CT + PET



Example; NCCCR, Doha, Qatar



Combined imaging answers many questions, but opens some new ones...

Clinical judgement remains essential in the era of imaging epidemics!

CTV contouring (Tumor and Nodes related)

Consists of *Primary CTV(high and low risk)* and *Nodal* CTV*(elective)*

Initial CTV-T:

- GTV
- Remaining unaffected cervix

} *HR-CTV-T initial*

- Parametria
- Uterus
- Vagina
- Involved organs (FIGO IVA)

} *LR-CTV-T initial*

Nodal CTV: *CTV-Elective and CTV-N*

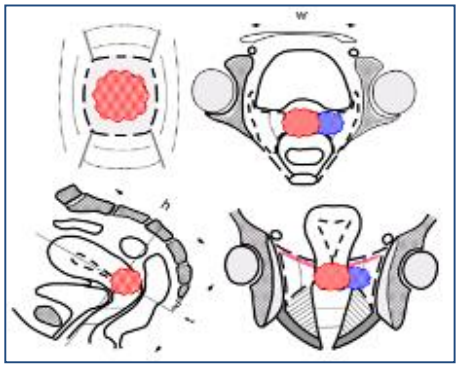
- Lymph node regions at risk (vessel orientated)
- Affected lymph-nodes: CTV-N

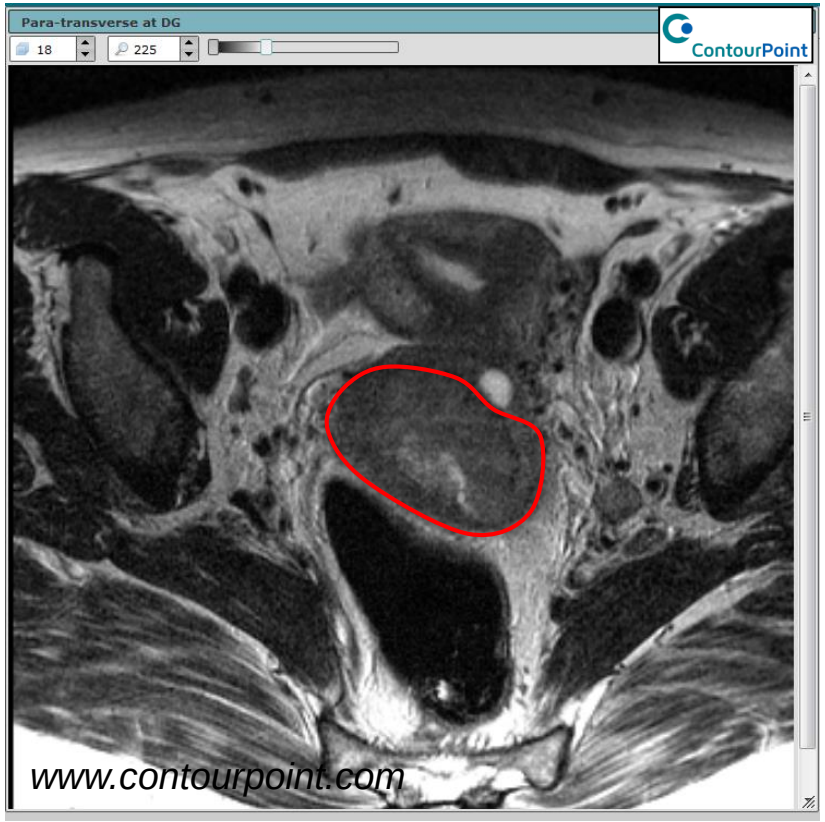
Initial CTV-T

- GTV
- Cervix
- Parametria
- Uterus
- Upper Vagina
- Involved organs (FIGO IVA)

Initial CTV-T

- GTV *(GTV-T initial)*
- Cervix
- Parametria
- Uterus
- Upper Vagina
- Involved organs (FIGO IVA)



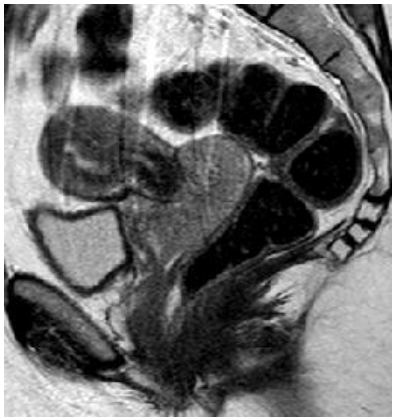


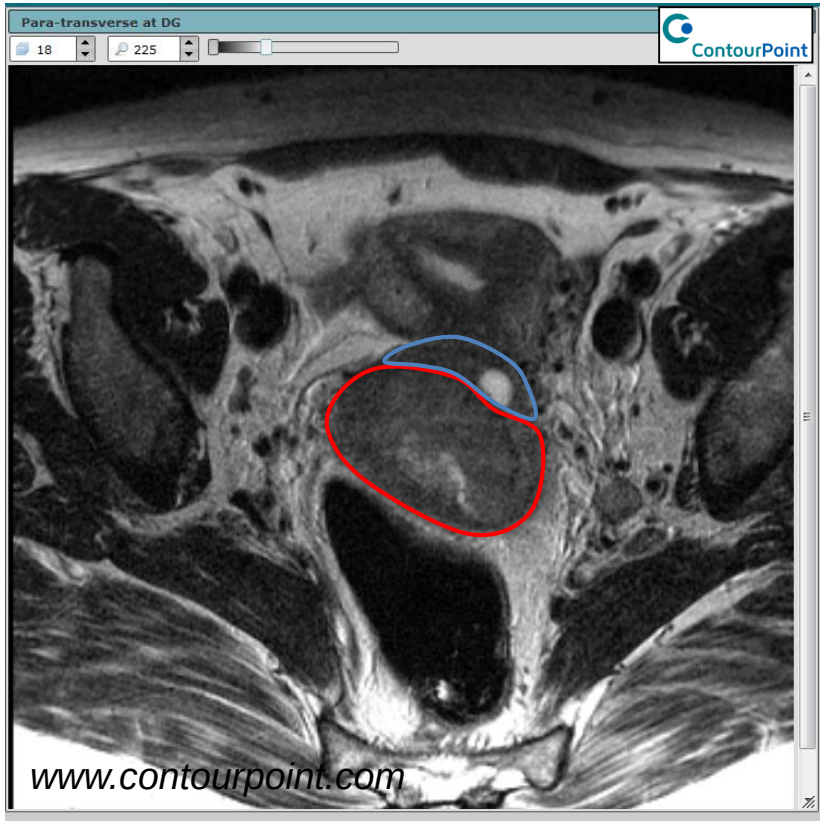
Initial CTV-T: HR CTV-T$_{initial}$

- GTV
- Cervix

} *HR-CTV-T initial*

- Parametria
- Uterus
- Upper Vagina
- Involved organs (FIGO IVA)

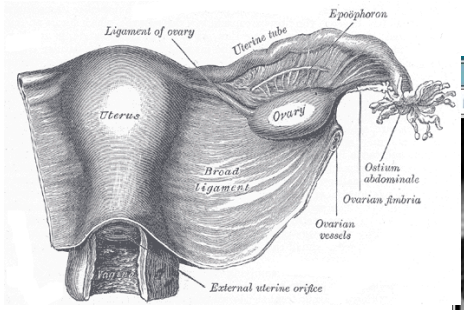


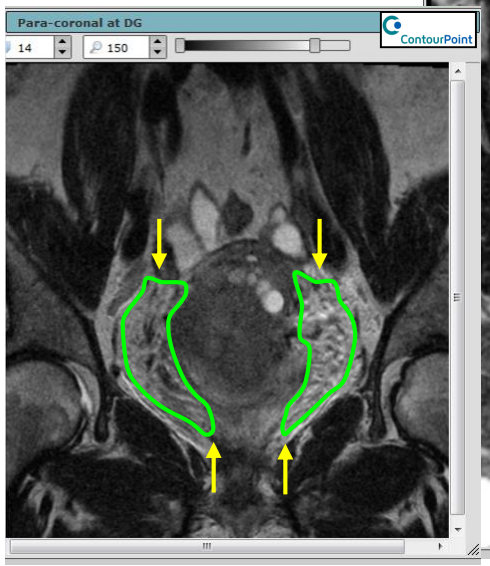


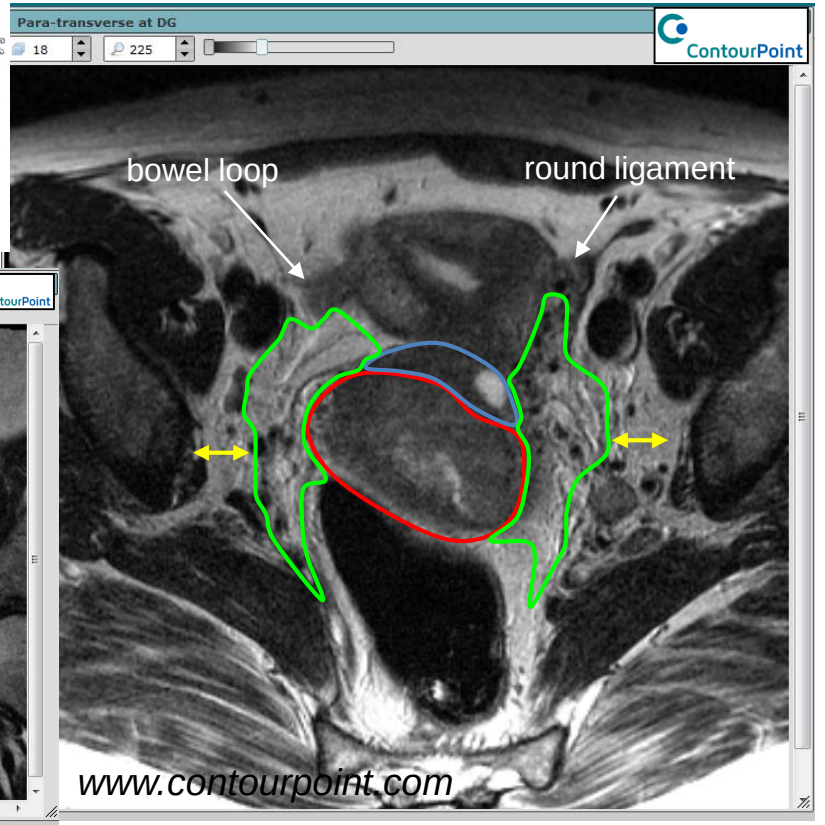
Initial CTV-T: LR CTV-T$_{initial}$

Parametrium = the lateral extension of the uterine subserous connective tissue into the broad ligament

- GTV
- Cervix
- Parametria
- Uterus
- Upper Vagina
- Involved organs



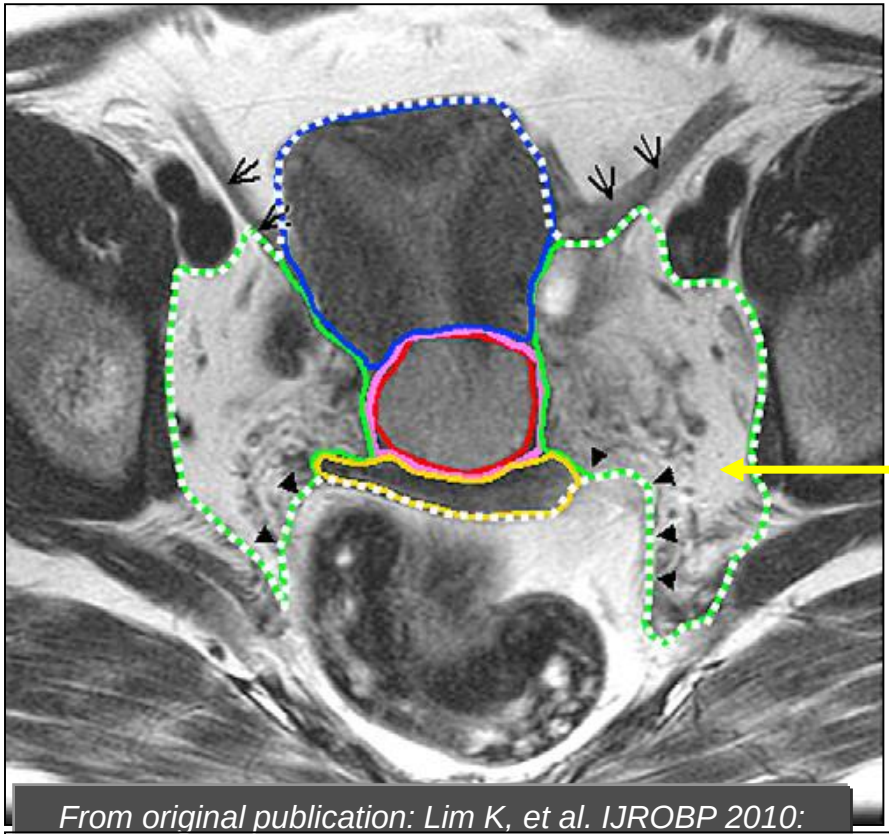


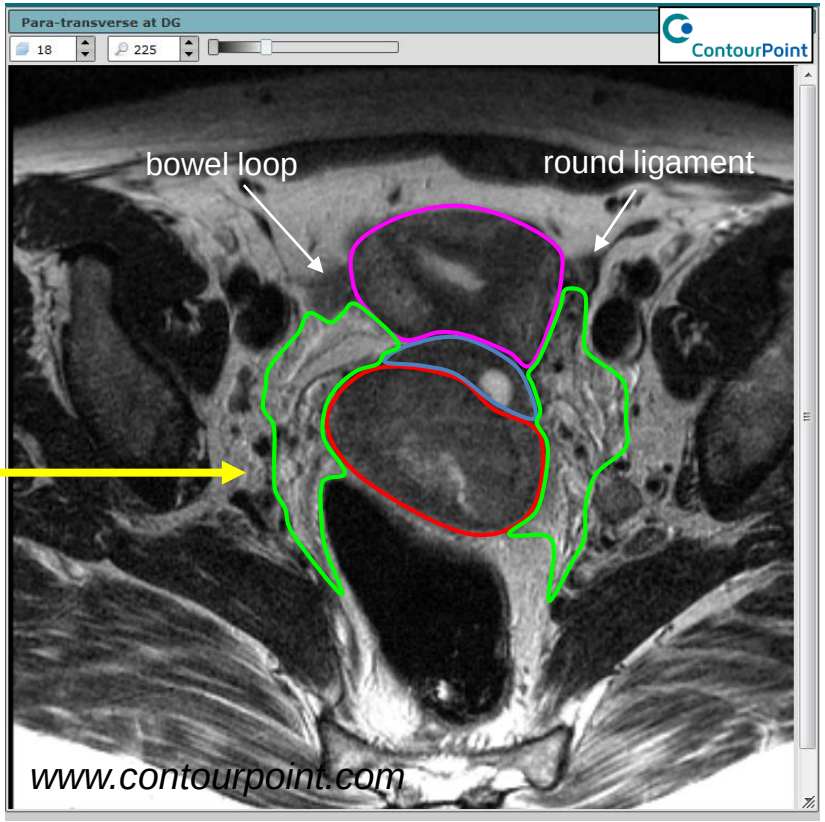


Anatomical boundaries

Anteriorly	*Posterior wall of bladder/bowel loops or posterior border of external iliac vessel*
Posteriorly	*Uterosacral ligaments and mesorectal fascia*
Laterally	*Medial border of internal obturator muscle/ pelvic sidewall*
Superiorly	*Top of fallopian tube/ broad ligament*
Inferiorly	*Depending on vaginal tumor extension, pelvic floor*

Initial CTV-T: LR CTV-T$_{initial}$

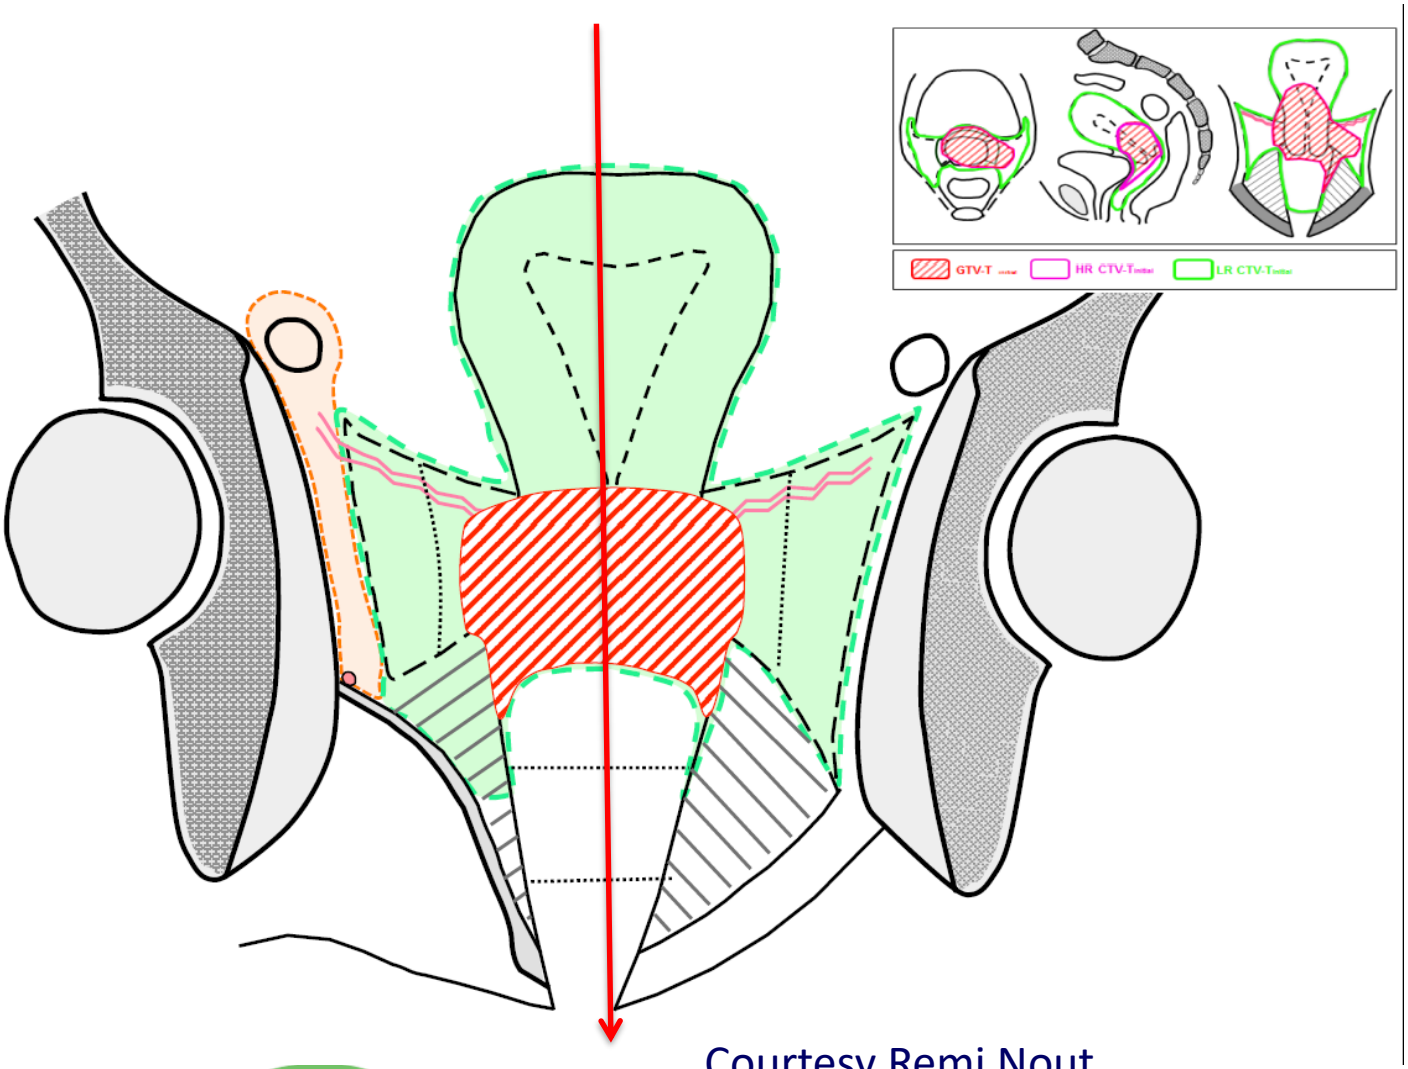




From original publication: Lim K, et al. IJROBP 2010:

metrial volume. Laterally, the parametrial volume should extend to the pelvic sidewall (excluding bone and muscle). It is acknowledged that there would be some overlap of this volume with the nodal CTV, particularly along the obturator strip. The pelvic sidewall was considered a more consistent

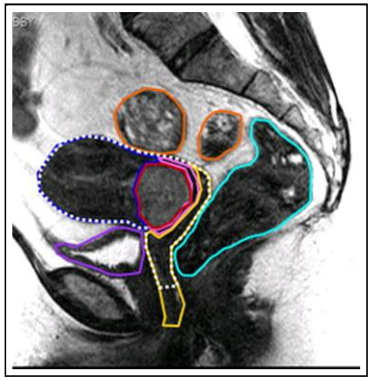
Future LR-CTV-T$_{initial}$ and CTV-T-E

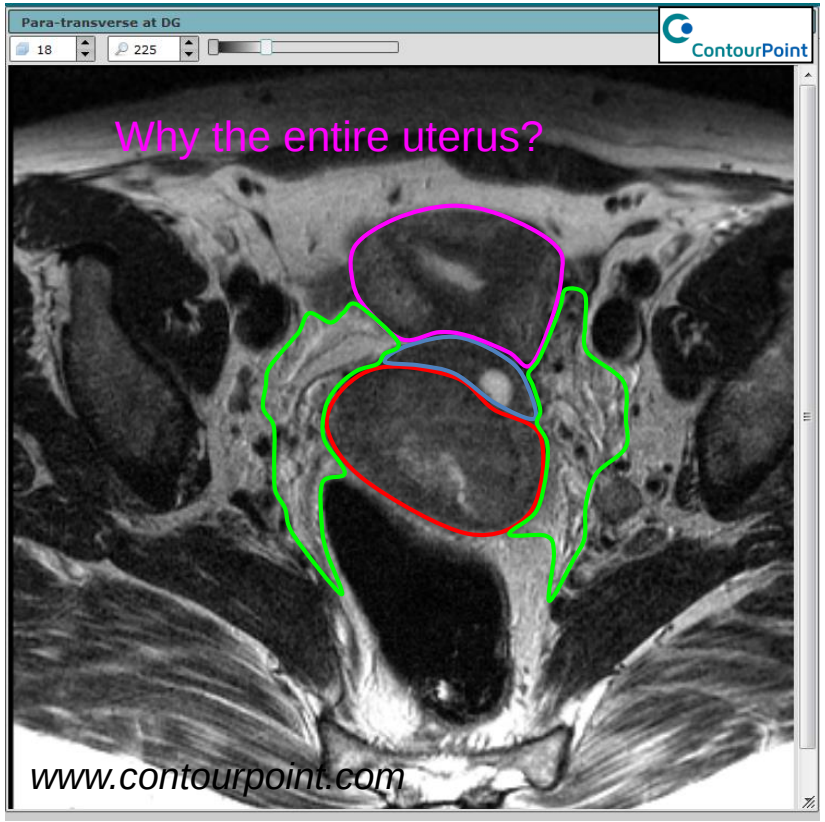


Courtesy Remi Nout

Initial CTV-T: LR CTV-$T_{initial}$

- GTV
- Cervix
- Parametria
- Uterus
- Upper Vagina
- Involved organs (FIGO IVA)



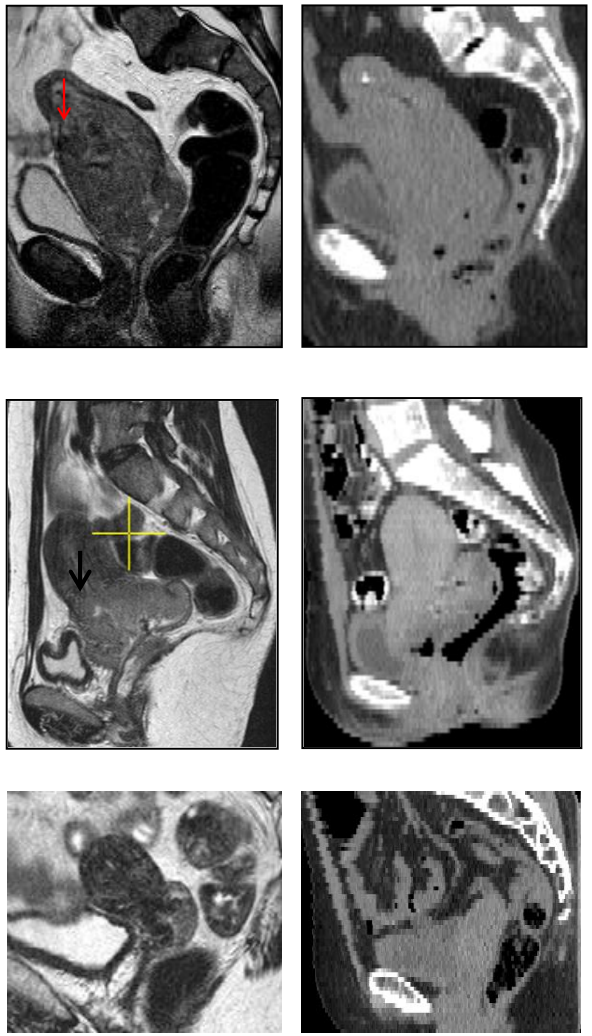


Lim K, et al. IJROBP 2010

Why the entire uterus?

Rationale

- Uterus & cervix: embryological one unit
  - –interconnected lymphatics
  - –no separating fascial plane
- Challenging to determine myometrial invasion
- Trachelectomy, early stage disease[a]:
  - Local recurrence < 5 %, Mortality < 3%
  - Uterine recurrences[b,c,d] 2 %
- Trachelectomy, tumor > 2 cm or lymphovascular invasion[a,e]:
  - Local recurrence up to 10 %



- Allowing for some dose reduction to the fundus in cases without uterine infiltration will be investigated in future

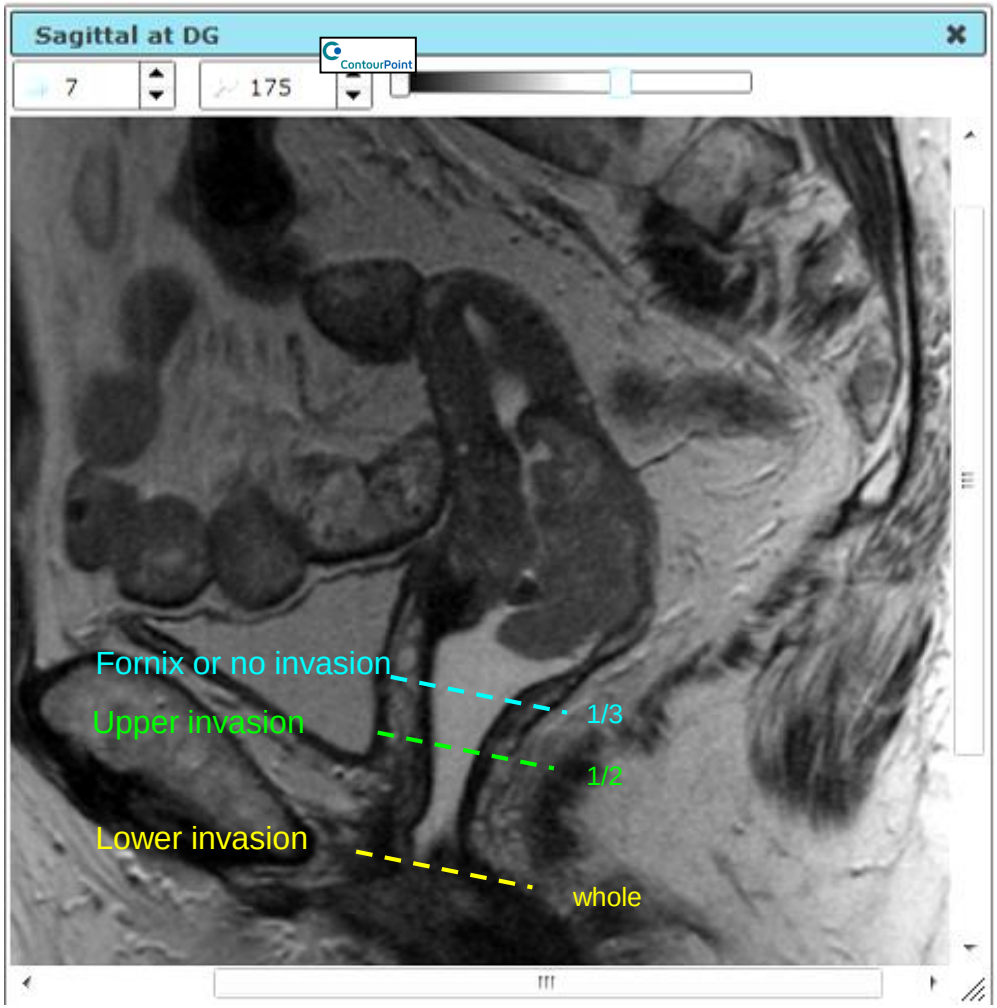
[e]Nishio H, et al. Gynecol Oncol 2009

Primary CTV: LR CTV-$T_{initial}$

Amount of vagina selected for target delineation is depending on vaginal tumor extension in any case: at least 2 cm caudal to vaginal extension of GTV

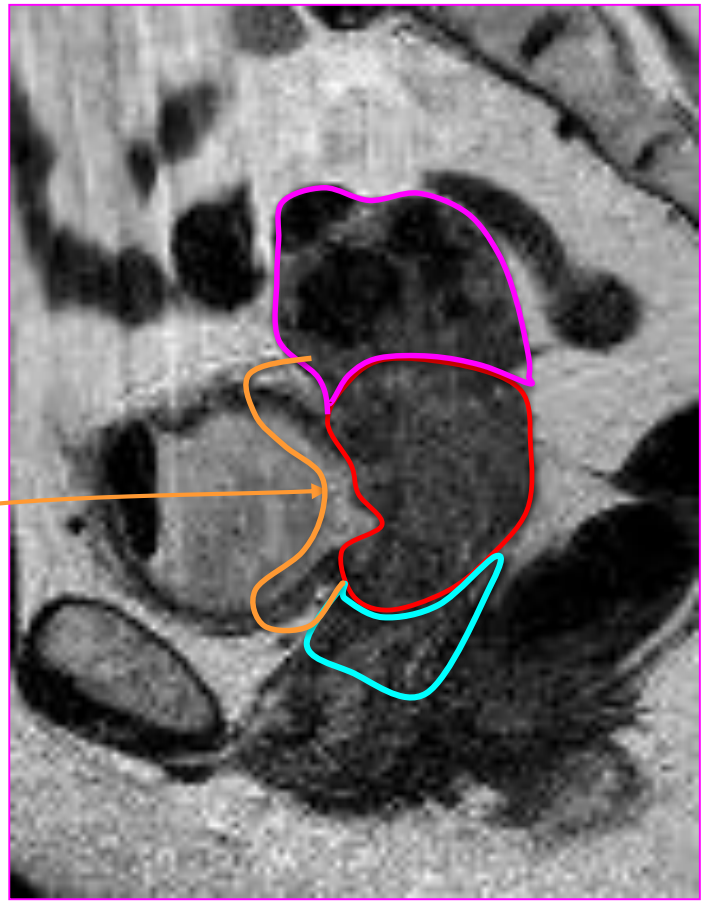
- GTV
- Cervix
- Parametria
- Uterus
- Varying Vaginal length
- Involved organs (FIGO IVA)



Primary CTV: LR CTV-$T_{initial}$

In case of infiltration into bladder, rectum, mesorectum, sacro-uterine ligaments :
2 cm margin into unaffected tissue

- GTV
- Cervix
- Parametria
- Uterus
- Upper Vagina
- Involved organs (FIGO IVA)



Primary CTV: LR CTV-T$_{initial}$

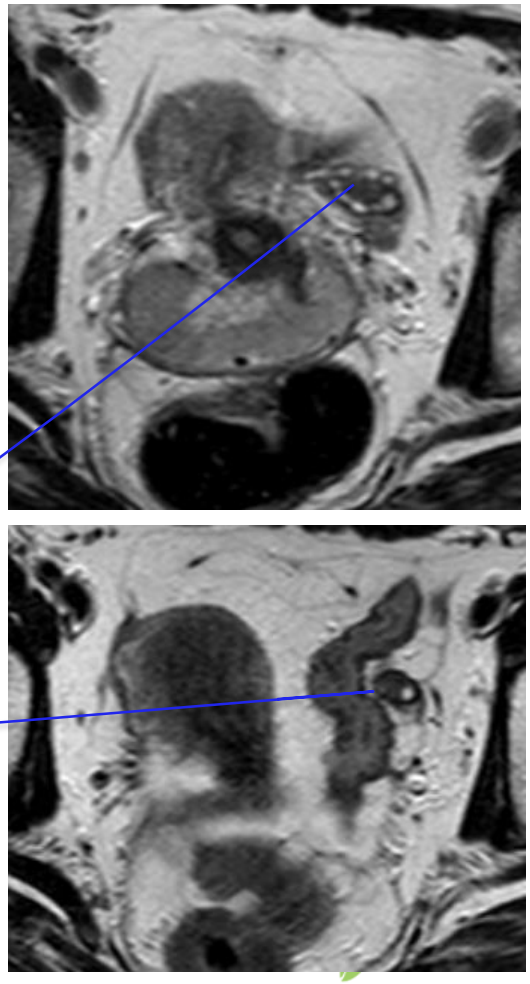
Overall risk of ovarian metastases is small, increased risk reported for:

- adeno/adenosquamous histology, even micro-invasive
- high grade and LVSI
- extension into the uterine corpus
- ovaries can be highly mobile !

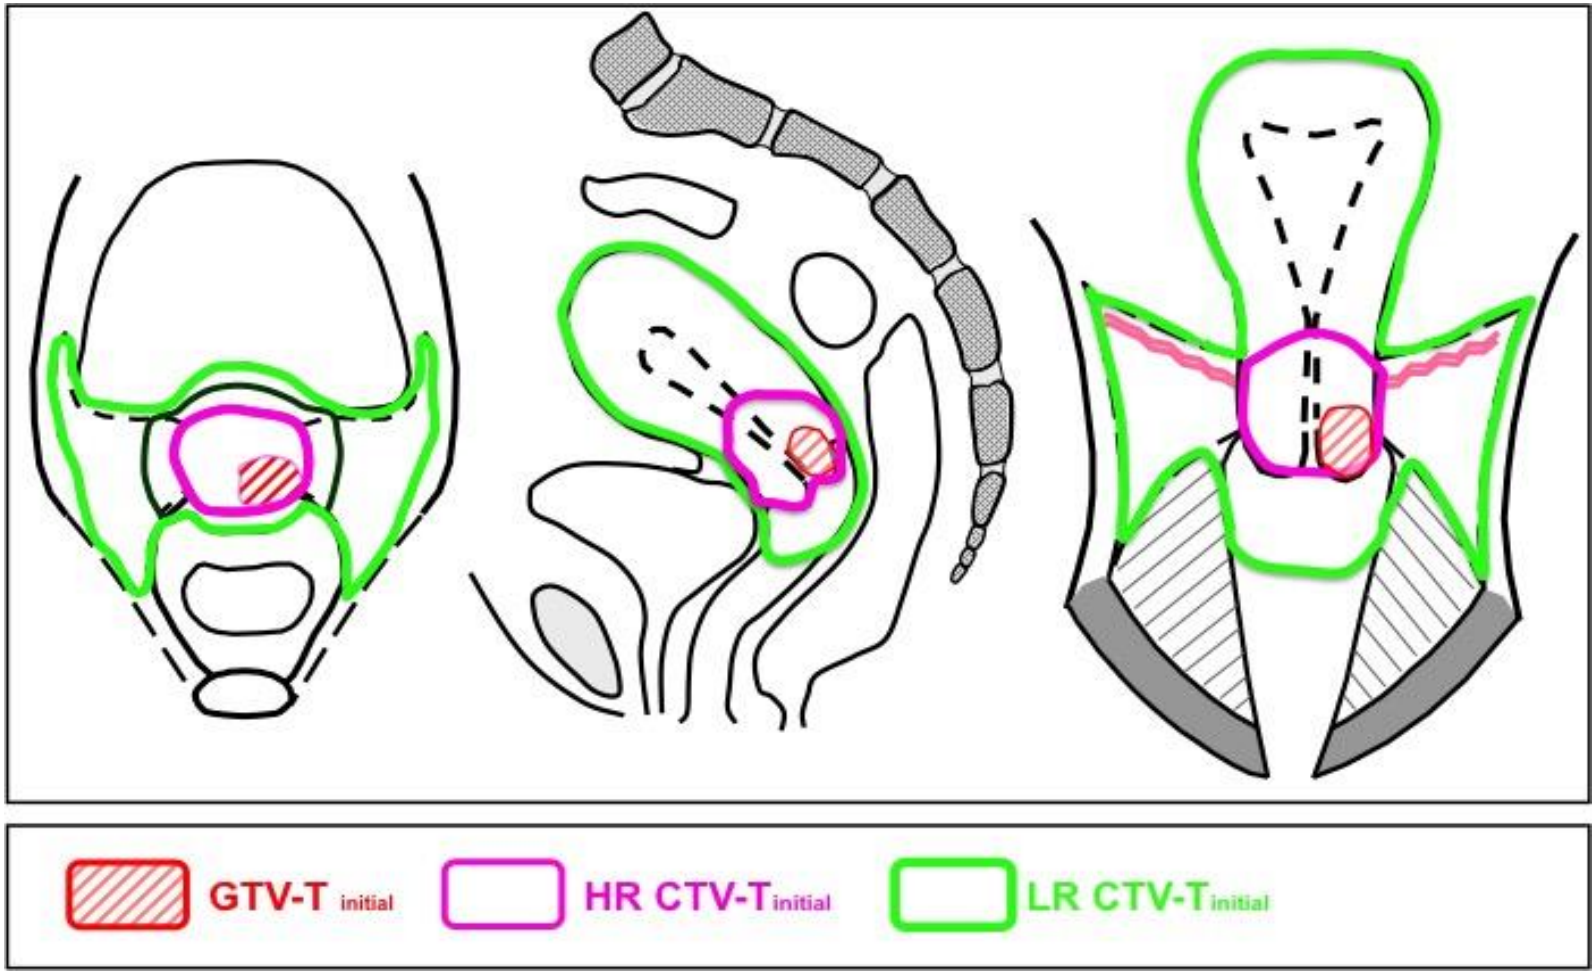
- GTV
- Cervix
- Parametria
- Uterus
- Vagina
- Involved organs (FIGO IVA)

LR-CTV-T initial

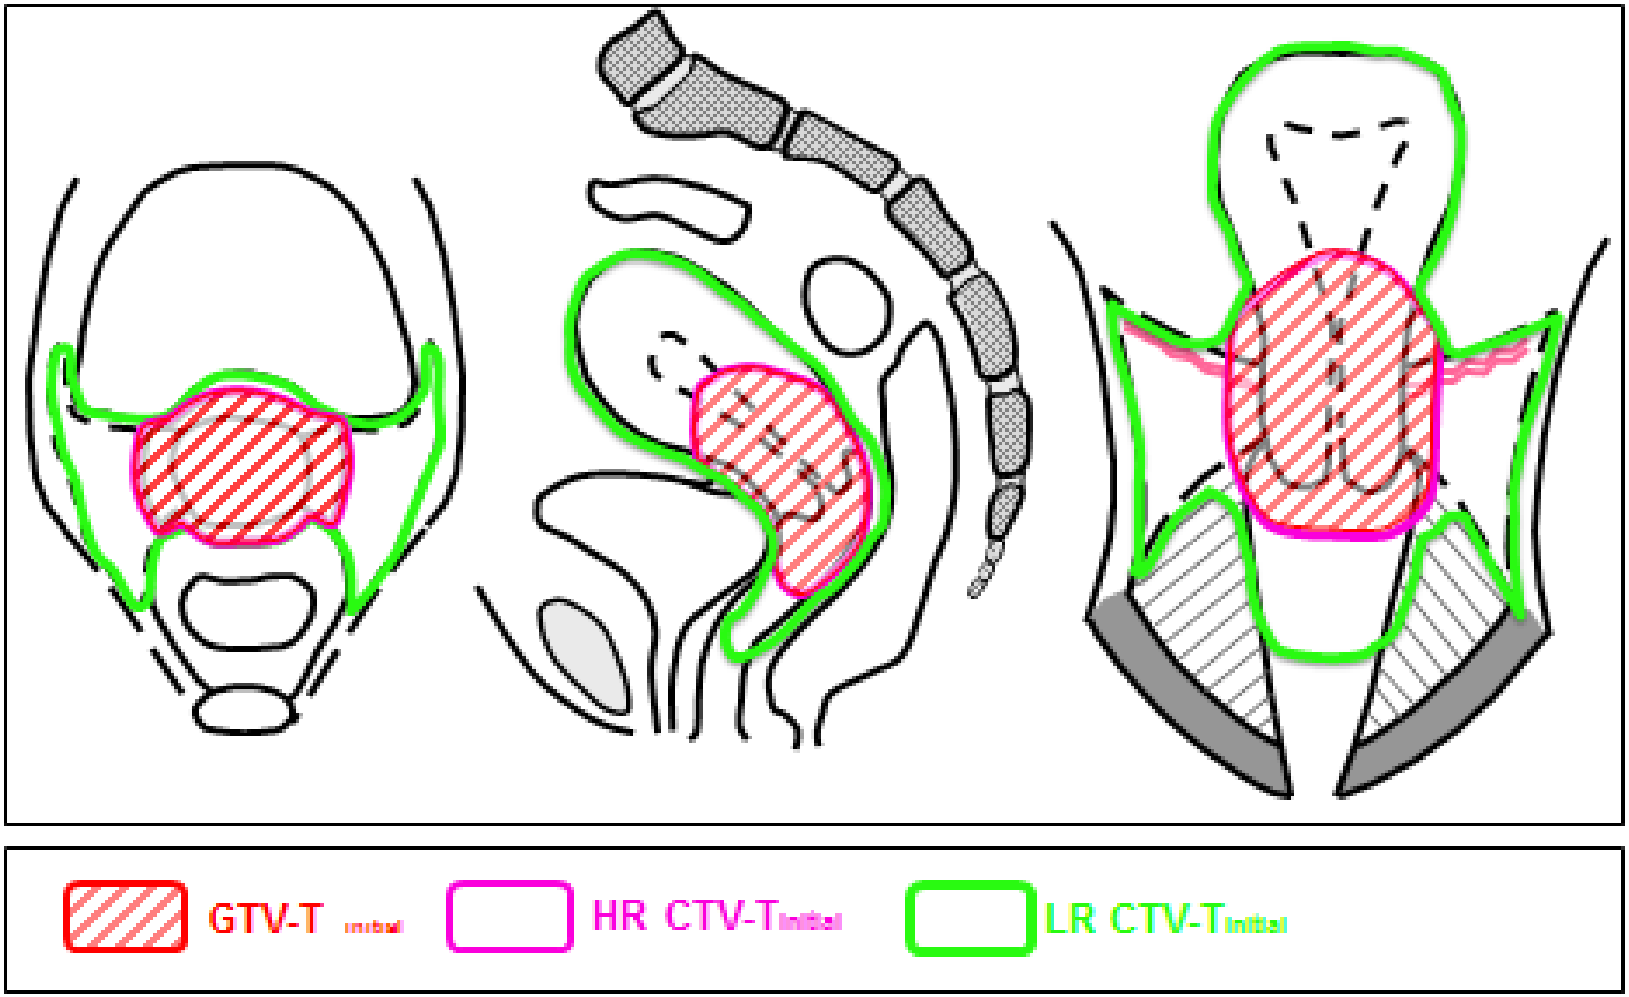
- Ovaries ?



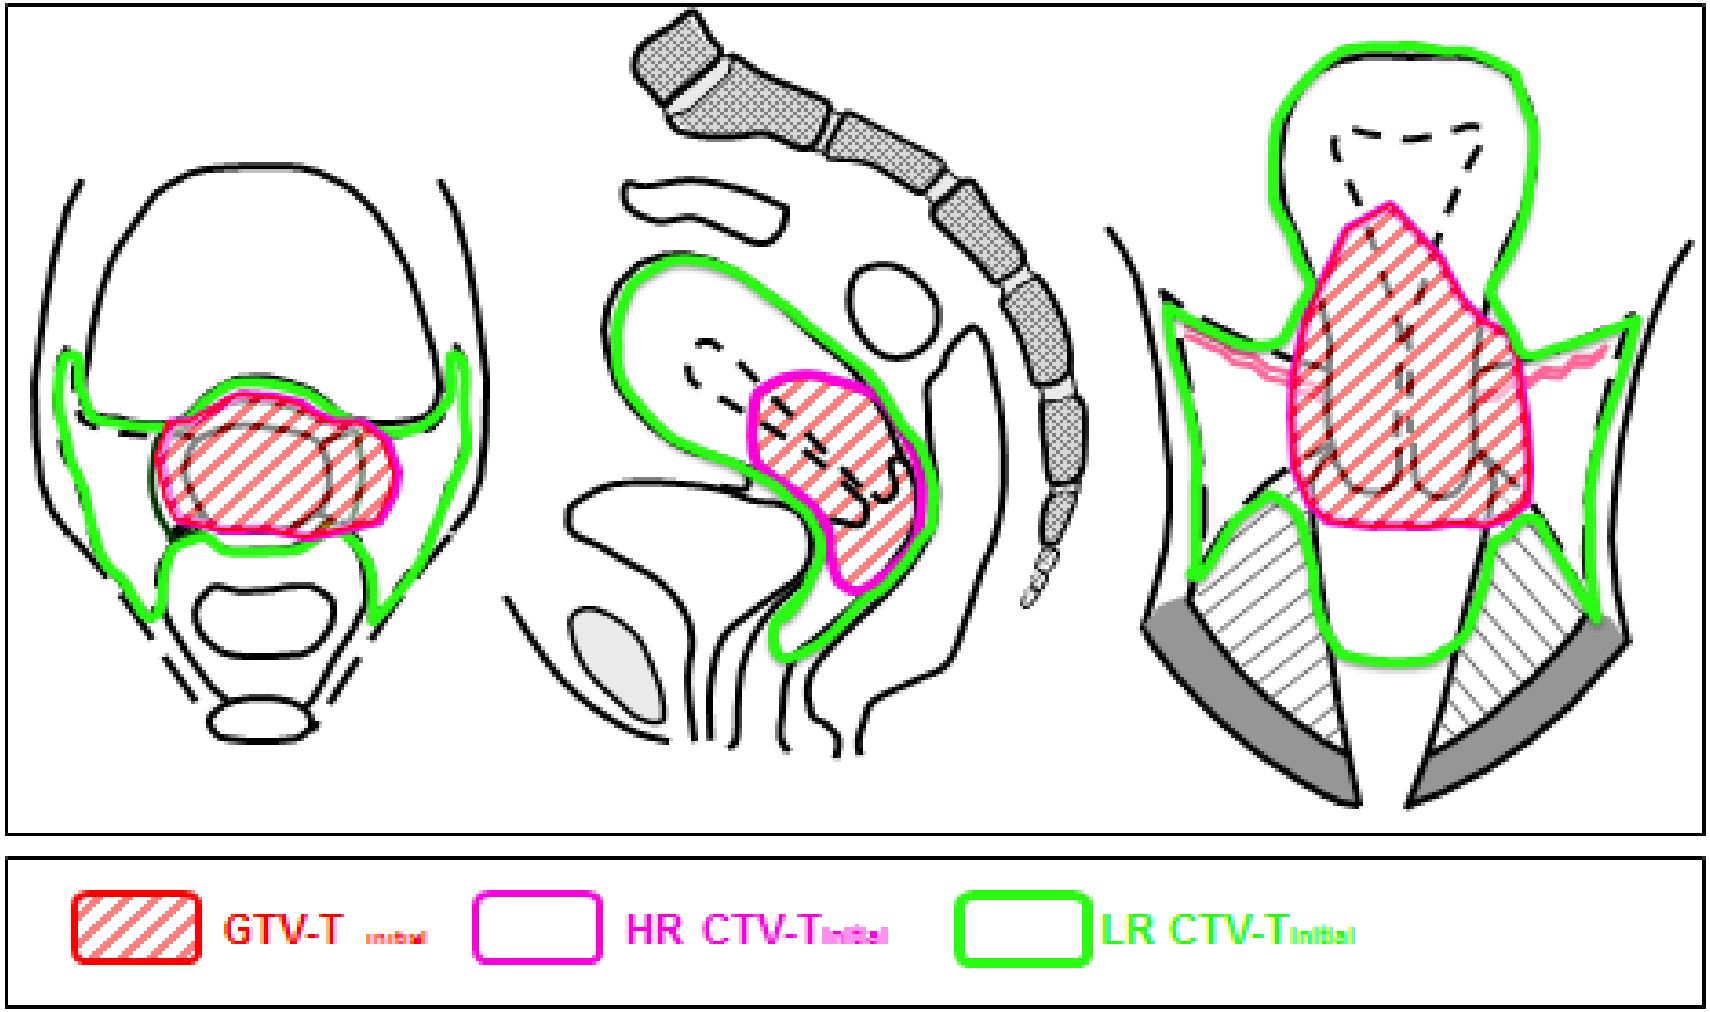
EMBRACE II: CTV-T: initial GTV, HR CTV, LR CTV: Stage IB1



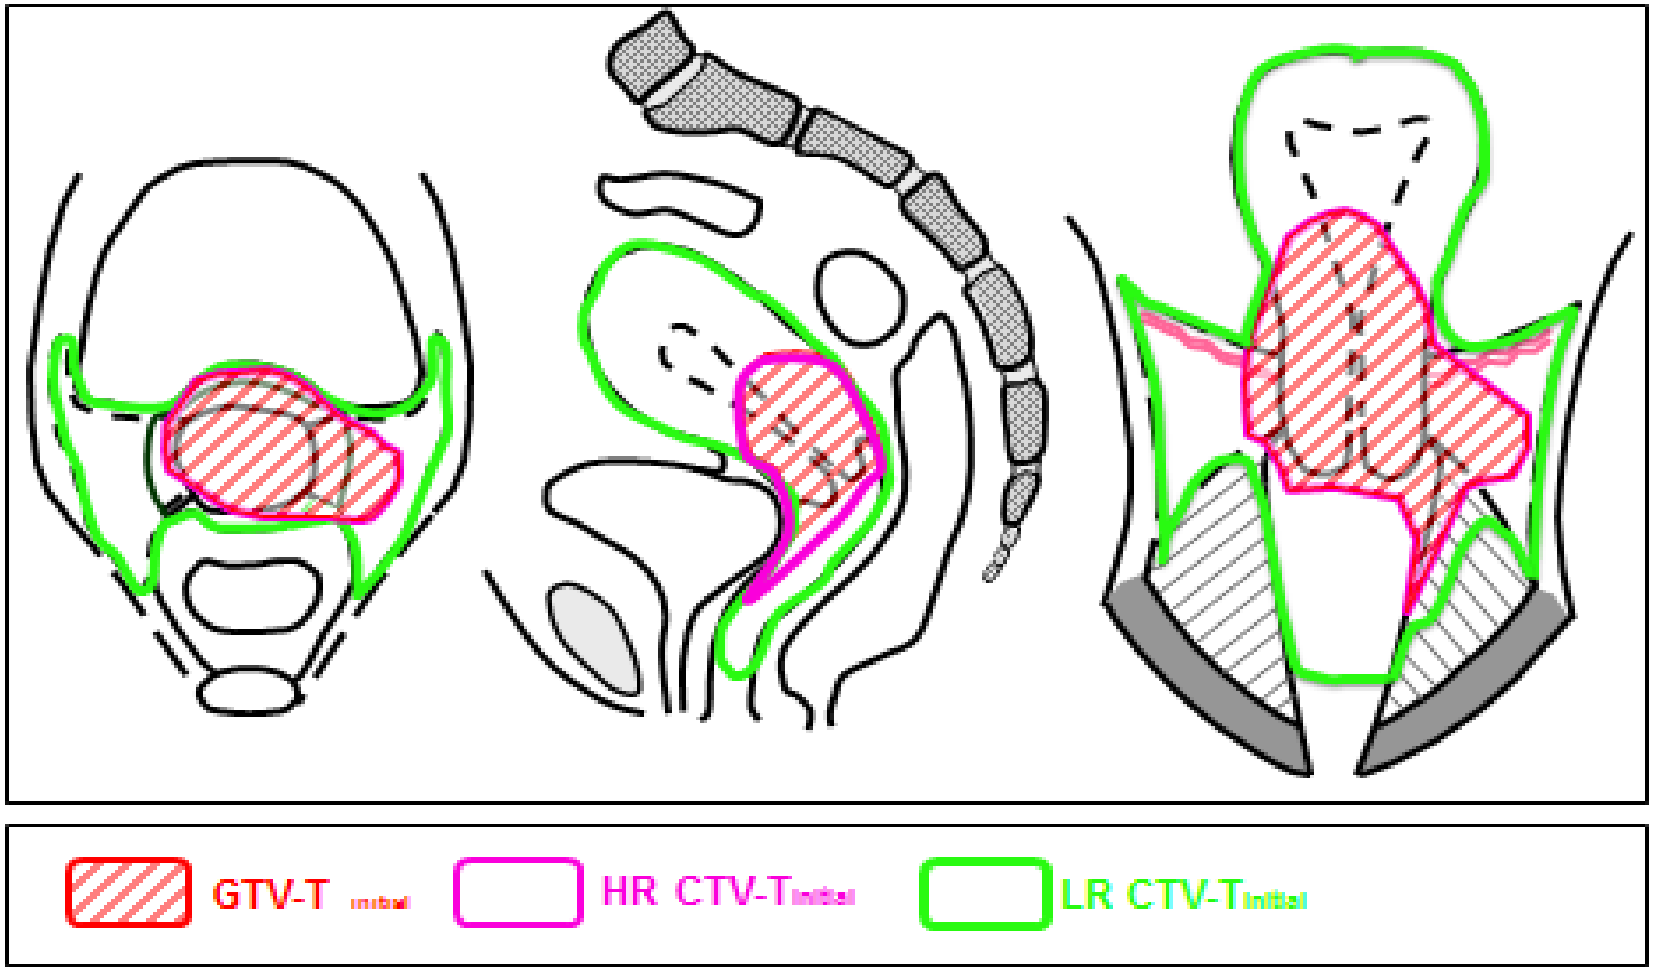
EMBRACE II: CTV-T: initial GTV, HR CTV, LR CTV: Stage IB2



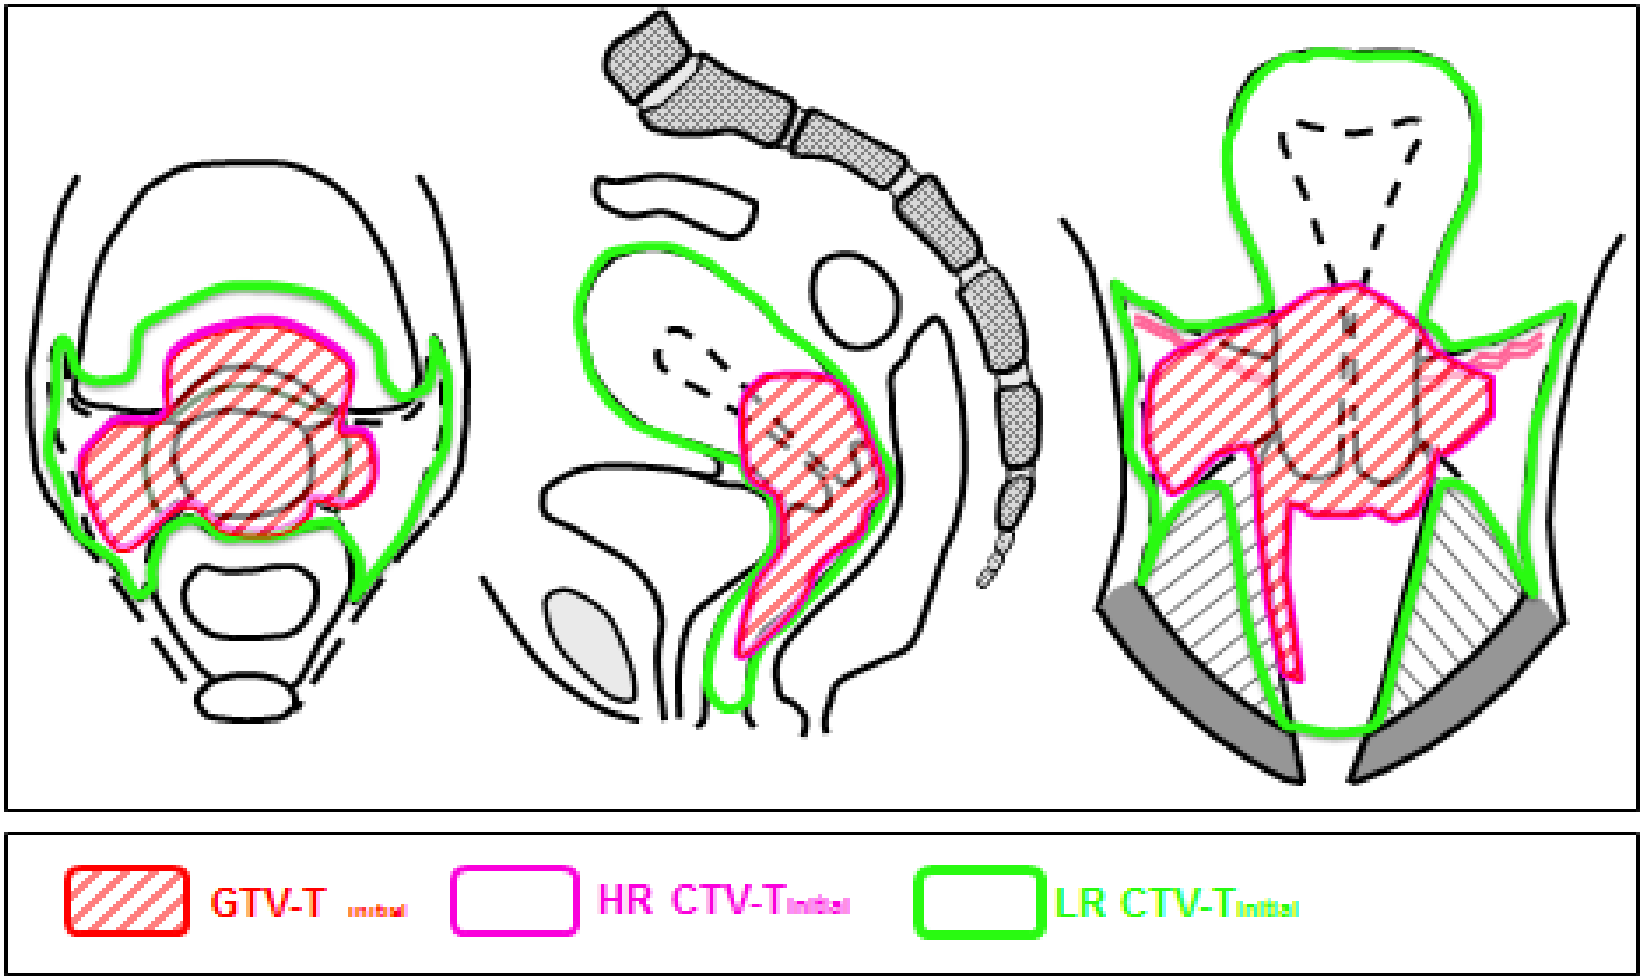
EMBRACE II: CTV-T: initial GTV, HR CTV, LR CTV: stage IIB



EMBRACE II: CTV-T: initial GTV, HR CTV, LR CTV: stage IIIB



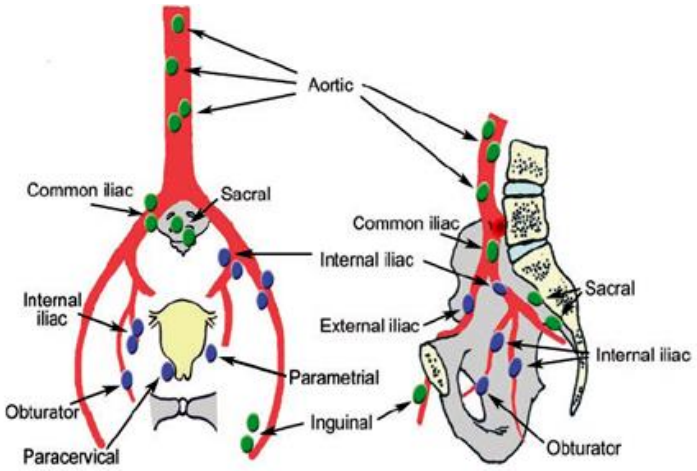
EMBRACE II: CTV-T: initial GTV, HR CTV, LR CTV: stage IVA



Nodal CTV *(CTV-E, no macroscopic nodal involvement)*

Lymph nodes are located around vessels

- Paraaortic
- Common iliac
- External iliac
- Internal iliac
- Obturator
- Presacral
- Inguinal (in stage IIIa)



Nodal CTV contouring = Delineation of vessels with margins

Which margin/s are necessary ?

The margin needed to include 99% of detectable lymph nodes is?

A. 5 mm
B. 7 mm
C. 10 mm
D. 5 mm with small adaptations
E. 7 mm with small adaptations
F. 10 mm with small adaptations

Nodal CTV

Ultrasmall Particles of Iron Oxide (USPIO) data

Taylor A et al., IJROBP 2005

- 20 patients, gynae cancer
- USPIO administered
- All nodes outlined
  - 61 nodes / patient
  - 1 to 12 mm short axis
- Muscle and bone excluded

	3D margin around vessels (mm)				
	3	5	**7**	10	15
Nodal coverage	56 %	76 %	**88 %**	94 %	99 %
Bowel V in PTV	-	-	**147 cm^3**	190 cm^3	266 cm^3

7 mm margin with minor adjustments: 99 % coverage of lymph nodes

Taylor A, Rockal AG, Reznek RH et al. Mapping pelvic lymph nodes: guidelines for delineation in intensity-modulated radiotherapy. Int. J. Radiation Oncology Biol. Phys., Vol 63.no.5, 1604-1612, 2005.

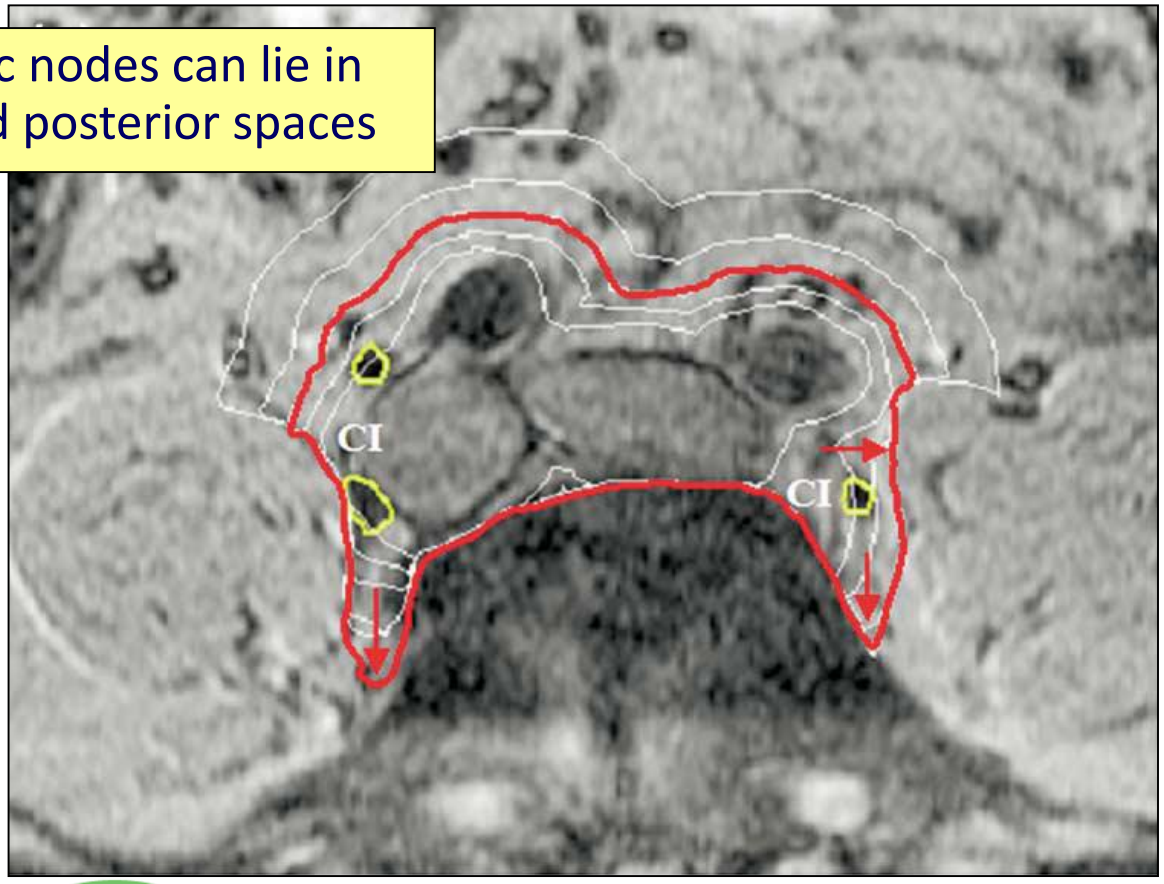
Nodal CTV

Ultrasmall Particles of Iron Oxide (USPIO) data

Taylor A et al., IJROBP 2005

7 mm margin with minor adjustments: 99 % coverage of lymph nodes

Common iliac nodes can lie in lateral and posterior spaces



Taylor A, Rockal AG, Reznek RH et al. Mapping pelvic lymph nodes: guidelines for delineation in intensity-modulated radiotherapy. Int. J. Radiation Oncology Biol. Phys., Vol 63.no.5, 1604-1612, 2005.

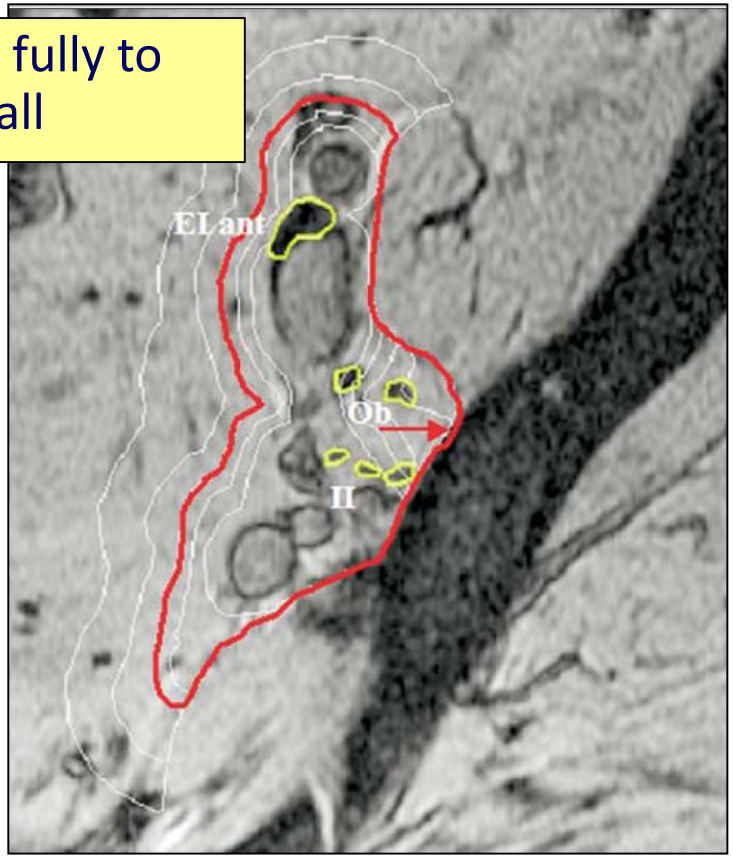
Nodal CTV

Ultrasmall Particles of Iron Oxide (USPIO) data

Taylor A et al., IJROBP 2005

7 mm margin with minor adjustments: 99 % coverage of lymph nodes

Contour must extend fully to pelvic sidewall



Taylor A, Rockal AG, Reznek RH et al. Mapping pelvic lymph nodes: guidelines for delineation in intensity-modulated radiotherapy. Int. J. Radiation Oncology Biol. Phys., Vol 63.no.5, 1604-1612, 2005.

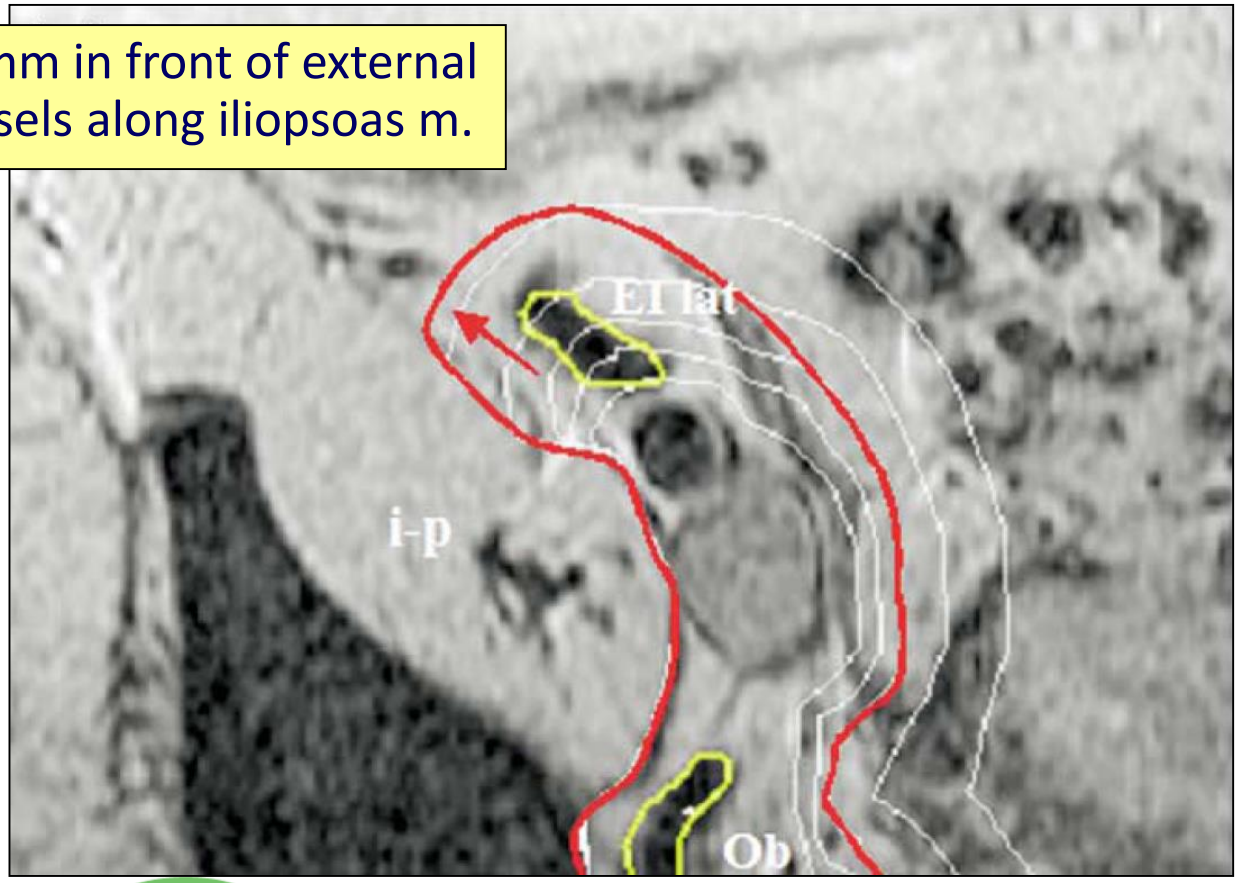
Nodal CTV

Ultrasmall Particles of Iron Oxide (USPIO) data

Taylor A et al., IJROBP 2005

7 mm margin with minor adjustments: 99 % coverage of lymph nodes

Extend 10 mm in front of external iliac vessels along iliopsoas m.



Taylor A, Rockal AG, Reznek RH et al. Mapping pelvic lymph nodes: guidelines for delineation in intensity-modulated radiotherapy. Int. J. Radiation Oncology Biol. Phys., Vol 63.no.5, 1604-1612, 2005.

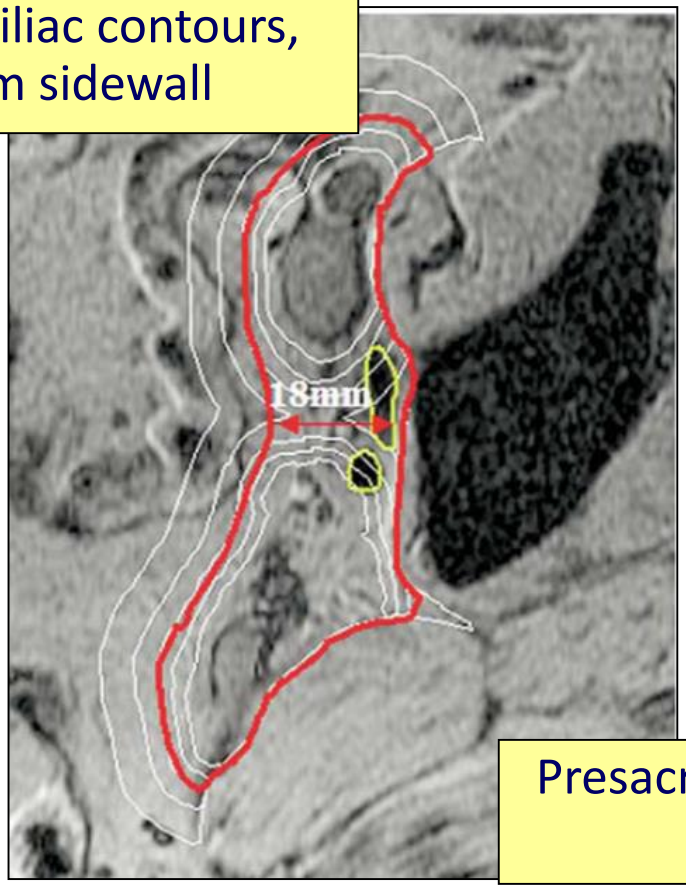
Nodal CTV

Ultrasmall Particles of Iron Oxide (USPIO) data

Taylor A et al., IJROBP 2005

7 mm margin with minor adjustments: 99 % coverage of lymph nodes

Join external & internal iliac contours, keep 18 mm from sidewall



Presacral nodes: keep 10 mm in front of sacrum

Taylor A, Rockal AG, Reznek RH et al. Mapping pelvic lymph nodes: guidelines for delineation in intensity-modulated radiotherapy. Int. J. Radiation Oncology Biol. Phys., Vol 63.no.5, 1604-1612, 2005.

Nodal CTV

Ultrasmall Particles of Iron Oxide (USPIO) data

Taylor A et al., IJROBP 2005

Recommendations for pelvic nodal CTV delineation

Uniformly draw a contour around the pelvic blood vessels by 7 mm.

Include all visible nodes and exclude muscle and bone from the volume.

Ensure the lateral border of the volume extends to the psoas muscle and pelvic sidewall.

Continue the medial border around the external iliac vessels posteriorly, parallel to the sidewall, until it joins the medial contour of the internal iliac vessels to encompass the obturator region. This creates a strip medial to the pelvic sidewall that should be at least 18 mm wide.

To include all the lateral external iliac nodes, extend the contour around the external iliac artery anterolaterally along the iliopsoas muscle by an additional 10 mm.

To cover the presacral region, connect the volumes on each side of the pelvis with a 10-mm strip over the anterior sacrum (S1 and S2)

Taylor A, Rockal AG, Reznek RH et al. Mapping pelvic lymph nodes: guidelines for delineation in intensity-modulated radiotherapy. Int. J. Radiation Oncology Biol. Phys., Vol 63.no.5, 1604-1612, 2005.

RTOG, GOG, NCIC, ESTRO, ACRIN Consensus

Small W, et al. IJROBP, 2008

(postoperative setting)

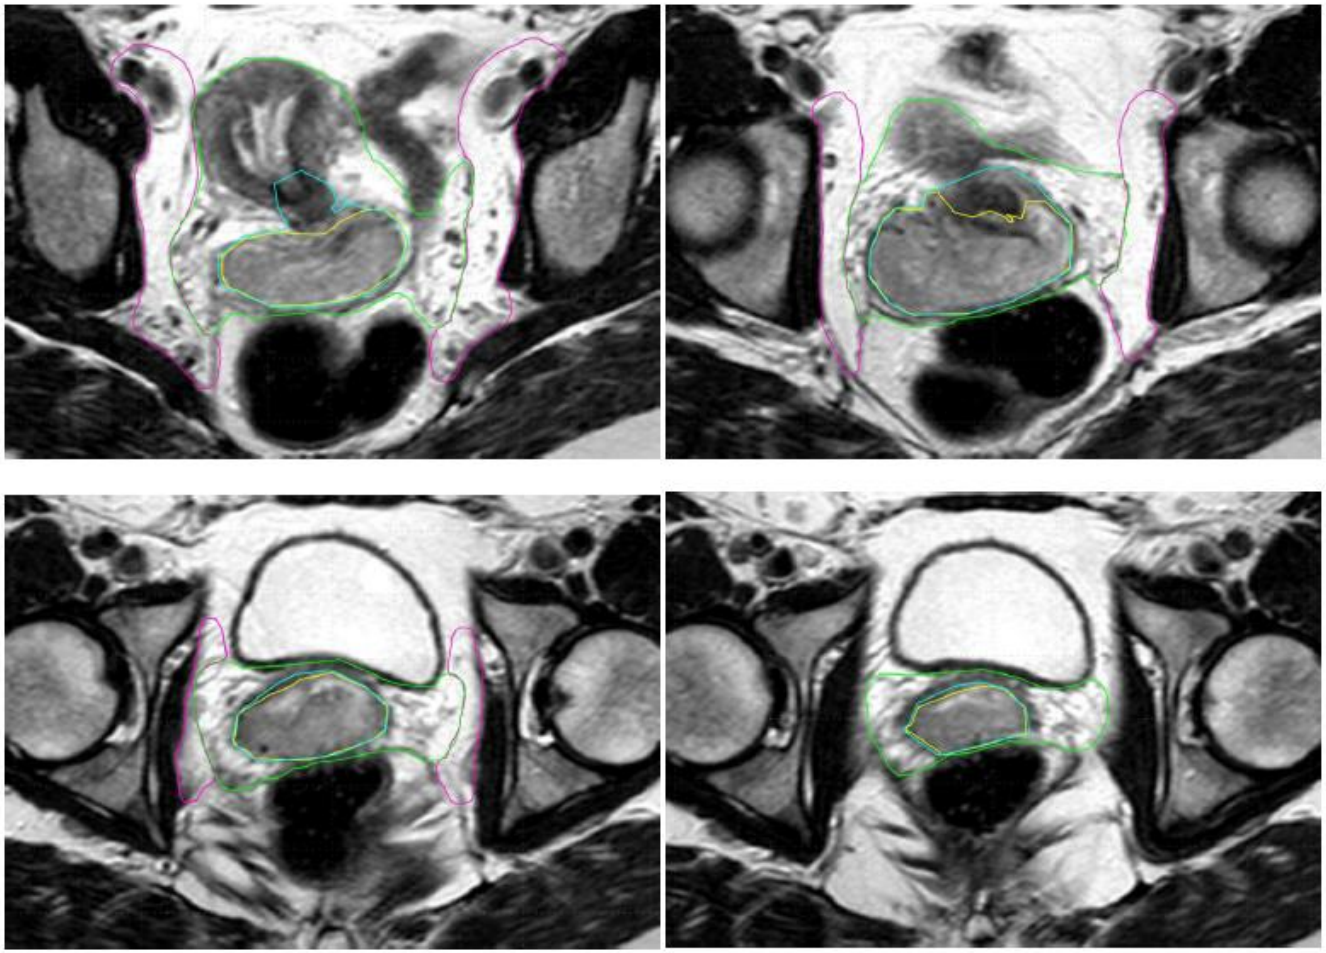
Pelvic nodal groups for cervix and endometrial cancer contouring:

- Common iliac
- External iliac
- Internal iliac
- Presacral
  - in cervix cancer
  - endometrial cancer with cervical invasion

Small W, Mell LK, Anderson P et al. Consensus guidelines for deineation of clinical target volume for intensity-modulated pelvic radiotherapy in postoperative treatment of endometrial and cervical cancer. Int. J. Radiation Oncology Biol. Phys., vol 71, No.2, 428-434, 2008

Elective nodal CTV: Caudal extension

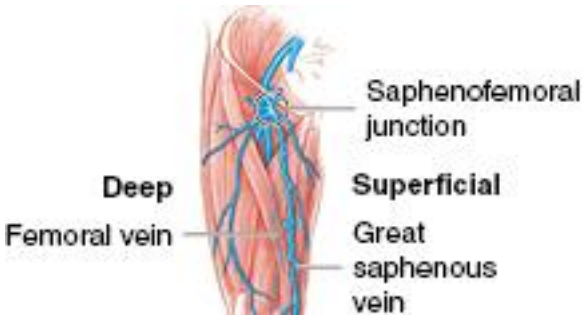
- Transition zone goes down to the pelvic floor (usually at the upper part of the obturator foramen, below femoral head, were internal iliac vessels enter or leave the true pelvis)

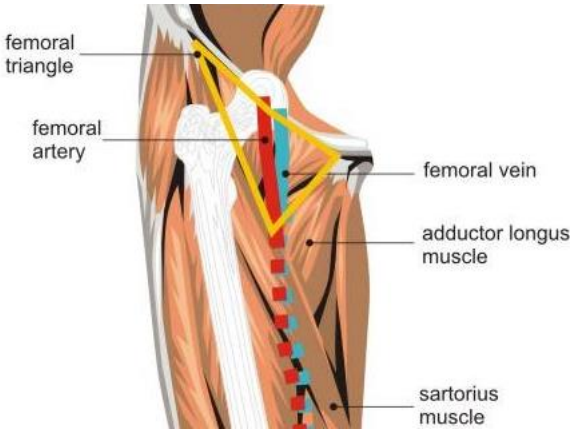


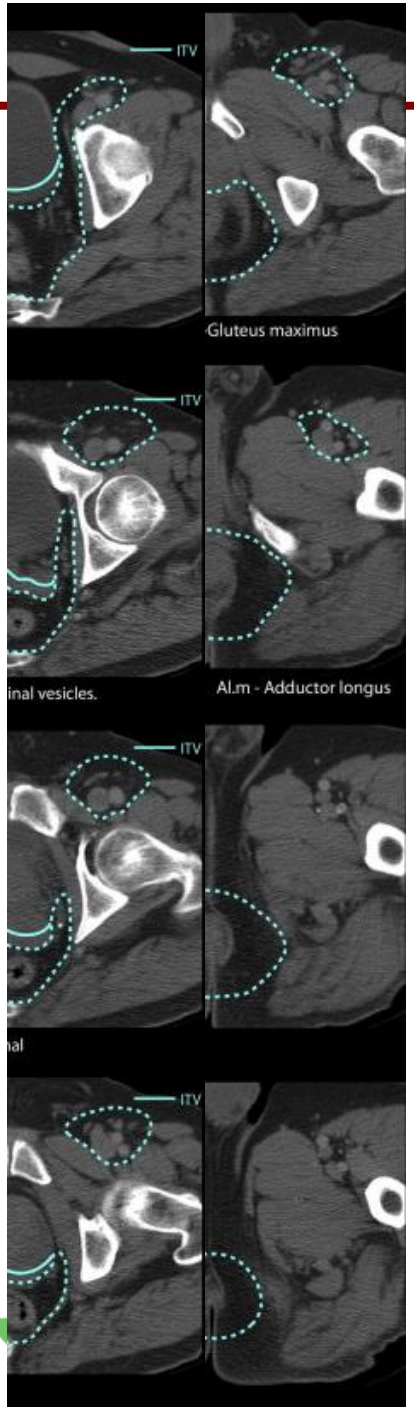
From EMBRACE II protocol

Elective nodal CTV: Caudal extension

- In case of distal one third vaginal involvement
- Include inguinal nodes continuously from the external iliac nodes at least 2 cm caudal to the saphenous/femoral junction/upper edge of trochanter minor





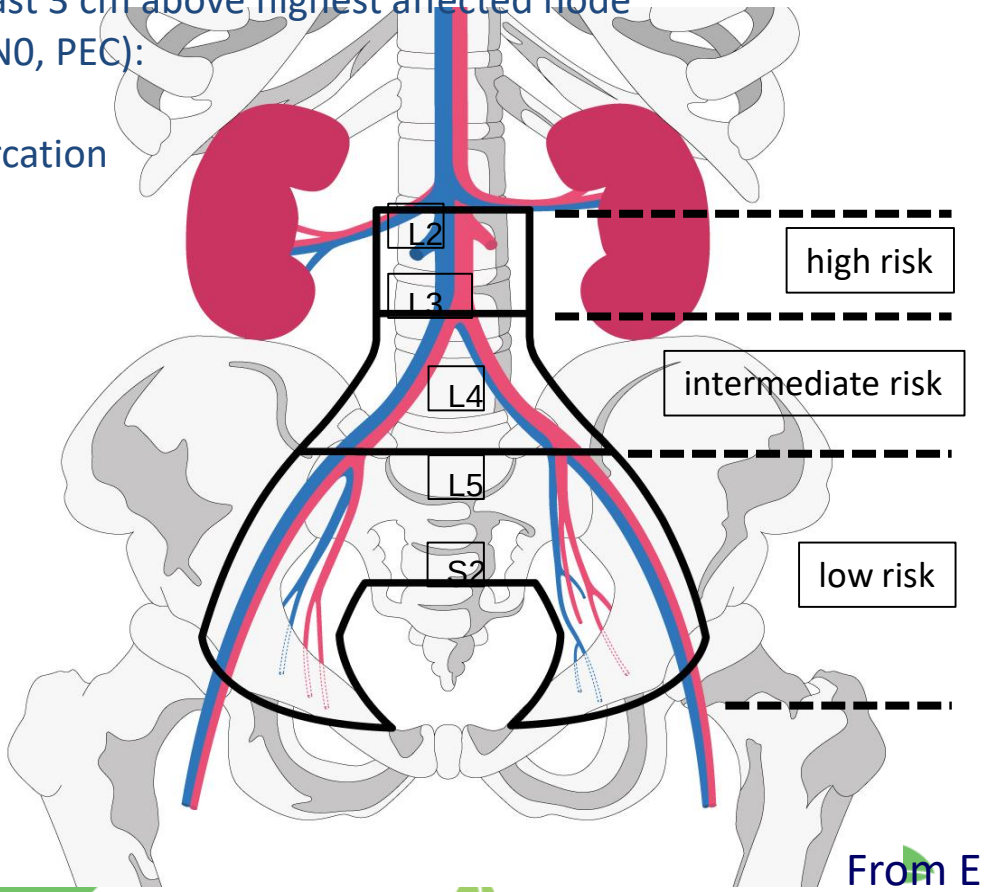


Ng et al., Australasian Gastrointestinal Trials Group (AGITG) Contouring Atlas and Planning Guidelines for Intensity-Modulated Radiotherapy in Anal Cancer, Int. J. Radiation Oncology Biol. Phys., Vol 83, 1455-1462, 2005.

Elective nodal CTV: Cranial extension

Ongoing investigations and discussion (EMBRACE II)

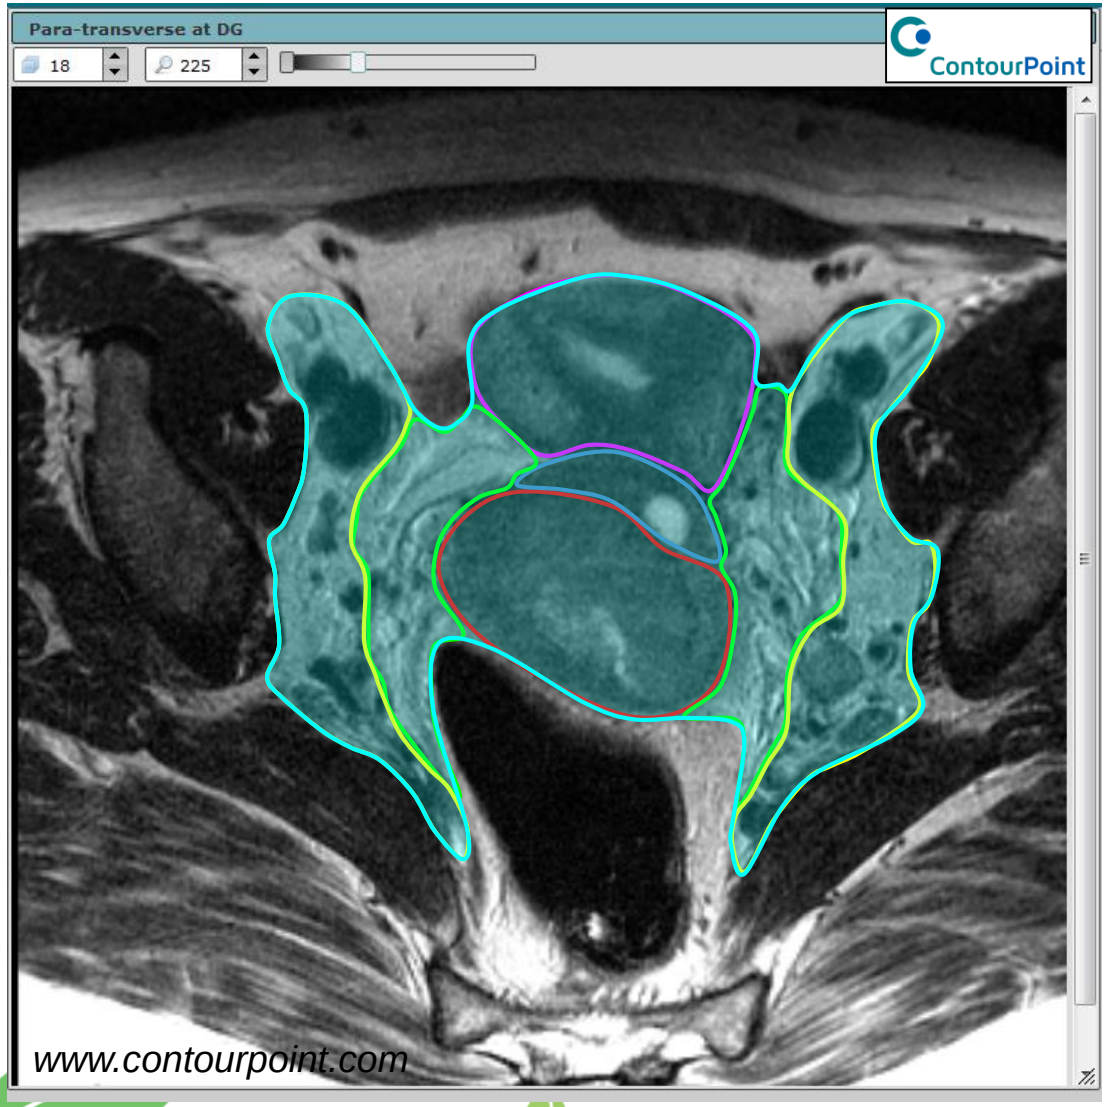
- Intermediate risk: upper border level of aortic bifurcation or defined by bony anatomy (L3/34)
- High risk: Depending on extension of nodal disease into common iliac region consider or ≥ 3 pelvic nodes:
  inclusion of low PAO region up to renal vessels (L2),
  extension of at least 3 cm above highest affected node
- Low risk (stage IB1, N0, PEC):
  Upper border:
  common iliac bifurcation



From EMBRACE II protocol

Total CTV for definitive cervix cancer EBRT

Initial CTV-T + Nodal CTV (CTV-E)

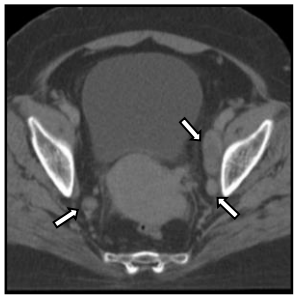


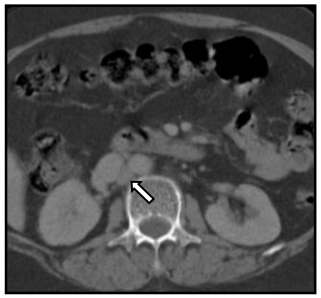
The margin needed to include 99% of detectable lymph nodes is?

A. 5 mm
B. 7 mm
C. 10 mm
D. 5 mm with small adaptations
E. 7 mm with small adaptations
F. 10 mm with small adaptations

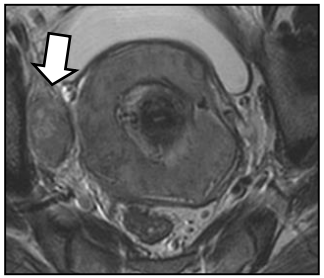
GTV for nodal RT boost

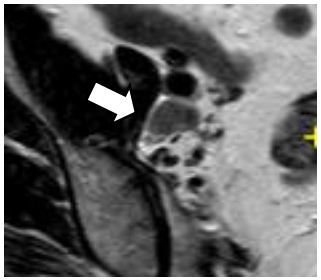
Imaging: indirect proof, (morphological & functional characteristics)

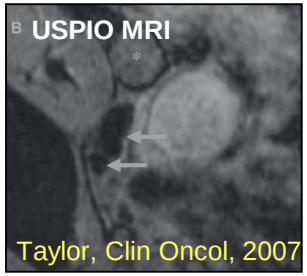




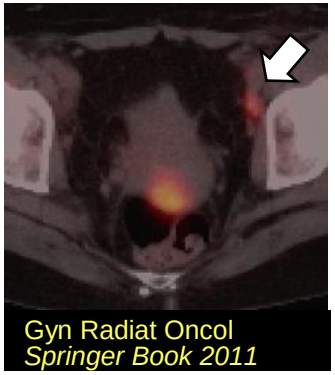
Sensitivity	Specificity	
21-73 %	82-93 %	

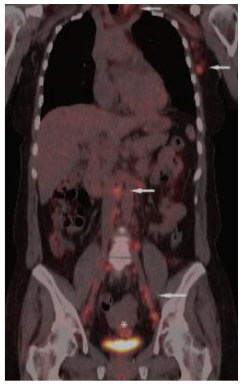






53 - 87 %	92 - 98 %	





68 - 94 %	95 %	Pelvis
95 - 100 %	95 - 99 %	PAO

MRI and PET-CT preferable over CT

New contrast agents and tracers....

Hricak H, et al. Am J Roentgenol. 1996
Olpin J, et al. Imaging. In: Gynecol Radiat Therapy...eds. Viswanathan AN, et al.

From GTV to CTV

CTV-N: in principal no margin around the nodal GTV

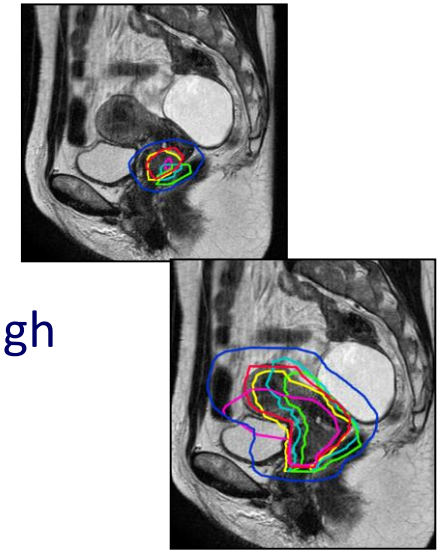
In case of extracapsular extension, add some margin, e.g up to 5 mm

EMBRACE II protocol

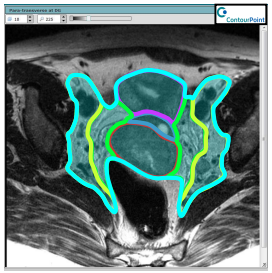
PTV-margin to be discussed

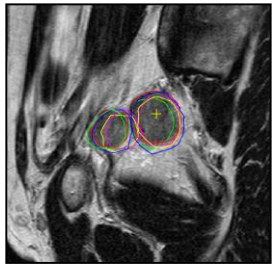
Conclusions

- **Concept of initial GTV-T is recommended**
- **Concept of initial CTV-T is recommended**
  with initial HR CTV-T and LR CTV-T
- (tumor and uterus moving is taken into account through the concept of Internal Target Volume (ITV-T)
  presentation Kari Tanderup on ITV and PTV



- **Concept of target for nodal region CTV-E is recommended**
  for pot. microscopic spread, vessels + 7mm: **CTV-E**
- Concept of Nodal boost target CTV-N is recommended
- (no ITV for CTV-E and CTV-N is recommended!)





Management and treatment planning of paraaortic node area

Christine Haie-Meder
Brachytherapy Unit
Gustave Roussy Cancer Center
Villejuif
France

Paraaortic (PAo) node involvement

Locally advanced disease : 36% - 50% of all tumors

Early stage tumors :
FIGO IA1 with lymph vascular space involvement, IA2, or IB1 with proven positive pelvic nodes :
3% to 5.5% risk of PAo node positivity

FIGO IB2-IVA : **15% - 35%** risk of involved PAo node

Is prophylactic para-aortic irradiation worthwhile in the treatment of advanced cervical carcinoma? Results of a controlled clinical trial of the EORTC radiotherapy group

C. Haie[1], M.H. Pejovic[2], A. Gerbaulet[1], J.C. Horiot[3], H. Pourquier[4], J. Delouche[5], J.F. Heinz[6], D. Brune[7], J. Fenton[8], G. Pizzi[9], P. Bey[10], R. Brossel[11], P. Pillement[12], F. Volterrani[13] and D. Chassagne[1]

Radiother Oncol 11 (1988) 101-12

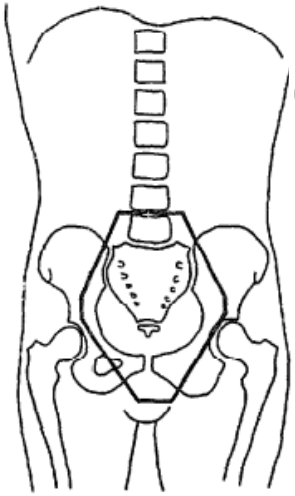


Fig. 1. Pelvic irradiation.

441 patients
Early stage IB-IIA1 with positive pelvic node
Advanced stage IIA2-IIIB whatever pelvic status
All with negative PAo nodes (lymphangiogram)

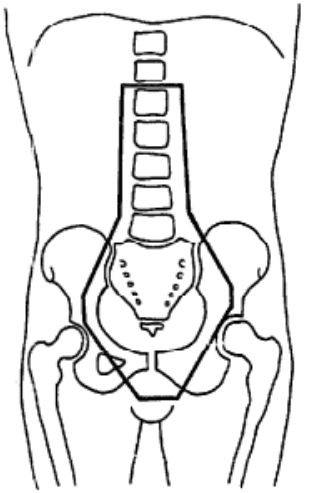

Fig. 2. Pelvic and para-aortic irradiation.

Observed (O) and expected (E) number of critical events.

	Randomized irradiation						
	Pelvis			Pelvis + para-aortic nodes			*p*
	O	E	O/E[a]	O	E	O/E[a]	
Pelvic failure	66	70.7	0.9	71	66.3	1.1	NS
Para-aortic node metastasis	29	19.8	1.5	10	19.1	0.5	<0.01
Other distant metastasis	42	40.4	1.0	31	38.6	0.8	NS

13%

[a] The O/E is the ratio of the number of events observed in a subgroup to the number of events expected in this subgroup assuming that the event rate of this subgroup is the same among all subgroups.

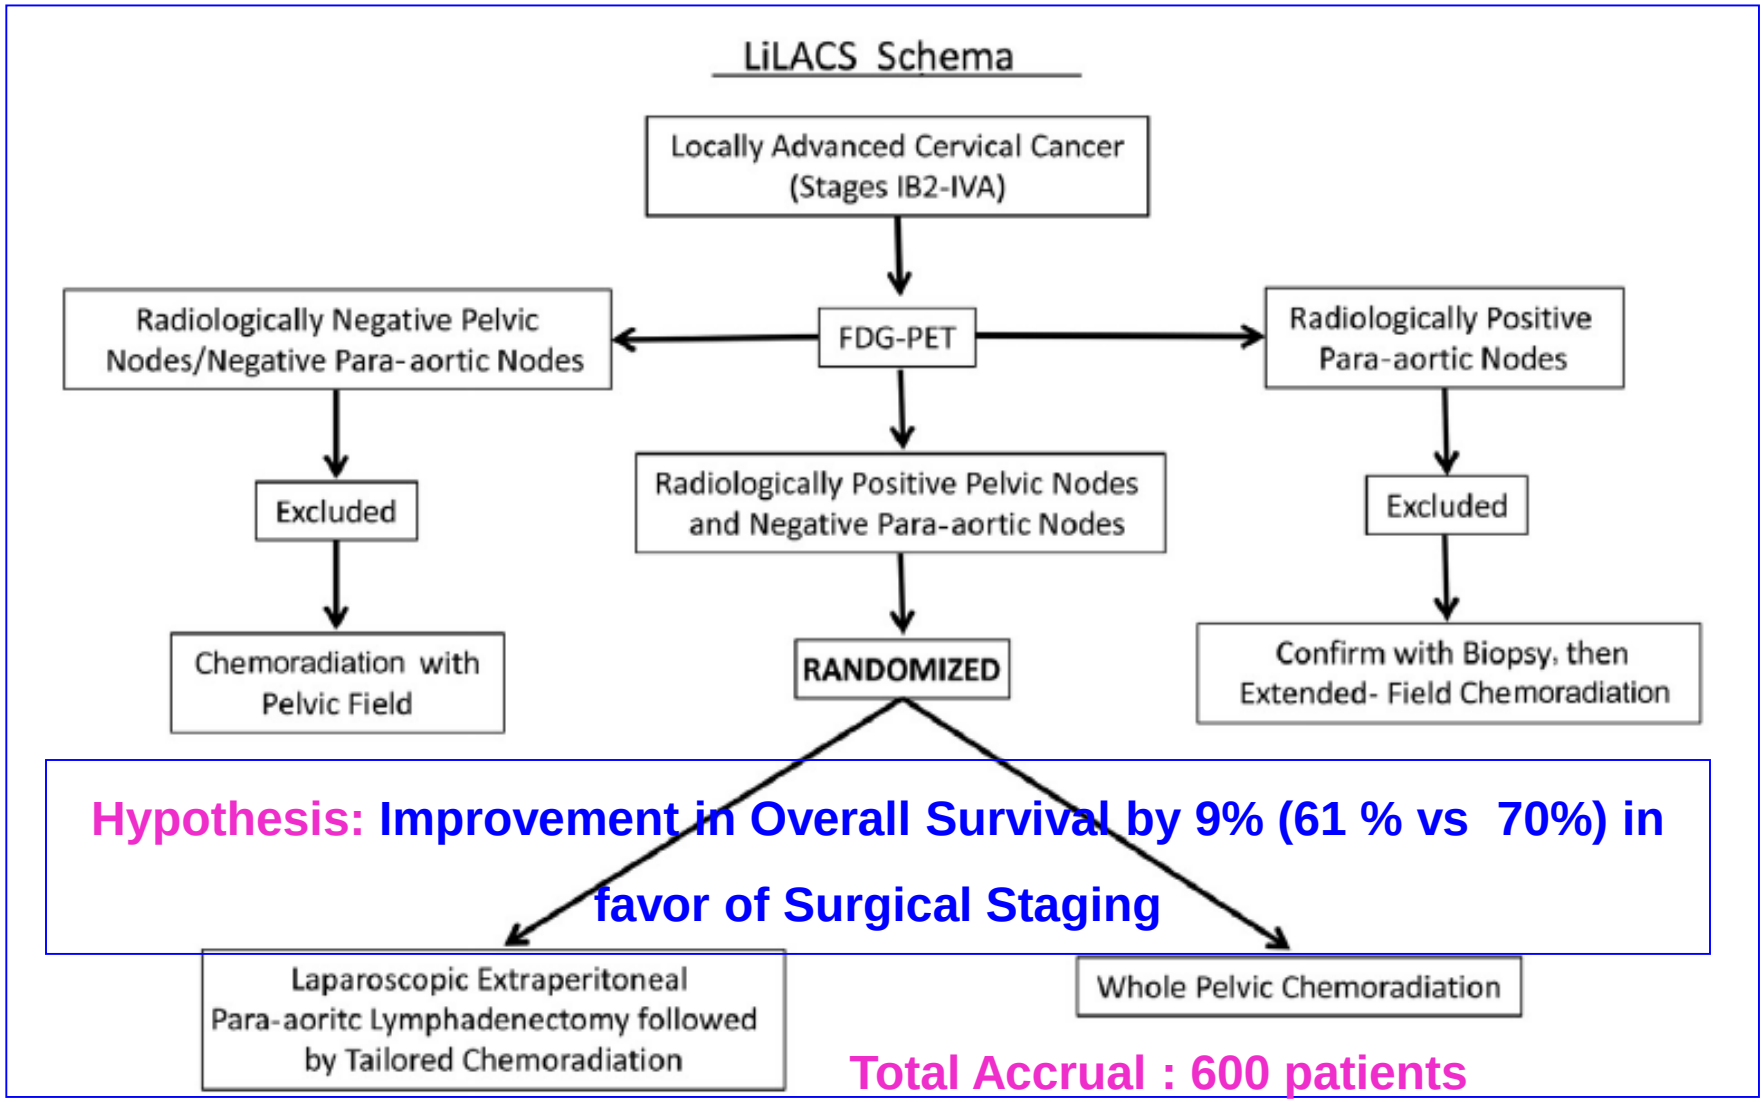
Lymphadenectomy in Locally Advanced Cervical Cancer Study (LiLACS): A Phase III Clinical Trial comparing surgical with radiological staging in patients with Stages IB2 - IVA Cervical Cancer

Journal of Minimally Invasive Gynecology (2014) 21, 3–8 © 2014



Up to which level should PAo lymph node dissection be performed?

Should Systematic Infrarenal Para-aortic Dissection Be the Rule in the Pretherapeutic Staging of Primary or Recurrent Locally Advanced Cervix Cancer Patients With a Negative Preoperative Para-aortic PET Imaging?

Eric Leblanc, MD, Ninad Katdare, MD,* Fabrice Narducci, MD,* Lucie Bresson, MD,* Sebastien Gouy, MD,† Philippe Morice, MD, PhD,† Gwenael Ferron, MD,‡ Denis Querleu, MD, PhD,‡ and Alejandra Martinez, MD‡*

Int J Gynecol Cancer 2016;26: 169-75

- **Incidence of skip metastases above the level of the inferior mesenteric artery (IMA)?**
- **Extraperitoneal PA retroperitoneal lymph node dissection**
- **All nodes were removed from both common iliac bifurcations up to the left renal vein**
- **Nodes resected from both common iliac bifurcation up to the origin of the IMA, called the inframesenteric group, and those from the IMA up to the left renal vein, called the supramesenteric group, were extracted separately in endoscopic bags**
- **Pathological examination of the supramesenteric and inframesenteric nodes separately**
- **Record of postoperative complications**

Should Systematic Infrarenal Para-aortic Dissection Be the Rule in the Pretherapeutic Staging of Primary or Recurrent Locally Advanced Cervix Cancer Patients With a Negative Preoperative Para-aortic PET Imaging?

Eric Leblanc, MD, Ninad Katdare, MD,* Fabrice Narducci, MD,* Lucie Bresson, MD,* Sebastien Gouy, MD,† Philippe Morice, MD, PhD,† Gwenael Ferron, MD,‡ Denis Querleu, MD, PhD,‡ and Alejandra Martinez, MD‡*

Int J Gynecol Cancer 2016;26: 169-75

- January 2010-December 2013 : 196 stage IB1 with pelvic pN1, IB2, to IVA LACC
- 30 patients (15%) PA Pn1
- Only 1 patient only with positive nodes exclusively located above the IMA (3.3% of the pN1 group; 95% confidence interval : 0%-9.7%)
- Complications : 15 (7.6%) patients
- **Conclusion:** Given the very low rate of skip metastases above the IMA and the potential additional morbidity of a systematic extended dissection, a **bilateral ilioinframesenteric dissection seems to be** an acceptable pattern of PA lymphadenectomy in LACC patients

PAo irradiation :
Which technique?
Which dose?

Extended field radiation with PAo node inclusion

Previous studies of irradiation to paraaortic metastasis[a]

Authors	No. of patients	Radiation technique	Dose (Gy)	Median survival (months)	5 year survival rate (%)	Major (≥ G3) complications (%)
Piver [25,26]	31	2P + Rot	44–60	–	9.6	–

- Disease limited to PAo nodes = reasonable outcome with field extension to the PAo area +/- CT
- Conv. RT techniques & CT = higher toxicities

Prophylactic extended-field irradiation of para-aortic lymph nodes in stages IIB & bulky IB and IIA cervical carcinomas

Ten-year treatment results of RTOG 79-20. JAMA 1995

- 10 yr OS - 44% Vs 55%
- DFS – similar 40 Vs 42%;
- LRF similar - 35% Vs 31%
- Better Survival following first failure
- Higher G 4 & 5 toxicities at 10 yrs 4% vs 8%
- Death due to RT complications 1% vs 2%

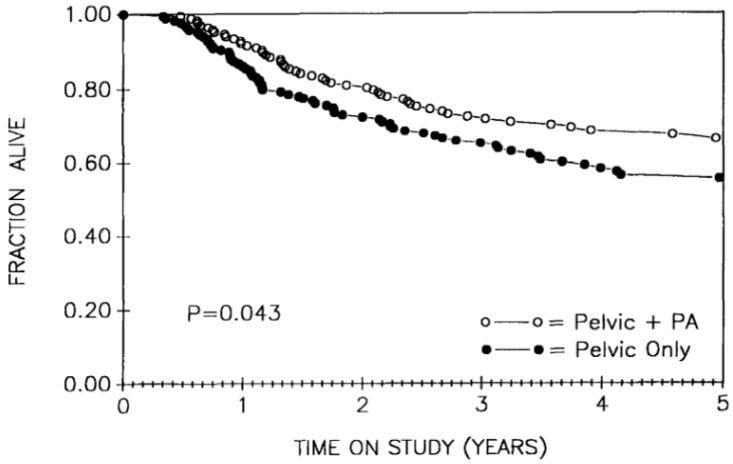

Fig. 1. RTOG 79-20 survival by assigned treatment (Kaplan-Meier).

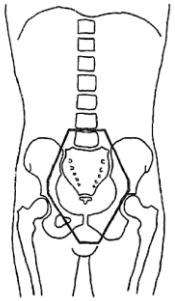
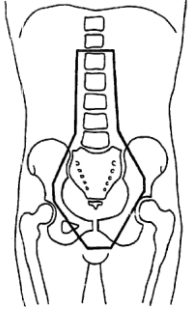


Is prophylactic para-aortic irradiation worthwhile in the treatment of advanced cervical carcinoma? Results of a controlled clinical trial of the EORTC radiotherapy group

C. Haie[1], M.H. Pejovic[2], A. Gerbaulet[1], J.C. Horiot[3], H. Pourquier[4], J. Delouche[5], J.F. Heinz[6],



- No difference in local control, distant metastases and DFS.
- Incidence of para-aortic metastases & distant metastases without tumour at pelvic sites was significantly higher in patients receiving pelvic RT.
- Higher GI complications in PAo RT group (3.5% vs 8% at 4 years : p= 0.005)

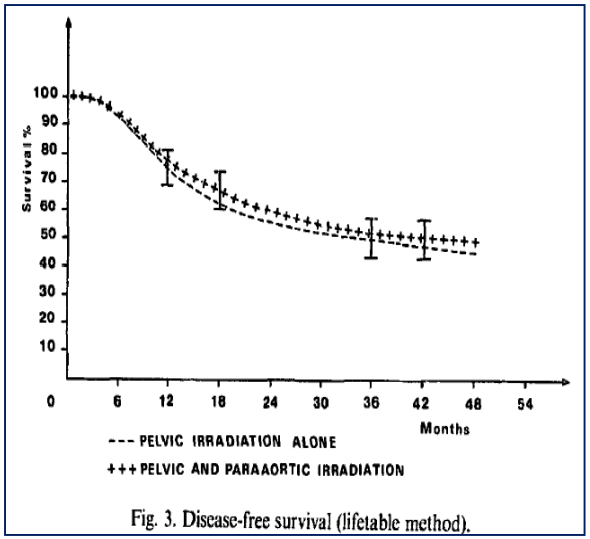


Fig. 3. Disease-free survival (lifetable method).

Conclusions:

- Routine para-aortic RT for all high risk patients with cervical carcinoma is of limited value.
- Patients with a high probability of local control can benefit from extended field irradiation, despite an increase in severe digestive complications.

Role of IMRT

IMRT for PAo RT

	Number of patients and study type	Dose of radiation therapy	Feasibility and toxic effects	Survival effect
Chen (2011)[73]	Retrospective study: 109 patients treated with IMRT and concomitant cisplatin-based chemotherapy; 13 had involved para-aortic nodes and underwent extended field radiation therapy	CTV received 45–48 Gy; GTV received 50·4–54 Gy; nodal GTV received 54–60 Gy with concomitant boost	Patients with para-aortic disease were not assessed separately; acute gastrointestinal and haematological toxic effects grade ≥3 of 2·7% and 23·9%; long-term gastrointestinal and genitourinary toxicity grade ≥3 of 4·6% and 6·4%	Patients with para-aortic disease were not assessed separately; 3-year overall and disease-free survival was 78·2% and 67·6%, respectively
Ahmed (2004)[75]	Planning study: planning techniques compared in 5 patients to assess dose reduction to organs at risk with IMRT; AP/PA to pelvis and para-aortic area, four-field box pelvis and para-aortic area and four-field box pelvis/IMRT in para-aortic area	45 Gy to the pelvis; dose to para-aortic gross nodal disease was 54–57 Gy with conventional radiation therapy and 60 Gy for IMRT	Feasibility of dose escalation with reduction of dose to the organs at risk by IMRT	--
Esthappan (2008)[76]	Planning study: IMRT plans generated for 10 patients with involved para-aortic nodes; PET-CT simulation	MTV nodal planned to 60 Gy; nodal PTVs planned to 50 Gy; MTV cervix planned to 20 Gy to be followed by brachytherapy	IMRT to pelvis and para-aortic feasible; volume of bowel receiving 45 Gy can be reduced to <15%	--
Gerszten (2006)[77]	Feasibility study: 21 patients treated with extended field IMRT and concurrent cisplatin	45 Gy with simultaneous integrated boost to 55 Gy to involved nodes with concurrent cisplatin followed by 5×5 Gy HDR brachytherapy	Well tolerated with no grade 3 or 4 genitourinary or gastrointestinal toxic effects; 19% grade 3 haematological toxic effects	--
Kidd (2010)[78]	Prospective study: 135 patients treated with IMRT, 317 with 3-dimensional radiation therapy; of those, 23 in IMRT group and 36 in non-IMRT group had extendedfield radiation therapy for PET-positive para-aortic nodes; PET-CT simulation	50·4 Gy to the pelvic volume and 20 Gy to the cervical volume followed by 6×6·5 Gy HDR brachytherapy	No separation of results for extended field vs pelvis alone; overall IMRT was better tolerated with 6% vs 17% rate of grade 3 bowel toxic effects (p=0·0017)	Improved overall and cause-specific survival in IMRT group (p=0·0001)
Mutic (2003)[79]	Planning study: four patients with para-aortic involved nodes; AP/PA to pelvic area and IMRT in para-aortic area; PET-CT simulation	Pelvis treated with AP/PA fields to 50·4 Gy with a midline shield at 16·2 Gy to be followed by brachytherapy; para-aortic area planned with IMRT to 50·4 Gy to PTV1 and 59·4 Gy to PTV2	IMRT in para-aortic region is feasible and reduces dose to organs at risk	--

AP/PA=anteroposterior/posteroanterior. CTV=clinical target volume. GTV=gross tumour volume. HDR=high dose rate. IMRT=intensity-modulated radiation therapy. MTV=metabolic target volume. PTV=planning target volume.

208 patients

Table 2. Para-aortic lymph nodes

Lymph node status	Patients (no.)	Mean lymph node dose (Gy)	Paraaortic lymph node failure
PET negative	175	0	1/175
PET positive/CT ≤1 cm	24	43.9*	0/24
PET positive/CT >1 cm to ≤2 cm	5	45*	0/5
PET positive/CT >2 cm to ≤3 cm	4	33.9	0/4
Total	208	—	1/208

Int J Radiat Oncol Biol Phys 2004;59:706-12

Which dose to the PAo nodes?

Lymph node as the only failure rate <2%

Table 4. Pelvic lymph nodes

Lymph node status	Patients (no.)	Failure sites: Cervix	Failure sites: Distant	Failure sites: Both
PET negative	76	7	7	1
PET positive/CT ≤1 cm	89	7	17	3
PET positive/CT >1 cm to ≤2 cm	21	1	5	1
PET positive/CT >2 cm to ≤3 cm	15	3	3	2
PET positive/CT >3 cm to ≤4 cm	5	0	3	0
PET positive/CT >4 cm to ≤5 cm	2	0	1	0
Total	208	18	36	7

29/132 (22%) with PET pelvic + at diagnosis will have distant metastases

Table 5. Paraaortic lymph nodes

Lymph node status	Patients (no.)	Failure sites: Cervix	Failure sites: Distant	Failure sites: Both
PET negative	175	17	20	5
PET positive/CT ≤1 cm	24	1	12	1
PET positive/CT >1 cm to ≤2 cm	5	0	3	0
PET positive/CT >2 cm to ≤3 cm	4	0	1	1
Total	208	18	36	7

16/33 (48%) with PET PAo + at diagnosis will have distant metastases

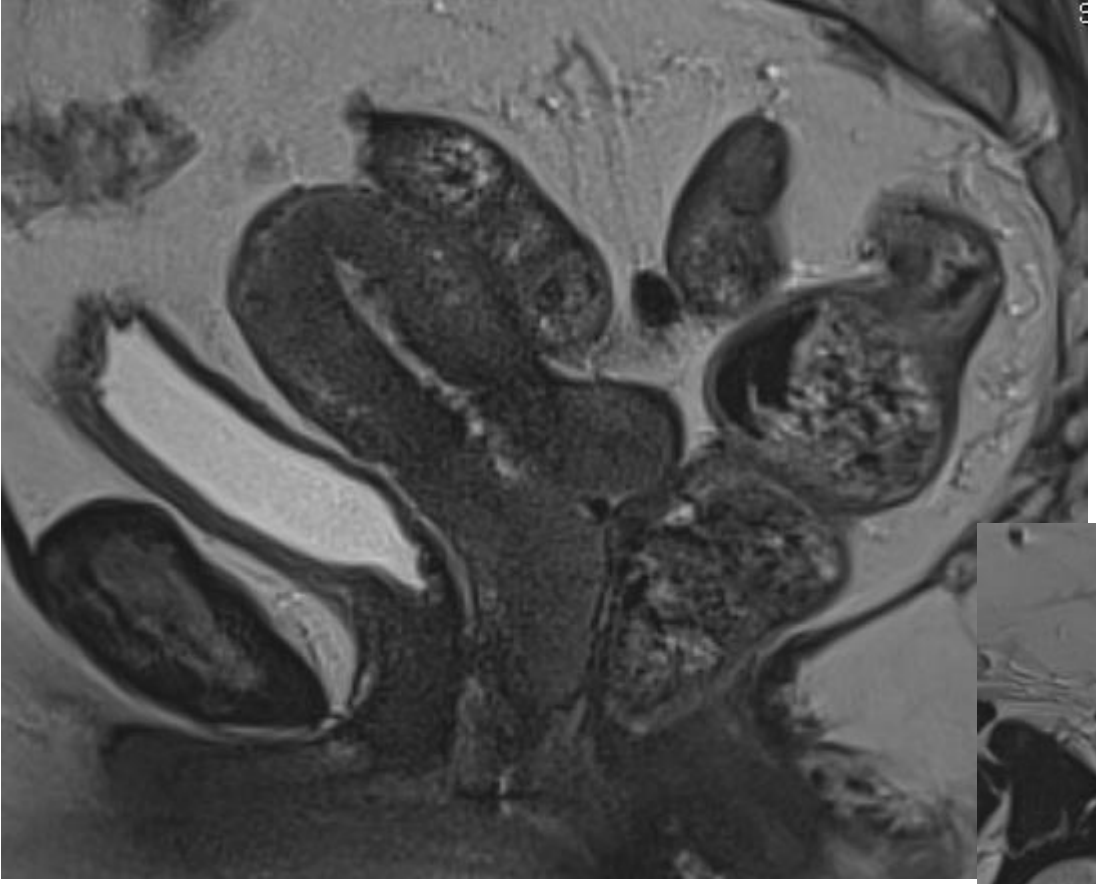
Int J Radiat Oncol Biol Phys 2004;59:706-12

Which dose to the PAo nodes if macroscopic disease?

- No clear consensus
- Escalation up to 55Gy (SIB IMRT)
- Risk of distant metastases
- Adjuvant chemotherapy?

Nodal assessment in advanced cervix cancer : Conclusions

- Role of PET-CT
- Importance of pretherapeutic PAo laparoscopic lymph node dissection
- Patients with PAo node ≤ 5 mm, treated by extended field CRT, have a disease free survival similar to the survival of patients with negative PA nodes
- No clear recommendations for dose if macroscopic PAo nodes



35 year old patient
Stage IIB
No lymph node at MRI

Image guidance, organ motion and ITV/PTV

ESTRO-AROI Teaching Course
Transition from conventional 2D to 3D radiotherapy with a special emphasis on brachytherapy in cervical cancers

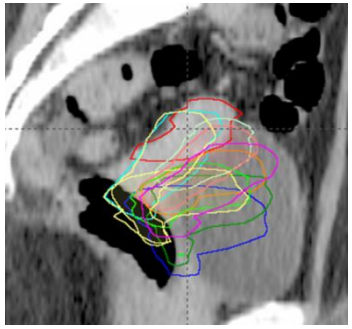
Bengaluru 2017

Prof Kari Tanderup
Prof Richard Pötter

Aarhus University Hospital

ITV and PTV

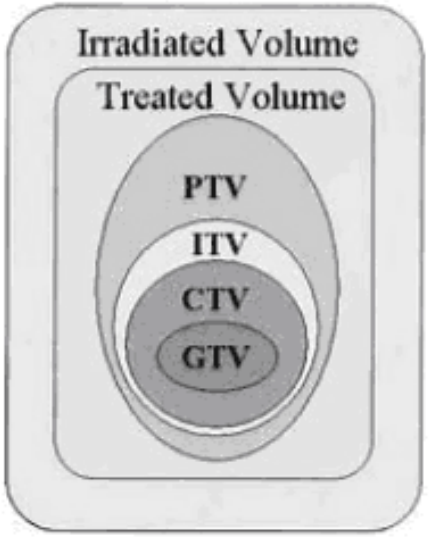
- **ITV: Internal variations**
  - **Position, size and shape of CTV**
    - **Tumour shrinkage**
    - **Organ movement**
    - **Organ deformation**

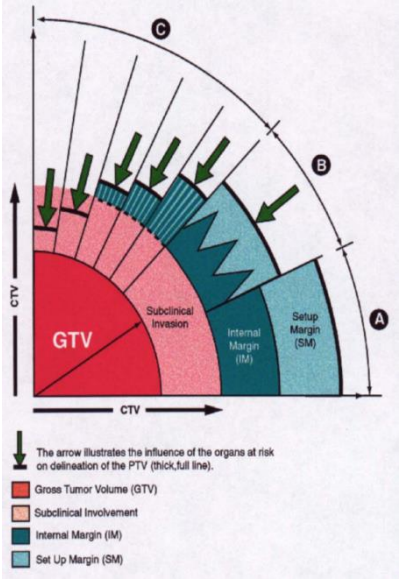


- **PTV: External variations**
  - **Beam positioning**
  - **Patient set-up (e.g. uncertainties when setting up according to skin marks)**

- **If no considerable internal variations are present**
  - **Expansion may be performed directly from CTV to PTV**

- **ITV and PTV margins are not directly “additive”**





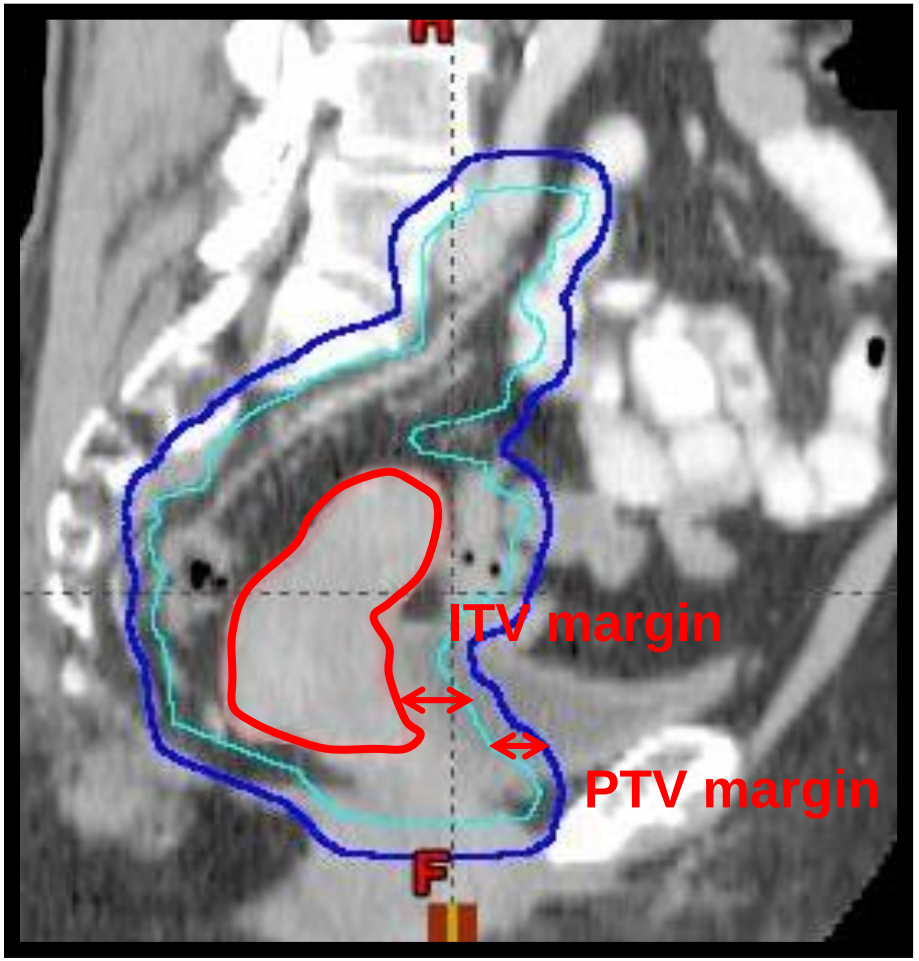
On which target volumes should we add ITV margin?

A. Uterus
B. GTV and cervix (initial CTV_{HR})
C. Pathologic lymph nodes
D. Elective lymph node target

Margins in cervix cancer

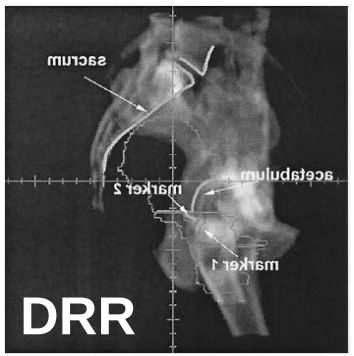
- Primary CTV
  - ITV margin
  - PTV margin
- Pathologic nodes
  - PTV margin
- Elective CTV
  - PTV margin

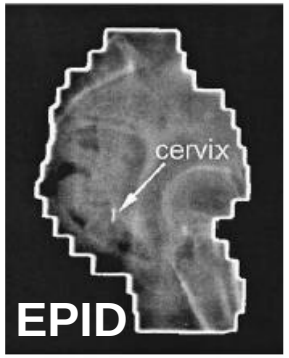
- Role of on-board imaging?



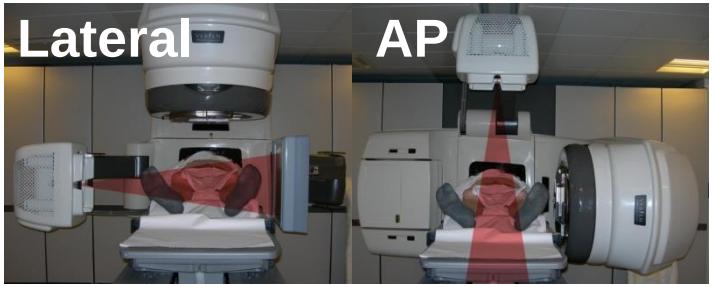
IGRT methods

- **EPID (Electronic Portal Imaging Device)**
  - **MV**
  - **2D**

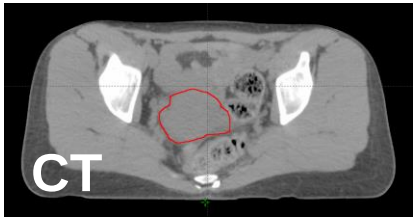


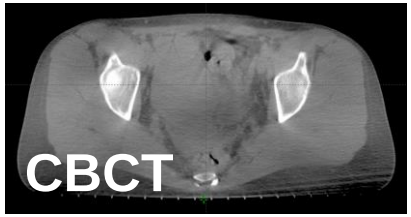


- **kV imaging (OBI – On Board Imaging)**
  - **kV**
  - **2D**



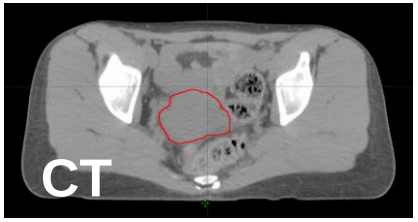
- **CBCT (Cone Beam CT) imaging**
  - **kV**
  - **3D**

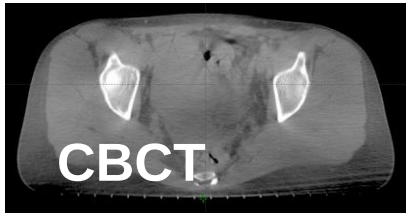




How to fuse CT planning scan to on-board imaging (CBCT, kV, EPID)?

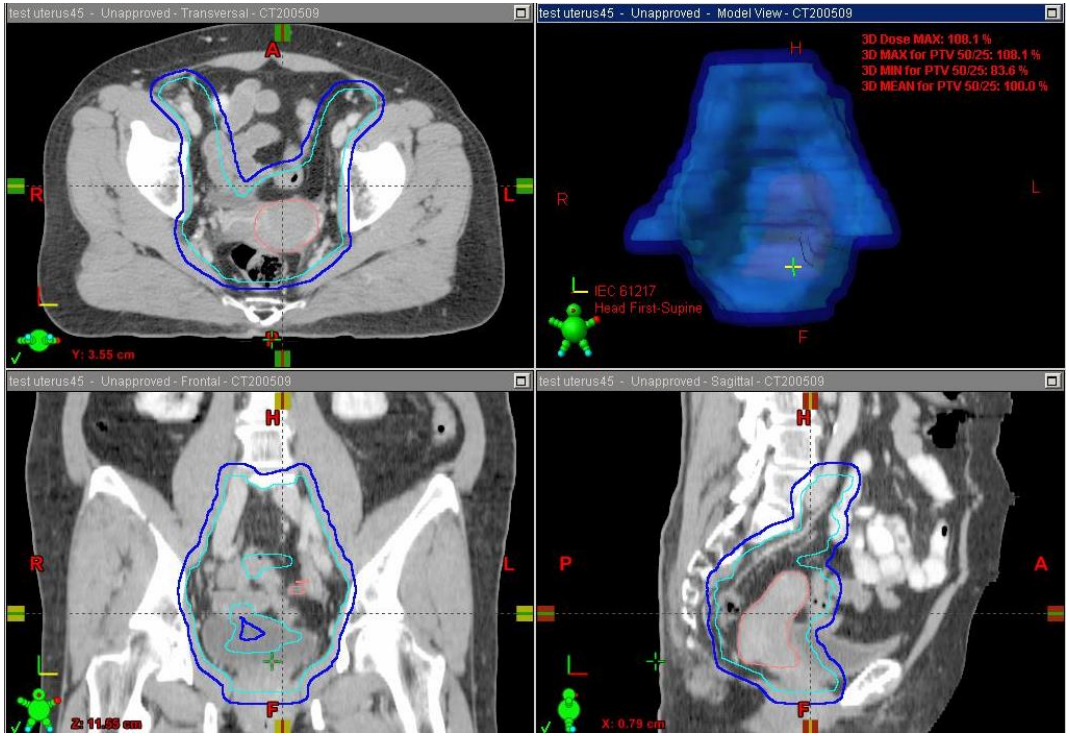
A. **Bony fusion**
B. **Fusion on cervix**
C. **Fusion on markers in cervix**





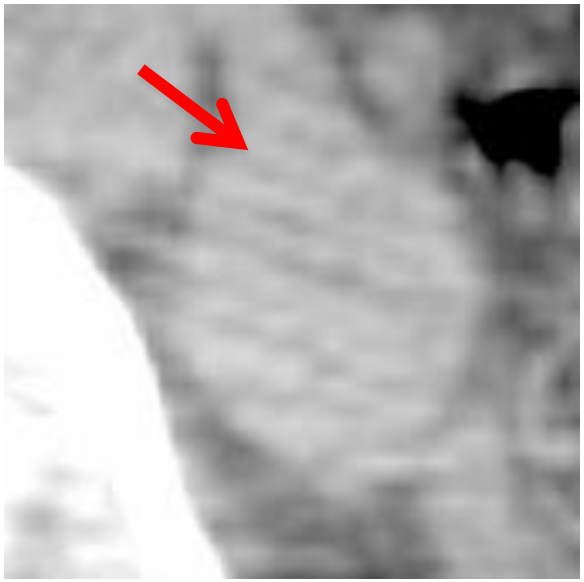
PTV elective target volume

- **Assumption:**
  - **Lymph nodes are in a fixed relation to bony anatomy**
  - **Bony registration aligns elective lymph node target**

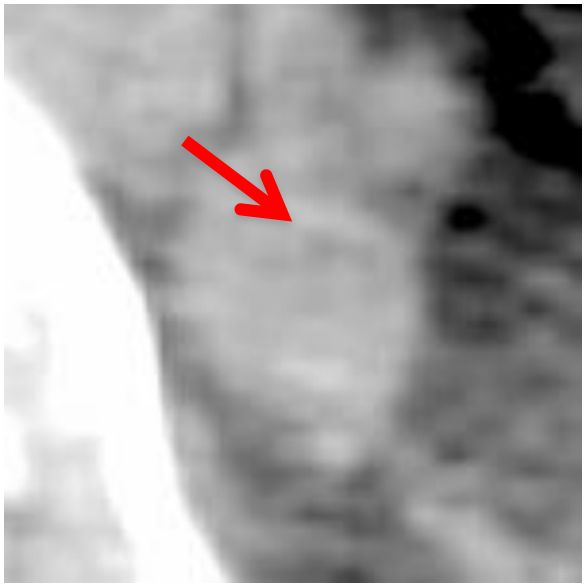


PTV pathological lymph nodes

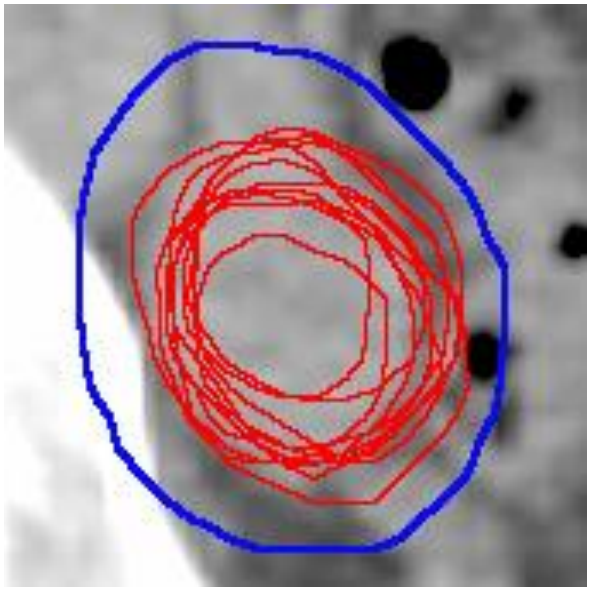
- **Assumption:**
  - **Lymph nodes are in a fixed relation to bony anatomy**
  - **Bony registration aligns pathological lymph node target**
- **Most often pathological lymph nodes shrink during RT**



CBCT 1st treatment



CBCT 24th treatment

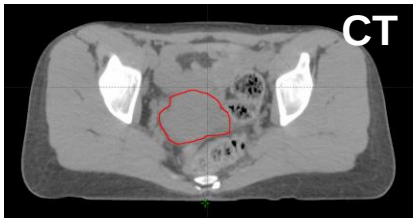


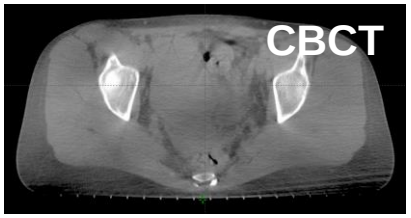
PTV (blue)
GTV on 10 CBCT (red)

Anne Ramlov, Radiother Oncol, in press

Skin marks versus daily bony registration

- **Daily image guidance with bony fusion**
  - Initial set-up according to skin marks
  - Image fusion according to bone
  - Verification of fusion
  - Couch correction
  - Typically 5mm PTV margin





- **Set-up on skin marks (no daily image guidance):**
  - Imaging at first RT or e.g. weekly
  - Typically 7-10mm PTV margin

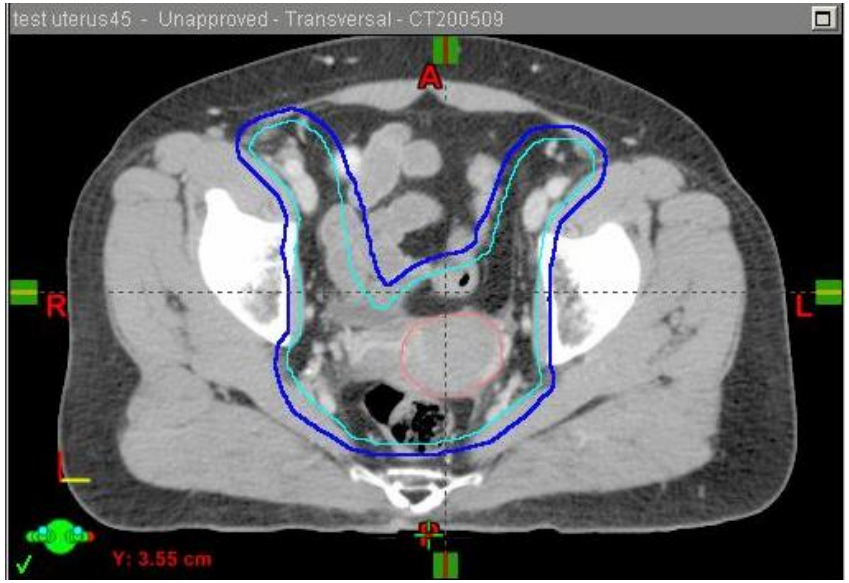
Variable	Vertical [mm]	Lateral [mm]	Longitudinal [mm]
Mean (M)	0,4	2,7	0,4
Σ	3,6	2,9	2,6
σ	3,6	3,2	2,4
Margin*	11,6	9,6	8,2

*Van Herk formalism: ***2,5*Σ+0,7*σ***
Semin Radiat Oncol 2004; 14:52-64

L.Laursen, RO 105 (2012) 220–225

Which PTV margin do you apply for CTV-E?

