WELCOME AND INTRODUCTION

UPPER GI: TECHNICAL AND CLINICAL CHALLENGES FOR RADIATION ONCOLOGISTS - FULLY BOOKED

25-28 March, 2017
Rome, Italy

ESTRO School

WELCOME AND INTRODUCTION

COURSE AIM

The aim of the course is to support an interactive educational environment by peer review of each step of radiation therapy practice (indication, prescription, delineation, planning, IGRT, outcome evaluation) according to the modern available technologies and knowledge and taking care of the clinician, physicist and RTT perspectives.

WELCOME AND INTRODUCTION

COURSE AIM

Specialists of different disciplines will support the radiation oncology audience in understanding the clinical needs, anatomic and pathologic details, and the therapeutic achievements needed to exploit the radiation technology at the best.

WELCOME AND INTRODUCTION

COURSE AIM

- Radiation Oncologists
Vincenzo Valentini (IT)
Marcel Verheij (NL)
Oscar Matzinger (CH)

- Physicist,
Dirk Verellen (BE)

- RTT
Lisa Wiersema (NL)

- Delineation Administrator
Francesco Cellini, RO (IT)

- Surgeon,
William Allum (UK)

- Medical oncologist
Florian Lordick (DE)
Nicola Silvestris (IT)

- Radiologist
Angela Riddell (UK)
Riccardo Manfredi (IT)

- Pathologist
Alexander Quaas (DE)

LEARNING OUTCOMES

By the end of this course, for each upper GI tumour site, participants should be able to practice:

- Proper indication for radiation therapy in a multidisciplinary perspective
- Prescription
- Tailored delineation according to tumour location and stage
- Dose distribution optimisation and comparison
- Optimal use of available IGRT technologies
- Proper monitoring of tumour response an control.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 1: Prescription

Participants will be invited to make their prescription on cases, that will be afterward delineated and planned in the following sessions, by a monkey questionnaire. Lectures on imaging based staging and state of art of treatment will help the final discussion.

COURSE CONTENT

Clinical cases

Esophageal

- Mid third
- GEJ

Gastric

- Partial gastrectomy
- Total gastrectomy

WELCOME AND INTRODUCTION

COURSE CONTENT

25 March (Saturday)			Speaker
	12.00 – 12.30	Registration	
	12.30 – 13.00	Welcome and Introduction Faculty and Participants	V.Valentini, Faculty, Participants
Esophageal cancer			
Session 1 Prescription	13.00-13.30	**Prescription interactive exercise**	All
	13.30-14.50	**Lecture (20'): imaging based staging and response evaluation**	A.Riddell
		Lecture (20'): state of art of surgery in a combined treatment perspective	W.Allum
		Lecture (20'): state of art of radiation therapy in a combined treatment perspective	V.Valentini
		Lecture (20'): state of art of chemotherapy in a combined treatment perspective	F.Lordick
	14.50-15.30	**Prescription interactive exercise**	All teachers

WELCOME AND INTRODUCTION

COURSE CONTENT

27 March (Monday)			Speaker
Gastric cancer			
Session 7 Prescription	8.30-9.00	**Prescription interactive exercise**	All
	9.00-10.20	**Lecture (20'): Imaging based staging**	A.Riddel
		Lecture (20'): state of art of surgery in a combined treatment perspective	W.Allum
		Lecture (20'): state of art of radiation therapy in a combined treatment perspective	V. Valentini
		Lecture (20'): state of art of chemotherapy in a combined treatment perspective	N.Silvestris
	10.20-11.00	**Prescription interactive exercise**	All teachers

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 2: Delineation (Falcon session)

The previously discussed cases will be available for a tutored small working group delineation exercise. A video on surgical procedure highlighing the key surgical steps to better understand local anatomy will be commented by a surgeon.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 2: Delineation (Falcon hands-on session)	16.00 – 16.45	**Hands-on: Group 1 delineation Middle Third**	Radiology anatomy: A.Riddell Tutors: M.Verhej, F.Cellini, L.Wiersema
		Hands-on: Group 2 video on surgical procedure (highlight of key surgical steps)	Surgical anatomy: W.Allum
	16.45 – 17.30	**Hands-on: Group 2 delineation Middle Third**	Radiology anatomy: A.Riddell Tutors: M.Verhej, F.Cellini, L.Wiersema
		Hands-on: Group 2 video on surgical procedure (highlight of key surgical steps)	Surgical anatomy: W.Allum

COURSE CONTENT

Session 3: Delineation

Lectures on primary tumour extension and nodal subsite involvement based on pathology evaluation and modern imaging will support the final recommendation for subsite delineation by stage and tumour position for the delineated cases.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 2: Delineation (Falcon hands-on session)	16.00 – 16.45	**Hands-on: Group 1 delineation Middle Third**	Radiology anatomy: A.Riddell Tutors: M.Verhej, F.Cellini, L.Wiersema
		Hands-on: Group 2 video on surgical procedure (highlight of key surgical steps)	Surgical anatomy: W.Allum
	16.45 – 17.30	**Hands-on: Group 2 delineation Middle Third**	Radiology anatomy: A.Riddell Tutors: M.Verhej, F.Cellini, L.Wiersema
		Hands-on: Group 2 video on surgical procedure (highlight of key surgical steps)	Surgical anatomy: W.Allum

Session 9: Delineation	14.00 – 16.05	**Lecture (20'): Tumor growth and nodal spread**	A.Quaas
		Lecture (20'): Imaging of primary and nodal subsite boundaries?	R.Manfredi
		Lecture (20'): incidence and location of local recurrences after combined treatment	W.Allum
		Lecture (20'): recommendation for subsite delineation by stage and tumor position	F.Cellini
		Discussion on delineation exercises (45')	All teachers

COURSE CONTENT

Session 4: In room imaging guided radiotherapy

The choice among competitive plans for the cases by interactive systems will be supported by lectures on dose issues for tumour control and constrains for organ at risk.

WELCOME AND INTRODUCTION

COURSE CONTENT

Session 4: Planning	11.00 – 12.20	**Lecture (20'): Dose issues in esophageal tumor control**	M. Verheij
		Lecture (20'): Dose constrains for organ at risk	O.Matzinger
		Interactive lecture (40'): choice among competitive plans for early and locally advanced esophageal cancer	D.Verellen

Session 4: Planning	11.00 – 12.20	**Lecture (20'): Dose issues in esophageal tumor control**	M. Verheij
		Lecture (20'): Dose constrains for organ at risk	O.Matzinger

COURSE CONTENT

Session 5: Planning

Drill and practice exercise in small working groups on how to determine PTV margin, and IGRT by portal imaging and CT cone beam will favor discussion on the daily dose delivery issues.

WELCOME AND INTRODUCTION

COURSE CONTENT

27 March (Monday)			Speaker
Gastric cancer			
Session 5: In room imaging guided radiotherapy	14.00 – 14.45	Hands-on: Group 1 + Group 2 - How to determine PTV margin	D.Verellen
	14.45 – 15.30	Hands-on: Group 1 + Group 2 - Tips and tricks on in room IGRT	O.Matzinger, F.Cellini, L.Wiersema

28 March (Tuesday)			Speaker
Session 11: In room imaging guided radiotherapy	8.45 – 9.30	Hands-on: Group 1 + Group 2 - Re-irradiation: an exercise on dose accumulation	D.Verellen
	9.30 – 10.15	Hands-on: Group 1 + Group 2 - Tips and tricks on in room IGRT	O.Matzinger, F.Cellini, L.Wiersema

COURSE CONTENT

Session 6: What we learn by failure analysis and future perspective

The challenge of tumour recurrence will be addressed by lectures on how to distinguish primary recurrence vs nodal recurrence by imaging, on incidence and location of local recurrences and on the new treatment perspectives.

WELCOME AND INTRODUCTION

COURSE CONTENT

26 March (Sunday)			Speaker
Session 6: what we learn by failure analysis and future perspective	15.50 – 17.15	Lecture (15'): Incidence and location of local recurrences after only surgery	W.Allum
		Lecture (15'): recurrence features by imaging	A.Riddell
		Lecture (15'): Palliative radiotherapy	M. Verheij
		Lecture (15'): Palliative chemotherapy	F.Lordick
		Discussion (10')	All teachers
		Lecture (15'): new perspectives in esophageal cancers	O.Matzinger

WELCOME AND INTRODUCTION

COURSE CONTENT

28 March (Tuesday)			Speaker
Session 12 : what we learn by failure analysis and future perspective	10.45 – 11.40	Lecture (15'): recurrence features by imaging	A.Riddell
		Lecture (15'): Palliative chemotherapy	N.Silvestris
		Lecture (15'): new perspectives in gastric cancers	M. Verheij
		Discussion (10')

ESTRO School

Imaging based staging and response evaluation in Esophageal Cancer

Dr Angela M Riddell

Royal Marsden, London. UK

ESTRO School

Esophageal Cancer - Current Staging Strategy

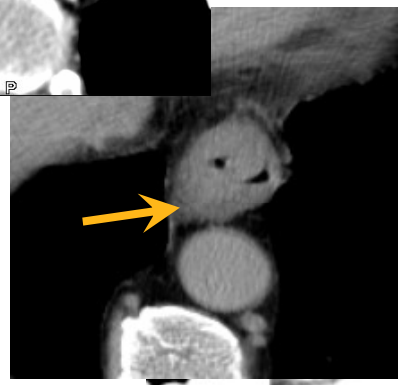
- Diagnosis – Endoscopic biopsy
- Initial Imaging:
  - MDCT
- Potentially curable disease:
  - PET/CT – exclude distant spread
  - Laparoscopy
  - EUS – Early disease, Proximal/ Distal Extent

T staging - MDCT

Initial Staging

- T stage - based on wall thickness and outline
- Limited soft tissue contrast
- Poor for early tumours

pT2



pT3

pT4

T Stage	Wall thickness	Wall Contour
T2	>3mm, <5mm	Smooth
T3	5-15mm	Irregular
T4	>15mm	Contact with adjacent structure

T Staging Accuracy - 74%*

* Davies, A. R., D. A. Deans, et al. (2006). Dis Esophagus **19**(6): 496-503

ESTRO School

T staging - MDCT

2016 –

62 patients; Underwent primary surgery

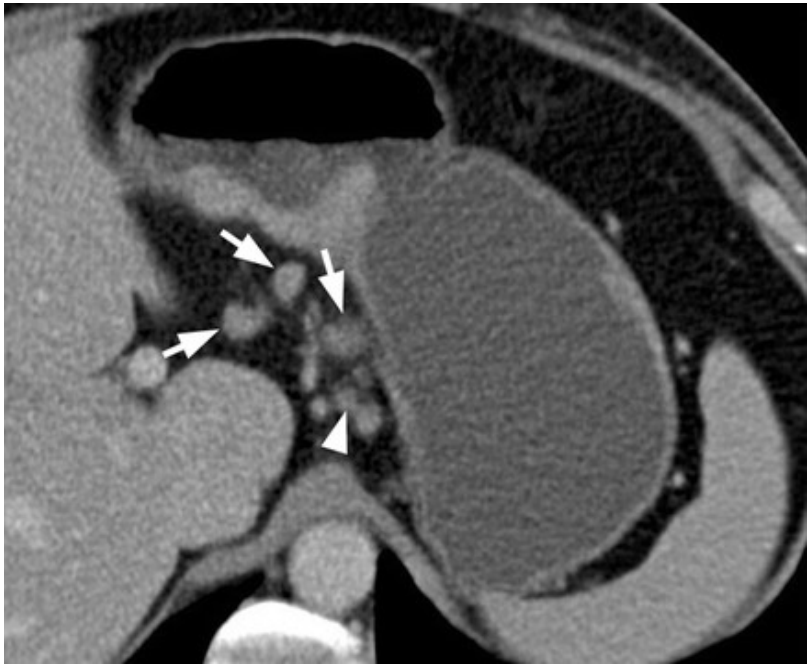
Stage	Sensitivity	Specificity	Accuracy
T2	61%	68%	66%
T3	67%	56%	63%

Sultan R, Haider Z, Chawla TU et al. *J Pak Med Assoc.* 2016 Jan;66(1):90-2.

ESTRO School

N Staging - MDCT

- CT - high specificity, but low sensitivity
- Based on size criteria (short axis):
  - ≥6mm perigastric
  - ≥ 8mm extra perigastric
  - ≥10mm mediastinum



Accuracy of N staging	
Oesophageal Cancer	68%*
Gastric Cancer	67%†

Stage	No of Regional Nodes
N1	≤2
N2	3-6
N3	≥7

* Davies, A. R., D. A. Deans, et al. (2006). Dis Esophagus **19**(6): 496-503
†Hur, J., M. S. Park, et al. (2006). J Comput Assist Tomogr **30**(3): 372-7.

ESTRO School

N staging - MDCT

2016 –

62 patients; Underwent primary surgery

Histopathology	CT		Total
	Node -ve	Node +ve	
Node -ve	15	5	20
Node +ve	17	25	42
	32	30	62

Stage	Sensitivity	Specificity	Accuracy
N Stage	59%	75%	65%

Sultan R, Haider Z, Chawla TU et al. *J Pak Med Assoc.* 2016 Jan;66(1):90-2.

ESTRO School

N Staging - MDCT

Tumour volume related to nodal burden*

Figure 1

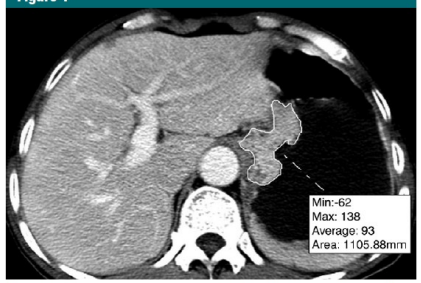


Figure 1: Transverse contrast-enhanced CT scan in 56-year-old man with AEG. Tumor area is manually drawn along margin of tumor, and value of this area (1105.88 mm) is automatically derived by software together with minimal, maximal, and average CT attenuation (in Hounsfield units).

Table 2

Gross Tumor Volume according to N Stage

N Stage	Stage T1–T3 (n = 216)	Stage T3 (n = 175)
N0	15.77 ± 6.95 (14.07, 17.48)	18.08 ± 10.00 (15.68, 20.49)
N1	27.01 ± 14.73 (23.11, 30.92)	28.83 ± 14.82 (24.62, 33.04)
N2	27.92 ± 14.49 (24.04, 31.85)	28.49 ± 14.15 (24.28, 32.69)
N3	38.62 ± 17.60 (32.83, 44.40)	38.82 ± 17.79 (32.89, 44.75)
N1–N2	27.46 ± 14.56 (24.74, 30.18)	28.66 ± 14.72 (25.74, 31.58)

Note.—Data are means ± standard deviations. Numbers in parentheses are 95% confidence intervals of the volume.

Table 3

ROC Analysis of Gross Tumor Volume in the Determination of N Stage

Gross Tumor Volume Cutoff	Comparison Groups	AUC	Sensitivity (%)	Specificity (%)	PPV (%)	NPV (%)	Accuracy (%)
Stage T1–T3 (n = 216)							
15.23 cm^3	N0 vs N1–N2	0.81	86 (96/112)	64 (42/66)	80 (96/120)	72 (42/58)	77 (138/178)
17.16 cm^3	N0 vs N1–N3	0.84	81 (122/150)	68 (45/66)	85 (122/143)	62 (45/73)	77 (167/216)
33.96 cm^3	N1–N2 vs N3	0.73	60 (23/38)	80 (90/112)	51 (23/45)	86 (90/105)	75 (113/150)
Stage T3 (n = 175)							
18.41 cm^3	N0 vs N1–N2	0.77	78 (78/100)	60 (23/38)	84 (78/93)	51 (23/45)	73 (101/138)
19.30 cm^3	N0 vs N1–N3	0.80	77 (105/137)	66 (25/38)	89 (105/118)	44 (25/57)	74 (130/175)
33.96 cm^3	N1–N2 vs N3	0.71	62 (23/37)	79 (79/100)	52 (23/44)	85 (79/93)	74 (102/137)

Note.—Numbers in parentheses are numbers of patients. AUC = area under the ROC curve, NPV = negative predictive value, PPV = positive predictive value.

ESTRO School

Endoscopic Ultrasound – T & N Staging

- Limitation: stenotic tumours
- These tumours are likely to be locally advanced*
- Such patients should be offered neoadjuvant therapy

*Worrell, S. G., D. S. Oh, et al. (2014). J Gastrointest Surg **18**(2): 318-320.

ESTRO School

Response to chemotherapy / CRT

Methods used for assessing response:

- MDCT: Response Evaluation Criteria in Solid Tumours (RECIST)

^{18}FDG-PET/CT:

Standardised Uptake Value (SUV mean / max)

Metabolic tumour volume (MTV)

Total lesion glycolysis (TLG)

MRI:

Apparent Diffusion Coefficient (ADC)

Response to chemotherapy / CRT

Predict outcome for OG patients

- responders to neoadjuvant therapy benefit most post surgery
- non-responders to neoadjuvant therapy have a poorer prognosis post op than those who have primary surgery alone*β
- Individualise patient care

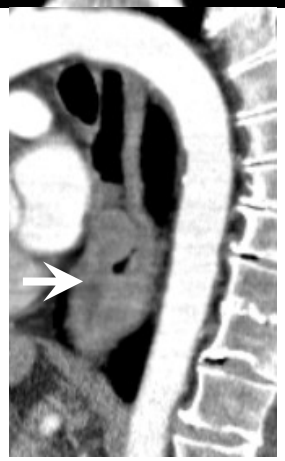
*Ancona E, Ruol A et al. 2001. Cancer; 91:2165-2174

βLaw S, Fok M et al 1997. J Thorac Cardiovasc Surg; 14: 210-217

ESTRO School

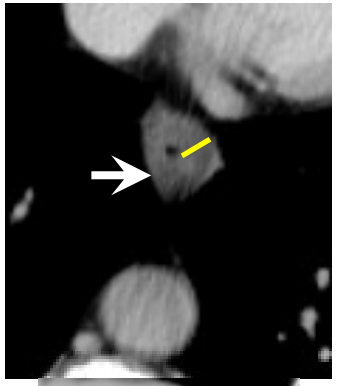
Response to chemotherapy / CRT

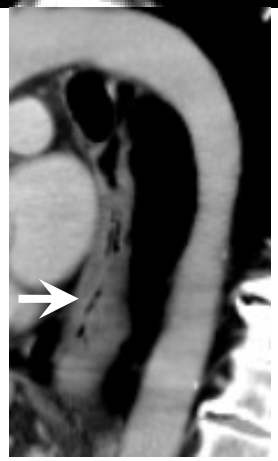
Multidetector Computed Tomography (MDCT)



Sept 2012

3 cycles chemo



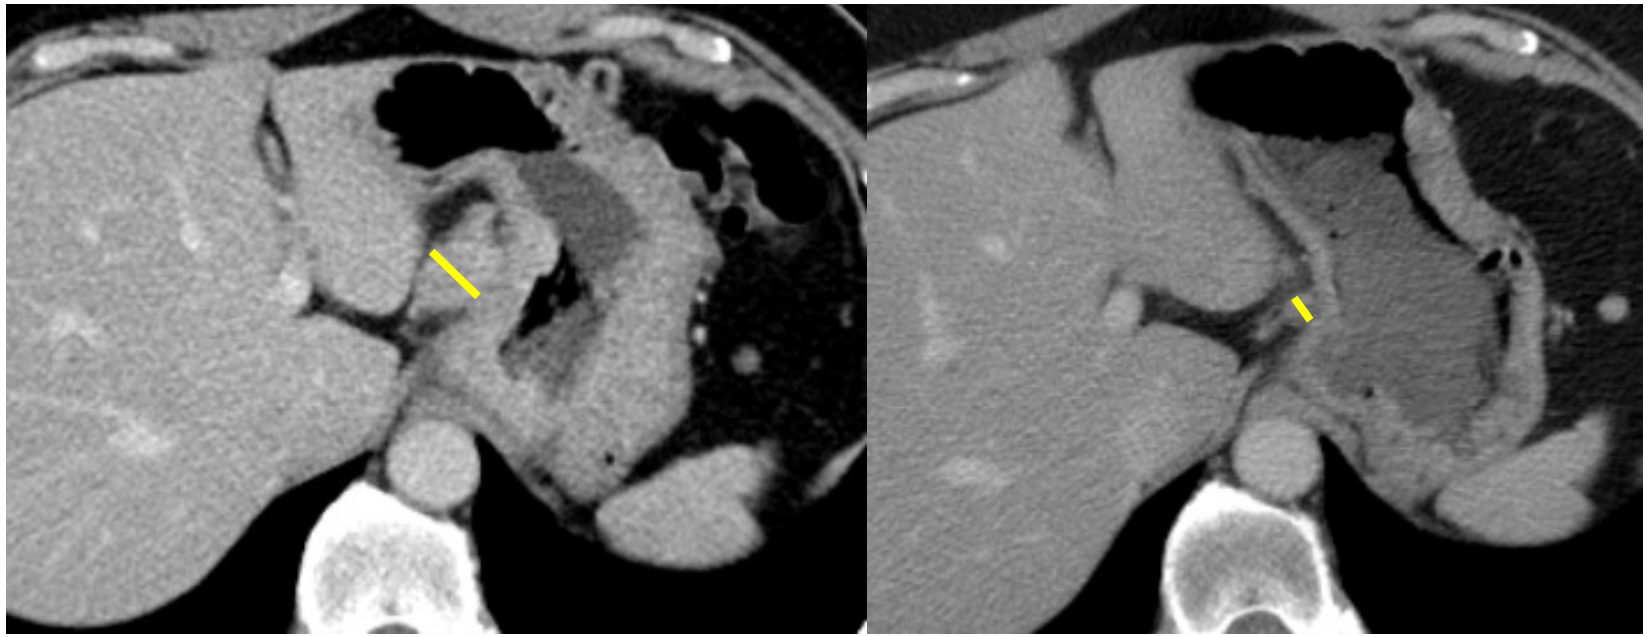


Dec 2012

Response by RECIST

ESTRO School

Response to chemotherapy / CRT



MDCT – measurement of lymph node size &/or metastases offer more consistent measures of response by RECIST

Response to chemotherapy / CRT

Challenges for MDCT

- Differences in luminal distension
- Lack of soft tissue contrast
- Unable to differentiate fibrosis & tumour

Detection of response by CT:

Sensitivity: 27 – 55%; Specificity: 50 – 91%*Ψ

*Cerfolio RJ, Bryant AS, Ohja B et al 2005. J Thorac Cardiovasc Surg; 129:1232-1241
ΨSwisher SG, Maish M, Erasmus JJ et al 2004. Ann Thorac Surg; 78: 1152 - 1160

MDCT - Restaging after neoadjuvant chemotherapy

- Predicted T stage correctly in 34 % (12/35)
- Overstaged 49 % (17/35)
- Understaged 17 % (6/35)*

- Accurate N stage was noted in 69 % (24/35)

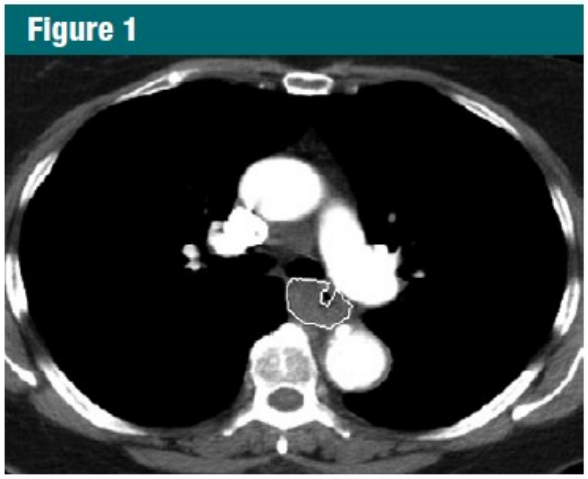
- Assessment of oesophageal tumour response should focus on combined morphologic and metabolic imaging

*Konieczny, A., P. Meyer, et al. (2013). Eur Radiol 23(9): 2492-2502.

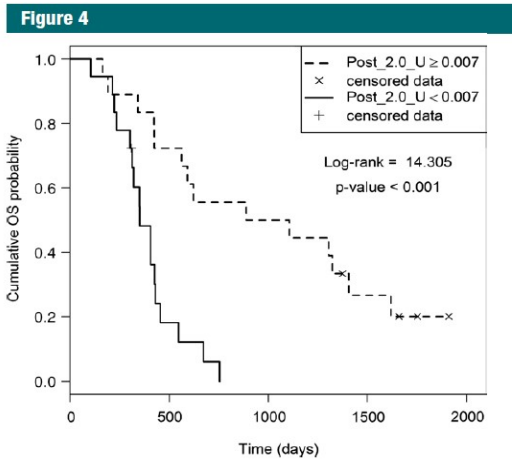
ESTRO School

Response to chemotherapy / CRT

CT Textural analysis §



ROI placed round the tumour



Kaplan-Meier survival analysis stratified by the uniformity of distribution of grey levels

Post treatment uniformity of 0.007 or higher is a positive prognostic indicator (median survival 33.2 months vs 11.7 months) §

§ Yip C, Landau B et al 2014. Radiology 270;1: 141-148

ESTRO School

^{18}FDG-PET/CT - Response to chemotherapy / CRT

- Metabolic response occurs early
  - Studies (eg MUNICON*) have used a reduction in the standardised uptake value (SUV) at 14 days

- SUV_{max} reduction of 35-60% have been shown to correlate with pathological response §

*Lordick F, Ott K et al. 2007 Lancet Oncol 8;9:797-805

§ Bruzzi J, Munden R et al. 2007. Radiographics 27;1635 - 1652

ESTRO School

^{18}FDG-PET/CT

Meta analysis >1500 patients*

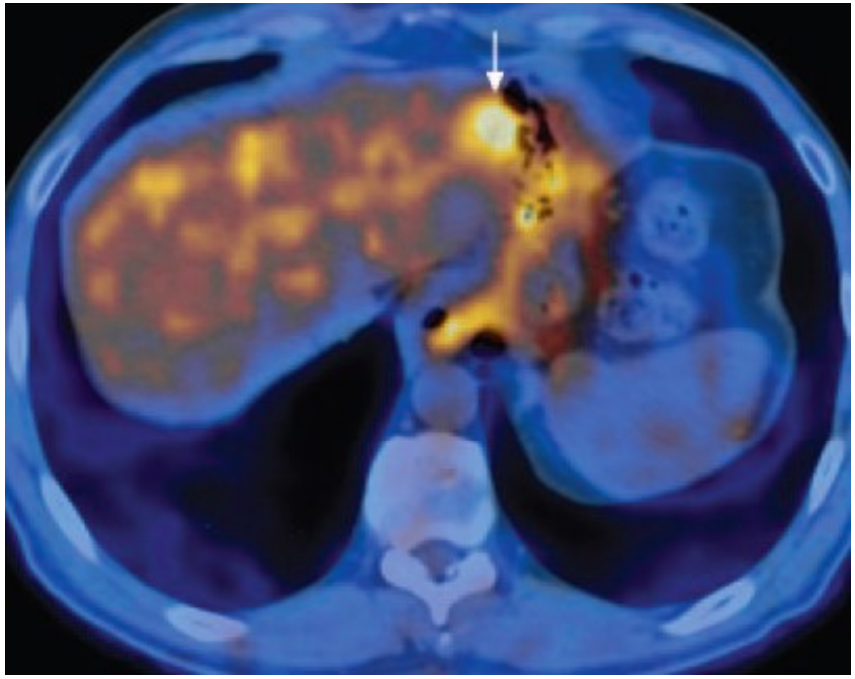
- Conclusion: metabolic response on ^{18}FDG-PET is a significant predictor of long-term survival data

*Schollaert, P., R. Crott, et al. (2014). J Gastrointest Surg 18(5): 894-905

Challenges for PET-CT

- False-positive interpretations
  - Post radiation therapy (due to inflammation/ulceration) – after 14/7 treatment
  - Change related to mucosal biopsy
  - Radiation damage to surrounding organs (eg liver)

Response to chemotherapy / CRT



Example of false positive PET-CT – area of increased FDG avidity in liver represents radiation induced necrosis/inflammation

Taken from: Bruzzi J, Munden R et al. 2007. Radiographics 27;1635 - 1652

ESTRO School

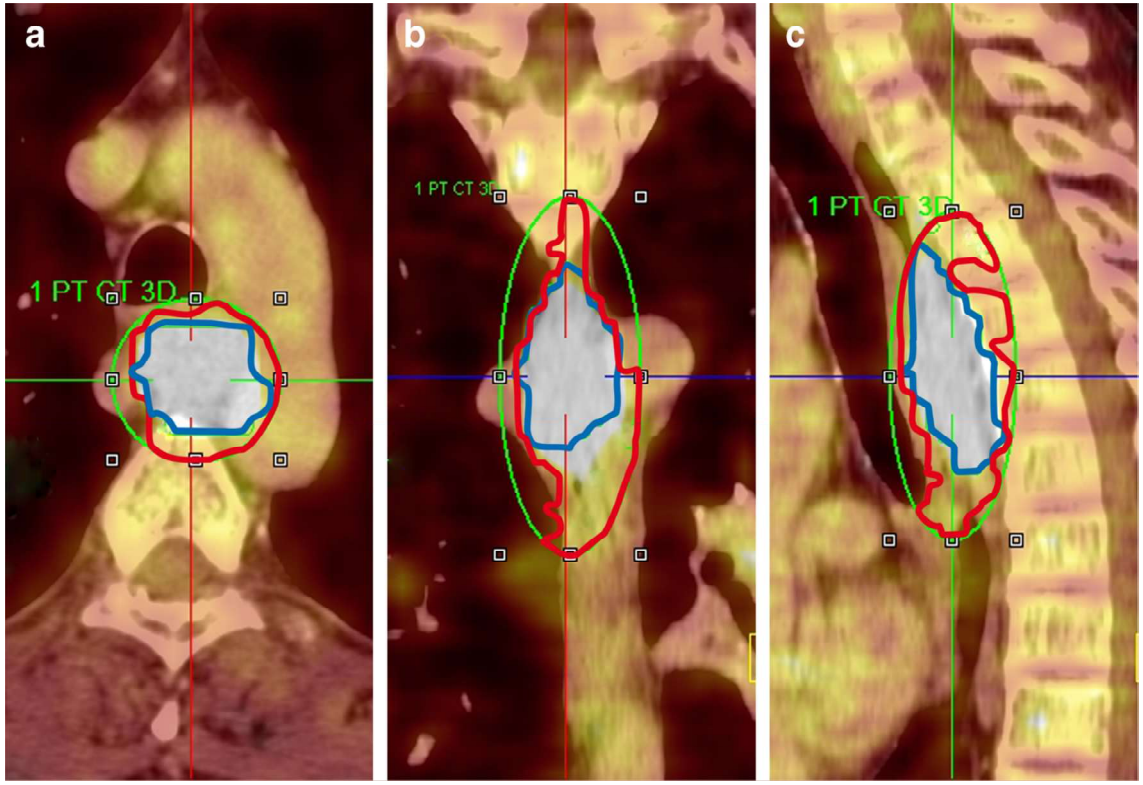
Response to chemotherapy / CRT

Current status for PET-CT

Recognised that PET SUV_{max} does not account for tumour heterogeneity

- Alternatives:
- Metabolic Tumour Volume (MTV)
  - Volume of tumour above a threshold of SUV_{max}
- Total Lesion Glycolysis (TLG)
  - MTV x SUV_{mean}

Response to chemotherapy / CRT



PET/CT images shown with delineation of MTV the SUV threshold of 40% SUV_{max} (Blue) and 25% SUV_{max} (red)

Tamandl D, Gore RM, Fueger B et al. 2015 Eur Radiol Jun 5 [Epub ahead of print]

ESTRO School

Response to chemotherapy / CRT

MTVratio & TLGratio shown to be independent predictors of OS following neoadjuvant chemoradiotherapy*

Table 2 Data are presented as medians with ranges in parentheses. *SUV* standard uptake value; *MTV* metabolic tumour volume; *TLG* total lesion glycolysis

Variable	Before chemotherapy	After chemotherapy	Ratio	*P* Value
CT volumetry (n=84)				
Tumour volume, mL	32.4 (4.6-278.3)	27.6 (0.0-210.6)	0.79 (0.0-2.65)	0.003
Maximum tumour thickness, mm	15 (6-29)	12 (5-27)	0.80 (0.38-1.85)	<0.001
PET metabolic parameters (SUV threshold 2.5, n=50)				
SUV_{mean}	5.2 (3.4-13.3)	3.5 (0.0-12.2)	0.65 (0.0-1.16)	<0.001
SUV_{max}	17.3 (6.2-63.8)	7.8 (0.0-56.4)	0.49 (0.0-1.93)	<0.001
MTV, mL	45.7 (4.0-242.3)	16.1 (0.0-358.7)	0.41 (0.0-7.65)	0.002
TLG, mL	272.5 (14.0-1491.6)	57.8 (0.0-1420.3)	0.31 (0.0-6.68)	<0.001
PET metabolic parameters (SUV threshold 4.0, n=50)				
SUV_{mean}	7.1 (4.6-17.7)	5.0 (0.0-16.3)	0.70 (0.0-1.22)	<0.001
SUV_{max}	18.6 (6.2-63.8)	8.2 (0.0-56.4)	0.49 (0.0-1.93)	<0.001
MTV, mL	22.0 (1.0-119.4)	4.1 (0.0-109.9)	0.20 (0.0-2.41)	<0.001
TLG, mL	171.8 (4.8-1177.2)	21.9 (0.0-654.9)	0.15 (0.0-2.68)	<0.001

Patients with a decrease in MTV of >50% or a decrease in TLG of >60% were shown to have superior overall survival

*Tamandl D, Gore RM, Fueger B et al. 2015 Eur Radiol Jun 5 [Epub ahead of print]

ESTRO School

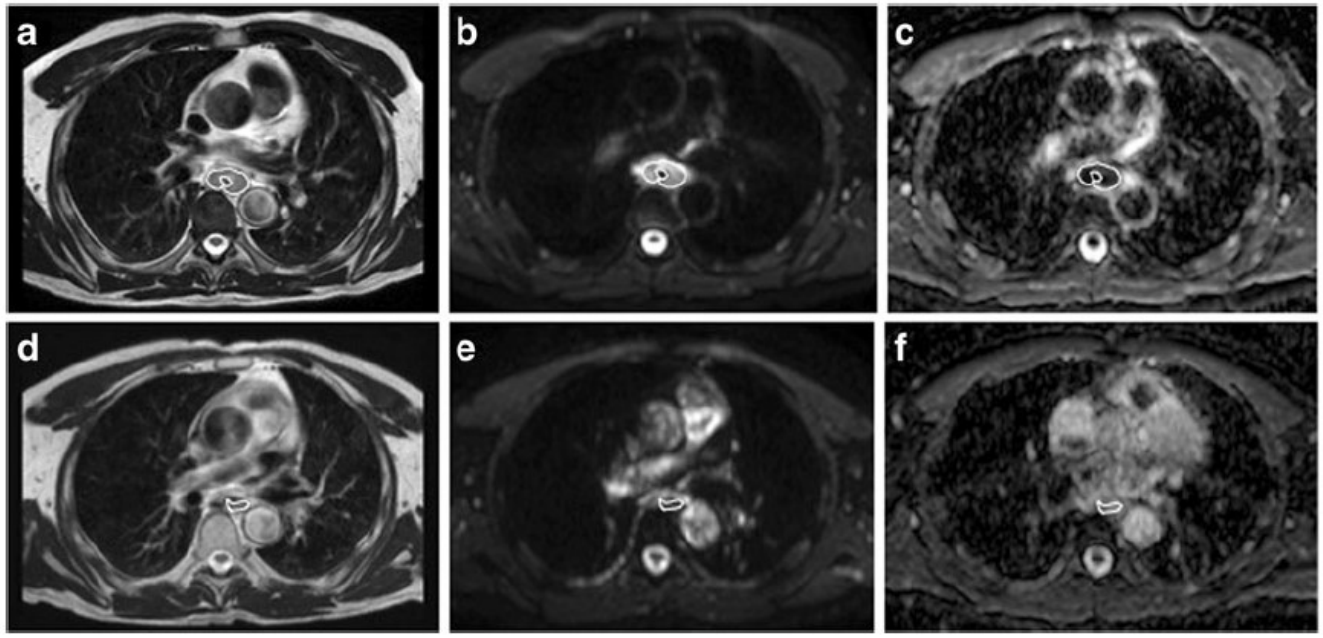
Response to chemotherapy / CRT

Current status for PET-CT

- Useful for response assessment, but consensus required for
  - timing of scan
  - optimised parameter to use to measure response (SUV_{max}, SUV_{mean} or MTV)
  - % change in the parameter that equates to response

Response to chemotherapy / CRT

Response assessment with Diffusion weighted MRI



Ax T2 DWI ADC

De Cobelli F, Giganti F et al 2013. Eur Radiol 23;2165-2174

ESTRO School

Response to chemotherapy / CRT

Responders

- Lower pre treatment ADC
- Higher post treatment ADC
- Change in ADC was inversely proportional to the pathology tumour regression grade

De Cobelli F, Giganti F et al 2013. Eur Radiol 23;2165-2174

ESTRO School

ADC as a prognostic biomarker

Limited small group studies

- Baseline ADC values ≤1.4 x$10^{-3}$$mm^2$/s were associated with poor prognosis

- ADC value correlated with tumour T stage[δ]

- Both for patients undergoing surgery alone & following neoadjuvant therapy*

*Giganti F, Salerno A, Ambrosi A et al. 2015 Radiol Med Sep 21 [Epub ahead of print]

[δ]Aoyagi T, Shuto K, Okazumi S et al. 2011 Dig Surg;28(4):252-7

ESTRO School

Response to chemotherapy / CRT

EUS – assessment of treatment response

•50% reduction in cross-sectional area or tumour thickness*β:

- response to treatment
- improved survival

*Willis J, Cooper GS et al 2002. Gastrointest Endosc 55;655-661

βOta M, Murata Y et al 2005. Dig Endosc 17; 59-63

ESTRO School

EUS - Reassessment after neoadjuvant chemotherapy (NAC)

Challenges for EUS post neoadjuvant therapy

- Unable to differentiate fibrosis / inflammation from tumour *(resulting in over-staging)*
- Unable to detect microscopic of viable tumour *(resulting in under-staging)*
- T staging accuracy 29%
  - Overstaged 23/45 (51%)
  - Understaged 7/45 (16%)
- N staging accuracy 62%
- Conclusion: EUS is an unreliable tool for staging esophageal cancer after NAC*

*Heinzow, H. S., H. Seifert, et al. (2013). J Gastrointest Surg **17**(6): 1050-1057.

ESTRO School

Summary

Initial Staging

- MDCT
- ^{18}FDG-PET/CT
- EUS (early tumours)

Provide

- TNM staging
- prognostic information

Individualise Patient care

Summary

Response Assessment

MDCT

•RECIST – relies on alteration in size; assumes reduction equates to response

PET-CT

•Useful for early response assessment

•Consensus required on technique & values used for response (SUV_{max}; MTV; TLG)

DW-MRI

•Potential to quantify response – further validation required to determine utility of ADC as a predictive biomarker

Thank you

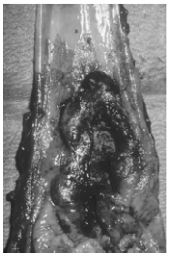
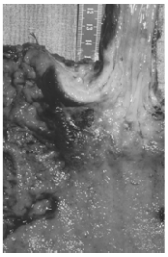
OESOPHAGO-GASTRIC JUNCTIONAL ADENOCARCINOMA





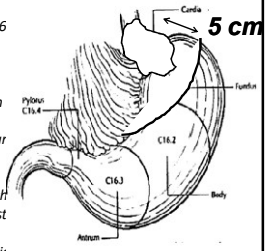
EGJ tumor (TNM 7th ed.)

Oesophagus
(ICD-O C15)
Includes Oesophagogastric junction (C16

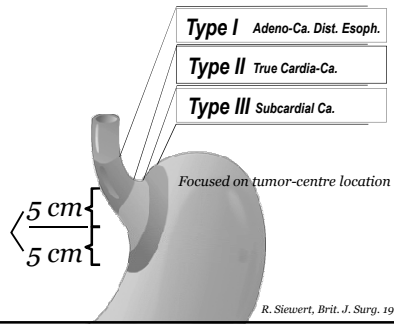
Rules for Classification

• A tumour the epicenter of which is within of the oesophagogastric junction and also extends into the oesophagus is classified ar staged using the oesophageal scheme.

• Tumours with an epicenter in the stomach greater than 5 cm from the oesophagogast junction or those within 5 cm of the oesophagogastric junction without extensi the oesophagus are classified and staged using the gastric carcinoma scheme.



SIEWERT AEG-Classification



R. Siewert, Brit. J. Surg. 1998

EORTC Consensus St Gallen 2012

- Type I – Oesophago-gastrectomy
- Type II – Oesophago-gastrectomy or
  - Extended Total Gastrectomy
- Type I & II – Mediastinal Lymphadenectomy
  – 2 field
- Type III - Extended Total Gastrectomy

Lutz et al *Eur J Cancer 2012; 48: 2941-53*

23 The Royal Marsden surgical audit group, January 2011

Type II Definition

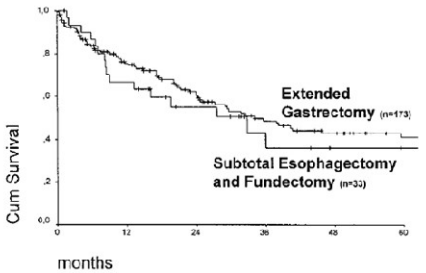
Centre of tumour 2cm above or below gastro-oesophageal junction

Defining the centre is NOT easy
- endoscopy
- imaging

Decisions based only on the centre ? Too simplistic

24

Survival in Type II according to surgery



Siewert et al Ann Surg 2002; 232: 353-61

25 The Royal Marsden surgical audit group, January 2011

Type II
French experience

500 cases (42% all EGJ cancers)	
Oesophagogastrectomy	292 (58%)
Extended total gastrectomy	203 (40%)
Other	5 (1%)

Sauvanet et al J Am Coll Surg 2005; 201: 253-62

26 The Royal Marsden surgical audit group, January 2011

Type II
French experience – Anastomotic leak

Overall (all OGJ cancer)	9%
Thoracic	10%
Abdominal	6%
Thoracic oesophago-jejunal	*14%*

Sauvanet et al J Am Coll Surg 2005; 201: 253-62

27 The Royal Marsden

Aim of Resection

Complete resection of primary tumour (R0)

Clear margins

Lymphadenectomy (>15 nodes)

28

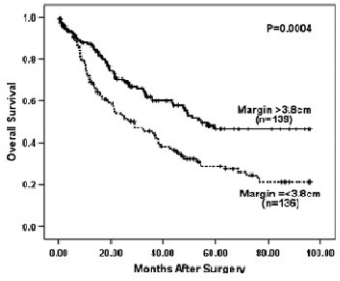
Proximal Margin according to surgery

Total Gastrectomy (n= 77)	**2.0cm (0.1 - 6.5cm)**
Oesophago-gastrectomy (n=199)	**5.5cm (0.3 - 16.0cm)**

Barbour et al Ann Surg 2007; 246: 1-8

29

Survival according to cephalad margin

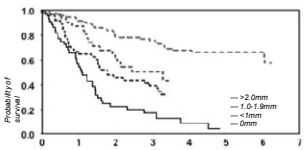


Barbour et al Ann Surg 2007; 246: 1-8

The Royal Marsden

Circumferential resection margin (CRM) size correlates with overall survival

Prospective database, single institution study, N = 229



CRM	n	Median Survival (95% CI)
Positive	**45**	**1.2 yrs** (0.9-1.4)
<1mm	**48**	**1.9 yrs** (1.4-3.2)
1.0-1.9mm	**31**	**3.5 yrs** (2.0–no upper CI)
≥ 2.0mm	**105**	**Not reached**

- *CRM size is a significant prognostic factor for overall survival*
- *40.6% of patients in this study had a CRM <1mm*
- *Post operative chemoradiation did not alter survival in patients with CRM <1mm*
- *BUT smaller CRM may just reflect a larger tumour*

Landau et al., ESMO 2010 (Abstract 711PD)

The Future – Molecular Signatures

Secrier M et al. *Nature Genetics* 2016; 5 Sep 2016 ([epub ahead of print]

The Future – Molecular Signatures

	C>A/T dominant (29%)	DDR impaired (18%)	Mutagenic (53%)
Etiology			
Description	• Dominant C>A/T mutational pattern • Aging as a pervasive risk factor • Fewer unstable genomes and large duplication events	• Prevalent defects in homologous recombination and chromosome segregation pathways	• Dominant T>G mutational pattern • Highest mutational burden • Highest neoantigen load
Therapy	• Conventional chemotherapy • Tailored ERBB2/MET inhibition	• DNA-damaging agents combined with PARPi • Proton irradiation • Photon irradiation with PARPi	• CHK/WEE1 inhibition • Immunotherapy: ◦ CTLA4-targeting agents ◦ PD-1\PD-L1-targeting agents

Welcome

Dear Participants of the International Gastric Cancer Congress 2019,

With great pleasure we announce the **2019 International Gastric Cancer Congress to be held in Prague**. Gastric Cancer continues to be a major health problem in Europe, in the Asian-Pacific Region, in America, Middle East and Africa. From a worldwide perspective, almost 1 Mio patients are diagnosed with gastric cancer / year and 750.000 die from this aggressive cancer.

for Radiation Oncologists

Primary tumor extension – pathology evaluation
Role of pathologist for treatment decisions in esophageal carcinoma

Alexander Quaas
Institute of Pathology
University of Cologne

UNIKLINIK KÖLN

Road map

- Facts – carcinoma of the oesophagus in Germany
- Tumor extension evaluation – using UICC-TNM 8th edition (2017)
- Patho-anatomical basics, reportings and technical workflow
- How pathologists can help in personalized treatment decisions

UNIKLINIK KÖLN

Facts

- Germany 2017: 5.600 men /1.600 women
- 80% will die carcinoma-releated in following 5 years
- 85% are diagnosed in advanced disease (cT2 and more)
- 60% squamous cell carcinoma (ESCC)
- 40% adenocarcinoma (EAC)
- In Cologne: 75% adenocarcinoma

Usually: ESCC or EAC

WHO classification[a] of tumours of the oesophagus

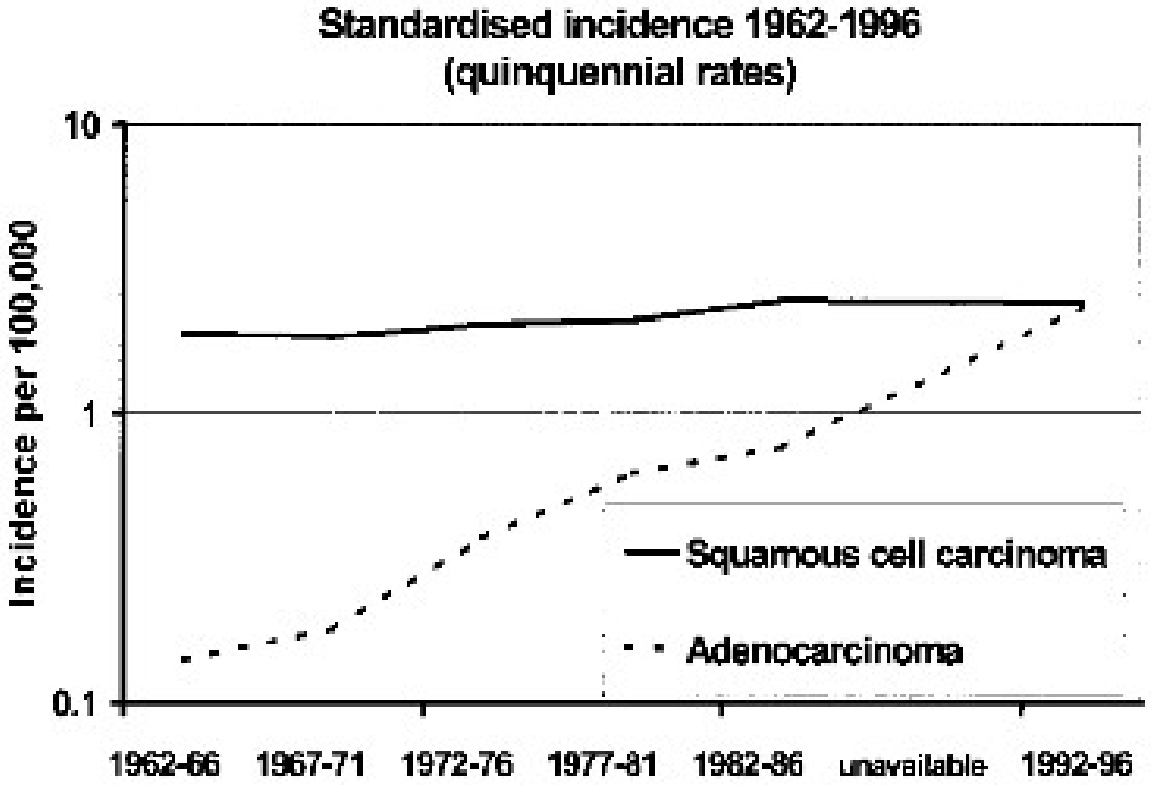
Epithelial tumours	
Premalignant lesions	
Squamous	
Intraepithelial neoplasia (dysplasia), low grade	8077/0*
Intraepithelial neoplasia (dysplasia), high grade	8077/2
Glandular	
Dysplasia (intraepithelial neoplasia), low grade	8148/0*
Dysplasia (intraepithelial neoplasia), high grade	8148/2
Carcinoma	
Squamous cell carcinoma	8070/3
Adenocarcinoma	8140/3
Adenoid cystic carcinoma	8200/3
Adenosquamous carcinoma	8560/3
Basaloid squamous cell carcinoma	8083/3
Mucoepidermoid carcinoma	8430/3
Spindle cell (squamous) carcinoma	8074/3
Verrucous (squamous) carcinoma	8051/3
Undifferentiated carcinoma	8020/3
Neuroendocrine neoplasms[b]	
Neuroendocrine tumour (NET)	
NET G1 (carcinoid)	8240/3
NET G2	8249/3
Neuroendocrine carcinoma (NEC)	8246/3
Large cell NEC	8013/3
Small cell NEC	8041/3
Mixed adenoneuroendocrine carcinoma	8244/3

Mesenchymal tumours	
Granular cell tumour	9580/0
Haemangioma	9120/0
Leiomyoma	8890/0
Lipoma	8850/0
Gastrointestinal stromal tumour	8936/3
Kaposi sarcoma	9140/3
Leiomyosarcoma	8890/3
Melanoma	8720/3
Rhabdomyosarcoma	8900/3
Synovial sarcoma	9040/3
Lymphomas	
Secondary tumours	

[a] The morphology codes are from the International Classification of Diseases for Oncology (ICD-O) {904A}. Behaviour is coded /0 for benign tumours, /1 for unspecified, borderline or uncertain behaviour, /2 for carcinoma *in situ* and grade III intraepithelial neoplasia, and /3 for malignant tumours.
[b] The classification is modified from the previous (third) edition of the WHO histological classification of tumours {691} taking into account changes in our understanding of these lesions. In the case of neuroendocrine neoplasms, the classification has been simplified to be of more practical utility in morphological classification.
* These new codes were approved by the IARC/WHO Committee for ICD-O at its meeting in March 2010.

UNIKLINIK KÖLN

EAC
Incidence continues to increase



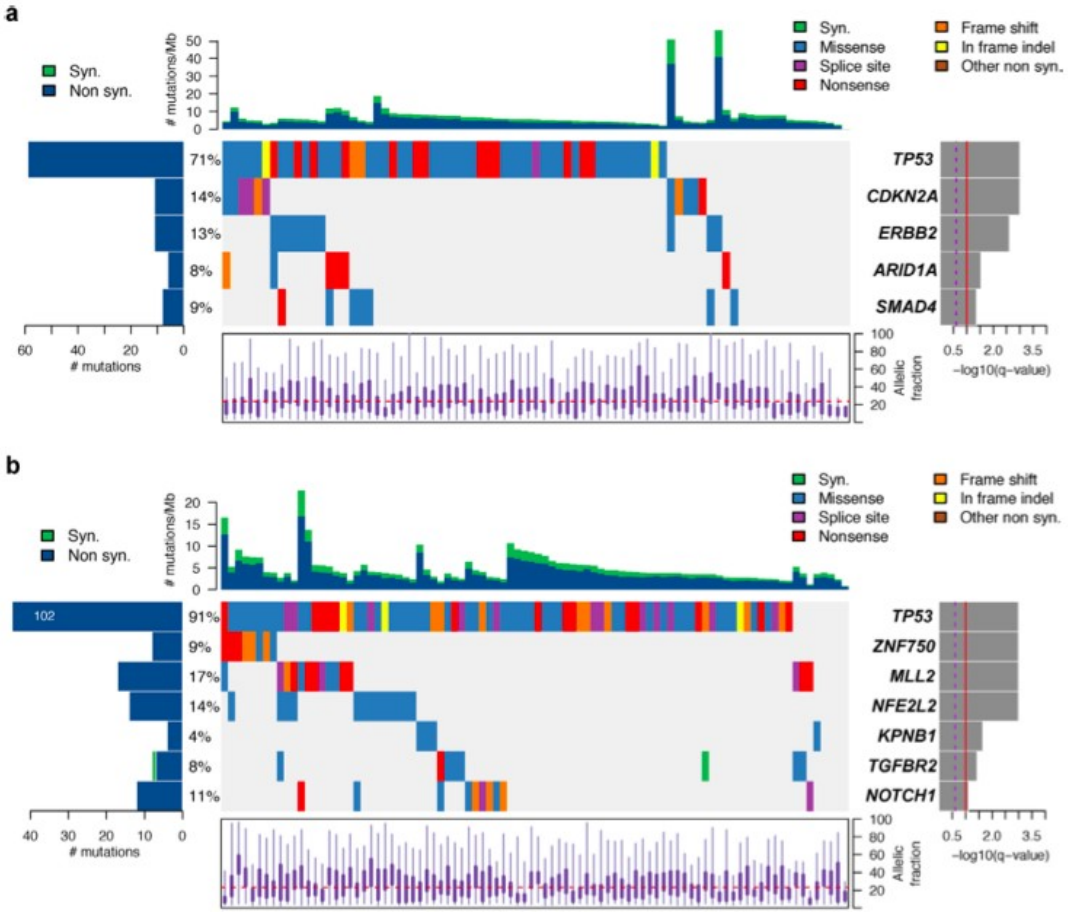
From: Powell et al. Int J Cancer 2003

UNIKLINIK KÖLN

Molecular features
Comparison: EAC vs. ESCC

EAC

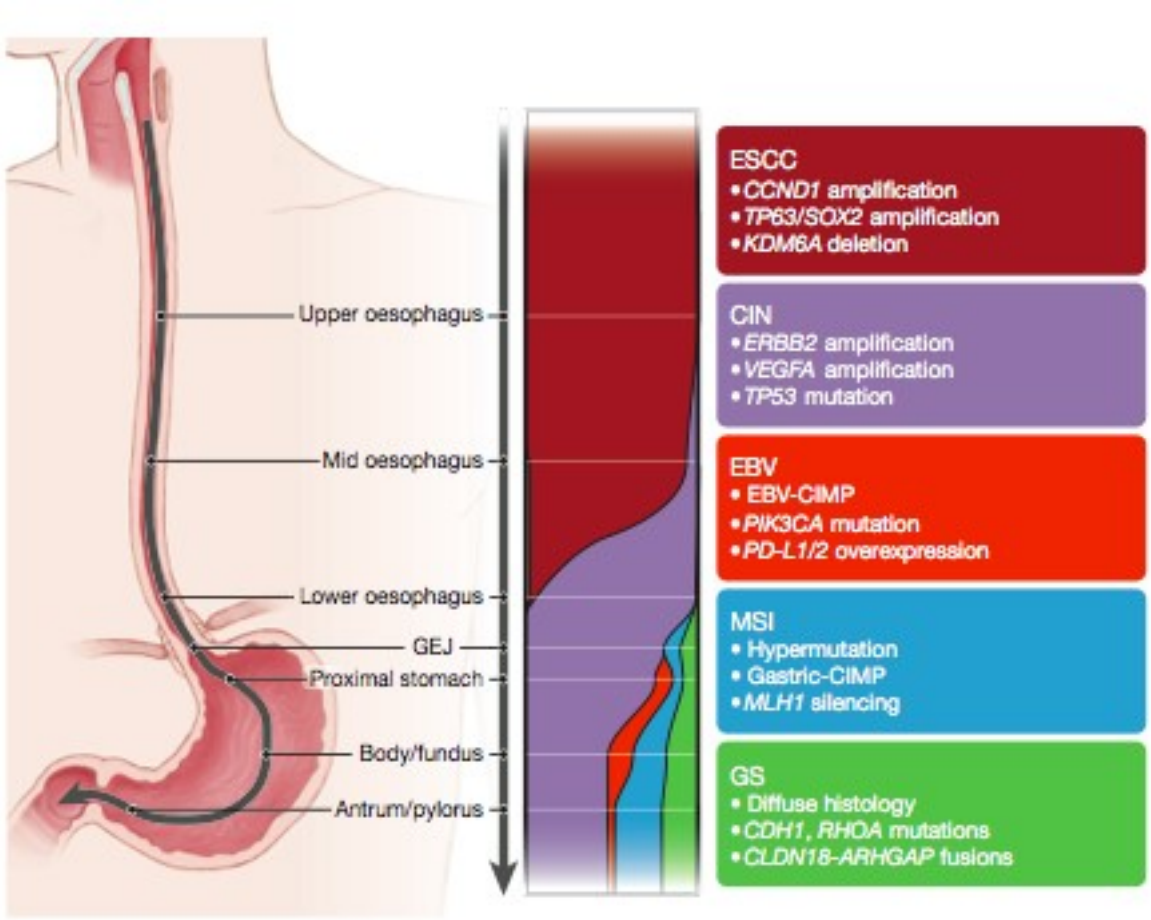
ESCC



From: Cancer Genome Atlas Research Network Group:
Integrated molecular characterization of esophageal carcinoma, Nature 2017

UNIKLINIK KÖLN

Molecular features: Main distribution/differences



gastric adenocarcinoma:

1) Chromosomal instable (CIS) 49,8%
2) Microsatellite-instable (MSI) 21,7%
3) Genomic stable (GS) 19,6%
4) EBV-induced (EBV) 8,9%

esophageal adenocarcinoma:

1) **EAC = CIS**
   ERBB2 amplification
   (like in gastric carcinoma)

2) **MSI and EBV very rare**

From: Cancer Genome Atlas Research Network Group:

1) Integrated molecular characterization of esophageal carcinoma, Nature 2017

2) Epstein-Barr Virus Infection and Mismatch Repair Deficiency in Esophageal Cancer: Clinical Implication for Potential Treatment with PD1/PD-L1 Blockade Therapy; *L.C. Hewitt, I.Z Inam, A. Quaas…. and H.Grabsch*

UNIKLINIK KÖLN

Prognosis and Treatment decisions

- PD-L1 expression is rare
- MSI-subtypes nearly non-existent
- EBV-subtypes non-existent

Checkpoint-inhibition in ESCC and EAC perhaps less effective than in lung cancer

- Her2/neu amplification/overexpression: about 15%

Trastuzumab in Her2-positive adenocarcinoma

- TP53 wildtype carcinoma: favourable prognosis?

Determination of TP53 helpful?

1) PD-L1 in esophageal carcinoma – different expression pattern on mRNA and protein level; *L. Tharun.....and A. Quaas*
2) Epithelial PD-L2 expression marks Barrett's Esophagus and Esophageal Adenocarcinoma; *S. Derks..... and A. Bass*
3) The prognostic value of TP53 mutations in oesophageal adenocarcinoma: a systematic review and meta-analysis; *O. M Fisher.... and R. V Lord* - „patients with OAC and TP53 gene mutations have reduced overall survival compared with patients without these mutations, and this effect is independent of tumour stage".
4) Radiation sensitivity in a preclinical mouse model of medulloblastoma relies on the function of the intrinsic apoptotic pathway; A.J. Crowther.....and T.R Gershon

UNIKLINIK KÖLN

Anatomical subsites

1. Cervical oesophagus (C15.0)

begins: lower border of the cricoid cartilage

ends: thoracic inlet (suprasternal notch). 18 cm distal upper incisor teeth

2. Intrathoracic oesophagus (C15.3-5)

- Upper: begins: thoracic inlet (about 18 cm) ends: tracheal bifurcation (about 24 cm)
- Mid: begins: tracheal bifurcation (about 24 cm) ends: 32 cm distal upper incisor teeth
- Lower: About 8 cm long and includes abdominal oesophagus. Ends about 40 cm.

3. Oesophago-gastric junction (C16.0)

Definition of oesophago-gastric junction: There is no universally agreed definition!

For histologists: junction of squamous epithelial cells to cylindric epithelial cell of the stomach

For surgeons: passage through the diaphragm

For gastroenterologists: junction at the beginning of proximal gastric folds

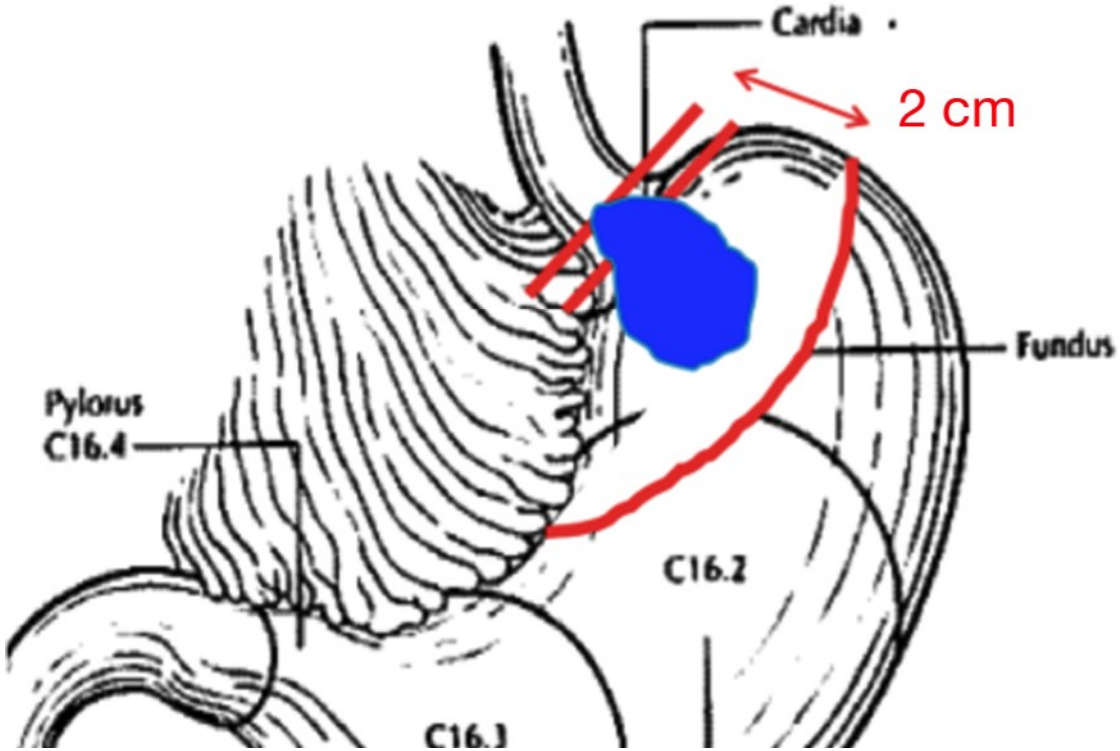
In Japan: at the distal end of palisade venes

Japanese Classification of Esophageal Cancer, 11 edition Esophagus, (2017) 14:1-65

UNIKLINIK KÖLN

Definition oesophageal/ gastric adenocarcinoma

Definition changed 2017



A tumour of epicentre of which is within **2 cm** of the oesophagogastric junction and also extends into the oesophagus is classified and staged using the oesophageal scheme. Tumours with an epicentre in the stomach greater than 2 cm from the oesophagogastric junction or those within 2 cm of the oesophagogastric junction without extension in the oesophagus are classified and staged using the gastric carcinoma

Modified from: Wittekind and Schmiegel

UNIKLINIK KÖLN

Staging: UICC

Oesophagus 8th edition, 2017

TNM definitions: AJCC = UICC

Tis: High grade intraepithelial neoplasia/dysplasia
T1: T1a: lamina propria or muscularis mucosae
T1b: submucosa
T2: mucularis propria
T3: adventitia
T4: T4a: pleura, pericardium, diaphragm, peritoneum
T4b: other adjacent structures (e.g. aorta, trachea)

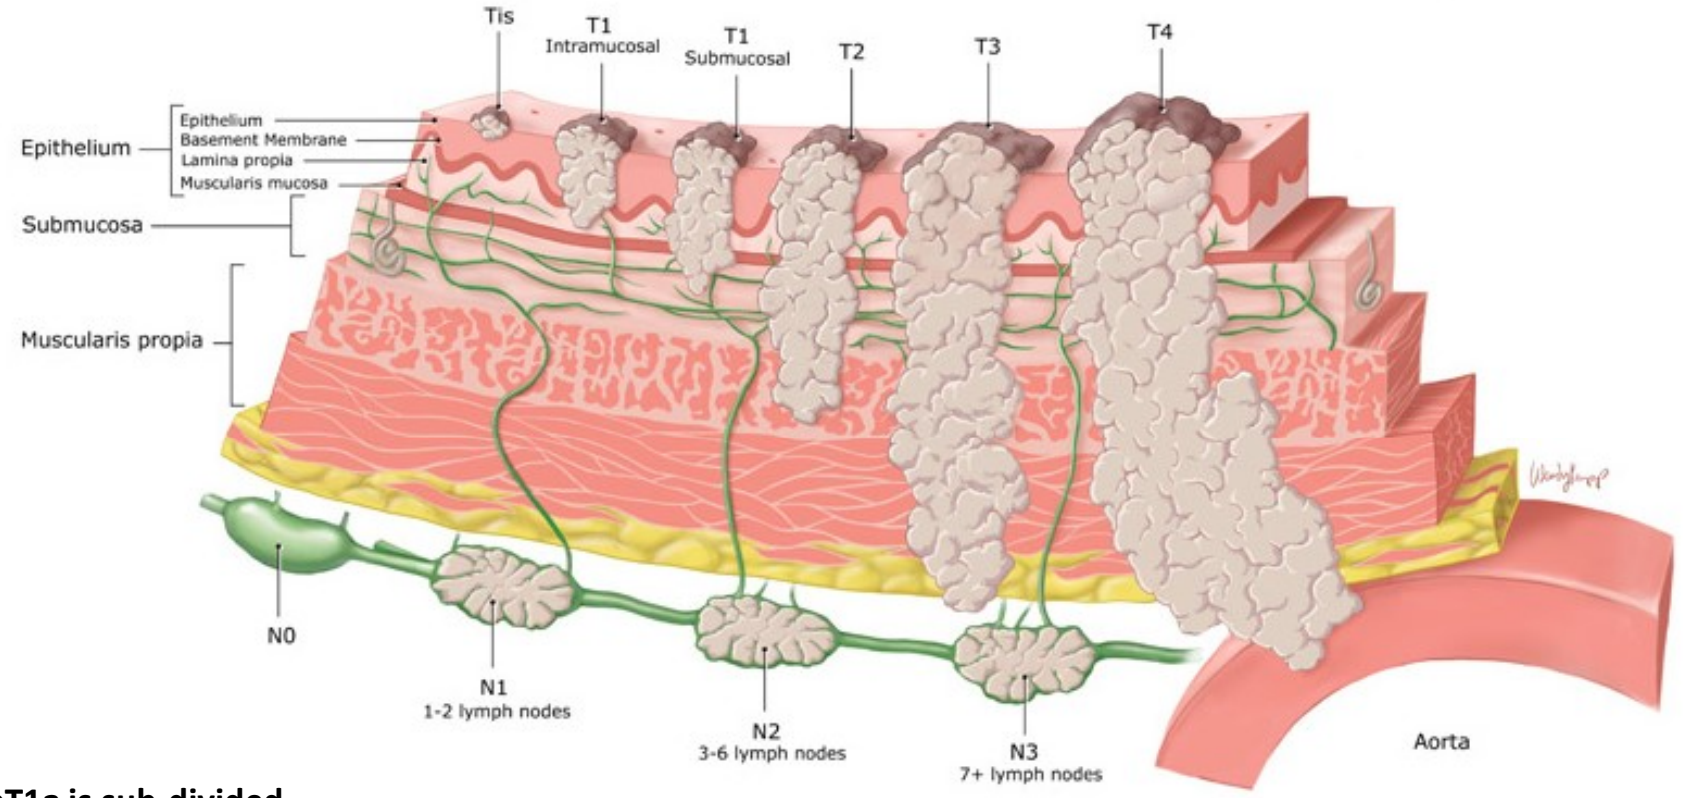
N1: 1-2 regional lymph node(s)
N2: 3-6
N3: >6

M1: Distant metastasis

Applies to carcinoma (ICD-0 C15) and includes adenocarcinoma of the oesophagogastric junction (ICD-0 C16.0)

UNIKLINIK KÖLN

Staging: UICC
Esophageal Cancer Staging



pT1a is sub-divided

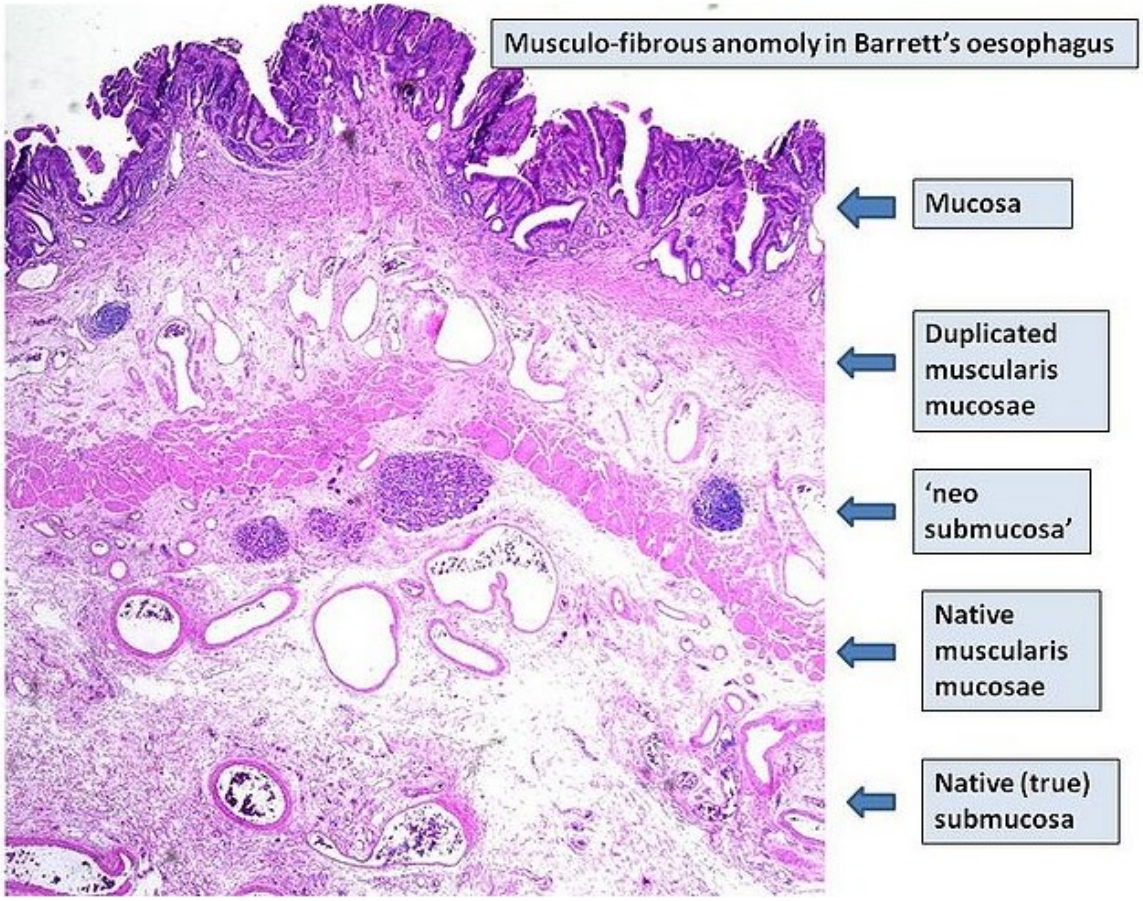
- m1 – into the lamina propria
- m2 – into the superficial/inner muscularis mucosae
- m3 – into the space between the layers of the muscularis mucosae
- m4 – into the outer/true muscularis mucosae

T1b is sub-divided as SM1-3 as follows

- sm1 – superficial 1/3 submucosa
- sm2 – intermediate one third of submucosa
- sm3 – outer one third of submucosa

UNIKLINIK KÖLN

Double layer of muscularis mucosae in Barrett (pT1a; m1-m4)

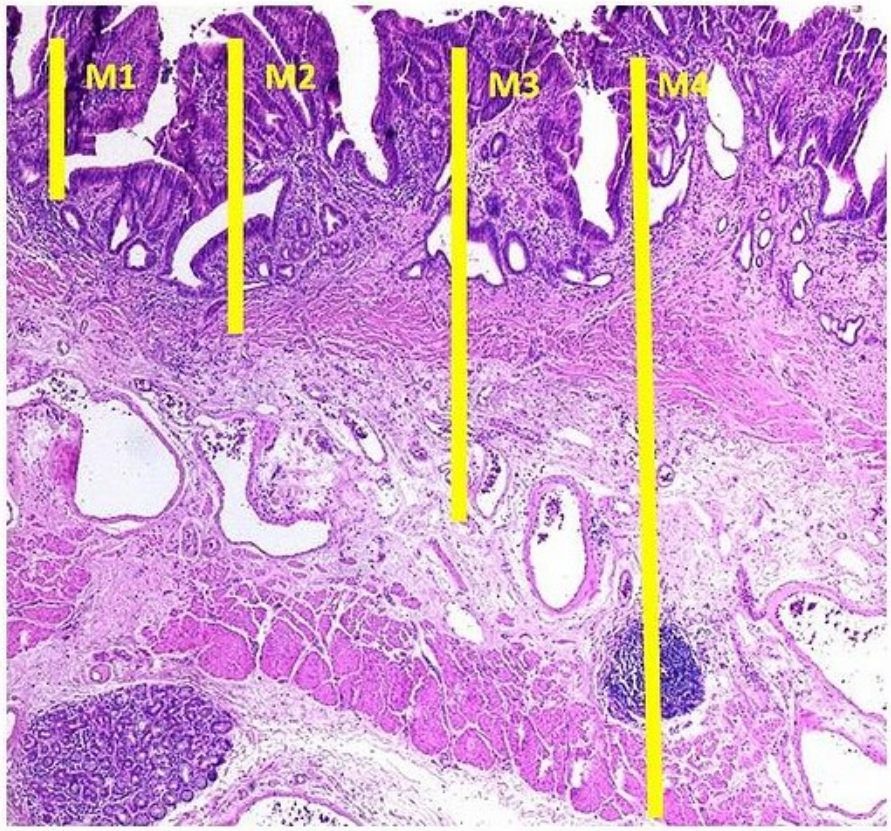


Bobryshev, Y, Brown, I, Clouston, A, Cancer Council Australia Barrett's Oesophagus Guidelines Working Party. What are the histological features of early adenocarcinoma of the oesophagus?

UNIKLINIK KÖLN

Double layer of muscularis mucosae in Barrett (pT1a; m1-m4)

Stolte staging system (mucosa)



Stolte

m1 - into the lamina propria

m2 - into the superficial/inner muscularis mucosae

m3 - into the space between the layers of the muscularis mucosae

m4 - into the outer/true muscularis mucosae

Bobryshev, Y, Brown, I, Clouston, A, Cancer Council Australia Barrett's Oesophagus Guidelines Working Party. What are the histological features of early adenocarcinoma of the oesophagus?

UNIKLINIK KÖLN

Prognostic factors

Univariable analysis of factors influencing survival

Variable	χ^2	DF	*P*-value
Age	48.020	41	0.210
Gender	1.039	1	0.308
Histological cell type	2.250	2	0.308
Histological tumour grade	10.260	2	0.006
Operative approach (TT *vs* TH)	0.795	1	0.373
Neoadjuvant therapy	0.627	1	0.429
T stage (same in TNM6 and TNM7)	21.514	3	<0.0001
N stage (TNM6)	21.499	1	<0.0001
N stage (TNM7)	37.509	3	<0.0001
Number of lymph node metastases	61.677	12	<0.0001
Stage groupings (TNM6)	36.587	4	<0.0001
Stage groupings (TNM7)	50.531	7	<0.0001
Prognostic groupings (TNM7)	47.147	7	<0.0001

Most important:

- Depth of invasion (primary tumor extension)
- Lymph node involvement
- Stage/prognostic groupings

UNIKLINIK KÖLN

Prognostic factors – Lymph nodes metastasis indicate poor prognosis

Extensive interconnecting lymphatic channels
High risk of skip areas (high risk of local recurrence)
Drain into lymph nodes: paraoesophageal, paratraechael, dorsal mediastinum, lung hilum, inferior thyroid artery, left gastric artery (celiac axis), paraesophageal in the neck.

Risk to develop nodal mets: T1b: 20%
T2: 60%
T3: 90%
T4: 100%

Biggest problem in oesophageal carcinoma:
- Often: locally advanced tumors (85% in T2 or more)
- Metastasizes early

From: neoadjuvant.wikidot.com staging and krebsdaten.de (Robert-Koch-Institut)

UNIKLINIK KÖLN

Regional Lymph Nodes

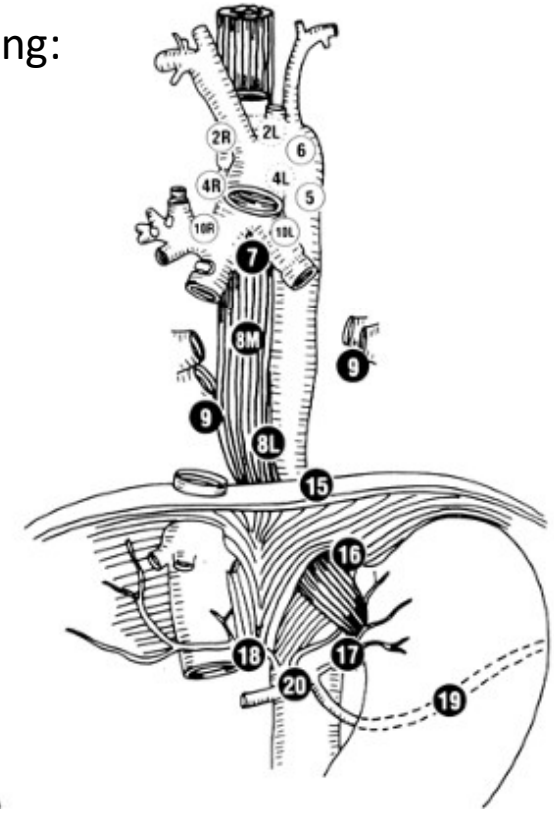
Localisation using TNM 8th edition

Regional lymph nodes, irrespective of the site of the primary those in the oesophageal drainage – including:

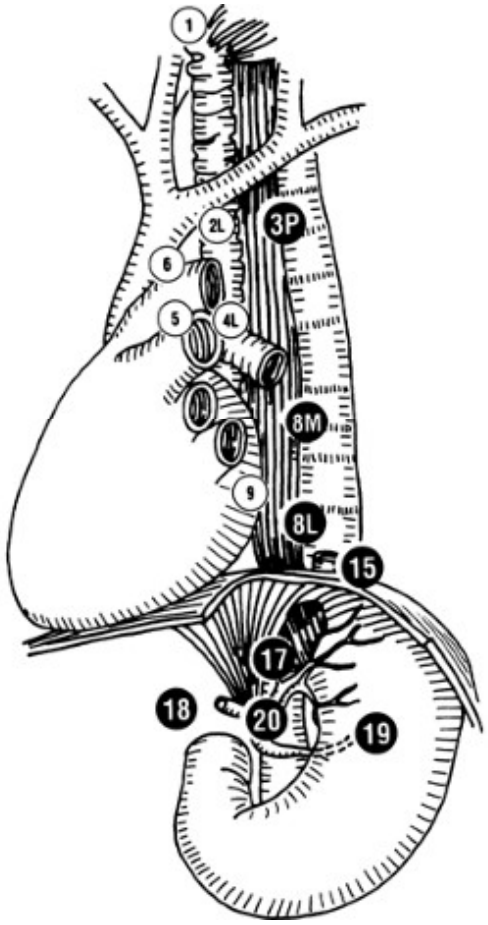
- paraoesophageal
- paratraechael
- dorsal medistinum
- lung hilum
- inferior thyroid artery
- left gastric artery (celiac axis) paraesophageal in the neck

How many we need

>7 lymph nodes



A



B

Localisation: distal parts of oesophagus/oesophgeal-gastric junction

UNIKLINIK KÖLN

Regression-Scores after neoadjuvant therapy

According to Becker et al:

Morphological regressions signs:

- oedema
- foamy histiocytes
- necrosis
- fibrosis and hyalinosis

Grading of Histophathologic Regression in the Primary Tumor Bed	
Grade	**Description**
1a	No residual tumor / tumor bed
1b	< 10% residual tumor / tumor bed
2	10-50% residual tumor / tumor bed
3	> 50% residual tumor / tumor bed

From: Becker et al. Ann Surg 2011 or Becker et al. Cancer 2003

UNIKLINIK KÖLN

Regression-Scores

Response Classification System

Scheme	Characteristic
Class I	Minor histomorphologic regression
a	With lymph node metastases
b	Without lymph node metastases
Class II	Major histomorphologic regression
a	With lymph node metastases
b	Without lymph node metastases

Major responder
Minor responder
Cut-off: 10% vital tumour

Cologne Regression Classification System

- Grade I indicates minimal/no regression, with more than 50% vital tumor remaining;
- Grade II indicates partial regression, with less than 50% and more than 0% vital tumor remaining;
- Grade III indicates sub-total regression, with 0% vital tumor remaining;
- Grade IV indicates complete regression, with no vital tumor remaining.[22,23]

Response grades I and II are classified as 'minor response,' and grades III and IV as 'major response.'

