ESTRO Course Book

Evidence Based Radiation Oncology

11 - 16 June, 2017
Ljubljana, Slovenia

NOTE TO THE PARTICIPANTS

The present slides are provided to you as a basis for taking notes during the course. In as many instances as practically possible, we have tried to indicate from which author these slides have been borrowed to illustrate this course.

It should be realised that the present texts can only be considered as notes for a teaching course and should not in any way be copied or circulated. They are only for personal use. Please be very strict in this, as it is the only condition under which such services can be provided to the participants of the course.

Evidence-based Radiation Oncology

Chris Cottrill

St Bartholomew's Cancer Centre London

Blood-letting

Blood-letting

Used by the Persians in Babylon in 500 BC

van Helmont recommended a randomised trial in 1662

Practice shown to be harmful in 1820

Practice ceased about 1910

van Helmont JA (1662) Lodowick Loyd, London

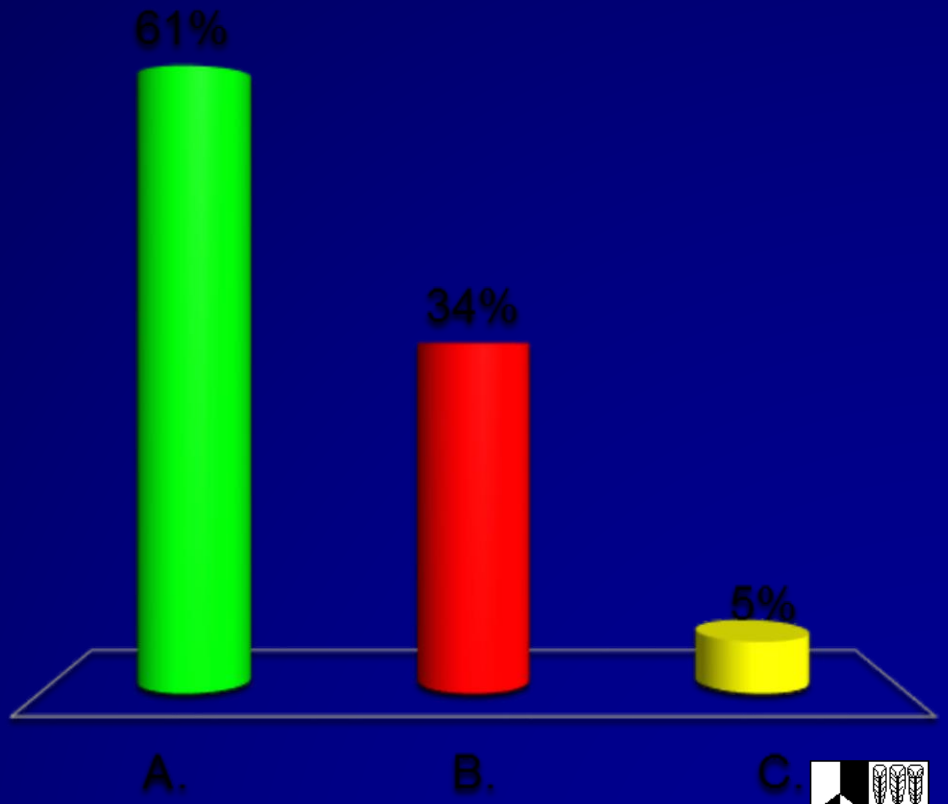
EMINENCE-based medicine

Making the same mistakes with an ever increasing degree of certainty!

EVIDENCE-based medicine

"Evidence-based medicine is destined to replace individual clinical judgement"

A. Agree
B. Disagree
C. Don't know



Evidence-based medicine

Integrating

individual clinical judgement

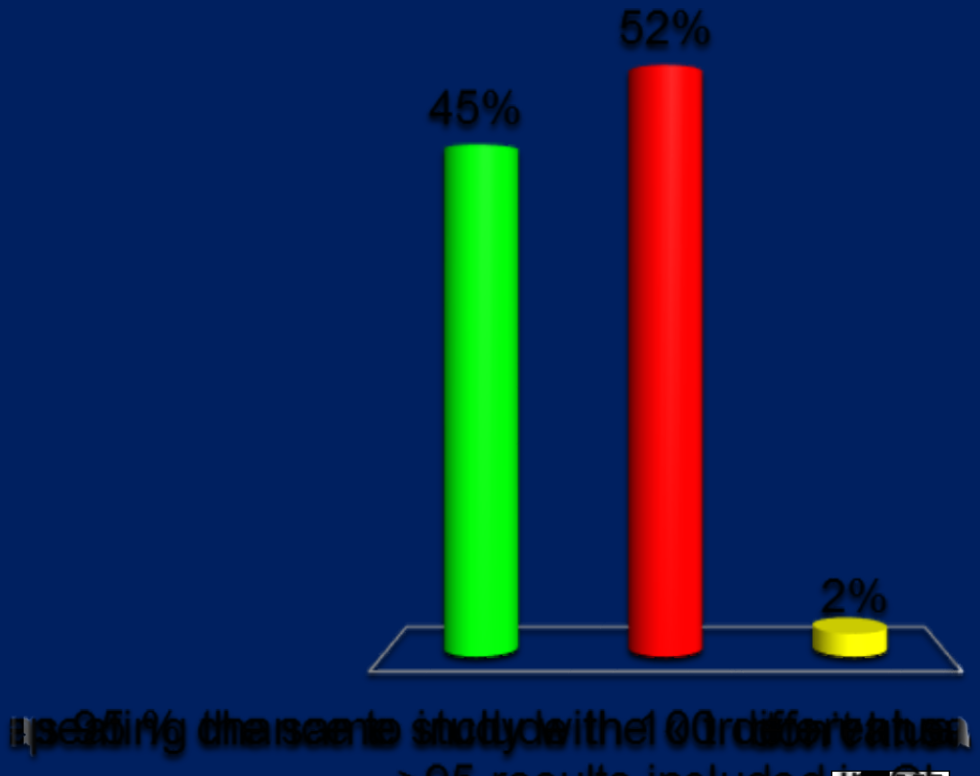
and best available evidence

Evidence-based medicine

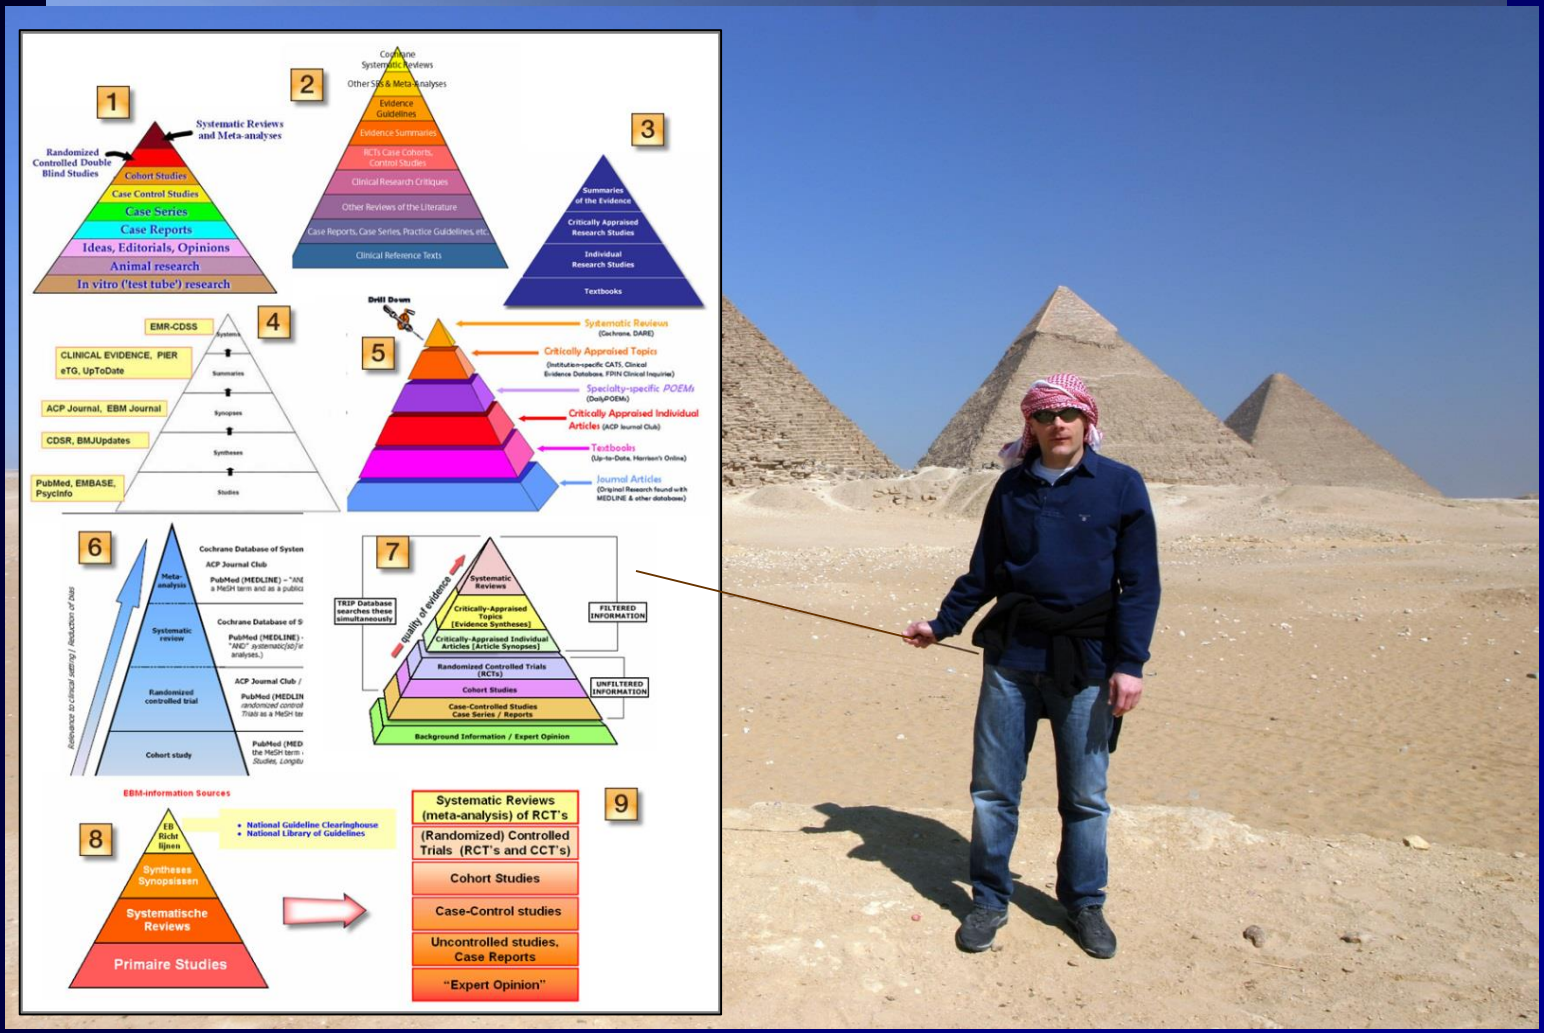
The use of mathematical estimates of the likelihood of benefit and the risk of harm, derived from high quality research on population samples, to inform decision-making in the diagnosis, investigation or management of individual patients

Confidence interval

A. has 95 % chance to include the « true » value
B. repeating the same study with 100 different samples would yield >95 results included in CI
C. don’t know

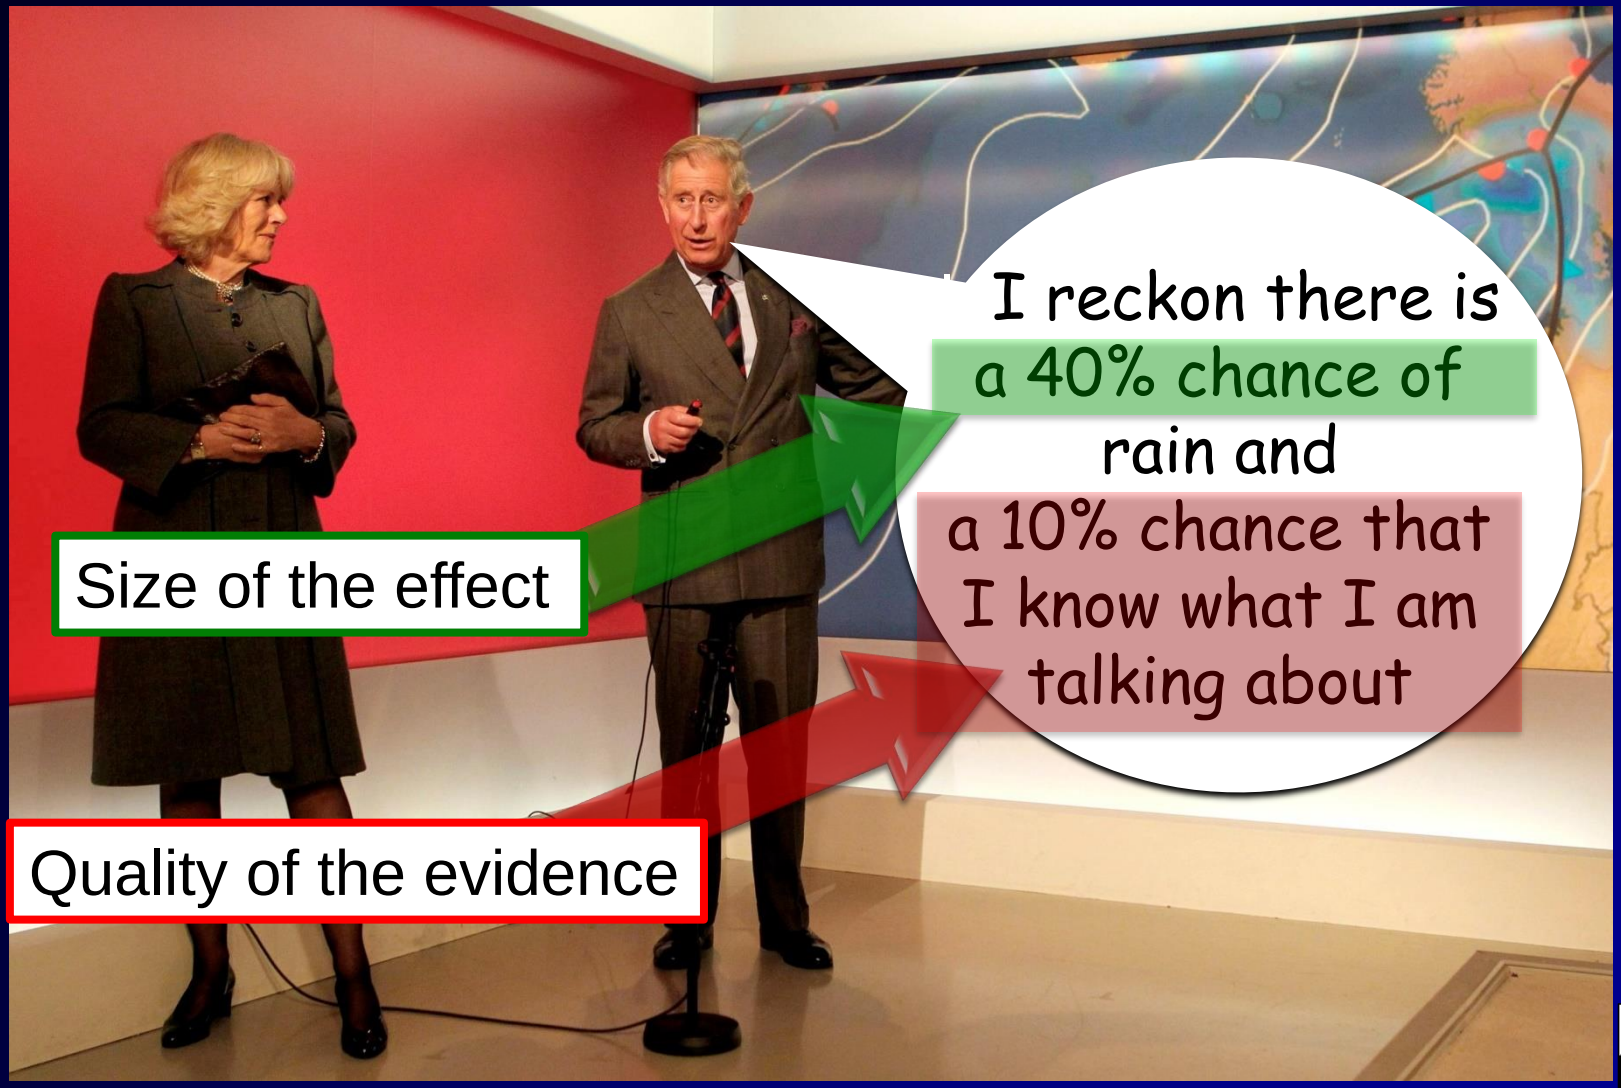


Let’s go to the pyramids !



Levels of Evidence

How do we judge the evidence?



The GRADE approach

GRADE

- GRading of recommendations, Assessment, Development and Evaluations Working Group
- Systematic and explicit approach to preparing evidence-based systematic reviews and clinical guidelines

GRADE categorises the quality of the evidence

- Study limitations
- Inconsistency of results
- Indirectness of evidence
- Imprecision
- Publication bias

Large magnitude of effect
Plausible biases would reduce effect
Dose-response gradient

Guyatt British Medical Journal 2008

The GRADE approach

GRADE categorises the strength of the recommendations

- Balance between desirable and undesirable effects
- Quality of evidence
- Values and preferences
- Costs (resource allocation)

Guyatt British Medical Journal 2008

The Will Rogers Phenomenon

Volumes

- Gross Tumour Volume (GTV)
- Clinical Target Volume (CTV)
- Planning Target Volume (PTV)
- Treated Volume
- Irradiated Volume
- Planning Organ at Risk Volume (PRV)

GTV

- Extent and location of malignant disease
- Clinical examination and / or imaging

  Primary tumour

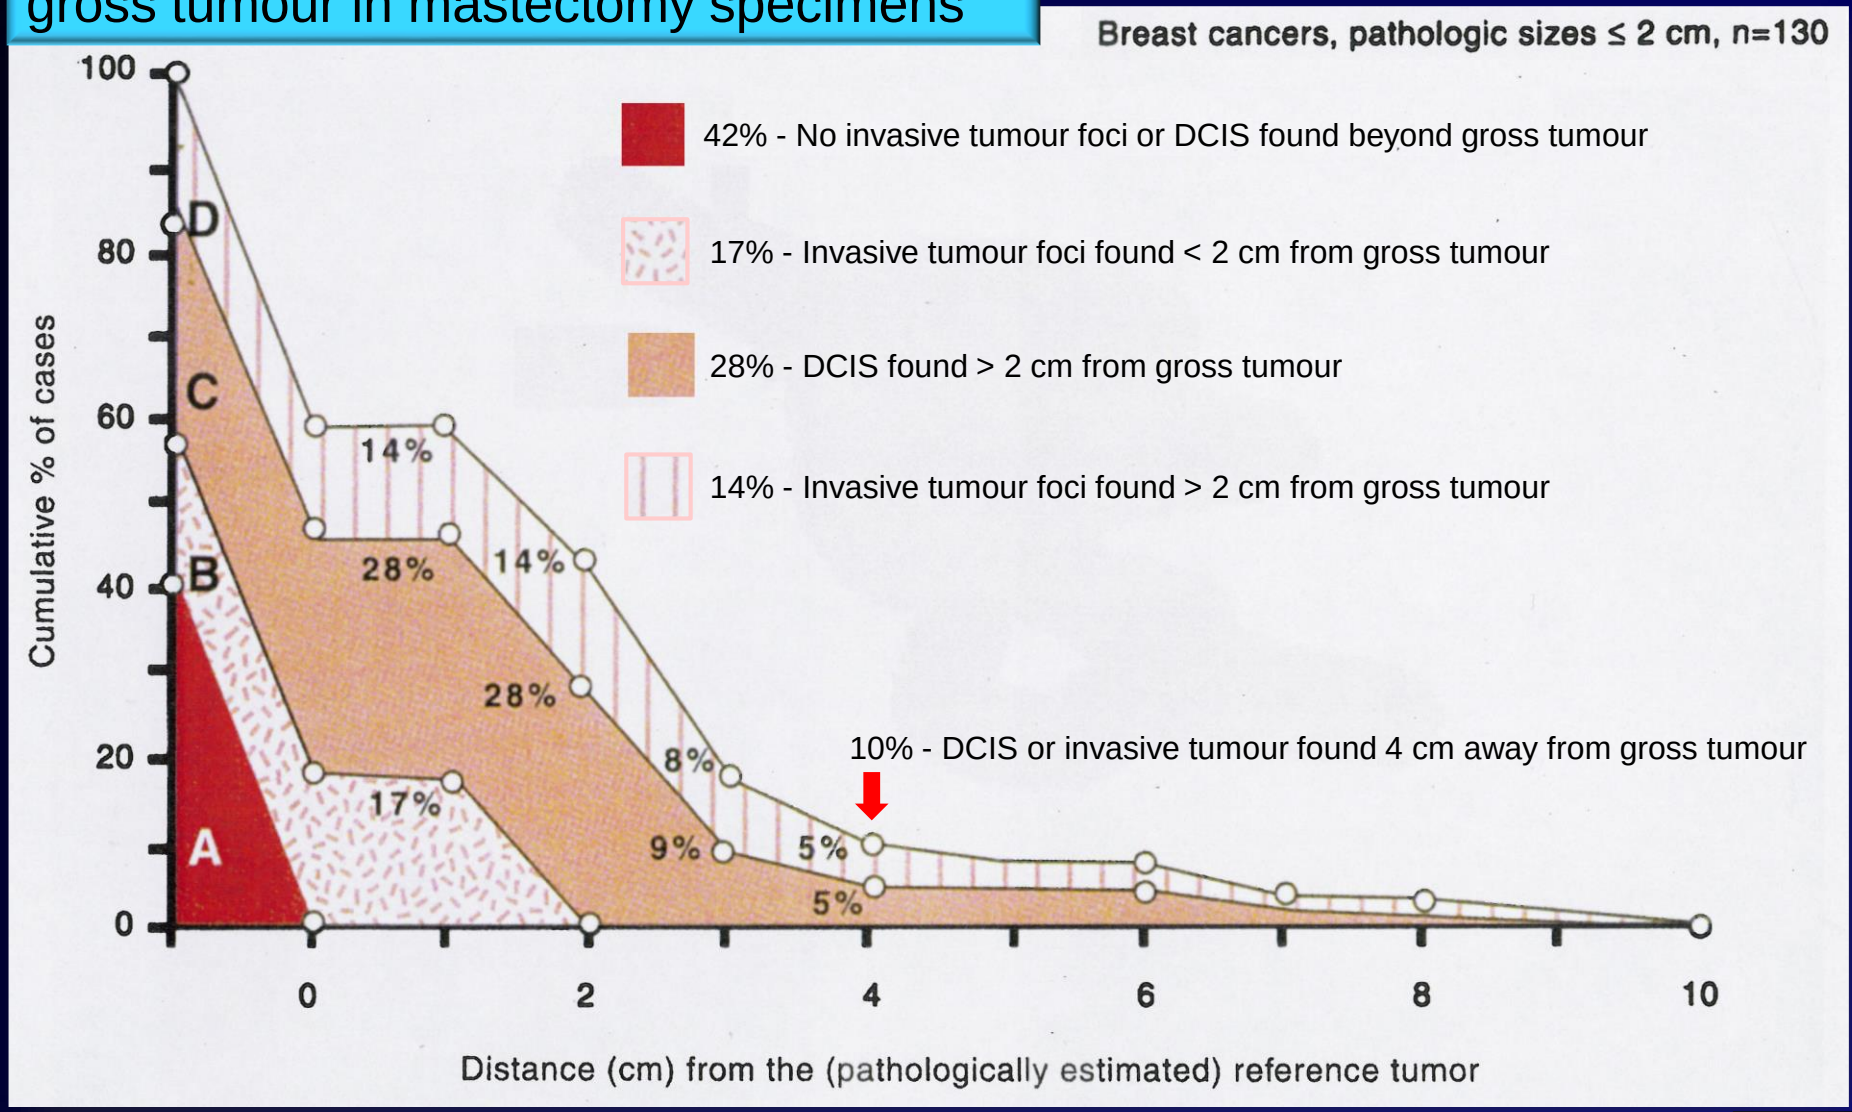
  ± macroscopic lymph node metastases

  ± other metastases
- Highest tumour cell density
- None after R0 surgery / CR to chemo

CTV

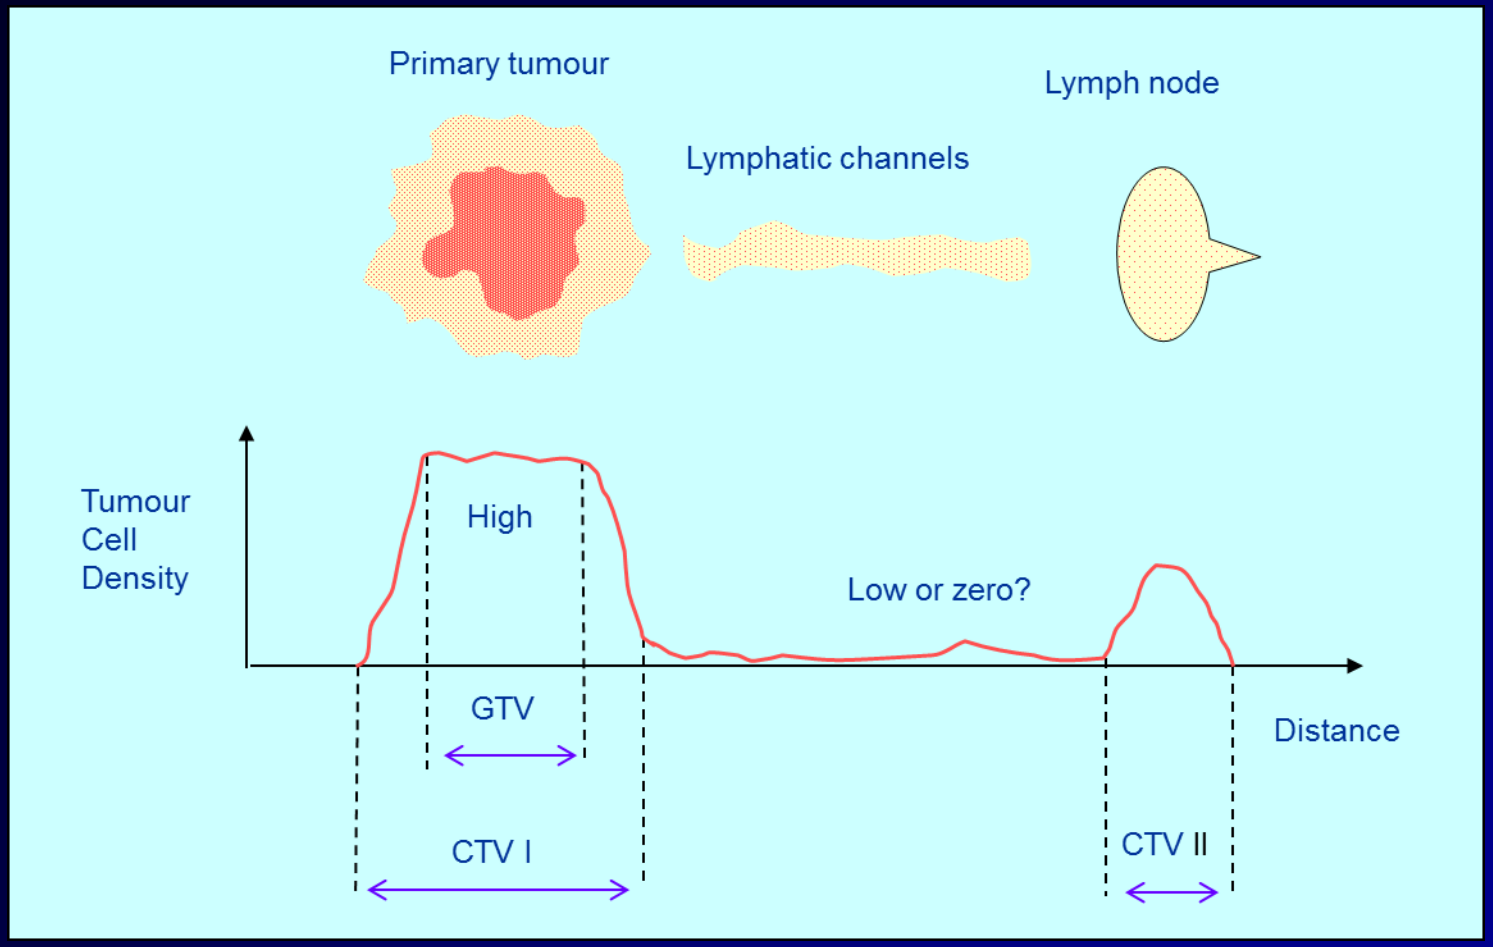
- The sites at risk of relapse if untreated
- Includes undetectable (“subclinical”) disease
- Estimate of risk
  - clinical experience
  - pathological
  - documented treatments and follow-up

Clinical example: tumour foci beyond gross tumour in mastectomy specimens



Redrawn from Holland R *et al* (1985) Cancer 56:979-990

GTV and CTV



Redrawn from ICRU Report 62 (1999)

PTV

- Geometrical concept used for treatment planning
- Defined to ensure that prescribed dose is actually delivered to CTV
- Includes margin on CTV to account for variations and uncertainties
- Does not exclude OAR
- Does not include penumbra

Organs at Risk

- Critical normal tissues which put constraints on planning
- Location may mean compromise in PTV coverage
- May be *serial* or *parallel*
- May have uncertainties in position, size and shape
- Planning organ at Risk Volume (PRV)

Set-up margin

Accounts for difficulties in delivering the treatment

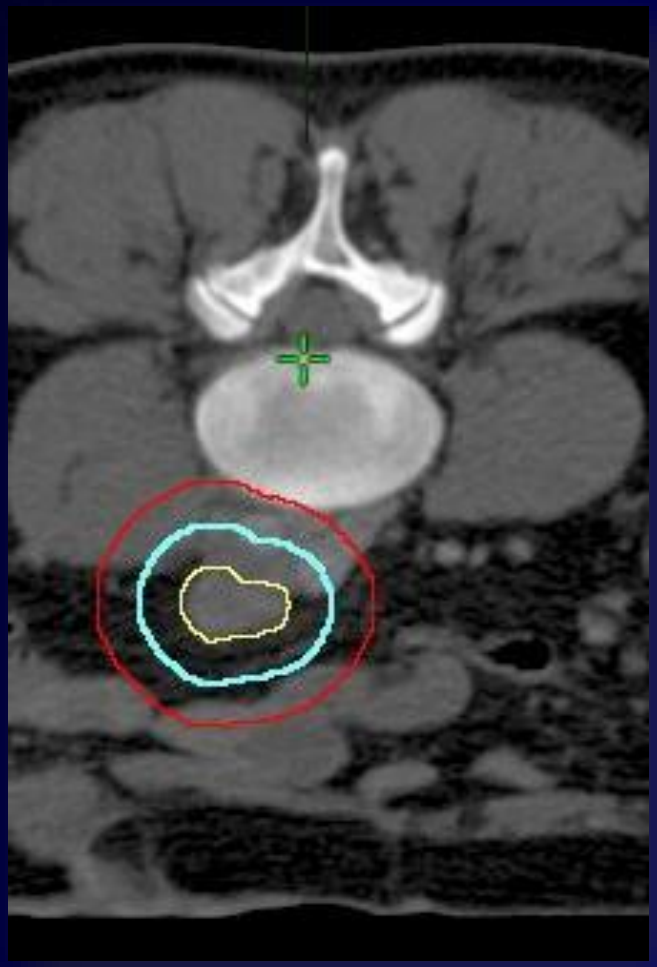
- Reproducing the patient position
- Reproducing the beam alignment
- Mechanical uncertainties
- Dosimetric uncertainties

PTV = ITV + set-up margin

Remember! Remember!

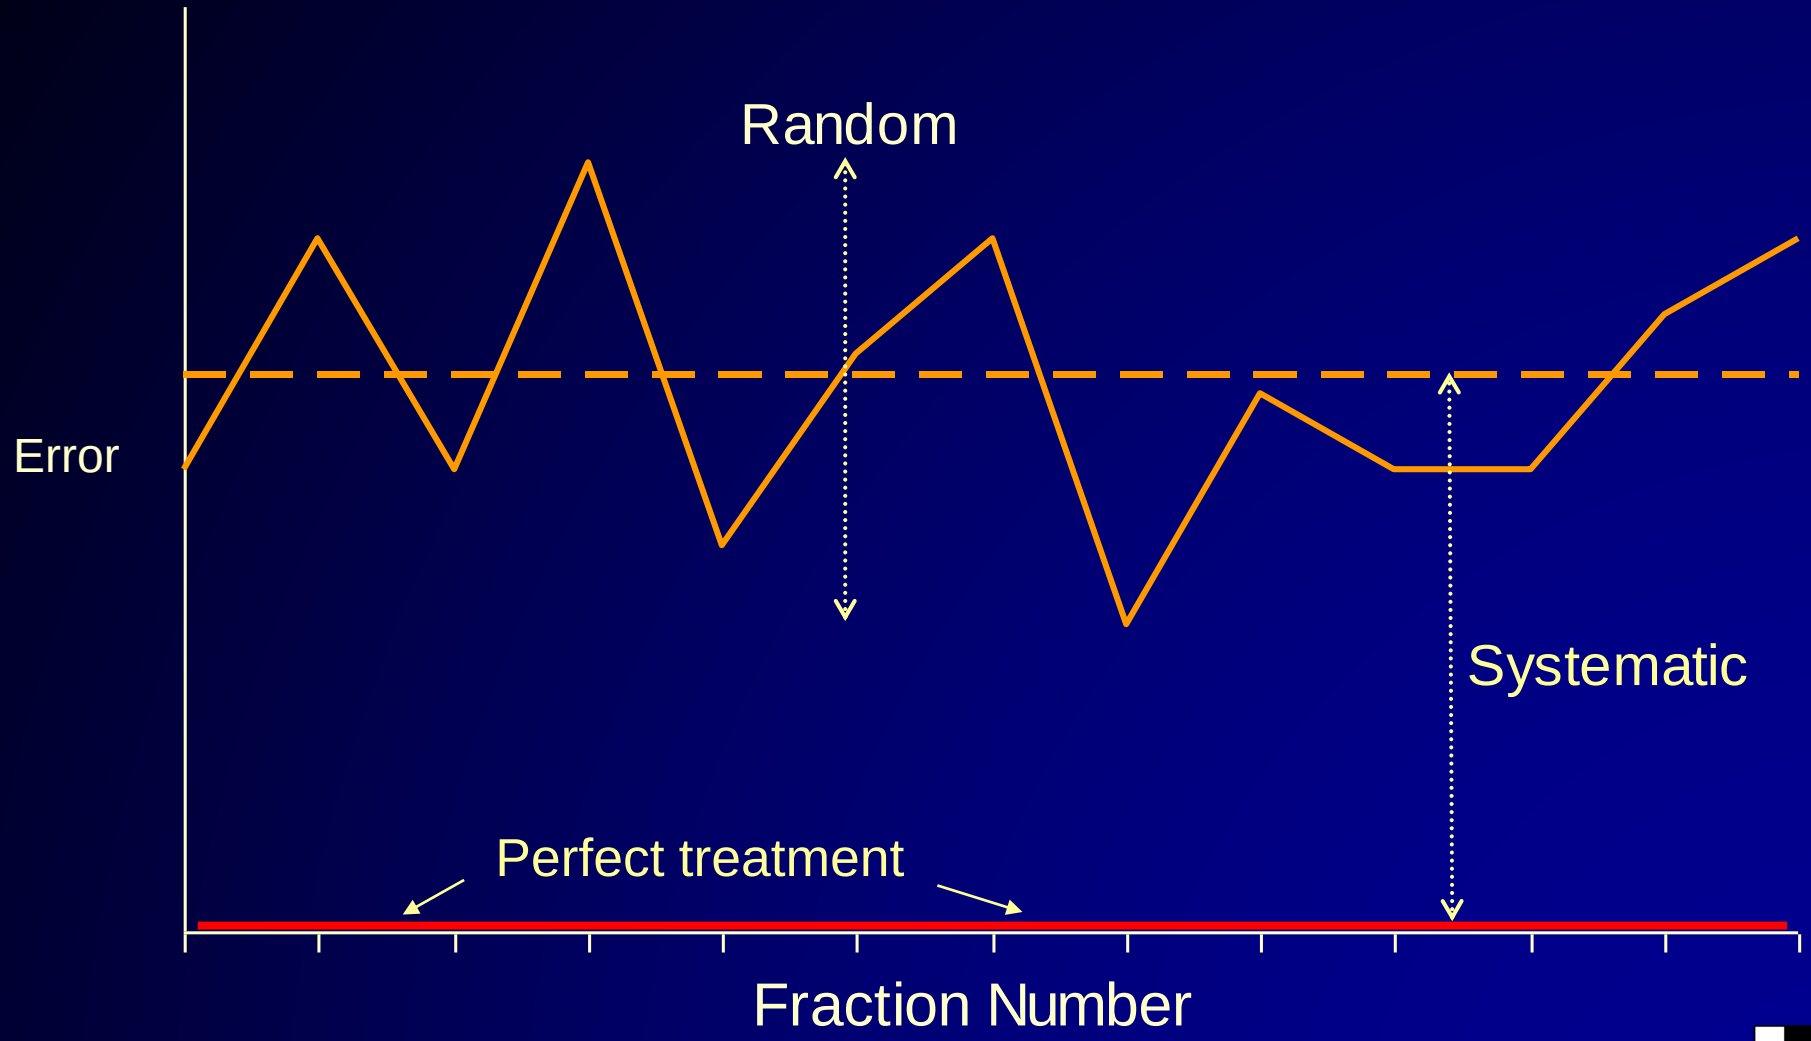
- GTV and CTV are biological
  - margins based on anatomy and pathology
- PTV is geometric
  - margin accounts for positional uncertainties and physics

Geometry alone

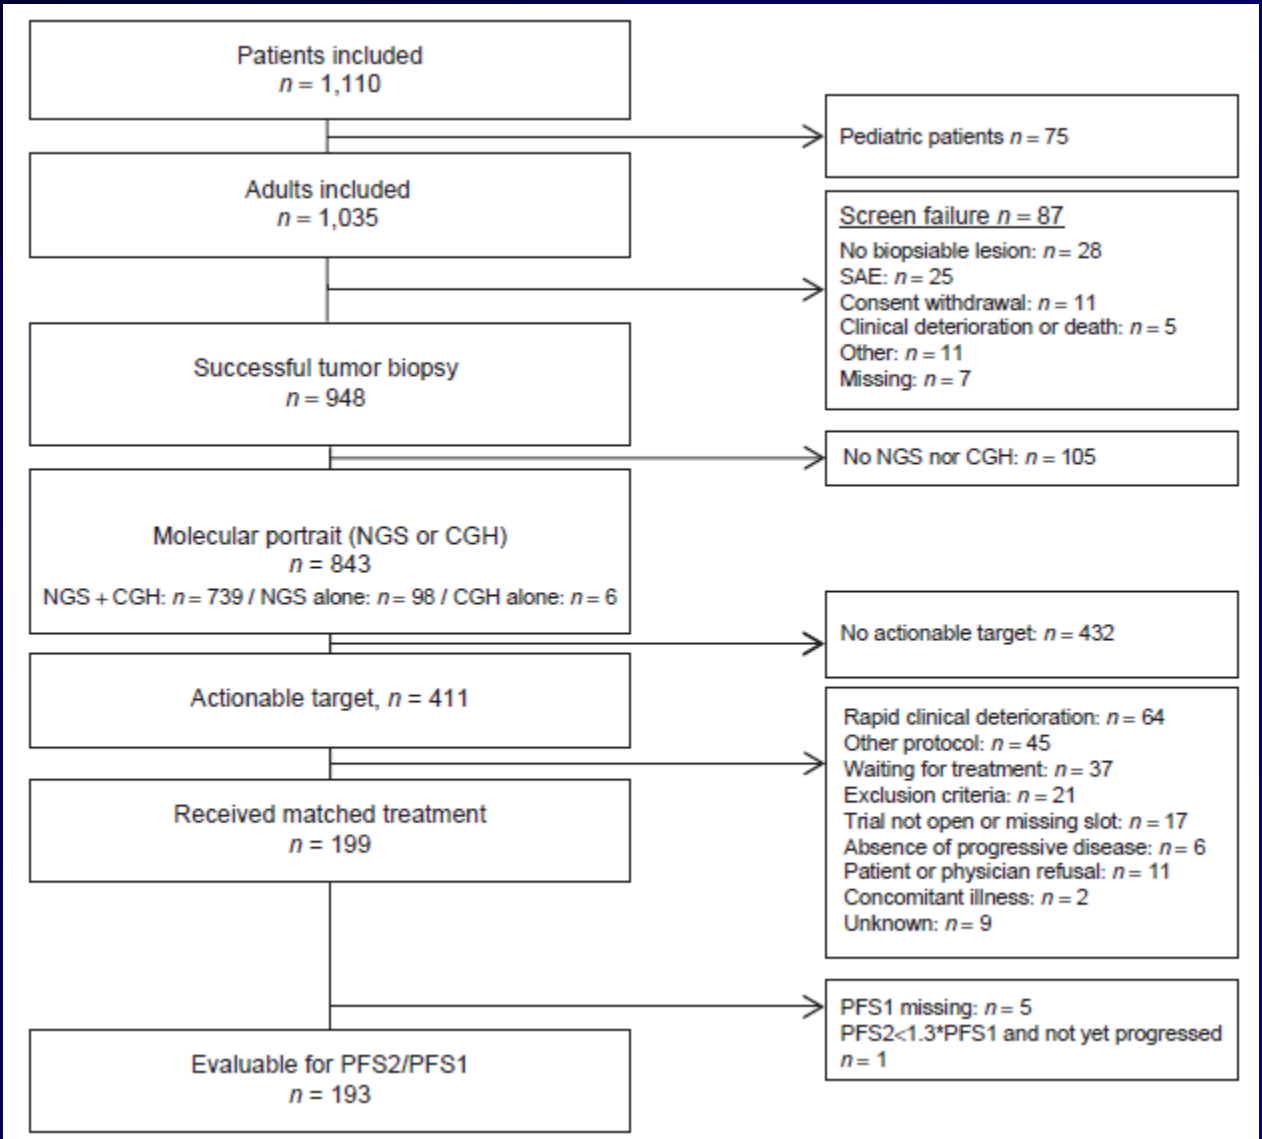


Biology and geometry

Systematic & random errors

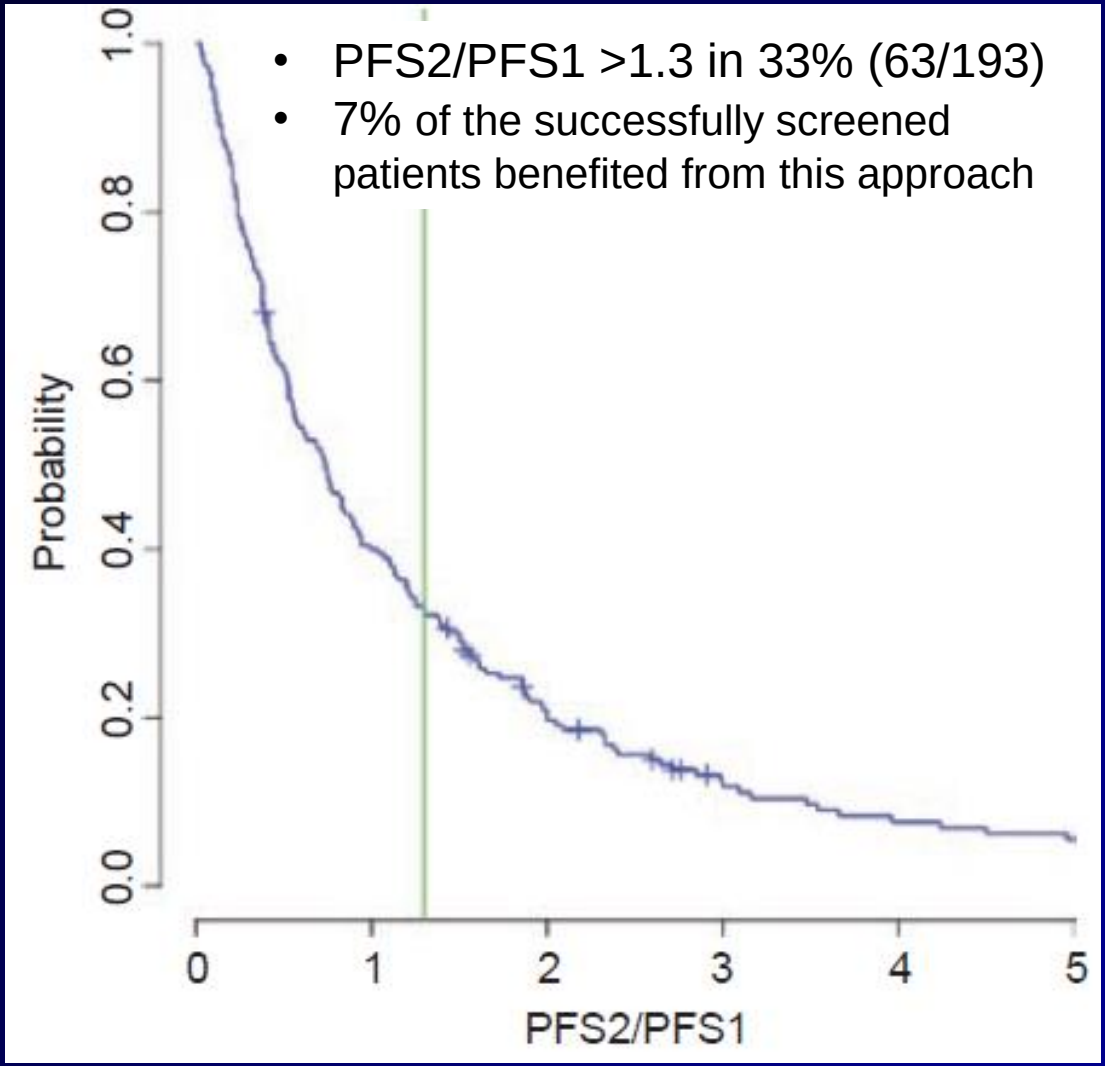


Personalised medicine



Massard Cancer Discov; 2017

Personalised medicine



- PFS2/PFS1 >1.3 in 33% (63/193)
- 7% of the successfully screened patients benefited from this approach

Massard Cancer Discov; 2017

ESTRO: Evidence-based Radiation Oncology

Big Data

In USA only 3% of the patients‘ data are used in clinical research

Challenges	Big data	Clinical trial
Bias	Disadvantage	Advantage
Detailed relevant data	Disadvantage	Advantage
Sample size	Advantage	Disadvantage
Timely results	Advantage	Disadvantage
“Generalizability”	Advantage	Disadvantage

Turner NEJM 2008

Several problems with research

….high quality research takes time (and resources)

Edgeworth R *et al* (1984) Eur J Phys 5:198-200

One last problem with research ...

Facial appearance affects science communication

Ana I. Gheorghiu[a], Mitchell J. Callan[a], and William J. Skylark[b,1]

[a]Department of Psychology, University of Essex, Colchester CO4 3SQ, United Kingdom; and [b]Department of Psychology, University of Cambridge, Cambridge CB2 3SQ, United Kingdom

„When judging whether a researcher does “good science,” people preferred scientists who look competent and moral, but also favored less sociable and more physically unattractive individuals“

Gheorghiu PNAS 2017

Conclusion

- a challenging issue
- evidence requires good quality data
- to be estimated
  - size of effect
  - quality of evidence
  - clinical significance

Personalised medicine

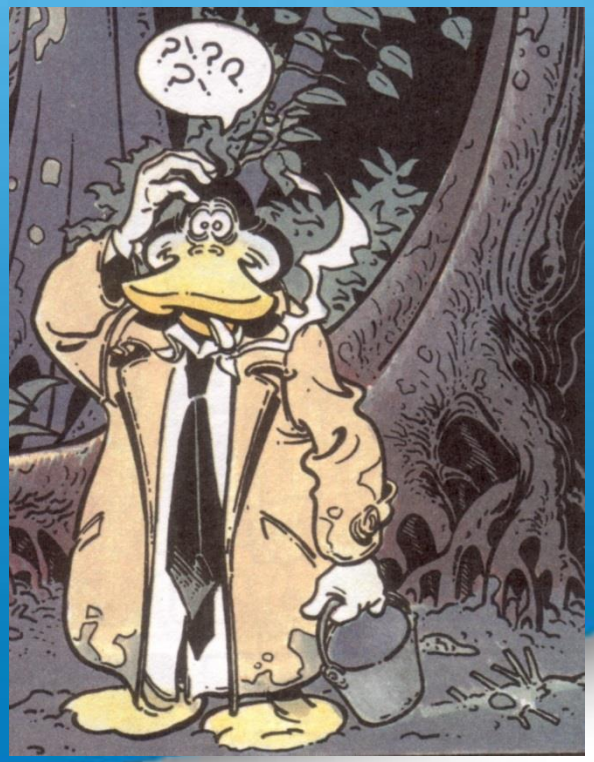
Statistics for the RadOnc



Testing hypothesis

Cancéropôle Nord-Ouest

litis

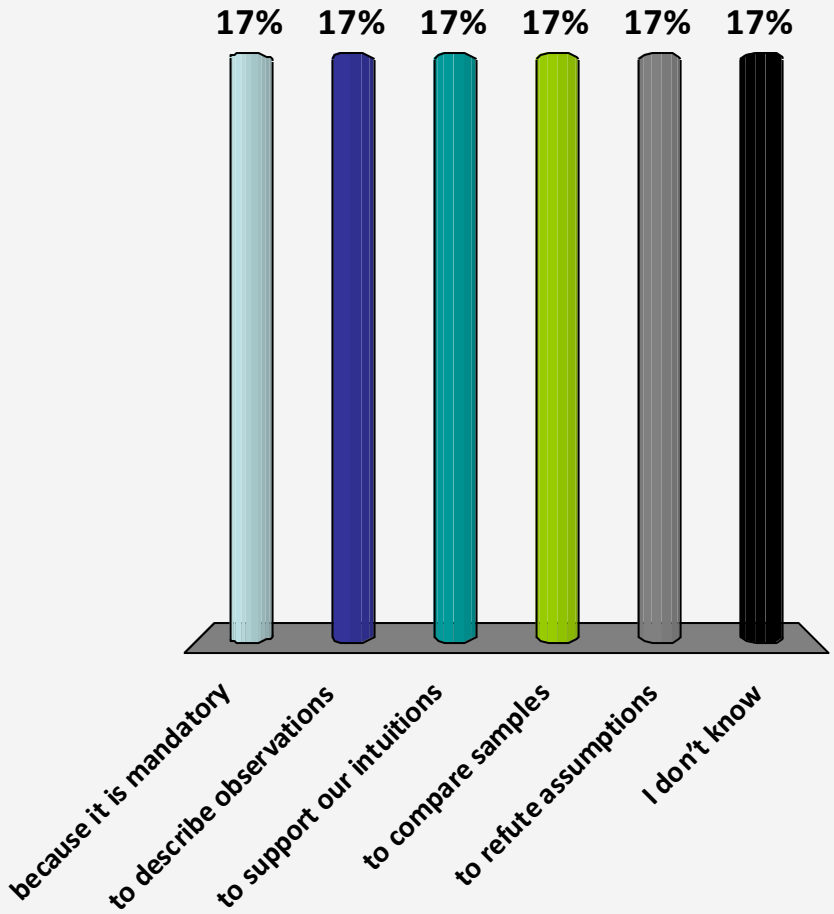
ESTRO European Society for RADIOTHERAPY & ONCOLOGY

UNIVERSITÉ DE ROUEN

CENTRE HENRI BECQUEREL HAUTE-NORMANDIE

Why do we use statistics ?

A. because it is mandatory
B. to describe observations
C. to support our intuitions
D. to compare samples
E. to refute assumptions
F. I don’t know



Phases of clinical research

Phase	Question	Endpoint
I	dose	(early) toxicity
II	activity	response (toxicity)
III	superiority	control survival toxicity

The principle of testing : H0

- H0 : an refutable assumption
- e.g. “all swans are white”

The principle of testing : H0

- H0 : an refutable assumption
- e.g. “all swans are white”

The principle of testing : H0

- In an ideal world
  - H0 : “new treatment cures all patients”
  - if a single failure is observed ...
  - then conclude : “H0 is false”
- In practice
  - H0 : “ new = old / none”
  - if a difference is observed ...
  - isn’t it by chance ?

What is « p » ?

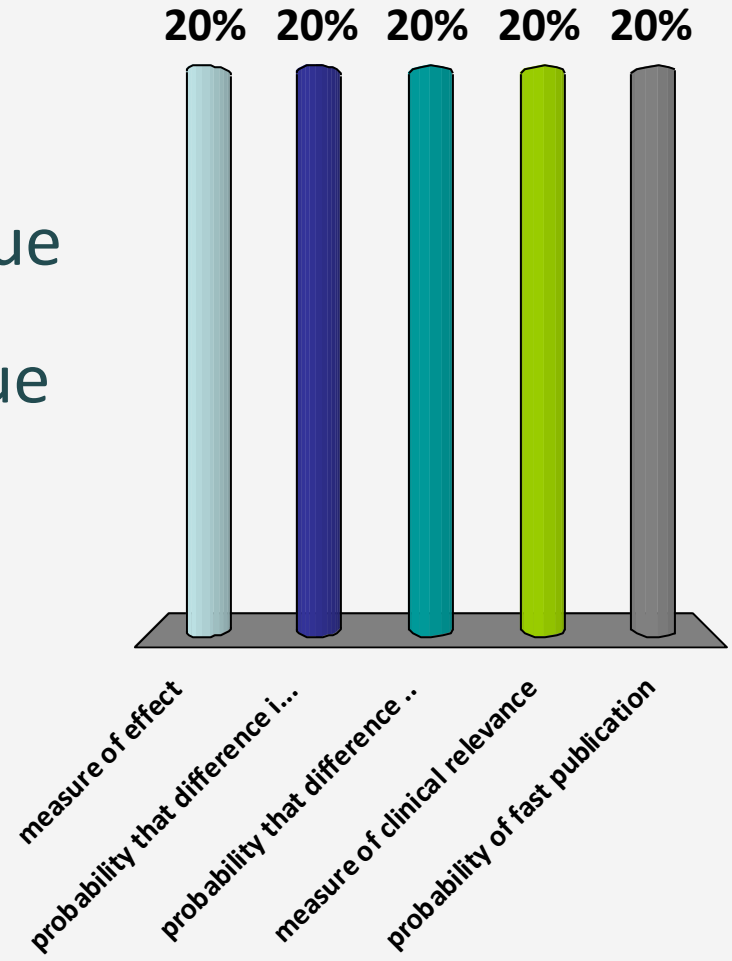
A. measure of effect

B. probability that difference is true

C. probability that difference is due to chance

D. measure of clinical relevance

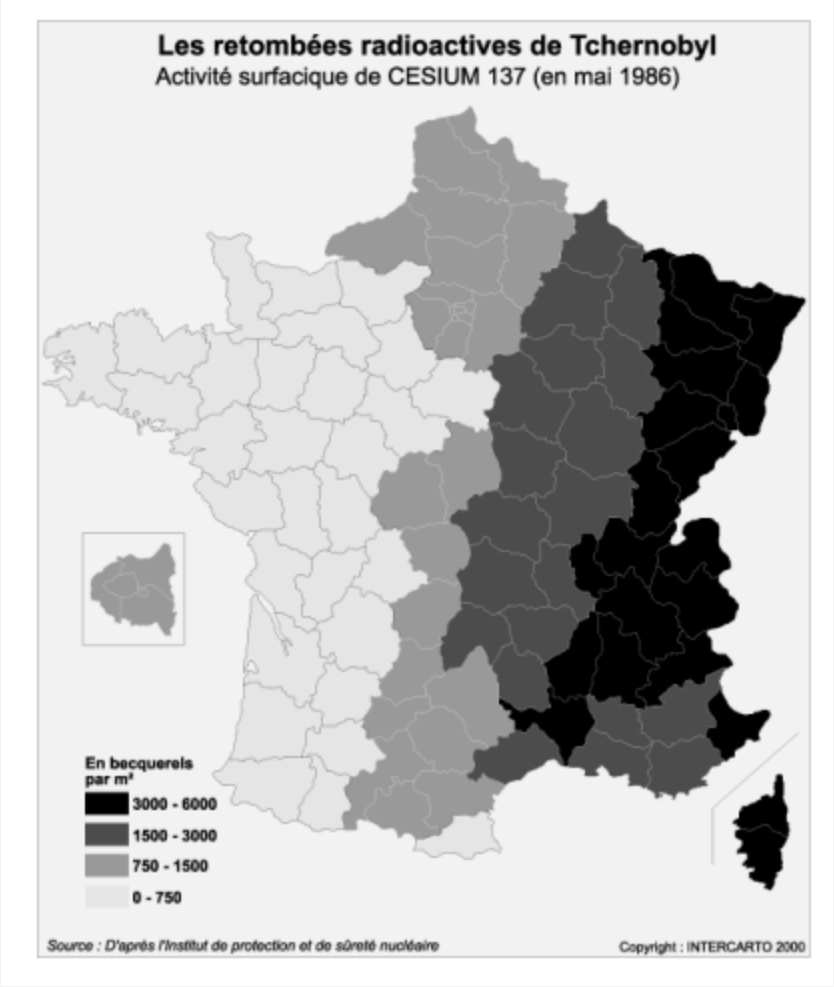
E. probability of fast publication

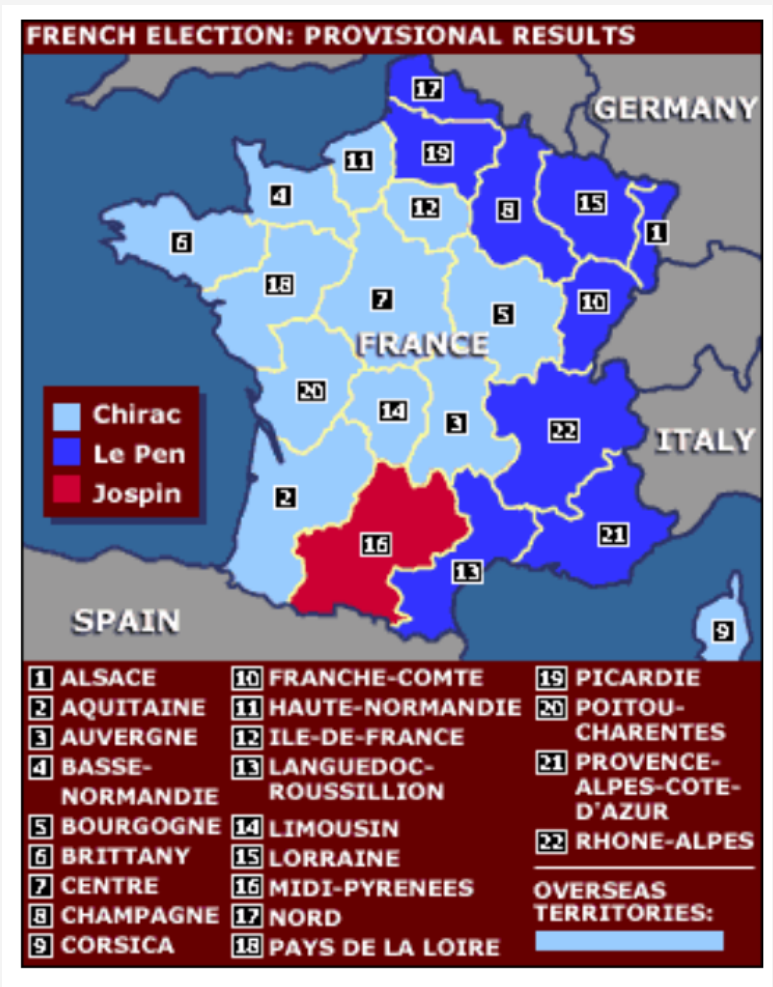


p-value

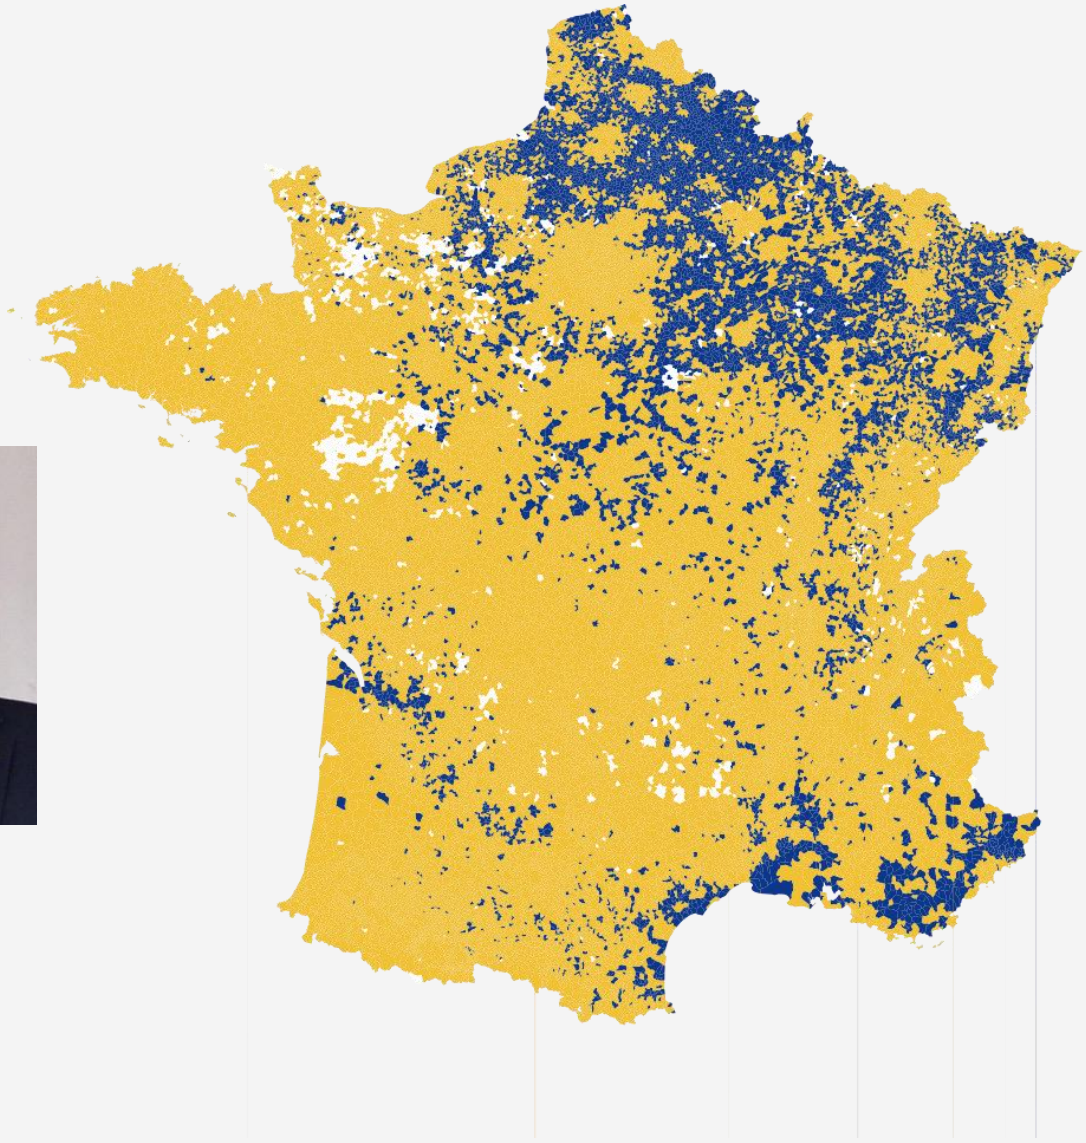
- Probability that the observed difference is due to chance if H0 holds true
- If $p \geq 0.05$: accept H0
  - the difference has ≥95% risk to be due to chance
- If $p < 0.05$: reject H0
  - the difference has ≤5% risk to be due to chance

Significance is not the same as cause





Significance is not the same as cause



Significance is not the same as cause

2 ways of being wrong

- type I : conclude “A ≠ B” while “A = B”
  - an ineffective treatment is selected
- type II : conclude “A = B” while “A ≠ B”
  - the best treatment is not selected

Both errors are equally disturbing

Errors in clinical trials

Truth	Trial conclusion	
	A = B	A ≠ B
A = B	correct	type I (p = α)
A ≠ B	type II (p = β)	correct (power = 1 - β)

Open access, freely available online

Essay

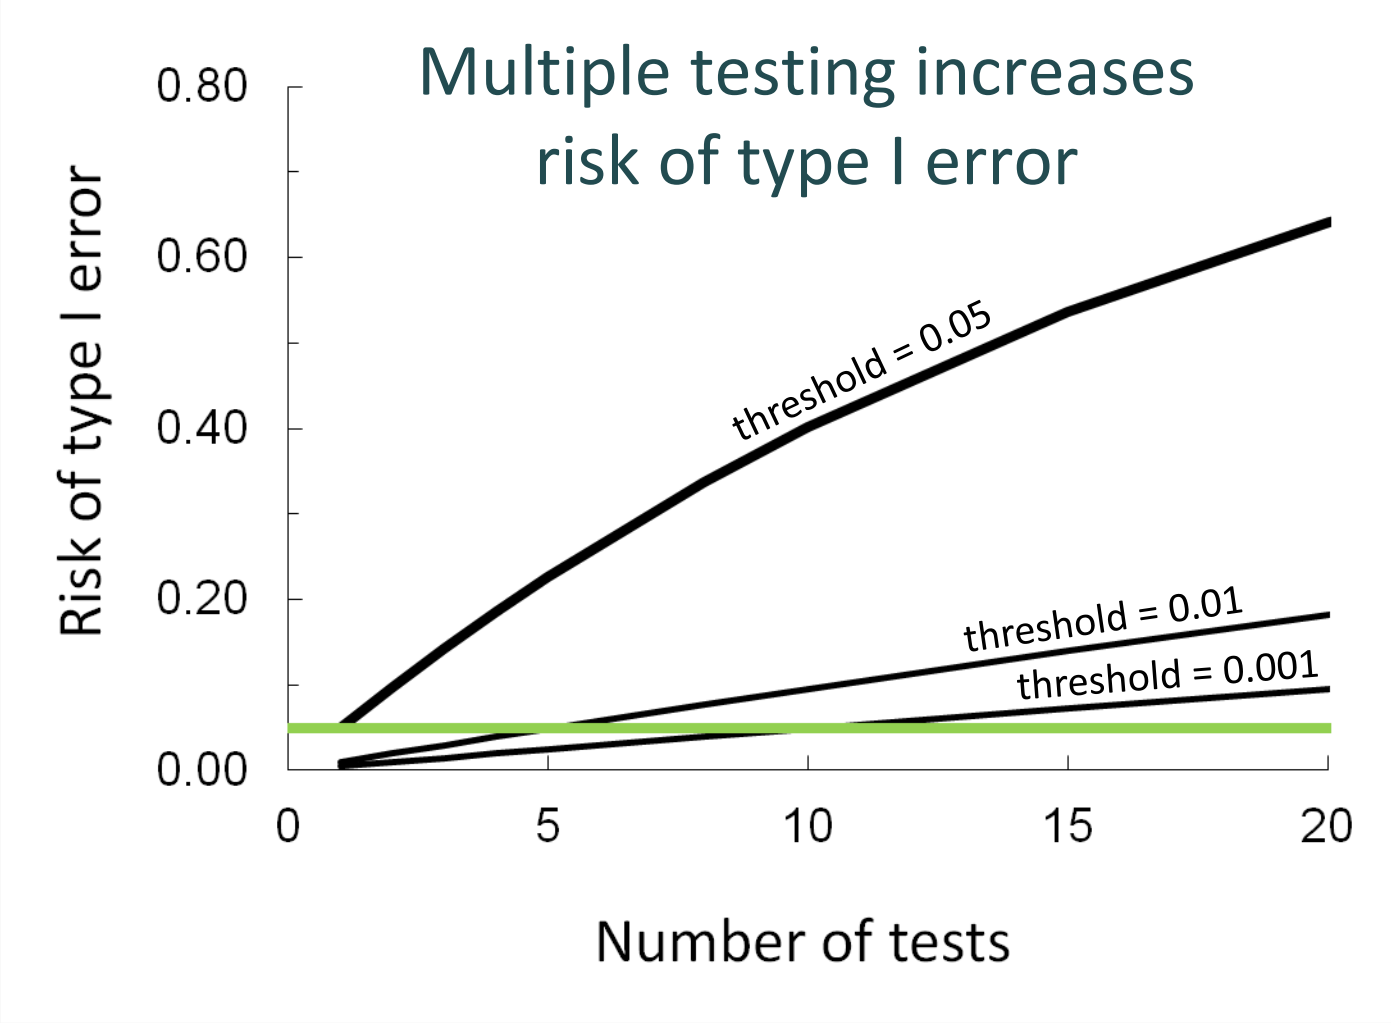
Why Most Published Research Findings Are False

John P. A. Ioannidis

- Lack of power
  - small studies / small effects
  - repeated tests
- Bias (≠ chance variability)
  - patient selection
  - flexibility (design, outcome, analysis)
  - selective reporting / reading

Ioannidis PLOS Med 2005

“Fishing” for significant p-values



Sample size

- A clinician's decision
  - meaningful difference
  - risks of error to be accepted
    - type I error : α
    - type II error : β (1 – power)
- To be calculated BEFORE +++++
  - a non feasible trial ?
  - an underpowered trial ?

Update on Lancaster 1601

Treatment	Scurvy	Total
lemon juice	0	2
rum	2	2
see water	2	2
prayer	2	2

- Observation:
  - P(S/no J) = 6/6 = 1.0 [0.16 – 1.0]
  - P(S/J) = 0/2 = 0.0 [0.0 – 0.46]
- Conclusion
  - p = 0.04
  - reject H0

Update on Lancaster 1601

Treatment	Scurvy	Total
lemon juice	0	2
rum	1	2
rectal enema	2	2
prayer	2	2

- Observation:
  - P(S/ no J) = 5/6 = 0.83 [0.36 – 1.0]
  - P(S/ J) = 0/2 = 0.0 [0.0 – 0.46]
- Conclusion
  - p = 0.11
  - do not reject H0

All tests should be bilateral

Patient informed	Prayer		HR [95% CI]
	Yes	No	
No	52 % (315/604)	51 % (304/597)	1.02 [0.92 – 1.15]
Yes	59 % (352/601)		
HR [95% CI]	1.14 [1.02 – 1.28]		

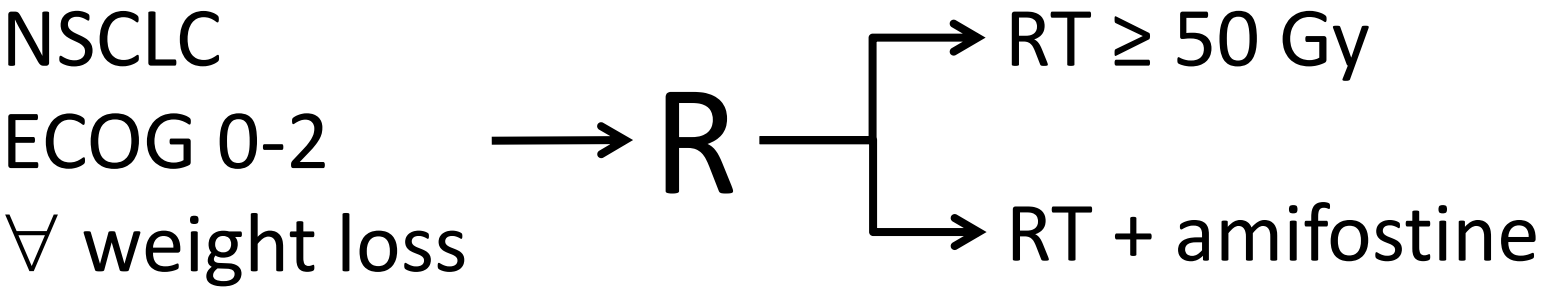
Study of the Therapeutic Effects of Intercessory Prayer (STEP) in cardiac bypass patients: A multicenter randomized trial of uncertainty and certainty of receiving intercessory prayer

Benson Am Heart J 2006

Bias

- factor(s) that produce(s) erroneous findings
  - design
  - data analysis
  - presentation
- e.g. selection bias
  - dose escalation only feasible in smaller tumours
  - frail patients referred to RT instead of surgery
- not to be confused with chance variability
  - findings could be erroneous by chance

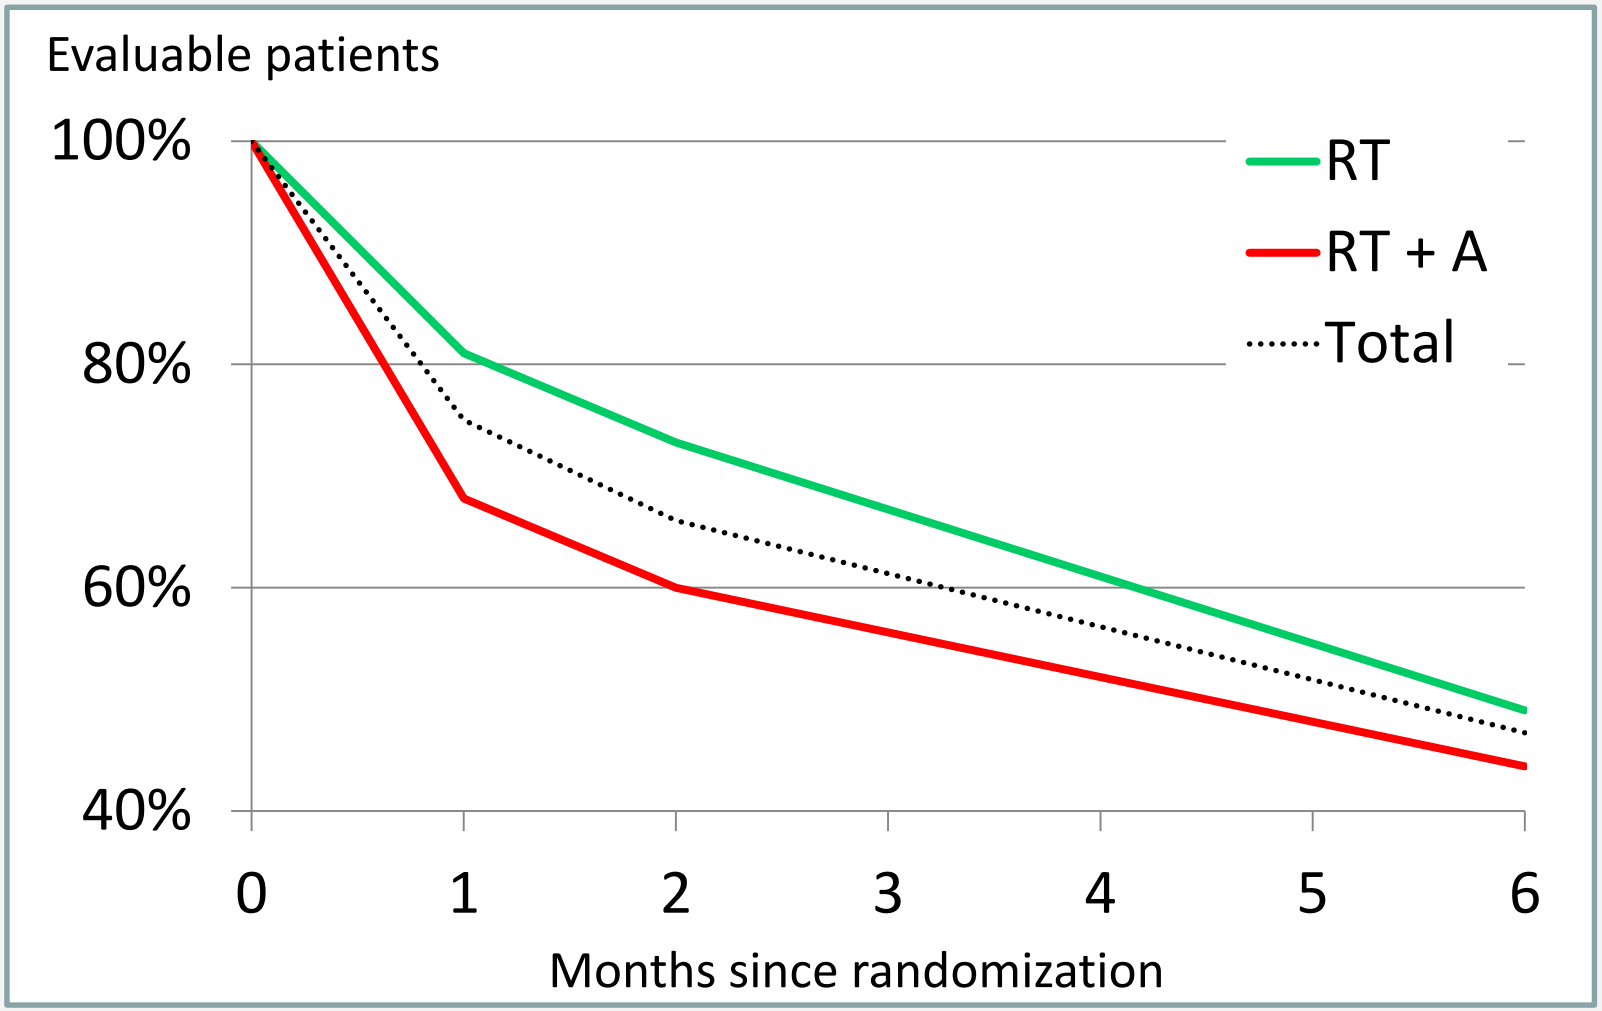
Exclusion of patients



N = 73 / 73

Antonadou IJROBP 2001

(Non-)evaluable patients



Antonadou IJROBP 2001

All patients are important

- lost patients = lost events
  - less power
  - bias
- many ways to lose patients
  - missing data
  - early stopping
  - patients exclusion

A word on ethics

- Randomisation is ethical … if
  - best alternative unknown
  - adequate methodology
  - informed consent

- What is not ethical ?
  - use of treatments without proven superiority
  - inclusion of patients in poor trials
  - diversion of patients eligible for research
  - waste of resources

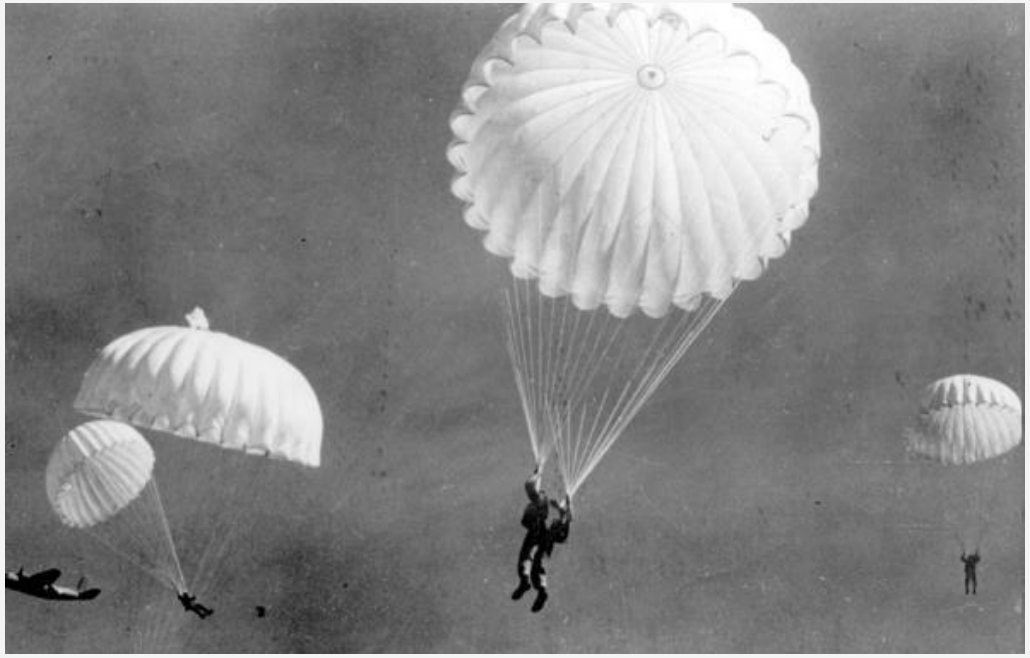
The problems with phase III

- Small effects mean (very …) large trials
  - many questions cannot be addressed
- The results are disappointing
  - 510 phase III @ ASCO 1989-1998
  - 223 (44%) with $p \leq 0.05$
  - 183 (36%) superiority of experimental arm
- The results come too late
  - not relevant for routine patients
  - obtained with obsolete modalities

Krzyzanowska JAMA 2003

Trials that are not feasible

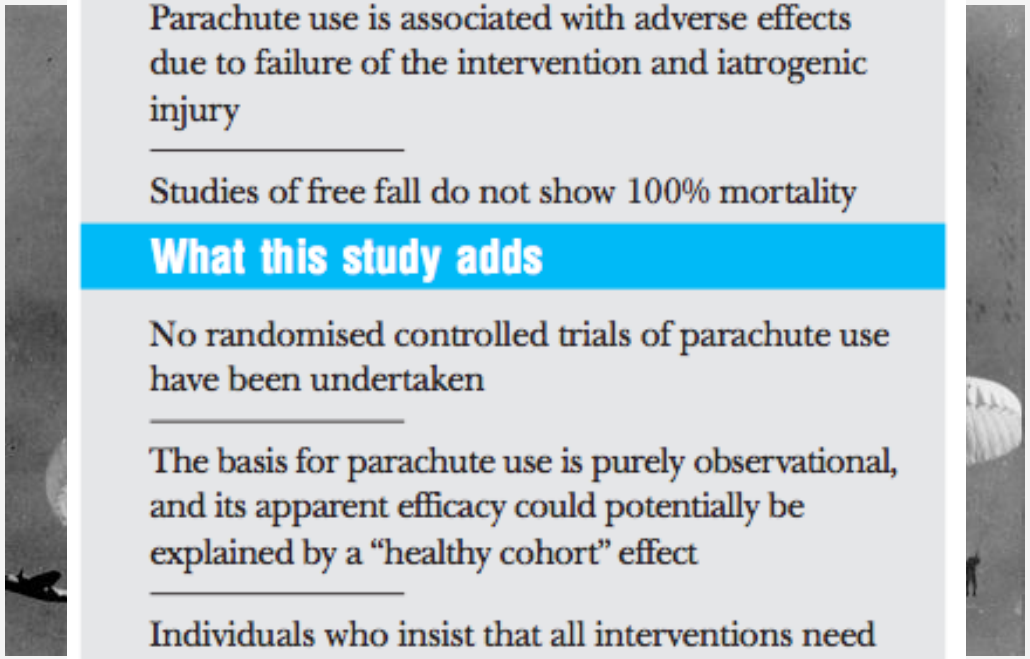
Parachute use to prevent death and major trauma related to gravitational challenge: systematic review of randomized trials



Smith BMJ 2003

Trials that are not feasible

Parachute use to prevent death and major trauma
r :
sys ials



What is already known about this topic

Parachutes are widely used to prevent death and major injury after gravitational challenge

Parachute use is associated with adverse effects due to failure of the intervention and iatrogenic injury

Studies of free fall do not show 100% mortality

What this study adds

No randomised controlled trials of parachute use have been undertaken

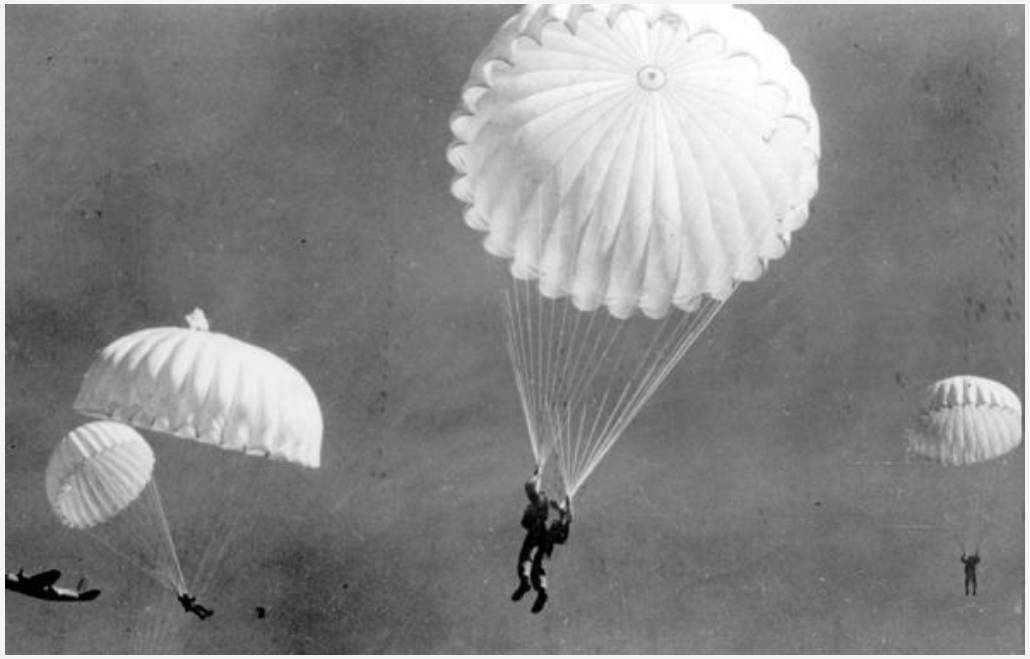
The basis for parachute use is purely observational, and its apparent efficacy could potentially be explained by a "healthy cohort" effect

Individuals who insist that all interventions need to be validated by a randomised controlled trial need to come down to earth with a bump

Smith BMJ 2003

Trials that are not feasible

Parachute use to prevent death and major trauma related to gravitational challenge: systematic review of randomised trials

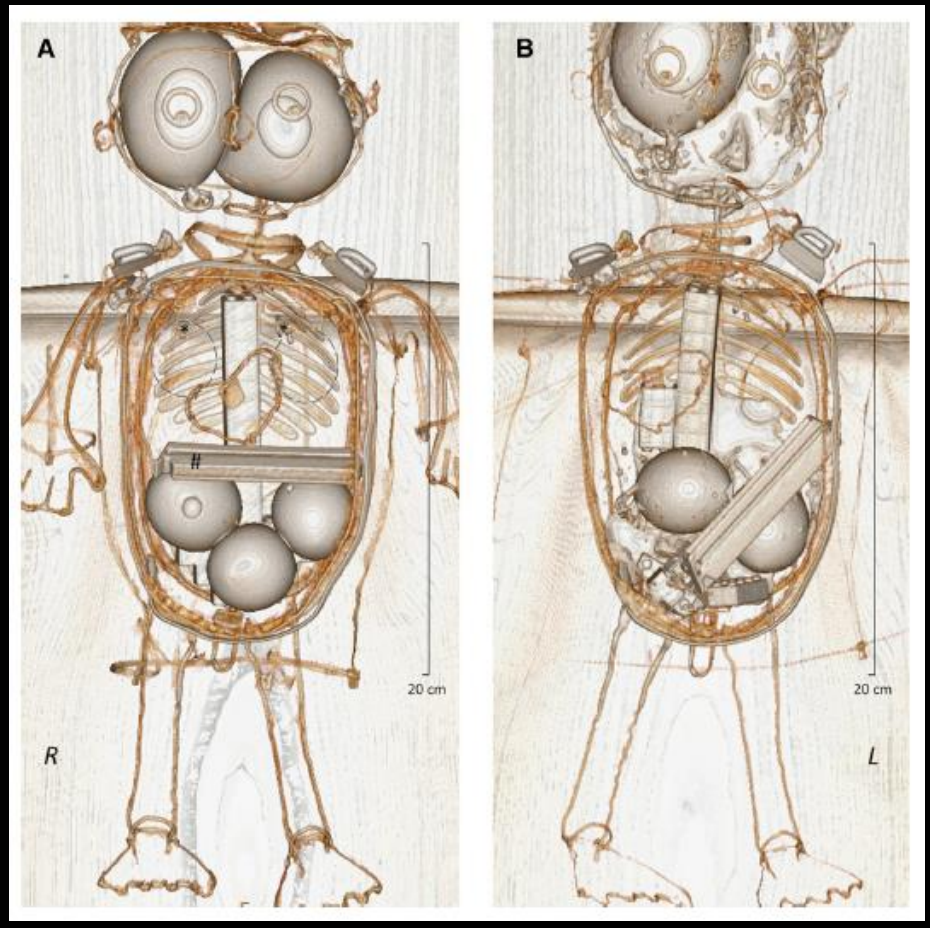


Smith GCS and Pell JP (2003) BMJ 327:1459-1461

Does usage of a parachute in contrast to free fall prevent major trauma?: a prospective randomised-controlled trial in rag dolls

Patrick Czorlich[1] · Till Burkhardt[1] · Jan Hendrik Buhk[2] · Jakob Matschke[3] · Marc Dreimann[4] · Nils Ole Schmidt[1] · Sven Oliver Eicker[1]

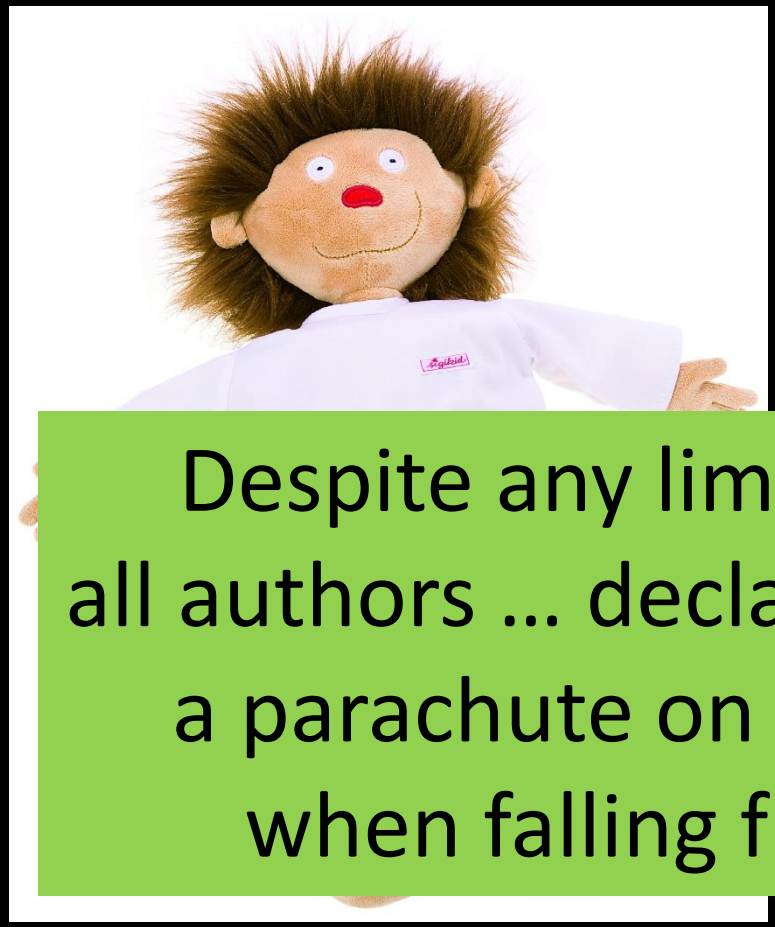
Eur Spine J 2016

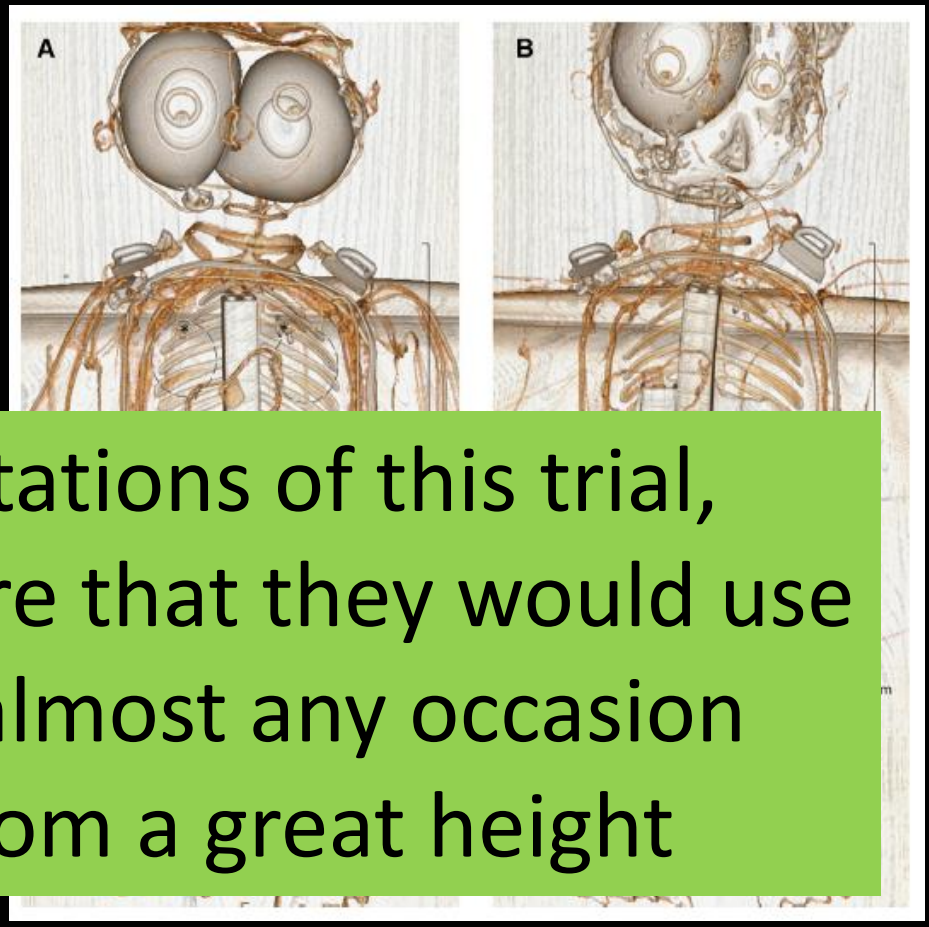


Does usage of a parachute in contrast to free fall prevent major trauma?: a prospective randomised-controlled trial in rag dolls

Patrick Czorlich[1] · Till Burkhardt[1] · Jan Hendrik Buhk[2] · Jakob Matschke[3] · Marc Dreimann[4] · Nils Ole Schmidt[1] · Sven Oliver Eicker[1]

Eur Spine J 2016





Despite any limitations of this trial,
all authors … declare that they would use
a parachute on almost any occasion
when falling from a great height

Essay

Why Most Published Research Findings Are False

John P. A. Ioannidis

Type of research	Power	True/false	Bias	PPV
Good quality RCT	0.80	1:1	0.10	0.85
Meta-analysis of good quality RCTs	0.95	2:1	0.30	0.85
Meta-analysis of small RCTs	0.80	1:3	0.40	0.41
Phase I/II RCT	0.20	1:5	0.20	0.23
Exploratory epidemiological study	0.80	1:10	0.30	0.20
Exploratory with massive testing	0.20	1:1000	0.80	0.001

Ioannidis PLOS Med 2005

Conclusion

- Good data more important than tests
- Study design
  - KISS: Keep It Simple, Stupid !
  - AGARA: As Good As Reasonably Achievable
- Are the results clinically significant ?

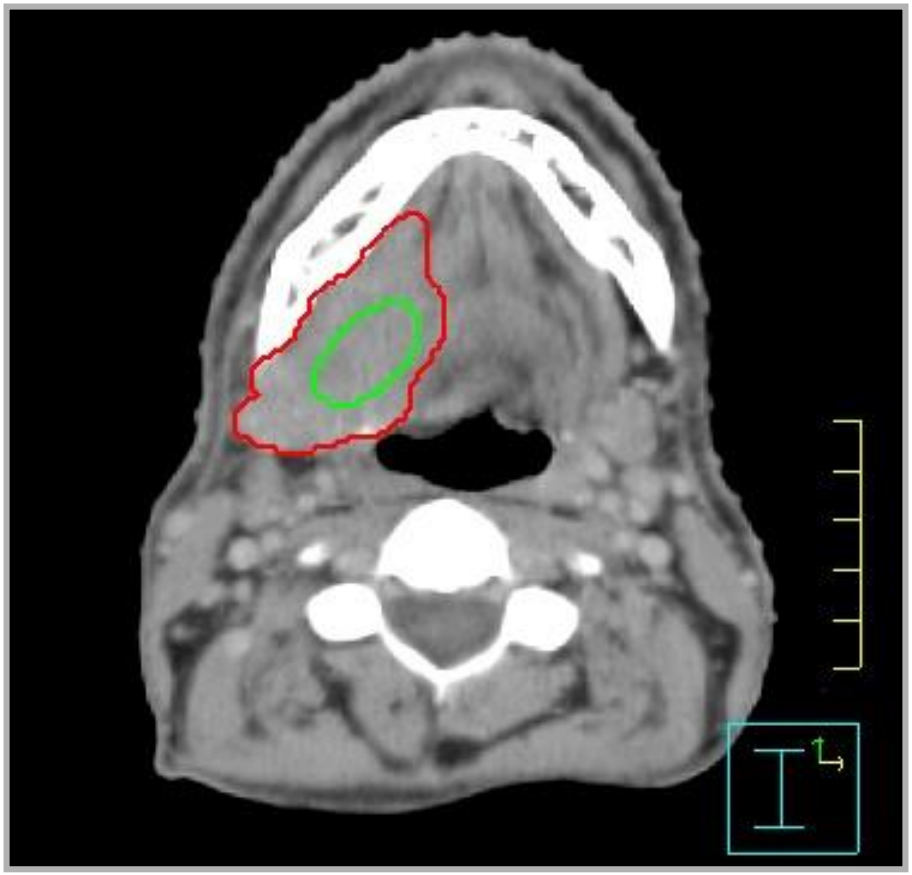
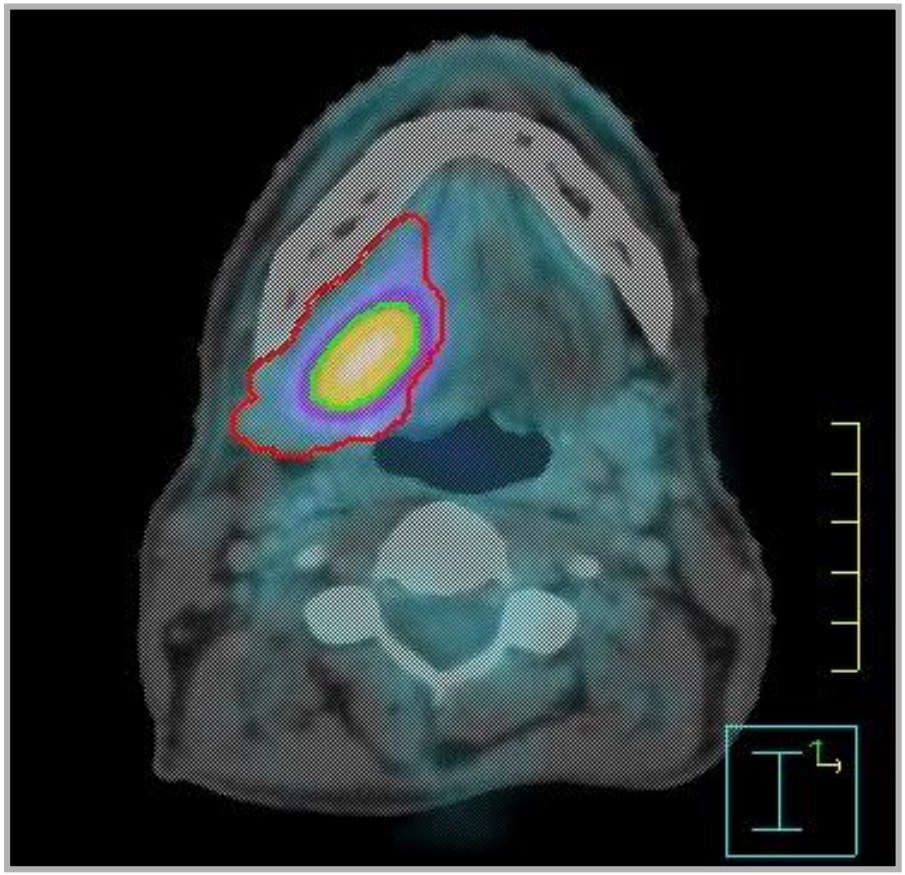
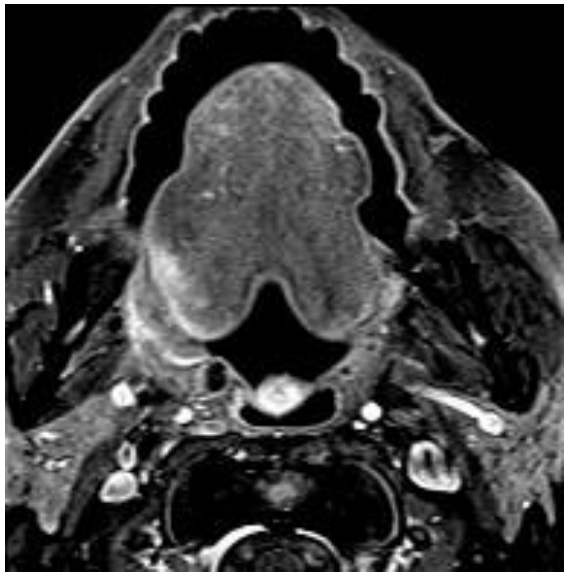
Delineation of tumor: what is the role of FDG-PET/CT?

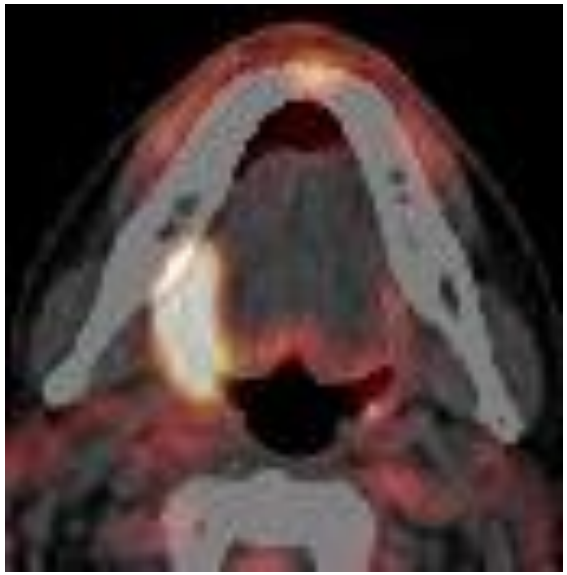




Schinagl et al. Cancer Imaging 2006

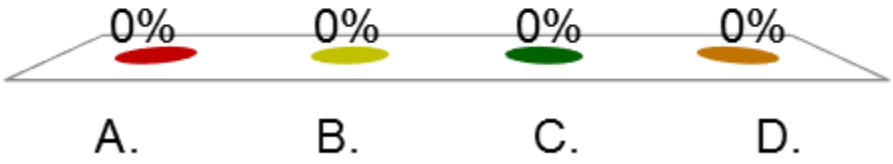
Delineation of head and neck tumors:





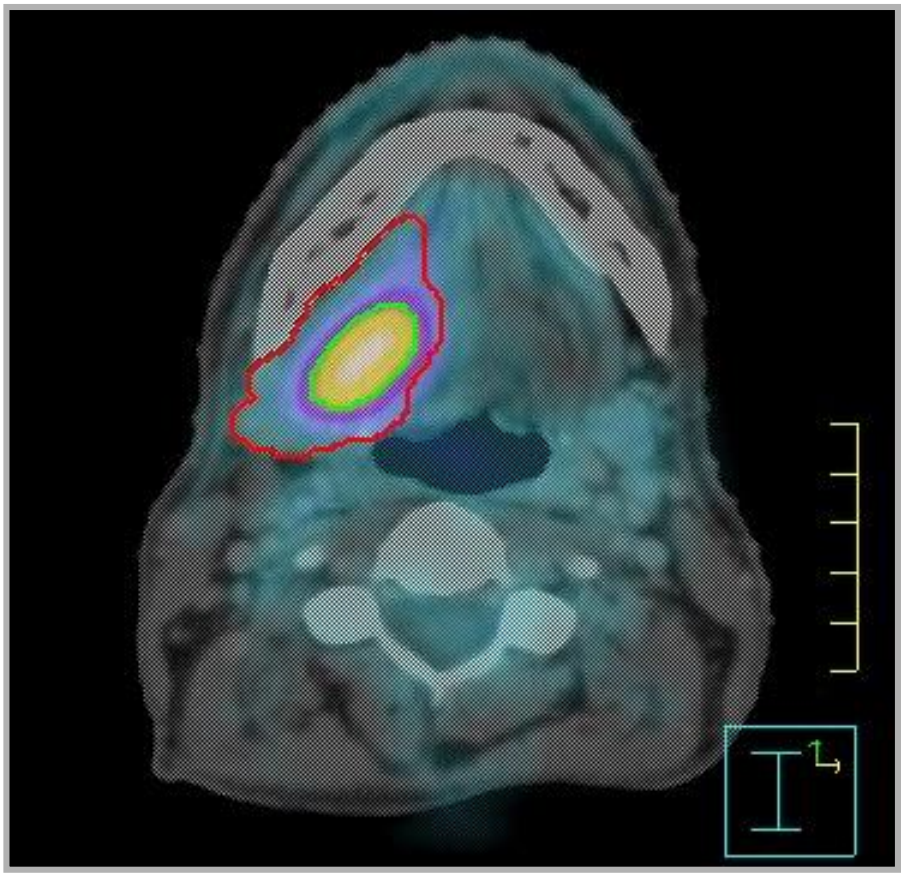
What do you use?

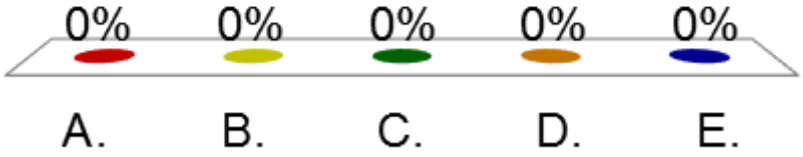
A. CT
B. CT and MRI
C. CT and PET
D. CT, MRI and PET



If you use PET for delineation, which segmentation method do you use?

A. visual
B. GTV - 40% - 50%
C. GTV - SUV
D. GTV - SBR
E. other



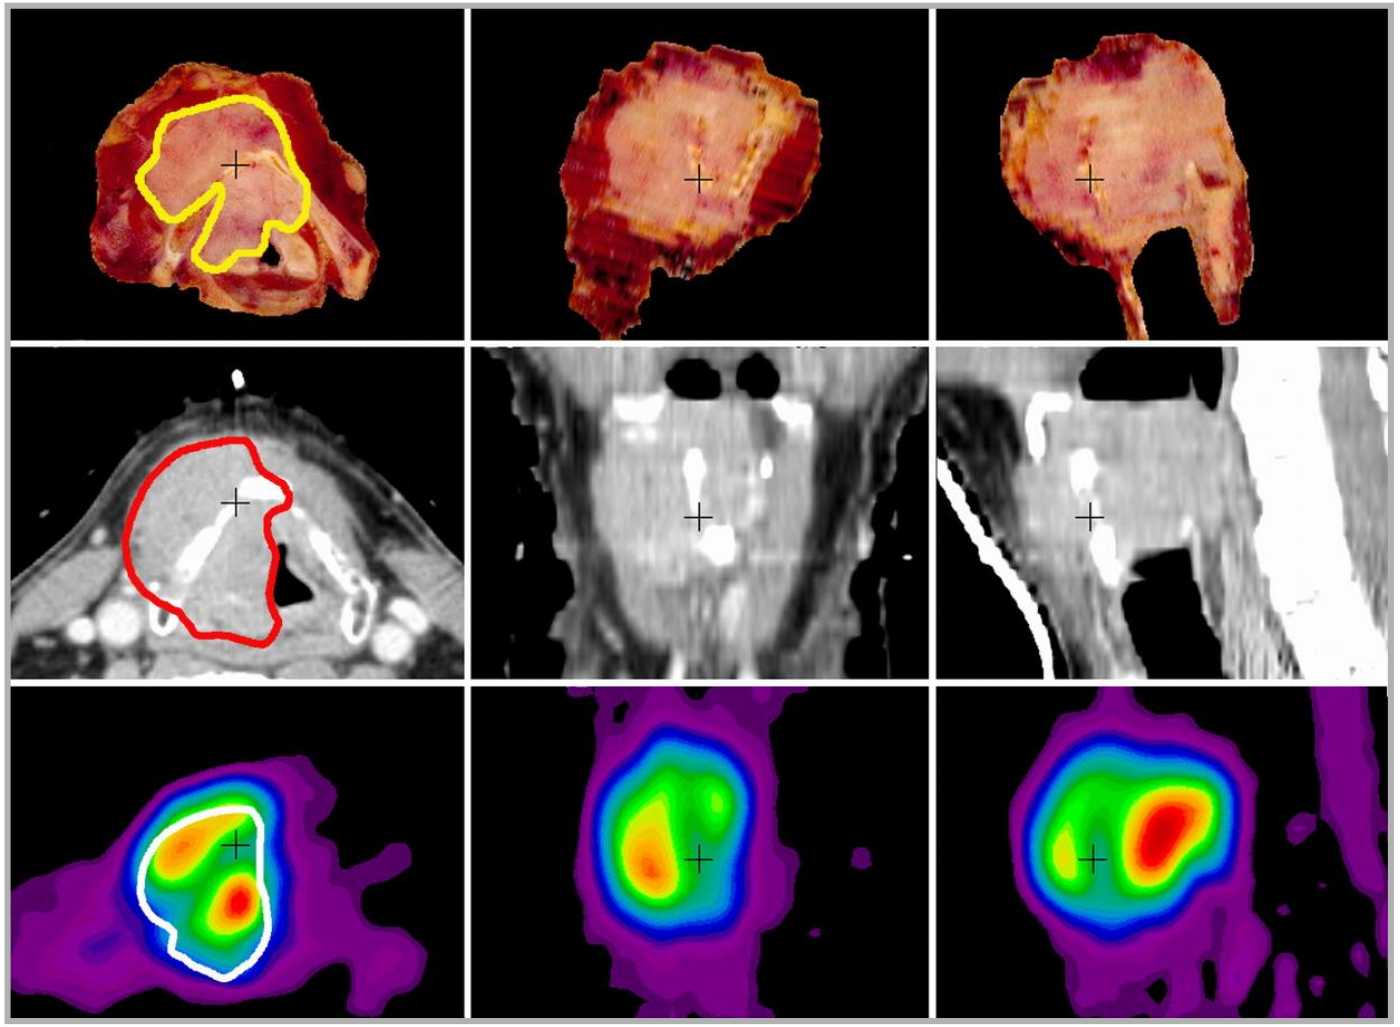


Assessment of tumor volume: validation of CT, MRI and FDG-PET

Surgical specimen

CT-scan

FDG-PET



Daisne, Radiology 2004

Assessment of tumor volume: validation of CT, MRI and FDG-PET

	Mean volume (cm^3)		
	oropharynx	larynx - hypopharynx	surgical specimen available
CT	32.0	21.4	20.8
MRI	27.9	21.4	23.8
PET	20.3	13.4	16.3
Specimen			13.4

In 9 patients for whom a surgical specimen was available, PET was most accurate for volume assessment

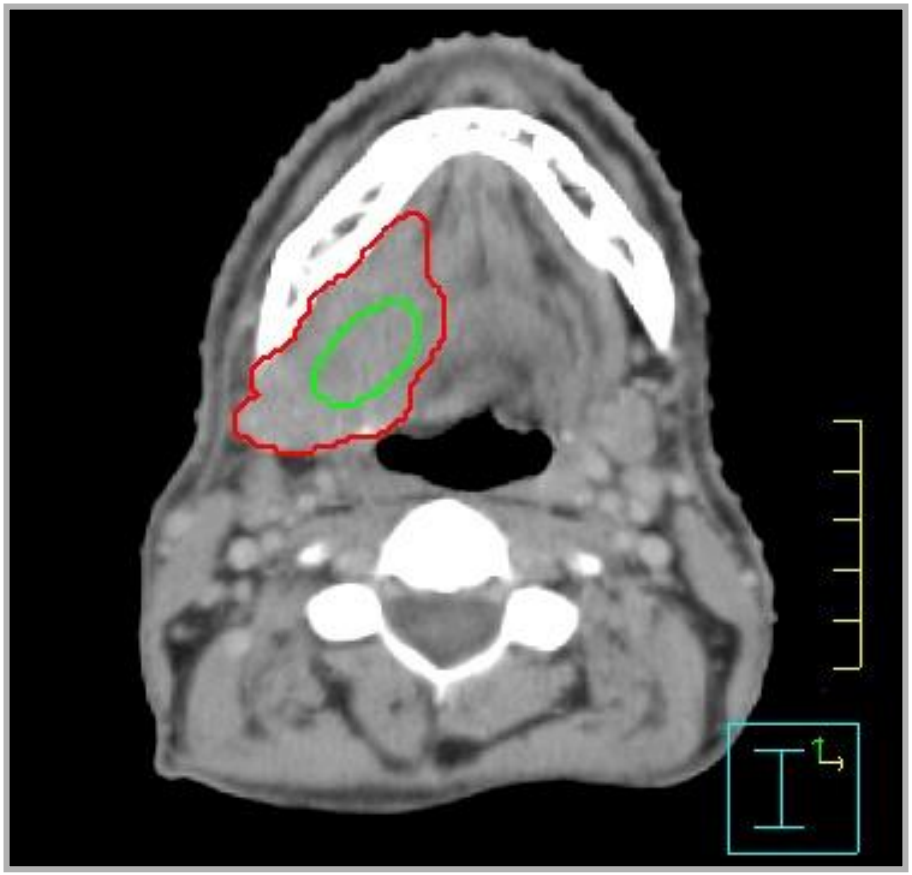
Daisne, Radiology 2004

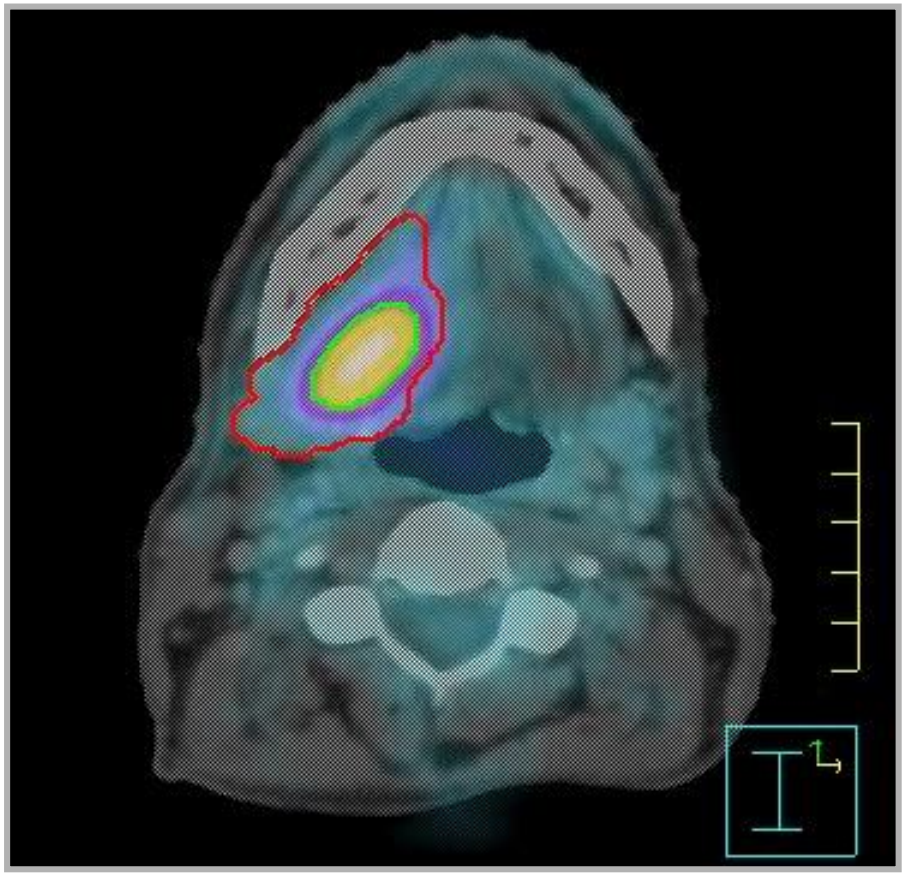
Mismatch of laryngeal tumor GTV's: CT, MRI and FDG-PET vs. surgical specimen

Pair	Volume (%) not identified by imaging study
Specimen to CT	10%
Specimen to MRI	9%
Specimen to PET	13%

Daisne, Radiology 2004

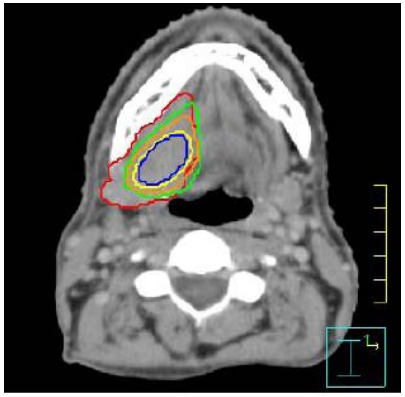
Segmentation of PET signal: which method?

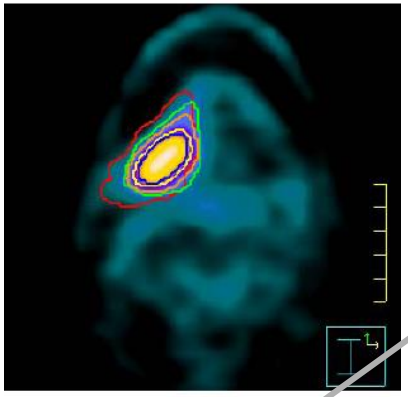


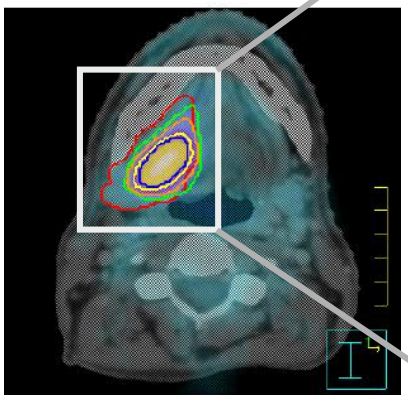


Schinagl et al. Cancer Imaging 2006

Segmentation of PET signal: which method?







Result of target volume definition is dependent on segmentation method:

CT:

GTV - CT 47.5 cm^3 (**red**)

PET:

GTV - visual 43.8 cm^3 (**green**)

$GTV_{40\%}$ 20.1 cm^3 (**yellow**)

GTV_{SUV} 32.6 cm^3 (**orange**)

GTV_{SBR} 15.7 cm^3 (**blue**)

Levels of evidence

IA	Meta-analysis of randomized controlled trials
IB	At least one randomized controlled trial
IIA	At least one controlled study without randomization
IIB	At least one quasi-experimental study
III	Non-experimental descriptive studies (comparative studies, correlation studies, case-control studies)
IV	Expert opinions

Grades of recommendation

A	Directly based on Level I evidence
B	Directly based on Level II evidence or extrapolated recommendations from Level I evidence
C	Directly based on Level III evidence or extrapolated recommendations from Level I or II evidence
D	Directly based on Level IV evidence or extrapolated recommendations from Level I, II, or III evidence

Levels of evidence

Levels of scientific evidence	
1++	High-quality meta-analyses, high-quality systematic reviews of clinical trials with very little risk of bias.
1+	Well-conducted meta-analyses, systematic review of clinical trials or well-conducted clinical trials with low risk of bias.
1-	Meta-analyses, systematic reviews of clinical trials or clinical trials with high risk of bias.
2++	High-quality systematic reviews of cohort or case and control studies; cohort or case and control studies with very low risk of bias and high probability of establishing a causal relationship.
2+	Well-conducted cohort or case and control studies with low risk of bias and moderate probability of establishing a causal relationship.
2-	Cohort or case and control studies with high risk of bias and significant risk that the relationship is not causal.
3	Non-analytical studies, such as case reports and case series.
4	Expert opinion.

Grades of recommendation

Grades of recommendations	
A	At least one meta-analysis, systematic review or clinical trial classified as 1++ and directly applicable to the target population of the guideline, or a volume of scientific evidence comprising studies classified as 1+ and which are highly consistent with each other.
B	A body of scientific evidence comprising studies classified as 2++, directly applicable to the target population of the guideline and highly consistent with each other, or scientific evidence extrapolated from studies classified as 1++ or 1+.
C	A body of scientific evidence comprising studies classified as 2+, directly applicable to the target population of the guideline and highly consistent with each other, or scientific evidence extrapolated from studies classified as 2++.
D	Level 3 or 4 scientific evidence, or scientific evidence extrapolated from studies classified as 2+.

Due to their high risk of bias, studies classified as 1- or 2- should not be used in compiling recommendations

Post-op complications	40.5%	26.1%	0.221
R0 resection	86.5%	91.3%	0.734
Pathological downstaging	21.6%	39.1%	0.07

Latkauskas T. Colorectal Dis. 2012;14(3):294-8

Conclusion 4

	SCRT	LCRT
Local recurrence	=	=
Survival	=	=
Toxicity (acute)	✓	✗
Toxicity (late)	=	=
Sphincter preservation	=	=

Summary

For operable rectal cancers

- Compared to post-op RT, post-op chemo-RT reduces LR + improves survival
- Compared to pre-op RT, pre-op chemo-RT reduces LR but does not improve survival
- Compared to post-op (C)RT, pre-op (C)RT reduces LR + reduces toxicity
- Short course RT is equivalent to long course CRT

Question

- Why have post-op CRT studies shown a survival improvement whereas pre-op CRT studies have not?

Possible answers

- Post-op studies (older)
  - Pathological information available
  - Poorer prognosis patients selected for evaluation
- Pre-op studies (newer)
  - Better control arms (better training)

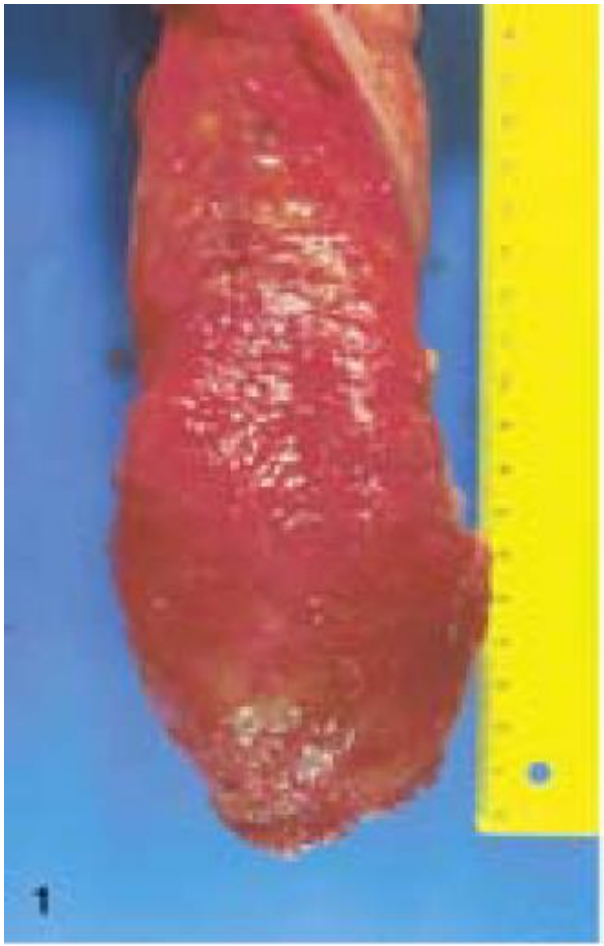
Better surgery (TME)

	Good Mesorectal	Intermediate Intra-mesorectal	Poor Muscularis propria
CRM +ve rate	9%	12%	19%

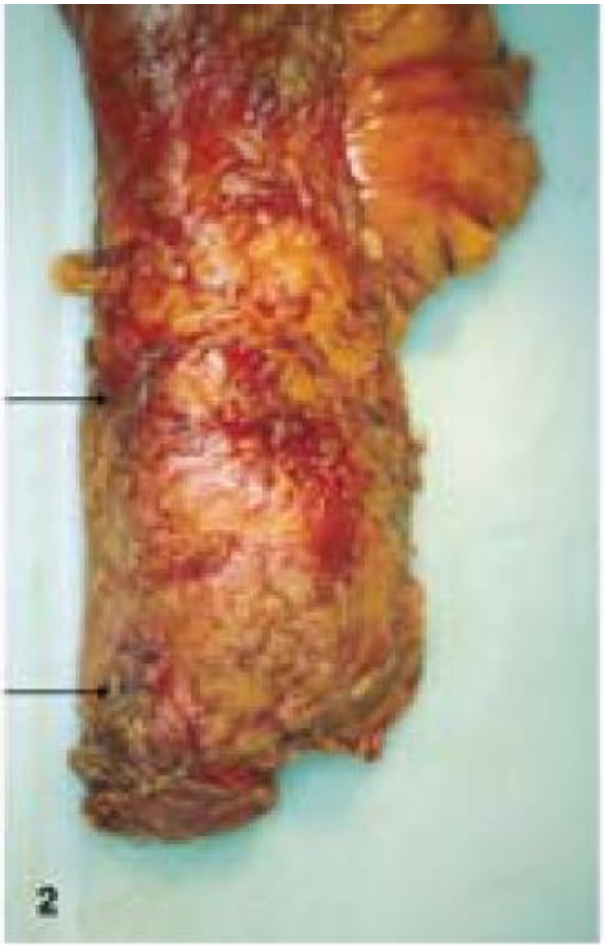
Quirke P, et al. Lancet. 2009; 373(9666): 821–828

Total mesorectal excision

Good



Intermediate



Poor

SCRT studies

Study	Participants	Good TME	LR
Swedish Rectal Cancer Trial	1987-1990	<10%	19.2% (213/1110)
MRC CR07	1998-2005	51%	7.5% (99/1350)
Dutch TME	1996-1999	56%	7.3% (140/1861)
MERCURY	2002-2003	73%	5.3% (13/246)

RT does not compensate for poor surgery

	TME		RT + TME	
	n	LR (%)	*n*	LR (%)
>2 mm	483	5.8	504	0.9
1–2 mm	53	14.9	47	0
≤1 mm	120	16.4	107	9.3
Postoperative RT	56	17.3	—	
No postoperative RT	64	15.7	—	
Total	656	8.4	662	2.1

MERCURY

- Pre-op MRI assessment of CRM predicts DFS + LR

	mCRM clear (n=310)		mCRM involved (n = 64)	
	Clear	Involved	Clear	Involved
(y)pCRM	94%	6%	47%	53%
LR	6%	21%	10%	32%

Under-reporting = 6%, Over-reporting 47%

Taylor FG, et al. J Clin Oncol. 2014;32(1):34-43

Outline

- Past questions
  - Chemo-RT or RT alone?
  - Pre-op or post-op?
  - Long course or short course?
- **Guidelines**
- Current questions

Risk-stratified treatment (pre-op)

- Early ('**Good**')

– surgery alone sufficient

- Intermediate ('**Bad**')

– give pre-op RT (5 × 5 Gy) **or** CRT

- Locally advanced ('**Ugly**')

– CRT needed to achieve high probability of R0 surgery

Glimelius B. Ann Oncol. 2010;21 Suppl 5:v82-6.

TNM 7

Primary Tumor (T)

- **TX** Primary tumor cannot be assessed
- **T0** No evidence of primary tumor
- **Tis** Carcinoma in situ: intraepithelial or invasion of lamina propria[1]
- **T1** Tumor invades submucosa
- **T2** Tumor invades muscularis propria
- **T3** Tumor invades through the muscularis propria into pericolorectal tissues
- **T4a** Tumor penetrates to the surface of the visceral peritoneum[2]
- **T4b** Tumor directly invades or is adherent to other organs or structures[2,3]

Regional Lymph Nodes (N)[4]

- **NX** Regional lymph nodes cannot be assessed
- **N0** No regional lymph node metastasis
- **N1** Metastasis in 1–3 regional lymph nodes
- **N1a** Metastasis in one regional lymph node
- **N1b** Metastasis in 2–3 regional lymph nodes
- **N1c** Tumor deposit(s) in the subserosa, mesentery, or nonperitonealized pericolic or perirectal tissues without regional nodal metastasis
- **N2** Metastasis in 4 or more regional lymph nodes
- **N2a** Metastasis in 4–6 regional lymph nodes
- **N2b** Metastasis in 7 or more regional lymph nodes

MRI staging (ESMO)

- **T3:** tumour invades through the muscularis propria into the subserosa or into non-peritonealised perirectal tissues
  - **T3a:** tumour extends <1 mm beyond muscularis propria [4]
  - **T3b:** tumour extends 1-5 mm beyond muscularis propria [4]
  - **T3c:** tumour extends 5-15 mm beyond muscularis propria [4]
  - **T3d:** tumour extends 15 mm beyond muscularis propria [4]

Glimelius B. Ann Oncol. 2010;21 Suppl 5:v82-6.

MRI staging (RSNA)

Mid to high

T3	Tumor invades through muscularis propria to pericolorectal tissues
a	Tumor < 5 mm into the perirectal fat or extramural
b	Tumor 5–10 mm into the perirectal fat or extramural
c	Tumor > 10 mm into the perirectal fat or extramural

Low

T1	Tumor confined to bowel wall but does not extend through full thickness; intact outer muscle coat
T2	Tumor replaces muscle coat but does not extend into intersphincteric plane
T3	Tumor invades intersphincteric plane or lies within 1 mm of levator muscle
T4	Tumor invades external anal sphincter and is within 1 mm and beyond levator muscle with or without invading adjacent organs

Hussain S. Published December 1, 2009. Updated July 16, 2012

Taylor FG. AJR 2008; 191:1827–1835.

ESMO guidelines

Good 	cT1-2, cT3a (b) if middle or high, N0 (or cN1 if high), mrf-, no EMVI cT3b = ≤5mm
Bad 	cT2 very low, cT3mrf- (unless cT3a(b) and mid- or high rectum), N1-2, EMVI+, limited cT4aN0
Ugly 	cT3mrf+, cT4a,b, lateral node+

Glimelius B. Ann Oncol. 2010;21 Suppl 5:v82-6.