A. ≤5 mm
B. 6-9 mm
C. ≥10 mm



Do you think it is worthwhile to implement daily IGRT and decrease margin from 7-10mm to 5mm?

A. It is too many ressources to implement daily IGRT
B. It will not have impact on morbidity
C. 5mm PTV margin is not safe for target coverage
D. PTV margin reduction to 5mm is worthwhile

Why does the margin matter?

D. Verellen *et al.*, Nature Reviews Cancer 2007

r

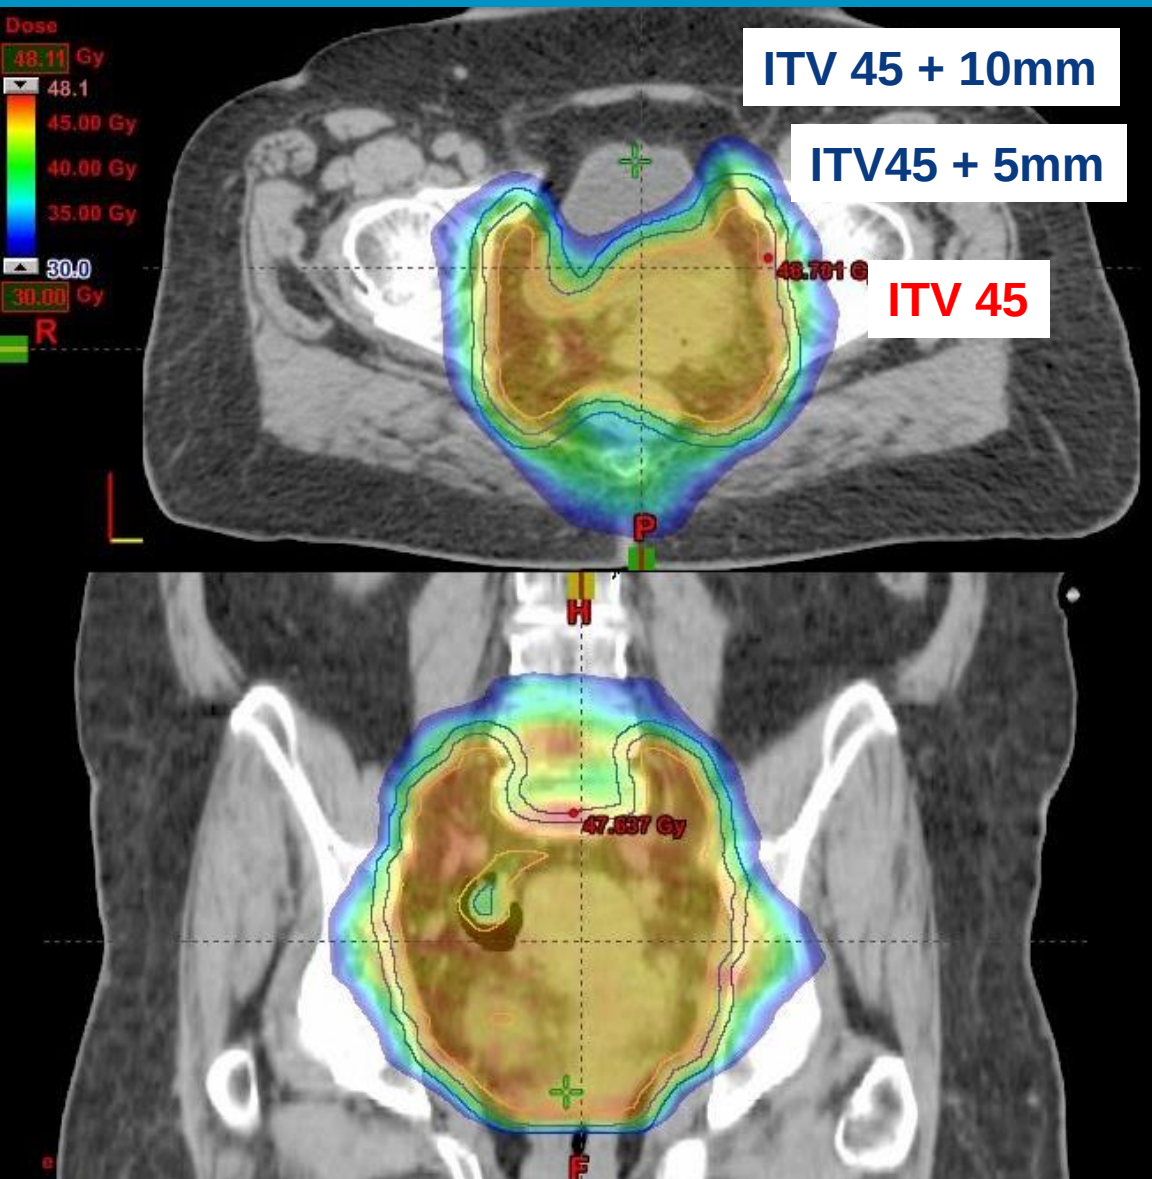
$\downarrow$

πr^2

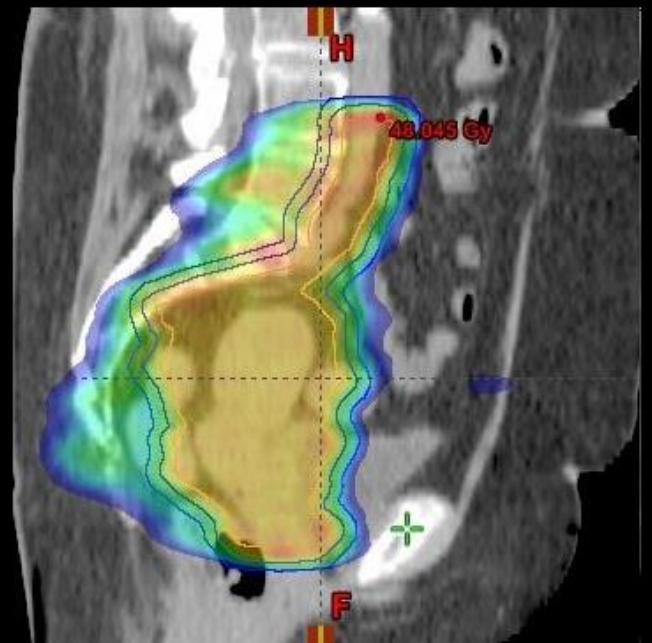
$\downarrow$

$4/3\pi r^3$

Let's take a look at the orange and the peel…

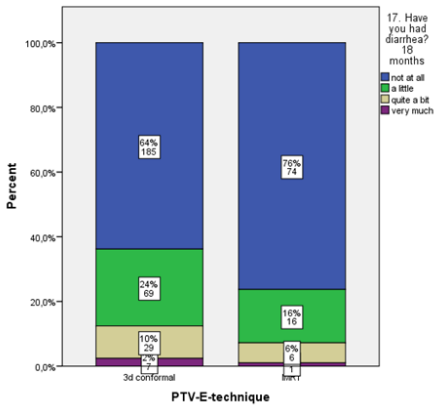


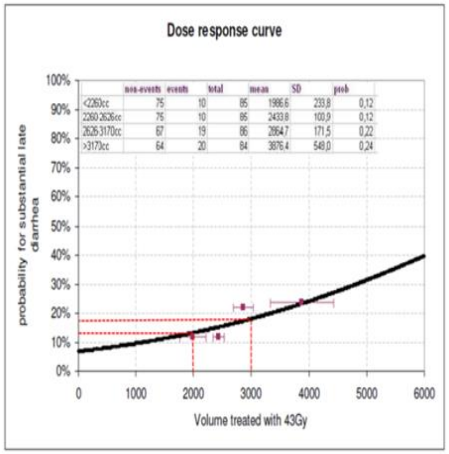
ITV 45	ITV 45 + 5mm	ITV 45 + 10mm
1000 cc	1500 cc	2000 cc



Is it important to reduce irradiated volume?

- **Evidence that bowel irradiation is related with acute morbidity**
- **Evidence that bowel irradiation is related with late morbidity**





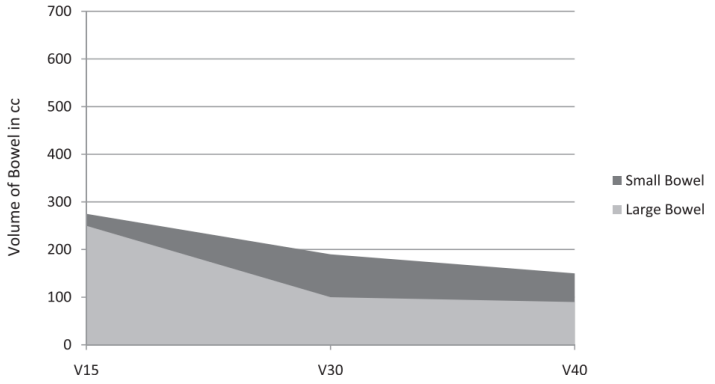


Fig. 1. Recommended dose–volume histogram. Restricting small bowel and large bowel volume doses within the recommended area under curve can restrict late bowel toxicity to within 5%.

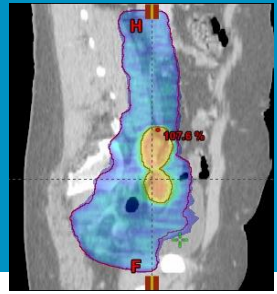
Preliminary EMBRACE data

Chopra S, IJROBP, 88, 630-635, 2014

EMBRACE I, EMBRACE II and AROI practice: EBRT volume (V43Gy)



Elective irrad.	Pelvic	Para-aortic
V43 (cc) EMBRACE I	~ 2500 cm^3	~ 3000 cm^3
CTV vol (cc)	~ 1000 cm^3	~ 1500 cm^3
PTV vol (cc) 5mm margin	~ 1500 cm^3	~ 2000 cm^3
V43Gy (cc) EMBRACE II	~ 1500 cm^3	~ 2000 cm^3

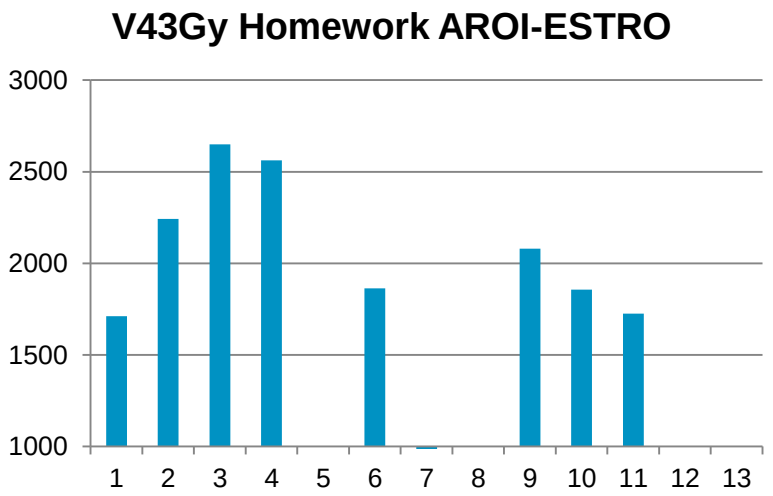
Nodal boost	Pelvic
V57 (cc) EMBRACE I	160 cm^3
CTV-N vol (cc)	10cc per node
PTV-N vol (cc) 5mm margin	30cc per node
V50Gy (cc) EMBRACE II	120 cm^3

Change of practice: EMBRACE I → EMBRACE II

CRT → IMRT : ↘ 500cm^3 (V43)

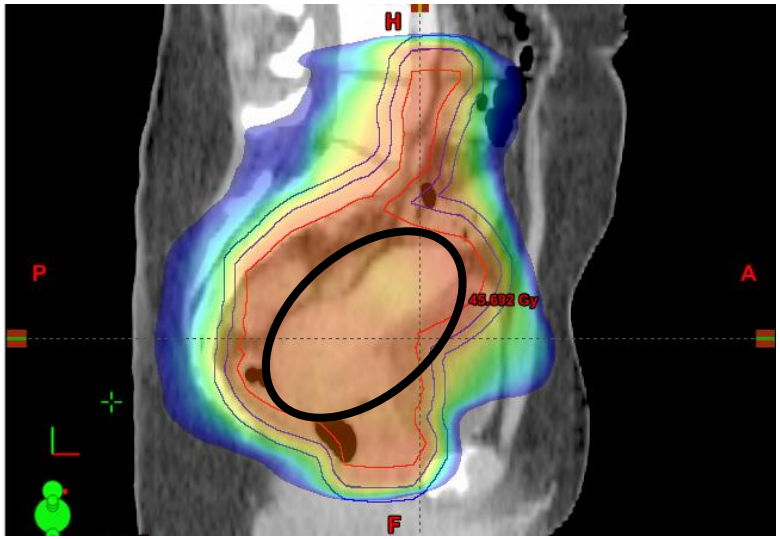
50Gy → 45Gy : ↘ 400cm^3 (V43)

xmm → 5mm : ↘ x cm^3 (V43)



Which total margin (ITV+PTV) is appropriate for the mobile primary tumour related CTV (GTV+cervix+uterus)?

A. 5 mm
B. 10 mm
C. 15 mm
D. 20mm
E. >20mm



Motion and dose – primary target

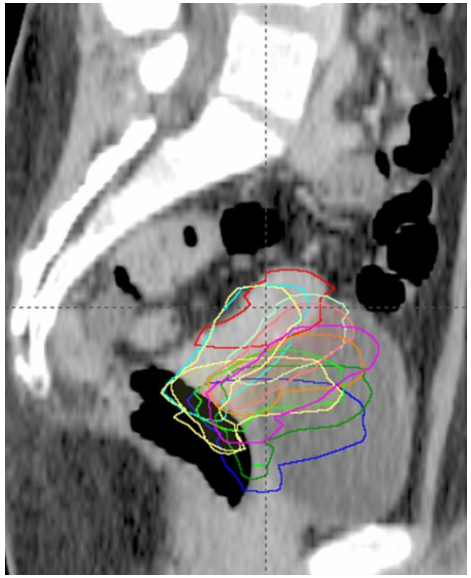
- **Jadon et al. A systematic review of organ motion and image-guided strategies in external beam radiotherapy for cervical cancer. Clin Oncol (R Coll Radiol). 2014 Apr;26(4):185-96**
  - **39 relevant studies**
  - **Patient specific motion: 5-40mm**
  - **Population based margins would be large (up to 40mm)**

- **Most studies evaluate geometry**
- **Few studies evaluate coverage (e.g. V95%)**
- **1 study evaluates dosimetric impact (D98)**

Which total dose (EBRT+BT) do you think this patient received to the non-involved uterus?

Patient case:

- 45/25fx EBRT
- 1.5cm CTV-PTV margin
- 50% of fractions: uterus outside PTV
- 40Gy EQD2 BT prescribed to CTV_{HR}



A. 20Gy

B. 30Gy

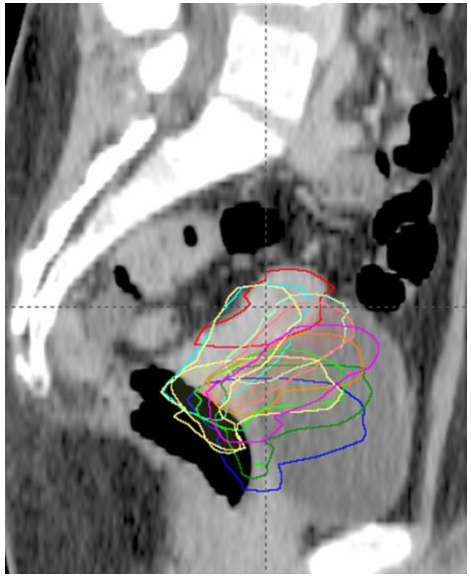
C. 35Gy

D. >40Gy

Which total dose (EBRT+BT) do you think this patient received to the non-involved uterus?

Patient case:

- 45/25fx EBRT
- 40Gy EQD2 BT
- 1.5cm CTV-PTV margin
- 50% of fractions: uterus outside PTV



EBRT dose: **38Gy**

BT dose: **6Gy**

EBRT+BT dose: **44Gy**

(Normally patients receive >5-10Gy to the uterus from BT)

Sapru et al, Radither Oncol 107 (2013) 93–98

Accumulated doses

- Daily image guidance
- IMRT PTV margins of
  - 5mm
  - 20mm
- Shortcomings:
  - Uterus dose? (CTV includes upper uterus only in case of myometrium invasion)
  - Only 20 patients

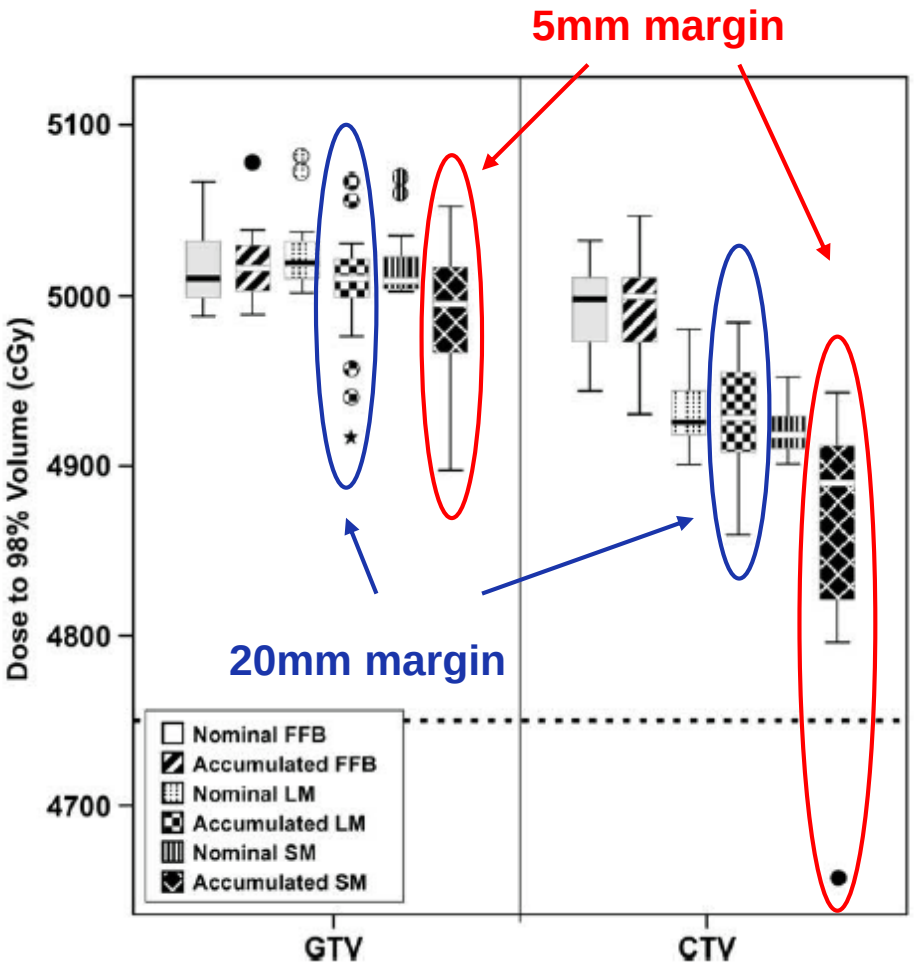


Fig. 4. Box plots of nominal and accumulated dose to 98% of gross tumor volume and primary tumor clinical target volume for four-field box (FFB), large-margin (LM), and small-margin (SM) plans.

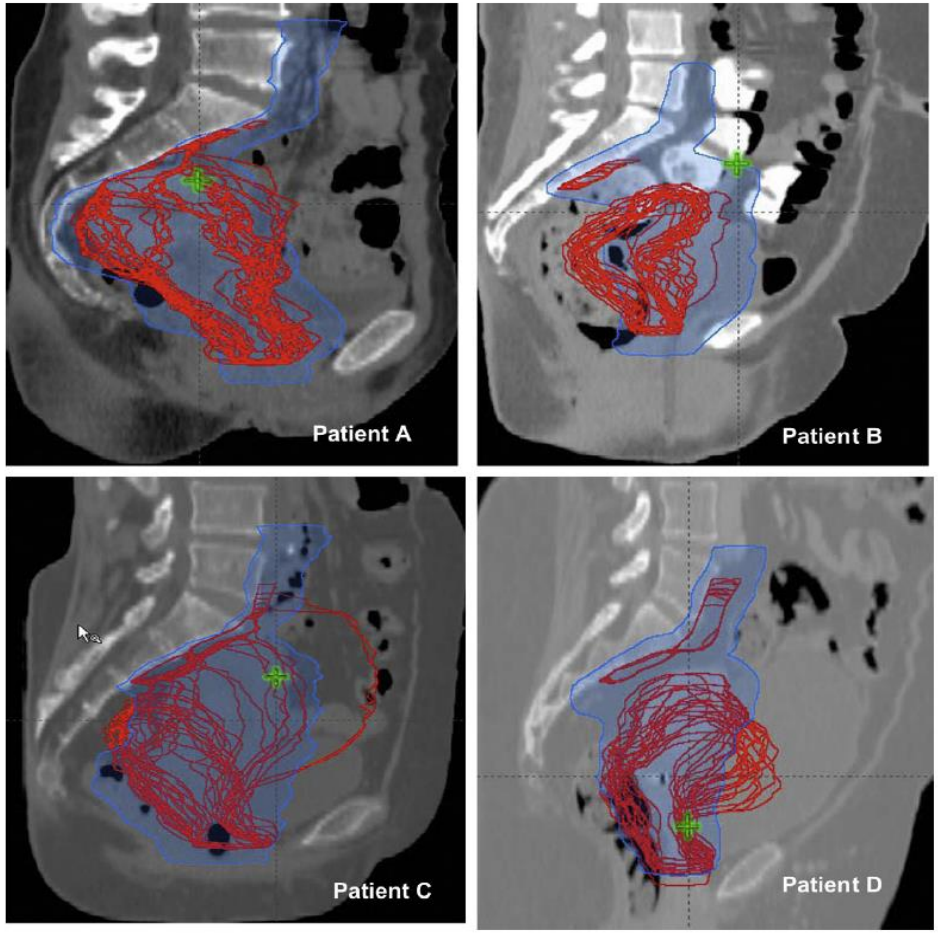
Lim et al, Pelvic radiotherapy for cancer of the cervix: Is what you plan actually what you deliver?, IJROBP 2009

Which of these motion patterns are of most concern for local control?



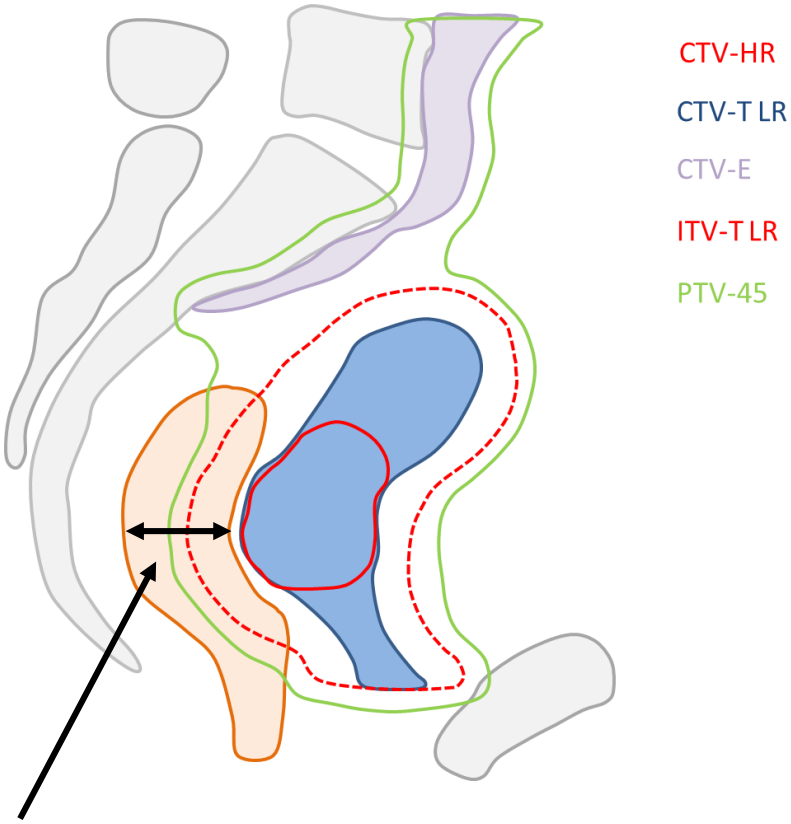
A. A
B. B
C. C
D. D

Tyagi et al, DAILY ONLINE CONE BEAM COMPUTED TOMOGRAPHY TO ASSESS INTERFRACTIONAL MOTION IN PATIENTS WITH INTACT CERVICAL CANCER, IJROBP 2011

ITV-T LR and PTV-T LR

Standard:

- 10-15mm ITV margin
- 5mm PTV margin
- Total 15-20mm margin



Maximum rectal filling at treatment planning scan: 40mm

Bladder filling strategy in your department?

A. No bladder filling protocol
B. Patient to void before each fraction for reproducible bladder filling
C. Instruct patients to keep full bladder at treatment
D. Specific drinking protocol

Bladder filling and bowel volume

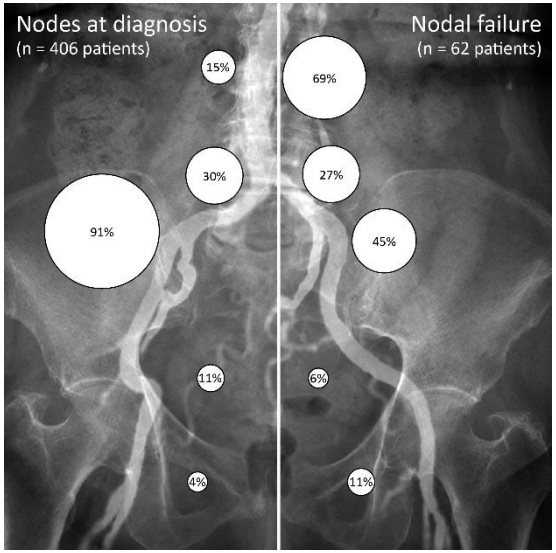
- **Full bladder versus empty bladder decreases volume of bowel irradiated to a significant dose**
- **Examples drinking protocol:**
  - **Instruction of patients to keep full bladder**
  - **Aarhus University Hospital: 450-500ml 1 hour prior to planning CT scan and to each treatment**
  - **Tata Memorial: 750-1000ml 30 minutes prior to planning CT and to each treatment**
- **Reproducibility of bladder filling?**
  - **Significant variation**
  - **Main purpose is to push bowel away!**

What has most impact on bowel dose?

A. **Bladder filling protocol**
B. **Reduction from 10 to 5mm CTV-E margin**
C. **Re-planning during radiotherapy to address tumour shinkage**

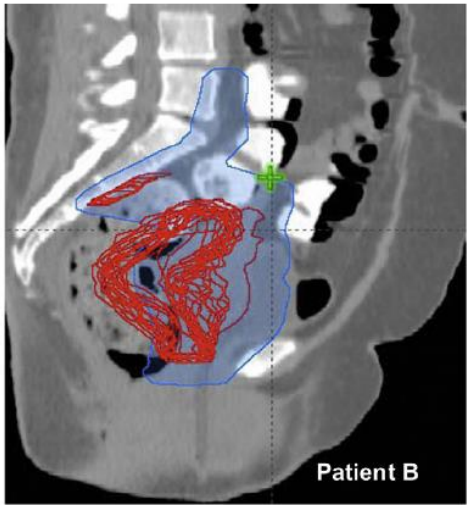
Take home message: nodal CTV

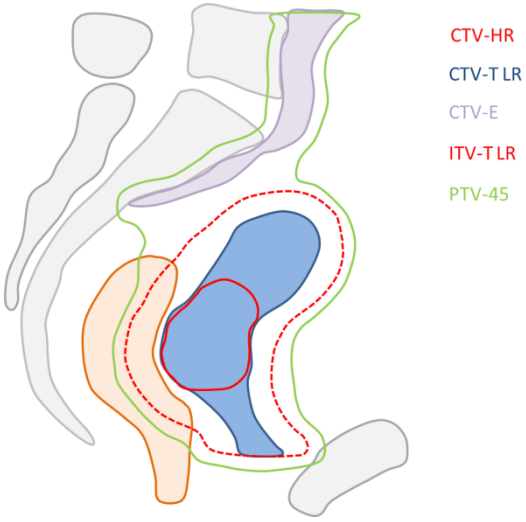
- **Margins add to considerable irradiation of normal tissue**
- **PTV margin for elective target volume:**
  - **7-10mm margin without daily image guidance**
  - **5mm margin with daily image guidance and bony fusion**
- **Potential in pelvic elective radiotherapy to reduce irradiated volume by 40% with IMRT and daily IGRT (2500cc → 1500cc)**



Take home message: primary CTV

- **Significant inter-fraction variations have been reported: 5-40mm**
- **Uninvolved uterus is not the most critical target**
- **Clinical practise:**
  - **~15-20mm is common for CTV-T LR to PTV margin**
  - **Be aware of rectal filling at time of treatment planning! E.g. threshold of 40mm diameter of filling.**





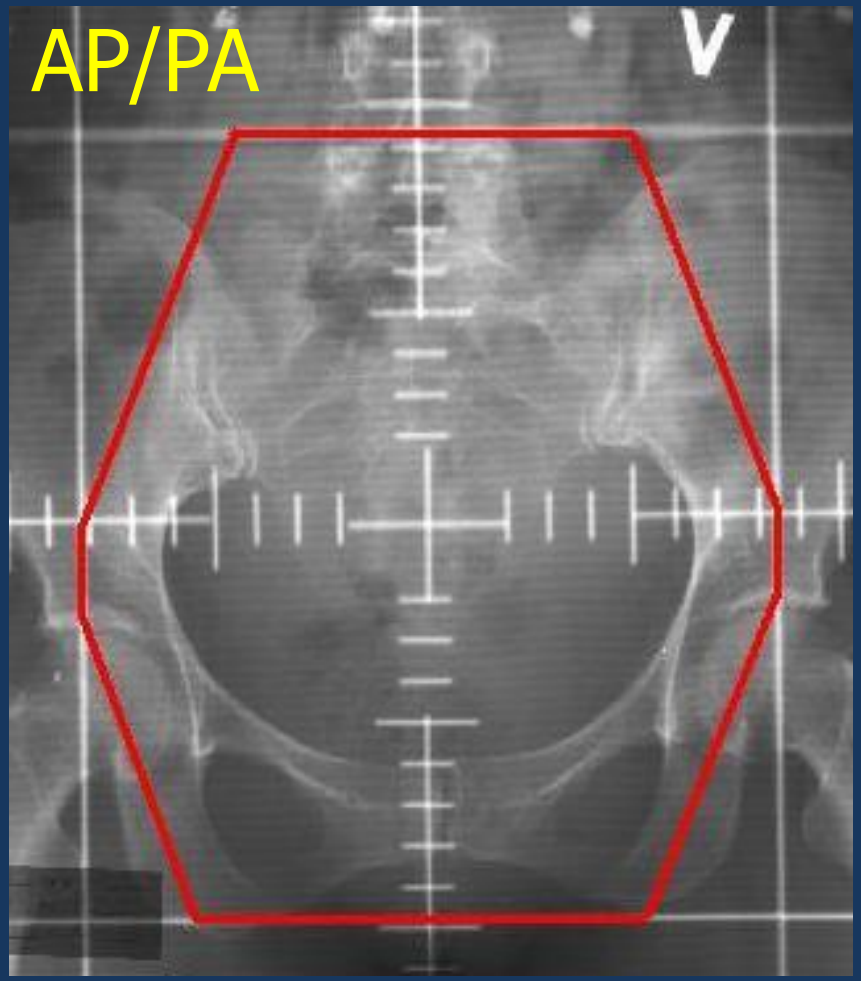
Treatment Techniques of EBRT for Cervical Cancer – physics aspects

Jamema Swamidas
Medical physicist
Tata Memorial Hospital, Mumbai,
India

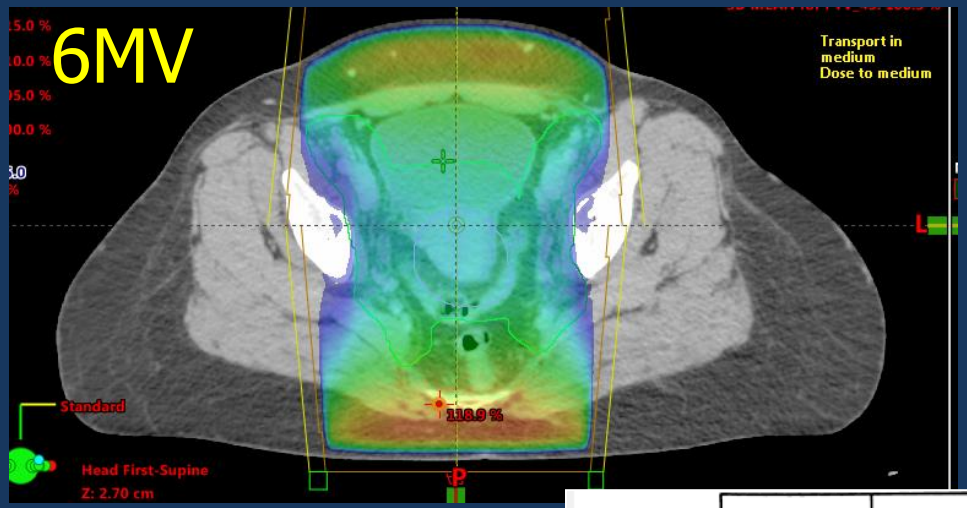
What kind of techniques do we have?

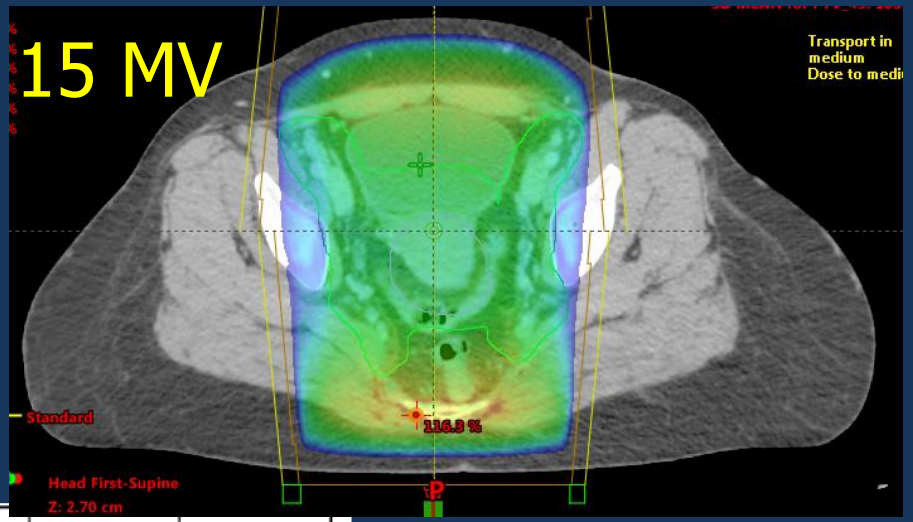
- AP-PA fields
- Four-field box techniques, X-ray based / CT based
- 3DCRT – 3 Dimensional Conformal Radiotherapy
- IMRT
- Rotational technique (VMAT) - FF and FFF
- Proton Therapy

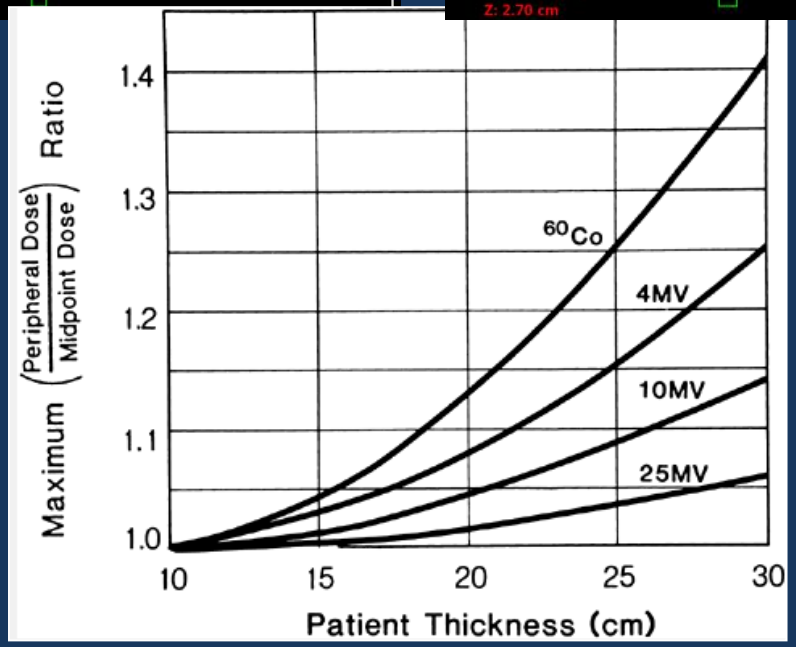
Based on X-ray imaging



AP/PA 6 MV vs 15MV

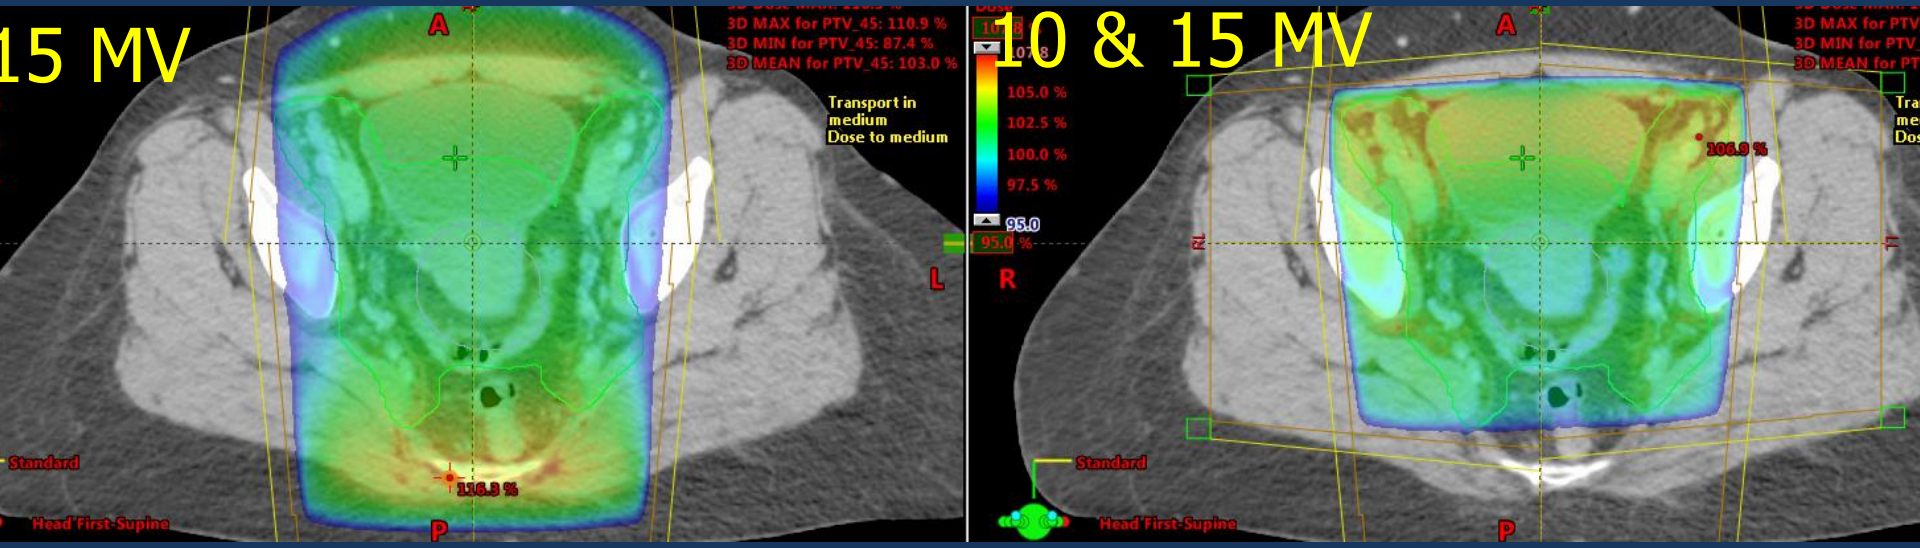






Khan 1994

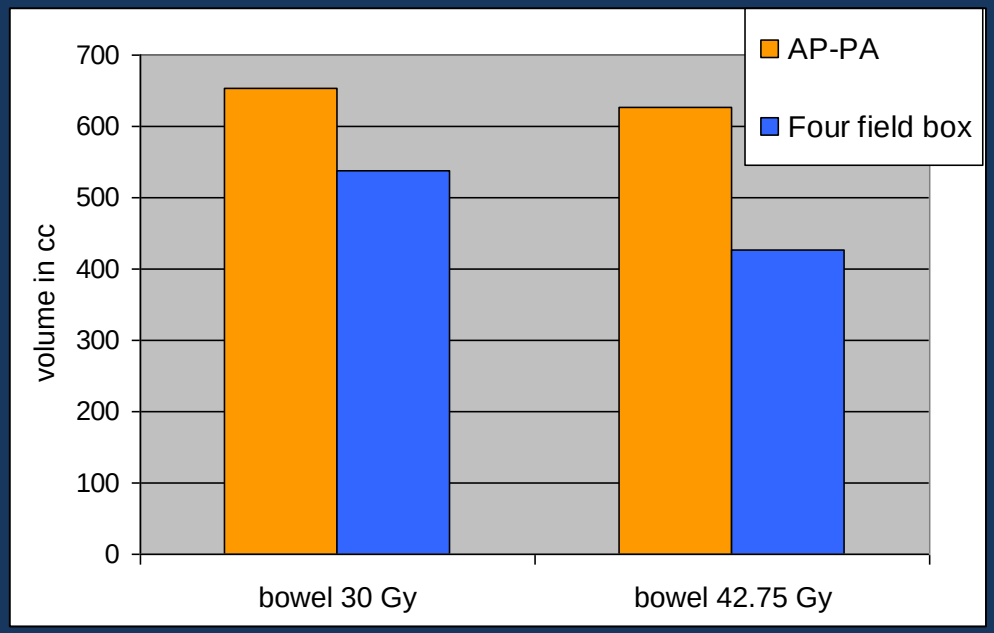
AP/PA vs 4F BOX (3DCRT)

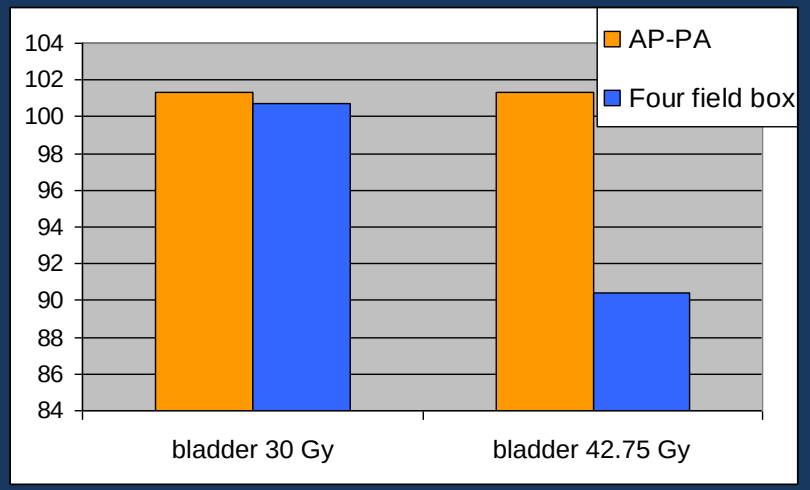


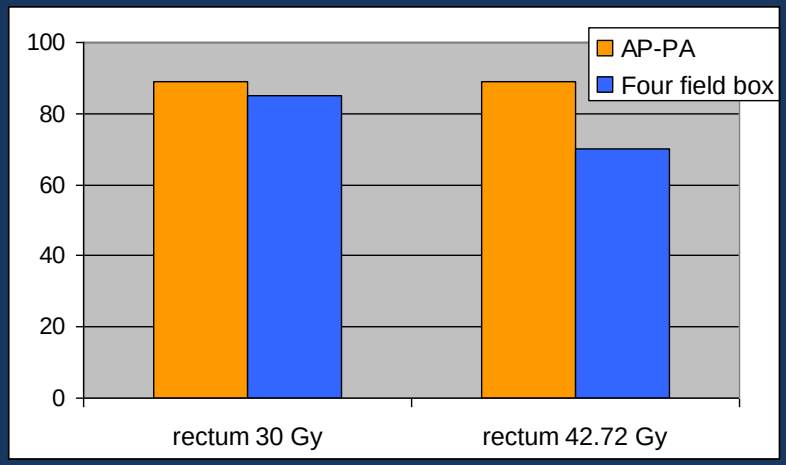
- Significant Organ sparing
- Improved conformity

AP/PA vs 4F BOX (3DCRT)

10 MV

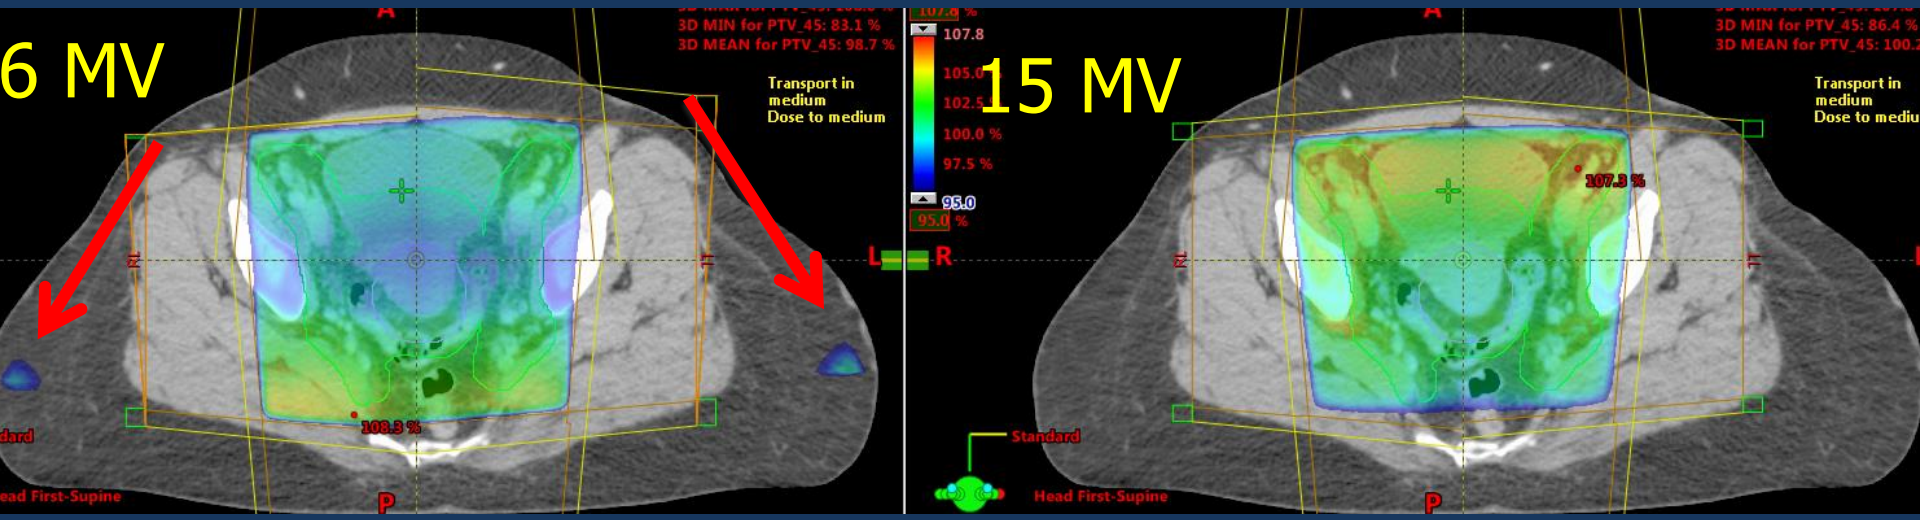






Van de Bunt et al 2006

4F Box 6MV vs 15MV



- Homogeneity in higher energy
- Dose (95%) spilling in muscles

MLB (midline block) 3DCRT

- Central rectangular portion with an area 10 × 4 cm at isocenter
- Homogeneity around target for teletherapy and brachytherapy
- Thickness of 5.5 HVL
- The fall-off of dose between point A and point B is estimated by normalizing the point A dose value to 100%.

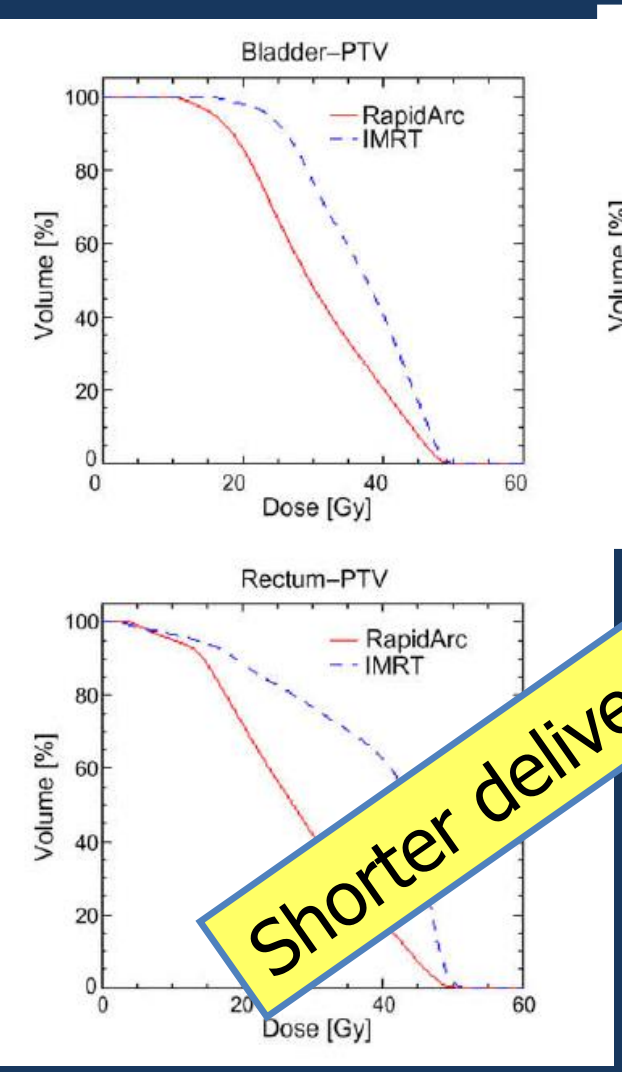
VMAT vs IMRT

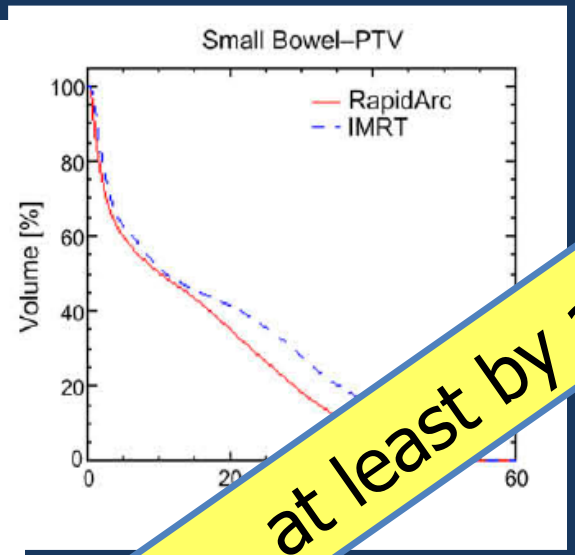
- Target:
  - VMAT showed a slightly improved target coverage in terms of D2% (not significant) .
  - No sig diff in min dose, same HI
  - Conformity is superior in VMAT
- OARs:
  - VMAT reduced irradiated high dose levels (V40 and V50) particularly for the bladder (not significant?).
- integral dose significantly lower ?.
- Reduced treatment time and MU in VMAT.

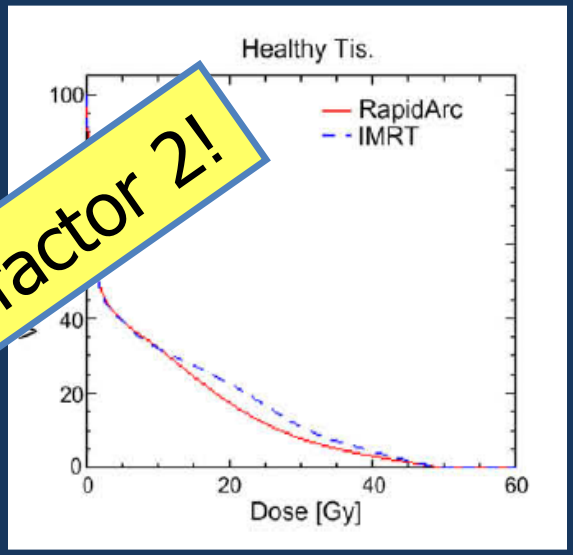
Cozzi et al R&O 2008

IMRT vs VMAT (RapidArc)

8 patients with ca. cervix





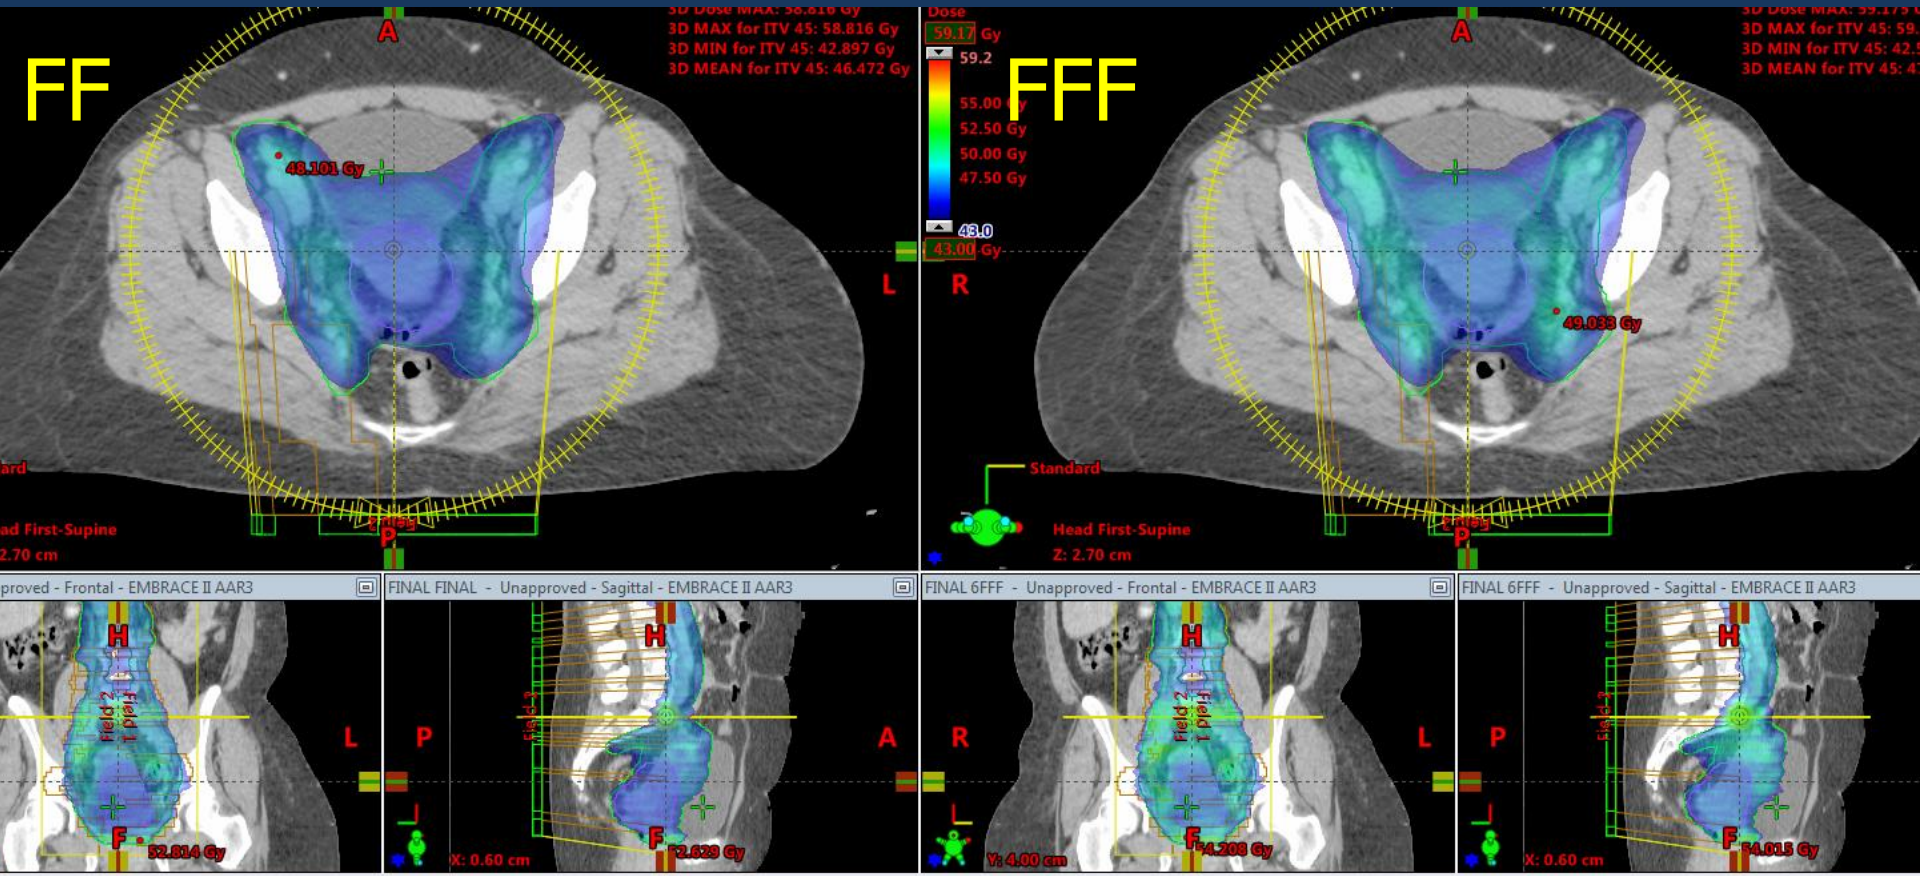


Shorter delivery time, at least by a factor 2!

	Parameter	Objectives	IMRT	RapidArc	p
Rectum-PTV	Mean (Gy)	<45	42.5	36.3	0.02
	V_{40Gy}(%)	Minimise	78.7	51.5	0.03
	$D_{2\%}$(Gy)	<47.5	50.9	51.1	0.65
	$D_{50\%}$(Gy)	<30	44.1	38.0	0.02
Bladder-PTV	Mean (Gy)	<42	36.6	30.3	0.001
	V_{40Gy}(%)	Minimise	40.5	20.2	0.01
	$D_{2\%}$(Gy)	<47.5	47.8	46.9	0.04
	$D_{50\%}$(Gy)	<35	36.6	29.0	0.002

Cozzi et al R&O 2008, Qiao L 2016 et al

VMAT FF vs FFF



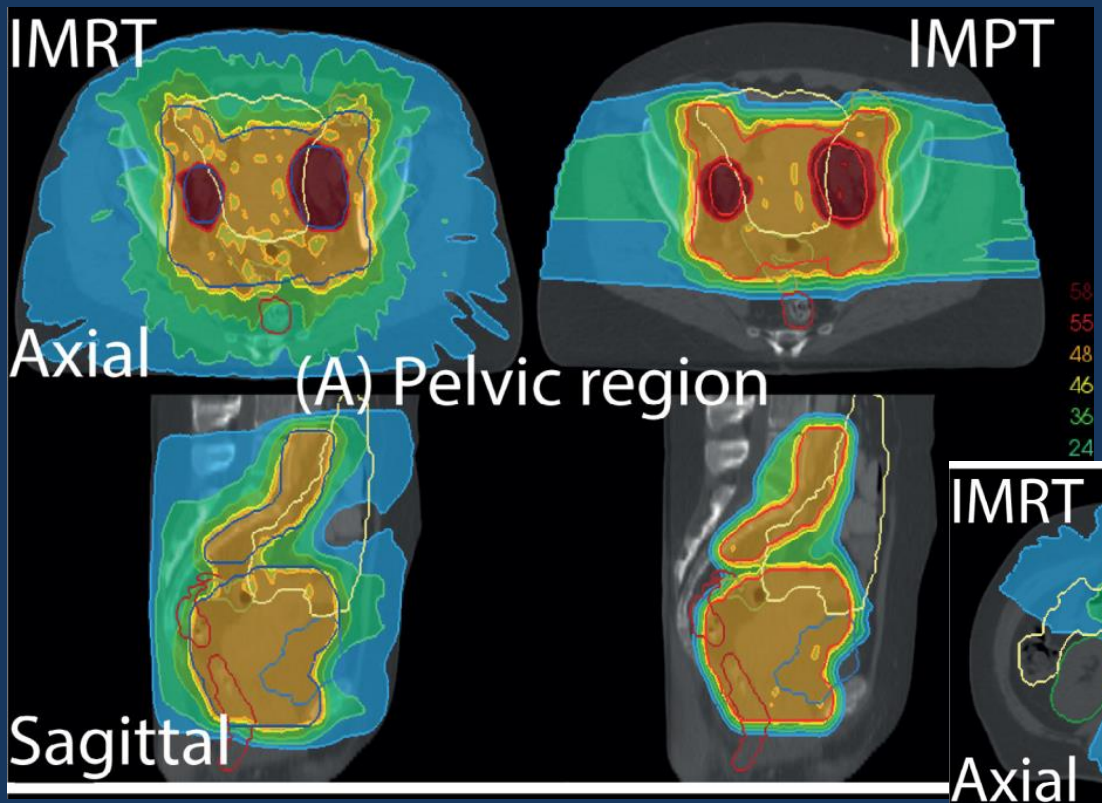
VMAT FF vs FFF

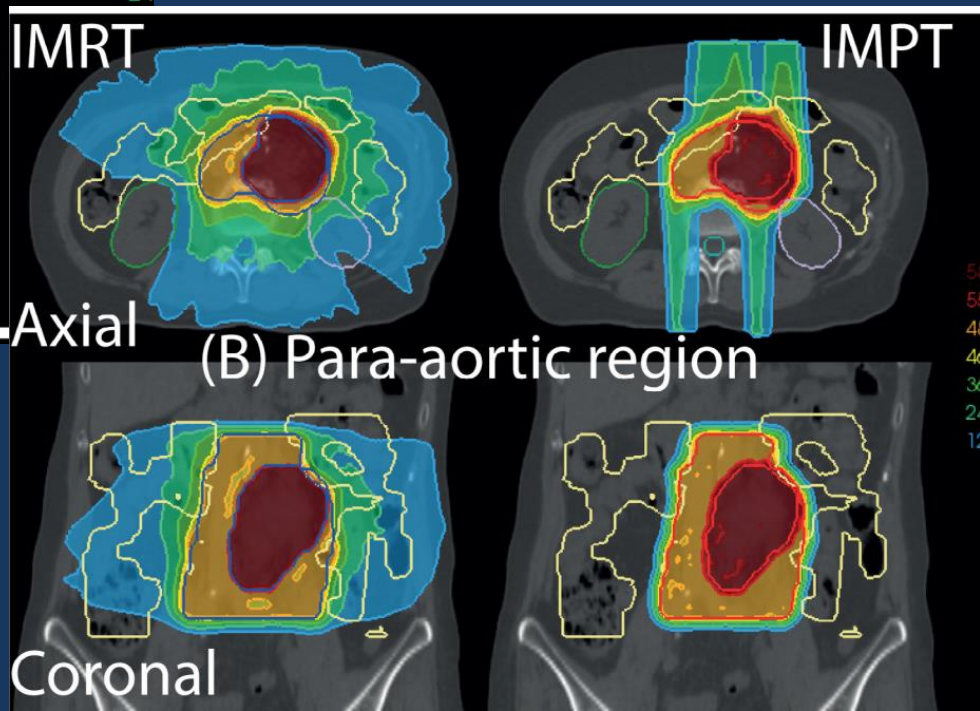
- No differences in dose distribution between FFF-VMAT and FF-VMAT for OARs and target.
- Reduction of beam-on time
- 11% less for 6FFF-VMAT and 16% less for 10FFF - VMAT

Fuli Zhang et al. Oncology and Translational Medicine August 2016, Qiao et al

.

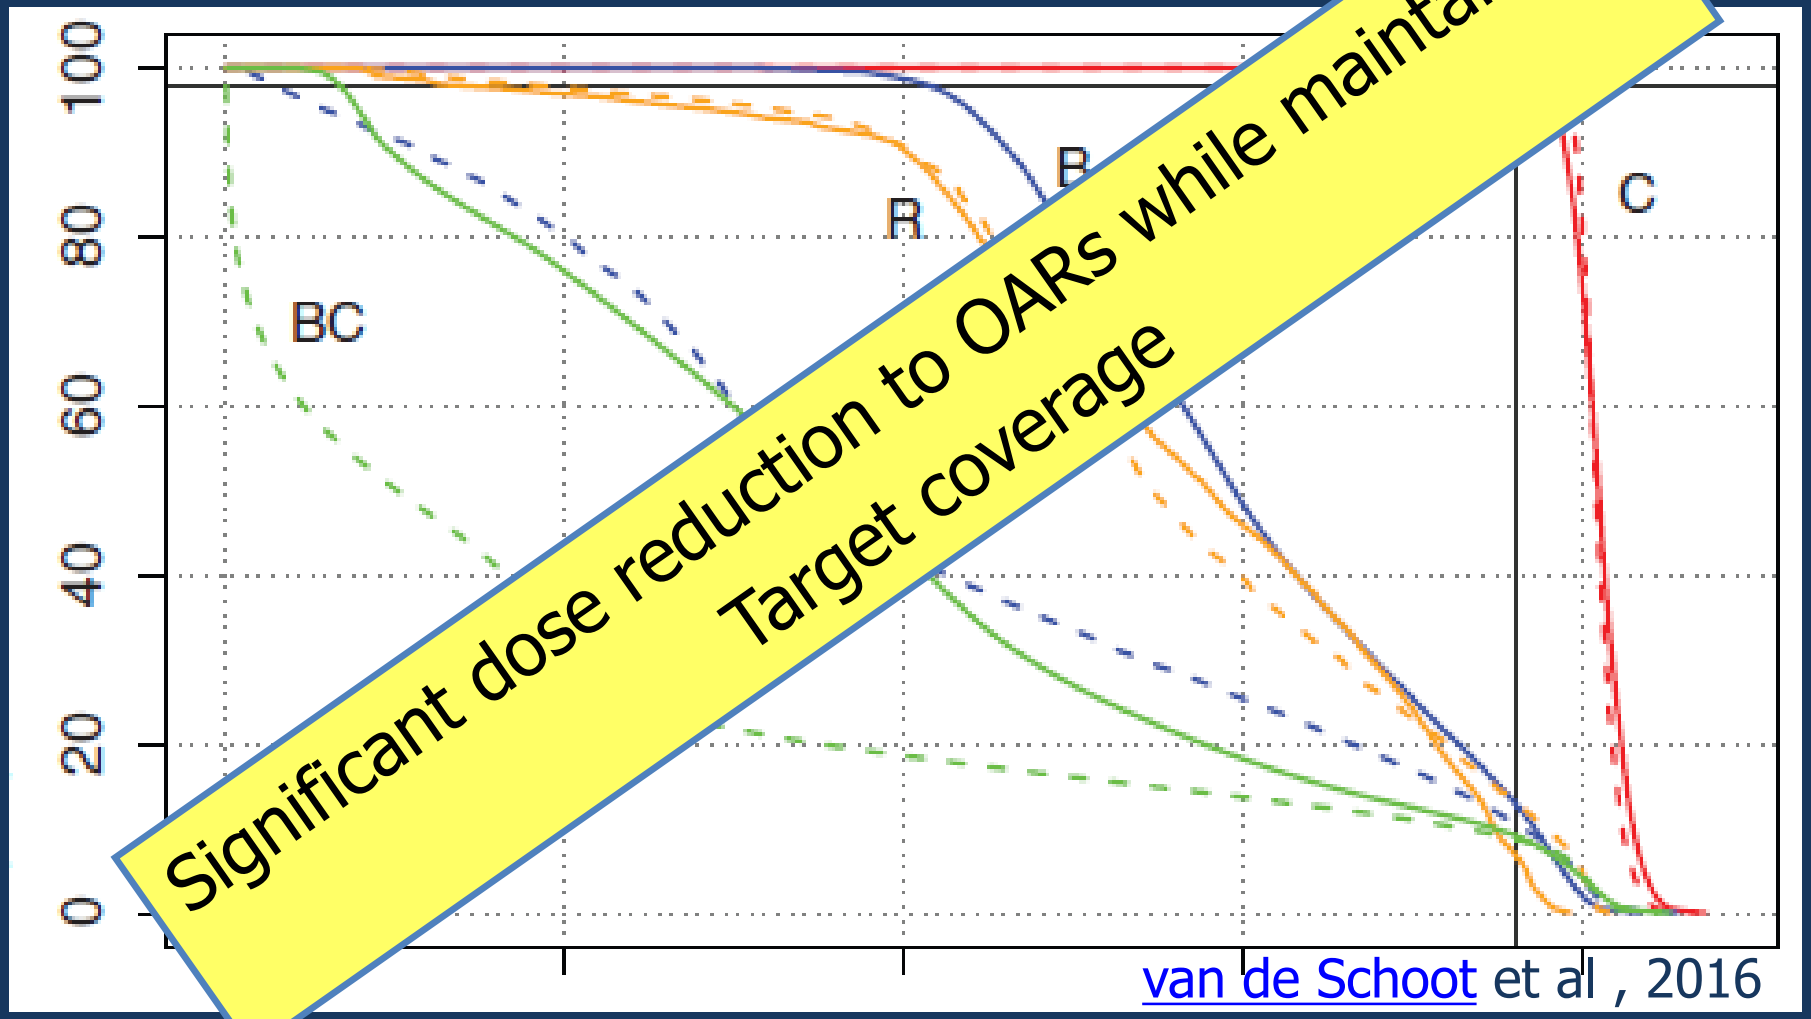
IMRT vs IMPT





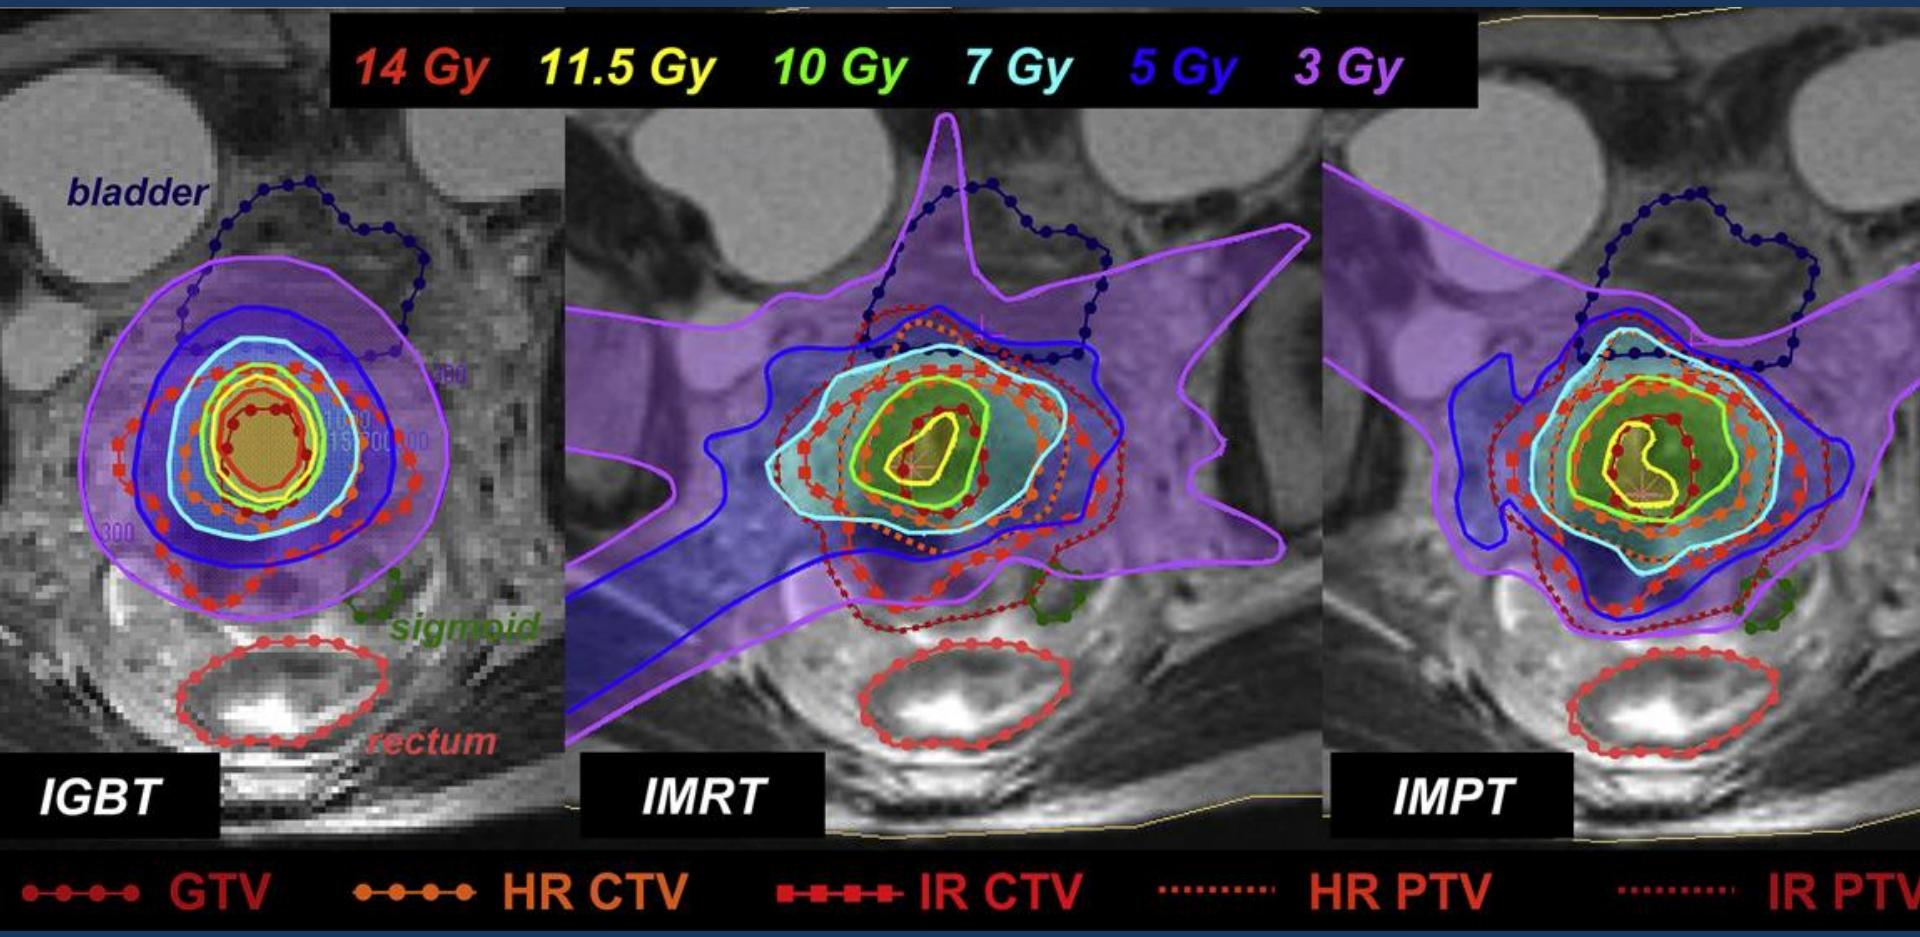
Vande san de et al, 2016

VMAT vs IMPT



van de Schoot et al , 2016

IGBT vs IMRT vs IMPT



George et al, 2008

IMRT vs IGBT

- For IMRT CTV-PTV margins is needed, i.e. a larger volume, compared to brachytherapy, has to be treated.
- D90 for IMRT was lower compared to BT for most of the patients.
- The volumes receiving intermediate doses (>60Gy) are much larger for IMRT.
- The importance of very high central doses are most likely of major importance for the excellent local control obtained with brachytherapy.

Advanced BT is superior to IMRT

Conclusion

- Conventional simulator radiograph based planning is still prevalent
- Choice of energy
- MLB – normalization, T odeling
- 3DCRT vs IMRT – icant organ sparing
- IMRT vs VM gnificant reduction of MU
- VMAT F FF – Marginal Reduction of time
- VMAT vs IMPT – Significant reduction of dose to OARs

Advanced BT is superior than IMRT

Use of IMRT Techniques in GYN Cancers- Clinical Evidence

- Optimize dose to normal tissue
  - Decrease the normal tissue toxicities
- Optimize more dose to tumor (Boost: Sequential/Simultaneous)
  - Increase tumor control rates
- Expansion of Indications
  - Extended field radiation
  - Salvage Re-irradiation

Review

Gynecol Oncol 130:229–36;2013

Intensity modulated radiotherapy in gynecologic cancers: Hope, hype or hyperbole?

Aaron Wagner [a], Anuja Jhingran [b], David Gaffney [a,*]

- In **postoperative cases**, IMRT use **should be considered**. To demonstrate preferred patient reported outcomes, participation on the RTOG/GOG 1203 TIME-C trial is encouraged.

- In **intact cases**, the use of IMRT should be **limited to IRB-approved protocols** secondary to additional planning concerns.

- **Consensus guidelines** exist as to contouring both postoperative and intact cases, and should be utilized. However, **changes are in progress**, secondary to concerns as noted above, and appropriate care should be taken during treatment planning, which may require patient **specific adjustments**.

- **IGRT** should be utilized when IMRT is implemented secondary to the significant inter-fraction variability that can occur.

Q: What percentage of cervical cancer patients with intact uterus undergo IMRT/VMAT treatment at your centre?

A. 10%

B. 25%

C. 85%

D. None

IIB	13 (59)	12 (55)
IIIB	09 (41)	10 (45)
KPS, median (range)	90 (70-90)	90 (70-90)

Gandhi A et al; IJROBP ; 87:542-8;2013

Table 2 Dose–volume histogram characteristics for target coverage and OARs

Characteristic	WP-CRT arm	WP-IMRT arm	*P* value
Mean CTV D_{95}, Gy	51.95 ± 0.85	51.26 ± 0 .28	.42
Mean CTV Nodal D_{95}, Gy	52.01 ± 1.1	51.52 ± 0.26	.243
Mean PTV D_{95}, Gy	49.44 ± 4.37	50.68 ± 0.40	.438
Mean rectum V_{40}, % volume	98.37 ± 4.58	42 ± 2.78	.0001
Mean bladder V_{40}, % volume	97.54 ± 3.78	42.44 ± 2.74	.0001
Mean small bowel V_{40}, % volume	61.21 ± 14.63	31.66 ± 3.56	.001
Mean small bowel V_{90}, volume in cm^3	417.54 ± 42.16	199.89 ± 47.08	.005
Mean small bowel V_{100}, volume in cm^3	336.22 ± 37.88	102.47 ± 29.09	.001
Mean bone marrow V_{10} , % volume	99.44 ± 2.85	96.05 ± 3.61	.619
Mean bone marrow V_{20}, % volume	98.95 ± 3.71	87.24 ± 4.70	.618

Significant reduction in V40 for Rectum, bladder and small bowel

Gandhi A et al; IJROBP ; 87:542-8;2013

Table 3 Acute gastrointestinal and genitourinary toxicity in WP-CRT and WP-IMRT arms

Toxicity	WP-CRT arm, n (%)	WP-IMRT arm, n (%)	*P* value	Effect size
Vomiting grade ≥2	8 (36.4)	2 (9.1)	**.034**	**0.273**
Vomiting grade ≥3	1 (4.5)	1 (4.5)	.756	0
GI grade ≥2	14 (63.6)	7 (31.8)	**.034**	**0.318**
GI grade ≥3	6 (27.3)	1 (4.5)	**.047**	**0.228**
GU grade ≥2	7 (31.8)	5 (23.8)	.404	0.08
GU grade ≥ 3	3 (13.6)	0 (0)	.125	0.136

GI Chronic toxicity

	WP-CRT arm	WP-IMRT arm	p value
Overall	50%	13.6%	.011
Grade 1	27.3%	9%	
Grade 2	13.6%	4.5%	

CONCLUSION: WP-IMRT is associated with significantly less toxicity compared with WP-CRT and has a comparable clinical outcome. Further studies with larger sample sizes and longer follow-up times are warranted to justify its use in routine clinical practice.

Post Operative IMRT in GYN Cancers

I. J. Radiation Oncology ● Biology ● Physics Volume 52, Number 5, 2002

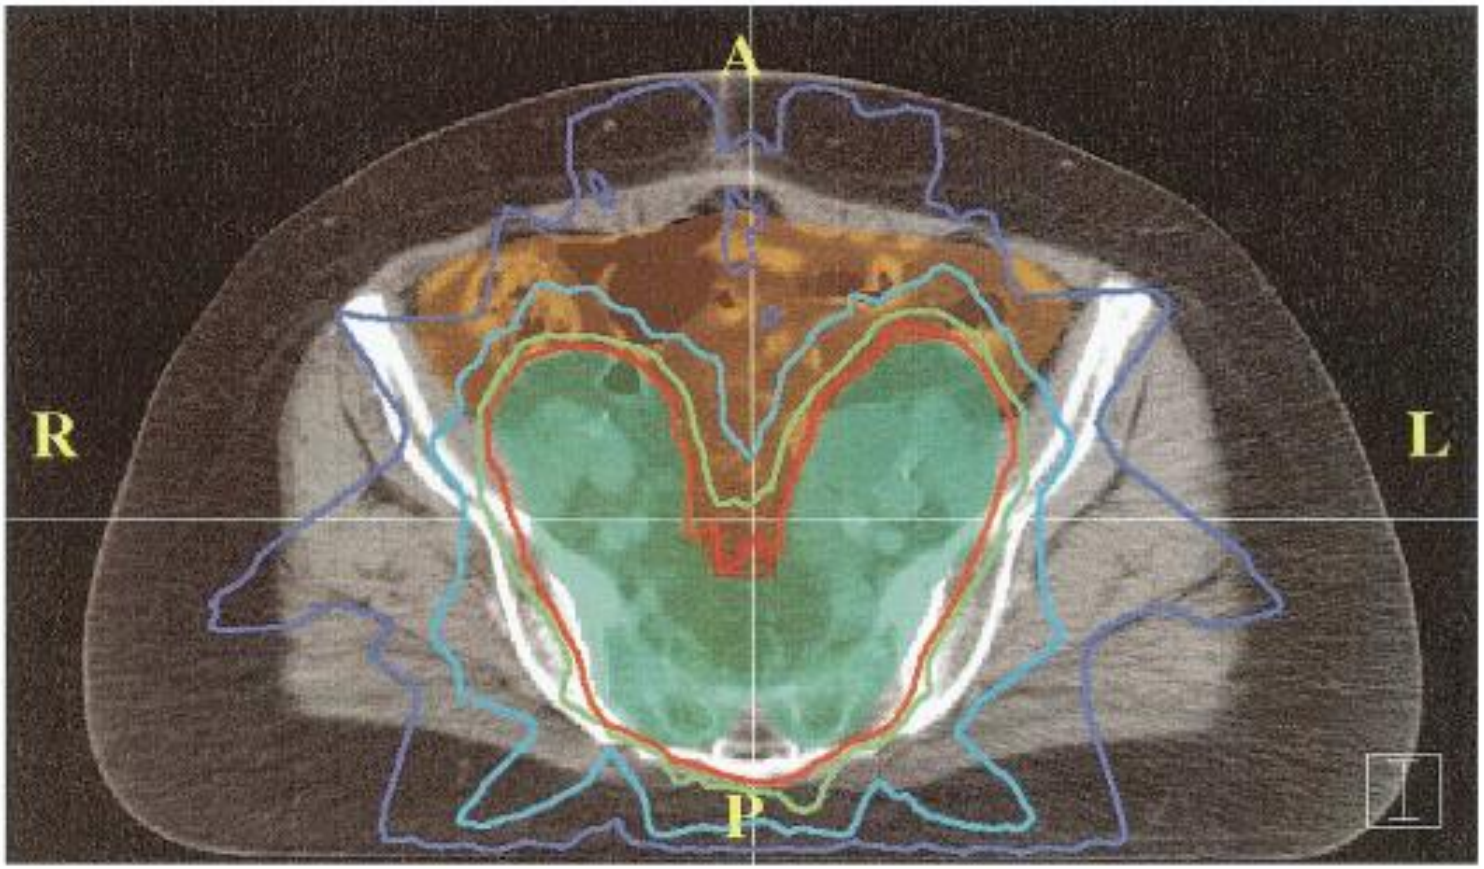

Fig. 2. Isodose curves from an IM-WPRT plan superimposed on an axial CT slice through the upper pelvis. The small bowel and PTV are shaded in orange and green, respectively. Highlighted are the 100% (red), 90% (green), 70% (light blue), and 50% (dark blue) isodose curves.

RTOG 0418

A phase II study of post op IMRT in gynecological cancer

- 83 patients (43 pts endometrial ; 40 pts cervical cancer)
- RT 50.4Gy with weekly CDDP (40mg/m^2)
- 90% patients received 4 cycles of CDDP
- Pelvic IMRT with emphasis on small bowel & BM sparing technique

IJROBP 2013

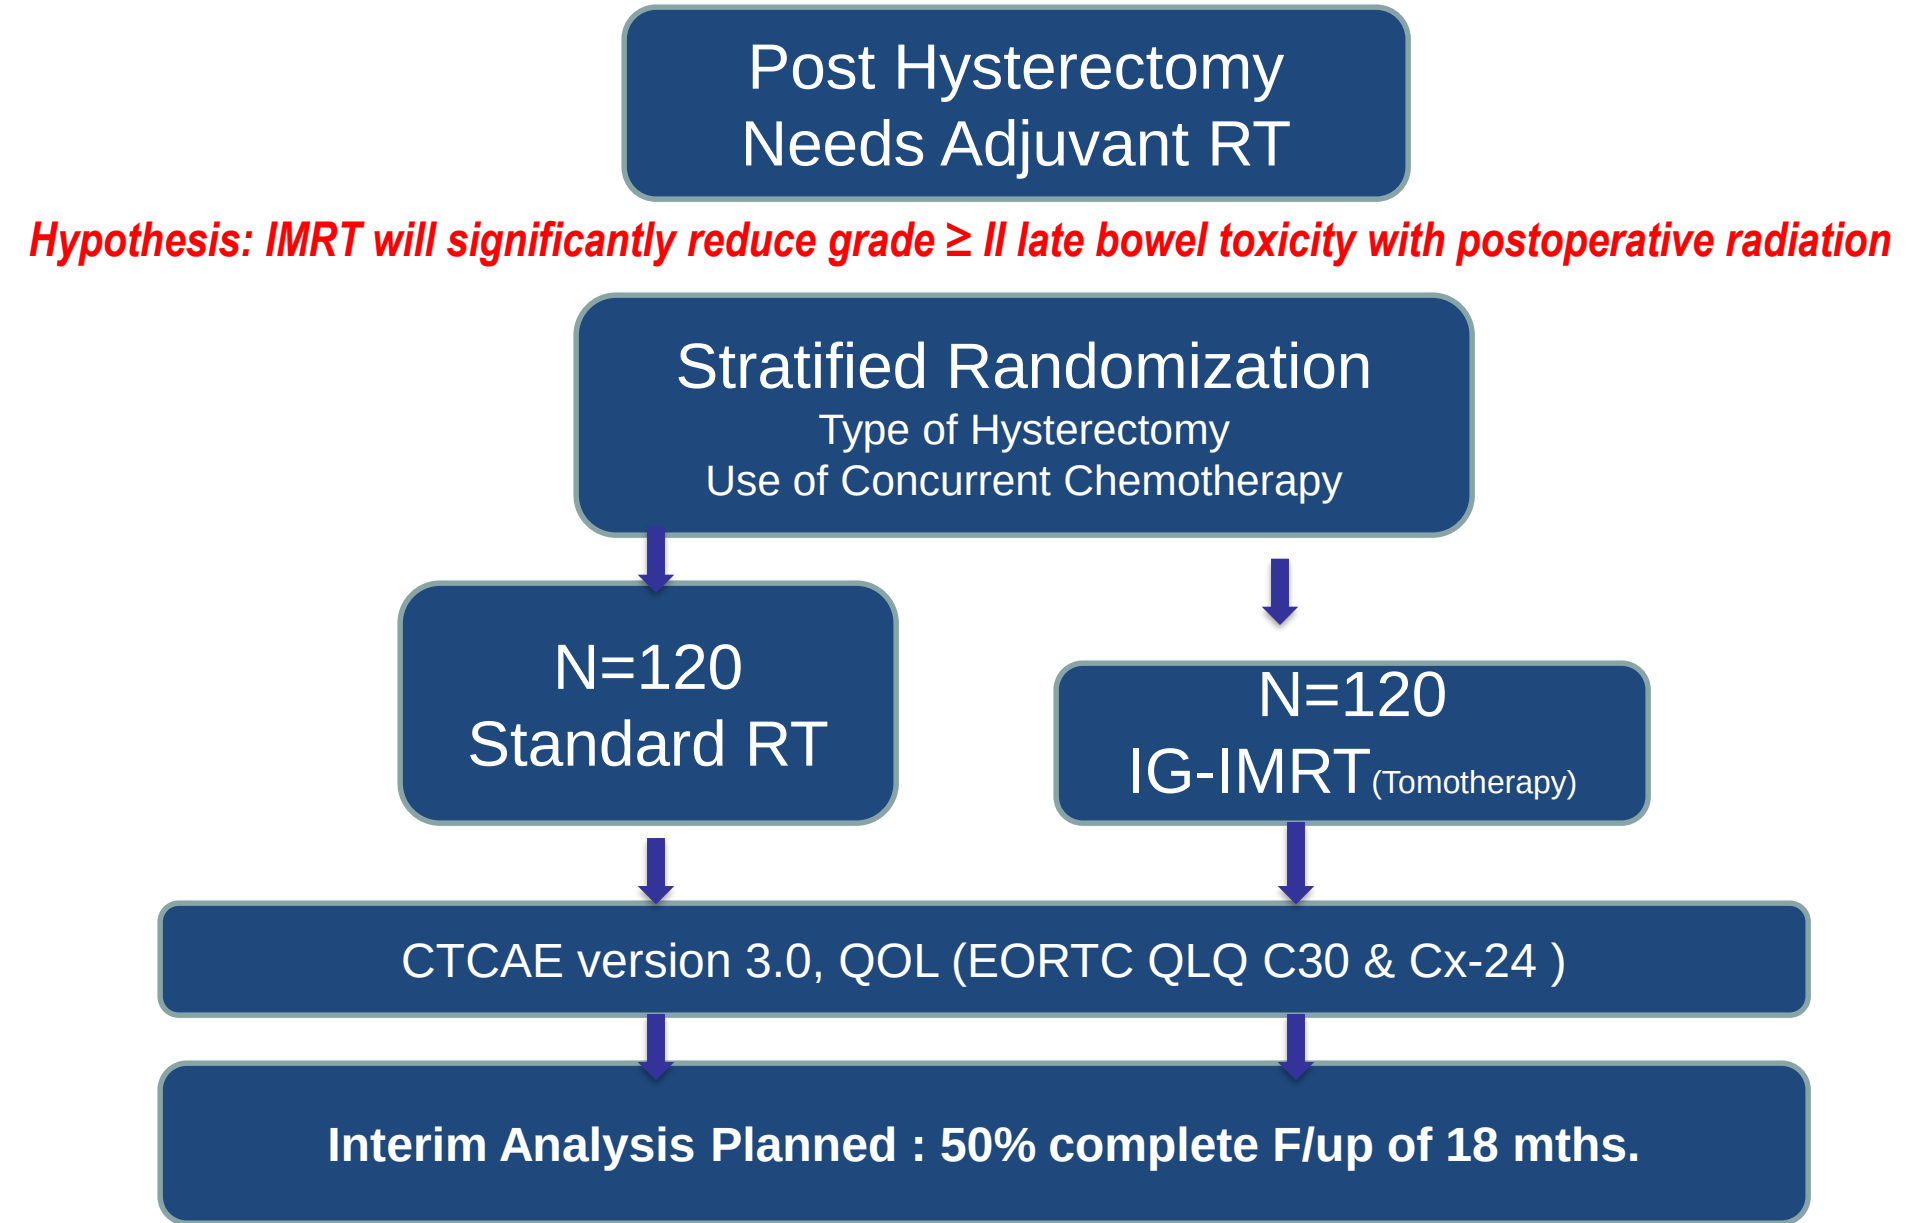
- Hematological toxicities in CRT pts
  - Gr 1 : 23%
  - Gr 2 : 33%
  - Gr 3 : 25% (Vs 31% RTOG 9708 p = NS)
- Median V 10 : 96%; V20: 84%
- Median V 30 : 61%; V40: 37%
- V40 >37% : 75% had Gr≥2 Vs 40%
- Grade 4 toxicity : 0% Vs 13% (RTOG 9708)

Conclusions: Pelvic IMRT with weekly cisplatin is associated with low rates of HT and high rates of weekly cisplatin use. The volume of bone marrow receiving 40 Gy and the median dose to bone marrow correlated with higher rates of grade 2 toxicity among patients receiving weekly cisplatin (cervical cancer patients). Evaluation and limitation of the volume in patients receiving concurrent

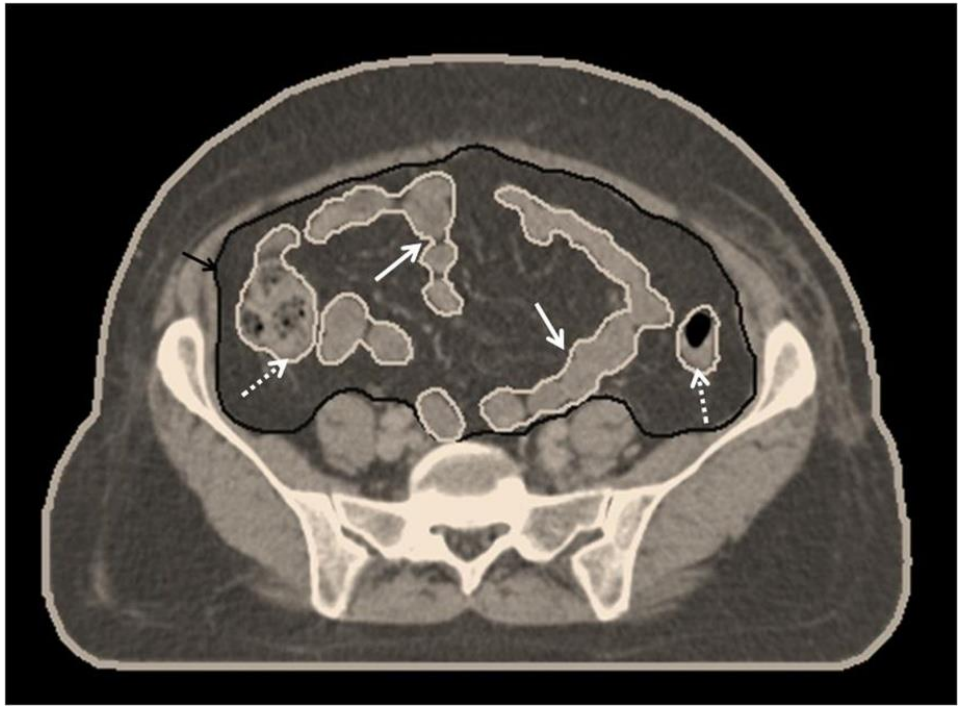
V 40 Gy > 40% correlated with ≥ grade 2 HT toxicity
Mahantshetty et al; IJGC 2012

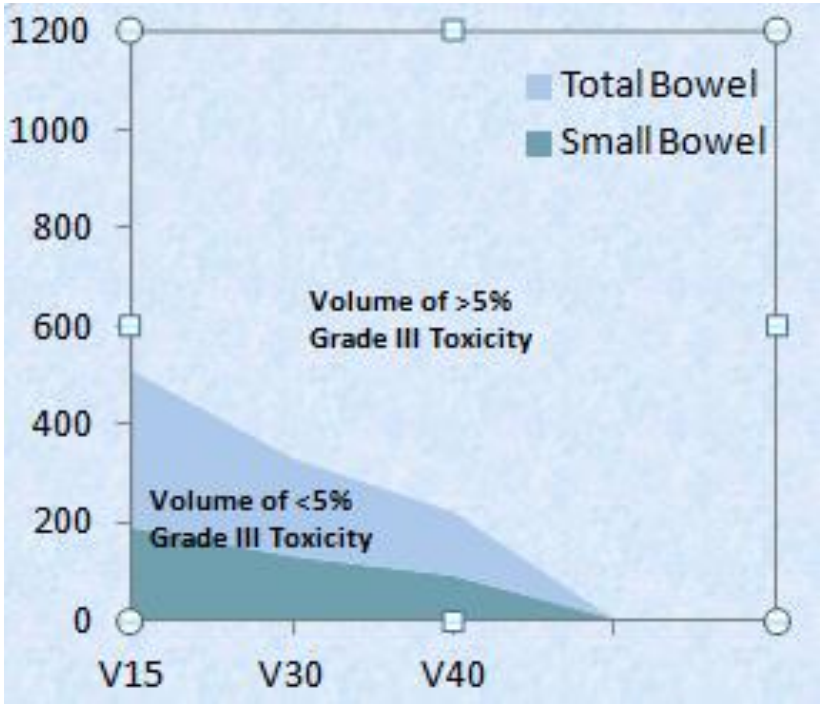
IJROBP 2013

Phase III RCT of Postoperative Adjuvant Conventional Radiation (3DCRT) Vs. Image Guided Intensity Modulated Radiotherapy (IG-IMRT) for Reducing Late Bowel Toxicity in Cervical Cancer (PARCER): Interim Analysis (Tata Memorial Centre)



OAR Contouring & Dose Constraints





Small & Large Bowel

Peritoneal Cavity

Rectum, Bladder

Hard Constraints:
V15 SB <190 cc, V40 SB <100 cc

Soft Constraints:
Rectum <60% vol >/= 30 Gy
<35% Bladder >/=45 Gy

Bowel Doses : 3DCRT vs. IMRT

Bowel Dose	IMRT	3DCRT	P value
V15 Small Bowel ≥ 275 cc	8 (13.1%)	25 (44.6%)	<0.0001
V40Small Bowel ≥ 150 cc	1 (1.6%)	26 (46.4%)	<0.0001
V15 Peritoneal Cavity ≥ 1200 cc	15 (24.5%)	24 (42.8%)	0.06
V40 Peritoneal Cavity ≥ 750 cc	1 (1.6%)	20 (35.7%)	<0.0001

IMRT led to significant reduction in Bowel and PC doses

S Chopra et al; ASTRO 2015

Primary Endpoint

	IG-IMRT	3DCRT	p value
Late Grade ≥ II toxicity (Primary Endpoint)	11.4%	25%	0.13
Late Grade ≥ III toxicity (Exploratory Endpoint)	3.2%	17.8%	0.02

Median Follow Up = 20 months

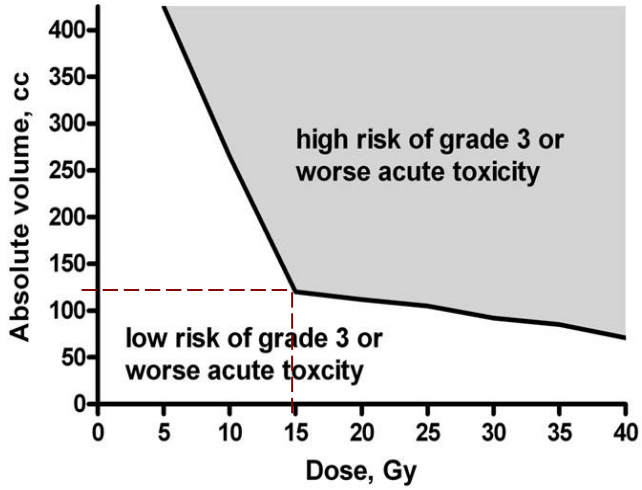
14% absolute difference; statistically insignificant at interim analysis

S Chopra et al; ASTRO 2015

Dose constraints depend on contouring approach

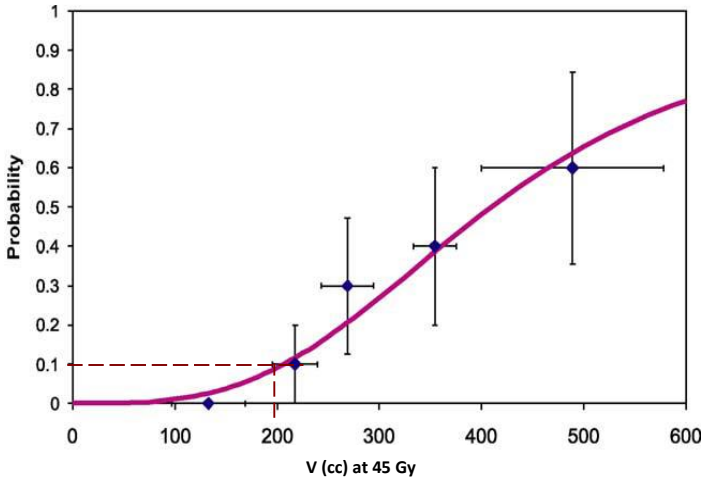
Treshold – based risk models

Baglan – Robertson, IJROBP 2002



Based on delineation of Bowel Loops

Roeske, Radiother Oncol 2003



Based on delineation of Bowel bag

Small bowel	Individual small bowel loops	3D-CRT	Grade ≥ 3 acute toxicity[§]	V15 <120 cc	<10	Volume based on segmentation of the individual loops of bowel, not the entire potential peritoneal space
	Entire potential space within peritoneal cavity	3D-CRT	Grade ≥ 3 acute toxicity[§]	V45 <195 cc	<10	Volume based on the entire potential space within the peritoneal cavity

INTERTECC Preliminary Data: Jan 2015

	All (N=61)
Treated within 60 days, n (%)	57 (93%)
Completed 5 cycles cisplatin, n (%)	50 (82%)
Achieved Hard Bowel Constraint (V45<250cc), n (%)	55 (90%)
Achieved Soft Bowel Constraint (V45<200cc), n (%)	45 (74%)
Achieved Bone Marrow Constraints (V10<90%, V20<75%), n (%)	57 (93%)
Active Bone Marrow Sparing, n (%)	30 (43%)
FDG-PET, n (%)	15 (21%)
FLT-PET, n (%)	15 (21%)
Bowel V45 (cc) (mean, s.d.)	147 ± 89
Bone Marrow V10 (mean, s.d.)	84% ± 6.3%
Bone Marrow V20 (mean, s.d.)	65% ± 9.8%
Bone Marrow V30 (mean, s.d.)	42% ± 6.8%
Bone Marrow V40 (mean, s.d.)	19% ± 5.4%
Bone Marrow Mean Dose (Gy) (mean, s.d.)	26.0 ± 2.3
Active Bone Marrow Mean Dose (Gy) (mean, s.d.)	26.0 ± 2.6
Completed both baseline & Follow-up QOL Assessment, n (%)	54 (89%)

Bone Marrow-sparing Intensity Modulated Radiation Therapy With Concurrent Cisplatin For Stage IB-IVA Cervical Cancer: An International Multicenter Phase II Clinical Trial (INTERTECC-2).

Mell LK[1], Sirák I[2], Wei L[3], Tarnawski R[4], Mahantshetty U[5], Yashar CM[6], McHale MT[7], Xu R[7], Honerkamp-Smith G[7], Carmona R[7], Wright M[7], Williamson CW[6], Kasaová L[2], Li N[6], Kry S[8], Michalski J[9], Bosch W[9], Straube W[9], Schwarz J[10], Lowenstein J[7], Jiang SB[7], Saenz CC[7], Plaxe S[7], Einck J[6], Khorprasert C[11], Koonings P[12], Harrison T[12], Shi M[3], Mundt AJ[6]; INTERTECC Study Group.

RESULTS:

- October 2011 to April 2015, (median follow-up was 26.0 months)
- 83 patients
- The incidence of any primary event was 26.5% (95% [CI] 18.2%-36.9%), significantly lower than the 40% incidence hypothesized a priori from historical data (P=.013)
-
1
-
IM
2

Significant reduction in acute grade 3 neutropenia but not leucopenia with BM sparing IMRT

leukopenia (25.7% vs 41.7%; P=.13) and any grade ≥3 hematologic toxicity (31.4% vs 43.8%; P=.25).

CONCLUSIONS:

IMRT reduces acute hematologic and GI toxicity compared with standard treatment, with promising therapeutic outcomes. Positron emission tomography IG-IMRT reduces the incidence of acute neutropenia.

Int J Radiation Oncol Biol Phys, Vol. 90, No. 5, pp. 1083–1090, 2014

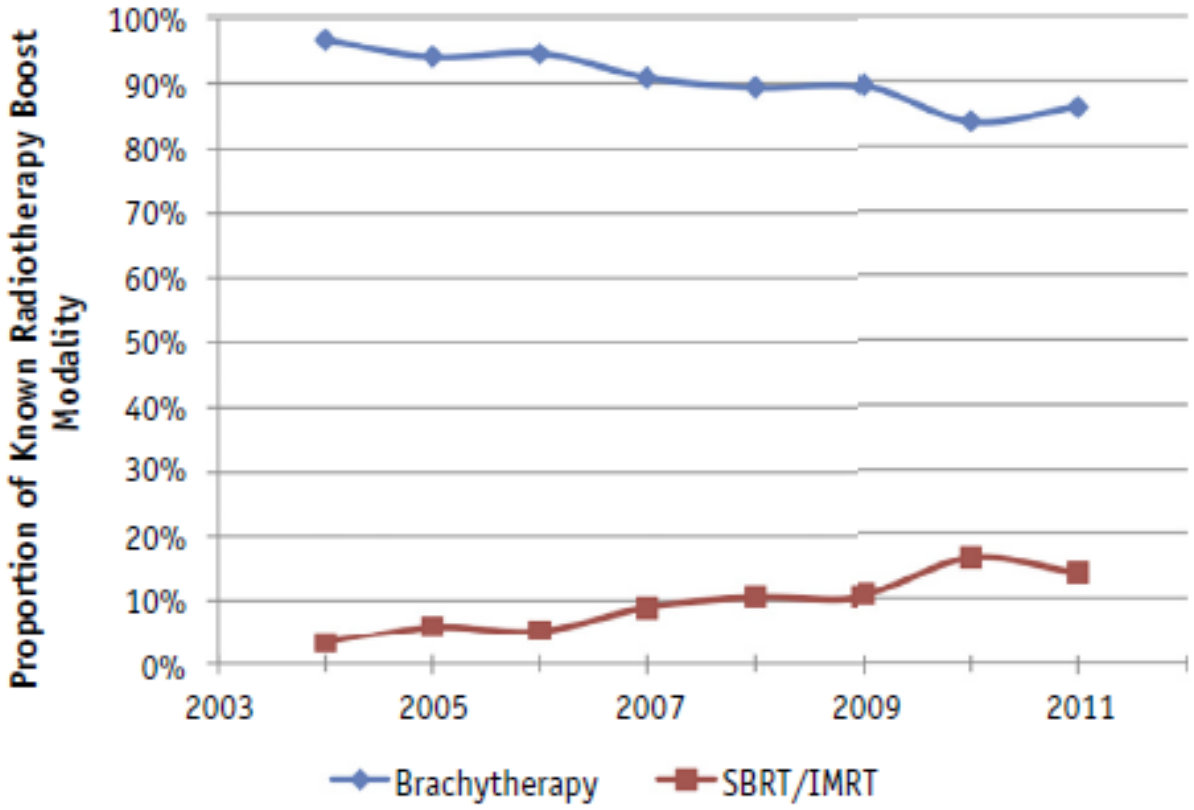

Fig. 1. Changes in radiation therapy boost modality utilization over time from 2004 to 2011. IMRT = intensity modulated radiation therapy; SBRT = stereotactic body radiation therapy.

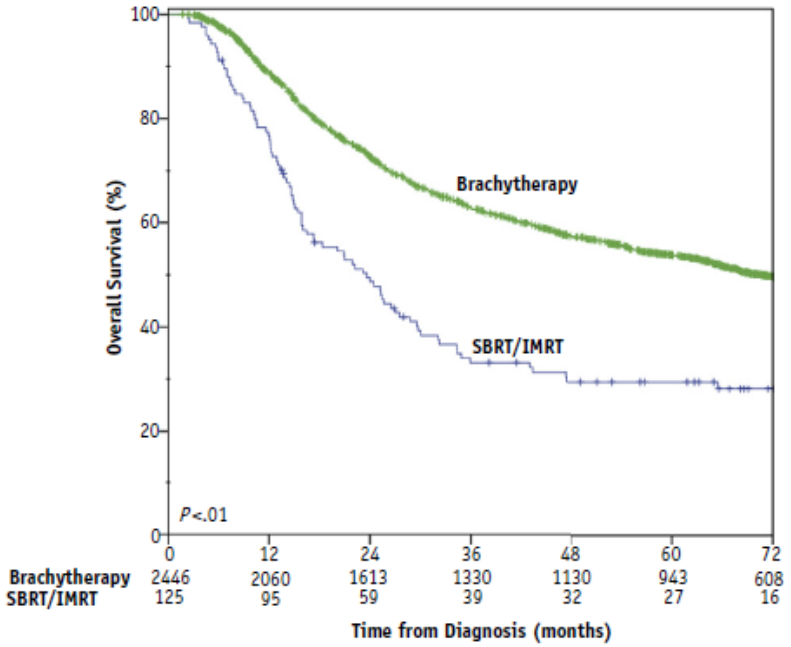

Fig. 2. Kaplan-Meier overall survival estimate stratified by boost modality. IMRT = intensity modulated radiation therapy; SBRT = stereotactic body radiation therapy.

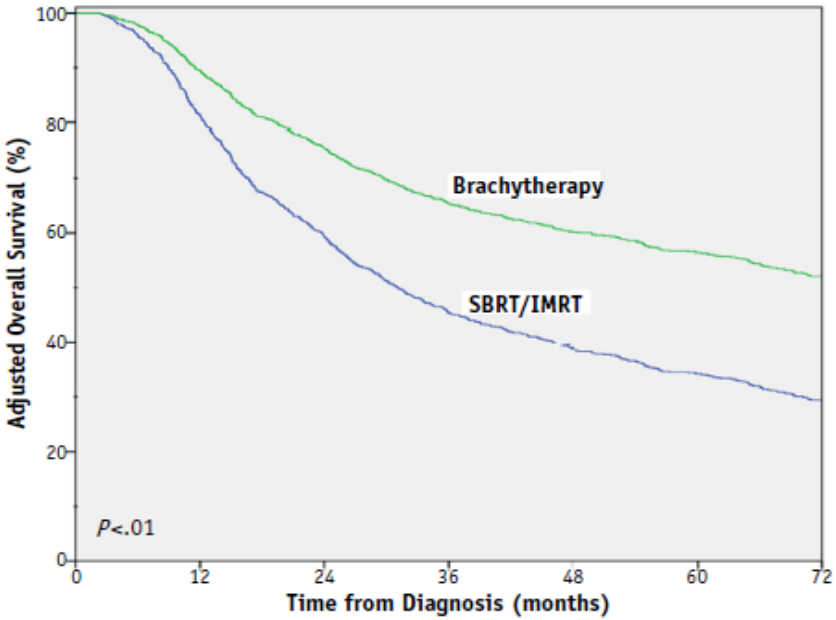

Fig. 3. Adjusted overall survival estimate, stratified by boost modality and corrected for significant variables on multivariable Cox proportional hazard model analysis (age, Charlson/Deyo score, stage, and chemotherapy utilization). IMRT = intensity modulated radiation therapy; SBRT = stereotactic body radiation therapy.

SUMMARY

- **Pelvic IMRT**

  - IMRT /IGRT reduces toxicities especially in post op pelvic settings

  - Ongoing studies : BM sparing potential for further interventions

- **PA Region IMRT**

  - Potential to reduce toxicities

  - Dose Escalation protocols with PET : promising

- **SBRT – IMRT Vs BT**

  - Use of SBRT results in inferior outcome as compared to 2D BT

Patient preparation and principles of BT Application Counseling, Anesthesia and Procedure

Umesh Mahantshetty, DMRT, MD, DNBR

Professor, Radiation Oncology

TATA MEMORIAL HOSPITAL, MUMBAI, INDIA

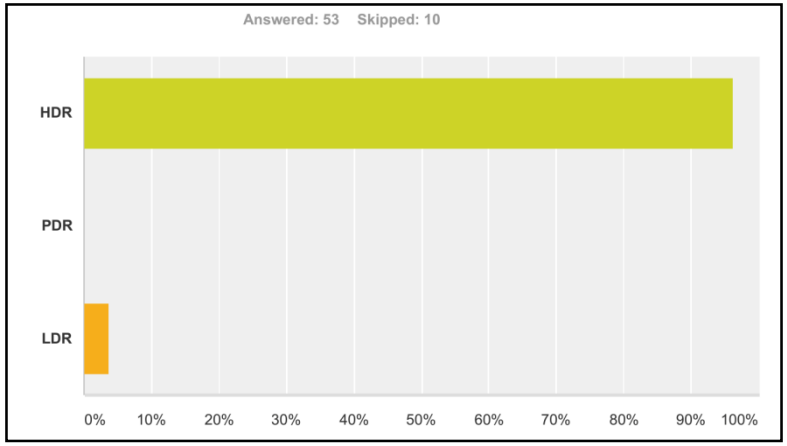
GYN GEC – ESTRO TEACHING FACULTY

OUTLINE

- Patient Selection
- Preplanning
- Pre-procedure Counseling and Preparation
- Principles of BT Application
- Post BT Treatment Care

Patient Selection (1)

- Cervical Cancer patients treated with radical radio (chemo) therapy
- Radical radiation therapy : combination of External & BT
- Brachytherapy: Majority centers practice fractionated High Dose Rate (HDR) System. LDR / PDR are the other systems.
- HDR Brachytherapy: fractionated with 2 - 6 fractions once weekly depending on FIGO Stage



Patient Selection (2)

- Brachytherapy boost is planned towards the end or after completion of external beam radiation therapy
- Pelvic examination to assess suitability for brachytherapy application
- **Brachytherapy Procedure Pre-requisites:**
  - Review for fitness to undergo anesthesia
  - Pelvic anatomy and tumor topography suitable for appropriate applicator placement
- **Pre-planning:** Tumor topography, Imaging & availability of applicators.

Imaging protocols MRI and CT

Key issues for image-guided radiotherapy

Quantitative tumor regression

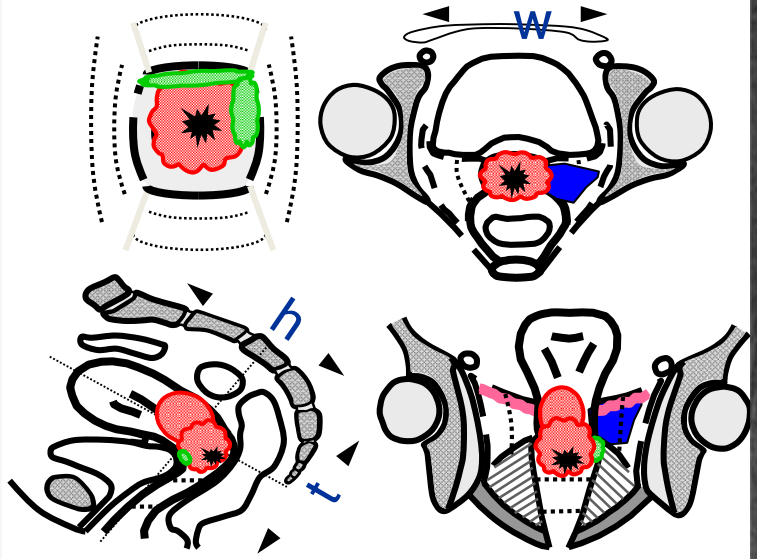
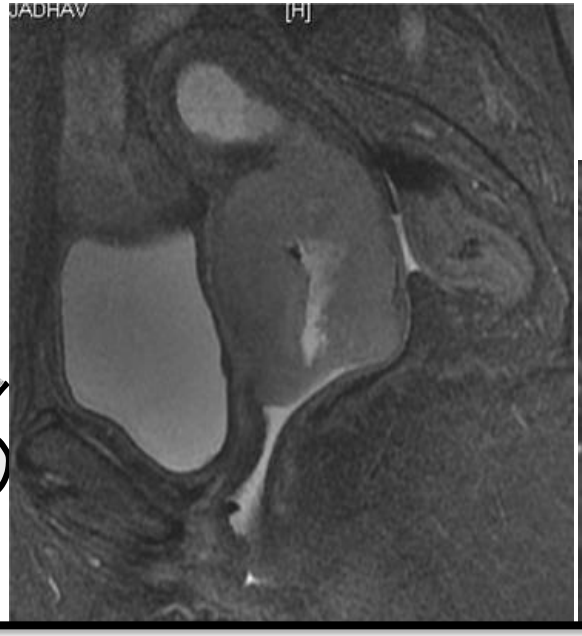
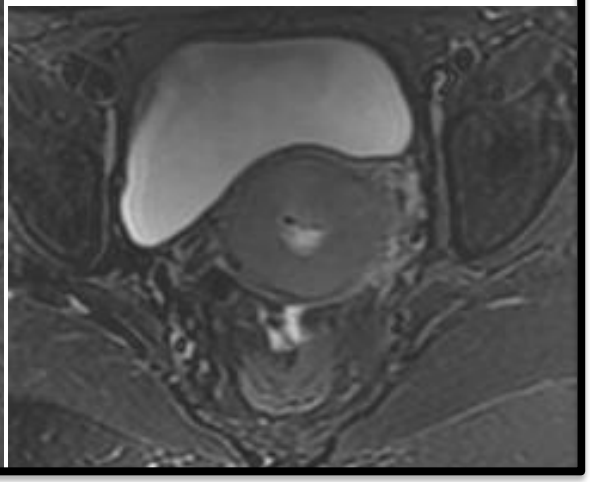
Clinical Drawing

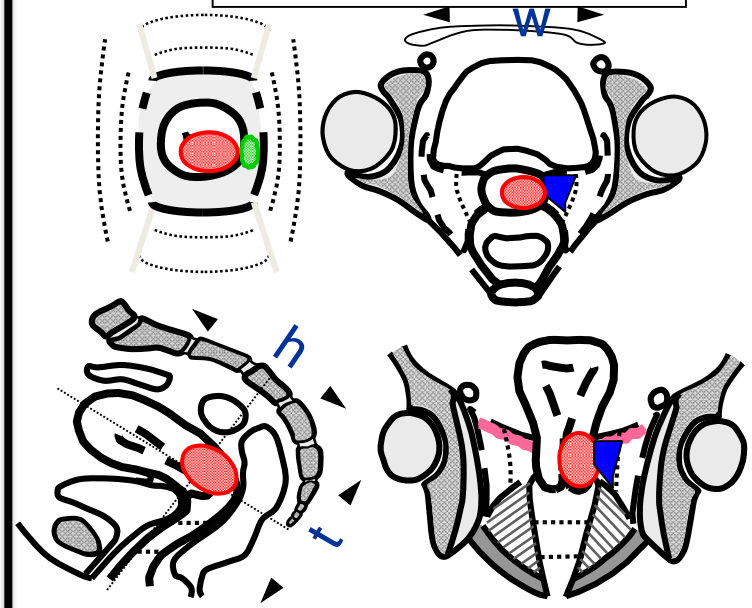


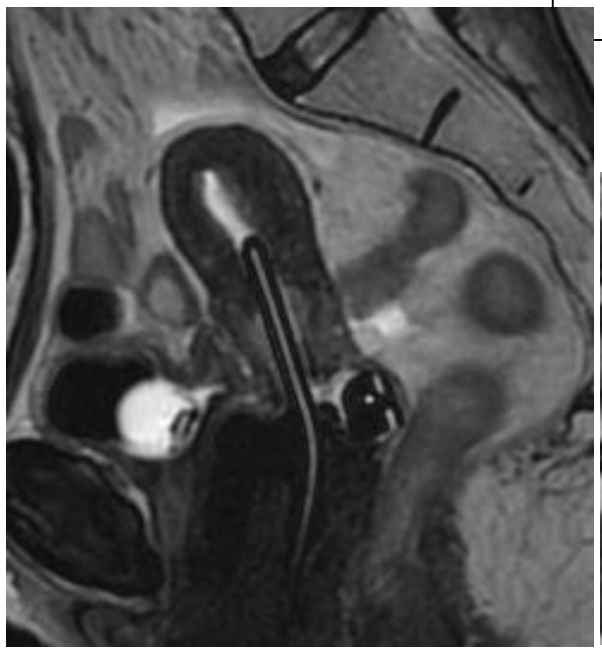


MR at Diagnosis

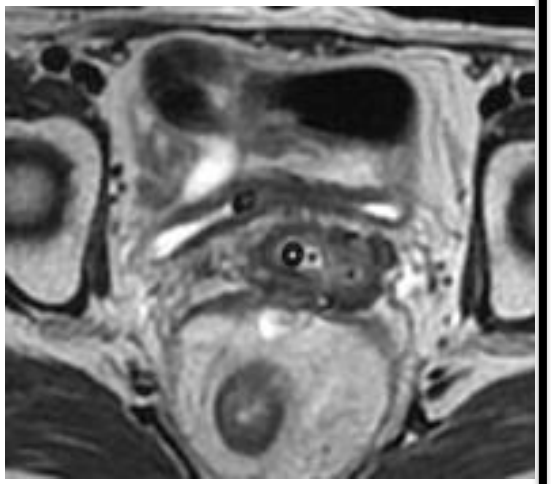


Clinical Drawing





MR at Brachytherapy



PREPLANNING

- ✧ Staging
- ✧ RADIO(CHEMO)THERAPY details
- ✧ Timing : depending upon response to EBRT
- ✧ Anesthesia fitness and type
- ✧ Assessment of response to EBRT
- ✧ Assessment of vagina: size of the ovoid / ring
- ✧ Admission to ward for preparation (Day: -1)

Pre-procedure Counseling, Instructions and Preparation for Brachytherapy Procedure (Day : -1)

- Counseling about the procedure in patients language
- Obtain written Informed Consent
- Pre-operative instructions:
  - Preparation of parts (perineum),
  - Bowel preparation by simple enema
  - Vaginal Douche
  - Nil by mouth at-least 4-6 hours prior to procedure

Pre-operative Counseling, Instructions and Preparation for Brachytherapy Procedure (Day : -1)

- Appropriate medications for existing co-morbidities
- Review latest blood investigations (anemia & electrolyte imbalance) and correction accordingly
- Evaluate patient suitability for Imaging (CT / MR)
- Check for Appropriate Applicators availability

Principles of the BT Procedure - 1

- ✧ Secure intravenous access.
- ✧ Check for the desired Instrumentation before BT procedure starts
- ✧ Short Anesthesia
- ✧ Position patient in lithotomy position.
- ✧ Parts painted and draped.
- ✧ Foley's catheterization and 7 ml of Radio opaque contrast
- ✧ EUA: response to external RT

  determine appropriate ovoid dimension.

Q. Do you do the BT Procedure under anesthesia?

A. Yes

B. No

Q. If yes, which Anesthesia do you routine utilize?

A. Short General Anesthesia
B. Spinal Anesthesia
C. Sedation / Blocks / Analgesics
D. Verbal Anesthesia

Anesthesia for Brachytherapy Procedure

- **Principle: Adequate relaxation for cervical dilatation, vaginal packing and application reproducible esp. in fractionated HDR**
- Short General Anesthesia: preferred for proper application
- Alternatives if patient high risk for general anesthesia:
  - Spinal anesthesia with epidural analgesia
  - Sedation and analgesics
  - Regional Blocks: Obturator blocks
  - Local blocks: Para-cervical blocks

Brachytherapy Techniques (2)

- Choice of appropriate technique depends on:
  - residual tumor topography at brachytherapy
  - availability of brachytherapy applicators
  - availability of expertise
- In General: depending on residual disease at brachytherapy
  - Disease confined to cervix and medial third parametrium: IC alone
  - Extensions beyond medial third parametrium: IC + IS combination
  - Extensive disease not amenable to IC + IS: IS
- Applications can be modified in subsequent fractions (esp. HDR)

Brachytherapy Techniques (1)

- **Intracavitary (IC)**

  - Tandem - Ovoid, Tandem - ring, Tandem - cylinder etc.

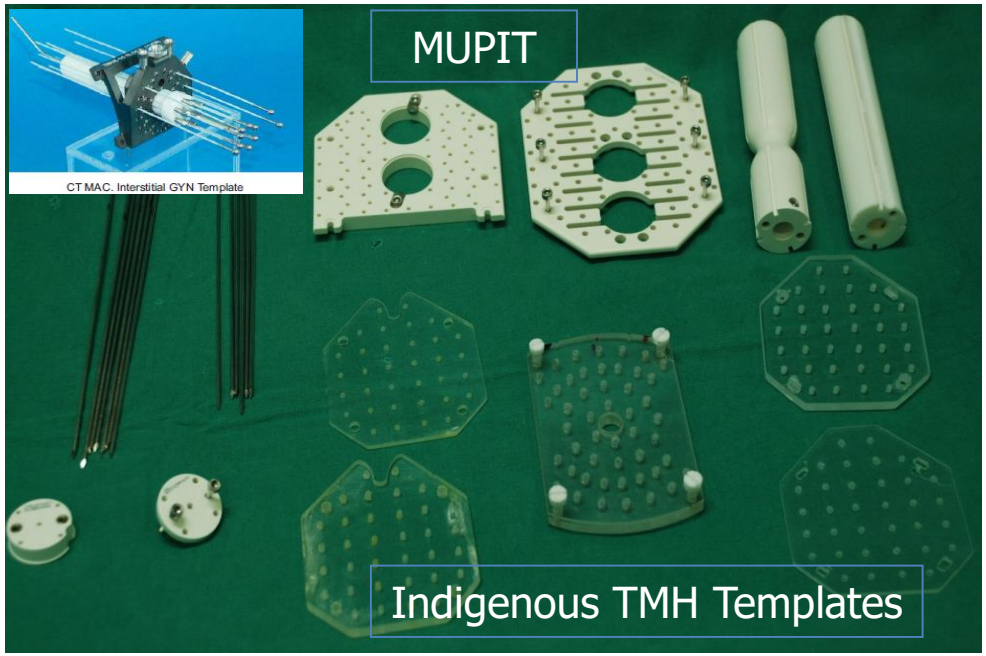
- **Combined Intracavitary and Interstitial (IC + IS)**

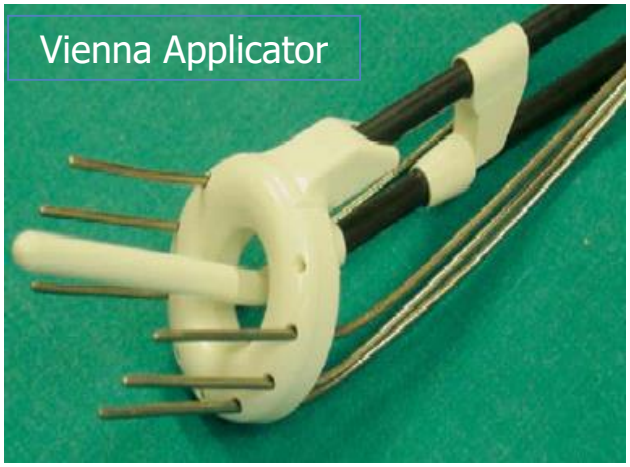
  - Vienna Applicator, Utrecht applicator, etc.

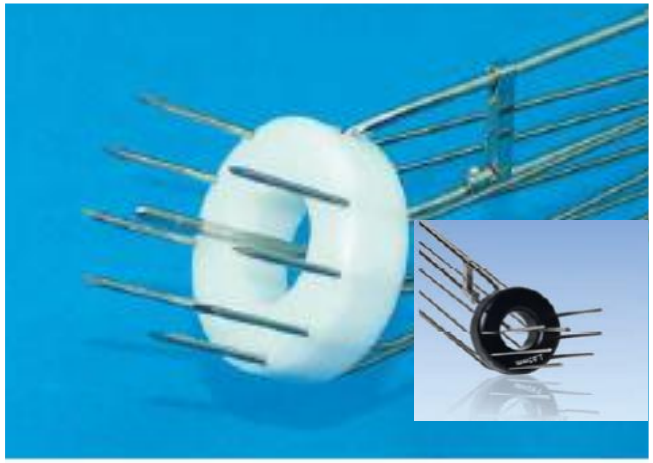
- **Interstitial (IS)**

  - MUPIT, Indigenous Templates with needles / tubes

Brachytherapy Applicators for GYN Cancers







CT Vienna System with Titanium Needles

Tandem - Ring with needles/tubes

Tandem - Ovoid with tubes

VIDEO PRESENTATION
OF
BT PROCEDURE

Treatment delivery & Care in the Ward

- Removal of the applicators under sedation/ analgesics after treatment delivery
- Shift of patient to the ward from treatment unit
- Follow the post procedure instructions
- Back Care, Bowel Care, Hydration, Catheter care
- Patient Position : to avoid movements / displacement of the applicators
- Medications, (Antibiotics, anti-inflammatory) , Analgesia (epidural)
- Intake – Output charting,
- Regular monitoring of Vital parameters

REMOVAL OF THE APPLICATOR

Intracavitary Alone:

- Unlock the Applicator Assembly
- Each tube / catheter of ICA component is removed separately
- A gentle vaginal examination with local anesthesia jelly is performed to check for bleeding/ vaginal tears

IC + IS

- Unlock the Applicator Assembly
- Uterine tandem is gently pulled out
- The Vienna ring / Ovoid with Needles/ tubes assembly is pulled out gently in total
- Be careful with the bent needles / needle tips not injuring the vagina
- A gentle vaginal examination with local anesthesia jelly is performed to check for bleeding/ vaginal tears

Management of acute bleeding after removal

Do not panic!!!

- Secure the IV access and start IV fluids
- Nurse : TO monitor the vitals Unlock the Applicator Assembly
- At removal : look at the needle / tube tips
- Needles / tubes with fresh blood tinge are usually potential spots
- Bimanual compression with betadine gauze & local anesthetic rolled on your fingers
- Maintain the compression for atleast 7- 10 minutes
- Estimate the Bleeder : Arterial Vs Venous or vaginal tear
- To perform CT pelvis after patient is stable to assess pelvic collection

“Man often becomes what he believes himself to be.

If I keep on saying to myself that I cannot do a certain thing, it is possible that I may end by really becoming incapable of doing it. On the contrary, if I have the belief that I can do it, I shall surely acquire the capacity to do it even if I may not have it at the beginning.” — Mahatma Gandhi

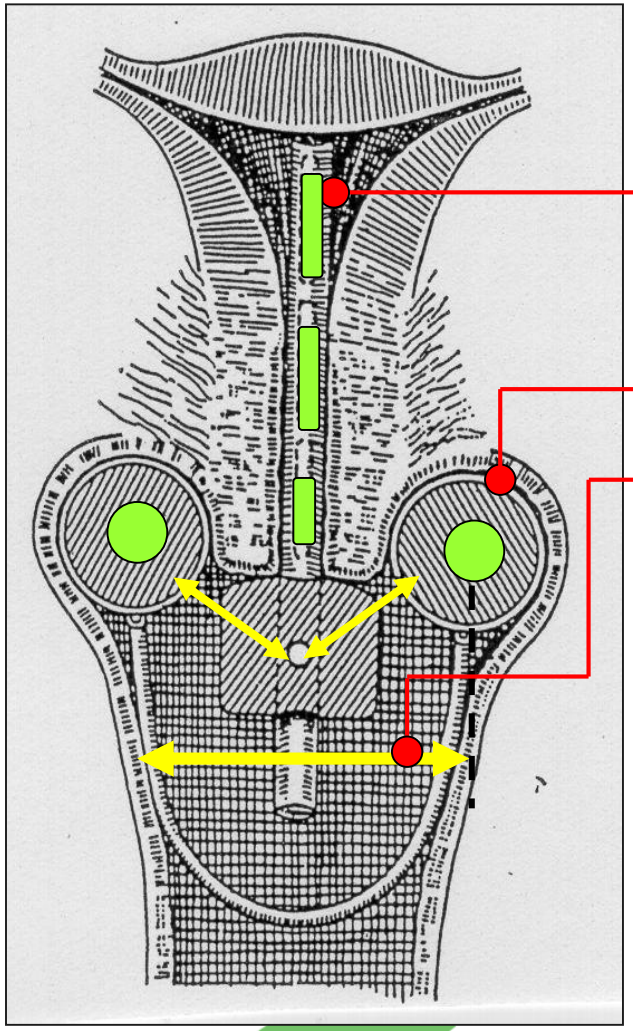
Richard Pötter, Medical University Vienna

Historical Systems & Techniques

Historical Paris Technique

1910-1920: Curie Institute, Paris, France



GEC ESTRO Handbook of Brachytherapy

Applicator:

- Rubber tandem
- Cork colpostats (paraffin coated)

→ not connected

- Distance – colpostats: not fixed

→ no fixed geometry

^{226}Ra preloading

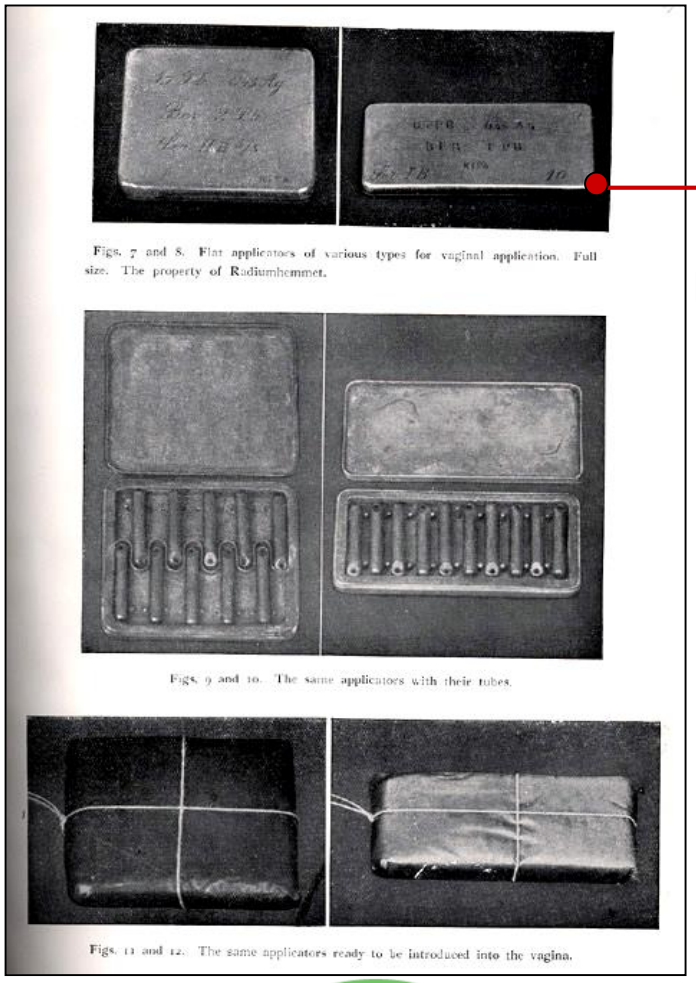
- X mg of ^{226}Ra for Y hours

Typical application

- ≈ 5 days (*120 h*)
- 7000-8000 mgh

Classical Stockholm method

1913-1914: Radiumhemmet, Stockholm, Sweden

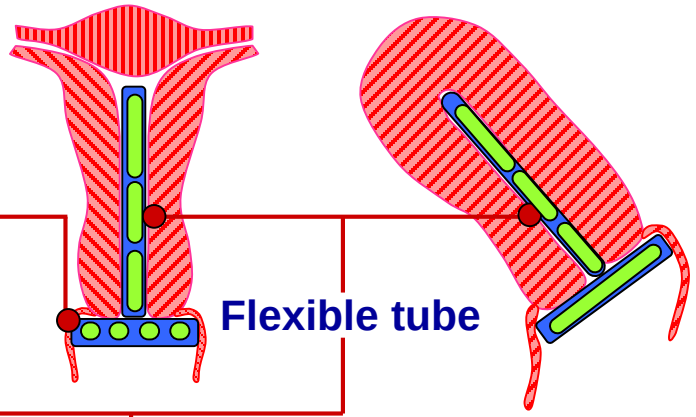


Figs. 7 and 8. Flat applicators of various types for vaginal application. Full size. The property of Radiumhemmet.