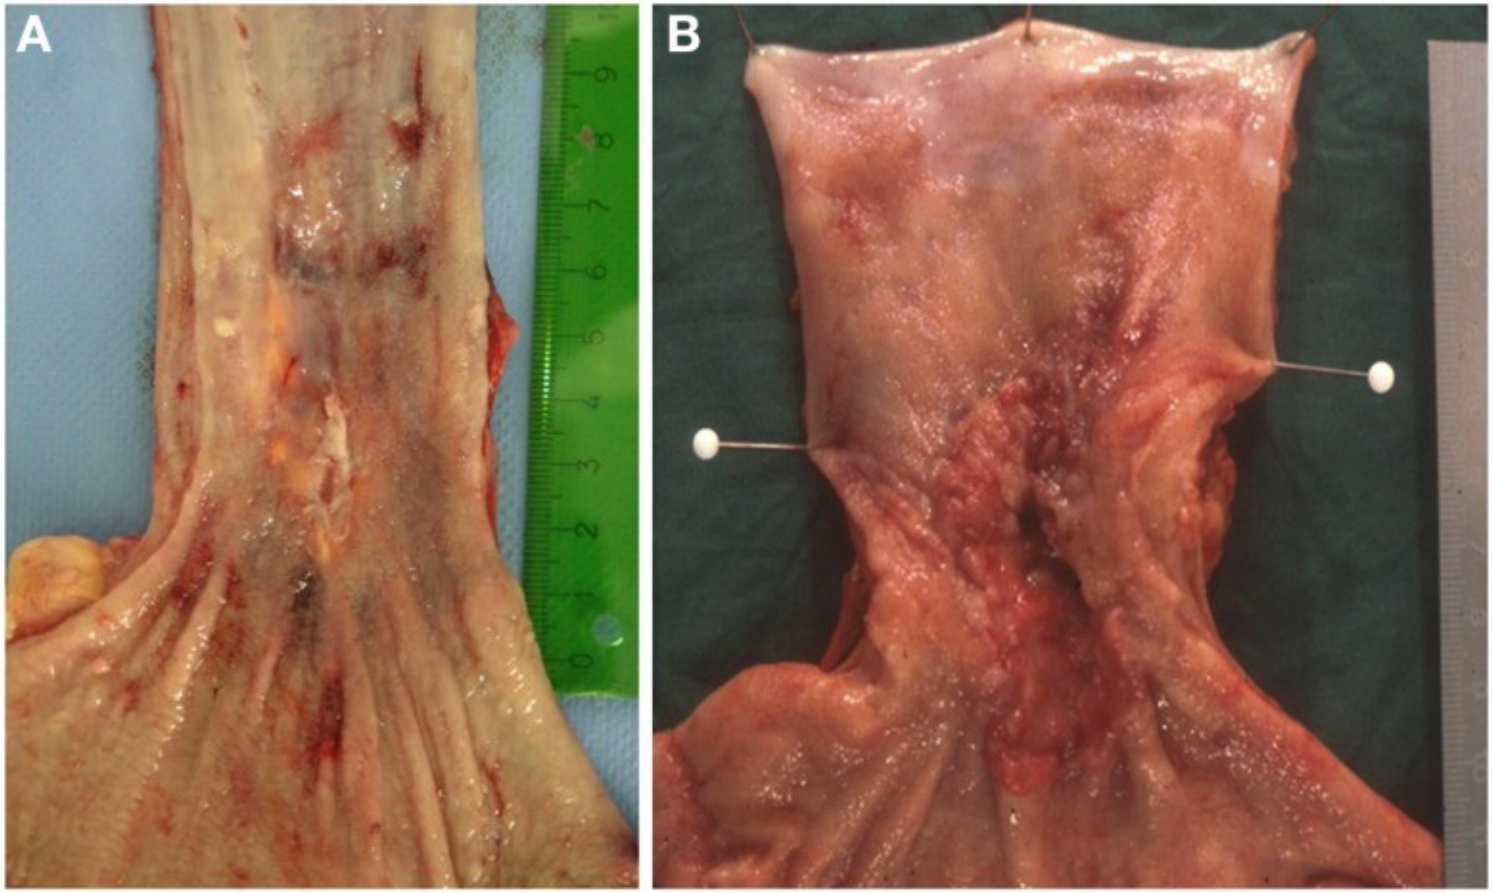
UNIKLINIK KÖLN

Photographic documentation Adenocarcinoma



From: Front Oncol. 2013; 3: 262. Thies, Langer **Gross images of esophageal adenocarcinomas with (A) macroscopic significant regression and (B) no macroscopic significant regression after neoadjuvant chemotherapy**.

UNIKLINIK KÖLN

Work-flow in Cologne

1) Photographic documentation of all surgical specimens

2) Macroscopically

- Tumor size (if possible in three dimension)
- Tumor localisation
- Tumor extension
- Distance to margins (oral, aboral, circumferential)
- Complete embedding of the tumor from oral to aboral (CRM is included and colourmarked)
- Lymph nodes are completely embedded

3) Reporting

- Histological types (adenocarcinoma, squamous cell carcinoma)
- UICC staging (y) pT pN (including ece+) L V Pn (=perineural invasion)
- Margins (free; distance; oral, aboral, circumferential)
- Grading (in case of neoadjuvant chemo-/radiotherapy: no grading)
- Regression grade (in case of neoadjuvant therapy using Becker and Cologne Score)

UNIKLINIK KÖLN

Summary

- Incidence of adenocarcinoma is increasing
- Overall prognosis is dismal (despite some advances), mainly due to:
  - locally advanced disease (we diagnose too late)
  - early lymph nodes metastasis (intense network of lymph vessels)
  - no well defined subtypes
  - treatment options are still insufficient (personalized: Herceptin only)
- No EBV and MSI subtypes
- PDL1-checkpoint-inhibition less effective?
- HER2/neu still the only personalized treatment option
- >7 regional lymph nodes
- Standardized work flow in pathology embedding of whole tumor bed
- Regression scores after neoadjuvant treatment

UNIKLINIK KÖLN

Questions

- Why do we have differences in responding to treatment (major and minor responder)?
- How important is the TP53 wildtype group?
- Can liquid biopsies be helpful in detection early recurrences?

UNIKLINIK KÖLN

ESTRO School

Imaging the primary

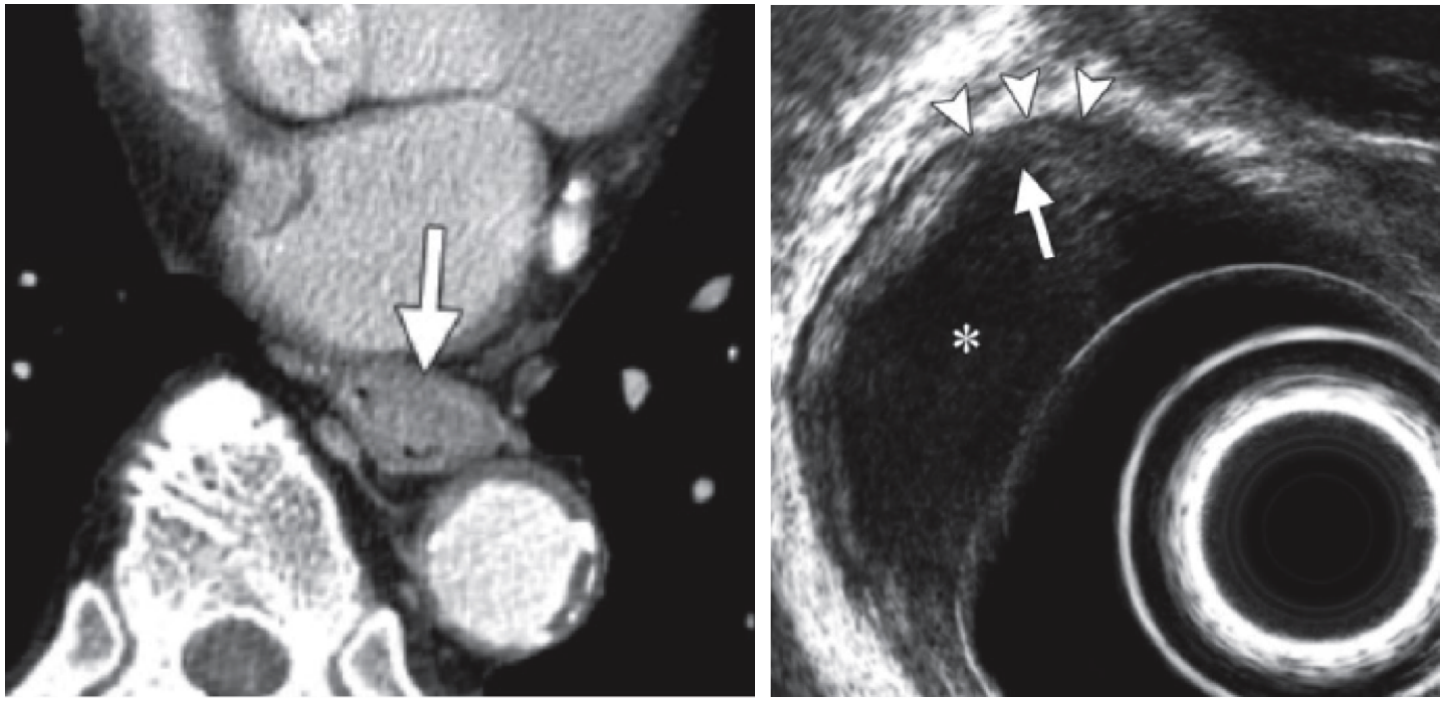
- Endoscopic Ultrasound (EUS) delineates the layers of the oesophageal wall

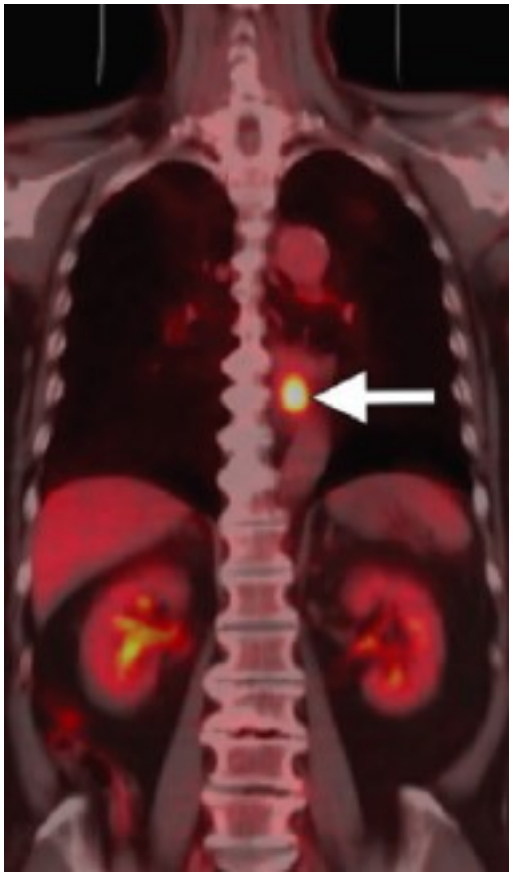


Hong SJ, Kim T J, Nam KB 2014. Radiographics; 34:1722-1740

ESTRO School

Imaging the primary – PET-CT

- 78-95% sensitivity for detecting primary tumour
- False positive due to oesophagitis & GORD
- T staging limited
- Provides information for tumour delineation
- Controversy remains over optimum segmentation method for determining target volume



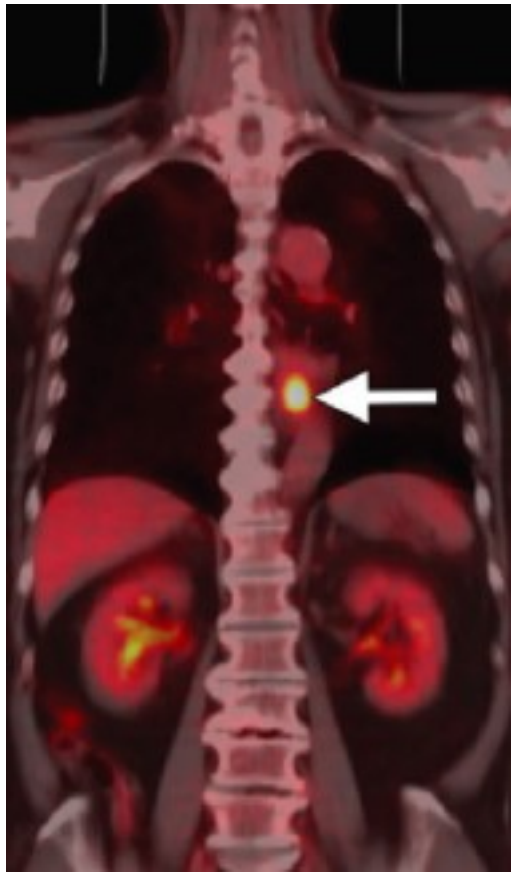
ESTRO School

Imaging the primary – PET-CT

Utility for Radiotherapy planning

Systematic review*:

- 3/50 studies demonstrated positive correlation of PET-CT length with path
- 1/50 showed improved inter & intra observer variability
- No studies demonstrated improved locoregional control



*Muijs CT, Beukema JC, Pruim J 2010. Radiother Oncol. Nov;97(2):165-71

ESTRO School

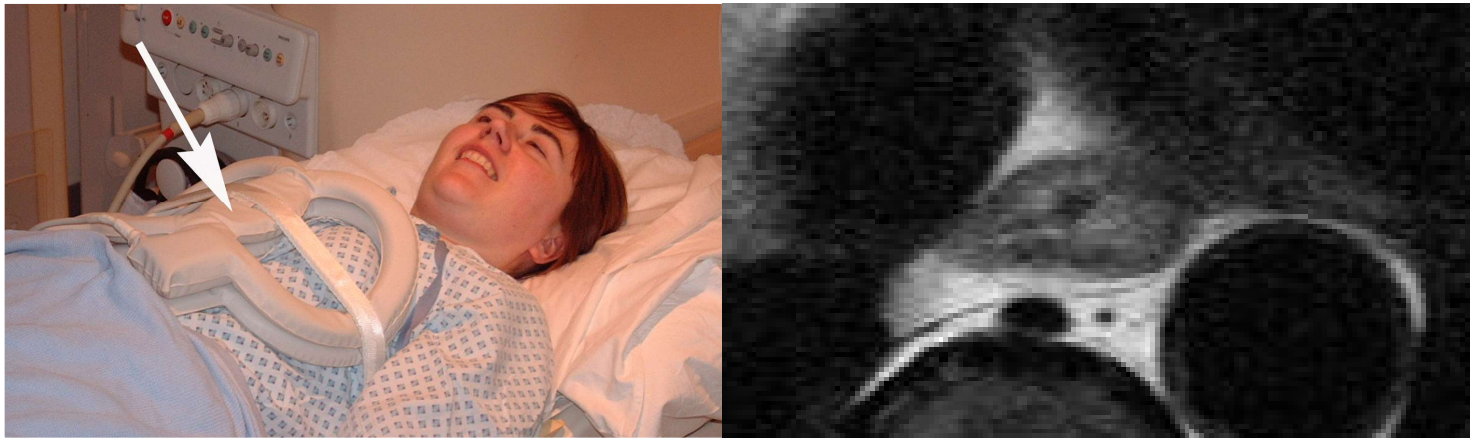
Imaging the primary: High Resolution MRI

- Advances in surface coil technology & fast imaging techniques
- Improved signal to noise
- Small field of view
- Thin slice imaging
- High Resolution Images = Voxel size 1-2mm^3

- Enables demonstration of the esophageal wall layers, allowing for local staging.

MRI Technique

External Surface coil MRI



Patient preparation

Starve for 2 hours

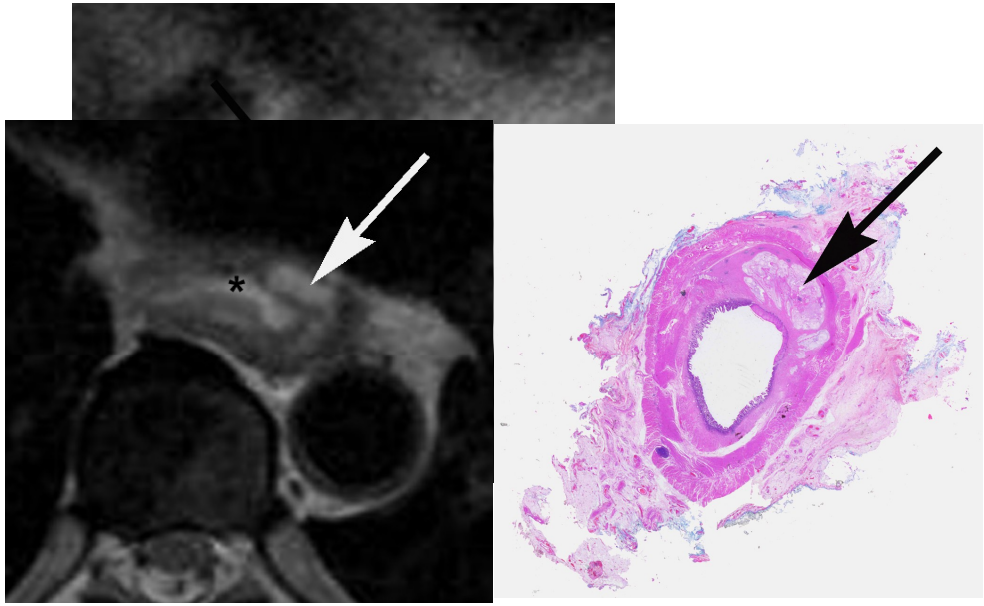
Antispasmodic

400mls water prior to scan

No requirement for IV contrast

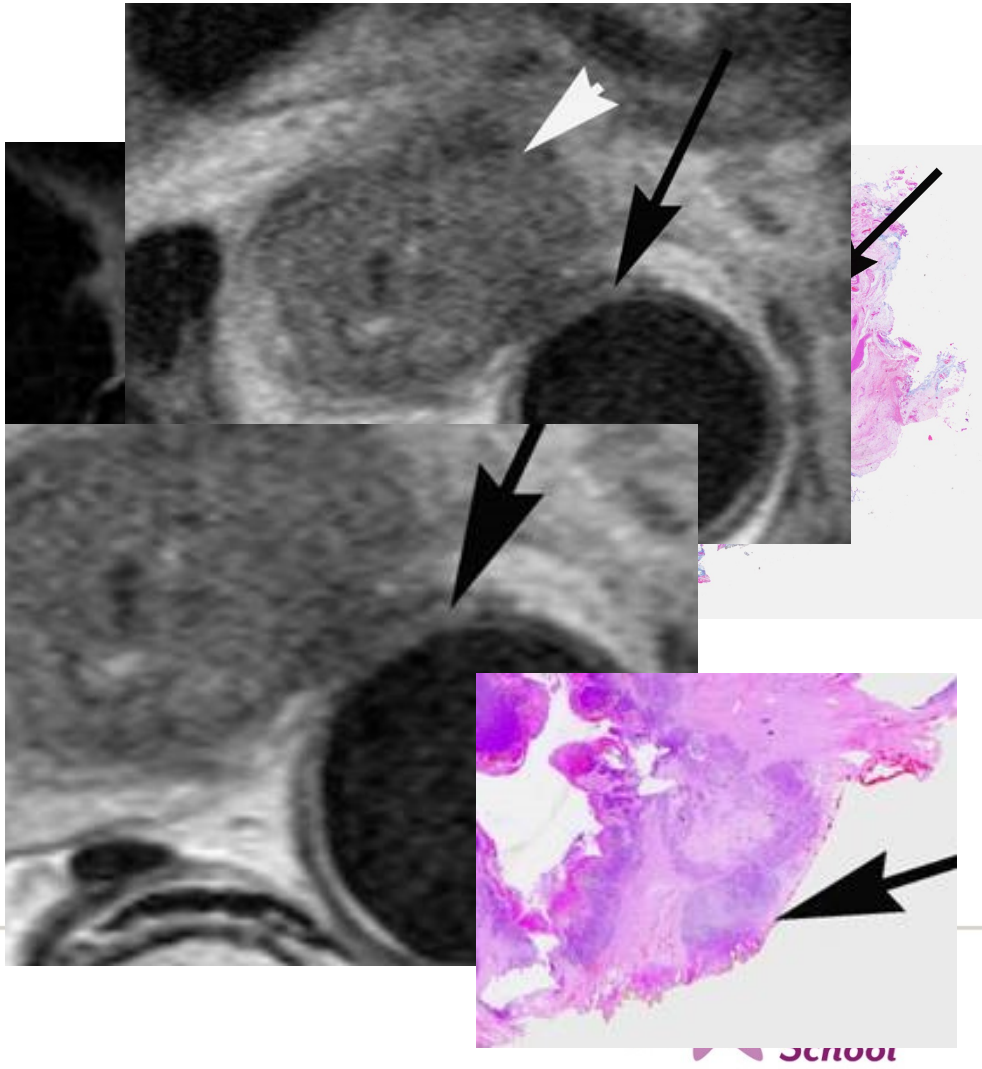
Potential advantages of MRI over MDCT

- Superior soft tissue contrast
  - Local staging
  - Tumour characterisation



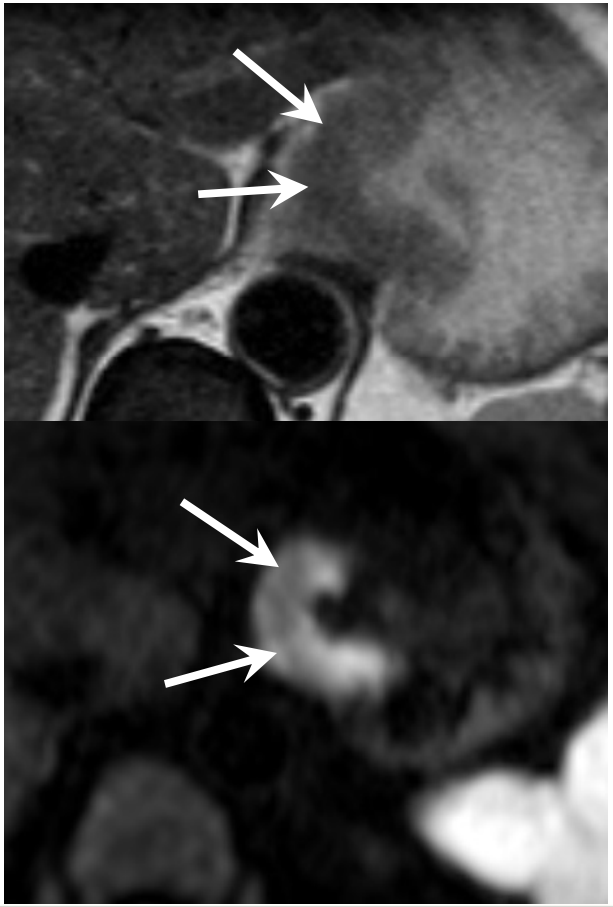
Potential advantages of MRI over MDCT

- Superior soft tissue contrast
  - Local staging
  - Tumour characterisation
- Improved assessment of the circumferential resection margin (CRM)

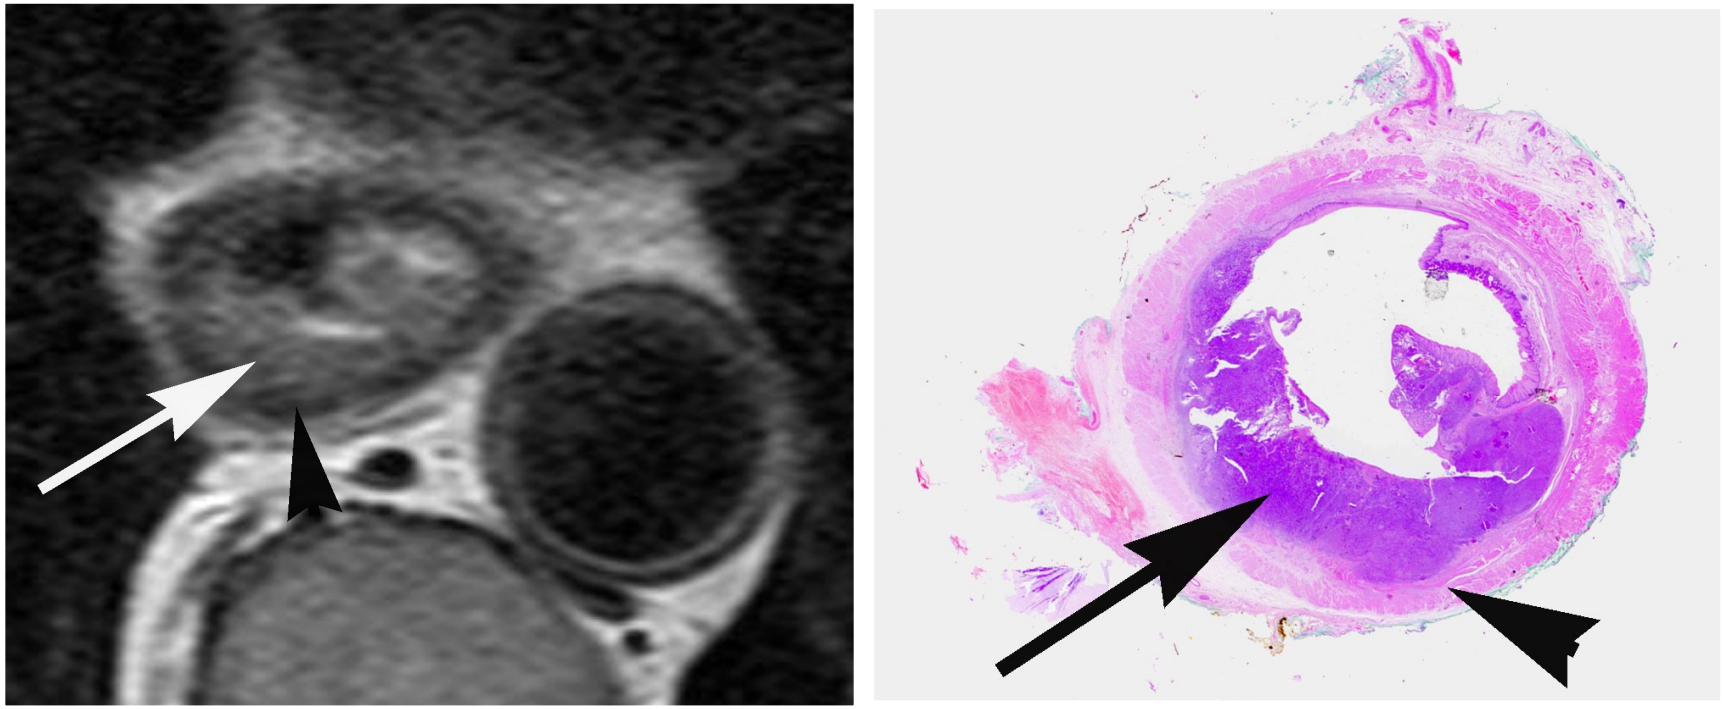


Potential advantages of MRI over MDCT

- Superior soft tissue contrast
  - Local staging
  - Tumour characterisation
- Improved assessment of the circumferential resection margin (CRM)
- Functional Information
  - Diffusion Weighted Imaging



High Resolution MRI



T2 tumour

Riddell A M, Allum W H, Thompson J N et al 2007. European Radiology: 17(2); 391-399

ESTRO School

MRI -T Staging

- Spatial resolution of MRI insufficient to accurately stage early tumours
- Good level of agreement with histology for ≤T2 vs ≥T3

	Path		
MRI	T= 0-2	T= 3-4	
T= 0-2	26	5	31 (44.3%)
T = 3-4	5	34	39 (55.7%)
	31 (44.3%)	39 (55.7%)	70

- Kappa for MRI 0.71
- Kappa for EUS 0.57 (post chemotherapy)

MRI - Prediction of Resectability

	Path Margin		
	Positive (no resection)	Negative	Total
MRI Positive	17(5)	5	22
Negative	9	44	53
Total	26	49	75

Correlation with Path for resected tumours:

Sensitivity	65%
Specificity	90%
PPV	77%
NPV	83%

Accuracy with MRI = 61/75, 81%

ESTRO School

Sub-site Anatomy Oesophagus

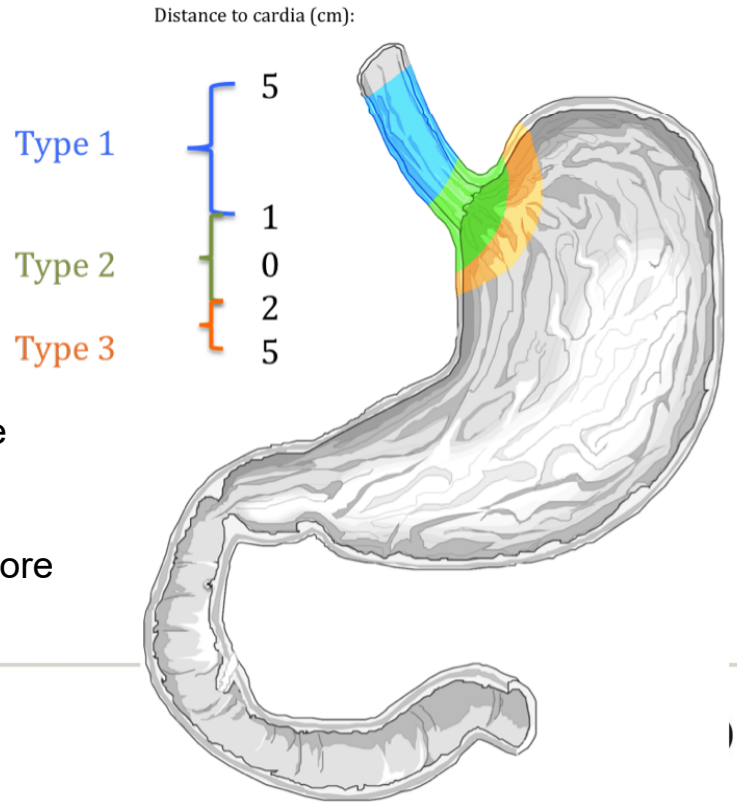
Gastroesophageal junction

Based on the anatomic location of the tumour centre three subtypes can be defined :

Type I tumours have their tumour centres more than 1 cm above the anatomical gastroesophageal junction.

Type II tumours are the true carcinomas of the cardia and have their tumour centres located within 1 cm oral and 2 cm aboral of the anatomical gastroesophageal junction.

Type III tumours have their tumour centre more than 2 cm but not more than 5 cm below the anatomical gastroesophageal junction.



AJCC: staging scheduled in the US on 01.2018.
UICC: January 1, 2017

EGJ tumors:

tumor epicenter no more than 2 cm into the proximal stomach are staged as
➔ esophageal cancers

epicenter located more than 2 cm into the proximal stomach are staged as
➔ stomach cancers

all cardia cancers not involving the EGJ, even if within 2 cm of the EGJ
➔ stomach cancers

Oesophageal cancer

Dose issues in esophageal tumor control

Marcel Verheij MD PhD
Department of Radiation Oncology
NKI, Amsterdam

ESTRO School

Contents

- Introduction
- Treatment options
- Radiotherapy: dose escalation

Epidemiology of esophageal cancer

- 2012: Europe ~46,000 cases/year; ~39,500 deaths
- 6th leading cause of cancer-related mortality
- 8th most common cancer worldwide
- Worldwide >450,000 people are affected
- Incidence is increasing rapidly
- Overall 5-year survival 15-25%
- Diagnosis at advanced (metastatic) stages
- 30-40% present with resectable disease
- SCC is predominant type; in some western European countries adenocarcinoma exceeds SCC

ESTRO School

Incidence of adenocarcinoma of the esophagus, GEJ and stomach 1973 - 2008, United States

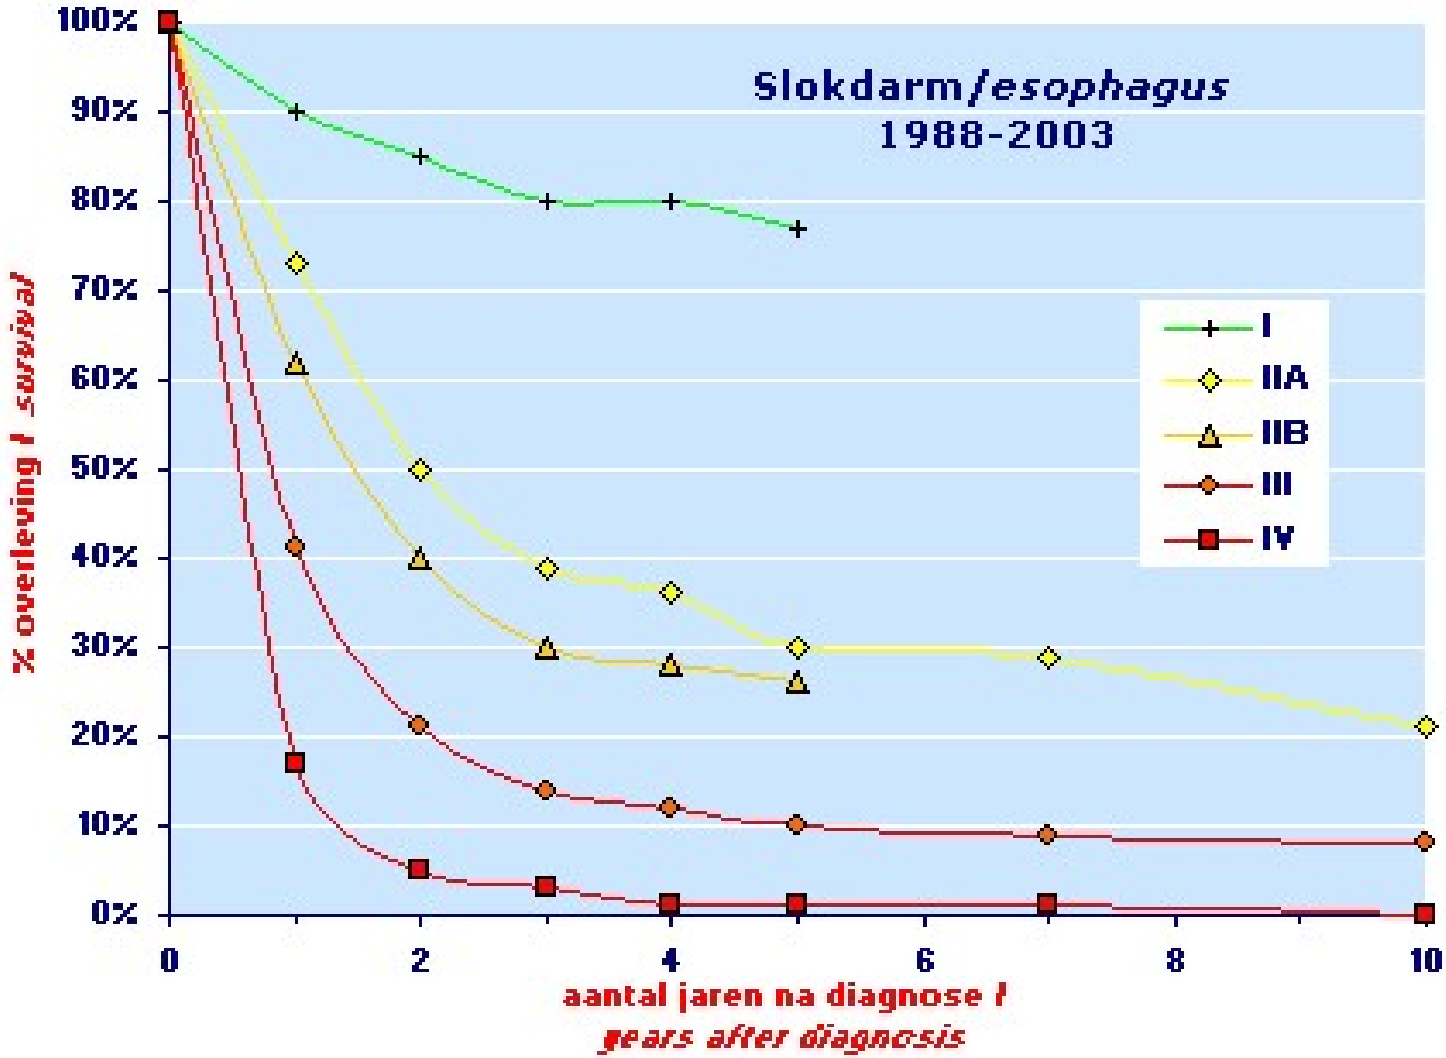
ESTRO School

Relative survival according to stage in The Netherlands 1988 - 2003



ESTRO School

Esophageal cancer: risk factors

Oesophageal SCC

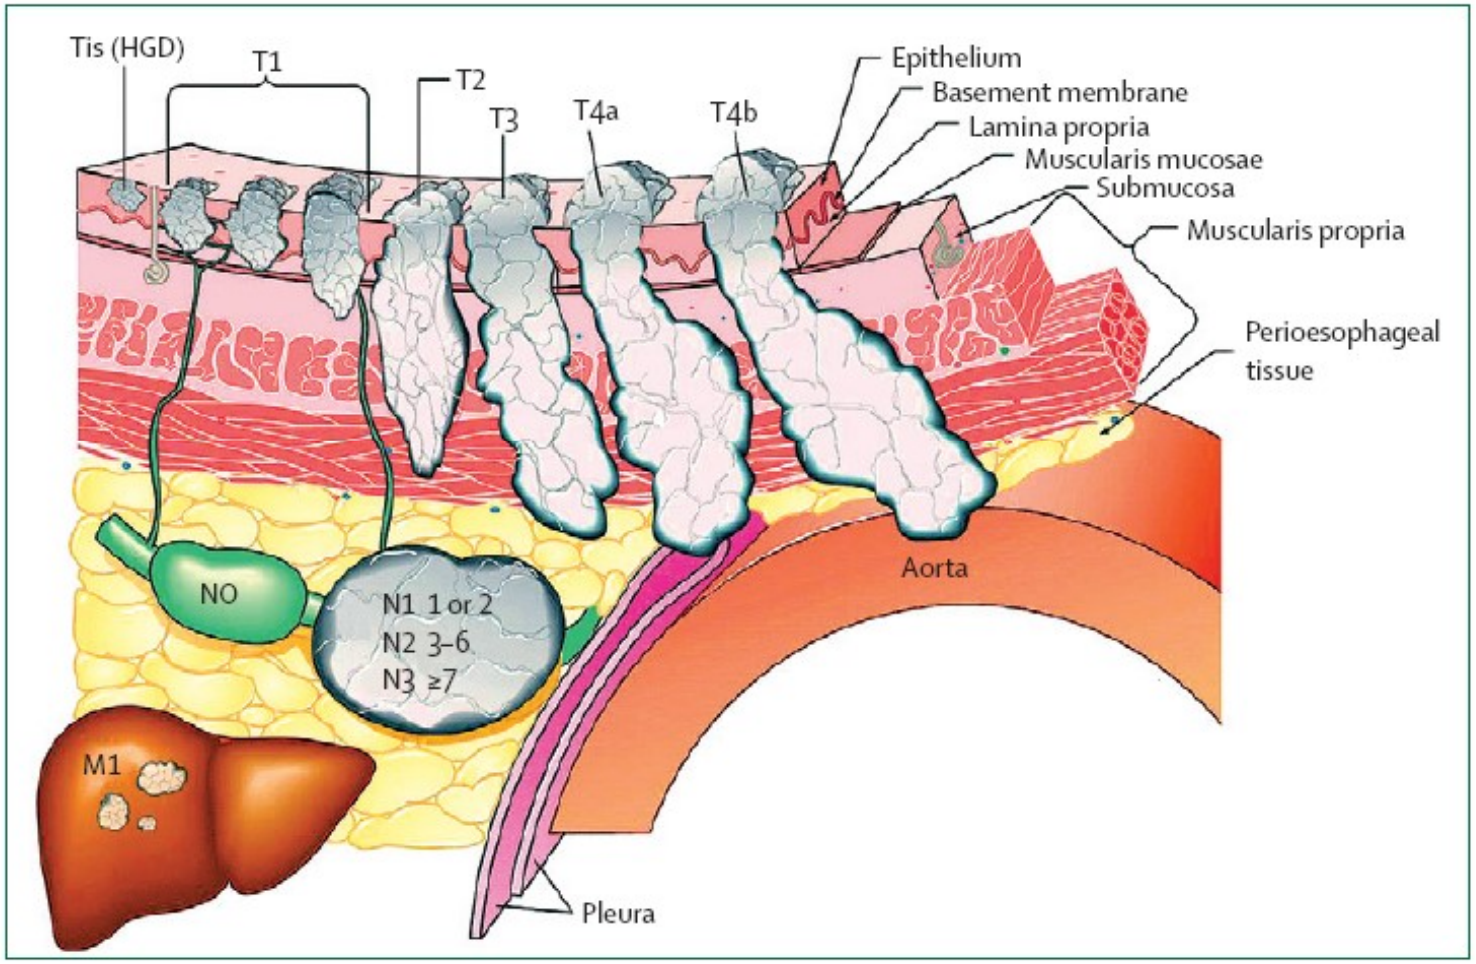
- Tobacco use
- Alcohol consumption
- Mutations of enzymes that metabolise alcohol
- Achalasia
- Caustic injury
- History of thoracic radiation
- Low socioeconomic status
- Poor oral hygiene
- Nutritional deficiencies
- Non-epidermolytic palmoplantar keratoderma

Oesophageal adenocarcinoma

- Symptomatic gastro-oesophageal reflux disease
- Barrett's oesophagus
- Obesity
- Tobacco use
- History of thoracic radiation
- Diet low in vegetables and fruits
- Increased age
- Male sex
- Medications that relax the lower oesophageal sphincter
- Familial history (rare)

TNM esophageal cancer 7th edition

(including esophagogastric junction)



Pennathur et al, Lancet 2013

ESTRO School

Treatment options

- Operable/resectable vs. inoperable/irresectable
- Surgery vs. neoadjuvant chemotherapy + surgery
- Neoadjuvant chemoradiotherapy with surgical resection
- Surgery with adjuvant chemotherapy, radiotherapy, or chemoradiotherapy
- Definitive (chemo-) radiotherapy

Surgery vs. neoadjuvant chemotherapy + surgery

	Number of patients	Study treatments	Chemotherapy regimen	Histology	Median survival (months)	Overall survival (%)
Kelsen et al, 1998[91]	440	Surgery vs surgery and chemotherapy	Cisplatin+fluorouracil for three cycles before surgery	204 (46%) SCC, 236 (54%) adenocarinoma	14·9 vs 16·1	(3-year) 26% vs 23%
MRC, 2002[92] and Allum et al, 2009*	802	Surgery vs surgery and chemotherapy	Cisplatin+fluorouracil for two cycles before surgery	247 (31%) SCC, 533 (66%) adenocarcinoma, 24 (3%) undifferentiated or unknown	13·3 vs 16·8	(5-year) 17% vs 23%†
Cunningham et al, 2006[93]	503	Surgery vs surgery and chemotherapy	Epirubicin+cisplatin+ fluorouracil for three cycles before and after surgery	503 (100%) adenocarcinoma (372 [74%] gastric, 131 [26%] oesophageal)	NR	(5-year) 23% vs 36%†

SCC=squamous-cell carcinoma. MRC=Medical Research Council Oesophageal Cancer Working Group. NR=not reported. *Appendix p 7. †Significant difference in favour of the neoadjuvant chemotherapy group.

Table 2: **Results of randomised trials of neoadjuvant chemotherapy**

- Rationale: control early spread of systemic disease
- Results not consistent
- MAGIC study (Cunningham) may not be generalisable to all esophageal adenocarcinoma (26% EGJ/adeno)

Pennathur et al, Lancet 2013

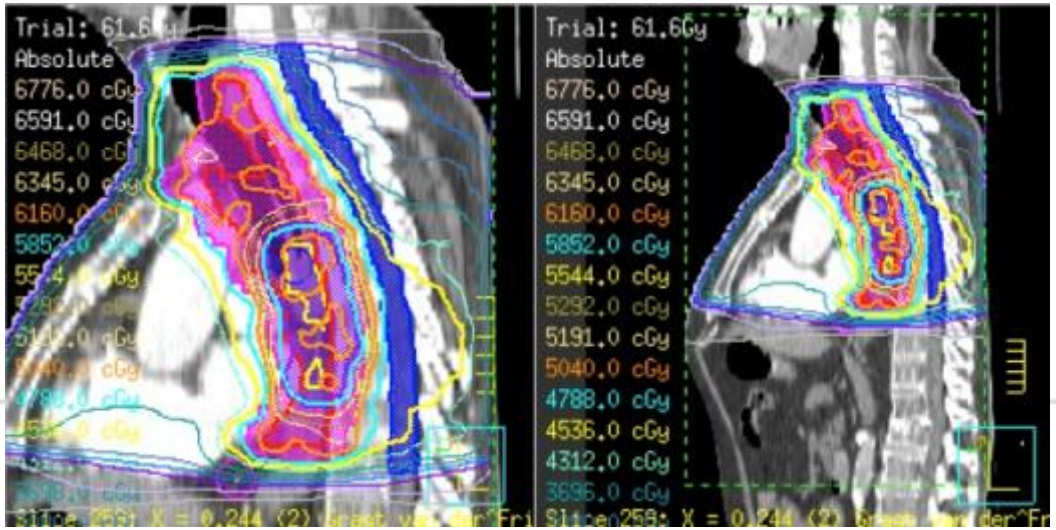
Dose escalation in definitive CRT

ART-DECO: Dutch dose escalation trial in patients with locally irresectable or medically inoperable carcinoma of the esophageal or GEJ treated with definitive CRT

R

Standard: 50.4 Gy/28 fr + weekly carboplatin/paclitaxel

Experimental: 61.6 Gy/28 fr (SIB boost GTV_{oes}) + weekly C/P



ESTRO School

Conclusions

- *Incidence of esophageal cancer is increasing*
- *Prognosis is poor due to advanced stages at diagnosis*
- *Treatment is challenging and requires multidisciplinary approach*
- *Largest gain is obtained in neo-adjuvant setting (CRT>CT?)*
- *Whether there is room for RT dose escalation remains unanswered (subgroups? Better/safer RT techniques?)*

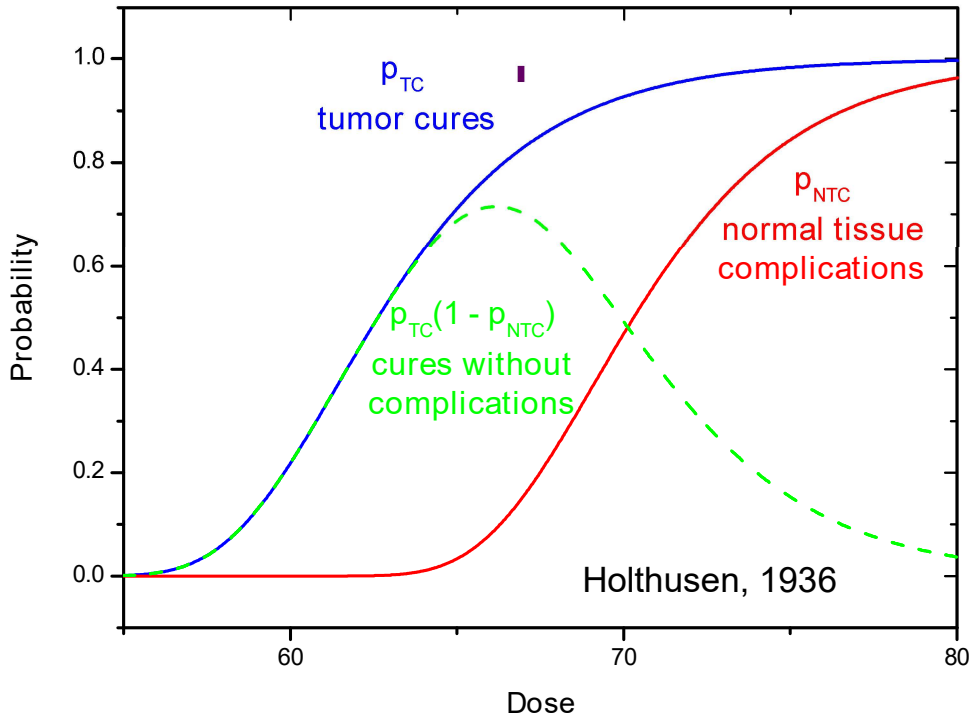
Introduction

Radiation therapy affects both tumor cells and uninvolved normal cells



Introduction

- 1972: First formal attempt to address normal tissue tolerance to radiation

Rubin P, Cassarett G. A direction for clinical radiation pathology. In: Vaeth JM, et al., eds. Frontiers of radiation therapy and oncology VI. Baltimore, MD: University Park Press, 1972:1–16.

- 1991: A committee reviewed available published data
  - ➔ but much of the data was nonexistent
  - ➔ rely on experience of 8 clinicians from major institutions in the US

CAVE:

- *Literature review up to 1991.*
- *Pre-dated the 3D-CRT, IMRT- IGRT era.*
- *Dose-volume histograms were not in routine clinical use.*
- *Arbitrary decision: organs be divided into one-third, two-thirds, and whole organ volumes*
- *It was only for external beam radiation with conventional fractionation.*
- *Only one severe complication was chosen as an endpoint*

Emami B, Lyman J, Brown A, et al. Tolerance of normal tissue to therapeutic irradiation. Int J Radiat Oncol Biol Phys 1991;21(1):109–122.

2007: Milano & al.

Last, but … Esophagus

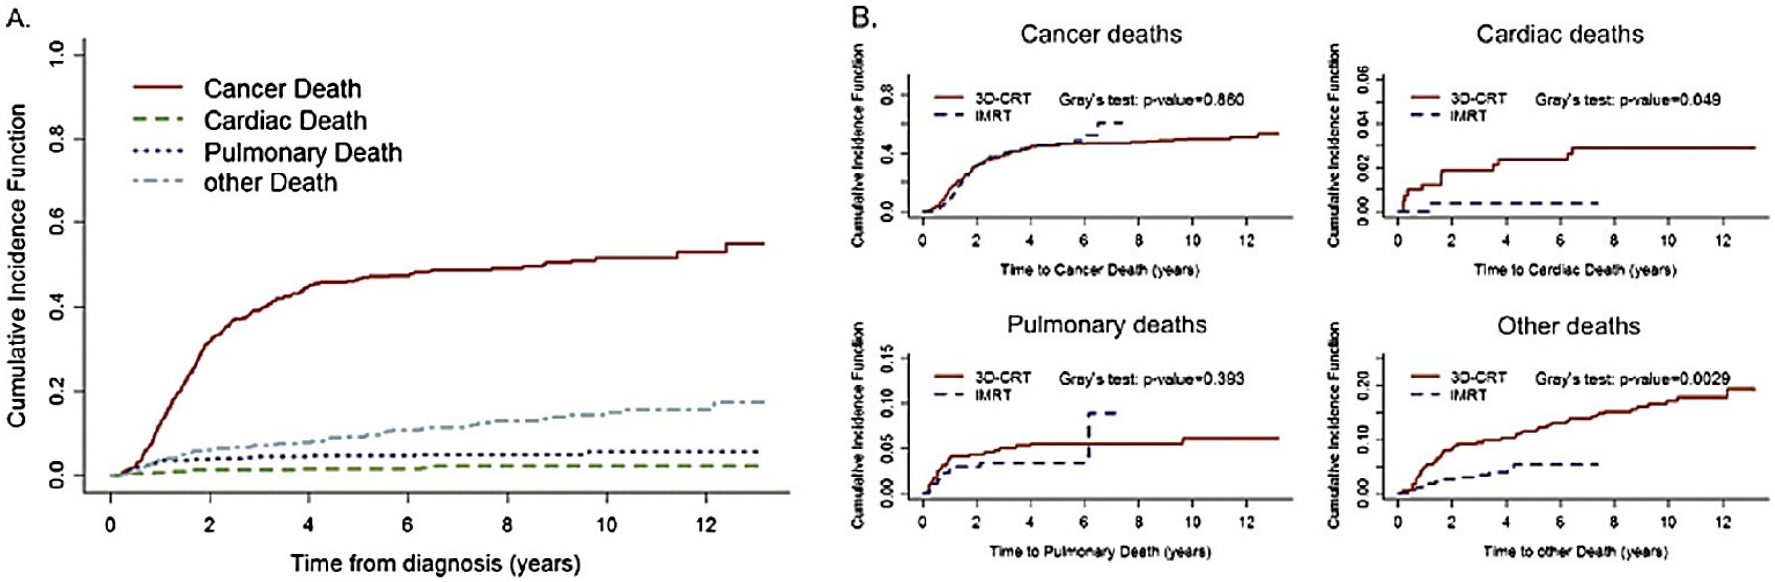
Organ	Endpoint	Rate (%)	Dose-volume parameter	D_{max} (Gy)	D_{mean} (Gy)
Esophagus	Grade ≥2 esophagitis	<30	V35 <50% V50 <40% V70 <20%	<74 Point	
	Grade ≥3 esophagitis	≤10	V60 <30%		<34

- Dose limit = 50 Gy Mean dose > 34 Gy *Sing IJROBP 2003*
- Lenght of esophagus receiving more than 55 Gy *Maguire IJROBP 1999*
- Acute esophageal toxicity is the greatest predictor of late toxicity

ESTRO School

IMRT : Evolution or Revolution?

Propensity score-based comparison of long-term outcomes with 3-dimensional conformal radiotherapy vs intensity-modulated radiotherapy for esophageal cancer.



Int J Radiat Oncol Biol Phys. 2012 Dec 1;84(5):1078-85. doi: 10.1016/j.ijrobp.2012.02.015.

ESTRO School

CONCLUSIONS

- IMRT should be favored in the treatment of esophageal cancer
- The inverse treatment planning is asking for contraints to the tumor as well as for organs at risk
- The constraints to OARs should minimize the dose delivered to critical structures which could be associated to acute toxicities and poor compliance
- The ALARA principle should be applied to all thoracic irradiated organs.

“Competitive” plans

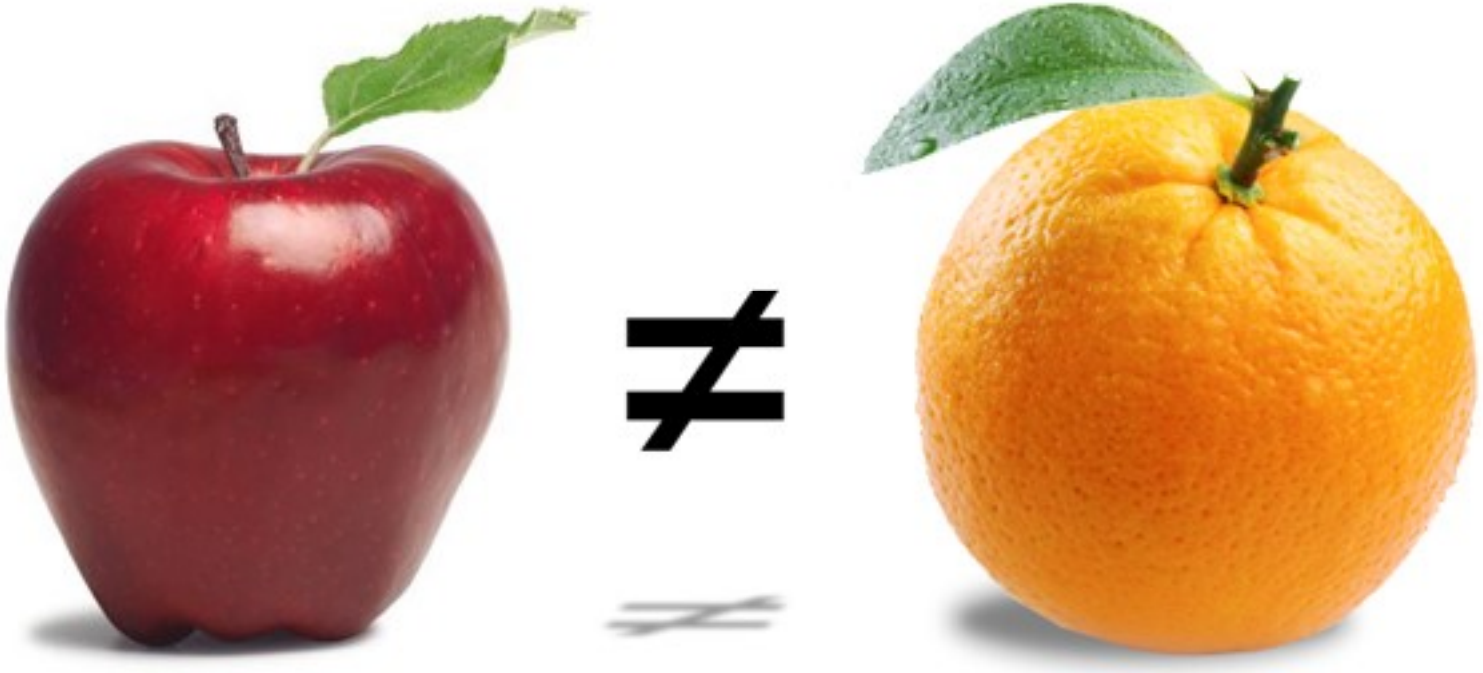
Dirk Verellen

DV is involved in an on-going scientific collaboration with RaySearch

ESTRO School

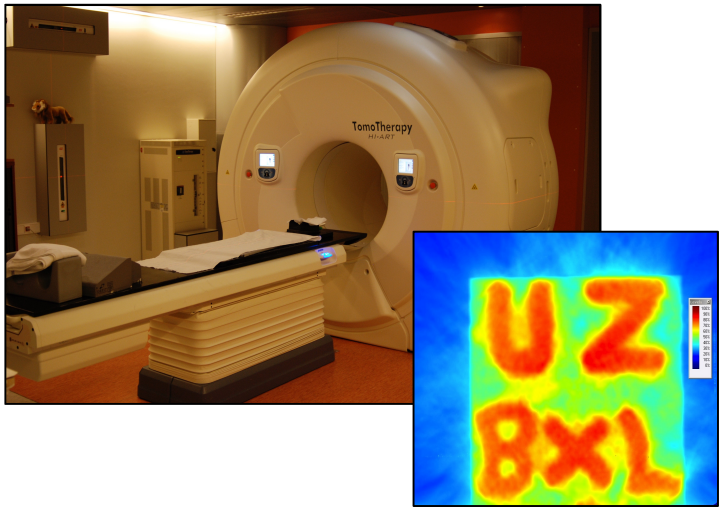
Outline

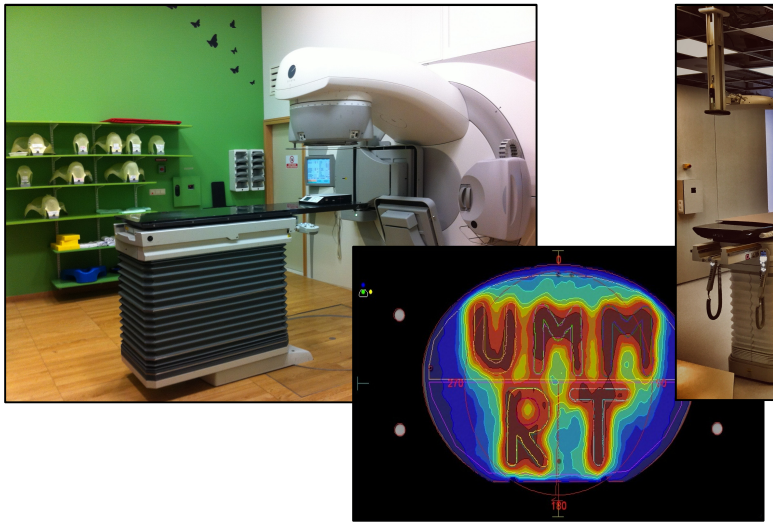
- How to compare plans?
- Oesophagus: 3D-CRT versus VMAT
- Oesophagus: 3D-CRT versus Helical TomoTherapy
- Partial gastrectomy: 3D-CRT versus Helical TomoTherapy

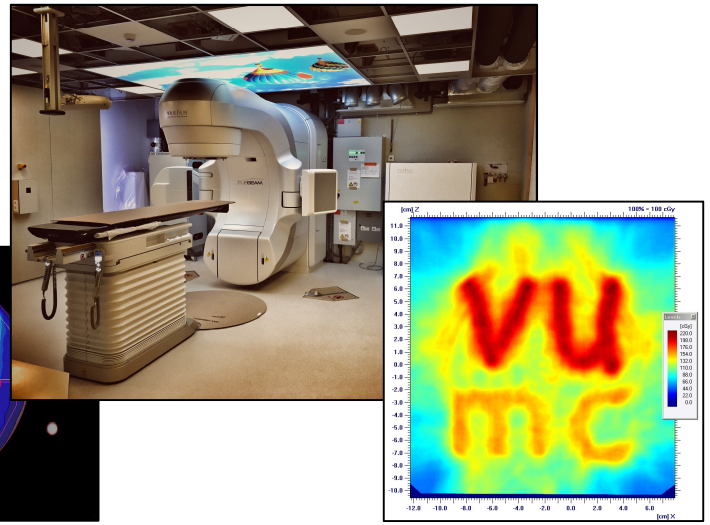


A few disclaimers

- Unlike the title suggests, this exercise is not trying to show superiority of a technology







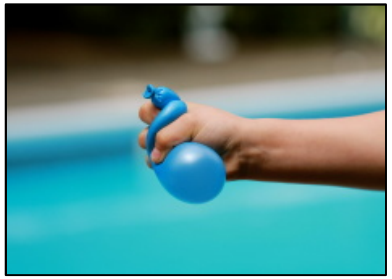
- The plans shown in this presentation are typical plans as they would be performed in clinic, generated by a dosimetrist.
  - eg focus on a certain constraint in the optimizer could drive the IMRT plan to outperform another on that particular variable … bias, selectivity ….
  - The acceptance criteria, were: “the plan being clinically acceptable, presenting a good compromise.”

ESTRO School

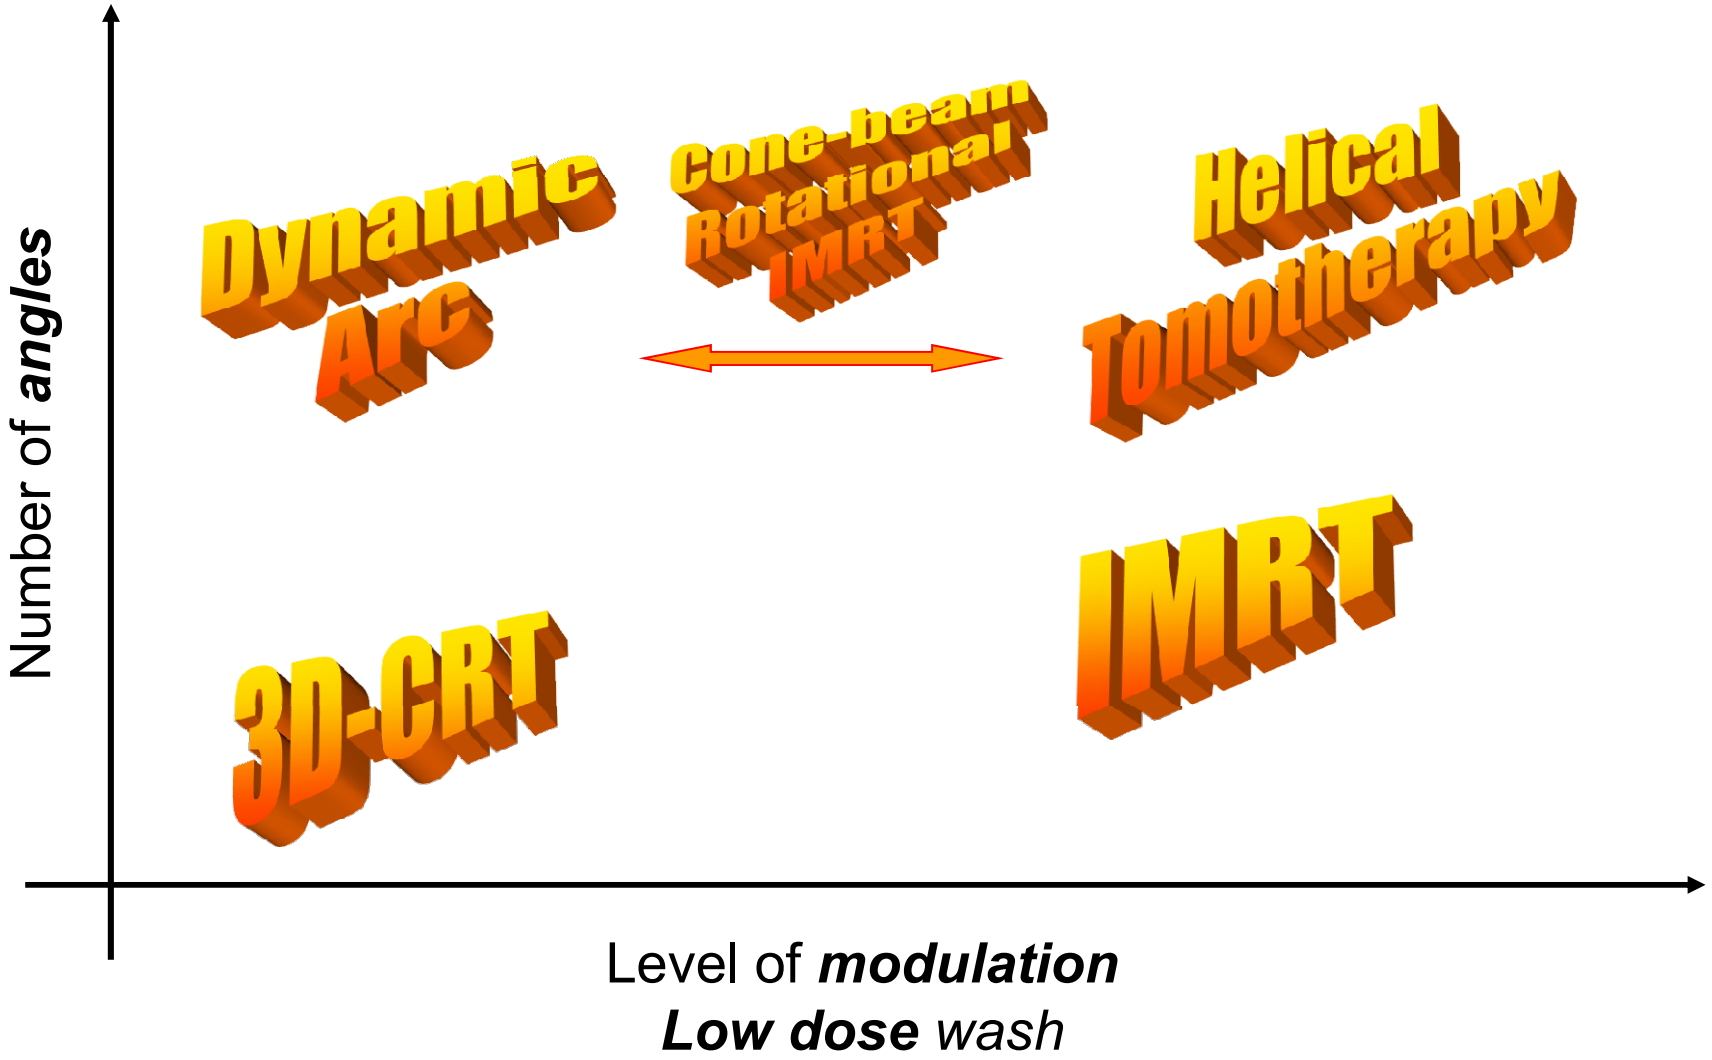
A few disclaimers

- We're limiting ourselves to photon treatment
  - … for obvious reasons

- From 3D-CRT to IMRT to rotational IMRT: "**re-distribution of dose**"
  - Simplistic: "if you want more conformality, you'll sacrifice on homogeneity and *vice versa*."
  - The clinical choice is: "delivering more dose to *some* normal tissues and sparing *others* completely" versus "distributing low dose values uniformly within large volumes of normal tissues (***low dose wash***)."



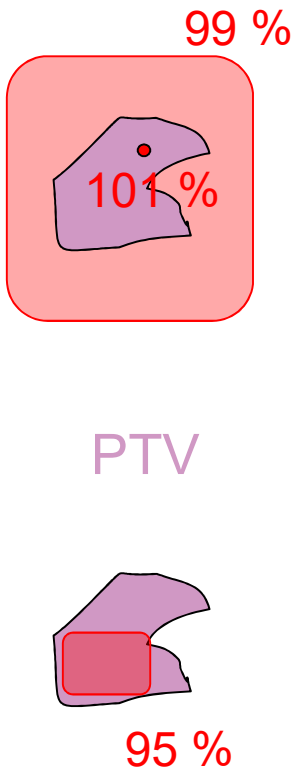
You get what you pay for



Dose homogeneity & Conformity

Tumor dose inhomogeneity, $TDI = (D_{max} - D_{min})/D_{median}$
Conformity Index, $CI_{95} = V_{NonTargetTissue}/V_{CTV}$

Technique	TDI	CI
Tomotherapy	**0.38**	**0.35**
IMRT opposing	**0.26**	**2.33**
IMRT non opposing	**0.25**	**0.33**
Dynamic Arc	**0.26**	**0.51**
IMRS opposing	**0.30**	**0.43**
IMRS non opposing	**0.26**	**0.29**



TDI ++

CI ++

Dose homogeneity & Conformity

- Paddick Conformity Index:
  - simultaneously takes into account irradiation of the target volume and irradiation of the healthy tissue

$$\frac{TV_{PI}}{PIV} \times \frac{TV_{PI}}{TV}$$

  - TV_{PI} is the target volume (TV) within the prescribed isodose volume (PIV)
  - **Part 1**: Healthy tissue receiving dose > PI (ideally ➔ 1)
  - **Part 2**: Quality of target coverage (ideally ➔ 1)
  - Ideally, **should be close to 1**.

Dose homogeneity & Conformity

- Homogeneity Index:

$$HI = \frac{D_2 - D_{98}}{D_P}$$

  - D_2: represents maximum dose, dose to 2% of the PTV
  - D_{98}: represents minimum dose, dose to 98% of the PTV
  - D_p: prescription dose
  - **Lower values indicate more homogeneity**.

Dose homogeneity & Conformity

- Gradient Index:
  - A measure for dose fall-off

$$GI = \frac{PIV_{50}}{PIV}$$

  - PIV: Prescription isodose volume, in this case PIV_{95}
  - PIV_{50}: Volume that receives half of prescription dose
  - **The lower the better** (eg for SRS a GI less than 3 is suggested).

Oesophagus, a case study (1)

PTV margins: The “paranoid target volume”

Dirk Verellen

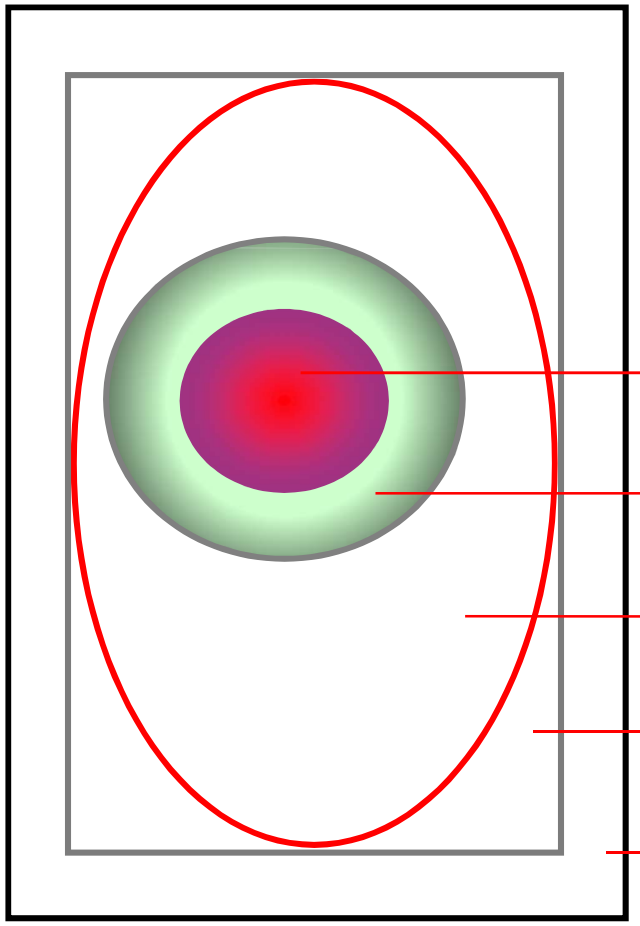
DV is involved in an on-going scientific collaboration with RaySearch

ESTRO School

Outline

- PTV as a pragmatic solution
- Is there still room for the concept PTV when we evolve to BCRT, ART, … particle therapy?

Let's start with the definition



GTV

CTV

PTV

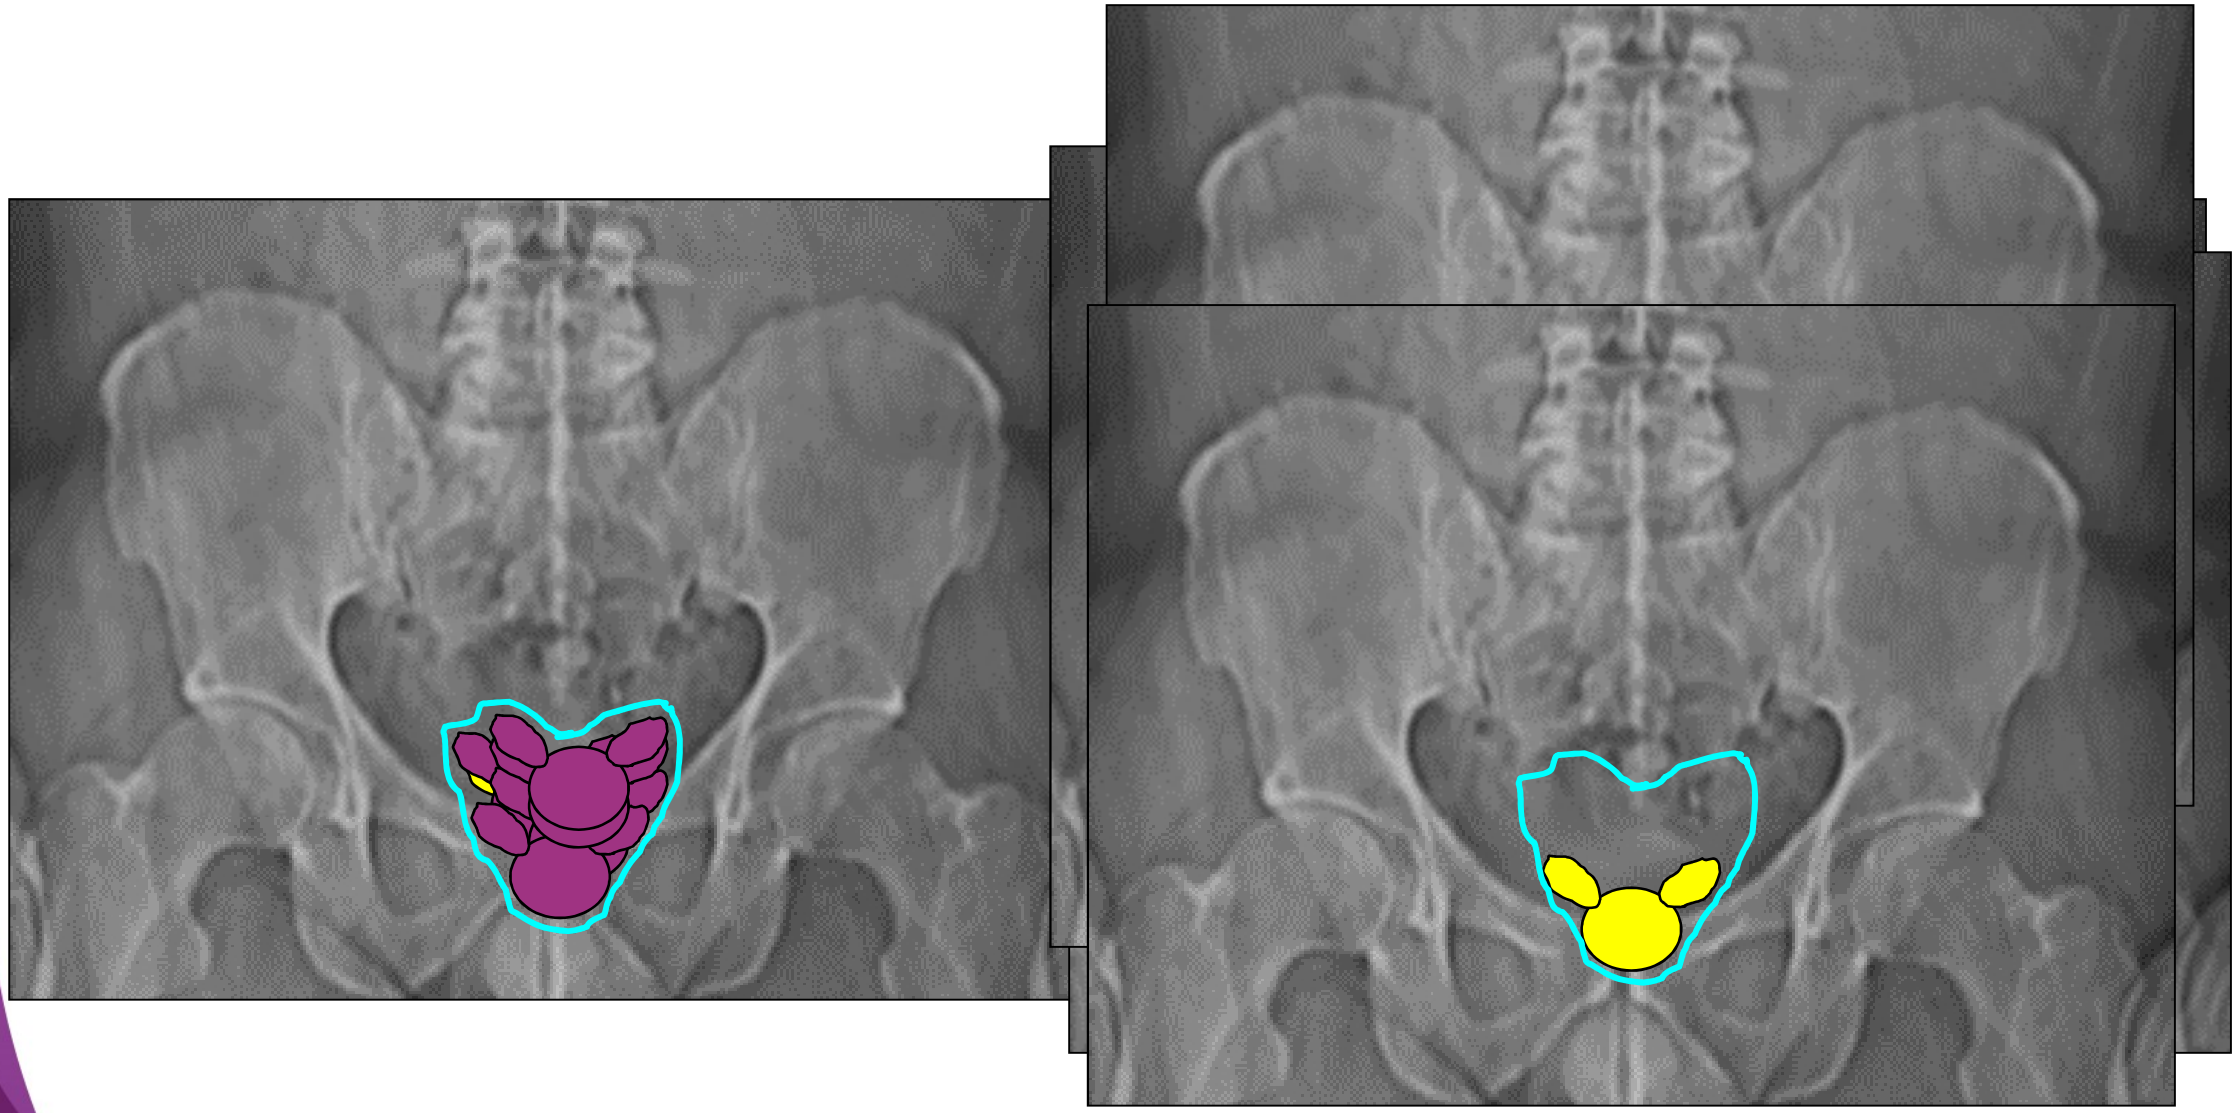
TV

IV

Clinically determined

"statistical box" representing a volume with a high probability of containing the CTV

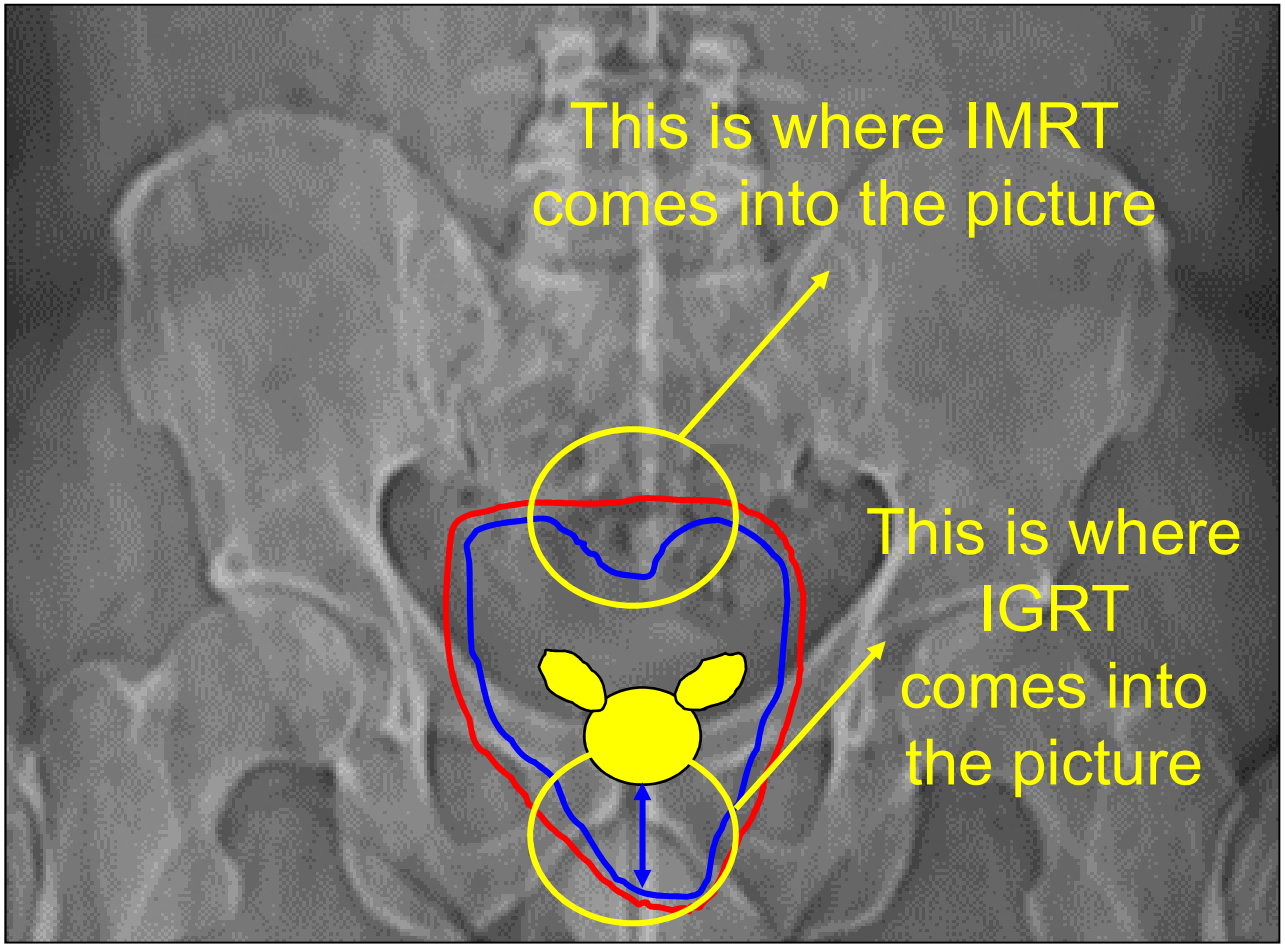
Let’s start with the definition



“The dancing prostate”

ESTRO School

Let's start with the definition



Set up Margin

+

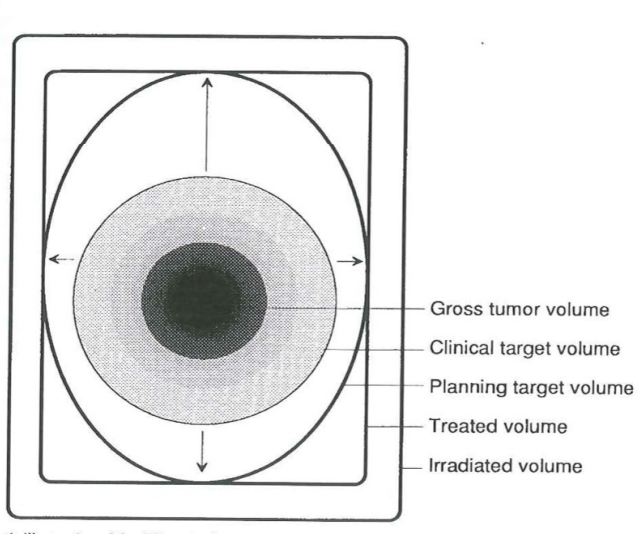
Internal Margin

Irradiated Volume

"The dancing prostate"

Let's start with the definition

- ICRU 50



- ICRU 62

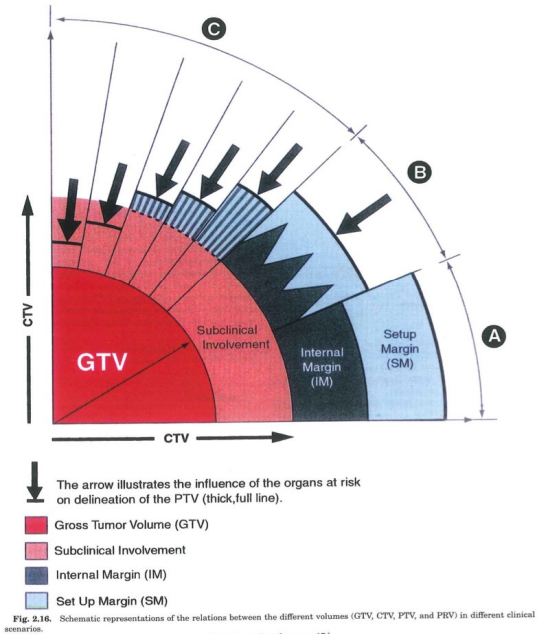


Fig. 2.16. Schematic representations of the relations between the different volumes (GTV, CTV, PTV, and PRV) in different clinical scenarios.