NCCN

CLINICAL STAGE	NEOADJUVANT THERAPY[m]
T3, N0 or T any, N1-2 or T4 and/or locally unresectable or medically inoperable	Chemo/RT • Capecitabine/long-course RT[m] or infusional 5-FU/ long-course RT[m] (category 1 and preferred for both) or • Bolus 5-FU/leucovorin/ long-course RT[m,n] or RT[m] • Short-course RT[o] (not recommended for T4 tumors) or Chemotherapy[p] • FOLFOX (preferred) or CapeOx (preferred) or • 5-FU/leucovorin or capecitabine

NICE CG131 (UK)

Good 	• cT1 or cT2 or cT3a **and** • No lymph node involvement cT3a = <5mm
Bad 	• Any cT3b or greater, in which the potential surgical margin is not threatened **or** • Any suspicious lymph node not threatening the surgical resection margin **or** • The presence of extramural vascular invasion
Ugly 	• A threatened (<1 mm) or breached resection margin **or** • Low tumours encroaching onto the inter-sphincteric plane **or** with levator involvement

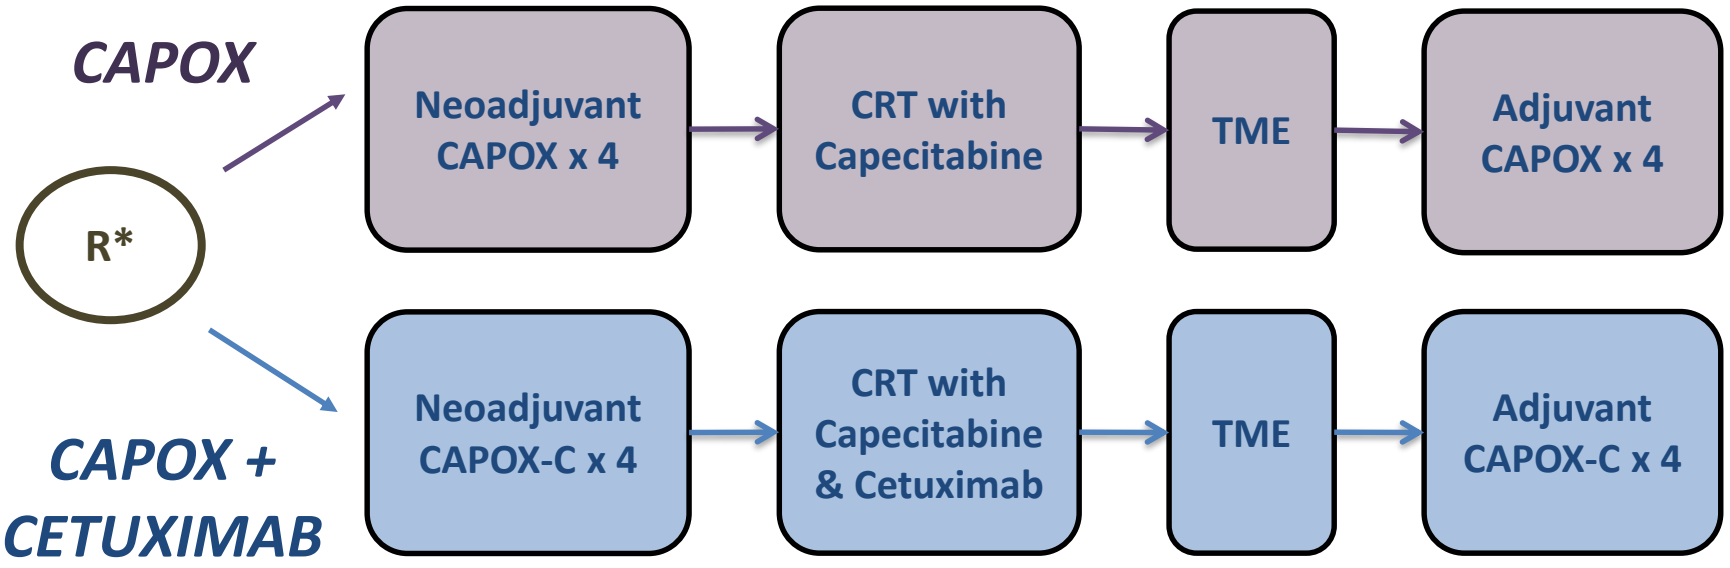
ACCORD 12/0405-Prodige 2

	Cap45	Capox50	*p value*
pCR	13.9%	19.2%	0.09
Sphincter sparing	74.6%	75.4%	
Local recurrence	6.1%	4.4%	
Overall survival	87.6%	88.3%	
Acute G3-4 diarrhoea	3.2%	12.6%	<0.001

Gerard JP, J Clin Oncol. 2010 Apr 1;28(10):1638-44

The EXPERT-C trial – Design



**Patients recruited from 15 European Centres 2005-2008*

Key inclusion criteria:

- Tumours within 1mm of mesorectal fascia
- Tumours extending ≥5mm into peri-rectal fat
- T4 tumours
- Presence of extramural vascular invasion
- T3 tumours at/below levators

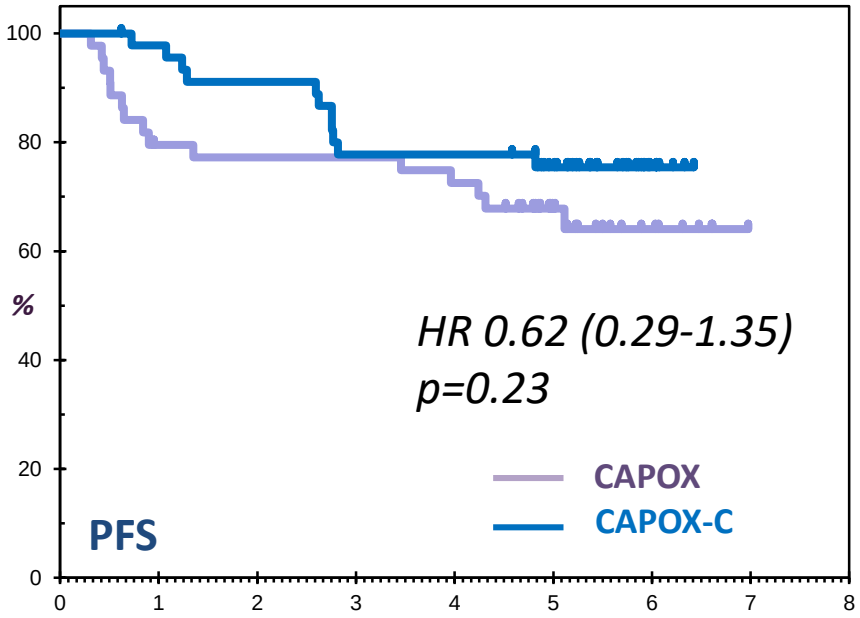
Endpoints

- Primary endpoint:
  CR in *KRAS/BRAF* WT patients
- Secondary endpoints:
  RR, PFS, OS, safety and QoL

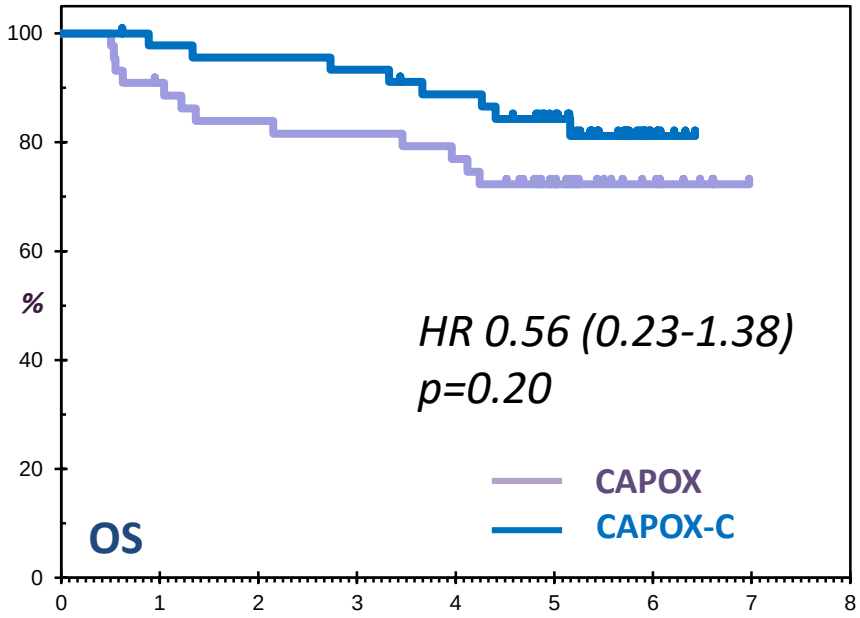
Dewdney, J Clin Oncol 2012

The EXPERT-C trial – Results

- No significant improvement in PFS and OS in the *KRAS/BRAF* WT group (median follow-up 63.8 months)



Time from randomisation (years)



Time from randomisation (years)

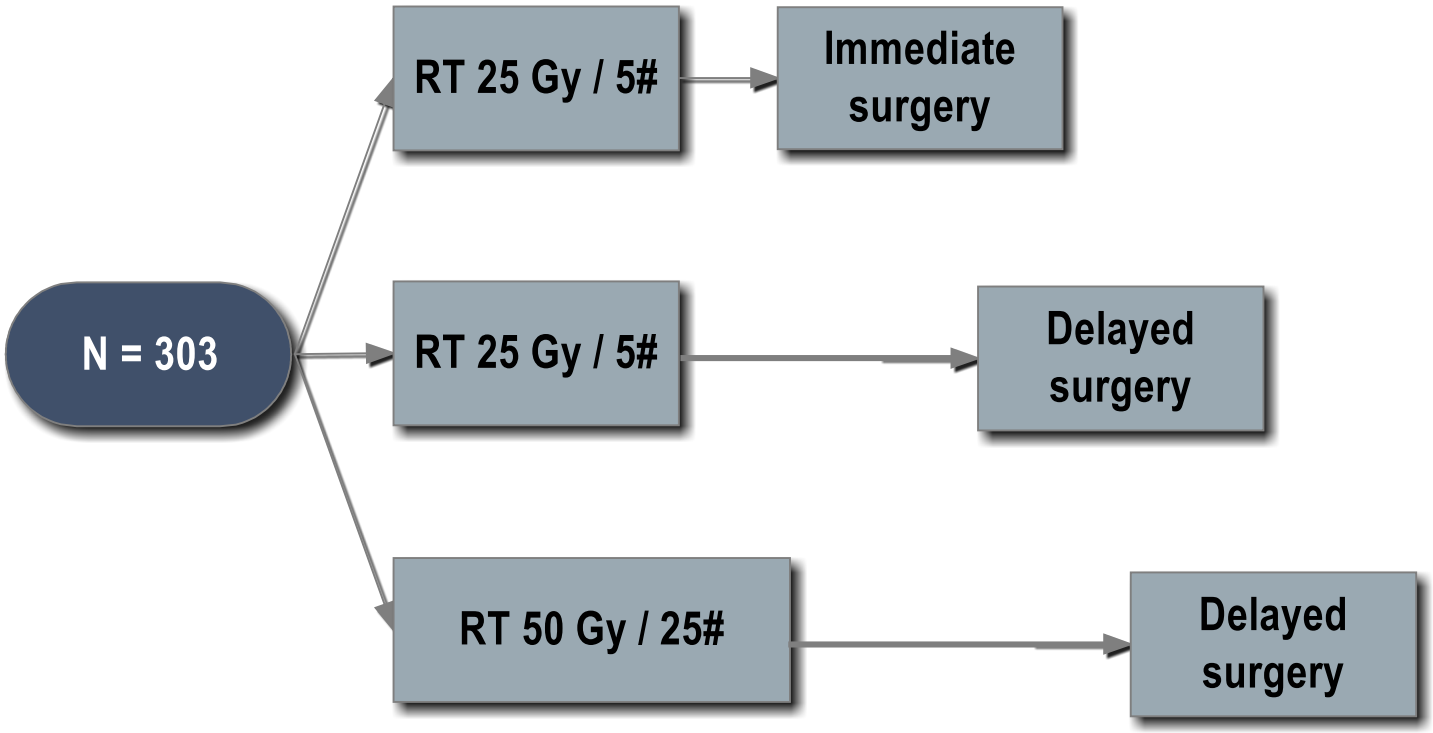
Stockholm III

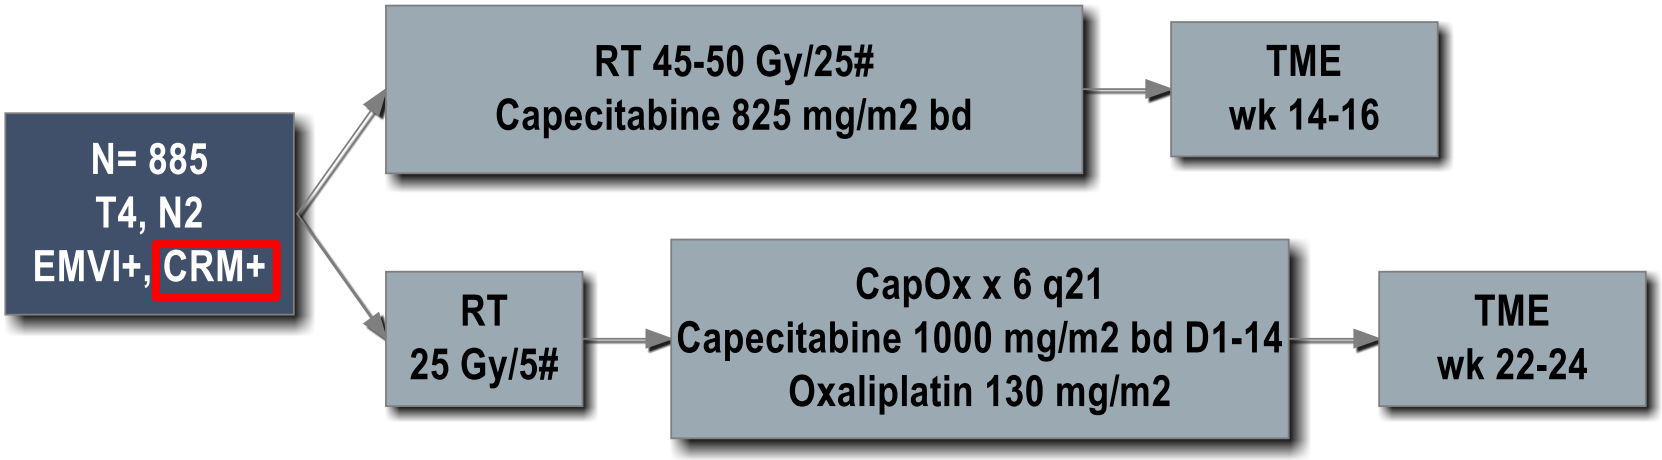


Stockholm III

- Longer delay after SCRT results in
  - Lower ypT categories
  - Higher rate of pathological CR (11·8% vs 1·7%; P = 0·001)
  - More Dworak grade 4 tumour regression (10·1% vs 1·7%; P < 0·001)

Pettersson D. Br J Surg. 2015;102(8):972-8

RAPIDO



- End points
  - 3-year DFS
  - OS, CRM status, pCR, acute + late toxicity, surgical complications, QoL

Brachytherapy

- 200 patients, T1-T4, Papillon boost (80-110 Gy in 3-4#)
  - CRT = 127 (63%)
  - SCRT = 57 (28%)
  - No EBRT = 16 (8%)
- Results
  - CR = 136 (68%), maintained in 116
  - PR = 64 (34%), 38 immediate surgery, 8 = ypT0
  - Organ preservation = 79%

Global Sample Size	59
Global Recruitment to Date	118%

MERRION

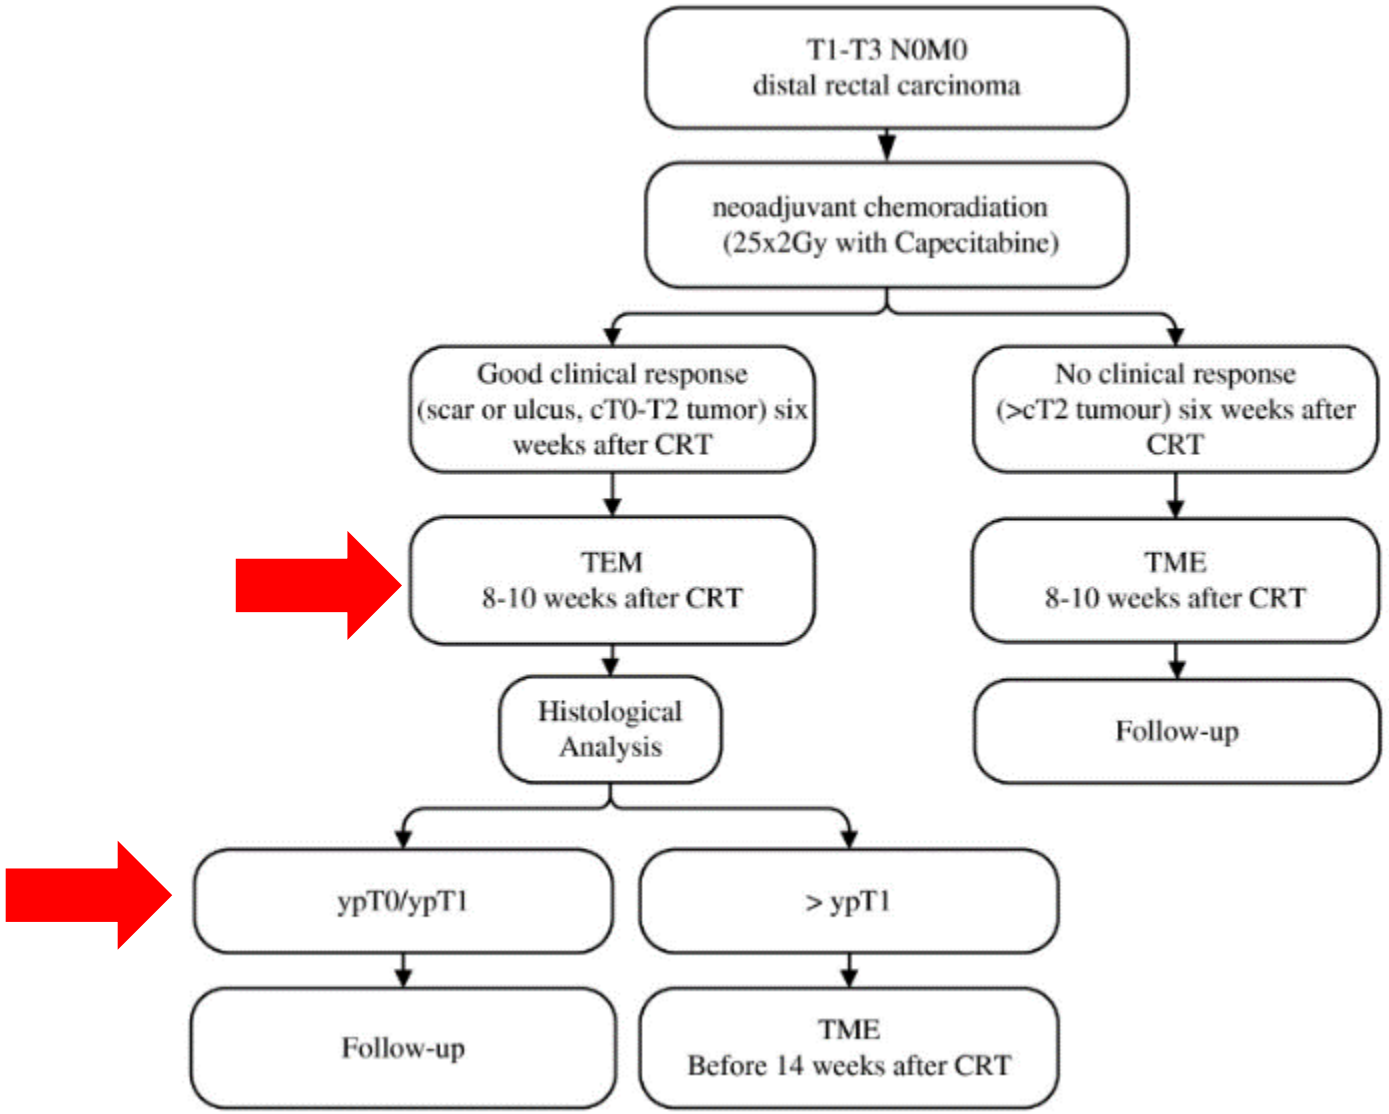
- **M**ulticenter **E**valuation of **R**ectal cancer **R**e**I**maging p**O**st **N**eoadjuvant Therapy

	yMRT Stage		
ypT Stage	**<yMRT4**	**yMRT4**	**Total**
<ypT4	217	27	244
ypT4	6	17	23
Total	223	44	267
Kappa statistic (κ)		0.445	

MR understages 26.1% (6/23) of ypT4 tumors and overstages 11.1% (27/244) of ypT0-3 tumors. The associated κ statistic of 0.445 indicates unacceptable agreement of MR with pathological staging.

Hanly AM, et al. Ann Surg. 2014;259(4):723-7

Dutch CARTS study



Dutch CARTS study

- 55 patients
  - cT1 N0 = 10, cT2 N0 = 29, cT3 N0 =16
- 47 patients had TEM
  - ypT0-1 disease in 30
- Local recurrence developed in 3 of 9 (33%) patients with ypT2 tumours who declined further surgery
- TEM after chemo-radiotherapy enabled organ preservation in one-half of the patients with rectal cancer

Verseveld M, et al. Br J Surg. 2015;102(7):853-60

Dutch CARTS study

- Grade 3 complications = 42%
- Two deaths from toxicity

Verseveld M, et al. Br J Surg. 2015;102(7):853-60

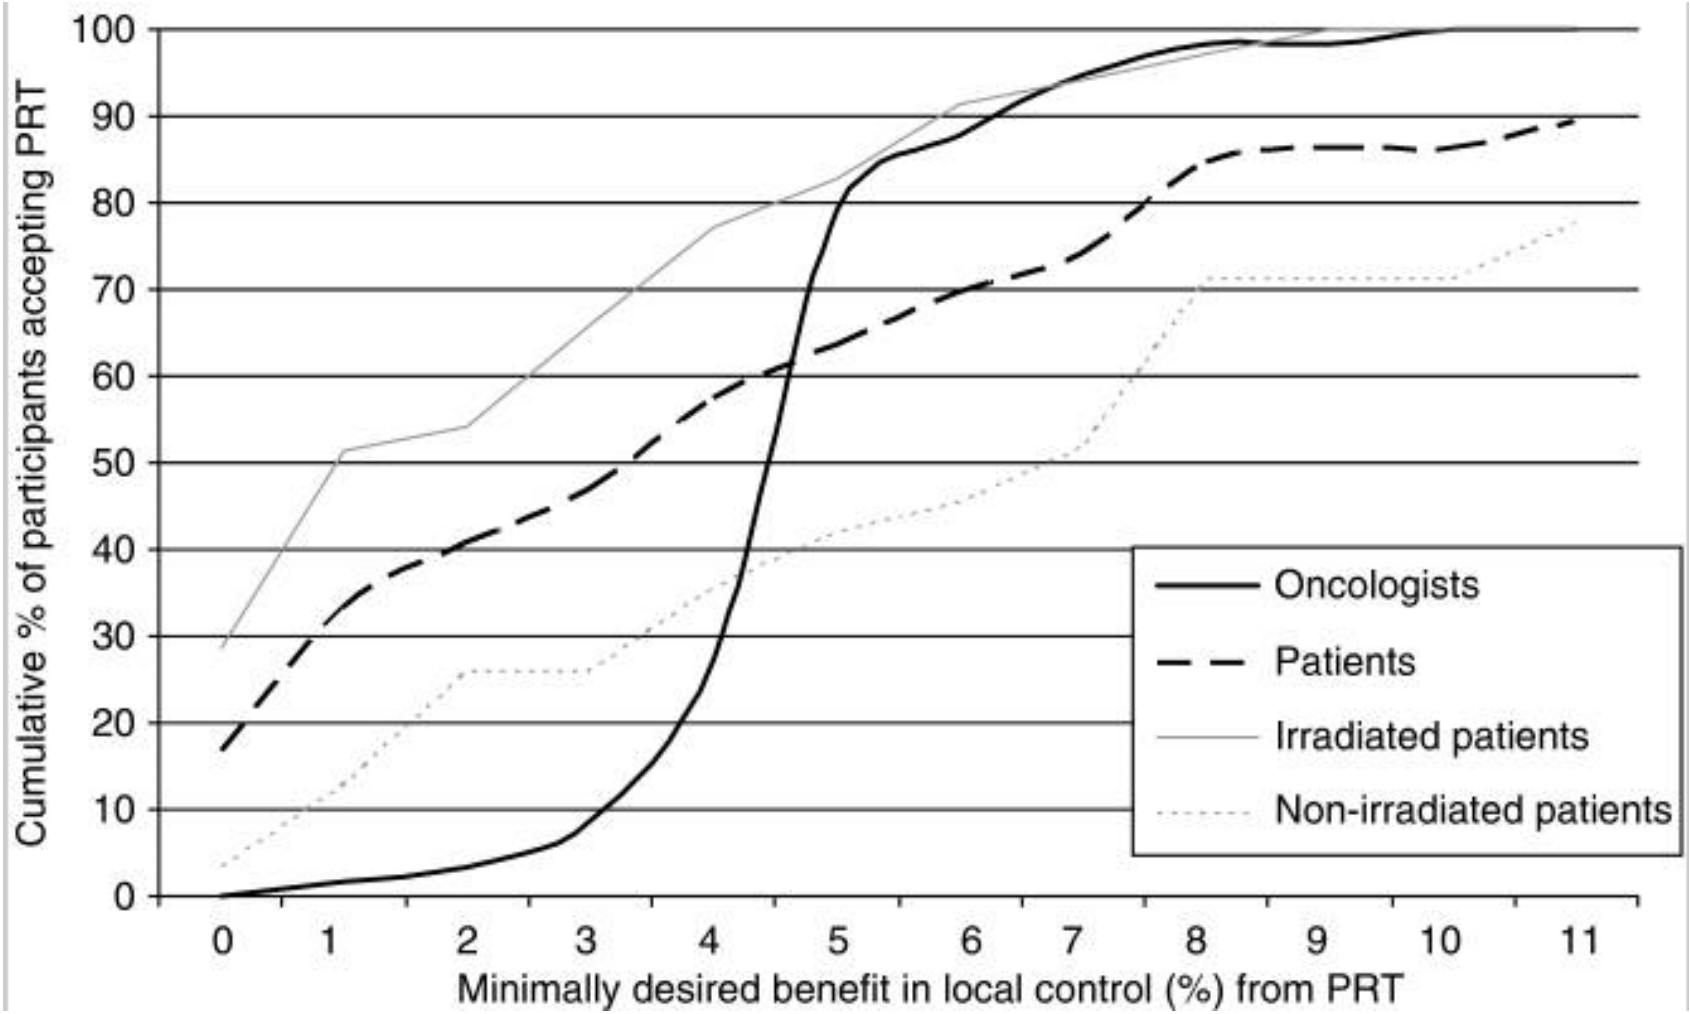
What benefit?

What benefit?

- Interview
  - 66 disease-free patients
  - 60 oncologists (surgical, radiation, medical)
- Outcome measures
  - Survival
  - Local control
  - Faecal incontinence
  - Sexual dysfunction

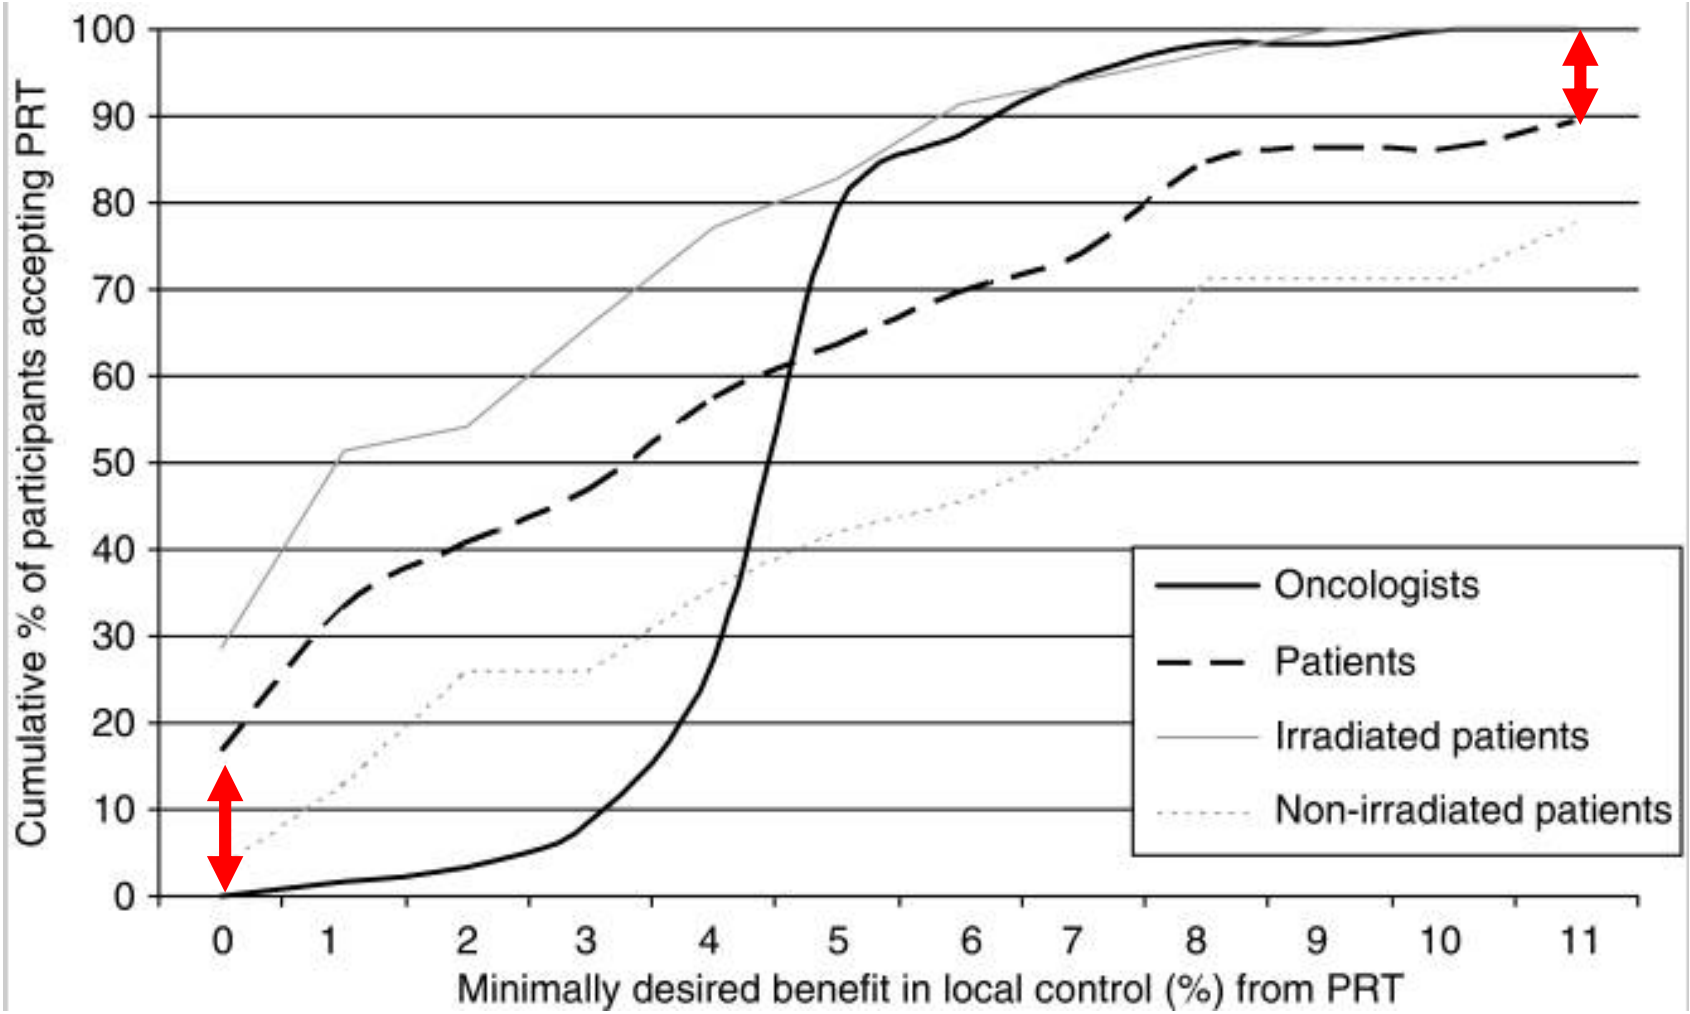
Pieterse AH, et al. Br J Cancer. 2007;97(6):717-24

Pre-op RT for LC



Pieterse AH, et al. Br J Cancer. 2007;97(6):717-24

Pre-op RT for LC



Pieterse AH, et al. Br J Cancer. 2007;97(6):717-24

Pre-op RT for LC

- Radiotherapists considered local control more important than medical oncologists (35±9 vs 24±8, P = 0.02) and surgeons (28±11, P = 0.04).
- Surgeons considered sexual dysfunction more important than radiotherapists (20±9 vs 14±5, P = 0.02).
- Medical oncologists considered survival more important than surgeons (28±9 vs 17±12, P = 0.05).
- Clinicians who had supervised tended to consider local control more important than clinicians who had not (36±9 vs 29±10 P = 0.05)

Pieterse AH, et al. Br J Cancer. 2007;97(6):717-24

Pre-op RT for LC

- One medical oncologist would not advise PRT to male patients, and only for a 7% benefit to female patients.
- One surgical oncologist would advise PRT to male patients for 6% benefit, but could not decide for female patients.

Pieterse AH, et al. Br J Cancer. 2007;97(6):717-24

Priority

	Patients	Oncologists	
Incontinence	29 (47%)	24 (41%)	**6%**
Local control	21 (34%)	20 (34%)	**0%**
Survival	7 (11%)	12 (20%)	**9%**
Sexual dysfunction	5 (8%)	3 (5%)	**3%**

Chan BMJ 2005

Objectives of meta-analysis

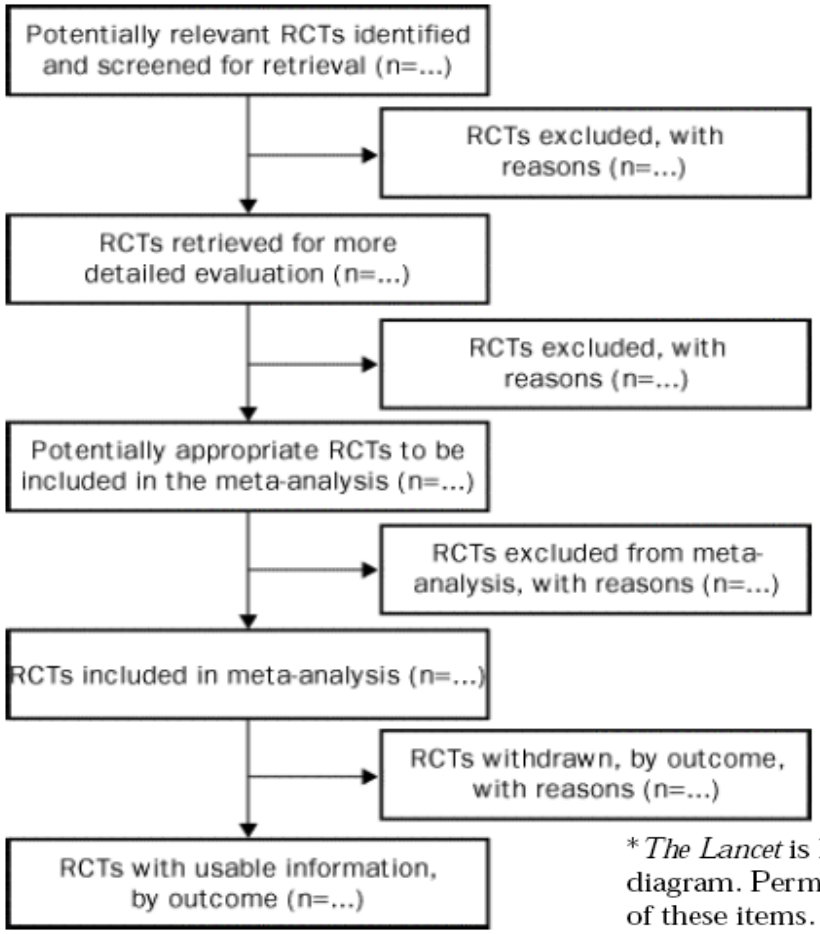
- Increase the level of evidence
  - a more reliable answer
  - a more precise measure of effect
- Generate new hypothesis
  - from differences between trials
  - from subgroup analyses

A scientific methodology

- An explicit (and relevant ...) question
- An exhaustive search of the data
  - avoid publication bias
- Assess the quality of the data
  - trial methodology
- A protocol written a priori
  - including sample size calculation

Data description

Improving the quality of reports of meta-analyses of randomised controlled trials: the QUOROM statement flow diagram



* *The Lancet* is happy for readers to make copies of the checklist and flow diagram. Permission need not be obtained from the journal for reproduction of these items.

Hazard ratio

- Ratio of risks of death (event)
  - in « experimental » group
  - vs. in « control » group

Hazard ratio = 1

A. experimental better than control

B. experimental equal to control

C. experimental worse than control

D. can’t conclude

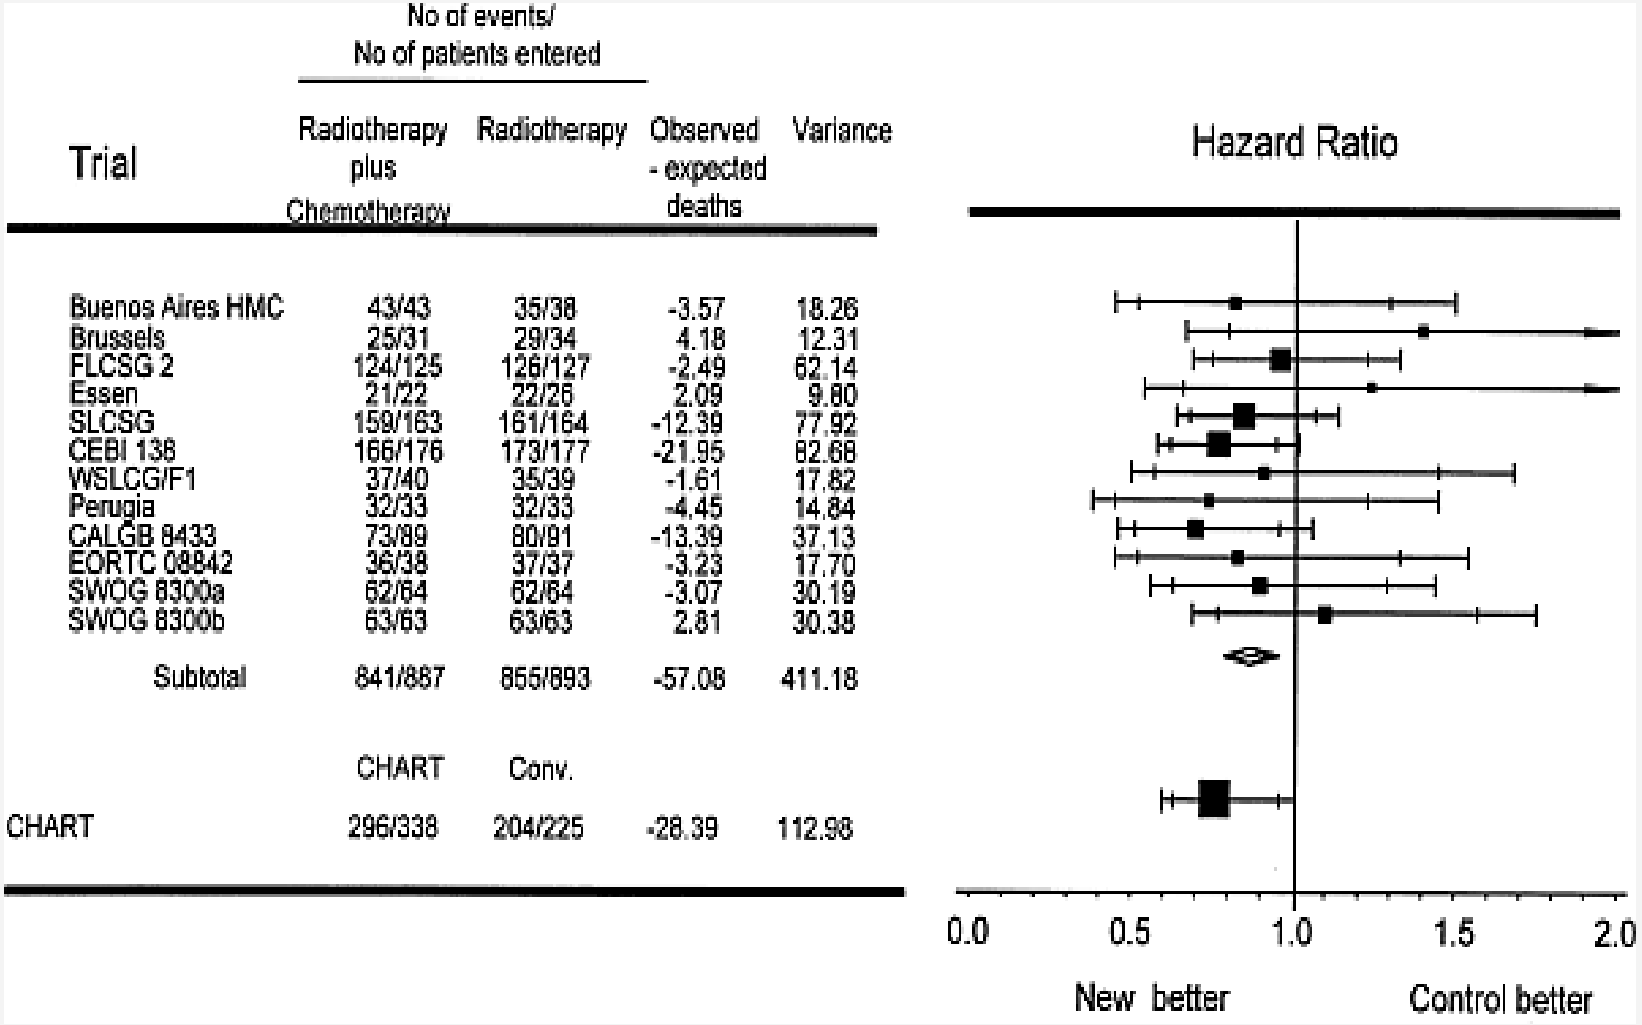
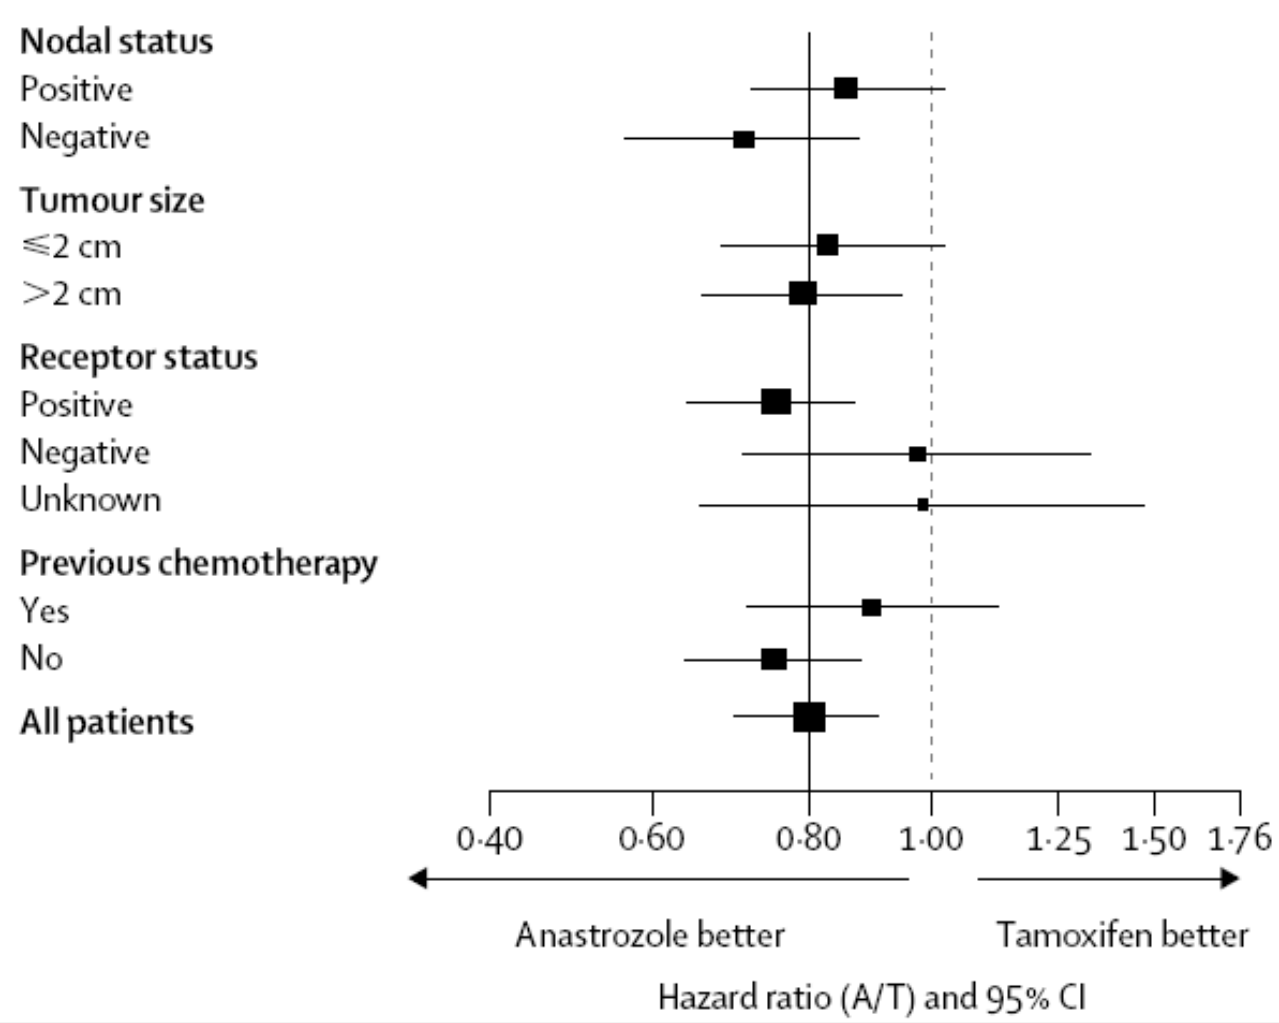
Forest plot



Saunders R&O 1999

Subgroup analysis



ATAC trials, Cuzick Lancet 2005

Additional advantages

- Cheap and quick
  - no need to produce more data
  - finance data retrieval and management
- Homogeneous statistical analysis
  - all eligible data ++++
  - uniform endpoint
  - longer follow-up
  - intent to treat

Prefer individual data

- Improved quality of data
  - check random procedure
  - update follow-up
- Improved analysis
  - uniform endpoint definition
  - intent to treat
  - assess heterogeneity between trials
- Contact with investigators

Limits

- No control over previous work
  - selection bias
  - obsolete staging / treatment
  - inadequate evaluation of toxicity
- Trial exclusion = loss of information
- Individual data not available or complete
- Publication bias fully avoided ?

Essay

Why Most Published Research Findings Are False

John P. A. Ioannidis

Type of research	Power	True/false	Bias	PPV
Good quality RCT	0.80	1:1	0.10	0.85
Meta-analysis of good quality RCTs	0.95	2:1	0.30	0.85
Meta-analysis of small RCTs	0.80	1:3	0.40	0.41
Phase I/II RCT	0.20	1:5	0.20	0.23
Exploratory epidemiological study	0.80	1:10	0.30	0.20
Exploratory with massive testing	0.20	1:1000	0.80	0.001

Ioannidis PLOS Med 2005

Conclusion

- Meta-analyses don’t replace RCTs
- Good data more important than tests
- Beware of zoom effect
- Hypotheses need confirmation

Evidence-based radiotherapy for endometrial cancer

Dr Li Tee Tan

Cambridge University Hospitals NHS
NHS Foundation Trust

Epidemiology

- Most common gynae cancer in western countries
- Confined to the uterus in 75%
  - High risk features in 30%
  - Occult metastatic disease in 15%
- Treatment of choice = surgery

Adjuvant radiotherapy

- Who to treat?
- How to treat?
- What to treat?

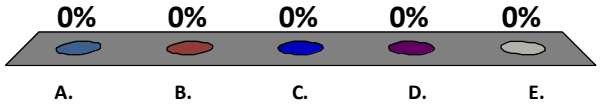
Patient

- Age 55
- LAVH + BSO (no LND) for IbG2 endometrioid ca
- Tumour invades into outer half of myometrium to within 3 mm of serosal surface
- No LVSI

What adjuvant RT would you recommend?

A. None
B. Vault BT
C. Pelvic RT
D. Don't know

- Age 55
- Stage IbG2 (no LND)
- No LVSI



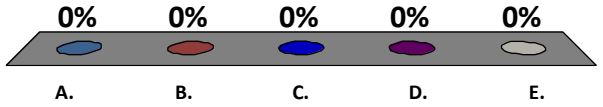
Would your recommendation be different if she was 65 instead of 55?

A. No

B. Yes – recommend more intensive RT

C. Yes – recommend less intensive RT

- Age **65**
- Stage IbG2 (no LND)
- No LVSI



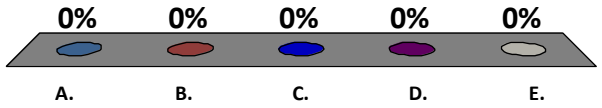
Would your recommendation be different if tumour was G3 instead of G2?

A. No

B. Yes – recommend more intensive RT

C. Yes – recommend less intensive RT

- Age 55
- Stage Ib**G3** (no LND)
- No LVSI

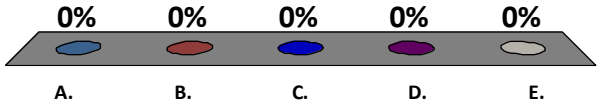


Would your recommendation be different if there was focal LVSI?

A. No

B. Yes

- Age 55
- Stage IbG2 (no LND)
- **Focal** LVSI



FIGO staging 2009

IA	Tumour confined to the uterus, no or < ½ myometrial invasion
IB	Tumour confined to the uterus, > ½ myometrial invasion
II	Cervical stromal invasion, but not beyond uterus
IIIA	Tumour invades serosa or adnexa
IIIB	Vaginal and/or parametrial involvement
IIIC1	Pelvic node involvement
IIIC2	Para-aortic involvement
IVA	Tumour invasion bladder and/or bowel mucosa
IVB	Distant metastases including abdominal metastases and/or inguinal lymph nodes

Adjuvant radiotherapy

- **Who to treat?**
- How to treat?
- What to treat?

PORTEC-1

- Role of RT in Stage I disease (no LND)
- Whole pelvis RT vs. observation
- Inclusion criteria
  - G1, deep (≥50%) invasion (2009 Ib)
  - G2, superficial or deep invasion (2009 Ia + Ib)
  - G3, superficial (<50%) invasion (2009 Ia)

Creutzberg CL, et al. Lancet. 2000 22;355(9213):1404-11

PORTEC-1 results

	RT	Control	*p* value
Local recurrence	4%	14%	<0.001

RT recommended only if two adverse features present: age ≥ 60, deep myometrial invasion, G3.

Other RCTs

Trial	No of pts.	Surgery	Randomization	Local recurrence	Survival
Portec 1	714	TAH-BSO	Obs	14%	85%
2000	Stage IB, G2-3		EBRT	4%	81%
	Stage IC, G1-2			(p<.001)	(n.s.)
GOG-99	392	TAH-BSO &	Obs	12%	86%
2004	Stage IB, IC, IIA	LA	EBRT	3%	92%
				(p<.01)	(n.s.)
ASTEC/EN.5	789	TAH-BSO	Obs	6% (BT50%)	84%
2009	Stage IAB G3	LA optional	EBRT	3% (BT50%)	84%
	Stage IC	(30%)		(p<0.02)	(n.s.)

Adjuvant radiotherapy

- Who to treat?
- **How to treat?**
- What to treat?

PORTEC-2

- Type of RT
- Vaginal BT vs. whole pelvis RT
- Inclusion criteria
  - 1C (deep invasion), G1 or 2, age ≥ 60 (Ib)
  - 1B (superficial invasion), G3 and age ≥ 60 (Ib)
  - 2A, any age, G1 or 2, deep or superficial invasion (Ia + Ib)
  - 2A, any age, G3, superficial invasion (Ia)

Nout RA, et al. Lancet. 2010 6;375(9717):816-23

PORTEC-2 results

	VBT	EBRT	*p* value
Vaginal recurrence	1.8%	1.6%	0.74
Pelvic recurrence	5.1%	2.1%	0.17
Acute GI toxicity	12.6%	53.8%	

VBT is adjuvant treatment of choice for patients with "high-intermediate risk" endometrial Ca

ESMO-ESGO-ESTRO recommendations 2015

4 risk groups

Risk group	Histology	Adjuvant treatment
Low	Ia, G1-2, LVSI -ve	None

Colombo N. Radiother Oncol. 2015;117(3):559-81

ESMO-ESGO-ESTRO recommendations 2015

4 risk groups

Risk group	Histology	Adjuvant treatment
Low	Ia, G1-2, LVSI -ve	None
Intermediate	Ib, G1-2, LVSI -ve	BT or none if <60

Colombo N. Radiother Oncol. 2015;117(3):559-81

ESMO-ESGO-ESTRO recommendations 2015

4 risk groups

Risk group	Histology	Adjuvant treatment	
Low	Ia, G1-2, LVSI -ve	None	
Intermediate	Ib, G1-2, LVSI -ve	BT or none if <60	
		With LND	No LND
High-intermediate	Ib, G1-2, LVSI +ve Ia, G3	BT or none	BT if G3 and LVSI - EBRT if LVSI+

LVSI must be unequivocally positive (not focal)

Colombo N. Radiother Oncol. 2015;117(3):559-81

ESMO-ESGO-ESTRO recommendations 2015

4 risk groups

Risk group	Histology	Adjuvant treatment	
		With LND	No LND
High	Ib G3	EBRT or BT	EBRT (+ chemo)
	II G1-2, LVSI -ve II G3 or LVSI +ve	BT EBRT	EBRT EBRT (+ chemo)
	III	EBRT (+ chemo)	

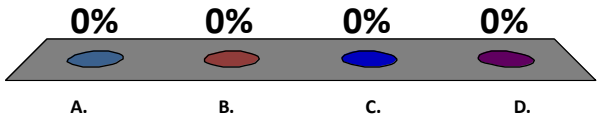
Colombo N. Radiother Oncol. 2015;117(3):559-81

Adjuvant radiotherapy

- Who to treat?
- How to treat?
- **What to treat?**

What is your standard superior border for adjuvant EBRT for endometrial cancer?

A. L5/S1 junction
B. L4/L5 junction
C. Common iliac bifurcation
D. Aortic bifurcation



RTOG consensus guidelines

- “CTV should include the common, external, and internal iliac lymph node regions”
- “Common iliac lymph nodes from 7 mm below L4–L5 interspace”

Small W Jr. Int J Radiat Oncol Biol Phys. 2008;71(2):428-34

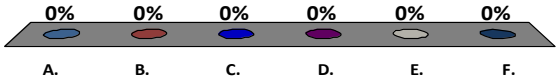
Gynecologic Cancer Intergroup

- Upper border of pelvic field
  - L4/5 = 14
  - L5/S1 = 13
  - Not specified = 6
- Cambridge = L5/S1
  - Common iliac node recurrence rare
  - No survival benefit, limit toxicity

Small W, et al. Int J Gynecol Cancer. 2009;19(3):395-9

What is your treatment length for adjuvant vault brachytherapy?

A. Top 2 cm
B. Top 3 cm
C. Top 4 cm
D. Upper third
E. Upper half
F. Other



Gynecologic Cancer Intergroup

TABLE 5. How much of the vagina do you most often treat?

Response	%
Whole vagina	4.0
Upper one third	28.0
Upper one half	12.0
Upper two thirds	16.0
3.0 cm	16.0
4.0 cm	16.0
5.0 cm	4.0
7.0 cm	4.0

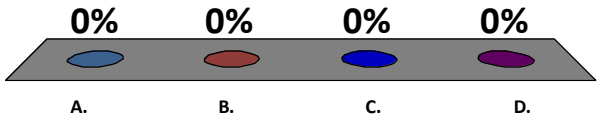
Cambridge: treat top 2 cm only (PORTEC-3 = 2-3 cm)

Local recurrence 2007-2012 = 4.5% (PORTEC-1 = 4%)

Small W, et al. Int J Gynecol Cancer. 2009;19(3):395-9

Where do you prescribe the dose for adjuvant vault brachytherapy?

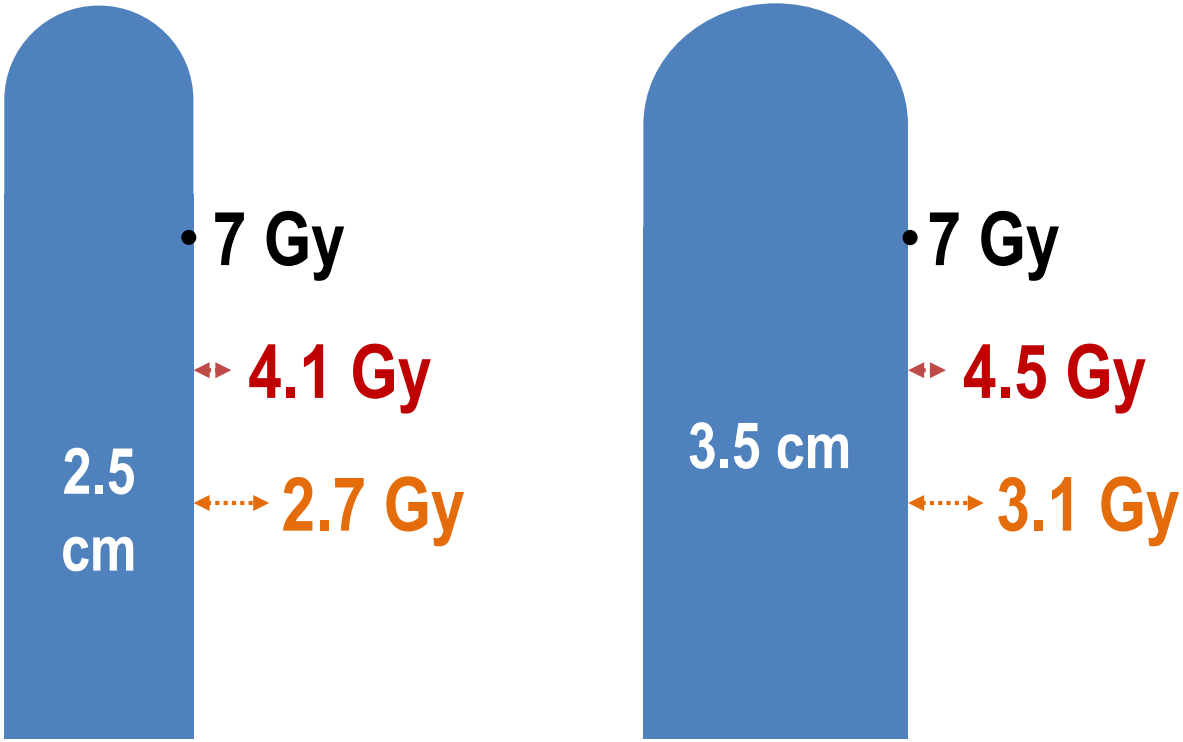
A. Surface of applicator
B. 0.5 cm depth
C. 1 cm depth
D. Other



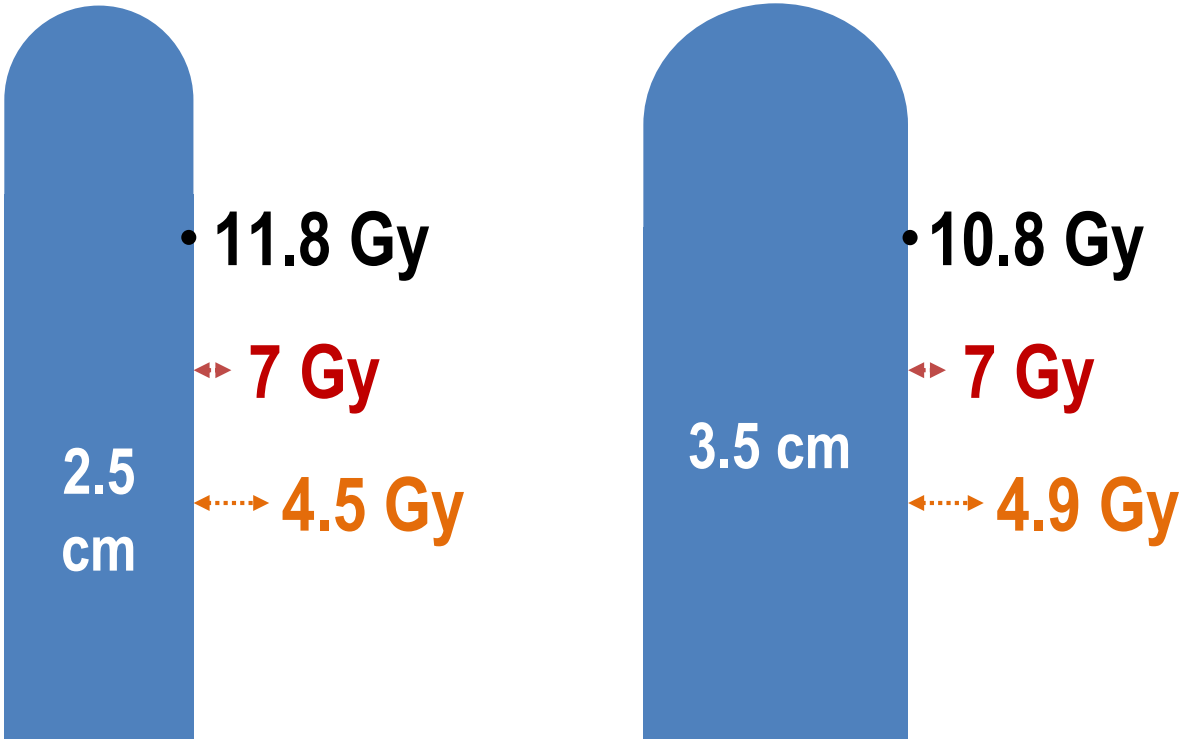
Published schedules for BT alone

Dose/#	Publication	Prescription
7 Gy x 3	Nout *et al*, Lancet 2010 (PORTEC-2)	5 mm
7 Gy x 3	Small *et al*, IJROBP 2005 (ABS)	5 mm
5.5 Gy x 4	Chong & Hoskin, Brachytherapy 2008 (UK)	5 mm
5.5 Gy x 5	Atahan *et al*, Int J Gynecol Cancer 2008 (Turkey)	5 mm
16.2 Gy x 2	Petereit *et al*. Int J Gynecol Cancer 1999 (USA)	0 mm
6 Gy x 6	Ng *et al*, Gynecol Oncol 2000 (Australia)	0 mm

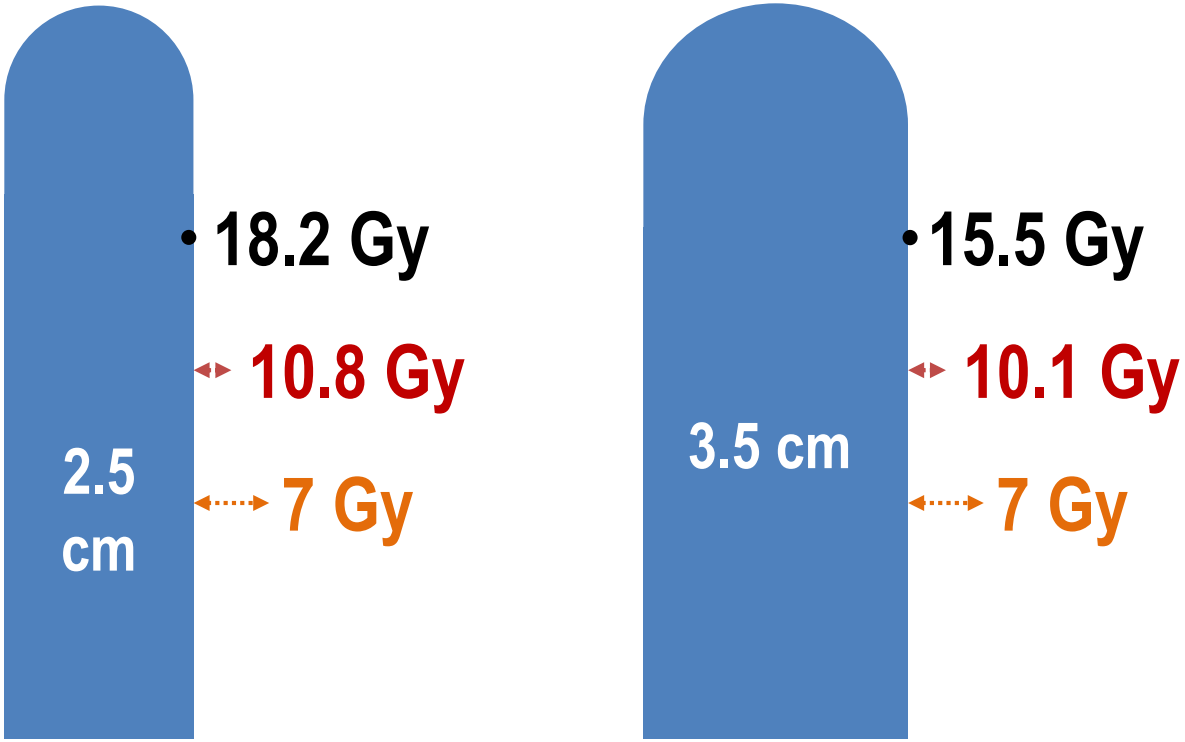
Prescription point



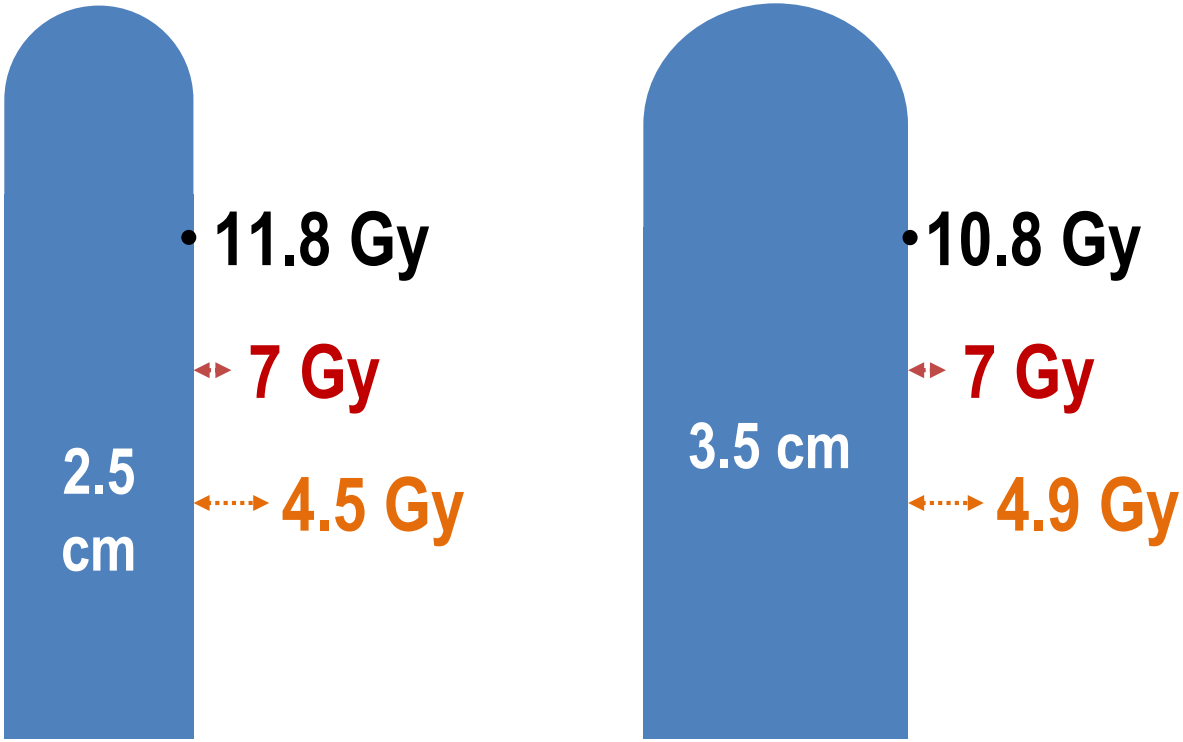
Prescription point



Prescription point



Prescription point

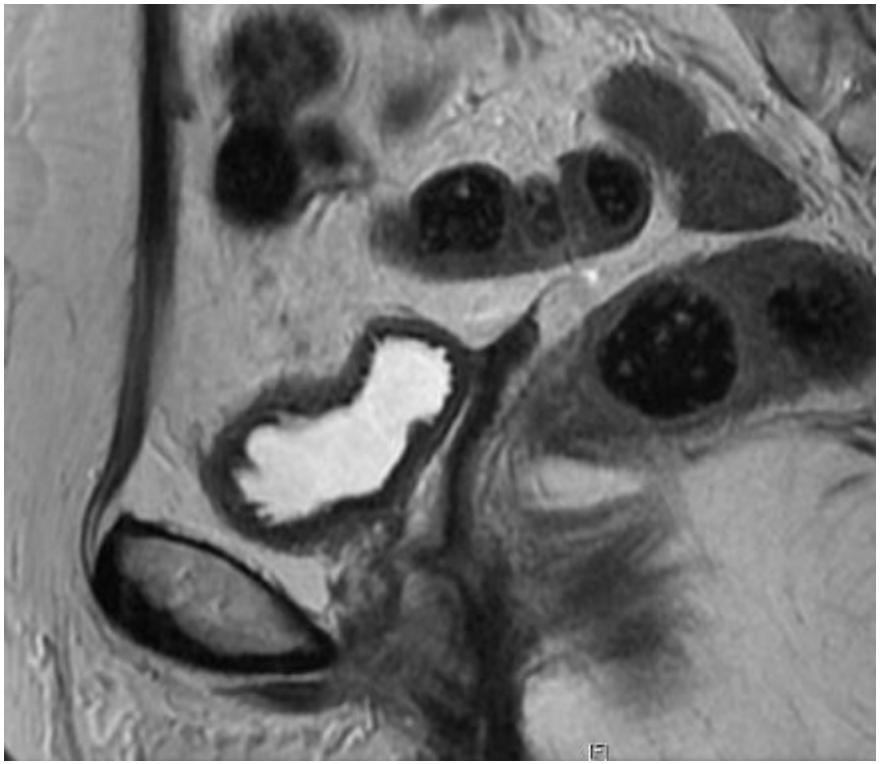


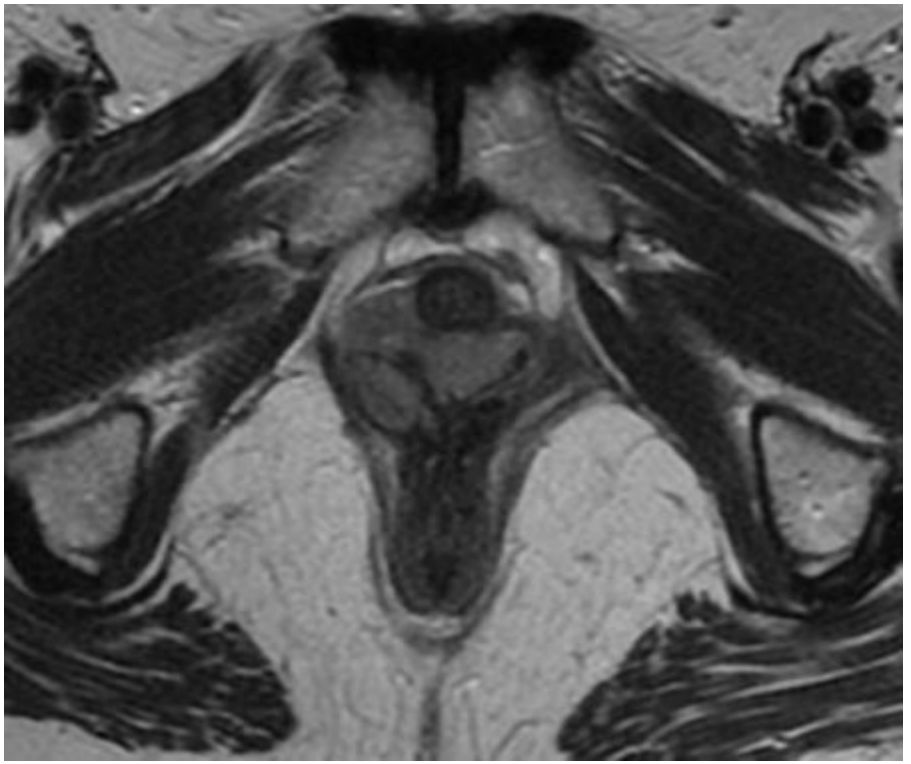
Vaginal wall is ~5 mm thick (ICRU rectal point)

Patient

- Age 55
- LAVH + BSO for IbG2 endometrioid ca
  - Tumour invades into outer half of myometrium to within 3 mm of serosal surface
  - No LVSI
- No post-operative RT
- Isolated vaginal recurrence at 12 months

Patient

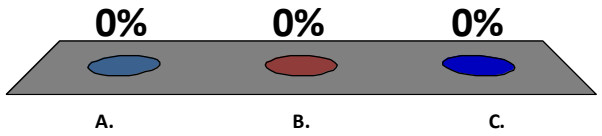




What treatment would you recommend for recurrence?

A. Surgery
B. Radiotherapy
C. Chemotherapy

- Age 55
- Stage IbG2
- No LVSI
- No post-op RT

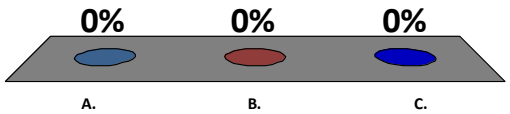


What local control rate would you expect after salvage RT for vault recurrence?

A. 20%

B. 50%

C. 80%

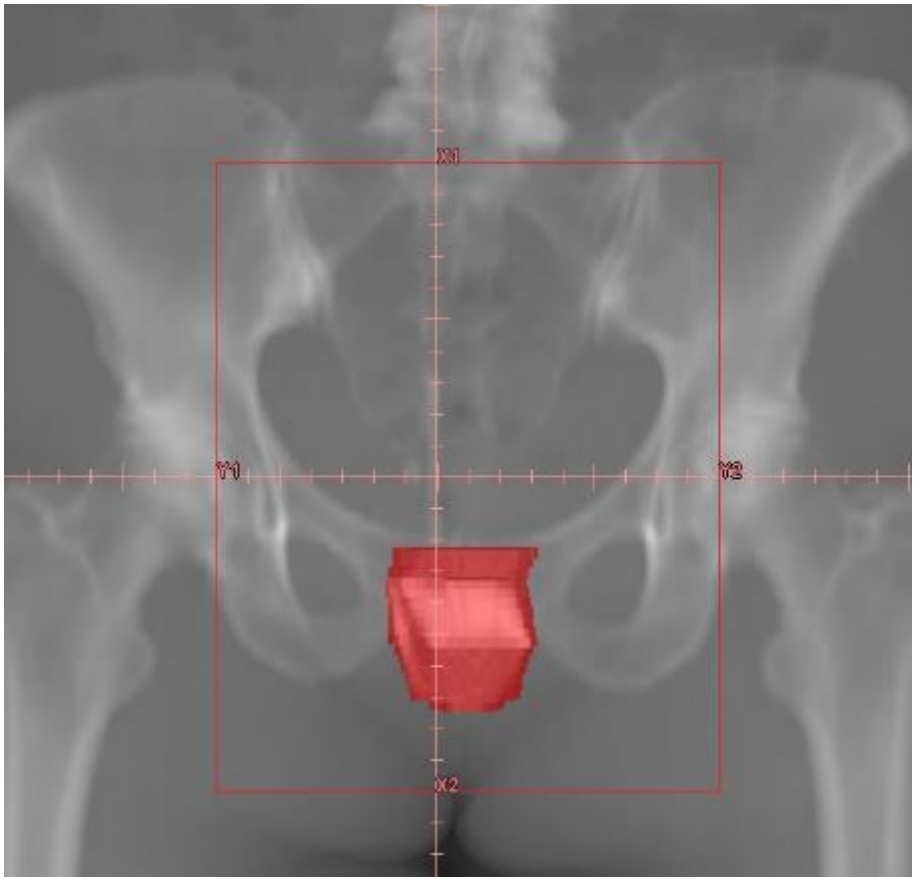


Vault recurrence

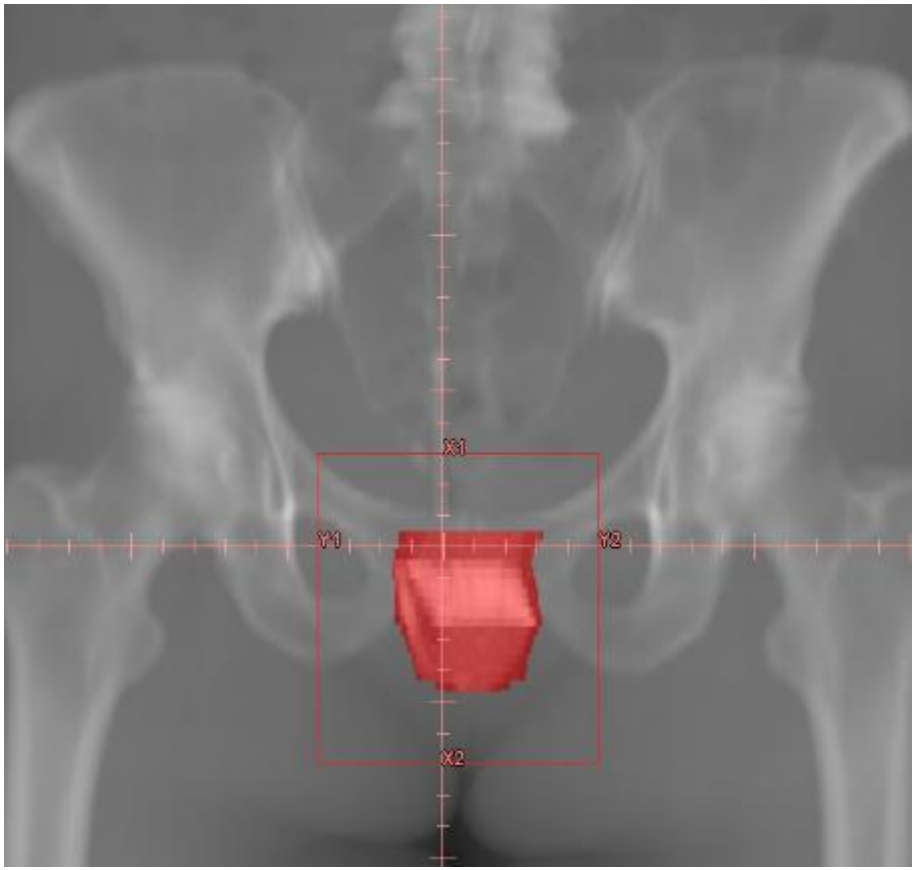
- Danish Endometrial Cancer Study
  - 1166 patients, surgery alone
  - Vaginal recurrence: low risk 6.3%, intermediate risk 22%
  - **Curative treatment: 100% CR, 74% cured**
- Must give sufficient dose (>65 Gy)
  - EBRT boost
  - Interstitial boost
  - IMRT

Ørtoft G, et al. Int J Gynecol Cancer. 2013; 23(8):1429-37

Patient

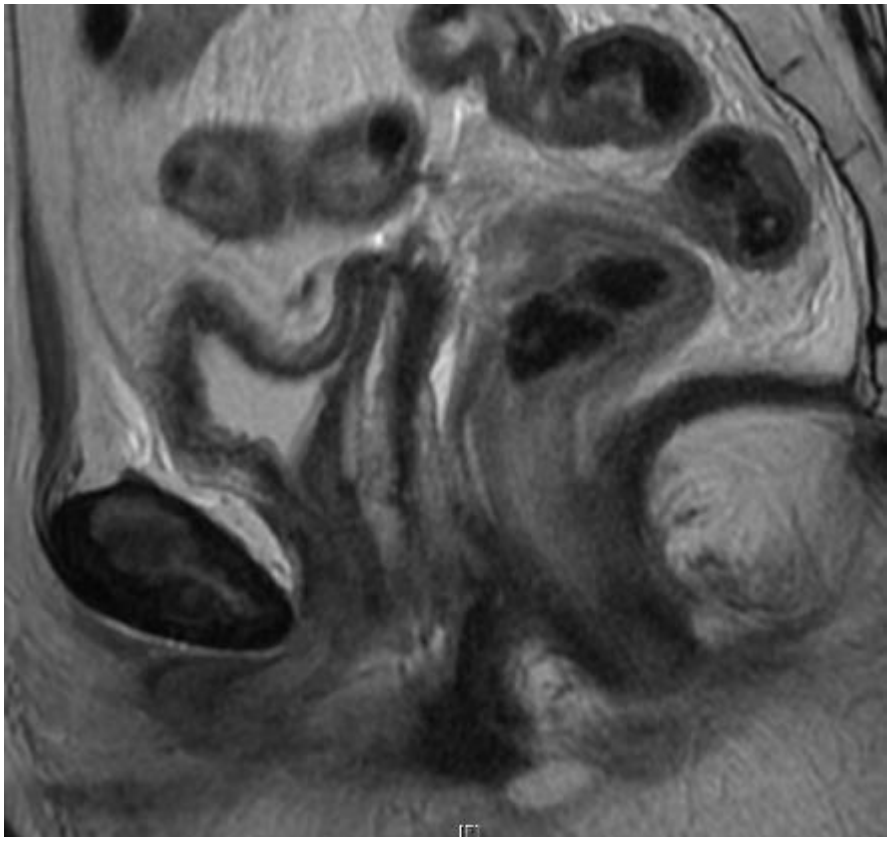


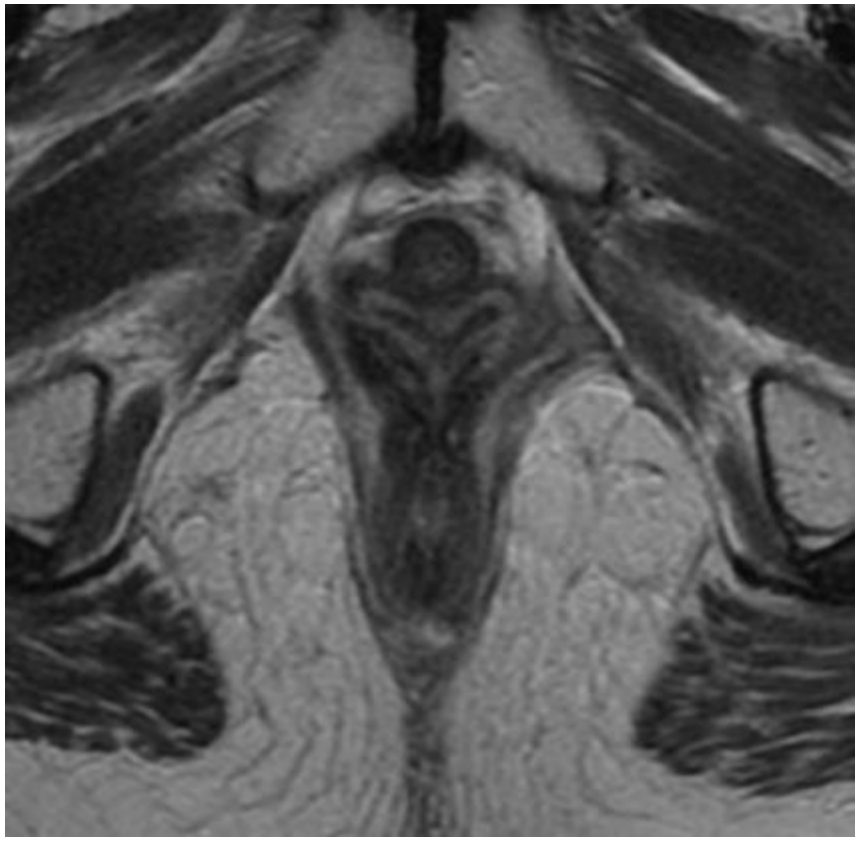
45Gy in 25#



20Gy in 10#

Patient





ESMO-ESGO-ESTRO recommendations 2015

- RT with curative intent is indicated in patients with isolated vaginal relapse after surgery.
- Use of systemic therapy or surgery before RT for vaginal or pelvic node recurrence could be considered in certain patients with more bulky disease.

Colombo N. Radiother Oncol. 2015;117(3):559-81

Evidence-based radiotherapy for cervix cancer

Dr Li Tee Tan

Cambridge University Hospitals NHS
NHS Foundation Trust

Grades of recommendation

Grades of recommendations	
A	At least one meta-analysis, systematic review or clinical trial classified as 1++ and directly applicable to the target population of the guideline, or a volume of scientific evidence comprising studies classified as 1+ and which are highly consistent with each other.
B	A body of scientific evidence comprising studies classified as 2++, directly applicable to the target population of the guideline and highly consistent with each other, or scientific evidence extrapolated from studies classified as 1++ or 1+.
C	A body of scientific evidence comprising studies classified as 2+, directly applicable to the target population of the guideline and highly consistent with each other, or scientific evidence extrapolated from studies classified as 2++.
D	Level 3 or 4 scientific evidence, or scientific evidence extrapolated from studies classified as 2+.

Due to their high risk of bias, studies classified as 1- or 2- should not be used in compiling recommendations

Good Clinical Practice

√[1]	Practice recommended on the basis of clinical experience and consensus by the drafting team

Outline

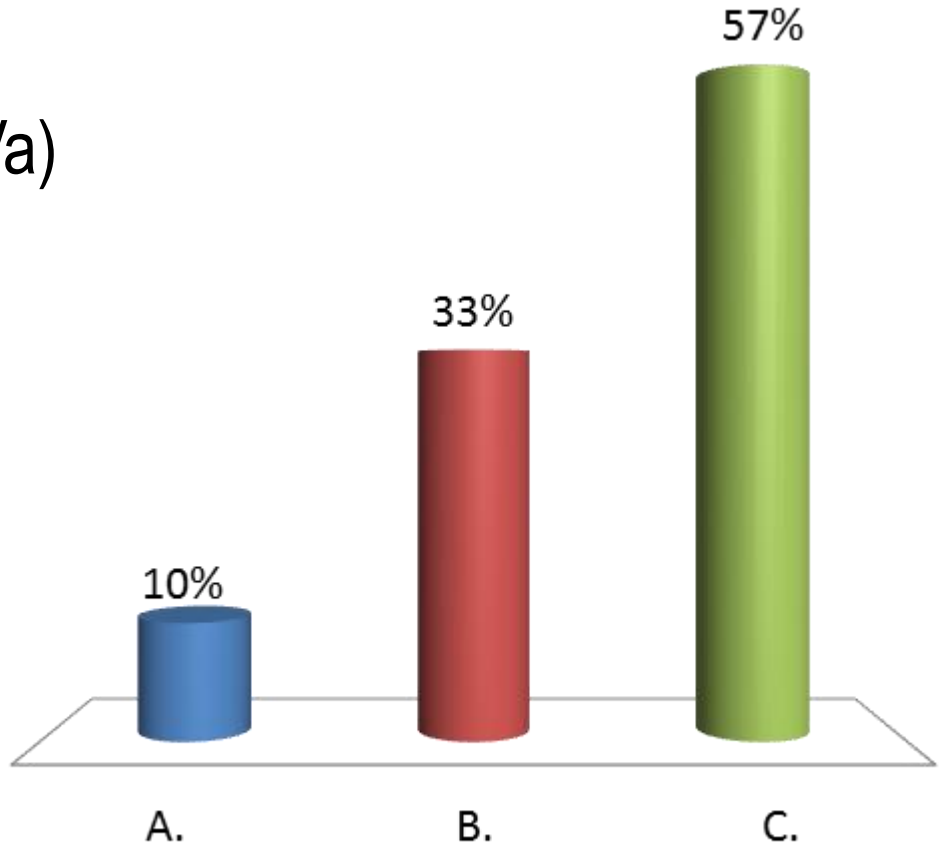
  - **Which stage?**
  - What volume?
  - What technique?
  - What dose?
- Brachytherapy
- Chemotherapy
- Surgery

For which disease stage would you recommend radiotherapy as curative treatment?

A. Early stage (Ib1, IIa)
B. Advanced stage (Ib2, IIb-IVa)
C. Both



Early stage disease

- Level Ib evidence
- Randomised study of radical surgery versus radiotherapy for stage Ib-IIa cervical cancer
  - 469 women
  - Post-op RT if pT2b or greater, <3 mm uninvolved cervical stroma, involved margin, positive nodes
- Results
  - No difference in OS (84% both groups)
  - More morbidity with surgery (28% vs.12%, p = 0·0004)

Landoni F, et al. Lancet. 1997;350(9077):535-40.

Advanced stage disease

- Level II evidence

	II		III		IVA	
	S	LC	S	LC	S	LC
FIGO 1987-1989	66%		39%		11%	
PCS 1973	57%		47%			
M.D. Anderson 1975	65%	82%	40%	67%		
Washington University	68%	84%	45%	63%		
French Co-operative Study	76%	80%	50%	57%

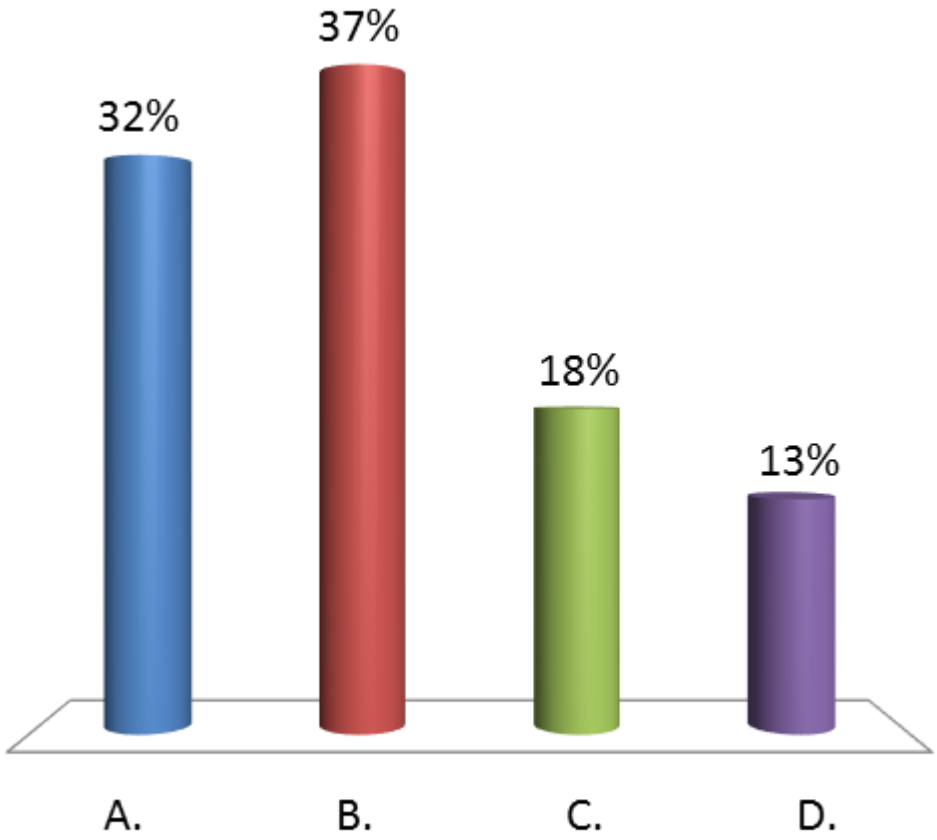
- **Radiotherapy**
  - Which stage?
  - **What volume?**
  - What technique?
  - What dose?
- Brachytherapy
- Chemotherapy
- Surgery

Where is your standard superior border for EBRT for node-negative cervix cancer?

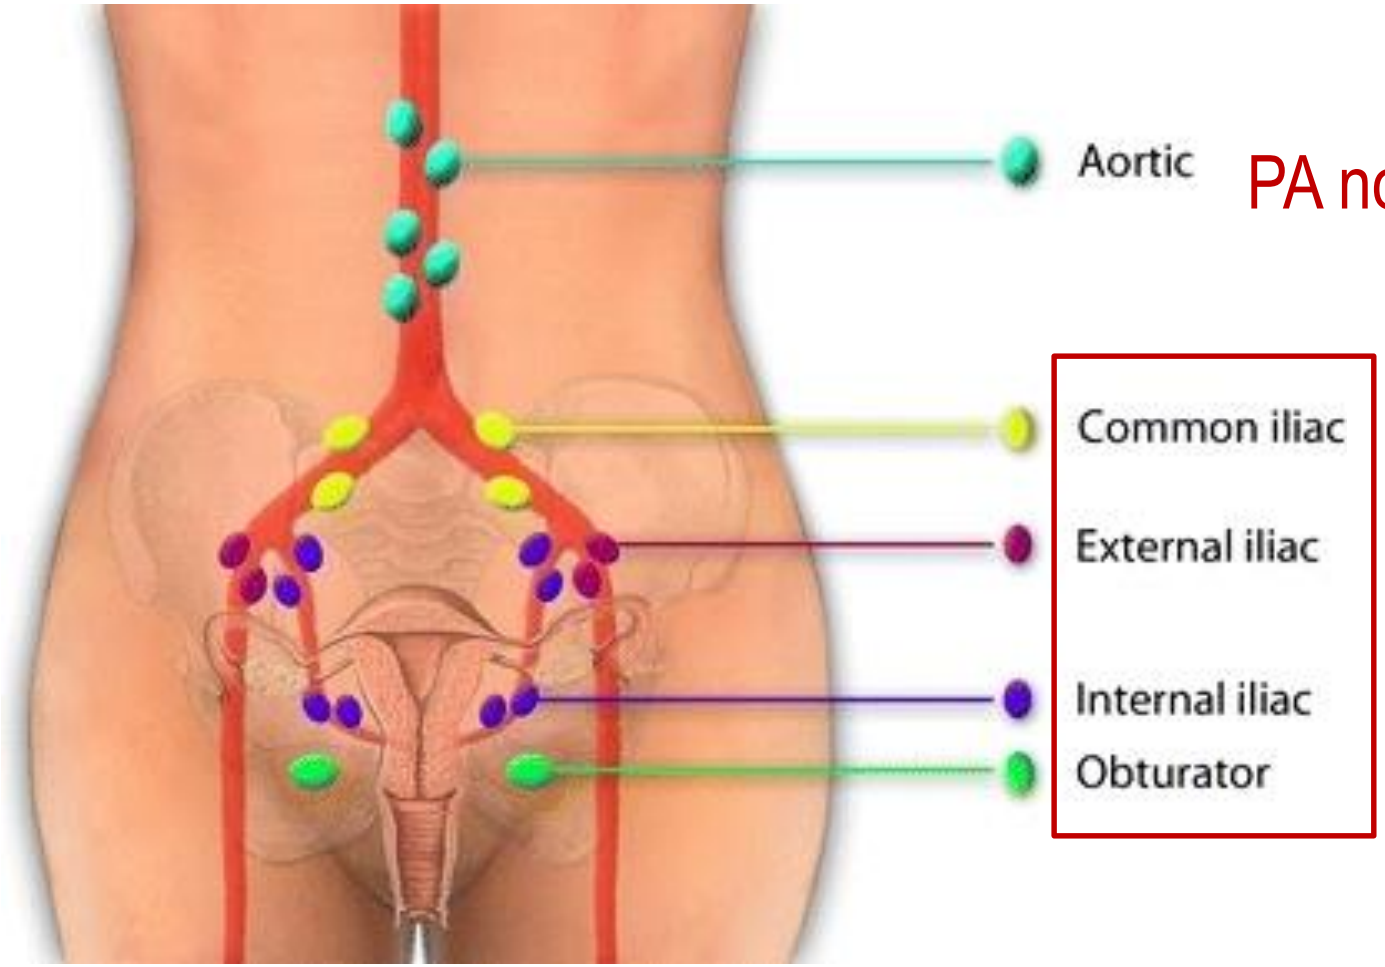
A. L5/S1 junction
B. L4/L5 junction
C. Inferior to L5/S1 junction (individualised)
D. Superior to L4/L5 junction (individualised)



Target volume

- Primary tumour (GTV-T)
- Pathological nodes (GTV-N)
- Elective volume (CTV-E)
  - Uterus
  - Parametria
  - Vagina (2 cm below GTV-T)
  - Regional nodes

Regional nodes

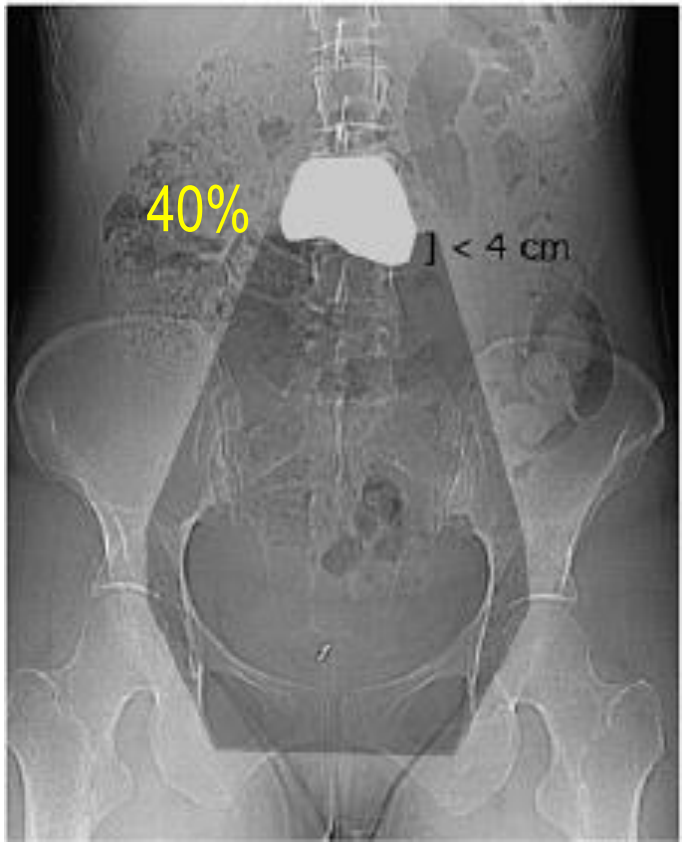


TNM

PA nodes = M1

Patterns of regional failure

- MD Anderson 1980-2000 (1894 patients)
  - 198 regional (no central) recurrences (33% distant mets)

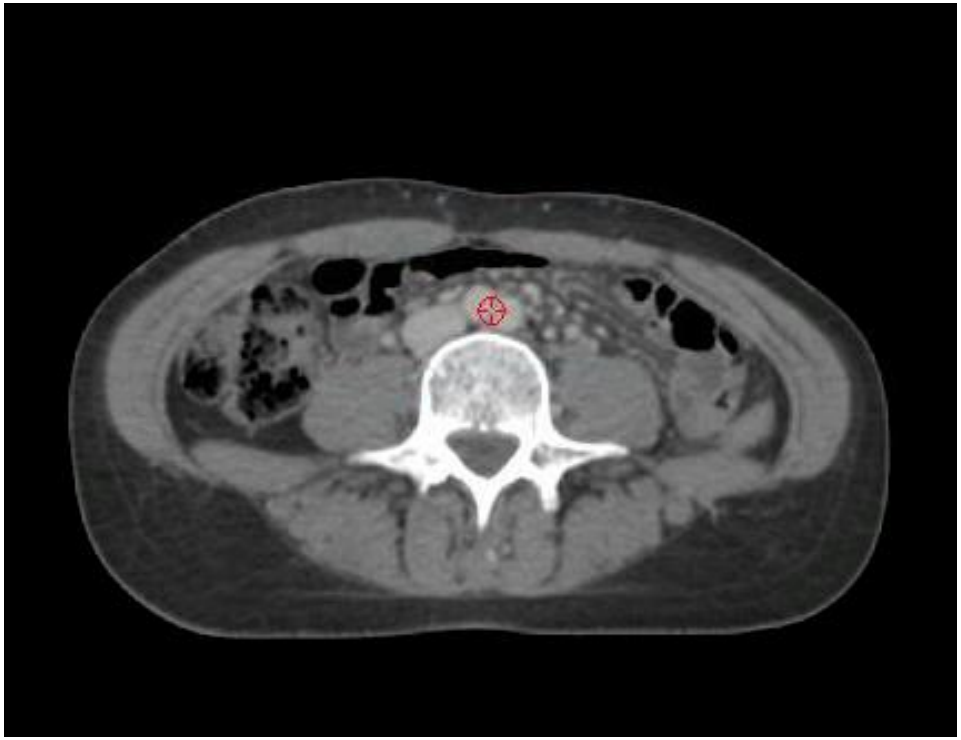


Beadle BM, et al. Int J Radiat Oncol Biol Phys. 2010;76(5):1396-403

Nodal delineation - common iliac

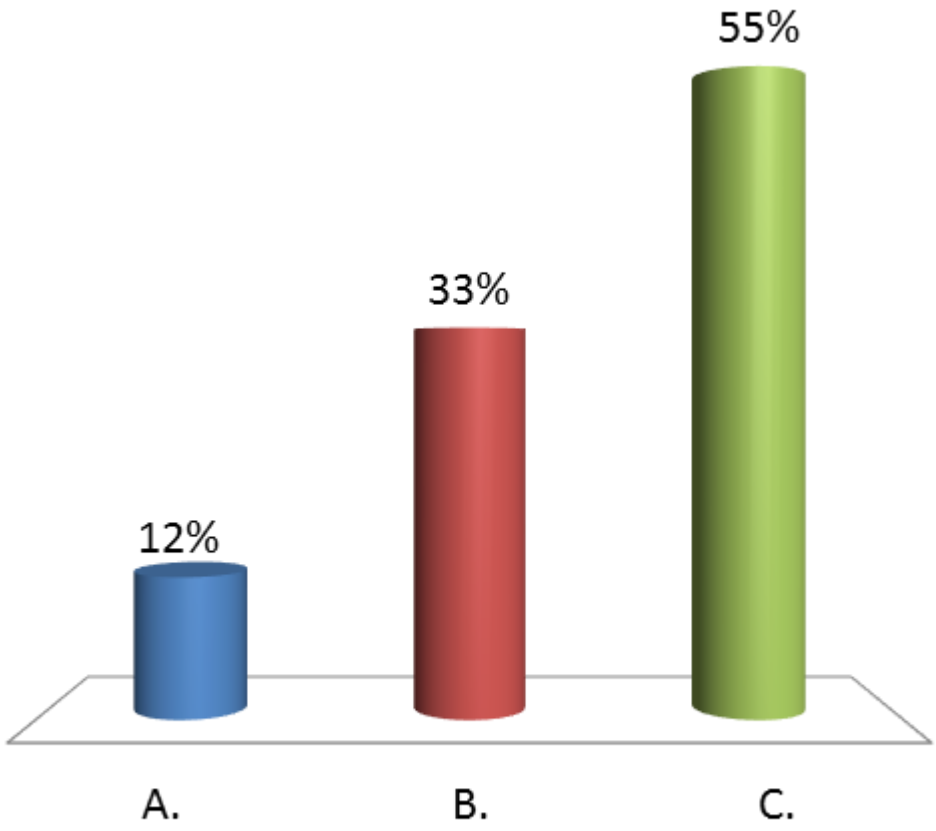
- Taylor A, *et al*. IJROBP, 2005;63:1604–12
  - 7 mm margin round vessels
  - Bifurcation of aorta
  - Extend posterior and lateral borders to psoas and vertebral body
- Small W, *et al*. IJROBP 2008;71:428-434 (RTOG)
  - From 7 mm below L4/5 interspace to bifurcation of common iliac arteries

Nodal delineation - common iliac



Are paraaortic node metastases in cervical cancer curable?

A. No
B. Yes, if microscopic
C. Yes, microscopic and macroscopic



PA node irradiation - macroscopic disease

- Level II evidence
- RTOG 92-10
  - 30 patients, Stage I-IV + biopsy-proven PA nodes
  - Hyperfractionated (bd) EBRT + cisplatin/5FU
- Results
  - 4-year OS 29% (median FU = 57 months)

Grigsby PW, et al. Int J Radiat Oncol Biol Phys. 2001;51(4):982-7

PA node irradiation - prophylactic

- Level Ib evidence
- RTOG 79-20
  - 367 patients, Ib2, IIa (> 4 cm), IIb
  - Pelvis vs. pelvis + PA (40-50 Gy, no chemo)
- Results
  - 10-year OS 44% vs. 55% (p = 0.02)

Rotman M, et al. JAMA. 1995;274(5):387-93

PA node irradiation - prophylactic

- 441 patients
  - I-IIb proximal + positive LN, all IIb distal or III
  - Pelvis vs. pelvis + PA (45 Gy)
- Results
  - No significant difference in local control, OS, DFS
    Significantly higher incidence of PA metastases + distant metastases without local recurrence in pelvic RT group
- Patients with high probability of local control can benefit from EFRT

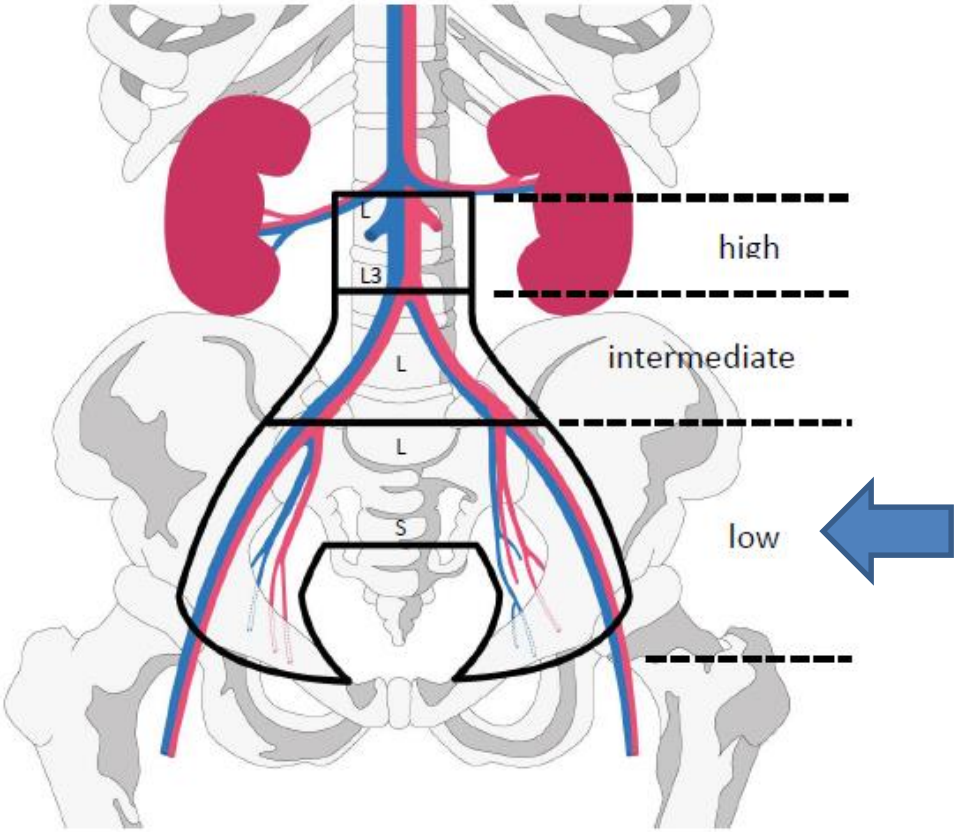
Haie C, et al. Radiother Oncol. 1988 Feb;11(2):101-12

Prophylactic extended field RT

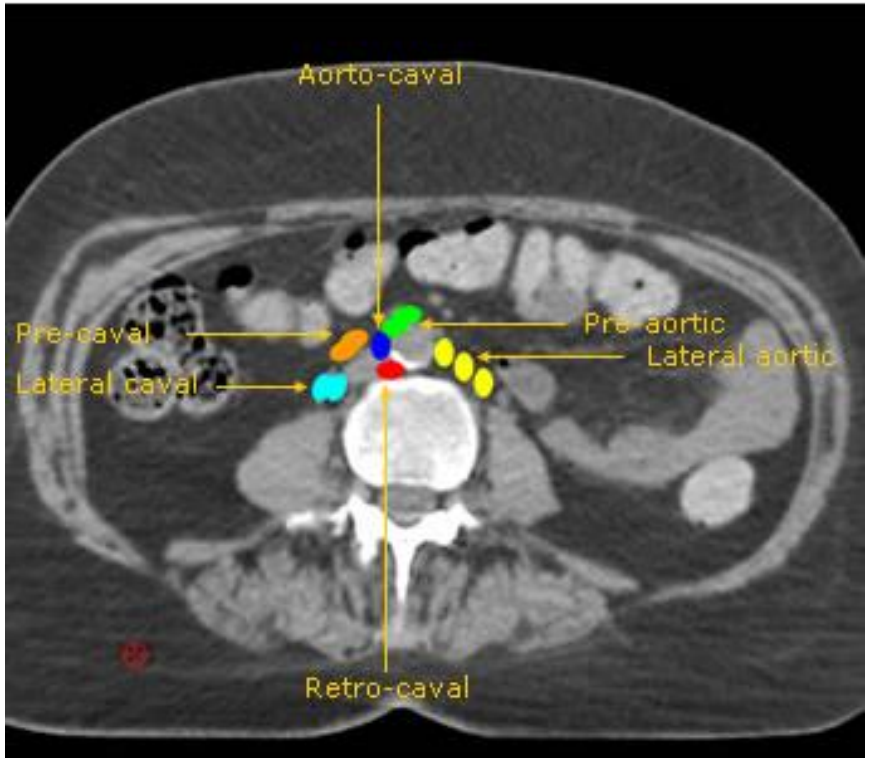
- Which patients?
  - PET-CT (sensitivity 84%, specificity 95%)
  - RPLND
- EMBRACE II criteria
  - Common iliac node or ≥ 3 pelvic nodes
  - Treat to renal vein (PA nodes above renal vessels incurable)

EMBRACE II EBRT CTV

Risk Group LN	Definition
Low Risk (LR LN)	Tumour size ≤4cm AND stage IA/IB1/IIA1 AND N0 AND squamous cell carcinoma AND no uterine invasion
Intermediate Risk (IR LN)	Not low risk No high risk features
High Risk (HR LN)	Based on nodal pathology • ≥ 1 pathologic node at common iliac or above • OR ≥ 3 pathologic nodes

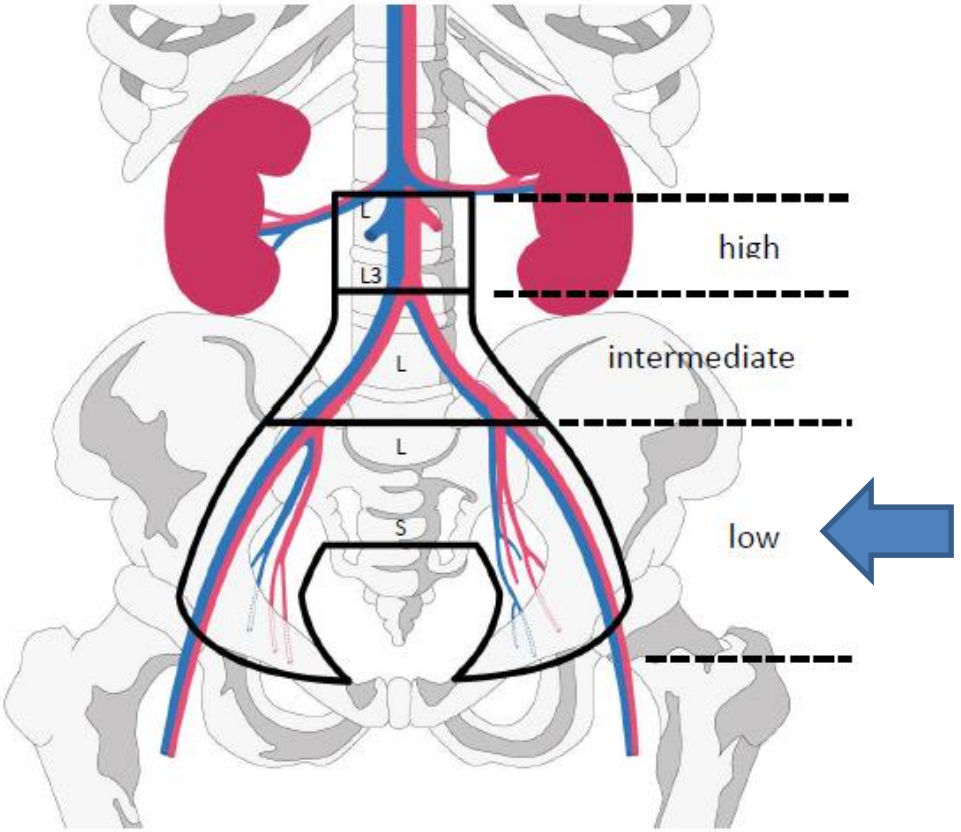


PA node irradiation - contouring



EMBRACE II EBRT CTV

Risk Group LN	Definition
Low Risk (LR LN)	Tumour size ≤4cm AND stage IA/IB1/IIA1 AND N0 AND squamous cell carcinoma AND no uterine invasion
Intermediate Risk (IR LN)	Not low risk No high risk features
High Risk (HR LN)	Based on nodal pathology • ≥ 1 pathologic node at common iliac or above • OR ≥ 3 pathologic nodes



Do you think that decreasing the CTV for low risk tumours is “experimental”?

A. Yes

B. No

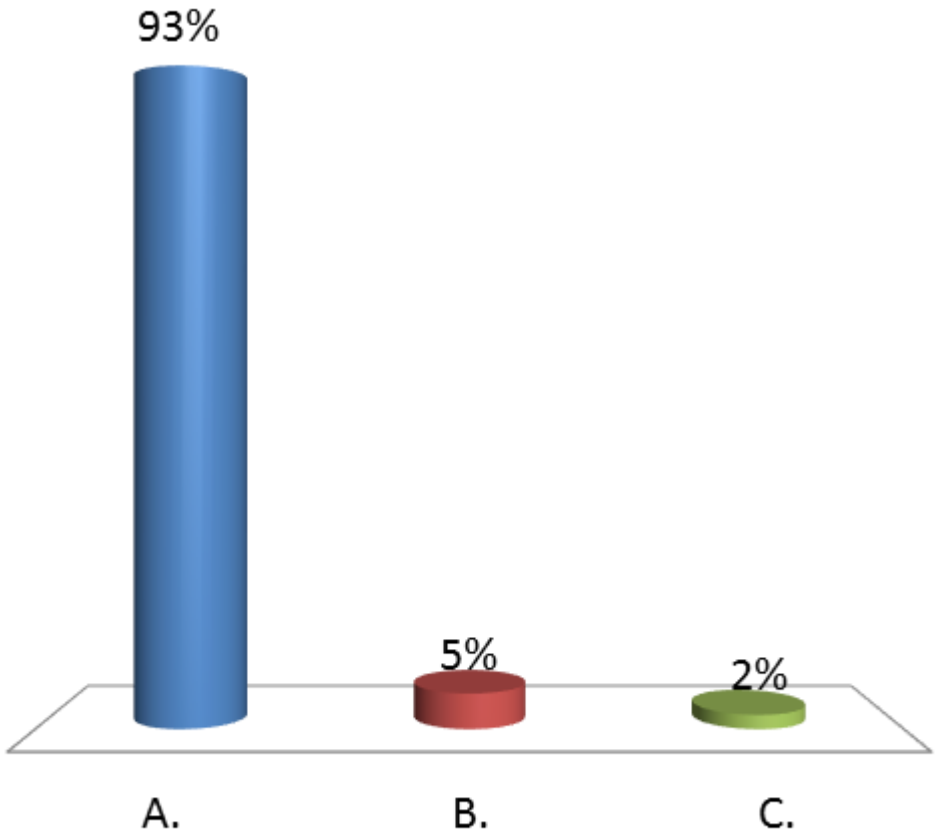
Do you routinely give concomitant chemotherapy with radiotherapy for cervix cancer?

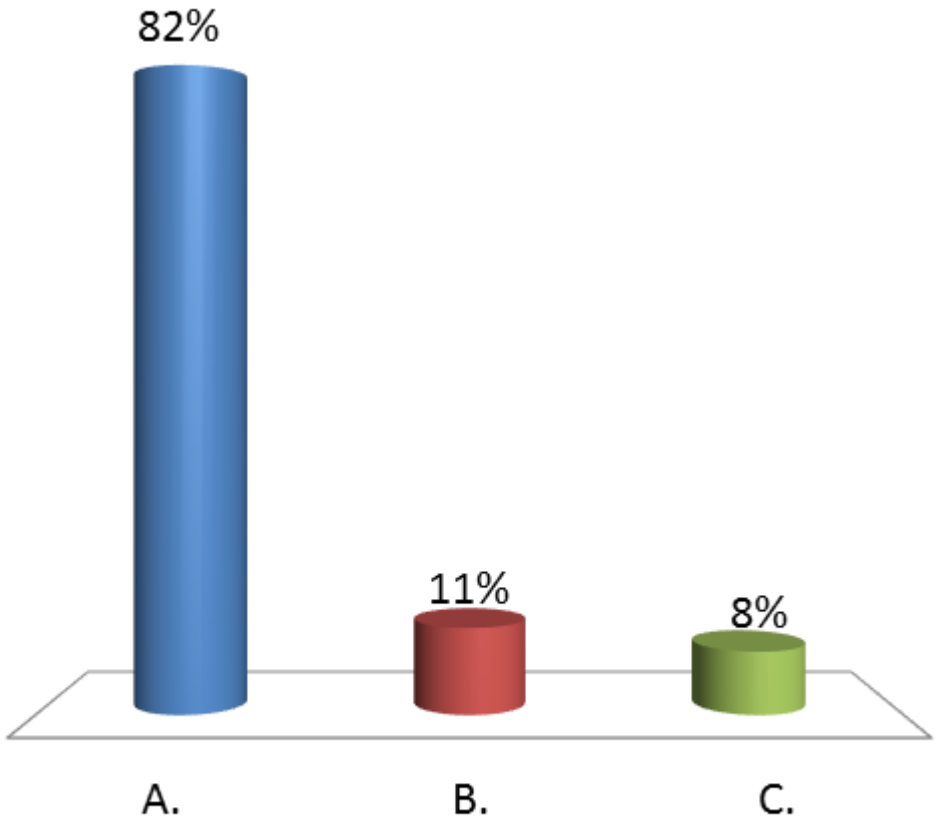
A. Yes
B. No
C. Don't treat cervix cancer



0

Which concomitant chemotherapy regimen is used at your centre?

A. Weekly cisplatin only
B. Weekly cisplatin and cisplatin-5FU
C. Both platinum and non-platinum regimens



Which FIGO stage would you treat with concomitant chemo-RT?

A. All stages
B. Not Ib1 patients
C. Not IIIb or IVa patients

Pearcey 2002	Pelvic RT ± Cisplatin 40 mg/m^2, 259 pat, ns for OS/LC

Meta-analyses

- **2001 (2005)**

  Survival and recurrence after concomitant chemotherapy and radiotherapy for cancer of the uterine cervix: a systematic review and meta-analysis.

  *Lancet 2001;**358**:781–6*

- **2002**

  Concurrent cisplatin-based chemotherapy plus radiotherapy for cervical cancer--a meta-analysis.

  *Clin Oncol (R Coll Radiol). 2002;**14**:203-12*

- **2008**

  Chemoradiotherapy for Cervical Cancer Meta-Analysis Collaboration. Reducing uncertainties about the effects of chemoradiotherapy for cervical cancer: a systematic review and meta-analysis of individual patient data from 18 randomised trials.

  J Clin Oncol. 2008;26:5802-12

Conclusion 1

- Addition of chemotherapy to radiotherapy significantly improves 5-year survival

5-year survival

Metaanalysis	Trials	Patients	Increase	HR	*p* value
2001 (2005)	24	4921	10% (7 to 13%)	0.69 (0.61 to 0.77)	<0.00001
2002	8	1065		0.74 (0.64 to 0.86)	0.00006
2008	13	3104	6%	0.81 (0.71 to 0.91)	0.0006

Conclusion 2

- Significant survival benefit for both
  - Platinum-based
  - Non-platinum based

Trial ID	CTRT events	CTRT pts.	Control events	Control pts.	O-E	Variance

Evidence-based radiotherapy for vulva cancer

Dr Li Tee Tan

Cambridge University Hospitals NHS
NHS Foundation Trust

Epidemiology

- Rare - 3-5% of gynae cancers
- Squamous cell carcinoma in 85-90%
- Elderly patients

Evidence- based RT

A	At least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or A body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results
B	A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results; or Extrapolated evidence from studies rated as 1++ or 1+
C	A body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or Extrapolated evidence from studies rated as 2++
D	Evidence level 3 or 4; or Extrapolated evidence from studies rated as 2+
✓	Recommended best practice based on the clinical experience of the guideline development group

FIGO Staging 2009

IA	≤ 2 cm in size with stromal invasion ≤ 1 mm, negative nodes
IB	> 2 cm in size or with stromal invasion > 1 mm, negative nodes
II	Spread to lower 1/3 urethra, lower 1/3 vagina, anus, negative nodes
III	Positive inguino-femoral lymph nodes
IIIA(i)	1 lymph node metastasis ≥ 5 mm
IIIA(ii)	1-2 lymph node metastasis(es) < 5 mm
IIIB(i)	2 or more lymph nodes metastases ≥ 5 mm
IIIB(ii)	3 or more lymph nodes metastases < 5 mm
IIIC	Positive node(s) with extracapsular spread
IVA(i)	Invades upper 2/3 urethra, upper 2/3, bladder mucosa, rectal mucosa, or fixed to pelvic bone
IVA(ii)	Fixed or ulcerated inguino-femoral lymph nodes
IVB	Any distant metastasis including pelvic lymph nodes

Role of radiotherapy

- Post-operative
- Pre-operative

Post-operative radiotherapy

- Aims
  - Reduce local recurrence
  - Reduce regional recurrence
  - Improve survival
- Questions
  - Does it work?
  - Can it replace groin surgery?
  - Does adding chemotherapy help?

Reduce local recurrence

- 135 patients (observational study)
  - Stage I-II = 110
  - Stage III-IV = 25

Table 14–6. CORRELATION OF SURGICAL MARGIN WITH LOCAL RECURRENCE FOLLOWING SURGICAL THERAPY OF VULVAR CANCER

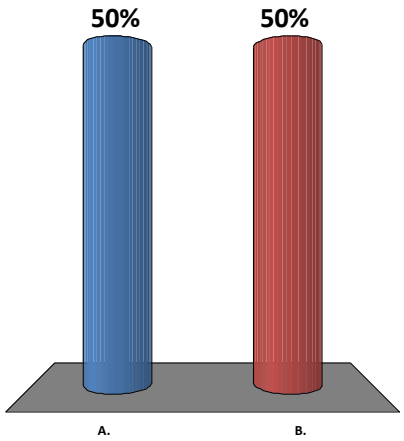
	Surgical Margin < 8 mm (N = 44)	Surgical Margin ≥ 8 mm (N = 91)
Local recurrence	21/44 (48%)	0/91

Heaps JM, et al. Gynecol Oncol. 1990;38(3):309-14

Would you offer post-op RT if margin is <8mm and further excision is not possible?

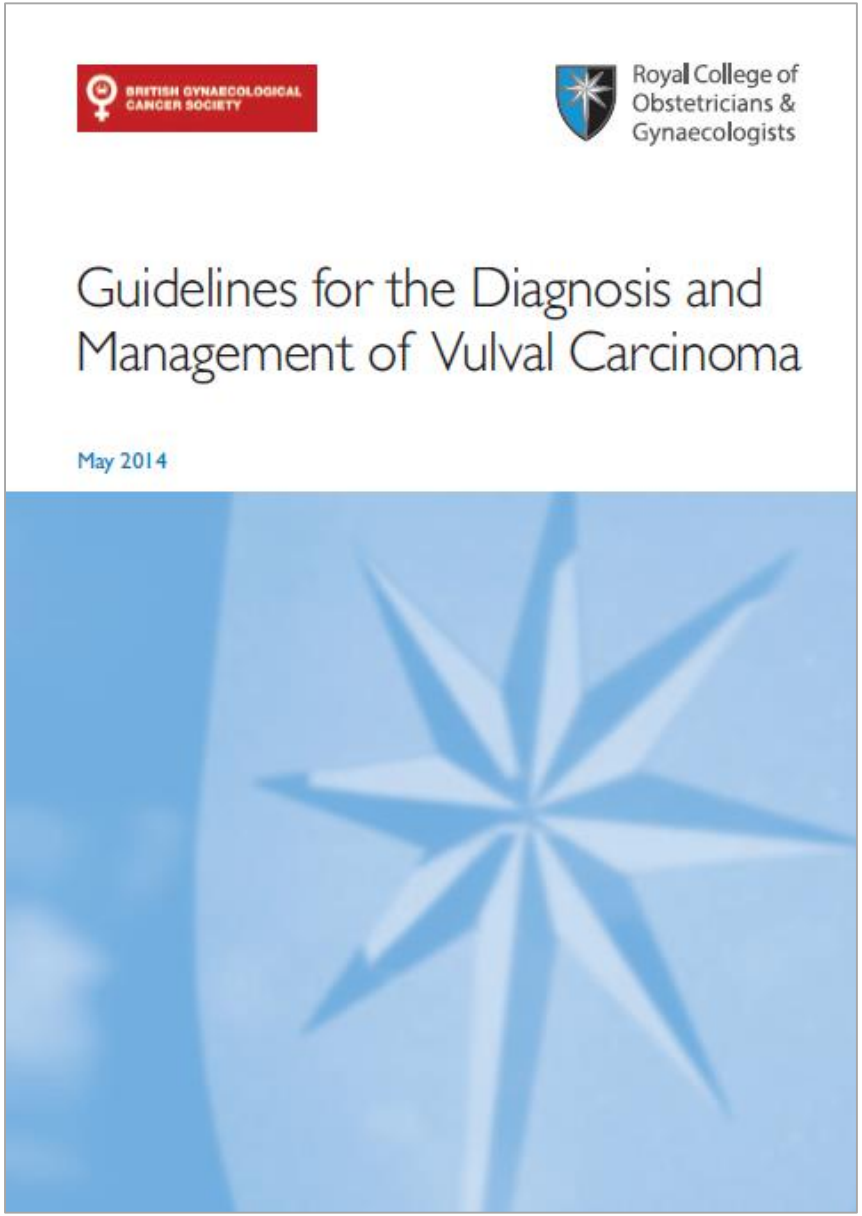
A. Yes

B. No



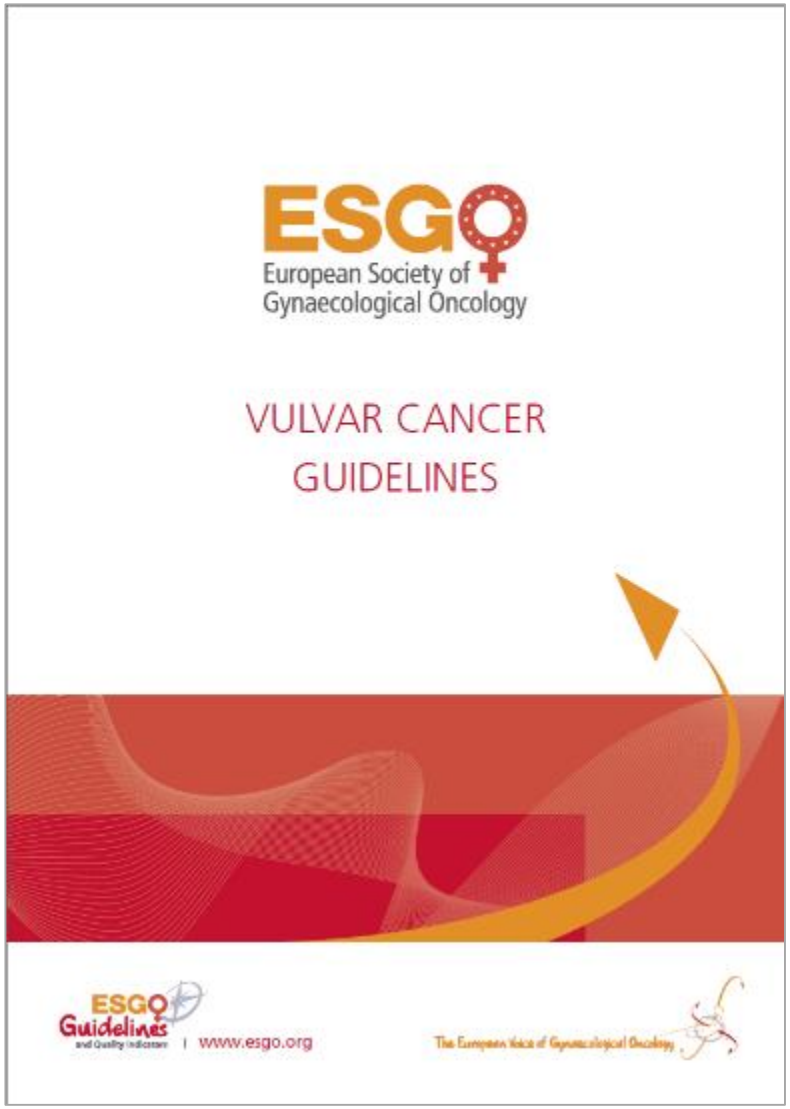
BGCS/RCOG guidelines 2014

"There is not enough evidence to recommend adjuvant local therapy routinely in patients with close surgical margins."



ESGO 2016

- In case of close but clear pathological margins, postoperative vulvar radiotherapy may be considered to reduce the frequency of local recurrences. There is no consensus for the threshold of pathological margin distance below which adjuvant radiotherapy should be advised.