Figs. 9 and 10. The same applicators with their tubes.

Figs. 11 and 12. The same applicators ready to be introduced into the vagina.

Applicator:



Flat box (plate) — Flexible tube

not connected → No fixed geometry

^{226}Ra preloading

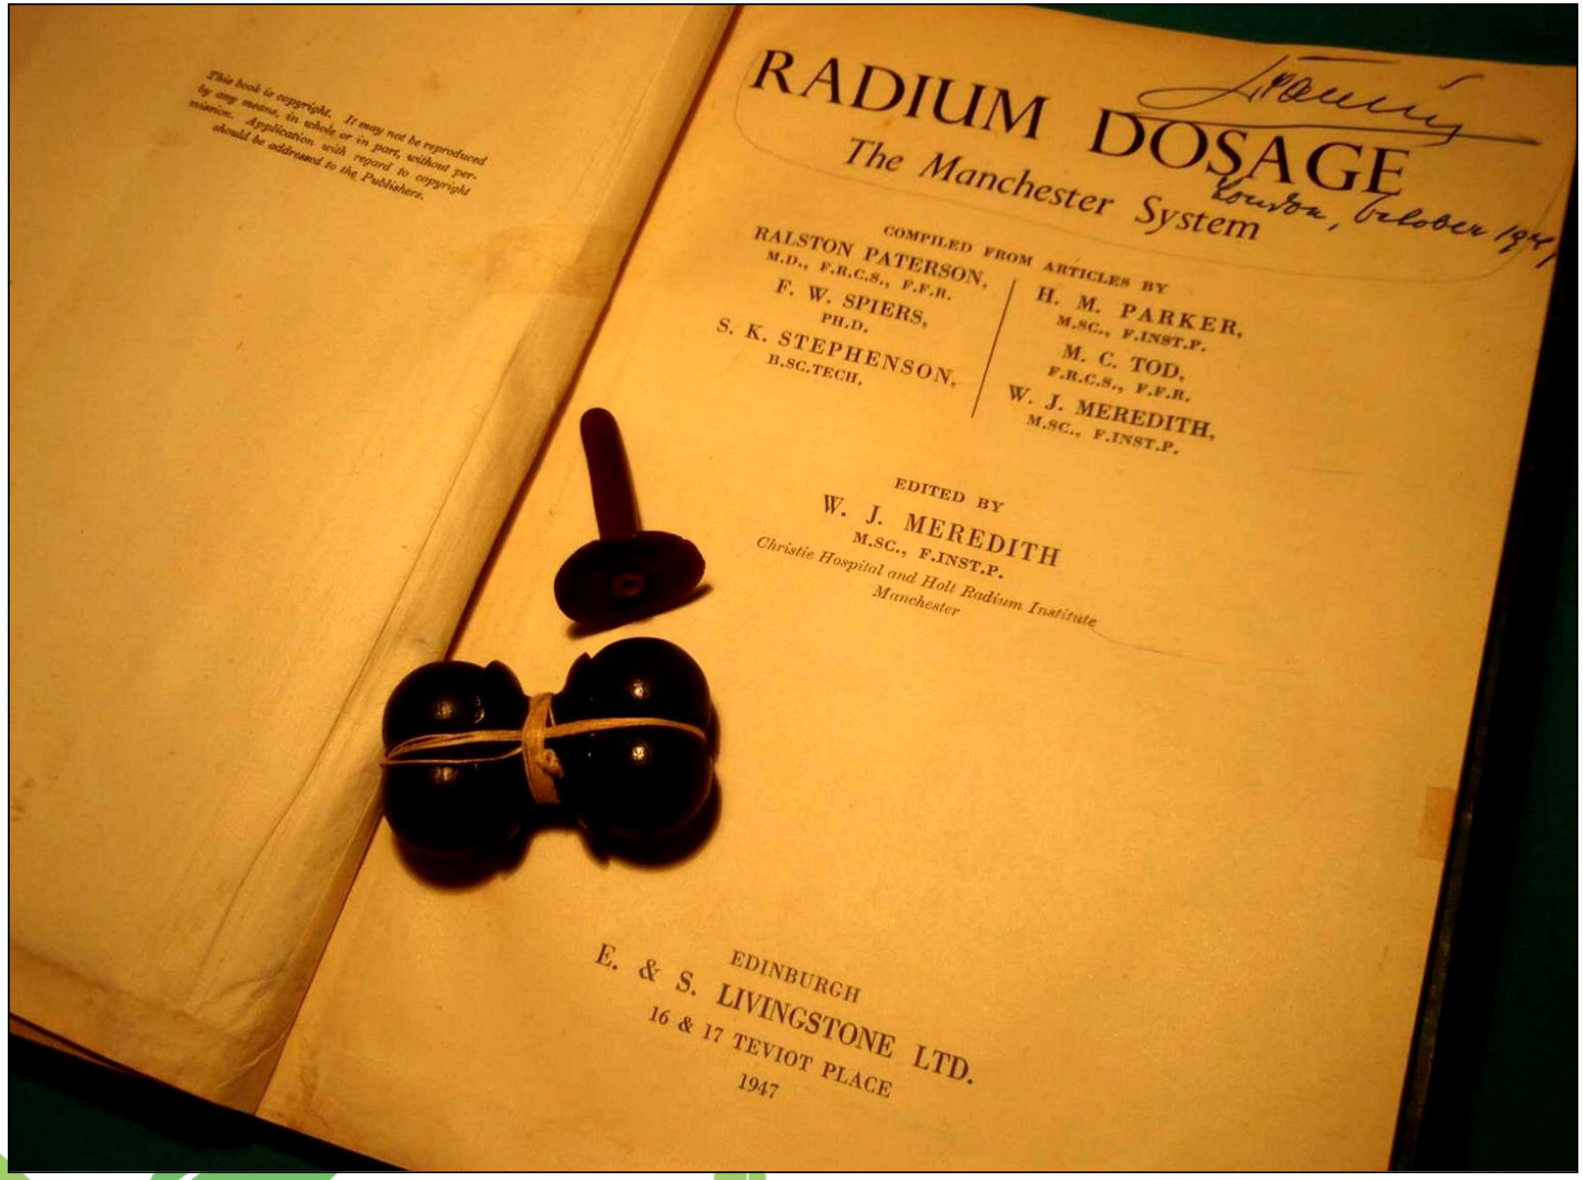
- X mg of ^{226}Ra for Y hours

Typical treatment

- 2 – 3 applications (á 20-30 h)
- ≈ 7000 mgh

Historical Manchester System

1938: Holt Radium Institute, Manchester, England



Historical Manchester System

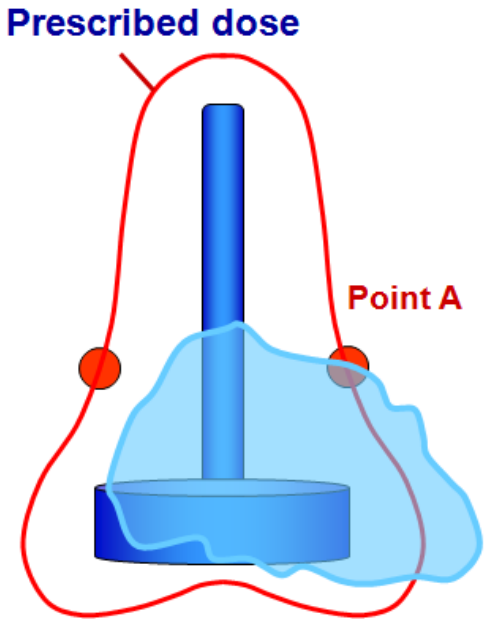
Limitations of modern IC applicators

How far from point A can we “push” the prescription isodose?



A. Up to ~1 mm

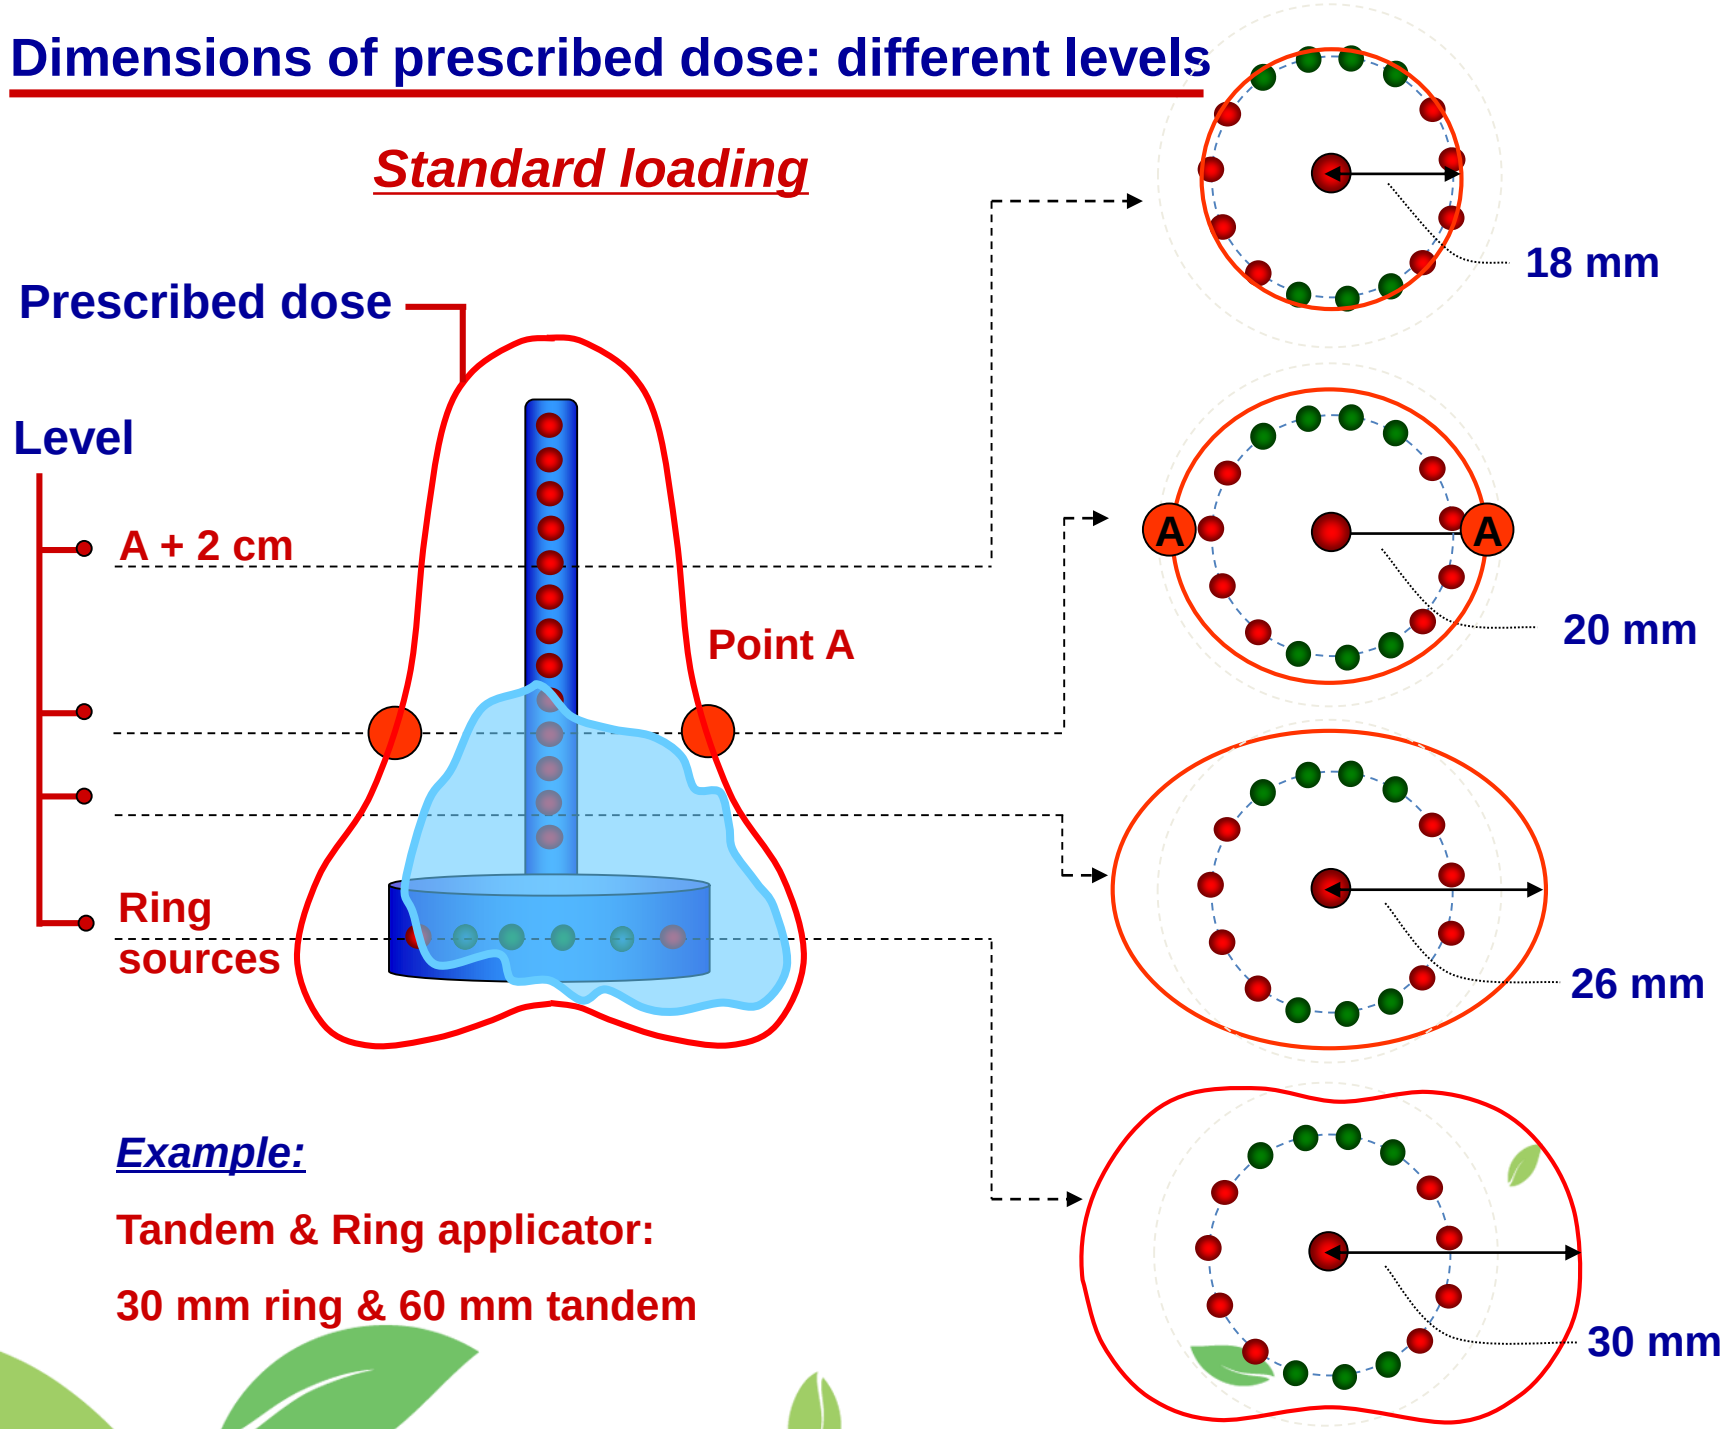
B. Up to ~ 5 mm

C. Up to ~ 10 mm

D. Up to ~ 20 mm

Dimensions of prescribed dose: different levels

Standard loading



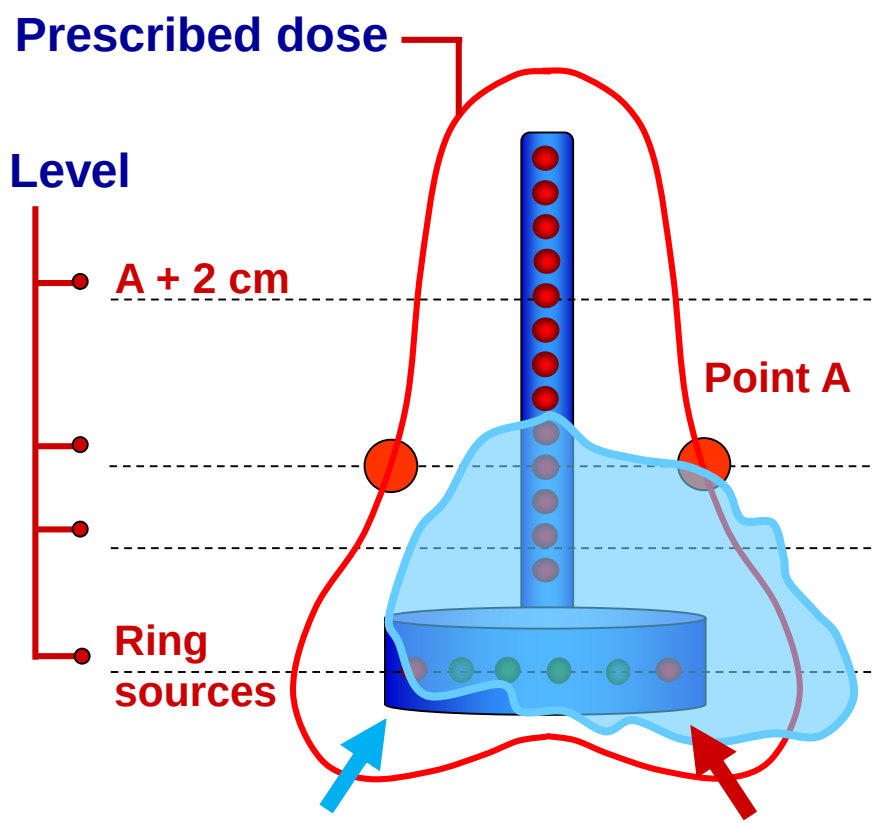
Example:

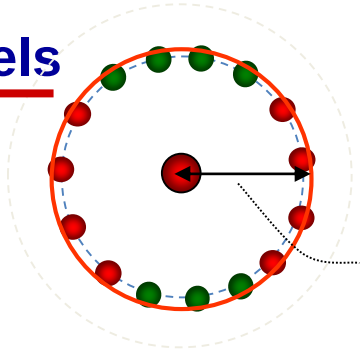
Tandem & Ring applicator:

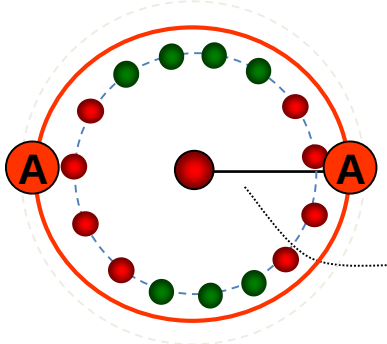
30 mm ring & 60 mm tandem

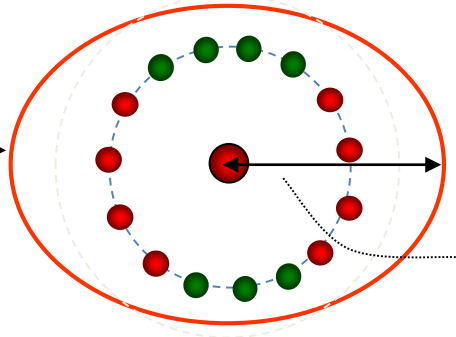
Dimensions of prescribed dose: different levels

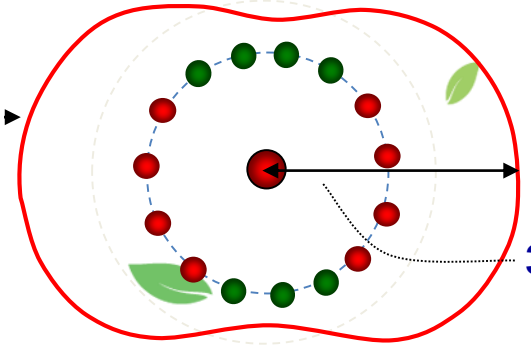
Standard loading











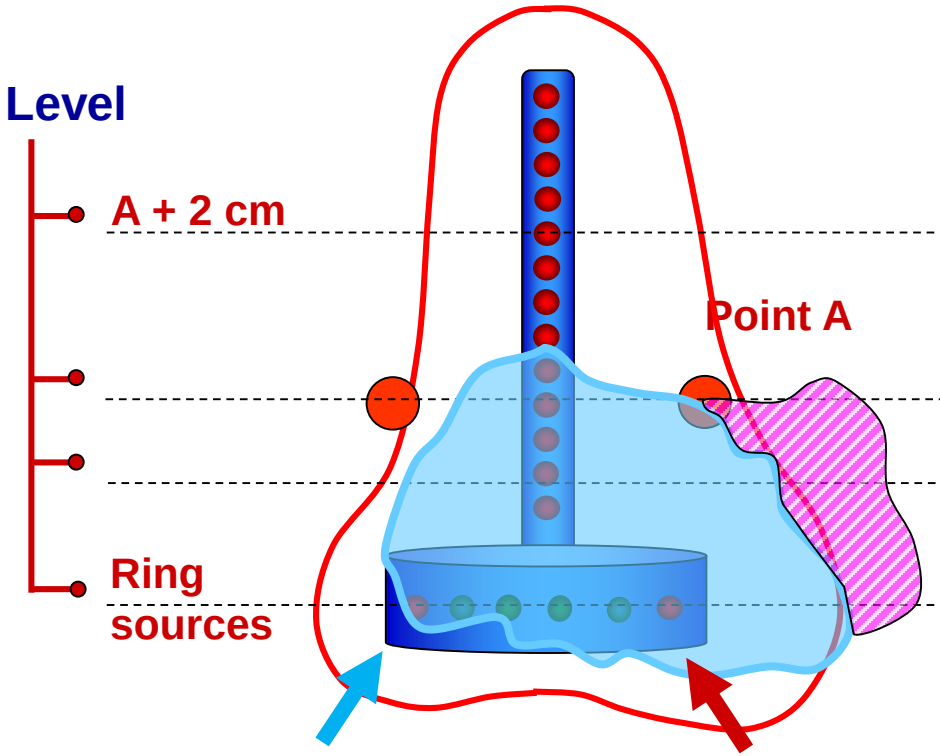
Example:

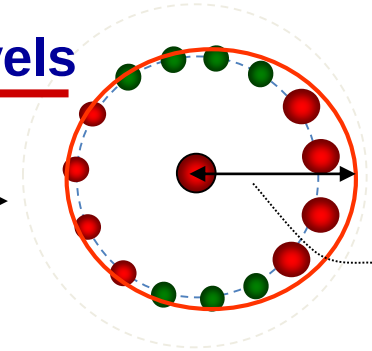
Tandem & Ring applicator:

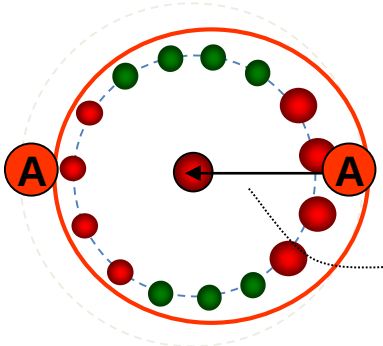
30 mm ring & 60 mm tandem

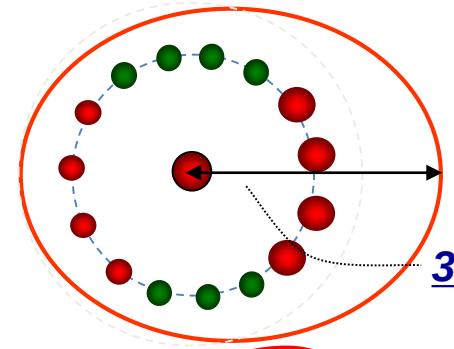
Dimensions of prescribed dose: different levels

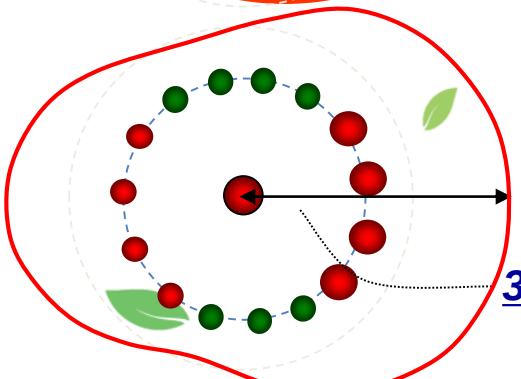
Modified Intracavitary loading



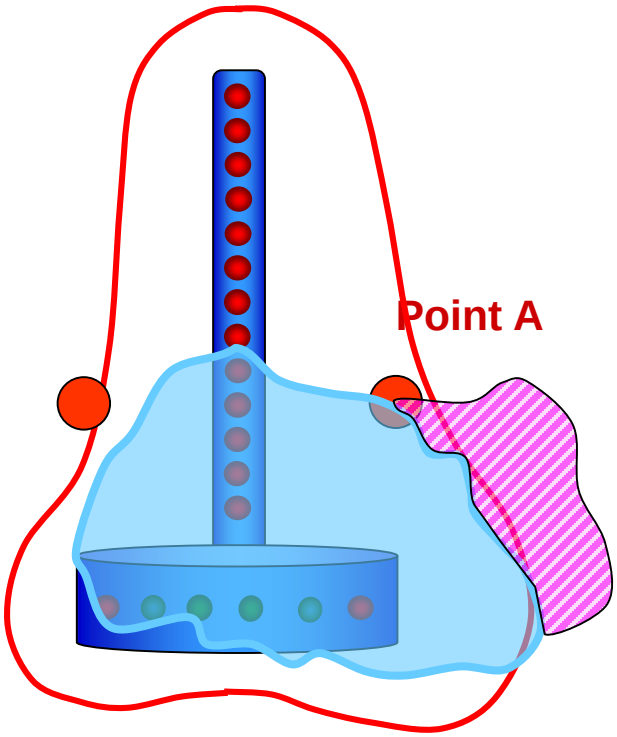






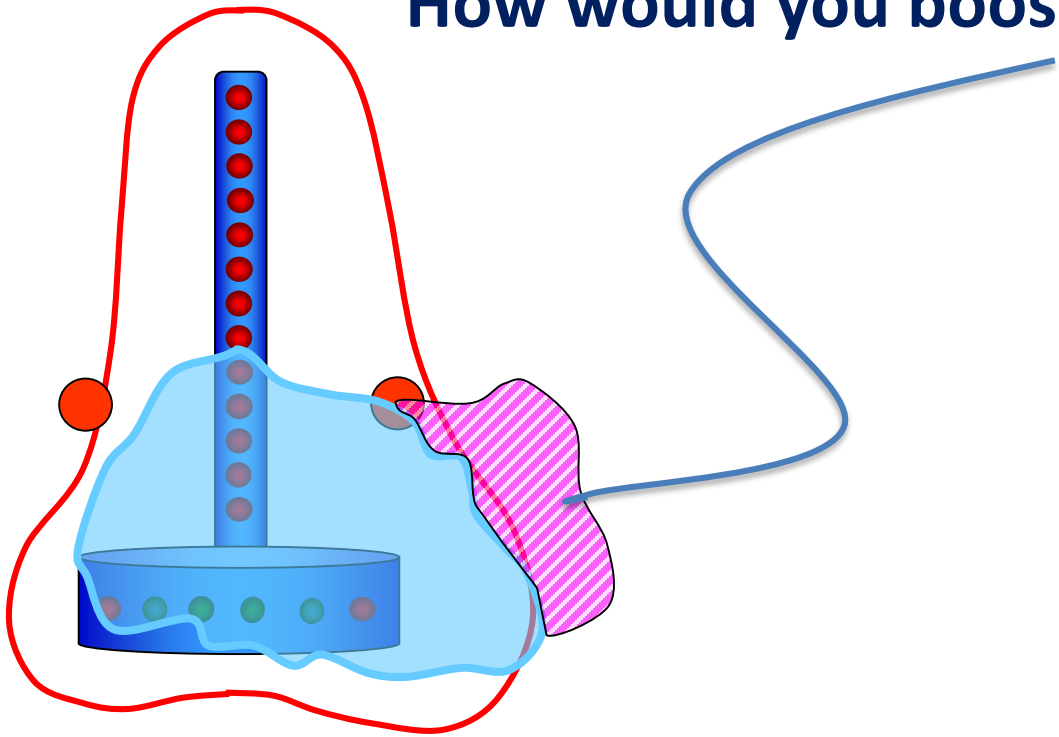


Overcoming limitations of IC applicators



Overcoming limitations of IC applicators

How would you boost this area?



A. By expansion of dose from IC applicator

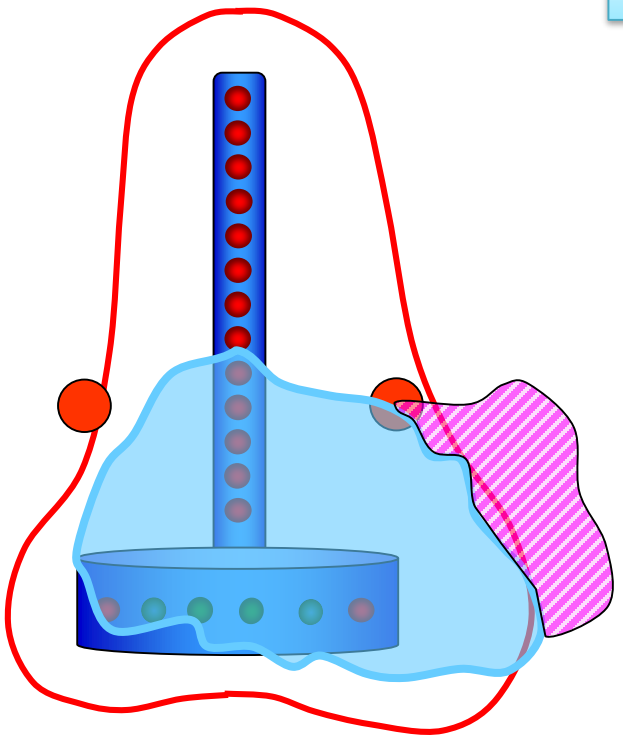
B. By EBRT boost with midline shielding

C. By adding Interstitial to Intracavitary BT

D. Other

Overcoming limitations of IC applicators

External beam boost with midline "shielding"



Mid-line block

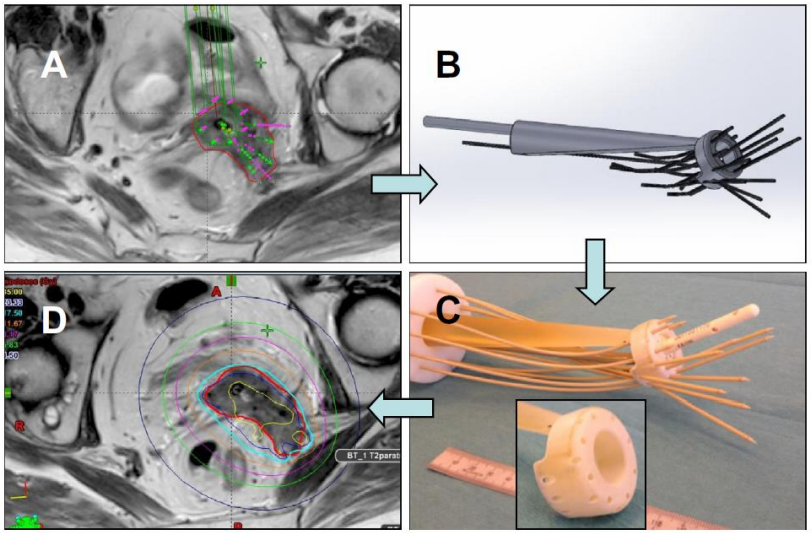
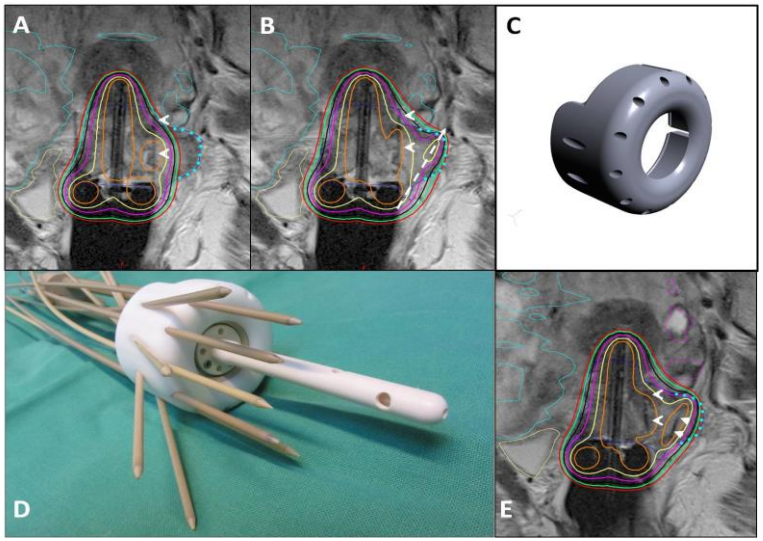
Classic Moulage technique



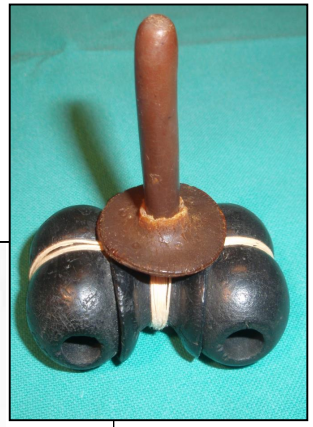
Lindegaard J, et al. Radiother Oncol 2016

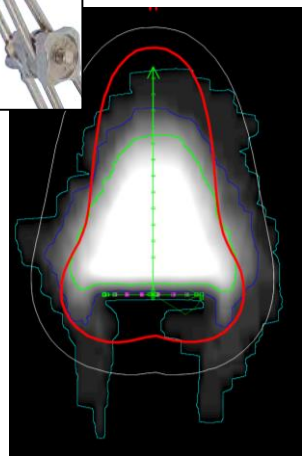


Petric P, et al.. In: Song W, et al. Eds. Taylor & Francis 2016

Summary

- Modern intracavitary applicators
  - Same concept as historical systems; main differences:
    - CT, MRI compatibility, materials
    - Fixed, adjustable components
    - Smaller channel diameters
- Intracavitary technique alone:
  - limited possibility for D adaptation
- Interstitial boost superior to EBRT boost
- Emerging technologies:
  - Comprehensive applicator IC/IS (Vienna II type)
  - 3D printing





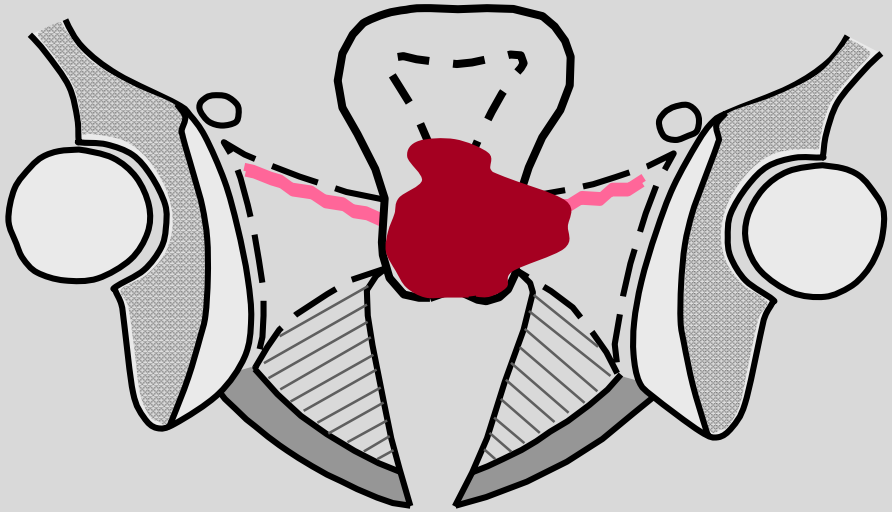
Combined intracavitary-interstitial technique for cervix cancer

Umesh Mahantshetty, Professor, Radiation Oncology,
Tata Memorial Hospital, Mumbai, India

Johannes C. Athanasios Dimopoulos, Head, Radiation Oncology
Metropolitan Hospital, Athens, Greece

Q: What brachytherapy technique would you do for this tumor topography after external radiation and chemotherapy?

At BT

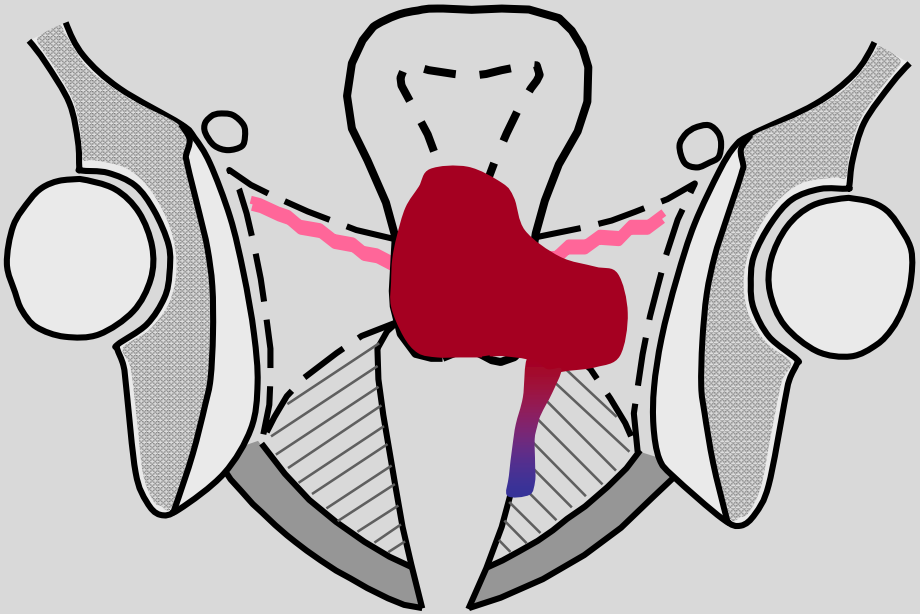


A. Standard Intracavitary
B. Intracavitary + interstitial
C. EBRT boost
D. EBRT boost + Intracavitary

KBD

Q: What brachytherapy technique would you do for this tumor topography after external radiation and chemotherapy?

At BT



A. Standard Intracavitary
B. Intracavitary + interstitial
C. EBRT boost + Intracavitary
D. No further Radiation

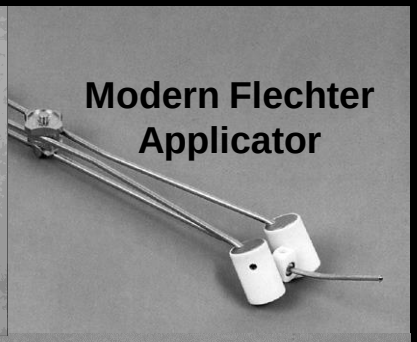
OUTLINE

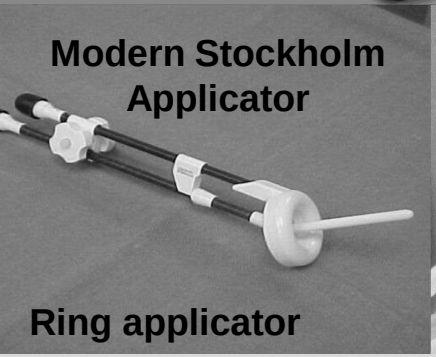
- *Limitations of STD Intracavitary Applicators*
- *Conventional Interstitial Techniques*
- *Modern Intracavitary + Interstitial Techniques*
- *Optimizing Applicator placement by Image guidance*
- *Principles of Selection of Appropriate Technique*

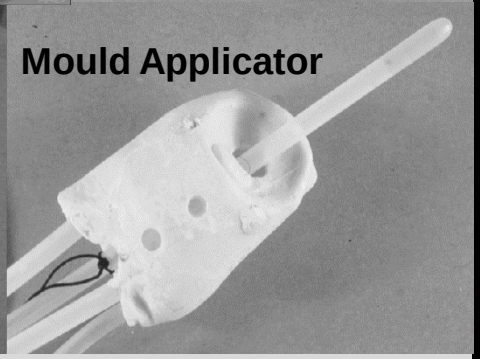
Limitations of pure intracavitary techniques

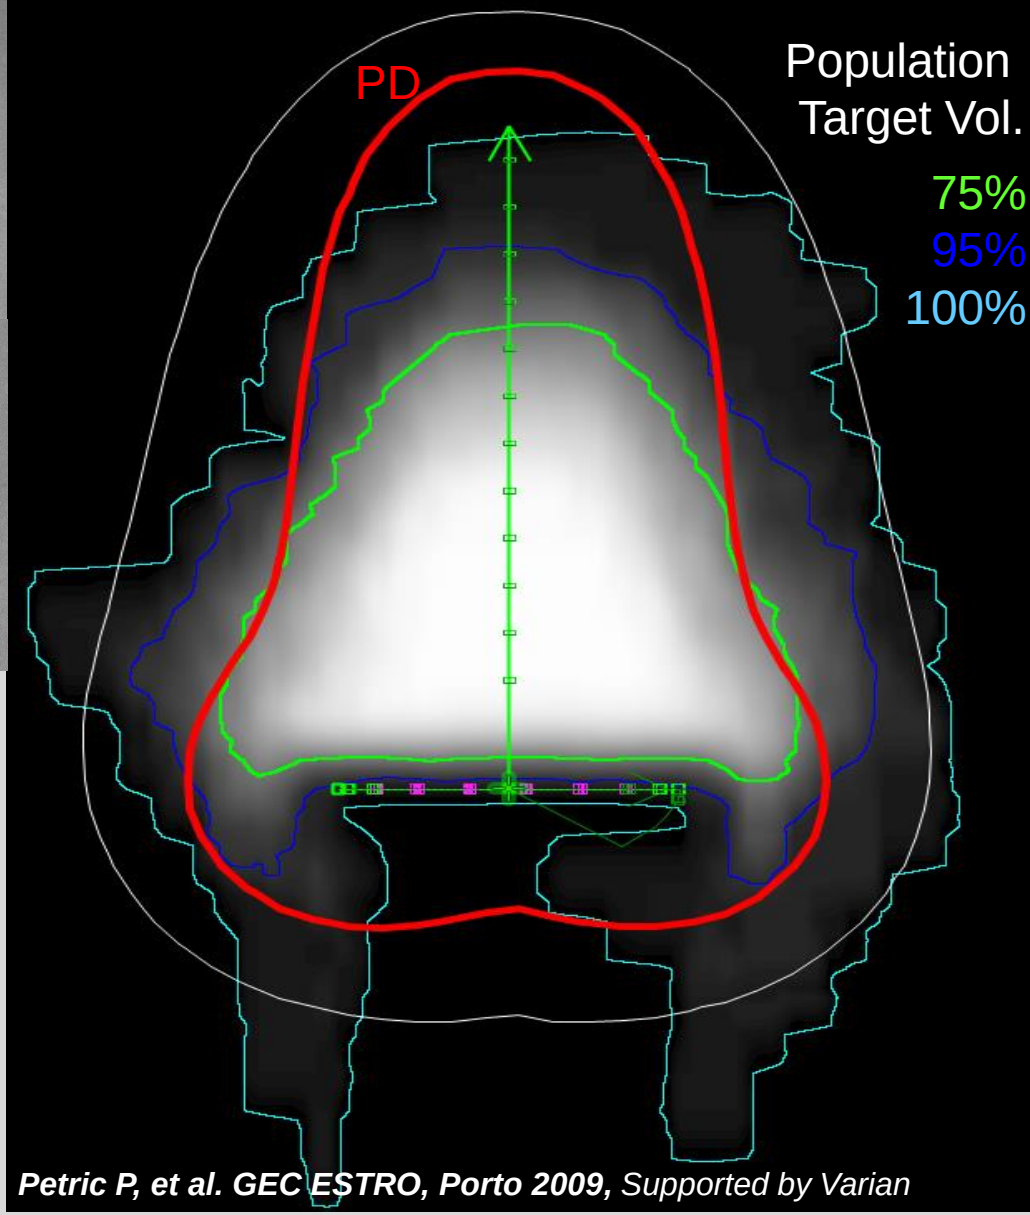
- *middle/distal parametrial tumor extension*
- *unfavourable topography/unfavourable relation to the applicator (e.g. asymmetrical tumors) (depending on applicator position)*
- *2-3 cm distal intravaginal tumor growth*
- *para-vaginal tumor growth*
- *unfavourable topography of organs at risk (not predictable – correction within the frame of subsequent applications)*

264 patients









Petric P, et al. GEC ESTRO, Porto 2009, *Supported by Varian*

Courtesy: P. Petric,D. Berger

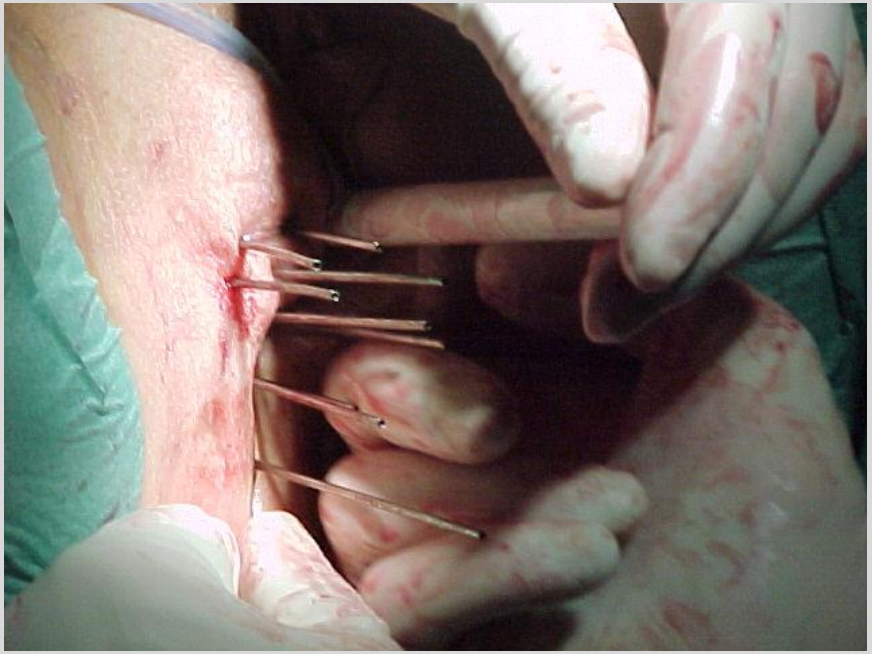
Indications for combined intracavitary/interstitial

- *middle/distal parametrial tumor extension*
- *unfavourable topography/unfavourable relation to the applicator (e.g. asymmetrical tumors) (depending on applicator position)*
- *distal intravaginal tumor growth*
- *para-vaginal tumor growth*
- *unfavourable topography of organs at risk (not predictable – correction within the frame of subsequent applications)*

INTERSTITIAL TECHNIQUES
AIMS IN LOCALLY ADVANCED DISEASE

- *accurate and reproducible placement of needles*
- *tailor positions of needles to the target*
- *tailor dose distribution to target and OAR*
  - *adequate target coverage*
  - *Optimal sparing of OAR*

CLASSICAL INTERSTITIAL TECHNIQUES
FREEHAND PLACEMENT



CLASSICAL INTERSTITIAL TECHNIQUES

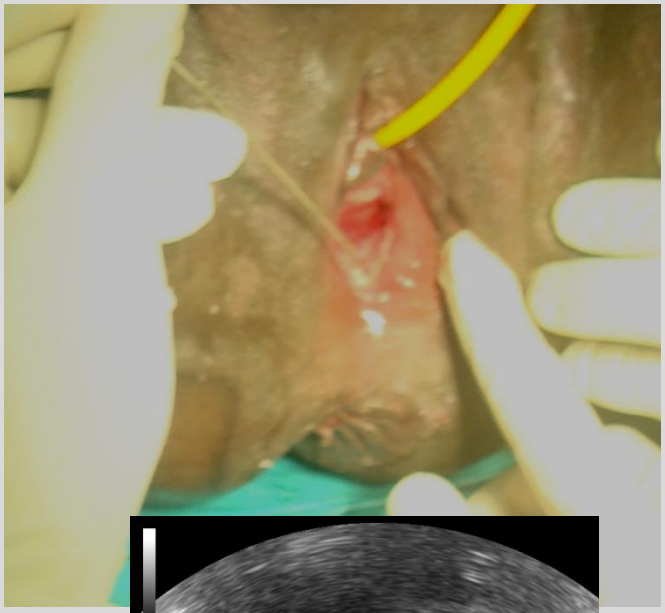
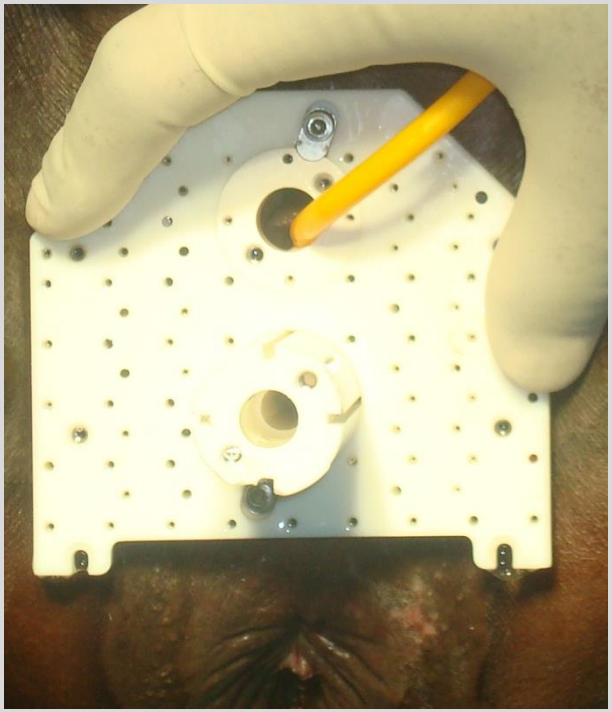
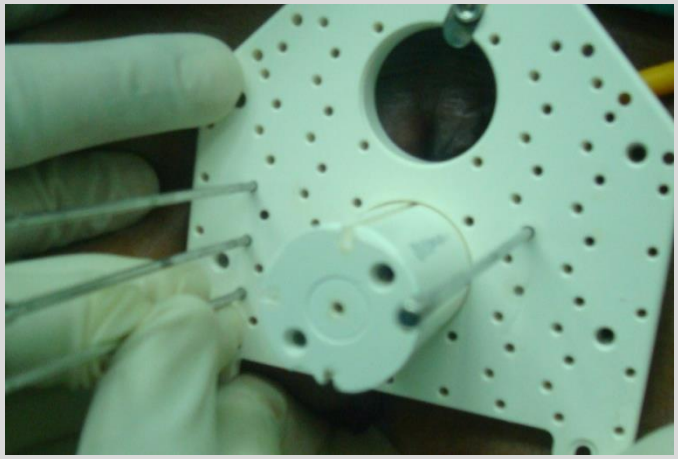
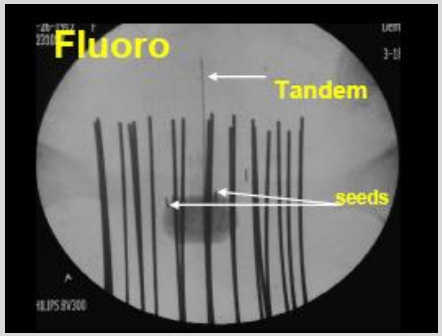
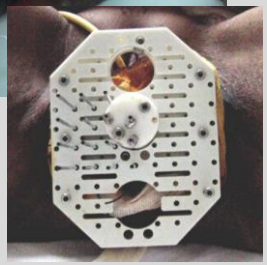
PRINICPLES OF MUPIT PROCEDURE





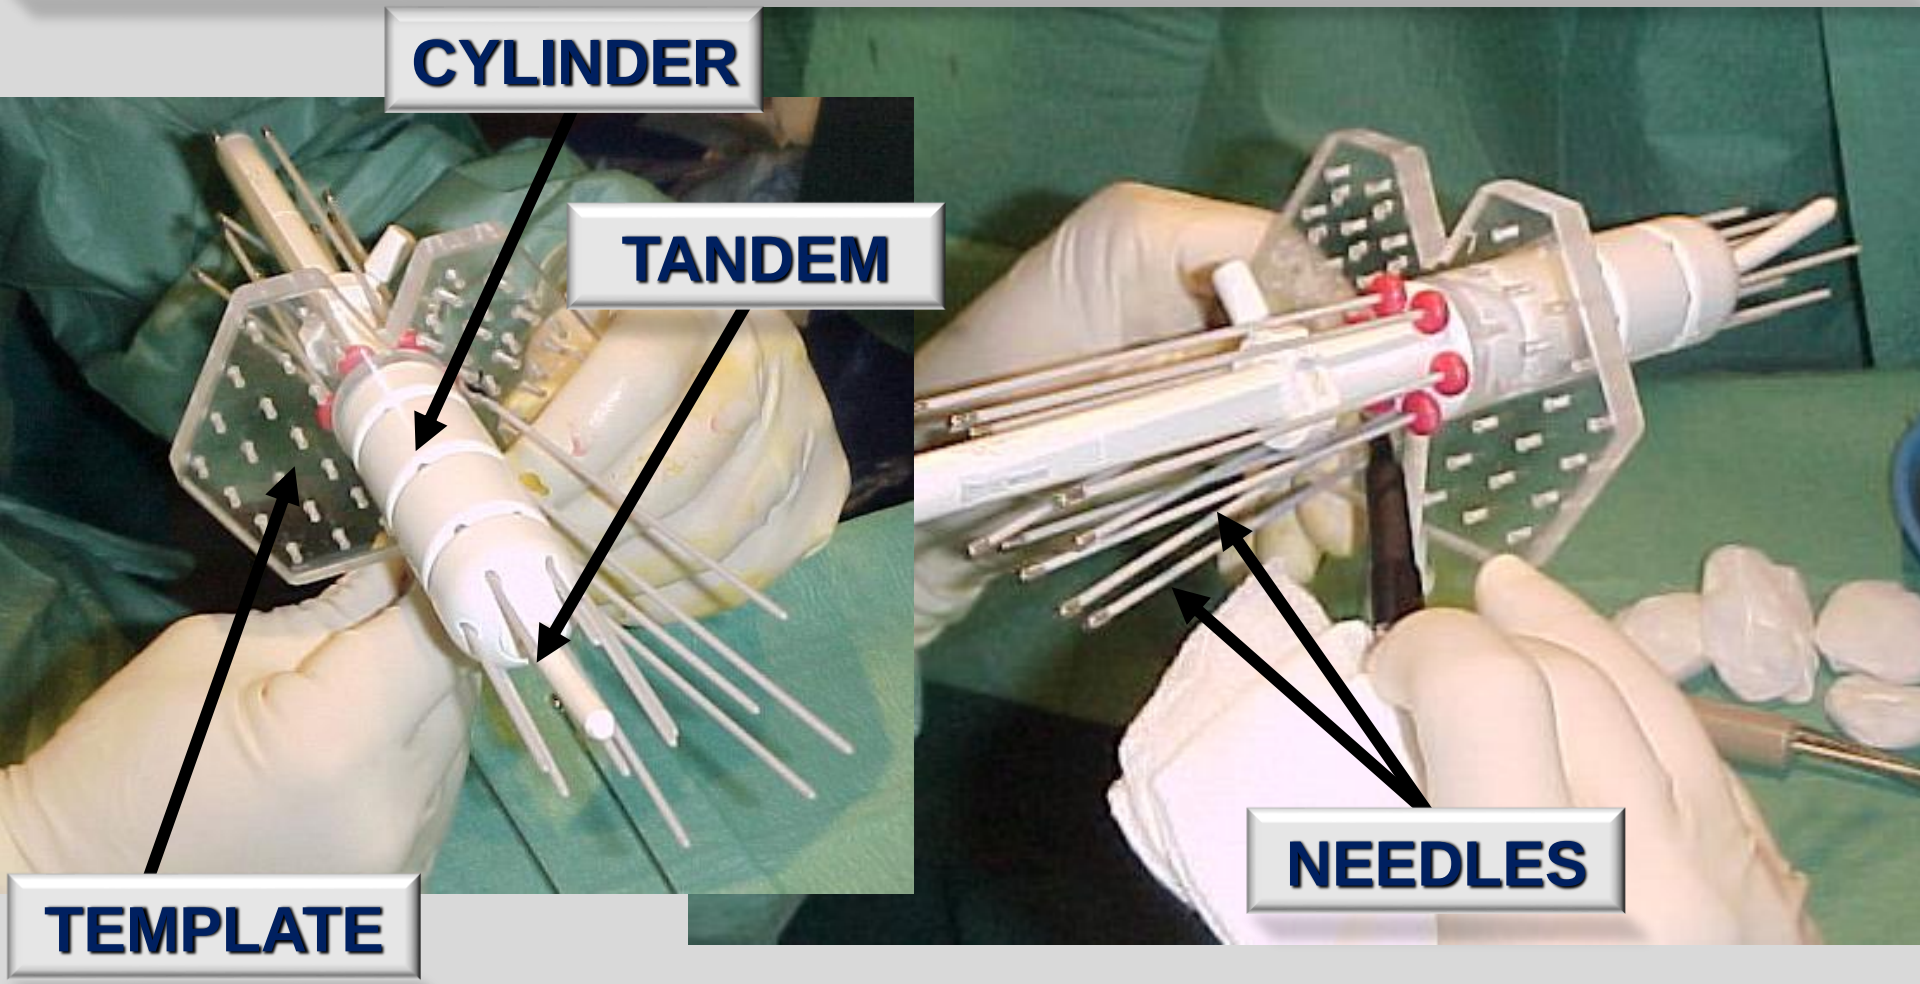


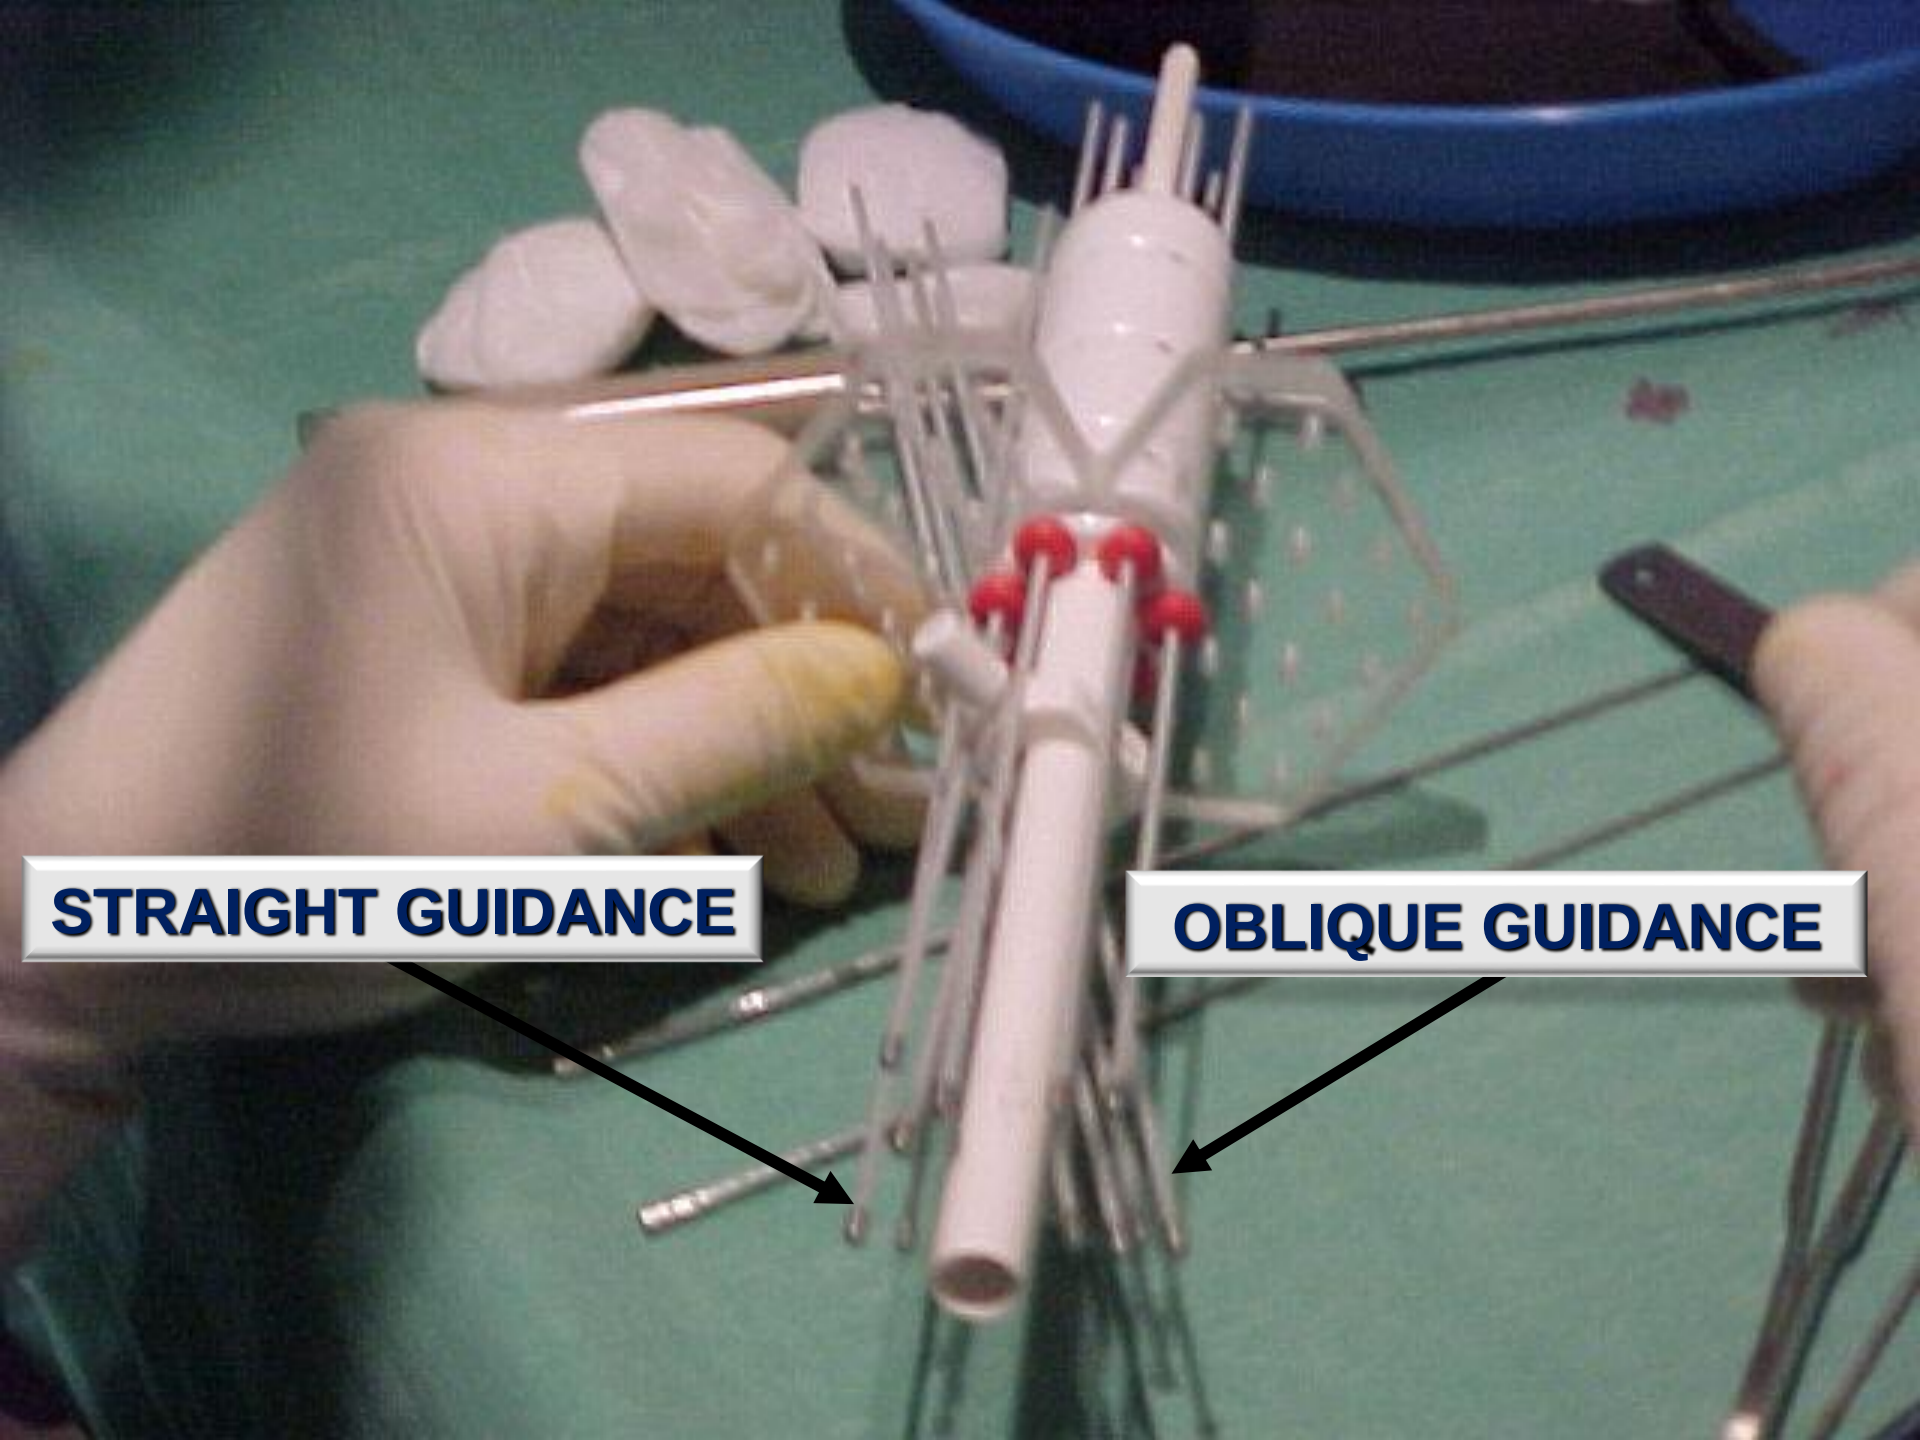




MODIFIED CLASSICAL INTERSTITIAL TECHNIQUES

MRI-compatible cylinder + tandem + template

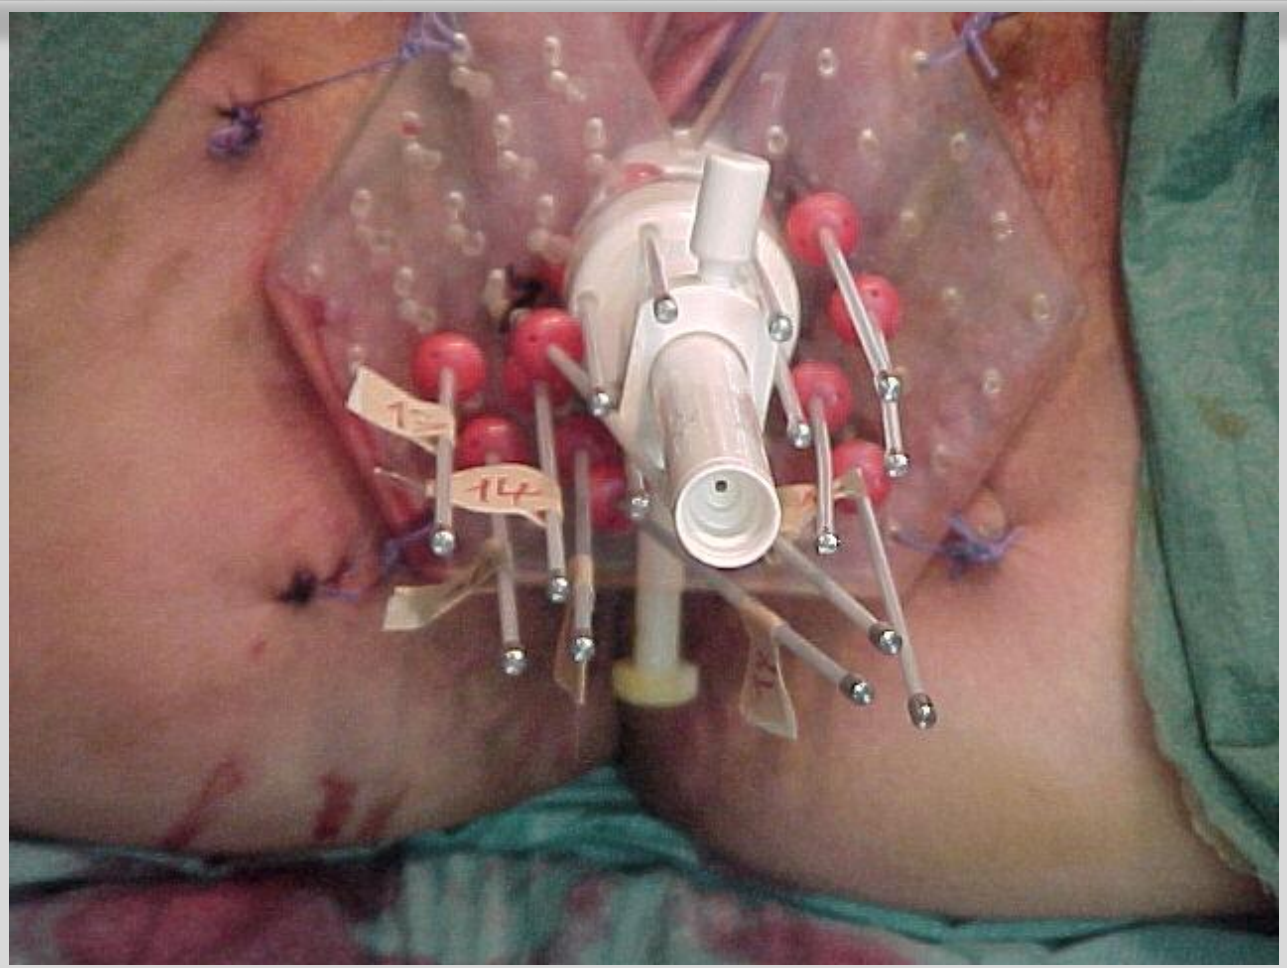




STRAIGHT GUIDANCE
OBLIQUE GUIDANCE

MODIFIED CLASSICAL INTERSTITIAL TECHNIQUES

COMPLETED IMPLANT



CLASSICAL & MODIFIED INTERSTITIAL TECHNIQUES

DRAWBACKS

- *Accurate freehand implantation is difficult*
  - *positioning often inaccurate*
  - *loss of parallelism*
  - *not reproducible*

- *Perineal templates (Syed, MUPIT, others)*
  - *high number of needles used*
  - *long distances between template and target (loss of parallelism, inaccurate positioning)*
  - *impediment for general acceptance: considerable risk of serious acute/late complications*

INTRACAVITARY + INTERSTITIAL TECHNIQUES

TASKS

- *improve control over the placement of needles: short distance between template and the target (accurate and reproducible insertion)*
- *lesser number of needles to achieve an adequate target coverage*
- *to be combined with individualised MRI based treatment planning to tailor the dose distribution (improve local control without increasing side effects)*

SELECTION OF APPLICATION TECHNIQUE

Based on clinical examination and sectional imaging:

At the time of diagnosis

- Initial tumor extension

During EBRT

-Quantitative and qualitative tumor regression

At the time of brachytherapy

-Topography of residual tumor in relation to the applicator

Selection of Brachytherapy Technique

- In General: depending on residual disease at brachytherapy
  - Disease confined to cervix and medial third parametrium: IC alone
  - Extensions beyond medial third parametrium: IC + IS combination
  - Extensive disease not amenable to IC + IS: IS
- Applications can be modified in subsequent fractions (esp. HDR)

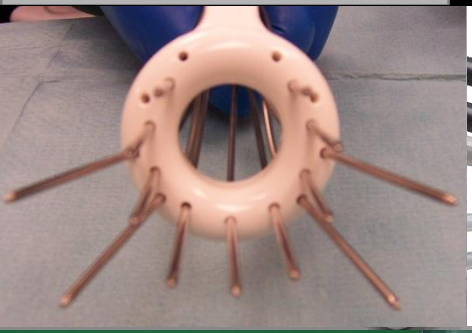
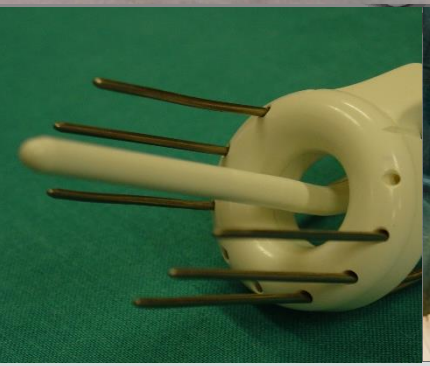
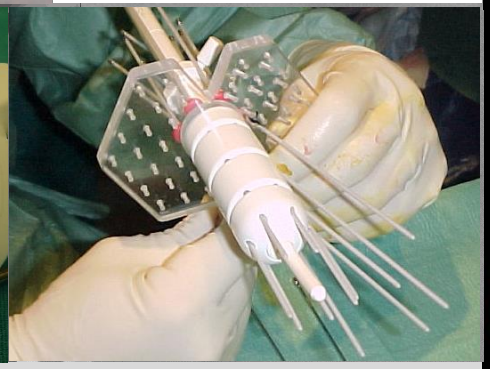
264 patients with tumour mapping Ljubljana, Vienna, Aarhus

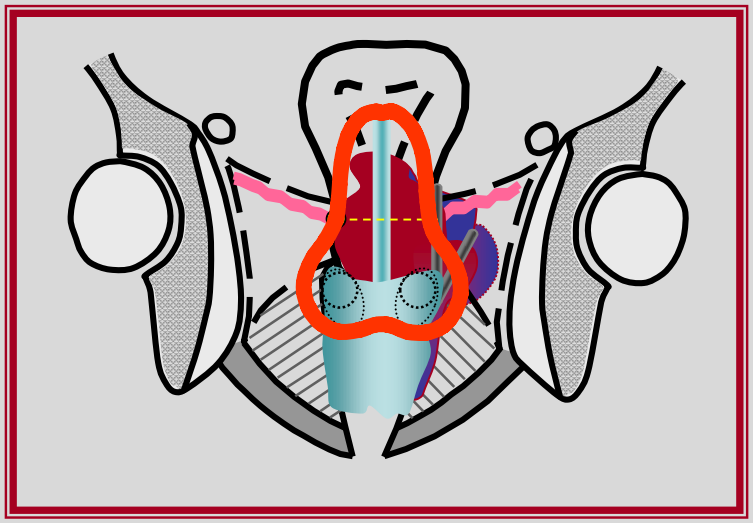
Provided by Primoz Petric and Jacob Lindegaard Ljubljana/Aarhus

Mission

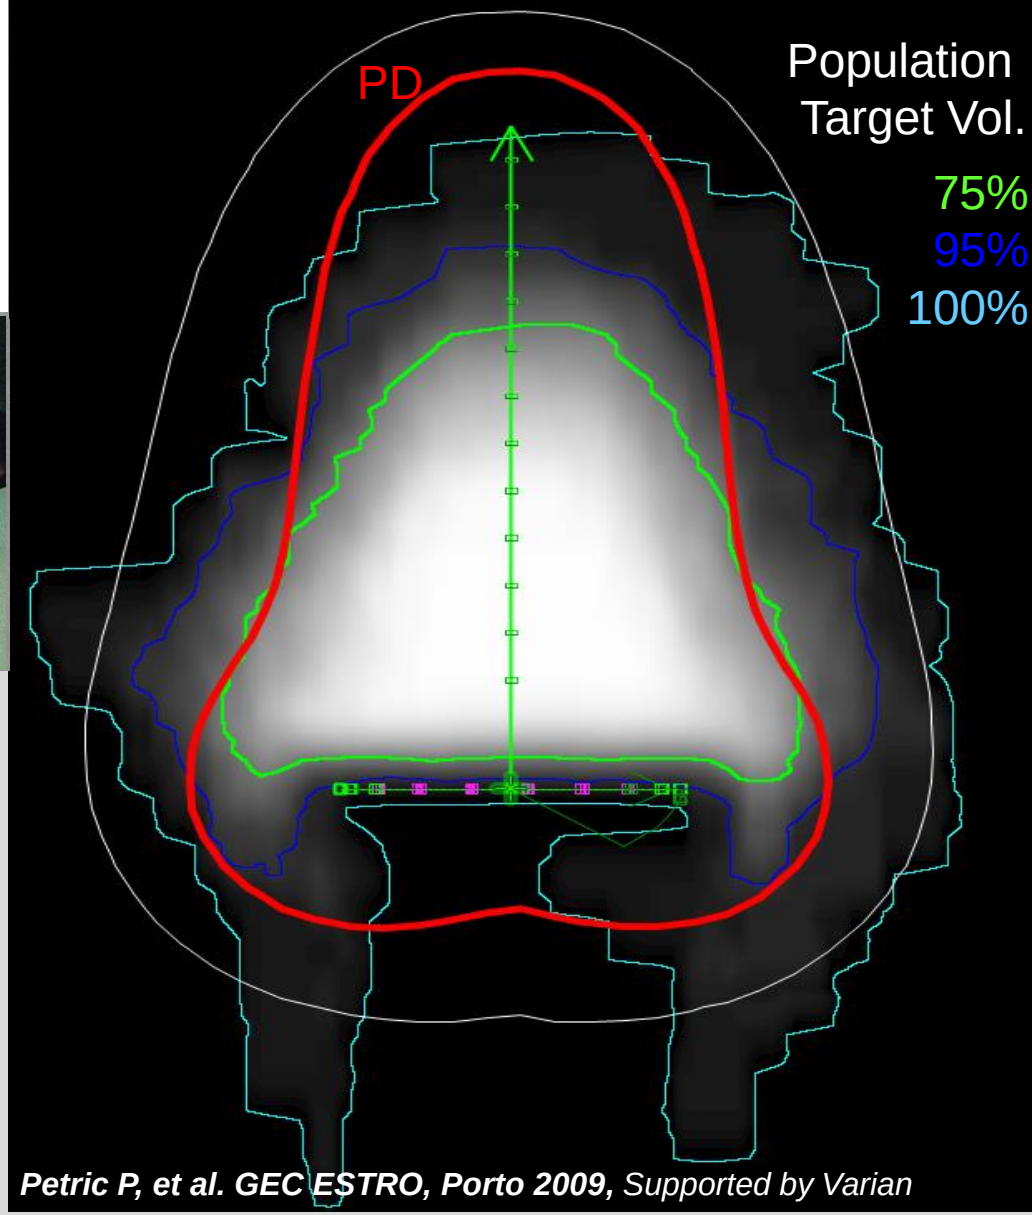








264 patients



Petric P, et al. GEC ESTRO, Porto 2009, *Supported by Varian*

Courtesy: P. Petric,D. Berger

SUMMARY & CONCLUSIONS

- *Conbined Intracavitary & Interstitial techniques when inappropriate coverage (topographic and dosimetric) with pure intracavitary techniques*
- *Several approaches (applicators,guidance) available*
- *Application technique: Various tumor topography at BT*
- *A good portion of cases can be treated with simple techniques*
- *Combined Intracavitary & Interstitial techniques: Associated with a learning curve for accurate placement/few needles/MRI based tuomr topoography*

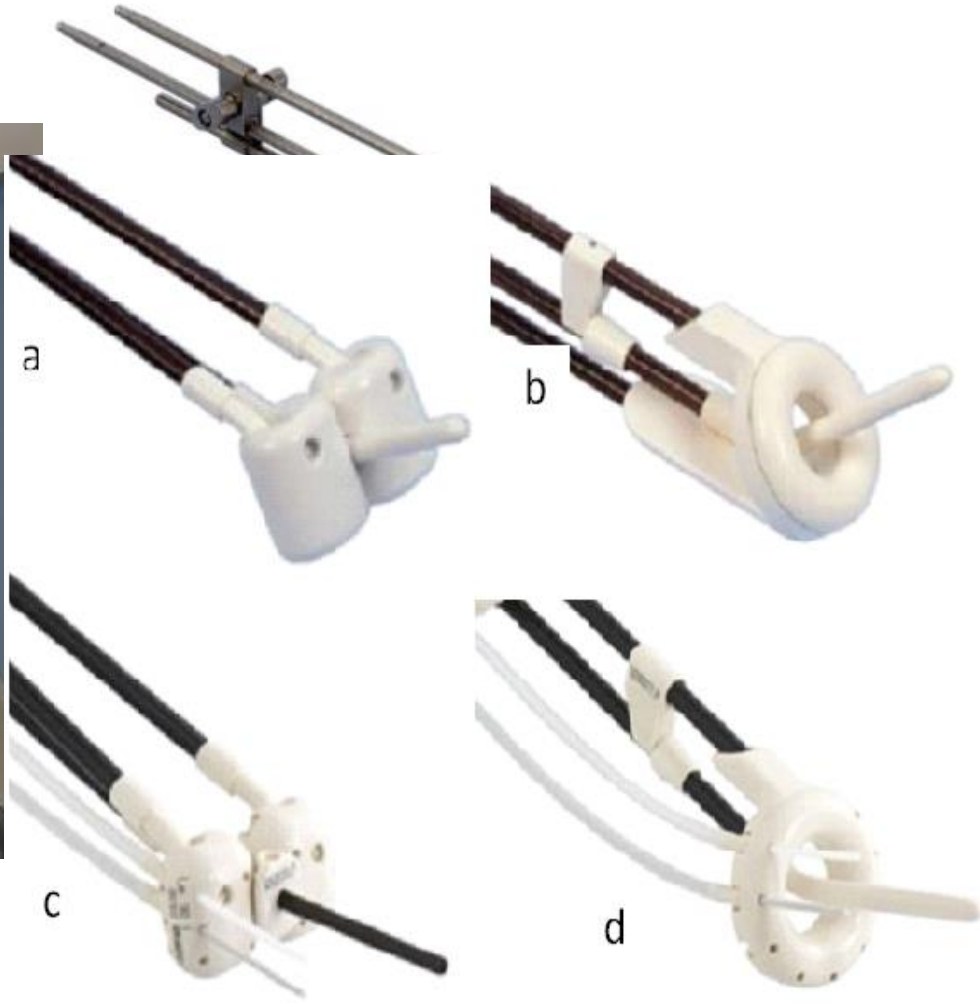
Applicator commissioning

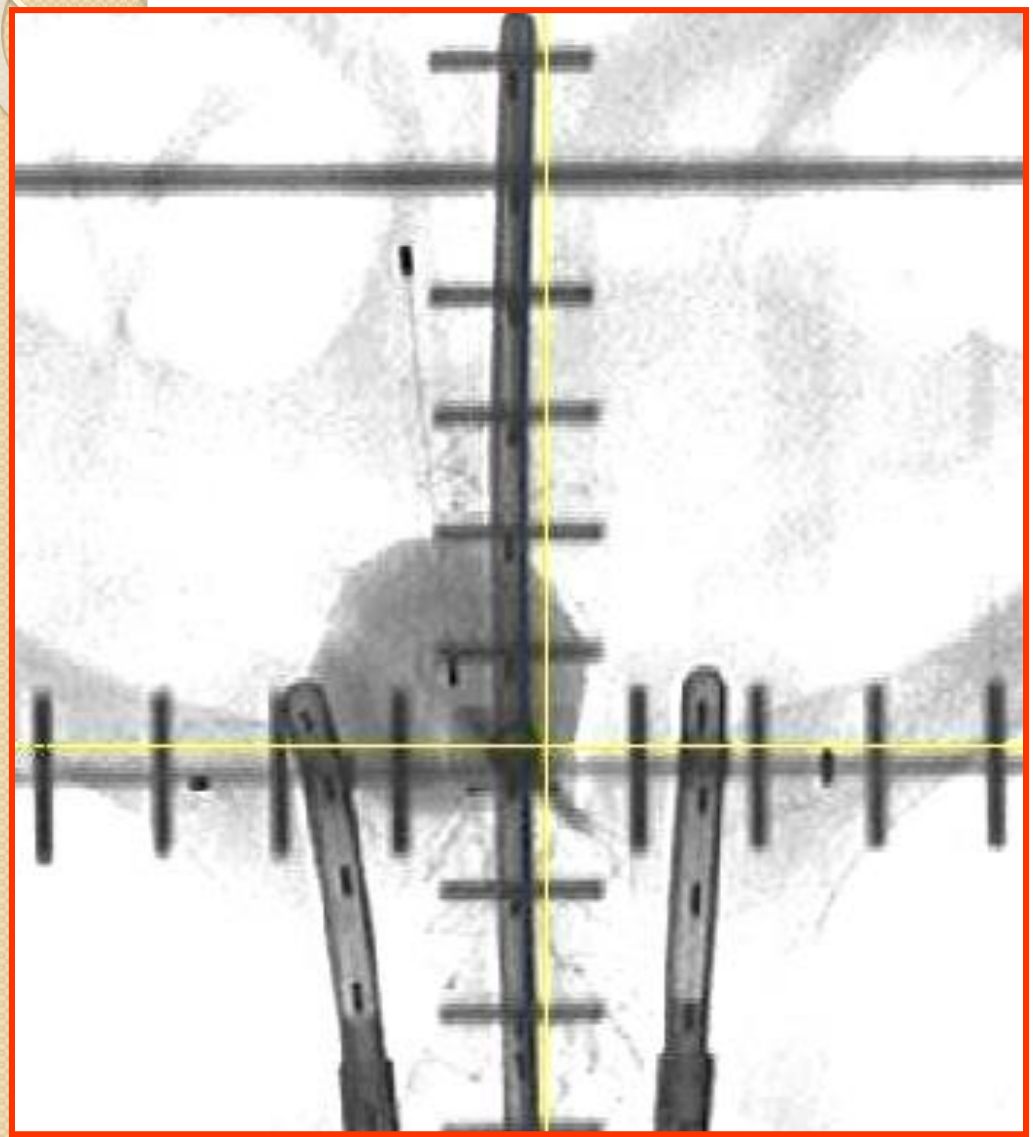
Swamidas V Jamema PhD,

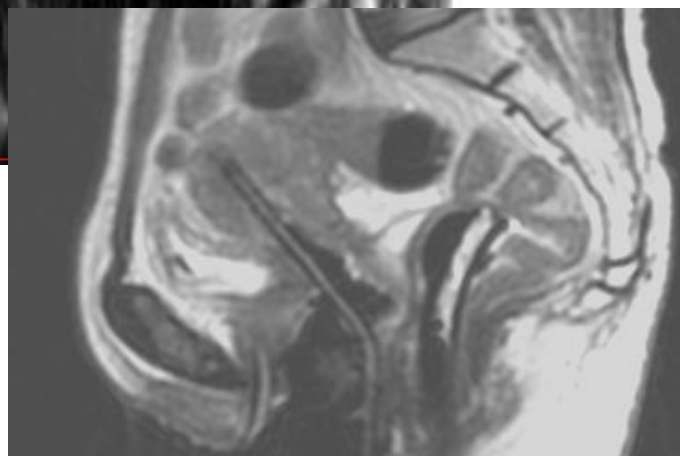
Tata Memorial Hospital, Mumbai, India

Commissioning



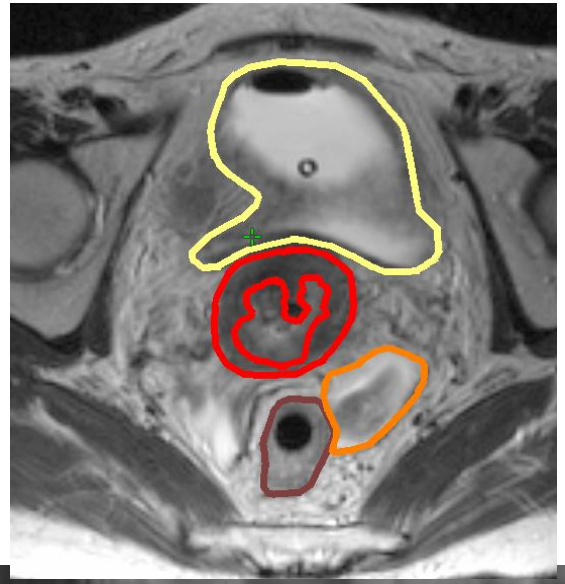
Why so much fuss about Applicator reconstruction in 3D BT

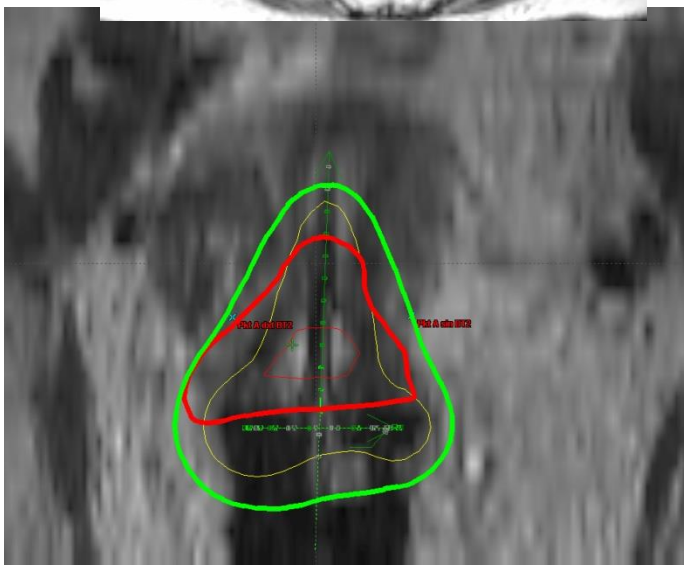




Why applicator reconstruction important: Clinical consequences

- 10 intracavitary cervical cancer patients
- MR scan with ring applicator in situ
- Contouring on transversal T2 images:
  - HR-CTV
  - Bladder
  - Rectum
  - Sigmoid
- Manual 3D dose optimisation
- DVH parameters:
  - D100, D90 for HR-CTV
  - D_{2cc} for bladder, rectum, sigmoid



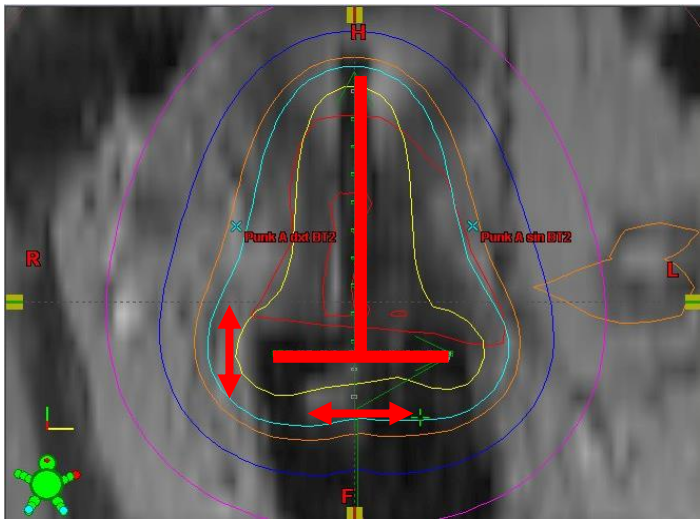


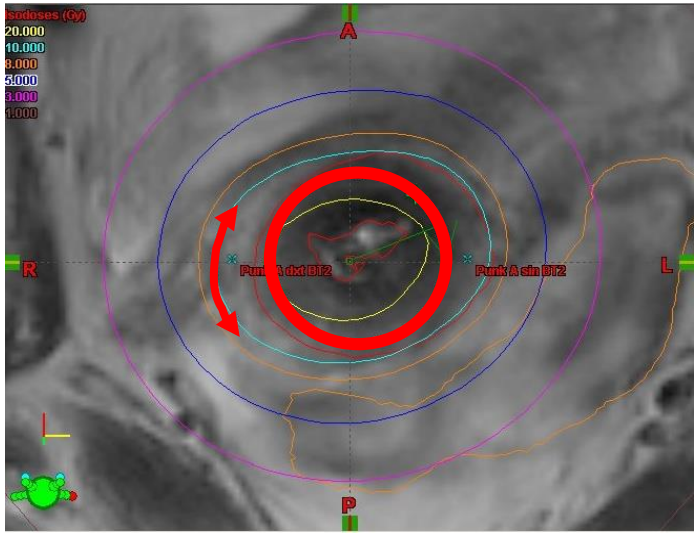
Tanderup et al, R&O 2008

Simulation of uncertainty

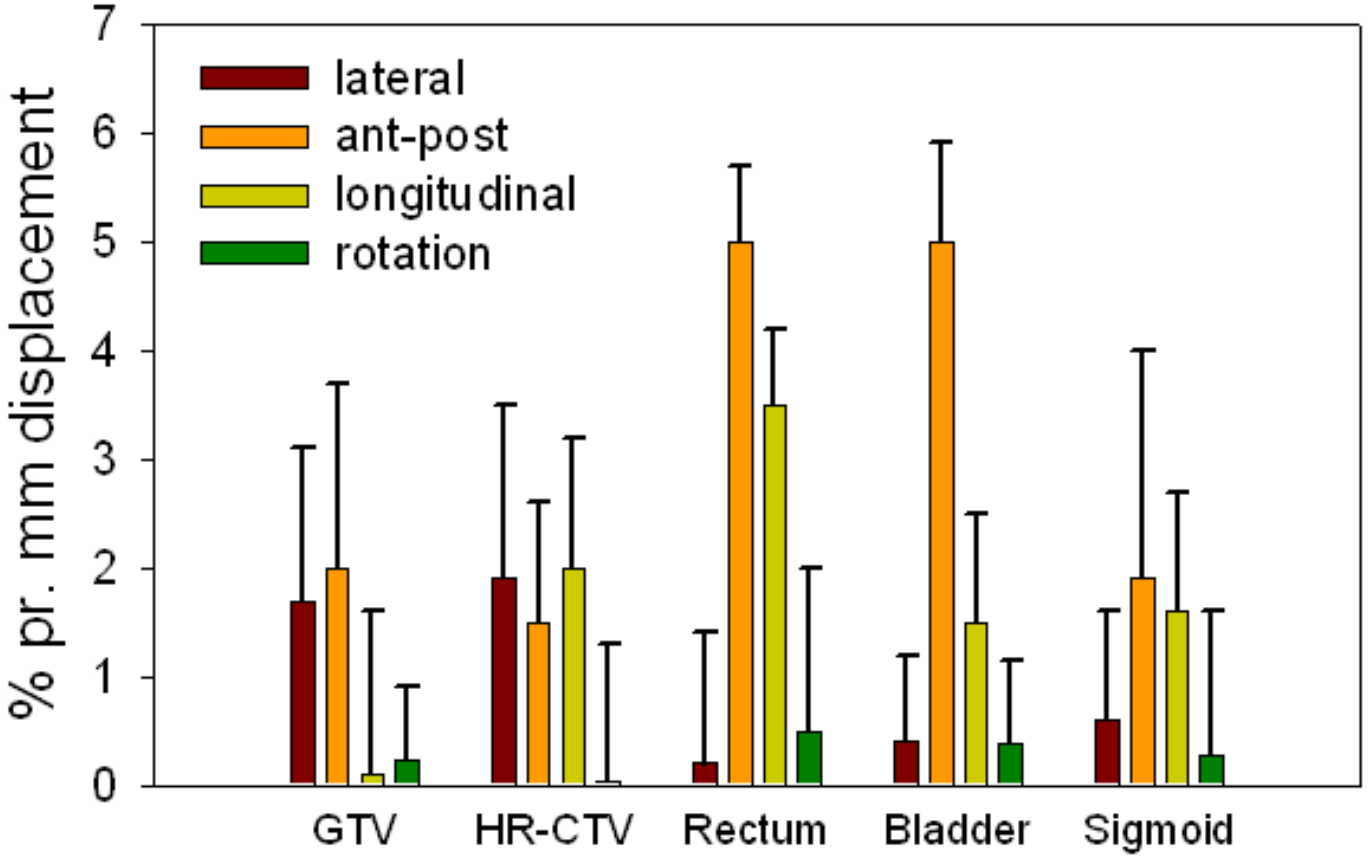
- Displacement in directions:
  - Longitudinal (along tandem):
    - ± 3 mm, ± 5 mm
  - Lateral:
    - ± 3 mm
  - Ant-post
    - ± 3 mm
- Rotation of ring:
  - ± 15 dgr (4 mm)

Tanderup et al, R&O 2008



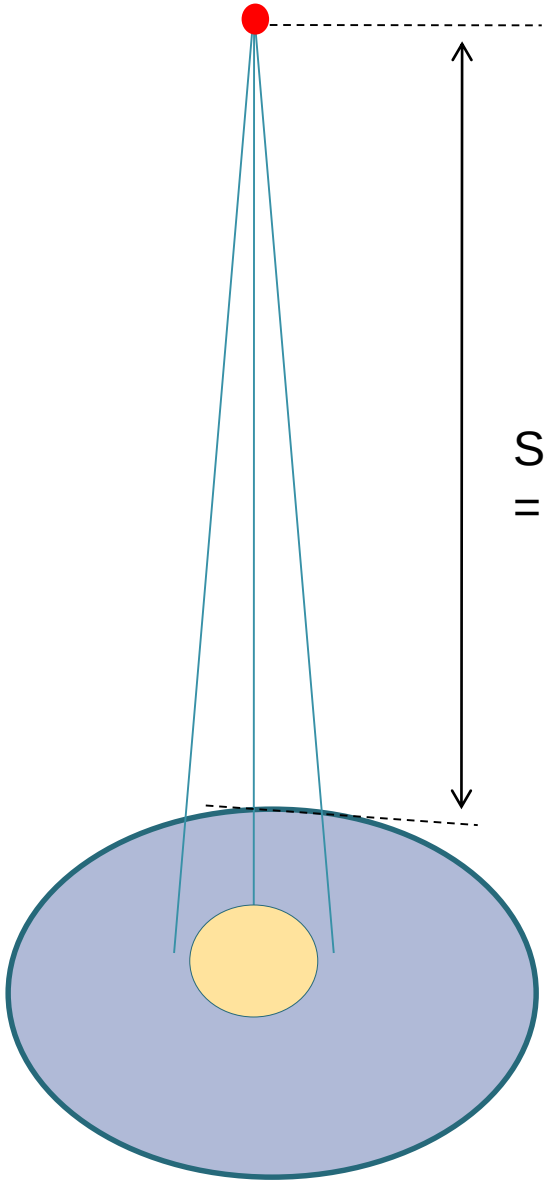


Mean DVH shifts (%) pr mm

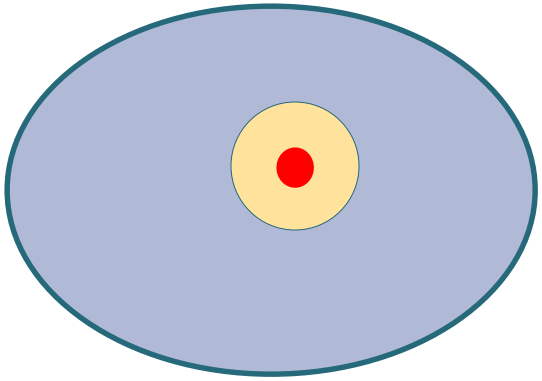


Tanderup et al, R&O 2008

What is Applicator reconstruction in Brachytherapy?



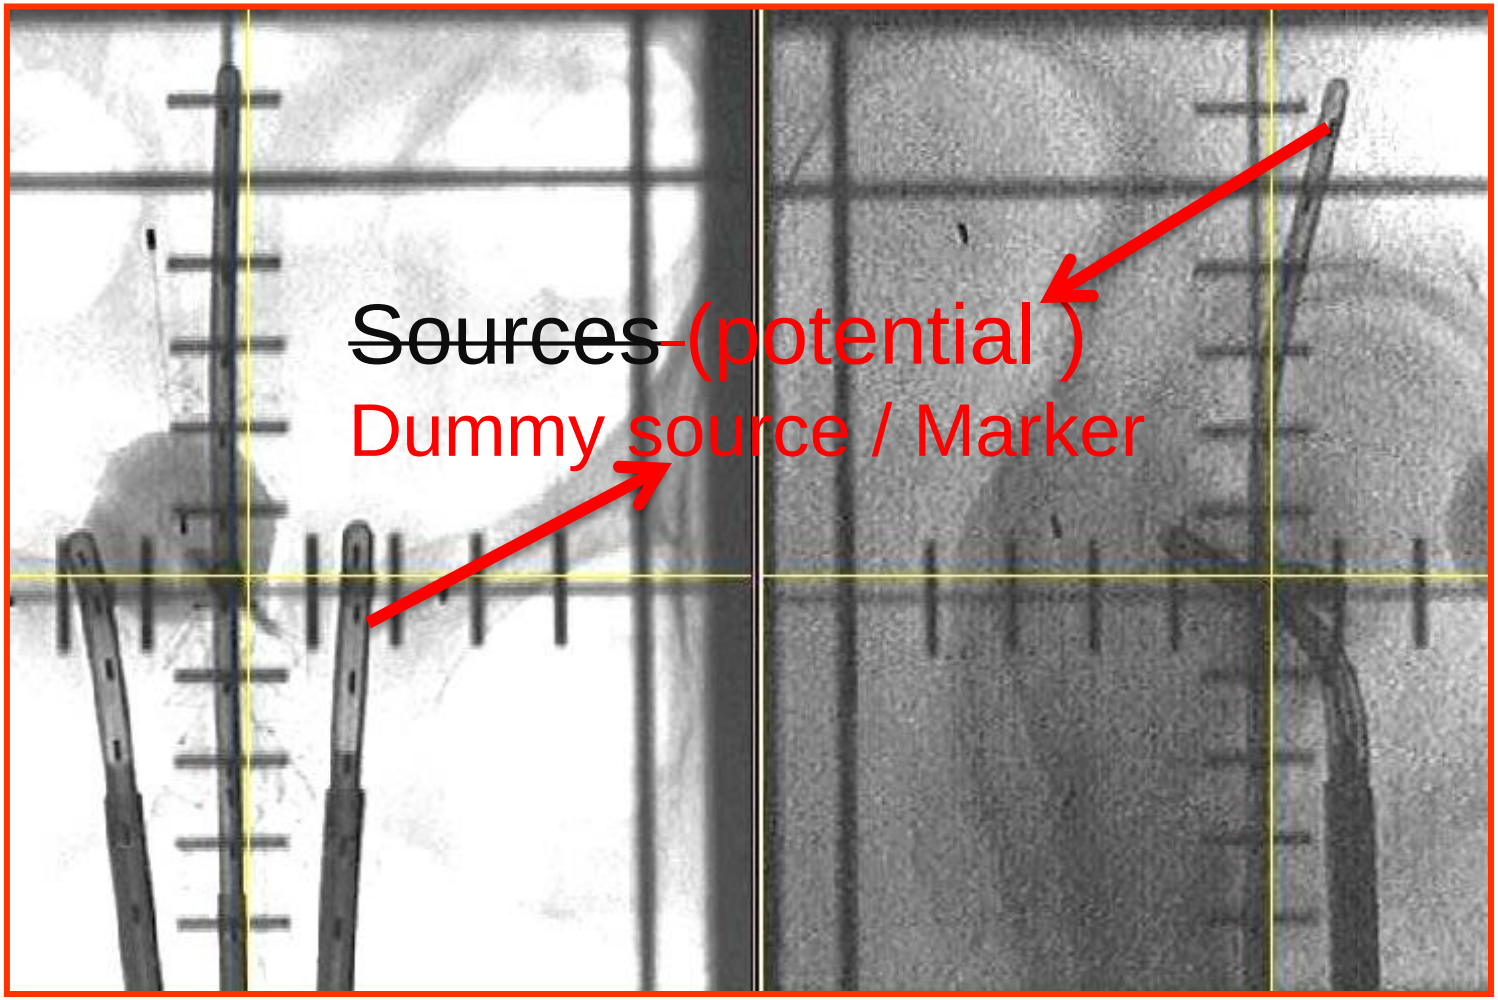
External therapy



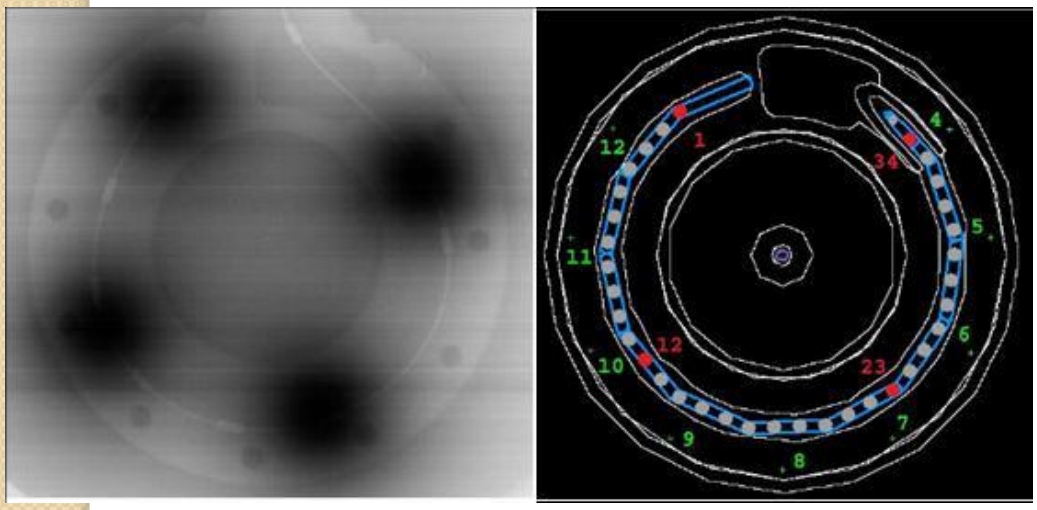
Brachytherapy

defining a source path inside the applicator

What is applicator reconstruction?



Commissioning of applicator



Ack: Hellebust TP

- The location of dwell positions is found in relation to one another or in relation to reference points in the applicator,
  - e.g., the distance from the tip of the tandem applicator to the first dwell position.

GEC-ESTRO Recommendations

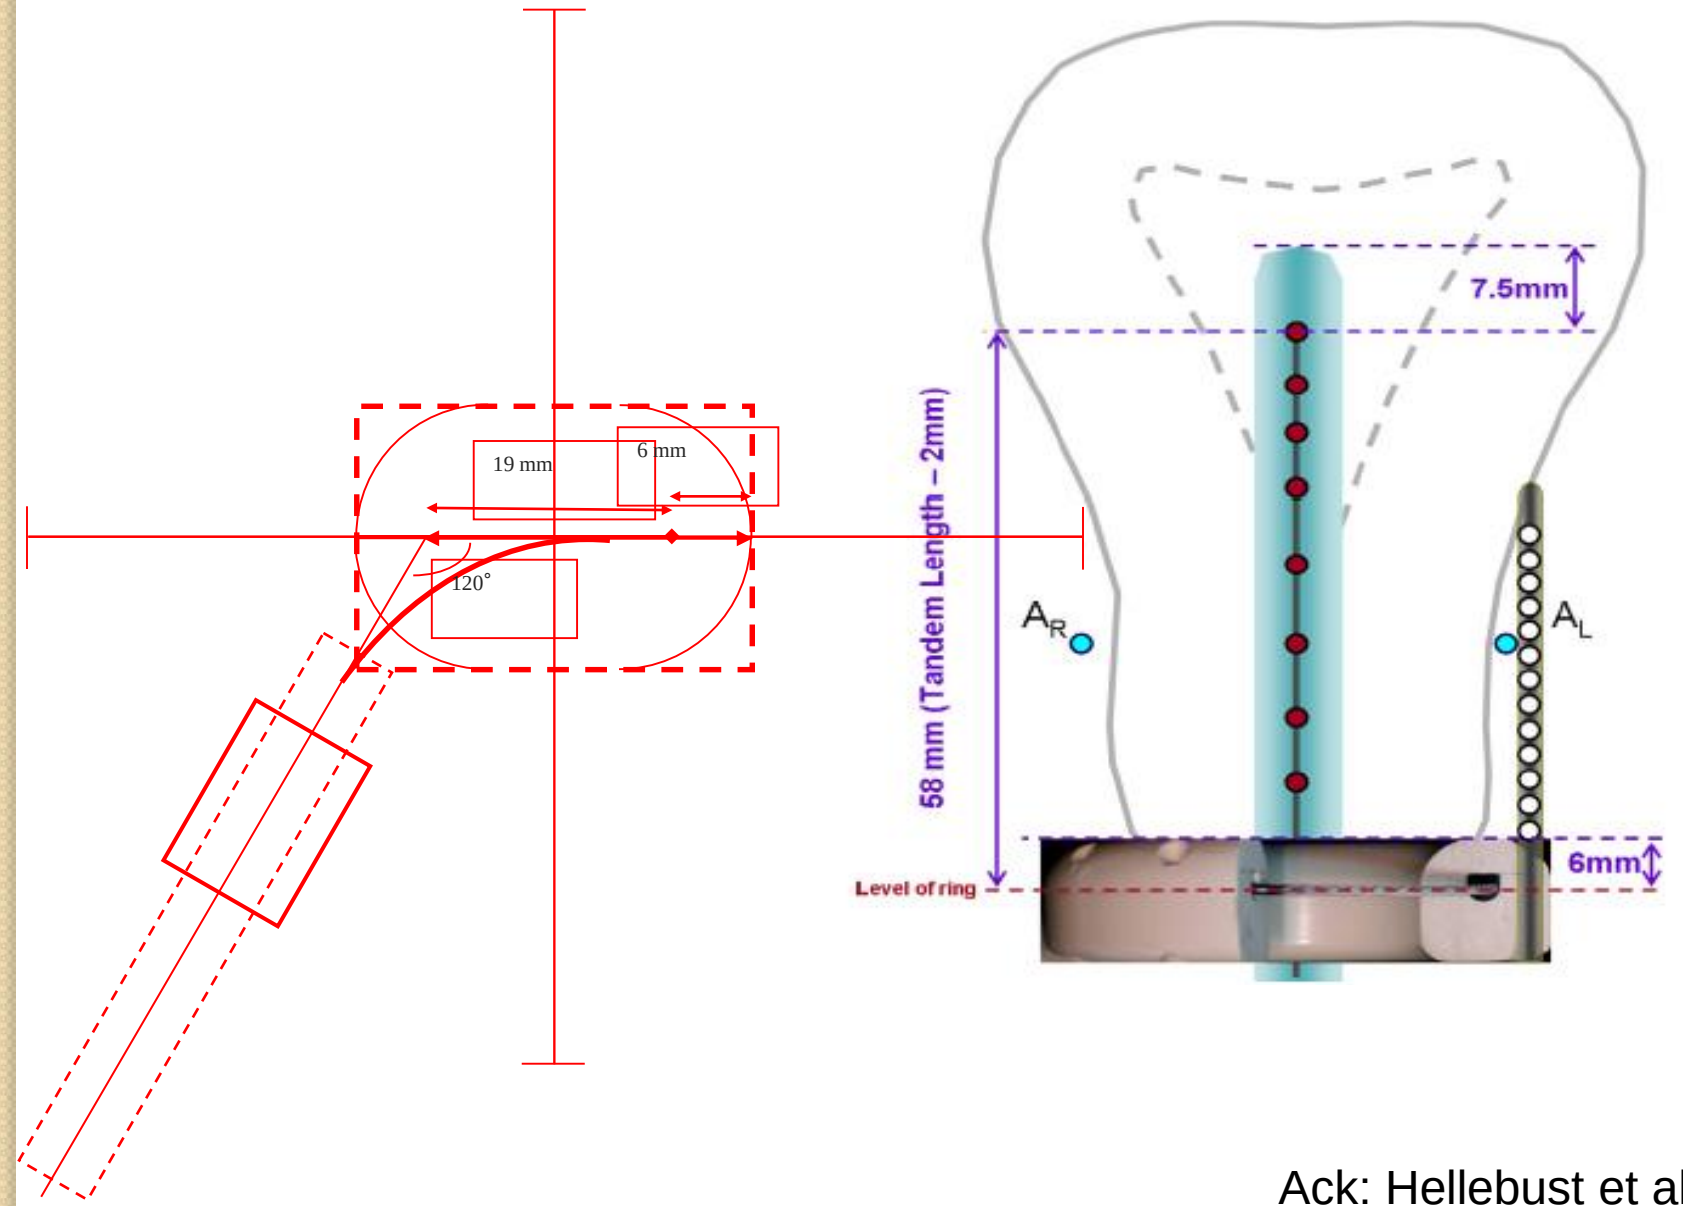
Recommendations from Gynaecological (GYN) GEC-ESTRO Working Group: Considerations and pitfalls in commissioning and applicator reconstruction in 3D image-based treatment planning of cervix cancer brachytherapy

Taran Paulsen Hellebust [a,*], Christian Kirisits [b], Daniel Berger [b], José Pérez-Calatayud [c], Marisol De Brabandere [d], Astrid De Leeuw [e], Isabelle Dumas [f], Robert Hudej [g], Gerry Lowe [h], Rachel Wills [h], Kari Tanderup [i]

Radiotherapy and Oncology 96 (2010) 153-160

Inaccuracy in applicator reconstruction can lead to geometrical uncertainties and thus uncertainties in the definition of source positions which influence the accuracy of the delivered dose to both target volumes and organs at risk.

Step 1/5: Understand the geometry

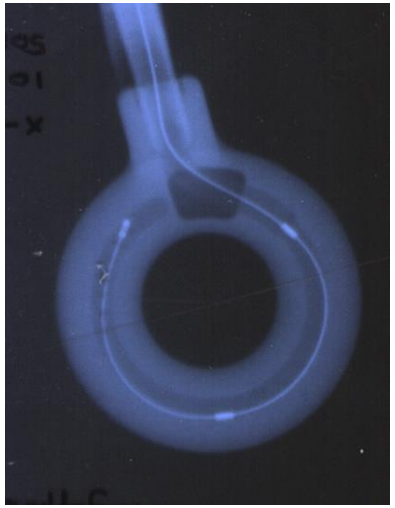


Ack: Hellebust et al

Step 1/5: Understand the geometry

The ring applicator from Bebig vs Elekta

X-ray



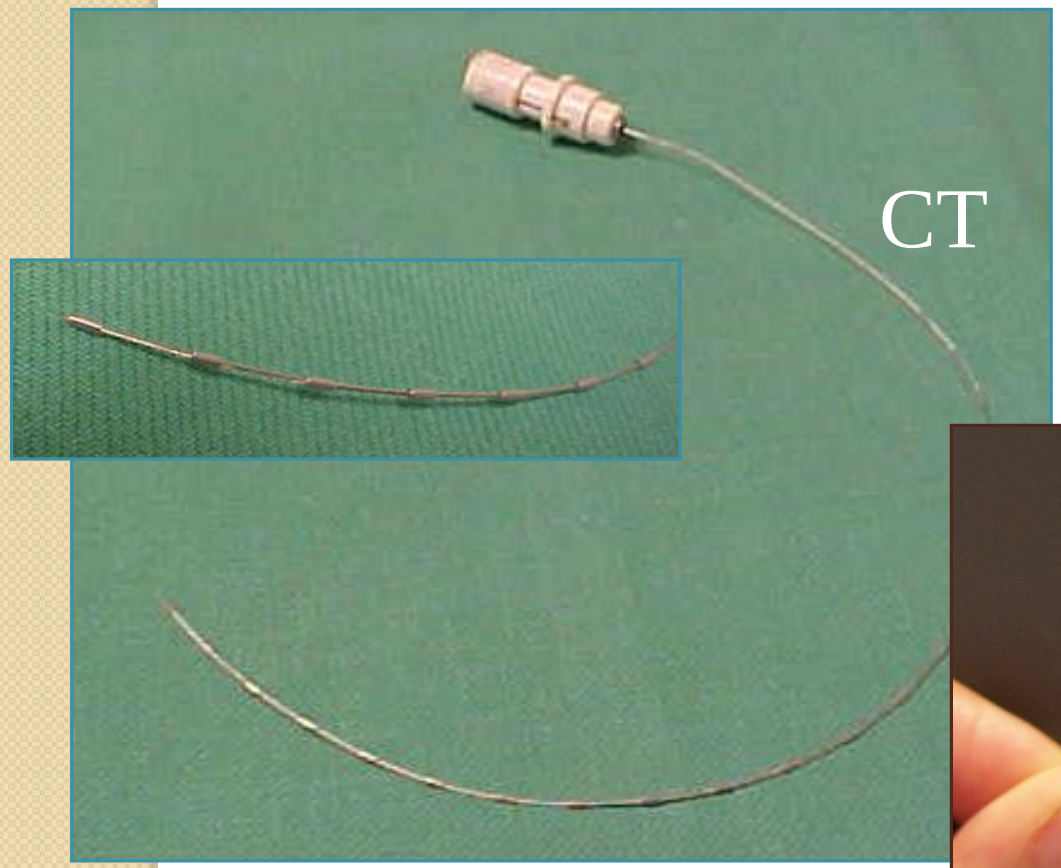
X-ray

Elekta

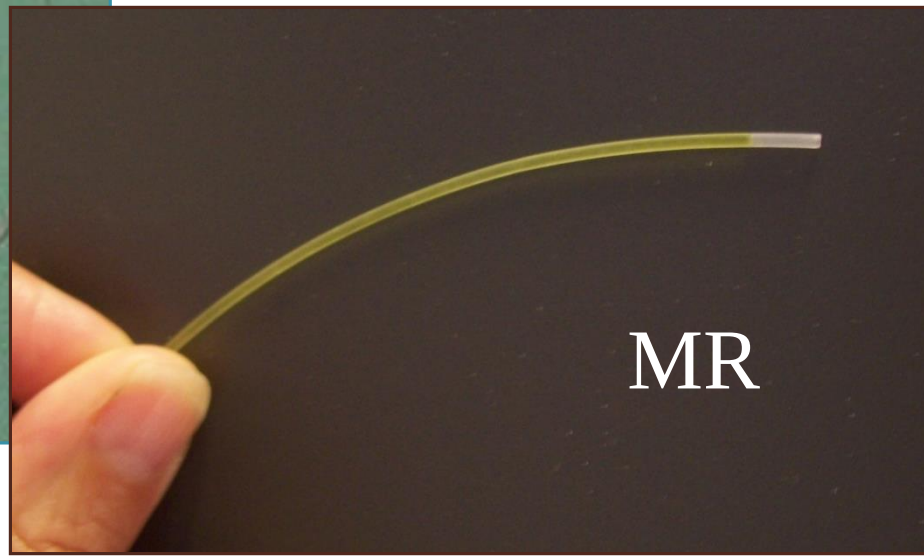
Bebig

Slide courtesy : Hellebust

Step 2/5: Choose the Markers

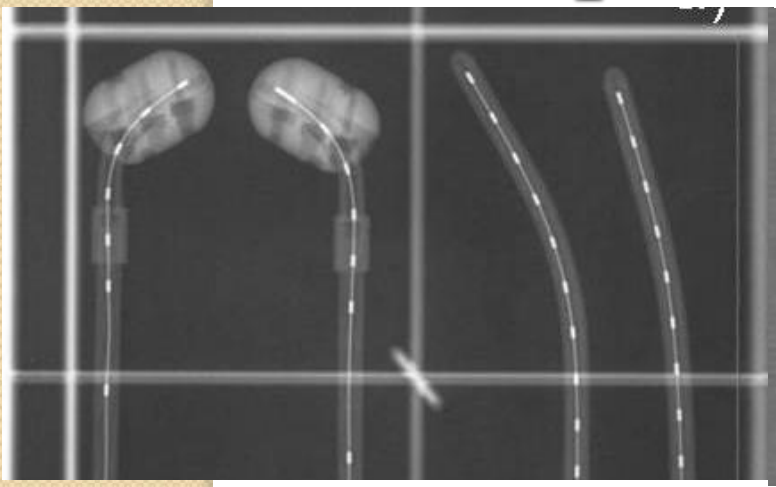


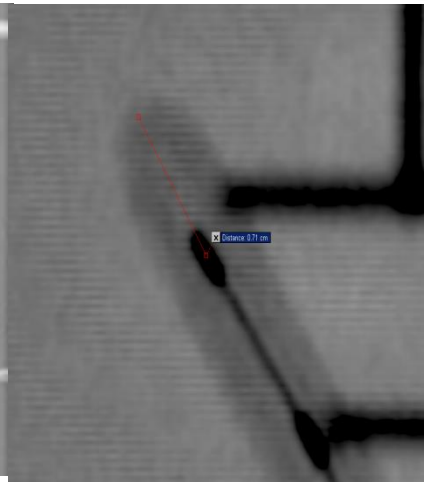
important: Dedicated for each type of applicator, check for locking!!

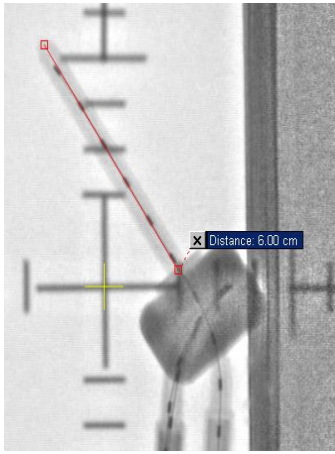


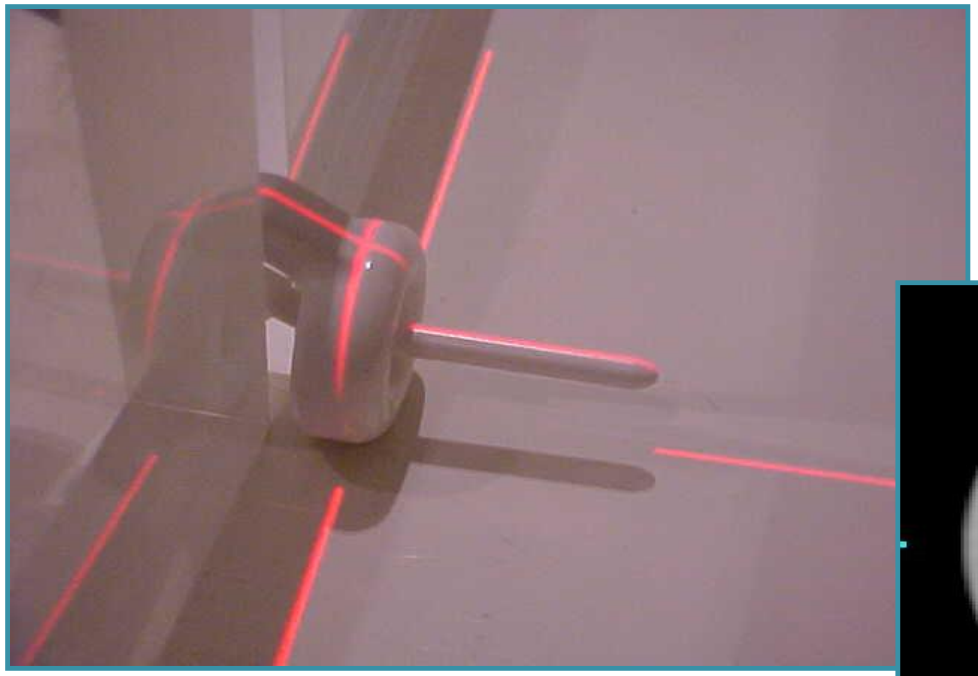
Ack: Hellebust

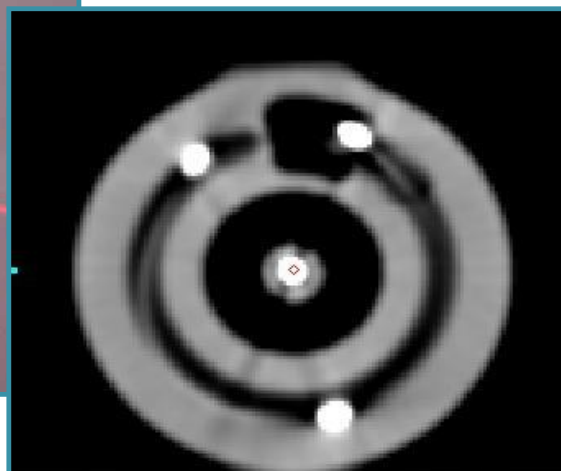
Step 3/5: Radiograph / CT





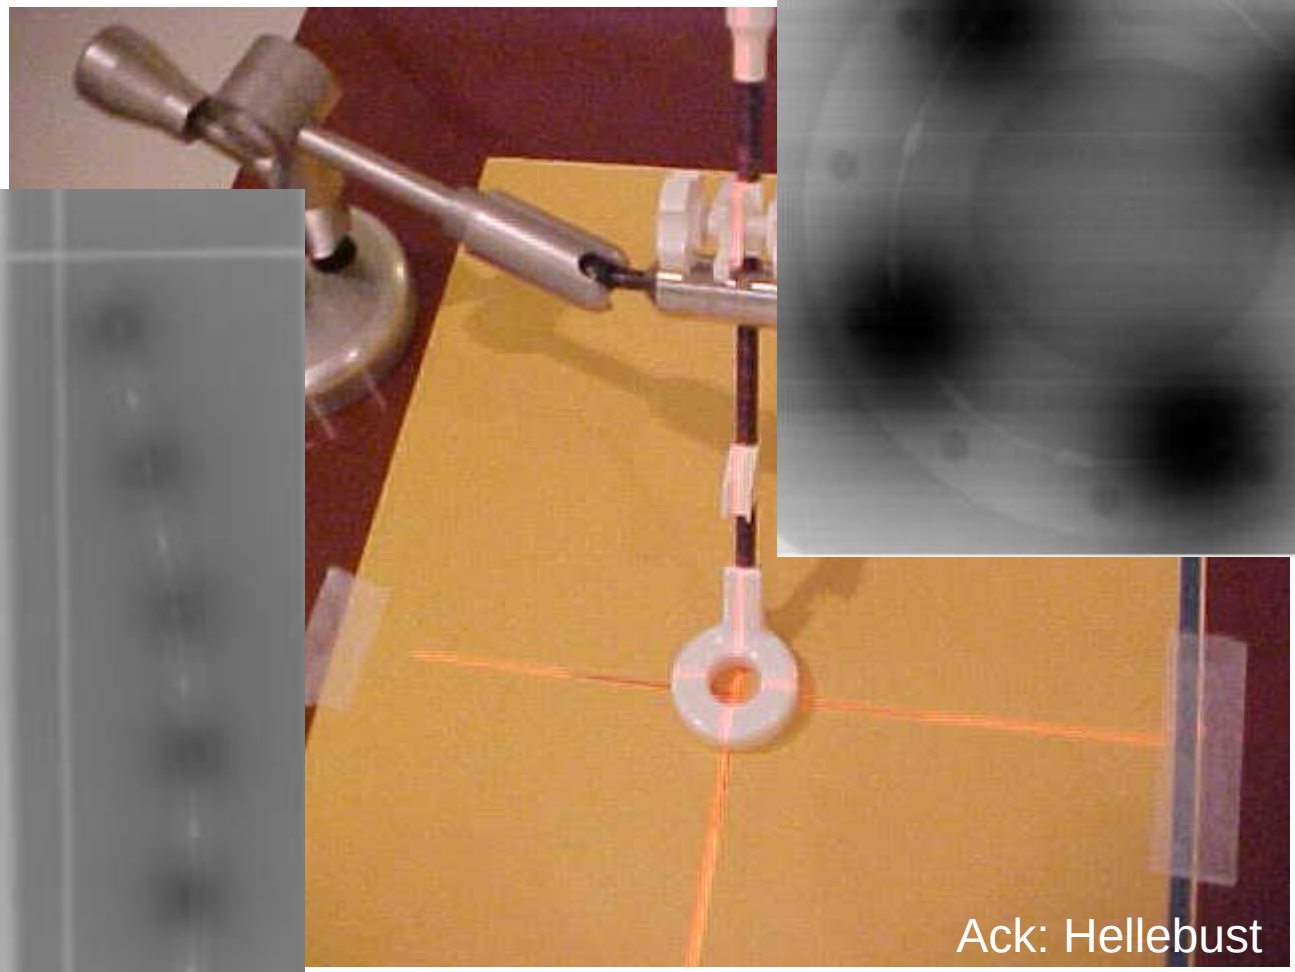


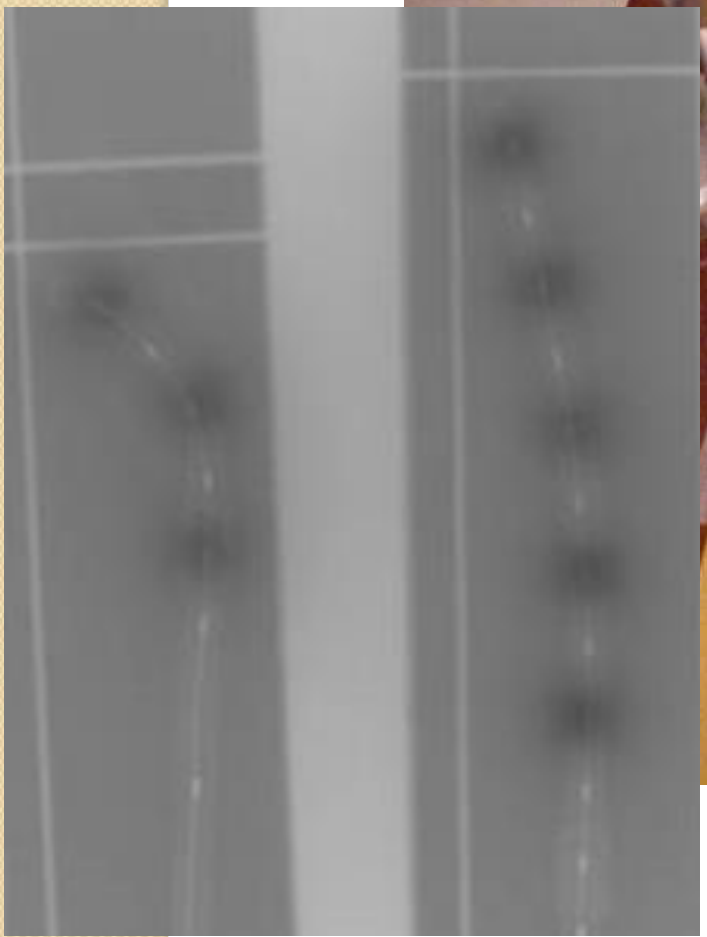




Ack: Hellebust TP

Step 4 /5 : Auto radiograph



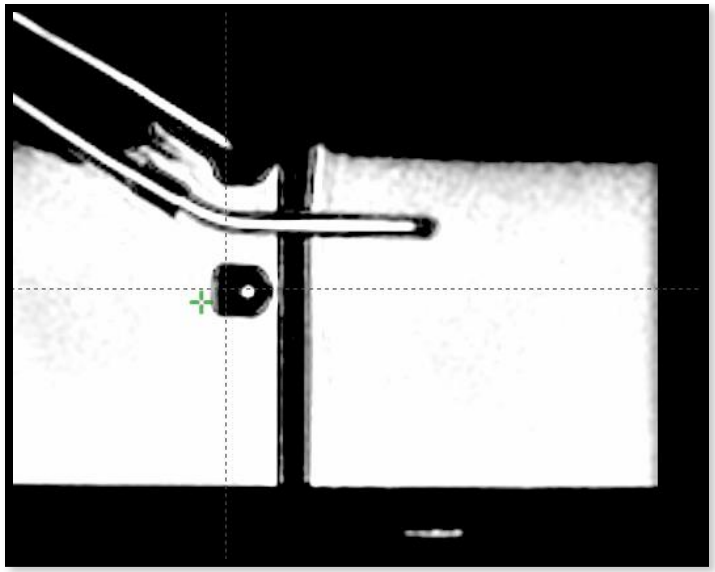


Ack: Hellebust

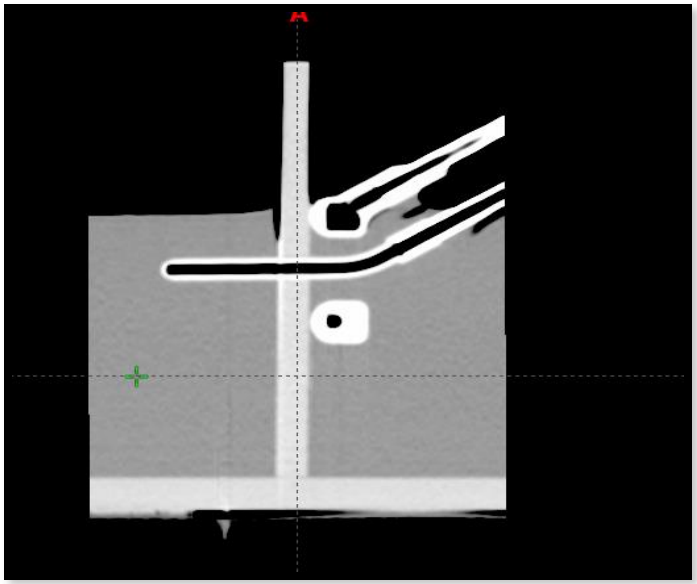
Step 5/5 : Analysis

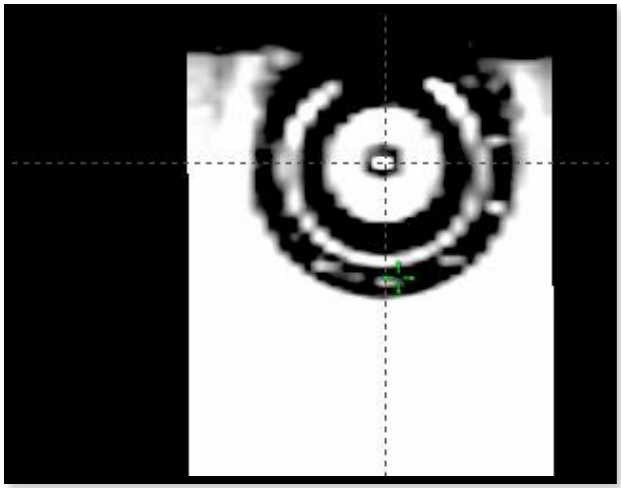
- Compare the auto radiograph with the manufacturer specifications
- Comparing step 1 with 4

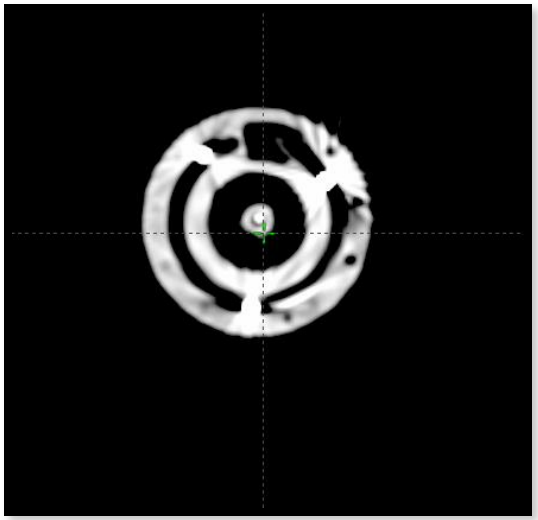
MRI



CT

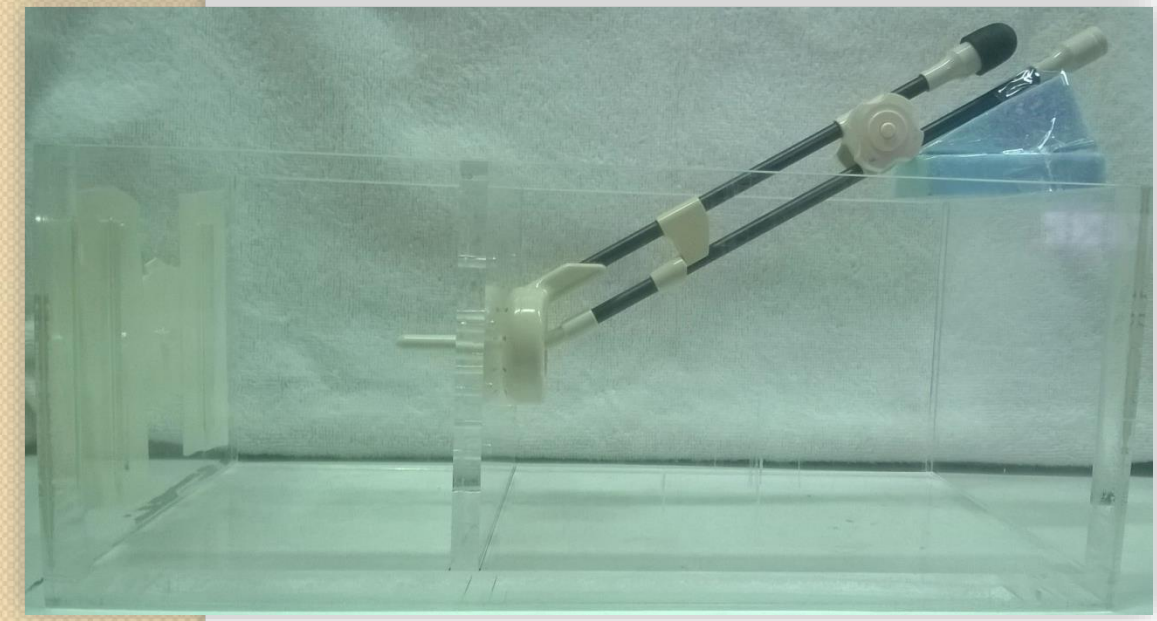




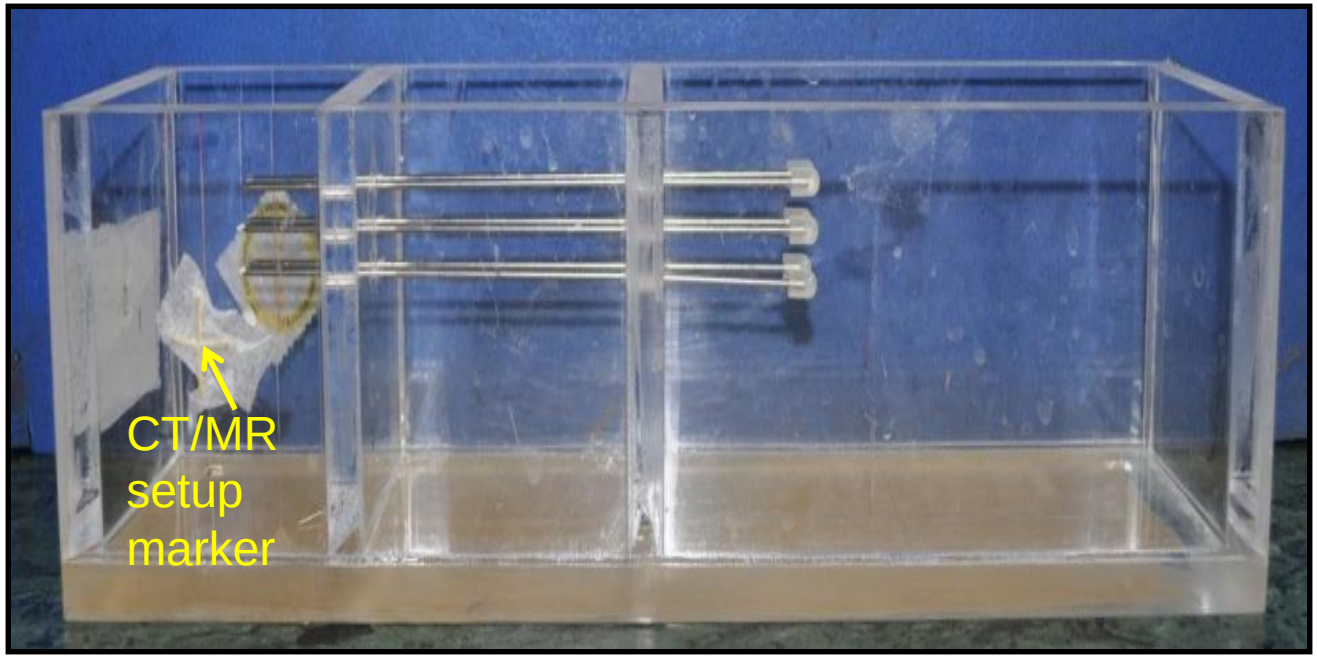


Phantom

- Should facilitate accurate positioning of the applicator
- External setup markers for proper setup during imaging



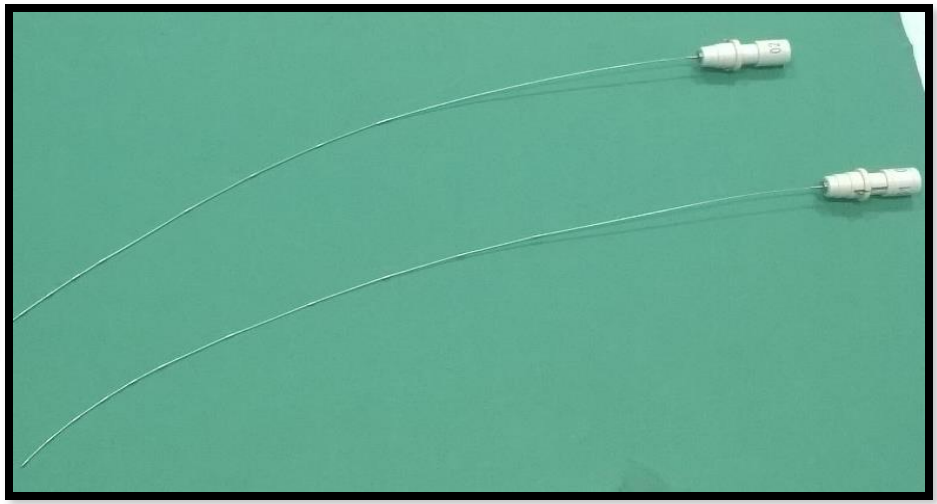
Vienna Applicator



Interstitial Needles

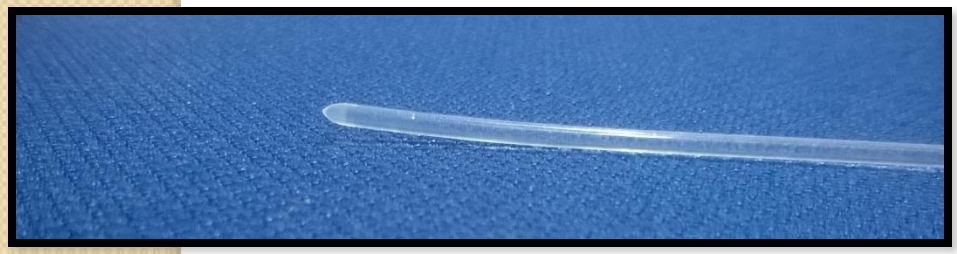
Medium:

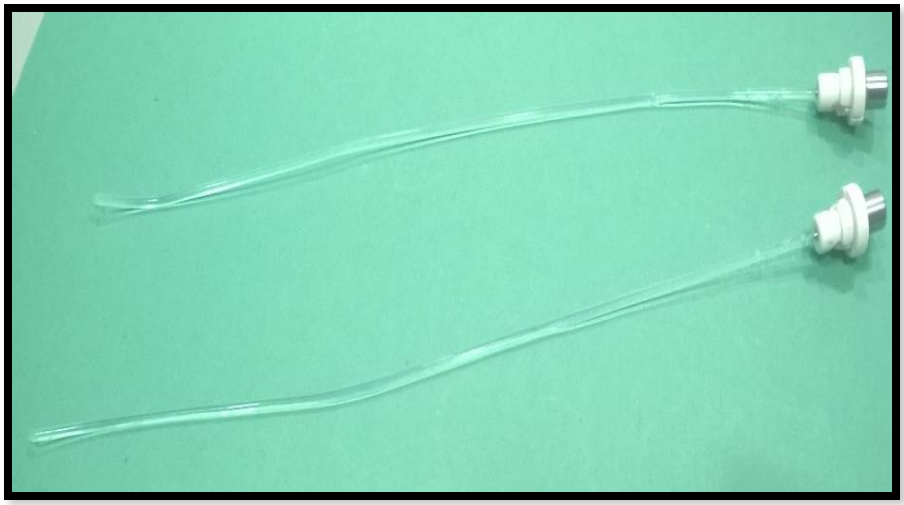
- Preferable if it resembles human tissue imaging qualities.
- Ideal for CT/ MR applicator is Agarose gel (3%) with CuSO4 (1 g/L)



X-ray markers for CT/MR applicator.