- … ICRU 83 …

ESTRO School

Let's start with the definition

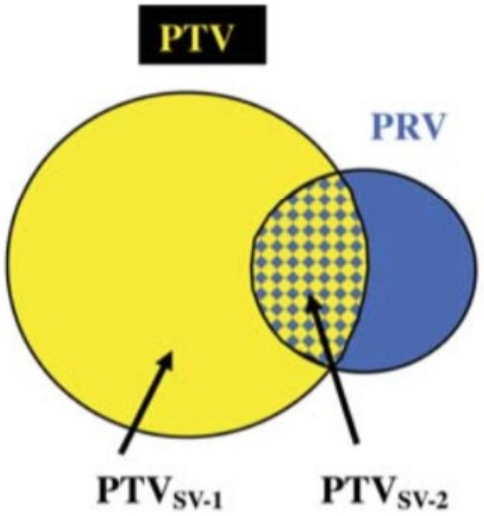
- **ICRU 83**:
  - The PTV is **A GEOMETRICAL CONCEPT** introduced for treatment planning and evaluation. **It is the recommended tool to shape absorbed-dose distributions to ensure that the prescribed absorbed dose will actually be delivered to all parts of the CTV with a clinically acceptable probability**, despite geometrical uncertainties such as organ motion and setup variations
  - It surrounds the representation of the CTV with a margin such that the planned absorbed dose is delivered to the CTV
  - This margin takes into account both the **internal** and the **setup** uncertainties
  - **Although the delineation of the GTV and the CTV is independent of the irradiation technique, the delineation of the PTV is dependent on the technique and is part of the treatment prescription**.
  - A margin must be added to the CTV taking into account uncertainties and variations in (1) position, size, and shape of the CTV (internal variations), and (2) patient and beam positioning (external variations)

Let's start with the definition

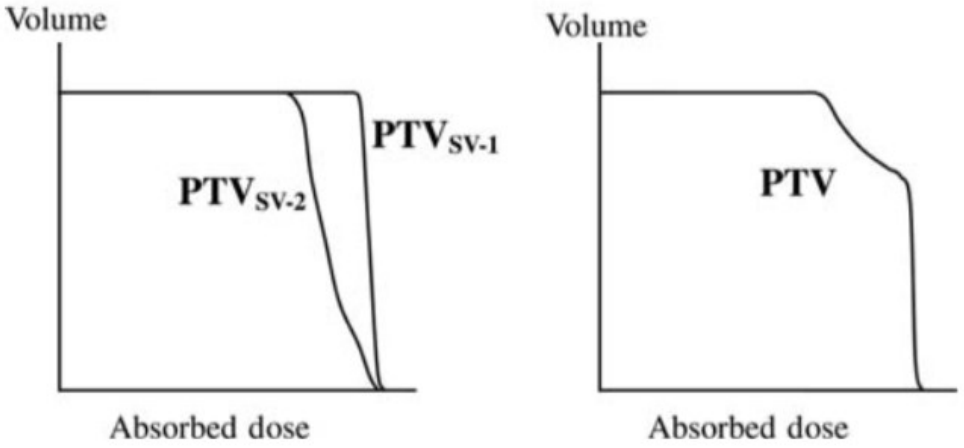
- **ICRU 83**:
  - In earlier ICRU documents, the possibility of **compromising** the margins of the PTV if they encroached on **OAR** was suggested (ICRU, 1999; 2004; 2007), but is **no longer recommended**. To reduce the CTV-to-PTV margin has always been a temptation. As an example, the CTV-to-PTV margin between the prostate and rectum is often 1 cm, except in the anterior – posterior direction for which it is reduced to spare the rectum
  - To ensure accurate reporting of absorbed dose to the PTV in cases for which the PTV encroaches or overlaps another PTV, OAR, or PRV, it is now recommended that the delineation of the primary PTV margins should not be compromised. Developments in treatment-planning software now make it possible to achieve sufficient dose sparing of the OAR by **using priority rules in optimizer** planning systems (see Section 2). Alternatively, subdivision of the PTV into regions with different prescribed absorbed doses (so-called **PTV-subvolumes**, PTVSV) may be used.

Let's start with the definition

- **ICRU 83**:

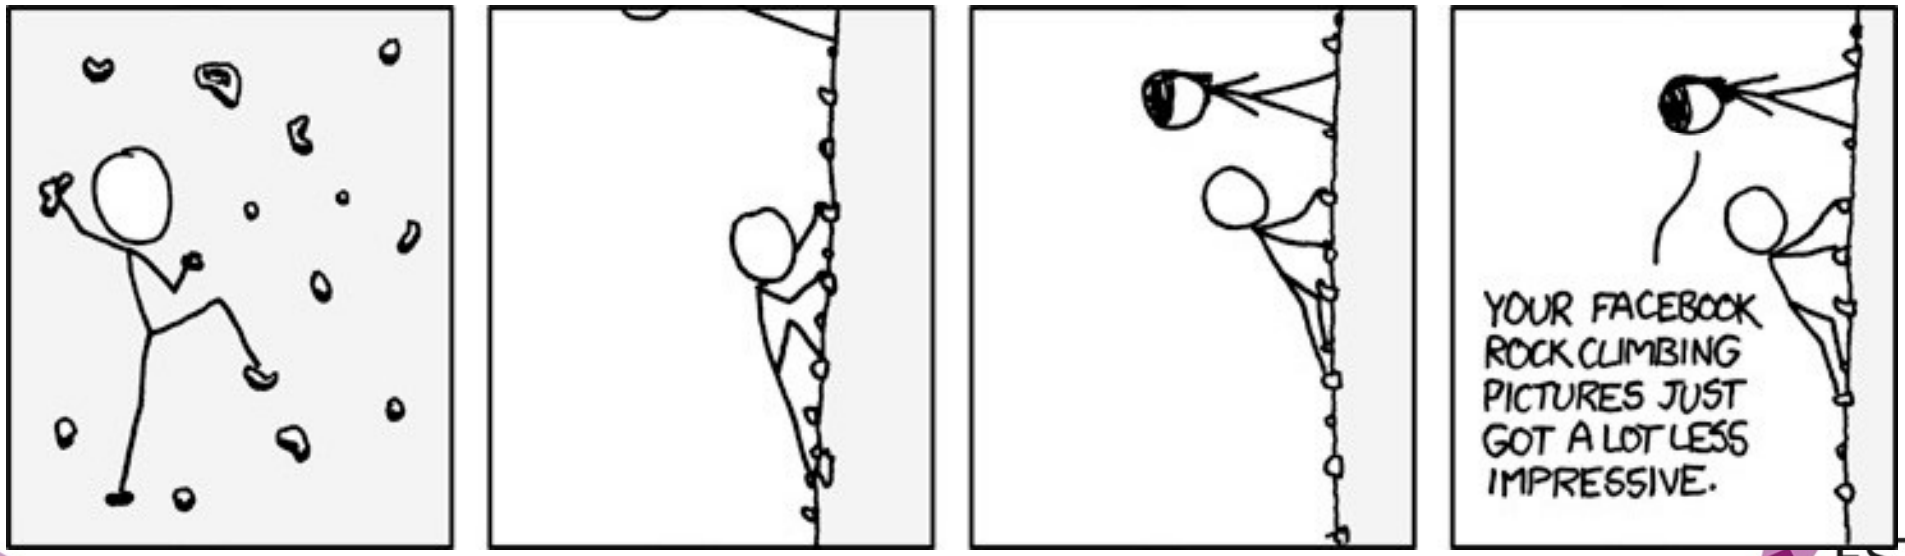


$$PTV = PTV_{SV-1} + PTV_{SV-2}$$



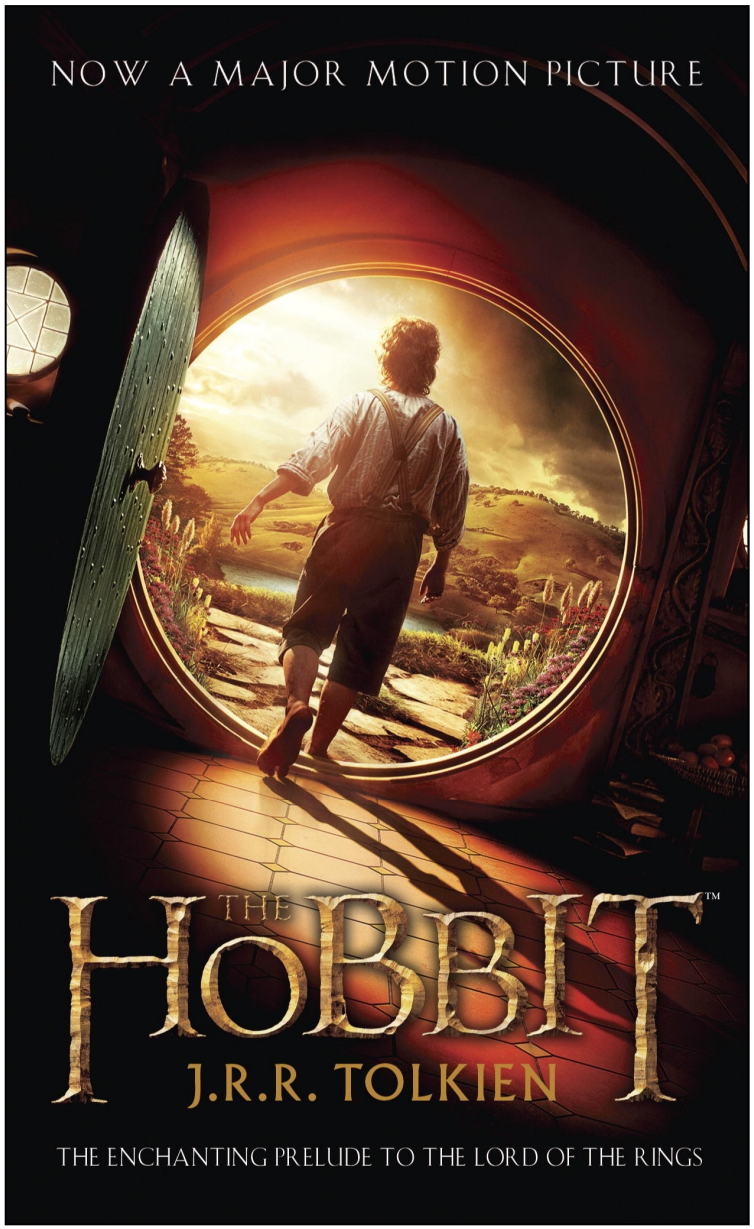
That was easy …

- What about clinical practice?
  - Requiring 100 % confidence for adequately treating the CTV would result in unreasonably large margins.
  - To quote ICRU 83, case number B3. Adenocarcinoma of the Prostate: "*The PTV-T was defined by adding an anisotropic margin to the CTV. This margin was 7 mm posteriorly, and 10 mm in all other directions …*"
- **But where does the 7 mm come from**??????



The PTV

- There and back again



ESTRO School

PTV in literature

PRESCRIBING, RECORDING, AND REPORTING PHOTON-BEAM IMRT

Table 4.4. Summary of various published recommendations for margins around target volumes (CTV) and OAR (modified from van Herk, 2004).

Author	Region	Recipe	Comments
Bel *et al.* (1996)	PTV	0.7σ	Statistical uncertainties only (linear approximation)—Monte Carlo.
Antolak and Rosen (1999)	PTV	1.65σ	Statistical uncertainties only, block margin?
Stroom *et al.* (1999a)	PTV	$2\,\Sigma + 0.7\sigma$	95 % absorbed dose to on average 99 % of CTV tested in realistic plans.
van Herk *et al.* (2000)	PTV	$2.5\,\Sigma + 0.7\,\sigma$ (or more correctly): $2.5\Sigma + 1.64$ $(\sigma - \sigma_e)$	Minimum absorbed dose to CTV is 95 % for 90% of patients. Analytical solution for perfect conformation.
McKenzie (2000)	PTV	$2.5\,\Sigma + \beta + (\sigma - \sigma_e)$	Extension of van Herk *et al.* (2000) for fringe dose due to limited number of beams. The factor β depends on the beam organization.
Parker *et al.* (2002)	PTV	$\Sigma + \sqrt{(\sigma^2 + \Sigma^2)}$	95 % minimum absorbed dose and 100 % absorbed dose for 95 % of volume. Probability levels not specified.
van Herk *et al.* (2002)	PTV	$2.5 + \Sigma + 0.7\sigma + 3$ mm (or more correctly): $\sqrt{2.7^2\Sigma^2 + 1.6^2\sigma^2} - 2.8$ mm	Monte Carlo based test of 1 % TCP loss due to geometrical errors for prostate patients, fitted for various σ and Σ.
Ten Haken *et al.* (1997), Engelsman *et al.* (2001a, 2001b)	PRV (liver and lung)	0	No margin for respiration, but compensation by absorbed-dose escalation to iso-NTCP, reducing target-dose homogeneity constraints.
McKenzie *et al.* (2000)	PRV	A	Margin for respiration on top of other margins when respiration dominates other uncertainties.
van Herk *et al.* (2003)	PRV (lung)	0.25 A (caudally); 0.45 A (cranially)	Margin for (random) respiration combined with random setup error of 3 mm SD, when respiration dominates other uncertainties ($A > 1$ cm).
McKenzie *et al.* (2002)	PRV	$1.3\,\Sigma \pm 0.5\,\sigma$	Margins for small and/or serial organs at risk in low (+) or high (−) absorbed-dose region.

Symbols: Σ, standard deviation of systematic uncertainties; σ, standard deviation of statistical (random) uncertainties; σ_e, describes width of beam penumbra fitted with a Gaussian function; A, peak-to-peak amplitude of respiration.

PTV in practice?

- … Use **coverage probabilities** to derive margins …
- … This idea is limited to effects expressed in terms of physical dose, biological response parameters are not included …
  - Stroom *et al.*: 99% of target volume receives 95% of the prescribed dose or more
  - Van Herk *et al.*: 90% of patients in the population receives a minimum cumulative CTV dose of at least 95 % of the prescribed dose.
- … Not all patients will be treated to 100% of the prescription dose in all fractions!!!

ESTRO School

Margins and the "van Herk recipe"

- A short refreshment on the "philosophy"
  - "**Blur**" the planned dose distribution using ***all execution (random) errors*** (i.e. set-up, inter/intra fraction motion, penumbra, …) to estimate the cumulative dose distribution: **σ**
  - **Shift** the blurred dose with the ***preparation*** error (***systemetic error***): **Σ**
  - Use a probability distribution of preparation errors to compute the fraction of patients that receive a certain dose to the CTV:
  - For a given dose level:
    - Find the region of space where the cumulative dose exceeds the given dose level.
    - Compute the ***probability*** that the CTV is in that region
  - … this gives you the required margin.

$$\mathbf{M}_{ptv} = \alpha\sqrt{(\boldsymbol{\Sigma}^2{}_i + \boldsymbol{\Sigma}^2{}_e)} + \beta\sqrt{(\boldsymbol{\sigma}^2{}_i + \boldsymbol{\sigma}^2{}_e + \boldsymbol{\sigma}^2{}_p)} - \beta\boldsymbol{\sigma}_p, \quad (13)$$

Margins and the “van Herk recipe”

- So, don’t use

Simplified PTV margin recipe for dose - probability

To cover the CTV for 90% of the patients with the 95% isodose (analytical solution) :

PTV margin = 2.5 Σ + 0.7 σ

Σ = quadratic sum of SD of all preparation (systematic) errors
σ = quadratic sum of SD of all execution (random) errors

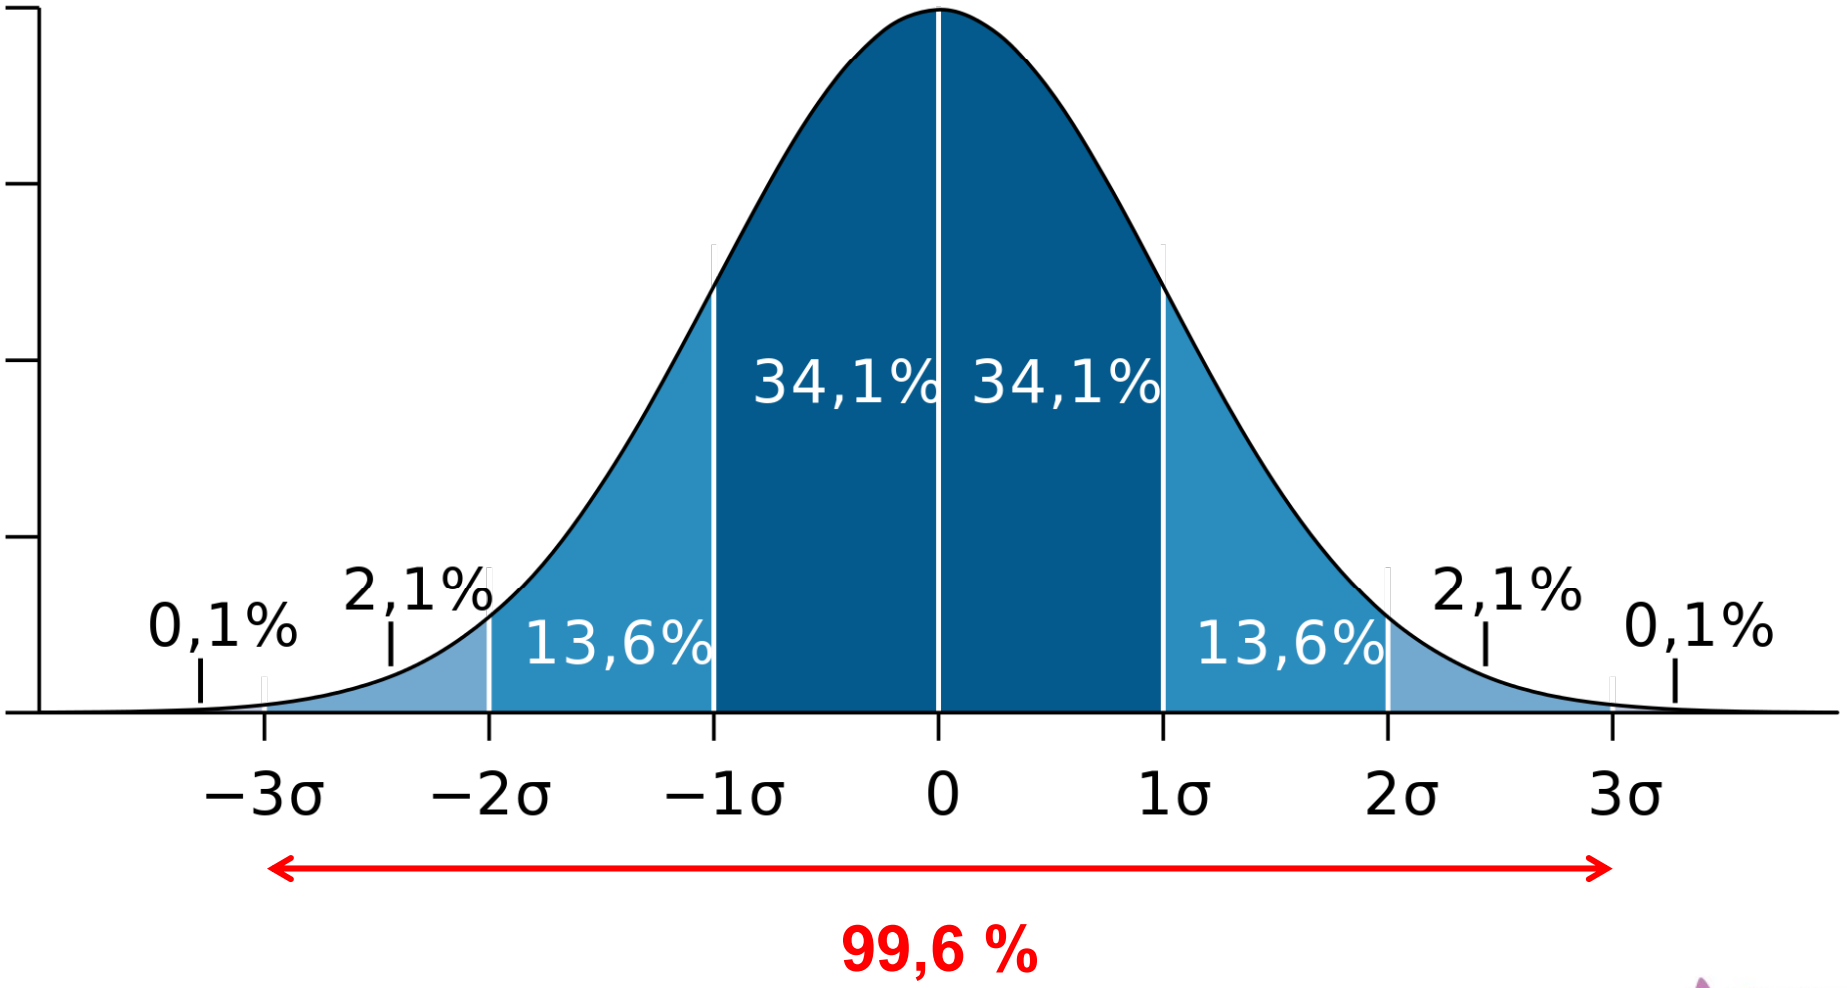
(van Herk et al, IJROBP 47: 1121-1135, 2000)

*For a big CTV with smooth shape, penumbra 5 mm

- Without knowing what it’s about

It’s all about probabilities

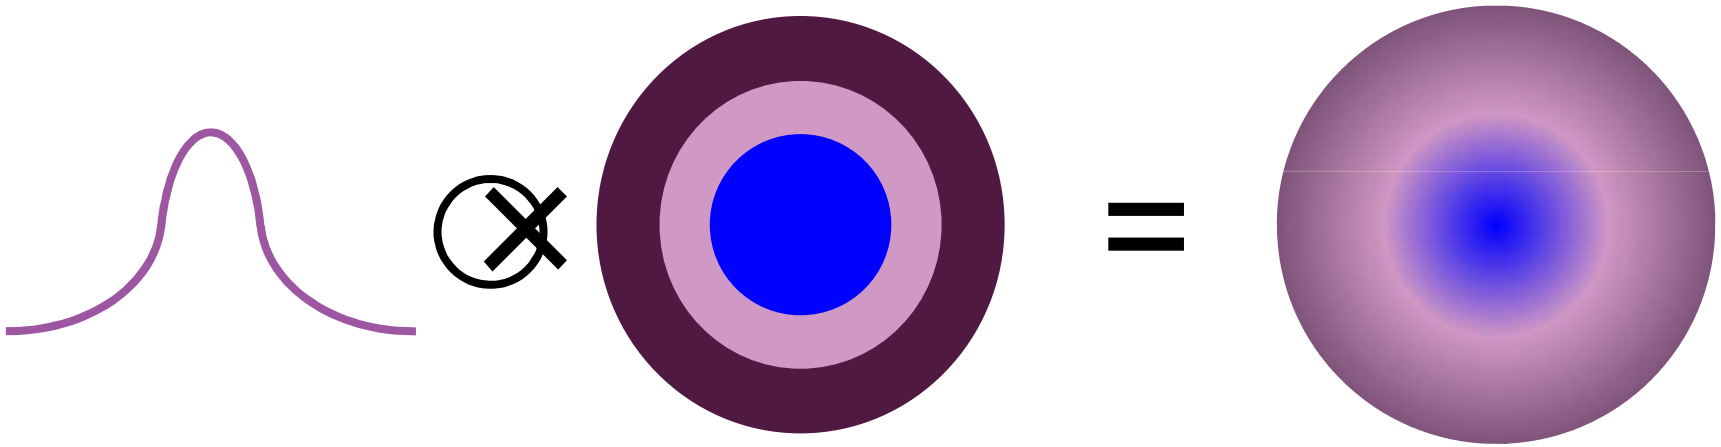
- This idea assumes Normal Distributions!



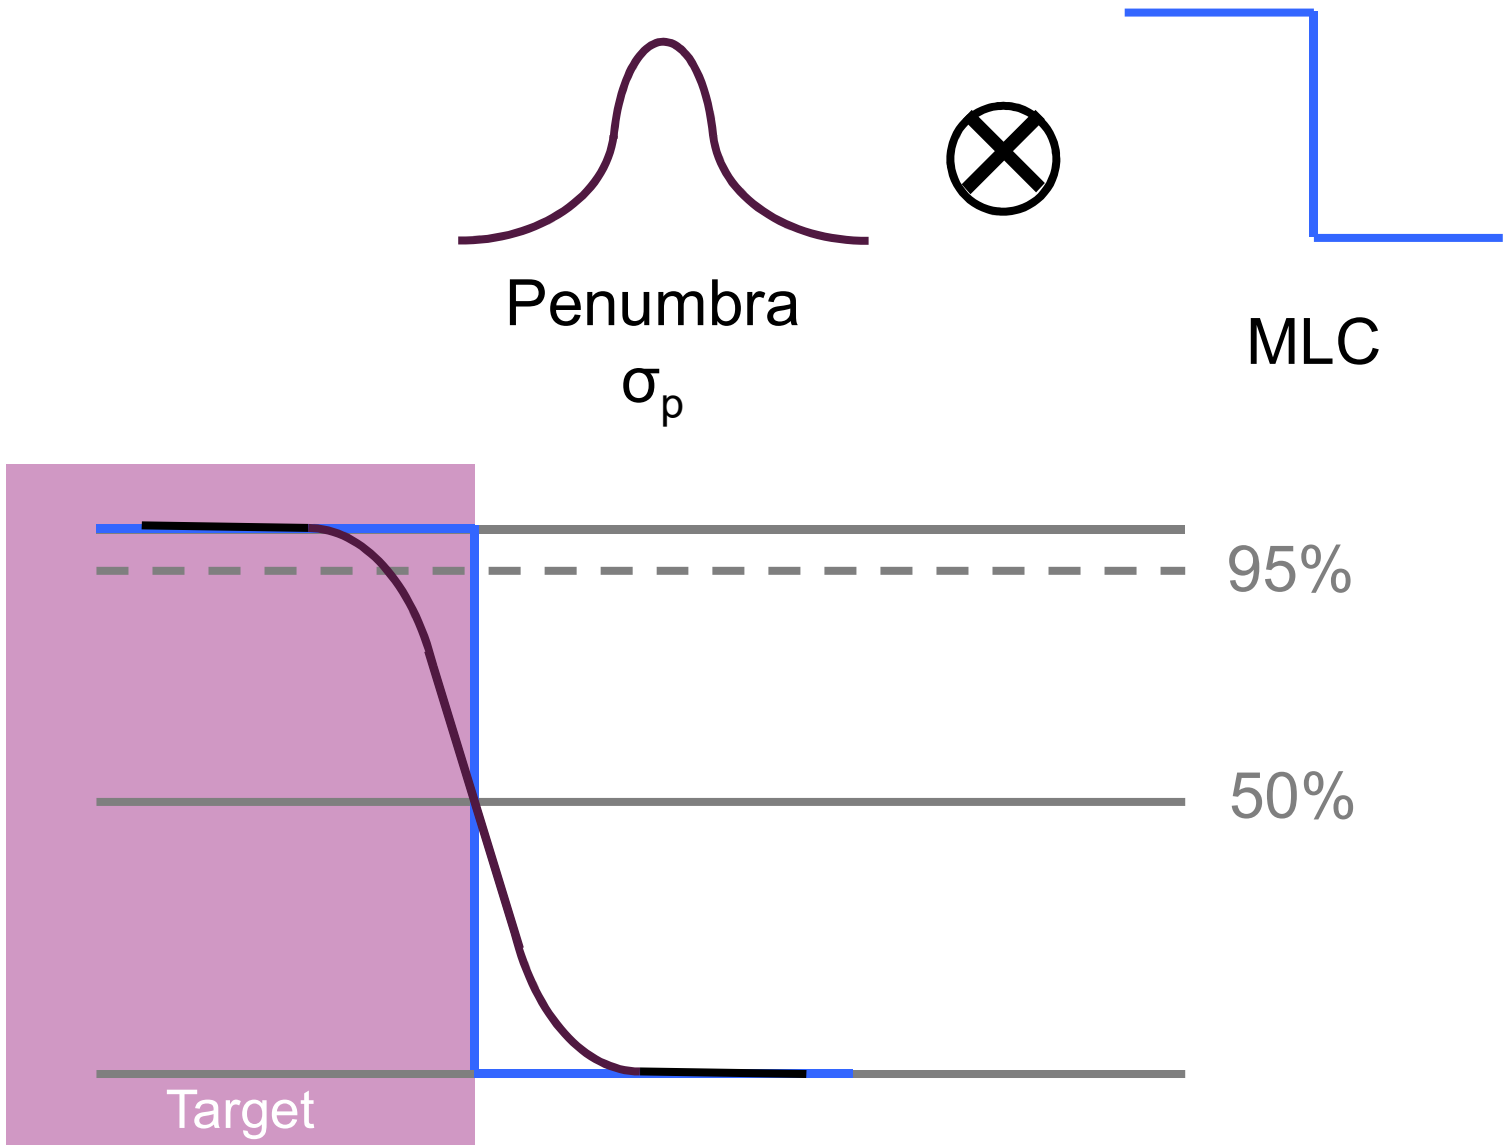
ESTRO School

The “blurring” part: random

- “Daily” random variations in alignment of dose distribution with CTV cause a blurring effect of the delivered dose distribution.
- This blurring can be described by convolving a random distribution (normal) with the planned dose distribution



The “blurring” part: random

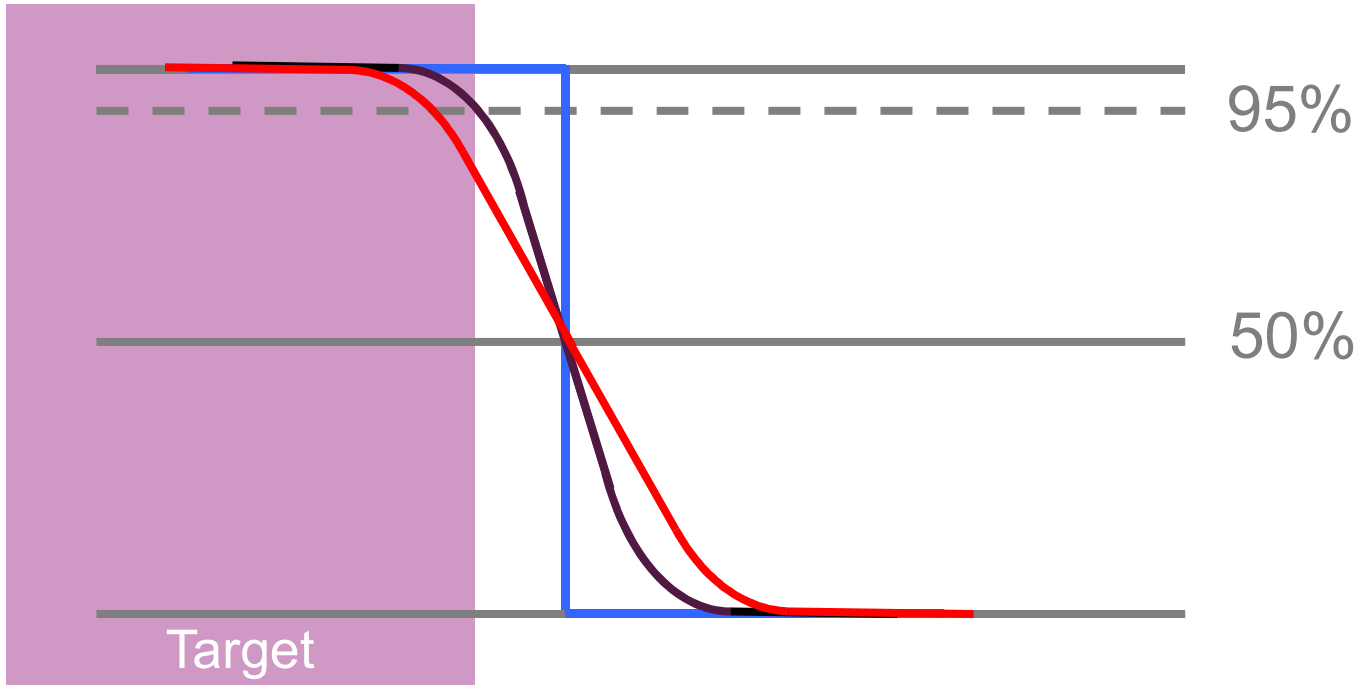


The “blurring” part: random

Random uncertainties
σ

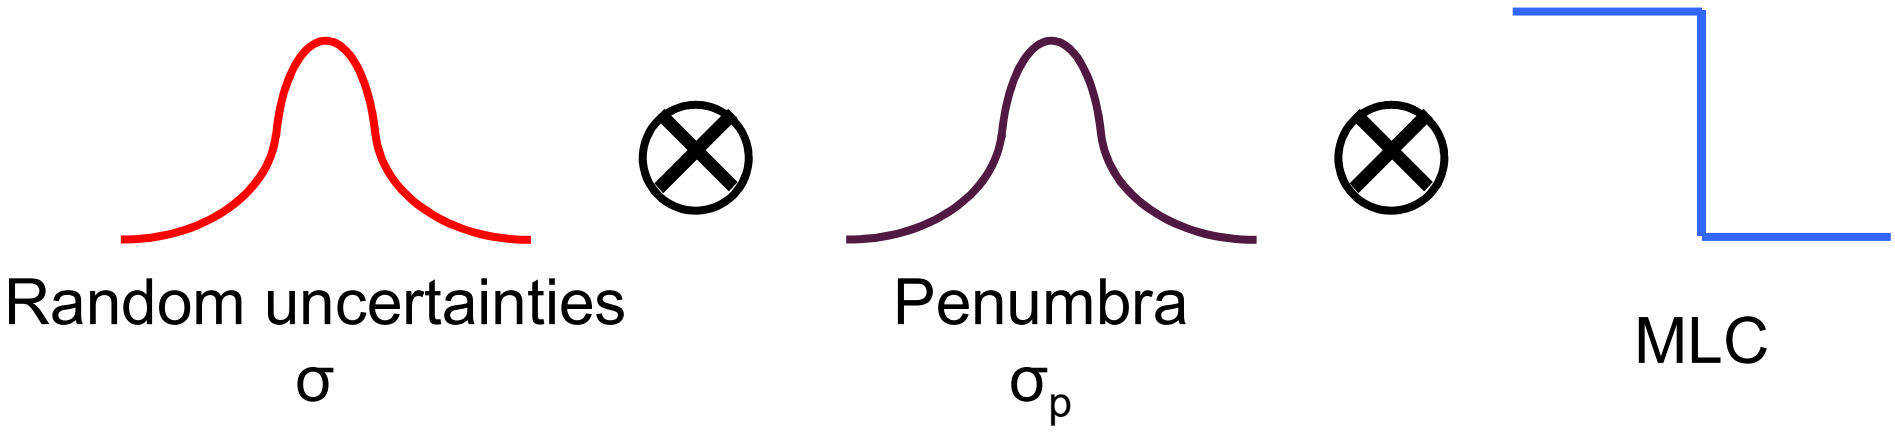
Penumbra
σ_p

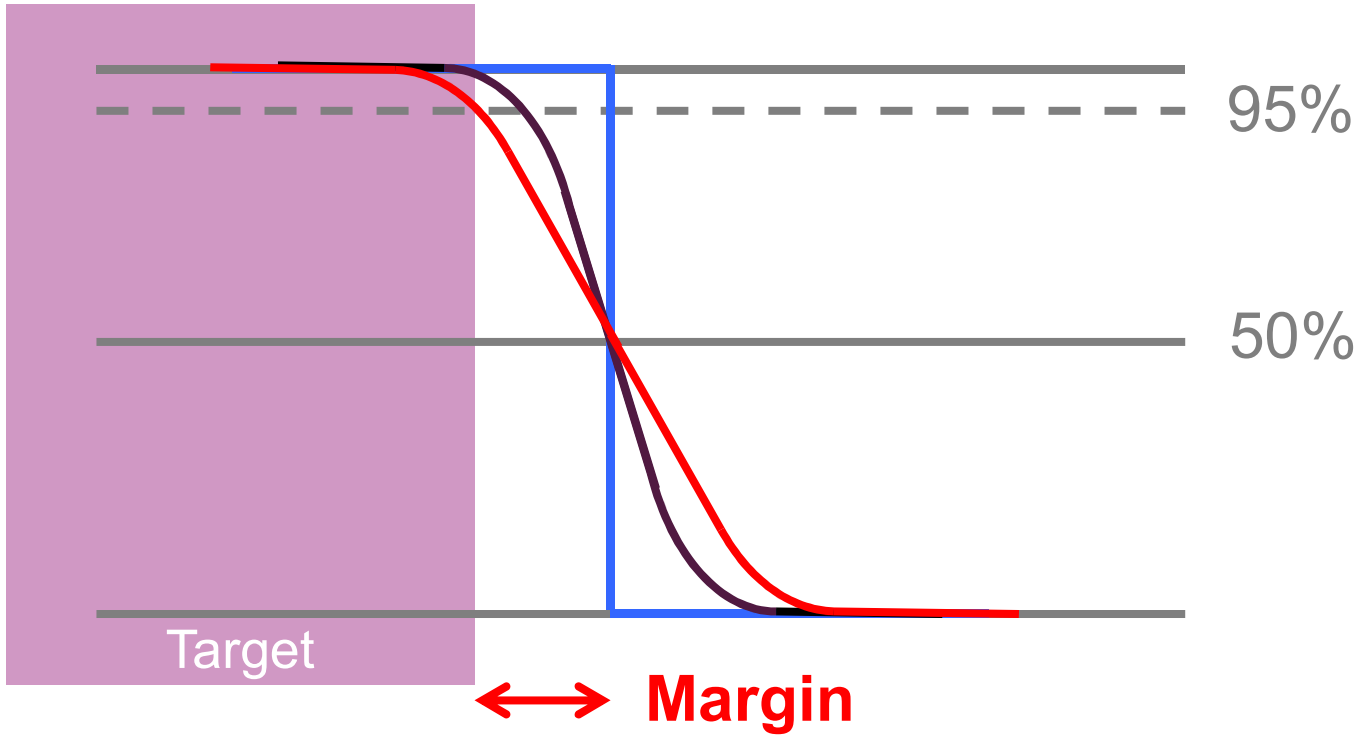
MLC



ESTRO School

The “blurring” part: random



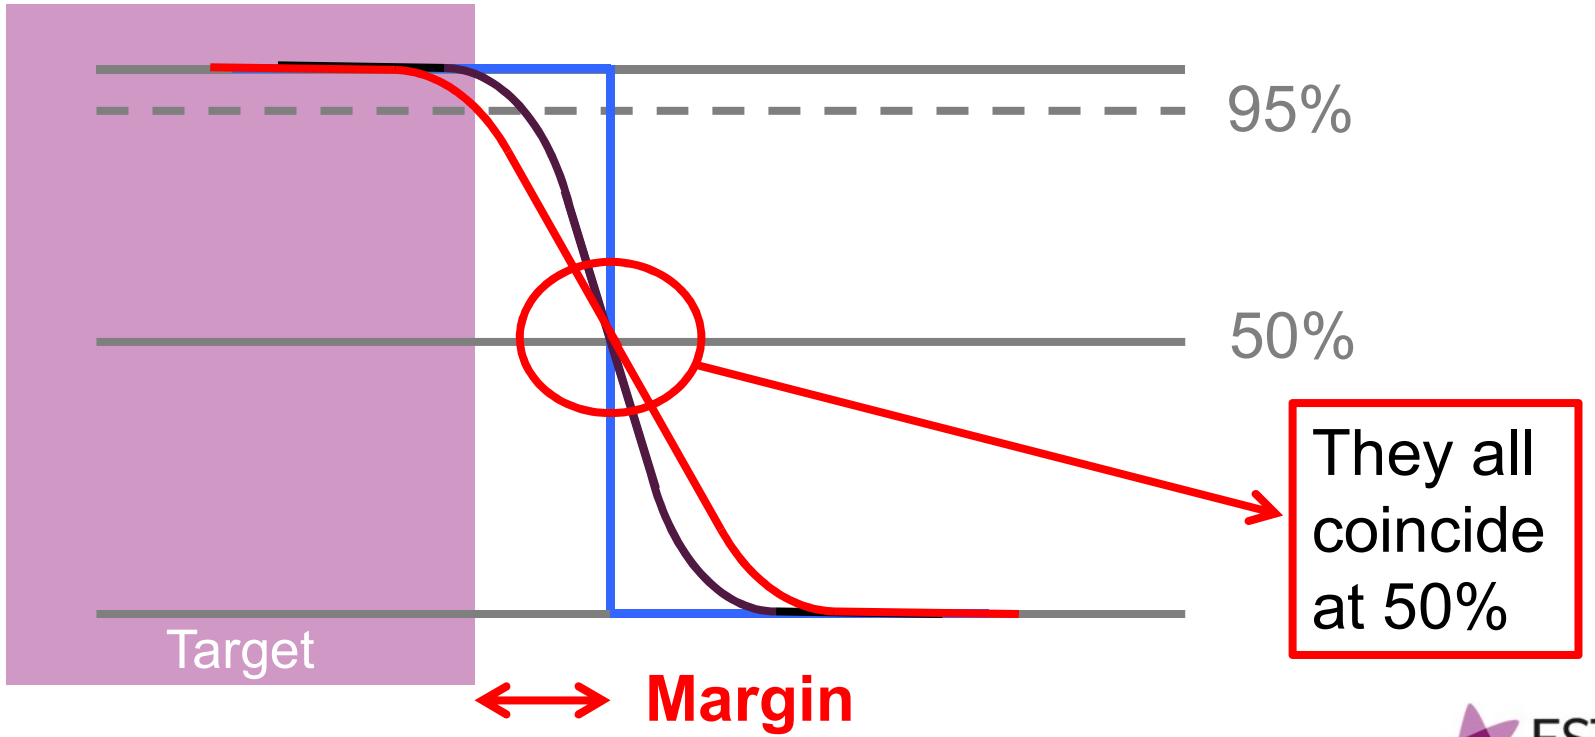


Dose prescription and margins

Random uncertainties
σ

Penumbra
σ_p

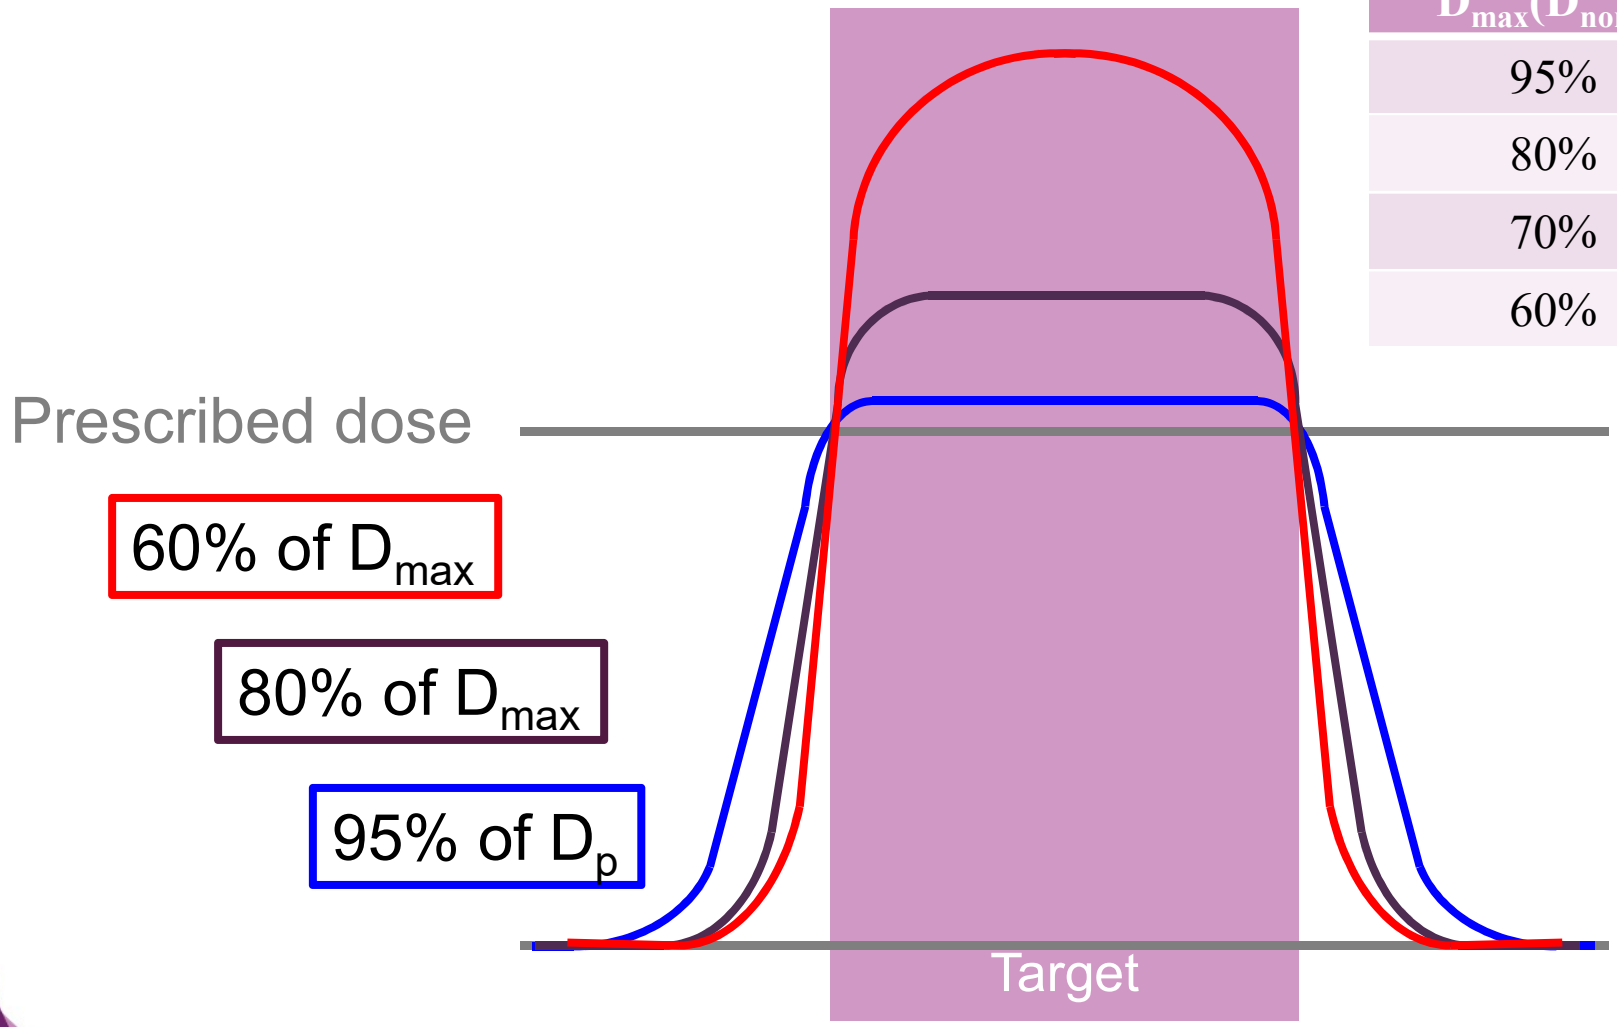
MLC



ESTRO School

Dose prescription and margins

% of $D_{max}(D_{norm})$	β
95%	1.64
80%	0.84
70%	0.52
60%	0.25



The “blurring” part: random

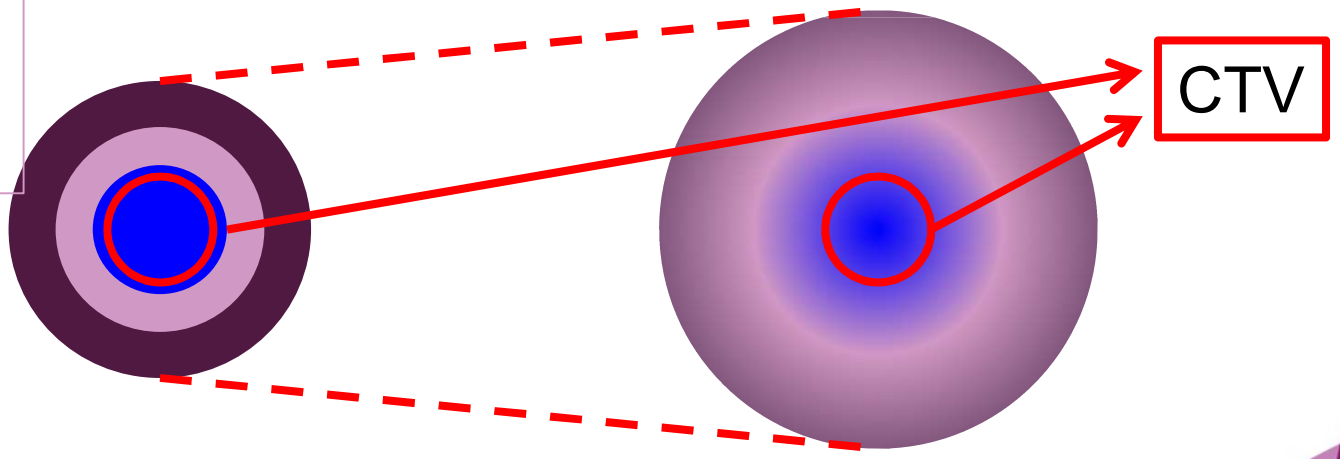
- Cumulative minimum dose to CTV ≥ 95% of prescription dose

	σ_p
Water	3.2
Lung	6.4

$$M_r = \beta\sqrt{\sigma^2 + \sigma_p^2} - \beta\sigma_p$$

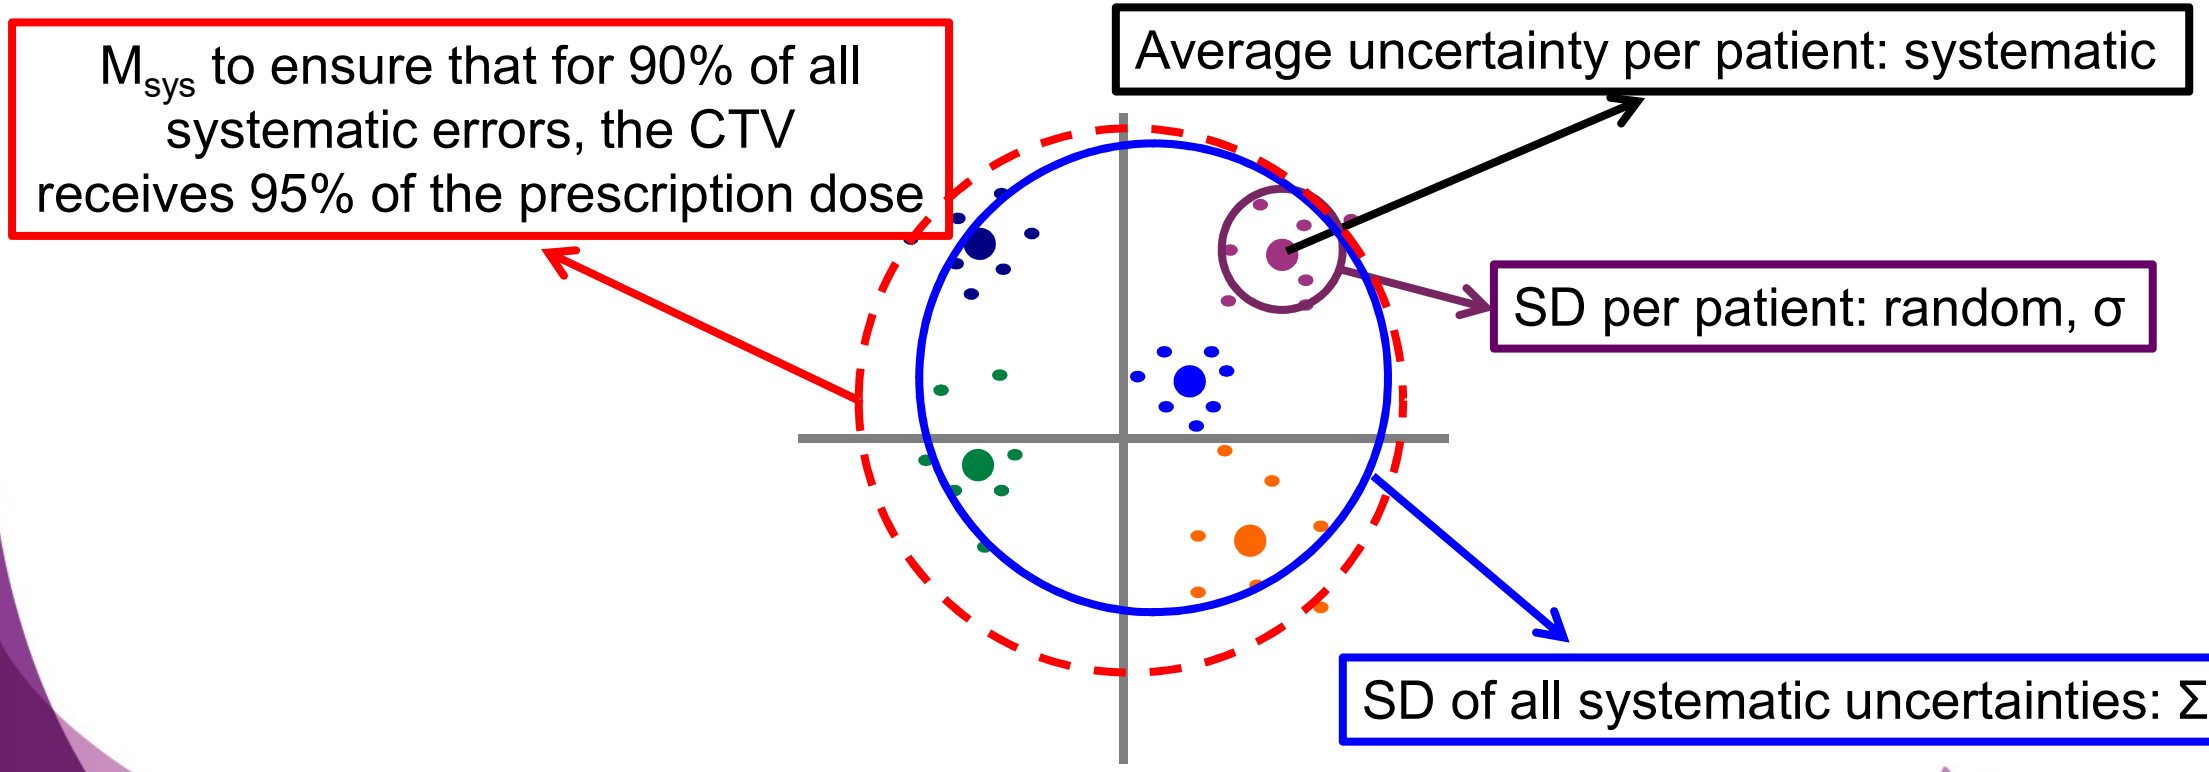
% of D_{norm}	β
95%	1.64
80%	0.84
70%	0.52
60%	0.25

But, what about:
IMRT, VMAT,
Helical TomoTherapy?



The “shift” part: systematic

- Systematic uncertainties (typically preparation errors) cause a **shift** of the (blurred) dose distribution.
- Again, we assume the systematic uncertainties within a certain population of patients to be described by a normal distribution



The “shift” part: systematic

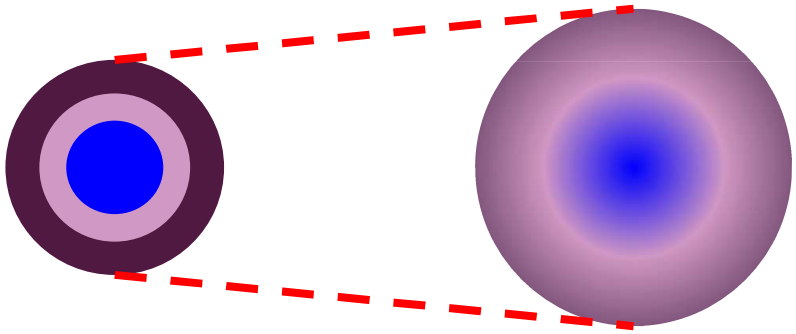
- Assuming a “spherical” target

$$\int_0^{M_{sys}} p(\Sigma)\,dr = 0.9 \quad \Rightarrow \quad M_{sys} = 2.5\Sigma$$

confidence	α
80%	2.16
90%	2.50
95%	2.79
99%	3.36

Margins and the “van Herk recipe”

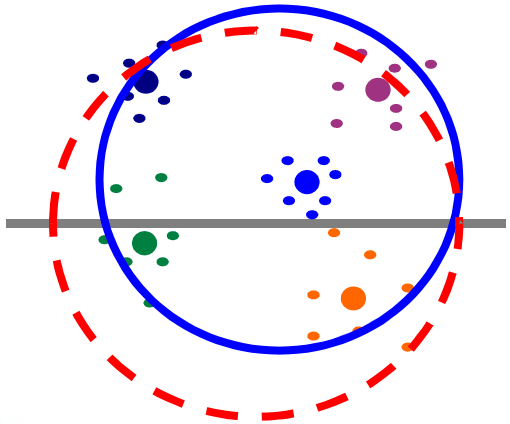
- “Blurring” part: cumulative minimum dose ≥ 95% of D_p



$$M_r = \beta\sqrt{\sigma^2 + \sigma_p^2} - \beta\sigma_p$$

$$\beta = 1.64$$

- “Shifting part: ≥90% of population receives a cumulative CTV dose ≥ 95% of D_p



$$M = \alpha\Sigma + M_r$$

$$\alpha = 2.5$$

Total systematic and random uncertainties

- Why "quadratic sum"?

  - For a simple criterion such as probability level of minimum dose, random and systematic uncertainties could be added linearly.

$$M = M_{sys} + M_r$$

  - For the separate systematic and random uncertainties a **quadratic sum** is required:

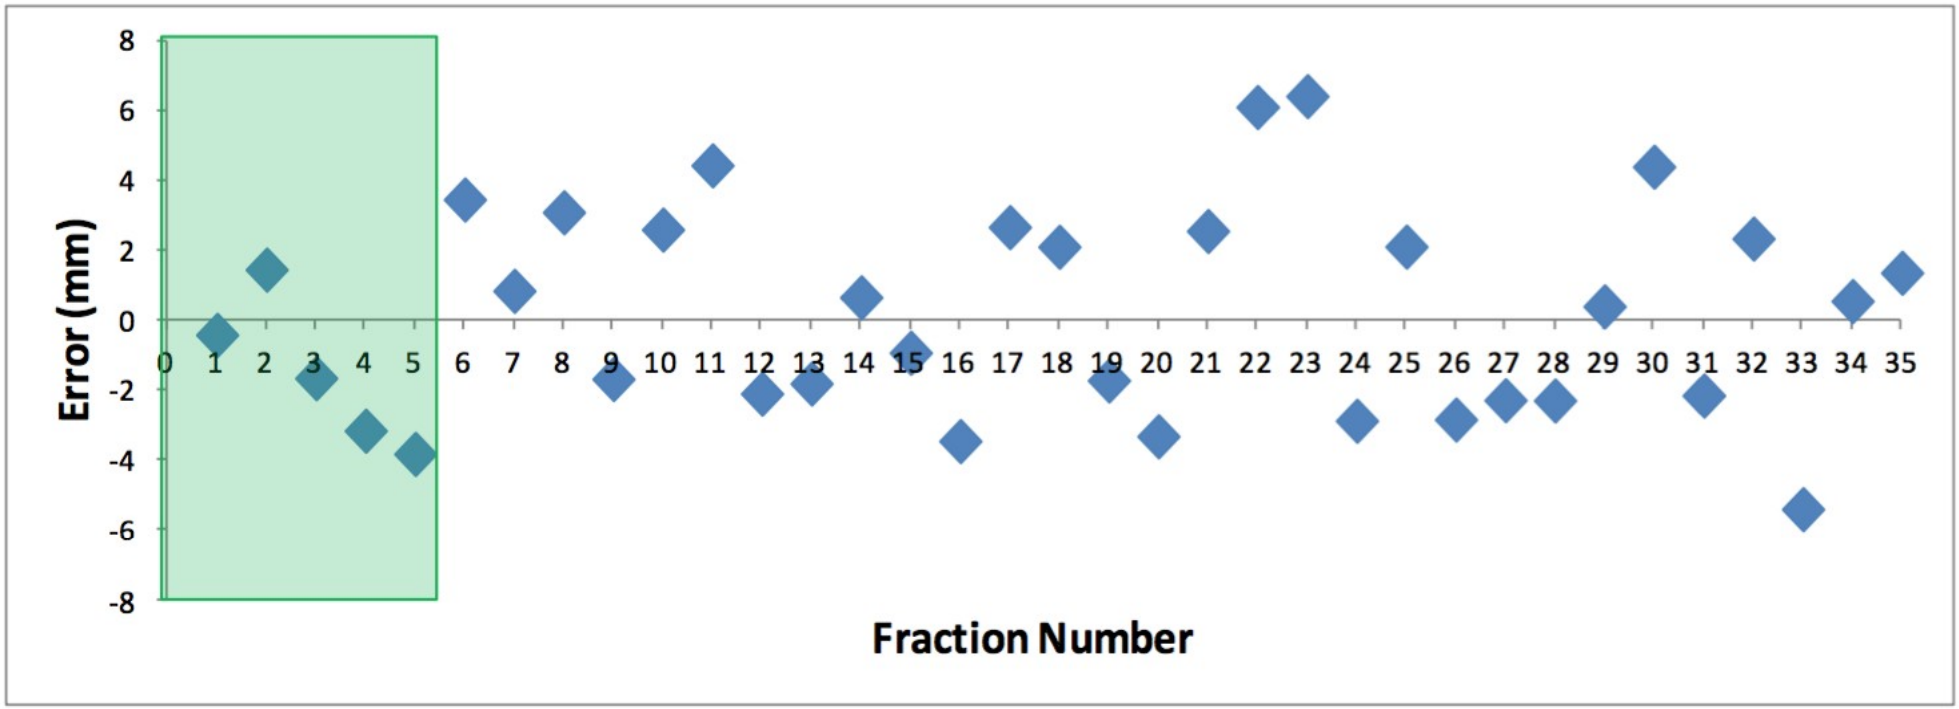
$$\Sigma = \sqrt{\Sigma_a^2 + \Sigma_b^2 + \Sigma_c^2}$$

$$\Sigma = \sqrt{10^2 + 3^2 + 3^2} = 10.9$$

  - **It emphasizes the large uncertainties**!!! (see example)

Margins and number of fractions

- If the number of fractions decreases (eg HYPOFRACTIONATION) the “random” component becomes more “systematic” (ie a “shift”)



- Uncertainty after 35 fractions: 0.1mm
- Uncertainty after 5 fractions: -1.6mm

Margins and number of fractions

- If the number of fractions decreases (eg HYPOFRACTIONATION) the "random" component becomes more "systematic" (ie a "shift")

- Effective systematic uncertainty (shift)

$$\Sigma_{eff} = \sqrt{\Sigma^2 + \frac{1}{N}\sigma^2}$$

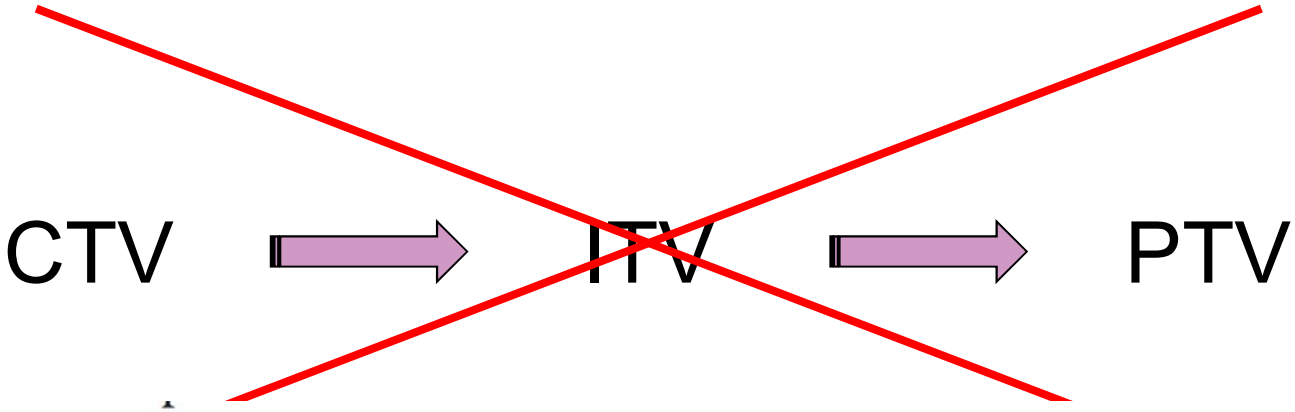
- Effective random uncertainty (blur)

$$\sigma_{eff} = \sqrt{\left(1 - \frac{1}{N}\right)\sigma^2}$$

$N \to 1$

… and motion management

- Based on the previous, it is obvious that



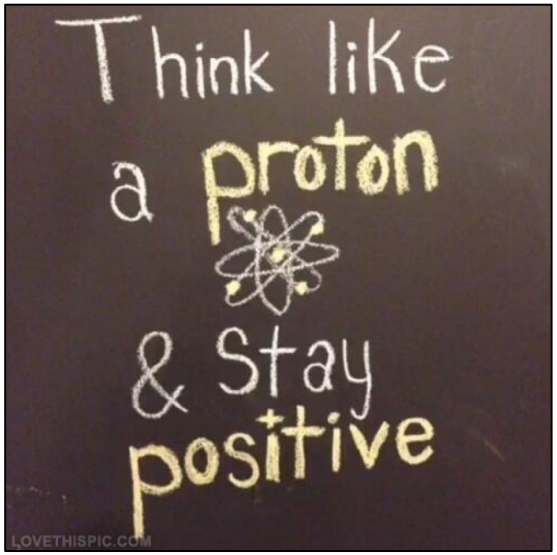
$$\mathbf{M}_{ptv} = \alpha\sqrt{(\boldsymbol{\Sigma}^2{}_i + \boldsymbol{\Sigma}^2{}_e)} + \beta\sqrt{(\boldsymbol{\sigma}^2{}_i + \boldsymbol{\sigma}^2{}_e + \boldsymbol{\sigma}^2{}_p)} - \beta\boldsymbol{\sigma}_p, \quad (13)$$

- For more details: see ESTRO course

  "Clinical Practice & Implementation of Image-Guided Stereotactic Body Radiotherapy"

… and particle therapy

- Don’t even think of using a PTV!!



- Halperin’s rule:
  - Most tumours are radioresistent if you miss them …
  - Proton therapy offers many new and expensive ways of missing the tumour.

Validity of the margin recipe

- Assumes **homogeneous patient population** (identical SD)
- Assumes **many fractions**
- Assumes **spherical symmetry**
  - More or less OK if CTV >> σ
- Assumes **"ideal" conformation**
  - ie preparation errors have the same impact in all directions
- **Rotations and shape variations** have been ignored
- Uncertainties were assumed to be isotropic
  - The concept can be generalized to 3D by separating x, y, and z directions.
- The different sources of uncertainties are assumed to be **statistically independent**
  - As most of the uncertainties are introduces at different stages of the treatment, this assumption seems OK
- And again: **normal probability distributions** are assumed.

PTV in practice: oesophagus

- In this exercise we will work out the antero-posterior margin only, the latero-lateral and cranio-caudal margins can be deduced in a similar way.
- 3D (isotropic) margins assume a ball rolling along the 3D CTV … sounds easier than it is.

- **As this is an example based on a particular patient population using a particular IGRT workflow, this data is NOT TO BE USED in an other setting**.

PTV margin (mm)	

Delineation

- Again, ideally an intra-observer study should be performed in combination with MRI and pathology data to assess the treatment volumes.
- In this exercise we will start with a conservative systematic "guestimate" of 4mm.

- Food for thought:
  - The well cited paper from Steenbakkers *et al.* comparing delineation in lung without and with help from PET:
  - Observer variations (1 SD) without PET 10 mm, with PET … 4 mm!!

Van de Steene *et al.* Radiother Oncol 2002

When to Image for surveillance

Questions:

- When to perform surveillance imaging?
  - Perform routine / Wait until symptomatic?
- Where is recurrence likely to occur ?
  - Locoregional / distant sites?

Esophageal Cancer Recurrence Patterns and Implications for Surveillance

Feiran Lou, MD, MS, Camelia S. Sima, MD, MS, Prasad S. Adusumilli, MD, Manjit S. Bains, MD, Inderpal S. Sarkaria, MD, Valerie W. Rusch, MD, and **Nabil P. Rizk, MD, MS**
Thoracic Service, Department of Surgery, Memorial Sloan-Kettering Cancer Center, New York, NY

J Thorac Oncol. 2013 8(12):1558-1562

When to Image for surveillance

>1000 patients, retrospective review

Clinical review & CT every 4-6 months for 2 years; CT annually after

Endoscopy every 6 months for 2 years then annually

- Distant failure more common than locoregional
- 75% recurrences occurred within the first 2 years
- 50% patients were asymptomatic at time of diagnosis of relapse
- CT detected 45% of all recurrences
- Endoscopy only identified 65% symptomatic & 15% asymptomatic patients
- Symptomatic patients had worse prognosis

J Thorac Oncol. 2013 8(12):1558-1562

Locoregional relapse

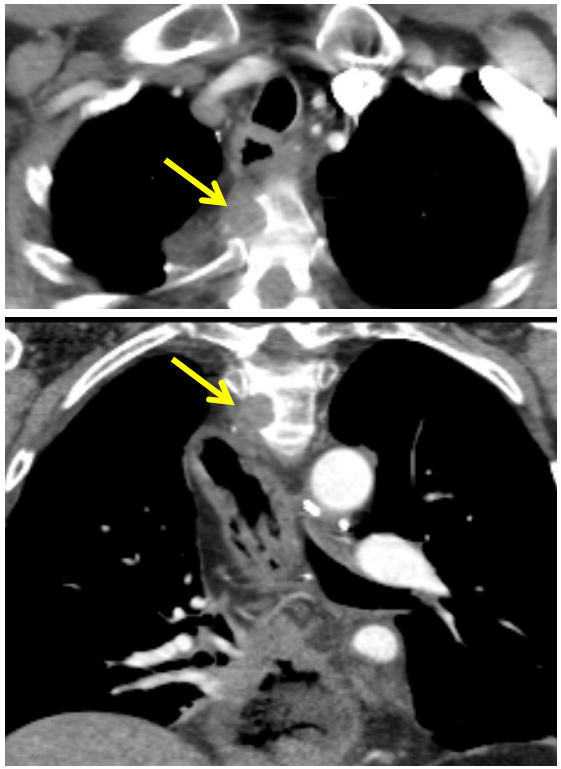
74 year old male patient underwent Ivor Lewis oesophagectomy following perioperative chemotherapy. 1 year post op he developed back pain.

30.05.2014

Baseline

08.10.2014



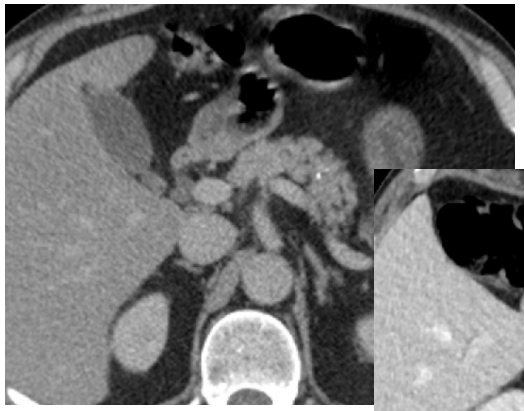
Bone involvement due to direct extension from LRR, not haematogenous spread

ESTRO School

Local & distant spread

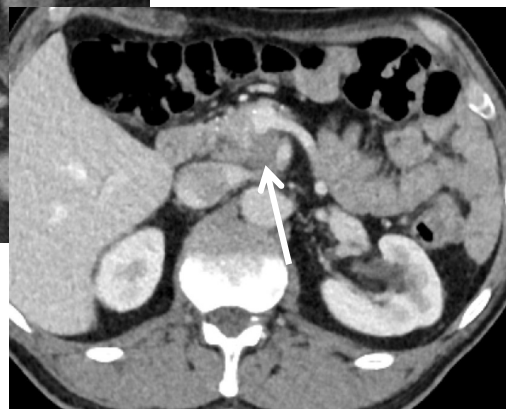
60 year old male patient. Underwent preoperative ECX x4 followed by surgery for pT3N2M0 R0 TRG4 GOJ tumour. Post op he had 54Gy in 30♯ completed Feb 2015. Presented with rectal bleeding

10.02.2014



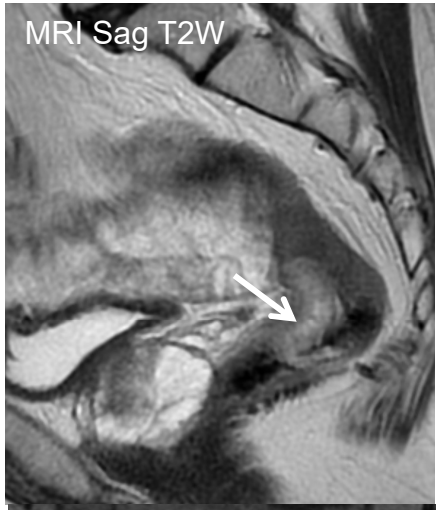
Baseline

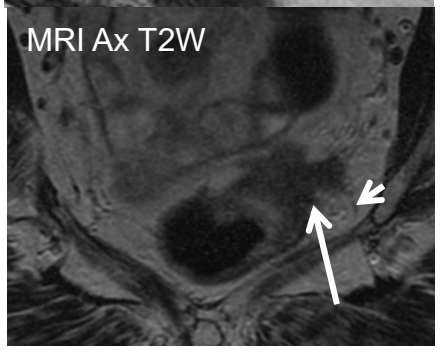
13.04.2016



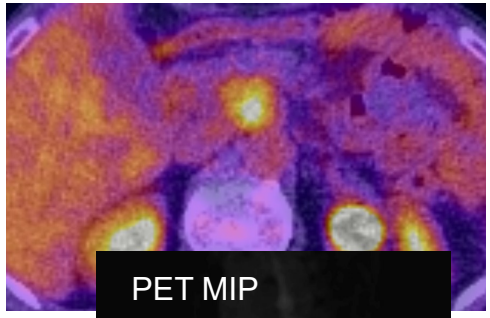
SMA Nodal relapse

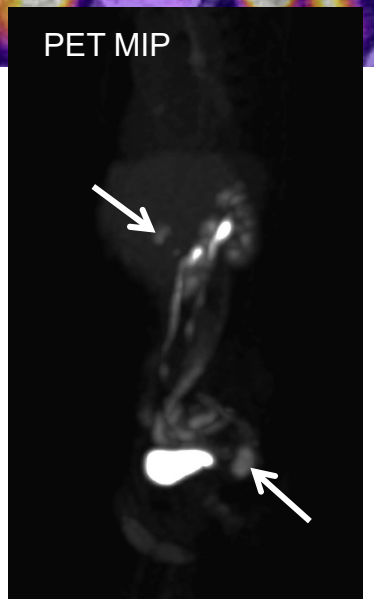
13.04.2016





24.05.2016





Biopsy showed adenocarcinoma with immunohistochemistry profile consistent with an oesophageal primary similar to original primary

ESTRO School

Summary

- Recurrence occurs within 2 years of definitive therapy.
- Distant failure is more common than locoregional recurrence
- MDCT will identify a majority of relapse; PET-CT should be considered if conventional CT is negative.
- Patients who are asymptomatic at time of relapse have better prognosis – therefore imaging surveillance is recommended

CRT and CT	40.4	34.2	not applicable	0.49 (0.23–1.05)

EBRT: external beam radiotherapy; BRT: brachytherapy; CRT: chemoradiotherapy; CT: chemotherapy.

Bernards et al. Acta Oncol 2016

- *Median survival of M+ EC improved from 18 (1994-1998) to 25 wks (2009-2013)*
- *Contributing factors: major changes in treatment strategies and better pt selection*

Introduction

- More than 50% of patients have inoperable disease at presentation
- Around 35% of patients with EC present with metastatic disease
- These patients have an extremely poor prognosis:
  - 1-yr survival rate 18%
  - Median survival 3-5 months
- In 80-90% of LA-EC dysphagia is predominant symptom
- There are different modalities to achieve adequate locoregional palliation:
  - EBRT
  - Brachytherapy
  - Chemoradiotherapy
  - Chemotherapy
  - Endoscopic stent placement
- There is no consensus on which regimen should be used in first line

Introduction

Adequate local/locoregional palliation should be:

- Delivered in short treatment time
- Fast
- Effective (dysphagia, pain, QOL)
- Sustained
- Well-tolerated
- Cost-effective

Brachy vs. stent

Single-dose brachytherapy versus metal stent placement for the palliation of dysphagia from oesophageal cancer: multicentre randomised trial

Brachy vs. stent

Stent placement or brachytherapy for palliation of dysphagia from esophageal cancer: a prognostic model to guide treatment selection (CME)

Volume 62, No. 3 : 2005 GASTROINTESTINAL ENDOSCOPY

Ewout W. Steyerberg, PhD, Marjolein Y. V. Homs, PhD, Annemieke Stokvis, BSc, Marie-Louise Essink-Bot, MD, PhD, Peter D. Siersema, MD, PhD, for the SIREC Study Group

Rotterdam, The Netherlands

Capsule Summary

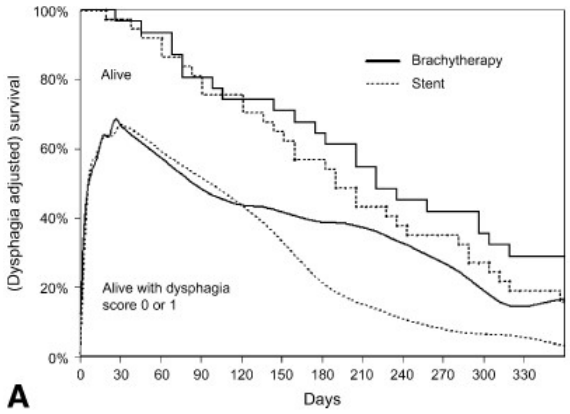
What is already known on this topic

- Single-dose brachytherapy is preferable to stent placement in patients with dysphagia due to inoperable cancer of the esophagus or GE junction.
- Stent placement may be reserved for dysphagic patients with short life expectancy or with persistent or recurrent tumor growth after brachytherapy.