Expert opinion

Reduce regional recurrence
Improve survival

- GOG-37 (RCT)
  - 114 patients
  - Positive inguinal nodes
- Pelvic node dissection vs pelvic RT

	Surgery	Radiotherapy
Regional recurrence	24%	5%
Survival	54%	68%

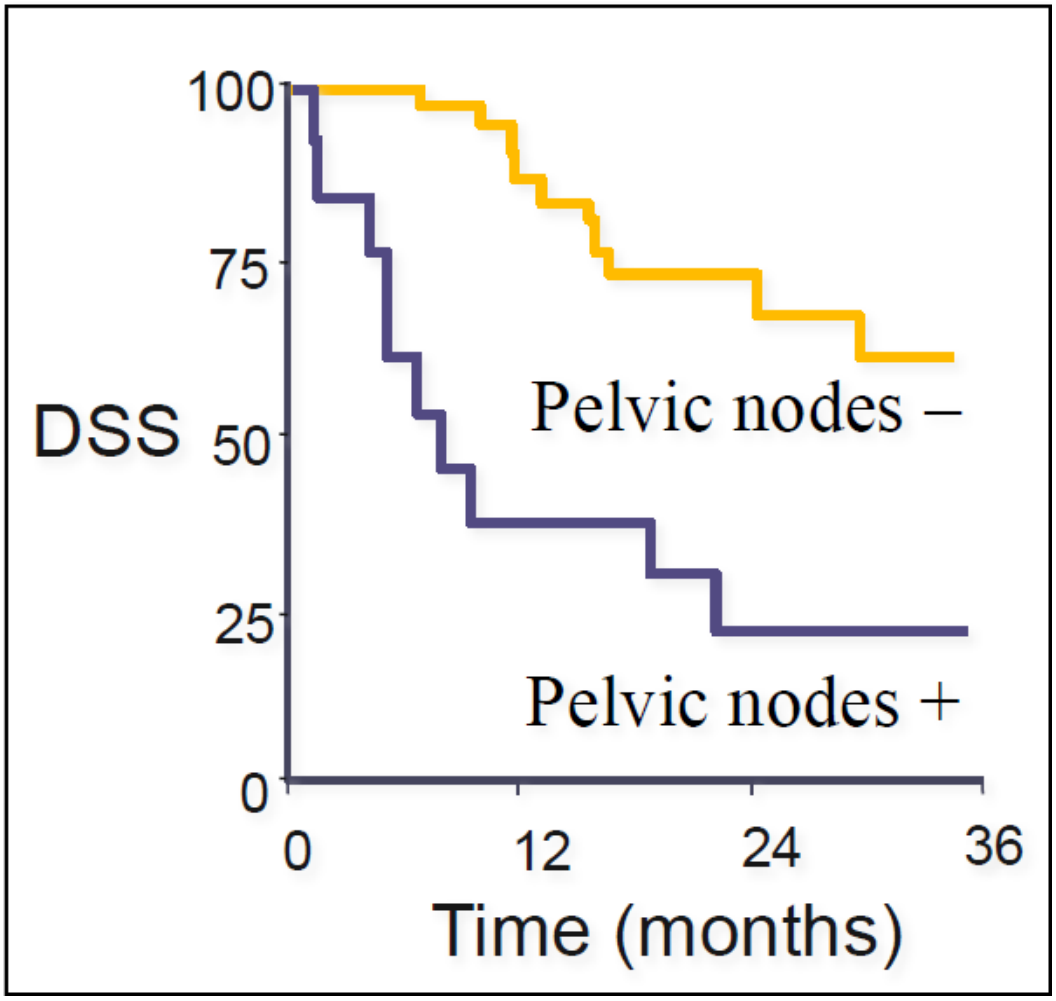
$p = 0.03$

Homesley HD, et al. Obstet Gynecol. 1986;68(6):733-40

Indications for post-operative RT

- 2 or more microscopic nodes
- 1 or more macroscopic node
- Extracapsular disease

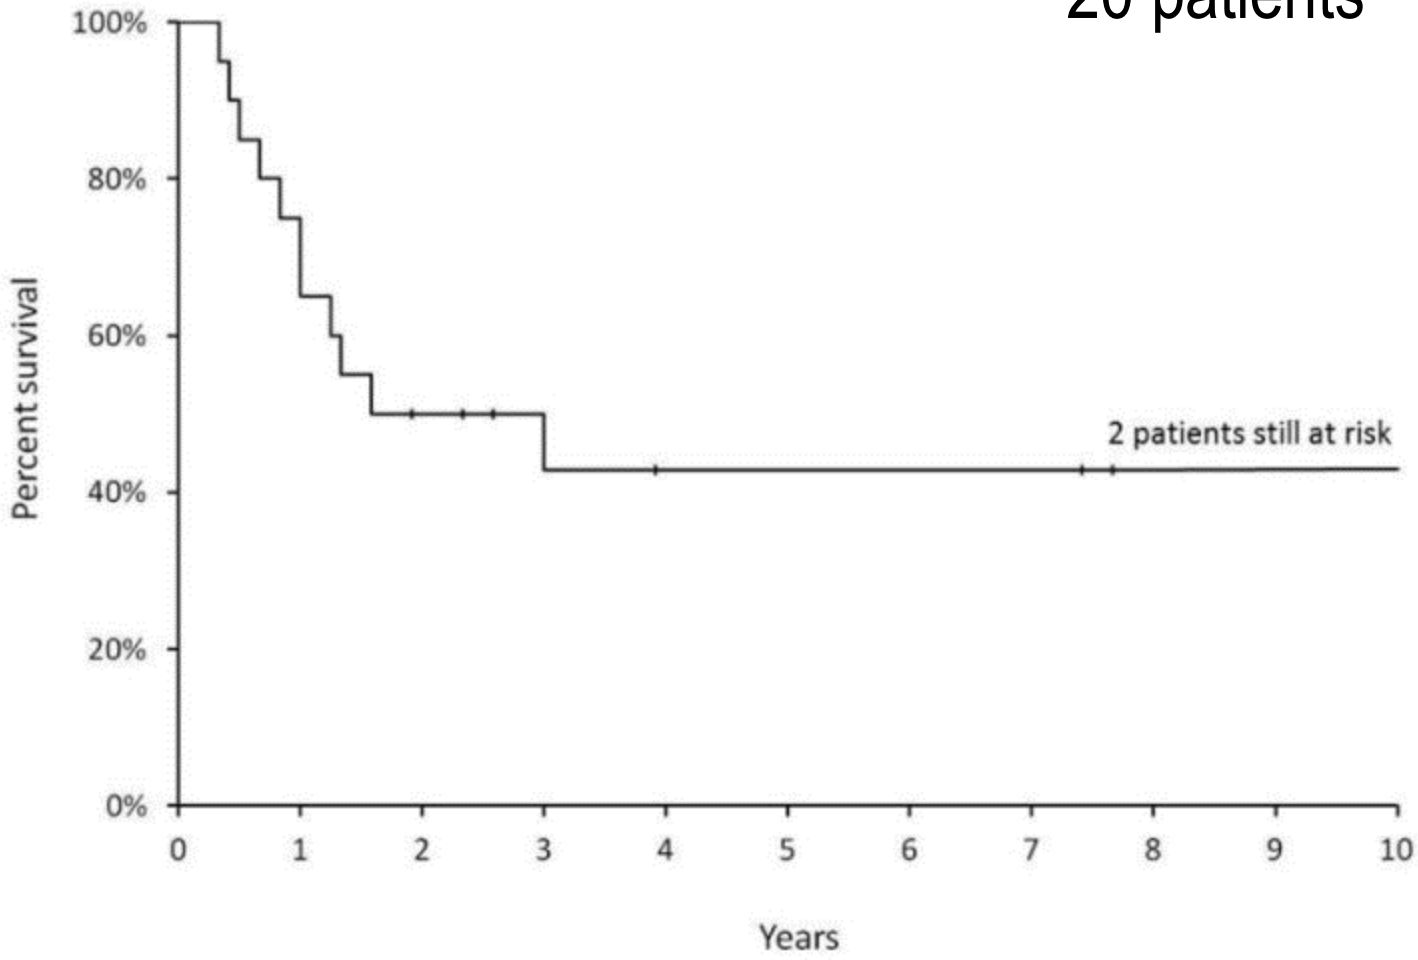
Pelvic nodes = M1



Homesley HD, et al. Obstet Gynecol. 1986;68(6):733-40

Positive pelvic lymph nodes

20 patients



Thaker NG. Gynecol Oncol. 2015;136(2):269-73.

Replace groin surgery

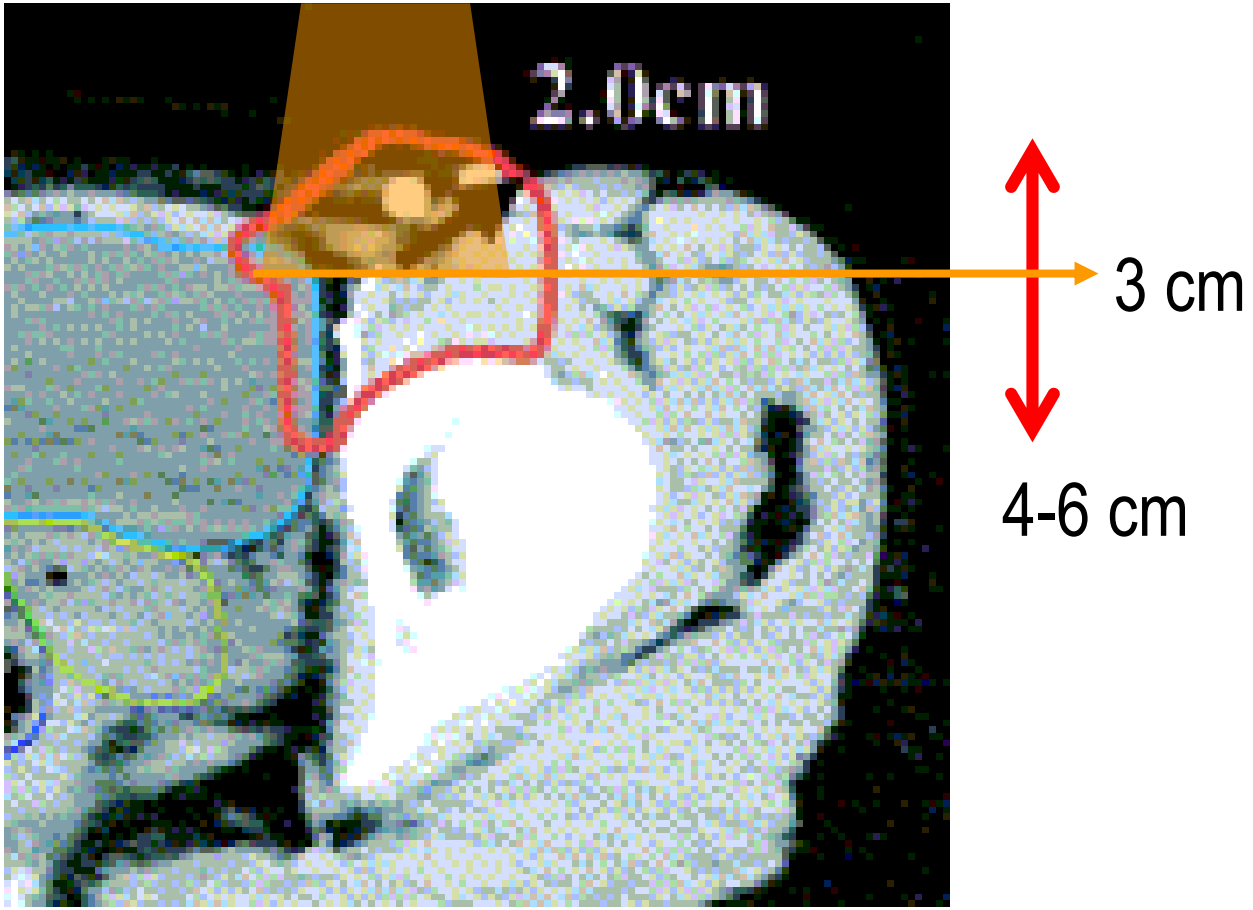
- GOG 88
  - RT vs inguinal node dissection
  - 58 patients
  - T1-3, N0-1, M0

	Surgery	Radiotherapy
Groin relapse	0%	18.5%

Stehman FB, et al. IJROBP 1992. 24:389-396

RT vs nodal dissection

- 50 Gy at 3 cm depth

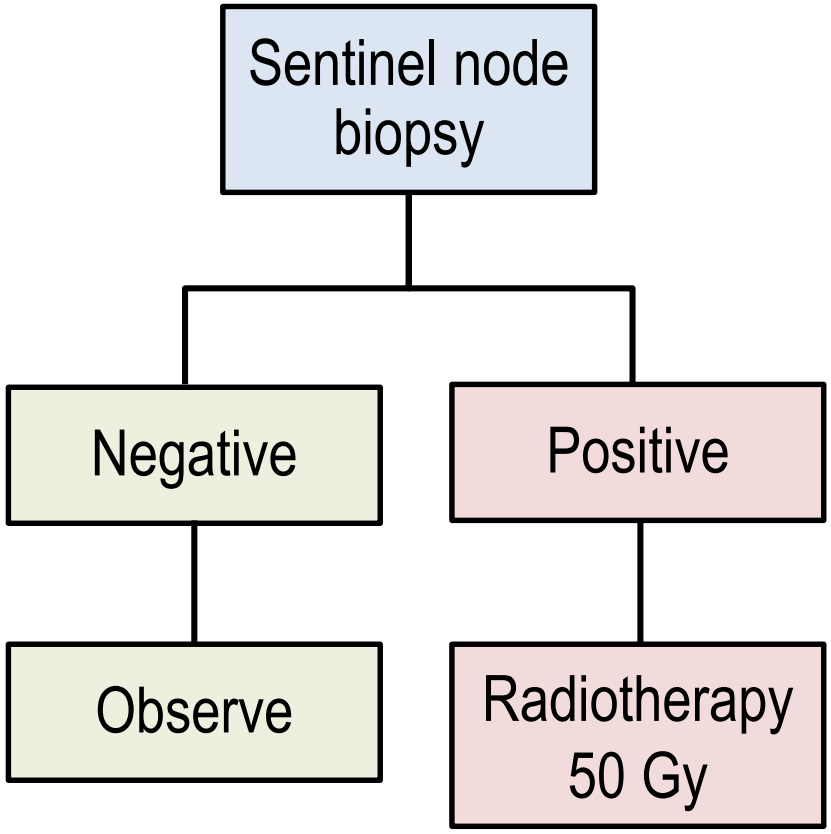


RCOG 2014

- Surgery is the cornerstone of therapy for the groin nodes in women with vulval cancer.
- Individual women who are not fit enough to withstand surgery, even when performed under regional anaesthesia, can be treated with primary radiotherapy.

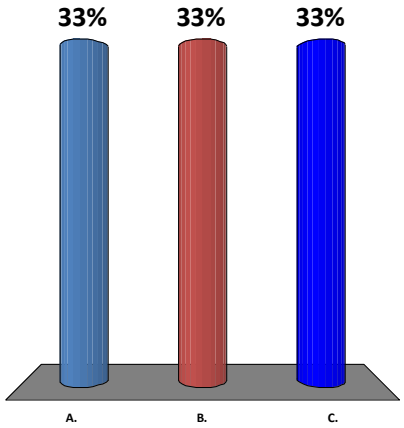
GROINSS-V II

- Observational study
  - T1-T2 < 4 cm
  - No clinical/radiological involved nodes



Do you offer concomitant chemotherapy with adjuvant radiotherapy for vulvar cancer?

A. Usually
B. Sometimes
C. No



GYNECOLOGIC CANCER INTERGROUP

An Organization of International Cooperative Groups for Clinical Trials in Gynecologic Cancers

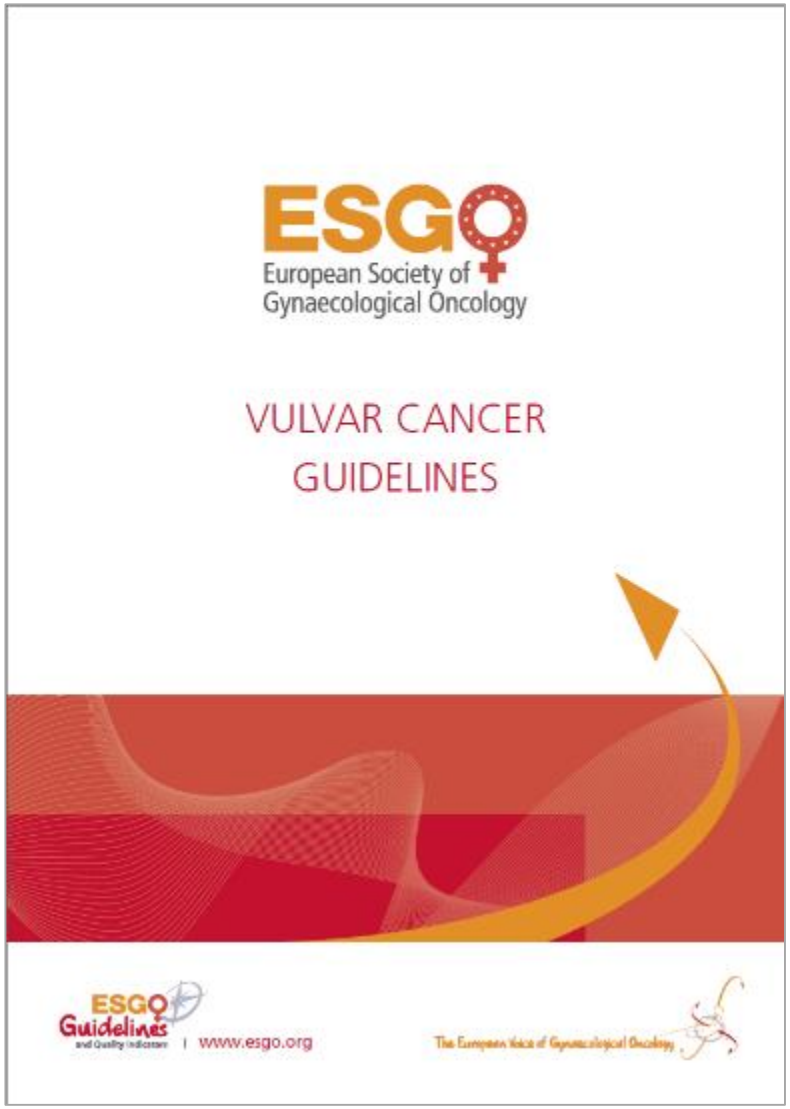
Patterns of Care for Radiotherapy in Vulvar Cancer: A Gynecologic Cancer Intergroup Study

- Use of concomitant chemotherapy
  - No = 50%
  - Yes = 50%
- Regimens
  - Cisplatin 70%
  - Cis + 5FU 20%
  - 5FU + MMC 10%

Gaffney DK, et al. Int J Gynecol Cancer. 2009;19:163-7

ESGO 2016

- Based on evidence from other squamous cell cancers such as cervical, head & neck, and anal cancer, the addition of concomitant, radiosensitising chemotherapy to adjuvant radiotherapy should be considered.



Grade C: Extrapolated evidence from studies rated as 2++

Role of radiotherapy

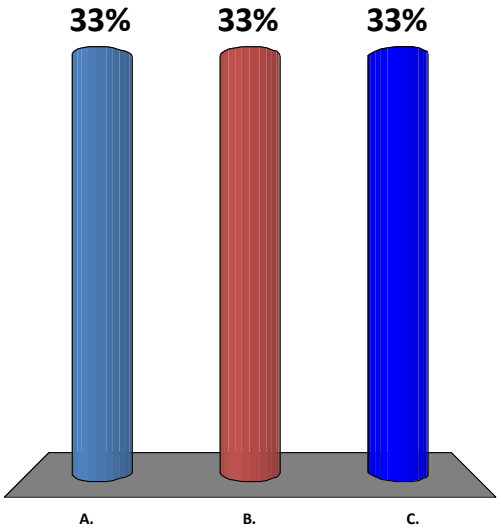
- Post-operative
- **Pre-operative**

Pre-operative

- Aims
  - Downstage disease
  - Avoid mutilating surgery
- Questions
  - Benefit of adding chemotherapy?
  - Avoid all surgery?

Do you offer neoadjuvant chemo-RT for vulvar cancer?

A. Usually
B. Sometimes
C. No



GYNECOLOGIC CANCER INTERGROUP
An Organization of International Cooperative Groups for Clinical Trials in Gynecologic Cancers

Patterns of Care for Radiotherapy in Vulvar Cancer: A Gynecologic Cancer Intergroup Study

- Use of concomitant chemotherapy
  - No = 19%
  - Yes = 81%
- Regimens
  - Cisplatin 55%
  - Cis + 5FU 31%
  - 5FU + MMC 5%
  - Other 9%

Gaffney DK, et al. Int J Gynecol Cancer. 2009;19:163-7

Concomitant chemotherapy

- RCT of neoadjuvant chemoRT vs. surgery
  - 68 patients
  - **Operable cancer**, FIGO Stage II-IV
  - Reported in abstract only (IJGC 2003; Vol. 13 Suppl 1:6)
  - No difference in 5-year survival or morbidity

Maneo A, et al. Cochrane Database of Systematic Reviews 2011

Avoid surgery

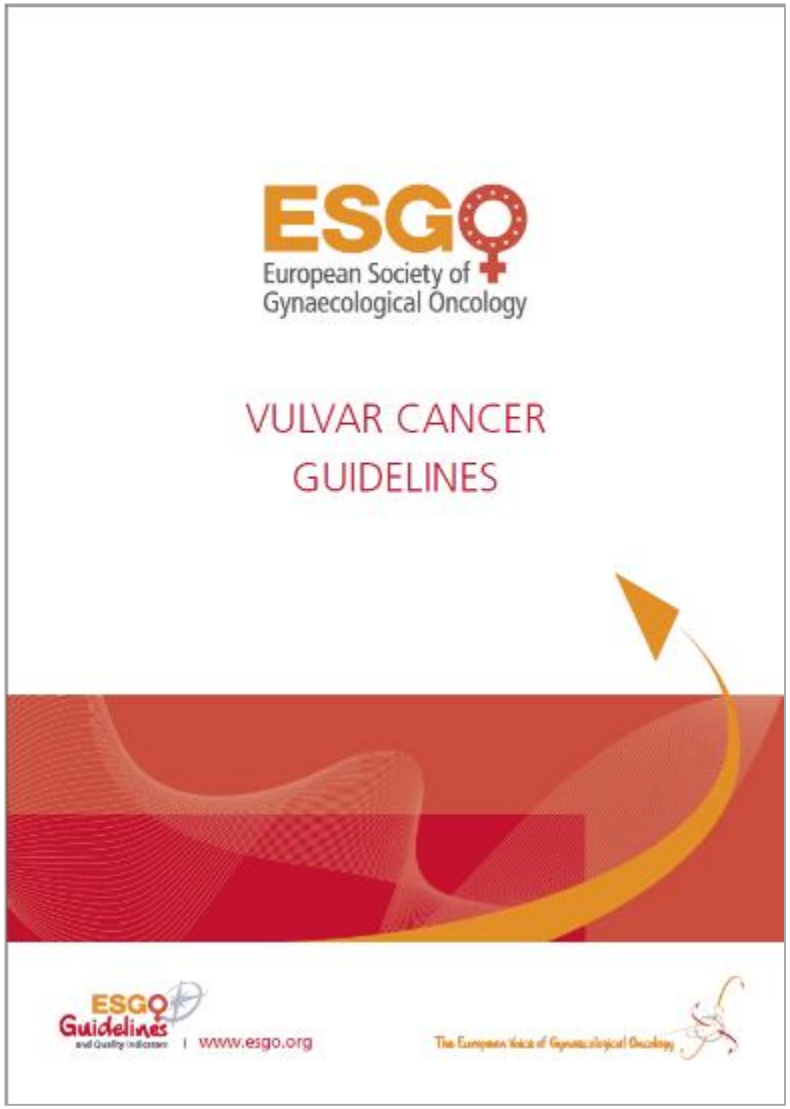
- Phase II studies
  - Operability achieved in 63-92% of cases with platinum-based regimens
  - Effective for both primary and nodes

Outcome

- 27-85% of patients died due to treatment-related causes or disease
- Toxicity substantial
  - Severe skin reactions
  - Avascular necrosis
- Different from cervical and anal cancers
  - Less responsive
  - Worse skin reaction c.f. anal Ca - vulva dystrophy?

ESGO 2016

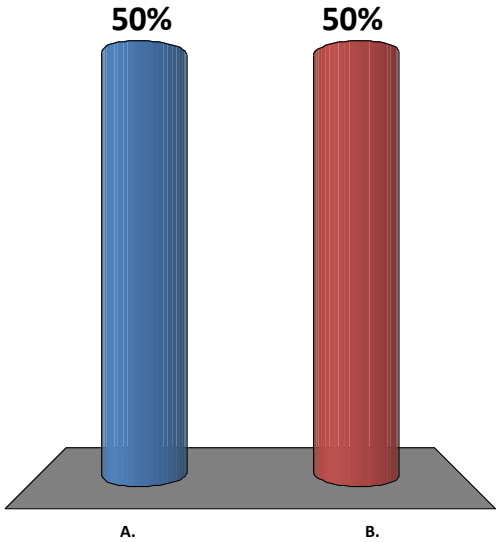
- Definitive chemoradiation (with radiation dose escalation) is the treatment of choice in patients with unresectable disease.
- In advanced stage disease, neoadjuvant chemoradiation should be considered in order to avoid exenterative surgery.



Grade C

Do you routinely use IMRT for vulva cancers?

A. Yes
B. No



Survey 2016

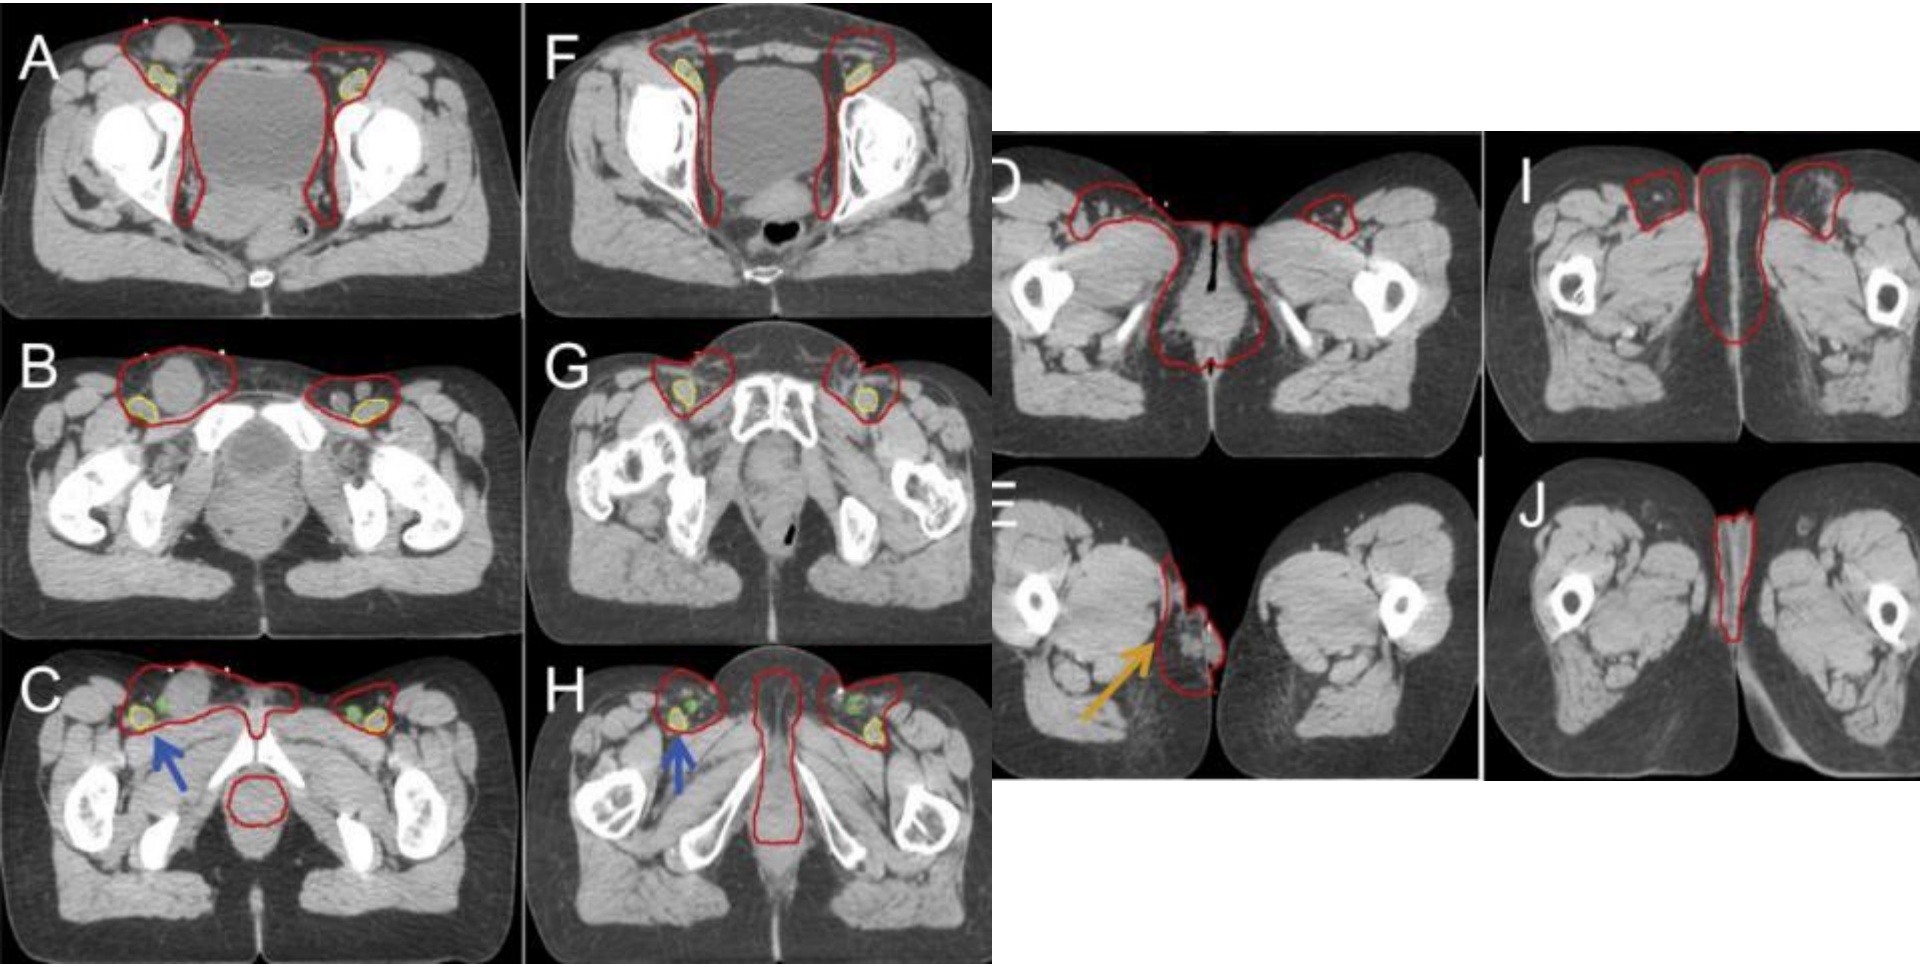
Vulva
Do not use IMRT
Use IMRT occasionally
Use IMRT routinely

IMRT Contouring

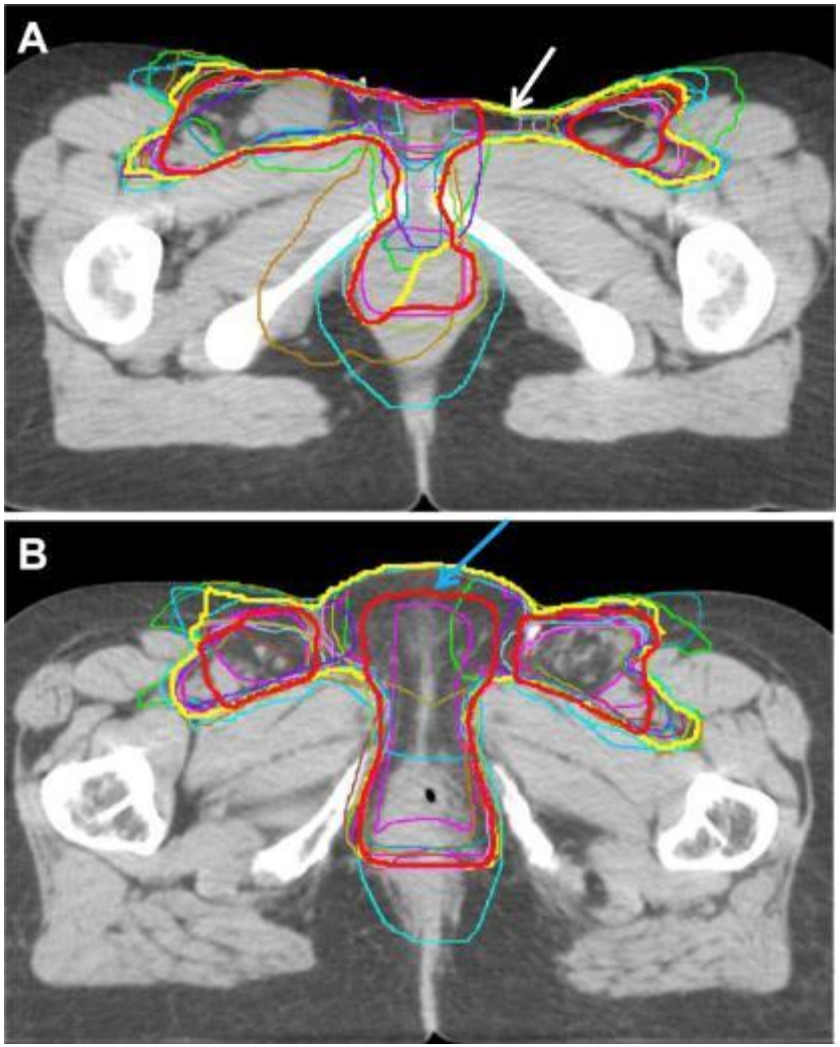
- How high?
- How low?
- What margin round femoral vessels?
- How much vagina?
- Include mons?
- “In transit lymphatics?”

IMRT contouring



Gaffney DK. Int J Radiat Oncol Biol Phys. 2016;95(4):1191-200

IMRT contouring



Gaffney DK. Int J Radiat Oncol Biol Phys. 2016;95(4):1191-200

Contouring inguinal nodes CTV

- Perivascular margin (femoral vessels)
  - Anteromedial ≥35 mm,
  - Anterior ≥23 mm,
  - Anterolateral ≥25 mm,
  - Medial ≥22 mm
- "Lymph node recurrence is not seen posterior or lateral to femoral vessels, thus there is no need to add margins to the vessels in those regions."

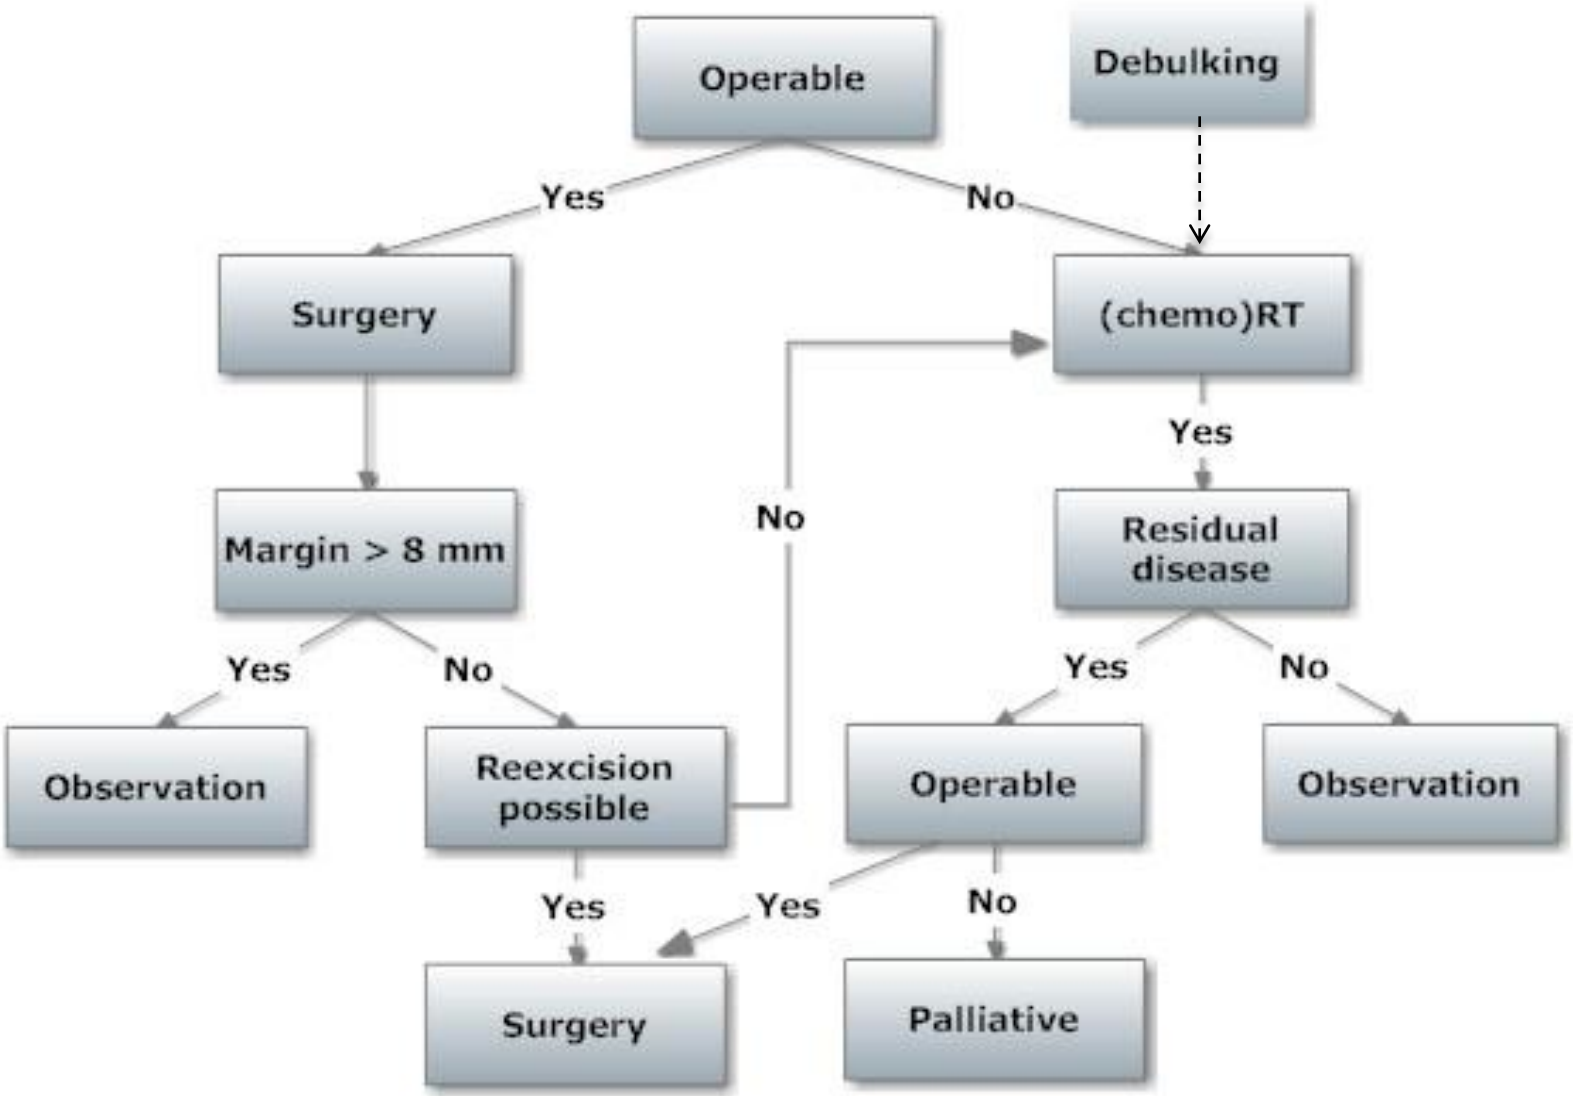
Gaffney DK. Int J Radiat Oncol Biol Phys. 2016;95(4):1191-200

Contouring inguinal nodes CTV

- Inferior border
  - 2 cm below the sapheno-femoral junction
  - Level of the lesser trochanter

Gaffney DK. Int J Radiat Oncol Biol Phys. 2016;95(4):1191-200

Decision tree - vulva



Decision tree - groins

A
B

Summary

- T1 with Gad
- T2
  - Flair easier than standard T2

- Check the T1 without Gad as well as the T1 with Gad!
- Practical points:
  - Slice thickness
  - Time between MRI and RT
  - Fusion error

EBRO: CNS Tumours

Ljubljana 2017

Dr. Matt Williams FRCR PhD

Radiotherapy Dept, Charing Cross Hospital, London

Computational Oncology Group, Imperial College

Matthew.Williams@imperial.ac.uk

Introduction

- Neuro-oncology is a fascinating area
- Rare tumours
- Poor outcomes
- Uneven outcomes

- Gliomas (grade 1 – 4)
- Ependymoma
- Medullblastoma
- Pituitary
- Meningioma

Introduction 2

- Evidence-base is small enough
  - Balancing unequal considerations
    - Early RT in LGG: Seizures:
    - PFS; OS; Cognition; Fatigue

- Good example of both strengths and weaknesses of EBM
  - Meta-analysis showed benefit of chemo in HGG pre-Stupp – not used
  - Much decision-making is non-evidence based
  - Trials are partial, and address only some of the questions
    - Sometimes with long lead times and ignoring other evidence
    - E.g. RTOG 98-02

Cases

- 8 Cases in all
  - 3 HGG
  - 2 LGG
  - 3 Mets

- Most of them are ‘grey’ cases
- I will try and strike a balance between reviewing the evidence and offering some practical suggestions
  - Gaps in the evidence are sources of research
  - Cases get more uncertain as we go on

Some notation

- Intervention A vs B improves OS, but is more likely to lead to grade 3 - 4 toxicity
  - $A >_{OS} B$
  - $A <_{Grade3\text{-}4} B$ (n.b: A < B in the sense that it is worse)

- In patients with disease D, having high F is associated with a better survival than low F.
  - Patients D, High $F >_{OS}$ Low F

Some examples

- In patients with GBM:
  - Chemo-RT leads to a longer survival than RT alone (Stupp, 2005)
  - Chemo-RT is more toxic than RT, esp. haematological toxicity (Stupp, 2005)
  - MGMT-methylation is associated with improved survival (Hegi, 2005)

  - In patients with GBM
    - CRT $>_{OS}$ RT
    - CRT $<_{Grade3\text{-}4}$ RT
    - GBM and CRT; MGMT-meth $>_{OS}$ MGMT-unmeth

Clinical Cases

- What do you see?
- What would you do, and why ?
  - What are the benefits and harms of your approach
- What are the expected outcomes ?
- Can you present the arguments for and against ?
  - Useful to consider dialectical argumentation approach

Recent British Politics

- Recent General Election 2017
- Theresa May is (still) British Prime Minister

- One feature of the British system is that the Prime Minister is just an MP (in this case, Maidenhead)
- But:
  - Her local election gets more interest
  - Anyone may register to stand as local MP
  - So…..

LIVE Maidenhead
ELECTION 2017
GLASGOW SOUTH
Stewart McDonald re-elected
SNP hold
UK SEATS
LAB 157
CON 139
SNP 24
DUP 8
LD 3

Intergalactic space lord, running to be an independent member of parliament for Maidenhead

Lord Buckethead

Elmo is a [Muppet](#) character on [Sesame Street](#). He is three-and-a-half years old

Elmo

Case 1

- 59 yr old right-handed man
  - 2 weeks history of increasing headaches
  - Sudden onset speech problems and facial drooping
  - Admitted as ? CVA
  - ECOG PS = 1

16
W 1411 : L 705

High-grade Glioma Background

- High-grade glioma
  - Grade 3 – 4 glioma
  - Astrocytoma and oligodendroglioma
  - Grade 4 astrocytoma = GBM = WHO Grade 4 glioma
    - Debate over GBM-O

  - Rare tumours
  - Poor prognosis
  - Little improvement over time
  - Surgery and RT mainstay of treatment
  - Some role for chemo

Case 1

- Likely to be a GBM
- Operable
- “Optimal” treatment is Surgery, Chemo-RT and adjuvant chemotherapy

Case 1

- Likely to be a GBM
- Operable
- Optimal treatment is Surgery, Chemo-RT and adjuvant chemotherapy
  - What is the benefit of each ?
  - What are the risks of each ?
  - What radiotherapy dose, fractionation and margins, and why ?
  - How long do we continue chemotherapy for ?

- We need to know these to make decisions about what to do for an individual

Case 1

- What are the benefits of surgery?

Case 1

- What are the benefits of surgery?

HUGE! Operate on all of them

None, they all die anyway

Case 1

- Surgery offers:
  - Diagnosis
    - Modern diagnostics often need more than a biopsy
  - Improvement in symptoms
  - Does surgery improve survival ?

Case 1

- Benefits of surgery:
  - No randomised data on the benefit of surgery in newly diagnosed GBM in most patients*
  - Repeated data from retrospective analysis of trial patients
  - Trials of surgical adjuvants (IO-MRI, 5-ALA)
  - Often group patients by extent of resection (GTR; STR; Bx)
  - Consistent message:
    - GTR $>_{OS}$ STR/Bx; GTR $>_{6mPFS}$ STR/Bx
  - Less clear (but perhaps true):
    - GTR $>_{OS}$ STR $>_{OS}$ Bx; GTR $>_{6mPFS}$ STR $>_{6mPFS}$ Bx
  - However, these are all post-hoc analyses
    - What is the obvious confounding factor here ?

*Vuorinen et al. *Acta Neuro. 2003*

Case 1 Pathology

- Which molecular markers are important ?
  - What is their impact ?
  - How would it change your management ?

Case 1 Pathology

- MGMT
- IDH-1
- 1p/19q
- EGFR

- New WHO classification focuses on IDH-1 and 1p/19q
- Doesn’t mention MGMT

Case 1 Pathology

- MGMT
- IDH-1
- 1p/19q
- EGFR

- New WHO classification focuses on IDH-1 and 1p/19q
- Doesn’t mention MGMT

Case 1 Pathology

- MGMT – MGMT Methylation is prognostic and predictive
- IDH-1 – Prognostic and ?predictive
- 1p/19q – Prognostic and predictive
- EGFR - ?Prognostic not predictive; not a target (currently)
  - Multiple attempts to target EGFR-receptors in GBM
  - All failed

Case 1 Pathology

- IDH-wt
- MGMT methylated
- 1p/19q retained

What does this mean ?

Case 1 Pathology

- IDH-wt
- MGMT methylated
- 1p/19q retained

- This is a “GBM”

Case 1 Treatment

- Surgery
- Radiotherapy

Case 1 Treatment

- Surgery
- Radiotherapy
  - But what dose, fractionation, and margins ?

Case 1 Treatment

- Surgery
- Radiotherapy
  - But what dose, fractionation, and margins ?

All so confusing

Case 1 RT Dose

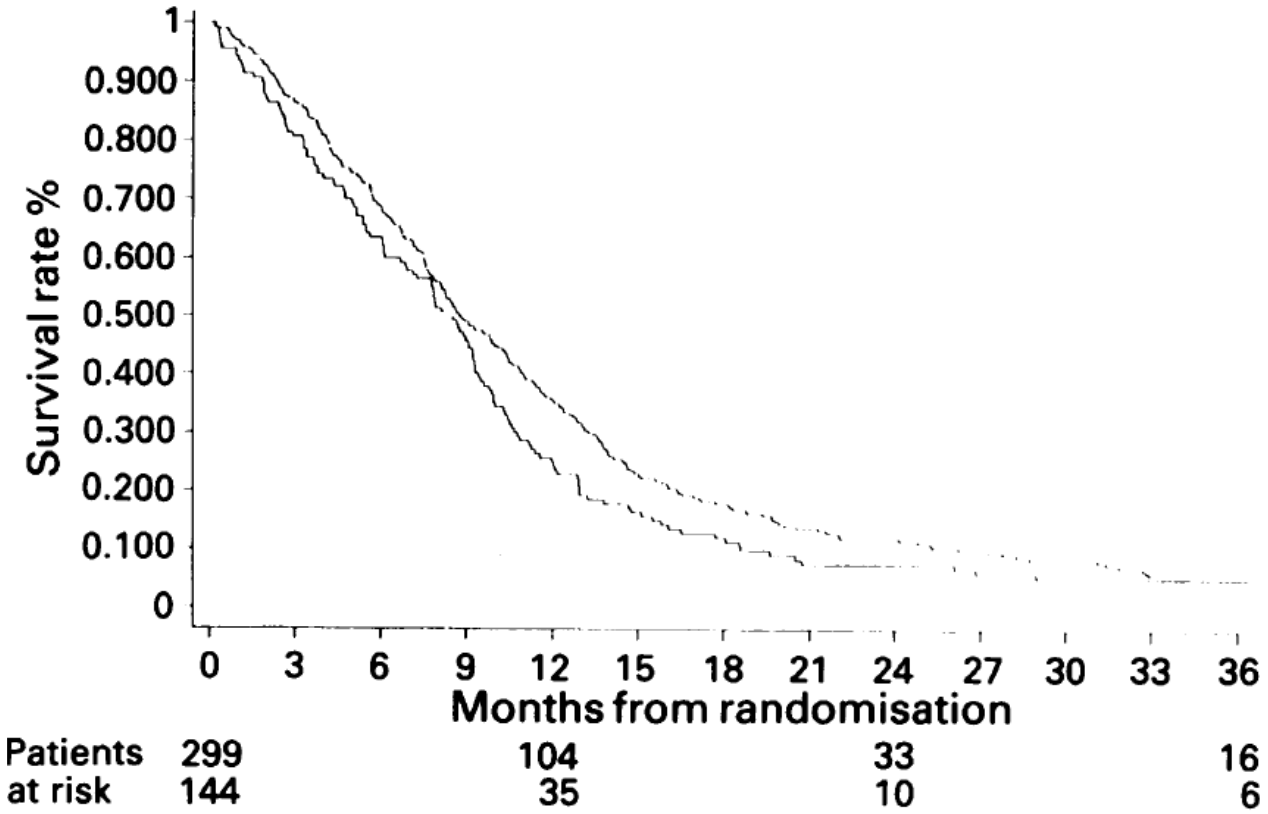

Figure 1 Survival by allocated treatment. —— Group 1 (45 Gy), – – – Group 2 (60 Gy).

Bleehen, BJC 1991

Table VI Definition of prognostic index

Prognostic factor	*Category*	*Score*
Age (years)	⩽44	0
	45–59	6
	⩾60	12
WHO performance status	0–1	0
	2	4
	3–4	8
Extent of neurosurgery	complete resection	0
	partial resection	4
	biopsy	8
History of fits (months)	⩾3	0
	<3	5
	none	10

Prognostic Index = sum of scores for each factor, a low score indicating a better prognosis.

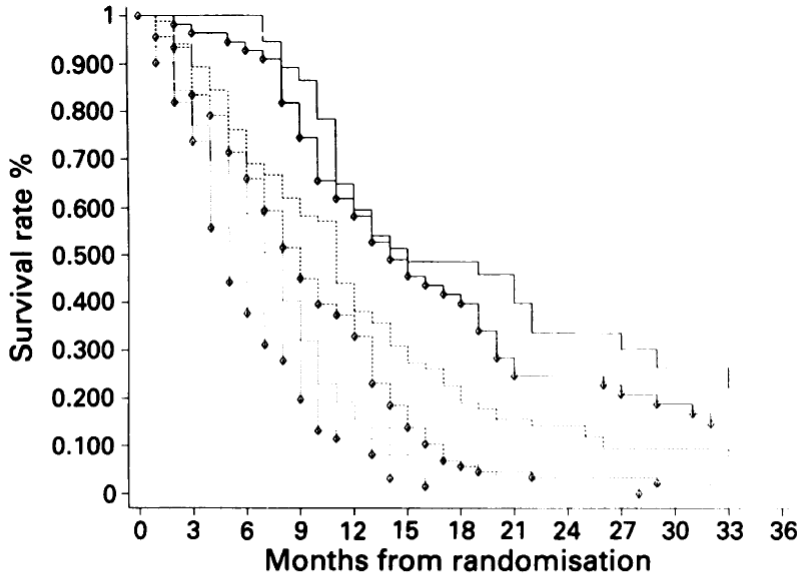

Figure 2 Prognostic groups. Index score: —— 0–10; —◇— 11–15; – – – 16–20; —◇— 21–25; ····· 26–33; ···◇··· 34–38.

Case 1 Treatment:

- Post-op RT
  - Meta-analysis: RR: 0.81
  - 60Gy $>_{OS}$ 45Gy (Bleehan)
  - Persistent failure from benefit of higher doses/ boosts/ etc.

- But what margins ?

Laperriere, RadiotherOncol 2002
Bleehen, BJC 1991
Walker, RedJ, 1979

Case 1 Treatment:

- Post-op RT
  - Meta-analysis: RR: 0.81
  - 60Gy $>_{OS}$ 45Gy (Bleehan)
  - Persistent failure from benefit of higher doses/ boosts/ etc.

- But what margins ?
  - How do we define success in GBM radiotherapy?

Laperriere, RadiotherOncol 2002
Bleehen, BJC 1991
Walker, RedJ, 1979

Case 1 Treatment:

- Post-op RT
  - Non-randomised data
  - Success is local failure
    - Because we know we did not miss
    - Opens up a route to redefining success (pattern of failure vs. OS).

- US vs. Europe
  - Europe – single phase; 2 – 3 cm margins
  - USA – 2 phase, 2 dose levels
  - USA volumes are bigger; no better; more normal tissue irradiated

Case 1 Treatment:

- Post-op RT
- T1 and T2 sequences on MRI
- GTV: T1 contrast enhancing
- CTV: GTV + 2 – 3 cm
  - Make sure it includes T2 abnormality
  - Allow for fusion errors
  - Edit for natural boundaries
  - CTV -> PTV margin

Case 1 Treatment

- Surgery
- Radiotherapy
  - 60Gy/ 30#. 2 – 3 cm CTV. Use MRI for planning
- Chemotherapy

Case 1 Chemotherapy

- Would you suggest chemotherapy?
- Which agents, when and for how long?
- What are the additional toxicities?

Chemotherapy

Table 4. Grade 3 or 4 Hematologic Toxic Effects in Patients Treated with Temozolomide.

Toxic Effect	Concomitant Temozolomide Therapy (N=284)	Adjuvant Temozolomide Therapy (N=223)	Entire Study Period* (N=284)
	number of patients (percent)		
Leukopenia	7 (2)	11 (5)	20 (7)
Neutropenia	12 (4)	9 (4)	21 (7)
Thrombocytopenia	9 (3)	24 (11)	33 (12)
Anemia	1 (<1)	2 (1)	4 (1)
Any	19 (7)	32 (14)	46 (16)

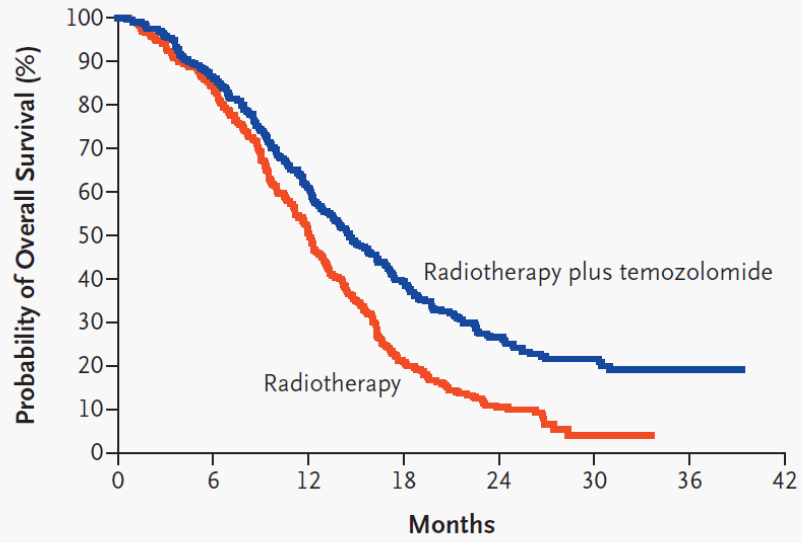
* The entire study period was defined as the period from study entry to seven days after disease progression.

Table 1. Demographic Characteristics of the Patients at Baseline.

Characteristic	Radiotherapy (N=286)	Radiotherapy plus Temozolomide (N=287)
Age — yr		
Median	57	56
Range	23–71	19–70
Age — no. (%)*		
<50 yr	81 (28)	90 (31)
≥50 yr	205 (72)	197 (69)
Sex — no. (%)		
Male	175 (61)	185 (64)
Female	111 (39)	102 (36)
WHO performance status — no. (%)*†		
0	110 (38)	113 (39)
1	141 (49)	136 (47)
2	35 (12)	38 (13)
Extent of surgery — no. (%)*		
Biopsy	45 (16)	48 (17)
Debulking	241 (84)	239 (83)
Complete resection	113 (40)	113 (39)
Partial resection	128 (45)	126 (44)

Stupp, NEJM 2005; LancetOnc 2009

Chemotherapy



No. at Risk							
Radiotherapy	286	240	144	59	23	2	0
Radiotherapy plus temozolomide	287	246	174	109	57	27	4

Figure 1. Kaplan–Meier Estimates of Overall Survival According to Treatment Group.

The hazard ratio for death among patients treated with radiotherapy plus temozolomide, as compared with those who received radiotherapy alone, was 0.63 (95 percent confidence interval, 0.52 to 0.75; P<0.001).

Table 3. Overall and Progression-free Survival According to Treatment Group.*

Variable	Radiotherapy (N=286)	Radiotherapy plus Temozolomide (N=287)
	value (95% CI)	
Median overall survival (mo)	12.1 (11.2–13.0)	14.6 (13.2–16.8)
Overall survival (%)		
At 6 months	84.2 (80.0–88.5)	86.3 (82.3–90.3)
At 12 months	50.6 (44.7–56.4)	61.1 (55.4–66.7)
At 18 months	20.9 (16.2–26.6)	39.4 (33.8–45.1)
At 24 months	10.4 (6.8–14.1)	26.5 (21.2–31.7)
Median progression-free survival (mo)	5.0 (4.2–5.5)	6.9 (5.8–8.2)
Progression-free survival (%)		
At 6 months	36.4 (30.8–41.9)	53.9 (48.1–59.6)
At 12 months	9.1 (5.8–12.4)	26.9 (21.8–32.1)
At 18 months	3.9 (1.6–6.1)	18.4 (13.9–22.9)
At 24 months	1.5 (0.1–3.0)	10.7 (7.0–14.3)

* A total of 160 patients in the radiotherapy group and 60 patients in the radiotherapy-plus-temozolomide group received temozolomide as salvage therapy. CI denotes confidence interval.

Stupp, NEJM 2005; LancetOnc 2009

Case 1 Chemotherapy

MGMT methylated – Prognostic

Predictive

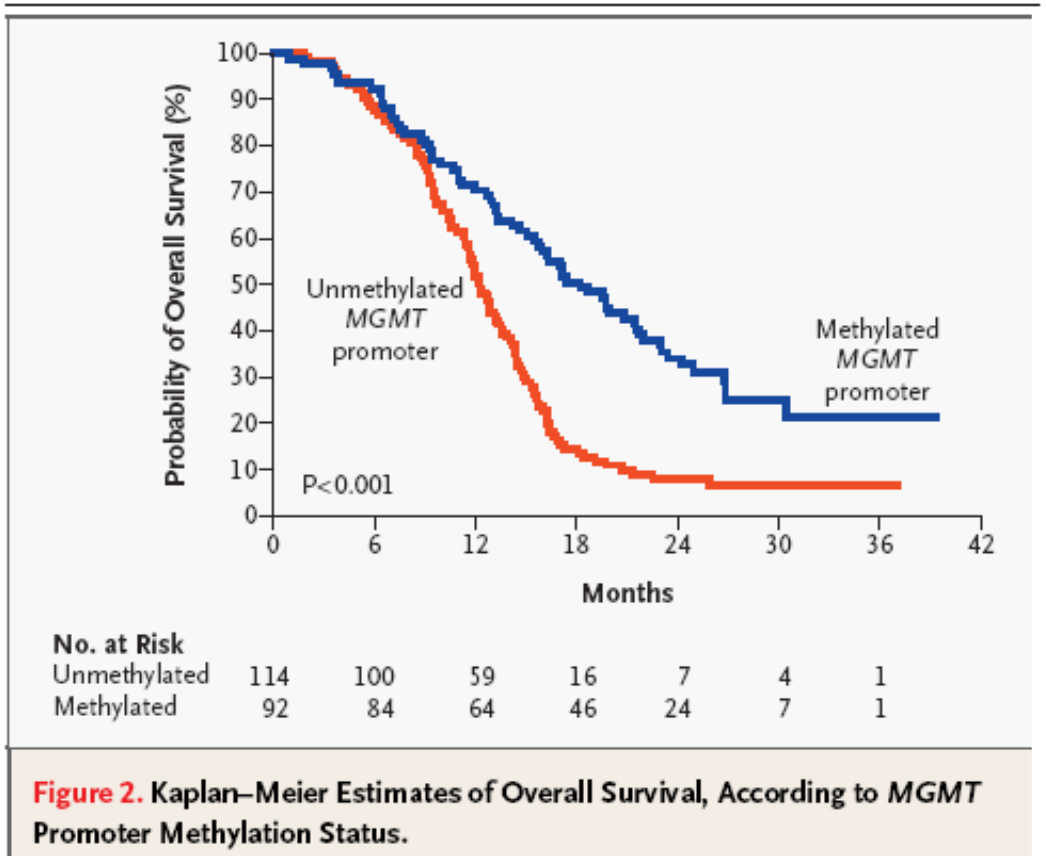


Figure 2. Kaplan–Meier Estimates of Overall Survival, According to *MGMT* Promoter Methylation Status.

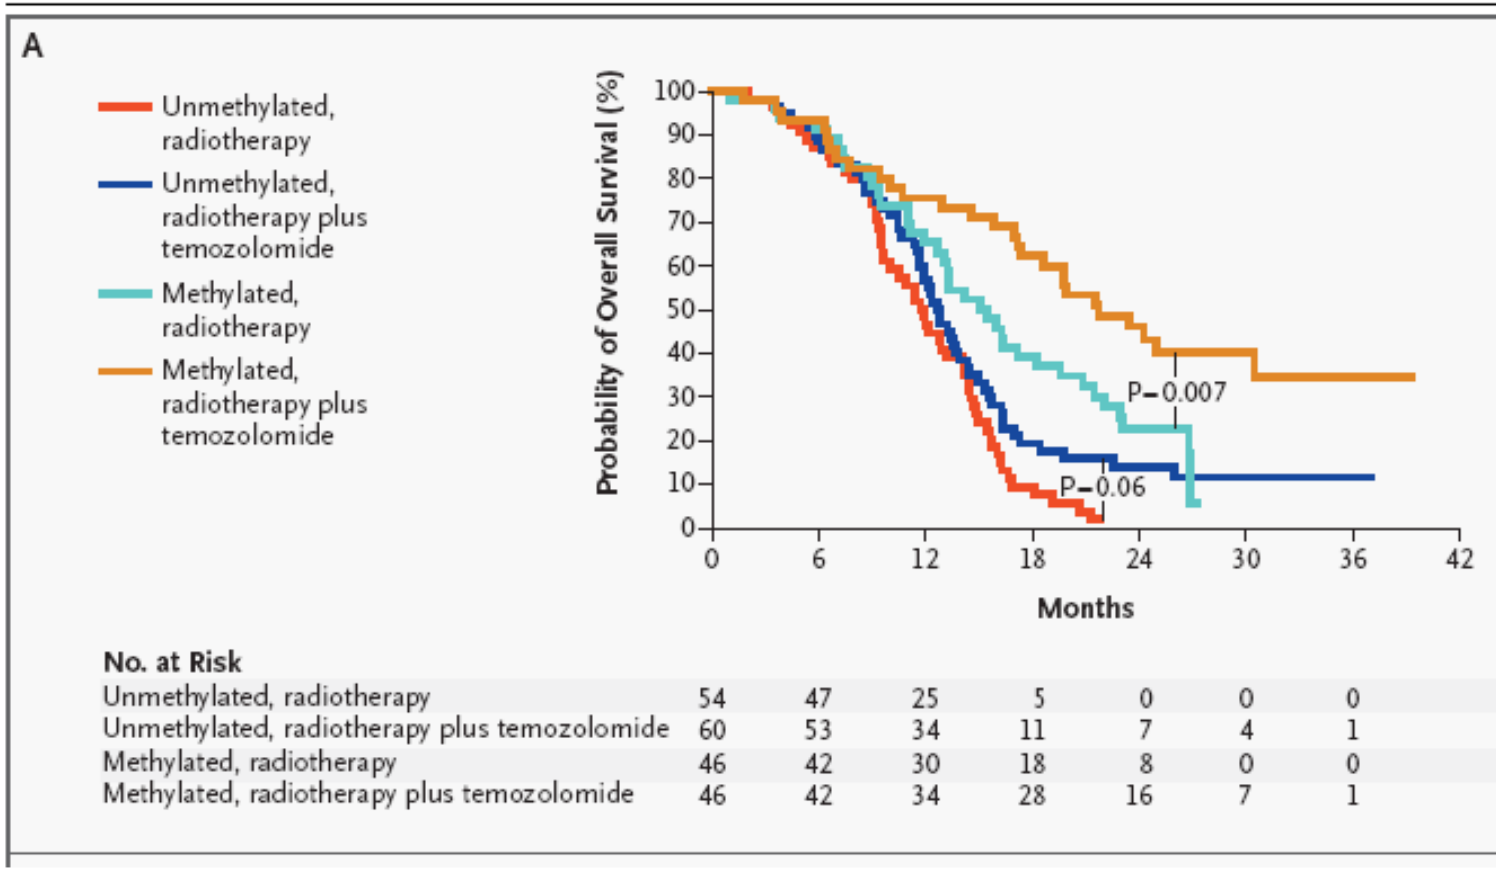

Hegi NEJM 2005

Case 1 Chemotherapy

- Would you give chemotherapy without results of the Stupp trial?

Case 1 Chemotherapy

- Would you give chemotherapy without results of the Stupp trial?

Bernard talked about publication bias

Case 1 Chemotherapy

- Multiple trials demonstrate benefit from adjuvant chemotherapy in HGG
- First meta-analysis in 1993
  - 16 trials; 3000 patients; 10% improvement in OS
  - 12 Trials; IPD MA; 3004 patients; Improved Median OS by 2 months
- Phase 2 trial of RT + TMZ

Fine, Cancer 1993
Stewart, Lancet 2002
Athanassiou, JCO, 2005

Case 1 Chemotherapy

- Multiple trials demonstrate benefit from adjuvant chemotherapy in HGG
- First meta-analysis in 1993
  - 16 trials; 3000 patients; 10% improvement in OS
  - 12 Trials; IPD MA; 3004 patients; Improved Median OS by 2 months
- Phase 2 trial of RT + TMZ

What took you so long ?

Fine, Cancer 1993
Stewart, Lancet 2002
Athanassiou, JCO, 2005

Case 1 Chemotherapy

- Better prognosis if MGMT methylated
- Benefit from addition of TMZ
  - 150 – 200mg/m2 d1 – d5
  - For how long?

Case 1 Chemotherapy

- No benefit from extended TMZ on OS
  - Multiple retrospective studies show that those who take TMZ for 12 months live longer than those who take TMZ for 6 months
  - Recent analysis of RCT data suggests maybe PFS improvement but no OS improvement

Blumenthal, NeuroOnc 2017

Case 1 Chemotherapy

- No benefit from extended TMZ on OS
  - Multiple retrospective studies show that those who take TMZ for 12 months live longer than those who take TMZ for 6 months
  - Recent analysis of RCT data suggests maybe PFS improvement but no OS improvement
  - Why is there is difference between retrospective data and RCT?
  - Is PFS worthwhile?

Blumenthal, NeuroOnc 2017

Case 1 Prognosis

- 59 yr old right-handed man
  - 2 weeks history of increasing headaches
  - Sudden onset speech problems and facial drooping
  - Admitted as ? CVA
  - ECOG PS = 1

Case 1 Prognosis

https://www.eortc.be/tools/gbmcalculator/

- 59
- PS 1
- TMZ/RT
- Surgery
  - 12.3 months (Bx)
  - 14.8 (STR)
  - 18.5 (GTR)

- Doesn't include MGMT!

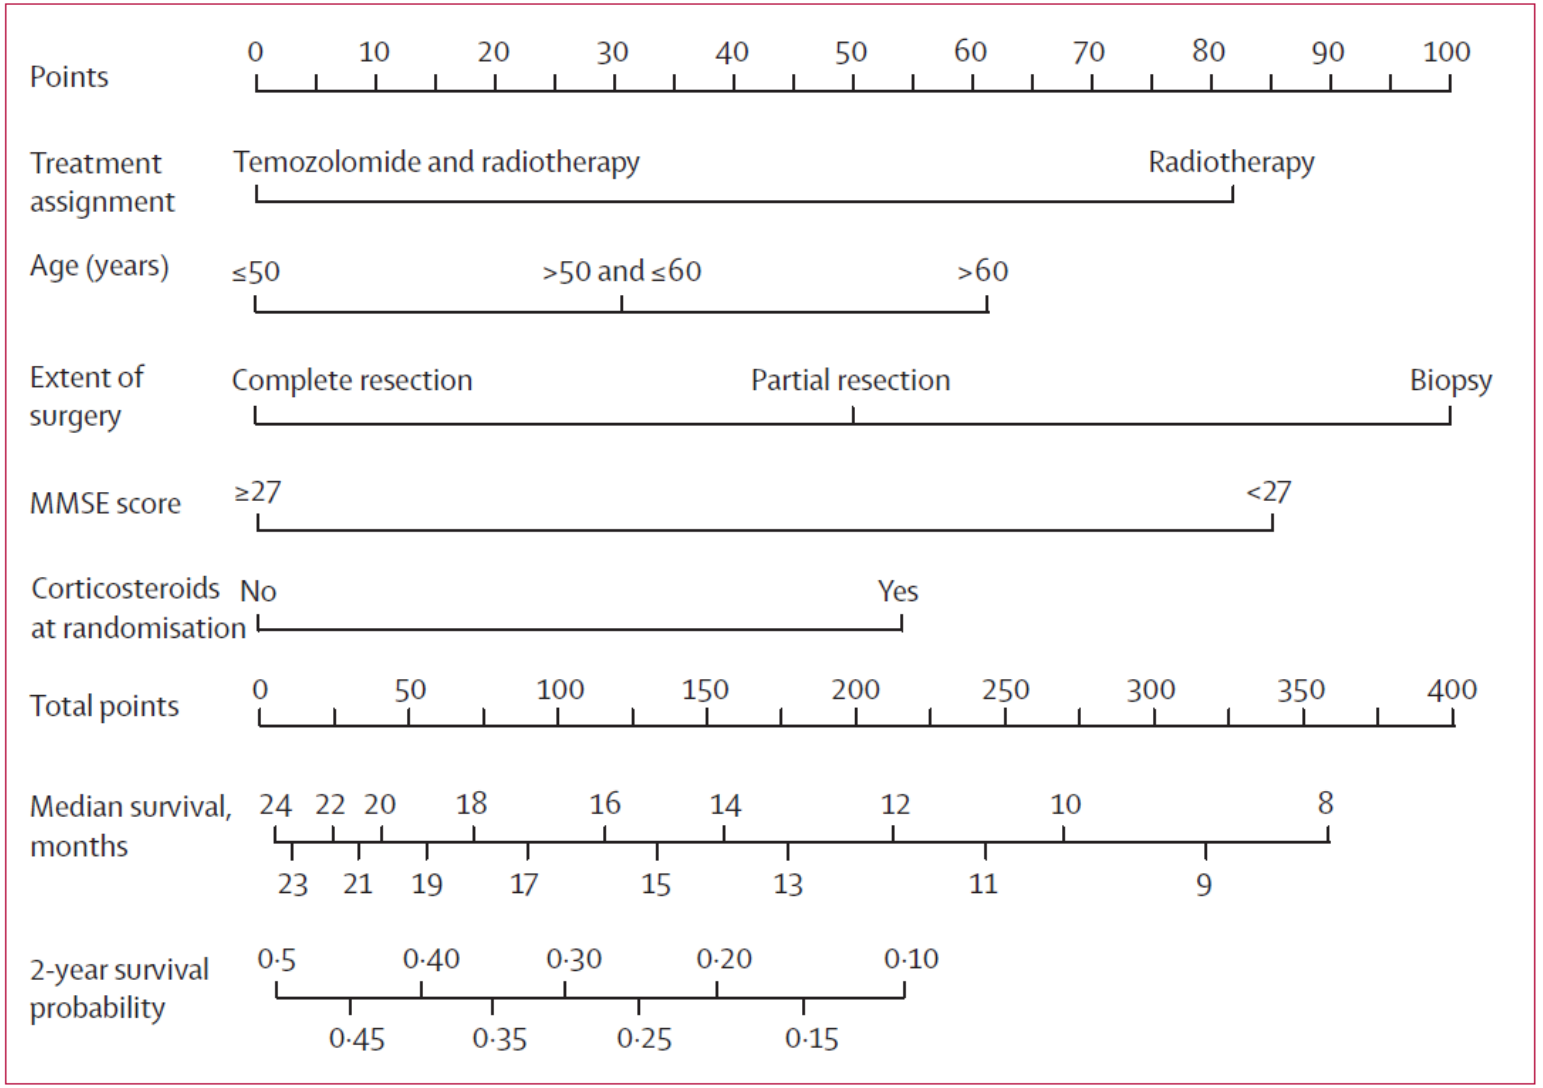

Figure 1: Nomogram for predicting median survival and probability of survival at 2 years in all randomised patients (population 1)

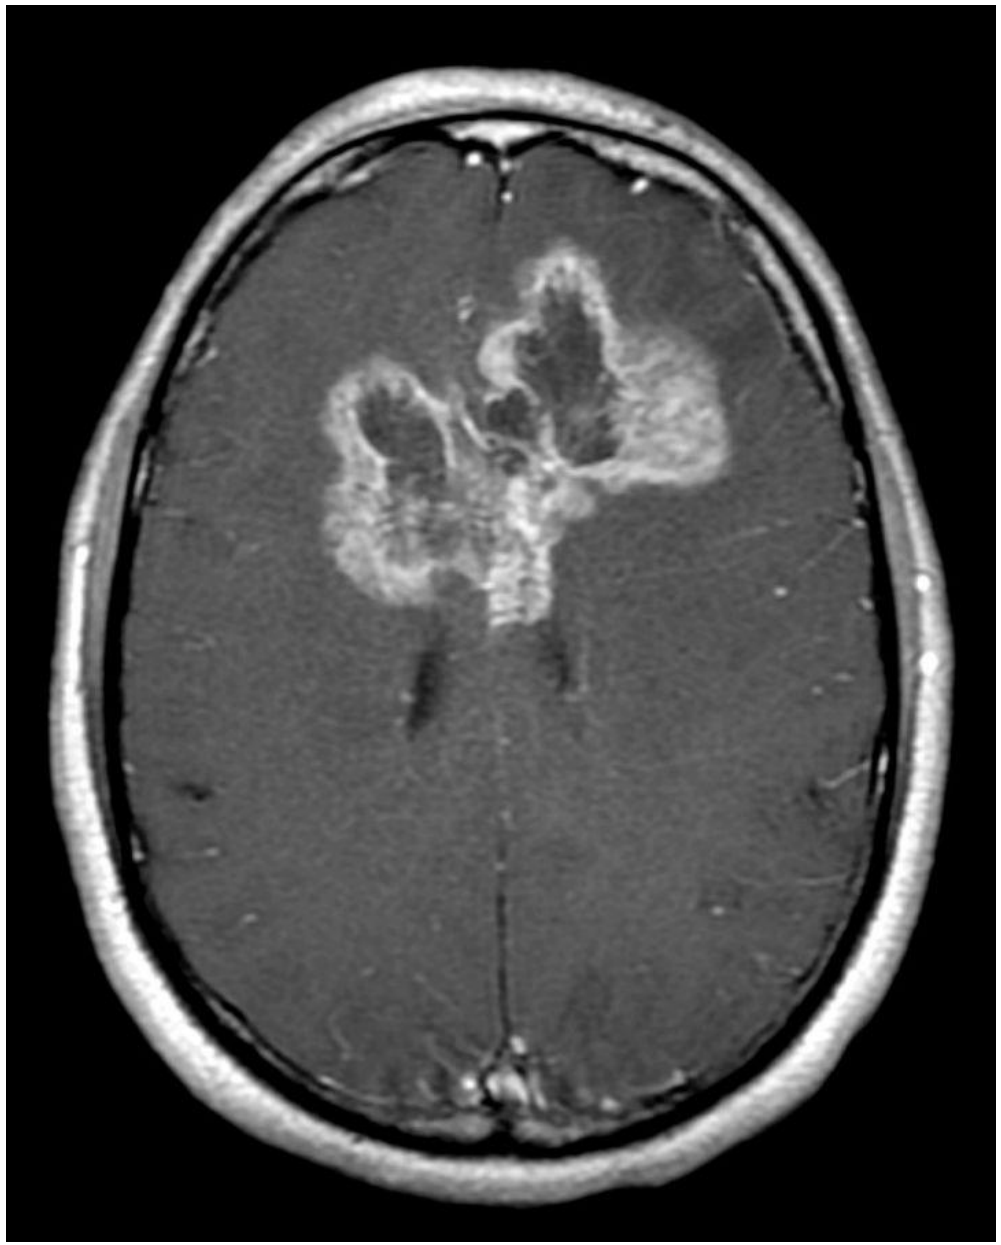
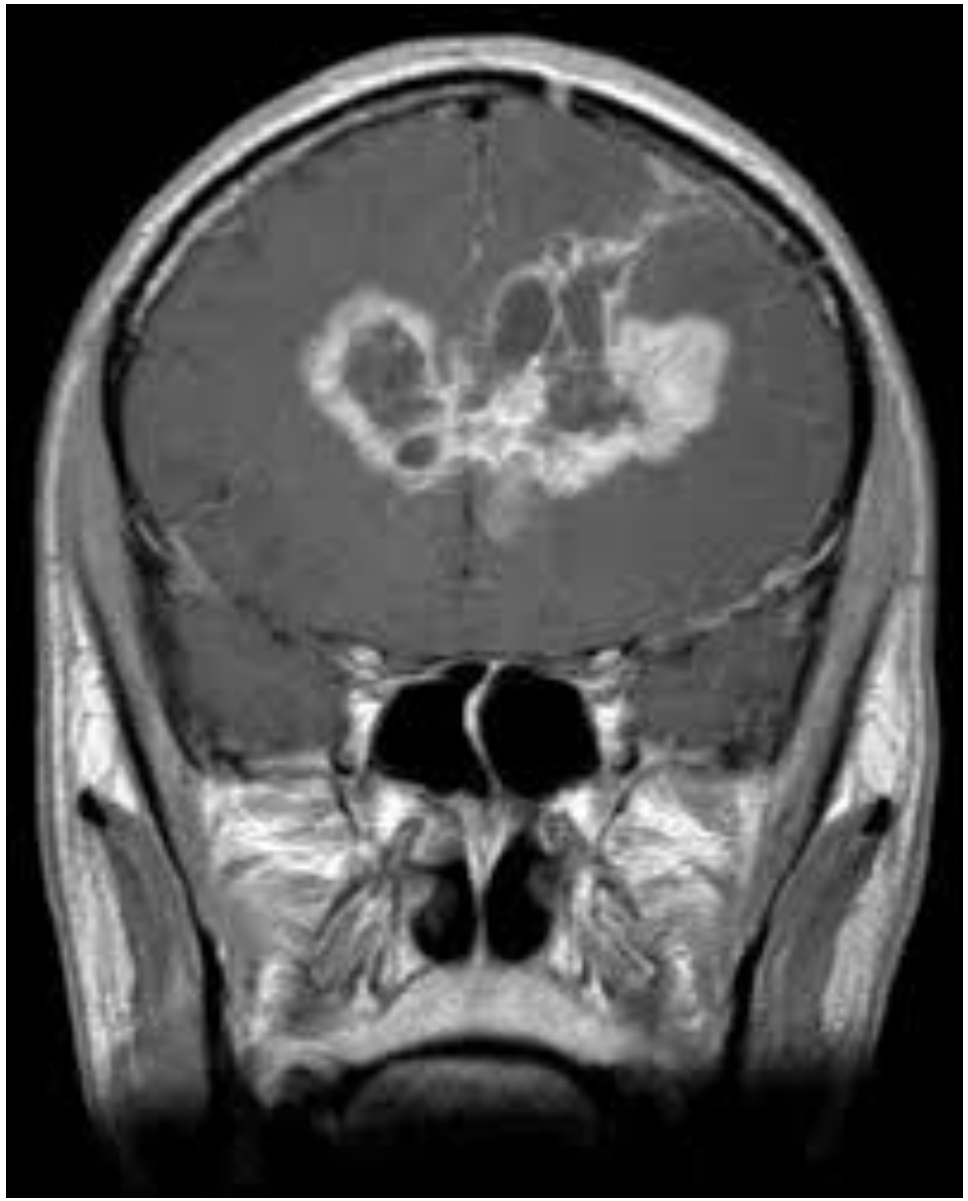
Case 1 Questions ?

Case 2

- 81 yr old man
  - Admitted with problems walking and not coping at home
  - Previously very well
  - ECOG PS = 3
  - Improved with steroids





Case 2

- Role of surgery ?
- Role of RT ?
- Role of chemo ?

Case 2 Surgery

- Is it resectable ?

- Would tissue help otherwise ?

Everything is resectable !

Why put them through a biopsy ?

Role of surgery

- Is the lesion resectable?
  - What would a biopsy accomplish ?
- What are subsequent treatment options ?
- What are the likely outcomes ?
  - 30 day mortality after resection of brain tumours?
  - Functional outcomes ?

Case 2

- Likely to be a GBM
- Prognostic factors in GBM:
  - Age: Elderly $<_{OS}$ Young
  - Surgery: Complete Resection $>_{OS}$ Incomplete Resection $>_{OS}$ Biopsy
  - Performance Status: Good PS $>_{OS}$ Low PS
  - MGMT: MGMT-meth $>_{OS}$ MGMT-unmeth

  - Older literature grouped grade 3 & 4: Grade 3 $>_{OS}$ Grade 4

Case 2: Age

	Patients Age <65 y, *n* = 110	Patients Age ≥65 y, *n* = 42	
Mean age, y (range)	51.6 (23–64)	71.9 (65–83)	$P < .0001$
Median KPS (range)	80 (40–100)	80 (40–100)	$P = .0737$
Extent of operation, *n*			$P = 1.0$
Resection	97 (88%)	37 (88%)	
Biopsy	13 (12%)	5 (12%)	
Initial treatment, *n*			$P = .364$
RT + TMZ	91 (83%)	32 (65%)	
RT alone	19 (17%)	10 (24%)	
MGMT promoter, *n*			$P = .851$
Methylated	39 (35%)	16 (38%)	
Unmethylated	71 (65%)	26 (62%)	

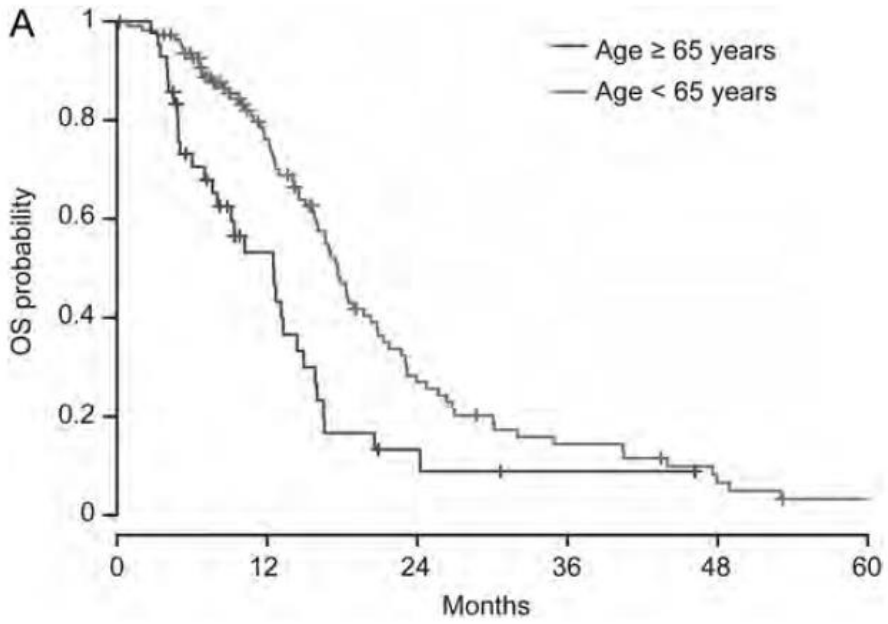


Fig. 3. Survival by age in TCGA collective. (A) OS of G-CIMP–negative patients, stratified by age (<65 vs ≥65 y).

Wiestler, NeuroOnc2013

Case 2: Age

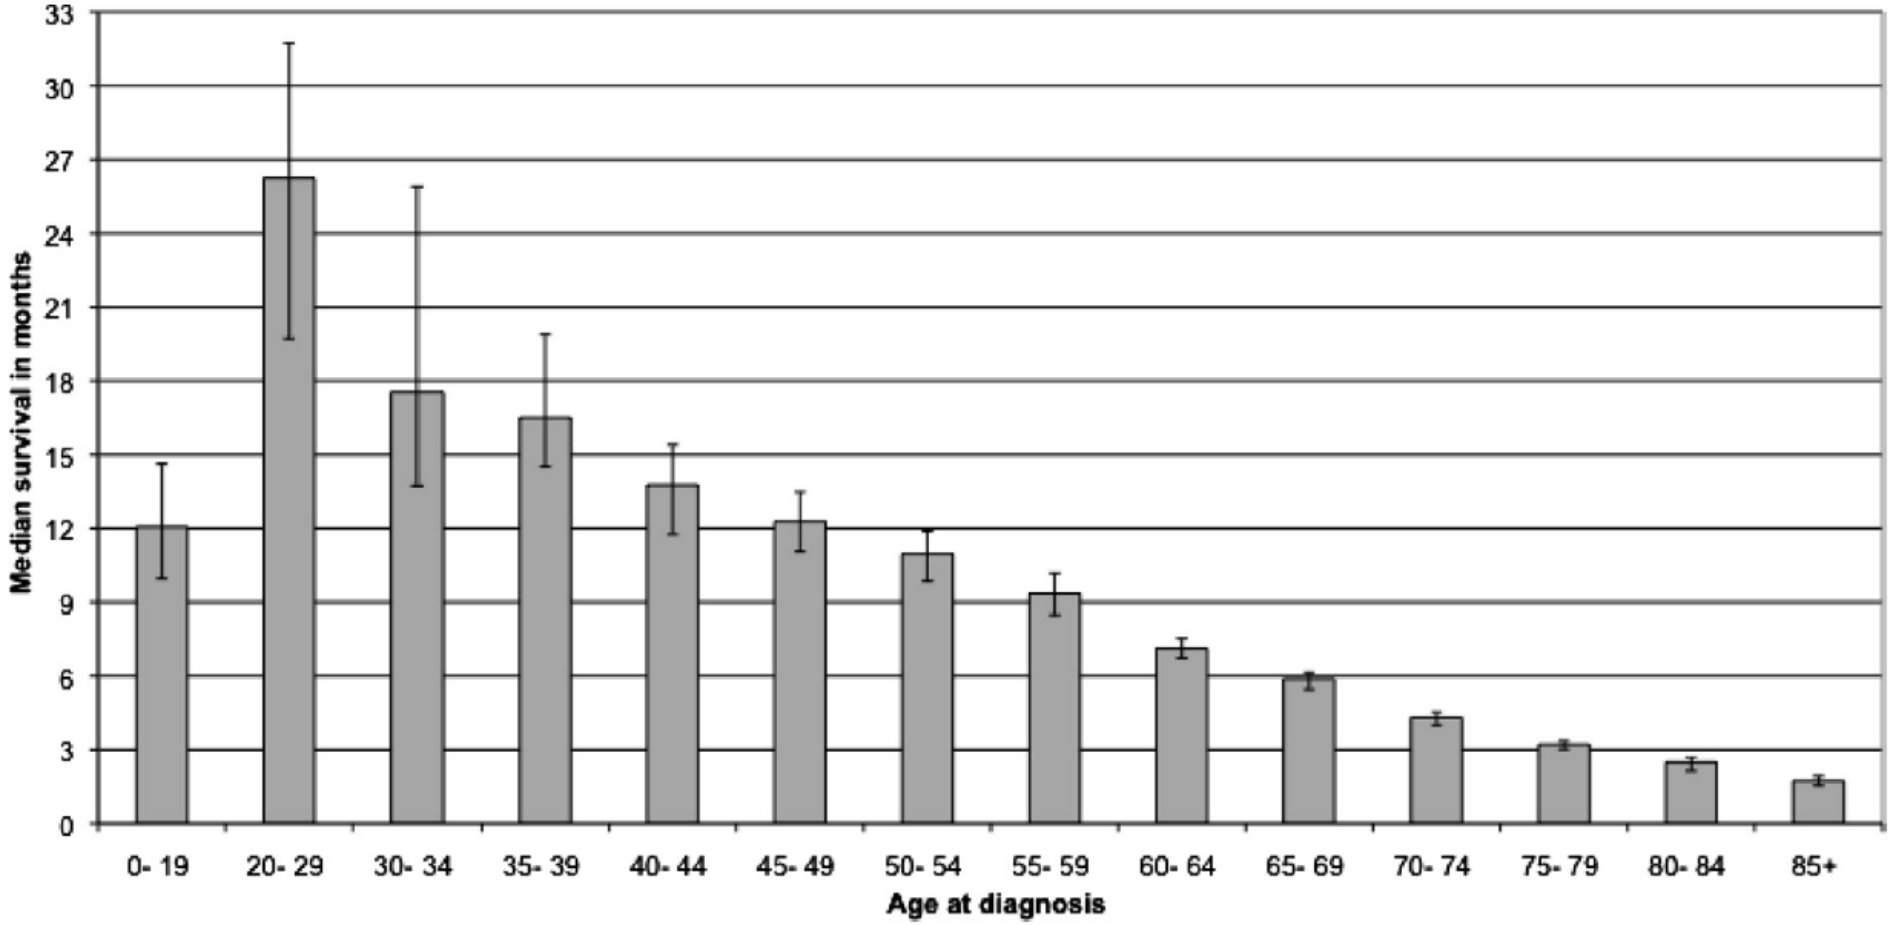

Fig. 4. Median life expectancy in months for patients with a GBM by age. There is a significant stepwise reduction in life expectancy with increasing age $\geqslant$20 years ($p < 0{\cdot}0001$). Bars denote 95% confidence intervals.

Brodbelt, EJC 2015

Case 2

- 81 yr old man with an iresectable GBM
  - Treatment options – RT or chemo
  - Historically, RT has a prognosis of ~ 6/12
    - Probably worse given lack of surgery

- Biopsy allows for MGMT-testing
  - NOA-8 study
  - Nordic

Case 2

- NOA-8 study
  - 412 pts; GBM or G3 Astrocytoma; >65 yr old; Non-inferiority 25% margin
    - TMZ 100mg/m2 d1-7q14 or
    - RT 60 in 30
  - Median OS 8/12
  - 73/209 pts were MGMT-meth
  - MGMT-meth $>_{MedianOS}$ MGMT-non-meth (12 vs 8 months)
  - MGMT-meth & TMZ $>_{EFS}$ MGMT-meth & RT
  - MGMT-non-meth & RT $>_{EFS}$ MGMT-non-meth & TMZ

Wick Lancet Onc 2012

Case 2

- Nordic study
  - 291 pts; GBM; >60 yr old
    - TMZ 200mg/m2 d1-5q28 or
    - RT 60 in 30 or
    - RT 34 in 10
  - Median OS 8/12 with RT_{34} or TMZ (~6/12 with RT_{60})
  - GBM >70yr old; $RT_{34} >_{OS} RT_{60}$
  - GBM >70yr old; TMZ $>_{OS} RT_{60}$
  - GBM >70yr old; $RT_{34} \sim_{OS}$ TMZ
  - Toxicity non-zero (3 deaths ~1%TRM)

Malmstrom LancetOnc 2012

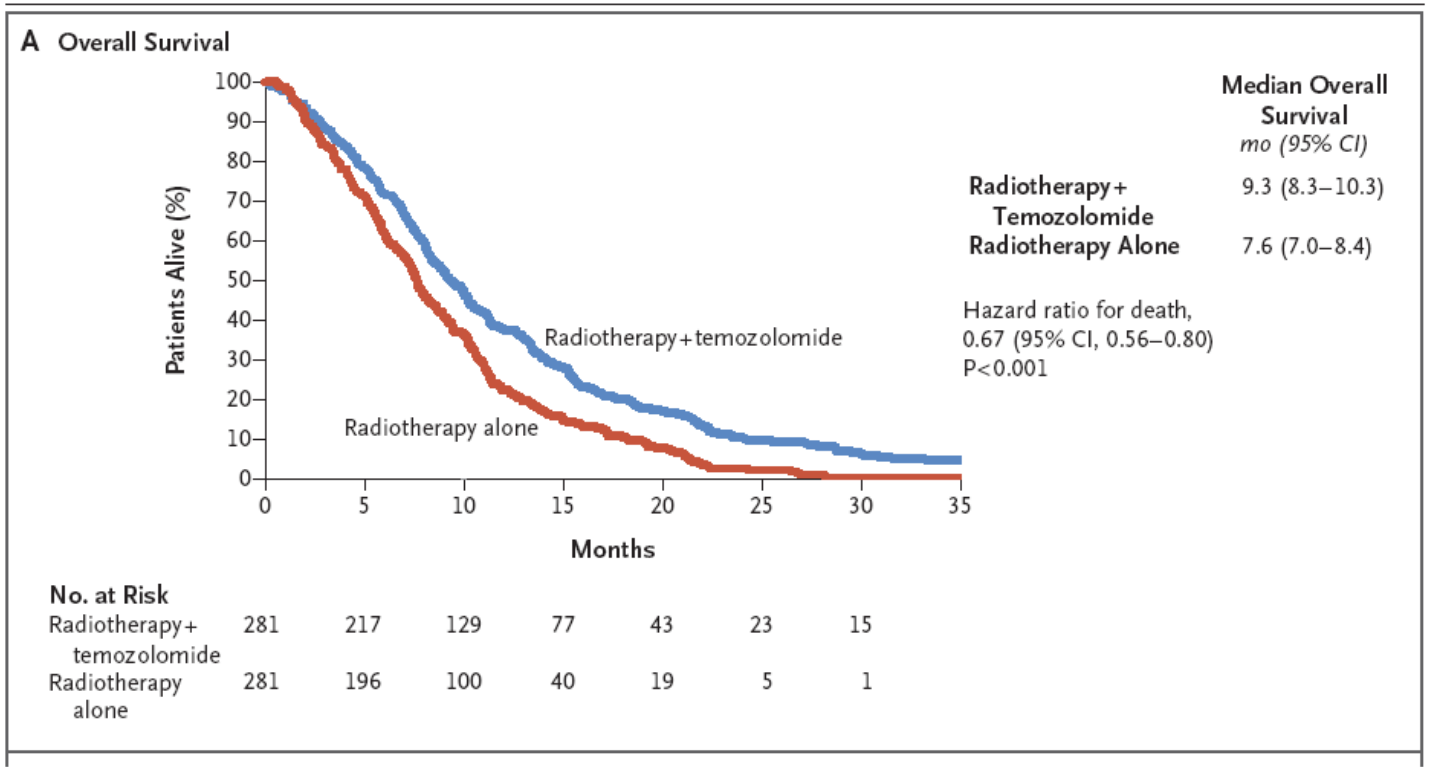
Case 2

- IAEA trial
  - 98 pts; GBM; >50 & KPS 50 – 70; >65 KPS 50 - 100
    - RT 25Gy/5# vs. 40Gy/15#
    - $RT_{25} \sim_{OS} RT_{40}$
    - $RT_{25} \sim_{PFS} RT_{40}$
    - However, not pre-specified non-inferiority trial

Roa JCO 2016

Case 2

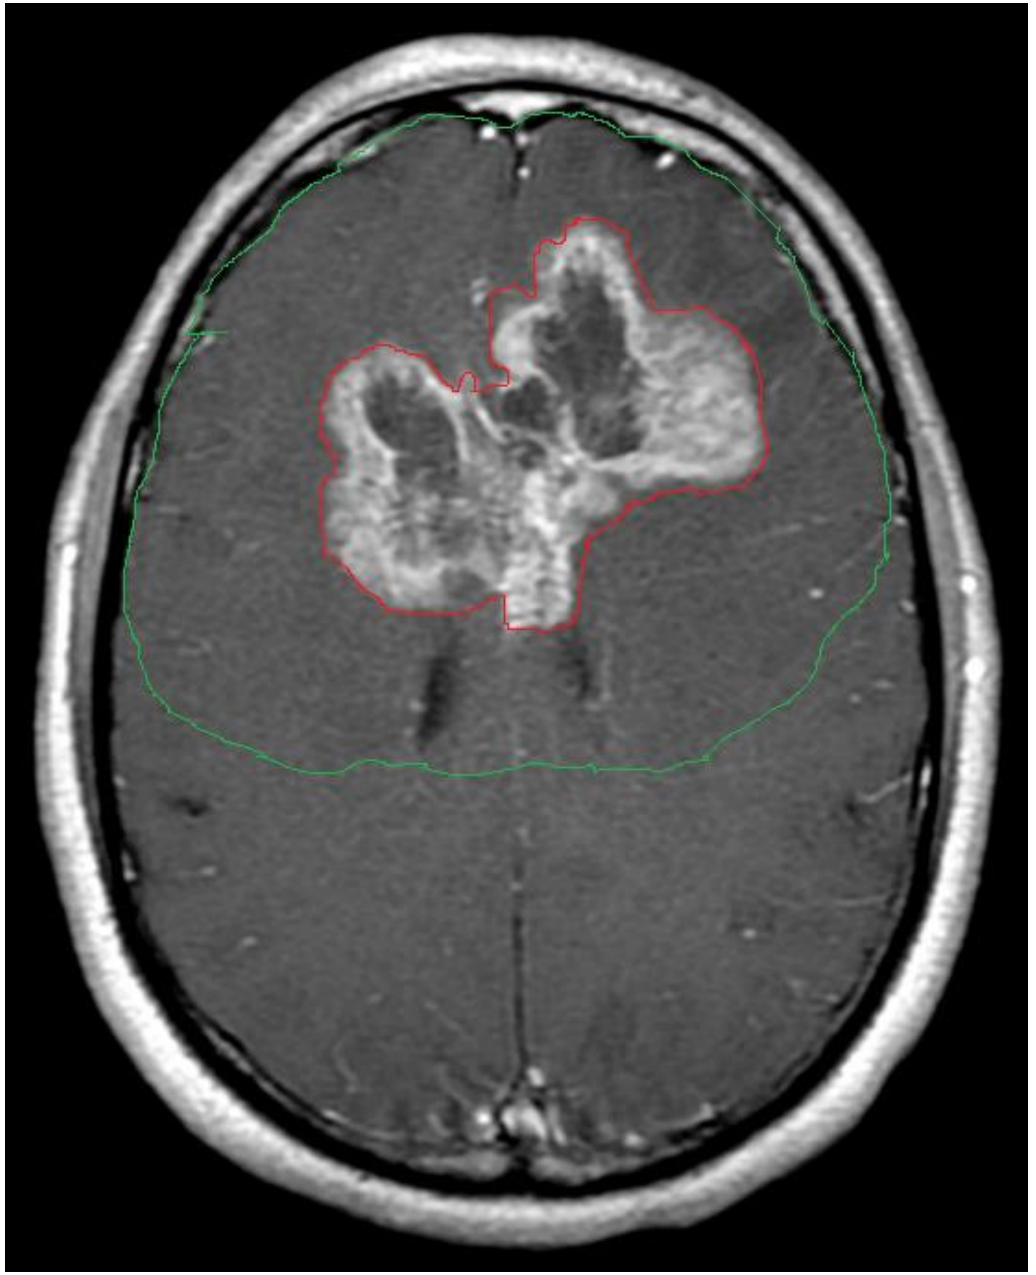
- Chemo-RT in the elderly (>65)
  - 30% > 76 yo
  - ECOG PS 0 - 2



Perry NEJM 2017

RT Margins

- GTV = CE area
- CTV = GTV +2 – 3 cm
  - Check T2 abnormality



Treatment options

- No treatment (BSC) or Treatment
- RT or TMZ
  - 30Gy/6#
  - OR 40/15 with Chemo
  - OR 25/5

Treatment options

- No treatment (BSC) or Treatment
- RT or TMZ
  - 30Gy/6#
  - OR 40/15 with Chemo
  - OR 25/5

This is a mess

What’s the best thing to do ?

Some practical considerations

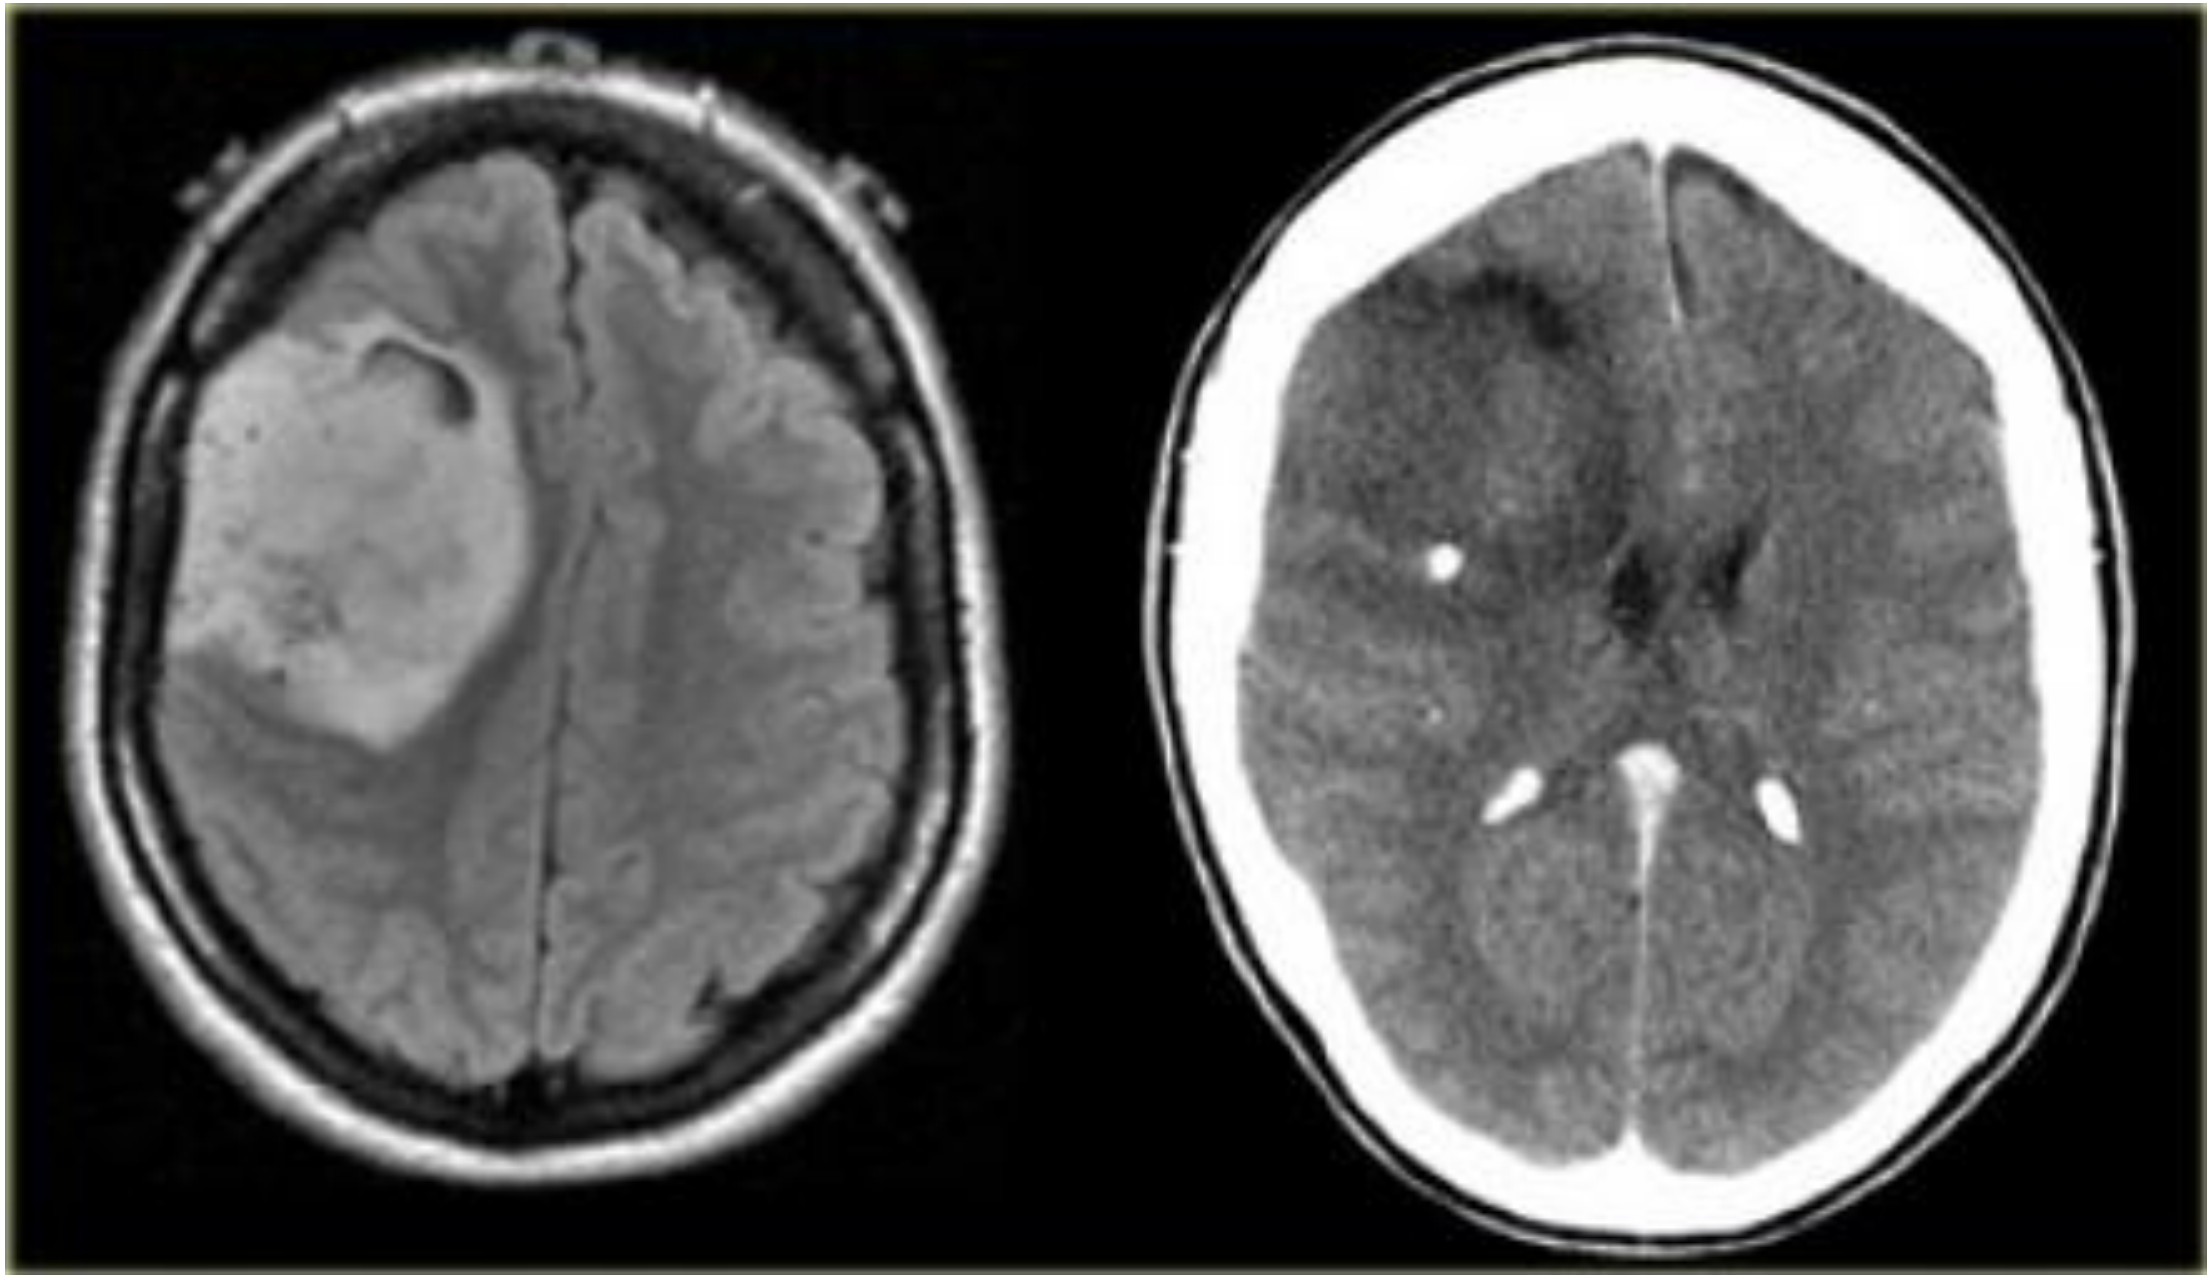
- Biopsy and MGMT testing may take weeks
  - Likely survival is ~4 – 8 months
  - Might get functional improvement with treatment (?how common)
  - May delay functional decline
- We suggest either CRT (if fit) OR surgery and RT OR Nothing

- Simultaneously address:
  - Discharge planning
  - Palliative & End-of-life care
  - Rehabilitation (OT/ PT)

Case 2 Questions ?

Case 3

- 37 yr old left-handed woman
  - Diagnosed with a ‘low-grade glioma’ 8 years ago
  - Well
  - Admitted following a single seizure
  - Clinically well
  - ECOG PS = 0



Case 3

- Lesion is likely to be an intermediate grade tumour
  - Age
  - History
  - Prolonged non-progression

- Historically divided into Grade 2 or Grade 3
  - We have known that they have variable outcomes
  - Age, histology, neurological status, tumour size, grade are prognostic
  - And yet still much variability

Case 3 pathology

- Note that grade is still important
- But for grade 2/3, mol pathology is important
- But there are other factors
  - Age
  - Performance Status
  - Surgical resectability
  - rCBV on perfusion MRI

- We do not yet know how to integrate these
  - Don’t yet appear in the WHO classification

Brief detour

- This is a generic problem
- We know a,b and c are important
- We know how they relate to each other and outcomes
  - Then we show that x and y are more important than a
  - Now we have x and y, b and c
  - But we don’t know how they relate to each other…

  - Updating multi-parameter models with non-independence of parameters
  - Significant underlying technical challenge

Case 3 pathology

- Partial resection
  - ~4cc of tissue
- Molecular pathology shows Grade 3 astrocytoma
  - 1p/19q co-deleted
  - IDH-1 mutated
  - MGMT methylated

Case 3 pathology

- Partial resection
  - ~4cc of tissue
- Molecular pathology shows Grade 3 astrocytoma
  - 1p/19q co-deleted
  - IDH-1 mutated
  - MGMT methylated

What does this mean ?

Case 3 Management

- How would you interpret the pathology ?
- Treatment ?
- Prognosis ?

Case 3 Management

- How would you interpret the pathology ?

A: GBM
B: Anaplastic Astro (Grade 3)
C: Anaplastic Oligo (Grade 3)
D: Anaplastic OligoAstro (Grade 3)
E: Astrocytoma (Grade 2)

(Report: Grade 3 astrocytoma; 1p/19q co-deleted; IDH-1 mutated; MGMT methylated)

Case 3 Pathology

- Molecular pathology shows Grade 3 astrocytoma
  - 1p/19q co-deleted
  - IDH-1 mutated
  - MGMT methylated

- This is a grade 3 oligodendroglioma
  - 1p/19q co-deletion is prognostic AND predictive

Case 3 Pathology

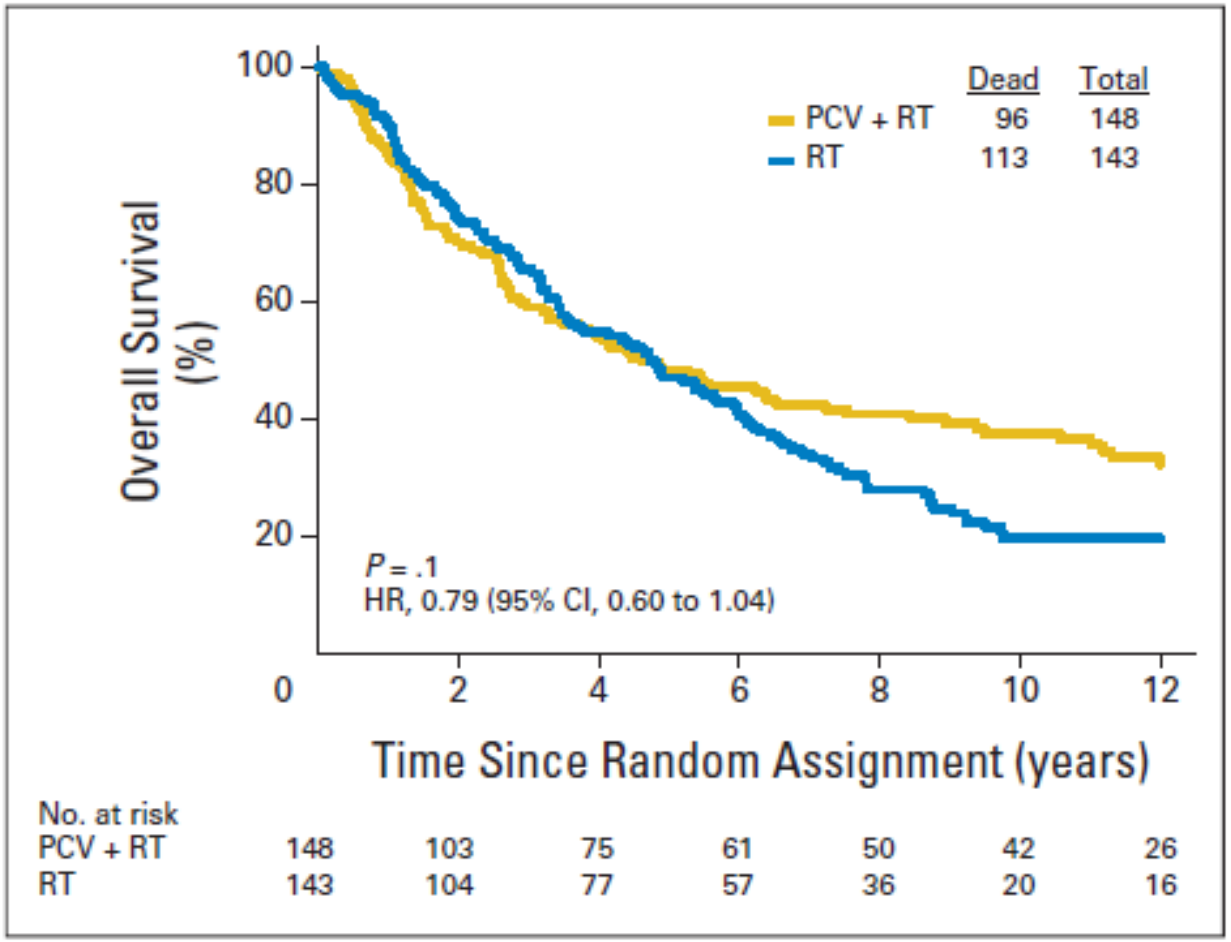


Fig 2. Kaplan-Meier estimates of overall survival by treatment group. The hazard ratio (HR) for survival of patients treated with procarbazine, lomustine, and vincristine (PCV) plus radiotherapy (RT) compared with RT alone was 0.79 (95% CI, 0.60 to 1.04; $P = .1$).

Prognostic – 1p/19q better for both arms

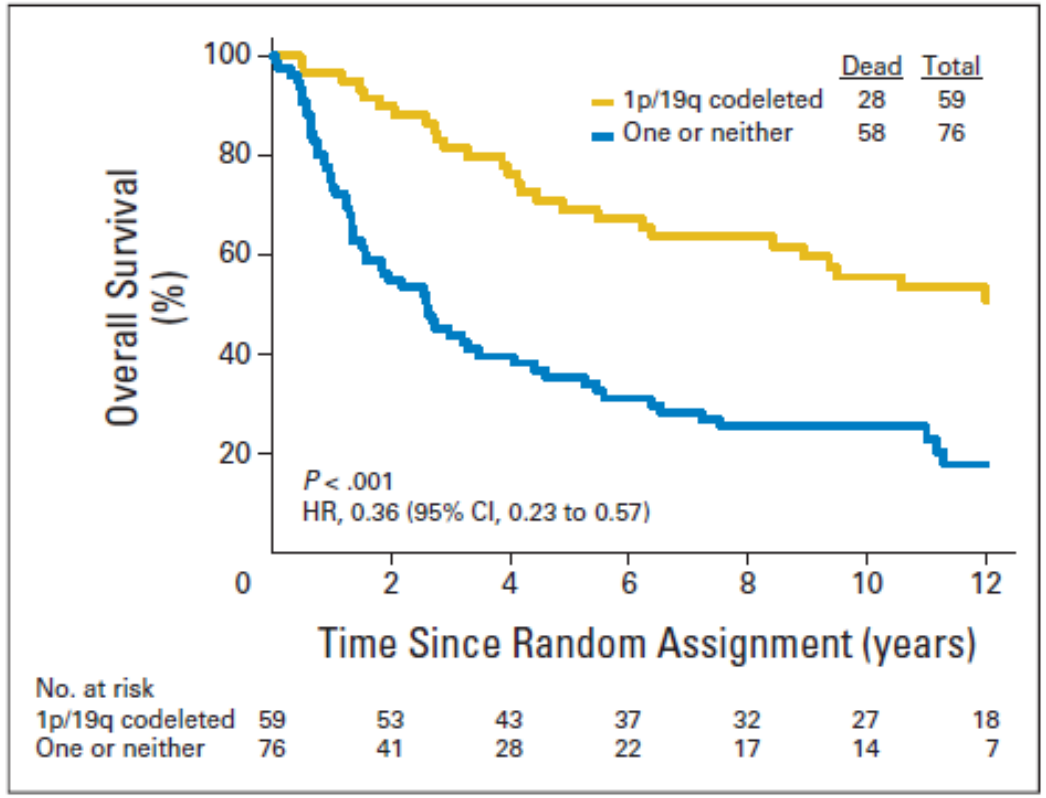

Fig 3. Kaplan-Meier estimates of overall survival by genotype for procarbazine, lomustine, and vincristine plus radiotherapy arm. The hazard ratio (HR) for overall survival of patients with 1p/19q codeleted anaplastic oligodendroglioma (AO)/anaplastic oligoastrocytoma (AOA) compared with those with AO/AOA in whom one or neither allele was deleted was 0.36 (95% CI, 0.23 to 0.57; $P < .001$).

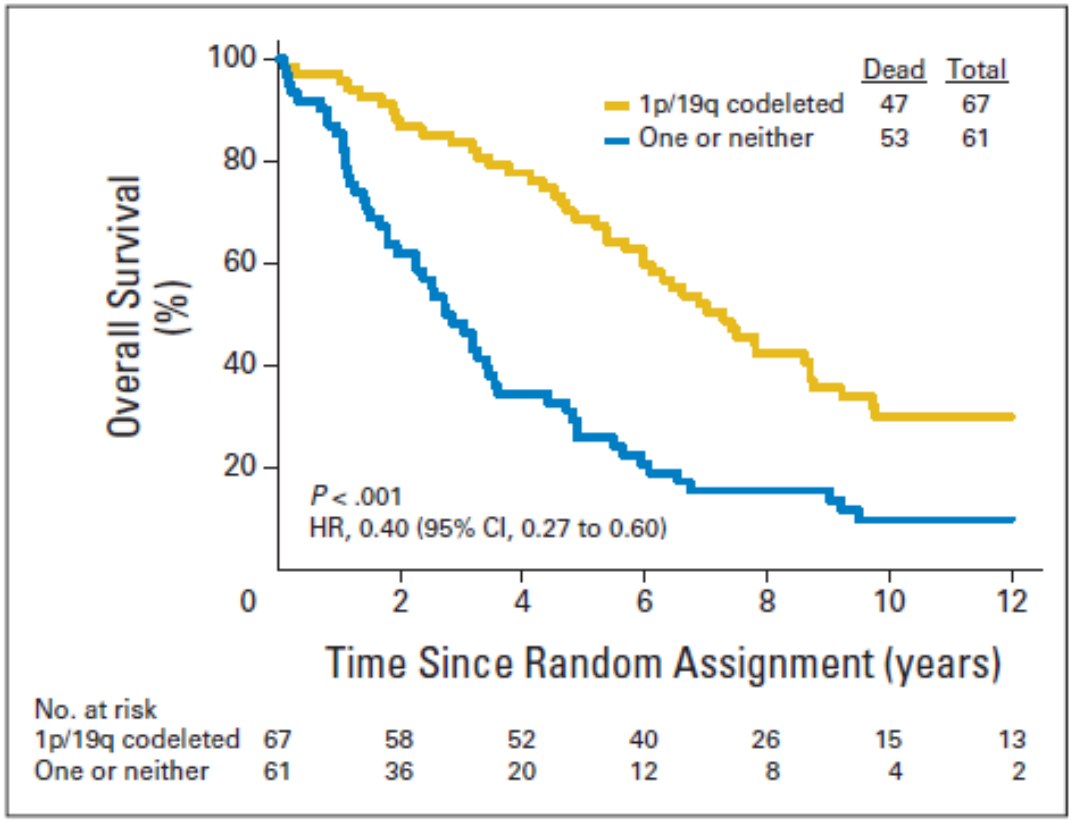

Fig 4. Kaplan-Meier estimates of overall survival by genotype for radiotherapy arm. The hazard ratio (HR) for overall survival of patients with 1p/19q codeleted anaplastic oligodendroglioma (AO)/anaplastic oligoastrocytoma (AOA) compared with those with AO/AOA in whom one or neither allele was deleted was 0.40 (95% CI, 0.27 to 0.60; $P < .001$).

Predictive

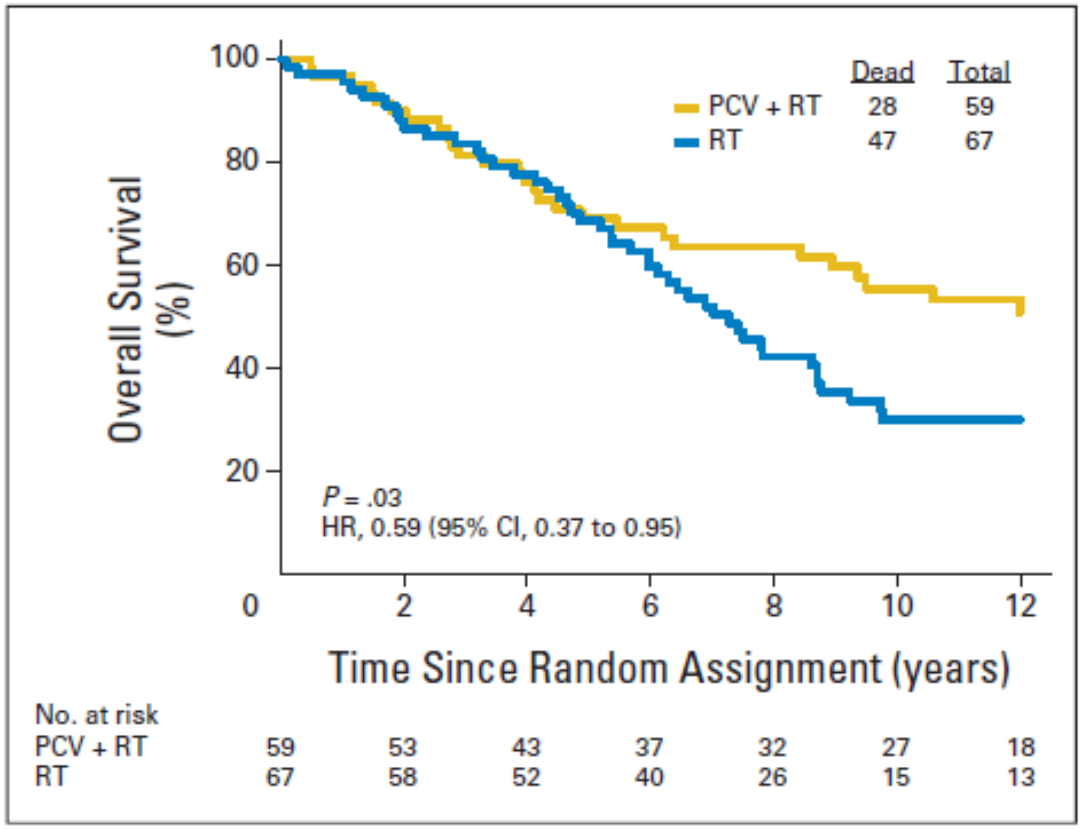

Fig 5. Kaplan-Meier estimates of overall survival by treatment for patients with 1p/19q codeleted anaplastic oligodendroglioma (AO)/anaplastic oligoastrocytoma (AOA). The hazard ratio (HR) for overall survival of patients with codeleted AO/AOA treated with procarbazine, lomustine, and vincristine (PCV) plus radiotherapy (RT) compared with those treated with RT alone was 0.59 (95% CI, 0.37 to 0.95; $P = .03$).

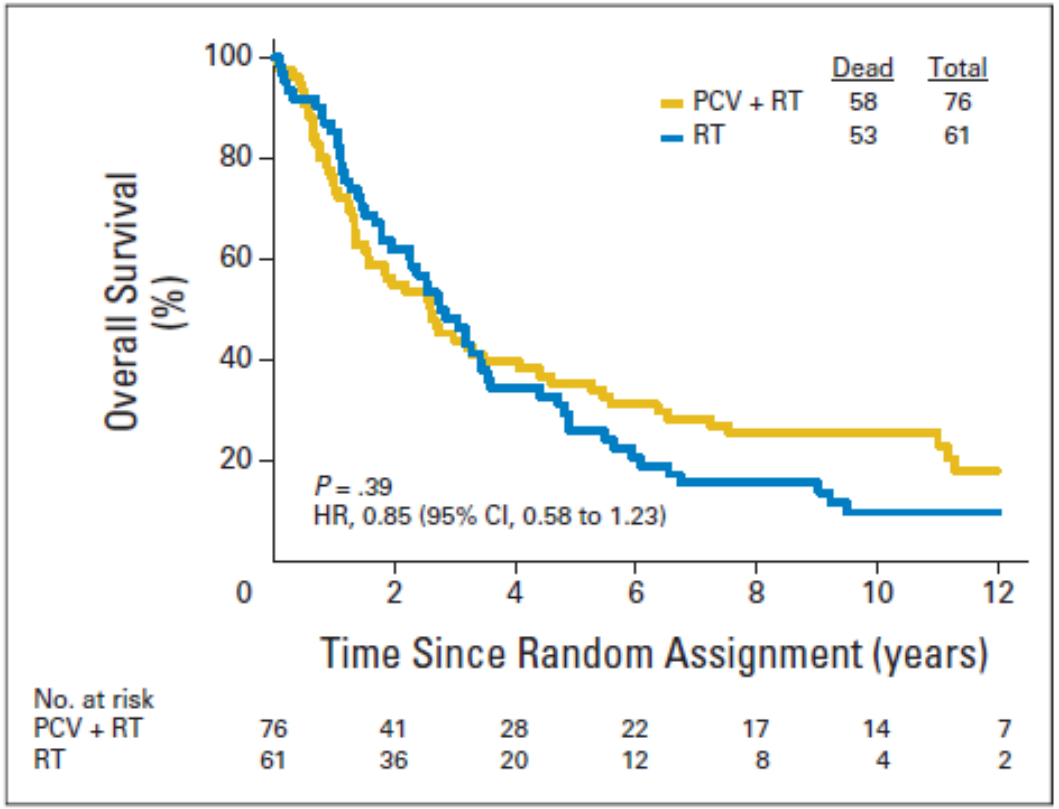

Fig 6. Kaplan-Meier estimates of overall survival by treatment for patients with anaplastic oligodendroglioma (AO)/anaplastic oligoastrocytoma (AOA) in whom one or neither allele (1p or 19q) was deleted. The hazard ratio (HR) for overall survival of those with noncodeleted AO/AOA treated with procarbazine, lomustine, and vincristine (PCV) plus radiotherapy (RT) compared with those treated with RT alone was 0.85 (95% CI, 0.58 to 1.23; $P = .39$).

Case 3 Management

- Treatment:
  - Optimal treatment for G3 oligo is (surgery), RT and chemo
  - G3 ‘oligo’: RT + PCV $>_{OS}$ RT alone
    - 1p/19q is prognostic, as is IDH-1 mutation
    - 1p/19q is also predictive
    - Unclear if there is a role for chemo in non-1p/19q co-deleted tumours

- Prognosis ?

Cainrncross, JCO 2013
van den Bent, JCO 2013

Case 3 Management

- Patient says they will have EITHER RT or chemo, but not both
  - Which would you suggest ?

A: RT
B: Chemo

Case 3 Management

- Patient says they will have EITHER RT or chemo, but not both
  - Which would you suggest ?