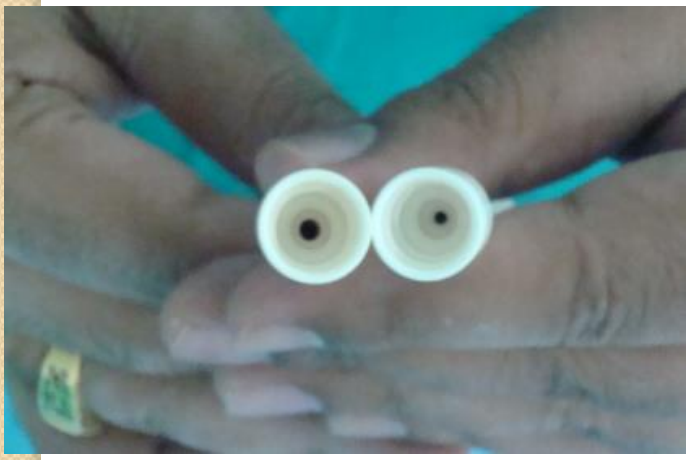
DO NOT USE X-RAY MARKER DURING MRI.

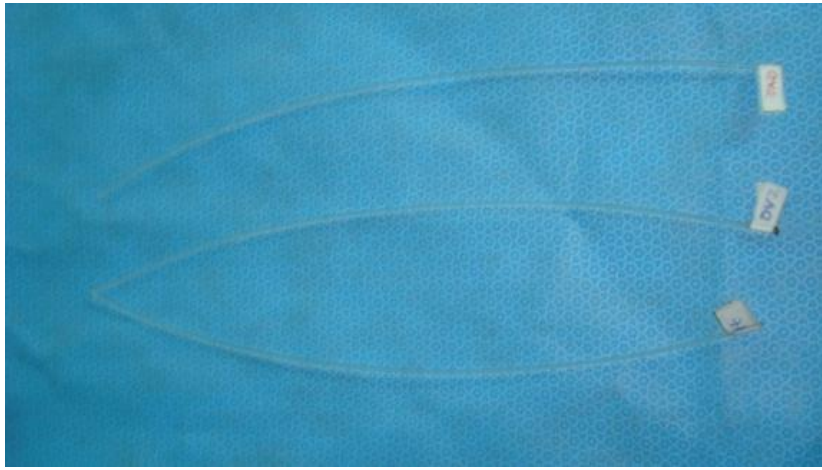


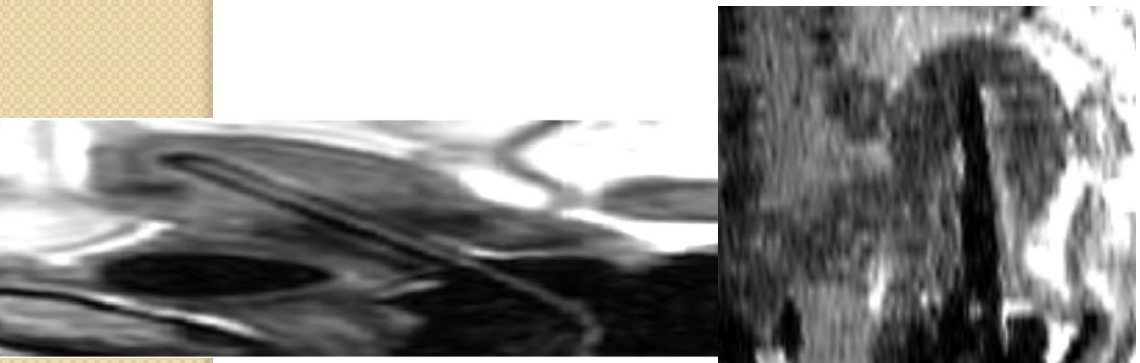


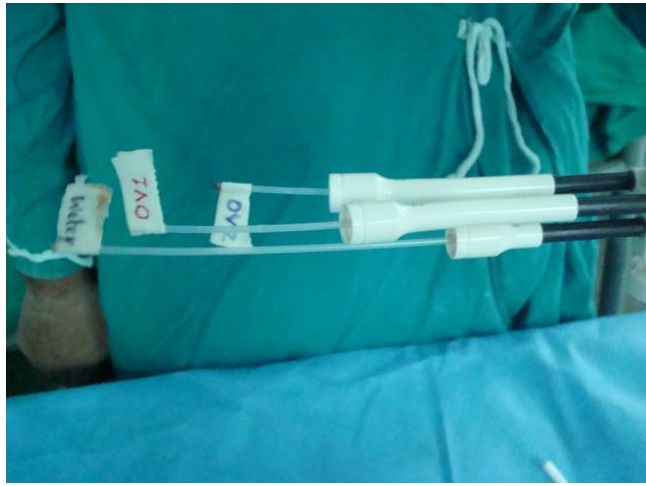
MR markers for CT/MR applicator.
They are filled with water.
$CuSO_4$ can also be used.

Applicator reconstruction using MR images



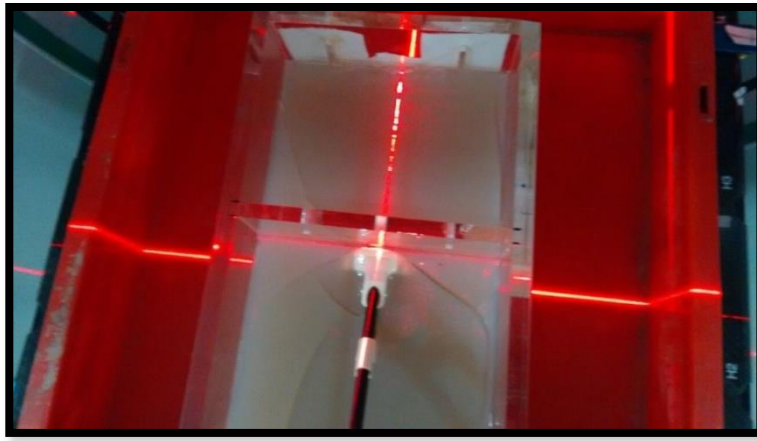






Imaging

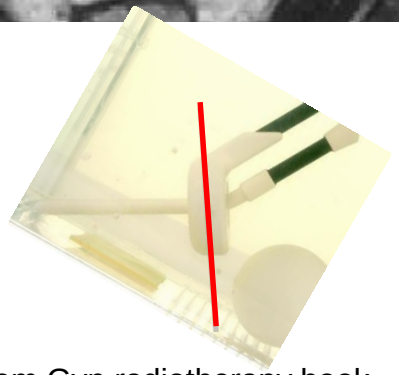
- Setup according to the external markers.
- Align the axis of the applicator along the saggital Laser.



- Imaging Series
  - CT – <1 mm slice thickness
  - MRI – T1, T2 para-axial, para-saggital and para- coronal. 2- 3 mm slice thickness.

Orientation of the imaging sequence

- Para transverse



From Gyn radiotherapy book,
Editor: A viswanathan,
Kirisits C, Erickson B, Potter P

- Transverse (MP Reconstructed)

Hellebust et al, PMB 52 (2007)

Summary

- Applicator commissioning is essential
- Uncertainties in commissioning / applicator reconstruction leads to dose variation in target / OARs
- Consists of simple 5 steps
  - Understand the geometry
  - Choose the markers
  - Radiograph / auto radiograph
  - Analyze the images

Gyn GEC ESTRO recommendations

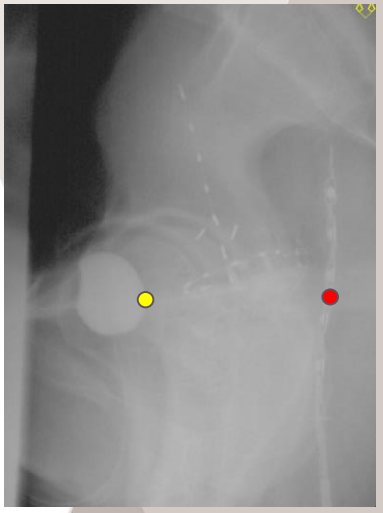
GTV, CTVs :

- at time of diagnosis
- at time of brachytherapy

GUSTAVE ROUSSY
CANCER CAMPUS
GRAND PARIS

Brachytherapy evolution in prescription

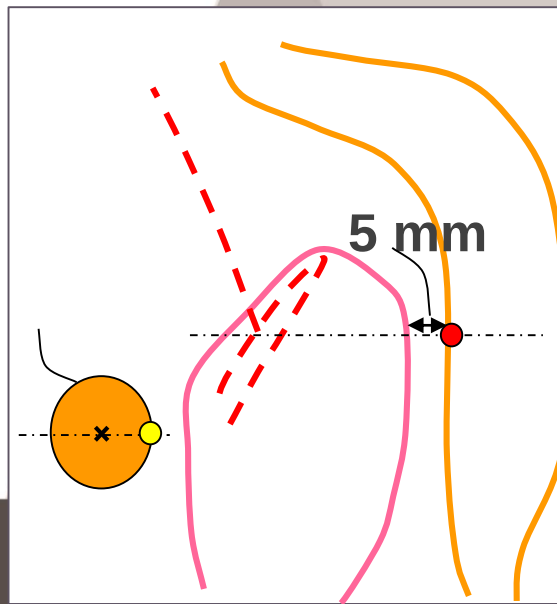
- 2D era : dose prescription based on X-rays and « systems »:
  - mg/h of radium or TRAK
  - mainly to point A
  - or to a reference volume



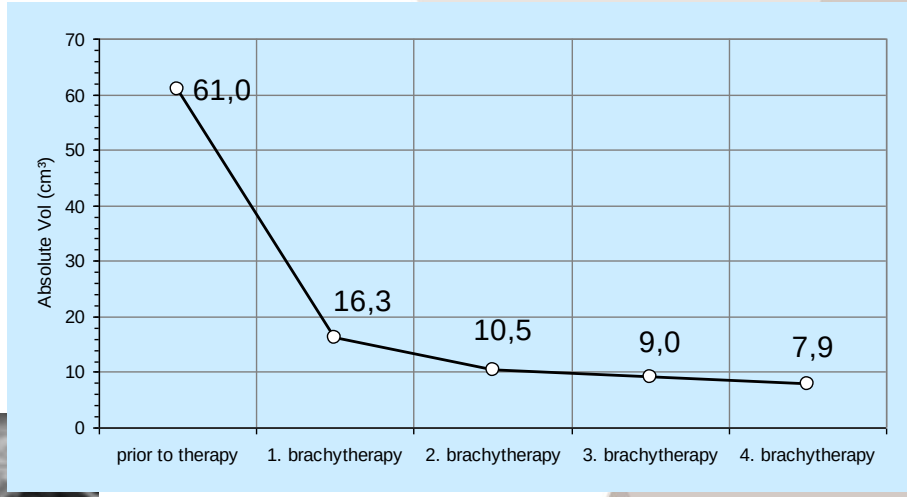
- Introduction of 3D-images
  - prescription to a target volume

To apply to uterovaginal brachytherapy

common language



Adaptive MRI based planning concept



Dimopoulos et al. IJROBP 2006

GEC-ESTRO volume concept

Within GEC-ESTRO, 3 teams coming from different traditions :

- Leuven : ovoid / mould PDR / point A
- Vienna : ring / HDR / point A
- Paris : mould / LDR / PDR / reference / volume

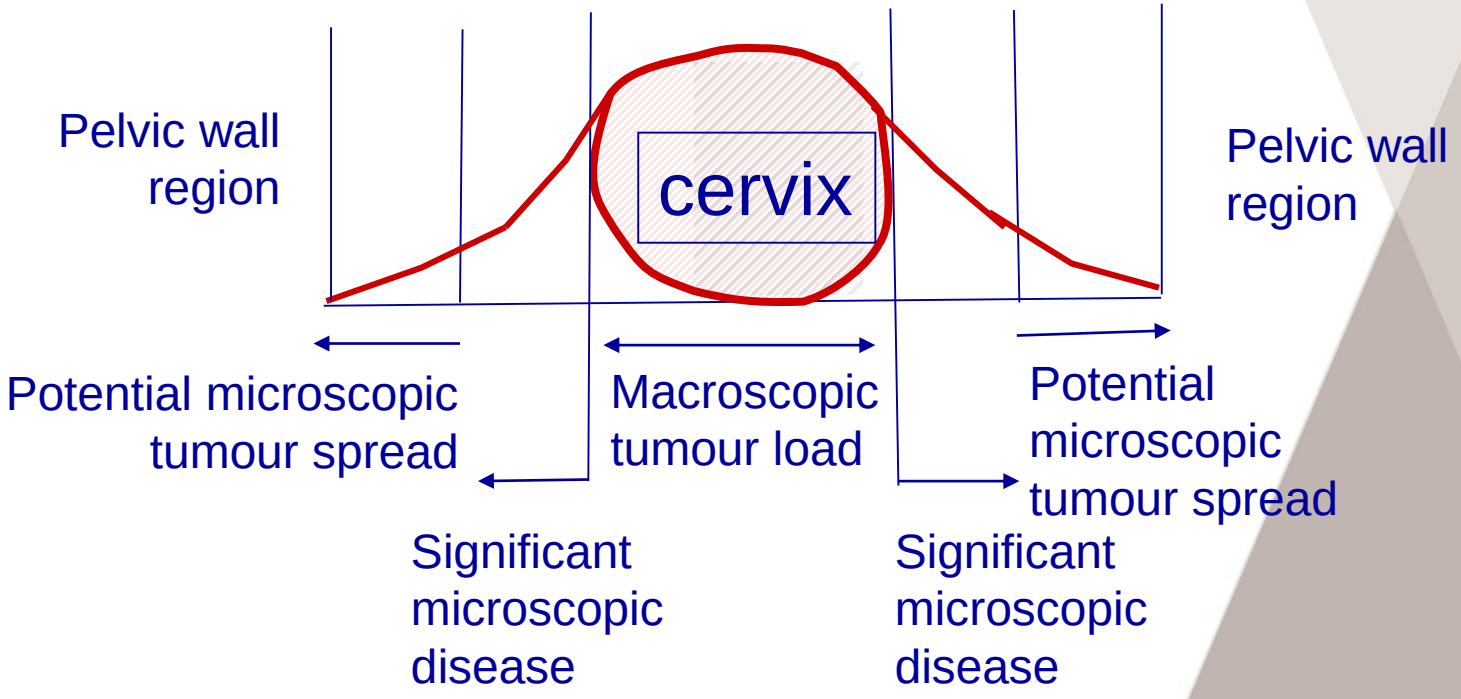
Principles for MRI based Cervix BT

Delineation of GTV, PTV and OAR
in relation to the applicator

- **MRI compatible applicators**
- **Specific investigation protocols**
  - **Quality of images**
- **Image acquisition: orientation**
- **Accuracy of Images (QA)**

Target volume concepts

Cancer cell density
in 3 different target volumes



Target volume concepts

Target definition

2 CTVs

A first target related to the extent of GTV **at time of BT**:
corresponding to residual disease
with a high dose prescribed to this target (80-90 Gy)
High risk CTV

A second target related to the extent of GTV **at diagnosis** :
with an intermediate dose prescribed to this target (60 Gy)
Intermediate risk CTV

Target volume concepts

HR CTV :

- GTV **at the time of BT**
- CTV if complete response : limited to cervix
- CTV if incomplete response : cervix plus adjacent structures with presumed residual disease - assessed by both clinical examination and imaging (~30-60 cc)
- Intent : 85 to 90 + Gy total dose to CTV in definitive radiotherapy in advanced disease
- Dose comparable with dose to point A

Target volume concepts

High Risk CTV :

GTV at time of brachytherapy

In all cases includes:

- Whole cervix
- Presumed tumour extension assessed by:
- Clinical assessment
- Residual grey zones on MRI

NO SAFETY MARGINS

AIM : DOSE HIGH ENOUGH TO STERILIZE MACROSCOPIC TUMOUR

Target volume concepts

IR CTV :

- Integrates GTV **at the time of diagnosis**
- Always includes HR-CTV
- In case of major response :
  includes safety margins with regard to initial size GTV
- Intent : 60 + Gy total dose to CTV in definitive radiotherapy in advanced disease
- Dose comparable with dose to the 60Gy isodose (ICRU recommendations)

Target volume concepts

Intermediate Risk CTV :

GTV at time of diagnosis

In all cases includes:

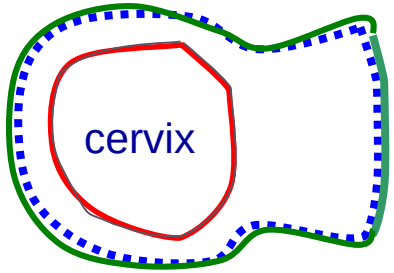
- HR-CTV
- integrates initial CTV

SAFETY MARGINS :
1-1.5 cm cranially
0.5cm antero-posteriorly
1cm laterally

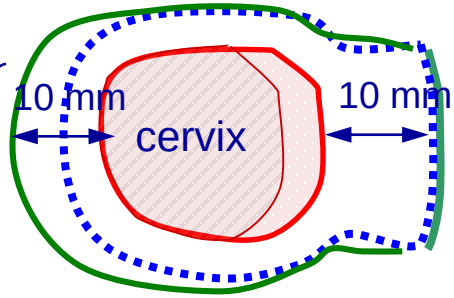
AIM : TO STERILIZE MICROSCOPIC TUMOUR

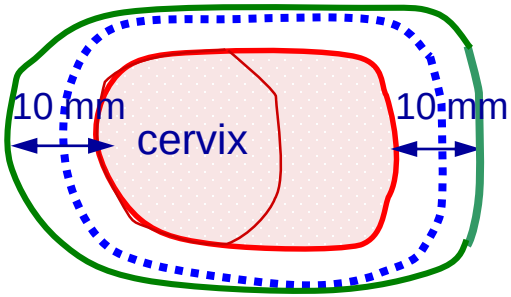
CTV BT

Complete remission

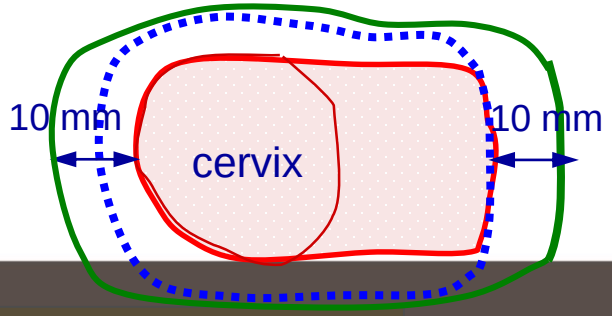


Partial remission





Stable disease



Legend

HR-CTV

IR-CTV

Initial tumour extension (at diagnosis)

Residual disease

Turning point

Question n° 1: HR-CTV includes:

1. at least the whole cervix
2. the whole cervix + safety margins
3. the whole uterus + safety margins
4. the totality of the initial tumor extension

Turning point

Question n° 2 : IR-CTV includes:

1. the initial tumor size and extension plus safety margins
2. the whole uterus + safety margins
3. HR-CTV plus safety margins taking the initial tumor extension into account

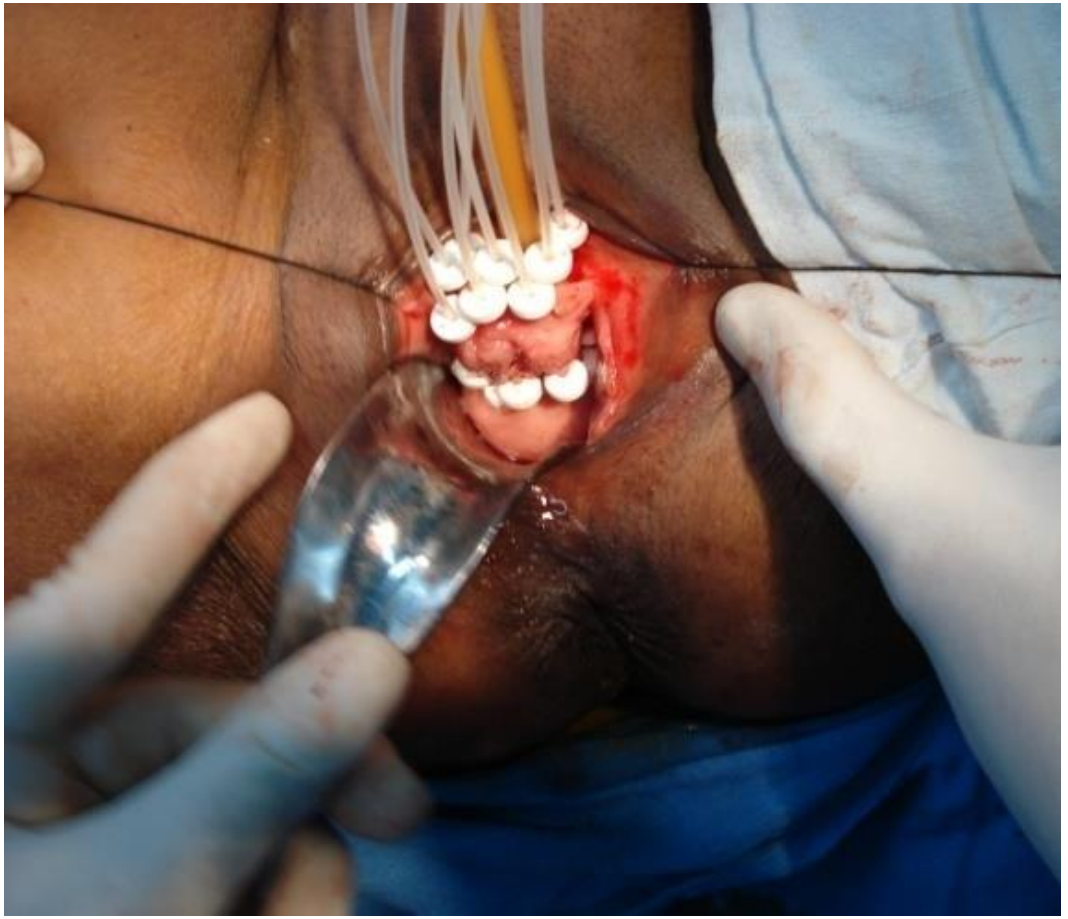
OARs in Brachytherapy

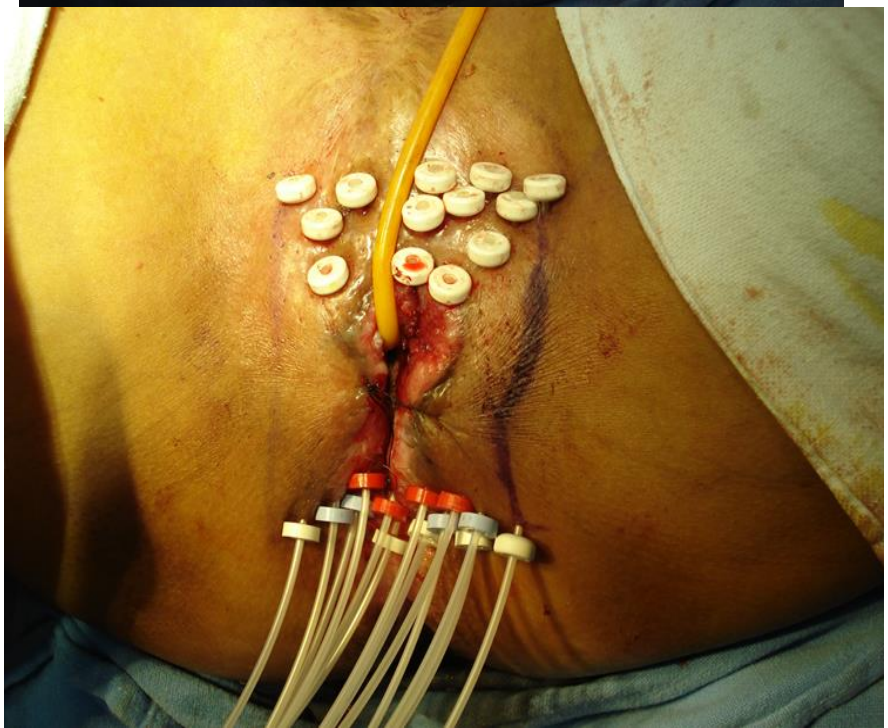
What are the relevant OARs in ICRT ?

A. A: Bladder, Rectum
B. B: Bladder, Rectum, Sigmoid
C. C: Bladder, Rectum, Sigmoid, Vagina
D. D: Bladder, Rectum, Sigmoid, Vagina, Urethra

OARs in Brachytherapy

Various brachytherapy procedures





Why are OARs important in Brachytherapy?

- Considerable dose is delivered by brachytherapy (WPRT= 45 Gy + 40-45 by ICRT)
- Almost equal to EBRT dose
- OARs lie very close to the target volumes
- Dose intensity is higher
- Sharp dose fall off

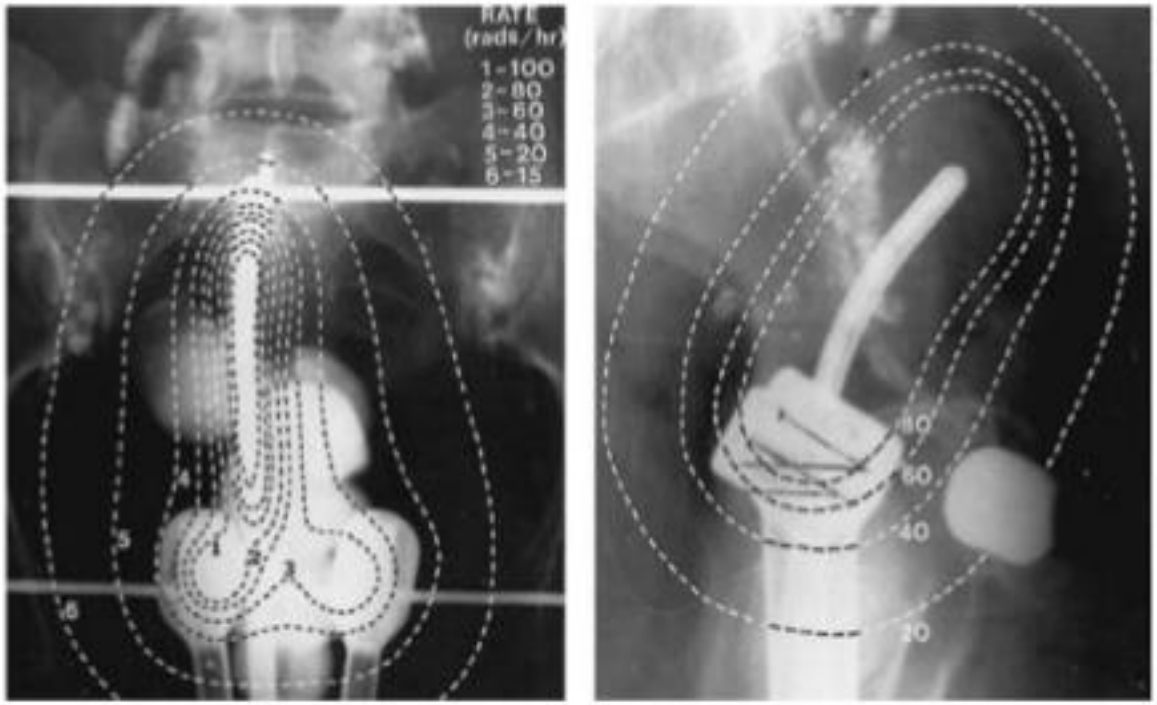
Morbidities and QOL

- Accurate evaluation of morbidities and correlation with doses require:
  - Accurate delineation of OARs
  - Take in to account all potential OARs (possible in 3D not in 2D)

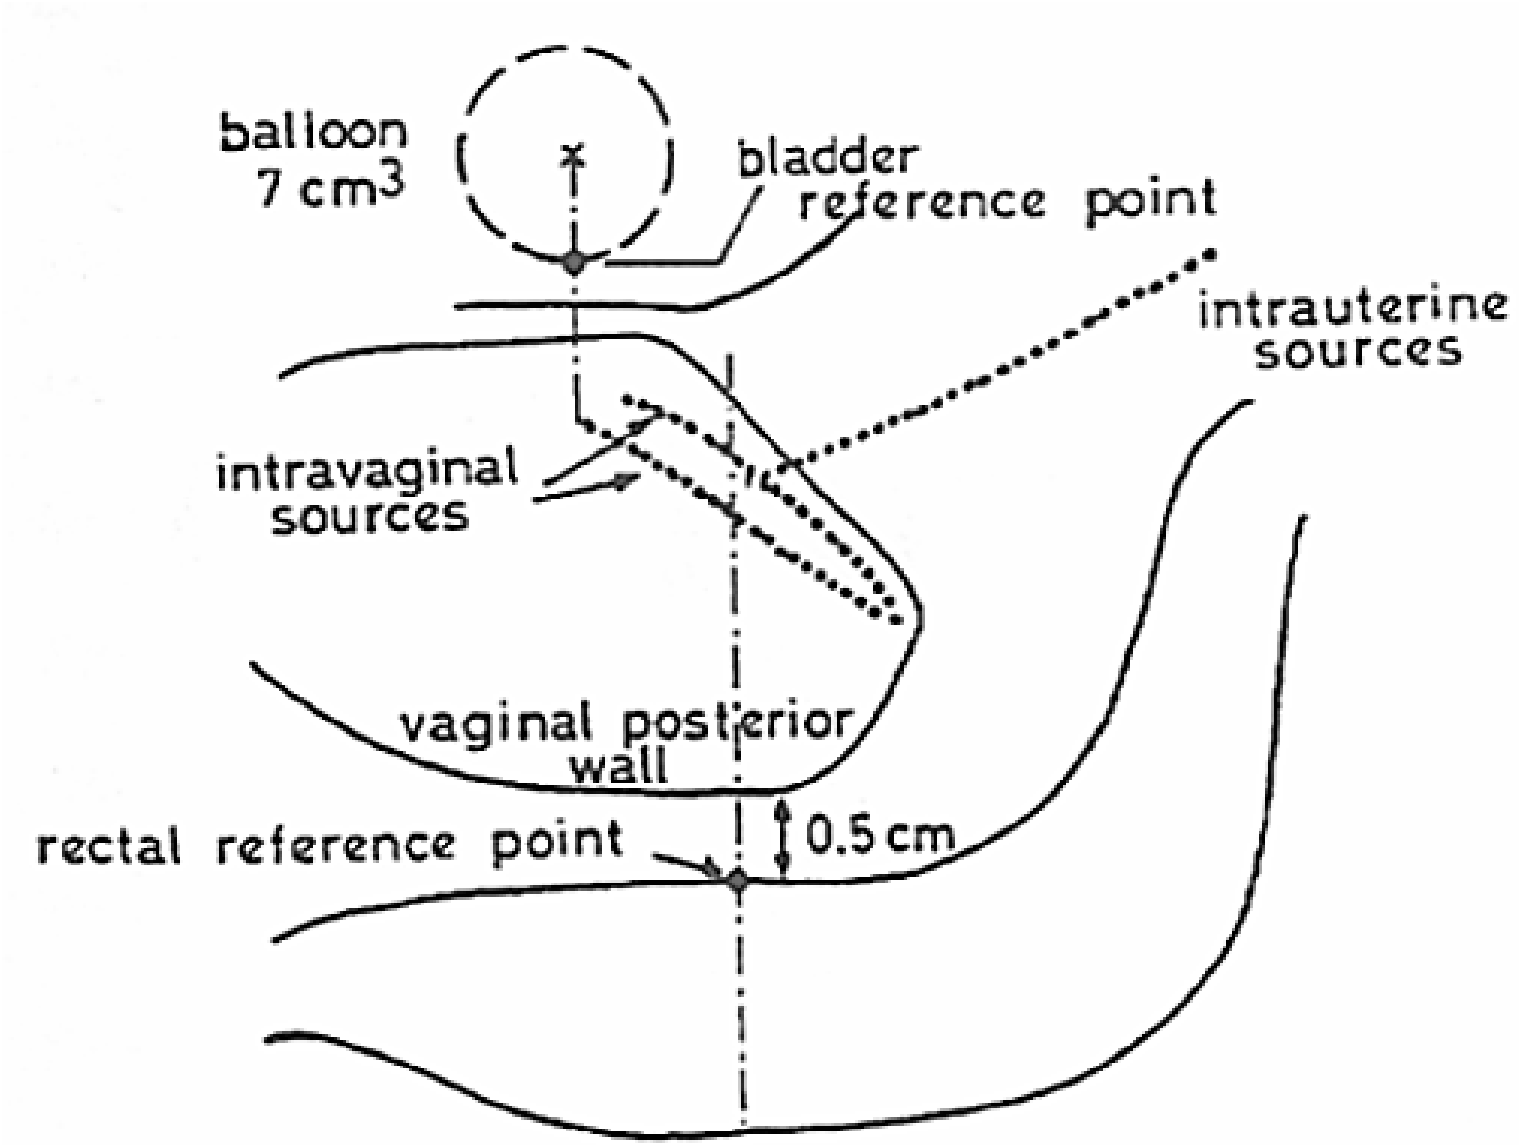
2D delineation of Organ at Risks

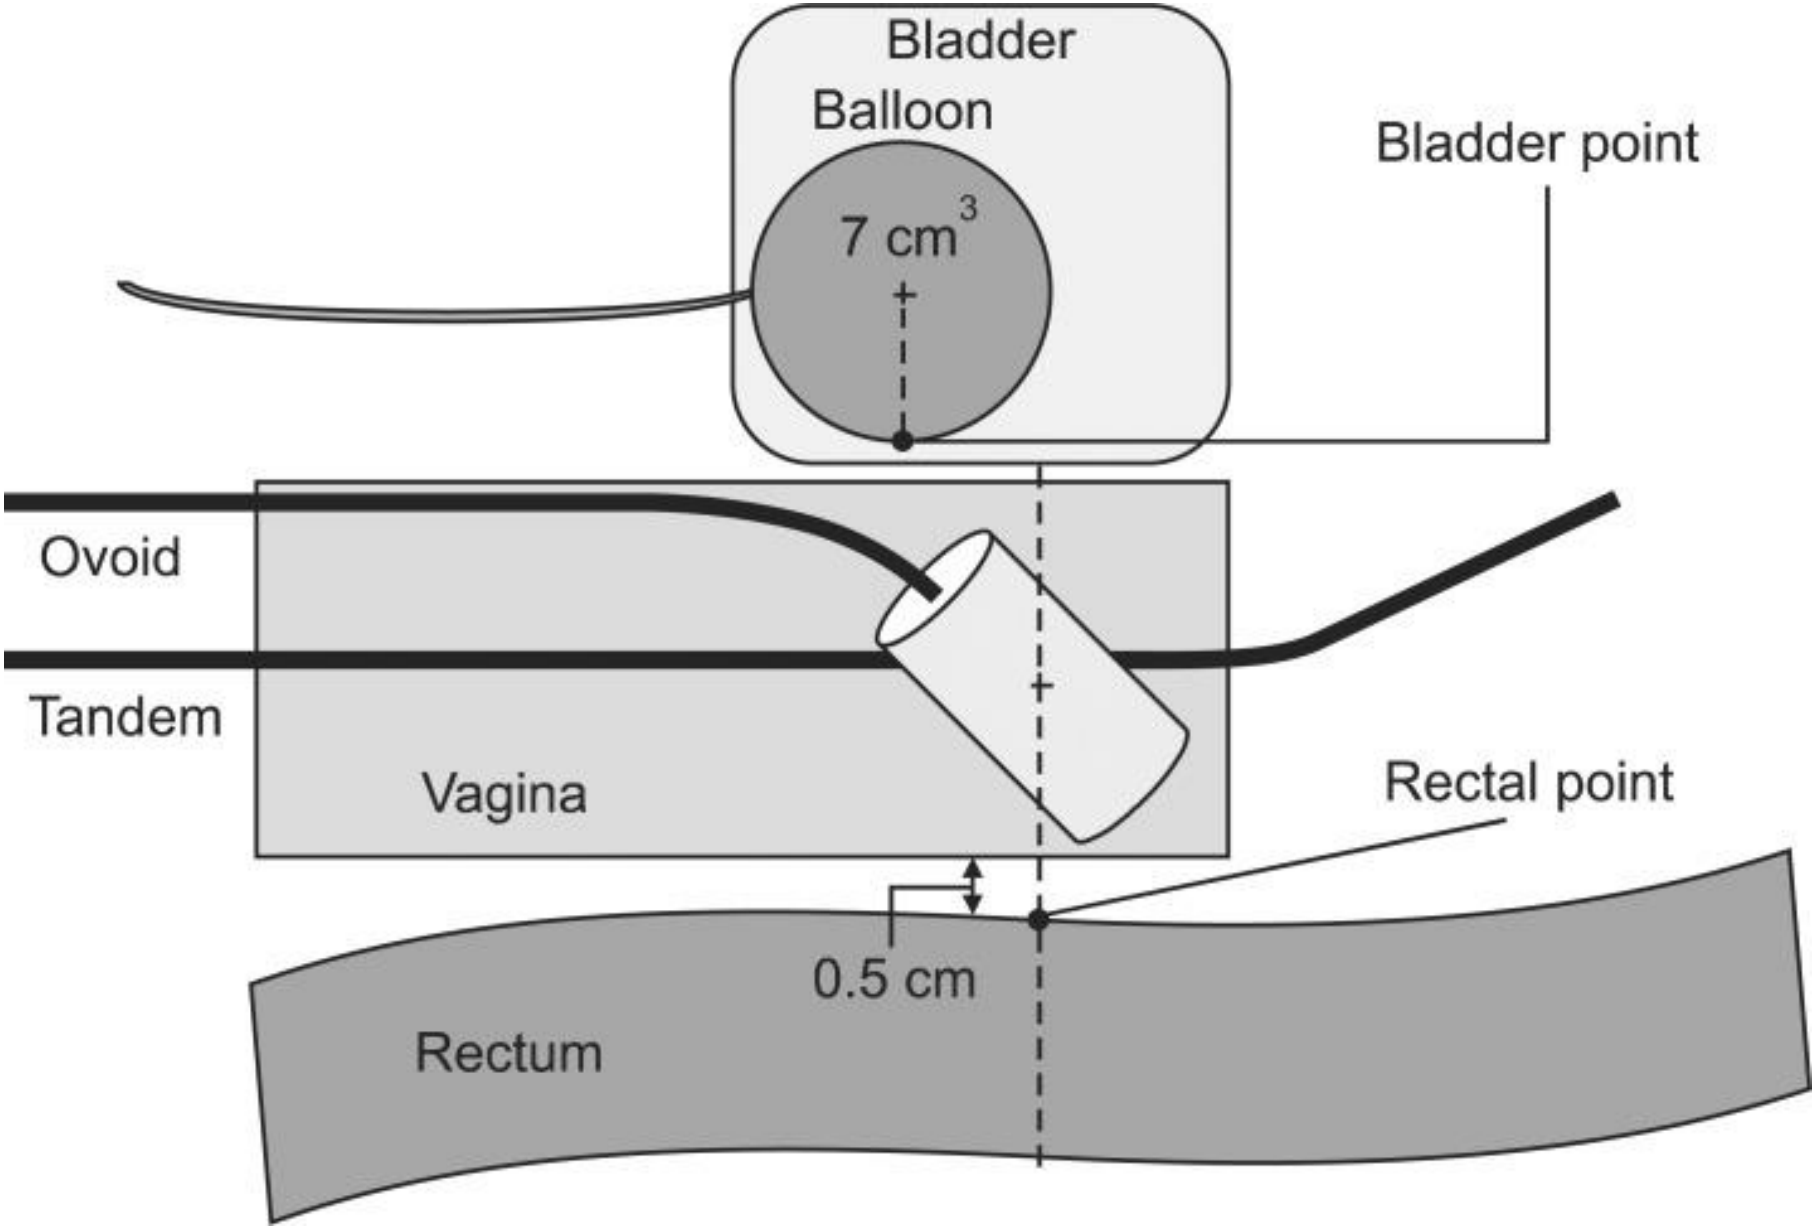
- Based on radiographic imaging
- Most guidelines do not recommend radiographic image
- OARs are localized based on points
- Only few organs are localised
- The toxicity correlation is poor
- If volumetric imaging is not available, X-ray based simulation may be practiced but certainly not encouraged

2D brachytherapy planning



ICRU 38: Bladder and Rectal points





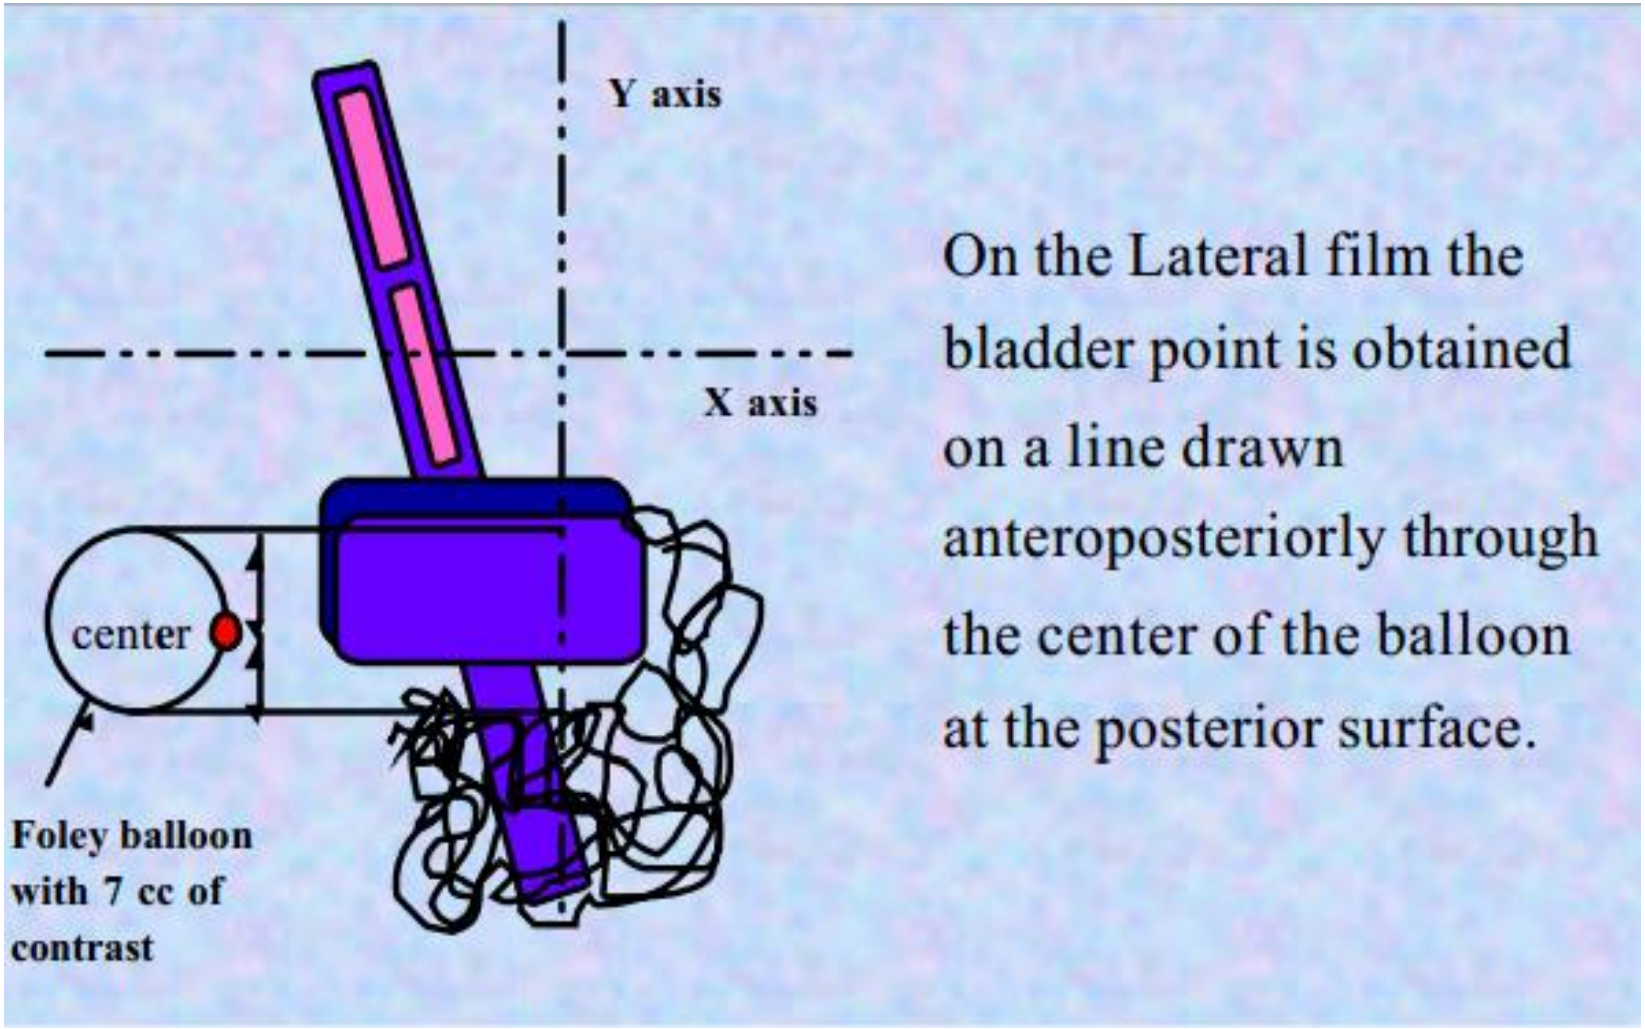
Bladder
Balloon
7 cm3
Bladder point
Ovoid
Tandem
Vagina
Rectal point
0.5 cm
Rectum

Bladder reference point

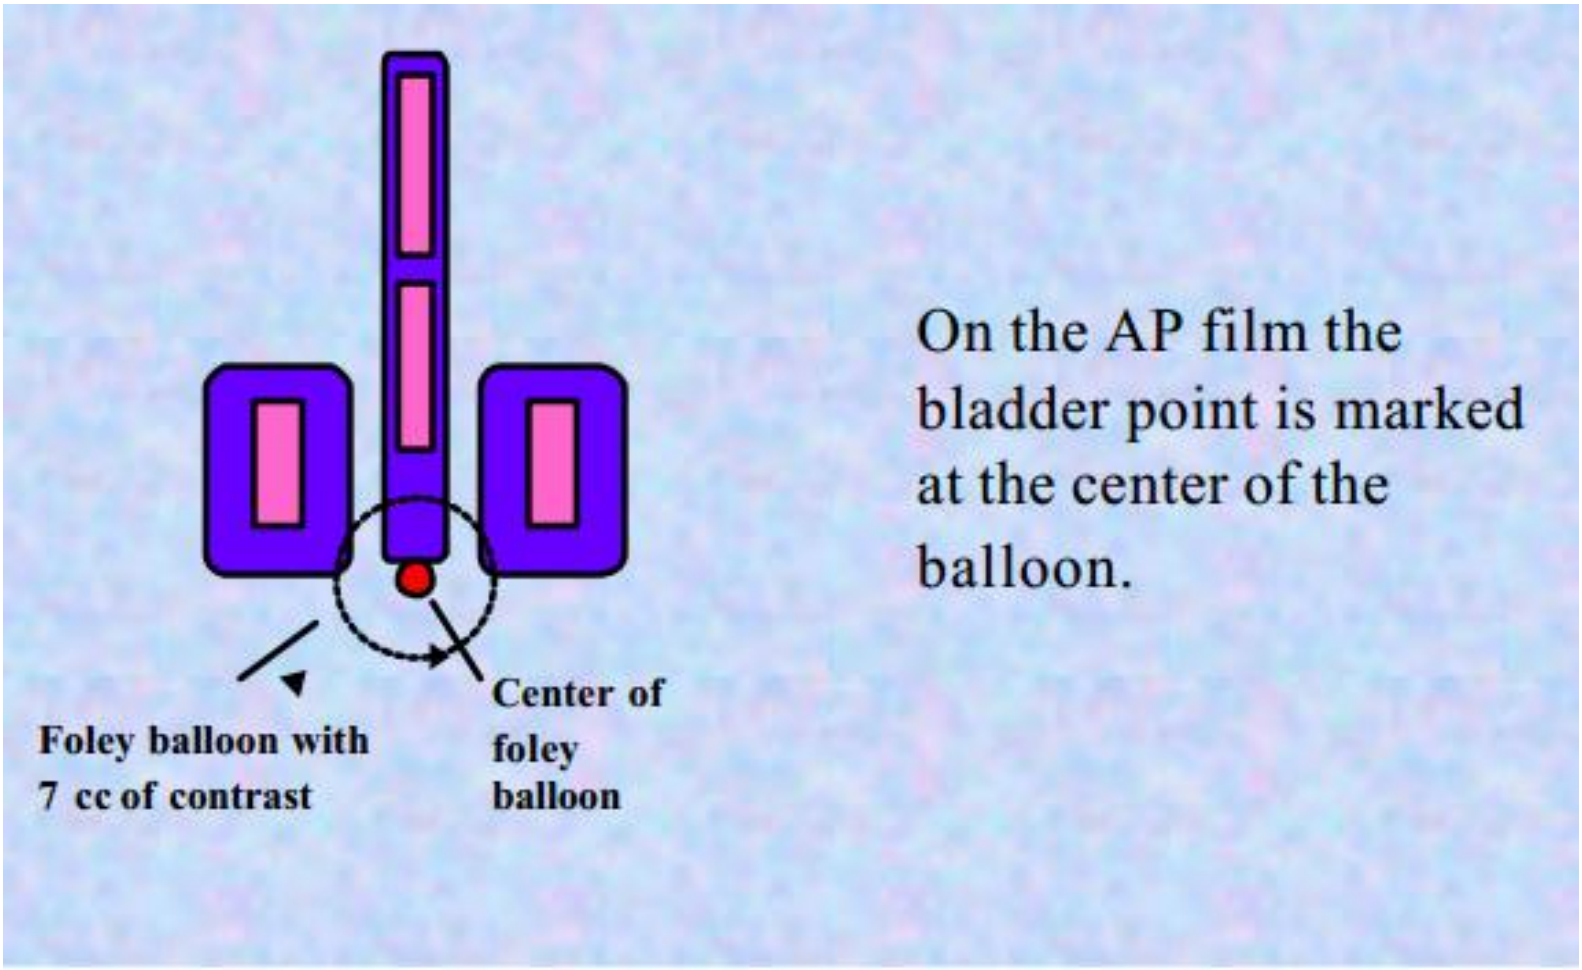
Bladder point is obtained in following way:

- Foley's catheter balloon is filled with 7 cm^3 of radio-opaque fluid
- Catheter is pulled downward to bring the balloon against the urethra
- On lateral radiograph, reference point is at the posterior surface of balloon
- On frontal radiograph reference point is taken at the centre of balloon

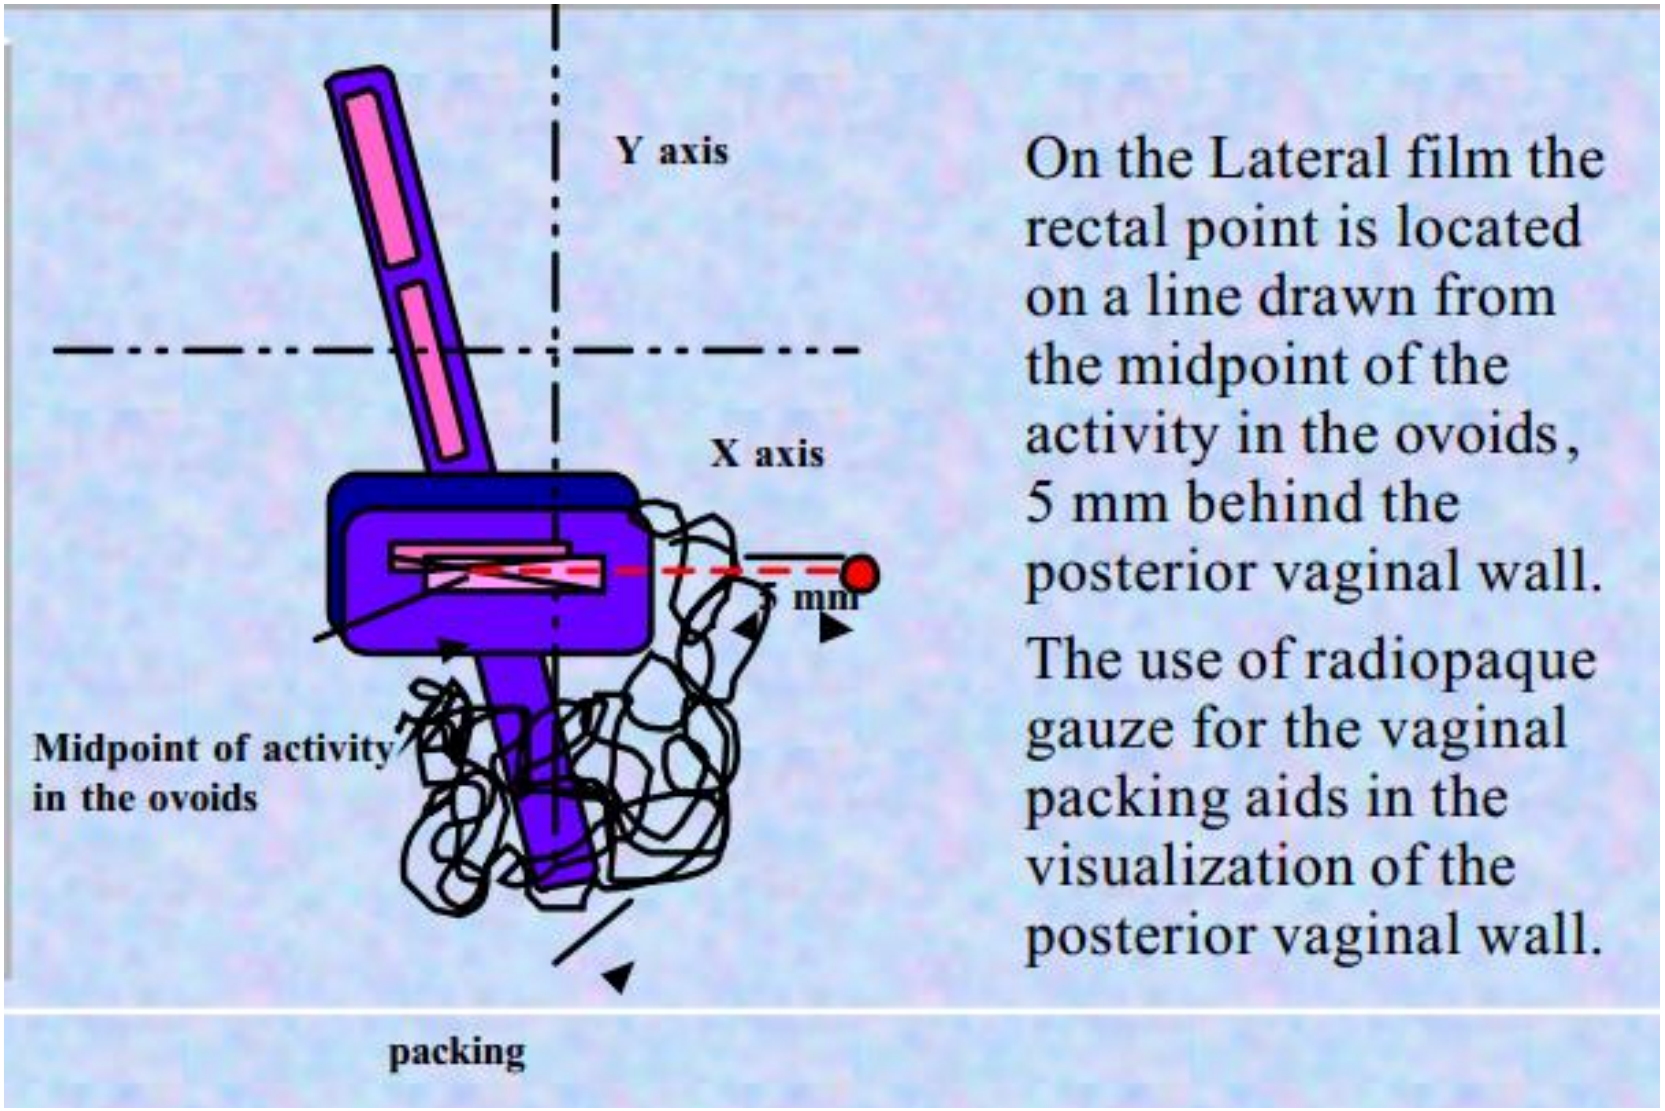
Bladder reference point: Lateral view



Bladder reference point: AP view



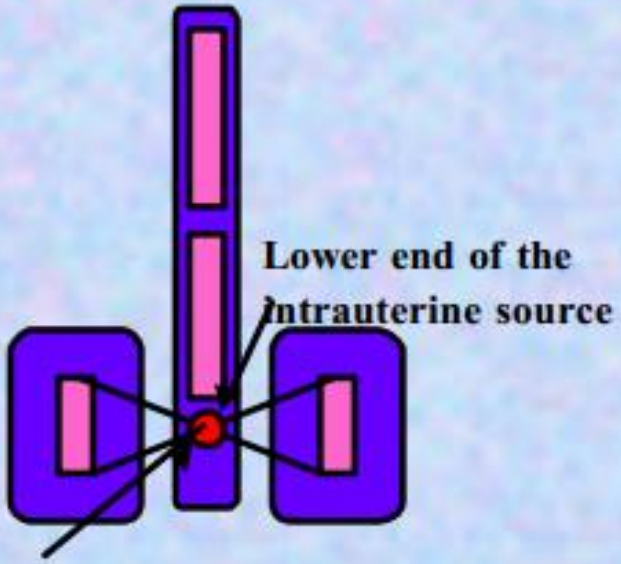
Rectal reference point: Lateral view



On the Lateral film the rectal point is located on a line drawn from the midpoint of the activity in the ovoids, 5 mm behind the posterior vaginal wall.

The use of radiopaque gauze for the vaginal packing aids in the visualization of the posterior vaginal wall.

Rectal reference point: AP view



The rectal point is identified at the midpoint of the activity of the sources in the ovoids or at the lower end of the intrauterine source.

3D delineation of OAR

- Based on the volumetric imaging
- Various imaging devices used

- MRI : Standard
- CT Scan : Practical
- USG : Investigational

Delineation of OARs

- **Sigmoid colon:** Should be clearly identified, and the whole structure should be contoured, with specific focus on the areas adjacent to the uterus. Length up to the junction with the descending colon.
- **Rectum :** This implies the entire length from the ano-rectum to the recto-sigmoid junction
- **Bladder:** The whole posterior, posterior-caudal (trigone), and posterior-cranial bladder wall should be included till bladder neck

Vaginal wall

Delineation, DVH, Reporting:

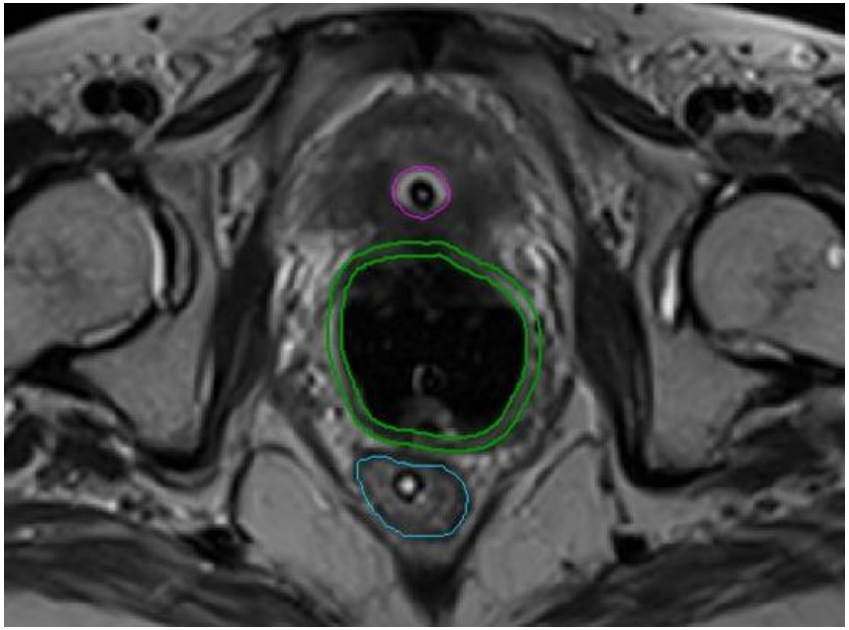
- ↑ uncertainties
- ↓ reproducibility

SUBJECT OF FURTHER STUDIES

Berger D, et al. IJROBP 2007

Vaginal wall Contouring

- Contour vaginal wall according to visible low signal intensity of vaginal wall.
- If not accurately distinguished: Take 3 mm as overall organ wall thickness and contour from fornices till introitus in three parts as per ICRU 89



Other OARs

- **Urethra-** Foleys catheter and surrounding low signal intensity was used for delineating urethra from bladder neck to urethral orifice
- **Uninvolved Uterus-** Whole uterus is contoured. HR CTV was subtracted from whole uterus to obtain volume of uninvolved uterus

Summary

- OAR delineation in Gyn Brachy is very crucial
- 2D delineation of OAR is not encouraged
- 3D imaging should be preferred
- Though MRI is ideal imaging for OAR delineation, but has practical issues
- CT scan is feasible, practical
- USG is new

TREATMENT OF CANCER OF THE CERVIX UTERI—A REVISED "MANCHESTER METHOD"

By Margaret Tod, M.B., Ch.B., F.R.C.S.E., F.F.R., and W. J. Meredith, M.Sc., F.Inst.P.

The Christie Hospital and Holt Radium Institute, Manchester

(Accepted for publication March, 1953)

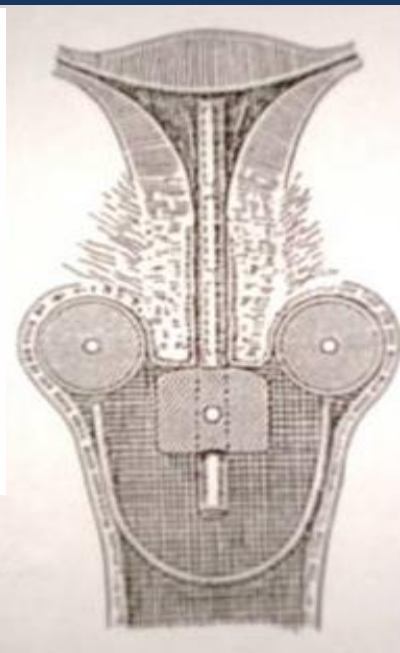
Introduction

...e "Manchester method" technique for the ...dium treatment of cancer of the uterine cervix ...rst described by Tod and Meredith (1938). ...its three main features were:

...The selection and definition of two points, A and ... dosage specification. Point A (*cf.* Fig. 2) was ...d as being "2 cm lateral to the central canal of ...erus and 2 cm up from the mucous membrane ... lateral fornix in the axis of the uterus". Point ... cm lateral to Point A at the same level.

and dimensions have proved to be clinically convenient as well as physically desirable, so no change in the vaginal applicators has become necessary. The flanged, thin rubber intra-uterine tubes, chosen to reduce dilatation to a minimum, and made in various lengths, have also proved to be satisfactory. The applicators are illustrated in Fig. 1.

3. *The use of a system of loading of the intra-uterine tube and vaginal ovoids in terms of simple numbers of "units" of radium such that the dose rate at Point A was fairly constant no matter which combination of applicators was used.* Although it is possible to obtain

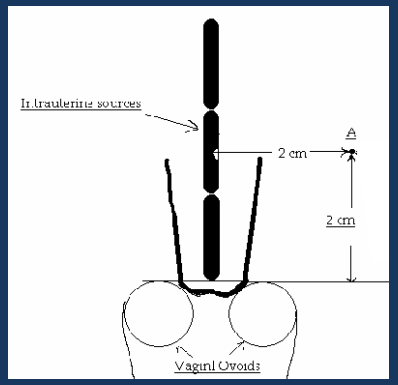


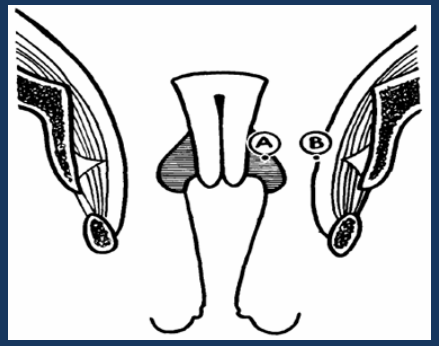
Manchester system – 3 rules

- Rule 1:Define treatment in terms of dose to a ***point*** representative of the target i.e., uterus, more or less reproducible from patient to patient.

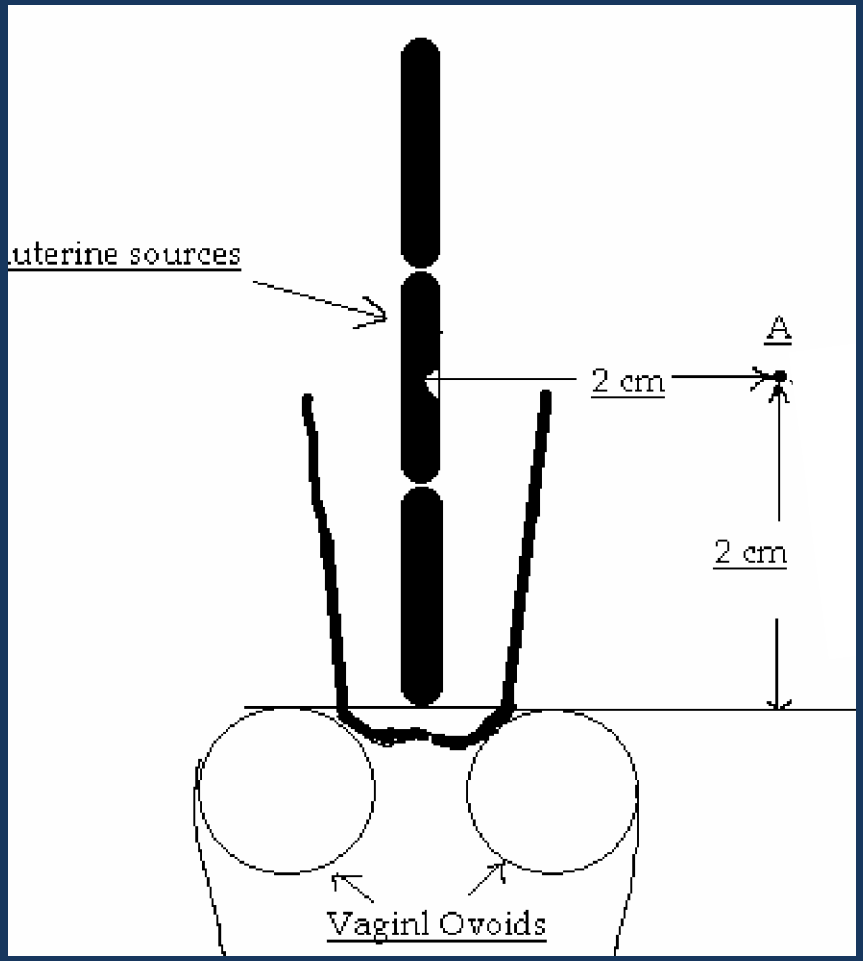
- Rule 2: Design applicators and their loading to enable the same dose-rate to this point 'A' regardless of which combination of applicators is used.

- Rule 3:Define a set of rules dictating the relationship, position, and activity of radium sources in the uterine and vaginal applicators to achieve the consistent dose rates



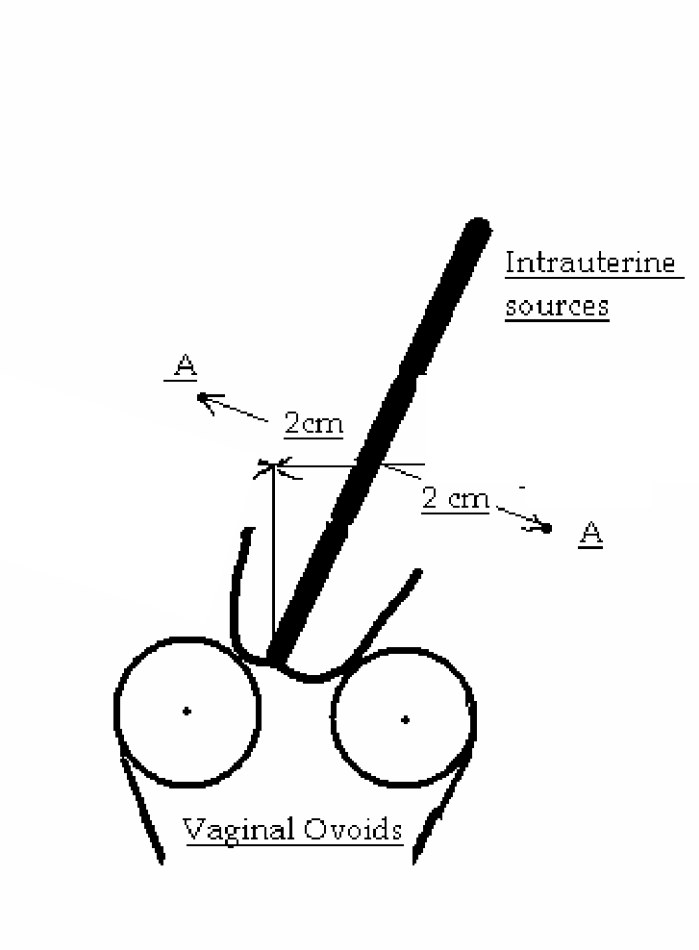


1938 - Original definition of point A



2 cm lateral to the uterine canal and 2 cm from the mucous membrane of the LATERAL SUPERIOR FORNIX of the vagina in the plane of the uterus.

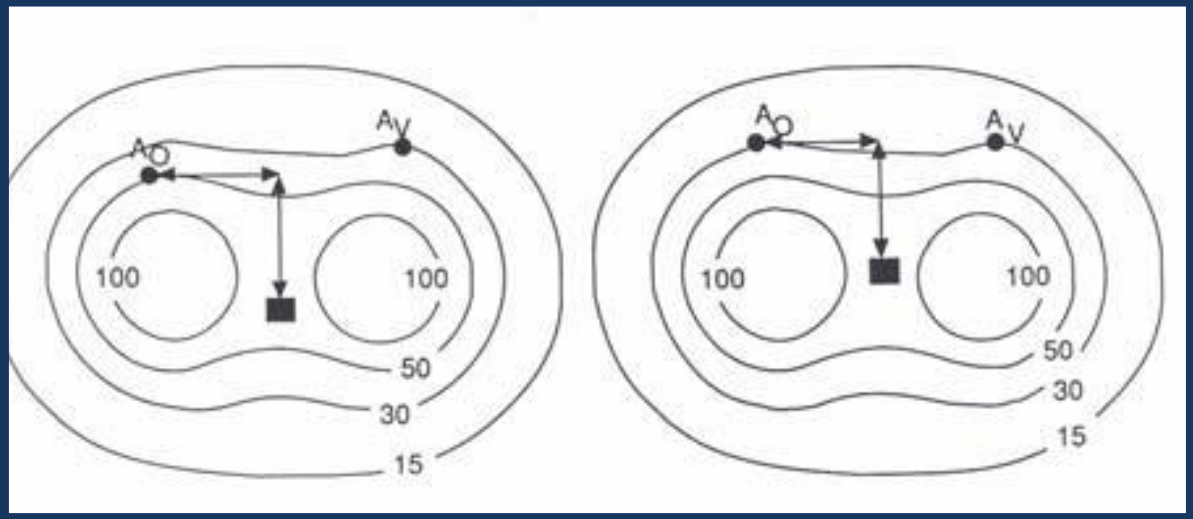
1953 -Modified definition of point A



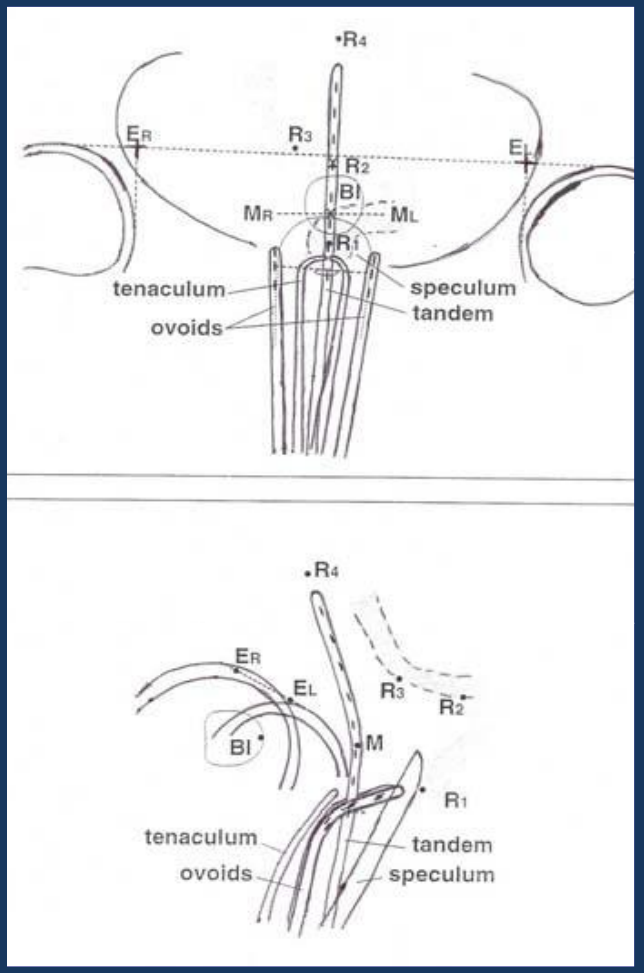
2 cm lateral to the uterine canal and 2 cm from the LOWER END OF THE IUT/OS

Definition - Point A

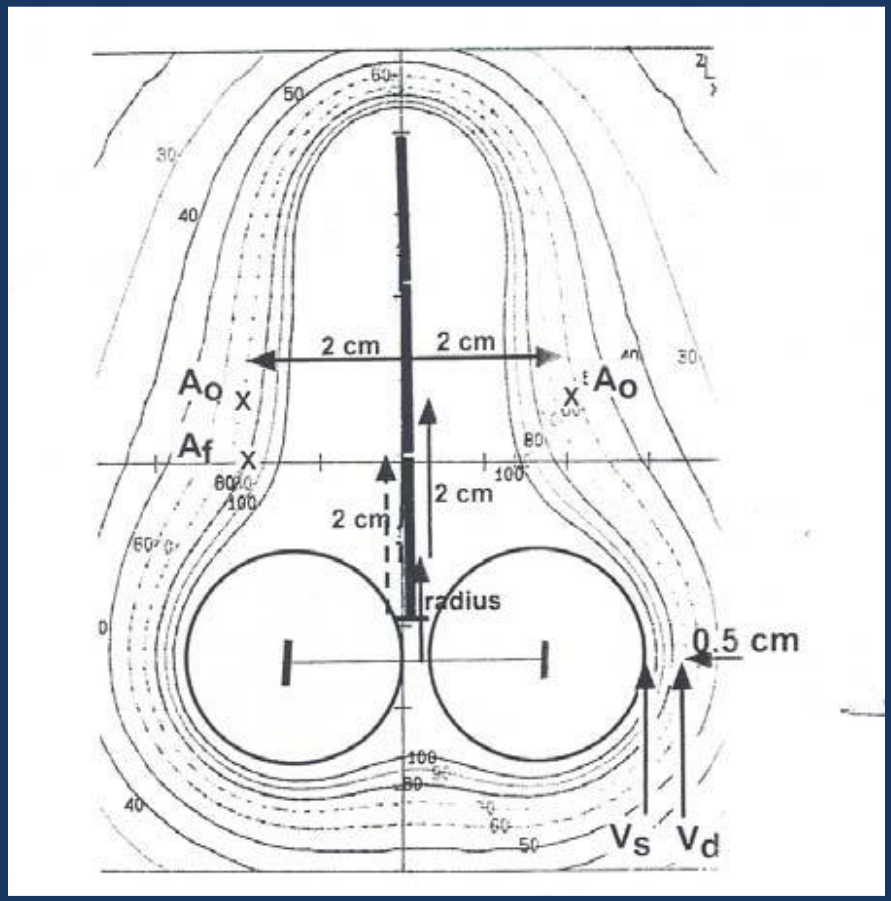
Point Av



Point M



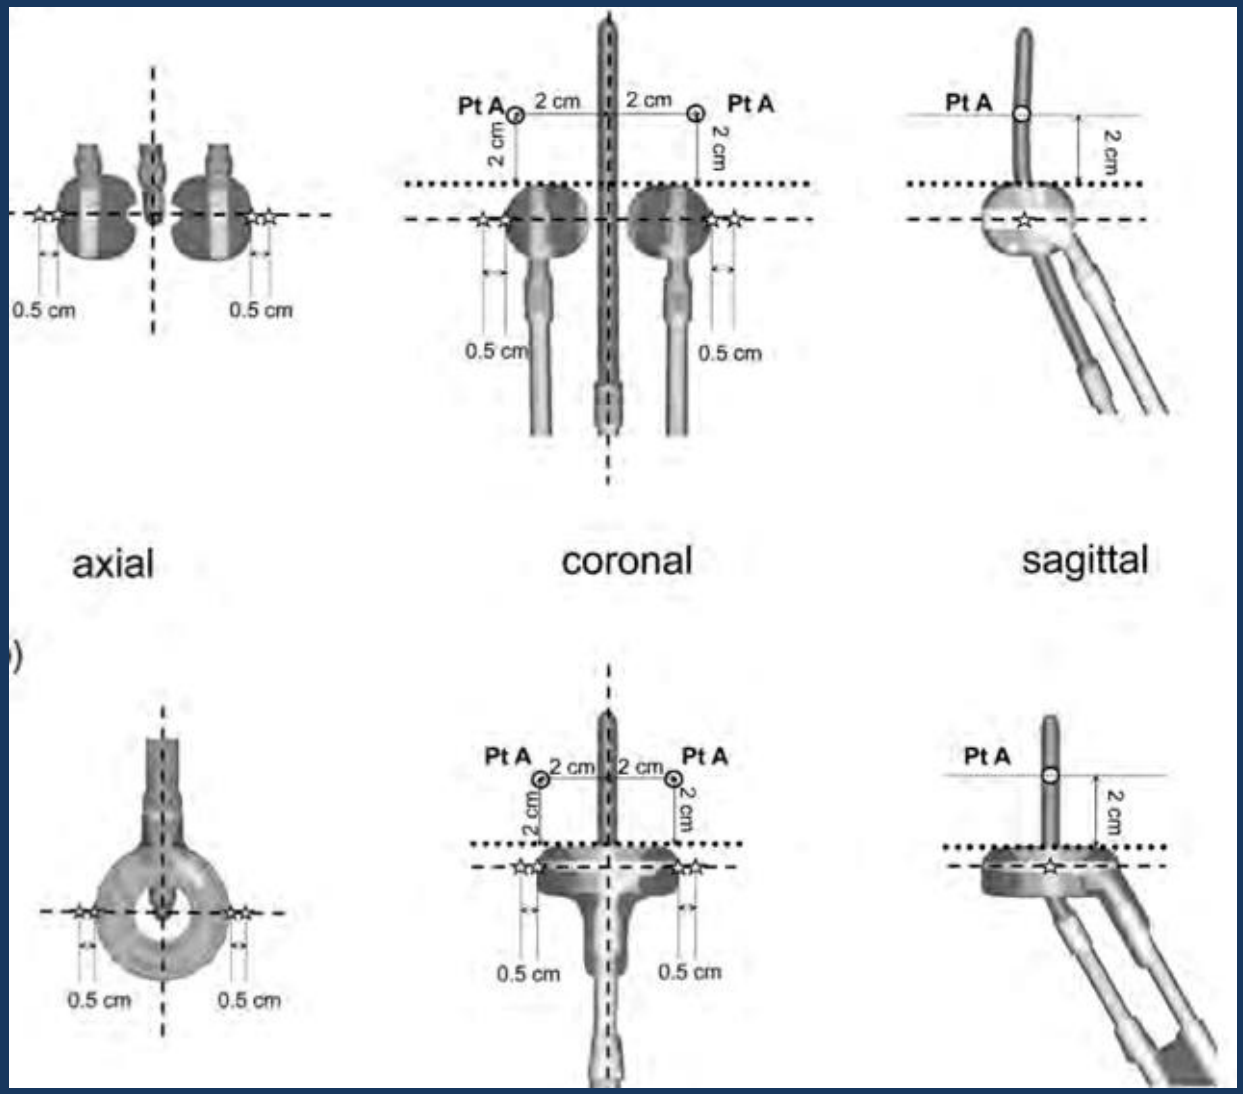
ABS Definition - Point A



- T/O:

Draw a line connecting the middle of the sources in the vaginal ovoids on the AP radiograph and move 2cm (plus radius of the ovoid), superiorly along the tandem from the intersection of this line with the intrauterine source line and then 2 cm lateral on either side of the tandem.

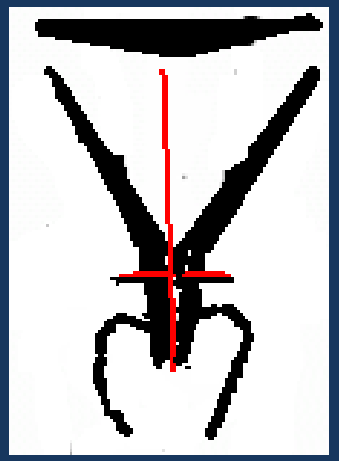
ICRU 89 – Point A



Limitation of Point A

- Different methods of definition provide different values for the calculated dose rate to point A.

- Relates to position of sources and not to specific anatomic structure.
- It is very sensitive to position of ovoid sources relative to tandem which should not be deciding factor in deciding on implant duration.



- Depending on size of cervix point A may be inside or outside of tumor.

ICRU 38 & Point A

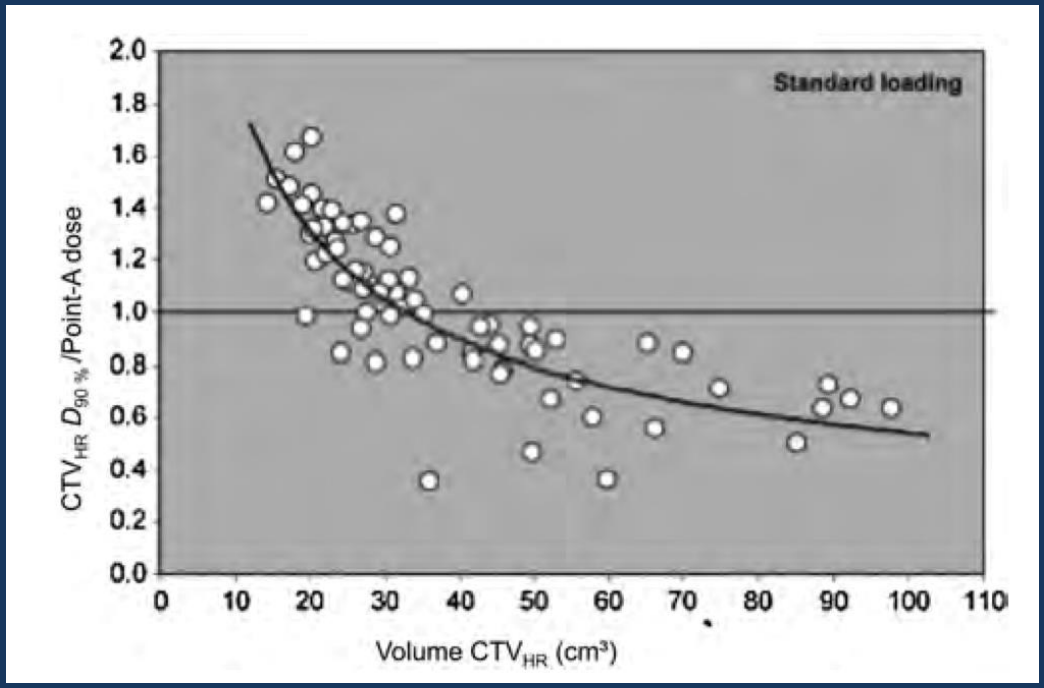
- ICRU 38 discouraged the use of point A and B because the exact meaning and their definitions have not always been interpreted in the same way in different centers and even in the same center over a period of time.

- Encourages the use of target volume for dose prescription and reporting along with the reference volume for 60Gy absorbed dose prescription.

ICRU 89- Point A

- Recommended while reporting treatment regimens.
  - Allows comparison between different approaches.
  - Acts as a link to non- 3D image-based approaches.
  - Serves as a quality assurance parameter along with TRAK.
  - Standard loading point-A normalized plan acts as a perfect starting point for complicated IC+IS plans.

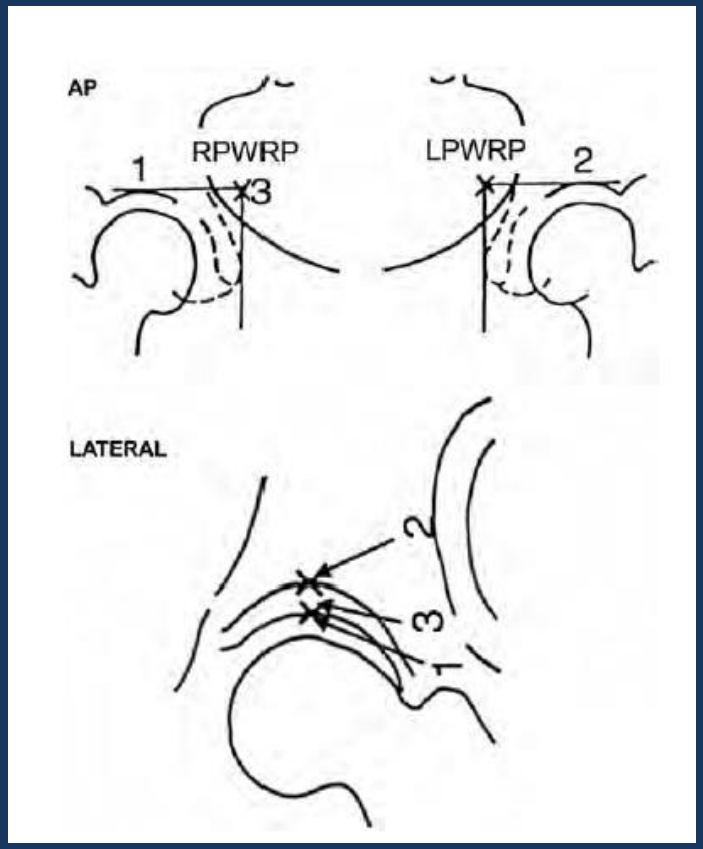
Point A and HR CTV D90



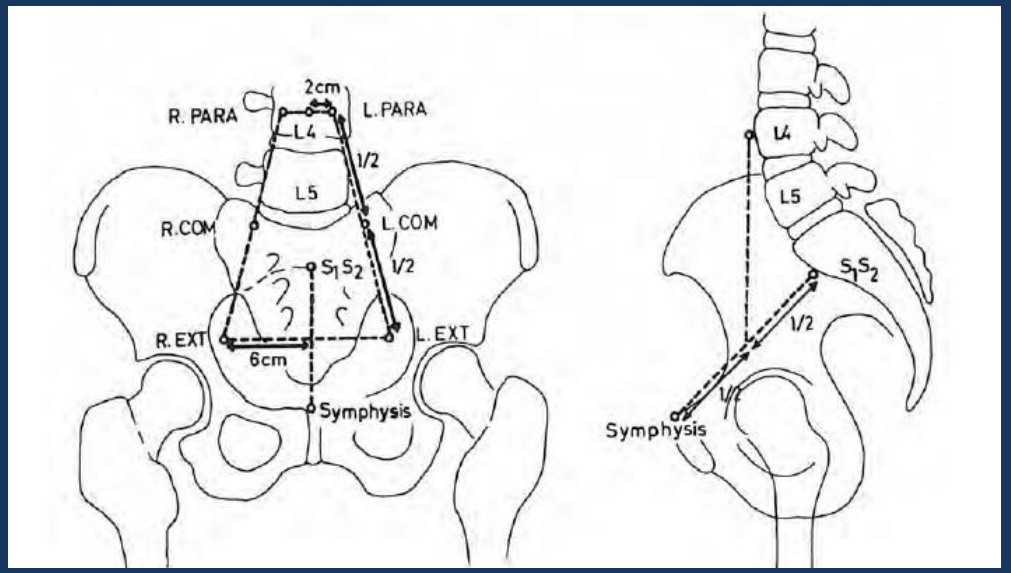
- It provides an estimate of the average CTVHR D90 % for a large patient population with a balanced disease-stage distribution
- Point A is a good representation of “an average position” of the tumor
- Helps in introducing / check for major dose escalation or reduction for such patient population as a whole.

Pelvic wall and lymph node points

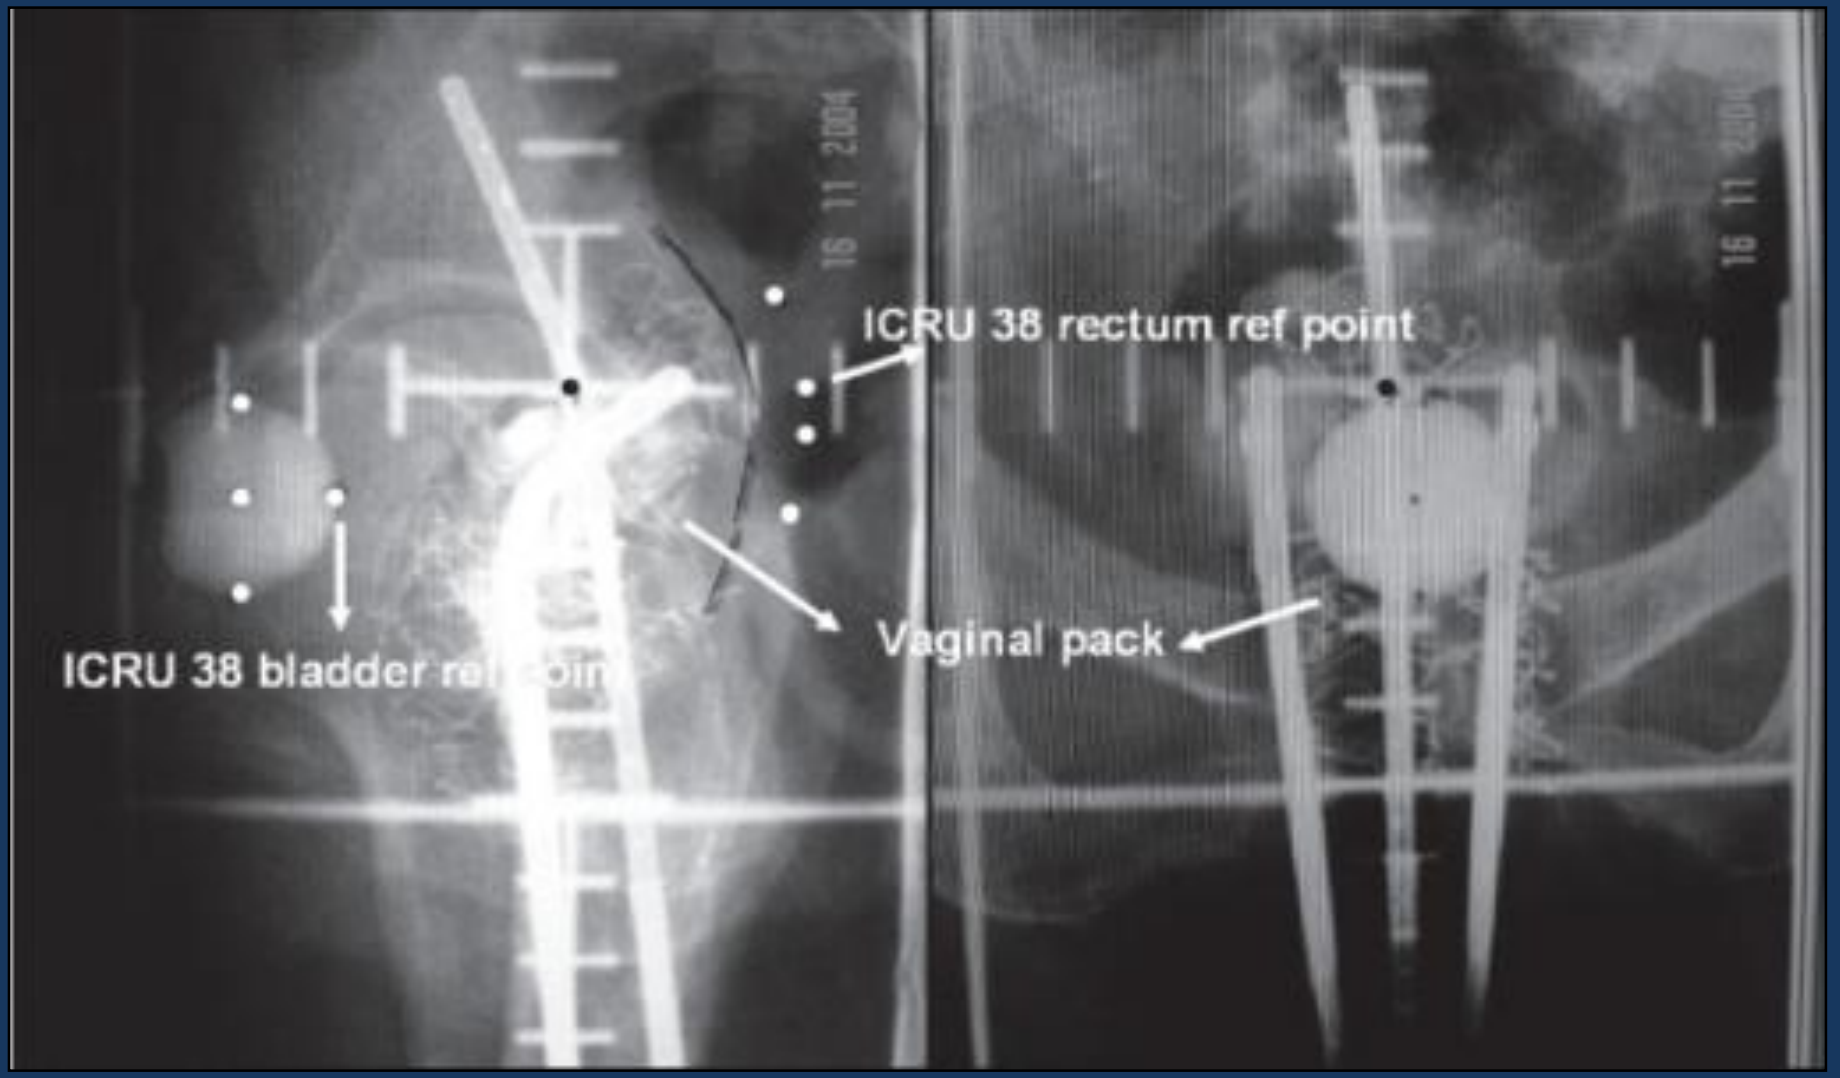
PWRP



Lymphatic trapezoid



OARs – ICRU rectum and bladder point



Correlation of ICRU reference points and D2cc

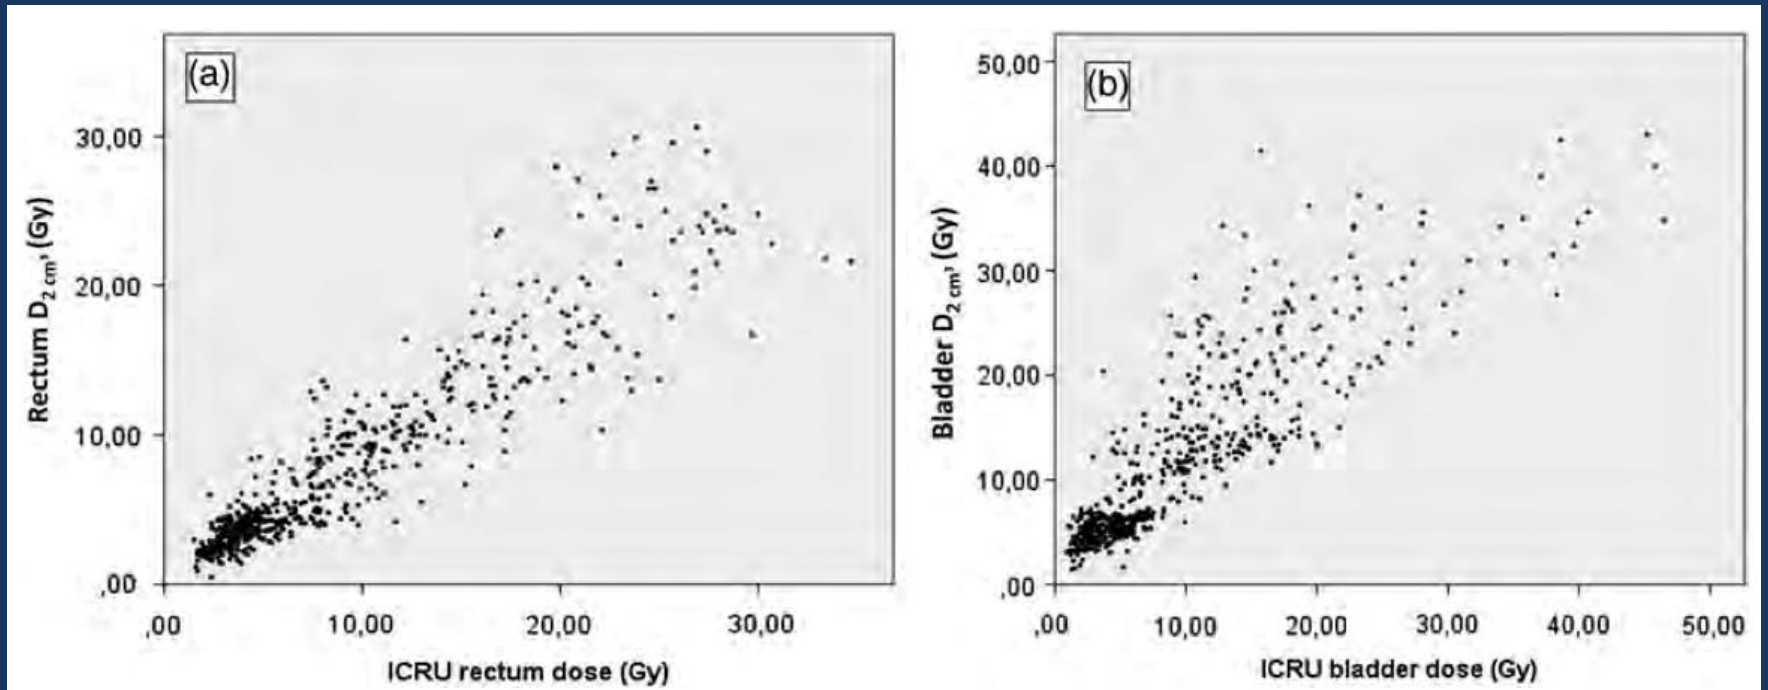
- Rectum: ICRU rectal reference point correlates with the D2cc dose of the organ rectum (Barillot et al., 2000; Crook et al., 1987; Georg et al., 2011; Koom et al., 200
  Perez et al., 1999; Pourquier et al., 1996; Stryker et al., 1988).

- Bladder: ICRU bladder reference point, does not correlate well with bladder complications (ICRU 38 bladder point underestimates the bladder dose) (Stryker et al., 1988).

Correlation of ICRU reference point and D2cc

- Rectum: ICRU point is 20% (sd 40 %) larger than D2cm3
- Bladder: ICRU point is 20% (sd 32 %) smaller than D2cm3

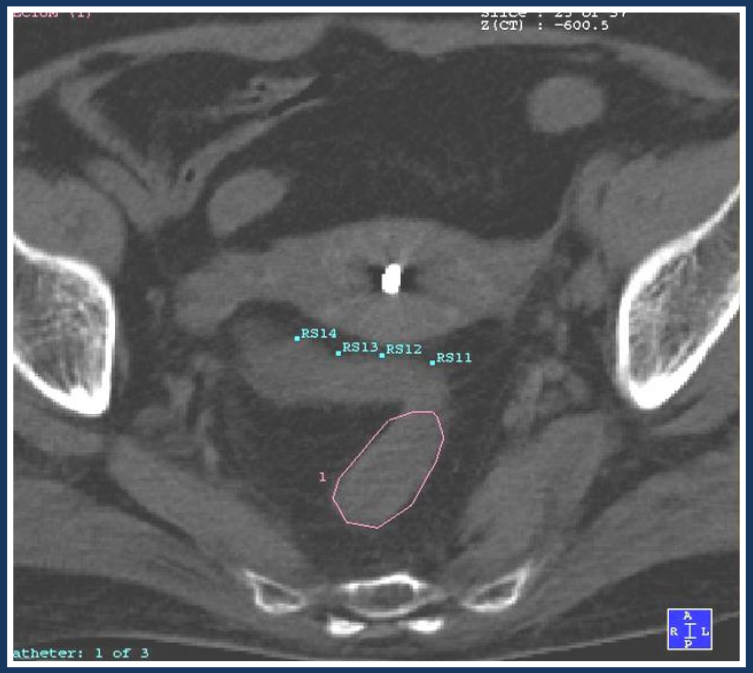
(Kirchheiner et al., 2016).



Sigmoid points on 2D radiographs

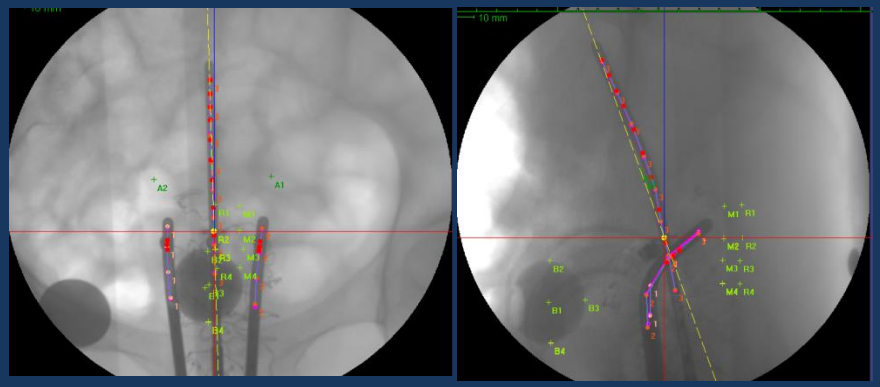
- 27 Patients treated with CT image based dosimetry
- Upper rectal and sigmoid points were marked on CT images
- Searched for a reproducible point with respect to applicator and other points
- No point was found that was reproducible that can act as a surrogate for upper rectal and sigmoid

- Barium contrast inserted and withdrawn that visualizes the sigmoid wall.

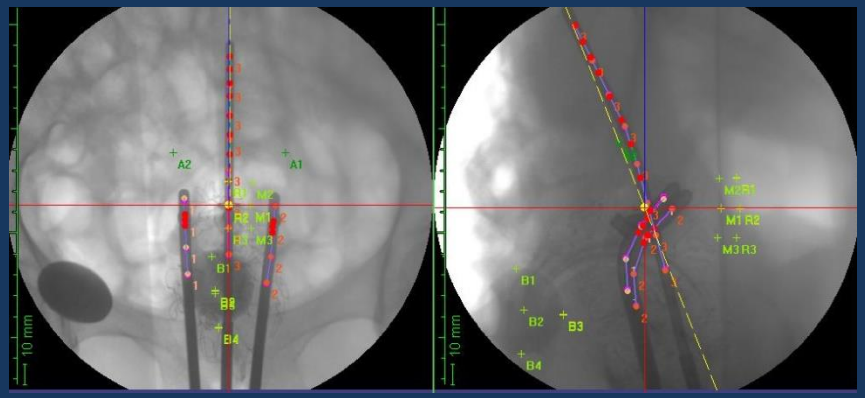


Mahantshetty et al, JCRT 2011

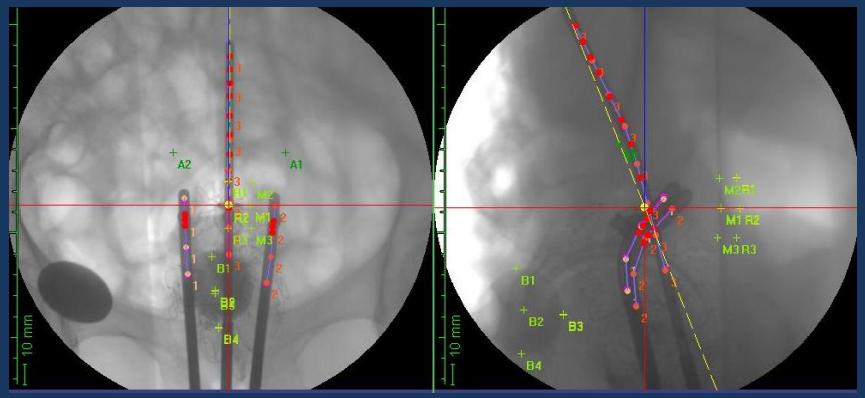
2D Inter application dose variation



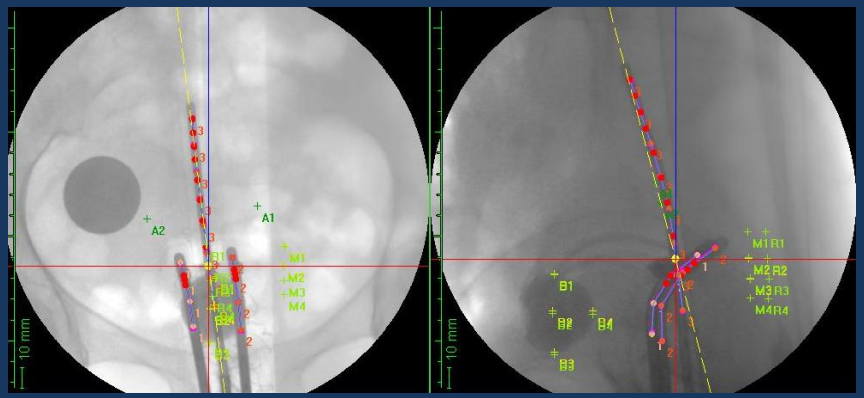
B=49.4%, R= 78.5%



B=39.06%, R=59.03%



B=45.32%, R=64.99%



B=41.32%, R= 67.28%

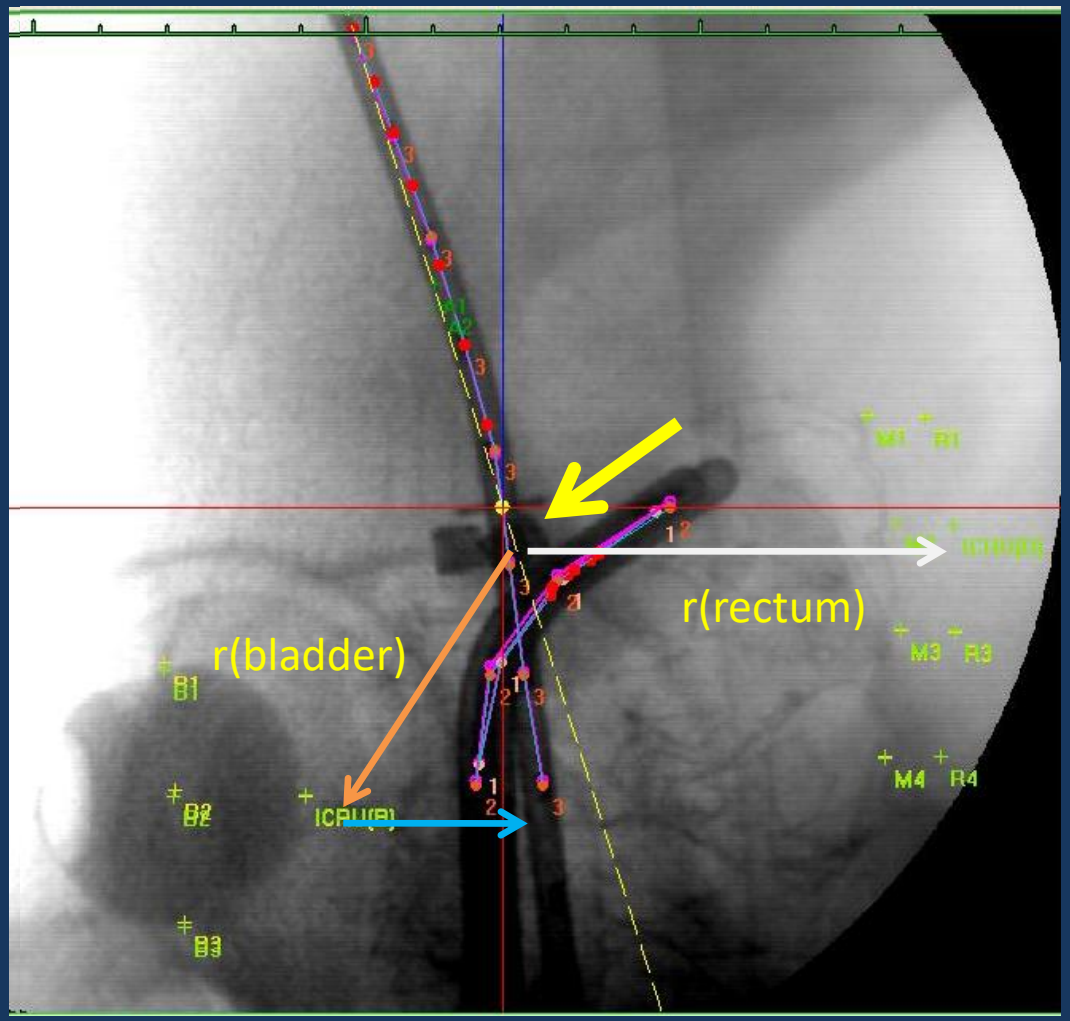
Inter application variation- spatial location

- Flange as the ref point (polar co cordinates)

r(bladder)= distance b/w centre of Flange and ICRU bladder point

r(rectum)= distance b/w centre of Flange and ICRU rectum point

Θ(bladder)=270° - Sin^{-1}ø
where, Sin ø=(a/r) &
a= perpendicular distance b/w ICRU bladder point and vertical axis



RESULTS - Summary

Inter application dose variation

TYPE	BLADDER		RECTUM	
	Mean	St. dev.	Mean	St. dev.
% interapplication dose variation w.r.t. 1st fraction	10.4	7.9	9.1	5.3

Inter application spatial location – OAR points

TYPE	BLADDER		RECTUM	
	Mean	St. dev.	Mean	St. dev.
Mean position in polar coordinates w.r.t. flange(r cm,θ^o)	(2.8,207.5)	(0.4,13.2)	(2.7,0)	(0.3,0)
Variation w.r.t. 1st fractionr cm, θ^o)	(0.4,5.9)	(0.2,5.4)	(0.3,0)	(0.28,0)

2D inter application conclusion

- The inter-fraction dose variation of about 10% is seen in 60% of cases for both rectum and bladder. However , maximum variation for rectum and bladder is within 20% and 30% respectively.

- The variation in ICRU rectal point was less as compared to ICRU Bladder point doses

- Inter-fraction variation in doses and spatial location may be critical if the ICRU bladder and rectal point doses are high at first brachytherapy planning

2D radiograph – Reporting – ICRU 89

Level 1

- TRAK
- Point A
- Recto Vaginal Reference point dose
- Bladder Reference point dose

Level 2

- Estimated dose in the CTVHR (in the CTVIR if used for prescription)
- Pelvic wall point (optional)
- Lymphatic trapezoid (optional)
- OARs
- Vaginal point doses at level of sources (lateral at 5 mm)
- Lower- and mid-vagina doses (PIBS, PIBS +2 cm)

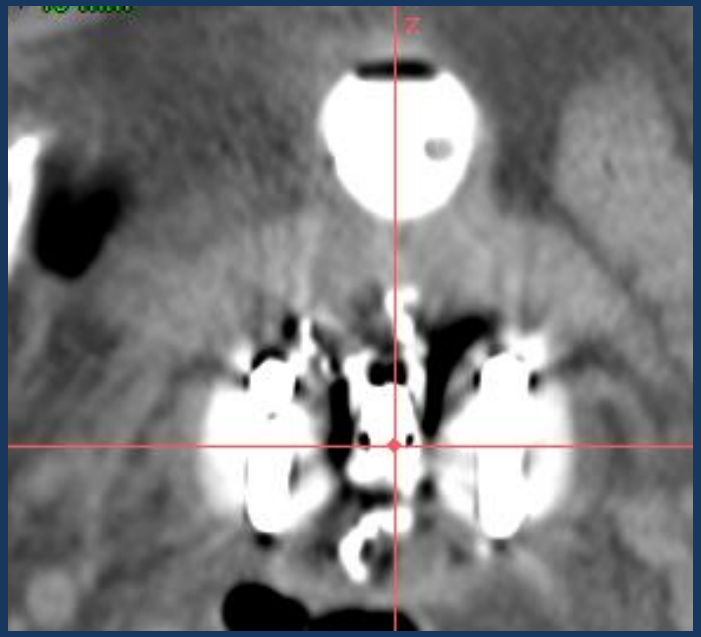
Reporting- Level 3 – Research oriented

- All that is reported in Level 1 and 2
- OAR volumes, points:
  - Additional bladder and rectum points
  - Sigmoid point
  - Anal-canal point (e.g., low-vagina point)
  - Vulva point (e.g., low-vagina point)
- Other points of interest
- OAR-dose reporting:
  - Length of treated vagina
- Isodose surface volumes:
  - 85 Gy EQD2 volume
  - 60 Gy EQDW volume

CT Imaging

- Metal (SS applicators), produces streak artifacts in CT images
- CT/MR compatible applicators made of plastic/titanium-zirconium alloy (non ferromagnetic materials) produce less artifacts

SS Applicator



CT/MR Applicator

Imaging protocol - CT

- 3-5 mm slice thickness
- HFS (if FFS, check for orientation)
- Optimize WL / WW (to minimize the artifacts in SS applicator to visualize OARs)
- Not necessarily full body contour as EXRT
- Bladder protocol - (empty/50cc – inst protocol)
- Markers required ? – institutional protocol
- Contrast

Summary

- Soft tissue structures cannot be visualized in radiographs , therefore, doses to surrogates are used to represent target and OARs.

- Standard loading pattern and Point A plan is a good start for complicated plans and hence recommended by ICRU 89

- Point A dose is NOT a surrogate for tumor dose. For small tumors, 2D planning delivers high dose to the tumor while exceeding the dose to the OARs, For large tumors, 2D Planning under-dose the tumor

- ICRU Rectal point over estimates and bladder point over estimates as compared to D2cc

MR imaging – Physics point of view

- No electron density information
  - Image registration with CT can be done
  - With iridium sources, tissue density is of less influence on the dose calculation due to the predominant Compton effect
- Image distortion
- Image artifacts
- Poor applicator visualization

Tata Memorial Hospital

ROUTINE GYN BRACHYTHERAPY PRACTICE

- GYN BT Applications: 4 - 10 (Avg. 6)
- BT procedures under anesthesia per day : 4-8 (Avg: 6) includ,. IC+ IS
- Vault BT (Endometrium /Cervix post-op): 1 - 2

- 13 - SUMMARY OF THE RECOMMENDATIONS
- APPENDIX – EXAMPLES, SPREADSHEETS, DRAWINGS

Committee:
Chairmen: Richard Pötter, Christian Kirisits
B. Erickson, C. Haie-Meder, J. Lindegaard, E. van Limbergen, J. Rownd, K. Tanderup, B. Thomadsen

Learning Objectives (I)

- Understand the concepts and learn the terms
  of dose volume and dose point parameters
  for planning, prescribing, recording and reporting
  the GTV and the CTV doses for 3D IGABT;

- Understand the concepts and learn the terms
  of dose volume and dose point parameters
  for planning, prescribing, recording and reporting
  the OAR doses for 3D IGABT;

Learning Objectives (II)

- Be able to use brachytherapy related
  dose volume and dose point parameters
  for planning aims and dose prescription
  for GTV, CTV, and the relevant OARs in IGABT.

Three levels of reporting

- **Level 1 - *Minimum standard for reporting***
- **Level 2 - *Advanced standard for reporting***
- **Level 3 - *Research oriented reporting***

Level 1 - *Minimum standard for reporting*

Source and dose calculation:

- **Radionuclide and source model**
- **Source strength**
- **Dose calculation algorithm**

Level 1 – *minimum standard for reporting*

- **Comprehensive clinical gynecologic examination (diagnosis, BT)**
- **Volumetric imaging (MRI, CT, US, PET CT) at time of diagnosis and BT (as available)**
- **FIGO/TNM stage**
- **Baseline morbidity and QoL assessment**
- **Schematic 3D documentation on a clinical diagram indicating dimensions (width, thickness) and volumes for:**
  - **GTV_{init} (GTV at diagnosis)**
  - **GTV_{res} (GTV at brachytherapy)**
  - **CTV_{HR} (GTV_{res} (plus residual pathologic tissue plus whole cervix)**
  - **(CTV_{IR}: GTV_{init} and CTV_{HR} plus safefy margin if used for prescription)**

At Diagnosis [X]

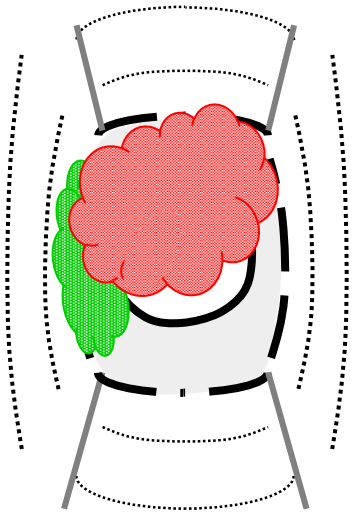
At Brachytherapy [ ]

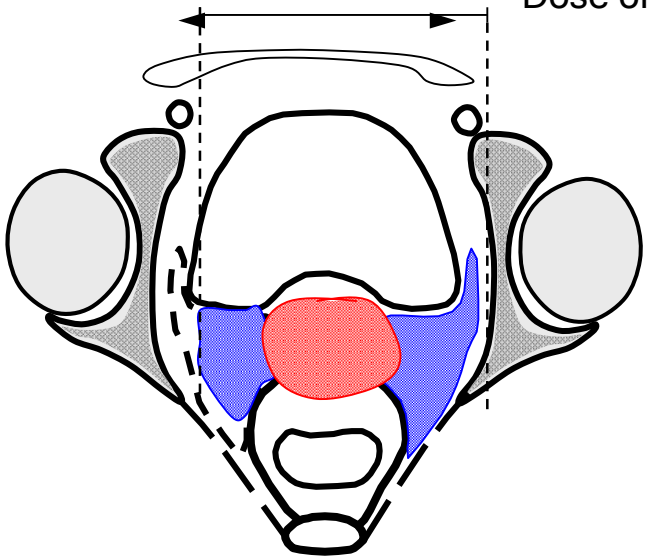
Dose of EBRT ___ Gy

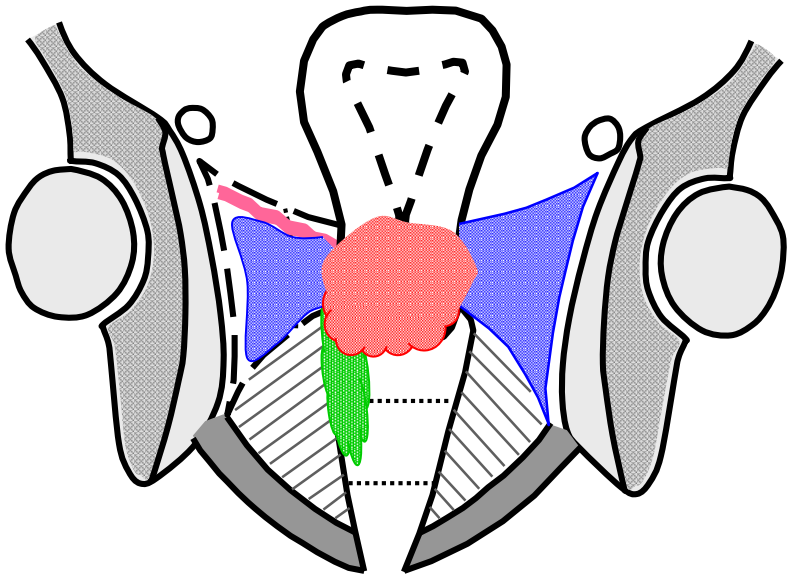
IIIB

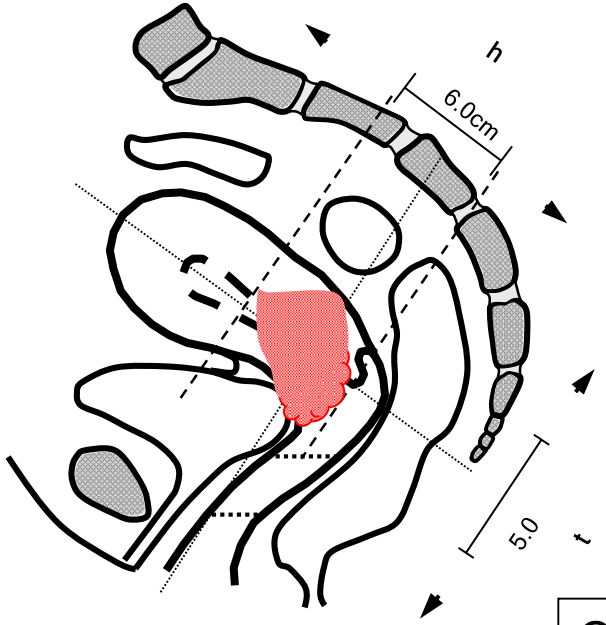
w = 9.0 cm
h = 6.0 cm
t = 5.0 cm

Vagina: 5 cm









dd/mm/yy

Signature

Note: vagina and parametria not included in h

Case IV

At Diagnosis ☐

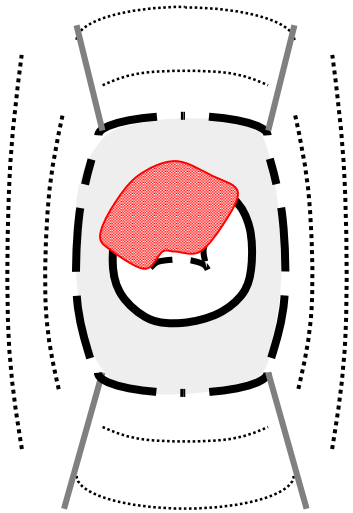
At Brachytherapy ☒

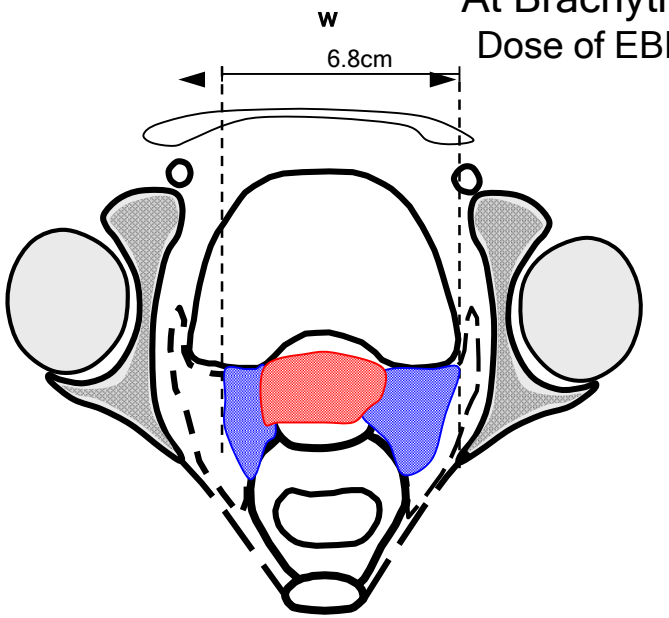
Dose of EBRT 50.4 Gy

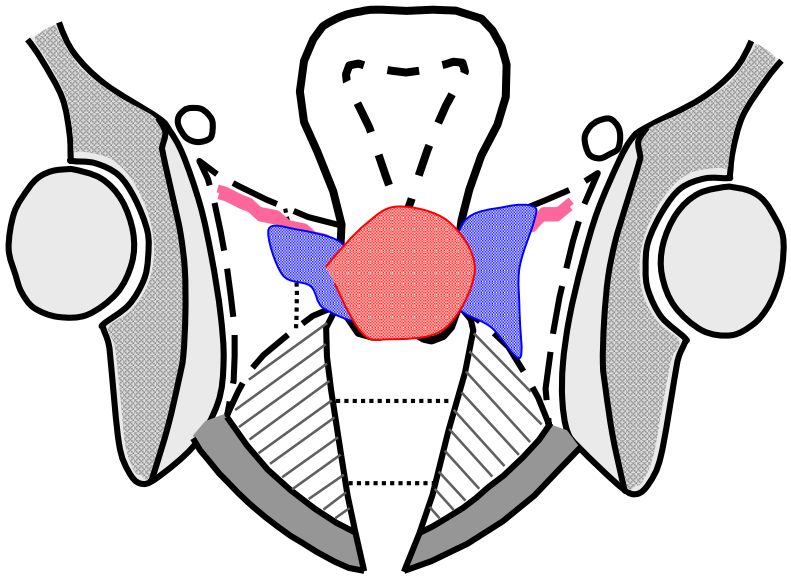
IIIB

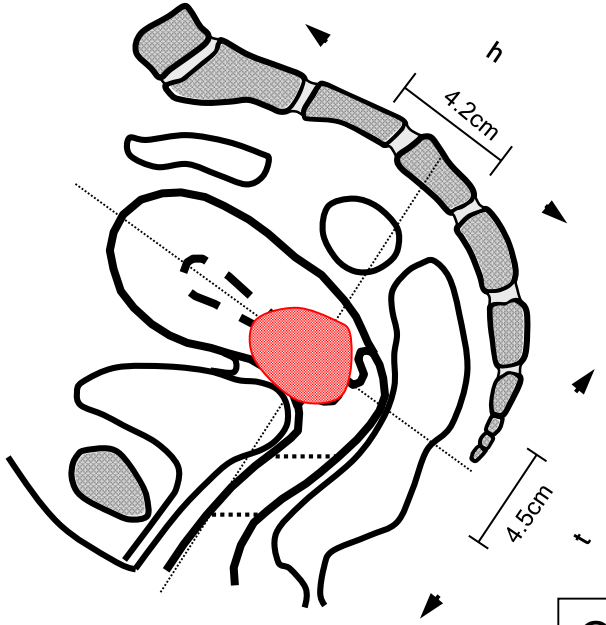
w = 6.8 cm
h = 4.2 cm
t = 4.5 cm

Vagina: 0 cm









dd/mm/yy
/ /

Signature

Note: parametria **not** included in **h**.