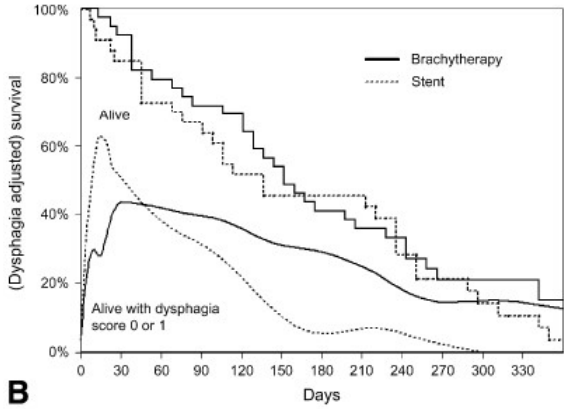
What this study adds to our knowledge

- In a regression analysis model of patients' data from a multi-center, randomized, controlled trial and a consecutive series, a simple prognostic score could identify patients in whom stent placement would be at least equivalent to brachytherapy.

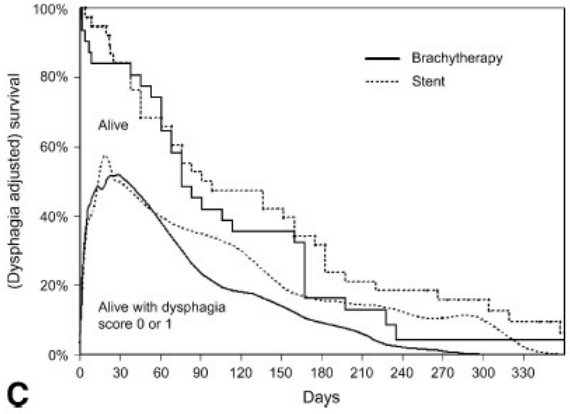
Brachy vs. stent



Good prognosis score <3.5



Intermediate prognosis score 3.5-5



Poor prognosis score >5

Primary endpoint: TTP of patient-reported dysphagia

Adamson et al. Trials 2014

Integrated pilot phase aims: that at least 70% of patients referred for SEMS are eligible for the study and that at least 50% consent to randomisation

ESTRO School

Summary

Use of brachytherapy and EBRT as palliative strategy in esophageal cancer

NKI 2007 - 2016 (n=335)

Treatment modality	N (%)
Brachytherapy	**67 (20)**
EBRT	**268 (80)**
13x3 Gy	153 (57)
10x3 Gy	81 (30)
5x4 Gy	19 (7)
4x6 Gy	2 (<1)
Not finished	13 (5)

Summary

- There are different strategies to alleviate dysphagia in LA-EC
- There is no consensus on the optimal intervention
- Systematic comparisons of different modalities are rare
- Chemotherapy can provide palliation, improve QOL and prolong OS
- Chemoradiotherapy is more effective than radiotherapy in terms of locoregional control
- Clinical benefit from chemotherapy, chemoradiotherapy and EBRT is slow in onset, and most patients are unfit

Summary

- More rapid relief of dysphagia can be obtained by SEMS or brachy
- SEMS improve dysphagia more rapidly than brachy
- Brachy (fractionated and single dose) effect is more sustained, less toxic and associated with better QOL than SEMS
- Adding EBRT to SEMS or brachy may improve/prolong dysphagia relief, but is intensive and associated with significant toxicity
- EBRT provides durable and effective relief of dysphagia, but reaches optimal effect up to 6 weeks after treatment

Summary

The regimen of choice depends on patient-, disease- and treatment-related factors:

- Chemoradiotherapy could be considered for patients in good condition, with a relatively good prognosis and oligometastatic disease
- Chemotherapy could be considered for patients in relatively good condition, with a life expectancy >6 months and metastatic disease
- EBRT is recommended for patients with a life expectancy between three and six months, when there is no need for immediate relief
- Brachytherapy is recommended for patients with a life expectancy between three and six months, where EBRT would take too long
- In patients with a shorter life expectancy or those with severe dysphagia/stenosing tumor, endoscopic stent placement is preferred, which offers instant relief of symptoms

Management of advanced/metastatic disease

Patients with metastatic oesophageal cancer can be considered for different options of palliative treatment depending on the clinical situation. Single-dose brachytherapy may be a preferred option even after external RT, since it provides better long-term relief of dysphagia with fewer complications than metal stent placement [I, B].

Chemotherapy is indicated for palliative treatment in selected patients, particularly for patients with AC who have a good PS [III, B].

In squamous cell oesophageal cancer, the value of palliative combination chemotherapy is less proved. Therefore, BSC or palliative monotherapy should also be considered [II, B].

Integrated genomic characterization of oesophageal carcinoma

The Cancer Genome Atlas Research Network*

Oesophageal cancers are prominent worldwide; however, there are few targeted therapies and survival rates for these cancers remain dismal. Here we performed a comprehensive molecular analysis of 164 carcinomas of the oesophagus derived from Western and Eastern populations. Beyond known histopathological and epidemiologic distinctions, molecular features differentiated oesophageal squamous cell carcinomas from oesophageal adenocarcinomas. Oesophageal squamous cell carcinomas resembled squamous carcinomas of other organs more than they did oesophageal adenocarcinomas. Our analyses identified three molecular subclasses of oesophageal squamous cell carcinomas, but none showed evidence for an aetiological role of human papillomavirus. Squamous cell carcinomas showed frequent genomic amplifications of *CCND1* and *SOX2* and/or *TP63*, whereas *ERBB2*, *VEGFA* and *GATA4* and *GATA6* were more commonly amplified in adenocarcinomas. Oesophageal adenocarcinomas strongly resembled the chromosomally unstable variant of gastric adenocarcinoma, suggesting that these cancers could be considered a single disease entity. However, some molecular features, including DNA hypermethylation, occurred disproportionally in oesophageal adenocarcinomas. These data provide a framework to facilitate more rational categorization of these tumours and a foundation for new therapies.

Welcome

Dear Participants of the International Gastric Cancer Congress 2019,

With great pleasure we announce the **2019 International Gastric Cancer Congress to be held in Prague**. Gastric Cancer continues to be a major health problem in Europe, in the Asian-Pacific Region, in America, Middle East and Africa. From a worldwide perspective, almost 1 Mio patients are diagnosed with gastric cancer / year and 750.000 die from this aggressive cancer.

New perspectives in esophageal cancers

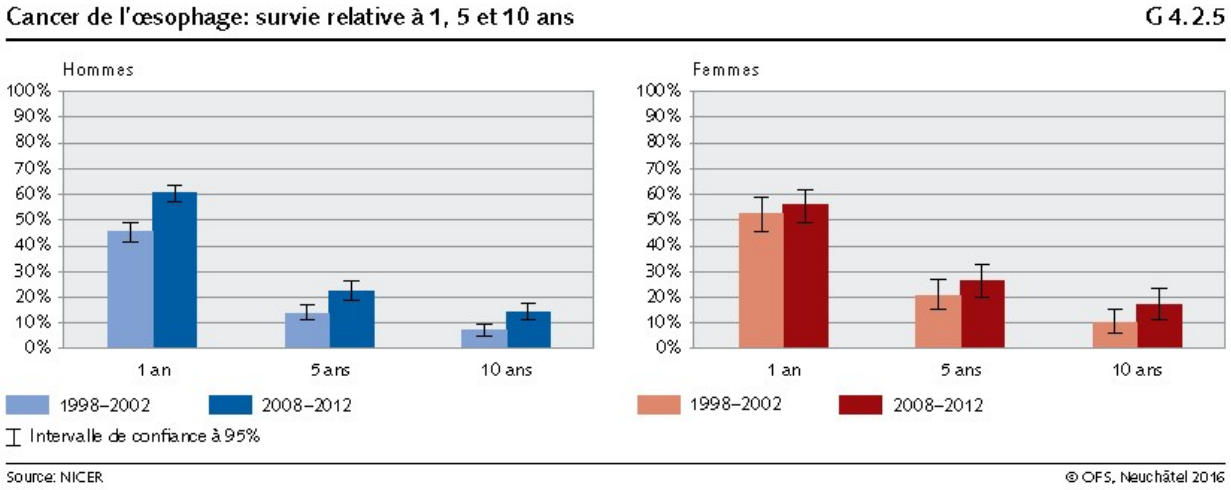
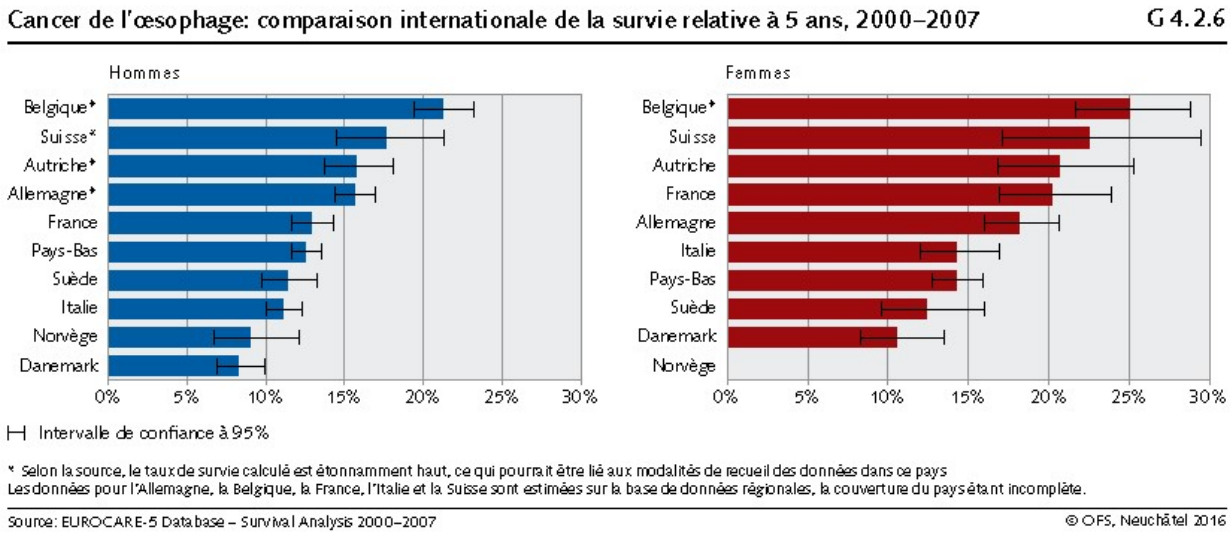
Survival

5-year survival rates of 12–20% in Western populations





Historical Perspective

For over a century, ***surgical resection***:
key modality for the treatment of EC

But ***outcomes*** with surgery were ***poor***

- High rates of postoperative complications
- High local and distant failure

Taylor, H. Oesophageal carcinoma treated by resection and presternal oesophago-gastrostomy. Proc. R. Soc. Med. 1947, 40, 465–466

Garlock, J.H. Progress in the Treatment of Carcinoma of the Oesophagus and Upper Stomach. Ann. R. Coll. Surg. Engl. 1948, 2, 183–188.

Garlock, J.H. Progress in the Treatment of Carcinoma of the Oesophagus and Upper Stomach. Surgery 1948, 23, 906–911.

Earlam, R.; Cunha-Melo, J.R. Oesophageal squamous cell carcinoma: I. A critical review of surgery. Br. J. Surg.1980, 67, 381–390.

Historical Perspective (2)

Improve local control (LC) after surgery ➔ ***postoperative radiotherapy***:

- improved LC
- patterns of failure shifted towards distant metastasis

- local failures were still not uncommon

The rise of radiosensitizing chemotherapy revolutionized care for EC

Scheel, A. The results of radiation treatment of esophageal cancer at Det Norske Radiumhospital. Acta Chir. Scand. **1952**, 103, 425–429.

N, sample size; RT, radiation therapy; L(R)R, loco(regional) recurrence; DM, distant metastasis; OS, overall survival; 5FU, 5-fluorouracil; GyE, Gray-equivalent; GI, gastrointestinal.

MD Anderson: 47% post-CRT resection

➔ pCR 28%
➔ Postoperative wound complication 3%, cardiac complication 8%, pulmonary complication 7%
➔ 3 year OS 52%.

ESTRO School

Prospective trials and PBT

- Phase II trial being conducted at Loma Linda Medical Center: evaluate outcomes in a targeted population of 38 resectable patients undergoing carboplatin/paclitaxel and PBT

  (NCT01684904)

- Randomized phase IIB trial by MD Anderson is targeting 180 patients to compare chemo-PBT versus chemo-IMRT

  (NCT01512589)

Targeted therapies?

EGFR:

The SCOPE1 trial: addition of cetuximab to standard chemoradiation for localized esophageal cancers

Stop before phase 3 chemoradiation plus cetuximab ➔ shorter median OS and more grade 3 and 4 toxicities

Crosby T, Hurt CN, Falk S, Gollins S, Mukherjee S, Staffurth J, et al. Chemoradiotherapy with or without cetuximab in patients with oesophageal cancer (SCOPE1): A multicentre, phase 2/3 randomised trial. Lancet Oncol. 2013;14(7):627–37

HER2:

Overexpressed in gastric & GEJ tumor ➔ Positive TOGA trial

➔ RTOG 1010 ongoing

VEGF:

AVAGAST trial randomized inoperable locally advanced or metastatic gastric or GEJ adenocarcinomas to bevacizumab or placebo with capecitabine and cisplatin

➔Survival did not reach statistical significance

Shen L, Li J, Xu J, Pan H, Dai G, Qin S, et al. Bevacizumab plus capecitabine and cisplatin in chinese patients with inoperable locallyadvanced or metastatic gastric or gastroesophageal junction cancer: Randomized, double-blind, phase III study (AVATAR study). Gastric Cancer. 2015;18(1):168–76

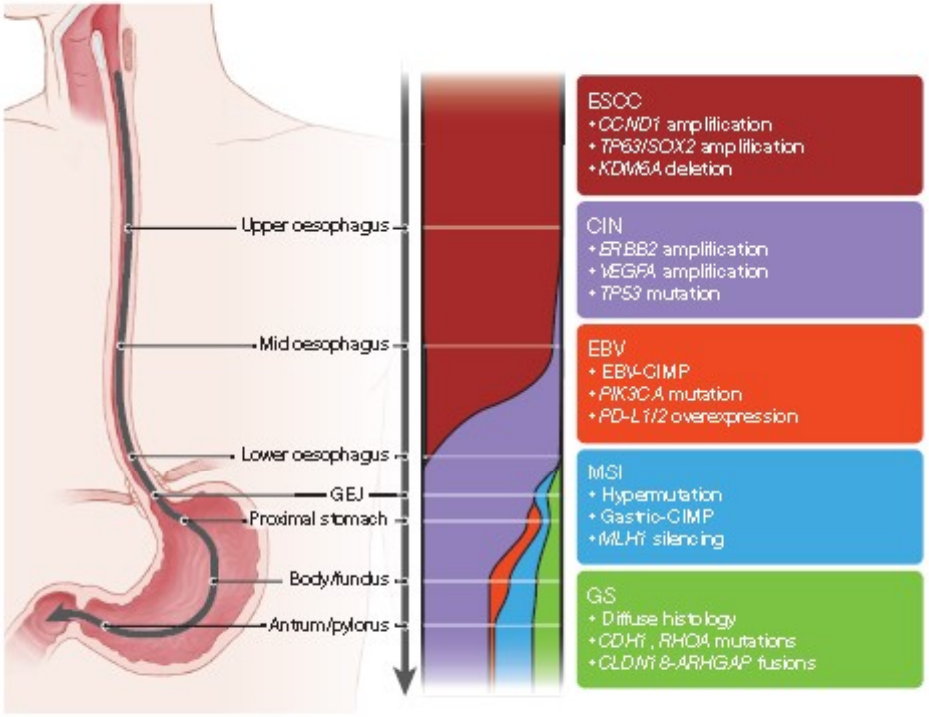

Figure 6 | Gradations of molecular subclasses of gastroesophageal carcinoma. Schematic representing shifting proportion of subtypes of gastroesophageal carcinoma from the proximal oesophagus to the distal stomach. The widths of the colour bands represent the proportion of the subtypes present within anatomic regions. Key features of subtypes are indicated in associated text.

Ongoing trials:

Other avenues currently being explored:

- immune checkpoint inhibitors:
  PD-L1 and PD-1 (pembrolizumab and nivolumab)
- c-MET
- heat shock protein
- Hedgehog pathways.
- …

Post-induction therapy FDG PET

clinically useful in the selection of subsequent therapy?:

➔identify CR ➔ avoid surgery

Outcomes of patients with esophageal cancer staged with [^{18}F]fluorodeoxyglucose positron emission tomography (FDG-PET): can postchemoradiotherapy FDG-PET predict the utility of resection? Monjazeb AM, Riedlinger G, Aklilu M, Geisinger KR, Mishra G, Isom S, Clark P, Levine EA, Blackstock. J Clin Oncol. 2010;28(31):4714

But: not confirmed in

Utility of (18)F-FDG PET for Predicting Histopathologic Response in Esophageal Carcinoma following Chemoradiation. Arnett AL, Merrell KW, Macintosh EM, James SE, Nathan MA, Shen KR, Ravi K, Neben Wittich MA, Haddock MG, Hallemeier. J Thorac Oncol. 2017 Jan;12(1):121-128

➔Identify non responders:

MUNICON study:metabolic responders had a significantly better prognosis than did non responders

PET to assess early metabolic response and to guide treatment of adenocarcinoma of the oesophagogastric junction: the MUNICON phase II trial.AULordick F, Ott K, Krause BJ, Weber WA, Becker K, Stein HJ, Lorenzen S, Schuster T, Wieder H, Herrmann K, Bredenkamp R, Höfler H, Fink U, Peschel C, Schwaiger M, Siewert JR SOLancet Oncol. 2007;8(9):797

Metabolic response?

Munich II study

ESTRO School

Ongoing trial

CALGB 80803, NCT01333033

Post-induction chemotherapy PET

➔ choice of the chemotherapy regimen during subsequent chemoradiotherapy followed by surgery

Preliminary report presented at the 2017 ASCO GI Cancers Symposium

- PET non responders who crossed over to an alternative chemotherapy regimen had a higher pathologic complete response (CR) rate than did those who continued the same regimen

Goodman KA, Niedzwiecki D, Hall N, et al. Initial results of CALGB 80803 (Alliance): A randomized phase II trial of PET scan-directed combined modality therapy for esophageal cancer (abstract). J Clin Oncol 35, 2017 (suppl 4S; abstract 1)

RT Dose escalation?

- CAVE Minsky !

- ART-DECO ongoing

  - Inoperable carcinoma

  - Radio-chemotherapy (50.4 Gy) + weekly carbo/paclitaxel
  - SIB (61.6 Gy GTV tumor) + weekly carbo/paclitaxel

Conclusion:
Perspectives in esophageal cancers

- RT:
  - dose (escalation? Differentiation?)
  - volumes (need for universal guidelines ➔ TCP/NTCP)
  - Delivery & IGRT

- Differentiation:
  - oesophagus/GEJ/gastric
  - histologic
  - molecular differentiation

- Oncological strategy & response assessment
  - de-escalate
  - intensify treatment

Pluridisciplinarity!!!

Gastric Cancer – Imaged based staging

Dr Angela M Riddell

Royal Marsden, London. UK

ESTRO School

STOMACH 8TH EDITION - AJCC

Primary Tumor

- TX — Primary tumour cannot be assessed
- T0 — No evidence of primary tumour
- Tis — Carcinoma in situ
- T1 — Lamina propria or submucosa
  - T1a — Lamina propria or muscularis mucosae
  - T1b — Submucosa
- T2 — Muscularis propria
- T3 — Subserosa
- T4 — Adjacent structures
  - T4a — Perforates serosa
  - T4b — Other adjacent structures

Regional Lymph Nodes

- NX — Lymph nodes cannot be assessed
- N0 — No regional lymph node metastasis
- N1 — 1 to 2 regional lymph nodes
- N2 — 3 to 6 nodes
- N3 — ≥ 7 nodes
  - N3a — 7 to 15 nodes
  - N3b — ≥16 nodes

Distant Metastasis

- M0 — No distant metastasis
- M1 — Distant metastasis

ESTRO School

Staging of Gastric Cancer

Two main categories:

Early gastric cancer

Malignant invasion confined to the mucosa & submucosa

Advanced gastric cancer

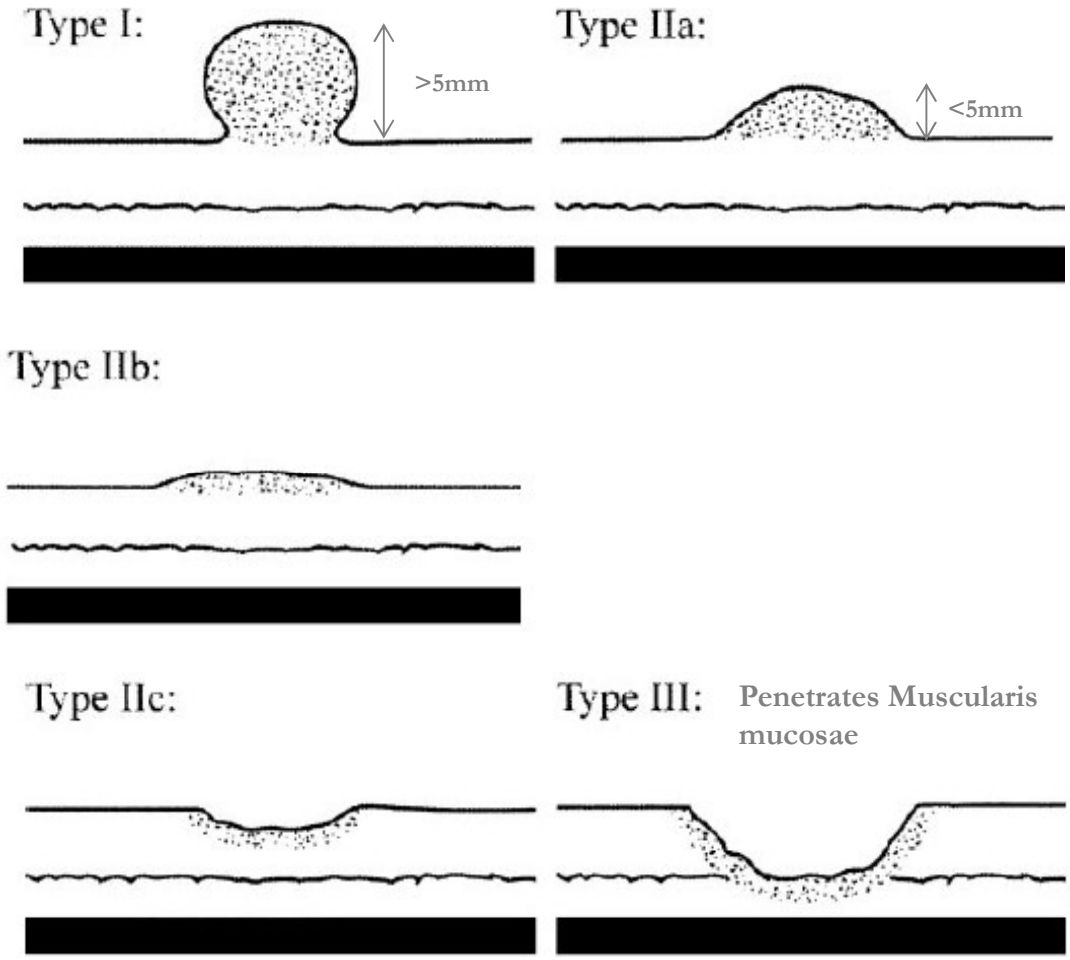
Malignant invasion into the muscularis propria

Early Gastric cancer

Elevated

Flat

Depressed



Adapted from: Ba-Ssalamah A, Prokop M et al. Radiographics 2003; 23:625-644

ESTRO School

Advanced Gastric Cancer Staging

Diagnosis – Endoscopic biopsy

Initial Imaging

MDCT

Potentially operable disease

- PET/CT – exclude distant spread
- Laparoscopy

Other imaging modalities

- EUS – Early disease, Proximal/ Distal Extent
- MRI – Trouble shooting

MDCT - Patient preparation

- Fasted for 6hrs
- Gastric distension
  - Anti spasmodic –Buscopan®
  - Oral contrast – water
- Position
  - Supine
  - Prone
  - Oblique angle to improve regional gastric distension

MDCT - Scan Technique

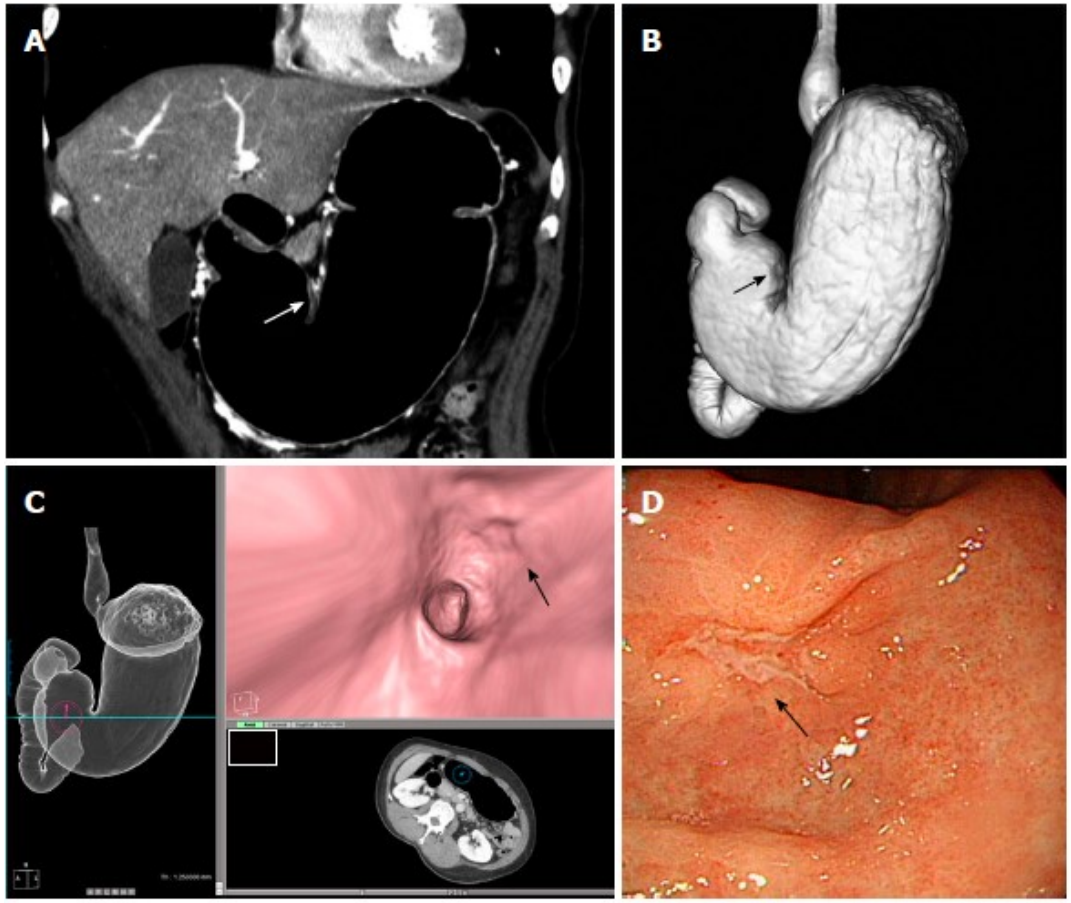
Protocol:

- Oral contrast – water: 500mls over 45 mins. 200mls prior to scan
- IV contrast: Portal venous phase imaging (70 second delay)
- Thorax, abdomen & pelvis

Scan parameters aim to achieve resolution that can enable MPR post-processing using isotropic voxels

MDCT - Scan Technique

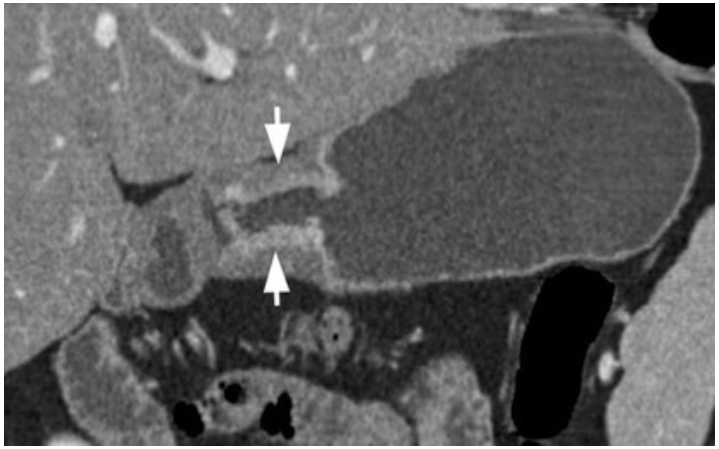
Virtual gastroscopy



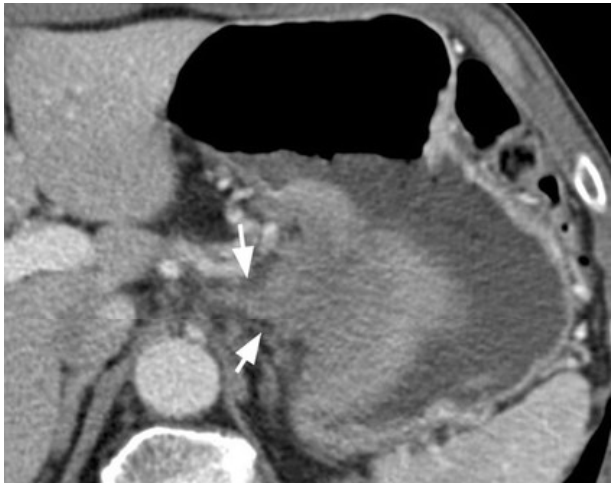
Useful to detect mucosal / early lesions.

ESTRO School

MDCT - T Staging



pT2



pT3

Parameter	Percentage range
Accuracy	77 - 89%
Sensitivity	83-100%
Specificity	80 -97%

pT4

Choi J, Joo I, Lee, J 2014 WJG 20;16: 4546 - 4557

MDCT - N Staging

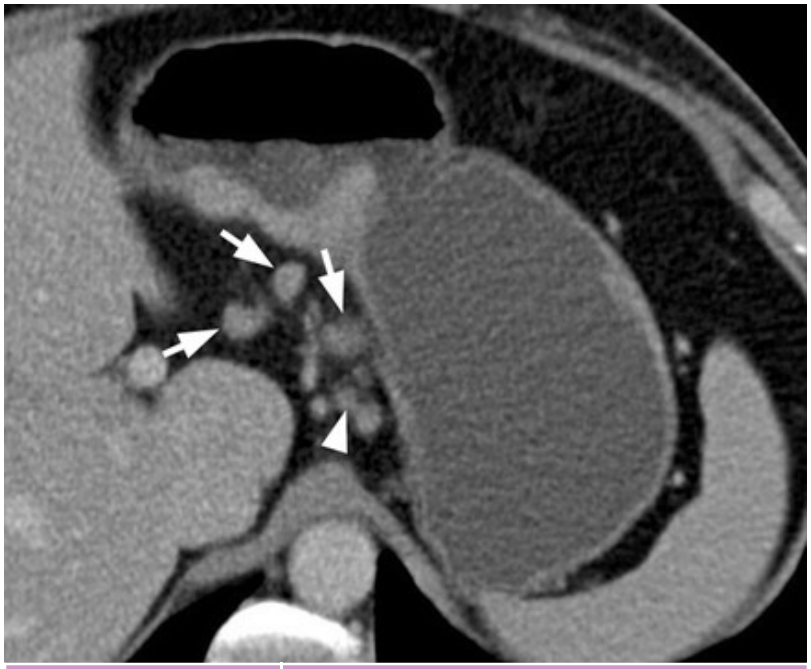
Lymphatic spread is found in 74%–88% of patients

N staging depends on the number of lymph nodes involved

Based on size criteria (short axis):

≥6mm perigastric

≥ 8mm extra perigastric

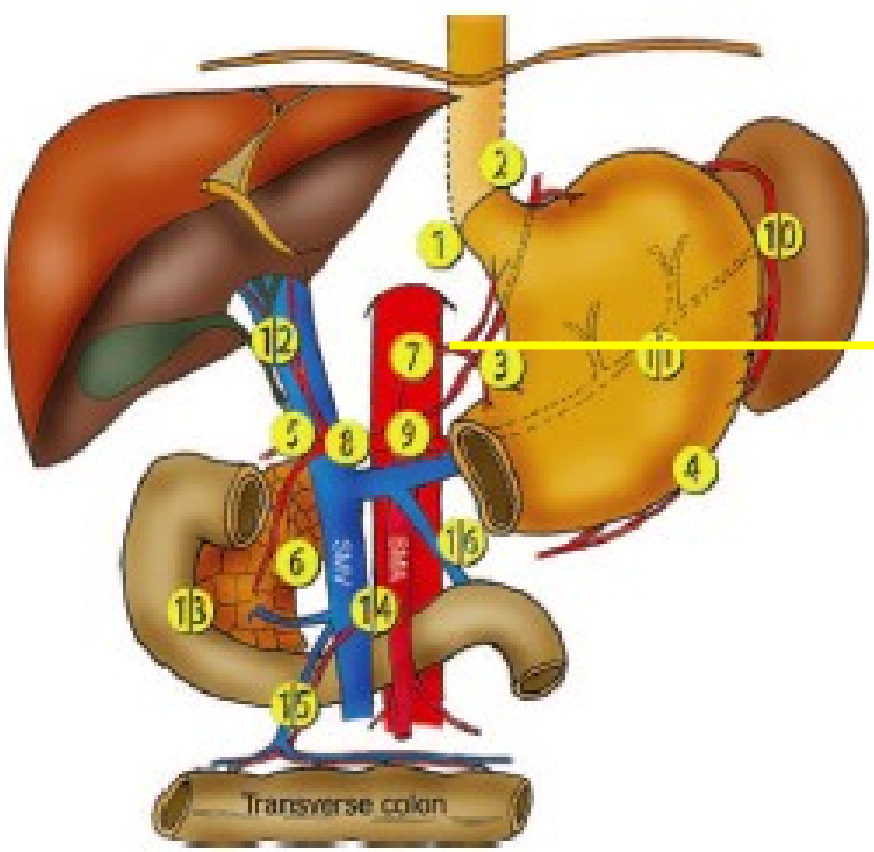


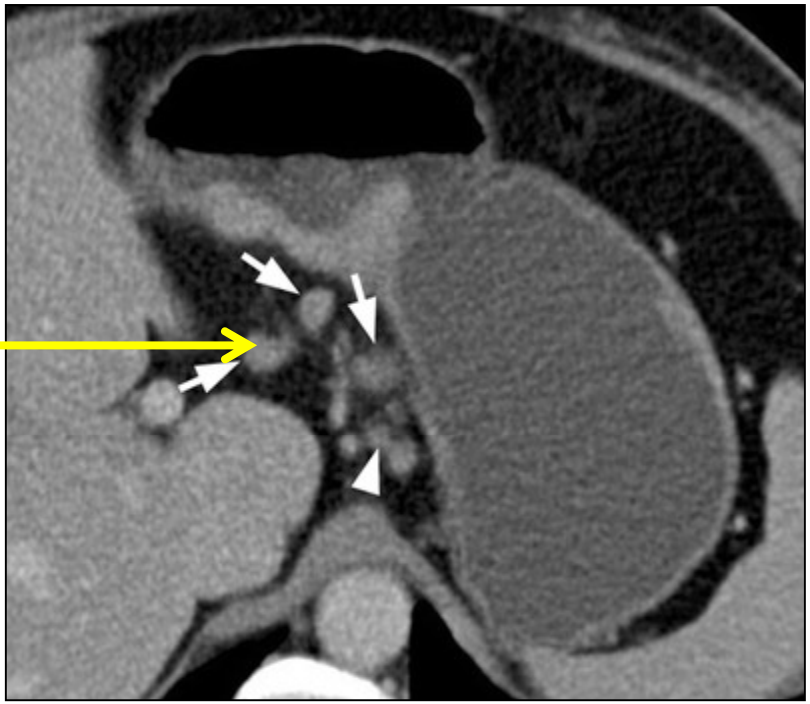
Parameter	Percentage range
Sensitivity	62.5 - 91.9%
Specificity	50 - 87.9%

Stage	No of Regional Nodes
N1	≤2
N2	3-6
N3a	7 - 15
N3b	≥16

Kwee RM, Kwee TC. 2009 Gastric cancer; 12: 6-22

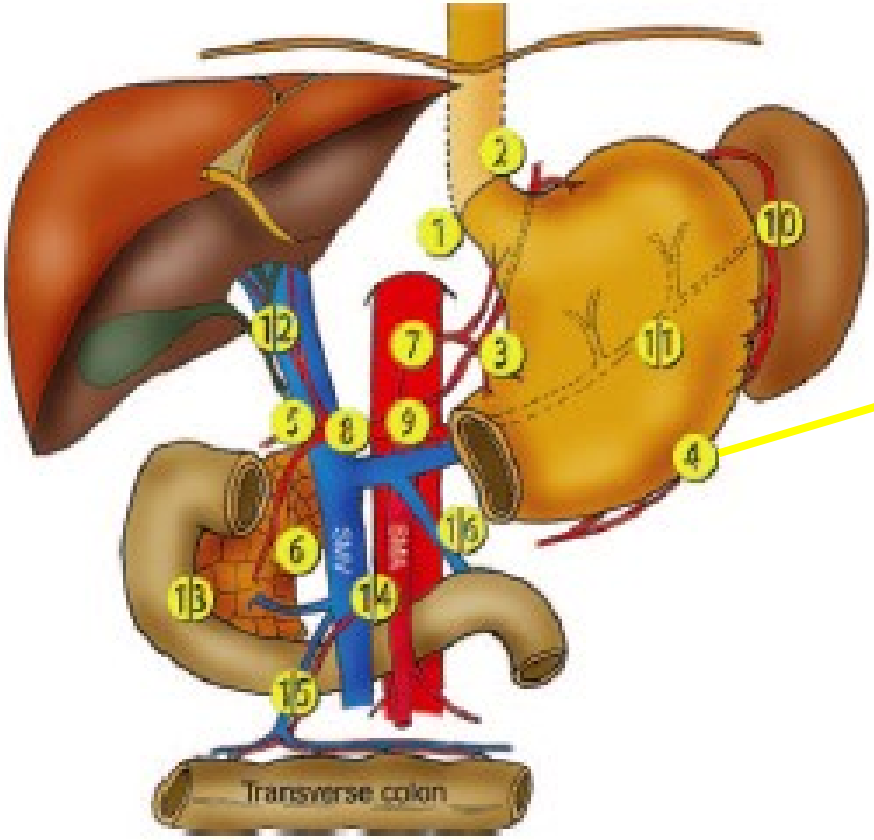
Upper Abdominal Lymph nodes groups

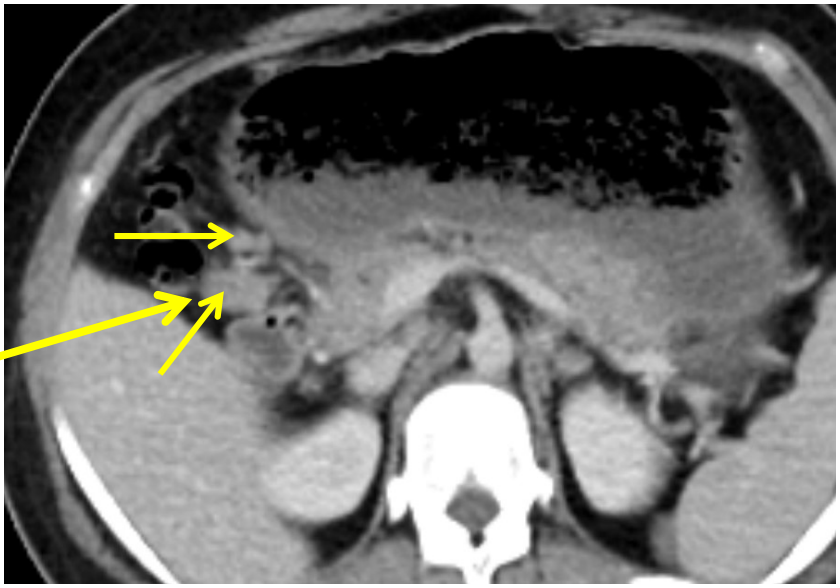




Station 7
Left gastric artery territory

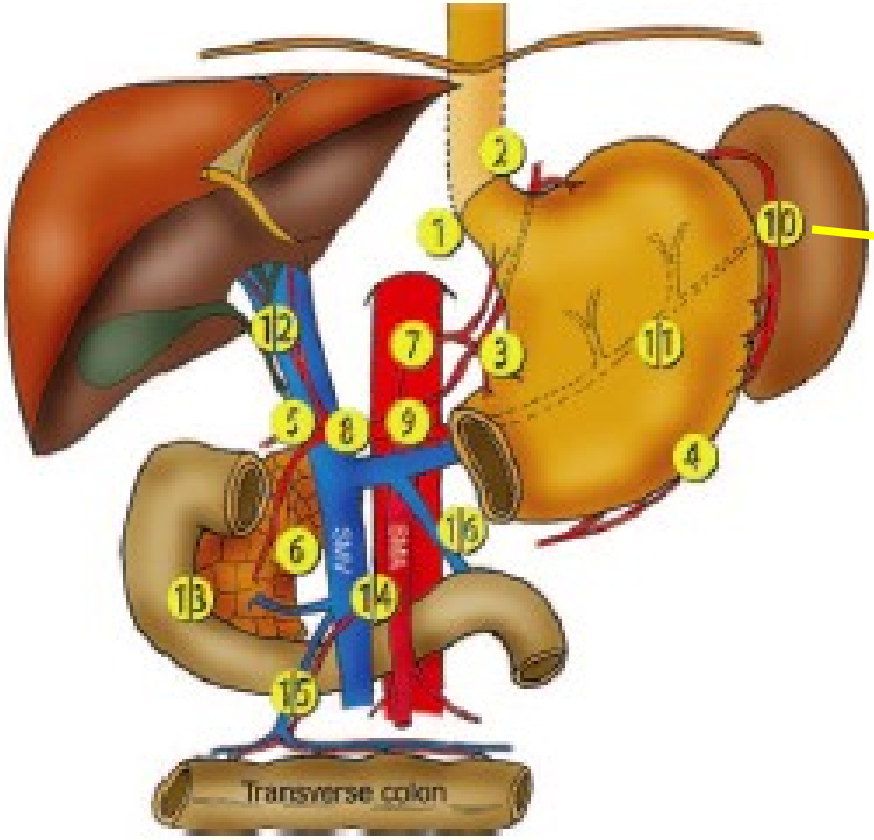
Upper Abdominal Lymph nodes groups

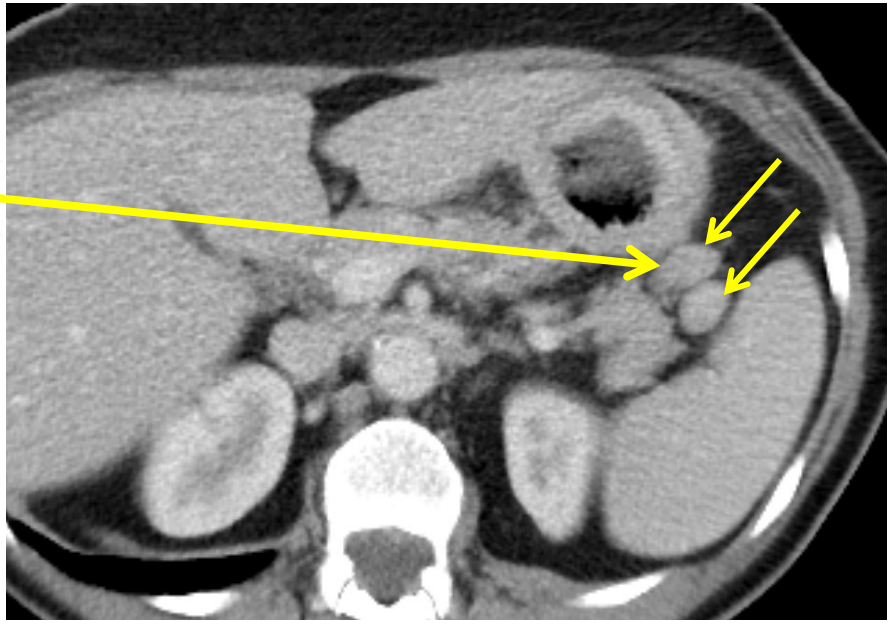




Station 4
Gastroepiploic artery

Upper Abdominal Lymph nodes groups

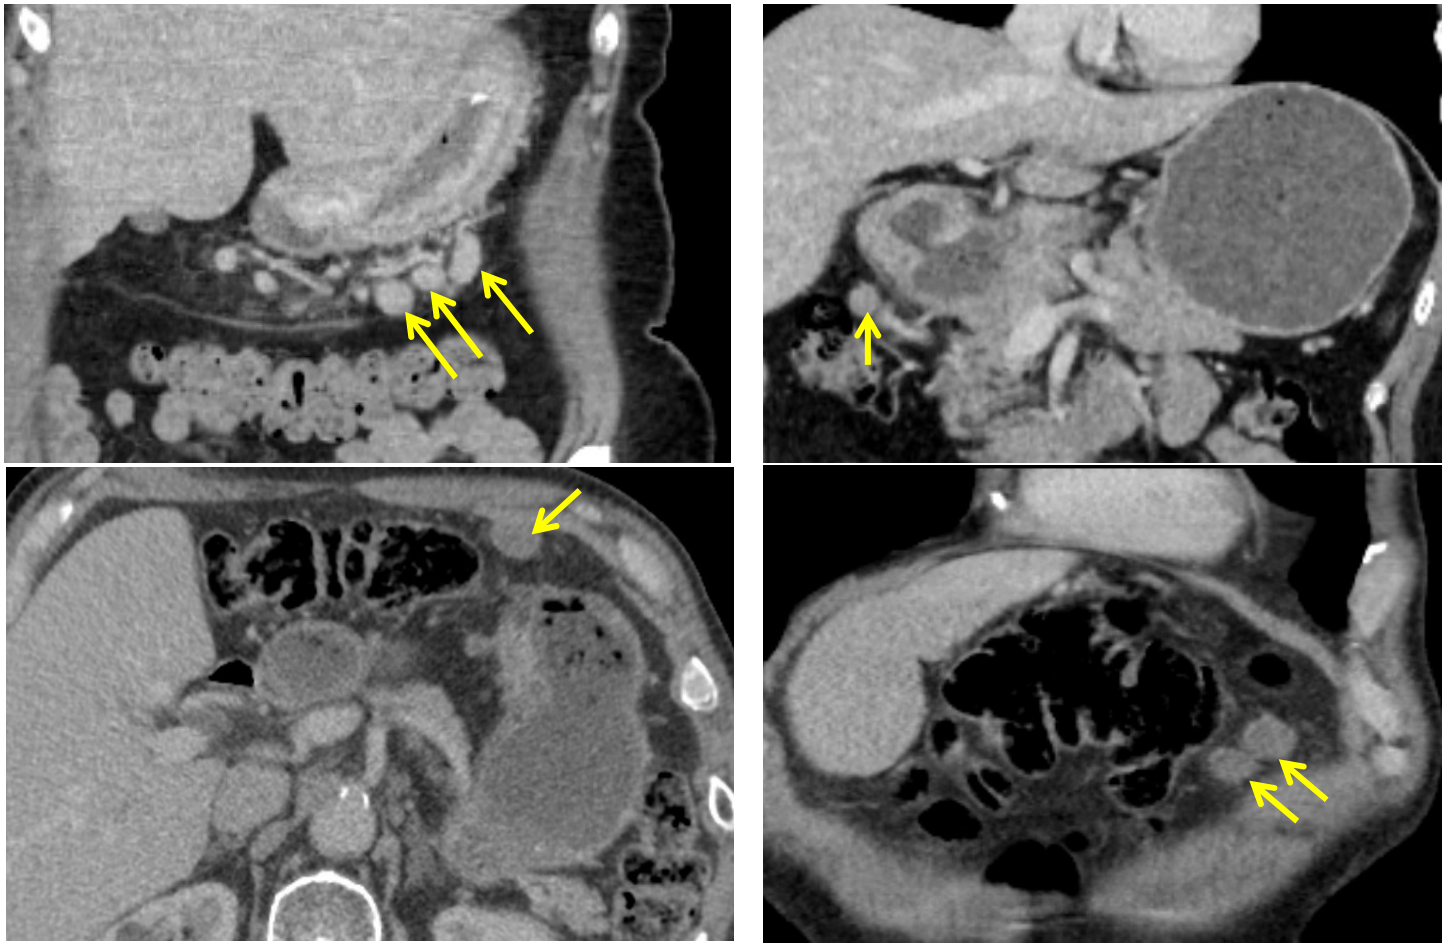




Station 10 Splenic hilum

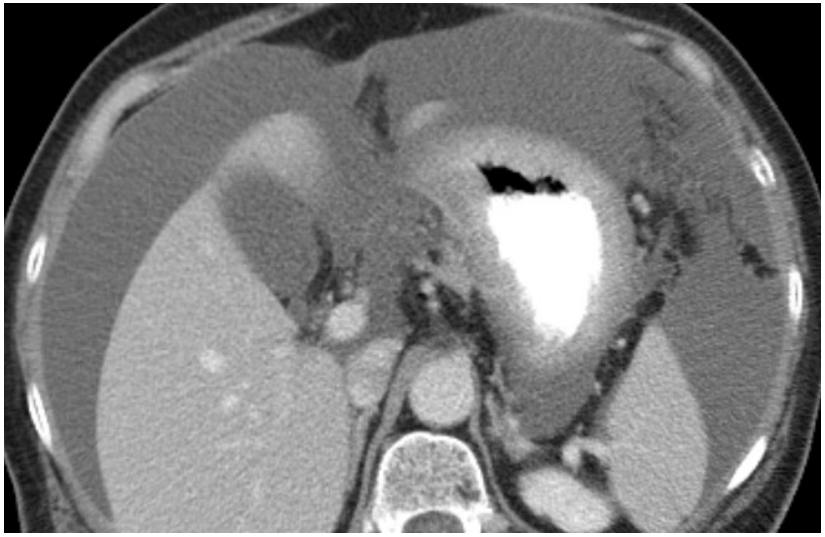
Upper Abdominal Lymph nodes groups

Difficulty distinguishing Gastroepiploic nodes from peritoneal disease



MDCT – M staging

- Detection of hepatic mets:
  sens 88%, spec 99%*.
- Detection of peritoneal disease
  No ascites: sens 30%†
  In presence of ascites:
  Sens 51%, Spec 97%*



Laparoscopy for potentially operable patients

*Yajima, K., T. Kanda, et al. (2006). Am J Surg **192**(2): 185-90.

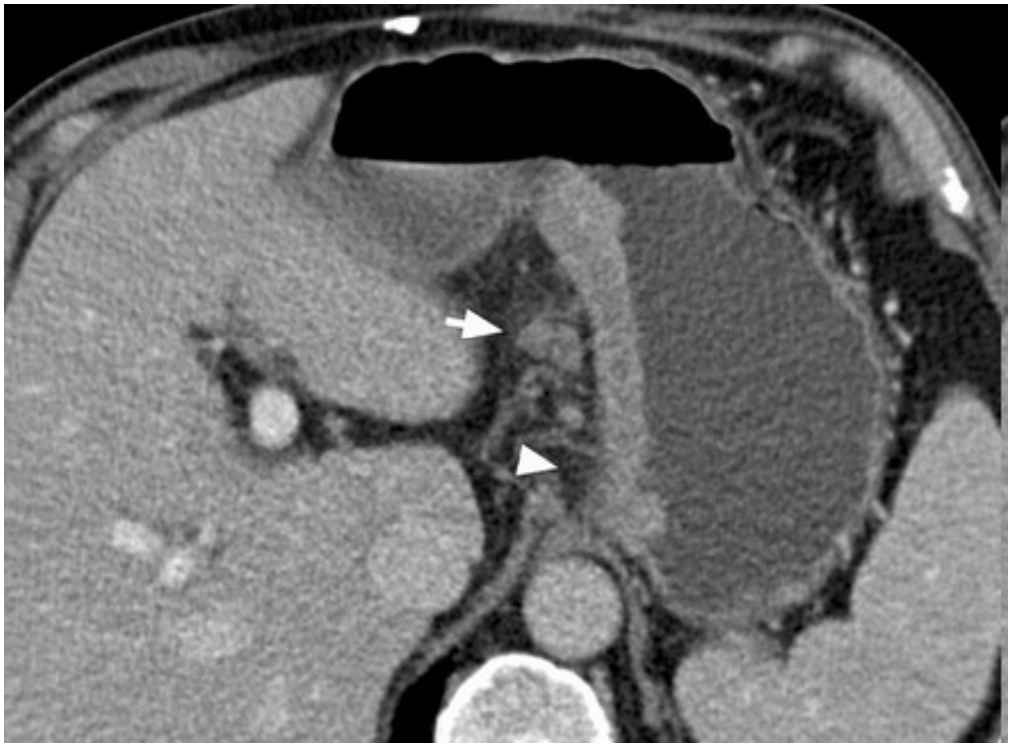
ESTRO School

Gastric Cancer staging



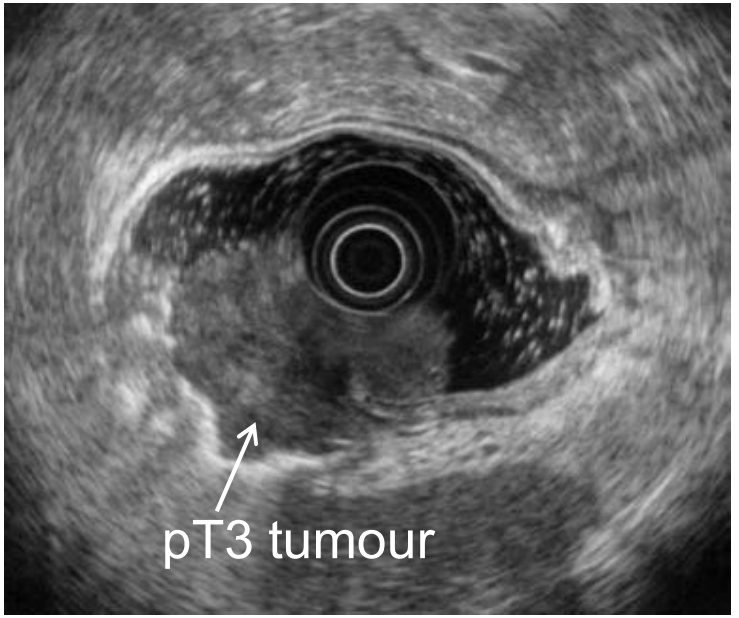
CT Report:

- Length
- Location
- T Stage
- N & M Stage

EUS - T Staging

5-20mHz probes

- High spatial resolution enables visualization of individual wall layers
- EUS T staging more accurate than MDCT



Wide variation in accuracy in literature (65-92%)

Overstaging early tumours

Image from: Bohle W et al. 2011 J Gastrointestin Liver Dis; Vol. 20 No 2, 135-139

ESTRO School

EUS - N Staging

Provides morpholgical information

- Malignant nodes: round, hypoechoic, lose echogenic hilum
- Fine needle aspiration (FNA) possible

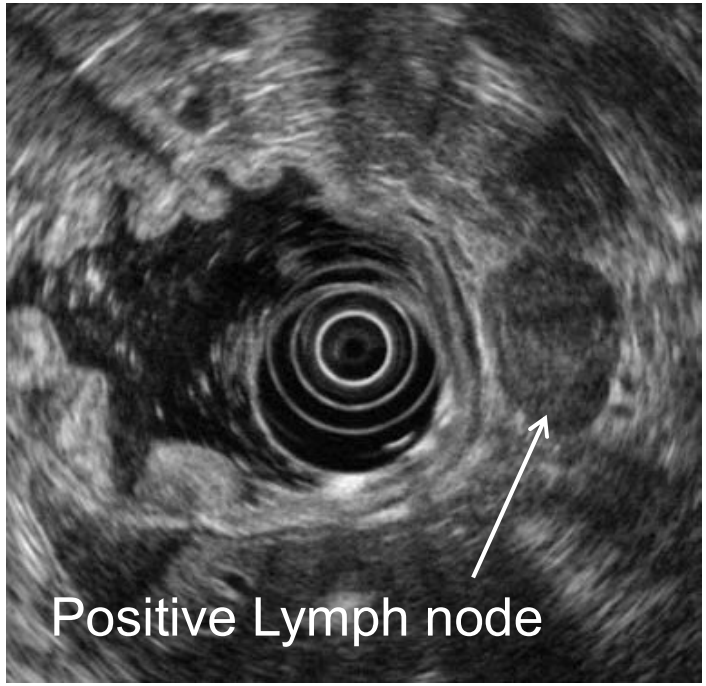


Image from: Bohle W et al. 2011 J Gastrointestin Liver Dis; Vol. 20 No 2, 135-139

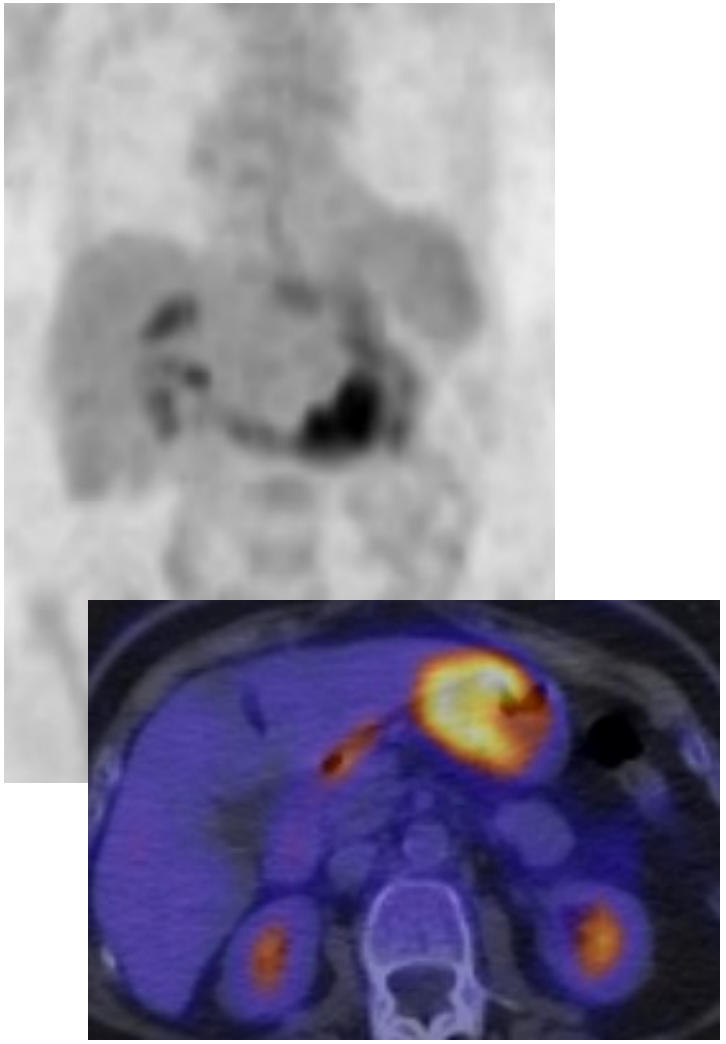
ESTRO School

^{18}FDG-PET/CT

Gastric Cancer

- Variable ^{18}FDG avidity dependent upon tumour subtype
- Intestinal-type have greater FDG avidity
- Limited uptake in diffuse-type

  ~30% tumours not visualised

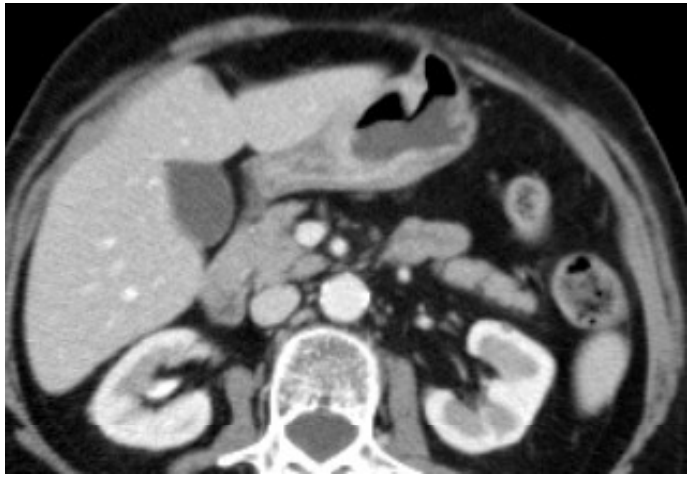


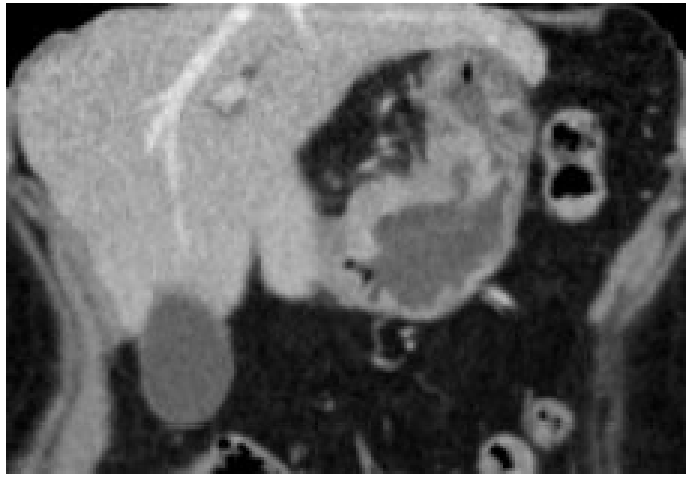
ESTRO School

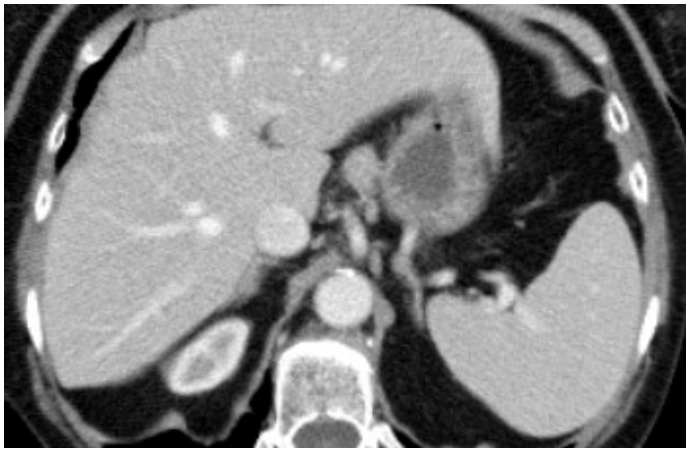
Challenges of nodal staging

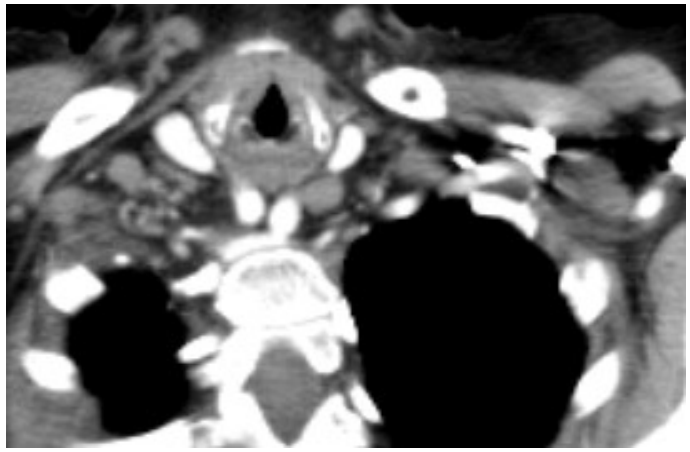
72 year old female with weight loss and anaemia

Case

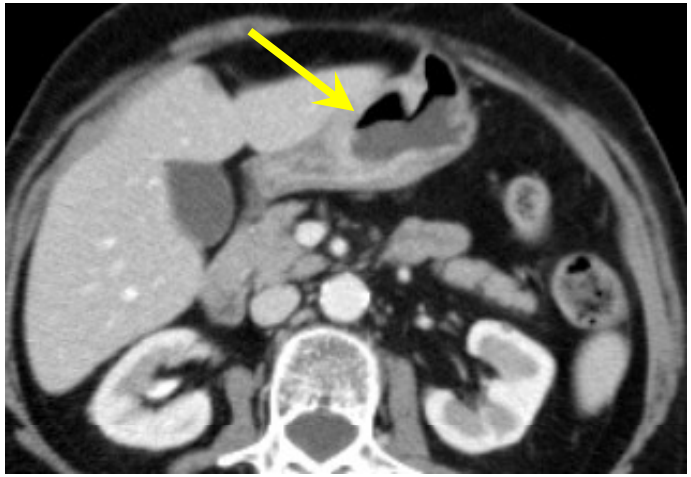


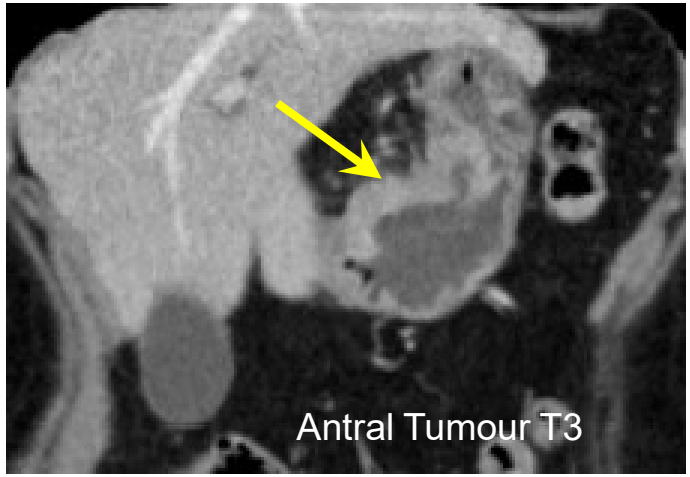


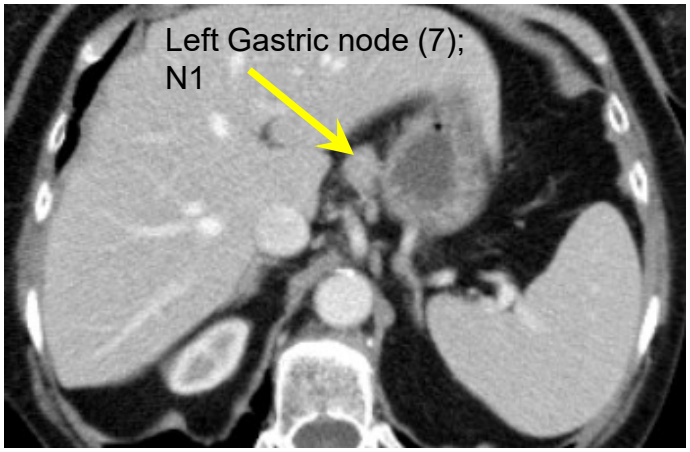


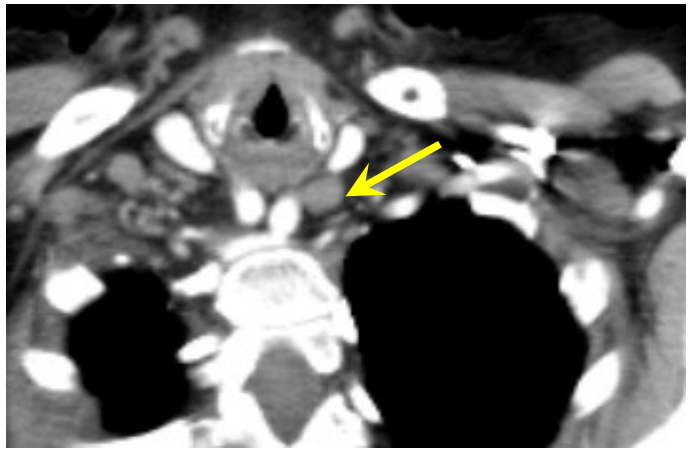


Case









T3N1 ?? M1 – Supraclavicular node…

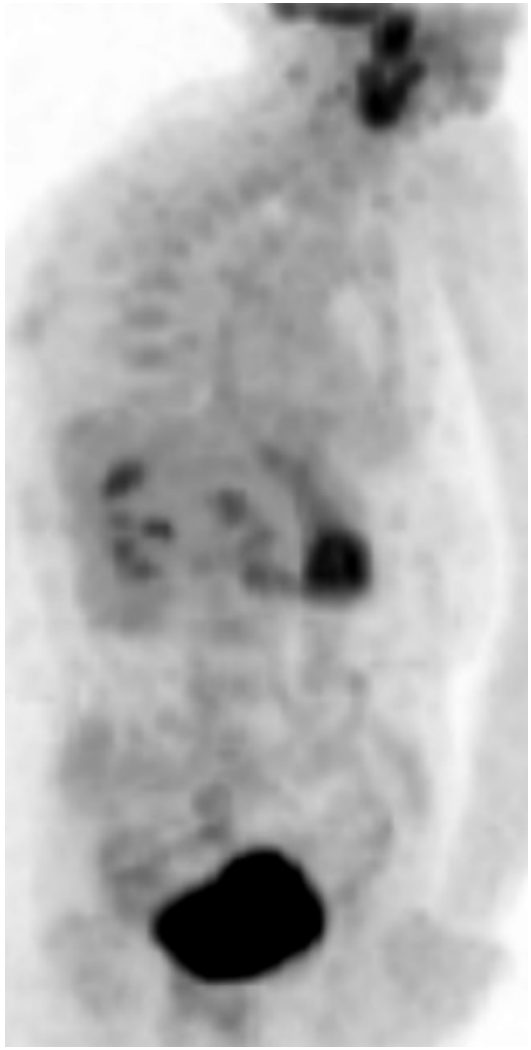
ESTRO School

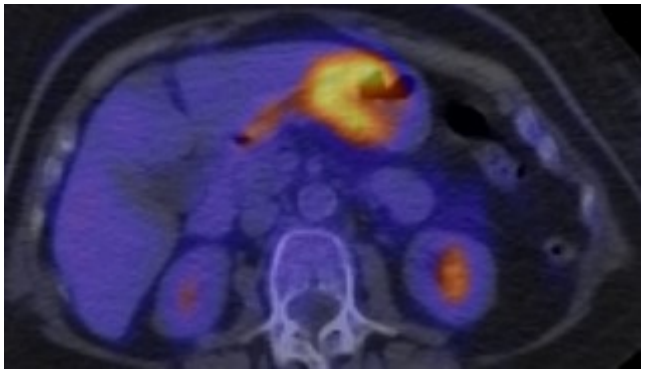
Case

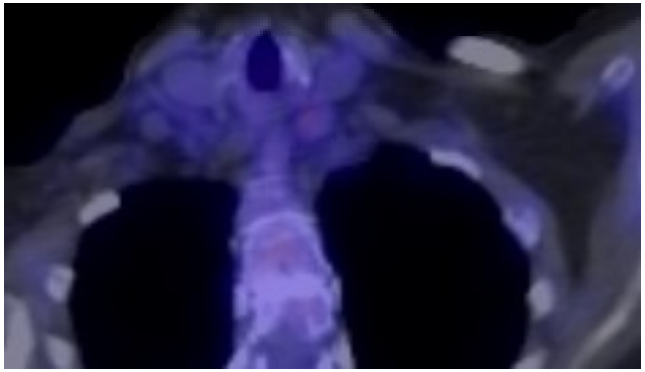
What to do next?

- Consider supraclavicular node positive based on size (9mm)?
- Arrange a PET-CT scan
- Arrange an U/S +/- FNA

Case







Moderate FDG avidity in node ‘equivocal’ on PET-CT

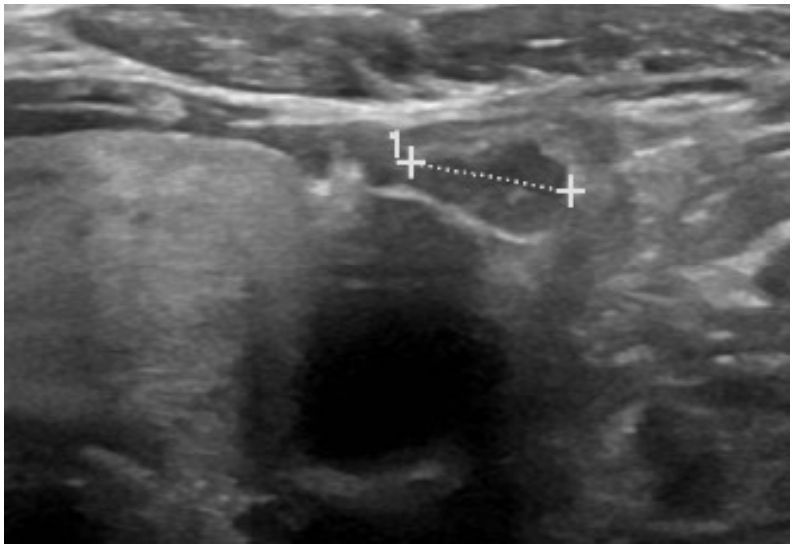
Case

What to do next?

- Consider supraclavicular node positive based on PET-CT findings
- Arrange an U/S +/- FNA
- Consider PET-CT findings as negative in the node & proceed with neoadjuvant therapy followed by surgery

Case

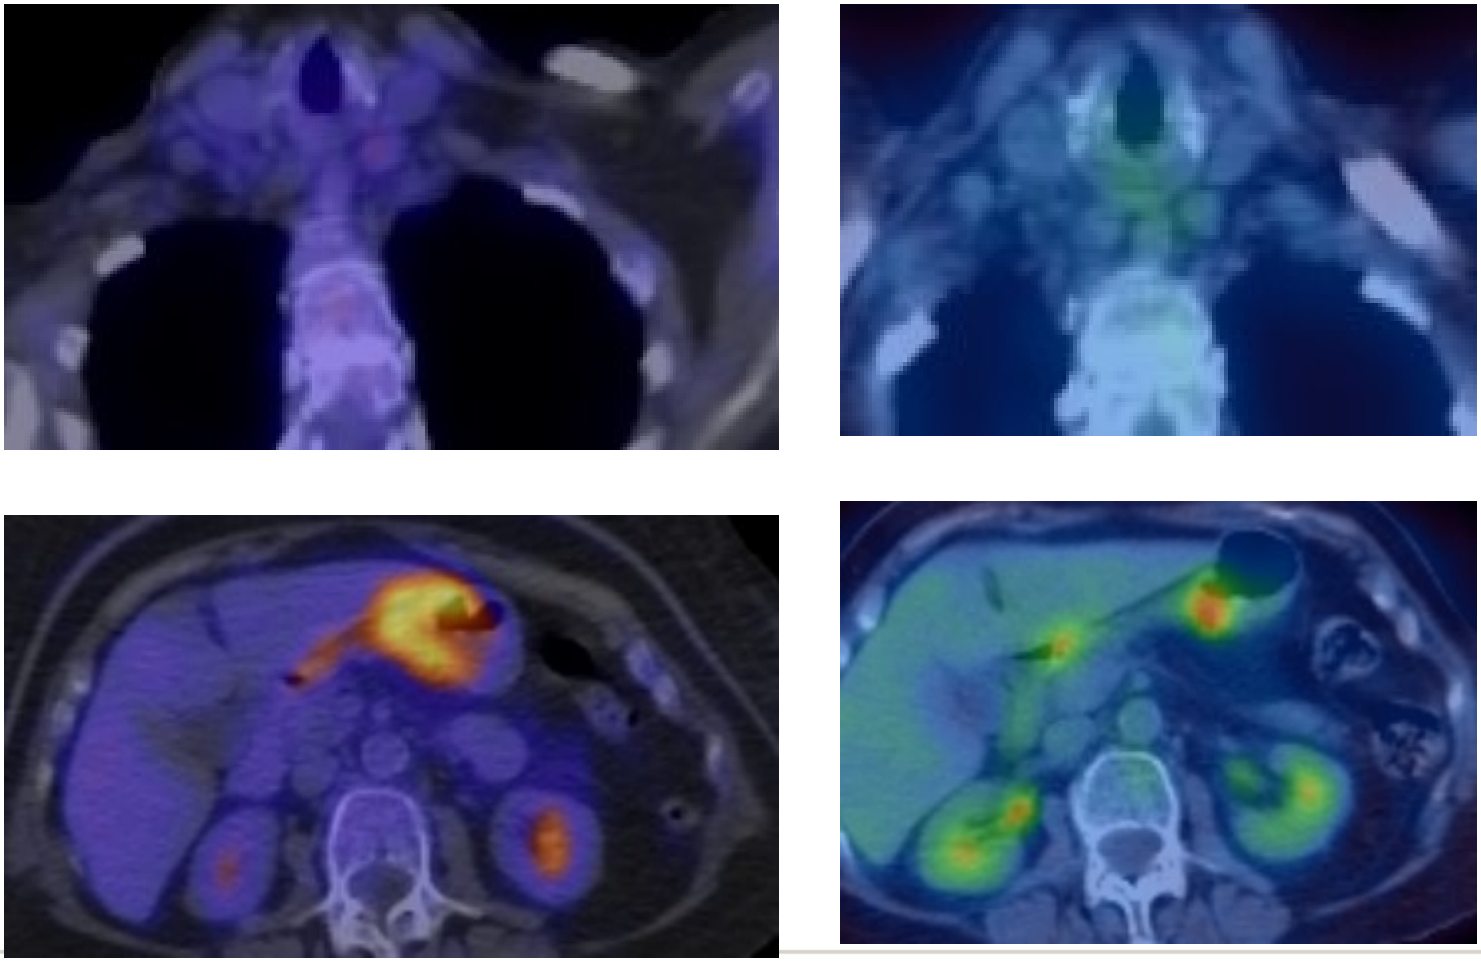
- An U/S with FNA was arranged
- Sonographic appearance in keeping with a reactive node.
- Cytology – C1



Case

The patient was given neoadjuvant therapy

Case



Post x2 Chemo cycles - PR

ESTRO School

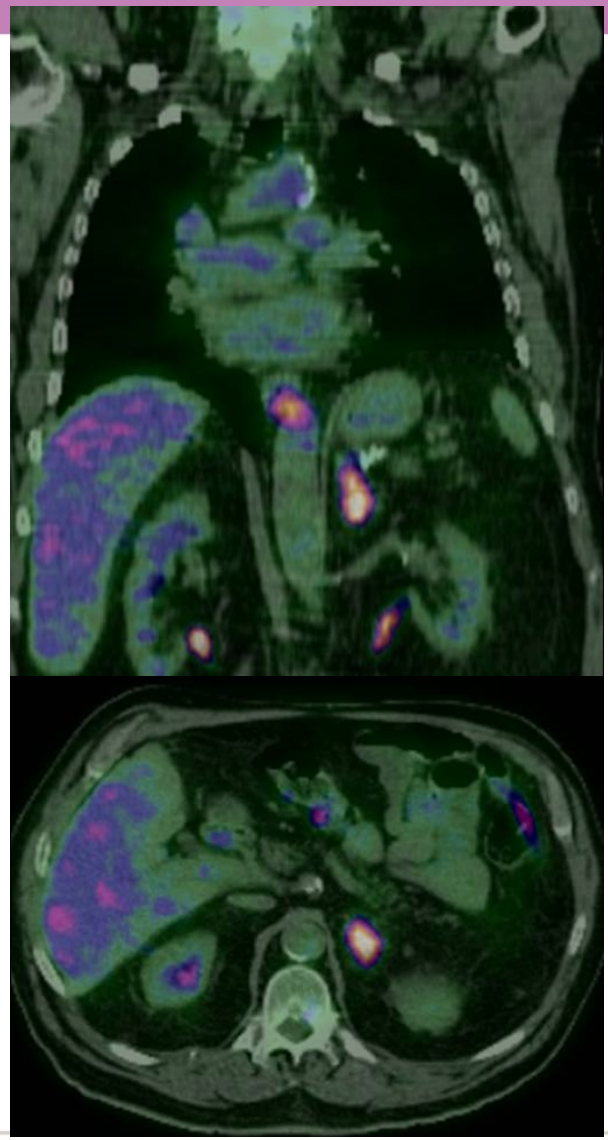
Case

- Had second laparoscopy – no metastases
- Went on to have total gastrectomy in Dec 2009.
- Well with no recurrence
- Patient opted for no further treatment post op.