  A: RT
  B: Chemo

- NOA-04:
  - RT ~ Chemo (with cross-over)

Wick, JCO 2009

Case 3 Management

- Prognosis ?
  - RT Alone; Chemo alone; RT then chemo
  - Median Survival:

A: <5 Yrs

B: 5 – 10 Yrs

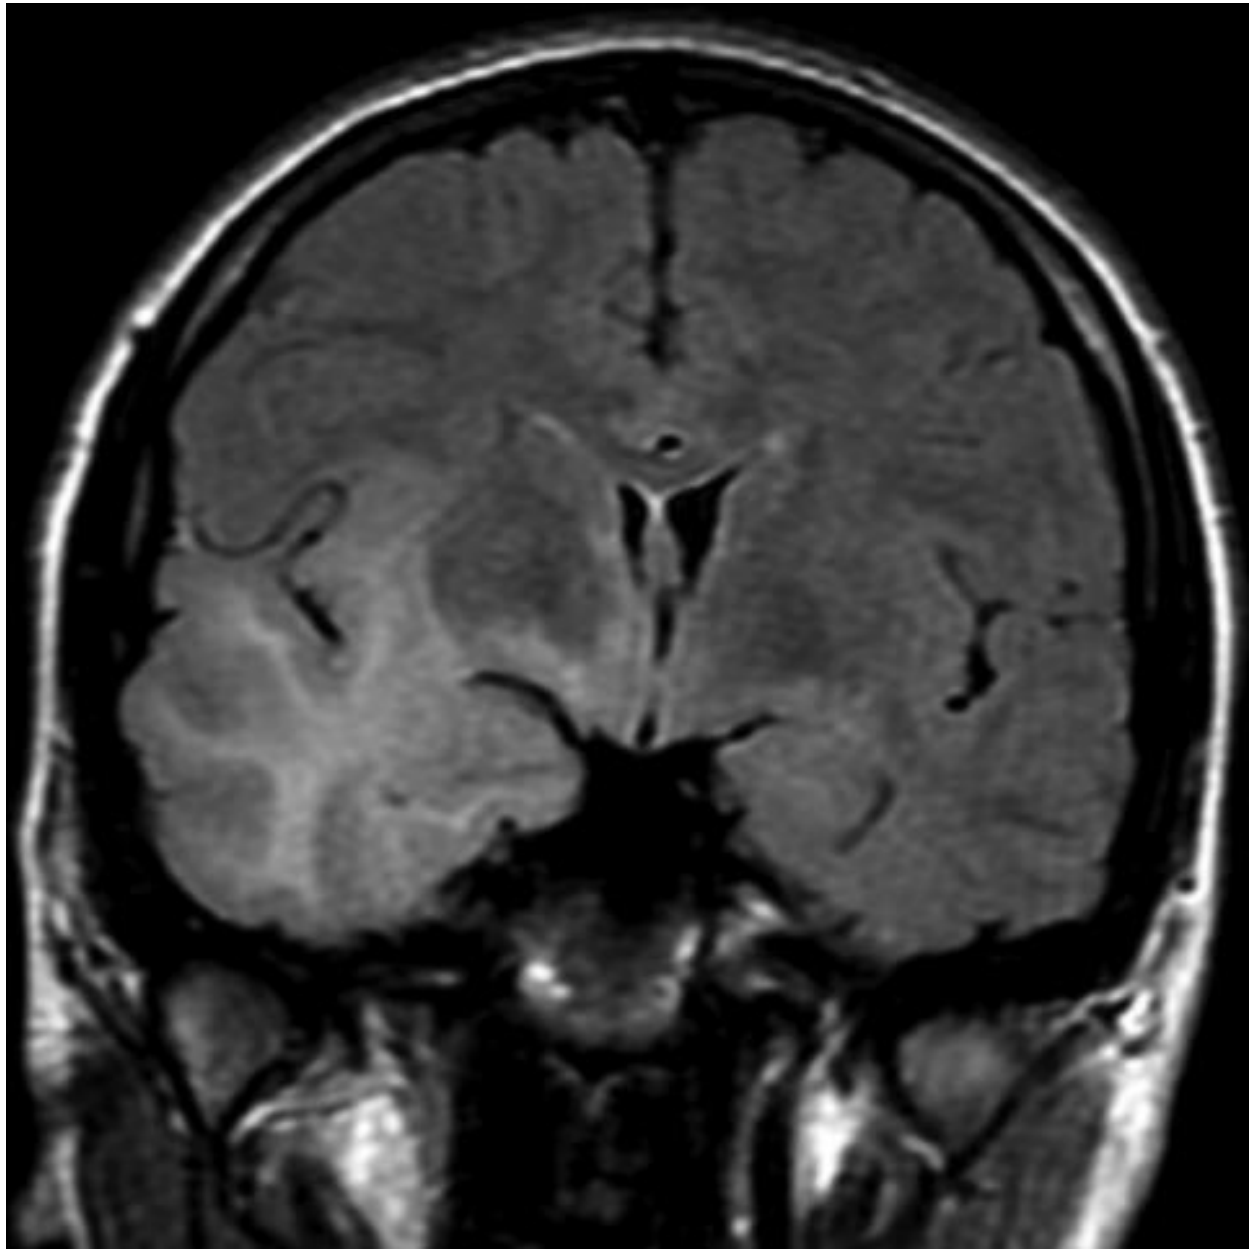
C: 10 – 15 Yrs

D: 15 – 20 Yrs

Case 3 Questions ?

Case 4

- 27 yr old man with increasing sensory symptoms in his left arm
  - Occasionally spreading to left leg and arm
  - Increasing frequency over the last 3 months
  - Otherwise well



Case 4

- What is the likely diagnosis ?
- What is the likely prognosis ?

Case 4 Management

- Young man
- Gradual onset of symptoms
- Imaging more suggestive of low-grade glioma

Case 4 Management

- Most likely to be grade 2 astrocytoma
  - Bx would help
- Prognosis in LGG:

Astrocytoma histology
Age >=40
Tumor >=6 cm
Tumor crossing midline
Neurologic deficit

Risk Group	Score	Median OS
Low risk	0 - 2	7.8 years
High risk	3 - 5	3.7 years

Prognosis in ‘Low risk’ group:
55 yr old, triple-neg
20mm, 4 LN+ve woman with breast cancer

Pignatti, JCO 2002

Case 4 Management

- Most likely to be grade 2 astrocytoma
  - Bx would help
- Prognosis in LGG:

Astrocytoma histology
Age >=40
Tumor >=6 cm
Tumor crossing midline
Neurologic deficit

Risk Group	Score	Median OS
Low risk	0 - 2	7.8 years
High risk	3 - 5	3.7 years

Prognosis in 'Low risk' group:
55 yr old, triple-neg
20mm, 4 LN+ve woman with breast cancer

This is an old study…
Don't you have anything newer ?

Pignatti, JCO 2002

Case 4 Management

- Options:
  - Surveillance
  - Surgery
  - RT
  - Chemo
  - Combination of the above

  - Genuinely think that LGG is one of the most challenging tumours for decision-making
  - Risks of long-term toxicity
  - Under-appreciated impact of tumours

Case 4 Management

- Surgery
  - No randomised data for surgery in LGG
  - Several pieces of evidence favour surgery
    - However, we are balancing OS against functional deficits
    - Very operator and centre dependent
    - Even in large centres, with technology, substantial rates of post-op deficit
  - Early resection hospital $>_{OS}$ Late resection hospital
    - 153 pts from Norway

Jakola, JAMA 2012

Case 4 Management

- Adjuvant therapy
  - RT
  - Chemo
  - Combined
  - Nothing

Case 4 Management

- Early RT $>_{PFS}$ Late RT
- Early RT $\sim_{OS}$ Late RT
- Early RT $\sim_{RiskTrans}$ Late RT

- TMZ ~or $<_{OS}$ RT

- RT + PCV > RT alone
  - RTOG 98-02 (1998 – 2002)
    - RT + PCV $>_{OS}$ RT (13 vs 7 yrs)
    - RT + PCV $>_{PFS}$ RT
- RT + PCV $\sim_{CogFunct}$ RT alone

van den Bent Lancet 2005

Case 4 Management

- RT Dose
  - $RT_{>45} \sim_{OS} RT_{45}$
  - $RT_{>45} <_{Tox} RT_{45}$
- But..
  - RTOG 98-02 used 54/30

Case 4 Management

- Central problem is of risk-stratification
  - JCO risk model
  - EORTC updated risk model
    - Time since first LGG symptoms
    - MRC score
    - Astrocytoma
    - Tumor size >5cm
  - Add other things?
    - Perfusion MRI
    - Etc.

Gorlia, NeuroOnc 2013

Case 4 Management

- Central problem is of risk-stratification
  - JCO risk model
  - EORTC updated risk model
    - Time since first LGG symptoms
    - MRC score
    - Astrocytoma
    - Tumor size >5cm
  - Add other things?
    - Perfusion MRI
    - Etc.

This is newer…. But still missing lots of things

Gorlia, NeuroOnc 2013

Case 4 Management

- RTOG 98-02 ‘Low-risk’ group
  - Aged <40 and GTR of tumour (111 pts)
  - 50% PFS at 5 years

Gorlia, NeuroOnc 2013

Case 4 Management

- RTOG 98-02 ‘Low-risk’ group
  - Aged <40 and GTR of tumour (111 pts)
  - 50% PFS at 5 years

That is small group of patients, who have a complete resection

Gorlia, NeuroOnc 2013

Case 4 Pathology

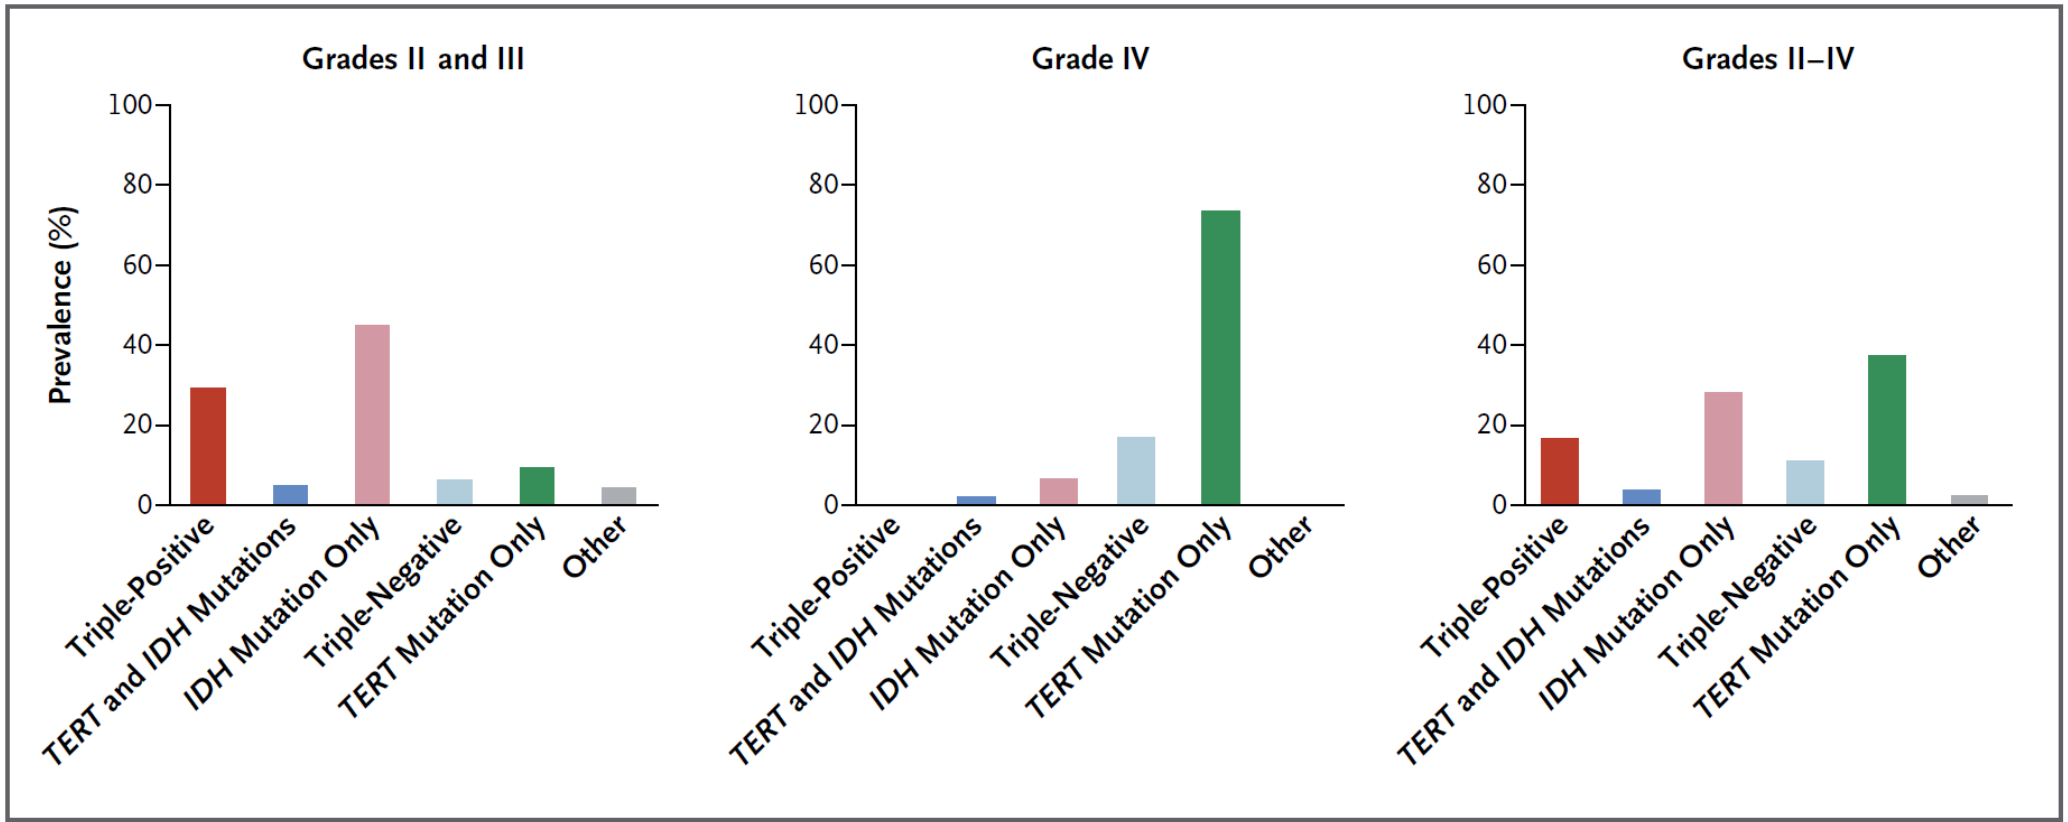


Figure 1. Prevalence of the Glioma Molecular Groups in the Combined Sample.

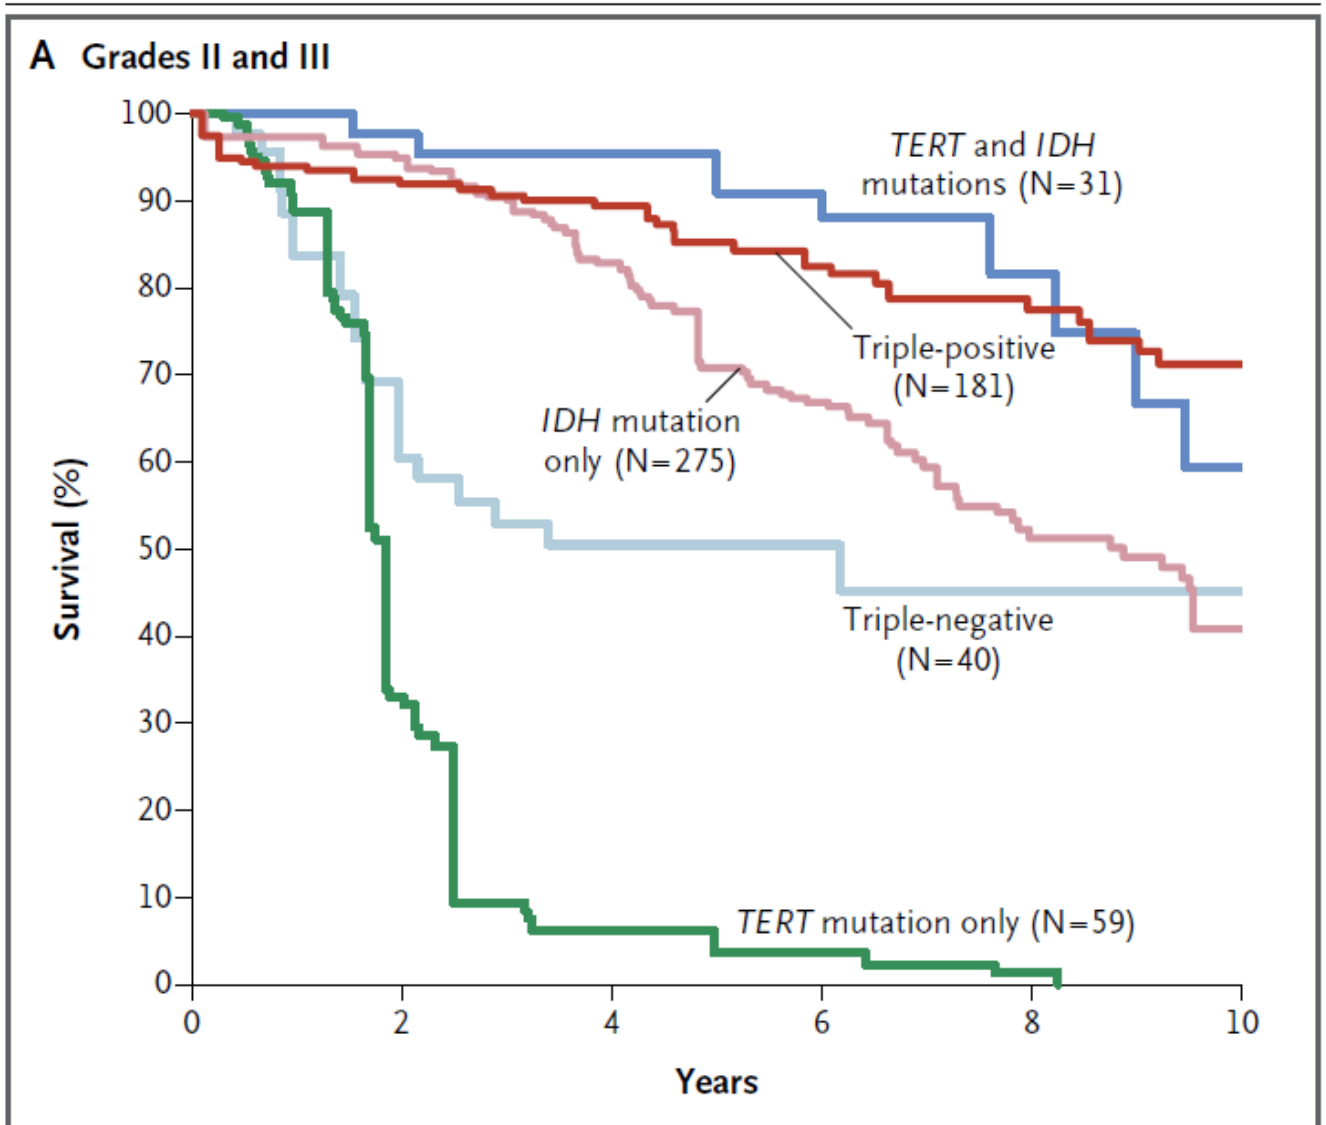
The prevalence of the molecular groups among gliomas of grade II or III (astrocytomas, mixed oligoastrocytomas, and oligodendrogliomas), grade IV (glioblastoma multiforme), and grades II through IV combined is shown.

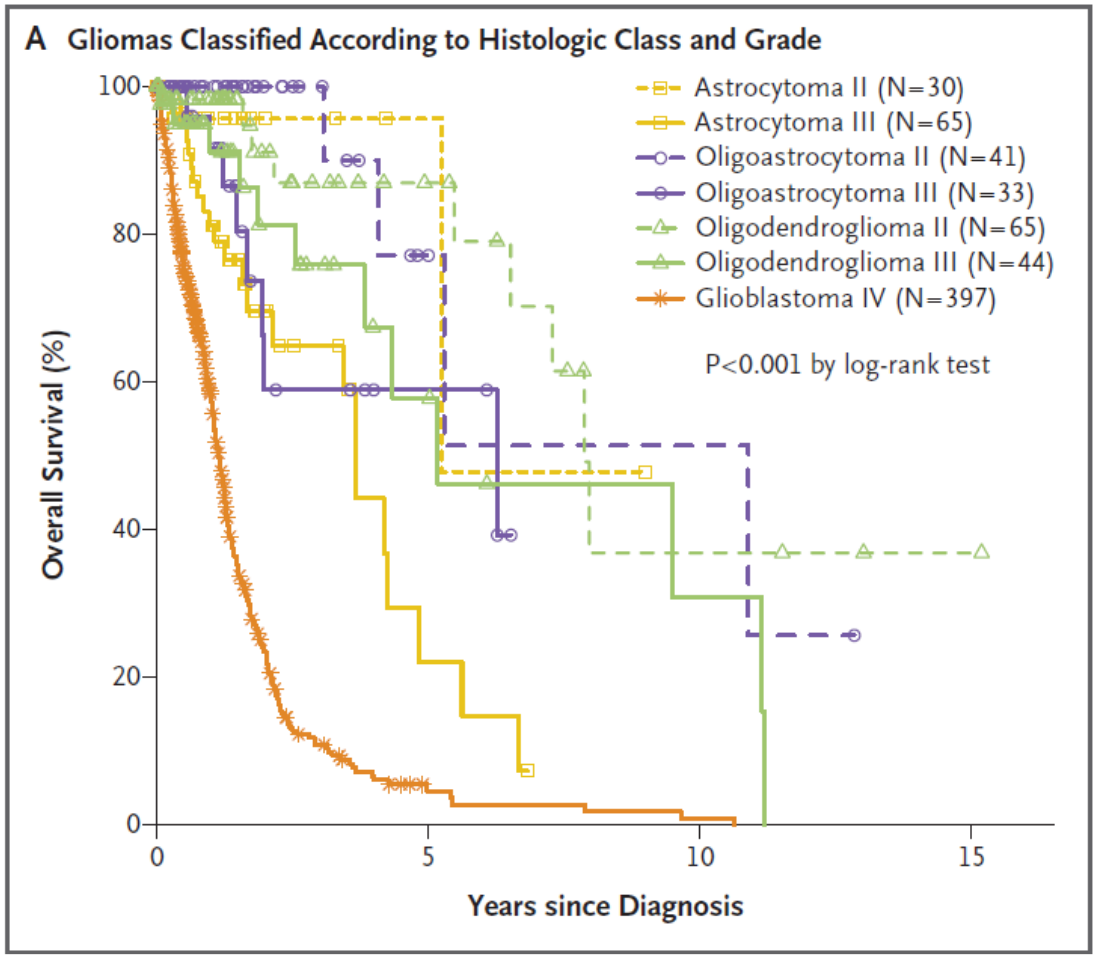
Eckel-Passow NEJM 2015

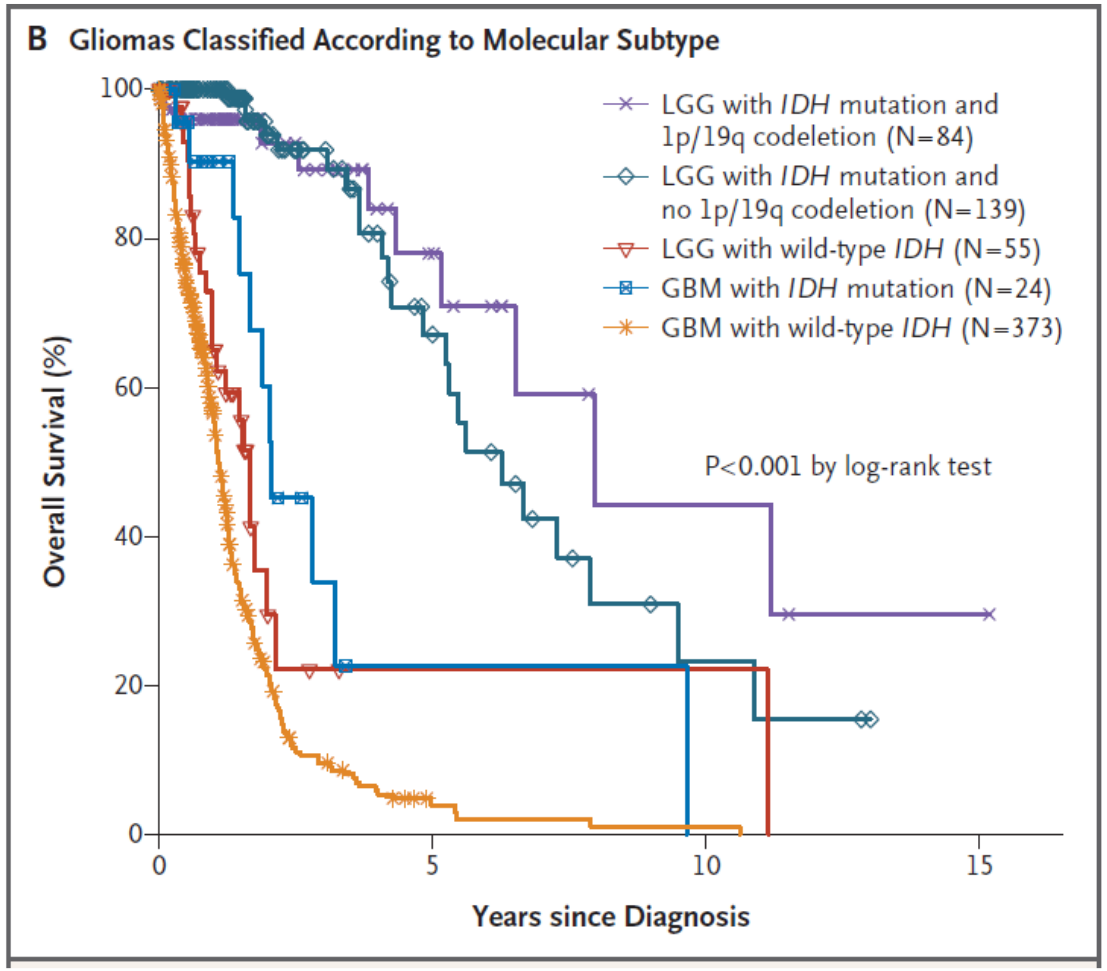
Case 4 Pathology



Eckel-Passow NEJM 2015

Case 4 Pathology





Case 4 Management

- Biopsy shows grade 2 astrocytoma
  - Mol pathology shows:
  - 1p/19q non co-del
  - IDH -1 mutant
  - ATRX wild-type

- Treatment ?
- Prognosis ?

Case 4 treatment

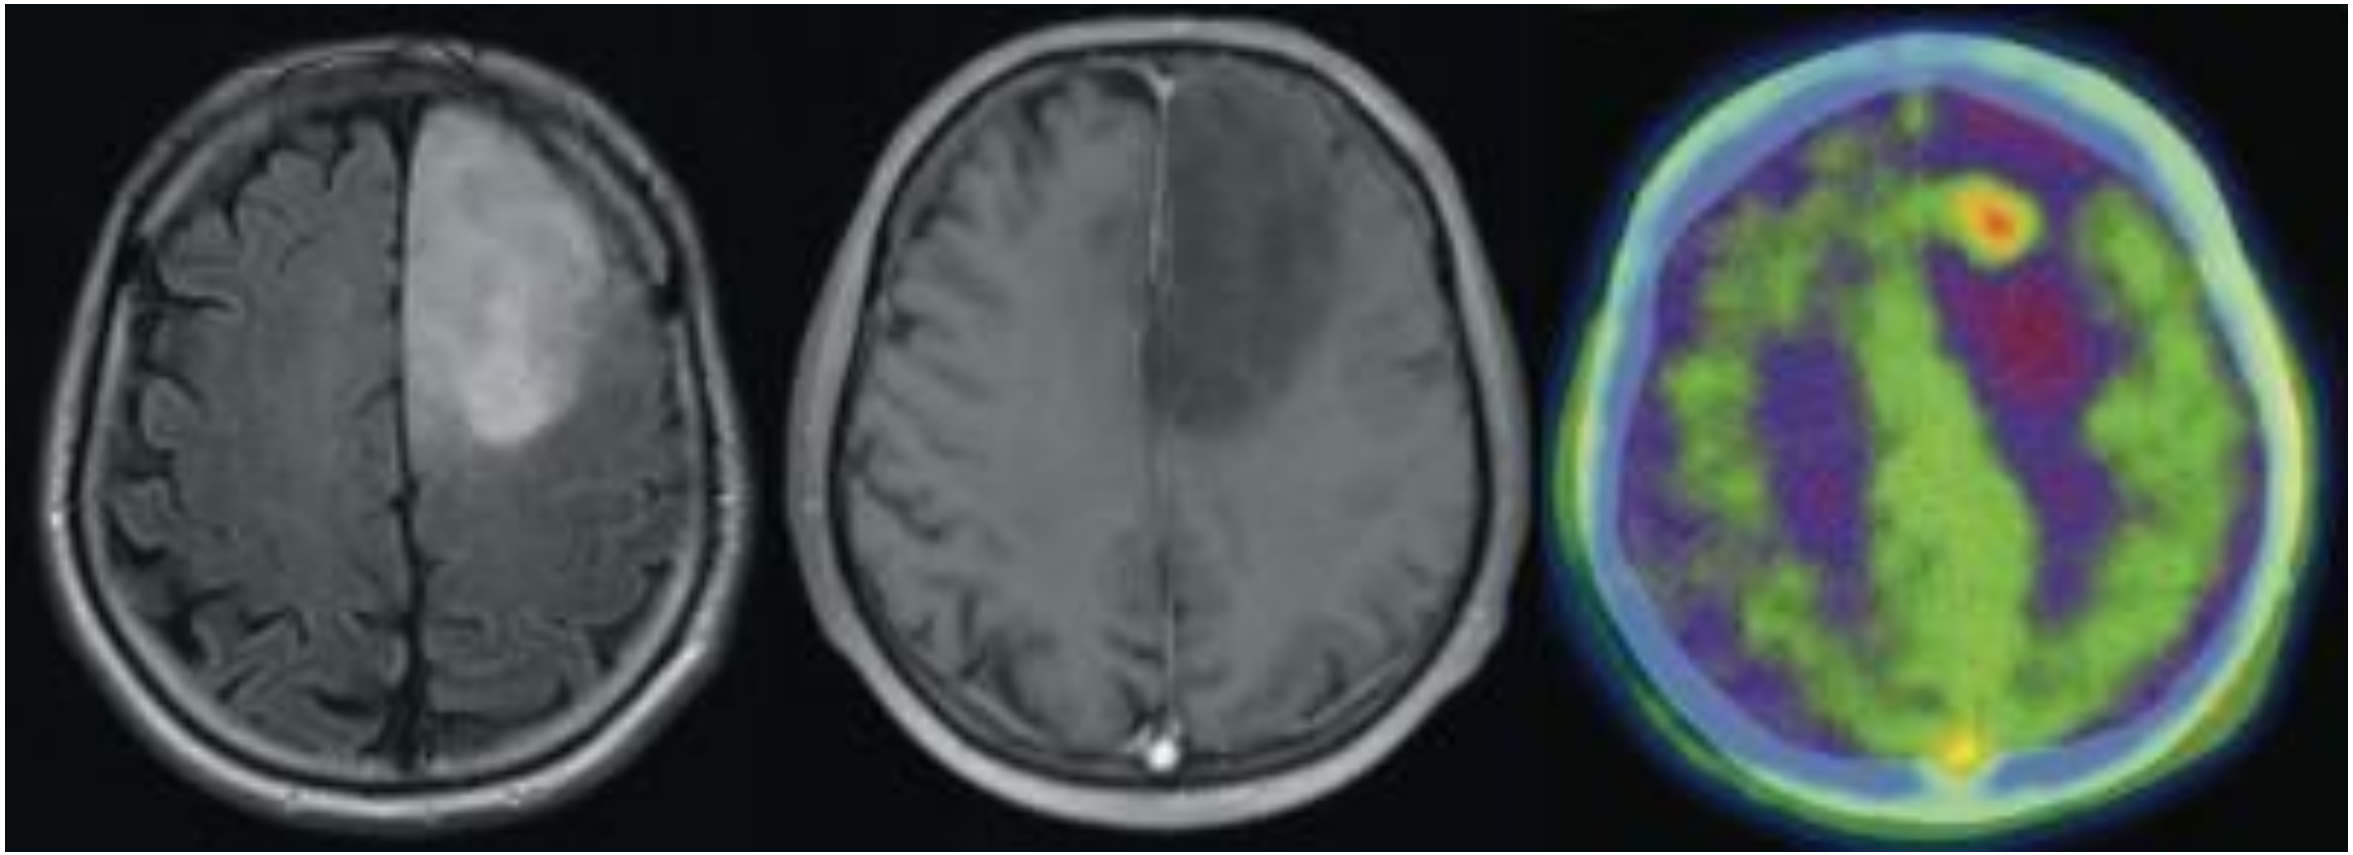
- Suggest Active surveillance
- Biopsy is helpful
- Beware of ‘gentle drift’
  - Often useful to compare imaging over a longer time span

- If we need to treat, then RT + Chemo is better than RT
  - What dose to use ?

Case 4 Questions ?

Case 5

- 55 yr old man
  - Sudden onset facial droop
  - In retrospect, 2 episodes of ‘automatism’ - walked home without remembering it
  - Past history of hypertension and hypercholestrolaemia



Case 5

- What does the imaging suggest ?
- Prognosis ?

Case 5

Astrocytoma histology
Age >=40
Tumor >=6 cm
Tumor crossing midline
Neurologic deficit

Risk Group	Score	Median OS
Low risk	0 - 2	7.8 years
High risk	3 - 5	3.7 years

Time Since first symptoms (30 wks; longer better)

MRC score (No probs/ some or major deficit)

Astrocytoma

Tumour size (5cm)

Case 5

Astrocytoma histology
Age >=40
Tumor >=6 cm
Tumor crossing midline
Neurologic deficit

Risk Group	Score	Median OS
Low risk	0 - 2	7.8 years
High risk	3 - 5	3.7 years

Newer EORTC still doesn't include molecular pathology

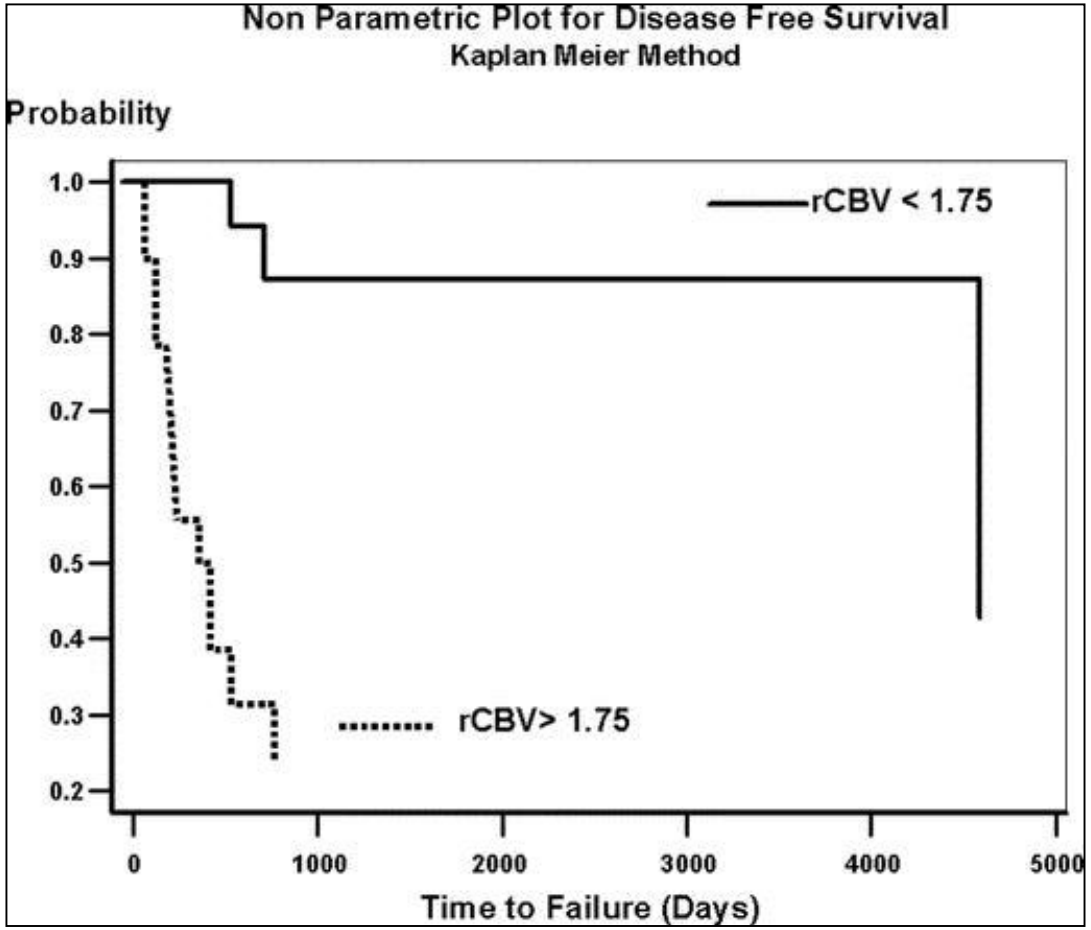
Time Since first symptoms (30 wks; longer better)

MRC score (No probs/ some or major deficit)

Astrocytoma

Tumour size (5cm)

Role of rCBV



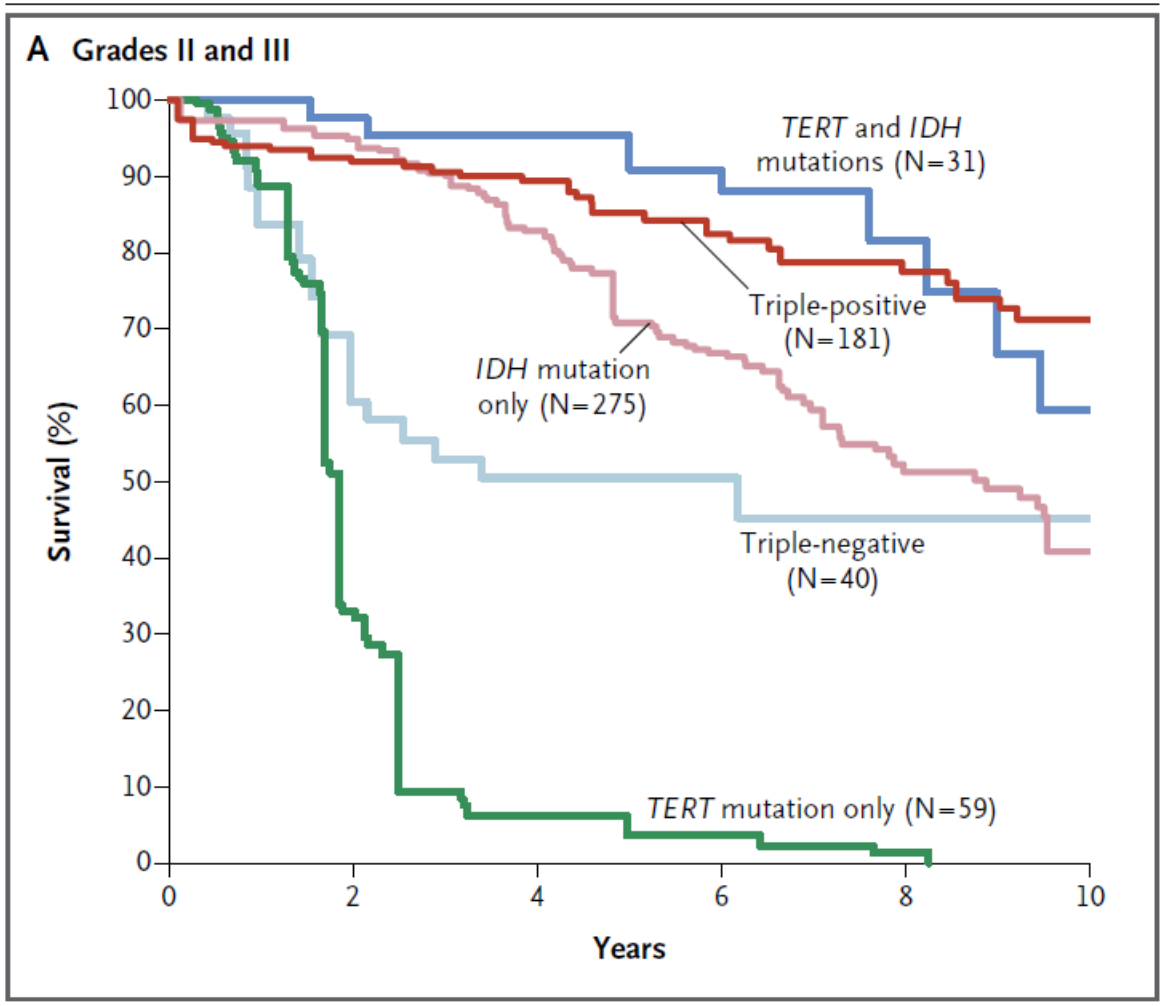
Perfusion Magnetic Resonance Imaging Predicts Patient Outcome as an Adjunct to Histopathology: A Second Reference Standard in the Surgical and Nonsurgical Treatment of Low-grade Gliomas.
Law, Meng; Oh, Sarah; Johnson, Glyn; Babb, James; Zagzag, David; Golfinos, John; Kelly, Patrick

Neurosurgery. 58(6):1099-1107, June 2006.
DOI: 10.1227/01.NEU.0000215944.81730.18

Case 5 Prognosis

- ‘Conventional’ prognosis
- Functional imaging adds to this
  - Also adds info on targeting of surgery

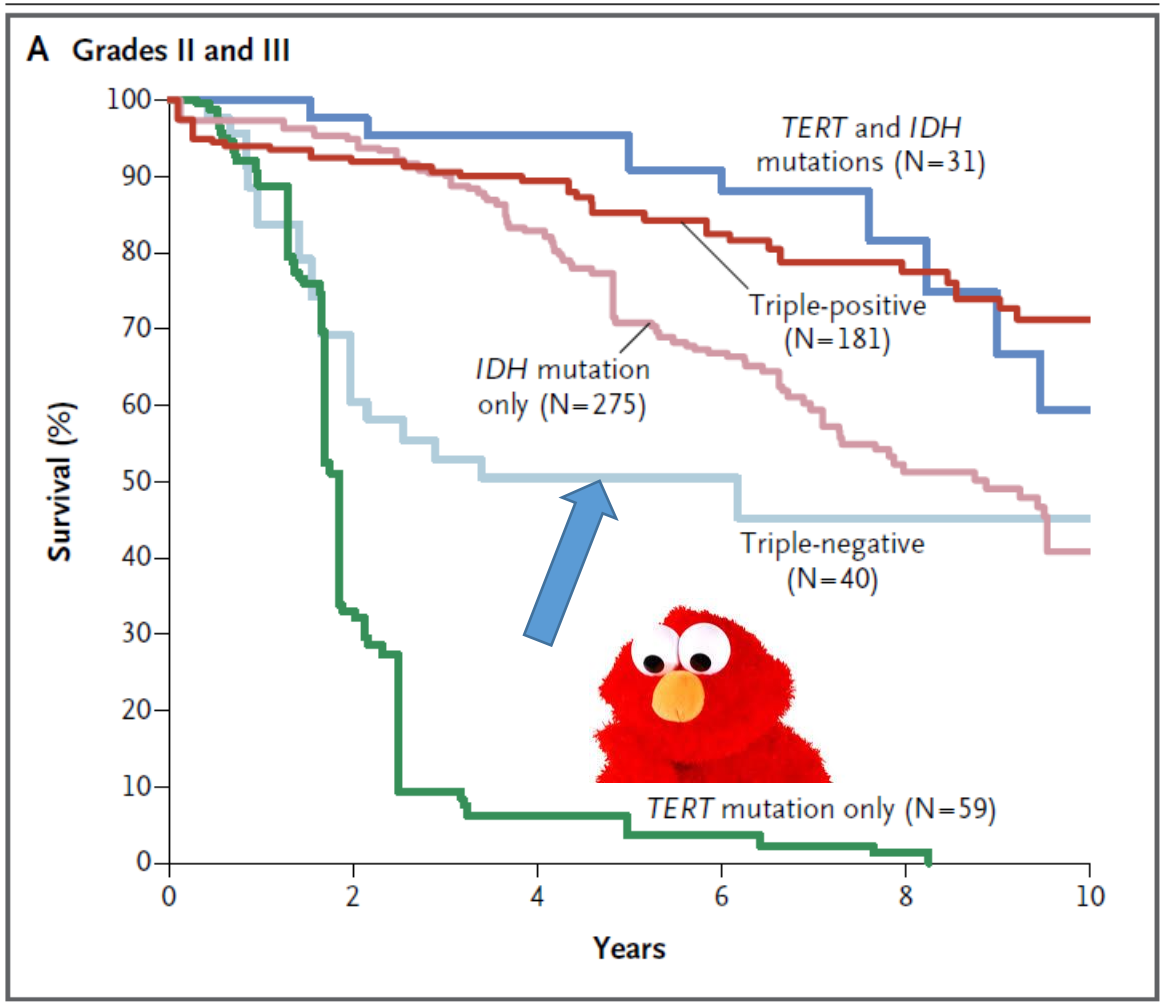
- Bx shows
  - IDH-wt
  - TERT-wt
  - No 1p/19q loss



Case 5 Prognosis

- ‘Conventional’ prognosis
- Functional imaging adds to this
  - Also adds info on targeting of surgery

- Bx shows
  - IDH-wt
  - TERT-wt
  - No 1p/19q loss



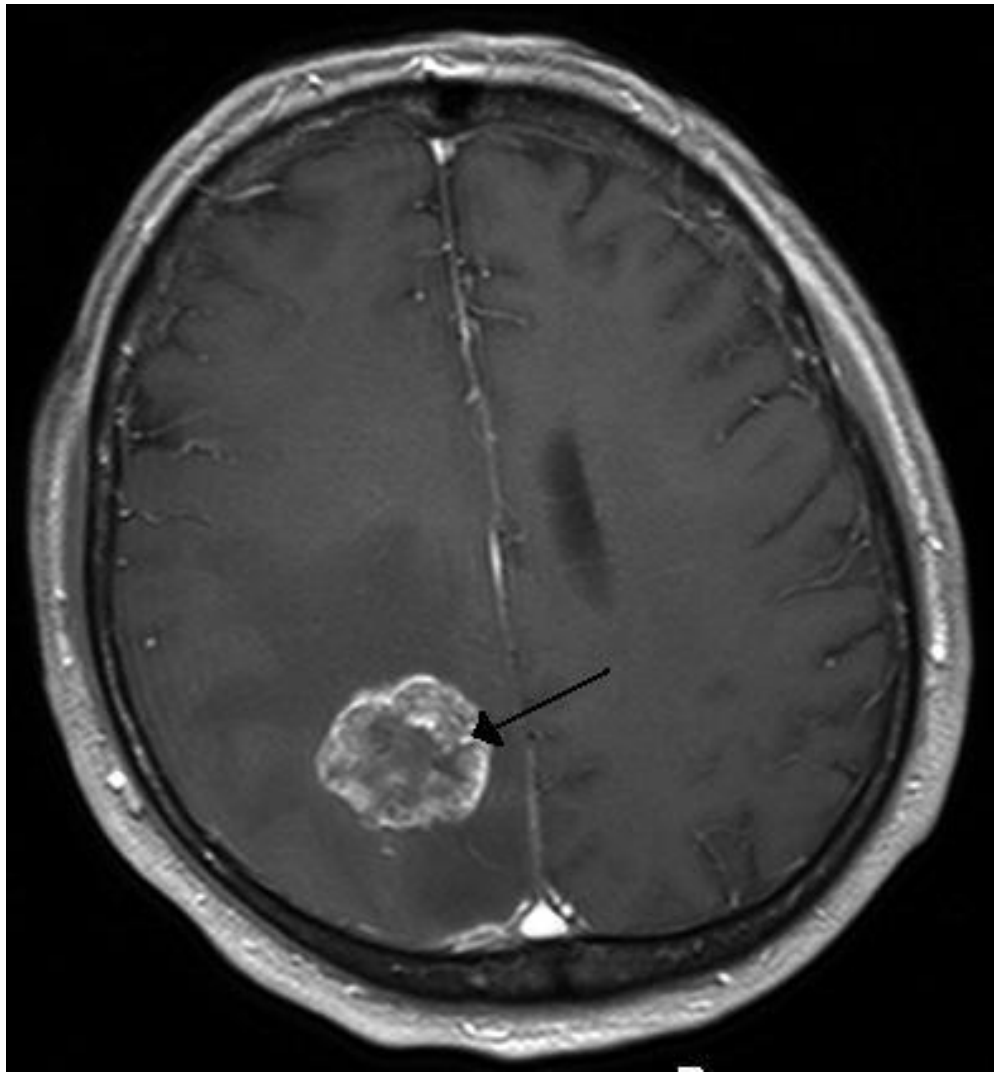
Case 5 Management

- Surgical resection
- Check histology
  - Either RT + PCV (Grade 2 astro)
  - RT + PCV (Grade 3 oligo)
  - RT alone (Grade 3 astro)
    - EORTC 26053-22054: RT +/- TMZ (4-way randomisation)
    - DMSC: Add Adj. TMZ
- Unsatisfactory evidence

Case 5 Questions ?

Case 6

- 56 yr old woman with a history of breast cancer
  - HER-2 positive, ER/PR –ve
  - Surgery, adjuvant RT and adjuvant chemo
  - Ongoing adjuvant Herceptin
  - 3 week history of headache and dizziness
  - Restaging CT shows no evidence of extra-cranial disease



Case 6

- Likely metastatic breast cancer
- Well
- No ECD

- Prognosis ?
- Treatment ?
- Evidence base for treatment ?

Case 6

- Prognosis?

A: <3 months

B: 3 – 9 months

C: 9 – 14 months

D: 14 – 18 months

E: 18 + months

Case 6

- Treatment ?

A: Surgery

B: SRS

C: WBRT

D: Surgery & WBRT

E: SRS & WBRT

Case 6 - prognosis

- Best prognostic tool is dsGPA
  - Better than the RPA
  - dsGPA = 3.5; MedOS ~ 11 months

Case 6 - prognosis

Table 1. Median Survival Time for Patients With Brain Metastases by DS-GPA Score

	Overall			DS-GPA Score															
				0-1.0				1.5-2.0				2.5-3.0				3.5-4.0

Case 6

- Best prognostic tool is dsGPA
  - Better than the RPA
  - dsGPA = 3.5; MedOS ~ 11 months

- But still problems in terms of patient cohort and how standard they are
- Decision-making:
  - How is the patient ?
  - How is the disease ?
  - What are the options ?

Case 6

- Patient is well (PS and ECD)
- Disease is limited
  - But large
- Treatment options:
  - WBRT
  - Surgery
  - SRS
  - Or combinations of these

Case 6

- Given good PS and limited disease, focal treatment seems best
  - SRS or surgery
  - Benefits and risks of each

- Argument for adding WBRT

Is Surgery or SRS better ?

Case 6 - WBRT

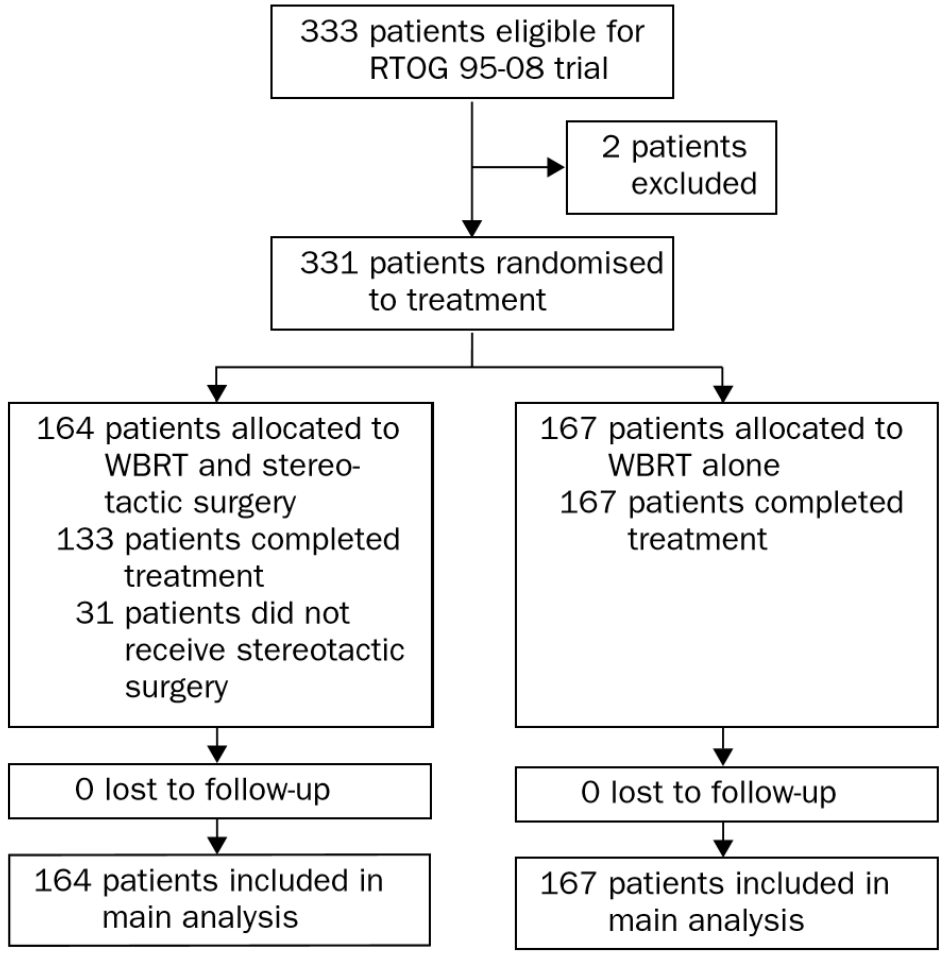

Figure 1: **Trial profile**

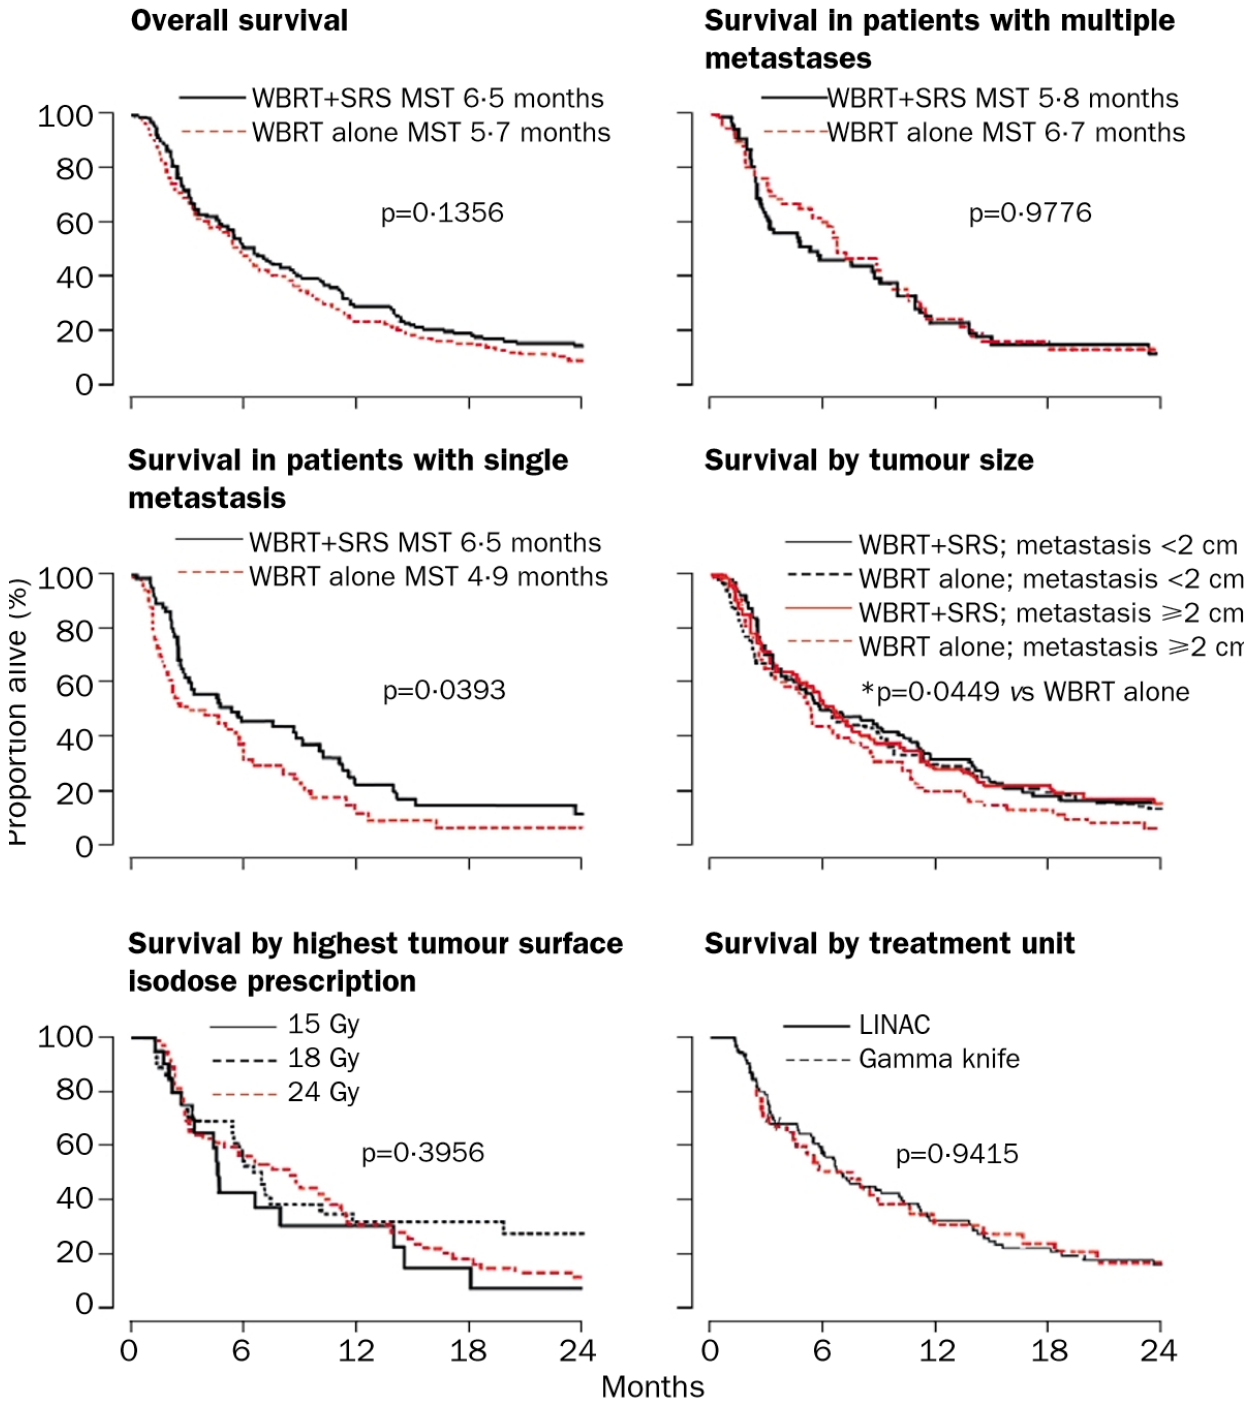
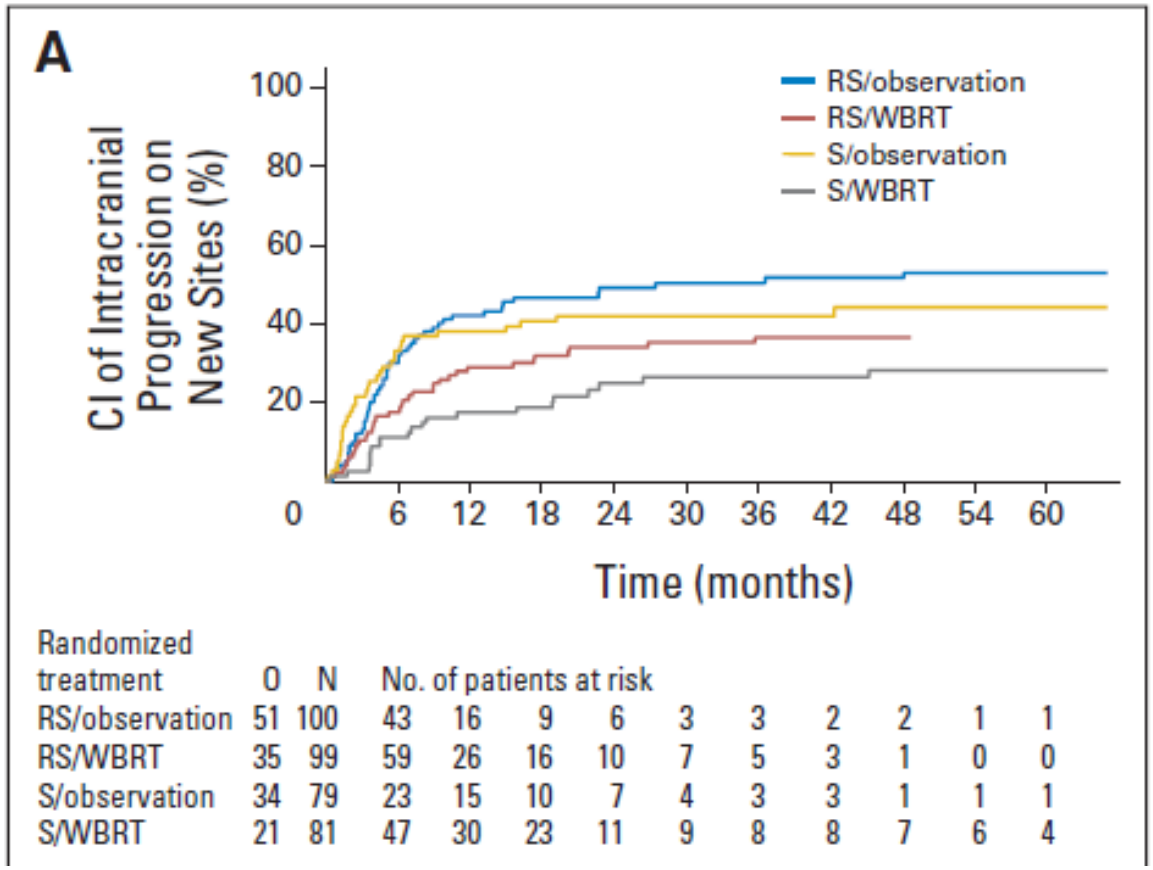
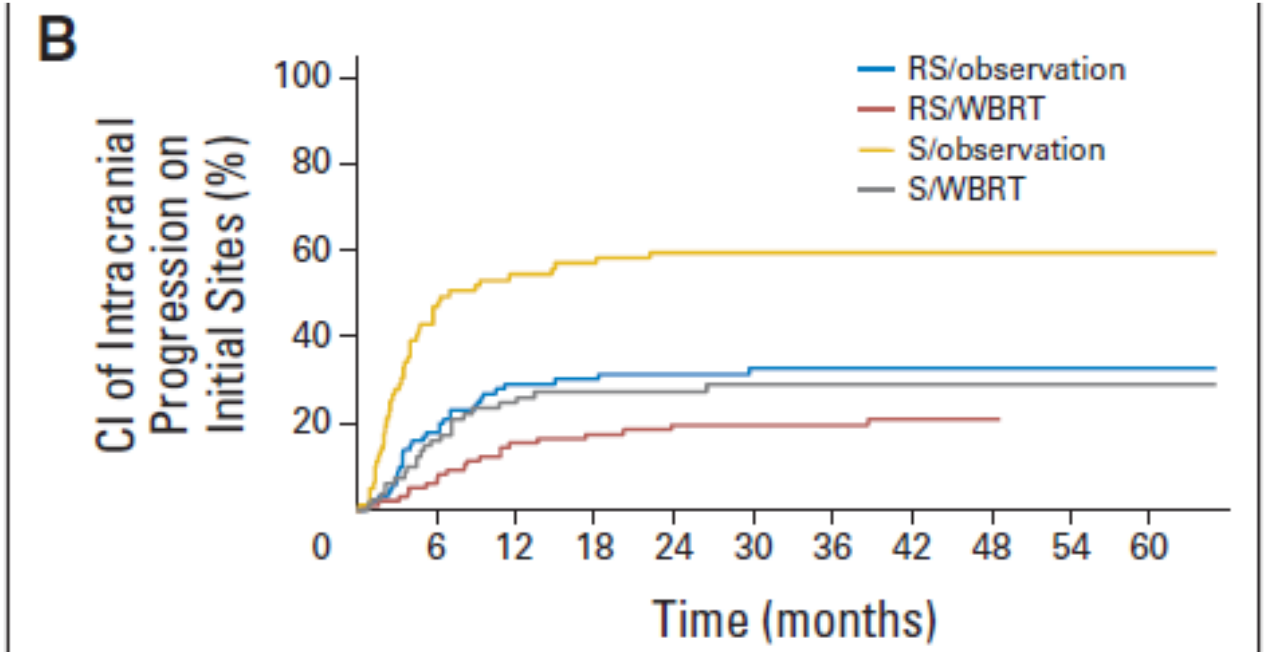
Andrews Lancet 2004



Case 6 - WBRT



Randomized treatment	O	N	No. of patients at risk									
RS/observation	51	100	43	16	9	6	3	3	2	2	1	1
RS/WBRT	35	99	59	26	16	10	7	5	3	1	0	0
S/observation	34	79	23	15	10	7	4	3	3	1	1	1
S/WBRT	21	81	47	30	23	11	9	8	8	7	6	4

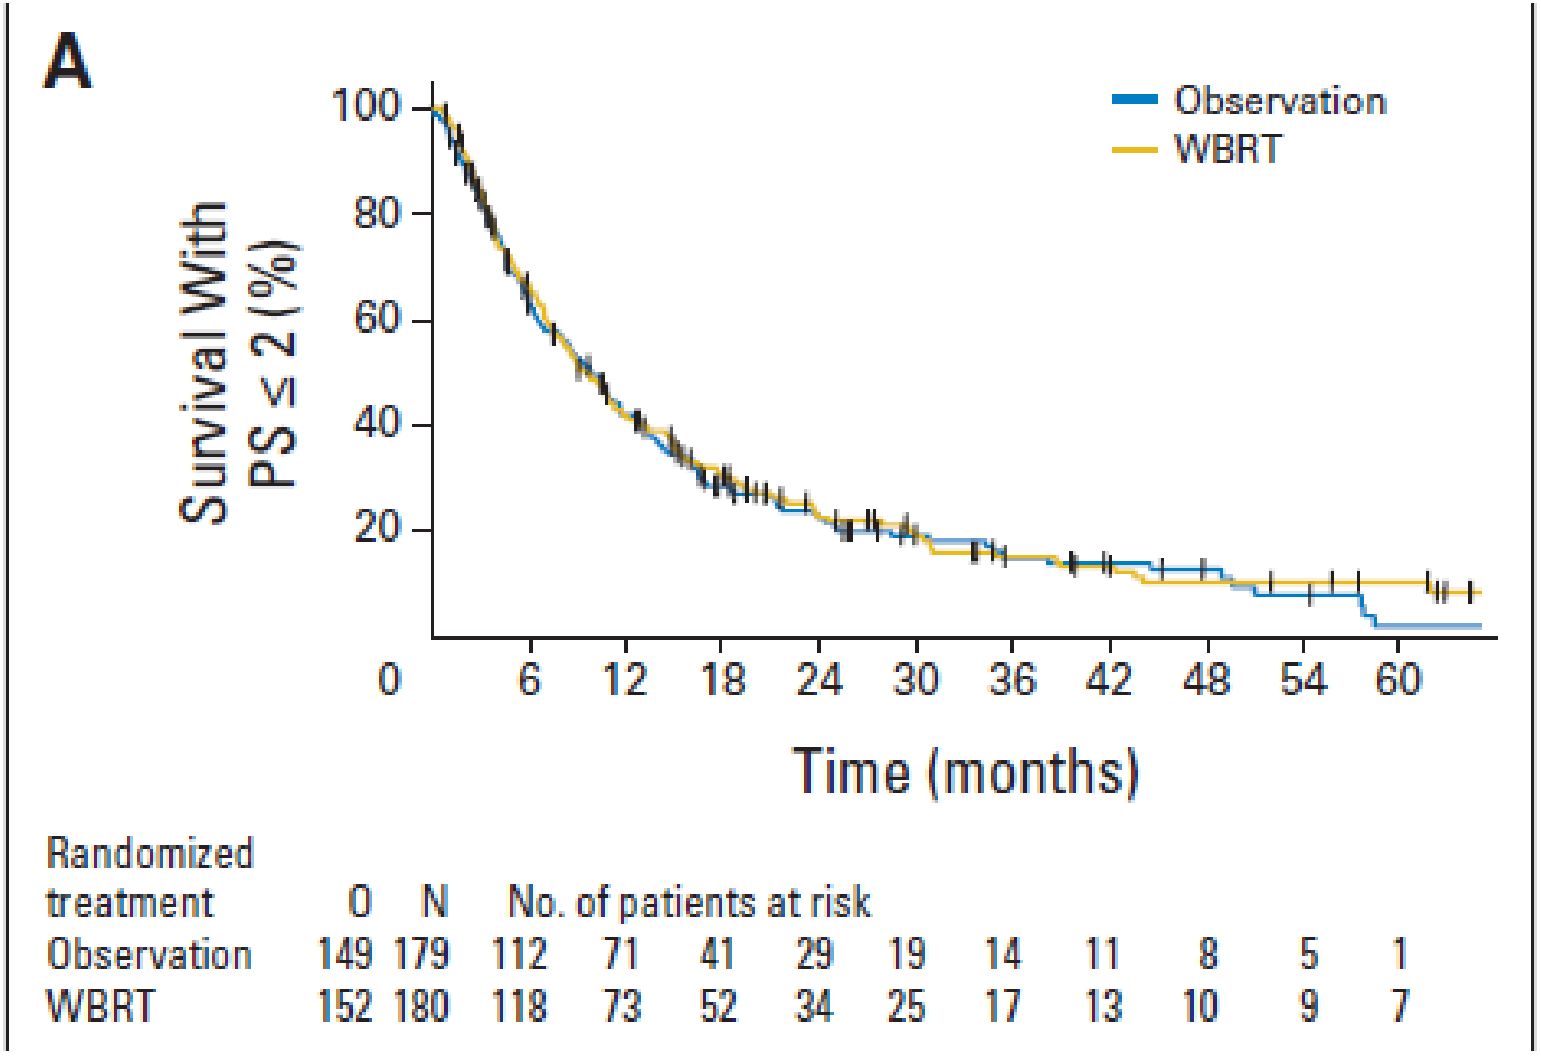


Randomized treatment	O	N	No. of patients at risk									
RS/observation	32	100	43	16	9	6	3	3	2	2	1	1
RS/WBRT	20	99	59	26	16	10	7	5	3	1	0	0
S/observation	47	79	23	15	10	7	4	3	3	1	1	1
S/WBRT	23	81	47	30	23	11	9	8	8	7	6	4

Fig 2. Time to intracranial progression at (A) new sites and (B) initial sites in patients treated initially by radiosurgery (RS) or surgery (S) after observation or adjuvant whole-brain radiotherapy (WBRT). Patients who died before the event (competing risk) were censored. CI, cumulative incidence; O, number of events; N, number of patients.

Kocher JCO 2011

Case 6 - WBRT



Kocher JCO 2011

Case 6 - WBRT

- WBRT reduces intracranial relapse rate
  - But doesn’t improve OS

- This is because brain mets don’t always kill the patient

- Brain mets as a marker of aggressive disease
- Therefore associated with poor survival
  - Not always causal

Case 6

- Role of WBRT
  - Focal Rx +WBRT $\sim_{OS}$ Focal Rx alone
  - Focal Rx +WBRT $>_{IntraCranProg}$ Focal Rx alone
  - Focal Rx +WBRT $\sim_{TimePS2}$ Focal Rx alone

  - SRS + WBRT $<_{CogFunc}$ SRS Alone

  - Is WBRT better in a small subset of patients ?
    - Andrews Lancet 2004 (Single met; SRS + WBRT $>_{OS}$ SRS alone)
    - Sperduto RedJ 2014 (GPA 3.5 – 4; SRS + WBRT $>_{OS}$ SRS alone)
    - Ayoma JAMA 2015 (NSCLC; GPA 2.5 – 4; SRS + WBRT $>_{OS}$ SRS alone)

Case 6

- Surgery or SRS have ~ 50% of Intra-cranial progression
  - Roughly-halved by WBRT
  - WBRT does not increase OS
    - But might do in a small sub-group
    - But these are the one who get neuro-cognitive decline
- Options:
  - Surgery + close surveillance
  - Surgery + WBRT

Case 6

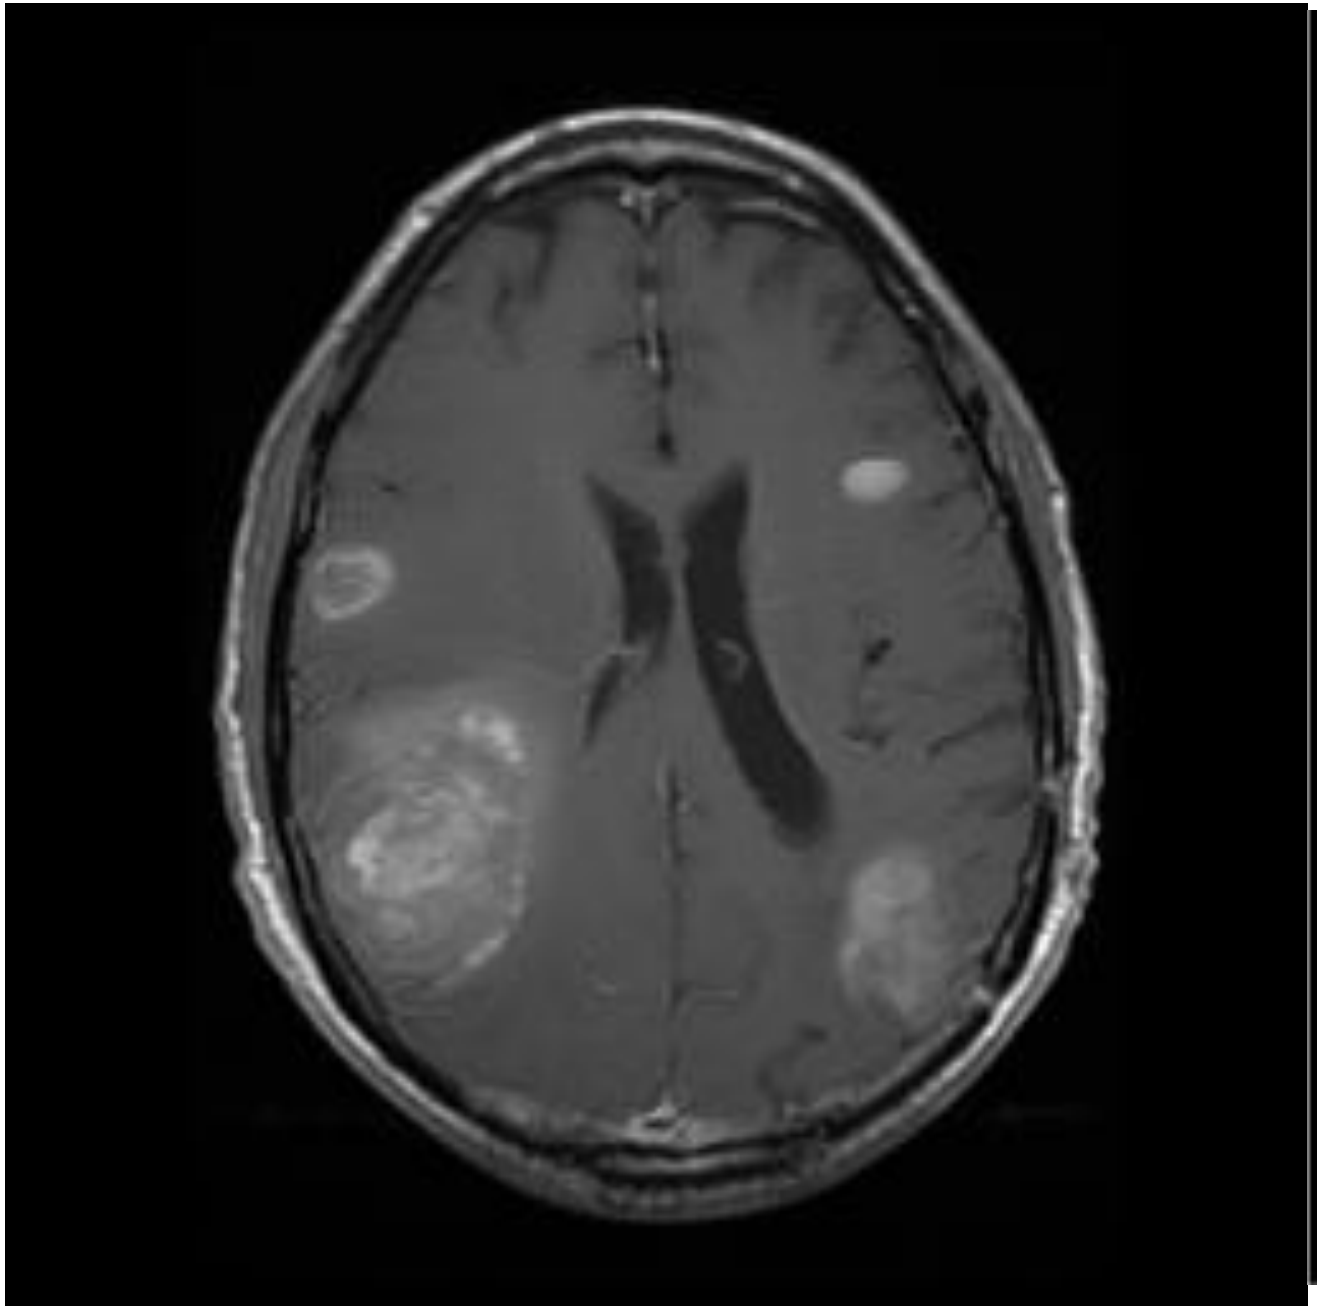
- Potential ideas:
  - HS-WBRT ?
  - Cavity SRS ?
  - Chemo-protection

- Relapse on HER-2 targeted agent not uncommon
  - Not a reason to stop HER-2 treatment
  - Careful with TDM-1!

Case 6 Questions ?

Case 7

- 27 yr old woman
  - Excision of a pigmented lesion from her back 3 years ago
  - Told ‘not cancer’
  - 4 week history of headache
  - Collapsed
  - Brought to hospital
  - GCS = 14/15
  - GCS improves to 15/15, ECOG PS = 3



Case 7 imaging

- What is the most important thing you see on the imaging ?

Case 7

- PS = 3
- Multiple mets
- Young
- Imaging shows leptomeningeal disease

- Treatment options ?
- Prognosis ?

Treatment options

- Leptomeningeal disease
- With parenchymal disease
- Therefore argument against focal therapy

- Options are WBRT/ WBRT & focal spinal/ CSRT/ chemo/ IT chemo
  - No clear evidence in favour of any one of them
  - Very little evidence
  - Some very selective case series

Case 7 – Practical aspects

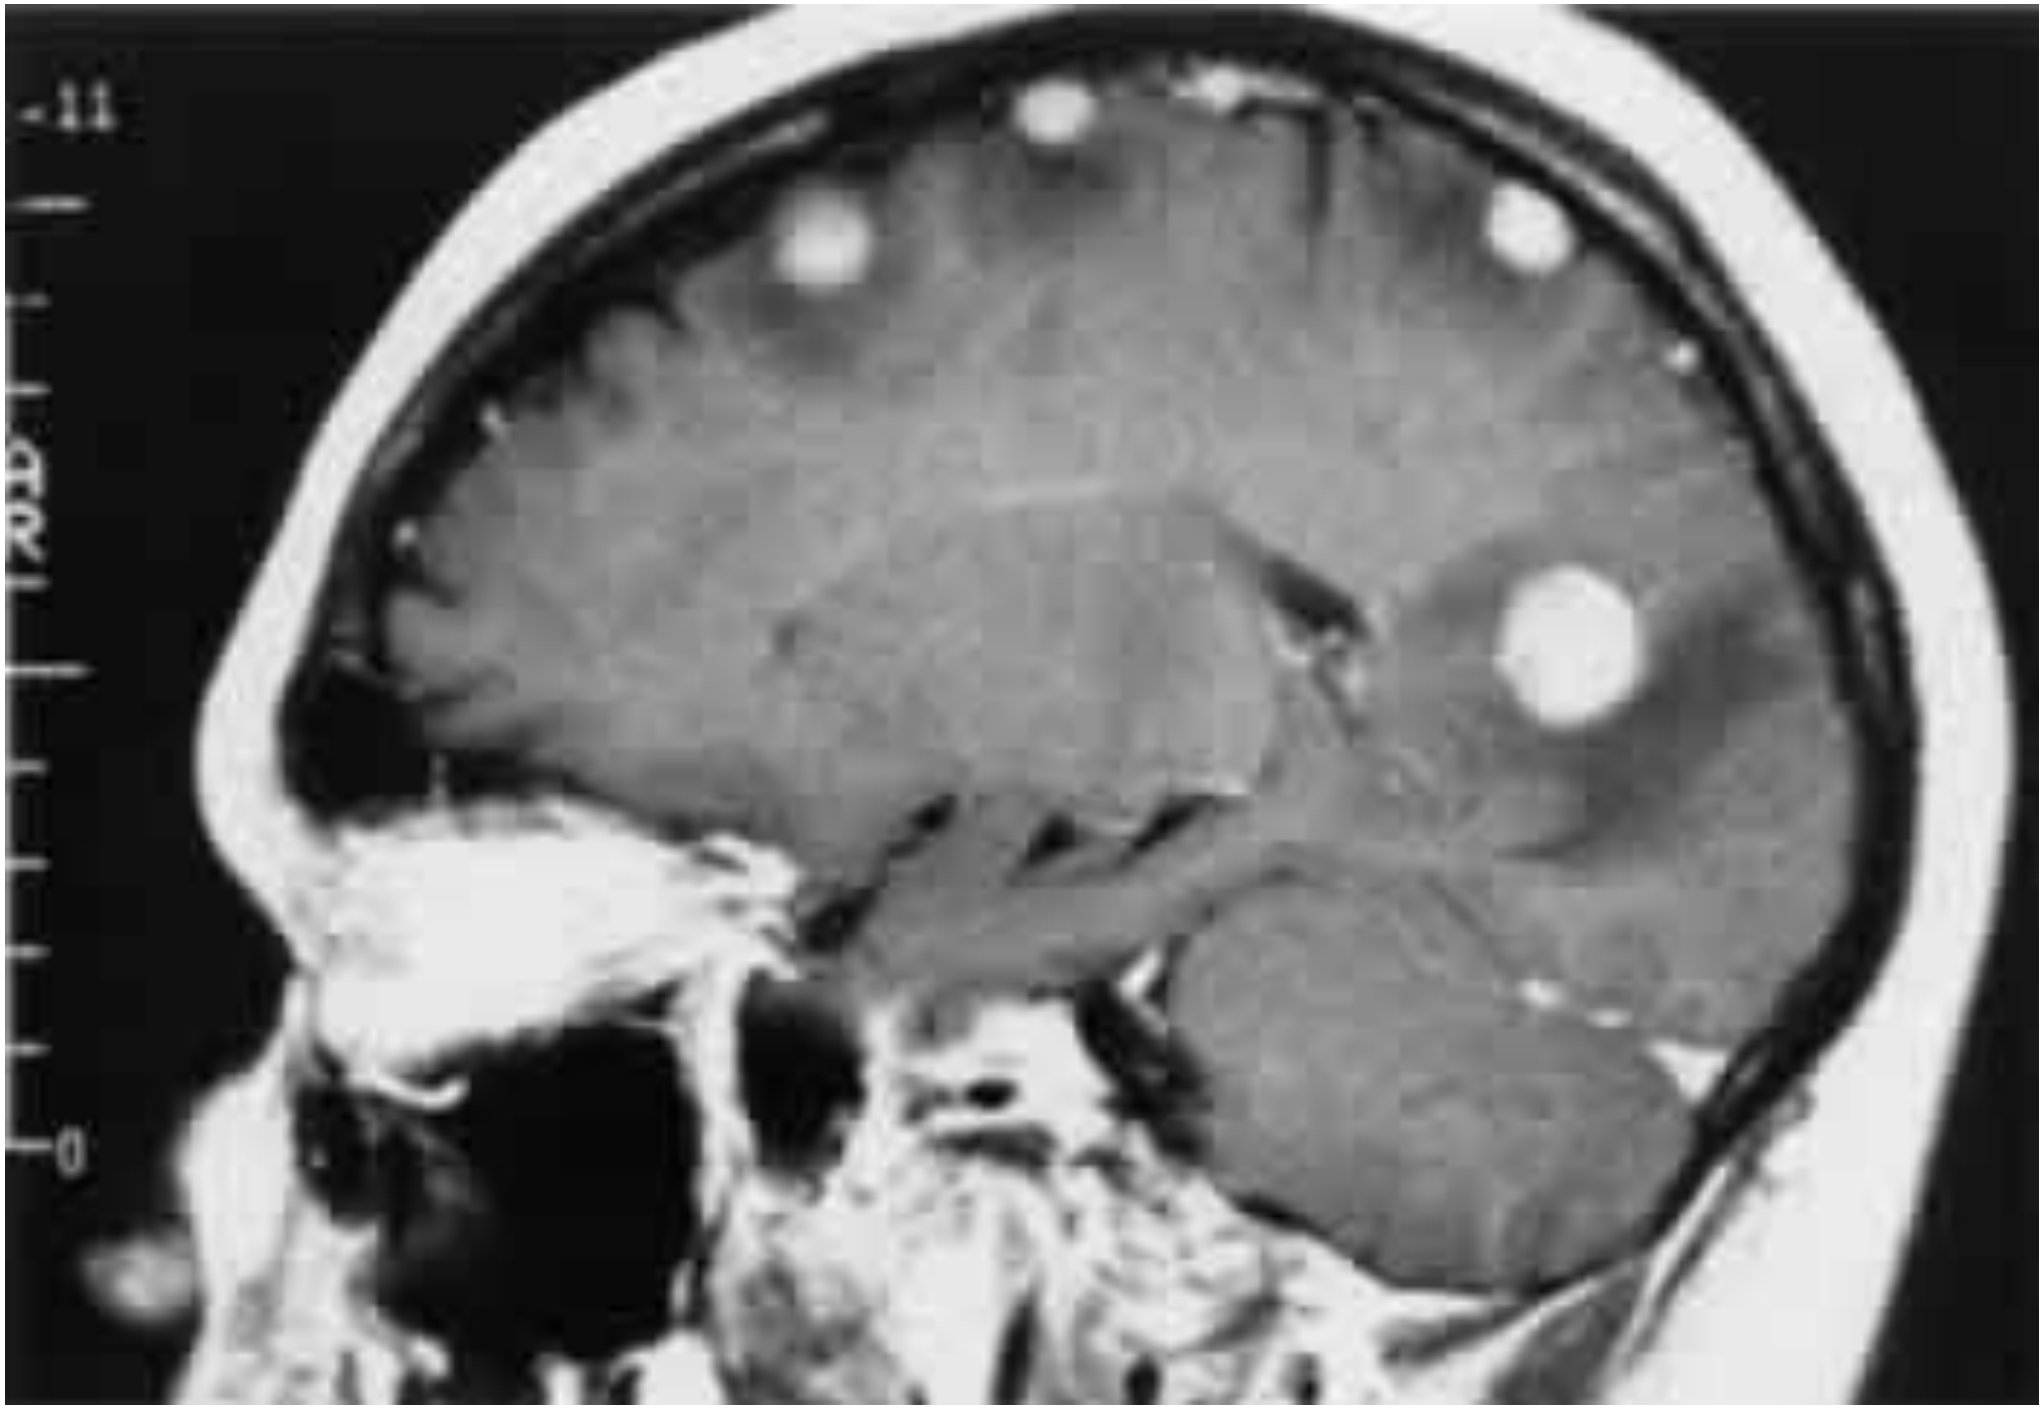
- Prognosis poor
- IT chemo has risks due to poor CSF flow

- I would suggest WBRT or no treatment
  - This patient got no treatment as in ITU and rapid deterioration

Case 7 Questions ?

Case 8

- 44 yr old woman
  - Metastatic lung cancer
  - Progressive liver mets
  - Otherwise well
  - ECOG PS = 1



-11
0

Case 8

- Met lung cancer
- Progressive ECD
- Well
- Multiple small lesions

- Treatment options ?
- Evidence ?
- Benefits and risks of each ?

Case 8

- NOT going to cover SRS in detail

- SRS feasibility:
  - Conventionally 1 - 3 or 1 – 4 mets
  - 20cc total volume
  - Volume drives toxicity

  - HypoFrac may help with this
  - Do the number of mets matter ?

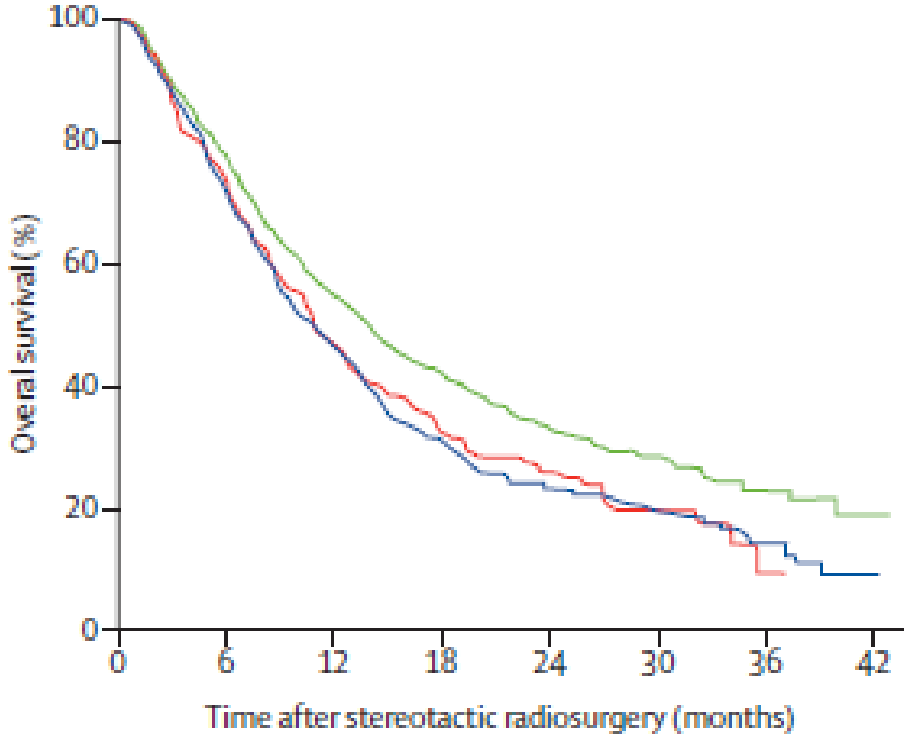
Case 8 - multimets

- GK study across Japan
- 1194 pts in 3 yrs
- 1 – 10 mets
- Total vol <15ml

- Non-inferiority for survival

Yamamoto, LancetOnc 2014

Group	Median overall survival, months (95% CI)	HR (95% CI)	p value
1 tumour	13·9 (12·0–15·6)	0·76 (0·66–0·88)	0·0004
2–4 tumours	10·8 (9·4–12·4)	Reference	
5–10 tumours	10·8 (9·1–12·7)	0·97 (0·81–1·18)	0·78



Number at risk				
1 tumour	455	234	97	22
2–4 tumours	531	215	61	16
5–10 tumours	208	84	31	1

***Figure*: Kaplan-Meier curves of overall survival**
HR=hazard ratio.

Case 8

- Treatment options
  - Surgery or SRS or WBRT
  - Options in favour of each
- Evidence
- However, WBRT seems ‘too much’; Surgery seems ‘unwise’
  - This does NOT come out of the evidence
  - Such decisions are ‘pre-trial’ – and lead to problems with the evidence
  - We need to be careful about how we interpret the evidence

Case 8 Questions ?

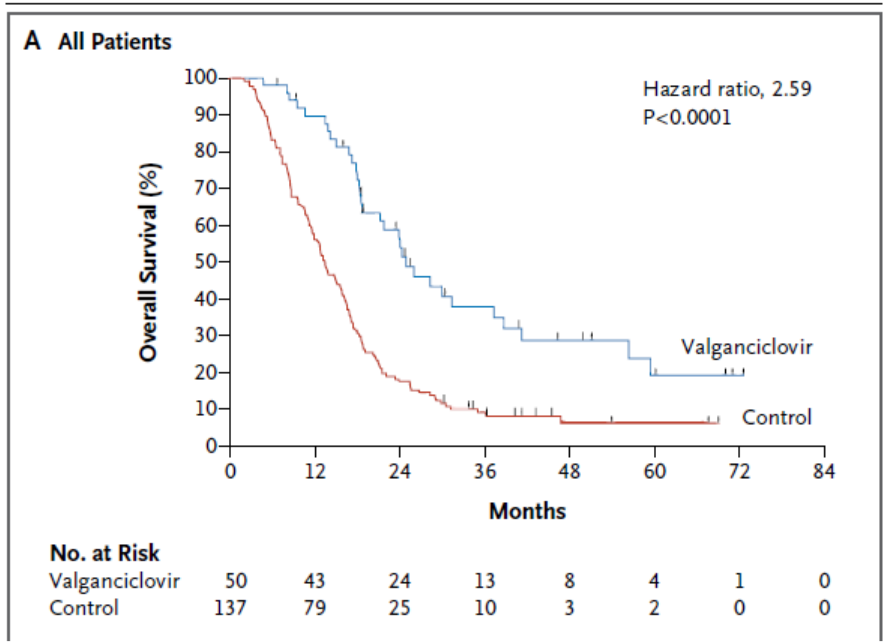
Summary

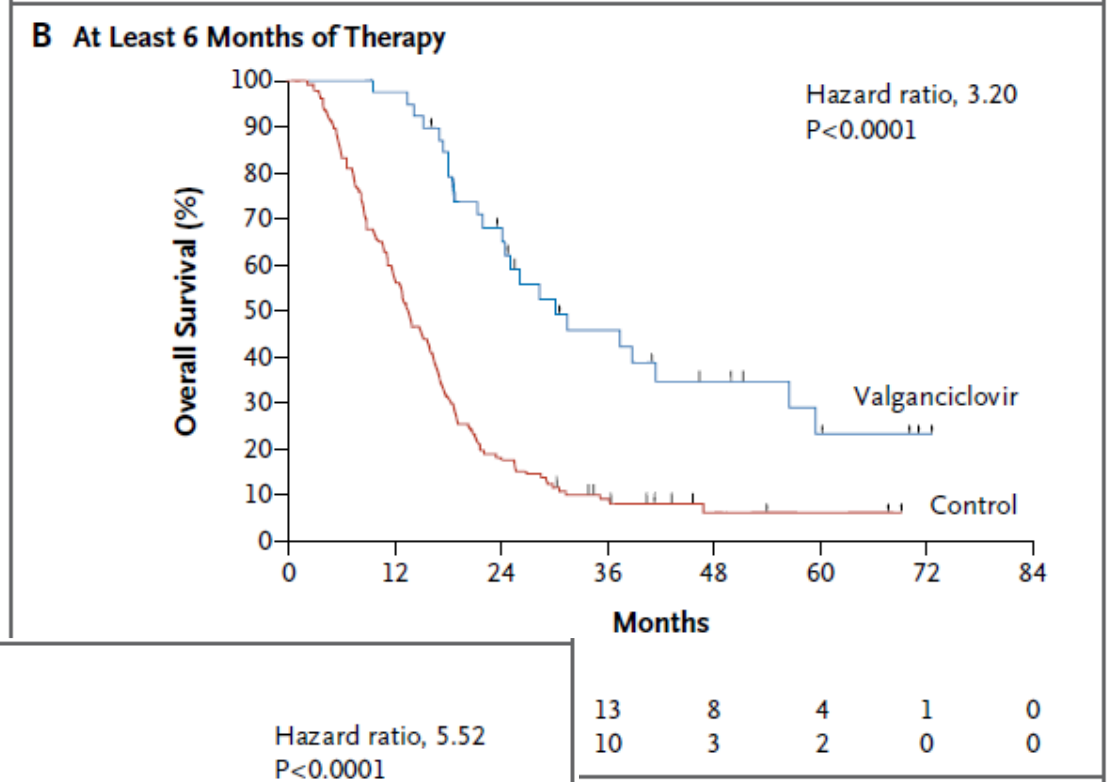
- 3 HGG; 2 LGG; 3 Mets
  - No meningioma, pituitary, medulloblastoma, pilocytic astrocytoma
  - Focus on treatment and prognosis
- For glioma, grade still matters
  - But molecular pathology is becoming more important for risk stratification
  - We are not going to reduce the dose in IDH-mut GBM
- Brain mets – still poor evidence base
- Clinically fascinating area
  - Good mix of technology and humanity

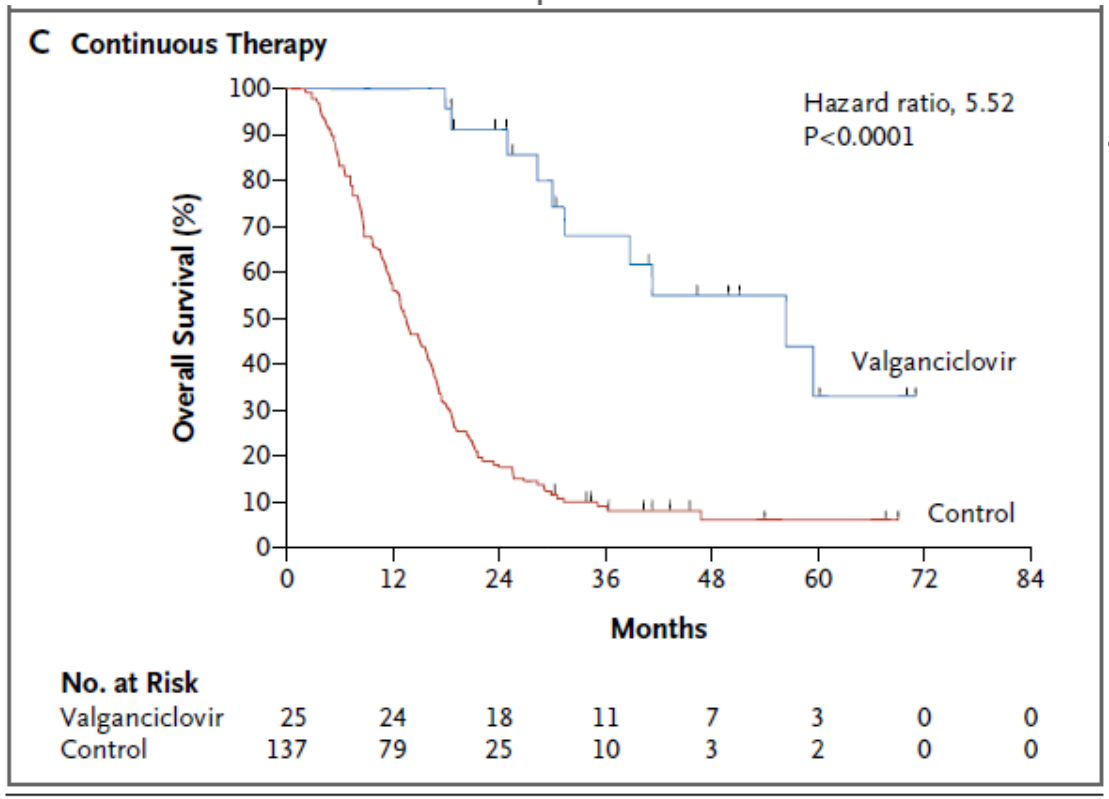
Evidence-based Neuro-oncology

- Brain tumours are devastating
- Patients and families are desperate
  - “Is there anything else I can try?”

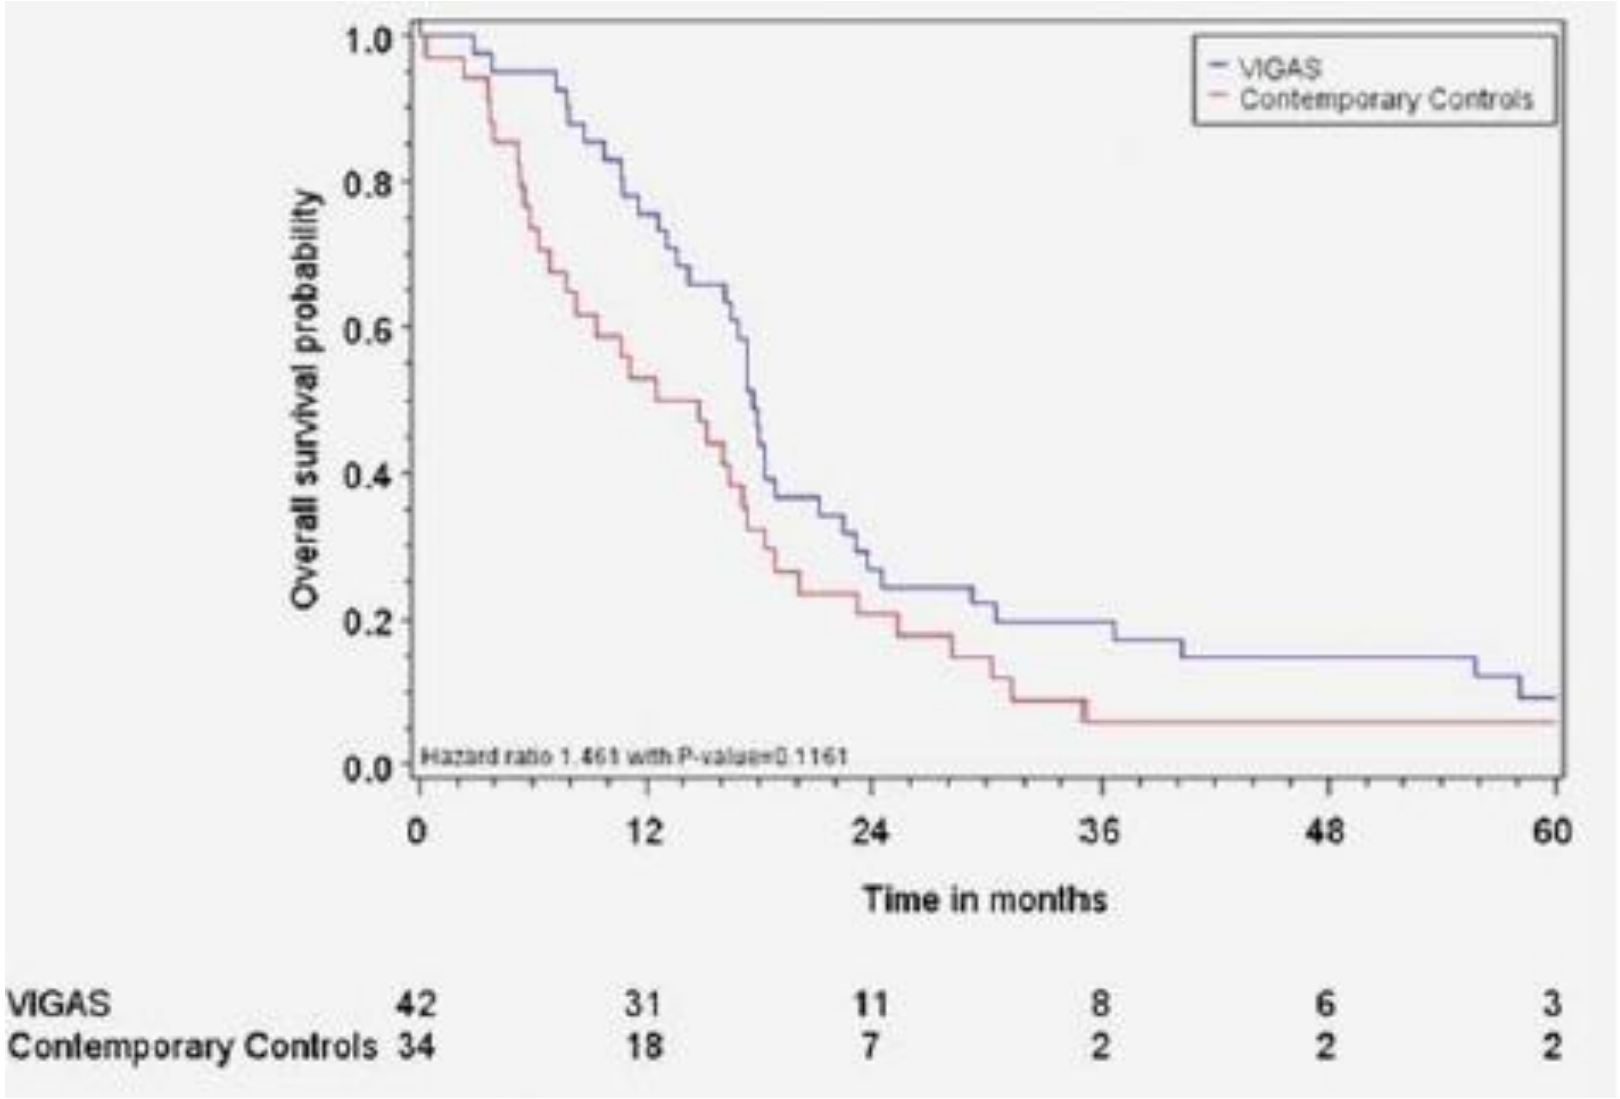
Valgancyclovir in GBM





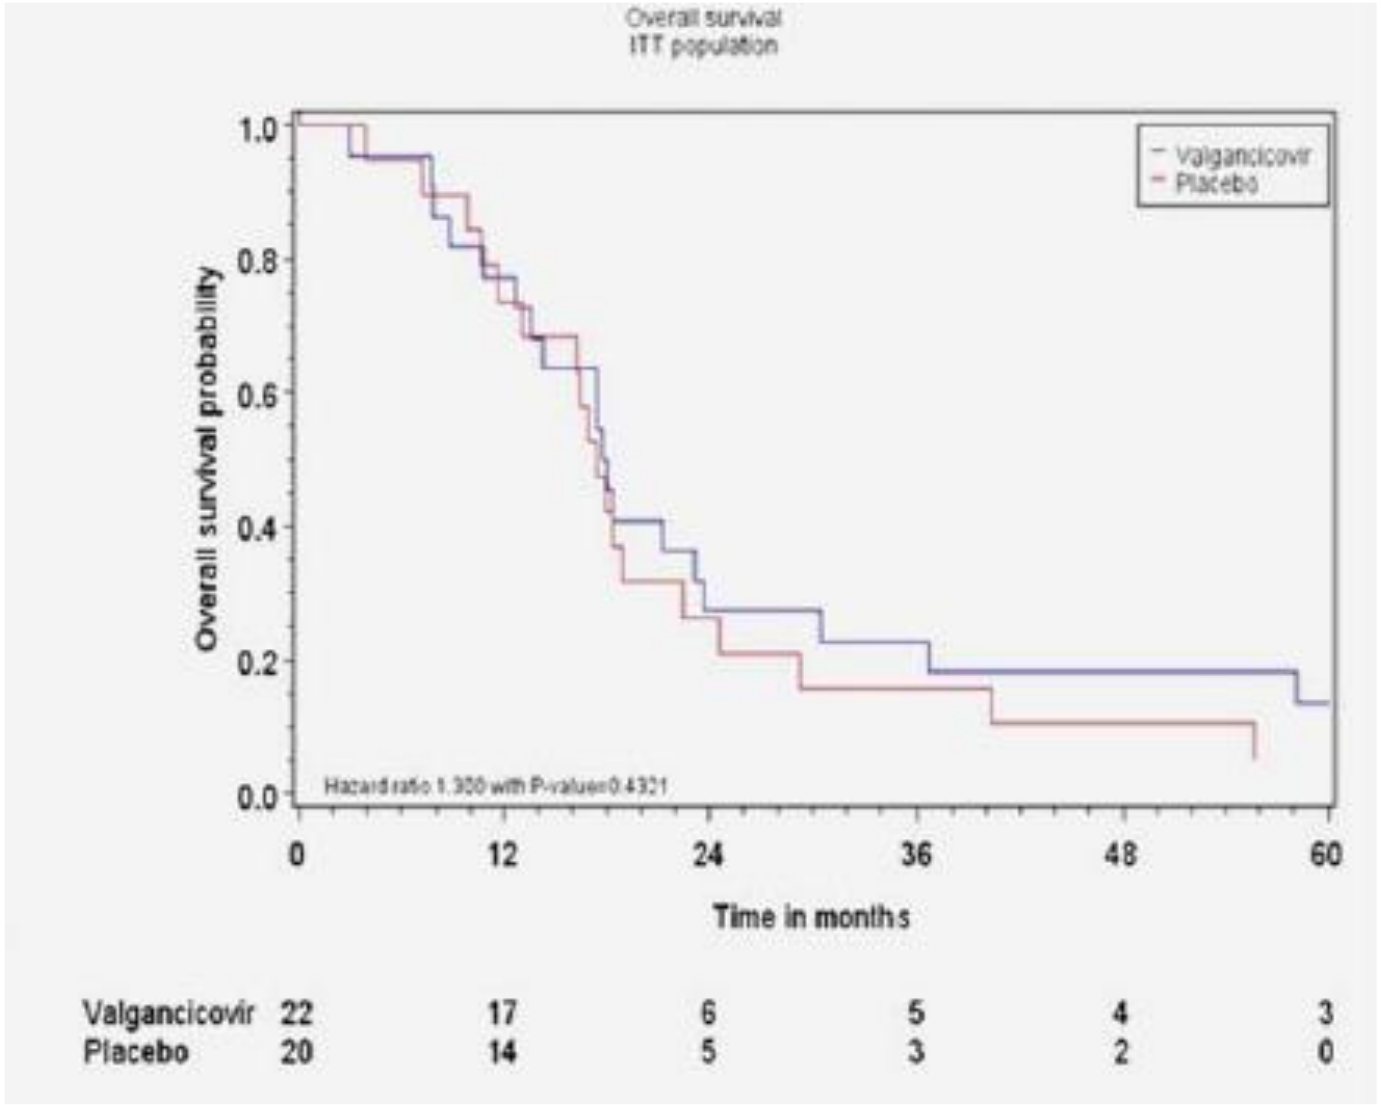


Valgancyclovir and GBM (2)



Stragliotto IJC 2013

Valgancyclovir and GBM (3)



Stragliotto IJC 2013

ACT studies

- ~1/3rd GBM are EGFR+ve
- EGFR+ve GBM have a worse prognosis
- We can target EGFR

ACT studies

- ~1/3rd GBM are EGFR+ve
- EGFR+ve GBM have a worse prognosis
- We can target EGFR

Let’s do a trial !

ACT Phase 2

- New GBM: GTR; No progression after CRT

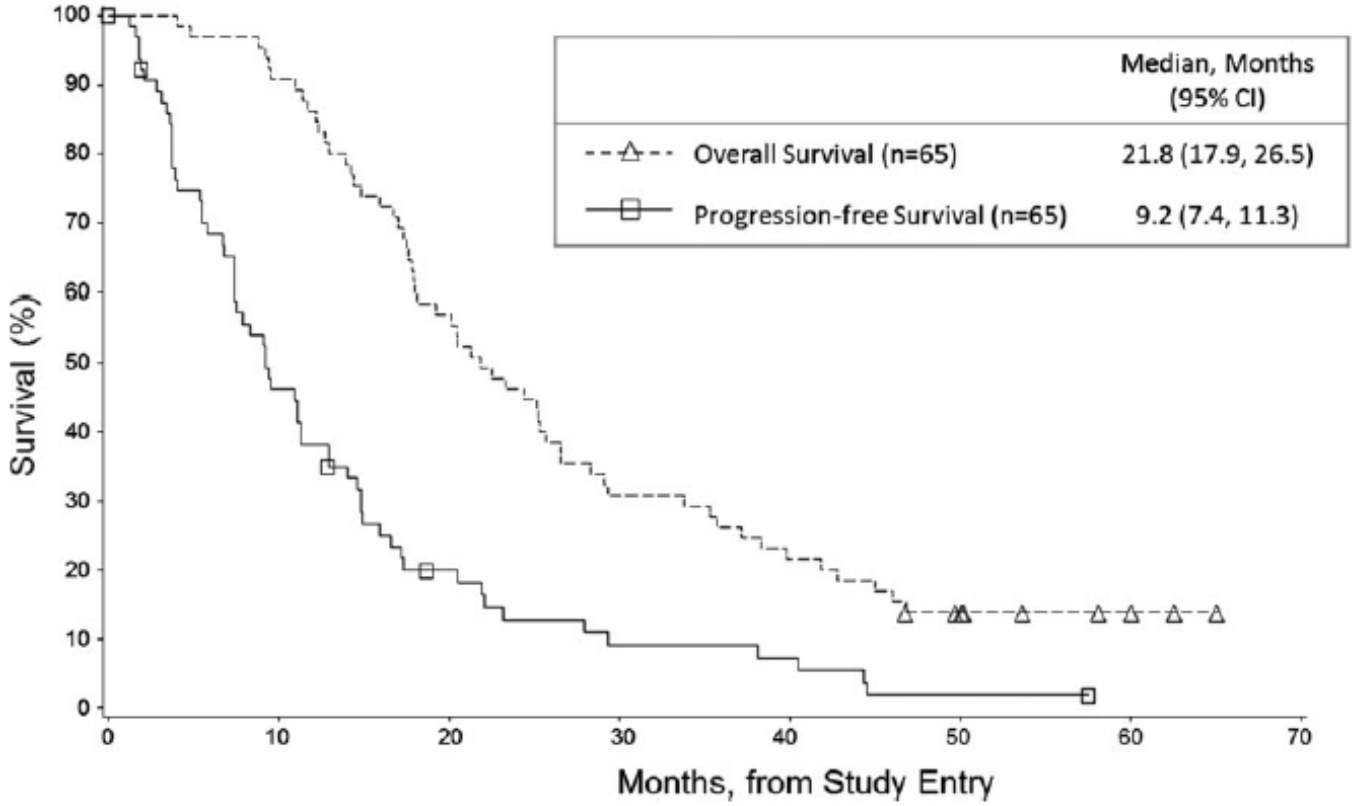


Fig. 2. Kaplan–Meier estimates of PFS and OS. Survival durations are calculated from study entry, representing a median of 3.0 (range, 2.4–4.4) months from diagnosis (as shown in Table 1). Line markers represent censored data.

ACT Phase 2

- New GBM: GTR; No progression after CRT

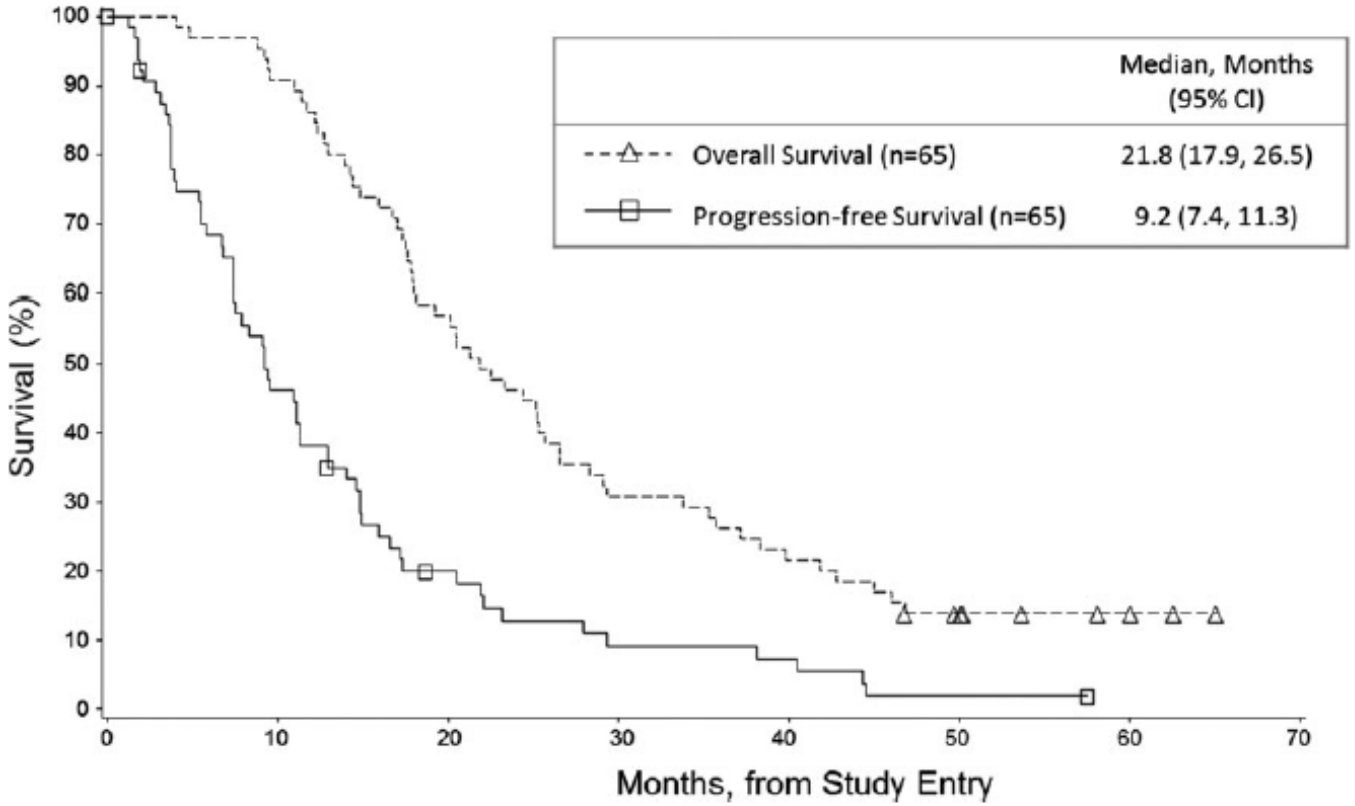

Fig. 2. Kaplan–Meier estimates of PFS and OS. Survival durations are calculated from study entry, representing a median of 3.0 (range, 2.4–4.4) months from diagnosis (as shown in Table 1). Line markers represent censored data.

ACT IV: Phase 3

- 745 pts
- HR = 0.99

- No other data yet available….

ACT IV: Phase 3

- 745 pts
- HR = 0.99

- “the rindopepimut combination showed OS data similar to expectations in the phase III study while patients in the control arm significantly outperformed.”

- Reanalysis of EORTC trial patient who met enrolment criteria showed this better analysis
- RCTs are not perfect…. But better than this

GBM post-2005

- Stupp 2005
- Improved Median OS by 2 months
- Multiple other trials of targeted agents
  - All failed

- Only positive trial: TTF
  - 21 000 Euro/ month

The future

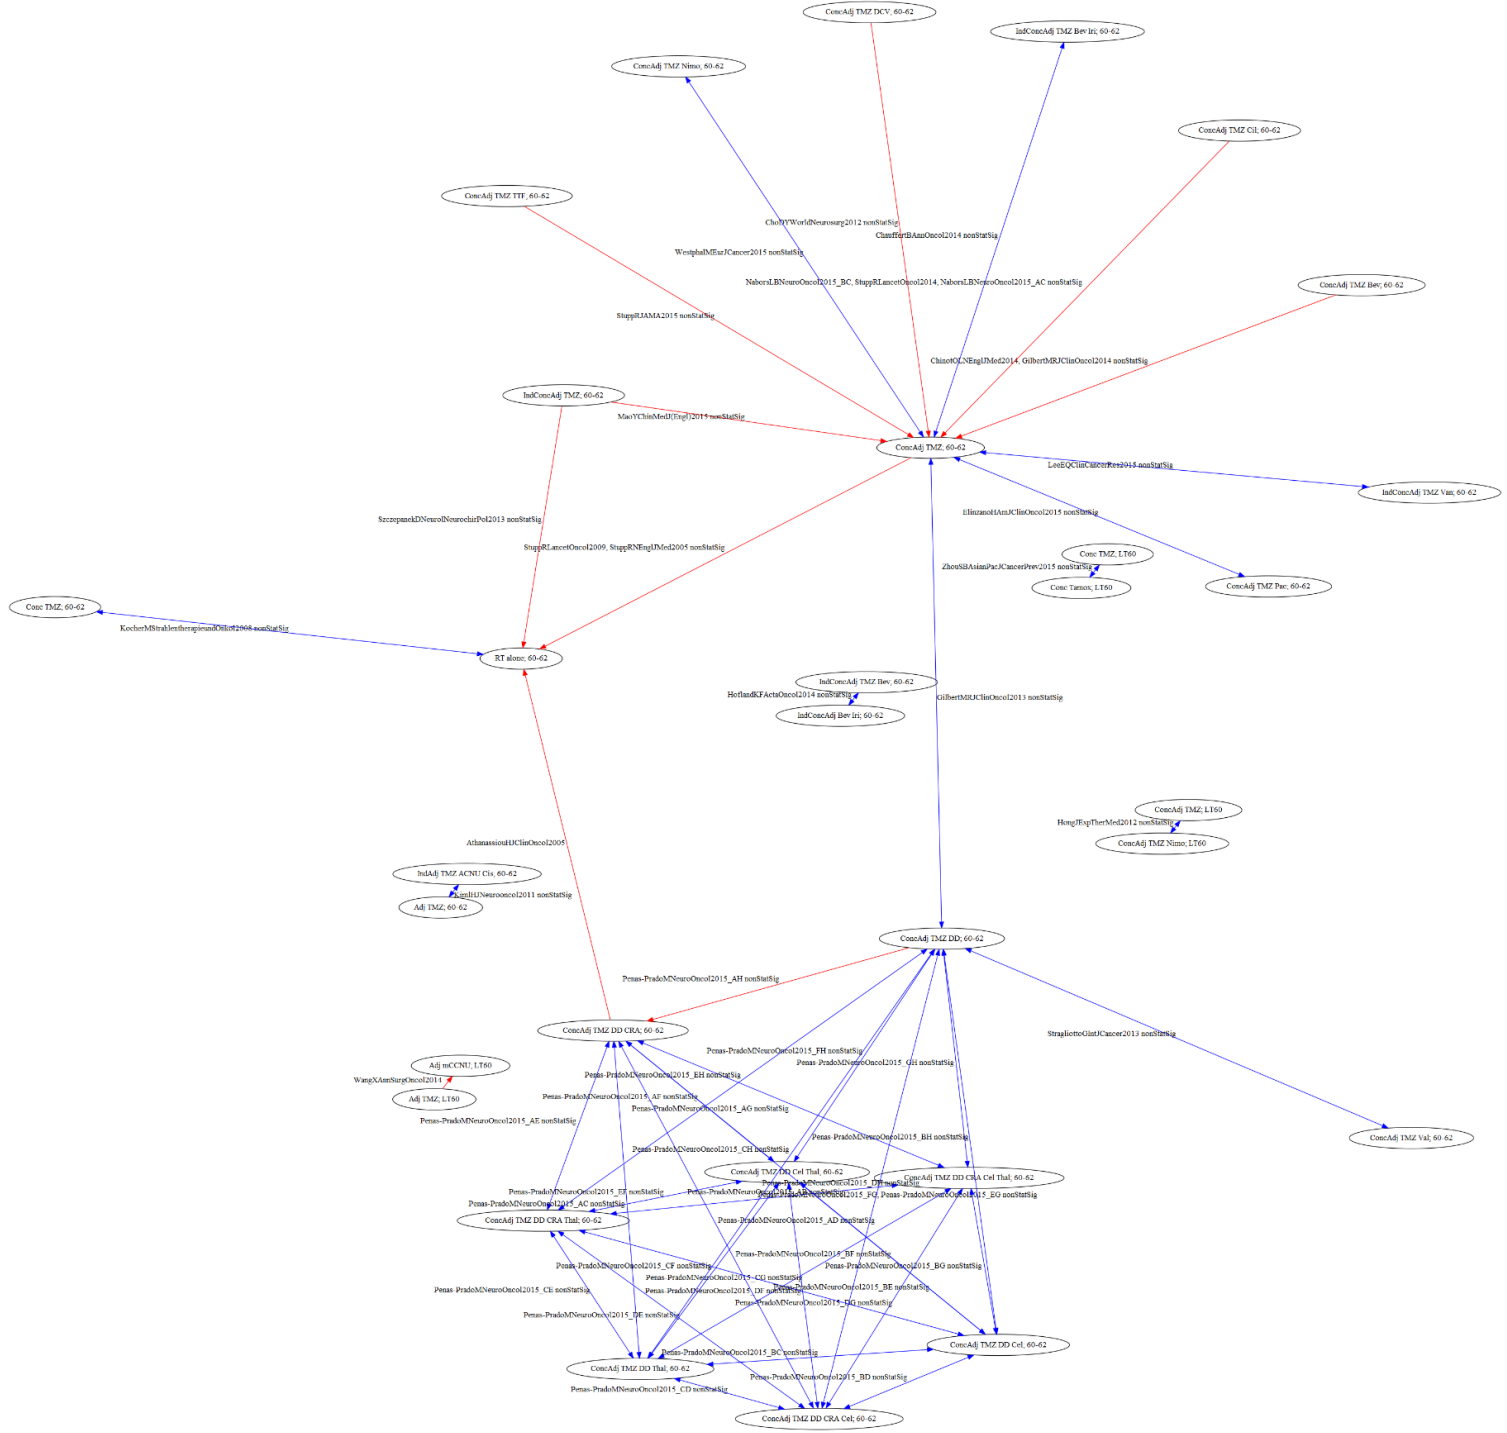
- Better definitions of tumours
  - WHO made a start on this
    - IDH-Mut GBM; H3 K27M mut midline glioma
  - Causes as many problems as it solves
  - Will lead to basket trials

- Randomised Phase 2 trials!

- Better technology gives more options
  - Decision-making is more difficult with more options
- Knowledge is Fractal

Alan Rector

GBM Systematic Review



END

Case 3 pathology notes

- Recent work suggest an integrated pathology approach may help
- The TCGA paper looks at 293 pts with grade 2/3 gliomas. They suggest that LGG with IDH-wild type are essentially GBMs (Fig. 4, Fig. 5B), and are distinct from other LGG, in that they occur in older patients, and in different locations. For these patients, survival is intermediate between 'true' GBM with IDH-wt and GBM with mutated IDH-mutation.
-
- It is work remembering that those with IDH-mut and 1p/19q still only had a median OS of 8 years, which is better - but still worse than many cancers. IDH-wt GBM is still the worst disease - which suggests that grade still plays some role in prognosis.
-
- The Eckel-Passow paper looks at IDH, 1p/19q and TERT promoter mutations. Genetics was associated with survival in Grade 2/3 gliomas, but not in GBM. Tumours with TERT mutations only did really very badly, even if they were grade 2/3 (although most TERT-mut only tumours were GBM).
-
- There are still some significant outstanding issues: data on performance status and treatment is incomplete (and one might think has some impact on outcome), and although the molecular groups segregate well, they are not perfect (e.g. the inverse association by TERT and ATRX - but not in everyone; the idea that IDH-mut is not prognostic in GBM patients with TERT mutations). Some of these are also subject to small-cohort problems.
-
- Nonetheless, I think the data are interesting, but mainly for grade 2/3 tumours (GBMs do badly, and grade still matters). This might end up pushing us towards more tissue sampling in those with lower-grade tumours, in order to risk stratify. The impact on treatment is less clear, although one can make an argument that in someone with a grade II TERT-mut astrocytoma, the outcomes are so poor one should treat them as a GBM. I am not convinced we have the evidence for this yet - the fact they do badly doesn't mean that they do better with CRT.
-
- As ever, I am happy to discuss - although I am not a molecular pathologist!

High dose versus conventional dose in external beam radiotherapy of prostate cancer: a meta-analysis of long-term follow-up

6 RCTs, 2822 patients
Endpoint: 10-year efficacy of CDRT vs HDRT

- OS = no difference
- PCSS = no difference
- Better BFS : 34.0 vs. 24.7 % ($p < 0.00001$).

- Toxicity: HDRT significantly increased:
  - late Grade 2+ GI tox (28.0 vs. 18.6 %, $p < 0.0001$)
  - late G2+ GU toxicity (22.6 vs. 19.5 %, $p = 0.04$).

Hou Z et al., J Cancer Res Clin Oncol. 2015 Jun;141(6):1063-71

Efficacy and toxicity of external-beam radiation therapy for localised prostate cancer: a network meta-analysis

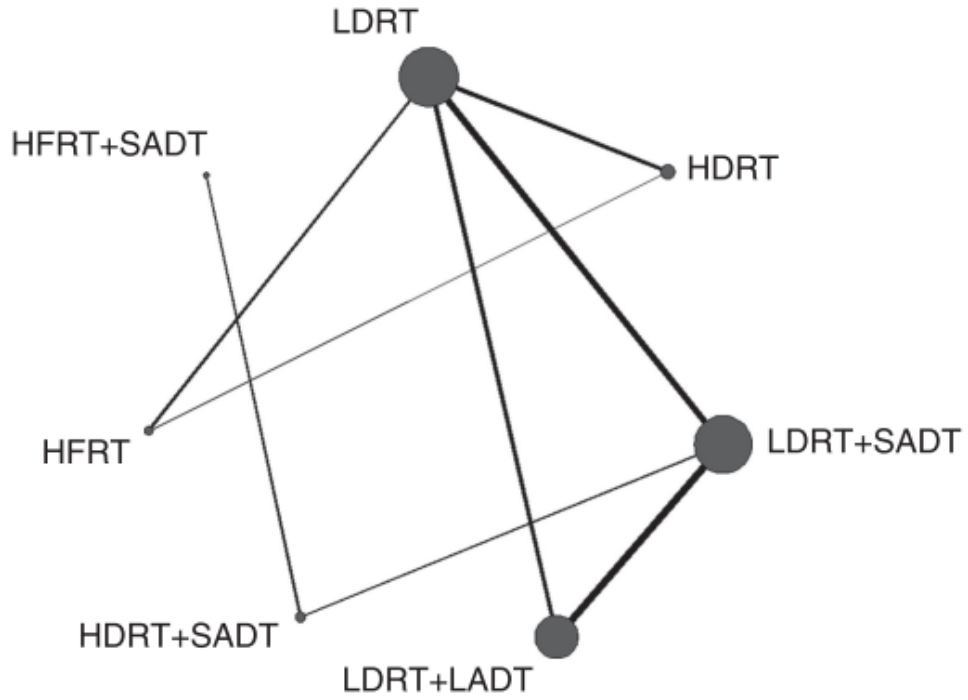

Figure 2. Network of eligible comparisons for the network meta-analysis for efficacy. The width of the lines is proportional to the number of trials comparing each pair of treatments, and the size of each node is proportional to the number of randomised participants (sample size).

National Comprehensive Cancer Network®

NCCN Guidelines Version 2.2017
Prostate Cancer

PRINCIPLES OF RADIATION THERAPY

Primary External Beam Radiation Therapy

- Highly conformal RT techniques should be used to treat prostate cancer.
- Doses of 75.6 to 79.2 Gy in conventional fractions to the prostate (± seminal vesicles for part of the therapy) are appropriate for patients with low-risk cancers. For patients with intermediate- or high-risk disease, doses up to 81.0 Gy provide improved PSA-assessed disease control.

Roach 3rd et al, IJROBP 2006; 66(3) 647 - 653

Is there still a role for pelvic irradiation?

Could these new evidences on the pattern of relapse of PC (at least partially) explain the failure of available RCTs on pelvic irradiation???