Case IV

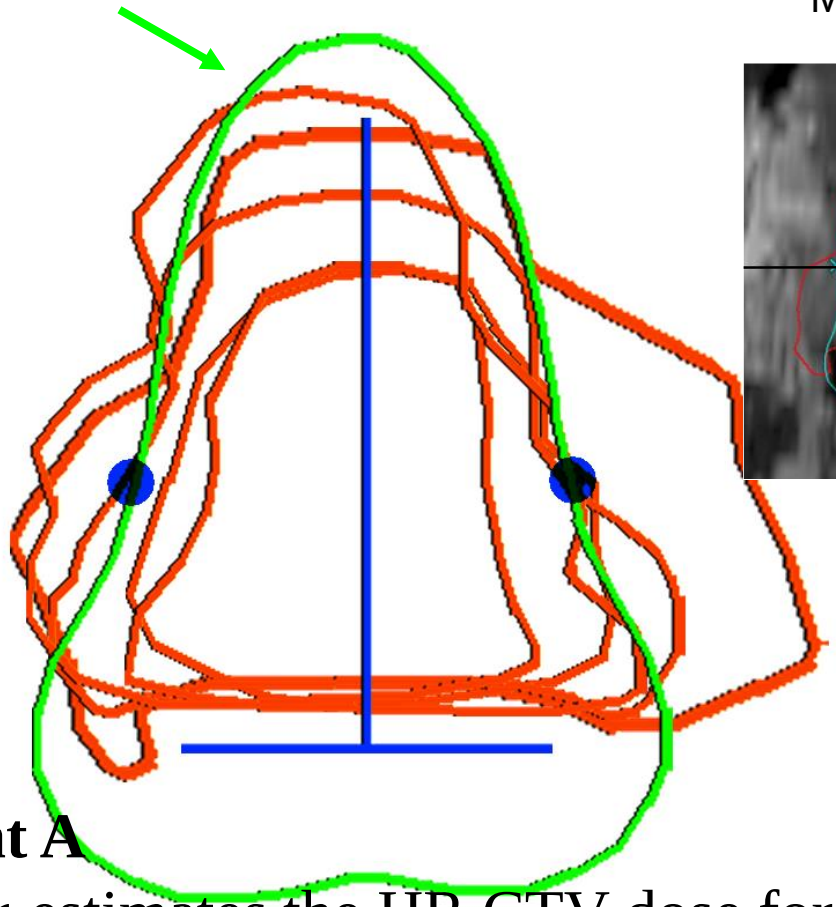
Level 1 – *minimum standard for reporting*

Dose reporting:

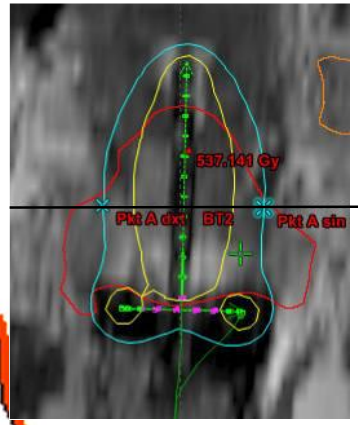
- **TRAK**
- **Point A dose**
- **Recto-vaginal reference point dose (prior: ICRU rectum point)**
- **Bladder reference point for radiographs (if 2D imaging)**
- **$D_{0.1cm^3}$, D_{2cm^3} for bladder, rectum (if 3D imaging)**
- **Overall treatment time**

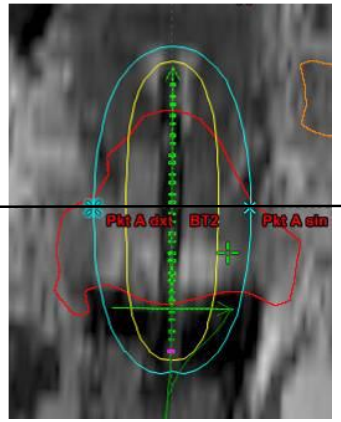
Point-A based brachytherapy and HR CTV volume and dose

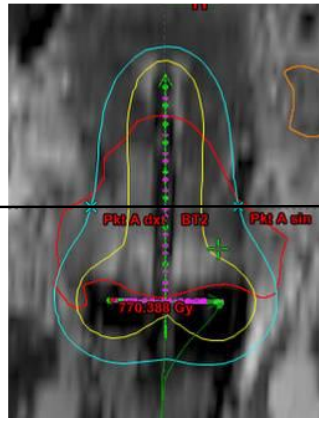
Point A isodose

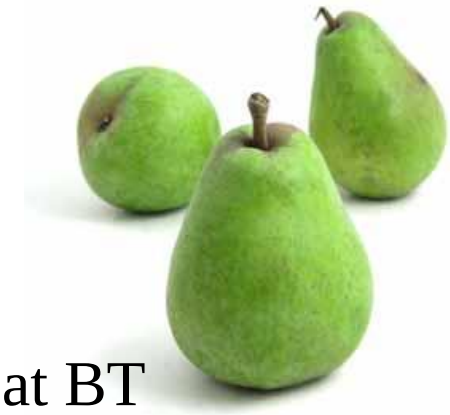


Milwaukee Toronto Vienna









Point A

Over-estimates the HR CTV dose for large tumors at BT

Under-estimates the HR CTV dose for small tumors at BT

Dose Delivery Pattern ICRU 89

Absorbed dose rate/dose per fraction

Number of fractions

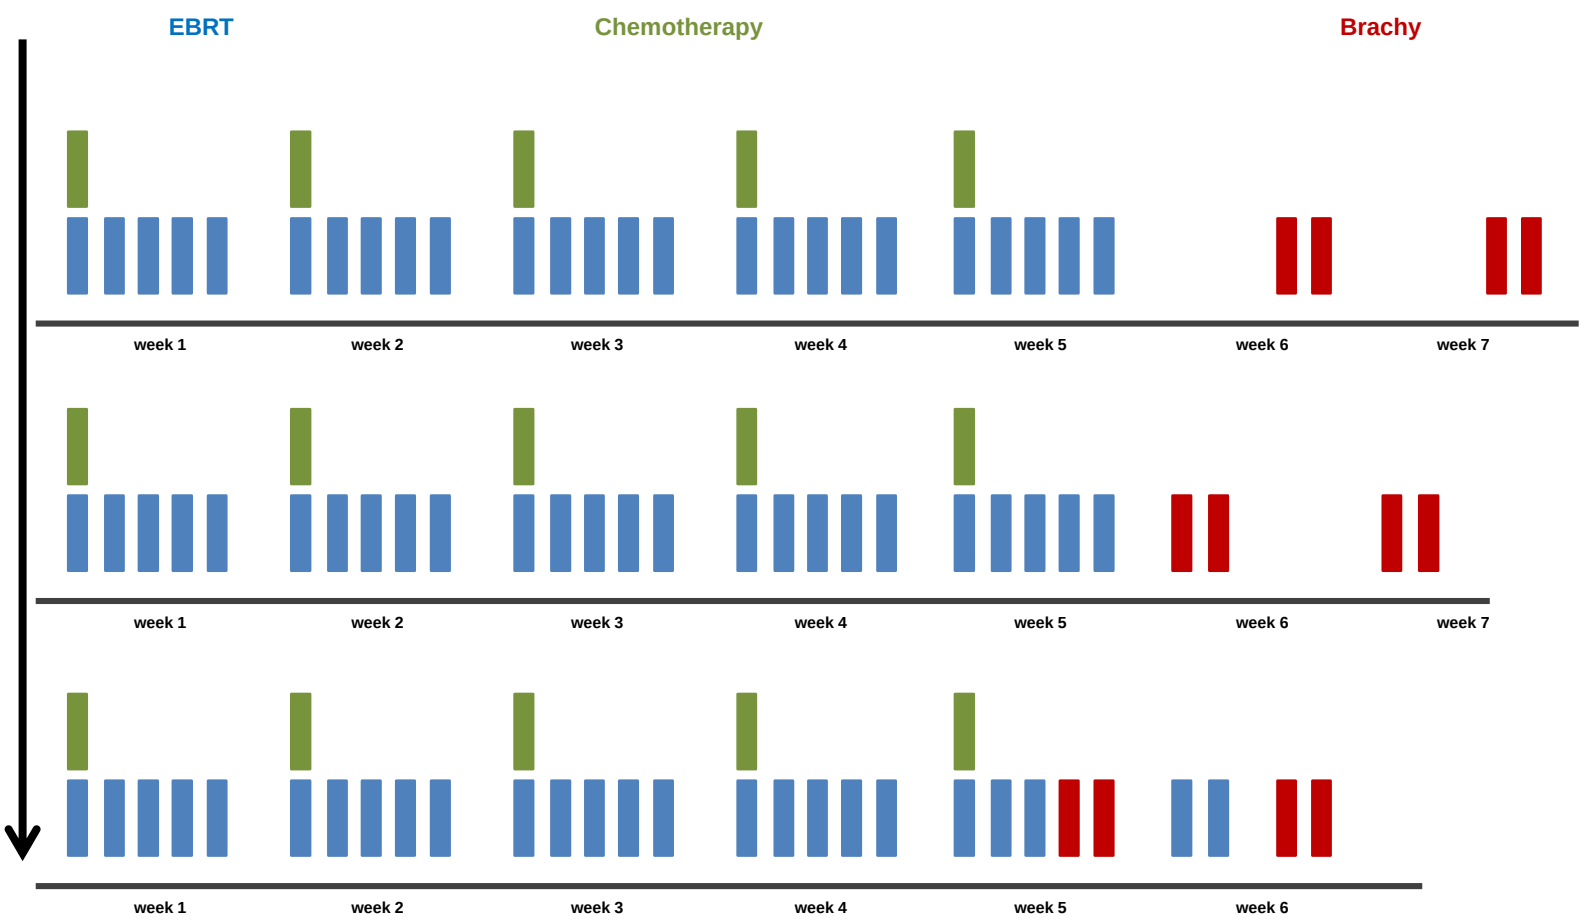
Time between fractions

(Pulse number, size, time, if PDR)

Overall treatment time

Total EQD2

Overall Treatment Time (BT, EBRT, total)



When comparing total dose to point A and total dose to 90% of the HR CTV (D90)

A. Dose in point A is always lower than D90
B. Dose in point A is always higher than D90
C. Dose in point A is always similar/equal to D90
D. In small tumors point A dose is smaller than D90
E. In large tumors D90 is larger than point A dose

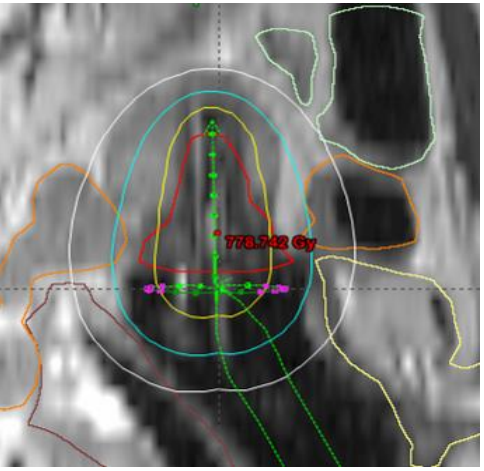
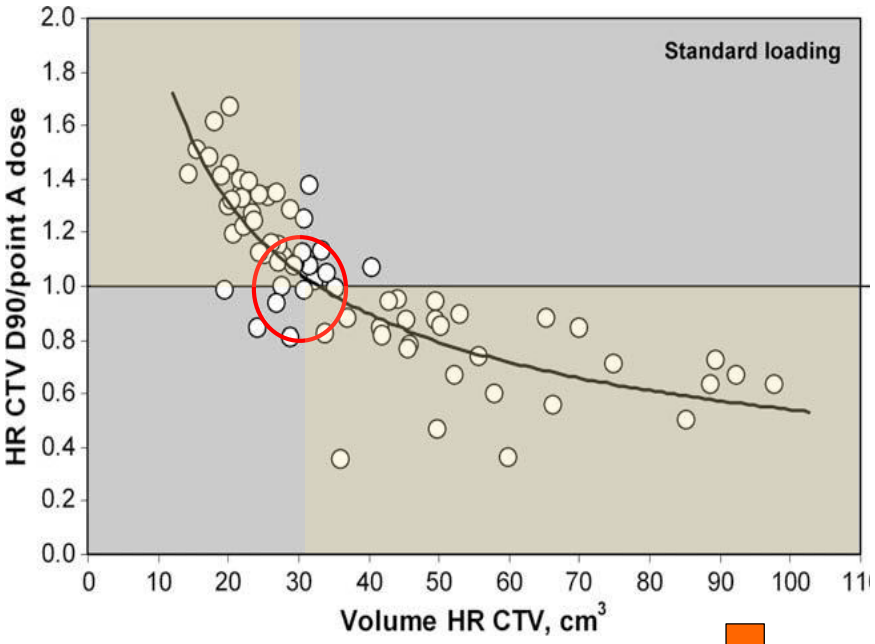
Consequences of prescribing to Point-A

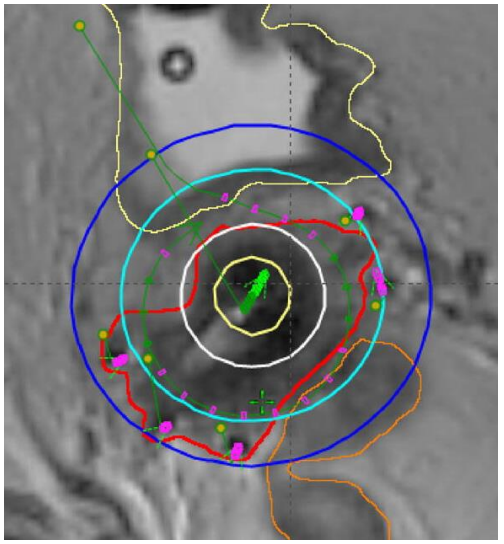


Overdosing organs at risk



Tanderup et al, Radiotherapy Oncol 2010

Underdosing the tumour



Level 2 - *Advanced standard for reporting* All that is reported in level 1 plus (ICRU 89):

.

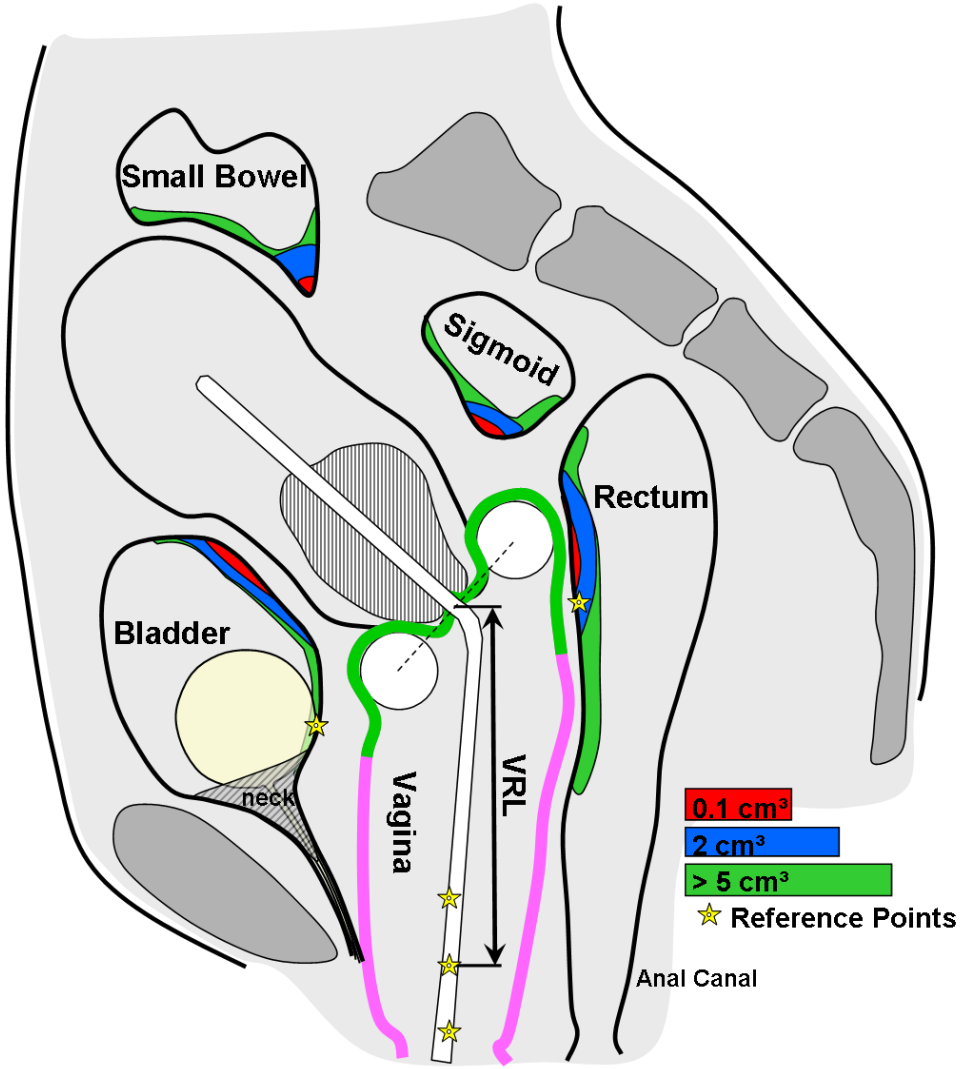
Dose reporting based on volumetric imaging for OARs:

- **Bladder reference point dose**
- **$D_{0.1cm^3}$,D_{2cm^3} for sigmoid**
- **D_{2cm^3} bowel**
- **Intermediate and low dose parameters in bladder, rectum, sigmoid, bowel (e.g. V_{15Gy}, V_{25Gy}, V_{35Gy}, V_{45Gy} or $D_{98\%}$, $D_{50\%}$, $D_{2\%}$)**
- **Vaginal point doses at level of sources (lateral at 5 mm)**
- **Lower and mid-vagina doses (PIBS, PIBS ±2cm)**

DVH Parameters and Reference Points,

ICRU/GEC ESTRO report 89, 2016

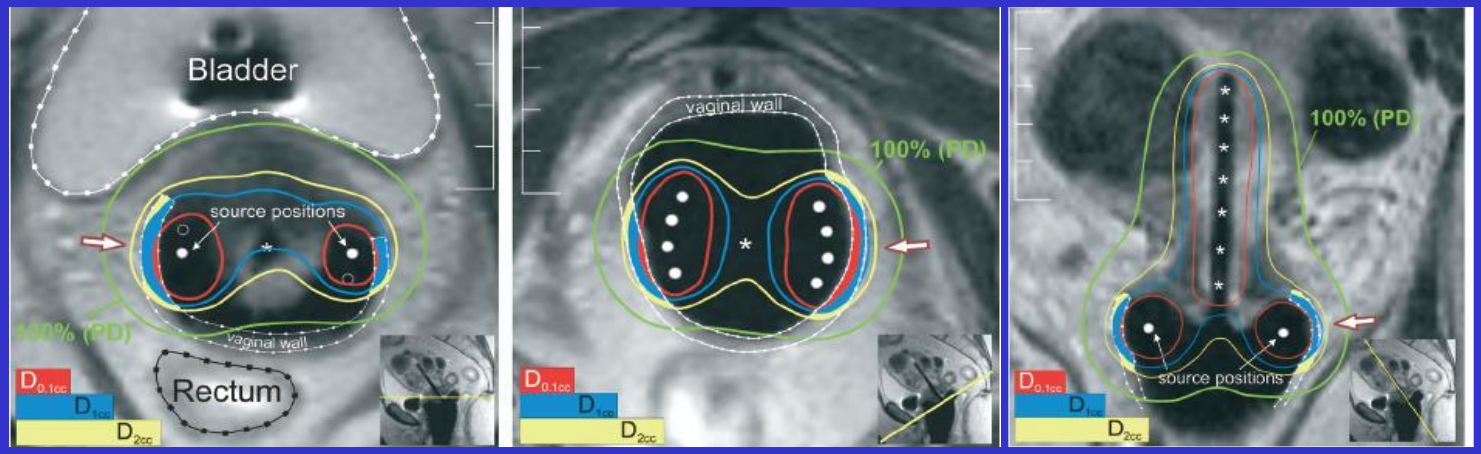
Fig. 6.4, Fig. 8.8



Vaginal dose assessment and reporting

UNCERTAINTIES IN ASSESMENT OF THE VAGINAL DOSE FOR INTRACAVITARY BRACHYTHERAPY OF CERVICAL CANCER USING A TANDEM-RING APPLICATOR

DANIEL BERGER, M.SC., JOHANNES DIMOPOULOS, M.D., PETRA GEORG, M.D., DIETMAR GEORG, PH.D., RICHARD PÖTTER, M.D., AND CHRISTIAN KIRISITS, SC.D.

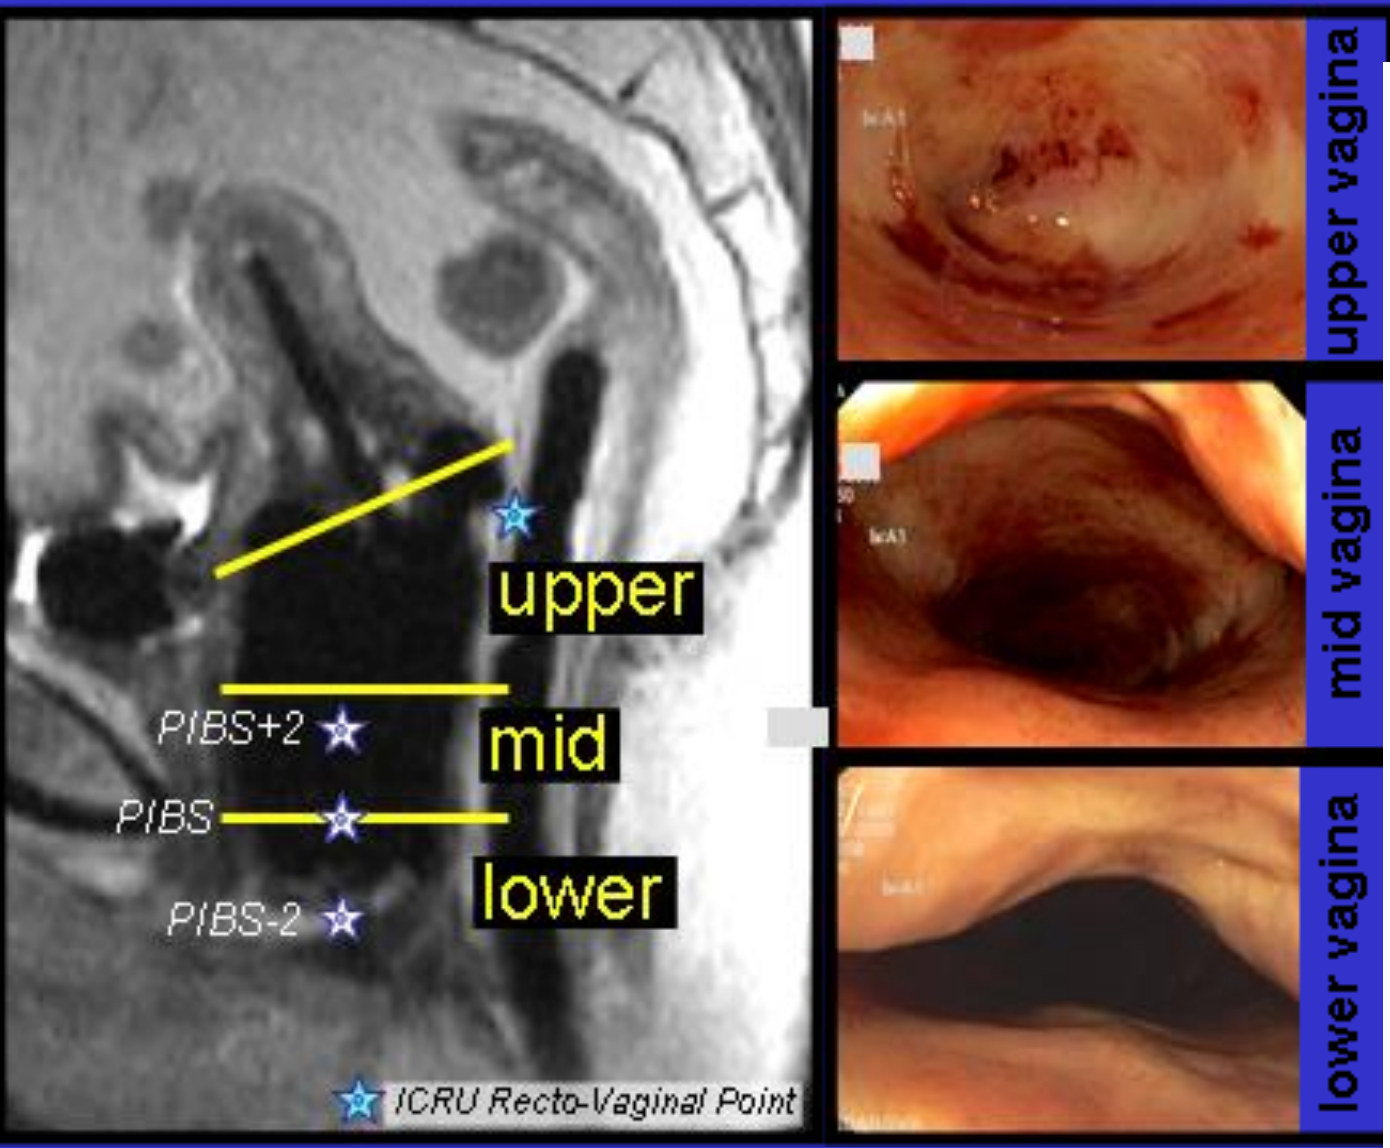


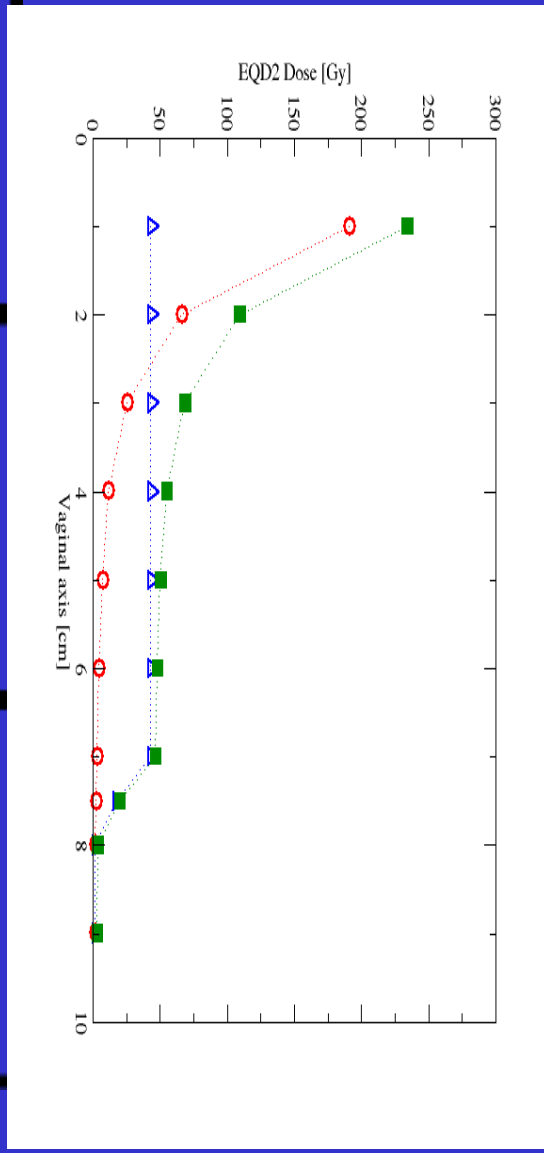
DVH parameters have HIGH uncertainty for representative vaginal dose estimation

They are influenced by the resolution of sectional imaging, contouring accuracy and applicator reconstruction

Berger et al, IJROBP 2007

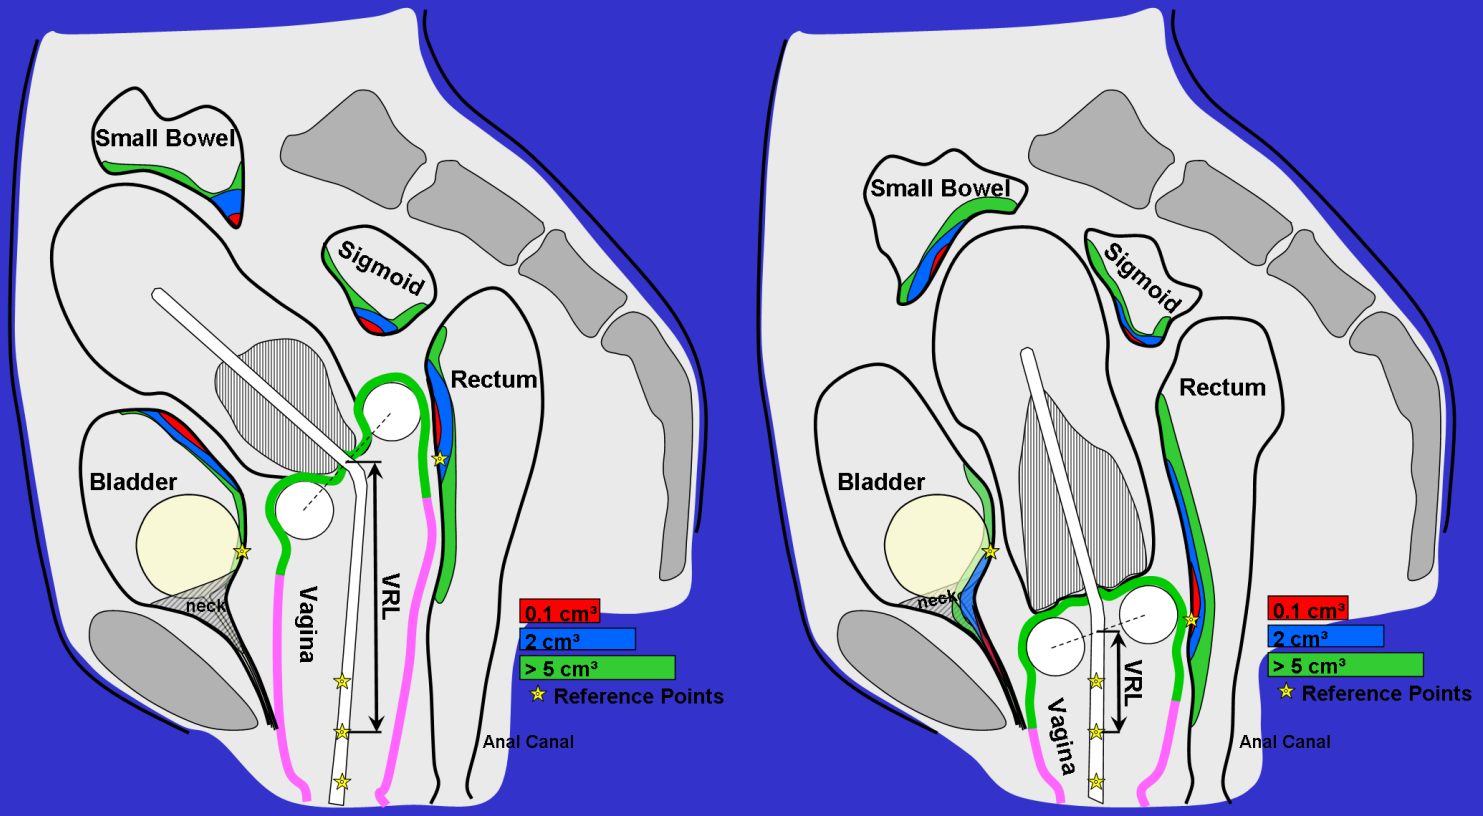
Vaginal morbidity and radiation doses





ICRU/GEC ESTRO Report 89 Fig. 6.1/Fig. 8.11

DVH Parameters and Reference Points, Vaginal point: *variations in application*



ICRU/GEC ESTRO
report 89, 2016
Fig. 6.4, Fig. 8.8

Vaginal Reference Length (VRL)

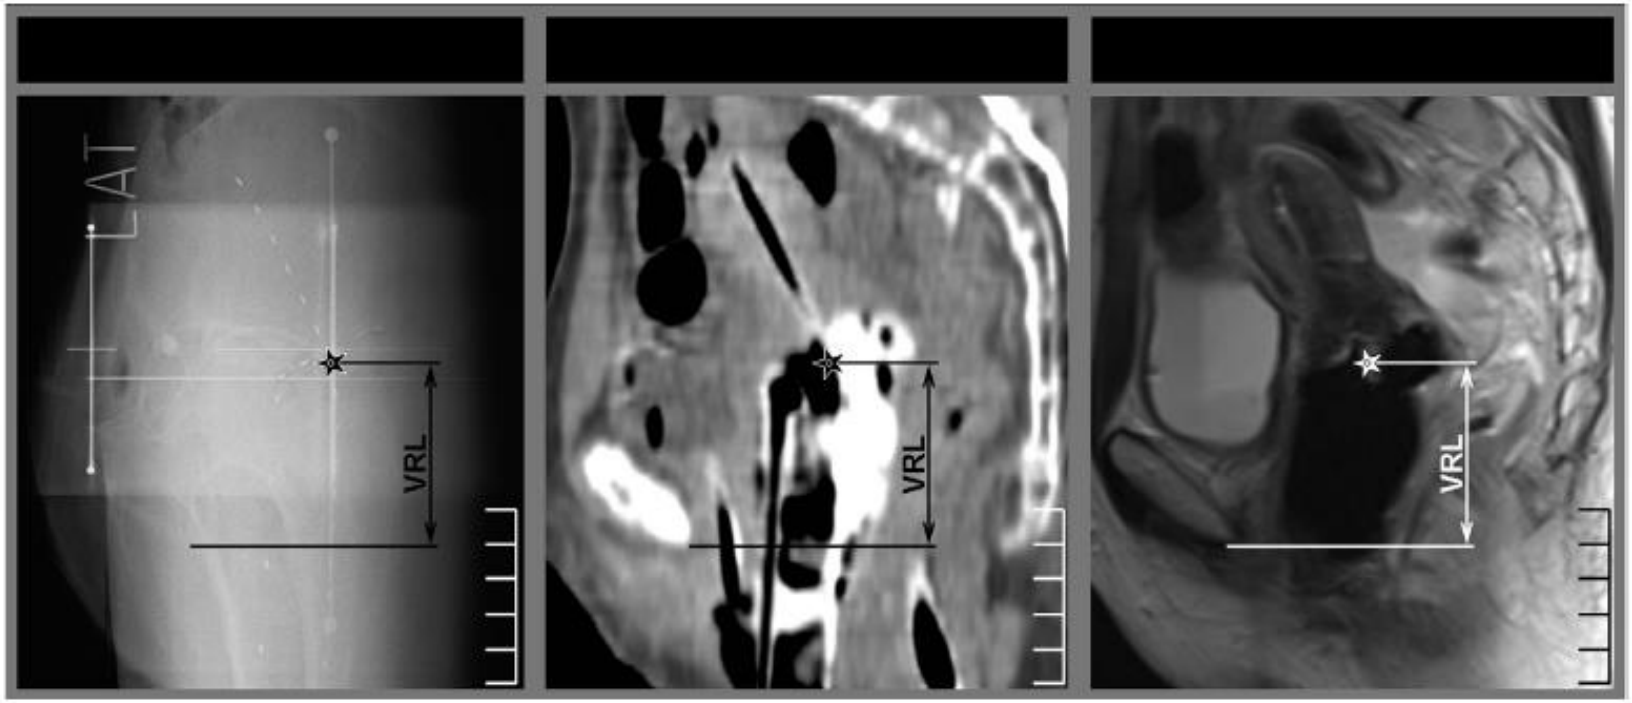


Fig. 1. Definition of vaginal dose points and vaginal reference length (VRL). (A) Vaginal dose points are defined in relation to a point at the level of the posterior–inferior border of the symphysis (PIBS) on sagittal (reconstructed) CT or MR images used for EBRT and BT treatment planning. The star at PIBS level represents the vaginal reference point. In the table on the right side mean (SD) and median (min–max) values are given for each level in EBRT and for total dose in EQD2. Additionally, total doses to the top are given for all four clockwise positions at the vaginal surface and 5 mm depth (e.g. median total dose at 3 o'clock is respectively 266 and 115 Gy for surface and 5 mm depth). (B) VRL at time of BT with a ring applicator in situ on a lateral radiograph, sagittal MPR CT image and sagittal MRI view. VRL is measured from centre of the ring (indicated by a star) to the PIBS level, indicated by the solid line orthogonal to the body axis.

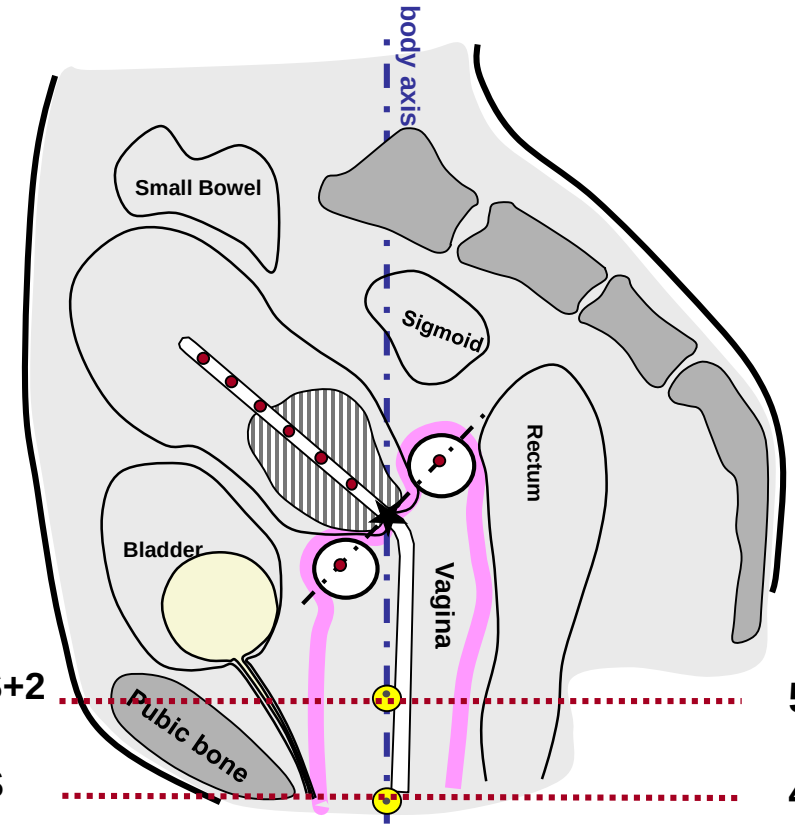
Vaginal reference points



PIBS+2 — 53 (32-109) Gy (mid vagina)

PIBS — 41 (4-81) Gy

PIBS-2 — 5 (1-51) Gy (introitus)

Vienna Data (n=59)

Westerveld et al. Radioth and Oncology 2013

D_{2cm3} and $D0.1_{cm3}$ for OAR are recommended

A. for the vagina
B. for the bladder only
C. for rectum, sigmoid, bladder

General principles for reporting of physical and equieffective EBRT and BT dose (ICRU/GEC ESTRO report 88)

Physical dose and number of fractions is assessed for target, OARs, dose points:

- BT

- EBRT

Total equi-effective dose (EQD2) is calculated according to the linear quadratic model through the following steps:

- BT EQD2 for each fraction
- Total BT EQD2
- Total EBRT EQD2
- Accumulated total EBRT+BT EQD2*

**Based on current assumptions outlined in ICRU 88 chapter 9*

Reporting of radiobiological parameters:

α/β values for tumour and OARs*

In addition $T_{1/2}$ and recovery model for LDR and PDR treatments*

*At present: α/β=3 Gy for late effects in OAR and 10 Gy for tumour, and $T_{1/2}$=1.5h

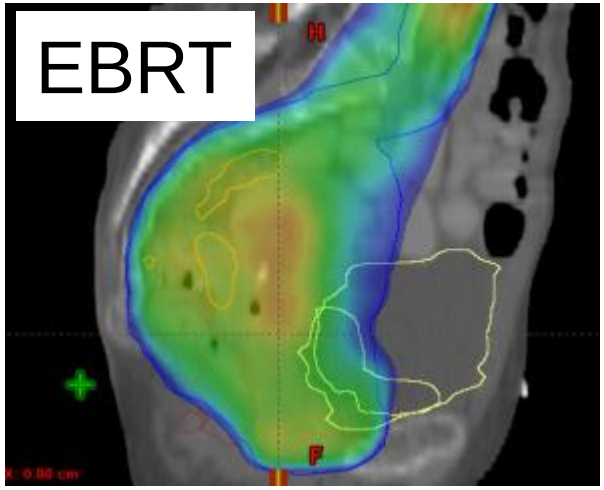
Pelvic EBRT (elective) + BT

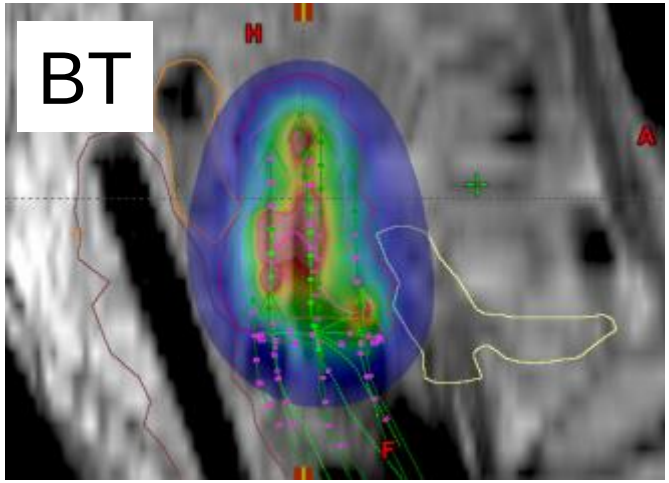
- **Elective target volume and CTV-T:**
  - **Normally homogeneous dose within 95%-107% of PD**

Recommended assessment of total EQD2 dose:

Target (HR CTV-T): $D90_{EQD2}$ **(total) =** PD_{EQD2}**(EBRT) +** $D90_{EQD2}$**(BT)**

OAR: $D_{2cm3,\ EQD2}$ **(total) =** PD_{EQD2}**(EBRT) +** $D_{2cm3,\ EQD2}$ **(BT)**





Calculation of EQD2 in spreadsheet

- **EBRT+BT**
- **EQD_2 calculations**
  - **Tumor: α/β = 10 Gy**
  - **OAR: α/β = 3 Gy**
  - **T½ = 1.5 h**

DVH analysis of MR-guided intracavitary PDR brachytherapy

When adding doses from EBRT and BT You assume for the HR CTV for BT that

A. 50% of the ICRU point dose of EBRT has been applied (or of median EBRT dose)
B. 90% of the dose of the ICRU point dose of EBRT has been applied (or of median EBRT dose)
C. 100% of the dose of the ICRU point dose of EBRT has been applied (or of median EBRT dose)

When adding doses from EBRT and BT You assume for the 2 cm3 for OAR that

A. 50% of the EBRT ICRU point dose has been applied (or of median EBRT dose)
B. 90% of the EBRT ICRU point dose has been applied (or of median EBRT dose)
C. 100% of the EBRT ICRU point dose EBRT has been applied (or of median EBRT dose)

Limitations of adding doses according to „ICRU point-3D model“ both for CTV and OAR

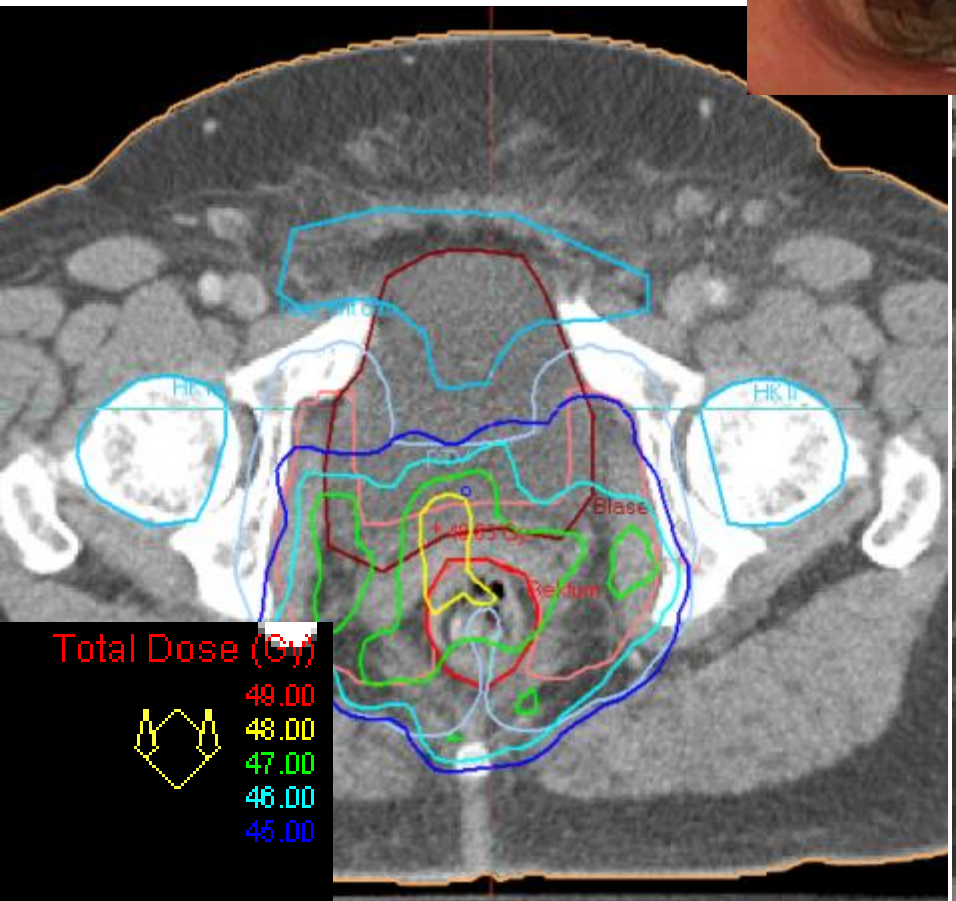
- Non-homogenous dose distribution EBRT
  e.g. IMRT, VMAT…
- Parametrial boost
- Lymph node boost
- Limitations of the linear-quadratic model

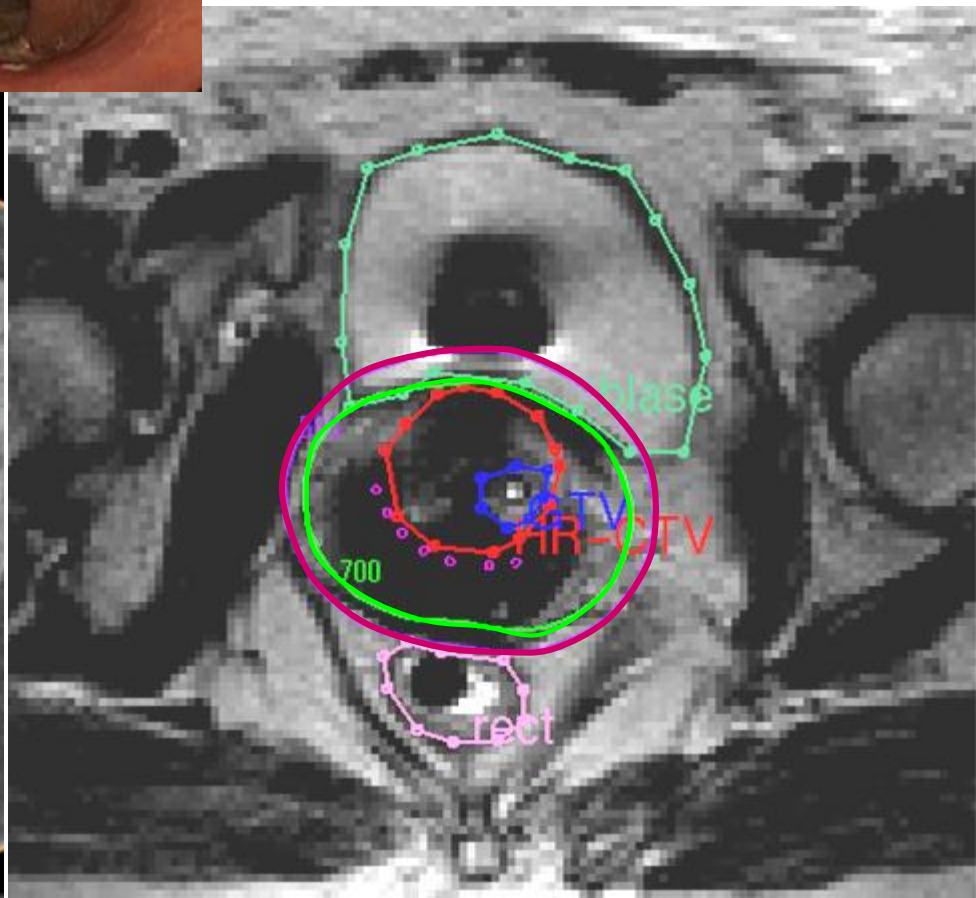
- Future solution for complex adding doses….

How could this happen?

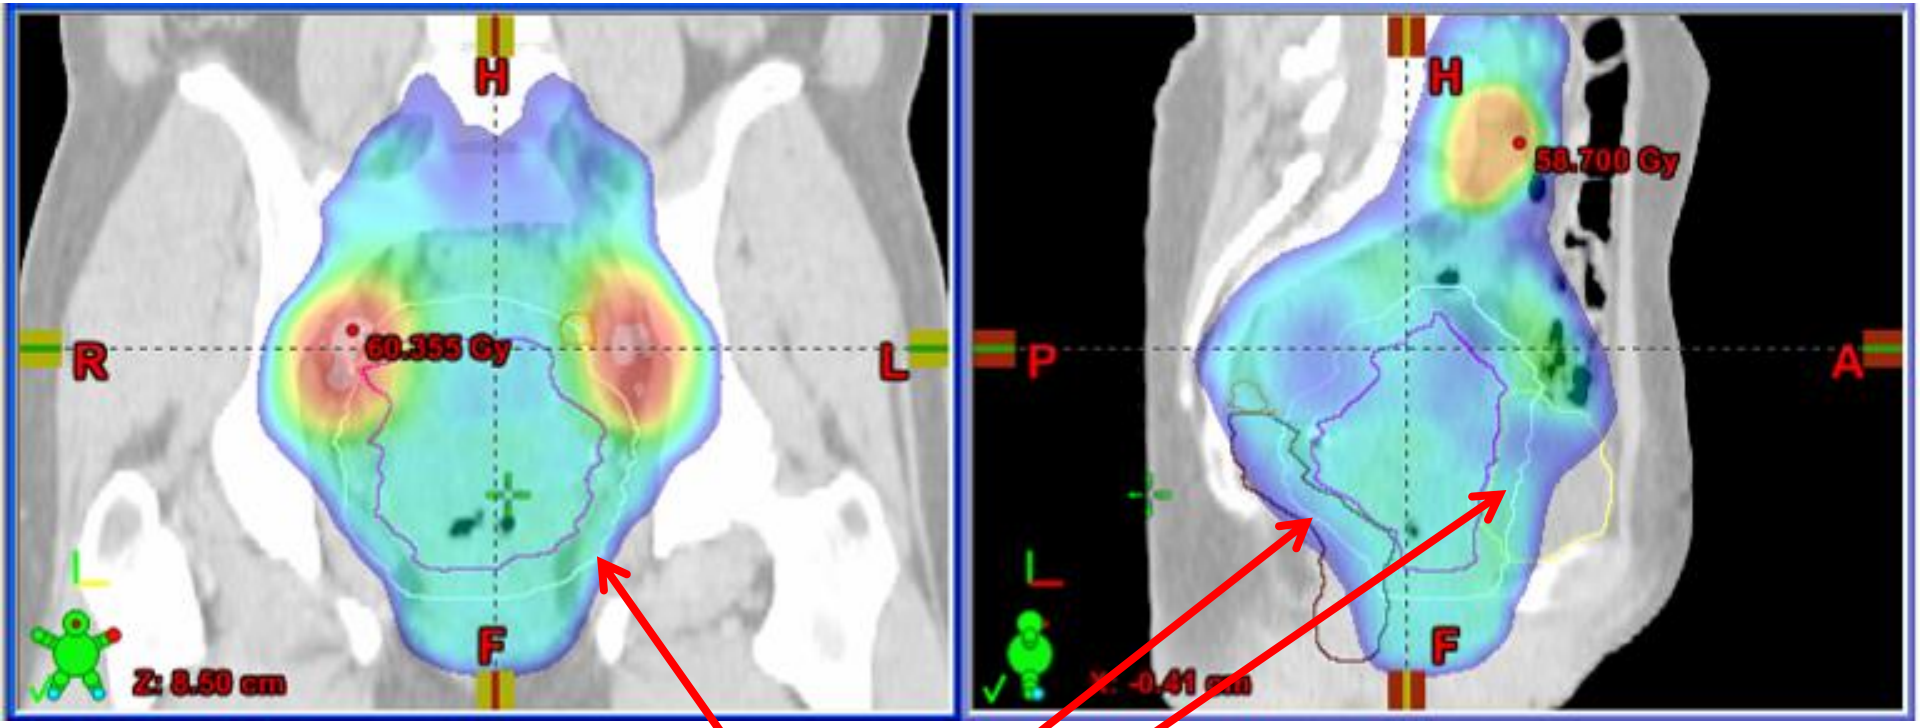
D2cc = 65.7 Gy EQD2$_{(\alpha/\beta=3)}$

D2cc = 79.2 Gy EQD2$_{(\alpha/\beta=3)}$

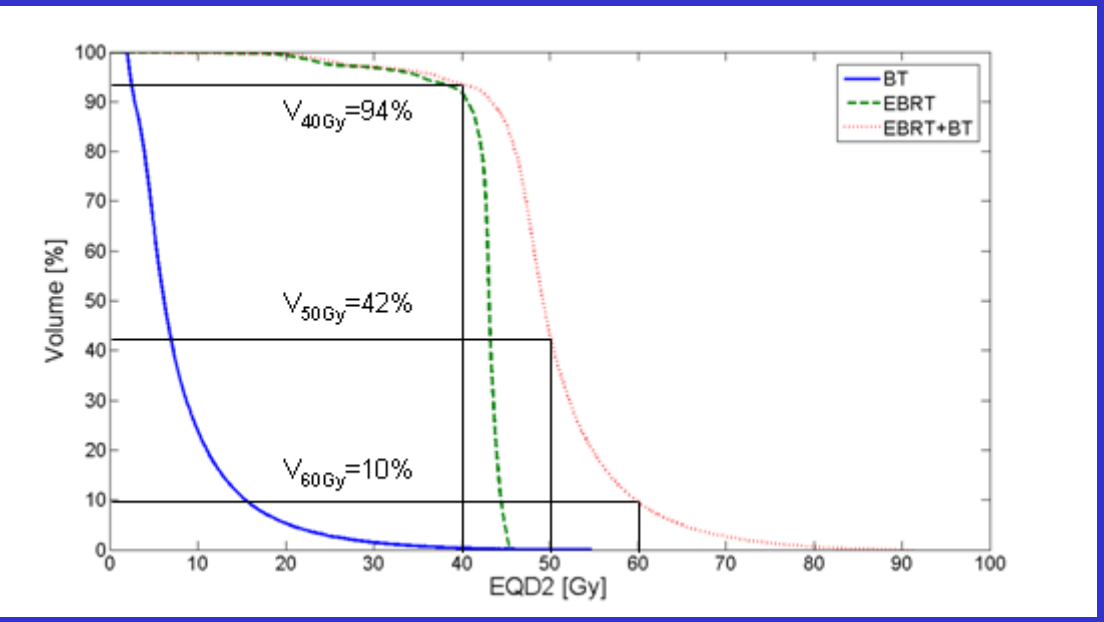


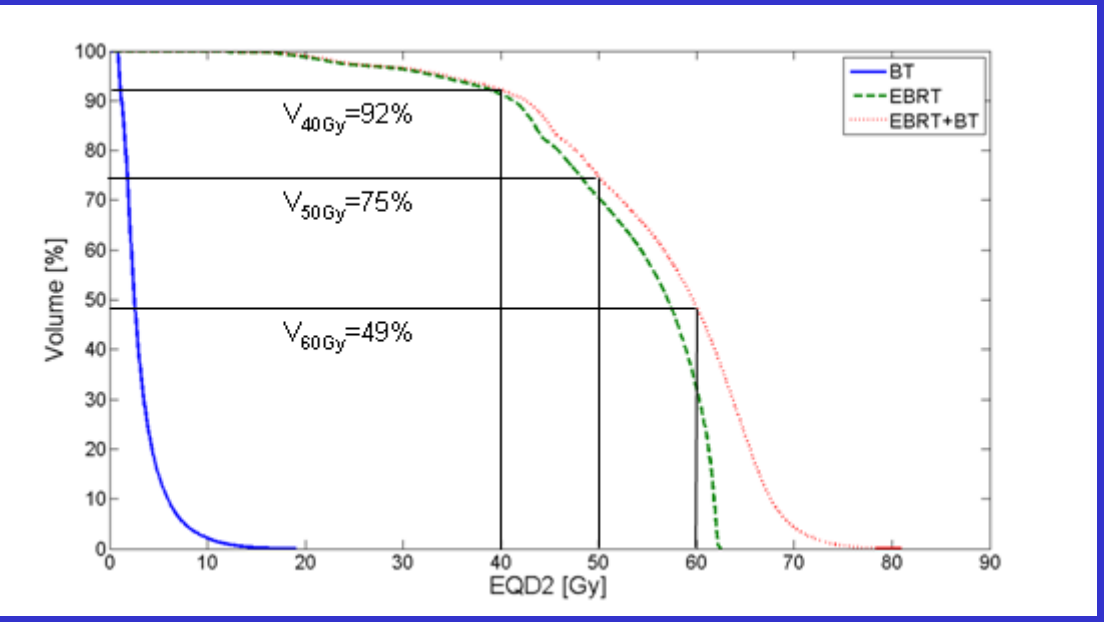


Be aware of IMRT hot spots in the BT region!



Homogenous volume for inverse dose planning





DVHs for different contributions of EBRT and BT *and* specific morbidity endpoints

ICRU/GEC ESTRO report 89 Fig. 8.8

FROM PLANNING AIMS TO PRESCRIPTION

Traditional concepts:

"when prescribing to a target, the prescription dose is the planned dose to cover this target as completely as possible."

or

prescription to a 100% isodose which is "to cover" the target volume"

Need for common terminology according to ICRU reports on proton treatment and IMRT

- **Planning aim dose**
  - **Set of dose and dose/volume constraints for a treatment**
- **Prescribed dose**
  - **Finally accepted treatment plan (which is assumed to be delivered to an individual patient)**
- **Delivered dose**
  - **Actually delivered dose to the individual patient**

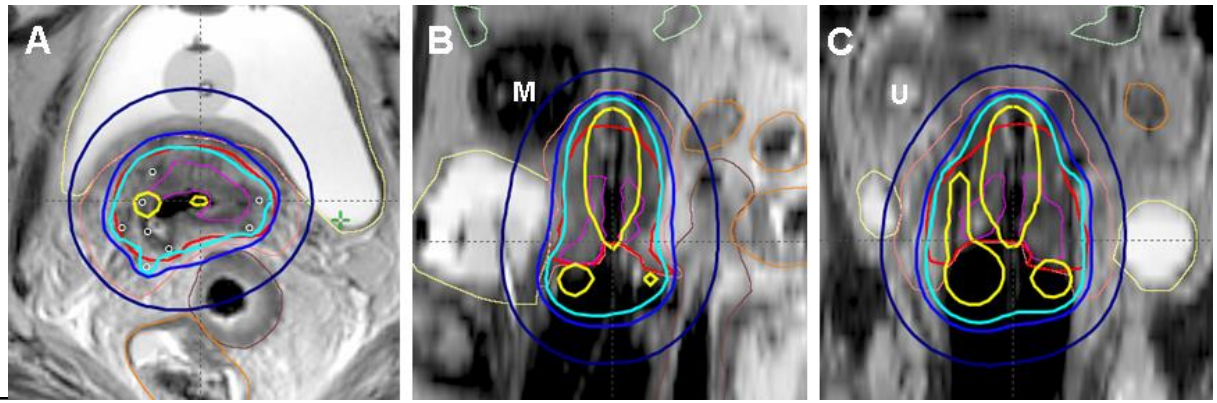
Planning aim and prescription dose

- **Planning aim: what you want to obtain**
- **Prescribed dose: what you decide to treat**

Case 6

Appendix,

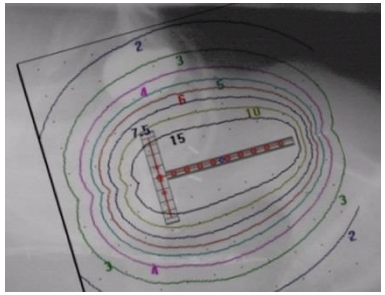
ICRU 89



Structure	Dose-volume parameter	Planning aim, Gy	Prescribed dose Gy
CTV_{HR}	$EQD2_{10}$ D_{90}	≥ 85	88.9
Bladder	$EQD2_3$ D_{2cm^3}	≤ 90	71.1
Rectum	$EQD2_3$ D_{2cm^3}	≤ 70	65.6
Sigmoid	$EQD2_3$ D_{2cm^3}	≤ 70	57.4
Bowel	$EQD2_3$ D_{2cm^3}	≤ 70	53.3

Planning aim and prescription dose

- **Planning aim: what you want to obtain**
- **Prescribed dose: what you decide to treat**



Example 2

Structure	Dose parameter	Planning aim, Gy	Prescribed dose Gy
Target	Point A	7Gy	6.5Gy
Bladder	ICRU point	≤ 7Gy	6.8 Gy
Rectum	ICRU point	≤ 75% of 7Gy	5.3 Gy

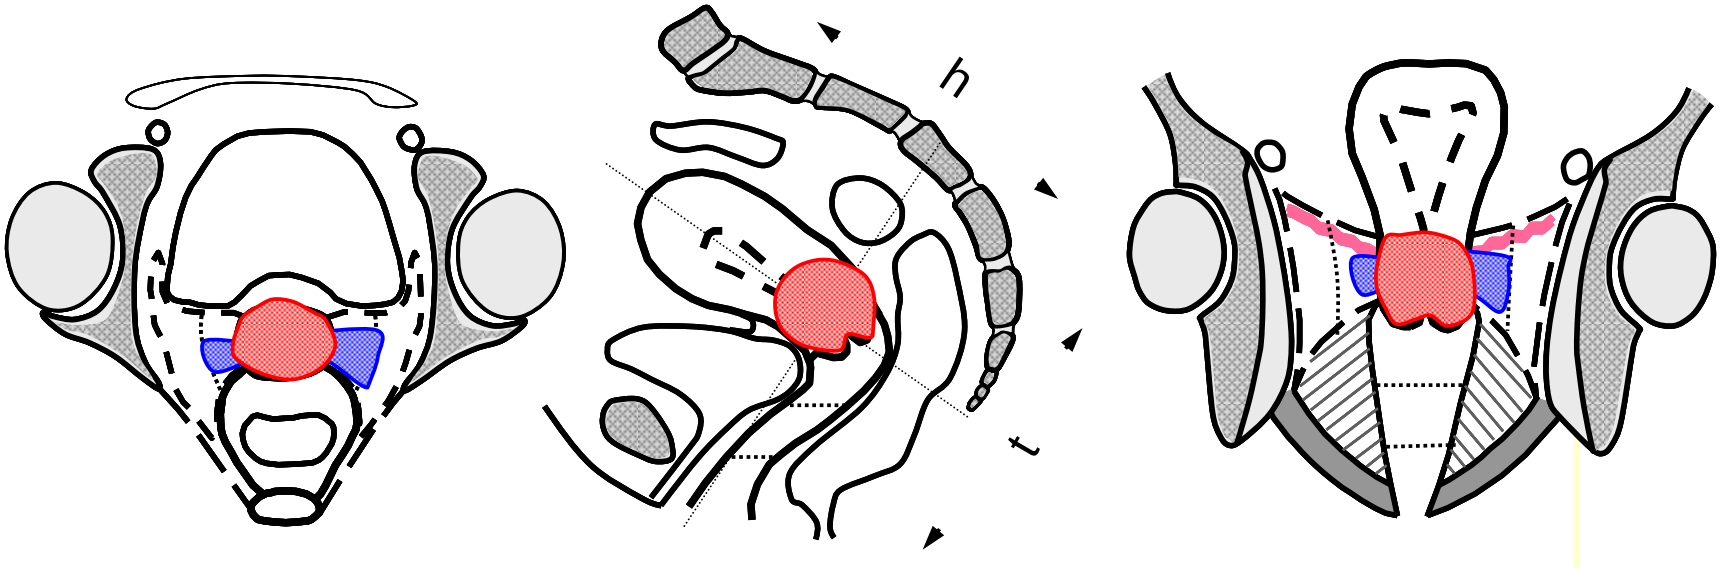
Example

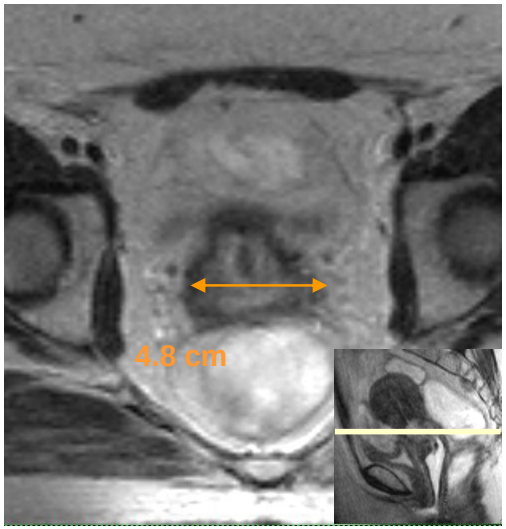
(Appendix case 5, ICRU 89)

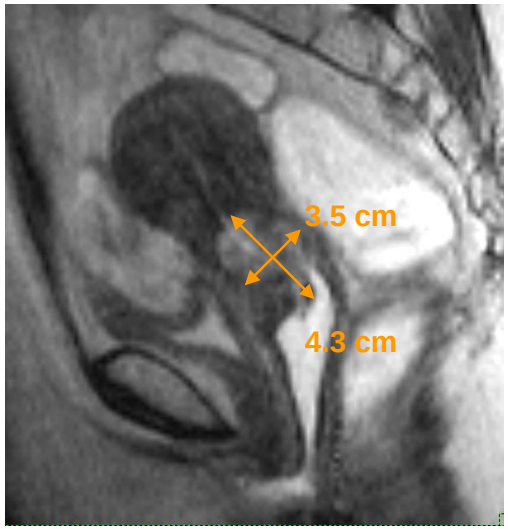
Table A.5.3. Treatment planning aim and prescribed doses.

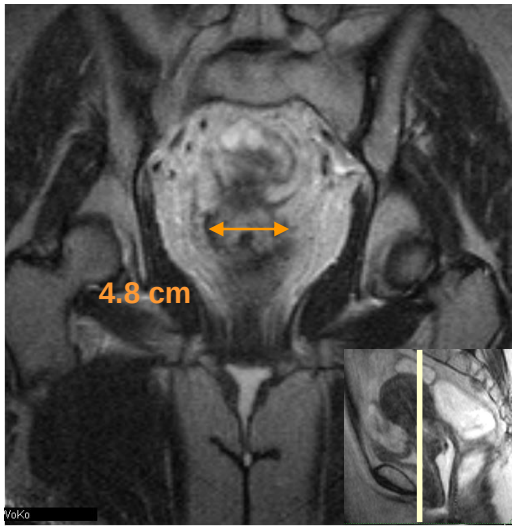
			Planning aim (Gy)	Prescribed dose (Gy)
CTV_{HR}	D_{90}	$EQD2_{10}$	≥85	92.3
Bladder	D_{2cm^3}	$EQD2_3$	≤90	80.6
Rectum	D_{2cm^3}	$EQD2_3$	≤70	64.3
Sigmoid	D_{2cm^3}	$EQD2_3$	≤75	51.7

Example – disease at BT (Appendix case 5, ICRU 89)









Example (Appendix case 5, ICRU 89)

Dimensions and volumes of GTVs and CTVs at diagnosis and at brachytherapy

		Diagnosis	BT1+2	BT3+4
Clinical dimensions GTV	w * t (mm)	60 *40	-	-
MRI dimensions GTV	w * t * h (mm)	55*40*45	35*35*43	35*35*43
MRI volume GTV	(cm^3)	52	33	33
Clinical dimensions CTV_{HR}	w * t (mm)	-	50*40	50*40
MRI dimensions CTV_{HR}	w * t * h (mm)	-	48*35*43	46*32*41
CTV_{HR}	(cm^3)	-	43	43

Learning Objectives (I)

- Understand the concepts and learn the terms
  of dose volume and dose point parameters
  for planning, prescribing, recording and reporting
  the GTV and the CTV doses for 3D IGABT;

- Understand the concepts and learn the terms
  of dose volume and dose point parameters
  for planning, prescribing, recording and reporting
  the OAR doses for 3D IGABT;

Learning Objectives (II)

- Be able to use brachytherapy related
  dose volume and dose point parameters
  for planning aims and dose prescription
  for GTV, CTV, and the relevant OARs in IGABT.

Applicator Reconstruction, geometry and image fusion

Swamidas V Jamema PhD,

Tata Memorial Hospital, Mumbai, India

svjamema@gmail.com

Localization techniques

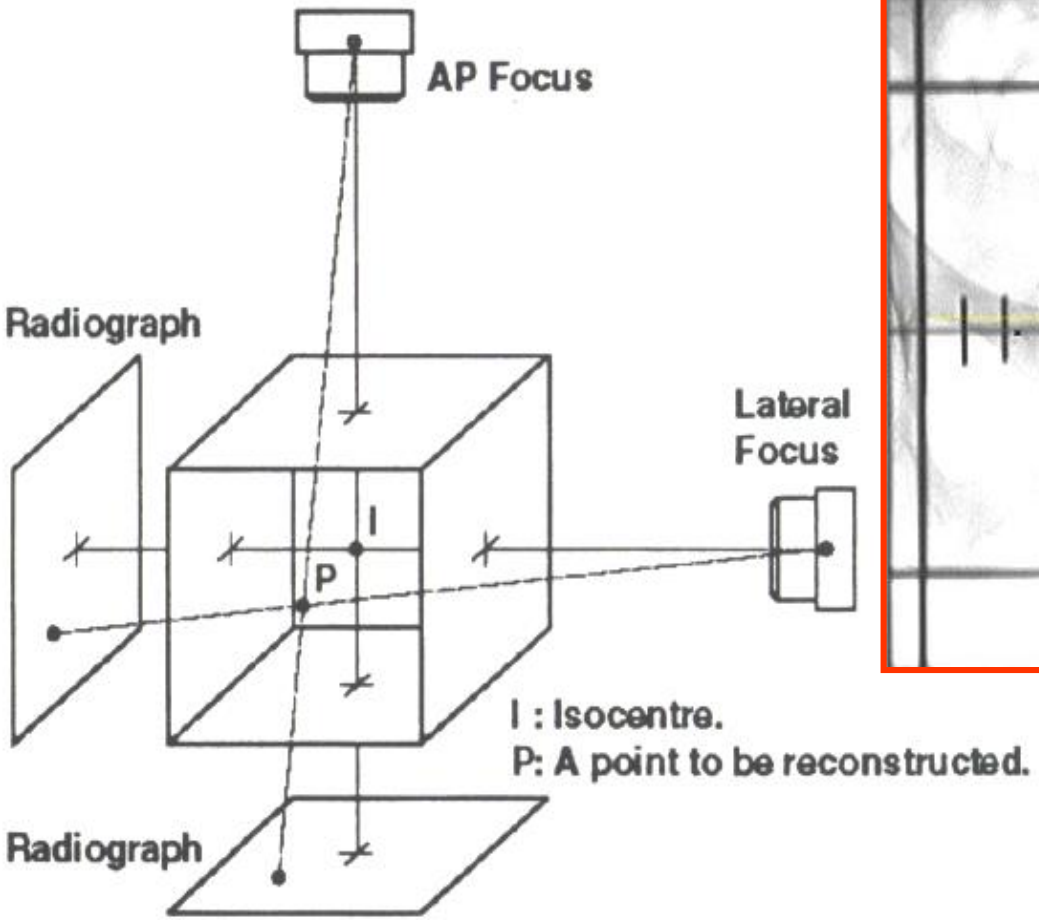
Conventional simulator, C-arm

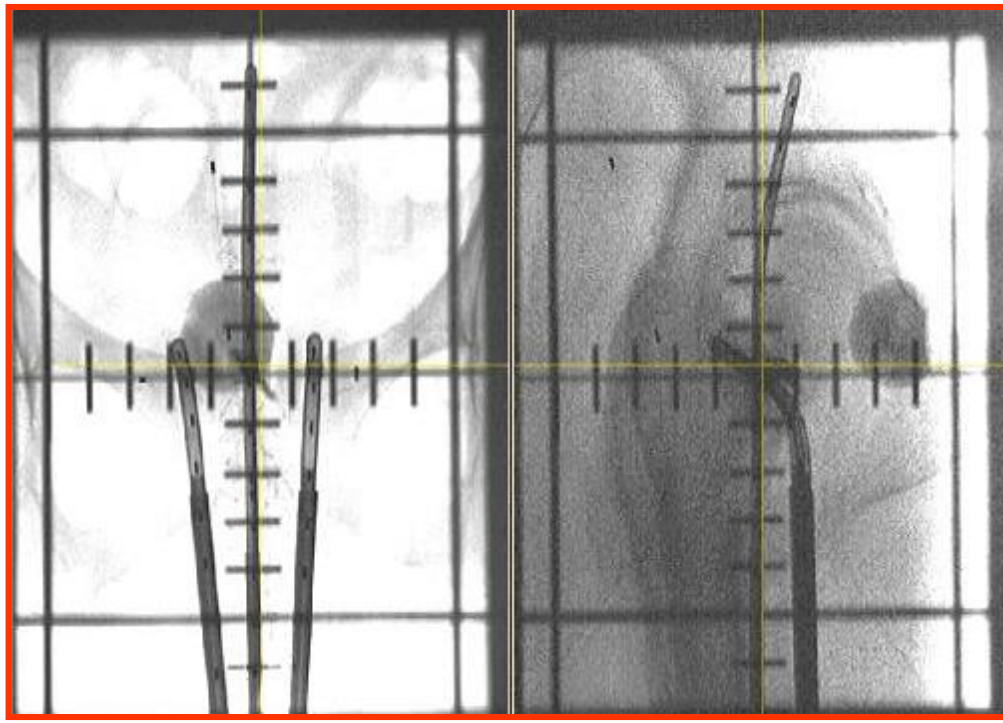
- Orthogonal images
- Semi-orthogonal
- Variable angle
- Stereo-shift

3D sectional images

- CT
- MR

Orthogonal images





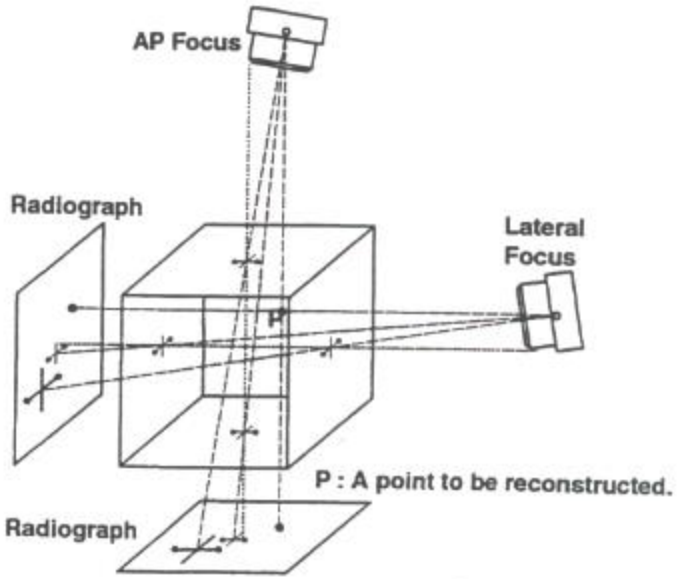
From: Plato user manual

- Magnification = FFD/FAD
- Markers locked
- may not be useful for Ring applicators

Semi-orthogonal

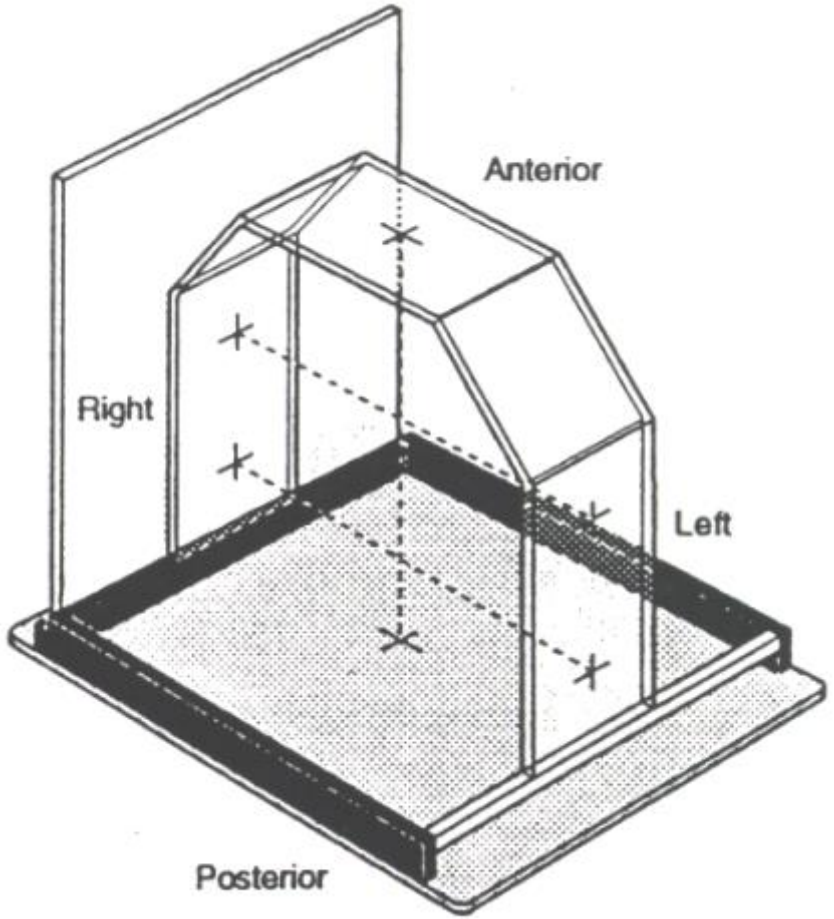
Note

If there is only a portable or mobile radiographic unit available, the semi-orthogonal reconstruction method is the only technique for treatment planning .



Reconstruction Box

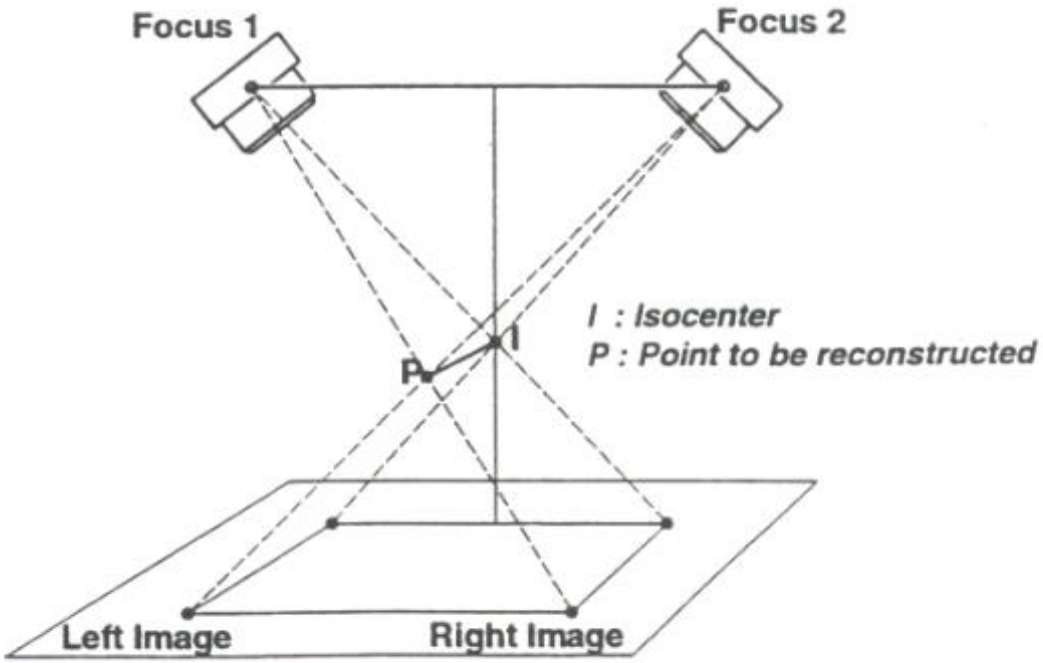
The reconstruction box is constructed with radiopaque initials AP and LAT within the appropriate sides of the box. These initials will appear on the radiograph as a large AP image which corresponds



From: Plato user manual

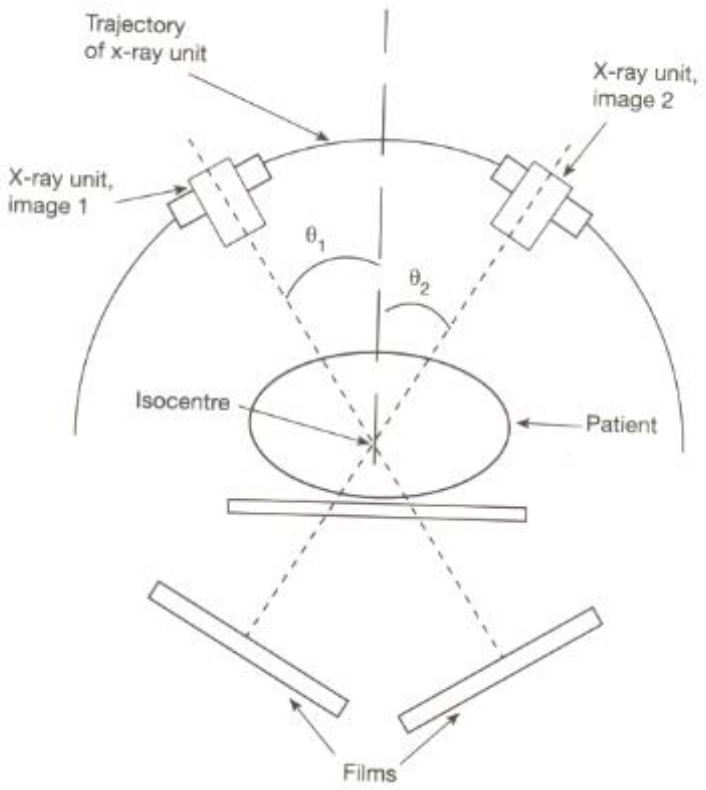
Stereo-shift

This method is particularly useful
when only an X-ray unit is available for localization

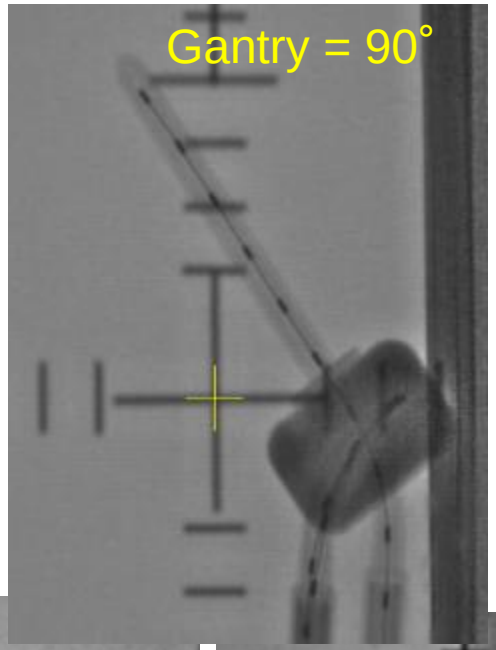


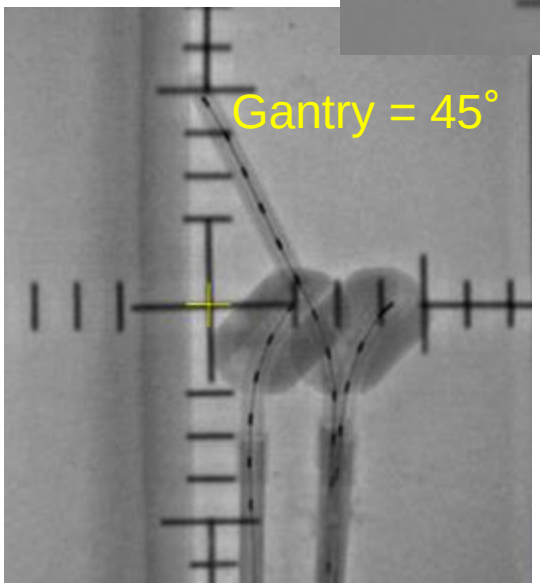
From: Plato user manual

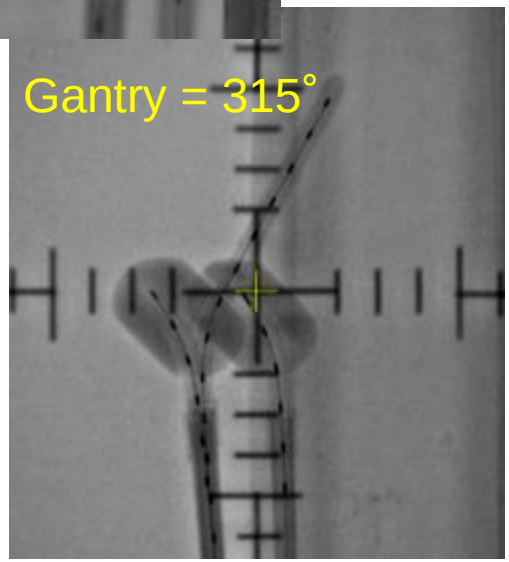
Variable angle



From: Thomadsen “Achieving quality in brachytherapy”, IoP 2000







Reconstruction

- Library plans
- Direct reconstruction
- New reconstruction method

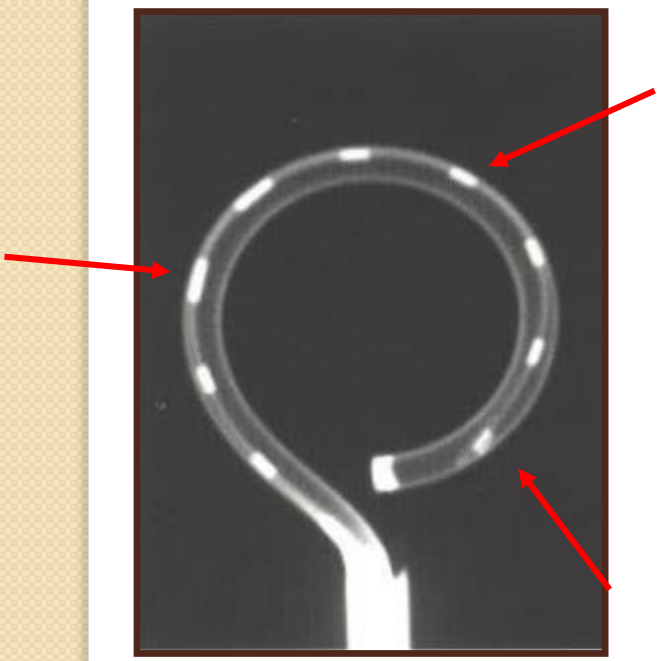
Library plans

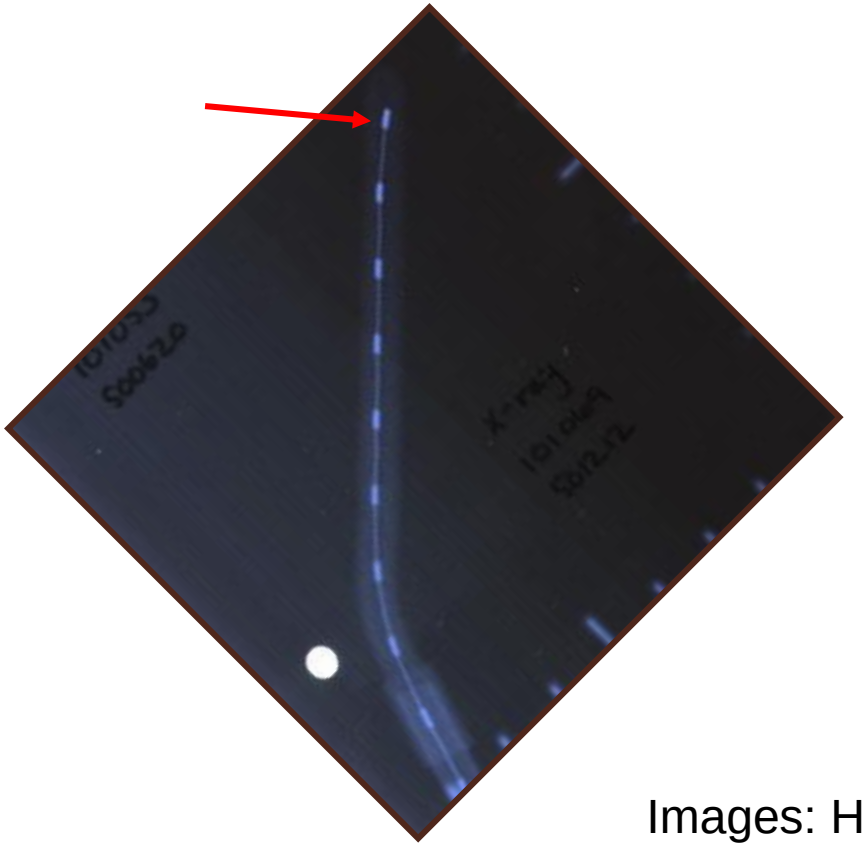
- Accurate compared to other methods
- Used only for rigid applicators (ring)
- A pre-defined library file with the source path geometry is used and imported into the clinical image set.
- Well defined points should be used to merge with the co ordinate system

Producing library plans – 2D radiographs

Needs minimum three well defined points that can be easily recognized in the clinical images.
Points on the x-ray catheters are often used

Example:

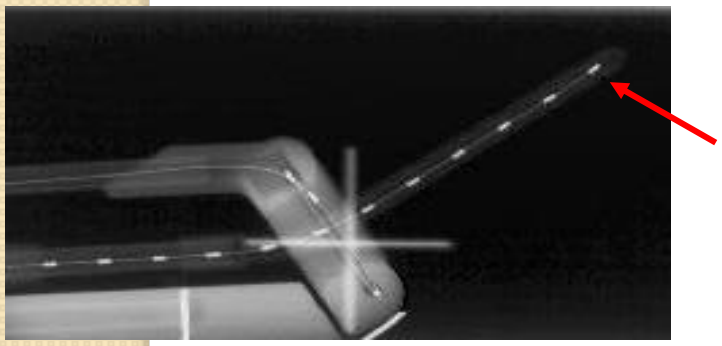


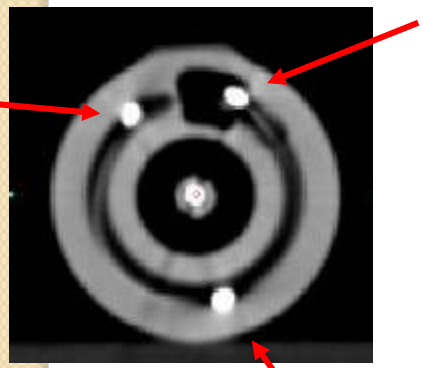


Images: Hellebust

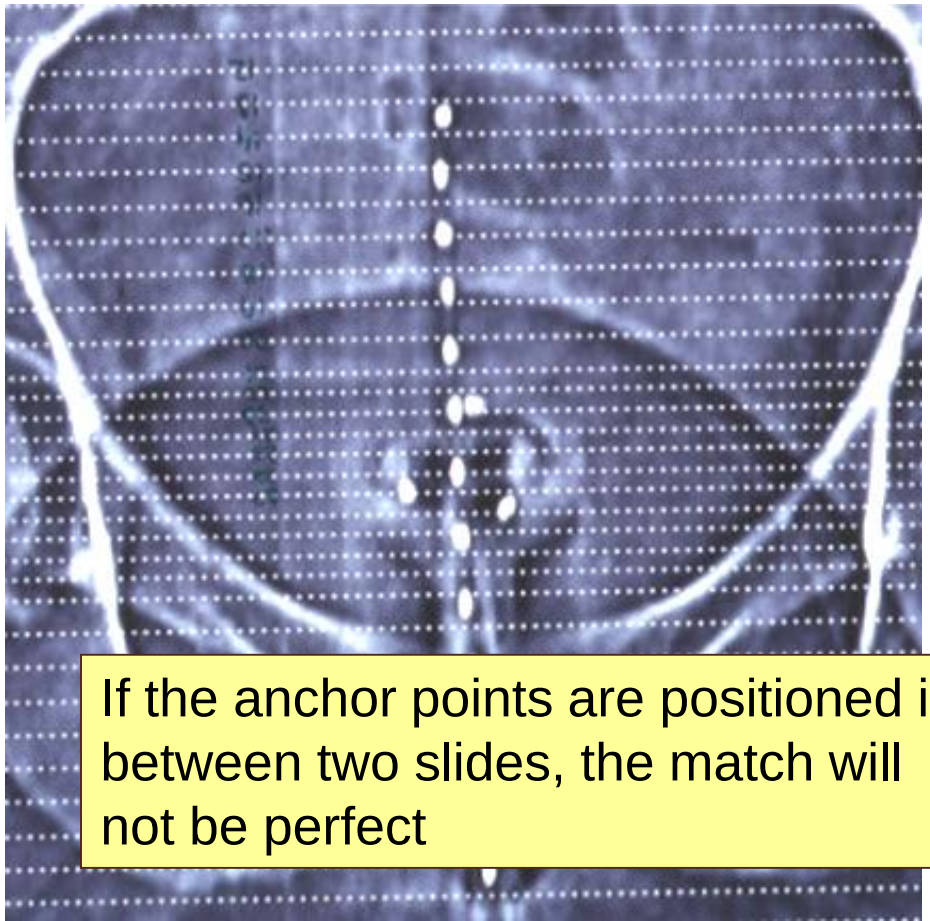
Library plans – 3D sectional images

Requires minimum three well defined points (anchor points) to position the applicator in the 3D study





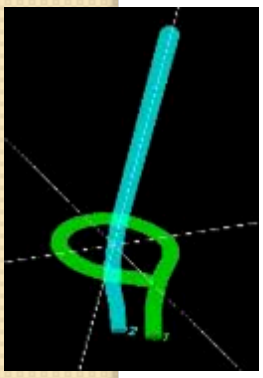
Ack: Hellebust TP

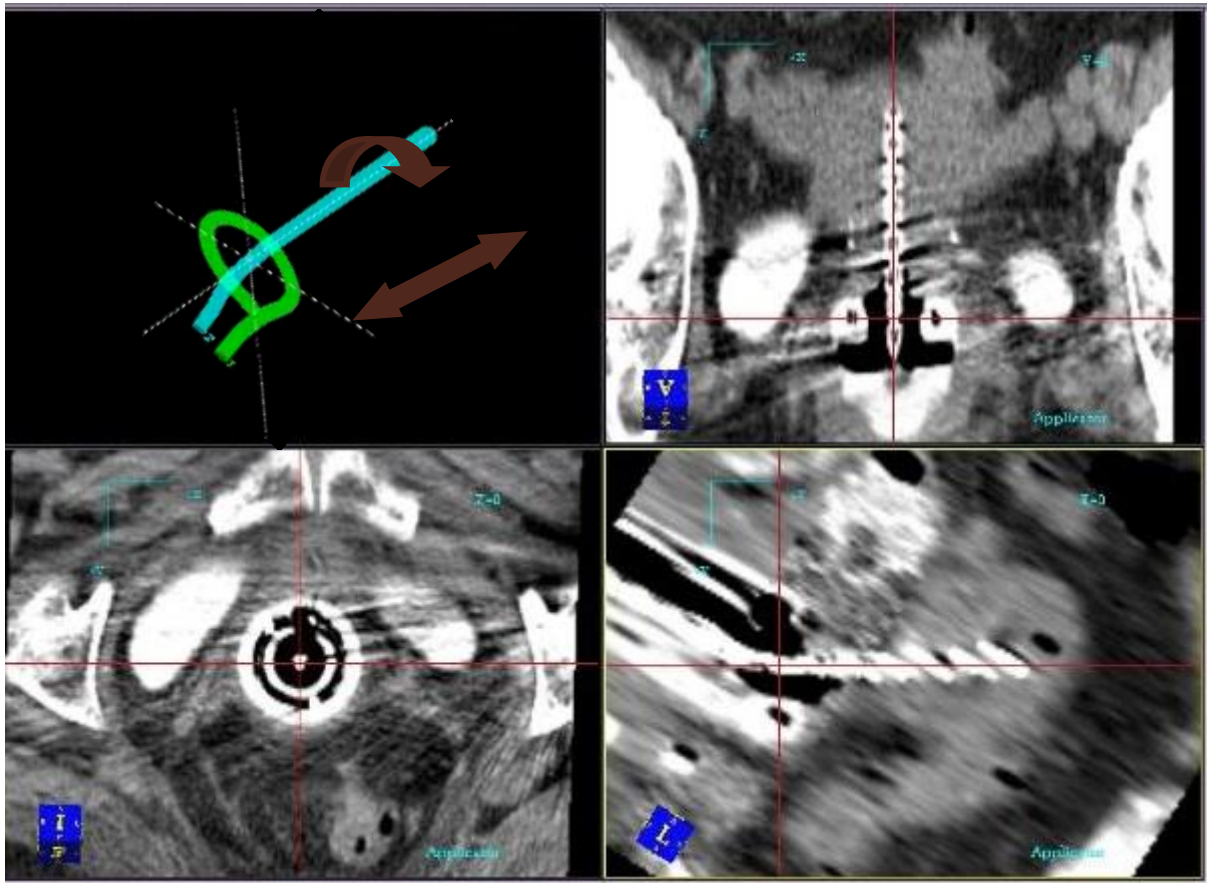


If the anchor points are positioned in between two slides, the match will not be perfect

Library plans – An advantage in image based planning

A facility to rotate and translate the applicator in the 3D study is more optimal

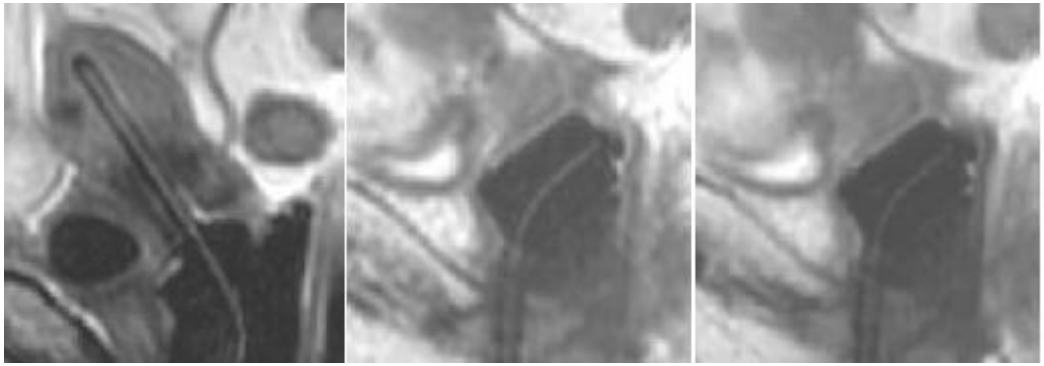




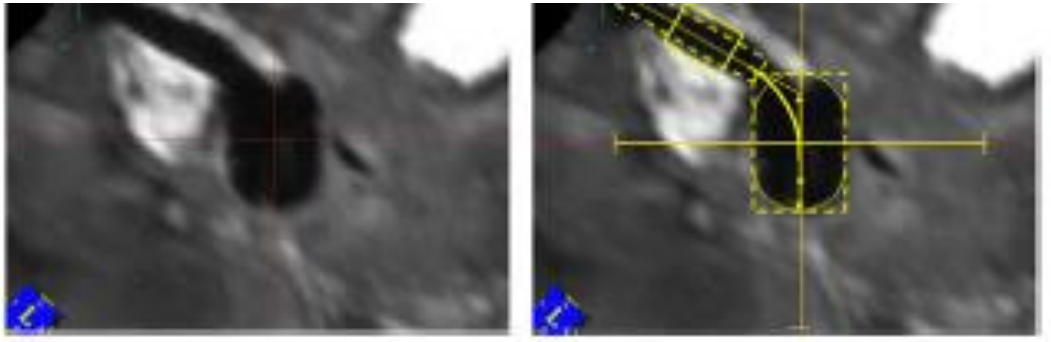
Ack: Hellebust TP

Applicator reconstruction – MPR

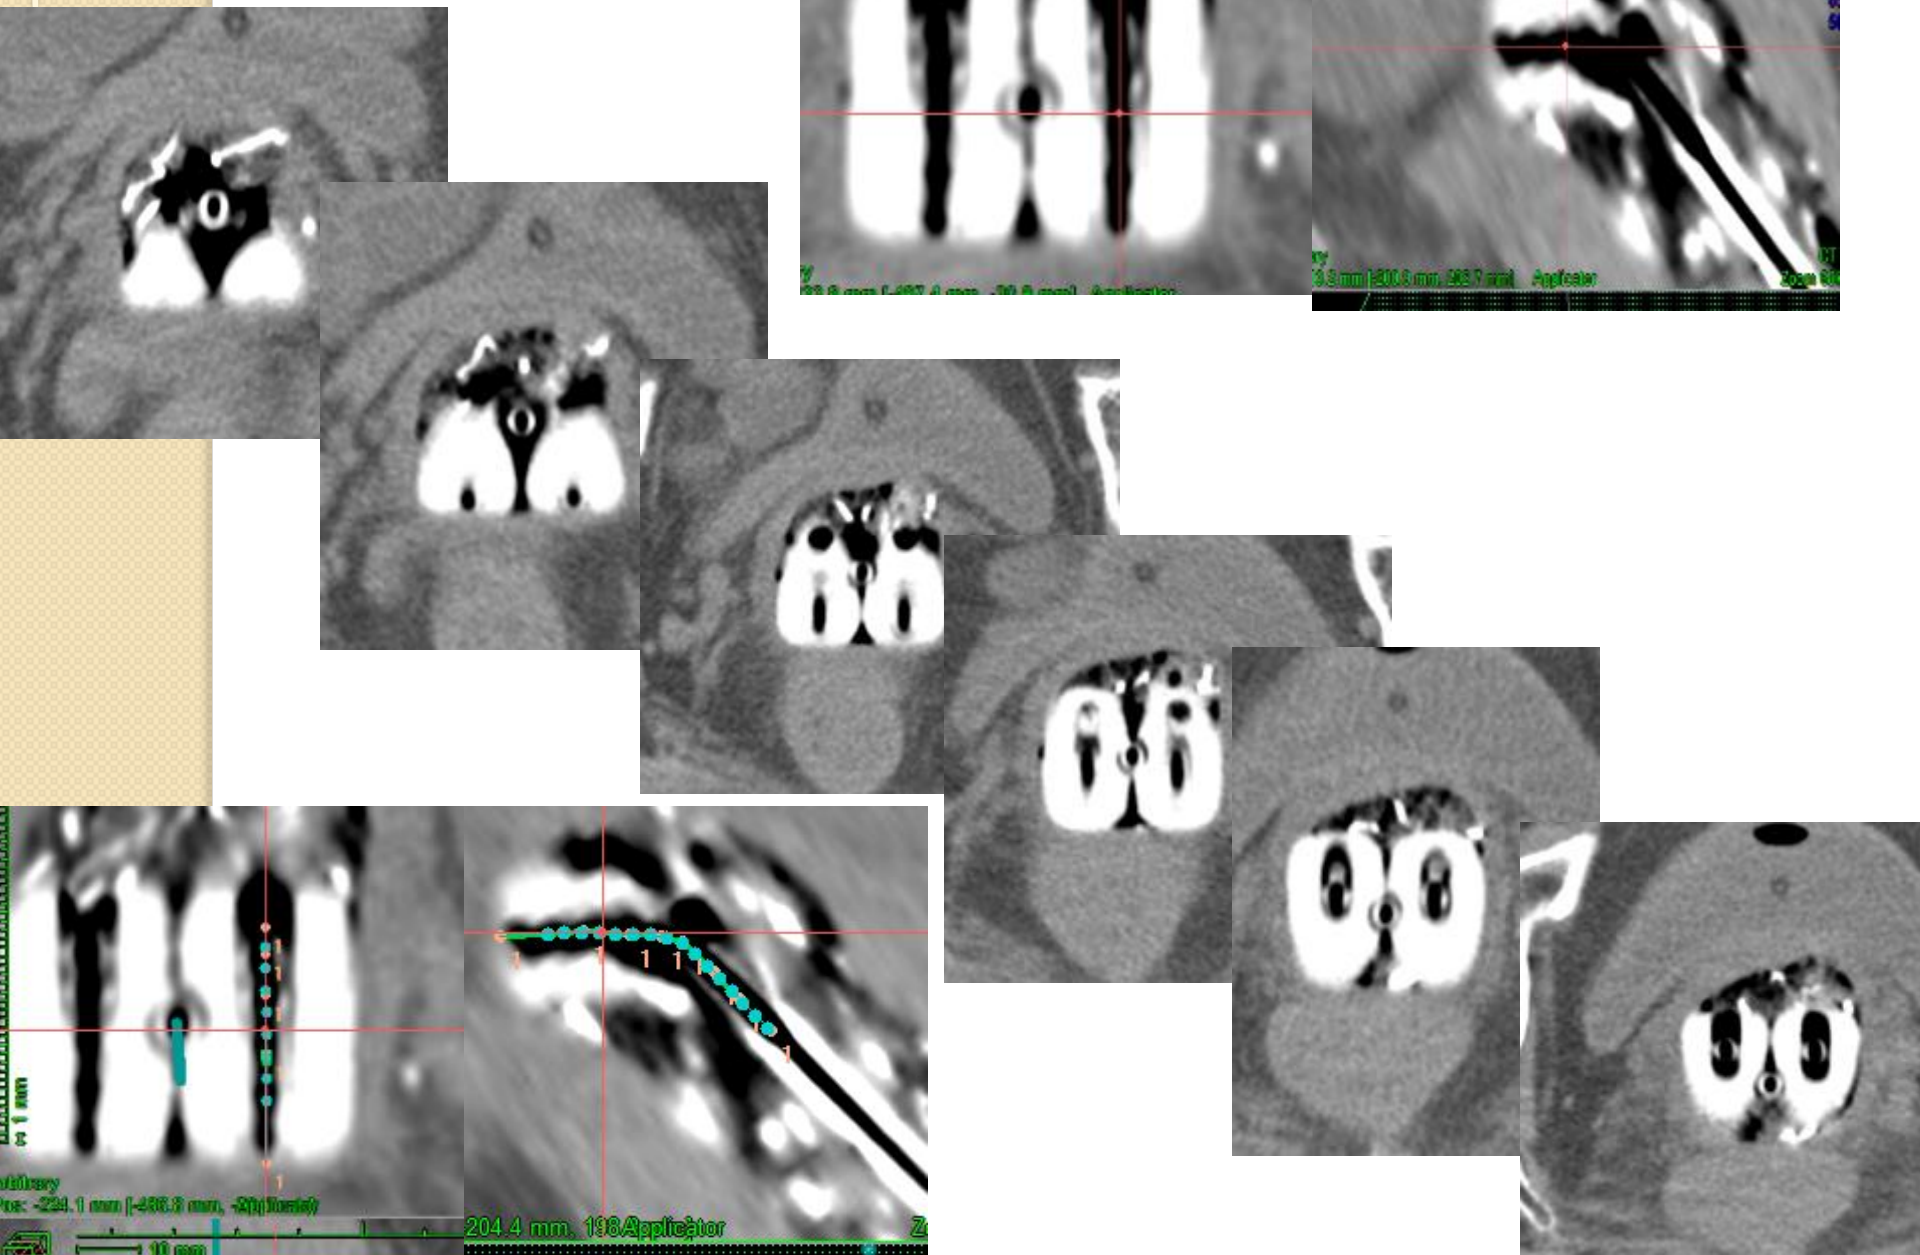
- Clear visualization of the source channels in a single plane.
- Check the geometry of the applicator verified during commissioning.
- Especially useful for curved applicators (ovoid/ring)



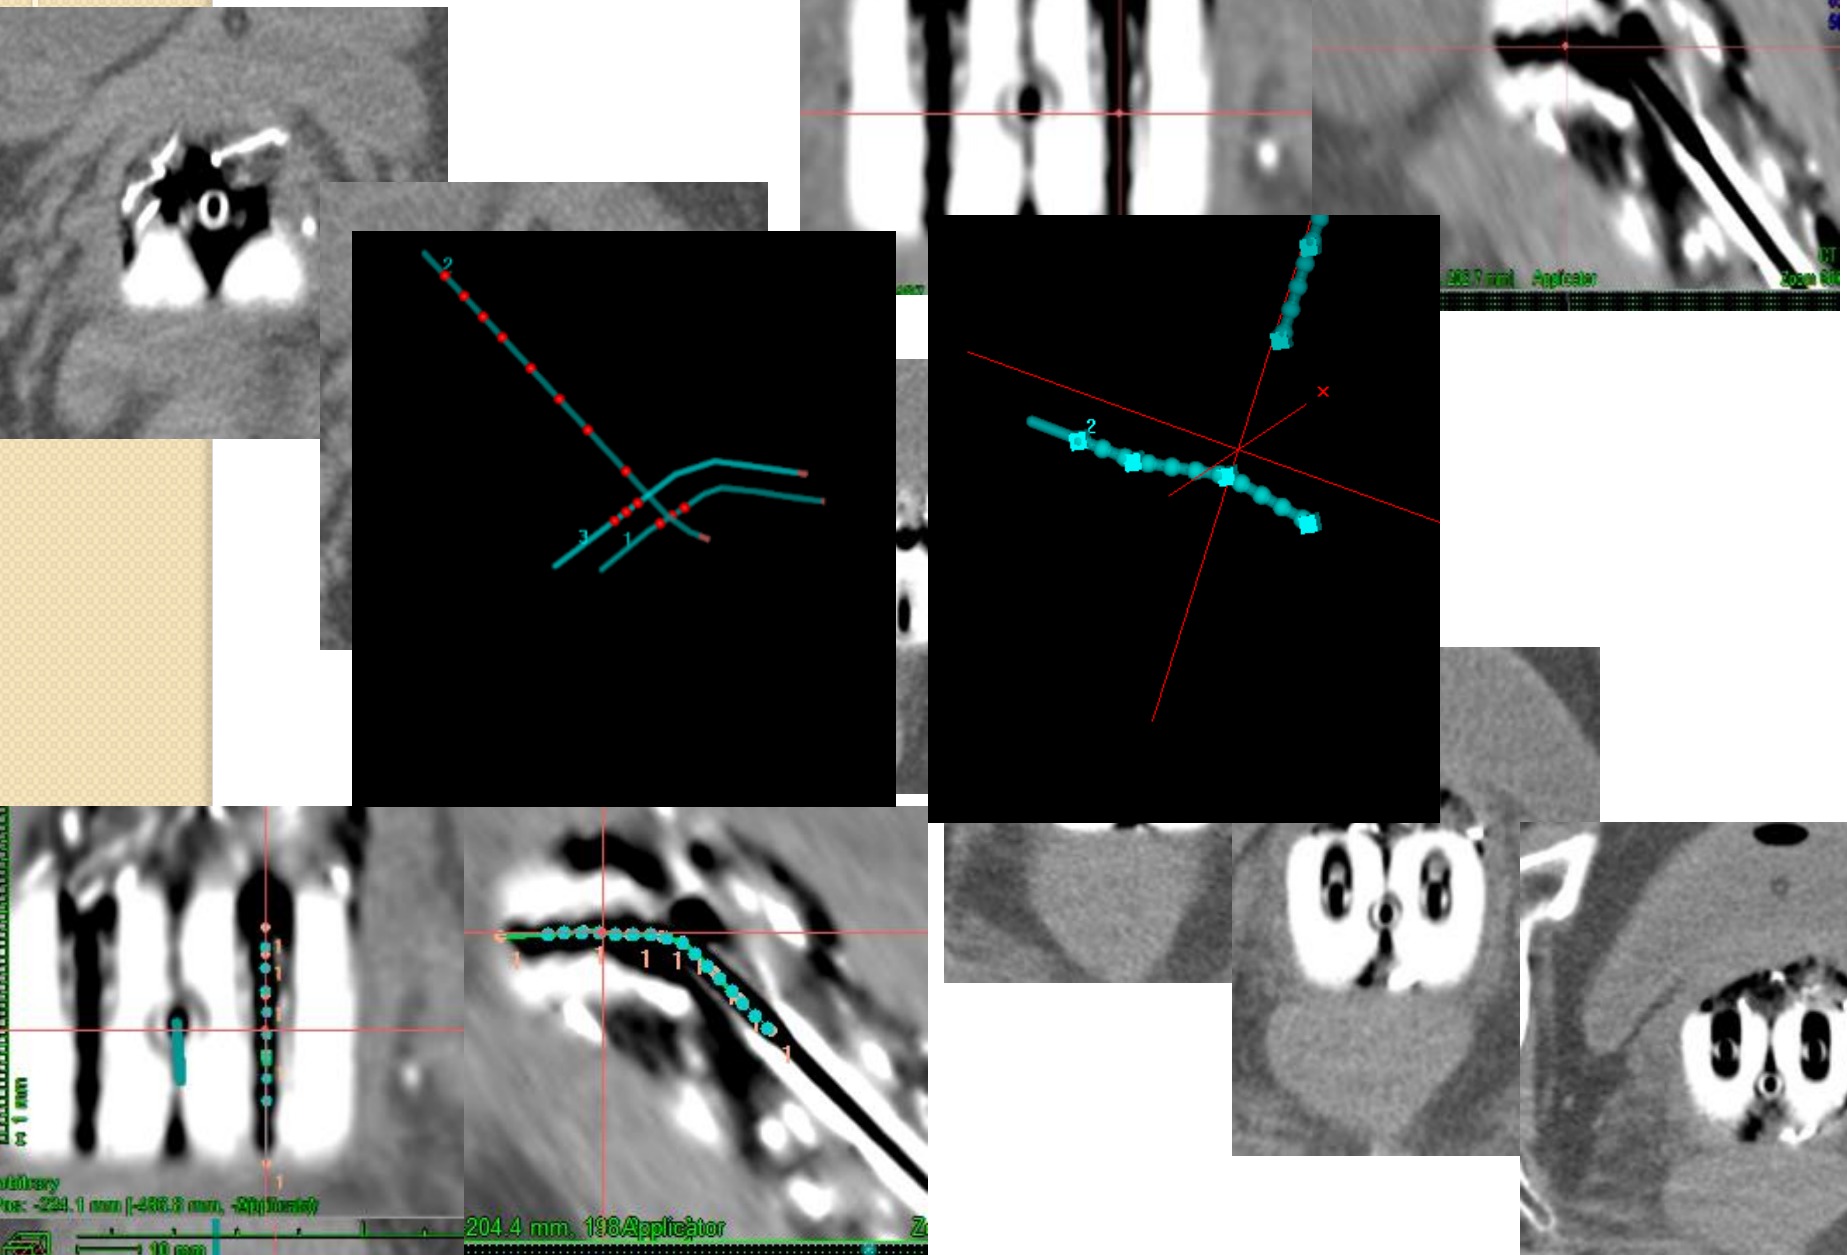
Leeuw et al, RO,2009



MPR- T/O

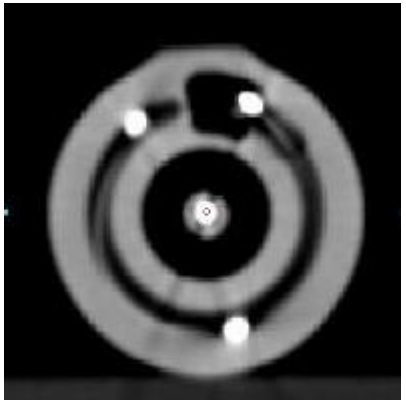


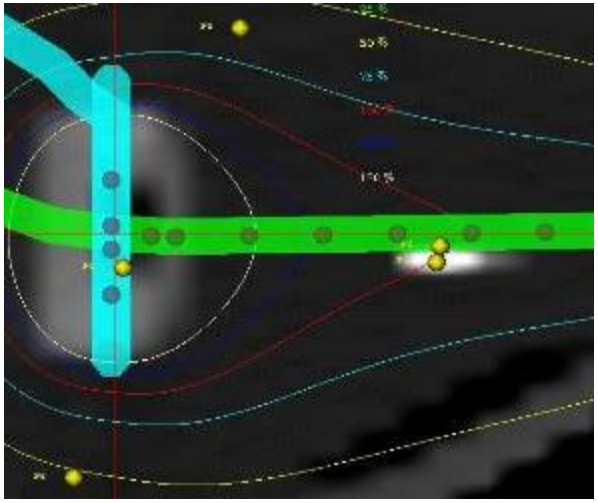
MPR – T/O



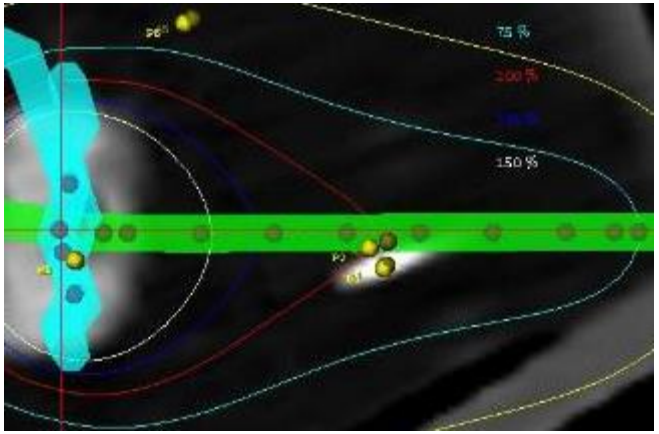
MPR- Ring

Ring in one slice





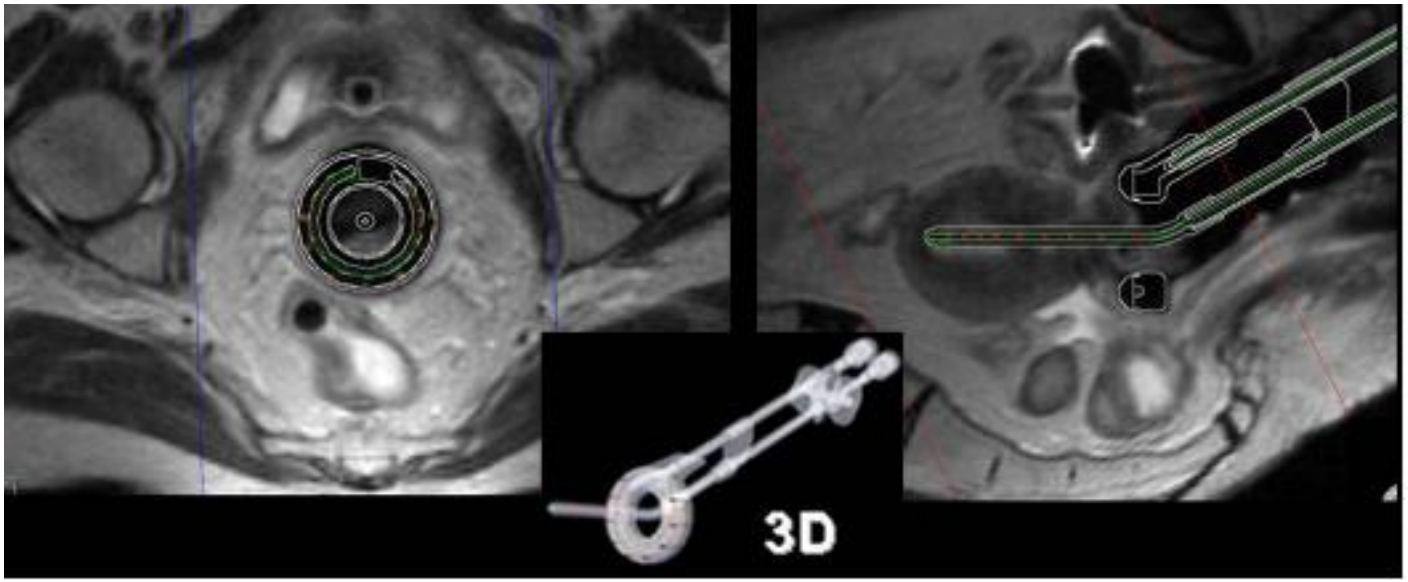
Ring in several slices



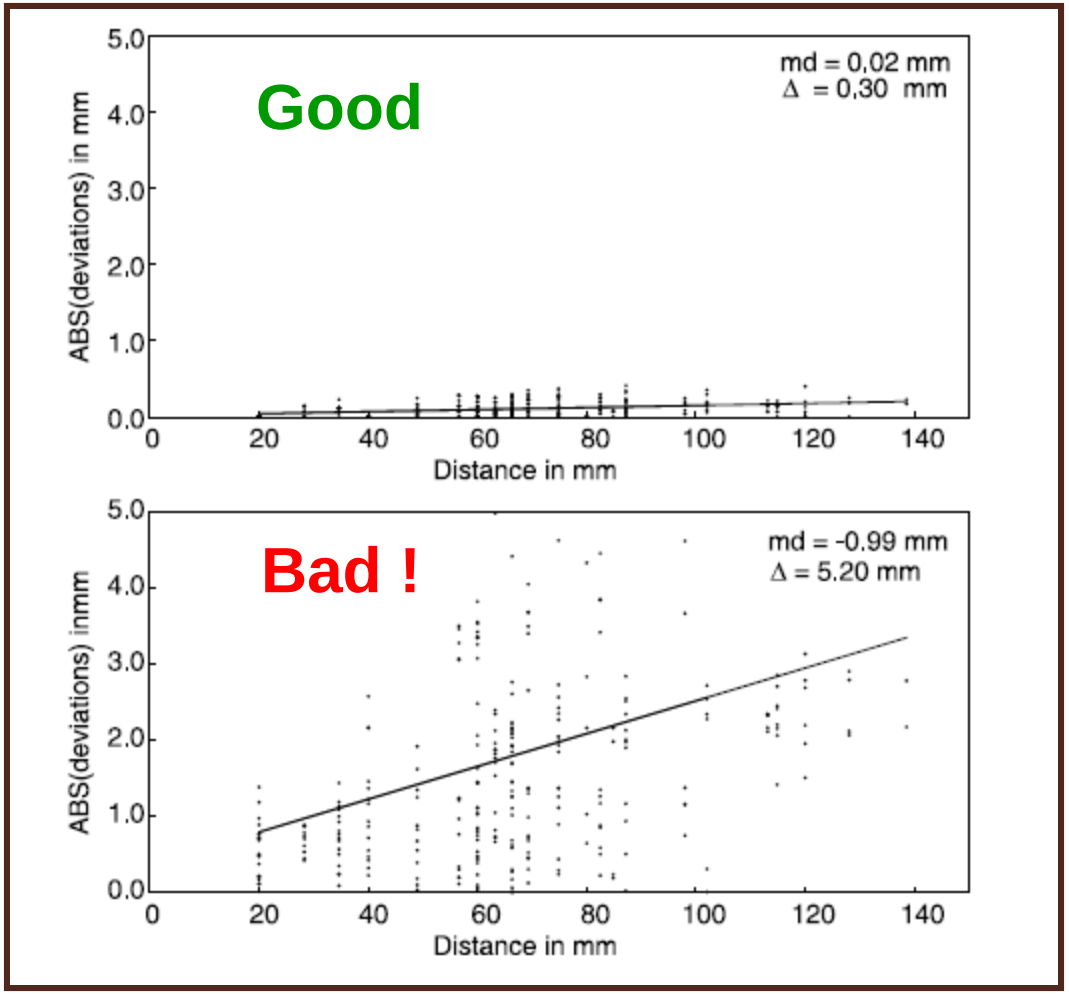
Ack: Hellebust

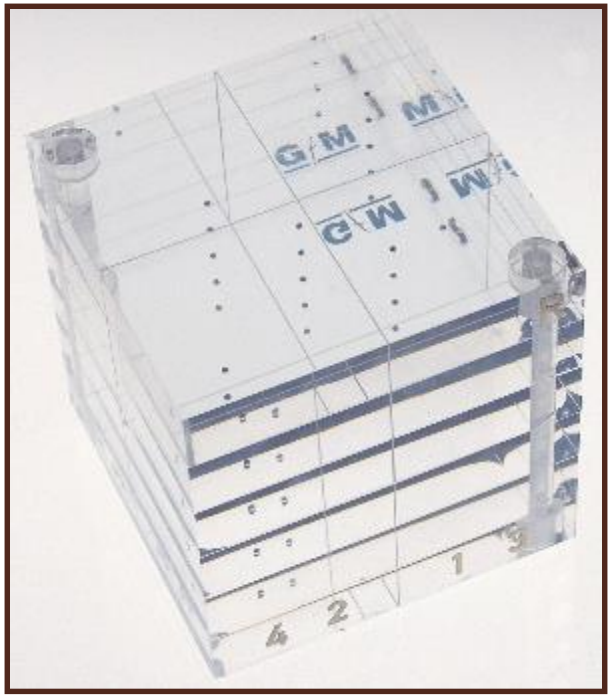
Applicator reconstruction – new method

- Some TPSs contain an applicator library which includes information about the physical outer applicator dimensions, an applicator file can be imported and rotated and translated until it matches the black area in the patient MR images
- Fast, simple, and less prone to reconstruction errors.