^{18}FDG-PET/CT

Main advantage

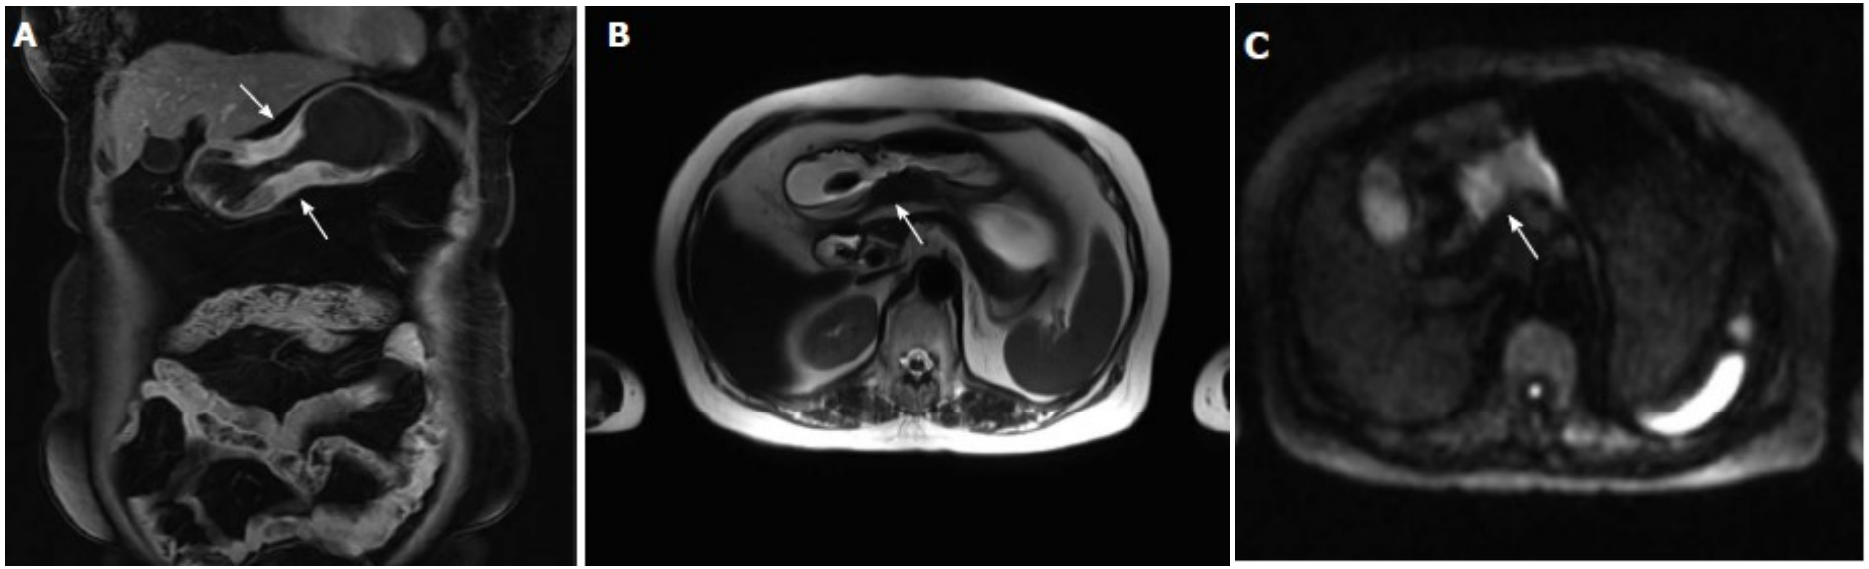
Identification of occult metastatic disease*



*Kinkel K, Ying L et al (2002) Radiology 224:748–756

ESTRO School

Gastric Cancer Staging - MRI



Limited studies

- In vitro studies – demonstrate individual layers of the oesophageal wall. High level of accuracy for staging all tumours
- In vivo studies – T & N staging similar to MDCT

Choi J, Joo I, Lee, J 2014 WJG 20;16: 4546 - 4557

ESTRO School

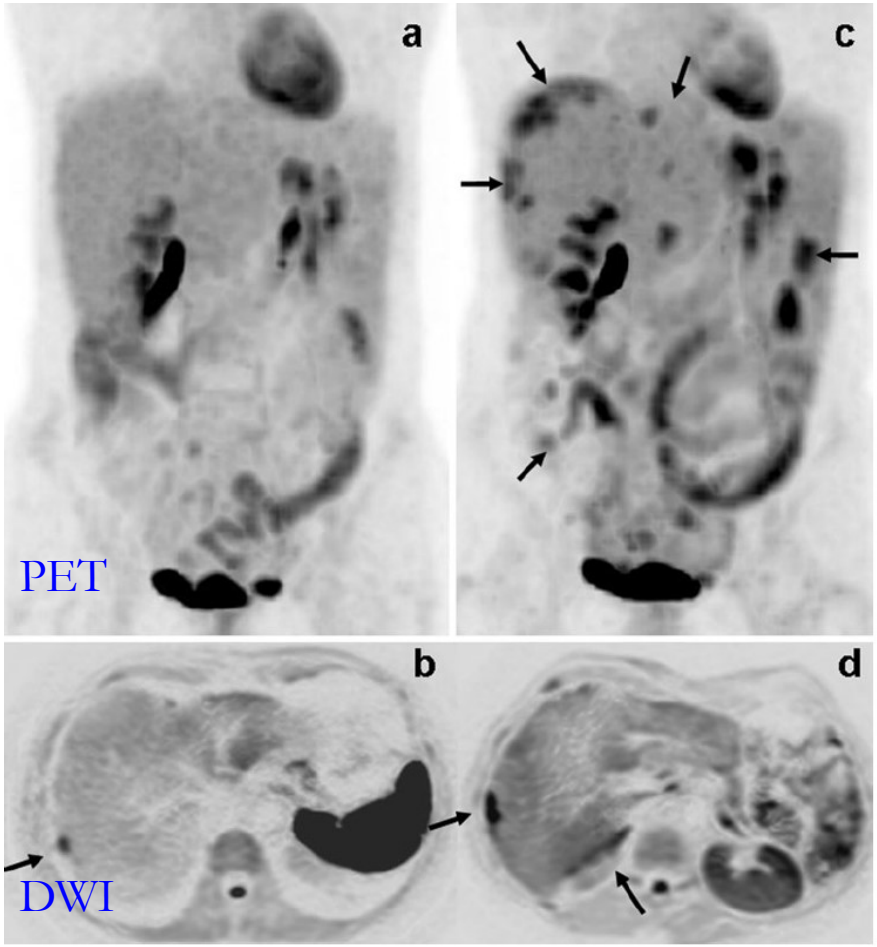
M Staging – Peritoneal disease

MDCT

Accuracy 25-90% dependent on site, size & morphology of disease

Functional imaging

PET-CT & Diffusion Weighted MRI (DW-MRI) have similar improved accuracy, but falls for foci <1cm*



*Soussan M, Des Guetz G et al. (2012) Eur Radiol 22:1479 - 1487

ESTRO School

Summary – Imaging for Gastric Cancer staging

Staging

- MDCT T & N staging & exclude metastatic disease
- PET-CT refine staging & localise tumour
  - False negative with diffuse type

- EUS – defining prox / distal extent.
- MRI – Trouble shooting & clinical research

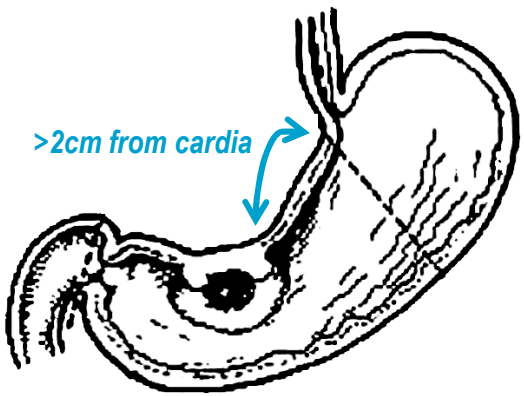
R0 Resection

A surgical procedure in which there is no evidence of macroscopic residual tumour in the tumour bed, lymph nodes and/or distant sites with microscopic negative resection margins

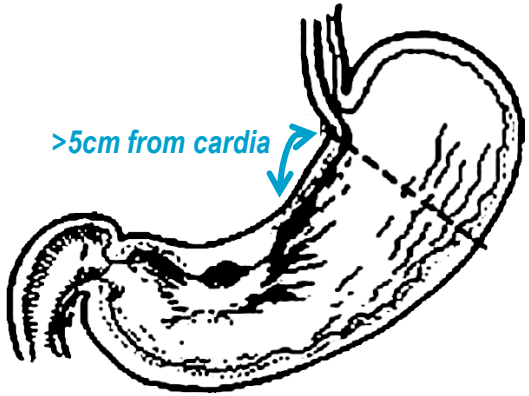
Hermanek P, Wittekind C. Pathol Res Pract. 1994;190(2):115-123.

Indication and Division Lines for Distal Subtotal and Total Gastrectomy

Distal subtotal gastrectomy

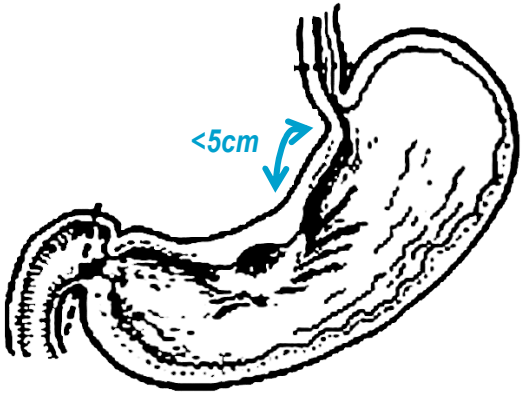


Early cancer or well-circumscribed advanced cancer

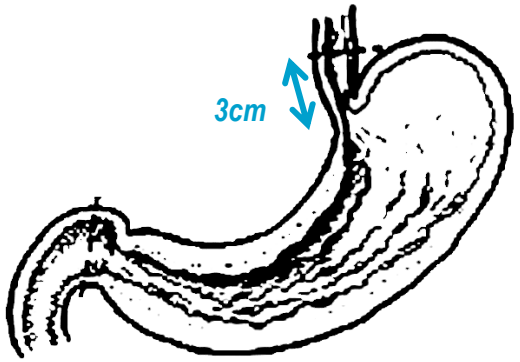


Infiltrative advanced cancer

Total gastrectomy



When the proximal distance from the cardia is less than the required length, total gastrectomy is indicated



Total gastrectomy is always indicated in diffuse carcinoma (Borrmann type 4) regardless of its size

Total Gastrectomy and Lymph Node Dissection

Tailored Treatment

Treatment modality varies:

- Stage
- Patient risk
- Surgical volume
- Available chemotherapy
- Quality of radiotherapy

"the result of treatment for locally advanced gastric cancer is the sum of the effect of local tumour control by surgery, with or without radiotherapy and / or systemic chemotherapy"

Takeshi Sano 2007

Gastric cancer

Lecture (20'): state of art of chemotherapy in a combined treatment perspective

Perioperative chemotherapy

- ✓ *What is the impact of preoperative chemotherapy alone?*
- ✓ *Should perioperative chemotherapy be considerd a standard?*
- ✓ *What could be the reasons of the undertreatment of gastric cancer patients despite available high quality evidence?*
- ✓ *Has preoperative treatment a negative impact on post-operative outcomes?*
- ✓ *What are potential prognostic markers?*
- ✓ *How can we treat non-responding patients?*
- ✓ *More is better?*

Adjuvant chemotherapy

- ✓ *More is better?*
- ✓ *Is it better late than ever?*

Perioperative or adjuvant chemotherapy

- ✓ *What is better?*

ESTRO School

Comparison of Neoadjuvant Versus a Surgery First Approach for Gastric and Esophagogastric Cancer

Journal of SURGICAL ONCOLOGY
2016;114:296–303

Preoperative Chemotherapy

- **Meta-analysis of 12 trials** with 1,800 patients with resectable gastric or gastroesophageal cancer: ***neoadjuvant chemotherapy*** *could significantly* ***downstage tumors*** *and* ***improve R0 resection*** *while* ***slightly improving the overall survival*** (*Xiong et al., Eur J Surg Oncol, 2014*)

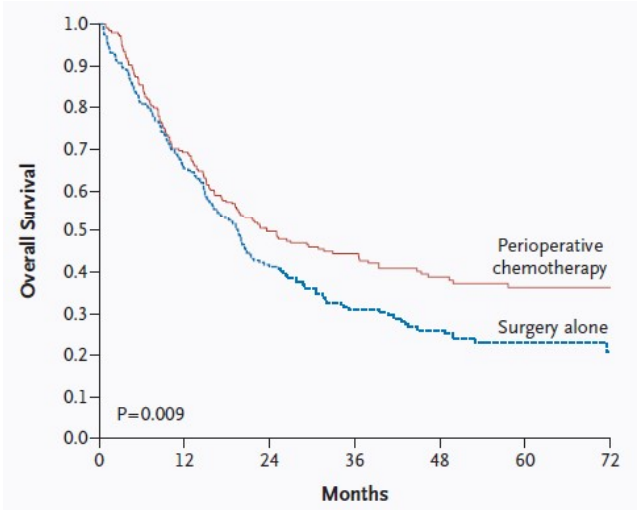
- **Additional meta-analysis** comparing neoadjuvant chemotherapy with surgery alone: *the* ***only significant finding*** *is that there were* ***significantly fewer negative lymph nodes after neoadjuvant treatment*** (*Xu et al., PLoS One, 2014*)

Neoadjuvant chemotherapy does not improve OS

Perioperative Chemotherapy versus Surgery Alone for Resectable Gastroesophageal Cancer

The NEW ENGLAND JOURNAL of MEDICINE 2006;355:11-20.

3 preoperative and 3 postoperative cycles of ***ECF***
Primary endpoint: ***OS***



The perioperative-chemotherapy group had a ***higher likelihood of overall survival*** (hazard ratio for death, 0.75; 95 percent confidence interval, 0.60 to 0.93; P = 0.009; ***five-year survival rate, 36% vs 23%***)

Perioperative Chemotherapy Compared With Surgery Alone for Resectable Gastroesophageal Adenocarcinoma: An FNCLCC and FFCD Multicenter Phase III Trial

VOLUME 29 · NUMBER 13 · MAY 1 2011
JOURNAL OF CLINICAL ONCOLOGY

2-3 preoperative cycles and 3-4 cycles of postoperative ***CF***
Primary endpoint: ***OS***

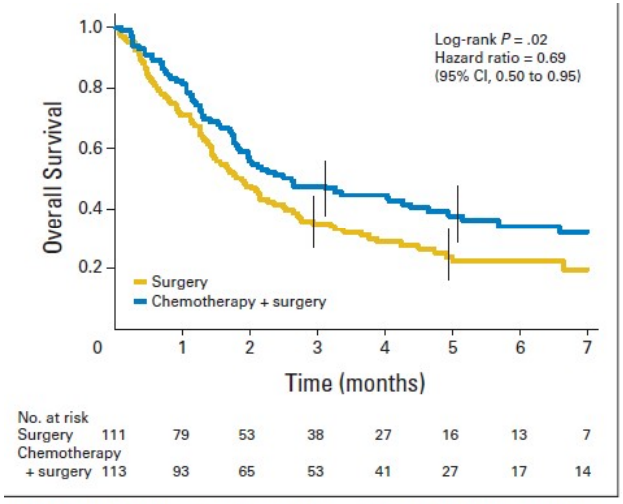


Fig 2. Kaplan-Meier curve showing overall survival from date of random assignment.

The CS group had a better OS (***5-year rate 38% vs 24%***; hazard ratio [HR] for death: 0.69; 95% CI, 0.50 to 0.95; *P* <0.02)

Trends in the Use of Evidence-Based Therapy for Resectable Gastric Cancer

Journal of SURGICAL ONCOLOGY
2014;110:285–290

We performed a retrospective cohort study of patients with ***Stage IB–IV (M0) gastric adenocarcinoma*** who underwent resection ***from 1991 to 2009*** using the linked ***SEER–Medicare database***

TABLE I. Trends in Use of Multimodality Therapy Over Time (N = 4841)

	1991–2001	2002–2005	2006–2009	*P*-Value
Any preoperative chemotherapy	0.8% (18)	1.5% (20)	4.7% (52)	<0.001
Post-operative chemoradiation	13.0% (310)	24.8% (333)	25.4% (282)	<0.001
Surgery alone	68.7% (1641)	55.5% (746)	50.4% (559)	<0.001
Other	17.6% (419)	18.2% (245)	19.5% (216)	0.386
Total	100% (2,388)	100% (1,344)	100% (1,109)	—

Only 19.1% of patients received post-operative chemoradiation therapy (CRT), and ***1.9% received peri-operative chemotherapy***; most patients underwent surgery alone (60.9%)

The proportion of patients treated with postoperative CRT increased significantly after trial publication as did the ***proportion of patients treated with peri-operative chemotherapy***

There are a number of ***hypotheses that might explain*** the undertreatment of gastric cancer patients despite high quality evidence supporting its use:

- ✓ *timeliness of information dissemination*
- ✓ *economic impact of treatment*
- ✓ *availability of resources and multidisciplinary expertise*

Trends in the use and impact of neoadjuvant chemotherapy on perioperative outcomes for resected gastric cancer: Evidence from the American College of Surgeons National Cancer Database

SURGERY
2016;159:1099-112

Using the ***American College of Surgeons National Cancer Database***, 16,128 patients underwent gastrectomy for cancer ***from 2003 to 2012***

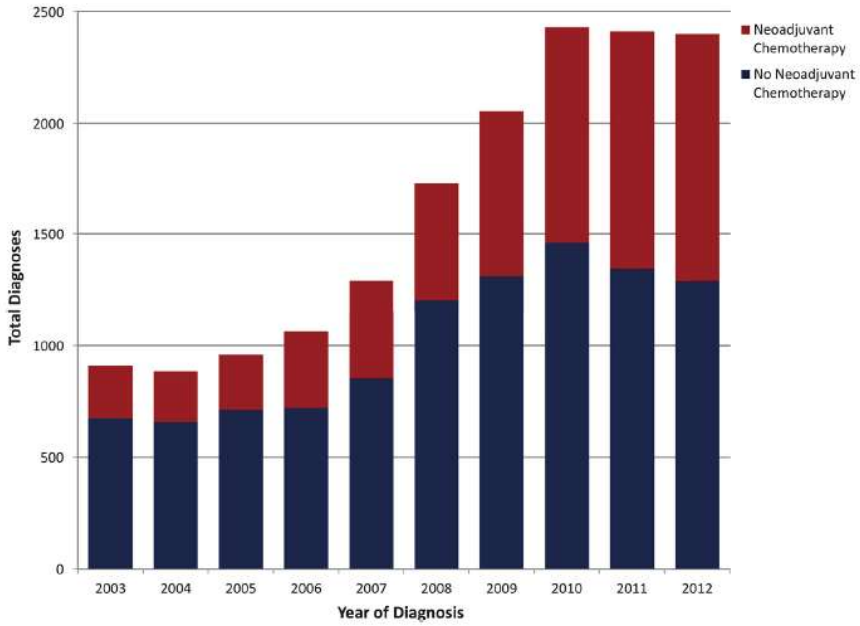

Fig 1. Use of neoadjuvant chemotherapy, by year.

- ***36.6%*** received ***NAC*** and 63.4% did not receive chemotherapy in the neoadjuvant setting.
- ***Patients who received NAC*** were more frequently ***younger***, male, white, ***privately insured***, with ***fewer comorbidities***, and ***treated at an academic center*** (all P <.0001).
- Over time, the use of NAC increased annually, from ***25.9%*** in ***2003*** to ***46.3%*** in ***2012***

Trends in the use and impact of neoadjuvant chemotherapy on perioperative outcomes for resected gastric cancer: Evidence from the American College of Surgeons National Cancer Database

SURGERY
2016;159:1099-112

- Patients who received NAC had a ***postoperative duration of stay 0.43 days shorter than patients who did not receive chemotherapy*** (5.79 vs 6.22 days; P = .050)

- They had a ***36% lower odds of 30-day mortality*** (odds ratio, 0.64, P<.0001) but nonsignificant lower odds of 90-day mortality

Conclusion. *With concerns regarding the toxicity of NAC, these findings suggest that NAC is not associated with worse postoperative outcomes. In light of evidence touting the benefits of NAC, its adoption as a component in the multimodality care of gastric cancer is slowly increasing, although use of NAC remains poor overall. (Surgery 2016;159:1099-112.)*

Mismatch Repair Deficiency, Microsatellite Instability, and Survival

An Exploratory Analysis of the Medical Research Council Adjuvant Gastric Infusional Chemotherapy (MAGIC) Trial

JAMA Oncology

JAMA Oncol. doi:10.1001/jamaoncol.2016.6762

IMPORTANCE Mismatch repair (MMR) deficiency (MMRD) and microsatellite instability (MSI) are prognostic for survival in many cancers and for resistance to fluoropyrimidines in early colon cancer. However, the effect of MMRD and MSI in curatively resected gastric cancer treated with perioperative chemotherapy is unknown.

Figure 1. Overall Survival by Microsatellite Instability (MSI) Status and Treatment Arm in the Study Patients

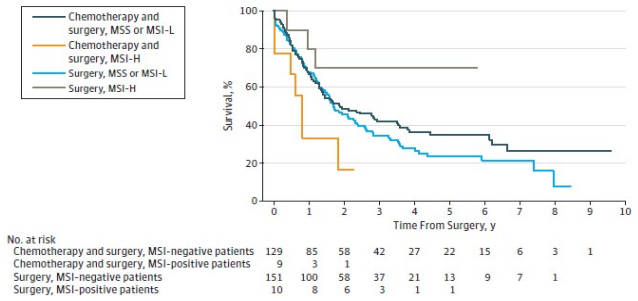

Figure 2. Overall Survival by Mismatch Repair (MMR) Protein Status in the Study Patients

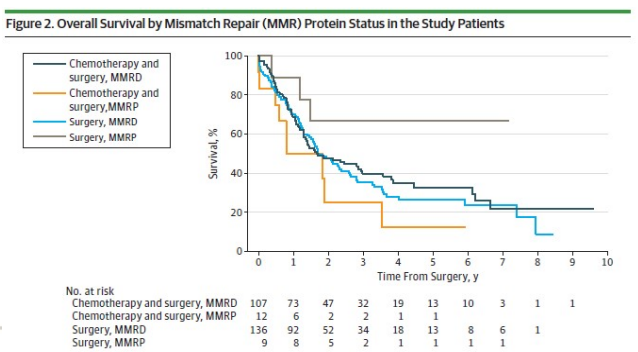

We found that patients with MSI-H or MMRD tumors have superior survival compared with patients with MSS/MSI-L or MMRP tumors when treated with surgery alone and conversely have inferior survival to patients with MSS/MSI-L or MMRP tumors when treated with perioperative chemotherapy plus surgery. These findings are significant, because if validated, they suggest that patients with MSI-H or MMRD may not benefit (or may experience a detrimental effect) from perioperative chemotherapy and may be better served by a surgery-only approach. Because MSI or MMRD tumors comprise up to 10% to 20% of stomach cancers in some series, this finding has the potential to affect large numbers of patients.[15]

Gastric cancer: ESMO Clinical Practice Guidelines for diagnosis, treatment and follow-up†

ANNALS OF ONCOLOGY
27 (Supplement 5): v38–v49, 2016

Table 5. Summary of recommendations

Management of local/locoregional disease
Perioperative chemotherapy
• Perioperative (pre- and postoperative) chemotherapy with a platinum and fluoropyrimidine combination is recommended for patients with ≥stage IB resectable gastric cancer [I, A]
• Since capecitabine avoids the need for an indwelling central venous access device, and is non-inferior to 5-FU in the advanced disease setting, capecitabine-containing regimens can also be suggested in the perioperative setting [IV, C]

Histopathological regression after neoadjuvant docetaxel, oxaliplatin, fluorouracil, and leucovorin versus epirubicin, cisplatin, and fluorouracil or capecitabine in patients with resectable gastric or gastro-oesophageal junction adenocarcinoma (FLOT4-AIO): results from the phase 2 part of a multicentre, open-label, randomised phase 2/3 trial

THE LANCET Oncology

Lancet Oncol 2016; 17:1697-708

- Patients with resectable gastric or gastro-oesophageal junction cancer who had ***clinical stage cT2 or higher***, ***nodal positive (cN+)*** disease, ***or both***

- 3 preoperative and 3 postoperative 3-week cycles of ***ECF/ECX*** or 4 preoperative and 4 postoperative ***FLOT*** (2-week cycles of *docetaxel* 50 mg/m², intravenous *oxaliplatin* 85 mg/m², intravenous *leucovorin* 200 mg/m², and *5-FU* 2600 mg/m² as a 24 h infusion, all on day 1)

- **Primary endpoint**: ***pathological complete regression*** (***TRG1a***: *equivalent to pathological complete regression; no residual tumour cells*)

Histopathological regression after neoadjuvant docetaxel, oxaliplatin, fluorouracil, and leucovorin versus epirubicin, cisplatin, and fluorouracil or capecitabine in patients with resectable gastric or gastro-oesophageal junction adenocarcinoma (FLOT4-AIO): results from the phase 2 part of a multicentre, open-label, randomised phase 2/3 trial

Benefit of Adjuvant Chemotherapy for Resectable Gastric Cancer

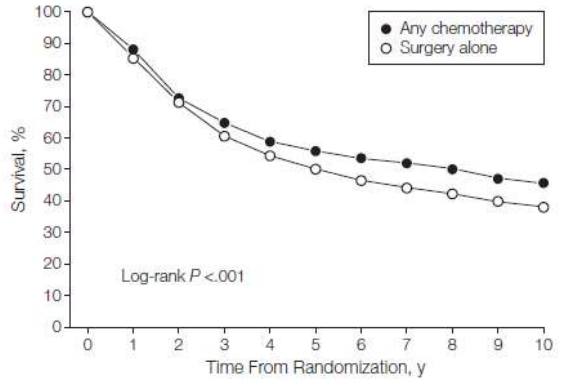
A Meta-analysis

The GASTRIC (Global Advanced/Adjuvant Stomach Tumor Research International Collaboration) Group*

JAMA

May 5, 2010—Vol 303, No. 17

Figure 3. Overall Survival Estimate After Any Chemotherapy or Surgery Alone Truncated at 10 Years



No. at risk

Any chemotherapy	1924	1688	1385	1217	1080	929	709	526	390	297	243
Surgery alone	1857	1568	1300	1092	952	782	583	407	267	172	138

The estimates of the survival curves use an actuarial approach as described in the Methods.

- Adjuvant chemotherapy was associated with a ***statistically significant benefit in terms of overall survival*** (hazard ratio [HR], 0.82; 95% confidence interval [CI], 0.76-0.90; *P*.001)
- The estimated ***median OS was 4.9 years*** (95% CI, 4.4-5.5) ***in the surgery-only group*** vs ***7.8 years*** (95% CI, 6.5-8.7) in the group receiving ***adjuvant chemotherapy***
- ***Absolute benefits*** were ***5.8% at 5 years*** (from 49.6% to 55.3%) and ***7.4% at 10 years*** (from 37.5% to 44.9%)

Conclusion Among the RCTs included, postoperative adjuvant chemotherapy based on fluorouracil regimens was associated with reduced risk of death in gastric cancer compared with surgery alone.

ESTRO School

Adjuvant capecitabine plus oxaliplatin for gastric cancer after D2 gastrectomy (CLASSIC): 5-year follow-up of an open-label, randomised phase 3 trial

THE LANCET Oncology

Lancet Oncol 2014; 15: 1389–96

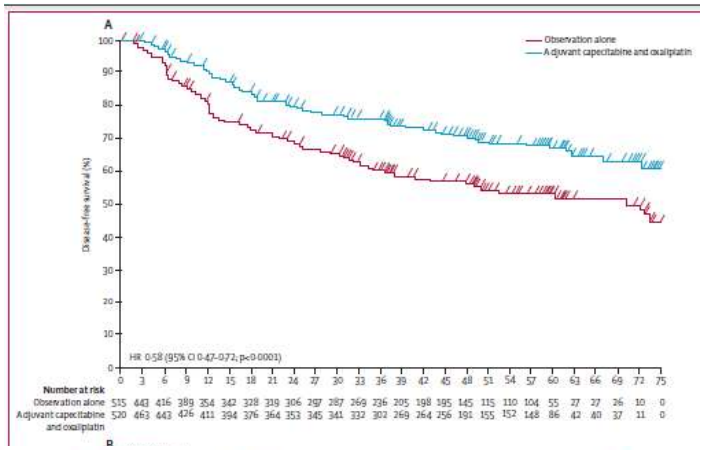

Figure 2: Disease-free survival (A) and overall survival (B) in the intention-to-treat population

- 139 (***27%***) patients had ***DFS events*** in the adjuvant ***capecitabine and oxaliplatin*** group versus 203 (***39%***) patients in the ***observation group*** (stratified hazard ratio [HR] 0·58, 95% CI 0·47–0·72; p<0·0001).
- Estimated ***5-year DFS*** was ***68%*** (95% CI 63–73) in the adjuvant ***capecitabine and oxaliplatin*** group versus ***69%*** (64–73) in the ***observation group***
- Estimated ***5-year OS*** was ***78%*** (95% CI 74–82) in the

Interpretation Adjuvant treatment with capecitabine plus oxaliplatin after D2 gastrectomy should be considered for patients with operable stage II or III gastric cancer.

Randomized trial on adjuvant treatment with FOLFIRI followed by docetaxel and cisplatin versus 5-fluorouracil and folinic acid for radically resected gastric cancer

ANNALS OF ONCOLOGY

Annals of Oncology 25: 1373–1378, 2014

Conclusions: A more intensive regimen failed to show any benefit in disease-free and OS versus monotherapy.

Sequential paclitaxel followed by tegafur and uracil (UFT) or S-1 versus UFT or S-1 monotherapy as adjuvant chemotherapy for T4a/b gastric cancer (SAMIT): a phase 3 factorial randomised controlled trial.

THE LANCET Oncology

2014 Jul;15(8):886-93.

INTERPRETATION: Sequential treatment did not improve disease-free survival.

Two large randomized trials ***failed to report an evidence of superiority of sequential polichemotherapy over single agent CT with fluoropyrimidine***, since none of them met the primary endpoint in terms of DFS

Combination or single-agent chemotherapy as adjuvant treatment of gastric cancer
A systematic review and meta-analysis of published trials

98 (2016) 24–28

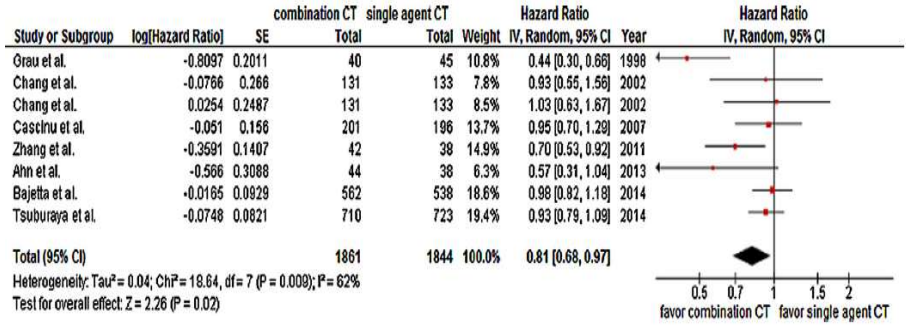

Fig. 2. Overall survival in the overall population.

- In the overall population, ***combination CT decreased the risk of death by 13%*** (HR = 0.87; 95% CI, 0.79–0.95; p = 0.004)
- When analysis was ***limited to studies with D2 lymphadenectomy***, a ***significant reduction of the risk of death was also found*** in favor of combination CT (HR = 0.86; 95%CI, 0.76–0.98; p = 0.02)

Conclusions: This analysis reported that adjuvant combination CT decreases the risk of death over single agent therapy in patients with non-metastatic GC.

- When analysis was ***limited to studies with D2 lymphadenectomy***, a ***non-significant reduction of the risk of relapse*** was found in favor of combination CT

ESTRO School

Timing of Adjuvant Chemotherapy and Impact on Survival for Resected Gastric Cancer

Annals of SURGICAL ONCOLOGY
(2016) 23:4203–4213

	Time to adjuvant chemotherapy				*p* Value	
	<8wk	8-12 wk	>12 wk	No Chemotx	Chemotx cohorts	All cohorts
Overall	37.97	34.98	32.39	48.06	0.759	0.405
Pathologic Stage						
1	113.96	ϕ	ϕ	98.79	0.648	0.193
2	74.08	64.96	65.27	29.90	0.956	<0.001
3	24.88	22.92	23.41	11.68	0.295	<0.001

FIG. 1 Kaplan-Meier estimates of overall postoperative survival of patients undergoing definitive resection for pathologic stages 1–3 gastric cancer, stratified by time to initiation of adjuvant chemotherapy

Median survival was longer for chemotherapy cohorts when compared with the no chemotherapy cohort, specifically in patients with pathologic stages 2 and 3 disease

Conclusions. Time to initiation of AC does not impact survival. With improved survival over patients who did not receive AC, even delayed initiation of chemotherapy should be offered, when appropriate.

- The ***completition rate*** of the whole protocol treatment was only ***47.8%***, whereas that of the ***preoperative chemotherapy*** was ***97%***

Both these trials demonstrated that ***the survival benefit seemed attributable to the effects of the preoperative chemotherapy***

Adjuvant Therapy Completion Rates in Patients with Gastric Cancer Undergoing Perioperative Chemotherapy Versus a Surgery-First Approach

Journal of Gastrointestinal Surgery

J Gastrointest Surg (2016) 20:172–179

Clinicopathologic and treatment variables of 155 patients undergoing potentially curative gastrectomy for stages Ib–IIIc gastric adenocarcinoma from 2001 to 2014 were analyzed, and rates of receipt of chemotherapy and radiotherapy in patients treated with either a surgery-first approach (SURG) or neoadjuvant therapy followed by surgery followed by postoperative therapy (PERIOP) were compared.

Fig. 1 Therapy completion rates in the surgery-first (SURG) group

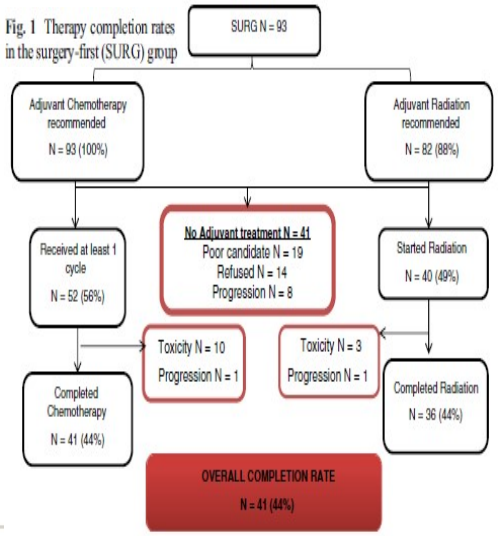

Fig. 2 Therapy completion rates in the perioperative chemotherapy (PERIOP) group

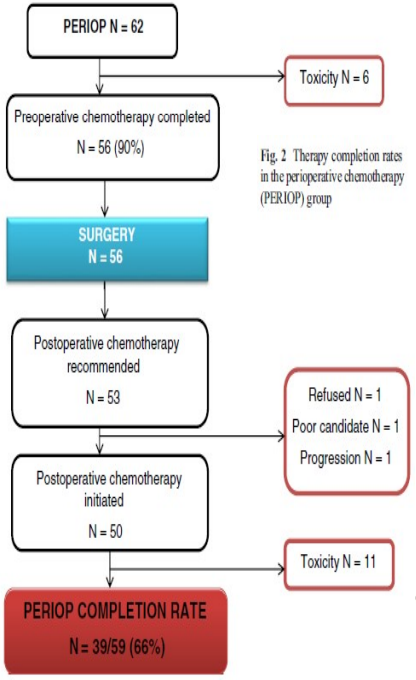


Conclusions

A significantly higher percentage of gastric cancer patients treated with perioperative chemotherapy receive some or all of the recommended multimodality therapy than do patients treated with a surgery-first approach. Strategies designed to deliver *all* (or as much as possible) chemotherapy and radiotherapy *prior to* surgery should be pursued in order to ensure the optimal treatment, and thus the best outcomes, for patients with high-risk gastric cancers.

ESTRO School

Adjuvant therapy for locally advanced gastric cancer

DOI 10.1007/s00595-017-1493-y

- Although the MAGIC and FNCLCC/FFCD trials showed that preoperative chemotherapy was effective for locally advanced gastric cancer, ***whether perioperative chemotherapy is effective when combined with D2 dissection is unclear***
- D2 gastrectomy was performed in ***only 42.5%*** of the patients in the perioperative chemotherapy arm in the ***MAGIC trial*** and the extent of dissection was ***not described in the FNCLCC/FFCD trial***

Perioperative chemotherapy more of a benefit for overall survival than adjuvant chemotherapy for operable gastric cancer: an updated Meta-analysis

SCIENTIFIC REPORTS

| 5:12850 | DOI: 10.1038/srep12850

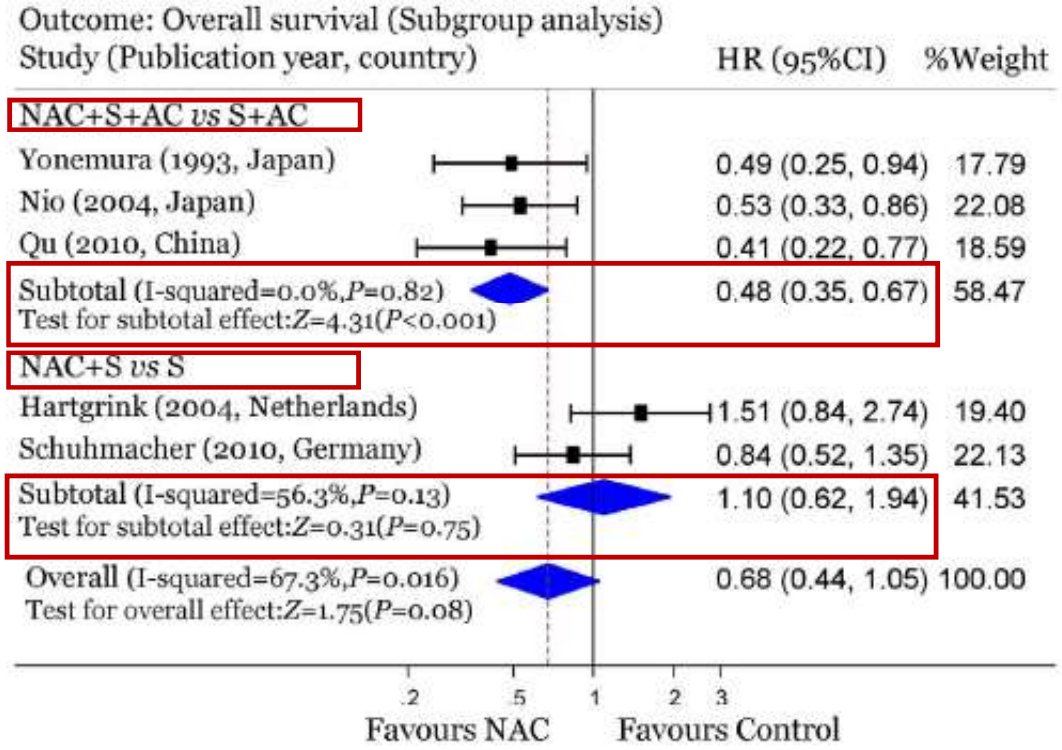
- Would ***NAC alone*** have survival benefits for operable gastric cancer patients, or ***should it be combined with AC***?
- Or ***is AC itself sufficient to improve the survival*** in gastric cancer patients and ***NAC is not useful***?

- The key question is that ***we still don't know if PC exactly has an extra advantage than AC*** in the treatment of operable gastric cancers

- Updated meta-analysis involving 2,093 patients from 14 different trials between 1966 and June, 2014, comparing ***NAC-containing strategies*** with ***NAC-free strategies***, mainly in terms of OS of patients with resectable gastric cancer

Perioperative chemotherapy more of a benefit for overall survival than adjuvant chemotherapy for operable gastric cancer: an updated Meta-analysis

SCIENTIFIC REPORTS
| 5:12850 | DOI: 10.1038/srep12850



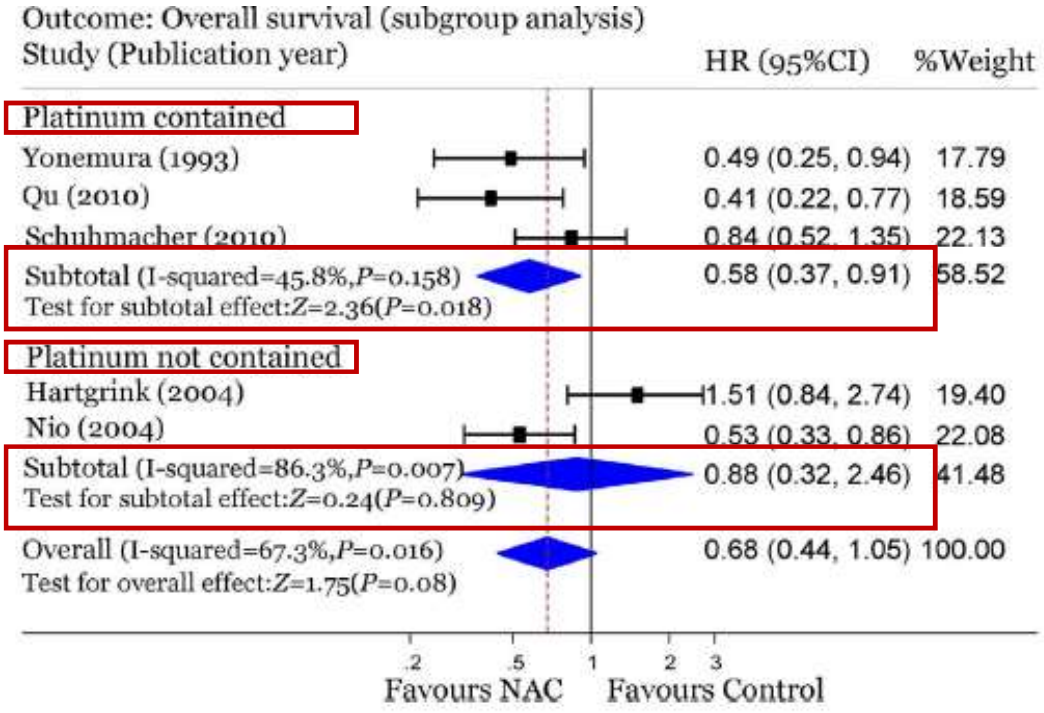
- The OS of the treatment arm that involved ***both AC and NAC*** was significantly improved over the control arm (***AC only***) (HR = 0.48, 95% CI: 0.35–0.67; P < 0.001)

- ***NAC alone plus surgery*** did ***not*** show ***any survival benefit over surgery alone***

Perioperative chemotherapy more of a benefit for overall survival than adjuvant chemotherapy for operable gastric cancer: an updated Meta-analysis

SCIENTIFIC REPORTS

| 5:12850 | DOI: 10.1038/srep12850



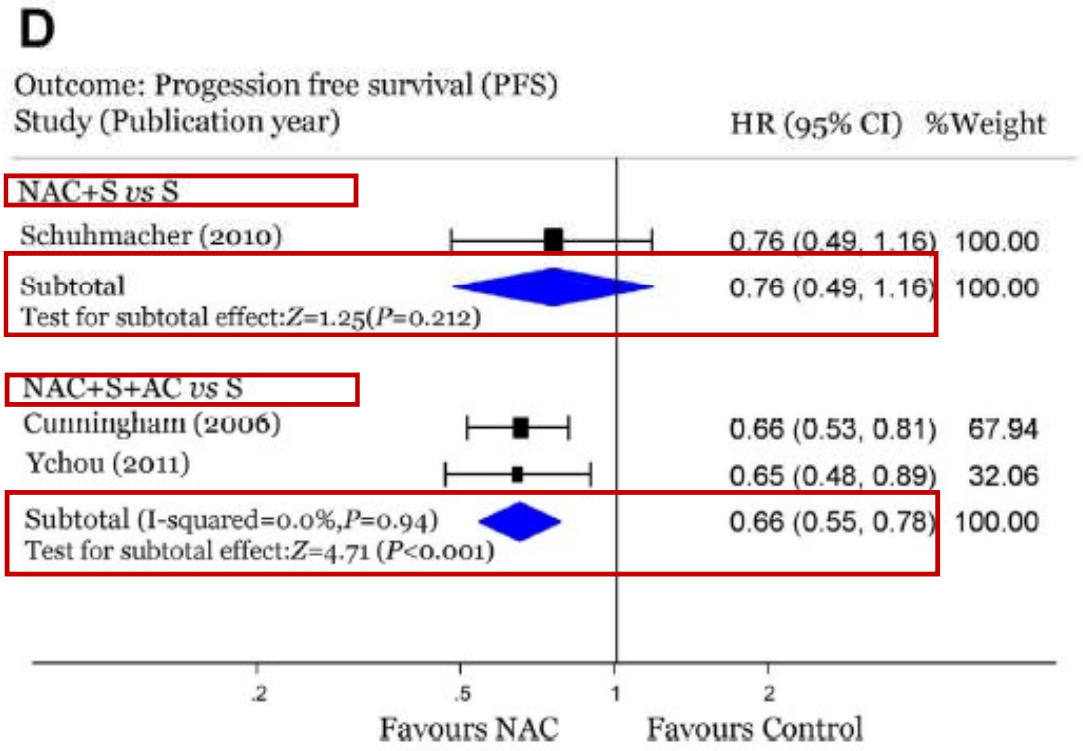
- The ***platinum-containing regimens*** showed ***better efficacy*** in improving OS ***than other regimens***

ESTRO School

Perioperative chemotherapy more of a benefit for overall survival than adjuvant chemotherapy for operable gastric cancer: an updated Meta-analysis

SCIENTIFIC REPORTS

| 5:12850 | DOI: 10.1038/srep12850

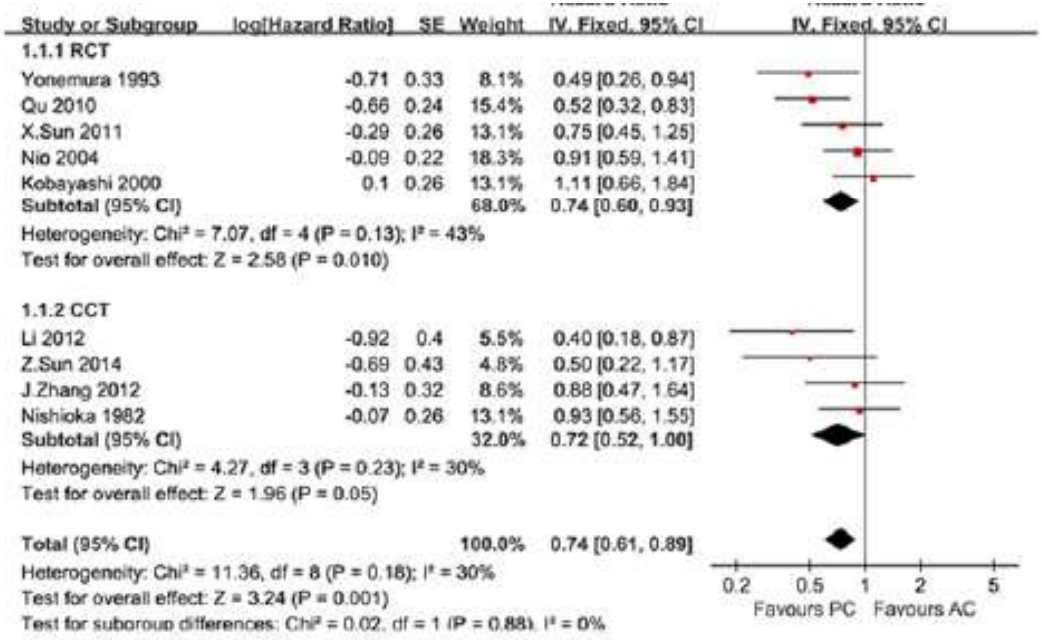


- The results of the perioperative subgroup showed a significant ***increase in PFS***

Which is better for gastric cancer patients, perioperative or adjuvant chemotherapy: a meta-analysis

BMC Cancer

Zhao *et al. BMC Cancer* (2016) 16:631



- Compared with the adjuvant chemotherapy group, the ***perioperative chemotherapy group had significantly better prognosis*** (HR, 0.74; 95 % CI, 0.61 to 0.89; P < 0.01).

ESTRO School

27 March (Monday)

Gastric cancer

Lecture (20'): state of art of chemotherapy in a combined treatment perspective

ESTRO School

Perioperative chemotherapy

- ✓ *What is the impact of preoperative chemotherapy alone?* — *Modest*
- ✓ *Should perioperative chemotherapy be considerd a standard?* — *YES!*
- ✓ *What could be the reasons of the undertreatment of gastric* — *Lack of multidisciplinary expertise*
- ✓ *cancer patients despite available high quality evidence?*
- ✓ *Has pre-operative treatment a negative impact on posto-operative outcomes?* — *No*
- ✓ *What are potential prognostic markers?* — *Lymph node status; TRG*
- ✓ *How can we treat non-responding patients?* — *Clinical trials*
- ✓ *More is better?* — *Probably YES (FLOT4)*

Adjuvant chemotherapy

- ✓ *More is better?* — *May be - Selection of patients is crucial*
- ✓ *Is it better late than ever?* — *Yes*

Perioperative or adjuvant chemotherapy

- ✓ *What is better?* — *NAC alone is not enough and AC alone is not good enough to definitely improve the OS (after D2 dissection?)*
- *AC is inferior to PC*

Thanks!

UNIKLINIK KÖLN

Traditional morphology based diagnostics

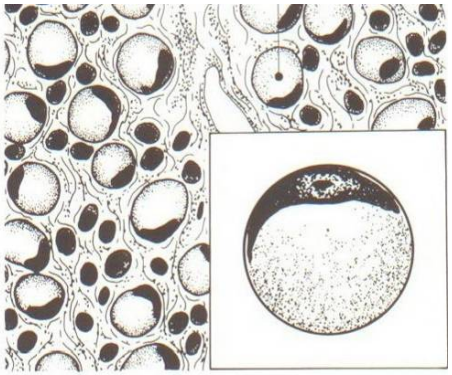
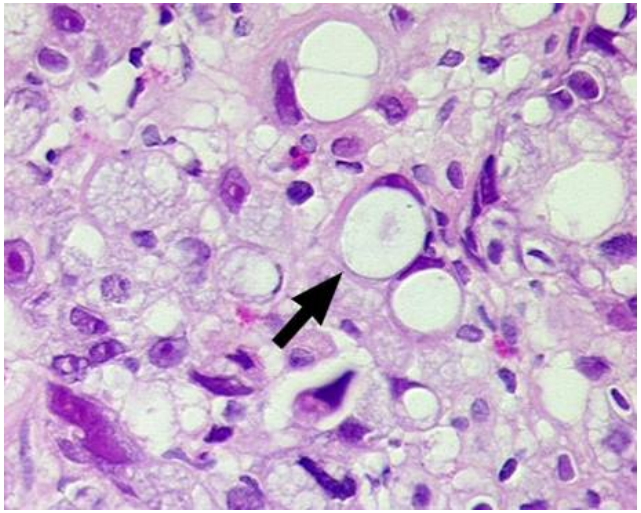
Table 1 Gastric adenocarcinoma classification systems

WHO (2010)	Lauren (1965)
Papillary adenocarcinoma Tubular adenocarcinoma Mucinous adenocarcinoma	Intestinal type
Signet-ring cell carcinoma And other poorly cohesive carcinoma	Diffuse type
Mixed carcinoma	Indeterminate type
Adenosquamous carcinoma	
Squamous cell carcinoma	
Hepatoid adenocarcinoma	
Carcinoma with lymphoid stroma	
Choriocarcinoma	
Carcinosarcoma	
Parietal cell carcinoma	
Malignant rhabdoid tumor	
Mucoepidermoid carcinoma	
Paneth cell carcinoma	
Undifferentiated carcinoma	
Mixed adeno-neuroendocrine carcinoma	
Endodermal sinus tumor	
Embryonal carcinoma	
Pure gastric yolk sac tumor	
Oncocytic adenocarcinoma	

"Carcinomas of the stomach are a heterogeneous group of lesions in terms of architecture, pattern of growth, cell differentiation, and histogenesis..."





From: Bing Hu, Gastric cancer: Classification, histology and application of molecular pathology, J Gastrointest Oncol 2012;3(3):251-261
Hye Seung Han and Gregory Y. Lauwers, Connection 2010

UNIKLINIK KÖLN

Molecular subtypes

1) Chromosomal instable 49,8%
2) Microsatellite-instable 21,7%
3) Genomic stable 19,6%
4) EBV-induced 8,9%

Microsatellite-instable carcinoma and EBV-positive carcinoma: more antigenes/highly inflammed: probably immunocheckpoint inhibition (and perhaps radiation) more effective

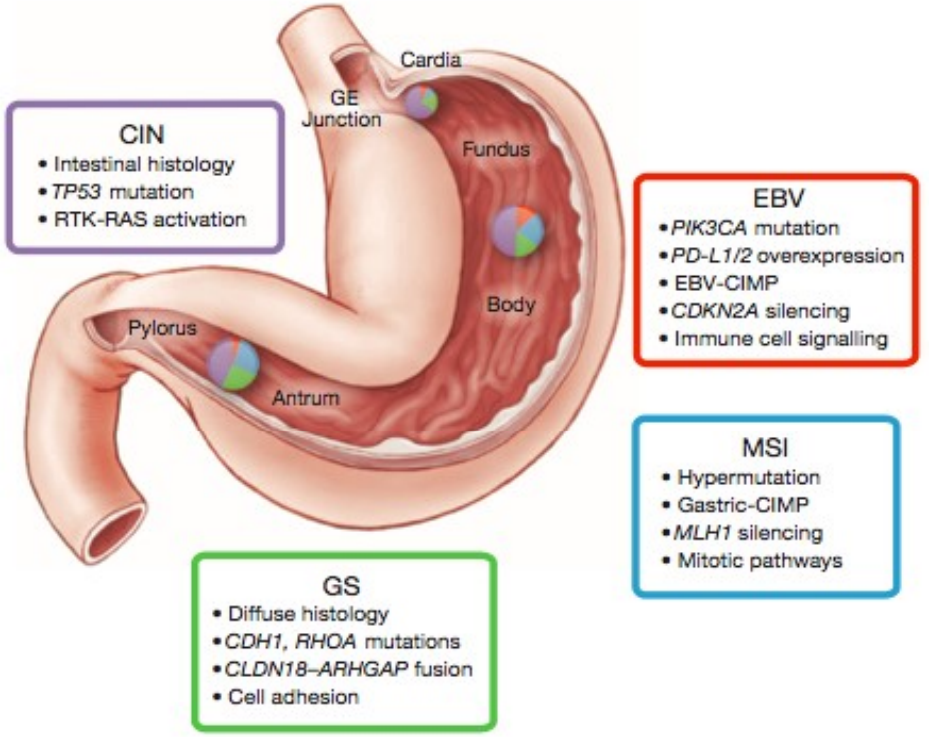


Figure 6 | Key features of gastric cancer subtypes. This schematic lists some of the salient features associated with each of the four molecular subtypes of gastric cancer. Distribution of molecular subtypes in tumours obtained from distinct regions of the stomach is represented by inset charts.

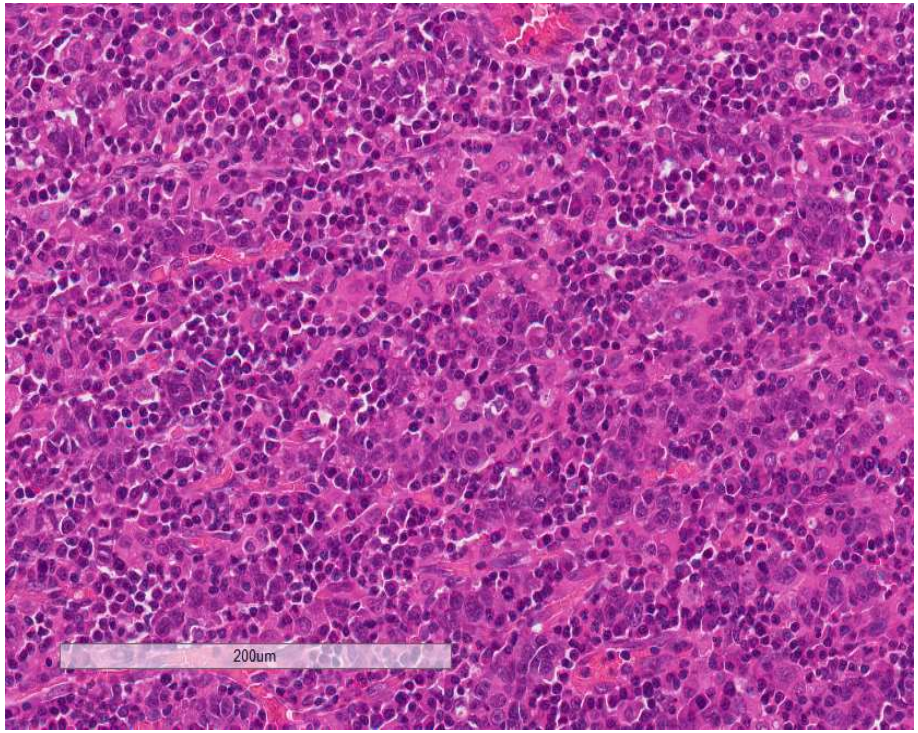
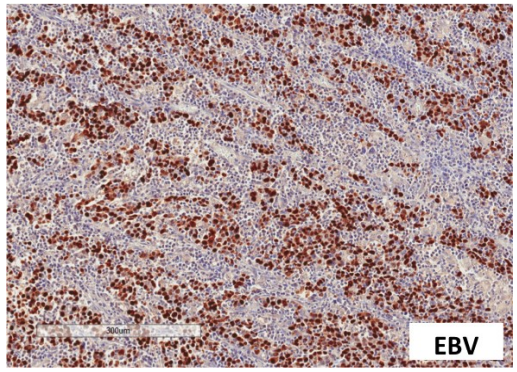
From: CancerGenomeAtlasResearchNetwork, „comprehensive molecular characterization of gastric adenocarcinoma“ Nature 2014

UNIKLINIK KÖLN

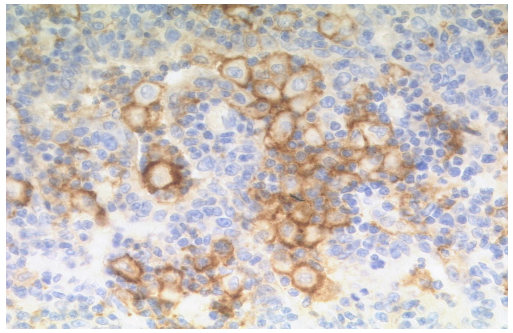
EBV+ gastric carcinoma



WHO: Gastric carcinoma with lymphoid stroma (medullary or lymphoepithelioma-like carcinoma)



EBV-encoded RNA (EBER) in-situ hybridization (ISH)



PD-L1 Immunohistochemistry, Dako-clone 28-8

UNIKLINIK KÖLN

Classifications

WHO (2010)	Lauren (1965)	Goseki (1992)	Ming (1992)	Molecular (2014)
Papillary adenocarcinoma	Intestinal type		(expanding type)	Chromosomal instable, MSI*
Tubular adenocarcinoma		type 1, (type 2, type 3)	(infiltrating type)	
Mucinous adenocarcinoma				
Signet-ring cell carcinoma	Diffuse type	type 4		Genomic stable
And other poorly cohesive carcinoma				
Mixed carcinoma	Indeterminate type			
Adenosquamous carcinoma				
Squamous cell carcinoma				
Hepatoid adenocarcinoma				
Carcinoma with lymphoid stroma				EBV-related; MSI*
Choriocarcinoma				
Carcinosacrcoma				
Parietal cell carcinoma				
Malignant rhabdoid tumor				
Mucoepideroid carcinoma				
Paneth cell carcinoma				
Undifferentiated carcinoma				
Mixed adeno-neuroendocrine carcinoma				
Endodermal sinus tumor				
Embryonal carcinoma				
Pure gastric yolk sac tumor				
Oncocytic adenocarcinoma				

The correlation between the different classification systems is relatively. The Ming classification can not be assigned to the other classifications.

* MSI = Microsatellite instable

Summary

- Two main types: intestinal and diffuse adenocarcinoma
- Many (and rare) special types according to WHO
- Heterogeneity of tumors is a big problem (morphology-based and molecular-based; Her2/neu only focally expressed
- Some progress in molecular subtyping
  - MSI and EBV related: checkpoint inhibition effective?
  - rare other subtypes (BRCA, ATM, POLE)
- >16 regional lymph nodes
- Regression scores after neoadjuvant treatment (e.g. Becker et.al)
- Tumormicroenviroment

UNIVERSITÀ CATTOLICA del Sacro Cuore

ESTRO School

CTV DELINEATION: Postoperative Setting

CTV consists of 3 parts:

1. Anastomoses
2. Gastric Bed/Remnant
3. Lymphnodes (at risk)

CTV DELINEATION: Postoperative Setting

1. Anastomoses

- for tumors of the proximal stomach or GE- junction, the oesophagojejunal anastomosis has to be treated
- duodenal stump has to be treated in tumors of the distal stomach

CTV DELINEATION: Postoperative Setting

2. Gastric Bed/Remnant

- GEJ and proximal tumors at least 2/3-3/4 of the left medial hemidiaphragm
- T1-2 tumors: tumor bed not necessarily
- Hepatogastric ligament (i.e. part of lesser omentum between liver and lesser curvature, which contains peri-gastric nodes)
- Anterior abdominal wall: only in T3-4 tumors with invasion or a close relationship with the anterior abdominal wall on pre-operative imaging or when described by the surgeon during surgery

CTV DELINEATION: Postoperative Setting

3. Lymphnodes

- **GE-Junction/ Cardia/proximal 1/3**: para-oesophageal, perigastric, hepatogastro lig, perigastric, ,celiac (left gastric artery, celiac axis), splenic hilum, suprapancreatic, porta hepatis, pancreaticoduodenal **[Stations 1-4;7,9-13]**

- **Corpus/middle 1/3:** perigastric, suprapyloric, infrapyloric, celiac (left gastric artery, common hepatic artery and celiac axis), splenic hilum, suprapancreatic, porta hepatis, pancreaticoduodenal **[Stations 3-13]**

- **Antrum/distal 1/3:** perigastric, suprapyloric, infrapyloric, splenic artery, pancreaticoduodenal, porta hepatis, celiac (left gastric artery, common hepatic artery and celiac axis), suprapancreatic **[Stations 3-9;11-13]**

CTV DELINEATION: Postoperative Setting

3. Lymphnodes

- **GE-Junction/ Cardia/proximal 1/3**: para-oesophageal, perigastric, hepatogastro lig, perigastric, ,celiac (left gastric artery, celiac axis), splenic hilum, suprapancreatic, porta hepatis, pancreaticoduodenal **[Stations 1-4;7 9-13]**

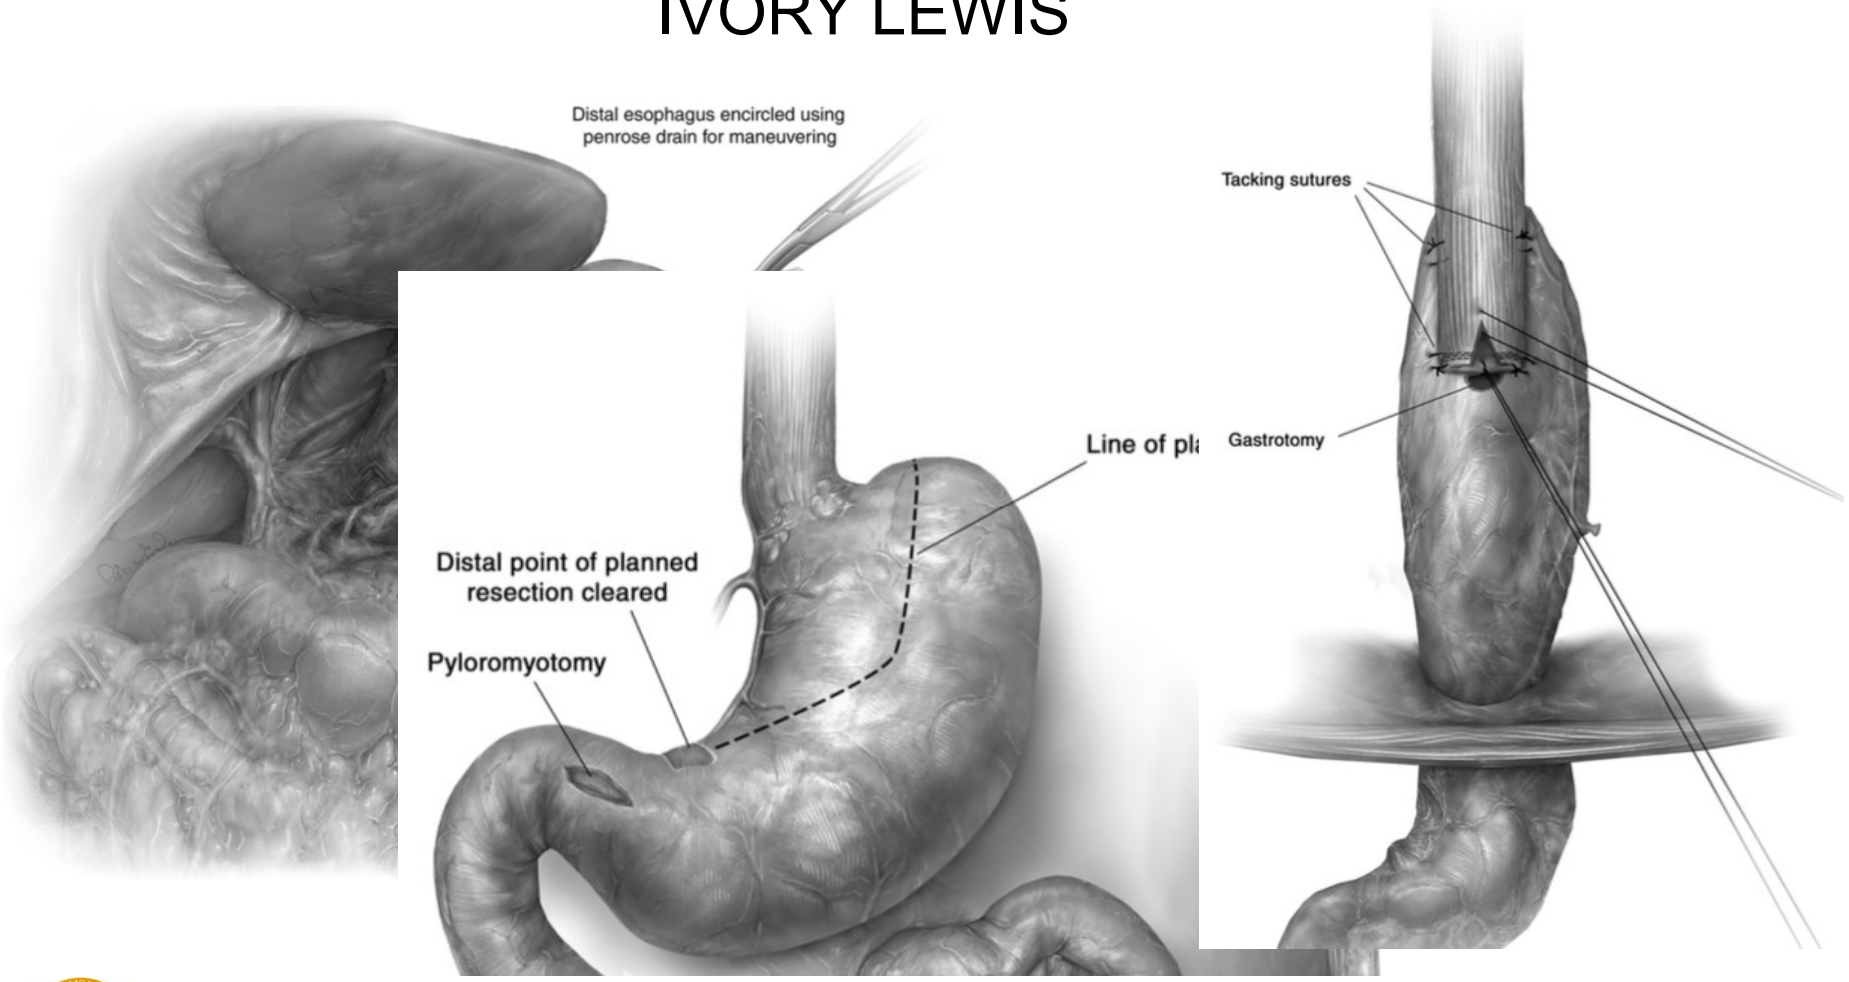
+ all combinations when tumor invaded more than one part of the stomach before start of treatment

- **Corpus/m**eliac (left gastric art ic hilum, suprapancreatic, porta hepatis, pancreaticoduodenal **[Stations 3-13]**

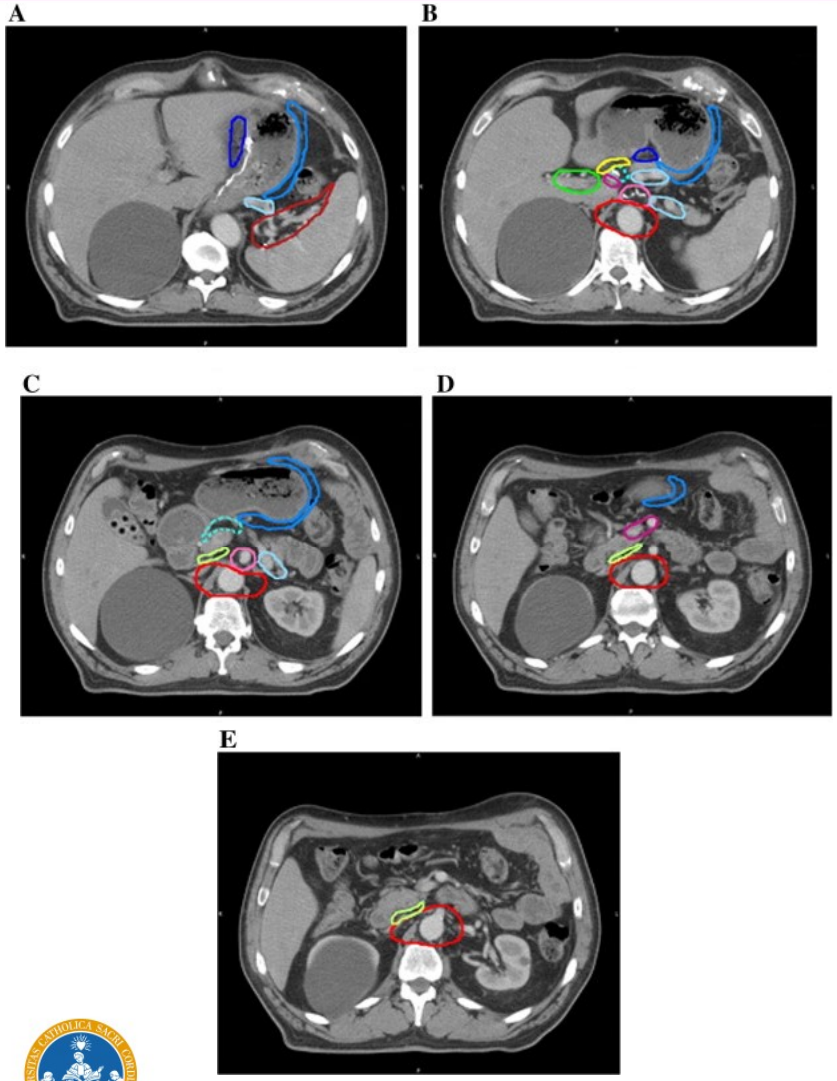
- **Antrum/distal 1/3:** perigastric, suprapyloric, infrapyloric, splenic artery, pancreaticoduodenal, porta hepatis, celiac (left gastric artery, common hepatic artery and celiac axis), suprapancreatic **[Stations 3-9;11-13]**

CTV DELINEATION: Postoperative Setting – Surgical Approach

IVORY LEWIS



CTV DELINEATION: Postoperative Setting – Surgical Approach



IVORY LEWIS

- Paracardial LN are tipically dissected;
- Perigastric LN may be transposed into thoracic cavity;
- Splenic artery not routinely dissected;
- Left gastric artery can be taken at its origin (clips?);
- Kocher maneuver: medially and superiorly shifting duodenum along with supra/infra-pyloric LN

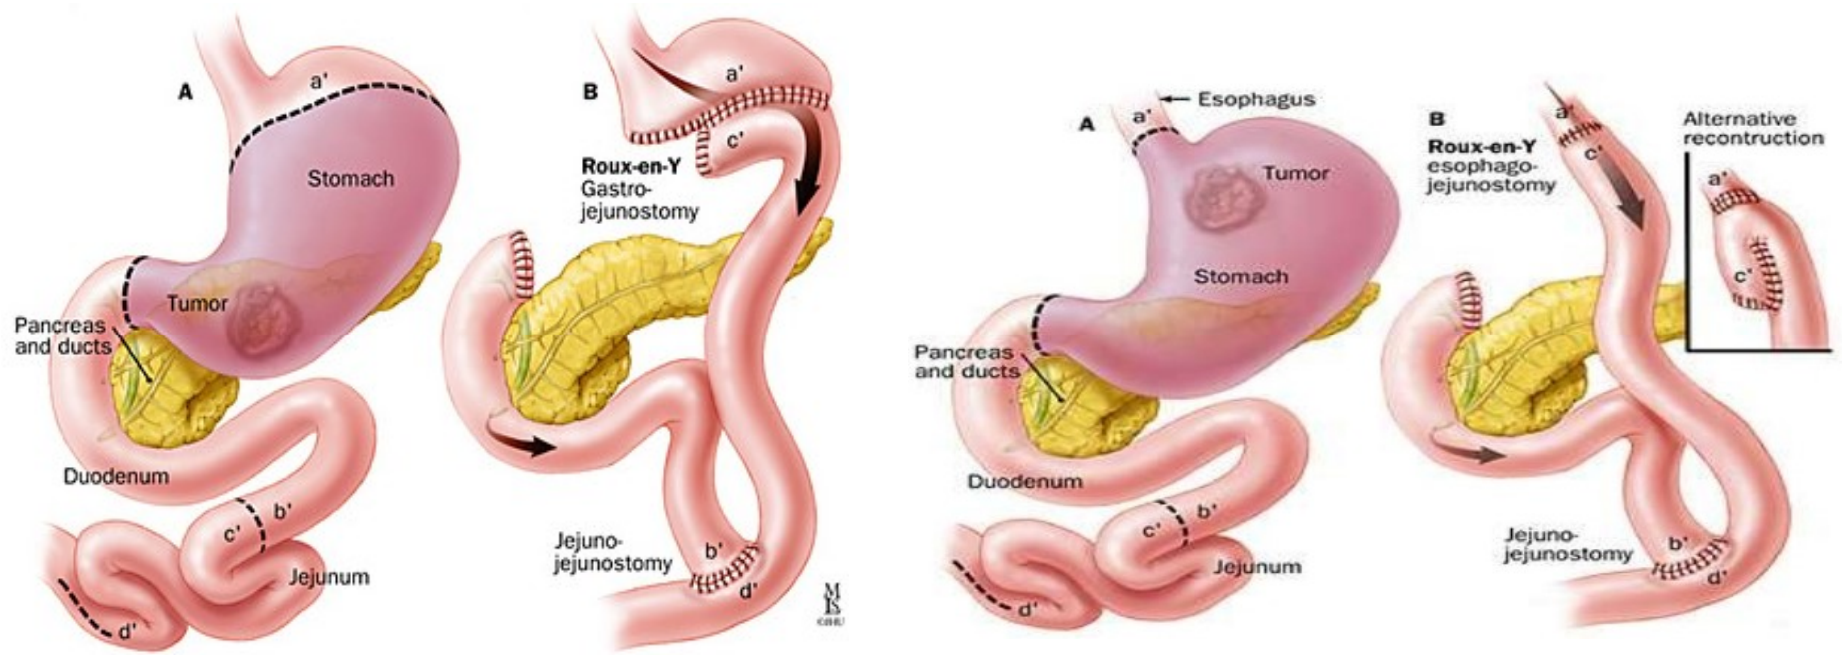
UNIVERSITÀ CATTOLICA del Sacro Cuore

Wo *et al.; PRO* - 2013

ESTRO School

CTV DELINEATION: Postoperative Setting – Surgical Approach

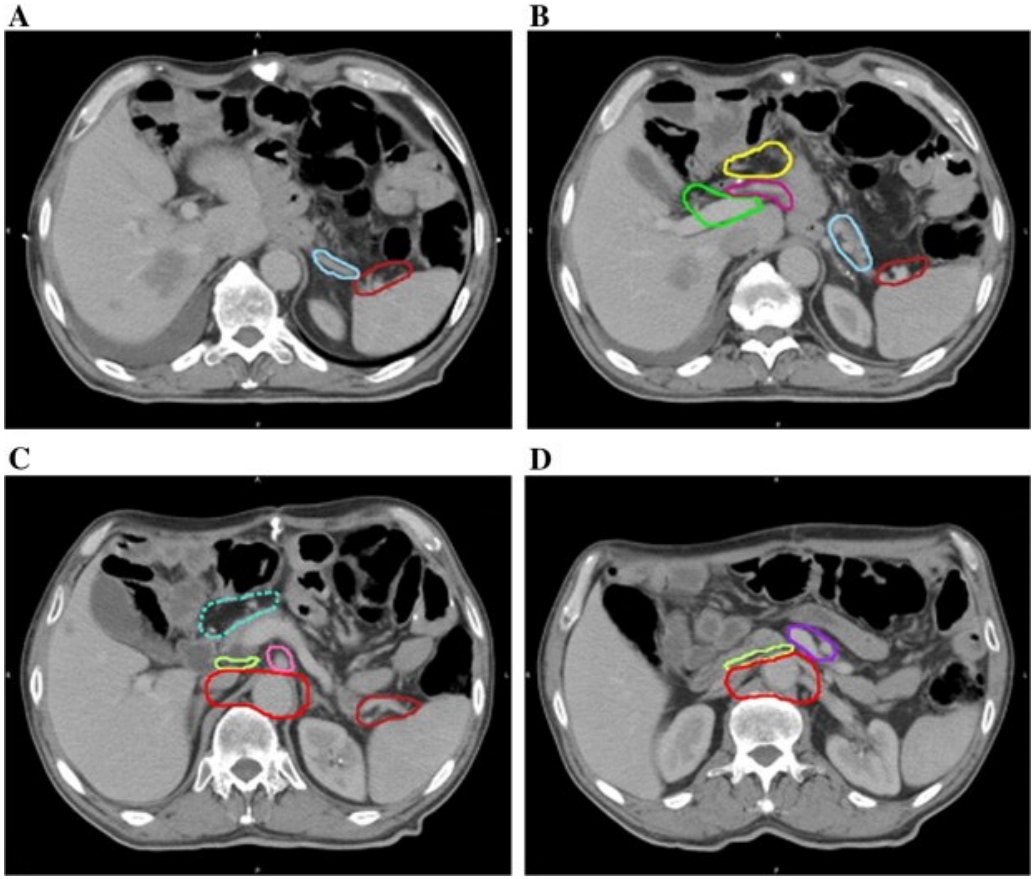
Roux-En-Y



UNIVERSITÀ CATTOLICA del Sacro Cuore

ESTRO School

CTV DELINEATION: Postoperative Setting – Surgical Approach

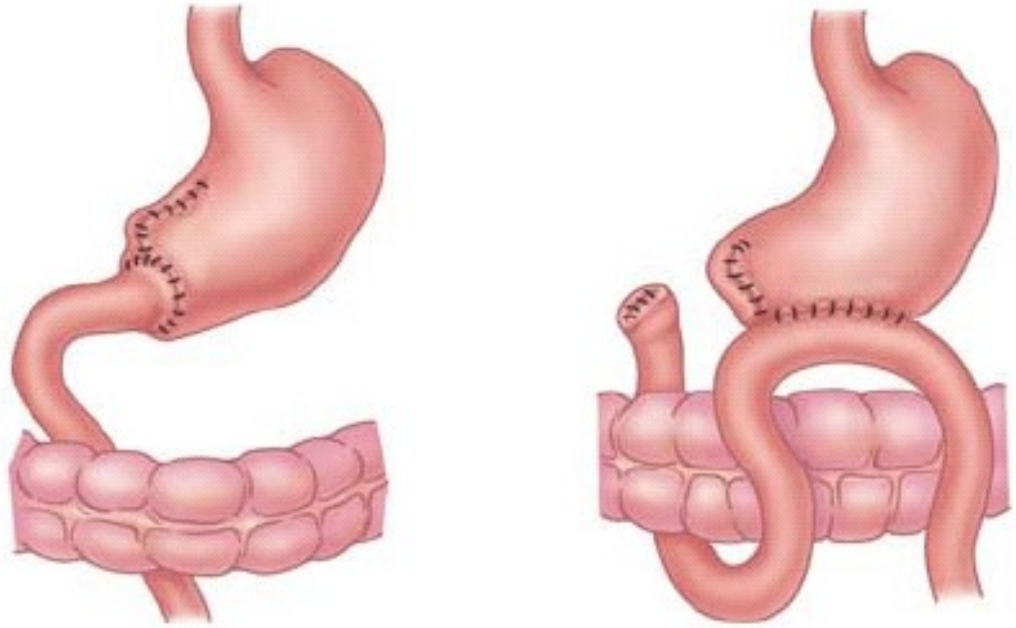


Roux-En-Y

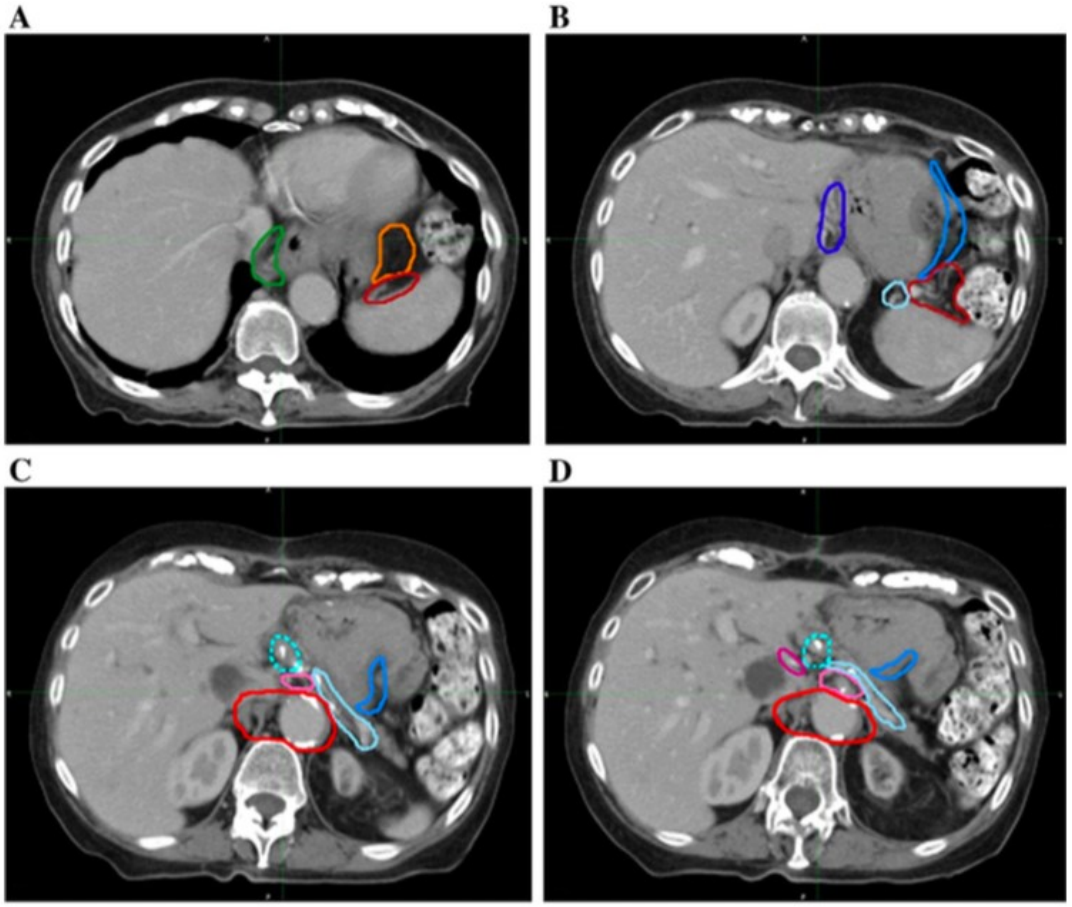
- Stomach removed (completely or partially) along with paracardial, lesser, greater curvature
- Supra- and infrapyloric LN should be identified

CTV DELINEATION: Postoperative Setting – Surgical Approach

Subtotal Gastrectomy



CTV DELINEATION: Postoperative Setting – Surgical Approach



Subtotal Gastrectomy

- Paracardial and portions of the lesser and greater nodes not dissected
- Infrapyloric and suprapyloric ideally removed

CTV DELINEATION: Guidelines

NCCN National Comprehensive Cancer Network®

NCCN Guidelines Version 1.2016
Gastric Cancer

Proximal One-Third/Cardia/Esophagogastric Junction Primaries

- **Preoperative and Postoperative**
  - **With proximal gastric lesions or lesions at the esophagogastric junction (EGJ), a 3- to 5-cm margin of distal esophagus and nodal areas at risk should be included. Nodal areas at risk include: perigastric, celiac, splenic hilar, porta hepatic, and lymph nodes. Coverage of nodal areas may be modified based on clinical circumstances and the risks of toxicity.**

Middle One-Third/Body Primaries

- **Preoperative and Postoperative**
  - **Nodal areas at risk include: perigastric, suprapancreatic, celiac, splenic hilar, porta hepatic, and pancreaticoduodenal lymph nodes.**

Distal One-Third/Antrum/Pylorus Primaries

- **Preoperative**
  - **First and second part of duodenum should be included if the gross lesion extended to the gastroduodenal junction. Nodal areas at risk include: perigastric, suprapancreatic, celiac, porta hepatic, and pancreaticoduodenal lymph nodes.**
- **Postoperative**
  - **A 3- to 5-cm margin of duodenal stump should be included if the gross lesion extended to the gastroduodenal junction. Nodal areas at risk include: perigastric, suprapancreatic, celiac, porta hepatic, and pancreaticoduodenal lymph nodes.**

CTV DELINEATION: CONCLUSION

- Main setting of Target delineation is defined but still some issues remaining
- Refer to available Consensus recommendations
- Refer to Atlas to identify normal structures and target
- Refer to Surgeon and Radiologist into Multidisciplinar frame

ESTRO School

Dose issues in gastric tumor control

Marcel Verheij MD PhD
Department of Radiation Oncology
NKI, Amsterdam

Contents

- Introduction
- Current evidence-based treatment strategies
- Dose issue 1: efficacy
- Dose issue 2: toxicity

Epidemiology of gastric cancer

- Europe ~140,000 cases/year; ~107,000 deaths
- The Netherlands >2,000 cases/yr; ~1,000 deaths
- 3rd cause of death from cancer worldwide
- Distal cancers decreasing; tumors of cardia or GEJ increasing
- Proximal gastric cancer associated with reflux disease
- Distal gastric cancer associated with *H. pylori*
- 65% T3-T4; 85% N+; 30% liver metastases

Summary (1): general

- *Gastric cancer has a poor outcome*

- *Despite adequate surgery (D2; ≥15 ln), local-regional recurrence rates remain high*

- *Evidence-based strategies to improve surgical results are:*

  - *post-operative chemoradiation (SWOG/US)*
  - *peri-operative chemotherapy (MAGIC/EU)*
  - *adjuvant chemotherapy (ARTIST, CLASSIC/Asia)*

- *CRITICS showed no difference between post-operative chemotherapy and post-operative chemoradiation after adequate surgery and pre-operative chemotherapy*

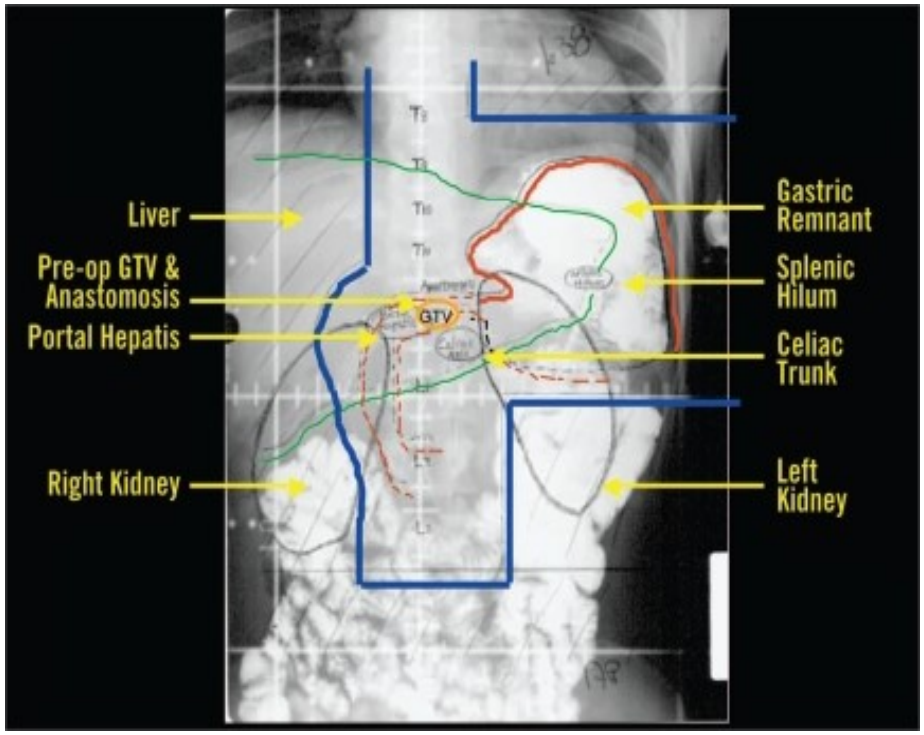
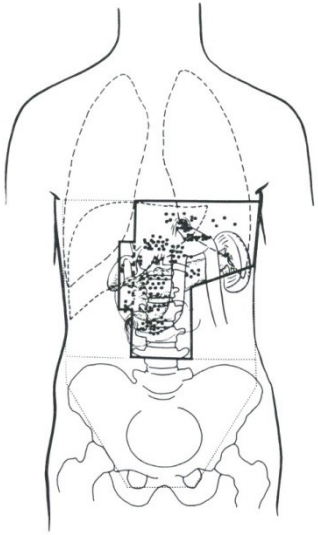
Summary (2): efficacy

- *Gastric cancer is relatively radioresistant and has a high tendency to recur locoregionally after surgery*
- *To obtain disease control, high radiation doses (>40-50 Gy) are required*
- *Radiotherapy alone in the pre- or post-operative setting is well-tolerated, but shows limited benefit*
- *Chemoradiotherapy shows the largest benefit*
- *Pre-operative chemoradiotherapy has advantages over post-operative treatment*

Radiotherapy-technique according to the SWOG protocol (2001)

2D AP-PA





ESTRO School

Adjuvant chemoradiotherapy vs. surgery

SWOG-Intergroup 0116 Trial: comments

Suboptimal surgery:

- only 10% underwent the advised D2 dissection; 54% < D1

Suboptimal radiotherapy:

- 34% had major radiation treatment plan deviation
- outdated radiation techniques; no data on late toxicity (kidney)

Suboptimal chemotherapy:

- according to present standard, chemotherapy was suboptimal and the interaction with radiation limited

Critical structures and dose constraints

- Kidneys: at least 2/3 of the volume of 1 (right) normally functioning kidney should receive less than 18 Gy (i.e. 40% of the prescribed physical dose)
- Liver: EQD2 D_{mean} < 30 Gy (α/β=3)
- Heart: 3/3 <40 Gy; 2/3 <50 Gy; 1/3 < 66 Gy
  (<30% cardiac silhouette may receive 40 Gy)
- Spinal cord: EQD2 D_{max} ≤ 50 Gy (α/β=2)
- Spleen: ?