The Roach formulas

- Based on PSA, Gleason Score (GS) and the T status;

- Allow a prediction of the risk of:

  - Nodal Involvment (N+)
  - Extracapsular extention (ECE)
  - Non-organ confined disease (NOCD)
  - Seminal Vescicles invasion (SV)

Roach M, Oncol News Int 6(Suppl 3):5-6, 1997

The Roach formulas

- ECE risk = 1.5 x PSA + ([Gleason-3) x 10)[1]
- N+ risk = 2/3 x PSA + ([Gleason-6] x 10)[2]
- SV invasion = PSA +([Gleason -6] x 10) [3]

1. Roach 3rd et al, Semin Urol Oncol. 2000 May;18(2):108-14
2. Roach 3rd et al, Int J Radiat Oncol Biol Phys. 1994 Jan 1;28(1):33-7
3. Diaz et al, Int J Radiat Oncol Biol Phys. 1994 Sep 30;30(2):323-9

The Roach formulas

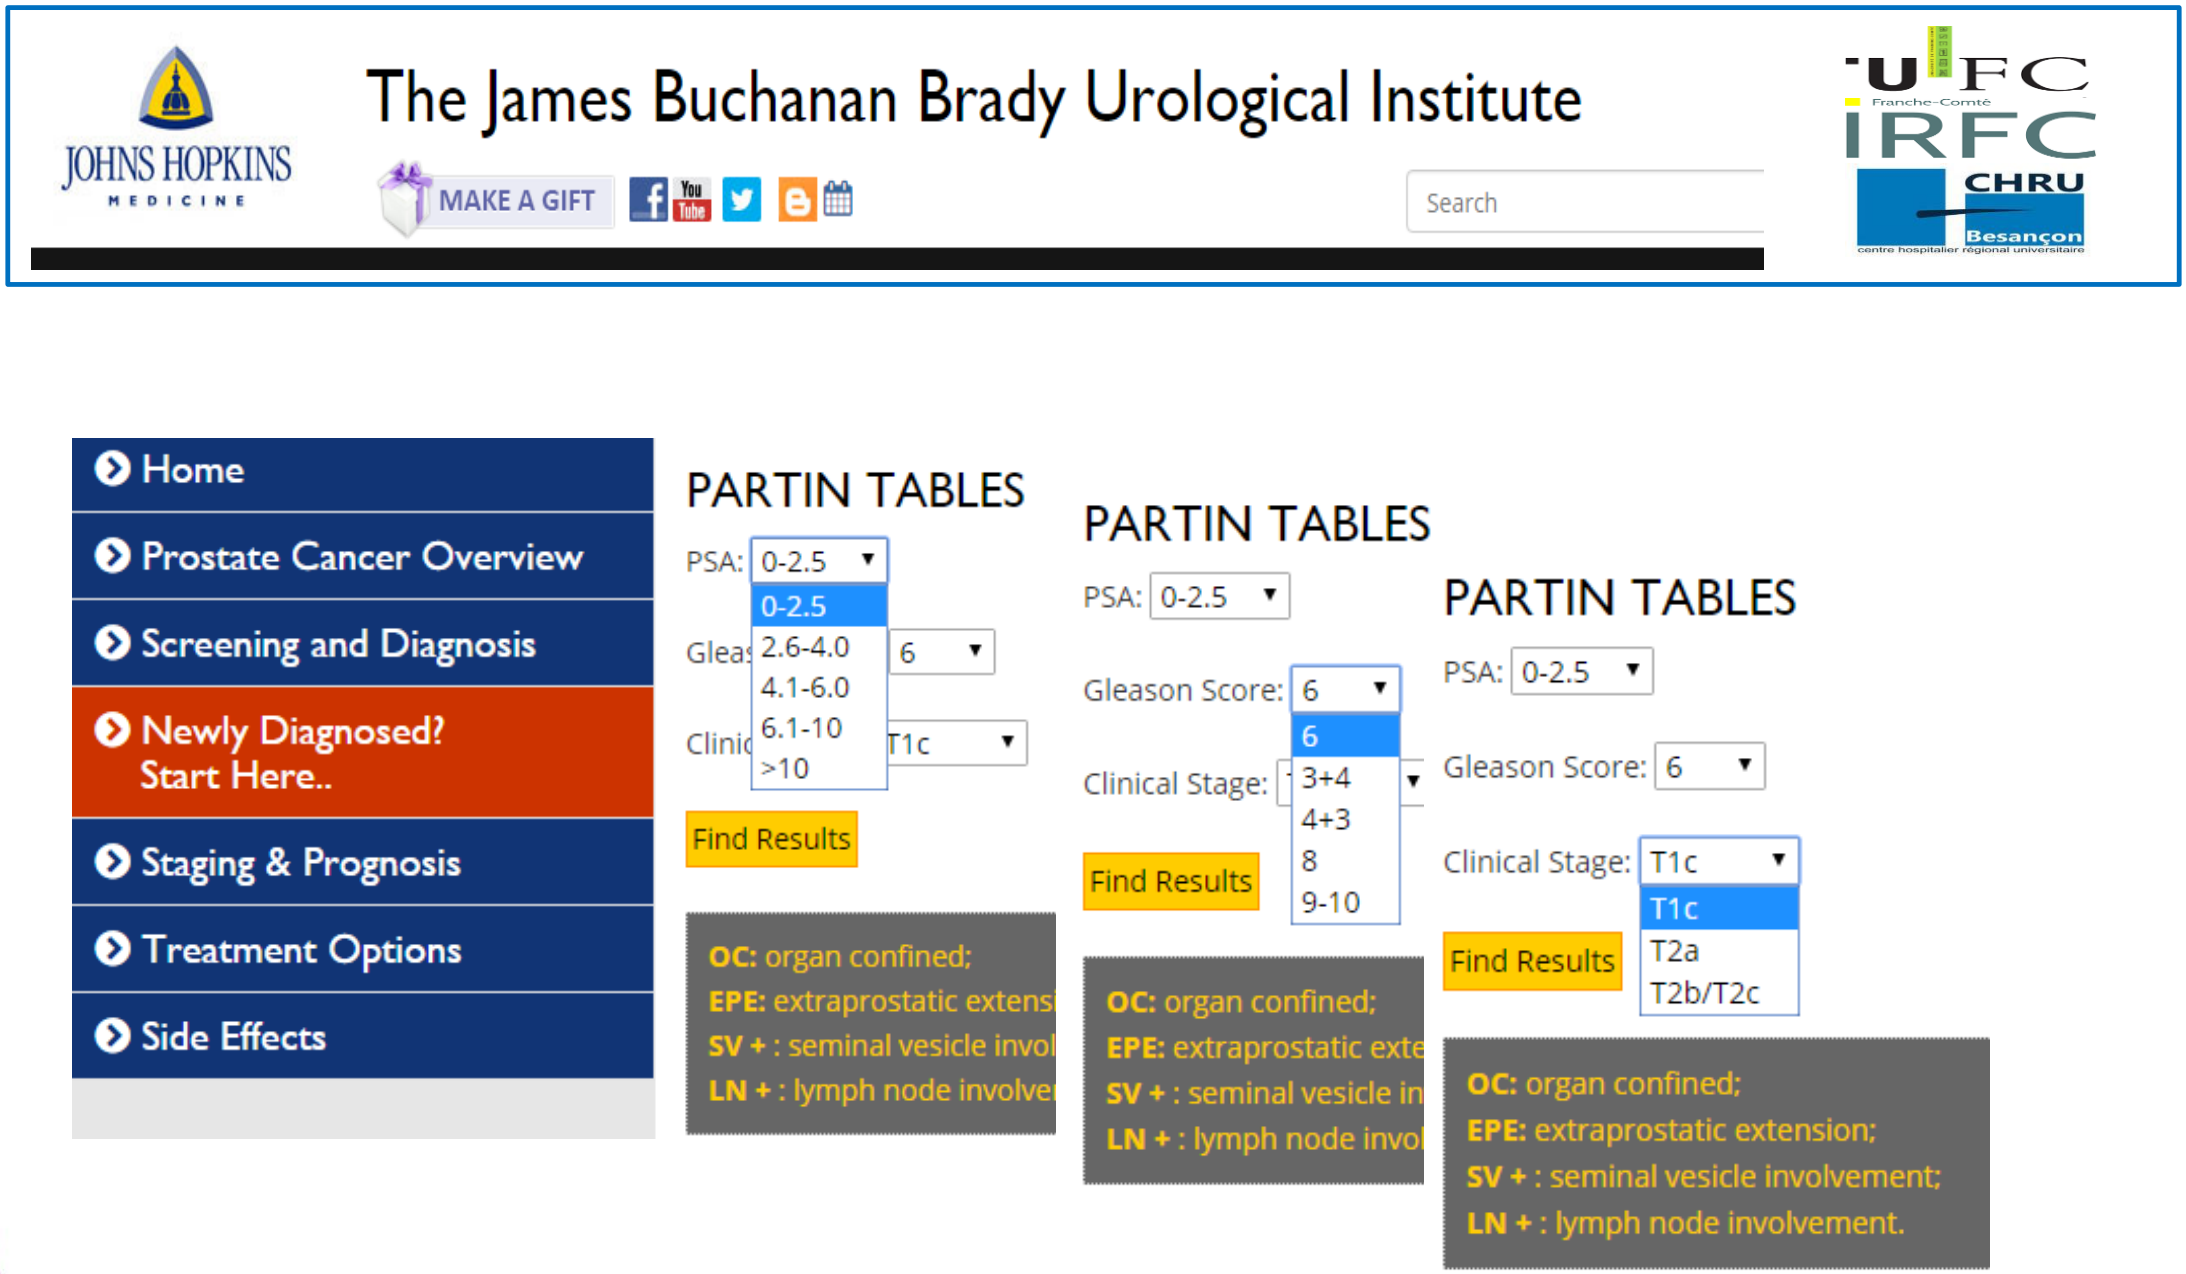
T1a and T1C:	TG = 1
T1b, T2a	TG = 2
T2b, T2c	TG = 2.5
T3a	TG = 3

Roach M, Oncol News Int 1997; 6(Suppl 3): 5-6

The Roach formulas

- ECE risk = (1.5 x PSA) + [(GS - 3) × 10].
- N+ risk = 2/3 PSA [(GS + TG - 8) × 10].
- NOCD risk = 3/2 PSA [(GS + TG - 4) × 10].

Roach M, Oncol News Int 1997; 6(Suppl 3): 5-6



http://urology.jhu.edu/prostate/partintables.php

PATIENTS CARACTERISTICS

Median PSA = 4.9 ng/mL,

63% had Gleason 6 disease, and 78% of men had T1c disease.

73% of patients had OC disease

23% had EPE

3% had SV + but not LN +

1% had LN + disease

And T3 Tumors??

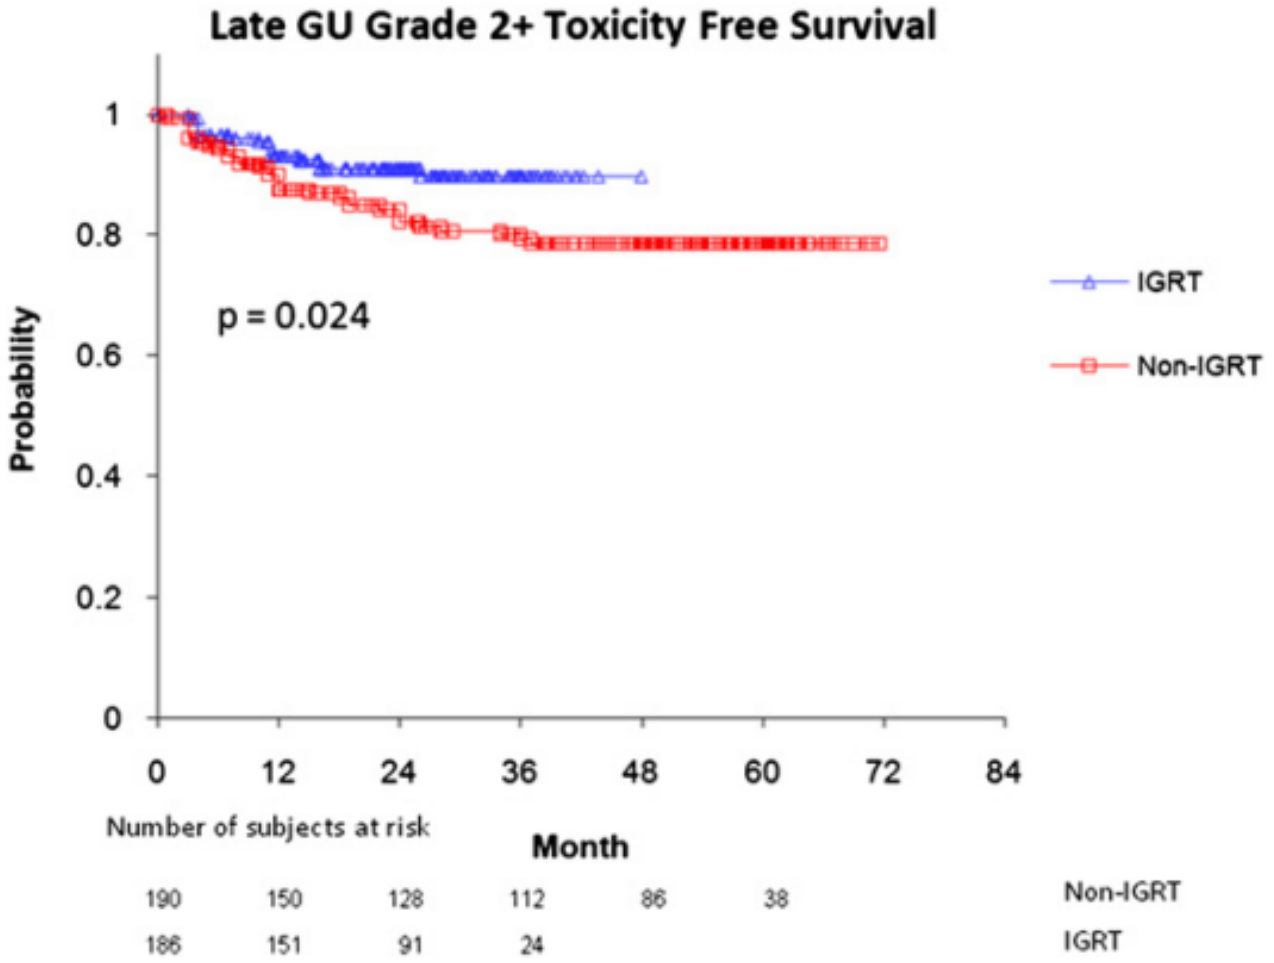
IMRT group = 186 pts
IGRT-IMRT group = 190 pts

IGRT performed with Kv and intraprostatic fiducials

Same total dose = 86.4 Gy

Zelefsky M et al, IJROBP 2012; 84 (1): 125-129

Improved Clinical Outcomes With High-Dose Image Guided Radiotherapy Compared With Non-IGRT for the Treatment of Clinically Localized Prostate Cancer



Zelefsky M et al, IJROBP 2012; 84 (1): 125-129

Improved Clinical Outcomes With High-Dose Image Guided Radiotherapy Compared With Non-IGRT for the Treatment of Clinically Localized Prostate Cancer

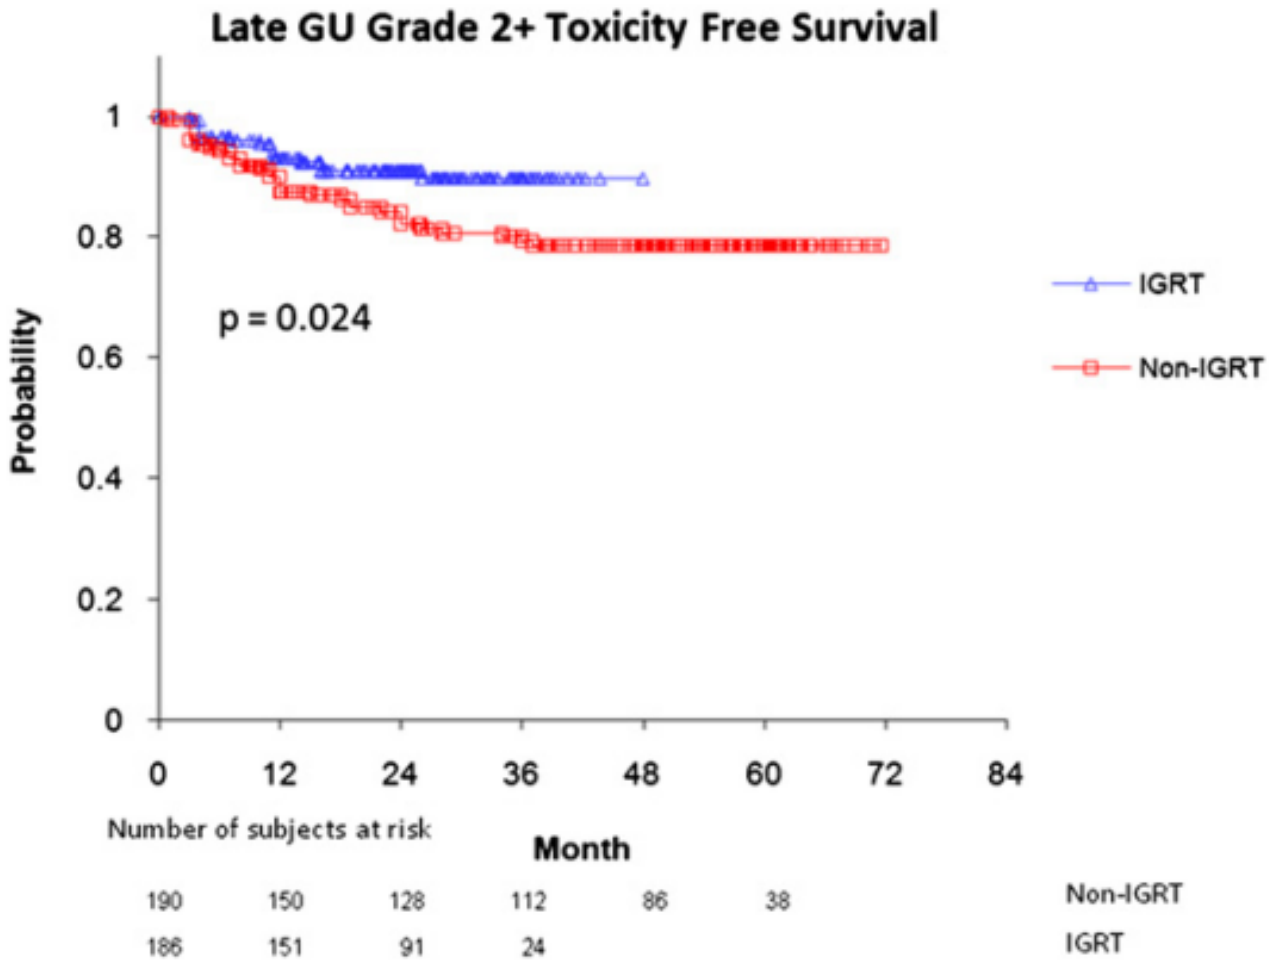
Table 3 Cox regression analysis for predictors of late urinary toxicity

Cox regression	Coefficient	95% CI (±)	SE	*p*	Hazard exponent coefficient
Age	0.028	0.041	0.021	0.183	1.028
Androgen deprivation therapy	0.150	0.566	0.288	0.603	1.161
IGRT	0.711	0.606	0.309	0.021	2.037
Baseline IPSS	0.043	0.036	0.018	0.021	1.044

Abbreviations: CI = confidence interval; IGRT = image-guided radiotherapy; IPSS = International Prostate Symptom Score; SE = standard error.

Zelefsky M et al, IJROBP 2012; 84 (1): 125-129

Improved Clinical Outcomes With High-Dose Image Guided Radiotherapy Compared With Non-IGRT for the Treatment of Clinically Localized Prostate Cancer



No impact on rectal toxicity

Zelefsky M et al, IJROBP 2012; 84 (1): 125-129

No impact on rectal toxicity…WHY???

Improved Clinical Outcomes With High-Dose Image Guided Radiotherapy Compared With Non-IGRT for the Treatment of Clinically Localized Prostate Cancer

PTV = prostate + entire seminal vesicles + a 1-cm margin except posteriorly, where a 0.6-cm margin was used

"…PTV regions receiving less than the prescription routinely included the prostate e rectal interface (to adhere to our rectal dose e volume constraints) and occasionally the superior portion of the seminal vesicles to adequately spare small bowel…."

Zelefsky M et al, IJROBP 2012; 84 (1): 125-129

Improved Clinical Outcomes With High-Dose Image Guided Radiotherapy Compared With Non-IGRT for the Treatment of Clinically Localized Prostate Cancer

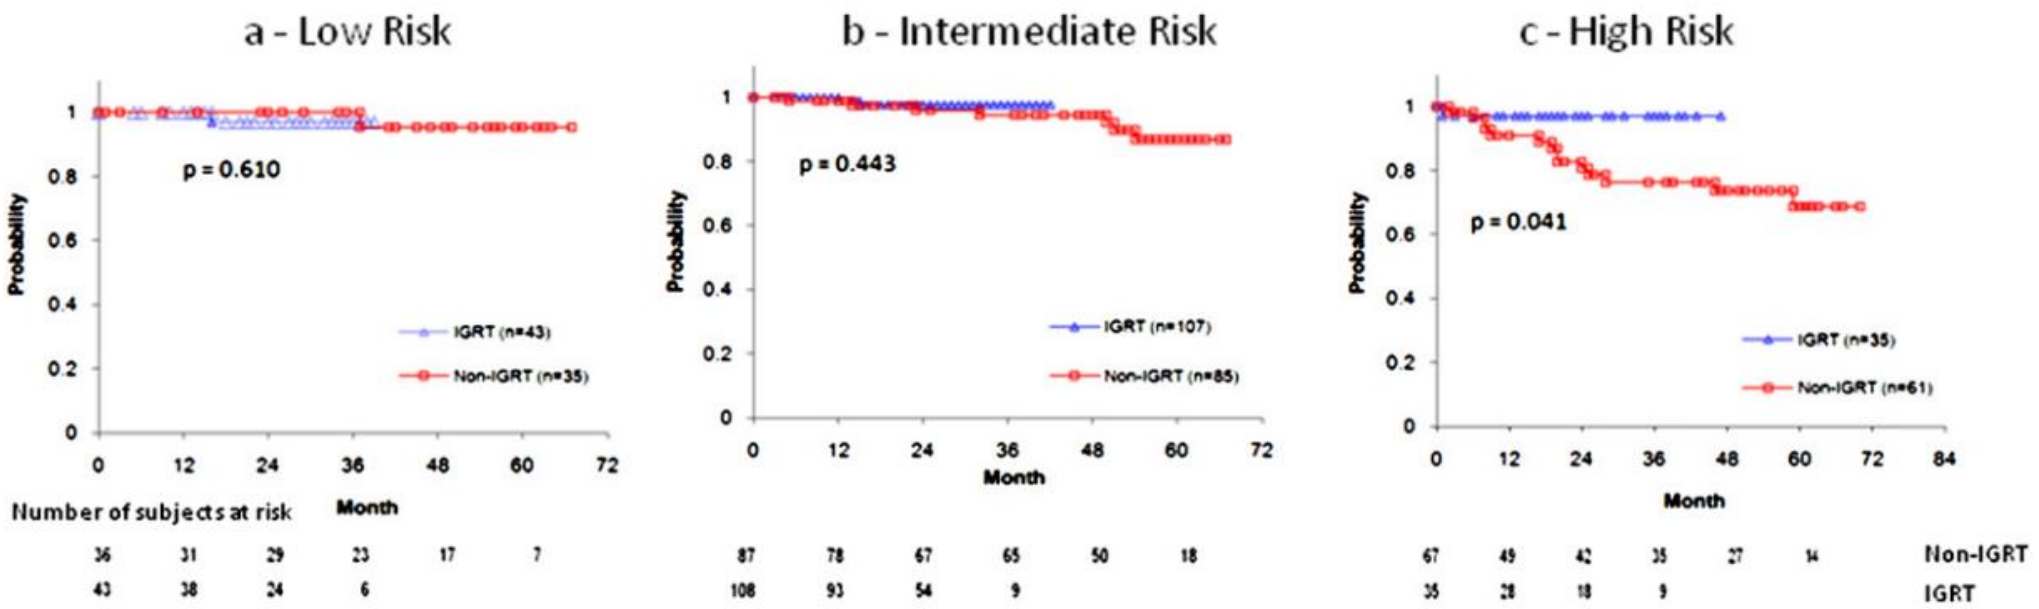


Fig. 2. Comparison of prostate specific antigen relapse-free survival outcomes between patients treated with image-guided radiotherapy (IGRT) to 86.4 Gy and those treated with intensity-modulated radiotherapy to the same dose level.

Zelefsky M et al, IJROBP 2012; 84 (1): 125-129

Better biochemical free survival …WHY???

Improved Clinical Outcomes With High-Dose Image Guided Radiotherapy Compared With Non-IGRT for the Treatment of Clinically Localized Prostate Cancer

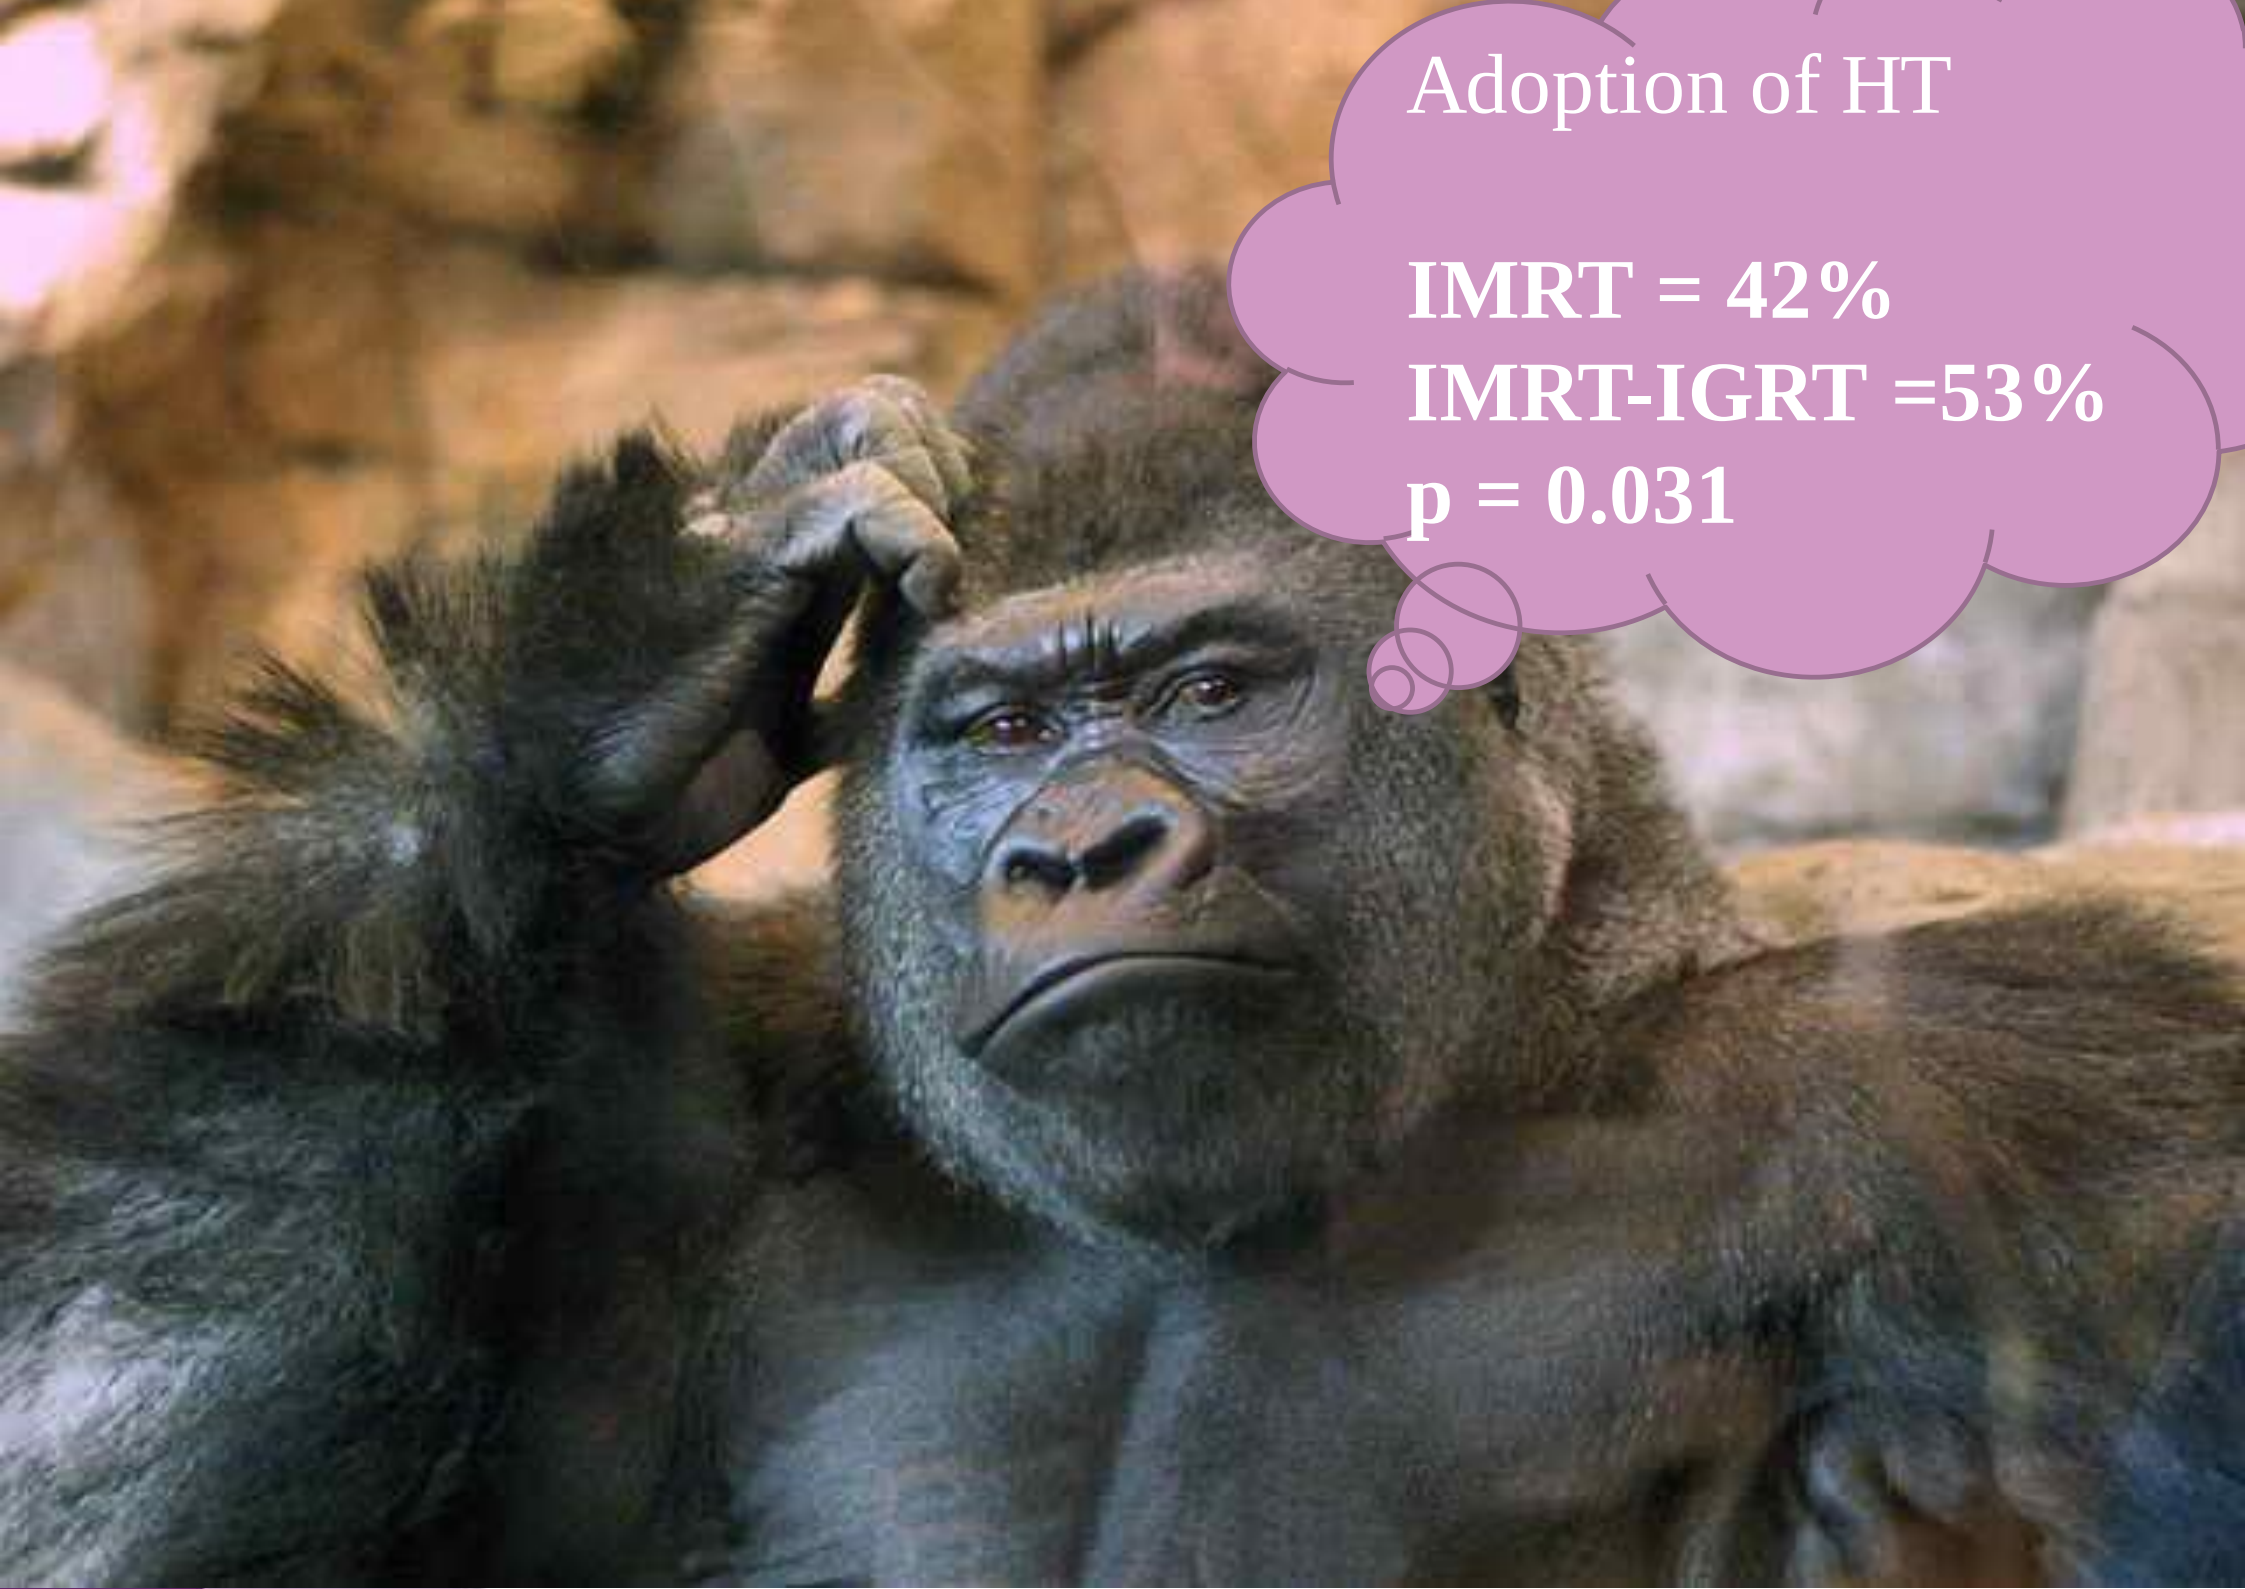
PTV = prostate + entire seminal vesicles + a 1-cm margin except posteriorly, where a 0.6-cm margin was used

"…The enhanced accuracy of IGRT could possibly explain the improved biochemical tumor control observed for high-risk patients with a large volume of disease in whom escalated dose levels are critical for local tumor control…" (Zelefsky et al)

Zelefsky M et al, IJROBP 2012; 84 (1): 125-129

Treatment period
IMRT = 2006-08
IGRT/IMRT = 2007-09

Median follow-up (months)
IMRT = 49
IGRT/IMRT = 24



Adoption of HT
IMRT = 42%
IMRT-IGRT =53%
p = 0.031

Munch, *The Scream, 1893*

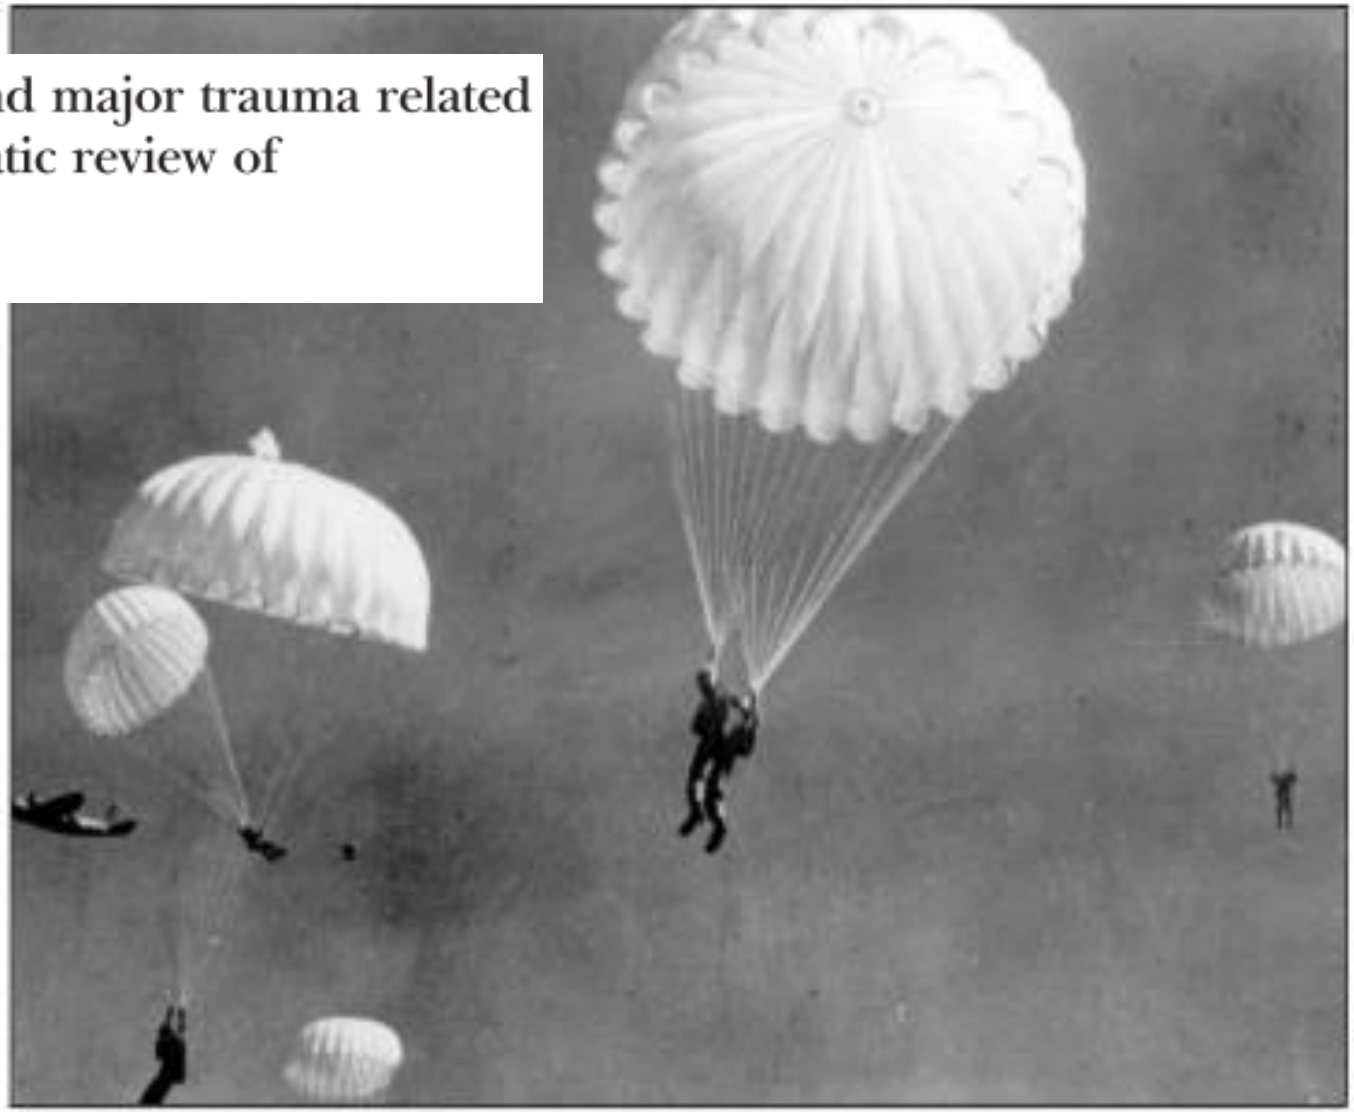
IMRT and IGRT in PCa

Should we forget IMRT and IGRT in the PCa treatment because of the lack of high level randomized trials?

IMRT and IGRT in PCa
…a pragmatic approach…

Parachute use to prevent death and major trauma related to gravitational challenge: systematic review of randomised controlled trials

Gordon C S Smith, Jill P Pell *BMJ* 2003;327:1459–61



Parachutes reduce the risk of injury after gravitational challenge, but their effectiveness has not been proved with randomised controlled trials

IMRT and IGRT in PCa
…a pragmatic approach…

Parachute use to prevent death and major trauma related to gravitational challenge: systematic review of randomised controlled trials

Gordon C S Smith, Jill P Pell

BMJ 2003;327:1459–61

What is already known about this topic

Parachutes are widely used to prevent death and major injury after gravitational challenge

Parachute use is associated with adverse effects due to failure of the intervention and iatrogenic injury

Studies of free fall do not show 100% mortality

What this study adds

No randomised controlled trials of parachute use have been undertaken

The basis for parachute use is purely observational, and its apparent efficacy could potentially be explained by a "healthy cohort" effect

Individuals who insist that all interventions need to be validated by a randomised controlled trial need to come down to earth with a bump

How to deliver

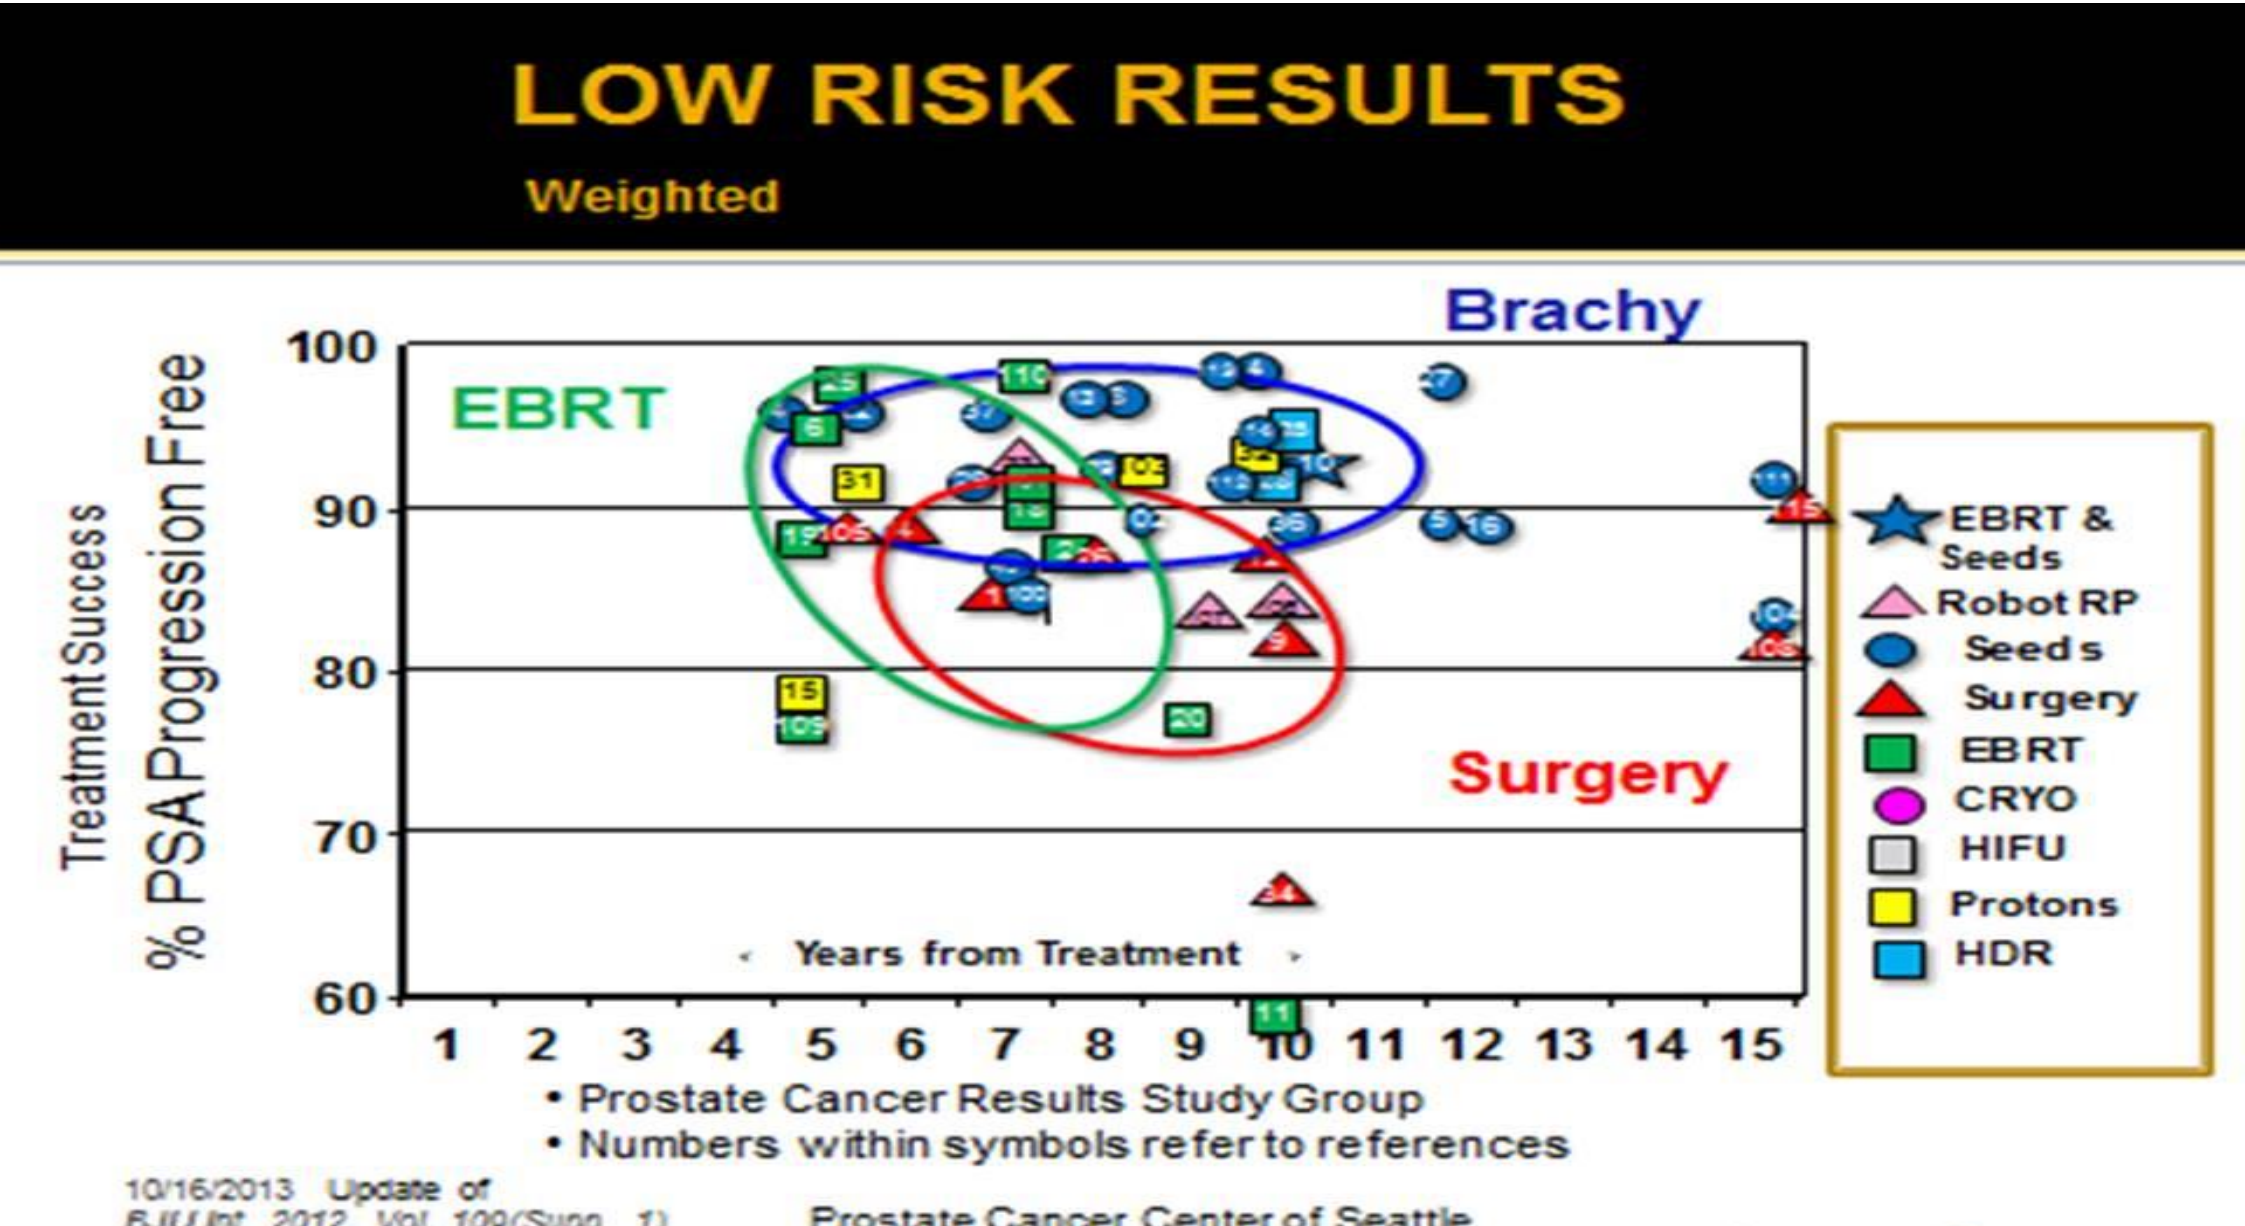
- **Role of IMRT**
- **Role of IGRT**
- **Role of BRT**

Is the adoption of BRT as boost evidence – based? Data from RCTs

Author (year)	Years of enrollement	PTS	BRT schedule	EBRT dose	Risk group	FUP (years)	5-y bRFS (%)
Santhia (2005)	1992-1997	51 53	- 35 Gy (HDR)	66 40	IR HR	8.2	49 71 p = 0.04
Hoskin (2012)	1997-2005	108 110	- 17 X 2 (HDR)	55 (2.75) 35.75 (2.75)	LR IR HR	12	61 75 p = 0.002
RTOG 0232	2003 - 2012	296 292	LDR EBRT + LDR	125-145 45 + 125/145	IR	5	NS

The adoption of BRT as boost could be considered evidence based

Is the adoption of BRT monotherapy evidence – based?



Is the adoption of BRT monotherapy evidence – based?

BJU Int, 2012, Vol. 109(Supp 1)

Prostate Cancer Center of Seattle

Is the adoption of BRT monotherapy evidence – based?

Brachytherapy (LDR or HDR) as monotherapy = large but retrospective studies.

Comparable results with RP or EBRT in terms of bRFS rates.

BRT (LDR or HDR) is included in the NCCN guidelines as a standard therapeutic option for low risk PC, BUT high level evidences based on RCTs are still lacking

How … to combine with systemic treatments

RCTs for ADT + RT vs RT alone

Table 2: Randomized trials examining the addition of ADT to radiation for high-risk patients.

Trial	Study cohort	Median follow-up	Trial arms	Outcomes
RTOG 85-31 [11, 12]	945 patients T3 (82%) or N1 (18%)	7.6 years	RT versus RT + ADT (44–46 Gy to whole pelvis; 20–25 Gy boost to prostate) ADT: goserelin at least 2 years, preferably until progression	10-year OS (39% versus 49%, $p = 0.002$) 10-year DSS (78% versus 84%, $p = 0.005$) Overall survival benefit limited to patients with Gleason 7–10
RTOG 86-10 [13–15]	456 patients T2-T4, N0-1 with "bulky" disease (palpable ≥ 25 cm^2)	11.9 years	RT versus RT + ADT (44–46 Gy to whole pelvis; 20–25 Gy boost to prostate) ADT: 4 months' goserelin + flutamide, starting 2 months prior to RT	10-year OS (34% versus 43%, $p = 0.12$) 10-year DSS (23% versus 36%, $p = 0.01$) Subset analyses at 8 years showed that benefit was confined to Gleason 2–6 patients. No benefit to ADT in Gleason 7–10
TROG 96-01 [16]	802 patients T2b-T4N0	10.6 years	RT alone versus RT + 3 mo. ADT versus RT + 6 mo. (66 Gy, no pelvic node treatment) ADT: goserelin + flutamide given *neoadjuvantly*	At 10 years, addition of 6 months' ADT improved 10-year OS (70.8% versus 57.5%, $p = 0.0005$) 10-year DSS (48% versus 23%, $p < 0.0001$)
EORTC 22863 [17, 18]	415 patients T1-2N0 grade 3 or T3-4N0-1	9.1 years	RT versus RT + 3 years' ADT (50 Gy to pelvis, 20 Gy boost) ADT: 1 month' cyproterone acetate, goserelin × 3 years starting with RT	10-year OS (40% versus 58%, $p = 0.0004$) 10-year DSS (10% versus 30%, $p < 0.0001$)

OS: overall survival, DSS: disease-specific survival.

Juloori et al, Prostate Cancer. 2016;2016:2420786

RCTs for ADT + RT vs RT alone

Table 3: Randomized trials comparing LTAD and STAD with radiation in high-risk patients.

Trial	Study cohort	Median follow-up	Trial arms	Outcomes
EORTC 22961 [19]	970 patients with T2c-T4 or N1-2	6.4 years	RT + 6 months' ADT versus RT + 36 months' ADT (Prostate dose 70 Gy) ADT: 6 months' CAB (LHRH agonist + antiandrogen) ± 2.5 years' LHRH agonist	5-year OS 81% versus 85% ($p = 0.02$) 5-year DSS 95% versus 97% ($p = 0.002$) QOL measures the same in each arm No difference in cardiac fatal event Increased rates of reported gynecomastia, incontinence, and sexual dysfunction with LTAD
RTOG 92-02 [20, 21]	1514 patients with T2c-T4	11.3 years	RT + 4 months' ADT versus RT + 28 months' ADT (44–50 Gy to whole pelvis, boost to 65–70 Gy prostate) ADT: goserelin + flutamide 4 months total (prior to and during RT) ± 2 years' goserelin	10-year OS 52% versus 54% ($p = 0.25$) 10-year DSS 84% versus 89% ($p = 0.0001$) Gleason 8–10 subset: 10-year OS 32% versus 45% ($p = 0.0061$) Increased grade 3 GI toxicity at 8 years with LTAD (2.9% versus 1.2%, $p = 0.04$)
DART 01/05 Spain [22]	355 patients (47% int.-risk, 53% high-risk)	5.3 years	RT + 4 months' ADT versus RT + 28 months' ADT (76–82 Gy to prostate) ADT: goserelin + antiandrogen for 4 months total (prior to and during RT) ± 2 years' goserelin	5-year OS 86% versus 95% ($p = 0.009$) 5-year BRFS 81% versus 89% ($p = 0.019$) 5-year metastasis-free survival 83% versus 94% ($p = 0.009$)
PCS IV Trial Canada Nabid et al. [23]	630 node-negative, high-risk patients	6.5 years	RT + 18 months' ADT versus RT + 36 months' ADT (44 Gy to whole pelvis, 70 Gy to prostate) ADT: bicalutamide 1 month, goserelin q 3 months for 18 or 36 months	10-year OS 59% versus 62% ($p = 0.28$) 10-year DSS 84.1% versus 83.7% ($p = 0.82$)

LTAD: long-term ADT, STAD: short-term ADT, OS: overall survival, DSS: disease-specific survival, and BRFS: biochemical relapse-free survival.

Combination of androgen deprivation therapy and radiotherapy for localized prostate cancer in the contemporary era

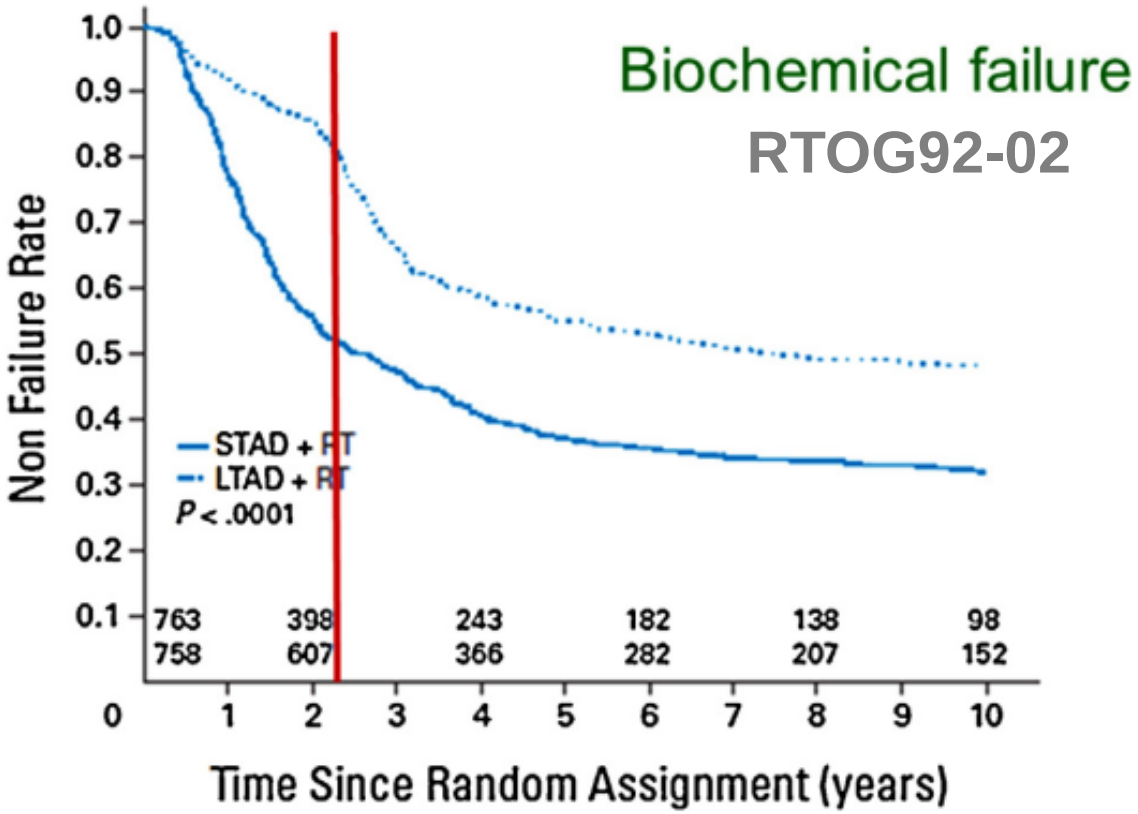

Fig. 1. Biochemical failure in RTOG 92-02 trial (modified from [14]).

What ….is the role of RT in the postop setting?

Why should we continue to discuss about ART?

When …

Which…

Where …

How …

A cast of shadow on adjuvant radiotherapy for prostate cancer: A critical review based on a methodological perspective

- SWOG and EORTC trial: only few patients presented a PSA dosage

- Only the German trial delivered really ART, as 1/3 of the patients of the other 2 studies with a dosage of PSA presented an elevated value of PSA…it is SRT!

- Impact of ADT in the observational arms…

[1]Arcangeli S et al. Crit Rev Oncol Hematol. 2016 Jan;97:322-7

Why should we continue to discuss about ART?

- These trials typically represent a paradigm of the time delay-related limitations[1]

- Indeed, only 20% of the patients potentially candidate to ART really receive it[2]

- Introduction of the PSA dosage and of the concept of early salvage RT (SRT)

[1]Arcangeli S et al. Crit Rev Oncol Hematol. 2016 Jan;97:322-7
[2]Hoffman Ke et al, J Urol. 2011; 185 (1): 116–120

National Comprehensive Cancer Network®

NCCN Guidelines Version 2.2017
Prostate Cancer

aRT

Indications for adjuvant RT include pT3 disease, positive margin(s), Gleason score 8–10, or seminal vesicle involvement. Adjuvant RT is usually given within 1 year after RP and once any operative side effects have improved/ stabilized. Patients with positive surgical margins may benefit the most.

sRT

- Indications for salvage RT include an undetectable PSA that becomes detectable and then increases on 2 subsequent measurements. Treatment is more effective when pre-treatment PSA is low and PSADT is long.

How to combine ADT in the postoperative setting?

National Comprehensive Cancer Network®

NCCN Guidelines Version 2.2017 Prostate Cancer

- Two years instead of 6 months of ADT can be considered in addition to RT based on RTOG 9601 for men with persistent PSA after RP or for PSA levels that exceed 1.0 ng/mL at the time of initiation of salvage therapy. Six months of ADT can be considered coadministered with salvage radiation based on the results of GETUG-16. An LHRH agonist should be used. For 2-year ADT, there is level 1 evidence to support 150 mg bicalutamide daily but an LHRH agonist could be considered as an alternative.

“I quote no authors but God and experience”

Andrew Taylor Still

How many papers do you read per week ?

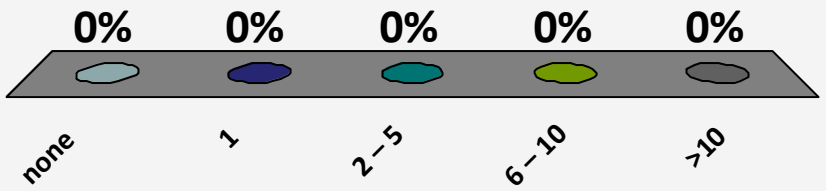
A. none

B. 1

C. 2 – 5

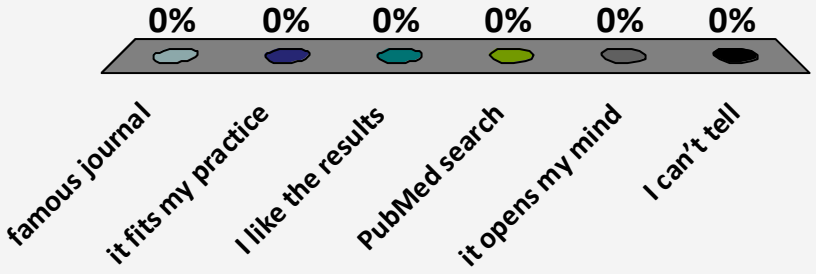
D. 6 – 10

E. >10



How do you select paper(s) to read ?

A. famous journal
B. it fits my practice
C. I like the results
D. PubMed search
E. it opens my mind
F. I can’t tell



Critical reading / writing

- Numerous and intricated criterions
  - medical
  - statistical
  - editorial
- Need for a systematic approach
  - checklist for the busy clinician

The CONSORT statement: revised recommendations for improving the quality of reports of parallel-group randomised trials

*David Moher, Kenneth F Schulz, Douglas G Altman, for the CONSORT Group**

To comprehend the results of a randomised controlled trial (RCT), readers must understand its design, conduct, analysis, and interpretation. That goal can be achieved only through total transparency from authors. Despite several decades of educational efforts, the reporting of RCTs needs improvement. Investigators and editors developed the original CONSORT

"... (to avoid) biased estimates of treatment effect,

... to judge the reliability or the relevance of the findings"

primary data analysis. Inclusion of these numbers allows the reader to judge whether the authors have done an intention-to-treat analysis. In sum, the CONSORT statement is intended to improve the reporting of an RCT, enabling readers to understand a trial's conduct and to assess the validity of its results.

Moher Lancet 2001

I'll buy it if …

- The question makes sense to me
  - fits to my clinical practice
  - opens my mind
- The data provide a reliable answer
  - study design and conduct
  - quality of data and analysis
- The paper follows the rules
  - the information I need …
  - where I expect to find it

Criteria

- Clinical relevance
- Trial design and conduct
- Data
- Results

Clinical relevance

- a question
- a primary endpoint
- a reference group
- inclusion / non inclusion criteria

(Non-)inclusion criteria

(Non-) inclusion criteria

Simple endpoints

Endpoint	Event
survival	death
tumour control	relapse
complication	complication

Complex endpoints and competitors

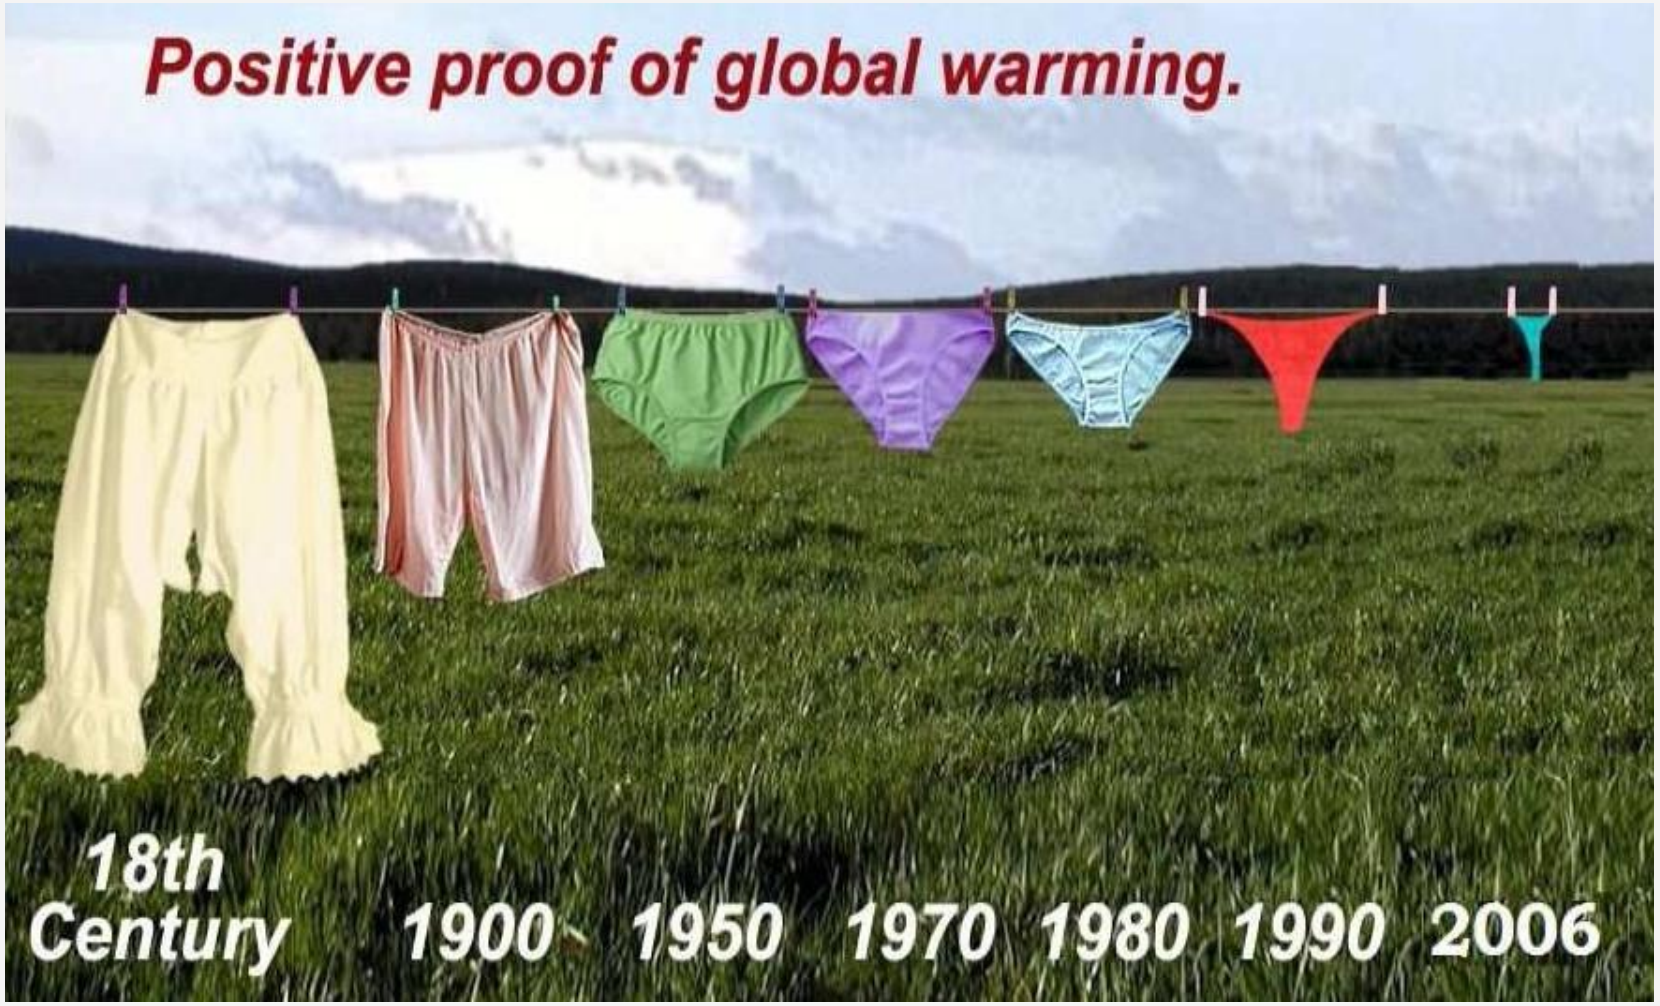
Endpoint	Event(s)	Competitors
cancer specific survival	death of cancer	other causes
disease free survival	relapse or death	…
time to progression	relapse	death
complication	complication	death or relapse
uncomplicated cure	complication or relapse	death

Note: relapse can be local / regional / distant …
or clinical / biological / …

Surrogate endpoint

- Replace the “true” endpoint
  - e.g. overall survival
- by a more “convenient” surrogate
  - easier to measure
  - obtained earlier
- AND reflecting clinical benefit

Surrogate endpoint



Parachute use to prevent death and major trauma related to gravitational challenge: systematic review of randomised controlled trials

Gordon C S Smith, Jill P Pell

BMJ 2003

Parachutes reduce the risk of injury after gravitational challenge, but their effectiveness has not been proved with randomised controlled trials

What is already known about this topic

Parachutes are widely used to prevent death and major injury after gravitational challenge

Parachute use is associated with adverse effects due to failure of the intervention and iatrogenic injury

Studies of free fall do not show 100% mortality

What this study adds

No randomised controlled trials of parachute use have been undertaken

The basis for parachute use is purely observational, and its apparent efficacy could potentially be explained by a "healthy cohort" effect

Individuals who insist that all interventions need to be validated by a randomised controlled trial need to come down to earth with a bump

Does usage of a parachute in contrast to free fall prevent major trauma?: a prospective randomised-controlled trial in rag dolls

Patrick Czorlich[1] · Till Burkhardt[1] · Jan Hendrik Buhk[2] · Jakob Matschke[3] · Marc Dreimann[4] · Nils Ole Schmidt[1] · Sven Oliver Eicker[1]

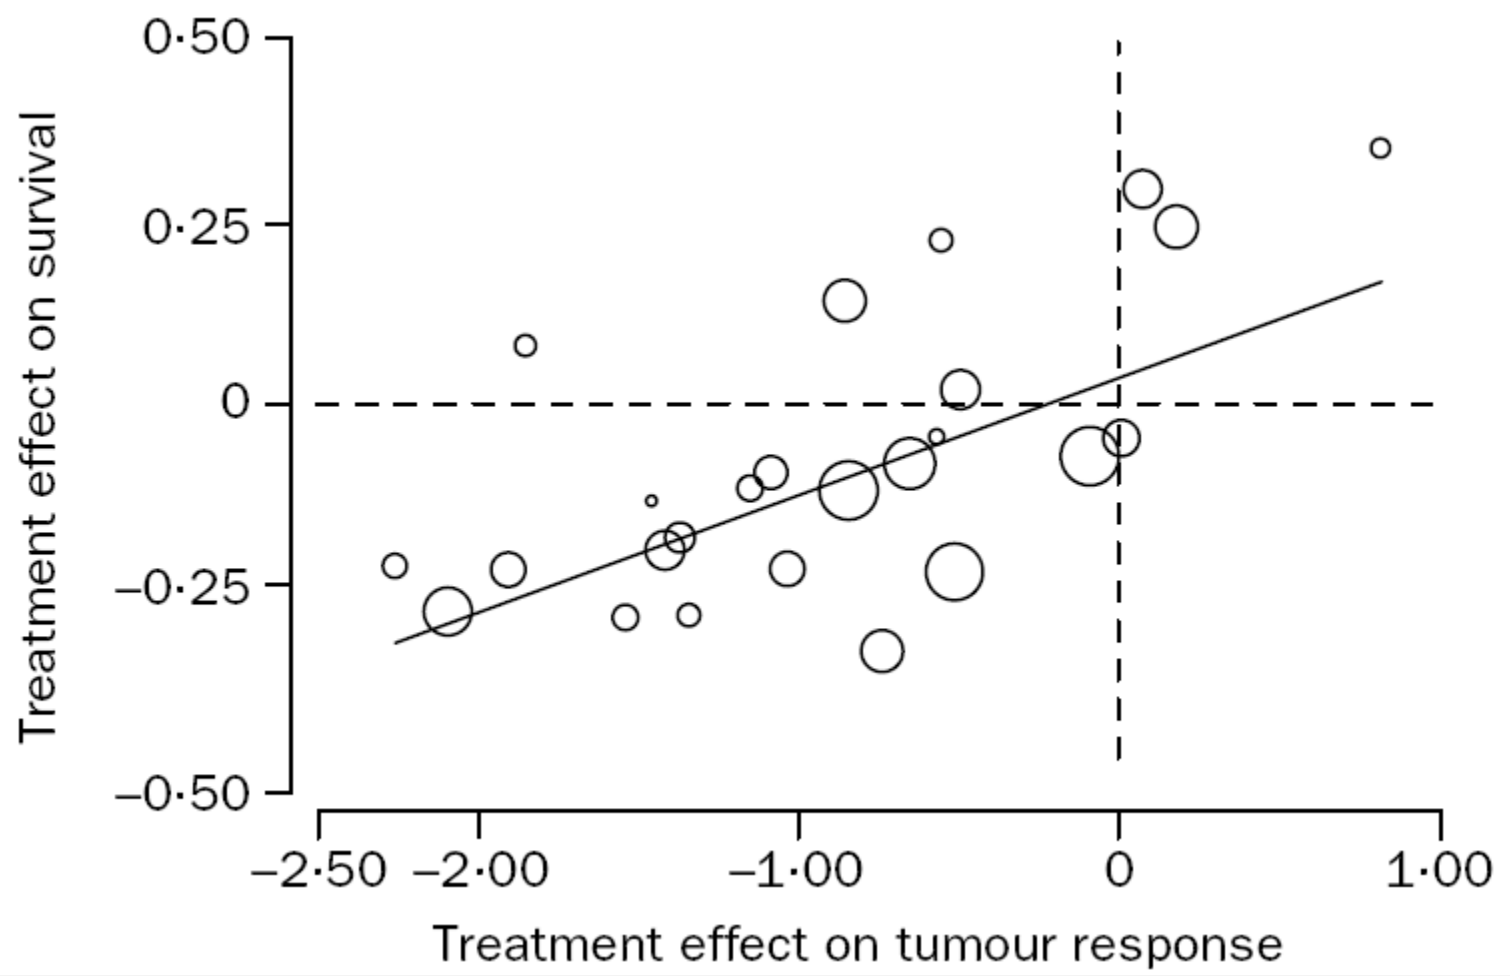
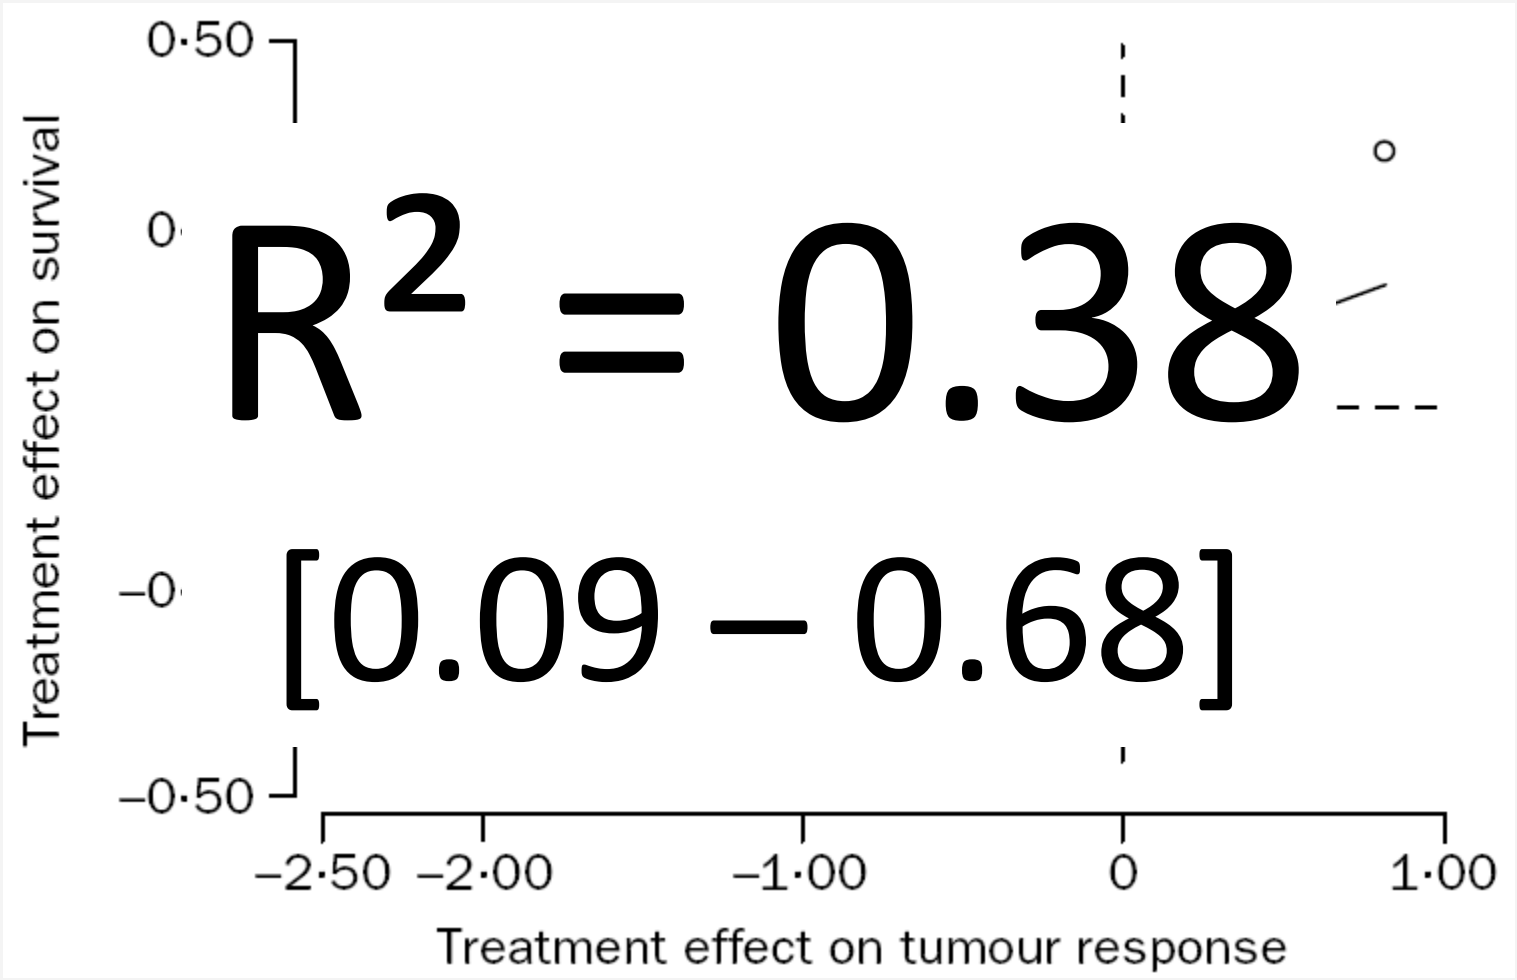
Response vs. survival



Buyse Lancet 2000

Response vs. survival



Buyse Lancet 2000

Censored event

- The event has not happened (… yet !)
  - follow-up too short
  - competitive events
  - missing data
- Specific to delayed endpoints
  - late toxicity
- “Time-dependent” statistics
  - i.e. Kaplan-Meier, actuarial, …

Censored events

- Quality of the data
  - follow-up duration in censored patients
  - number / nature of competitive events
  - missing data and cause
- Advantages of overall survival
  - clear-cut endpoint
  - only depends on follow-up duration
  - “statisticians love blood”

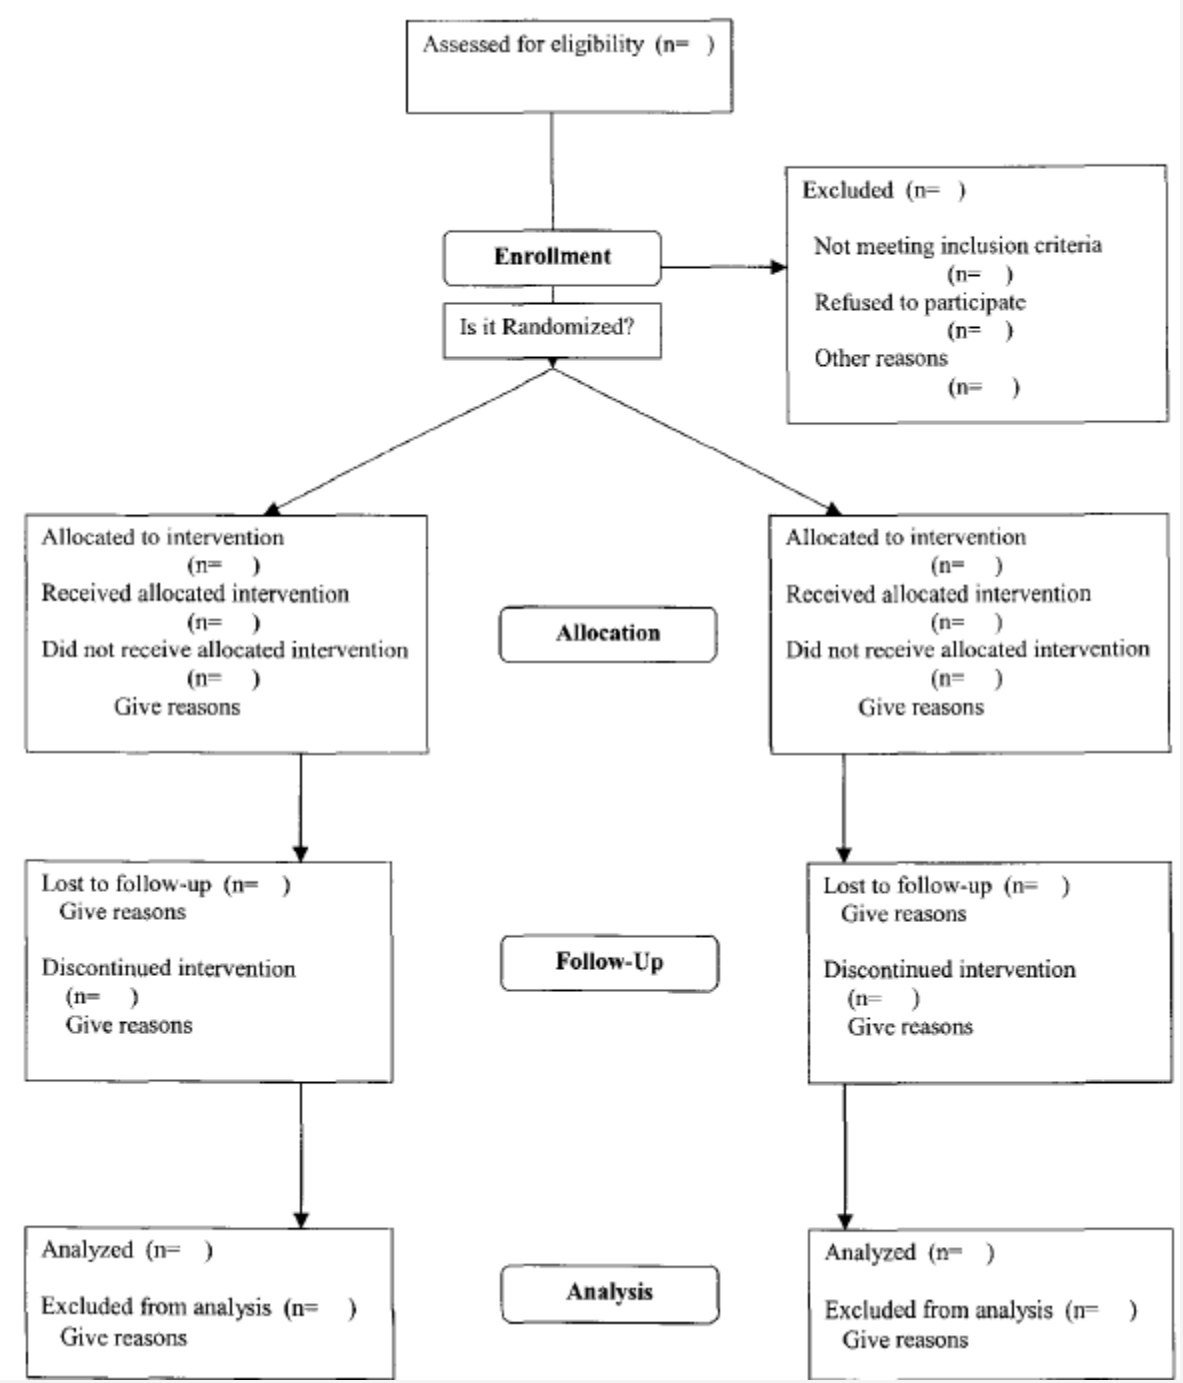
Methodology of trial

- Sample size
  - calculated a priori
- Treatment allocation
  - investigator cannot guess next patient’s group
- Follow-up
  - same modalities in all groups
- Evaluation of effect
  - simple / double / triple blind
  - independent assessment of endpoint

Conduct of trial

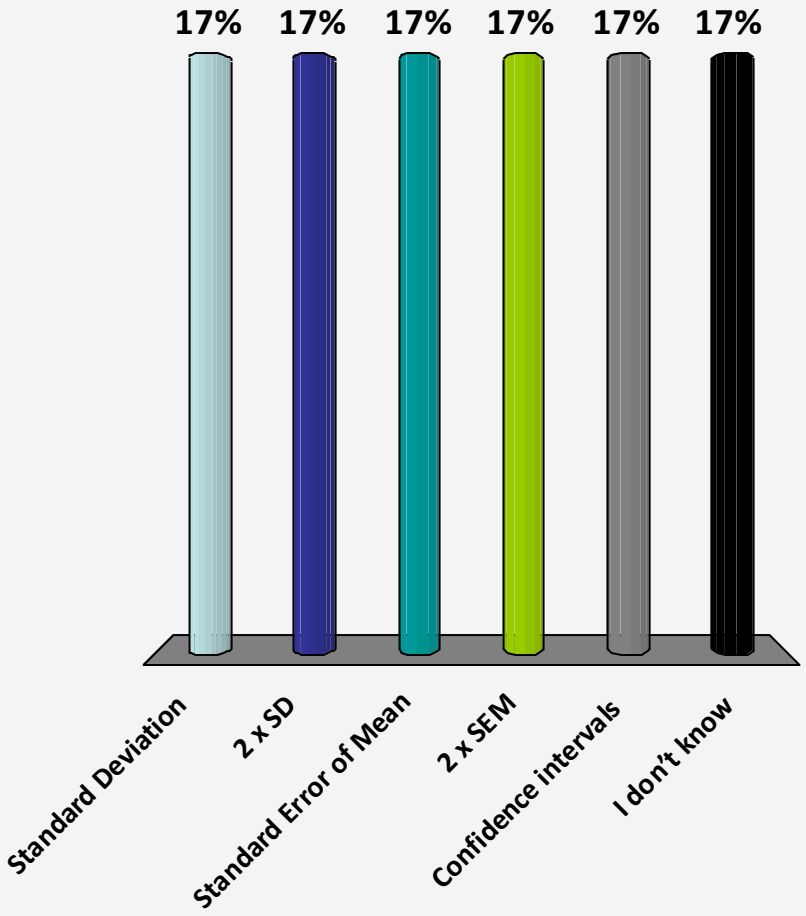
- Duration of inclusion period
- Inclusion of planned number of patients
- Adequate duration of follow-up

Data description



What are the error bars ?

A. Standard Deviation
B. 2 x SD
C. Standard Error of Mean
D. 2 x SEM
E. Confidence intervals
F. I don’t know



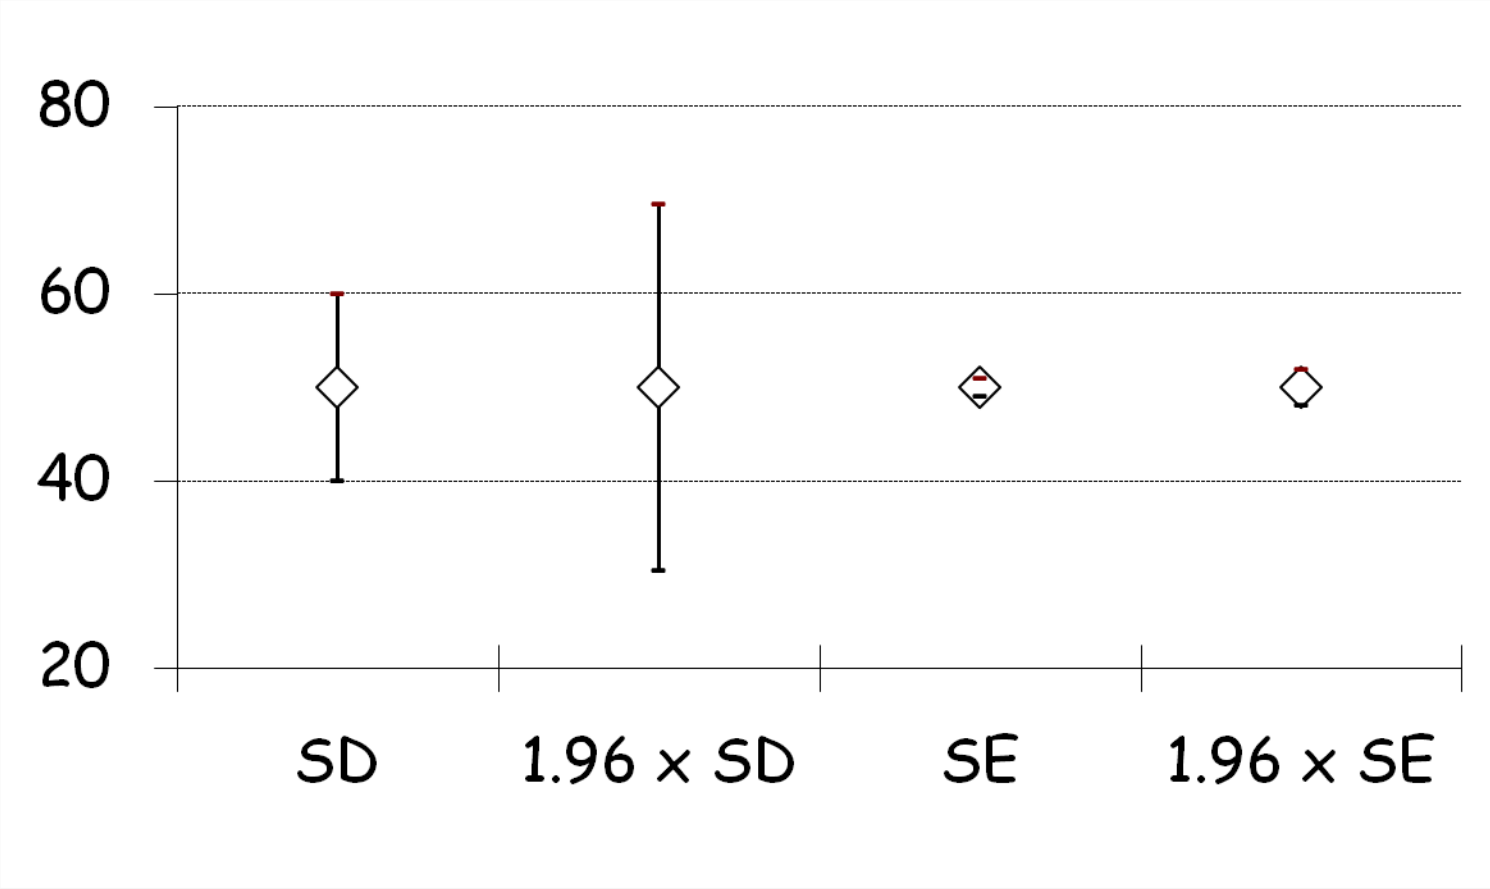
Confidence intervals

- Parameter values estimated on a sample
  - not on whole population
- 95% confidence interval
  - limits around the observed value
  - 95% chance to include result of the same study run with another sample of patients
- Describe the data ++++
  - reliability / precision of estimation

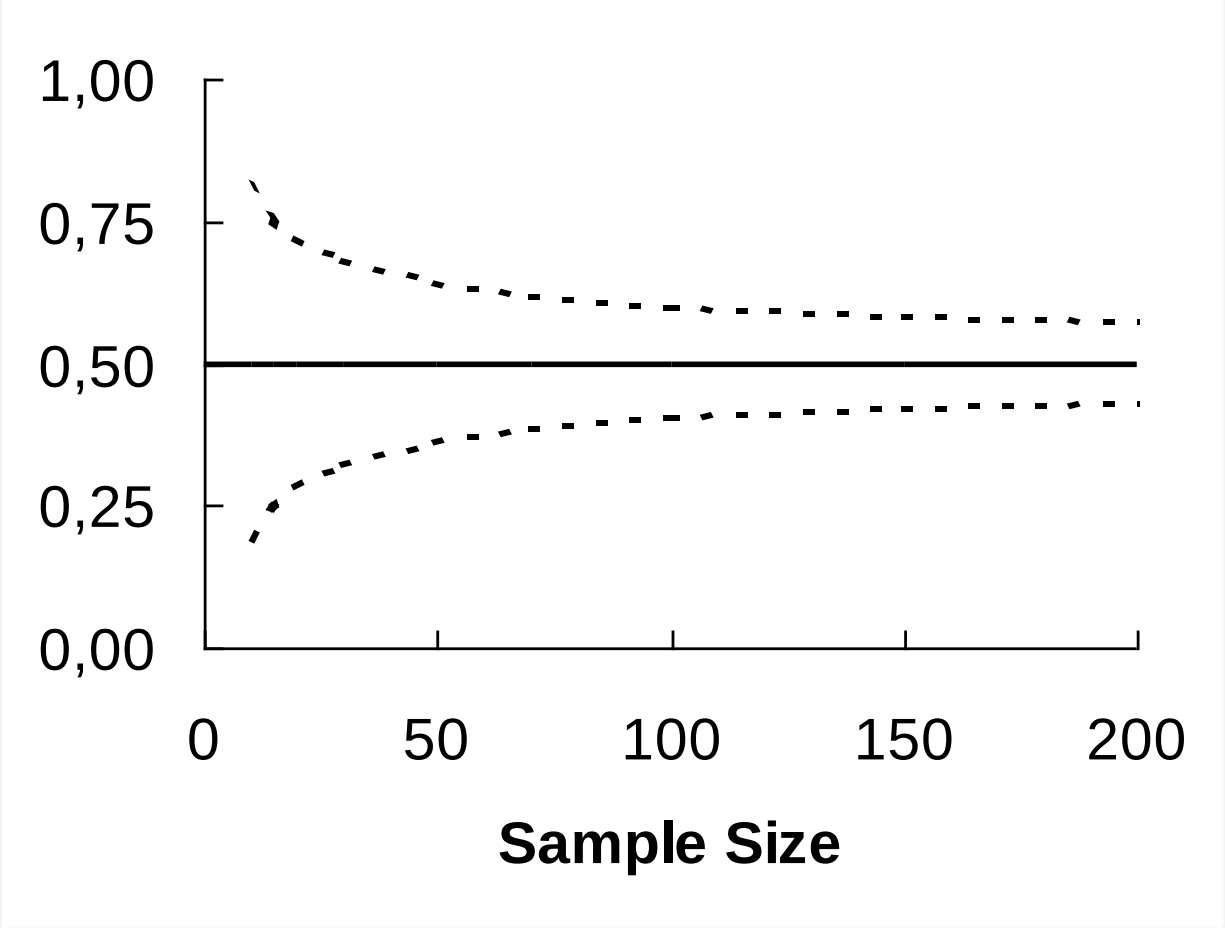
SD or SE ?

- SD = standard deviation = $\sqrt{}$(variance)
  - variance = $\sum_i^n (x_i - m)^2 / (n-1)$
- SE(M) = standard error of the mean
  - SE = $\sqrt{}(s^2/n)$ << SD
- SD or SE ?
  - the author's choice has to be explicit

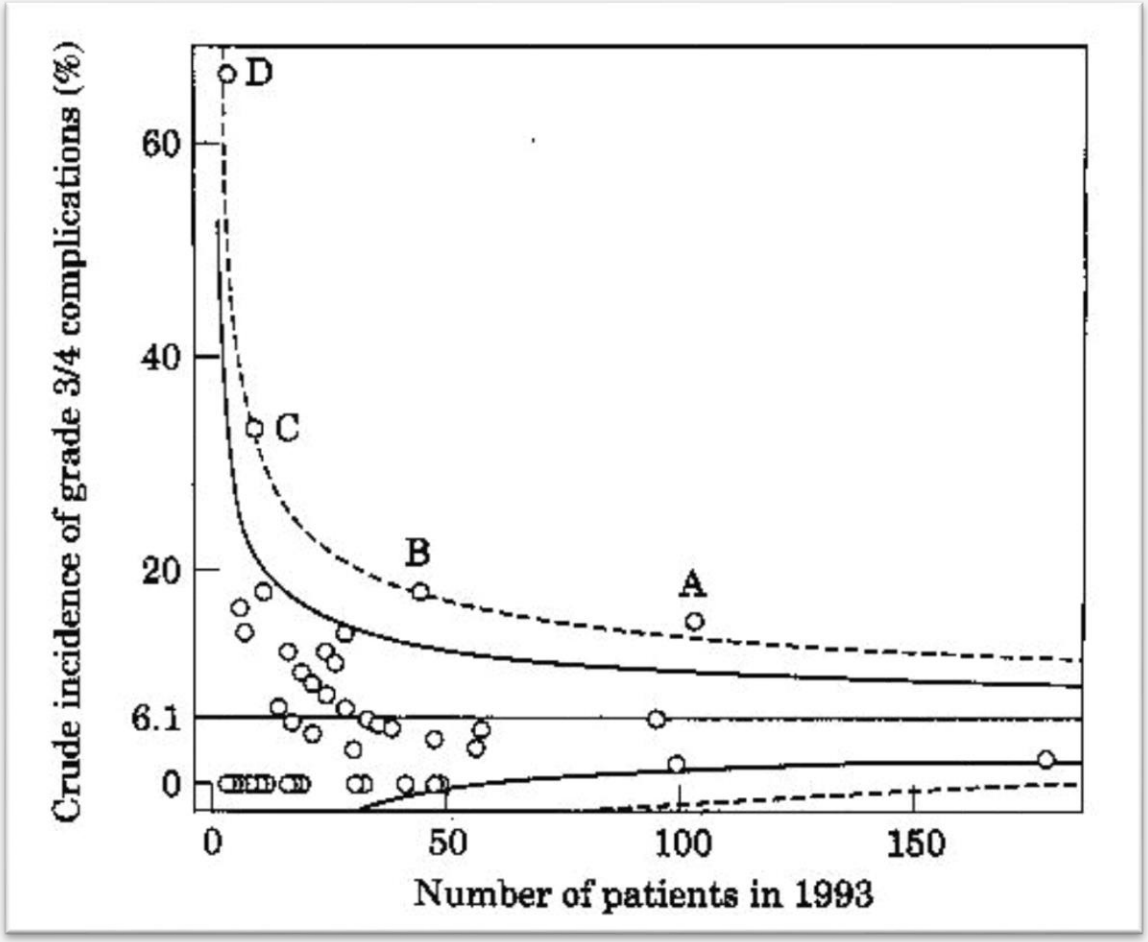
Error bars



The CI only depends on sample size



The CI only depends on sample size



Denton Clin Oncol 2002

Interpretation of results

- Intent-to-treat analysis ++++
  - patients analysed as randomised
  - whatever actual treatment
- Reasonable results of reference group
- Adequate statistics
  - tests appropriate for endpoint (2-tailed)
  - confirmation by multivariate analysis
  - consistency of subgroup analyses

Conclusion according to primary endpoint

Cetuximab Monotherapy and Cetuximab plus Irinotecan in Irinotecan-Refractory Metastatic Colorectal Cancer

METHODS

We randomly assigned 329 patients whose disease had progressed during or within three months after treatment with an irinotecan-based regimen to receive either cetuximab and irinotecan (at the same dose and schedule as in a prestudy regimen [218 patients]) or cetuximab monotherapy (111 patients). In cases of disease progression, the addition of irinotecan to cetuximab monotherapy was permitted. The patients were evaluated radiologically for tumor response and were also evaluated for the time to tumor progression, survival, and side effects of treatment.

CONCLUSIONS

Cetuximab has clinically significant activity when given alone or in combination with irinotecan in patients with irinotecan-refractory colorectal cancer.

Conclusion: The addition of radiotherapy to neoadjuvant chemotherapy results in higher histological complete response rate, higher R0 resection rate, and a lower frequency of lymph-node metastases, without significantly affecting survival.

Overall Survival

Kranzfelder et al. Br J Surg 2011

Conclusions

EBRO 2017

- Incidence of esophageal cancer is increasing
- Prognosis is poor due to advanced stages at diagnosis
- Treatment is challenging and requires multidisciplinary approach
- Largest gain is obtained in neo-adjuvant setting (CRT>CT?)

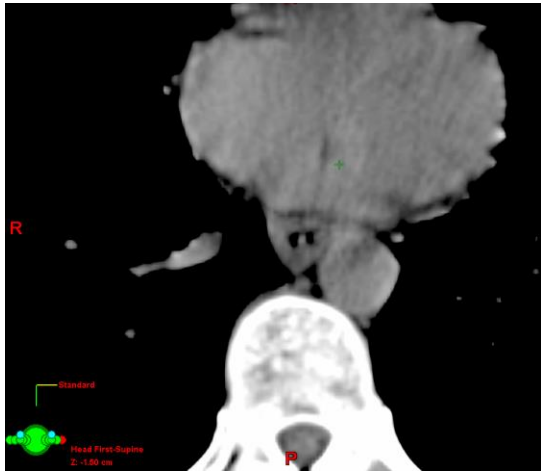
EBRO 2017

Defining GTV



Problems

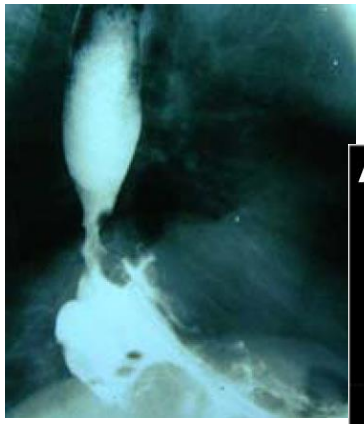
- Translating EUS findings to planning CT
- Differentiating tumour from normal oesophagus
- Differentiating tumour from other pathology

Possible solution

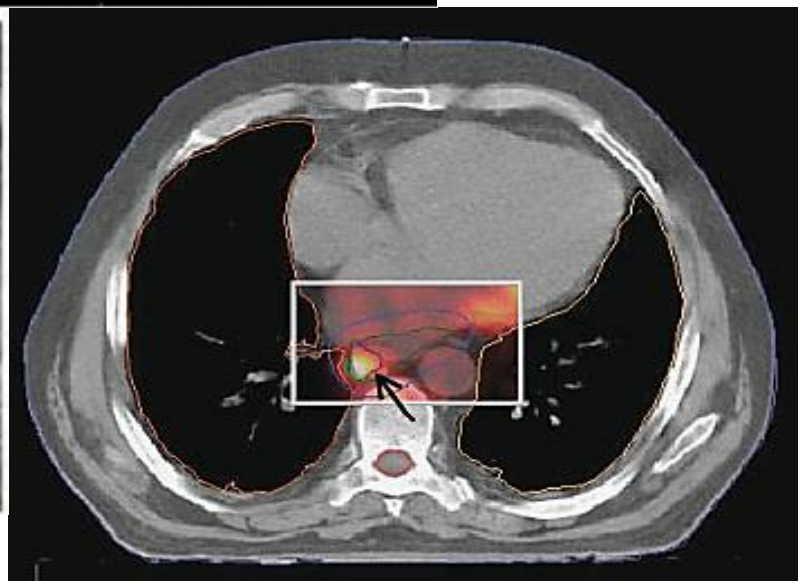
- Endoscopic placement of clips
- Integrating staging imaging and CT planning

Defining GTV

EBRO 2017

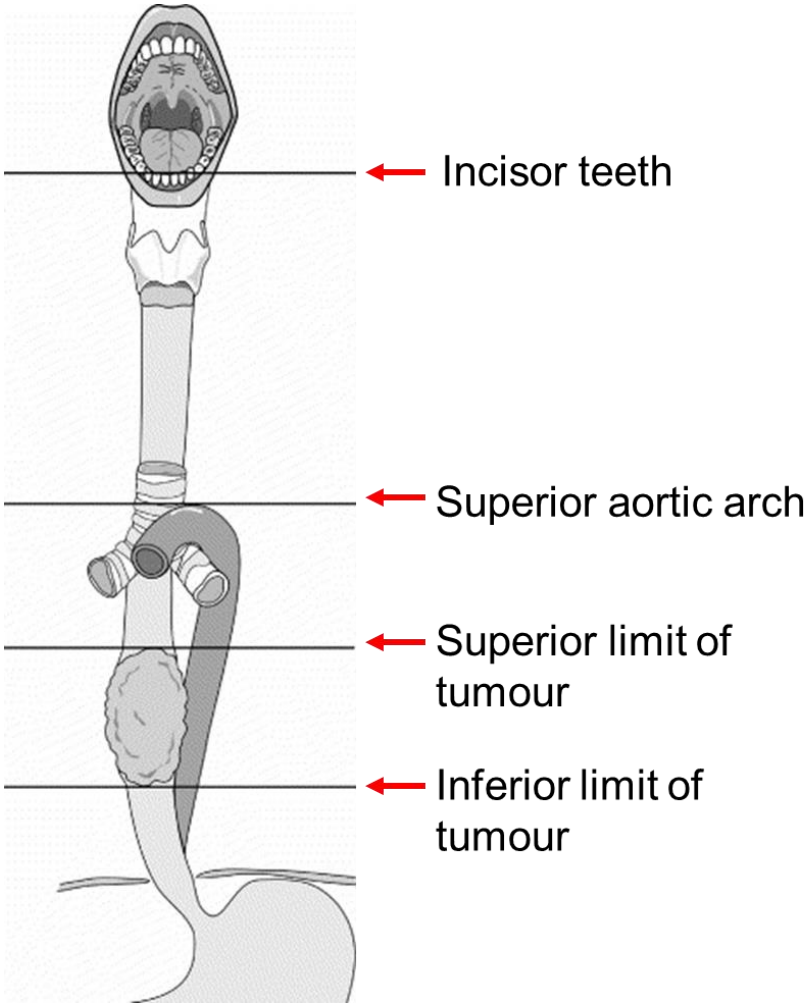


- Barium swallow
- CT-Scan
- Endoscopy
- EUS
- PET - CT



Defining GTV: EUS in treatment planning

EBRO 2017



11 cases

GTV^{CT} mean = 5.95 cm

GTV^{EUS} mean = 6.91 cm

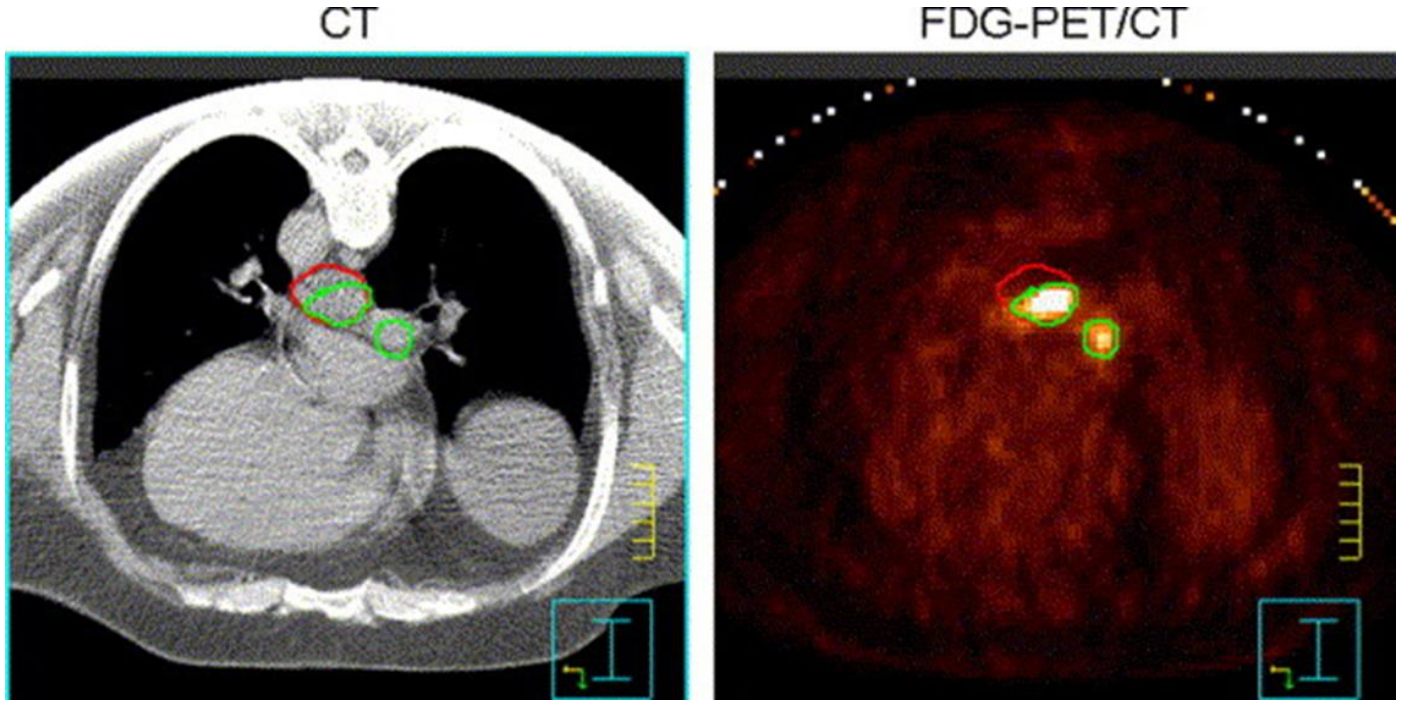
Variation in position:

Superior limit -25 to +75 mm

Inferior limit – 55 to + 15 mm

Thomas et al Radiother. Oncol. 2004

Defining GTV:
PET-CT in treatment planning



GTV defined by PET is smaller than by CT alone in 10/16

Gondi et al IJROBP 2007

EBRO 2017

Defining GTV:
PET-CT in treatment planning

- PET is more accurate for nodal assessment
- Distant lymph nodes and distant metastasis

- PET can improve the RT planning
  - PET shows the longitudinal extent better than CT
  - PET may be the only way to visualize the lower border of the tumor in case of tight stenosis

Gastric cancer – radiotherapy planning

Critical structures and dose constraints

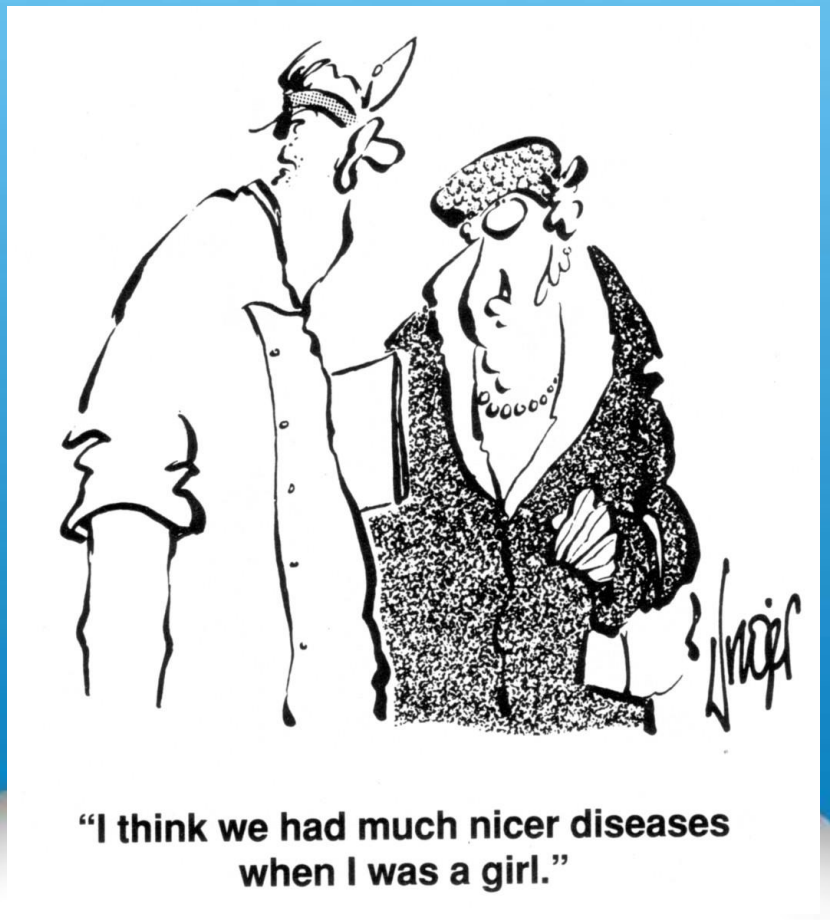
Small bowel Toxicity

Table 1. QUANTEC Summary: Approximate Dose/Volume/Outcome Data for Several Organs Following Conventional Fractionation (Unless Otherwise Noted)* (*Continued*)

Organ	Volume segmented	Irradiation type (partial organ unless otherwise stated)†	Endpoint	Dose (Gy), or dose/volume parameters†	Rate (%)	Notes on dose/volume parameters
Small bowel	Individual small bowel loops	3D-CRT	Grade ≥ 3 acute toxicity§	V15 <120 cc	<10	Volume based on segmentation of the individual loops of bowel, not the entire potential peritoneal space
	Entire potential space within peritoneal cavity	3D-CRT	Grade ≥ 3 acute toxicity§	V45 <195 cc	<10	Volume based on the entire potential space within the peritoneal cavity

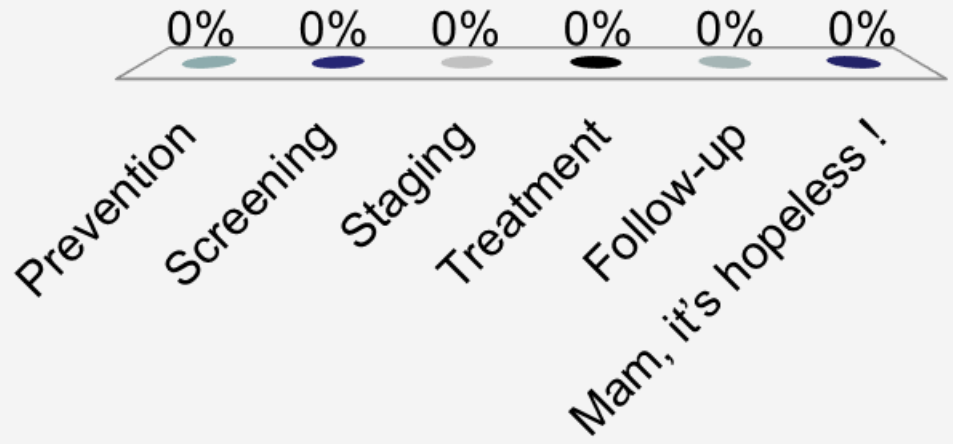
Non small cell lung cancer



"I think we had much nicer diseases when I was a girl."

To reduce lung cancer mortality, what do you recommend ?

A. Prevention
B. Screening
C. Staging
D. Treatment
E. Follow-up
F. Sir, it's hopeless !



Facts …

- > 1 million new cases per year worldwide
  - 75 - 80 % non small cell cancers
- Leading cause of cancer death in the world
  - overall survival @ 5 years ~10%
- 80 – 90 % caused by smoking
  - prevention more cost-effective than treatment

34 439 male UK doctors

- Persistent smokers
  - died 10 years younger than non-smokers
  - 50% killed by tobacco-induced diseases
  - 25% killed before age 70
- Life duration over study period
  - increased in non-smokers
  - stable in persistent smokers

Doll BMJ 2004

The Effects of a Smoking Cessation Intervention on 14.5-Year Mortality

A Randomized Clinical Trial

% smokers @ 5yr	intervention	usual care	p
none	22	5	
intermittent	29	23	<.001
permanent	49	71	

- 5887 patients with asymptomatic airway obstruction
  - intervention + inhaled bronchodilator
  - intervention + inhaled placebo
  - usual care

Anthonisen Ann Intern Med 2005

The Effects of a Smoking Cessation Intervention on 14.5-Year Mortality

A Randomized Clinical Trial

% smokers @ 5yr	intervention	usual care	p

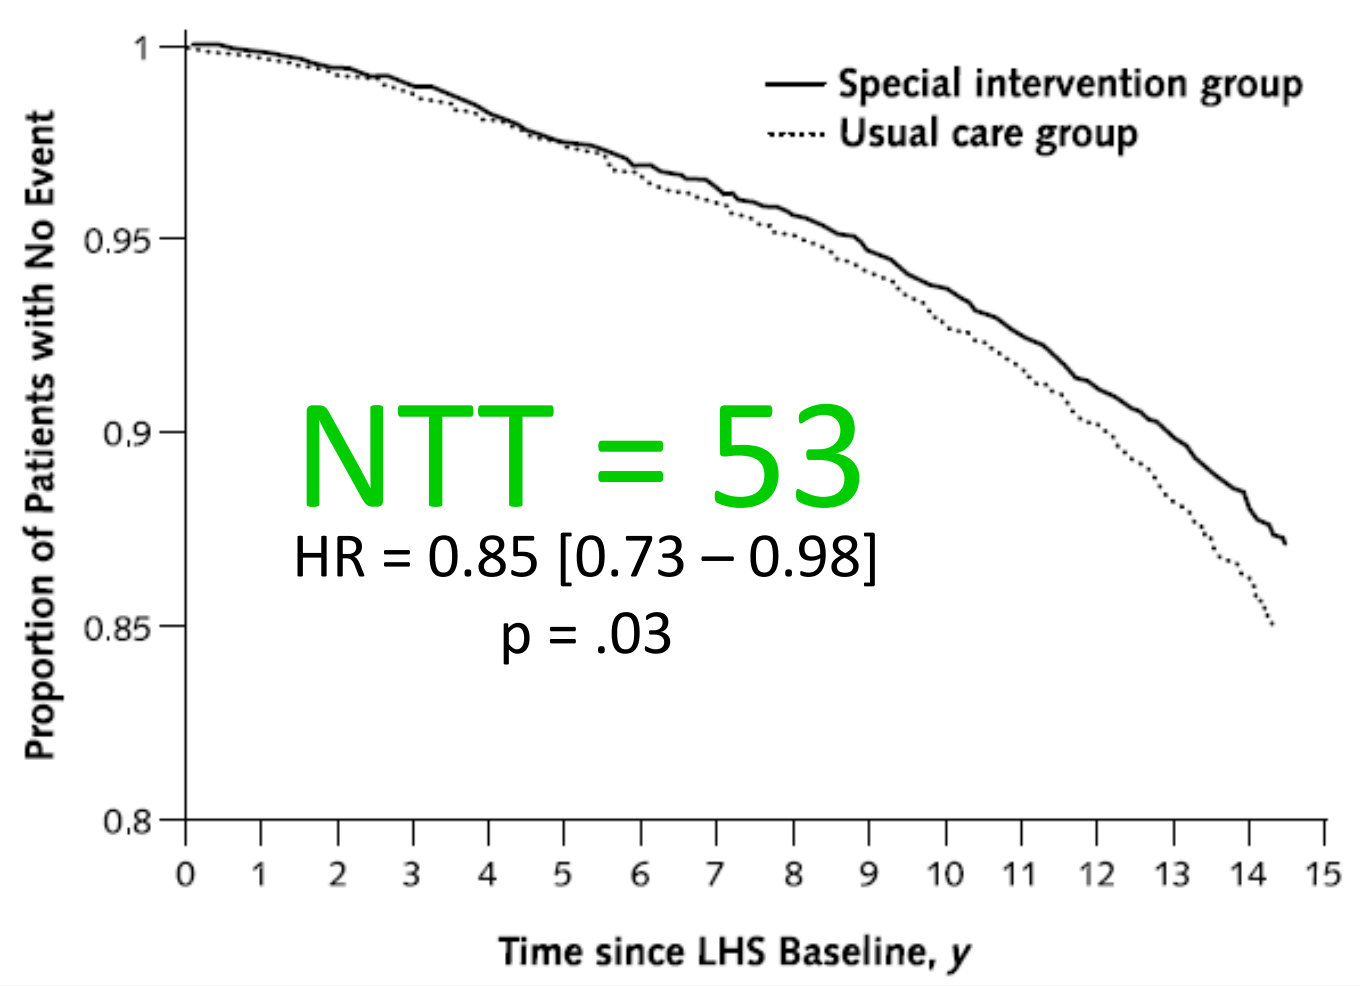
NTT = 100/17 = 6

- 5887 patients with asymptomatic airway obstruction
  - intervention + inhaled bronchodilator
  - intervention + inhaled placebo
  - usual care

Anthonisen Ann Intern Med 2005

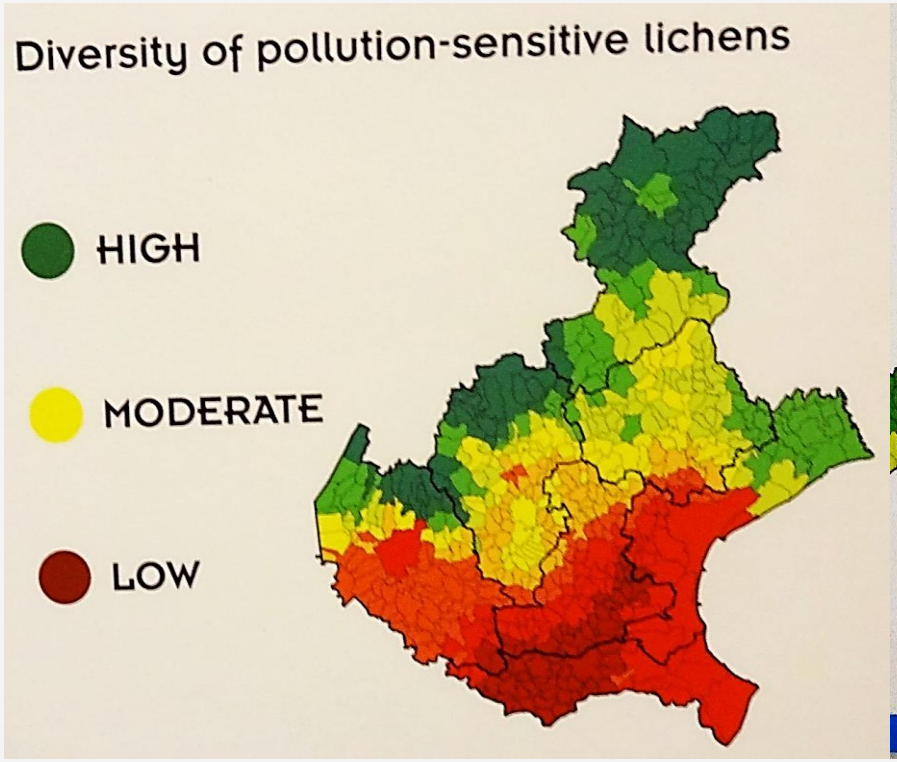
The Effects of a Smoking Cessation Intervention on 14.5-Year Mortality

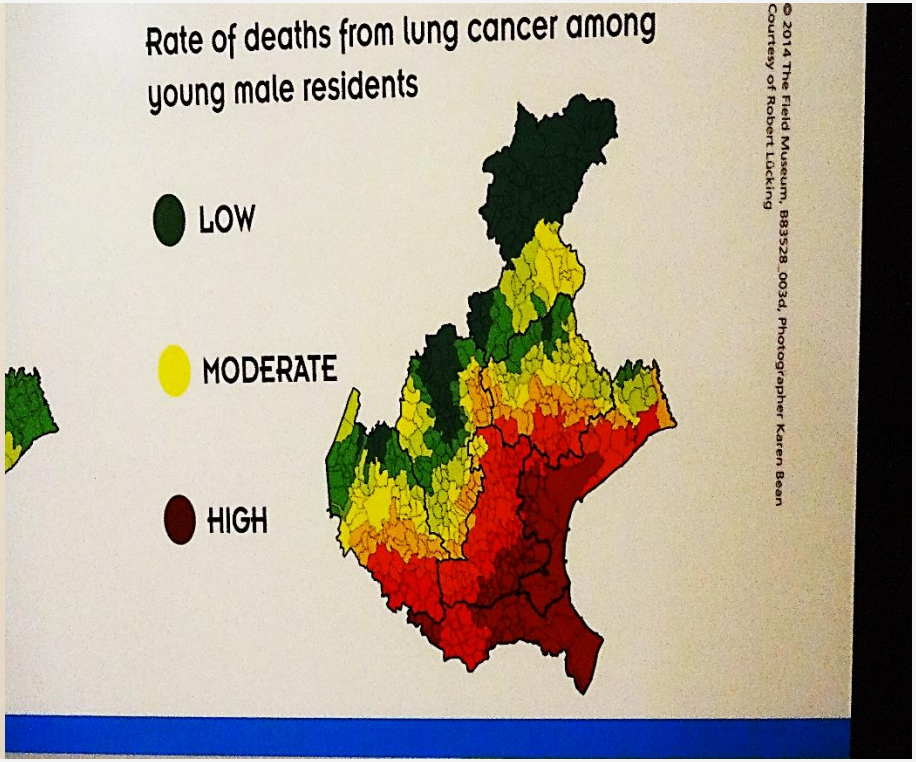
A Randomized Clinical Trial



Anthonisen Ann Intern Med 2005

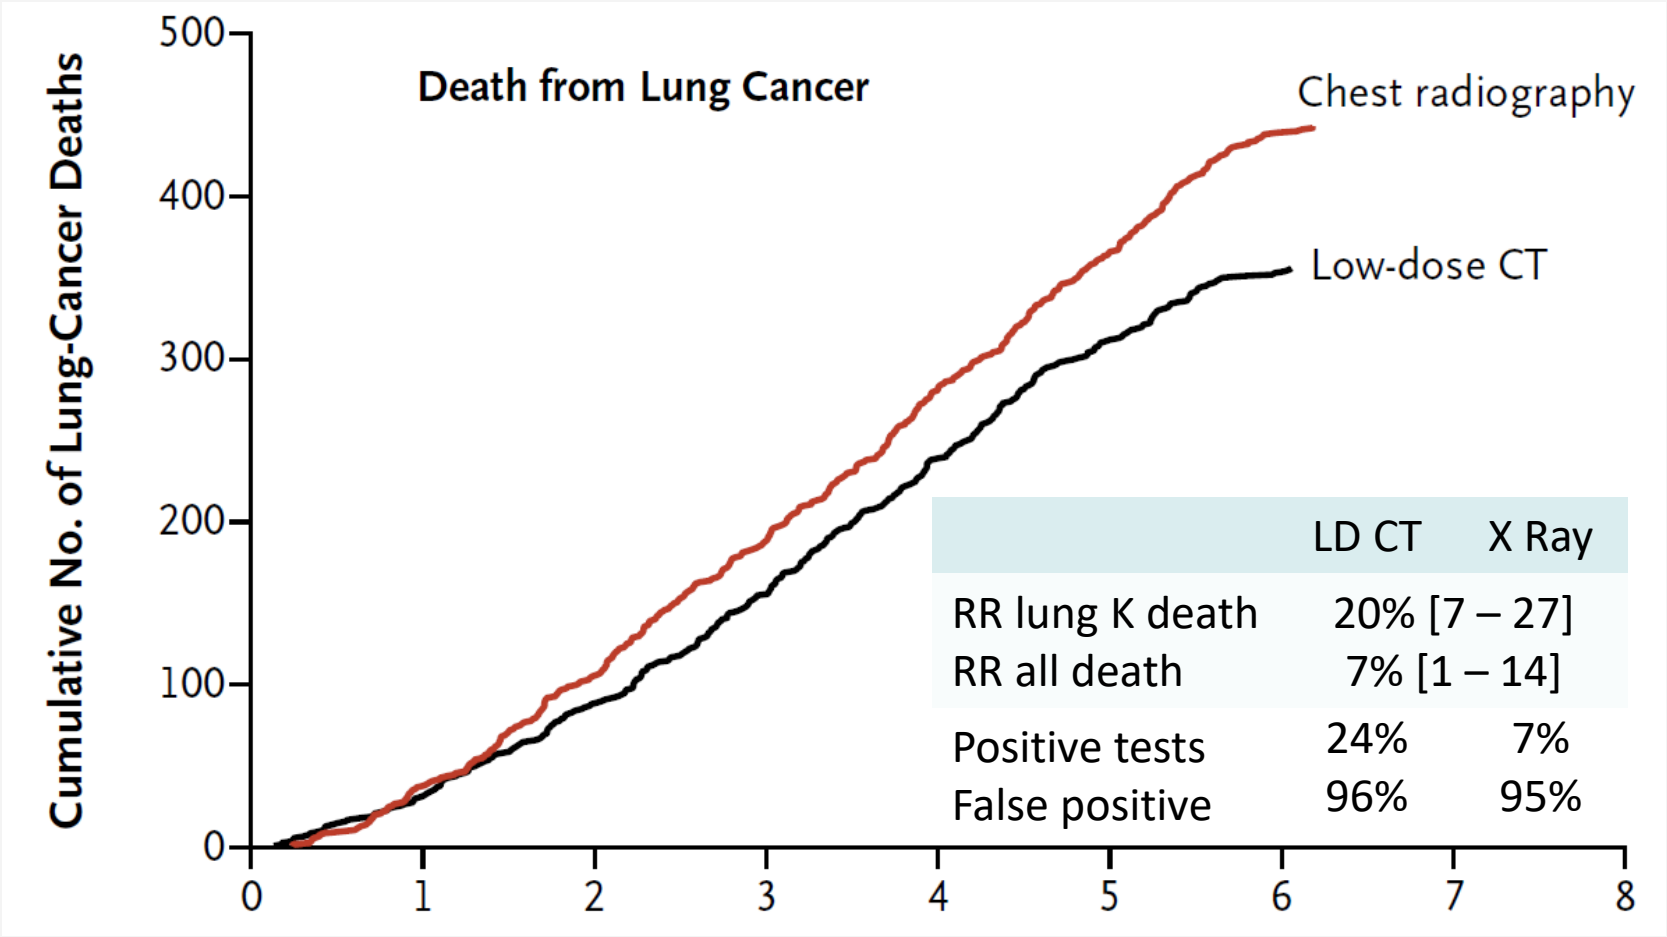
Prevention & environment





Anonymous, Lichen Exhibit, Field Museum Chicago 2016

Reduced Lung-Cancer Mortality with Low-Dose Computed Tomographic Screening



National Lung Screening Trial Research Team NEJM 2011

Conclusion (1)

- Prevention is effective
- Smoking cessation is effective
  - even when only a minority quits
- Screening still under investigation
  - target population
  - process

?	34	35	30	41

Dinan SEER JCO 2012

Conclusion (2)

- Prognostic factors stronger than treatment
  - weight loss (50% at diagnosis)
  - performance status (40% at diagnosis)
  - TN stage (PET)
- Better staging, better treatment
  - high incidence of metastasis at diagnosis
  - role of PET/CT
- Co-existent diseases
  - tobacco

European Organisation for Research and Treatment of Cancer Recommendations for Planning and Delivery of High-Dose, High-Precision Radiotherapy for Lung Cancer

Level of recommendation	Quality of evidence		
	A (high)	B (moderate)	C (low)
1 (strong)	applies for most patients, in most circumstances without reservation		may change with new evidence
2 (weak)	best action depends on patients, circumstances, and societal values		other alternatives may be equally reasonable

De Ruysscher JCO 2010

Stereotactic Body Radiotherapy

Well tolerated by elderly and frail patients	1B
Poor pulmonary function is not a contraindication	1B
May be safely administered after pneumonectomy	1C
Can be safely delivered without rigid immobilization	1B
Doses per fraction ≥18 Gy should not be given to centrally located tumours	1C
Lower doses per fraction adapted to OAR may be safe for centrally located tumours	1C

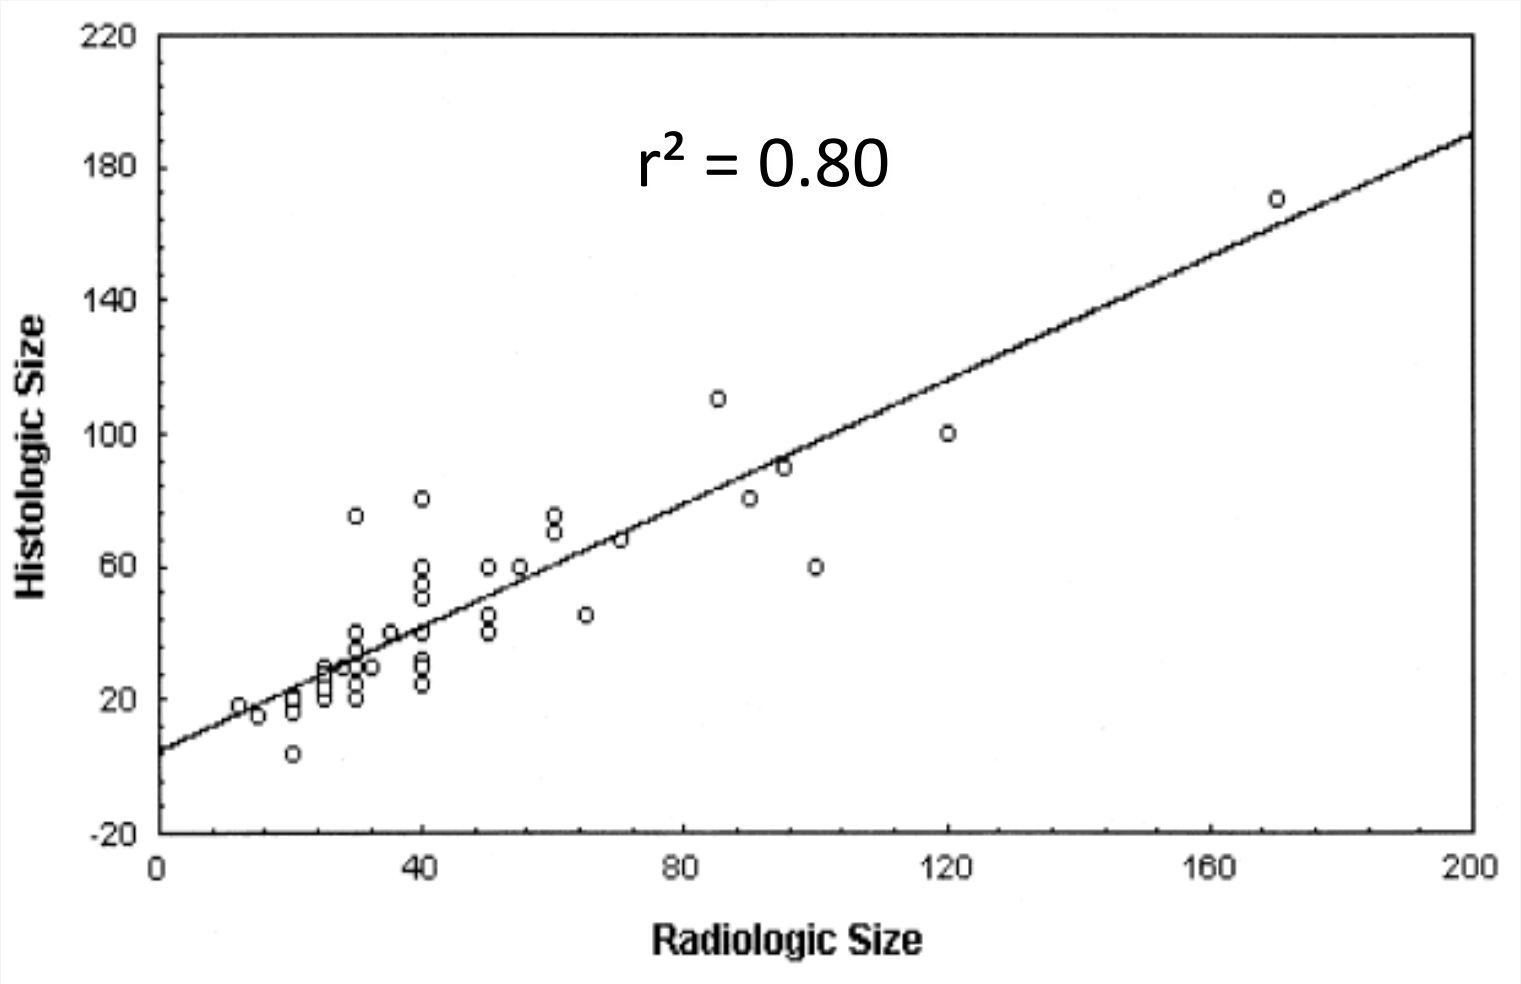
De Ruysscher EORTC JCO 2010

Radical external radiotherapy

A stable and reproducible position during imaging and treatment is essential • arms above head • stable arm support	1B
Planning CT scan extends from cricoid cartilage to L2	1B
Slice thickness of 2-3 mm for delineation and DRR	1B
IV contrast can improve delineation of centrally located primary tumors and lymph nodes	1C
4D-CT scan is strongly preferred	1B

De Ruysscher EORTC JCO 2010

Delineating GTV_T on CT



Giraud IJROBP 2000

Do you delineate primary tumour on FDG-PET ?