Localization – Quality Assurance



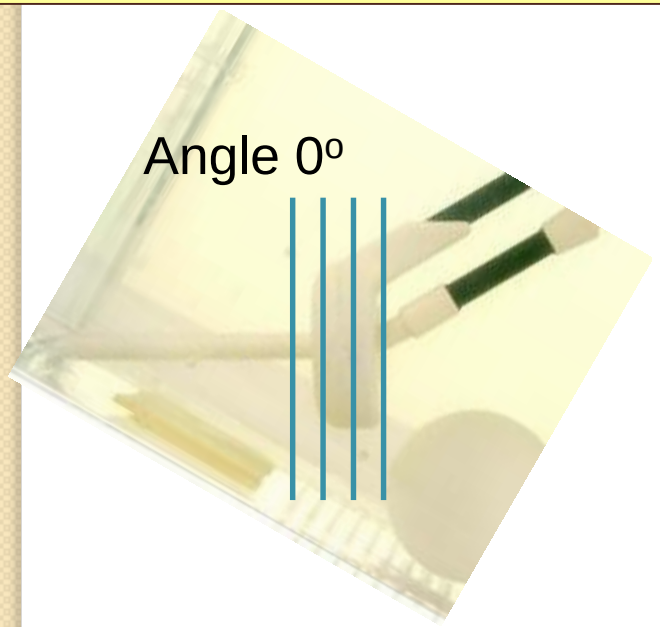


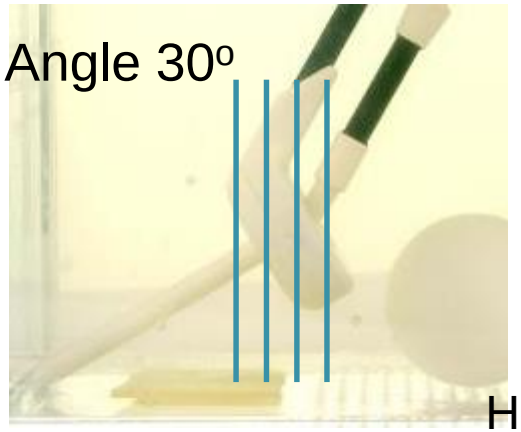
Roué A et al ESTRO-EQUAL audit on geometric reconstruction, R&O, 2006

Reconstruction accuracy, CT

Phantom filled with gel and a ring applicator set, six lead pellets and a table tennis ball

CT scan of the phantom with four different angles





Hellebust et al

Reconstruction accuracy

The ring applicator was reconstructed using three different methods:

- Library plan (LIB) (the markers on the x-ray catheter were used as matching points)
- Reconstructing directly from the CT images (DR)
- Digitising from Multi Planar Reconstruction images (MPR)

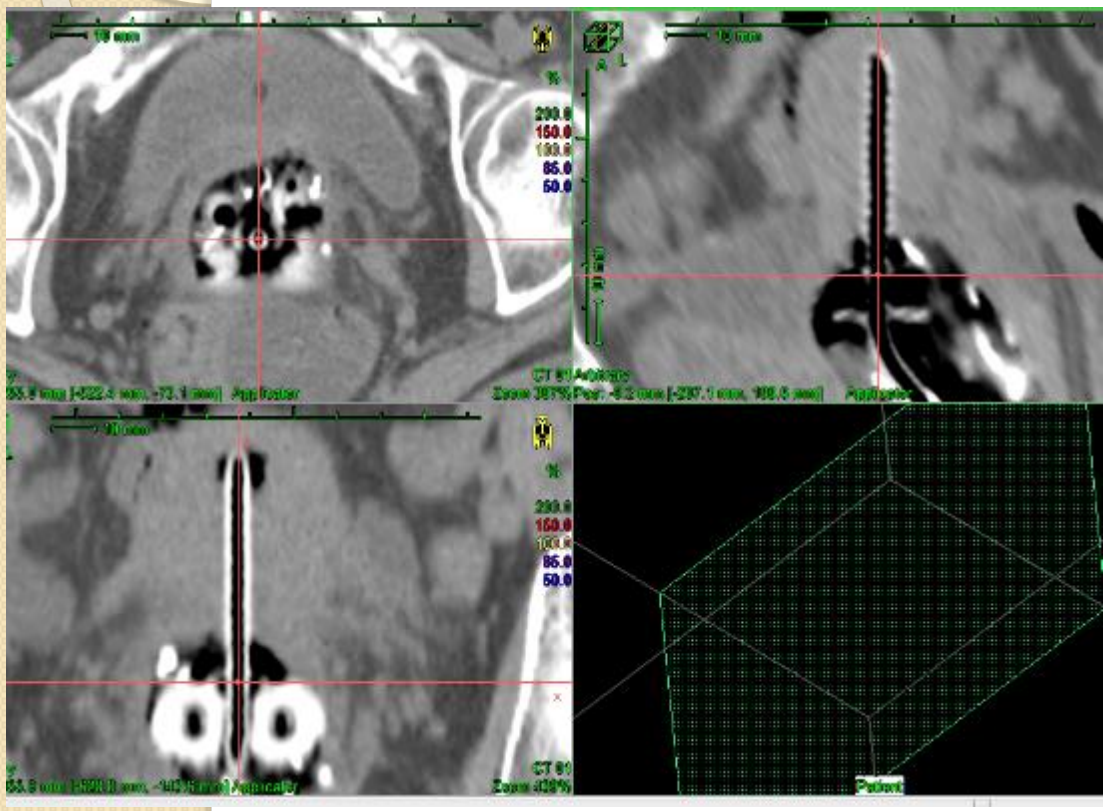
Accuracy, reconstruction method

Point	DR	MPR	LIB
P1	1.27	1.07	0.85
P2	1.63	1.49	1.43
P3	3.70	2.12	2.22
P4	2.82	2.06	1.65
P5	2.16	1.75	2.12
P6	2.78	1.90	1.47

Relative standard deviation

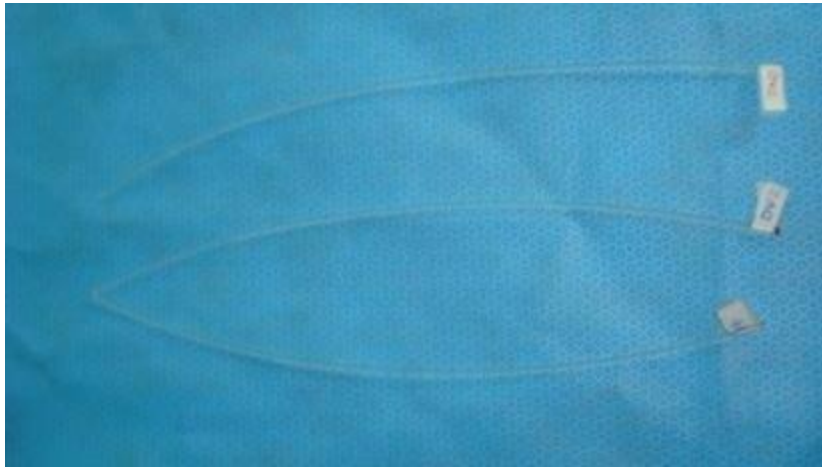
Hellebust et al, PMB 52 (2007)

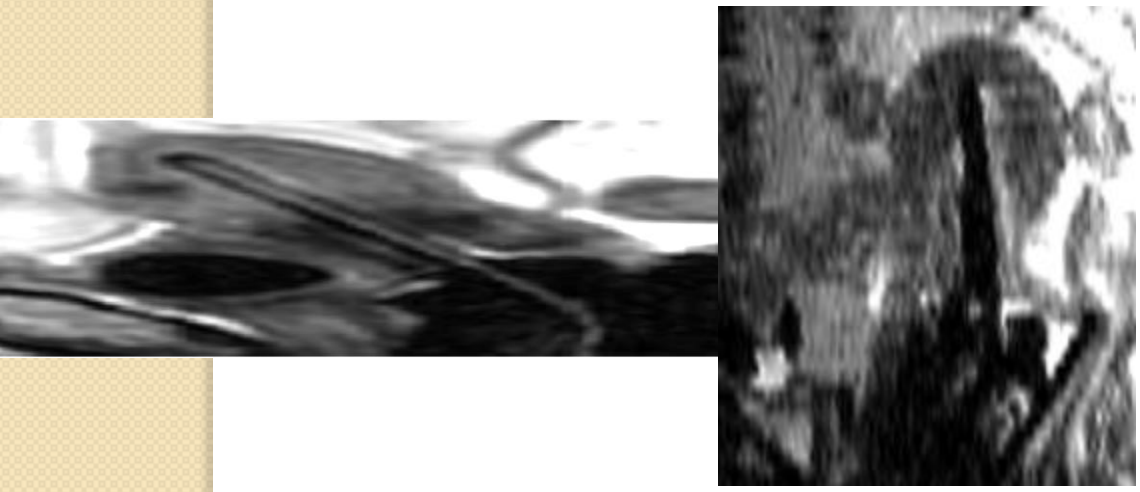
Applicator reconstruction using CT images



- Easy to visualize source channel
- Need not use the marker

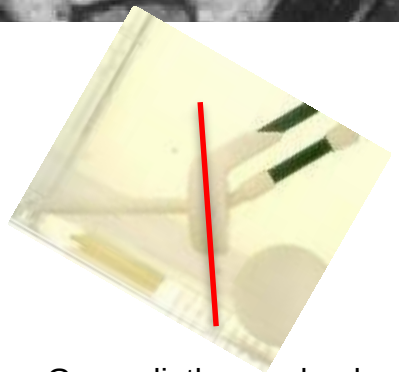
Applicator reconstruction using MR images





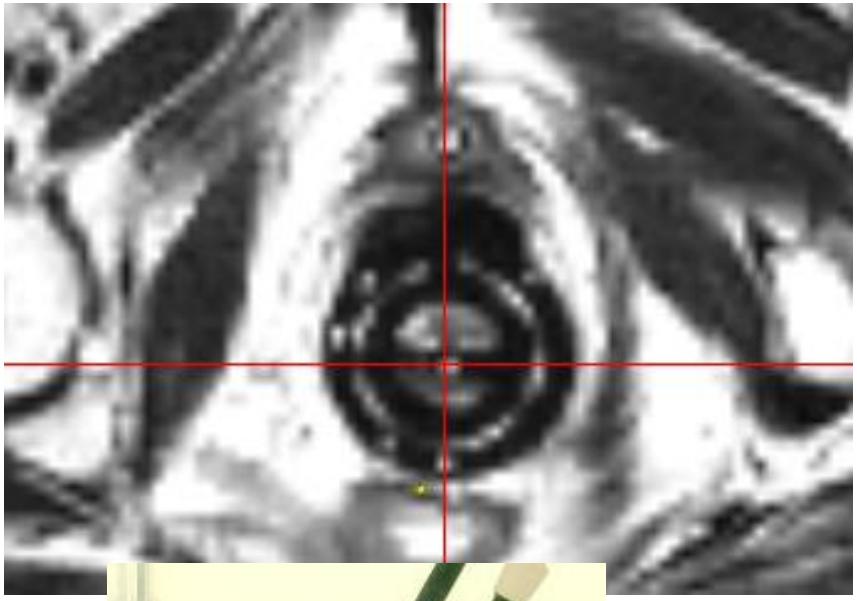
Applicator reconstruction using MR images

- Para transverse



From Gyn radiotherapy book,
Editor: A viswanathan,
Kirisits C, Erickson B, Potter P

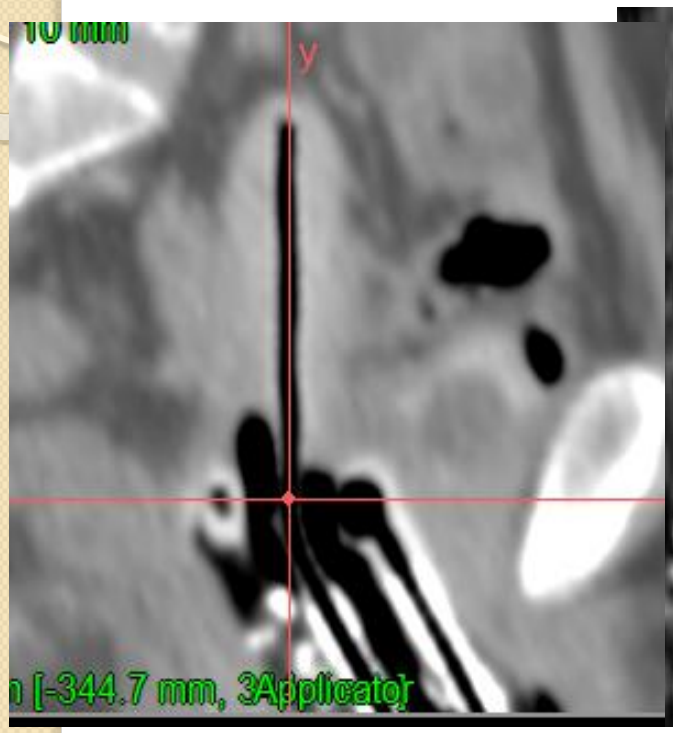
- Transverse (MP Reconstructed)

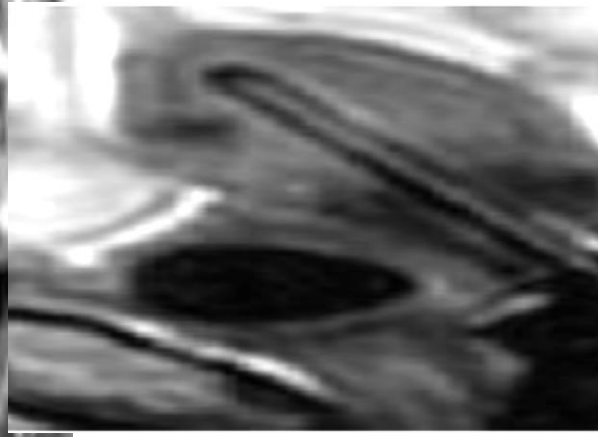


Application of registration in Brachytherapy

- Applicator reconstruction
- Target volume delineation- Transfer of volumes
  - MR to CT
  - MR(T2) to MR(T1)

Role of registration: applicator Reconstruction





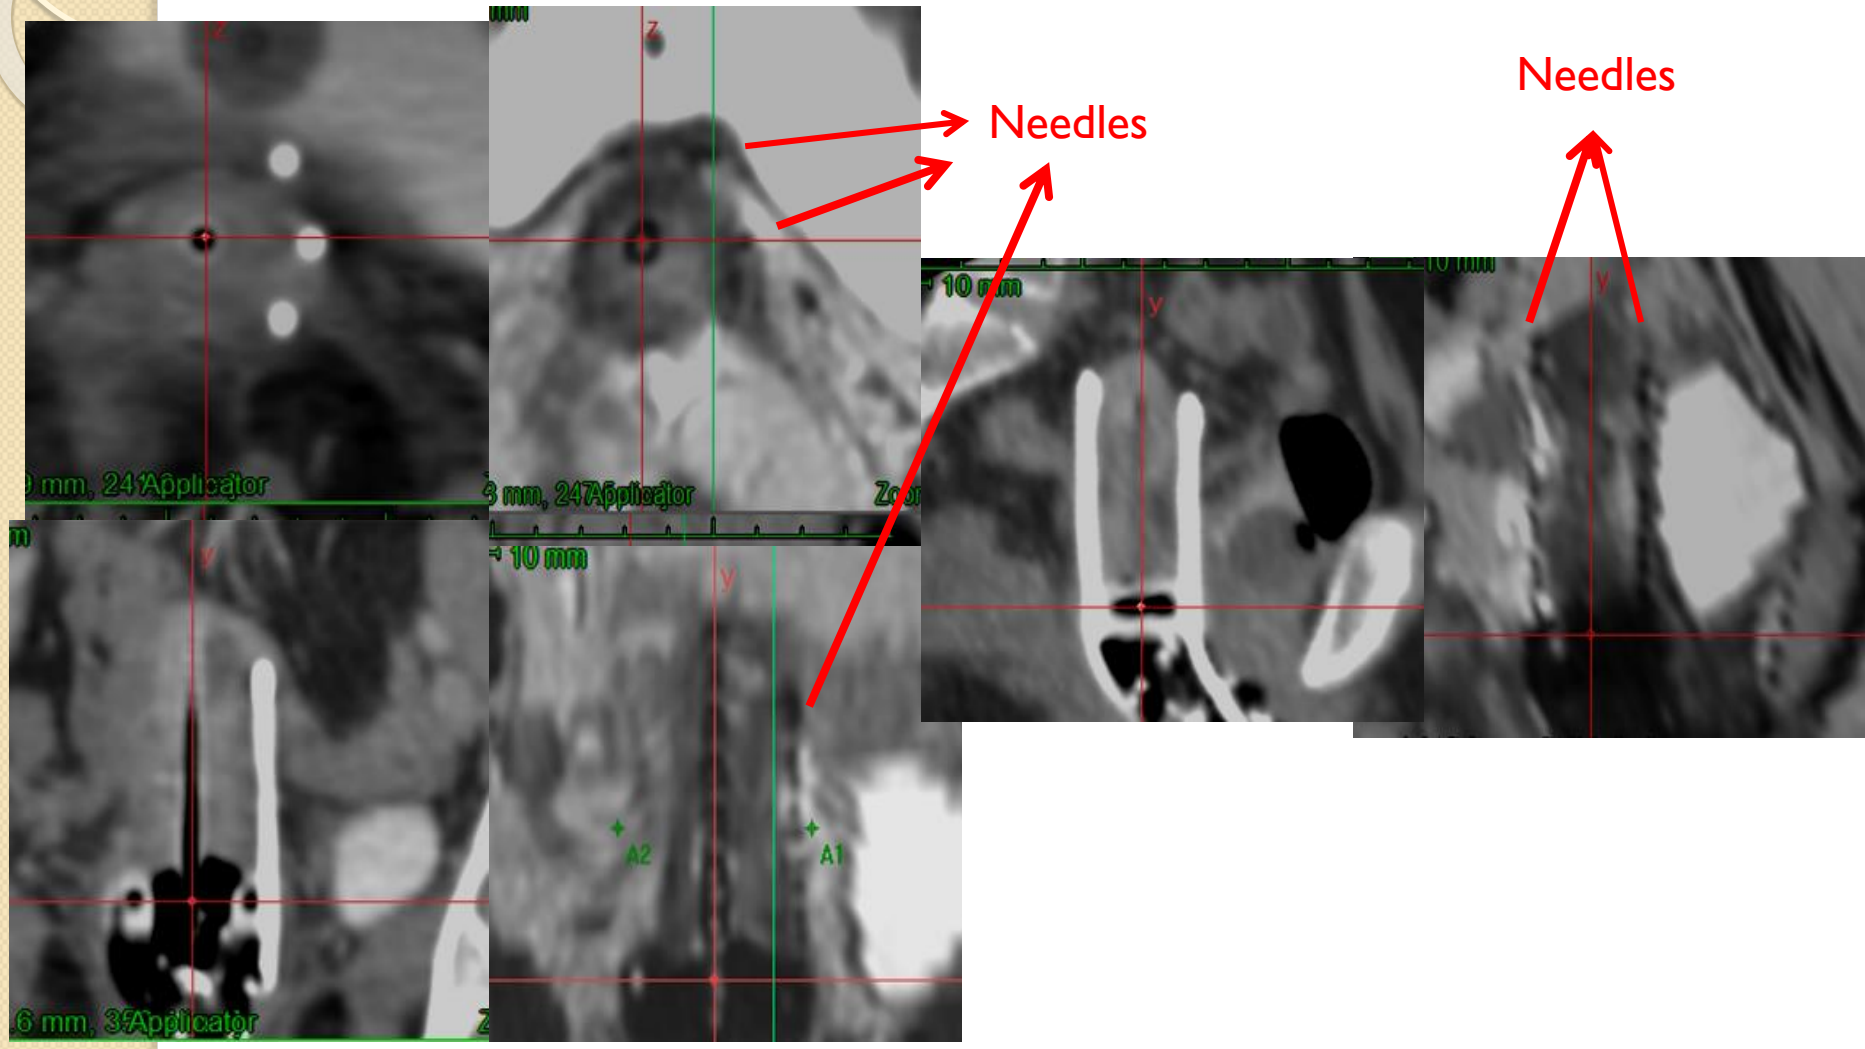
CT – No marker

MR – No marker

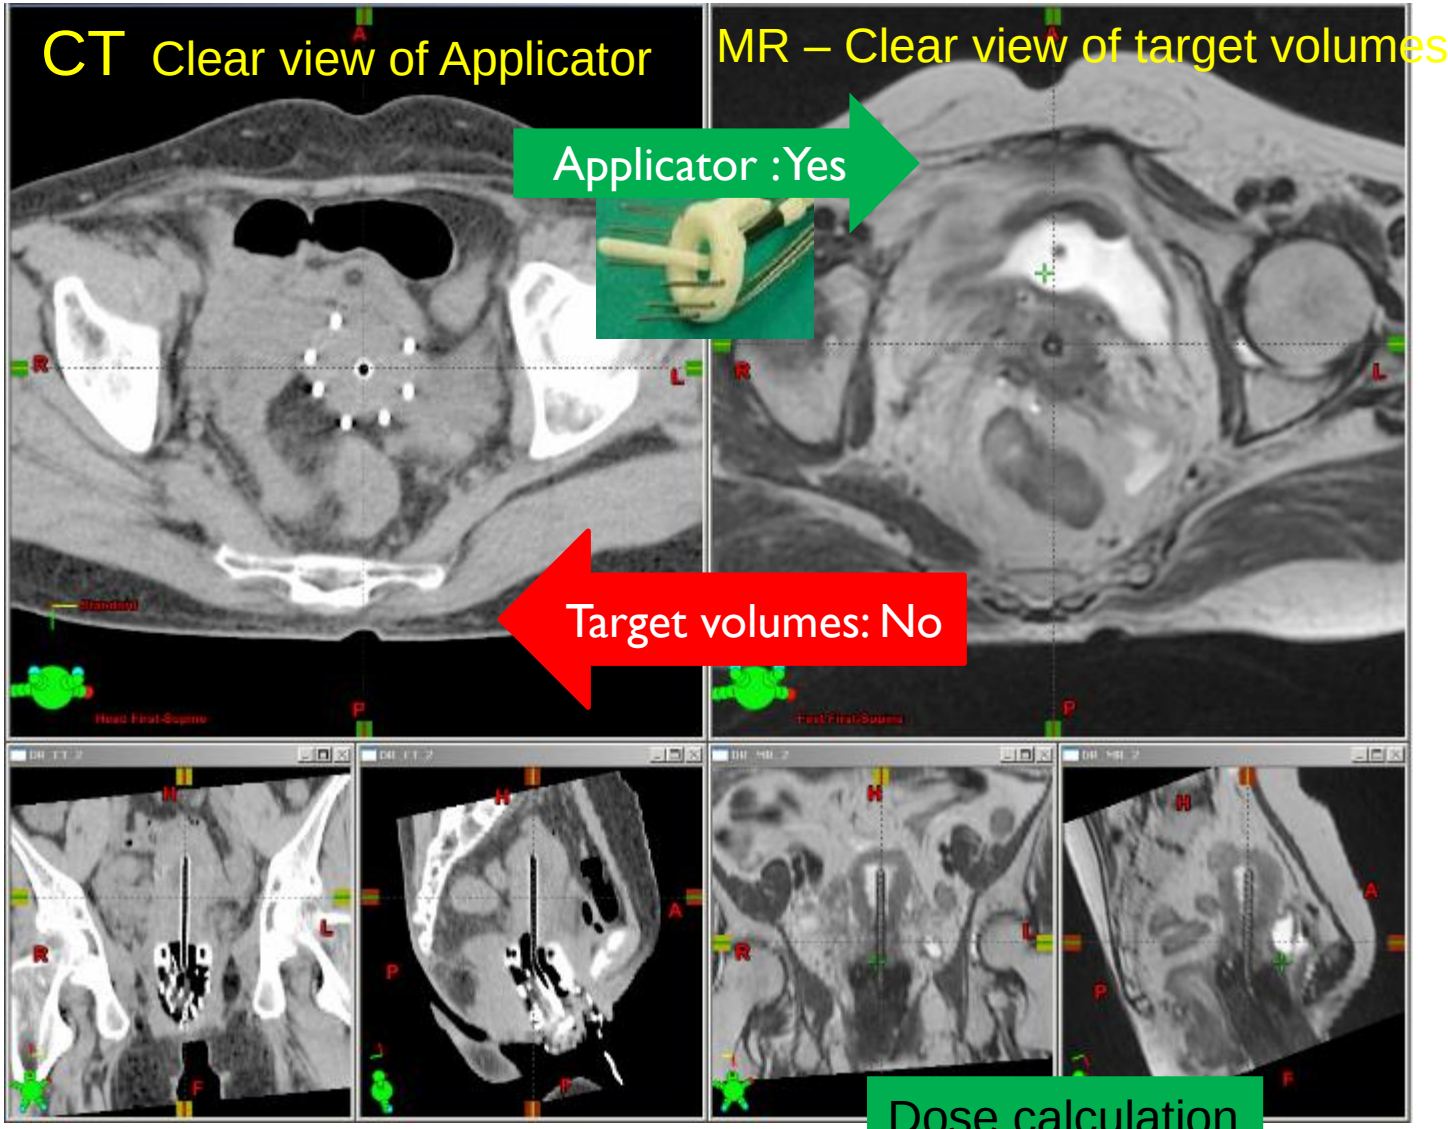
MR – Water marker

Role of registration: applicator

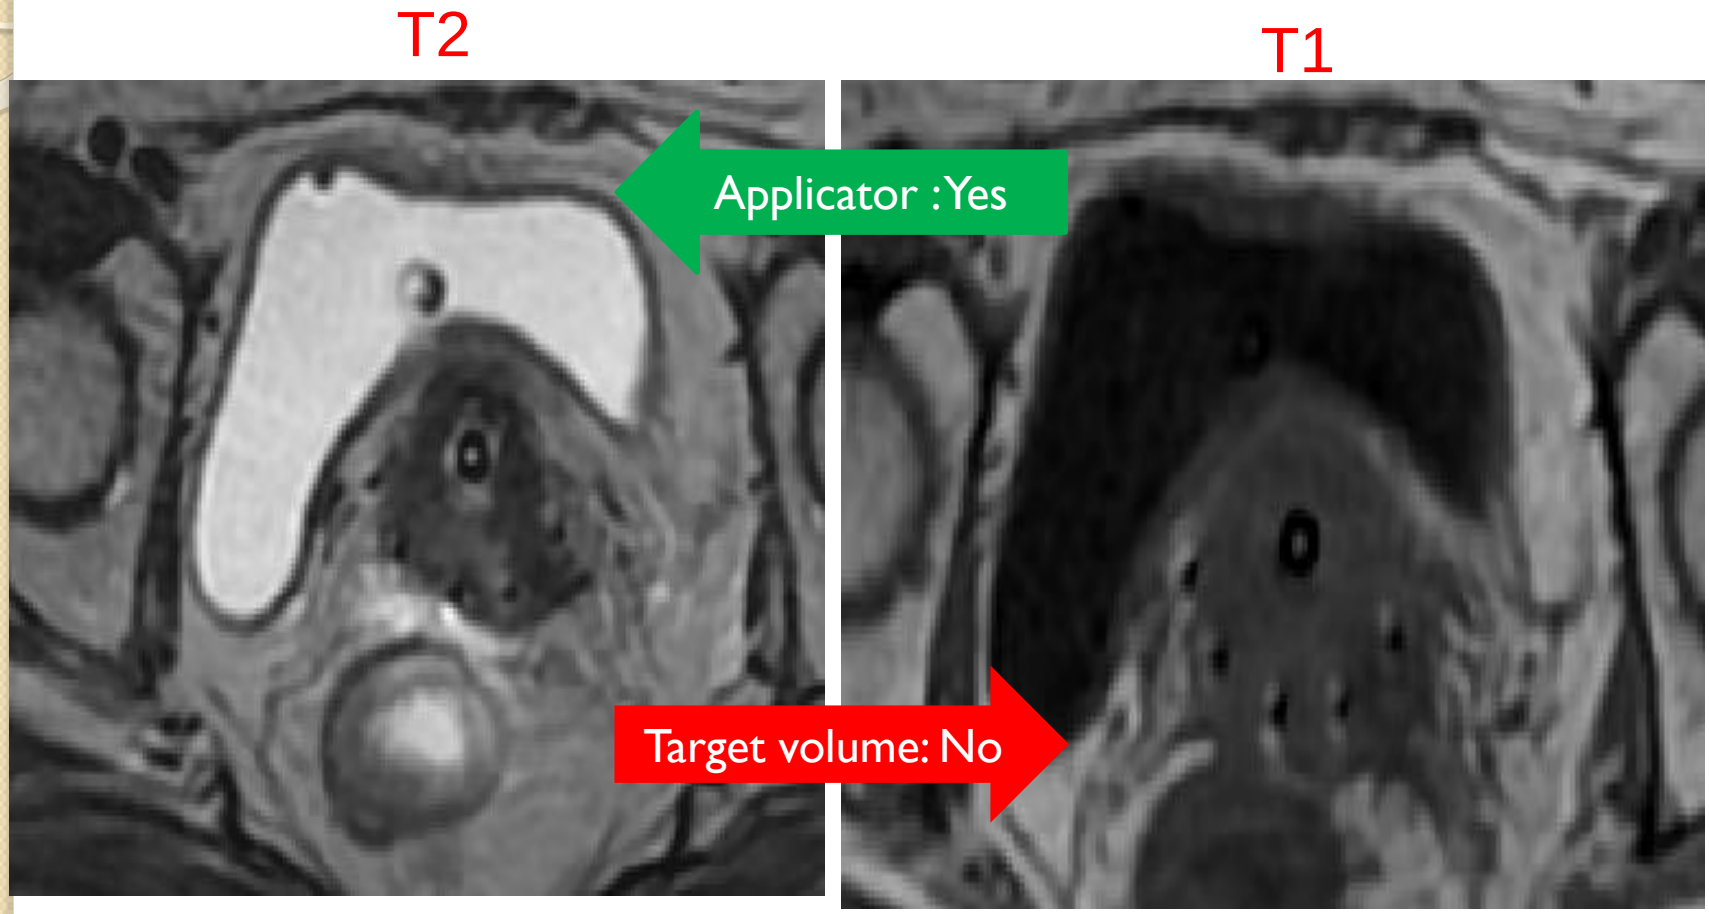
Reconstruction : needles



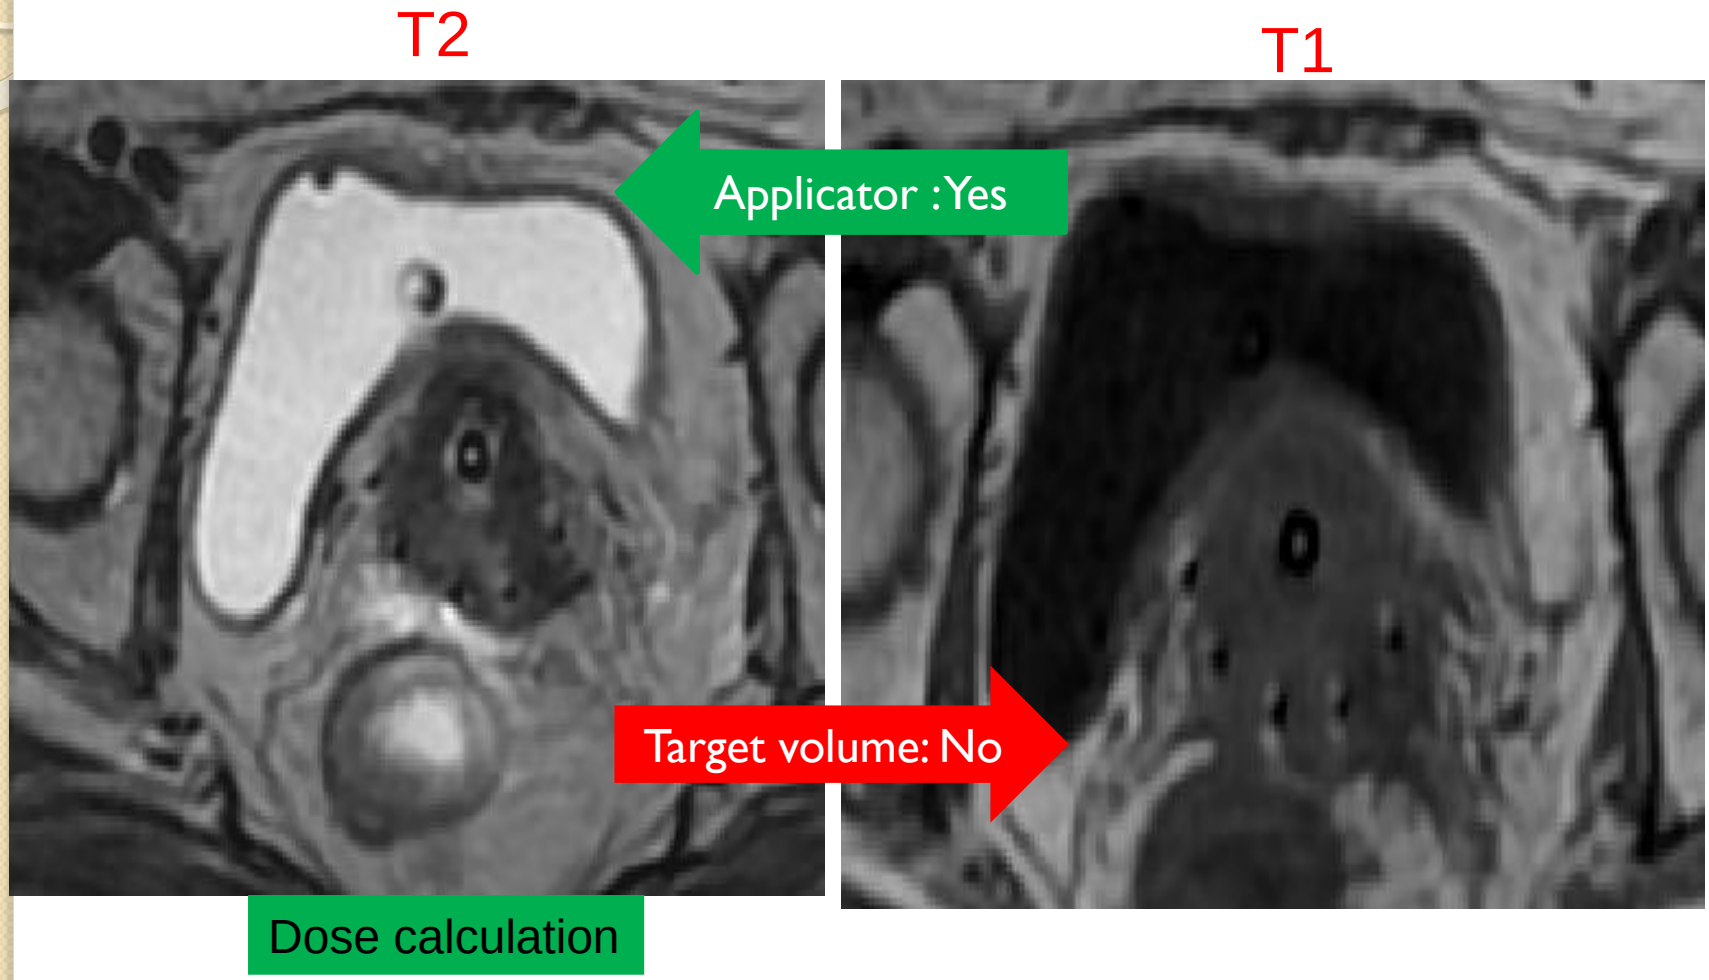
Registration of CT vs MR – Reconstruction



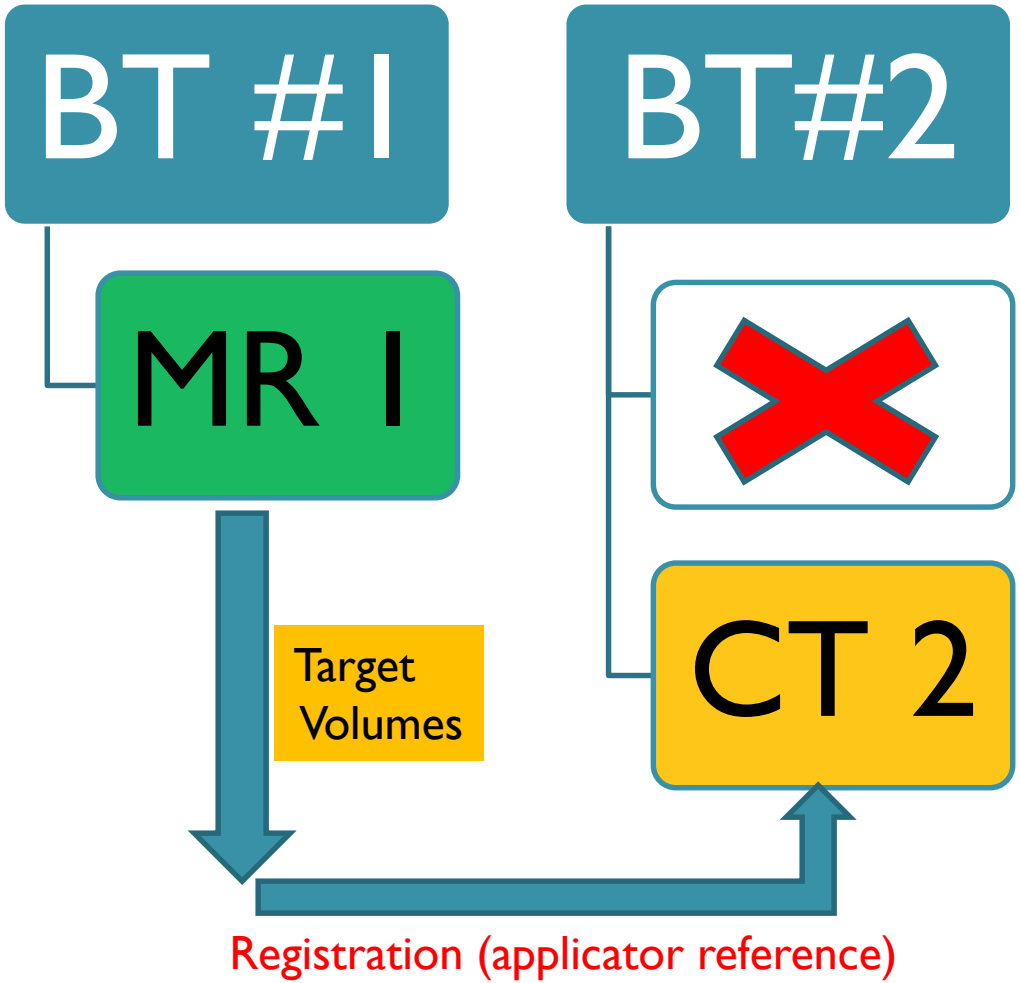
Registration of T1 vs T2 for Reconstruction



Registration of T1 vs T2 for Reconstruction



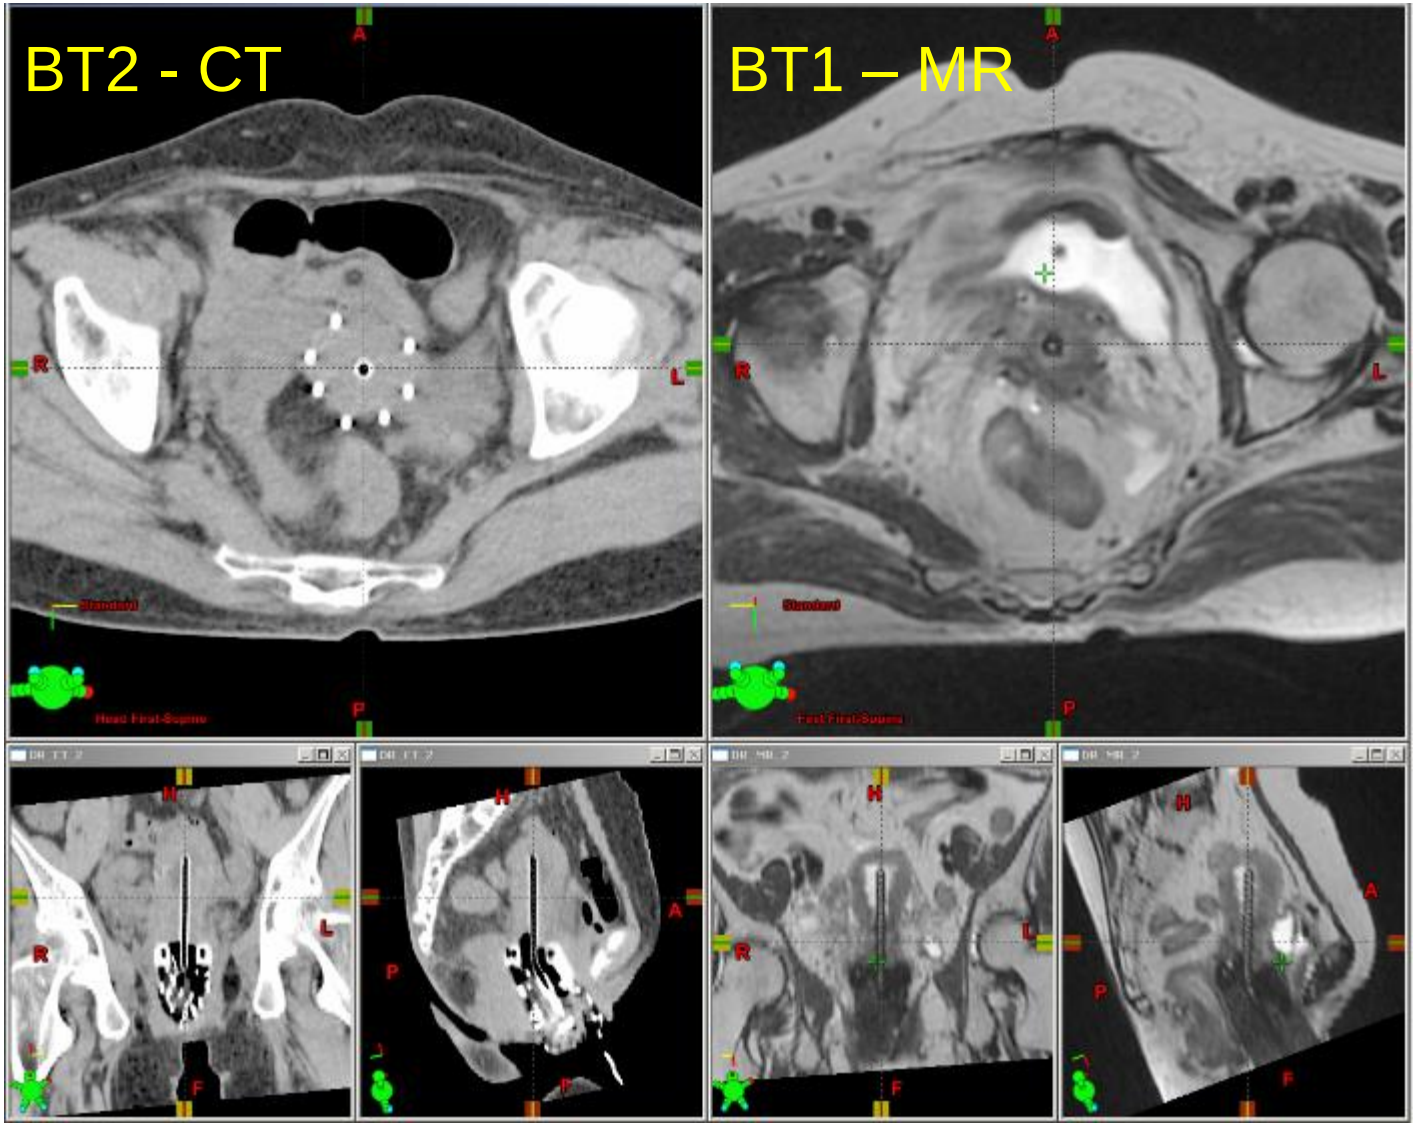
Role of registration in BT – Target



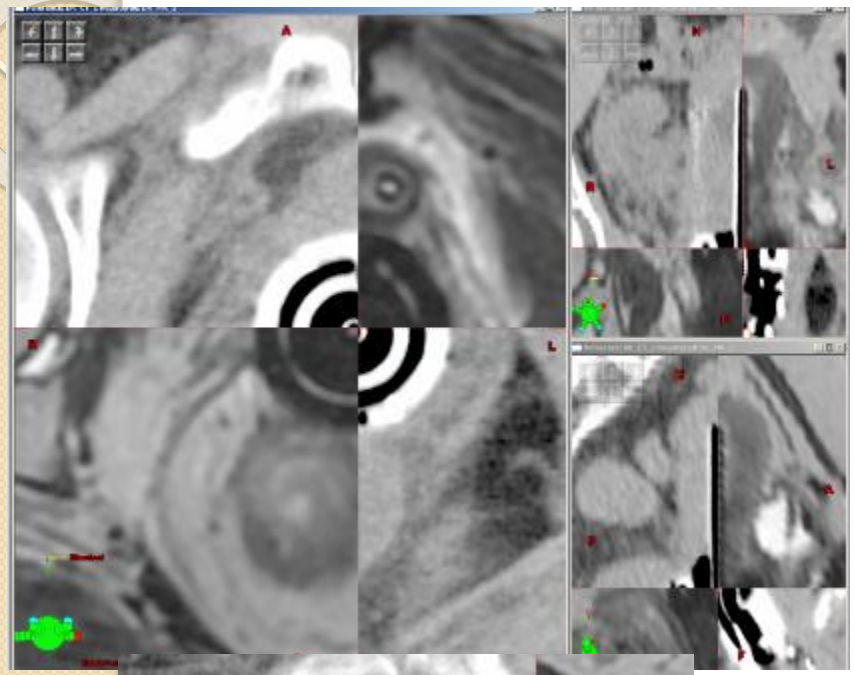
Affordable solution

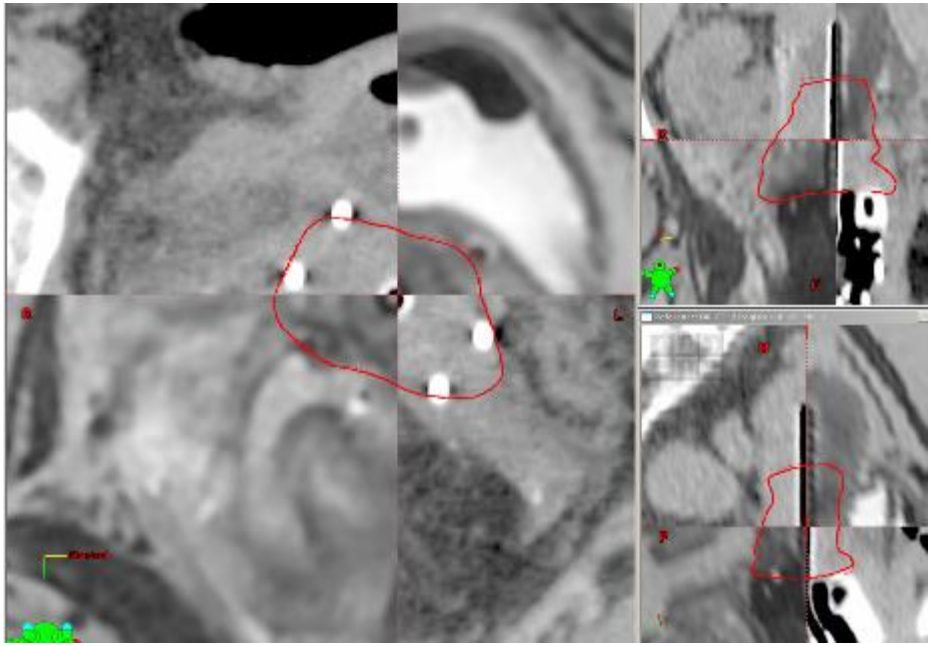
Nesvacil et al 2012

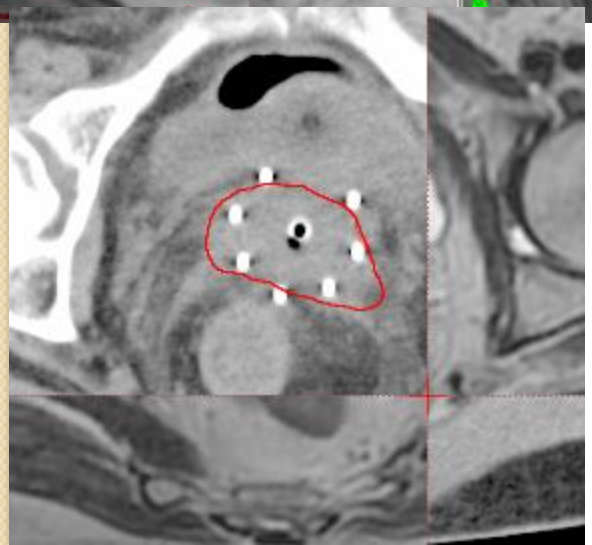
Registration of CT vs MR – Target volume Transfer

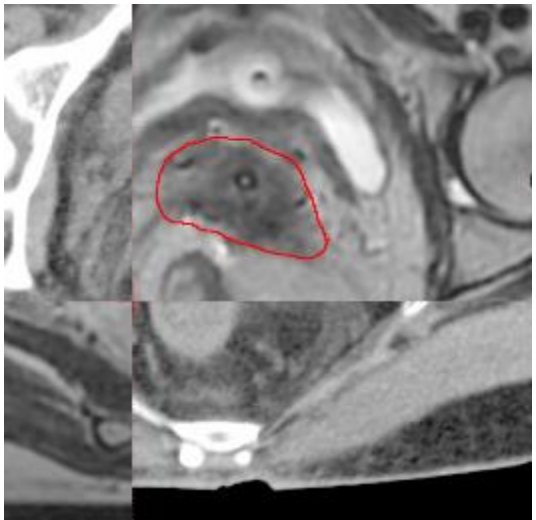


CT vs MR (Target volume transfer)

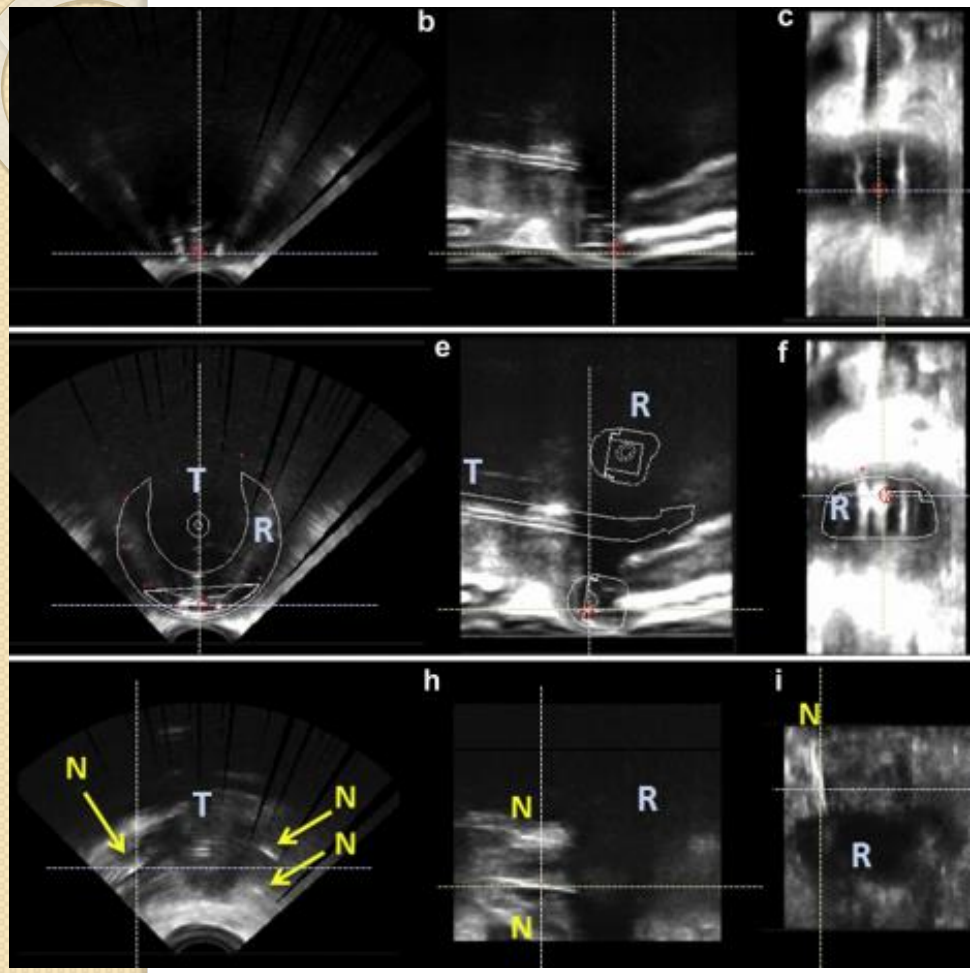


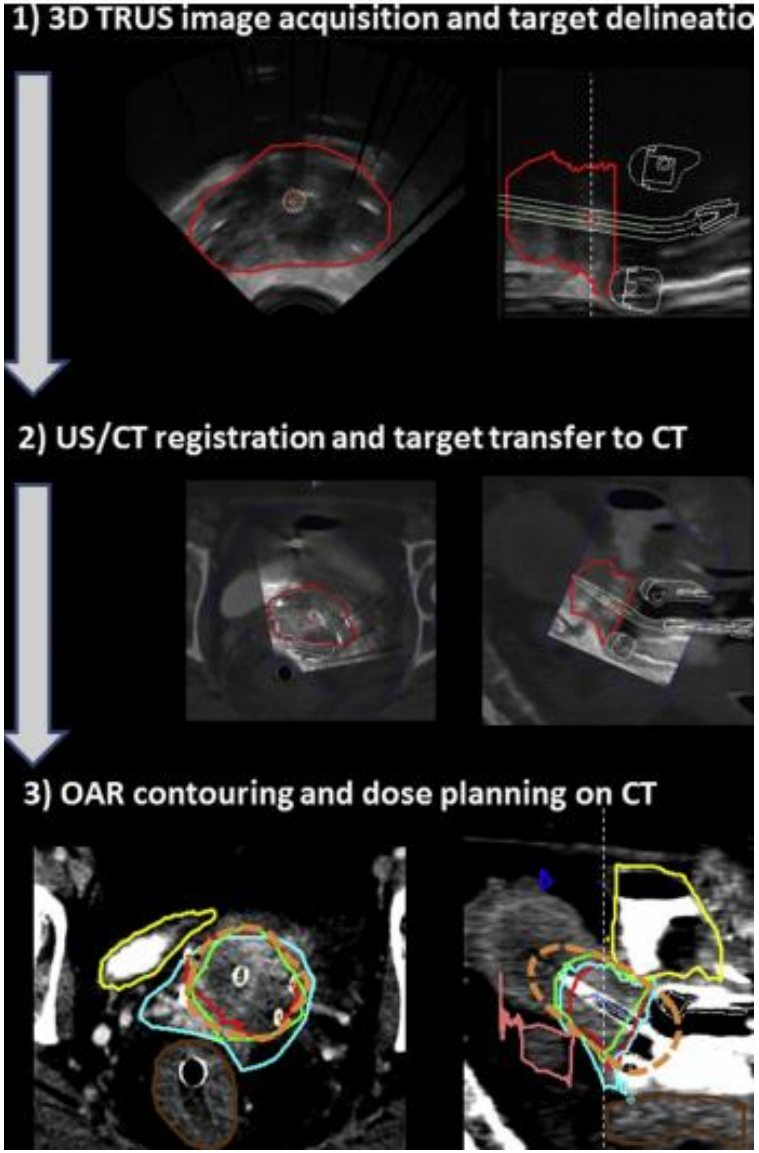






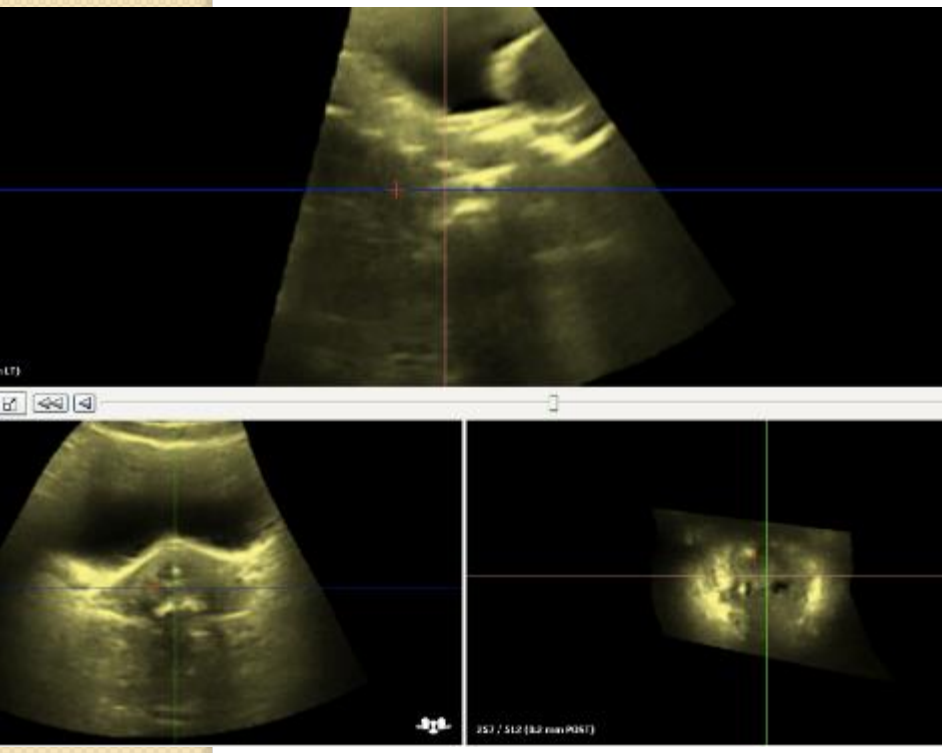
Rigid Registration – TRUS and CT



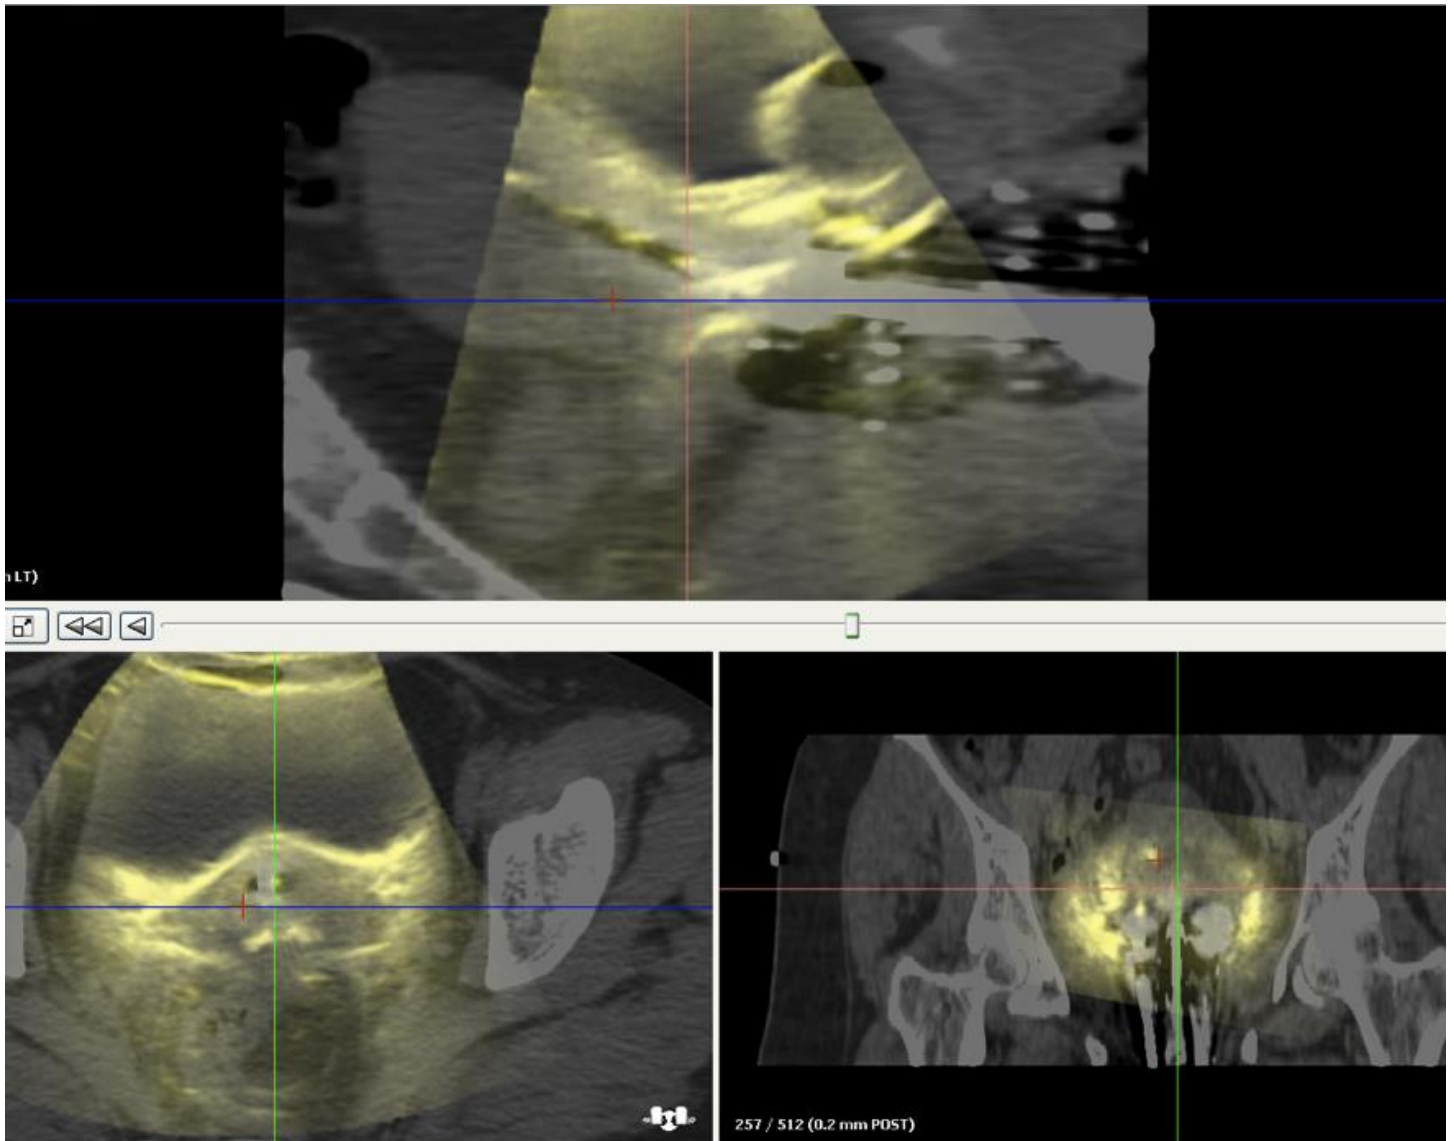


Nesvacil et al 2016

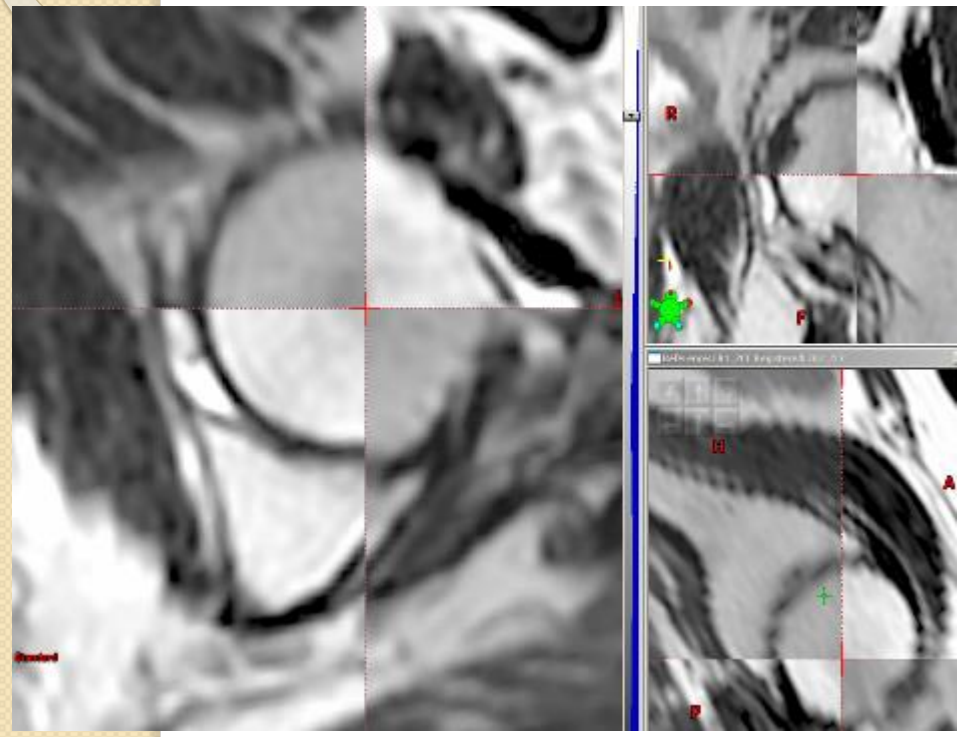
Registration of CT vs Trans abdominal US



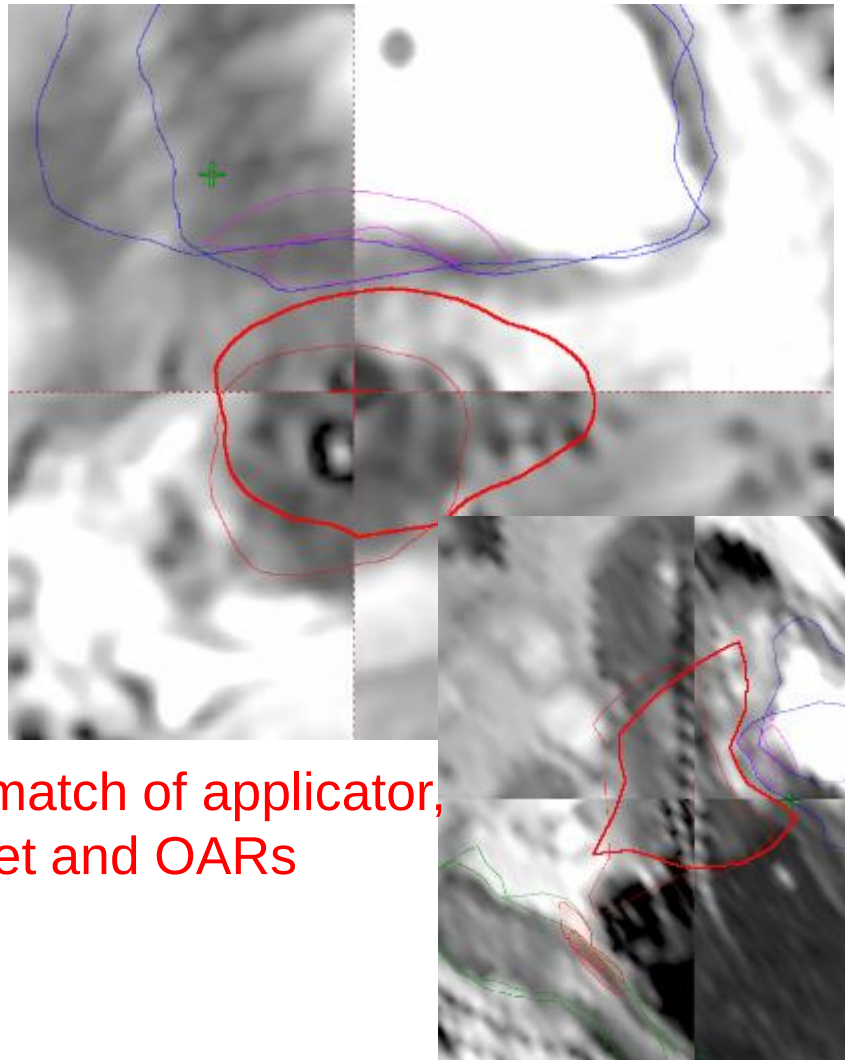
Registration of CT vs US



Registration in Brachytherapy – Bone as a reference ? No

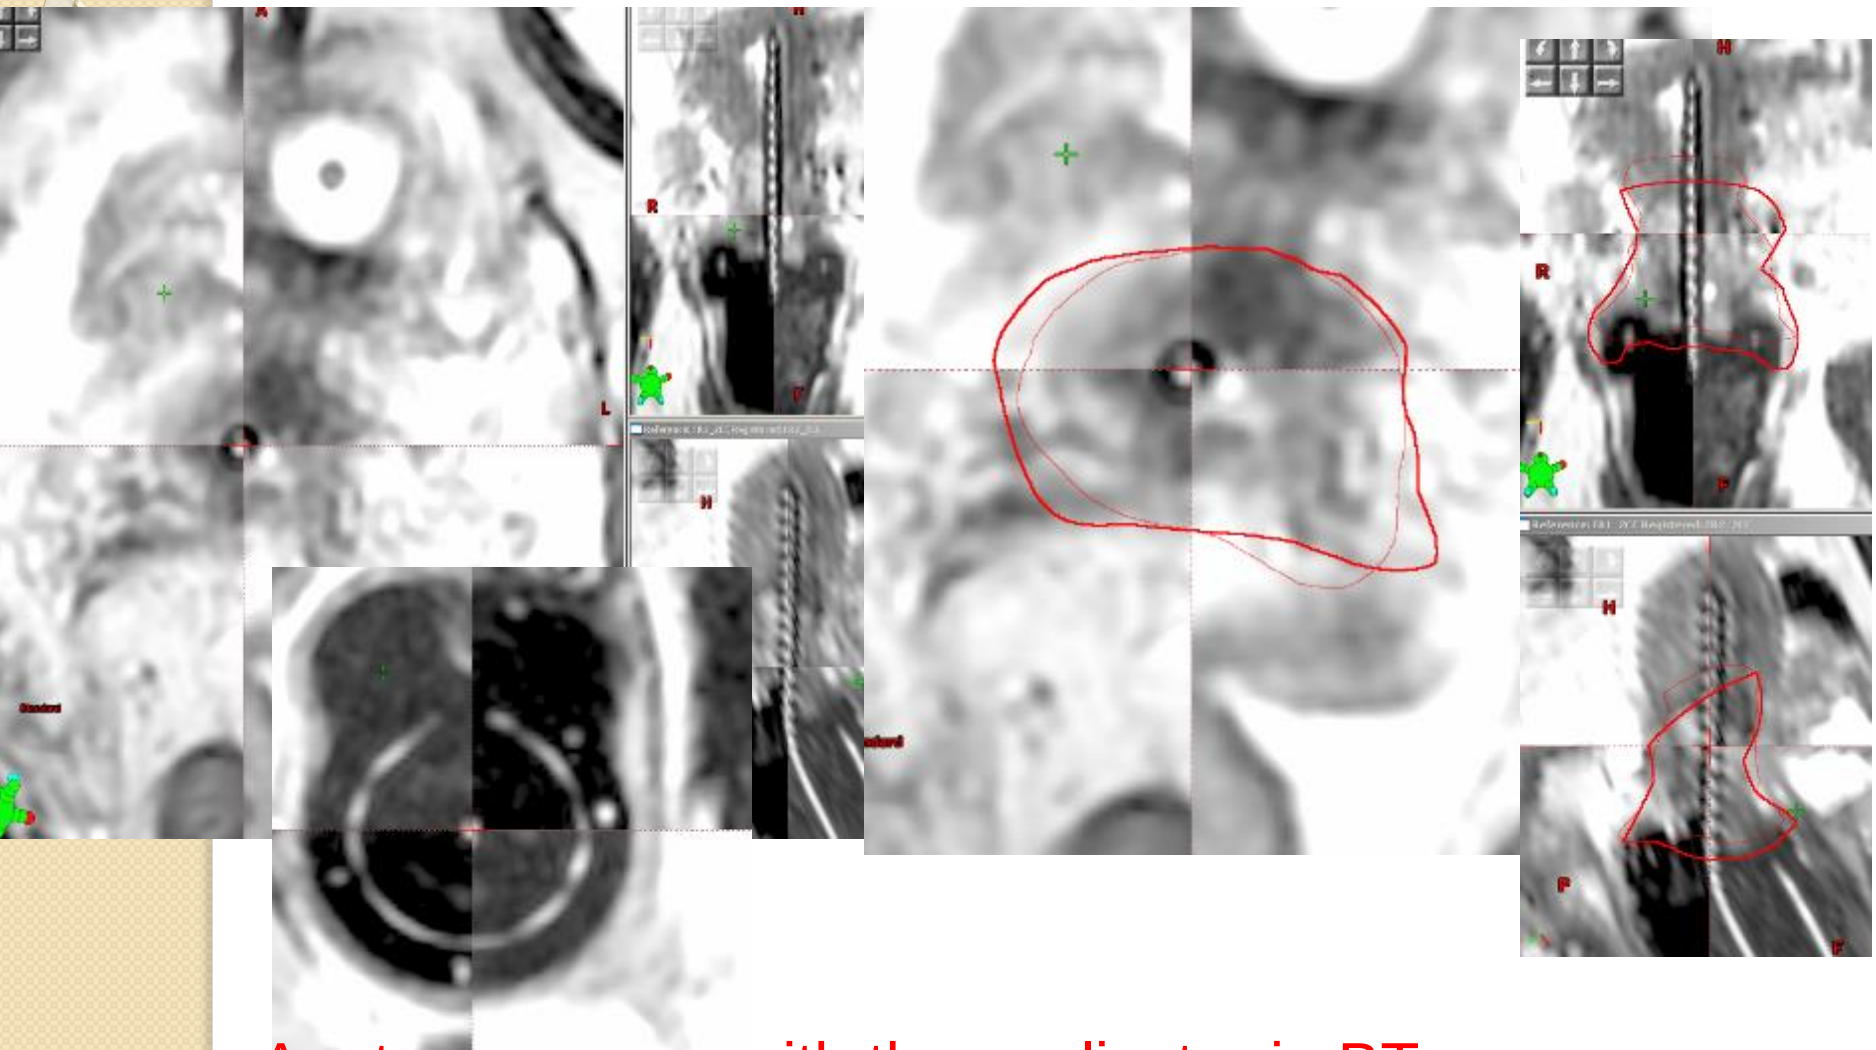


Good matching of bones



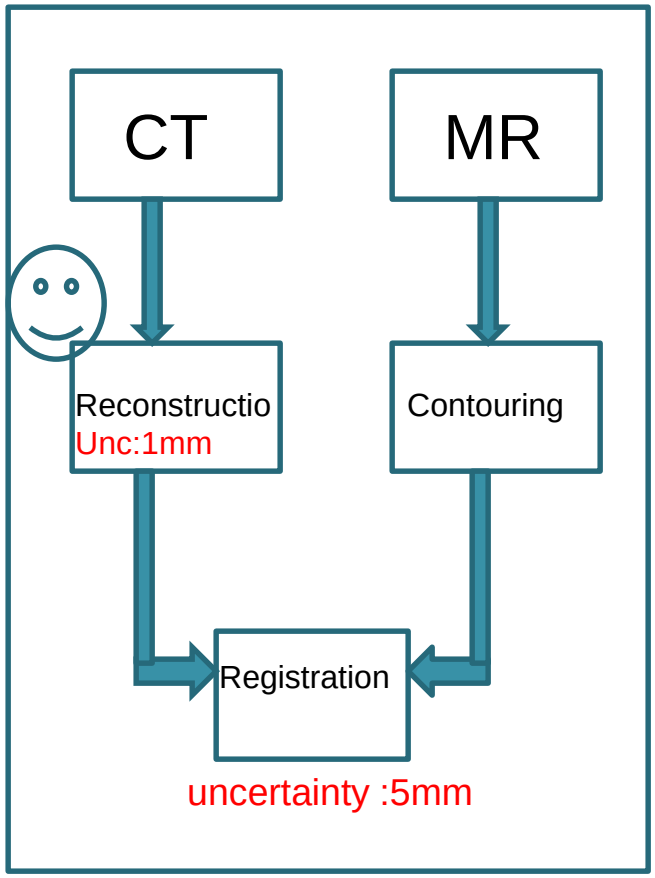
Mismatch of applicator, target and OARs

Registration in Brachytherapy – applicator as a reference? -Yes

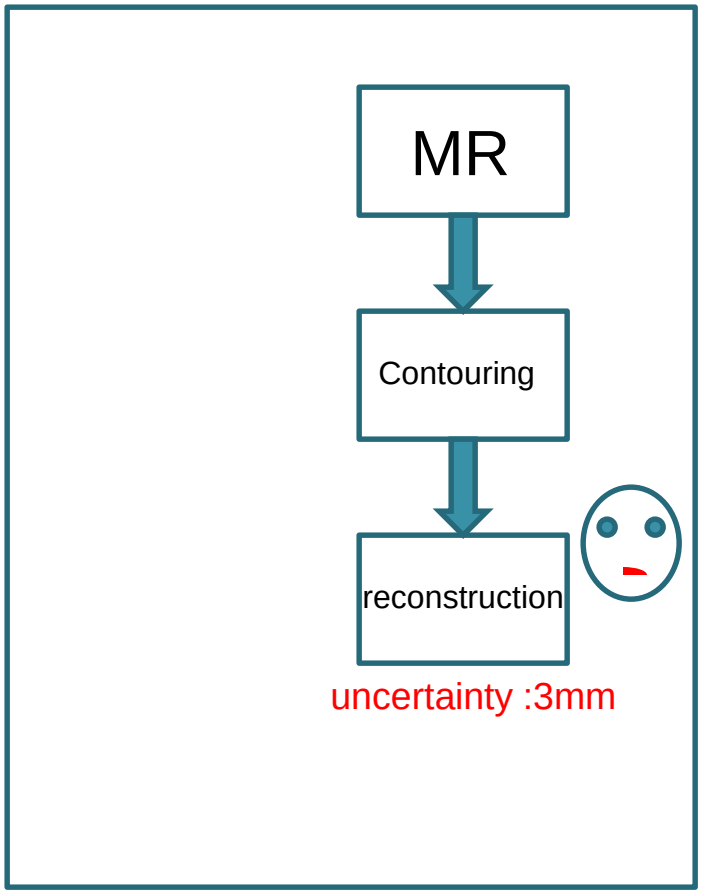


Anatomy moves with the applicator in BT

How to reduce uncertainties



Scenario 1

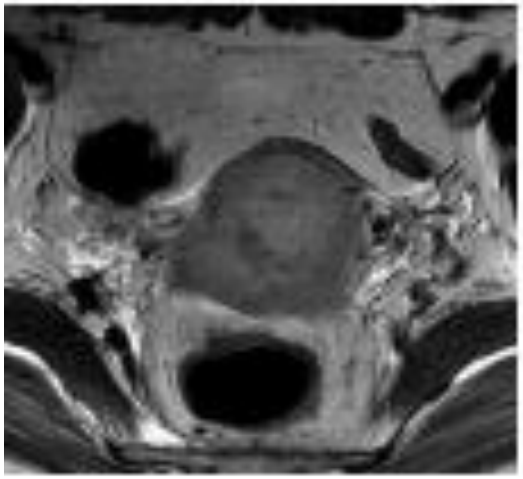


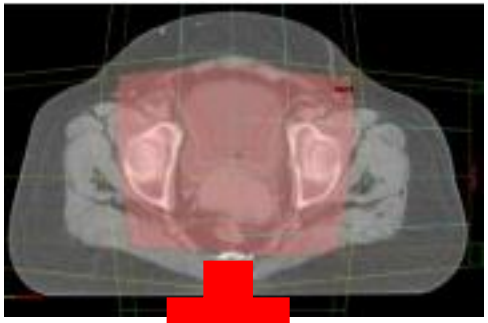
Scenario 2

Which is preferred?

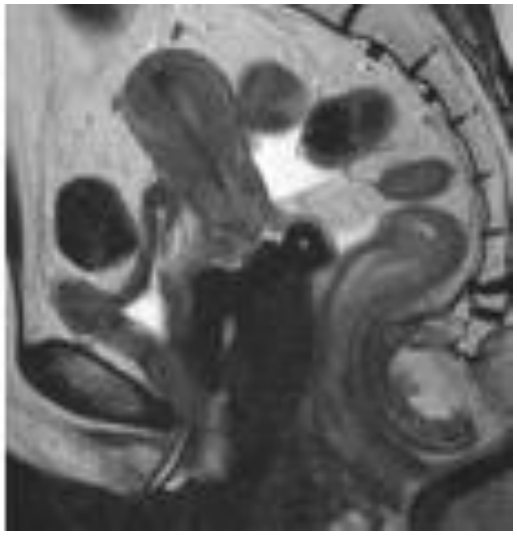
Registration of EBRT & BT images ?

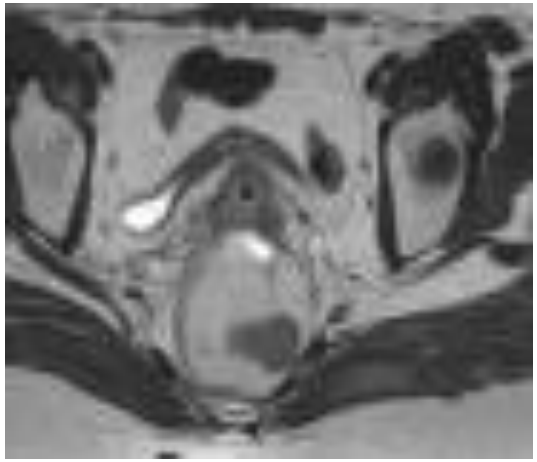
Pre RT





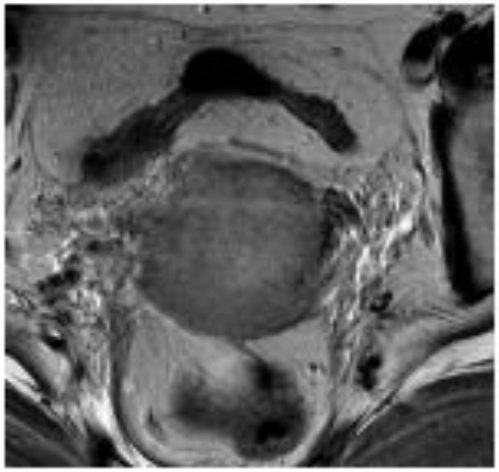
Brachytherapy

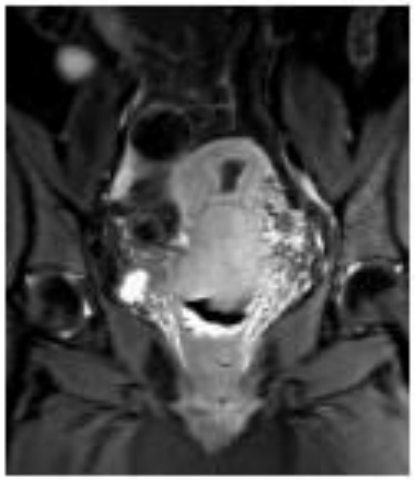




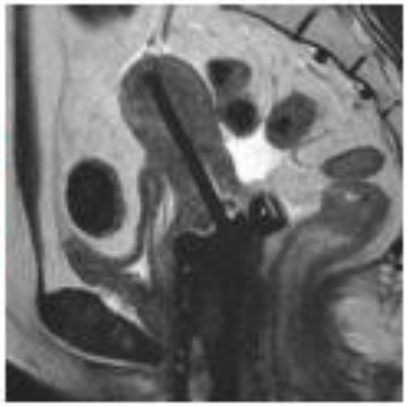
Can we register these two image sets? No

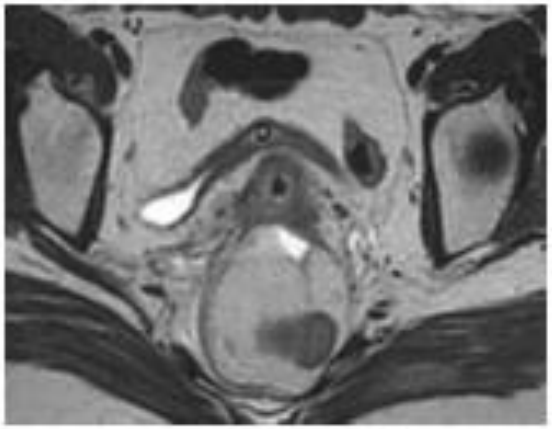
Pre Rx





Post Rx





External beam Radiotherapy

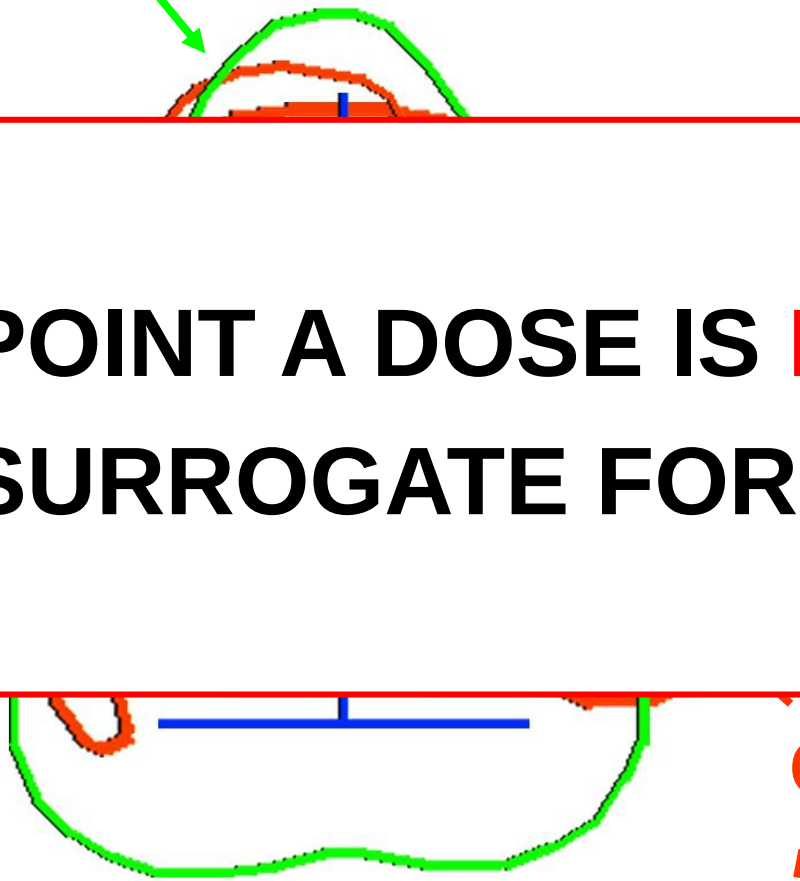
Limitation of point A and standard loading pattern

Point A isodose



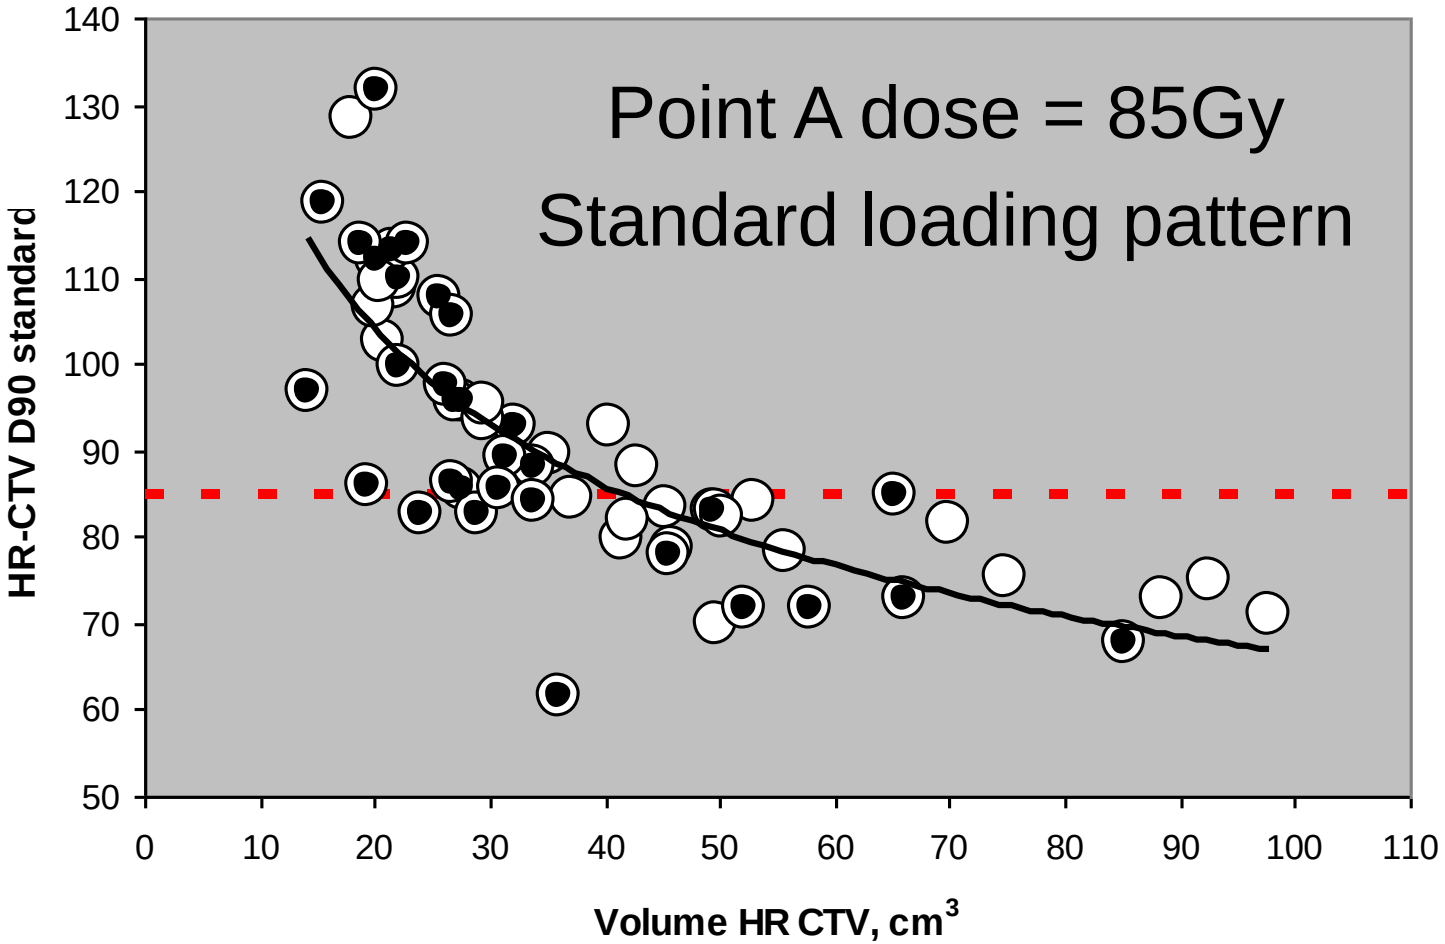
Minimum HR-CTV dose relative to point A:

POINT A DOSE IS NOT A GOOD SURROGATE FOR TARGET DOSE

CTV's assessed from MRI

5 pt's

Limitation of standard loading pattern with dose prescription to point A



◉ Violation of OAR constraint

K Tanderup et al, Radiother Oncol 2010

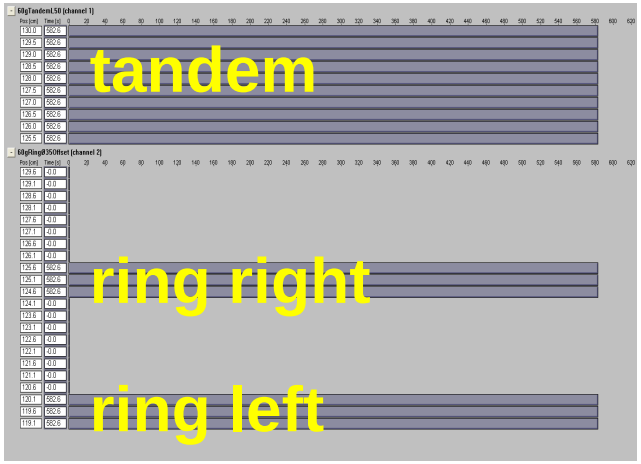
Tools for dose optimisation

- **Manual dose optimisation**
- **Graphical optimization / Dose shaper**
- **Inverse planning**

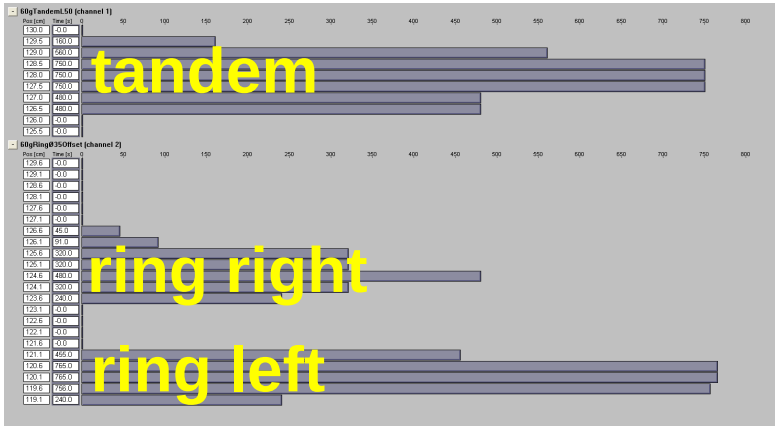
Manual optimisation

Dwell times

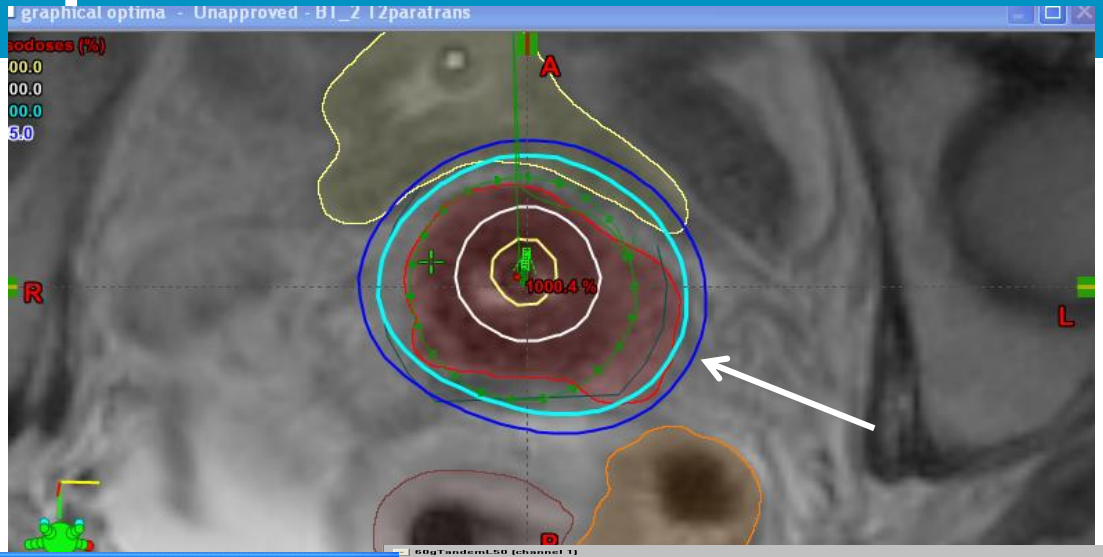
Standard

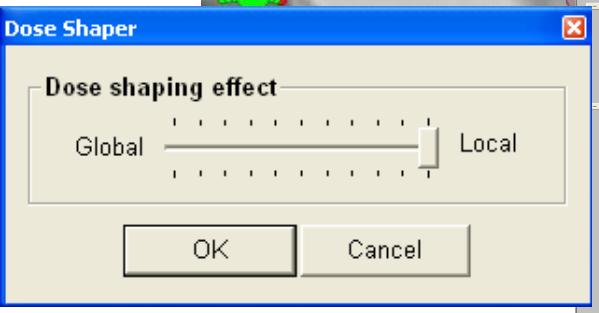


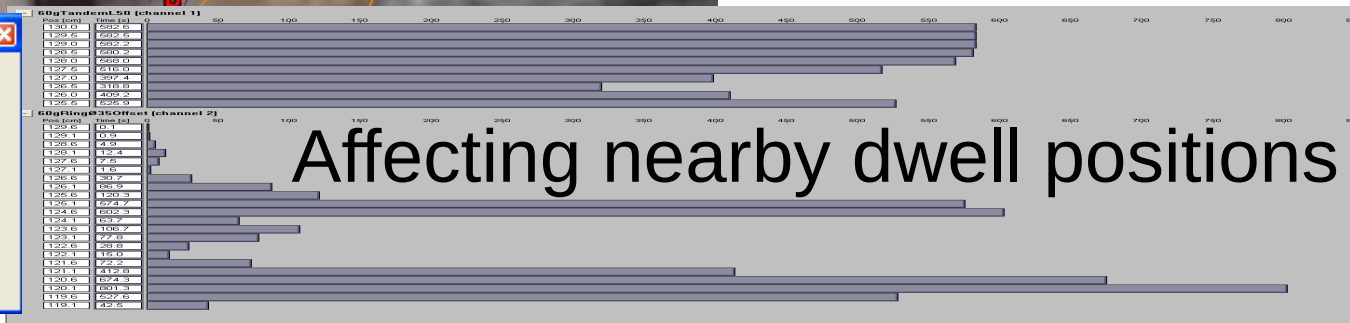
Manually optimised



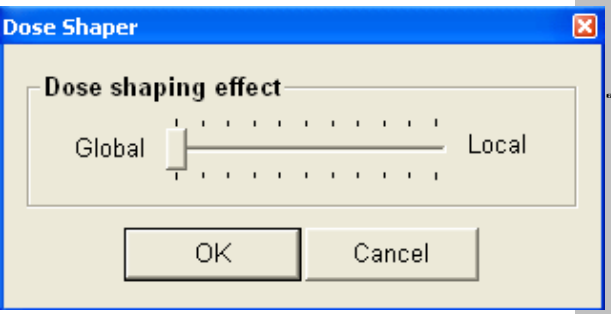
Graphical dose optimisation – “drag and drop”

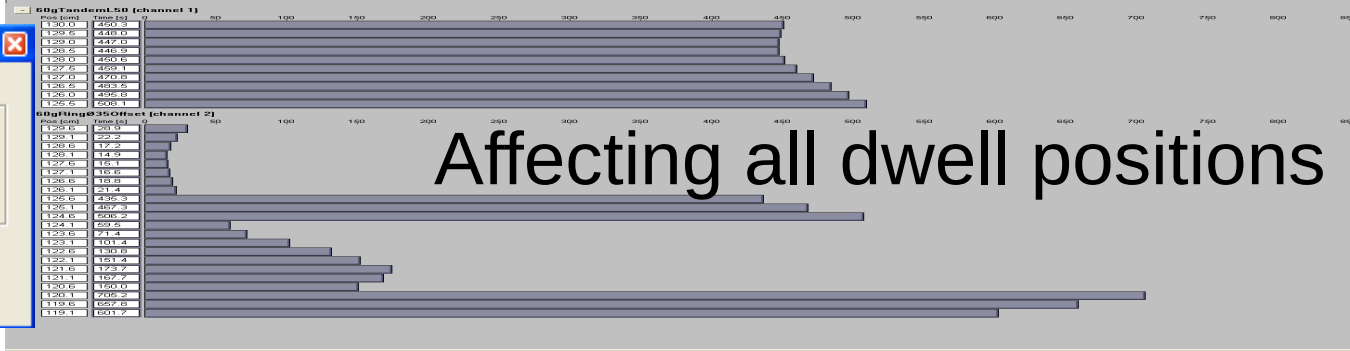






Affecting nearby dwell positions

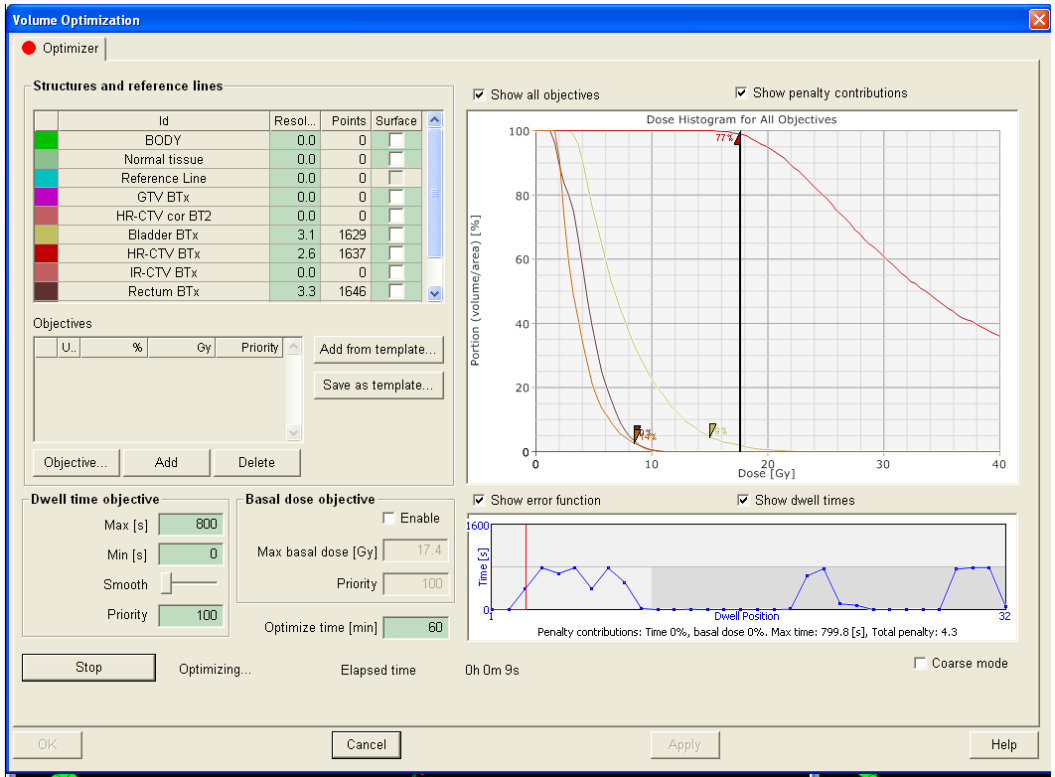


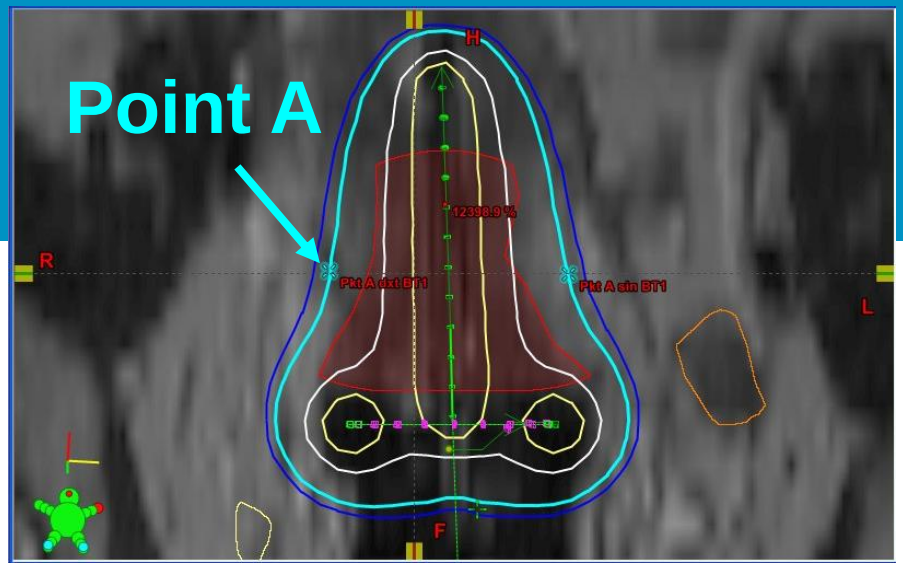


Affecting all dwell positions

Inverse dose optimisation

- **Controlled by DVH constraints**
- **Weighting factors for different structures**





Always start optimisation with Standard loading pattern Standard prescription

Calculation on MRI? It is OK!

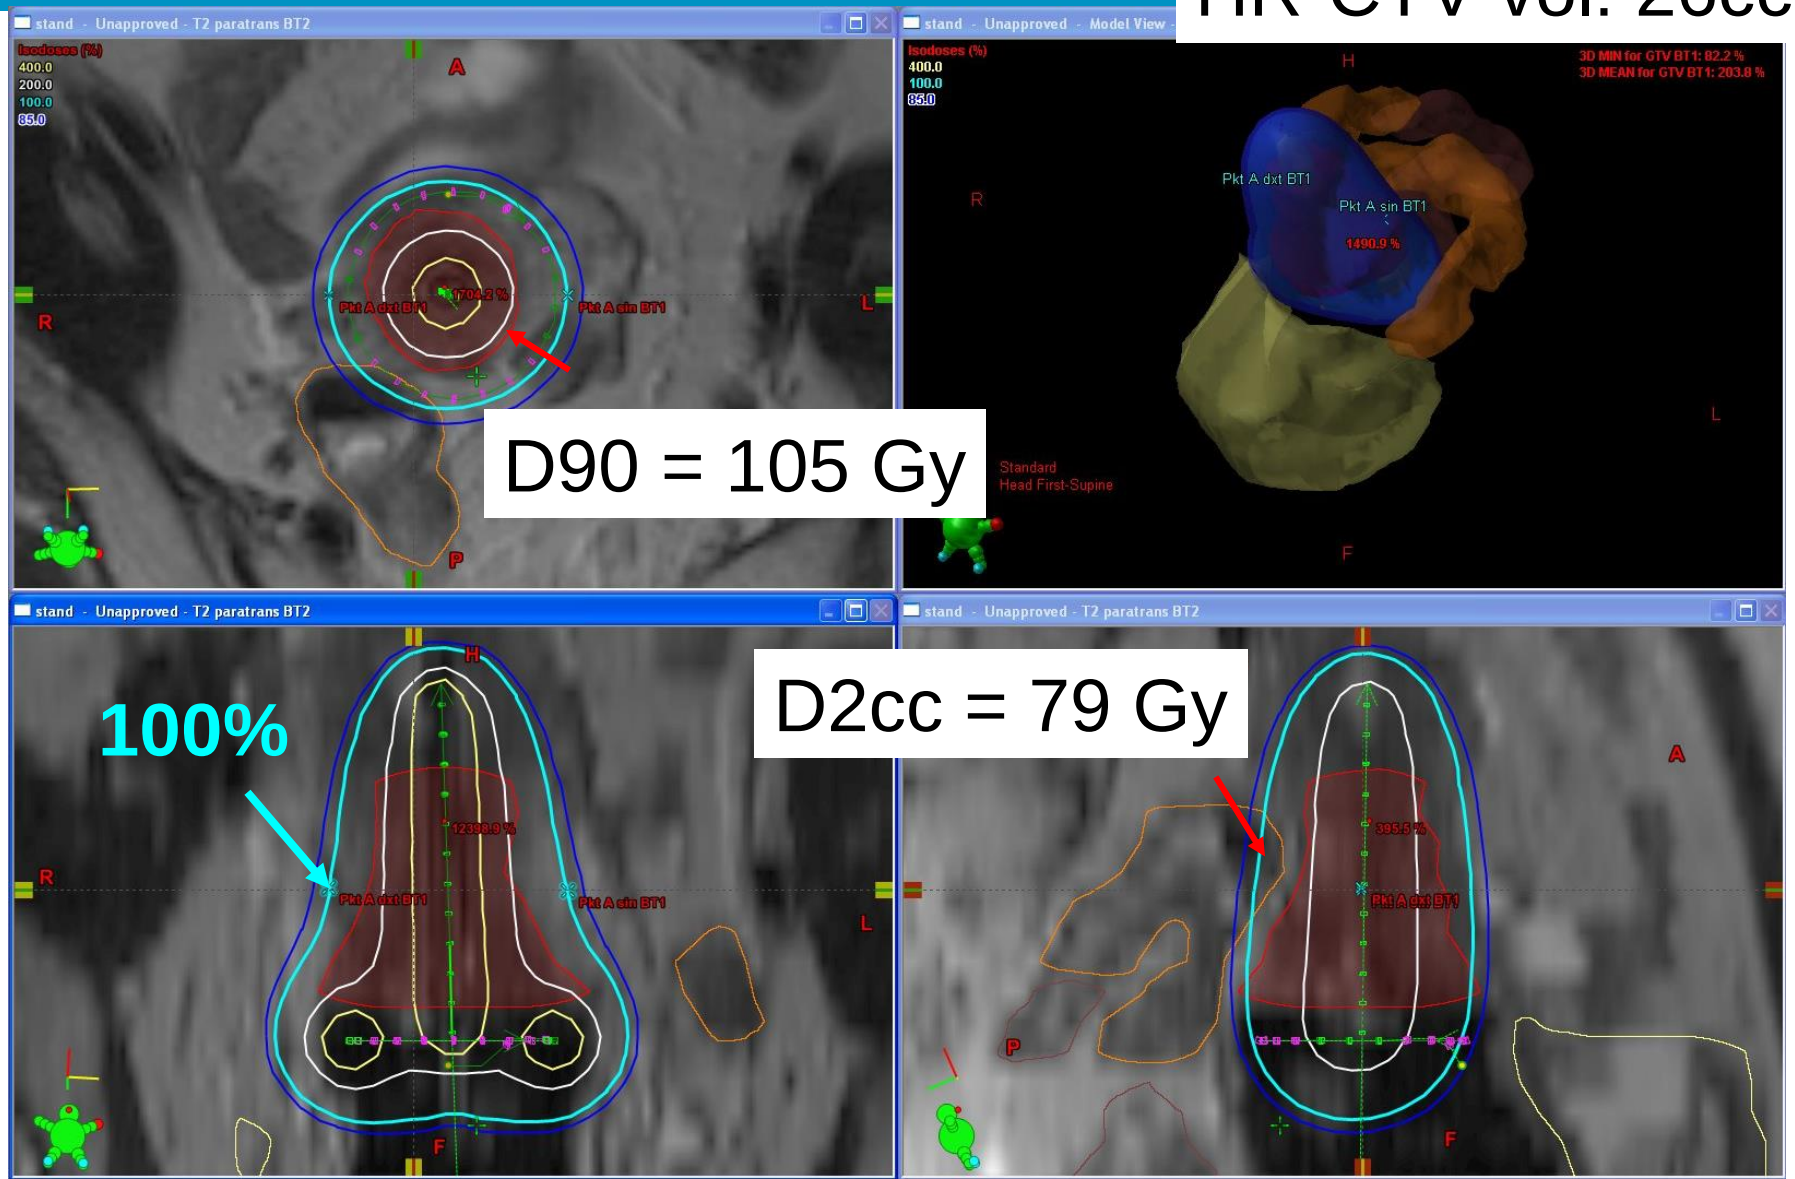
- **TG43 algorithm is based on water calculation and can be done on CT, MRI and US**
- **Model based algorithms take tissue into account (based on CT), but has limited impact for gyn brachy**

Implant	% Variation
Surface Mould (Nose)	9 ± 7
Head and Neck (Base of Tongue)	8 ± 8
Breast APBI –Multi Catheter	8 ± 2.0
Lip Implant	11 ± 14
Eye Lid	22 ± 37
Gynaecology – Vienna applicator (Polymer)	1 ± 0.2
Gynaecology – Ring applicator (SS)	4 ± 0.7

Courtesy Jamema Swamidas

Example 1: good response stage IB2 Standard plan

HR-CTV vol: 26cc



D90 = 105 Gy

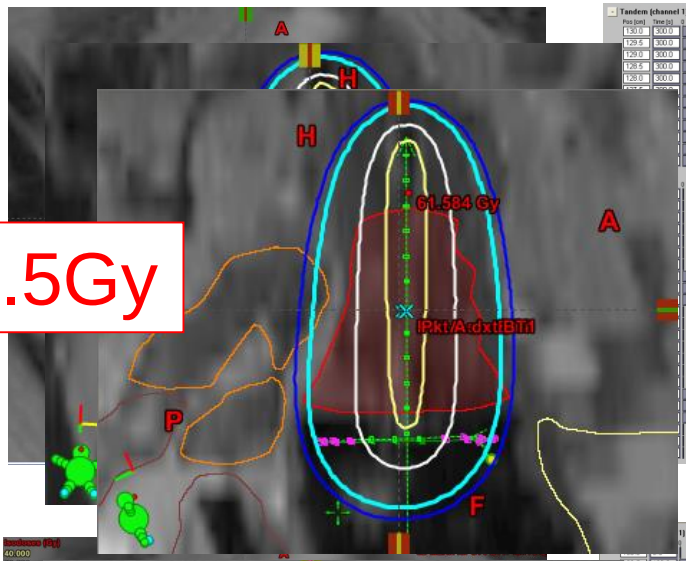
D2cc = 79 Gy

Example 1
Manual dose optimisation

Dose **Dwell times**

Standard

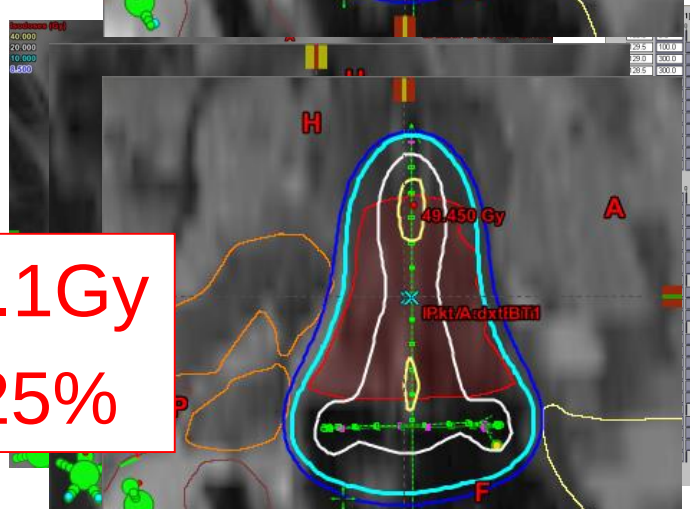
Point A = 17.5Gy

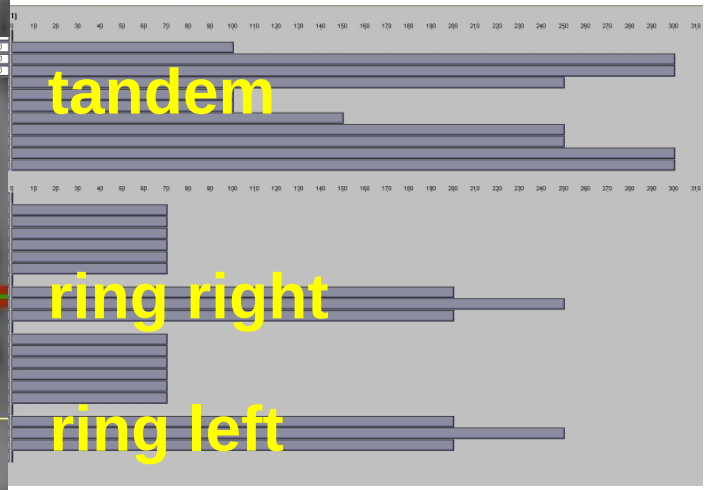


Manual optimisation

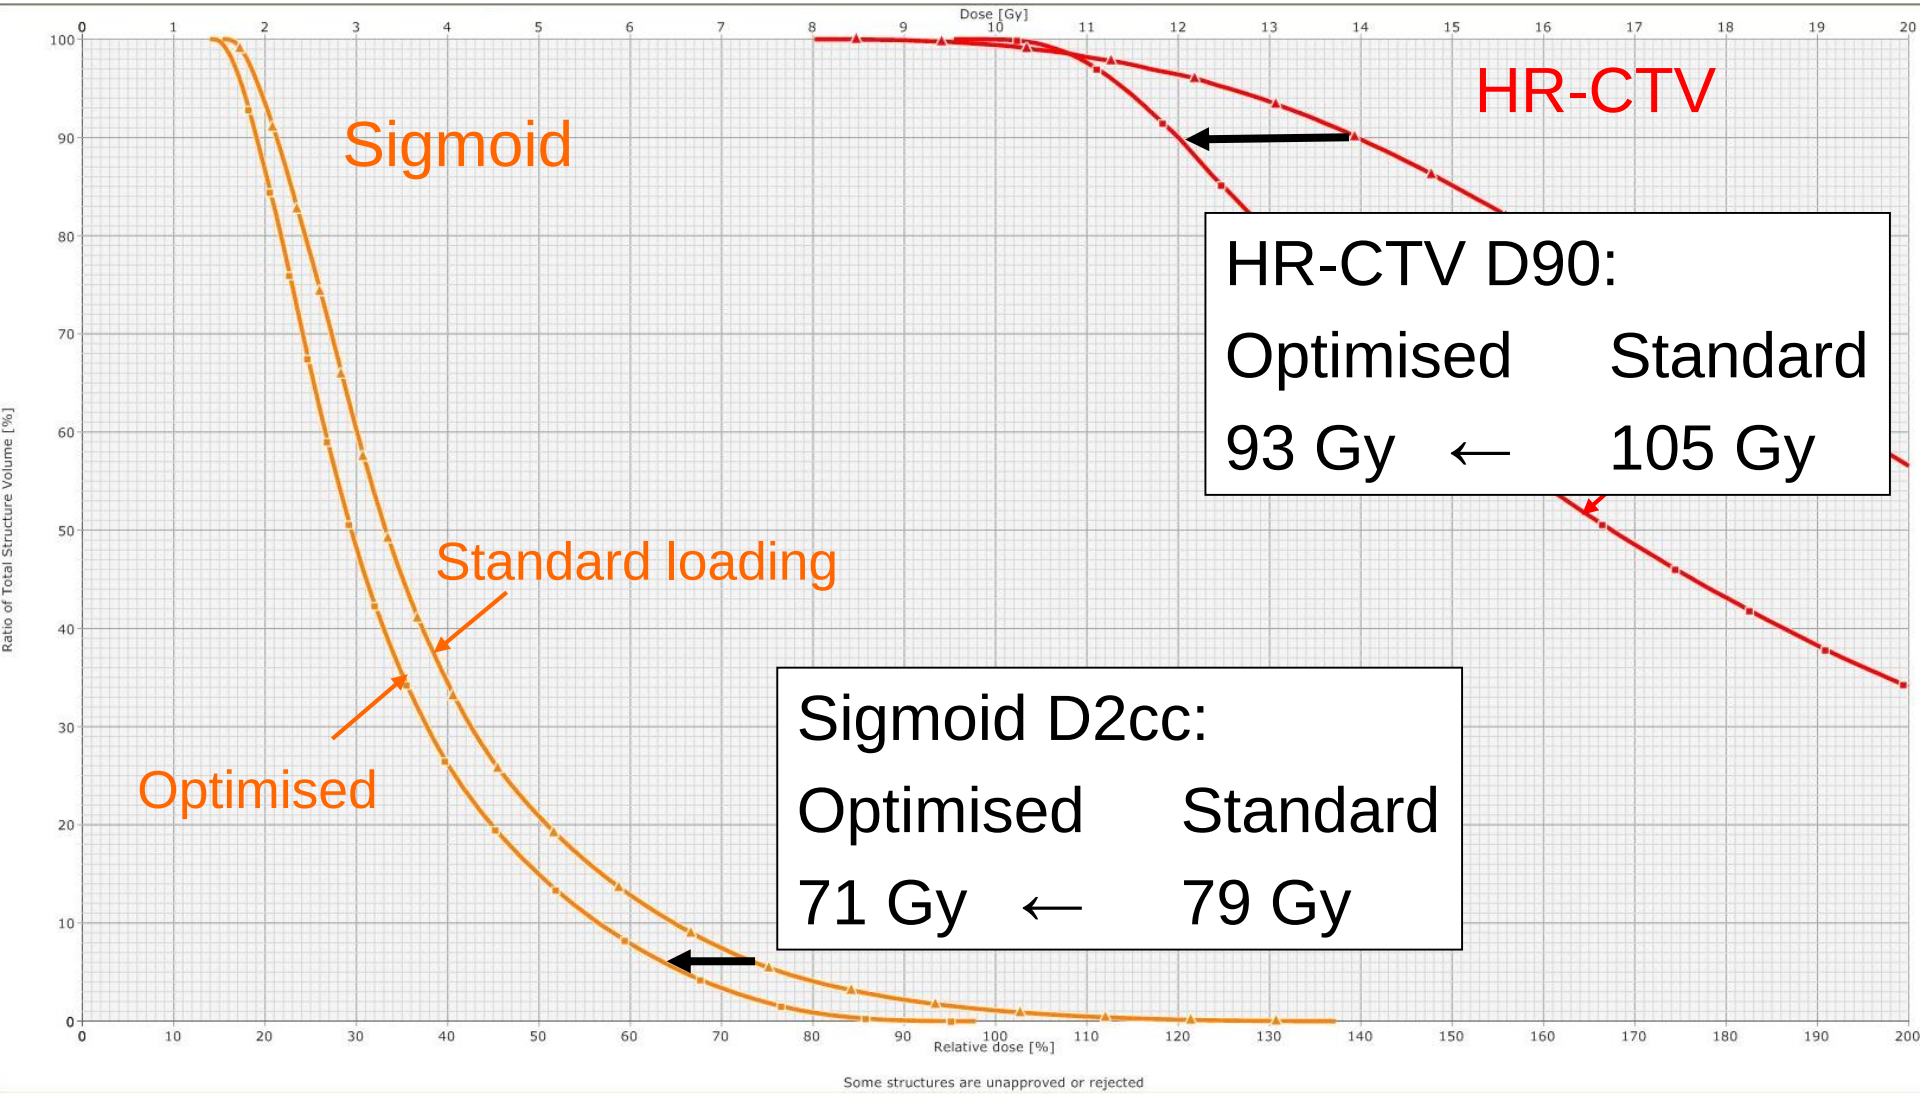
Point A = 13.1Gy

Reduction: 25%





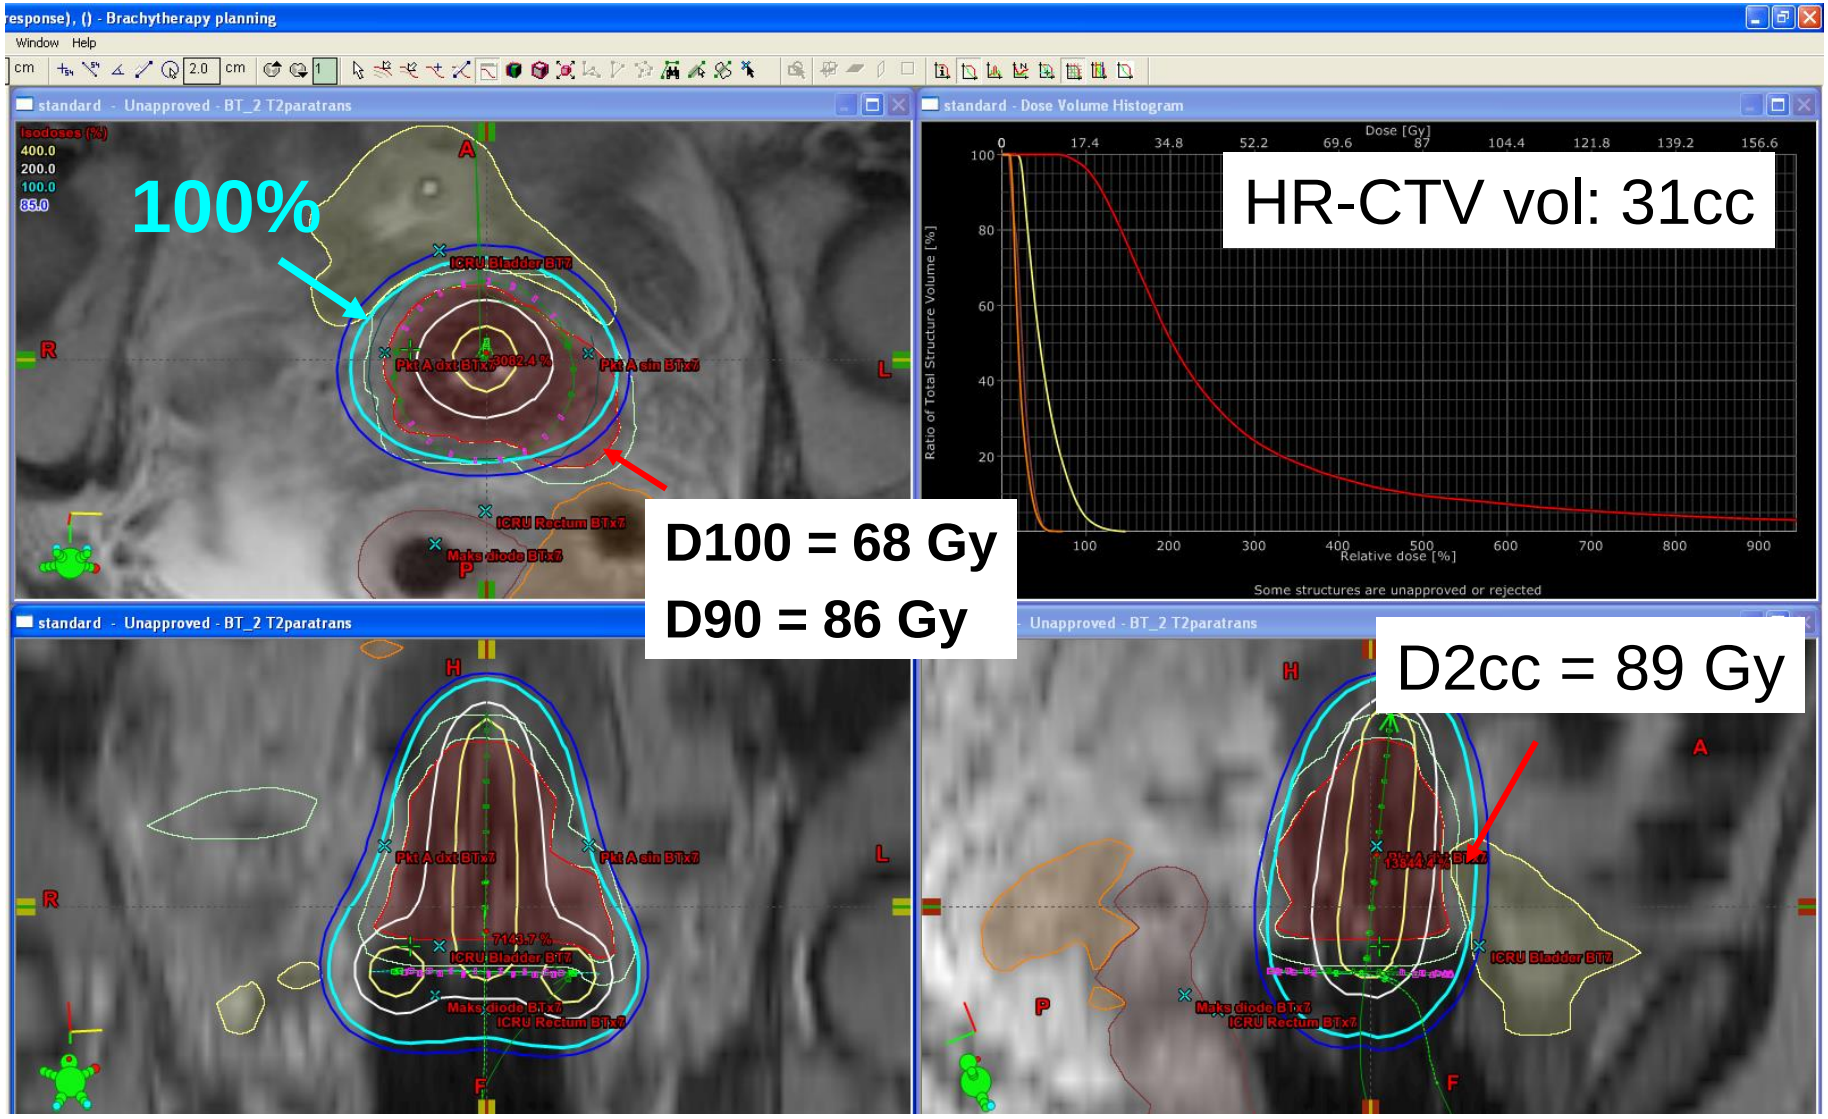
Example 1, DVH



Example 1, summary

- **Small tumour (HR-CTV vol 26cc)**
- **Decrease of pear (and point A dose)**
- **OAR dose decreased**
- **Planning aim: >85Gy**
- **Prescribed dose HR CTV D90: 93Gy**
- **100% isodose adjusted by ~5mm**

Example 2, Stage IIB Standard plan

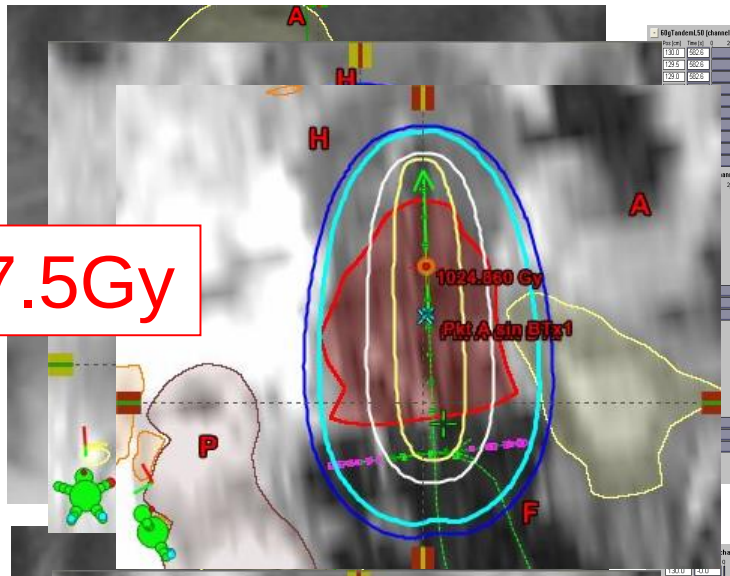


Example 2
Manual dose optimisation

Dose **Dwell times**

Standard

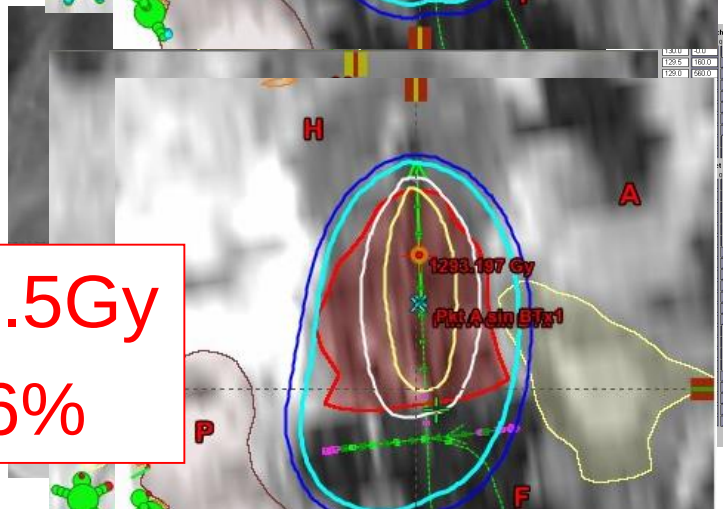
Point A = 17.5Gy

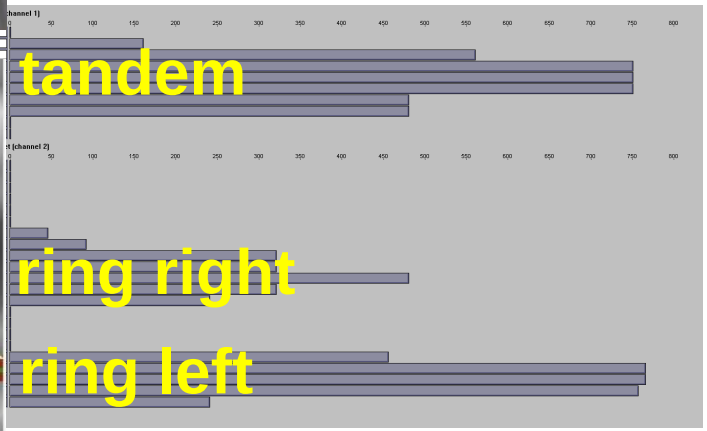


Manual optimisation

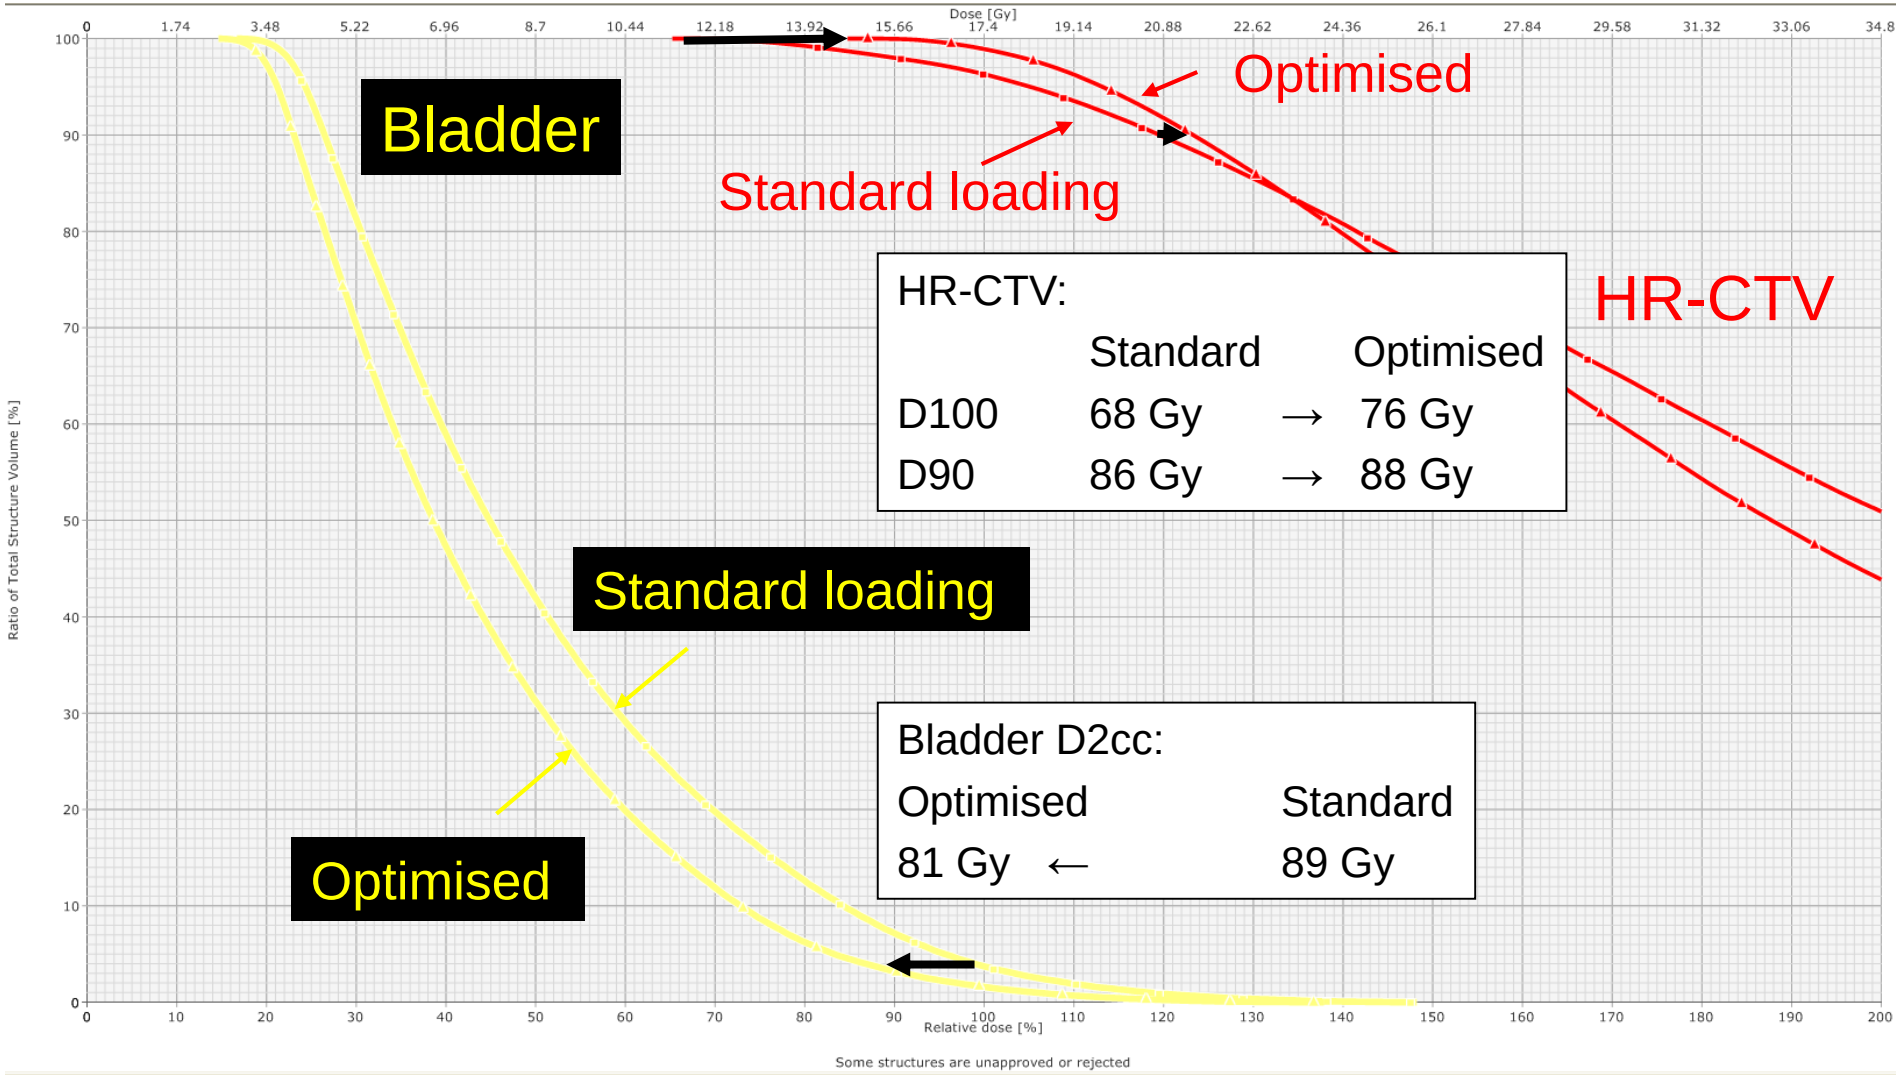
Point A = 16.5Gy

Reduction: 6%





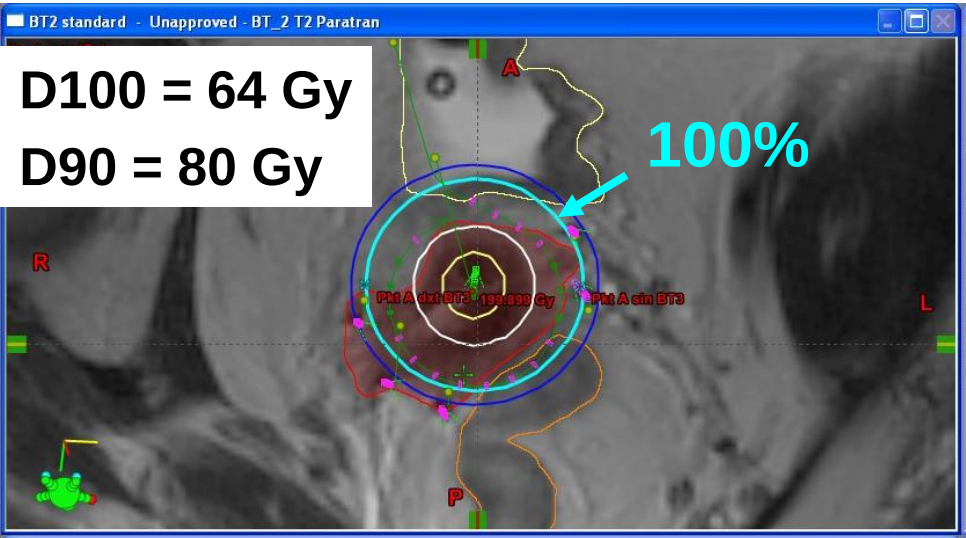
Example 2, DVH

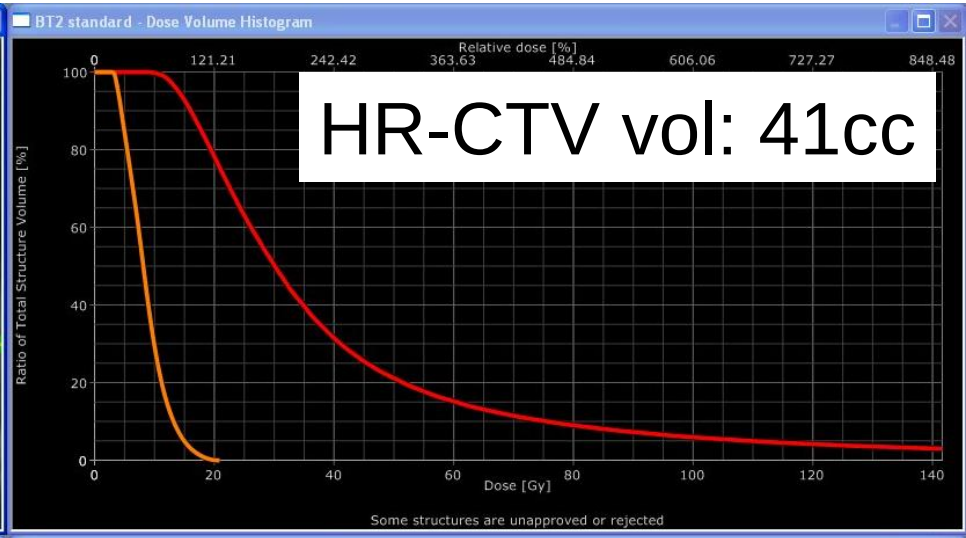


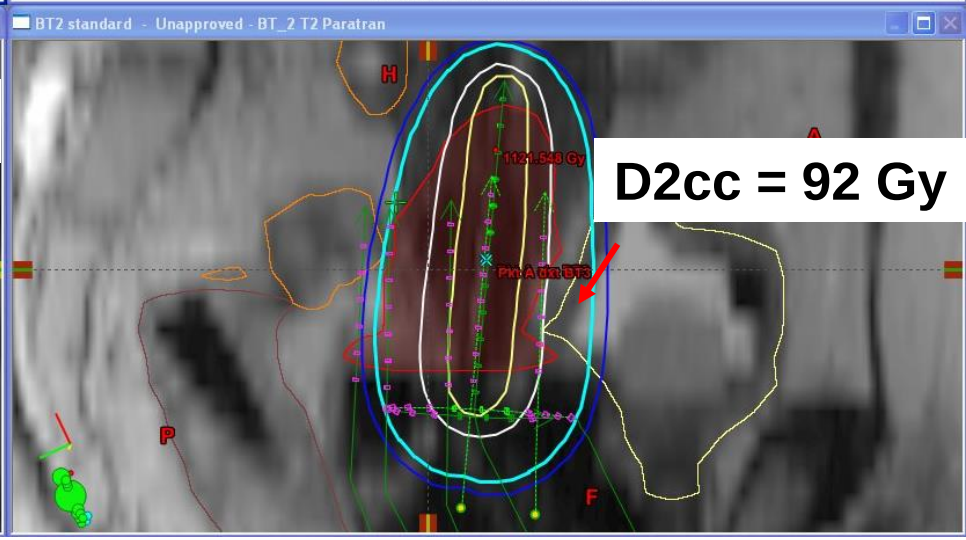
Example 2, summary

- **Small tumour (HR-CTV vol 31cc)**
- **Relatively small adaptations of the standard pear shaped isodose**
- **Target coverage increased – OAR dose decreased**
- **Planning aim: >85Gy**
- **Prescribed dose HR CTV D90: 88Gy**
- **100% isodose adjusted by ~5mm**

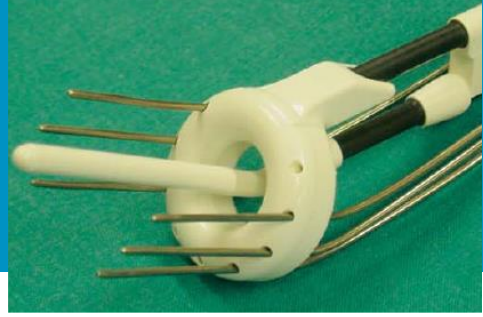
Example 3, Stage IIIB
Standard dose plan







Example 3
Manually optimised plan



Dose **Dwell times**

Standard

TRAK = 2.1 cGy

Manual optimisation

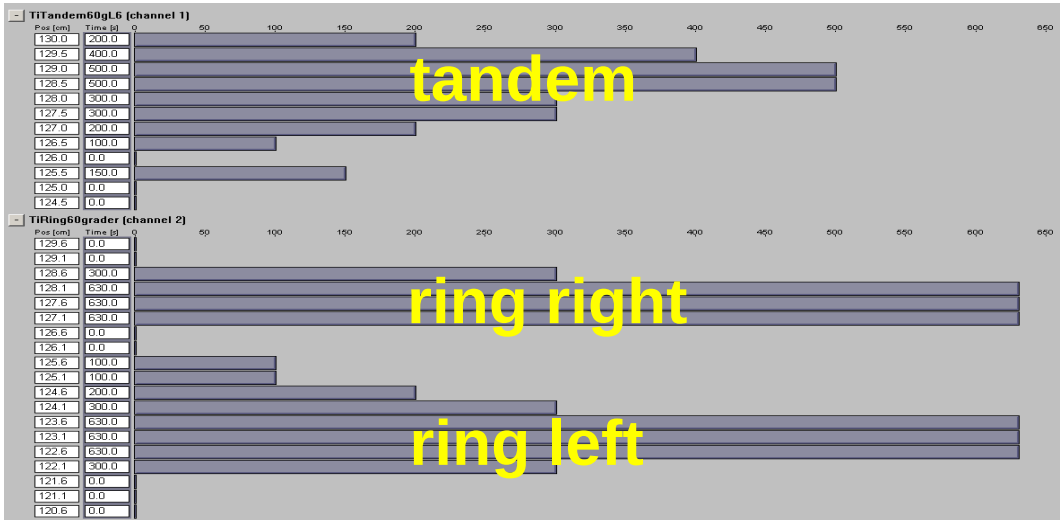
TRAK = 2.2 cGy

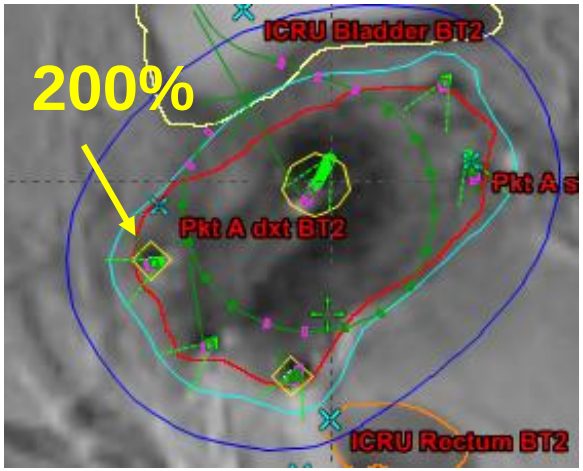
Increase: 7%

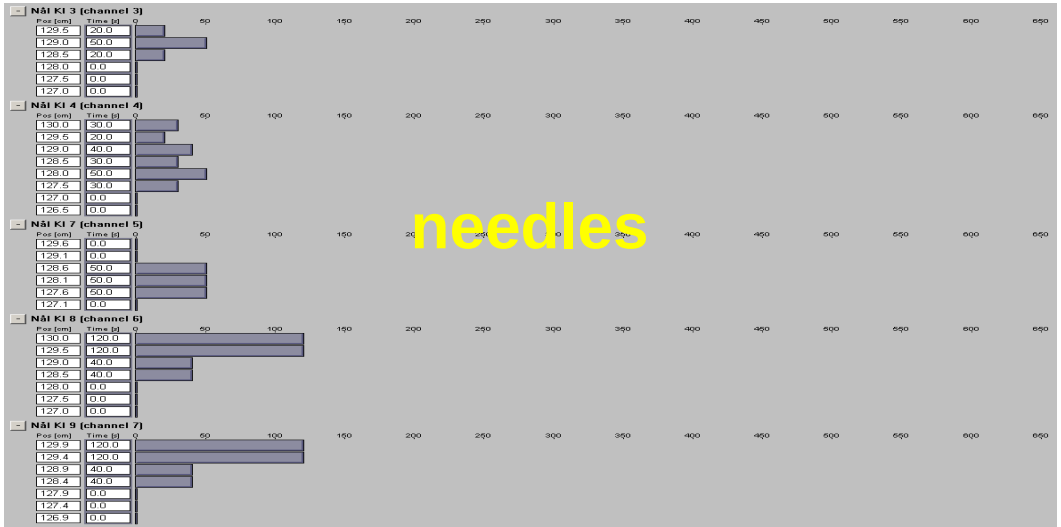
Loading of needles: dwell times and isodoses

Dwell times needles:

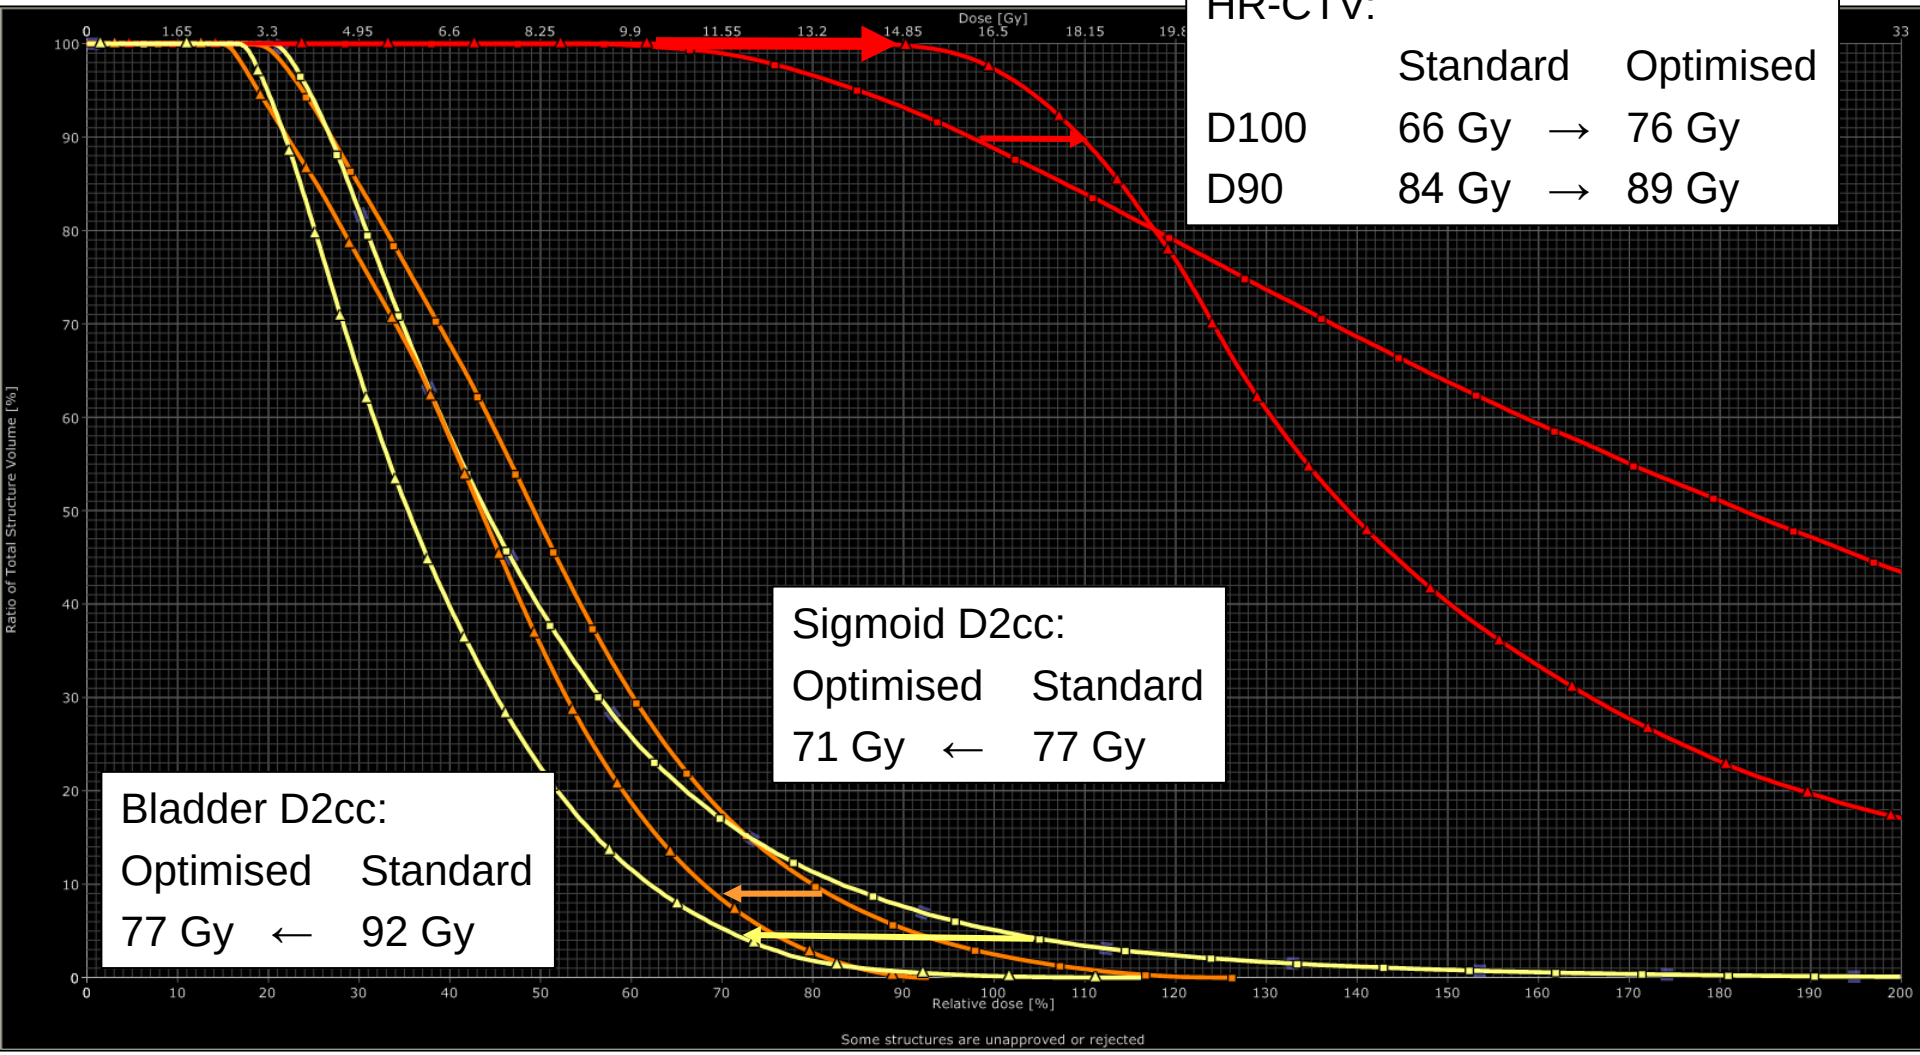
- **10-20% of dwell time in tandem/ring**
- **May be >10-20% if needle is placed directly in the GTV**







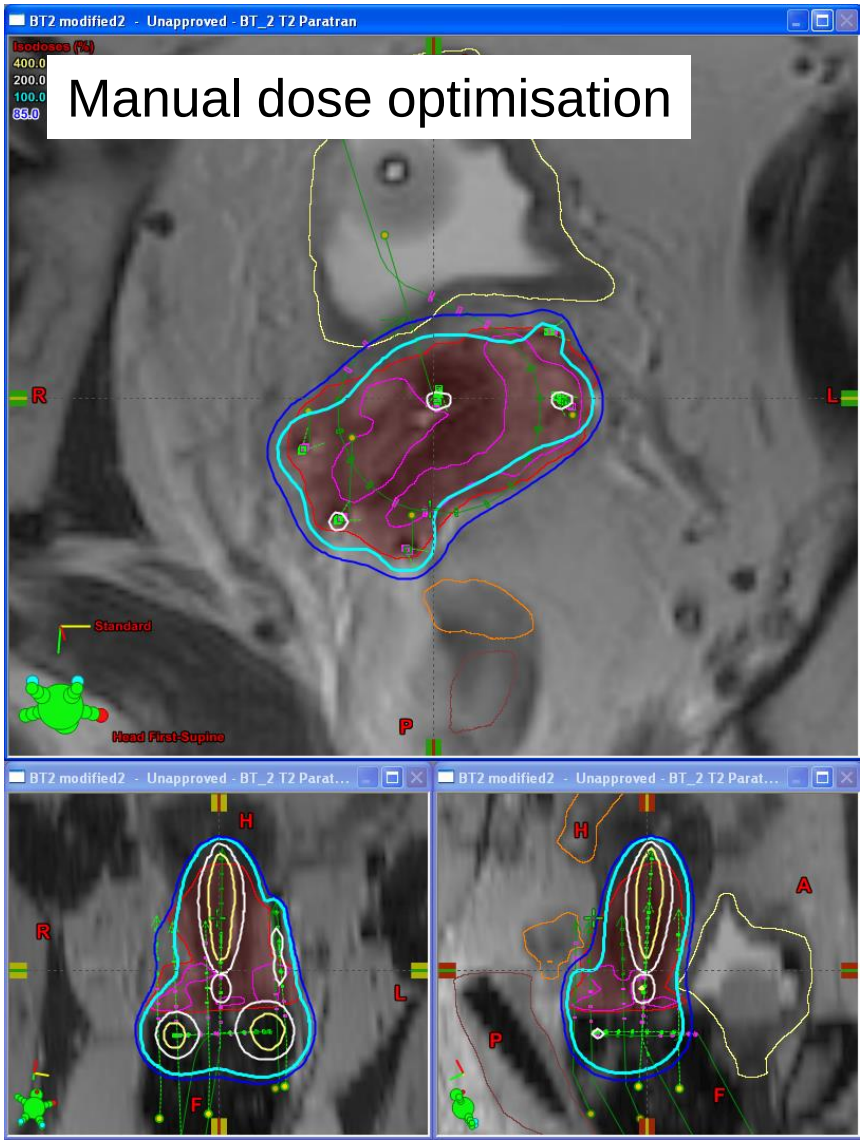
Example 3, DVH

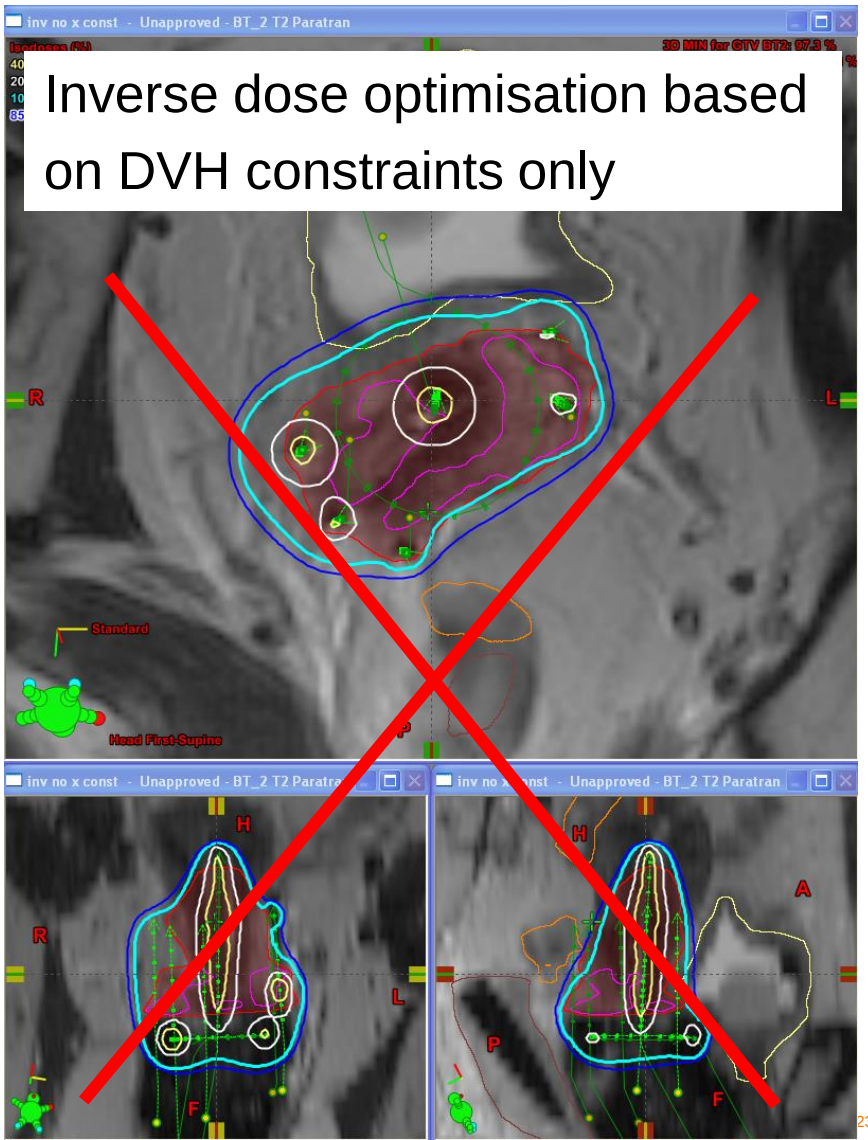


Example 3, summary

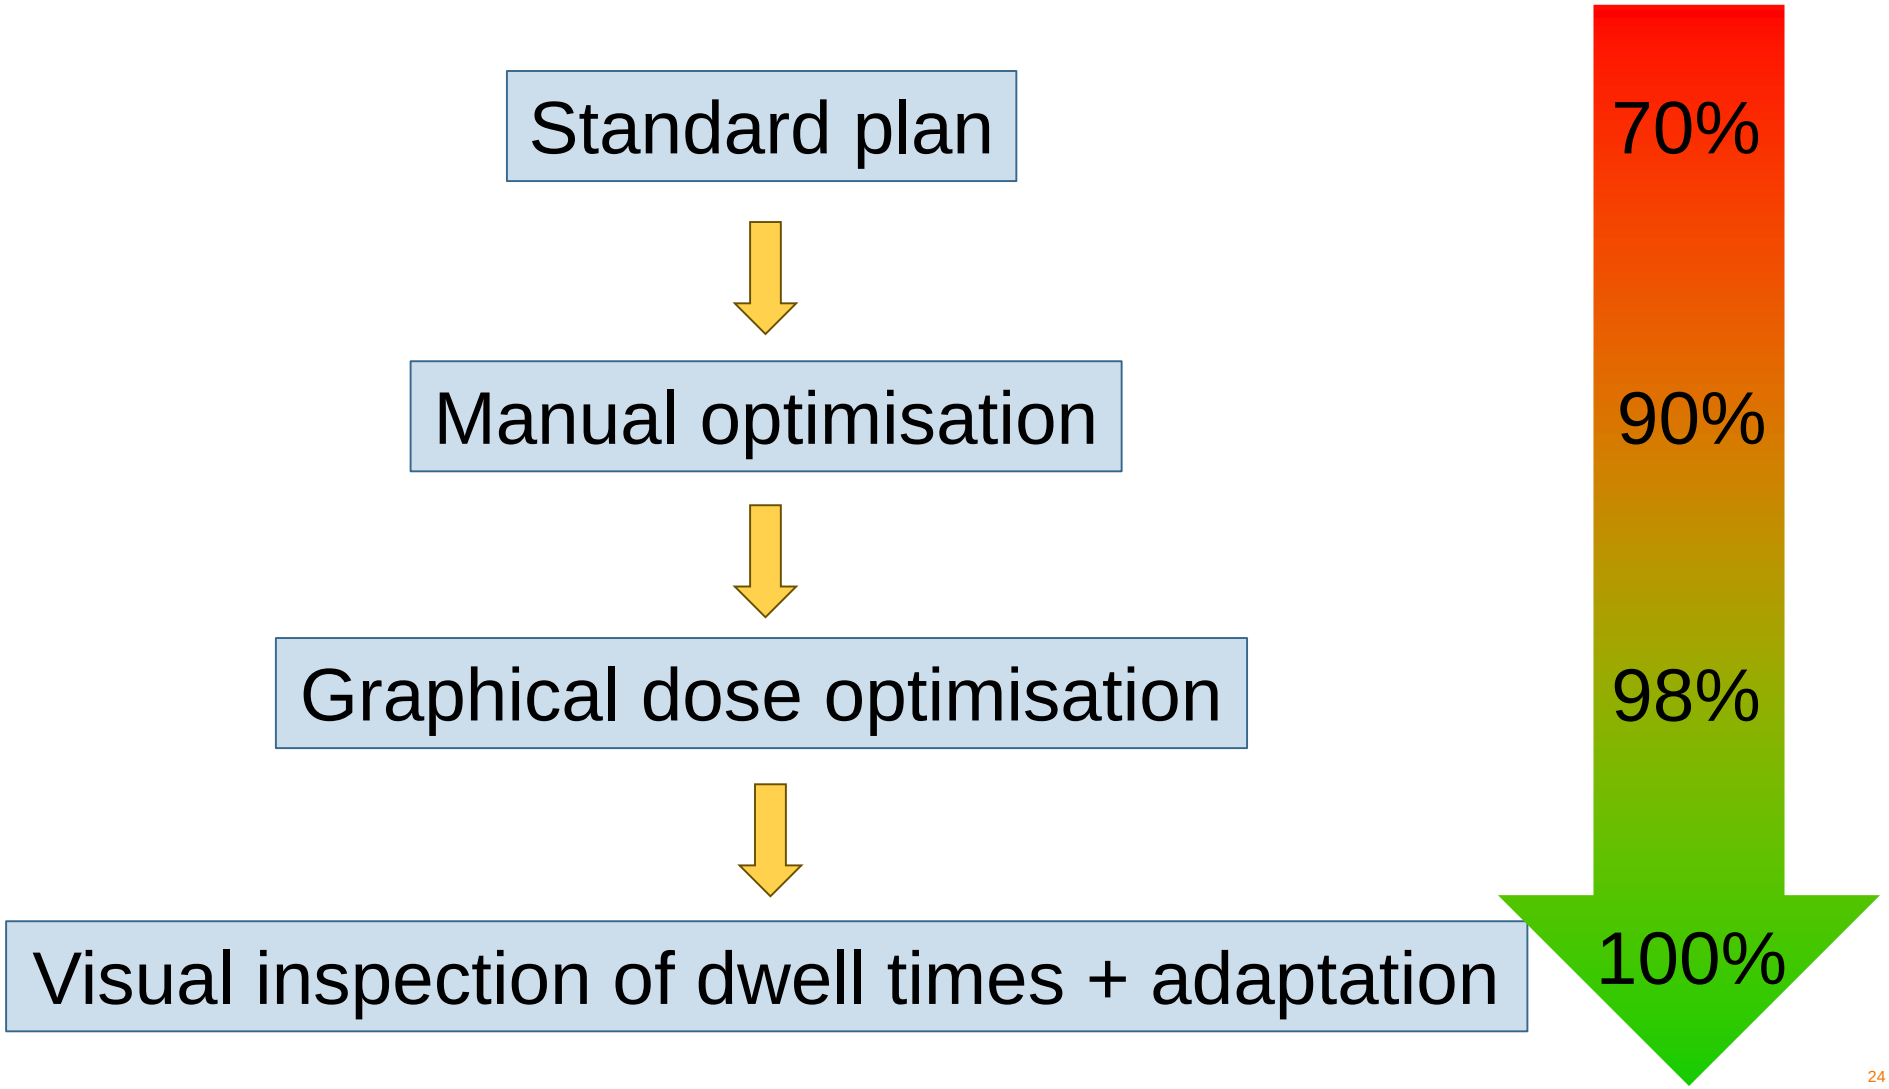
- **Bad response (HR-CTV vol 41cc)**
- **Need of modified applicator (ring+needles)**
- **Needle loading: <20%**
- **Target coverage significantly increased – OAR dose significantly decreased**
- **Planning aim: >85Gy**
- **Prescribed dose HR CTV D90: 89Gy**
- **100% isodose adjusted by ~ 10 mm**

Example 3, inverse planning

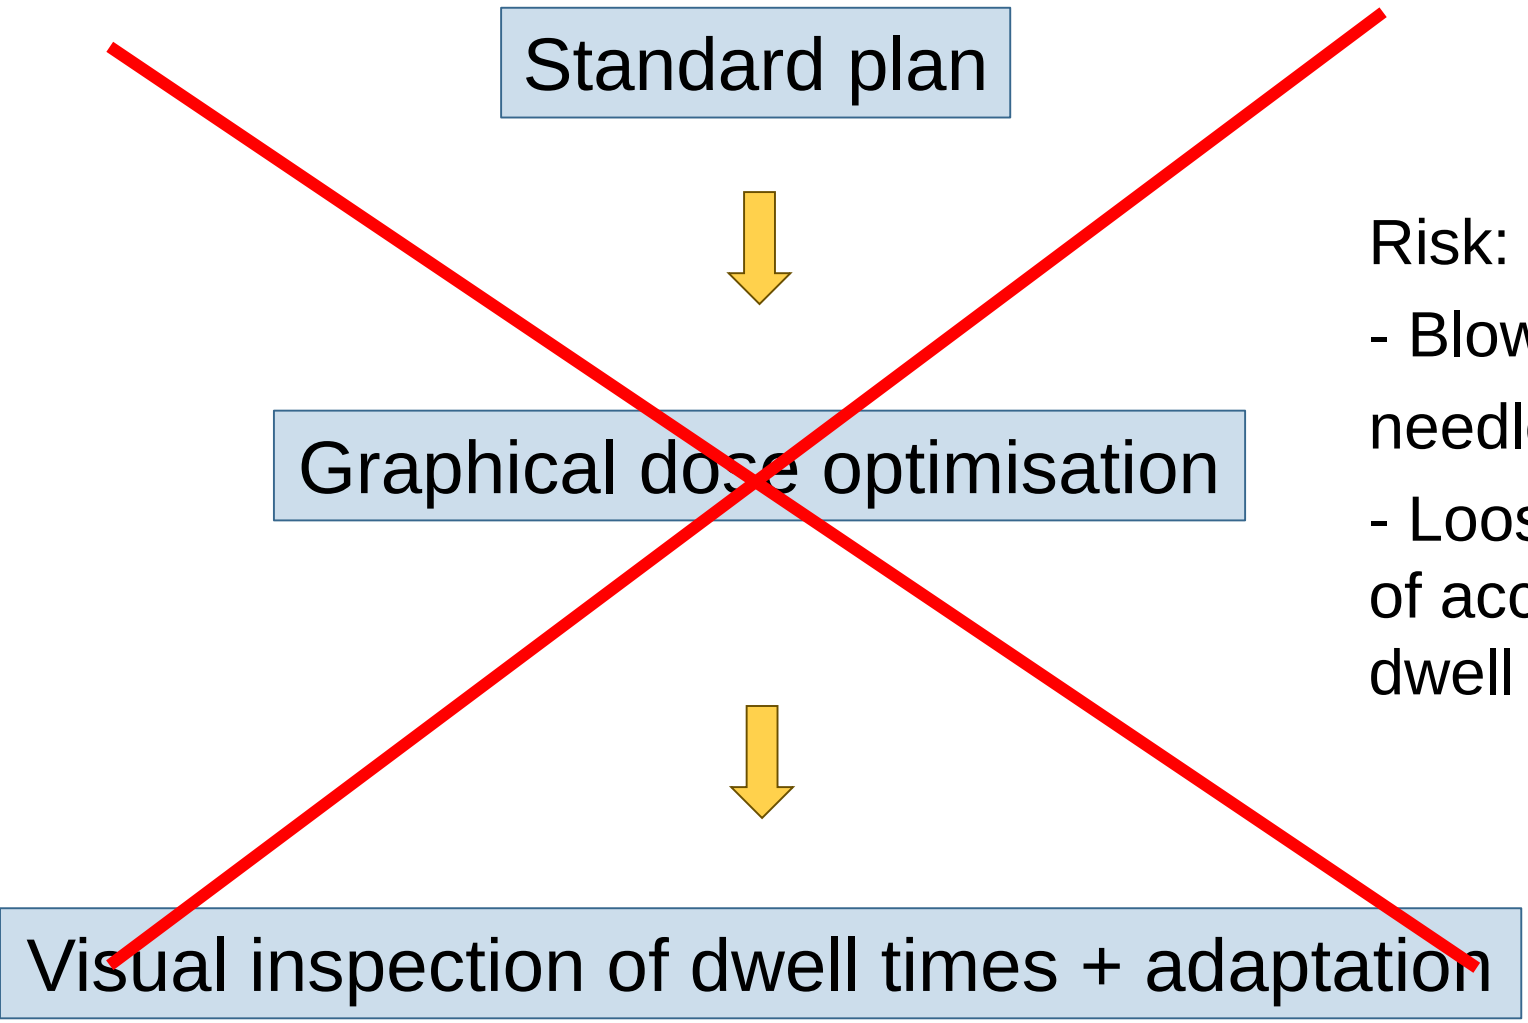




When to use graphical dose optimisation (dose shaper)?