Pan C. IJROBP 2010

ESTRO School

OAR: liver

Radiation-induced liver disease (RILD):

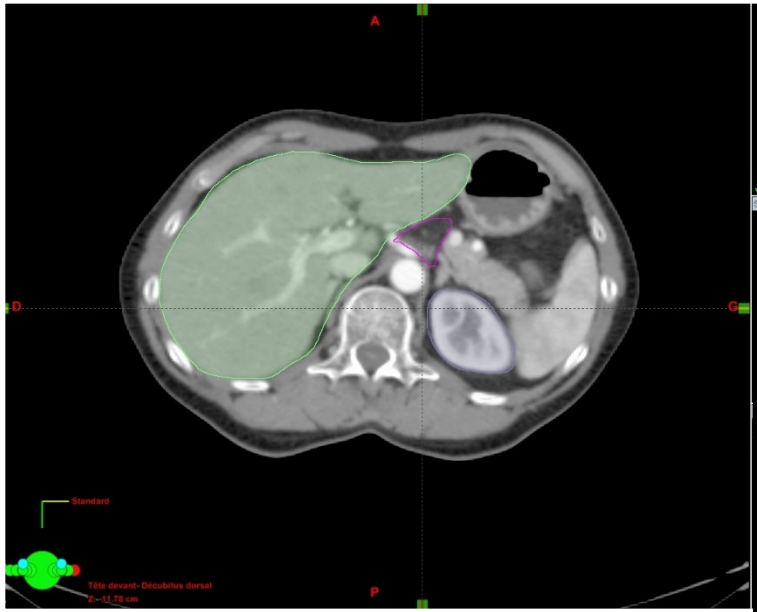
➔ between 2 weeks and 3 months after radiotherapy

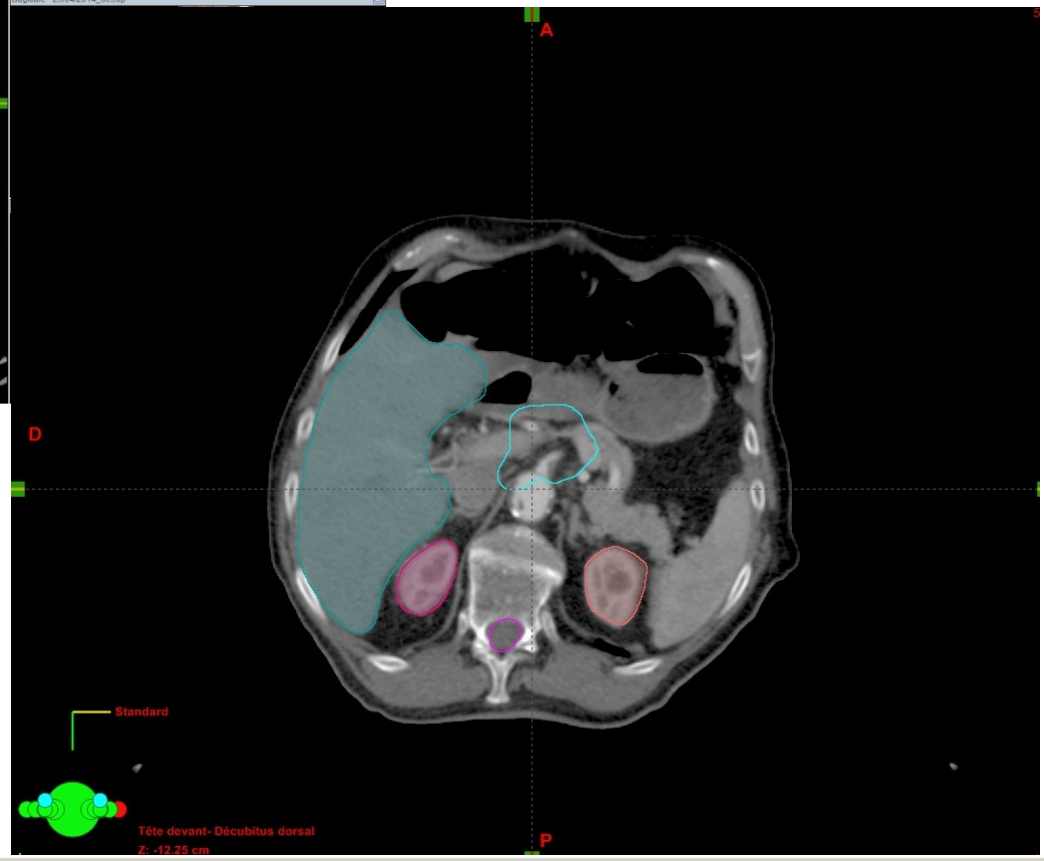
➔ Preexisting liver disease may render patients more susceptible

Findings by QUANTEC are very similar to the original estimates by Emami

Organ	Endpoint	Rate (%)	Dose-volume parameter	D_{max} (Gy)	D_{mean} (Gy)
Liver	RILD, normal liver	<5			≤30
	RILD, liver disease	<5			≤28

Kidneys





ESTRO School

Kidney

- Radiation-induced renal dysfunction:
  - wide array of endpoints (creatinine clearance to renal failure)

- Bilateral ***whole kidney*** irradiation: pooled analysis by Cassady:
  - mean dose of 18 Gy corresponded to a 5% risk of injury at 5 years.
- For bilateral ***partial kidney*** irradiation, the data is less clear
- Small volumes of the kidney can tolerate relatively high doses of radiation

QUANTEC:

- <5% risk of injury when the mean kidney dose is limited to <18 Gy.
- Current common practice of limiting the equivalent of one kidney to <20 Gy

Organ	Endpoint	Rate (%)	Dose-volume parameter	D_{max} (Gy)	D_{mean} (Gy)
Kidney 1	Renal dysfunction	<5	Equivalent of 1 kidney <18 Gy		
Kidney 2	Renal dysfunction	<5			<18

NCCN guidelines

Normal Tissue Tolerance Dose-Limits

- **Treatment planning is essential to reduce unnecessary dose to organs at risk including liver (60% of liver <30 Gy, ≤25 Gy mean dose to liver), kidneys (at least 2/3 of one kidney <20 Gy), spinal cord (<45 Gy), heart (1/3 of heart <40 Gy, effort should be made to keep the left ventricle doses to a minimum), and lungs.[a]**
- **It is recognized that these dose guidelines may be appropriately exceeded based on clinical circumstances**

Liver:	60% < 30 Gy; mean dose < 25 Gy
Kidneys:	2/3 of one Kidney < 20 Gy
Spinal cord:	< 45 Gy
Heart:	1/3 heart < 40 Gy; left ventricle ALARA
Lungs

Re-irradiation and “modern” treatment planning

Dirk Verellen

DV is involved in an on-going scientific collaboration with RaySearch

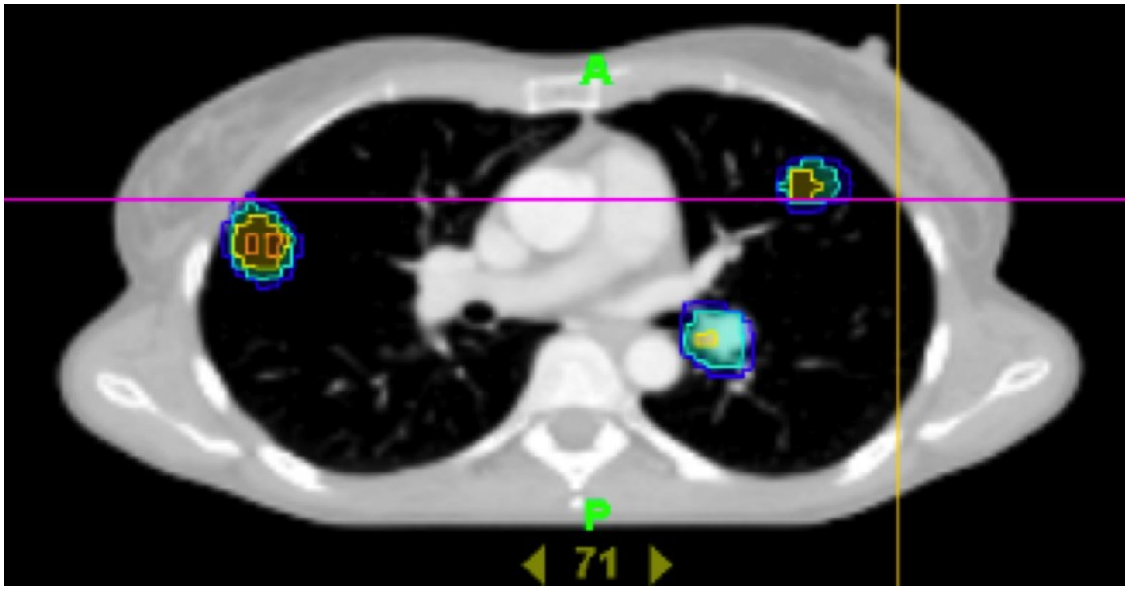
ESTRO School

Outline

- Where do we come from?
  - Intra-departmental
  - Inter-departmental

- A few examples:
  - "poor man's solution": breast as example
  - Dose accumulation, with different fractionations: Oesophagus
    - Level 1: manually assessing EQD2
    - Level 2: rescaling both dose distributions to EQD2 and accumulate
    - Level 3: rescaling dose distributions taking into account the different α/β (and recovery …) of all OAR's and accumulate.
  - SBRT oligometastases: mixing fractionations and treatment machines
- Some remaining challenges
- Conclusions

Palliation and QoL: a case study



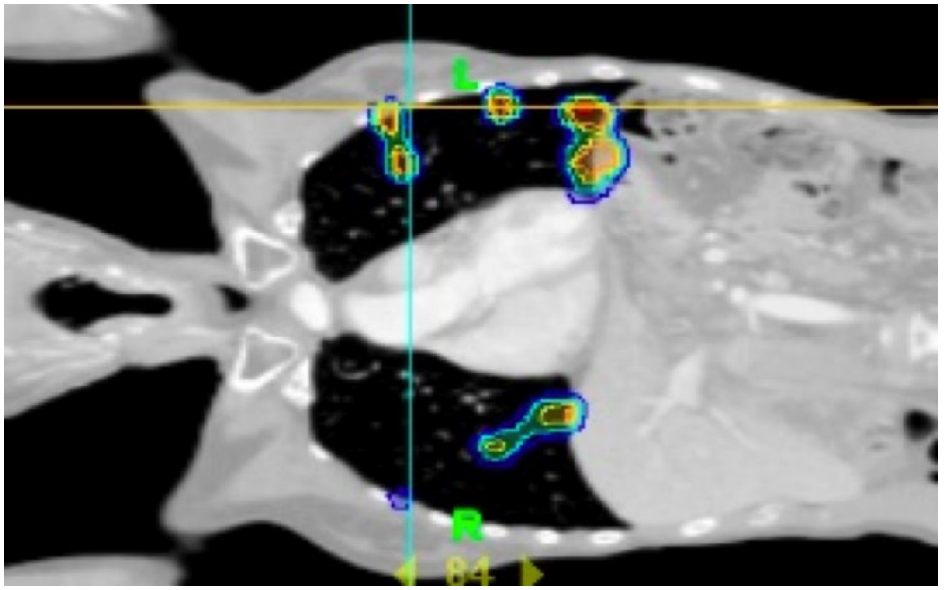


Illustration of a palliative setting in radiotherapy. The patient previously treated for a nasopharyngeal carcinoma presented multiple (17) metastasis not responding after several cycles of chemotherapy, and was treated on all lesions with 10 times 4 Gy with helical tomotherapy in **July 2008**, early 2012 the patient was still in good overall condition.

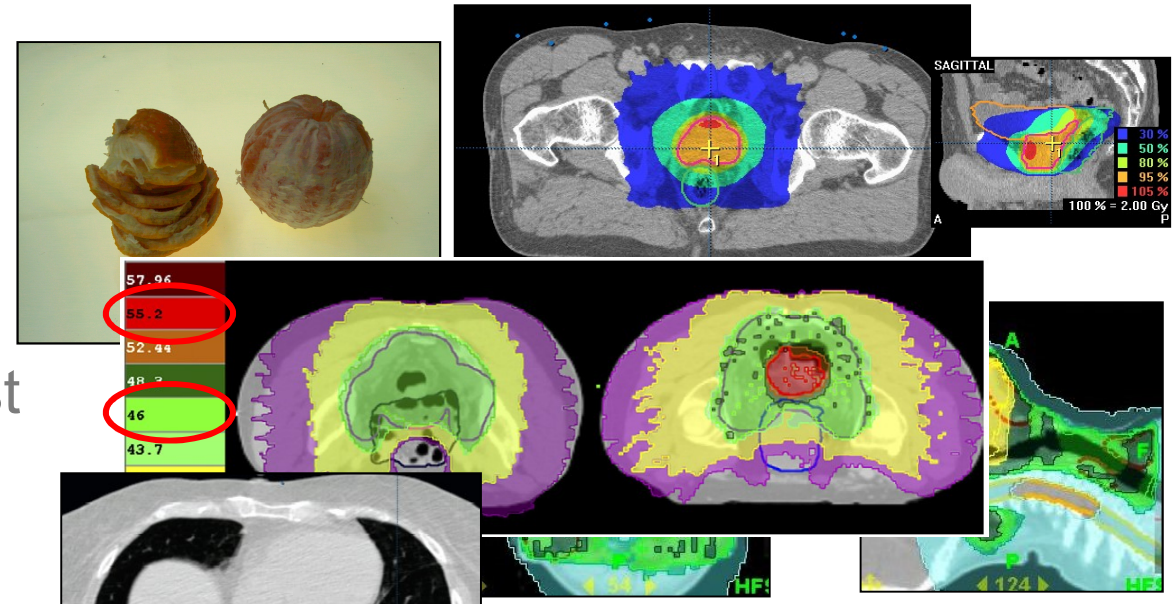
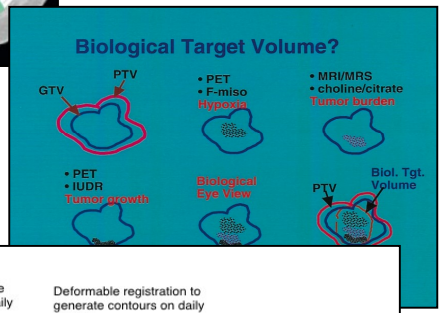
“...et les 2500m d'altitude ne m'ont posé aucun trouble particulier au plan respiratoire ni cardiaque, juste quelques courbatures aux mollets le lendemain.....”

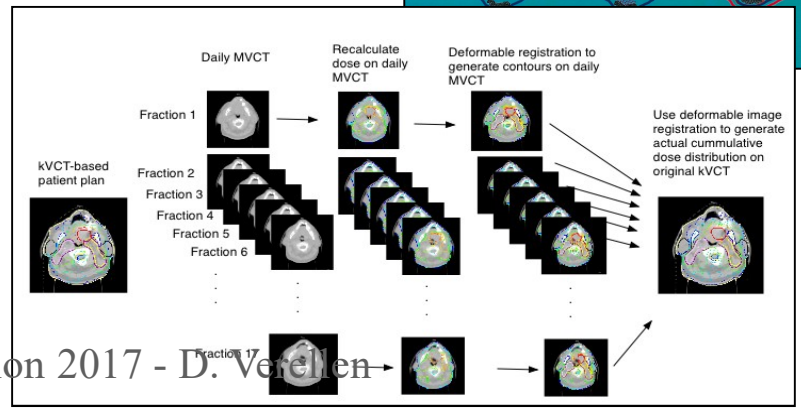
Possibilities created by IGRT/IMRT

- Margin reduction:
  - Dose escalation
  - Conformal avoidance
- Simultaneous Integrated Boost (SIB)
- Reviewed dose fractionation (SBRT)
- Biological Conformal Radiation Therapy (BCRT)
- Adaptive Radiation Therapy (ART)



Paint by numbers, Warhol 1962

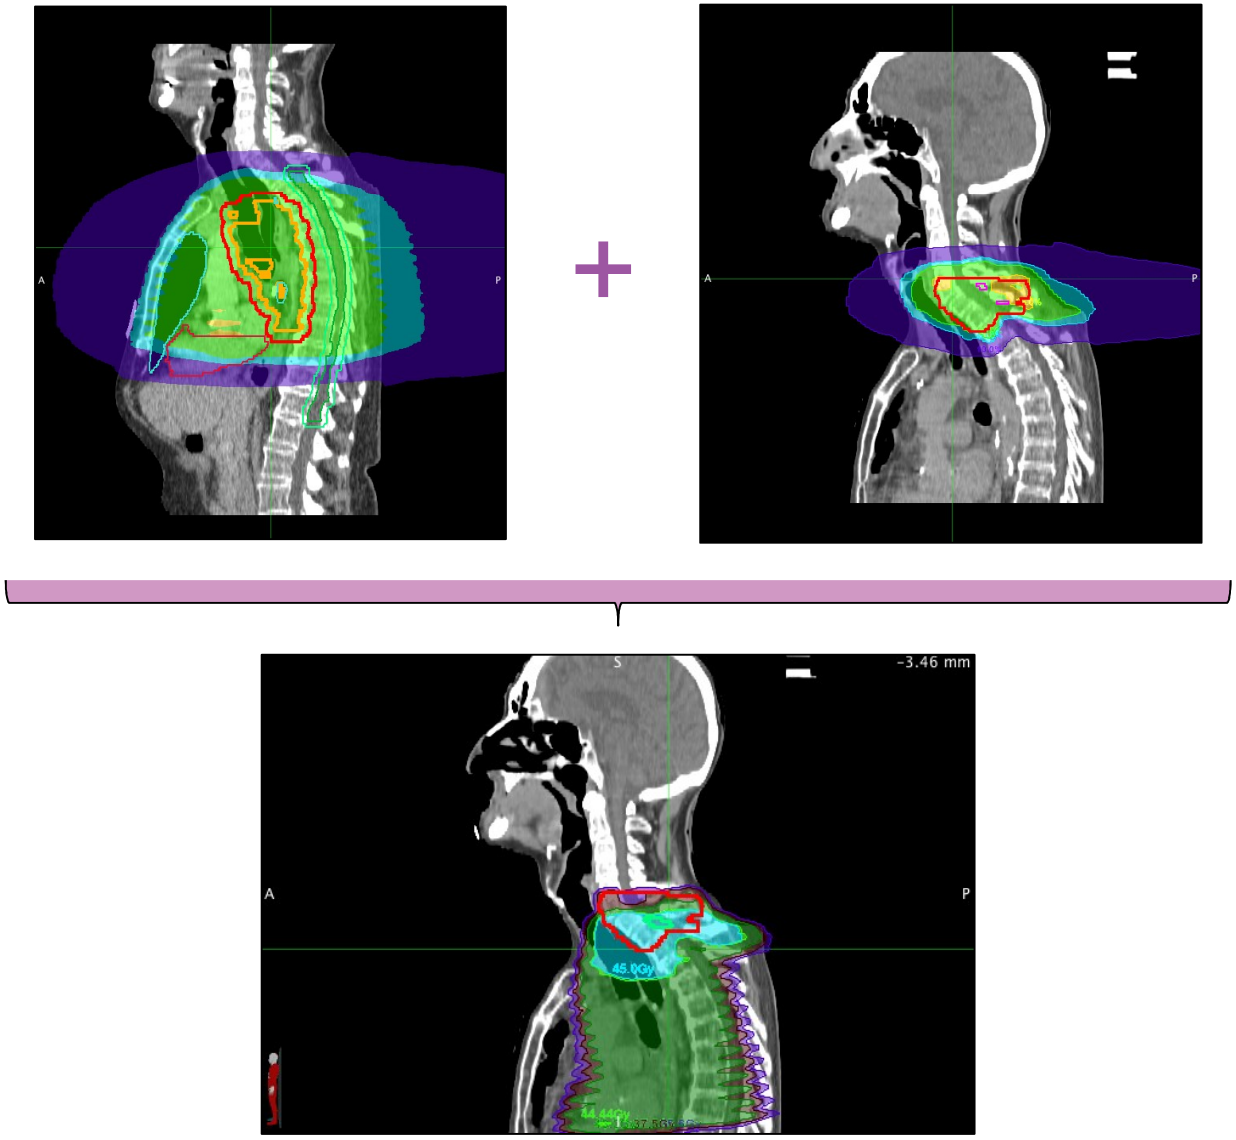




ESTRO School

Possibilities created by IGRT/IMRT and modern treatment planning

- Re-irradiation



ESTRO School

Is it that simple?

- **Requirements for dose accumulation**?
  - Adding dose distributions from different treatment planning systems
  - Adding dose distributions originating from different fractionations schemes
  - Including α/β for different OARs and PTVs, and rescaling dose distribution dynamically (… what α/β will we use?)
  - Including the recovery factors …
  - Assessing accuracy of deformable registration?
  - Applying the information in optimization
  - Is the planned dose equal to the delivered dose?
  - … what is the tolerance dose?????

Vision Papers
True Dose
Imaging
Biomarkers
Data Sharing
Lessons of QUANTEC

Each with 10 sections

1. **Clinical Significance**- Describes the clinical situations where the organ is irradiated, and the incidence/significance of organ injury.
2. **Endpoints**- Describes the different endpoints often considered when assessing injury, the impact of endpoint-selection on the reported injury rates, the challenges/utilities of different endpoints, and the time course of organ injury.
3. **Challenges Defining Volumes**- Describes how the organ is typically defined (or segmented) on treatment planning images. Includes a discussion of uncertainties/challenges in organ definition (e.g. changes in organ volume/shape during therapy), and the associated impact on DVH's and dose/volume/outcome analyses.
4. **Review of Dose/Volume Data**- A comprehensive summary of reported 3D dose/volume data for clinically-relevant outcomes.
5. **Factors Affecting Risk**- Other clinical factors affecting the risk of injury are noted (e.g. age, combined modality therapy, dose fractionation).
6. **Mathematical/Biological Models**- Models that have been used to relate 3D dose/volume data to clinical outcomes are summarized, along with associated model parameters, limitations and uncertainties.
7. **Special Situations**- Most of the data discussed relates to conventional fractionation. This section describes situations were the presented data/models may not apply (e.g. hypo-fractionation).
8. **Recommended Dose/Volume Limits**- The available information is condensed into meaningful dose/volume limits, with associated risk rates, to apply clinically.
9. **Future Toxicity Studies**- Describes areas in need of future study.
10. **Toxicity Scoring**- Recommendations on how to score organ injury.

Fig. 1. Outline of the issue: the first section consists of Introductory Papers; the second section consists of Organ-Specific Papers, each containing 10 topic sections; and the third section consists of Vision Papers.

- Useful guidelines for normal tissue tolerances in the **primary** situation
- Very limited information concerning **re-irradiation**

ESTRO School

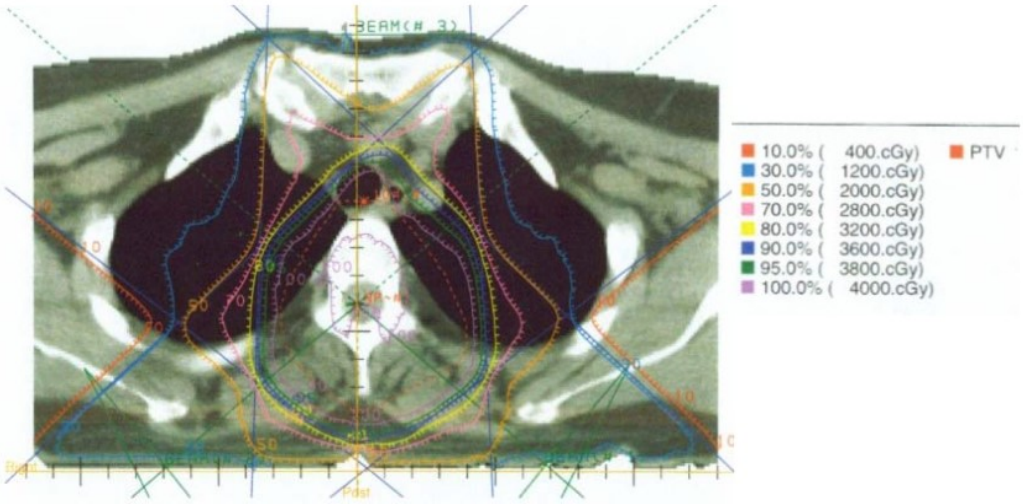
The QUANTEC Report 2010

- Very limited information concerning re-irradiation
- Maybe, because reliable data is limited …
  - Even in a so-called intra-departmental situation, using the same treatment planning system for years, it '*was*' difficult to accumulate dose.
  - In an inter-departmental situation, with patients being referred from other centres, compatibility issues made it impossible to accurately assess the previous dose, let alone accumulate dose accurately.
  - Even when dose matrices can be accumulated, using deformable registration algorithms some issues remain to be solved:
    - Accuracy of deformable registration algorithm
    - Assessing differences in dose fractionation
    - Accounting for different sensitivities and different doses delivered to OAR's
    - Type A or B dose calculation algorithm?

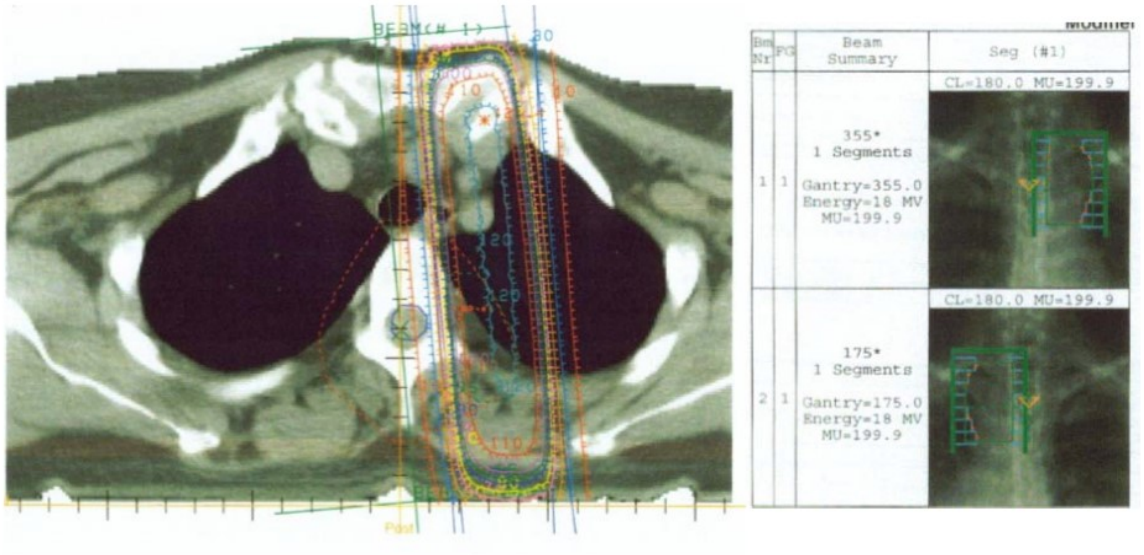
The past …?

- An example of re-irradiation for vertebral metastases

20 Gy wedged fields



20 Gy AP-PA with spinal cord sparing



- … in short: common sense

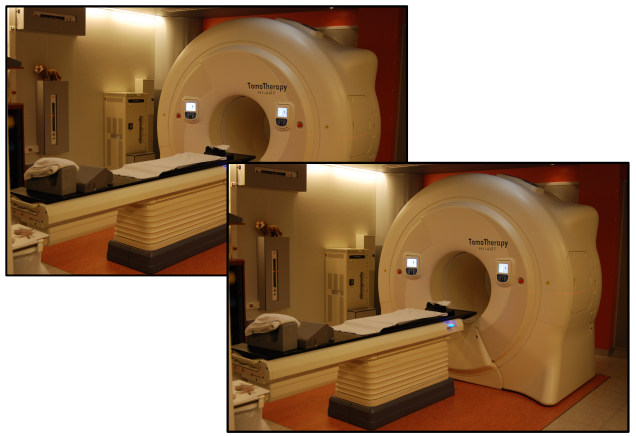
Accumulated dose a case study (1)

- A 75 year old, male patient
- 2012:
  - Prostate cancer
  - TUR + 39x2Gy + androgen deprivation
- 2014:
  - **Adenocarcinoma oesophagus**
  - Surgery
- 2015:
  - Recurrence of adenocarcinoma
  - Surgery + neo adjuvant Radio-chemotherapy (41.4 Gy)
- 2016:
  - Metastases (liver + cervical vertebra C7, overlapping with primary)
  - C7: 15x2.5 Gy (original protocol: 15x 3Gy)

Accumulated dose a case study (1)



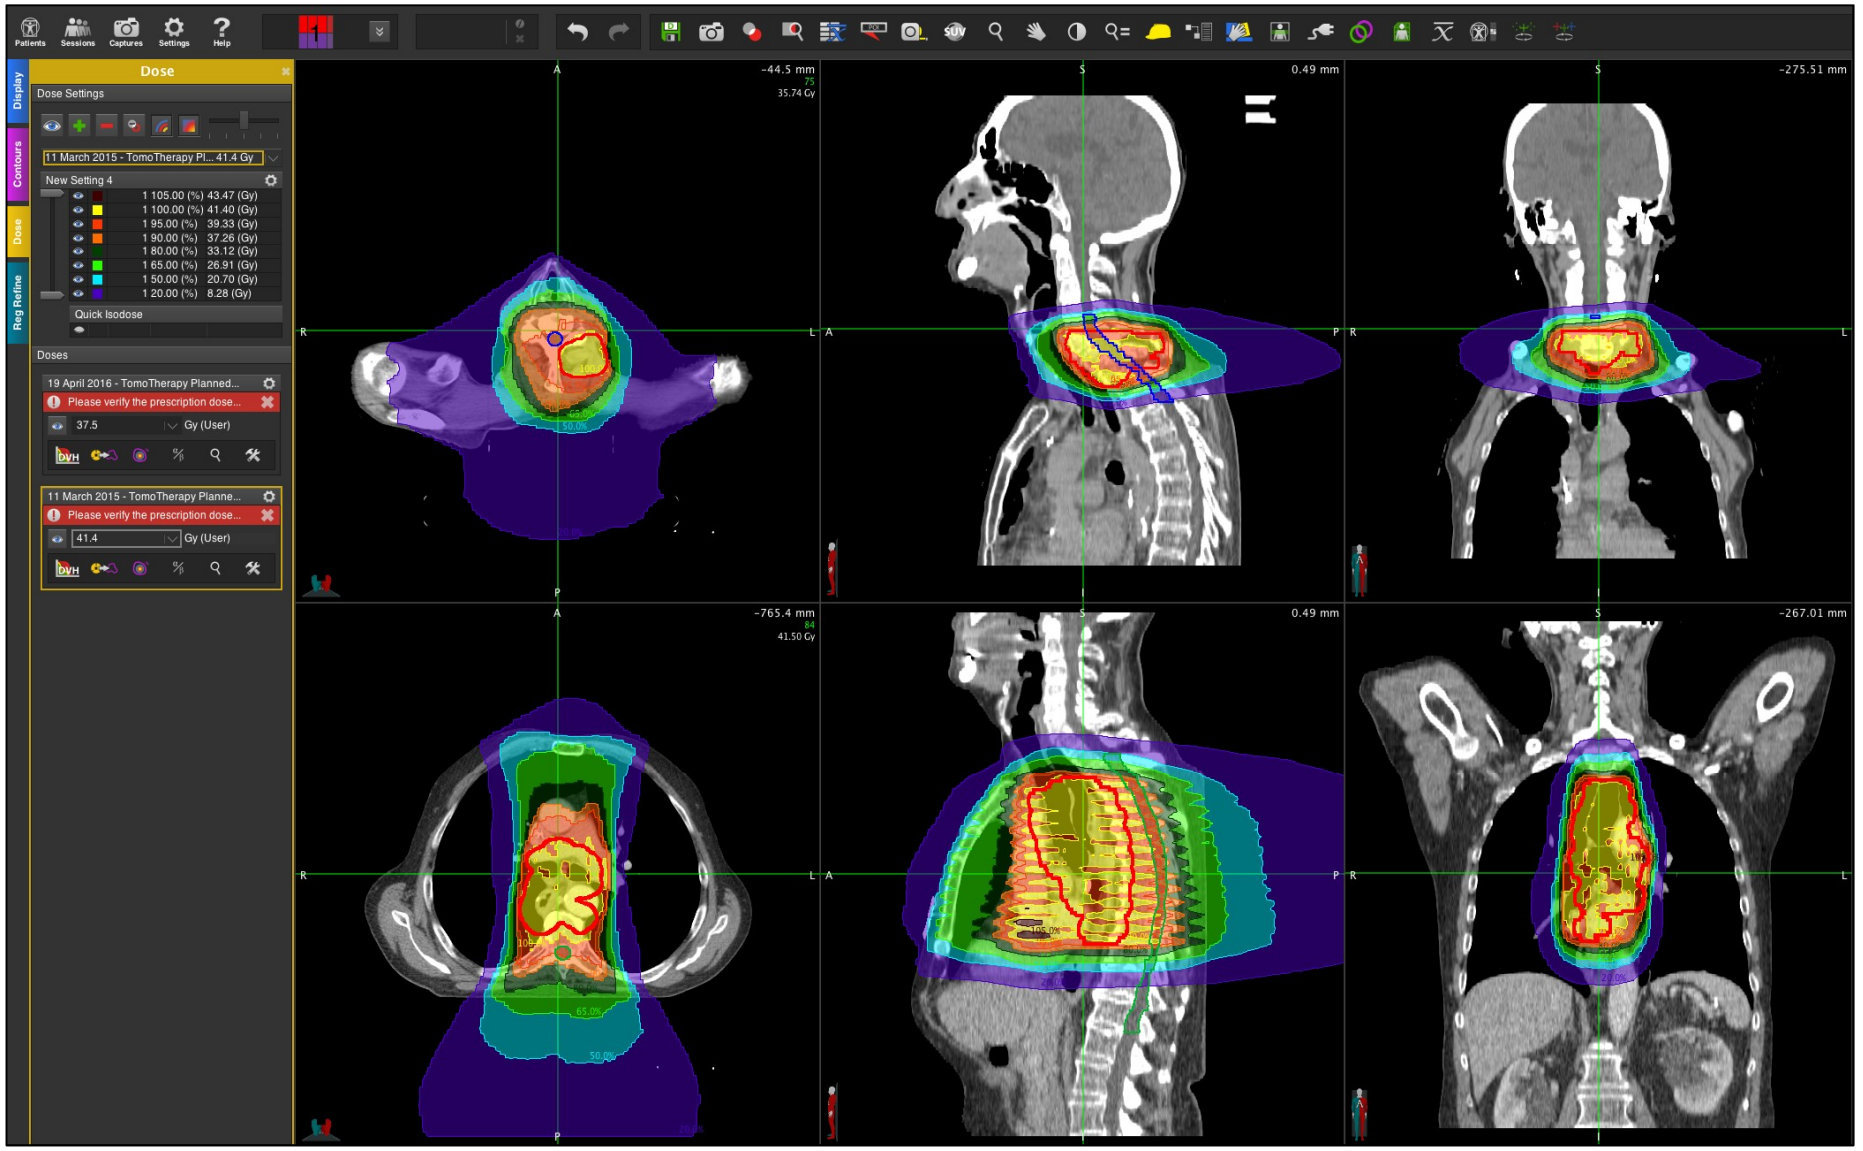
- Treatment approach re-irradiation:

- Previous irradiation (TomoTherapy): **23 x 1.8 Gy = 41.4 Gy**
- Re-irradiation (TomoTherapy): **15 x 2.5 Gy = 37.5 Gy**

- Dose distribution adapted/compromised based on accumulated dose accounting for spinal cord tolerances.

- **Assumption**s:
  - No recovery (previous irradiation late 2015, re-irradiation early 2016)
  - Spinal cord tolerance: **50 Gy $EQD_{2/2}$** ($EQD_{2/2} = D \times \frac{d + \alpha/\beta}{2 + \alpha/\beta}$)
    (2 Gy equivalent dose with $\alpha/\beta = 2$:

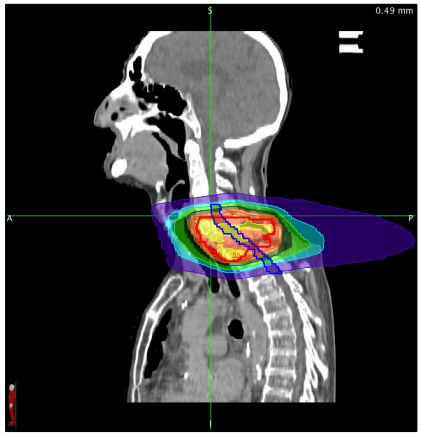
Accumulated dose
a case study (1)

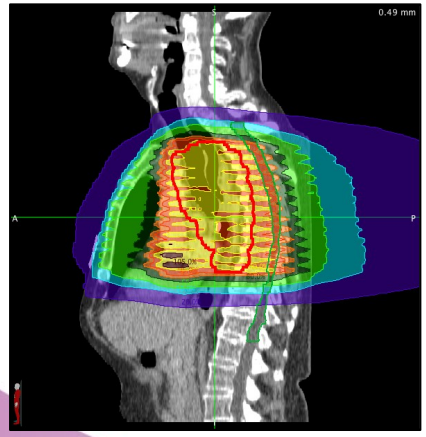


ESTRO School

Accumulated dose
a case study (1)

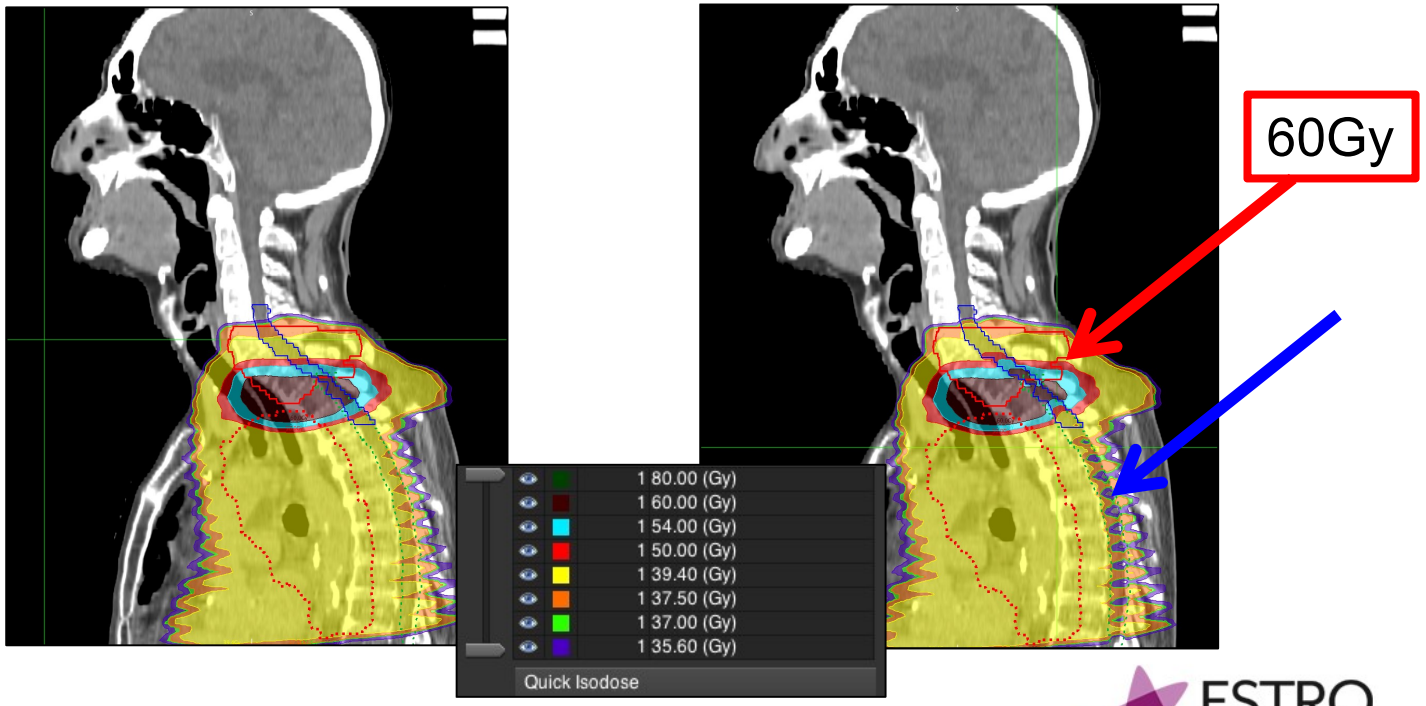
- Just adding the treatments, ignoring previous treatment **is not an option**:
  - In this particular case the dose distributions overlap due to the "TomoTherapy over-travel" although both PTV's do not overlap!!!





Total Dose

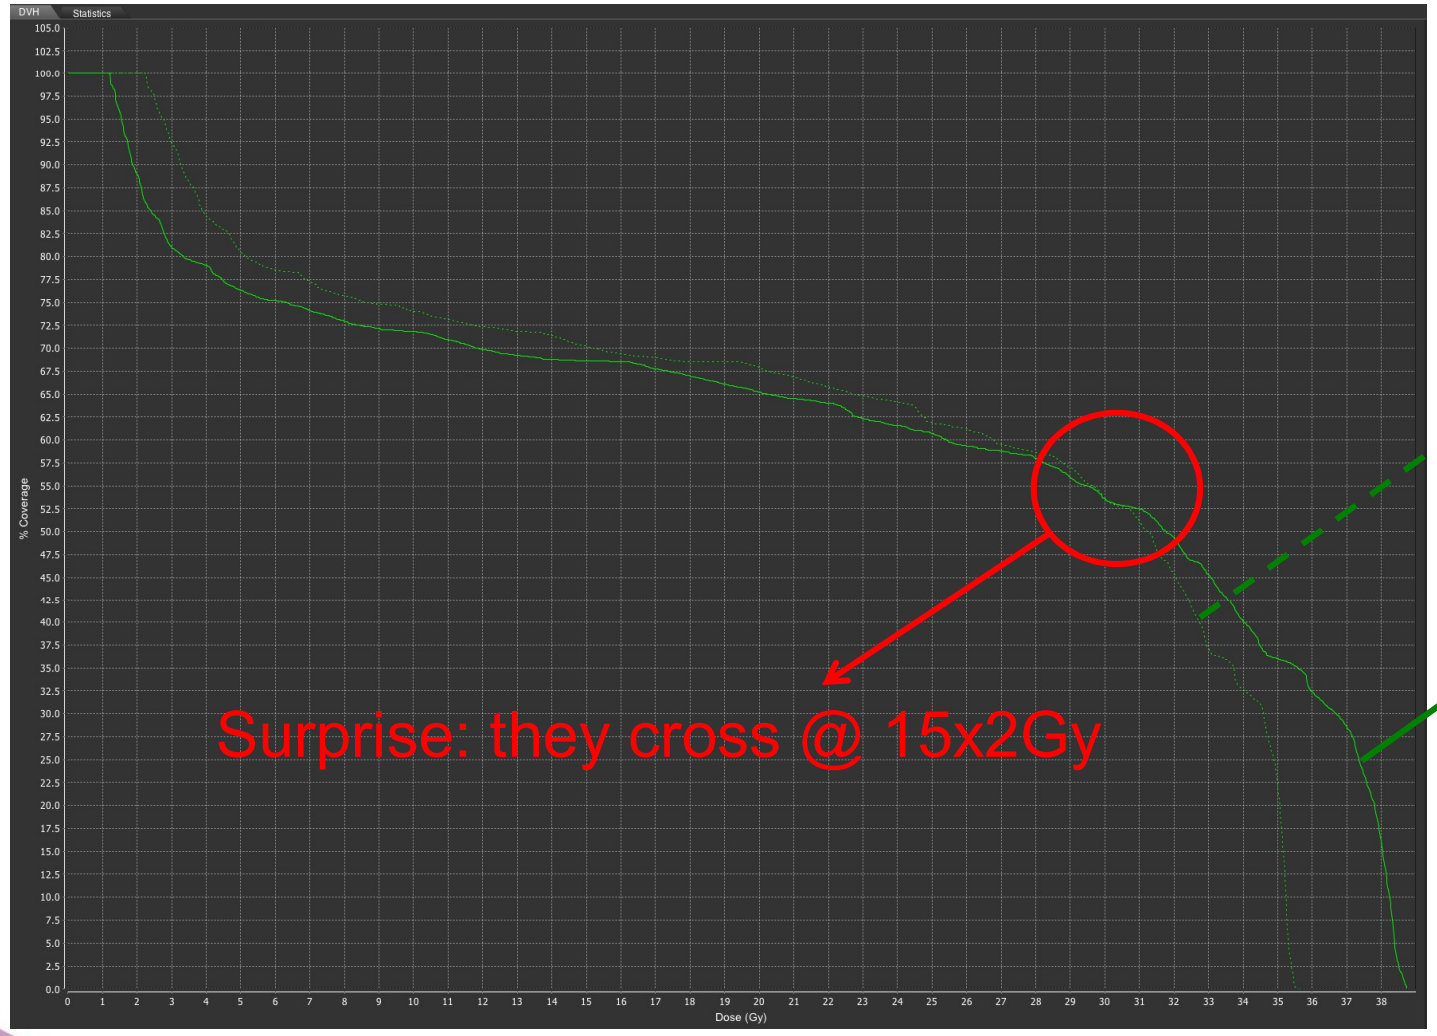
EQD2/2 (spinal cord only)



ESTRO School

Accumulated dose a case study (1)

- For illustration purposes we will only focus on the spinal cord



D_p = 15 x 2.5 Gy

Dose Re-irradiation

EQD2/2 Re-irradiation

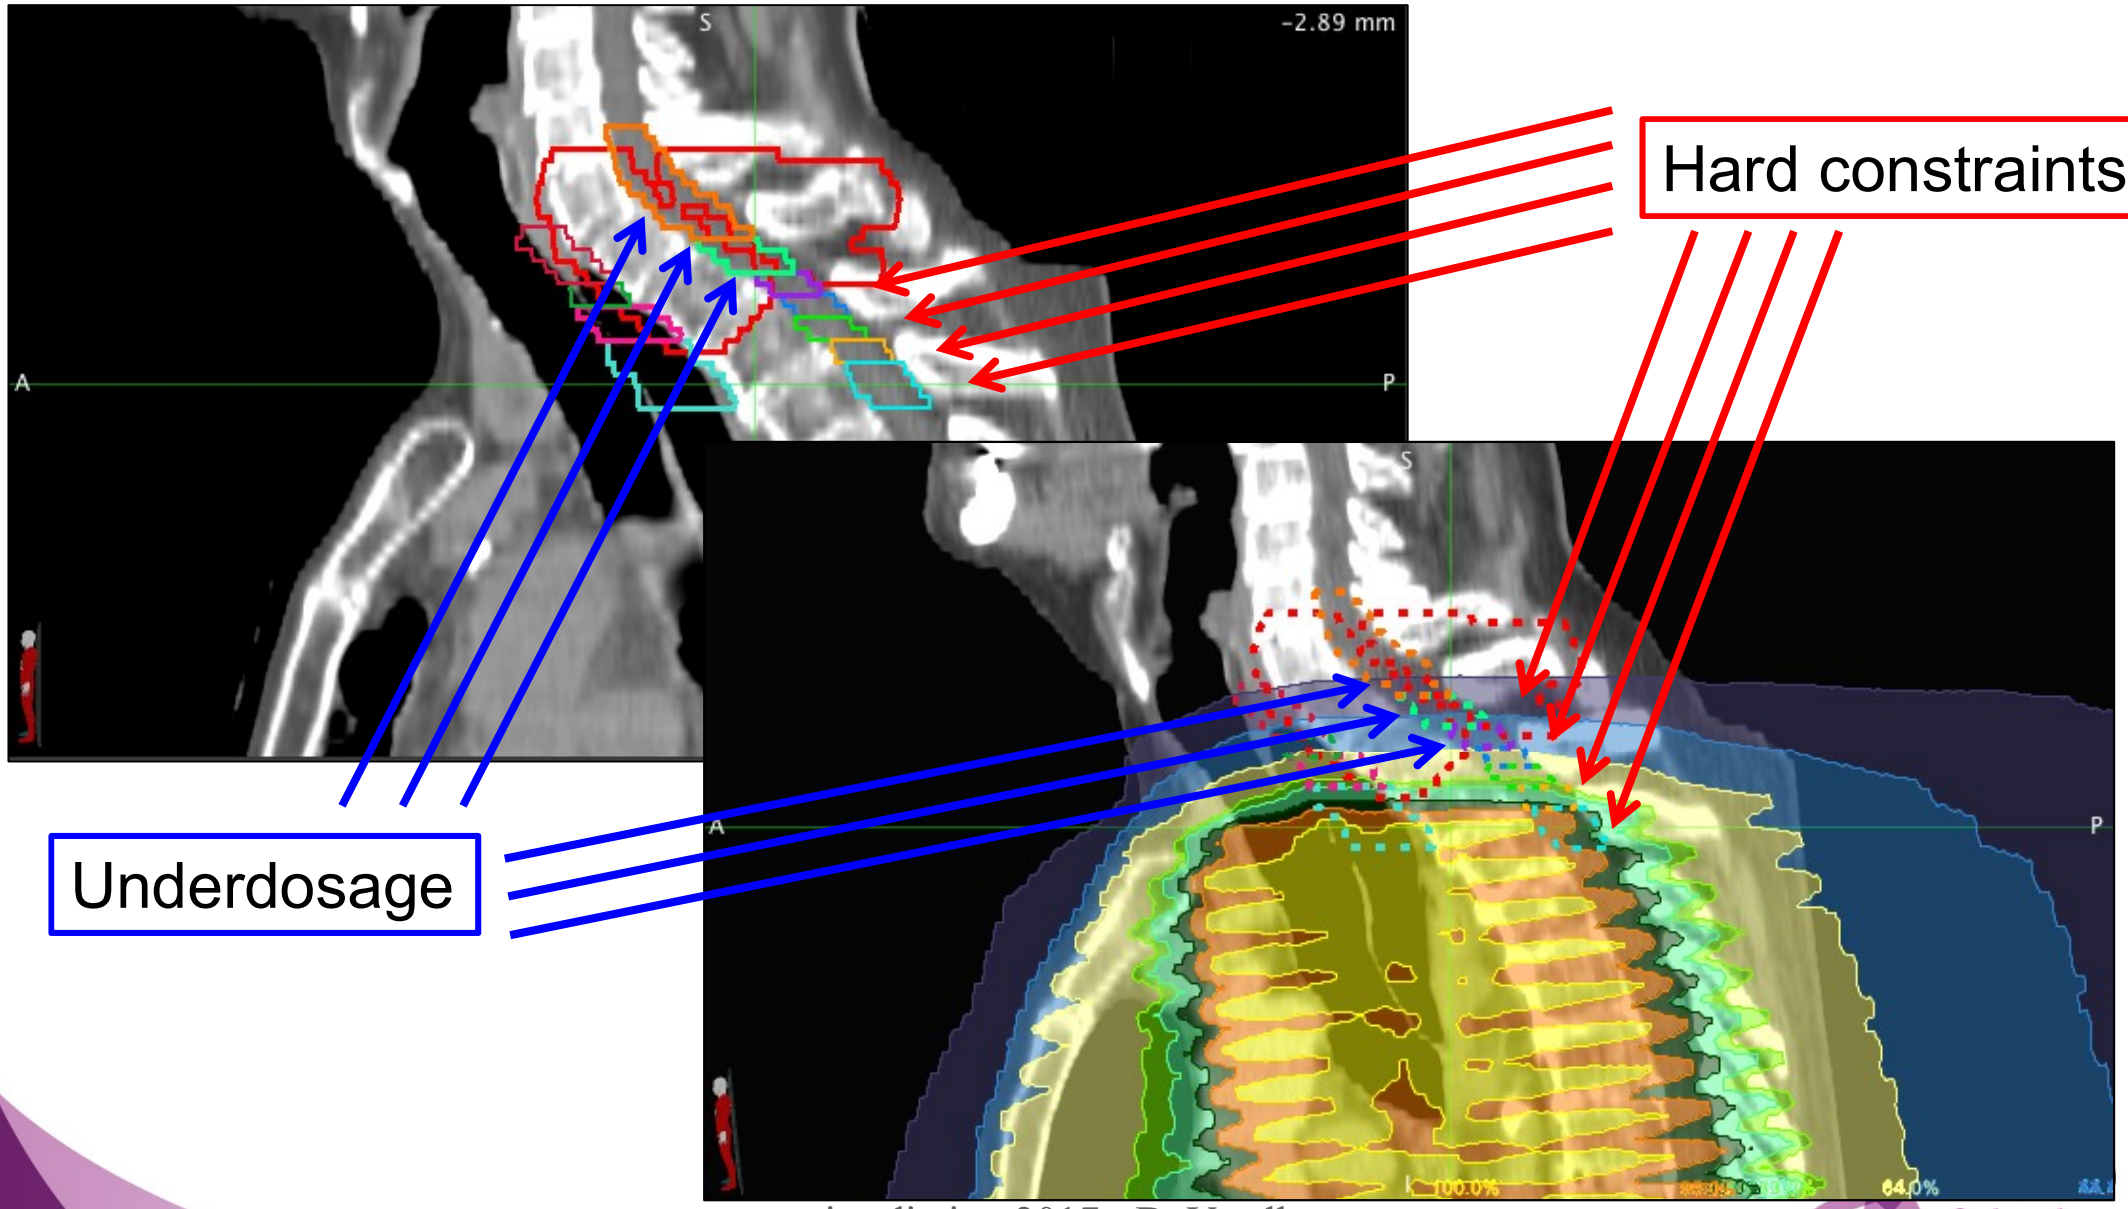
ESTRO School

Accumulated dose a case study (1)

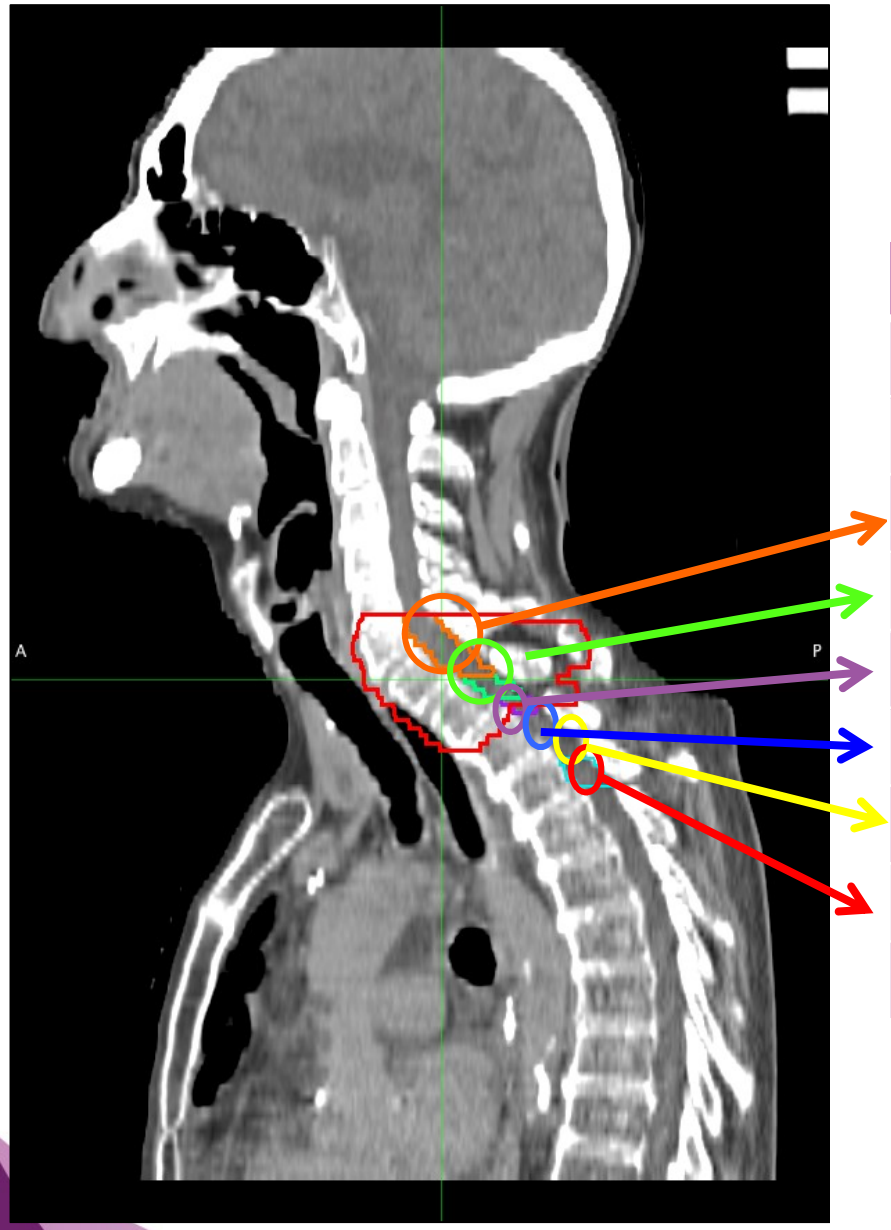
- **3 different scenario's will be illustrated**:

- (**1**) Accumulate (physical) dose of primary and re-irradiation
  - Evaluate the dose received to different regions of the spinal cord, correct for EQD2/2
  - Define tolerance dose for re-irradiation to these different regions using EQD2/2, translate to physical dose, and use this in the optimization algorithm
- (**2**) Accumulate dose distribution of primary and re-irradiation, but rescaled to EQD2/2 to assess dose to spinal cord.
- (**3**) Recalculate both dose distributions with EQD2/2 in spinal cord only, physical dose everywhere else, and accumulate.
- *… Recalculate dose distribution with EQD2/2 in all OARs* ***and*** *PTV, and accumulate … include recovery factors …*

Accumulated dose
a case study (1)



Accumulated dose a case study (1)



D_P = 23 x 1.8 Gy		D_P = 15 x 2.5 Gy	
$D_{received}$	$EQD_{2/2}$	$EQD_{2/2}$	$D_{tolerated}$
16.4	11.1	38.9	35.6
21.0	15.3	34.7	33.0
25.7	20.0	30.0	30.0
31.7	26.8	23.2	25.2
34.6	30.3	19.7	22.5
37.4	33.9	16.1	19.5
	Tolerance $EQD_{2/2}$ = 50.0 Gy		

Into the optimization

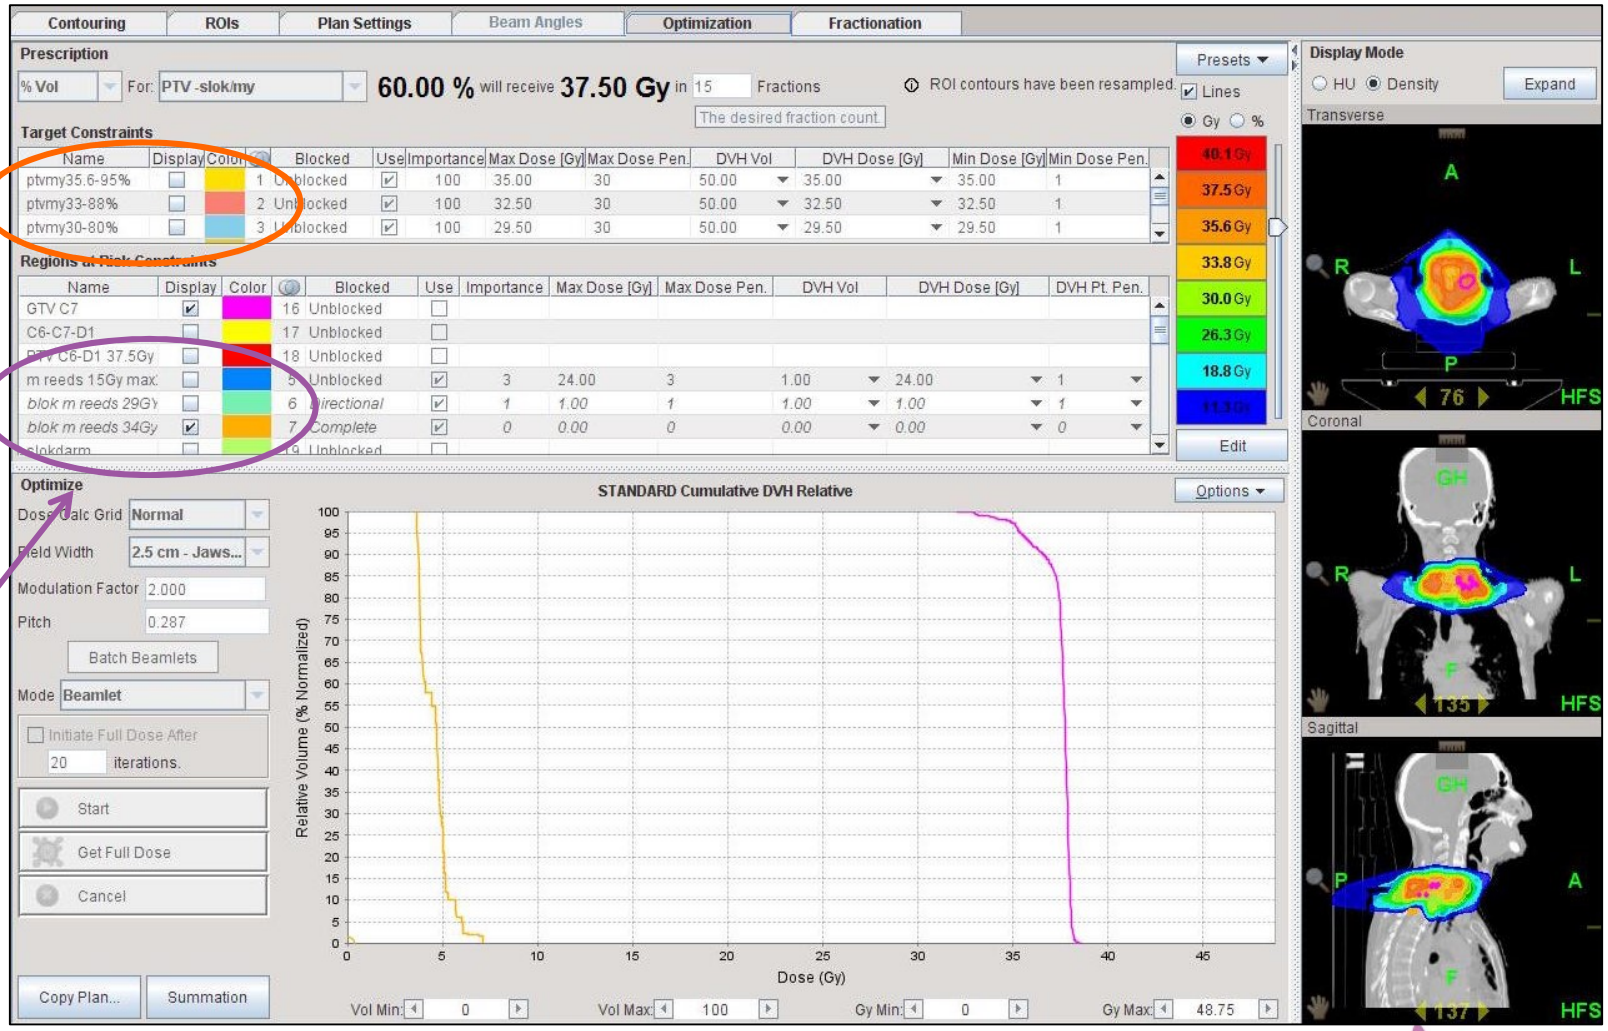
ESTRO School

Accumulated dose a case study (1)

- Dose optimization

Spinal cord inside PTV: defined as Sub-PTV's

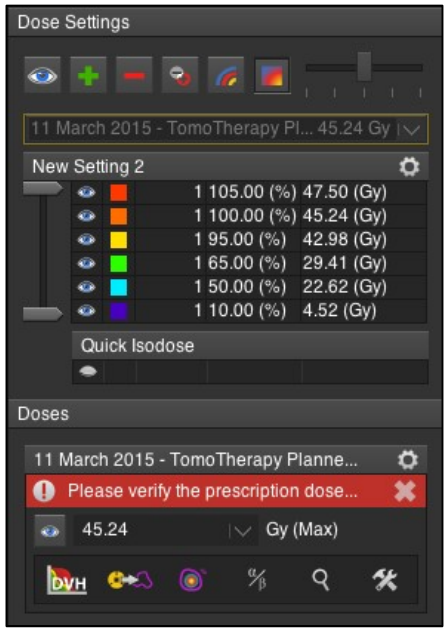
Spinal cord outside PTV: defined as OARs

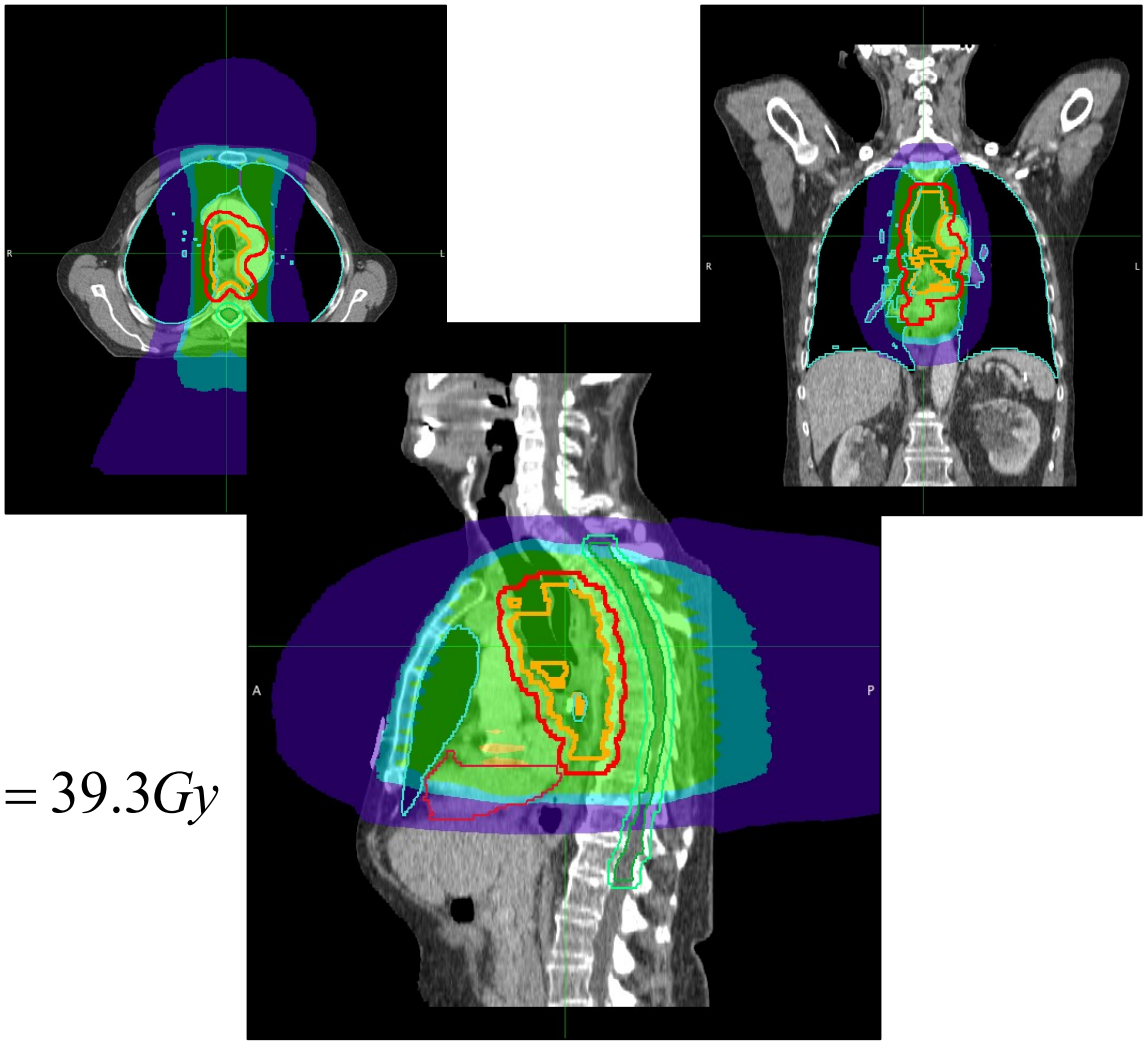


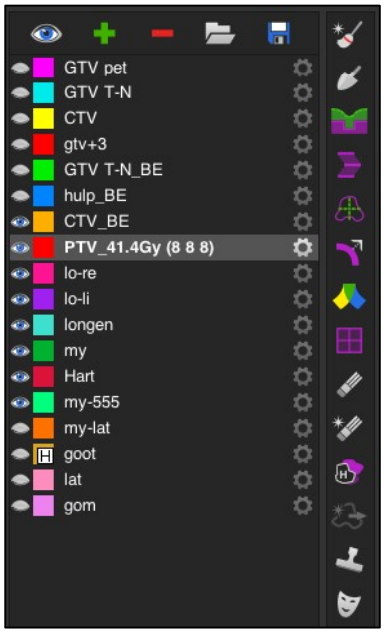
ESTRO School

Accumulated dose a case study (1)

- Previous irradiation: 23 x 1.8 Gy = 41.4 Gy





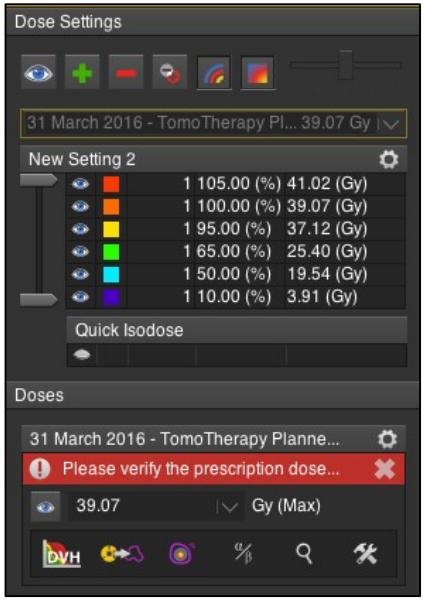


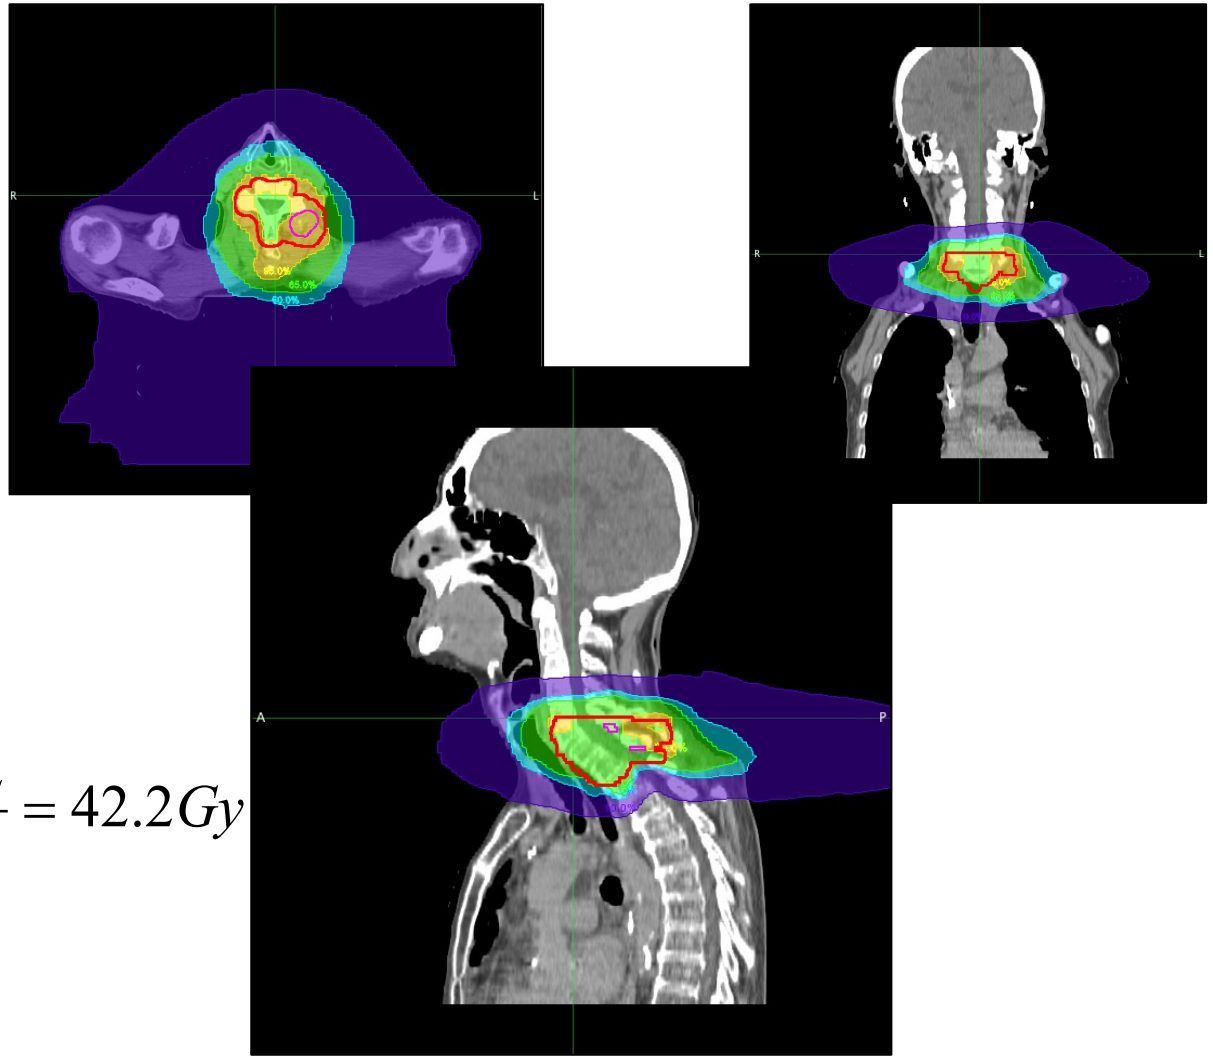
$$EQD_{2/2} = 41.4 \times \frac{1.8+2}{2+2} = 39.3Gy$$

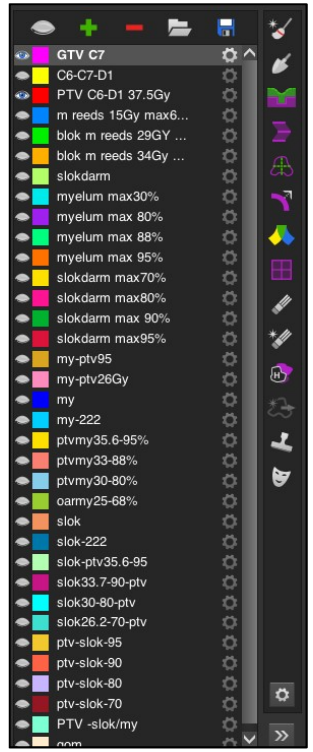
ESTRO School

Accumulated dose
a case study (1)

- Re-irradiation: 15 x 2.5 Gy = 37.5 Gy (optimized based on tolerances)