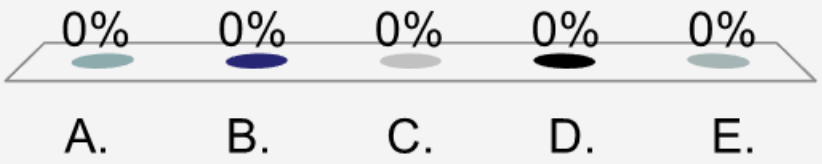
A. No

B. Yes, no registration on CT

C. Yes, with registration on CT

D. Yes, PET in RT position

E. No access to PET



PET/CT for RT planning

PET/CT is recommended for target volume definition	1B
Strictly standardized protocols with nuclear medicine	2B
Should be acquired in radiotherapy position	1B
Should be registered with CT using rigid methods	1B

Remark : any automated task (registration, delineation) should be supervised

De Ruysscher EORTC JCO 2010

Delineating GTV_T on PET/CT

Toxicity	HR [95% CI]	p
Oesophagitis gr. 3-4	4.9 [3.1 – 7.8]	< 0.001
Pneumonitis gr. 3-4	0.69 [0.42 – 1.12]	0.13
Blood	Not assessable	
Late lung	Not assessable	

	Sequential CTRT	Concomitant CTRT
No RT	10%	4%

Auperin JCO 2010

Conclusion (5)

Sequential / concurrent CTRT can be safely administered if •WHO performance status 0-1 •no major comorbidity •age ≤ 70-75 years	1A
Only cisplatin, carboplatin, etoposide, paclitaxel, docetaxel, and vinorelbine can be safely combined with concurrent radiotherapy	1A
Dose to central bronchi ≤ 80 Gy if concurrent CT-RT	1B

De Ruysscher EORTC JCO 2010

Conclusion (5bis)

- Concomitant CRT is standard (level 1)
  - platinum-based doublet
- CT added to RT increases acute toxicity (level 1)
  - no applicable to unfit patients
- Survival benefit is relatively small (level 1)
- What about new drugs ?????

Conclusion (6)

- Pre-operative chemotherapy
  - survival benefit ...
  - RT = surgery if response to CT
- Pre-operative chemo-radiotherapy
  - surgery improves local control, not survival ...
  - but no evidence for pre-operative CT-RT
- Comments
  - high incidence of metastases
  - how do you plan RT after induction CT ?

Post-operative radiotherapy

Betel quid

600 million frequent users

Relative risk if used with tobacco and alcohol: ~ 120

Head and neck cancer: etiologic factors

- Tobacco use (smoking, chewing)
- Alcohol abuse

Other factors:

- Oral cancer: betel quid, poor oral hygiene
- Nasal cavity and paranasal sinus cancers: wood dust, leather dust
- Nasopharynx carcinoma: EBV associated, salted fish consumption, genetic factors?
- Oropharynx carcinoma: HPV associated
- Hypopharynx carcinoma: vitamin C and iron deficiency (Plummer-Vinson syndrome)
- Salivary gland tumors: ionizing radiation, asbestos, certain metals

A genetic progression model of oral carcinogenesis

Well differentiated squamous cell carcinoma

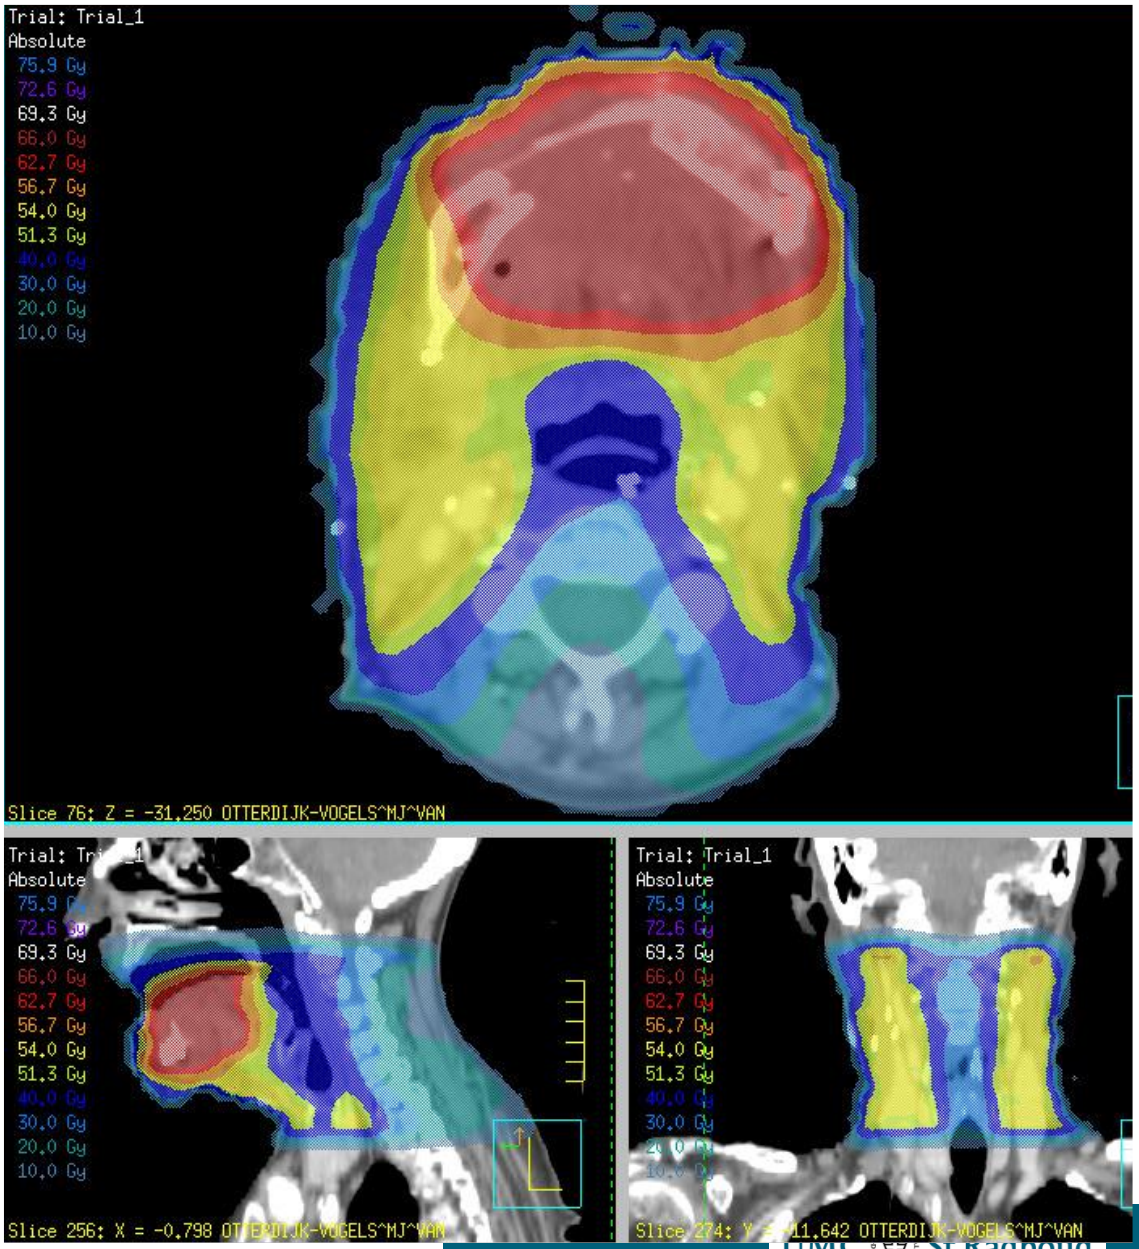
Invasion of mandibula

Closest margin 0,1 mm (ventral towards lip)

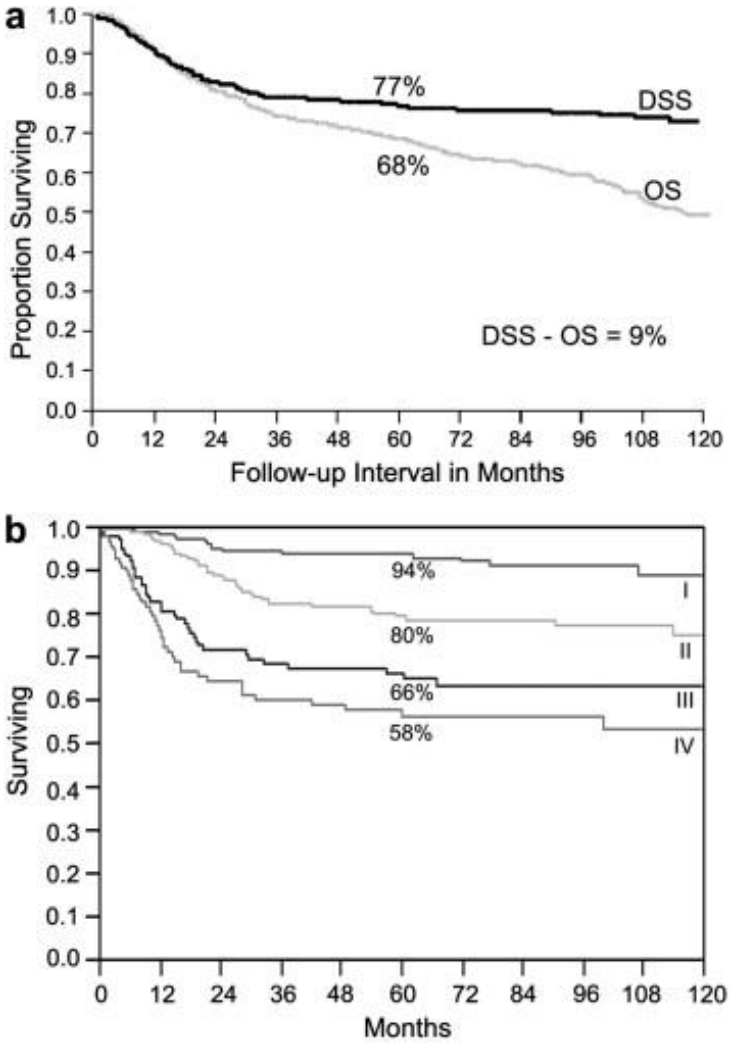
Dorsal margin 3 mm

Other margins > 5mm

All lymph nodes negative



Surgery for oral cancer (N = 595)



Shah et al. Oral Oncol 2009

Treatment of early (T1-T2) oral cancer

- Comparable results with surgery and radiotherapy.
- Choice of treatment - relevant factors:
  - functional outcome
  - long term sequelae
  - competence and skills of H&N team
- Brachytherapy is an integral part of radiotherapy for oral cancer (expertise required!).
- Complication risk of brachytherapy increases with total dose and implanted volume.

Treatment of T3-T4 oral cancer

- Surgery with or without postoperative (chemo)radiation.
- If not resectable or patient inoperable: (chemo)radiation.

Indications for postoperative radiotherapy

- Positive or close resection margins
- Nodal metastases with extracapsular spread
- Multiple nodal (levels) metastases
- Bone- or cartilage invasion
- Invasion of soft tissues of the neck
- Vascular invasion
- Perineural spread
- Tumor volume
- Tumor spillage
- Histology

Postoperative radiotherapy for head and neck cancer: dose?

2-year actuarial control at primary site

Risk	Dose (Gy)	Control rate (%)
Lower	54.0	63
	57.6	92
	63.0	89
Higher	63.0	89
	68.4	81

2-year actuarial control in the neck

Risk	Dose (Gy)	Control rate (%)
Lower	54.0	89
	57.6	86
	63.0	89
Higher	63.0	84
	68.4	77

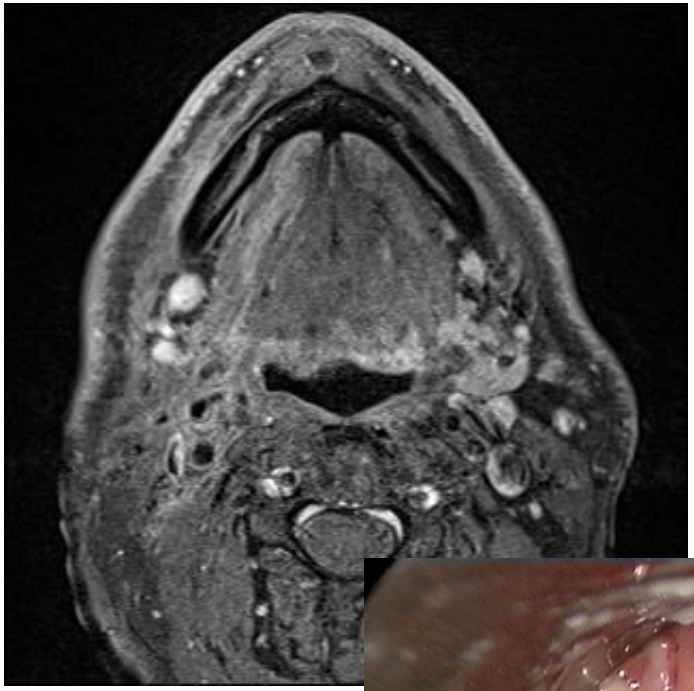
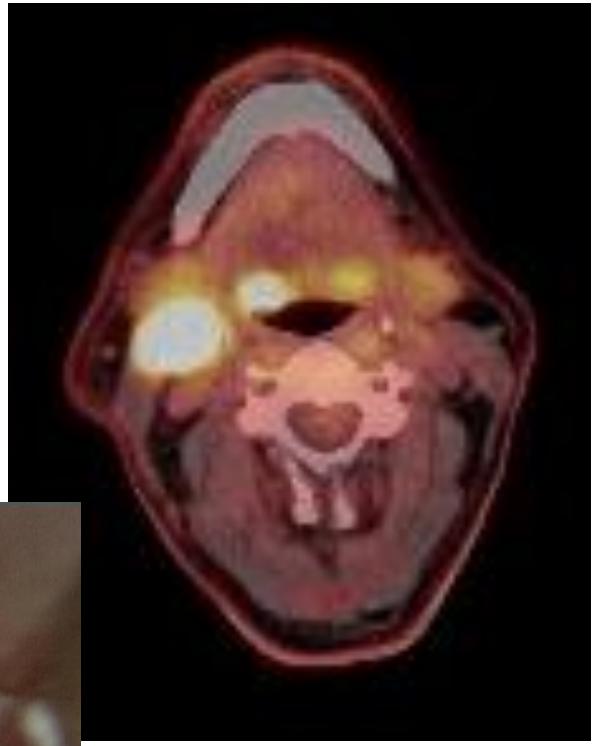
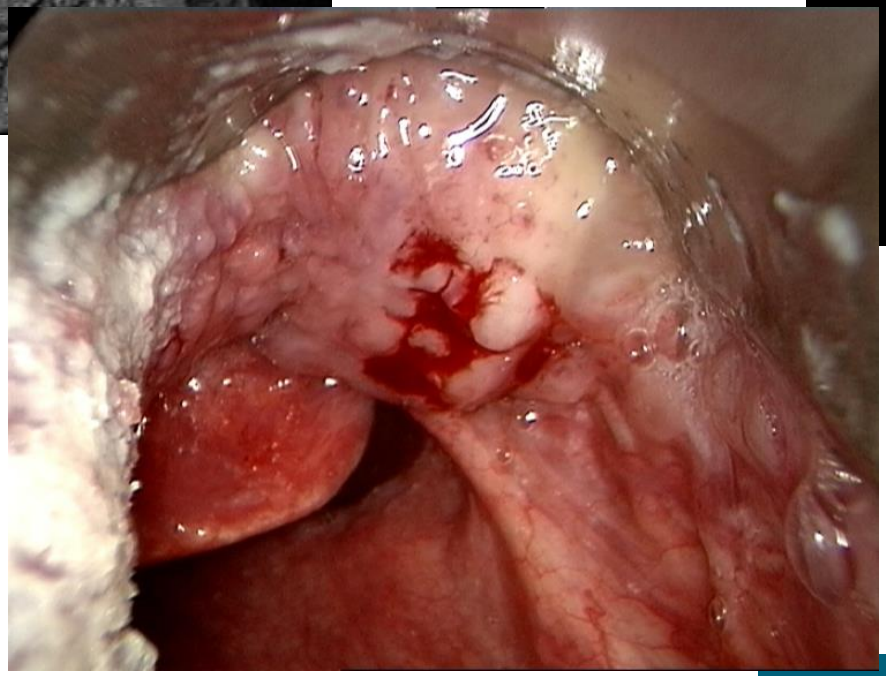
Base of tongue cancer T1

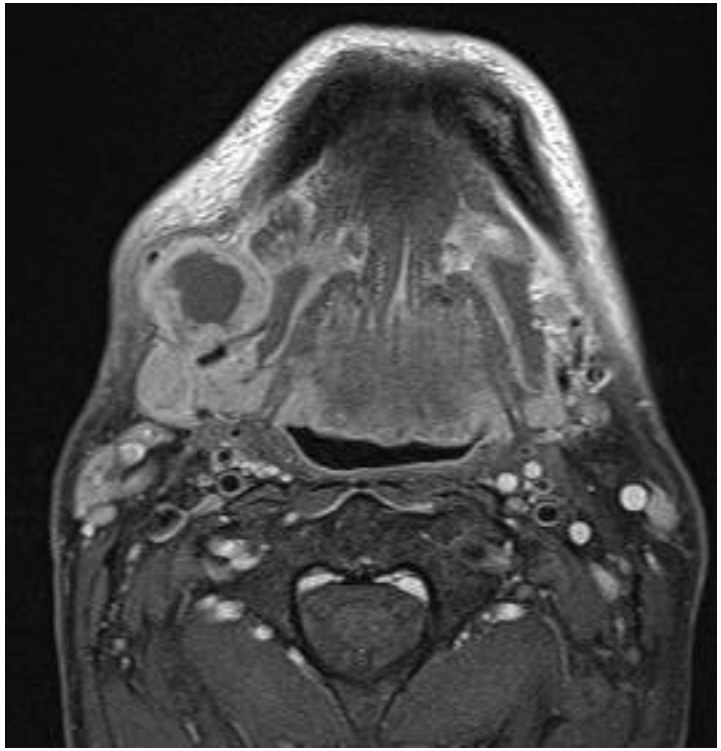






T1: ≤ 2 cm

Carcinoma soft palate T2



T2: 2 - 4 cm

Carcinoma soft palate (case)

Man, 65 yrs with pain left side throat and otalgia since 6 weeks.
Normal intake, no weight loss.
No significant comorbidity.
Smoking 70 PY, alcohol 25-30 U/wk.

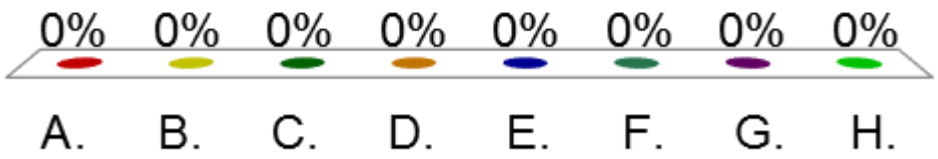
Physical exam reveals tumor soft palate (L) involving uvula, ant/post faucial pillar, retromolar trigone, tonsillar area.
Base of tongue and posterior pharyngeal wall uninvolved.

Palpable lymph node 2 cm level II left.

Biopsy shows moderately differentiated squamous cell carcinoma.

Carcinoma soft palate (case)
-
What imaging do you order for assessment of loco-regional extensions?

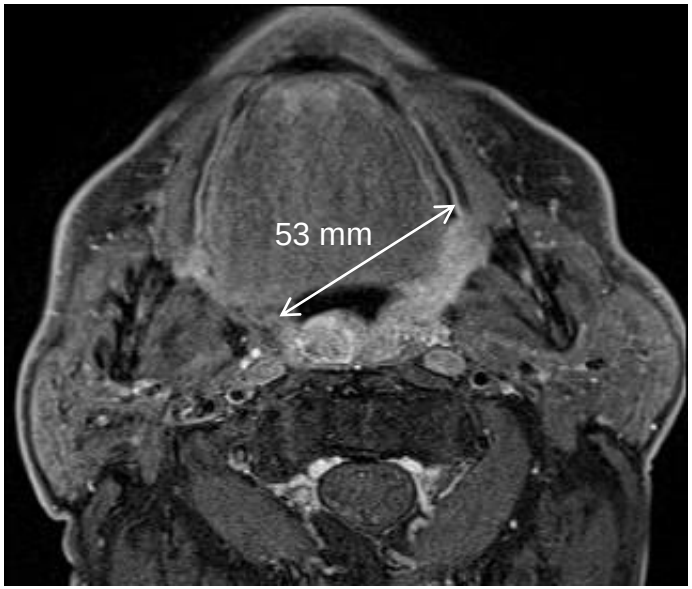
A. CT
B. MRI
C. PET
D. Ultrasound neck (US)
E. CT + MRI
F. MRI + PET
G. MRI + US
H. MRI + PET + US



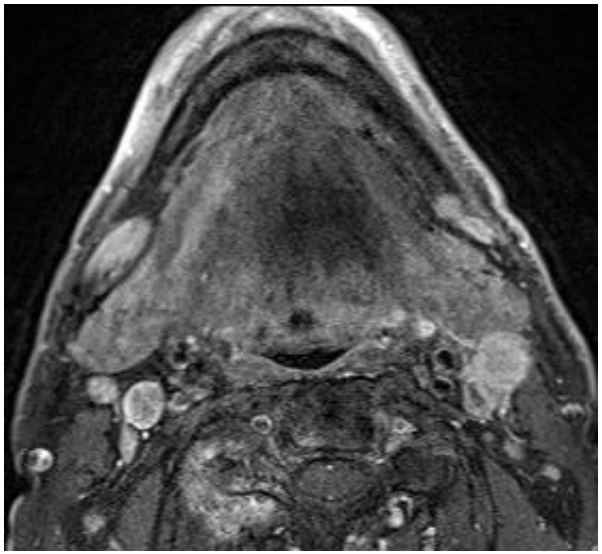
Carcinoma soft palate (case)

MRI:

tumor soft palate (L) involving uvula, ant faucial pillar, retromolar trigone, tonsillar area.

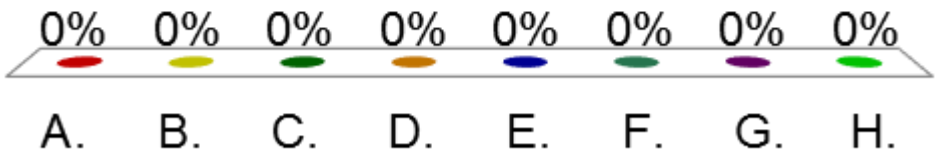


Neck: bilateral retropharyngeal lymph nodes; enlarged lymph nodes level Ib and II (L+R).



Carcinoma soft palate (case)
-
How do you stage this tumor?

A. T2N1
B. T2N2b
C. T2N2c
D. T3N1
E. T3N2b
F. T3N2c
G. T4N2b
H. T4N2c



Carcinoma soft palate (case)

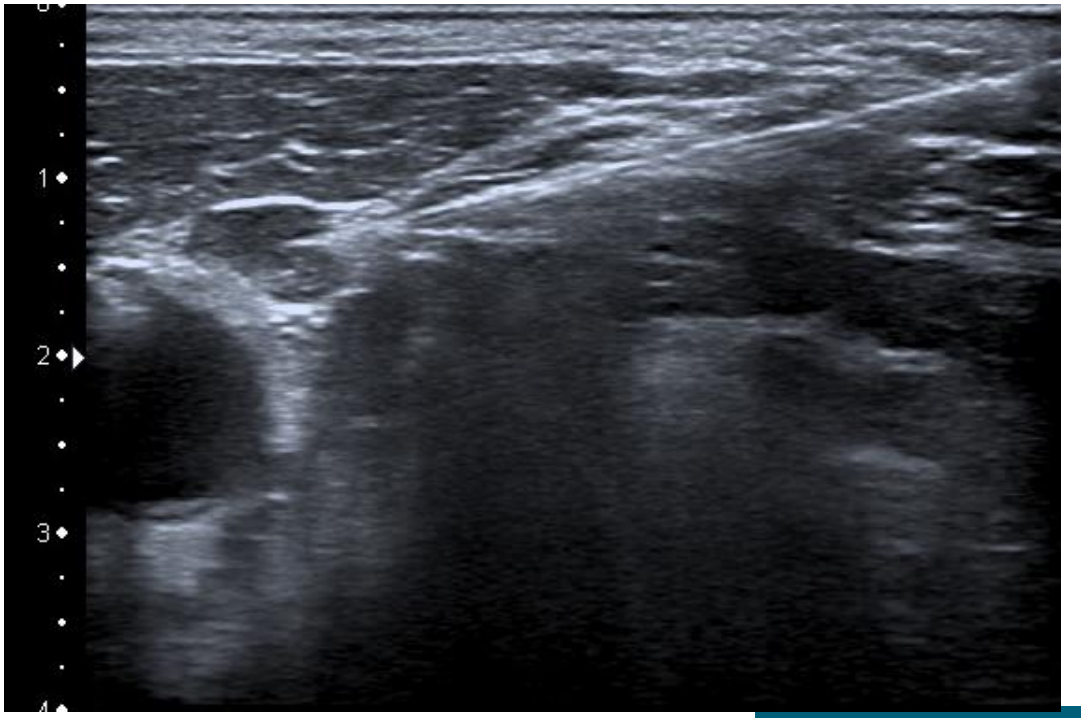
US + cytology:

level Ib (R): lymphoid cells, reactive.

level II (R): lymphoid cells, reactive.

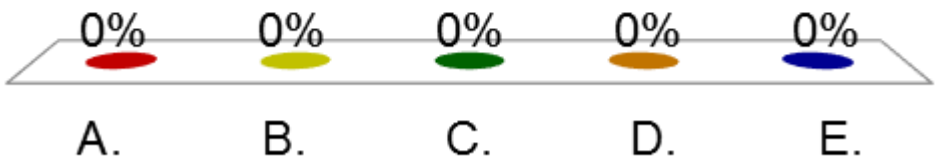
level Ib (L): few cells, not malignant.

Level II (L): squamous cell carcinoma.



Carcinoma soft palate (case)
-
What imaging do you order for assessment of distant metastases?

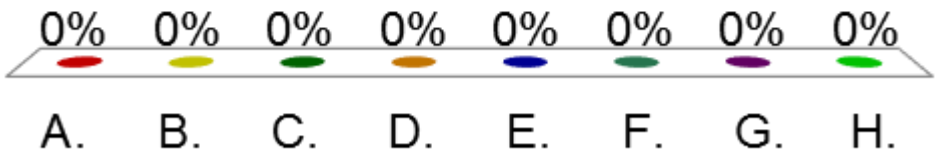
A. Chest X-ray
B. CT chest
C. CT chest + abdomen
D. PET-scan
E. CT chest/abdomen + PET-scan



Carcinoma soft palate (case)
-
Chest X-ray negative

How do you stage this tumor?

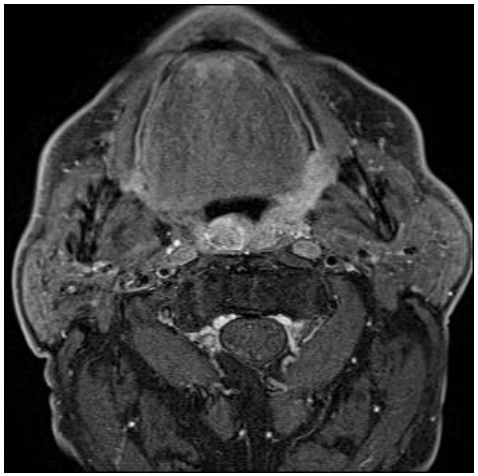
A. T2N1M0
B. T2N2bM0
C. T2N2cM0
D. T3N1M0
E. T3N2bM0
F. T3N2cM0
G. T4N2bM0
H. T4N2cM0



Carcinoma soft palate: T3N2cM0

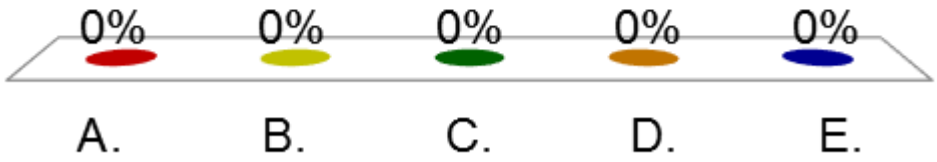
T3: > 4 cm
or extension to lingual surface epiglottis

Carcinoma soft palate: T3N2cM0



What treatment do you recommend?

A. Surgery + or – postop radiotherapy
B. Radiotherapy
C. Radiotherapy + cetuximab
D. Chemoradiation
E. Chemoradiation + cetuximab



Patient consented to be randomized in EORTC 1219:

Accelerated radiotherapy + cisplatin

with or without nimorazole

Primary tumor + metastatic nodes: 70 Gy in 35 fr, 6x/wk

Neck (L), levels Ib-II-III-IV-V, retrostyloid and RP: 54.25 Gy

Neck (R), levels II-III-IV and RP: 54.25 Gy

VMAT-SIB technique

Cisplatin weekly 40 mg/m^2

Nimorazole or placebo

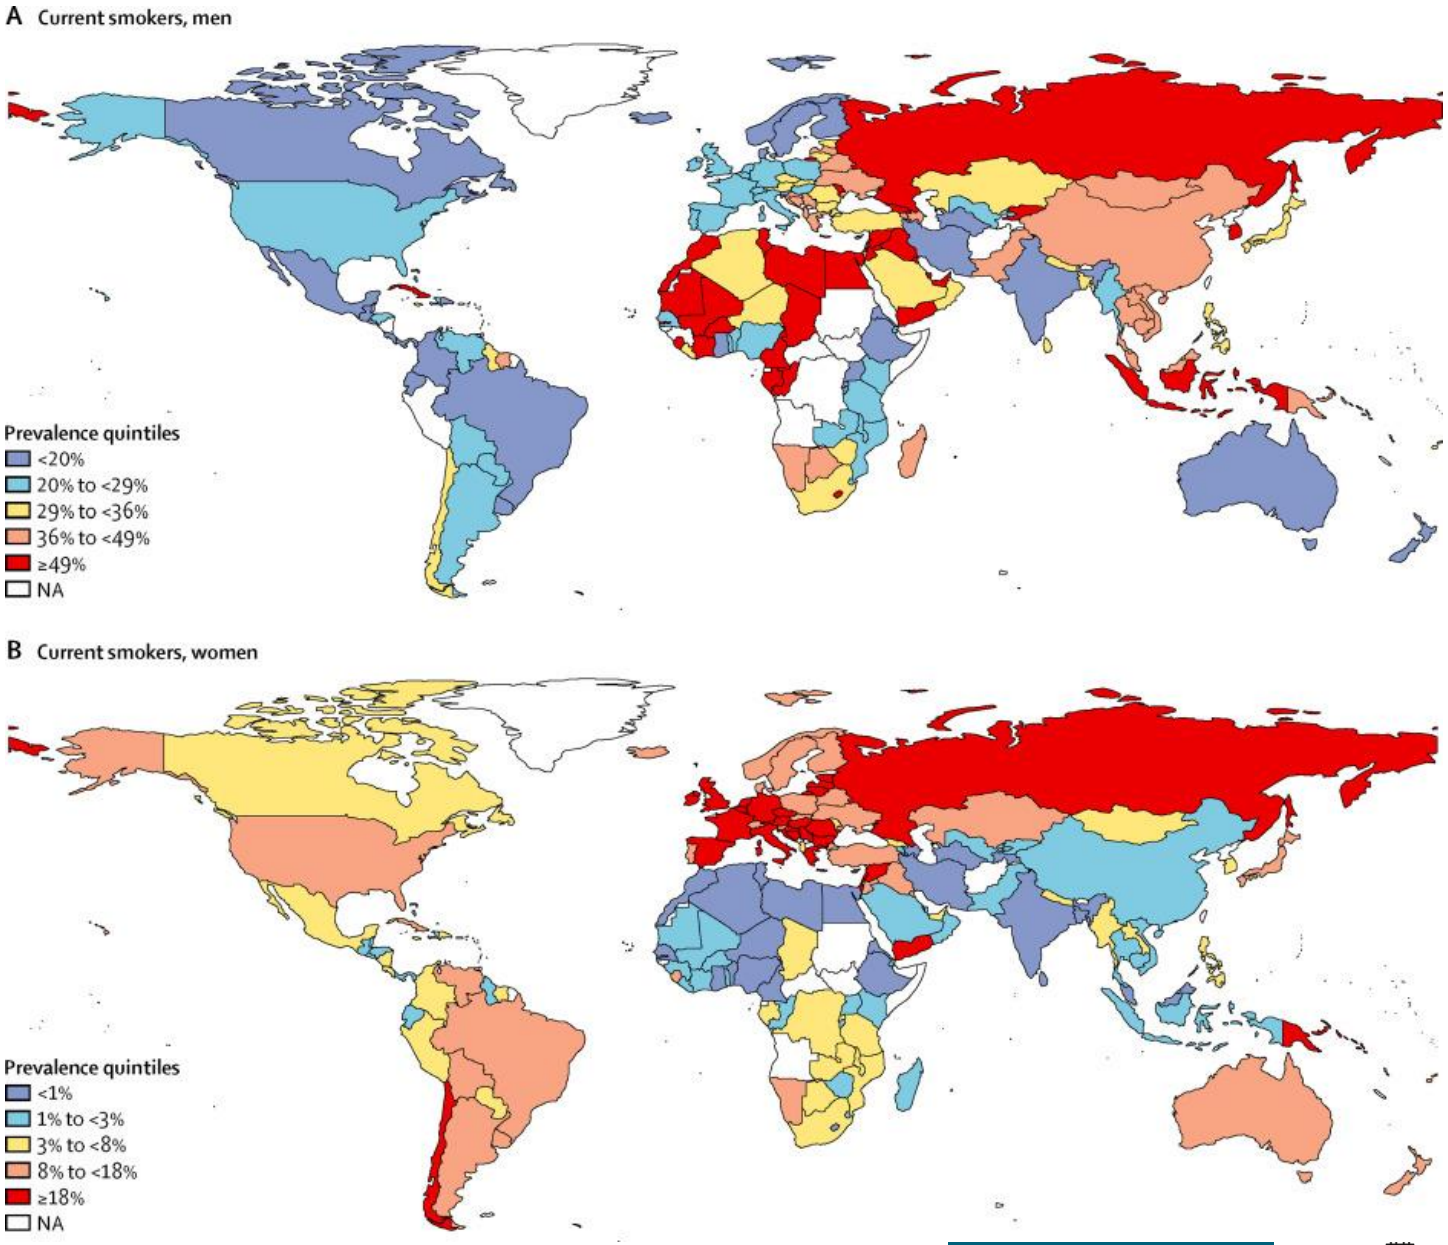
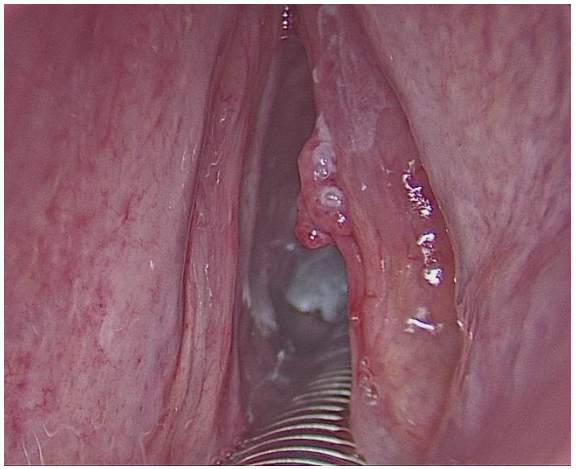
Estimated prevalence of current tobacco smoking in 2010

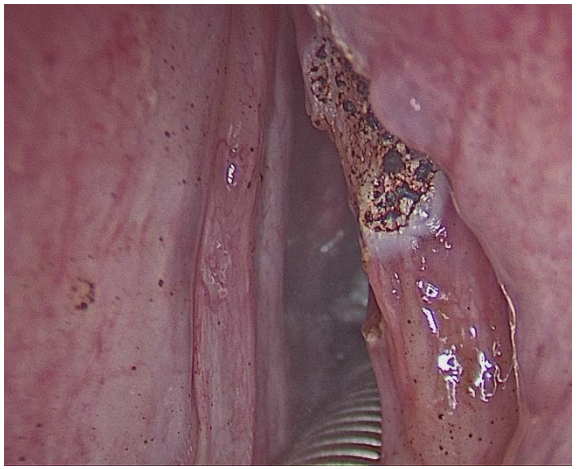


The Lancet 2015 385, 966-976

Larynx cancer T1

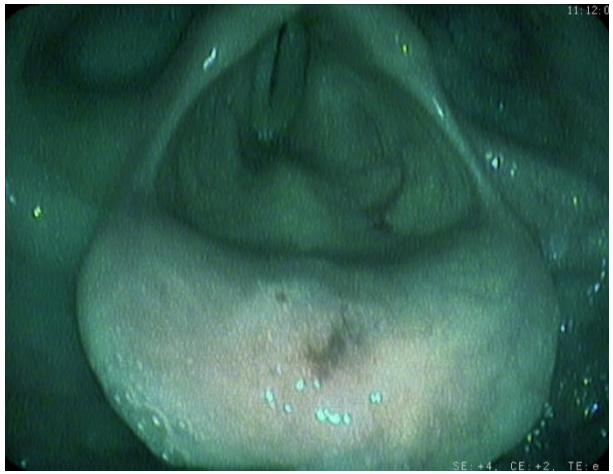
glottic





T1: limited to vocal cords with normal mobility

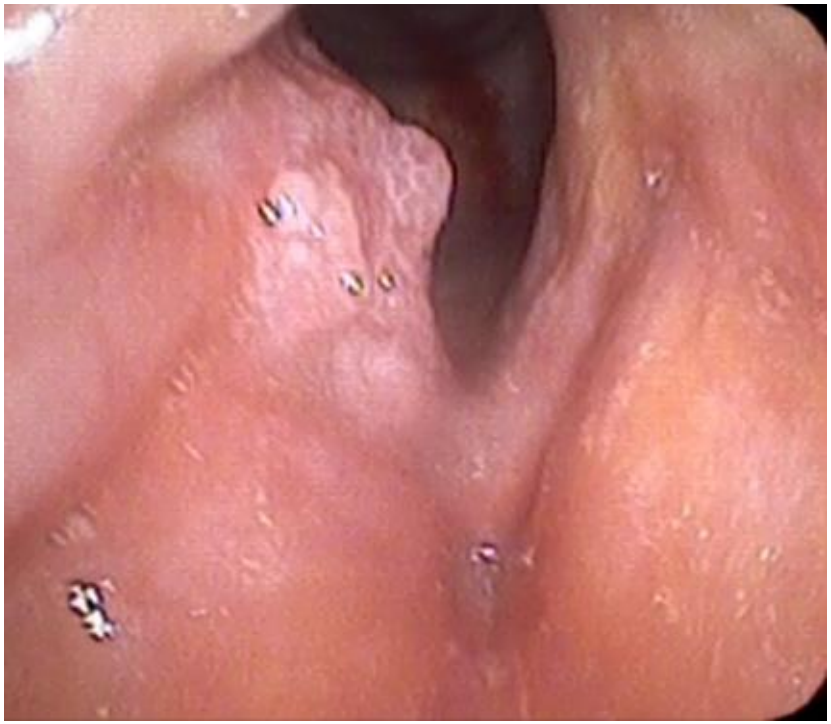
supraglottic



T1: limited to one subsite with normal mobility

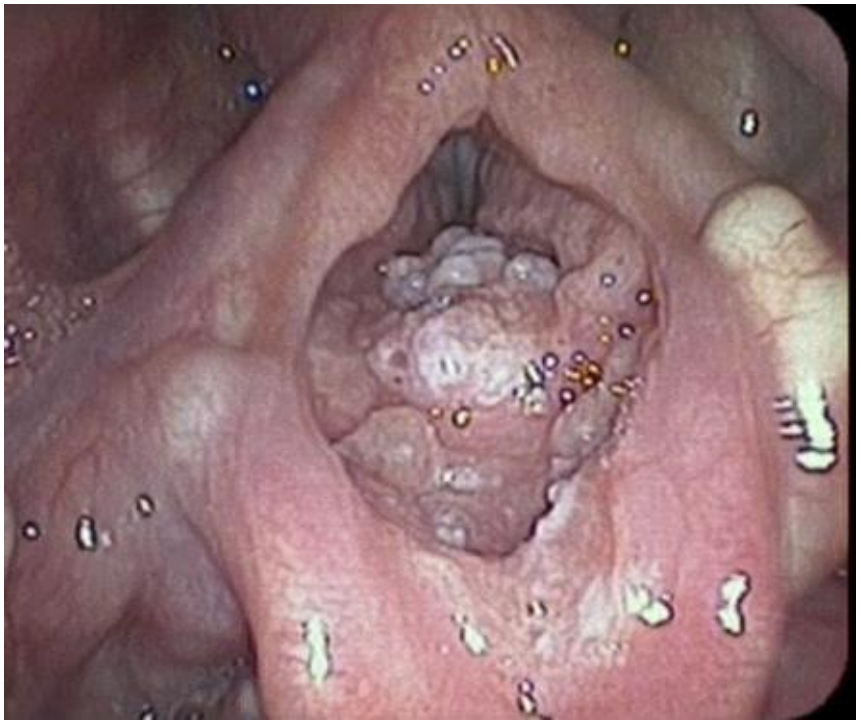
Larynx cancer T2

glottic



T2: supra- and/or subglottic extension and/or impaired mobility

supraglottic

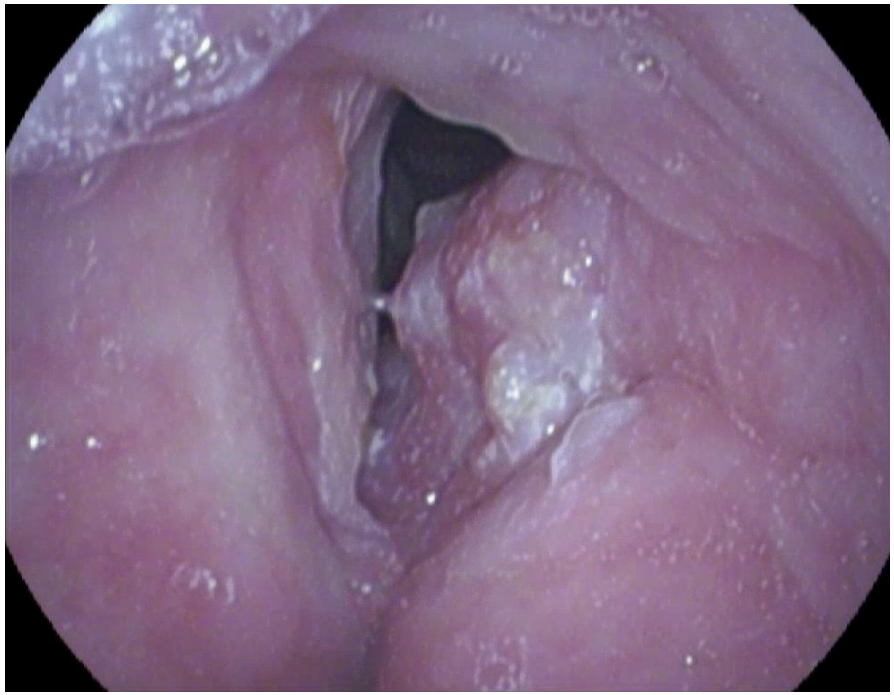


T2: more than one subsite without fixation

Larynx cancer T3

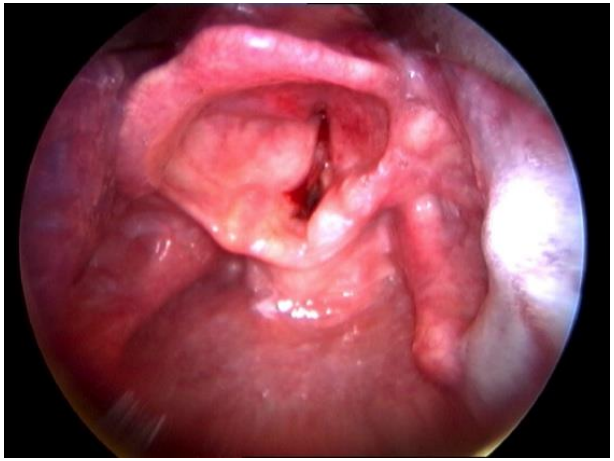
glottic

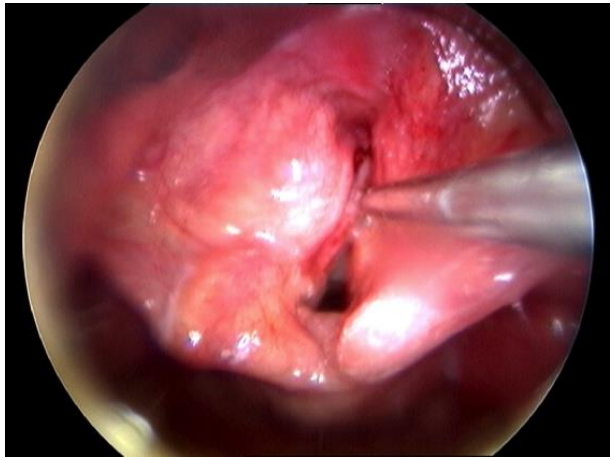
supraglottic



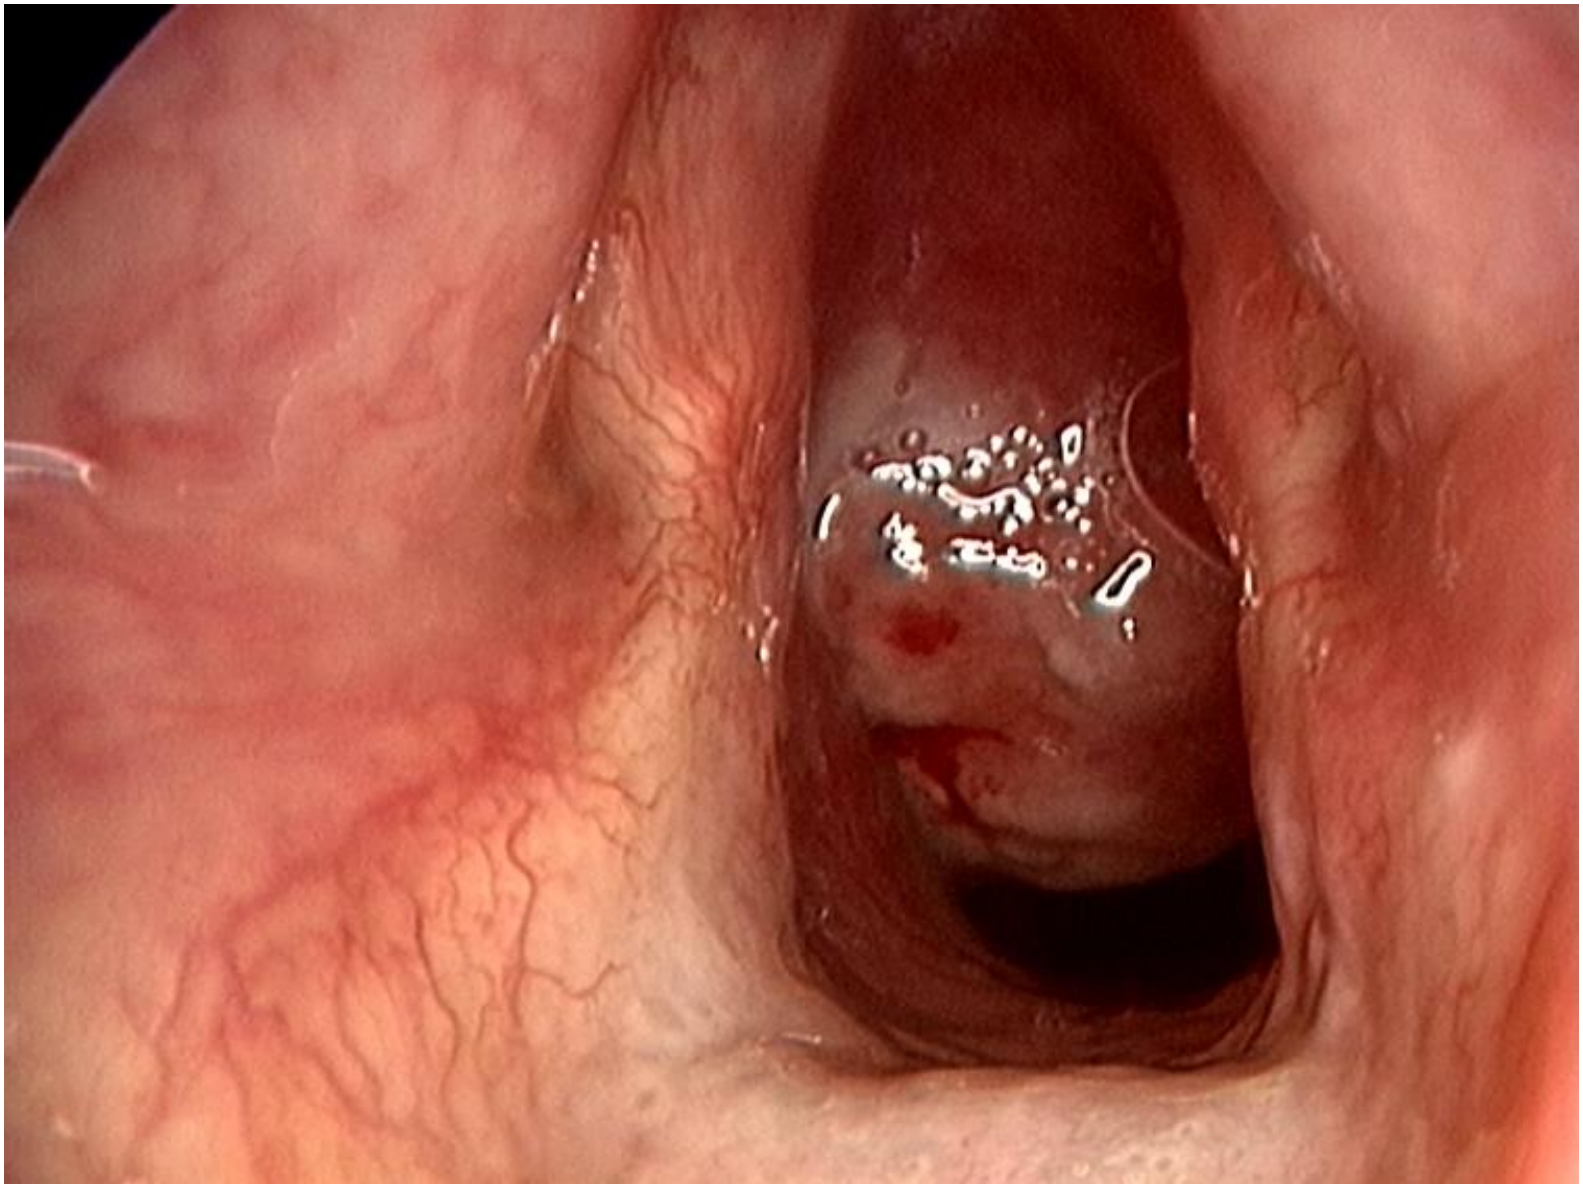
Limited to larynx with vocal cord fixation and/or invades postcricoid area, pre-epiglottic space, paraglottic space or inner cortex of thyroid cartilage

Larynx cancer T4





Tumor invades through the outer cortex of the thyroid cartilage and/or invades tissues beyond the larynx



Larynx carcinoma (case)

Man, 66 yrs with voice change (“hot potatoe”) and dysphagia since 3-4 months.
Normal intake, no weight loss.
No comorbidity.
Smoking 44 PY, alcohol no.

Physical exam reveals supraglottic tumor with deformation of epiglottis, involvement of bilateral a-e folds and limited invasion false cords.
Bilateral pyriform sinus and vocal cords uninvolved and normal mobility.

Palpable lymph nodes level II-III right and level II left.

Biopsy shows squamous cell carcinoma.

Larynx carcinoma (case)

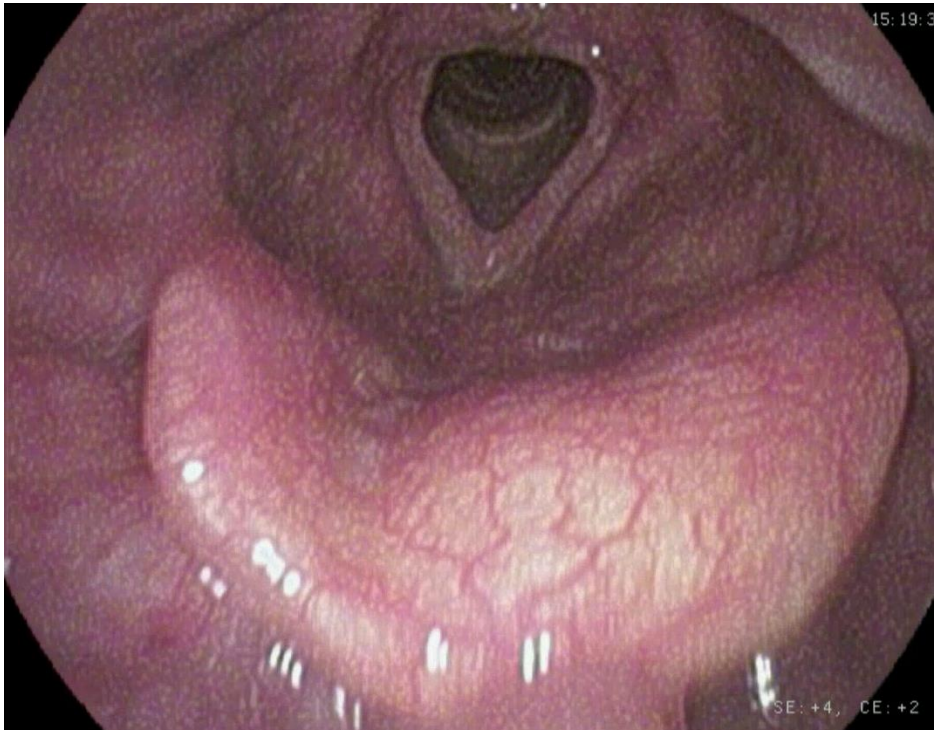
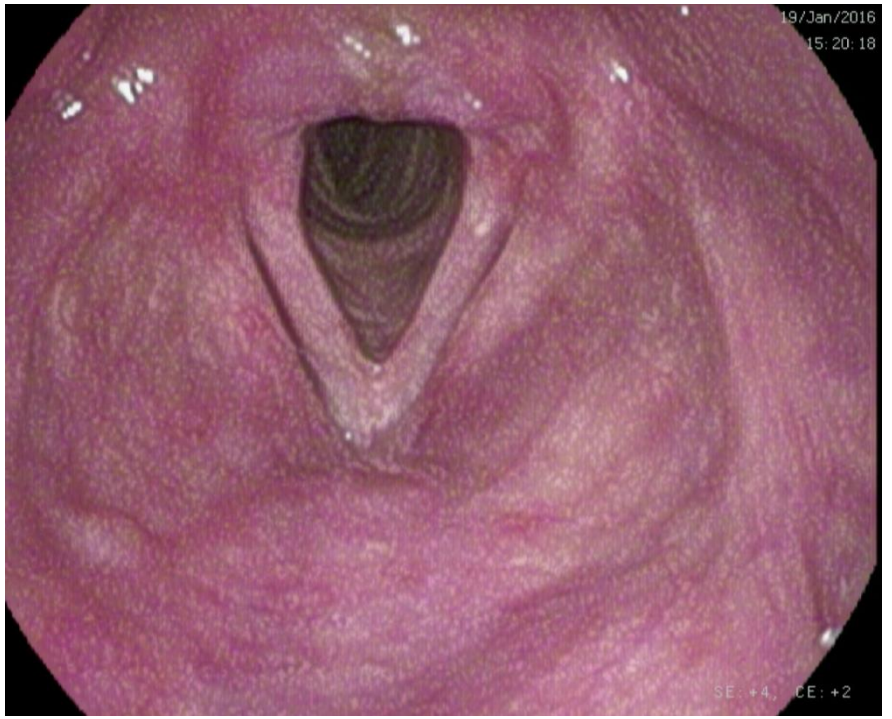
One year after completion of treatment





ELSEVIER

Radiotherapy and Oncology 63 (2002) 299–307

RADIOTHERAPY & ONCOLOGY
JOURNAL OF THE EUROPEAN SOCIETY FOR THERAPEUTIC RADIOLOGY AND ONCOLOGY

www.elsevier.com/locate/radonline

Carcinoma of the larynx: the Dutch national guideline for diagnostics, treatment, supportive care and rehabilitation

- **A function preserving treatment should be the first choice for every patient with a larynx carcinoma.**
- **Surgery is used only if the expected functional outcome is poor or for large tumor volumes or for patients with severe stridor while adequate endoscopic debulking is not possible.**

American Society of Clinical Oncology Clinical Practice Guideline for the use of Larynx-Preservation Strategies in the Treatment of Laryngeal Cancer

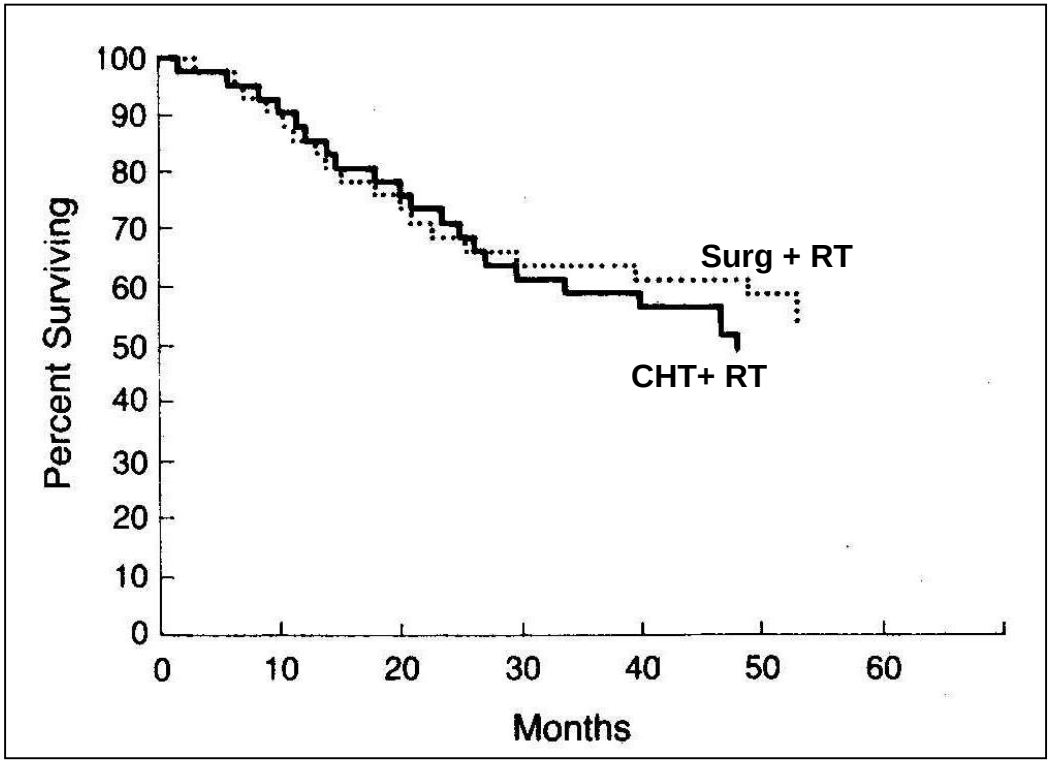
Journal of Clinical Oncology 24:3693-3704, 2006

- **Evidence supports the use of larynx-preservation approaches for appropriately selected patients.**
- **For most patients with T3 or T4 disease without tumor invasion through cartilage into soft tissues, a larynx-preservation approach is an appropriate, standard treatment option.....**

Larynx preservation therapy is recommended for advanced larynx carcinoma:
-
What is the cost in terms of 5-year survival ?

A. 0%
B. 5%
C. 10%
D. 20%

VA study: laryngectomy + RT vs. neoadjuvant CHT + RT



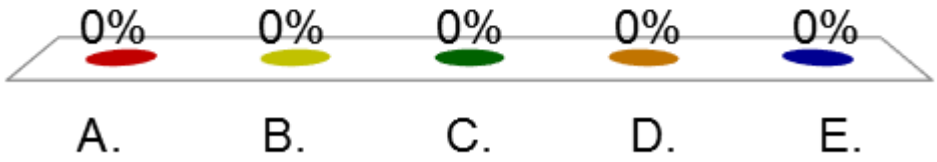
Distribution by T-stage:

T1,2	9%
T3	65%
T4	26%

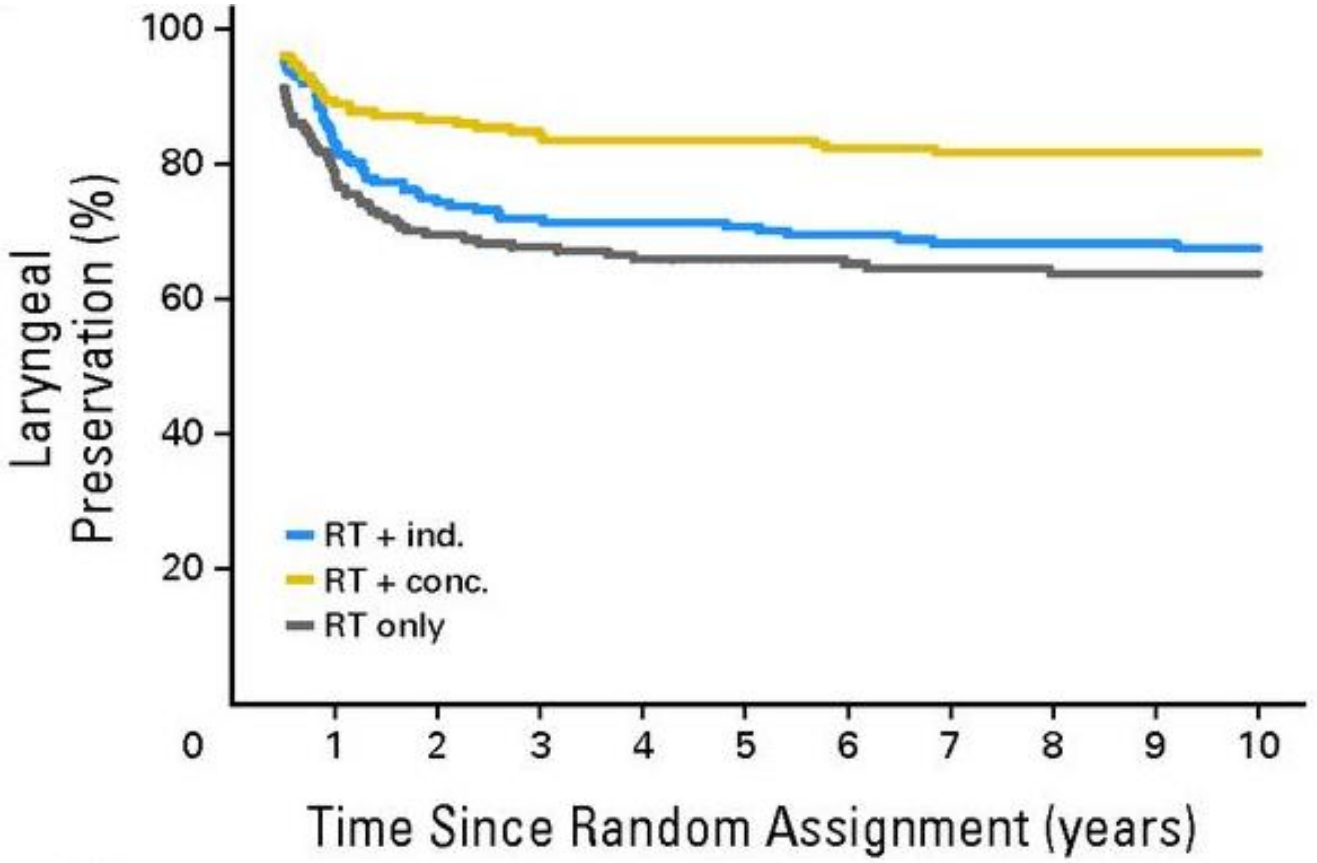
VA. NEJM, 1991

Larynx preservation therapy is recommended for advanced (T2-T4) larynx carcinoma:
-
What is the larynx preservation rate after chemoradiation ?

A. 40 - 50%
B. 50 - 60%
C. 60 - 70%
D. 70 - 80%
E. > 80%



Larynx preservation: larynx carcinoma

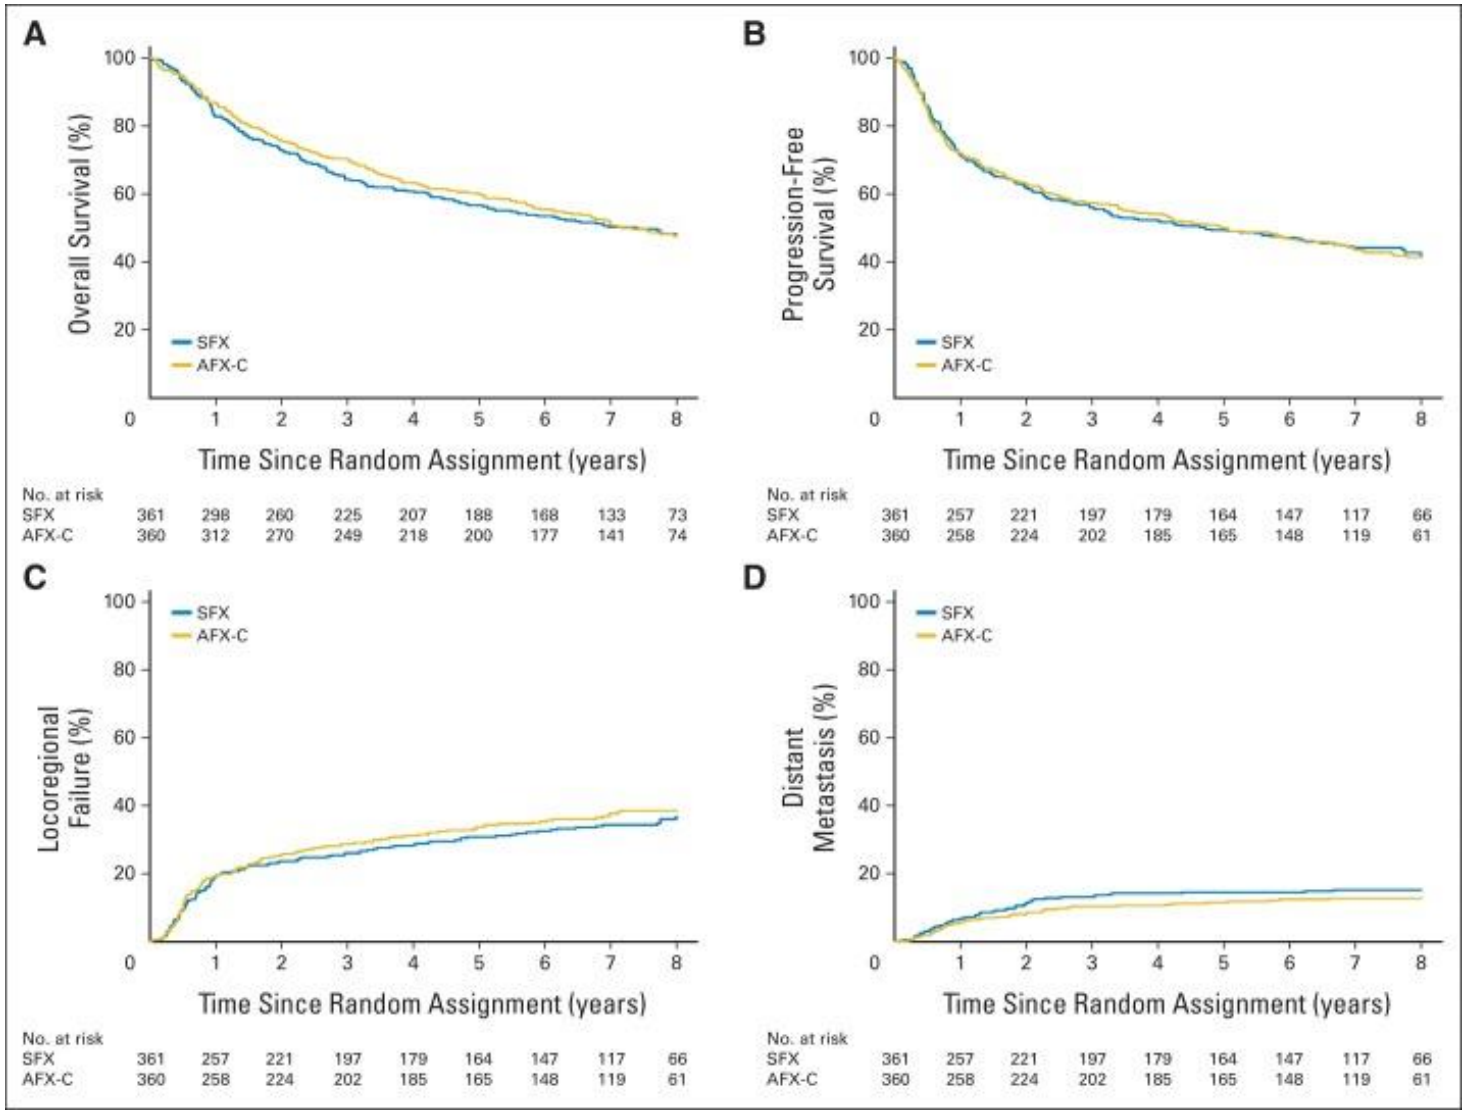


5-yr-overall survival:

Radiotherapy with concurrent cisplatin	**54%**
Radiotherapy with neoadjuvant chemotherapy	**58%**
Conventional radiotherapy alone	**55%**

Forastiere et al. NEJM, 2003; JCO, 2013

Accelerated vs conventionally fractionated chemoradiation



Nguyen-Tan et al. J. Clin. Oncol. 2014

ARCON for T2-4 squamous cell carcinoma of the larynx

Randomization
345 pts

174 → **Accelerated Radiotherapy**

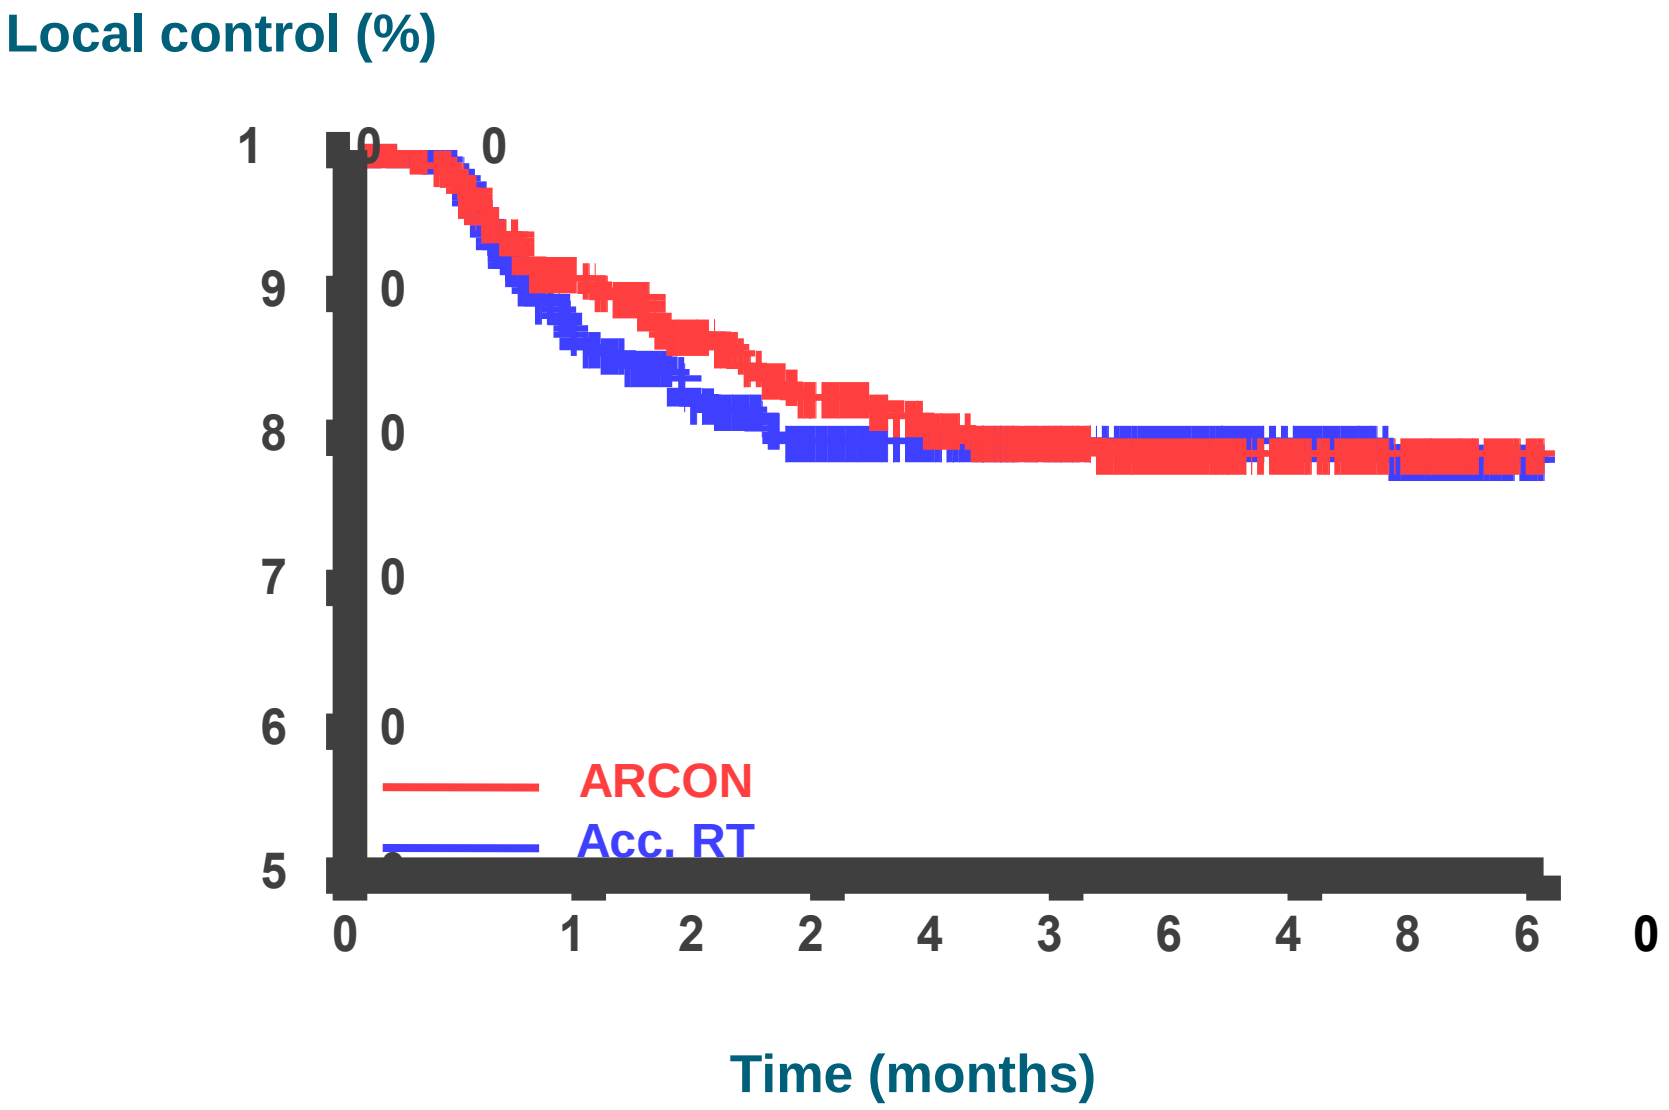
171 → **Accelerated Radiotherapy + carbogen and nicotinamide**

Fractionation schedule:

	primary	metastatic nodes
Acc. RT	68 Gy	68 Gy
ARCON	64 Gy*	68 Gy

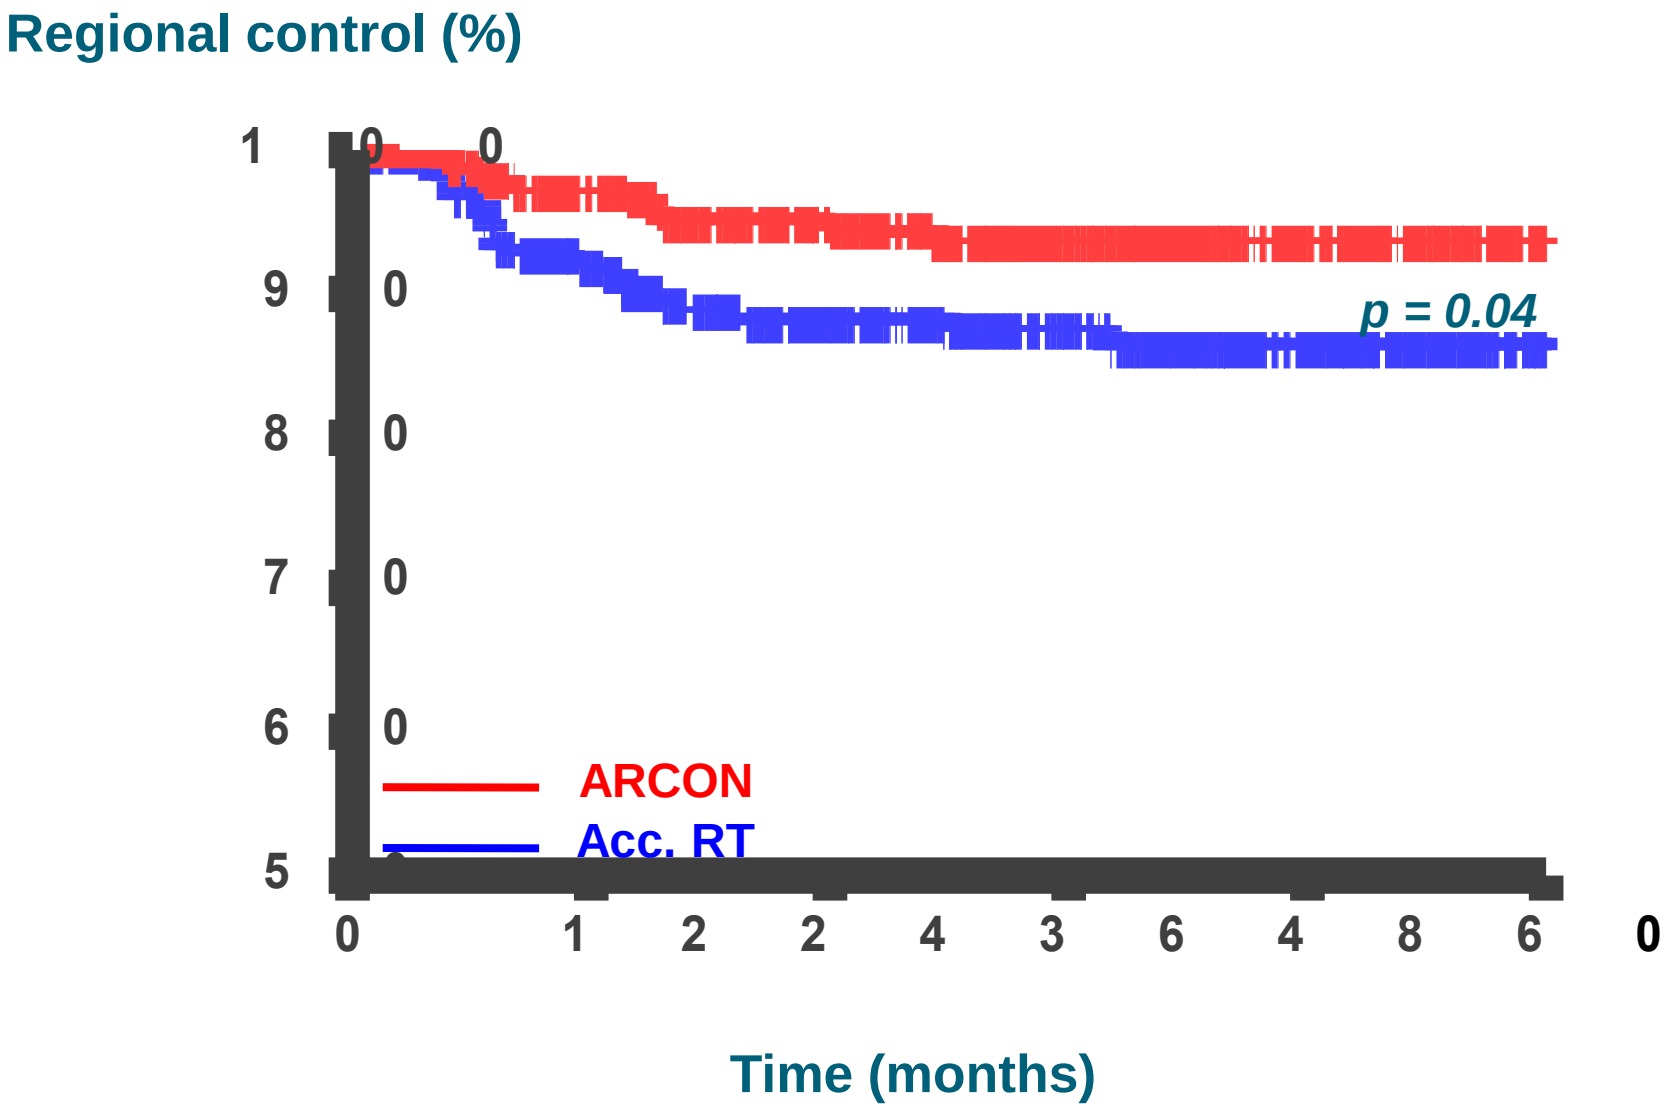
*Aim: improve tumor control with equal toxicity between arms!

ARCON for larynx carcinoma, local control



Janssens et al. JCO 2012

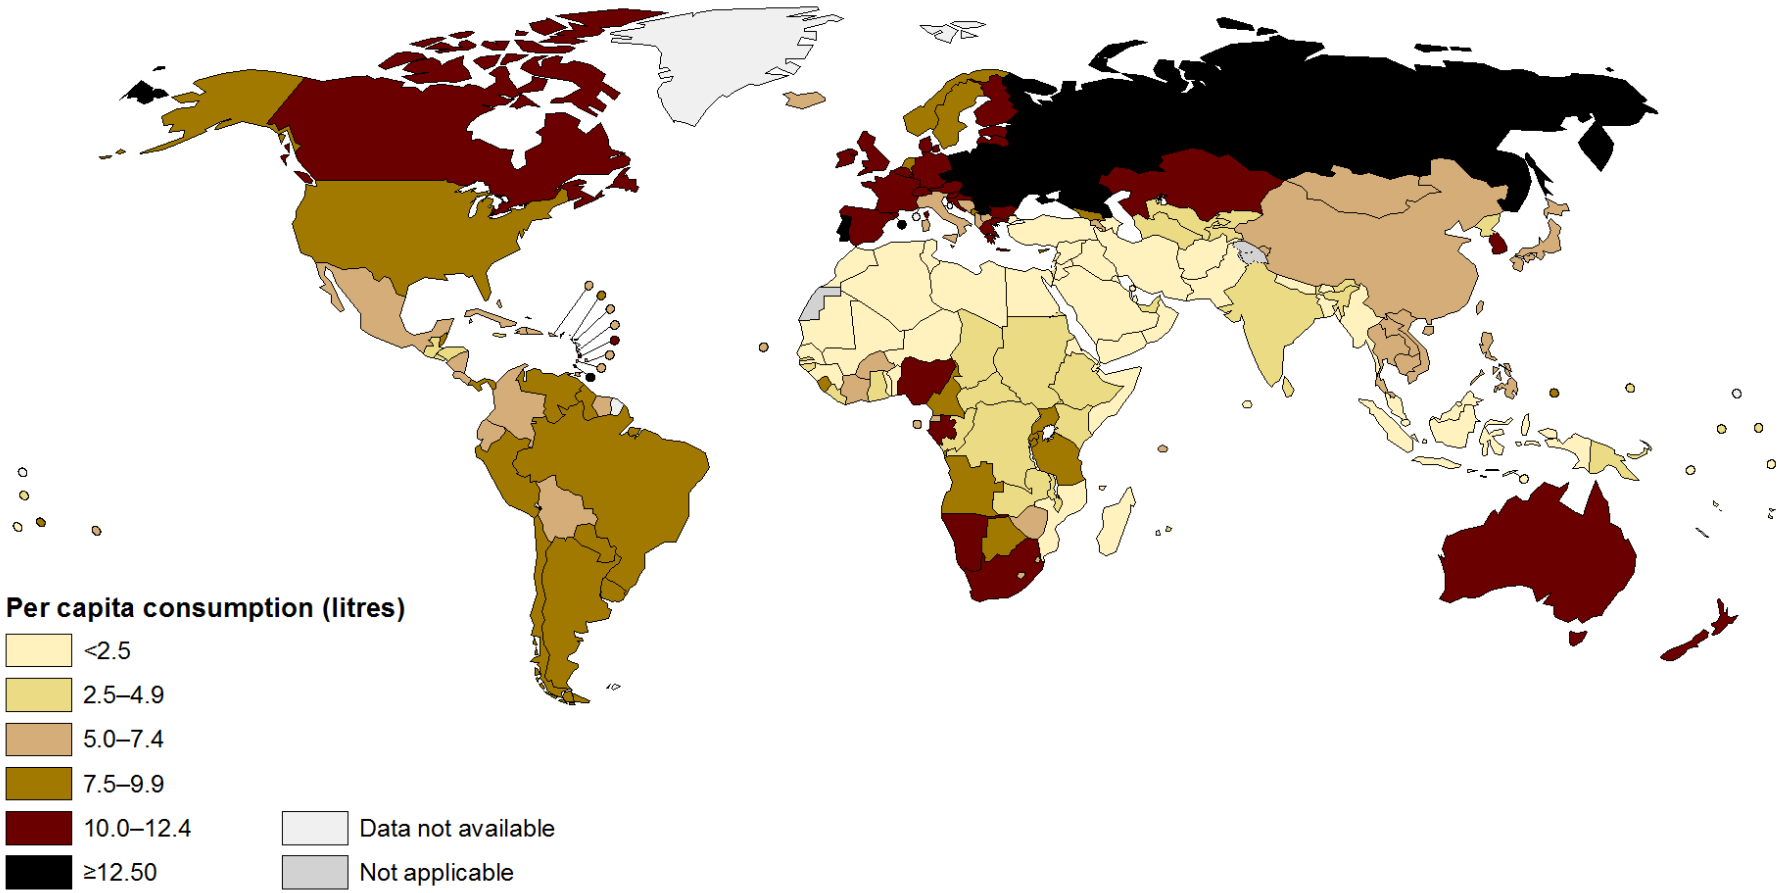
ARCON for larynx carcinoma, regional control



Janssens et al. JCO 2012

CARCINOMA OF THE HYPOPHARYNX

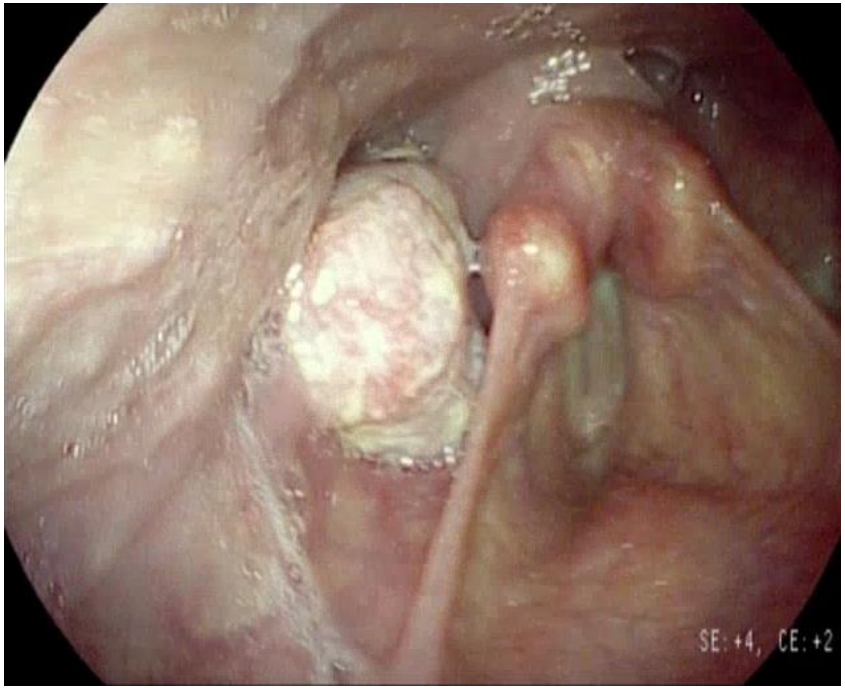
Total alcohol per capita (15+ years) consumption, in litres of pure alcohol, 2010

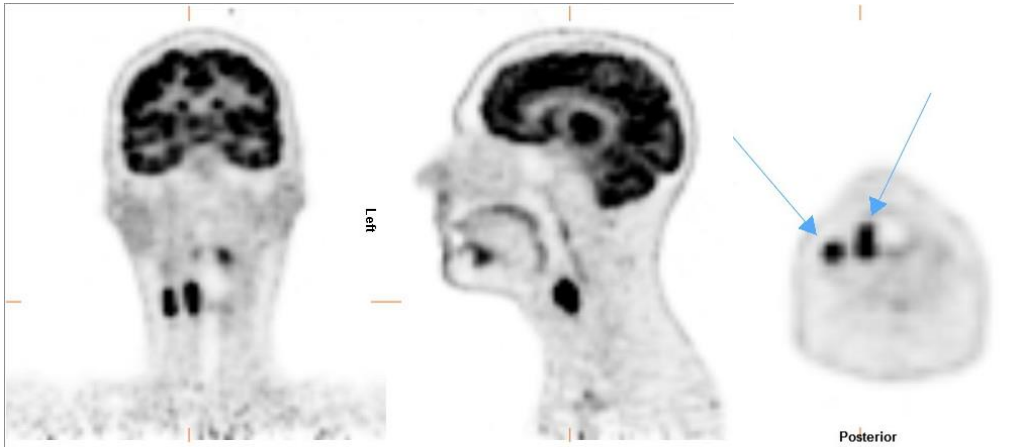


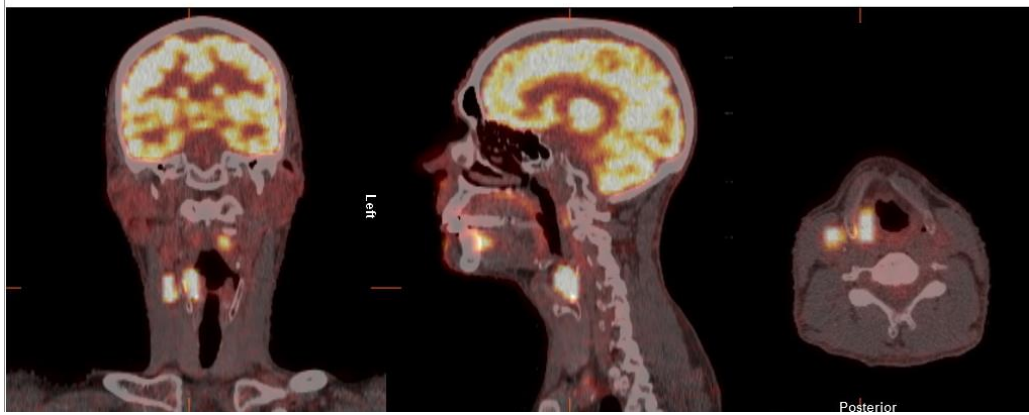
Data Source: World Health Organization
Map Production: Health Statistics and Information Systems (HSI)
World Health Organization

World Health Organization

Hypopharynx cancer T1

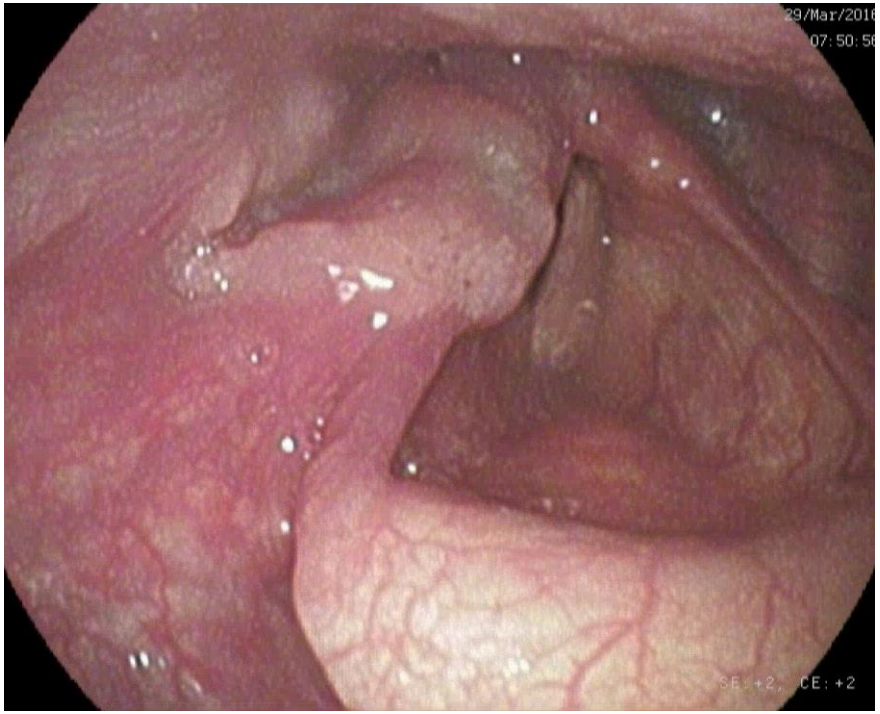


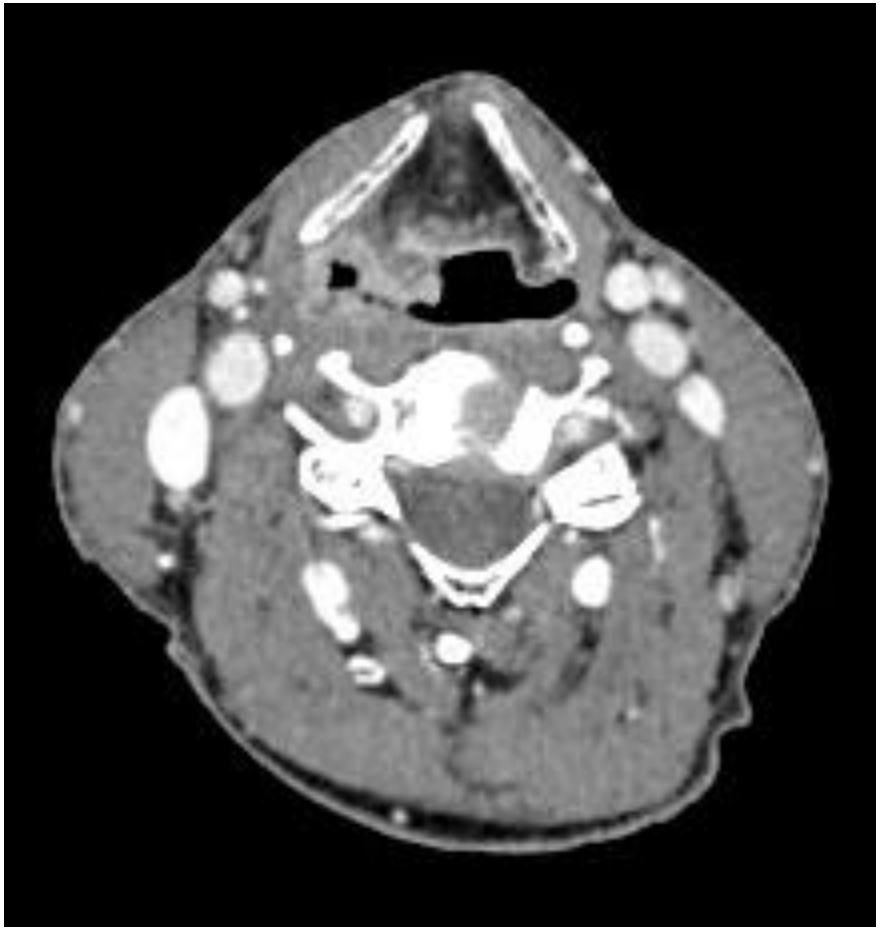




T1: ≤ 2 cm, one subsite

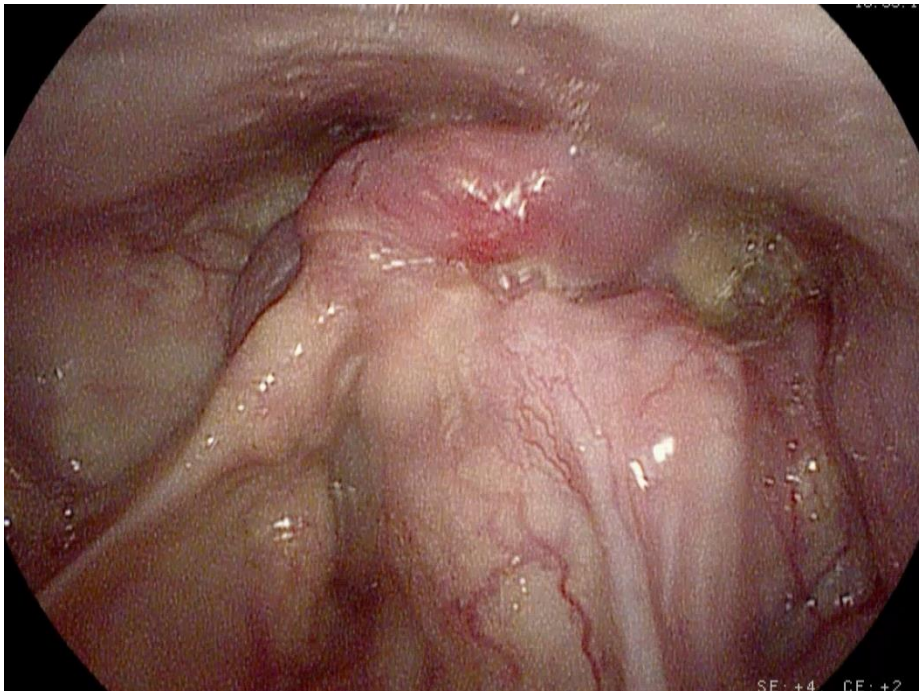
Hypopharynx cancer T2





T2: 2-4 cm, > 1 subsite

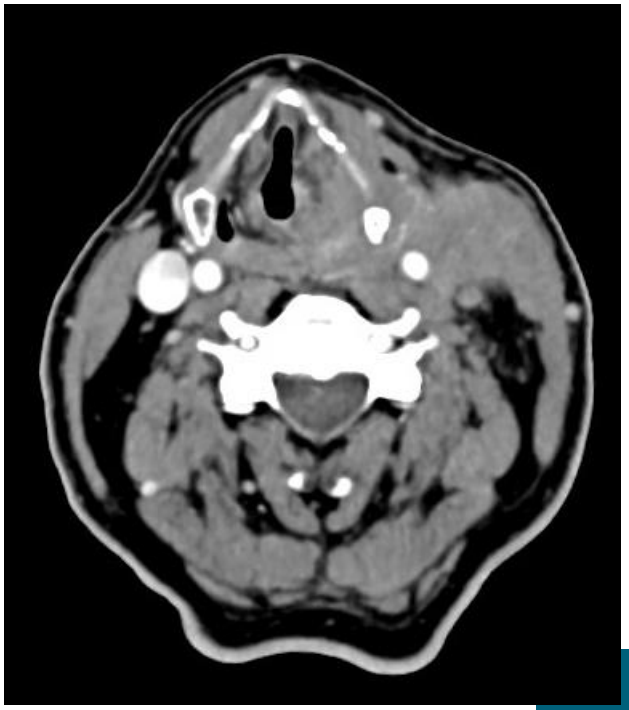
Hypopharynx cancer T3



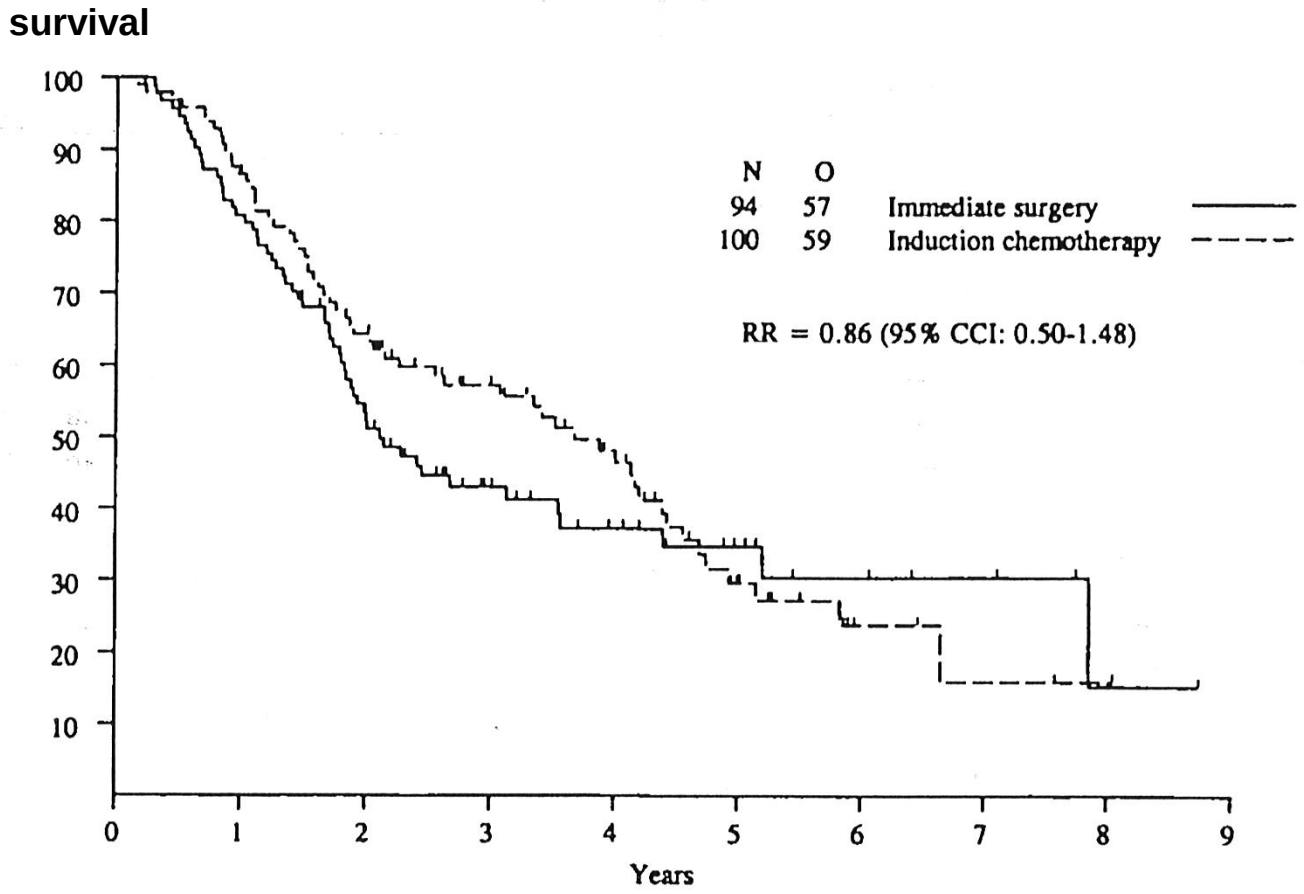
T3: >4 cm,
fixation hemilarynx or
extension esophagus

Hypopharynx cancer T4

T4a: invades laryngeal cartilage, hyoid bone, thyroid gland, esophagus, soft tissues



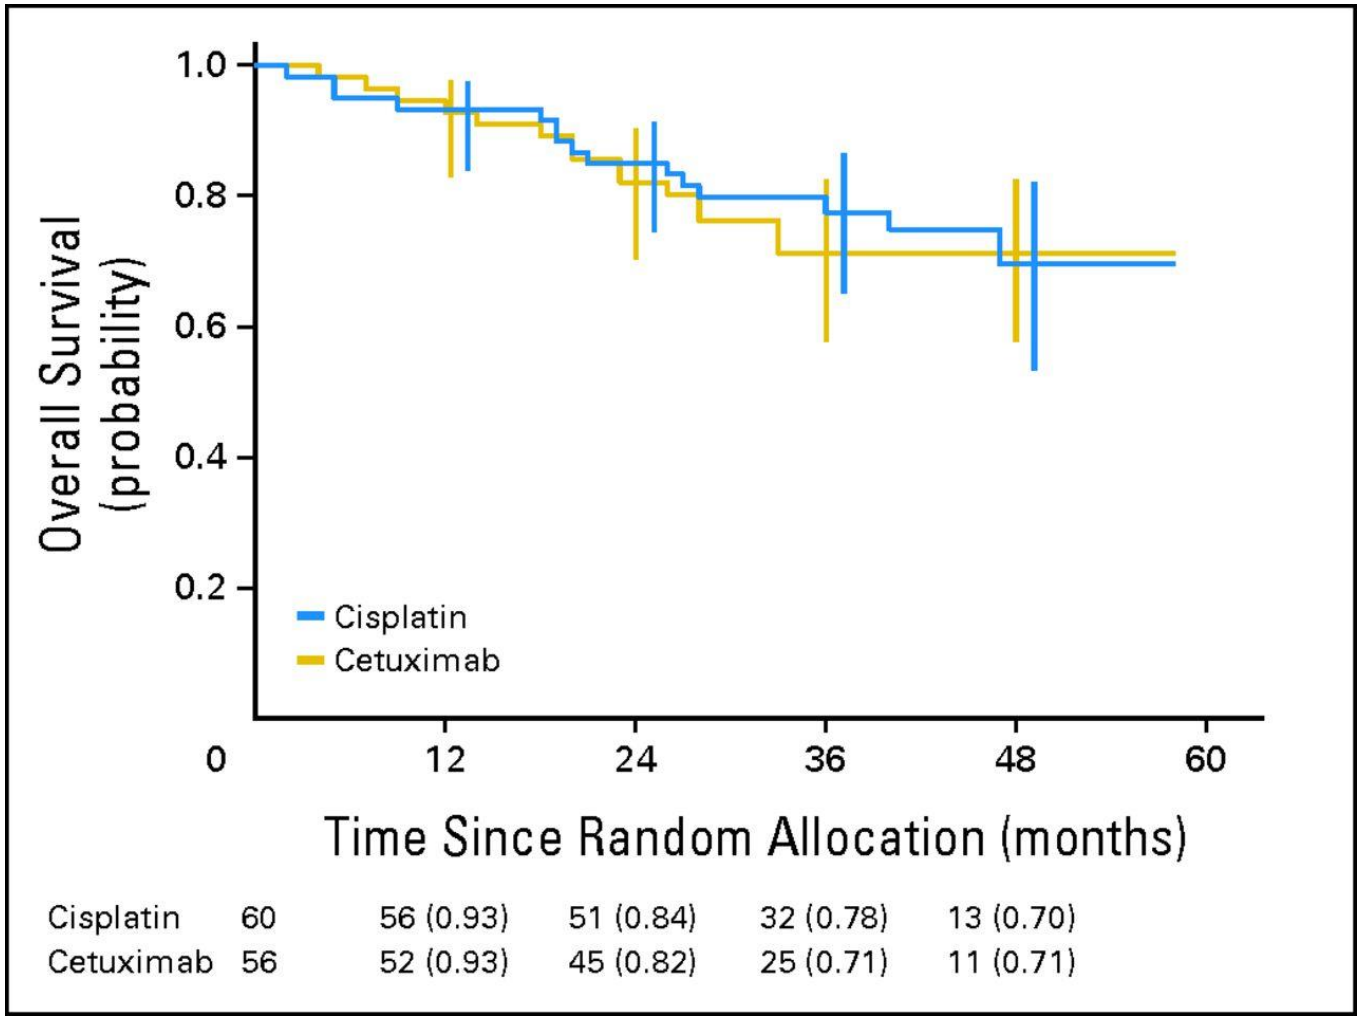
Larynx preservation in pyriform sinus cancer: surgery + postop RT vs induction CHT + RT



Lefebvre et al., JNCI 1996

Induction chemotherapy followed by chemoradiotherapy or bioradiotherapy for larynx preservation

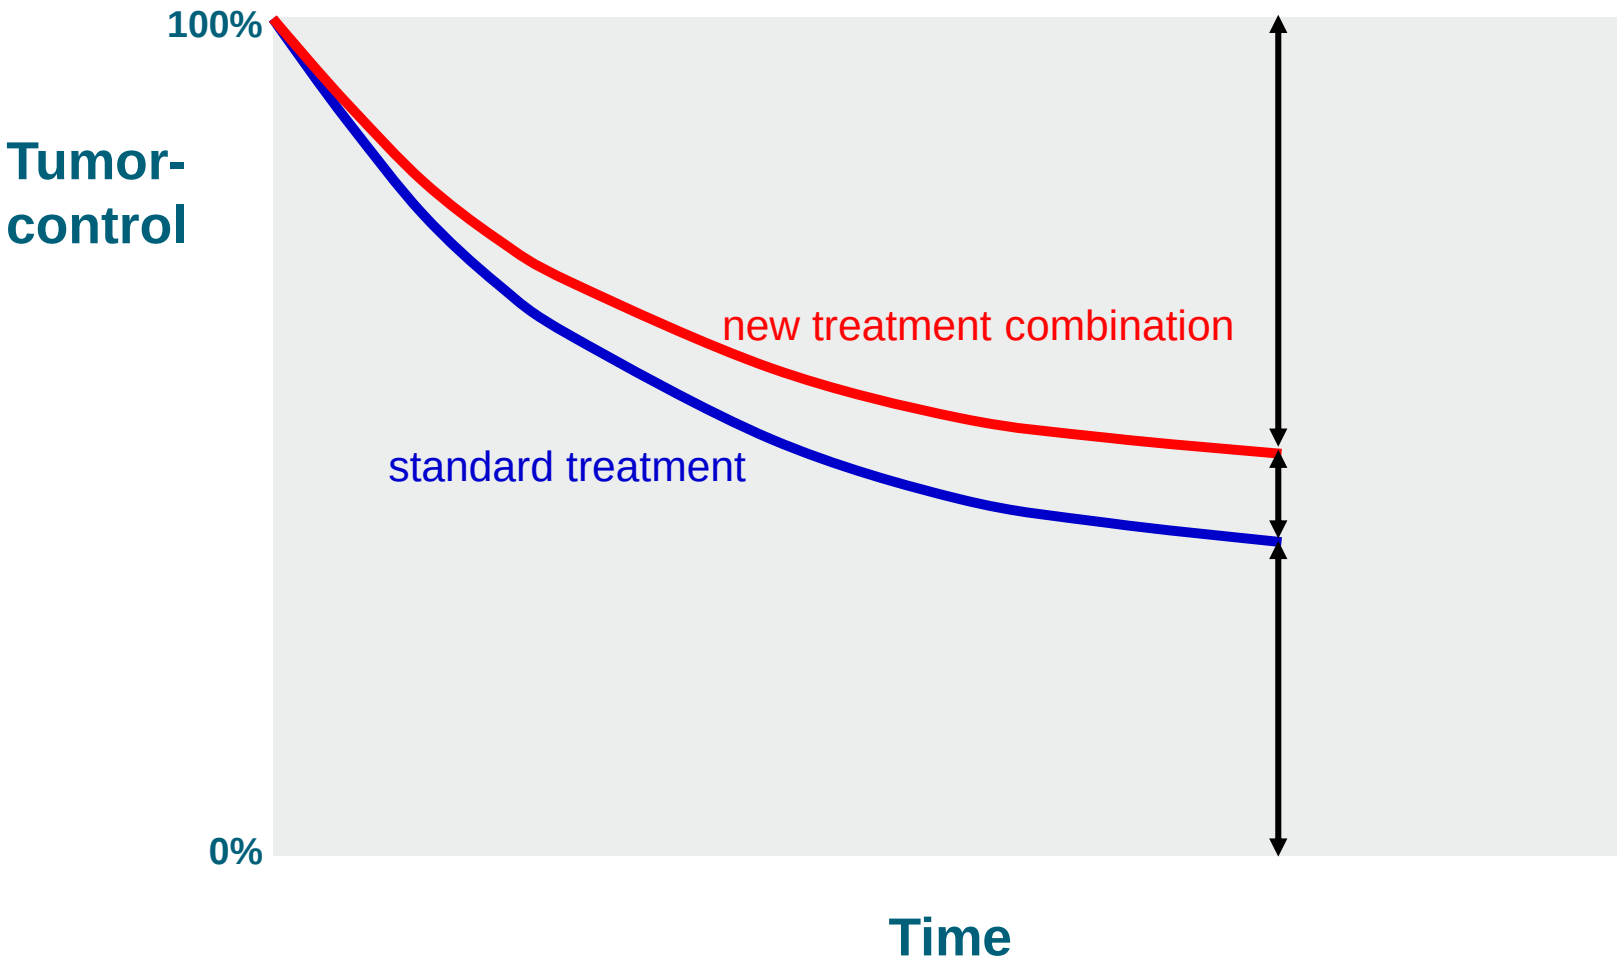
TREMPLIN trial – survival of responders (> 50% volume reduction)



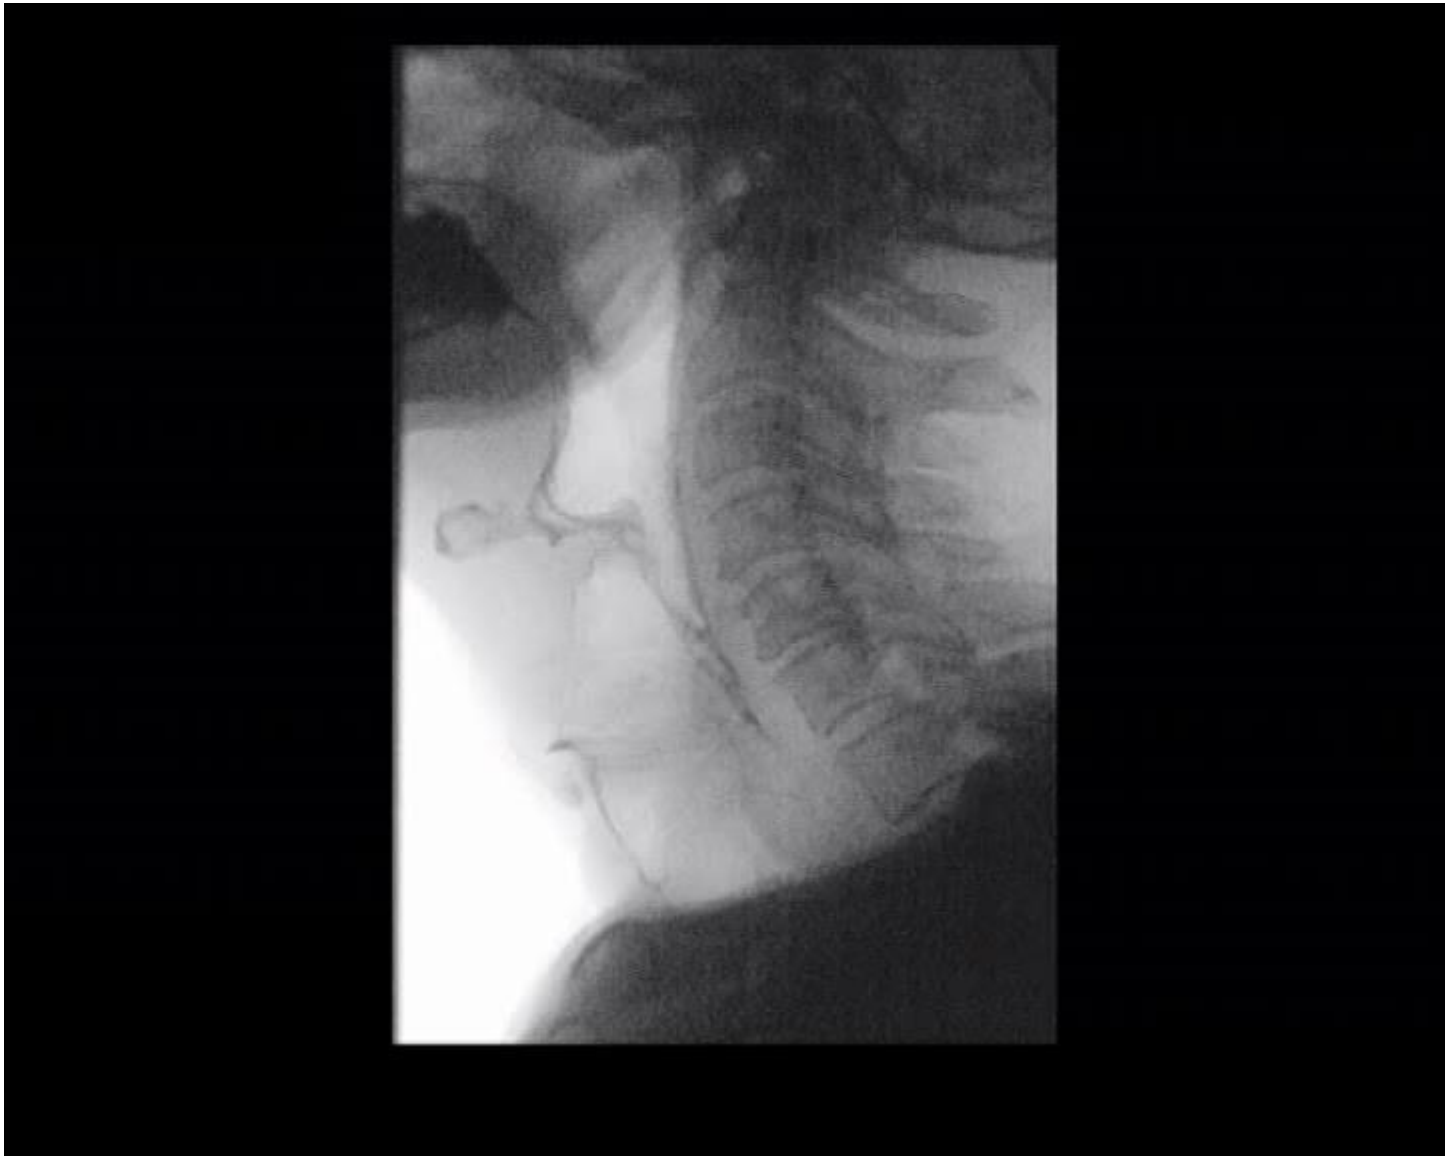
Lefebvre et al., JCO 2013

TOXICITY

New treatment combinations, who profits?