When to use graphical dose optimisation (dose shaper)?

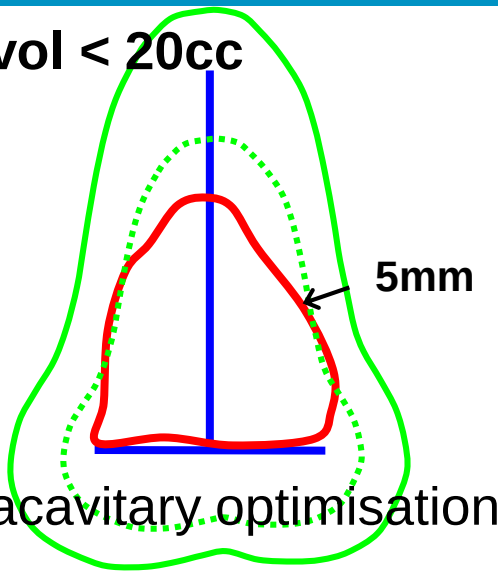


Risk:

- Blowing up needle loading
- Loosing intuition of acceptable dwell times

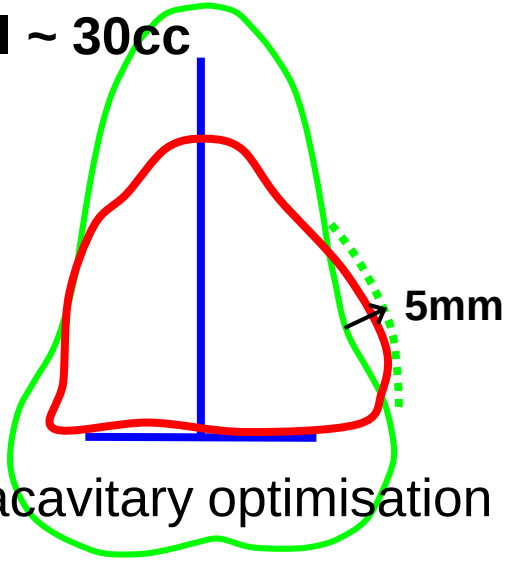
Typical scenarios of dose optimisation

HR-CTV vol < 20cc



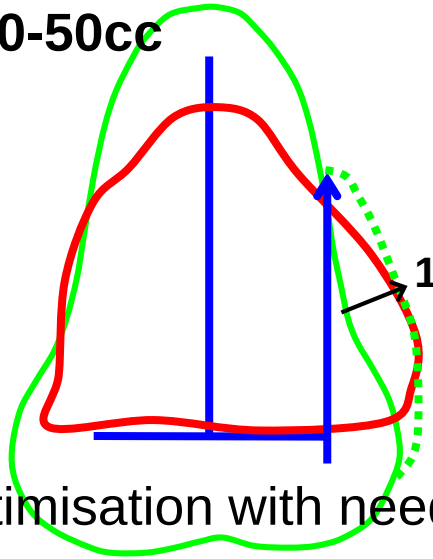
Intracavitary optimisation

HR-CTV vol ~ 30cc



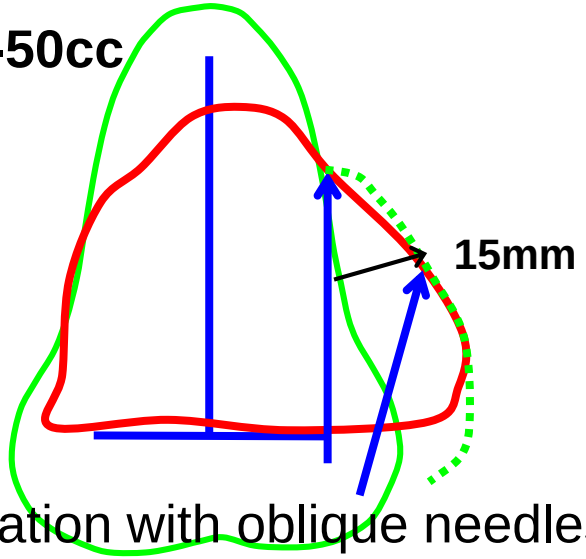
Intracavitary optimisation

HR-CTV vol > 40-50cc



Optimisation with needles

HR-CTV vol > 40-50cc



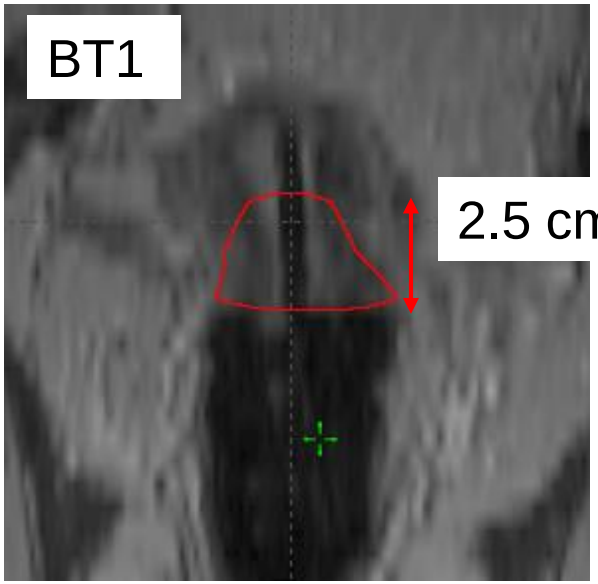
Optimisation with oblique needles

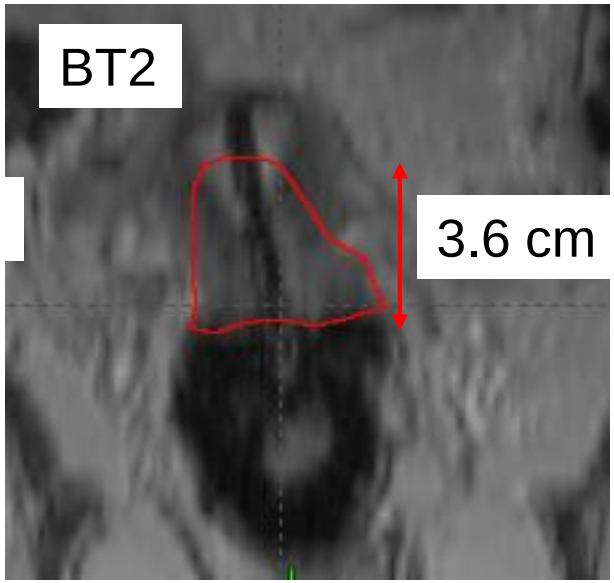
Conclusion – optimisation techniques

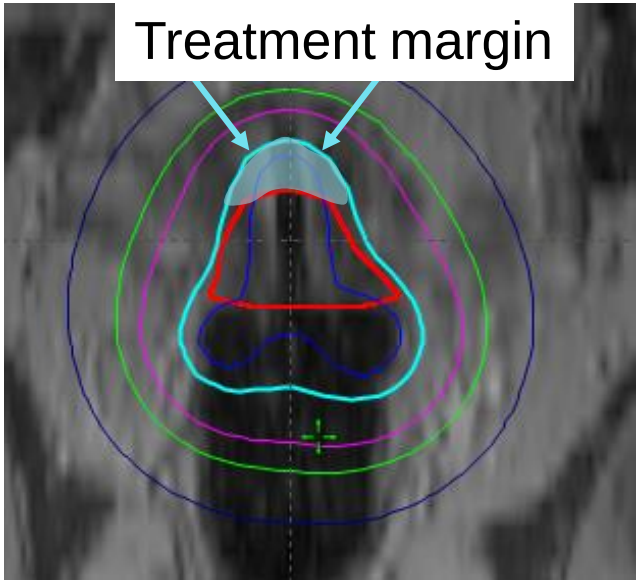
Manual	Conservative and “safe” Iterative procedure Dependent on experience of dose planner
Graphical	Fast for small adaptations and fine tuning after manual opt Beware of: -dwell times -deviations from standard loading
Inverse	Fast Requires extra contouring + manual adaptations Beware of: -dwell times -high dose regions -dose to non-contoured tissue -deviations from standard loading

Example contouring uncertainty

- **Variation in cranial border of HR-CTV**
- **Intra-observer variation!**
- **<u>Load the tandem above the CTV_{HR} when feasible</u>**







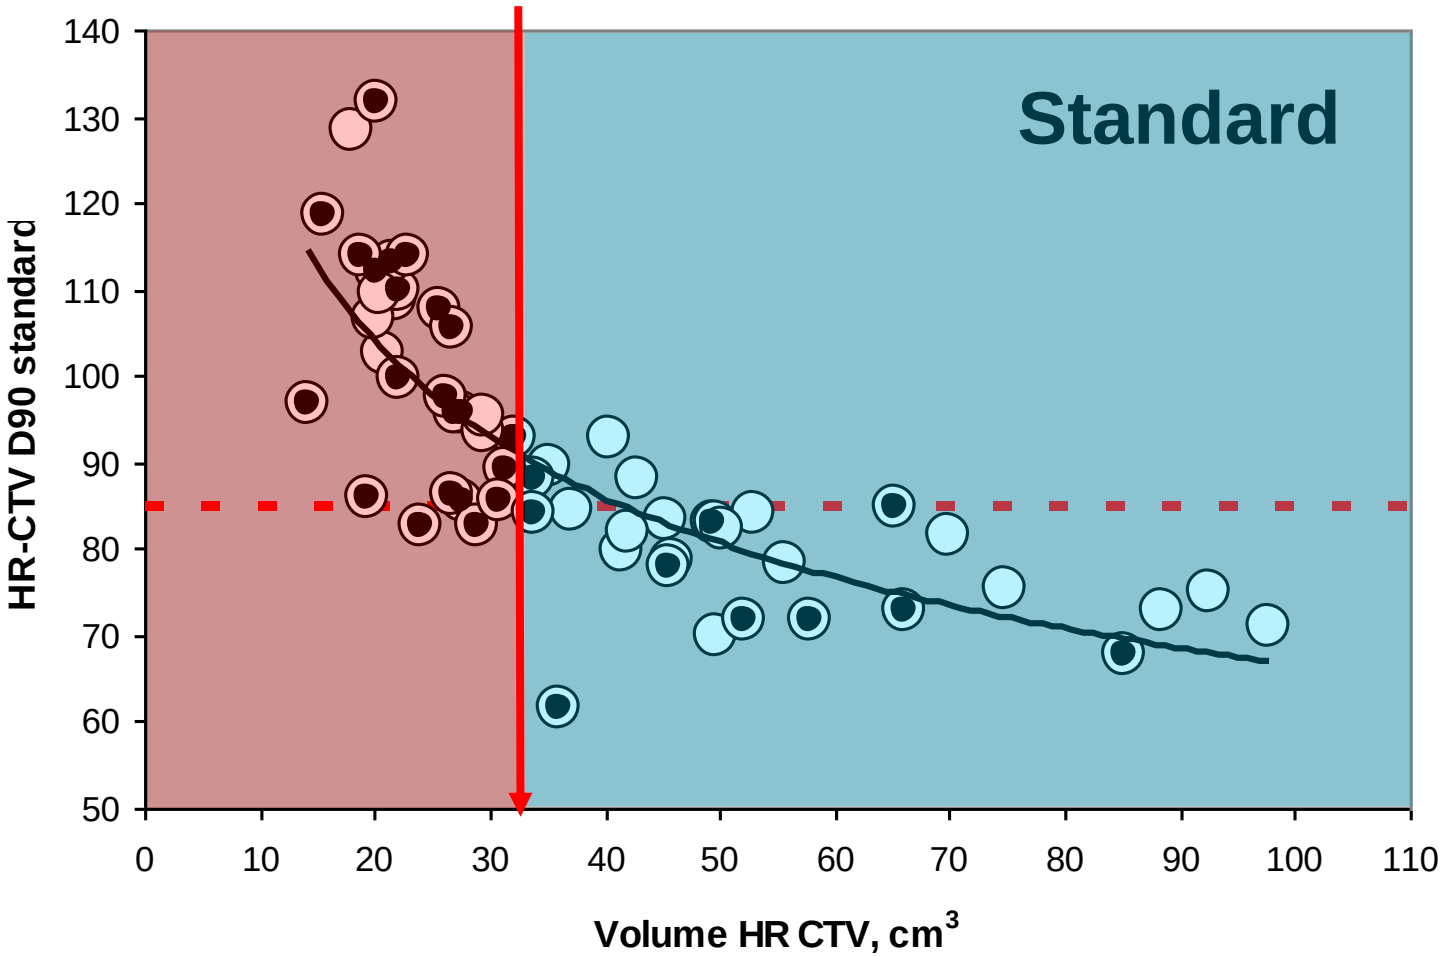
Vaginal dose de-escalation

- **Change of loading pattern:**
  - **Shift of dwell time from vaginal sources to tandm/needles**
  - **E.g. 140% isodose out of vaginal mucosa**
  - **Aim for <30-40% loading in ring/ovoids**

	Aim	Priority
ICRU recto-vaginal point dose	<65Gy EQD2 (EBRT+BT)	Primary
The ratio of vaginal TRAK and total TRAK	<30-40%	Secondary
Vaginal lateral dose points at 5mm	<85Gy EQD2 (EBRT+BT)	Secondary
Visual inspection of the 140% isodose	Intruding as little as possible into vaginal tissue, and preferentially located within the applicator	Secondary

Volume is important!

Median volume: 32cc

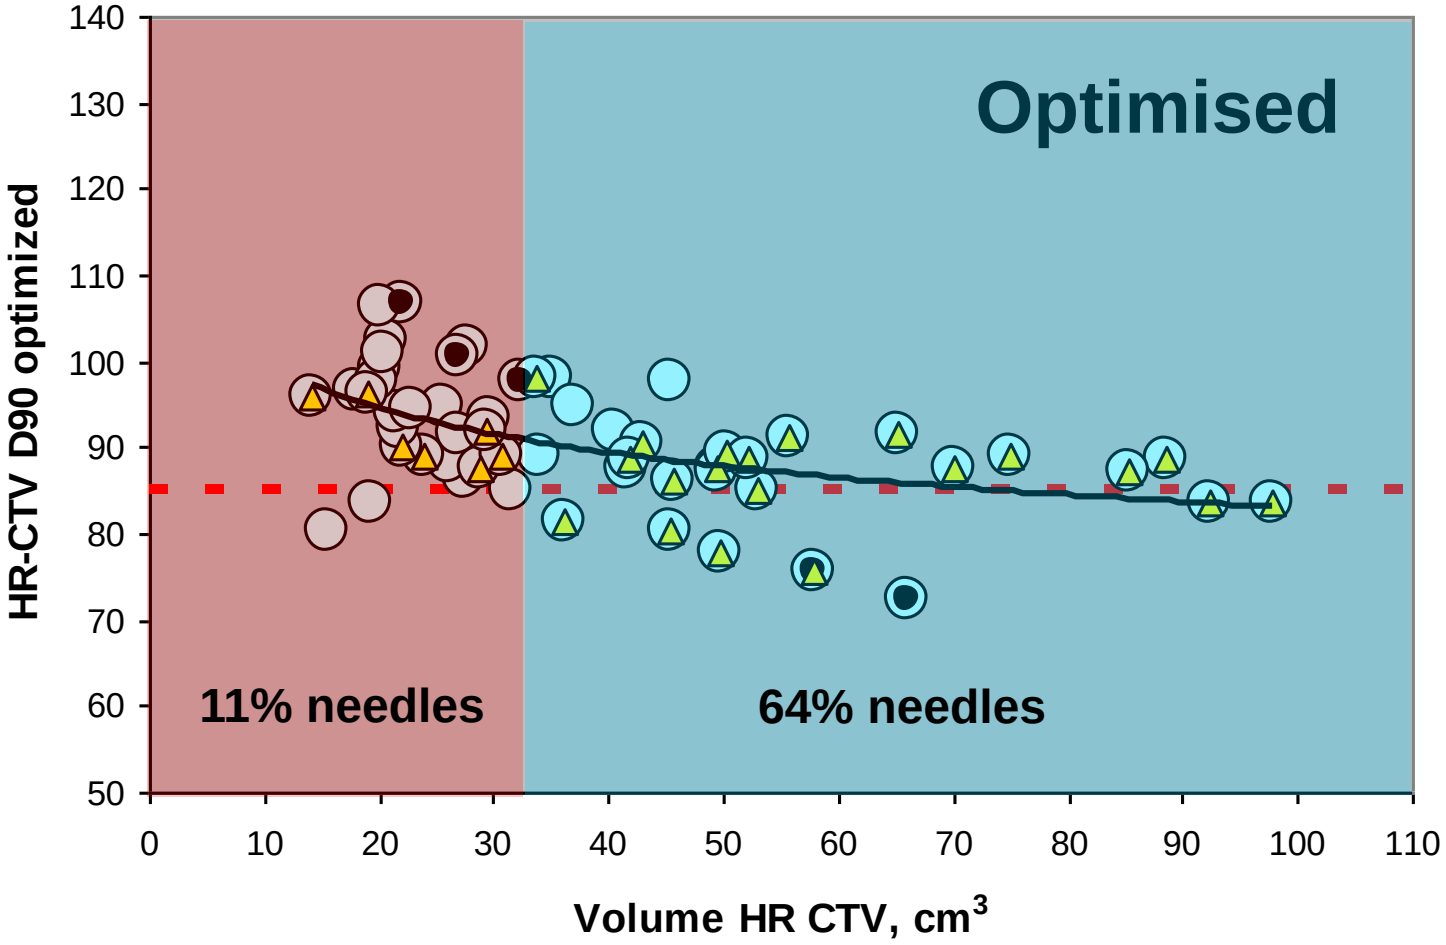


- Violation of OAR constraint

K Tanderup et al, Radiother Oncol 2010

Volume is important!

K Tanderup et al, Radiother Oncol 2010

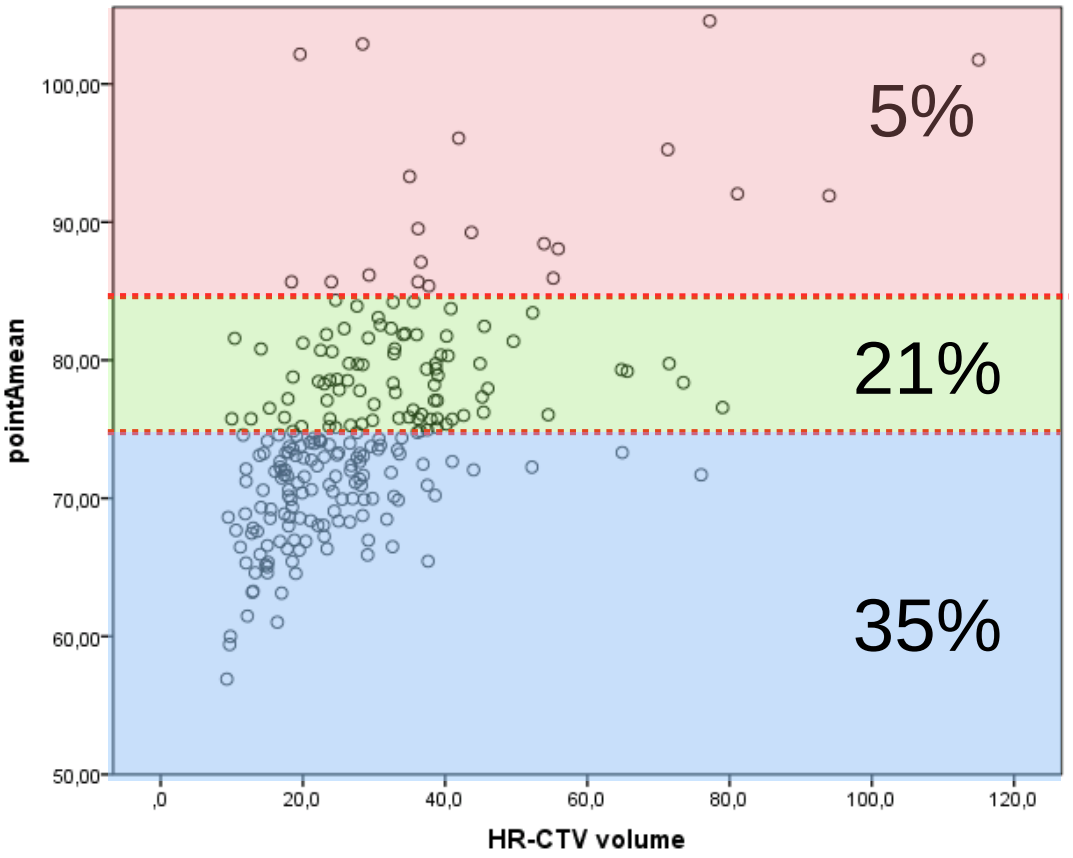


Violation of OAR constraint

Application of needles

Point A dose and HR CTV volume EMBRACE - Intracavitary applications

- **There is a significant variation of point A dose as compared to traditional levels like 75Gy and 85Gy**
  - **35% < 75Gy**
  - **44% either >85Gy or IC/IS**

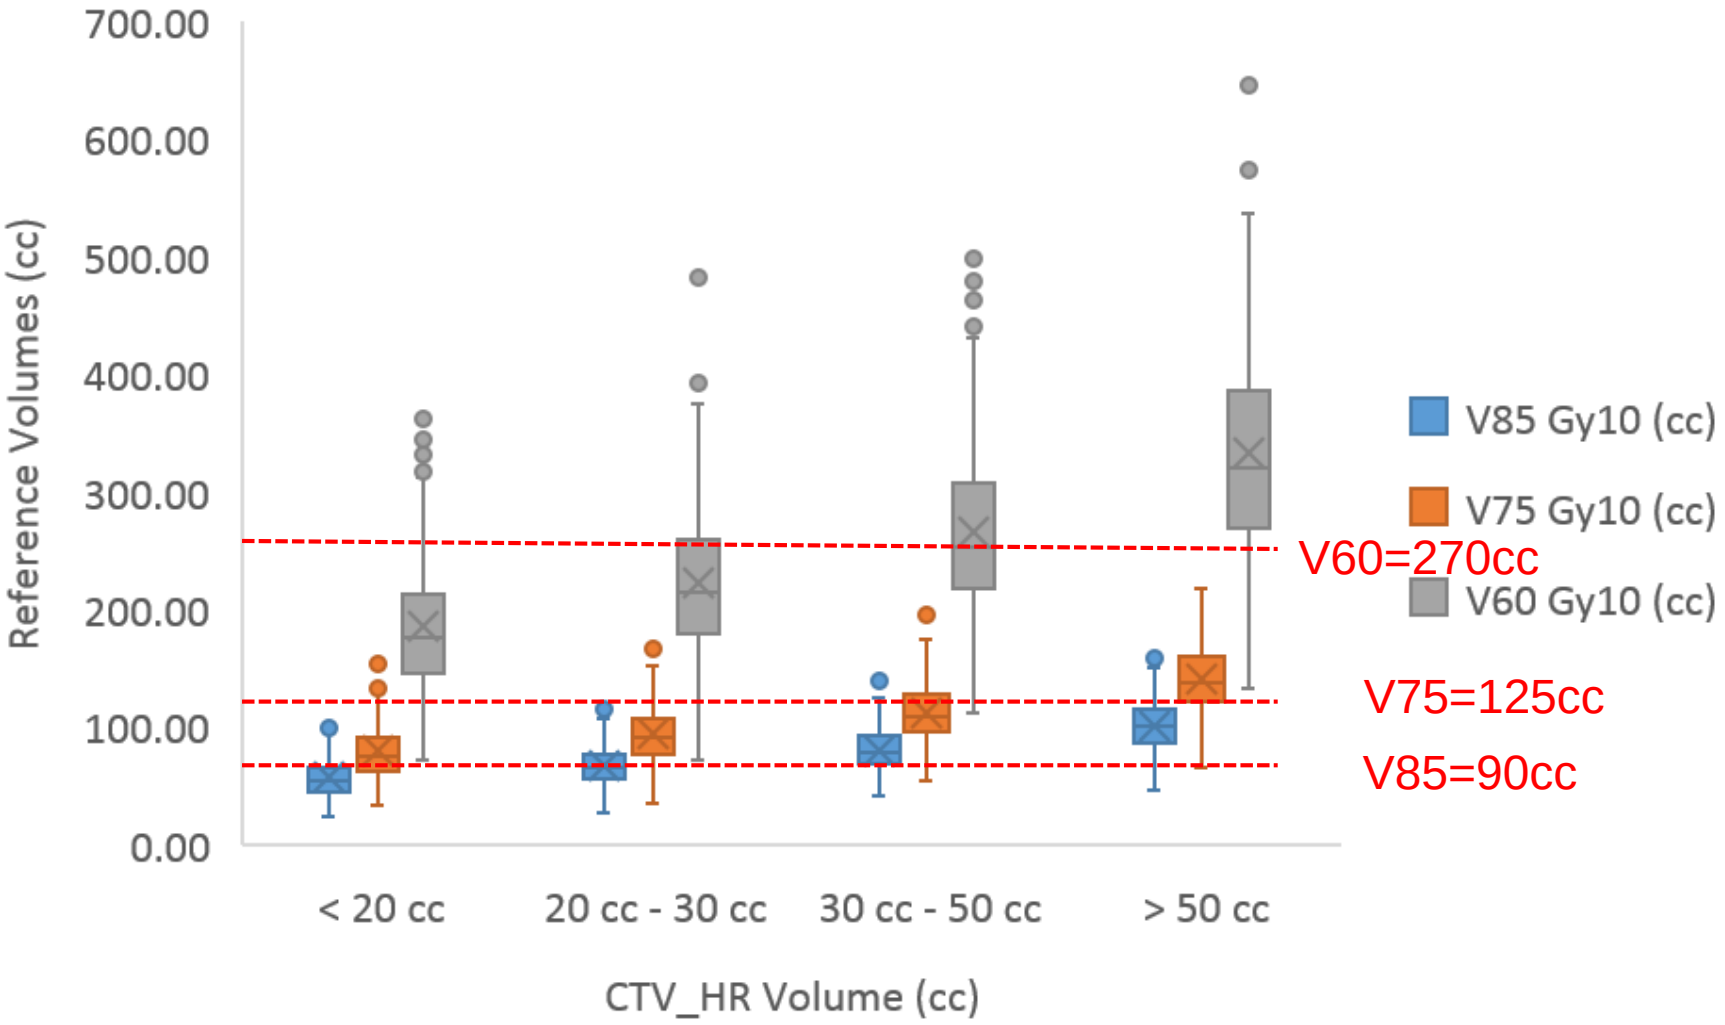


+ 39% IC/IS

Irradiated volumes of optimised plans

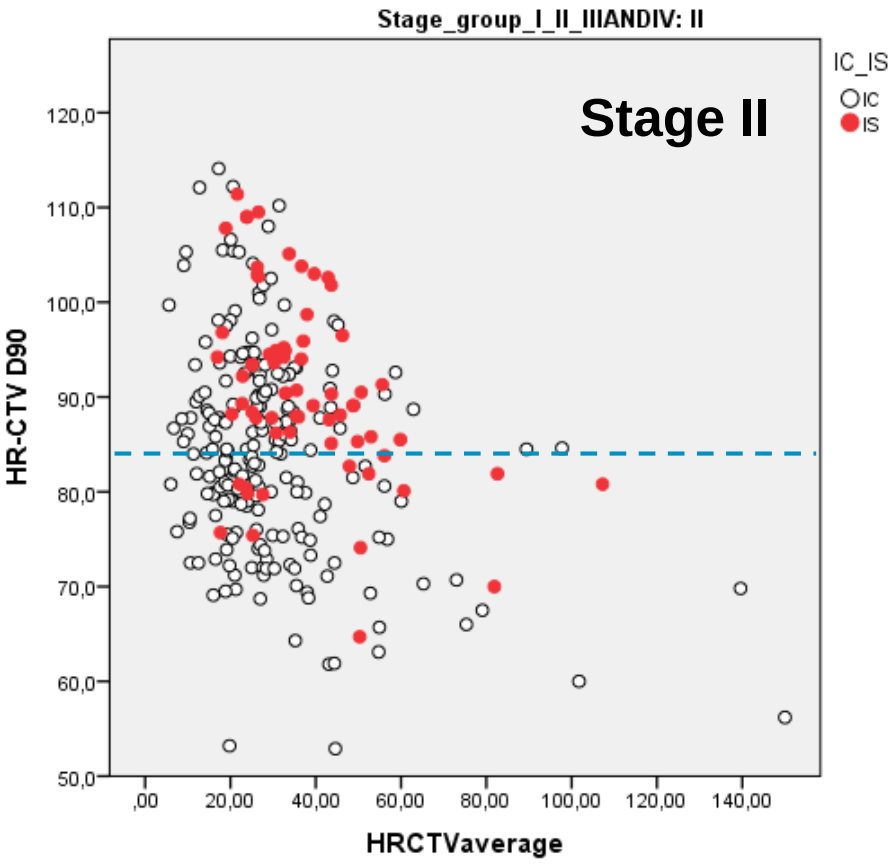
	No. patients	V85 Gy $EQD2_{10}$ (cm^3)	V75 Gy $EQD2_{10}$ (cm^3)	V60 Gy $EQD2_{10}$ (cm^3)
All patients	1204	71 (23 ÷ 184)	99 (34 ÷265)	230(72 ÷ 786)
CTV_{HR} < 30 cm^3	670	60 (23 ÷ 118)	83 (34 ÷ 166)	195 (72 ÷ 392)
$CTV_{HR} \geq 30$ cm^3	534	86 (41 ÷ 184)	119 (55 ÷265)	278 (112 ÷ 786)
Stage I & II	957	69 (23 ÷ 184)	96 (34 ÷265)	225 (71 ÷786)
Stage III & IV	230	80 (28 ÷ 171)	111 (37 ÷ 230)	258 (79 ÷ 645)
Standard plan (T&R, T&O)	-	89 (78, 100)	124 (109, 138)	270 (247, 293)

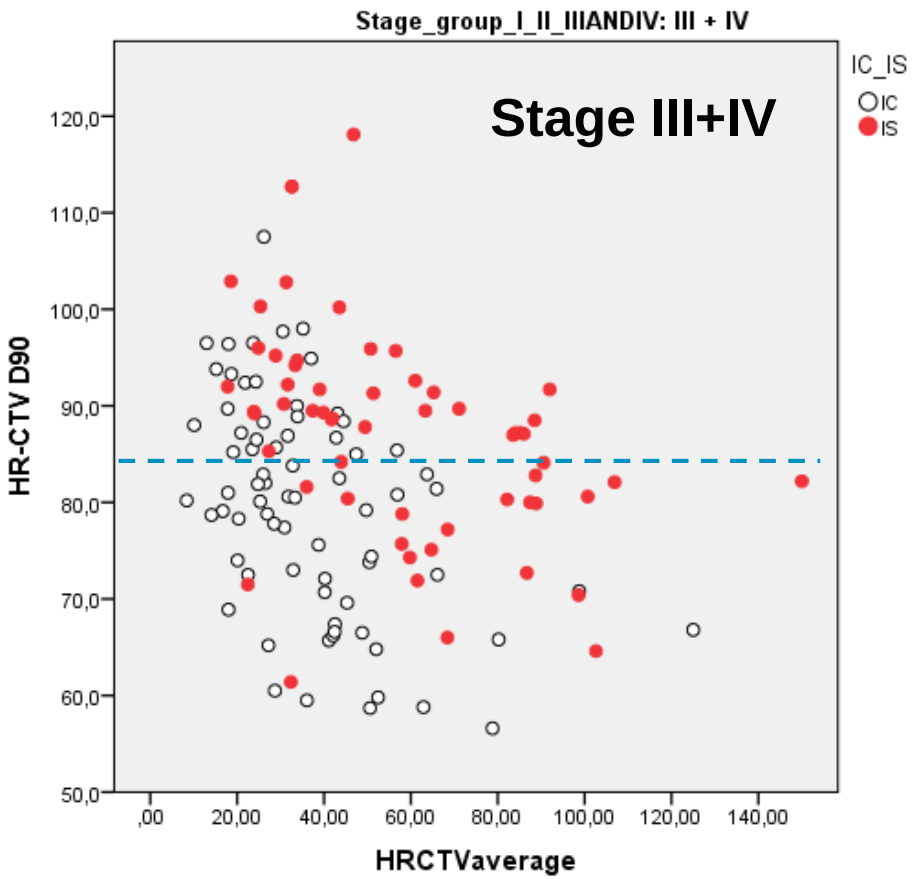
Irradiated volumes of optimised plans



Importance of needles

IC/IS increases therapeutic window by ~10Gy ***(Fokdal L et al. Radiother Oncol 2013 April;107(1):63-8)***





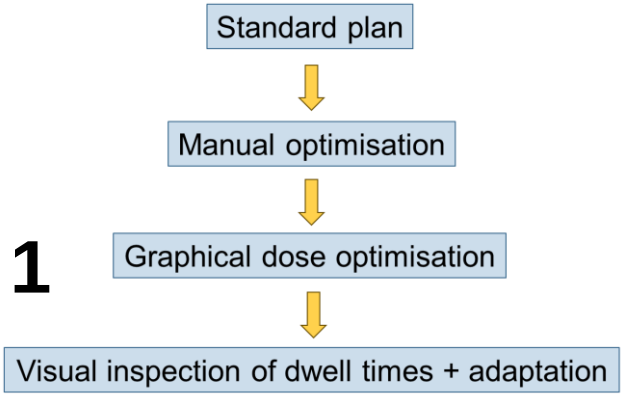
Take home message – dose optimisation

- **Always start dose optimisation with standard loading pattern**
- **Use manual dose optimisation for major changes**
- **Use graphical optimisation for minor adaptation**
- **Needle loading: start with 10-20%**

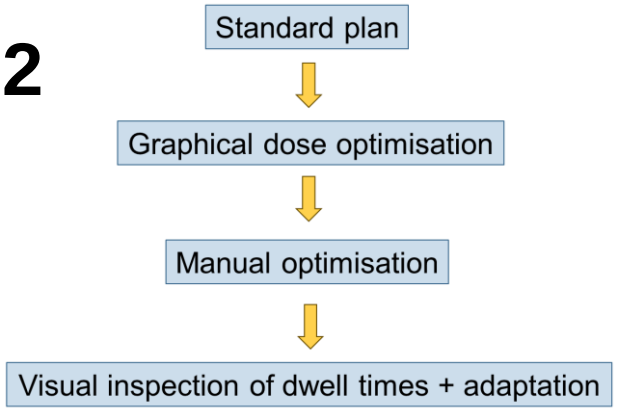
- **Application of combined intracavitary-interstitial applicator: increased therapeutic window by ~10Gy**

I prefer to do optimisation

A. Flow 1

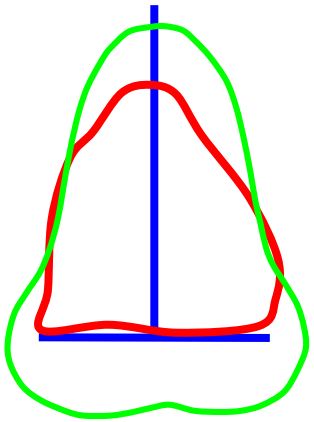


B. Flow 2

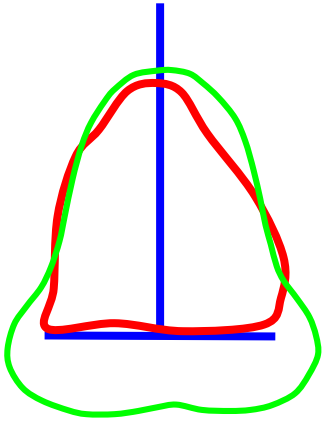


Which dose distribution do you prefer?

A. **Plan 1**



B. **Plan 2**



Radiobiological models to combine dose from external beam radiotherapy and brachytherapy (HDR, MDR, LDR, PDR)

Daniel Berger, Kari Tanderup

ESTRO-AROI Teaching Course
Transition from conventional 2D to 3D radiotherapy with a special emphasis on brachytherapy in cervical cancers

Bengaluru 2017

Challenge

- Brachytherapy is hypo-fractionated
- A variety of schedules exist:
  - 7Gy x 3
  - 9Gy x 2
  - 7Gy x 4
- How to communicate doses between institutions?
- We need biologically equieffective doses!

Prescribing, Recording, and Reporting Brachytherapy for Cancer of the Cervix

OXFORD UNIVERSITY PRESS

INTERNATIONAL COMMISSION ON RADIATION UNITS AND MEASUREMENTS

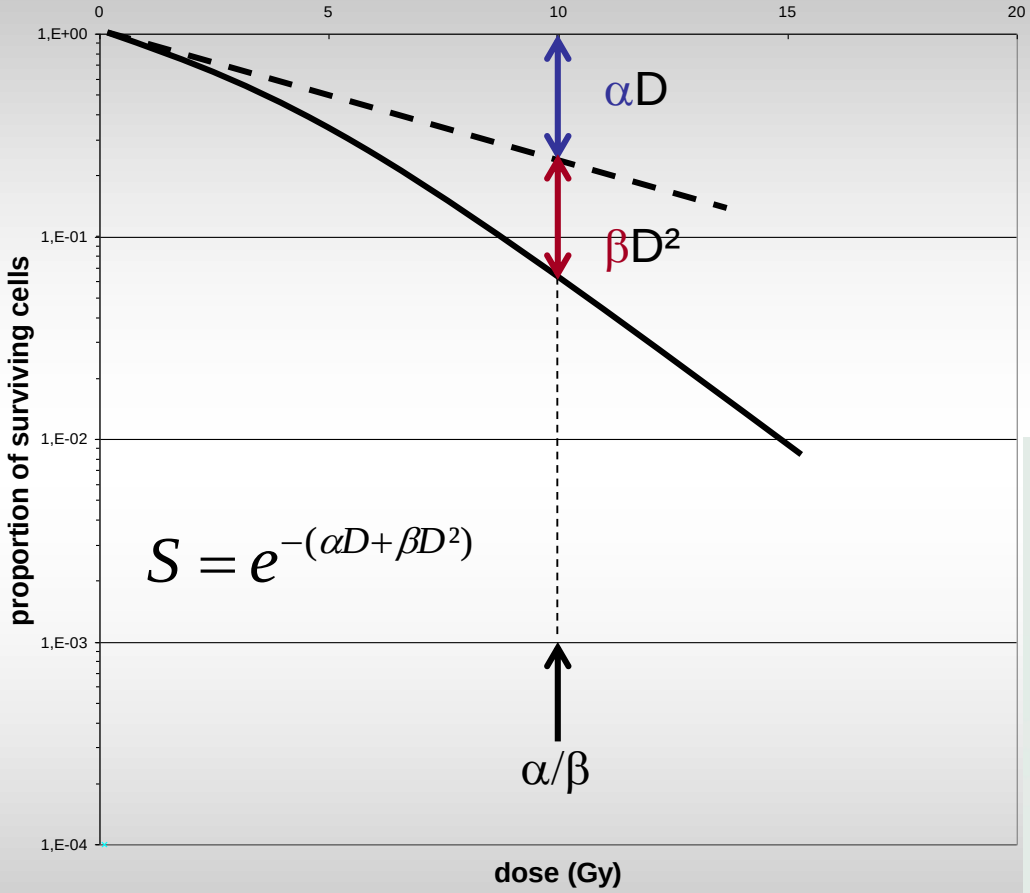
4 R's of radiobiology

- Repair
  - Repair of sub-lethal DNA damage
- Redistribution
  - Radiosensitivity depends on phase in the cell cycle → redistribution changes radiosensitivity
- Repopulation
  - Cell divide during a radiotherapy treatment
- Reoxygenation
  - Radiosensitivity changes due to change in oxygenation

Which of the following radiobiological effect(s) is(are) taken into account in the EQD2 calculation when using the LQ-model?

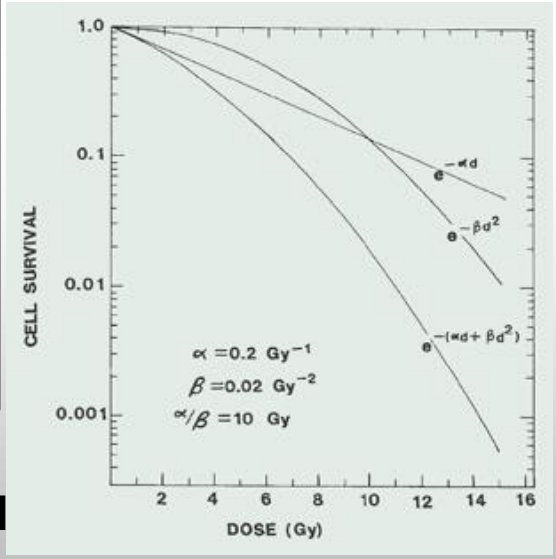
A. Repair
B. Redistribution
C. Repopulation
D. Reoxygenation
E. all

Linear-Quadratic Model



-> Lethal damage

-> Sublethal damage



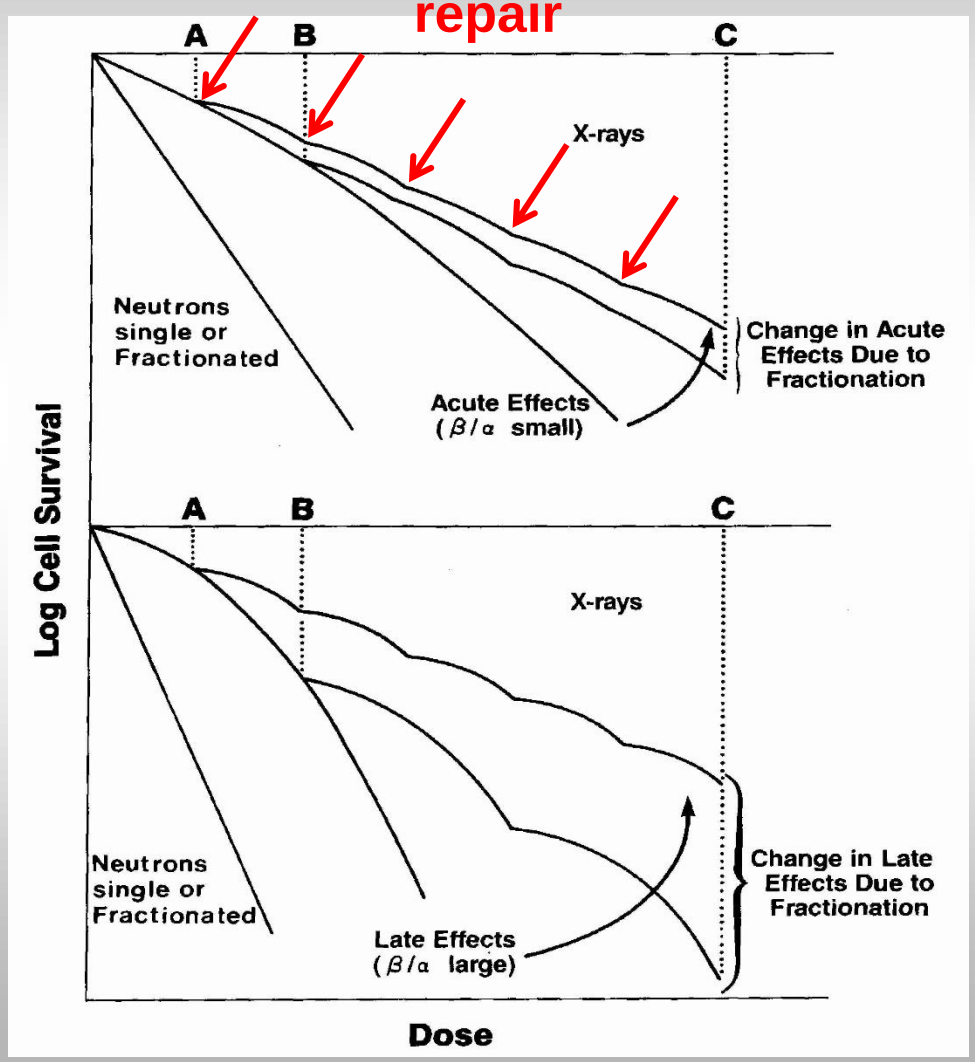
Survival curve according to the LQ-model

This can be used to fit a continuously bending curve to cell survival data

remember survival curve by Puck and Marcus

Fractionation & acute and late reacting tissue

Repair between fractions:
- The shape of curve starts over again!



LQ model

- **Recovery or Repair (half-time ~1.5hour)**
- ~~**Redistribution**~~
- ~~**Repopulation (< 1 day)**~~
- ~~**Reoxygenation**~~

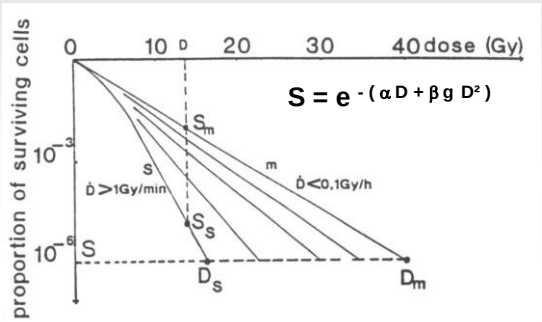
Considered in the mathematical description (“equation”)

Radiobiological Considerations HDR

Linear - Quadratic model for incomplete monoexponential sublethal (DNA) damage repair

- **Biologically Effective Dose:**

$$BED = nd\,[\,1 + d\,/\,(\alpha/\beta)\,]$$



The Role of Dose Rate in Brachytherapy (J. Dutreix) In: A Practical Manual of Brachytherapy (Pierquin / Marinello, Medical Physics Publishing)

- **BED ... <u>virtual dose value</u> that produces the same biological effect as the physical dose with an infinite low dose rate**

n ... number of equal fractions
d … dose per fraction

<u>tissue dependent parameters :</u>

α/β ...parameter describing lethal / sublethal lesions

Calculation of EQD2 for HDR

EQD2: Absorbed doses that, when delivered with 2Gy per fraction, would produce the same biologic effect

$$EQD_2 = n \cdot d \frac{d + \alpha/\beta}{2 + \alpha/\beta}$$

- n: number of fractions
- d: fractional dose
- Tumor $\alpha/\beta=10$
- Late morbidity $\alpha/\beta=3$

EXAMPLE: Calculation of EQD2 for HDR 1 fraction of 7Gy

- D: total dose
- d: fractional dose
- Tumor $\alpha/\beta=10$
- Late morbidity $\alpha/\beta=3$

$$EQD_2 = n \cdot d \frac{d + \alpha/\beta}{2 + \alpha/\beta}$$

Tumour

$$EQD_2 = 7 \cdot \frac{7+10}{2+3} Gy = 10Gy$$

Organ at risk

$$EQD_2 = 7 \cdot \frac{7+3}{2+3} Gy = 14Gy$$

EXAMPLE: Calculation of EQD2 for HDR 3 fractions of 7Gy

- D: total dose
- d: fractional dose
- Tumor $\alpha/\beta=10$
- Late morbidity $\alpha/\beta=3$

$$EQD_2 = n \cdot d \frac{d + \alpha/\beta}{2 + \alpha/\beta}$$

Tumour

$$EQD_2 = 7 \cdot 3 \cdot \frac{7+10}{2+3} Gy = 30Gy$$

Organ at risk

$$EQD_2 = 7 \cdot 3 \cdot \frac{7+3}{2+3} Gy = 42Gy$$

Limitations of the EQD2 model for BT

- **Chemotherapy is not taken into account**
- **Uncertainty increases for single fraction dose values >10Gy**
- **Only cell repair is considered**
- **α/β values and $T_{1/2}$ are under discussion (E.g. tumour type prostate, OAR etc.)**
- **Overall uncertainty of the biological dose calculation (values) in the range of ~10% -> Reasonable rounding of values**

EBRT + BT dose

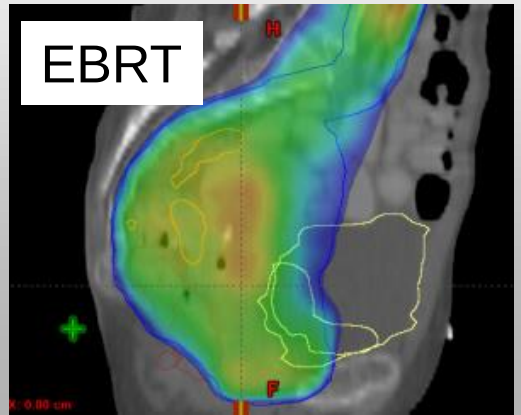
- Dose in elective target volume:
  - Assumption: homogeneous dose 95%-107% of prescribed dose (PD)

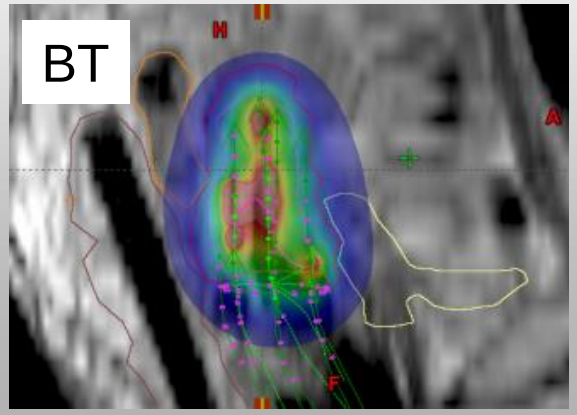
Good approximation:

Target: $D90\ (total) = PD_{(EBRT)} + D90(BT)$

OAR: $D_{2cm3}\ (total) = PD_{(EBRT)} + D_{2cm3}(BT)$

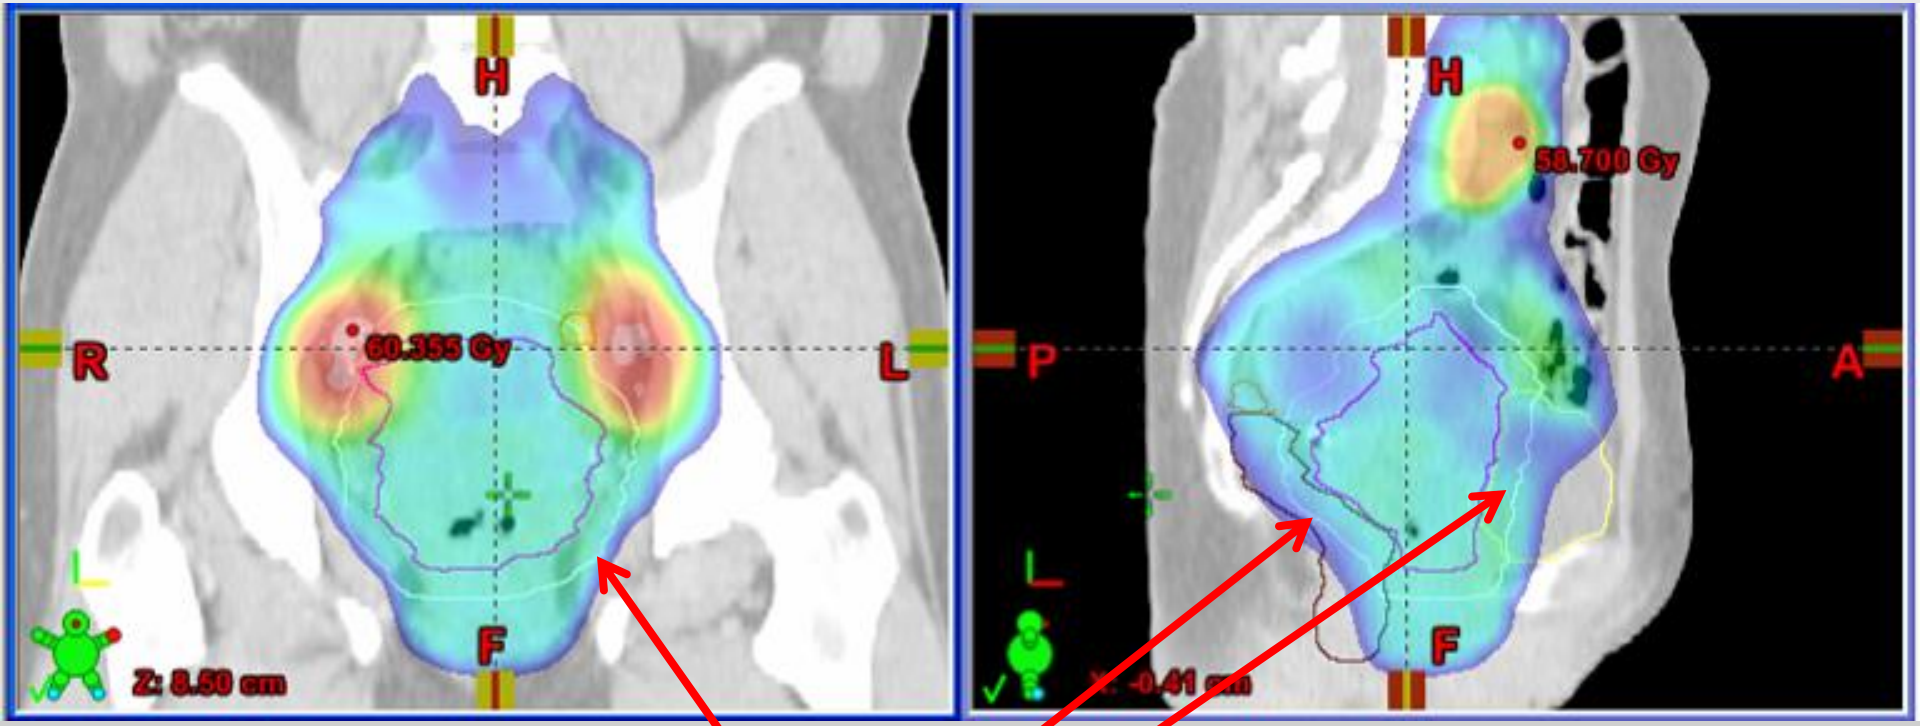
~~**NOT:** $D_{2cm3}\ (total) = D_{2cm3\ (EBRT)} + D_{2cm3}(BT)$~~





Be aware of IMRT hot spots in the BT region!

Lymph node boost: Create homogeneous dose during planning!

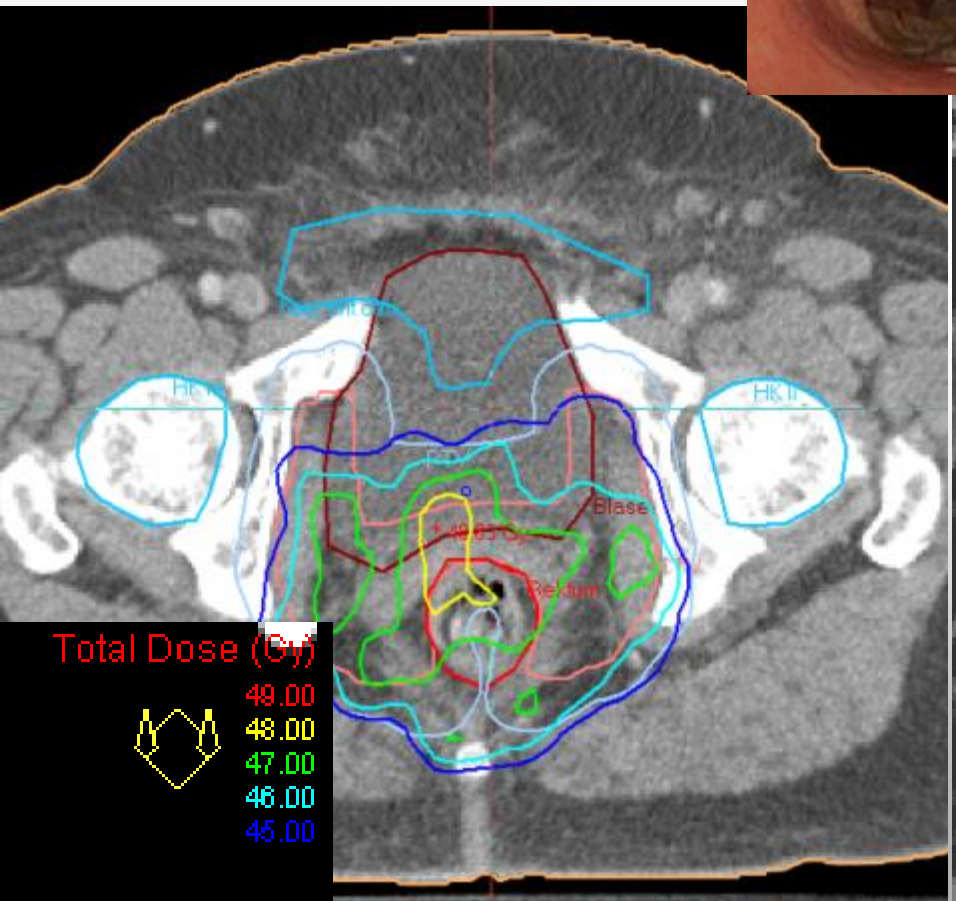


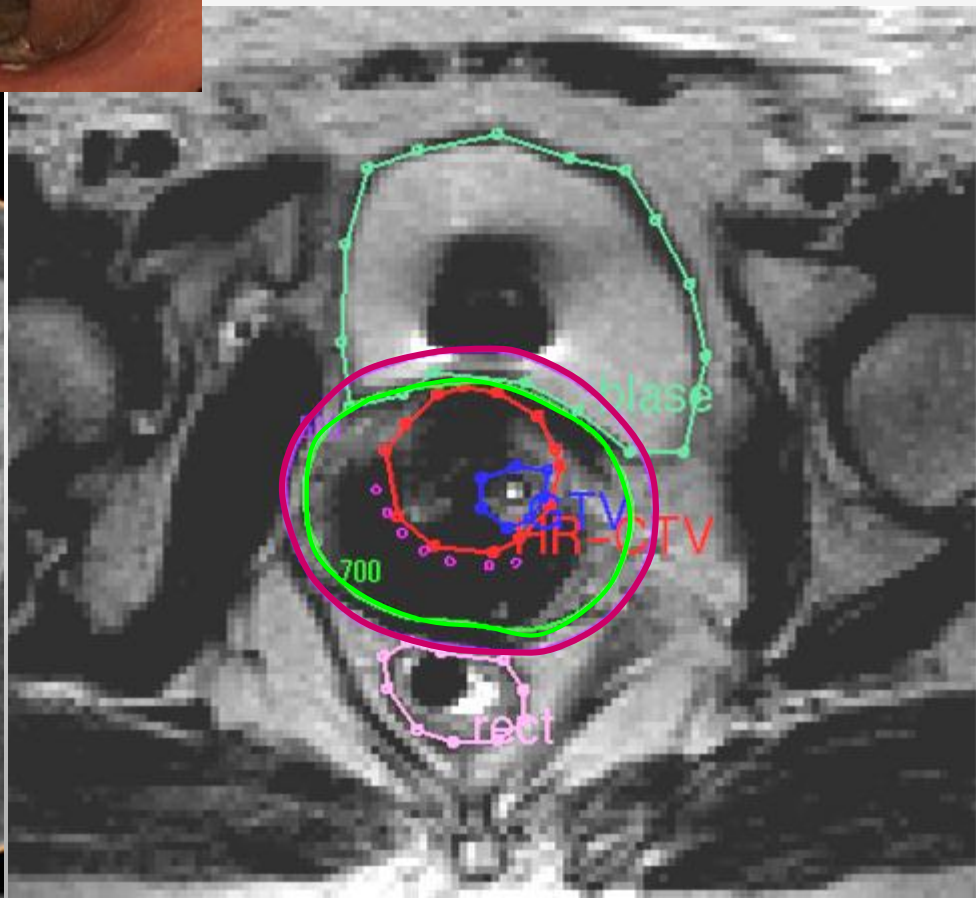
Homogenous volume for inverse dose planning

How could this happen?

D2cm3 = 65.7 Gy EQD2$_{(\alpha/\beta=3)}$

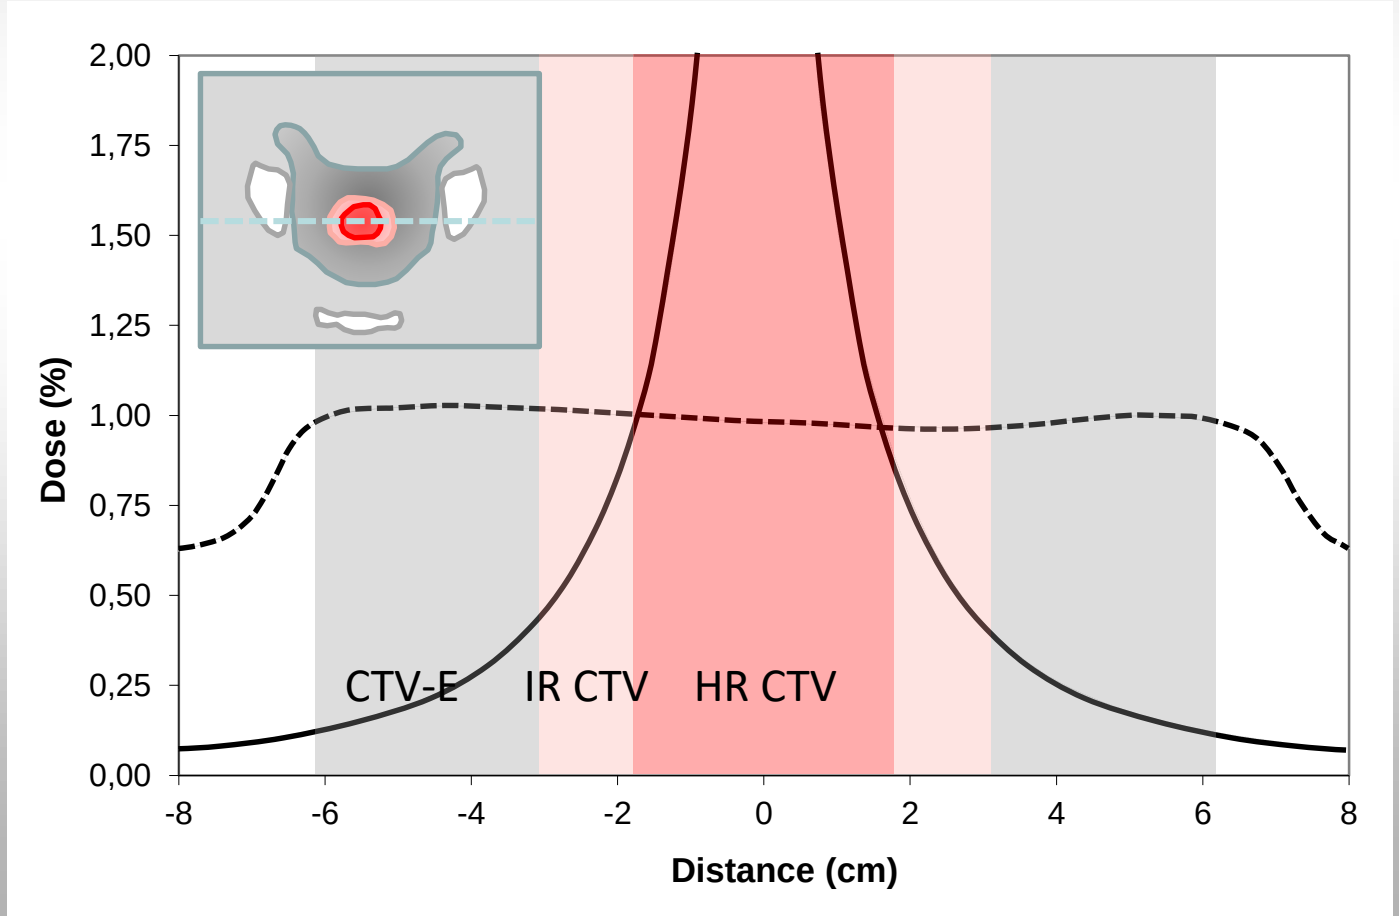
D2cm3 = 79.2 Gy EQD2$_{(\alpha/\beta=3)}$



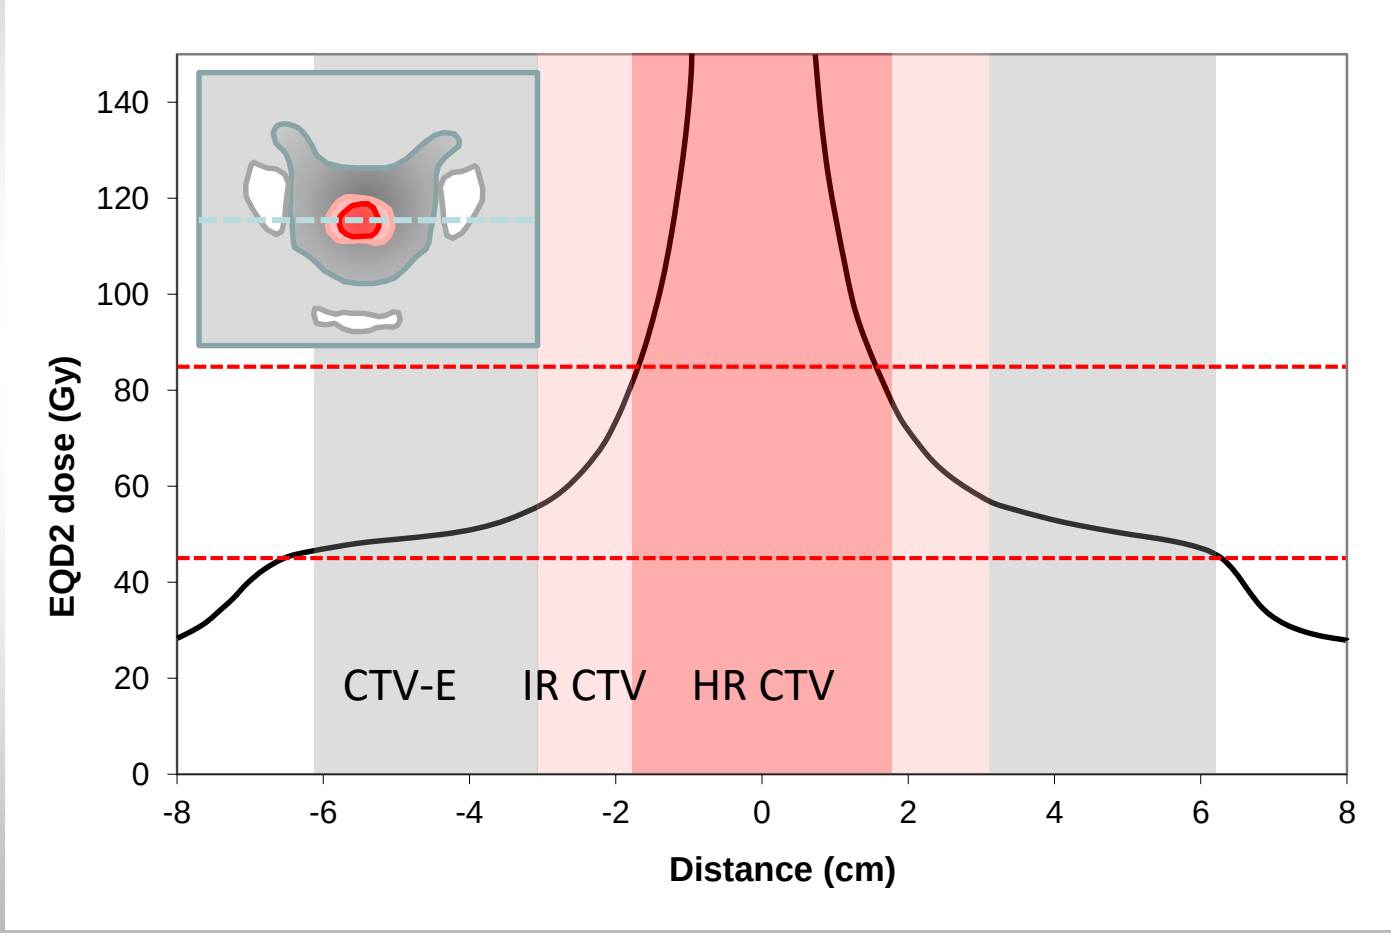


Depth dose: physical dose

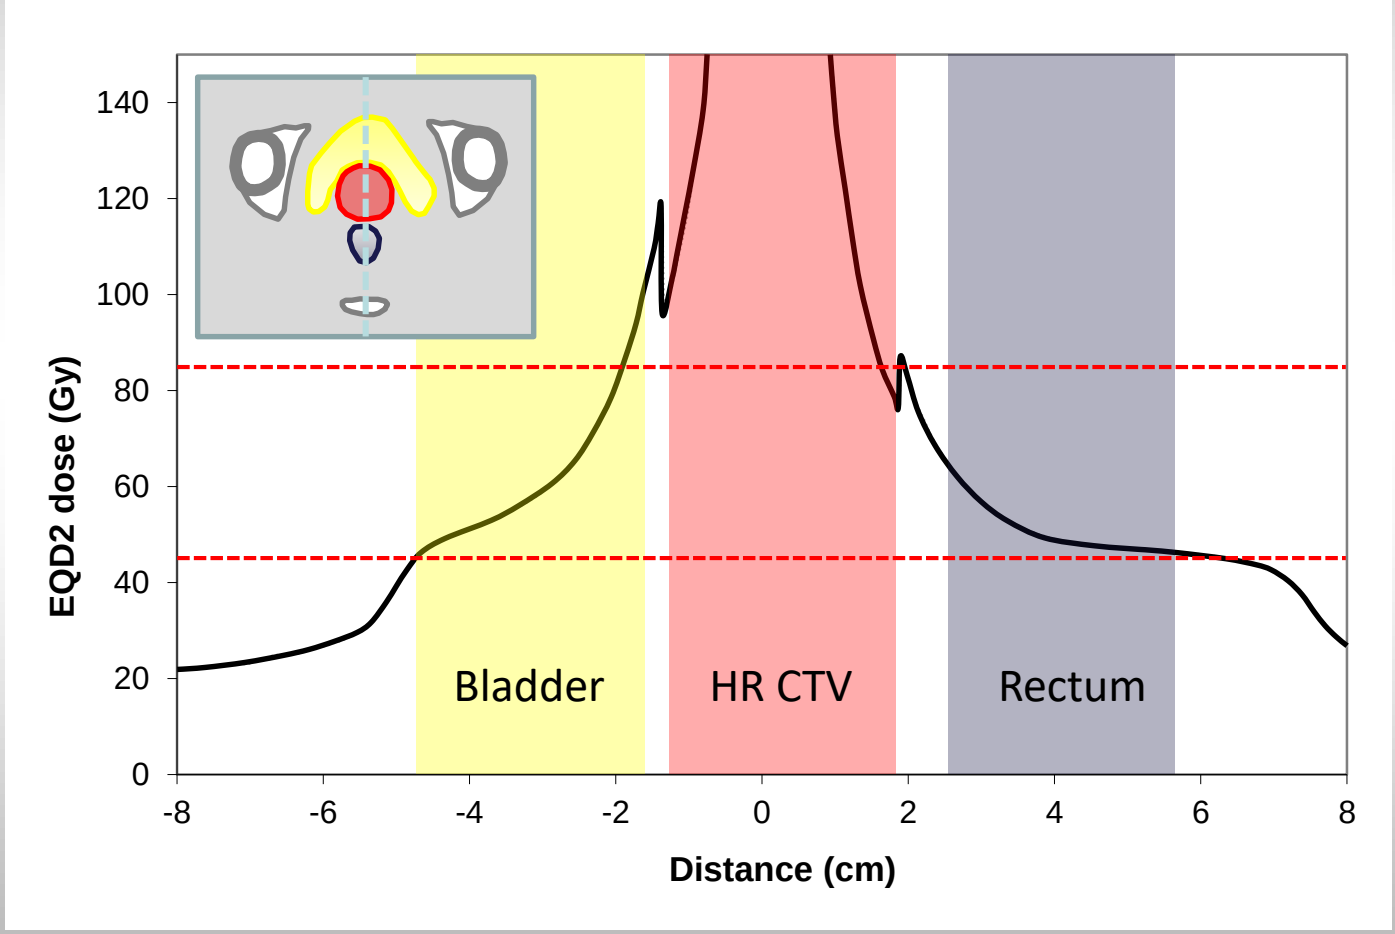
High, intermediate, low doses within mm
Dose gradient: 6% pr mm at point A



EBRT+BT: total EQD2 tumour



EBRT+BT: total EQD2 OARs



Values of biological parameters

- **Tumour and early reacting normal tissue:**

α/β ~ 10 Gy	**7 – 20 Gy for most tumours** **9 – 10 Gy for cervix carcinoma**
$T_{1/2}$ ~ 1.5 hours	**0.5 – 1.5 hours**

- **Late reacting normal tissue:**

α/β ~ 3 Gy	**0.5 – 6 Gy** **3 – 4 Gy for bladder, rectum, sigmoid**
$T_{1/2}$ ~ 1.5 hours	**1 – 2 hours**

Clinical and experimental experience

A single fraction HDR dose of 7Gy to the tumour corresponds to a EQD2 of

A. 5Gy
B. 7Gy
C. 10Gy

Limitation

4 Rs of Radiobiology

- **Recovery or Repair (half-time ~1hour)**
- ~~**Redistribution**~~
- **Repopulation (< 1 day)**
- ~~**Reoxygenation**~~

Repopulation
– changing the overall treatment time -

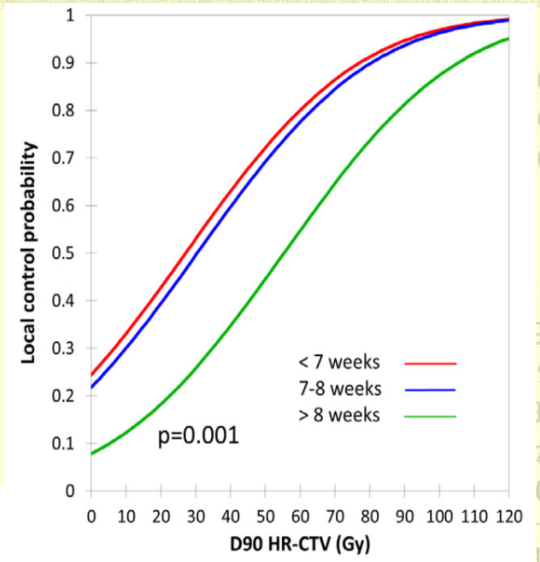
Influencing the local control rate

$$EQD_{2,T} = EQD_{2,t} - (T - t)D_{prolif}$$

- Increasing OTT by one week is equivalent to a loss of 5 Gy in CTV_{HR} D90

Tanderup, retroEMBRACE, 2016, submitted

- Timing of the BT boost?



Mazeron et al, Radiother Oncol 2015

EBRT ⟺ BT

„Per day delay in overall treatment time results in loss of ~ 0.3 – 0.8 Gy/day“

Which of the following radiobiological effect(s) is(are) taken into account in the EQD2 calculation when using the LQ-model?

A. Repair
B. Redistribution
C. Repopulation
D. Reoxygenation
E. all

Take home messages

- EQD2 calculation is simple
- EQD2 has shown useful in pooling of data across fractionation schedules (EMBRACE)
- LQ model does not tage OTT time into account – remember loss of 5Gy per week at OTT>50 days
- Implement a spreadsheet in your department

$$EQD_2 = n \cdot d \frac{d + \alpha/\beta}{2 + \alpha/\beta}$$

$$EQD_2 = 7 \cdot \frac{7+10}{2+3} Gy = 10Gy$$

Time dose fractionation for EBRT + HDR BT

ESTRO-AROI Teaching Course
Transition from conventional 2D to 3D radiotherapy with a special emphasis on brachytherapy in cervical cancers

Bengaluru 2017

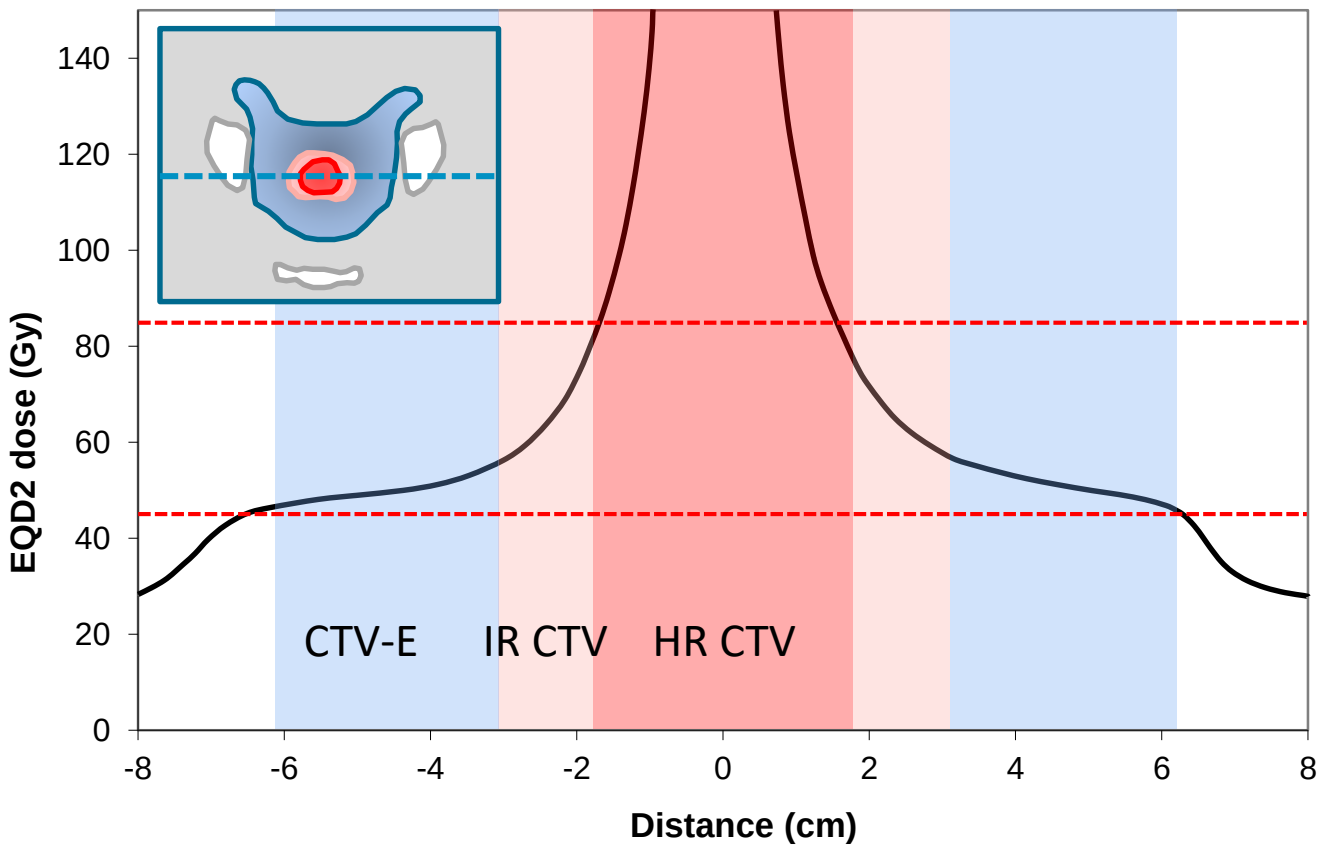
Prof Kari Tanderup, PhD
Prof Richard Pötter

Aarhus University Hospital

Combination of EBRT and BT

- EBRT dose and fractionation
- BT dose and fractionation
- Timing of BT boost
- Overall treatment time

EBRT+BT: total EQD2 tumour

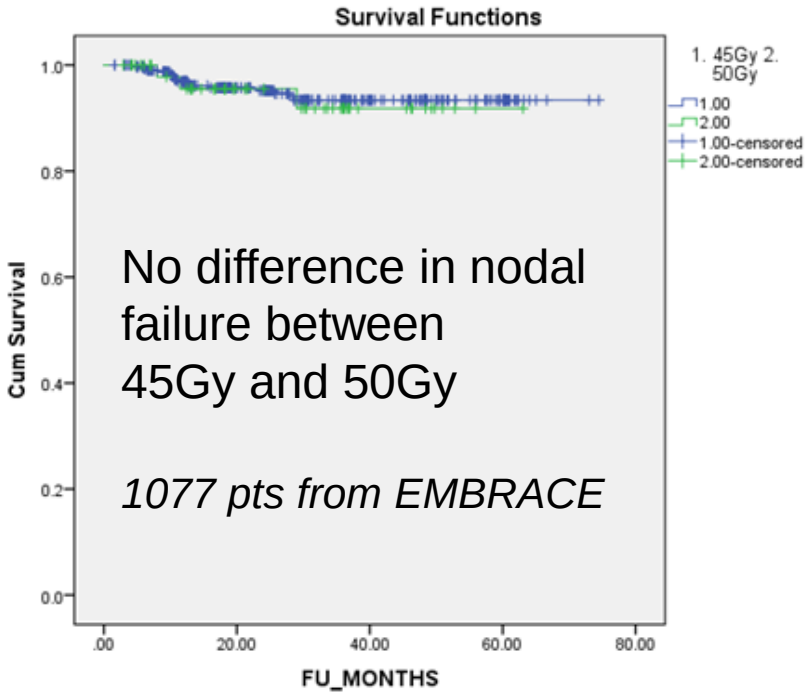


Which dose do you deliver to the elective lymph node target?

A. 45-46Gy whole pelvis
B. 50Gy whole pelvis
C. 50-55Gy with midline block after 40-45Gy
D. Other

What do we know about dose to the elective target volume?

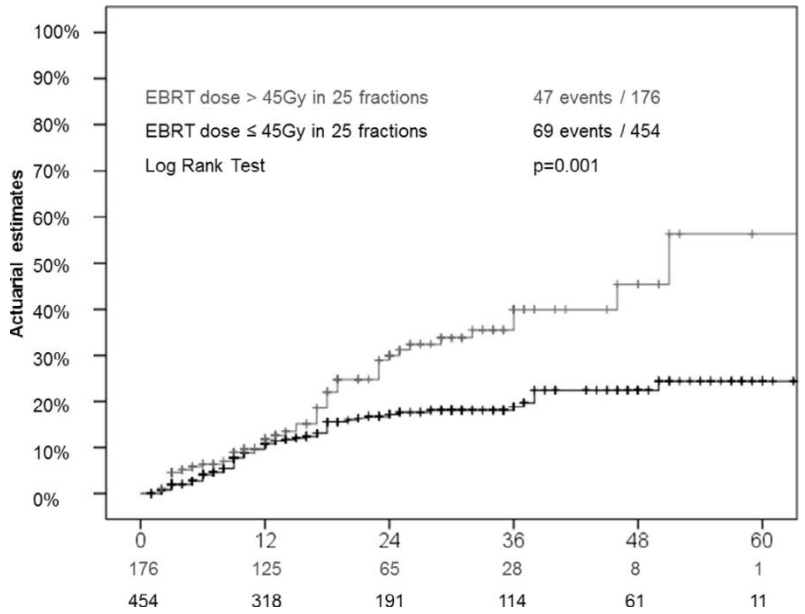
- **Do we need 45Gy or 50Gy for control of microscopic disease in lymph nodes with chemoradiation?**



C Nomden, A de Leeuw, IM Jürgenliemk- Schultz, UMCU

- **Difference in morbidity between 45Gy and 50Gy?**

Vaginal stenosis
630 pts from EMBRACE



Kirchheiner et al, RO 118 160–166, 2016

Which total EBRT dose do you deliver to pathologic lymph nodes?

A. No boost

B. ~ 55Gy

C. ~ 60Gy

D. >60Gy

What do we know about dose to pathological nodes?

Nodal recurrence in pathological nodes after boost

Pittsburgh, IJROBP 2015:

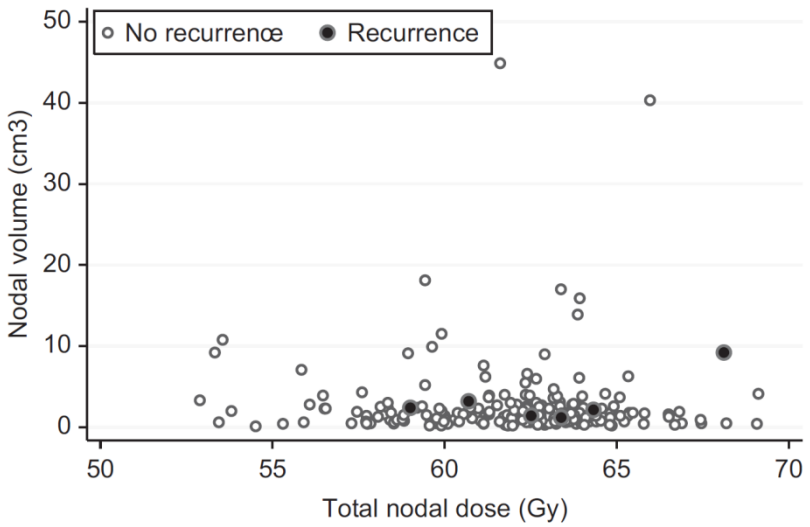
0% after boost dose of 55Gy

EMBRACE I:

8% at median FUP of 2 years in patients boosted with a median dose of 59Gy

Ramlov et al, Acta Oncol, 2015:

limited dose effect for pathological nodes (~55-65Gy boosts)

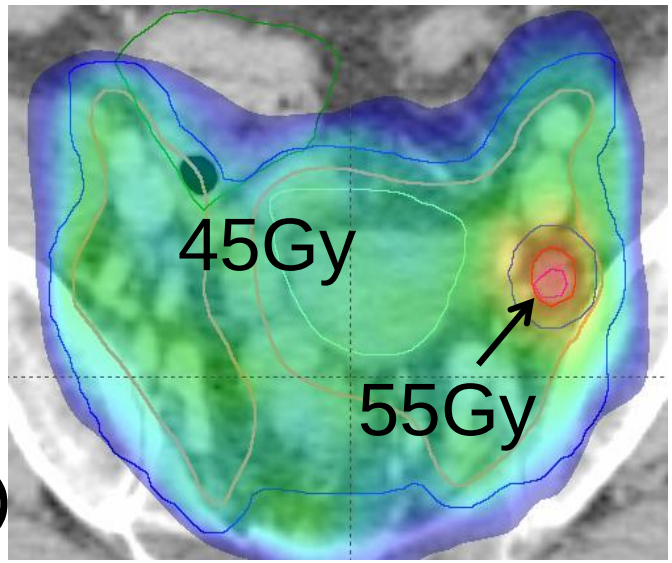


Post-boost with CRT

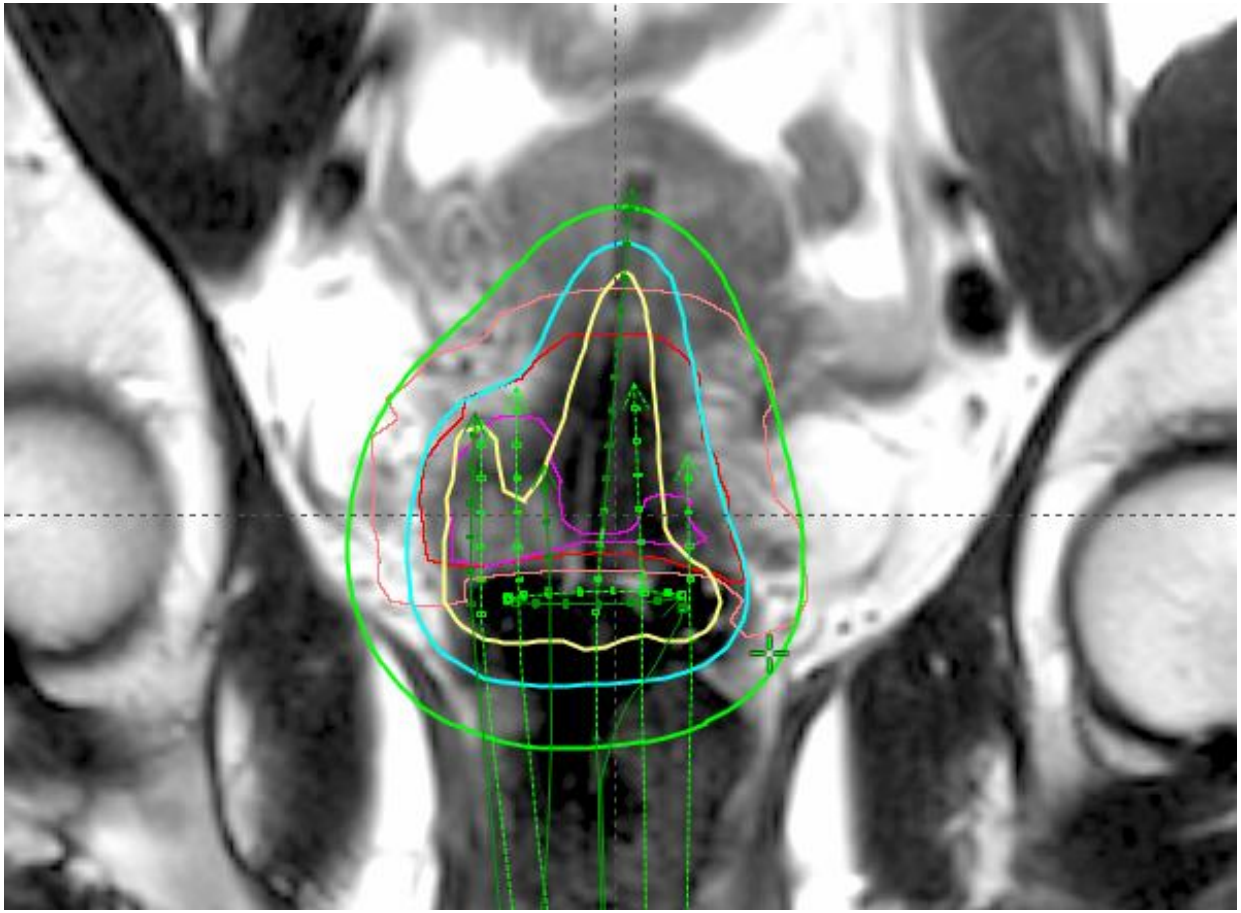
- AP-PA or 4 Field Box
- Avoid central pelvis irradiation
- Assessment of BT contribution (~0-6Gy)
- Examples of dose and fractionation:
  - Aim for total EBRT+BT dose of 55-60Gy
  - E.g. 50Gy whole pelvis + 5Gy
  - E.g. 45Gy whole pelvis + 10Gy

Recommendation of EMBRACE II: Simultaneously integrated lymph node boost (SIB)

- **Simultaneously integrated lymph node boost:**
  - **IMRT**
  - **Dose planning with two dose levels**
    - **Elective target**
    - **Pathological lymph node target**
  - **In case of very big nodes: to consider a replan after 20-25Gy**
- **Recommended lymph node dose in EMBRACE II**
  - **Total 60Gy EQD2**
  - **45Gy/25fx to elective CTV**
  - **55Gy/25fx (within pelvis: 3-4Gy BT)**
  - **57.5Gy/25fx (outside pelvis: 0Gy BT)**



Time, dose and fractionation primary tumour



EQD2 for some common schedules

EBRT dose	EBRT #fx	BT fraction dose	BT fractions	Total EQD2
50Gy	25 fx	7Gy	3 fx	80Gy
50Gy	25 fx	8Gy	3 fx	86Gy
50Gy	25 fx	9Gy	2 fx	79Gy
45Gy	25 fx	7Gy	4 fx	85Gy

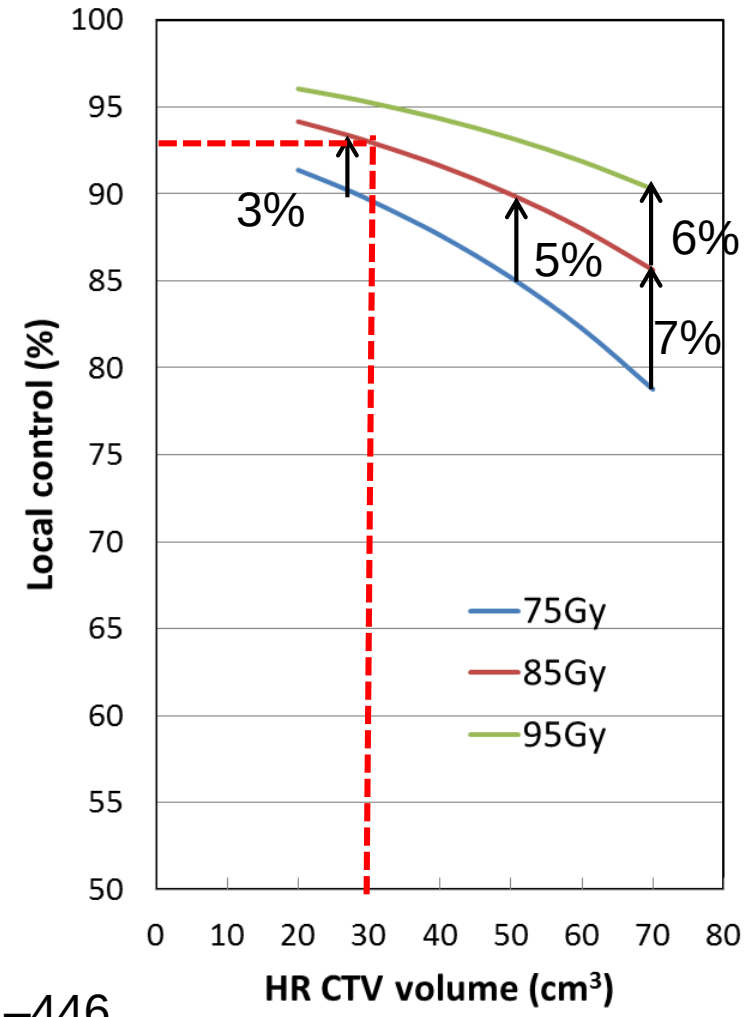
What do we know about dose and local control for CTV_{HR}?

Effect of dose, volume and time:

Dose:	10Gy → 5% LC
Time:	7 days ~ 5Gy
Volume	$10cm^3$ ~ 5Gy

85Gy for $30cm^3$ CTV_{HR}: 93% LC

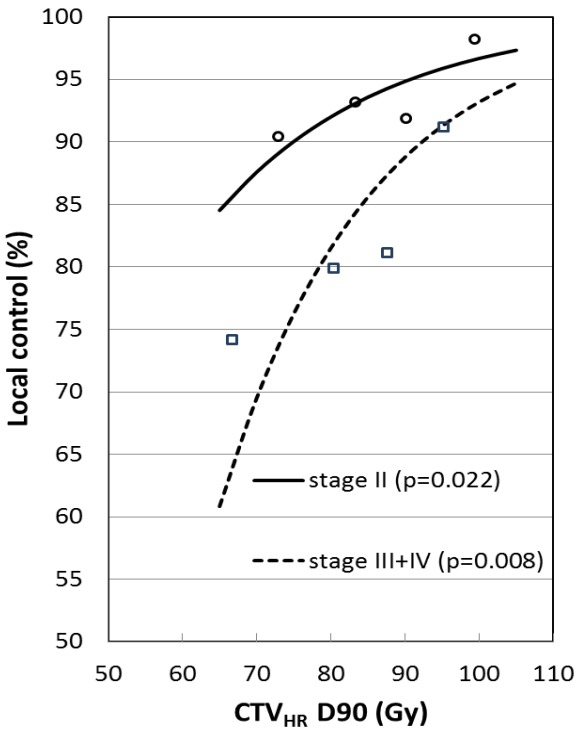
Local control at 3 years

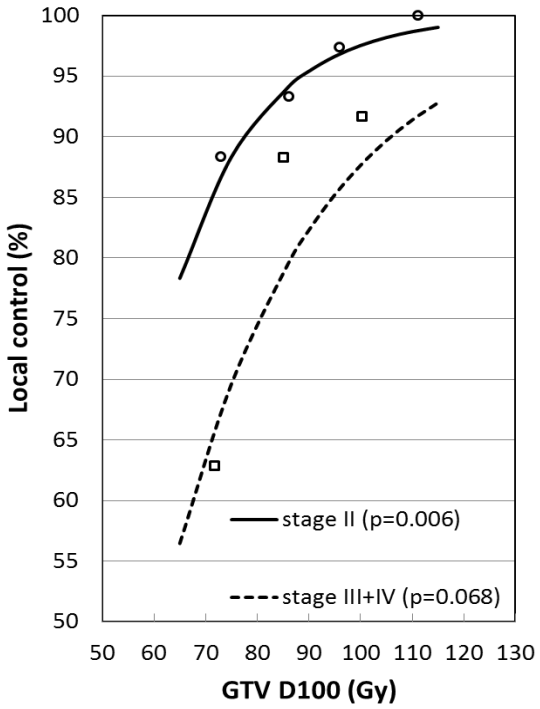


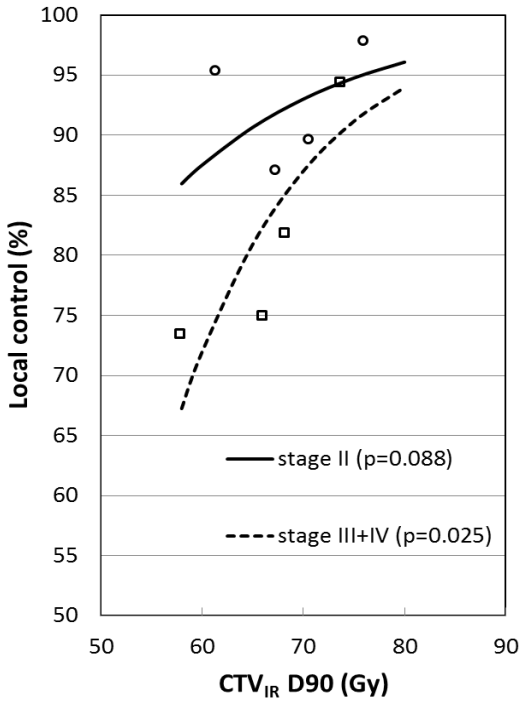
Tanderup et al, Radiother Oncol 120 (2016) 441–446

Dose effect GTV, CTV_{HR} and CTV_{IR}

Analysis according to stage







Tanderup et al, Radiother Oncol 120 (2016) 441–446

When do you preferentially start BT boost after initiation of EBRT for stage IIB?

A. **Week1**

B. **Week 2**

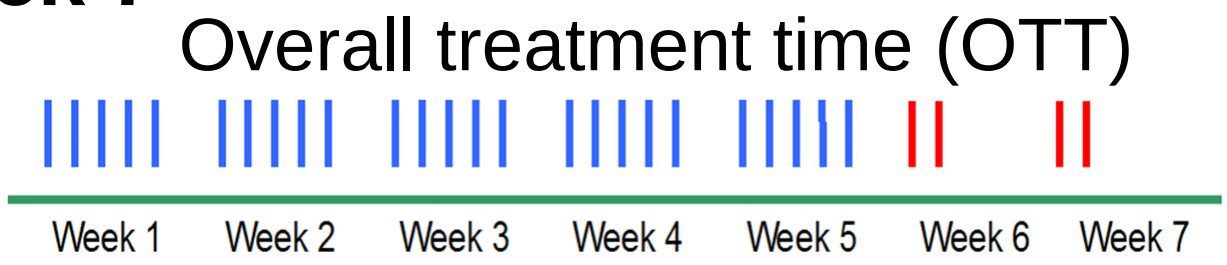
C. **Week 3**

D. **Week 4**

E. **Week 5**

F. **Week 6**

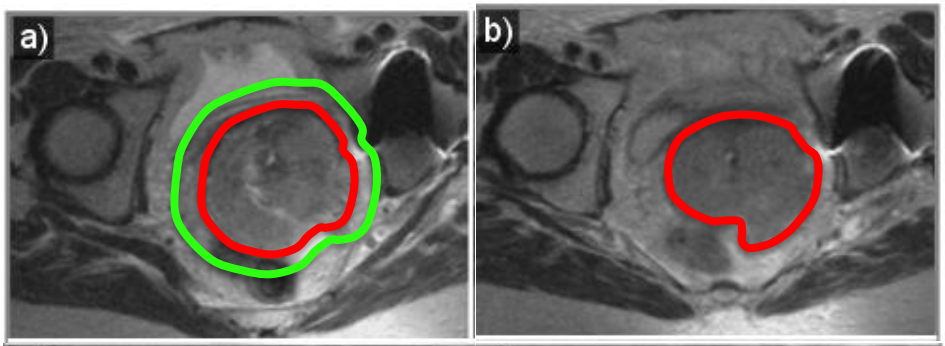
G. **Week 7**



Example: cervical cancer, FIGO IIIB: total dose 90 Gy EQD2

EBRT dose

0 Gy →



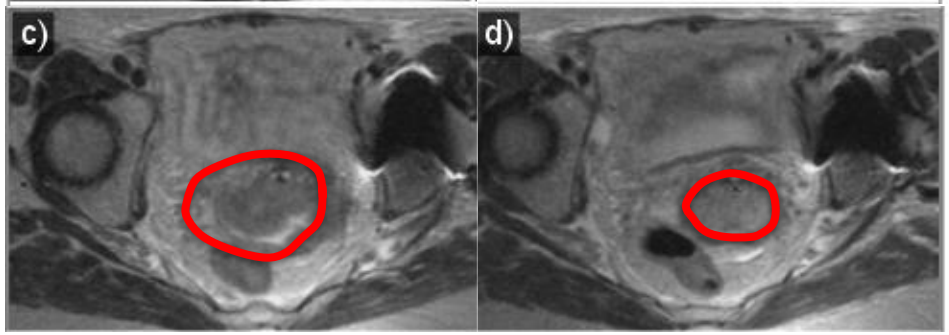
← 9 Gy

EBRT dose

Cisplatin (40 mg/m²) x1

18 Gy →

Cisplatin (40 mg/m²) x2

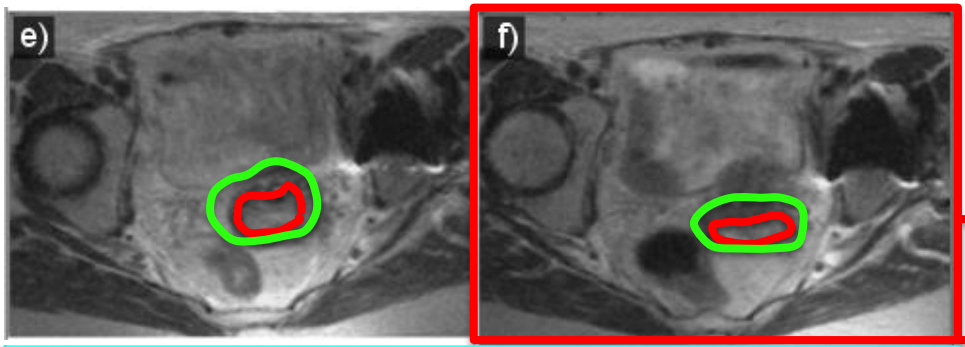


← 27 Gy

Cisplatin (40 mg/m²) x3

36 Gy →

Cisplatin (40 mg/m²) x4

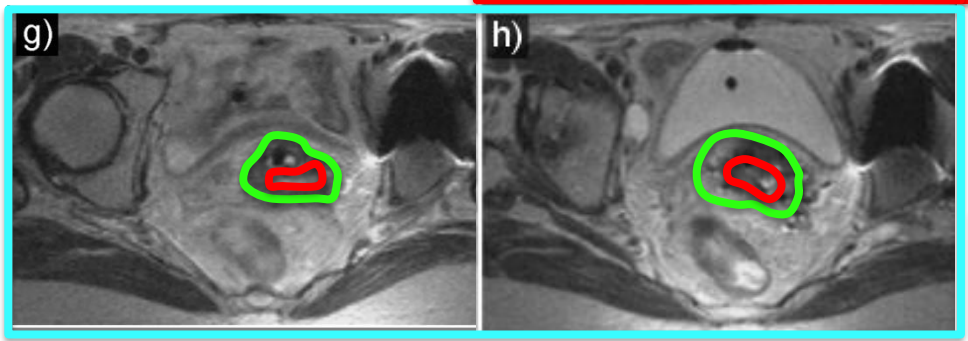


← 45 Gy

Pre-brachytherapy

EBRT45 Gy →

Cisplatin (40 mg/m²) x5



← IGABT 45 Gy

Brachytherapy

GTV
CTV

Impact of overall treatment time

1 week extra OTT ~ 5Gy less to CTV_{HR}

1 week extra OTT ~ loss of 2.5% local control

- **How to keep overall treatment time limited?**
- **Primary tumour:**
  - **Start BT towards the end of EBRT or immediately after end of EBRT**
  - **With the help of IC/IS it is not necessary to wait further for tumour shrinkage**
- **Pathological lymph nodes**
  - **Simultaneously integrated boost**

Equieffective dose and impact of overall treatment time

	EQD2	OTT correction
45Gy/25 fx EBRT 7Gy x 4 fx HDR BT	85Gy	+2Gy
50Gy/25 fx EBRT 7Gy x 3 fx HDR BT	80Gy	+5Gy
45Gy/25 fx EBRT 7Gy x 4 fx HDR BT	85Gy	+5Gy
50Gy/25 fx EBRT 7Gy x 3 fx HDR BT	80Gy	-5Gy

Common dose planning aims for target structures

	EBRT dose	BT dose EQD2	Total EQD2 EBRT+BT
Elective lymph node target: CTV-E	45-50Gy	-	45-50Gy
Pathological lymph nodes	55-60Gy	0-4Gy	60Gy
Intermediate Risk CTV: CTV_{IR}	45-50Gy	15-20Gy	60-70Gy
High Risk CTV: CTV_{HR}	45-50Gy	35-45Gy	85-90Gy
GTV	45-50Gy	50-55Gy	95-100Gy
Point A	45-50Gy	30-40Gy	80-85Gy

Take home messages

- **Elective lymph node target: 45-50Gy EBRT**
  - **Perspective of reducing morbidity with 45Gy**
- **Pathological lymph nodes: 55-60Gy EBRT**
  - **Balance between tumour control and morbidity**
- **Primary tumour (CTV_{HR}): >85-90Gy EBRT+BT**
  - **Balance between EBRT and BT**
  - **With more IC/IS BT it is possible to reduce EBRT dose to 45Gy**
- **Overall treatment time: <50 days**

Recap of BT planning principles: Radiography based/ CT information

- Clinical Drawings and Documentation
- Principles of Conventional Radiography Based BT planning
  - Point A definition
  - Standard Loading and Manual Optimization
  - ICRU 38 reporting (ICRU 89- Level 1)
- Understanding the STD Pear shaped distribution and its clinical implications

Motivate for 3D Imaging environment

Recap of BT planning principles: Radiography based/ CT information

Utilization of CT Imaging

- **Non – MRI Environment :**

  - CT imaging for BT application

  - Contouring of OAR's

  - Conventional Planning : Point A normalization & Prescription

  - Evaluation of OAR doses : ICRUB, ICRUR, 2 /0.1cm3 doses

  - Report: Point A , OAR doses in total EQD2 for each patient

Motivate for MR environment

Recap of BT planning principles: Radiography based/ CT information

Utilization of CT Imaging

- **MRI at Diagnosis Environment :**

  - CT imaging for BT application
  - Establish CT protocol: IV Contrast, bladder contrast
  - Contouring of OAR's mandatory
  - High Risk CTV Concept: Pre Rx (MR) & at BT Clinical drawing
  - Conventional Planning : Point A normalization & Prescription
  - Evaluation of doses to CT-HR CTV and OAR's
  - Report: Point A , CT-HR CTV, OAR doses in total EQD2 for each patient

Motivate & Mobilize few patients for MR environment at BT

Working for success
will make you a Master;
But
Working for satisfaction
will make you a Legend.
GOOD MORNING!

Medical aspects of treatment planning and dose constraints: focus on BT

Clinical evidence for dose-effects

ESTRO AROI Teaching Course
Transition from conventional 2D to 3D Radiotherapy with a special emphasis on brachytherapy in cervical cancer

Bengaluru March 2017

Richard Pötter

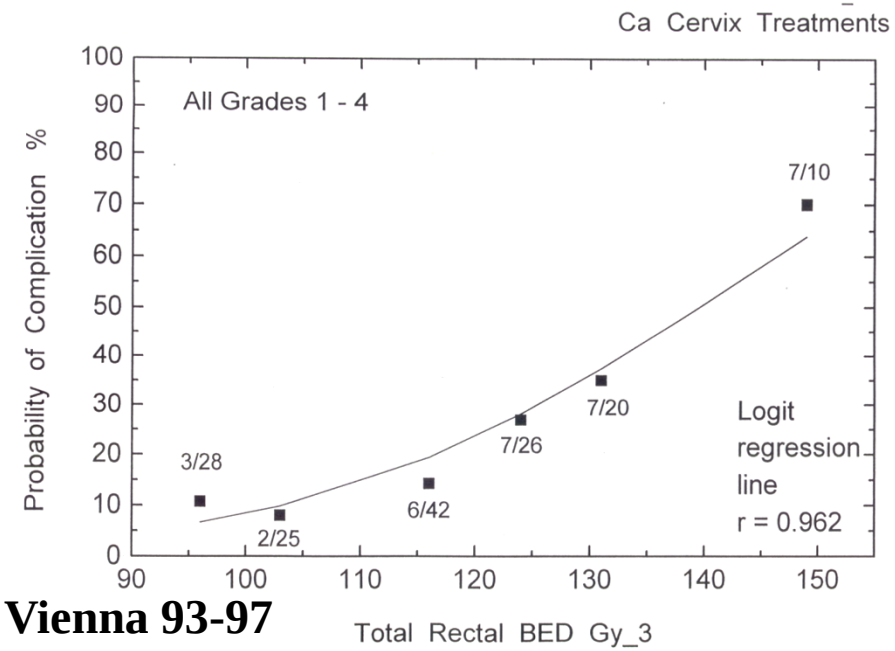
Kari Tanderup

DOSE EFFECT RELATIONSHIP POINT A

N=1499		Dose pt A	Pelvic failure
Stage IB and IIA	(<2 cm)	70-80 Gy	<10%
	(>2 cm)	up to 85-90 Gy	25-37%
Stage IIB		70 Gy	50%
	nonbulky	>80 Gy	20%
	bulky	>80 Gy	30%
Stage III unilateral		up to 70 Gy	50%
		>70 Gy	35%
Stage III bilateral/bulky		< 70 Gy	60%
		>70 Gy	50%
		>85 Gy	35%

„Refinements in brachytherapy techniques are necessary to improve the present results“ (Perez et al IJROBP 1998)

Dose Effect relationship for late rectum side effects based on points (ICRU reference points)

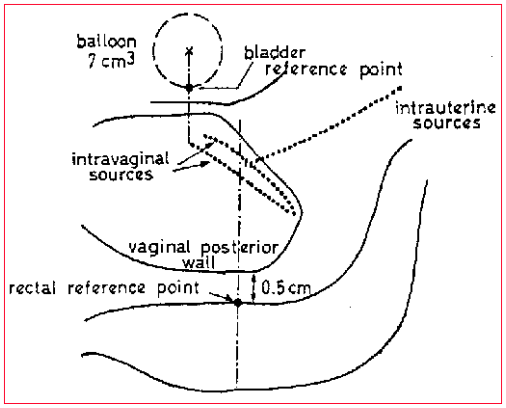


Vienna 93-97

J. Fowler, Knocke, Pötter 1998 unpublished

32 „events“ in 151 patients

Actuarial rate 3y: 24%



BED ~120-130 Gy_3 „cut-off level“ in recent experience

Iso-effective dose in 2Gy/fr ~ 70-80 Gy $_{\alpha\beta 3,2Gyfr}$

no clear dose effect relations bladder, sigmoid, vagina

Clinical Evidence in IGABT Cervix Cancer dose volume effects (dve)

Upcoming Evidence

- Mono-instititutional cohorts (ongoing, publicat. since 2007)
- Multi-center cohorts with retrospective evaluation
  RetroEMBRACE (publications since 2016)
- Prospective Trials
  STIC: comparative 2D vs. 3D (published 2012)
  EMBRACE I: observational, 08/2008 - 12/2015
  EMBRACE II: interventional, from 03/2016

Mono-institutional cohorts dose volume effects (retrospective)

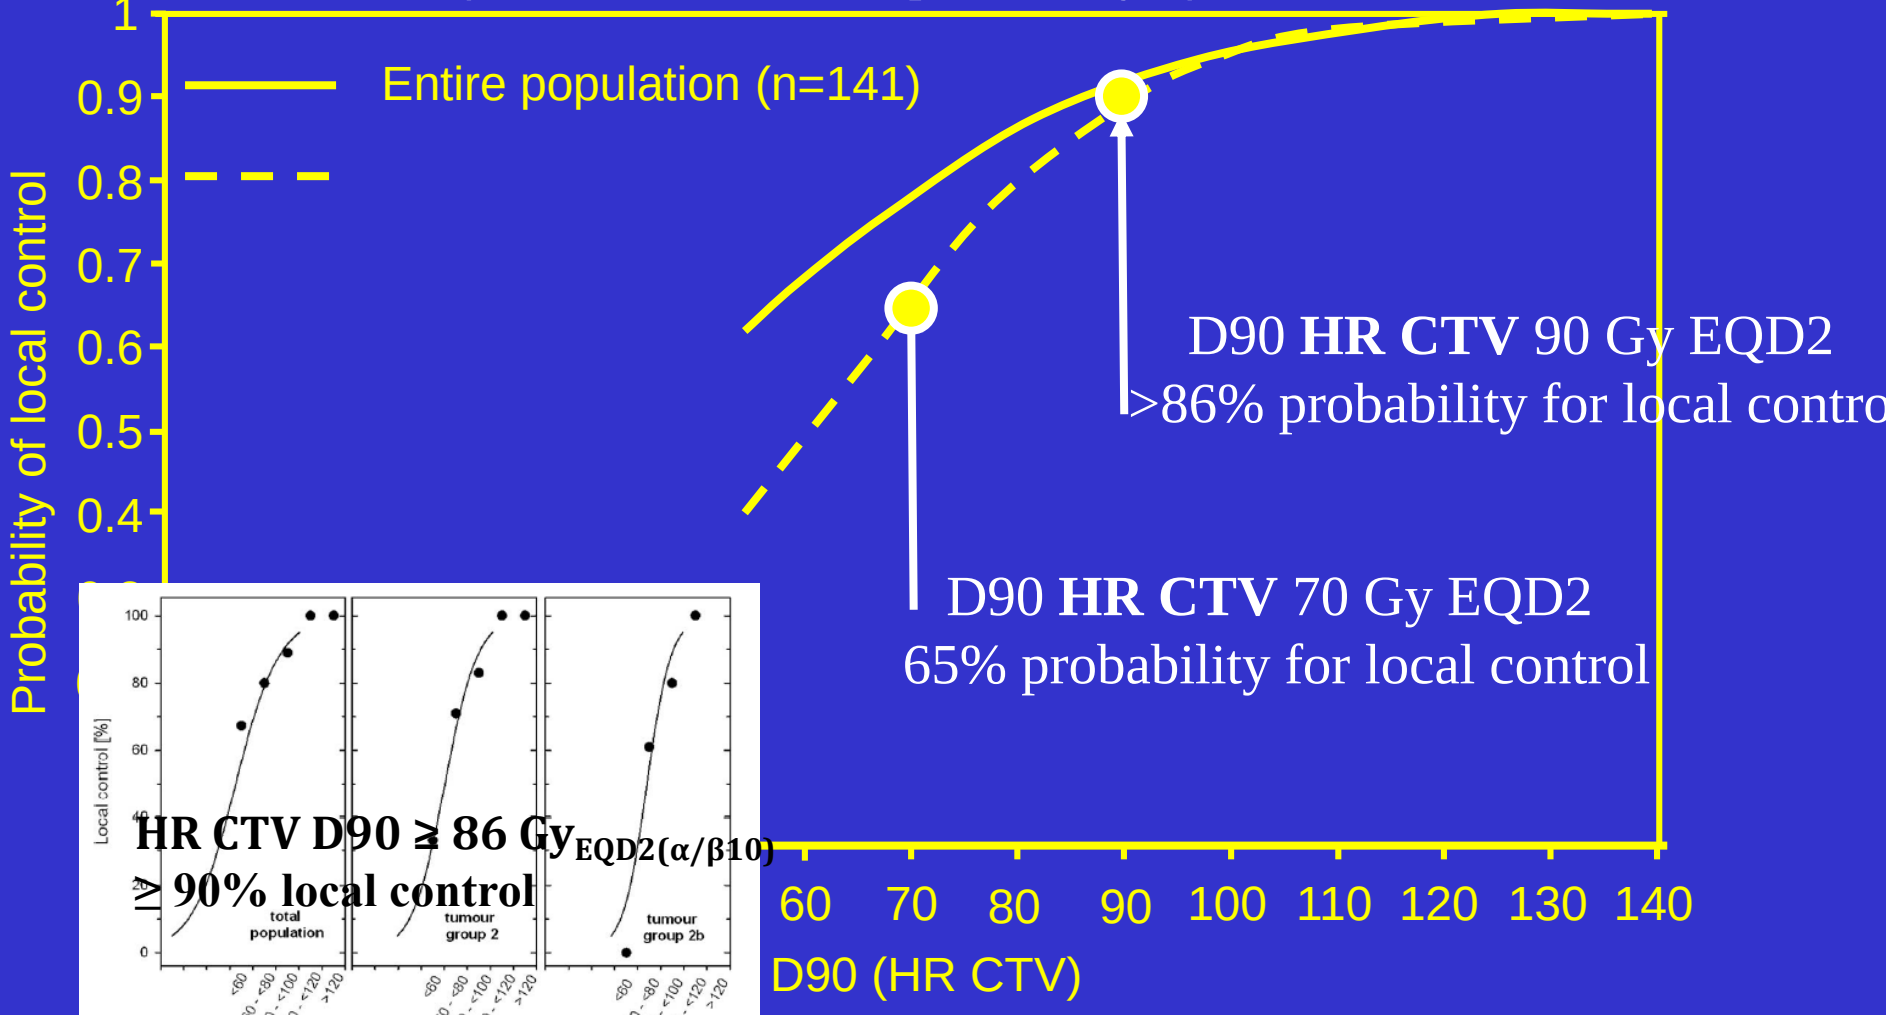
- **Vienna** (Dimopoulos 2008, 2010, Georg 2009,2011(Pötter 2007, 2011))
- **Seoul** (Kim et al. 2008)
- **Paris** (Mazeron 2014, 2015 (Castelnaud-Marchand 2015, Haie-Meder))
- **Aarhus** (Lindegaard, Tanderup 2014)
- **Leuven** (Ribeiro, Limbergen 2016)

Linking DVH-parameters to clinical outcome

HR CTV/Tumour

Analysis (n=141, FIGO: IB-IVA, median follow-up=51 months)

D90 for the HR-CTV and probability of local control

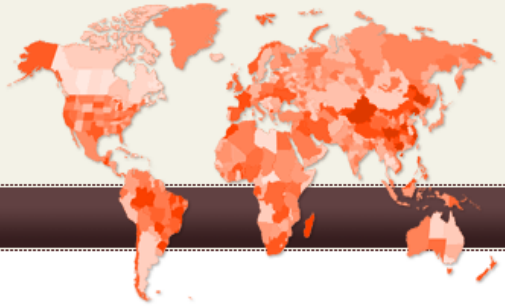


HR CTV D90 ≥ 86 Gy$_{EQD2(\alpha/\beta10)}$
≥ 90% local control

Dimopoulos et al., R&O 2010 *Dimopoulos et al. IJROBP 2008*

RETRO EMBRACE

An intErnational study on MRI-guided BRachytherapy in locally Advanced CErvical cancer



About Retro-Embrace | Contacts | Login

- **Web-based database with a retrospective multicentre collection of data on 3D RT plus IGABT in cervical cancer**
- **780 pts**
- **Eligibility criteria:**
  - **Diagnosis of cervical cancer and treatment with curative intent by IGABT**
  - **Reporting according to GEC ESTRO recommendations**

Overall outcome published by Sturdza et al. Radioth Oncol 2016

Diarrhea

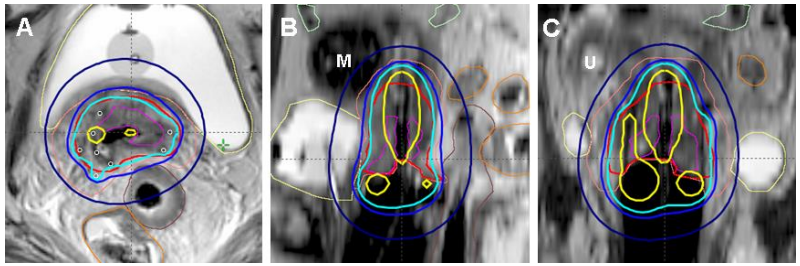
Jensen, Tanderup work in progress

Planning aim and prescription dose

- **Planning aim: what you want to obtain**
- **Prescribed dose: what you decide to treat**



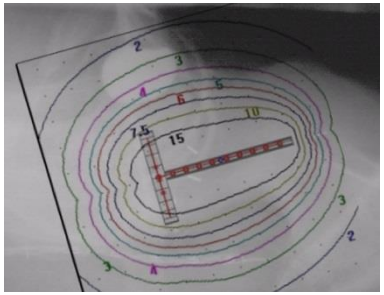
Example 1

Structure	Dose-volume parameter	Planning aim, Gy	Prescribed dose Gy
CTV_{HR}	$EQD2_{10}$ D_{90}	≥ 85	88.9
Bladder	$EQD2_3$ D_{2cm^3}	≤ 90	71.1
Rectum	$EQD2_3$ D_{2cm^3}	≤ 70	65.6
Sigmoid	$EQD2_3$ D_{2cm^3}	≤ 70	57.4
Bowel	$EQD2_3$ D_{2cm^3}	≤ 70	53.3

Planning aim and prescription dose

- **Planning aim: what you want to obtain**
- **Prescribed dose: what you decide to treat**

Example 2



Structure	Dose parameter	Planning aim, Gy	Prescribed dose Gy
Target	Point A	7Gy	6.5Gy
Bladder	ICRU point	≤ 7Gy	6.8 Gy
Rectum	ICRU point	≤ 75% of 7Gy	5.3 Gy

Conclusion dose effect BT (I)

- **Dose effect demonstrated for:**
  - **Residual GTV D100, adaptive CTV_{HR} D90, and CTV_{IR} D90**
  - **Bladder D 2cm^3**
  - **Rectum D 2cm^3**
  - **Vagina (recto-vaginal point)**

- **Upcoming evidence:** **Bowel D 2cm^3 + EBRT dose/volume**
  Vagina PIBS: EBRT + BT

- **Dose effect not demonstrated for**
  - **Sigmoid**

Conclusion dose effect BT (II)

- **Future Perspective (EMBRACE II)**
- **prospective protocol:**

  planning aims and limits for miminum prescribed dose

  ”soft constraints” and ”hard constraints”

  taking into account multiple parameters:

  - **Target dose $CTV_{HR,}$ (CTV_{IR} GTV_{res})**
  - **Target volume $CTV_{HR,}$ (CTV_{IR} GTV_{res})**
  - **Overall treatment time <50 days**
  - **OARs $D2cm^3$ and dose points (vagina, rectum)**

EMBRACE II (2016) cervix cancer: D90, 98 CTV_{HR}, Pt A protocol for planning aims and dose prescription

	D90 CTV_{HR} $EQD2_{10}$	D98 CTV_{HR} $EQD2_{10}$	D98 GTV $EQD2_{10}$	D98 CTV_{IR} $EQD2_{10}$	Point A $EQD2_{10}$
Planning Aims	> 90 Gy < 95 Gy	> 75 Gy	>95 Gy	> 60 Gy	> 65 Gy
Limits for Prescribed Dose	> 85 Gy	-	>90 Gy	-	-

What is the proposed planning aim for D90 CTV_{HR} – indicate all correct answers

A. **Planning aim: 90-95Gy**
B. **Hard constraint: >85Gy**
C. **Hard constraint: >90Gy**
D. **Hard constraint: <95Gy**

EMBRACE II (2016) cervix cancer: $D2cm^3$ for OARs protocol for planning aims and dose prescription

	Bladder D_{2cm^3} $EQD2_3$	Rectum D_{2cm^3} $EQD2_3$	Recto-vaginal point $EQD2_3$	Sigmoid/ Bowel D_{2cm^3} $EQD2_3$
Planning Aims	< 80 Gy	< 65 Gy	< 65 Gy	< 70 Gy*
Limits for Prescribed Dose	< 90 Gy	< 75 Gy	< 75 Gy	< 75 Gy*

Which treatment plan would you prefer?