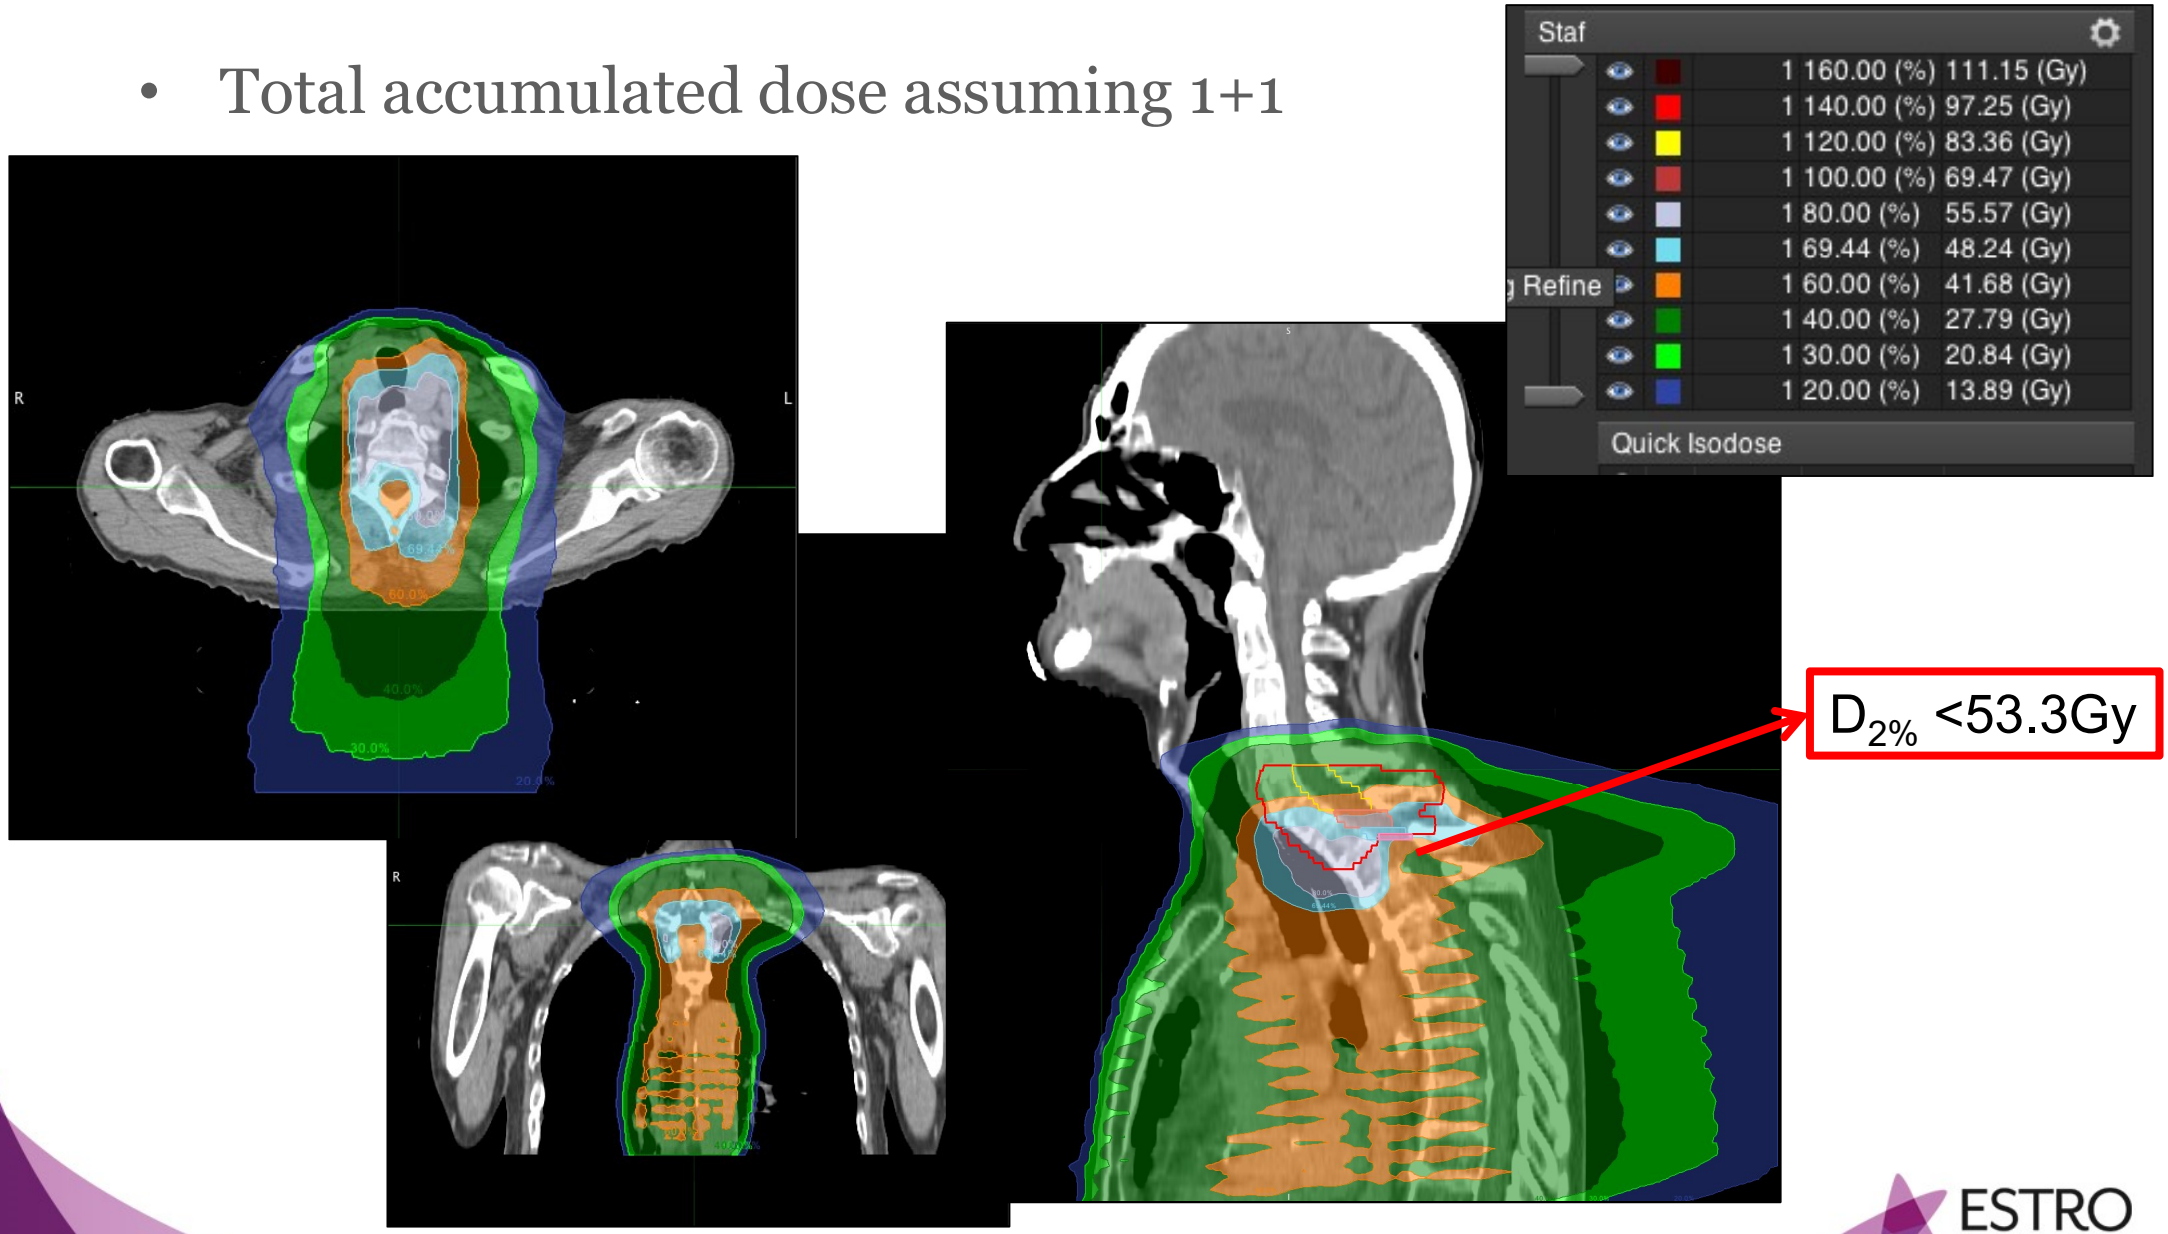


$$EQD_{2/2} = 37.5 \times \frac{2.5+2}{2+2} = 42.2Gy$$

ESTRO School

Accumulated dose a case study (1)

- Total accumulated dose assuming 1+1

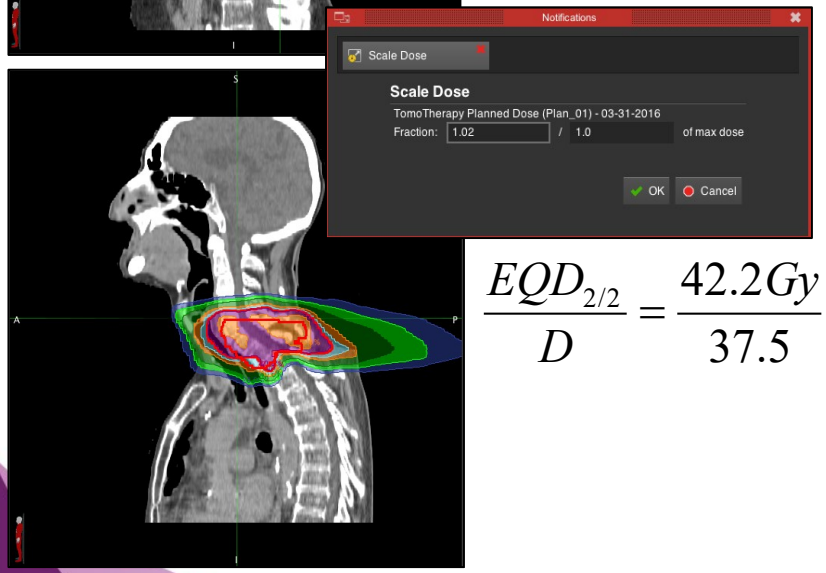


ESTRO School

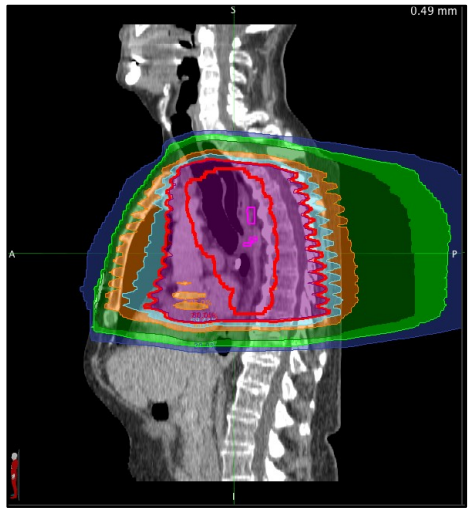
Accumulated dose a case study (1)

- Rescaling entire dose distribution for $EQD_{2/2}$, and accumulating rescaled doses

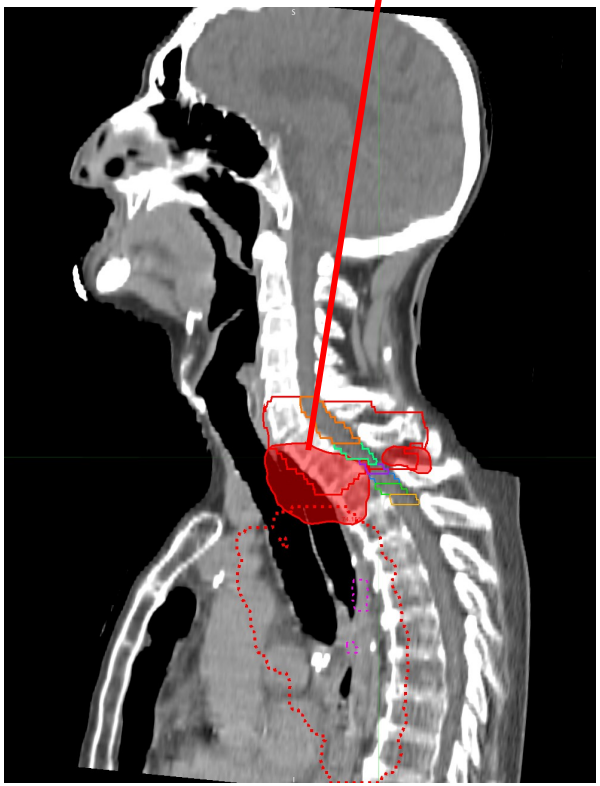
$$\frac{EQD_{2/2}}{D} = \frac{39.3Gy}{41.4}$$



$$\frac{EQD_{2/2}}{D} = \frac{42.2Gy}{37.5}$$



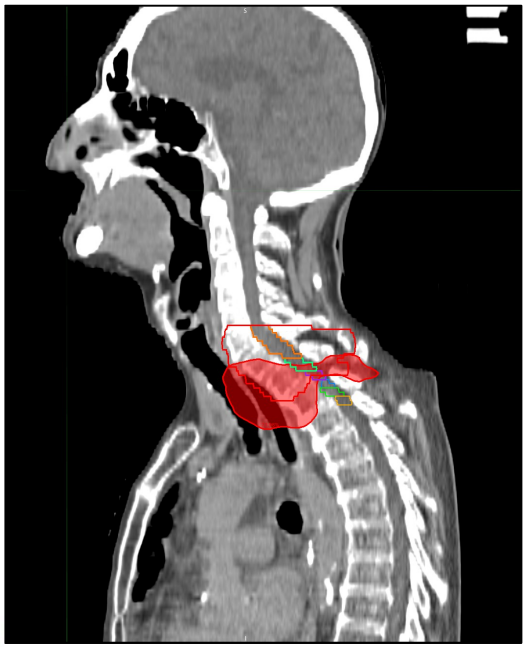
$EQD_{2/2}$: 50 Gy



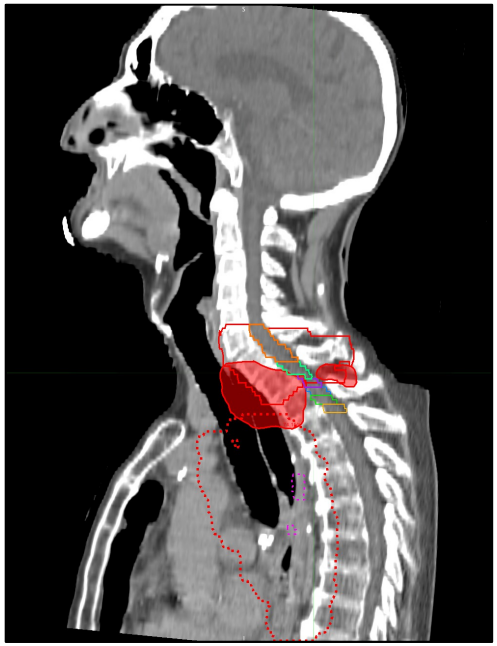
ESTRO School

Accumulated dose a case study (1)

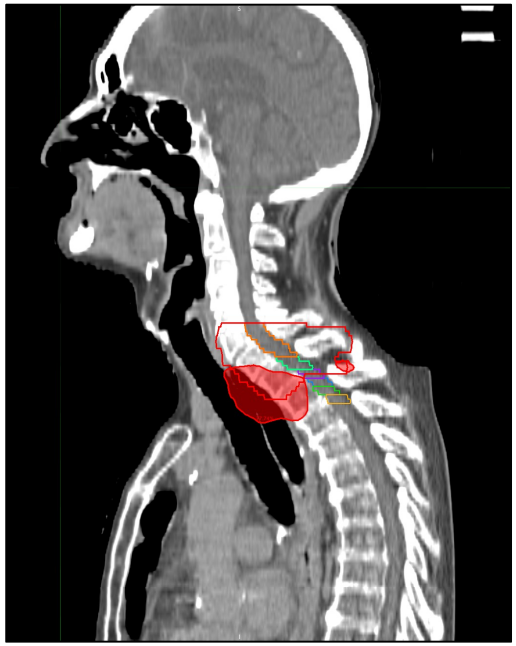
- Rescaling entire dose distribution for $EQD_{2/2}$, and accumulating rescaled doses



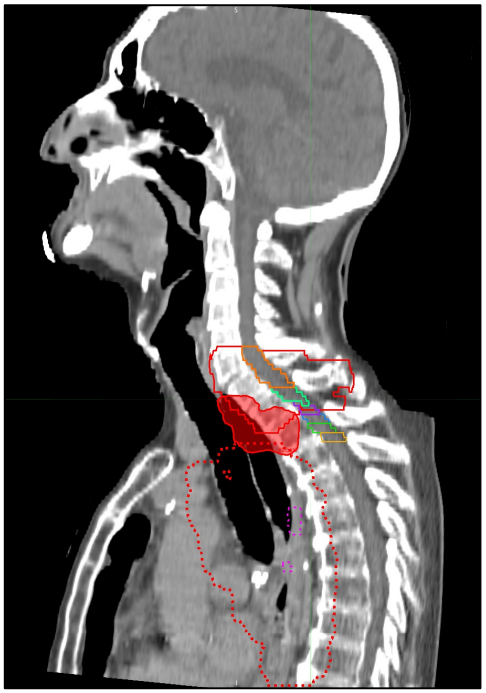
Dose: 50 Gy



$EQD_{2/2}$: 50 Gy



Dose: 54 Gy



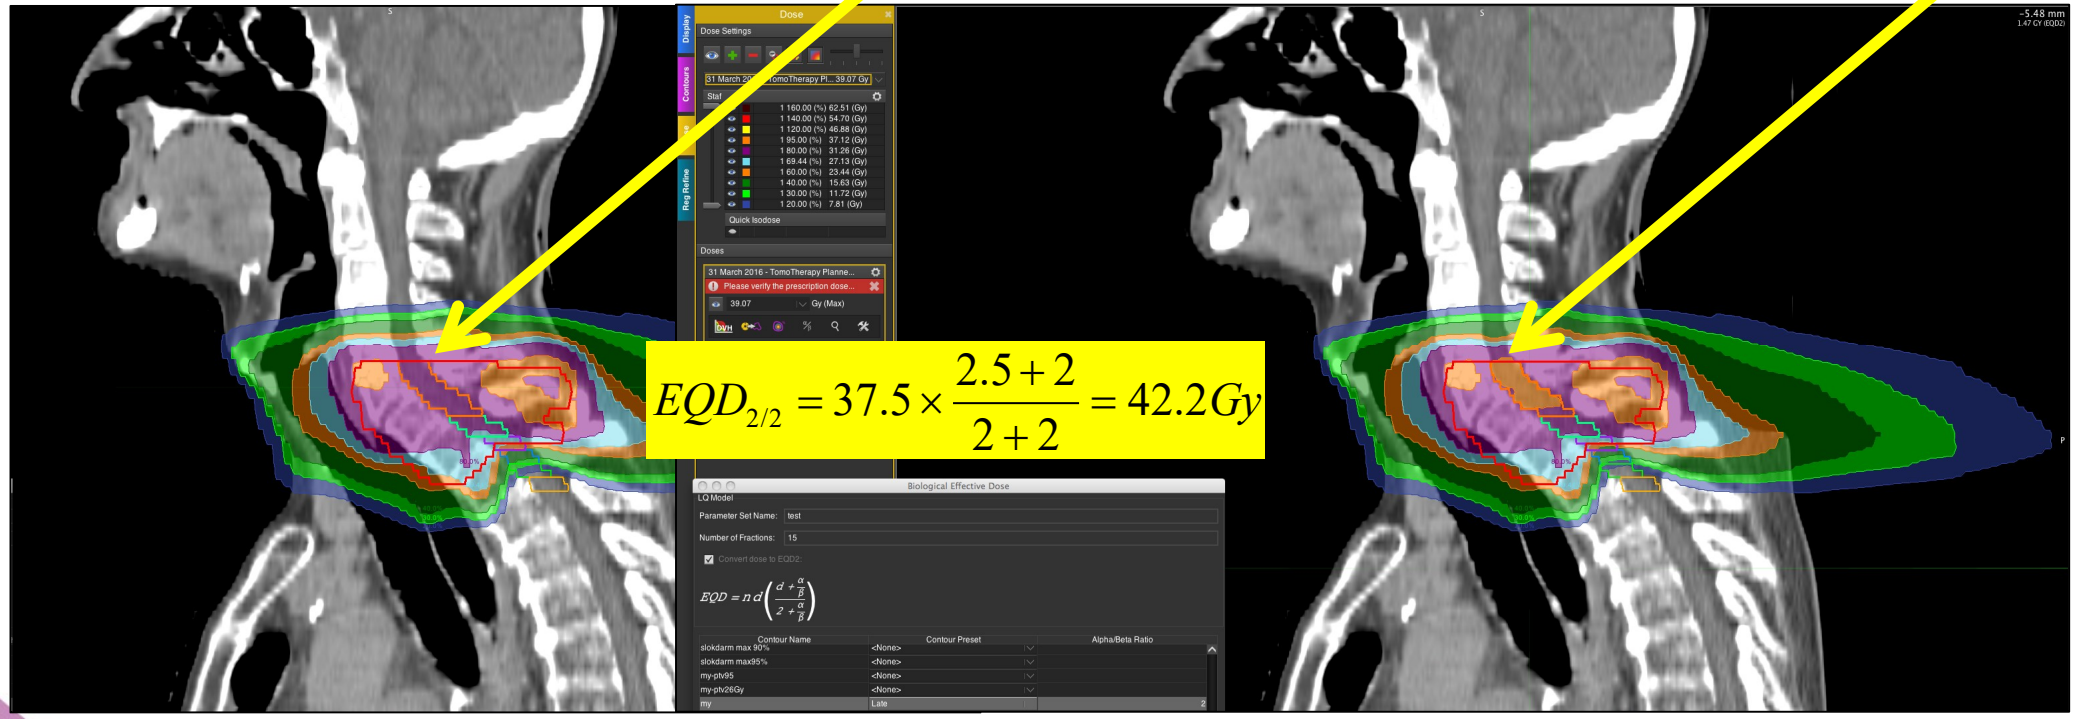
$EQD_{2/2}$: 54 Gy

Accumulated dose a case study (1)

- Dose corrected for $EQD_{2/2}$ in spinal cord (displayed dose outside spinal cord is uncorrected physical dose)

Re-irradiation Dose (uncorrected)

Re-irradiation $EQD_{2/2}$



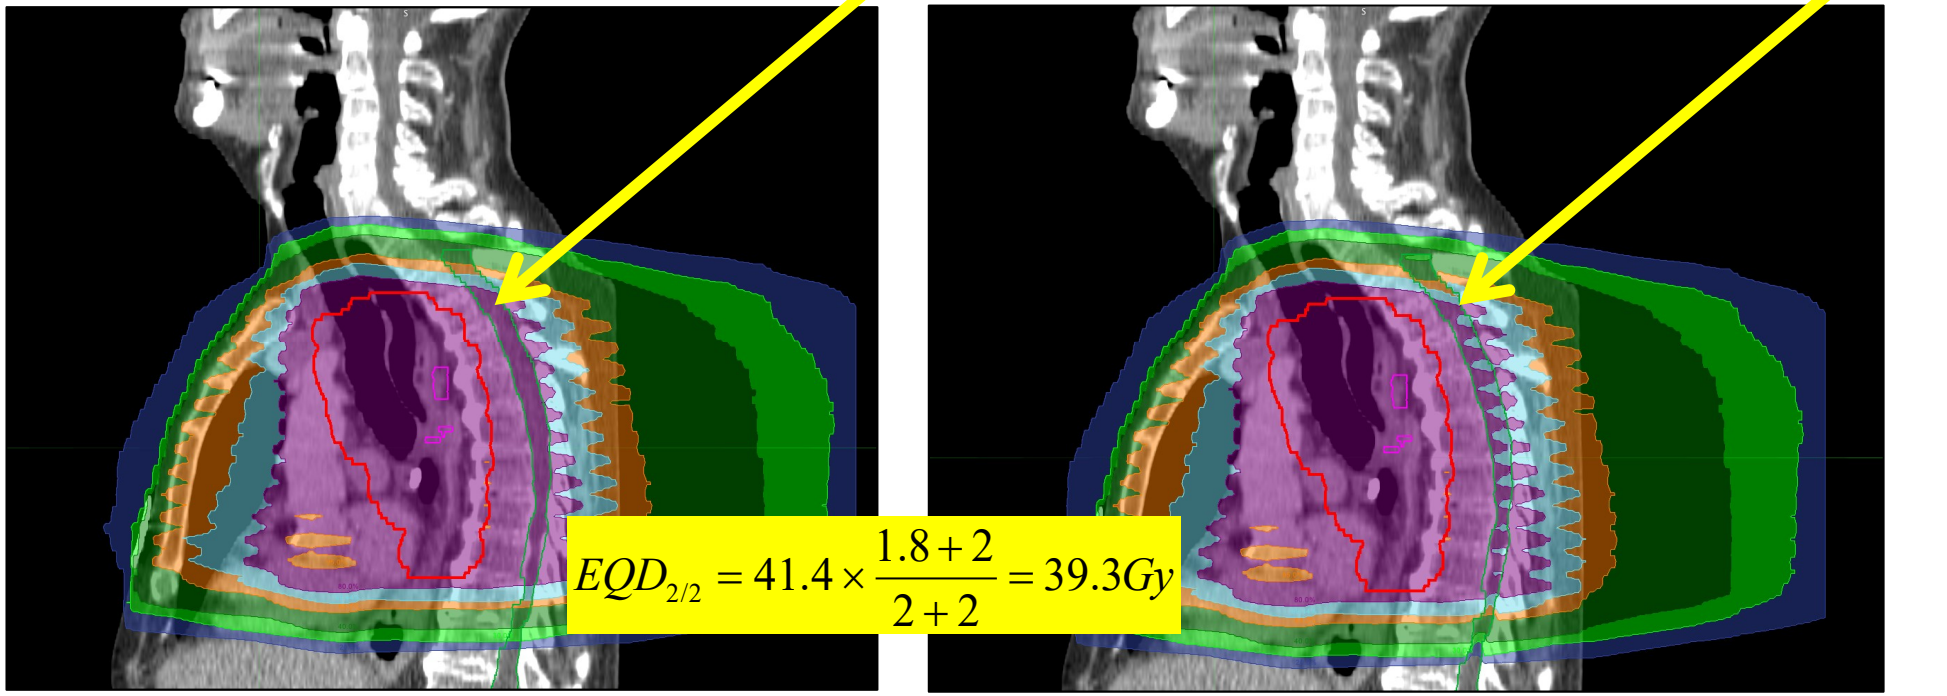
ESTRO School

Accumulated dose a case study (1)

- Dose corrected for $EQD_{2/2}$ in spinal cord (displayed dose outside spinal cord is uncorrected physical dose)

Previous Dose (uncorrected)

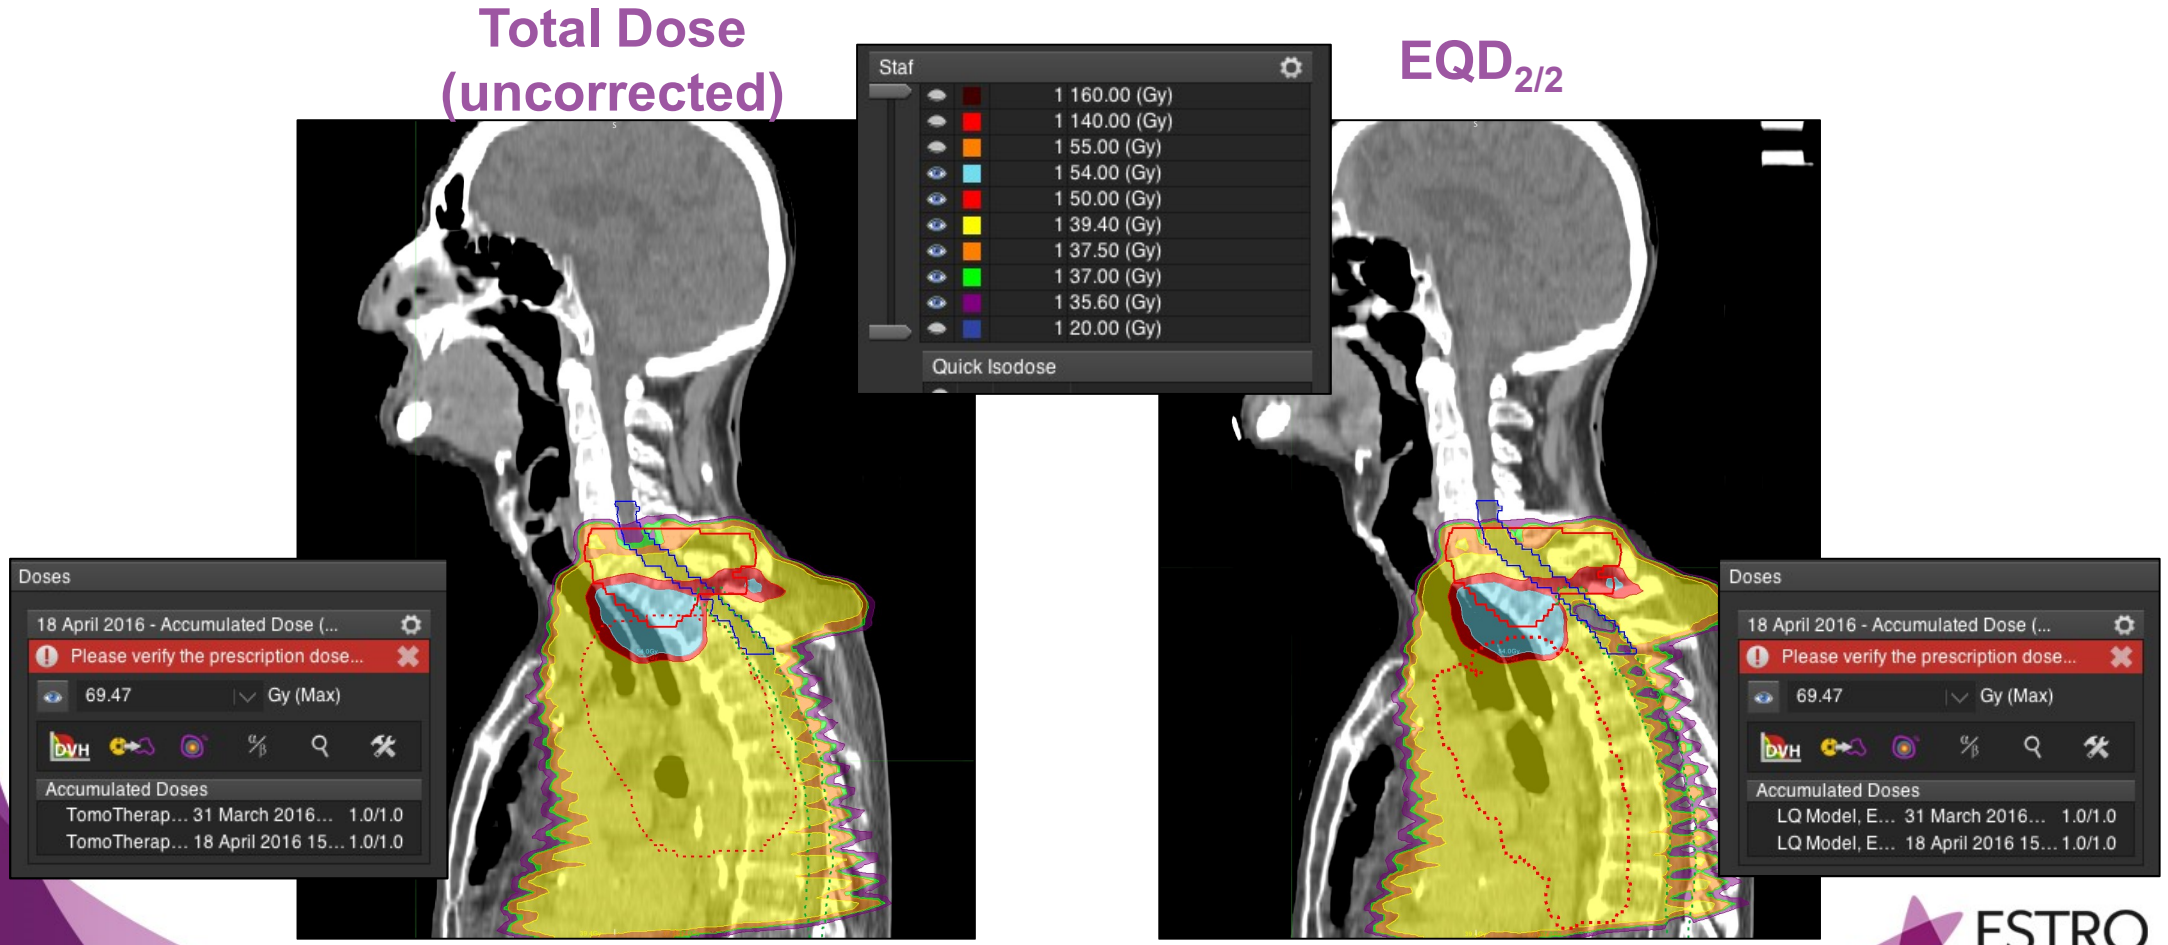
Previous $EQD_{2/2}$



$$EQD_{2/2} = 41.4 \times \frac{1.8+2}{2+2} = 39.3Gy$$

Accumulated dose
a case study (1)

- Dose corrected for $EQD_{2/2}$ in spinal cord and then accumulated (displayed dose outside spinal cord is uncorrected physical dose)

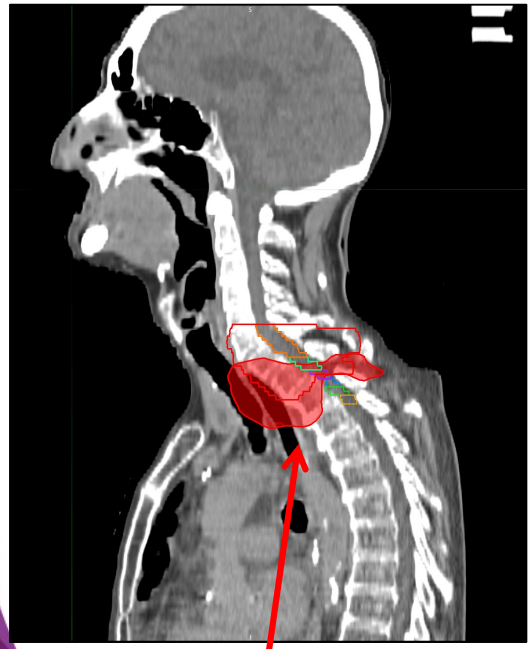


ESTRO School

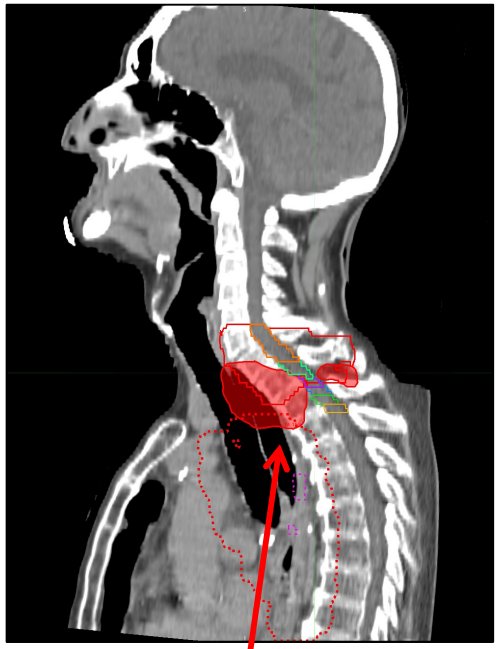
Accumulated dose a case study (1)

- 1st scenario:
  - Re-irradiation optimized using $EQD_{2/2}$ constraints, but accumulated dose = physical dose
  - $D_{2\%}$(spinal cord) = 53.3Gy (physical dose)

- 2nd scenario:

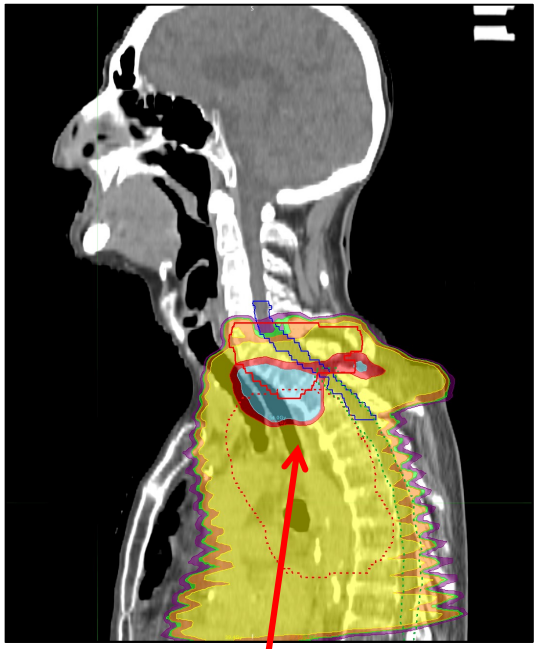


Dose: 50 Gy

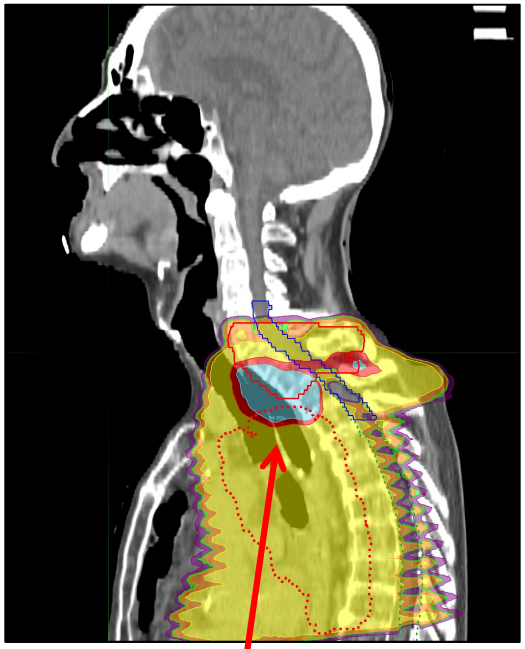


$EQD_{2/2}$: 50 Gy

- 3rd scenario:

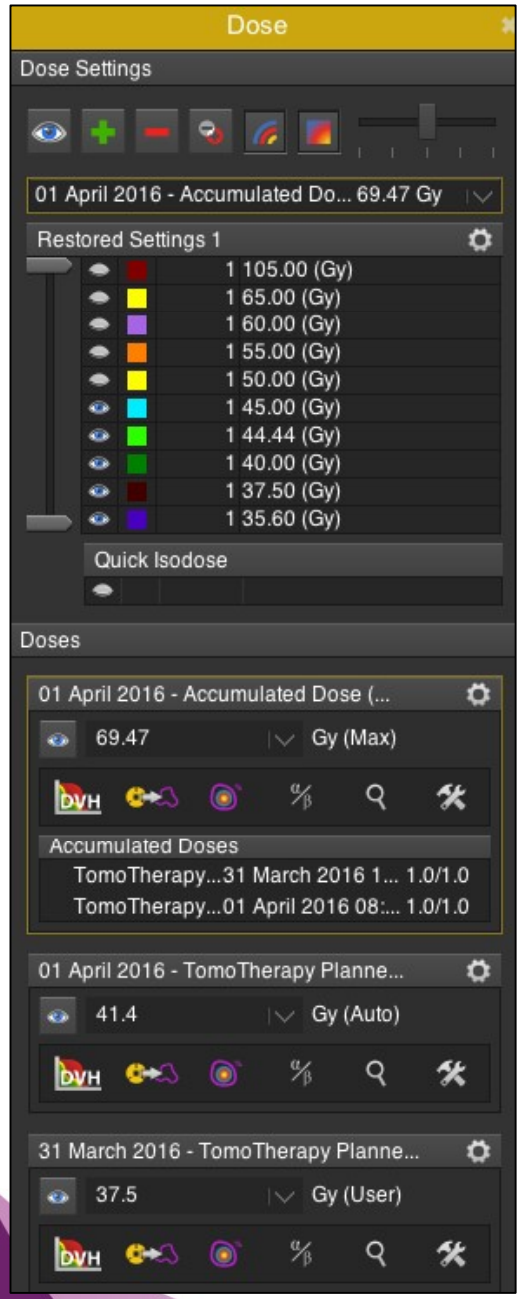


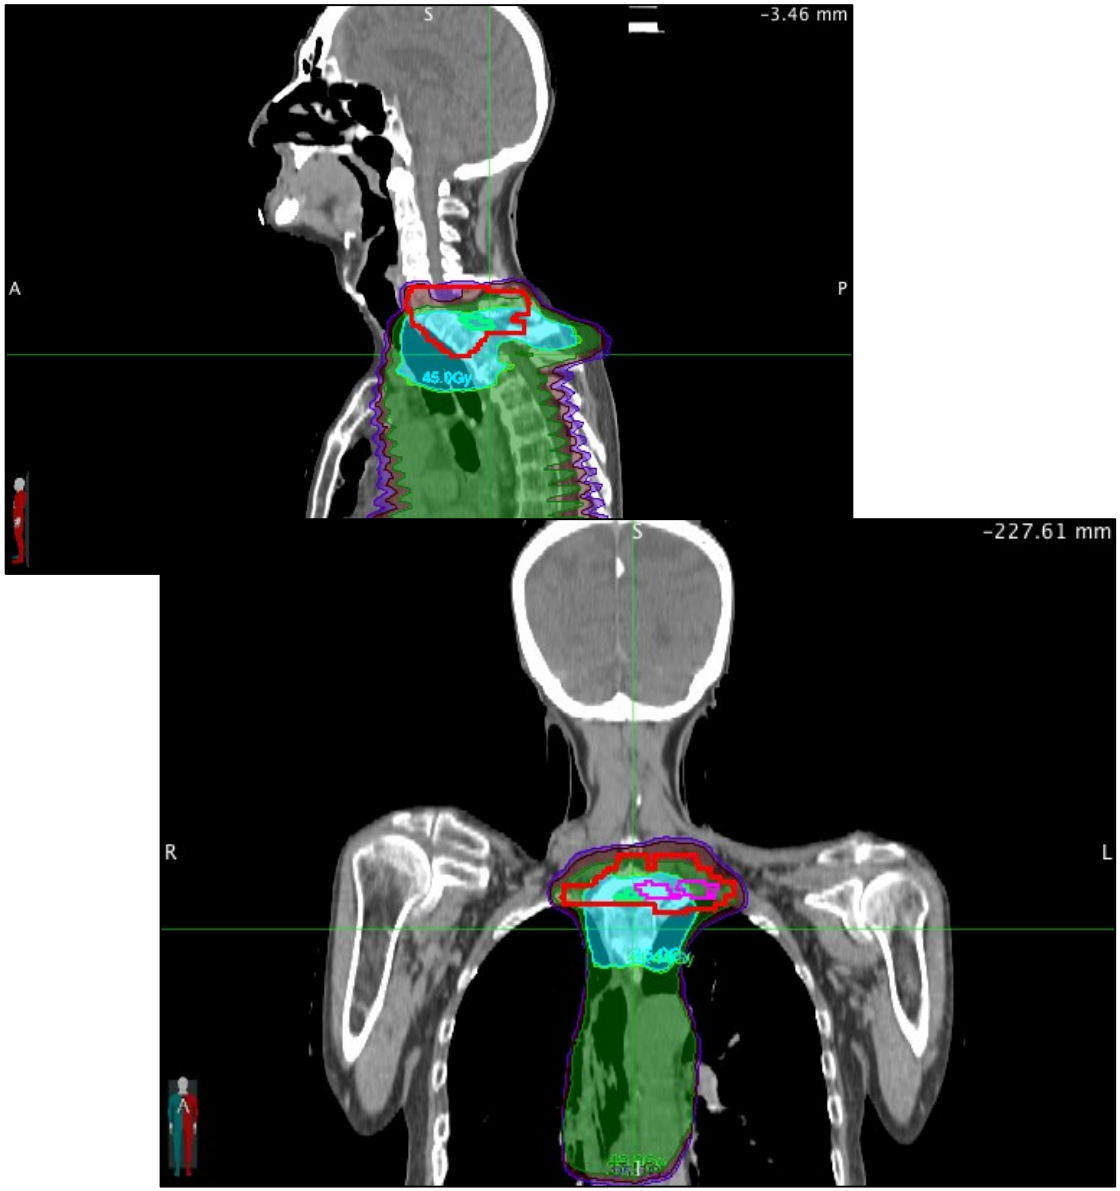
Dose: 50 Gy

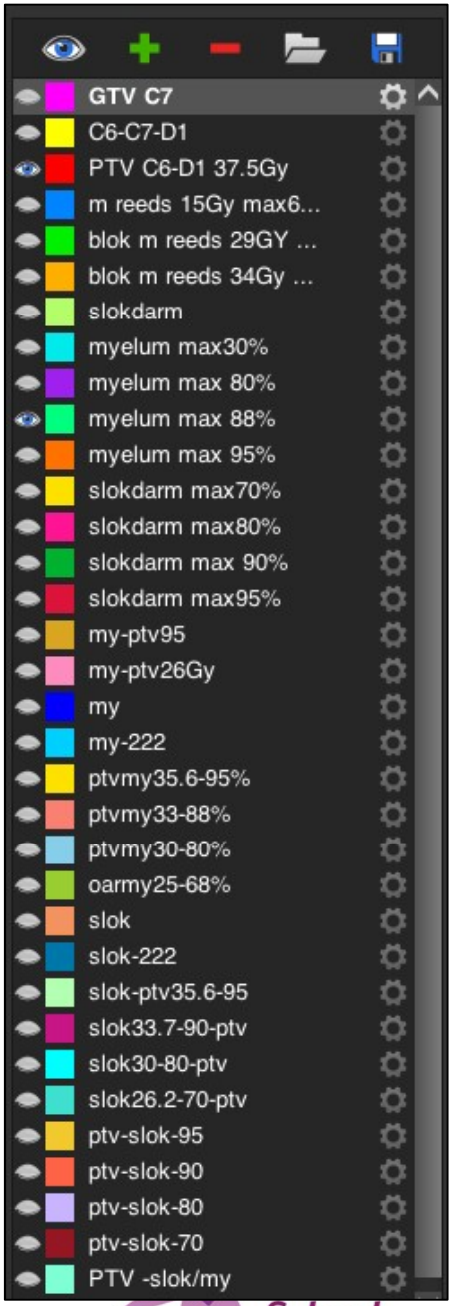


$EQD_{2/2}$: 50 Gy

Accumulated dose a case study (1)







Accumulated dose a case study (2)

- A 75 year old, male patient
- February 2015:

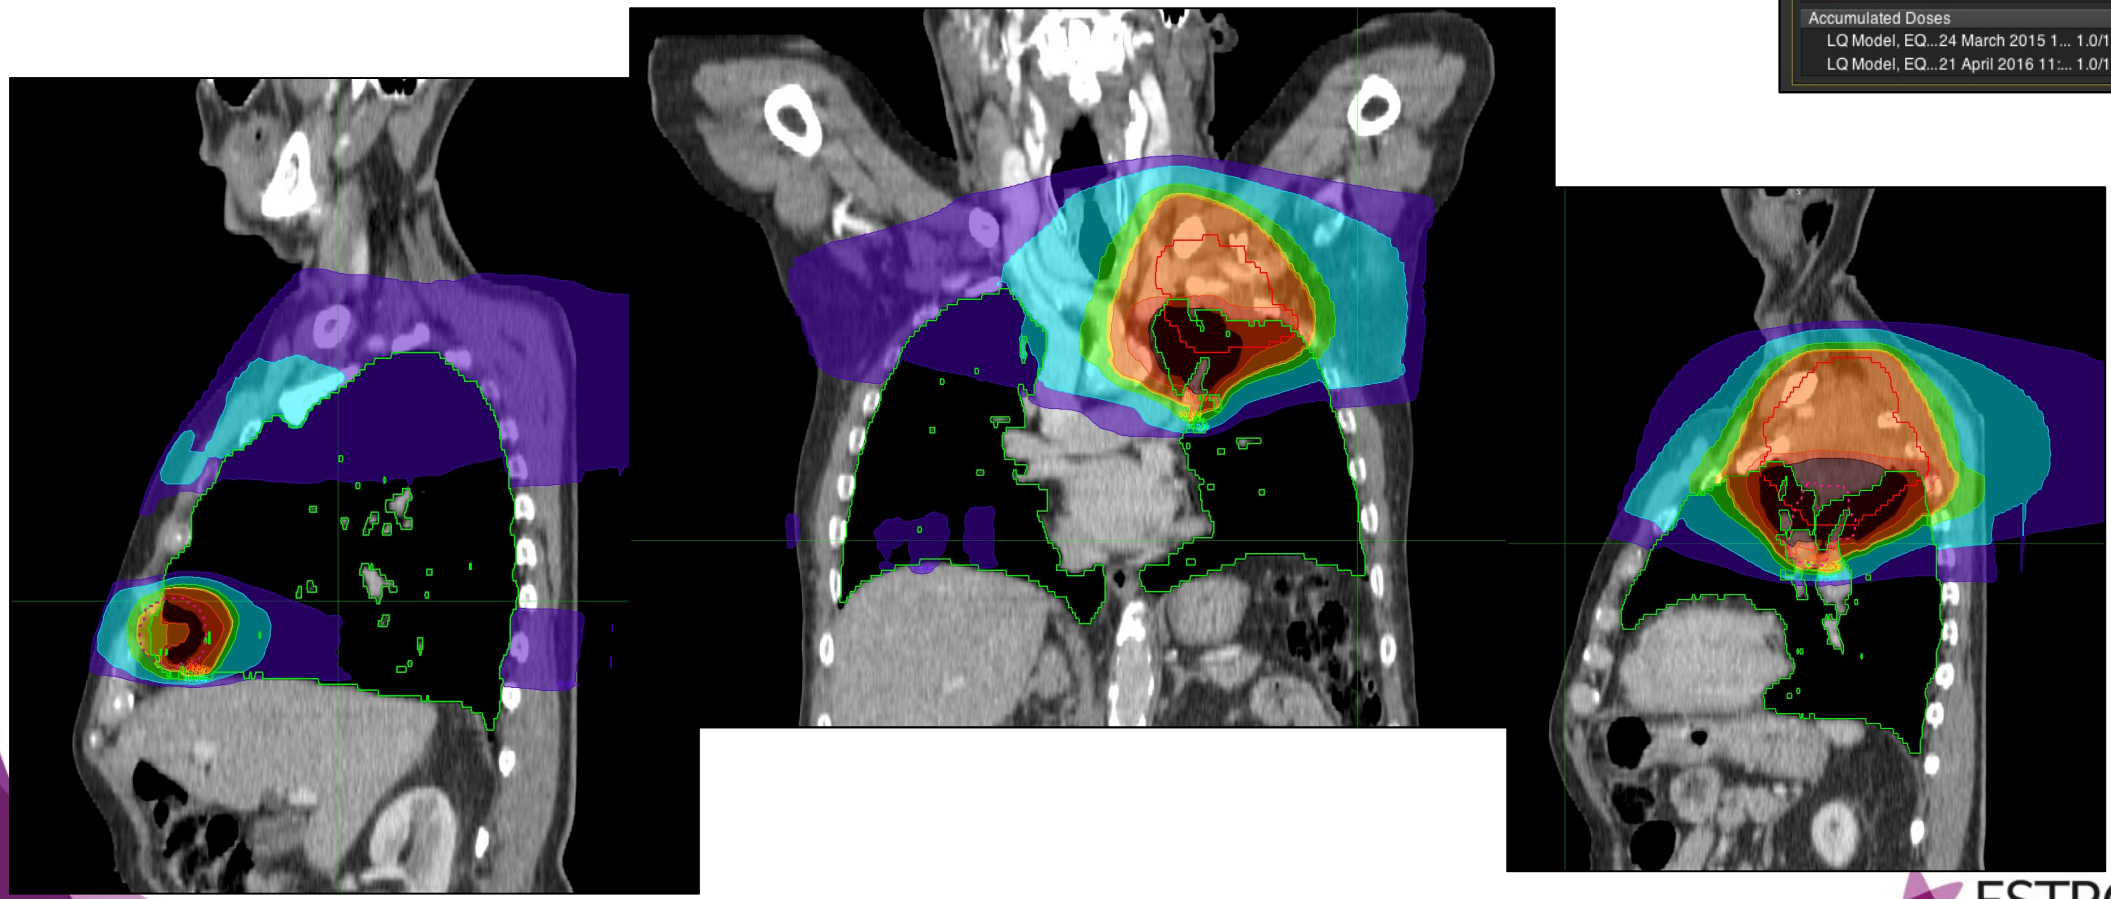
  - $EQD_{2/3}$ (oesophagus, lung)
  - $EQD_{2/2}$ (spinal cord)



ESTRO School

Accumulated dose a case study (2)

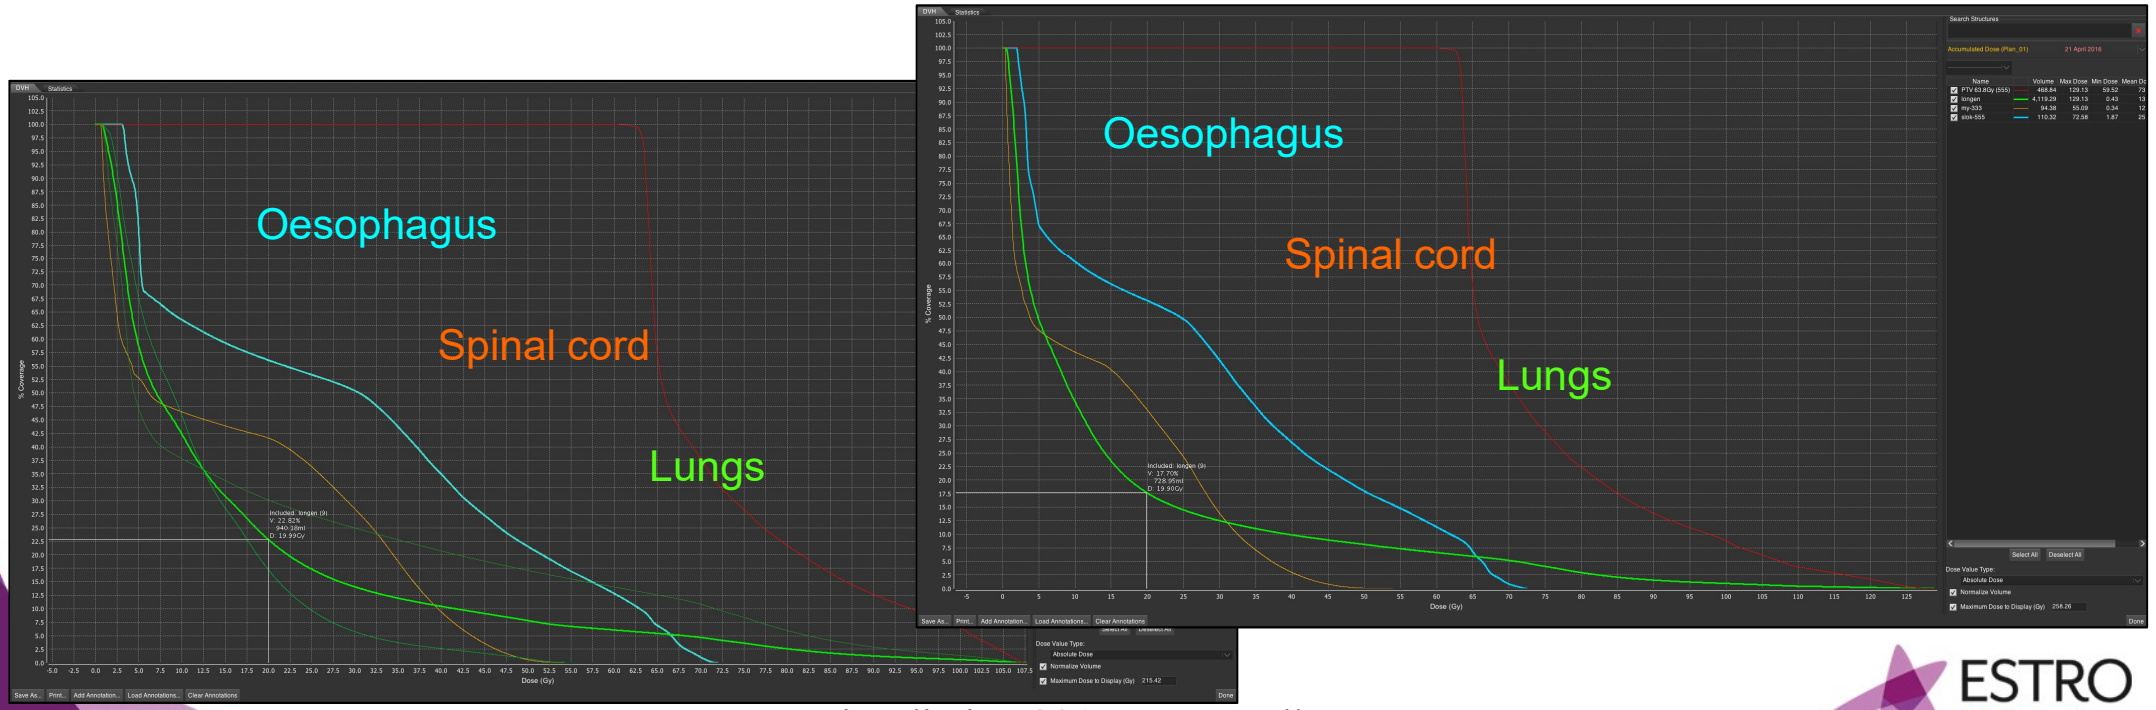
- Total accumulated dose: comparison

Total Dose (uncorrected)

- V_{20} (lungs): 22.8%
- $D_{2\%}$ (Oesophagus: 68.9Gy
- $D_{2\%}$ (spinal cord): 47.5 Gy

$EQD_{2/2}$

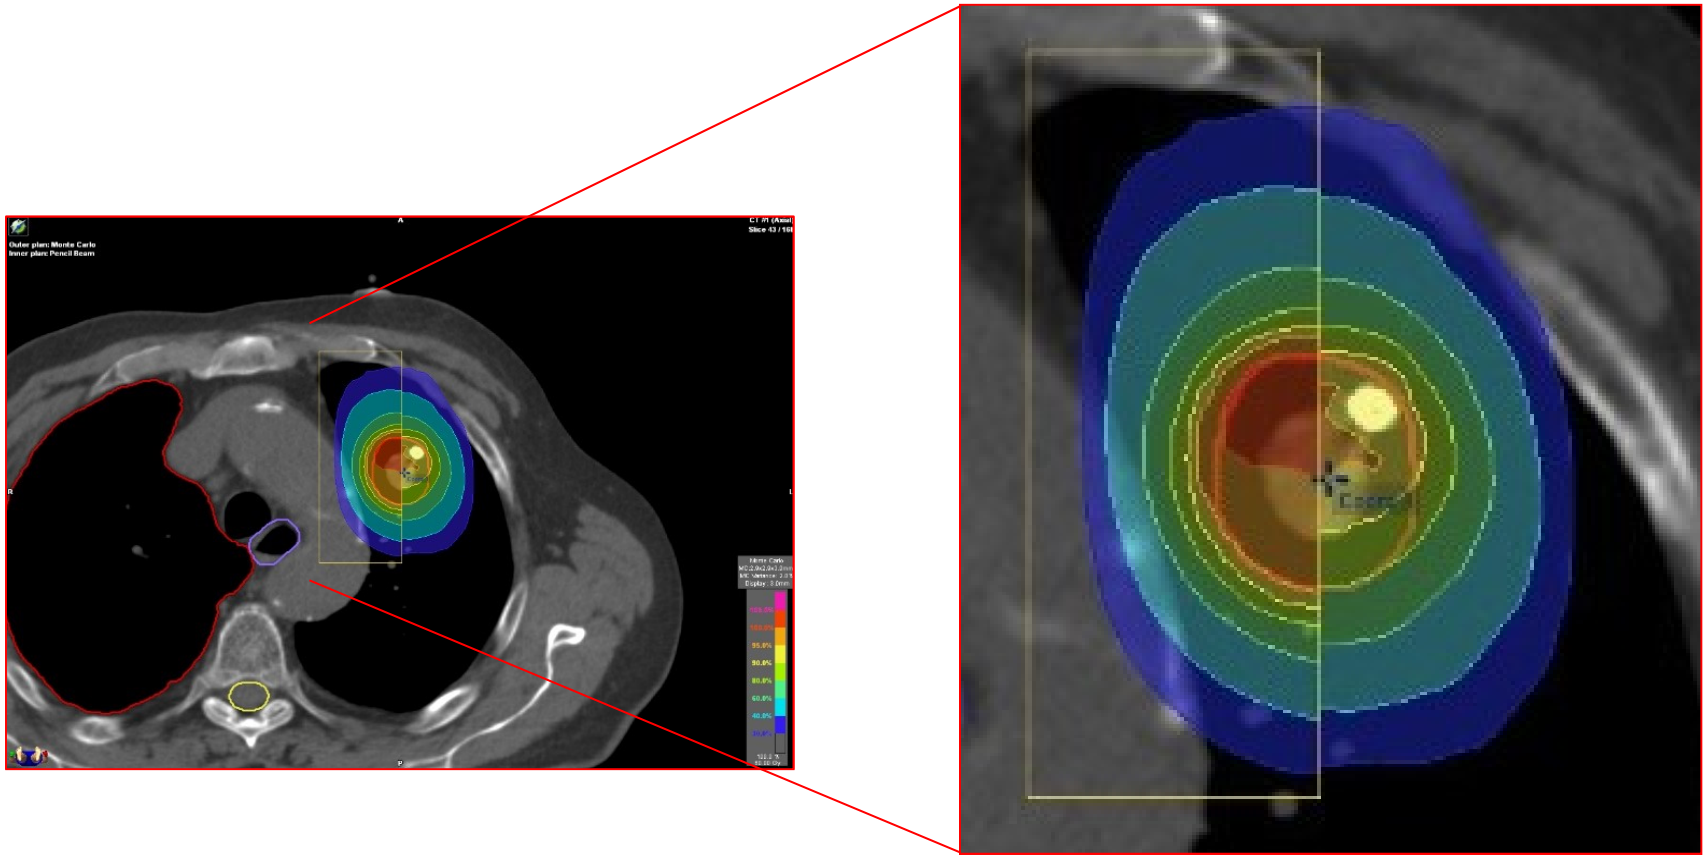
- V_{20} (lungs): 17.6%
- $D_{2\%}$ (Oesophagus: 68.5 Gy
- $D_{2\%}$ (spinal cord): 42.0 Gy



ESTRO School

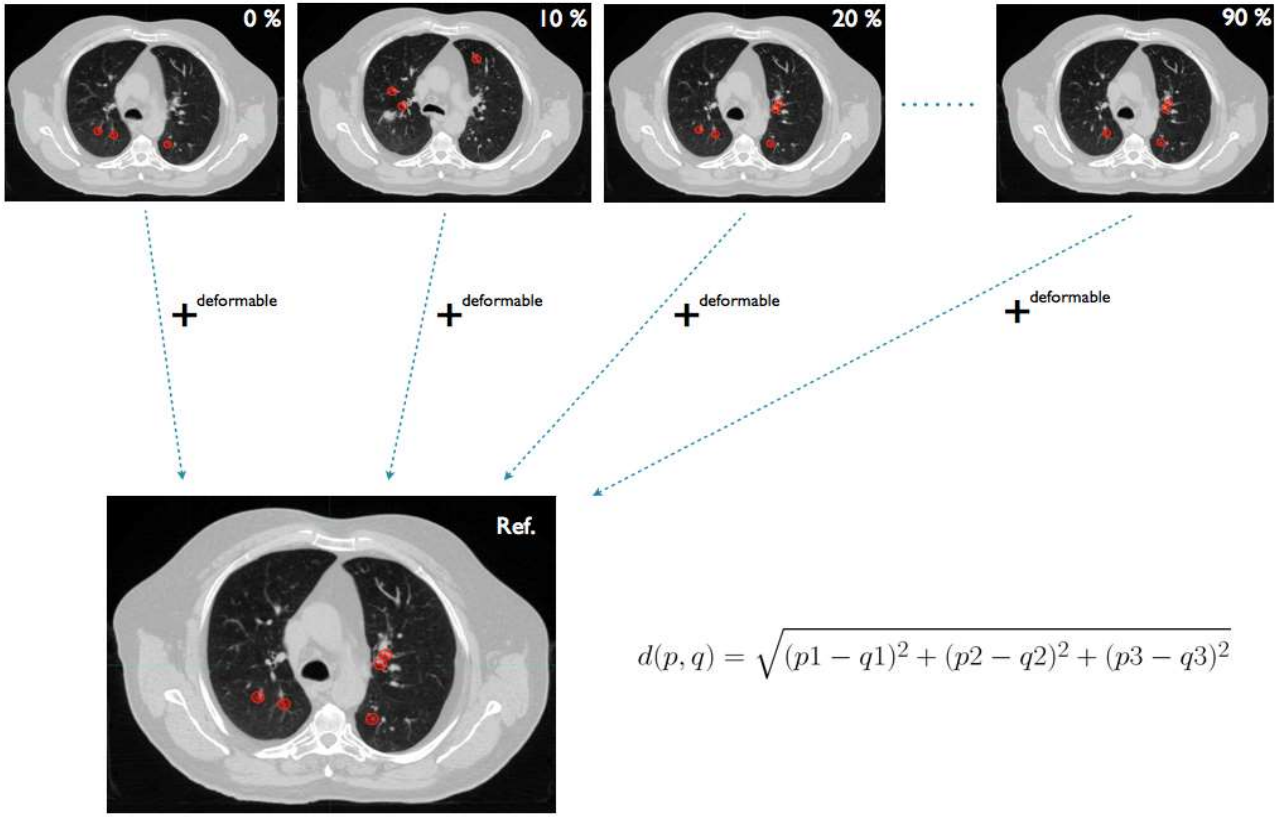
Dose calculation algorithm?

- Type A or B?



Deformable registration …???

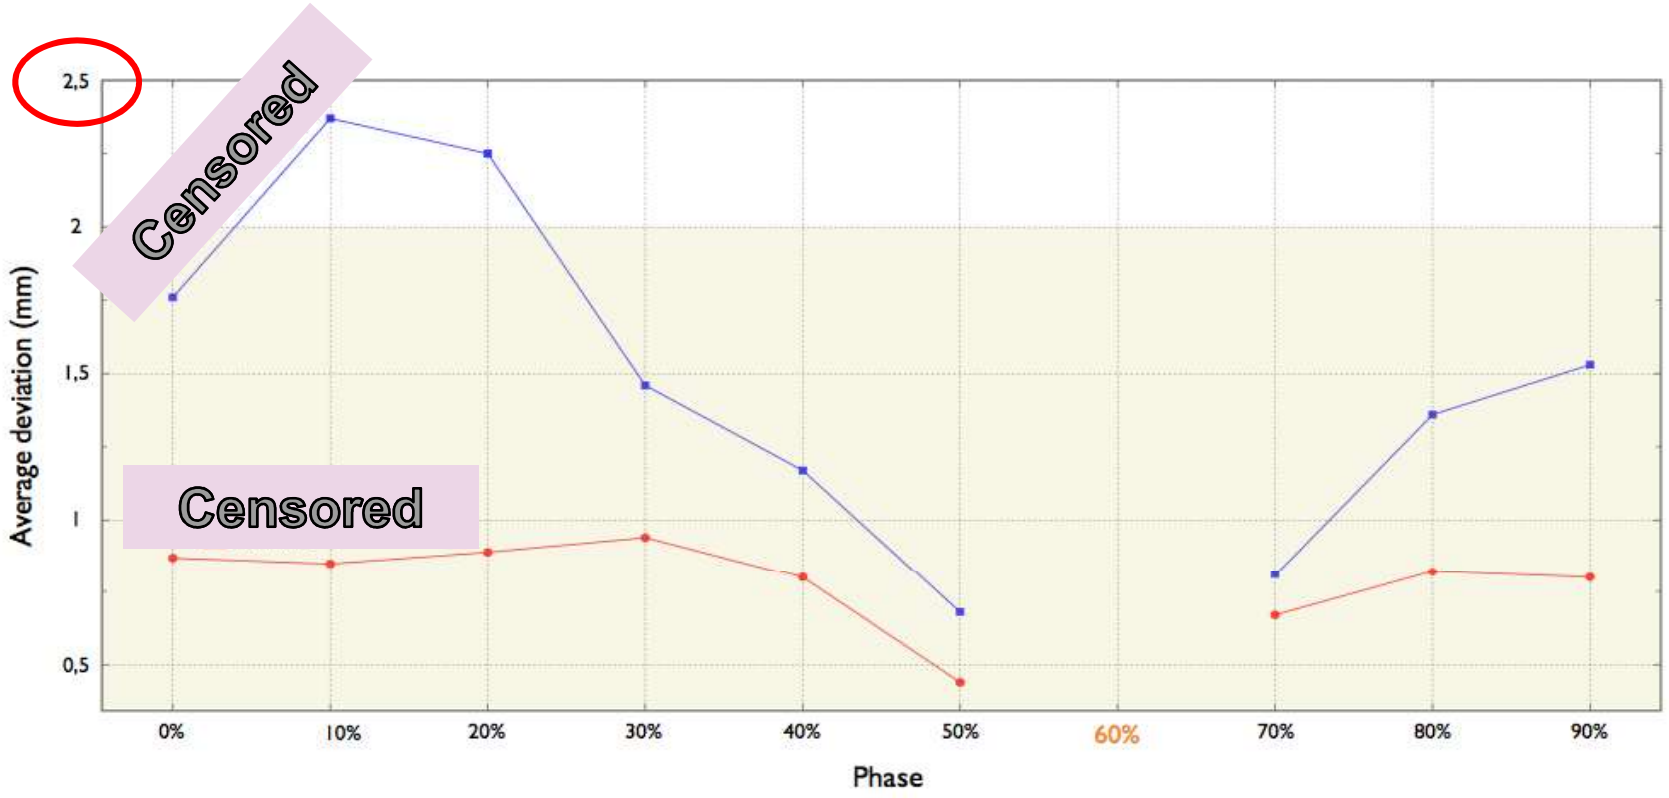
- http://www.creatis.insa-lyon.fr/rio/popi-model
- 4D-CT datasets, with 100 POIs on vessel and bronchial bifurcations



$$d(p,q) = \sqrt{(p1-q1)^2 + (p2-q2)^2 + (p3-q3)^2}$$

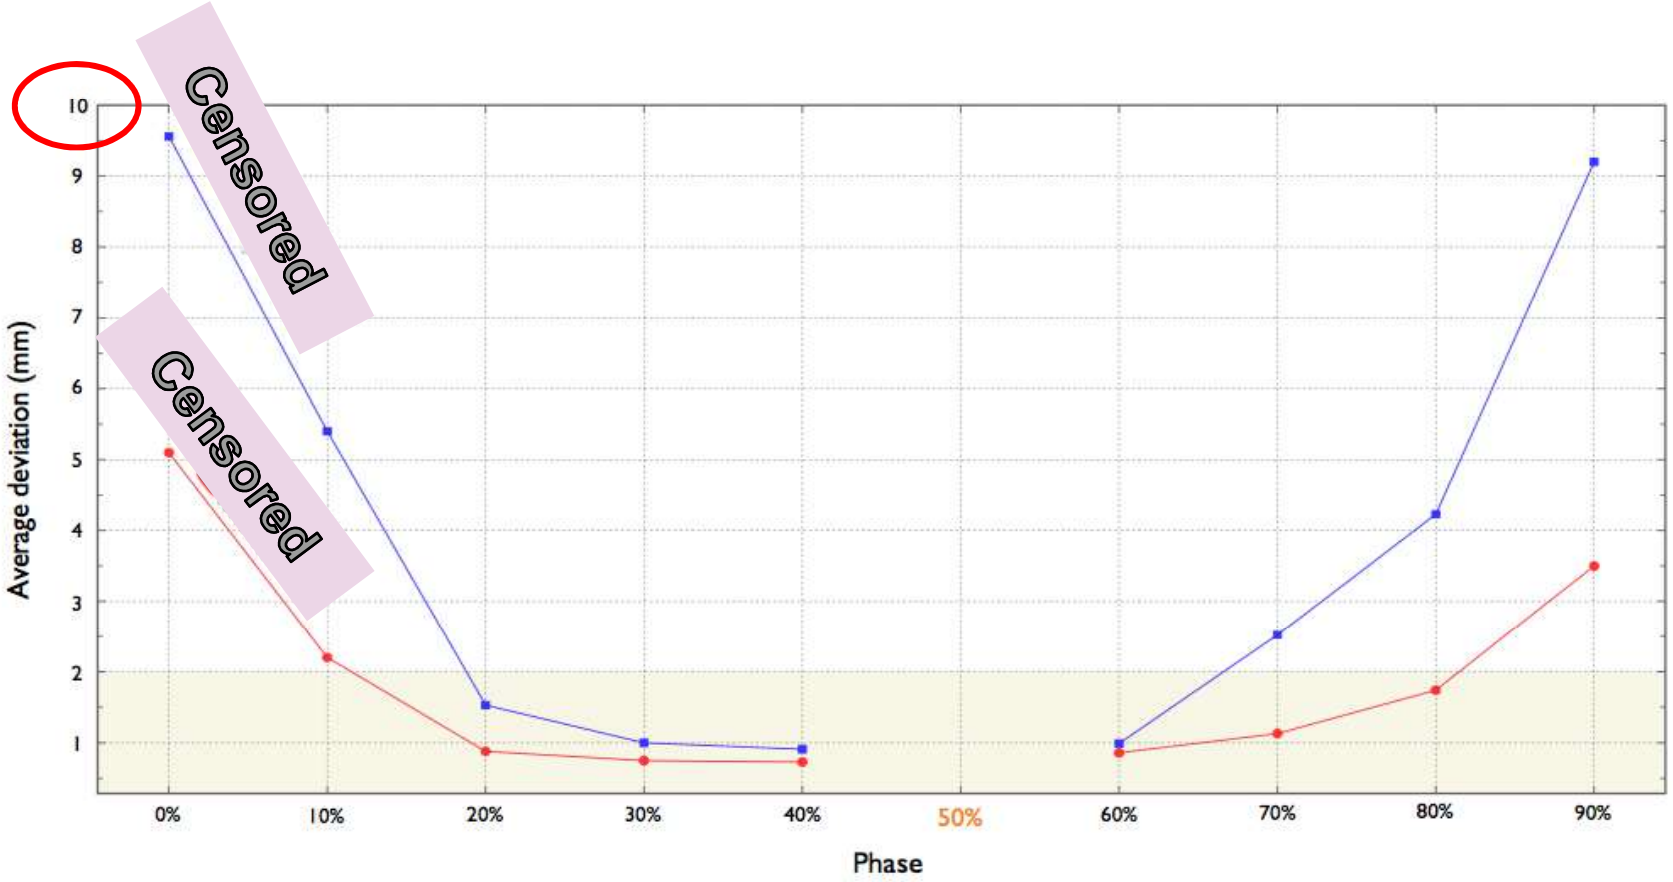
Deformable registration …???

- "Easy" case

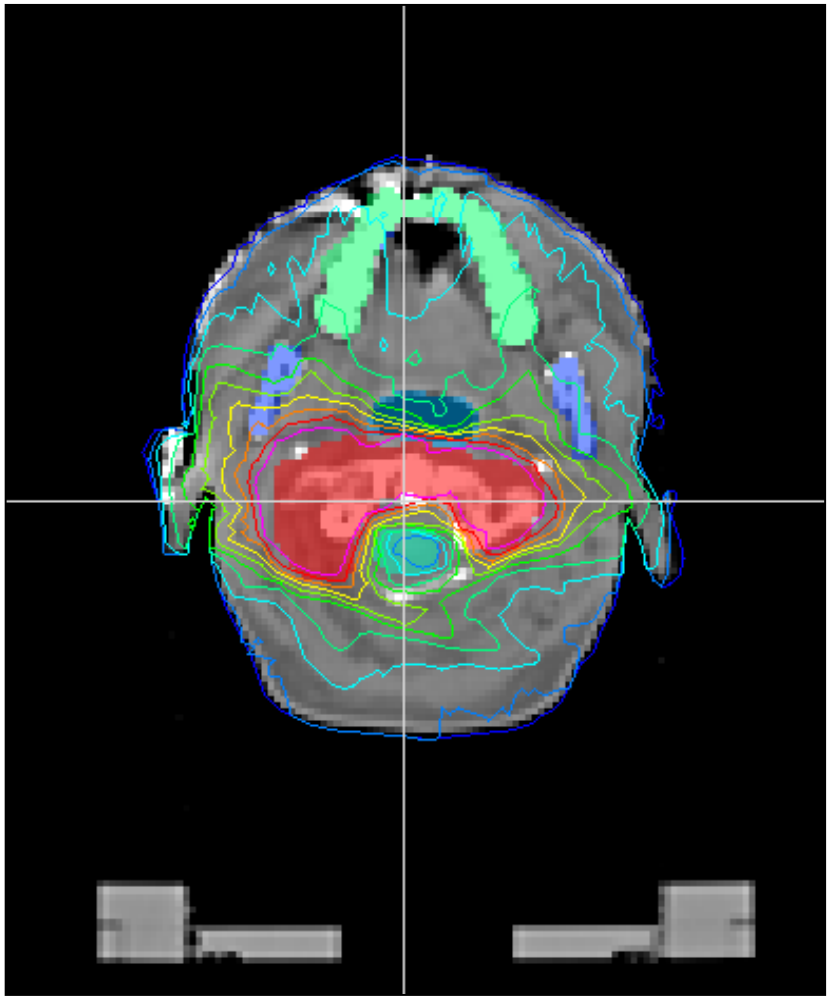


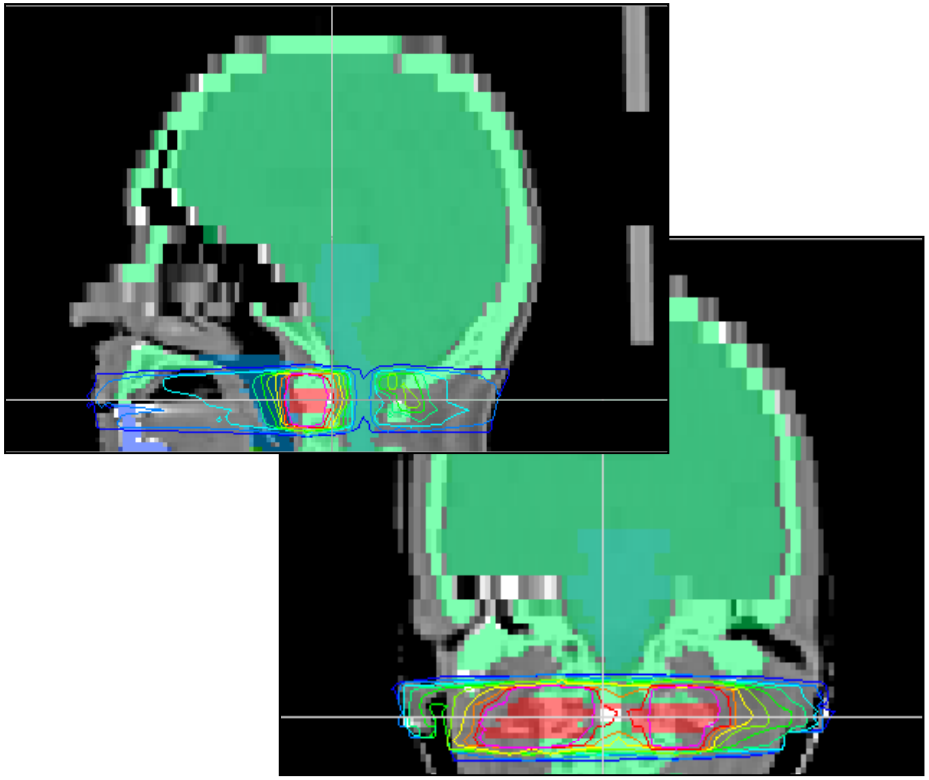
Deformable registration …???

- “Difficult” case



Should we refrain from irradiation?





Second IMRT treatment at AZ-VUB, using sequential tomotherapy: 1995

Conclusions

- If the TPS does not allow for dose accumulation
  - Rescale the primary dose to EQD2 and assess tolerance dose for OAR, use these tolerances as dose constraints in the optimization …
- If the TPS allows for dose accumulation, but not for EQD2 recalculation
  - Rescale primary and re-irradiation to EQD2 and accumulate dose
- If TPS allows for dose accumulation, EQD2, recovery, …
  - Use it … but how?

Conclusions cont'd

- Today it would **be unethical not to have** an open system that allows import and export of RT-structures and RT-Dose!!!
- UNIFORM REPORTING is key for the future … a new ICRU report?
- Accuracy of deformable image registration??
- Accuracy of dose calculation should no longer be an issue Today, but might be an issue when previous irradiation dates from the type A era!!!

Patterns of relapse

Retrospective review

- 1985 -2000
- 1172 patients; R0 resection
- 492 (42%) recurrence
- Locoregional recurrence – surgical bed; upper abdominal retroperitoneal lymph nodes; anastomotic recurrence

Location of recurrence	Number
Locoregional	199 (54%)
Distant	188 (51%)
Peritoneal	108 (29%)

79% recurred within 2 years

D'Angelica M, Gonen M, Brennan M et al 2004 Ann of Surg; 240:808-816

ESTRO School

Role of imaging for detection of relapse

Surveillance imaging may be:

- Directed within a clinical trial protocol
- Local protocols
- Response to development of clinical symptoms
- Response to rising tumour markers
- No standard recommendations

Detecting relapse

- Challenging!
- Extremely difficult sometimes to identify relapse
- Post op – anatomy no longer predictable
- Mobile tissues, appearances vary on sequential imaging
- No specific rules….
- Important to discuss with operative procedure with surgeon
- Discuss pathological findings
- Multi-disciplinary effort

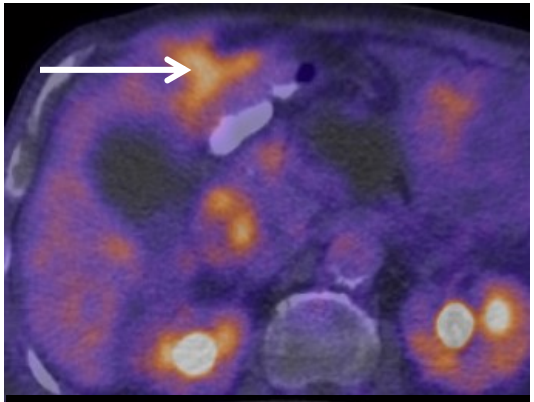
Gastric cancer patterns of disease relapse

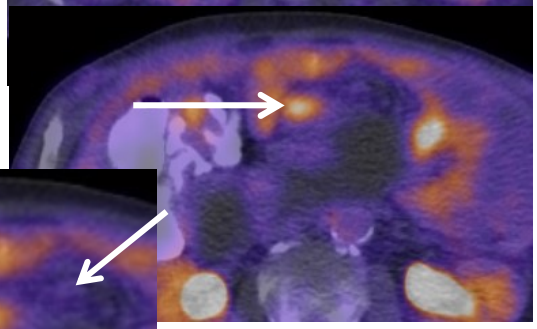
Male patient underwent a total gastrectomy on 09.09.2014 post neoadjuvant chemotherapy. The path staging was pT3bN1 R0 (3/40 nodes positive).