Swallowing act after chemoradiation for larynx carcinoma



Reporting of late morbidity: deficiencies

- *Early reports: insufficient length of follow-up*
- *Incomplete reporting*
- *Pooled data for multiple toxicity items*
- *Crude rates*
- *Clinician graded toxicity vs. patient reported outcomes*
- *Differences in scoring/reporting between studies*

Randomized trials testing new strategies for curative treatment of head and neck cancer

Published between 2000 and 2008 in:

- N Engl J Med
- Lancet
- Lancet Oncol
- J Clin Oncol
- Int J Radiat Oncol Biol Phys
- Radiother Oncol

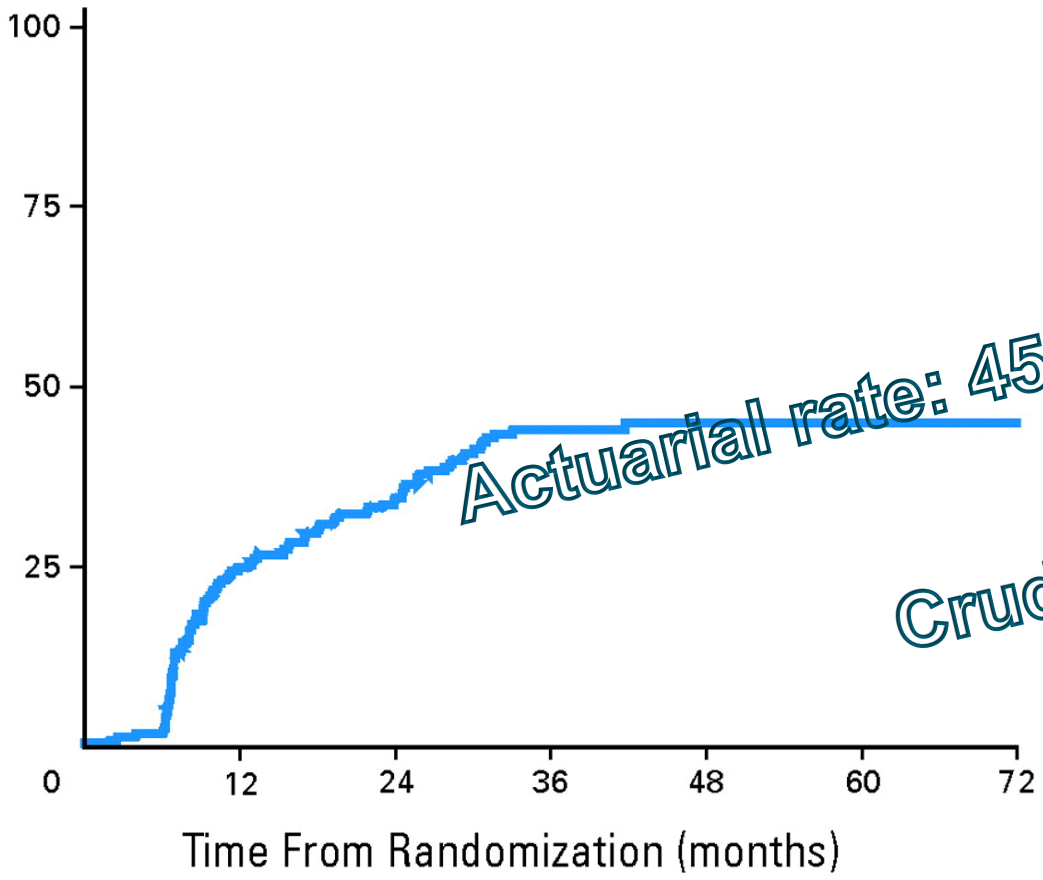
46 studies

→ 31/46 reported late morbidity

→ 20/46 systematic and detailed

→ 10/46 by actuarial method

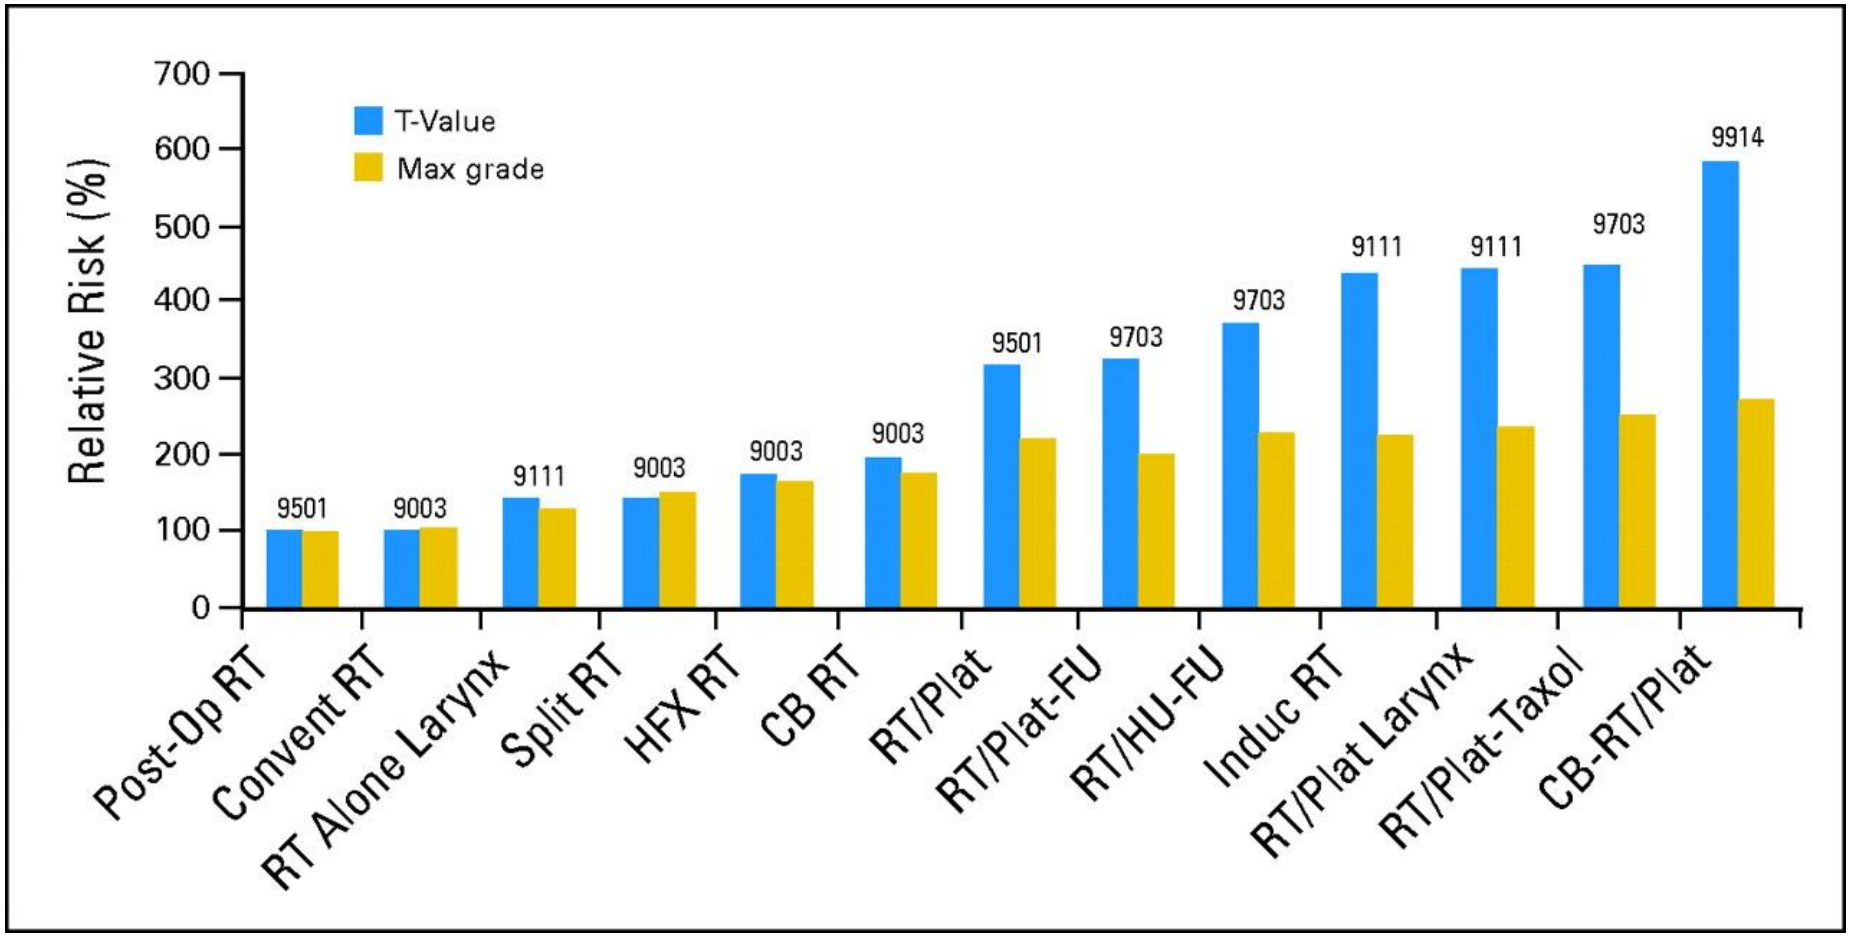
Severe late toxicity (≥ gr 3) after concurrent chemoradiation in RTOG studies 91-11, 97-03 and 99-14.



Patients at risk	230	174	143	81	36	17	11

Machtay et al. J Clin Oncol 2008

A new method for summarizing toxicity scores: “TAME”



Acute toxicity relative risk values (T) vs. relative max-grade values for 13 H&N treatment groups from RTOG trials

Trotti et al. Lancet Oncol 2007

For a multicenter randomized trial in H&N cancer:

-

What is the average accrual per center per year?

A. < 5
B. 5 - 10
C. 10 - 15

Target volume definition

GTV: ***Gross tumor volume:***

Use all information available from clinical examination and imaging (physician drawing target volume must have examined the patient!)

CTV: ***GTV + potential routes of subclinical spread***

GTV - CTV margins: ***fixed margins generally don't work***

- Soft tissues: generous margins (1-1.5 cm)
- Bone, cartilage, air cavities: tighter margins
- Known routes of spread:
  Nasopharynx: cavernous sinus
- Neck nodes: 0.5 cm; if extranodal growth ≥ 1.0 cm

PTV: ***CTV - PTV margins:***

- 5 mm is generally adequate
- Can be reduced to 2-3 mm with customized positioning and immobilization devices and DPI/CBCT-based correction protocols. To 1-2 mm with robust fixation and CBCT online.

THE GLOBOCAN PROJECT

Welcome to the **GLOBOCAN** project. The aim of the project is to provide contemporary estimates of the incidence of, mortality and prevalence from major types of cancer, at national level, for 184 countries of the world. The GLOBOCAN estimates are presented for **2012**, separately for each sex. 1-, 3- and 5-year prevalence data are available for the adult population only (ages 15 and over). Please note that:

1. These estimates are based on the most recent data available at IARC and on information publically available on the Internet, but more recent figures may be available directly from local sources.
2. Because the sources of data are continuously improving in quality and extent, estimates may not be truly comparable overtime and **care should be taken when comparing these estimates with those published earlier**. The observed differences may be the

Prognostic factors for recurrence

•**Tumour and patient factors:**

Family history with or without BRCA1/2 mutation

Age

- Tumour size and stage
- Vascular Invasion
- Surgical positive margin
- Young age

•Treatment related

- Radiotherapy
- Adjuvant systemic therapy

But also related to biological sub-type

Risk factors for breast cancer

-BRCA 1 and BRCA 2 Mutations

-Life style

institutCurie
Ensemble, prenons le cancer de vitesse.

Lifestyle factors which might be modified to reduce breast cancer incidence in the UK

Factor	% of breast cancers attributable to lifestyle risk factor that might be modified
Alcohol	6
Overweight and obesity	9
Physical exercise	3
Post-menopausal hormones	3
Ionizing radiation	1
Occupation	5
Reproduction (breast-feeding)	3
Total	**27**

This is the theoretical maximum amount. Realistically, not all this could be achieved.

So lifestyle changes can only make a modest contribution to reduction in breast cancer..

BRCA gene products are involved in:

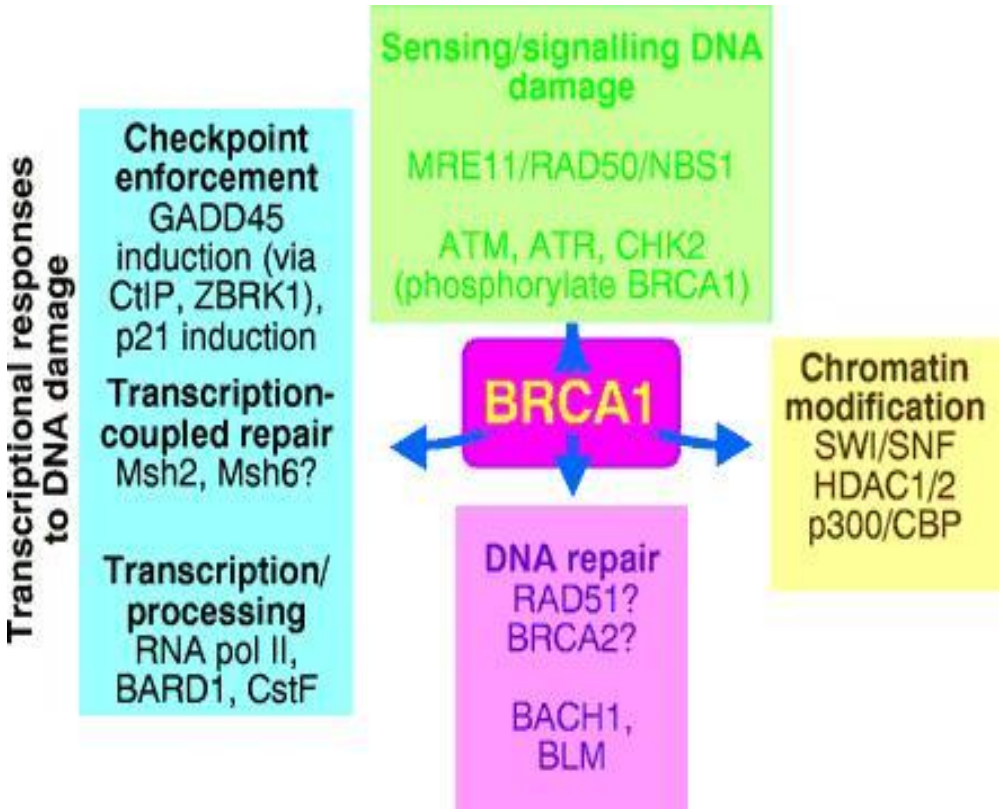
Double-strand break repair mechanisms

Cell-cycle checkpoints control

Regulation of apoptosis

"Caretakers" genes

Involved in the maintenance of genome integrity and stability



Protein partners of BRCA1 in DNA damage responses. There is accumulating evidence that BRCA1 performs multiple functions in the cellular response to DNA damage through its interactions with different protein partners. The list of BRCA1-interacting proteins indicated here is not exhaustive but illustrates points made in the text (*Image Permit Pending* Venkitaraman,2001).

institutCurie

CLINICAL TRIAL

Is the breast-conserving treatment with radiotherapy appropriate in *BRCA1/2* mutation carriers? Long-term results and review of the literature

Youlia M. Kirova · Alexia Savignoni · Brigitte Sigal-Zafrani · Anne de La Rochefordiere · Rémy J. Salmon · Pascale This · Bernard Asselain · Dominique Stoppa-Lyonnet · Alain Fourquet

Background and Purpose

- **Because tumors in *BRCA* mutation carriers might be more sensitive to radiation with increased risk of second primaries, we report after long term follow-up whether mutation status influenced the rate of ipsilateral tumors after breast-conserving treatment.**

- **A case-control study was performed**

Patients Selection

- **Retrospective analysis of BC patients treated at the Institut Curie between 1981 and 1999.**

- **Genetic testing was proposed to women who presented one of the following family criteria:**

  - **2 first-degree relatives affected with cancer, with at least one with invasive BC before 41 yrs, or one with ovarian cancer at any age**

  - **At least 3 first- or second-degree relatives from the same lineage affected with invasive breast or ovarian cancer at any age**

Patients and Methods

131 pts with family history (with 136 breast tumors) were tested.

They were matched to 261 control BC pts (with 271 tumors) without family history (sporadic cases), chosen from a population of 9179 pts, treated between 1981 and 1999.

Matching criteria

1. Age at diagnosis
2. Year of treatment
3. Follow-up of controls at least equal to the time-interval between diagnosis and genetic testing in cases.

BRCA status

- BRCA status was unknown in all pts but one at the time of diagnosis and treatment.

- Mutations were found in 20.6% pts with familial history (21.3% tumors)
  - BRCA1: 19 pts (with 21 tumors)
  - BRCA2: 8 pts (with 8 tumors)

Follow-up

- **Median follow-up for all patients 13.4 years**

–Cases (BRCA1/2 mutation carriers):	**13.9 years**	**[3-19.2]**
–Familial cases (Non carriers)	**13.4 years**	**[2.3-22.5]**
–Controls:	**13 years**	**[2.7-24.8]**

Breast Conserving surgery and radiotherapy in *BRCA1* and *BRCA2* mutations carriers

Genetic testing : toward individual cancer risk: modifying factors

Prophylactic mastectomy and patients' choice

Future alternatives for treatment tailoring

Conclusions

institutCurie
Ensemble, prenons le cancer de vitesse

Prophylactic mastectomy

- **Prophylactic mastectomy has been shown to reduce the risk of breast cancer incidence or recurrence, but there is insufficient data to support an improvement in survival in affected or unaffected carriers**

- **The complexity of the problem demands a multidisciplinary approach within the context of a family cancer clinic.**

- *Menke-Pluymers MB, et al, Ned Tijdschr Geneeskd. 2005*
- *Meijers-Heijboer EJ, et al, Lancet. 2000*

Prophylactic mastectomy

- The resultant lack of knowledge drives and sustains patient anxiety, sometimes prompting them to select mastectomy in hopes of a cure while sacrificing cosmesis, body image, and perhaps sexuality
- *Kiebert GM, et al, J Clin Oncol. 1991*
- *Schover LR.CA Cancer Journal for Clinicians. 1991*

- *BRCA1/2* mutation carriers who underwent prophylactic mastectomy reported a less favorable body image, while 70% of them reported changes in their sexual relationships.

Fourquet A et al. Familial breast cancer: clinical response to induction chemotherapy or radiotherapy related to *BRCA1/2* mutations status. Am J Clin Oncol 2009

- **The BRCA1 and BRCA2 genes were screened for germline mutation in a retrospective cohort of 90 pts (with 93 tumors) with a family history of breast and/or ovarian cancer, treated with induction anthracycline-containing chemotherapy and/or radiotherapy.**

- Median tumor size was 40 mm.

- Clinical responses and breast preservation rates were correlated to BRCA1/2 mutation status, and to other clinical and pathologic factors.

- A complete clinical response was achieved in 15/39 (46%) BRCA1/2-mutated tumors and in 7/54 (17%) nonmutated tumors (P = 0.008). Complete or major clinical response rate was observed in 55 of the 74 tumors treated with induction chemotherapy (74.3%).

Fourquet A et al. Familial breast cancer: clinical response to induction chemotherapy or radiotherapy related to *BRCA1/2* mutations status. Am J Clin Oncol 2009,(continued)

- The overall complete or major clinical response rate in the tumors treated with induction radiotherapy was 68% (13/19 tumors).

- Following induction treatment by either chemotherapy or radiotherapy, more breast-conserving treatments could be performed in mutation carriers than in noncarriers: the rates of breast preservation were 82% in BRCA1/2-mutated tumors and 63% in nonmutated tumors, respectively (P = 0.045).

- ***BRCA mutation was the sole predictor of breast conservation. This suggests that impaired repair mechanisms related to the BRCA1/2 mutations increased the chemosensitivity and radiosensitivity of large breast cancers.***

Future alternatives for treatment tailoring

Conclusions

institutCurie
Ensemble, prenons le cancer de vitesse

Conclusions

Most studies suggest there is no increased risk of breast recurrence in *BRCA 1/2* carriers at 10 years and longer follow-up

Age is the strongest predictor of local recurrence

Added benefit from tamoxifen and / or oophorectomy

Added benefit from chemotherapy

New targeted treatments could change the prognosis of these cancers

But:

- All studies carry methodological biases: selection criteria, non-matched comparisons, longevity (Neyman) biases

- Very few data on long follow-up (> 10 year)

- High risk of CBC

Treatment decisions have to take into account:

- Whether the patient is a known *BRCA* carrier or not
- Her family history
- Her choice

Breast Cancer:

How do clinical trials impact on practice of radiotherapy in breast cancer?

Youlia Kirova, M.D.,
Department of Radiation Oncology

Evidenced Based Radiation Oncology

Introduction

- Several large phase III clinical trials conducted over the years have set up the scene for breast cancer irradiation
- To evaluate their impact of practice
  - Main trials, and metaanalyses
  - National guidelines

Material

- Trials and metaanalyses
- Guidelines
  - NCCN (USA) 2016
  - INCa (France) 2015
  - REMAGUS (Institut Curie & Institut Gustave Roussy) 2017

Trials

1. Postmastectomy Radiotherapy
2. Mastectomy vs Breast-conserving treatment with RT
3. Whole-breast irradiation after breast-conserving surgery
    - Invasive cancer
    - DCIS
4. Fractionation trials
5. Toxicity

Trials

1. **Postmastectomy Radiotherapy**
2. **Mastectomy vs Breast-conserving treatment with RT**
3. **Whole-breast irradiation after breast-conserving surgery**
    - **Invasive cancer**
    - **DCIS**
4. **Fractionation trials**
5. **Toxicity**

Trials: Postmastectomy Radiotherapy

“Effect of radiotherapy after mastectomy and axillary surgery on 10-year recurrence and 20-year breast cancer mortality: meta-analysis of individual patient data for 8135 women in 22 randomised trials”

- ***Early Breast Cancer Trialists’ Collaborative Group (EBCTCG)***
- **Lancet 2014; 383:2127-35**

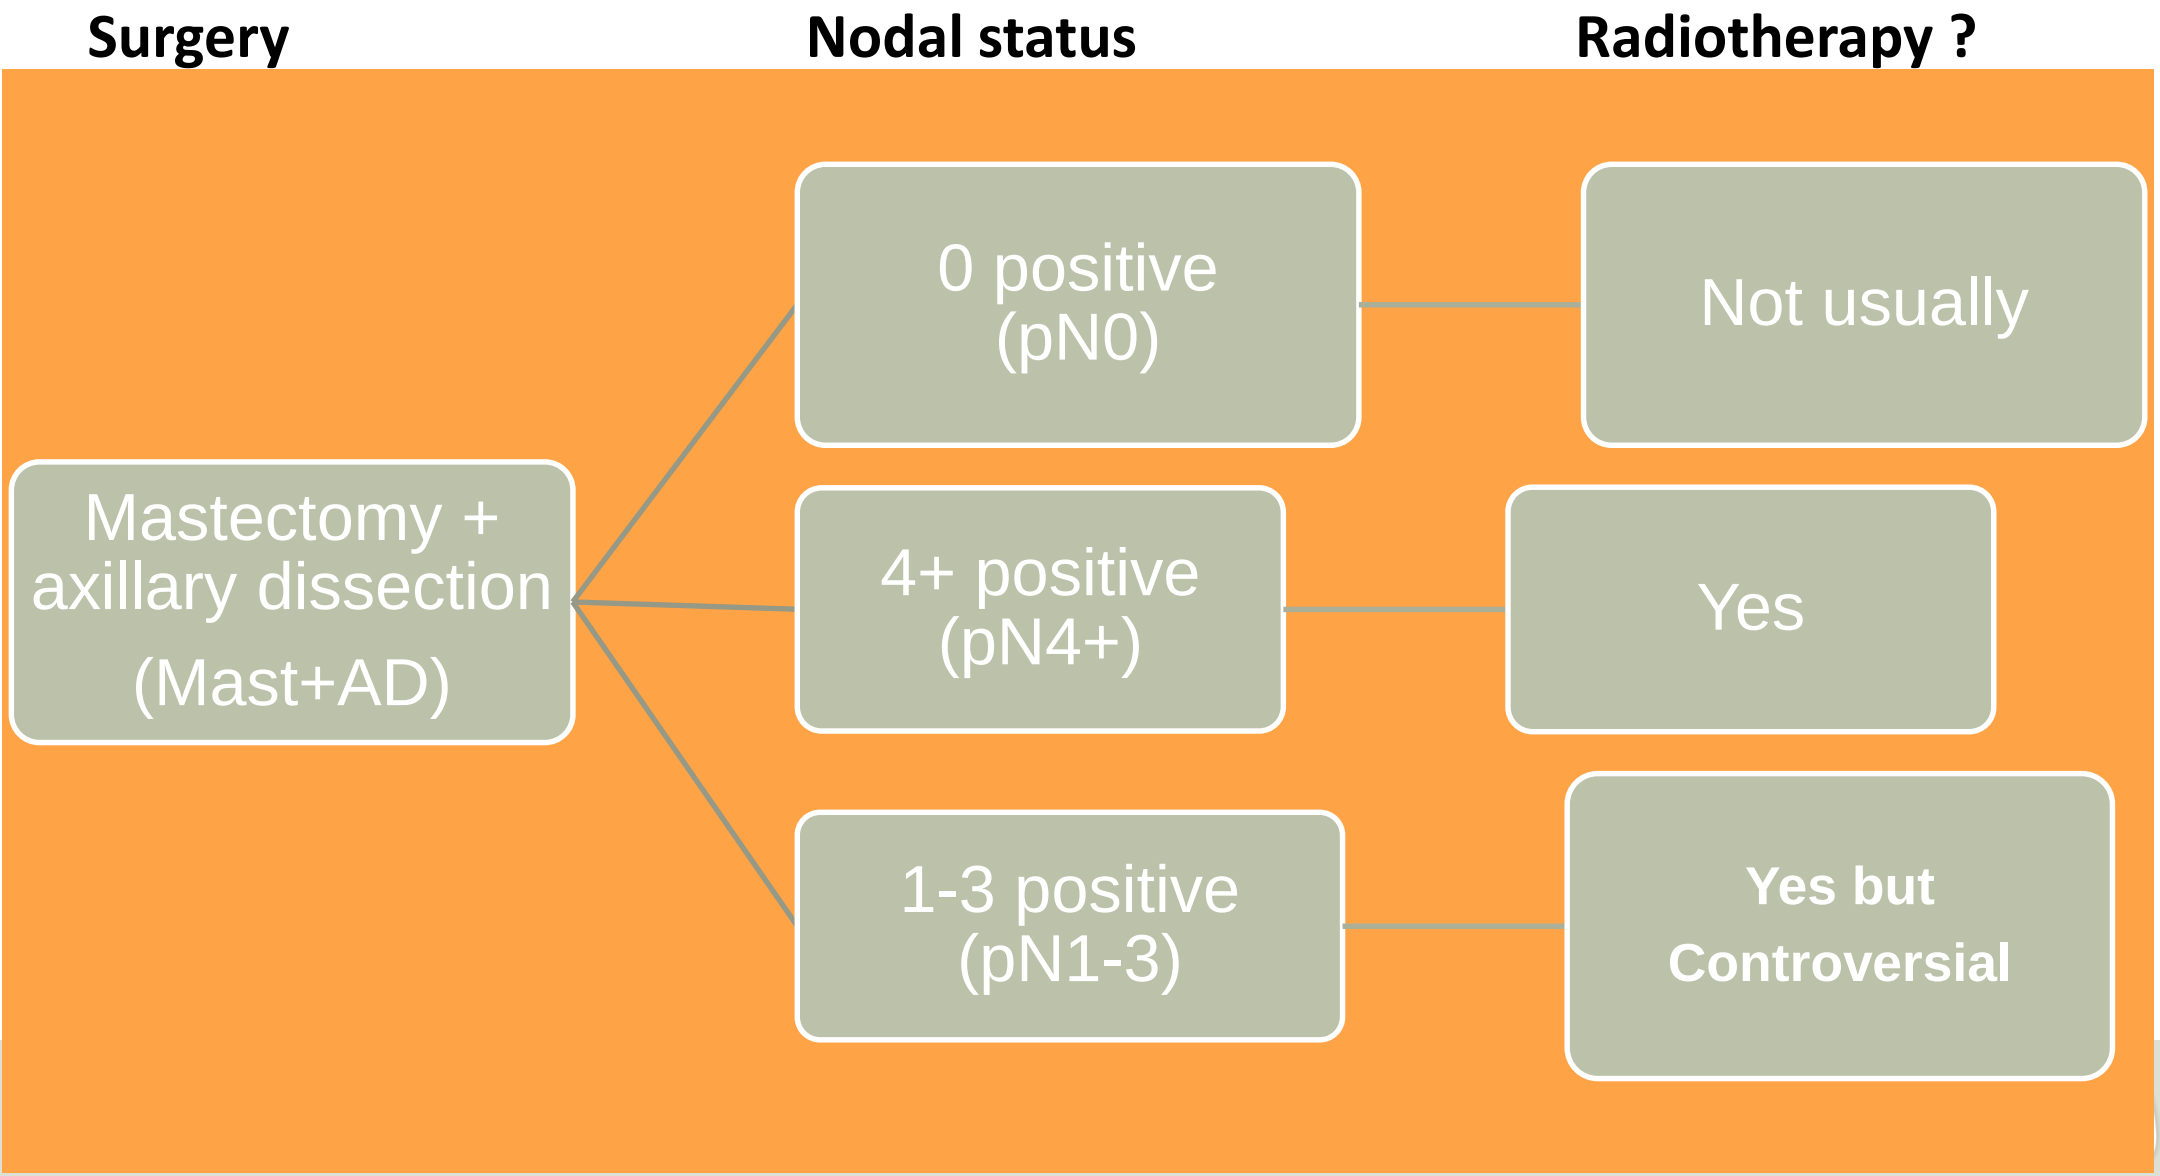
Individual patient data

- **Criteria:**
  - **Randomised trials of radiotherapy (RT) versus same surgery but no RT**
  - **Started before 2000**
  - **Mastectomy and axillary dissection to at least level II**
  - **RT to include chest wall**

- **Found:**
  - **3786 women in 14 trials (started 1964 to 1982)**
  - **43 000 years of follow-up to 2009 (median 9.0 years)**
  - **RT to axillary, internal mammary and supraclavicular nodes**

EBCTCG, Lancet 2014

Current Guidelines

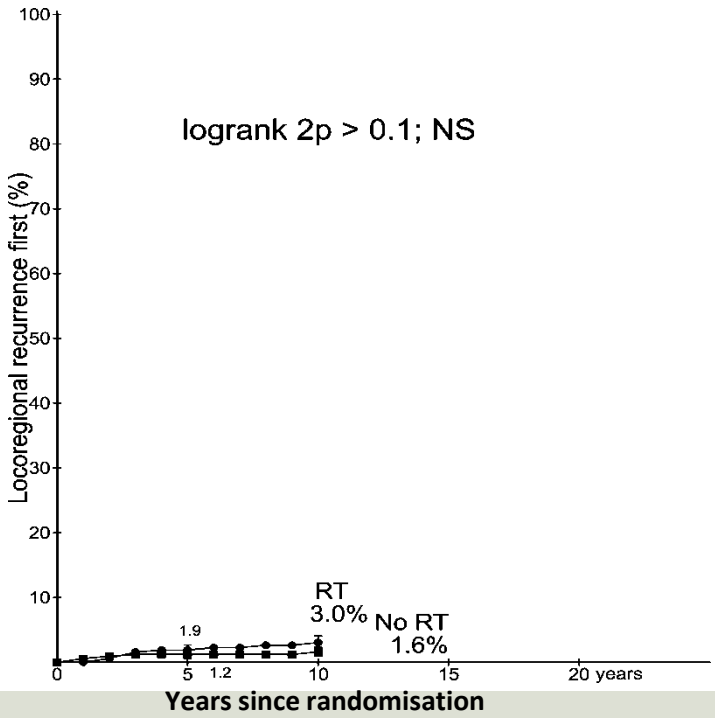


Trials of radiotherapy after mastectomy and axillary dissection

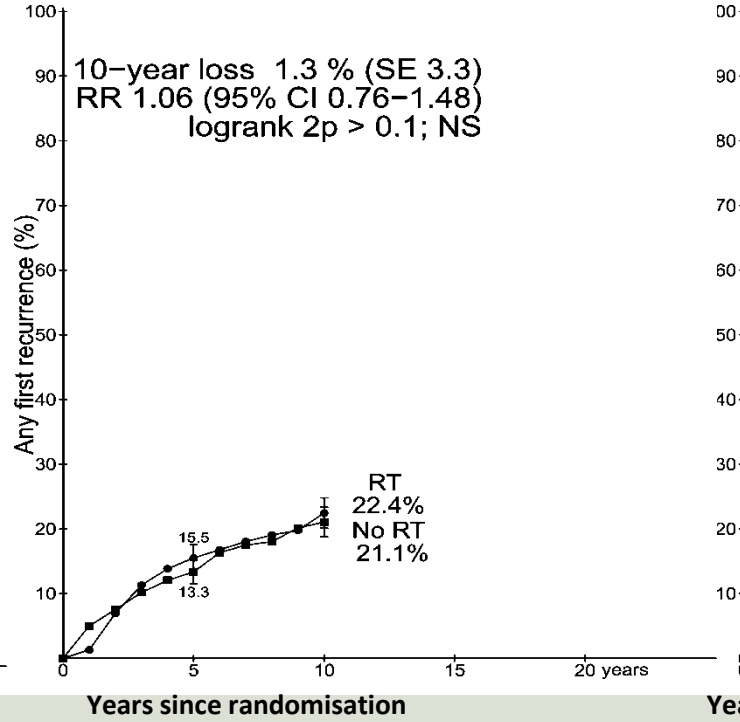
700 pN0 women

RT: No significant benefit

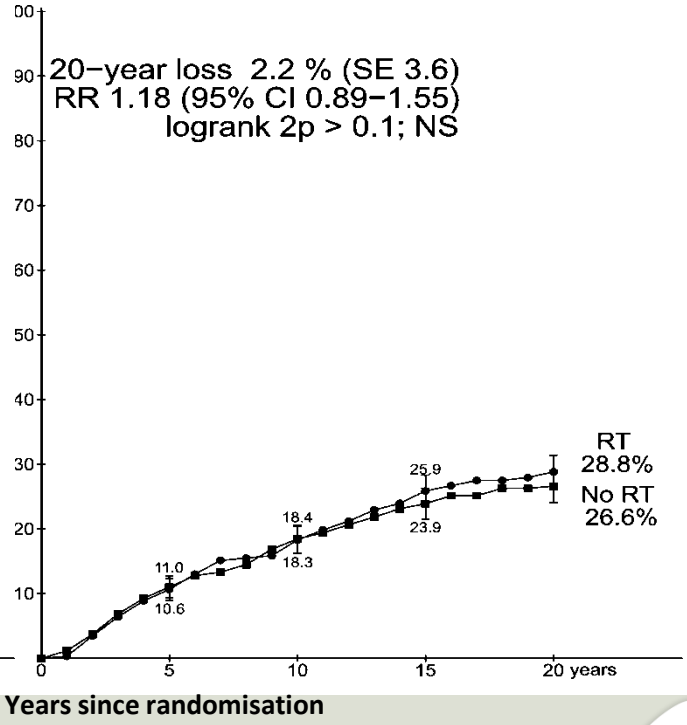
Locoregional recurrence first



Any first recurrence



Breast cancer mortality



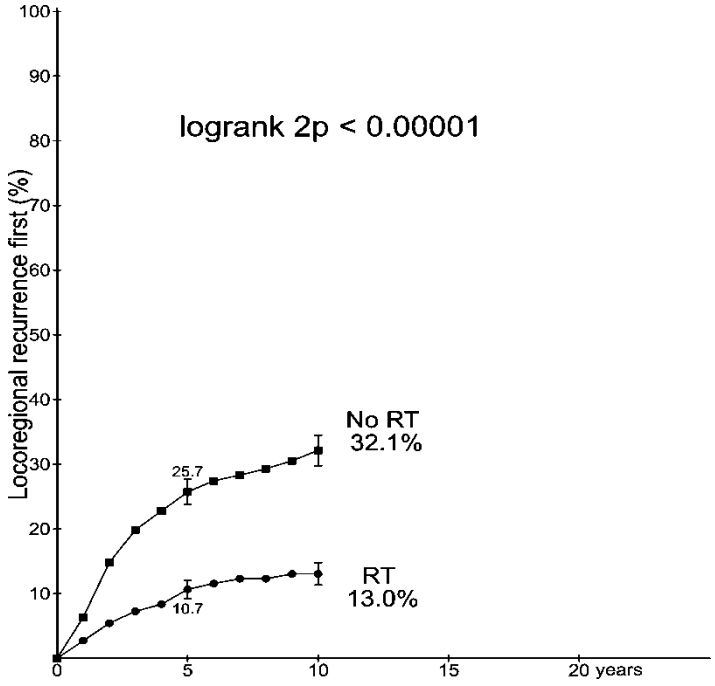
EBCTCG, Lancet 2014

Trials of radiotherapy after mastectomy and axillary dissection

1772 pN4+ women

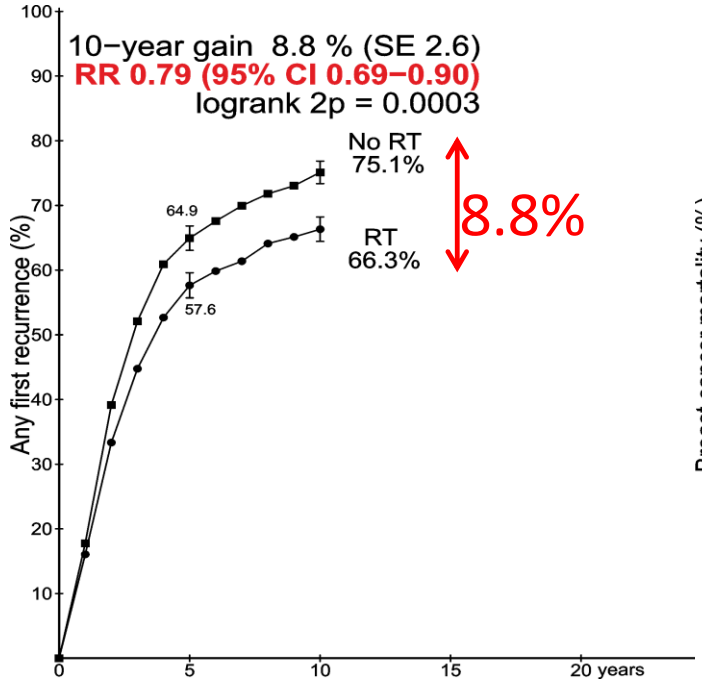
RT: Significant benefit

Locoregional recurrence first



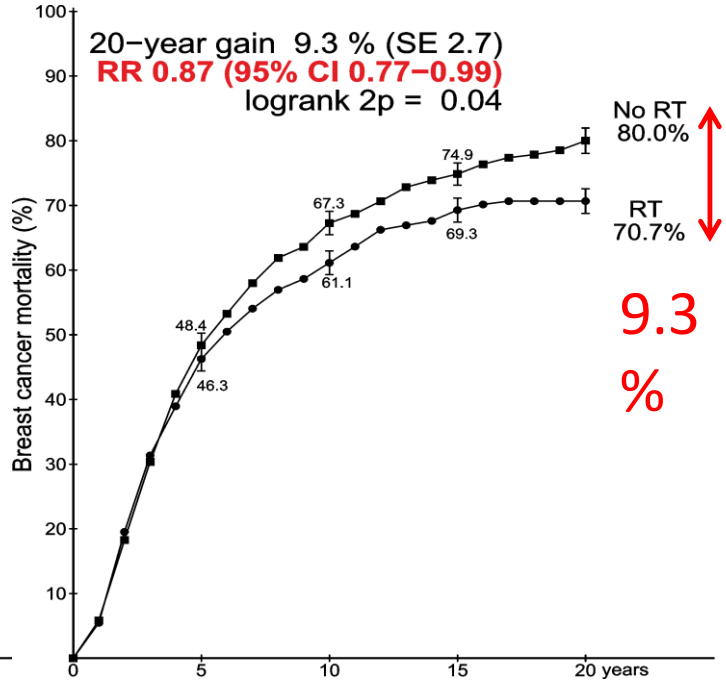
Years since randomisation

Any first recurrence



Years since randomisation

Breast cancer mortality



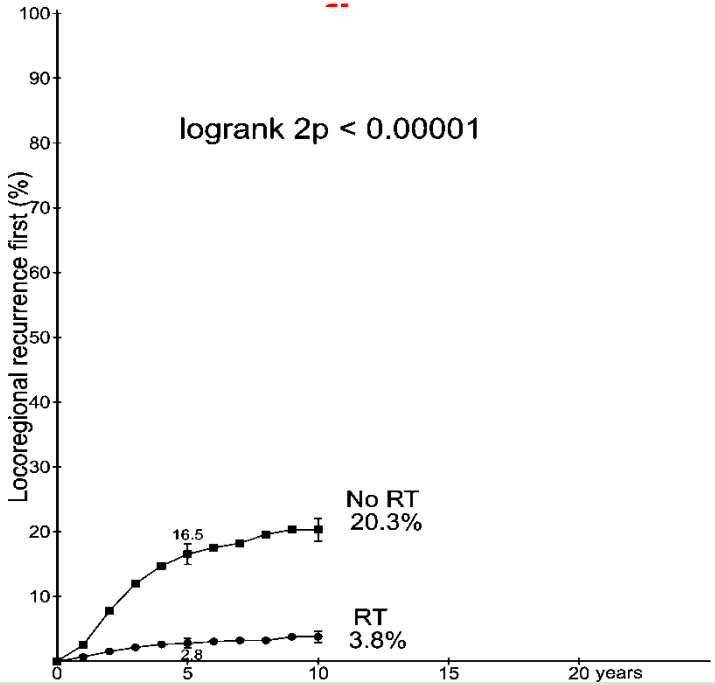
Years since randomisation

Trials of radiotherapy after mastectomy and axillary dissection

1314 pN1-3 women

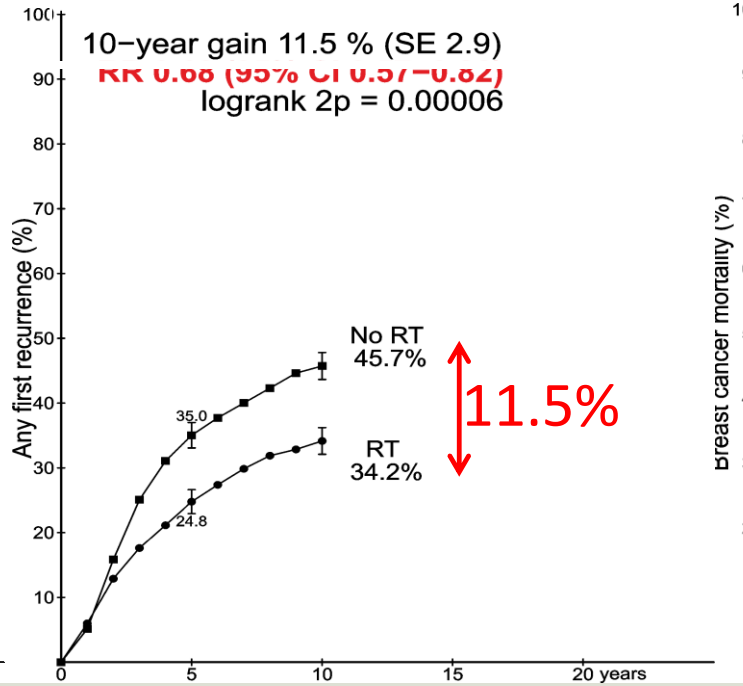
RT: Significant benefit

Locoregional recurrence



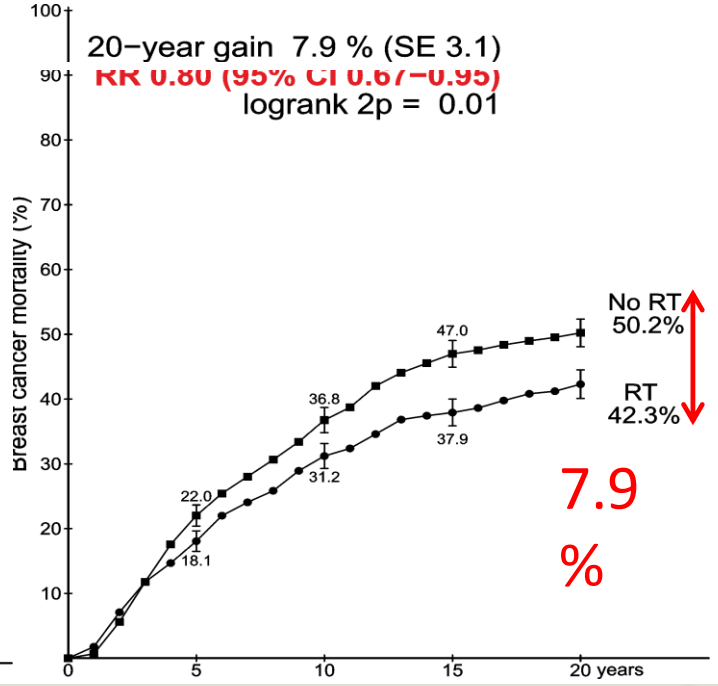
Years since randomisation

Any first recurrence



Years since randomisation

Breast cancer mortality



Years since randomisation

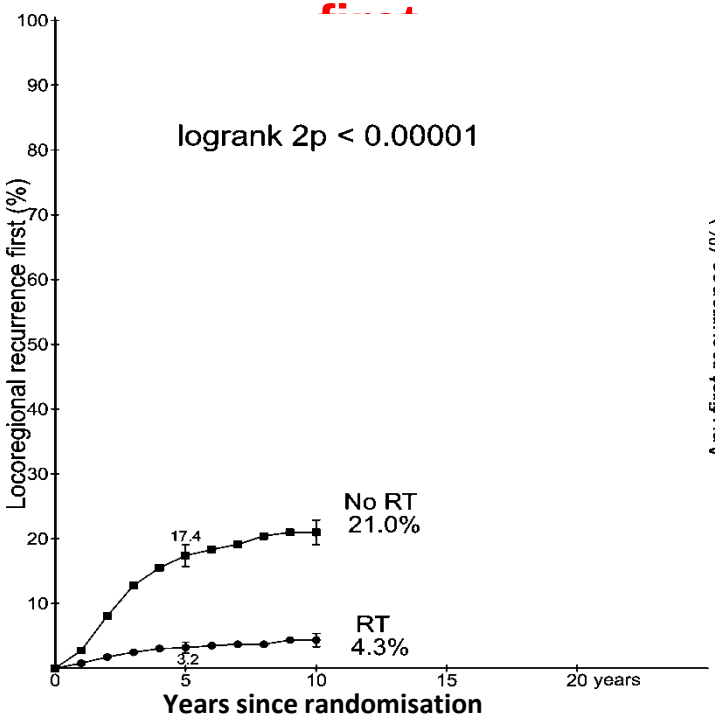
EBCTCG, Lancet 2014

Trials of radiotherapy after mastectomy and axillary dissection

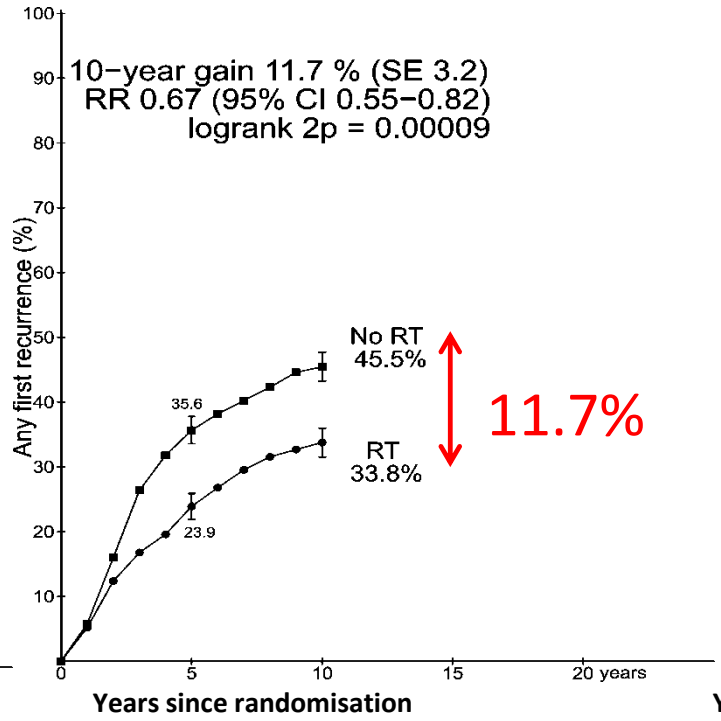
1133 pN1-3 women in trials with systemic therapy

RT: Significant benefit

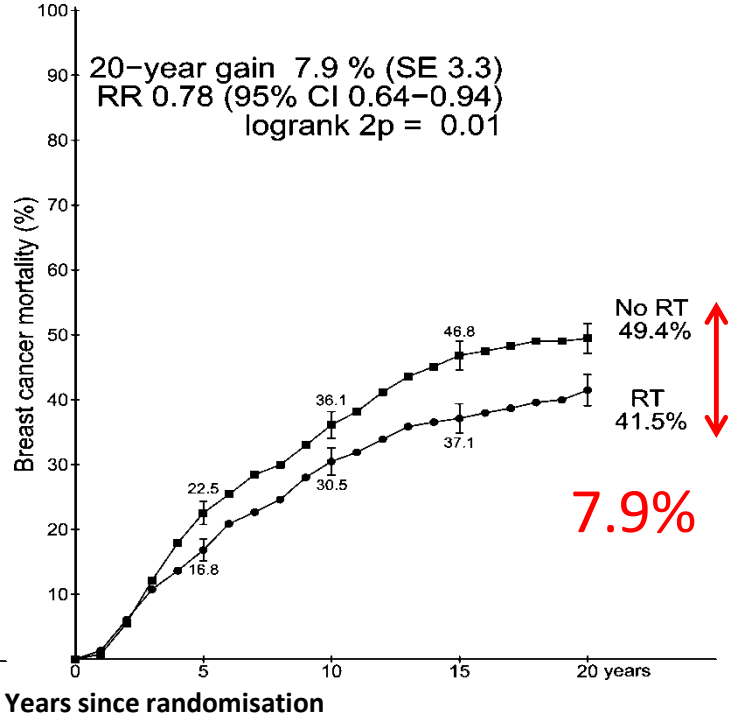
Locoregional recurrence first



Any first recurrence



Breast cancer mortality

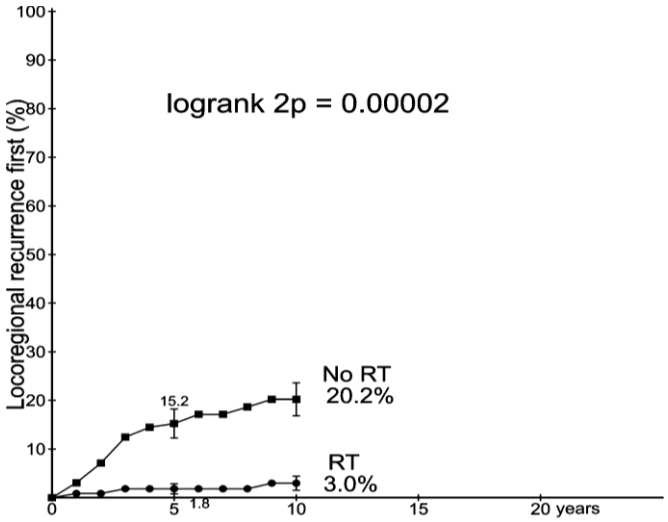


EBCTCG, Lancet 2014

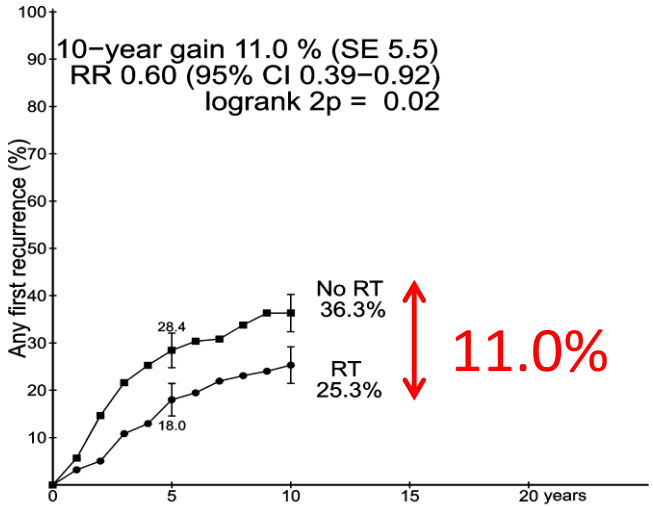
Trials of radiotherapy after mastectomy and axillary dissection

318 women with Mast+AD, systemic therapy and 1 positive node

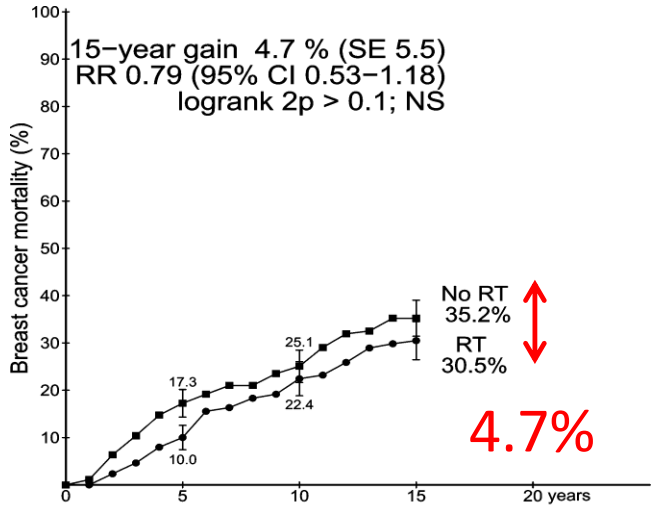
Locoregional recurrence first



Any first recurrence



Breast cancer mortality



EBCTCG, Lancet 2014

Conclusions: radiotherapy after mastectomy and axillary dissection

- In these trials, for pN1-3 women, **RT gave significant benefit**
  - Absolute reductions
    - 10-year recurrence: 11.5 % (34.2% vs. 45.7 %)
    - 20-year breast cancer mortality: 7.9% (42.3 % vs. 50.2 %)
  - Proportional reductions
    - Recurrence: 32 % (SE 8)
    - Breast cancer mortality: 20 % (SE 8)

- For women today, RT
  - Absolute reductions likely to be smaller
  - Proportional benefits at least as big

EBCTCG, Lancet 2014

Conclusion 1

- A 70% locoregional risk reduction was achieved by PMRT, mostly during the first five years of follow-up
- In node positive cancer, PMRT significantly reduced mortality: this effect became apparent after 5 years

Conclusions 3

- Following breast-conserving surgery, the rate of loccoregional recurrence was reduced by 70% with radiotherapy.
- The rate of any recurrence (LRR, metastasis, CBC) as first event was reduced by 42 % with RT.
- Locoregional radiotherapy was associated with an 18% decrease in breast cancer mortality, after 5 years.
- The effects of radiotherapy were proportional, independent, from known risk factors: the higher the risk following surgery, the higher the benefit from RT.

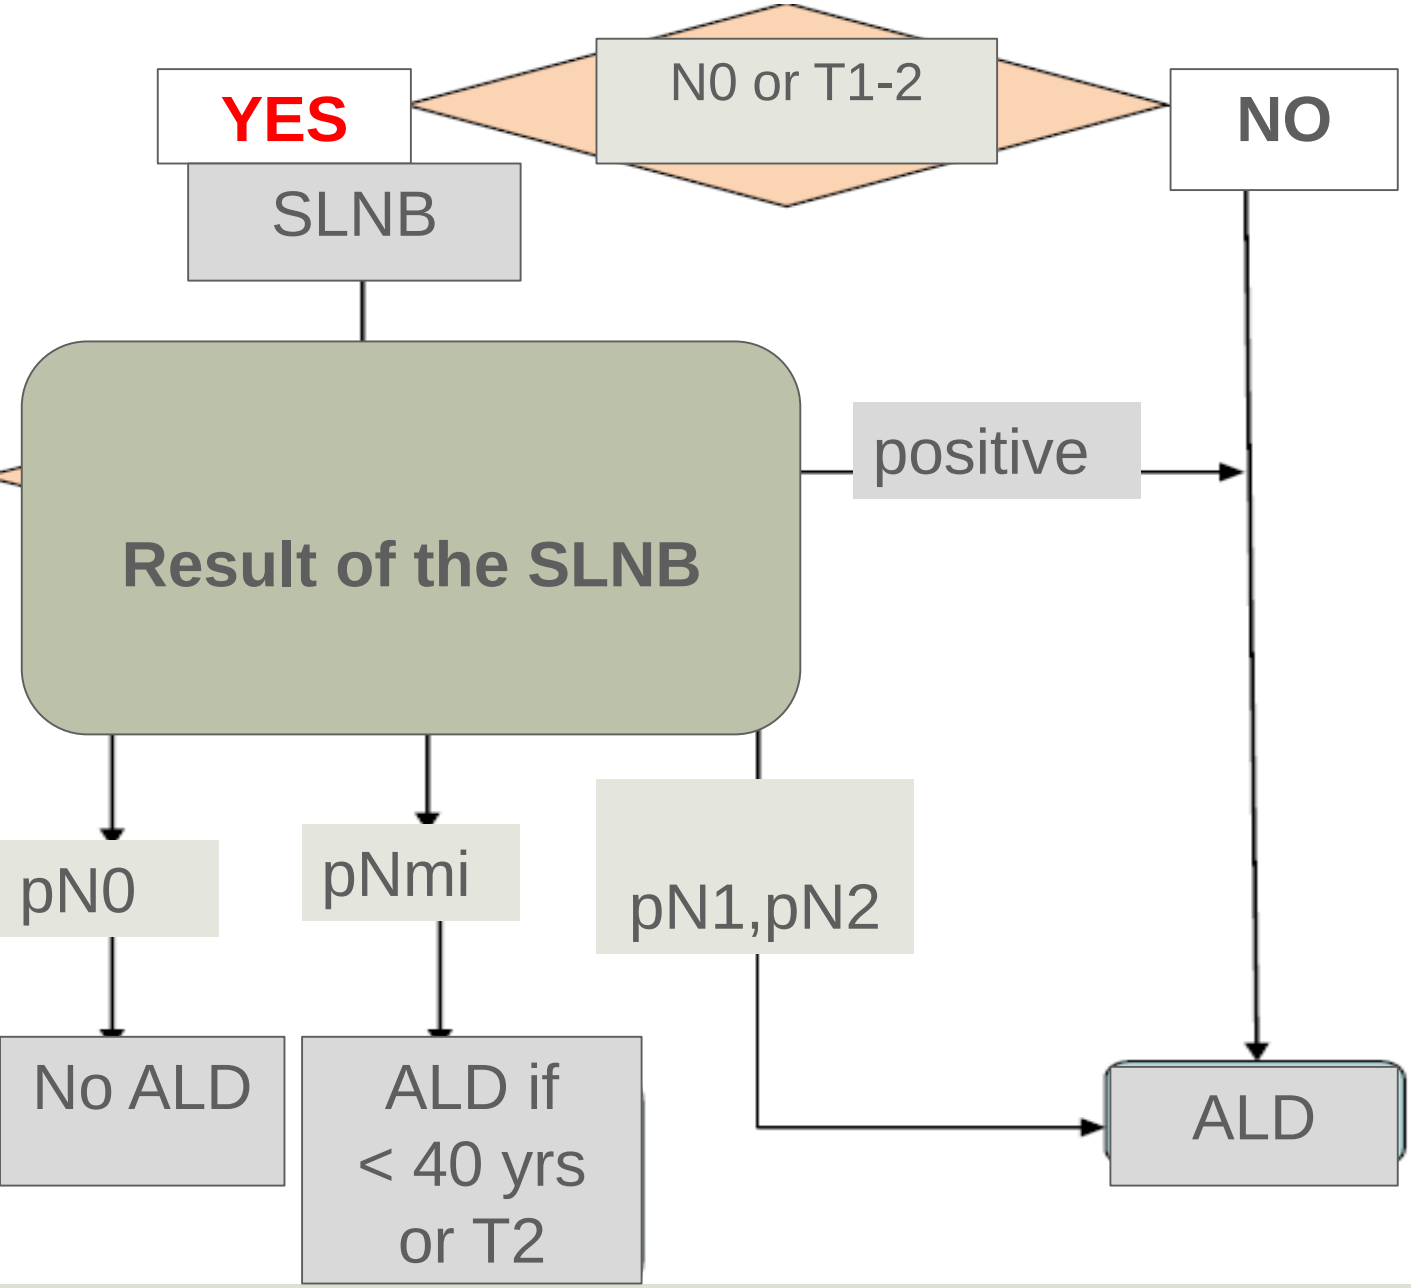
Therefore: Guidelines for LN Surgery



SUMMARY SURGERY

SLNB is the standard of care for patients with invasive breast cancer who undergo primary surgery

The role of the axillary staging is declining for systemic treatment decisions

AD is indicated in clinically N+ disease

SLNB after PST is reliable in cN0 patients

SUMMARY RADIOTHERAPY

-Regional lymph node radiotherapy to stage II and III breast cancer patients applied in an everyday treatment setting

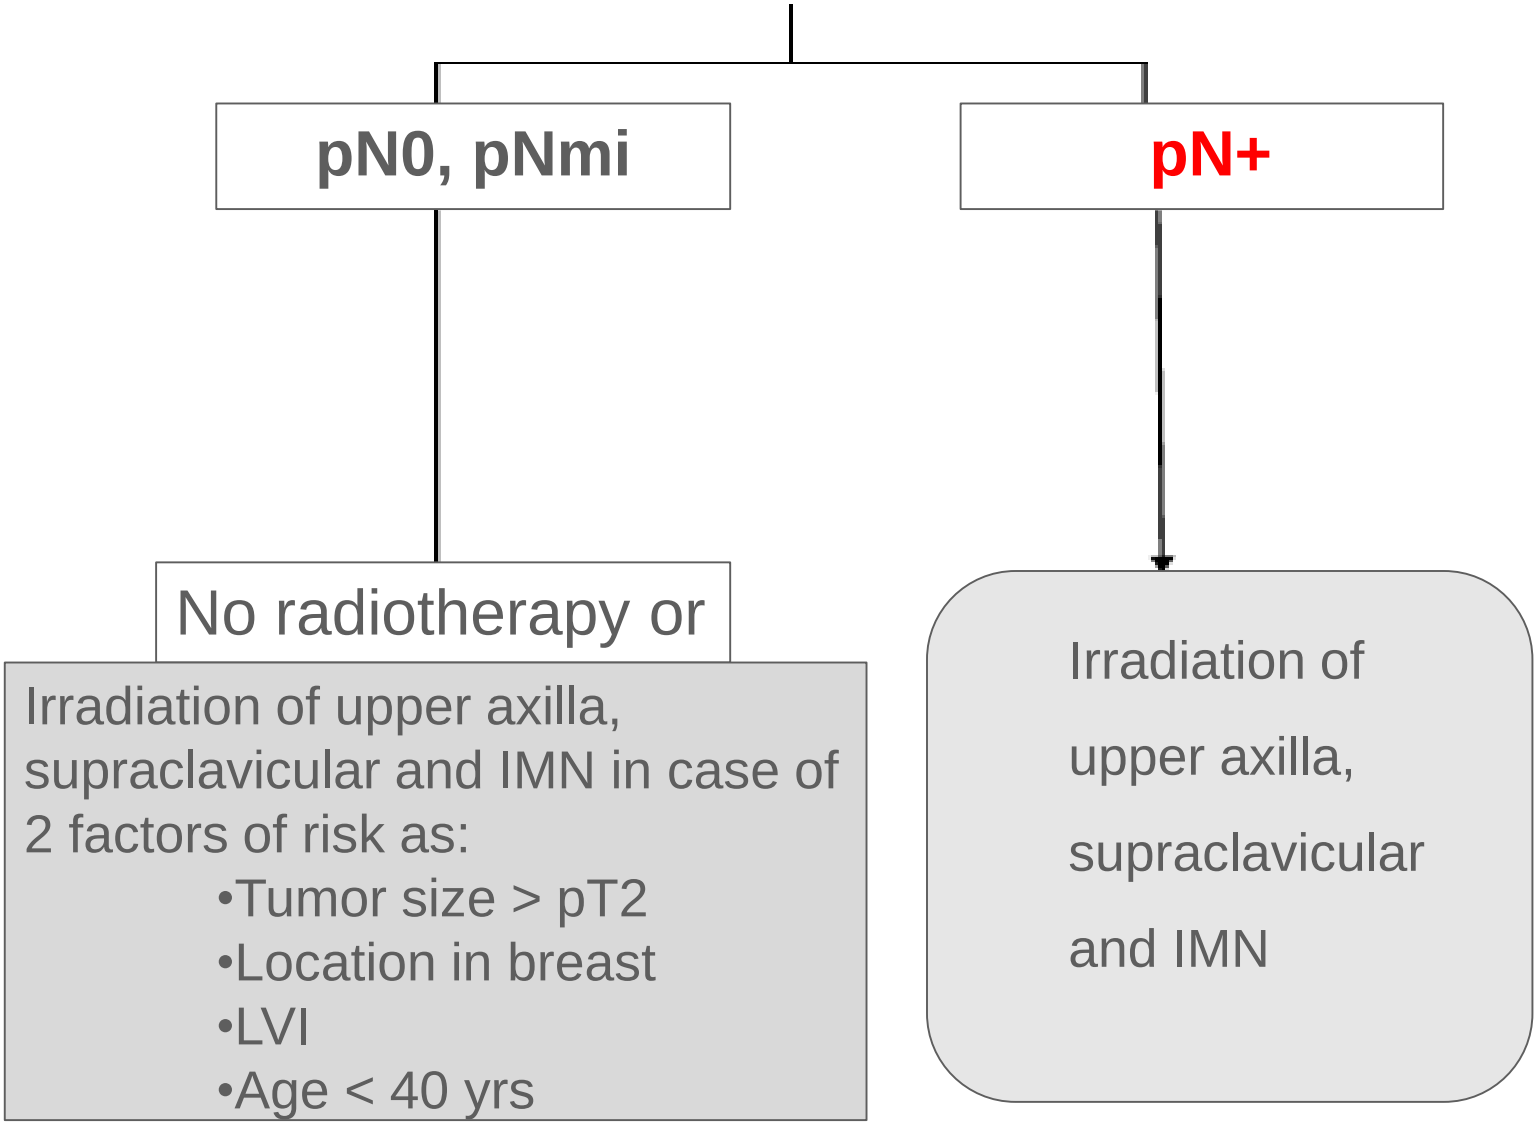
-Improved overall survival

-Decreased incidence of metastatic disease

-Decreased incidence of breast cancer death

-RT is an apropiate tool to replace AD to ensure regional control in N+ patients

Therefore: Guidelines for LN irradiation



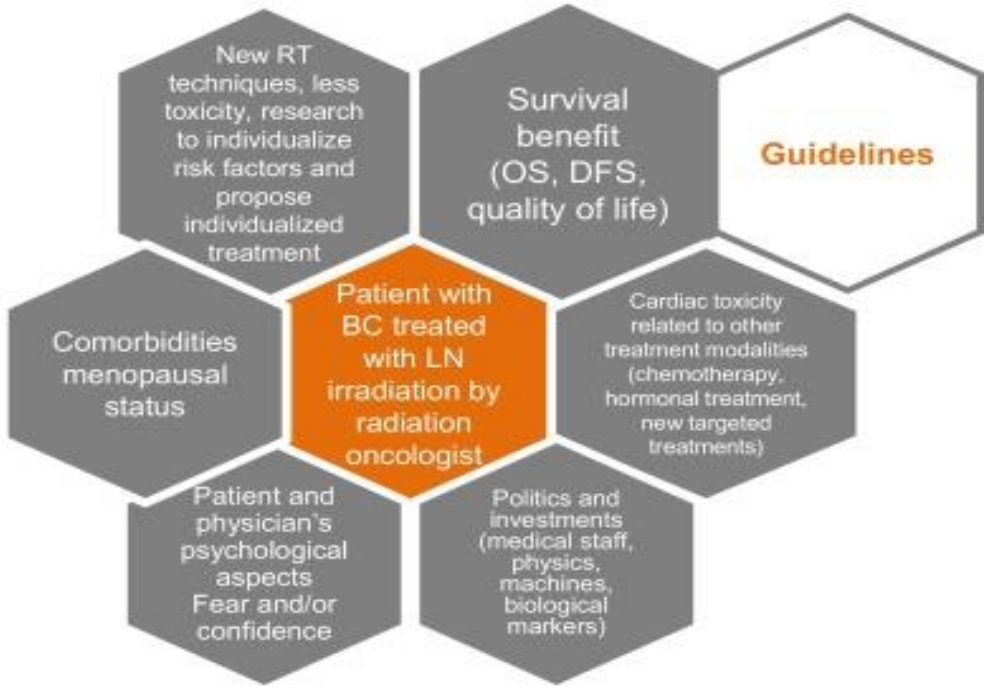


Fig. 1. Consideration of irradiation of regional lymph nodes in the complex breast cancer treatment. RT: radiation therapy; OS: overall survival; DFS: disease-free survival; BC: breast cancer; LN: lymph node.

ORIGINAL REPORT

RTOG 9804: A Prospective Randomized Trial for Good-Risk Ductal Carcinoma In Situ Comparing Radiotherapy With Observation

Beryl McCormick, Kathryn Winter, Clifford Hudis, Henry Mark Kuerer, Eileen Rakovitch, Barbara L. Smith, Nour Sneige, Jennifer Moughan, Amit Shah, Isabelle Germain, Alan C. Hartford, Afshin Rashtian, Eleanor M. Walker, Albert Yuen, Eric A. Strom, Jeannette L. Wilcox, Laura A. Vallow, William Small Jr, Anthony T. Pu, Kevin Kerlin, and Julia White

RTOG 9804: Primary Objective: In the defined good-risk DCIS group following lumpectomy to negative margins, assess the role of whole breast irradiation ± tamoxifen compared to observation ± tamoxifen, in decreasing or delaying the appearance of local failure, both invasive and *in situ.*

RTOG 9804

Low-risk DCIS

-No symptoms: either mammographic finding or incidental finding in otherwise benign bx

-ONLY low or intermediate grade anywhere

-Size (defined on mammogram if possible) ≤ 2.5 cm

-Margin width ≥ 3 mm

-Stratified by age (+/- 50), size (≤1 cm, >1 cm), margin width (3-9 mm, >1 cm, negative re-excision)

McCormick et al., JCO, 2015

RTOG 9804

Stratify

Age
1. < 50
2. ≥ 50

Final Path Margins
1. Negative (re-excision)
2. 3-9 mm
3. ≥ 10 mm

Mammographic/Pathologic Size of Primary
1. ≤ 1 cm
2. > 1 cm to ≤ 2.5 cm

Nuclei Grade
1. Low
2. Intermediate

Tamoxifen Use
1. No
2. Yes

Randomize

Arm 1
Observation with or without tamoxifen 20 mg per day for 5 years

Arm 2
Radiation therapy* to the whole breast, with or without tamoxifen 20 mg per day for 5 years

McCormick et al., JCO 2015

RTOG 9804

From 1999 to 2006 a total of 636 patients were included.

Radiotherapy:

50 Gy at 2 Gy per fraction x 25 or

50.4 Gy at 1.8 Gy per fraction x 28 or

42.5 Gy at 2.65 Gy per fraction x 16

No Boost

McCormick et al., JCO 2015

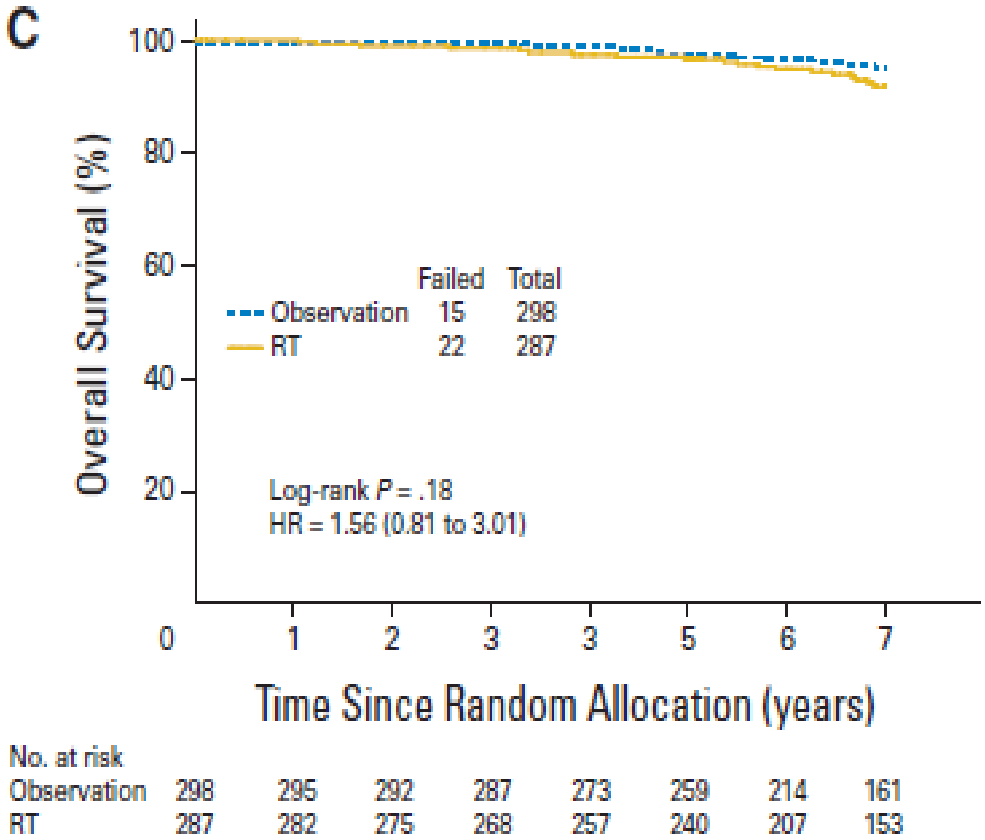
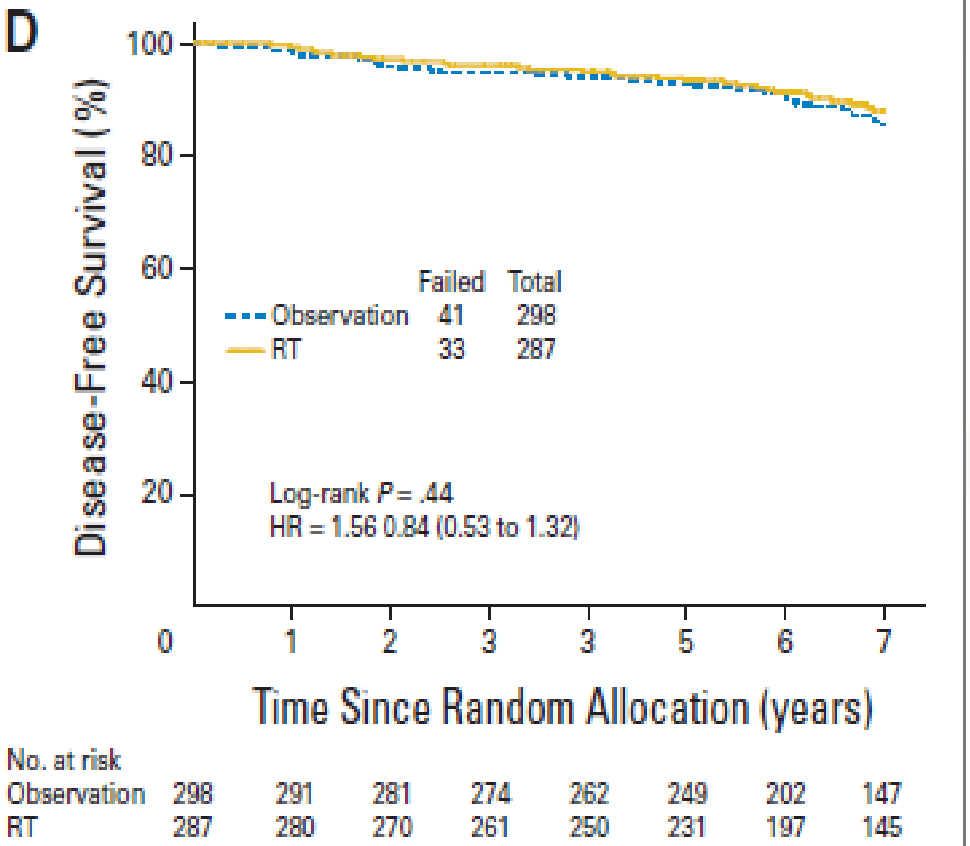
RTOG 9804: Results, Overall Survival





McCormick et al., JCO 2015

RTOG 9804: Results, Conclusions

In conclusion, the RTOG 9804 trial in DCIS successfully identified a subset of women with good-risk DCIS based on standard pathology features including nuclear grade, size, and margin width. Although the addition of RT significantly decreased the LF rate for the patients accrued to this study, the full clinical implications of these results will require further follow-up, given the historic patterns of LF over 10 to 15 years from diagnosis of good-risk DCIS.

McCormick et al., JCO 2015

Conclusions

Following breast-conserving surgery of DCIS, WBRT reduces the rate of breast recurrence by 50-60%

The effect is proportional

No subgroups were identified where radiotherapy could be omitted

NCCN Guidelines

Lumpectomy and WBRT

or Total Mastectomy

or Lumpectomy alone

Radiotherapy reduces local recurrence risk by 50%, but no differences in survival

DCIS: the role of boost

How to increase the efficacy of radiation therapy?

The role of boost to the tumor bed.

Radiation Boost for Ductal Carcinoma In Situ (DCIS) After Whole Breast Radiation Therapy (WBRT) Improves Local Control: Collaborative Analysis of Patients Treated at Ten Academic Institutions,

Moran MS, Zhao Y, Ma S, Kirova YM, et al, JAMA Oncol, 2017

Purpose:

To estimate the benefit of the DCIS boost

Calculate sample size needed to show this difference

To assess the independent effects of the DCIS-boost on ipsilateral breast tumor recurrence (IBTR) in a large DCIS cohort

Radiation Boost for Ductal Carcinoma In Situ (DCIS) After Whole Breast Radiation Therapy (WBRT) Improves Local Control

Methods and patients:

Inclusion Criteria:

Centers with existing DCIS databases
Pure DCIS (no micro-invasion)
Treated with WBRT (no APBI)
Minimum 5 years follow-up
LR relative to clinical pathologic parameters
No brachytherapy boost (photon/electron only)

Parameters collected:

Grade, Size,Age
RT boost no boost

Margin status
Comedo necrosis
ER status & Tamoxifen

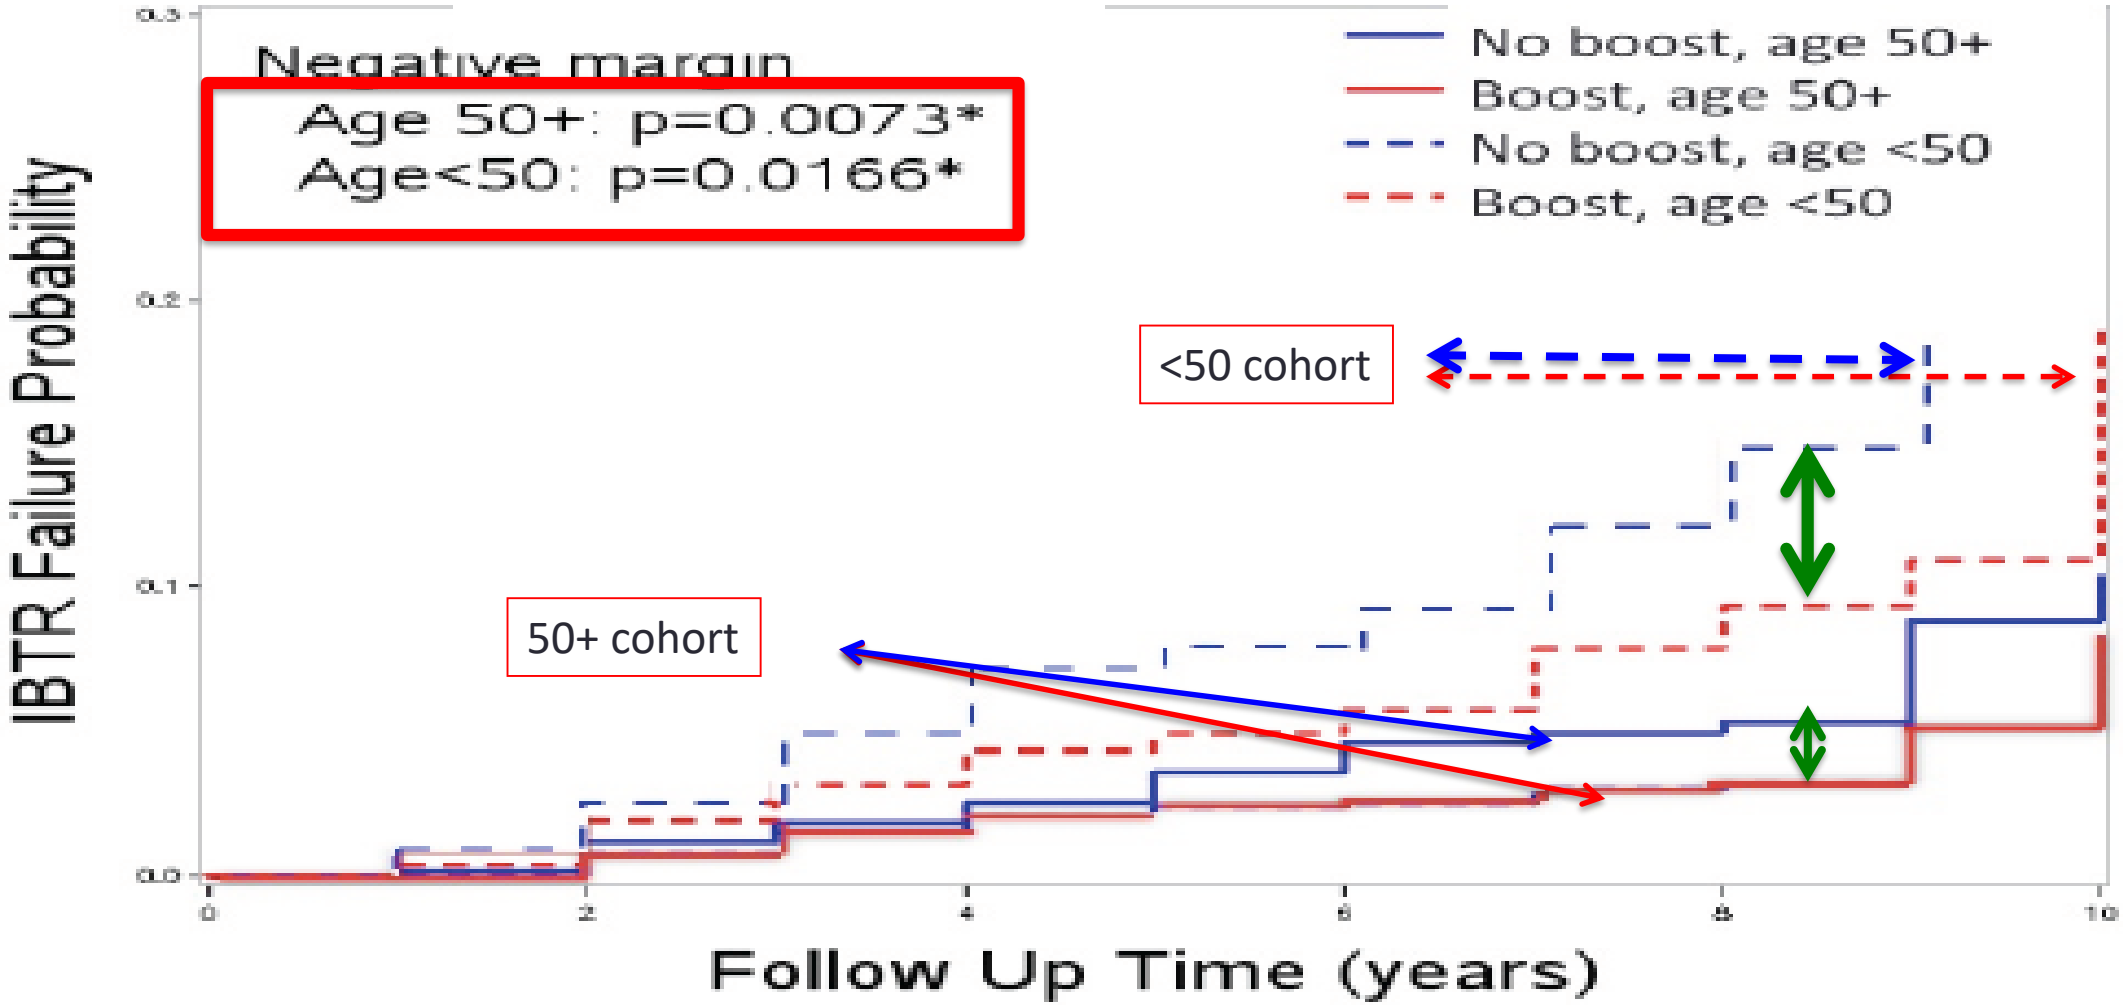
Radiation Boost for Ductal Carcinoma In Situ (DCIS) After Whole Breast Radiation Therapy (WBRT) Improves Local Control, *Moran MS, et al, JAMA Oncol 2017*

Boost Stratified by Age (<50 vs. 50+)



Radiation Boost for Ductal Carcinoma In Situ (DCIS) After Whole Breast Radiation Therapy (WBRT) Improves Local Control,

Conclusions:

These findings suggest that the DCIS-boost results in a small, statistically significant benefit in decreasing long-term IBTR of similar magnitude to boost for invasive cancers

- This benefit appears to be independent of:
  - Tamoxifen use
  - Definition of negative margins

- Similar to anticipated benefits seen in magnitude and age trends as with invasive cancers

DCIS treatment decisions are complex; Tailor to:

- Clinical-pathologic features & tumor biology
- Patient preferences
- Anticipated longevity

These data support the use of a boost in DCIS

A boost should be considered for DCIS for patients undergoing WBRT, with life expectancies 10-15+ years

Moran MS, et al, JAMA Oncol 2017

Conclusions 4

- Following breast-conserving surgery of DCIS, WBRT reduces the rate of breast recurrence by 50-60%
- The effect is proportional
- No subgroups were identified where radiotherapy could be omitted
- The DCIS-boost results in a small, statistically significant benefit in decreasing long-term IBTR of similar magnitude to boost for invasive cancers

DCIS. NCCN Guidelines

- Lumpectomy and WBRT
- or Total Mastectomy
- or Lumpectomy alone

Radiotherapy reduces local recurrence risk by 50%, but no differences in survival

Local control: are HF schemes applicable in all patients?

1. Chest wall irradiation after mastectomy:
   - Subgroup of the START trials
   - Insufficient statistical power

2. Lymph nods irradiation
   - Idem

HF and Boost

- No boost delivered in the CONSORT trial

- Only some patients had a boost in the UK trials, *with a conventional 2 Gy per fraction regimen*

HF in high recurrence risk tumors?

- Young women
- High grade, high proliferation
- Basal-like or HER2+

NCCN

- The breast should receive a dose of 45-50 Gy at 1.8 – 2 Gy per fraction, or 42.5 Gy at 2.66 Gy per fraction.

NCI France

- Hypofractionation should be considered if all criteria are present:
  - Age > 50 years
  - pT1-2, pN0,
  - Grade I-II
  - HR +ve tumors
  - Free margins

NCI France

- HF is not recommended if either one is present
  - Adjuvant chemotherapy
  - Mastectomy
  - Lymph nodes irradiation
  - Grade III
  - Lymphovascular involvement

NCI France

- No recommendation for a boost
- Recommended fractionation regimen:
  - 42.5 Gy/16 fractions in 3 weeks
  - 41.6 Gy/13 fractions in 5 weeks
  - 40 Gy/15 fractions in 3 weeks
- Special care is advised to limit heart and lungs dose, and to ensure an homogeneous dose coverage of the breast

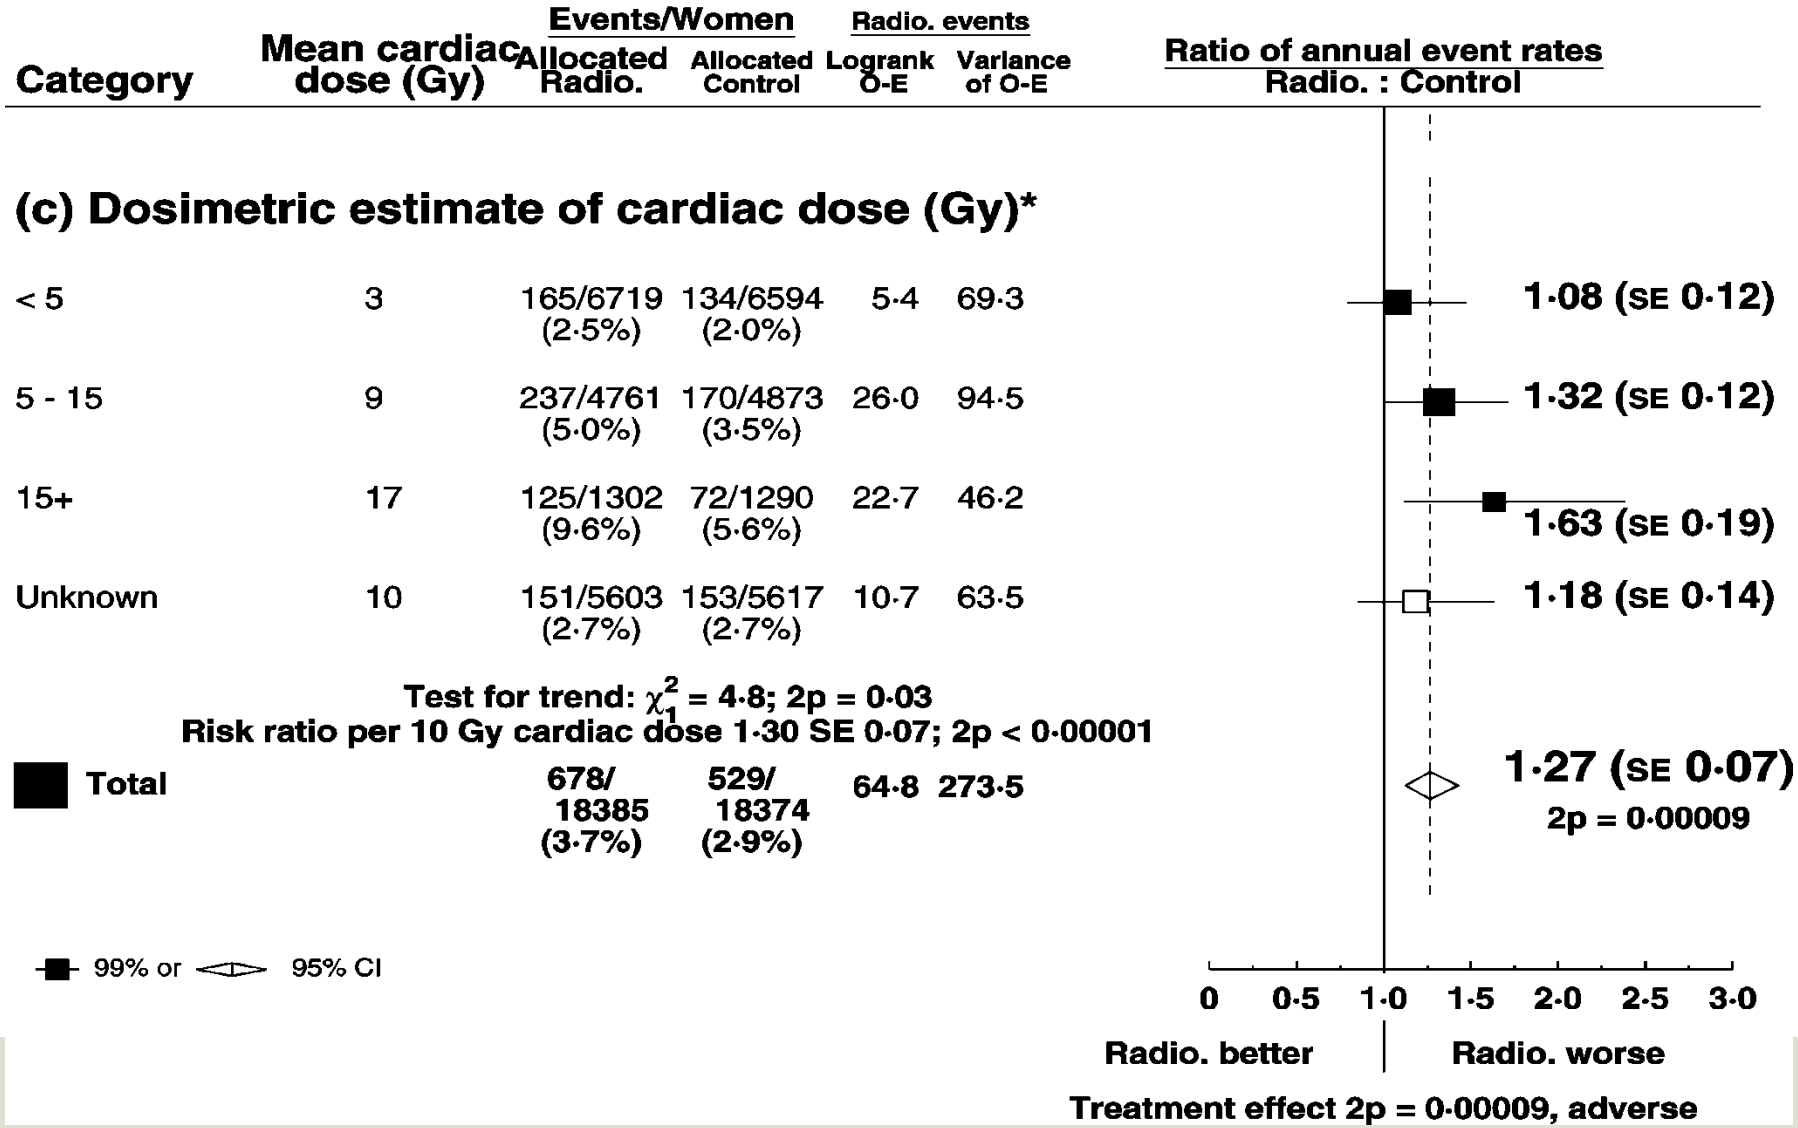
Retrospective evaluation of mortality in relation to cardiac dose



Conclusions

- Clinical trials of radiotherapy over the past 40 years have significantly impacted the clinical practice by
  - Allowing a large number of women to preserve their breast
  - Demonstrating the relationship between local control and survival
  - Stimulating the improvement in RT delivery, thus reducing its potential toxicity
- They have contributed to continuously decrease the rate of recurrence of breast cancer

Locoregional rates following BCT were reduced by 50% over a decade...

MINDACT-CONCLUSIONS

- Mindact results provide level 1A evidence of the clinical utility of MammaPrint® for assessing the lack of a clinically relevant chemotherapy benefit in the clinically high risk (c-High) population.
- c-High/g-Low patients, including 48% Node positive, had a 5-year DMFS rate in excess of 94%, whether randomized to adjuvant CT or no CT.
- In the entire MINDACT population, the trial confirmed the hypothesis that the « genomic » strategy leads to a 14% reduction in CT prescription versus the « clinical » strategy.
- Among the c-High risk patients, the clinical use of MammaPrint® is associated with a 46% reduction in chemotherapy prescription.

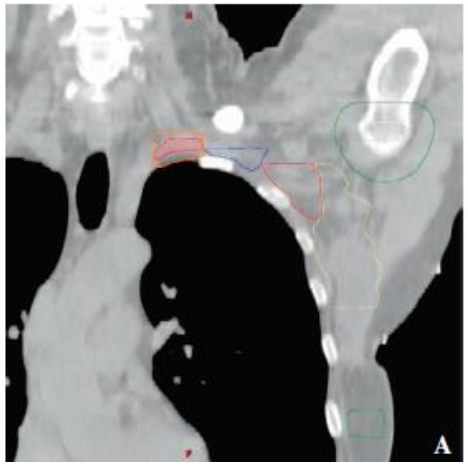
ESTRO breast cancer consensus guidelines

ESTRO consensus guideline on target volume delineation for elective radiation therapy of early stage breast cancer, version 1.1 ☆



To the Editor,

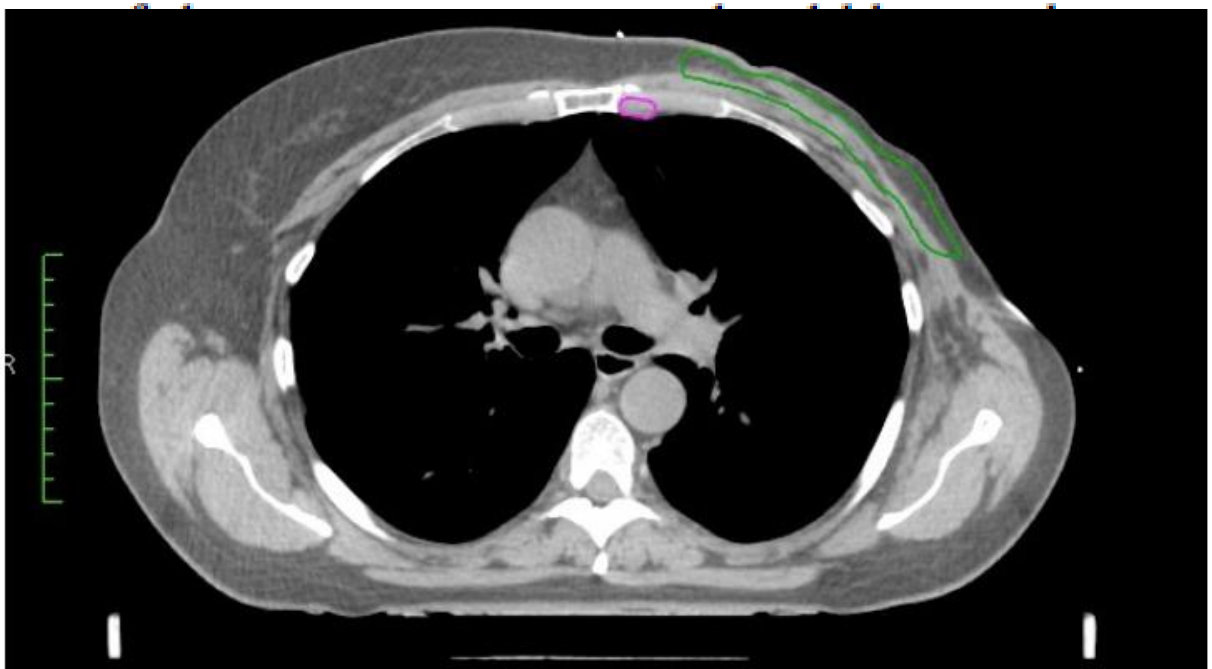
One year ago we presented the ESTRO consensus guideline on target volume delineation for elective radiation therapy of early stage breast cancer [1]. We hereby present an update following the need for modification of the caudal part of CTVn_L4 and the lateral border of CTVn_IMN in the published pdf-files. Also, as a consequence of frequent questions, we provide more information regarding the lateral border of the CTVp_breast and for dose planning in relation to the humeral joint.

CHEST WALL AFTER MASTECTOMY

Delineation of the thoracic wall

CTVp_thoracic wall

In mastectomy patients, radio-opaque wires should be positioned around the –imaginary – original site of the breast and also corresponding to the mastectomy scar. While the position of the contra-lateral breast can be helpful for this if both arms are symmetrically elevated, in general the surface of the CTVp_thoracic wall is reduced by the surgical procedure following the pulling on adjacent skin and subcutaneous tissue to close the defect after removal of the breast. Therefore, careful palpation of the thoracic wall while positioning the radio-opaque markers

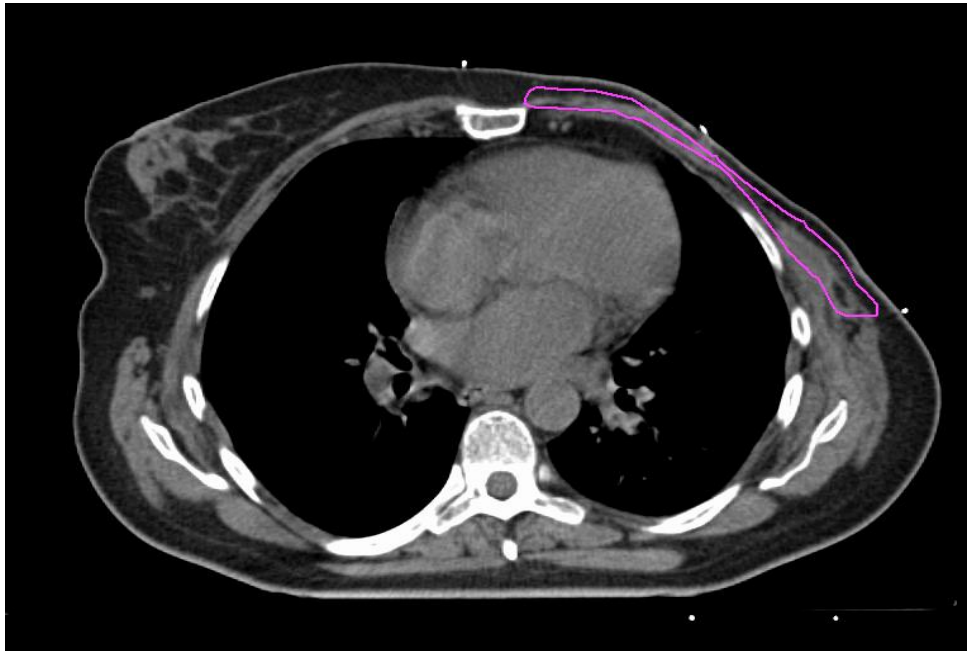


ESTRO Consensus, Radiother Oncol, 2015

ESTRO School

Delineation of the thoracic wall

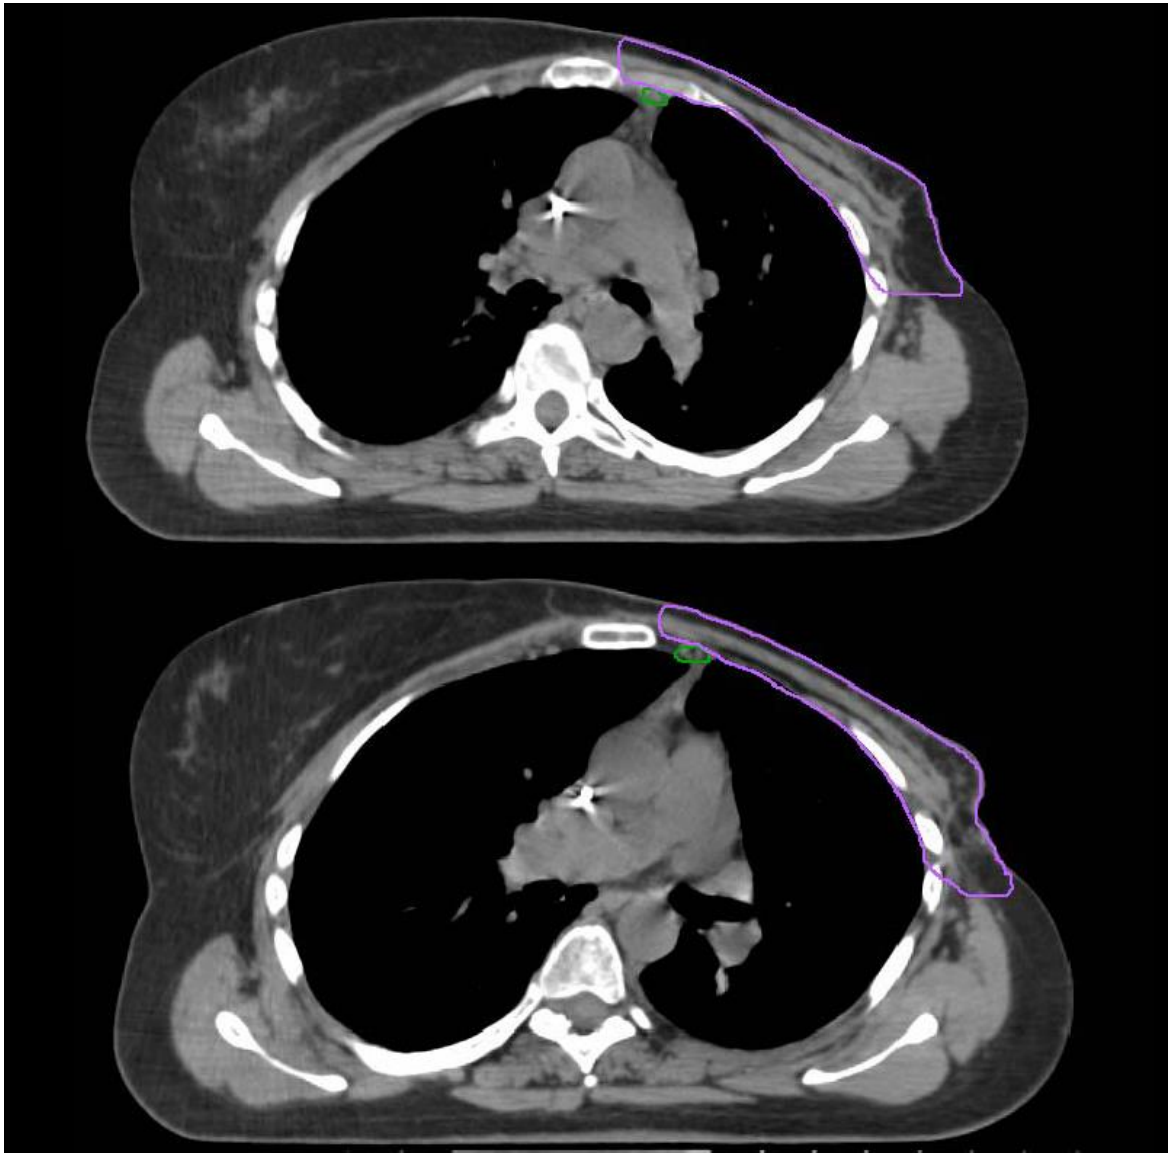
- **All borders of the CTV thoracic wall are usually considered to be identical to the CTV breast.**
- **In case of an extremely thin thoracic wall, omission of the first 5 mm beneath the skin may result in no CTV at all.**
- **In that case, do extend the CTV into the skin, and consequently use bolus.**



ESTRO Consensus, Radiother Oncol, 2015

ESTRO School

Delineation of the thoracic wall: RTOG



Discussion:

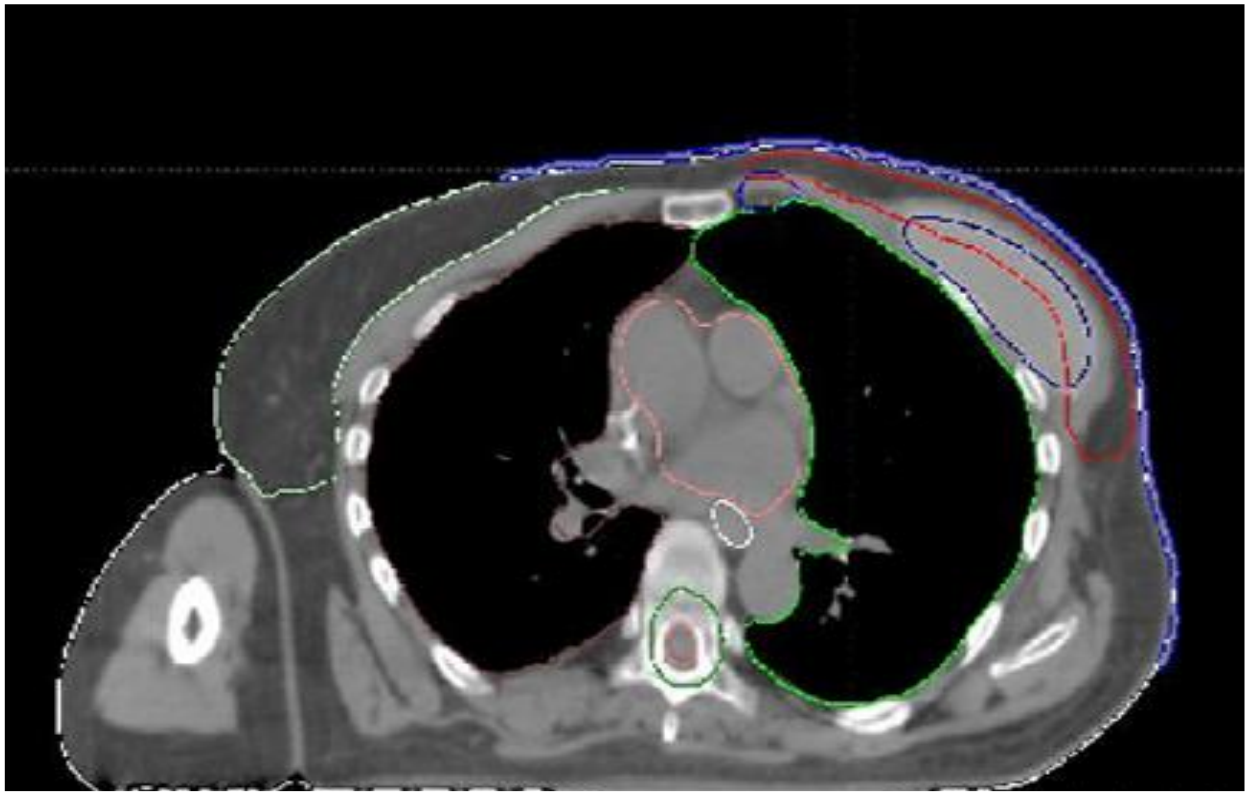
Always include skin and/or thoracic wall in CTV ?

Ref: BreastCancer Atlas RTOG

ESTRO School

Immediate breast reconstruction

The clinical target volume (CTV) was defined as the biologic entity that included the remaining breast tissue at risk of microscopic disease (CTV1),



The volume between skin and implant, the pectoral muscle must be included

Massabeau et al., Med Dosim 2012

institutCurie
Ensemble, prenons le cancer de vitesse.

ESTRO School

Breast

Delineation of the CTV breast using CT:
CTV breast = “whole glandular breast tissue”

This target volume includes the total glandular breast tissue, whose borders are often not clearly visible. To facilitate delineation, radio-opaque markers may be placed around the breast for CT-scanning, keeping in mind that these markers do not necessarily represent the true borders of the CTVp_breast.

ESTRO Consensus, Radiother Oncol, 2015

BOOST VOLUME

Breast Boost: Are We Missing the Target?

A Dosimetric Comparison of Two Boost Techniques

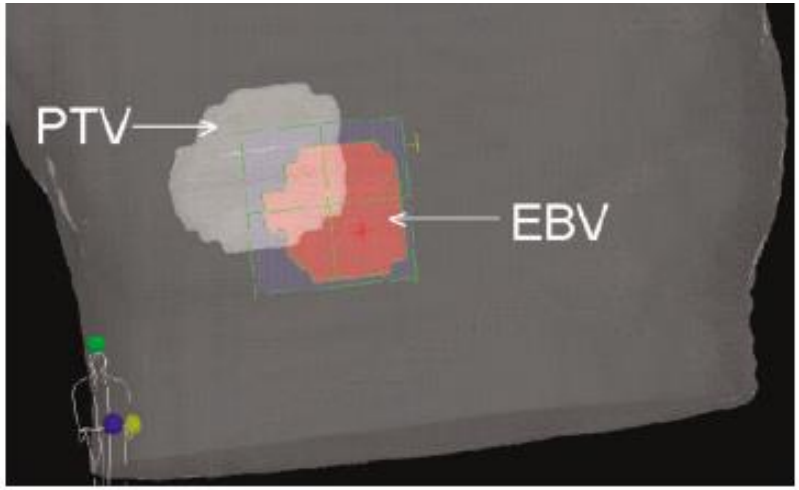

FIGURE 2. Minimal overlap of the two volumes was noted in the plans based on this patient, resulting in significant underdosing of the tumor bed and unnecessary irradiation of the normal breast tissue. PTV: planning target volume; EBV: electron boost volume.

Benda et al.; Cancer, 2003

CONCLUSIONS. Clinical delineation of the tumor bed not only carries a significant risk of missing the target, but unnecessarily treats breast tissue that may otherwise be spared. Better delineation of the tumor bed, which optimizes coverage of the target volume and spares normal breast tissue, has the potential to improve both local control and cosmetic outcome. The authors recommend the use of surgical clips to delineate the target volume, followed by CT-based treatment planning, accounting for not only microscopic disease, but also organ motion and daily setup error. *Cancer* 2003;97:905–9.

Practical use of the procedure

Reducing interobserver variation of boost-CTV delineation in breast conserving radiation therapy using a pre-operative CT and delineation guidelines ☆

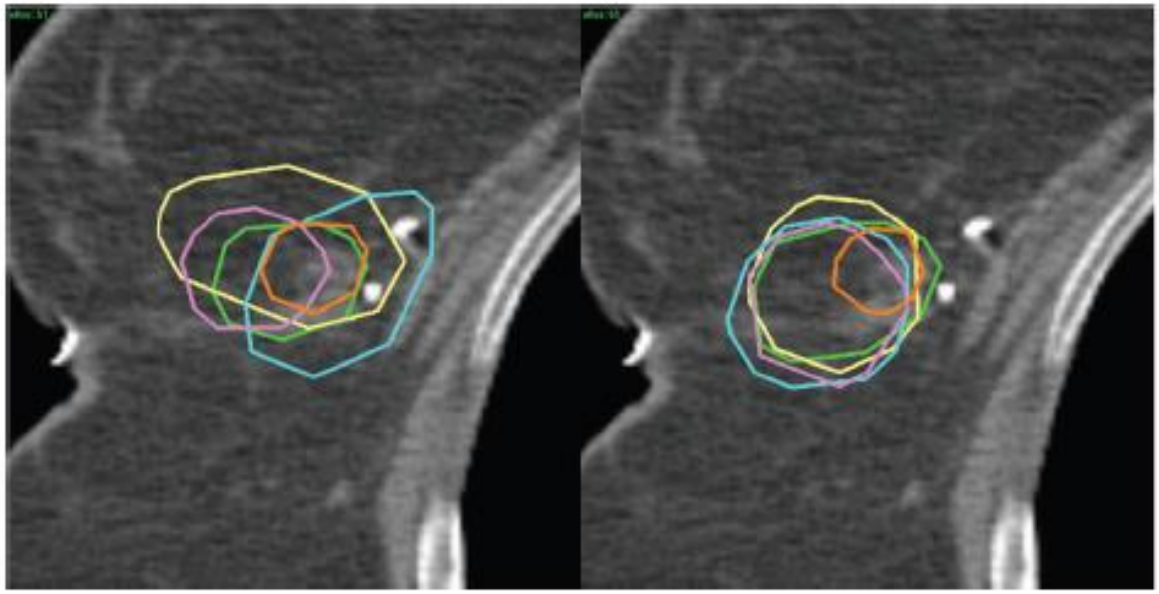

Fig. 1. Example showing the boost-CTV-1 delineations (left) and boost-CTV-2 delineations (right) for a case with GTV consensus and no tumour free margins known. A considerable decrease in interobserver variation can be seen.

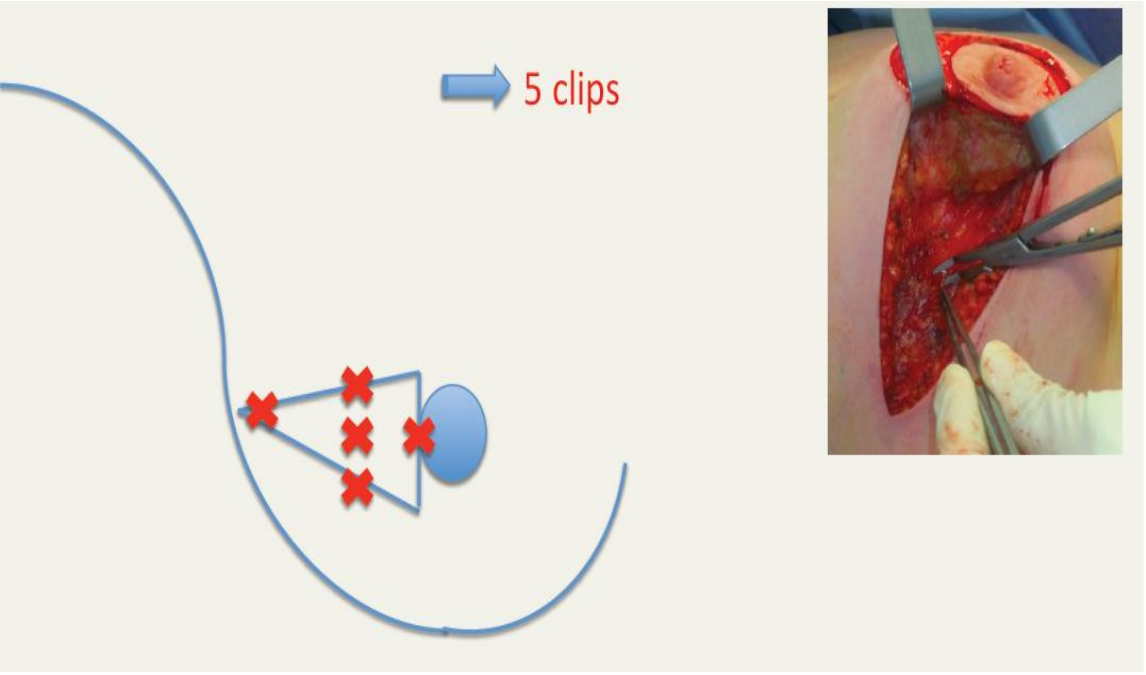
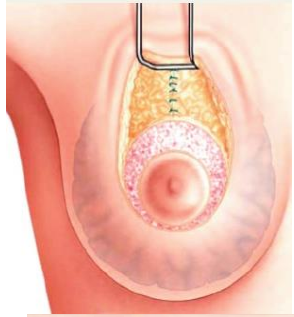
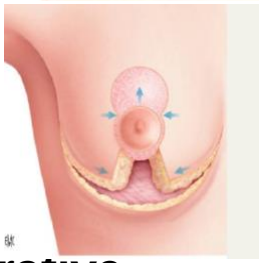
Boersma et al, Radiother Oncol 2012

Boost after oncoplastic surgery: specific recommandations







The use of more than 3 clips associated with pre- to post-operative CT image registration allows better definition of the PTV boost volume after oncoplastic surgical procedure and decrease the risk of recurrence and complications.

The multidisciplinary approach with close collaboration between surgeons, pathologists and radiation oncologists is needed

Furet et al, EJSO, 2014

institutCurie
Ensemble, prenons le cancer de vitesse.

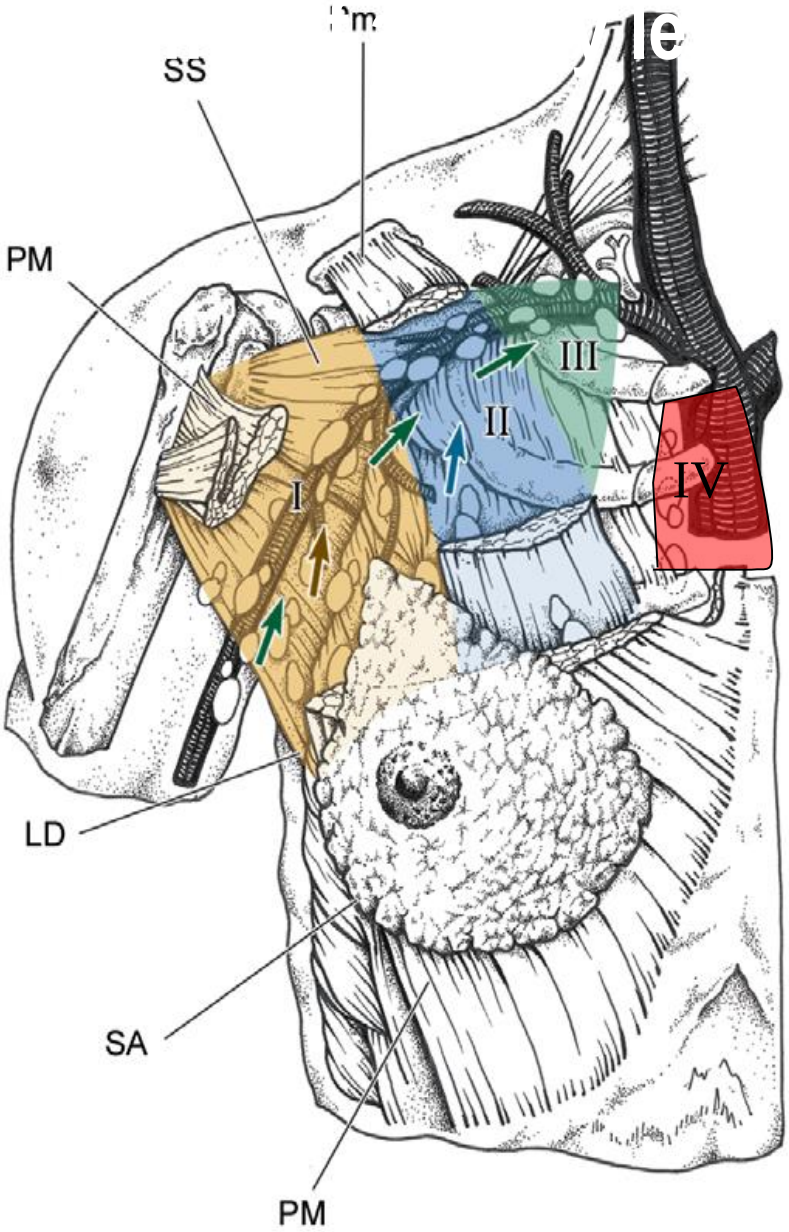
Conclusions Boost

The definition of the tumor bed boost volume is still challenge for different teams and multidisciplinary approach with collaboration of radiation oncologist, surgeon, radiologist, pathologist is recommended as well as written protocols for the clips placement.

This will contribute to substantially reduce long-term toxicity and preserve the cosmesis.

To improve the definition of tumor bed volume, all available methods as the pre- and postoperative image registration, placement of clips protocols, margins information, as well as the post operative deformation have to be used.

Pm: pectoralis minor



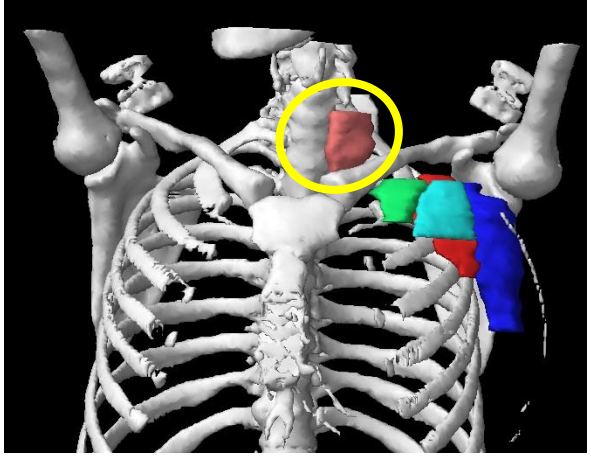
Level I

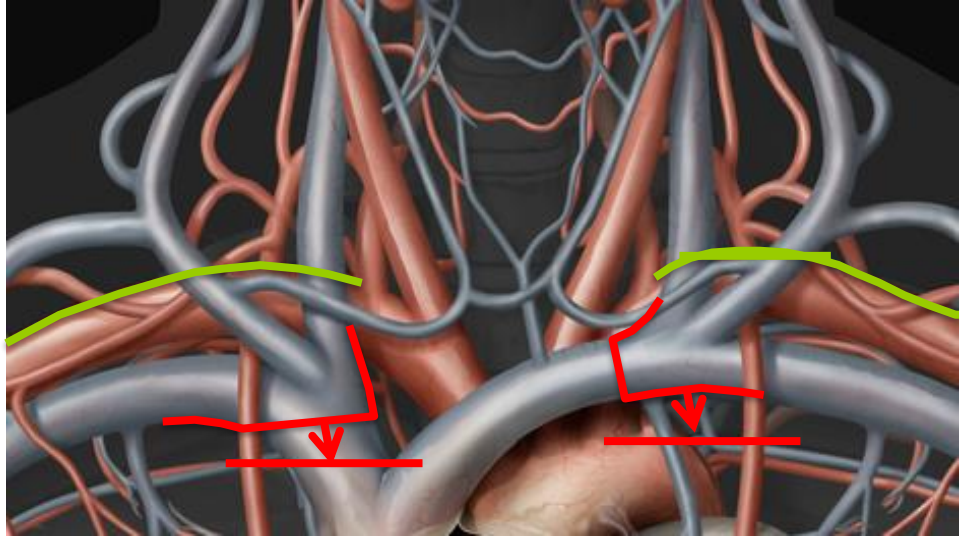
Level II

Level III

Level IV

ESTRO School

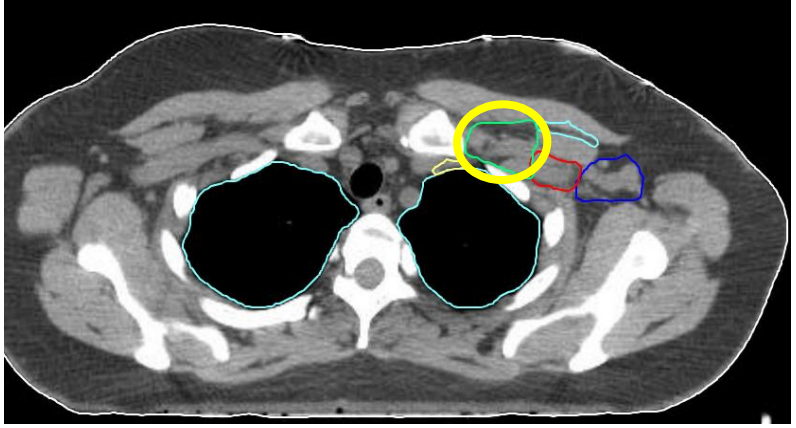


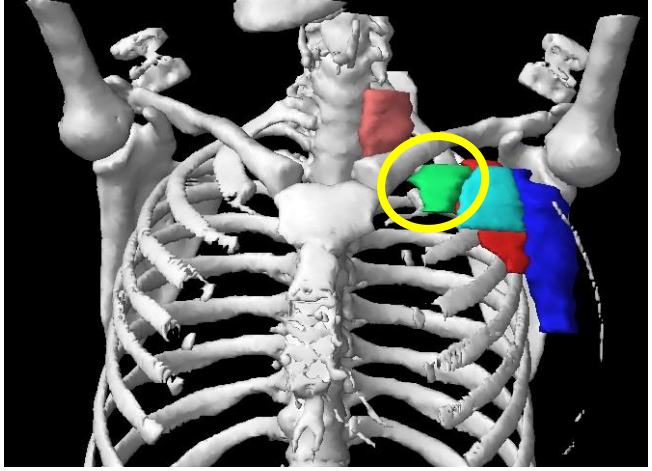


Supraclavicular LN area, CTVn_L4:

- ✓ Superior border: upper limit of subclavian artery
- ✓ Caudal border: 5mm caudal from junction of subclavian and internal jugular veins
- ✓ Ventral border: sternocleidomastoideus muscle, clavicle
- ✓ Dorsal border: Pleura
- ✓ Medial border: including the jugular vein without margin; excluding the thyroid gland and the common carotid artery
- ✓ Lateral border: includes the anterior scalene muscle, and connects to medial border CTVn L3

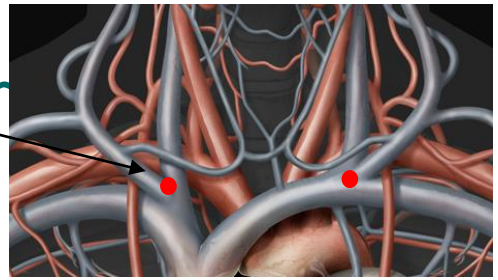
ESTRO School



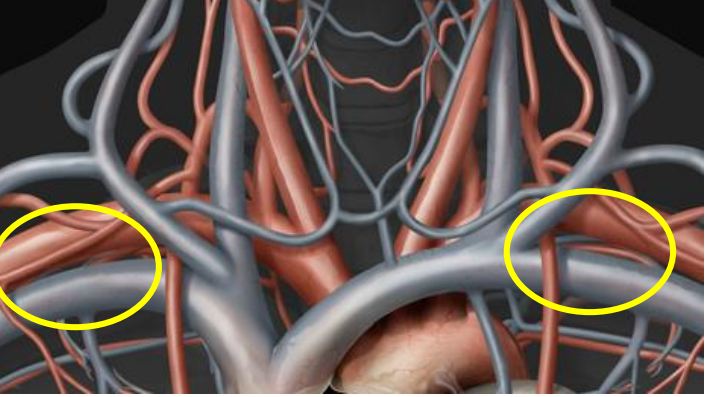


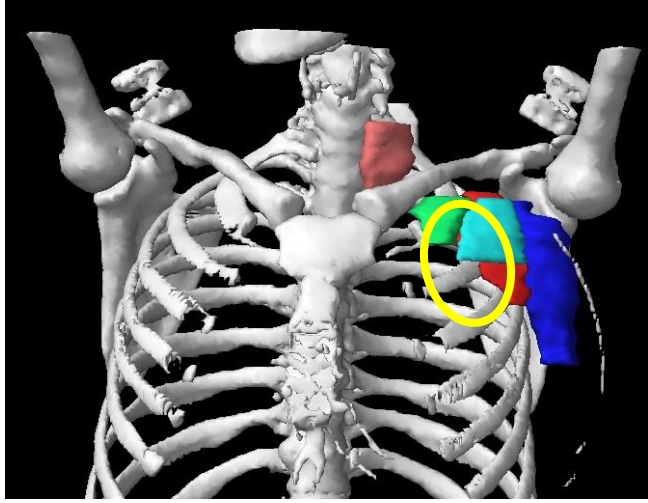
Axilla level 3 (infraclavicular) – CTVn_L3:

- ✓ Cranial border: 5 mm cranial of the subclavian vein. More medially it is the clavicle
- ✓ Caudal border: 5 mm below the subclavian vein
- ✓ Lateral border: medial side of the pectoralis minor muscle
- ✓ Medial border: junction of subclavian and jugular vein
- ✓ Ventral border: pectoralis major muscle
- ✓ Dorsal border: up to 5mm post. of subclavian/axillary vein



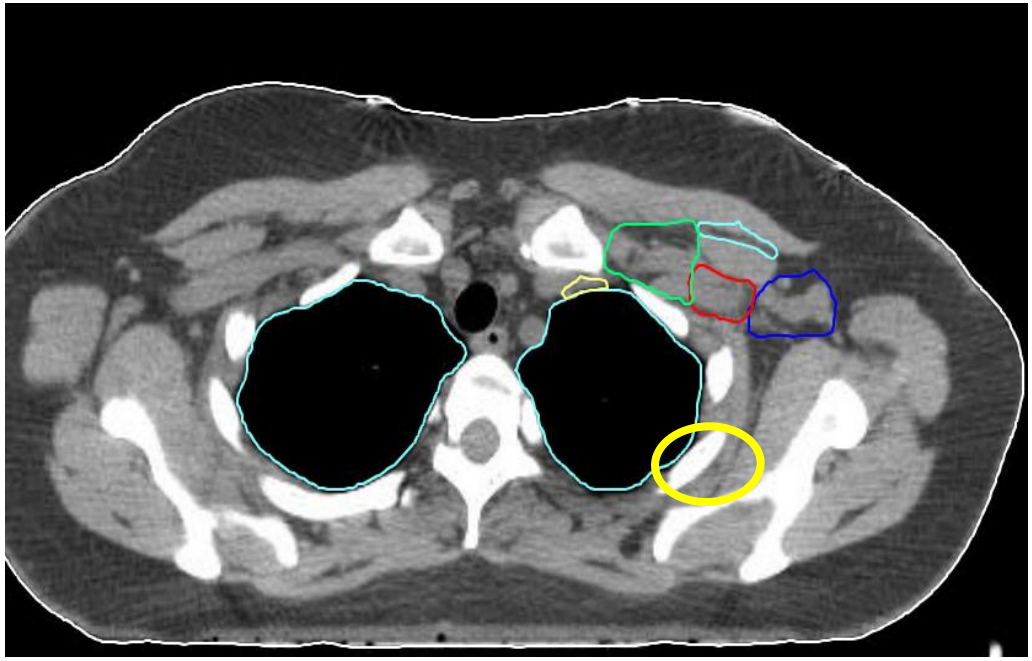
ESTRO School



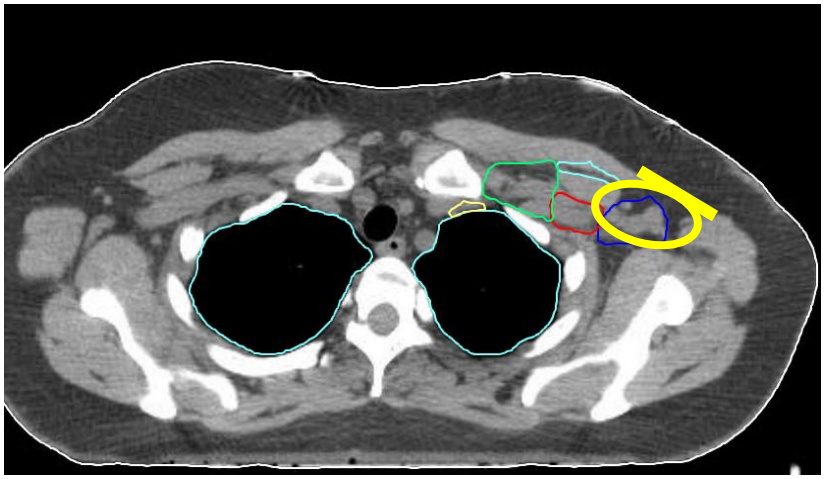


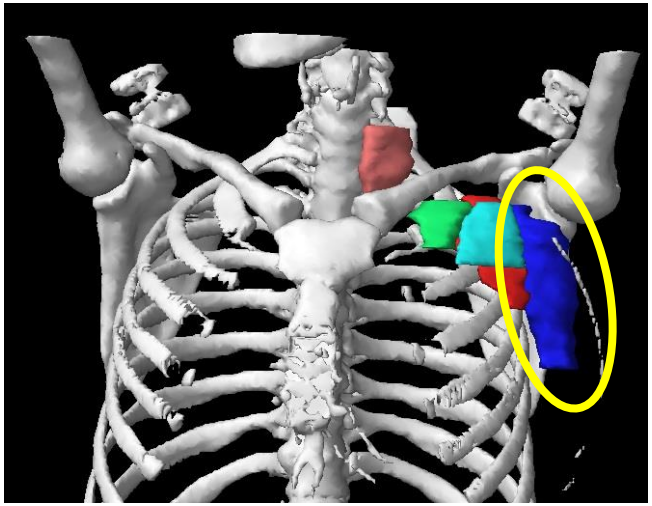
Axilla level 2 – CTVn_L2

- ✓ In between levels 1 and 3
- ✓ Dorsal of minor pectoral muscle
- ✓ Cranial/Dorsal: 5 mm around axillary vein
- ✓ Caudal: dorsal of minor pectoral muscle



ESTRO School





Axilla level 1- CTVn_L1:

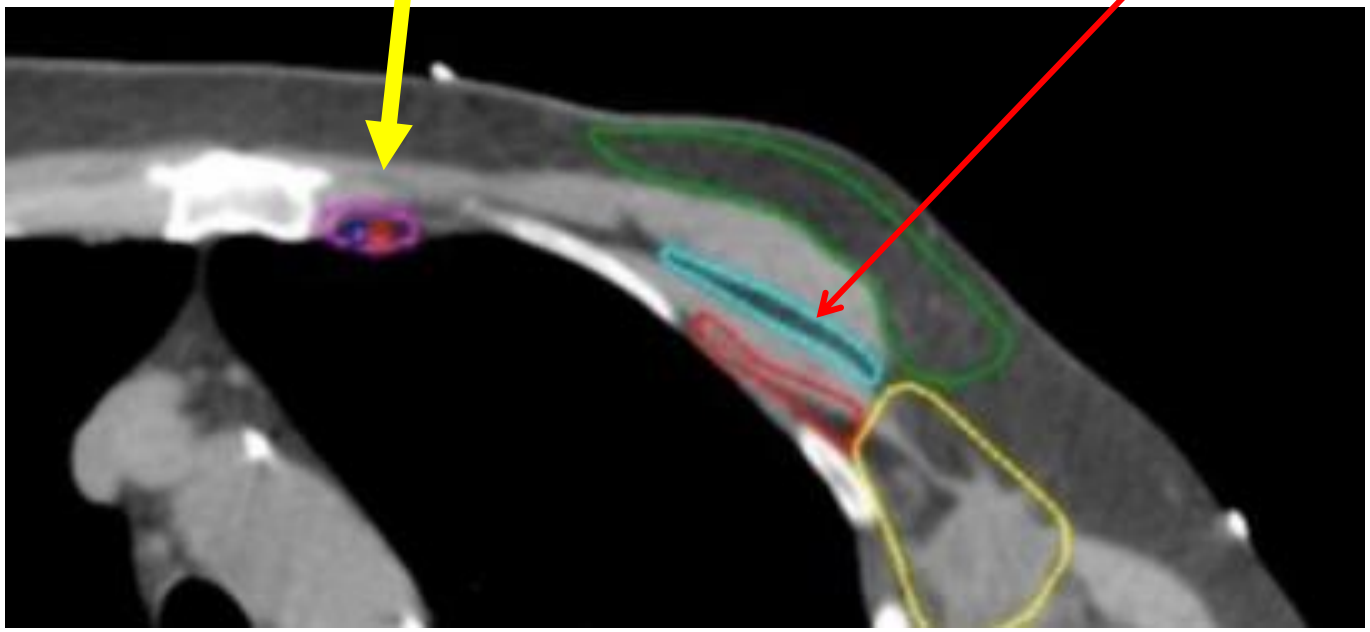
- ✓ General: use surgical effects to guide
- ✓ Cranio-medial: lateral limit of level 2/ interpectoral nodes
- ✓ Cranio-lateral: up to 1 cm below and following edge of caput humeri, OR where axillary vein crosses the minor pectoral muscle; 5mm around axillary vein
- ✓ Caudal border: between the level of ribs 4 – 5
- ✓ Lateral border: up to superficial part of muscles **(line)**
- ✓ Medial border: level 2 and thoracic wall
- ✓ Ventral border: pectoralis major & minor muscles
- ✓ Dorsal border: up to the posterior blood vessels

ESTRO School

CTV of internal mammary lymph node area

- ✓ Cranial: junction of subclavian and internal jugular veins → *L4*
- ✓ Caudal: superior side of the 4th rib
- ✓ Ventral: anterior limit of the vascular area
- ✓ Medial: 5 mm medial of vessels; edge of the sternal bone
- ✓ Dorsal: pleura
- ✓ Lateral: 5 mm lateral of vessels

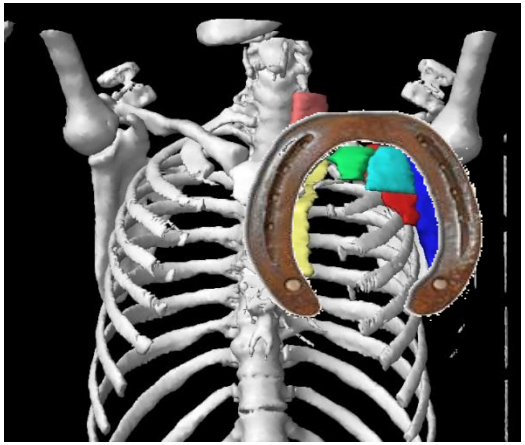
Intrapectoral LN=Rotter



ESTRO School

Conclusions for LN volumes

- General rule for LN areas: veins+ 5mm margin in surrounding fatty tissue.
- IV contrast ➔ facilitates ➔
- for learning but not required.
- Normal anatomy atlas = more than helpful.
- Coronal views: very helpful as well !
- Lymph node regions should all interconnect.
- Some discussion points left:
  - Are we ready to leave a gap between PTVs of primary tumor and LN areas ?