A. **Sigmoid D2cm3=75Gy, Bladder D2cm3=85Gy**

B. **Sigmoid D2cm3=70Gy, Bladder D2cm3=90Gy**

Which treatment plan would you prefer?

A. **HR-CTV D90=95Gy, Bladder D2cm3=90Gy, Rectum D2cm3=75Gy**

B. **HR-CTV D90=90Gy, Bladder D2cm3=85Gy, Rectum D2cm3=70Gy**

C. **I cannot decide without more clinical information**

Parametrial and nodal boost including midline block: combination of EBRT and BT

ESTRO-AROI Teaching Course
Transition from conventional 2D to 3D radiotherapy with a special emphasis on brachytherapy in cervical cancers

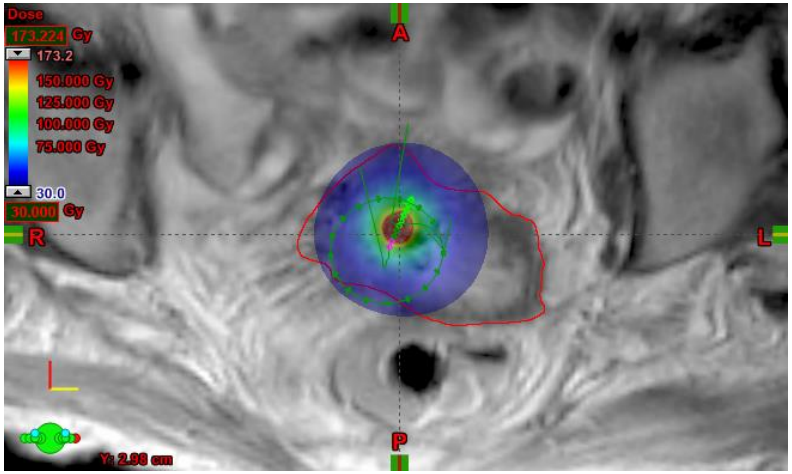
Bengaluru 2017

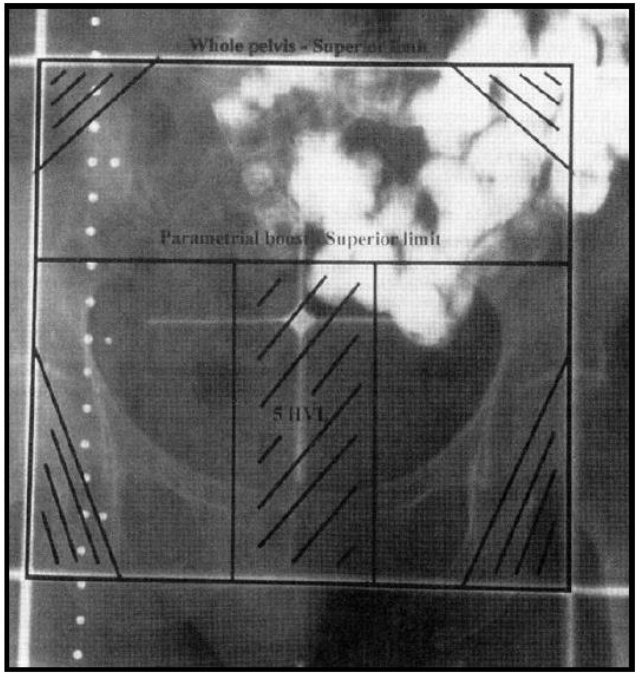
Kari Tanderup
Ina Jürgenliemk-Schulz

Aarhus University Hospital

Indication for parametrial boost

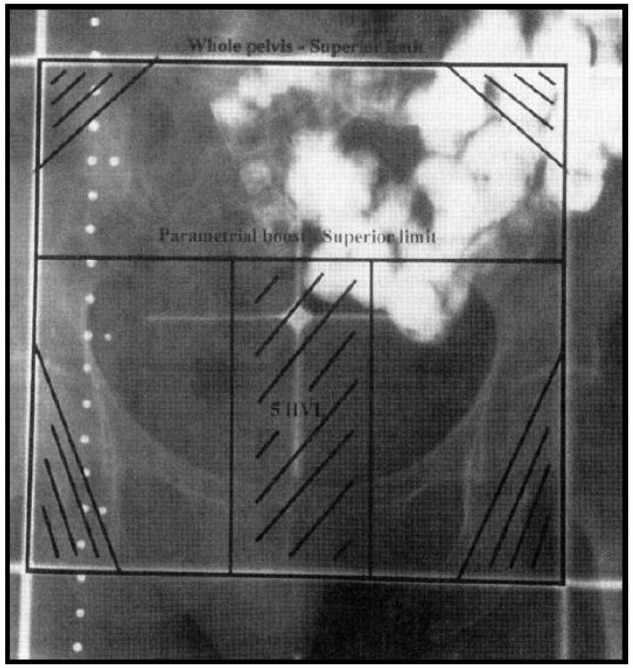
- **Bulky stage IIB and IIIB**
- **Insufficient coverage of BT dose**





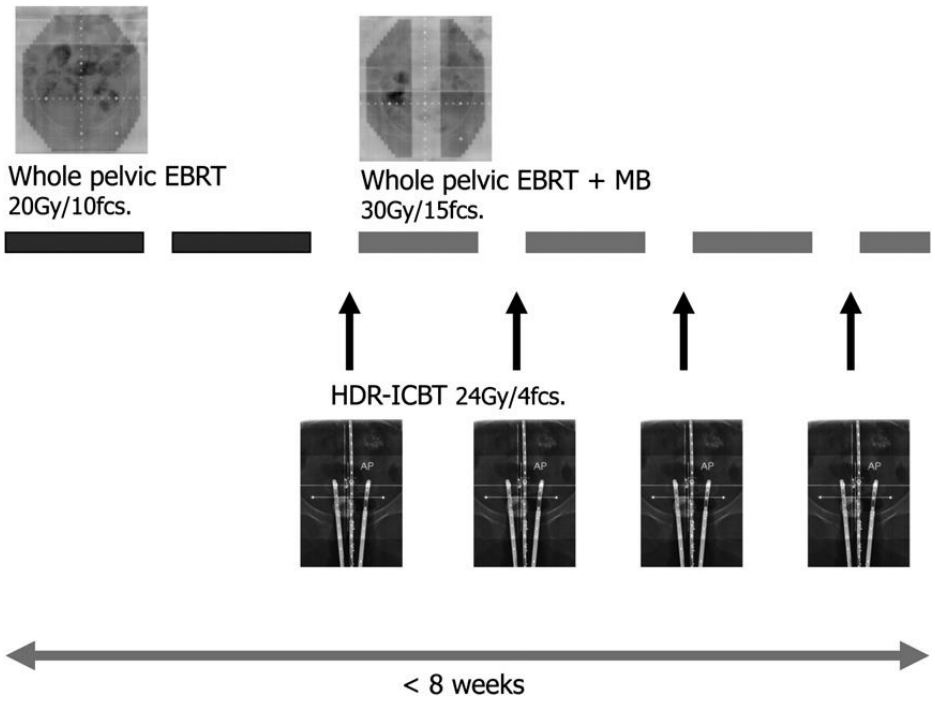
Standard technique

- Delivered after 45-50Gy EBRT
- Midline block of 4cm
- Upper border: bottom of sacroiliac joints
- 3-5 fractions of 1.8Gy
- GOG standard:
  - 5.4Gy in stage IIB
  - 9Gy in stage IIIB



Midline block

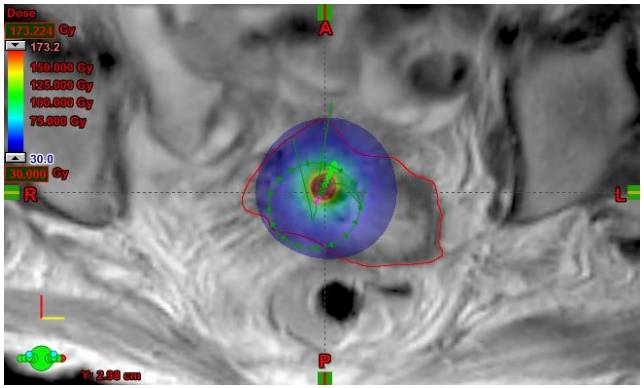
- EBRT whole pelvis to 20-30Gy
- Application of midline block
- Higher amount of BT applied
  - e.g. 6.5Gy in 6 fractions
- BT is started early during EBRT
  - e.g. week 1 or 2
- Widely used in Japan
  - 70% of patients in Japan, Patterns of care 1999-2001, Toita et al IJROBP 70(3) 2008



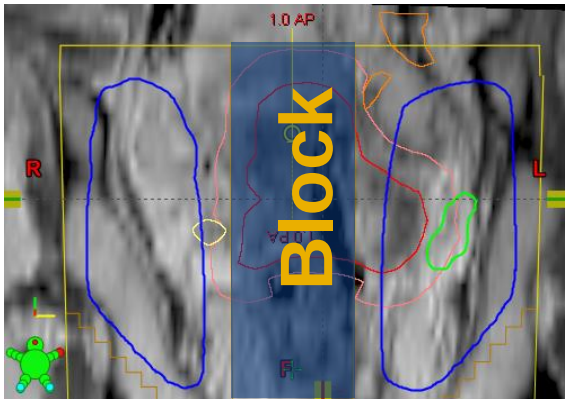
Toita et al, IJROBP, Vol. 82, No. 1, 49–56, 2012

Challenge: Midline block dose calculation

- **Which dose does midline block fields deliver to HR-CTV and IR-CTV (D90 and D100)?**
- **Does midline blocked fields deliver dose to bladder, rectum and sigmoid (D2cc)?**
- **Challenge for dose calculation:**
  - **BT and EBRT physical doses cannot be directly added and transformed to EQD2 dose**
  - **Anatomy changes between EBRT and BT**



+

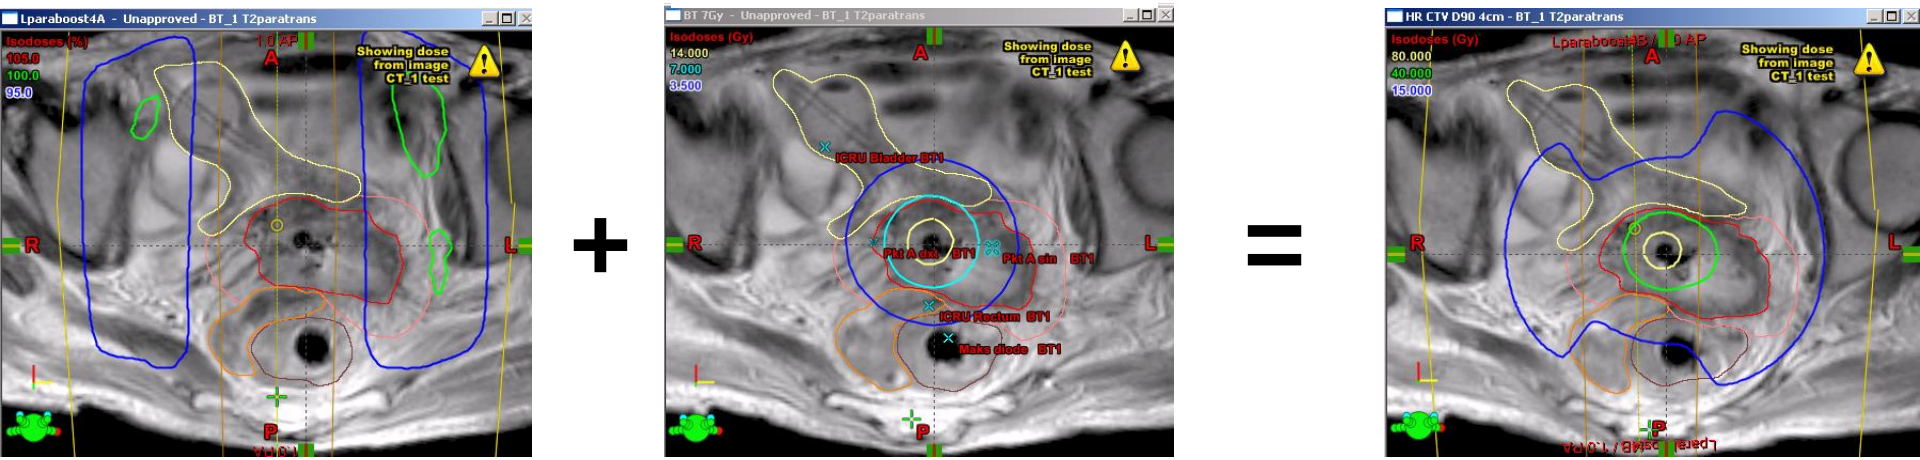


= ?

Accumulation of dose

- 6 patients with large tumours and/or unfavourable topography were analysed
- HR-CTV volumes of 31-100 ccm
- Radiotherapy schedule:
  - 45 Gy (25fx) whole pelvis EBRT
  - 9 Gy (5fx) midline block boost
  - 4x7 Gy HDR intracavitary BT

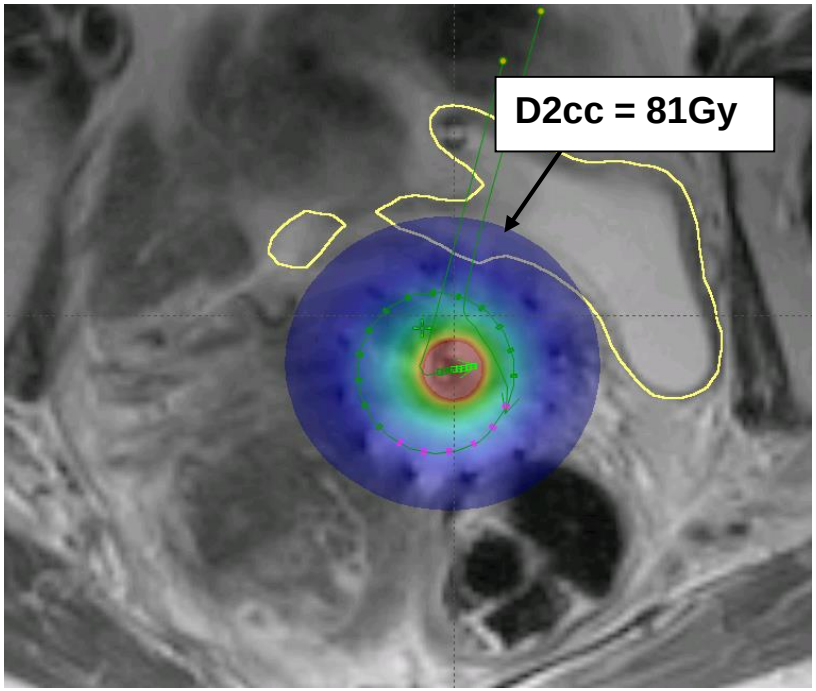
Midline block + *Intracavitary BT* = *Midline block + BT*



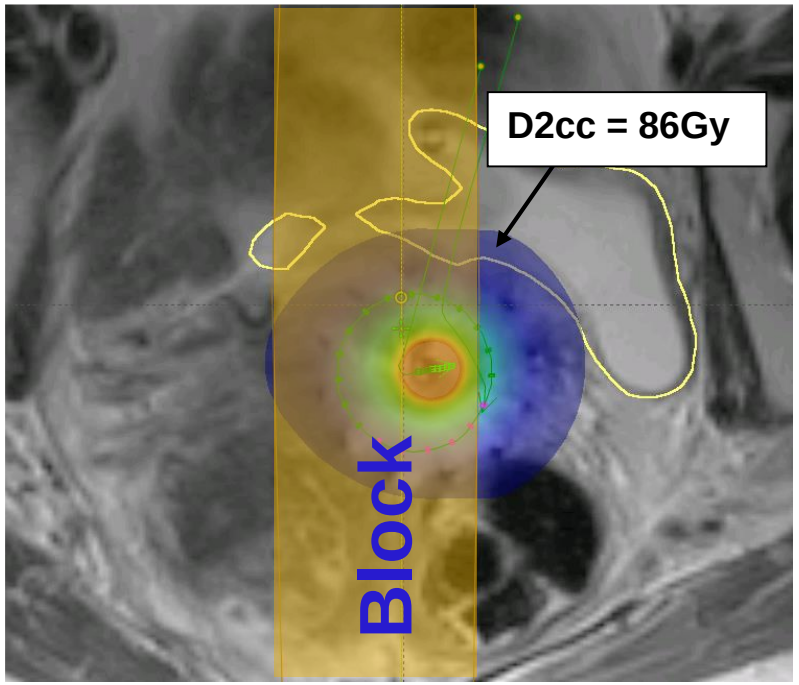
L. Fenkell et al, IJROBP 2011

Example, dose to OAR

BT



BT + midline boost



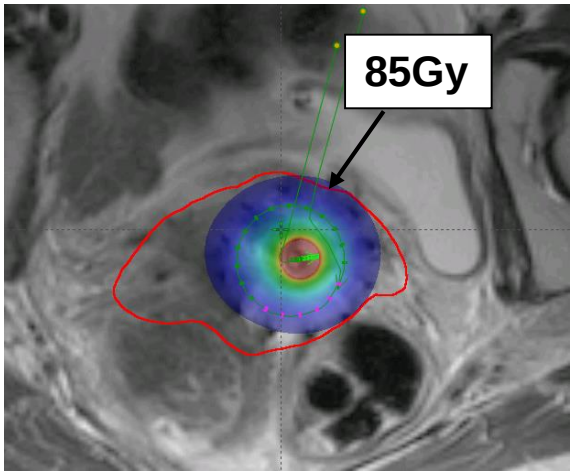
L. Fenkell et al, IJROBP 2011

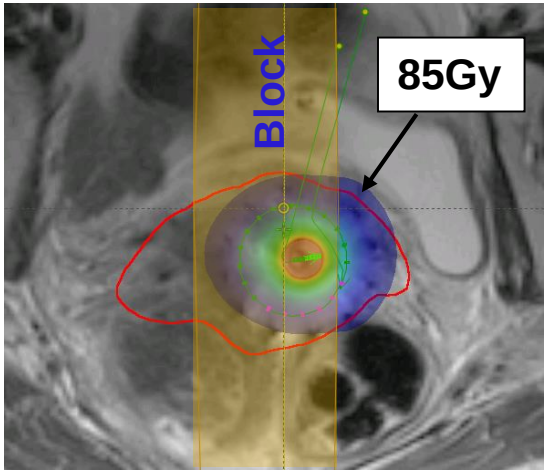
Example, dose to HR and IR CTV

BT

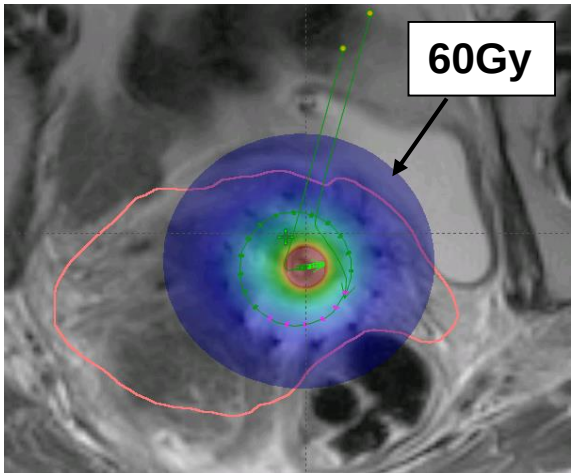
BT + midline boost

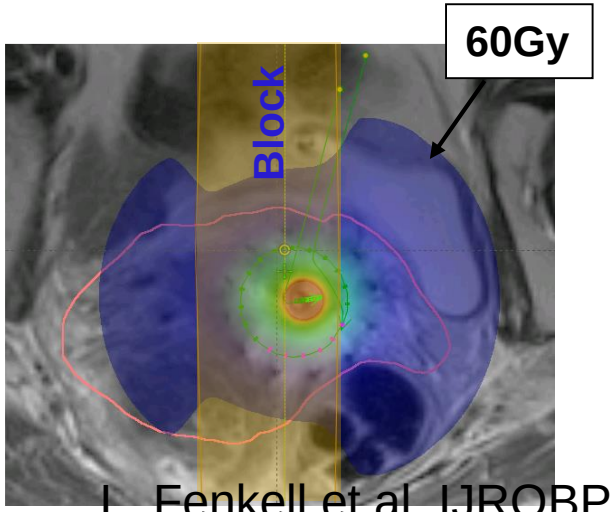
HR CTV





IR CTV



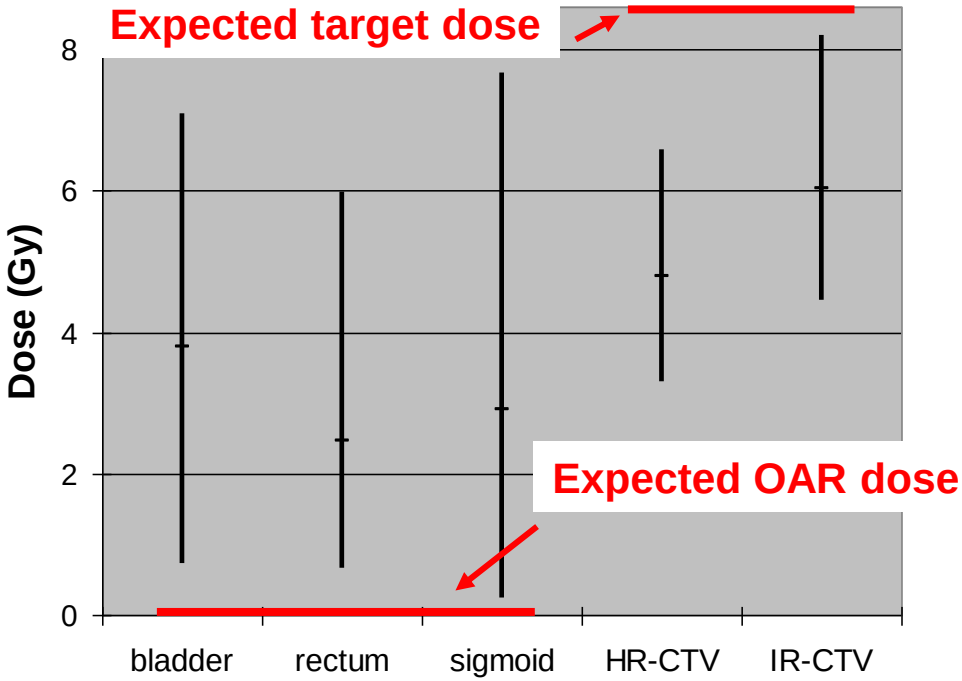


L. Fenkell et al, IJROBP 2011

Addition of BT dose and EBRT parametrial boost dose

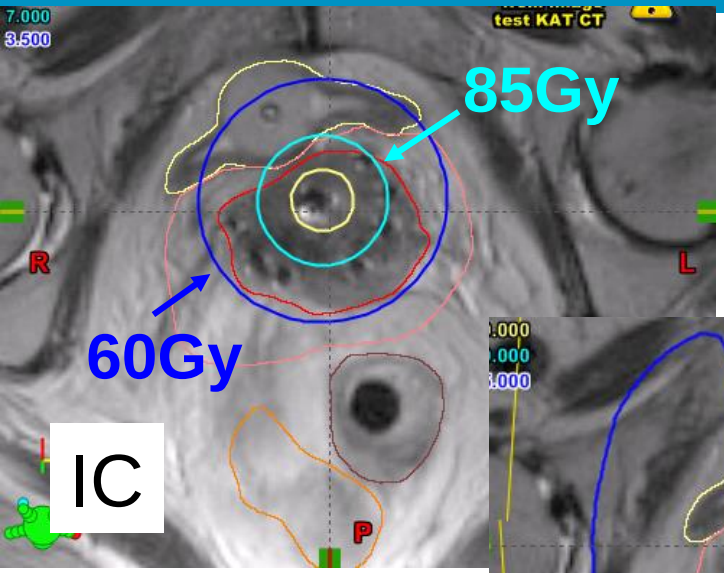
Significant uncertainties for addition of BT and parametrial boost!!

- 9 Gy parametrial boost
- Target dose << 9Gy
- Significant OAR dose

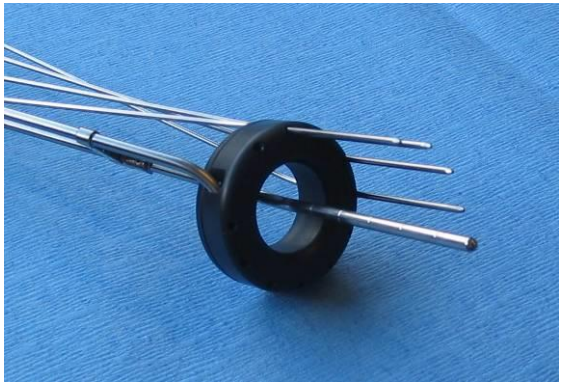


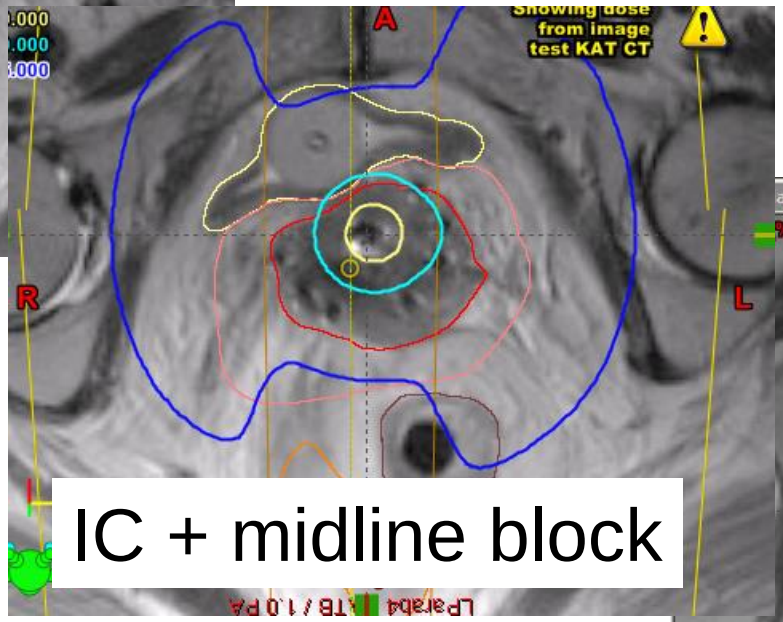
L. Fenkell et al, IJROBP 2011

Midline block boost compared to interstitial needles



IC





IC + midline block

IC + IS

Comparison between IC+BT and IC/IS

A number of 23 patients (stage II, III, IV)
with parametrial involvement at time of BT

EQD2 (Gy)	IC+PB Mean (SD)	IC/IS Mean (SD)	Diff IC+PB - IC/IS	p value
GTV D90	110.7 (15.7)	106.5 (10.5)	4.0 (11.2)	0.10
HR CTV D90	88.7 (5.3)	89.0 (3.4)	-0.3 (4.8)	0.79
D_{2cm3} Bladder	77.2 (5.9)	71.8 (5.0)	5.4 (4.0)	<0.001
D_{2cm3} Rectum	68.1 (6.3)	64.1 (4.8)	4.4 (2.7)	<0.001
D_{2cm3} Sigmoid	67.5 (5.5)	62.6 (5.2)	5.0 (2.9)	<0.001
D_{2cm3} Bowel	68.3 (6.9)	62.1 (6.7)	6.2 (3.5)	<0.001

Mohamed et al, Brachytherapy 2014

Techniques for boosting of pathologic lymph nodes

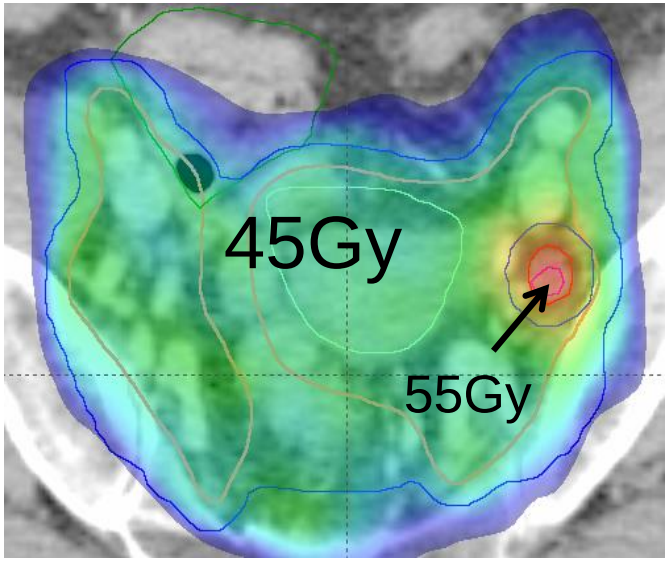
- **Techniques:**
  - **Post boost with CRT**
  - **Simultaneous integrated boost with IMRT**

Post-boost with CRT

- AP-PA or 4 Field Box
- Avoid central pelvis irradiation
- Assessment of BT contribution (~0-6Gy)
- CTV according to residual GTV (taking shrinkage into account)
- Examples of dose and fractionation:
  - Aim for total EBRT+BT dose of 55-60Gy
  - E.g. 50Gy whole pelvis + 5Gy
  - E.g. 45Gy whole pelvis + 10Gy

Simultaneously integrated lymph node boost (SIB)

- **Simultaneously integrated lymph node boost:**
  - **IMRT**
  - **Dose planning with two dose levels**
    - **Elective target**
    - **Pathological lymph node target**
- **Recommended lymph node dose in EMBRACE II:**
  - **45Gy/25fx to elective CTV**
  - **55Gy/25fx (within pelvis)**
  - **57.5Gy/25fx (outside pelvis)**

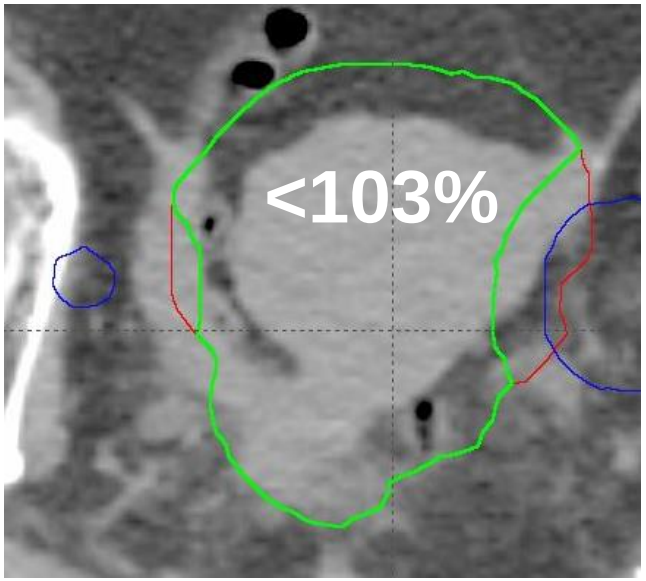


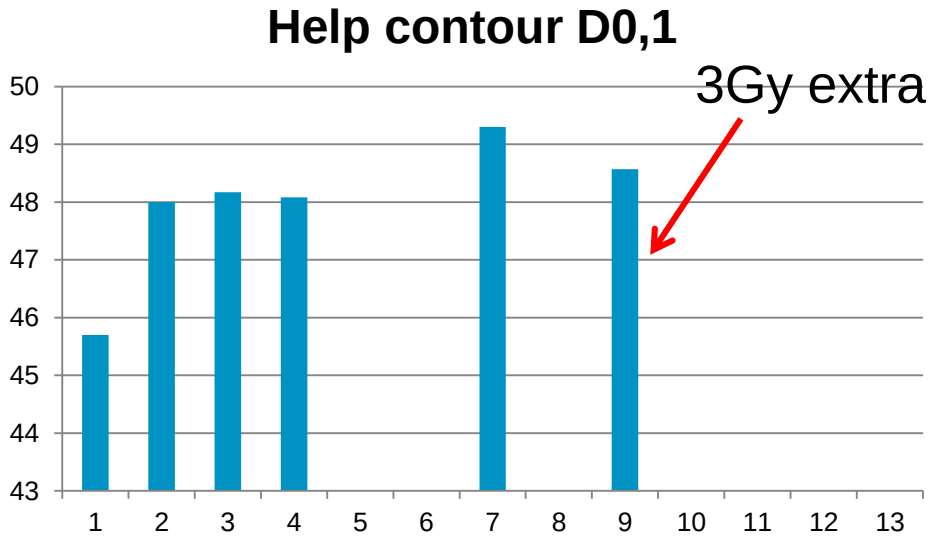
Advantages and disadvantages of SIB boost

- **Advantages:**
  - **Limits overall treatment time of nodal target (hypo-fractionation of small volumes)**
  - **Limits irradiation of normal tissue as compared to AP-PA post boost**
  - **Is robust to inter-fraction motion**
- **Disadvantages:**
  - **In case of large lymph nodes, the boost volume becomes higher – can be modified through replanning after e.g. 20-25Gy**

Help contour in the region of the primary tumour where BT is delivered

- **Homogeneity is particularly relevant when boosting lymph nodes**
- **Control of dose in the BT region**
- **Help contour:**
  - **Margin of 1cm to initial GTV or CTV_{HR}**
  - **Strict constraint on max dose: 103%**



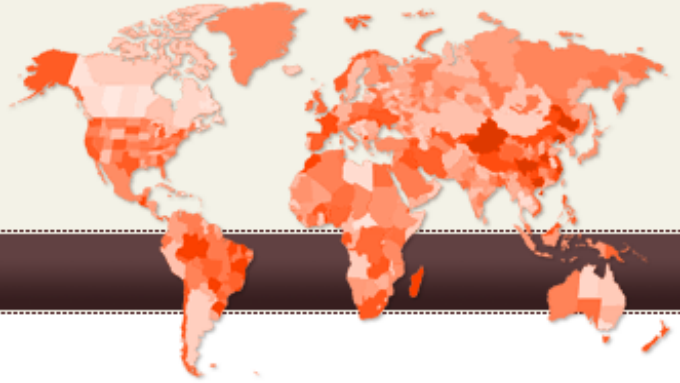


Conclusion

- **Combination of parametrial boost and BT:**
  - **High EBRT and BT gradients in the same region**
  - **Difficult to predict target dose**
  - **Difficult to predict OAR dose**
  - **Large normal tissue volume irradiated to a significant dose**
- **Combination of interstitial BT and intracavitary BT:**
  - **Higher target dose (compared with para-boost)**
  - **Reduced OAR dose (compared with para-boost)**
  - **Better conformality with HR-CTV and IR-CTV**
- **Simultaneous integrated boost**
  - **Limits overall treatment time**

EMBRACE

{ An intErnational study on MRI-guided BRachytherapy in locally Advanced CErvical cancer }



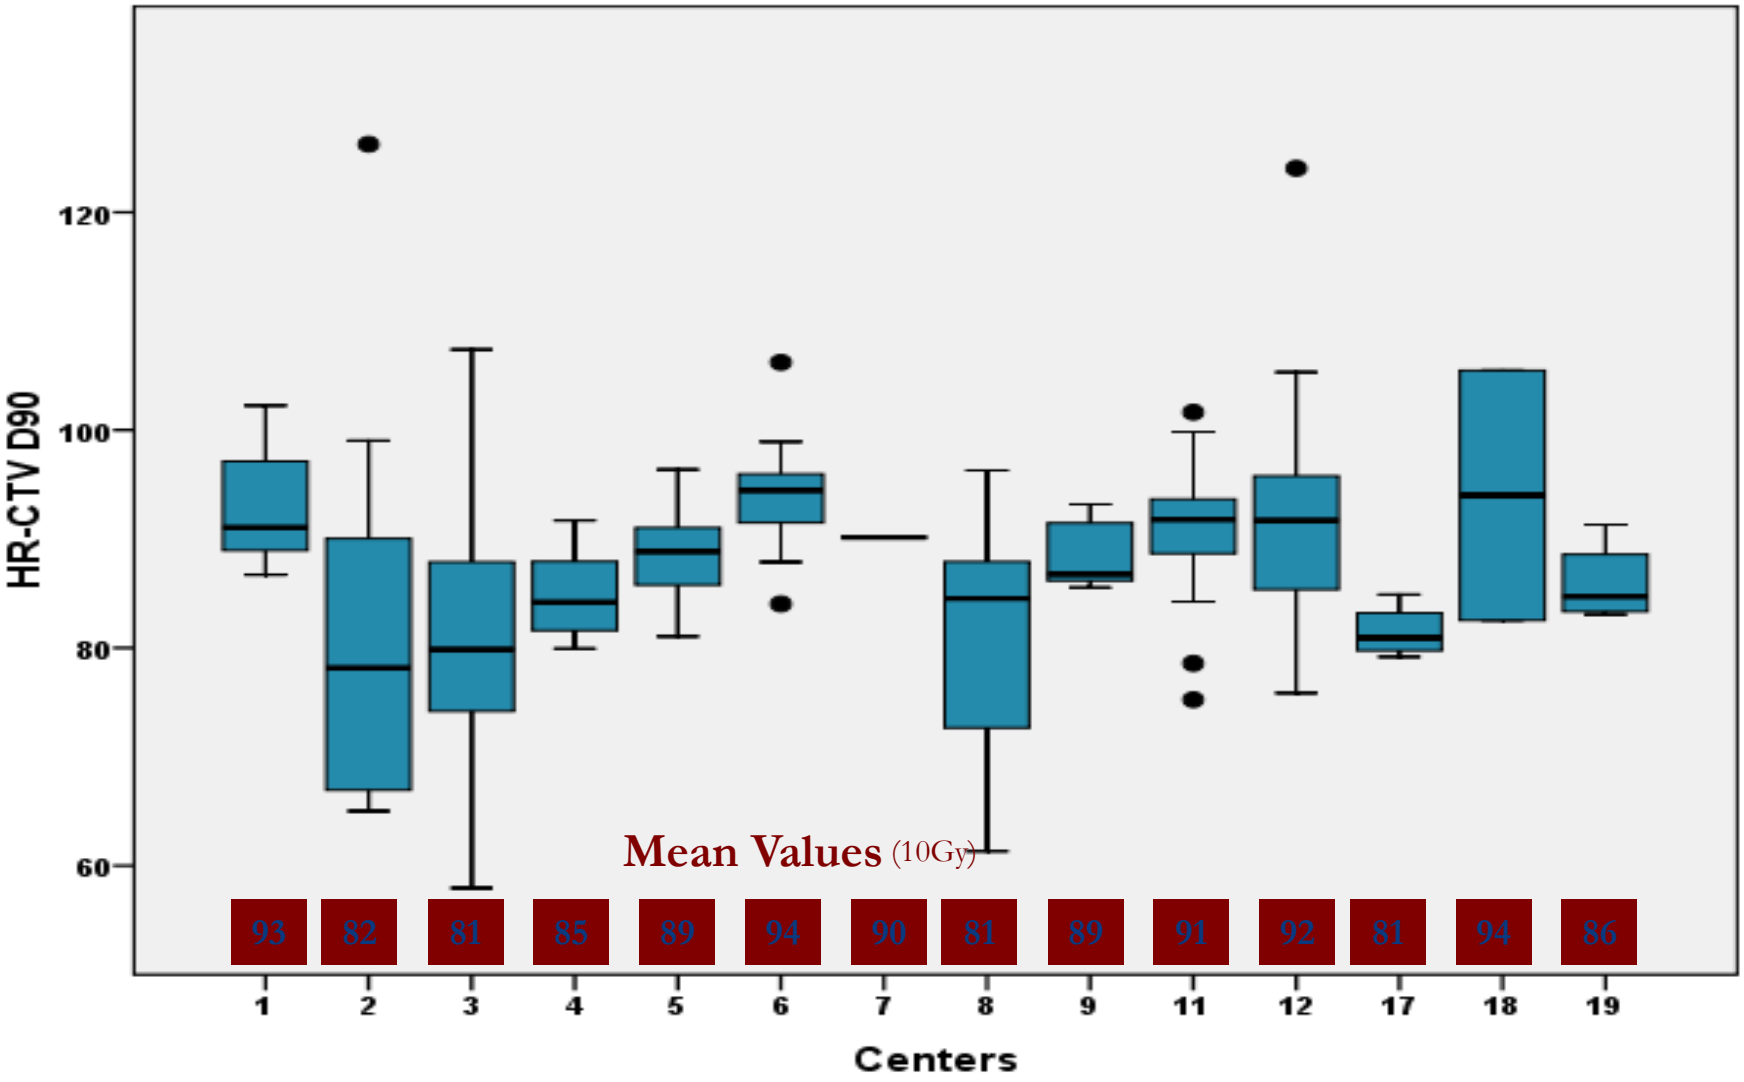
About Embrace | Contacts | Participation | Login

- **EMBRACE - International study on MRI-based 3D brachytherapy in locally advanced cervical cancer**
- **A prospective observational multi-centre trial**
- **Contouring and reporting according to GEC ESTRO recommendations**
- **Fractionation, planning and prescription according to institutional practice**
- **Enrollment of patients in 2008-2015, 1419 pts accrued**

VARIAN medical systems | A partner for life

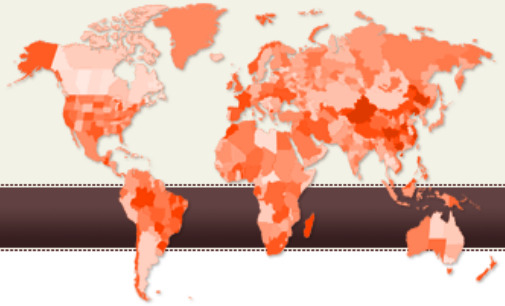
Nucletron Improving patient care

Heterogeneity of dose prescription: HRCTV D90



RETRO EMBRACE

An intErnational study on MRI-guided BRachytherapy in locally Advanced CErvical cancer



About Retro-Embrace | Contacts | Login

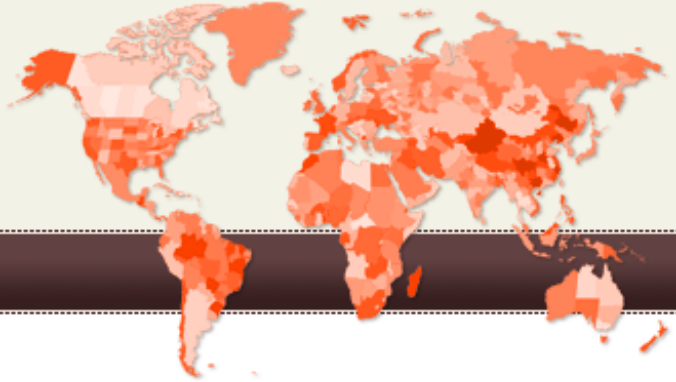
- **Web-based database with a retrospective multicentre collection of data on 3D RT plus IGABT in cervical cancer**
- **780 pts**
- **Eligibility criteria:**
  - **Diagnosis of cervical cancer and treatment with curative intent by IGABT**
  - **Reporting according to GEC ESTRO recommendations**

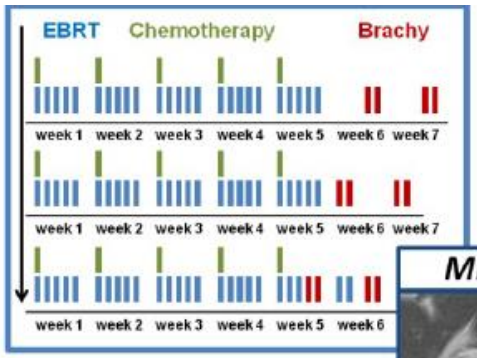
VARIAN medical systems | A partner for life

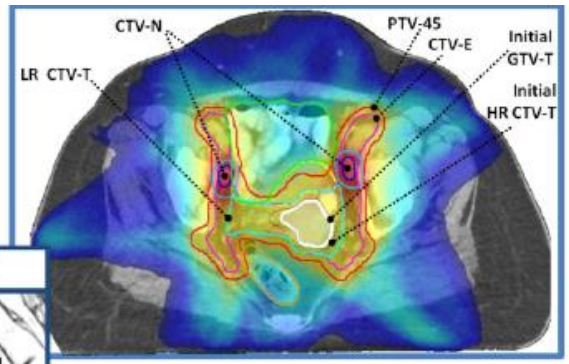
Nucletron Improving patient care

EMBRACE II

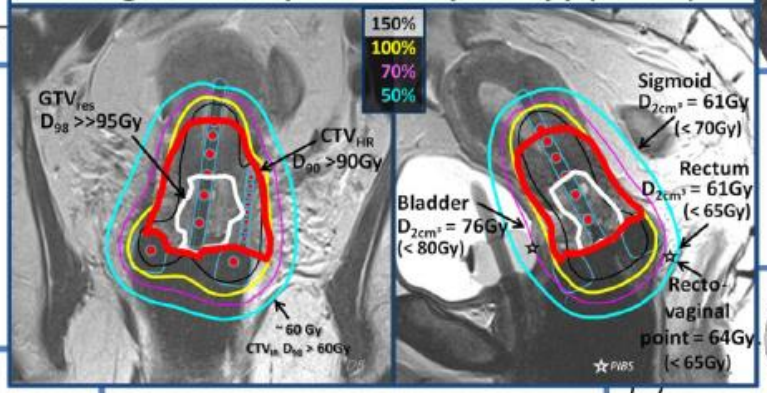
An intErnational study
on MRI-guided BRachytherapy
in locally Advanced CErvical cancer

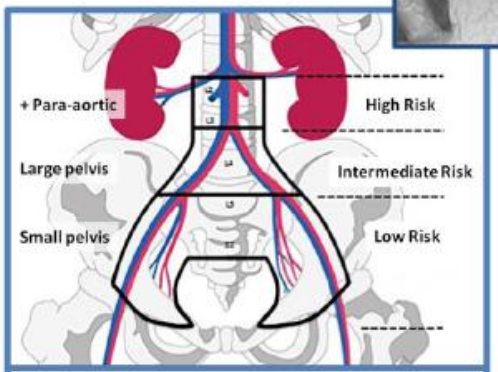




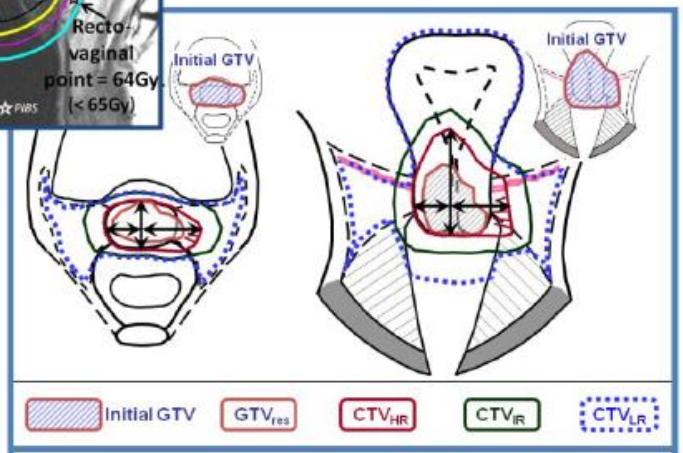


MRI guided adaptive brachytherapy (IGABT)





Nodal CTV-E based on Risk Group



Residual GTV-T, Adaptive HR CTV-T, IR CTV-T

EMBRACE II design

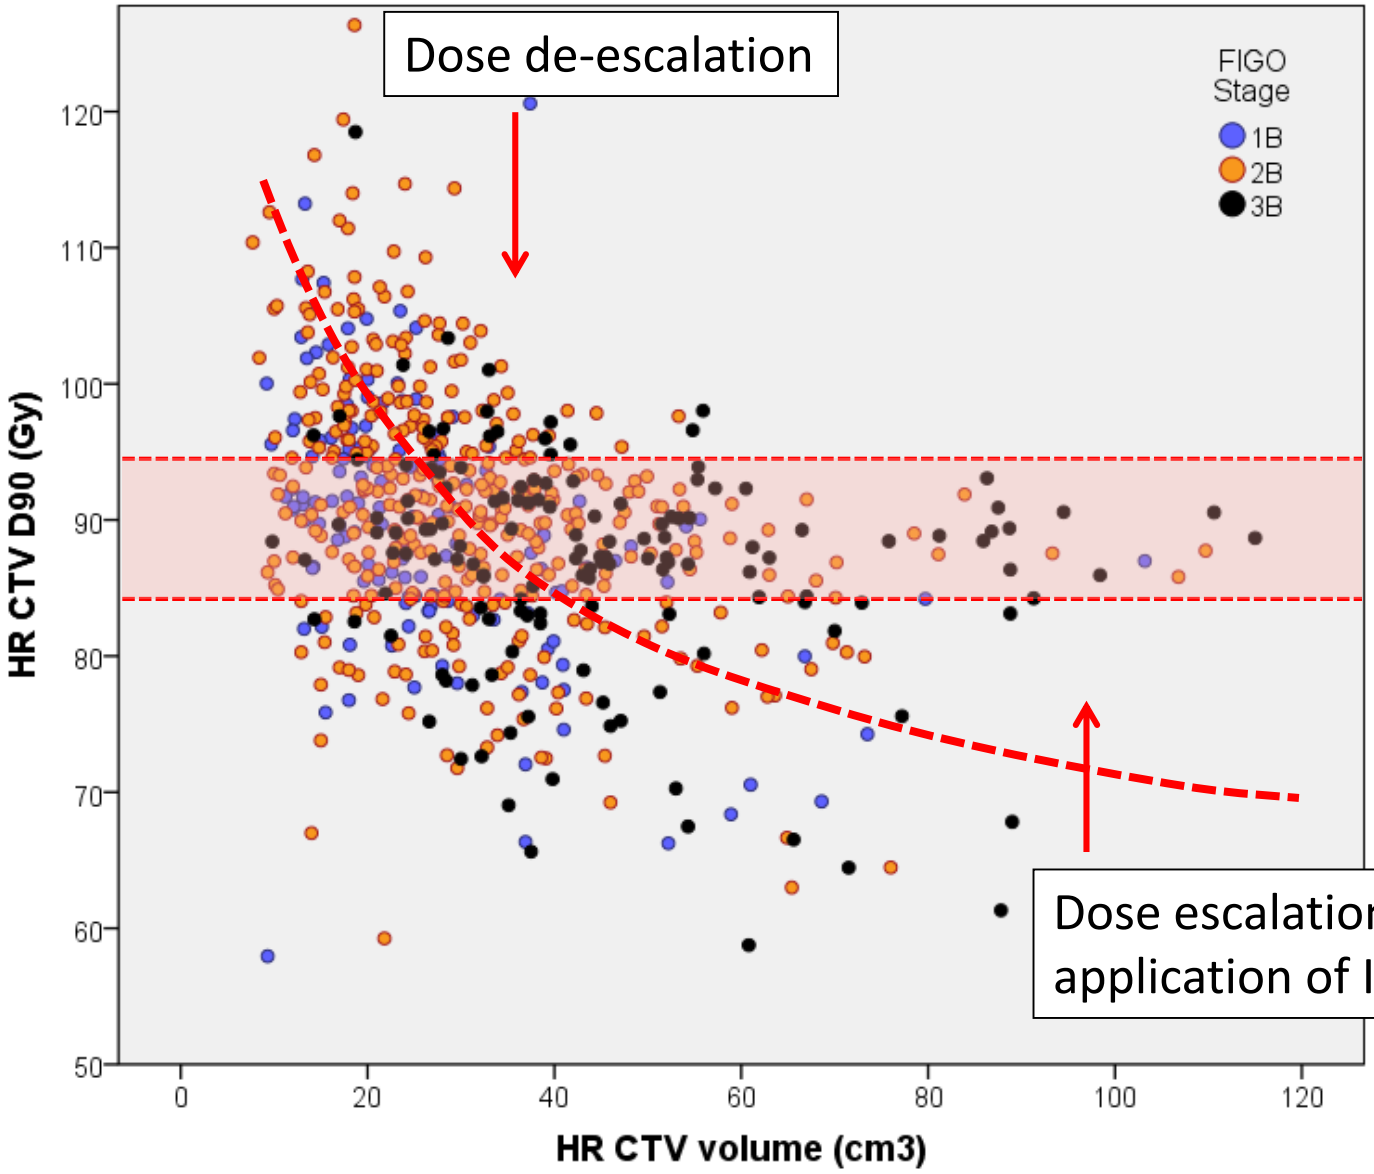
- **Prospective interventional and observational study**
- **Multiple endpoints**
- **Multicenter: >25 centers**
  - **25 current EMBRACE centers and >10 new centers**
- **1000 patients in 4 years and follow up for 5 years**

- **Substudies on**
  - **Adaptive EBRT**
  - **Vaginal morbidity**
  - **Functional imaging**
  - **Translational research**

EMBRACE II interventions

- **Increased use of IC/IS technique in BT:**
  - **HR CTV >30cm3: utilisation of IC/IS of >70% in patients and CTV_{HR}>85Gy in 80% of patients (63% in EMBRACE I))**
- **Reduction of vaginal source loading**
- **Systematic utilisation of IMRT**
- **Utilisation of daily IGRT (set-up according to bony structures)**
- **EBRT target concept related to the primary tumour; concepts for OAR contouring**
- **EBRT dose prescription (45Gy/25fx) and reporting**
- **Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence**
- **Systematic application of simultaneous chemotherapy**
- **Reduction of overall treatment time**

EMBRACE II dose prescription



769 pts EMBRACE

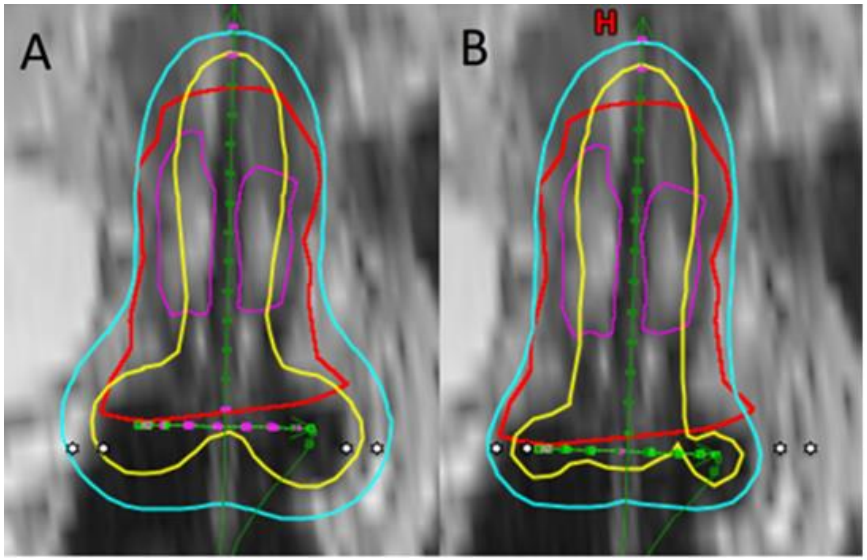
HR CTV D90 85-95Gy

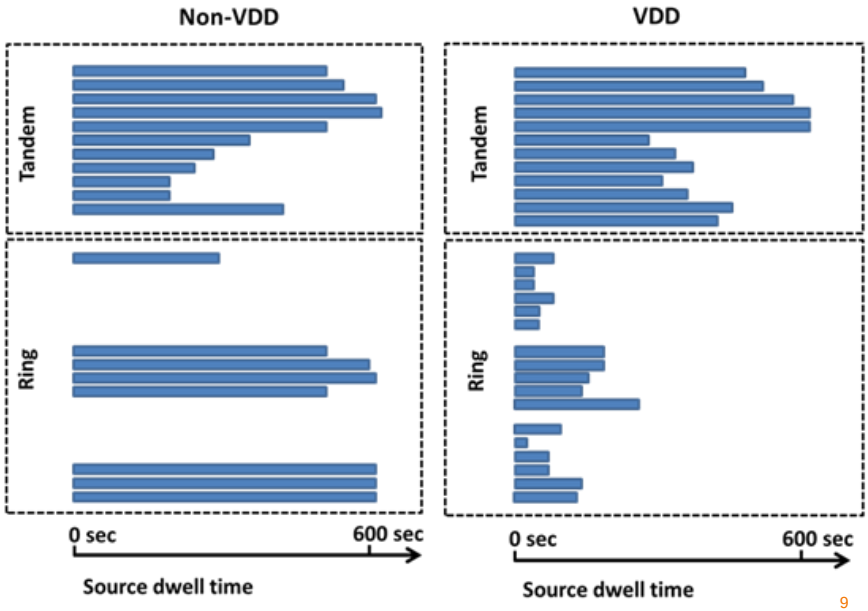
EMBRACE II interventions

- **Increased use of IC/IS technique in BT**
- **Reduction of vaginal source loading (<33% of total loading (51% in EMBRACE I)**
- **Systematic utilisation of IMRT**
- **Utilisation of daily IGRT (set-up according to bony structures)**
- **EBRT target concept related to the primary tumour; concepts for OAR contouring**
- **EBRT dose prescription (45Gy/25fx) and reporting**
- **Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence**
- **Systematic application of simultaneous chemotherapy**
- **Reduction of overall treatment time**

Vaginal dose de-escalation

	Aim	Priority
ICRU recto-vaginal point dose	<65Gy EQD2 (EBRT+BT)	Primary
The ratio of vaginal TRAK and total TRAK	<30-40%	Secondary
Vaginal lateral dose points at 5mm	<85Gy EQD2 (EBRT+BT)	Secondary
Visual inspection of the 140% isodose	Intruding as little as possible into vaginal tissue, and preferentially located within the applicator	Secondary



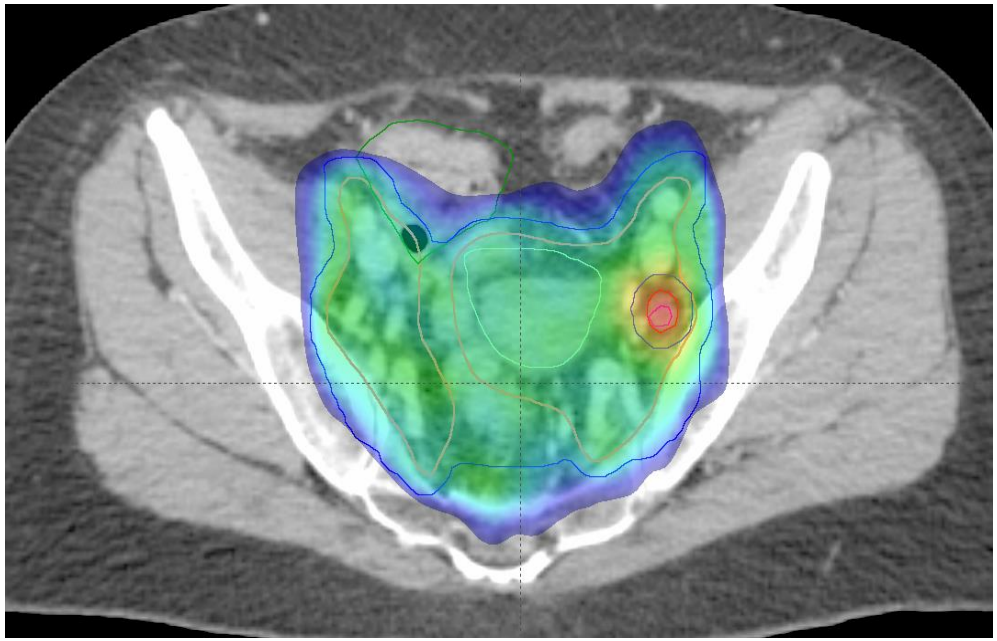


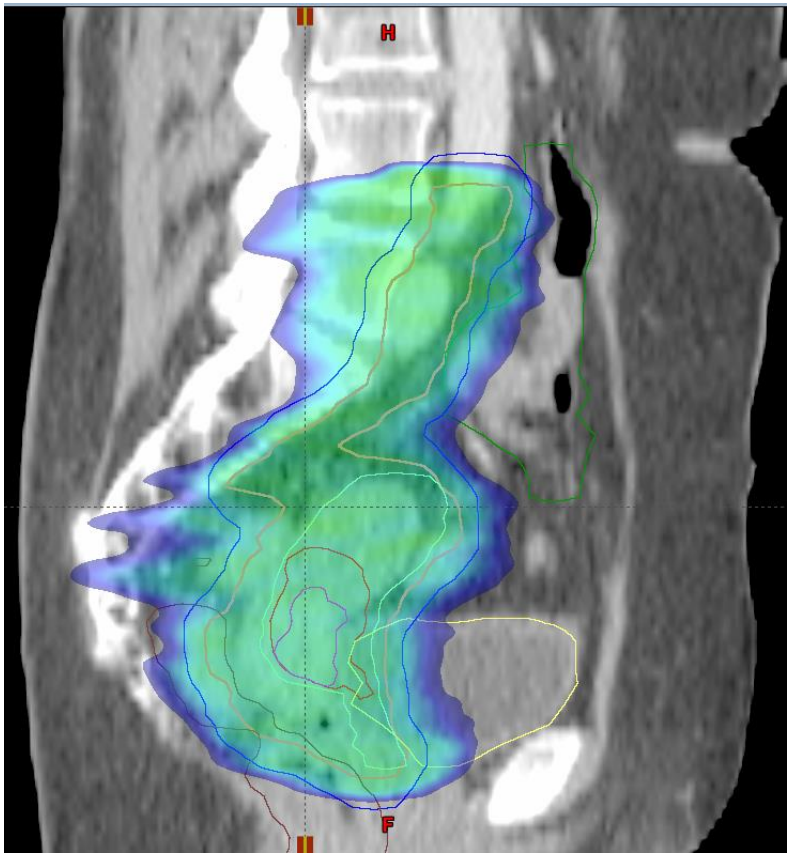
EMBRACE II interventions

- **Increased use of IC/IS technique in BT**
- **Reduction of vaginal source loading**
- **Systematic utilisation of IMRT + Utilisation of daily IGRT (reduction of V43Gy by 1000cm3 (from 2500cm3 to 1500cm3 pelvis)**
- **EBRT target concept related to the primary tumour; concepts for OAR contouring**
- **EBRT dose prescription (45Gy/25fx) and reporting**
- **Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence**
- **Systematic application of simultaneous chemotherapy**
- **Reduction of overall treatment time**

IMRT + daily IGRT

- 5mm PTV margin
- SIB LN boosting



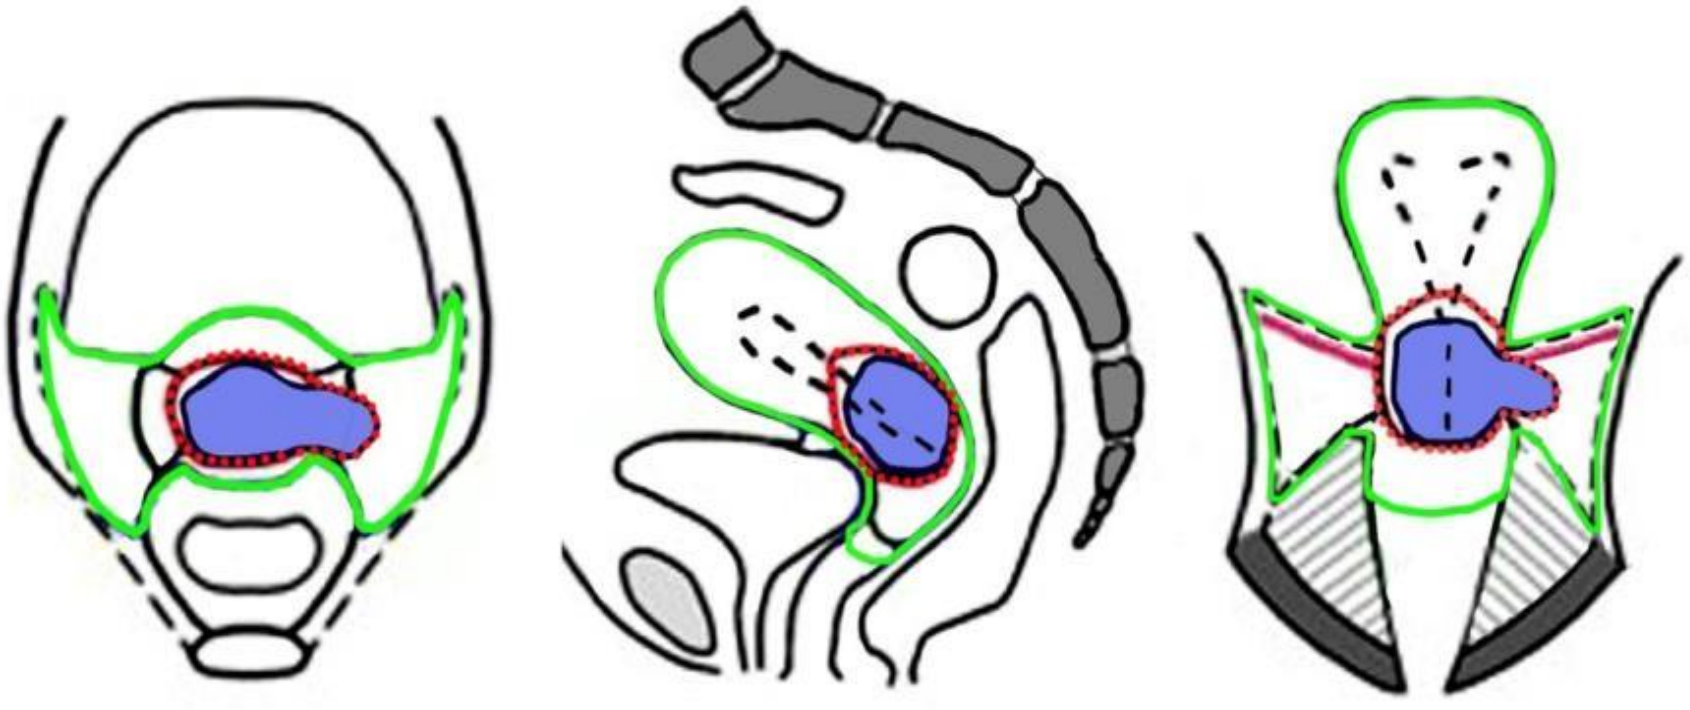


EMBRACE II interventions

- **Increased use of IC/IS technique in BT**
- **Reduction of vaginal source loading**
- **Systematic utilisation of IMRT**
- **Utilisation of daily IGRT (set-up according to bony structures)**
- **EBRT target concept related to the primary tumour; concepts for OAR contouring**
- **EBRT dose prescription (45Gy/25fx) and reporting**
- **Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence**
- **Systematic application of simultaneous chemotherapy**
- **Reduction of overall treatment time**

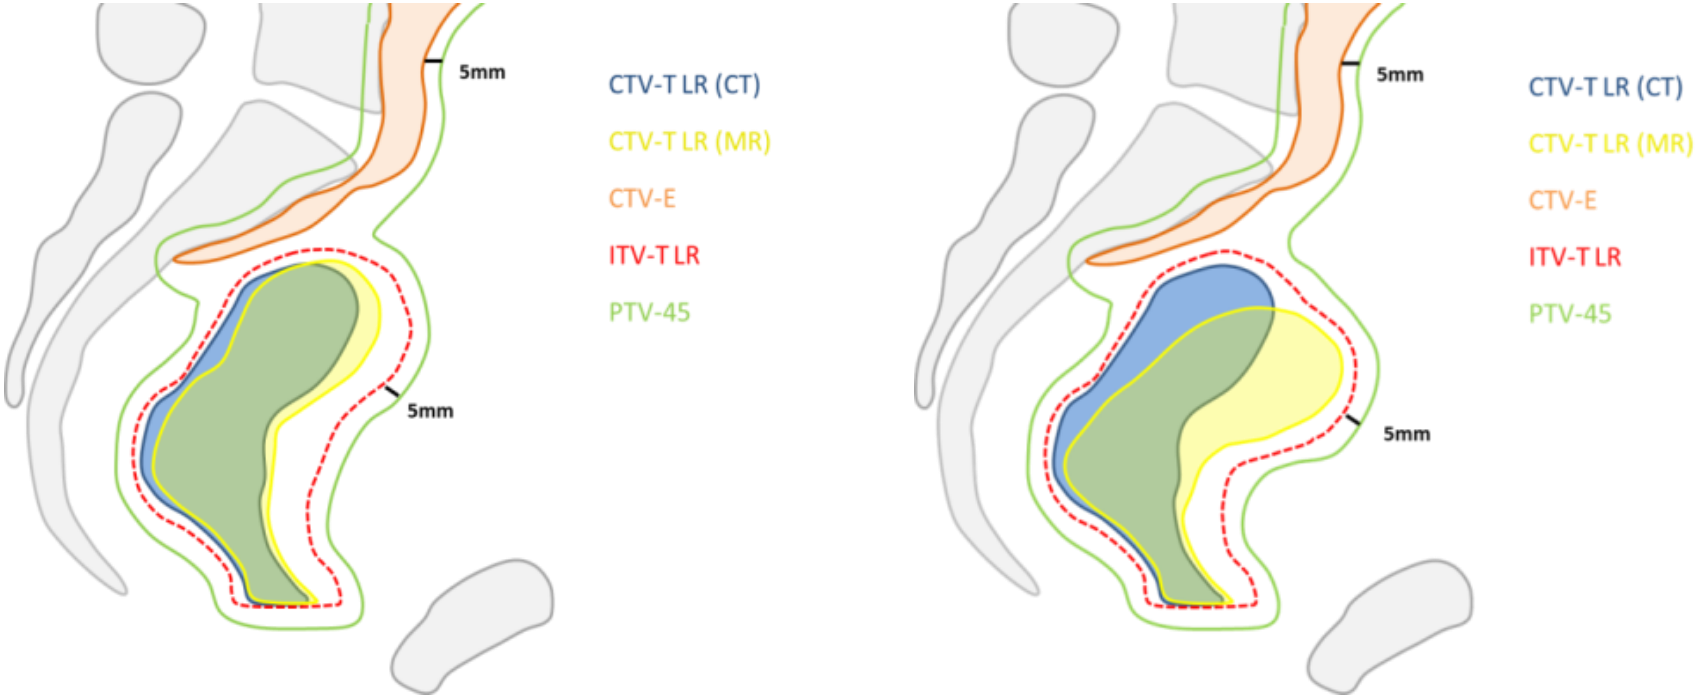
Target concept related to primary tumour

- **Initial GTV (blue)**
- **Initial HR CTV-T (red): GTV+cervix**
- **LR CTV-T (green): HR CTV + uterus + parametria + vagina**



Internal target volume

- **Combined appearance on CT and MRI**
- **Taking organ motion into account**



EMBRACE II interventions

- Increased use of IC/IS technique in BT
- Reduction of vaginal source loading
- Systematic utilisation of IMRT
- Utilisation of daily IGRT (set-up according to bony structures)
- EBRT target concept related to the primary tumour; concepts for OAR contouring
- EBRT dose prescription and reporting (45Gy/25 fx in all fractions (30% patients with >45Gy in EMBRACE I)
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence
- Systematic application of simultaneous chemotherapy
- Reduction of overall treatment time

EBRT dose prescription

- **CTV-E:**
  - **45Gy/25fx**

- **CTV-N**
  - **Delivered as SIB**
  - **Suggested dose and fractionation**
    - **55Gy/25 fx inside pelvis (assuming 3-4Gy BT contribution)**
    - **57.5Gy/25fx outside pelvis**
    - **Equivalent to a total of 60Gy EQD2**

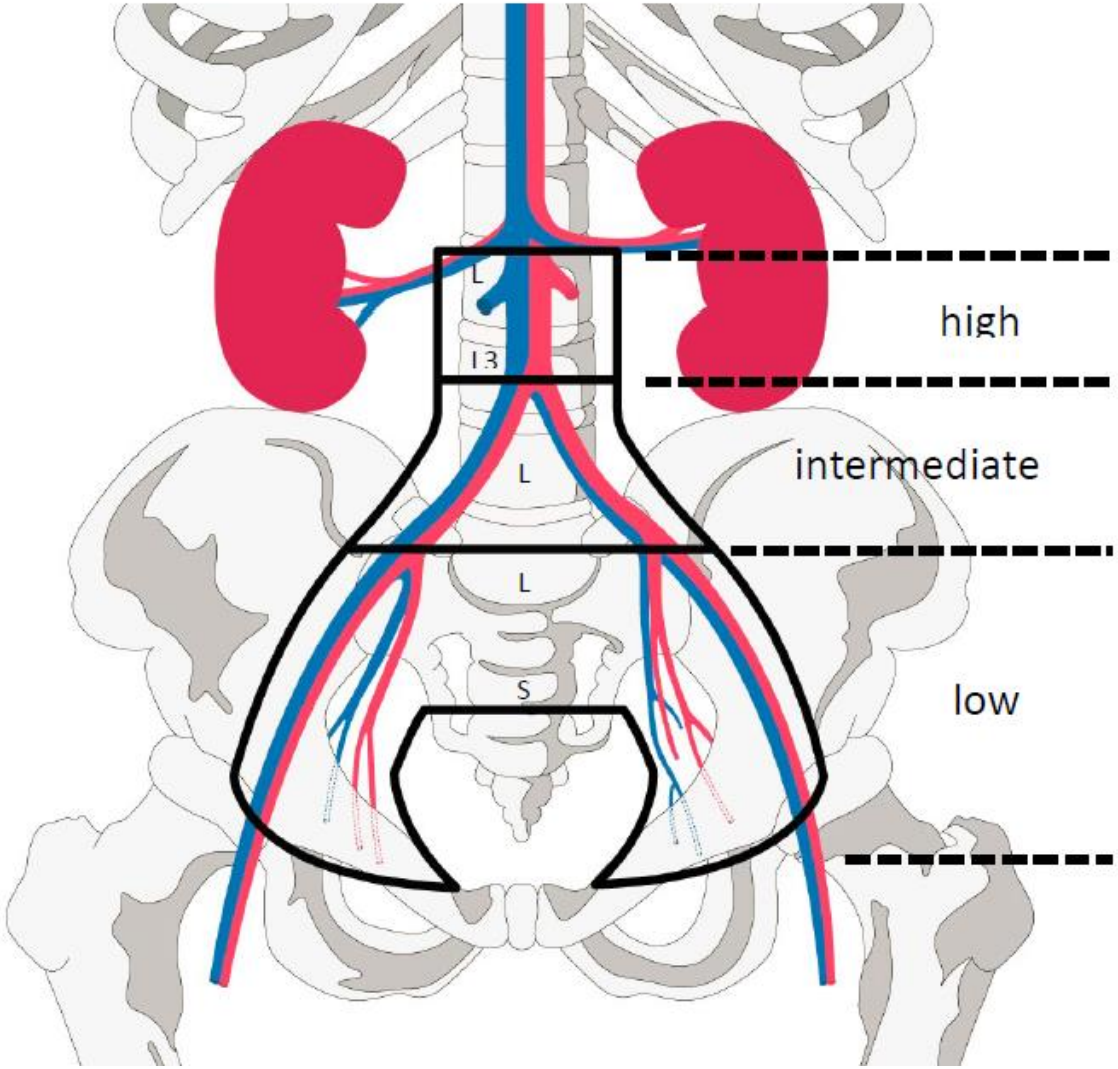
EMBRACE II interventions

- Increased use of IC/IS technique in BT
- Reduction of vaginal source loading
- Systematic utilisation of IMRT
- Utilisation of daily IGRT (set-up according to bony structures)
- EBRT target concept related to the primary tumour; concepts for OAR contouring
- EBRT dose prescription (45Gy/25fx) and reporting
- Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence (application of PAN irradiation in 55% of N+ patients (25% in EMBRACE I))
- Systematic application of simultaneous chemotherapy
- Reduction of overall treatment time

Target concept related to elective lymph nodes

Risk Group LN	Definition	EBRT lymph node regions
Low Risk (LR LN)	Tumour size ≤4cm AND stage IA/IB1/IIA1 AND N0 AND squamous cell carcinoma AND no uterine invasion	**"Small Pelvis"** internal iliac external iliac obturator presacral
Intermediate Risk (IR LN)	Not low risk No high risk features	**"Large Pelvis"** Nodes included in "Small Pelvis" and common iliac region (including the aortic bifurcation). In addition: • inguinal in case of distal vaginal involvement. • Mesorectal space in case of mesorectal nodes and advanced local disease
High Risk (HR LN)	Based on nodal pathology • ≥ 1 pathologic node at common iliac or above • OR ≥ 3 pathologic nodes	**"Large Pelvis + Para-aortic"** Nodes included in "Large Pelvis" and para-aortic region with the upper border of CTV minimum at the level of renal veins (usually incl. L2), and at least 3 cm cranial of the highest pathological node in case of para-aortic nodes].

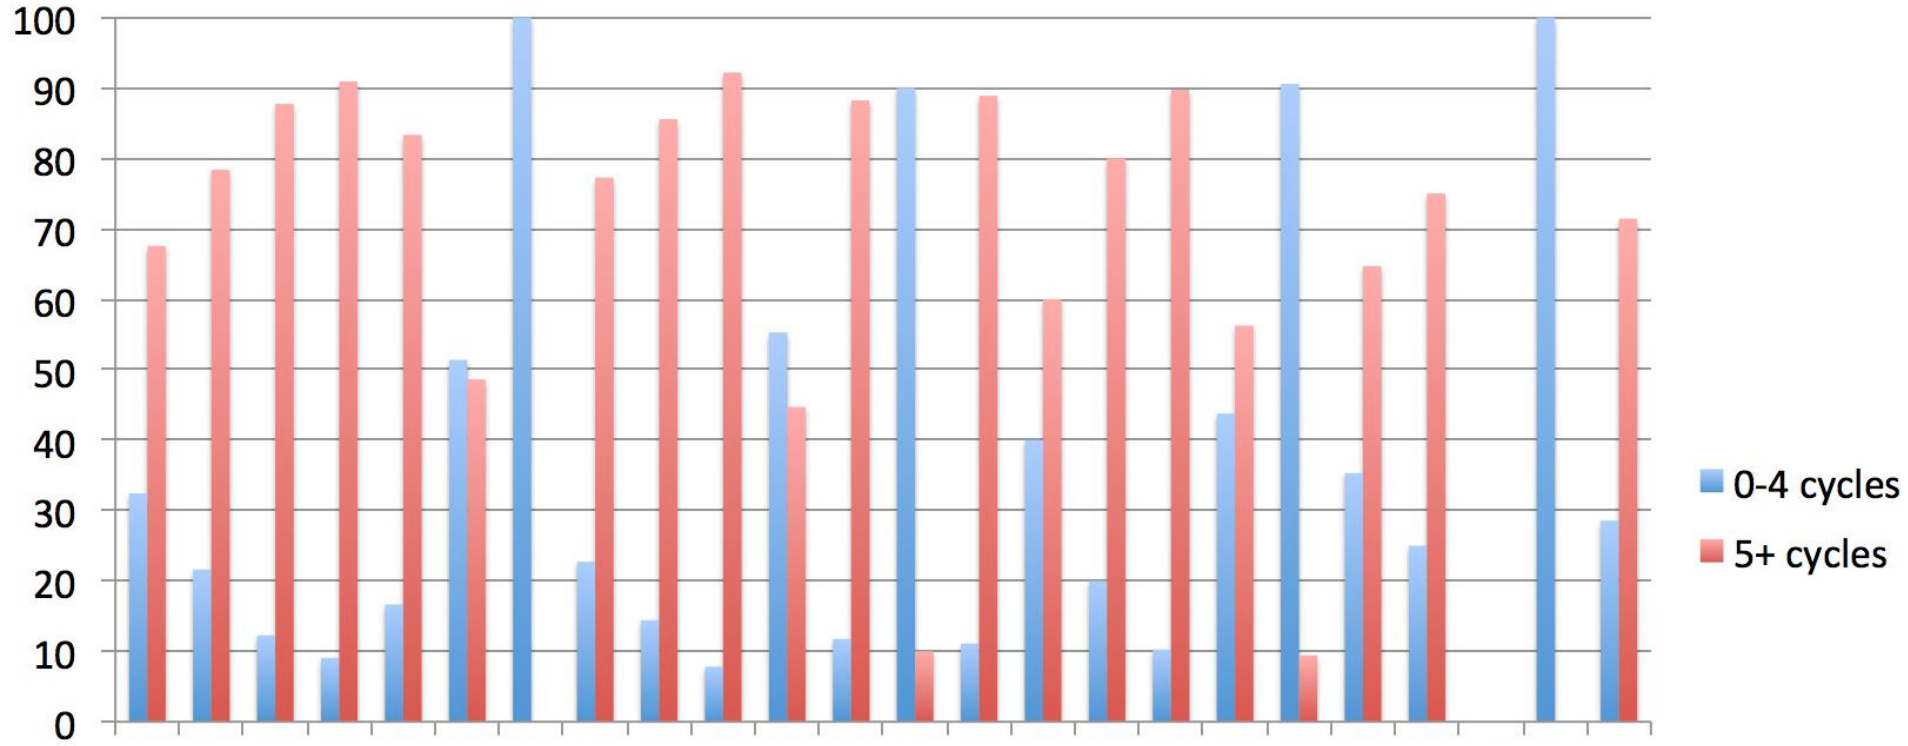
Target concept related to elective lymph nodes



EMBRACE II interventions

- **Increased use of IC/IS technique in BT**
- **Reduction of vaginal source loading**
- **Systematic utilisation of IMRT**
- **Utilisation of daily IGRT (set-up according to bony structures)**
- **EBRT target concept related to the primary tumour; concepts for OAR contouring**
- **EBRT dose prescription (45Gy/25fx) and reporting**
- **Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence**
- **Systematic application of simultaneous chemotherapy (administration of 5 cycles in 80% of patients (69% in EMBRACE I)**
- **Reduction of overall treatment time**

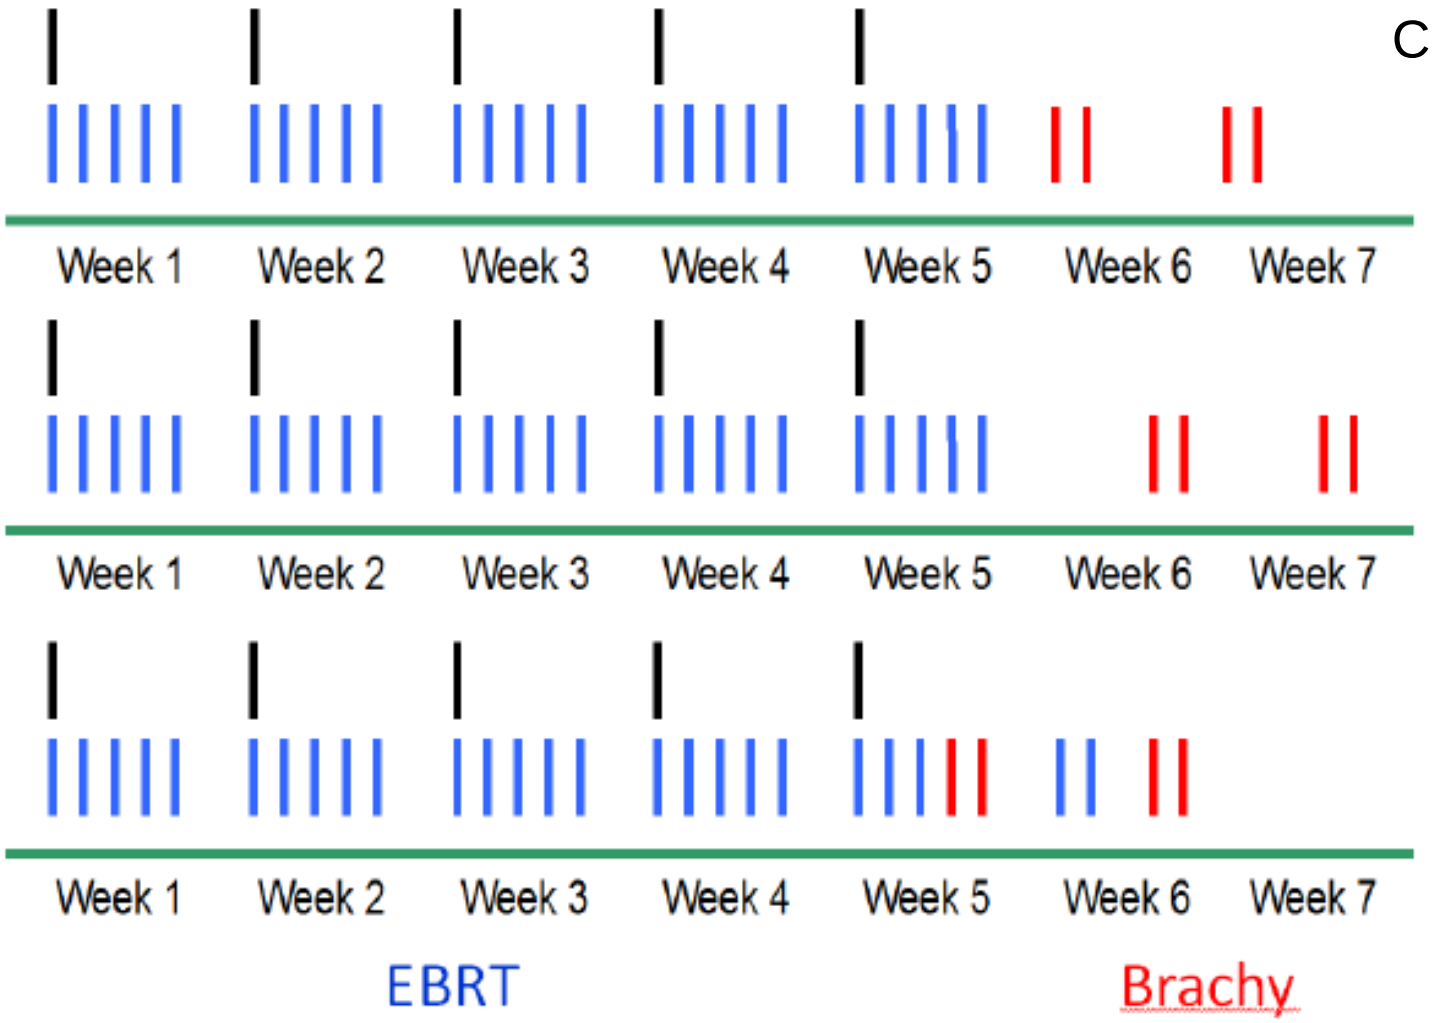
Administration of chemotherapy in EMBRACE I



EMBRACE II interventions

- **Increased use of IC/IS technique in BT**
- **Reduction of vaginal source loading**
- **Systematic utilisation of IMRT**
- **Utilisation of daily IGRT (set-up according to bony structures)**
- **EBRT target concept related to the primary tumour; concepts for OAR contouring**
- **EBRT dose prescription (45Gy/25fx) and reporting**
- **Adaptation of EBRT nodal elective CTV according to risk of nodal and systemic recurrence**
- **Systematic application of simultaneous chemotherapy**
- **Reduction of overall treatment time (OTT<50 days in 80% of patients (50% of patients in EMBRACE I)**

Control of OTT: 3 examples of schedules



Accreditation and dummy run for new centers

- **Documentation of compliance (web based)**
  - **Treatment of >10 pts per year qualifying for accrual to EMBRACE II**
  - **Both EBRT and BT performed in the center**
  - **Routine use of IMRT or VMAT**
  - **Routine use of daily IGRT with bony fusion**
  - **Routine use of MRI guided IGABT**
  - **Routine use of combined IC/IS (>20-50% of pts)**

Accreditation and dummy run for new centers

- **Dummy run**
  - **Contouring training for EBRT and BT (self-assessment)**
  - **EBRT planning exercise (self assessment)**
  - **Registration of 5 patient in registration database**
  - **Submission of EBRT and BT contours**
  - **Submission of EBRT and BT treatment plan**

Roadmap EMBRACE II

- **Oct 2015:** **Protocol distributed to EMBRACE centers**
- **Nov 2015:** **Protocol distribution to interested centers**
- **Spring 2016:** **Dummy run EMBRACE centers**
- **April 2016:** **Start of accrual**
- **Autumn 2016 →** **Dummy run new centers**

Cervix cancer brachytheraphy

Variation of treatment planning parameters (D90 HR-CTV, D_{2cc} for OAR) for cervical cancer tandem ring brachytherapy in a multicentre setting: Comparison of standard planning and 3D image guided optimisation based on a joint protocol for dose–volume constraints

Ina M. Jürgenliemk-Schulz [a,1], Stefan Lang [b,*,1], Kari Tanderup [c], Astrid de Leeuw [a], Christian Kirisits [b], Jacob Lindegaard [c], Primoz Petric [d], Robert Hudej [d], Richard Pötter [b], On behalf of the Gyn GEC ESTRO network

Table 1
Treatment concepts of the different ring centres (R1–R6): EBRT dose, BT dose rate and fractionation schedule, additional interstitial sources.

Centre	R1	R2	R3	R4	R5	R6
EBRT						
Physical dose (Gy)	45	45	45	45	45	45
Fractionation	25 × 1.8	25 × 1.8	25 × 1.8	25 × 1.8	25 × 1.8	25 × 1.8
Brachytherapy						
Dose rate	PDR	PDR	HDR	HDR	HDR	HDR
Number of fractions	3	2	6	5	4	3
Prescribed physical dose/fraction (Gy)	12	20	4.7	5.5	7	7
Interstitial needles	Yes	Yes	No	No	Yes	No

IGABT cervix cancer
Practice homogeneity

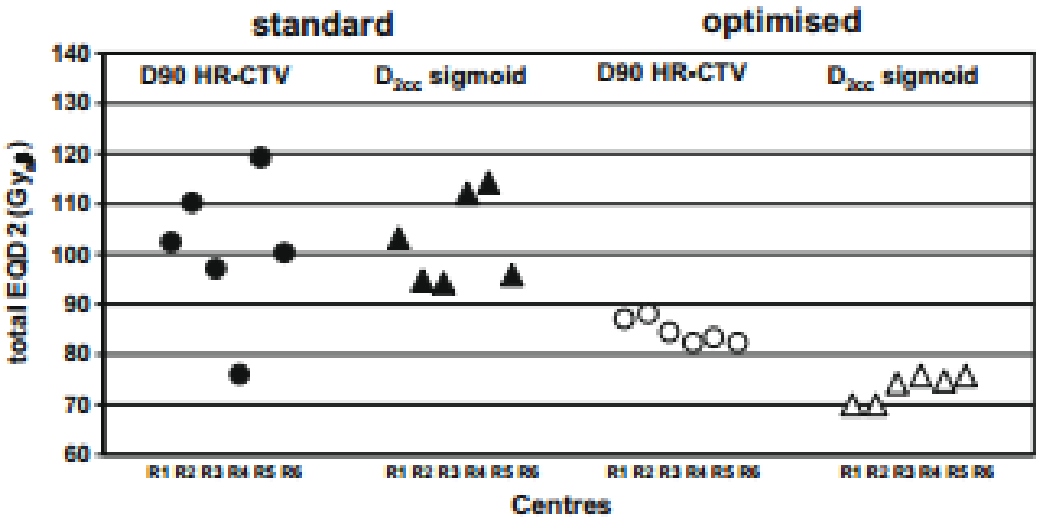

Fig. 2. Dose level variations (D90 HR-CTV and D_{2cc} sigmoid) in standard and optimised plans from the different centres for the limited volume case. The radiobiological effect of dose rate (PDR: R1/R2, HDR: R3/R4/R5/R6) and fractionation is indicated for the different treatment schedules (3rd and 4th column). Number of fractions is decreasing and dose per fraction is increasing for R3–R6 (compare Table 1).

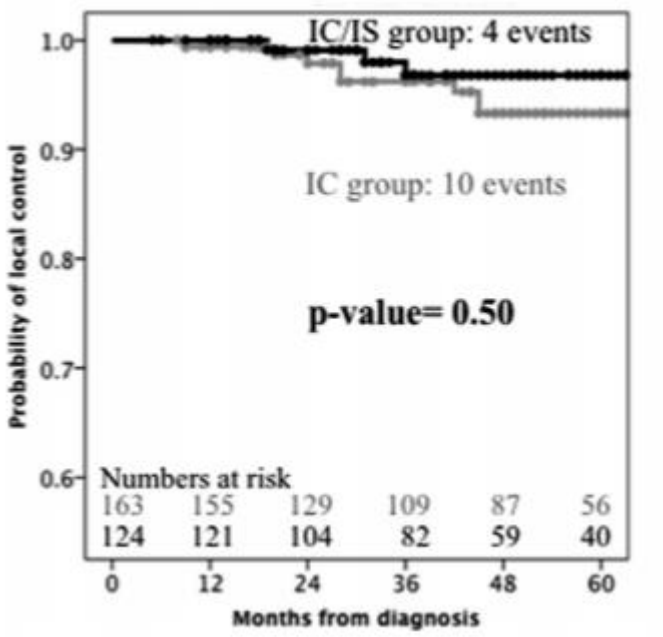
2C. Small target volume (CTV_{HR}<30 cm^3)



Fokdal Radiother Oncol 2016;120:434-40

2B. Large target volume (CTV_{HR}≥30 cm^3)

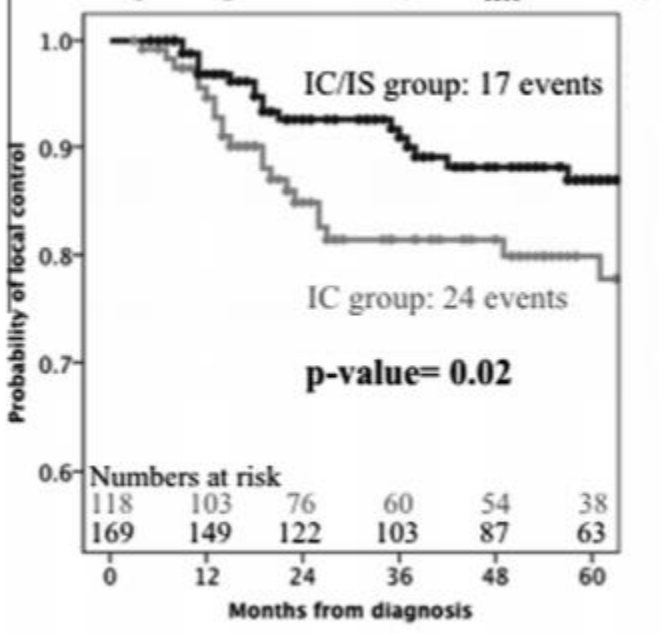


Table 2
Local failures (crude percentage) are listed according to stage, as well as CTV_{HR} volume and total $EQD2_{10}$ (EBRT + BT) doses for CTV_{HR}, GTV and CTV_{IR} (mean and standard deviation).

Stage	# local failures/# pts	% local failures	CTV_{HR} volume 488 pts	CTV_{HR} D90 488 pts	GTV D100 267 pts	CTV_{IR} D90 353 pts
All stages	43/488	8.8%	36 ± 22 cm^3	86 ± 12 Gy	92 ± 19 Gy	68 ± 7 Gy
IB	1/67	1.5%	25 ± 15 cm^3	89 ± 13 Gy	101 ± 27 Gy	71 ± 7 Gy
IIA + IIB	21/280	7.5%	33 ± 19 cm^3	87 ± 11 Gy	93 ± 18 Gy	69 ± 6 Gy
IIIA + IIIB + IV	21/141	14.9%	47 ± 27 cm^3	83 ± 12 Gy	88 ± 18 Gy	66 ± 7 Gy

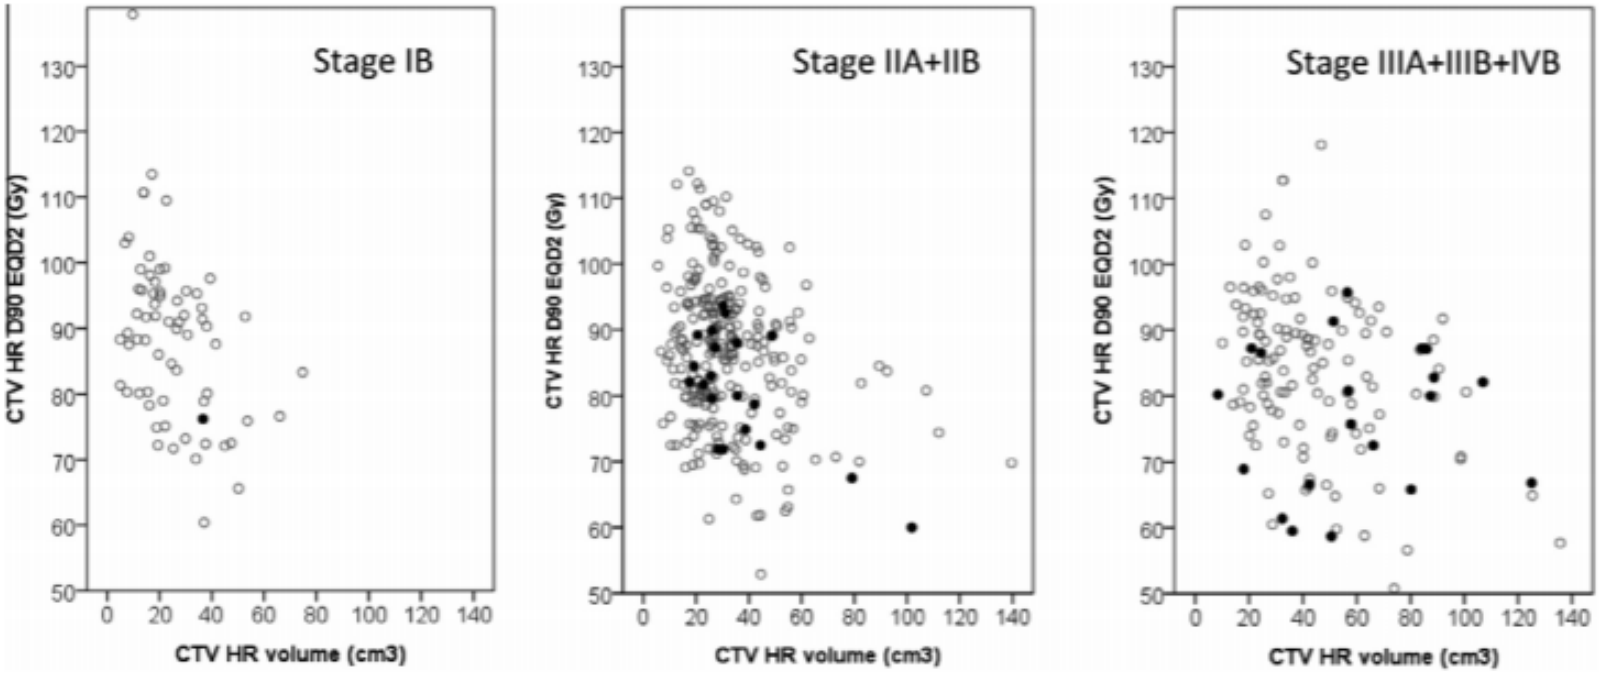

Fig. 1. Distribution of local failures according to stage as a function of CTV_{HR} volume and dose (D90). Patients with local control are indicated with open circles. Patients with local failure are indicated with filled circles.

Demonstration of clinical evidence for dose effect for CTVHR

3-year local control rates D90 CTVHR dose ≥85 Gy in 7 weeks:

- >94% in limited size CTVHR (20 cm3)
- >93% in intermediate size CTV HR (30 cm3)
- >86% in large size CTVHR (70 cm3)

Doses of 90–95 Gy add 1–4% to local control

An increase of OTT by one week is equivalent to de-escalating CTVHR dose by 5 Gy

An increased CTVHR volume by 10 cm3 requires an additional 5 Gy for equivalent local control.

Tanderup Radiother Oncol 2016;120:441–46

Late rectal morbidity EMBRACE data

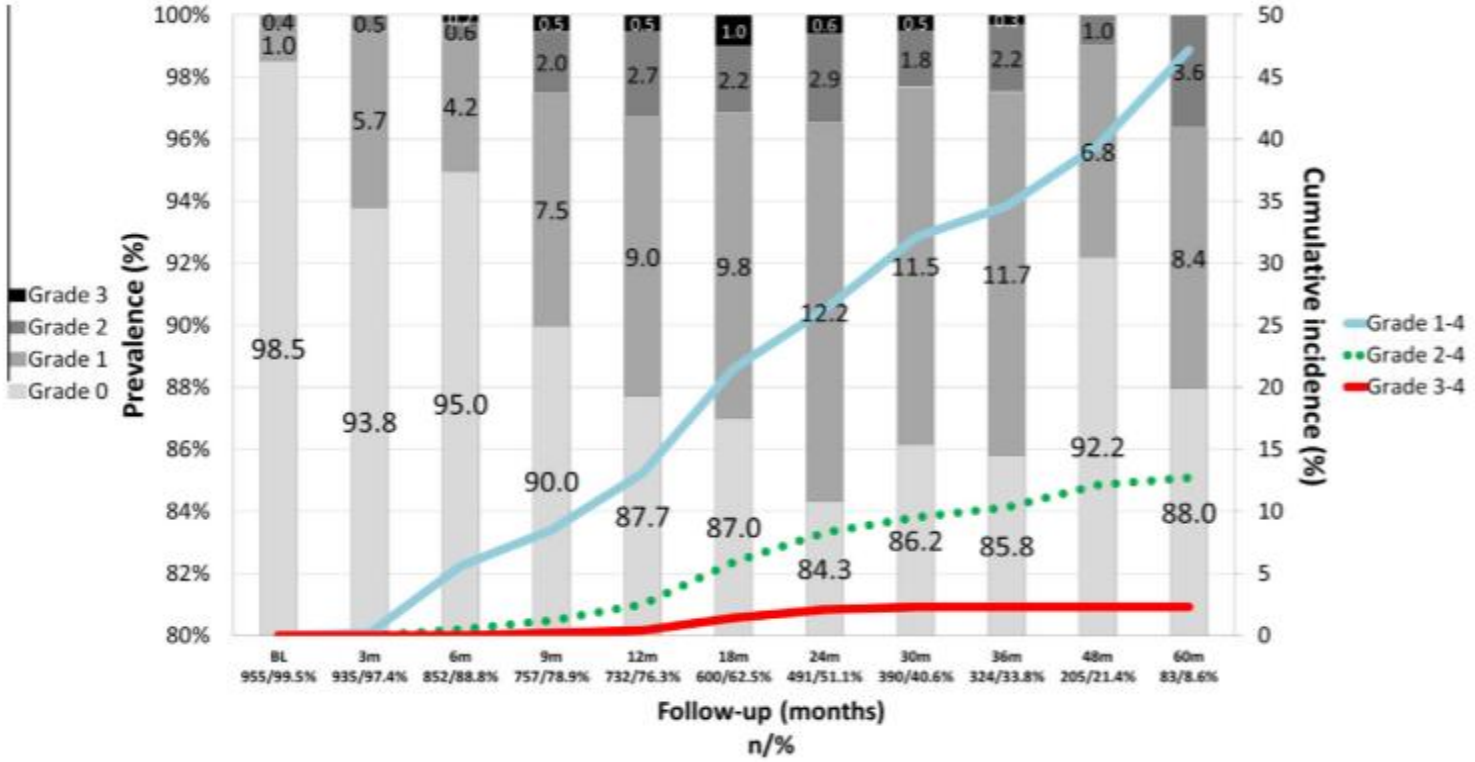

Fig. 1. Incidence and prevalence of rectal morbidity. BL: baseline. m: months. Prevalence is represented using histograms, with legends on the left, and incidence using curves, legends on the right. Prevalence rates according to grade and time are presented on the histograms.

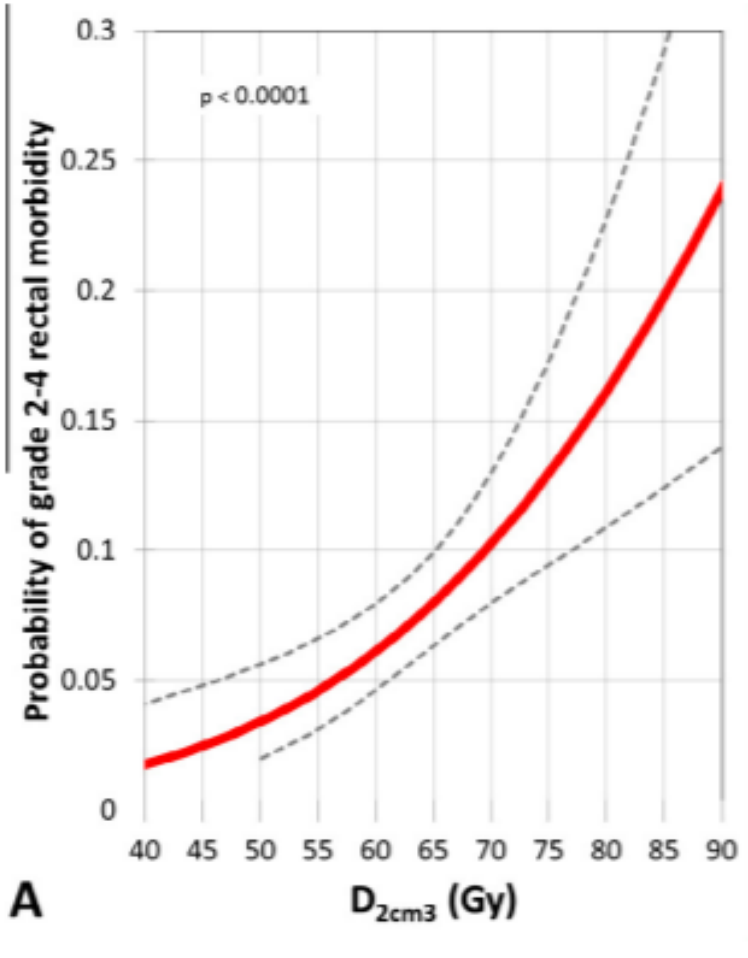
Mazeron et al. Radiother Oncol 2016

Actuarial estimate evaluation of overall rectal morbidity at 3 years
D2cm3 ≥75Gy risk of 30% of grade 2–4
D2cm3 ≤65 Gy risk of <10% of grade 2-4



Mazeron et al. Radiother Oncol 2016

Dose–effect relationship and risk factors for vaginal stenosis after definitive radio(chemo)therapy with image-guided brachytherapy for locally advanced cervical cancer in the EMBRACE study

Kathrin Kirchheiner [a,*], Remi A. Nout [b], Jacob C. Lindegaard [c], Christine Haie-Meder [d], Umesh Mahantshetty [e], Barbara Segedin [f], Ina M. Jürgenliemk-Schulz [g], Peter J. Hoskin [h], Bhavana Rai [i], Wolfgang Dörr [a,j], Christian Kirisits [a], Søren M. Bentzen [k], Richard Pötter [a,j], Kari Tanderup [c], the EMBRACE Collaborative Group [1]

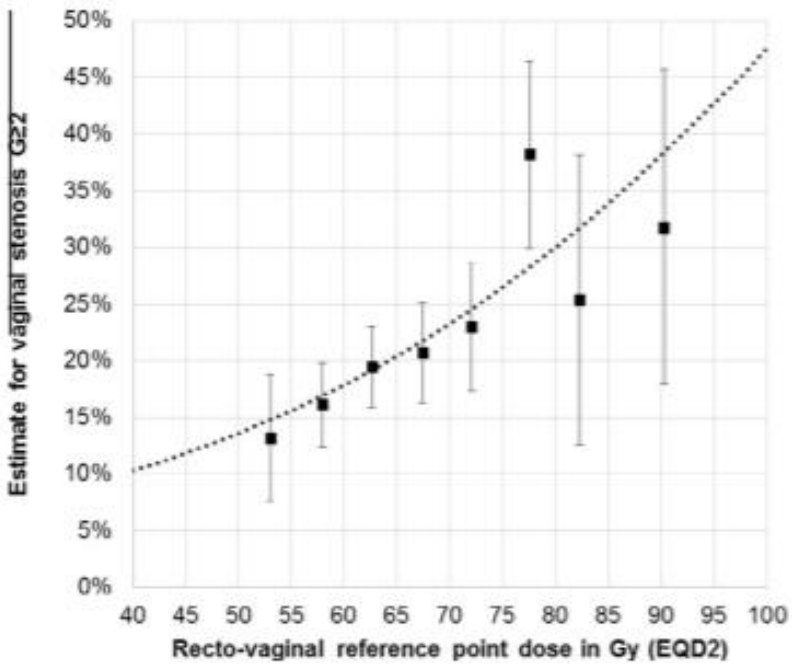


Fig. 4. Dose–effect relationship of the combined EBRT and brachytherapy dose to recto-vaginal reference point in EQD2 and vaginal stenosis $G \geqslant 2$ in $N = 630$ patients.

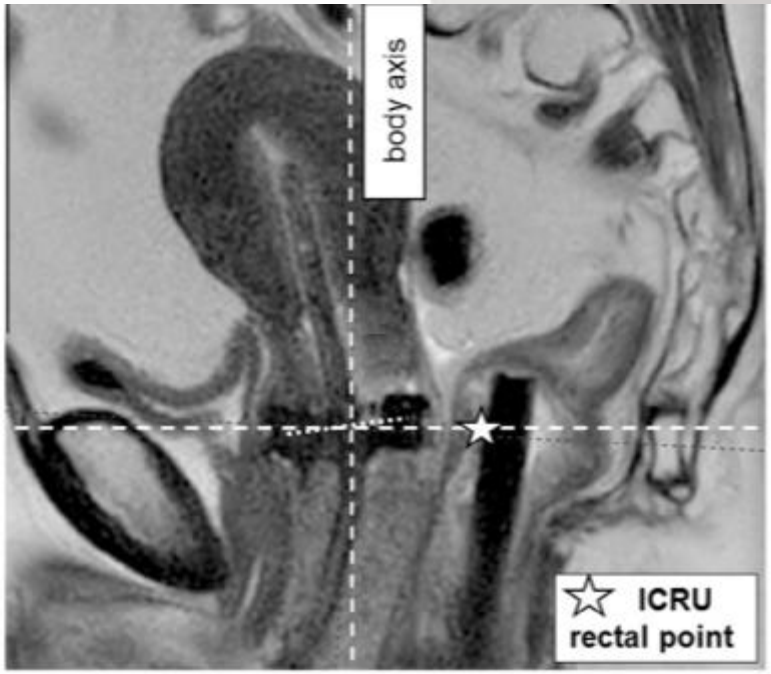

Fig. 1. ICRU rectal point depicted on sagittal T2 MRI, positioned at the intersection level between tandem and the source positions in the ring and 5 mm dorsal of the posterior vaginal wall on the axis perpendicular to the body axis.

Kircheiner et al. Radiother Oncol 2016

Dose–effect relationship and risk factors for vaginal stenosis after definitive radio(chemo)therapy with image-guided brachytherapy for locally advanced cervical cancer in the EMBRACE study

Kathrin Kirchheiner [a,*], Remi A. Nout [b], Jacob C. Lindegaard [c], Christine Haie-Meder [d], Umesh Mahantshetty [e], Barbara Segedin [f], Ina M. Jürgenliemk-Schulz [g], Peter J. Hoskin [h], Bhavana Rai [i], Wolfgang Dörr [a,j], Christian Kirisits [a], Søren M. Bentzen [k], Richard Pötter [a,j], Kari Tanderup [c], the EMBRACE Collaborative Group [1]

Recommendations:

- ERT dose not exceeding 45Gy
- Planning aim ≤65 Gy EQD2 ICRU recto-vaginal point

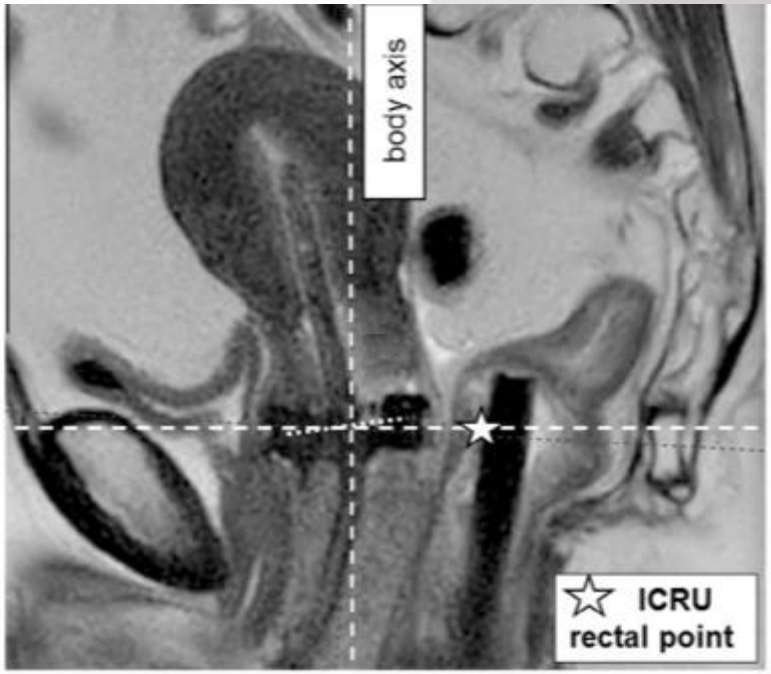

Fig. 1. ICRU rectal point depicted on sagittal T2 MRI, positioned at the intersection level between tandem and the source positions in the ring and 5 mm dorsal of the posterior vaginal wall on the axis perpendicular to the body axis.

Kircheiner et al. Radiother Oncol 2016

Summary

90% LC probability D90 (EQD2) to HR-CTV

92 Gy if volumes ≥ 30 cm3

OTT < 50 days

D2 cm3 (EQD2)
<80 Gy for the bladder
<65 Gy for the rectum

ICRU recto-vaginal point ≤65 Gy

ERT dose = 45 Gy

Future research

- Dose escalation for advanced disease in HR CTV
- Dose de-escalation for limited and favourable advanced disease (good response,…)
- Testing Dose/Volume constraints and morbidity/QoL
- Concomitant ERT-CT and adjuvant chemotherapy for subgroups with high risk of distant metastases
- Biomarker investigation (Hypoxia, HPV, EGFR, VEGF..)

CONTACTS

GEC-ESTRO BRACHYTHERAPY COMMITTEE

Over the years, GEC-ESTRO has substantially increased its work, initiating new activities such as organ-related working groups, an executive committee, teaching courses and publications and it is now an integral part of ESTRO. Further information on these activities can be found here.

Working groups

There are six brachytherapy working groups. Please click on the links below or on the right hand side of this page for further information about the activities of the group.

GEC-ESTRO Breast - Chair: Csaba Polgar
GEC-ESTRO Head and Neck - Chair: György Kovacs
GEC-ESTRO Urology - Chair: Peter Hoskin
GEC-ESTRO Gynaecology - Chair: Richard Pötter and Kari Tanderup
GEC-ESTRO BRAPHYQS - Chair: Frank-André Sieber
GEC-ESTRO Anal - Chair: Arthur Sun Myint

Brachytherapy publications

GEC ESTRO Handbook of Brachytherapy

The GEC ESTRO Handbook of Brachytherapy is aimed at clinicians, physicists and radiotherapy technologists worldwide, this textbook covers the basics of brachytherapy, including the physics and radiobiology and also describes in detail all aspects of clinical practice.

First published in 2002, this valuable handbook is currently under review. The new version of the GEC ESTRO Handbook of brachytherapy will be included in DOVE, the current version of the book can be found here.

Guidelines and recommendations

Brachytherapy guidelines and recommedations issued by ESTRO and other organisations can be found through the search portal. These comprehensive books present a full review of the state of the art of brachytherapy and clinical radiobiology and are widely regarded as essential reading for all those involved in the delivery of radiation oncology therapies.

Collaboration

Intraoperative Radiotherapy

Following a request from the European Group of the International Society of Intraoperative Radiotherapy (ISIORT), the GEC-ESTRO Annual Meeting will provide some visibility to that specialty. A separate pre-meeting workshop will take place at usual GEC-ESTRO meeting. The first event was held in Montpellier in May 2007 and a similar workshop has taken place in Porto in May 2009.

EMBRACE

(European Study on MRI Based 3D Brachytherapy in Locally Advanced Cervical Cancer): A PROSPECTIVE OBSERVATIONAL MULTI-CENTRE STUDY

AIMS:

- Implementation of 3D MRI based cervix cancer brachytherapy in a multi-centre setting in Europe and outside Europe
- Quality control of MRI based brachytherapy in a multi-centre setting applying Gyn GEC ESTRO Recommendations for reporting
- Prospective assessment of outcome for disease, morbidity and quality of life in patients receiving MRI based cervix cancer brachytherapy
- Correlation of local control and dose volume parameters for GTV, HR CTV and IR CTV with the establishment of hazard ratios and dose effect curves for the primary tumour
- Correlation of late morbidity and dose volume parameters for the OAR (rectum, sigmoid, bladder) with the establishment of hazard ratios and dose effect curves for OAR.
- Validation of the GYN GEC ESTRO recommendations in a multi-centre setting
- Publications upcoming: Kirchheiner, Mazeron, Mohammed, Sapru, Jastaniyah, Yoshida, Kirisits, Nomden, Fortin, Schmid …..

RETRO-EMBRACE

Retro-EMBRACE is a retrospective collection of data on 3D IGBT in locally advanced cervical cancer from all centres in which this modality is implemented.
780 patients included
Eligibility criteria to enter data on patients in this database are:
Diagnosis of cervical cancer and treatment with curative intend by way of IGBT (including MRI, CT, (US) or combination of these) before EMBRACE started accrual at your centre, irrespective of the follow up time.

The aim of this data collection is to gather information on the existing experience with IGBT in cervical cancer until EMBRACE data matures.
Publications upcoming: Sturdza, Tanderup, Fokdal……2016

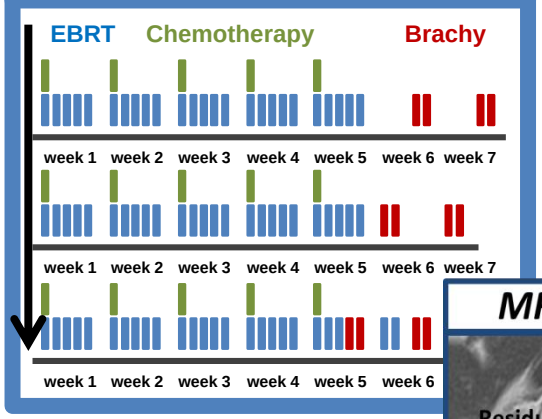
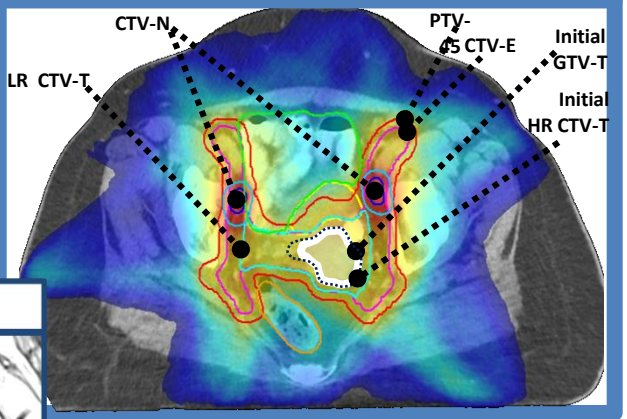
EMBRACE II

Start 4/2016

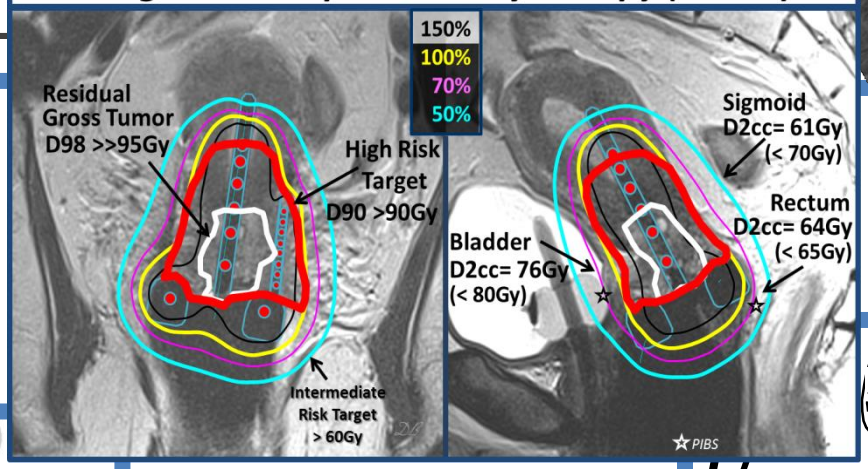
RChTh + BT in < 50 days

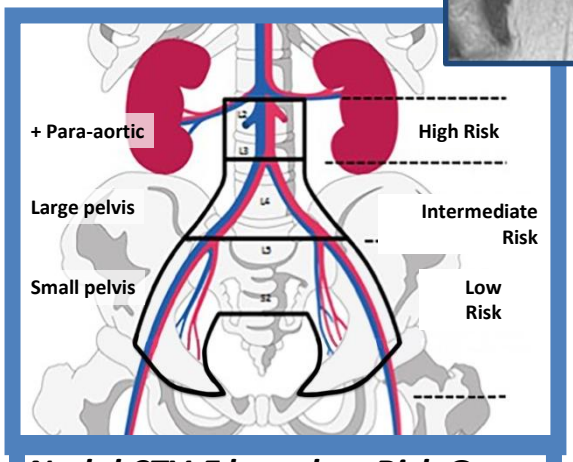


IMRT + IGRT

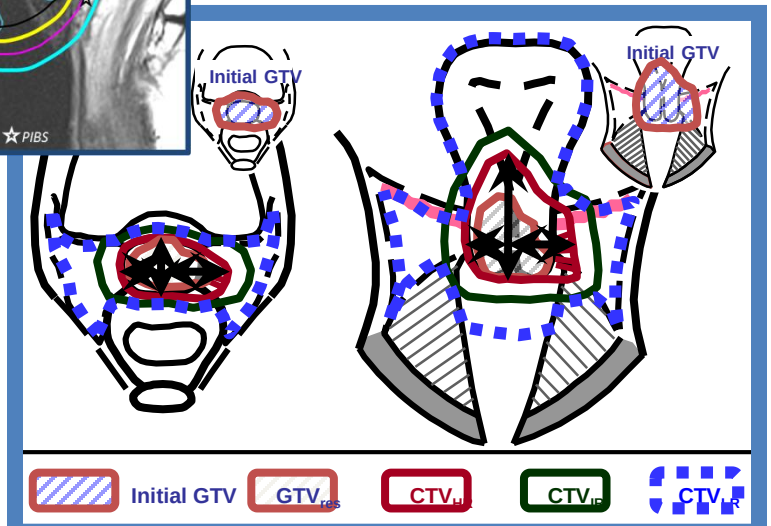


MRI guided adaptive brachytherapy (IGABT)





Nodal CTV-E based on Risk Group



Residual GTV-T, Adaptive HR CTV-T, IR CTV-T

Step 4: Defining MRI based (adaptive) Volumes and Doses

GYN GEC ESTRO recommendations I (Haie-Meder et al.) - contouring

GYN GEC ESTRO recommendations II (Pötter et al.) - dose vol. parameters

GYN GEC ESTRO recommendations III (Hellebust et al.) - reconstruction

GYN GEC ESTRO recommendations IV (Dimopoulos et al.) - imaging

ABS recommendations on GYN general (Viswanathan and Thomadsen, ABS Cervical Cancer Recommendations Committee) - general

ABS recommendations on GYN HDR (Viswanathan et al.)

ABS recommendations on GYN PDR (Lee et al.)

GEC ESTRO gyn network Step by step process
over the last 20 years...
EMBRACE study and research group
over the last 10 years

- Pioneering monoinstitutional experiences: from 1998
- GEC ESTRO Recom I: Target concepts (RO 2005)
- GEC ESTRO Recom II: Reporting (RO 2006)
- GEC ESTRO Recom III: Applicator reconstruction (RO 2010)
- GEC ESTRO Recom IV: Requirements for imaging (RO 2012)
- ICRU GEC ESTRO report 89 (2016)
- Uncertainties in contouring, treatment planning, treatment delivery: 15 papers (RO vol 107, 2013)
- Retrospective and prospective multicenter clinical studies (2008→)
- Clinical outcome of IGABT (RO vol 120, 2016)

- 18 ESTRO teaching course since 2004 (~2000 participants)
- Annual hands-on workshops (education of >150 institutions)
- Web-based contouring teaching (ESTRO School, 2 editions)

More Ongoing Activities
Education & Training

I. Aalderwegen BT acad.

- Hands-on workshops (Vienna, Aarhus…>25)
- International hands-on workshops (~10)
- ESTRO School (international programmes):
  - ESTRO School technology transfer grants (since 2008)
  - web based contouring workshops (3 so far)
  - AROI ESTRO Teaching and Training Programme (2017-2019)
- Cambridge CCMO: web based e-learning program cervix cancer (EMBRACE II)

**Also: GEC ESTRO Handbook of Brachytherapy*

1st edition 2002;

2nd edition developing since 12/2014

my and ….our Steps (n=12) R. Pötter

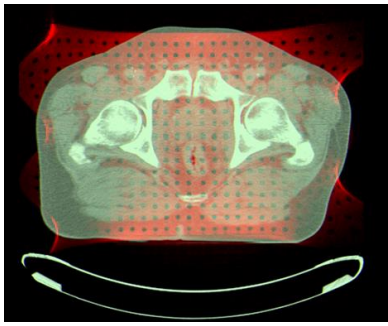
- Building up the vision for MRI
- Providing (some) infrastructure for image based RT (BT)
- Starting (CT) MRI based gynaecologic brachytherapy
- Defining MRI based (adaptive) volumes and doses
- Introducing dose volume constraints into clinical practice
- Developing combined intracavitary/interstitial techniques
- Providing clinical evidence (disease, morbidity, QoL)
- Analysing MRI based DVH parameters and outcome
- Assessing and minimizing uncertainties
- Educating, training and disseminating the „New“
- Designing and managing BT research & development
- Building local, national and international cooperation

Step 1: „building up the vision for MRI“

- Defining „MRI-assisted Simulation“ for EBRT:

  image distortion, fusion, MRI defined target, OAR

  Thesis (Habilitation) 1989, Radioth&Oncol 1991, 1995



- Applying „MRI simulation“ for various sites:

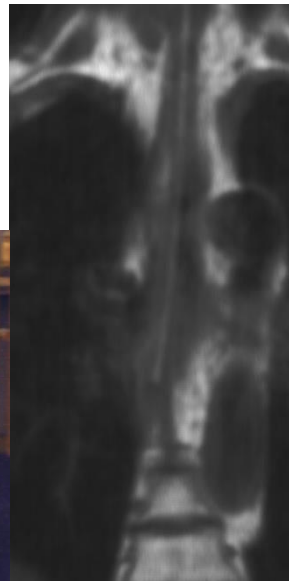
  brain, base of the skull, prostate, lymphoma

  Advances in Radiation Therapy 1993

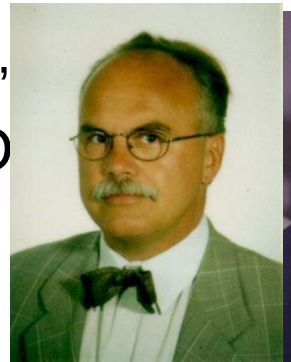
- Applying „MRI simulation“ for Brachytherapy

  Gynaecology, Oesophagus, GEC ESTRO 1990

  Activity 1992



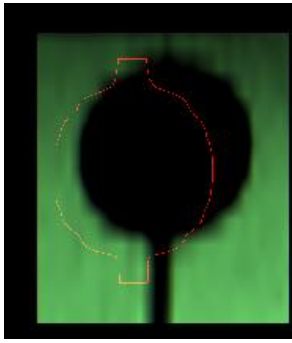
[in coop. with MRI team at Münster University, Germany, in particular U. Haverkamp,PhD G. Kovacs,++]



Step 2: „providing (some) infrastructure“

- Decision in Vienna in favour of an open MRI system for radiotherapy planning, within brachytherapy (1995)

  [instead of a digital fluoroscopy based planning system (500.000€)]



- *Installation, testing, tuning MRI for radiotherapy (97-9)*

  (Fransson et al. Strahlentherapie 2001)

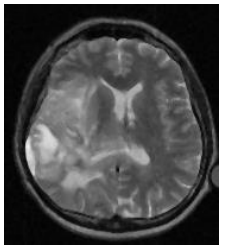
- *Developing specific sequences (prostate, gynae) (1998)*

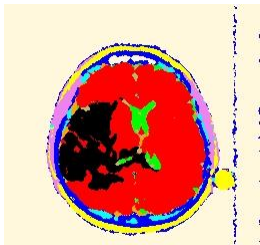
  (research grant MRI medical physics: A. Fransson, Karolinska, Stockholm)

- *Systematic Comparison MRI vs. CT based treatment planning: EBRT for brain and prostate tumours*

  (Fransson et al. Radioth&Oncol 2000,

  Petersch et al. Radioth&Oncol 2003)





Step 3: starting (CT) MRI based gynaecological BT (1994-98-2000+++)

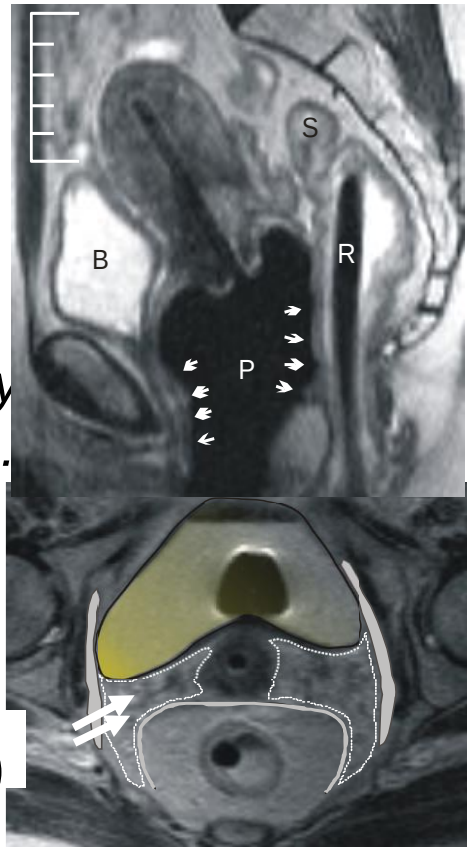
- „**Hardware“:** *MRI/CT compatible applicators, (1995)*
  MRI compatible anaesthesiological equipment

- **Specific demands for gyn BT application**:
  contrast for the tamponade, bladder balloon

- **Specific MRI protocol**: *at diagnosis, at brachytherapy*
  T2 (T1) images, slice orientation, bladder filling…

- **Defining the place of MRI**:
  (before) after clinical insertion of the applicator

- **Learning to read MRI after EBRT (with clin. Exam.)**
  with applicator in place:
  residual GTV, Cervix, grey zones…OAR…



[**cooperation with medical physics, diagnostic MRI expertise, industry]**

Transition from "Conventional 2D to 3D Radiotherapy" with a special emphasis on "Brachytherapy in Cervical Cancers"

ESTRO School

GOALS AND TIMELINES: EBRT

	PHYSICIAN	PHYSICIST
EMBRACE II Target Concept Implementation		
CTV to PTV margins Primary Nodes: Pathological and elective		
Bladder protocol		
IMRT/VMAT		
IGRT protocol Imaging / frequency		
Dose and fractionation modifications		

GOALS AND TIMELINES: BT

	PHYSICIAN	PHYSICIST
BT Application:		
Imaging:		
Planning Process :		
Dose and fractionation modifications:		
Research Interests: **For eg. EMBRACE like…**		

GOALS

SHORT TERM EBRT

- **Embrace II Target Concept:**

  - Possibility of Implementation in more than 50% Participants

  - Others : Institutional Discussion and decide

- **CTV-PTV margins:**

  - Majority have defined some values

- **Bladder filing Protocol:**

  - Some form of bladder filing will be adpated in almost all Institutions

  - However, heterrogenous range : 300 – 750 ml after 30-45 minutes

GOALS

SHORT TERM EBRT cont.

- **IGRT Protocol:**
  - **Bony match/ CBCT : majority**
  - **Frequency : Variation in the protocol**

- **Dose fractionation:**
  - **Majority to shift from 50 Gy to 45 Gy**
  - **A few : to implement SIB for nodal disease**

GOALS

SHORT TERM BT

- **BT Application:**

  - Shift from IC to IC + IS around 8-10 Institutions

  - Around 30% already doing IC + IS

- **Imaging :**

  - CT Environment : Majority to adapt CT Information

Recap of BT planning principles: Radiography based/ CT information

Utilization of CT Imaging

- **Non – MRI Environment :**

  - CT imaging for BT application

  - Contouring of OAR's

  - Conventional Planning : Point A normalization & Prescription

  - Evaluation of OAR doses : ICRUB, ICRUR, 2 /0.1cm3 doses

  - Report: Point A , OAR doses in total EQD2 for each patient

Motivate for MR environment

GOALS

SHORT TERM BT

- **BT Planning Process:**

  - CT based planning

  - MR in 1st fraction and CT based subsequently

  - Plan Optimization and planning

- **Dose and fractionation modifications :**

  - Significant centers would modify

GOALS

BT

EMBRACE like Research