29.10.2014

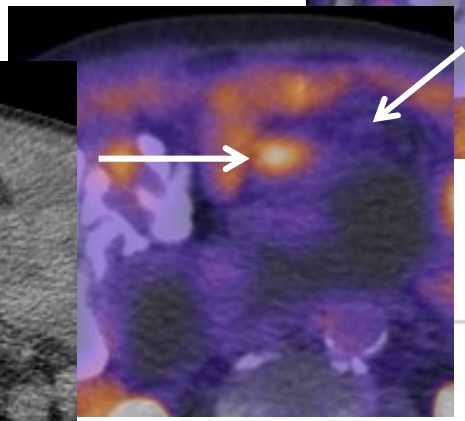
12.02.2015

06.03.2015





Baseline

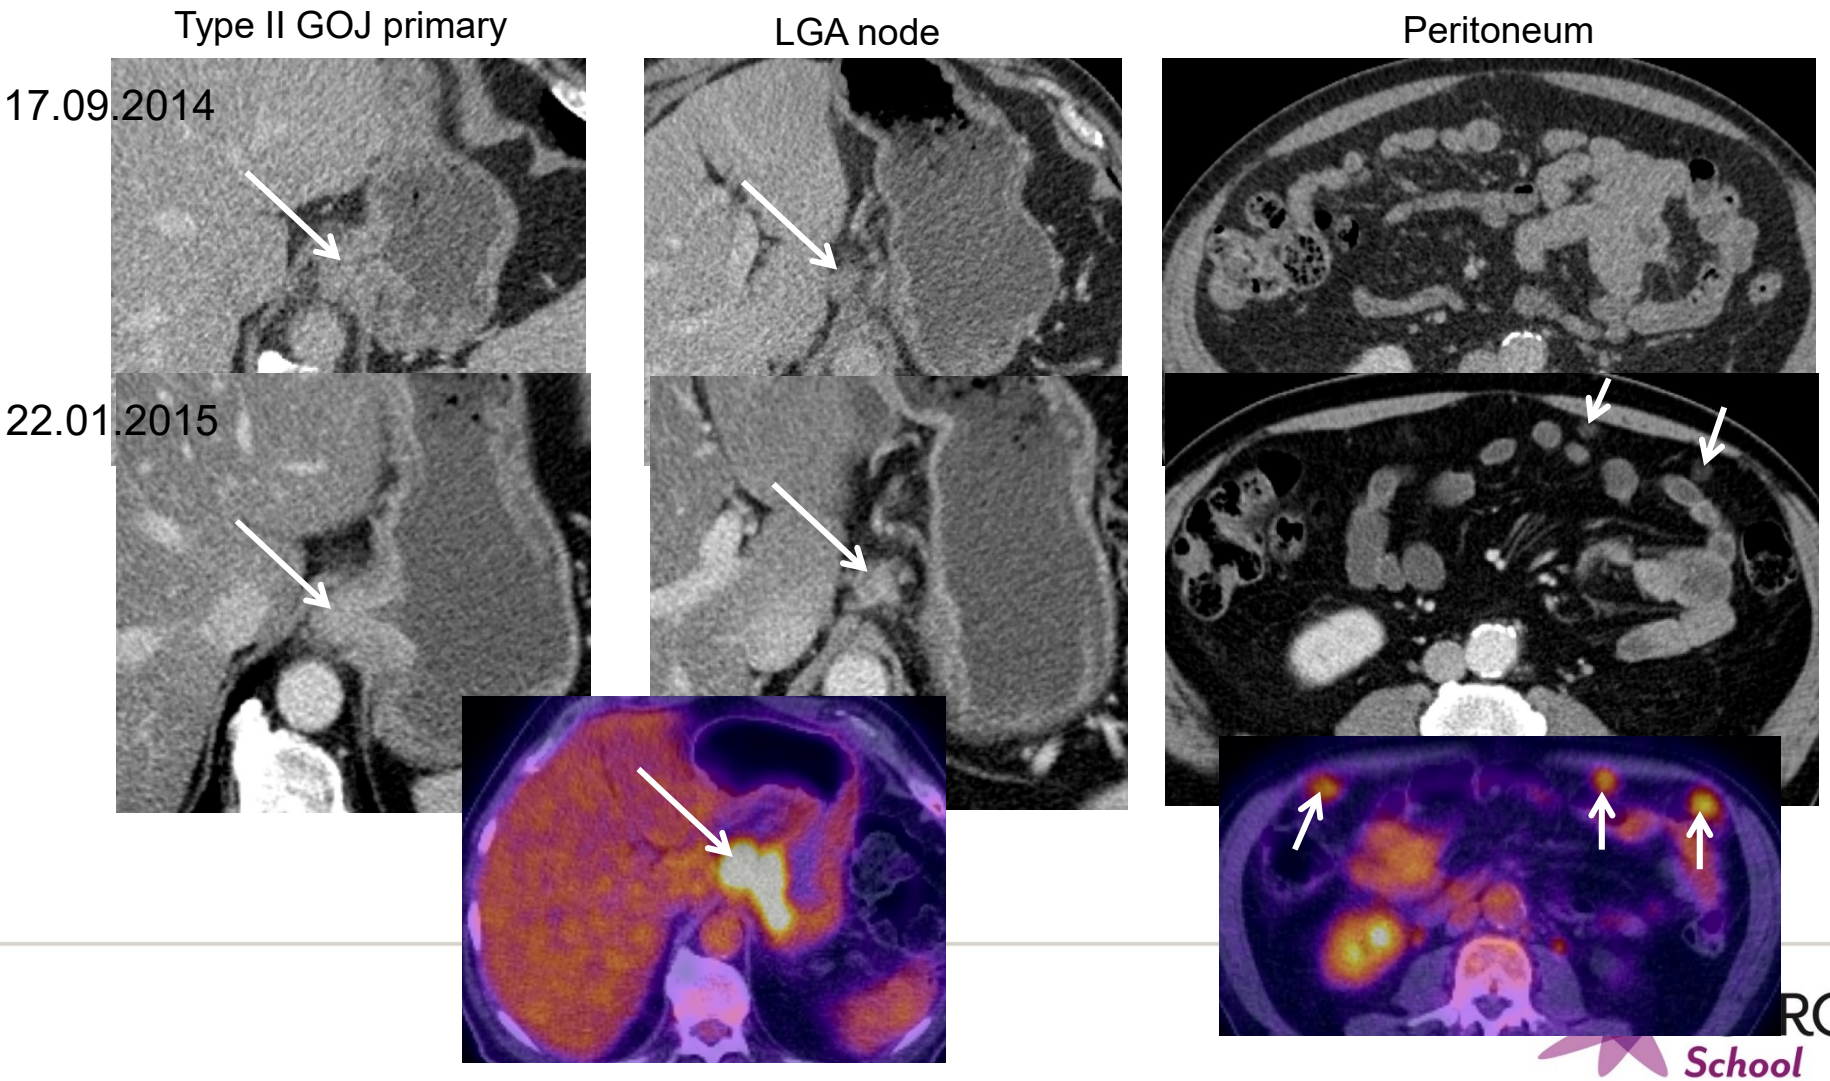


Serosal disease causing small bowel obstruction

ESTRO School

Locoregional and distant relapse

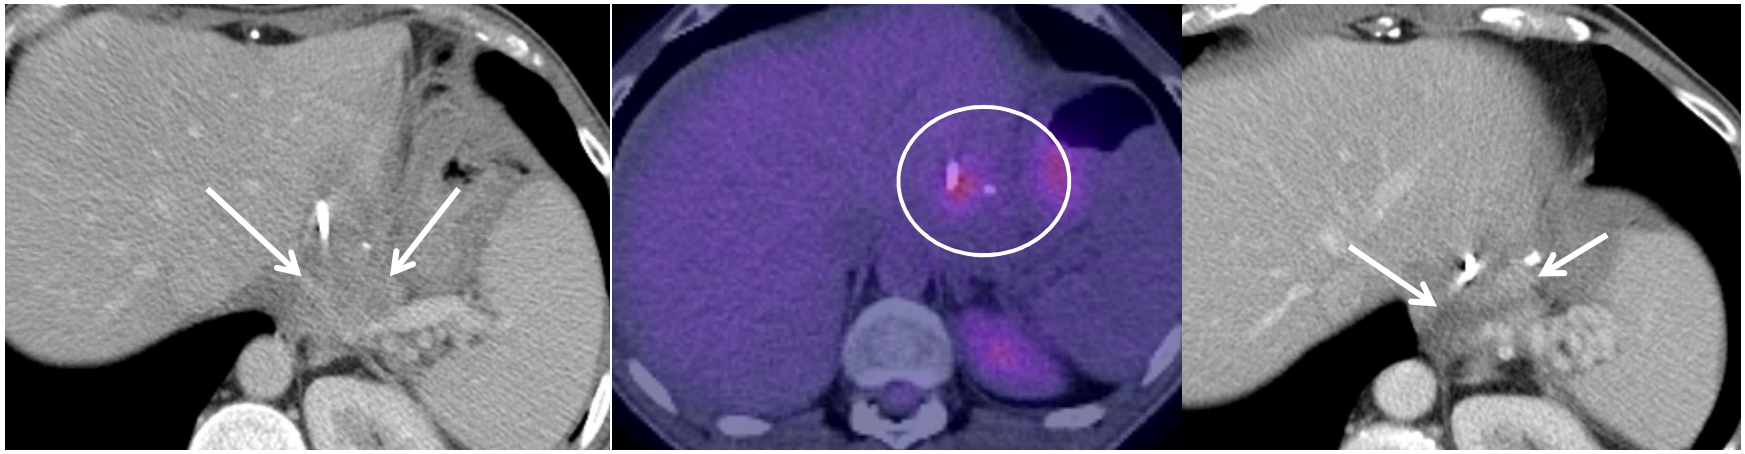
Type II GOJ tumour staged as T3N2. Commenced chemo. Progressive symptoms of dysphagia.



Challenging anatomy

44 year old male with familial E-cadherin CDH1 gene +ve; poorly differentiated signet ring cell gastric carcinoma. Total gastrectomy 27.04.2010. pT3N1 (1/31 nodes)

10.12.2014 | 10.12.2014 | 19.03.2015

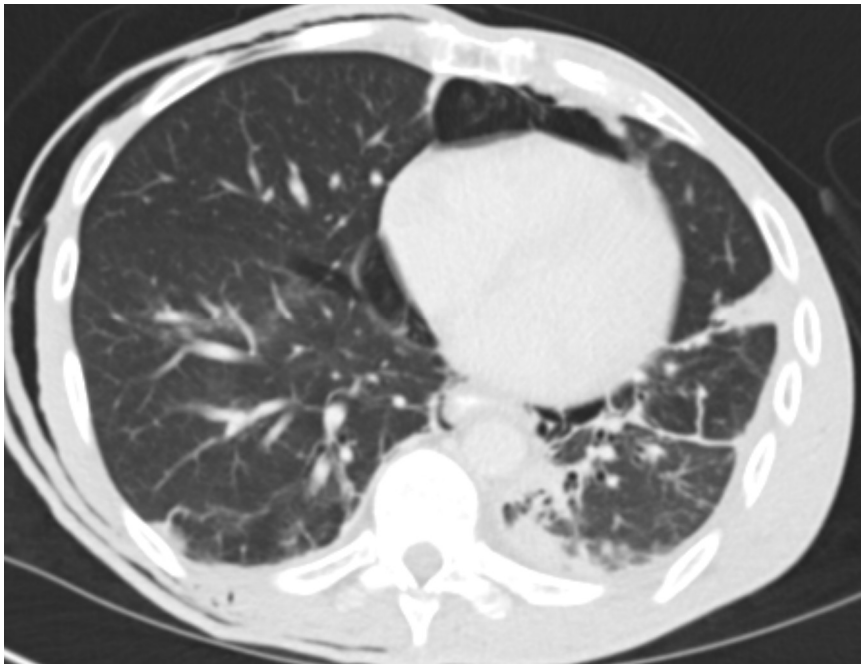


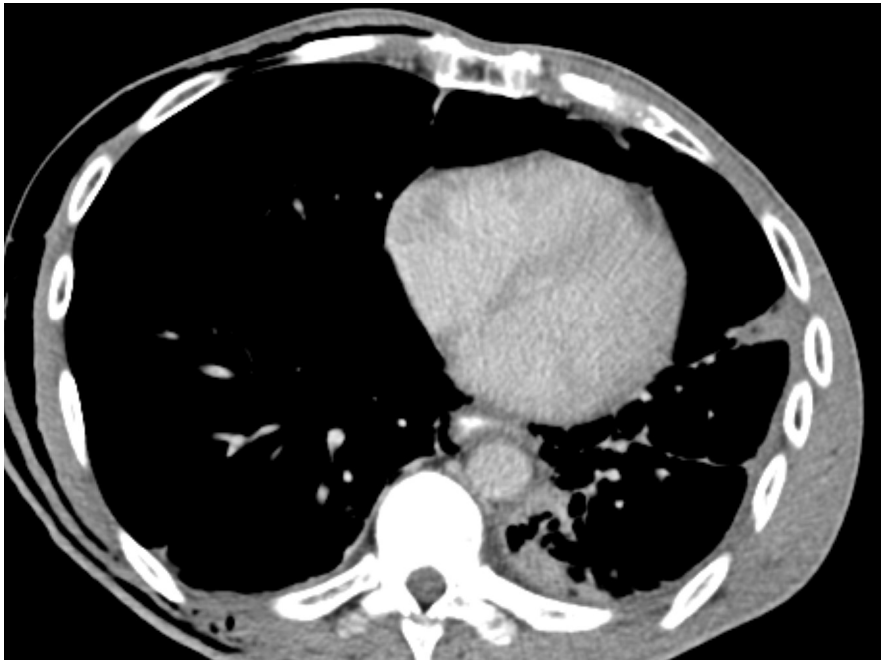
Likely locoregional relapse?? PET-CT not avid…….

Partial response post chemotherapy

Example of False positive PET-CT

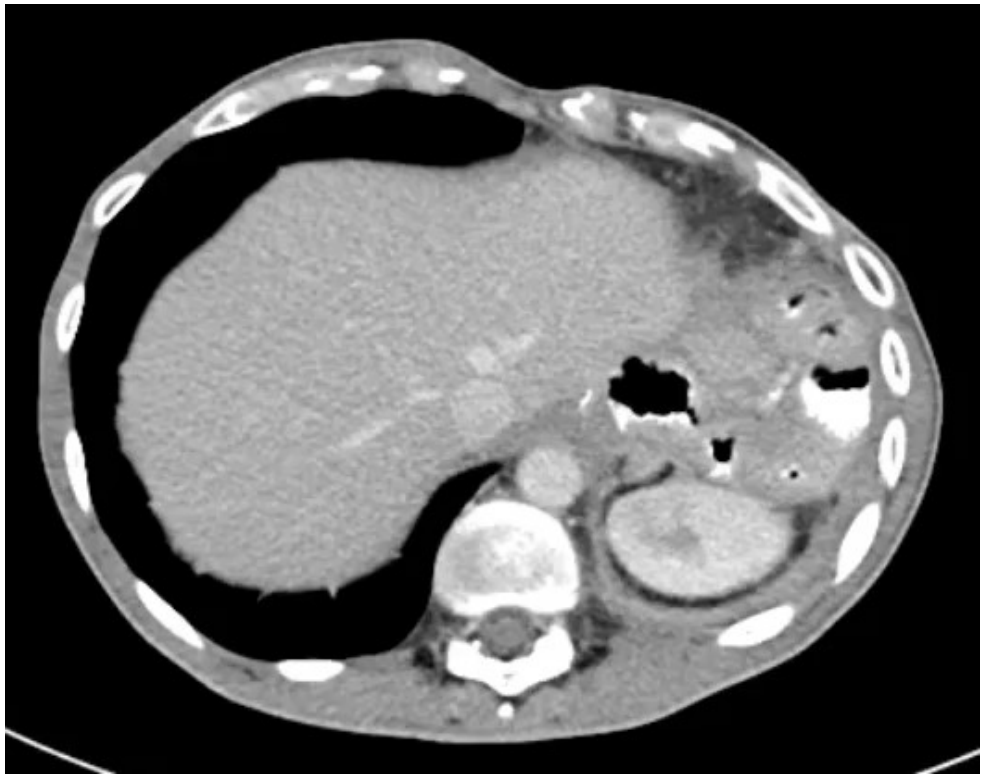
45 yr old male total gastrectomy in 2010. Relapse in 2015 treated with CRT and surgery (refashioning oesophago-jejunal anastomosis). Required dilatation of anastomosis due to recurrent strictures; complicated by perforation





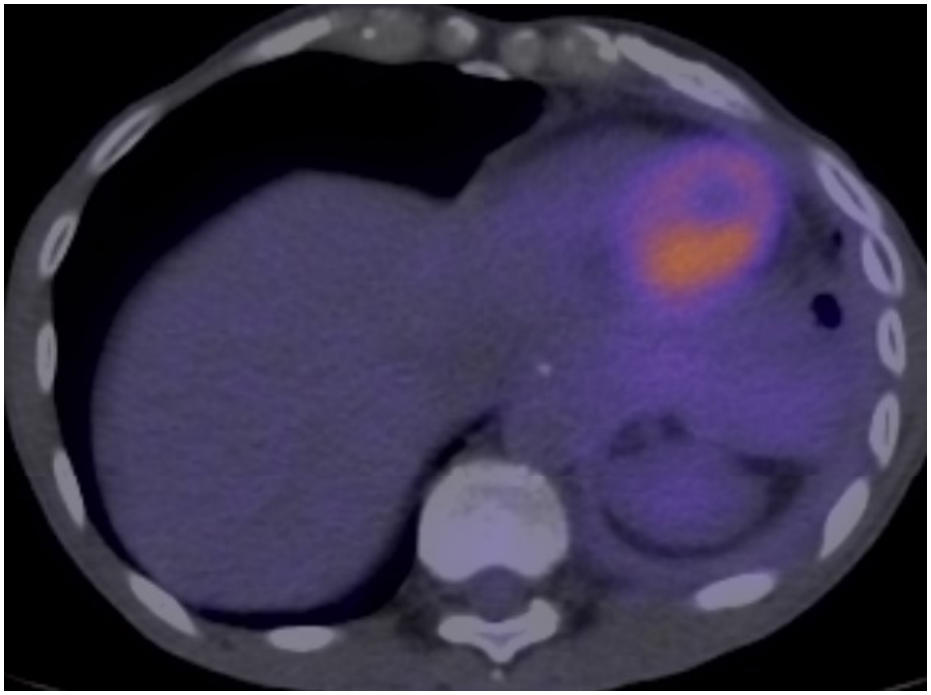
28.06.2016 – post dilatation of anatomotic stricture.

Example of False positive



CT 11.07.2016 Follow up. Patient clinically improving

Example of False positive



03.08.2016 PET-CT reported as recurrent disease

Summary

Detecting relapse following gastric surgery is challenging

- Unfamiliar anatomy
- Lack of intra abdominal fat
- False negative CT
- PET-CT may assist in detection of relapse
- Advise follow up if symptoms persist & imaging is negative

Thank you

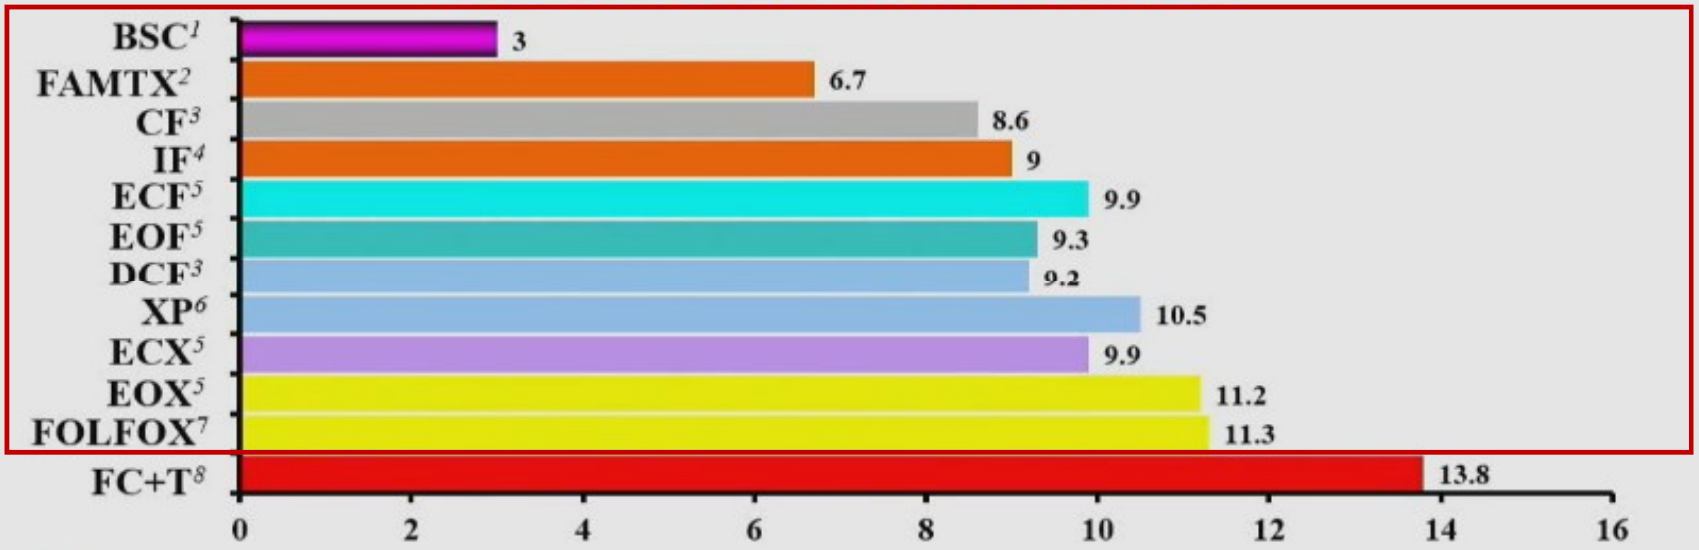
Overall survival with chemotherapy in advanced OG cancer



THE ROYAL MARSDEN

[1]Murad et al. Cancer 1993; [2]Vanhoefer et al. J Clin Oncol 2000; [3]Van Cutsem et al. J Clin Oncol 2006; [4]Dank et al. Ann Oncol 2008; [5]Cunningham et al. N Engl J Med 2008; [6]Kang et al. Ann Oncol 2009; [7]Shah et al JAMA Oncol 2016; [8]Bang et al. Lancet 2010

Optimal first-line chemotherapeutic treatment in patients with locally advanced or metastatic esophagogastric carcinoma: triplet *versus* doublet chemotherapy: a systematic literature review and meta-analysis

CANCER METASTASIS REVIEWS

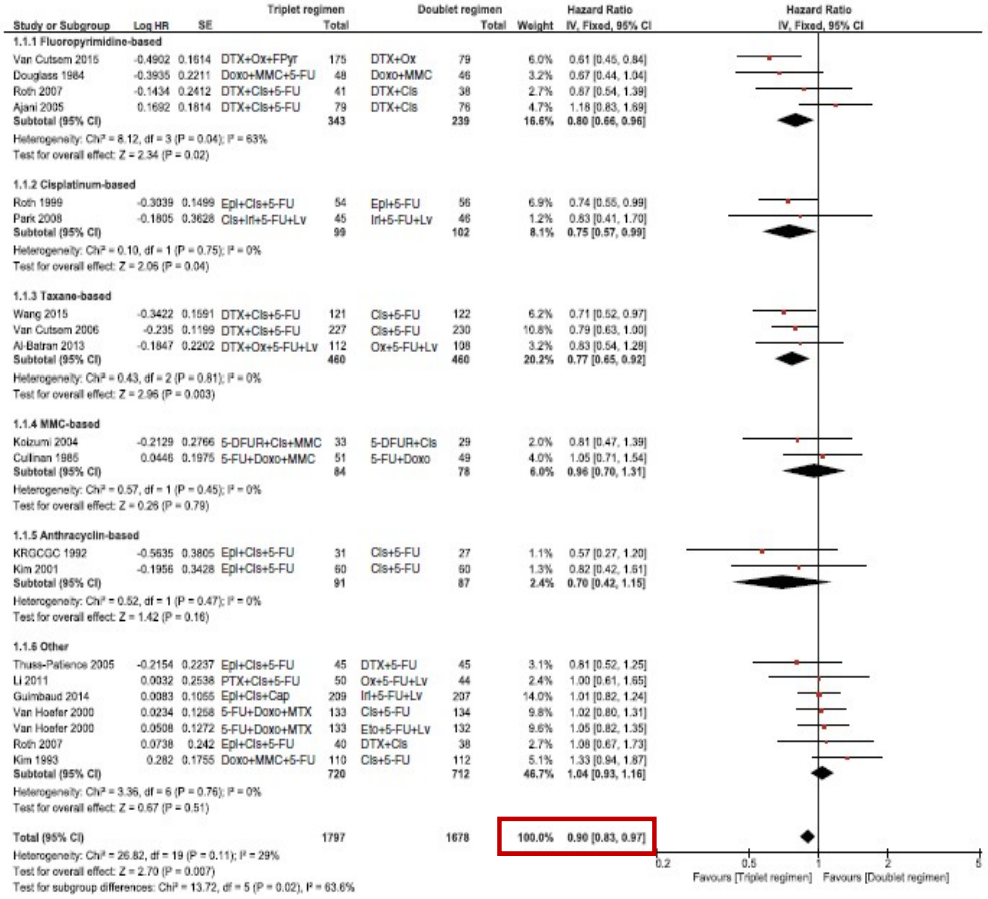
Cancer Metastasis Rev (2015) 34:429–441
DOI 10.1007/s10555-015-9576-y

There is a debate whether triplet or doublet chemotherapy should be used as a first-line treatment in patients with advanced or metastatic esophagogastric cancer. Therefore, here we will review the available literature to assess the efficacy and safety of triplet *versus* doublet chemotherapy as a first-line treatment in patients with advanced esophagogastric cancer.

Optimal first-line chemotherapeutic treatment in patients with locally advanced or metastatic esophagogastric carcinoma: triplet *versus* doublet chemotherapy: a systematic literature review and meta-analysis

CANCER METASTASIS REVIEWS

Cancer Metastasis Rev (2015) 34:429–441
DOI 10.1007/s10555-015-9576-y



3.2 Overall survival, progression-free survival, and objective response rate

A significant improvement in OS with a low heterogeneity was observed in favor of a triplet (HR 0.90, 95 % confidence interval (CI) 0.83–0.97, I^2=29 %). When examining the subgroups, especially the triplets with fluoropyrimidine, taxane and cisplatin showed a significant benefit (Fig. 2.).

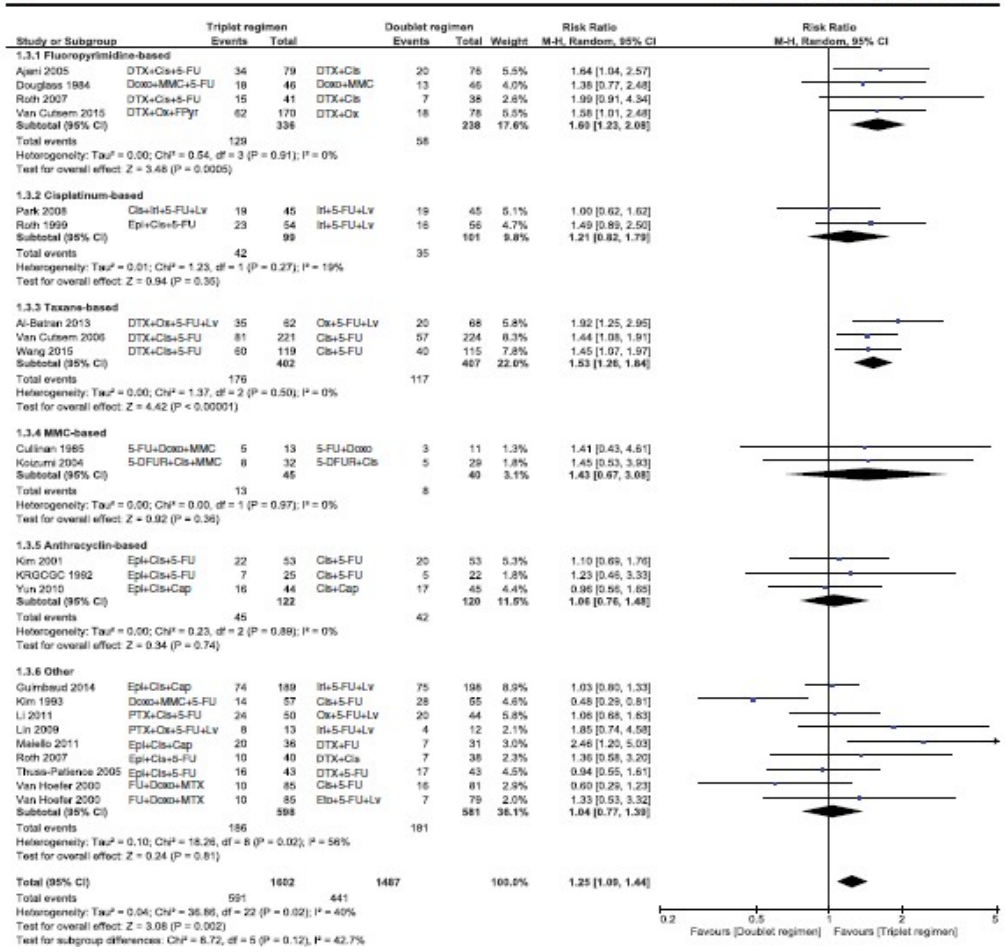
Although the survival of patients treated with a triplet significantly outweighed the survival of patients treated with a doublet, overall, ***the survival gain was modest with a hazard ratio of 0.90 of which the clinical relevance may be questioned***

ESTRO School

Optimal first-line chemotherapeutic treatment in patients with locally advanced or metastatic esophagogastric carcinoma: triplet *versus* doublet chemotherapy: a systematic literature review and meta-analysis

CANCER METASTASIS REVIEWS

Cancer Metastasis Rev (2015) 34:429–441
DOI 10.1007/s10555-015-9576-y



3.2 Overall survival, progression-free survival, and objective response rate

In addition, the use of a triplet was associated with a better ORR compared to a doublet (risk ratio=1.25, 95 % CI 1.09-1.44). This was mainly due to triplets with a fluoropyrimidine or taxane (Fig. 4.)

3.4 Toxicity

The risk of grade 3–4 thrombocytopenia (6.2 vs 3.7 %), infection (10.2 vs 6.4 %), and mucositis (9.7 vs 4.7 %) was significantly increased with a triplet compared to a doublet

ESTRO School

Optimal first-line chemotherapeutic treatment in patients with locally advanced or metastatic esophagogastric carcinoma: triplet *versus* doublet chemotherapy: a systematic literature review and meta-analysis

CANCER METASTASIS REVIEWS

Cancer Metastasis Rev (2015) 34:429–441
DOI 10.1007/s10555-015-9576-y

Although in general in metastatic disease ORR is not considered to be the most robust outcome measure, in advanced esophagogastric cancer, ORR may be a clinically relevant end point, given the high symptom burden that patients may suffer from that may be alleviated by response to treatment [1].

It Is Time to Stop Using Epirubicin to Treat Any Patient With Gastroesophageal Adenocarcinoma

VOLUME 35 · NUMBER 4 · FEBRUARY 1, 2017

JOURNAL OF CLINICAL ONCOLOGY

However, considering the overall poor performance of epirubicin combinations in the many trials we have described (in which it never showed benefit against two-drug combinations or even single-agent FU), we cannot justify the use of precious resources to launch a new trial to address this issue. We do not recommend epirubicin-based treatment for any patient with GEAC.

HER2	GATSBY	Phase II/III/ second	HER2 IHC	TDM1 vs. paclitaxel or docetaxel	Negative (OS)	Kang et al[29]
VEGFR-2	RAINBOW	Phase III/second	All comer	Paclitaxel/ramucirumab vs. paclitaxel/placebo	Positive (OS)	Wilke et al[30]
VEGFR-2	REGARD	Phase III/third	All comer	Ramucirumab vs. placebo	Positive (OS)	Fuchs et al[31]

Negative trials with targeted agents have ***substantially out numbered the positive trials*** (the ToGA, REGARD, and RAINBOW trials) in GAC in the past decade

Major factors accounting for this negative outcome may be

(1) ***many trials did not select the patient population based on specific target***,

(2) ***inaccurate biomarker for patient selection*** (i.e., HER2, FISH vs. HER2 IHC)

Molecular classification of gastric cancer

ANNALS OF ONCOLOGY
Annals of Oncology 27: 763–769, 2016

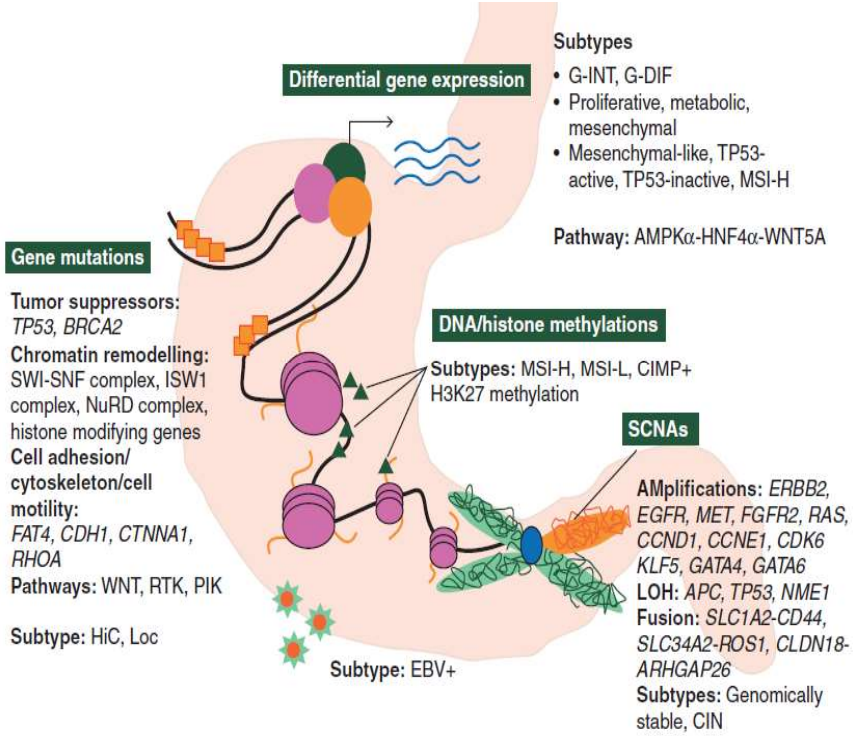

Figure 1. Genetic and epigenetic modification of gastric cancer (GC). The genetic alteration that contributes to GC involves gene mutations, differential gene expression as well as somatic copy number alterations (SCNAs). The epigenetic modifications involve DNA as well as histone methylation.

- Recent ***advancements in genomic technology have now allowed*** GCs to be studied at high resolution and at the molecular level
- Such ***molecular profiling data*** have greatly facilitated ***identification of candidate driver alterations in GC***
- Achieving an understanding of potential driver alterations involved in GC pathogenesis can lead to the ***identification of*** clinically important biomarkers and ***potential treatment targets***

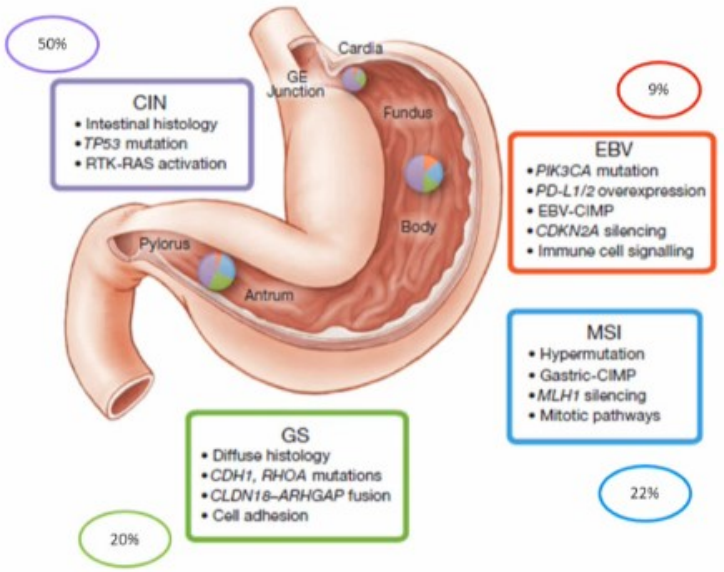
Comprehensive molecular characterization of gastric adenocarcinoma

The Cancer Genome Atlas Research Network*

nature

VOL 513 | 11 SEPTEMBER 2014

Comprehensive molecular characterization of GC - TCGA



The landmark Cancer Genome Atlas (TCGA) study performed sequencing of 295 gastric cancer samples on 6 different molecular platforms

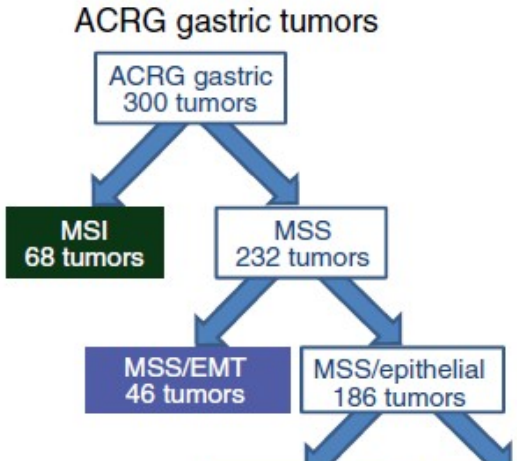
Based on this, ***gastric cancer was clustered into 4 groups***:

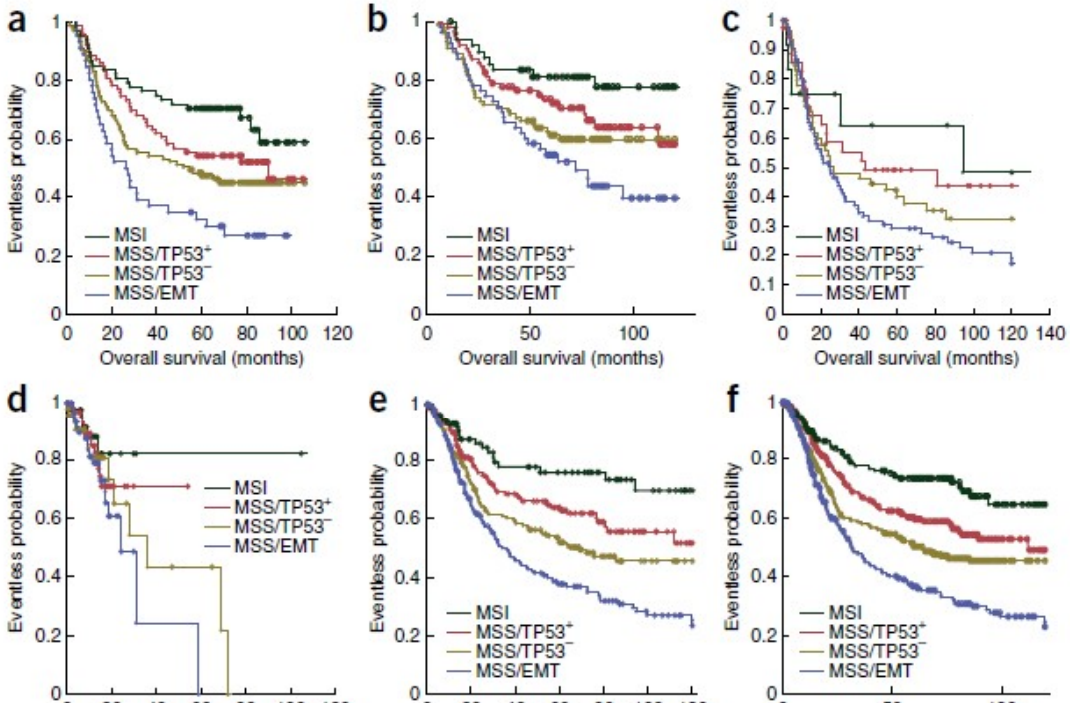
- ✓ ***Ebstein-Barr virus(EBV) positive*** (9%),
- ✓ ***tumours with microsatellite instability (MSI)*** (22%),
- ✓ ***genomically stable tumours*** (20%)
- ✓ and those with ***chromosomal instability*** (50%)

Molecular analysis of gastric cancer identifies subtypes associated with distinct clinical outcomes

nature medicine
VOLUME 21 | NUMBER 5 | MAY 2015

The ***Asian Cancer Research Group (ACRG)*** used gene expression data to ***describe four molecular subtypes linked to distinct patterns of molecular alterations, disease progression and prognosis***





Do we have distinct treatment choices for these different molecular pathways?

Mismatch Repair Deficiency, Microsatellite Instability, and Survival

An Exploratory Analysis of the Medical Research Council Adjuvant Gastric Infusional Chemotherapy (MAGIC) Trial

JAMA Oncology

JAMA Oncol. doi:10.1001/jamaoncol.2016.6762

IMPORTANCE Mismatch repair (MMR) deficiency (MMRD) and microsatellite instability (MSI) are prognostic for survival in many cancers and for resistance to fluoropyrimidines in early colon cancer. However, the effect of MMRD and MSI in curatively resected gastric cancer treated with perioperative chemotherapy is unknown.

Figure 1. Overall Survival by Microsatellite Instability (MSI) Status and Treatment Arm in the Study Patients

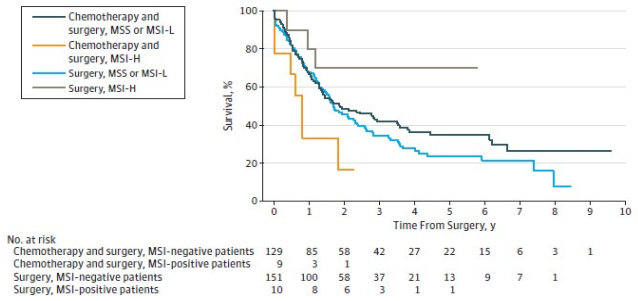

Figure 2. Overall Survival by Mismatch Repair (MMR) Protein Status in the Study Patients

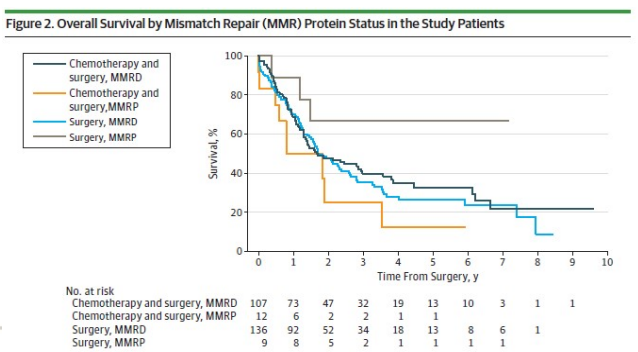

We found that patients with MSI-H or MMRD tumors have superior survival compared with patients with MSS/MSI-L or MMRP tumors when treated with surgery alone and conversely have inferior survival to patients with MSS/MSI-L or MMRP tumors when treated with perioperative chemotherapy plus surgery. These findings are significant, because if validated, they suggest that patients with MSI-H or MMRD may not benefit (or may experience a detrimental effect) from perioperative chemotherapy and may be better served by a surgery-only approach. Because MSI or MMRD tumors comprise up to 10% to 20% of stomach cancers in some series, this finding has the potential to affect large numbers of patients.[15]

Molecular classification of gastric cancer

EXPERT REVIEW OF MOLECULAR DIAGNOSTICS
EXPERT REVIEW OF MOLECULAR DIAGNOSTICS, 2017
VOL. 17, NO. 3, 293–301

The accurate classification of MSI-GC may become clinically relevant for two reasons:

- (1) MSI-GCs may not require ***any standard adjuvant (radio-)chemotherapy*** in a curative setting;
- (2) MSI-GCs express the immune checkpoint molecules PD-L1 and PD-1 and ***may be considered suitable for the treatment with immune checkpoint inhibitors*** in the palliative setting

Pembrolizumab for patients with PD-L1-positive advanced gastric cancer (KEYNOTE-012): a multicentre, open-label, phase 1b trial

THE LANCET Oncology

Lancet Oncol 2016; 17: 717–26

Background Expression of PD-L1 has been shown to be upregulated in some patients with gastric cancer. As part of the phase 1b KEYNOTE-012 study, we aimed to assess the safety and activity of the anti-PD-1 antibody pembrolizumab in patients with PD-L1-positive recurrent or metastatic adenocarcinoma of the stomach or gastro-oesophageal junction.

Pre-operative chemoradiotherapy is an attractive approach

Advantages

- Smaller treatment volume by more accurate target definition
- Downstaging/-sizing; higher chance of radical R0 surgery
- Good compliance (CROSS)
- Early indication of treatment sensitivity

Disadvantages

- No information on histology, lymph node status
- Toxicity may delay definitive surgery

Pre-operative chemoradiotherapy: phase I-II studies

Authors	Patients	RT	Chemotherapy	Surgery	Outcome
Allal et al. IJROBP 2005; Ann Oncol 2003	N=19 T3-4 or N+	Median dose 38.4 Gy (hyperfx)	2 cycles of Cisplatin (100 mg/m^2) d1; 5FU (800 mg/m^2) d1-4; leucovorin (60 mg bid) d1-4 Second cycle during RT	D2 with (sub) total gastric resection	R0 resection 100% pCR+pPR 47% 2yr OS 71%

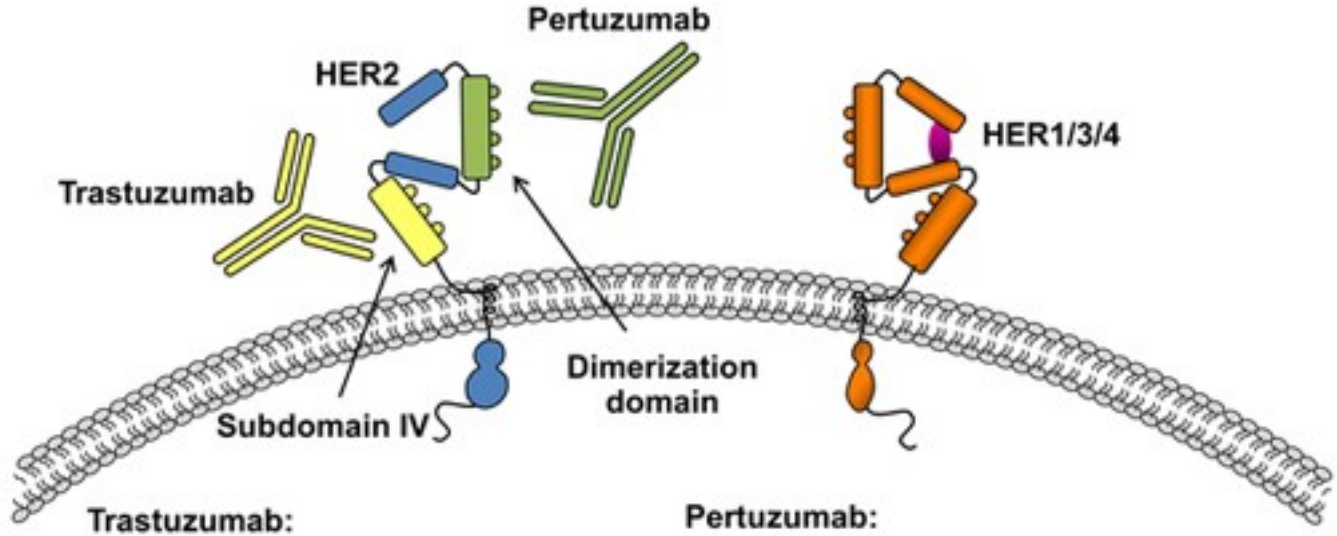
HER2 positive primary GC:

Pertuzumab and Trastuzumab
Complementary Mechanisms of Action



Trastuzumab:

- Inhibits ligand-independent HER2 signaling
- Activates ADCC
- Prevents HER2 ECD shedding

Pertuzumab:

- Inhibits ligand-dependent HER2 dimerization and signaling
- Activates ADCC

Lymph node imaging

Riccardo MANFREDI, MD, MBA, FESGAR
Department of Radiology
University of Rome “A. Gemelli”
Rome – Italy

Gemelli

Fondazione Policlinico Universitario A. Gemelli
Università Cattolica del Sacro Cuore

Outline

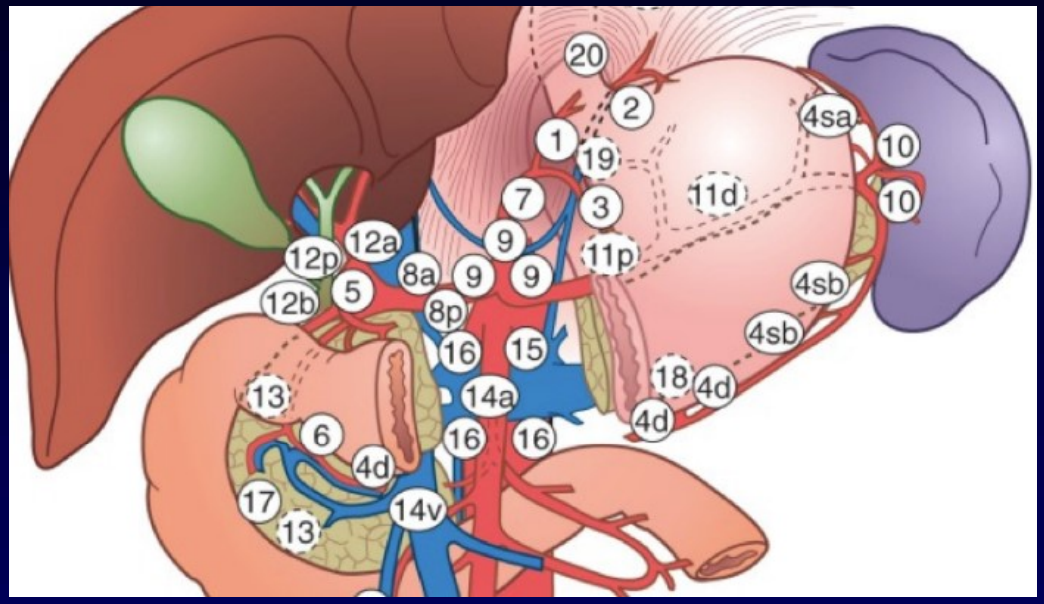
- Prognosis
- Management
- Pelvic Lymph Node sites
- Diagnostic imaging
  - MRI morphology
  - DCE MRI
  - Diffusion-weighted MRI
  - MR lymphography with USPIOs
  - PET/CT
  - Sentinel node techniques

Rationale

- Dissemination to lymph nodes is one of the principle routes of metastatic disease
- Lymph node assessment is a mandatory part of tumour staging

Prognosis

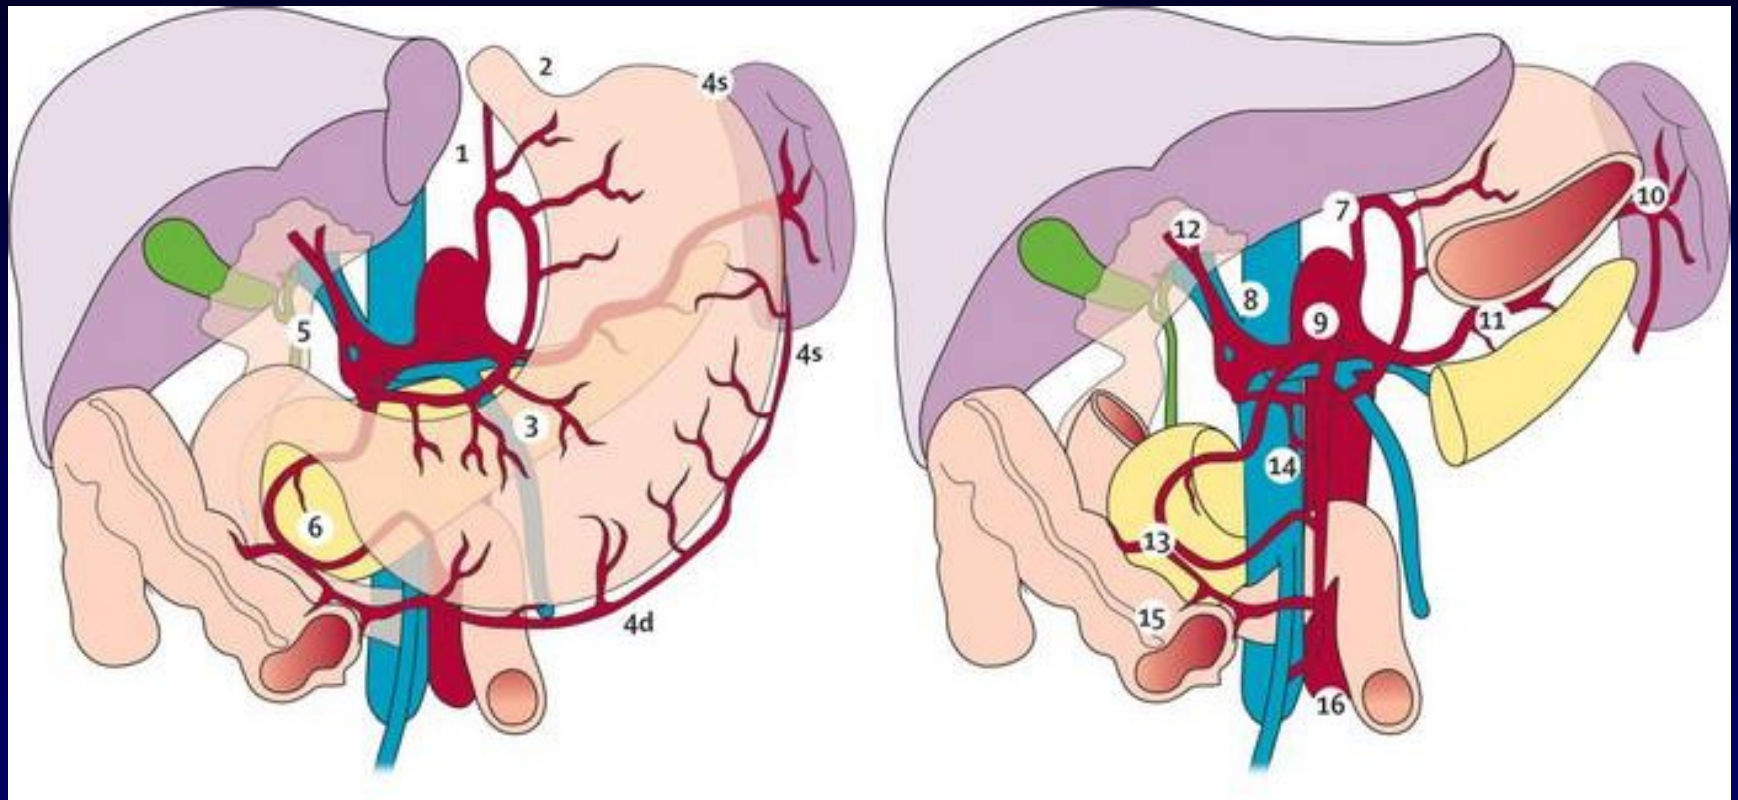
Pancreatic Lymph nodes



- I stations: Posterior and anterior surface of the head, mesenteric artery
- II stations: Common hepatic artery, hepatic hilum and abdominal aorta

Ishikawa Surgery 1997; Napai J Jpn Surg 1987; Kayara Surgery 1995 and Cancer 1999

Gastric lymph nodes



N1 Lymph nodes (perigastric)

1 Right cardiac nodes
2 Left cardiac nodes
3 Nodes along the lesser curvature
4d Lymph nodes along the short gastric and the left gastroepiploic vessels
4s Lymph nodes along the right gastroepiploic vessels
5 Suprapyloric nodes
6 Infrapyloric nodes

N2 Lymph nodes (branches coeliac axis)

7 Nodes along root left gastric artery
8 Nodes along common hepatic artery
9 Nodes around coeliac axis
10 Nodes at splenic hilum
11 Nodes along splenic artery

N3 Lymph nodes

12 Nodes at the hepatoduodenal ligament
13 Retropancreatic (periduodenal) nodes
14 Nodes at the root of the mesentery

N4 Lymph nodes

15 Nodes along the middle colic vein
16 Para-aortic nodes

Diagnostic Imaging

Criteria for LN involvement

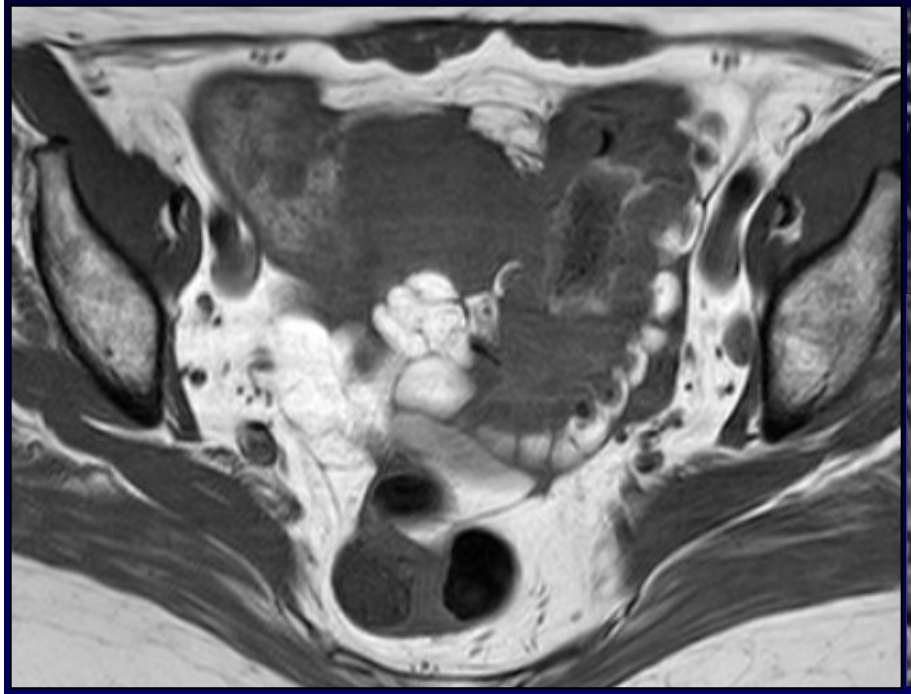
- Ultrasound
  - superficial nodes only
  - FNA
- CT and MRI
  - Morphology
  - Number and site
  - Nodal size

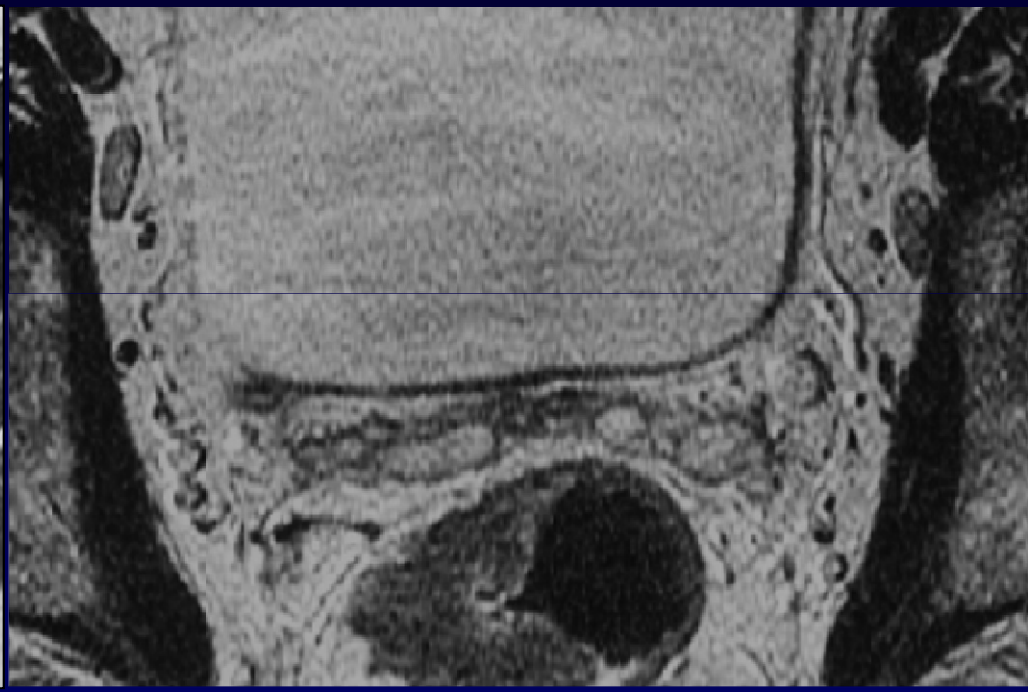
Methods for LN diagnosis

- MRI morphology
- DCE MRI
- Diffusion-weighted MRI
- MR lymphography with USPIOs
- PET/CT
- Sentinel node techniques

- Fatty Hilum
- Shape
- SI ≈ primary tumour
- Necrosis
- Extra-capsular extension
- Size

Morphology: Benign LNs





Fatty hilum
Small size

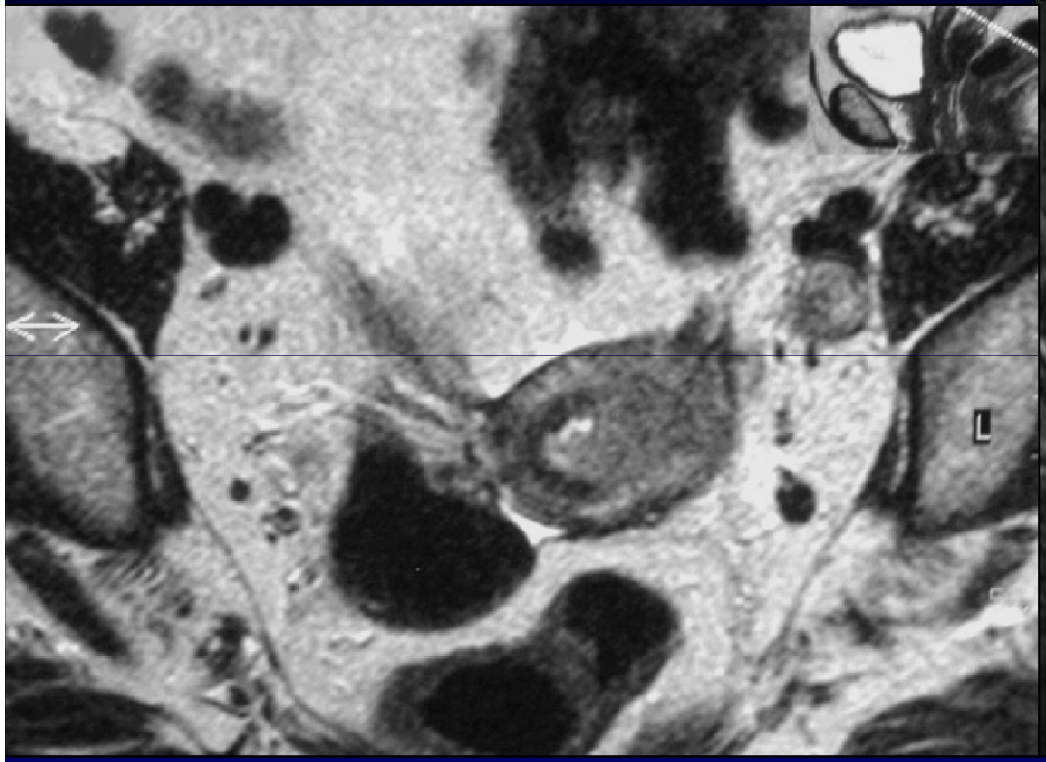
Long thin ovoid shape

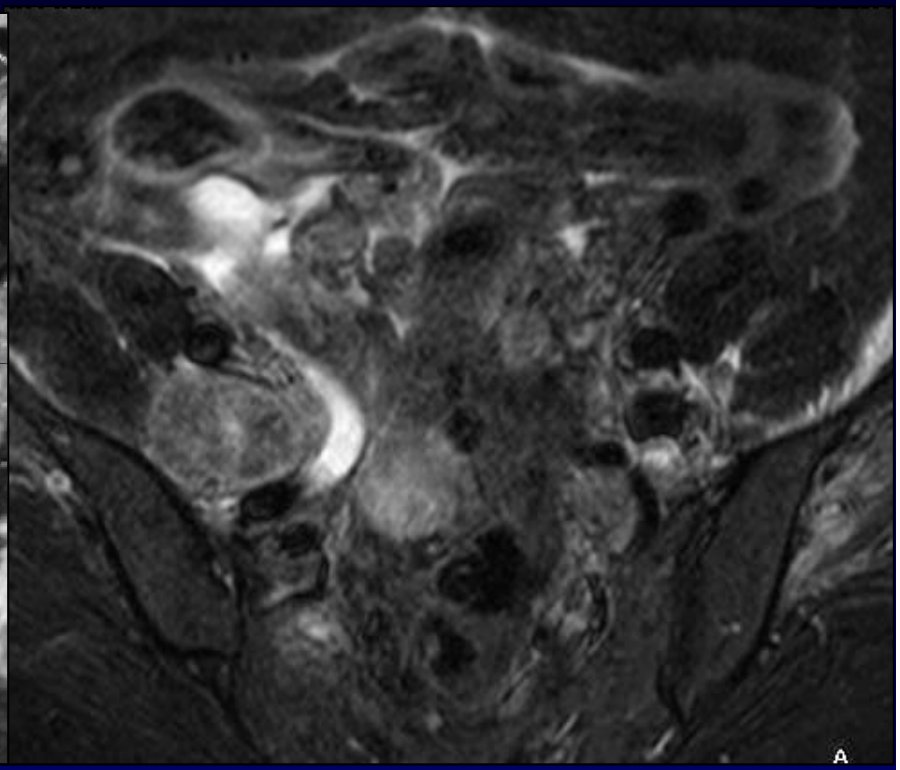
Morphology: Malignant LNs

- Malignant characteristics
  - Round shape
  - Necrosis
  - Signal intensity similar to primary tumour*
  - Extracapsular tumour extension
  - Speckled calcification (e.g. in mucinous adenocarcinoma of colon or ovary)

*Barentsz J et al, Radiology 1996; 201:185-193

Morphology
Nodal Shape





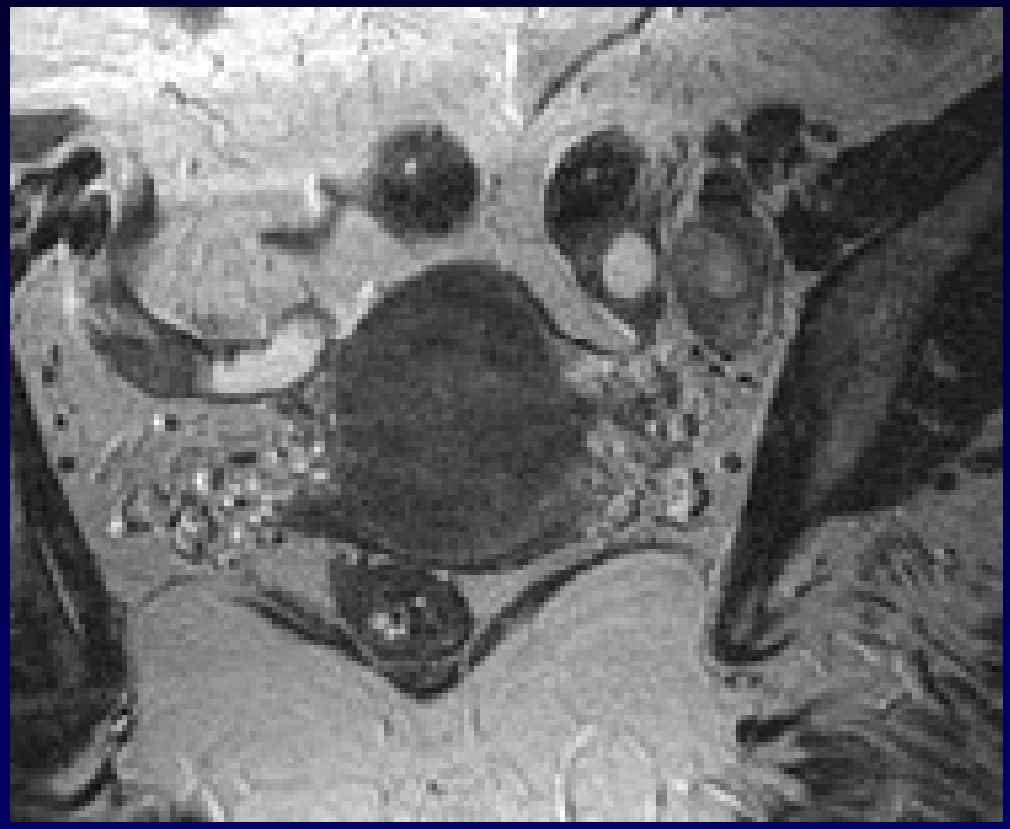
Round node 8 – 10 mm SA

Ovoid node > 10 mm SA

Jager et al, AJR, 1996

Morphology: Malignant LNs

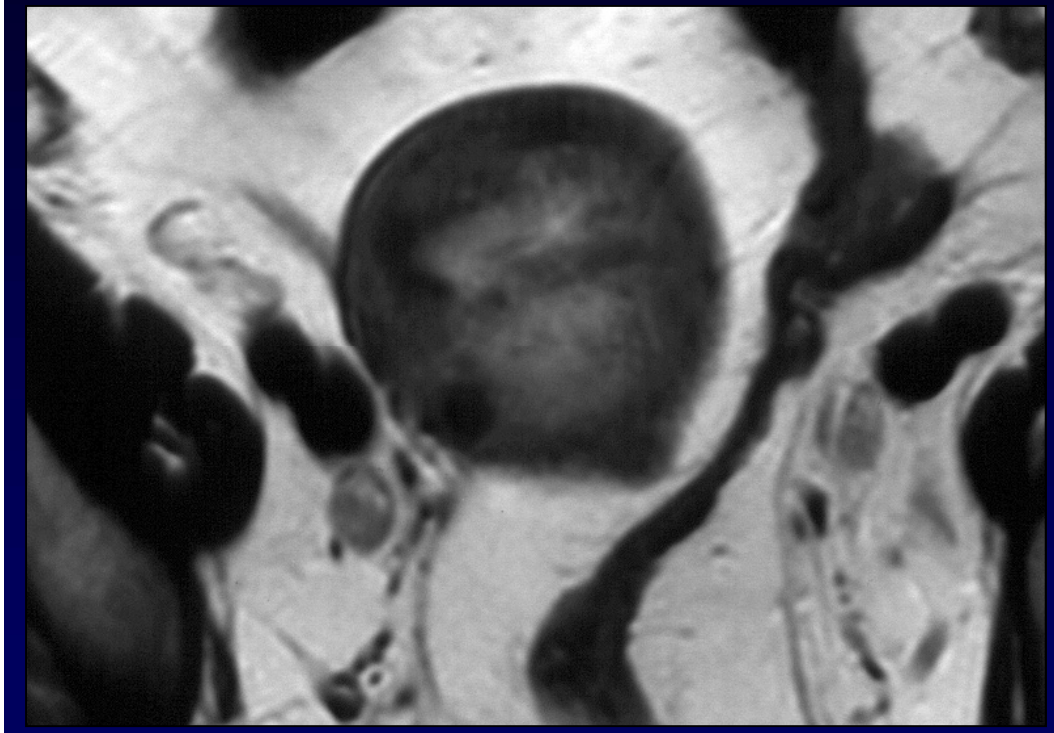
Necrosis



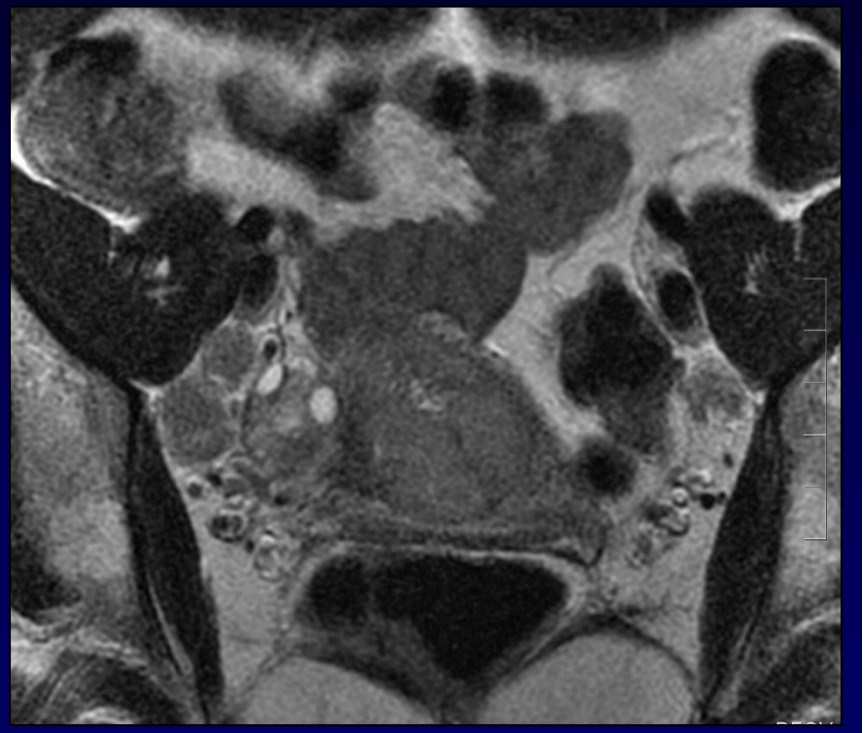
PPV of Necrosis: 100%

Kim SH, et al, AJR 1994

Morphology: Malignant LNs



Similar SI to primary tumour



Irregular contour or

Extra-capsular tumour

Yang et al, AJR 2000

Barentsz J et al, Radiology 1996; 201:185-193

Morphology: Malignant LNs

Rectal Cancer

Benign	Malignant
Smooth border	Irregular border
Uniform signal intensity	Mixed signal intensity

High resolution MRI

Sensitivity 85%; Specificity 97%

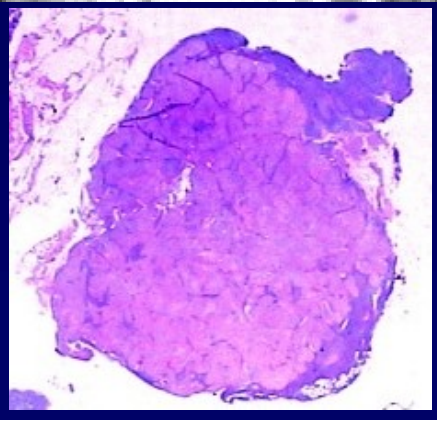
Brown et al, Radiology, 2003;227;371-377

Nodal Site

- Recognized drainage routes
- Suspicious nodes:
  - Borderline node at expected site of drainage
  - Asymmetric obturator nodes in cervical or endometrial cancer
  - Unusual site for visible node
    - e.g. para-cervical, pre-sacral or para-vescical

Nodal site and Number

- Cluster of normal or borderline sized nodes within the drainage route may cause concern
- Very little specific data is available



Lymph Node Size

- Measurement of **maximum short axis diameter** is relatively constant, regardless of the orientation of the node
- Normal nodal size varies depending on the anatomical site

Glazer G et al, AJR, 1985;144;261-265

Lymph Node Size: Upper limits of normal

- Short axis
  - Lower para-aortic 11 mm
  - Common iliac 9 mm
  - Internal iliac 7 mm
  - Obturator 8 mm
  - External iliac 10 mm
- 'Size Ratio'
  - <8 mm benign (minimal SA)
  - >10 mm malignant
  - 8 – 10mm – malignant if round (SA/LA > 0.8)

Carrington B, Imaging in Oncology, 2nd Ed, p1007
Jager et al, AJR, 1996;167:1503-1507

Size criteria are unreliable

Prostate cancer

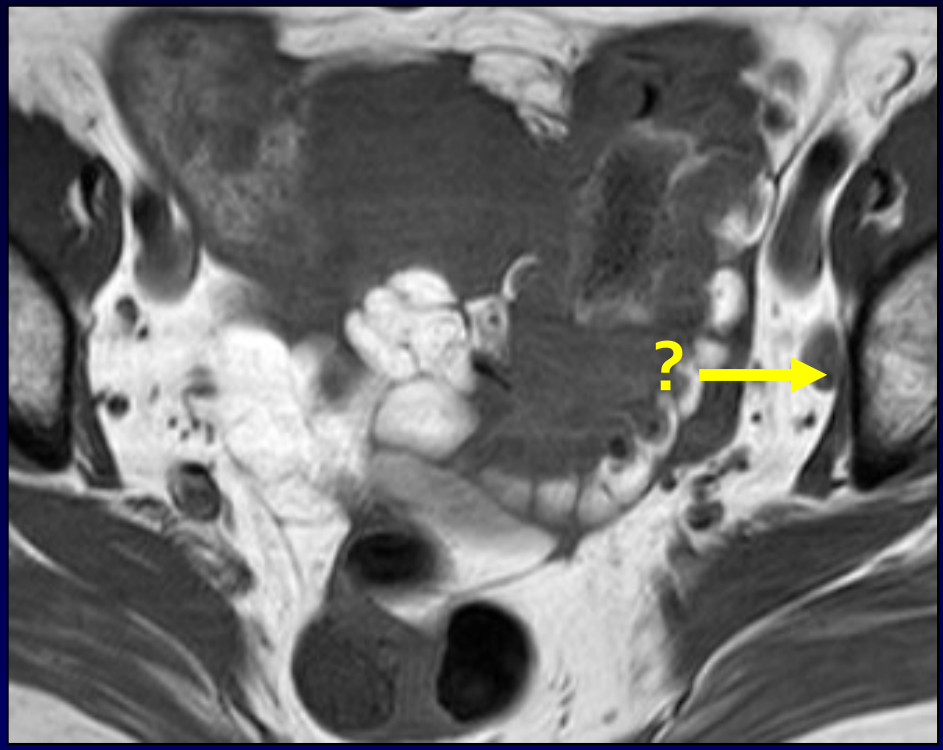
- 71% of nodal mets did not fulfil size criteria

Cervix cancer

- 80% of nodal mets < 10mm

Rectal cancer

- RDOG study – 322 patients
- sensitivity 38%



Normal sized node may contain a metastasis

Harisinghani et al, NEJM, 2003
Benedetti, 1996
Zerhouni EA, Radiology, 1996

MR diagnosis of nodal metastases in cervical cancer:

Size criteria

• Sensitivity	35 – 68%
• Specificity	67 - 93%
• PPV	50 - 67%
• NPV	77 – 96%

Beyersdorff et al 1995, Eur J Gyn Oncol: 16; 274
Reinhardt et al, 2001, Radiology: 218;776
Narayan et al, Int J Gynecol Cancer 2001: 11;263
Yu et al, AJR: 171,707

Methods for LN diagnosis

- MRI morphology
- Dynamic CE MRI
- Diffusion-weighted MRI
- MR lymphography with USPIOs
- PET/CT
- Sentinel node techniques

Dynamic CE-MRI

LNs in bladder cancer

- Malignant nodes demonstrated early enhancement
  - Sensitivity increased from 71 to 86%
  - Specificity remained high 98 vs 95%
- Wash out rate of contrast in the primary tumour was faster in node positive patients – but this could not predict nodal status

Barentsz J et al, Radiology 1996; 201:185-193
Bahri S et al Ann Oncol, 2008
Tuncbilek et al, Eur J Radiol, 2005

Dynamic CE-MRI

LNs in breast cancer

- Nodal enhancement index of >21% and nodal area of > 0.4 cm^2 indicated nodal involvement
- Enhancement index of <21% and nodal area of < 0.4 cm^2 carried very high negative predictive value for nodal involvement

Murray AD et al, BJR, 2002

Methods for LN diagnosis

- MRI morphology
- DCE MRI
- Diffusion-weighted MRI
- MR lymphography with USPIOs
- PET/CT
- Sentinel node techniques

DW-MRI

- Diffusivity of water molecules within tissue
  - Does not require injection of contrast medium
  - High cellular density = ⬇⬇ diffusivity
  - Reduced diffusivity is seen as low ADC
- Proven in detecting malignant disease in endometrium and cervix
- Evaluating response to radiotherapy

Tamai K et al, JMRI, 2007
McVeigh P et al, Eur Radiol 2008
Harry et al, Gyn Oncol 2008

WELCOME AND INTRODUCTION

UPPER GI: TECHNICAL AND CLINICAL CHALLENGES FOR RADIATION ONCOLOGISTS - FULLY BOOKED

25-28 March, 2017
Rome, Italy

ESTRO School

TAKE HOME MESSAGE

COURSE AIM

The aim of the course is to support an interactive educational environment by peer review of each step of radiation therapy practice (indication, prescription, delineation, planning, IGRT, outcome evaluation) according to the modern available technologies and knowledge and taking care of the clinician, physicist and RTT perspectives.

TAKE HOME MESSAGE

COURSE AIM

Specialists of different disciplines will support the radiation oncology audience in understanding the clinical needs, anatomic and pathologic details, and the therapeutic achievements needed to exploit the radiation technology at the best.

TAKE HOME MESSAGE

LEARNING OUTCOMES

By the end of this course, for each upper GI tumour site, participants should be able to practice:

- Proper indication for radiation therapy in a multidisciplinary perspective
- Prescription
- Tailored delineation according to tumour location and stage
- Dose distribution optimisation and comparison
- Optimal use of available IGRT technologies
- Proper monitoring of tumour response an control.