ESTRO School

Recent comments on RTOG atlases (& probably also valid for ESTRO atlas):

- In case of massive involvement supraclavicular nodes: nodes extend beyond CTVn_L4 → should atlas be adapted ? (*Brown et al, IJRBOP 2015; Jing et al IJRBOP 2015)*
- To cover 95% of lymph nodes at cranial and anterior borders of level 1, CTVn_L1 should be increased considerably: i.e. take into account nodal involvement seen before surgery/ chemotherapy *(Gentile et al, IJRBOP 2015).*
- *NB: ESTRO guidelines are meant for elective irradiation of early stage breast cancer; i.e. in case of clinically overt pathological nodes: individualise target volume delineation !*

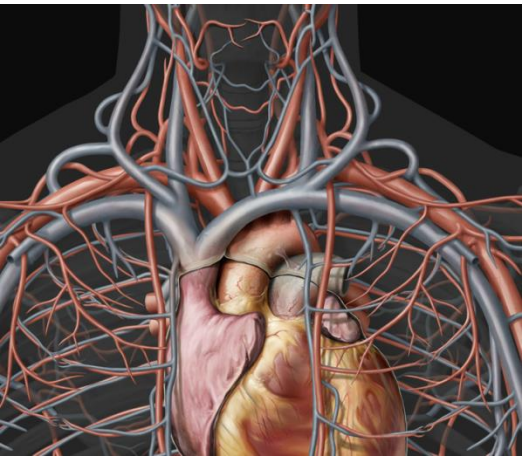
ESTRO School

General considerations

- We don’t have clinical reason to increase field size compared to the old standard fields.

  ➔ mind resulting field size/including OAR!

  ➔a margin of 5 mm from CTV to PTV should be sufficient (if adequate fixation as well as a carefully designed IGRT procedure are used)



ESTRO School

Technological developments should aim at:

1. More precisely defining target volumes, with the help of imaging
2. Ensuring an optimal, homogeneous coverage of target volumes
3. Avoiding or limiting unnecessary irradiation of organs at risk
4. Ensuring a precise day-to-day set-up reproducibility

POSTMASTECTOMY ELECTRON BEAM CHEST WALL IRRADIATION IN WOMEN WITH BREAST CANCER: A CLINICAL STEP TOWARD CONFORMAL ELECTRON THERAPY

YOULIA M. KIROVA, M.D., FRANCOIS CAMPANA, M.D., NATHALIE FOURNIER-BIDOZ, PH.D., ANNE STILHART, REMI DENDALE, M.D., MARC A. BOLLET, M.D., AND ALAIN FOURQUET, M.D.

Department of Radiation Oncology, Institut Curie, Paris, France

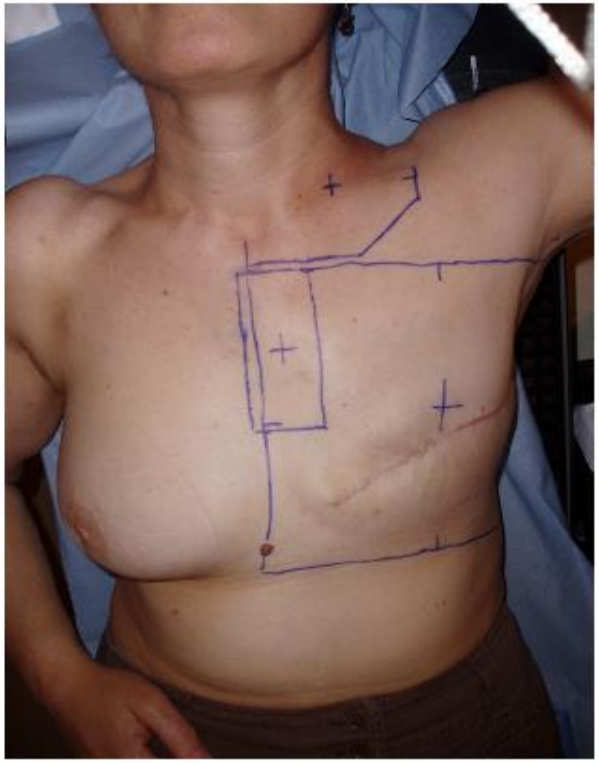

Fig. 3. Postmastectomy fields for new technique: chest wall (electrons), internal mammary chain (electrons and photon boost), and supraclavicular nodes (photons).

slice; and the maximal depth of the 40-Gy isodose in the ipsilateral

Prospective clinical study

The data of all patients treated with the new technique were prospectively recorded, and early toxicity was assessed weekly according to the Radiation Therapy Oncology Group classification (9). The Radiation Therapy Oncology Group grades were as follows: Grade 0, no skin reaction; Grade 1, follicular, faint, or dull erythema, epilation, dry desquamation, and decreased sweating; Grade 2, tender or bright erythema, patchy moist desquamation, and moderate edema; Grade 3, confluent, moist desquamation other than skin

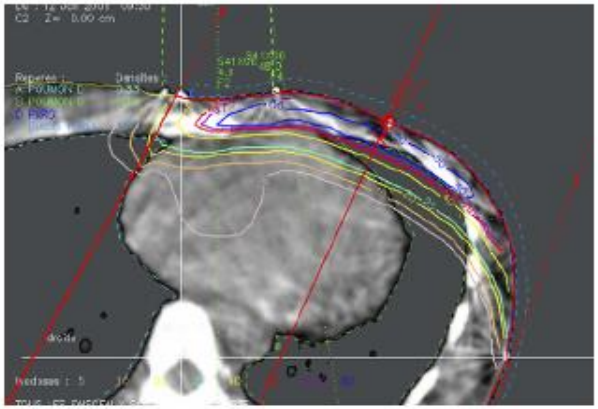

Fig. 4. Dose distribution for 50-Gy prescribed dose using new technique.

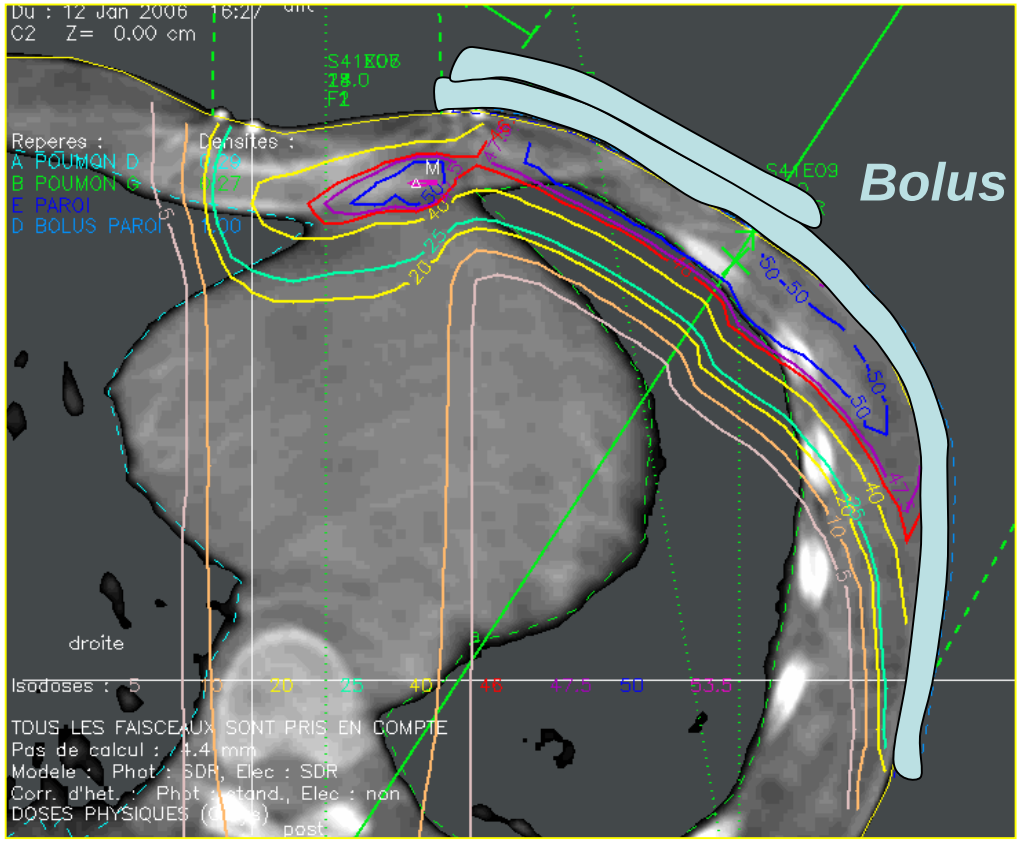
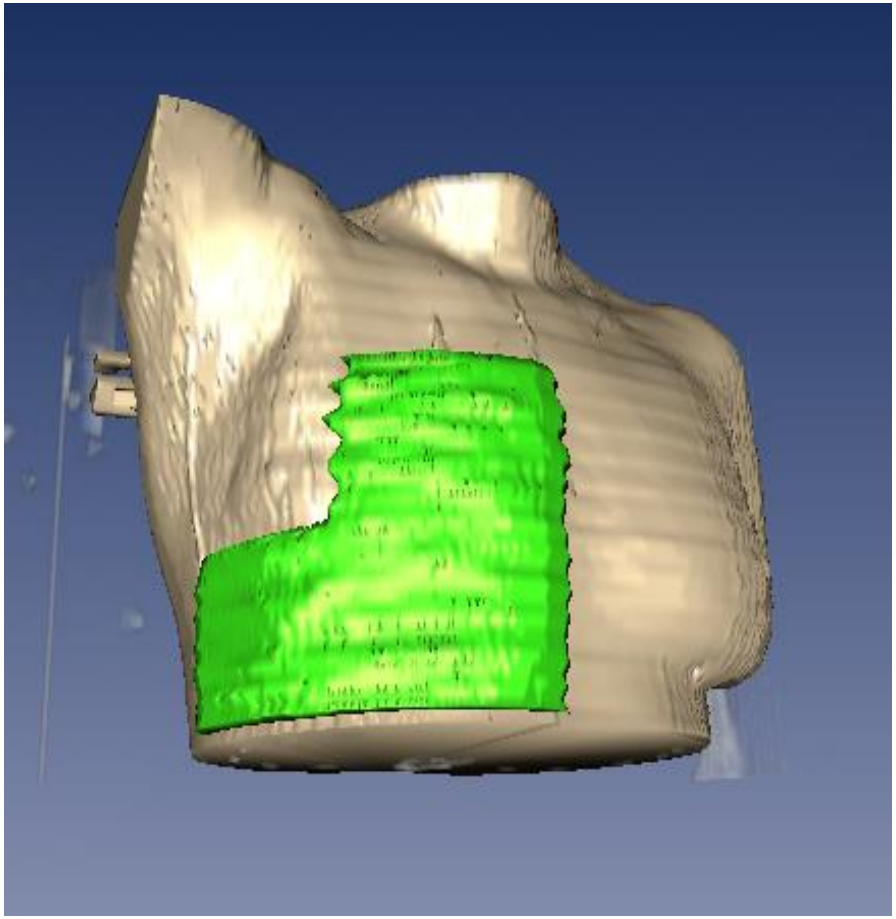
New technique, solutions in case of problems



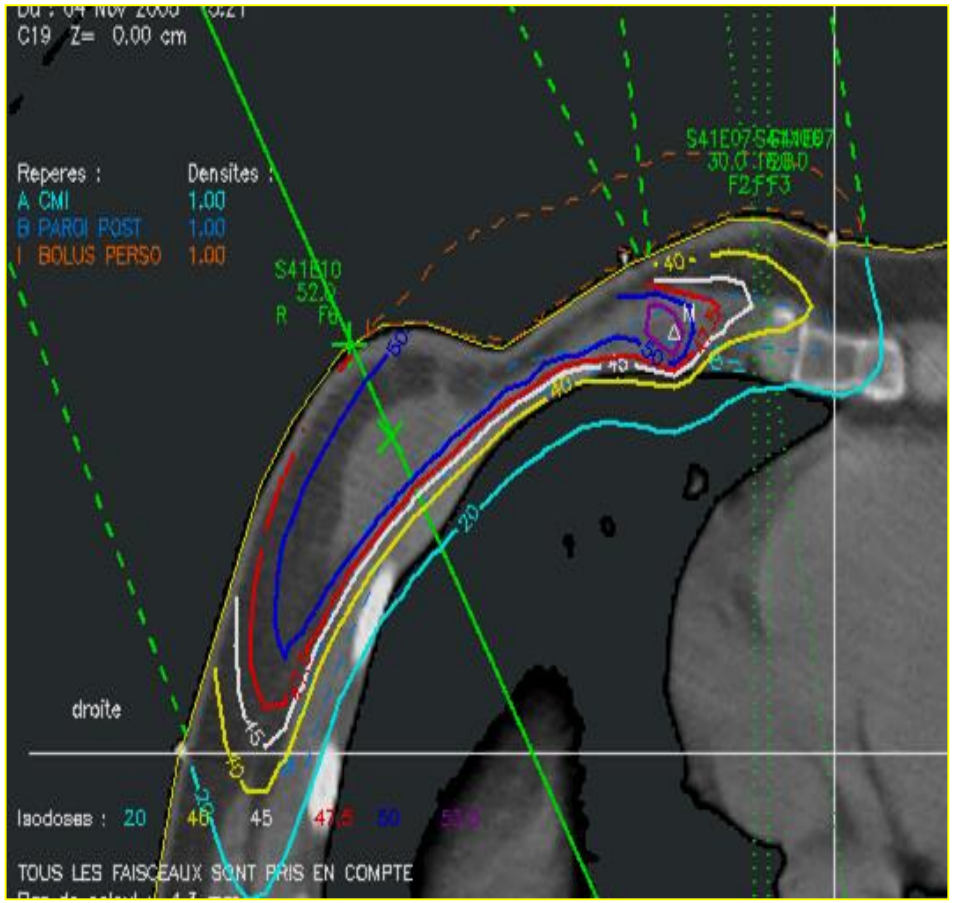
- **When the reference isodose (47.5 Gy) enters into the ipsilateral lung, a second layer of bolus of 0.5 cm is placed (prepared by the dosimetrist).**

- **When two layers of bolus are needed to protect the lung, a beam's eye view showing the projection of the bolus layers limits helps for bolus confection.**

Future directions



3 D individual bolus



Dose distribution using 3D bolus

Immediate breast reconstruction when postmastectomy radiotherapy is indicated should be done with caution

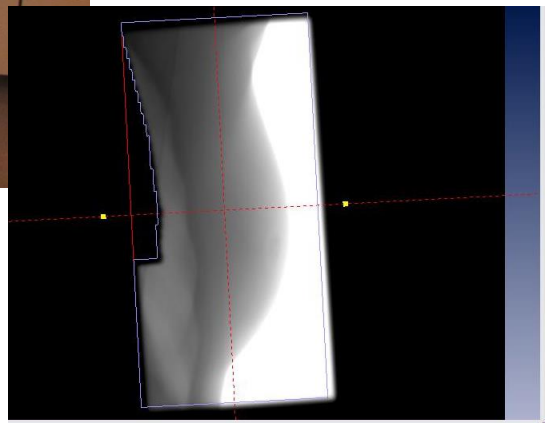
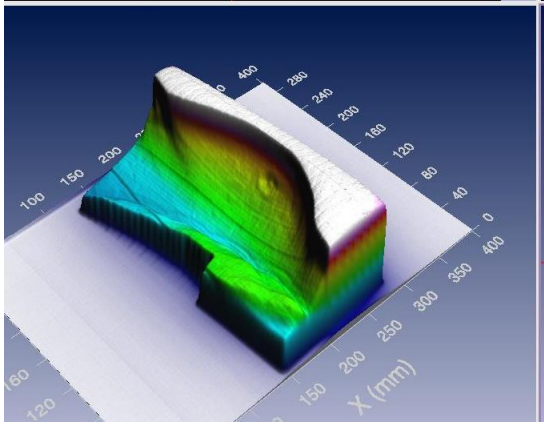
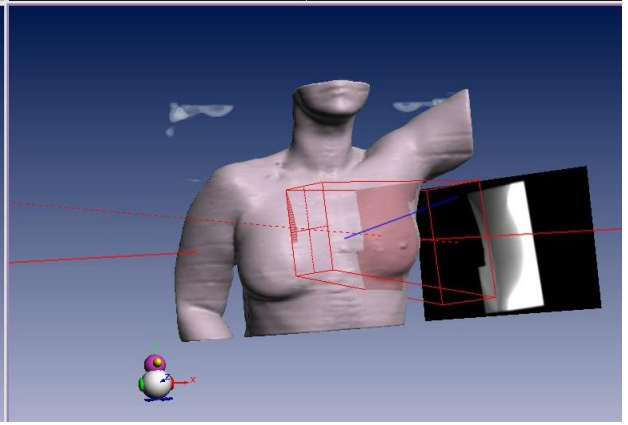
Don’t forget: In vivo dosimetry and quality controls



Transit dosimetry





François P et al. *Phys Med*, 2011

Conclusions 1

- Women with breast cancer present with a wide variety of clinical situations and anatomical differences
- Technical improvements allow to individualize the delivery of irradiation, with the aim of increasing its efficacy and limiting its toxicity

Conclusions 2

- Breast cancers represent a significant part of patients in a radiation oncology department (30-40 % of patients)

- A large majority of patients with preserved breast can be adequately treated with simplified IMRT field-in field techniques

Conclusions 3

- At present, full IMRT and rotational techniques (VMAT, Tomotherapy) should be used in difficult cases only, where adequate coverage of the target volumes cannot be achieved with conventional techniques, or organs at risk may receive unacceptable high doses.

Conclusions 4

These technical developments have drawbacks which could preclude their expected benefits.

- Increased costs
- Increased time for treatment planning
- Increased complexity which may impair security

Conclusions 5

- Not all patients need highly sophisticated treatment
- Training and expertise are mandatory
- Clinical expertise and judgement are essential

Conclusions 6

- Experience with immediate breast reconstruction + RT = limited.
- IBR has a negative impact on target coverage and dose homogeneity
- New treatment modalities could be an interesting option in case of bilateral implant irradiation as Intensity modulation radiotherapy (IMRT), IMRT with helicoïdal tomotherapy, rotational arc therapy, etc.

- …There is also for selected patients…

How you will this T4N3 patient?

- After non response to chemotherapy, patient adressed for preoperative radiotherapy?

Outline

- Thinking about palliation & prognosis
- Palliative RT
- Evidence-base in specific areas of palliative RT

Palliation

- What are we trying to achieve with palliative radiotherapy ?

Palliation

- Multiple aims
- Different aims in different patients
- Different aims over times
- Different between doctors

Example Symptomatic Brain Metastases of SCLC

	Europe	USA
Extend Life	23 %	48 %
Relieve Symptoms	87 %	96 %
Prevent Symptoms	39 %	80 %
Give Hope	20 %	44 %

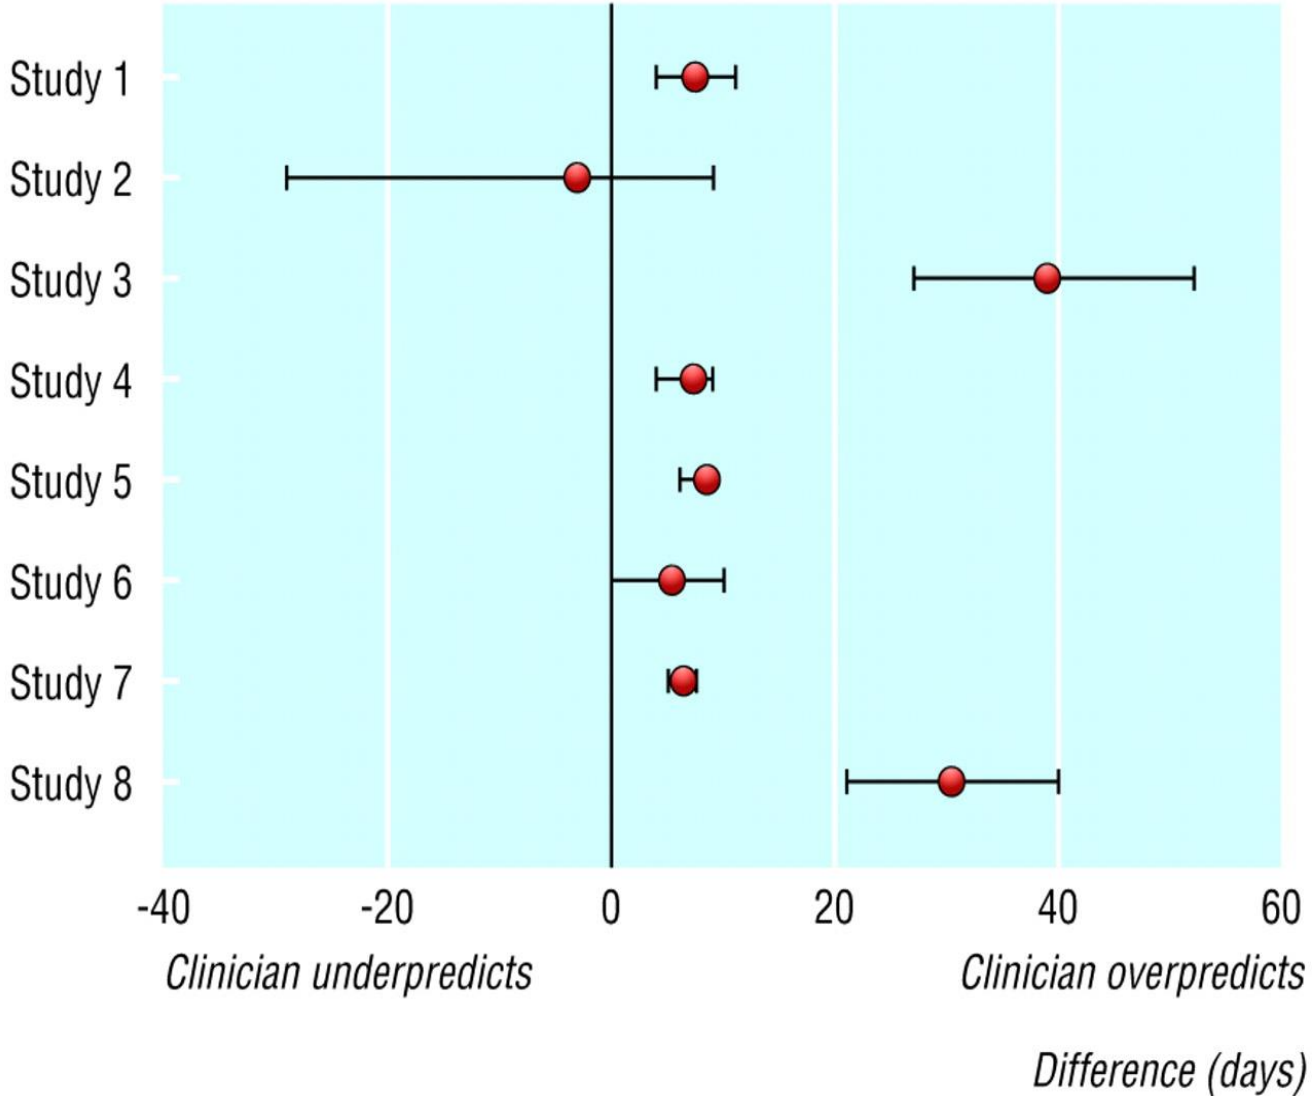
Maher et al, RedJ 1992

Prognosis

- Tailoring ideal palliative care requires understanding prognosis
- How good are we at predicting prognosis ?

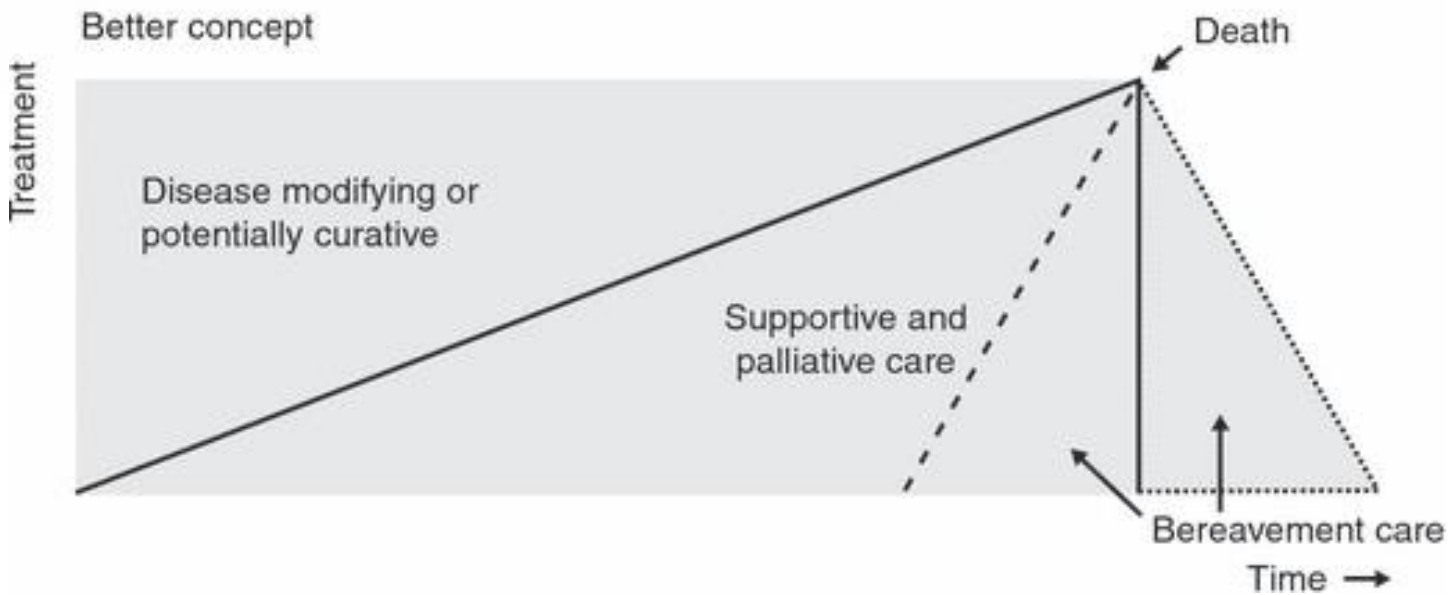
Prognosis

- Clinicians are not very good
- Doctors are worse than nurses



Glare BMJ 2003

Aims of palliation



Lynn & Adamason 2003

Expected Prognosis

- What is the expected survival in patients who receive palliative radiotherapy for:

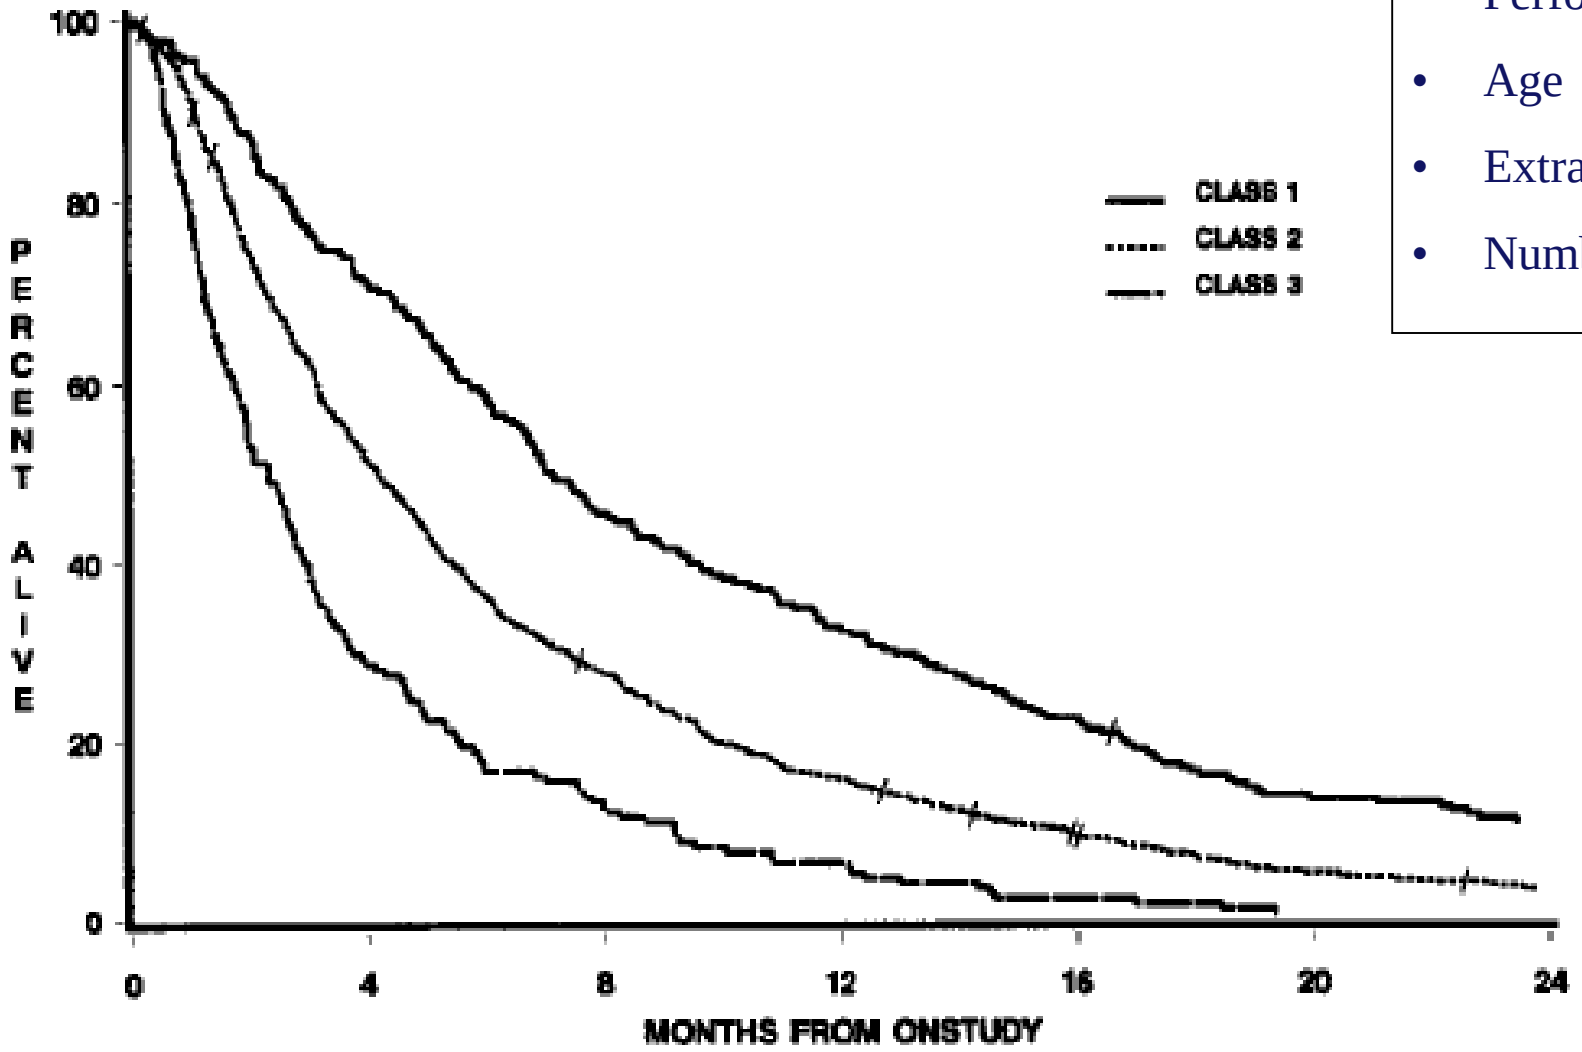
- Breast cancer with bone mets
- Brain mets (lung cancer)
- Oesophageal cancer (primary)

Beware of trials

GPA (Brain mets)

4000 pts

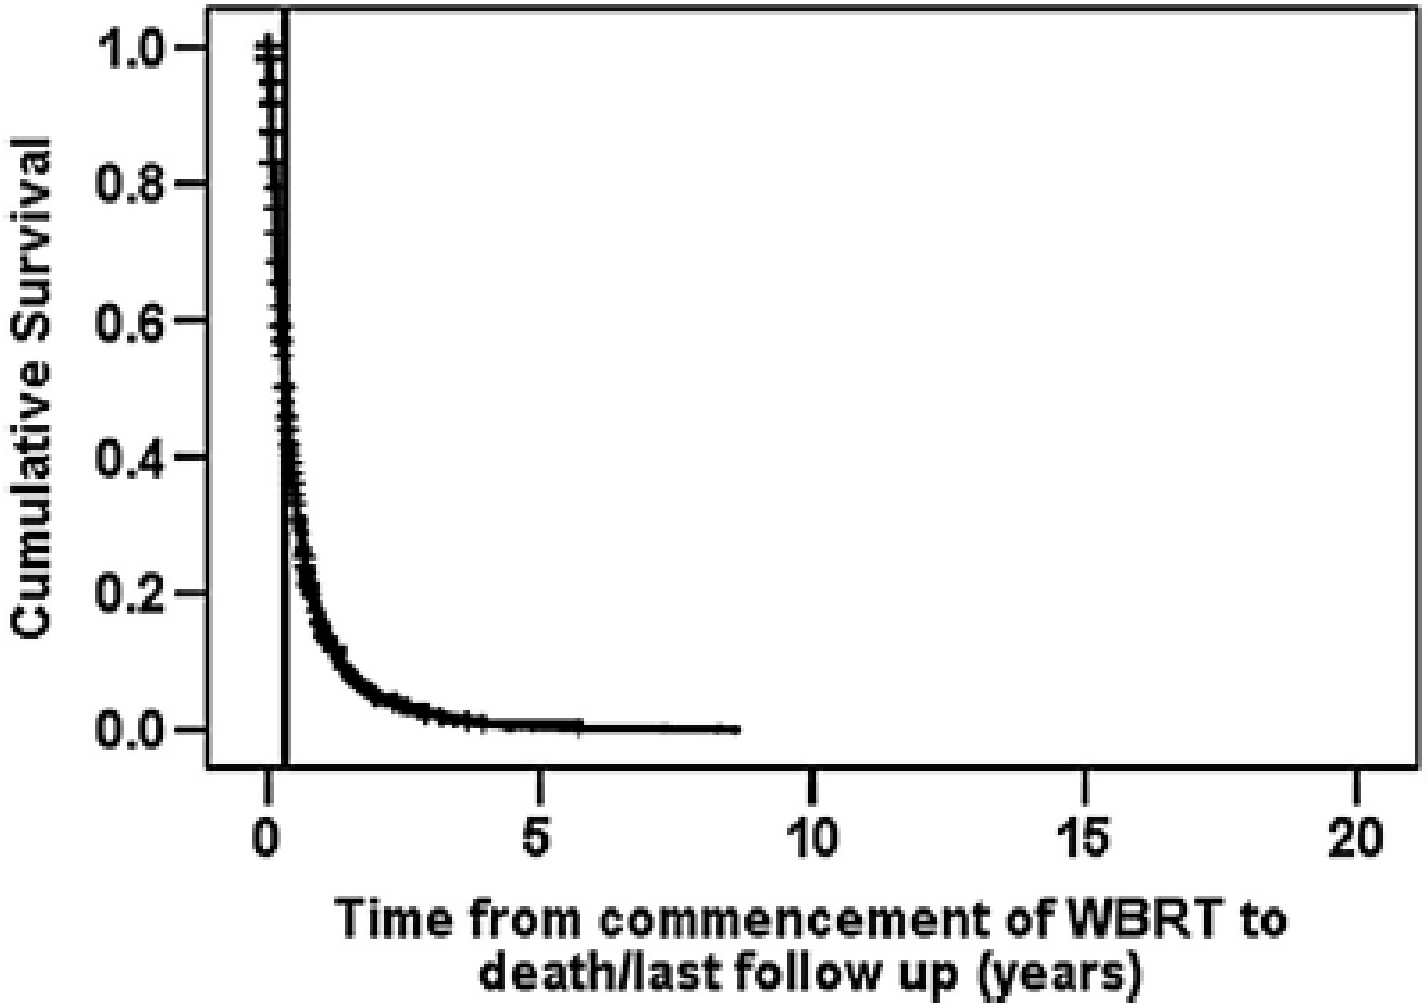
- Performance
- Age
- Extracranial mets
- Number of brain mets



Beware of trials

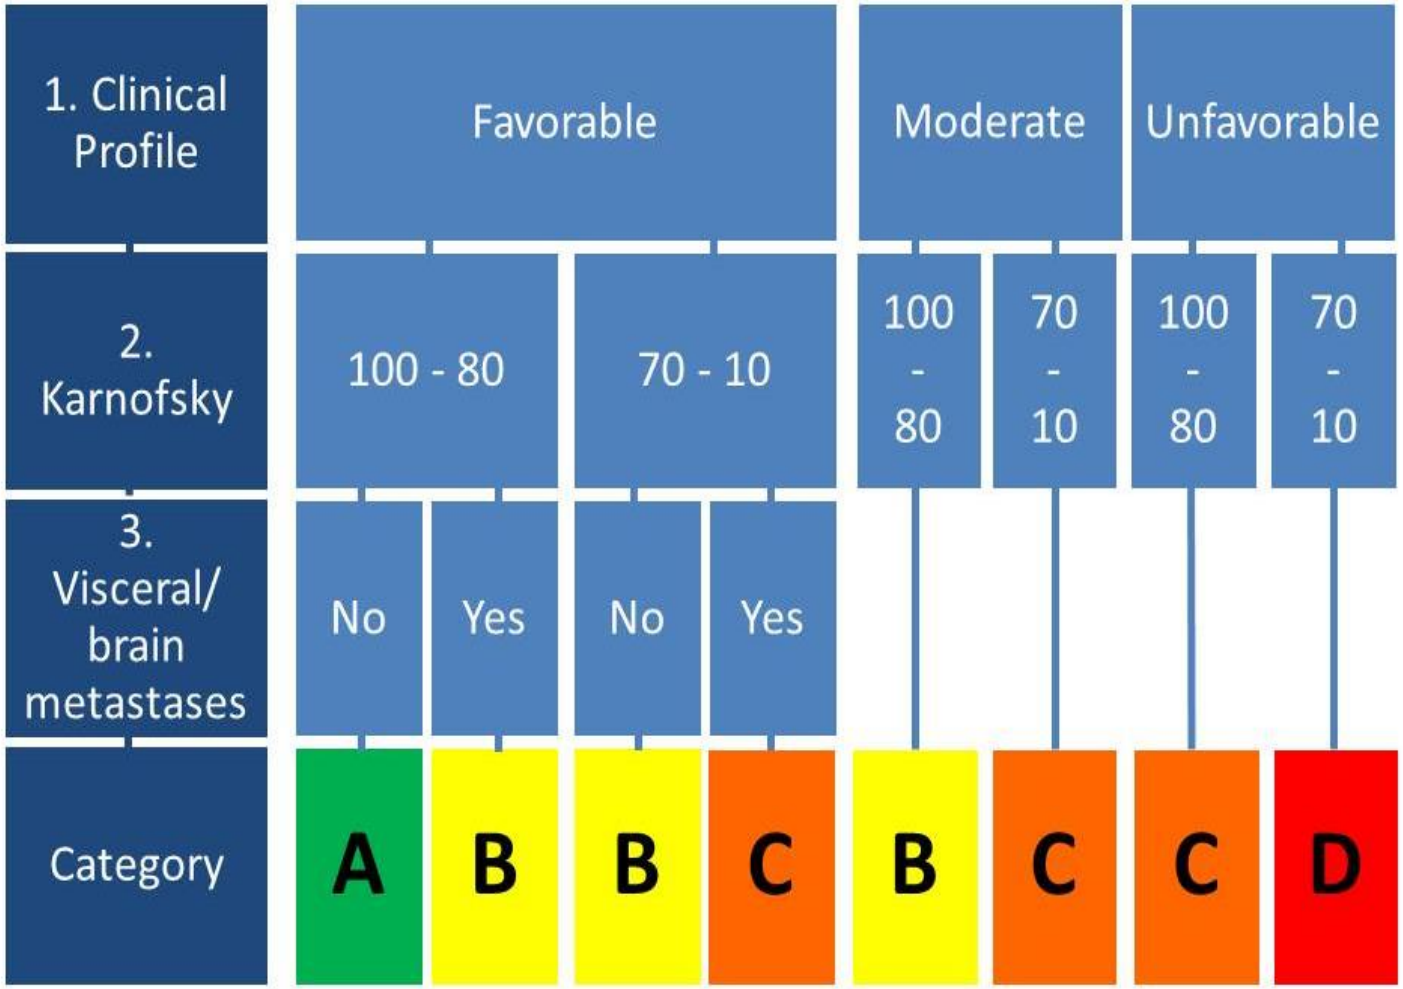
Brain mets (Routine care)

- N= 3459, three centers (n= 709 Dutch)
- Risk factors
  - Older age
  - Short time between diagnosis and brain mets
  - Primary tumor
- Median OS 4 months
- 25% died < 8 weeks

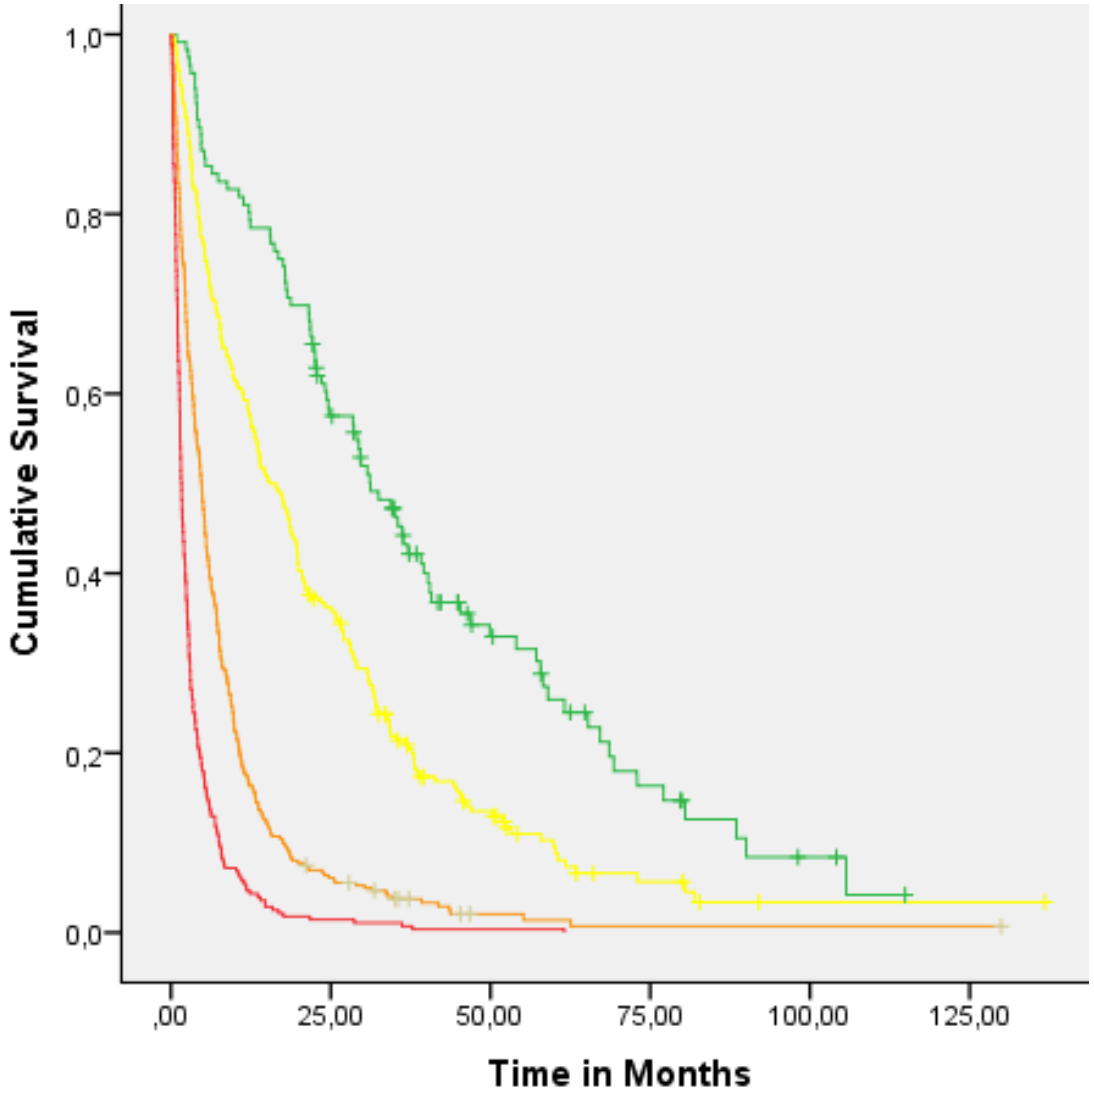


Windsor et al, Clin Oncol 2013

Formal prognostic tools can help

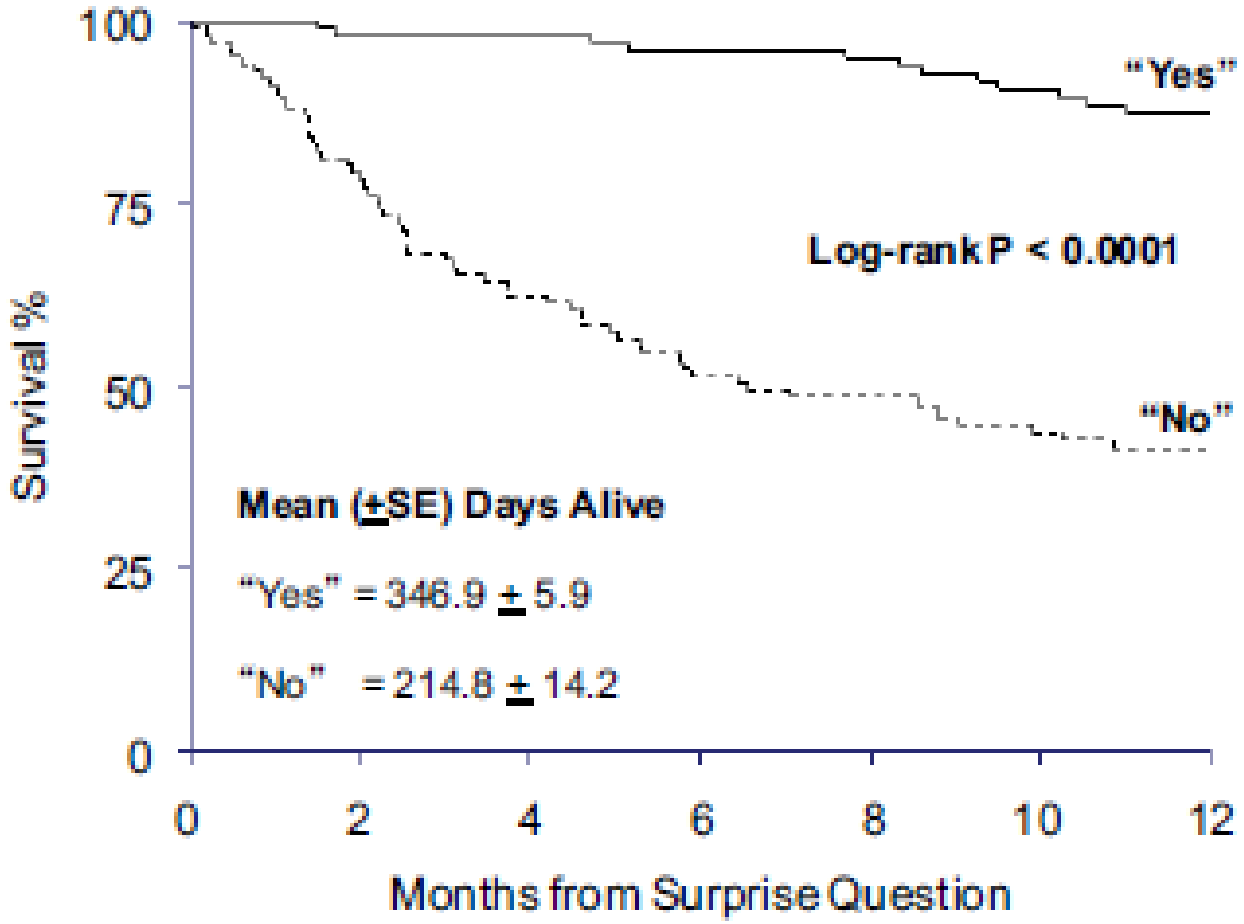


Formal prognostic tools can help



Would I be surprised ?

- Would I be surprised if my patient died in the next year ?



Survival Intervals

- Median * 0.25: 90%
- Median* 0.5: 75%
- Median * 2: 25%
- Median * 3: 10%

- “Worst, Some, Many, Most”
- 50% die between 75% and 25%

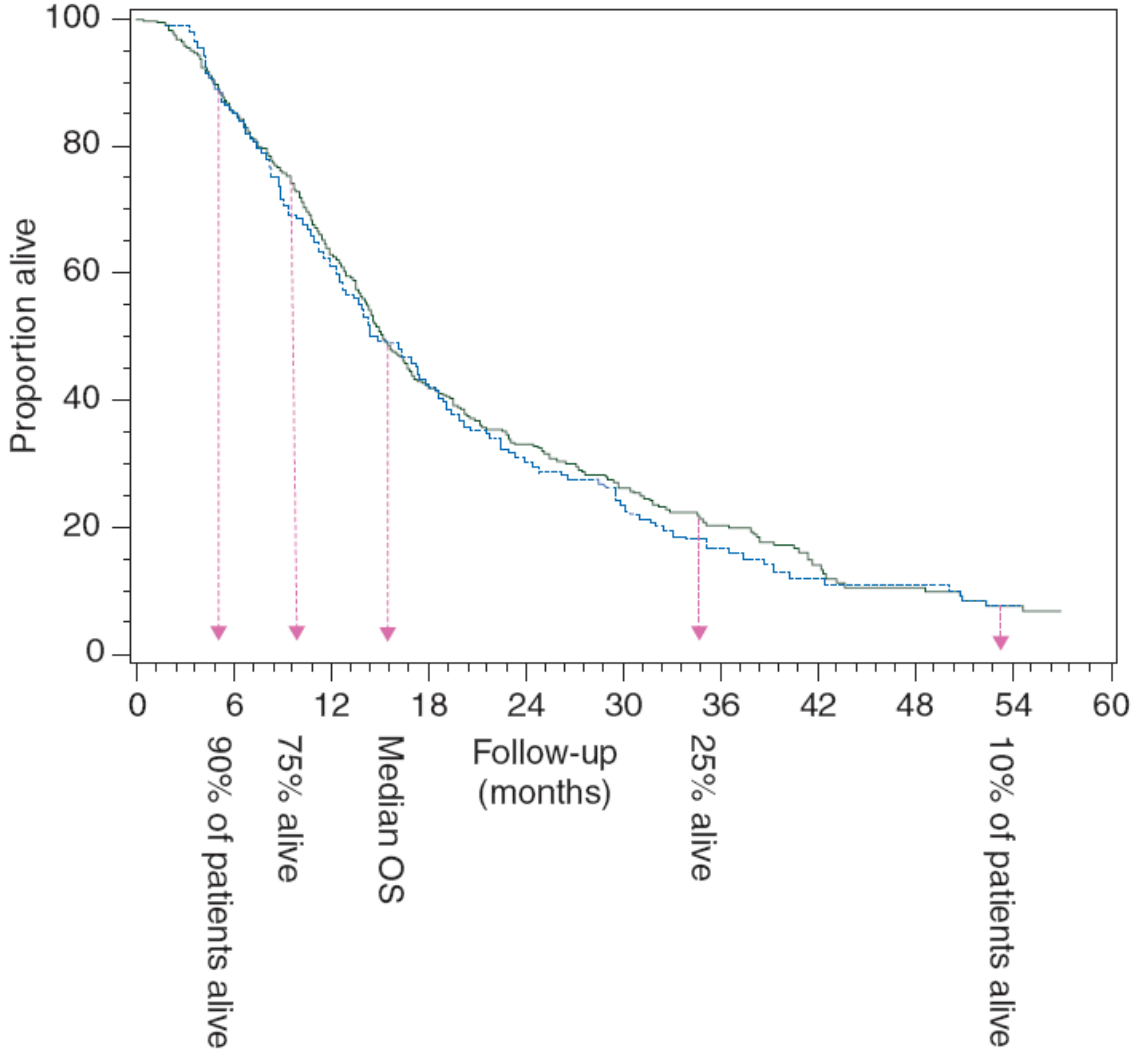


Figure 1. Measuring the time to different levels of survival from published survival curves.

Kiely, JCO 2011
Williams, AnnOnc 2014

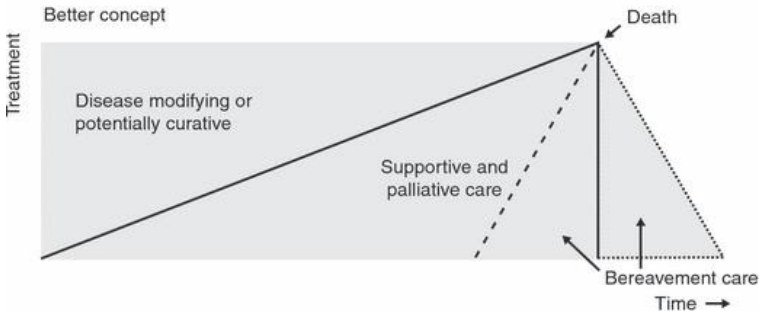
Prognosis

?

Role of radiotherapy in palliation

- Palliative RT can (should) run alongside other palliative measures
- Is it effective?
- Safe?
- Cost-effective?
- Tolerable?

- Palliative RT as a palliative intervention
  not an RT technique



Effectiveness of palliative RT

Condition	*Rates of symptom improvement*
Metastatic bone pain	
Partial relief	70%–94%
Complete relief	28%–80%
Hemoptysis	72%–86%
Chest pain (lung cancer)	59%–86%
Dyspnea (lung cancer)	41%–66%
Cough (lung cancer)	48%–66%
Dysphagia	61%–65%
Superior vena cava obstruction	60%–90%
Brain metastases	50%–70%
Spinal cord compression	64%–73%

Samant & Tucker Curr Onc 2006

Effectiveness of palliative RT

Condition	*NNT*
Painful bone metastases	
Partial relief	1.25
Complete relief	2.5
Hemoptysis	1.25
Chest pain (lung cancer)	1.43
Superior vena cava syndrome	1.3
Brain metastases	1.67
Spinal cord compression	1.5

Effectiveness of palliative RT

Condition	*NNT*
Painful bone metastases	
Partial relief	1.25
Complete relief	2.5
Hemoptysis	1.25
Chest pain (lung cancer)	1.43
Superior vena cava syndrome	1.3
Brain metastases	1.67
Spinal cord compression	1.5

- Some of these are over estimates
- Some are wrong
- But the “pooled” NNT for palliative RT remains good

Comparative NNT

Costs of palliative RT

- Different treatment modalities
  - Hillner et al — JCO 2000
    - *Oral pamidronate US$ 775 per month*
    - *Prevent SRE US$ 3940 chemo vs $ 9390 hormonal*
  - Swedish Council — Acta Oncol 1996
    - *RT US$ 2000 per patient*
  - Ferrel et al — J.Pain Sympt.Man 1994
    - *Oral analgesics US$ 1000 per patient / month*
    - *Parenteral US$ 4000*
  - Macklis et al — Am.J.Clin.Onc 1998
    - *RT US$ 1200-2500 vs narcotics $9000 – 36000*
  - Stevens et al — Austral.Rad. 1997
    - *RT costs per month survival AUS$ 105*

What drives the cost of palliative RT

- Case: man with hormone refractory prostate cancer
  1. Pain medication
  2. Chemotherapy (trial on mitoxantrone + prednison)
  3. Radiotherapy
     - SF 1 x 8 Gy, MF 10 x 3 Gy
     - Retreatments included

- For each treatment -> based on literature data
  - Model entering -> transition probabilities
  - Costs calculations
  - Utilities calculations

Konski RedJ 2004

Costs of palliative RT

Treatment	Cost ($)	Incremental cost ($)	Effectiveness (QALM)	Incremental effectiveness (QALM)	Incremental cost-effectiveness ($/QALY)
Pain medication	11 700		5.75		
Single fraction radiotherapy	11 900	200	6.1	0.35	6857
Multiple fraction radiotherapy	13 200	1500	6.25	0.5	36 000
Chemotherapy	15 300	3600	4.93	−0.82	–

QALM, quality-adjusted life per month; QALY, quality-adjusted life year.

Costs of RT

		8 Gy × 1 ($n=80$)		4 Gy × 6 ($n=86$)	*P* value*
Costs of radiotherapy		2438		3311	<0.001
Initial treatment		1838		2448	–
Re-treatments ≤12 weeks	18%	466	5%	159	0.01
Time, travel, out of pocket	10 h	134	25 h	704	<0.001
Other medical costs		2072		3114	0.18
Hospitalisation	28%	914	41%	2160	0.08
Systemic therapy	61%	373	59%	247	0.19
Consultations	6.3	302	6.4	248	0.42
Pain medication		79		56	0.19
Other medication		322		247	0.51
Home nursing care	5 h	81	9 h	156	0.22
Other non-medical costs		190		28	0.44
Time, travel	8 h	94		130	0.35
Out of pocket		127		64	0.19
Domestic help	42 h	438	43 h	482	0.65
(Un)paid labour	56 h	−468	77 h	−647	0.26
Medical costs		**4376**		**5720**	0.09
Societal costs		**4700**		**6453**	0.06

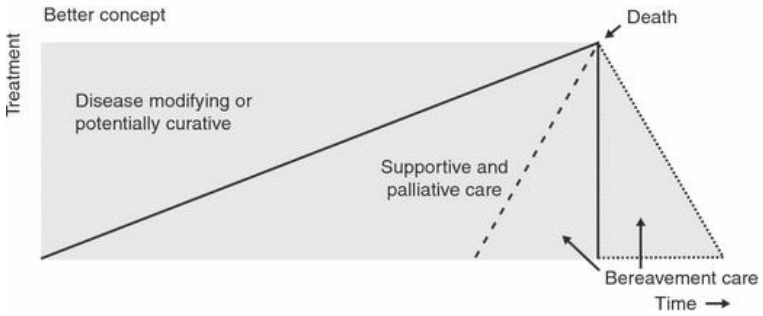
Konski RedJ 2004

Message

- Palliative RT is an effective palliative measure
- It is cost effective
- Costs are driven by a variety of measures
  - RT Treatment
  - Other medical costs
  - Travel, time, care costs
- Costs to patient (ambulance, stretcher, etc.) can be great, and non-monetary

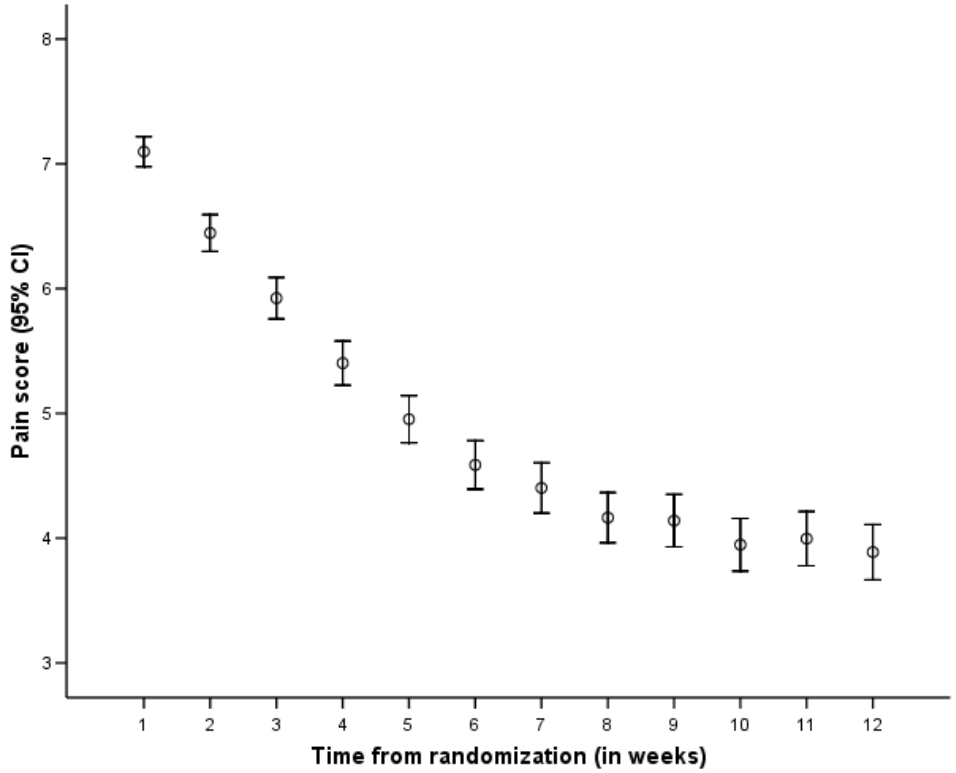
Specific clinical situations for Pall RT

- Bone mets
  - Retreatment
- MSCC
- Lung cancer
- Brain Mets



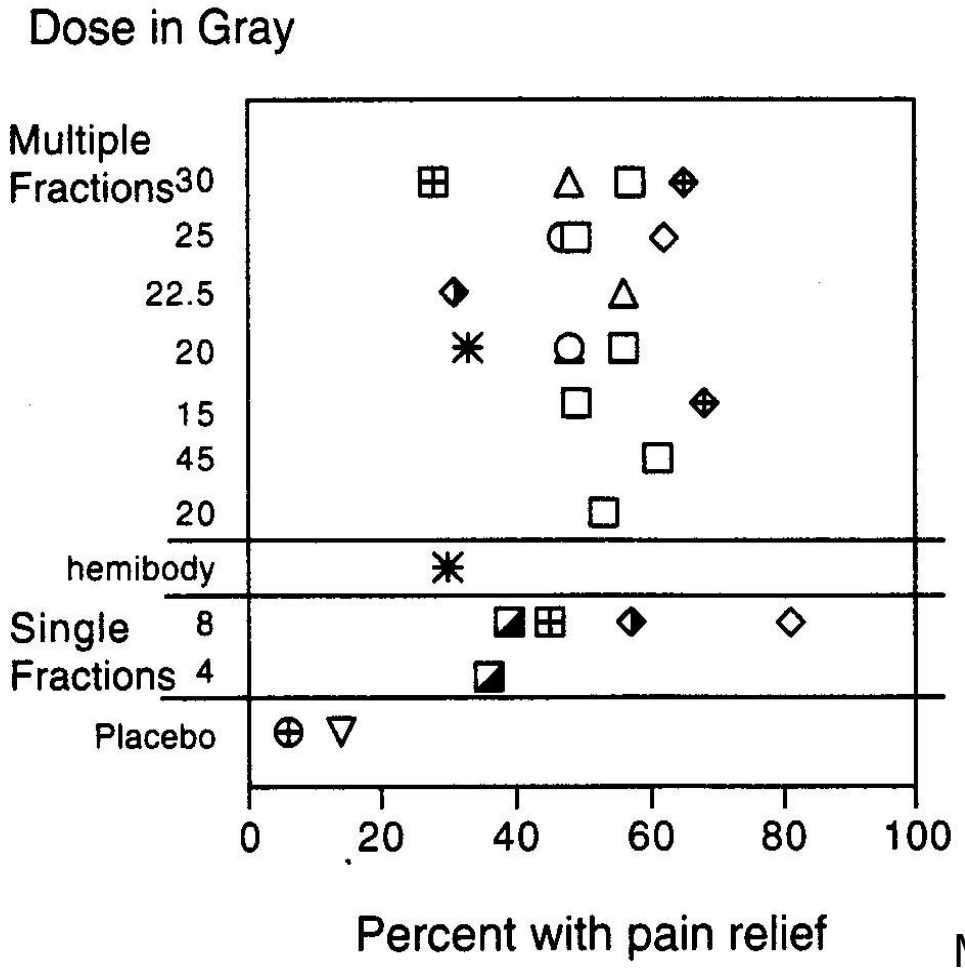
PallRT is an effective treatment for bone mets

- 75% of patients get significant pain relief within 3 weeks



PallRT is an effective treatment for bone mets

- Multiple fractions no better than single fraction

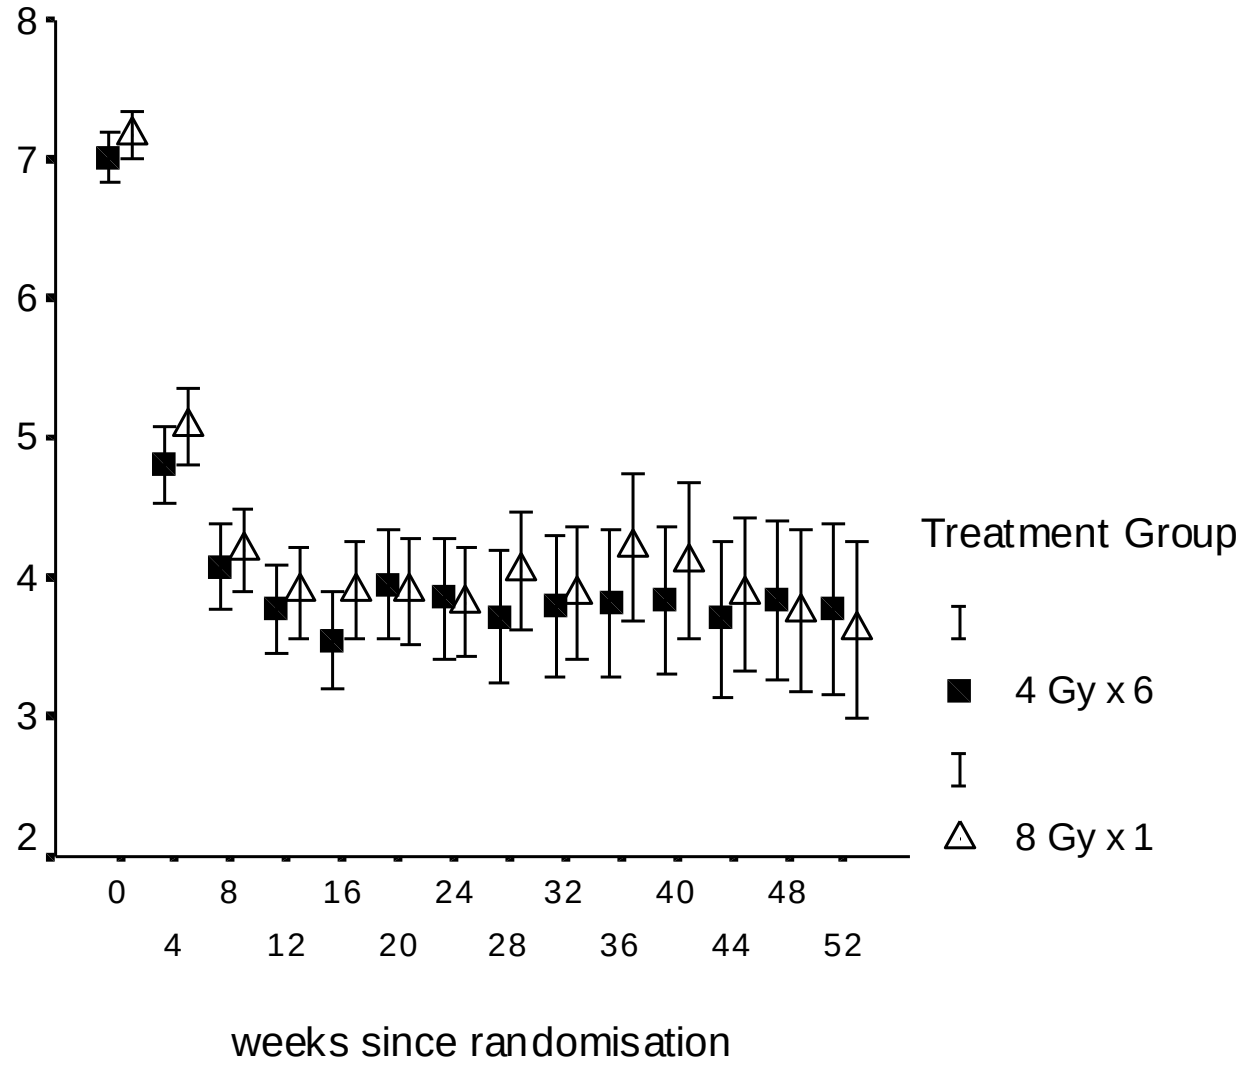


McQuay 1997

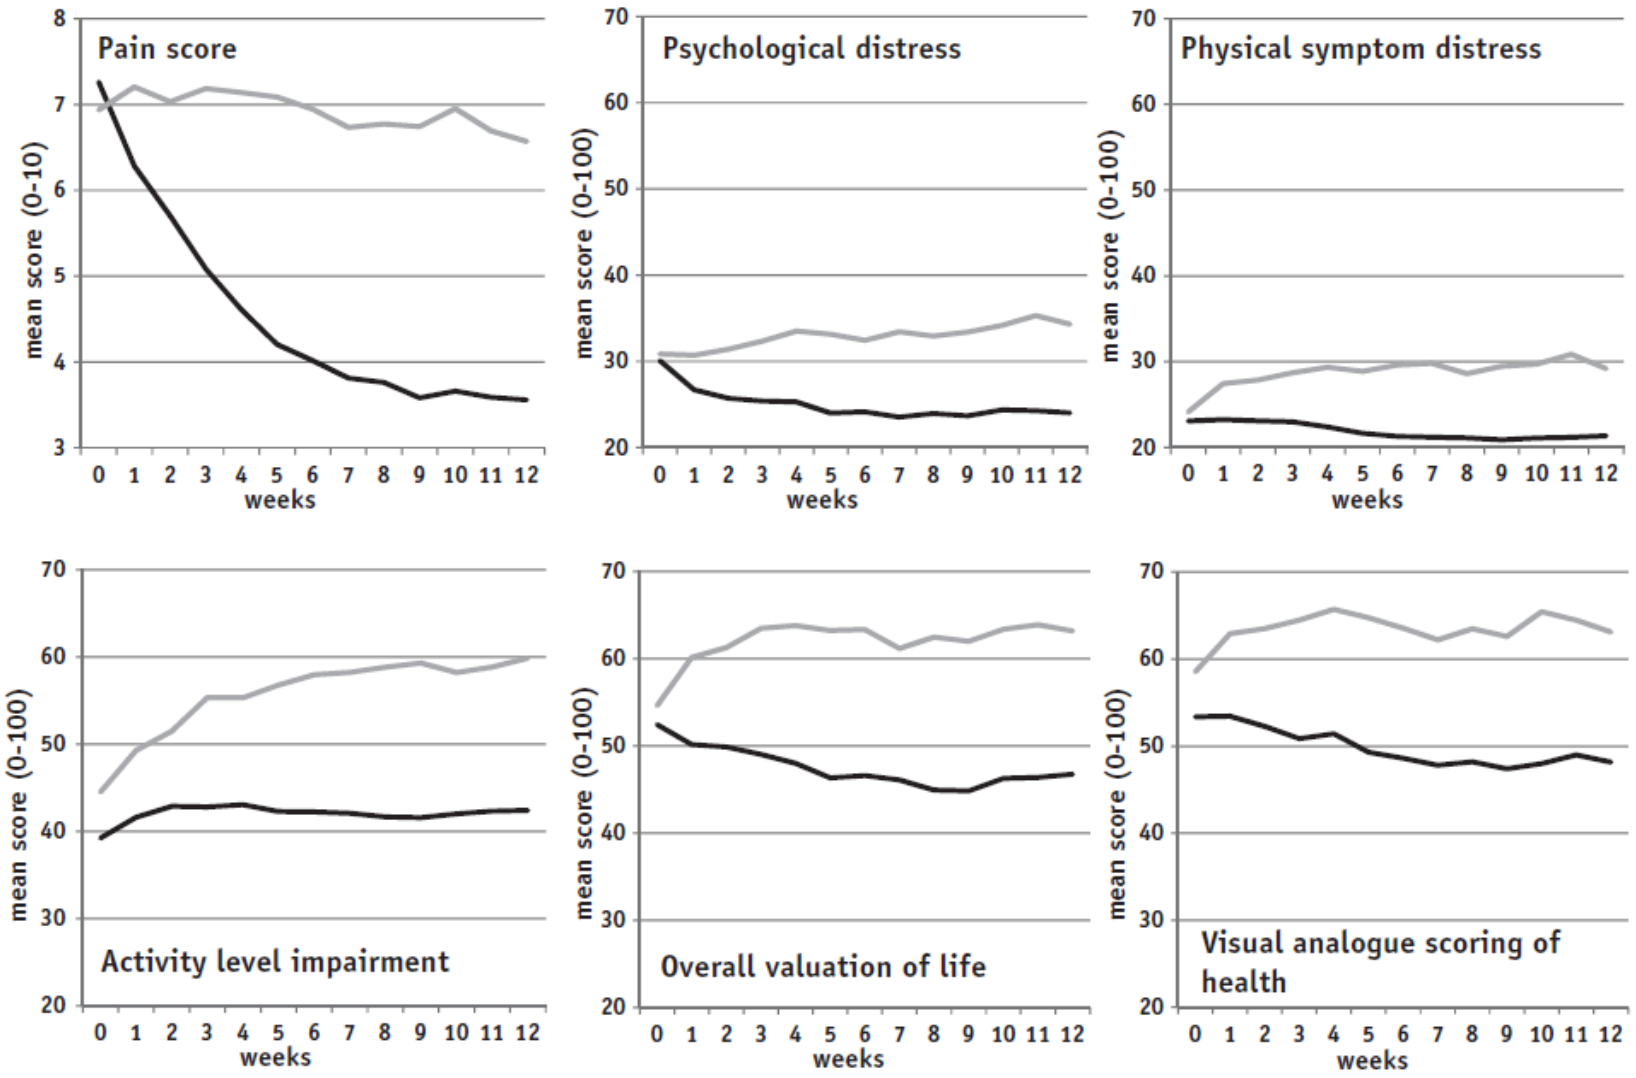
PallRT is an effective treatment for bone mets

- Single fraction offer durable response
- (N = 320 lived longer than 1 year; no benefit from multi #)
- No difference between tumours subgroups
- Elderly

- 4Gy is worse than 8Gy



Responding pts have improved QoL



Nesthoff et al. IJROBP 2015

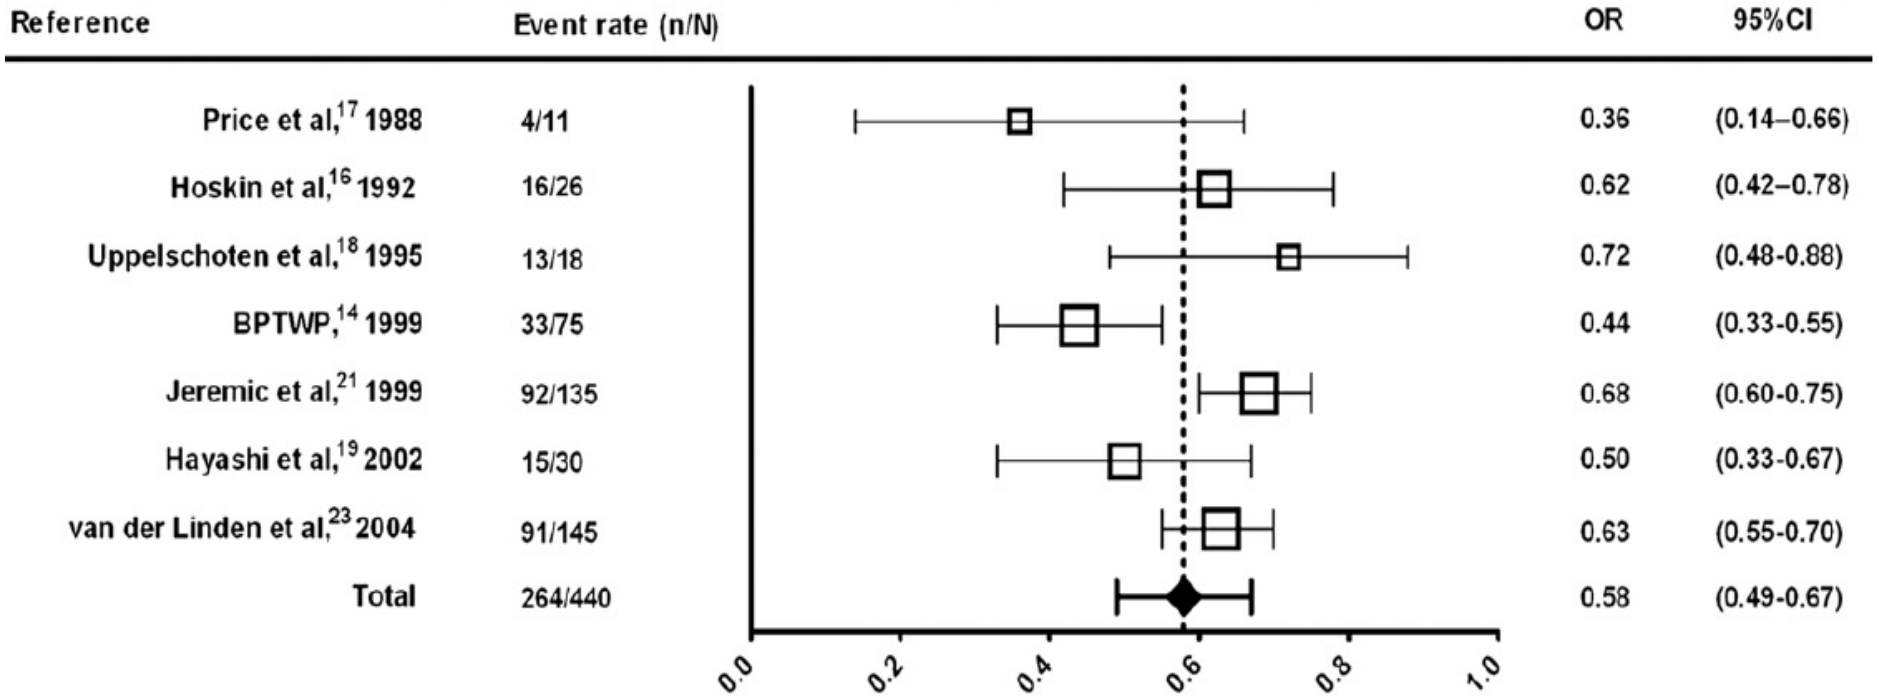
Recurrent pain

- ~50% of patients experience recurrent pain
  - 50% of patients died by 7 months

- Are those who have single fraction more likely to have retreatment
  - In some trials, yes
  - But pain scores no different
  - -> Probably clinicians more willing to prescribe second course if first was single fraction

Bone met retreatment

- Retreatment is possible
- Effective (~60% RR) - non randomsied
- Safe



RCT on retreatment

Two-month Response	Intention to Treat Analysis		Per-Protocol Analysis	
	8 Gy Single Fraction (N = 425)	*20 Gy Multiple Fractions (N = 425)*	*8 Gy Single Fraction (N = 258)*	*20 Gy Multiple Fractions (N = 263)*
Complete Response	36 (8%)	32 (8%)	35 (14%)	31 (12%)
Partial Response	83 (20%)	104 (24%)	82 (32%)	104 (40%)
Overall Response	**119 (28%)**	**136 (32%)**	**117 (45%)**	**135 (51%)**
Inevaluable	162 (36%)	160 (36%)	0	0

Langendijk, RedJ 2000

Palliative RT is effective

Table 5. Response classification for general and respiratory symptoms

		Cough	Hemoptysis	Dyspnea	Pain arm/ shoulder	Chest pain	Fatigue	Appetite loss
Total patients		65	65	65	65	65	65	65
Inadequate follow-up data*		13	18	12	19	18	13	17
Remaining for analysis		52	47	53	46	47	52	48
Improvement	Mild	2/21 (10%)	7/18 (39%)	7/14 (50%)	1/5 (20%)	4/15 (27%)	0/10 (0%)	4/9 (44%)
	Moderate/severe	12/24 (50%)	4/8 (50%)	8/31 (26%)	6/16 (38%)	8/17 (47%)	5/48 (10%)	4/27 (15%)
Control	Mild	8/21 (38%)	5/18 (28%)	7/14 (50%)	2/5 (40%)	5/15 (33%)	4/10 (40%)	1/9 (11%)
Prevention	Nil	3/7 (43%)	20/21 (95%)	3/8 (38%)	17/25 (68%)	11/15 (73%)	2/4 (50%)	7/12 (58%)
Dead without palliation	Nil	1/7 (14%)	0/21 (0%)	1/8 (13%)	1/25 (4%)	0/15 (0%)	0/4 (0%)	0/12 (0%)
	Mild	5/21 (24%)	1/18 (6%)	2/14 (14%)	1/5 (20%)	2/15 (13%)	3/10 (30%)	0/9 (0%)
	Moderate/severe	6/24 (25%)	3/8 (38%)	10/31 (32%)	4/16 (25%)	5/17 (29%)	9/48 (19%)	8/27 (30%)
Response rate		25/52 (48%)	37/47 (79%)	19/53 (36%)	26/46 (57%)	28/47 (60%)	11/52 (21%)	16/48 (33%)

* The number of patients with inadequate follow-up data may differ between scales because of the definition of "inadequate follow-up" (see also Table 2).

More than just physical effects

- In those with an objective response (!)
  - Physical functioning
  - Cognitive, emotional, global QoL all improve

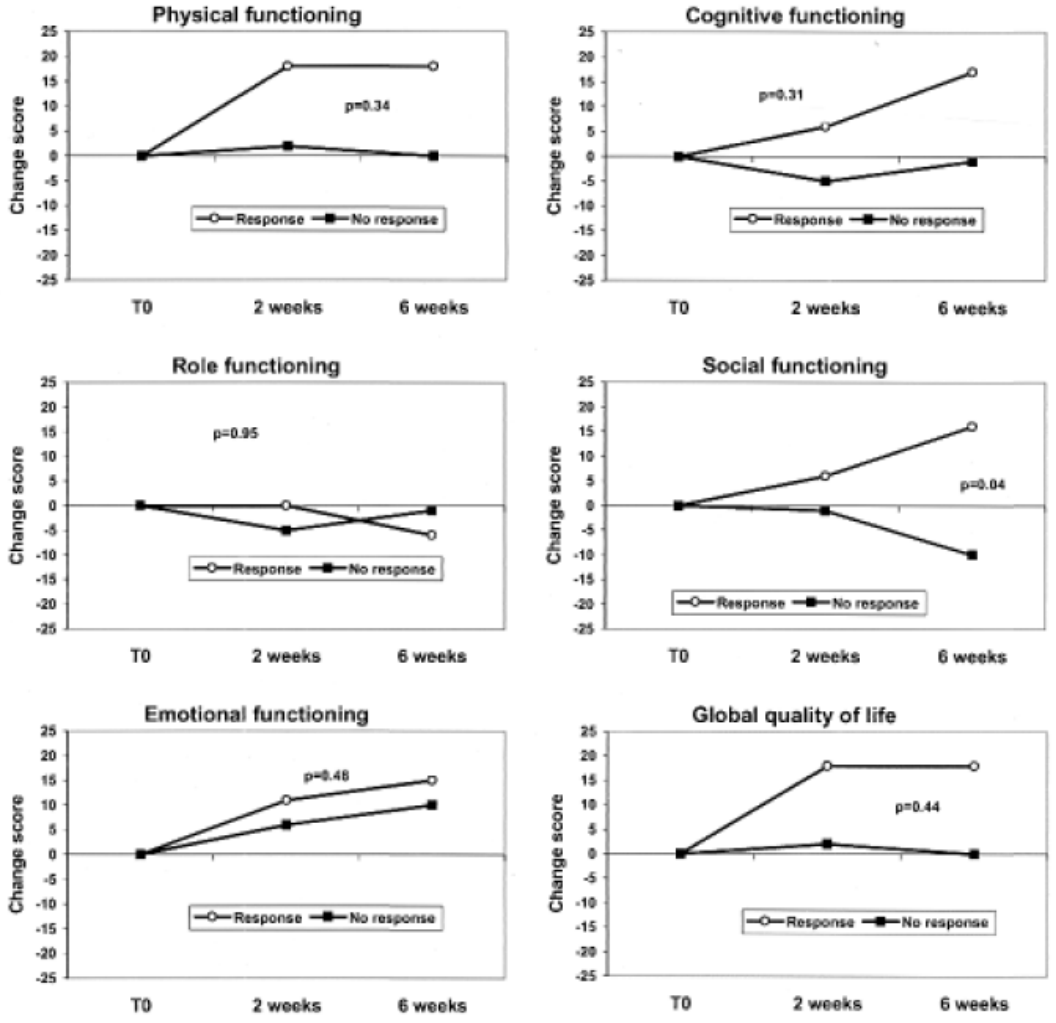

Fig. 2. Change scores for functioning scales and global QoL stratified by objective tumor response.

Early Palliative care

- 151 pts new diagnosis metastatic NSCLC
- Randomised to early palliative care (plus oncology) vs. oncology alone
- QoL at baseline and 12 weeks
  - Survival, use of chemo, documentation of DNAR wishes

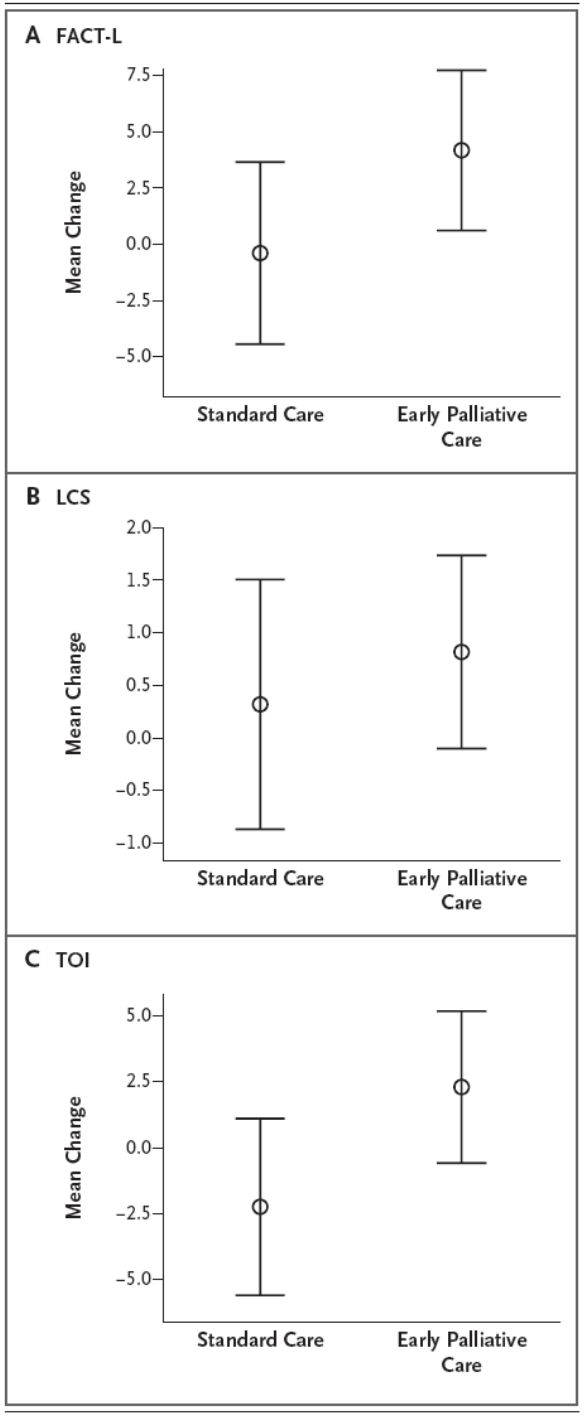
ORIGINAL ARTICLE

Early Palliative Care for Patients with Metastatic Non–Small-Cell Lung Cancer

Jennifer S. Temel, M.D., Joseph A. Greer, Ph.D., Alona Muzikansky, M.A., Emily R. Gallagher, R.N., Sonal Admane, M.B., B.S., M.P.H., Vicki A. Jackson, M.D., M.P.H., Constance M. Dahlin, A.P.N., Craig D. Blinderman, M.D., Juliet Jacobsen, M.D., William F. Pirl, M.D., M.P.H., J. Andrew Billings, M.D., and Thomas J. Lynch, M.D.

Outcomes

- QoL better

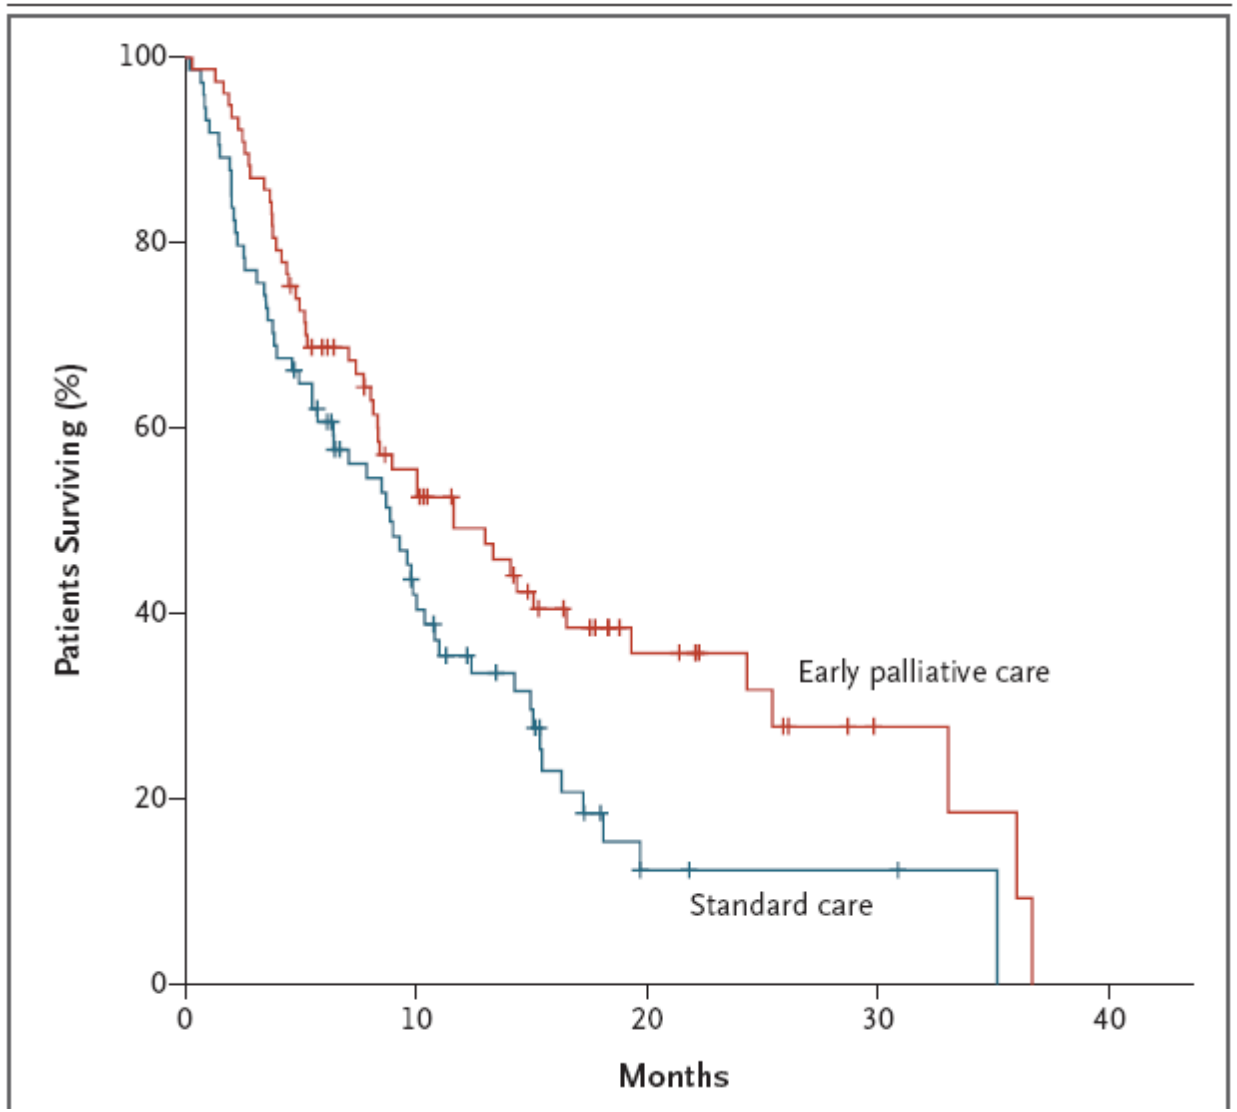


Survival better

- 8.9 vs. 11.6 months
- Persists on multivariate analysis

- Single centre
- In USA

- Other studies NOT shown OS benefit



Temel, NEJM, 2010

Palliative RT lung dose & fractionation

- Poor PS:
  - 1 fraction (10Gy) as good as 2 fraction (17Gy/ 2#; 1 week apart)
  - PS 2 – 4; Main symptoms from primary
  - Max 200 cm^2 field
  - Median OS 3.5 vs 4 months

- Better PS:
  - 13 fraction (39Gy/ 13#) vs. 2 fraction (17Gy/ 2#)
  - Locally advanced, non-metastatic
  - 7 vs. 9 months OS

Bleehan, BJC, 1992
Macbeth, ClinOnc1996

Lung

?

Brain metastases

- Other half neuro-oncology talks
- Talking about poor PS, large disease, extensive ECD

- Is WBRT effective for palliation?

The effects of WBRT

- Lots of retrospective studies

- 75 pts. WBRT 20Gy/5#
  - Median OS 85 days (2.5 months)
  - At 1 month, 19% patients had improved symptoms
  - 4 pts had improved PS

  - 84% had improvement with steroids
    - No relationship between oedema and steroids
    - No relationship to steroid response and RT response

Bezjak, EJC, 2002

FEBRUARY, 1971

THE MANAGEMENT OF METASTASES TO THE BRAIN BY IRRADIATION AND CORTICOSTEROIDS*

By JOHN HORTON, M.B., CH.B.,† DONALD H. BAXTER, M.D.,‡ KENNETH B. OLSON, M.D.,†
and THE EASTERN COOPERATIVE ONCOLOGY GROUP§
ALBANY, NEW YORK

- Prednisolone 40mg +/ RT
- 40 Gy (4 000 rads) over 4 weeks
- Cobalt
- Assessed PS and median OS as outcome

Horton, AJR, 1971

The results indicate that a combination of irradiation and prednisone offers only a slight advantage over prednisone alone. This hardly justifies the expense, work and inconvenience to the patient and his family of a 4 week course of irradiation taking up about a third of his final days.

Quartz trial

- Non-inferiority Phase 3 RCT
- NSCLC brain mets
- Primary outcome QUALYs (survival and EQ-5D)
  - Non-inferior if no less than 7 QUALY days
- BSC + steroids vs BSC + steroids + RT (20Gy/5#)
- 538 pts 72 centres

Quartz patients

- Originally intended to be > 1000 pts
- Slow recruitment
- Reduced target to 530
- One-sided tests

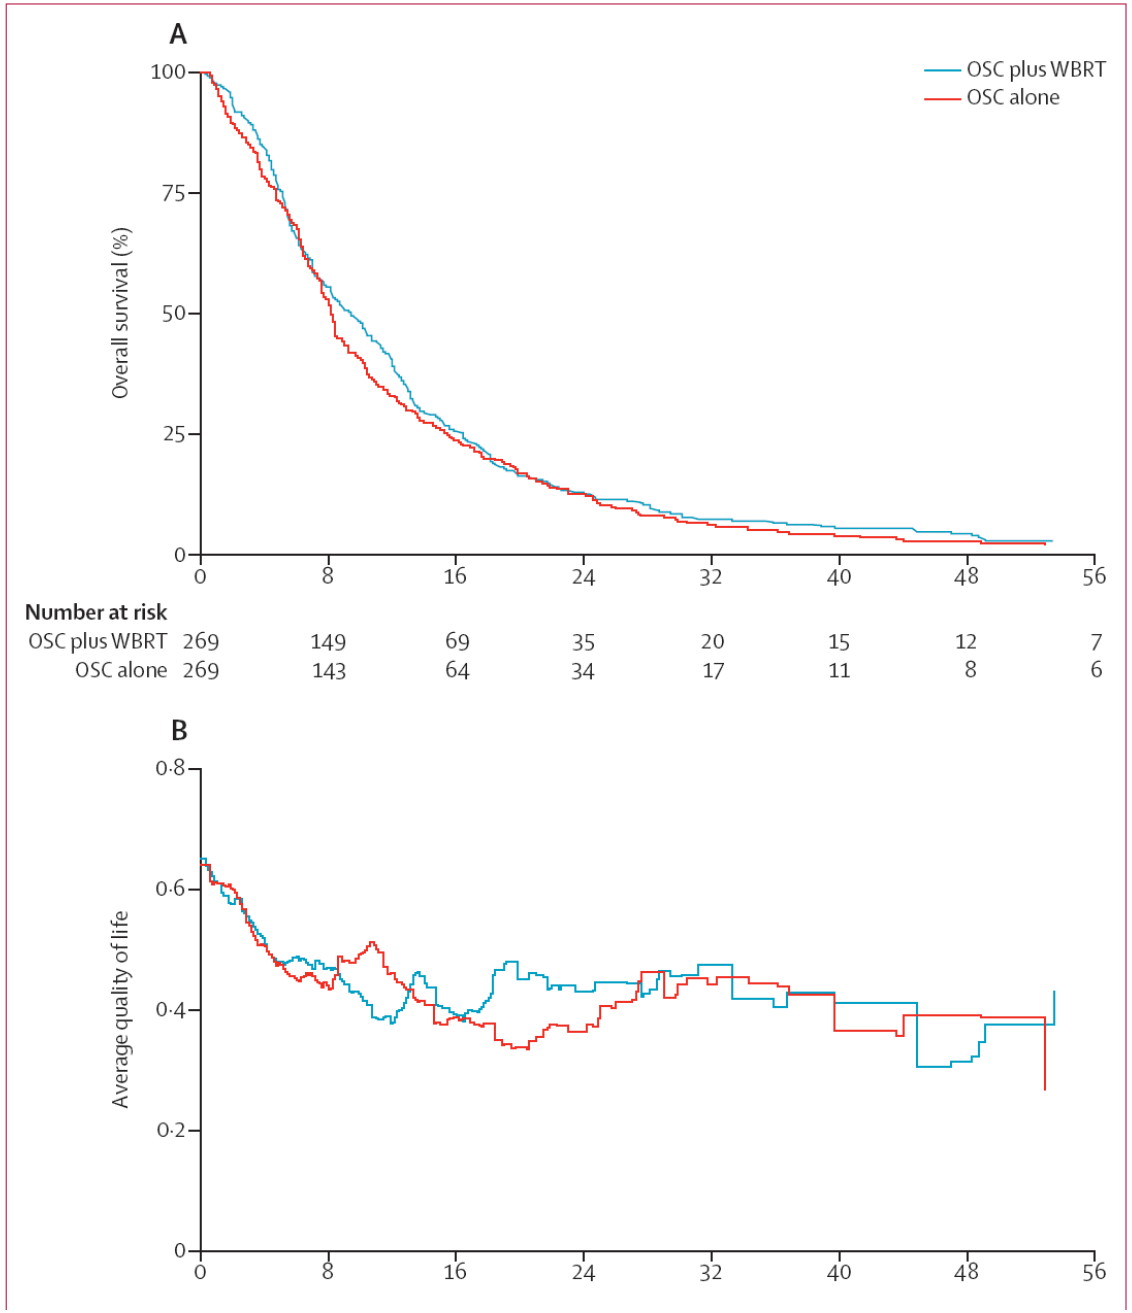
- Took 7 years to recruit
- Released interim data in 2013 (151 pts)

- 98% on steroids

	OSC plus WBRT (n=269)	OSC alone (n=269)
(Continued from previous column)		
GPA prognostic class		
3·5–4·0	5 (2%)	2 (1%)
2·5–3·0	39 (15%)	40 (15%)
1·5–2·0	109 (41%)	104 (39%)
0·0–1·0	111 (42%)	123 (46%)
Data unavailable	5	0

Quartz results

- Median OS 9.2 weeks
- 84% had response to steroids
- No change in steroid use
- -4.7 QUALY days for avoiding WBRT



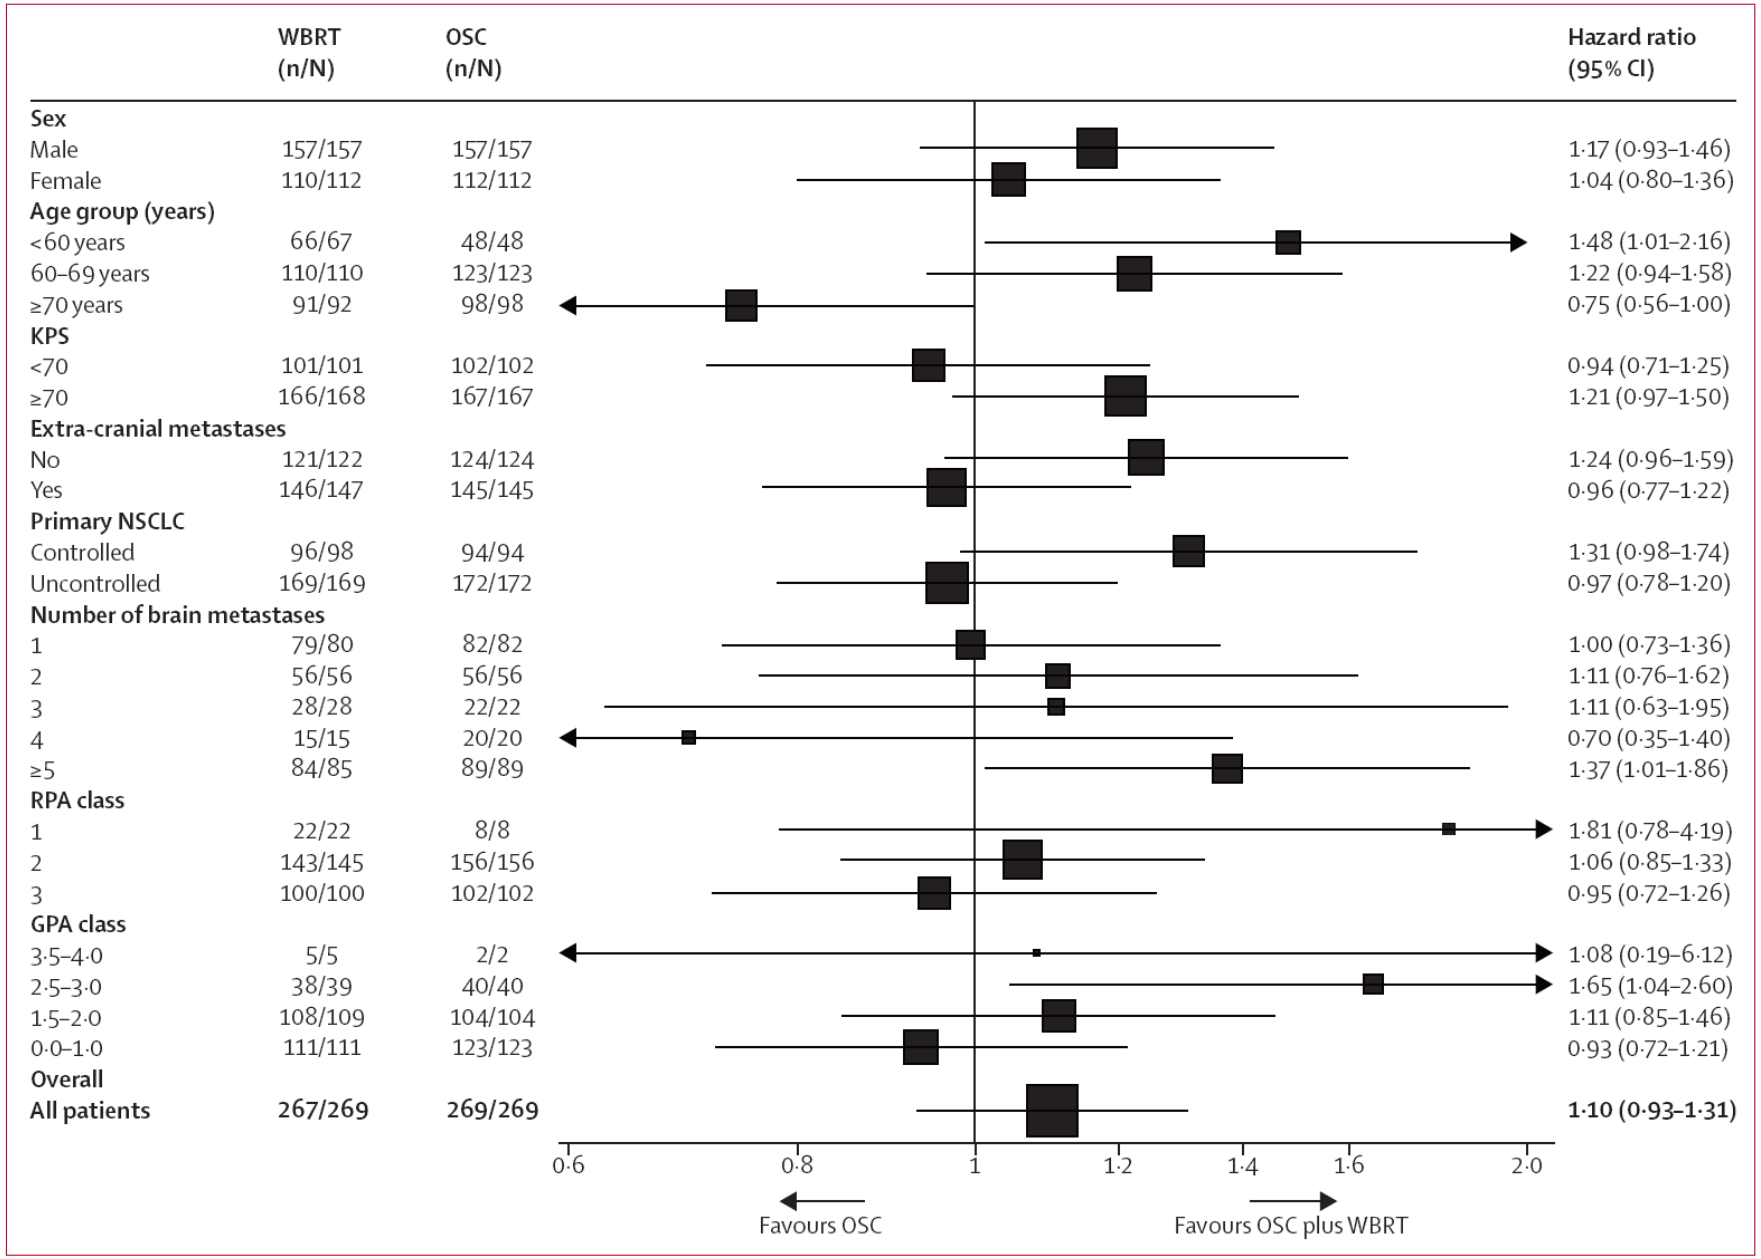


***Figure 3*: Forest plot of overall survival by patient characteristics**

All hazard ratios are obtained from Cox proportional hazard models with adjustment for randomised group only. KPS=Karnofsky Performance Status. NSCLC=non-small cell lung cancer. RPA=recursive partitioning analysis. GPA=graded prognostic assessment. WBRT=whole brain radiotherapy. OSC=optimal supportive care.

Quartz message

- WBRT is not effective in patients with NSCLC and poor prognosis
  - Survival, QoL, Steroids
  - Steroids ARE effective
- However….
  - Not apply to ALL NSCLC pts
- Recruitment difficult
  - Interim results
- 1971….. 2016

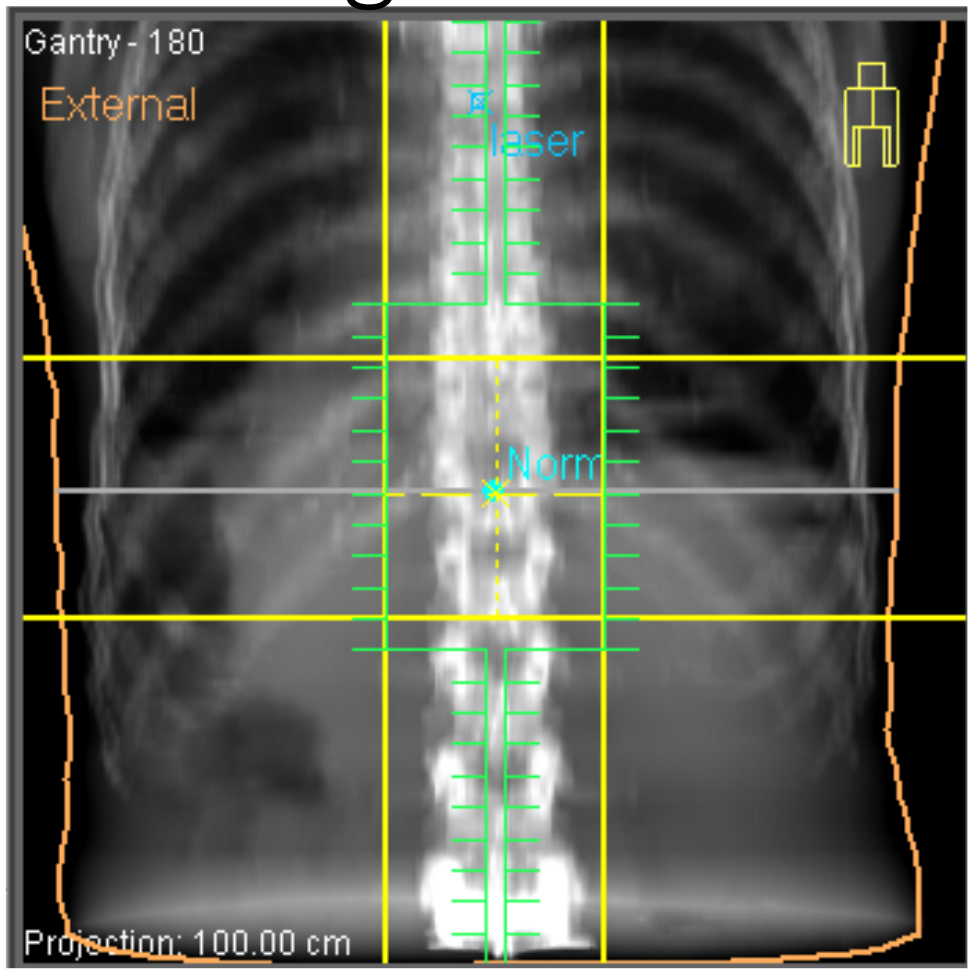
Brain Mets

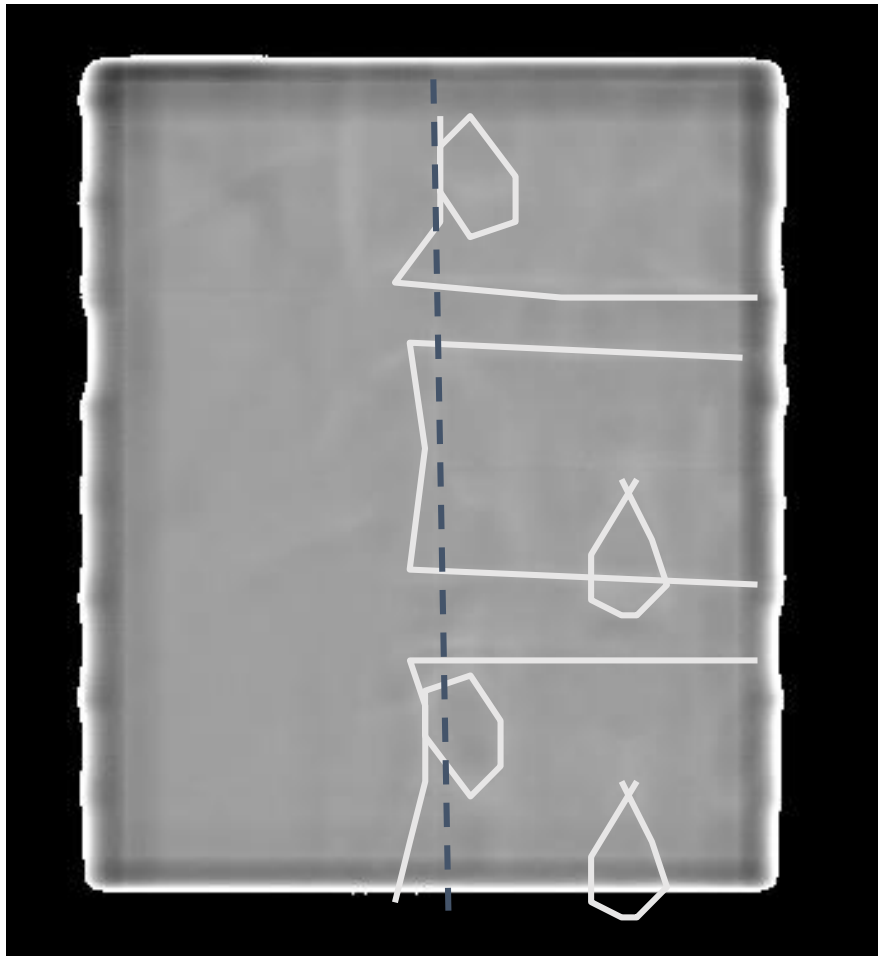
?

Palliative RT is still RT

- Need to consider set-up

Shift during treatment -> position verification





Lateral shift 2 cm

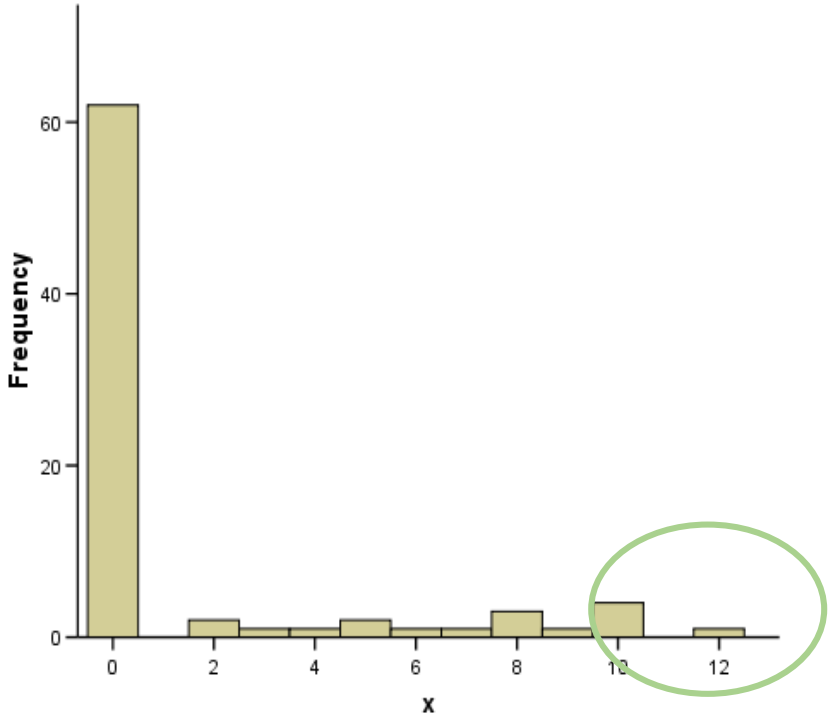
Set up errors

	Patient A	Patient B	Patient C
distress	relaxed	nervous	nervous
performance	good	good	poor
physical complaints	no pain	no pain	highly symptomatic
set up error	1 mm	3 mm	5mm

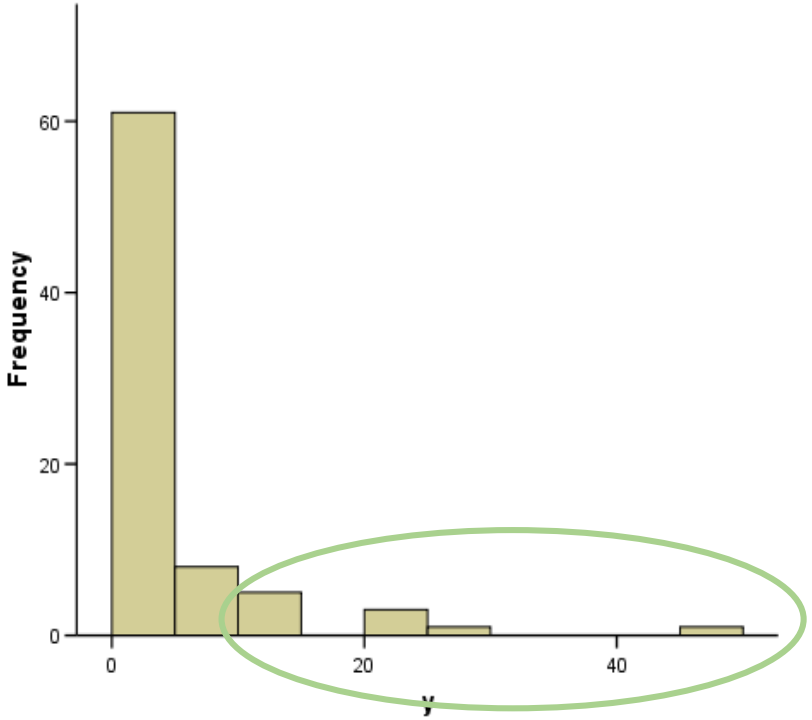
O. Morin, EPI workshop Leuven 2010

Errors ≥ 10mm in 14%

X-axis; lateral shift

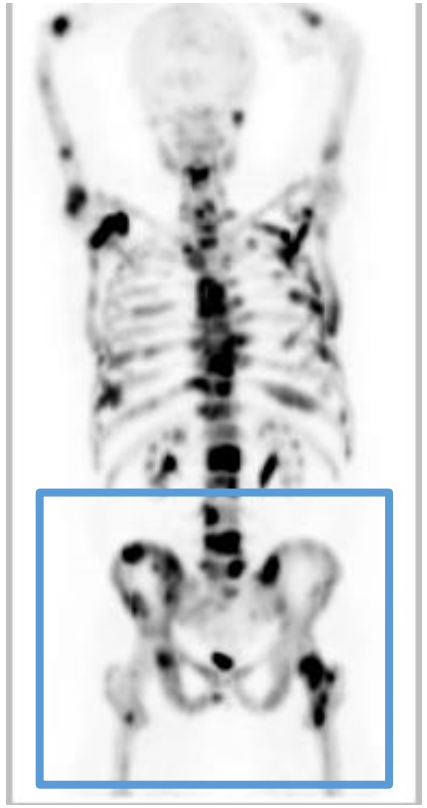


Y-axis; longitudinal shift



Patients with diffuse pain from e.g. prostate cancer

Strontium^{89}



Hemibody

Now also consider ^{223}Ra

Palliative care

Every patient who faces a life-threatening incurable disease.

1. *What do you know of your illness and how far advanced it is?*
2. *What are your fears and uncertainties regarding your future?*
3. *What are your goals and priorities in life?*
4. *What are you willing to give up or not , and what will you accept?*
5. *What makes a day a good day for you?*

Summary

- Many cancer patients die
- Many treatments are ineffective, and expensive, and time-consuming
  - More expensive, less effective nearer the end of life

- Palliative RT is effective and cost-effective
- Short dose/# schedules

- Chose who NOT to treat
- Integrate palliative RT within palliative care

Evidence in Palliative RT

- Good data for bone mets
  - Still slow to change practice
- Reasonable data for other sites
  - Although lung data was pre-chemotherapy era
- It is possible to run RCTs in palliative RT….. But not easy
  - “Toxicity” of single fraction
  - Reimbursement
  - Slow progress (1971 – 2016)

Believe what people do, not say

- Lots of interest in hypofractionated RT
- People still often use multi-fraction
- SCORAD and QUARTZ both found it difficult to recruit

- 23 686
- 309 votes

Don’t always believe what people say

- Audit local practice
  - Most audits show low rates of single-fraction RT

- What proportion of patients with bone mets are treated as a single fraction ?
- How long do people live after WBRT ?

Presenting and publishing scientific data

A few tips to convince

Bernard Dubray

How many papers have you written ?

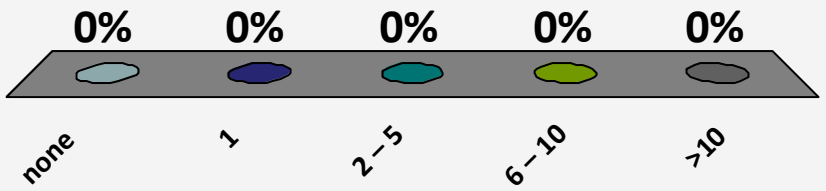
A. none

B. 1

C. 2 – 5

D. 6 – 10

E. >10



How many times have you presented scientific data ?

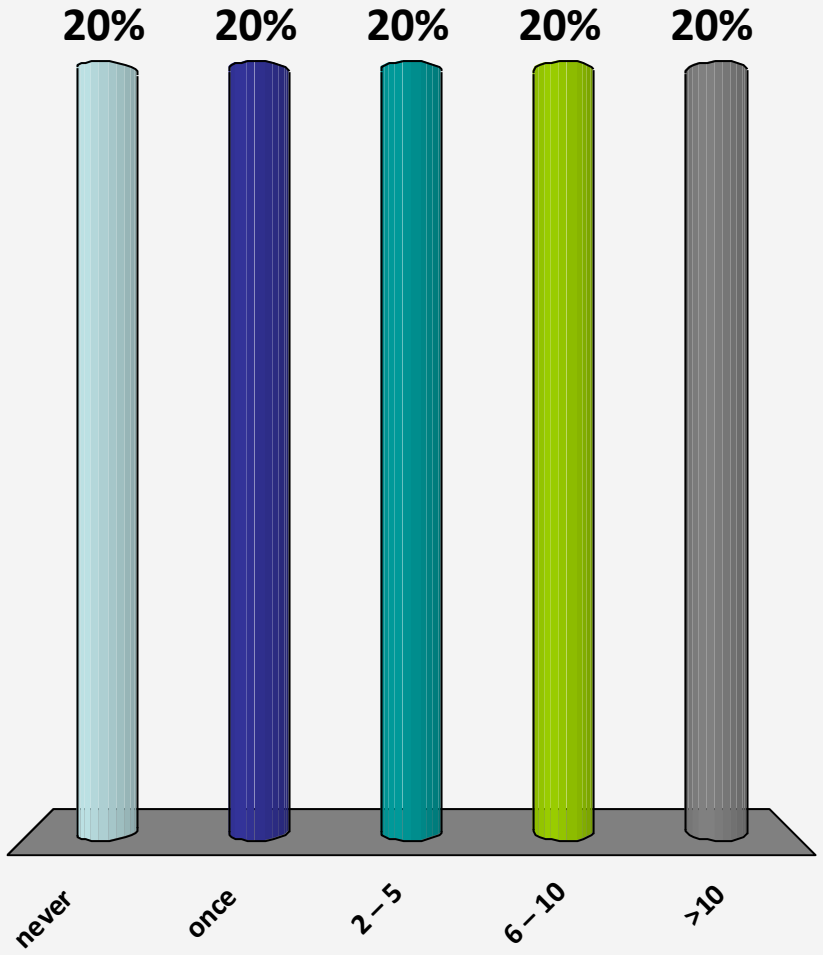
A. never

B. once

C. 2 – 5

D. 6 – 10

E. >10



Presenting and publishing

- Numerous issues
  - medicine /science
  - statistics
  - format and rules
  - communication skills
- Objectives
  - author: “my stuff is worth your money !”
  - audience: “do I really want to buy that ?”

I'll buy it if …

- The question makes sense to me
  - fits to my clinical practice
  - opens my mind
- The data provide a reliable answer
  - study design and conduct
  - quality of data and analysis
- The presentation / paper follows the rules
  - the information I need …
  - where I expect to find it

I'll sell it if …

- The question makes sense to them
  - what is my message ?
- The data provide a reliable answer
  - study design and conduct
  - quality of data and analysis
- The presentation / paper follows the rules
  - the information they need …
  - where they expect to find it

Getting ready

- What is my message ?
- What is the audience ?
- What are the rules ?

A good title

- Informative
- Short (< 12 words)
- Matching the content
- Attractive (reasonably …)

Which paper would you read first ?

A. Ceritinib versus CT in patients with *ALK*-rearranged NSCLC previously given CT and crizotinib (ASCEND-5)

B. Sexual conflict to the extreme

C. Toilet reading habits in Israeli adults

D. Uromycitisis Poisoning Results in Lower Urinary Tract Infection and Acute Renal Failure: Case Report

E. The conceptual penis as a social construct

Uromycitisis Poisoning Results in Lower Urinary Tract Infection and Acute Renal Failure: Case Report

Abstract

Uromycitisis is a rare but serious condition that affects over 2,000 mostly adult men and women in the United States each year. Described simply, it is caused by prolonged failure to evacuate the contents of the bladder and can result in a serious infection of the lower urinary tract known as "uromycitisis poisoning," which, if untreated, can cause acute renal failure and has an associated high mortality. Because people with uromycitisis often cannot hold in their urine and feel they must-and, at times, actually must-urinate in inappropriate places, sometimes running afoul of local public sanitation ordinances, they can feel great personal shame and place themselves in legal jeopardy, through no fault of their own. We report the case of a 37-year-old male who suffers from uromycitisis, was prevented from urinating in public, was admitted to the emergency room with uromycitisis poisoning, was misdiagnosed, and was referred to our institution for treatment.

Case Report

The conceptual penis as a social construct

Jamie Lindsay[1]* and Peter Boyle[1]

Abstract: Anatomical penises may exist, but as pre-operative transgendered women also have anatomical penises, the penis *vis-à-vis* maleness is an incoherent construct. We argue that the conceptual penis is better understood not as an anatomical organ but as a social construct isomorphic to performative toxic masculinity. Through detailed poststructuralist discursive criticism and the example of climate change, this paper will challenge the prevailing and damaging social trope that penises are best understood as the male sexual organ and reassign it a more fitting role as a type of masculine performance.
